Chapter 1. Introduction	53
1.1. Overview	53
1.2. Attribution	53
1.3. Other chapters	54
Chapter 2. Conventions	57
2.1. Comments	57
2.2. Set theory	57
2.3. Categories	57
2.4. Algebra	57
2.5. Notation	57
2.6. Other chapters	57
Chapter 3. Set Theory	59
3.1. Introduction	59
3.2. Everything is a set	59
3.3. Classes	59
3.4. Ordinals	60
3.5. The hierarchy of sets	60
3.6. Cardinality	60
3.7. Cofinality	61
3.8. Reflection principle	61
3.9. Constructing categories of schemes	62
3.10. Sets with group action	67
3.11. Coverings of a site	68
3.12. Abelian categories and injectives	70
3.13. Other chapters	70
Chapter 4. Categories	73
4.1. Introduction	73
4.2. Definitions	73
4.3. Opposite Categories and the Yoneda Lemma	77
4.4. Products of pairs	78
4.5. Coproducts of pairs	78
4.6. Fibre products	79
4.7. Examples of fibre products	80
4.8. Fibre products and representability	81
4.9. Pushouts	82
4.10. Equalizers	83
4.11. Coequalizers	83

4.12.	Initial and final objects	83
4.13.	Monomorphisms and Epimorphisms	83
4.14.	Limits and colimits	84
4.15.	Limits and colimits in the category of sets	86
4.16.	Connected limits	87
4.17.	Cofinal and initial categories	87
4.18.	Finite limits and colimits	89
4.19.	Filtered colimits	91
4.20.	Cofiltered limits	95
4.21.	Limits and colimits over partially ordered sets	95
4.22.	Essentially constant systems	98
4.23.	Exact functors	101
4.24.	Adjoint functors	101
4.25.	Localization in categories	103
4.26.	Formal properties	113
4.27.	2-categories	115
4.28.	$(2, 1)$ -categories	117
4.29.	2-fibre products	117
4.30.	Categories over categories	124
4.31.	Fibred categories	125
4.32.	Inertia	131
4.33.	Categories fibred in groupoids	133
4.34.	Presheaves of categories	140
4.35.	Presheaves of groupoids	141
4.36.	Categories fibred in sets	142
4.37.	Categories fibred in setoids	144
4.38.	Representable categories fibred in groupoids	146
4.39.	Representable 1-morphisms	147
4.40.	A criterion for representability	150
4.41.	Other chapters	152
Chapter 5.	Topology	155
5.1.	Introduction	155
5.2.	Basic notions	155
5.3.	Hausdorff spaces	155
5.4.	Bases	156
5.5.	Submersive maps	157
5.6.	Connected components	158
5.7.	Irreducible components	160
5.8.	Noetherian topological spaces	162
5.9.	Krull dimension	164
5.10.	Codimension and catenary spaces	164
5.11.	Quasi-compact spaces and maps	165
5.12.	Locally quasi-compact spaces	169
5.13.	Limits of spaces	171
5.14.	Constructible sets	173
5.15.	Constructible sets and Noetherian spaces	176
5.16.	Characterizing proper maps	178
5.17.	Jacobson spaces	180

5.18.	Specialization	182
5.19.	Dimension functions	185
5.20.	Nowhere dense sets	186
5.21.	Profinite spaces	187
5.22.	Spectral spaces	188
5.23.	Limits of spectral spaces	193
5.24.	Stone-Čech compactification	197
5.25.	Extremally disconnected spaces	198
5.26.	Miscellany	200
5.27.	Partitions and stratifications	201
5.28.	Other chapters	202
Chapter 6. Sheaves on Spaces		205
6.1.	Introduction	205
6.2.	Basic notions	205
6.3.	Presheaves	205
6.4.	Abelian presheaves	206
6.5.	Presheaves of algebraic structures	207
6.6.	Presheaves of modules	208
6.7.	Sheaves	209
6.8.	Abelian sheaves	211
6.9.	Sheaves of algebraic structures	211
6.10.	Sheaves of modules	213
6.11.	Stalks	213
6.12.	Stalks of abelian presheaves	214
6.13.	Stalks of presheaves of algebraic structures	215
6.14.	Stalks of presheaves of modules	215
6.15.	Algebraic structures	216
6.16.	Exactness and points	217
6.17.	Sheafification	218
6.18.	Sheafification of abelian presheaves	220
6.19.	Sheafification of presheaves of algebraic structures	221
6.20.	Sheafification of presheaves of modules	222
6.21.	Continuous maps and sheaves	223
6.22.	Continuous maps and abelian sheaves	226
6.23.	Continuous maps and sheaves of algebraic structures	228
6.24.	Continuous maps and sheaves of modules	229
6.25.	Ringed spaces	232
6.26.	Morphisms of ringed spaces and modules	233
6.27.	Skyscraper sheaves and stalks	235
6.28.	Limits and colimits of presheaves	236
6.29.	Limits and colimits of sheaves	236
6.30.	Bases and sheaves	239
6.31.	Open immersions and (pre)sheaves	246
6.32.	Closed immersions and (pre)sheaves	251
6.33.	Glueing sheaves	252
6.34.	Other chapters	254
Chapter 7. Sites and Sheaves		257

7.1.	Introduction	257
7.2.	Presheaves	257
7.3.	Injective and surjective maps of presheaves	258
7.4.	Limits and colimits of presheaves	258
7.5.	Functoriality of categories of presheaves	259
7.6.	Sites	261
7.7.	Sheaves	263
7.8.	Families of morphisms with fixed target	264
7.9.	The example of G-sets	267
7.10.	Sheafification	269
7.11.	Quasi-compact objects and colimits	274
7.12.	Injective and surjective maps of sheaves	277
7.13.	Representable sheaves	278
7.14.	Continuous functors	279
7.15.	Morphisms of sites	280
7.16.	Topoi	282
7.17.	G-sets and morphisms	284
7.18.	More functoriality of presheaves	285
7.19.	Cocontinuous functors	287
7.20.	Cocontinuous functors and morphisms of topoi	289
7.21.	Cocontinuous functors which have a right adjoint	293
7.22.	Cocontinuous functors which have a left adjoint	293
7.23.	Existence of lower shriek	294
7.24.	Localization	295
7.25.	Glueing sheaves	298
7.26.	More localization	299
7.27.	Localization and morphisms	301
7.28.	Morphisms of topoi	304
7.29.	Localization of topoi	310
7.30.	Localization and morphisms of topoi	312
7.31.	Points	314
7.32.	Constructing points	318
7.33.	Points and morphisms of topoi	320
7.34.	Localization and points	322
7.35.	2-morphisms of topoi	324
7.36.	Morphisms between points	325
7.37.	Sites with enough points	325
7.38.	Criterion for existence of points	327
7.39.	Weakly contractible objects	329
7.40.	Exactness properties of pushforward	330
7.41.	Almost cocontinuous functors	334
7.42.	Subtopoi	336
7.43.	Sheaves of algebraic structures	338
7.44.	Pullback maps	341
7.45.	Topologies	342
7.46.	The topology defined by a site	345
7.47.	Sheafification in a topology	347
7.48.	Topologies and sheaves	350

7.49.	Topologies and continuous functors	351
7.50.	Points and topologies	351
7.51.	Other chapters	351
Chapter 8. Stacks		353
8.1.	Introduction	353
8.2.	Presheaves of morphisms associated to fibred categories	353
8.3.	Descent data in fibred categories	355
8.4.	Stacks	357
8.5.	Stacks in groupoids	361
8.6.	Stacks in setoids	362
8.7.	The inertia stack	364
8.8.	Stackification of fibred categories	365
8.9.	Stackification of categories fibred in groupoids	369
8.10.	Inherited topologies	370
8.11.	Gerbes	372
8.12.	Functoriality for stacks	375
8.13.	Stacks and localization	383
8.14.	Other chapters	384
Chapter 9. Fields		387
9.1.	Introduction	387
9.2.	Basic definitions	387
9.3.	Examples of fields	387
9.4.	Vector spaces	388
9.5.	The characteristic of a field	389
9.6.	Field extensions	389
9.7.	Finite extensions	391
9.8.	Algebraic extensions	393
9.9.	Minimal polynomials	394
9.10.	Algebraic closure	395
9.11.	Relatively prime polynomials	397
9.12.	Separable extensions	398
9.13.	Purely inseparable extensions	401
9.14.	Normal extensions	403
9.15.	Splitting fields	405
9.16.	Roots of unity	406
9.17.	Finite fields	406
9.18.	Primitive elements	407
9.19.	Galois theory	407
9.20.	The complex numbers	409
9.21.	Kummer extensions	410
9.22.	Artin-Schreier extensions	410
9.23.	Transcendence	410
9.24.	Linearly disjoint extensions	413
9.25.	Review	413
9.26.	Other chapters	414
Chapter 10. Commutative Algebra		417

10.1.	Introduction	417
10.2.	Conventions	417
10.3.	Basic notions	417
10.4.	Snake lemma	419
10.5.	Finite modules and finitely presented modules	420
10.6.	Ring maps of finite type and of finite presentation	421
10.7.	Finite ring maps	423
10.8.	Colimits	423
10.9.	Localization	427
10.10.	Internal Hom	432
10.11.	Tensor products	433
10.12.	Tensor algebra	438
10.13.	Base change	439
10.14.	Miscellany	441
10.15.	Cayley-Hamilton	442
10.16.	The spectrum of a ring	444
10.17.	Local rings	448
10.18.	The Jacobson radical of a ring	449
10.19.	Nakayama's lemma	450
10.20.	Open and closed subsets of spectra	451
10.21.	Connected components of spectra	452
10.22.	Glueing functions	453
10.23.	More glueing results	456
10.24.	Zerodivisors and total rings of fractions	459
10.25.	Irreducible components of spectra	460
10.26.	Examples of spectra of rings	461
10.27.	A meta-observation about prime ideals	464
10.28.	Images of ring maps of finite presentation	467
10.29.	More on images	470
10.30.	Noetherian rings	472
10.31.	Locally nilpotent ideals	474
10.32.	Curiosity	475
10.33.	Hilbert Nullstellensatz	475
10.34.	Jacobson rings	476
10.35.	Finite and integral ring extensions	485
10.36.	Normal rings	489
10.37.	Going down for integral over normal	492
10.38.	Flat modules and flat ring maps	493
10.39.	Supports and annihilators	499
10.40.	Going up and going down	501
10.41.	Separable extensions	504
10.42.	Geometrically reduced algebras	506
10.43.	Separable extensions, continued	508
10.44.	Perfect fields	509
10.45.	Geometrically irreducible algebras	511
10.46.	Geometrically connected algebras	514
10.47.	Geometrically integral algebras	516
10.48.	Valuation rings	516

10.49.	More Noetherian rings	520
10.50.	Length	522
10.51.	Artinian rings	525
10.52.	Homomorphisms essentially of finite type	526
10.53.	K-groups	527
10.54.	Graded rings	529
10.55.	Proj of a graded ring	530
10.56.	Blow up algebras	534
10.57.	Noetherian graded rings	536
10.58.	Noetherian local rings	538
10.59.	Dimension	540
10.60.	Applications of dimension theory	544
10.61.	Support and dimension of modules	545
10.62.	Associated primes	546
10.63.	Symbolic powers	549
10.64.	Relative assassin	550
10.65.	Weakly associated primes	552
10.66.	Embedded primes	556
10.67.	Regular sequences and depth	557
10.68.	Quasi-regular sequences	560
10.69.	Ext groups and depth	563
10.70.	Functorialities for Ext	566
10.71.	An application of Ext groups	567
10.72.	Tor groups and flatness	568
10.73.	Functorialities for Tor	573
10.74.	Projective modules	573
10.75.	Finite projective modules	575
10.76.	Open loci defined by module maps	577
10.77.	Faithfully flat descent for projectivity of modules	579
10.78.	Characterizing flatness	579
10.79.	Universally injective module maps	581
10.80.	Descent for finite projective modules	587
10.81.	Transfinite dévissage of modules	588
10.82.	Projective modules over a local ring	590
10.83.	Mittag-Leffler systems	591
10.84.	Inverse systems	593
10.85.	Mittag-Leffler modules	594
10.86.	Interchanging direct products with tensor	598
10.87.	Coherent rings	603
10.88.	Examples and non-examples of Mittag-Leffler modules	605
10.89.	Countably generated Mittag-Leffler modules	607
10.90.	Characterizing projective modules	608
10.91.	Ascending properties of modules	610
10.92.	Descending properties of modules	610
10.93.	Completion	612
10.94.	Taking limits of modules	618
10.95.	Criteria for flatness	619
10.96.	Base change and flatness	625

10.97.	Flatness criteria over Artinian rings	626
10.98.	What makes a complex exact?	629
10.99.	Cohen-Macaulay modules	632
10.100.	Cohen-Macaulay rings	635
10.101.	Catenary rings	636
10.102.	Regular local rings	637
10.103.	Epimorphisms of rings	639
10.104.	Pure ideals	642
10.105.	Rings of finite global dimension	644
10.106.	Regular rings and global dimension	647
10.107.	Auslander-Buchsbaum	650
10.108.	Homomorphisms and dimension	651
10.109.	The dimension formula	652
10.110.	Dimension of finite type algebras over fields	653
10.111.	Noether normalization	656
10.112.	Dimension of finite type algebras over fields, reprise	658
10.113.	Dimension of graded algebras over a field	660
10.114.	Generic flatness	660
10.115.	Around Krull-Akizuki	665
10.116.	Factorization	669
10.117.	Orders of vanishing	673
10.118.	Quasi-finite maps	677
10.119.	Zariski's Main Theorem	680
10.120.	Applications of Zariski's Main Theorem	684
10.121.	Dimension of fibres	686
10.122.	Algebras and modules of finite presentation	688
10.123.	Colimits and maps of finite presentation	691
10.124.	More flatness criteria	698
10.125.	Openness of the flat locus	703
10.126.	Openness of Cohen-Macaulay loci	705
10.127.	Differentials	707
10.128.	Finite order differential operators	712
10.129.	The naive cotangent complex	714
10.130.	Local complete intersections	721
10.131.	Syntomic morphisms	727
10.132.	Smooth ring maps	733
10.133.	Formally smooth maps	739
10.134.	Smoothness and differentials	745
10.135.	Smooth algebras over fields	746
10.136.	Smooth ring maps in the Noetherian case	750
10.137.	Overview of results on smooth ring maps	753
10.138.	Étale ring maps	754
10.139.	Local homomorphisms	766
10.140.	Integral closure and smooth base change	766
10.141.	Formally unramified maps	768
10.142.	Conormal modules and universal thickenings	769
10.143.	Formally étale maps	772
10.144.	Unramified ring maps	773

10.145.	Henselian local rings	779
10.146.	Serre's criterion for normality	793
10.147.	Formal smoothness of fields	796

10.156.	Colimits and maps of finite presentation, II	824
10.157.	Other chapters	827
Chapter 11.	Brauer groups	829
11.1.	Introduction	829
11.2.	Noncommutative algebras	829
11.3.	Wedderburn's theorem	829
11.4.	Lemmas on algebras	830
11.5.	The Brauer group of a field	832
11.6.	Skolem-Noether	833
11.7.	The centralizer theorem	834
11.8.	Splitting fields	835
11.9.	Other chapters	836
Chapter 12.	Homological Algebra	839
12.1.	Introduction	839
12.2.	Basic notions	839
12.3.	Preadditive and additive categories	839
12.4.	Karoubian categories	841
12.5.	Abelian categories	842
12.6.	Extensions	849
12.7.	Additive functors	851
12.8.	Localization	853
12.9.	Serre subcategories	855
12.10.	K-groups	857
12.11.	Cohomological delta-functors	860
12.12.	Complexes	861
12.13.	Truncation of complexes	866
12.14.	Homotopy and the shift functor	867
12.15.	Graded objects	871
12.16.	Filtrations	872
12.17.	Spectral sequences	877
12.18.	Spectral sequences: exact couples	878
12.19.	Spectral sequences: differential objects	880
12.20.	Spectral sequences: filtered differential objects	882
12.21.	Spectral sequences: filtered complexes	885
12.22.	Spectral sequences: double complexes	888
12.23.	Injectives	892

12.24.	Projectives	893
12.25.	Injectives and adjoint functors	894
12.26.	Essentially constant systems	896
12.27.	Inverse systems	897
12.28.	Exactness of products	901
12.29.	Other chapters	901
Chapter 13.	Derived Categories	903
13.1.	Introduction	903
13.2.	Triangulated categories	903
13.3.	The definition of a triangulated category	903
13.4.	Elementary results on triangulated categories	906
13.5.	Localization of triangulated categories	913
13.6.	Quotients of triangulated categories	919
13.7.	Adjoint functors for exact functors	925
13.8.	The homotopy category	926
13.9.	Cones and termwise split sequences	926
13.10.	Distinguished triangles in the homotopy category	933
13.11.	Derived categories	936
13.12.	The canonical delta-functor	938
13.13.	Triangulated subcategories of the derived category	941
13.14.	Filtered derived categories	942
13.15.	Derived functors in general	945
13.16.	Derived functors on derived categories	953
13.17.	Higher derived functors	956
13.18.	Injective resolutions	960
13.19.	Projective resolutions	964
13.20.	Right derived functors and injective resolutions	966
13.21.	Cartan-Eilenberg resolutions	968
13.22.	Composition of right derived functors	969
13.23.	Resolution functors	970
13.24.	Functorial injective embeddings and resolution functors	972
13.25.	Right derived functors via resolution functors	974
13.26.	Filtered derived category and injective resolutions	975
13.27.	Ext groups	982
13.28.	Unbounded complexes	985
13.29.	K-injective complexes	988
13.30.	Bounded cohomological dimension	991
13.31.	Derived colimits	993
13.32.	Derived limits	995
13.33.	Generators of triangulated categories	995
13.34.	Compact objects	996
13.35.	Brown representability	998
13.36.	Other chapters	999
Chapter 14.	Simplicial Methods	1001
14.1.	Introduction	1001
14.2.	The category of finite ordered sets	1001
14.3.	Simplicial objects	1003

14.4.	Simplicial objects as presheaves	1004
14.5.	Cosimplicial objects	1005
14.6.	Products of simplicial objects	1006
14.7.	Fibre products of simplicial objects	1007
14.8.	Pushouts of simplicial objects	1007
14.9.	Products of cosimplicial objects	1008
14.10.	Fibre products of cosimplicial objects	1008
14.11.	Simplicial sets	1008
14.12.	Truncated simplicial objects and skeleton functors	1009
14.13.	Products with simplicial sets	1010
14.14.	Hom from simplicial sets into cosimplicial objects	1011
14.15.	Internal Hom	1012
14.16.	Hom from simplicial sets into simplicial objects	1012
14.17.	Splitting simplicial objects	1017
14.18.	Coskeleton functors	1021
14.19.	Augmentations	1027
14.20.	Left adjoints to the skeleton functors	1029
14.21.	Simplicial objects in abelian categories	1033
14.22.	Simplicial objects and chain complexes	1036
14.23.	Dold-Kan	1040
14.24.	Dold-Kan for cosimplicial objects	1042
14.25.	Homotopies	1043
14.26.	Homotopies in abelian categories	1046
14.27.	Homotopies and cosimplicial objects	1047
14.28.	More homotopies in abelian categories	1049
14.29.	Trivial Kan fibrations	1053
14.30.	Kan fibrations	1055
14.31.	A homotopy equivalence	1058
14.32.	Standard resolutions	1061
14.33.	Other chapters	1065
Chapter 15.	More on Algebra	1067
15.1.	Introduction	1067
15.2.	Advice for the reader	1067
15.3.	A comment on the Artin-Rees property	1067
15.4.	Fibre products of rings	1069
15.5.	Fitting ideals	1076
15.6.	Lifting	1078
15.7.	Henselian pairs	1084
15.8.	Auto-associated rings	1091
15.9.	Flattening stratification	1092
15.10.	Flattening over an Artinian ring	1093
15.11.	Flattening over a closed subset of the base	1093
15.12.	Flattening over a closed subsets of source and base	1095
15.13.	Flattening over a Noetherian complete local ring	1096
15.14.	Descent flatness along integral maps	1098
15.15.	Torsion and flatness	1100
15.16.	Content ideals	1100
15.17.	Flatness and finiteness conditions	1101

15.18.	Blowing up and flatness	1104
15.19.	Completion and flatness	1105
15.20.	The Koszul complex	1107
15.21.	Koszul regular sequences	1110
15.22.	Regular ideals	1117
15.23.	Local complete intersection maps	1118
15.24.	Cartier's equality and geometric regularity	1120
15.25.	Geometric regularity	1121
15.26.	Topological rings and modules	1123
15.27.	Formally smooth maps of topological rings	1125
15.28.	Some results on power series rings	1130
15.29.	Geometric regularity and formal smoothness	1132
15.30.	Regular ring maps	1137
15.31.	Ascending properties along regular ring maps	1138
15.32.	Permanence of properties under completion	1139
15.33.	Permanence of properties under étale maps	1140
15.34.	Permanence of properties under henselization	1141
15.35.	Field extensions, revisited	1144
15.36.	The singular locus	1147
15.37.	Regularity and derivations	1148
15.38.	Formal smoothness and regularity	1150
15.39.	G-rings	1152
15.40.	Excellent rings	1158
15.41.	Injective abelian groups	1159
15.42.	Injectives in the category of modules	1159
15.43.	Derived categories of modules	1161
15.44.	Computing Tor	1161
15.45.	Derived tensor product	1162
15.46.	Derived change of rings	1165
15.47.	Tor independence	1167
15.48.	Spectral sequences for Tor	1168
15.49.	Products and Tor	1169
15.50.	Pseudo-coherent modules	1171
15.51.	Tor dimension	1178
15.52.	Projective dimension	1181
15.53.	Injective dimension	1183
15.54.	Hom complexes	1184
15.55.	Derived hom	1187
15.56.	Perfect complexes	1190
15.57.	Characterizing perfect complexes	1196
15.58.	Relatively finitely presented modules	1201
15.59.	Relatively pseudo-coherent modules	1204
15.60.	Pseudo-coherent and perfect ring maps	1209
15.61.	Rlim of abelian groups and modules	1210
15.62.	Torsion modules	1218
15.63.	Formal glueing of module categories	1220
15.64.	Derived Completion	1228
15.65.	Taking limits of complexes	1237

15.66.	Miscellany	1239
15.67.	Weakly étale ring maps	1241
15.68.	Ramification theory	1247
15.69.	Eliminating ramification	1253
15.70.	Picard groups of rings	1270
15.71.	Extensions of valuation rings	1273
15.72.	Structure of modules over a PID	1275
15.73.	Other chapters	1279
Chapter 16.	Smoothing Ring Maps	1281
16.1.	Introduction	1281
16.2.	Colimits	1282
16.3.	Singular ideals	1283
16.4.	Presentations of algebras	1285
16.5.	The lifting problem	1290
16.6.	The lifting lemma	1293
16.7.	The desingularization lemma	1295
16.8.	Warmup: reduction to a base field	1298
16.9.	Local tricks	1299
16.10.	Separable residue fields	1301
16.11.	Inseparable residue fields	1303
16.12.	The main theorem	1309
16.13.	The approximation property for G-rings	1309
16.14.	Approximation for henselian pairs	1311
16.15.	Other chapters	1312
Chapter 17.	Sheaves of Modules	1315
17.1.	Introduction	1315
17.2.	Pathology	1315
17.3.	The abelian category of sheaves of modules	1315
17.4.	Sections of sheaves of modules	1318
17.5.	Supports of modules and sections	1319
17.6.	Closed immersions and abelian sheaves	1319
17.7.	A canonical exact sequence	1321
17.8.	Modules locally generated by sections	1321
17.9.	Modules of finite type	1322
17.10.	Quasi-coherent modules	1323
17.11.	Modules of finite presentation	1327
17.12.	Coherent modules	1328
17.13.	Closed immersions of ringed spaces	1331
17.14.	Locally free sheaves	1332
17.15.	Tensor product	1333
17.16.	Flat modules	1335
17.17.	Flat morphisms of ringed spaces	1338
17.18.	Symmetric and exterior powers	1338
17.19.	Internal Hom	1340
17.20.	Koszul complexes	1342
17.21.	Invertible sheaves	1342
17.22.	Localizing sheaves of rings	1344

17.23.	Modules of differentials	1345
17.24.	The naive cotangent complex	1349
17.25.	Other chapters	1350
Chapter 18. Modules on Sites		1353
18.1.	Introduction	1353
18.2.	Abelian presheaves	1353
18.3.	Abelian sheaves	1354
18.4.	Free abelian presheaves	1355
18.5.	Free abelian sheaves	1356
18.6.	Ringed sites	1356
18.7.	Ringed topoi	1357
18.8.	2-morphisms of ringed topoi	1358
18.9.	Presheaves of modules	1359
18.10.	Sheaves of modules	1360
18.11.	Sheafification of presheaves of modules	1360
18.12.	Morphisms of topoi and sheaves of modules	1361
18.13.	Morphisms of ringed topoi and modules	1363
18.14.	The abelian category of sheaves of modules	1364
18.15.	Exactness of pushforward	1365
18.16.	Exactness of lower shriek	1366
18.17.	Global types of modules	1369
18.18.	Intrinsic properties of modules	1369
18.19.	Localization of ringed sites	1370
18.20.	Localization of morphisms of ringed sites	1373
18.21.	Localization of ringed topoi	1374
18.22.	Localization of morphisms of ringed topoi	1376
18.23.	Local types of modules	1377
18.24.	Basic results on local types of modules	1381
18.25.	Closed immersions of ringed topoi	1381
18.26.	Tensor product	1383
18.27.	Internal Hom	1384
18.28.	Flat modules	1386
18.29.	Towards constructible modules	1390
18.30.	Flat morphisms	1393
18.31.	Invertible modules	1394
18.32.	Modules of differentials	1395
18.33.	Finite order differential operators	1399
18.34.	The naive cotangent complex	1401
18.35.	Stalks of modules	1403
18.36.	Skyscraper sheaves	1405
18.37.	Localization and points	1406
18.38.	Pullbacks of flat modules	1406
18.39.	Locally ringed topoi	1407
18.40.	Lower shriek for modules	1412
18.41.	Constant sheaves	1413
18.42.	Locally constant sheaves	1415
18.43.	Other chapters	1417

Chapter 19. Injectives	1419
19.1. Introduction	1419
19.2. Baer's argument for modules	1419
19.3. G-modules	1423
19.4. Abelian sheaves on a space	1424
19.5. Sheaves of modules on a ringed space	1424
19.6. Abelian presheaves on a category	1425
19.7. Abelian Sheaves on a site	1426
19.8. Modules on a ringed site	1428
19.9. Embedding abelian categories	1429
19.10. Grothendieck's AB conditions	1431
19.11. Injectives in Grothendieck categories	1432
19.12. K-injectives in Grothendieck categories	1434
19.13. Additional remarks on Grothendieck abelian categories	1437
19.14. Other chapters	1439
Chapter 20. Cohomology of Sheaves	1441
20.1. Introduction	1441
20.2. Topics	1441
20.3. Cohomology of sheaves	1441
20.4. Derived functors	1442
20.5. First cohomology and torsors	1443
20.6. First cohomology and invertible sheaves	1444
20.7. Locality of cohomology	1444
20.8. Projection formula	1447
20.9. Mayer-Vietoris	1447
20.10. The Čech complex and Čech cohomology	1449
20.11. Čech cohomology as a functor on presheaves	1449
20.12. Čech cohomology and cohomology	1453
20.13. Flasque sheaves	1457
20.14. The Leray spectral sequence	1459
20.15. Functoriality of cohomology	1461
20.16. Refinements and Čech cohomology	1462
20.17. Cohomology on Hausdorff quasi-compact spaces	1464
20.18. The base change map	1466
20.19. Proper base change in topology	1467
20.20. Cohomology and colimits	1468
20.21. Vanishing on Noetherian topological spaces	1470
20.22. Cohomology with support in a closed	1473
20.23. Cohomology on spectral spaces	1474
20.24. The alternating Čech complex	1476
20.25. Alternative view of the Čech complex	1480
20.26. Čech cohomology of complexes	1481
20.27. Flat resolutions	1489
20.28. Derived pullback	1492
20.29. Cohomology of unbounded complexes	1493
20.30. Unbounded Mayer-Vietoris	1494
20.31. Producing K-injective resolutions	1498
20.32. Čech cohomology of unbounded complexes	1500

20.33.	Hom complexes	1501
20.34.	Internal hom in the derived category	1503
20.35.	Strictly perfect complexes	1506
20.36.	Pseudo-coherent modules	1509
20.37.	Tor dimension	1512
20.38.	Perfect complexes	1514
20.39.	Compact objects	1516
20.40.	Other chapters	1517
Chapter 21. Cohomology on Sites		1519
21.1.	Introduction	1519
21.2.	Topics	1519
21.3.	Cohomology of sheaves	1519
21.4.	Derived functors	1520
21.5.	First cohomology and torsors	1521
21.6.	First cohomology and extensions	1522
21.7.	First cohomology and invertible sheaves	1523
21.8.	Locality of cohomology	1524
21.9.	The Cech complex and Cech cohomology	1526
21.10.	Cech cohomology as a functor on presheaves	1527
21.11.	Cech cohomology and cohomology	1531
21.12.	Cohomology of modules	1534
21.13.	Limp sheaves	1536
21.14.	The Leray spectral sequence	1537
21.15.	The base change map	1539
21.16.	Cohomology and colimits	1540
21.17.	Flat resolutions	1542
21.18.	Derived pullback	1545
21.19.	Cohomology of unbounded complexes	1547
21.20.	Some properties of K-injective complexes	1547
21.21.	Derived and homotopy limits	1548
21.22.	Producing K-injective resolutions	1550
21.23.	Cohomology on Hausdorff and locally quasi-compact spaces	1555
21.24.	Spectral sequences for Ext	1559
21.25.	Hom complexes	1559
21.26.	Internal hom in the derived category	1561
21.27.	Derived lower shriek	1564
21.28.	Derived lower shriek for fibred categories	1566
21.29.	Homology on a category	1569
21.30.	Calculating derived lower shriek	1574
21.31.	Simplicial modules	1576
21.32.	Cohomology on a category	1578
21.33.	Strictly perfect complexes	1580
21.34.	Pseudo-coherent modules	1583
21.35.	Tor dimension	1586
21.36.	Perfect complexes	1588
21.37.	Projection formula	1591
21.38.	Weakly contractible objects	1591
21.39.	Compact objects	1593

21.40.	Complexes with locally constant cohomology sheaves	1595
21.41.	Other chapters	1597
Chapter 22.	Differential Graded Algebra	1599
22.1.	Introduction	1599
22.2.	Conventions	1599
22.3.	Differential graded algebras	1599
22.4.	Differential graded modules	1600
22.5.	The homotopy category	1602
22.6.	Cones	1602
22.7.	Admissible short exact sequences	1603
22.8.	Distinguished triangles	1605
22.9.	Cones and distinguished triangles	1606
22.10.	The homotopy category is triangulated	1608
22.11.	Projective modules over algebras	1610
22.12.	Injective modules over algebras	1610
22.13.	P-resolutions	1614
22.14.	I-resolutions	1616
22.15.	The derived category	1618
22.16.	The canonical delta-functor	1620
22.17.	Linear categories	1621
22.18.	Graded categories	1621
22.19.	Differential graded categories	1623
22.20.	Obtaining triangulated categories	1627
22.21.	Derived Hom	1638
22.22.	Variant of derived Hom	1639
22.23.	Tensor product	1640
22.24.	Derived tensor product	1641
22.25.	Variant of derived tensor product	1644
22.26.	Characterizing compact objects	1646
22.27.	Equivalences of derived categories	1650
22.28.	Other chapters	1654
Chapter 23.	Divided Power Algebra	1657
23.1.	Introduction	1657
23.2.	Divided powers	1657
23.3.	Divided power rings	1660
23.4.	Extending divided powers	1661
23.5.	Divided power polynomial algebras	1664
23.6.	Tate resolutions	1666
23.7.	Application to complete intersections	1670
23.8.	Local complete intersection rings	1673
23.9.	Local complete intersection maps	1677
23.10.	Other chapters	1680
Chapter 24.	Hypercoverings	1683
24.1.	Introduction	1683
24.2.	Hypercoverings	1683
24.3.	Acyclicity	1687

24.4.	Cech cohomology and hypercoverings	1690
24.5.	Hypercoverings a la Verdier	1692
24.6.	Covering hypercoverings	1694
24.7.	Adding simplices	1696
24.8.	Homotopies	1697
24.9.	Cohomology and hypercoverings	1699
24.10.	Hypercoverings of spaces	1703
24.11.	Hypercoverings and weakly contractible objects	1705
24.12.	Other chapters	1706
Chapter 25.	Schemes	1709
25.1.	Introduction	1709
25.2.	Locally ringed spaces	1709
25.3.	Open immersions of locally ringed spaces	1710
25.4.	Closed immersions of locally ringed spaces	1712
25.5.	Affine schemes	1713
25.6.	The category of affine schemes	1716
25.7.	Quasi-coherent sheaves on affines	1719
25.8.	Closed subspaces of affine schemes	1723
25.9.	Schemes	1723
25.10.	Immersion of schemes	1724
25.11.	Zariski topology of schemes	1725
25.12.	Reduced schemes	1727
25.13.	Points of schemes	1728
25.14.	Glueing schemes	1730
25.15.	A representability criterion	1733
25.16.	Existence of fibre products of schemes	1735
25.17.	Fibre products of schemes	1737
25.18.	Base change in algebraic geometry	1739
25.19.	Quasi-compact morphisms	1741
25.20.	Valuative criterion for universal closedness	1742
25.21.	Separation axioms	1745
25.22.	Valuative criterion of separatedness	1750
25.23.	Monomorphisms	1750
25.24.	Functoriality for quasi-coherent modules	1752
25.25.	Other chapters	1753
Chapter 26.	Constructions of Schemes	1755
26.1.	Introduction	1755
26.2.	Relative glueing	1755
26.3.	Relative spectrum via glueing	1757
26.4.	Relative spectrum as a functor	1758
26.5.	Affine n-space	1761
26.6.	Vector bundles	1762
26.7.	Cones	1762
26.8.	Proj of a graded ring	1763
26.9.	Quasi-coherent sheaves on Proj	1769
26.10.	Invertible sheaves on Proj	1770
26.11.	Functoriality of Proj	1773

26.12.	Morphisms into Proj	1775
26.13.	Projective space	1779
26.14.	Invertible sheaves and morphisms into Proj	1782
26.15.	Relative Proj via glueing	1784
26.16.	Relative Proj as a functor	1786
26.17.	Quasi-coherent sheaves on relative Proj	1791
26.18.	Functoriality of relative Proj	1793
26.19.	Invertible sheaves and morphisms into relative Proj	1794
26.20.	Twisting by invertible sheaves and relative Proj	1795
26.21.	Projective bundles	1796
26.22.	Grassmannians	1798

41.37.	Additivity of chern classes	2704
41.38.	The splitting principle	2706
41.39.	Chern classes and tensor product	2707
41.40.	Todd classes	2708
41.41.	Grothendieck-Riemann-Roch	2708
41.42.	Other chapters	2708
Chapter 42.	Adequate Modules	2711
42.1.	Introduction	2711
42.2.	Conventions	2711
42.3.	Adequate functors	2712
42.4.	Higher exts of adequate functors	2719
42.5.	Adequate modules	2725
42.6.	Parasitic adequate modules	2730
42.7.	Derived categories of adequate modules, I	2731
42.8.	Pure extensions	2734
42.9.	Higher exts of quasi-coherent sheaves on the big site	2737
42.10.	Derived categories of adequate modules, II	2738
42.11.	Other chapters	2739
Chapter 43.	Dualizing Complexes	2741
43.1.	Introduction	2741
43.2.	Essential surjections and injections	2741
43.3.	Injective modules	2742
43.4.	Projective covers	2744
43.5.	Injective hulls	2745
43.6.	Duality over Artinian local rings	2747
43.7.	Injective hull of the residue field	2748
43.8.	Local cohomology	2750
43.9.	Torsion versus complete modules	2756
43.10.	Trivial duality for a ring map	2758
43.11.	Sections with support in a closed subscheme	2759
43.12.	Dualizing complexes	2761
43.13.	Dualizing complexes over local rings	2764
43.14.	The dimension function of a dualizing complex	2766
43.15.	The local duality theorem	2768
43.16.	Dualizing complexes on schemes	2769
43.17.	Twisted inverse image	2770
43.18.	Flat and proper morphisms	2776
43.19.	Upper shriek functors	2778
43.20.	Other chapters	2780
Chapter 44.	Étale Cohomology	2783
44.1.	Introduction	2783
44.2.	Which sections to skip on a first reading?	2783
44.3.	Prologue	2783

44.4.	The étale topology	2784
44.5.	Feats of the étale topology	2785
44.6.	A computation	2785
44.7.	Nontorsion coefficients	2787
44.8.	Sheaf theory	2787
44.9.	Presheaves	2787
44.10.	Sites	2788
44.11.	Sheaves	2789
44.12.	The example of G -sets	2789
44.13.	Sheafification	2790
44.14.	Cohomology	2791
44.15.	The fpqc topology	2792
44.16.	Faithfully flat descent	2794
44.17.	Quasi-coherent sheaves	2796
44.18.	Cech cohomology	2797
44.19.	The Cech-to-cohomology spectral sequence	2800
44.20.	Big and small sites of schemes	2800
44.21.	The étale topos	2803
44.22.	Cohomology of quasi-coherent sheaves	2803
44.23.	Examples of sheaves	2806
44.24.	Picard groups	2806
44.25.	The étale site	2807
44.26.	Étale morphisms	2807
44.27.	Étale coverings	2809
44.28.	Kummer theory	2810
44.29.	Neighborhoods, stalks and points	2813
44.30.	Points in other topologies	2819
44.31.	Supports of abelian sheaves	2820
44.32.	Henselian rings	2822
44.33.	Stalks of the structure sheaf	2824
44.34.	Functoriality of small étale topos	2825
44.35.	Direct images	2825
44.36.	Inverse image	2826
44.37.	Functoriality of big topoi	2828
44.38.	Functoriality and sheaves of modules	2829
44.39.	Comparing big and small topoi	2830
44.40.	Comparing topologies	2831
44.41.	Recovering morphisms	2832
44.42.	Push and pull	2838
44.43.	Property (A)	2838
44.44.	Property (B)	2840
44.45.	Property (C)	2842
44.46.	Topological invariance of the small étale site	2844
44.47.	Closed immersions and pushforward	2846
44.48.	Integral universally injective morphisms	2847
44.49.	Big sites and pushforward	2848
44.50.	Exactness of big lower shriek	2849
44.51.	Étale cohomology	2851

44.52.	Colimits	2851
44.53.	Stalks of higher direct images	2854
44.54.	The Leray spectral sequence	2854
44.55.	Vanishing of finite higher direct images	2854
44.56.	Schemes étale over a point	2857
44.57.	Galois action on stalks	2858
44.58.	Group cohomology	2861
44.59.	Cohomology of a point	2862
44.60.	Cohomology of curves	2863
44.61.	Brauer groups	2863
44.62.	The Brauer group of a scheme	2865
44.63.	Galois cohomology	2866
44.64.	Higher vanishing for the multiplicative group	2867
44.65.	The Artin-Schreier sequence	2869
44.66.	Picard groups of curves	2872
44.67.	Extension by zero	2875
44.68.	Locally constant sheaves	2876
44.69.	Constructible sheaves	2878
44.70.	Auxiliary lemmas on morphisms	2882
44.71.	More on constructible sheaves	2883
44.72.	Constructible sheaves on Noetherian schemes	2888
44.73.	Cohomology with support in a closed subscheme	2892
44.74.	Affine analog of proper base change	2894
44.75.	Cohomology of torsion sheaves on curves	2899
44.76.	Finite étale covers of proper schemes	2904
44.77.	The proper base change theorem	2907
44.78.	Applications of proper base change	2913
44.79.	The trace formula	2913
44.80.	Frobenii	2913
44.81.	Traces	2917
44.82.	Why derived categories?	2917
44.83.	Derived categories	2918
44.84.	Filtered derived category	2919
44.85.	Filtered derived functors	2920
44.86.	Application of filtered complexes	2921
44.87.	Perfectness	2921
44.88.	Filtrations and perfect complexes	2922
44.89.	Characterizing perfect objects	2923
44.90.	Complexes with constructible cohomology	2923
44.91.	Cohomology of nice complexes	2926
44.92.	Lefschetz numbers	2927
44.93.	Preliminaries and sorites	2930
44.94.	Proof of the trace formula	2933
44.95.	Applications	2936
44.96.	On l -adic sheaves	2936
44.97.	L -functions	2938
44.98.	Cohomological interpretation	2938
44.99.	List of things which we should add above	2941

44.100.	Examples of L-functions	2941
44.101.	Constant sheaves	2942
44.102.	The Legendre family	2943
44.103.	Exponential sums	2945
44.104.	Trace formula in terms of fundamental groups	2945
44.105.	Fundamental groups	2945
44.106.	Profinite groups, cohomology and homology	2948
44.107.	Cohomology of curves, revisited	2949
44.108.	Abstract trace formula	2950
44.109.	Automorphic forms and sheaves	2951
44.110.	Counting points	2954
44.111.	Precise form of Chebotarev	2955
44.112.	How many primes decompose completely?	2956
44.113.	How many points are there really?	2957
44.114.	Other chapters	2958
Chapter 45.	Crystalline Cohomology	2961
45.1.	Introduction	2961
45.2.	Divided power envelope	2961
45.3.	Some explicit divided power thickenings	2965
45.4.	Compatibility	2967
45.5.	Affine crystalline site	2968
45.6.	Module of differentials	2970
45.7.	Divided power schemes	2976
45.8.	The big crystalline site	2978
45.9.	The crystalline site	2981
45.10.	Sheaves on the crystalline site	2983
45.11.	Crystals in modules	2984
45.12.	Sheaf of differentials	2985
45.13.	Two universal thickenings	2987
45.14.	The de Rham complex	2989
45.15.	Connections	2989
45.16.	Cosimplicial algebra	2990
45.17.	Crystals in quasi-coherent modules	2992
45.18.	General remarks on cohomology	2996
45.19.	Cosimplicial preparations	2998
45.20.	Divided power Poincaré lemma	3000
45.21.	Cohomology in the affine case	3001
45.22.	Two counter examples	3004
45.23.	Applications	3006
45.24.	Some further results	3006
45.25.	Pulling back along purely inseparable maps	3013
45.26.	Frobenius action on crystalline cohomology	3018
45.27.	Other chapters	3020
Chapter 46.	Pro-étale Cohomology	3023
46.1.	Introduction	3023
46.2.	Some topology	3023
46.3.	Local isomorphisms	3026

46.4.	Ind-Zariski algebra	3027
46.5.	Constructing w-local affine schemes	3027
46.6.	Identifying local rings versus ind-Zariski	3031
46.7.	Ind-étale algebra	3035
46.8.	Constructing ind-étale algebras	3036
46.9.	Weakly étale versus pro-étale	3039
46.10.	Constructing w-contractible covers	3040
46.11.	The pro-étale site	3042
46.12.	Points of the pro-étale site	3051
46.13.	Compact generation	3052
46.14.	Generalities on derived completion	3052
46.15.	Application to theorem on formal functions	3060
46.16.	Derived completion in the constant Noetherian case	3062
46.17.	Derived completion on the pro-étale site	3063
46.18.	Comparison with the étale site	3065
46.19.	Cohomology of a point	3069
46.20.	Weakly contractible hypercoverings	3070
46.21.	Functoriality of the pro-étale site	3072
46.22.	Finite morphisms and pro-étale sites	3073
46.23.	Closed immersions and pro-étale sites	3073
46.24.	Extension by zero	3076
46.25.	Constructible sheaves on the pro-étale site	3077
46.26.	Constructible adic sheaves	3079
46.27.	A suitable derived category	3082
46.28.	Proper base change	3086
46.29.	Other chapters	3088
Chapter 47.	Algebraic Spaces	3091
47.1.	Introduction	3091
47.2.	General remarks	3091
47.3.	Representable morphisms of presheaves	3092
47.4.	Lists of useful properties of morphisms of schemes	3093
47.5.	Properties of representable morphisms of presheaves	3095
47.6.	Algebraic spaces	3097
47.7.	Fibre products of algebraic spaces	3098
47.8.	Glueing algebraic spaces	3099
47.9.	Presentations of algebraic spaces	3101
47.10.	Algebraic spaces and equivalence relations	3102
47.11.	Algebraic spaces, retrofitted	3106
47.12.	Immersion and Zariski coverings of algebraic spaces	3108
47.13.	Separation conditions on algebraic spaces	3109
47.14.	Examples of algebraic spaces	3110
47.15.	Change of big site	3114
47.16.	Change of base scheme	3116
47.17.	Other chapters	3119
Chapter 48.	Properties of Algebraic Spaces	3121
48.1.	Introduction	3121
48.2.	Conventions	3121

48.3.	Separation axioms	3121
48.4.	Points of algebraic spaces	3123
48.5.	Quasi-compact spaces	3127
48.6.	Special coverings	3128
48.7.	Properties of Spaces defined by properties of schemes	3130
48.8.	Dimension at a point	3131
48.9.	Reduced spaces	3132
48.10.	The schematic locus	3133
48.11.	Obtaining a scheme	3135
48.12.	Points on quasi-separated spaces	3136
48.13.	Étale morphisms of algebraic spaces	3138
48.14.	Spaces and fpqc coverings	3141
48.15.	The étale site of an algebraic space	3142
48.16.	Points of the small étale site	3149
48.17.	Supports of abelian sheaves	3154
48.18.	The structure sheaf of an algebraic space	3156
48.19.	Stalks of the structure sheaf	3157
48.20.	Dimension of local rings	3157
48.21.	Local irreducibility	3158
48.22.	Noetherian spaces	3159
48.23.	Regular algebraic spaces	3160
48.24.	Sheaves of modules on algebraic spaces	3161
48.25.	Étale localization	3162
48.26.	Recovering morphisms	3164
48.27.	Quasi-coherent sheaves on algebraic spaces	3168
48.28.	Properties of modules	3171
48.29.	Locally projective modules	3172
48.30.	Quasi-coherent sheaves and presentations	3173
48.31.	Morphisms towards schemes	3175
48.32.	Quotients by free actions	3175
48.33.	Other chapters	3176
Chapter 49.	Morphisms of Algebraic Spaces	3179
49.1.	Introduction	3179
49.2.	Conventions	3179
49.3.	Properties of representable morphisms	3179
49.4.	Separation axioms	3180
49.5.	Surjective morphisms	3185
49.6.	Open morphisms	3186
49.7.	Submersive morphisms	3188
49.8.	Quasi-compact morphisms	3188
49.9.	Universally closed morphisms	3191
49.10.	Monomorphisms	3194
49.11.	Pushforward of quasi-coherent sheaves	3196
49.12.	Immersions	3198
49.13.	Closed immersions	3200
49.14.	Closed immersions and quasi-coherent sheaves	3203
49.15.	Supports of modules	3204
49.16.	Scheme theoretic image	3206

49.17.	Scheme theoretic closure and density	3208
49.18.	Dominant morphisms	3210
49.19.	Universally injective morphisms	3210
49.20.	Affine morphisms	3212
49.21.	Quasi-affine morphisms	3215
49.22.	Types of morphisms étale local on source-and-target	3216
49.23.	Morphisms of finite type	3219
49.24.	Points and geometric points	3221
49.25.	Points of finite type	3224
49.26.	Quasi-finite morphisms	3226
49.27.	Morphisms of finite presentation	3229
49.28.	Flat morphisms	3232
49.29.	Flat modules	3236
49.30.	Generic flatness	3238
49.31.	Relative dimension	3239
49.32.	Morphisms and dimensions of fibres	3241
49.33.	Syntomic morphisms	3243
49.34.	Smooth morphisms	3244
49.35.	Unramified morphisms	3246
49.36.	Étale morphisms	3250
49.37.	Proper morphisms	3251
49.38.	Valuative criteria	3253
49.39.	Valuative criterion for universal closedness	3260
49.40.	Valuative criterion of separatedness	3263
49.41.	Integral and finite morphisms	3264
49.42.	Finite locally free morphisms	3266
49.43.	Normalization of algebraic spaces	3267
49.44.	Separated, locally quasi-finite morphisms	3270
49.45.	Applications	3273
49.46.	Zariski's Main Theorem (representable case)	3273
49.47.	Universal homeomorphisms	3274
49.48.	Other chapters	3276
Chapter 50.	Decent Algebraic Spaces	3279
50.1.	Introduction	3279
50.2.	Conventions	3279
50.3.	Universally bounded fibres	3279
50.4.	Finiteness conditions and points	3281
50.5.	Conditions on algebraic spaces	3286
50.6.	Reasonable and decent algebraic spaces	3289
50.7.	Points and specializations	3291
50.8.	Stratifying algebraic spaces by schemes	3293
50.9.	Schematic locus	3295
50.10.	Points on spaces	3297
50.11.	Reduced singleton spaces	3299
50.12.	Decent spaces	3302
50.13.	Locally separated spaces	3303
50.14.	Valuative criterion	3304
50.15.	Relative conditions	3307

50.16.	Points of fibres	3312
50.17.	Monomorphisms	3316
50.18.	Birational morphisms	3317
50.19.	Other chapters	3317
Chapter 51.	Cohomology of Algebraic Spaces	3319
51.1.	Introduction	3319
51.2.	Conventions	3319
51.3.	Higher direct images	3319
51.4.	Colimits and cohomology	3322
51.5.	The alternating Čech complex	3323
51.6.	Higher vanishing for quasi-coherent sheaves	3327
51.7.	Vanishing for higher direct images	3329
51.8.	Cohomology with support in a closed subspace	3329
51.9.	Vanishing above the dimension	3331
51.10.	Cohomology and base change, I	3332
51.11.	Coherent modules on locally Noetherian algebraic spaces	3334
51.12.	Coherent sheaves on Noetherian spaces	3336
51.13.	Devissage of coherent sheaves	3337
51.14.	Limits of coherent modules	3341
51.15.	Vanishing cohomology	3343
51.16.	Finite morphisms and affines	3347
51.17.	A weak version of Chow's lemma	3348
51.18.	Noetherian valuative criterion	3349
51.19.	Higher direct images of coherent sheaves	3352
51.20.	The theorem on formal functions	3355
51.21.	Applications of the theorem on formal functions	3359
51.22.	Other chapters	3360
Chapter 52.	Limits of Algebraic Spaces	3363
52.1.	Introduction	3363
52.2.	Conventions	3363
52.3.	Morphisms of finite presentation	3363
52.4.	Limits of algebraic spaces	3368
52.5.	Descending properties	3369
52.6.	Descending properties of morphisms	3374
52.7.	Descending relative objects	3378
52.8.	Absolute Noetherian approximation	3380
52.9.	Applications	3382
52.10.	Relative approximation	3385
52.11.	Finite type closed in finite presentation	3385
52.12.	Approximating proper morphisms	3388
52.13.	Embedding into affine space	3389
52.14.	Sections with support in a closed subset	3390
52.15.	Characterizing affine spaces	3392
52.16.	Finite cover by a scheme	3393
52.17.	Other chapters	3395
Chapter 53.	Divisors on Algebraic Spaces	3397

53.1.	Introduction	3397
53.2.	Effective Cartier divisors	3397
53.3.	Relative Proj	3400
53.4.	Functoriality of relative proj	3404
53.5.	Closed subspaces of relative proj	3405
53.6.	Blowing up	3406
53.7.	Strict transform	3410
53.8.	Admissible blowups	3412
53.9.	Other chapters	3414
Chapter 54.	Algebraic Spaces over Fields	3417
54.1.	Introduction	3417
54.2.	Conventions	3417
54.3.	Geometric components	3417
54.4.	Generically finite morphisms	3418
54.5.	Integral algebraic spaces	3420
54.6.	Modifications and alterations	3421
54.7.	Schematic locus	3422
54.8.	Geometrically connected algebraic spaces	3425
54.9.	Spaces smooth over fields	3428
54.10.	Other chapters	3428
Chapter 55.	Topologies on Algebraic Spaces	3431
55.1.	Introduction	3431
55.2.	The general procedure	3431
55.3.	Fpqc topology	3432
55.4.	Fppf topology	3433
55.5.	Syntomic topology	3434
55.6.	Smooth topology	3434
55.7.	Étale topology	3435
55.8.	Zariski topology	3435
55.9.	Other chapters	3436
Chapter 56.	Descent and Algebraic Spaces	3439
56.1.	Introduction	3439
56.2.	Conventions	3439
56.3.	Descent data for quasi-coherent sheaves	3439
56.4.	Fpqc descent of quasi-coherent sheaves	3441
56.5.	Descent of finiteness properties of modules	3441
56.6.	Fpqc coverings	3443
56.7.	Descent of finiteness properties of morphisms	3444
56.8.	Descending properties of spaces	3446
56.9.	Descending properties of morphisms	3447
56.10.	Descending properties of morphisms in the fpqc topology	3448
56.11.	Descending properties of morphisms in the fppf topology	3456
56.12.	Properties of morphisms local on the source	3457
56.13.	Properties of morphisms local in the fpqc topology on the source	3458
56.14.	Properties of morphisms local in the fppf topology on the source	3458

56.15.	Properties of morphisms local in the syntomic topology on the source	3459
56.16.	Properties of morphisms local in the smooth topology on the source	3459
56.17.	Properties of morphisms local in the étale topology on the source	3459
56.18.	Properties of morphisms smooth local on source-and-target	3460

56.20.	Descent data in terms of sheaves	3466
56.21.	Other chapters	3467
Chapter 57.	Derived Categories of Spaces	3469
57.1.	Introduction	3469
57.2.	Conventions	3469
57.3.	Generalities	3469
57.4.	Derived category of quasi-coherent modules on the small étale site	3469
57.5.	Derived category of quasi-coherent modules	3471
57.6.	Total direct image	3473
57.7.	Derived category of coherent modules	3476
57.8.	Induction principle	3476
57.9.	Mayer-Vietoris	3479
57.10.	The coherator	3483
57.11.	The coherator for Noetherian spaces	3488
57.12.	Pseudo-coherent and perfect complexes	3490
57.13.	Approximation by perfect complexes	3494
57.14.	Generating derived categories	3496
57.15.	Compact and perfect objects	3499
57.16.	Derived categories as module categories	3500
57.17.	Cohomology and base change, IV	3502
57.18.	Producing perfect complexes	3507
57.19.	Computing Ext groups and base change	3507
57.20.	Limits and derived categories	3510
57.21.	Cohomology and base change, V	3511
57.22.	Other chapters	3512
Chapter 58.	More on Morphisms of Spaces	3515
58.1.	Introduction	3515
58.2.	Conventions	3515
58.3.	Radicial morphisms	3515
58.4.	Conormal sheaf of an immersion	3517
58.5.	The normal cone of an immersion	3520
58.6.	Sheaf of differentials of a morphism	3522
58.7.	Topological invariance of the étale site	3526
58.8.	Thickenings	3527
58.9.	First order infinitesimal neighbourhood	3533
58.10.	Formally smooth, étale, unramified transformations	3534
58.11.	Formally unramified morphisms	3538
58.12.	Universal first order thickenings	3540
58.13.	Formally étale morphisms	3546
58.14.	Infinitesimal deformations of maps	3548
58.15.	Infinitesimal deformations of algebraic spaces	3549

58.16.	Formally smooth morphisms	3550
58.17.	Smoothness over a Noetherian base	3555
58.18.	Openness of the flat locus	3557
58.19.	Critère de platitude par fibres	3558
58.20.	Flatness over a Noetherian base	3562
58.21.	Normalization revisited	3563
58.22.	Slicing Cohen-Macaulay morphisms	3563
58.23.	Étale localization of morphisms	3565
58.24.	Zariski's Main Theorem	3566
58.25.	Stein factorization	3570
58.26.	Extending properties from an open	3573
58.27.	Blowing up and flatness	3574
58.28.	Applications	3575
58.29.	Chow's lemma	3577
58.30.	Variants of Chow's Lemma	3580
58.31.	Grothendieck's existence theorem	3581
58.32.	Grothendieck's algebraization theorem	3588
58.33.	Regular immersions	3590
58.34.	Pseudo-coherent morphisms	3593
58.35.	Perfect morphisms	3594
58.36.	Local complete intersection morphisms	3594
58.37.	When is a morphism an isomorphism?	3597
58.38.	Exact sequences of differentials and conormal sheaves	3601
58.39.	Other chapters	3602
Chapter 59.	Pushouts of Algebraic Spaces	3605
59.1.	Introduction	3605
59.2.	Pushouts in the category of algebraic spaces	3605
59.3.	Formal glueing of quasi-coherent modules	3612
59.4.	Formal glueing of algebraic spaces	3617
59.5.	Coequalizers and glueing	3618
59.6.	Other chapters	3621
Chapter 60.	Groupoids in Algebraic Spaces	3623
60.1.	Introduction	3623
60.2.	Conventions	3623
60.3.	Notation	3623
60.4.	Equivalence relations	3624
60.5.	Group algebraic spaces	3625
60.6.	Properties of group algebraic spaces	3625
60.7.	Examples of group algebraic spaces	3626
60.8.	Actions of group algebraic spaces	3627
60.9.	Principal homogeneous spaces	3628
60.10.	Equivariant quasi-coherent sheaves	3629
60.11.	Groupoids in algebraic spaces	3630
60.12.	Quasi-coherent sheaves on groupoids	3631
60.13.	Crystals in quasi-coherent sheaves	3633
60.14.	Groupoids and group spaces	3635
60.15.	The stabilizer group algebraic space	3636

60.16.	Restricting groupoids	3637
60.17.	Invariant subspaces	3638
60.18.	Quotient sheaves	3639
60.19.	Quotient stacks	3641
60.20.	Functoriality of quotient stacks	3643
60.21.	The 2-cartesian square of a quotient stack	3645
60.22.	The 2-coequalizer property of a quotient stack	3646
60.23.	Explicit description of quotient stacks	3647
60.24.	Restriction and quotient stacks	3649
60.25.	Inertia and quotient stacks	3651
60.26.	Gerbes and quotient stacks	3652
60.27.	Quotient stacks and change of big site	3653
60.28.	Separation conditions	3654
60.29.	Other chapters	3655
Chapter 61. More on Groupoids in Spaces		3657
61.1.	Introduction	3657
61.2.	Notation	3657
61.3.	Useful diagrams	3657
61.4.	Properties of groupoids	3658
61.5.	Comparing fibres	3659
61.6.	Restricting groupoids	3659
61.7.	Properties of groups over fields and groupoids on fields	3660
61.8.	No rational curves on groups	3663
61.9.	The finite part of a morphism	3665
61.10.	Finite collections of arrows	3672
61.11.	The finite part of a groupoid	3672
61.12.	Étale localization of groupoid schemes	3674
61.13.	Other chapters	3677
Chapter 62. Bootstrap		3679
62.1.	Introduction	3679
62.2.	Conventions	3679
62.3.	Morphisms representable by algebraic spaces	3679
62.4.	Properties of maps of presheaves representable by algebraic spaces	3682
62.5.	Bootstrapping the diagonal	3684
62.6.	Bootstrap	3686
62.7.	Finding opens	3687
62.8.	Slicing equivalence relations	3688
62.9.	Quotient by a subgroupoid	3690
62.10.	Final bootstrap	3692
62.11.	Applications	3694
62.12.	Algebraic spaces in the étale topology	3698
62.13.	Other chapters	3699
Chapter 63. Quotients of Groupoids		3701
63.1.	Introduction	3701
63.2.	Conventions and notation	3701
63.3.	Invariant morphisms	3701

63.4.	Categorical quotients	3702
63.5.	Quotients as orbit spaces	3704
63.6.	Coarse quotients	3712
63.7.	Topological properties	3713
63.8.	Invariant functions	3713
63.9.	Good quotients	3714
63.10.	Geometric quotients	3714
63.11.	Other chapters	3714
Chapter 64.	Simplicial Spaces	3717
64.1.	Introduction	3717
64.2.	Simplicial topological spaces	3717
64.3.	Simplicial sites and topoi	3721
64.4.	Simplicial semi-representable objects	3724
64.5.	Hypercovering in a site	3727
64.6.	Proper hypercoverings in topology	3728
64.7.	Simplicial schemes	3730
64.8.	Descent in terms of simplicial schemes	3730
64.9.	Quasi-coherent modules on simplicial schemes	3732
64.10.	Groupoids and simplicial schemes	3734
64.11.	Descent data give equivalence relations	3736
64.12.	An example case	3736
64.13.	Other chapters	3737
Chapter 65.	Formal Algebraic Spaces	3739
65.1.	Introduction	3739
65.2.	Formal schemes à la EGA	3739
65.3.	Conventions and notation	3745
65.4.	Topological rings and modules	3745
65.5.	Affine formal algebraic spaces	3750
65.6.	Countably indexed affine formal algebraic spaces	3754
65.7.	Formal algebraic spaces	3756
65.8.	Colimits of algebraic spaces along thickenings	3759
65.9.	Completion along a closed subset	3761
65.10.	Fibre products	3763
65.11.	Separation axioms for formal algebraic spaces	3764
65.12.	Quasi-compact formal algebraic spaces	3766
65.13.	Quasi-compact and quasi-separated formal algebraic spaces	3767
65.14.	Morphisms representable by algebraic spaces	3768
65.15.	Types of formal algebraic spaces	3773
65.16.	Morphisms and continuous ring maps	3776
65.17.	Adic morphisms	3780
65.18.	Morphisms of finite type	3781
65.19.	Monomorphisms	3784
65.20.	Closed immersions	3784
65.21.	Separation axioms for morphisms	3785
65.22.	Proper morphisms	3787
65.23.	Formal algebraic spaces and fpqc coverings	3788
65.24.	Maps out of affine formal schemes	3789

65.25. Other chapters	3791
Chapter 66. Restricted Power Series	3793
66.1. Introduction	3793
66.2. Restricted power series	3793
66.3. Algebras topologically of finite type	3793
66.4. Two categories	3797
66.5. A naive cotangent complex	3799
66.6. Rig-étale homomorphisms	3801
66.7. Rig-étale morphisms	3804
66.8. Glueing rings along a principal ideal	3805
66.9. Glueing rings along an ideal	3807
66.10. In case the base ring is a G-ring	3813
66.11. Rig-surjective morphisms	3816
66.12. Algebraization	3820
66.13. Application to modifications	3828
66.14. Other chapters	3829
Chapter 67. Resolution of Surfaces	3831
67.1. Introduction	3831
67.2. A trace map in positive characteristic	3831
67.3. Modifications	3833
67.4. Quadratic transformations	3834
67.5. Quadratic transformations of spaces	3837
67.6. Examples	3839
67.7. Other chapters	3840
Chapter 68. Formal Deformation Theory	3843
68.1. Introduction	3843
68.2. Notation and Conventions	3845
68.3. The base category	3845
68.4. The completed base category	3851
68.5. Categories cofibered in groupoids	3854
68.6. Prorepresentable functors and predeformation categories	3856
68.7. Formal objects and completion categories	3857
68.8. Smooth morphisms	3861
68.9. Schlessinger's conditions	3866
68.10. Tangent spaces of functors	3872
68.11. Tangent spaces of predeformation categories	3875
68.12. Versal formal objects	3877
68.13. Minimal versal formal objects	3881
68.14. Miniversal formal objects and tangent spaces	3884
68.15. Rim-Schlessinger conditions and deformation categories	3887
68.16. Lifts of objects	3892
68.17. Schlessinger's theorem on prorepresentable functors	3894
68.18. Infinitesimal automorphisms	3895
68.19. Groupoids in functors on an arbitrary category	3899
68.20. Groupoids in functors on the base category	3900
68.21. Smooth groupoids in functors on the base category	3901

68.22.	Deformation categories as quotients of groupoids in functors	3902
68.23.	Presentations of categories cofibered in groupoids	3903
68.24.	Presentations of deformation categories	3904
68.25.	Remarks regarding minimality	3905
68.26.	Change of residue field	3908
68.27.	Other chapters	3910
Chapter 69.	Deformation Theory	3913
69.1.	Introduction	3913
69.2.	Deformations of rings and the naive cotangent complex	3913
69.3.	Thickenings of ringed spaces	3916
69.4.	Modules on first order thickenings of ringed spaces	3917
69.5.	Infinitesimal deformations of modules on ringed spaces	3924
69.6.	Application to flat modules on flat thickenings of ringed spaces	3926
69.7.	Deformations of ringed spaces and the naive cotangent complex	3928
69.8.	Thickenings of ringed topoi	3932
69.9.	Modules on first order thickenings of ringed topoi	3932
69.10.	Infinitesimal deformations of modules on ringed topoi	3939
69.11.	Application to flat modules on flat thickenings of ringed topoi	3942
69.12.	Deformations of ringed topoi and the naive cotangent complex	3943
69.13.	Other chapters	3947
Chapter 70.	The Cotangent Complex	3949
70.1.	Introduction	3949
70.2.	Advice for the reader	3949
70.3.	The cotangent complex of a ring map	3949
70.4.	Simplicial resolutions and derived lower shriek	3950
70.5.	Constructing a resolution	3953
70.6.	Functoriality	3958
70.7.	The fundamental triangle	3960
70.8.	Localization and étale ring maps	3965
70.9.	Smooth ring maps	3966
70.10.	Comparison with the naive cotangent complex	3967
70.11.	A spectral sequence of Quillen	3969
70.12.	Comparison with Lichtenbaum-Schlessinger	3972
70.13.	The cotangent complex of a local complete intersection	3975
70.14.	Tensor products and the cotangent complex	3976
70.15.	Deformations of ring maps and the cotangent complex	3977
70.16.	The Atiyah class of a module	3978
70.17.	The cotangent complex	3979
70.18.	The Atiyah class of a sheaf of modules	3982
70.19.	The cotangent complex of a morphism of ringed spaces	3983
70.20.	Deformations of ringed spaces and the cotangent complex	3983
70.21.	The cotangent complex of a morphism of ringed topoi	3984
70.22.	Deformations of ringed topoi and the cotangent complex	3985
70.23.	The cotangent complex of a morphism of schemes	3986
70.24.	The cotangent complex of a scheme over a ring	3987
70.25.	The cotangent complex of a morphism of algebraic spaces	3988
70.26.	The cotangent complex of an algebraic space over a ring	3990

70.27.	Fibre products of algebraic spaces and the cotangent complex	3992
70.28.	Other chapters	3993
Chapter 71.	Algebraic Stacks	3995
71.1.	Introduction	3995
71.2.	Conventions	3995
71.3.	Notation	3995
71.4.	Representable categories fibred in groupoids	3996

CHAPTER 1

Introduction

1.1. Overview

Besides the book by Laumon and Moret-Bailly, see [LMB00], and the work (in progress) by Fulton et al, we think there is a place for an open source textbook on algebraic stacks and the algebraic geometry that is needed to define them. The Stacks Project attempts to do this by building the foundations starting with commutative algebra and proceeding via the theory of schemes and algebraic spaces to a comprehensive foundation for the theory of algebraic stacks.

We expect this material to be read online as a key feature are the hyperlinks giving quick access to internal references spread over many different pages. If you use an embedded pdf or dvi viewer in your browser, the cross file links should work.

This project is a collaborative effort and we encourage you to help out. Please email any typos or errors you find while reading or any suggestions, additional material, or examples you have to stacks.project@gmail.com. You can download a tarball containing all source files, extract, run make, and use a dvi or pdf viewer locally. Please feel free to edit the LaTeX files and email your improvements.

1.2. Attribution

The scope of this work is such that it is a daunting task to attribute correctly and succinctly all of those mathematicians whose work has led to the development of the theory we try to explain here. We hope eventually to generate enough community interest to find contributors willing to write sections with historical remarks for each and every chapter.

Those who contributed to this work are listed on the title page of the book version of this work and online. Here we would like to name a selection of major contributions:

- (1) Jarod Alper wrote Guide to Literature.
- (2) Bhargav Bhatt wrote the initial version of Étale Morphisms of Schemes.
- (3) Bhargav Bhatt wrote the initial version of More on Algebra, Section 15.63.
- (4) Kiran Kedlaya contributed the initial writeup of Descent, Section 34.4.
- (5) The initial versions of
 - (a) Algebra, Section 10.27,
 - (b) Injectives, Section 19.2, and
 - (c) the chapter Fieldsare from The CRing Project, courtesy of Akhil Mathew et al.
- (6) Alex Perry wrote the material on projective modules, Mittag-Leffler modules, including the proof of Algebra, Theorem 10.92.5.
- (7) Alex Perry wrote Formal Deformation Theory.

- (8) Thibaut Pugin, Zachary Maddock and Min Lee took course notes which formed the basis for Étale Cohomology.
- (9) David Rydh has contributed many helpful comments, pointed out several mistakes, helped out in an essential way with the material on residual gerbes, and was the originator for the material in More on Groupoids in Spaces, Sections 61.9 and 61.12.
- (10) Burt Totaro contributed Examples, Sections 82.55, 82.56, and Properties of Stacks, Section 77.12.
- (11) The material in the chapter Pro-étale Cohomology is taken from a paper by Bhargav Bhatt and Peter Scholze.
- (12) Bhargav Bhatt contributed Examples, Sections 82.60 and 82.63.
- (13) Ofer Gabber found mistakes, contributed corrections and he contributed Formal Spaces, Lemma 65.9.5, the material in More on Groupoids, Section 39.14, the main result of Properties of Spaces, Section 48.14, and the proof of More on Flatness, Proposition 37.24.13.

CHAPTER 2

Conventions

2.1. Comments

The philosophy behind the conventions used in writing these documents is to choose those conventions that work.

2.2. Set theory

We use Zermelo-Fraenkel set theory with the axiom of choice. See [Kun83]. We do not use universes (different from SGA4). We do not stress set-theoretic issues, but we make sure everything is correct (of course) and so we do not ignore them either.

2.3. Categories

A category \mathcal{C} consists of a set of objects and, for each pair of objects, a set of morphisms between them. In other words, it is what is called a “small” category in other texts. We will use “big” categories (categories whose objects form a proper class) as well, but only those that are listed in Categories, Remark 4.2.2.

2.4. Algebra

In these notes a ring is a commutative ring with a 1. Hence the category of rings has an initial object \mathbf{Z} and a final object $\{0\}$ (this is the unique ring where $1 = 0$). Modules are assumed unitary. See [Eis95].

2.5. Notation

The natural integers are elements of $\mathbf{N} = \{1, 2, 3, \dots\}$. The integers are elements of $\mathbf{Z} = \{\dots, -2, -1, 0, 1, 2, \dots\}$. The field of rational numbers is denoted \mathbf{Q} . The field of real numbers is denoted \mathbf{R} . The field of complex numbers is denoted \mathbf{C} .

CHAPTER 3

Set Theory

3.1. Introduction

We need some set theory every now and then. We use Zermelo-Fraenkel set theory with the axiom of choice (ZFC) as described in [Kun83] and [Jec02].

3.2. Everything is a set

Most mathematicians think of set theory as providing the basic foundations for mathematics. So how does this really work? For example, how do we translate the sentence “ X is a scheme” into set theory? Well, we just unravel the definitions: A scheme is a locally ringed space such that every point has an open neighbourhood which is an affine scheme. A locally ringed space is a ringed space such that every stalk of the structure sheaf is a local ring. A ringed space is a pair (X, \mathcal{O}_X) consisting of a topological space X and a sheaf of rings \mathcal{O}_X on it. A topological space is a pair (X, τ) consisting of a set X and a set of subsets $\tau \subset \mathcal{P}(X)$ satisfying the axioms of a topology. And so on and so forth.

So how, given a set S would we recognize whether it is a scheme? The first thing we look for is whether the set S is an ordered pair. This is defined (see [Jec02], page 7) as saying that S has the form $(a, b) := \{\{a\}, \{a, b\}\}$ for some sets a, b . If this is the case, then we would take a look to see whether a is an ordered pair (c, d) . If so we would check whether $d \subset \mathcal{P}(c)$, and if so whether d forms the collection of sets for a topology on the set c . And so on and so forth.

So even though it would take a considerable amount of work to write a complete formula $\phi_{\text{scheme}}(x)$ with one free variable x in set theory that expresses the notion “ x is a scheme”, it is possible to do so. The same thing should be true for any mathematical object.

3.3. Classes

Informally we use the notion of a *class*. Given a formula $\phi(x, p_1, \dots, p_n)$, we call

$$C = \{x : \phi(x, p_1, \dots, p_n)\}$$

a *class*. A class is easier to manipulate than the formula that defines it, but it is not strictly speaking a mathematical object. For example, if R is a ring, then we may consider the class of all R -modules (since after all we may translate the sentence “ M is an R -module” into a formula in set theory, which then defines a class). A *proper class* is a class which is not a set.

In this way we may consider the category of R -modules, which is a “big” category—in other words, it has a proper class of objects. Similarly, we may consider the “big” category of schemes, the “big” category of rings, etc.

3.4. Ordinals

A set T is *transitive* if $x \in T$ implies $x \subset T$. A set α is an *ordinal* if it is transitive and well-ordered by \in . In this case, we define $\alpha + 1 = \alpha \cup \{\alpha\}$, which is another ordinal called the *successor* of α . An ordinal α is called a *successor ordinal* if there exists an ordinal β such that $\alpha = \beta + 1$. The smallest ordinal is \emptyset which is also denoted 0. If α is not 0, and not a successor ordinal, then α is called a *limit ordinal* and we have

$$\alpha = \bigcup_{\gamma \in \alpha} \gamma.$$

The first limit ordinal is ω and it is also the first infinite ordinal. The first uncountable ordinal ω_1 is the set of all countable ordinals. The collection of all ordinals is a proper class. It is well-ordered by \in in the following sense: any nonempty set (or even class) of ordinals has a least element. Given a set A of ordinals, we define the *supremum* of A to be $\sup_{\alpha \in A} \alpha = \bigcup_{\alpha \in A} \alpha$. It is the least ordinal bigger or equal to all $\alpha \in A$. Given any well-ordered set (S, \geq) , there is a unique ordinal α such that $(S, \geq) \cong (\alpha, \in)$; this is called the *order type* of the well-ordered set.

3.5. The hierarchy of sets

We define, by transfinite induction, $V_0 = \emptyset$, $V_{\alpha+1} = P(V_\alpha)$ (power set), and for a limit ordinal α ,

$$V_\alpha = \bigcup_{\beta < \alpha} V_\beta.$$

Note that each V_α is a transitive set.

Lemma 3.5.1. *Every set is an element of V_α for some ordinal α .*

Proof. See [Jec02, Lemma 6.3]. □

In [Kun83, Chapter III] it is explained that this lemma is equivalent to the axiom of foundation. The *rank* of a set S is the least ordinal α such that $S \in V_\alpha$.

3.6. Cardinality

The *cardinality* of a set A is the least ordinal α such that there exists a bijection between A and α . We sometimes use the notation $\alpha = |A|$ to indicate this. We say an ordinal α is a *cardinal* if and only if it occurs as the cardinality of some set A —in other words, if $\alpha = |A|$. We use the greek letters κ, λ for cardinals. The first infinite cardinal is ω , and in this context it is denoted \aleph_0 . A set is *countable* if its cardinality is $\leq \aleph_0$. If α is an ordinal, then we denote α^+ the least cardinal $> \alpha$. You can use this to define $\aleph_1 = \aleph_0^+$, $\aleph_2 = \aleph_1^+$, etc, and in fact you can define \aleph_α for any ordinal α by transfinite induction. We note the equality $\aleph_1 = \omega_1$.

The *addition* of cardinals κ, λ is denoted $\kappa \oplus \lambda$; it is the cardinality of $\kappa \amalg \lambda$. The *multiplication* of cardinals κ, λ is denoted $\kappa \otimes \lambda$; it is the cardinality of $\kappa \times \lambda$. It is uninteresting since if κ and λ are infinite cardinals, then $\kappa \otimes \lambda = \max(\kappa, \lambda)$. The *exponentiation* of cardinals κ, λ is denoted κ^λ ; it is the cardinality of the set of (set) maps from λ to κ . Given any set K of cardinals, the *supremum* of K is $\sup_{\kappa \in K} \kappa = \bigcup_{\kappa \in K} \kappa$, which is also a cardinal.

3.7. Cofinality

A *cofinal subset* S of a partially ordered set T is a subset $S \subset T$ such that $\forall t \in T \exists s \in S (t \leq s)$. Note that a subset of a well-ordered set is a well-ordered set (with induced ordering). Given an ordinal α , the *cofinality* $\text{cf}(\alpha)$ of α is the least ordinal β which occurs as the order type of some cofinal subset of α . The cofinality of an ordinal is always a cardinal (this is clear from the definition). Hence alternatively we can define the cofinality of α as the least cardinality of a cofinal subset of α .

Lemma 3.7.1. *Suppose that $T = \text{colim}_{\alpha < \beta} T_\alpha$ is a colimit of sets indexed by ordinals less than a given ordinal β . Suppose that $\varphi : S \rightarrow T$ is a map of sets. Then φ lifts to a map into T_α for some $\alpha < \beta$ provided that β is not a limit of ordinals indexed by S , in other words, if β is an ordinal with $\text{cf}(\beta) > |S|$.*

Proof. For each element $s \in S$ pick a $\alpha_s < \beta$ and an element $t_s \in T_{\alpha_s}$ which maps to $\varphi(s)$ in T . By assumption $\alpha = \sup_{s \in S} \alpha_s$ is strictly smaller than β . Hence the map $\varphi_\alpha : S \rightarrow T_\alpha$ which assigns to s the image of t_s in T_α is a solution. \square

The following is essentially Grothendieck's argument for the existence of ordinals with arbitrarily large cofinality which he used to prove the existence of enough injectives in certain abelian categories, see [Gro57].

Proposition 3.7.2. *Let κ be a cardinal. Then there exists an ordinal whose cofinality is bigger than κ .*

Proof. If κ is finite, then $\omega = \text{cf}(\omega)$ works. Let us thus assume that κ is infinite. Consider the smallest ordinal α whose cardinality is strictly greater than κ . We claim that $\text{cf}(\alpha) > \kappa$. Note that α is a limit ordinal, since if $\alpha = \beta + 1$, then $|\alpha| = |\beta|$ (because α and β are infinite) and this contradicts the minimality of α . (Of course α is also a cardinal, but we do not need this.) To get a contradiction suppose $S \subset \alpha$ is a cofinal subset with $|S| \leq \kappa$. For $\beta \in S$, i.e., $\beta < \alpha$, we have $|\beta| \leq \kappa$ by minimality of α . As α is a limit ordinal and S cofinal in α we obtain $\alpha = \bigcup_{\beta \in S} \beta$. Hence $|\alpha| \leq |S| \otimes \kappa \leq \kappa \otimes \kappa \leq \kappa$ which is a contradiction with our choice of α . \square

3.8. Reflection principle

Some of this material is in the chapter of [Kun83] called "Easy consistency proofs".

Let $\phi(x_1, \dots, x_n)$ be a formula of set theory. Let us use the convention that this notation implies that all the free variables in ϕ occur among x_1, \dots, x_n . Let M be a set. The formula $\phi^M(x_1, \dots, x_n)$ is the formula obtained from $\phi(x_1, \dots, x_n)$ by replacing all the $\forall x$ and $\exists x$ by $\forall x \in M$ and $\exists x \in M$, respectively. So the formula $\phi(x_1, x_2) = \exists x(x \in x_1 \wedge x \in x_2)$ is turned into $\phi^M(x_1, x_2) = \exists x \in M(x \in x_1 \wedge x \in x_2)$. The formula ϕ^M is called the *relativization of ϕ to M* .

Theorem 3.8.1. *Suppose given $\phi_1(x_1, \dots, x_n), \dots, \phi_m(x_1, \dots, x_n)$ a finite collection of formulas of set theory. Let M_0 be a set. There exists a set M such that $M_0 \subset M$ and $\forall x_1, \dots, x_n \in M$, we have*

$$\forall i = 1, \dots, m, \phi_i^M(x_1, \dots, x_n) \Leftrightarrow \forall i = 1, \dots, m, \phi_i(x_1, \dots, x_n).$$

In fact we may take $M = V_\alpha$ for some limit ordinal α .

Proof. See [Jec02, Theorem 12.14] or [Kun83, Theorem 7.4]. \square

We view this theorem as saying the following: Given any $x_1, \dots, x_n \in M$ the formulas hold with the bound variables ranging through all sets if and only if they hold for the bound variables ranging through elements of V_α . This theorem is a meta-theorem because it deals with the formulas of set theory directly. It actually says that given the finite list of formulas ϕ_1, \dots, ϕ_m with at most free variables x_1, \dots, x_n the sentence

$$\forall M_0 \exists M, M_0 \subset M \forall x_1, \dots, x_n \in M \phi_1(x_1, \dots, x_n) \wedge \dots \wedge \phi_m(x_1, \dots, x_n) \leftrightarrow \phi_1^M(x_1, \dots, x_n) \wedge \dots \wedge \phi_m^M(x_1, \dots, x_n)$$

is provable in ZFC. In other words, whenever we actually write down a finite list of formulas ϕ_i , we get a theorem.

It is somewhat hard to use this theorem in “ordinary mathematics” since the meaning of the formulas $\phi_i^M(x_1, \dots, x_n)$ is not so clear! Instead, we will use the idea of the proof of the reflection principle to prove the existence results we need directly.

3.9. Constructing categories of schemes

We will discuss how to apply this to produce, given an initial set of schemes, a “small” category of schemes closed under a list of natural operations. Before we do so, we introduce the size of a scheme. Given a scheme S we define

$$\text{size}(S) = \max(\aleph_0, \kappa_1, \kappa_2),$$

where we define the cardinal numbers κ_1 and κ_2 as follows:

- (1) We let κ_1 be the cardinality of the set of affine opens of S .
- (2) We let κ_2 be the supremum of all the cardinalities of all $\Gamma(U, \mathcal{O}_S)$ for all $U \subset S$ affine open.

Lemma 3.9.1. *For every cardinal κ , there exists a set A such that every element of A is a scheme and such that for every scheme S with $\text{Size}(S) \leq \kappa$, there is an element $X \in A$ such that $X \cong S$ (isomorphism of schemes).*

Proof. Omitted. Hint: think about how any scheme is isomorphic to a scheme obtained by glueing affines. \square

We denote $Bound$ the function which to each cardinal κ associates

$$(3.9.1.1) \quad Bound(\kappa) = \max\{\kappa^{\aleph_0}, \kappa^+\}.$$

We could make this function grow much more rapidly, e.g., we could set $Bound(\kappa) = \kappa^\kappa$, and the result below would still hold. For any ordinal α , we denote Sch_α the full subcategory of category of schemes whose objects are elements of V_α . Here is the result we are going to prove.

Lemma 3.9.2. *With notations $size$, $Bound$ and Sch_α as above. Let S_0 be a set of schemes. There exists a limit ordinal α with the following properties:*

- (1) *We have $S_0 \subset V_\alpha$; in other words, $S_0 \subset \text{Ob}(Sch_\alpha)$.*
- (2) *For any $S \in \text{Ob}(Sch_\alpha)$ and any scheme T with $size(T) \leq Bound(size(S))$, there exists a scheme $S' \in \text{Ob}(Sch_\alpha)$ such that $T \cong S'$.*
- (3) *For any countable¹ diagram category \mathcal{I} and any functor $F : \mathcal{I} \rightarrow Sch_\alpha$, the limit $\lim_{\mathcal{I}} F$ exists in Sch_α if and only if it exists in Sch and moreover, in this case, the natural morphism between them is an isomorphism.*

¹Both the set of objects and the morphism sets are countable. In fact you can prove the lemma with \aleph_0 replaced by any cardinal whatsoever in (3) and (4).

- (4) For any countable diagram category \mathcal{I} and any functor $F : \mathcal{I} \rightarrow Sch_\alpha$, the colimit $\text{colim}_{\mathcal{I}} F$ exists in Sch_α if and only if it exists in Sch and moreover, in this case, the natural morphism between them is an isomorphism.

Proof. We define, by transfinite induction, a function f which associates to every ordinal an ordinal as follows. Let $f(0) = 0$. Given $f(\alpha)$, we define $f(\alpha + 1)$ to be the least ordinal β such that the following hold:

- (1) We have $\alpha + 1 \leq \beta$ and $f(\alpha) \leq \beta$.
- (2) For any $S \in \text{Ob}(Sch_{f(\alpha)})$ and any scheme T with $\text{size}(T) \leq \text{Bound}(\text{size}(S))$, there exists a scheme $S' \in \text{Ob}(Sch_\beta)$ such that $T \cong S'$.
- (3) For any countable diagram category \mathcal{I} and any functor $F : \mathcal{I} \rightarrow Sch_{f(\alpha)}$, if the limit $\lim_{\mathcal{I}} F$ or the colimit $\text{colim}_{\mathcal{I}} F$ exists in Sch , then it is isomorphic to a scheme in Sch_β .

To see β exists, we argue as follows. Since $\text{Ob}(Sch_{f(\alpha)})$ is a set, we see that $\kappa = \sup_{S \in \text{Ob}(Sch_{f(\alpha)})} \text{Bound}(\text{size}(S))$ exists and is a cardinal. Let A be a set of schemes obtained starting with κ as in Lemma 3.9.1. There is a set CountCat of countable categories such that any countable category is isomorphic to an element of CountCat . Hence in (3) above we may assume that \mathcal{I} is an element in CountCat . This means that the pairs (\mathcal{I}, F) in (3) range over a set. Thus, there exists a set B whose elements are schemes such that for every (\mathcal{I}, F) as in (3), if the limit or colimit exists, then it is isomorphic to an element in B . Hence, if we pick any β such that $A \cup B \subset V_\beta$ and $\beta > \max\{\alpha + 1, f(\alpha)\}$, then (1)–(3) hold. Since every nonempty collection of ordinals has a least element, we see that $f(\alpha + 1)$ is well defined. Finally, if α is a limit ordinal, then we set $f(\alpha) = \sup_{\alpha' < \alpha} f(\alpha')$.

Pick β_0 such that $S_0 \subset V_{\beta_0}$. By construction $f(\beta) \geq \beta$ and we see that also $S_0 \subset V_{f(\beta)}$. Moreover, as f is nondecreasing, we see $S_0 \subset V_{f(\beta)}$ is true for any $\beta \geq \beta_0$. Next, choose any ordinal $\beta_1 > \beta_0$ with cofinality $\text{cf}(\beta_1) > \omega = \aleph_0$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that $\alpha = f(\beta_1)$ is a solution to the problem posed in the lemma.

The first property of the lemma holds by our choice of $\beta_1 > \beta_0$ above.

Since β_1 is a limit ordinal (as its cofinality is infinite), we get $f(\beta_1) = \sup_{\beta < \beta_1} f(\beta)$. Hence $\{f(\beta) \mid \beta < \beta_1\} \subset f(\beta_1)$ is a cofinal subset. Hence we see that

$$V_\alpha = V_{f(\beta_1)} = \bigcup_{\beta < \beta_1} V_{f(\beta)}.$$

Now, let $S \in \text{Ob}(Sch_\alpha)$. We define $\beta(S)$ to be the least ordinal β such that $S \in \text{Ob}(Sch_{f(\beta)})$. By the above we see that always $\beta(S) < \beta_1$. Since $\text{Ob}(Sch_{f(\beta+1)}) \subset \text{Ob}(Sch_\alpha)$, we see by construction of f above that the second property of the lemma is satisfied.

Suppose that $\{S_1, S_2, \dots\} \subset \text{Ob}(Sch_\alpha)$ is a countable collection. Consider the function $\omega \rightarrow \beta_1$, $n \mapsto \beta(S_n)$. Since the cofinality of β_1 is $> \omega$, the image of this function cannot be a cofinal subset. Hence there exists a $\beta < \beta_1$ such that $\{S_1, S_2, \dots\} \subset \text{Ob}(Sch_{f(\beta)})$. It follows that any functor $F : \mathcal{I} \rightarrow Sch_\alpha$ factors through one of the subcategories $Sch_{f(\beta)}$. Thus, if there exists a scheme X that is the colimit or limit of the diagram F , then, by construction of f , we see X is isomorphic to an object of $Sch_{f(\beta+1)}$ which is a subcategory of Sch_α . This proves the last two assertions of the lemma. \square

Remark 3.9.3. The lemma above can also be proved using the reflection principle. However, one has to be careful. Namely, suppose the sentence $\phi_{scheme}(X)$ expresses the property “ X is a scheme”, then what does the formula $\phi_{scheme}^{V_\alpha}(X)$ mean? It is true that the reflection principle says we can find α such that for all $X \in V_\alpha$ we have $\phi_{scheme}(X) \leftrightarrow \phi_{scheme}^{V_\alpha}(X)$ but this is entirely useless. It is only by combining two such statements that something interesting happens. For example suppose $\phi_{red}(X, Y)$ expresses the property “ X, Y are schemes, and Y is the reduction of X ” (see Schemes, Definition 25.12.5). Suppose we apply the reflection principle to the pair of formulas $\phi_1(X, Y) = \phi_{red}(X, Y)$, $\phi_2(X) = \exists Y, \phi_1(X, Y)$. Then it is easy to see that any α produced by the reflection principle has the property that given $X \in \text{Ob}(Sch_\alpha)$ the reduction of X is also an object of Sch_α (left as an exercise).

Lemma 3.9.4. *Let S be an affine scheme. Let $R = \Gamma(S, \mathcal{O}_S)$. Then the size of S is equal to $\max\{\aleph_0, |R|\}$.*

Proof. There are at most $\max\{|R|, \aleph_0\}$ affine opens of $\text{Spec}(R)$. This is clear since any affine open $U \subset \text{Spec}(R)$ is a finite union of principal opens $D(f_1) \cup \dots \cup D(f_n)$ and hence the number of affine opens is at most $\sup_n |R|^n = \max\{|R|, \aleph_0\}$, see [Kun83, Ch. I, 10.13]. On the other hand, we see that $\Gamma(U, \mathcal{O}) \subset R_{f_1} \times \dots \times R_{f_n}$ and hence $|\Gamma(U, \mathcal{O})| \leq \max\{\aleph_0, |R_{f_1}|, \dots, |R_{f_n}|\}$. Thus it suffices to prove that $|R_f| \leq \max\{\aleph_0, |R|\}$ which is omitted. \square

Lemma 3.9.5. *Let S be a scheme. Let $S = \bigcup_{i \in I} S_i$ be an open covering. Then $\text{size}(S) \leq \max\{|I|, \sup_i \{\text{size}(S_i)\}\}$.*

Proof. Let $U \subset S$ be any affine open. Since U is quasi-compact there exist finitely many elements $i_1, \dots, i_n \in I$ and affine opens $U_i \subset U \cap S_i$ such that $U = U_1 \cup U_2 \cup \dots \cup U_n$. Thus

$$|\Gamma(U, \mathcal{O}_U)| \leq |\Gamma(U_1, \mathcal{O})| \otimes \dots \otimes |\Gamma(U_n, \mathcal{O})| \leq \sup_i \{\text{size}(S_i)\}$$

Moreover, it shows that the set of affine opens of S has cardinality less than or equal to the cardinality of the set

$$\coprod_{n \in \omega} \prod_{i_1, \dots, i_n \in I} \{\text{affine opens of } S_{i_1}\} \times \dots \times \{\text{affine opens of } S_{i_n}\}.$$

Each of the sets inside the disjoint union has cardinality at most $\sup_i \{\text{size}(S_i)\}$. The index set has cardinality at most $\max\{|I|, \aleph_0\}$, see [Kun83, Ch. I, 10.13]. Hence by [Jec02, Lemma 5.8] the cardinality of the coproduct is at most $\max\{\aleph_0, |I|\} \otimes \sup_i \{\text{size}(S_i)\}$. The lemma follows. \square

Lemma 3.9.6. *Let $f : X \rightarrow S, g : Y \rightarrow S$ be morphisms of schemes. Then we have $\text{size}(X \times_S Y) \leq \max\{\text{size}(X), \text{size}(Y)\}$.*

Proof. Let $S = \bigcup_{k \in K} S_k$ be an affine open covering. Let $X = \bigcup_{i \in I} U_i, Y = \bigcup_{j \in J} V_j$ be affine open coverings with I, J of cardinality $\leq \text{size}(X), \text{size}(Y)$. For each $i \in I$ there exists a finite set K_i of $k \in K$ such that $f(U_i) \subset \bigcup_{k \in K_i} S_k$. For each $j \in J$ there exists a finite set K_j of $k \in K$ such that $g(V_j) \subset \bigcup_{k \in K_j} S_k$. Hence $f(X), g(Y)$ are contained in $S' = \bigcup_{k \in K'} S_k$ with $K' = \bigcup_{i \in I} K_i \cup \bigcup_{j \in J} K_j$. Note that the cardinality of K' is at most $\max\{\aleph_0, |I|, |J|\}$. Applying Lemma 3.9.5 we see that it suffices to prove that $\text{size}(f^{-1}(S_k) \times_{S_k} g^{-1}(S_k)) \leq \max\{\text{size}(X), \text{size}(Y)\}$ for $k \in K'$. In other words, we may assume that S is affine.

Assume S affine. Let $X = \bigcup_{i \in I} U_i$, $Y = \bigcup_{j \in J} V_j$ be affine open coverings with I , J of cardinality $\leq \text{size}(X), \text{size}(Y)$. Again by Lemma 3.9.5 it suffices to prove the lemma for the products $U_i \times_S V_j$. By Lemma 3.9.4 we see that it suffices to show that

$$|A \otimes_C B| \leq \max\{\aleph_0, |A|, |B|\}.$$

We omit the proof of this inequality. \square

Lemma 3.9.7. *Let S be a scheme. Let $f : X \rightarrow S$ be locally of finite type with X quasi-compact. Then $\text{size}(X) \leq \text{size}(S)$.*

Proof. We can find a finite affine open covering $X = \bigcup_{i=1, \dots, n} U_i$ such that each U_i maps into an affine open S_i of S . Thus by Lemma 3.9.5 we reduce to the case where both S and X are affine. In this case by Lemma 3.9.4 we see that it suffices to show

$$|A[x_1, \dots, x_n]| \leq \max\{\aleph_0, |A|\}.$$

We omit the proof of this inequality. \square

In Algebra, Lemma 10.103.13 we will show that if $A \rightarrow B$ is an epimorphism of rings, then $|B| \leq \max(|A|, \aleph_0)$. The analogue for schemes is the following lemma.

Lemma 3.9.8. *Let $f : X \rightarrow Y$ be a monomorphism of schemes. If at least one of the following properties holds, then $\text{size}(X) \leq \text{size}(Y)$:*

- (1) f is quasi-compact,
- (2) f is locally of finite presentation,
- (3) add more here as needed.

But the bound does not hold for monomorphisms which are locally of finite type.

Proof. Let $Y = \bigcup_{j \in J} V_j$ be an affine open covering of Y with $|J| \leq \text{size}(Y)$. By Lemma 3.9.5 it suffices to bound the size of the inverse image of V_j in X . Hence we reduce to the case that Y is affine, say $Y = \text{Spec}(B)$. For any affine open $\text{Spec}(A) \subset X$ we have $|A| \leq \max(|B|, \aleph_0) = \text{size}(Y)$, see remark above and Lemma 3.9.4. Thus it suffices to show that X has at most $\text{size}(Y)$ affine opens. This is clear if X is quasi-compact, whence case (1) holds. In case (2) the number of isomorphism classes of B -algebras A that can occur is bounded by $\text{size}(B)$, because each A is of finite type over B , hence isomorphic to an algebra $B[x_1, \dots, x_n]/(f_1, \dots, f_m)$ for some n, m , and $f_j \in B[x_1, \dots, x_n]$. However, as $X \rightarrow Y$ is a monomorphism, there is a unique morphism $\text{Spec}(A) \rightarrow X$ over $Y = \text{Spec}(B)$ if there is one, hence the number of affine opens of X is bounded by the number of these isomorphism classes.

To prove the final statement of the lemma consider the ring $B = \prod_{n \in \mathbf{N}} \mathbf{F}_2$ and set $Y = \text{Spec}(B)$. For every ultrafilter \mathcal{U} on \mathbf{N} we obtain a maximal ideal $\mathfrak{m}_{\mathcal{U}}$ with residue field \mathbf{F}_2 ; the map $B \rightarrow \mathbf{F}_2$ sends the element (x_n) to $\lim_{\mathcal{U}} x_n$. Details omitted. The morphism of schemes $X = \coprod_{\mathcal{U}} \text{Spec}(\mathbf{F}_2) \rightarrow Y$ is a monomorphism as all the points are distinct. However the cardinality of the set of affine open subschemes of X is equal to the cardinality of the set of ultrafilters on \mathbf{N} which is $2^{2^{\aleph_0}}$. We conclude as $|B| = 2^{\aleph_0} < 2^{2^{\aleph_0}}$. \square

Lemma 3.9.9. *Let α be an ordinal as in Lemma 3.9.2 above. The category Sch_{α} satisfies the following properties:*

- (1) If $X, Y, S \in \text{Ob}(\text{Sch}_\alpha)$, then for any morphisms $f : X \rightarrow S$, $g : Y \rightarrow S$ the fibre product $X \times_S Y$ in Sch_α exists and is a fibre product in the category of schemes.
- (2) Given any at most countable collection S_1, S_2, \dots of elements of $\text{Ob}(\text{Sch}_\alpha)$, the coproduct $\coprod_i S_i$ exists in $\text{Ob}(\text{Sch}_\alpha)$ and is a coproduct in the category of schemes.
- (3) For any $S \in \text{Ob}(\text{Sch}_\alpha)$ and any open immersion $U \rightarrow S$, there exists a $V \in \text{Ob}(\text{Sch}_\alpha)$ with $V \cong U$.
- (4) For any $S \in \text{Ob}(\text{Sch}_\alpha)$ and any closed immersion $T \rightarrow S$, there exists a $S' \in \text{Ob}(\text{Sch}_\alpha)$ with $S' \cong T$.
- (5) For any $S \in \text{Ob}(\text{Sch}_\alpha)$ and any finite type morphism $T \rightarrow S$, there exists a $S' \in \text{Ob}(\text{Sch}_\alpha)$ with $S' \cong T$.
- (6) Suppose S is a scheme which has an open covering $S = \bigcup_{i \in I} S_i$ such that there exists a $T \in \text{Ob}(\text{Sch}_\alpha)$ with (a) $\text{size}(S_i) \leq \text{size}(T)^{\aleph_0}$ for all $i \in I$, and (b) $|I| \leq \text{size}(T)^{\aleph_0}$. Then S is isomorphic to an object of Sch_α .
- (7) For any $S \in \text{Ob}(\text{Sch}_\alpha)$ and any morphism $f : T \rightarrow S$ locally of finite type such that T can be covered by at most $\text{size}(S)^{\aleph_0}$ open affines, there exists a $S' \in \text{Ob}(\text{Sch}_\alpha)$ with $S' \cong T$. For example this holds if T can be covered by at most $|\mathbf{R}| = 2^{\aleph_0} = \aleph_0^{\aleph_0}$ open affines.
- (8) For any $S \in \text{Ob}(\text{Sch}_\alpha)$ and any monomorphism $T \rightarrow S$ which is either locally of finite presentation or quasi-compact, there exists a $S' \in \text{Ob}(\text{Sch}_\alpha)$ with $S' \cong T$.
- (9) Suppose that $T \in \text{Ob}(\text{Sch}_\alpha)$ is affine. Write $R = \Gamma(T, \mathcal{O}_T)$. Then any of the following schemes is isomorphic to a scheme in Sch_α :
 - (a) For any ideal $I \subset R$ with completion $R^* = \lim_n R/I^n$, the scheme $\text{Spec}(R^*)$.
 - (b) For any finite type R -algebra R' , the scheme $\text{Spec}(R')$.
 - (c) For any localization $S^{-1}R$, the scheme $\text{Spec}(S^{-1}R)$.
 - (d) For any prime $\mathfrak{p} \subset R$, the scheme $\text{Spec}(\overline{\kappa(\mathfrak{p})})$.
 - (e) For any subring $R' \subset R$, the scheme $\text{Spec}(R')$.
 - (f) Any scheme of finite type over a ring of cardinality at most $|R|^{\aleph_0}$.
 - (g) And so on.

Proof. Statements (1) and (2) follow directly from the definitions. Statement (3) follows as the size of an open subscheme U of S is clearly smaller than or equal to the size of S . Statement (4) follows from (5). Statement (5) follows from (7). Statement (6) follows as the size of S is $\leq \max\{|I|, \sup_i \text{size}(S_i)\} \leq \text{size}(T)^{\aleph_0}$ by Lemma 3.9.5. Statement (7) follows from (6). Namely, for any affine open $V \subset T$ we have $\text{size}(V) \leq \text{size}(S)$ by Lemma 3.9.7. Thus, we see that (6) applies in the situation of (7). Part (8) follows from Lemma 3.9.8.

Statement (9) is translated, via Lemma 3.9.4, into an upper bound on the cardinality of the rings R^* , $S^{-1}R$, $\overline{\kappa(\mathfrak{p})}$, R' , etc. Perhaps the most interesting one is the ring R^* . As a set, it is the image of a surjective map $R^{\aleph_0} \rightarrow R^*$. Since $|R^{\aleph_0}| = |R|^{\aleph_0}$, we see that it works by our choice of $\text{Bound}(\kappa)$ being at least $\aleph_0^{\aleph_0}$. Phew! (The cardinality of the algebraic closure of a field is the same as the cardinality of the field, or it is \aleph_0 .) \square

Remark 3.9.10. Let R be a ring. Suppose we consider the ring $\prod_{\mathfrak{p} \in \text{Spec}(R)} \kappa(\mathfrak{p})$. The cardinality of this ring is bounded by $|R|^{2^{|R|}}$, but is not bounded by $|R|^{\aleph_0}$ in

general. For example if $R = \mathbf{C}[x]$ it is not bounded by $|R|^{\aleph_0}$ and if $R = \prod_{n \in \mathbf{N}} \mathbf{F}_2$ it is not bounded by $|R|^{|R|}$. Thus the ‘‘And so on’’ of Lemma 3.9.9 above should be taken with a grain of salt. Of course, if it ever becomes necessary to consider these rings in arguments pertaining to fppf/étale cohomology, then we can change the function *Bound* above into the function $\kappa \mapsto \kappa^{2^\kappa}$.

In the following lemma we use the notion of an fpqc covering which is introduced in Topologies, Section 33.8.

Lemma 3.9.11. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume there exists an fpqc covering $\{g_j : Y_j \rightarrow Y\}_{j \in J}$ such that g_j factors through f . Then $\text{size}(Y) \leq \text{size}(X)$.*

Proof. Let $V \subset Y$ be an affine open. By definition there exist $n \geq 0$ and $a : \{1, \dots, n\}$ and affine opens $V_i \subset Y_{a(i)}$ such that $V = g_{a(1)}(V_1) \cup \dots \cup g_{a(n)}(V_n)$. Denote $h_j : Y_j \rightarrow X$ a morphism such that $f \circ h_j = g_j$. Then $h_{a(1)}(V_1) \cup \dots \cup h_{a(n)}(V_n)$ is a quasi-compact subset of $f^{-1}(V)$. Hence we can find a quasi-compact open $W \subset f^{-1}(V)$ which contains $h_{a(i)}(V_i)$ for $i = 1, \dots, n$. In particular $V = f(W)$.

On the one hand this shows that the cardinality of the set of affine opens of Y is at most the cardinality of the set S of quasi-compact opens of X . Since every quasi-compact open of X is a finite union of affines, we see that the cardinality of this set is at most $\sup |S|^n = \max(\aleph_0, |S|)$. On the other hand, we have $\mathcal{O}_Y(V) \subset \prod_{i=1, \dots, n} \mathcal{O}_{Y_{a(i)}}(V_i)$ because $\{V_i \rightarrow V\}$ is an fpqc covering. Hence $\mathcal{O}_Y(V) \subset \mathcal{O}_X(W)$ because $V_i \rightarrow V$ factors through W . Again since W has a finite covering by affine opens of X we conclude that $|\mathcal{O}_Y(V)|$ is bounded by the size of X . The lemma now follows from the definition of the size of a scheme. \square

In the following lemma we use the notion of an fppf covering which is introduced in Topologies, Section 33.7.

Lemma 3.9.12. *Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fppf covering of a scheme. There exists an fppf covering $\{W_j \rightarrow X\}_{j \in J}$ which is a refinement of $\{X_i \rightarrow X\}_{i \in I}$ such that $\text{size}(\coprod W_j) \leq \text{size}(X)$.*

Proof. Choose an affine open covering $X = \bigcup_{a \in A} U_a$ with $|A| \leq \text{size}(X)$. For each a we can choose a finite subset $I_a \subset I$ and for $i \in I_a$ a quasi-compact open $W_{a,i} \subset X_i$ such that $U_a = \bigcup_{i \in I_a} f_i(W_{a,i})$. Then $\text{size}(W_{a,i}) \leq \text{size}(X)$ by Lemma 3.9.7. We conclude that $\text{size}(\prod_a \prod_{i \in I_a} W_{i,a}) \leq \text{size}(X)$ by Lemma 3.9.5. \square

3.10. Sets with group action

Let G be a group. We denote $G\text{-Sets}$ the ‘‘big’’ category of G -sets. For any ordinal α , we denote $G\text{-Sets}_\alpha$ the full subcategory of $G\text{-Sets}$ whose objects are in V_α . As a notion for size of a G -set we take $\text{size}(S) = \max\{\aleph_0, |G|, |S|\}$ (where $|G|$ and $|S|$ are the cardinality of the underlying sets). As above we use the function $\text{Bound}(\kappa) = \kappa^{\aleph_0}$.

Lemma 3.10.1. *With notations G , $G\text{-Sets}_\alpha$, size , and Bound as above. Let S_0 be a set of G -sets. There exists a limit ordinal α with the following properties:*

- (1) *We have $S_0 \cup \{G\} \subset \text{Ob}(G\text{-Sets}_\alpha)$.*

- (2) For any $S \in \text{Ob}(G\text{-Sets}_\alpha)$ and any G -set T with $\text{size}(T) \leq \text{Bound}(\text{size}(S))$, there exists a $S' \in \text{Ob}(G\text{-Sets}_\alpha)$ that is isomorphic to T .
- (3) For any countable diagram category \mathcal{I} and any functor $F : \mathcal{I} \rightarrow G\text{-Sets}_\alpha$, the limit $\lim_{\mathcal{I}} F$ and colimit $\text{colim}_{\mathcal{I}} F$ exist in $G\text{-Sets}_\alpha$ and are the same as in $G\text{-Sets}$.

Proof. Omitted. Similar to but easier than the proof of Lemma 3.9.2 above. \square

Lemma 3.10.2. *Let α be an ordinal as in Lemma 3.10.1 above. The category $G\text{-Sets}_\alpha$ satisfies the following properties:*

- (1) The G -set ${}_G G$ is an object of $G\text{-Sets}_\alpha$.
- (2) (Co)Products, fibre products, and pushouts exist in $G\text{-Sets}_\alpha$ and are the same as their counterparts in $G\text{-Sets}$.
- (3) Given an object U of $G\text{-Sets}_\alpha$, any G -stable subset $O \subset U$ is isomorphic to an object of $G\text{-Sets}_\alpha$.

Proof. Omitted. \square

3.11. Coverings of a site

Suppose that \mathcal{C} is a category (as in Categories, Definition 4.2.1) and that $\text{Cov}(\mathcal{C})$ is a proper class of coverings satisfying properties (1), (2), and (3) of Sites, Definition 7.6.2. We list them here:

- (1) If $V \rightarrow U$ is an isomorphism, then $\{V \rightarrow U\} \in \text{Cov}(\mathcal{C})$.
- (2) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and for each i we have $\{V_{ij} \rightarrow U_i\}_{j \in J_i} \in \text{Cov}(\mathcal{C})$, then $\{V_{ij} \rightarrow U\}_{i \in I, j \in J_i} \in \text{Cov}(\mathcal{C})$.
- (3) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of \mathcal{C} , then $U_i \times_U V$ exists for all i and $\{U_i \times_U V \rightarrow V\}_{i \in I} \in \text{Cov}(\mathcal{C})$.

For an ordinal α , we set $\text{Cov}(\mathcal{C})_\alpha = \text{Cov}(\mathcal{C}) \cap V_\alpha$. Given an ordinal α and a cardinal κ , we set $\text{Cov}(\mathcal{C})_{\kappa, \alpha}$ equal to the set of elements $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})_\alpha$ such that $|I| \leq \kappa$.

We recall the following notion, see Sites, Definition 7.8.2. Two families of morphisms, $\{\varphi_i : U_i \rightarrow U\}_{i \in I}$ and $\{\psi_j : W_j \rightarrow U\}_{j \in J}$, with the same target of \mathcal{C} are called *combinatorially equivalent* if there exist maps $\alpha : I \rightarrow J$ and $\beta : J \rightarrow I$ such that $\varphi_i = \psi_{\alpha(i)}$ and $\psi_j = \varphi_{\beta(j)}$. This defines an equivalence relation on families of morphisms having a fixed target.

Lemma 3.11.1. *With notations as above. Let $\text{Cov}_0 \subset \text{Cov}(\mathcal{C})$ be a set contained in $\text{Cov}(\mathcal{C})$. There exist a cardinal κ and a limit ordinal α with the following properties:*

- (1) We have $\text{Cov}_0 \subset \text{Cov}(\mathcal{C})_{\kappa, \alpha}$.
- (2) The set of coverings $\text{Cov}(\mathcal{C})_{\kappa, \alpha}$ satisfies (1), (2), and (3) of Sites, Definition 7.6.2 (see above). In other words $(\mathcal{C}, \text{Cov}(\mathcal{C})_{\kappa, \alpha})$ is a site.
- (3) Every covering in $\text{Cov}(\mathcal{C})$ is combinatorially equivalent to a covering in $\text{Cov}(\mathcal{C})_{\kappa, \alpha}$.

Proof. To prove this, we first consider the set \mathcal{S} of all sets of morphisms of \mathcal{C} with fixed target. In other words, an element of \mathcal{S} is a subset T of $\text{Arrows}(\mathcal{C})$ such that all elements of T have the same target. Given a family $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I}$ of morphisms with fixed target, we define $\text{Supp}(\mathcal{U}) = \{\varphi \in \text{Arrows}(\mathcal{C}) \mid \exists i \in I, \varphi = \varphi_i\}$. Note that two families $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I}$ and $\mathcal{V} = \{\psi_j : W_j \rightarrow U\}_{j \in J}$ are combinatorially equivalent if and only if $\text{Supp}(\mathcal{U}) = \text{Supp}(\mathcal{V})$. Next, we define

$\mathcal{S}_\tau \subset \mathcal{S}$ to be the subset $\mathcal{S}_\tau = \{T \in \mathcal{S} \mid \exists \mathcal{U} \in \text{Cov}(\mathcal{C}) \ T = \text{Supp}(\mathcal{U})\}$. For every element $T \in \mathcal{S}_\tau$, set $\beta(T)$ to equal the least ordinal β such that there exists a $\mathcal{U} \in \text{Cov}(\mathcal{C})_\beta$ such that $T = \text{Supp}(\mathcal{U})$. Finally, set $\beta_0 = \sup_{T \in \mathcal{S}_\tau} \beta(T)$. At this point it follows that every $\mathcal{U} \in \text{Cov}(\mathcal{C})$ is combinatorially equivalent to some element of $\text{Cov}(\mathcal{C})_{\beta_0}$.

Let κ be the maximum of \aleph_0 , the cardinality $|\text{Arrows}(\mathcal{C})|$,

$$\sup\{|U_i \rightarrow U\}_{i \in I \in \text{Cov}(\mathcal{C})_{\beta_0}} |I|, \quad \text{and} \quad \sup\{|U_i \rightarrow U\}_{i \in I \in \text{Cov}_0} |I|.$$

Since κ is an infinite cardinal, we have $\kappa \otimes \kappa = \kappa$. Note that obviously $\text{Cov}(\mathcal{C})_{\beta_0} = \text{Cov}(\mathcal{C})_{\kappa, \beta_0}$.

We define, by transfinite induction, a function f which associates to every ordinal an ordinal as follows. Let $f(0) = 0$. Given $f(\alpha)$, we define $f(\alpha + 1)$ to be the least ordinal β such that the following hold:

- (1) We have $\alpha + 1 \leq \beta$ and $f(\alpha) \leq \beta$.
- (2) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$ and for each i we have $\{W_{ij} \rightarrow U_i\}_{j \in J_i} \in \text{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$, then $\{W_{ij} \rightarrow U\}_{i \in I, j \in J_i} \in \text{Cov}(\mathcal{C})_{\kappa, \beta}$.
- (3) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})_{\kappa, \alpha}$ and $W \rightarrow U$ is a morphism of \mathcal{C} , then $\{U_i \times_U W \rightarrow W\}_{i \in I} \in \text{Cov}(\mathcal{C})_{\kappa, \beta}$.

To see β exists we note that clearly the collection of all coverings $\{W_{ij} \rightarrow U\}$ and $\{U_i \times_U W \rightarrow W\}$ that occur in (2) and (3) form a set. Hence there is some ordinal β such that V_β contains all of these coverings. Moreover, the index set of the covering $\{W_{ij} \rightarrow U\}$ has cardinality $\sum_{i \in I} |J_i| \leq \kappa \otimes \kappa = \kappa$, and hence these coverings are contained in $\text{Cov}(\mathcal{C})_{\kappa, \beta}$. Since every nonempty collection of ordinals has a least element we see that $f(\alpha + 1)$ is well defined. Finally, if α is a limit ordinal, then we set $f(\alpha) = \sup_{\alpha' < \alpha} f(\alpha')$.

Pick an ordinal β_1 such that $\text{Arrows}(\mathcal{C}) \subset V_{\beta_1}$, $\text{Cov}_0 \subset V_{\beta_0}$, and $\beta_1 \geq \beta_0$. By construction $f(\beta_1) \geq \beta_1$ and we see that the same properties hold for $V_{f(\beta_1)}$. Moreover, as f is nondecreasing this remains true for any $\beta \geq \beta_1$. Next, choose any ordinal $\beta_2 > \beta_1$ with cofinality $\text{cf}(\beta_2) > \kappa$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that the pair $\kappa, \alpha = f(\beta_2)$ is a solution to the problem posed in the lemma.

The first and third property of the lemma holds by our choices of $\kappa, \beta_2 > \beta_1 > \beta_0$ above.

Since β_2 is a limit ordinal (as its cofinality is infinite) we get $f(\beta_2) = \sup_{\beta < \beta_2} f(\beta)$. Hence $\{f(\beta) \mid \beta < \beta_2\} \subset f(\beta_2)$ is a cofinal subset. Hence we see that

$$V_\alpha = V_{f(\beta_2)} = \bigcup_{\beta < \beta_2} V_{f(\beta)}.$$

Now, let $\mathcal{U} \in \text{Cov}_{\kappa, \alpha}$. We define $\beta(\mathcal{U})$ to be the least ordinal β such that $\mathcal{U} \in \text{Cov}_{\kappa, f(\beta)}$. By the above we see that always $\beta(\mathcal{U}) < \beta_2$.

We have to show properties (1), (2), and (3) defining a site hold for the pair $(\mathcal{C}, \text{Cov}_{\kappa, \alpha})$. The first holds because by our choice of β_2 all arrows of \mathcal{C} are contained in $V_{f(\beta_2)}$. For the third, we use that given a covering $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})_{\kappa, \alpha}$ we have $\beta(\mathcal{U}) < \beta_2$ and hence any base change of \mathcal{U} is by construction of f contained in $\text{Cov}(\mathcal{C})_{\kappa, f(\beta+1)}$ and hence in $\text{Cov}(\mathcal{C})_{\kappa, \alpha}$.

Finally, for the second condition, suppose that $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$ and for each i we have $\mathcal{W}_i = \{W_{ij} \rightarrow U_i\}_{j \in J_i} \in \text{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$. Consider the function $I \rightarrow \beta_2, i \mapsto \beta(\mathcal{W}_i)$. Since the cofinality of β_2 is $> \kappa \geq |I|$ the image of this function cannot be a cofinal subset. Hence there exists a $\beta < \beta_1$ such that $\mathcal{W}_i \in \text{Cov}_{\kappa, f(\beta)}$ for all $i \in I$. It follows that the covering $\{W_{ij} \rightarrow U\}_{i \in I, j \in J_i}$ is an element of $\text{Cov}(\mathcal{C})_{\kappa, f(\beta+1)} \subset \text{Cov}(\mathcal{C})_{\kappa, \alpha}$ as desired. \square

Remark 3.11.2. It is likely the case that, for some limit ordinal α , the set of coverings $\text{Cov}(\mathcal{C})_\alpha$ satisfies the conditions of the lemma. This is after all what an application of the reflection principle would appear to give (modulo caveats as described at the end of Section 3.8 and in Remark 3.9.3).

3.12. Abelian categories and injectives

The following lemma applies to the category of modules over a sheaf of rings on a site.

Lemma 3.12.1. *Suppose given a big category \mathcal{A} (see Categories, Remark 4.2.2). Assume \mathcal{A} is abelian and has enough injectives. See Homology, Definitions 12.5.1 and 12.23.4. Then for any given set of objects $\{A_s\}_{s \in S}$ of \mathcal{A} , there is an abelian subcategory $\mathcal{A}' \subset \mathcal{A}$ with the following properties:*

- (1) $\text{Ob}(\mathcal{A}')$ is a set,
- (2) $\text{Ob}(\mathcal{A}')$ contains A_s for each $s \in S$,
- (3) \mathcal{A}' has enough injectives, and
- (4) an object of \mathcal{A}' is injective if and only if it is an injective object of \mathcal{A} .

Proof. Omitted. \square

CHAPTER 4

Categories

4.1. Introduction

Categories were first introduced in [EM45]. The category of categories (which is a proper class) is a 2-category. Similarly, the category of stacks forms a 2-category. If you already know about categories, but not about 2-categories you should read Section 4.26 as an introduction to the formal definitions later on.

4.2. Definitions

We recall the definitions, partly to fix notation.

Definition 4.2.1. A *category* \mathcal{C} consists of the following data:

- (1) A set of objects $\text{Ob}(\mathcal{C})$.
- (2) For each pair $x, y \in \text{Ob}(\mathcal{C})$ a set of morphisms $\text{Mor}_{\mathcal{C}}(x, y)$.
- (3) For each triple $x, y, z \in \text{Ob}(\mathcal{C})$ a composition map $\text{Mor}_{\mathcal{C}}(y, z) \times \text{Mor}_{\mathcal{C}}(x, y) \rightarrow \text{Mor}_{\mathcal{C}}(x, z)$, denoted $(\phi, \psi) \mapsto \phi \circ \psi$.

These data are to satisfy the following rules:

- (1) For every element $x \in \text{Ob}(\mathcal{C})$ there exists a morphism $\text{id}_x \in \text{Mor}_{\mathcal{C}}(x, x)$ such that $\text{id}_x \circ \phi = \phi$ and $\psi \circ \text{id}_x = \psi$ whenever these compositions make sense.
- (2) Composition is associative, i.e., $(\phi \circ \psi) \circ \chi = \phi \circ (\psi \circ \chi)$ whenever these compositions make sense.

It is customary to require all the morphism sets $\text{Mor}_{\mathcal{C}}(x, y)$ to be disjoint. In this way a morphism $\phi : x \rightarrow y$ has a unique *source* x and a unique *target* y . This is not strictly necessary, although care has to be taken in formulating condition (2) above if it is not the case. It is convenient and we will often assume this is the case. In this case we say that ϕ and ψ are *composable* if the source of ϕ is equal to the target of ψ , in which case $\phi \circ \psi$ is defined. An equivalent definition would be to define a category as a quintuple $(\text{Ob}, \text{Arrows}, s, t, \circ)$ consisting of a set of objects, a set of morphisms (arrows), source, target and composition subject to a long list of axioms. We will occasionally use this point of view.

Remark 4.2.2. Big categories. In some texts a category is allowed to have a proper class of objects. We will allow this as well in these notes but only in the following list of cases (to be updated as we go along). In particular, when we say: “Let \mathcal{C} be a category” then it is understood that $\text{Ob}(\mathcal{C})$ is a set.

- (1) The category *Sets* of sets.
- (2) The category *Ab* of abelian groups.
- (3) The category *Groups* of groups.
- (4) Given a group G the category *G-Sets* of sets with a left G -action.

- (5) Given a ring R the category Mod_R of R -modules.
- (6) Given a field k the category of vector spaces over k .
- (7) The category of rings.
- (8) The category of schemes.
- (9) The category Top of topological spaces.
- (10) Given a topological space X the category $\text{PSh}(X)$ of presheaves of sets over X .
- (11) Given a topological space X the category $\text{Sh}(X)$ of sheaves of sets over X .
- (12) Given a topological space X the category $\text{PAb}(X)$ of presheaves of abelian groups over X .
- (13) Given a topological space X the category $\text{Ab}(X)$ of sheaves of abelian groups over X .
- (14) Given a small category \mathcal{C} the category of functors from \mathcal{C} to Sets .
- (15) Given a category \mathcal{C} the category of presheaves of sets over \mathcal{C} .
- (16) Given a site \mathcal{C} the category of sheaves of sets over \mathcal{C} .

One of the reason to enumerate these here is to try and avoid working with something like the “collection” of “big” categories which would be like working with the collection of all classes which I think definitively is a meta-mathematical object.

Remark 4.2.3. It follows directly from the definition that any two identity morphisms of an object x of \mathcal{A} are the same. Thus we may and will speak of *the* identity morphism id_x of x .

Definition 4.2.4. A morphism $\phi : x \rightarrow y$ is an *isomorphism* of the category \mathcal{C} if there exists a morphism $\psi : y \rightarrow x$ such that $\phi \circ \psi = \text{id}_y$ and $\psi \circ \phi = \text{id}_x$.

An isomorphism ϕ is also sometimes called an *invertible* morphism, and the morphism ψ of the definition is called the *inverse* and denoted ϕ^{-1} . It is unique if it exists. Note that given an object x of a category \mathcal{A} the set of invertible elements $\text{Aut}_{\mathcal{A}}(x)$ of $\text{Mor}_{\mathcal{A}}(x, x)$ forms a group under composition. This group is called the *automorphism* group of x in \mathcal{A} .

Definition 4.2.5. A *groupoid* is a category where every morphism is an isomorphism.

Example 4.2.6. A group G gives rise to a groupoid with a single object x and morphisms $\text{Mor}(x, x) = G$, with the composition rule given by the group law in G . Every groupoid with a single object is of this form.

Example 4.2.7. A set C gives rise to a groupoid \mathcal{C} defined as follows: As objects we take $\text{Ob}(\mathcal{C}) := C$ and for morphisms we take $\text{Mor}(x, y)$ empty if $x \neq y$ and equal to $\{\text{id}_x\}$ if $x = y$.

Definition 4.2.8. A *functor* $F : \mathcal{A} \rightarrow \mathcal{B}$ between two categories \mathcal{A}, \mathcal{B} is given by the following data:

- (1) A map $F : \text{Ob}(\mathcal{A}) \rightarrow \text{Ob}(\mathcal{B})$.
- (2) For every $x, y \in \text{Ob}(\mathcal{A})$ a map $F : \text{Mor}_{\mathcal{A}}(x, y) \rightarrow \text{Mor}_{\mathcal{B}}(F(x), F(y))$, denoted $\phi \mapsto F(\phi)$.

These data should be compatible with composition and identity morphisms in the following manner: $F(\phi \circ \psi) = F(\phi) \circ F(\psi)$ for a composable pair (ϕ, ψ) of morphisms of \mathcal{A} and $F(\text{id}_x) = \text{id}_{F(x)}$.

Note that every category \mathcal{A} has an *identity* functor $\text{id}_{\mathcal{A}}$. In addition, given a functor $G : \mathcal{B} \rightarrow \mathcal{C}$ and a functor $F : \mathcal{A} \rightarrow \mathcal{B}$ there is a *composition* functor $G \circ F : \mathcal{A} \rightarrow \mathcal{C}$ defined in an obvious manner.

Definition 4.2.9. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a functor.

- (1) We say F is *faithful* if for any objects x, y of $\text{Ob}(\mathcal{A})$ the map

$$F : \text{Mor}_{\mathcal{A}}(x, y) \rightarrow \text{Mor}_{\mathcal{B}}(F(x), F(y))$$

is injective.

- (2) If these maps are all bijective then F is called *fully faithful*.
 (3) The functor F is called *essentially surjective* if for any object $y \in \text{Ob}(\mathcal{B})$ there exists an object $x \in \text{Ob}(\mathcal{A})$ such that $F(x)$ is isomorphic to y in \mathcal{B} .

Definition 4.2.10. A *subcategory* of a category \mathcal{B} is a category \mathcal{A} whose objects and arrows form subsets of the objects and arrows of \mathcal{B} and such that source, target and composition in \mathcal{A} agree with those of \mathcal{B} . We say \mathcal{A} is a *full subcategory* of \mathcal{B} if $\text{Mor}_{\mathcal{A}}(x, y) = \text{Mor}_{\mathcal{B}}(x, y)$ for all $x, y \in \text{Ob}(\mathcal{A})$. We say \mathcal{A} is a *strictly full subcategory* of \mathcal{B} if it is a full subcategory and given $x \in \text{Ob}(\mathcal{A})$ any object of \mathcal{B} which is isomorphic to x is also in \mathcal{A} .

If $\mathcal{A} \subset \mathcal{B}$ is a subcategory then the identity map is a functor from \mathcal{A} to \mathcal{B} . Furthermore a subcategory $\mathcal{A} \subset \mathcal{B}$ is full if and only if the inclusion functor is fully faithful. Note that given a category \mathcal{B} the set of full subcategories of \mathcal{B} is the same as the set of subsets of $\text{Ob}(\mathcal{B})$.

Remark 4.2.11. Suppose that \mathcal{A} is a category. A functor F from \mathcal{A} to *Sets* is a mathematical object (i.e., it is a set not a class or a formula of set theory, see *Sets*, Section 3.2) even though the category of sets is “big”. Namely, the range of F on objects will be a set $F(\text{Ob}(\mathcal{A}))$ and then we may think of F as a functor between \mathcal{A} and the full subcategory of the category of sets whose objects are elements of $F(\text{Ob}(\mathcal{A}))$.

Example 4.2.12. A homomorphism $p : G \rightarrow H$ of groups gives rise to a functor between the associated groupoids in Example 4.2.6. It is faithful (resp. fully faithful) if and only if p is injective (resp. an isomorphism).

Example 4.2.13. Given a category \mathcal{C} and an object $X \in \text{Ob}(\mathcal{C})$ we define the *category of objects over X* , denoted \mathcal{C}/X as follows. The objects of \mathcal{C}/X are morphisms $Y \rightarrow X$ for some $Y \in \text{Ob}(\mathcal{C})$. Morphisms between objects $Y \rightarrow X$ and $Y' \rightarrow X$ are morphisms $Y \rightarrow Y'$ in \mathcal{C} that make the obvious diagram commute. Note that there is a functor $p_X : \mathcal{C}/X \rightarrow \mathcal{C}$ which simply forgets the morphism. Moreover given a morphism $f : X' \rightarrow X$ in \mathcal{C} there is an induced functor $F : \mathcal{C}/X' \rightarrow \mathcal{C}/X$ obtained by composition with f , and $p_X \circ F = p_{X'}$.

Example 4.2.14. Given a category \mathcal{C} and an object $X \in \text{Ob}(\mathcal{C})$ we define the *category of objects under X* , denoted X/\mathcal{C} as follows. The objects of X/\mathcal{C} are morphisms $X \rightarrow Y$ for some $Y \in \text{Ob}(\mathcal{C})$. Morphisms between objects $X \rightarrow Y$ and $X \rightarrow Y'$ are morphisms $Y \rightarrow Y'$ in \mathcal{C} that make the obvious diagram commute. Note that there is a functor $p_X : X/\mathcal{C} \rightarrow \mathcal{C}$ which simply forgets the morphism. Moreover given a morphism $f : X' \rightarrow X$ in \mathcal{C} there is an induced functor $F : X'/\mathcal{C} \rightarrow X/\mathcal{C}$ obtained by composition with f , and $p_X \circ F = p_{X'}$.

Definition 4.2.15. Let $F, G : \mathcal{A} \rightarrow \mathcal{B}$ be functors. A *natural transformation*, or a *morphism of functors* $t : F \rightarrow G$, is a collection $\{t_x\}_{x \in \text{Ob}(\mathcal{A})}$ such that

- (1) $t_x : F(x) \rightarrow G(x)$ is a morphism in the category \mathcal{B} , and
- (2) for every morphism $\phi : x \rightarrow y$ of \mathcal{A} the following diagram is commutative

$$\begin{array}{ccc} F(x) & \xrightarrow{t_x} & G(x) \\ F(\phi) \downarrow & & \downarrow G(\phi) \\ F(y) & \xrightarrow{t_y} & G(y) \end{array}$$

Sometimes we use the diagram

$$\begin{array}{ccc} & F & \\ \mathcal{A} & \begin{array}{c} \curvearrowright \\ \Downarrow t \\ \curvearrowleft \end{array} & \mathcal{B} \\ & G & \end{array}$$

to indicate that t is a morphism from F to G .

Note that every functor F comes with the *identity* transformation $\text{id}_F : F \rightarrow F$. In addition, given a morphism of functors $t : F \rightarrow G$ and a morphism of functors $s : E \rightarrow F$ then the *composition* $t \circ s$ is defined by the rule

$$(t \circ s)_x = t_x \circ s_x : E(x) \rightarrow G(x)$$

for $x \in \text{Ob}(\mathcal{A})$. It is easy to verify that this is indeed a morphism of functors from E to G . In this way, given categories \mathcal{A} and \mathcal{B} we obtain a new category, namely the category of functors between \mathcal{A} and \mathcal{B} .

Remark 4.2.16. This is one instance where the same thing does not hold if \mathcal{A} is a “big” category. For example consider functors $\text{Sets} \rightarrow \text{Sets}$. As we have currently defined it such a functor is a class and not a set. In other words, it is given by a formula in set theory (with some variables equal to specified sets)! It is not a good idea to try to consider all possible formulae of set theory as part of the definition of a mathematical object. The same problem presents itself when considering sheaves on the category of schemes for example. We will come back to this point later.

Definition 4.2.17. An *equivalence of categories* $F : \mathcal{A} \rightarrow \mathcal{B}$ is a functor such that there exists a functor $G : \mathcal{B} \rightarrow \mathcal{A}$ such that the compositions $F \circ G$ and $G \circ F$ are isomorphic to the identity functors $\text{id}_{\mathcal{B}}$, respectively $\text{id}_{\mathcal{A}}$. In this case we say that G is a *quasi-inverse* to F .

Lemma 4.2.18. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a fully faithful functor. Suppose for every $X \in \text{Ob}(\mathcal{B})$ given an object $j(X)$ of \mathcal{A} and an isomorphism $i_X : X \rightarrow F(j(X))$. Then there is a unique functor $j : \mathcal{B} \rightarrow \mathcal{A}$ such that j extends the rule on objects, and the isomorphisms i_X define an isomorphism of functors $\text{id}_{\mathcal{B}} \rightarrow F \circ j$. Moreover, j and F are quasi-inverse equivalences of categories.

Proof. This lemma proves itself. □

Lemma 4.2.19. A functor is an equivalence of categories if and only if it is both fully faithful and essentially surjective.

Proof. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be essentially surjective and fully faithful. As by convention all categories are small and as F is essentially surjective we can, using the axiom of choice, choose for every $X \in \text{Ob}(\mathcal{B})$ an object $j(X)$ of \mathcal{A} and an isomorphism $i_X : X \rightarrow F(j(X))$. Then we apply Lemma 4.2.18 using that F is fully faithful. □

Definition 4.2.20. Let \mathcal{A}, \mathcal{B} be categories. We define the *product category* $\mathcal{A} \times \mathcal{B}$ to be the category with objects $\text{Ob}(\mathcal{A} \times \mathcal{B}) = \text{Ob}(\mathcal{A}) \times \text{Ob}(\mathcal{B})$ and

$$\text{Mor}_{\mathcal{A} \times \mathcal{B}}((x, y), (x', y')) := \text{Mor}_{\mathcal{A}}(x, x') \times \text{Mor}_{\mathcal{B}}(y, y').$$

Composition is defined componentwise.

4.3. Opposite Categories and the Yoneda Lemma

Definition 4.3.1. Given a category \mathcal{C} the *opposite category* \mathcal{C}^{opp} is the category with the same objects as \mathcal{C} but all morphisms reversed.

In other words $\text{Mor}_{\mathcal{C}^{opp}}(x, y) = \text{Mor}_{\mathcal{C}}(y, x)$. Composition in \mathcal{C}^{opp} is the same as in \mathcal{C} except backwards: if $\phi : y \rightarrow z$ and $\psi : x \rightarrow y$ in \mathcal{C}^{opp} then $\phi \circ^{opp} \psi := \psi \circ \phi$.

Definition 4.3.2. Let \mathcal{C}, \mathcal{S} be categories. A *contravariant* functor F from \mathcal{C} to \mathcal{S} is a functor $\mathcal{C}^{opp} \rightarrow \mathcal{S}$.

Concretely, a contravariant functor F is given by a map $F : \text{Ob}(\mathcal{C}) \rightarrow \text{Ob}(\mathcal{S})$ and for every morphism $\psi : x \rightarrow y$ in \mathcal{C} a morphism $F(\psi) : F(y) \rightarrow F(x)$. These should satisfy the property that, given another morphism $\phi : y \rightarrow z$, we have $F(\phi \circ \psi) = F(\psi) \circ F(\phi)$ as morphisms $F(z) \rightarrow F(x)$. (Note the reverse of order.)

Definition 4.3.3. Let \mathcal{C} be a category.

- (1) A *presheaf of sets on \mathcal{C}* or simply a *presheaf* is a contravariant functor F from \mathcal{C} to *Sets*.
- (2) The category of presheaves is denoted $PSh(\mathcal{C})$.

Of course the category of presheaves is a proper class.

Example 4.3.4. Functor of points. For any $U \in \text{Ob}(\mathcal{C})$ there is a contravariant functor

$$\begin{aligned} h_U &: \mathcal{C} &\longrightarrow & \text{Sets} \\ X &\longmapsto & \text{Mor}_{\mathcal{C}}(X, U) \end{aligned}$$

which takes an object X to the set $\text{Mor}_{\mathcal{C}}(X, U)$. In other words h_U is a presheaf. Given a morphism $f : X \rightarrow Y$ the corresponding map $h_U(f) : \text{Mor}_{\mathcal{C}}(Y, U) \rightarrow \text{Mor}_{\mathcal{C}}(X, U)$ takes ϕ to $\phi \circ f$. We will always denote this presheaf $h_U : \mathcal{C}^{opp} \rightarrow \text{Sets}$. It is called the *representable presheaf* associated to U . If \mathcal{C} is the category of schemes this functor is sometimes referred to as the *functor of points* of U .

Note that given a morphism $\phi : U \rightarrow V$ in \mathcal{C} we get a corresponding natural transformation of functors $h(\phi) : h_U \rightarrow h_V$ defined simply by composing with the morphism $U \rightarrow V$. It is trivial to see that this turns composition of morphisms in \mathcal{C} into composition of transformations of functors. In other words we get a functor

$$h : \mathcal{C} \longrightarrow \text{Fun}(\mathcal{C}^{opp}, \text{Sets}) = PSh(\mathcal{C})$$

Note that the target is a “big” category, see Remark 4.2.2. On the other hand, h is an actual mathematical object (i.e. a set), compare Remark 4.2.11.

Lemma 4.3.5 (Yoneda lemma). *Let $U, V \in \text{Ob}(\mathcal{C})$. Given any morphism of functors $s : h_U \rightarrow h_V$ there is a unique morphism $\phi : U \rightarrow V$ such that $h(\phi) = s$. In other words the functor h is fully faithful. More generally, given any contravariant functor F and any object U of \mathcal{C} we have a natural bijection*

$$\text{Mor}_{PSh(\mathcal{C})}(h_U, F) \longrightarrow F(U), \quad s \longmapsto s_U(id_U).$$

Proof. Just take $\phi = s_U(\text{id}_U) \in \text{Mor}_{\mathcal{C}}(U, V)$. \square

Definition 4.3.6. A contravariant functor $F : \mathcal{C} \rightarrow \text{Sets}$ is said to be *representable* if it is isomorphic to the functor of points h_U for some object U of \mathcal{C} .

Choose an object U of \mathcal{C} and an isomorphism $s : h_U \rightarrow F$. The Yoneda lemma guarantees that the pair (U, s) is unique up to unique isomorphism. The object U is called an object *representing* F .

4.4. Products of pairs

Definition 4.4.1. Let $x, y \in \text{Ob}(\mathcal{C})$. A *product* of x and y is an object $x \times y \in \text{Ob}(\mathcal{C})$ together with morphisms $p \in \text{Mor}_{\mathcal{C}}(x \times y, x)$ and $q \in \text{Mor}_{\mathcal{C}}(x \times y, y)$ such that the following universal property holds: for any $w \in \text{Ob}(\mathcal{C})$ and morphisms $\alpha \in \text{Mor}_{\mathcal{C}}(w, x)$ and $\beta \in \text{Mor}_{\mathcal{C}}(w, y)$ there is a unique $\gamma \in \text{Mor}_{\mathcal{C}}(w, x \times y)$ making the diagram

commute.

If a product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times y$ to be an object of \mathcal{C} such that

$$h_{x \times y}(w) = h_x(w) \times h_y(w)$$

functorially in w . In other words the product $x \times y$ is an object representing the functor $w \mapsto h_x(w) \times h_y(w)$.

Definition 4.4.2. We say the category \mathcal{C} has *products of pairs of objects* if a product $x \times y$ exists for any $x, y \in \text{Ob}(\mathcal{C})$.

We use this terminology to distinguish this notion from the notion of “having products” or “having finite products” which usually means something else (in particular it always implies there exists a final object).

4.5. Coproducts of pairs

Definition 4.5.1. Let $x, y \in \text{Ob}(\mathcal{C})$. A *coproduct*, or *amalgamated sum* of x and y is an object $x \amalg y \in \text{Ob}(\mathcal{C})$ together with morphisms $i \in \text{Mor}_{\mathcal{C}}(x, x \amalg y)$ and $j \in \text{Mor}_{\mathcal{C}}(y, x \amalg y)$ such that the following universal property holds: for any $w \in \text{Ob}(\mathcal{C})$ and morphisms $\alpha \in \text{Mor}_{\mathcal{C}}(x, w)$ and $\beta \in \text{Mor}_{\mathcal{C}}(y, w)$ there is a unique $\gamma \in \text{Mor}_{\mathcal{C}}(x \amalg y, w)$ making the diagram

commute.

If a coproduct exists it is unique up to unique isomorphism. This follows from the Yoneda lemma (applied to the opposite category) as the definition requires $x \amalg y$ to be an object of \mathcal{C} such that

$$\text{Mor}_{\mathcal{C}}(x \amalg y, w) = \text{Mor}_{\mathcal{C}}(x, w) \times \text{Mor}_{\mathcal{C}}(y, w)$$

functorially in w .

Definition 4.5.2. We say the category \mathcal{C} has *coproducts of pairs of objects* if a coproduct $x \amalg y$ exists for any $x, y \in \text{Ob}(\mathcal{C})$.

We use this terminology to distinguish this notion from the notion of “having coproducts” or “having finite coproducts” which usually means something else (in particular it always implies there exists an initial object in \mathcal{C}).

4.6. Fibre products

Definition 4.6.1. Let $x, y, z \in \text{Ob}(\mathcal{C})$, $f \in \text{Mor}_{\mathcal{C}}(x, y)$ and $g \in \text{Mor}_{\mathcal{C}}(z, y)$. A *fibre product* of f and g is an object $x \times_y z \in \text{Ob}(\mathcal{C})$ together with morphisms $p \in \text{Mor}_{\mathcal{C}}(x \times_y z, x)$ and $q \in \text{Mor}_{\mathcal{C}}(x \times_y z, z)$ making the diagram

$$\begin{array}{ccc} x \times_y z & \xrightarrow{q} & z \\ p \downarrow & & \downarrow g \\ x & \xrightarrow{f} & y \end{array}$$

commute, and such that the following universal property holds: for any $w \in \text{Ob}(\mathcal{C})$ and morphisms $\alpha \in \text{Mor}_{\mathcal{C}}(w, x)$ and $\beta \in \text{Mor}_{\mathcal{C}}(w, z)$ with $f \circ \alpha = g \circ \beta$ there is a unique $\gamma \in \text{Mor}_{\mathcal{C}}(w, x \times_y z)$ making the diagram

$$\begin{array}{ccccc} w & & & & \\ & \searrow \beta & & & \\ & & x \times_y z & \xrightarrow{q} & z \\ & \searrow \gamma & \downarrow p & & \downarrow g \\ & & x & \xrightarrow{f} & y \\ & \searrow \alpha & & & \end{array}$$

commute.

If a fibre product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times_y z$ to be an object of \mathcal{C} such that

$$h_{x \times_y z}(w) = h_x(w) \times_{h_y(w)} h_z(w)$$

functorially in w . In other words the fibre product $x \times_y z$ is an object representing the functor $w \mapsto h_x(w) \times_{h_y(w)} h_z(w)$.

Definition 4.6.2. We say a commutative diagram

$$\begin{array}{ccc} w & \longrightarrow & z \\ \downarrow & & \downarrow \\ x & \longrightarrow & y \end{array}$$

in a category is *cartesian* if w and the morphisms $w \rightarrow x$ and $w \rightarrow z$ form a fibre product of the morphisms $x \rightarrow y$ and $z \rightarrow y$.

Definition 4.6.3. We say the category \mathcal{C} has *fibre products* if the fibre product exists for any $f \in \text{Mor}_{\mathcal{C}}(x, y)$ and $g \in \text{Mor}_{\mathcal{C}}(z, y)$.

Definition 4.6.4. A morphism $f : x \rightarrow y$ of a category \mathcal{C} is said to be *representable*, if and only if for every morphism $z \rightarrow y$ in \mathcal{C} the fibre product $x \times_y z$ exists.

Lemma 4.6.5. Let \mathcal{C} be a category. Let $f : x \rightarrow y$, and $g : y \rightarrow z$ be representable. Then $g \circ f : x \rightarrow z$ is representable.

Proof. Omitted. □

Lemma 4.6.6. Let \mathcal{C} be a category. Let $f : x \rightarrow y$ be representable. Let $y' \rightarrow y$ be a morphism of \mathcal{C} . Then the morphism $x' := x \times_y y' \rightarrow y'$ is representable also.

Proof. Let $z \rightarrow y'$ be a morphism. The fibre product $x' \times_{y'} z$ is supposed to represent the functor

$$\begin{aligned} w &\mapsto h_{x'}(w) \times_{h_{y'}(w)} h_z(w) \\ &= (h_x(w) \times_{h_y(w)} h_{y'}(w)) \times_{h_{y'}(w)} h_z(w) \\ &= h_x(w) \times_{h_y(w)} h_z(w) \end{aligned}$$

which is representable by assumption. □

4.7. Examples of fibre products

In this section we list examples of fibre products and we describe them.

As a really trivial first example we observe that the category of sets has fibred products and hence every morphism is representable. Namely, if $f : X \rightarrow Y$ and $g : Z \rightarrow Y$ are maps of sets then we define $X \times_Y Z$ as the subset of $X \times Z$ consisting of pairs (x, z) such that $f(x) = g(z)$. The morphisms $p : X \times_Y Z \rightarrow X$ and $q : X \times_Y Z \rightarrow Z$ are the projection maps $(x, z) \mapsto x$, and $(x, z) \mapsto z$. Finally, if $\alpha : W \rightarrow X$ and $\beta : W \rightarrow Z$ are morphisms such that $f \circ \alpha = g \circ \beta$ then the map $W \rightarrow X \times_Y Z$, $w \mapsto (\alpha(w), \beta(w))$ obviously ends up in $X \times_Y Z$ as desired.

In many categories whose objects are sets endowed with certain types of algebraic structures the fibre product of the underlying sets also provides the fibre product in the category. For example, suppose that X, Y and Z above are groups and that f, g are homomorphisms of groups. Then the set-theoretic fibre product $X \times_Y Z$ inherits the structure of a group, simply by defining the product of two pairs by the formula $(x, z) \cdot (x', z') = (xx', zz')$. Here we list those categories for which a similar reasoning works.

- (1) The category *Groups* of groups.
- (2) The category *G-Sets* of sets endowed with a left G -action for some fixed group G .
- (3) The category of rings.
- (4) The category of R -modules given a ring R .

4.8. Fibre products and representability

In this section we work out fibre products in the category of contravariant functors from a category to the category of sets. This will later be superseded during the discussion of sites, presheaves, sheaves. Of some interest is the notion of a “representable morphism” between such functors.

Lemma 4.8.1. *Let \mathcal{C} be a category. Let $F, G, H : \mathcal{C}^{opp} \rightarrow \mathbf{Sets}$ be functors. Let $a : F \rightarrow G$ and $b : H \rightarrow G$ be transformations of functors. Then the fibre product $F \times_{a,G,b} H$ in the category $\mathbf{Fun}(\mathcal{C}^{opp}, \mathbf{Sets})$ exists and is given by the formula*

$$(F \times_{a,G,b} H)(X) = F(X) \times_{a_X, G(X), b_X} H(X)$$

for any object X of \mathcal{C} .

Proof. Omitted. □

As a special case suppose we have a morphism $a : F \rightarrow G$, an object $U \in \mathbf{Ob}(\mathcal{C})$ and an element $\xi \in G(U)$. According to the Yoneda Lemma 4.3.5 this gives a transformation $\xi : h_U \rightarrow G$. The fibre product in this case is described by the rule

$$(h_U \times_{\xi, G, a} F)(X) = \{(f, \xi') \mid f : X \rightarrow U, \xi' \in F(X), G(f)(\xi) = a_X(\xi')\}$$

If F, G are also representable, then this is the functor representing the fibre product, if it exists, see Section 4.6. The analogy with Definition 4.6.4 prompts us to define a notion of representable transformations.

Definition 4.8.2. Let \mathcal{C} be a category. Let $F, G : \mathcal{C}^{opp} \rightarrow \mathbf{Sets}$ be functors. We say a morphism $a : F \rightarrow G$ is *representable*, or that F is *relatively representable over G* , if for every $U \in \mathbf{Ob}(\mathcal{C})$ and any $\xi \in G(U)$ the functor $h_U \times_G F$ is representable.

Lemma 4.8.3. *Let \mathcal{C} be a category. Let $a : F \rightarrow G$ be a morphism of contravariant functors from \mathcal{C} to \mathbf{Sets} . If a is representable, and G is a representable functor, then F is representable.*

Proof. Omitted. □

Lemma 4.8.4. *Let \mathcal{C} be a category. Let $F : \mathcal{C}^{opp} \rightarrow \mathbf{Sets}$ be a functor. Assume \mathcal{C} has products of pairs of objects and fibre products. The following are equivalent:*

- (1) *The diagonal $F \rightarrow F \times F$ is representable.*
- (2) *For every U in \mathcal{C} , and any $\xi \in F(U)$ the map $\xi : h_U \rightarrow F$ is representable.*

Proof. Suppose the diagonal is representable, and let U, ξ be given. Consider any $V \in \mathbf{Ob}(\mathcal{C})$ and any $\xi' \in F(V)$. Note that $h_U \times h_V = h_{U \times V}$ is representable. Hence the fibre product of the maps $(\xi, \xi') : h_U \times h_V \rightarrow F \times F$ and $F \rightarrow F \times F$ is representable by assumption. This means there exists $W \in \mathbf{Ob}(\mathcal{C})$, morphisms $W \rightarrow U$, $W \rightarrow V$ and $h_W \rightarrow F$ such that

$$\begin{array}{ccc} h_W & \longrightarrow & F \\ \downarrow & & \downarrow \\ h_U \times h_V & \longrightarrow & F \times F \end{array}$$

is cartesian. We leave it to the reader to see that this implies that $h_W = h_U \times_F h_V$ as desired.

Assume (2) holds. Consider any $V \in \text{Ob}(\mathcal{C})$ and any $(\xi, \xi') \in (F \times F)(V)$. We have to show that $h_V \times_{F \times F} F$ is representable. What we know is that $h_V \times_{\xi, F, \xi'} h_V$ is representable, say by W in \mathcal{C} with corresponding morphisms $a, a' : W \rightarrow V$ (such that $\xi \circ a = \xi' \circ a'$). Consider $W' = W \times_{(a, a'), V \times V} V$. It is formal to show that W' represents $h_V \times_{F \times F} F$ because

$$h_{W'} = h_W \times_{h_V \times h_V} h_V = (h_V \times_{\xi, F, \xi'} h_V) \times_{h_V \times h_V} h_V = F \times_{F \times F} h_V.$$

□

4.9. Pushouts

The dual notion to fibre products is that of pushouts.

Definition 4.9.1. Let $x, y, z \in \text{Ob}(\mathcal{C})$, $f \in \text{Mor}_{\mathcal{C}}(y, x)$ and $g \in \text{Mor}_{\mathcal{C}}(y, z)$. A *pushout* of f and g is an object $x \amalg_y z \in \text{Ob}(\mathcal{C})$ together with morphisms $p \in \text{Mor}_{\mathcal{C}}(x, x \amalg_y z)$ and $q \in \text{Mor}_{\mathcal{C}}(z, x \amalg_y z)$ making the diagram

$$\begin{array}{ccc} y & \xrightarrow{g} & z \\ f \downarrow & & \downarrow q \\ x & \xrightarrow{p} & x \amalg_y z \end{array}$$

commute, and such that the following universal property holds: For any $w \in \text{Ob}(\mathcal{C})$ and morphisms $\alpha \in \text{Mor}_{\mathcal{C}}(x, w)$ and $\beta \in \text{Mor}_{\mathcal{C}}(z, w)$ with $\alpha \circ f = \beta \circ g$ there is a unique $\gamma \in \text{Mor}_{\mathcal{C}}(x \amalg_y z, w)$ making the diagram

$$\begin{array}{ccc} y & \xrightarrow{g} & z \\ f \downarrow & & \downarrow q \\ x & \xrightarrow{p} & x \amalg_y z \end{array} \begin{array}{c} \searrow \beta \\ \xrightarrow{\alpha} \\ \xrightarrow{\gamma} \\ \searrow \alpha \end{array} w$$

commute.

It is possible and straightforward to prove the uniqueness of the triple $(x \amalg_y z, p, q)$ up to unique isomorphism (if it exists) by direct arguments. Another possibility is to think of the coproduct as the product in the opposite category, thereby getting this uniqueness for free from the discussion in Section 4.6.

Definition 4.9.2. We say a commutative diagram

$$\begin{array}{ccc} y & \longrightarrow & z \\ \downarrow & & \downarrow \\ x & \longrightarrow & w \end{array}$$

in a category is *cocartesian* if w and the morphisms $x \rightarrow w$ and $z \rightarrow w$ form a pushout of the morphisms $y \rightarrow x$ and $y \rightarrow z$.

4.10. Equalizers

Definition 4.10.1. Suppose that X, Y are objects of a category \mathcal{C} and that $a, b : X \rightarrow Y$ are morphisms. We say a morphism $e : Z \rightarrow X$ is an *equalizer* for the pair (a, b) if $a \circ e = b \circ e$ and if (Z, e) satisfies the following universal property: For every morphism $t : W \rightarrow X$ in \mathcal{C} such that $a \circ t = b \circ t$ there exists a unique morphism $s : W \rightarrow Z$ such that $t = e \circ s$.

As in the case of the fibre product above, equalizers when they exist are unique up to unique isomorphism. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

4.11. Coequalizers

Definition 4.11.1. Suppose that X, Y are objects of a category \mathcal{C} and that $a, b : X \rightarrow Y$ are morphisms. We say a morphism $c : Y \rightarrow Z$ is a *coequalizer* for the pair (a, b) if $c \circ a = c \circ b$ and if (Z, c) satisfies the following universal property: For every morphism $t : Y \rightarrow W$ in \mathcal{C} such that $t \circ a = t \circ b$ there exists a unique morphism $s : Z \rightarrow W$ such that $t = s \circ c$.

As in the case of the pushouts above, coequalizers when they exist are unique up to unique isomorphism, and this follows from the uniqueness of equalizers upon considering the opposite category. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

4.12. Initial and final objects

Definition 4.12.1. Let \mathcal{C} be a category.

- (1) An object x of the category \mathcal{C} is called an *initial* object if for every object y of \mathcal{C} there is exactly one morphism $x \rightarrow y$.
- (2) An object x of the category \mathcal{C} is called a *final* object if for every object y of \mathcal{C} there is exactly one morphism $y \rightarrow x$.

In the category of sets the empty set \emptyset is an initial object, and in fact the only initial object. Also, any *singleton*, i.e., a set with one element, is a final object (so it is not unique).

4.13. Monomorphisms and Epimorphisms

Definition 4.13.1. Let \mathcal{C} be a category and let $f : X \rightarrow Y$ be a morphism of \mathcal{C} .

- (1) We say that f is a *monomorphism* if for every object W and every pair of morphisms $a, b : W \rightarrow X$ such that $f \circ a = f \circ b$ we have $a = b$.
- (2) We say that f is an *epimorphism* if for every object W and every pair of morphisms $a, b : Y \rightarrow W$ such that $a \circ f = b \circ f$ we have $a = b$.

Example 4.13.2. In the category of sets the monomorphisms correspond to injective maps and the epimorphisms correspond to surjective maps.

Lemma 4.13.3. Let \mathcal{C} be a category, and let $f : X \rightarrow Y$ be a morphism of \mathcal{C} . Then

- (1) f is a monomorphism if and only if X is the fibre product $X \times_Y X$, and
- (2) f is an epimorphism if and only if Y is the pushout $Y \amalg_X Y$.

Proof. Omitted. □

4.14. Limits and colimits

Let \mathcal{C} be a category. A *diagram* in \mathcal{C} is simply a functor $M : \mathcal{I} \rightarrow \mathcal{C}$. We say that \mathcal{I} is the *index category* or that M is an \mathcal{I} -diagram. We will use the notation M_i to denote the image of the object i of \mathcal{I} . Hence for $\phi : i \rightarrow i'$ a morphism in \mathcal{I} we have $M(\phi) : M_i \rightarrow M_{i'}$.

Definition 4.14.1. A *limit* of the \mathcal{I} -diagram M in the category \mathcal{C} is given by an object $\lim_I M$ in \mathcal{C} together with morphisms $p_i : \lim_I M \rightarrow M_i$ such that

- (1) for $\phi : i \rightarrow i'$ a morphism in \mathcal{I} we have $p_{i'} = M(\phi) \circ p_i$, and
- (2) for any object W in \mathcal{C} and any family of morphisms $q_i : W \rightarrow M_i$ such that for all $\phi : i \rightarrow i'$ in \mathcal{I} we have $q_{i'} = M(\phi) \circ q_i$ there exists a unique morphism $q : W \rightarrow \lim_I M$ such that $q_i = p_i \circ q$ for every object i of \mathcal{I} .

Limits $(\lim_I M, (p_i)_{i \in \text{Ob}(\mathcal{I})})$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Products of pairs, fibred products, and equalizers are examples of limits. The limit over the empty diagram is a final object of \mathcal{C} . In the category of sets all limits exist. The dual notion is that of colimits.

Definition 4.14.2. A *colimit* of the \mathcal{I} -diagram M in the category \mathcal{C} is given by an object $\text{colim}_I M$ in \mathcal{C} together with morphisms $s_i : M_i \rightarrow \text{colim}_I M$ such that

- (1) for $\phi : i \rightarrow i'$ a morphism in \mathcal{I} we have $s_{i'} = s_i \circ M(\phi)$, and
- (2) for any object W in \mathcal{C} and any family of morphisms $t_i : M_i \rightarrow W$ such that for all $\phi : i \rightarrow i'$ in \mathcal{I} we have $t_{i'} = t_i \circ M(\phi)$ there exists a unique morphism $t : \text{colim}_I M \rightarrow W$ such that $t_i = t \circ s_i$ for every object i of \mathcal{I} .

Colimits $(\text{colim}_I M, (s_i)_{i \in \text{Ob}(\mathcal{I})})$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Coproducts of pairs, pushouts, and coequalizers are examples of colimits. The colimit over an empty diagram is an initial object of \mathcal{C} . In the category of sets all colimits exist.

Remark 4.14.3. The index category of a (co)limit will never be allowed to have a proper class of objects. In this project it means that it cannot be one of the categories listed in Remark 4.2.2

Remark 4.14.4. We often write $\lim_i M_i$, $\text{colim}_i M_i$, $\lim_{i \in \mathcal{I}} M_i$, or $\text{colim}_{i \in \mathcal{I}} M_i$ instead of the versions indexed by \mathcal{I} . Using this notation, and using the description of limits and colimits of sets in Section 4.15 below, we can say the following. Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram.

- (1) The object $\lim_i M_i$ if it exists satisfies the following property

$$\text{Mor}_{\mathcal{C}}(W, \lim_i M_i) = \lim_i \text{Mor}_{\mathcal{C}}(W, M_i)$$

where the limit on the right takes place in the category of sets.

- (2) The object $\text{colim}_i M_i$ if it exists satisfies the following property

$$\text{Mor}_{\mathcal{C}}(\text{colim}_i M_i, W) = \lim_{i \in \mathcal{I}^{\text{opp}}} \text{Mor}_{\mathcal{C}}(M_i, W)$$

where on the right we have the limit over the opposite category with value in the category of sets.

By the Yoneda lemma (and its dual) this formula completely determines the limit, respectively the colimit.

As an application of the notions of limits and colimits we define products and coproducts.

Definition 4.14.5. Suppose that I is a set, and suppose given for every $i \in I$ an object M_i of the category \mathcal{C} . A *product* $\prod_{i \in I} M_i$ is by definition $\lim_{\mathcal{I}} M$ (if it exists) where \mathcal{I} is the category having only identities as morphisms and having the elements of I as objects.

An important special case is where $I = \emptyset$ in which case the product is a final object of the category. The morphisms $p_i : \prod M_i \rightarrow M_i$ are called the *projection morphisms*.

Definition 4.14.6. Suppose that I is a set, and suppose given for every $i \in I$ an object M_i of the category \mathcal{C} . A *coproduct* $\coprod_{i \in I} M_i$ is by definition $\text{colim}_{\mathcal{I}} M$ (if it exists) where \mathcal{I} is the category having only identities as morphisms and having the elements of I as objects.

An important special case is where $I = \emptyset$ in which case the product is an initial object of the category. Note that the coproduct comes equipped with morphisms $M_i \rightarrow \coprod M_i$. These are sometimes called the *coprojections*.

Lemma 4.14.7. Suppose that $M : \mathcal{I} \rightarrow \mathcal{C}$, and $N : \mathcal{J} \rightarrow \mathcal{C}$ are diagrams whose colimits exist. Suppose $H : \mathcal{I} \rightarrow \mathcal{J}$ is a functor, and suppose $t : M \rightarrow N \circ H$ is a transformation of functors. Then there is a unique morphism

$$\theta : \text{colim}_{\mathcal{I}} M \longrightarrow \text{colim}_{\mathcal{J}} N$$

such that all the diagrams

$$\begin{array}{ccc} M_i & \longrightarrow & \text{colim}_{\mathcal{I}} M \\ t_i \downarrow & & \downarrow \theta \\ N_{H(i)} & \longrightarrow & \text{colim}_{\mathcal{J}} N \end{array}$$

commute.

Proof. Omitted. □

Lemma 4.14.8. Suppose that $M : \mathcal{I} \rightarrow \mathcal{C}$, and $N : \mathcal{J} \rightarrow \mathcal{C}$ are diagrams whose limits exist. Suppose $H : \mathcal{I} \rightarrow \mathcal{J}$ is a functor, and suppose $t : N \circ H \rightarrow M$ is a transformation of functors. Then there is a unique morphism

$$\theta : \lim_{\mathcal{J}} N \longrightarrow \lim_{\mathcal{I}} M$$

such that all the diagrams

$$\begin{array}{ccc} \lim_{\mathcal{J}} N & \longrightarrow & N_{H(i)} \\ \downarrow \theta & & t_i \downarrow \\ \lim_{\mathcal{I}} M & \longrightarrow & M_i \end{array}$$

commute.

Proof. Omitted. □

Lemma 4.14.9. Let \mathcal{I}, \mathcal{J} be index categories. Let $M : \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{C}$ be a functor. We have

$$\text{colim}_i \text{colim}_j M_{i,j} = \text{colim}_{i,j} M_{i,j} = \text{colim}_j \text{colim}_i M_{i,j}$$

provided all the indicated colimits exist. Similar for limits.

Proof. Omitted. \square

Lemma 4.14.10. *Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Write $I = \text{Ob}(\mathcal{I})$ and $A = \text{Arrow}(\mathcal{I})$. Denote $s, t : A \rightarrow I$ the source and target maps. Suppose that $\prod_{i \in I} M_i$ and $\prod_{a \in A} M_{t(a)}$ exist. Suppose that the equalizer of*

$$\prod_{i \in I} M_i \begin{array}{c} \xrightarrow{\phi} \\ \xrightarrow{\psi} \end{array} \prod_{a \in A} M_{t(a)}$$

exists, where the morphisms are determined by their components as follows: $p_a \circ \psi = M(a) \circ p_{s(a)}$ and $p_a \circ \phi = p_{t(a)}$. Then this equalizer is the limit of the diagram.

Proof. Omitted. \square

Lemma 4.14.11. *Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Write $I = \text{Ob}(\mathcal{I})$ and $A = \text{Arrow}(\mathcal{I})$. Denote $s, t : A \rightarrow I$ the source and target maps. Suppose that $\prod_{i \in I} M_i$ and $\prod_{a \in A} M_{s(a)}$ exist. Suppose that the coequalizer of*

$$\prod_{a \in A} M_{s(a)} \begin{array}{c} \xrightarrow{\phi} \\ \xrightarrow{\psi} \end{array} \prod_{i \in I} M_i$$

exists, where the morphisms are determined by their components as follows: The component $M_{s(a)}$ maps via ψ to the component $M_{t(a)}$ via the morphism a . The component $M_{s(a)}$ maps via ϕ to the component $M_{s(a)}$ by the identity morphism. Then this coequalizer is the colimit of the diagram.

Proof. Omitted. \square

4.15. Limits and colimits in the category of sets

Not only do limits and colimits exist in *Sets* but they are also easy to describe. Namely, let $M : \mathcal{I} \rightarrow \text{Sets}$, $i \mapsto M_i$ be a diagram of sets. Denote $I = \text{Ob}(\mathcal{I})$. The limit is described as

$$\lim_{\mathcal{I}} M = \{(m_i)_{i \in I} \in \prod_{i \in I} M_i \mid \forall \phi : i \rightarrow i' \text{ in } \mathcal{I}, M(\phi)(m_i) = m_{i'}\}.$$

So we think of an element of the limit as a compatible system of elements of all the sets M_i .

On the other hand, the colimit is

$$\text{colim}_{\mathcal{I}} M = \left(\prod_{i \in I} M_i \right) / \sim$$

where the equivalence relation \sim is the equivalence relation generated by setting $m_i \sim m_{i'}$ if $m_i \in M_i$, $m_{i'} \in M_{i'}$ and $M(\phi)(m_i) = m_{i'}$ for some $\phi : i \rightarrow i'$. In other words, $m_i \in M_i$ and $m_{i'} \in M_{i'}$ are equivalent if there is a chain of morphisms in \mathcal{I}

$$\begin{array}{ccccccc} & & i_1 & & i_3 & & i_{2n-1} \\ & & \swarrow & & \swarrow & & \searrow \\ i = i_0 & & & & i_2 & & \dots & & i_{2n} = i' \end{array}$$

and elements $m_{i_j} \in M_{i_j}$ mapping to each other under the maps $M_{i_{2k-1}} \rightarrow M_{i_{2k-2}}$ and $M_{i_{2k-1}} \rightarrow M_{i_{2k}}$ induced from the maps in \mathcal{I} above.

This is not a very pleasant type of object to work with. But if the diagram is filtered then it is much easier to describe. We will explain this in Section 4.19.

4.16. Connected limits

A (co)limit is called connected if its index category is connected.

Definition 4.16.1. We say that a category \mathcal{I} is *connected* if the equivalence relation generated by $x \sim y \Leftrightarrow \text{Mor}_{\mathcal{I}}(x, y) \neq \emptyset$ has exactly one equivalence class.

Here we follow the convention of Topology, Definition 5.6.1 that connected spaces are nonempty. The following in some vague sense characterizes connected limits.

Lemma 4.16.2. *Let \mathcal{C} be a category. Let X be an object of \mathcal{C} . Let $M : \mathcal{I} \rightarrow \mathcal{C}/X$ be a diagram in the category of objects over X . If the index category \mathcal{I} is connected and the limit of M exists in \mathcal{C}/X , then the limit of the composition $\mathcal{I} \rightarrow \mathcal{C}/X \rightarrow \mathcal{C}$ exists and is the same.*

Proof. Let $M \rightarrow X$ be an object representing the limit in \mathcal{C}/X . Consider the functor

$$W \mapsto \lim_i \text{Mor}_{\mathcal{C}}(W, M_i).$$

Let (φ_i) be an element of the set on the right. Since each M_i comes equipped with a morphism $s_i : M_i \rightarrow X$ we get morphisms $f_i = s_i \circ \varphi_i : W \rightarrow X$. But as \mathcal{I} is connected we see that all f_i are equal. Since \mathcal{I} is nonempty there is at least one f_i . Hence this common value $W \rightarrow X$ defines the structure of an object of W in \mathcal{C}/X and (φ_i) defines an element of $\lim_i \text{Mor}_{\mathcal{C}/X}(W, M_i)$. Thus we obtain a unique morphism $\phi : W \rightarrow M$ such that φ_i is the composition of ϕ with $M \rightarrow M_i$ as desired. \square

Lemma 4.16.3. *Let \mathcal{C} be a category. Let X be an object of \mathcal{C} . Let $M : \mathcal{I} \rightarrow X/\mathcal{C}$ be a diagram in the category of objects under X . If the index category \mathcal{I} is connected and the colimit of M exists in X/\mathcal{C} , then the colimit of the composition $\mathcal{I} \rightarrow X/\mathcal{C} \rightarrow \mathcal{C}$ exists and is the same.*

Proof. Omitted. Hint: This lemma is dual to Lemma 4.16.2. \square

4.17. Cofinal and initial categories

In the literature sometimes the word “final” is used instead of cofinal in the following definition.

Definition 4.17.1. Let $H : \mathcal{I} \rightarrow \mathcal{J}$ be a functor between categories. We say \mathcal{I} is *cofinal in \mathcal{J}* or that H is *cofinal* if

- (1) for all $y \in \text{Ob}(\mathcal{J})$ there exists a $x \in \text{Ob}(\mathcal{I})$ and a morphism $y \rightarrow H(x)$, and
- (2) given $y \in \text{Ob}(\mathcal{J})$, $x, x' \in \text{Ob}(\mathcal{I})$ and morphisms $y \rightarrow H(x)$ and $y \rightarrow H(x')$ there exists a sequence of morphisms

$$x = x_0 \leftarrow x_1 \rightarrow x_2 \leftarrow x_3 \rightarrow \dots \rightarrow x_{2n} = x'$$

in \mathcal{I} and morphisms $y \rightarrow H(x_i)$ in \mathcal{J} such that the diagrams

$$\begin{array}{ccccc} & & y & & \\ & \swarrow & \downarrow & \searrow & \\ H(x_{2k}) & \longleftarrow & H(x_{2k+1}) & \longrightarrow & H(x_{2k+2}) \end{array}$$

commute for $k = 0, \dots, n - 1$.

Proof. This is a special case of Lemma 4.17.5. \square

4.18. Finite limits and colimits

A *finite* (co)limit is a (co)limit whose diagram category is finite, i.e., the diagram category has finitely many objects and finitely many morphisms. A (co)limit is called *nonempty* if the index category is nonempty. A (co)limit is called *connected* if the index category is connected, see Definition 4.16.1. It turns out that there are “enough” finite diagram categories.

Lemma 4.18.1. *Let \mathcal{I} be a category with*

- (1) *$\text{Ob}(\mathcal{I})$ is finite, and*
- (2) *there exist finitely many morphisms $f_1, \dots, f_m \in \text{Arrows}(\mathcal{I})$ such that every morphism of \mathcal{I} is a composition $f_{j_1} \circ f_{j_2} \circ \dots \circ f_{j_k}$.*

Then there exists a functor $F : \mathcal{J} \rightarrow \mathcal{I}$ such that

- (a) *\mathcal{J} is a finite category, and*
- (b) *for any diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ the (co)limit of M over \mathcal{I} exists if and only if the (co)limit of $M \circ F$ over \mathcal{J} exists and in this case the (co)limits are canonically isomorphic.*

Moreover, \mathcal{J} is connected (resp. nonempty) if and only if \mathcal{I} is so.

Proof. Say $\text{Ob}(\mathcal{I}) = \{x_1, \dots, x_n\}$. Denote $s, t : \{1, \dots, m\} \rightarrow \{1, \dots, n\}$ the functions such that $f_j : x_{s(j)} \rightarrow x_{t(j)}$. We set $\text{Ob}(\mathcal{J}) = \{y_1, \dots, y_m, z_1, \dots, z_n\}$. Besides the identity morphisms we introduce morphisms $g_j : y_{s(j)} \rightarrow z_{t(j)}$, $j = 1, \dots, m$ and morphisms $h_i : y_i \rightarrow z_i$, $i = 1, \dots, n$. Since all of the nonidentity morphisms in \mathcal{J} go from a y to a z there are no compositions to define and no associativity to check. Set $F(y_i) = F(z_i) = x_i$. Set $F(g_j) = f_j$ and $F(h_i) = \text{id}_{x_i}$. It is clear that F is a functor. It is clear that \mathcal{J} is finite. It is clear that \mathcal{J} is connected, resp. nonempty if and only if \mathcal{I} is so.

Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Consider an object W of \mathcal{C} and morphisms $q_i : W \rightarrow M(x_i)$ as in Definition 4.14.1. Then by taking $q_i : W \rightarrow M(F(y_i)) = M(F(z_i)) = M(x_i)$ we obtain a family of maps as in Definition 4.14.1 for the diagram $M \circ F$. Conversely, suppose we are given maps $qy_i : W \rightarrow M(F(y_i))$ and $qz_i : W \rightarrow M(F(z_i))$ as in Definition 4.14.1 for the diagram $M \circ F$. Since

$$M(F(h_i)) = \text{id} : M(F(y_i)) = M(x_i) \longrightarrow M(x_i) = M(F(z_i))$$

we conclude that $qy_i = qz_i$ for all i . Set q_i equal to this common value. The compatibility of $q_{s(j)} = qy_{s(j)}$ and $q_{t(j)} = qz_{t(j)}$ with the morphism $M(f_j)$ guarantees that the family q_i is compatible with all morphisms in \mathcal{I} as by assumption every such morphism is a composition of the morphisms f_j . Thus we have found a canonical bijection

$$\lim_{B \in \text{Ob}(\mathcal{J})} \text{Mor}_{\mathcal{C}}(W, M(F(B))) = \lim_{A \in \text{Ob}(\mathcal{I})} \text{Mor}_{\mathcal{C}}(W, M(A))$$

which implies the statement on limits in the lemma. The statement on colimits is proved in the same way (proof omitted). \square

Lemma 4.18.2. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *Connected finite limits exist in \mathcal{C} .*
- (2) *Equalizers and fibre products exist in \mathcal{C} .*

Proof. Since equalizers and fibre products are finite connected limits we see that (1) implies (2). For the converse, let \mathcal{I} be a finite connected diagram category. Let $F : \mathcal{J} \rightarrow \mathcal{I}$ be the functor of diagram categories constructed in the proof of Lemma 4.18.1. Then we see that we may replace \mathcal{I} by \mathcal{J} . The result is that we may assume that $\text{Ob}(\mathcal{I}) = \{x_1, \dots, x_n\} \amalg \{y_1, \dots, y_m\}$ with $n, m \geq 1$ such that all nonidentity morphisms in \mathcal{I} are morphisms $f : x_i \rightarrow y_j$ for some i and j .

Suppose that $n > 1$. Since \mathcal{I} is connected there exist indices i_1, i_2 and j_0 and morphisms $a : x_{i_1} \rightarrow y_{j_0}$ and $b : x_{i_2} \rightarrow y_{j_0}$. Consider the category

$$\mathcal{I}' = \{x\} \amalg \{x_1, \dots, \hat{x}_{i_1}, \dots, \hat{x}_{i_2}, \dots, x_n\} \amalg \{y_1, \dots, y_m\}$$

with

$$\text{Mor}_{\mathcal{I}'}(x, y_j) = \text{Mor}_{\mathcal{I}}(x_{i_1}, y_j) \amalg \text{Mor}_{\mathcal{I}}(x_{i_2}, y_j)$$

and all other morphism sets the same as in \mathcal{I} . For any functor $M : \mathcal{I} \rightarrow \mathcal{C}$ we can construct a functor $M' : \mathcal{I}' \rightarrow \mathcal{C}$ by setting

$$M'(x) = M(x_{i_1}) \times_{M(a), M(y_{j_0}), M(b)} M(x_{i_2})$$

and for a morphism $f' : x \rightarrow y_j$ corresponding to, say, $f : x_{i_1} \rightarrow y_j$ we set $M'(f) = M(f) \circ \text{pr}_1$. Then the functor M has a limit if and only if the functor M' has a limit (proof omitted). Hence by induction we reduce to the case $n = 1$.

If $n = 1$, then the limit of any $M : \mathcal{I} \rightarrow \mathcal{C}$ is the successive equalizer of pairs of maps $x_1 \rightarrow y_j$ hence exists by assumption. \square

Lemma 4.18.3. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *Nonempty finite limits exist in \mathcal{C} .*
- (2) *Products of pairs and equalizers exist in \mathcal{C} .*
- (3) *Products of pairs and fibre products exist in \mathcal{C} .*

Proof. Since products of pairs, fibre products, and equalizers are limits with nonempty index categories we see that (1) implies both (2) and (3). Assume (2). Then finite nonempty products and equalizers exist. Hence by Lemma 4.14.10 we see that finite nonempty limits exist, i.e., (1) holds. Assume (3). If $a, b : A \rightarrow B$ are morphisms of \mathcal{C} , then the equalizer of a, b is

$$(A \times_{a, B, b} A) \times_{(\text{pr}_1, \text{pr}_2), A \times A, \Delta} A.$$

Thus (3) implies (2), and the lemma is proved. \square

Lemma 4.18.4. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *Finite limits exist in \mathcal{C} .*
- (2) *Finite products and equalizers exist.*
- (3) *The category has a final object and fibred products exist.*

Proof. Since products of pairs, fibre products, equalizers, and final objects are limits over finite index categories we see that (1) implies both (2) and (3). By Lemma 4.14.10 above we see that (2) implies (1). Assume (3). Note that the product $A \times A$ is the fibre product over the final object. If $a, b : A \rightarrow B$ are morphisms of \mathcal{C} , then the equalizer of a, b is

$$(A \times_{a, B, b} A) \times_{(\text{pr}_1, \text{pr}_2), A \times A, \Delta} A.$$

Thus (3) implies (2) and the lemma is proved. \square

Lemma 4.18.5. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *Connected finite colimits exist in \mathcal{C} .*
- (2) *Coequalizers and pushouts exist in \mathcal{C} .*

Proof. Omitted. Hint: This is dual to Lemma 4.18.2. □

Lemma 4.18.6. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *Nonempty finite colimits exist in \mathcal{C} .*
- (2) *Coproducts of pairs and coequalizers exist in \mathcal{C} .*
- (3) *Coproducts of pairs and pushouts exist in \mathcal{C} .*

Proof. Omitted. Hint: This is the dual of Lemma 4.18.3. □

Lemma 4.18.7. *Let \mathcal{C} be a category. The following are equivalent:*

- (1) *finite colimits exist in \mathcal{C} ,*
- (2) *finite coproducts and coequalizers exist in \mathcal{C} , and*
- (3) *\mathcal{C} has an initial object and pushouts exist.*

Proof. Omitted. Hint: This is dual to Lemma 4.18.4. □

4.19. Filtered colimits

Colimits are easier to compute or describe when they are over a filtered diagram. Here is the definition.

Definition 4.19.1. We say that a diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ is *directed*, or *filtered* if the following conditions hold:

- (1) the category \mathcal{I} has at least one object,
- (2) for every pair of objects x, y of \mathcal{I} there exists an object z and morphisms $x \rightarrow z, y \rightarrow z$, and
- (3) for every pair of objects x, y of \mathcal{I} and every pair of morphisms $a, b : x \rightarrow y$ of \mathcal{I} there exists a morphism $c : y \rightarrow z$ of \mathcal{I} such that $M(c \circ a) = M(c \circ b)$ as morphisms in \mathcal{C} .

We say that an index category \mathcal{I} is *directed*, or *filtered* if $\text{id} : \mathcal{I} \rightarrow \mathcal{I}$ is filtered (in other words you erase the M in part (3) above.)

We observe that any diagram with filtered index category is filtered, and this is how filtered colimits usually come about. In fact, if $M : \mathcal{I} \rightarrow \mathcal{C}$ is a filtered diagram, then we can factor M as $\mathcal{I} \rightarrow \mathcal{I}' \rightarrow \mathcal{C}$ where \mathcal{I}' is a filtered index category¹ such that $\text{colim}_{\mathcal{I}} M$ exists if and only if $\text{colim}_{\mathcal{I}'} M'$ exists in which case the colimits are canonically isomorphic.

Suppose that $M : \mathcal{I} \rightarrow \text{Sets}$ is a filtered diagram. In this case we may describe the equivalence relation in the formula

$$\text{colim}_{\mathcal{I}} M = \left(\coprod_{i \in \mathcal{I}} M_i \right) / \sim$$

simply as follows

$$m_i \sim m_{i'} \Leftrightarrow \exists i'', \phi : i \rightarrow i'', \phi' : i' \rightarrow i'', M(\phi)(m_i) = M(\phi')(m_{i'}).$$

In other words, two elements are equal in the colimit if and only if they “eventually become equal”.

¹Namely, let \mathcal{I}' have the same objects as \mathcal{I} but where $\text{Mor}_{\mathcal{I}'}(x, y)$ is the quotient of $\text{Mor}_{\mathcal{I}}(x, y)$ by the equivalence relation which identifies $a, b : x \rightarrow y$ if $M(a) = M(b)$.

Lemma 4.19.2. *Let \mathcal{I} and \mathcal{J} be index categories. Assume that \mathcal{I} is filtered and \mathcal{J} is finite. Let $M : \mathcal{I} \times \mathcal{J} \rightarrow \text{Sets}$, $(i, j) \mapsto M_{i,j}$ be a diagram of diagrams of sets. In this case*

$$\text{colim}_i \lim_j M_{i,j} = \lim_j \text{colim}_i M_{i,j}.$$

In particular, colimits over \mathcal{I} commute with finite products, fibre products, and equalizers of sets.

Proof. Omitted. In fact, it is a fun exercise to prove that a category is filtered if and only if colimits over the category commute with finite limits (into the category of sets). \square

We give a counter example to the lemma in the case where \mathcal{J} is infinite. Namely, let \mathcal{I} consist of $\mathbf{N} = \{1, 2, 3, \dots\}$ with a unique morphism $i \rightarrow i'$ whenever $i \leq i'$. Let \mathcal{J} consist of the discrete category $\mathbf{N} = \{1, 2, 3, \dots\}$ (only morphisms are identities). Let $M_{i,j} = \{1, 2, \dots, i\}$ with obvious inclusion maps $M_{i,j} \rightarrow M_{i',j}$ when $i \leq i'$. In this case $\text{colim}_i M_{i,j} = \mathbf{N}$ and hence

$$\lim_j \text{colim}_i M_{i,j} = \prod_j \mathbf{N} = \mathbf{N}^{\mathbf{N}}$$

On the other hand $\lim_j M_{i,j} = \prod_j M_{i,j}$ and hence

$$\text{colim}_i \lim_j M_{i,j} = \bigcup_i \{1, 2, \dots, i\}^{\mathbf{N}}$$

which is smaller than the other limit.

It turns out we sometimes need a more finegrained control over the possible conditions one can impose on index categories. Thus we add some lemmas on the possible things one can require.

Lemma 4.19.3. *Let \mathcal{I} be an index category, i.e., a category. Assume that for every pair of objects x, y of \mathcal{I} there exists an object z and morphisms $x \rightarrow z$ and $y \rightarrow z$. Then colimits of diagrams of sets over \mathcal{I} commute with finite nonempty products.*

Proof. Let M and N be diagrams of sets over \mathcal{I} . To prove the lemma we have to show that the canonical map

$$\text{colim}(M_i \times N_i) \longrightarrow \text{colim } M_i \times \text{colim } N_i$$

is an isomorphism. If \mathcal{I} is empty, then this is true because the colimit of sets over the empty category is the empty set. If \mathcal{I} is nonempty, then we construct a map $\text{colim } M_i \times \text{colim } N_i \rightarrow \text{colim}(M_i \times N_i)$ as follows. Suppose that $m \in M_i$ and $n \in N_j$ give rise to elements s and t of the respective colimits. By assumption we can find $a : i \rightarrow k$ and $b : j \rightarrow k$ in \mathcal{I} . Then $(M(a)(m), N(b)(n))$ is an element of $M_k \times N_k$ and we map (s, t) to the corresponding element of $\text{colim } M_i \times N_i$. We omit the verification that this map is well defined and that it is an inverse of the map displayed above. \square

Lemma 4.19.4. *Let \mathcal{I} be an index category, i.e., a category. Assume that for every pair of objects x, y of \mathcal{I} there exists an object z and morphisms $x \rightarrow z$ and $y \rightarrow z$. Let $M : \mathcal{I} \rightarrow \text{Ab}$ be a diagram of abelian groups over \mathcal{I} . Then the set underlying $\text{colim}_i M_i$ is the colimit of M viewed as a diagram of sets over \mathcal{I} .*

Proof. In this proof all colimits are taken in the category of sets. By Lemma 4.19.3 we have $\operatorname{colim} M_i \times \operatorname{colim} M_i = \operatorname{colim}(M_i \times M_i)$ hence we can use the maps $+$: $M_i \times M_i \rightarrow M_i$ to define an addition map on $\operatorname{colim} M_i$. A straightforward argument, which we omit, shows that the set $\operatorname{colim} M_i$ with this addition is the colimit in the category of abelian groups. \square

Lemma 4.19.5. *Let \mathcal{I} be an index category, i.e., a category. Assume that for every solid diagram*

$$\begin{array}{ccc} x & \longrightarrow & y \\ \downarrow & & \downarrow \\ z & \dashrightarrow & w \end{array}$$

in \mathcal{I} there exists an object w and dotted arrows making the diagram commute. Then \mathcal{I} is a (possibly empty) disjoint union of categories satisfying the condition above and the condition of Lemma 4.19.3.

Proof. If \mathcal{I} is the empty category, then the lemma is true. Otherwise, we define a relation on objects of \mathcal{I} by saying that $x \sim y$ if there exists a z and morphisms $x \rightarrow z$ and $y \rightarrow z$. This is an equivalence relation by the assumption of the lemma. Hence $\operatorname{Ob}(\mathcal{I})$ is a disjoint union of equivalence classes. Let \mathcal{I}_j be the full subcategories corresponding to these equivalence classes. Then $\mathcal{I} = \coprod \mathcal{I}_j$ as desired. \square

Lemma 4.19.6. *Let \mathcal{I} be an index category, i.e., a category. Assume that for every solid diagram*

$$\begin{array}{ccc} x & \longrightarrow & y \\ \downarrow & & \downarrow \\ z & \dashrightarrow & w \end{array}$$

in \mathcal{I} there exists an object w and dotted arrows making the diagram commute. Then an injective morphism $M \rightarrow N$ of diagrams of sets (resp. abelian groups) over \mathcal{I} gives rise to an injective map $\operatorname{colim} M_i \rightarrow \operatorname{colim} N_i$ of sets (resp. abelian groups).

Proof. We first show that it suffices to prove the lemma for the case of a diagram of sets. Namely, by Lemma 4.19.5 we can write $\mathcal{I} = \coprod \mathcal{I}_j$ where each \mathcal{I}_j satisfies the condition of the lemma as well as the condition of Lemma 4.19.3. Thus, if M is a diagram of abelian groups over \mathcal{I} , then

$$\operatorname{colim}_{\mathcal{I}} M = \bigoplus_j \operatorname{colim}_{\mathcal{I}_j} M|_{\mathcal{I}_j}$$

It follows that it suffices to prove the result for the categories \mathcal{I}_j . However, colimits of abelian groups over these categories are computed by the colimits of the underlying sets (Lemma 4.19.4) hence we reduce to the case of an injective map of diagrams of sets.

Here we say that $M \rightarrow N$ is injective if all the maps $M_i \rightarrow N_i$ are injective. In fact, we will identify M_i with the image of $M_i \rightarrow N_i$, i.e., we will think of M_i as a subset of N_i . We will use the description of the colimits given in Section 4.15 without further mention. Let $s, s' \in \operatorname{colim} M_i$ map to the same element of $\operatorname{colim} N_i$. Say s comes from an element m of M_i and s' comes from an element m' of $M_{i'}$.

Then we can find a sequence $i = i_0, i_1, \dots, i_n = i'$ of objects of \mathcal{I} and morphisms

and elements $n_{i_j} \in N_{i_j}$ mapping to each other under the maps $N_{i_{2k-1}} \rightarrow N_{i_{2k-2}}$ and $N_{i_{2k-1}} \rightarrow N_{i_{2k}}$ induced from the maps in \mathcal{I} above with $n_{i_0} = m$ and $n_{i_{2n}} = m'$. We will prove by induction on n that this implies $s = s'$. The base case $n = 0$ is trivial. Assume $n \geq 1$. Using the assumption on \mathcal{I} we find a commutative diagram

We conclude that m and n_{i_2} map to the same element of N_w because both are the image of the element n_{i_1} . In particular, this element is an element $m'' \in M_w$ which gives rise to the same element as s in $\text{colim } M_i$. Then we find the chain

and the elements n_{i_j} for $j \geq 3$ which has a smaller length than the chain we started with. This proves the induction step and the proof of the lemma is complete. \square

Lemma 4.19.7. *Let \mathcal{I} be an index category, i.e., a category. Assume*

- (1) *for every pair of morphisms $a : w \rightarrow x$ and $b : w \rightarrow y$ in \mathcal{I} there exists an object z and morphisms $c : x \rightarrow z$ and $d : y \rightarrow z$ such that $c \circ a = d \circ b$, and*
- (2) *for every pair of morphisms $a, b : x \rightarrow y$ there exists a morphism $c : y \rightarrow z$ such that $c \circ a = c \circ b$.*

Then \mathcal{I} is a (possibly empty) union of disjoint filtered index categories \mathcal{I}_j .

Proof. If \mathcal{I} is the empty category, then the lemma is true. Otherwise, we define a relation on objects of \mathcal{I} by saying that $x \sim y$ if there exists a z and morphisms $x \rightarrow z$ and $y \rightarrow z$. This is an equivalence relation by the first assumption of the lemma. Hence $\text{Ob}(\mathcal{I})$ is a disjoint union of equivalence classes. Let \mathcal{I}_j be the full subcategories corresponding to these equivalence classes. The rest is clear from the definitions. \square

Lemma 4.19.8. *Let \mathcal{I} be an index category satisfying the hypotheses of Lemma 4.19.7 above. Then colimits over \mathcal{I} commute with fibre products and equalizers in sets (and more generally with finite connected limits).*

Proof. By Lemma 4.19.7 we may write $\mathcal{I} = \coprod \mathcal{I}_j$ with each \mathcal{I}_j filtered. By Lemma 4.19.2 we see that colimits of \mathcal{I}_j commute with equalizers and fibred products. Thus it suffices to show that equalizers and fibre products commute with coproducts in the category of sets (including empty coproducts). In other words, given a set J and sets A_j, B_j, C_j and set maps $A_j \rightarrow B_j, C_j \rightarrow B_j$ for $j \in J$ we have to show that

$$\left(\prod_{j \in J} A_j\right) \times_{\left(\prod_{j \in J} B_j\right)} \left(\prod_{j \in J} C_j\right) = \prod_{j \in J} A_j \times_{B_j} C_j$$

and given $a_j, a'_j : A_j \rightarrow B_j$ that

$$\text{Equalizer}\left(\prod_{j \in J} a_j, \prod_{j \in J} a'_j\right) = \prod_{j \in J} \text{Equalizer}(a_j, a'_j)$$

This is true even if $J = \emptyset$. Details omitted. \square

4.20. Cofiltered limits

Limits are easier to compute or describe when they are over a cofiltered diagram. Here is the definition.

Definition 4.20.1. We say that a diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ is *codirected* or *cofiltered* if the following conditions hold:

- (1) the category \mathcal{I} has at least one object,
- (2) for every pair of objects x, y of \mathcal{I} there exists an object z and morphisms $z \rightarrow x, z \rightarrow y$, and
- (3) for every pair of objects x, y of \mathcal{I} and every pair of morphisms $a, b : x \rightarrow y$ of \mathcal{I} there exists a morphism $c : w \rightarrow x$ of \mathcal{I} such that $M(a \circ c) = M(b \circ c)$ as morphisms in \mathcal{C} .

We say that an index category \mathcal{I} is *codirected*, or *cofiltered* if $\text{id} : \mathcal{I} \rightarrow \mathcal{I}$ is cofiltered (in other words you erase the M in part (3) above.)

We observe that any diagram with cofiltered index category is cofiltered, and this is how this situation usually occurs.

As an example of why cofiltered limits of sets are “easier” than general ones, we mention the fact that a cofiltered diagram of finite nonempty sets has nonempty limit (Lemma 4.21.5). This result does not hold for a general limit of finite nonempty sets.

4.21. Limits and colimits over partially ordered sets

A special case of diagrams is given by systems over partially ordered sets.

Definition 4.21.1. Let (I, \geq) be a partially ordered set. Let \mathcal{C} be a category.

- (1) A *system over I in \mathcal{C}* , sometimes called a *inductive system over I in \mathcal{C}* is given by objects M_i of \mathcal{C} and for every $i \leq i'$ a morphism $f_{ii'} : M_i \rightarrow M_{i'}$ such that $f_{ii} = \text{id}$ and such that $f_{ii''} = f_{i'i''} \circ f_{ii'}$ whenever $i \leq i' \leq i''$.
- (2) An *inverse system over I in \mathcal{C}* , sometimes called a *projective system over I in \mathcal{C}* is given by objects M_i of \mathcal{C} and for every $i \geq i'$ a morphism $f_{ii'} : M_i \rightarrow M_{i'}$ such that $f_{ii} = \text{id}$ and such that $f_{ii''} = f_{i'i''} \circ f_{ii'}$ whenever $i \geq i' \geq i''$. (Note reversal of inequalities.)

We will say $(M_i, f_{ii'})$ is a (inverse) system over I to denote this. The maps $f_{ii'}$ are sometimes called the *transition maps*.

In other words a system over I is just a diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ where \mathcal{I} is the category with objects I and a unique arrow $i \rightarrow i'$ if and only if $i \leq i'$. And an inverse system is a diagram $M : \mathcal{I}^{opp} \rightarrow \mathcal{C}$. From this point of view we could take (co)limits of any (inverse) system over I . However, it is customary to take *only colimits of systems over I* and *only limits of inverse systems over I* . More precisely: Given a system $(M_i, f_{ii'})$ over I the colimit of the system $(M_i, f_{ii'})$ is defined as

$$\operatorname{colim}_{i \in I} M_i = \operatorname{colim}_{\mathcal{I}} M,$$

i.e., as the colimit of the corresponding diagram. Given a inverse system $(M_i, f_{ii'})$ over I the limit of the inverse system $(M_i, f_{ii'})$ is defined as

$$\lim_{i \in I} M_i = \lim_{\mathcal{I}^{opp}} M,$$

i.e., as the limit of the corresponding diagram.

Definition 4.21.2. With notation as above. We say the system (resp. inverse system) $(M_i, f_{ii'})$ is a *directed system* (resp. *directed inverse system*) if the partially ordered set I is *directed*: I is nonempty and for all $i_1, i_2 \in I$ there exists $i \in I$ such that $i_1 \leq i$ and $i_2 \leq i$.

In this case the colimit is sometimes (unfortunately) called the “direct limit”. We will not use this last terminology. It turns out that diagrams over a filtered category are no more general than directed systems in the following sense.

Lemma 4.21.3. *Let \mathcal{I} be a filtered index category. There exists a directed partially ordered set (I, \geq) and a system $(x_i, \varphi_{ii'})$ over I in \mathcal{I} with the following properties:*

- (1) *For every category \mathcal{C} and every diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ with values in \mathcal{C} , denote $(M(x_i), M(\varphi_{ii'}))$ the corresponding system over I . If $\operatorname{colim}_{i \in I} M(x_i)$ exists then so does $\operatorname{colim}_{\mathcal{I}} M$ and the transformation*

$$\theta : \operatorname{colim}_{i \in I} M(x_i) \longrightarrow \operatorname{colim}_{\mathcal{I}} M$$

of Lemma 4.14.7 is an isomorphism.

- (2) *For every category \mathcal{C} and every diagram $M : \mathcal{I}^{opp} \rightarrow \mathcal{C}$ in \mathcal{C} , denote $(M(x_i), M(\varphi_{ii'}))$ the corresponding inverse system over I . If $\lim_{i \in I} M(x_i)$ exists then so does $\lim_{\mathcal{I}} M$ and the transformation*

$$\theta : \lim_{\mathcal{I}^{opp}} M \longrightarrow \lim_{i \in I} M(x_i)$$

of Lemma 4.14.8 is an isomorphism.

Proof. As mentioned in the beginning of the section, we may view partially ordered sets as categories and systems as functors. Throughout the proof, we will freely shift between these two points of view. We prove the first statement by constructing a category \mathcal{I}_0 , corresponding to a directed set, and a cofinal functor $M_0 : \mathcal{I}_0 \rightarrow \mathcal{I}$. Then, by Lemma 4.17.2, the colimit of a diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ coincides with the colimit of the diagram $M \circ M_0|_{\mathcal{I}_0} \rightarrow \mathcal{C}$, from which the statement follows. The second statement is dual to the first and may be proved by interpreting a limit in \mathcal{C} as a colimit in \mathcal{C}^{opp} . We omit the details.

A category \mathcal{F} is called *finitely generated* if there exists a finite set F of arrows in \mathcal{F} , such that each arrow in \mathcal{F} may be obtained by composing arrows from F . In particular, this implies that \mathcal{F} has finitely many objects. We start the proof by reducing to the case when \mathcal{I} has the property that every finitely generated

subcategory of \mathcal{I} may be extended to a finitely generated subcategory with a unique final object.

Let ω denote the directed set of finite ordinals, which we view as a filtered category. It is easy to verify that the product category $\mathcal{I} \times \omega$ is also filtered, and the projection $\Pi : \mathcal{I} \times \omega \rightarrow \mathcal{I}$ is cofinal.

Now let \mathcal{F} be any finitely generated subcategory of $\mathcal{I} \times \omega$. By using the axioms of a filtered category and a simple induction argument on a finite set of generators of \mathcal{F} , we may construct a cocone $(\{f_i\}, i_\infty)$ in \mathcal{I} for the diagram $\mathcal{F} \rightarrow \mathcal{I}$. That is, a morphism $f_i : i \rightarrow i_\infty$ for every object i in \mathcal{F} such that for each arrow $f : i \rightarrow i'$ in \mathcal{F} we have $f_i = f \circ f_{i'}$. We also choose i_∞ such that it is not contained in \mathcal{F} . This is possible since we may always post-compose the arrows f_i with an arrow which is the identity on the \mathcal{I} -component and strictly increasing on the ω -component. Now let \mathcal{F}^+ denote the category consisting of all objects and arrows in \mathcal{F} together with the object i_∞ , the identity arrow id_{i_∞} and the arrows f_i . Since there are no arrows from i_∞ in \mathcal{F}^+ to any object of \mathcal{F} , the arrow set in \mathcal{F}^+ is closed under composition, so \mathcal{F}^+ is indeed a category. By construction, it is a finitely generated subcategory of \mathcal{I} which has i_∞ as unique final object. Since, by Lemma 4.17.2, the colimit of any diagram $M : \mathcal{I} \rightarrow \mathcal{C}$ coincides with the colimit of $M \circ \Pi$, this gives the desired reduction.

The set of all finitely generated subcategories of \mathcal{I} with a unique final object is naturally ordered by inclusion. We take \mathcal{I}_0 to be the category corresponding to this set. We also have a functor $M_0 : \mathcal{I}_0 \rightarrow \mathcal{I}$, which takes an arrow $\mathcal{F} \subset \mathcal{F}'$ in \mathcal{I}_0 to the unique map from the final object of \mathcal{F} to the final object of \mathcal{F}' . Given any two finitely generated subcategories of \mathcal{I} , the category generated by these two categories is also finitely generated. By our assumption on \mathcal{I} , it is also contained in a finitely generated subcategory of \mathcal{I} with a unique final object. This shows that \mathcal{I}_0 is directed.

Finally, we verify that M_0 is cofinal. Since any object of \mathcal{I} is the final object in the subcategory consisting of only that object and its identity arrow, the functor M_0 is surjective on objects. In particular, Condition (1) of Definition 4.17.1 is satisfied. Given an object i of \mathcal{I} , $\mathcal{F}_1, \mathcal{F}_2$ in \mathcal{I}_0 and maps $\varphi_1 : i \rightarrow M_0(\mathcal{F}_1)$ and $\varphi_2 : i \rightarrow M_0(\mathcal{F}_2)$ in \mathcal{I} , we can take \mathcal{F}_{12} to be a finitely generated category with a unique final object containing $\mathcal{F}_1, \mathcal{F}_2$ and the morphisms φ_1, φ_2 . The resulting diagram commutes

$$\begin{array}{ccc}
 & M_0(\mathcal{F}_{12}) & \\
 & \nearrow & \nwarrow \\
 M_0(\mathcal{F}_1) & & M_0(\mathcal{F}_2) \\
 & \nwarrow & \nearrow \\
 & i &
 \end{array}$$

since it lives in the category \mathcal{F}_{12} and $M_0(\mathcal{F}_{12})$ is final in this category. Hence also Condition (2) is satisfied, which concludes the proof. \square

Remark 4.21.4. Note that a finite directed set (I, \geq) always has a greatest object i_∞ . Hence any colimit of a system $(M_i, f_{ii'})$ over such a set is trivial in the sense

that the colimit equals M_{i_∞} . In contrast, a colimit indexed by a finite filtered category need not be trivial. For instance, let \mathcal{I} be the category with a single object i and a single non-trivial morphism e satisfying $e = e \circ e$. The colimit of a diagram $M : \mathcal{I} \rightarrow \mathbf{Sets}$ is the image of the idempotent $M(e)$. This illustrates that something like the trick of passing to $\mathcal{I} \times \omega$ in the proof of Lemma 4.21.3 is essential.

Lemma 4.21.5. *If $S : \mathcal{I} \rightarrow \mathbf{Sets}$ is a cofiltered diagram of sets and all the S_i are finite nonempty, then $\lim_i S_i$ is nonempty. In other words, the limit of a directed inverse system of finite nonempty sets is nonempty.*

Proof. The two statements are equivalent by Lemma 4.21.3. Let I be a directed partially ordered set and let $(S_i)_{i \in I}$ be an inverse system of finite nonempty sets over I . Let us say that a *subsystem* T is a family $T = (T_i)_{i \in I}$ of nonempty subsets $T_i \subset S_i$ such that $T_{i'}$ is mapped into T_i by the transition map $S_{i'} \rightarrow S_i$ for all $i' \geq i$. Denote \mathcal{T} the set of subsystems. We order \mathcal{T} by inclusion. Suppose T_α , $\alpha \in A$ is a totally ordered family of elements of \mathcal{T} . Say $T_\alpha = (T_{\alpha,i})_{i \in I}$. Then we can find a lower bound $T = (T_i)_{i \in I}$ by setting $T_i = \bigcap_{\alpha \in A} T_{\alpha,i}$ which is manifestly a finite nonempty subset of S_i as all the $T_{\alpha,i}$ are nonempty and as the T_α form a totally ordered family. Thus we may apply Zorn's lemma to see that \mathcal{T} has minimal elements.

Let's analyze what a minimal element $T \in \mathcal{T}$ looks like. First observe that the maps $T_{i'} \rightarrow T_i$ are all surjective. Namely, as I is a directed partially ordered set and T_i is finite, the intersection $T'_i = \bigcap_{i' \geq i} \text{Im}(T_{i'} \rightarrow T_i)$ is nonempty. Thus $T' = (T'_i)$ is a subsystem contained in T and by minimality $T' = T$. Finally, we claim that T_i is a singleton for each i . Namely, if $x \in T_i$, then we can define $T'_{i'} = (T_{i'} \rightarrow T_i)^{-1}(\{x\})$ for $i' \geq i$ and $T'_j = T_j$ if $j \not\geq i$. This is another subsystem as we've seen above that the transition maps of the subsystem T are surjective. By minimality we see that $T = T'$ which indeed implies that T_i is a singleton. This holds for every $i \in I$, hence we see that $T_i = \{x_i\}$ for some $x_i \in S_i$ with $x_{i'} \mapsto x_i$ under the map $S_{i'} \rightarrow S_i$ for every $i' \geq i$. In other words, $(x_i) \in \lim S_i$ and the lemma is proved. \square

4.22. Essentially constant systems

Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram in a category \mathcal{C} . Assume the index category \mathcal{I} is filtered. In this case there are three successively stronger notions which pick out an object X of \mathcal{C} . The first is just

$$X = \text{colim}_{i \in \mathcal{I}} M_i.$$

Then X comes equipped with the coprojections $M_i \rightarrow X$. A stronger condition would be to require that X is the colimit and that there exists an $i \in \mathcal{I}$ and a morphism $X \rightarrow M_i$ such that the composition $X \rightarrow M_i \rightarrow X$ is id_X . A stronger condition is the following.

Definition 4.22.1. Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram in a category \mathcal{C} .

- (1) Assume the index category \mathcal{I} is filtered. We say M is *essentially constant* with *value* X if $X = \text{colim}_i M_i$ and there exists an $i \in \mathcal{I}$ and a morphism $X \rightarrow M_i$ such that
 - (a) $X \rightarrow M_i \rightarrow X$ is id_X , and
 - (b) for all j there exist k and morphisms $i \rightarrow k$ and $j \rightarrow k$ such that the morphism $M_j \rightarrow M_k$ equals the composition $M_j \rightarrow X \rightarrow M_i \rightarrow M_k$.

- (2) Assume the index category \mathcal{I} is cofiltered. We say M is *essentially constant* with *value* X if $X = \lim_i M_i$ and there exists an $i \in \mathcal{I}$ and a morphism $M_i \rightarrow X$ such that
- (a) $X \rightarrow M_i \rightarrow X$ is id_X , and
 - (b) for all j there exist k and morphisms $k \rightarrow i$ and $k \rightarrow j$ such that the morphism $M_k \rightarrow M_j$ equals the composition $M_k \rightarrow M_i \rightarrow X \rightarrow M_j$.

Which of the two versions is meant will be clear from context. If there is any confusion we will distinguish between these by saying that the first version means M is essentially constant as an *ind-object*, and in the second case we will say it is essentially constant as a *pro-object*. This terminology is further explained in Remarks 4.22.3 and 4.22.4. In fact we will often use the terminology “essentially constant system” which formally speaking is only defined for systems over directed partially ordered sets.

Definition 4.22.2. Let \mathcal{C} be a category. A directed system $(M_i, f_{ii'})$ is an *essentially constant system* if M viewed as a functor $I \rightarrow \mathcal{C}$ defines an essentially constant diagram. A directed inverse system $(M_i, f_{ii'})$ is an *essentially constant inverse system* if M viewed as a functor $I^{opp} \rightarrow \mathcal{C}$ defines an essentially constant inverse diagram.

If $(M_i, f_{ii'})$ is an essentially constant system and the morphisms $f_{ii'}$ are monomorphisms, then for all $i \leq i'$ sufficiently large the morphisms $f_{ii'}$ are isomorphisms. In general this need not be the case however. An example is the system

$$\mathbf{Z}^2 \rightarrow \mathbf{Z}^2 \rightarrow \mathbf{Z}^2 \rightarrow \dots$$

with maps given by $(a, b) \mapsto (a + b, 0)$. This system is essentially constant with value \mathbf{Z} . A non-example is to let $M = \bigoplus_{n \geq 0} \mathbf{Z}$ and to let $S : M \rightarrow M$ be the shift operator $(a_0, a_1, \dots) \mapsto (a_1, a_2, \dots)$. In this case the system $M \rightarrow M \rightarrow M \rightarrow \dots$ with transition maps S has colimit 0, and a map $0 \rightarrow M$ but the system is not essentially constant.

Remark 4.22.3. Let \mathcal{C} be a category. There exists a big category $\text{Ind-}\mathcal{C}$ of *ind-objects* of \mathcal{C} . Namely, if $F : \mathcal{I} \rightarrow \mathcal{C}$ and $G : \mathcal{J} \rightarrow \mathcal{C}$ are filtered diagrams in \mathcal{C} , then we can define

$$\text{Mor}_{\text{Ind-}\mathcal{C}}(F, G) = \lim_i \text{colim}_j \text{Mor}_{\mathcal{C}}(F(i), G(j)).$$

There is a canonical functor $\mathcal{C} \rightarrow \text{Ind-}\mathcal{C}$ which maps X to the *constant system* on X . This is a fully faithful embedding. In this language one sees that a diagram F is essentially constant if and only F is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

Remark 4.22.4. Let \mathcal{C} be a category. There exists a big category $\text{Pro-}\mathcal{C}$ of *pro-objects* of \mathcal{C} . Namely, if $F : \mathcal{I} \rightarrow \mathcal{C}$ and $G : \mathcal{J} \rightarrow \mathcal{C}$ are cofiltered diagrams in \mathcal{C} , then we can define

$$\text{Mor}_{\text{Pro-}\mathcal{C}}(F, G) = \lim_j \text{colim}_i \text{Mor}_{\mathcal{C}}(F(i), G(j)).$$

There is a canonical functor $\mathcal{C} \rightarrow \text{Pro-}\mathcal{C}$ which maps X to the *constant system* on X . This is a fully faithful embedding. In this language one sees that a diagram F is essentially constant if and only F is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

Lemma 4.22.5. *Let \mathcal{C} be a category. Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with filtered (resp. cofiltered) index category \mathcal{I} . Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. If M is essentially constant as an ind-object (resp. pro-object), then so is $F \circ M : \mathcal{I} \rightarrow \mathcal{D}$.*

Proof. If X is a value for M , then it follows immediately from the definition that $F(X)$ is a value for $F \circ M$. \square

Lemma 4.22.6. *Let \mathcal{C} be a category. Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with filtered index category \mathcal{I} . The following are equivalent*

- (1) M is an essentially constant ind-object, and
- (2) $X = \operatorname{colim}_i M_i$ exists and for any W in \mathcal{C} the map

$$\operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(W, M_i) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X)$$

is bijective.

Proof. Assume (2) holds. Then $\operatorname{id}_X \in \operatorname{Mor}_{\mathcal{C}}(X, X)$ comes from a morphism $X \rightarrow M_i$ for some i , i.e., $X \rightarrow M_i \rightarrow X$ is the identity. Then both maps

$$\operatorname{Mor}_{\mathcal{C}}(W, X) \longrightarrow \operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(W, M_i) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X)$$

are bijective for all W where the first one is induced by the morphism $X \rightarrow M_i$ we found above, and the composition is the identity. This means that the composition

$$\operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(W, M_i) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X) \longrightarrow \operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(W, M_i)$$

is the identity too. Setting $W = M_j$ and starting with id_{M_j} in the colimit, we see that $M_j \rightarrow X \rightarrow M_i \rightarrow M_k$ is equal to $M_j \rightarrow M_k$ for some k large enough. This proves (1) holds. The proof of (1) \Rightarrow (2) is omitted. \square

Lemma 4.22.7. *Let \mathcal{C} be a category. Let $M : \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with cofiltered index category \mathcal{I} . The following are equivalent*

- (1) M is an essentially constant pro-object, and
- (2) $X = \lim_i M_i$ exists and for any W in \mathcal{C} the map

$$\operatorname{colim}_{i \in \mathcal{I}^{\text{opp}}} \operatorname{Mor}_{\mathcal{C}}(M_i, W) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W)$$

is bijective.

Proof. Assume (2) holds. Then $\operatorname{id}_X \in \operatorname{Mor}_{\mathcal{C}}(X, X)$ comes from a morphism $M_i \rightarrow X$ for some i , i.e., $X \rightarrow M_i \rightarrow X$ is the identity. Then both maps

$$\operatorname{Mor}_{\mathcal{C}}(X, W) \longrightarrow \operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(M_i, W) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W)$$

are bijective for all W where the first one is induced by the morphism $M_i \rightarrow X$ we found above, and the composition is the identity. This means that the composition

$$\operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(M_i, W) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W) \longrightarrow \operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(M_i, W)$$

is the identity too. Setting $W = M_j$ and starting with id_{M_j} in the colimit, we see that $M_k \rightarrow M_i \rightarrow X \rightarrow M_j$ is equal to $M_k \rightarrow M_j$ for some k large enough. This proves (1) holds. The proof of (1) \Rightarrow (2) is omitted. \square

Lemma 4.22.8. *Let \mathcal{C} be a category. Let $H : \mathcal{I} \rightarrow \mathcal{J}$ be a functor of filtered index categories. If H is cofinal, then any diagram $M : \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ H$ is essentially constant.*

Proof. This follows formally from Lemmas 4.22.6 and 4.17.2. \square

Lemma 4.22.9. *Let \mathcal{I} and \mathcal{J} be filtered categories and denote $p : \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{J}$ the projection. Then $\mathcal{I} \times \mathcal{J}$ is filtered and a diagram $M : \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ p : \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant.*

Proof. We omit the verification that $\mathcal{I} \times \mathcal{J}$ is filtered. The equivalence follows from Lemma 4.22.8 because p is cofinal (verification omitted). \square

Lemma 4.22.10. *Let \mathcal{C} be a category. Let $H : \mathcal{I} \rightarrow \mathcal{J}$ be a functor of cofiltered index categories. If H is initial, then any diagram $M : \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ H$ is essentially constant.*

Proof. This follows formally from Lemmas 4.22.7, 4.17.4, 4.17.2, and the fact that if \mathcal{I} is initial in \mathcal{J} , then \mathcal{I}^{opp} is cofinal in \mathcal{J}^{opp} . \square

4.23. Exact functors

Definition 4.23.1. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a functor.

- (1) Suppose all finite limits exist in \mathcal{A} . We say F is *left exact* if it commutes with all finite limits.
- (2) Suppose all finite colimits exist in \mathcal{A} . We say F is *right exact* if it commutes with all finite colimits.
- (3) We say F is *exact* if it is both left and right exact.

Lemma 4.23.2. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a functor. Suppose all finite limits exist in \mathcal{A} , see Lemma 4.18.4. The following are equivalent:*

- (1) F is left exact,
- (2) F commutes with finite products and equalizers, and
- (3) F transforms a final object of \mathcal{A} into a final object of \mathcal{B} , and commutes with fibre products.

Proof. Lemma 4.14.10 shows that (2) implies (1). Suppose (3) holds. The fibre product over the final object is the product. If $a, b : A \rightarrow B$ are morphisms of \mathcal{A} , then the equalizer of a, b is

$$(A \times_{a, B, b} A) \times_{(pr_1, pr_2), A \times A, \Delta} A.$$

Thus (3) implies (2). Finally (1) implies (3) because the empty limit is a final object, and fibre products are limits. \square

4.24. Adjoint functors

Definition 4.24.1. Let \mathcal{C}, \mathcal{D} be categories. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ and $v : \mathcal{D} \rightarrow \mathcal{C}$ be functors. We say that u is a *left adjoint* of v , or that v is a *right adjoint* to u if there are bijections

$$\text{Mor}_{\mathcal{D}}(u(X), Y) \longrightarrow \text{Mor}_{\mathcal{C}}(X, v(Y))$$

functorial in $X \in \text{Ob}(\mathcal{C})$, and $Y \in \text{Ob}(\mathcal{D})$.

In other words, this means that there is a *given* isomorphism of functors $\mathcal{C}^{opp} \times \mathcal{D} \rightarrow \text{Sets}$ from $\text{Mor}_{\mathcal{D}}(u(-), -)$ to $\text{Mor}_{\mathcal{C}}(-, v(-))$. For any object X of \mathcal{C} we obtain a morphism $X \rightarrow v(u(X))$ corresponding to $\text{id}_{u(X)}$. Similarly, for any object Y of \mathcal{D} we obtain a morphism $u(v(Y)) \rightarrow Y$ corresponding to $\text{id}_{v(Y)}$. These maps are called the *adjunction maps*. The adjunction maps are functorial in X and Y , hence we obtain morphisms of functors $\text{id}_{\mathcal{C}} \rightarrow v \circ u$ and $u \circ v \rightarrow \text{id}_{\mathcal{D}}$. Moreover, if $\alpha : u(X) \rightarrow Y$ and $\beta : X \rightarrow v(Y)$ are morphisms, then the following are equivalent

- (1) α and β correspond to each other via the bijection of the definition,
- (2) β is the composition $X \rightarrow v(u(X)) \xrightarrow{v(\alpha)} v(Y)$, and
- (3) α is the composition $u(X) \xrightarrow{u(\beta)} u(v(Y)) \rightarrow Y$.

In this way one can reformulate the notion of adjoint functors in terms of adjunction maps.

Lemma 4.24.2. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. If for each $y \in \text{Ob}(\mathcal{D})$ the functor $x \mapsto \text{Mor}_{\mathcal{D}}(u(x), y)$ is representable, then u has a right adjoint.*

Proof. For each y choose an object $v(y)$ and an isomorphism $\text{Mor}_{\mathcal{C}}(-, v(y)) \rightarrow \text{Mor}_{\mathcal{D}}(u(-), y)$ of functors. By Yoneda's lemma (Lemma 4.3.5) for any morphism $g : y \rightarrow y'$ the transformation of functors

$$\text{Mor}_{\mathcal{C}}(-, v(y)) \rightarrow \text{Mor}_{\mathcal{D}}(u(-), y) \rightarrow \text{Mor}_{\mathcal{D}}(u(-), y') \rightarrow \text{Mor}_{\mathcal{C}}(-, v(y'))$$

corresponds to a unique morphism $v(g) : v(y) \rightarrow v(y')$. We omit the verification that v is a functor and that it is right adjoint to u . \square

Lemma 4.24.3. *Let u be a left adjoint to v as in Definition 4.24.1. Then*

- (1) u is fully faithful $\Leftrightarrow \text{id} \cong v \circ u$.
- (2) v is fully faithful $\Leftrightarrow u \circ v \cong \text{id}$.

Proof. Assume u is fully faithful. We have to show the adjunction map $X \rightarrow v(u(X))$ is an isomorphism. Let $X' \rightarrow v(u(X))$ be any morphism. By adjointness this corresponds to a morphism $u(X') \rightarrow u(X)$. By fully faithfulness of u this corresponds to a morphism $X' \rightarrow X$. Thus we see that $X \rightarrow v(u(X))$ defines a bijection $\text{Mor}(X', X) \rightarrow \text{Mor}(X', v(u(X)))$. Hence it is an isomorphism. Conversely, if $\text{id} \cong v \circ u$ then u has to be fully faithful, as v defines an inverse on morphism sets.

Part (2) is dual to part (1). \square

Lemma 4.24.4. *Let u be a left adjoint to v as in Definition 4.24.1.*

- (1) *Suppose that $M : \mathcal{I} \rightarrow \mathcal{C}$ is a diagram, and suppose that $\text{colim}_{\mathcal{I}} M$ exists in \mathcal{C} . Then $u(\text{colim}_{\mathcal{I}} M) = \text{colim}_{\mathcal{I}} u \circ M$. In other words, u commutes with (representable) colimits.*
- (2) *Suppose that $M : \mathcal{I} \rightarrow \mathcal{D}$ is a diagram, and suppose that $\lim_{\mathcal{I}} M$ exists in \mathcal{D} . Then $v(\lim_{\mathcal{I}} M) = \lim_{\mathcal{I}} v \circ M$. In other words v commutes with representable limits.*

Proof. A morphism from a colimit into an object is the same as a compatible system of morphisms from the constituents of the limit into the object, see Remark 4.14.4. So

$$\begin{aligned} \text{Mor}_{\mathcal{D}}(u(\text{colim}_{i \in \mathcal{I}} M_i), Y) &= \text{Mor}_{\mathcal{C}}(\text{colim}_{i \in \mathcal{I}} M_i, v(Y)) \\ &= \lim_{i \in \mathcal{I}^{opp}} \text{Mor}_{\mathcal{C}}(M_i, v(Y)) \\ &= \lim_{i \in \mathcal{I}^{opp}} \text{Mor}_{\mathcal{D}}(u(M_i), Y) \end{aligned}$$

proves that $u(\text{colim}_{i \in \mathcal{I}} M_i)$ is the colimit we are looking for. A similar argument works for the other statement. \square

Lemma 4.24.5. *Let u be a left adjoint of v as in Definition 4.24.1.*

- (1) *If \mathcal{C} has finite colimits, then u is right exact.*

(2) If \mathcal{D} has finite limits, then v is left exact.

Proof. Obvious from the definitions and Lemma 4.24.4. \square

4.25. Localization in categories

The basic idea of this section is given a category \mathcal{C} and a set of arrows S to construct a functor $F : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ such that all elements of S become invertible in $S^{-1}\mathcal{C}$ and such that F is universal among all functors with this property. References for this section are [GZ67, Chapter I, Section 2] and [Ver96, Chapter II, Section 2].

Definition 4.25.1. Let \mathcal{C} be a category. A set of arrows S of \mathcal{C} is called a *left multiplicative system* if it has the following properties:

LMS1 The identity of every object of \mathcal{C} is in S and the composition of two composable elements of S is in S .

LMS2 Every solid diagram

$$\begin{array}{ccc} X & \xrightarrow{g} & Y \\ t \downarrow & & \downarrow s \\ Z & \xrightarrow{f} & W \end{array}$$

with $t \in S$ can be completed to a commutative dotted square with $s \in S$.

LMS3 For every pair of morphisms $f, g : X \rightarrow Y$ and $t \in S$ with target X such that $f \circ t = g \circ t$ there exists a $s \in S$ with source Y such that $s \circ f = s \circ g$.

A set of arrows S of \mathcal{C} is called a *right multiplicative system* if it has the following properties:

RMS1 The identity of every object of \mathcal{C} is in S and the composition of two composable elements of S is in S .

RMS2 Every solid diagram

$$\begin{array}{ccc} X & \xrightarrow{g} & Y \\ t \downarrow & & \downarrow s \\ Z & \xrightarrow{f} & W \end{array}$$

with $s \in S$ can be completed to a commutative dotted square with $t \in S$.

RMS3 For every pair of morphisms $f, g : X \rightarrow Y$ and $s \in S$ with source Y such that $s \circ f = s \circ g$ there exists a $t \in S$ with target X such that $f \circ t = g \circ t$.

A set of arrows S of \mathcal{C} is called a *multiplicative system* if it is both a left multiplicative system and a right multiplicative system. In other words, this means that MS1, MS2, MS3 hold, where MS1 = LMS1 + RMS1, MS2 = LMS2 + RMS2, and MS3 = LMS3 + RMS3.

These conditions are useful to construct the categories $S^{-1}\mathcal{C}$ as follows.

Left calculus of fractions. Let \mathcal{C} be a category and let S be a left multiplicative system. We define a new category $S^{-1}\mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.25.2):

- (1) We set $\text{Ob}(S^{-1}\mathcal{C}) = \text{Ob}(\mathcal{C})$.
- (2) Morphisms $X \rightarrow Y$ of $S^{-1}\mathcal{C}$ are given by pairs $(f : X \rightarrow Y', s : Y' \rightarrow Y)$ with $s \in S$ up to equivalence. (Think of this as $s^{-1}f : X \rightarrow Y$.)

- (3) Two pairs $(f_1 : X \rightarrow Y_1, s_1 : Y \rightarrow Y_1)$ and $(f_2 : X \rightarrow Y_2, s_2 : Y \rightarrow Y_2)$ are said to be equivalent if there exists a third pair $(f_3 : X \rightarrow Y_3, s_3 : Y \rightarrow Y_3)$ and morphisms $u : Y_1 \rightarrow Y_3$ and $v : Y_2 \rightarrow Y_3$ of \mathcal{C} fitting into the commutative diagram

$$\begin{array}{ccccc}
 & & Y_1 & & \\
 & f_1 \nearrow & \downarrow u & \nwarrow s_1 & \\
 X & \xrightarrow{f_3} & Y_3 & \xleftarrow{s_3} & Y \\
 & f_2 \searrow & \uparrow v & \swarrow s_2 & \\
 & & Y_2 & &
 \end{array}$$

- (4) The composition of the equivalence classes of the pairs $(f : X \rightarrow Y', s : Y \rightarrow Y')$ and $(g : Y \rightarrow Z', t : Z \rightarrow Z')$ is defined as the equivalence class of a pair $(h \circ f : X \rightarrow Z'', u \circ t : Z \rightarrow Z'')$ where h and $u \in S$ are chosen to fit into a commutative diagram

$$\begin{array}{ccc}
 Y & \xrightarrow{g} & Z' \\
 s \downarrow & & \downarrow u \\
 Y' & \xrightarrow{h} & Z''
 \end{array}$$

which exists by assumption.

Lemma 4.25.2. *Let \mathcal{C} be a category and let S be a left multiplicative system.*

- (1) *The relation on pairs defined above is an equivalence relation.*
- (2) *The composition rule given above is well defined on equivalence classes.*
- (3) *Composition is associative and hence $S^{-1}\mathcal{C}$ is a category.*

Proof. Proof of (1). Let us say two pairs $p_1 = (f_1 : X \rightarrow Y_1, s_1 : Y \rightarrow Y_1)$ and $p_2 = (f_2 : X \rightarrow Y_2, s_2 : Y \rightarrow Y_2)$ are elementary equivalent if there exists a morphism $a : Y_1 \rightarrow Y_2$ of \mathcal{C} such that $a \circ f_1 = f_2$ and $a \circ s_1 = s_2$. Diagram:

$$\begin{array}{ccccc}
 X & \xrightarrow{f_1} & Y_1 & \xleftarrow{s_1} & Y \\
 \parallel & & \downarrow a & & \parallel \\
 X & \xrightarrow{f_2} & Y_2 & \xleftarrow{s_2} & Y
 \end{array}$$

Let us denote this property by saying $p_1 E p_2$. Note that $p E p$ and $a E b, b E c \Rightarrow a E c$. Part (1) claims that the relation $p \sim p' \Leftrightarrow \exists q : p E q \wedge p' E q$ is an equivalence relation. A simple formal argument, using the properties of E above shows that it suffices to prove $p_3 E p_1, p_3 E p_2 \Rightarrow p_1 \sim p_2$. Thus suppose that we are given a commutative diagram

$$\begin{array}{ccccc}
 & & Y_1 & & \\
 & f_1 \nearrow & \uparrow a_{31} & \nwarrow s_1 & \\
 X & \xrightarrow{f_3} & Y_3 & \xleftarrow{s_3} & Y \\
 & f_2 \searrow & \downarrow a_{32} & \swarrow s_2 & \\
 & & Y_2 & &
 \end{array}$$

with $s_i \in S$. First we apply LMS2 to get a commutative diagram

$$\begin{array}{ccc} Y & \xrightarrow{\quad} & Y_3 \\ s_1 \downarrow & & \downarrow s_{34} \\ Y_1 & \xrightarrow{a_{14}} & Y_4 \end{array}$$

with $s_{34} \in S$. Then we have $s_{34} \circ s_3 = a_{14} \circ a_{31} \circ s_3$. Hence by LMS3 there exists a morphism $s_{44} : Y_4 \rightarrow Y'_4$, $s_{44} \in S$ such that $s_{44} \circ s_{34} = s_{44} \circ a_{14} \circ a_{31}$. Hence after replacing Y_4 by Y'_4 , a_{14} by $s_{44} \circ a_{14}$, and s_{34} by $s_{44} \circ s_{34}$ we may assume that $s_{34} = a_{14} \circ a_{31}$. Next, we apply LMS2 to get a commutative diagram

$$\begin{array}{ccc} Y_3 & \xrightarrow{\quad} & Y_4 \\ a_{32} \downarrow & & \downarrow s_{45} \\ Y_2 & \xrightarrow{a_{25}} & Y_5 \end{array}$$

with $s_{45} \in S$. Thus we obtain a pair $p_5 = (s_{45} \circ s_{34} \circ f_3 : X \rightarrow Y_5, s_{45} \circ s_{34} \circ s_3 : Y \rightarrow Y_5)$ and the morphisms $s_{45} \circ a_{14} : Y_1 \rightarrow Y_5$ and $a_{25} : Y_2 \rightarrow Y_5$ show that indeed $p_1 E p_5$ and $p_2 E p_5$ as desired.

Proof of (2). Let $p = (f : X \rightarrow Y', s : Y \rightarrow Y')$ and $q = (g : Y \rightarrow Z', t : Z \rightarrow Z')$ be pairs as in the definition of composition above. To compose we have to choose a diagram

$$\begin{array}{ccc} Y & \xrightarrow{\quad g \quad} & Z' \\ s \downarrow & & \downarrow u_2 \\ Y' & \xrightarrow{\quad h_2 \quad} & Z_2 \end{array}$$

We first show that the equivalence class of the pair $r_2 = (h_2 \circ f : X \rightarrow Z_2, u_2 \circ t : Z \rightarrow Z_2)$ is independent of the choice of (Z_2, h_2, u_2) . Namely, suppose that (Z_3, h_3, u_3) is another choice with corresponding composition $r_3 = (h_3 \circ f : X \rightarrow Z_3, u_3 \circ t : Z \rightarrow Z_3)$. Then by LMS2 we can choose a diagram

$$\begin{array}{ccc} Z' & \xrightarrow{\quad} & Z_3 \\ u_2 \downarrow & & \downarrow u_{34} \\ Z_2 & \xrightarrow{h_{24}} & Z_4 \end{array}$$

with $u_{34} \in S$. Hence we obtain a pair $r_4 = (h_{24} \circ h_2 \circ f : X \rightarrow Z_4, u_{34} \circ u_3 \circ t : Z \rightarrow Z_4)$ and the morphisms $h_{24} : Z_2 \rightarrow Z_4$ and $u_{34} : Z_3 \rightarrow Z_4$ show that we have $r_2 E r_4$ and $r_3 E r_4$ as desired. Thus it now makes sense to define $p \circ q$ as the equivalence class of all possible pairs r obtained as above.

To finish the proof of (2) we have to show that given pairs p_1, p_2, q such that $p_1 E p_2$ then $p_1 \circ q = p_2 \circ q$ and $q \circ p_1 = q \circ p_2$ whenever the compositions make sense. To do this, write $p_1 = (f_1 : X \rightarrow Y_1, s_1 : Y \rightarrow Y_1)$ and $p_2 = (f_2 : X \rightarrow Y_2, s_2 : Y \rightarrow Y_2)$ and let $a : Y_1 \rightarrow Y_2$ be a morphism of \mathcal{C} such that $f_2 = a \circ f_1$ and $s_2 = a \circ s_1$. First assume that $q = (g : Y \rightarrow Z', t : Z \rightarrow Z')$. In this case choose a commutative

diagram as the one on the left

$$\begin{array}{ccc} Y & \xrightarrow{g} & Z' \\ s_2 \downarrow & & \downarrow u \\ Y_2 & \xrightarrow{h} & Z'' \end{array} \Rightarrow \begin{array}{ccc} Y & \xrightarrow{g} & Z' \\ s_1 \downarrow & & \downarrow u \\ Y_1 & \xrightarrow{h \circ a} & Z'' \end{array}$$

which implies the diagram on the right is commutative as well. Using these diagrams we see that both compositions are the equivalence class of $(h \circ a \circ f_1 : X \rightarrow Z'', u \circ t : Z \rightarrow Z'')$. Thus $p_1 \circ q = p_2 \circ q$. The proof of the other case, in which we have to show $q \circ p_1 = q \circ p_2$, is omitted.

Proof of (3). We have to prove associativity of composition. Consider a solid diagram

$$\begin{array}{ccccc} & & & & Z \\ & & & & \downarrow \\ & & & & Y \longrightarrow Z' \\ & & & & \downarrow \\ & & & & \dots \downarrow \\ X & \longrightarrow & Y' & \dots \longrightarrow & Z'' \\ \downarrow & & \downarrow & & \downarrow \\ W & \longrightarrow & X' & \dots \longrightarrow & Y'' & \dots \longrightarrow & Z''' \\ & & \downarrow & & \downarrow & & \downarrow \end{array}$$

which gives rise to three composable pairs. Using LMS2 we can choose the dotted arrows making the squares commutative and such that the vertical arrows are in S . Then it is clear that the composition of the three pairs is the equivalence class of the pair $(W \rightarrow Z''', Z \rightarrow Z''')$ gotten by composing the horizontal arrows on the bottom row and the vertical arrows on the right column. \square

We can “write any finite collection of morphisms with the same target as fractions with common denominator”.

Lemma 4.25.3. *Let \mathcal{C} be a category and let S be a left multiplicative system of morphisms of \mathcal{C} . Given any finite collection $g_i : X_i \rightarrow Y$ of morphisms of $S^{-1}\mathcal{C}$ we can find an element $s : Y \rightarrow Y'$ of S and $f_i : X_i \rightarrow Y'$ such that g_i is the equivalence class of the pair $(f_i : X_i \rightarrow Y', s : Y \rightarrow Y')$.*

Proof. For each i choose a representative $(X_i \rightarrow Y_i, s_i : Y \rightarrow Y_i)$. The lemma follows if we can find a morphism $s : Y \rightarrow Y'$ in S such that for each i there is a morphism $a_i : Y_i \rightarrow Y'$ with $a_i \circ s_i = s$. If we have two indices $i = 1, 2$, then we can do this by completing the square

$$\begin{array}{ccc} Y & \xrightarrow{s_2} & Y_2 \\ s_1 \downarrow & & \downarrow t_2 \\ Y_1 & \xrightarrow{a_1} & Y' \end{array}$$

with $t_2 \in S$ as is possible by Definition 4.25.1. Then $s = t_2 \circ s_2 \in S$ works. If we have $n > 2$ morphisms, then we use the above trick to reduce to the case of $n - 1$ morphisms, and we win by induction. \square

There is an easy characterization of equality of morphisms if they have the same denominator.

Lemma 4.25.4. *Let \mathcal{C} be a category and let S be a left multiplicative system of morphisms of \mathcal{C} . Let $A, B : X \rightarrow Y$ be morphisms of $S^{-1}\mathcal{C}$ which are the equivalence classes of $(f : X \rightarrow Y', s : Y \rightarrow Y')$ and $(g : X \rightarrow Y', s : Y \rightarrow Y')$. Then $A = B$ if and only if there exists a morphism $a : Y' \rightarrow Y''$ with $a \circ s \in S$ and such that $a \circ f = a \circ g$.*

Proof. The equality of A and B means that there exists a commutative diagram

with $t \in S$. In particular $u \circ s = v \circ s$. Hence by LMS3 there exists a $s' : Z \rightarrow Y''$ in S such that $s' \circ u = s' \circ v$. Setting a equal to this common value does the job. \square

Remark 4.25.5. Let \mathcal{C} be a category. Let S be a left multiplicative system. Given an object Y of \mathcal{C} we denote Y/S the category whose objects are $s : Y \rightarrow Y'$ with $s \in S$ and whose morphisms are commutative diagrams

where $a : Y' \rightarrow Y''$ is arbitrary. We claim that the category Y/S is filtered (see Definition 4.19.1). Namely, LMS1 implies that $\text{id}_Y : Y \rightarrow Y$ is in Y/S hence Y/S is nonempty. LMS2 implies that given $s_1 : Y \rightarrow Y_1$ and $s_2 : Y \rightarrow Y_2$ we can find a diagram

with $t \in S$. Hence $s_1 : Y \rightarrow Y_1$ and $s_2 : Y \rightarrow Y_2$ both map to $t \circ s_2 : Y \rightarrow Y_3$ in Y/S . Finally, given two morphisms a, b from $s_1 : Y \rightarrow Y_1$ to $s_2 : Y \rightarrow Y_2$ in Y/S we see that $a \circ s_1 = b \circ s_1$ hence by LMS3 there exists a $t : Y_2 \rightarrow Y_3$ such that $t \circ a = t \circ b$. Now the combined results of Lemmas 4.25.3 and 4.25.4 tell us that

$$(4.25.5.1) \quad \text{Mor}_{S^{-1}\mathcal{C}}(X, Y) = \text{colim}_{(s:Y \rightarrow Y') \in Y/S} \text{Mor}_{\mathcal{C}}(X, Y')$$

This formula expressing morphism sets in $S^{-1}\mathcal{C}$ as a filtered colimit of morphism sets in \mathcal{C} is occasionally useful.

Lemma 4.25.6. *Let \mathcal{C} be a category and let S be a left multiplicative system of morphisms of \mathcal{C} .*

- (1) *The rules $X \mapsto X$ and $(f : X \rightarrow Y) \mapsto (f : X \rightarrow Y, \text{id}_Y : Y \rightarrow Y)$ define a functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$.*

- (2) For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1}\mathcal{C}$.
 (3) If $G : \mathcal{C} \rightarrow \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H : S^{-1}\mathcal{C} \rightarrow \mathcal{D}$ such that $H \circ Q = G$.

Proof. Parts (1) and (2) are clear. To see (3) just set $H(X) = G(X)$ and set $H((f : X \rightarrow Y', s : Y \rightarrow Y')) = G(s)^{-1} \circ G(f)$. Details omitted. \square

Lemma 4.25.7. *Let \mathcal{C} be a category and let S be a left multiplicative system of morphisms of \mathcal{C} . The localization functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ commutes with finite colimits.*

Proof. This is clear from (4.25.5.1), Remark 4.14.4, and Lemma 4.14.9. \square

Lemma 4.25.8. *Let \mathcal{C} be a category. Let S be a left multiplicative system. If $f : X \rightarrow Y$, $f' : X' \rightarrow Y'$ are two morphisms of \mathcal{C} and if*

$$\begin{array}{ccc} Q(X) & \xrightarrow{a} & Q(X') \\ Q(f) \downarrow & & \downarrow Q(f') \\ Q(Y) & \xrightarrow{b} & Q(Y') \end{array}$$

is a commutative diagram in $S^{-1}\mathcal{C}$, then there exists a morphism $f'' : X'' \rightarrow Y''$ in \mathcal{C} and a commutative diagram

$$\begin{array}{ccccc} X & \xrightarrow{g} & X'' & \xleftarrow{s} & X' \\ f \downarrow & & \downarrow f'' & & \downarrow f' \\ Y & \xrightarrow{h} & Y'' & \xleftarrow{t} & Y' \end{array}$$

in \mathcal{C} with $s, t \in S$ and $a = s^{-1}g$, $b = t^{-1}h$.

Proof. We choose maps and objects in the following way: First write $a = s^{-1}g$ for some $s : X' \rightarrow X''$ in S and $g : X \rightarrow X''$. By LMS2 we can find $t : Y' \rightarrow Y''$ in S and $f'' : X'' \rightarrow Y''$ such that

$$\begin{array}{ccccc} X & \xrightarrow{g} & X'' & \xleftarrow{s} & X' \\ f \downarrow & & \downarrow f'' & & \downarrow f' \\ Y & & Y'' & \xleftarrow{t} & Y' \end{array}$$

commutes. Now in this diagram we are going to repeatedly change our choice of

$$X'' \xrightarrow{f''} Y'' \xleftarrow{t} Y'$$

by postcomposing both t and f'' by a morphism $d : Y'' \rightarrow Y'''$ with the property that $d \circ t \in S$. According to Remark 4.25.5 we may after such a replacement assume that there exists a morphism $h : Y \rightarrow Y''$ such that $b = t^{-1}h$. At this point we have everything as in the lemma except that we don't know that the left square of the diagram commutes. However, we do know that $Q(f''g) = Q(hf)$ in $S^{-1}\mathcal{D}$ because the right square commutes, the outer square commutes in $S^{-1}\mathcal{D}$ by assumption, and because $Q(s), Q(t)$ are isomorphisms. Hence using Lemma 4.25.4 we can find a morphism $d : Y'' \rightarrow Y'''$ in S (!) such that $df''g = dhf$. Hence we make one more replacement of the kind described above and we win. \square

Right calculus of fractions. Let \mathcal{C} be a category and let S be a right multiplicative system. We define a new category $S^{-1}\mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.25.9):

- (1) We set $\text{Ob}(S^{-1}\mathcal{C}) = \text{Ob}(\mathcal{C})$.
- (2) Morphisms $X \rightarrow Y$ of $S^{-1}\mathcal{C}$ are given by pairs $(f : X' \rightarrow Y, s : X' \rightarrow X)$ with $s \in S$ up to equivalence. (Think of this as $fs^{-1} : X \rightarrow Y$.)
- (3) Two pairs $(f_1 : X_1 \rightarrow Y, s_1 : X_1 \rightarrow X)$ and $(f_2 : X_2 \rightarrow Y, s_2 : X_2 \rightarrow X)$ are said to be equivalent if there exists a third pair $(f_3 : X_3 \rightarrow Y, s_3 : X_3 \rightarrow X)$ and morphisms $u : X_3 \rightarrow X_1$ and $v : X_3 \rightarrow X_2$ of \mathcal{C} fitting into the commutative diagram

$$\begin{array}{ccccc}
 & & X_1 & & \\
 & s_1 \swarrow & \uparrow u & \searrow f_1 & \\
 X & \xleftarrow{s_3} & X_3 & \xrightarrow{f_3} & Y \\
 & \nwarrow s_2 & \downarrow v & \nearrow f_2 & \\
 & & X_2 & &
 \end{array}$$

- (4) The composition of the equivalence classes of the pairs $(f : X' \rightarrow Y, s : X' \rightarrow X)$ and $(g : Y' \rightarrow Z, t : Y' \rightarrow Y)$ is defined as the equivalence class of a pair $(g \circ h : X'' \rightarrow Z, s \circ u : X'' \rightarrow X)$ where h and $u \in S$ are chosen to fit into a commutative diagram

$$\begin{array}{ccc}
 X'' & \xrightarrow{h} & Y' \\
 u \downarrow & & \downarrow t \\
 X' & \xrightarrow{f} & Y
 \end{array}$$

which exists by assumption.

Lemma 4.25.9. *Let \mathcal{C} be a category and let S be a right multiplicative system.*

- (1) *The relation on pairs defined above is an equivalence relation.*
- (2) *The composition rule given above is well defined on equivalence classes.*
- (3) *Composition is associative and hence $S^{-1}\mathcal{C}$ is a category.*

Proof. This lemma is dual to Lemma 4.25.2. It follows formally from that lemma by replacing \mathcal{C} by its opposite category in which S is a left multiplicative system. \square

We can “write any finite collection of morphisms with the same source as fractions with common denominator”.

Lemma 4.25.10. *Let \mathcal{C} be a category and let S be a right multiplicative system of morphisms of \mathcal{C} . Given any finite collection $g_i : X \rightarrow Y_i$ of morphisms of $S^{-1}\mathcal{C}$ we can find an element $s : X' \rightarrow X$ of S and $f_i : X' \rightarrow Y_i$ such that g_i is the equivalence class of the pair $(f_i : X' \rightarrow Y_i, s : X' \rightarrow X)$.*

Proof. This lemma is the dual of Lemma 4.25.3 and follows formally from that lemma by replacing all categories in sight by their opposites. \square

There is an easy characterization of equality of morphisms if they have the same denominator.

Lemma 4.25.11. *Let \mathcal{C} be a category and let S be a right multiplicative system of morphisms of \mathcal{C} . Let $A, B : X \rightarrow Y$ be morphisms of $S^{-1}\mathcal{C}$ which are the equivalence classes of $(f : X' \rightarrow Y, s : X' \rightarrow X)$ and $(g : X'' \rightarrow Y, t : X'' \rightarrow X)$. Then $A = B$ if and only if there exists a morphism $a : X'' \rightarrow X'$ with $s \circ a \in S$ and such that $f \circ a = g \circ a$.*

Proof. This is dual to Lemma 4.25.4. \square

Remark 4.25.12. Let \mathcal{C} be a category. Let S be a right multiplicative system. Given an object X of \mathcal{C} we denote S/X the category whose objects are $s : X' \rightarrow X$ with $s \in S$ and whose morphisms are commutative diagrams

$$\begin{array}{ccc} X' & \xrightarrow{\quad a \quad} & X'' \\ & \searrow s & \swarrow t \\ & & X \end{array}$$

where $a : X' \rightarrow X''$ is arbitrary. The category S/X is cofiltered (see Definition 4.20.1). (This is dual to the corresponding statement in Remark 4.25.5.) Now the combined results of Lemmas 4.25.10 and 4.25.11 tell us that

$$(4.25.12.1) \quad \text{Mor}_{S^{-1}\mathcal{C}}(X, Y) = \text{colim}_{(s: X' \rightarrow X) \in (S/X)^{\text{opp}}} \text{Mor}_{\mathcal{C}}(X', Y)$$

This formula expressing morphisms in $S^{-1}\mathcal{C}$ as a filtered colimit of morphisms in \mathcal{C} is occasionally useful.

Lemma 4.25.13. *Let \mathcal{C} be a category and let S be a right multiplicative system of morphisms of \mathcal{C} .*

- (1) *The rules $X \mapsto X$ and $(f : X \rightarrow Y) \mapsto (f : X \rightarrow Y, id_X : X \rightarrow X)$ define a functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$.*
- (2) *For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1}\mathcal{C}$.*
- (3) *If $G : \mathcal{C} \rightarrow \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H : S^{-1}\mathcal{C} \rightarrow \mathcal{D}$ such that $H \circ Q = G$.*

Proof. This lemma is the dual of Lemma 4.25.6 and follows formally from that lemma by replacing all categories in sight by their opposites. \square

Lemma 4.25.14. *Let \mathcal{C} be a category and let S be a right multiplicative system of morphisms of \mathcal{C} . The localization functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ commutes with finite limits.*

Proof. This is clear from (4.25.12.1), Remark 4.14.4, and Lemma 4.14.9. \square

Lemma 4.25.15. *Let \mathcal{C} be a category. Let S be a right multiplicative system. If $f : X \rightarrow Y$, $f' : X' \rightarrow Y'$ are two morphisms of \mathcal{C} and if*

$$\begin{array}{ccc} Q(X) & \xrightarrow{\quad a \quad} & Q(X') \\ Q(f) \downarrow & & \downarrow Q(f') \\ Q(Y) & \xrightarrow{\quad b \quad} & Q(Y') \end{array}$$

is a commutative diagram in $S^{-1}\mathcal{C}$, then there exists a morphism $f'' : X'' \rightarrow Y''$ in \mathcal{C} and a commutative diagram

$$\begin{array}{ccccc} X & \xleftarrow{s} & X'' & \xrightarrow{g} & X' \\ f \downarrow & & \downarrow f'' & & \downarrow f' \\ Y & \xleftarrow{t} & Y'' & \xrightarrow{h} & Y' \end{array}$$

in \mathcal{C} with $s, t \in S$ and $a = gs^{-1}$, $b = ht^{-1}$.

Proof. This lemma is dual to Lemma 4.25.8 but we can also prove it directly as follows. We choose maps and objects in the following way: First write $b = ht^{-1}$ for some $t : Y'' \rightarrow Y$ in S and $h : Y'' \rightarrow Y'$. By RMS2 we can find $s : X'' \rightarrow X$ in S and $f'' : X'' \rightarrow Y''$ such that

$$\begin{array}{ccccc} X & \xleftarrow{s} & X'' & & X' \\ f \downarrow & & \downarrow f'' & & \downarrow f' \\ Y & \xleftarrow{t} & Y'' & \xrightarrow{h} & Y' \end{array}$$

commutes. Now in this diagram we are going to repeatedly change our choice of

$$X \xleftarrow{s} X'' \xrightarrow{f''} Y''$$

by precomposing both s and f'' by a morphism $d : X''' \rightarrow X''$ with the property that $s \circ d \in S$. According to Remark 4.25.12 we may after such a replacement assume that there exists a morphism $g : X'' \rightarrow X'$ such that $a = gs^{-1}$. At this point we have everything as in the lemma except that we don't know that the right square of the diagram commutes. However, we do know that $Q(f'g) = Q(hf'')$ in $S^{-1}\mathcal{D}$ because the left square commutes, the outer square commutes in $S^{-1}\mathcal{D}$ by assumption, and because $Q(s), Q(t)$ are isomorphisms. Hence using Lemma 4.25.11 we can find a morphism $d : X''' \rightarrow X''$ in S (!) such that $f'gd = hf''d$. Hence we make one more replacement of the kind described above and we win. \square

Multiplicative systems and two sided calculus of fractions. If S is a multiplicative system then left and right calculus of fractions given canonically isomorphic categories.

Lemma 4.25.16. *Let \mathcal{C} be a category and let S be a multiplicative system. The category of left fractions and the category of right fractions $S^{-1}\mathcal{C}$ are canonically isomorphic.*

Proof. Denote $\mathcal{C}_{left}, \mathcal{C}_{right}$ the two categories of fractions. By the universal properties of Lemmas 4.25.6 and 4.25.13 we obtain functors $\mathcal{C}_{left} \rightarrow \mathcal{C}_{right}$ and $\mathcal{C}_{right} \rightarrow \mathcal{C}_{left}$. By the uniqueness of these functors they are each others inverse. \square

Definition 4.25.17. Let \mathcal{C} be a category and let S be a multiplicative system. We say S is *saturated* if, in addition to MS1, MS2, MS3 we also have

MS4 Given three composable morphisms f, g, h , if $fg, gh \in S$, then $g \in S$.

Note that a saturated multiplicative system contains all isomorphisms. Moreover, if f, g, h are composable morphisms in a category and fg, gh are isomorphisms, then g is an isomorphism (because then g has both a left and a right inverse, hence is invertible).

Lemma 4.25.18. *Let \mathcal{C} be a category and let S be a multiplicative system. Denote $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ the localization functor. The set*

$$\hat{S} = \{f \in \text{Arrows}(\mathcal{C}) \mid Q(f) \text{ is an isomorphism}\}$$

is equal to

$$S' = \{f \in \text{Arrows}(\mathcal{C}) \mid \text{there exist } g, h \text{ such that } gf, fh \in S\}$$

and is the smallest saturated multiplicative system containing S . In particular, if S is saturated, then $\hat{S} = S$.

Proof. It is clear that $S \subset S' \subset \hat{S}$ because elements of S' map to morphisms in $S^{-1}\mathcal{C}$ which have both left and right inverses. Note that S' satisfies MS4, and that \hat{S} satisfies MS1. Next, we prove that $S' = \hat{S}$.

Let $f \in \hat{S}$. Let $s^{-1}g = ht^{-1}$ be the inverse morphism in $S^{-1}\mathcal{C}$. (We may use both left fractions and right fractions to describe morphisms in $S^{-1}\mathcal{C}$, see Lemma 4.25.16.) The relation $\text{id}_X = s^{-1}gf$ in $S^{-1}\mathcal{C}$ means there exists a commutative diagram

$$\begin{array}{ccccc} & & X' & & \\ & gf \nearrow & \downarrow u & \nwarrow s & \\ X & \xrightarrow{f'} & X'' & \xleftarrow{s'} & X \\ & \searrow \text{id}_X & \uparrow v & \swarrow \text{id}_X & \\ & & X & & \end{array}$$

for some morphisms f', u, v and $s' \in S$. Hence $ugf = s' \in S$. Similarly, using that $\text{id}_Y = fht^{-1}$ one proves that $fhv \in S$ for some w . We conclude that $f \in S'$. Thus $S' = \hat{S}$. Provided we prove that $S' = \hat{S}$ is a multiplicative system it is now clear that this implies that $S' = \hat{S}$ is the smallest saturated system containing S .

Our remarks above take care of MS1 and MS4, so to finish the proof of the lemma we have to show that LMS2, RMS2, LMS3, RMS3 hold for \hat{S} . Let us check that LMS2 holds for \hat{S} . Suppose we have a solid diagram

$$\begin{array}{ccc} X & \xrightarrow{g} & Y \\ t \downarrow & & \downarrow s \\ Z & \xrightarrow{f} & W \end{array}$$

with $t \in \hat{S}$. Pick a morphism $a : Z \rightarrow Z'$ such that $at \in S$. Then we can use LMS2 for S to find a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{g} & Y \\ t \downarrow & & \downarrow s \\ Z & & \\ a \downarrow & & \\ Z' & \xrightarrow{f'} & W \end{array}$$

and setting $f = f' \circ a$ we win. The proof of RMS2 is dual to this. Finally, suppose given a pair of morphisms $f, g : X \rightarrow Y$ and $t \in \hat{S}$ with target X such that $ft = gt$.

Then we pick a morphism b such that $tb \in S$. Then $ftb = gtb$ which implies by LMS3 for S that there exists an $s \in S$ with source Y such that $sf = sg$ as desired. The proof of RMS3 is dual to this. \square

4.26. Formal properties

In this section we discuss some formal properties of the 2-category of categories. This will lead us to the definition of a (strict) 2-category later.

Let us denote $\text{Ob}(\text{Cat})$ the class of all categories. For every pair of categories $\mathcal{A}, \mathcal{B} \in \text{Ob}(\text{Cat})$ we have the “small” category of functors $\text{Fun}(\mathcal{A}, \mathcal{B})$. Composition of transformation of functors such as

$$\begin{array}{ccc} \mathcal{A} & \begin{array}{c} \xrightarrow{F''} \\ \Downarrow t' \\ \xrightarrow{F'} \\ \Downarrow t \\ \xrightarrow{F} \end{array} & \mathcal{B} \end{array} \text{ composes to } \begin{array}{ccc} \mathcal{A} & \begin{array}{c} \xrightarrow{F''} \\ \Downarrow tot' \\ \xrightarrow{F} \end{array} & \mathcal{B} \end{array}$$

is called *vertical* composition. We will use the usual symbol \circ for this. Next, we will define *horizontal* composition. In order to do this we explain a bit more of the structure at hand.

Namely for every triple of categories \mathcal{A}, \mathcal{B} , and \mathcal{C} there is a composition law

$$\circ : \text{Ob}(\text{Fun}(\mathcal{B}, \mathcal{C})) \times \text{Ob}(\text{Fun}(\mathcal{A}, \mathcal{B})) \longrightarrow \text{Ob}(\text{Fun}(\mathcal{A}, \mathcal{C}))$$

coming from composition of functors. This composition law is associative, and identity functors act as units. In other words – forgetting about transformations of functors – we see that Cat forms a category. How does this structure interact with the morphisms between functors?

Well, given $t : F \rightarrow F'$ a transformation of functors $F, F' : \mathcal{A} \rightarrow \mathcal{B}$ and a functor $G : \mathcal{B} \rightarrow \mathcal{C}$ we can define a transformation of functors $G \circ F \rightarrow G \circ F'$. We will denote this transformation ${}_G t$. It is given by the formula $({}_G t)_x = G(t_x) : G(F(x)) \rightarrow G(F'(x))$ for all $x \in \mathcal{A}$. In this way composition with G becomes a functor

$$\text{Fun}(\mathcal{A}, \mathcal{B}) \longrightarrow \text{Fun}(\mathcal{A}, \mathcal{C}).$$

To see this you just have to check that ${}_G(\text{id}_F) = \text{id}_{G \circ F}$ and that ${}_G(t_1 \circ t_2) = {}_G t_1 \circ {}_G t_2$. Of course we also have that ${}_{\text{id}_{\mathcal{A}}} t = t$.

Similarly, given $s : G \rightarrow G'$ a transformation of functors $G, G' : \mathcal{B} \rightarrow \mathcal{C}$ and $F : \mathcal{A} \rightarrow \mathcal{B}$ a functor we can define s_F to be the transformation of functors $G \circ F \rightarrow G' \circ F$ given by $(s_F)_x = s_{F(x)} : G(F(x)) \rightarrow G'(F(x))$ for all $x \in \mathcal{A}$. In this way composition with F becomes a functor

$$\text{Fun}(\mathcal{B}, \mathcal{C}) \longrightarrow \text{Fun}(\mathcal{A}, \mathcal{C}).$$

To see this you just have to check that $(\text{id}_G)_F = \text{id}_{G \circ F}$ and that $(s_1 \circ s_2)_F = s_{1,F} \circ s_{2,F}$. Of course we also have that $s_{\text{id}_{\mathcal{B}}} = s$.

These constructions satisfy the additional properties

$${}_{G_1}({}_{G_2}t) = {}_{G_1 \circ G_2}t, \quad (s_{F_1})_{F_2} = s_{F_1 \circ F_2}, \quad \text{and} \quad H(s_F) = (Hs)_F$$

whenever these make sense. Finally, given functors $F, F' : \mathcal{A} \rightarrow \mathcal{B}$, and $G, G' : \mathcal{B} \rightarrow \mathcal{C}$ and transformations $t : F \rightarrow F'$, and $s : G \rightarrow G'$ the following diagram is commutative

$$\begin{array}{ccc} G \circ F & \xrightarrow{Gt} & G \circ F' \\ s_F \downarrow & & \downarrow s_{F'} \\ G' \circ F & \xrightarrow{G't} & G' \circ F' \end{array}$$

in other words $G't \circ s_F = s_{F'} \circ Gt$. To prove this we just consider what happens on any object $x \in \text{Ob}(\mathcal{A})$:

$$\begin{array}{ccc} G(F(x)) & \xrightarrow{G(t_x)} & G(F'(x)) \\ s_{F(x)} \downarrow & & \downarrow s_{F'(x)} \\ G'(F(x)) & \xrightarrow{G'(t_x)} & G'(F'(x)) \end{array}$$

which is commutative because s is a transformation of functors. This compatibility relation allows us to define horizontal composition.

Definition 4.26.1. Given a diagram as in the left hand side of:

$$\begin{array}{ccc} \mathcal{A} & \begin{array}{c} \xrightarrow{F} \\ \Downarrow t \\ \xrightarrow{F'} \end{array} & \mathcal{B} & \begin{array}{c} \xrightarrow{G} \\ \Downarrow s \\ \xrightarrow{G'} \end{array} & \mathcal{C} \end{array} \text{ gives } \mathcal{A} \begin{array}{c} \xrightarrow{G \circ F} \\ \Downarrow s \star t \\ \xrightarrow{G' \circ F'} \end{array} \mathcal{C}$$

we define the *horizontal composition* $s \star t$ to be the transformation of functors $G't \circ s_F = s_{F'} \circ Gt$.

Now we see that we may recover our previously constructed transformations Gt and s_F as $Gt = \text{id}_G \star t$ and $s_F = s \star \text{id}_F$. Furthermore, all of the rules we found above are consequences of the properties stated in the lemma that follows.

Lemma 4.26.2. *The horizontal and vertical compositions have the following properties*

- (1) \circ and \star are associative,
- (2) the identity transformations id_F are units for \circ ,
- (3) the identity transformations of the identity functors $\text{id}_{\text{id}_{\mathcal{A}}}$ are units for \star and \circ , and
- (4) given a diagram

$$\begin{array}{ccc} \mathcal{A} & \begin{array}{c} \xrightarrow{F} \\ \Downarrow t \\ \xrightarrow{F'} \\ \Downarrow t' \\ \xrightarrow{F''} \end{array} & \mathcal{B} & \begin{array}{c} \xrightarrow{G} \\ \Downarrow s \\ \xrightarrow{G'} \\ \Downarrow s' \\ \xrightarrow{G''} \end{array} & \mathcal{C} \end{array}$$

$$\text{we have } (s' \circ s) \star (t' \circ t) = (s' \star t') \circ (s \star t).$$

Proof. The last statement turns using our previous notation into the following equation

$$s'_{F''} \circ G't' \circ s_{F'} \circ Gt = (s' \circ s)_{F''} \circ G(t' \circ t).$$

According to our result above applied to the middle composition we may rewrite the left hand side as $s'_{F''} \circ s_{F''} \circ_G t' \circ_G t$ which is easily shown to be equal to the right hand side. \square

Another way of formulating condition (4) of the lemma is that composition of functors and horizontal composition of transformation of functors gives rise to a functor

$$(\circ, \star) : \text{Fun}(\mathcal{B}, \mathcal{C}) \times \text{Fun}(\mathcal{A}, \mathcal{B}) \longrightarrow \text{Fun}(\mathcal{A}, \mathcal{C})$$

whose source is the product category, see Definition 4.2.20.

4.27. 2-categories

We will give a definition of (strict) 2-categories as they appear in the setting of stacks. Before you read this take a look at Section 4.26 and Example 4.28.2. Basically, you take this example and you write out all the rules satisfied by the objects, 1-morphisms and 2-morphisms in that example.

Definition 4.27.1. A (strict) 2-category \mathcal{C} consists of the following data

- (1) A set of objects $\text{Ob}(\mathcal{C})$.
- (2) For each pair $x, y \in \text{Ob}(\mathcal{C})$ a category $\text{Mor}_{\mathcal{C}}(x, y)$. The objects of $\text{Mor}_{\mathcal{C}}(x, y)$ will be called 1-morphisms and denoted $F : x \rightarrow y$. The morphisms between these 1-morphisms will be called 2-morphisms and denoted $t : F' \rightarrow F$. The composition of 2-morphisms in $\text{Mor}_{\mathcal{C}}(x, y)$ will be called *vertical* composition and will be denoted $t \circ t'$ for $t : F' \rightarrow F$ and $t' : F'' \rightarrow F'$.
- (3) For each triple $x, y, z \in \text{Ob}(\mathcal{C})$ a functor

$$(\circ, \star) : \text{Mor}_{\mathcal{C}}(y, z) \times \text{Mor}_{\mathcal{C}}(x, y) \longrightarrow \text{Mor}_{\mathcal{C}}(x, z).$$

The image of the pair of 1-morphisms (F, G) on the left hand side will be called the *composition* of F and G , and denoted $F \circ G$. The image of the pair of 2-morphisms (t, s) will be called the *horizontal* composition and denoted $t \star s$.

These data are to satisfy the following rules:

- (1) The set of objects together with the set of 1-morphisms endowed with composition of 1-morphisms forms a category.
- (2) Horizontal composition of 2-morphisms is associative.
- (3) The identity 2-morphism id_{id_x} of the identity 1-morphism id_x is a unit for horizontal composition.

This is obviously not a very pleasant type of object to work with. On the other hand, there are lots of examples where it is quite clear how you work with it. The only example we have so far is that of the 2-category whose objects are a given collection of categories, 1-morphisms are functors between these categories, and 2-morphisms are natural transformations of functors, see Section 4.26. As far as this text is concerned all 2-categories will be sub 2-categories of this example. Here is what it means to be a sub 2-category.

Definition 4.27.2. Let \mathcal{C} be a 2-category. A *sub 2-category* \mathcal{C}' of \mathcal{C} , is given by a subset $\text{Ob}(\mathcal{C}')$ of $\text{Ob}(\mathcal{C})$ and sub categories $\text{Mor}_{\mathcal{C}'}(x, y)$ of the categories $\text{Mor}_{\mathcal{C}}(x, y)$ for all $x, y \in \text{Ob}(\mathcal{C}')$ such that these, together with the operations \circ (composition 1-morphisms), \circ (vertical composition 2-morphisms), and \star (horizontal composition) form a 2-category.

Remark 4.27.3. Big 2-categories. In many texts a 2-category is allowed to have a class of objects (but hopefully a “class of classes” is not allowed). We will allow these “big” 2-categories as well, but only in the following list of cases (to be updated as we go along):

- (1) The 2-category of categories *Cat*.
- (2) The $(2, 1)$ -category of categories *Cat*.
- (3) The 2-category of groupoids *Groupoids*.
- (4) The $(2, 1)$ -category of groupoids *Groupoids*.
- (5) The 2-category of fibred categories over a fixed category.
- (6) The $(2, 1)$ -category of fibred categories over a fixed category.

See Definition 4.28.1. Note that in each case the class of objects of the 2-category \mathcal{C} is a proper class, but for all objects $x, y \in \text{Ob}(\mathcal{C})$ the category $\text{Mor}_{\mathcal{C}}(x, y)$ is “small” (according to our conventions).

The notion of equivalence of categories that we defined in Section 4.2 extends to the more general setting of 2-categories as follows.

Definition 4.27.4. Two objects x, y of a 2-category are *equivalent* if there exist 1-morphisms $F : x \rightarrow y$ and $G : y \rightarrow x$ such that $F \circ G$ is 2-isomorphic to id_y and $G \circ F$ is 2-isomorphic to id_x .

Sometimes we need to say what it means to have a functor from a category into a 2-category.

Definition 4.27.5. Let \mathcal{A} be a category and let \mathcal{C} be a 2-category.

- (1) A *functor* from an ordinary category into a 2-category will ignore the 2-morphisms unless mentioned otherwise. In other words, it will be a “usual” functor into the category formed out of 2-category by forgetting all the 2-morphisms.
- (2) A *weak functor*, or a *pseudo functor* φ from \mathcal{A} into the 2-category \mathcal{C} is given by the following data
 - (a) a map $\varphi : \text{Ob}(\mathcal{A}) \rightarrow \text{Ob}(\mathcal{C})$,
 - (b) for every pair $x, y \in \text{Ob}(\mathcal{A})$, and every morphism $f : x \rightarrow y$ a 1-morphism $\varphi(f) : \varphi(x) \rightarrow \varphi(y)$,
 - (c) for every $x \in \text{Ob}(\mathcal{A})$ a 2-morphism $\alpha_x : \text{id}_{\varphi(x)} \rightarrow \varphi(\text{id}_x)$, and
 - (d) for every pair of composable morphisms $f : x \rightarrow y, g : y \rightarrow z$ of \mathcal{A} a 2-morphism $\alpha_{g,f} : \varphi(g \circ f) \rightarrow \varphi(g) \circ \varphi(f)$.

These data are subject to the following conditions:

- (a) the 2-morphisms α_x and $\alpha_{g,f}$ are all isomorphisms,
- (b) for any morphism $f : x \rightarrow y$ in \mathcal{A} we have $\alpha_{\text{id}_y, f} = \alpha_y \star \text{id}_{\varphi(f)}$:

$$\varphi(x) \begin{array}{c} \xrightarrow{\varphi(f)} \\ \Downarrow \text{id}_{\varphi(f)} \\ \xrightarrow{\varphi(f)} \\ \xrightarrow{\varphi(f)} \end{array} \varphi(y) \begin{array}{c} \xrightarrow{\text{id}_y} \\ \Downarrow \alpha_y \\ \xrightarrow{\varphi(\text{id}_y)} \end{array} \varphi(y) = \varphi(x) \begin{array}{c} \xrightarrow{\varphi(f)} \\ \Downarrow \alpha_{\text{id}_y, f} \\ \xrightarrow{\varphi(\text{id}_y) \circ \varphi(f)} \end{array} \varphi(y)$$

- (c) for any morphism $f : x \rightarrow y$ in \mathcal{A} we have $\alpha_{f, \text{id}_x} = \text{id}_{\varphi(f)} \star \alpha_x$,
- (d) for any triple of composable morphisms $f : w \rightarrow x, g : x \rightarrow y$, and $h : y \rightarrow z$ of \mathcal{A} we have

$$(\text{id}_{\varphi(h)} \star \alpha_{g,f}) \circ \alpha_{h,g \circ f} = (\alpha_{h,g} \star \text{id}_{\varphi(f)}) \circ \alpha_{h \circ g, f}$$

in other words the following diagram with objects 1-morphisms and arrows 2-morphisms commutes

$$\begin{array}{ccc}
 \varphi(h \circ g \circ f) & \xrightarrow{\alpha_{h \circ g, f}} & \varphi(h \circ g) \circ \varphi(f) \\
 \alpha_{h, g \circ f} \downarrow & & \downarrow \alpha_{h, g} * \text{id}_{\varphi(f)} \\
 \varphi(h) \circ \varphi(g \circ f) & \xrightarrow{\text{id}_{\varphi(h)} * \alpha_{g, f}} & \varphi(h) \circ \varphi(g) \circ \varphi(f)
 \end{array}$$

Again this is not a very workable notion, but it does sometimes come up. There is a theorem that says that any pseudo-functor is isomorphic to a functor. Finally, there are the notions of *functor between 2-categories*, and *pseudo functor between 2-categories*. This last notion leads us into 3-category territory. We would like to avoid having to define this at almost any cost!

4.28. (2, 1)-categories

Some 2-categories have the property that all 2-morphisms are isomorphisms. These will play an important role in the following, and they are easier to work with.

Definition 4.28.1. A (strict) $(2, 1)$ -category is a 2-category in which all 2-morphisms are isomorphisms.

Example 4.28.2. The 2-category Cat , see Remark 4.27.3, can be turned into a $(2, 1)$ -category by only allowing isomorphisms of functors as 2-morphisms.

In fact, more generally any 2-category \mathcal{C} produces a $(2, 1)$ -category by considering the sub 2-category \mathcal{C}' with the same objects and 1-morphisms but whose 2-morphisms are the invertible 2-morphisms of \mathcal{C} . In this situation we will say “let \mathcal{C}' be the $(2, 1)$ -category associated to \mathcal{C} ” or similar. For example, the $(2, 1)$ -category of groupoids means the 2-category whose objects are groupoids, whose 1-morphisms are functors and whose 2-morphisms are isomorphisms of functors. Except that this is a bad example as a transformation between functors between groupoids is automatically an isomorphism!

Remark 4.28.3. Thus there are variants of the construction of Example 4.28.2 above where we look at the 2-category of groupoids, or categories fibred in groupoids over a fixed category, or stacks. And so on.

4.29. 2-fibre products

In this section we introduce 2-fibre products. Suppose that \mathcal{C} is a 2-category. We say that a diagram

$$\begin{array}{ccc}
 w & \longrightarrow & y \\
 \downarrow & & \downarrow \\
 x & \longrightarrow & z
 \end{array}$$

2-commutes if the two 1-morphisms $w \rightarrow y \rightarrow z$ and $w \rightarrow x \rightarrow z$ are 2-isomorphic. In a 2-category it is more natural to ask for 2-commutativity of diagrams than for actually commuting diagrams. (Indeed, some may say that we should not work with strict 2-categories at all, and in a “weak” 2-category the notion of a commutative diagram of 1-morphisms does not even make sense.) Correspondingly the notion of a fibre product has to be adjusted.

Let \mathcal{C} be a 2-category. Let $x, y, z \in \text{Ob}(\mathcal{C})$ and $f \in \text{Mor}_{\mathcal{C}}(x, z)$ and $g \in \text{Mor}_{\mathcal{C}}(y, z)$. In order to define the 2-fibre product of f and g we are going to look at 2-commutative diagrams

$$\begin{array}{ccc} w & \xrightarrow{a} & x \\ b \downarrow & & \downarrow f \\ y & \xrightarrow{g} & z. \end{array}$$

Now in the case of categories, the fibre product is a final object in the category of such diagrams. Correspondingly a 2-fibre product is a final object in a 2-category (see definition below). The 2-category of 2-commutative diagrams is the 2-category defined as follows:

- (1) Objects are quadruples (w, a, b, ϕ) as above where ϕ is an invertible 2-morphism $\phi : f \circ a \rightarrow g \circ b$,
- (2) 1-morphisms from (w', a', b', ϕ') to (w, a, b, ϕ) are given by $(k : w' \rightarrow w, \alpha : a' \rightarrow a \circ k, \beta : b' \rightarrow b \circ k)$ such that

$$\begin{array}{ccc} f \circ a' & \xrightarrow{\quad} & f \circ a \circ k \\ \phi' \downarrow & \text{id}_f \star \alpha & \downarrow \phi \star \text{id}_k \\ f \circ b' & \xrightarrow{\quad} & f \circ b \circ k \\ & \text{id}_f \star \beta & \end{array}$$

is commutative,

- (3) given a second 1-morphism $(k', \alpha', \beta') : (w'', a'', b'', \phi'') \rightarrow (w', a', b', \phi')$ the composition of 1-morphisms is given by the rule

$$(k, \alpha, \beta) \circ (k', \alpha', \beta') = (k \circ k', (\alpha \star \text{id}_{k'}) \circ \alpha', (\beta \star \text{id}_{k'}) \circ \beta'),$$

- (4) a 2-morphism between 1-morphisms (k_i, α_i, β_i) , $i = 1, 2$ with the same is given by a 2-morphism $\delta : k_1 \rightarrow k_2$ such that

$$\begin{array}{ccc} a' \xrightarrow{\alpha_1} a \circ k_1 & & b \circ k_1 \xleftarrow{\beta_1} b' \\ \searrow \alpha_2 & \downarrow \text{id}_a \star \delta & \downarrow \text{id}_b \star \delta \\ & a \circ k_2 & b \circ k_2 \end{array}$$

commute,

- (5) vertical composition of 2-morphisms is given by vertical composition of the morphisms δ in \mathcal{C} , and
- (6) horizontal composition of the diagram

$$(w'', a'', b'', \phi'') \begin{array}{c} \xrightarrow{(k'_1, \alpha'_1, \beta'_1)} \\ \Downarrow \delta' \\ \xrightarrow{(k'_2, \alpha'_2, \beta'_2)} \end{array} (w', a', b', \phi') \begin{array}{c} \xrightarrow{(k_1, \alpha_1, \beta_1)} \\ \Downarrow \delta \\ \xrightarrow{(k_2, \alpha_2, \beta_2)} \end{array} (w, a, b, \phi)$$

is given by the diagram

$$(w'', a'', b'', \phi'') \begin{array}{c} \xrightarrow{(k_1 \circ k'_1, (\alpha_1 \star \text{id}_{k'_1}) \circ \alpha'_1, (\beta_1 \star \text{id}_{k'_1}) \circ \beta'_1)} \\ \Downarrow \delta \star \delta' \\ \xrightarrow{(k_2 \circ k'_2, (\alpha_2 \star \text{id}_{k'_2}) \circ \alpha'_2, (\beta_2 \star \text{id}_{k'_2}) \circ \beta'_2)} \end{array} (w, a, b, \phi)$$

Note that if \mathcal{C} is actually a $(2, 1)$ -category, the morphisms α and β in (2) above are automatically also isomorphisms². In addition the 2-category of 2-commutative diagrams is also a $(2, 1)$ -category if \mathcal{C} is a $(2, 1)$ -category.

Definition 4.29.1. A *final object* of a $(2, 1)$ -category \mathcal{C} is an object x such that

- (1) for every $y \in \text{Ob}(\mathcal{C})$ there is a morphism $y \rightarrow x$, and
- (2) every two morphisms $y \rightarrow x$ are isomorphic by a unique 2-morphism.

Likely, in the more general case of 2-categories there are different flavours of final objects. We do not want to get into this and hence we only define 2-fibre products in the $(2, 1)$ -case.

Definition 4.29.2. Let \mathcal{C} be a $(2, 1)$ -category. Let $x, y, z \in \text{Ob}(\mathcal{C})$ and $f \in \text{Mor}_{\mathcal{C}}(x, z)$ and $g \in \text{Mor}_{\mathcal{C}}(y, z)$. A *2-fibre product of f and g* is a final object in the category of 2-commutative diagrams described above. If a 2-fibre product exists we will denote it $x \times_z y \in \text{Ob}(\mathcal{C})$, and denote the required morphisms $p \in \text{Mor}_{\mathcal{C}}(x \times_z y, x)$ and $q \in \text{Mor}_{\mathcal{C}}(x \times_z y, y)$ making the diagram

$$\begin{array}{ccc} x \times_z y & \xrightarrow{p} & x \\ q \downarrow & & \downarrow f \\ y & \xrightarrow{g} & z \end{array}$$

2-commute and we will denote the given invertible 2-morphism exhibiting this by $\psi : f \circ p \rightarrow g \circ q$.

Thus the following universal property holds: for any $w \in \text{Ob}(\mathcal{C})$ and morphisms $a \in \text{Mor}_{\mathcal{C}}(w, x)$ and $b \in \text{Mor}_{\mathcal{C}}(w, y)$ with a given 2-isomorphism $\phi : f \circ a \rightarrow g \circ b$ there is a $\gamma \in \text{Mor}_{\mathcal{C}}(w, x \times_z y)$ making the diagram

$$\begin{array}{ccccc} w & & & & \\ & \searrow a & & & \\ & & x \times_z y & \xrightarrow{p} & x \\ & \searrow \gamma & & & \downarrow f \\ & & & & \\ & \searrow b & & & \\ & & y & \xrightarrow{g} & z \end{array}$$

2-commute such that for suitable choices of $a \rightarrow p \circ \gamma$ and $b \rightarrow q \circ \gamma$ the diagram

$$\begin{array}{ccc} f \circ a & \longrightarrow & f \circ p \circ \gamma \\ \phi \downarrow & & \downarrow \psi \star \text{id}_{\gamma} \\ g \circ b & \longrightarrow & g \circ q \circ \gamma \end{array}$$

commutes. Moreover γ is unique up to isomorphism. Of course the exact properties are finer than this. All of the cases of 2-fibre products that we will need later on come from the following example of 2-fibre products in the 2-category of categories.

Example 4.29.3. Let \mathcal{A} , \mathcal{B} , and \mathcal{C} be categories. Let $F : \mathcal{A} \rightarrow \mathcal{C}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be functors. We define a category $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ as follows:

²In fact it seems in the 2-category case that one could define another 2-category of 2-commutative diagrams where the direction of the arrows α, β is reversed, or even where the direction of only one of them is reversed. This is why we restrict to $(2, 1)$ -categories later on.

- (1) an object of $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is a triple (A, B, f) , where $A \in \text{Ob}(\mathcal{A})$, $B \in \text{Ob}(\mathcal{B})$, and $f : F(A) \rightarrow G(B)$ is an isomorphism in \mathcal{C} ,
- (2) a morphism $(A, B, f) \rightarrow (A', B', f')$ is given by a pair (a, b) , where $a : A \rightarrow A'$ is a morphism in \mathcal{A} , and $b : B \rightarrow B'$ is a morphism in \mathcal{B} such that the diagram

$$\begin{array}{ccc} F(A) & \xrightarrow{f} & G(B) \\ \downarrow F(a) & & \downarrow G(b) \\ F(A') & \xrightarrow{f'} & G(B') \end{array}$$

is commutative.

Moreover, we define functors $p : \mathcal{A} \times_{\mathcal{C}} \mathcal{B} \rightarrow \mathcal{A}$ and $q : \mathcal{A} \times_{\mathcal{C}} \mathcal{B} \rightarrow \mathcal{B}$ by setting

$$p(A, B, f) = A, \quad q(A, B, f) = B,$$

in other words, these are the forgetful functors. We define a transformation of functors $\psi : F \circ p \rightarrow G \circ q$. On the object $\xi = (A, B, f)$ it is given by $\psi_{\xi} = f : F(p(\xi)) = F(A) \rightarrow G(B) = G(q(\xi))$.

Lemma 4.29.4. *In the $(2, 1)$ -category of categories 2-fibre products exist and are given by the construction of Example 4.29.3.*

Proof. Let us check the universal property: let \mathcal{W} be a category, let $a : \mathcal{W} \rightarrow \mathcal{A}$ and $b : \mathcal{W} \rightarrow \mathcal{B}$ be functors, and let $t : F \circ a \rightarrow G \circ b$ be an isomorphism of functors.

Consider the functor $\gamma : \mathcal{W} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ given by $W \mapsto (a(W), b(W), t_W)$. (Check this is a functor omitted.) Moreover, consider $\alpha : a \rightarrow p \circ \gamma$ and $\beta : b \rightarrow q \circ \gamma$ obtained from the identities $p \circ \gamma = a$ and $q \circ \gamma = b$. Then it is clear that (γ, α, β) is a morphism from (\mathcal{W}, a, b, t) to $(\mathcal{A} \times_{\mathcal{C}} \mathcal{B}, p, q, \psi)$.

Let $(k, \alpha', \beta') : (\mathcal{W}, a, b, t) \rightarrow (\mathcal{A} \times_{\mathcal{C}} \mathcal{B}, p, q, \psi)$ be a second such morphism. For an object W of \mathcal{W} let us write $k(W) = (a_k(W), b_k(W), t_{k,W})$. Hence $p(k(W)) = a_k(W)$ and so on. The map α' corresponds to functorial maps $\alpha' : a(W) \rightarrow a_k(W)$. Since we are working in the $(2, 1)$ -category of categories, in fact each of the maps $a(W) \rightarrow a_k(W)$ is an isomorphism. We can use these (and their counterparts $b(W) \rightarrow b_k(W)$) to get isomorphisms

$$\delta_W : \gamma(W) = (a(W), b(W), t_W) \longrightarrow (a_k(W), b_k(W), t_{k,W}) = k(W).$$

It is straightforward to show that δ defines a 2-isomorphism between γ and k in the 2-category of 2-commutative diagrams as desired. \square

Remark 4.29.5. Let \mathcal{A} , \mathcal{B} , and \mathcal{C} be categories. Let $F : \mathcal{A} \rightarrow \mathcal{C}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be functors. Another, slightly more symmetrical, construction of a 2-fibre product $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is as follows. An object is a quintuple (A, B, C, a, b) where A, B, C are objects of $\mathcal{A}, \mathcal{B}, \mathcal{C}$ and where $a : F(A) \rightarrow C$ and $b : G(B) \rightarrow C$ are isomorphisms. A morphism $(A, B, C, a, b) \rightarrow (A', B', C', a', b')$ is given by a triple of morphisms $A \rightarrow A', B \rightarrow B', C \rightarrow C'$ compatible with the morphisms a, b, a', b' . We can prove directly that this leads to a 2-fibre product. However, it is easier to observe that the functor $(A, B, C, a, b) \mapsto (A, B, b^{-1} \circ a)$ gives an equivalence from the category of quintuples to the category constructed in Example 4.29.3.

Lemma 4.29.6. *Let*

be a 2-commutative diagram of categories. A choice of isomorphisms $\alpha : G \circ K \rightarrow M \circ I$ and $\beta : M \circ H \rightarrow F \circ L$ determines a morphism

$$\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$$

of 2-fibre products associated to this situation.

Proof. Just use the functor

$$(X, Y, \phi) \mapsto (L(X), K(Y), \alpha_Y^{-1} \circ M(\phi) \circ \beta_X^{-1})$$

on objects and

$$(a, b) \mapsto (L(a), K(b))$$

on morphisms. \square

Lemma 4.29.7. *Assumptions as in Lemma 4.29.6.*

- (1) *If K and L are faithful then the morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is faithful.*
- (2) *If K and L are fully faithful and M is faithful then the morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is fully faithful.*
- (3) *If K and L are equivalences and M is fully faithful then the morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is an equivalence.*

Proof. Let (X, Y, ϕ) and (X', Y', ϕ') be objects of $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y}$. Set $Z = H(X)$ and identify it with $I(Y)$ via ϕ . Also, identify $M(Z)$ with $F(L(X))$ via α_X and identify $M(Z)$ with $G(K(Y))$ via β_Y . Similarly for $Z' = H(X')$ and $M(Z')$. The map on morphisms is the map

$$\begin{array}{c}
 \text{Mor}_{\mathcal{X}}(X, X') \times_{\text{Mor}_{\mathcal{Z}}(Z, Z')} \text{Mor}_{\mathcal{Y}}(Y, Y') \\
 \downarrow \\
 \text{Mor}_{\mathcal{A}}(L(X), L(X')) \times_{\text{Mor}_{\mathcal{C}}(M(Z), M(Z'))} \text{Mor}_{\mathcal{B}}(K(Y), K(Y'))
 \end{array}$$

Hence parts (1) and (2) follow. Moreover, if K and L are equivalences and M is fully faithful, then any object (A, B, ϕ) is in the essential image for the following reasons: Pick X, Y such that $L(X) \cong A$ and $K(Y) \cong B$. Then the fully faithfulness of M guarantees that we can find an isomorphism $H(X) \cong I(Y)$. Some details omitted. \square

Lemma 4.29.8. *Let*

be a diagram of categories and functors. Then there is a canonical isomorphism

$$(\mathcal{A} \times_{\mathcal{B}} \mathcal{C}) \times_{\mathcal{D}} \mathcal{E} \cong \mathcal{A} \times_{\mathcal{B}} (\mathcal{C} \times_{\mathcal{D}} \mathcal{E})$$

of categories.

Proof. Just use the functor

$$((A, C, \phi), E, \psi) \mapsto (A, (C, E, \psi), \phi)$$

if you know what I mean. \square

Henceforth we do not write the parentheses when dealing with fibred products of more than 2 categories.

Lemma 4.29.9. *Let*

be a commutative diagram of categories and functors. Then there is a canonical functor

$$pr_{02} : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{D}} \mathcal{E} \longrightarrow \mathcal{A} \times_{\mathcal{F}} \mathcal{E}$$

of categories.

Proof. If we write $\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{D}} \mathcal{E}$ as $(\mathcal{A} \times_{\mathcal{B}} \mathcal{C}) \times_{\mathcal{D}} \mathcal{E}$ then we can just use the functor

$$((A, C, \phi), E, \psi) \mapsto (A, E, G(\psi) \circ F(\phi))$$

if you know what I mean. \square

Lemma 4.29.10. *Let*

$$\mathcal{A} \rightarrow \mathcal{B} \leftarrow \mathcal{C} \leftarrow \mathcal{D}$$

be a diagram of categories and functors. Then there is a canonical isomorphism

$$\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{C}} \mathcal{D} \cong \mathcal{A} \times_{\mathcal{B}} \mathcal{D}$$

of categories.

Proof. Omitted. \square

We claim that this means you can work with these 2-fibre products just like with ordinary fibre products. Here are some further lemmas that actually come up later.

Lemma 4.29.11. *Let*

$$\begin{array}{ccc}
 \mathcal{C}_3 & \longrightarrow & \mathcal{S} \\
 \downarrow & & \downarrow \Delta \\
 \mathcal{C}_1 \times \mathcal{C}_2 & \xrightarrow{G_1 \times G_2} & \mathcal{S} \times \mathcal{S}
 \end{array}$$

be a 2-fibre product of categories. Then there is a canonical isomorphism $\mathcal{C}_3 \cong \mathcal{C}_1 \times_{G_1, \mathcal{S}, G_2} \mathcal{C}_2$.

Proof. We may assume that \mathcal{C}_3 is the category $(\mathcal{C}_1 \times \mathcal{C}_2) \times_{\mathcal{S} \times \mathcal{S}} \mathcal{S}$ constructed in Example 4.29.3. Hence an object is a triple $((X_1, X_2), \mathcal{S}, \phi)$ where $\phi = (\phi_1, \phi_2) : (G_1(X_1), G_2(X_2)) \rightarrow (\mathcal{S}, \mathcal{S})$ is an isomorphism. Thus we can associate to this the triple $(X_1, X_2, \phi_2 \circ \phi_1^{-1})$. Conversely, if (X_1, X_2, ψ) is an object of $\mathcal{C}_1 \times_{G_1, \mathcal{S}, G_2} \mathcal{C}_2$, then we can associate to this the triple $((X_1, X_2), G_1(X_1), (\text{id}_{G_1(X_1)}, \psi))$. We claim these constructions given mutually inverse functors. We omit describing how to deal with morphisms and show they are mutually inverse. \square

Lemma 4.29.12. *Let*

$$\begin{array}{ccc} \mathcal{C}' & \longrightarrow & \mathcal{S} \\ \downarrow & & \downarrow \Delta \\ \mathcal{C} & \xrightarrow{G_1 \times G_2} & \mathcal{S} \times \mathcal{S} \end{array}$$

be a 2-fibre product of categories. Then there is a canonical isomorphism

$$\mathcal{C}' \cong (\mathcal{C} \times_{G_1, \mathcal{S}, G_2} \mathcal{C}) \times_{(p, q), \mathcal{C} \times \mathcal{C}, \Delta} \mathcal{C}.$$

Proof. An object of the right hand side is given by $((C_1, C_2, \phi), C_3, \psi)$ where $\phi : G_1(C_1) \rightarrow G_2(C_2)$ is an isomorphism and $\psi = (\psi_1, \psi_2) : (C_1, C_2) \rightarrow (C_3, C_3)$ is an isomorphism. Hence we can associate to this the triple $(C_3, G_1(C_1), (G_1(\psi_1^{-1}), \psi_2^{-1} \circ G_2(\psi_2^{-1})))$ which is an object of \mathcal{C}' . Details omitted. \square

Lemma 4.29.13. *Let $\mathcal{A} \rightarrow \mathcal{C}$, $\mathcal{B} \rightarrow \mathcal{C}$ and $\mathcal{C} \rightarrow \mathcal{D}$ be functors between categories. Then the diagram*

$$\begin{array}{ccc} \mathcal{A} \times_{\mathcal{C}} \mathcal{B} & \longrightarrow & \mathcal{A} \times_{\mathcal{D}} \mathcal{B} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{\Delta_{\mathcal{C}/\mathcal{D}}} & \mathcal{C} \times_{\mathcal{D}} \mathcal{C} \end{array}$$

is a 2-fibre product diagram.

Proof. Omitted. \square

Lemma 4.29.14. *Let*

$$\begin{array}{ccc} \mathcal{U} & \longrightarrow & \mathcal{V} \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} \end{array}$$

be a 2-fibre product. Then the diagram

$$\begin{array}{ccc} \mathcal{U} & \longrightarrow & \mathcal{U} \times_{\mathcal{V}} \mathcal{U} \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \end{array}$$

is 2-cartesian.

Proof. This is a purely 2-category theoretic statement, valid in any $(2, 1)$ -category with 2-fibre products. Explicitly, it follows from the following chain of equivalences:

$$\begin{aligned} \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} (\mathcal{U} \times_{\mathcal{V}} \mathcal{U}) &= \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} ((\mathcal{X} \times_{\mathcal{Y}} \mathcal{V}) \times_{\mathcal{V}} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{V})) \\ &= \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \times_{\mathcal{Y}} \mathcal{V}) \\ &= \mathcal{X} \times_{\mathcal{Y}} \mathcal{V} = \mathcal{U} \end{aligned}$$

see Lemmas 4.29.8 and 4.29.10. \square

4.30. Categories over categories

In this section we have a functor $p : \mathcal{S} \rightarrow \mathcal{C}$. We think of \mathcal{S} as being on top and of \mathcal{C} as being at the bottom. To make sure that everybody knows what we are talking about we define the 2-category of categories over \mathcal{C} .

Definition 4.30.1. Let \mathcal{C} be a category. The 2-category of categories over \mathcal{C} is the sub 2-category of Cat defined as follows:

- (1) Its objects will be functors $p : \mathcal{S} \rightarrow \mathcal{C}$.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$.
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

In this situation we will denote

$$\text{Mor}_{Cat/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

the category of 1-morphisms between (\mathcal{S}, p) and (\mathcal{S}', p')

Since we have defined this as a sub 2-category of Cat we do not have to check any of the axioms. Rather we just have to check things such as “vertical composition of 2-morphisms over \mathcal{C} gives another 2-morphism over \mathcal{C} ”. This is clear.

Analogously to the fibre of a map of spaces, we have the notion of a fibre category, and some notions of lifting associated to this situation.

Definition 4.30.2. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} .

- (1) The *fibre category* over an object $U \in \text{Ob}(\mathcal{C})$ is the category \mathcal{S}_U with objects

$$\text{Ob}(\mathcal{S}_U) = \{x \in \text{Ob}(\mathcal{S}) : p(x) = U\}$$

and morphisms

$$\text{Mor}_{\mathcal{S}_U}(x, y) = \{\phi \in \text{Mor}_{\mathcal{S}}(x, y) : p(\phi) = \text{id}_U\}.$$

- (2) A *lift* of an object $U \in \text{Ob}(\mathcal{C})$ is an object $x \in \text{Ob}(\mathcal{S})$ such that $p(x) = U$, i.e., $x \in \text{Ob}(\mathcal{S}_U)$. We will also sometime say that x *lies over* U .
- (3) Similarly, a *lift* of a morphism $f : V \rightarrow U$ in \mathcal{C} is a morphism $\phi : y \rightarrow x$ in \mathcal{S} such that $p(\phi) = f$. We sometimes say that ϕ *lies over* f .

There are some observations we could make here. For example if $F : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ is a 1-morphism of categories over \mathcal{C} , then F induces functors of fibre categories $F : \mathcal{S}_U \rightarrow \mathcal{S}'_U$. Similarly for 2-morphisms.

Here is the obligatory lemma describing the 2-fibre product in the $(2, 1)$ -category of categories over \mathcal{C} .

Lemma 4.30.3. Let \mathcal{C} be a category. The $(2, 1)$ -category of categories over \mathcal{C} has 2-fibre products. Suppose that $F : \mathcal{X} \rightarrow \mathcal{S}$ and $G : \mathcal{Y} \rightarrow \mathcal{S}$ are morphisms of categories over \mathcal{C} . An explicit 2-fibre product $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is given by the following description

- (1) an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is a quadruple (U, x, y, f) , where $U \in \text{Ob}(\mathcal{C})$, $x \in \text{Ob}(\mathcal{X}_U)$, $y \in \text{Ob}(\mathcal{Y}_U)$, and $f : F(x) \rightarrow G(y)$ is an isomorphism in \mathcal{S}_U ,

- (2) a morphism $(U, x, y, f) \rightarrow (U', x', y', f')$ is given by a pair (a, b) , where $a : x \rightarrow x'$ is a morphism in \mathcal{X} , and $b : y \rightarrow y'$ is a morphism in \mathcal{Y} such that
- (a) a and b induce the same morphism $U \rightarrow U'$, and
 - (b) the diagram

$$\begin{array}{ccc} F(x) & \xrightarrow{f} & G(y) \\ \downarrow F(a) & & \downarrow G(b) \\ F(x') & \xrightarrow{f'} & G(y') \end{array}$$

is commutative.

The functors $p : \mathcal{X} \times_{\mathcal{S}} \mathcal{Y} \rightarrow \mathcal{X}$ and $q : \mathcal{X} \times_{\mathcal{S}} \mathcal{Y} \rightarrow \mathcal{Y}$ are the forgetful functors in this case. The transformation $\psi : F \circ p \rightarrow G \circ q$ is given on the object $\xi = (U, x, y, f)$ by $\psi_{\xi} = f : F(p(\xi)) = F(x) \rightarrow G(y) = G(q(\xi))$.

Proof. Let us check the universal property: let $p_{\mathcal{W}} : \mathcal{W} \rightarrow \mathcal{C}$ be a category over \mathcal{C} , let $X : \mathcal{W} \rightarrow \mathcal{X}$ and $Y : \mathcal{W} \rightarrow \mathcal{Y}$ be functors over \mathcal{C} , and let $t : F \circ X \rightarrow G \circ Y$ be an isomorphism of functors over \mathcal{C} . The desired functor $\gamma : \mathcal{W} \rightarrow \mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is given by $W \mapsto (p_{\mathcal{W}}(W), X(W), Y(W), t_W)$. Details omitted; compare with Lemma 4.29.4. \square

Lemma 4.30.4. Let \mathcal{C} be a category. Let $f : \mathcal{X} \rightarrow \mathcal{S}$ and $g : \mathcal{Y} \rightarrow \mathcal{S}$ be morphisms of categories over \mathcal{C} . For any object U of \mathcal{C} we have the following identity of fibre categories

$$(\mathcal{X} \times_{\mathcal{S}} \mathcal{Y})_U = \mathcal{X}_U \times_{\mathcal{S}_U} \mathcal{Y}_U$$

Proof. Omitted. \square

4.31. Fibred categories

A very brief discussion of fibred categories is warranted.

Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . Given an object $x \in \mathcal{S}$ with $p(x) = U$, and given a morphism $f : V \rightarrow U$, we can try to take some kind of “fibre product $V \times_U x$ ” (or a *base change* of x via $V \rightarrow U$). Namely, a morphism from an object $z \in \mathcal{S}$ into “ $V \times_U x$ ” should be given by a pair (φ, g) , where $\varphi : z \rightarrow x$, $g : p(z) \rightarrow V$ such that $p(\varphi) = f \circ g$. Pictorially:

$$\begin{array}{ccc} z & \xrightarrow{\quad ? \quad} & x \\ \downarrow \scriptstyle p & & \downarrow \scriptstyle p \\ p(z) & \xrightarrow{\quad f \quad} & U \end{array}$$

If such a morphism $V \times_U x \rightarrow x$ exists then it is called a strongly cartesian morphism.

Definition 4.31.1. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . A *strongly cartesian morphism*, or more precisely a *strongly \mathcal{C} -cartesian morphism* is a morphism $\varphi : y \rightarrow x$ of \mathcal{S} such that for every $z \in \text{Ob}(\mathcal{S})$ the map

$$\text{Mor}_{\mathcal{S}}(z, y) \longrightarrow \text{Mor}_{\mathcal{S}}(z, x) \times_{\text{Mor}_{\mathcal{C}}(p(z), p(x))} \text{Mor}_{\mathcal{C}}(p(z), p(y)),$$

given by $\psi \mapsto (\varphi \circ \psi, p(\psi))$ is bijective.

Note that by the Yoneda Lemma 4.3.5, given $x \in \text{Ob}(\mathcal{S})$ lying over $U \in \text{Ob}(\mathcal{C})$ and the morphism $f : V \rightarrow U$ of \mathcal{C} , if there is a strongly cartesian morphism $\varphi : y \rightarrow x$ with $p(\varphi) = f$, then (y, φ) is unique up to unique isomorphism. This is clear from the definition above, as the functor

$$z \longmapsto \text{Mor}_{\mathcal{S}}(z, x) \times_{\text{Mor}_{\mathcal{C}}(p(z), U)} \text{Mor}_{\mathcal{C}}(p(z), V)$$

only depends on the data $(x, U, f : V \rightarrow U)$. Hence we will sometimes use $V \times_U x \rightarrow x$ or $f^*x \rightarrow x$ to denote a strongly cartesian morphism which is a lift of f .

Lemma 4.31.2. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} .*

- (1) *The composition of two strongly cartesian morphisms is strongly cartesian.*
- (2) *Any isomorphism of \mathcal{S} is strongly cartesian.*
- (3) *Any strongly cartesian morphism φ such that $p(\varphi)$ is an isomorphism, is an isomorphism.*

Proof. Proof of (1). Let $\varphi : y \rightarrow x$ and $\psi : z \rightarrow y$ be strongly cartesian. Let t be an arbitrary object of \mathcal{S} . Then we have

$$\begin{aligned} & \text{Mor}_{\mathcal{S}}(t, z) \\ &= \text{Mor}_{\mathcal{S}}(t, y) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(y))} \text{Mor}_{\mathcal{C}}(p(t), p(z)) \\ &= \text{Mor}_{\mathcal{S}}(t, x) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(x))} \text{Mor}_{\mathcal{C}}(p(t), p(y)) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(y))} \text{Mor}_{\mathcal{C}}(p(t), p(z)) \\ &= \text{Mor}_{\mathcal{S}}(t, x) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(x))} \text{Mor}_{\mathcal{C}}(p(t), p(z)) \end{aligned}$$

hence $z \rightarrow x$ is strongly cartesian.

Proof of (2). Let $y \rightarrow x$ be an isomorphism. Then $p(y) \rightarrow p(x)$ is an isomorphism too. Hence $\text{Mor}_{\mathcal{C}}(p(z), p(y)) \rightarrow \text{Mor}_{\mathcal{C}}(p(z), p(x))$ is a bijection. Hence $\text{Mor}_{\mathcal{S}}(z, x) \times_{\text{Mor}_{\mathcal{C}}(p(z), p(x))} \text{Mor}_{\mathcal{C}}(p(z), p(y))$ is bijective to $\text{Mor}_{\mathcal{S}}(z, x)$. Hence the displayed map of Definition 4.31.1 is a bijection as $y \rightarrow x$ is an isomorphism, and we conclude that $y \rightarrow x$ is strongly cartesian.

Proof of (3). Assume $\varphi : y \rightarrow x$ is strongly cartesian with $p(\varphi) : p(y) \rightarrow p(x)$ an isomorphism. Applying the definition with $z = x$ shows that $(\text{id}_x, p(\varphi)^{-1})$ comes from a unique morphism $\chi : x \rightarrow y$. We omit the verification that χ is the inverse of φ . \square

Lemma 4.31.3. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be composable functors between categories. Let $x \rightarrow y$ be a morphism of \mathcal{A} . If $x \rightarrow y$ is strongly \mathcal{B} -cartesian and $F(x) \rightarrow F(y)$ is strongly \mathcal{C} -cartesian, then $x \rightarrow y$ is strongly \mathcal{C} -cartesian.*

Proof. This follows directly from the definition. \square

Lemma 4.31.4. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of \mathcal{S} . Assume*

- (1) *$x \rightarrow y$ is strongly cartesian,*
- (2) *$p(x) \times_{p(y)} p(z)$ exists, and*
- (3) *there exists a strongly cartesian morphism $a : w \rightarrow z$ in \mathcal{S} with $p(w) = p(x) \times_{p(y)} p(z)$ and $p(a) = \text{pr}_2 : p(x) \times_{p(y)} p(z) \rightarrow p(z)$.*

Then the fibre product $x \times_y z$ exists and is isomorphic to w .

Proof. Since $x \rightarrow y$ is strongly cartesian there exists a unique morphism $b : w \rightarrow x$ such that $p(b) = \text{pr}_1$. To see that w is the fibre product we compute

$$\begin{aligned}
& \text{Mor}_{\mathcal{S}}(t, w) \\
&= \text{Mor}_{\mathcal{S}}(t, z) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(z))} \text{Mor}_{\mathcal{C}}(p(t), p(w)) \\
&= \text{Mor}_{\mathcal{S}}(t, z) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(z))} (\text{Mor}_{\mathcal{C}}(p(t), p(x)) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(y))} \text{Mor}_{\mathcal{C}}(p(t), p(z))) \\
&= \text{Mor}_{\mathcal{S}}(t, z) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(y))} \text{Mor}_{\mathcal{C}}(p(t), p(x)) \\
&= \text{Mor}_{\mathcal{S}}(t, z) \times_{\text{Mor}_{\mathcal{S}}(t, y)} \text{Mor}_{\mathcal{S}}(t, y) \times_{\text{Mor}_{\mathcal{C}}(p(t), p(y))} \text{Mor}_{\mathcal{C}}(p(t), p(x)) \\
&= \text{Mor}_{\mathcal{S}}(t, z) \times_{\text{Mor}_{\mathcal{S}}(t, y)} \text{Mor}_{\mathcal{S}}(t, x)
\end{aligned}$$

as desired. The first equality holds because $a : w \rightarrow z$ is strongly cartesian and the last equality holds because $x \rightarrow y$ is strongly cartesian. \square

Definition 4.31.5. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . We say \mathcal{S} is a *fibred category over \mathcal{C}* if given any $x \in \text{Ob}(\mathcal{S})$ lying over $U \in \text{Ob}(\mathcal{C})$ and any morphism $f : V \rightarrow U$ of \mathcal{C} , there exists a strongly cartesian morphism $f^*x \rightarrow x$ lying over f .

Assume $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category. For every $f : V \rightarrow U$ and $x \in \text{Ob}(\mathcal{S}_U)$ as in the definition we may choose a strongly cartesian morphism $f^*x \rightarrow x$ lying over f . By the axiom of choice we may choose $f^*x \rightarrow x$ for all $f : V \rightarrow U = p(x)$ simultaneously. We claim that for every morphism $\phi : x \rightarrow x'$ in \mathcal{S}_U and $f : V \rightarrow U$ there is a unique morphism $f^*\phi : f^*x \rightarrow f^*x'$ in \mathcal{S}_V such that

$$\begin{array}{ccc}
f^*x & \xrightarrow{f^*\phi} & f^*x' \\
\downarrow & & \downarrow \\
x & \xrightarrow{\phi} & x'
\end{array}$$

commutes. Namely, the arrow exists and is unique because $f^*x' \rightarrow x'$ is strongly cartesian. The uniqueness of this arrow guarantees that f^* (now also defined on morphisms) is a functor $f^* : \mathcal{S}_U \rightarrow \mathcal{S}_V$.

Definition 4.31.6. Assume $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category.

- (1) A *choice of pullbacks*³ for $p : \mathcal{S} \rightarrow \mathcal{C}$ is given by a choice of a strongly cartesian morphism $f^*x \rightarrow x$ lying over f for any morphism $f : V \rightarrow U$ of \mathcal{C} and any $x \in \text{Ob}(\mathcal{S}_U)$.
- (2) Given a choice of pullbacks, for any morphism $f : V \rightarrow U$ of \mathcal{C} the functor $f^* : \mathcal{S}_U \rightarrow \mathcal{S}_V$ described above is called a *pullback functor* (associated to the choices $f^*x \rightarrow x$ made above).

Of course we may always assume our choice of pullbacks has the property that $\text{id}_U^*x = x$, although in practice this is a useless property without imposing further assumptions on the pullbacks.

Lemma 4.31.7. *Assume $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category. Assume given a choice of pullbacks for $p : \mathcal{S} \rightarrow \mathcal{C}$.*

³This is probably nonstandard terminology. In some texts this is called a “cleavage” but it conjures up the wrong image. Maybe a “cleaving” would be a better word. A related notion is that of a “splitting”, but in many texts a “splitting” means a choice of pullbacks such that $g^*f^* = (f \circ g)^*$ for any composable pair of morphisms. Compare also with Definition 4.34.2.

- (1) For any pair of composable morphisms $f : V \rightarrow U$, $g : W \rightarrow V$ there is a unique isomorphism

$$\alpha_{g,f} : (f \circ g)^* \longrightarrow g^* \circ f^*$$

as functors $\mathcal{S}_U \rightarrow \mathcal{S}_W$ such that for every $y \in \text{Ob}(\mathcal{S}_U)$ the following diagram commutes

$$\begin{array}{ccc} g^* f^* y & \longrightarrow & f^* y \\ (\alpha_{g,f})_y \uparrow & & \downarrow \\ (f \circ g)^* y & \longrightarrow & y \end{array}$$

- (2) If $f = \text{id}_U$, then there is a canonical isomorphism $\alpha_U : \text{id} \rightarrow (\text{id}_U)^*$ as functors $\mathcal{S}_U \rightarrow \mathcal{S}_U$.
- (3) The quadruple $(U \mapsto \mathcal{S}_U, f \mapsto f^*, \alpha_{g,f}, \alpha_U)$ defines a pseudo functor from \mathcal{C}^{opp} to the $(2,1)$ -category of categories, see Definition 4.27.5.

Proof. In fact, it is clear that the commutative diagram of part (1) uniquely determines the morphism $(\alpha_{g,f})_y$ in the fibre category \mathcal{S}_W . It is an isomorphism since both the morphism $(f \circ g)^* y \rightarrow y$ and the composition $g^* f^* y \rightarrow f^* y \rightarrow y$ are strongly cartesian morphisms lifting $f \circ g$ (see discussion following Definition 4.31.1 and Lemma 4.31.2). In the same way, since $\text{id}_x : x \rightarrow x$ is clearly strongly cartesian over id_U (with $U = p(x)$) we see that there exists an isomorphism $(\alpha_U)_x : x \rightarrow (\text{id}_U)^* x$. (Of course we could have assumed beforehand that $f^* x = x$ whenever f is an identity morphism, but it is better for the sake of generality not to assume this.) We omit the verification that $\alpha_{g,f}$ and α_U so obtained are transformations of functors. We also omit the verification of (3). \square

Lemma 4.31.8. Let \mathcal{C} be a category. Let $\mathcal{S}_1, \mathcal{S}_2$ be categories over \mathcal{C} . Suppose that \mathcal{S}_1 and \mathcal{S}_2 are equivalent as categories over \mathcal{C} . Then \mathcal{S}_1 is fibred over \mathcal{C} if and only if \mathcal{S}_2 is fibred over \mathcal{C} .

Proof. Denote $p_i : \mathcal{S}_i \rightarrow \mathcal{C}$ the given functors. Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2$, $G : \mathcal{S}_2 \rightarrow \mathcal{S}_1$ be functors over \mathcal{C} , and let $i : F \circ G \rightarrow \text{id}_{\mathcal{S}_2}$, $j : G \circ F \rightarrow \text{id}_{\mathcal{S}_1}$ be isomorphisms of functors over \mathcal{C} . We claim that in this case F maps strongly cartesian morphisms to strongly cartesian morphisms. Namely, suppose that $\varphi : y \rightarrow x$ is strongly cartesian in \mathcal{S}_1 . Set $f : V \rightarrow U$ equal to $p_1(\varphi)$. Suppose that $z' \in \text{Ob}(\mathcal{S}_2)$, with $W = p_2(z')$, and we are given $g : W \rightarrow V$ and $\psi' : z' \rightarrow F(x)$ such that $p_2(\psi') = f \circ g$. Then

$$\psi = j \circ G(\psi') : G(z') \rightarrow G(F(x)) \rightarrow x$$

is a morphism in \mathcal{S}_1 with $p_1(\psi) = f \circ g$. Hence by assumption there exists a unique morphism $\xi : G(z') \rightarrow y$ lying over g such that $\psi = \varphi \circ \xi$. This in turn gives a morphism

$$\xi' = F(\xi) \circ i^{-1} : z' \rightarrow F(G(z')) \rightarrow F(y)$$

lying over g with $\psi' = F(\varphi) \circ \xi'$. We omit the verification that ξ' is unique. \square

The conclusion from Lemma 4.31.8 is that equivalences map strongly cartesian morphisms to strongly cartesian morphisms. But this may not be the case for an arbitrary functor between fibred categories over \mathcal{C} . Hence we define the 2-category of fibred categories as follows.

Definition 4.31.9. Let \mathcal{C} be a category. The 2-category of fibred categories over \mathcal{C} is the sub 2-category of the 2-category of categories over \mathcal{C} (see Definition 4.30.1) defined as follows:

- (1) Its objects will be fibred categories $p : \mathcal{S} \rightarrow \mathcal{C}$.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$ and such that G maps strongly cartesian morphisms to strongly cartesian morphisms.
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

In this situation we will denote

$$\text{Mor}_{\text{Fib}/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

the category of 1-morphisms between (\mathcal{S}, p) and (\mathcal{S}', p')

Note the condition on 1-morphisms. Note also that this is a true 2-category and not a $(2, 1)$ -category. Hence when taking 2-fibre products we first pass to the associated $(2, 1)$ -category.

Lemma 4.31.10. *Let \mathcal{C} be a category. The $(2, 1)$ -category of fibred categories over \mathcal{C} has 2-fibre products, and they are described as in Lemma 4.30.3.*

Proof. Basically what one has to show here is that given $F : \mathcal{X} \rightarrow \mathcal{S}$ and $G : \mathcal{Y} \rightarrow \mathcal{S}$ morphisms of fibred categories over \mathcal{C} , then the category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ described in Lemma 4.30.3 is fibred. Let us show that $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ has plenty of strongly cartesian morphisms. Namely, suppose we have (U, x, y, ϕ) an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$. And suppose $f : V \rightarrow U$ is a morphism in \mathcal{C} . Choose strongly cartesian morphisms $a : f^*x \rightarrow x$ in \mathcal{X} lying over f and $b : f^*y \rightarrow y$ in \mathcal{Y} lying over f . By assumption $F(a)$ and $G(b)$ are strongly cartesian. Since $\phi : F(x) \rightarrow G(y)$ is an isomorphism, by the uniqueness of strongly cartesian morphisms we find a unique isomorphism $f^*\phi : F(f^*x) \rightarrow G(f^*y)$ such that $G(b) \circ f^*\phi = \phi \circ F(a)$. In other words $(G(a), G(b)) : (V, f^*x, f^*y, f^*\phi) \rightarrow (U, x, y, \phi)$ is a morphism in $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$. We omit the verification that this is a strongly cartesian morphism (and that these are in fact the only strongly cartesian morphisms). \square

Lemma 4.31.11. *Let \mathcal{C} be a category. Let $U \in \text{Ob}(\mathcal{C})$. If $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category and p factors through $p' : \mathcal{S} \rightarrow \mathcal{C}/U$ then $p' : \mathcal{S} \rightarrow \mathcal{C}/U$ is a fibred category.*

Proof. Suppose that $\varphi : x' \rightarrow x$ is strongly cartesian with respect to p . We claim that φ is strongly cartesian with respect to p' also. Set $g = p'(\varphi)$, so that $g : V'/U \rightarrow V/U$ for some morphisms $f : V \rightarrow U$ and $f' : V' \rightarrow U$. Let $z \in \text{Ob}(\mathcal{S})$. Set $p'(z) = (W \rightarrow U)$. To show that φ is strongly cartesian for p' we have to show

$$\text{Mor}_{\mathcal{S}}(z, x') \longrightarrow \text{Mor}_{\mathcal{S}}(z, x) \times_{\text{Mor}_{\mathcal{C}/U}(W/U, V/U)} \text{Mor}_{\mathcal{C}/U}(W/U, V'/U),$$

given by $\psi' \mapsto (\varphi \circ \psi', p'(\psi'))$ is bijective. Suppose given an element (ψ, h) of the right hand side, then in particular $g \circ h = p(\psi)$, and by the condition that φ is strongly cartesian we get a unique morphism $\psi' : z \rightarrow x'$ with $\psi = \varphi \circ \psi'$ and $p(\psi') = h$. OK, and now $p'(\psi') : W/U \rightarrow V/U$ is a morphism whose corresponding map $W \rightarrow V$ is h , hence equal to h as a morphism in \mathcal{C}/U . Thus ψ' is a unique morphism $z \rightarrow x'$ which maps to the given pair (ψ, h) . This proves the claim.

Finally, suppose given $g : V'/U \rightarrow V/U$ and x with $p'(x) = V/U$. Since $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category we see there exists a strongly cartesian morphism $\varphi : x' \rightarrow x$ with

$p(\varphi) = g$. By the same argument as above it follows that $p'(\varphi) = g : V'/U \rightarrow V/U$. And as seen above the morphism φ is strongly cartesian. Thus the conditions of Definition 4.31.5 are satisfied and we win. \square

Lemma 4.31.12. *Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be functors between categories. If \mathcal{A} is fibred over \mathcal{B} and \mathcal{B} is fibred over \mathcal{C} , then \mathcal{A} is fibred over \mathcal{C} .*

Proof. This follows from the definitions and Lemma 4.31.3. \square

Lemma 4.31.13. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of \mathcal{S} with $x \rightarrow y$ strongly cartesian. If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_y z$ exists, $p(x \times_y z) = p(x) \times_{p(y)} p(z)$, and $x \times_y z \rightarrow z$ is strongly cartesian.*

Proof. Pick a strongly cartesian morphism $\text{pr}_2^* z \rightarrow z$ lying over $\text{pr}_2 : p(x) \times_{p(y)} p(z) \rightarrow p(z)$. Then $\text{pr}_2^* z = x \times_y z$ by Lemma 4.31.4. \square

Lemma 4.31.14. *Let \mathcal{C} be a category. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of fibred categories over \mathcal{C} . There exist 1-morphisms of fibred categories over \mathcal{C}*

$$\mathcal{X} \begin{array}{c} \xrightarrow{u} \\ \xleftarrow{w} \end{array} \mathcal{X}' \xrightarrow{v} \mathcal{Y}$$

such that $F = v \circ u$ and such that

- (1) $u : \mathcal{X} \rightarrow \mathcal{X}'$ is fully faithful,
- (2) w is left adjoint to u , and
- (3) $v : \mathcal{X}' \rightarrow \mathcal{Y}$ is a fibred category.

Proof. Denote $p : \mathcal{X} \rightarrow \mathcal{C}$ and $q : \mathcal{Y} \rightarrow \mathcal{C}$ the structure functors. We construct \mathcal{X}' explicitly as follows. An object of \mathcal{X}' is a quadruple (U, x, y, f) where $x \in \text{Ob}(\mathcal{X}_U)$, $y \in \text{Ob}(\mathcal{Y}_U)$ and $f : y \rightarrow F(x)$ is a morphism in \mathcal{Y}_U . A morphism $(a, b) : (U, x, y, f) \rightarrow (U', x', y', f')$ is given by $a : x \rightarrow x'$ and $b : y \rightarrow y'$ with $p(a) = q(b) : U \rightarrow U'$ and such that $f' \circ b = F(a) \circ f$.

Let us make a choice of pullbacks for both p and q and let us use the same notation to indicate them. Let (U, x, y, f) be an object and let $h : V \rightarrow U$ be a morphism. Consider the morphism $c : (V, h^*x, h^*y, h^*f) \rightarrow (U, x, y, f)$ coming from the given strongly cartesian maps $h^*x \rightarrow x$ and $h^*y \rightarrow y$. We claim c is strongly cartesian in \mathcal{X}' over \mathcal{C} . Namely, suppose we are given an object (W, x', y', f') of \mathcal{X}' , a morphism $(a, b) : (W, x', y', f') \rightarrow (U, x, y, f)$ lying over $W \rightarrow U$, and a factorization $W \rightarrow V \rightarrow U$ of $W \rightarrow U$ through h . As $h^*x \rightarrow x$ and $h^*y \rightarrow y$ are strongly cartesian we obtain morphisms $a' : x' \rightarrow h^*x$ and $b' : y' \rightarrow h^*y$ lying over the given morphism $W \rightarrow V$. Consider the diagram

$$\begin{array}{ccccc} y' & \longrightarrow & h^*y & \longrightarrow & y \\ f' \downarrow & & h^*f \downarrow & & f \downarrow \\ F(x') & \longrightarrow & F(h^*x) & \longrightarrow & F(x) \end{array}$$

The outer rectangle and the right square commute. Since F is a 1-morphism of fibred categories the morphism $F(h^*x) \rightarrow F(x)$ is strongly cartesian. Hence the left square commutes by the universal property of strongly cartesian morphisms. This proves that \mathcal{X}' is fibred over \mathcal{C} .

The functor $u : \mathcal{X} \rightarrow \mathcal{X}'$ is given by $x \mapsto (p(x), x, F(x), \text{id})$. This is fully faithful. The functor $\mathcal{X}' \rightarrow \mathcal{Y}$ is given by $(U, x, y, f) \mapsto y$. The functor $w : \mathcal{X}' \rightarrow \mathcal{X}$ is given

by $(U, x, y, f) \mapsto x$. Each of these functors is a 1-morphism of fibred categories over \mathcal{C} by our description of strongly cartesian morphisms of \mathcal{X}' over \mathcal{C} . Adjointness of w and u means that

$$\text{Mor}_{\mathcal{X}}(x, x') = \text{Mor}_{\mathcal{X}'}((U, x, y, f), (p(x'), x', F(x'), \text{id})),$$

which follows immediately from the definitions.

Finally, we have to show that $\mathcal{X}' \rightarrow \mathcal{Y}$ is a fibred category. Let $c : y' \rightarrow y$ be a morphism in \mathcal{Y} and let (U, x, y, f) be an object of \mathcal{X}' lying over y . Set $V = q(y')$ and let $h = q(c) : V \rightarrow U$. Let $a : h^*x \rightarrow x$ and $b : h^*y \rightarrow y$ be the strongly cartesian morphisms covering h . Since F is a 1-morphism of fibred categories we may identify $h^*F(x) = F(h^*x)$ with strongly cartesian morphism $F(a) : F(h^*x) \rightarrow F(x)$. By the universal property of $b : h^*y \rightarrow y$ there is a morphism $c' : y' \rightarrow h^*y$ in \mathcal{Y}_V such that $c = b \circ c'$. We claim that

$$(a, c) : (V, h^*x, y', h^*f \circ b') \longrightarrow (U, x, y, f)$$

is strongly cartesian in \mathcal{X}' over \mathcal{Y} . To see this let (W, x_1, y_1, f_1) be an object of \mathcal{X}' , let $(a_1, b_1) : (W, x_1, y_1, f_1) \rightarrow (U, x, y, f)$ be a morphism and let $b_1 = c \circ c_1$ for some morphism $c_1 : y_1 \rightarrow y'$. Then

$$(a'_1, c_1) : (W, x_1, y_1, f_1) \longrightarrow (V, h^*x, y', h^*f \circ b')$$

(where $a'_1 : x_1 \rightarrow h^*x$ is the unique morphism lying over the given morphism $p(a_1) = q(b_1) : W \rightarrow V$ such that $a_1 = a \circ a'_1$) is the desired morphism. \square

4.32. Inertia

Given fibred categories $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ over a category \mathcal{C} and a 1-morphism $F : \mathcal{S} \rightarrow \mathcal{S}'$ we have the diagonal morphism

$$\Delta = \Delta_{\mathcal{S}/\mathcal{S}'} : \mathcal{S} \longrightarrow \mathcal{S} \times_{\mathcal{S}'} \mathcal{S}$$

in the $(2, 1)$ -category of fibred categories over \mathcal{C} .

Lemma 4.32.1. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be fibred categories. Let $F : \mathcal{S} \rightarrow \mathcal{S}'$ be a 1-morphism of fibred categories over \mathcal{C} . Consider the category $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ over \mathcal{C} whose*

- (1) *objects are pairs (x, α) where $x \in \text{Ob}(\mathcal{S})$ and $\alpha : x \rightarrow x$ is an automorphism with $F(\alpha) = \text{id}$,*
- (2) *morphisms $(x, \alpha) \rightarrow (y, \beta)$ are given by morphisms $\phi : x \rightarrow y$ such that*

$$\begin{array}{ccc} x & \xrightarrow{\quad} & y \\ \alpha \downarrow & \phi & \downarrow \beta \\ x & \xrightarrow{\quad} & y \end{array}$$

commutes, and

- (3) *the functor $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \rightarrow \mathcal{C}$ is given by $(x, \alpha) \mapsto p(x)$.*

Then

- (1) *there is an equivalence*

$$\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S}$$

in the $(2, 1)$ -category of categories over \mathcal{C} , and

- (2) *$\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ is a fibred category over \mathcal{C} .*

Proof. Note that (2) follows from (1) by Lemma 4.31.10. Thus it suffices to prove (1). We will use without further mention the construction of the 2-fibre product from Lemma 4.31.10. In particular an object of $\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'}, \mathcal{S}), \Delta} \mathcal{S}$ is a triple $(x, y, (\iota, \kappa))$ where x and y are objects of \mathcal{S} , and $(\iota, \kappa) : (x, x, \text{id}_{F(x)}) \rightarrow (y, y, \text{id}_{F(y)})$ is an isomorphism in $\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}$. This just means that $\iota, \kappa : x \rightarrow y$ are isomorphisms and that $F(\iota) = F(\kappa)$. Consider the functor

$$I_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'}, \mathcal{S}), \Delta} \mathcal{S}$$

which to an object (x, α) of the left hand side assigns the object $(x, x, (\alpha, \text{id}_x))$ of the right hand side and to a morphism ϕ of the left hand side assigns the morphism (ϕ, ϕ) of the right hand side. We claim that a quasi-inverse to that morphism is given by the functor

$$\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'}, \mathcal{S}), \Delta} \mathcal{S} \longrightarrow I_{\mathcal{S}/\mathcal{S}'}$$

which to an object $(x, y, (\iota, \kappa))$ of the left hand side assigns the object $(x, \kappa^{-1} \circ \iota)$ of the right hand side and to a morphism $(\phi, \phi') : (x, y, (\iota, \kappa)) \rightarrow (z, w, (\lambda, \mu))$ of the left hand side assigns the morphism ϕ . Indeed, the endo-functor of $I_{\mathcal{S}/\mathcal{S}'}$ induced by composing the two functors above is the identity on the nose, and the endo-functor induced on $\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'}, \mathcal{S}), \Delta} \mathcal{S}$ is isomorphic to the identity via the natural isomorphism

$$(\iota^{-1} \circ \kappa, \kappa \circ \iota^{-1} \circ \kappa) : (x, x, (\kappa^{-1} \circ \iota, \text{id}_x)) \longrightarrow (x, y, (\iota, \kappa)).$$

Some details omitted. \square

Definition 4.32.2. Let \mathcal{C} be a category.

- (1) Let $F : \mathcal{S} \rightarrow \mathcal{S}'$ be a 1-morphism of fibred categories over \mathcal{C} . The *relative inertia of \mathcal{S} over \mathcal{S}'* is the fibred category $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \rightarrow \mathcal{C}$ of Lemma 4.32.1.
- (2) By the *inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of \mathcal{S}* we mean $\mathcal{I}_{\mathcal{S}} = \mathcal{I}_{\mathcal{S}/\mathcal{C}}$.

Note that there are canonical 1-morphisms

$$(4.32.2.1) \quad \mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \quad \text{and} \quad \mathcal{I}_{\mathcal{S}} \longrightarrow \mathcal{S}$$

of fibred categories over \mathcal{C} . In terms of the description of Lemma 4.32.1 these simply map the object (x, α) to the object x and the morphism $\phi : (x, \alpha) \rightarrow (y, \beta)$ to the morphism $\phi : x \rightarrow y$. There is also a *neutral section*

$$(4.32.2.2) \quad e : \mathcal{S} \rightarrow \mathcal{I}_{\mathcal{S}/\mathcal{S}'} \quad \text{and} \quad e : \mathcal{S} \rightarrow \mathcal{I}_{\mathcal{S}}$$

defined by the rules $x \mapsto (x, \text{id}_x)$ and $(\phi : x \rightarrow y) \mapsto \phi$. This is a right inverse to (4.32.2.1). Given a 2-commutative square

$$\begin{array}{ccc} \mathcal{S}_1 & \xrightarrow{G} & \mathcal{S}_2 \\ F_1 \downarrow & & \downarrow F_2 \\ \mathcal{S}'_1 & \xrightarrow{G'} & \mathcal{S}'_2 \end{array}$$

there is a *functoriality map*

$$(4.32.2.3) \quad \mathcal{I}_{\mathcal{S}_1/\mathcal{S}'_1} \longrightarrow \mathcal{I}_{\mathcal{S}_2/\mathcal{S}'_2} \quad \text{and} \quad \mathcal{I}_{\mathcal{S}_1} \longrightarrow \mathcal{I}_{\mathcal{S}_2}$$

defined by the rules $(x, \alpha) \mapsto (G(x), G(\alpha))$ and $\phi \mapsto G(\phi)$. In particular there is always a comparison map

$$(4.32.2.4) \quad \mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{I}_{\mathcal{S}}$$

and all the maps above are compatible with this.

Lemma 4.32.3. *Let $F : \mathcal{S} \rightarrow \mathcal{S}'$ be a 1-morphism of categories fibred over a category \mathcal{C} . Then the diagram*

$$\begin{array}{ccc}
 \mathcal{I}_{\mathcal{S}/\mathcal{S}'} & \xrightarrow{(4.32.2.4)} & \mathcal{I}_{\mathcal{S}} \\
 F \circ (4.32.2.1) \downarrow & & \downarrow (4.32.2.3) \\
 \mathcal{S}' & \xrightarrow{e} & \mathcal{I}_{\mathcal{S}'}
 \end{array}$$

is a 2-fibre product.

Proof. Omitted. □

4.33. Categories fibred in groupoids

In this section we explain how to think about categories in groupoids and we see how they are basically the same as functors with values in the $(2, 1)$ -category of groupoids.

Definition 4.33.1. We say that \mathcal{S} is *fibred in groupoids* over \mathcal{C} if the following two conditions hold:

- (1) For every morphism $f : V \rightarrow U$ in \mathcal{C} and every lift x of U there is a lift $\phi : y \rightarrow x$ of f with target x .
- (2) For every pair of morphisms $\phi : y \rightarrow x$ and $\psi : z \rightarrow x$ and any morphism $f : p(z) \rightarrow p(y)$ such that $p(\phi) \circ f = p(\psi)$ there exists a unique lift $\chi : z \rightarrow y$ of f such that $\phi \circ \chi = \psi$.

Condition (2) phrased differently says that applying the functor p gives a bijection between the sets of dotted arrows in the following commutative diagram below:

$$\begin{array}{ccc}
 y & \longrightarrow & x \\
 \uparrow & \nearrow & \\
 z & & \\
 \vdots & & \\
 p(y) & \longrightarrow & p(x) \\
 \uparrow & \nearrow & \\
 p(z) & &
 \end{array}$$

Another way to think about the second condition is the following. Suppose that $g : W \rightarrow V$ and $f : V \rightarrow U$ are morphisms in \mathcal{C} . Let $x \in \text{Ob}(\mathcal{S}_U)$. By the first condition we can lift f to $\phi : y \rightarrow x$ and then we can lift g to $\psi : z \rightarrow y$. Instead of doing this two step process we can directly lift $g \circ f$ to $\gamma : z' \rightarrow x$. This gives the solid arrows in the diagram

$$(4.33.1.1) \quad
 \begin{array}{ccccc}
 & & z' & & \\
 & & \uparrow & \searrow \gamma & \\
 & & | & & \\
 & & \downarrow \psi & & \\
 z & \xrightarrow{\psi} & y & \xrightarrow{\phi} & x \\
 \downarrow p & & \downarrow p & & \downarrow p \\
 W & \xrightarrow{g} & V & \xrightarrow{f} & U
 \end{array}$$

where the squiggly arrows represent not morphisms but the functor p . Applying the second condition to the arrows $\phi \circ \psi$, γ and id_W we conclude that there is a unique morphism $\chi : z \rightarrow z'$ in \mathcal{S}_W such that $\gamma \circ \chi = \phi \circ \psi$. Similarly there is a unique morphism $z' \rightarrow z$. The uniqueness implies that the morphisms $z' \rightarrow z$ and $z \rightarrow z'$ are mutually inverse, in other words isomorphisms.

It should be clear from this discussion that a category fibred in groupoids is very closely related to a fibred category. Here is the result.

Lemma 4.33.2. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a functor. The following are equivalent*

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in groupoids, and
- (2) all fibre categories are groupoids and \mathcal{S} is a fibred category over \mathcal{C} .

Moreover, in this case every morphism of \mathcal{S} is strongly cartesian. In addition, given $f^*x \rightarrow x$ lying over f for all $f : V \rightarrow U = p(x)$ the data $(U \mapsto \mathcal{S}_U, f \mapsto f^*, \alpha_{f,g}, \alpha_U)$ constructed in Lemma 4.31.7 defines a pseudo functor from \mathcal{C}^{opp} in to the $(2, 1)$ -category of groupoids.

Proof. Assume $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids. To show all fibre categories \mathcal{S}_U for $U \in \text{Ob}(\mathcal{C})$ are groupoids, we must exhibit for every $f : y \rightarrow x$ in \mathcal{S}_U an inverse morphism. The diagram on the left (in \mathcal{S}_U) is mapped by p to the diagram on the right:

$$\begin{array}{ccc} y & \xrightarrow{f} & x \\ \uparrow & & \nearrow \text{id}_x \\ | & & \\ | & & \\ x & & \end{array} \qquad \begin{array}{ccc} U & \xrightarrow{\text{id}_U} & U \\ \uparrow & & \nearrow \text{id}_U \\ | & & \\ | & & \\ U & & \end{array}$$

Since only id_U makes the diagram on the right commute, there is a unique $g : x \rightarrow y$ making the diagram on the left commute, so $fg = \text{id}_x$. By a similar argument there is a unique $h : y \rightarrow x$ so that $gh = \text{id}_y$. Then $fgh = f : y \rightarrow x$. We have $fg = \text{id}_x$, so $h = f$. Condition (2) of Definition 4.33.1 says exactly that every morphism of \mathcal{S} is strongly cartesian. Hence condition (1) of Definition 4.33.1 implies that \mathcal{S} is a fibred category over \mathcal{C} .

Conversely, assume all fibre categories are groupoids and \mathcal{S} is a fibred category over \mathcal{C} . We have to check conditions (1) and (2) of Definition 4.33.1. The first condition follows trivially. Let $\phi : y \rightarrow x$, $\psi : z \rightarrow x$ and $f : p(z) \rightarrow p(y)$ such that $p(\phi) \circ f = p(\psi)$ be as in condition (2) of Definition 4.33.1. Write $U = p(x)$, $V = p(y)$, $W = p(z)$, $p(\phi) = g : V \rightarrow U$, $p(\psi) = h : W \rightarrow U$. Choose a strongly cartesian $g^*x \rightarrow x$ lying over g . Then we get a morphism $i : y \rightarrow g^*x$ in \mathcal{S}_V , which is therefore an isomorphism. We also get a morphism $j : z \rightarrow g^*x$ corresponding to the pair (ψ, f) as $g^*x \rightarrow x$ is strongly cartesian. Then one checks that $\chi = i^{-1} \circ j$ is a solution.

We have seen in the proof of (1) \Rightarrow (2) that every morphism of \mathcal{S} is strongly cartesian. The final statement follows directly from Lemma 4.31.7. \square

Lemma 4.33.3. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let \mathcal{S}' be the subcategory of \mathcal{S} defined as follows*

- (1) $\text{Ob}(\mathcal{S}') = \text{Ob}(\mathcal{S})$, and
- (2) for $x, y \in \text{Ob}(\mathcal{S}')$ the set of morphisms between x and y in \mathcal{S}' is the set of strongly cartesian morphisms between x and y in \mathcal{S} .

Let $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be the restriction of p to \mathcal{S}' . Then $p' : \mathcal{S}' \rightarrow \mathcal{C}$ is fibred in groupoids.

Proof. Note that the construction makes sense since by Lemma 4.31.2 the identity morphism of any object of \mathcal{S} is strongly cartesian, and the composition of strongly cartesian morphisms is strongly cartesian. The first lifting property of Definition 4.33.1 follows from the condition that in a fibred category given any morphism

$f : V \rightarrow U$ and x lying over U there exists a strongly cartesian morphism $\varphi : y \rightarrow x$ lying over f . Let us check the second lifting property of Definition 4.33.1 for the category $p' : \mathcal{S}' \rightarrow \mathcal{C}$ over \mathcal{C} . To do this we argue as in the discussion following Definition 4.33.1. Thus in Diagram 4.33.1.1 the morphisms ϕ, ψ and γ are strongly cartesian morphisms of \mathcal{S} . Hence γ and $\phi \circ \psi$ are strongly cartesian morphisms of \mathcal{S} lying over the same arrow of \mathcal{C} and having the same target in \mathcal{S} . By the discussion following Definition 4.31.1 this means these two arrows are isomorphic as desired (here we use also that any isomorphism in \mathcal{S} is strongly cartesian, by Lemma 4.31.2 again). \square

Example 4.33.4. A homomorphism of groups $p : G \rightarrow H$ gives rise to a functor $p : \mathcal{S} \rightarrow \mathcal{C}$ as in Example 4.2.12. This functor $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids if and only if p is surjective. The fibre category \mathcal{S}_U over the (unique) object $U \in \text{Ob}(\mathcal{C})$ is the category associated to the kernel of p as in Example 4.2.6.

Given $p : \mathcal{S} \rightarrow \mathcal{C}$, we can ask: if the fibre category \mathcal{S}_U is a groupoid for all $U \in \text{Ob}(\mathcal{C})$, must \mathcal{S} be fibred in groupoids over \mathcal{C} ? We can see the answer is no as follows. Start with a category fibred in groupoids $p : \mathcal{S} \rightarrow \mathcal{C}$. Altering the morphisms in \mathcal{S} which do not map to the identity morphism on some object does not alter the categories \mathcal{S}_U . Hence we can violate the existence and uniqueness conditions on lifts. One example is the functor from Example 4.33.4 when $G \rightarrow H$ is not surjective. Here is another example.

Example 4.33.5. Let $\text{Ob}(\mathcal{C}) = \{A, B, T\}$ and $\text{Mor}_{\mathcal{C}}(A, B) = \{f\}$, $\text{Mor}_{\mathcal{C}}(B, T) = \{g\}$, $\text{Mor}_{\mathcal{C}}(A, T) = \{h\} = \{gf\}$, plus the identity morphism for each object. See the diagram below for a picture of this category. Now let $\text{Ob}(\mathcal{S}) = \{A', B', T'\}$ and $\text{Mor}_{\mathcal{S}}(A', B') = \emptyset$, $\text{Mor}_{\mathcal{S}}(B', T') = \{g'\}$, $\text{Mor}_{\mathcal{S}}(A', T') = \{h'\}$, plus the identity morphisms. The functor $p : \mathcal{S} \rightarrow \mathcal{C}$ is obvious. Then for every $U \in \text{Ob}(\mathcal{C})$, \mathcal{S}_U is the category with one object and the identity morphism on that object, so a groupoid, but the morphism $f : A \rightarrow B$ cannot be lifted. Similarly, if we declare $\text{Mor}_{\mathcal{S}}(A', B') = \{f'_1, f'_2\}$ and $\text{Mor}_{\mathcal{S}}(A', T') = \{h'\} = \{g'f'_1\} = \{g'f'_2\}$, then the fibre categories are the same and $f : A \rightarrow B$ in the diagram below has two lifts.

Later we would like to make assertions such as “any category fibred in groupoids over \mathcal{C} is equivalent to a split one”, or “any category fibred in groupoids whose fibre categories are setlike is equivalent to a category fibred in sets”. The notion of equivalence depends on the 2-category we are working with.

Definition 4.33.6. Let \mathcal{C} be a category. The 2-category of categories fibred in groupoids over \mathcal{C} is the sub 2-category of the 2-category of fibred categories over \mathcal{C} (see Definition 4.31.9) defined as follows:

- (1) Its objects will be categories $p : \mathcal{S} \rightarrow \mathcal{C}$ fibred in groupoids.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).

- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism! Hence this is actually a (2, 1)-category and not just a 2-category. Here is the obligatory lemma on 2-fibre products.

Lemma 4.33.7. *Let \mathcal{C} be a category. The 2-category of categories fibred in groupoids over \mathcal{C} has 2-fibre products, and they are described as in Lemma 4.30.3.*

Proof. By Lemma 4.31.10 the fibre product as described in Lemma 4.30.3 is a fibred category. Hence it suffices to prove that the fibre categories are groupoids, see Lemma 4.33.2. By Lemma 4.30.4 it is enough to show that the 2-fibre product of groupoids is a groupoid, which is clear (from the construction in Lemma 4.29.4 for example). \square

Lemma 4.33.8. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be categories fibred in groupoids, and suppose that $G : \mathcal{S} \rightarrow \mathcal{S}'$ is a functor over \mathcal{C} .*

- (1) *Then G is faithful (resp. fully faithful, resp. an equivalence) if and only if for each $U \in \text{Ob}(\mathcal{C})$ the induced functor $G_U : \mathcal{S}_U \rightarrow \mathcal{S}'_U$ is faithful (resp. fully faithful, resp. an equivalence).*
- (2) *If G is an equivalence, then G is an equivalence in the 2-category of categories fibred in groupoids over \mathcal{C} .*

Proof. Let x, y be objects of \mathcal{S} lying over the same object U . Consider the commutative diagram

$$\begin{array}{ccc} \text{Mor}_{\mathcal{S}}(x, y) & \xrightarrow{G} & \text{Mor}_{\mathcal{S}'}(G(x), G(y)) \\ & \searrow p & \swarrow p' \\ & \text{Mor}_{\mathcal{C}}(U, U) & \end{array}$$

From this diagram it is clear that if G is faithful (resp. fully faithful) then so is each G_U .

Suppose G is an equivalence. For every object x' of \mathcal{S}' there exists an object x of \mathcal{S} such that $G(x)$ is isomorphic to x' . Suppose that x' lies over U' and x lies over U . Then there is an isomorphism $f : U' \rightarrow U$ in \mathcal{C} , namely, p' applied to the isomorphism $x' \rightarrow G(x)$. By the axioms of a category fibred in groupoids there exists an arrow $f^*x \rightarrow x$ of \mathcal{S} lying over f . Hence there exists an isomorphism $\alpha : x' \rightarrow G(f^*x)$ such that $p'(\alpha) = \text{id}_{U'}$ (this time by the axioms for \mathcal{S}'). All in all we conclude that for every object x' of \mathcal{S}' we can choose a pair $(o_{x'}, \alpha_{x'})$ consisting of an object $o_{x'}$ of \mathcal{S} and an isomorphism $\alpha_{x'} : x' \rightarrow G(o_{x'})$ with $p(\alpha_{x'}) = \text{id}_{p'(x')}$. From this point on we proceed as usual (see proof of Lemma 4.2.19) to produce an inverse functor $F : \mathcal{S}' \rightarrow \mathcal{S}$, by taking $x' \mapsto o_{x'}$ and $\varphi' : x' \rightarrow y'$ to the unique arrow $\varphi_{\varphi'} : o_{x'} \rightarrow o_{y'}$ with $\alpha_{y'}^{-1} \circ G(\varphi_{\varphi'}) \circ \alpha_{x'} = \varphi'$. With these choices F is a functor over \mathcal{C} . We omit the verification that $G \circ F$ and $F \circ G$ are 2-isomorphic (in the 2-category of categories fibred in groupoids over \mathcal{C}).

Suppose that G_U is faithful (resp. fully faithful) for all $U \in \text{Ob}(\mathcal{C})$. To show that G is faithful (resp. fully faithful) we have to show for any objects $x, y \in \text{Ob}(\mathcal{S})$ that G induces an injection (resp. bijection) between $\text{Mor}_{\mathcal{S}}(x, y)$ and $\text{Mor}_{\mathcal{S}'}(G(x), G(y))$. Set $U = p(x)$ and $V = p(y)$. It suffices to prove that G induces an injection (resp.

bijection) between morphism $x \rightarrow y$ lying over f to morphisms $G(x) \rightarrow G(y)$ lying over f for any morphism $f : U \rightarrow V$. Now fix $f : U \rightarrow V$. Denote $f^*y \rightarrow y$ a pullback. Then also $G(f^*y) \rightarrow G(y)$ is a pullback. The set of morphisms from x to y lying over f is bijective to the set of morphisms between x and f^*y lying over id_U . (By the second axiom of a category fibred in groupoids.) Similarly the set of morphisms from $G(x)$ to $G(y)$ lying over f is bijective to the set of morphisms between $G(x)$ and $G(f^*y)$ lying over id_U . Hence the fact that G_U is faithful (resp. fully faithful) gives the desired result.

Finally suppose for all G_U is an equivalence for all U , so it is fully faithful and essentially surjective. We have seen this implies G is fully faithful, and thus to prove it is an equivalence we have to prove that it is essentially surjective. This is clear, for if $z' \in \text{Ob}(\mathcal{S}')$ then $z' \in \text{Ob}(\mathcal{S}'_U)$ where $U = p'(z')$. Since G_U is essentially surjective we know that z' is isomorphic, in \mathcal{S}'_U , to an object of the form $G_U(z)$ for some $z \in \text{Ob}(\mathcal{S}_U)$. But morphisms in \mathcal{S}'_U are morphisms in \mathcal{S}' and hence z' is isomorphic to $G(z)$ in \mathcal{S}' . \square

Lemma 4.33.9. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be categories fibred in groupoids. Let $G : \mathcal{S} \rightarrow \mathcal{S}'$ be a functor over \mathcal{C} . Then G is fully faithful if and only if the diagonal*

$$\Delta_G : \mathcal{S} \longrightarrow \mathcal{S} \times_{G, \mathcal{S}', G} \mathcal{S}$$

is an equivalence.

Proof. By Lemma 4.33.8 it suffices to look at fibre categories over an object U of \mathcal{C} . An object of the right hand side is a triple (x, x', α) where $\alpha : G(x) \rightarrow G(x')$ is a morphism in \mathcal{S}'_U . The functor Δ_G maps the object x of \mathcal{S}_U to the triple $(x, x, \text{id}_{G(x)})$. Note that (x, x', α) is in the essential image of Δ_G if and only if $\alpha = G(\beta)$ for some morphism $\beta : x \rightarrow x'$ in \mathcal{S}_U (details omitted). Hence in order for Δ_G to be an equivalence, every α has to be the image of a morphism $\beta : x \rightarrow x'$, and also every two distinct morphisms $\beta, \beta' : x \rightarrow x'$ have to give distinct morphisms $G(\beta), G(\beta')$. This proves one direction of the lemma. We omit the proof of the other direction. \square

Lemma 4.33.10. *Let \mathcal{C} be a category. Let \mathcal{S}_i , $i = 1, 2, 3, 4$ be categories fibred in groupoids over \mathcal{C} . Suppose that $\varphi : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ and $\psi : \mathcal{S}_3 \rightarrow \mathcal{S}_4$ are equivalences over \mathcal{C} . Then*

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{S}_2, \mathcal{S}_3) \longrightarrow \text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{S}_1, \mathcal{S}_4), \quad \alpha \longmapsto \psi \circ \alpha \circ \varphi$$

is an equivalence of categories.

Proof. This is a generality and holds in any 2-category. \square

Lemma 4.33.11. *Let \mathcal{C} be a category. If $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids, then so is the inertia fibred category $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{C}$.*

Proof. Clear from the construction in Lemma 4.32.1 or by using (from the same lemma) that $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S} \times_{\Delta, \mathcal{S} \times_{\mathcal{C}} \mathcal{S}, \Delta} \mathcal{S}$ is an equivalence and appealing to Lemma 4.33.7. \square

Lemma 4.33.12. *Let \mathcal{C} be a category. Let $U \in \text{Ob}(\mathcal{C})$. If $p : \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in groupoids and p factors through $p' : \mathcal{S} \rightarrow \mathcal{C}/U$ then $p' : \mathcal{S} \rightarrow \mathcal{C}/U$ is fibred in groupoids.*

Proof. We have already seen in Lemma 4.31.11 that p' is a fibred category. Hence it suffices to prove the fibre categories are groupoids, see Lemma 4.33.2. For $V \in \text{Ob}(\mathcal{C})$ we have

$$\mathcal{S}_V = \coprod_{f:V \rightarrow U} \mathcal{S}_{(f:V \rightarrow U)}$$

where the left hand side is the fibre category of p and the right hand side is the disjoint union of the fibre categories of p' . Hence the result. \square

Lemma 4.33.13. *Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be functors between categories. If \mathcal{A} is fibred in groupoids over \mathcal{B} and \mathcal{B} is fibred in groupoids over \mathcal{C} , then \mathcal{A} is fibred in groupoids over \mathcal{C} .*

Proof. One can prove this directly from the definition. However, we will argue using the criterion of Lemma 4.33.2. By Lemma 4.31.12 we see that \mathcal{A} is fibred over \mathcal{C} . To finish the proof we show that the fibre category \mathcal{A}_U is a groupoid for U in \mathcal{C} . Namely, if $x \rightarrow y$ is a morphism of \mathcal{A}_U , then its image in \mathcal{B} is an isomorphism as \mathcal{B}_U is a groupoid. But then $x \rightarrow y$ is an isomorphism, for example by Lemma 4.31.2 and the fact that every morphism of \mathcal{A} is strongly \mathcal{B} -cartesian (see Lemma 4.33.2). \square

Lemma 4.33.14. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of \mathcal{S} . If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_y z$ exists and $p(x \times_y z) = p(x) \times_{p(y)} p(z)$.*

Proof. Follows from Lemma 4.31.13. \square

Lemma 4.33.15. *Let \mathcal{C} be a category. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over \mathcal{C} . There exists a factorization $\mathcal{X} \rightarrow \mathcal{X}' \rightarrow \mathcal{Y}$ by 1-morphisms of categories fibred in groupoids over \mathcal{C} such that $\mathcal{X} \rightarrow \mathcal{X}'$ is an equivalence over \mathcal{C} and such that \mathcal{X}' is a category fibred in groupoids over \mathcal{Y} .*

Proof. Denote $p : \mathcal{X} \rightarrow \mathcal{C}$ and $q : \mathcal{Y} \rightarrow \mathcal{C}$ the structure functors. We construct \mathcal{X}' explicitly as follows. An object of \mathcal{X}' is a quadruple (U, x, y, f) where $x \in \text{Ob}(\mathcal{X}_U)$, $y \in \text{Ob}(\mathcal{Y}_U)$ and $f : F(x) \rightarrow y$ is an isomorphism in \mathcal{Y}_U . A morphism $(a, b) : (U, x, y, f) \rightarrow (U', x', y', f')$ is given by $a : x \rightarrow x'$ and $b : y \rightarrow y'$ with $p(a) = q(b)$ and such that $f' \circ F(a) = b \circ f$. In other words $\mathcal{X}' = \mathcal{X} \times_{F, \mathcal{Y}, \text{id}} \mathcal{Y}$ with the construction of the 2-fibre product from Lemma 4.30.3. By Lemma 4.33.7 we see that \mathcal{X}' is a category fibred in groupoids over \mathcal{C} and that $\mathcal{X}' \rightarrow \mathcal{Y}$ is a morphism of categories over \mathcal{C} . As functor $\mathcal{X} \rightarrow \mathcal{X}'$ we take $x \mapsto (p(x), x, F(x), \text{id}_{F(x)})$ on objects and $(a : x \rightarrow x') \mapsto (a, F(a))$ on morphisms. It is clear that the composition $\mathcal{X} \rightarrow \mathcal{X}' \rightarrow \mathcal{Y}$ equals F . We omit the verification that $\mathcal{X} \rightarrow \mathcal{X}'$ is an equivalence of fibred categories over \mathcal{C} .

Finally, we have to show that $\mathcal{X}' \rightarrow \mathcal{Y}$ is a category fibred in groupoids. Let $b : y' \rightarrow y$ be a morphism in \mathcal{Y} and let (U, x, y, f) be an object of \mathcal{X}' lying over y . Because \mathcal{X} is fibred in groupoids over \mathcal{C} we can find a morphism $a : x' \rightarrow x$ lying over $U' = q(y') \rightarrow q(y) = U$. Since \mathcal{Y} is fibred in groupoids over \mathcal{C} and since both $F(x') \rightarrow F(x)$ and $y' \rightarrow y$ lie over the same morphism $U' \rightarrow U$ we can find $f' : F(x') \rightarrow y'$ lying over $\text{id}_{U'}$ such that $f \circ F(a) = b \circ f'$. Hence we obtain $(a, b) : (U', x', y', f') \rightarrow (U, x, y, f)$. This verifies the first condition (1) of Definition 4.33.1. To see (2) let $(a, b) : (U', x', y', f') \rightarrow (U, x, y, f)$ and $(a', b') : (U'', x'', y'', f'') \rightarrow (U, x, y, f)$ be morphisms of \mathcal{X}' and let $b'' : y' \rightarrow y''$ be a morphism of \mathcal{Y} such that $b' \circ b'' = b$. We have to show that there exists

a unique morphism $a'' : x' \rightarrow x''$ such that $f'' \circ F(a'') = b'' \circ f'$ and such that $(a', b') \circ (a'', b'') = (a, b)$. Because \mathcal{X} is fibred in groupoids we know there exists a unique morphism $a'' : x' \rightarrow x''$ such that $a' \circ a'' = a$ and $p(a'') = q(b'')$. Because \mathcal{Y} is fibred in groupoids we see that $F(a'')$ is the unique morphism $F(x') \rightarrow F(x'')$ such that $F(a') \circ F(a'') = F(a)$ and $q(F(a'')) = q(b'')$. The relation $f'' \circ F(a'') = b'' \circ f'$ follows from this and the given relations $f \circ F(a) = b \circ f'$ and $f \circ F(a') = b' \circ f''$. \square

Lemma 4.33.16. *Let \mathcal{C} be a category. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over \mathcal{C} . Assume we have a 2-commutative diagram*

$$\begin{array}{ccc} \mathcal{X}' & \xleftarrow{a} \mathcal{X} & \xrightarrow{b} \mathcal{X}'' \\ & \searrow f & \downarrow F \\ & & \mathcal{Y} \end{array}$$

where a and b are equivalences of categories over \mathcal{C} and f and g are categories fibred in groupoids. Then there exists an equivalence $h : \mathcal{X}'' \rightarrow \mathcal{X}'$ of categories over \mathcal{Y} such that $h \circ b$ is 2-isomorphic to a as 1-morphisms of categories over \mathcal{C} . If the diagram above actually commutes, then we can arrange it so that $h \circ b$ is 2-isomorphic to a as 1-morphisms of categories over \mathcal{Y} .

Proof. We will show that both \mathcal{X}' and \mathcal{X}'' over \mathcal{Y} are equivalent to the category fibred in groupoids $\mathcal{X} \times_{F, \mathcal{Y}, \text{id}} \mathcal{Y}$ over \mathcal{Y} , see proof of Lemma 4.33.15. Choose a quasi-inverse $b^{-1} : \mathcal{X}'' \rightarrow \mathcal{X}$ in the 2-category of categories over \mathcal{C} . Since the right triangle of the diagram is 2-commutative we see that

$$\begin{array}{ccc} \mathcal{X} & \xleftarrow{b^{-1}} \mathcal{X}'' & \\ F \downarrow & & \downarrow g \\ \mathcal{Y} & \xleftarrow{\quad} \mathcal{Y} & \end{array}$$

is 2-commutative. Hence we obtain a 1-morphism $c : \mathcal{X}'' \rightarrow \mathcal{X} \times_{F, \mathcal{Y}, \text{id}} \mathcal{Y}$ by the universal property of the 2-fibre product. Moreover c is a morphism of categories over \mathcal{Y} (!) and an equivalence (by the assumption that b is an equivalence, see Lemma 4.29.7). Hence c is an equivalence in the 2-category of categories fibred in groupoids over \mathcal{Y} by Lemma 4.33.8.

We still have to construct a 2-isomorphism between $c \circ b$ and the functor $d : \mathcal{X} \rightarrow \mathcal{X} \times_{F, \mathcal{Y}, \text{id}} \mathcal{Y}$, $x \mapsto (p(x), x, F(x), \text{id}_{F(x)})$ constructed in the proof of Lemma 4.33.15. Let $\alpha : F \rightarrow g \circ b$ and $\beta : b^{-1} \circ b \rightarrow \text{id}$ be 2-isomorphisms between 1-morphisms of categories over \mathcal{C} . Note that $c \circ b$ is given by the rule

$$x \mapsto (p(x), b^{-1}(b(x)), g(b(x)), \alpha_x \circ F(\beta_x))$$

on objects. Then we see that

$$(\beta_x, \alpha_x) : (p(x), x, F(x), \text{id}_{F(x)}) \longrightarrow (p(x), b^{-1}(b(x)), g(b(x)), \alpha_x \circ F(\beta_x))$$

is a functorial isomorphism which gives our 2-morphism $d \rightarrow b \circ c$. Finally, if the diagram commutes then α_x is the identity for all x and we see that this 2-morphism is a 2-morphism in the 2-category of categories over \mathcal{Y} . \square

4.34. Presheaves of categories

In this section we compare the notion of fibred categories with the closely related notion of a “presheaf of categories”. The basic construction is explained in the following example.

Example 4.34.1. Let \mathcal{C} be a category. Suppose that $F : \mathcal{C}^{opp} \rightarrow \mathit{Cat}$ is a functor to the 2-category of categories, see Definition 4.27.5. For $f : V \rightarrow U$ in \mathcal{C} we will suggestively write $F(f) = f^*$ for the functor from $F(U)$ to $F(V)$. From this we can construct a fibred category \mathcal{S}_F over \mathcal{C} as follows. Define

$$\mathrm{Ob}(\mathcal{S}_F) = \{(U, x) \mid U \in \mathrm{Ob}(\mathcal{C}), x \in \mathrm{Ob}(F(U))\}.$$

For $(U, x), (V, y) \in \mathrm{Ob}(\mathcal{S}_F)$ we define

$$\begin{aligned} \mathrm{Mor}_{\mathcal{S}_F}((V, y), (U, x)) &= \{(f, \phi) \mid f \in \mathrm{Mor}_{\mathcal{C}}(V, U), \phi \in \mathrm{Mor}_{F(V)}(y, f^*x)\} \\ &= \coprod_{f \in \mathrm{Mor}_{\mathcal{C}}(V, U)} \mathrm{Mor}_{F(V)}(y, f^*x) \end{aligned}$$

In order to define composition we use that $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of \mathcal{C} (by definition of a functor into a 2-category). Namely, we define the composition of $\psi : z \rightarrow g^*y$ and $\phi : y \rightarrow f^*x$ to be $g^*(\phi) \circ \psi$. The functor $p_F : \mathcal{S}_F \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. Let us check that this is indeed a fibred category. Given $f : V \rightarrow U$ in \mathcal{C} and (U, x) a lift of U , then we claim $(f, \mathrm{id}_{f^*x}) : (V, f^*x) \rightarrow (U, x)$ is a strongly cartesian lift of f . We have to show a h in the diagram on the left determines (h, ν) on the right:

$$\begin{array}{ccc} V & \xrightarrow{f} & U \\ \uparrow & \nearrow g & \\ W & & \end{array} \quad \begin{array}{ccc} (V, f^*x) & \xrightarrow{(f, \mathrm{id}_{f^*x})} & (U, x) \\ \uparrow & \nearrow (g, \psi) & \\ (W, z) & & \end{array}$$

Just take $\nu = \psi$ which works because $f \circ h = g$ and hence $g^*x = h^*f^*x$. Moreover, this is the only lift making the diagram (on the right) commute.

Definition 4.34.2. Let \mathcal{C} be a category. Suppose that $F : \mathcal{C}^{opp} \rightarrow \mathit{Cat}$ is a functor to the 2-category of categories. We will write $p_F : \mathcal{S}_F \rightarrow \mathcal{C}$ for the fibred category constructed in Example 4.34.1. A *split fibred category* is a fibred category isomorphic (!) over \mathcal{C} to one of these categories \mathcal{S}_F .

Lemma 4.34.3. *Let \mathcal{C} be a category. Let \mathcal{S} be a fibred category over \mathcal{C} . Then \mathcal{S} is split if and only if for some choice of pullbacks (see Definition 4.31.6) the pullback functors $(f \circ g)^*$ and $g^* \circ f^*$ are equal.*

Proof. This is immediate from the definitions. \square

Lemma 4.34.4. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. There exists a functor $F : \mathcal{C} \rightarrow \mathit{Cat}$ such that \mathcal{S} is equivalent to \mathcal{S}_F in the 2-category of fibred categories over \mathcal{C} . In other words, every fibred category is equivalent to a split one.*

Proof. Let us make a choice of pullbacks (see Definition 4.31.6). By Lemma 4.31.7 we get pullback functors f^* for every morphism f of \mathcal{C} .

We construct a new category \mathcal{S}' as follows. The objects of \mathcal{S}' are pairs (x, f) consisting of a morphism $f : V \rightarrow U$ of \mathcal{C} and an object x of \mathcal{S} over U , i.e., $x \in \mathrm{Ob}(\mathcal{S}_U)$. The functor $p' : \mathcal{S}' \rightarrow \mathcal{C}$ will map the pair (x, f) to the source of

the morphism f , in other words $p'(x, f : V \rightarrow U) = V$. A morphism $\varphi : (x_1, f_1 : V_1 \rightarrow U_1) \rightarrow (x_2, f_2 : V_2 \rightarrow U_2)$ is given by a pair (φ, g) consisting of a morphism $g : V_1 \rightarrow V_2$ and a morphism $\varphi : f_1^*x_1 \rightarrow f_2^*x_2$ with $p(\varphi) = g$. It is no problem to define the composition law: $(\varphi, g) \circ (\psi, h) = (\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \rightarrow \mathcal{S}'$ which simply maps x over U to the pair (x, id_x) .

At this point we need to check that p' makes \mathcal{S}' into a fibred category over \mathcal{C} , and we need to check that $\mathcal{S} \rightarrow \mathcal{S}'$ is an equivalence of categories over \mathcal{C} which maps strongly cartesian morphisms to strongly cartesian morphisms. We omit the verifications.

Finally, we can define pullback functors on \mathcal{S}' by setting $g^*(x, f) = (x, f \circ g)$ on objects if $g : V' \rightarrow V$ and $f : V \rightarrow U$. On morphisms $(\varphi, \text{id}_V) : (x_1, f_1) \rightarrow (x_2, f_2)$ between morphisms in \mathcal{S}'_V we set $g^*(\varphi, \text{id}_V) = (g^*\varphi, \text{id}_{V'})$ where we use the unique identifications $g^*f_i^*x_i = (f_i \circ g)^*x_i$ from Lemma 4.31.7 to think of $g^*\varphi$ as a morphism from $(f_1 \circ g)^*x_1$ to $(f_2 \circ g)^*x_2$. Clearly, these pullback functors g^* have the property that $g_1^* \circ g_2^* = (g_2 \circ g_1)^*$, in other words \mathcal{S}' is split as desired. \square

4.35. Presheaves of groupoids

In this section we compare the notion of categories fibred in groupoids with the closely related notion of a “presheaf of groupoids”. The basic construction is explained in the following example.

Example 4.35.1. This example is the analogue of Example 4.34.1, for “presheaves of groupoids” instead of “presheaves of categories”. The output will be a category fibred in groupoids instead of a fibred category. Suppose that $F : \mathcal{C}^{opp} \rightarrow \text{Groupoids}$ is a functor to the category of groupoids, see Definition 4.27.5. For $f : V \rightarrow U$ in \mathcal{C} we will suggestively write $F(f) = f^*$ for the functor from $F(U)$ to $F(V)$. We construct a category \mathcal{S}_F fibred in groupoids over \mathcal{C} as follows. Define

$$\text{Ob}(\mathcal{S}_F) = \{(U, x) \mid U \in \text{Ob}(\mathcal{C}), x \in \text{Ob}(F(U))\}.$$

For $(U, x), (V, y) \in \text{Ob}(\mathcal{S}_F)$ we define

$$\begin{aligned} \text{Mor}_{\mathcal{S}_F}((V, y), (U, x)) &= \{(f, \phi) \mid f \in \text{Mor}_{\mathcal{C}}(V, U), \phi \in \text{Mor}_{F(V)}(y, f^*x)\} \\ &= \coprod_{f \in \text{Mor}_{\mathcal{C}}(V, U)} \text{Mor}_{F(V)}(y, f^*x) \end{aligned}$$

In order to define composition we use that $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of \mathcal{C} (by definition of a functor into a 2-category). Namely, we define the composition of $\psi : z \rightarrow g^*y$ and $\phi : y \rightarrow f^*x$ to be $g^*(\phi) \circ \psi$. The functor $p_F : \mathcal{S}_F \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. The condition that $F(U)$ is a groupoid for every U guarantees that \mathcal{S}_F is fibred in groupoids over \mathcal{C} , as we have already seen in Example 4.34.1 that \mathcal{S}_F is a fibred category, see Lemma 4.33.2. But we can also prove conditions (1), (2) of Definition 4.33.1 directly as follows: (1) Lifts of morphisms exist since given $f : V \rightarrow U$ in \mathcal{C} and (U, x) an object of \mathcal{S}_F over U , then $(f, \text{id}_{f^*x}) : (V, f^*x) \rightarrow (U, x)$ is a lift of f . (2) Suppose given solid

diagrams as follows

$$\begin{array}{ccc}
 V & \xrightarrow{f} & U \\
 \uparrow & \nearrow g & \\
 h \downarrow & & \\
 W & &
 \end{array}
 \qquad
 \begin{array}{ccc}
 (V, y) & \xrightarrow{(f, \phi)} & (U, x) \\
 \uparrow & \nearrow (g, \psi) & \\
 (h, \nu) \downarrow & & \\
 (W, z) & &
 \end{array}$$

Then for the dotted arrows we have $\nu = (h^* \phi)^{-1} \circ \psi$ so given h there exists a ν which is unique by uniqueness of inverses.

Definition 4.35.2. Let \mathcal{C} be a category. Suppose that $F : \mathcal{C}^{opp} \rightarrow \text{Groupoids}$ is a functor to the 2-category of groupoids. We will write $p_F : \mathcal{S}_F \rightarrow \mathcal{C}$ for the category fibred in groupoids constructed in Example 4.35.1. A *split category fibred in groupoids* is a category fibred in groupoids isomorphic (!) over \mathcal{C} to one of these categories \mathcal{S}_F .

Lemma 4.35.3. *Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. There exists a functor $F : \mathcal{C} \rightarrow \text{Groupoids}$ such that \mathcal{S} is equivalent to \mathcal{S}_F over \mathcal{C} . In other words, every category fibred in groupoids is equivalent to a split one.*

Proof. Make a choice of pullbacks (see Definition 4.31.6). By Lemmas 4.31.7 and 4.33.2 we get pullback functors f^* for every morphism f of \mathcal{C} .

We construct a new category \mathcal{S}' as follows. The objects of \mathcal{S}' are pairs (x, f) consisting of a morphism $f : V \rightarrow U$ of \mathcal{C} and an object x of \mathcal{S} over U , i.e., $x \in \text{Ob}(\mathcal{S}_U)$. The functor $p' : \mathcal{S}' \rightarrow \mathcal{C}$ will map the pair (x, f) to the source of the morphism f , in other words $p'(x, f : V \rightarrow U) = V$. A morphism $\varphi : (x_1, f_1 : V_1 \rightarrow U_1) \rightarrow (x_2, f_2 : V_2 \rightarrow U_2)$ is given by a pair (φ, g) consisting of a morphism $g : V_1 \rightarrow V_2$ and a morphism $\varphi : f_1^* x_1 \rightarrow f_2^* x_2$ with $p(\varphi) = g$. It is no problem to define the composition law: $(\varphi, g) \circ (\psi, h) = (\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \rightarrow \mathcal{S}'$ which simply maps x over U to the pair (x, id_x) .

At this point we need to check that p' makes \mathcal{S}' into a category fibred in groupoids over \mathcal{C} , and we need to check that $\mathcal{S} \rightarrow \mathcal{S}'$ is an equivalence of categories over \mathcal{C} . We omit the verifications.

Finally, we can define pullback functors on \mathcal{S}' by setting $g^*(x, f) = (x, f \circ g)$ on objects if $g : V' \rightarrow V$ and $f : V \rightarrow U$. On morphisms $(\varphi, \text{id}_V) : (x_1, f_1) \rightarrow (x_2, f_2)$ between morphisms in \mathcal{S}'_V we set $g^*(\varphi, \text{id}_V) = (g^* \varphi, \text{id}_{V'})$ where we use the unique identifications $g^* f_i^* x_i = (f_i \circ g)^* x_i$ from Lemma 4.33.2 to think of $g^* \varphi$ as a morphism from $(f_1 \circ g)^* x_1$ to $(f_2 \circ g)^* x_2$. Clearly, these pullback functors g^* have the property that $g_1^* \circ g_2^* = (g_2 \circ g_1)^*$, in other words \mathcal{S}' is split as desired. \square

We will see an alternative proof of this lemma in Section 4.39.

4.36. Categories fibred in sets

Definition 4.36.1. A category is called *discrete* if the only morphisms are the identity morphisms.

A discrete category has only one interesting piece of information: its set of objects. Thus we sometime confuse discrete categories with sets.

Definition 4.36.2. Let \mathcal{C} be a category. A *category fibred in sets*, or a *category fibred in discrete categories* is a category fibred in groupoids all of whose fibre categories are discrete.

We want to clarify the relationship between categories fibred in sets and presheaves (see Definition 4.3.3). To do this it makes sense to first make the following definition.

Definition 4.36.3. Let \mathcal{C} be a category. The *2-category of categories fibred in sets over \mathcal{C}* is the sub 2-category of the category of categories fibred in groupoids over \mathcal{C} (see Definition 4.33.6) defined as follows:

- (1) Its objects will be categories $p : \mathcal{S} \rightarrow \mathcal{C}$ fibred in sets.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2, 1)$ -category. Here is the obligatory lemma on the existence of 2-fibre products.

Lemma 4.36.4. *Let \mathcal{C} be a category. The 2-category of categories fibred in sets over \mathcal{C} has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.30.3 returns a category fibred in sets if one starts out with such.*

Proof. Omitted. □

Example 4.36.5. This example is the analogue of Examples 4.34.1 and 4.35.1 for presheaves instead of “presheaves of categories”. The output will be a category fibred in sets instead of a fibred category. Suppose that $F : \mathcal{C}^{opp} \rightarrow \text{Sets}$ is a presheaf. For $f : V \rightarrow U$ in \mathcal{C} we will suggestively write $F(f) = f^* : F(U) \rightarrow F(V)$. We construct a category \mathcal{S}_F fibred in sets over \mathcal{C} as follows. Define

$$\text{Ob}(\mathcal{S}_F) = \{(U, x) \mid U \in \text{Ob}(\mathcal{C}), x \in \text{Ob}(F(U))\}.$$

For $(U, x), (V, y) \in \text{Ob}(\mathcal{S}_F)$ we define

$$\text{Mor}_{\mathcal{S}_F}((V, y), (U, x)) = \{f \in \text{Mor}_{\mathcal{C}}(V, U) \mid f^*x = y\}$$

Composition is inherited from composition in \mathcal{C} which works as $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of \mathcal{C} . The functor $p_F : \mathcal{S}_F \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. As every fibre category $\mathcal{S}_{F,U}$ is discrete with underlying set $F(U)$ and we have already see in Example 4.35.1 that \mathcal{S}_F is a category fibred in groupoids, we conclude that \mathcal{S}_F is fibred in sets.

Lemma 4.36.6. *Let \mathcal{C} be a category. The only 2-morphisms between categories fibred in sets are identities. In other words, the 2-category of categories fibred in sets is a category. Moreover, there is an equivalence of categories*

$$\left\{ \begin{array}{l} \text{the category of presheaves} \\ \text{of sets over } \mathcal{C} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{the category of categories} \\ \text{fibred in sets over } \mathcal{C} \end{array} \right\}$$

The functor from left to right is the construction $F \rightarrow \mathcal{S}_F$ discussed in Example 4.36.5. The functor from right to left assigns to $p : \mathcal{S} \rightarrow \mathcal{C}$ the presheaf of objects $U \mapsto \text{Ob}(\mathcal{S}_U)$.

Proof. The first assertion is clear, as the only morphisms in the fibre categories are identities.

Suppose that $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in sets. Let $f : V \rightarrow U$ be a morphism in \mathcal{C} and let $x \in \text{Ob}(\mathcal{S}_U)$. Then there is exactly one choice for the object f^*x . Thus we see that $(f \circ g)^*x = g^*(f^*x)$ for f, g as in Lemma 4.33.2. It follows that we may think of the assignments $U \mapsto \text{Ob}(\mathcal{S}_U)$ and $f \mapsto f^*$ as a presheaf on \mathcal{C} . \square

Here is an important example of a category fibred in sets.

Example 4.36.7. Let \mathcal{C} be a category. Let $X \in \text{Ob}(\mathcal{C})$. Consider the representable presheaf $h_X = \text{Mor}_{\mathcal{C}}(-, X)$ (see Example 4.3.4). On the other hand, consider the category $p : \mathcal{C}/X \rightarrow \mathcal{C}$ from Example 4.2.13. The fibre category $(\mathcal{C}/X)_U$ has as objects morphisms $h : U \rightarrow X$, and only identities as morphisms. Hence we see that under the correspondence of Lemma 4.36.6 we have

$$h_X \longleftrightarrow \mathcal{C}/X.$$

In other words, the category \mathcal{C}/X is canonically equivalent to the category \mathcal{S}_{h_X} associated to h_X in Example 4.36.5.

For this reason it is tempting to define a “representable” object in the 2-category of categories fibred in groupoids to be a category fibred in sets whose associated presheaf is representable. However, this would not be a good definition for use since we prefer to have a notion which is invariant under equivalences. To make this precise we study exactly which categories fibred in groupoids are equivalent to categories fibred in sets.

4.37. Categories fibred in setoids

Definition 4.37.1. Let us call a category a *setoid*⁴ if it is a groupoid where every object has exactly one automorphism: the identity.

If C is a set with an equivalence relation \sim , then we can make a setoid \mathcal{C} as follows: $\text{Ob}(\mathcal{C}) = C$ and $\text{Mor}_{\mathcal{C}}(x, y) = \emptyset$ unless $x \sim y$ in which case we set $\text{Mor}_{\mathcal{C}}(x, y) = \{1\}$. Transitivity of \sim means that we can compose morphisms. Conversely any setoid category defines an equivalence relation on its objects (isomorphism) such that you recover the category (up to unique isomorphism – not equivalence) from the procedure just described.

Discrete categories are setoids. For any setoid \mathcal{C} there is a canonical procedure to make a discrete category equivalent to it, namely one replaces $\text{Ob}(\mathcal{C})$ by the set of isomorphism classes (and adds identity morphisms). In terms of sets endowed with an equivalence relation this corresponds to taking the quotient by the equivalence relation.

Definition 4.37.2. Let \mathcal{C} be a category. A *category fibred in setoids* is a category fibred in groupoids all of whose fibre categories are setoids.

Below we will clarify the relationship between categories fibred in setoids and categories fibred in sets.

⁴A set on steroids!?

Definition 4.37.3. Let \mathcal{C} be a category. The 2-category of categories fibred in setoids over \mathcal{C} is the sub 2-category of the category of categories fibred in groupoids over \mathcal{C} (see Definition 4.33.6) defined as follows:

- (1) Its objects will be categories $p : \mathcal{S} \rightarrow \mathcal{C}$ fibred in setoids.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2, 1)$ -category.

Here is the obligatory lemma on the existence of 2-fibre products.

Lemma 4.37.4. *Let \mathcal{C} be a category. The 2-category of categories fibred in setoids over \mathcal{C} has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.30.3 returns a category fibred in setoids if one starts out with such.*

Proof. Omitted. □

Lemma 4.37.5. *Let \mathcal{C} be a category. Let \mathcal{S} be a category over \mathcal{C} .*

- (1) *If $\mathcal{S} \rightarrow \mathcal{S}'$ is an equivalence over \mathcal{C} with \mathcal{S}' fibred in sets over \mathcal{C} , then*
 - (a) *\mathcal{S} is fibred in setoids over \mathcal{C} , and*
 - (b) *for each $U \in \text{Ob}(\mathcal{C})$ the map $\text{Ob}(\mathcal{S}_U) \rightarrow \text{Ob}(\mathcal{S}'_U)$ identifies the target as the set of isomorphism classes of the source.*
- (2) *If $p : \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in setoids, then there exists a category fibred in sets $p' : \mathcal{S}' \rightarrow \mathcal{C}$ and an equivalence $\text{can} : \mathcal{S} \rightarrow \mathcal{S}'$ over \mathcal{C} .*

Proof. Let us prove (2). An object of the category \mathcal{S}' will be a pair (U, ξ) , where $U \in \text{Ob}(\mathcal{C})$ and ξ is an isomorphism class of objects of \mathcal{S}_U . A morphism $(U, \xi) \rightarrow (V, \psi)$ is given by a morphism $x \rightarrow y$, where $x \in \xi$ and $y \in \psi$. Here we identify two morphisms $x \rightarrow y$ and $x' \rightarrow y'$ if they induce the same morphism $U \rightarrow V$, and if for some choices of isomorphisms $x \rightarrow x'$ in \mathcal{S}_U and $y \rightarrow y'$ in \mathcal{S}_V the compositions $x \rightarrow x' \rightarrow y'$ and $x \rightarrow y \rightarrow y'$ agree. By construction there are surjective maps on objects and morphisms from $\mathcal{S} \rightarrow \mathcal{S}'$. We define composition of morphisms in \mathcal{S}' to be the unique law that turns $\mathcal{S} \rightarrow \mathcal{S}'$ into a functor. Some details omitted. □

Thus categories fibred in setoids are exactly the categories fibred in groupoids which are equivalent to categories fibred in sets. Moreover, an equivalence of categories fibred in sets is an isomorphism by Lemma 4.36.6.

Lemma 4.37.6. *Let \mathcal{C} be a category. The construction of Lemma 4.37.5 part (2) gives a functor*

$$F : \left\{ \begin{array}{l} \text{the 2-category of categories} \\ \text{fibred in setoids over } \mathcal{C} \end{array} \right\} \longrightarrow \left\{ \begin{array}{l} \text{the category of categories} \\ \text{fibred in sets over } \mathcal{C} \end{array} \right\}$$

(see Definition 4.27.5). *This functor is an equivalence in the following sense:*

- (1) *for any two 1-morphisms $f, g : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ with $F(f) = F(g)$ there exists a unique 2-isomorphism $f \rightarrow g$,*
- (2) *for any morphism $h : F(\mathcal{S}_1) \rightarrow F(\mathcal{S}_2)$ there exists a 1-morphism $f : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ with $F(f) = h$, and*
- (3) *any category fibred in sets \mathcal{S} is equal to $F(\mathcal{S})$.*

In particular, defining $F_i \in PSh(\mathcal{C})$ by the rule $F_i(U) = \text{Ob}(\mathcal{S}_{i,U})/\cong$, we have

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{S}_1, \mathcal{S}_2) \Big/ 2\text{-isomorphism} = \text{Mor}_{PSh(\mathcal{C})}(F_1, F_2)$$

More precisely, given any map $\phi : F_1 \rightarrow F_2$ there exists a 1-morphism $f : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ which induces ϕ on isomorphism classes of objects and which is unique up to unique 2-isomorphism.

Proof. By Lemma 4.36.6 the target of F is a category hence the assertion makes sense. The construction of Lemma 4.37.5 part (2) assigns to \mathcal{S} the category fibred in sets whose value over U is the set of isomorphism classes in \mathcal{S}_U . Hence it is clear that it defines a functor as indicated. Let $f, g : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ with $F(f) = F(g)$ be as in (1). For each object U of \mathcal{C} and each object x of $\mathcal{S}_{1,U}$ we see that $f(x) \cong g(x)$ by assumption. As \mathcal{S}_2 is fibred in setoids there exists a unique isomorphism $t_x : f(x) \rightarrow g(x)$ in $\mathcal{S}_{2,U}$. Clearly the rule $x \mapsto t_x$ gives the desired 2-isomorphism $f \rightarrow g$. We omit the proofs of (2) and (3). To see the final assertion use Lemma 4.36.6 to see that the right hand side is equal to $\text{Mor}_{\text{Cat}(\mathcal{C})}(F(\mathcal{S}_1), F(\mathcal{S}_2))$ and apply (1) and (2) above. \square

Here is another characterization of categories fibred in setoids among all categories fibred in groupoids.

Lemma 4.37.7. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. The following are equivalent:*

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in setoids, and
- (2) the canonical 1-morphism $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$, see (4.32.2.1), is an equivalence (of categories over \mathcal{C}).

Proof. Assume (2). The category $\mathcal{I}_{\mathcal{S}}$ has objects (x, α) where $x \in \mathcal{S}$, say with $p(x) = U$, and $\alpha : x \rightarrow x$ is a morphism in \mathcal{S}_U . Hence if $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$ is an equivalence over \mathcal{C} then every pair of objects $(x, \alpha), (x, \alpha')$ are isomorphic in the fibre category of $\mathcal{I}_{\mathcal{S}}$ over U . Looking at the definition of morphisms in $\mathcal{I}_{\mathcal{S}}$ we conclude that α, α' are conjugate in the group of automorphisms of x . Hence taking $\alpha' = \text{id}_x$ we conclude that every automorphism of x is equal to the identity. Since $\mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids this implies that $\mathcal{S} \rightarrow \mathcal{C}$ is fibred in setoids. We omit the proof of (1) \Rightarrow (2). \square

Lemma 4.37.8. *Let \mathcal{C} be a category. The construction of Lemma 4.37.6 which associates to a category fibred in setoids a presheaf is compatible with products, in the sense that the presheaf associated to a 2-fibre product $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ is the fibre product of the presheaves associated to $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$.*

Proof. Let $U \in \text{Ob}(\mathcal{C})$. The lemma just says that

$$\text{Ob}((\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_U)/\cong \quad \text{equals} \quad \text{Ob}(\mathcal{X}_U)/\cong \times_{\text{Ob}(\mathcal{Y}_U)/\cong} \text{Ob}(\mathcal{Z}_U)/\cong$$

the proof of which we omit. (But note that this would not be true in general if the category \mathcal{Y}_U is not a setoid.) \square

4.38. Representable categories fibred in groupoids

Here is our definition of a representable category fibred in groupoids. As promised this is invariant under equivalences.

Definition 4.38.1. Let \mathcal{C} be a category. A category fibred in groupoids $p : \mathcal{S} \rightarrow \mathcal{C}$ is called *representable* if there exists an object X of \mathcal{C} and an equivalence $j : \mathcal{S} \rightarrow \mathcal{C}/X$ (in the 2-category of groupoids over \mathcal{C}).

The usual abuse of notation is to say that X *represents* \mathcal{S} and not mention the equivalence j . We spell out what this entails.

Lemma 4.38.2. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids.*

- (1) \mathcal{S} is representable if and only if the following conditions are satisfied:
 - (a) \mathcal{S} is fibred in setoids, and
 - (b) the presheaf $U \mapsto \text{Ob}(\mathcal{S}_U)/\cong$ is representable.
- (2) If \mathcal{S} is representable the pair (X, j) , where j is the equivalence $j : \mathcal{S} \rightarrow \mathcal{C}/X$ is uniquely determined up to isomorphism.

Proof. The first assertion follows immediately from Lemma 4.37.5. For the second, suppose that $j' : \mathcal{S} \rightarrow \mathcal{C}/X'$ is a second such pair. Choose a 1-morphism $t' : \mathcal{C}/X' \rightarrow \mathcal{C}/X$ such that $j' \circ t' \cong \text{id}_{\mathcal{C}/X'}$ and $t' \circ j' \cong \text{id}_{\mathcal{S}}$. Then $j \circ t' : \mathcal{C}/X' \rightarrow \mathcal{C}/X$ is an equivalence. Hence it is an isomorphism, see Lemma 4.36.6. Hence by the Yoneda Lemma 4.3.5 (via Example 4.36.7 for example) it is given by an isomorphism $X' \rightarrow X$. \square

Lemma 4.38.3. *Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Assume that \mathcal{X}, \mathcal{Y} are representable by objects X, Y of \mathcal{C} . Then*

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{X}, \mathcal{Y}) / 2\text{-isomorphism} = \text{Mor}_{\mathcal{C}}(X, Y)$$

More precisely, given $\phi : X \rightarrow Y$ there exists a 1-morphism $f : \mathcal{X} \rightarrow \mathcal{Y}$ which induces ϕ on isomorphism classes of objects and which is unique up to unique 2-isomorphism.

Proof. By Example 4.36.7 we have $\mathcal{C}/X = \mathcal{S}_{h_X}$ and $\mathcal{C}/Y = \mathcal{S}_{h_Y}$. By Lemma 4.37.6 we have

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{X}, \mathcal{Y}) / 2\text{-isomorphism} = \text{Mor}_{\text{PSh}(\mathcal{C})}(h_X, h_Y)$$

By the Yoneda Lemma 4.3.5 we have $\text{Mor}_{\text{PSh}(\mathcal{C})}(h_X, h_Y) = \text{Mor}_{\mathcal{C}}(X, Y)$. \square

4.39. Representable 1-morphisms

Let \mathcal{C} be a category. In this section we explain what it means for a 1-morphism between categories fibred in groupoids over \mathcal{C} to be representable. Note that the 2-category of categories fibred in groupoids over \mathcal{C} is a “full” sub 2-category of the 2-category of categories over \mathcal{C} (see Definition 4.33.6). Hence if $\mathcal{S}, \mathcal{S}'$ are fibred in groupoids over \mathcal{C} then

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

denotes the category of 1-morphisms in this 2-category (see Definition 4.30.1). These are all groupoids, see remarks following Definition 4.33.6. Here is the 2-category analogue of the Yoneda lemma.

Lemma 4.39.1 (2-Yoneda lemma). *Let $\mathcal{S} \rightarrow \mathcal{C}$ be fibred in groupoids. Let $U \in \text{Ob}(\mathcal{C})$. The functor*

$$\text{Mor}_{\text{Cat}/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}) \longrightarrow \mathcal{S}_U$$

given by $G \mapsto G(\text{id}_U)$ is an equivalence.

Proof. Make a choice of pullbacks for \mathcal{S} (see Definition 4.31.6). We define a functor

$$\mathcal{S}_U \longrightarrow \text{Mor}_{\mathcal{C}/\mathcal{C}}(\mathcal{C}/U, \mathcal{S})$$

as follows. Given $x \in \text{Ob}(\mathcal{S}_U)$ the associated functor is

- (1) on objects: $(f : V \rightarrow U) \mapsto f^*x$, and
- (2) on morphisms: the arrow $(g : V'/U \rightarrow V/U)$ maps to the composition

$$(f \circ g)^*x \xrightarrow{(\alpha_{g,f})x} g^*f^*x \rightarrow f^*x$$

where $\alpha_{g,f}$ is as in Lemma 4.33.2.

We omit the verification that this is an inverse to the functor of the lemma. \square

Remark 4.39.2. We can use the 2-Yoneda lemma to give an alternative proof of Lemma 4.35.3. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. We define a contravariant functor F from \mathcal{C} to the category of groupoids as follows: for $U \in \text{Ob}(\mathcal{C})$ let

$$F(U) = \text{Mor}_{\mathcal{C}/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}).$$

If $f : U \rightarrow V$ the induced functor $\mathcal{C}/U \rightarrow \mathcal{C}/V$ induces the morphism $F(f) : F(V) \rightarrow F(U)$. Clearly F is a functor. Let \mathcal{S}' be the associated category fibred in groupoids from Example 4.35.1. There is an obvious functor $G : \mathcal{S}' \rightarrow \mathcal{S}$ over \mathcal{C} given by taking the pair (U, x) , where $U \in \text{Ob}(\mathcal{C})$ and $x \in F(U)$, to $x(\text{id}_U) \in \mathcal{S}$. Now Lemma 4.39.1 implies that for each U ,

$$G_U : \mathcal{S}'_U = F(U) = \text{Mor}_{\mathcal{C}/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}) \rightarrow \mathcal{S}_U$$

is an equivalence, and thus G equivalence between \mathcal{S} and \mathcal{S}' by Lemma 4.33.8.

Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Let $U \in \text{Ob}(\mathcal{C})$. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ and $G : \mathcal{C}/U \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over \mathcal{C} . We want to describe the 2-fibre product

$$\begin{array}{ccc} (\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} & \longrightarrow & \mathcal{X} \\ \downarrow & & \downarrow F \\ \mathcal{C}/U & \xrightarrow{G} & \mathcal{Y} \end{array}$$

Let $y = G(\text{id}_U) \in \mathcal{Y}_U$. Make a choice of pullbacks for \mathcal{Y} (see Definition 4.31.6). Then G is isomorphic to the functor $(f : V \rightarrow U) \mapsto f^*y$, see Lemma 4.39.1 and its proof. We may think of an object of $(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X}$ as a quadruple $(V, f : V \rightarrow U, x, \phi)$, see Lemma 4.30.3. Using the description of G above we may think of ϕ as an isomorphism $\phi : f^*y \rightarrow F(x)$ in \mathcal{Y}_V .

Lemma 4.39.3. *In the situation above the fibre category of $(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X}$ over an object $f : V \rightarrow U$ of \mathcal{C}/U is the category described as follows:*

- (1) objects are pairs (x, ϕ) , where $x \in \text{Ob}(\mathcal{X}_V)$, and $\phi : f^*y \rightarrow F(x)$ is a morphism in \mathcal{Y}_V ,
- (2) the set of morphisms between (x, ϕ) and (x', ϕ') is the set of morphisms $\psi : x \rightarrow x'$ in \mathcal{X}_V such that $F(\psi) = \phi' \circ \phi^{-1}$.

Proof. See discussion above. \square

Lemma 4.39.4. *Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. Let $G : \mathcal{C}/U \rightarrow \mathcal{Y}$ be a 1-morphism. Then*

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U$$

is a category fibred in groupoids.

Proof. We have already seen in Lemma 4.33.7 that the composition

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U \longrightarrow \mathcal{C}$$

is a category fibred in groupoids. Then the lemma follows from Lemma 4.33.12. \square

Definition 4.39.5. Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. We say F is *representable*, or that \mathcal{X} is *relatively representable over \mathcal{Y}* , if for every $U \in \text{Ob}(\mathcal{C})$ and any $G : \mathcal{C}/U \rightarrow \mathcal{Y}$ the category fibred in groupoids

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U$$

is representable over \mathcal{C}/U .

Lemma 4.39.6. *Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. If F is representable then every one of the functors*

$$F_U : \mathcal{X}_U \longrightarrow \mathcal{Y}_U$$

between fibre categories is faithful.

Proof. Clear from the description of fibre categories in Lemma 4.39.3 and the characterization of representable fibred categories in Lemma 4.38.2. \square

Lemma 4.39.7. *Let \mathcal{C} be a category. Let \mathcal{X}, \mathcal{Y} be categories fibred in groupoids over \mathcal{C} . Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. Make a choice of pullbacks for \mathcal{Y} . Assume*

- (1) *each functor $F_U : \mathcal{X}_U \longrightarrow \mathcal{Y}_U$ between fibre categories is faithful, and*
- (2) *for each U and each $y \in \mathcal{Y}_U$ the presheaf*

$$(f : V \rightarrow U) \longmapsto \{(x, \phi) \mid x \in \mathcal{X}_V, \phi : f^*y \rightarrow F(x)\} / \cong$$

is a representable presheaf on \mathcal{C}/U .

Then F is representable.

Proof. Clear from the description of fibre categories in Lemma 4.39.3 and the characterization of representable fibred categories in Lemma 4.38.2. \square

Before we state the next lemma we point out that the 2-category of categories fibred in groupoids is a $(2, 1)$ -category, and hence we know what it means to say that it has a final object (see Definition 4.29.1). And it has a final object namely $\text{id} : \mathcal{C} \rightarrow \mathcal{C}$. Thus we define 2-*products* of categories fibred in groupoids over \mathcal{C} as the 2-fibred products

$$\mathcal{X} \times \mathcal{Y} := \mathcal{X} \times_{\mathcal{C}} \mathcal{Y}.$$

With this definition in place the following lemma makes sense.

Lemma 4.39.8. *Let \mathcal{C} be a category. Let $\mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. Assume \mathcal{C} has products of pairs of objects and fibre products. The following are equivalent:*

- (1) *The diagonal $\mathcal{S} \rightarrow \mathcal{S} \times \mathcal{S}$ is representable.*

(2) For every U in \mathcal{C} , any $G : \mathcal{C}/U \rightarrow \mathcal{S}$ is representable.

Proof. Suppose the diagonal is representable, and let U, G be given. Consider any $V \in \text{Ob}(\mathcal{C})$ and any $G' : \mathcal{C}/V \rightarrow \mathcal{S}$. Note that $\mathcal{C}/U \times \mathcal{C}/V = \mathcal{C}/U \times V$ is representable. Hence the fibre product

$$\begin{array}{ccc} (\mathcal{C}/U \times V) \times_{(\mathcal{S} \times \mathcal{S})} \mathcal{S} & \longrightarrow & \mathcal{S} \\ \downarrow & & \downarrow \\ \mathcal{C}/U \times V & \xrightarrow{(G, G')} & \mathcal{S} \times \mathcal{S} \end{array}$$

is representable by assumption. This means there exists $W \rightarrow U \times V$ in \mathcal{C} , such that

$$\begin{array}{ccc} \mathcal{C}/W & \longrightarrow & \mathcal{S} \\ \downarrow & & \downarrow \\ \mathcal{C}/U \times \mathcal{C}/V & \longrightarrow & \mathcal{S} \times \mathcal{S} \end{array}$$

is cartesian. This implies that $\mathcal{C}/W \cong \mathcal{C}/U \times_{\mathcal{S}} \mathcal{C}/V$ (see Lemma 4.29.11) as desired.

Assume (2) holds. Consider any $V \in \text{Ob}(\mathcal{C})$ and any $(G, G') : \mathcal{C}/V \rightarrow \mathcal{S} \times \mathcal{S}$. We have to show that $\mathcal{C}/V \times_{\mathcal{S} \times \mathcal{S}} \mathcal{S}$ is representable. What we know is that $\mathcal{C}/V \times_{G, \mathcal{S}, G'} \mathcal{C}/V$ is representable, say by $a : W \rightarrow V$ in \mathcal{C}/V . The equivalence

$$\mathcal{C}/W \rightarrow \mathcal{C}/V \times_{G, \mathcal{S}, G'} \mathcal{C}/V$$

followed by the second projection to \mathcal{C}/V gives a second morphism $a' : W \rightarrow V$. Consider $W' = W \times_{(a, a'), V \times V} V$. There exists an equivalence

$$\mathcal{C}/W' \cong \mathcal{C}/V \times_{\mathcal{S} \times \mathcal{S}} \mathcal{S}$$

namely

$$\begin{aligned} \mathcal{C}/W' &\cong \mathcal{C}/W \times_{(\mathcal{C}/V \times \mathcal{C}/V)} \mathcal{C}/V \\ &\cong (\mathcal{C}/V \times_{(G, \mathcal{S}, G')} \mathcal{C}/V) \times_{(\mathcal{C}/V \times \mathcal{C}/V)} \mathcal{C}/V \\ &\cong \mathcal{C}/V \times_{(\mathcal{S} \times \mathcal{S})} \mathcal{S} \end{aligned}$$

(for the last isomorphism see Lemma 4.29.12) which proves the lemma. \square

Biographical notes: Parts of this have been taken from Vistoli's notes [Vis04].

4.40. A criterion for representability

The following lemma is often useful to prove the existence of universal objects in big categories, please see the discussion in Remark 4.40.2.

Lemma 4.40.1. *Let \mathcal{C} be a big⁵ category which has limits. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Assume that*

- (1) *F commutes with limits,*
- (2) *there exists a family $\{x_i\}_{i \in I}$ of objects of \mathcal{C} and for each $i \in I$ an element $f_i \in F(x_i)$ such that for $y \in \text{Ob}(\mathcal{C})$ and $g \in F(y)$ there exists an i and a morphism $\varphi : x_i \rightarrow y$ with $F(\varphi(f_i)) = g$.*

⁵See Remark 4.2.2.

Then F is representable, i.e., there exists an object x of \mathcal{C} such that

$$F(y) = \text{Mor}_{\mathcal{C}}(x, y)$$

functorially in y .

Proof. Let \mathcal{I} be the category whose objects are the pairs (x_i, f_i) and whose morphisms $(x_i, f_i) \rightarrow (x_{i'}, f_{i'})$ are maps $\varphi : x_i \rightarrow x_{i'}$ in \mathcal{C} such that $F(\varphi)(f_i) = f_{i'}$. Set

$$x = \lim_{(x_i, f_i) \in \mathcal{I}} x_i$$

(this will not be the x we are looking for, see below). The limit exists by assumption. As F commutes with limits we have

$$F(x) = \lim_{(x_i, f_i) \in \mathcal{I}} F(x_i).$$

Hence there is a universal element $f \in F(x)$ which maps to $f_i \in F(x_i)$ under F applied to the projection map $x \rightarrow x_i$. Using f we obtain a transformation of functors

$$\xi : \text{Mor}_{\mathcal{C}}(x, -) \longrightarrow F(-)$$

see Section 4.3. Let y be an arbitrary object of \mathcal{C} and let $g \in F(y)$. Choose $x_i \rightarrow y$ such that f_i maps to g which is possible by assumption. Then F applied to the maps

$$x \longrightarrow x_i \longrightarrow y$$

(the first being the projection map of the limit defining x) sends f to g . Hence the transformation ξ is surjective.

In order to find the object representing F we let $e : x' \rightarrow x$ be the equalizer of all self maps $\varphi : x \rightarrow x$ with $F(\varphi)(f) = f$. Since F commutes with limits, it commutes with equalizers, and we see there exists an $f' \in F(x')$ mapping to f in $F(x)$. Since ξ is surjective and since f' maps to x we see that also $\xi' : \text{Mor}_{\mathcal{C}}(x', -) \rightarrow F(-)$ is surjective. Finally, suppose that $a, b : x' \rightarrow y$ are two maps such that $F(a)(f) = F(b)(f)$. We have to show $a = b$. Consider the equalizer $e' : x'' \rightarrow x'$. Again we find $f'' \in F(x'')$ mapping to f' . Choose a map $\psi : x \rightarrow x''$ such that $F(\psi)(f) = f''$. Then we see that $e \circ e' \circ \psi : x \rightarrow x$ is a morphism with $F(e \circ e' \circ \psi)(f) = f$. Hence $e \circ e' \circ \psi \circ e = e$. This means that $e : x' \rightarrow x$ factors through $e' \circ e : x'' \rightarrow x$ and since e and e' are monomorphisms this implies $x'' = x'$, i.e., $a = b$ as desired. \square

Remark 4.40.2. The lemma above is often used to construct the free something on something. For example the free abelian group on a set, the free group on a set, etc. The idea, say in the case of the free group on a set E is to consider the functor

$$F : \text{Groups} \rightarrow \text{Sets}, \quad G \longmapsto \text{Map}(E, G)$$

This functor commutes with limits. As our family of objects we can take a family $E \rightarrow G_i$ consisting of groups G_i of cardinality at most $\max(\aleph_0, |E|)$ and set maps $E \rightarrow G_i$ such that every isomorphism class of such a structure occurs at least once. Namely, if $E \rightarrow G$ is a map from E to a group G , then the subgroup G' generated by the image has cardinality at most $\max(\aleph_0, |G|)$. The lemma tells us the functor is representable, hence there exists a group F_E such that $\text{Mor}_{\text{Groups}}(F_E, G) = \text{Map}(E, G)$. In particular, the identity morphism of F_E corresponds to a map $E \rightarrow F_E$ and one can show that F_E is generated by the image without imposing any relations.

Another typical application is that we can use the lemma to construct colimits once it is known that limits exist. We illustrate it using the category of topological spaces which has limits by Topology, Lemma 5.13.1. Namely, suppose that $\mathcal{I} \rightarrow \text{Top}$, $i \mapsto X_i$ is a functor. Then we can consider

$$F : \text{Top} \longrightarrow \text{Sets}, \quad Y \longmapsto \lim_{\mathcal{I}} \text{Mor}_{\text{Top}}(X_i, Y)$$

This functor commutes with limits. Moreover, given any topological space Y and an element $(\varphi_i : X_i \rightarrow Y)$ of $F(Y)$, there is a subspace $Y' \subset Y$ of cardinality at most $|\coprod X_i|$ such that the morphisms φ_i map into Y' . Namely, we can take the induced topology on the union of the images of the φ_i . Thus it is clear that the hypotheses of the lemma are satisfied and we find a topological space X representing the functor F , which precisely means that X is the colimit of the diagram $i \mapsto X_i$.

Theorem 4.40.3 (Adjoint functor theorem). *Let $G : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of big categories. Assume \mathcal{C} has limits, G commutes with them, and for every object y of \mathcal{D} there exists a set of pairs $(x_i, f_i)_{i \in I}$ with $x_i \in \text{Ob}(\mathcal{C})$, $f_i \in \text{Mor}_{\mathcal{C}}(y, G(x_i))$ such that for any pair (x, f) with $x \in \text{Ob}(\mathcal{C})$, $f \in \text{Mor}_{\mathcal{C}}(y, G(x))$ there is an i and a morphism $h : x_i \rightarrow x$ such that $f = G(h) \circ f_i$. Then G has a left adjoint F .*

Proof. The assumptions imply that for every object y of \mathcal{D} the functor $x \mapsto \text{Mor}_{\mathcal{D}}(y, G(x))$ satisfies the assumptions of Lemma 4.40.1. Thus it is representable by an object, let's call it $F(y)$. An application of Yoneda's lemma (Lemma 4.3.5) turns the rule $y \mapsto F(y)$ into a functor which by construction is an adjoint to G . We omit the details. \square

CHAPTER 5

Topology

5.1. Introduction

Basic topology will be explained in this document. A reference is [Eng77].

5.2. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

- (1) X is a *topological space*,
- (2) $x \in X$ is a *point*,
- (3) $x \in X$ is a *closed point*,
- (4) $E \subset X$ is a *dense set*,
- (5) $f : X_1 \rightarrow X_2$ is *continuous*,
- (6) a continuous map of spaces $f : X \rightarrow Y$ is *open* if $f(U)$ is open in Y for $U \subset X$ open,
- (7) a continuous map of spaces $f : X \rightarrow Y$ is *closed* if $f(Z)$ is closed in Y for $Z \subset X$ closed,
- (8) a *neighbourhood of $x \in X$* is any subset $E \subset X$ which contains an open subset that contains x ,
- (9) the *induced topology* on a subset $E \subset X$,
- (10) $\mathcal{U} : U = \bigcup_{i \in I} U_i$ is an *open covering of U* (note: we allow any U_i to be empty and we even allow, in case U is empty, the empty set for I),
- (11) the open covering \mathcal{V} is a *refinement* of the open covering \mathcal{U} (if $\mathcal{V} : V = \bigcup_{j \in J} V_j$ and $\mathcal{U} : U = \bigcup_{i \in I} U_i$ this means each V_j is completely contained in one of the U_i),
- (12) $\{E_i\}_{i \in I}$ is a *fundamental system of neighbourhoods of x in X* ,
- (13) a topological space X is called *Hausdorff* or *separated* if and only if for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U, y \in V$,
- (14) the *product* of two topological spaces,
- (15) the *fibre product* $X \times_Y Z$ of a pair of continuous maps $f : X \rightarrow Y$ and $g : Z \rightarrow Y$,
- (16) etc.

5.3. Hausdorff spaces

The category of topological spaces has finite products.

Lemma 5.3.1. *Let X be a topological space. The following are equivalent*

- (1) X is Hausdorff,
- (2) the diagonal $\Delta(X) \subset X \times X$ is closed.

Proof. Omitted. □

Lemma 5.3.2. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If Y is Hausdorff, then the graph of f is closed in $X \times Y$.*

Proof. The graph is the inverse image of the diagonal under the map $X \times Y \rightarrow Y \times Y$. Thus the lemma follows from Lemma 5.3.1. □

Lemma 5.3.3. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $s : Y \rightarrow X$ be a continuous map such that $f \circ s = id_Y$. If X is Hausdorff, then $s(Y)$ is closed.*

Proof. This follows from Lemma 5.3.1 as $s(Y) = \{x \in X \mid x = s(f(x))\}$. □

Lemma 5.3.4. *Let $X \rightarrow Z$ and $Y \rightarrow Z$ be continuous maps of topological spaces. If Z is Hausdorff, then $X \times_Z Y$ is closed in $X \times Y$.*

Proof. This follows from Lemma 5.3.1 as $X \times_Z Y$ is the inverse image of $\Delta(Z)$ under $X \times Y \rightarrow Z \times Z$. □

5.4. Bases

Basic material on bases for topological spaces.

Definition 5.4.1. Let X be a topological space. A collection of subsets \mathcal{B} of X is called a *base for the topology on X* or a *basis for the topology on X* if the following conditions hold:

- (1) Every element $B \in \mathcal{B}$ is open in X .
- (2) For every open $U \subset X$ and every $x \in U$, there exists an element $B \in \mathcal{B}$ such that $x \in B \subset U$.

Let X be a set and let \mathcal{B} be a collection of subsets. Assume that $X = \bigcup_{B \in \mathcal{B}} B$ and that given $x \in B_1 \cap B_2$ with $B_1, B_2 \in \mathcal{B}$ there is a $B_3 \in \mathcal{B}$ with $x \in B_3 \subset B_1 \cap B_2$. Then there is a unique topology on X such that \mathcal{B} is a basis for this topology. This remark is sometimes used to define a topology.

Lemma 5.4.2. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let $\mathcal{U} : U = \bigcup_i U_i$ be an open covering of $U \subset X$. There exists an open covering $U = \bigcup_j V_j$ which is a refinement of \mathcal{U} such that each V_j is an element of the basis \mathcal{B} .*

Proof. Omitted. □

Definition 5.4.3. Let X be a topological space. A collection of subsets \mathcal{B} of X is called a *subbase for the topology on X* or a *subbasis for the topology on X* if the finite intersections of elements of \mathcal{B} forms a basis for the topology on X .

In particular every element of \mathcal{B} is open.

Lemma 5.4.4. *Let X be a set. Given any collection \mathcal{B} of subsets of X there is a unique topology on X such that \mathcal{B} is a subbase for this topology.*

Proof. Omitted. □

5.5. Submersive maps

If X is a topological space and $E \subset X$ is a subset, then we usually endow E with the *induced topology*.

Lemma 5.5.1. *Let X be a topological space. Let Y be a set and let $f : Y \rightarrow X$ be an injective map of sets. The induced topology on Y is the topology characterized by each of the following statements*

- (1) *it is the weakest topology on Y such that f is continuous,*
- (2) *the open subsets of Y are $f^{-1}(U)$ for $U \subset X$ open,*
- (3) *the closed subsets of Y are the sets $f^{-1}(Z)$ for $Z \subset X$ closed.*

Proof. Omitted. □

Dually, if X is a topological space and $X \rightarrow Y$ is a surjection of sets, then Y can be endowed with the *quotient topology*.

Lemma 5.5.2. *Let X be a topological space. Let Y be a set and let $f : X \rightarrow Y$ be a surjective map of sets. The quotient topology on Y is the topology characterized by each of the following statements*

- (1) *it is the strongest topology on Y such that f is continuous,*
- (2) *a subset V of Y is open if and only if $f^{-1}(V)$ is open,*
- (3) *a subset Z of Y is closed if and only if $f^{-1}(Z)$ is closed.*

Proof. Omitted. □

Let $f : X \rightarrow Y$ be a continuous map of topological spaces. In this case we obtain a factorization $X \rightarrow f(X) \rightarrow Y$ of maps of sets. We can endow $f(X)$ with the quotient topology coming from the surjection $X \rightarrow f(X)$ or with the induced topology coming from the injection $f(X) \rightarrow Y$. The map

$$(f(X), \text{quotient topology}) \longrightarrow (f(X), \text{induced topology})$$

is continuous.

Definition 5.5.3. Let $f : X \rightarrow Y$ be a continuous map of topological spaces.

- (1) We say f is a *strict map of topological spaces* if the induced topology and the quotient topology on $f(X)$ agree (see discussion above).
- (2) We say f is *submersive*¹ if f is surjective and strict.

Thus a continuous map $f : X \rightarrow Y$ is submersive if f is surjection and for any $T \subset Y$ we have T is open or closed if and only if $f^{-1}(T)$ is so. In other words, Y has the quotient topology relative to the surjection $X \rightarrow Y$.

Lemma 5.5.4. *Let $f : X \rightarrow Y$ be surjective, open, continuous map of topological spaces. Let $T \subset Y$ be a subset. Then*

- (1) $f^{-1}(\overline{T}) = \overline{f^{-1}(T)}$,
- (2) $T \subset Y$ is closed if and only if $f^{-1}(T)$ is closed,
- (3) $T \subset Y$ is open if and only if $f^{-1}(T)$ is open, and
- (4) $T \subset Y$ is locally closed if and only if $f^{-1}(T)$ is locally closed.

In particular we see that f is submersive.

¹This is very different from the notion of a submersion between differential manifolds! It is probably a good idea to use “strict and surjective” in stead of “submersive”.

Proof. It is clear that $\overline{f^{-1}(T)} \subset f^{-1}(\overline{T})$. If $x \in X$, and $x \notin \overline{f^{-1}(T)}$, then there exists an open neighbourhood $x \in U \subset X$ with $U \cap f^{-1}(T) = \emptyset$. Since f is open we see that $f(U)$ is an open neighbourhood of $f(x)$ not meeting T . Hence $x \notin f^{-1}(\overline{T})$. This proves (1). Part (2) is an easy consequence of (1). Part (3) is obvious from the fact that f is open and surjective. For (4), if $f^{-1}(T)$ is locally closed, then $f^{-1}(T) \subset \overline{f^{-1}(T)} = f^{-1}(\overline{T})$ is open, and hence by (3) applied to the map $f^{-1}(\overline{T}) \rightarrow \overline{T}$ we see that T is open in \overline{T} , i.e., T is locally closed. \square

Lemma 5.5.5. *Let $f : X \rightarrow Y$ be surjective, closed, continuous map of topological spaces. Let $T \subset Y$ be a subset. Then*

- (1) $f^{-1}(\overline{T}) = \overline{f^{-1}(T)}$,
- (2) $T \subset Y$ is closed if and only if $f^{-1}(T)$ is closed,
- (3) $T \subset Y$ is open if and only if $f^{-1}(T)$ is open, and
- (4) $T \subset Y$ is locally closed if and only if $f^{-1}(T)$ is locally closed.

In particular we see that f is submersive.

Proof. It is clear that $\overline{f^{-1}(T)} \subset f^{-1}(\overline{T})$. Then $T \subset f(\overline{f^{-1}(T)}) \subset \overline{T}$ is a closed subset, hence we get (1). Part (2) is obvious from the fact that f is closed and surjective. Part (3) follows from (2) applied to the complement of T . For (4), if $f^{-1}(T)$ is locally closed, then $f^{-1}(T) \subset \overline{f^{-1}(T)} = f^{-1}(\overline{T})$ is open, and hence by (3) applied to the map $f^{-1}(\overline{T}) \rightarrow \overline{T}$ we see that T is open in \overline{T} , i.e., T is locally closed. \square

5.6. Connected components

Definition 5.6.1. Let X be a topological space.

- (1) We say X is *connected* if X is not empty and whenever $X = T_1 \amalg T_2$ with $T_i \subset X$ open and closed, then either $T_1 = \emptyset$ or $T_2 = \emptyset$.
- (2) We say $T \subset X$ is a *connected component* of X if T is a maximal connected subset of X .

The empty space is not connected.

Lemma 5.6.2. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If $E \subset X$ is a connected subset, then $f(E) \subset Y$ is connected as well.*

Proof. Omitted. \square

Lemma 5.6.3. *Let X be a topological space. If $T \subset X$ is connected, then so is its closure. Each point of X is contained in a connected component. Connected components are always closed, but not necessarily open.*

Proof. Let \overline{T} be the closure of the connected subset T . Suppose $\overline{T} = T_1 \amalg T_2$ with $T_i \subset \overline{T}$ open and closed. Then $T = (T \cap T_1) \amalg (T \cap T_2)$. Hence T equals one of the two, say $T = T_1 \cap T$. Thus clearly $\overline{T} \subset T_1$ as desired.

Pick a point $x \in X$. Consider the set A of connected subsets $x \in T_\alpha \subset X$. Note that A is nonempty since $\{x\} \in A$. There is a partial ordering on A coming from inclusion: $\alpha \leq \alpha' \Leftrightarrow T_\alpha \subset T_{\alpha'}$. Choose a maximal totally ordered subset $A' \subset A$, and let $T = \bigcup_{\alpha \in A'} T_\alpha$. We claim that T is connected. Namely, suppose that $T = T_1 \amalg T_2$ is a disjoint union of two open and closed subsets of T . For each $\alpha \in A'$ we have either $T_\alpha \subset T_1$ or $T_\alpha \subset T_2$, by connectedness of T_α . Suppose that

for some $\alpha_0 \in A'$ we have $T_{\alpha_0} \not\subset T_1$ (say, if not we're done anyway). Then, since A' is totally ordered we see immediately that $T_\alpha \subset T_2$ for all $\alpha \in A'$. Hence $T = T_2$.

To get an example where connected components are not open, just take an infinite product $\prod_{n \in \mathbf{N}} \{0, 1\}$ with the product topology. This is a totally disconnected space so connected components are singletons, which are not open. \square

Lemma 5.6.4. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that*

- (1) *all fibres of f are connected, and*
- (2) *a set $T \subset Y$ is closed if and only if $f^{-1}(T)$ is closed.*

Then f induces a bijection between the sets of connected components of X and Y .

Proof. Let $T \subset Y$ be a connected component. Note that T is closed, see Lemma 5.6.3. The lemma follows if we show that $f^{-1}(T)$ is connected because any connected subset of X maps into a connected component of Y by Lemma 5.6.2. Suppose that $f^{-1}(T) = Z_1 \amalg Z_2$ with Z_1, Z_2 closed. For any $t \in T$ we see that $f^{-1}(\{t\}) = Z_1 \cap f^{-1}(\{t\}) \amalg Z_2 \cap f^{-1}(\{t\})$. By (1) we see $f^{-1}(\{t\})$ is connected we conclude that either $f^{-1}(\{t\}) \subset Z_1$ or $f^{-1}(\{t\}) \subset Z_2$. In other words $T = T_1 \amalg T_2$ with $f^{-1}(T_i) = Z_i$. By (2) we conclude that T_i is closed in Y . Hence either $T_1 = \emptyset$ or $T_2 = \emptyset$ as desired. \square

Lemma 5.6.5. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) f is open, (b) all fibres of f are connected. Then f induces a bijection between the sets of connected components of X and Y .*

Proof. This is a special case of Lemma 5.6.4. \square

Lemma 5.6.6. *Let $f : X \rightarrow Y$ be a continuous map of nonempty topological spaces. Assume that (a) Y is connected, (b) f is open and closed, and (c) there is a point $y \in Y$ such that the fiber $f^{-1}(y)$ is a finite set. Then X has at most $|f^{-1}(y)|$ connected components. Hence any connected component T of X is open and closed, and $p(T)$ is a nonempty open and closed subset of Y , which is therefore equal to Y .*

Proof. If the topological space X has at least N connected components for some $N \in \mathbf{N}$, we find by induction a decomposition $X = X_1 \amalg \dots \amalg X_N$ of X as a disjoint union of N nonempty open and closed subsets X_1, \dots, X_N of X . As f is open and closed, each $f(X_i)$ is a nonempty open and closed subset of Y and is hence equal to Y . In particular the intersection $X_i \cap f^{-1}(y)$ is nonempty for each $1 \leq i \leq N$. Hence $f^{-1}(y)$ has at least N elements. \square

Definition 5.6.7. A topological space is *totally disconnected* if the connected components are all singletons.

A discrete space is totally disconnected. A totally disconnected space need not be discrete, for example $\mathbf{Q} \subset \mathbf{R}$ is totally disconnected but not discrete.

Lemma 5.6.8. *Let X be a topological space. Let $\pi_0(X)$ be the set of connected components of X . Let $X \rightarrow \pi_0(X)$ be the map which sends $x \in X$ to the connected component of X passing through x . Endow $\pi_0(X)$ with the quotient topology. Then $\pi_0(X)$ is a totally disconnected space and any continuous map $X \rightarrow Y$ from X to a totally disconnected space Y factors through $\pi_0(X)$.*

Proof. By Lemma 5.6.4 the connected components of $\pi_0(X)$ are the singletons. We omit the proof of the second statement. \square

Definition 5.6.9. A topological space X is called *locally connected* if every point $x \in X$ has a fundamental system of connected neighbourhoods.

Lemma 5.6.10. *Let X be a topological space. If X is locally connected, then*

- (1) *any open subset of X is locally connected, and*
- (2) *the connected components of X are open.*

So also the connected components of open subsets of X are open. In particular, every point has a fundamental system of open connected neighbourhoods.

Proof. Omitted. \square

5.7. Irreducible components

Definition 5.7.1. Let X be a topological space.

- (1) We say X is *irreducible*, if X is not empty, and whenever $X = Z_1 \cup Z_2$ with Z_i closed, we have $X = Z_1$ or $X = Z_2$.
- (2) We say $Z \subset X$ is an *irreducible component* of X if Z is a maximal irreducible subset of X .

An irreducible space is obviously connected.

Lemma 5.7.2. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If $E \subset X$ is an irreducible subset, then $f(E) \subset Y$ is irreducible as well.*

Proof. Suppose $f(E)$ is the union of $Z_1 \cap f(E)$ and $Z_2 \cap f(E)$, for two distinct closed subsets Z_1 and Z_2 of Y ; this is equal to the intersection $(Z_1 \cup Z_2) \cap f(E)$, so $f(E)$ is then contained in the union $Z_1 \cup Z_2$. For the irreducibility of $f(E)$ it suffices to show that it is contained in either Z_1 or Z_2 . The relation $f(E) \subset Z_1 \cup Z_2$ shows that $f^{-1}(f(E)) \subset f^{-1}(Z_1 \cup Z_2)$; as the right-hand side is clearly equal to $f^{-1}(Z_1) \cup f^{-1}(Z_2)$ and since $E \subset f^{-1}(f(E))$, it follows that $E \subset f^{-1}(Z_1) \cup f^{-1}(Z_2)$, from which one concludes by the irreducibility of E that $E \subset f^{-1}(Z_1)$ or $E \subset f^{-1}(Z_2)$. Hence one sees that either $f(E) \subset f(f^{-1}(Z_1)) \subset Z_1$ or $f(E) \subset Z_2$. \square

Lemma 5.7.3. *Let X be a topological space.*

- (1) *If $T \subset X$ is irreducible so is its closure in X .*
- (2) *Any irreducible component of X is closed.*
- (3) *Every irreducible subset of X is contained in some irreducible component of X .*
- (4) *Every point of X is contained in some irreducible component of X , in other words, X is the union of its irreducible components.*

Proof. Let \bar{T} be the closure of the irreducible subset T . If $\bar{T} = Z_1 \cup Z_2$ with $Z_i \subset \bar{T}$ closed, then $T = (T \cap Z_1) \cup (T \cap Z_2)$ and hence T equals one of the two, say $T = Z_1 \cap T$. Thus clearly $\bar{T} \subset Z_1$. This proves (1). Part (2) follows immediately from (1) and the definition of irreducible components.

Let $T \subset X$ be irreducible. Consider the set A of irreducible subsets $T \subset T_\alpha \subset X$. Note that A is nonempty since $T \in A$. There is a partial ordering on A coming from inclusion: $\alpha \leq \alpha' \Leftrightarrow T_\alpha \subset T_{\alpha'}$. Choose a maximal totally ordered subset $A' \subset A$, and let $T' = \bigcup_{\alpha \in A'} T_\alpha$. We claim that T' is irreducible. Namely, suppose

that $T' = Z_1 \cup Z_2$ is a union of two closed subsets of T . For each $\alpha \in A'$ we have either $T_\alpha \subset Z_1$ or $T_\alpha \subset Z_2$, by irreducibility of T_α . Suppose that for some $\alpha_0 \in A'$ we have $T_{\alpha_0} \not\subset Z_1$ (say, if not we're done anyway). Then, since A' is totally ordered we see immediately that $T_\alpha \subset Z_2$ for all $\alpha \in A'$. Hence $T' = Z_2$. This proves (3). Part (4) is an immediate consequence of (3) as a singleton space is irreducible. \square

A singleton is irreducible. Thus if $x \in X$ is a point then the closure $\overline{\{x\}}$ is an irreducible closed subset of X .

Definition 5.7.4. Let X be a topological space.

- (1) Let $Z \subset X$ be an irreducible closed subset. A *generic point* of Z is a point $\xi \in Z$ such that $Z = \overline{\{\xi\}}$.
- (2) The space X is called *Kolmogorov*, if for every $x, x' \in X$, $x \neq x'$ there exists a closed subset of X which contains exactly one of the two points.
- (3) The space X is called *sober* if every irreducible closed subset has a unique generic point.

A space X is Kolmogorov if for $x_1, x_2 \in X$ we have $x_1 = x_2$ if and only if $\overline{\{x_1\}} = \overline{\{x_2\}}$. Hence we see that a sober topological space is Kolmogorov.

Lemma 5.7.5. *Let X be a topological space. If X has an open covering $X = \bigcup X_i$ with X_i sober (resp. Kolmogorov), then X is sober (resp. Kolmogorov).*

Proof. Omitted. \square

Example 5.7.6. Recall that a topological space X is Hausdorff iff for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U$, $y \in V$. In this case X is irreducible if and only if X is a singleton. Similarly, any subset of X is irreducible if and only if it is a singleton. Hence a Hausdorff space is sober.

Lemma 5.7.7. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) Y is irreducible, (b) f is open, and (c) there exists a dense collection of points $y \in Y$ such that $f^{-1}(y)$ is irreducible. Then X is irreducible.*

Proof. Suppose $X = Z_1 \cup Z_2$ with Z_i closed. Consider the open sets $U_1 = Z_1 \setminus Z_2 = Y \setminus Z_2$ and $U_2 = Z_2 \setminus Z_1 = X \setminus Z_2$. To get a contradiction assume that U_1 and U_2 are both nonempty. By (b) we see that $f(U_i)$ is open. By (a) we have Y irreducible and hence $f(U_1) \cap f(U_2) \neq \emptyset$. By (c) there is a point y which corresponds to a point of this intersection such that the fibre $X_y = f^{-1}(y)$ is irreducible. Then $X_y \cap U_1$ and $X_y \cap U_2$ are nonempty disjoint open subsets of X_y which is a contradiction. \square

Lemma 5.7.8. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) f is open, and (b) for every $y \in Y$ the fibre $f^{-1}(y)$ is irreducible. Then f induces a bijection between irreducible components.*

Proof. We point out that assumption (b) implies that f is surjective (see Definition 5.7.1). Let $T \subset Y$ be an irreducible component. Note that T is closed, see Lemma 5.7.3. The lemma follows if we show that $f^{-1}(T)$ is irreducible because any irreducible subset of X maps into an irreducible component of Y by Lemma 5.7.2. Note that $f^{-1}(T) \rightarrow T$ satisfies the assumptions of Lemma 5.7.7. Hence we win. \square

The construction of the following lemma is sometimes called the “soberification”.

Lemma 5.7.9. *Let X be a topological space. There is a canonical continuous map*

$$c : X \longrightarrow X'$$

from X to a sober topological space X' which is universal among continuous maps from X to sober topological spaces. Moreover, the assignment $U' \mapsto c^{-1}(U')$ is a bijection between opens of X' and X which commutes with finite intersections and arbitrary unions. The image $c(X)$ is a Kolmogorov topological space and the map $c : X \rightarrow c(X)$ is universal for maps of X into Kolmogorov spaces.

Proof. Let X' be the set of irreducible closed subsets of X and let

$$c : X \rightarrow X', \quad x \mapsto \overline{\{x\}}.$$

For $U \subset X$ open, let $U' \subset X'$ denote the set of irreducible closed subsets of X which meet U . Then $c^{-1}(U') = U$.

If $U_1 \neq U_2$ are open in X , then $U'_1 \neq U'_2$. Namely, if $U_1 \not\subset U_2$, then let Z be the closure of an irreducible component of $U_1 \setminus U_2$. Then $Z \in U'_1$ but $Z \notin U'_2$. Hence c induces a bijection between the subsets of X' of the form U' and the opens of X .

Let U_1, U_2 be open in X . Suppose that $Z \in U'_1$ and $Z \in U'_2$. Then $Z \cap U_1$ and $Z \cap U_2$ are nonempty open subsets of the irreducible space Z and hence $Z \cap U_1 \cap U_2$ is nonempty. Thus $(U_1 \cap U_2)' = U'_1 \cap U'_2$. The rule $U \mapsto U'$ is also compatible with arbitrary unions (details omitted). Thus it is clear that the collection of U' form a topology on X' and that we have a bijection as stated in the lemma.

Next we show that X' is sober. Let $T \subset X'$ be an irreducible closed subset. Let $U \subset X$ be the open such that $X' \setminus T = U'$. Then $Z = X \setminus U$ is irreducible because of the properties of the bijection of the lemma. We claim that $Z \in T$ is a generic point. Namely, any open of the form $V' \subset X'$ which does not contain Z must come from an open $V \subset X$ which misses Z , i.e., is contained in U .

Finally, we check the universal property. Let $f : X \rightarrow Y$ be a continuous map to a sober topological space. Then we let $f' : X' \rightarrow Y$ be the map which sends the irreducible closed $Z \subset X$ to the unique generic point of $\overline{f(Z)}$. It follows immediately that $f' \circ c = f$ as maps of sets, and the properties of c imply that f' is continuous. We omit the verification that the continuous map f' is unique. We also omit the proof of the statements on Kolmogorov spaces. \square

5.8. Noetherian topological spaces

Definition 5.8.1. A topological space is called *Noetherian* if the descending chain condition holds for closed subsets of X . A topological space is called *locally Noetherian* if every point has a neighbourhood which is Noetherian.

Lemma 5.8.2. *Let X be a Noetherian topological space.*

- (1) *Any subset of X with the induced topology is Noetherian.*
- (2) *The space X has finitely many irreducible components.*
- (3) *Each irreducible component of X contains a nonempty open of X .*

Proof. Let $T \subset X$ be a subset of X . Let $T_1 \supset T_2 \supset \dots$ be a descending chain of closed subsets of T . Write $T_i = T \cap Z_i$ with $Z_i \subset X$ closed. Consider the descending chain of closed subsets $Z_1 \supset Z_1 \cap Z_2 \supset Z_1 \cap Z_2 \cap Z_3 \dots$. This stabilizes by assumption and hence the original sequence of T_i stabilizes. Thus T is Noetherian.

Let A be the set of closed subsets of X which do not have finitely many irreducible components. Assume that A is not empty to arrive at a contradiction. The set A is partially ordered by inclusion: $\alpha \leq \alpha' \Leftrightarrow Z_\alpha \subset Z_{\alpha'}$. By the descending chain condition we may find a smallest element of A , say Z . As Z is not a finite union of irreducible components, it is not irreducible. Hence we can write $Z = Z' \cup Z''$ and both are strictly smaller closed subsets. By construction $Z' = \bigcup Z'_i$ and $Z'' = \bigcup Z''_j$ are finite unions of their irreducible components. Hence $Z = \bigcup Z'_i \cup \bigcup Z''_j$ is a finite union of irreducible closed subsets. After removing redundant members of this expression, this will be the decomposition of Z into its irreducible components, a contradiction.

Let $Z \subset X$ be an irreducible component of X . Let Z_1, \dots, Z_n be the other irreducible components of X . Consider $U = Z \setminus (Z_1 \cup \dots \cup Z_n)$. This is not empty since otherwise the irreducible space Z would be contained in one of the other Z_i . Because $X = Z \cup Z_1 \cup \dots \cup Z_n$ (see Lemma 5.7.3), also $U = X \setminus (Z_1 \cup \dots \cup Z_n)$ and hence open in X . Thus Z contains a nonempty open of X . \square

Lemma 5.8.3. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces.*

- (1) *If X is Noetherian, then $f(X)$ is Noetherian.*
- (2) *If X is locally Noetherian and f open, then $f(X)$ is locally Noetherian.*

Proof. In case (1), suppose that $Z_1 \supset Z_2 \supset Z_3 \supset \dots$ is a descending chain of closed subsets of $f(X)$ (as usual with the induced topology as a subset of Y). Then $f^{-1}(Z_1) \supset f^{-1}(Z_2) \supset f^{-1}(Z_3) \supset \dots$ is a descending chain of closed subsets of X . Hence this chain stabilizes. Since $f(f^{-1}(Z_i)) = Z_i$ we conclude that $Z_1 \supset Z_2 \supset Z_3 \supset \dots$ stabilizes also. In case (2), let $y \in f(X)$. Choose $x \in X$ with $f(x) = y$. By assumption there exists a neighbourhood $E \subset X$ of x which is Noetherian. Then $f(E) \subset f(X)$ is a neighbourhood which is Noetherian by part (1). \square

Lemma 5.8.4. *Let X be a topological space. Let $X_i \subset X$, $i = 1, \dots, n$ be a finite collection of subsets. If each X_i is Noetherian (with the induced topology), then $\bigcup_{i=1, \dots, n} X_i$ is Noetherian (with the induced topology).*

Proof. Omitted. \square

Example 5.8.5. Any nonempty, Kolmogorov Noetherian topological space has a closed point (combine Lemmas 5.11.8 and 5.11.13). Let $X = \{1, 2, 3, \dots\}$. Define a topology on X with opens \emptyset , $\{1, 2, \dots, n\}$, $n \geq 1$ and X . Thus X is a locally Noetherian topological space, without any closed points. This space cannot be the underlying topological space of a locally Noetherian scheme, see Properties, Lemma 27.5.8.

Lemma 5.8.6. *Let X be a locally Noetherian topological space. Then X is locally connected.*

Proof. Let $x \in X$. Let E be a neighbourhood of x . We have to find a connected neighbourhood of x contained in E . By assumption there exists a neighbourhood E' of x which is Noetherian. Then $E \cap E'$ is Noetherian, see Lemma 5.8.2. Let $E \cap E' = Y_1 \cup \dots \cup Y_n$ be the decomposition into irreducible components, see Lemma 5.8.2. Let $E'' = \bigcup_{x \in Y_i} Y_i$. This is a connected subset of $E \cap E'$ containing x . It contains the open $E \cap E' \setminus (\bigcup_{x \notin Y_i} Y_i)$ of $E \cap E'$ and hence it is a neighbourhood of x in X . This proves the lemma. \square

5.9. Krull dimension

Definition 5.9.1. Let X be a topological space.

- (1) A *chain of irreducible closed subsets* of X is a sequence $Z_0 \subset Z_1 \subset \dots \subset Z_n \subset X$ with Z_i closed irreducible and $Z_i \neq Z_{i+1}$ for $i = 0, \dots, n-1$.
- (2) The *length* of a chain $Z_0 \subset Z_1 \subset \dots \subset Z_n \subset X$ of irreducible closed subsets of X is the integer n .
- (3) The *dimension* or more precisely the *Krull dimension* $\dim(X)$ of X is the element of $\{-\infty, 0, 1, 2, 3, \dots, \infty\}$ defined by the formula:

$$\dim(X) = \sup\{\text{lengths of chains of irreducible closed subsets}\}$$

Thus $\dim(X) = -\infty$ if and only if X is the empty space.

- (4) Let $x \in X$. The *Krull dimension of X at x* is defined as

$$\dim_x(X) = \min\{\dim(U), x \in U \subset X \text{ open}\}$$

the minimum of $\dim(U)$ where U runs over the open neighbourhoods of x in X .

Note that if $U' \subset U \subset X$ are open then $\dim(U') \leq \dim(U)$. Hence if $\dim_x(X) = d$ then x has a fundamental system of open neighbourhoods U with $\dim(U) = \dim_x(X)$.

Example 5.9.2. The Krull dimension of the usual Euclidean space \mathbf{R}^n is 0.

Example 5.9.3. Let $X = \{s, \eta\}$ with open sets given by $\{\emptyset, \{\eta\}, \{s, \eta\}\}$. In this case a maximal chain of irreducible closed subsets is $\{s\} \subset \{s, \eta\}$. Hence $\dim(X) = 1$. It is easy to generalize this example to get a $(n+1)$ -element topological space of Krull dimension n .

Definition 5.9.4. Let X be a topological space. We say that X is *equidimensional* if every irreducible component of X has the same dimension.

5.10. Codimension and catenary spaces

We only define the codimension of irreducible closed subsets.

Definition 5.10.1. Let X be a topological space. Let $Y \subset X$ be an irreducible closed subset. The *codimension* of Y in X is the supremum of the lengths e of chains

$$Y = Y_0 \subset Y_1 \subset \dots \subset Y_e \subset X$$

of irreducible closed subsets in X starting with Y . We will denote this $\text{codim}(Y, X)$.

The codimension is an element of $\{0, 1, 2, \dots\} \cup \{\infty\}$. If $\text{codim}(Y, X) < \infty$, then every chain can be extended to a maximal chain (but these do not all have to have the same length).

Lemma 5.10.2. *Let X be a topological space. Let $Y \subset X$ be an irreducible closed subset. Let $U \subset X$ be an open subset such that $Y \cap U$ is nonempty. Then*

$$\text{codim}(Y, X) = \text{codim}(Y \cap U, U)$$

Proof. The rule $T \mapsto \overline{T}$ defines a bijective inclusion preserving map between the closed irreducible subsets of U and the closed irreducible subsets of X which meet U . Using this the lemma easily follows. Details omitted. \square

Example 5.10.3. Let $X = [0, 1]$ be the unit interval with the following topology: The sets $[0, 1]$, $(1 - 1/n, 1]$ for $n \in \mathbf{N}$, and \emptyset are open. So the closed sets are \emptyset , $\{0\}$, $[0, 1 - 1/n]$ for $n > 1$ and $[0, 1]$. This is clearly a Noetherian topological space. But the irreducible closed subset $Y = \{0\}$ has infinite codimension $\text{codim}(Y, X) = \infty$. To see this we just remark that all the closed sets $[0, 1 - 1/n]$ are irreducible.

Definition 5.10.4. Let X be a topological space. We say X is *catenary* if for every pair of irreducible closed subsets $T \subset T'$ we have $\text{codim}(T, T') < \infty$ and every maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \dots \subset T_e = T'$$

has the same length (equal to the codimension).

Lemma 5.10.5. *Let X be a topological space. The following are equivalent:*

- (1) X is catenary,
- (2) X has an open covering by catenary spaces.

Moreover, in this case any locally closed subspace of X is catenary.

Proof. Suppose that X is catenary and that $U \subset X$ is an open subset. The rule $T \mapsto \overline{T}$ defines a bijective inclusion preserving map between the closed irreducible subsets of U and the closed irreducible subsets of X which meet U . Using this the lemma easily follows. Details omitted. \square

Lemma 5.10.6. *Let X be a topological space. The following are equivalent:*

- (1) X is catenary, and
- (2) for pair of irreducible closed subsets $Y \subset Y'$ we have $\text{codim}(Y, Y') < \infty$ and for every triple $Y \subset Y' \subset Y''$ of irreducible closed subsets we have

$$\text{codim}(Y, Y'') = \text{codim}(Y, Y') + \text{codim}(Y', Y'').$$

Proof. Omitted. \square

5.11. Quasi-compact spaces and maps

The phrase “compact” will be reserved for Hausdorff topological spaces. And many spaces occurring in algebraic geometry are not Hausdorff.

Definition 5.11.1. Quasi-compactness.

- (1) We say that a topological space X is *quasi-compact* if every open covering of X has a finite refinement.
- (2) We say that a continuous map $f : X \rightarrow Y$ is *quasi-compact* if the inverse image $f^{-1}(V)$ of every quasi-compact open $V \subset Y$ is quasi-compact.
- (3) We say a subset $Z \subset X$ is *retrocompact* if the inclusion map $Z \rightarrow X$ is quasi-compact.

In many texts on topology a space is called *compact* if it is quasi-compact and Hausdorff; and in other texts the Hausdorff condition is omitted. To avoid confusion in algebraic geometry we use the term quasi-compact. Note that the notion of quasi-compactness of a map is very different from the notion of a “proper map” in topology, since there one requires the inverse image of any (quasi-)compact subset of the target to be (quasi-)compact, whereas in the definition above we only consider quasi-compact *open* sets.

Lemma 5.11.2. *A composition of quasi-compact maps is quasi-compact.*

Proof. This is immediate from the definition. \square

Lemma 5.11.3. *A closed subset of a quasi-compact topological space is quasi-compact.*

Proof. Let $E \subset X$ be a closed subset of the quasi-compact space X . Let $E = \bigcup V_j$ be an open covering. Choose $U_j \subset X$ open such that $V_j = E \cap U_j$. Then $X = (X \setminus E) \cup \bigcup U_j$ is an open covering of X . Hence $X = (X \setminus E) \cup U_{j_1} \cup \dots \cup U_{j_n}$ for some n and indices j_i . Thus $E = V_{j_1} \cup \dots \cup V_{j_n}$ as desired. \square

Lemma 5.11.4. *Let X be a Hausdorff topological space.*

- (1) *If $E \subset X$ is quasi-compact, then it is closed.*
- (2) *If $E_1, E_2 \subset X$ are disjoint quasi-compact subsets then there exists opens $U_i \subset E_i$ with $U_1 \cap U_2 = \emptyset$.*

Proof. Proof of (1). Let $x \in X$, $x \notin E$. For every $e \in E$ we can find disjoint opens V_e and U_e with $e \in V_e$ and $x \in U_e$. Since $E \subset \bigcup V_e$ we can find finitely many e_1, \dots, e_n such that $E \subset V_{e_1} \cup \dots \cup V_{e_n}$. Then $U = U_{e_1} \cap \dots \cap U_{e_n}$ is an open neighbourhood of x which avoids $V_{e_1} \cup \dots \cup V_{e_n}$. In particular it avoids E . Thus E is closed.

Proof of (2). In the proof of (1) we have seen that given $x \in E_1$ we can find an open neighbourhood $x \in U_x$ and an open $E_2 \subset V_x$ such that $U_x \cap V_x = \emptyset$. Because E_1 is quasi-compact we can find a finite number $x_i \in E_1$ such that $E_1 \subset U = U_{x_1} \cup \dots \cup U_{x_n}$. We take $V = V_{x_1} \cap \dots \cap V_{x_n}$ to finish the proof. \square

Lemma 5.11.5. *Let X be a quasi-compact Hausdorff space. Let $E \subset X$. The following are equivalent: (a) E is closed in X , (b) E is quasi-compact.*

Proof. The implication (a) \Rightarrow (b) is Lemma 5.11.3. The implication (b) \Rightarrow (a) is Lemma 5.11.4. \square

The following is really a reformulation of the quasi-compact property.

Lemma 5.11.6. *Let X be a quasi-compact topological space. If $\{Z_\alpha\}_{\alpha \in A}$ is a collection of closed subsets such that the intersection of each finite subcollection is nonempty, then $\bigcap_{\alpha \in A} Z_\alpha$ is nonempty.*

Proof. Omitted. \square

Lemma 5.11.7. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces.*

- (1) *If X is quasi-compact, then $f(X)$ is quasi-compact.*
- (2) *If f is quasi-compact, then $f(X)$ is retrocompact.*

Proof. If $f(X) = \bigcup V_i$ is an open covering, then $X = \bigcup f^{-1}(V_i)$ is an open covering. Hence if X is quasi-compact then $X = f^{-1}(V_{i_1}) \cup \dots \cup f^{-1}(V_{i_n})$ for some $i_1, \dots, i_n \in I$ and hence $f(X) = V_{i_1} \cup \dots \cup V_{i_n}$. This proves (1). Assume f is quasi-compact, and let $V \subset Y$ be quasi-compact open. Then $f^{-1}(V)$ is quasi-compact, hence by (1) we see that $f(f^{-1}(V)) = f(X) \cap V$ is quasi-compact. Hence $f(X)$ is retrocompact. \square

Lemma 5.11.8. *Let X be a topological space. Assume that*

- (1) *X is nonempty,*
- (2) *X is quasi-compact, and*
- (3) *X is Kolmogorov.*

Then X has a closed point.

Proof. Consider the set

$$\mathcal{T} = \{Z \subset X \mid Z = \overline{\{x\}} \text{ for some } x \in X\}$$

of all closures of singletons in X . It is nonempty since X is nonempty. Make \mathcal{T} into a partially ordered set using the relation of inclusion. Suppose Z_α , $\alpha \in A$ is a totally ordered subset of \mathcal{T} . By Lemma 5.11.6 we see that $\bigcap_{\alpha \in A} Z_\alpha \neq \emptyset$. Hence there exists some $x \in \bigcap_{\alpha \in A} Z_\alpha$ and we see that $Z = \overline{\{x\}} \in \mathcal{T}$ is a lower bound for the family. By Zorn's lemma there exists a minimal element $Z \in \mathcal{T}$. As X is Kolmogorov we conclude that $Z = \{x\}$ for some x and $x \in X$ is a closed point. \square

Lemma 5.11.9. *Let X be a quasi-compact Kolmogorov space. Then the set X_0 of closed points of X is quasi-compact.*

Proof. Let $X_0 = \bigcup U_{i,0}$ be an open covering. Write $U_{i,0} = X_0 \cap U_i$ for some open $U_i \subset X$. Consider the complement Z of $\bigcup U_i$. This is a closed subset of X , hence quasi-compact (Lemma 5.11.3) and Kolmogorov. By Lemma 5.11.8 if Z is nonempty it would have a closed point which contradicts the fact that $X_0 \subset \bigcup U_i$. Hence $Z = \emptyset$ and $X = \bigcup U_i$. Since X is quasi-compact this covering has a finite subcover and we conclude. \square

Lemma 5.11.10. *Let X be a topological space. Assume*

- (1) X is quasi-compact,
- (2) X has a basis for the topology consisting of quasi-compact opens, and
- (3) the intersection of two quasi-compact opens is quasi-compact.

For any $x \in X$ the connected component of X containing x is the intersection of all open and closed subsets of X containing x .

Proof. Let T be the connected component containing x . Let $S = \bigcap_{\alpha \in A} Z_\alpha$ be the intersection of all open and closed subsets Z_α of X containing x . Note that S is closed in X . Note that any finite intersection of Z_α 's is a Z_α . Because T is connected and $x \in T$ we have $T \subset S$. It suffices to show that S is connected. If not, then there exists a disjoint union decomposition $S = B \amalg C$ with B and C open and closed in S . In particular, B and C are closed in X , and so quasi-compact by Lemma 5.11.3 and assumption (1). By assumption (2) there exist quasi-compact opens $U, V \subset X$ with $B = S \cap U$ and $C = S \cap V$ (details omitted). Then $U \cap V \cap S = \emptyset$. Hence $\bigcap_\alpha U \cap V \cap Z_\alpha = \emptyset$. By assumption (3) the intersection $U \cap V$ is quasi-compact. By Lemma 5.11.6 for some $\alpha' \in A$ we have $U \cap V \cap Z_{\alpha'} = \emptyset$. Since $X \setminus (U \cup V)$ is disjoint from S and closed in X hence quasi-compact, we can use the same lemma to see that $Z_{\alpha''} \subset U \cup V$ for some $\alpha'' \in A$. Then $Z_\alpha = Z_{\alpha'} \cap Z_{\alpha''}$ is contained in $U \cup V$ and disjoint from $U \cap V$. Hence $Z_\alpha = U \cap Z_\alpha \amalg V \cap Z_\alpha$ is a decomposition into two open pieces, hence $U \cap Z_\alpha$ and $V \cap Z_\alpha$ are open and closed in X . Thus, if $x \in B$ say, then we see that $S \subset U \cap Z_\alpha$ and we conclude that $C = \emptyset$. \square

Lemma 5.11.11. *Let X be a topological space. Assume X is quasi-compact and Hausdorff. For any $x \in X$ the connected component of X containing x is the intersection of all open and closed subsets of X containing x .*

Proof. Let T be the connected component containing x . Let $S = \bigcap_{\alpha \in A} Z_\alpha$ be the intersection of all open and closed subsets Z_α of X containing x . Note that S is closed in X . Note that any finite intersection of Z_α 's is a Z_α . Because T is

connected and $x \in T$ we have $T \subset S$. It suffices to show that S is connected. If not, then there exists a disjoint union decomposition $S = B \amalg C$ with B and C open and closed in S . In particular, B and C are closed in X , and so quasi-compact by Lemma 5.11.3. By Lemma 5.11.4 there exist disjoint opens $U, V \subset X$ with $B \subset U$ and $C \subset V$. Then $X \setminus U \cup V$ is closed in X hence quasi-compact (Lemma 5.11.3). It follows that $(X \setminus U \cup V) \cap Z_\alpha = \emptyset$ for some α by Lemma 5.11.6. In other words, $Z_\alpha \subset U \cup V$. Thus $Z_\alpha = Z_\alpha \cap V \amalg Z_\alpha \cap U$ is a decomposition into two open pieces, hence $U \cap Z_\alpha$ and $V \cap Z_\alpha$ are open and closed in X . Thus, if $x \in B$ say, then we see that $S \subset U \cap Z_\alpha$ and we conclude that $C = \emptyset$. \square

Lemma 5.11.12. *Let X be a topological space. Assume*

- (1) X is quasi-compact,
- (2) X has a basis for the topology consisting of quasi-compact opens, and
- (3) the intersection of two quasi-compact opens is quasi-compact.

For a subset $T \subset X$ the following are equivalent:

- (a) T is an intersection of open and closed subsets of X , and
- (b) T is closed in X and is a union of connected components of X .

Proof. It is clear that (a) implies (b). Assume (b). Let $x \in X$, $x \notin T$. Let $x \in C \subset X$ be the connected component of X containing x . By Lemma 5.11.10 we see that $C = \bigcap V_\alpha$ is the intersection of all open and closed subsets V_α of X which contain C . In particular, any pairwise intersection $V_\alpha \cap V_\beta$ occurs as a V_α . As T is a union of connected components of X we see that $C \cap T = \emptyset$. Hence $T \cap \bigcap V_\alpha = \emptyset$. Since T is quasi-compact as a closed subset of a quasi-compact space (see Lemma 5.11.3) we deduce that $T \cap V_\alpha = \emptyset$ for some α , see Lemma 5.11.6. For this α we see that $U_\alpha = X \setminus V_\alpha$ is an open and closed subset of X which contains T and not x . The lemma follows. \square

Lemma 5.11.13. *Let X be a Noetherian topological space.*

- (1) *The space X is quasi-compact.*
- (2) *Any subset of X is retrocompact.*

Proof. Suppose $X = \bigcup U_i$ is an open covering of X indexed by the set I which does not have a refinement by a finite open covering. Choose i_1, i_2, \dots elements of I inductively in the following way: If $X \neq U_{i_1} \cup \dots \cup U_{i_n}$ then choose i_{n+1} such that $U_{i_{n+1}}$ is not contained in $U_{i_1} \cup \dots \cup U_{i_n}$. Thus we see that $X \supset (X \setminus U_{i_1}) \supset (X \setminus U_{i_1} \cup U_{i_2}) \supset \dots$ is a strictly decreasing infinite sequence of closed subsets. This contradicts the fact that X is Noetherian. This proves the first assertion. The second assertion is now clear since every subset of X is Noetherian by Lemma 5.8.2. \square

Lemma 5.11.14. *A quasi-compact locally Noetherian space is Noetherian.*

Proof. The conditions imply immediately that X has a finite covering by Noetherian subsets, and hence is Noetherian by Lemma 5.8.4. \square

Lemma 5.11.15 (Alexander subbase theorem). *Let X be a topological space. Let \mathcal{B} be a subbase for X . If every covering of X by elements of \mathcal{B} has a finite refinement, then X is quasi-compact.*

Proof. Assume there is an open covering of X which does not have a finite refinement. Using Zorn's lemma we can choose a maximal open covering $X = \bigcup_{i \in I} U_i$ which does not have a finite refinement (details omitted). In other words, if $U \subset X$ is any open which does not occur as one of the U_i , then the covering $X = U \cup \bigcup_{i \in I} U_i$ does have a finite refinement. Let $I' \subset I$ be the set of indices such that $U_i \in \mathcal{B}$. Then $\bigcup_{i \in I'} U_i \neq X$, since otherwise we would get a finite refinement covering X by our assumption on \mathcal{B} . Pick $x \in X$, $x \notin \bigcup_{i \in I'} U_i$. Pick $i \in I$ with $x \in U_i$. Pick $V_1, \dots, V_n \in \mathcal{B}$ such that $x \in V_1 \cap \dots \cap V_n \subset U_i$. This is possible as \mathcal{B} is a subbasis for X . Note that V_j does not occur as a U_i . By maximality of the chosen covering we see that for each j there exist $i_{j,1}, \dots, i_{j,n_j} \in I$ such that $X = V_j \cup U_{i_{j,1}} \cup \dots \cup U_{i_{j,n_j}}$. Since $V_1 \cap \dots \cap V_n \subset U_i$ we conclude that $X = U_i \cup \bigcup U_{i_{j,l}}$ a contradiction. \square

5.12. Locally quasi-compact spaces

Recall that a neighbourhood of a point need not be open.

Definition 5.12.1. A topological space X is called *locally quasi-compact*² if every point has a fundamental system of quasi-compact neighbourhoods.

The term *locally compact space* in the literature often refers to a space as in the following lemma.

Lemma 5.12.2. *A Hausdorff space is locally quasi-compact if and only if every point has a quasi-compact neighbourhood.*

Proof. Let X be a Hausdorff space. Let $x \in X$ and let $x \in E \subset X$ be a quasi-compact neighbourhood. Then E is closed by Lemma 5.11.4. Suppose that $x \in U \subset X$ is an open neighbourhood of x . Then $Z = E \setminus U$ is a closed subset of E not containing x . Hence we can find a pair of disjoint open subsets $W, V \subset E$ of E such that $x \in V$ and $Z \subset W$, see Lemma 5.11.4. It follows that $\overline{V} \subset E$ is a closed neighbourhood of x contained in $E \cap U$. Also \overline{V} is quasi-compact as a closed subset of E (Lemma 5.11.3). In this way we obtain a fundamental system of quasi-compact neighbourhoods of x . \square

Lemma 5.12.3. *Let X be a Hausdorff and quasi-compact space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. Then there exists an open covering $X = \bigcup_{i \in I} V_i$ such that $\overline{V_i} \subset U_i$ for all i .*

Proof. Let $x \in X$. Choose an $i(x) \in I$ such that $x \in U_{i(x)}$. Since $X \setminus U_{i(x)}$ and $\{x\}$ are disjoint closed subsets of X , by Lemmas 5.11.3 and 5.11.4 there exists an open neighbourhood U_x of x whose closure is disjoint from $X \setminus U_{i(x)}$. Thus $\overline{U_x} \subset U_{i(x)}$. Since X is quasi-compact, there is a finite list of points x_1, \dots, x_m such that $X = U_{x_1} \cup \dots \cup U_{x_m}$. Setting $V_i = \bigcup_{i=i(x_j)} U_{x_j}$ the proof is finished. \square

Lemma 5.12.4. *Let X be a Hausdorff and quasi-compact space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. Suppose given an integer $p \geq 0$ and for every $(p+1)$ -tuple i_0, \dots, i_p of I an open covering $U_{i_0} \cap \dots \cap U_{i_p} = \bigcup W_{i_0 \dots i_p, k}$. Then there exists an open covering $X = \bigcup_{j \in J} V_j$ and a map $\alpha : J \rightarrow I$ such that $\overline{V_j} \subset U_{\alpha(j)}$ and such that each $V_{j_0} \cap \dots \cap V_{j_p}$ is contained in $W_{\alpha(j_0) \dots \alpha(j_p), k}$ for some k .*

²This may not be standard notation. Alternative notions used in the literature are: (1) Every point has some quasi-compact neighbourhood, and (2) Every point has a closed quasi-compact neighbourhood. A scheme has the property that every point has a fundamental system of open quasi-compact neighbourhoods.

Proof. Since X is quasi-compact, there is a reduction to the case where I is finite (details omitted). We prove the result for I finite by induction on p . The base case $p = 0$ is immediate by taking a covering as in Lemma 5.12.3 refining the open covering $X = \bigcup W_{i_0, k}$.

Induction step. Assume the lemma proven for $p - 1$. For all p -tuples i'_0, \dots, i'_{p-1} of I let $U_{i'_0} \cap \dots \cap U_{i'_{p-1}} = \bigcup W_{i'_0 \dots i'_{p-1}, k}$ be a common refinement of the coverings $U_{i_0} \cap \dots \cap U_{i_p} = \bigcup W_{i_0 \dots i_p, k}$ for those $(p + 1)$ -tuples such that $\{i'_0, \dots, i'_{p-1}\} = \{i_0, \dots, i_p\}$ (equality of sets). (There are finitely many of these as I is finite.) By induction there exists a solution for these opens, say $X = \bigcup V_j$ and $\alpha : J \rightarrow I$. At this point the covering $X = \bigcup_{j \in J} V_j$ and α satisfies $\overline{V_j} \subset U_{\alpha(j)}$ and each $V_{j_0} \cap \dots \cap V_{j_p}$ is contained in $W_{\alpha(j_0) \dots \alpha(j_p), k}$ for some k if there is a repetition in $\alpha(j_0), \dots, \alpha(j_p)$. Of course, we may and do assume that J is finite.

Fix $i_0, \dots, i_p \in I$ pairwise distinct. Consider $(p + 1)$ -tuples $j_0, \dots, j_p \in J$ with $i_0 = \alpha(j_0), \dots, i_p = \alpha(j_p)$ such that $V_{j_0} \cap \dots \cap V_{j_p}$ is **not** contained in $W_{\alpha(j_0) \dots \alpha(j_p), k}$ for any k . Let N be the number of such $(p + 1)$ -tuples. We will show how to decrease N . Since

$$\overline{V_{j_0}} \cap \dots \cap \overline{V_{j_p}} \subset U_{i_0} \cap \dots \cap U_{i_p} = \bigcup W_{i_0 \dots i_p, k}$$

we find a finite set $K = \{k_1, \dots, k_t\}$ such that the LHS is contained in $\bigcup_{k \in K} W_{i_0 \dots i_p, k}$. Then we consider the open covering

$$V_{j_0} = (V_{j_0} \setminus (\overline{V_{j_1}} \cap \dots \cap \overline{V_{j_p}})) \cup \left(\bigcup_{k \in K} V_{j_0} \cap W_{i_0 \dots i_p, k} \right)$$

The first open on the RHS intersects $V_{j_1} \cap \dots \cap V_{j_p}$ in the empty set and the other opens $V_{j_0, k}$ of the RHS satisfy $V_{j_0, k} \cap V_{j_1} \cap \dots \cap V_{j_p} \subset W_{\alpha(j_0) \dots \alpha(j_p), k}$. Set $J' = J \amalg K$. For $j \in J$ set $V'_j = V_j$ if $j \neq j_0$ and set $V'_{j_0} = V_{j_0} \setminus (\overline{V_{j_1}} \cap \dots \cap \overline{V_{j_p}})$. For $k \in K$ set $V'_k = V_{j_0, k}$. Finally, the map $\alpha' : J' \rightarrow I$ is given by α on J and maps every element of K to i_0 . A simple check shows that N has decreased by one under this replacement. Repeating this procedure N times we arrive at the situation where $N = 0$.

To finish the proof we argue by induction on the number M of $(p + 1)$ -tuples $i_0, \dots, i_p \in I$ with pairwise distinct entries for which there exists a $(p + 1)$ -tuple $j_0, \dots, j_p \in J$ with $i_0 = \alpha(j_0), \dots, i_p = \alpha(j_p)$ such that $V_{j_0} \cap \dots \cap V_{j_p}$ is **not** contained in $W_{\alpha(j_0) \dots \alpha(j_p), k}$ for any k . To do this, we claim that the operation performed in the previous paragraph does not increase M . This follows formally from the fact that the map $\alpha' : J' \rightarrow I$ factors through a map $\beta : J' \rightarrow J$ such that $V'_{j'} \subset V_{\beta(j')}$. \square

Lemma 5.12.5. *Let X be a Hausdorff and locally quasi-compact space. Let $Z \subset X$ be a quasi-compact (hence closed) subset. Suppose given an integer $p \geq 0$, a set I , for every $i \in I$ an open $U_i \subset X$, and for every $(p + 1)$ -tuple i_0, \dots, i_p of I an open $W_{i_0 \dots i_p} \subset U_{i_0} \cap \dots \cap U_{i_p}$ such that*

- (1) $Z \subset \bigcup U_i$, and
- (2) for every i_0, \dots, i_p we have $W_{i_0 \dots i_p} \cap Z = U_{i_0} \cap \dots \cap U_{i_p} \cap Z$.

Then there exist opens V_i of X such that we have $Z \subset \bigcup V_i$, for all i we have $\overline{V_i} \subset U_i$, and we have $V_{i_0} \cap \dots \cap V_{i_p} \subset W_{i_0 \dots i_p}$ for all $(p + 1)$ -tuples i_0, \dots, i_p .

Proof. Since Z is quasi-compact, there is a reduction to the case where I is finite (details omitted). Because X is locally quasi-compact and Z is quasi-compact, we

can find a neighbourhood $Z \subset E$ which is quasi-compact, i.e., E is quasi-compact and contains an open neighbourhood of Z in X . If we prove the result after replacing X by E , then the result follows. Hence we may assume X is quasi-compact.

We prove the result in case I is finite and X is quasi-compact by induction on p . The base case is $p = 0$. In this case we have $X = (X \setminus Z) \cup \bigcup W_i$. By Lemma 5.12.3 we can find a covering $X = V \cup \bigcup V_i$ by opens $V_i \subset W_i$ and $V \subset X \setminus Z$ with $\overline{V_i} \subset W_i$ for all i . Then we see that we obtain a solution of the problem posed by the lemma.

Induction step. Assume the lemma proven for $p - 1$. Set $W_{j_0 \dots j_{p-1}}$ equal to the intersection of all $W_{i_0 \dots i_p}$ with $\{j_0, \dots, j_{p-1}\} = \{i_0, \dots, i_p\}$ (equality of sets). By induction there exists a solution for these opens, say $V_i \subset U_i$. It follows from our choice of $W_{j_0 \dots j_{p-1}}$ that we have $V_{i_0} \cap \dots \cap V_{i_p} \subset W_{i_0 \dots i_p}$ for all $(p + 1)$ -tuples i_0, \dots, i_p where $i_a = i_b$ for some $0 \leq a < b \leq p$. Thus we only need to modify our choice of V_i if $V_{i_0} \cap \dots \cap V_{i_p} \not\subset W_{i_0 \dots i_p}$ for some $(p + 1)$ -tuple i_0, \dots, i_p with pairwise distinct elements. In this case we have

$$T = \overline{V_{i_0} \cap \dots \cap V_{i_p} \setminus W_{i_0 \dots i_p}} \subset \overline{V_{i_0}} \cap \dots \cap \overline{V_{i_p}} \setminus W_{i_0 \dots i_p}$$

is a closed subset of X contained in $U_{i_0} \cap \dots \cap U_{i_p}$ not meeting Z . Hence we can replace V_{i_0} by $V_{i_0} \setminus T$ to “fix” the problem. After repeating this finitely many times for each of the problem tuples, the lemma is proven. \square

5.13. Limits of spaces

The category of topological spaces has products. Namely, if I is a set and for $i \in I$ we are given a topological space X_i then we endow $\prod_{i \in I} X_i$ with the *product topology*. As a basis for the topology we use sets of the form $\prod U_i$ where $U_i \subset X_i$ is open and $U_i = X_i$ for almost all i .

The category of topological spaces has equalizers. Namely, if $a, b : X \rightarrow Y$ are morphisms of topological spaces, then the equalizer of a and b is the subset $\{x \in X \mid a(x) = b(x)\} \subset X$ endowed with the induced topology.

Lemma 5.13.1. *The category of topological spaces has limits.*

Proof. This follows from the discussion above and Categories, Lemma 4.14.10. \square

Lemma 5.13.2. *Let \mathcal{I} be a cofiltered category. Let $i \mapsto X_i$ be a diagram of topological spaces over \mathcal{I} . Let $X = \lim X_i$ be the limit with projection maps $f_i : X \rightarrow X_i$.*

- (1) *Any open of X is of the form $\bigcup_{j \in J} f_j^{-1}(U_j)$ for some subset $J \subset I$ and opens $U_j \subset X_j$.*
- (2) *Any quasi-compact open of X is of the form $f_i^{-1}(U_i)$ for some i and some $U_i \subset X_i$ open.*

Proof. The construction of the limit given above shows that $X \subset \prod X_i$ with the induced topology. A basis for the topology of $\prod X_i$ are the opens $\prod U_i$ where $U_i \subset X_i$ is open and $U_i = X_i$ for almost all i . Say $i_1, \dots, i_n \in \text{Ob}(\mathcal{I})$ are the objects such that $U_{i_j} \neq X_{i_j}$. Then

$$X \cap \prod U_i = f_{i_1}^{-1}(U_{i_1}) \cap \dots \cap f_{i_n}^{-1}(U_{i_n})$$

For a general limit of topological spaces these form a basis for the topology on X . However, if \mathcal{I} is cofiltered as in the statement of the lemma, then we can pick a $j \in \text{Ob}(\mathcal{I})$ and morphisms $j \rightarrow i_l$, $l = 1, \dots, n$. Let

$$U_j = (X_j \rightarrow X_{i_1})^{-1}(U_{i_1}) \cap \dots \cap (X_j \rightarrow X_{i_n})^{-1}(U_{i_n})$$

Then it is clear that $X \cap \prod U_i = f_j^{-1}(U_j)$. Thus for any open W of X there is a set A and a map $\alpha : A \rightarrow \text{Ob}(\mathcal{I})$ and opens $U_a \subset X_{\alpha(a)}$ such that $W = \bigcup f_{\alpha(a)}^{-1}(U_a)$. Set $J = \text{Im}(\alpha)$ and for $j \in J$ set $U_j = \bigcup_{\alpha(a)=j} U_a$ to see that $W = \bigcup_{j \in J} f_j^{-1}(U_j)$. This proves (1).

To see (2) suppose that $\bigcup_{j \in J} f_j^{-1}(U_j)$ is quasi-compact. Then it is equal to $f_{j_1}^{-1}(U_{j_1}) \cup \dots \cup f_{j_m}^{-1}(U_{j_m})$ for some $j_1, \dots, j_m \in J$. Since \mathcal{I} is cofiltered, we can pick a $i \in \text{Ob}(\mathcal{I})$ and morphisms $i \rightarrow j_l$, $l = 1, \dots, m$. Let

$$U_i = (X_i \rightarrow X_{j_1})^{-1}(U_{j_1}) \cup \dots \cup (X_i \rightarrow X_{j_m})^{-1}(U_{j_m})$$

Then our open equals $f_i^{-1}(U_i)$ as desired. \square

Lemma 5.13.3. *Let \mathcal{I} be a cofiltered category. Let $i \mapsto X_i$ be a diagram of topological spaces over \mathcal{I} . Let X be a topological space such that*

- (1) $X = \lim X_i$ as a set (denote f_i the projection maps),
- (2) the sets $f_i^{-1}(U_i)$ for $i \in \text{Ob}(\mathcal{I})$ and $U_i \subset X_i$ open form a basis for the topology of X .

Then X is the limit of the X_i as a topological space.

Proof. Follows from the description of the limit topology in Lemma 5.13.2. \square

Theorem 5.13.4 (Tychonov). *A product of quasi-compact spaces is quasi-compact.*

Proof. Let I be a set and for $i \in I$ let X_i be a quasi-compact topological space. Set $X = \prod X_i$. Let \mathcal{B} be the set of subsets of X of the form $U_i \times \prod_{i' \in I, i' \neq i} X_{i'}$ where $U_i \subset X_i$ is open. By construction this family is a subbasis for the topology on X . By Lemma 5.11.15 it suffices to show that any covering $X = \bigcup_{j \in J} B_j$ by elements B_j of \mathcal{B} has a finite refinement. We can decompose $J = \prod J_i$ so that if $j \in J_i$, then $B_j = U_j \times \prod_{i' \neq i} X_{i'}$ with $U_j \subset X_i$ open. If $X_i = \bigcup_{j \in J_i} U_j$, then there is a finite refinement and we conclude that $X = \bigcup_{j \in J} B_j$ has a finite refinement. If this is not the case, then for every i we can choose an point $x_i \in X_i$ which is not in $\bigcup_{j \in J_i} U_j$. But then the point $x = (x_i)_{i \in I}$ is an element of X not contained in $\bigcup_{j \in J} B_j$, a contradiction. \square

The following lemma does not hold if one drops the assumption that the spaces X_i are Hausdorff, see Examples, Section 82.4.

Lemma 5.13.5. *Let \mathcal{I} be a category and let $i \mapsto X_i$ be a diagram over \mathcal{I} in the category of topological spaces. If each X_i is quasi-compact and Hausdorff, then $\lim X_i$ is quasi-compact.*

Proof. Recall that $\lim X_i$ is a subspace of $\prod X_i$. By Theorem 5.13.4 this product is quasi-compact. Hence it suffices to show that $\lim X_i$ is a closed subspace of $\prod X_i$ (Lemma 5.11.3). If $\varphi : j \rightarrow k$ is a morphism of \mathcal{I} , then let $\Gamma_\varphi \subset X_j \times X_k$ denote

the graph of the corresponding continuous map $X_j \rightarrow X_k$. By Lemma 5.3.2 this graph is closed. It is clear that $\lim X_i$ is the intersection of the closed subsets

$$\Gamma_\varphi \times \prod_{l \neq j, k} X_l \subset \prod X_i$$

Thus the result follows. \square

The following lemma generalizes Categories, Lemma 4.21.5 and partially generalizes Lemma 5.11.6.

Lemma 5.13.6. *Let \mathcal{I} be a cofiltered category and let $i \mapsto X_i$ be a diagram over \mathcal{I} in the category of topological spaces. If each X_i is quasi-compact, Hausdorff, and nonempty, then $\lim X_i$ is nonempty.*

Proof. In the proof of Lemma 5.13.5 we have seen that $X = \lim X_i$ is the intersection of the closed subsets

$$Z_\varphi = \Gamma_\varphi \times \prod_{l \neq j, k} X_l$$

inside the quasi-compact space $\prod X_i$ where $\varphi : j \rightarrow k$ is a morphism of \mathcal{I} and $\Gamma_\varphi \subset X_j \times X_k$ is the graph of the corresponding morphism $X_j \rightarrow X_k$. Hence by Lemma 5.11.6 it suffices to show any finite intersection of these subsets is nonempty. Assume $\varphi_t : j_t \rightarrow k_t$, $t = 1, \dots, n$ is a finite collection of morphisms of \mathcal{I} . Since \mathcal{I} is cofiltered, we can pick an object j and a morphism $\psi_t : j \rightarrow j_t$ for each t . For each pair t, t' such that either (a) $j_t = j_{t'}$, or (b) $j_t = k_{t'}$, or (c) $k_t = k_{t'}$ we obtain two morphisms $j \rightarrow l$ with $l = j_t$ in case (a), (b) or $l = k_t$ in case (c). Because \mathcal{I} is cofiltered and since there are finitely many pairs (t, t') we may choose a map $j' \rightarrow j$ which equalizes these two morphisms for all such pairs (t, t') . Pick an element $x \in X_{j'}$ and for each t let x_{j_t} , resp. x_{k_t} be the image of x under the morphism $X_{j'} \rightarrow X_j \rightarrow X_{j_t}$, resp. $X_{j'} \rightarrow X_j \rightarrow X_{j_t} \rightarrow X_{k_t}$. For any index $l \in \text{Ob}(\mathcal{I})$ which is not equal to j_t or k_t for some t we pick an arbitrary element $x_l \in X_l$ (using the axiom of choice). Then $(x_i)_{i \in \text{Ob}(\mathcal{I})}$ is in the intersection

$$Z_{\varphi_1} \cap \dots \cap Z_{\varphi_n}$$

by construction and the proof is complete. \square

5.14. Constructible sets

Definition 5.14.1. Let X be a topological space. Let $E \subset X$ be a subset of X .

- (1) We say E is *constructible*³ in X if E is a finite union of subsets of the form $U \cap V^c$ where $U, V \subset X$ are open and retrocompact in X .
- (2) We say E is *locally constructible* in X if there exists an open covering $X = \bigcup V_i$ such that each $E \cap V_i$ is constructible in V_i .

Lemma 5.14.2. *The collection of constructible sets is closed under finite intersections, finite unions and complements.*

Proof. Note that if U_1, U_2 are open and retrocompact in X then so is $U_1 \cup U_2$ because the union of two quasi-compact subsets of X is quasi-compact. It is also true that $U_1 \cap U_2$ is retrocompact. Namely, suppose $U \subset X$ is quasi-compact open, then $U_2 \cap U$ is quasi-compact because U_2 is retrocompact in X , and then we

³In the second edition of EGA I [GD71] this was called a “globally constructible” set and a the terminology “constructible” was used for what we call a locally constructible set.

conclude $U_1 \cap (U_2 \cap U)$ is quasi-compact because U_1 is retrocompact in X . From this it is formal to show that the complement of a constructible set is constructible, that finite unions of constructibles are constructible, and that finite intersections of constructibles are constructible. \square

Lemma 5.14.3. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If the inverse image of every retrocompact open subset of Y is retrocompact in X , then inverse images of constructible sets are constructible.*

Proof. This is true because $f^{-1}(U \cap V^c) = f^{-1}(U) \cap f^{-1}(V)^c$, combined with the definition of constructible sets. \square

Lemma 5.14.4. *Let $U \subset X$ be open. For a constructible set $E \subset X$ the intersection $E \cap U$ is constructible in U .*

Proof. Suppose that $V \subset X$ is retrocompact open in X . It suffices to show that $V \cap U$ is retrocompact in U by Lemma 5.14.3. To show this let $W \subset U$ be open and quasi-compact. Then W is open and quasi-compact in X . Hence $V \cap W = V \cap U \cap W$ is quasi-compact as V is retrocompact in X . \square

Lemma 5.14.5. *Let $U \subset X$ be a retrocompact open. Let $E \subset U$. If E is constructible in U , then E is constructible in X .*

Proof. Suppose that $V, W \subset U$ are retrocompact open in U . Then V, W are retrocompact open in X (Lemma 5.11.2). Hence $V \cap (U \setminus W) = V \cap (X \setminus W)$ is constructible in X . We conclude since every constructible subset of U is a finite union of subsets of the form $V \cap (U \setminus W)$. \square

Lemma 5.14.6. *Let X be a topological space. Let $E \subset X$ be a subset. Let $X = V_1 \cup \dots \cup V_m$ be a finite covering by retrocompact opens. Then E is constructible in X if and only if $E \cap V_j$ is constructible in V_j for each $j = 1, \dots, m$.*

Proof. If E is constructible in X , then by Lemma 5.14.4 we see that $E \cap V_j$ is constructible in V_j for all j . Conversely, suppose that $E \cap V_j$ is constructible in V_j for each $j = 1, \dots, m$. Then $E = \bigcup E \cap V_j$ is a finite union of constructible sets by Lemma 5.14.5 and hence constructible. \square

Lemma 5.14.7. *Let X be a topological space. Let $Z \subset X$ be a closed subset such that $X \setminus Z$ is quasi-compact. Then for a constructible set $E \subset X$ the intersection $E \cap Z$ is constructible in Z .*

Proof. Suppose that $V \subset X$ is retrocompact open in X . It suffices to show that $V \cap Z$ is retrocompact in Z by Lemma 5.14.3. To show this let $W \subset Z$ be open and quasi-compact. The subset $W' = W \cup (X \setminus Z)$ is quasi-compact, open, and $W = Z \cap W'$. Hence $V \cap Z \cap W = V \cap Z \cap W'$ is a closed subset of the quasi-compact open $V \cap W'$ as V is retrocompact in X . Thus $V \cap Z \cap W$ is quasi-compact by Lemma 5.11.3. \square

Lemma 5.14.8. *Let X be a topological space. Let $T \subset X$ be a subset. Suppose*

- (1) *T is retrocompact in X ,*
- (2) *quasi-compact opens form a basis for the topology on X .*

Then for a constructible set $E \subset X$ the intersection $E \cap T$ is constructible in T .

Proof. Suppose that $V \subset X$ is retrocompact open in X . It suffices to show that $V \cap T$ is retrocompact in T by Lemma 5.14.3. To show this let $W \subset T$ be open and quasi-compact. By assumption (2) we can find a quasi-compact open $W' \subset X$ such that $W = T \cap W'$ (details omitted). Hence $V \cap T \cap W = V \cap T \cap W'$ is the intersection of T with the quasi-compact open $V \cap W'$ as V is retrocompact in X . Thus $V \cap T \cap W$ is quasi-compact. \square

Lemma 5.14.9. *Let $Z \subset X$ be a closed subset whose complement is retrocompact open. Let $E \subset Z$. If E is constructible in Z , then E is constructible in X .*

Proof. Suppose that $V \subset Z$ is retrocompact open in Z . Consider the open subset $\tilde{V} = V \cup (X \setminus Z)$ of X . Let $W \subset X$ be quasi-compact open. Then

$$W \cap \tilde{V} = (V \cap W) \cup ((X \setminus Z) \cap W).$$

The first part is quasi-compact as $V \cap W = V \cap (Z \cap W)$ and $(Z \cap W)$ is quasi-compact open in Z (Lemma 5.11.3) and V is retrocompact in Z . The second part is quasi-compact as $(X \setminus Z)$ is retrocompact in X . In this way we see that \tilde{V} is retrocompact in X . Thus if $V_1, V_2 \subset Z$ are retrocompact open, then

$$V_1 \cap (Z \setminus V_2) = \tilde{V}_1 \cap (X \setminus \tilde{V}_2)$$

is constructible in X . We conclude since every constructible subset of Z is a finite union of subsets of the form $V_1 \cap (Z \setminus V_2)$. \square

Lemma 5.14.10. *Let X be a topological space. Every constructible subset of X is retrocompact.*

Proof. Let $E = \bigcup_{i=1, \dots, n} U_i \cap V_i^c$ with U_i, V_i retrocompact open in X . Let $W \subset X$ be quasi-compact open. Then $E \cap W = \bigcup_{i=1, \dots, n} U_i \cap V_i^c \cap W$. Thus it suffices to show that $U \cap V^c \cap W$ is quasi-compact if U, V are retrocompact open and W is quasi-compact open. This is true because $U \cap V^c \cap W$ is a closed subset of the quasi-compact $U \cap W$ so Lemma 5.11.3 applies. \square

Question: Does the following lemma also hold if we assume X is a quasi-compact topological space? Compare with Lemma 5.14.7.

Lemma 5.14.11. *Let X be a topological space. Assume X has a basis consisting of quasi-compact opens. For E, E' constructible in X , the intersection $E \cap E'$ is constructible in E .*

Proof. Combine Lemmas 5.14.8 and 5.14.10. \square

Lemma 5.14.12. *Let X be a topological space. Assume X has a basis consisting of quasi-compact opens. Let E be constructible in X and $F \subset E$ constructible in E . Then F is constructible in X .*

Proof. Observe that any retrocompact subset T of X has a basis for the induced topology consisting of quasi-compact opens. In particular this holds for any constructible subset (Lemma 5.14.10). Write $E = E_1 \cup \dots \cup E_n$ with $E_i = U_i \cap V_i^c$ where $U_i, V_i \subset X$ are retrocompact open. Note that $E_i = E \cap E_i$ is constructible in E by Lemma 5.14.11. Hence $F \cap E_i$ is constructible in E_i by Lemma 5.14.11. Thus it suffices to prove the lemma in case $E = U \cap V^c$ where $U, V \subset X$ are retrocompact open. In this case the inclusion $E \subset X$ is a composition

$$E = U \cap V^c \rightarrow U \rightarrow X$$

Then we can apply Lemma 5.14.9 to the first inclusion and Lemma 5.14.5 to the second. \square

Lemma 5.14.13. *Let X be a topological space which has a basis for the topology consisting of quasi-compact opens. Let $E \subset X$ be a subset. Let $X = E_1 \cup \dots \cup E_m$ be a finite covering by constructible subsets. Then E is constructible in X if and only if $E \cap E_j$ is constructible in E_j for each $j = 1, \dots, m$.*

Proof. Combine Lemmas 5.14.11 and 5.14.12. \square

Lemma 5.14.14. *Let X be a topological space. Suppose that $Z \subset X$ is irreducible. Let $E \subset X$ be a finite union of locally closed subsets (e.g. E is constructible). The following are equivalent*

- (1) *The intersection $E \cap Z$ contains an open dense subset of Z .*
- (2) *The intersection $E \cap Z$ is dense in Z .*

If Z has a generic point ξ , then this is also equivalent to

- (3) *We have $\xi \in E$.*

Proof. Write $E = \bigcup U_i \cap Z_i$ as the finite union of intersections of open sets U_i and closed sets Z_i . Suppose that $E \cap Z$ is dense in Z . Note that the closure of $E \cap Z$ is the union of the closures of the intersections $U_i \cap Z_i \cap Z$. As Z is irreducible we conclude that the closure of $U_i \cap Z_i \cap Z$ is Z for some i . Fix such an i . It follows that $Z \subset Z_i$ since otherwise the closed subset $Z \cap Z_i$ of Z would not be dense in Z . Then $U_i \cap Z_i \cap Z = U_i \cap Z$ is an open nonempty subset of Z . Because Z is irreducible, it is open dense. Hence $E \cap Z$ contains an open dense subset of Z . The converse is obvious.

Suppose that $\xi \in Z$ is a generic point. Of course if (1) \Leftrightarrow (2) holds, then $\xi \in E$. Conversely, if $\xi \in E$, then $\xi \in U_i \cap Z_i$ for some $i = i_0$. Clearly this implies $Z \subset Z_{i_0}$ and hence $U_{i_0} \cap Z_{i_0} \cap Z = U_{i_0} \cap Z$ is an open not empty subset of Z . We conclude as before. \square

5.15. Constructible sets and Noetherian spaces

Lemma 5.15.1. *Let X be a Noetherian topological space. Constructible sets in X are finite unions of locally closed subsets of X .*

Proof. This follows immediately from Lemma 5.11.13. \square

Lemma 5.15.2. *Let $f : X \rightarrow Y$ be a continuous map of Noetherian topological spaces. If $E \subset Y$ is constructible in Y , then $f^{-1}(E)$ is constructible in X .*

Proof. Follows immediately from Lemma 5.15.1 and the definition of a continuous map. \square

Lemma 5.15.3. *Let X be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent*

- (1) *E is constructible in X , and*
- (2) *for every irreducible closed $Z \subset X$ the intersection $E \cap Z$ either contains a nonempty open of Z or is not dense in Z .*

Proof. Assume E is constructible and $Z \subset X$ irreducible closed. Then $E \cap Z$ is constructible in Z by Lemma 5.15.2. Hence $E \cap Z$ is a finite union of nonempty locally closed subsets T_i of Z . Clearly if none of the T_i is open in Z , then $E \cap Z$ is not dense in Z . In this way we see that (1) implies (2).

Conversely, assume (2) holds. Consider the set \mathcal{S} of closed subsets Y of X such that $E \cap Y$ is not constructible in Y . If $\mathcal{S} \neq \emptyset$, then it has a smallest element Y as X is Noetherian. Let $Y = Y_1 \cup \dots \cup Y_r$ be the decomposition of Y into its irreducible components, see Lemma 5.8.2. If $r > 1$, then each $Y_i \cap E$ is constructible in Y_i and hence a finite union of locally closed subsets of Y_i . Thus $E \cap Y$ is a finite union of locally closed subsets of Y too and we conclude that $E \cap Y$ is constructible in Y by Lemma 5.15.1. This is a contradiction and so $r = 1$. If $r = 1$, then Y is irreducible, and by assumption (2) we see that $E \cap Y$ either (a) contains an open V of Y or (b) is not dense in Y . In case (a) we see, by minimality of Y , that $E \cap (Y \setminus V)$ is a finite union of locally closed subsets of $Y \setminus V$. Thus $E \cap Y$ is a finite union of locally closed subsets of Y and is constructible by Lemma 5.15.1. This is a contradiction and so we must be in case (b). In case (b) we see that $E \cap Y = E \cap Y'$ for some proper closed subset $Y' \subset Y$. By minimality of Y we see that $E \cap Y'$ is a finite union of locally closed subsets of Y' and we see that $E \cap Y' = E \cap Y$ is a finite union of locally closed subsets of Y and is constructible by Lemma 5.15.1. This contradiction finishes the proof of the lemma. \square

Lemma 5.15.4. *Let X be a Noetherian topological space. Let $x \in X$. Let $E \subset X$ be constructible in X . The following are equivalent*

- (1) E is a neighbourhood of x , and
- (2) for every irreducible closed subset Y of X which contains x the intersection $E \cap Y$ is dense in Y .

Proof. It is clear that (1) implies (2). Assume (2). Consider the set \mathcal{S} of closed subsets Y of X containing x such that $E \cap Y$ is not a neighbourhood of x in Y . If $\mathcal{S} \neq \emptyset$, then it has a minimal element Y as X is Noetherian. Suppose $Y = Y_1 \cup Y_2$ with two smaller nonempty closed subsets Y_1, Y_2 . If $x \in Y_i$ for $i = 1, 2$, then $Y_i \cap E$ is a neighbourhood of x in Y_i and we conclude $Y \cap E$ is a neighbourhood of x in Y which is a contradiction. If $x \in Y_1$ but $x \notin Y_2$ (say), then $Y_1 \cap E$ is a neighbourhood of x in Y_1 and hence also in Y , which is a contradiction as well. We conclude that Y is irreducible closed. By assumption (2) we see that $E \cap Y$ is dense in Y . Thus $E \cap Y$ contains an open V of Y , see Lemma 5.15.3. If $x \in V$ then $E \cap Y$ is a neighbourhood of x in Y which is a contradiction. If $x \notin V$, then $Y' = Y \setminus V$ is a proper closed subset of Y containing x . By minimality of Y we see that $E \cap Y'$ contains an open neighbourhood $V' \subset Y'$ of x in Y' . But then $V' \cup V$ is an open neighbourhood of x in Y contained in E , a contradiction. This contradiction finishes the proof of the lemma. \square

Lemma 5.15.5. *Let X be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent*

- (1) E is open in X , and
- (2) for every irreducible closed subset Y of X the intersection $E \cap Y$ is either empty or contains a nonempty open of Y .

Proof. This follows formally from Lemmas 5.15.3 and 5.15.4. \square

5.16. Characterizing proper maps

We include a section discussing the notion of a proper map in usual topology. It turns out that in topology, the notion of being proper is the same as the notion of being universally closed, in the sense that any base change is a closed morphism (not just taking products with spaces). The reason for doing this is that in algebraic geometry we use this notion of universal closedness as the basis for our definition of properness.

Lemma 5.16.1 (Tube lemma). *Let X and Y be topological spaces. Let $A \subset X$ and $B \subset Y$ be quasi-compact subsets. Let $A \times B \subset W \subset X \times Y$ with W open in $X \times Y$. Then there exists opens $A \subset U \subset X$ and $B \subset V \subset Y$ such that $U \times V \subset W$.*

Proof. For every $a \in A$ and $b \in B$ there exist opens $U_{(a,b)}$ of X and $V_{(a,b)}$ of Y such that $(a, b) \in U_{(a,b)} \times V_{(a,b)} \subset W$. Fix b and we see there exist a finite number a_1, \dots, a_n such that $A \subset U_{(a_1,b)} \cup \dots \cup U_{(a_n,b)}$. Hence $A \times \{b\} \subset (U_{(a_1,b)} \cup \dots \cup U_{(a_n,b)}) \times (V_{(a_1,b)} \cap \dots \cap V_{(a_n,b)}) \subset W$. Thus for every $b \in B$ there exist opens $U_b \subset X$ and $V_b \subset Y$ such that $A \times \{b\} \subset U_b \times V_b \subset W$. As above there exist a finite number b_1, \dots, b_m such that $B \subset V_{b_1} \cup \dots \cup V_{b_m}$. Then we win because $A \times B \subset (U_{b_1} \cap \dots \cap U_{b_m}) \times (V_{b_1} \cup \dots \cup V_{b_m})$. \square

The notation in the following definition may be slightly different from what you are used to.

Definition 5.16.2. Let $f : X \rightarrow Y$ be a continuous map between topological spaces.

- (1) We say that the map f is *closed* iff the image of every closed subset is closed.
- (2) We say that the map f is *proper*⁴ iff the map $Z \times X \rightarrow Z \times Y$ is closed for any topological space Z .
- (3) We say that the map f is *quasi-proper* iff the inverse image $f^{-1}(V)$ of every quasi-compact subset $V \subset Y$ is quasi-compact.
- (4) We say that f is *universally closed* iff the map $f' : Z \times_Y X \rightarrow Z$ is closed for any map $g : Z \rightarrow Y$.

The following lemma is useful later.

Lemma 5.16.3. *A topological space X is quasi-compact if and only if the projection map $Z \times X \rightarrow Z$ is closed for any topological space Z .*

Proof. (See also remark below.) If X is not quasi-compact, there exists an open covering $X = \bigcup_{i \in I} U_i$ such that no finite number of U_i cover X . Let Z be the subset of the power set $\mathcal{P}(I)$ of I consisting of I and all nonempty finite subsets of I . Define a topology on Z with as a basis for the topology the following sets:

- (1) All subsets of $Z \setminus \{I\}$.
- (2) The empty set.
- (3) For every finite subset K of I the set $U_K := \{J \subset I \mid J \in Z, K \subset J\}$.

It is left to the reader to verify this is the basis for a topology. Consider the subset of $Z \times X$ defined by the formula

$$M = \{(J, x) \mid J \in Z, x \in \bigcap_{i \in J} U_i^c\}$$

⁴This is the terminology used in [Bou71]. Usually this is what is called “universally closed” in the literature. Thus our notion of proper does not involve any separation conditions.

If $(J, x) \notin M$, then $x \in U_i$ for some $i \in J$. Hence $U_{\{i\}} \times U_i \subset Z \times X$ is an open subset containing (J, x) and not intersecting M . Hence M is closed. The projection of M to Z is $Z - \{I\}$ which is not closed. Hence $Z \times X \rightarrow Z$ is not closed.

Assume X is quasi-compact. Let Z be a topological space. Let $M \subset Z \times X$ be closed. Let $z \in Z$ be a point which is not in $\text{pr}_1(M)$. By the Tube Lemma 5.16.1 there exists an open $U \subset Z$ such that $U \times X$ is contained in the complement of M . Hence $\text{pr}_1(M)$ is closed. \square

Remark 5.16.4. Lemma 5.16.3 is a combination of [Bou71, I, p. 75, Lemme 1] and [Bou71, I, p. 76, Corrolaire 1].

Theorem 5.16.5. *Let $f : X \rightarrow Y$ be a continuous map between topological spaces. The following condition is equivalent.*

- (1) *The map f is quasi-proper and closed.*
- (2) *The map f is proper.*
- (3) *The map f is universally closed.*
- (4) *The map f is closed and $f^{-1}(y)$ is quasi-compact for any $y \in Y$.*

Proof. (See also the remark below.) If the map f satisfies (1), it automatically satisfies (4) because any single point is quasi-compact.

Assume map f satisfies (4). We will prove it is universally closed, i.e., (3) holds. Let $g : Z \rightarrow Y$ be a continuous map of topological spaces and consider the diagram

$$\begin{array}{ccc} Z \times_Y X & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ Z & \xrightarrow{\quad g \quad} & Y \end{array}$$

During the proof we will use that $Z \times_Y X \rightarrow Z \times X$ is a homeomorphism onto its image, i.e., that we may identify $Z \times_Y X$ with the corresponding subset of $Z \times X$ with the induced topology. The image of $f' : Z \times_Y X \rightarrow Z$ is $\text{Im}(f') = \{z : g(z) \in f(X)\}$. Because $f(X)$ is closed, we see that $\text{Im}(f')$ is a closed subspace of Z . Consider a closed subset $P \subset Z \times_Y X$. Let $z \in Z$, $z \notin f'(P)$. If $z \notin \text{Im}(f')$, then $Z \setminus \text{Im}(f')$ is an open neighbourhood which avoids $f'(P)$. If z is in $\text{Im}(f')$ then $(f')^{-1}\{z\} = \{z\} \times f^{-1}\{g(z)\}$ and $f^{-1}\{g(z)\}$ is quasi-compact by assumption. Because P is a closed subset of $Z \times_Y X$, we have a closed P' of $Z \times X$ such that $P = P' \cap Z \times_Y X$. Since $(f')^{-1}\{z\}$ is a subset of $P^c = P'^c \cup (Z \times_Y X)^c$, and since $(f')^{-1}\{z\}$ is disjoint from $(Z \times_Y X)^c$ we see that $(f')^{-1}\{z\}$ is contained in P'^c . We may apply the Tube Lemma 5.16.1 to $(f')^{-1}\{z\} = \{z\} \times f^{-1}\{g(z)\} \subset (P')^c \subset Z \times X$. This gives $V \times U$ containing $(f')^{-1}\{z\}$ where U and V are open sets in X and Z respectively and $V \times U$ has empty intersection with P' . Then the set $V \cap g^{-1}(Y - f(U^c))$ is open in Z since f is closed, contains z , and has empty intersection with the image of P . Thus $f'(P)$ is closed. In other words, the map f is universally closed.

The implication (3) \Rightarrow (2) is trivial. Namely, given any topological space Z consider the projection morphism $g : Z \times Y \rightarrow Y$. Then it is easy to see that f' is the map $Z \times X \rightarrow Z \times Y$, in other words that $(Z \times Y) \times_Y X = Z \times X$. (This identification is a purely categorical property having nothing to do with topological spaces per se.)

Assume f satisfies (2). We will prove it satisfies (1). Note that f is closed as f can be identified with the map $\{pt\} \times X \rightarrow \{pt\} \times Y$ which is assumed closed.

Choose any quasi-compact subset $K \subset Y$. Let Z be any topological space. Because $Z \times X \rightarrow Z \times Y$ is closed we see the map $Z \times f^{-1}(K) \rightarrow Z \times K$ is closed (if T is closed in $Z \times f^{-1}(K)$, write $T = Z \times f^{-1}(K) \cap T'$ for some closed $T' \subset Z \times X$). Because K is quasi-compact, $K \times Z \rightarrow Z$ is closed by Lemma 5.16.3. Hence the composition $Z \times f^{-1}(K) \rightarrow Z \times K \rightarrow Z$ is closed and therefore $f^{-1}(K)$ must be quasi-compact by Lemma 5.16.3 again. \square

Remark 5.16.6. Here are some references to the literature. In [Bou71, I, p. 75, Theorem 1] you can find: (2) \Leftrightarrow (4). In [Bou71, I, p. 77, Proposition 6] you can find: (2) \Rightarrow (1). Of course, trivially we have (1) \Rightarrow (4). Thus (1), (2) and (4) are equivalent. Fan Zhou claimed and proved that (3) and (4) are equivalent; let me know if you find a reference in the literature.

Lemma 5.16.7. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If X is quasi-compact and Y is Hausdorff, then f is proper.*

Proof. Since every point of Y is closed, we see from Lemma 5.11.3 that the closed subset $f^{-1}(y)$ of X is quasi-compact for all $y \in Y$. Thus, by Theorem 5.16.5 it suffices to show that f is closed. If $E \subset X$ is closed, then it is quasi-compact (Lemma 5.11.3), hence $f(E) \subset Y$ is quasi-compact (Lemma 5.11.7), hence $f(E)$ is closed in Y (Lemma 5.11.4). \square

Lemma 5.16.8. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. If f is bijective, X is quasi-compact, and Y is Hausdorff, then f is a homeomorphism.*

Proof. This follows immediately from Lemma 5.16.7 which tells us that f is closed, i.e., f^{-1} is continuous. \square

5.17. Jacobson spaces

Definition 5.17.1. Let X be a topological space. Let X_0 be the set of closed points of X . We say that X is *Jacobson* if every closed subset $Z \subset X$ is the closure of $Z \cap X_0$.

Let X be a Jacobson space and let X_0 be the set of closed points of X with the induced topology. Clearly, the definition implies that the morphism $X_0 \rightarrow X$ induces a bijection between the closed subsets of X_0 and the closed subsets of X . Thus many properties of X are inherited by X_0 . For example, the Krull dimensions of X and X_0 are the same.

Lemma 5.17.2. *Let X be a topological space. Let X_0 be the set of closed points of X . Suppose that for every irreducible closed subset $Z \subset X$ the intersection $X_0 \cap Z$ is dense in Z . Then X is Jacobson.*

Proof. Let $Z \subset X$ be closed. According to Lemma 5.7.3 we have $Z = \bigcup Z_i$ with Z_i irreducible and closed. Thus $X_0 \cap Z_i$ is dense in each Z_i , then $X_0 \cap Z$ is dense in Z . \square

Lemma 5.17.3. *Let X be a sober, Noetherian topological space. If X is not Jacobson, then there exists a non-closed point $\xi \in X$ such that $\{\xi\}$ is locally closed.*

Proof. Assume X is sober, Noetherian and not Jacobson. By Lemma 5.17.2 there exists an irreducible closed subset $Z \subset X$ which is not the closure of its closed points. Since X is Noetherian we may assume Z is minimal with this property. Let

$\xi \in Z$ be the unique generic point (here we use X is sober). Note that the closed points are dense in $\overline{\{z\}}$ for any $z \in Z$, $z \neq \xi$ by minimality of Z . Hence the closure of the set of closed points of Z is a closed subset containing all $z \in Z$, $z \neq \xi$. Hence $\{\xi\}$ is locally closed as desired. \square

Lemma 5.17.4. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Then X is Jacobson if and only if each U_i is Jacobson. Moreover, in this case $X_0 = \bigcup U_{i,0}$.*

Proof. Let X be a topological space. Let X_0 be the set of closed points of X . Let $U_{i,0}$ be the set of closed points of U_i . Then $X_0 \cap U_i \subset U_{i,0}$ but equality may not hold in general.

First, assume that each U_i is Jacobson. We claim that in this case $X_0 \cap U_i = U_{i,0}$. Namely, suppose that $x \in U_{i,0}$, i.e., x is closed in U_i . Let $\overline{\{x\}}$ be the closure in X . Consider $\overline{\{x\}} \cap U_j$. If $x \notin U_j$, then $\overline{\{x\}} \cap U_j = \emptyset$. If $x \in U_j$, then $U_i \cap U_j \subset U_j$ is an open subset of U_j containing x . Let $T' = U_j \setminus U_i \cap U_j$ and $T = \overline{\{x\}} \cap U_j \cup T'$. Then T, T' are closed subsets of U_j and T contains x . As U_j is Jacobson we see that the closed points of U_j are dense in T . Because $T = \overline{\{x\}} \cap U_j \cup T'$ this can only be the case if x is closed in U_j . Hence $\overline{\{x\}} \cap U_j = \{x\}$. We conclude that $\overline{\{x\}} = \{x\}$ as desired.

Let $Z \subset X$ be a closed subset (still assuming each U_i is Jacobson). Since now we know that $X_0 \cap Z \cap U_i = U_{i,0} \cap Z$ are dense in $Z \cap U_i$ it follows immediately that $X_0 \cap Z$ is dense in Z .

Conversely, assume that X is Jacobson. Let $Z \subset U_i$ be closed. Then $X_0 \cap \overline{Z}$ is dense in \overline{Z} . Hence also $X_0 \cap Z$ is dense in Z , because $\overline{Z} \setminus Z$ is closed. As $X_0 \cap U_i \subset U_{i,0}$ we see that $U_{i,0} \cap Z$ is dense in Z . Thus U_i is Jacobson as desired. \square

Lemma 5.17.5. *Let X be Jacobson. The following types of subsets $T \subset X$ are Jacobson:*

- (1) *Open subspaces.*
- (2) *Closed subspaces.*
- (3) *Locally closed subspaces.*
- (4) *Finite unions of locally closed subspaces.*
- (5) *Constructible sets.*
- (6) *Any subset $T \subset X$ which locally on X is a finite union of locally closed subsets.*

In each of these cases closed points of T are closed in X .

Proof. Let X_0 be the set of closed points of X . For any subset $T \subset X$ we let $(*)$ denote the property:

- $(*)$ For every closed subset $Z \subset T$ the set $Z \cap X_0$ is dense in Z .

Note that always $X_0 \cap T \subset T_0$. Hence property $(*)$ implies that T is Jacobson. In addition it clearly implies that every closed point of T is closed in X .

Let $U \subset X$ be an open subset. Suppose $Z \subset U$ is closed. Then $X_0 \cap \overline{Z}$ is dense in \overline{Z} . Hence $X_0 \cap Z$ is dense in Z , because $\overline{Z} \setminus Z$ is closed. Thus $(*)$ holds.

Let $Z \subset X$ be a closed subset. Since closed subsets of Z are the same as closed subsets of X contained in Z property $(*)$ is immediate.

Let $T \subset X$ be locally closed. Write $T = U \cap Z$ for some open $U \subset X$ and some closed $Z \subset X$. Note that closed subsets of T are the same thing as closed subsets of U which happen to be contained in Z . Hence (*) holds for T because we proved it for U above.

Suppose $T_i \subset X$, $i = 1, \dots, n$ are locally closed subsets. Let $T = T_1 \cup \dots \cup T_n$. Suppose $Z \subset T$ is closed. Then $Z_i = Z \cap T_i$ is closed in T_i . By (*) for T_i we see that $Z_i \cap X_0$ is dense in Z_i . Clearly this implies that $X_0 \cap Z$ is dense in Z , and property (*) holds for T .

The case of constructible subsets is subsumed in the case of finite unions of locally closed subsets, see Definition 5.14.1.

The condition of the last assertion means that there exists an open covering $X = \bigcup U_i$ such that each $T \cap U_i$ is a finite union of locally closed subsets of U_i . We conclude that T is Jacobson by Lemma 5.17.4 and the case of a finite union of locally closed subsets dealt with above. It is formal to deduce (*) for T from (*) for all the inclusions $T \cap U_i \subset U_i$ and the assertions $X_0 = \bigcup U_{i,0}$ and $T_0 = \bigcup (T \cap U_i)_0$ from Lemma 5.17.4. \square

Lemma 5.17.6. *A finite Jacobson space is discrete.*

Proof. If X is finite Jacobson, $X_0 \subset X$ the subset of closed points, then, on the one hand, $\overline{X_0} = X$. On the other hand, X , and hence X_0 is finite, so $X_0 = \{x_1, \dots, x_n\} = \bigcup_{i=1, \dots, n} \{x_i\}$ is a finite union of closed sets, hence closed, so $X = \overline{X_0} = X_0$. Every point is closed, and by finiteness, every point is open. \square

Lemma 5.17.7. *Suppose X is a Jacobson topological space. Let X_0 be the set of closed points of X . There is a bijective, inclusion preserving correspondence*

$$\{\text{constructible subsets of } X\} \leftrightarrow \{\text{constructible subsets of } X_0\}$$

given by $E \mapsto E \cap X_0$. This correspondence preserves the subset of retrocompact open subsets, as well as complements of these.

Proof. Obvious from Lemma 5.17.5 above. \square

Lemma 5.17.8. *Suppose X is a Jacobson topological space. Let X_0 be the set of closed points of X . There is a bijective, inclusion preserving correspondence*

$$\{\text{finite unions loc. closed subsets of } X\} \leftrightarrow \{\text{finite unions loc. closed subsets of } X_0\}$$

given by $E \mapsto E \cap X_0$. This correspondence preserves the subsets of locally closed, of open and of closed subsets.

Proof. Obvious from Lemma 5.17.5 above. \square

5.18. Specialization

Definition 5.18.1. Let X be a topological space.

- (1) If $x, x' \in X$ then we say x is a *specialization* of x' , or x' is a *generalization* of x if $x \in \overline{\{x'\}}$. Notation: $x' \rightsquigarrow x$.
- (2) A subset $T \subset X$ is *stable under specialization* if for all $x' \in T$ and every specialization $x' \rightsquigarrow x$ we have $x \in T$.
- (3) A subset $T \subset X$ is *stable under generalization* if for all $x \in T$ and every generalization x' of x we have $x' \in T$.

Lemma 5.18.2. *Let X be a topological space.*

- (1) *Any closed subset of X is stable under specialization.*
- (2) *Any open subset of X is stable under generalization.*
- (3) *A subset $T \subset X$ is stable under specialization if and only if the complement T^c is stable under generalization.*

Proof. Omitted. □

Definition 5.18.3. Let $f : X \rightarrow Y$ be a continuous map of topological spaces.

- (1) We say that *specializations lift along f* or that f is *specializing* if given $y' \rightsquigarrow y$ in Y and any $x' \in X$ with $f(x') = y'$ there exists a specialization $x' \rightsquigarrow x$ of x' in X such that $f(x) = y$.
- (2) We say that *generalizations lift along f* or that f is *generalizing* if given $y' \rightsquigarrow y$ in Y and any $x \in X$ with $f(x) = y$ there exists a generalization $x' \rightsquigarrow x$ of x in X such that $f(x') = y'$.

Lemma 5.18.4. *Suppose $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous maps of topological spaces. If specializations lift along both f and g then specializations lift along $g \circ f$. Similarly for “generalizations lift along”.*

Proof. Omitted. □

Lemma 5.18.5. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces.*

- (1) *If specializations lift along f , and if $T \subset X$ is stable under specialization, then $f(T) \subset Y$ is stable under specialization.*
- (2) *If generalizations lift along f , and if $T \subset X$ is stable under generalization, then $f(T) \subset Y$ is stable under generalization.*

Proof. Omitted. □

Lemma 5.18.6. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces.*

- (1) *If f is closed then specializations lift along f .*
- (2) *If f is open, X is a Noetherian topological space, each irreducible closed subset of X has a generic point, and Y is Kolmogorov then generalizations lift along f .*

Proof. Assume f is closed. Let $y' \rightsquigarrow y$ in Y and any $x' \in X$ with $f(x') = y'$ be given. Consider the closed subset $T = \overline{\{x'\}}$ of X . Then $f(T) \subset Y$ is a closed subset, and $y' \in f(T)$. Hence also $y \in f(T)$. Hence $y = f(x)$ with $x \in T$, i.e., $x' \rightsquigarrow x$.

Assume f is open, X Noetherian, every irreducible closed subset of X has a generic point, and Y is Kolmogorov. Let $y' \rightsquigarrow y$ in Y and any $x \in X$ with $f(x) = y$ be given. Consider $T = f^{-1}(\{y'\}) \subset X$. Take an open neighbourhood $x \in U \subset X$ of x . Then $f(U) \subset Y$ is open and $y \in f(U)$. Hence also $y' \in f(U)$. In other words, $T \cap U \neq \emptyset$. This proves that $x \in \overline{T}$. Since X is Noetherian, T is Noetherian (Lemma 5.8.2). Hence it has a decomposition $T = T_1 \cup \dots \cup T_n$ into irreducible components. Then correspondingly $\overline{T} = \overline{T_1} \cup \dots \cup \overline{T_n}$. By the above $x \in \overline{T_i}$ for some i . By assumption there exists a generic point $x' \in \overline{T_i}$, and we see that $x' \rightsquigarrow x$. As $x' \in \overline{T}$ we see that $f(x') \in \overline{\{y'\}}$. Note that $f(\overline{T_i}) = f(\{x'\}) \subset \overline{\{f(x')\}}$. If $f(x') \neq y'$, then since Y is Kolmogorov $\overline{f(x')}$ is not a generic point of the irreducible closed subset $\overline{\{y'\}}$ and the inclusion $\overline{\{f(x')\}} \subset \overline{\{y'\}}$ is strict, i.e., $y' \notin \overline{f(T_i)}$. This contradicts the fact that $f(T_i) = \{y'\}$. Hence $f(x') = y'$ and we win. □

Lemma 5.18.7. *Suppose that $s, t : R \rightarrow U$ and $\pi : U \rightarrow X$ are continuous maps of topological spaces such that*

- (1) π is open,
- (2) U is sober,
- (3) s, t have finite fibres,
- (4) generalizations lift along s, t ,
- (5) $(t, s)(R) \subset U \times U$ is an equivalence relation on U and X is the quotient of U by this equivalence relation (as a set).

Then X is Kolmogorov.

Proof. Properties (3) and (5) imply that a point x corresponds to an finite equivalence class $\{u_1, \dots, u_n\} \subset U$ of the equivalence relation. Suppose that $x' \in X$ is a second point corresponding to the equivalence class $\{u'_1, \dots, u'_m\} \subset U$. Suppose that $u_i \rightsquigarrow u'_j$ for some i, j . Then for any $r' \in R$ with $s(r') = u'_j$ by (4) we can find $r \rightsquigarrow r'$ with $s(r) = u_i$. Hence $t(r) \rightsquigarrow t(r')$. Since $\{u'_1, \dots, u'_m\} = t(s^{-1}(\{u'_j\}))$ we conclude that every element of $\{u'_1, \dots, u'_m\}$ is the specialization of an element of $\{u_1, \dots, u_n\}$. Thus $\overline{\{u'_1, \dots, u'_m\}} \subset \overline{\{u_1, \dots, u_n\}}$. Thus $\overline{\{u_1, \dots, u_n\}} \cup \dots \cup \overline{\{u_n\}}$ is a union of equivalence classes, hence of the form $\pi^{-1}(Z)$ for some subset $Z \subset X$. By (1) we see that Z is closed in X and in fact $Z = \{x\}$ because $\pi(\{u_i\}) \subset \{x\}$ for each i . In other words, $x \rightsquigarrow x'$ if and only if some lift of x in U specializes to some lift of x' in U , if and only if every lift of x' in U is a specialization of some lift of x in U .

Suppose that both $x \rightsquigarrow x'$ and $x' \rightsquigarrow x$. Say x corresponds to $\{u_1, \dots, u_n\}$ and x' corresponds to $\{u'_1, \dots, u'_m\}$ as above. Then, by the results of the preceding paragraph, we can find a sequence

$$\dots \rightsquigarrow u'_{j_3} \rightsquigarrow u_{i_3} \rightsquigarrow u'_{j_2} \rightsquigarrow u_{i_2} \rightsquigarrow u'_{j_1} \rightsquigarrow u_{i_1}$$

which must repeat, hence by (2) we conclude that $\{u_1, \dots, u_n\} = \{u'_1, \dots, u'_m\}$, i.e., $x = x'$. Thus X is Kolmogorov. \square

Lemma 5.18.8. *Let $f : X \rightarrow Y$ be a morphism of topological spaces. Suppose that Y is a sober topological space, and f is surjective. If either specializations or generalizations lift along f , then $\dim(X) \geq \dim(Y)$.*

Proof. Assume specializations lift along f . Let $Z_0 \subset Z_1 \subset \dots \subset Z_e \subset Y$ be a chain of irreducible closed subsets of Y . Let $\xi_e \in X$ be a point mapping to the generic point of Z_e . By assumption there exists a specialization $\xi_e \rightsquigarrow \xi_{e-1}$ in X such that ξ_{e-1} maps to the generic point of Z_{e-1} . Continuing in this manner we find a sequence of specializations

$$\xi_e \rightsquigarrow \xi_{e-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$$

with ξ_i mapping to the generic point of Z_i . This clearly implies the sequence of irreducible closed subsets

$$\overline{\{\xi_0\}} \subset \overline{\{\xi_1\}} \subset \dots \subset \overline{\{\xi_e\}}$$

is a chain of length e in X . The case when generalizations lift along f is similar. \square

Lemma 5.18.9. *Let X be a Noetherian sober topological space. Let $E \subset X$ be a subset of X .*

- (1) *If E is constructible and stable under specialization, then E is closed.*
- (2) *If E is constructible and stable under generalization, then E is open.*

Proof. Let E be constructible and stable under generalization. Let $Y \subset X$ be an irreducible closed subset with generic point $\xi \in Y$. If $E \cap Y$ is nonempty, then it contains ξ (by stability under generalization) and hence is dense in Y , hence it contains a nonempty open of Y , see Lemma 5.15.3. Thus E is open by Lemma 5.15.5. This proves (2). To prove (1) apply (2) to the complement of E in X . \square

5.19. Dimension functions

It scarcely makes sense to consider dimension functions unless the space considered is sober (Definition 5.7.4). Thus the definition below can be improved by considering the sober topological space associated to X . Since the underlying topological space of a scheme is sober we do not bother with this improvement.

Definition 5.19.1. Let X be a topological space.

- (1) Let $x, y \in X$, $x \neq y$. Suppose $x \rightsquigarrow y$, that is y is a specialization of x . We say y is an *immediate specialization* of x if there is no $z \in X \setminus \{x, y\}$ with $x \rightsquigarrow z$ and $z \rightsquigarrow y$.
- (2) A map $\delta : X \rightarrow \mathbf{Z}$ is called a *dimension function*⁵ if
 - (a) whenever $x \rightsquigarrow y$ and $x \neq y$ we have $\delta(x) > \delta(y)$, and
 - (b) for every immediate specialization $x \rightsquigarrow y$ in X we have $\delta(x) = \delta(y) + 1$.

It is clear that if δ is a dimension function, then so is $\delta + t$ for any $t \in \mathbf{Z}$. Here is a fun lemma.

Lemma 5.19.2. *Let X be a topological space. If X is sober and has a dimension function, then X is catenary. Moreover, for any $x \rightsquigarrow y$ we have*

$$\delta(x) - \delta(y) = \text{codim}(\overline{\{y\}}, \overline{\{x\}}).$$

Proof. Suppose $Y \subset Y' \subset X$ are irreducible closed subsets. Let $\xi \in Y$, $\xi' \in Y'$ be their generic points. Then we see immediately from the definitions that $\text{codim}(Y, Y') \leq \delta(\xi) - \delta(\xi') < \infty$. In fact the first inequality is an equality. Namely, suppose

$$Y = Y_0 \subset Y_1 \subset \dots \subset Y_e = Y'$$

is any maximal chain of irreducible closed subsets. Let $\xi_i \in Y_i$ denote the generic point. Then we see that $\xi_i \rightsquigarrow \xi_{i+1}$ is an immediate specialization. Hence we see that $e = \delta(\xi) - \delta(\xi')$ as desired. This also proves the last statement of the lemma. \square

Lemma 5.19.3. *Let X be a topological space. Let δ, δ' be two dimension functions on X . If X is locally Noetherian and sober then $\delta - \delta'$ is locally constant on X .*

Proof. Let $x \in X$ be a point. We will show that $\delta - \delta'$ is constant in a neighbourhood of x . We may replace X by an open neighbourhood of x in X which is Noetherian. Hence we may assume X is Noetherian and sober. Let Z_1, \dots, Z_r be the irreducible components of X passing through x . (There are finitely many as X is Noetherian, see Lemma 5.8.2.) Let $\xi_i \in Z_i$ be the generic point. Note $Z_1 \cup \dots \cup Z_r$ is a neighbourhood of x in X (not necessarily closed). We claim that $\delta - \delta'$ is constant on $Z_1 \cup \dots \cup Z_r$. Namely, if $y \in Z_i$, then

$$\delta(x) - \delta(y) = \delta(x) - \delta(\xi_i) + \delta(\xi_i) - \delta(y) = -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i)$$

⁵This is likely nonstandard notation. This notion is usually introduced only for (locally) Noetherian schemes, in which case condition (a) is implied by (b).

by Lemma 5.19.2. Similarly for δ' . Whence the result. \square

Lemma 5.19.4. *Let X be locally Noetherian, sober and catenary. Then any point has an open neighbourhood $U \subset X$ which has a dimension function.*

Proof. We will use repeatedly that an open subspace of a catenary space is catenary, see Lemma 5.10.5 and that a Noetherian topological space has finitely many irreducible components, see Lemma 5.8.2. In the proof of Lemma 5.19.3 we saw how to construct such a function. Namely, we first replace X by a Noetherian open neighbourhood of x . Next, we let $Z_1, \dots, Z_r \subset X$ be the irreducible components of X . Let

$$Z_i \cap Z_j = \bigcup Z_{ijk}$$

be the decomposition into irreducible components. We replace X by

$$X \setminus \left(\bigcup_{x \notin Z_i} Z_i \cup \bigcup_{x \notin Z_{ijk}} Z_{ijk} \right)$$

so that we may assume $x \in Z_i$ for all i and $x \in Z_{ijk}$ for all i, j, k . For $y \in X$ choose any i such that $y \in Z_i$ and set

$$\delta(y) = -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i).$$

We claim this is a dimension function. First we show that it is well defined, i.e., independent of the choice of i . Namely, suppose that $y \in Z_{ijk}$ for some i, j, k . Then we have (using Lemma 5.10.6)

$$\begin{aligned} \delta(y) &= -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i) \\ &= -\text{codim}(\overline{\{x\}}, Z_{ijk}) - \text{codim}(Z_{ijk}, Z_i) + \text{codim}(\overline{\{y\}}, Z_{ijk}) + \text{codim}(Z_{ijk}, Z_i) \\ &= -\text{codim}(\overline{\{x\}}, Z_{ijk}) + \text{codim}(\overline{\{y\}}, Z_{ijk}) \end{aligned}$$

which is symmetric in i and j . We omit the proof that it is a dimension function. \square

Remark 5.19.5. Combining Lemmas 5.19.3 and 5.19.4 we see that on a catenary, locally Noetherian, sober topological space the obstruction to having a dimension function is an element of $H^1(X, \mathbf{Z})$.

5.20. Nowhere dense sets

Definition 5.20.1. Let X be a topological space.

- (1) Given a subset $T \subset X$ the *interior* of T is the largest open subset of X contained in T .
- (2) A subset $T \subset X$ is called *nowhere dense* if the closure of T has empty interior.

Lemma 5.20.2. *Let X be a topological space. The union of a finite number of nowhere dense sets is a nowhere dense set.*

Proof. Omitted. \square

Lemma 5.20.3. *Let X be a topological space. Let $U \subset X$ be an open. Let $T \subset U$ be a subset. If T is nowhere dense in U , then T is nowhere dense in X .*

Proof. Assume T is nowhere dense in U . Suppose that $x \in X$ is an interior point of the closure \overline{T} of T in X . Say $x \in V \subset \overline{T}$ with $V \subset X$ open in X . Note that $\overline{T} \cap U$ is the closure of T in U . Hence the interior of $\overline{T} \cap U$ being empty implies $V \cap U = \emptyset$. Thus x cannot be in the closure of U , a fortiori cannot be in the closure of T , a contradiction. \square

Lemma 5.20.4. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let $T \subset X$ be a subset. If $T \cap U_i$ is nowhere dense in U_i for all i , then T is nowhere dense in X .*

Proof. Omitted. (Hint: closure commutes with intersecting with opens.) \square

Lemma 5.20.5. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $T \subset X$ be a subset. If f identifies X with a closed subset of Y and T is nowhere dense in X , then also $f(T)$ is nowhere dense in Y .*

Proof. Omitted. \square

Lemma 5.20.6. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $T \subset Y$ be a subset. If f is open and T is a closed nowhere dense subset of Y , then also $f^{-1}(T)$ is a closed nowhere dense subset of X . If f is surjective and open, then T is closed nowhere dense if and only if $f^{-1}(T)$ is closed nowhere dense.*

Proof. Omitted. (Hint: In the first case the interior of $f^{-1}(T)$ maps into the interior of T , and in the second case the interior of $f^{-1}(T)$ maps onto the interior of T .) \square

5.21. Profinite spaces

Here is the definition.

Definition 5.21.1. A topological space is *profinite* if it is homeomorphic to a limit of a diagram of finite discrete spaces.

This is not the most convenient characterization of a profinite space.

Lemma 5.21.2. *Let X be a topological space. The following are equivalent*

- (1) X is a profinite space, and
- (2) X is Hausdorff, quasi-compact, and totally disconnected.

If this is true, then X is a cofiltered limit of finite discrete spaces.

Proof. Assume (1). Choose a diagram $i \mapsto X_i$ of finite discrete spaces such that $X = \lim X_i$. As each X_i is Hausdorff and quasi-compact we find that X is quasi-compact by Lemma 5.13.5. If $x, x' \in X$ are distinct points, then x and x' map to distinct points in some X_i . Hence x and x' have disjoint open neighbourhoods, i.e., X is Hausdorff. In exactly the same way we see that X is totally disconnected.

Assume (2). Let \mathcal{I} be the set of finite disjoint union decompositions $X = \bigsqcup_{i \in I} U_i$ with U_i open (and closed). For each $I \in \mathcal{I}$ there is a continuous map $X \rightarrow I$ sending a point of U_i to i . We define a partial ordering: $I \leq I'$ for $I, I' \in \mathcal{I}$ if and only if the covering corresponding to I' refines the covering corresponding to I . In this case we obtain a canonical map $I' \rightarrow I$. In other words we obtain an inverse system of finite discrete spaces over \mathcal{I} . The maps $X \rightarrow I$ fit together and we obtain a continuous map

$$X \longrightarrow \lim_{I \in \mathcal{I}} I$$

We claim this map is a homeomorphism, which finishes the proof. (The final assertion follows too as the partially ordered set \mathcal{I} is directed: given two disjoint union decompositions of X we can find a third refining either.) Namely, the map is injective as X is totally disconnected and hence $\{x\}$ is the intersection of all open and closed subsets of X containing x (Lemma 5.11.11), the map is surjective by Lemma 5.11.6. By Lemma 5.16.8 the map is a homeomorphism. \square

Lemma 5.21.3. *Let X be a profinite space. Every open covering of X has a refinement by a finite covering $X = \coprod U_i$ with U_i open and closed.*

Proof. Write $X = \lim X_i$ as a limit of an inverse system of finite discrete spaces over a directed partially ordered set I (Lemma 5.21.2). Denote $f_i : X \rightarrow X_i$ the projection. For every point $x = (x_i) \in X$ a fundamental system of open neighbourhoods is the collection $f_i^{-1}(\{x_i\})$. Thus, as X is quasi-compact, we may assume we have an open covering

$$X = f_{i_1}^{-1}(\{x_{i_1}\}) \cup \dots \cup f_{i_n}^{-1}(\{x_{i_n}\})$$

Choose $i \in I$ with $i \geq i_j$ for $j = 1, \dots, n$ (this is possible as I is a directed partially ordered set). Then we see that the covering

$$X = \coprod_{t \in X_i} f_i^{-1}(\{t\})$$

refines the given covering and is of the desired form. \square

Lemma 5.21.4. *Let X be a topological space. If X is quasi-compact and every connected component of X is the intersection of the open and closed subsets containing it, then $\pi_0(X)$ is a profinite space.*

Proof. We will use Lemma 5.21.2 to prove this. Since $\pi_0(X)$ is the image of a quasi-compact space it is quasi-compact (Lemma 5.11.7). It is totally disconnected by construction (Lemma 5.6.8). Let $C, D \subset X$ be distinct connected components of X . Write $C = \bigcap U_\alpha$ as the intersection of the open and closed subsets of X containing C . Any finite intersection of U_α 's is another. Since $\bigcap U_\alpha \cap D = \emptyset$ we conclude that $U_\alpha \cap D = \emptyset$ for some α (use Lemmas 5.6.3, 5.11.3 and 5.11.6) Since U_α is open and closed, it is the union of the connected components it contains, i.e., U_α is the inverse image of some open and closed subset $V_\alpha \subset \pi_0(X)$. This proves that the points corresponding to C and D are contained in disjoint open subsets, i.e., $\pi_0(X)$ is Hausdorff. \square

5.22. Spectral spaces

The material in this section is taken from [Hoc69] and [Hoc67]. In his thesis Hochster proves (among other things) that the spectral spaces are exactly the topological spaces that occur as the spectrum of a ring.

Definition 5.22.1. A topological space X is called *spectral* if it is sober, quasi-compact, the intersection of two quasi-compact opens is quasi-compact, and the collection of quasi-compact opens forms a basis for the topology. A continuous map $f : X \rightarrow Y$ of spectral spaces is called *spectral* if the inverse image of a quasi-compact open is quasi-compact.

In other words a continuous map of spectral space is spectral if and only if it is quasi-compact (Definition 5.11.1).

Let X be a spectral space. The *constructible topology* on X is the topology which has as a subbase of opens the sets U and U^c where U is a quasi-compact open of X . Note that since X is spectral an open $U \subset X$ is retrocompact if and only if U is quasi-compact. Hence the constructible topology can also be characterized as the coarsest topology such that every constructible subset of X is both open and closed. Since the collection of quasi-compact opens is a basis for the topology on X we see that the constructible topology is stronger than the given topology on X .

Lemma 5.22.2. *Let X be a spectral space. The constructible topology is Hausdorff and quasi-compact.*

Proof. Since the collection of all quasi-compact opens forms a basis for the topology on X , it is clear that X is Hausdorff in the constructible topology.

Let \mathcal{B} be the collection of subsets $B \subset X$ with B either quasi-compact open or closed with quasi-compact complement. If $B \in \mathcal{B}$ then $B^c \in \mathcal{B}$. It suffices to show every covering $X = \bigcup_{i \in I} B_i$ with $B_i \in \mathcal{B}$ has a finite refinement, see Lemma 5.11.15. Taking complements we see that we have to show that any family $\{B_i\}_{i \in I}$ of elements of \mathcal{B} such that $B_{i_1} \cap \dots \cap B_{i_n} \neq \emptyset$ for all n and all $i_1, \dots, i_n \in I$ has a common point of intersection. We may and do assume $B_i \neq B_{i'}$ for $i \neq i'$.

To get a contradiction assume $\{B_i\}_{i \in I}$ is a maximal family of elements of \mathcal{B} having the finite intersection property but empty intersection. An application of Zorn's lemma shows that we may assume our family is maximal (details omitted). Let $I' \subset I$ be those indices such that B_i is closed and set $Z = \bigcap_{i \in I'} B_i$. This is a closed subset of X . If Z is reducible, then we can write $Z = Z' \cup Z''$ as a union of two closed subsets, neither equal to Z . This means in particular that we can find a quasi-compact open $U' \subset X$ meeting Z' but not Z'' . Similarly, we can find a quasi-compact open $U'' \subset X$ meeting Z'' but not Z' . Set $B' = X \setminus U'$ and $B'' = X \setminus U''$. Note that $Z'' \subset B'$ and $Z' \subset B''$. If there exist a finite number of indices $i_1, \dots, i_n \in I$ such that $B' \cap B_{i_1} \cap \dots \cap B_{i_n} = \emptyset$ as well as a finite number of indices $j_1, \dots, j_m \in I$ such that $B'' \cap B_{j_1} \cap \dots \cap B_{j_m} = \emptyset$ then we find that $Z \cap B_{i_1} \cap \dots \cap B_{i_n} \cap B_{j_1} \cap \dots \cap B_{j_m} = \emptyset$. However, the set $B_{i_1} \cap \dots \cap B_{i_n} \cap B_{j_1} \cap \dots \cap B_{j_m}$ is quasi-compact hence we would find a finite number of indices $i'_1, \dots, i'_l \in I'$ with $B_{i_1} \cap \dots \cap B_{i_n} \cap B_{j_1} \cap \dots \cap B_{j_m} \cap B_{i'_1} \cap \dots \cap B_{i'_l} = \emptyset$ a contradiction. Thus we see that we may add either B' or B'' to the given family contradicting maximality. We conclude that Z is irreducible. However, this leads to a contradiction as well, as now every nonempty (by the same argument as above) open $Z \cap B_i$ for $i \in I \setminus I'$ contains the unique generic point of Z . This contradiction proves the lemma. \square

Lemma 5.22.3. *Let $f : X \rightarrow Y$ be a spectral map of spectral spaces. Then the fibres of f are quasi-compact.*

Proof. Let X' and Y' denote X and Y endowed with the constructible topology which are quasi-compact Hausdorff spaces by Lemma 5.22.2. As f is spectral the map $X' \rightarrow Y'$ is continuous too. Thus we get a commutative diagram

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ Y' & \longrightarrow & Y \end{array}$$

of continuous maps of topological spaces. Since Y' is hausdorff we see that the fibres X'_y are closed in X' . As X' is quasi-compact we see that X'_y is quasi-compact (Lemma 5.11.3). As $X'_y \rightarrow X_y$ is a surjective continuous map we conclude that X_y is quasi-compact (Lemma 5.11.7). \square

Lemma 5.22.4. *Let X be a spectral space. Let $E \subset X$ be closed in the constructible topology (for example constructible or closed). Then E with the induced topology is a spectral space.*

Proof. Let $Z \subset E$ be a closed irreducible subset. Let η be the generic point of the closure \overline{Z} of Z in X . To prove that E is sober, we show that $\eta \in E$. If not, then since E is closed in the constructible topology, there exists a constructible subset $F \subset X$ such that $\eta \in F$ and $F \cap E = \emptyset$. By Lemma 5.14.14 this implies $F \cap \overline{Z}$ contains a nonempty open subset of \overline{Z} . But this is impossible as \overline{Z} is the closure of Z and $Z \cap F = \emptyset$.

Since E is closed in the constructible topology, it is quasi-compact in the constructible topology (Lemmas 5.11.3 and 5.22.2). Hence a fortiori it is quasi-compact in the topology coming from X . If $U \subset X$ is a quasi-compact open, then $E \cap U$ is closed in the constructible topology, hence quasi-compact (as seen above). It follows that the quasi-compact open subsets of E are the intersections $E \cap U$ with U quasi-compact open in X . These form a basis for the topology. Finally, given two $U, U' \subset X$ quasi-compact opens, the intersection $(E \cap U) \cap (E \cap U') = E \cap (U \cap U')$ and $U \cap U'$ is quasi-compact as X is spectral. This finishes the proof. \square

Lemma 5.22.5. *Let X be a spectral space. Let $E \subset X$ be a constructible subset.*

- (1) *If $x \in \overline{E}$, then x is the specialization of a point of E .*
- (2) *If E is stable under specialization, then E is closed.*
- (3) *If E is stable under generalization, then E is open.*

Proof. Proof of (1). Let $x \in \overline{E}$. Let $\{U_i\}$ be the set of quasi-compact open neighbourhoods of x . A finite intersection of the U_i is another one. The intersection $U_i \cap E$ is nonempty for all i . Since the subsets $U_i \cap E$ are closed in the constructible topology we see that $\bigcap (U_i \cap E)$ is nonempty by Lemma 5.22.2 and Lemma 5.11.6. Since X is a sober space and $\{U_i\}$ is a fundamental system of open neighbourhoods of x , we see that $\bigcap U_i$ is the set of generalizations of x . Thus x is a specialization of a point of E .

Part (2) is immediate from (1).

Proof of (3). Assume E is stable under generalization. The complement of E is constructible (Lemma 5.14.2) and closed under specialization (Lemma 5.18.2). Hence the complement is closed by (2), i.e., E is open. \square

Lemma 5.22.6. *Let X be a spectral space. Let $x, y \in X$. Then either there exists a third point specializing to both x and y , or there exist disjoint open neighbourhoods containing x and y .*

Proof. Let $\{U_i\}$ be the set of quasi-compact open neighbourhoods of x . A finite intersection of the U_i is another one. Let $\{V_j\}$ be the set of quasi-compact open neighbourhoods of y . A finite intersection of the V_j is another one. If $U_i \cap V_j$ is empty for some i, j we are done. If not, then the intersection $U_i \cap V_j$ is nonempty for all i, j . The sets $U_i \cap V_j$ are closed in the constructible topology on X . By Lemma

5.22.2 we see that $\bigcap(U_i \cap V_j)$ is nonempty (Lemma 5.11.6). Since X is a sober space and $\{U_i\}$ is a fundamental system of open neighbourhoods of x , we see that $\bigcap U_i$ is the set of generalizations of x . Similarly, $\bigcap V_j$ is the set of generalizations of y . Thus any element of $\bigcap(U_i \cap V_j)$ specializes to both x and y . \square

Lemma 5.22.7. *Let X be a spectral space. The following are equivalent*

- (1) X is profinite,
- (2) X is Hausdorff,
- (3) X is totally disconnected,
- (4) every quasi-compact open is closed,
- (5) there are no nontrivial specializations between points,
- (6) every point of X is closed,
- (7) every point of X is the generic point of an irreducible component of X ,
- (8) add more here.

Proof. The implication (1) \Rightarrow (2) is trivial. If every quasi-compact open is closed, then X is Hausdorff, so (4) \Rightarrow (2).

It is clear that (4), (5), and (6) are equivalent since X is sober. It follows from Lemma 5.22.6 that this implies X is Hausdorff.

If X is totally disconnected, then every point is closed. So (3) implies (6).

Thus every condition implies that X is Hausdorff. Conversely, if X is Hausdorff, then every quasi-compact open is also closed (Lemma 5.11.4). This implies that X is totally disconnected. Hence it is profinite, by Lemma 5.21.2. This also implies (4), (5), and (6) hold. \square

Lemma 5.22.8. *If X is a spectral space, then $\pi_0(X)$ is a profinite space.*

Proof. Combine Lemmas 5.11.10 and 5.21.4. \square

Lemma 5.22.9. *The product of two spectral spaces is spectral.*

Proof. Let X, Y be spectral spaces. Denote $p : X \times Y \rightarrow X$ and $q : X \times Y \rightarrow Y$ the projections. Let $Z \subset X \times Y$ be a closed irreducible subset. Then $p(Z) \subset X$ is irreducible and $q(Z) \subset Y$ is irreducible. Let $x \in X$ be the generic point of the closure of $p(Z)$ and let $y \in Y$ be the generic point of the closure of $q(Z)$. If $(x, y) \notin Z$, then there exist opens $U \subset X, V \subset Y$ such that $Z \cap U \times V = \emptyset$. Hence Z is contained in $(X \setminus U) \times Y \cup X \times (Y \setminus V)$. Since Z is irreducible, we see that either $Z \subset (X \setminus U) \times Y$ or $Z \subset X \times (Y \setminus V)$. In the first case $p(Z) \subset (X \setminus U)$ and in the second case $q(Z) \subset (Y \setminus V)$. Both cases are absurd as x is in the closure of $p(Z)$ and y is in the closure of $q(Z)$. Thus we conclude that $(x, y) \in Z$, which means that (x, y) is the generic point for Z .

A basis of the topology of $X \times Y$ are the opens of the form $U \times V$ with $U \subset X$ and $V \subset Y$ quasi-compact open (here we use that X and Y are spectral). Then $U \times V$ is quasi-compact as the product of quasi-compact spaces is quasi-compact. Moreover, any quasi-compact open of $X \times Y$ is a finite union of such quasi-compact rectangles $U \times V$. It follows that the intersection of two such is again quasi-compact (since X and Y are spectral). This concludes the proof. \square

Lemma 5.22.10. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. if*

- (1) X and Y are spectral,

- (2) f is spectral and bijective, and
 (3) generalizations (resp. specializations) lift along f .

Then f is a homeomorphism.

Proof. Since f is spectral it defines a continuous map between X and Y in the constructible topology. By Lemmas 5.22.2 and 5.16.8 it follows that $X \rightarrow Y$ is a homeomorphism in the constructible topology. Let $U \subset X$ be quasi-compact open. Then $f(U)$ is constructible in Y . Let $y \in Y$ specialize to a point in $f(U)$. By the last assumption we see that $f^{-1}(y)$ specializes to a point of U . Hence $f^{-1}(y) \in U$. Thus $y \in f(U)$. It follows that $f(U)$ is open, see Lemma 5.22.5. Whence f is a homeomorphism. To prove the lemma in case specializations lift along f one shows instead that $f(Z)$ is closed if $X \setminus Z$ is a quasi-compact open of X . \square

Lemma 5.22.11. *The inverse limit of a directed inverse system of finite sober topological spaces is a spectral topological space.*

Proof. Let I be a directed partially ordered set. Let X_i be an inverse system of finite sober spaces over I . Let $X = \lim X_i$ which exists by Lemma 5.13.1. As a set $X = \lim X_i$. Denote $p_i : X \rightarrow X_i$ the projection. Because I is directed we may apply Lemma 5.13.2. A basis for the topology is given by the opens $p_i^{-1}(U_i)$ for $U_i \subset X_i$ open. Note that $p_i^{-1}(U_i)$ is quasi-compact as a profinite topological space (Lemma 5.21.2). Since an open covering of $p_i^{-1}(U_i)$ is in particular an open covering in the profinite topology, we conclude that $p_i^{-1}(U_i)$ is quasi-compact. Given $U_i \subset X_i$ and $U_j \subset X_j$, then $p_i^{-1}(U_i) \cap p_j^{-1}(U_j) = p_k^{-1}(U_k)$ for some $k \geq i, j$ and open $U_k \subset X_k$. Finally, if $Z \subset X$ is irreducible and closed, then $p_i(Z) \subset X_i$ is irreducible and therefore has a unique generic point ξ_i (because X_i is a finite sober topological space). Then $\xi = \lim \xi_i$ is a generic point of Z (it is a point of Z as Z is closed). This finishes the proof. \square

Lemma 5.22.12. *Let W be the topological space with two points one closed the other not. A topological space is spectral if and only if it is homeomorphic to a closed subspace of a product of copies of W .*

Proof. Write $W = \{0, 1\}$ where 0 is a specialization of 1 but not vice versa. Let I be a set. The space $\prod_{i \in I} W$ is spectral by Lemma 5.22.11. Thus we see that a closed subspace of $\prod_{i \in I} W$ is a spectral space by Lemma 5.22.4.

For the converse, let X be a spectral space. Let $U \subset X$ be a quasi-compact open. Consider the continuous map

$$f_U : X \longrightarrow W$$

which maps every point in U to 1 and every point in $X \setminus U$ to 0. Taking the product of these maps we obtain a continuous map

$$f = \prod f_U : X \longrightarrow \prod_U W$$

If $x', x \in X$ are distinct, then since X is sober either x' is not a specialization of x or conversely. In either case (as the quasi-compact opens form a basis for the topology of X) there exists a quasi-compact open $U \subset X$ such that $f_U(x') \neq f_U(x)$. Thus f is injective. Let $Y = f(X)$ endowed with the induced topology. By construction the map $f : X \rightarrow Y$ is spectral. Let $y' \rightsquigarrow y$ be a specialization in Y and say $f(x') = y'$ and $f(x) = y$. Arguing as above we see that $x' \rightsquigarrow x$, since otherwise

there is a U such that $x \in U$ and $x' \notin U$, which would imply $f_U(x') \not\sim f_U(x)$. We conclude that $f : X \rightarrow Y$ is a homeomorphism by Lemma 5.22.10. \square

Lemma 5.22.13. *A topological space is spectral if and only if it is a directed inverse limit of finite sober topological spaces.*

Proof. One direction is given by Lemma 5.22.11. For the converse, assume X is spectral. Then we may assume $X \subset \prod_{i \in I} W$ is a closed subset where $W = \{0, 1\}$ as in Lemma 5.22.12. We can write

$$\prod_{i \in I} W = \lim_{J \subset I \text{ finite}} \prod_{j \in J} W$$

as a cofiltered limit. For each J , let $X_J \subset \prod_{j \in J} W$ be the image of X . Then we see that $X = \lim X_J$ as sets because X is closed in the product. A formal argument (omitted) on limits shows that $X = \lim X_J$ as topological spaces. \square

Lemma 5.22.14. *Let X be a topological space and let $c : X \rightarrow X'$ be the universal map from X to a sober topological space, see Lemma 5.7.9.*

- (1) *If X is quasi-compact, so is X' .*
- (2) *If X is quasi-compact, has a basis of quasi-compact opens, and the intersection of two quasi-compact opens is quasi-compact, then X' is spectral.*
- (3) *If X is Noetherian, then X' is a Noetherian spectral space.*

Proof. Let $U \subset X$ be open and let $U' \subset X'$ be the corresponding open, i.e., the open such that $c^{-1}(U') = U$. Then U is quasi-compact if and only if U' is quasi-compact, as pulling back by c is a bijection between the opens of X and X' which commutes with unions. This in particular proves (1).

Proof of (2). It follows from the above that X' has a basis of quasi-compact opens. Since c^{-1} also commutes with intersections of pairs of opens, we see that the intersection of two quasi-compact opens X' is quasi-compact. Finally, X' is quasi-compact by (1) and sober by construction. Hence X' is spectral.

Proof of (3). It is immediate that X' is Noetherian as this is defined in terms of the acc for open subsets which holds for X . We have already seen in (2) that X' is spectral. \square

5.23. Limits of spectral spaces

Lemma 5.22.13 tells us that every spectral space is a cofiltered limit of finite sober spaces. Every finite sober space is a spectral space and every continuous map of finite sober spaces is a spectral map of spectral spaces. In this section we prove some lemmas concerning limits of systems of spectral topological spaces along spectral maps.

Lemma 5.23.1. *Let \mathcal{I} be a category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral.*

- (1) *Given subsets $Z_i \subset X_i$ closed in the constructible topology with $f_a(Z_j) \subset Z_i$ for all $a : j \rightarrow i$ in \mathcal{I} , then $\lim Z_i$ is quasi-compact.*
- (2) *The space $X = \lim X_i$ is quasi-compact.*

Proof. The limit $Z = \lim Z_i$ exists by Lemma 5.13.1. Denote X'_i the space X_i endowed with the constructible topology and Z'_i the corresponding subspace of X'_i . Let $a : j \rightarrow i$ in \mathcal{I} be a morphism. As f_a is spectral it defines a continuous

map $f_a : X'_j \rightarrow X'_i$. Thus $f_a|_{Z'_j} : Z'_j \rightarrow Z'_i$ is a continuous map of quasi-compact Hausdorff spaces (by Lemmas 5.22.2 and 5.11.3). Thus $Z' = \lim Z'_i$ is quasi-compact by Lemma 5.13.5. The maps $Z'_i \rightarrow Z_i$ are continuous, hence $Z' \rightarrow Z$ is continuous and a bijection on underlying sets. Hence Z is quasi-compact as the image of the surjective continuous map $Z' \rightarrow Z$ (Lemma 5.11.7). \square

Lemma 5.23.2. *Let \mathcal{I} be a cofiltered category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral.*

- (1) *Given nonempty subsets $Z_i \subset X_i$ closed in the constructible topology with $f_a(Z_j) \subset Z_i$ for all $a : j \rightarrow i$ in \mathcal{I} , then $\lim Z_i$ is nonempty.*
- (2) *If each X_i is nonempty, then $X = \lim X_i$ is nonempty.*

Proof. Denote X'_i the space X_i endowed with the constructible topology and Z'_i the corresponding subspace of X'_i . Let $a : j \rightarrow i$ in \mathcal{I} be a morphism. As f_a is spectral it defines a continuous map $f_a : X'_j \rightarrow X'_i$. Thus $f_a|_{Z'_j} : Z'_j \rightarrow Z'_i$ is a continuous map of quasi-compact Hausdorff spaces (by Lemmas 5.22.2 and 5.11.3). By Lemma 5.13.6 the space $\lim Z'_i$ is nonempty. Since $\lim Z'_i = \lim Z_i$ as sets we conclude. \square

Lemma 5.23.3. *Let \mathcal{I} be a cofiltered category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral. Let $X = \lim X_i$ with projections $p_i : X \rightarrow X_i$. Let $i \in \text{Ob}(\mathcal{I})$ and let $E, F \subset X_i$ be subsets with E closed in the constructible topology and F open in the constructible topology. Then $p_i^{-1}(E) \subset p_i^{-1}(F)$ if and only if there is a morphism $a : j \rightarrow i$ in \mathcal{I} such that $f_a^{-1}(E) \subset f_a^{-1}(F)$.*

Proof. Observe that

$$p_i^{-1}(E) \setminus p_i^{-1}(F) = \lim_{a:j \rightarrow i} f_a^{-1}(E) \setminus f_a^{-1}(F)$$

Since f_a is a spectral map, it is continuous in the constructible topology hence the set $f_a^{-1}(E) \setminus f_a^{-1}(F)$ is closed in the constructible topology. Hence Lemma 5.23.2 applies to show that the LHS is nonempty if and only if each of the spaces of the RHS is nonempty. \square

Lemma 5.23.4. *Let \mathcal{I} be a cofiltered category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral. Let $X = \lim X_i$ with projections $p_i : X \rightarrow X_i$. Let $E \subset X$ be a constructible subset. Then there exists an $i \in \text{Ob}(\mathcal{I})$ and a constructible subset $E_i \subset X_i$ such that $p_i^{-1}(E_i) = E$. If E is open, resp. closed, we may choose E_i open, resp. closed.*

Proof. Assume E is a quasi-compact open of X . By Lemma 5.13.2 we can write $E = p_i^{-1}(U_i)$ for some i and some open $U_i \subset X_i$. Write $U_i = \bigcup U_{i,\alpha}$ as a union of quasi-compact opens. As E is quasi-compact we can find $\alpha_1, \dots, \alpha_n$ such that $E = p_i^{-1}(U_{i,\alpha_1} \cup \dots \cup U_{i,\alpha_n})$. Hence $E_i = U_{i,\alpha_1} \cup \dots \cup U_{i,\alpha_n}$ works.

Assume E is a constructible closed subset. Then E^c is quasi-compact open. So $E^c = p_i^{-1}(F_i)$ for some i and quasi-compact open $F_i \subset X_i$ by the result of the previous paragraph. Then $E = p_i^{-1}(F_i^c)$ as desired.

If E is general we can write $E = \bigcup_{l=1, \dots, n} U_l \cap Z_l$ with U_l constructible open and Z_l constructible closed. By the result of the previous paragraphs we may write $U_l = p_{i_l}^{-1}(U_{l,i_l})$ and $Z_l = p_{j_l}^{-1}(Z_{l,j_l})$ with $U_{l,i_l} \subset X_{i_l}$ constructible open and $Z_{l,j_l} \subset X_{j_l}$ constructible closed. As \mathcal{I} is cofiltered we may choose an object k of \mathcal{I} and morphism

$a_l : k \rightarrow i_l$ and $b_l : k \rightarrow j_l$. Then taking $E_k = \bigcup_{l=1, \dots, n} f_{a_l}^{-1}(U_{l, i_l}) \cap f_{b_l}^{-1}(Z_{l, j_l})$ we obtain a constructible subset of X_k whose inverse image in X is E . \square

Lemma 5.23.5. *Let \mathcal{I} be a cofiltered index category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral. Then the inverse limit $X = \lim X_i$ is a spectral topological space and the projection maps $p_i : X \rightarrow X_i$ are spectral.*

Proof. The limit $X = \lim X_i$ exists (Lemma 5.13.1) and is quasi-compact by Lemma 5.23.1.

Denote $p_i : X \rightarrow X_i$ the projection. Because \mathcal{I} is cofiltered we can apply Lemma 5.13.2. Hence a basis for the topology on X is given by the opens $p_i^{-1}(U_i)$ for $U_i \subset X_i$ open. Since a basis for the topology of X_i is given by the quasi-compact open, we conclude that a basis for the topology on X is given by $p_i^{-1}(U_i)$ with $U_i \subset X_i$ quasi-compact open. A formal argument shows that

$$p_i^{-1}(U_i) = \operatorname{colim}_{a: j \rightarrow i} f_a^{-1}(U_i)$$

as topological spaces. Since each f_a is spectral the sets $f_a^{-1}(U_i)$ are closed in the constructible topology of X_j and hence $p_i^{-1}(U_i)$ is quasi-compact by Lemma 5.23.1. Thus X has a basis for the topology consisting of quasi-compact opens.

Any quasi-compact open U of X is of the form $U = p_i^{-1}(U_i)$ for some i and some quasi-compact open $U_i \subset X_i$ (see Lemma 5.23.4). Given $U_i \subset X_i$ and $U_j \subset X_j$ quasi-compact open, then $p_i^{-1}(U_i) \cap p_j^{-1}(U_j) = p_k^{-1}(U_k)$ for some k and quasi-compact open $U_k \subset X_k$. Namely, choose k and morphisms $k \rightarrow i$ and $k \rightarrow j$ and let U_k be the intersection of the pullbacks of U_i and U_j to X_k . Thus we see that the intersection of two quasi-compact opens of X is quasi-compact open.

Finally, let $Z \subset X$ be irreducible and closed. Then $p_i(Z) \subset X_i$ is irreducible and therefore $Z_i = \overline{p_i(Z)}$ has a unique generic point ξ_i (because X_i is a spectral space). Then $f_a(\xi_j) = \xi_i$ for $a : j \rightarrow i$ in \mathcal{I} because $\overline{f_a(Z_j)} = Z_i$. Hence $\xi = \lim \xi_i$ is a point of X . Claim: $\xi \in Z$. Namely, if not we can find a quasi-compact open containing ξ disjoint from Z . This would be of the form $p_i^{-1}(U_i)$ for some i and quasi-compact open $U_i \subset X_i$. Then $\xi_i \in U_i$ but $p_i(Z) \cap U_i = \emptyset$ which contradicts $\xi_i \in \overline{p_i(Z)}$. So $\xi \in Z$ and hence $\overline{\{\xi\}} \subset Z$. Conversely, every $z \in Z$ is in the closure of ξ . Namely, given a quasi-compact open neighbourhood U of z we write $U = p_i^{-1}(U_i)$ for some i and quasi-compact open $U_i \subset X_i$. We see that $p_i(z) \in U_i$ hence $\xi_i \in U_i$ hence $\xi \in U$. Thus ξ is the generic point of Z . This finishes the proof. \square

Lemma 5.23.6. *Let \mathcal{I} be a cofiltered index category. Let $i \mapsto X_i$ be a diagram of spectral spaces such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral. Set $X = \lim X_i$ and denote $p_i : X \rightarrow X_i$ the projection.*

- (1) *Given any quasi-compact open $U \subset X$ there exists an $i \in \operatorname{Ob}(\mathcal{I})$ and a quasi-compact open $U_i \subset X_i$ such that $p_i^{-1}(U_i) = U$.*
- (2) *Given $U_i \subset X_i$ and $U_j \subset X_j$ quasi-compact opens such that $p_i^{-1}(U_i) \subset p_j^{-1}(U_j)$ there exist $k \in \operatorname{Ob}(\mathcal{I})$ and morphisms $a : k \rightarrow i$ and $b : k \rightarrow j$ such that $f_a^{-1}(U_i) \subset f_b^{-1}(U_j)$.*
- (3) *If $U_i, U_{1,i}, \dots, U_{n,i} \subset X_i$ are quasi-compact opens and $p_i^{-1}(U_i) = p_i^{-1}(U_{1,i}) \cup \dots \cup p_i^{-1}(U_{n,i})$ then $f_a^{-1}(U_i) = f_a^{-1}(U_{1,i}) \cup \dots \cup f_a^{-1}(U_{n,i})$ for some morphism $a : j \rightarrow i$ in \mathcal{I} .*

(4) *Same statement as in (3) but for intersections.*

Proof. Part (1) is a special case of Lemma 5.23.4. Part (2) is a special case of Lemma 5.23.3 as quasi-compact opens are both open and closed in the constructible topology. Parts (3) and (4) follow formally from (1) and (2) and the fact that taking inverse images of subsets commutes with taking unions and intersections. \square

Lemma 5.23.7. *Let W be a subset of a spectral space X . The following are equivalent*

- (1) *W is an intersection of constructible sets and closed under generalizations,*
- (2) *W is quasi-compact and closed under generalizations,*
- (3) *there exists a quasi-compact subset $E \subset X$ such that W is the set of points specializing to E ,*
- (4) *W is an intersection of quasi-compact open subsets,*
- (5) *there exists a nonempty set I and quasi-compact opens $U_i \subset X$, $i \in I$ such that $W = \bigcap U_i$ and for all $i, j \in I$ there exists a $k \in I$ with $U_k \subset U_i \cap U_j$.*

In this case we have (a) W is a spectral space, (b) $W = \lim U_i$ as topological spaces, and (c) for any open U containing W there exists an i with $U_i \subset U$.

Proof. Let $E \subset X$ satisfy (1). Then E is closed in the constructible topology, hence quasi-compact in the constructible topology (by Lemmas 5.22.2 and 5.11.3), hence quasi-compact in the topology of X (because opens in X are open in the constructible topology). Thus (2) holds.

It is clear that (2) implies (3) by taking $E = W$.

Let X be a spectral space and let $E \subset W$ be as in (3). Since $E \subset W$ is dense we see that W is quasi-compact. If $x \in X$, $x \notin W$, then $Z = \overline{\{x\}}$ is disjoint from W . Since W is quasi-compact we can find a quasi-compact open U with $W \subset U$ and $U \cap Z = \emptyset$. We conclude that (4) holds.

If $W = \bigcup_{j \in J} U_j$ then setting I equal to the set of finite subsets of J and $U_i = U_{j_1} \cap \dots \cap U_{j_r}$ for $i = \{j_1, \dots, j_r\}$ shows that (4) implies (5). It is immediate that (5) implies (1).

Let I and U_i be as in (5). Since $W = \bigcap U_i$ we have $W = \lim U_i$ by the universal property of limits. Then W is a spectral space by Lemma 5.23.5. Let $U \subset X$ be an open neighbourhood of W . Then $E_i = U_i \cap (X \setminus U)$ is a family of constructible subsets of the spectral space $Z = X \setminus U$ with empty intersection. Using that the spectral topology on Z is quasi-compact (Lemma 5.22.2) we conclude from Lemma 5.11.6 that $E_i = \emptyset$ for some i . \square

Lemma 5.23.8. *Let X be a spectral space. Let $E \subset X$ be a constructible subset. Let $W \subset X$ be the set of points of X which specialize to a point of E . Then $W \setminus E$ is a spectral space. If $W = \bigcap U_i$ with U_i as in Lemma 5.23.7 (5) then $W \setminus E = \lim(U_i \setminus E)$.*

Proof. Since E is constructible, it is quasi-compact and hence Lemma 5.23.7 applies to W . If E is constructible, then E is constructible in U_i for all $i \in I$. Hence $U_i \setminus E$ is spectral by Lemma 5.22.4. Since $W \setminus E = \bigcap (U_i \setminus E)$ we have $W \setminus E = \lim U_i \setminus E$ by the universal property of limits. Then $W \setminus E$ is a spectral space by Lemma 5.23.5. \square

5.24. Stone-Čech compactification

The Stone-Čech compactification of a topological space X is a map $X \rightarrow \beta(X)$ from X to a Hausdorff quasi-compact space $\beta(X)$ which is universal for such maps. We prove this exists by a standard argument using the following simple lemma.

Lemma 5.24.1. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that $f(X)$ is dense in Y and that Y is Hausdorff. Then the cardinality of Y is at most the cardinality of $P(P(X))$ where P is the power set operation.*

Proof. Let $S = f(X) \subset Y$. Let \mathcal{D} be the set of all closed domains of Y , i.e., subsets $D \subset Y$ which equal the closure of its interior. Note that the closure of an open subset of Y is a closed domain. For $y \in Y$ consider the set

$$I_y = \{T \subset S \mid \text{there exists } D \in \mathcal{D} \text{ with } T = S \cap D \text{ and } y \in D\}$$

Since S is dense in Y for every closed domain D we see that $S \cap D$ is dense in D . Hence, if $D \cap S = D' \cap S$ for $D, D' \in \mathcal{D}$, then $D = D'$. Thus $I_y = I_{y'}$ implies that $y = y'$ because the Hausdorff condition assures us that we can find a closed domain containing y but not y' . The result follows. \square

Let X be a topological space. Let κ be the cardinality of $P(P(X))$ as in the lemma above. There is a set I of isomorphism classes of continuous maps $f : X \rightarrow Y$ which has dense image and where Y is Hausdorff and quasi-compact. For $i \in I$ choose a representative $f_i : X \rightarrow Y_i$. Consider the map

$$\prod f_i : X \longrightarrow \prod_{i \in I} Y_i$$

and denote $\beta(X)$ the closure of the image. Since each Y_i is Hausdorff, so is $\beta(X)$. Since each Y_i is quasi-compact, so is $\beta(X)$ (use Theorem 5.13.4 and Lemma 5.11.3).

Let us show the canonical map $X \rightarrow \beta(X)$ satisfies the universal property with respect to maps to Hausdorff, quasi-compact spaces. Namely, let $f : X \rightarrow Y$ be such a morphism. Let $Z \subset Y$ be the closure of $f(X)$. By Lemma 5.24.1 the cardinality of Z is at most κ . Thus $X \rightarrow Z$ is isomorphic to one of the maps $f_i : X \rightarrow Y_i$, say $f_{i_0} : X \rightarrow Y_{i_0}$. Thus f factors as $X \rightarrow \beta(X) \rightarrow \prod Y_i \rightarrow Y_{i_0} \cong Z \rightarrow Y$ as desired.

Lemma 5.24.2. *Let X be a Hausdorff, locally quasi-compact space. There exists a map $X \rightarrow X^*$ which identifies X as an open subspace of a quasi-compact Hausdorff space X^* such that $X^* \setminus X$ is a singleton (one point compactification). In particular, the map $X \rightarrow \beta(X)$ identifies X with an open subspace of $\beta(X)$.*

Proof. Set $X^* = X \amalg \{\infty\}$. We declare a subset V of X^* to be open if either $V \subset X$ is open in X , or $\infty \in V$ and $U = V \cap X$ is an open of X such that $X \setminus U$ is quasi-compact. We omit the verification that this defines a topology. It is clear that $X \rightarrow X^*$ identifies X with an open subspace of X .

Since X is locally quasi-compact, every point $x \in X$ has a quasi-compact neighbourhood $x \in E \subset X$. Then E is closed (Lemma 5.11.3) and $V = (X \setminus E) \amalg \{\infty\}$ is an open neighbourhood of ∞ disjoint from the interior of E . Thus X^* is Hausdorff.

Let $X^* = \bigcup V_i$ be an open covering. Then for some i , say i_0 , we have $\infty \in V_{i_0}$. By construction $Z = X^* \setminus V_{i_0}$ is quasi-compact. Hence the covering $Z \subset \bigcup_{i \neq i_0} Z \cap V_i$ has a finite refinement which implies that the given covering of X^* has a finite refinement. Thus X^* is quasi-compact.

The map $X \rightarrow X^*$ factors as $X \rightarrow \beta(X) \rightarrow X^*$ by the universal property of the Stone-Ćech compactification. Let $\varphi : \beta(X) \rightarrow X^*$ be this factorization. Then $X \rightarrow \varphi^{-1}(X)$ is a section to $\varphi^{-1}(X) \rightarrow X$ hence has closed image (Lemma 5.3.3). Since the image of $X \rightarrow \beta(X)$ is dense we conclude that $X = \varphi^{-1}(X)$. \square

5.25. Extremely disconnected spaces

The material in this section is taken from [Gle58] (with a slight modification as in [Rai59]). In Gleason's paper it is shown that in the category of quasi-compact Hausdorff spaces, the "projective objects" are exactly the extremely disconnected spaces.

Definition 5.25.1. A topological space X is called *extremely disconnected* if the closure of every open subset of X is open.

If X is Hausdorff and extremely disconnected, then X is totally disconnected (this isn't true in general). If X is quasi-compact, Hausdorff, and extremely disconnected, then X is profinite by Lemma 5.21.2, but the converse does not hold in general. Namely, Gleason shows that in an extremely disconnected Hausdorff space X a convergent sequence x_1, x_2, x_3, \dots is eventually constant. Hence for example the p -adic integers $\mathbf{Z}_p = \lim \mathbf{Z}/p^n \mathbf{Z}$ is a profinite space which is not extremely disconnected.

Lemma 5.25.2. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume f is surjective and $f(E) \neq Y$ for all proper closed subsets $E \subset X$. Then for $U \subset X$ open the subset $f(U)$ is contained in the closure of $Y \setminus f(X \setminus U)$.*

Proof. Pick $y \in f(U)$ and let $V \subset Y$ be any open neighbourhood of y . We will show that V intersects $Y \setminus f(X \setminus U)$. Note that $W = U \cap f^{-1}(V)$ is a nonempty open subset of X , hence $f(X \setminus W) \neq Y$. Take $y' \in Y$, $y' \notin f(X \setminus W)$. It is elementary to show that $y' \in V$ and $y' \in Y \setminus f(X \setminus U)$. \square

Lemma 5.25.3. *Let X be an extremely disconnected space. If $U, V \subset X$ are disjoint open subsets, then \overline{U} and \overline{V} are disjoint too.*

Proof. By assumption \overline{U} is open, hence $V \cap \overline{U}$ is open and disjoint from U , hence empty because \overline{U} is the intersection of all the closed subsets of X containing U . This means the open $\overline{V} \cap \overline{U}$ avoids V hence is empty by the same argument. \square

Lemma 5.25.4. *Let $f : X \rightarrow Y$ be a continuous map of Hausdorff quasi-compact topological spaces. If Y is extremely disconnected, f is surjective, and $f(Z) \neq Y$ for every proper closed subset Z of X , then f is a homeomorphism.*

Proof. By Lemma 5.16.8 it suffices to show that f is injective. Suppose that $x, x' \in X$ are distinct points with $y = f(x) = f(x')$. Choose disjoint open neighbourhoods $U, U' \subset X$ of x, x' . Observe that f is closed (Lemma 5.16.7) hence $T = f(X \setminus U)$ and $T' = f(X \setminus U')$ are closed in Y . Since X is the union of $X \setminus U$ and $X \setminus U'$ we see that $Y = T \cup T'$. By Lemma 5.25.2 we see that y is contained in the closure of $Y \setminus T$ and the closure of $Y \setminus T'$. On the other hand, by Lemma 5.25.3, this intersection is empty. In this way we obtain the desired contradiction. \square

Lemma 5.25.5. *Let $f : X \rightarrow Y$ be a continuous surjective map of Hausdorff quasi-compact topological spaces. There exists a quasi-compact subset $E \subset X$ such that $f(E) = Y$ but $f(E') \neq Y$ for all proper closed subsets $E' \subset E$.*

Proof. We will use without further mention that the quasi-compact subsets of X are exactly the closed subsets (Lemma 5.11.5). Consider the collection \mathcal{E} of all quasi-compact subsets $E \subset X$ with $f(E) = Y$ ordered by inclusion. We will use Zorn's lemma to show that \mathcal{E} has a minimal element. To do this it suffices to show that given a totally ordered family E_λ of elements of \mathcal{E} the intersection $\bigcap E_\lambda$ is an element of \mathcal{E} . It is quasi-compact as it is closed. For every $y \in Y$ the sets $E_\lambda \cap f^{-1}(\{y\})$ are nonempty and closed, hence the intersection $\bigcap E_\lambda \cap f^{-1}(\{y\}) = \bigcap (E_\lambda \cap f^{-1}(\{y\}))$ is nonempty by Lemma 5.11.6. This finishes the proof. \square

Proposition 5.25.6. *Let X be a Hausdorff, quasi-compact topological space. The following are equivalent*

- (1) X is extremally disconnected,
- (2) for any surjective continuous map $f : Y \rightarrow X$ with Y Hausdorff quasi-compact there exists a continuous section, and
- (3) for any solid commutative diagram

$$\begin{array}{ccc} & & Y \\ & \nearrow \text{dotted} & \downarrow \\ X & \longrightarrow & Z \end{array}$$

of continuous maps of quasi-compact Hausdorff spaces with $Y \rightarrow Z$ surjective, there is a dotted arrow in the category of topological spaces making the diagram commute.

Proof. It is clear that (3) implies (2). On the other hand, if (2) holds and $X \rightarrow Z$ and $Y \rightarrow Z$ are as in (3), then (2) assures there is a section to the projection $X \times_Z Y \rightarrow X$ which implies a suitable dotted arrow exists (details omitted). Thus (3) is equivalent to (2).

Assume X is extremally disconnected and let $f : Y \rightarrow X$ be as in (2). By Lemma 5.25.5 there exists a quasi-compact subset $E \subset Y$ such that $f(E) = X$ but $f(E') \neq X$ for all proper closed subsets $E' \subset E$. By Lemma 5.25.4 we find that $f|_E : E \rightarrow X$ is a homeomorphism, the inverse of which gives the desired section.

Assume (2). Let $U \subset X$ be open with complement Z . Consider the continuous surjection $f : \overline{U} \amalg Z \rightarrow X$. Let σ be a section. Then $\overline{U} = \sigma^{-1}(\overline{U})$ is open. Thus X is extremally disconnected. \square

Lemma 5.25.7. *Let $f : X \rightarrow X$ be a continuous selfmap of a Hausdorff topological space. If f is not id_X , then there exists a proper closed subset $E \subset X$ such that $X = E \cup f(E)$.*

Proof. Pick $p \in X$ with $f(p) \neq p$. Choose disjoint open neighbourhoods $p \in U$, $f(p) \in V$ and set $E = X \setminus U \cap f^{-1}(V)$. \square

Example 5.25.8. We can use Proposition 5.25.6 to see that the Stone-Ćech compactification $\beta(X)$ of a discrete space X is extremally disconnected. Namely, let $f : Y \rightarrow \beta(X)$ be a continuous surjection where Y is quasi-compact and Hausdorff. Then we can lift the map $X \rightarrow \beta(X)$ to a continuous (!) map $X \rightarrow Y$ as X is discrete. By the universal property of the Stone-Ćech compactification we see that we obtain a factorization $X \rightarrow \beta(X) \rightarrow Y$. Since $\beta(X) \rightarrow Y \rightarrow \beta(X)$ equals the identity on the dense subset X we conclude that we get a section. In particular,

we conclude that the Stone-Čech compactification of a discrete space is totally disconnected, whence profinite (see discussion following Definition 5.25.1 and Lemma 5.21.2).

Using the supply of extremally disconnected spaces given by Example 5.25.8 we can prove that every quasi-compact Hausdorff space has a “projective cover” in the category of quasi-compact Hausdorff spaces.

Lemma 5.25.9. *Let X be a quasi-compact Hausdorff space. There exists a continuous surjection $X' \rightarrow X$ with X' quasi-compact, Hausdorff, and extremally disconnected. If we require that every proper closed subset of X' does not map onto X , then X' is unique up to isomorphism.*

Proof. Let $Y = X$ but endowed with the discrete topology. Let $X' = \beta(Y)$. The continuous map $Y \rightarrow X$ factors as $Y \rightarrow X' \rightarrow X$. This proves the first statement of the lemma by Example 5.25.8.

By Lemma 5.25.5 we can find a quasi-compact subset $E \subset X'$ such that no proper closed subset of E surjects onto X . Because X' is extremally disconnected there exists a continuous map $f : X' \rightarrow E$ over X (Proposition 5.25.6). Composing f with the map $E \rightarrow X'$ gives a continuous selfmap $f|_E : E \rightarrow E$. This map has to be id_E as otherwise Lemma 5.25.7 shows that E isn't minimal. Thus the id_E factors through the extremally disconnected space X' . A formal, categorical argument (using the characterization of Proposition 5.25.6 shows that E is extremally disconnected.

To prove uniqueness, suppose we have a second $X'' \rightarrow X$ minimal cover. By the lifting property proven in Proposition 5.25.6 we can find a continuous map $g : X' \rightarrow X''$ over X . Observe that g is a closed map (Lemma 5.16.7). Hence $g(X') \subset X''$ is a closed subset surjecting onto X and we conclude $g(X') = X''$ by minimality of X'' . On the other hand, if $E \subset X'$ is a proper closed subset, then $g(E) \neq X''$ as E does not map onto X by minimality of X' . By Lemma 5.25.4 we see that g is an isomorphism. \square

Remark 5.25.10. Let X be a quasi-compact Hausdorff space. Let κ be an infinite cardinal bigger or equal than the cardinality of X . Then the cardinality of the minimal quasi-compact, Hausdorff, extremally disconnected cover $X' \rightarrow X$ (Lemma 5.25.9) is at most 2^{2^κ} . Namely, choose a subset $S \subset X'$ mapping bijectively to X . By minimality of X' the set S is dense in X' . Thus $|X'| \leq 2^{2^\kappa}$ by Lemma 5.24.1.

5.26. Miscellany

The following lemma applies to the underlying topological space associated to a quasi-separated scheme.

Lemma 5.26.1. *Let X be a topological space which*

- (1) *has a basis of the topology consisting of quasi-compact opens, and*
- (2) *has the property that the intersection of any two quasi-compact opens is quasi-compact.*

Then

- (1) *X is locally quasi-compact,*
- (2) *a quasi-compact open $U \subset X$ is retrocompact,*

- (3) any quasi-compact open $U \subset X$ has a cofinal system of open coverings $\mathcal{U} : U = \bigcup_{j \in J} U_j$ with J finite and all U_j and $U_j \cap U_{j'}$ quasi-compact,
 (4) add more here.

Proof. Omitted. □

Definition 5.26.2. Let X be a topological space. We say $x \in X$ is an *isolated point* of X if $\{x\}$ is open in X .

5.27. Partitions and stratifications

Stratifications can be defined in many different ways. We welcome comments on the choice of definitions in this section.

Definition 5.27.1. Let X be a topological space. A *partition* of X is a decomposition $X = \coprod X_i$ into locally closed subsets X_i . The X_i are called the *parts* of the partition. Given two partitions of X we say one *refines* the other if the parts of one are unions of parts of the other.

Thus we can say that X has a partition into connected components and a partition into irreducible components and that the partition into irreducible components refines the partition into connected components.

Definition 5.27.2. Let X be a topological space. A *good stratification* of X is a partition $X = \coprod X_i$ such that for all $i, j \in I$ we have

$$X_i \cap \overline{X_j} \neq \emptyset \Rightarrow X_i \subset \overline{X_j}.$$

Given a good stratification $X = \coprod_{i \in I} X_i$ we obtain a partial ordering on I by setting $i \leq j$ if and only if $X_i \subset \overline{X_j}$. Then we see that

$$\overline{X_j} = \bigcup_{i \leq j} X_i$$

However, what often happens in algebraic geometry is that one just has that the left hand side is a subset of the right hand side in the last displayed formula. This leads to the following definition.

Definition 5.27.3. Let X be a topological space. A *stratification* of X is given by a partition $X = \coprod_{i \in I} X_i$ and a partial ordering on I such that for each $j \in I$ we have

$$\overline{X_j} \subset \bigcup_{i \leq j} X_i$$

The parts X_i are called the *strata* of the stratification.

We often impose additional conditions on the stratification. For example, we say a stratification is *locally finite* if every point has a neighbourhood which meets only finitely many strata.

Remark 5.27.4. Given a locally finite stratification $X = \coprod X_i$ of a topological space X , we obtain a family of closed subsets $Z_i = \bigcup_{j \leq i} X_j$ of X indexed by I such that

$$Z_i \cap Z_j = \bigcup_{k \leq i, j} Z_k$$

Conversely, given closed subsets $Z_i \subset X$ indexed by a partially ordered set I such that $X = \bigcup Z_i$, such that every point has a neighbourhood meeting only finitely many Z_i , and such that the displayed formula holds, then we obtain a locally finite stratification of X by setting $X_i = Z_i \setminus \bigcup_{j < i} Z_j$.

Lemma 5.27.5. *Let X be a topological space. Let $X = \coprod X_i$ be a finite partition of X . Then there exists a finite stratification of X refining it.*

Proof. Let $T_i = \overline{X_i}$ and $\Delta_i = T_i \setminus X_i$. Let S be the set of all intersections of T_i and Δ_i . (For example $T_1 \cap T_2 \cap \Delta_4$ is an element of S .) Then $S = \{Z_s\}$ is a finite collection of closed subsets of X such that $Z_s \cap Z_{s'} \in S$ for all $s, s' \in S$. Define a partial ordering on S by inclusion. Then set $Y_s = Z_s \setminus \bigcup_{s' < s} Z_{s'}$ to get the desired stratification. \square

Lemma 5.27.6. *Let X be a topological space. Suppose $X = T_1 \cup \dots \cup T_n$ is written as a union of constructible subsets. There exists a finite stratification $X = \coprod X_i$ with each X_i constructible such that each T_k is a union of strata.*

Proof. By definition of constructible subsets, we can write each T_i as a finite union of $U \cap V^c$ with $U, V \subset X$ retrocompact open. Hence we may assume that $T_i = U_i \cap V_i^c$ with $U_i, V_i \subset X$ retrocompact open. Let S be the finite set of closed subsets of X consisting of $\emptyset, X, U_i^c, V_i^c$ and finite intersections of these. Write $S = \{Z_s\}$. If $s \in S$, then Z_s is constructible (Lemma 5.14.2). Moreover, $Z_s \cap Z_{s'} \in S$ for all $s, s' \in S$. Define a partial ordering on S by inclusion. Then set $Y_s = Z_s \setminus \bigcup_{s' < s} Z_{s'}$ to get the desired stratification. \square

Lemma 5.27.7. *Let X be a Noetherian topological space. Any finite partition of X can be refined by a finite good stratification.*

Proof. Let $X = \coprod X_i$ be a finite partition of X . Let Z be an irreducible component of X . Since $X = \bigcup \overline{X_i}$ with finite index set, there is an i such that $Z \subset \overline{X_i}$. Since X_i is locally closed this implies that $Z \cap X_i$ contains an open of Z . Thus $Z \cap X_i$ contains an open U of X (Lemma 5.8.2). Write $X_i = U \amalg X_i^1 \amalg X_i^2$ with $X_i^1 = (X_i \setminus U) \cap \overline{U}$ and $X_i^2 = (X_i \setminus U) \cap \overline{U}^c$. For $i' \neq i$ we set $X_{i'}^1 = X_{i'} \cap \overline{U}$ and $X_{i'}^2 = X_{i'} \cap \overline{U}^c$. Then

$$X \setminus U = \coprod X_i^k$$

is a partition such that $\overline{U} \setminus U = \bigcup X_i^1$. Note that $X \setminus U$ is closed and strictly smaller than X . By Noetherian induction we can refine this partition by a finite good stratification $X \setminus U = \coprod_{\alpha \in A} T_\alpha$. Then $X = U \amalg \coprod_{\alpha \in A} T_\alpha$ is a finite good stratification of X refining the partition we started with. \square

CHAPTER 6

Sheaves on Spaces

6.1. Introduction

Basic properties of sheaves on topological spaces will be explained in this document. A reference is [God73].

This will be superseded by the discussion of sheaves over sites later in the documents. But perhaps it makes sense to briefly define some of the notions here.

6.2. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

- (1) Let X be a topological space. The phrase: “Let $U = \bigcup_{i \in I} U_i$ be an open covering” means the following: I is a set, and for each $i \in I$ we are given an open subset $U_i \subset X$. Furthermore U is the union of the U_i . It is allowed to have $I = \emptyset$ in which case there are no U_i and $U = \emptyset$. It is also allowed, in case $I \neq \emptyset$ to have any or all of the U_i be empty.
- (2) etc, etc.

6.3. Presheaves

Definition 6.3.1. Let X be a topological space.

- (1) A *presheaf* \mathcal{F} of sets on X is a rule which assigns to each open $U \subset X$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ a map $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ such that $\rho_U^U = \text{id}_{\mathcal{F}(U)}$ and whenever $W \subset V \subset U$ we have $\rho_W^U = \rho_W^V \circ \rho_V^U$.
- (2) A *morphism* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on X is a rule which assigns to each open $U \subset X$ a map of sets $\varphi : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps, i.e., whenever $V \subset U \subset X$ are open the diagram

$$\begin{array}{ccc} \mathcal{F}(U) & \xrightarrow{\varphi} & \mathcal{G}(U) \\ \downarrow \rho_V^U & & \downarrow \rho_V^U \\ \mathcal{F}(V) & \xrightarrow{\varphi} & \mathcal{G}(V) \end{array}$$

commutes.

- (3) The category of presheaves of sets on X will be denoted $PSh(X)$.

The elements of the set $\mathcal{F}(U)$ are called the *sections* of \mathcal{F} over U . For every $V \subset U$ the map $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is called the *restriction map*. We will use the notation $s|_V := \rho_V^U(s)$ if $s \in \mathcal{F}(U)$. This notation is consistent with the notion of restriction of functions from topology because if $W \subset V \subset U$ and s is a section of \mathcal{F} over

U then $s|_W = (s|_V)|_W$ by the property of the restriction maps expressed in the definition above.

Another notation that is often used is to indicate sections over an open U by the symbol $\Gamma(U, -)$ or by $H^0(U, -)$. In other words, the following equalities are tautological

$$\Gamma(U, \mathcal{F}) = \mathcal{F}(U) = H^0(U, \mathcal{F}).$$

In this chapter we will not use this notation, but in others we will.

Definition 6.3.2. Let X be a topological space. Let A be a set. The *constant presheaf with value A* is the presheaf that assigns the set A to every open $U \subset X$, and such that all restriction mappings are id_A .

6.4. Abelian presheaves

In this section we briefly point out some features of the category of presheaves that allow one to define presheaves of abelian groups.

Example 6.4.1. Let X be a topological space X . Consider a rule \mathcal{F} that associates to every open subset a singleton set. Since every set has a unique map into a singleton set, there exist unique restriction maps ρ_V^U . The resulting structure is a presheaf of sets. It is a final object in the category of presheaves of sets, by the property of singleton sets mentioned above. Hence it is also unique up to unique isomorphism. We will sometimes write $*$ for this presheaf.

Lemma 6.4.2. *Let X be a topological space. The category of presheaves of sets on X has products (see Categories, Definition 4.14.5). Moreover, the set of sections of the product $\mathcal{F} \times \mathcal{G}$ over an open U is the product of the sets of sections of \mathcal{F} and \mathcal{G} over U .*

Proof. Namely, suppose \mathcal{F} and \mathcal{G} are presheaves of sets on the topological space X . Consider the rule $U \mapsto \mathcal{F}(U) \times \mathcal{G}(U)$, denoted $\mathcal{F} \times \mathcal{G}$. If $V \subset U \subset X$ are open then define the restriction mapping

$$(\mathcal{F} \times \mathcal{G})(U) \longrightarrow (\mathcal{F} \times \mathcal{G})(V)$$

by mapping $(s, t) \mapsto (s|_V, t|_V)$. Then it is immediately clear that $\mathcal{F} \times \mathcal{G}$ is a presheaf. Also, there are projection maps $p : \mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ and $q : \mathcal{F} \times \mathcal{G} \rightarrow \mathcal{G}$. We leave it to the reader to show that for any third presheaf \mathcal{H} we have $\text{Mor}(\mathcal{H}, \mathcal{F} \times \mathcal{G}) = \text{Mor}(\mathcal{H}, \mathcal{F}) \times \text{Mor}(\mathcal{H}, \mathcal{G})$. \square

Recall that if $(A, + : A \times A \rightarrow A, - : A \rightarrow A, 0 \in A)$ is an abelian group, then the zero and the negation maps are uniquely determined by the addition law. In other words, it makes sense to say “let $(A, +)$ be an abelian group”.

Lemma 6.4.3. *Let X be a topological space. Let \mathcal{F} be a presheaf of sets. Consider the following types of structure on \mathcal{F} :*

- (1) *For every open U the structure of an abelian group on $\mathcal{F}(U)$ such that all restriction maps are abelian group homomorphisms.*
- (2) *A map of presheaves $+$: $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$, a map of presheaves $-$: $\mathcal{F} \rightarrow \mathcal{F}$ and a map $0 : * \rightarrow \mathcal{F}$ (see Example 6.4.1) satisfying all the axioms of $+$, $-$, 0 in a usual abelian group.*

- (3) A map of presheaves $+$: $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$, a map of presheaves $-$: $\mathcal{F} \rightarrow \mathcal{F}$ and a map 0 : $*$ $\rightarrow \mathcal{F}$ such that for each open $U \subset X$ the quadruple $(\mathcal{F}(U), +, -, 0)$ is an abelian group,
- (4) A map of presheaves $+$: $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ such that for every open $U \subset X$ the map $+$: $\mathcal{F}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an abelian group.

There are natural bijections between the collections of types of data (1) - (4) above.

Proof. Omitted. □

The lemma says that to give an abelian group object \mathcal{F} in the category of presheaves is the same as giving a presheaf of sets \mathcal{F} such that all the sets $\mathcal{F}(U)$ are endowed with the structure of an abelian group and such that all the restriction mappings are group homomorphisms. For most algebra structures we will take this approach to (pre)sheaves of such objects, i.e., we will define a (pre)sheaf of such objects to be a (pre)sheaf \mathcal{F} of sets all of whose sets of sections $\mathcal{F}(U)$ are endowed with this structure compatibly with the restriction mappings.

Definition 6.4.4. Let X be a topological space.

- (1) A *presheaf of abelian groups on X* or an *abelian presheaf over X* is a presheaf of sets \mathcal{F} such that for each open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an abelian group, and such that all restriction maps ρ_V^U are homomorphisms of abelian groups, see Lemma 6.4.3 above.
- (2) A *morphism of abelian presheaves over X* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets which induces a homomorphism of abelian groups $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ for every open $U \subset X$.
- (3) The category of presheaves of abelian groups on X is denoted $PAb(X)$.

Example 6.4.5. Let X be a topological space. For each $x \in X$ suppose given an abelian group M_x . For $U \subset X$ open we set

$$\mathcal{F}(U) = \bigoplus_{x \in U} M_x.$$

We denote a typical element in this abelian group by $\sum_{i=1}^n m_{x_i}$, where $x_i \in U$ and $m_{x_i} \in M_{x_i}$. (Of course we may always choose our representation such that x_1, \dots, x_n are pairwise distinct.) We define for $V \subset U \subset X$ open a restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}(V)$ by mapping an element $s = \sum_{i=1}^n m_{x_i}$ to the element $s|_V = \sum_{x_i \in V} m_{x_i}$. We leave it to the reader to verify that this is a presheaf of abelian groups.

6.5. Presheaves of algebraic structures

Let us clarify the definition of presheaves of algebraic structures. Suppose that \mathcal{C} is a category and that $F : \mathcal{C} \rightarrow \text{Sets}$ is a faithful functor. Typically F is a “forgetful” functor. For an object $M \in \text{Ob}(\mathcal{C})$ we often call $F(M)$ the *underlying set* of the object M . If $M \rightarrow M'$ is a morphism in \mathcal{C} we call $F(M) \rightarrow F(M')$ the *underlying map of sets*. In fact, we will often not distinguish between an object and its underlying set, and similarly for morphisms. So we will say a map of sets $F(M) \rightarrow F(M')$ is a *morphism of algebraic structures*, if it is equal to $F(f)$ for some morphism $f : M \rightarrow M'$ in \mathcal{C} .

In analogy with Definition 6.4.4 above a “presheaf of objects of \mathcal{C} ” could be defined by the following data:

- (1) a presheaf of sets \mathcal{F} , and
- (2) for every open $U \subset X$ a choice of an object $A(U) \in \text{Ob}(\mathcal{C})$

subject to the following conditions (using the phraseology above)

- (1) for every open $U \subset X$ the set $\mathcal{F}(U)$ is the underlying set of $A(U)$, and
- (2) for every $V \subset U \subset X$ open the map of sets $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is a morphism of algebraic structures.

In other words, for every $V \subset U$ open in X the restriction mappings ρ_V^U is the image $F(\alpha_V^U)$ for some unique morphism $\alpha_V^U : A(U) \rightarrow A(V)$ in the category \mathcal{C} . The uniqueness is forced by the condition that F is faithful; it also implies that $\alpha_W^U = \alpha_W^V \circ \alpha_V^U$ whenever $W \subset V \subset U$ are open in X . The system $(A(-), \alpha_V^U)$ is what we will define as a presheaf with values in \mathcal{C} on X , compare Sites, Definition 7.2.2. We recover our presheaf of sets (\mathcal{F}, ρ_V^U) via the rules $\mathcal{F}(U) = F(A(U))$ and $\rho_V^U = F(\alpha_V^U)$.

Definition 6.5.1. Let X be a topological space. Let \mathcal{C} be a category.

- (1) A *presheaf* \mathcal{F} on X with values in \mathcal{C} is given by a rule which assigns to every open $U \subset X$ an object $\mathcal{F}(U)$ of \mathcal{C} and to each inclusion $V \subset U$ a morphism $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ in \mathcal{C} such that whenever $W \subset V \subset U$ we have $\rho_W^U = \rho_W^V \circ \rho_V^U$.
- (2) A *morphism* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with value in \mathcal{C} is given by a morphism $\varphi : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ in \mathcal{C} compatible with restriction morphisms.

Definition 6.5.2. Let X be a topological space. Let \mathcal{C} be a category. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a faithful functor. Let \mathcal{F} be a presheaf on X with values in \mathcal{C} . The presheaf of sets $U \mapsto F(\mathcal{F}(U))$ is called the *underlying presheaf of sets of* \mathcal{F} .

It is customary to use the same letter \mathcal{F} to denote the underlying presheaf of sets, and this makes sense according to our discussion preceding Definition 6.5.1. In particular, the phrase “let $s \in \mathcal{F}(U)$ ” or “let s be a section of \mathcal{F} over U ” signifies that $s \in F(\mathcal{F}(U))$.

This notation and these definitions apply in particular to: *Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field, etc and morphisms between these.*

6.6. Presheaves of modules

Suppose that \mathcal{O} is a presheaf of rings on X . We would like to define the notion of a presheaf of \mathcal{O} -modules over X . In analogy with Definition 6.4.4 we are tempted to define this as a sheaf of sets \mathcal{F} such that for every open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an $\mathcal{O}(U)$ -module compatible with restriction mappings (of \mathcal{F} and \mathcal{O}). However, it is customary (and equivalent) to define it as in the following definition.

Definition 6.6.1. Let X be a topological space, and let \mathcal{O} be a presheaf of rings on X .

- (1) A *presheaf of \mathcal{O} -modules* is given by an abelian presheaf \mathcal{F} together with a map of presheaves of sets

$$\mathcal{O} \times \mathcal{F} \longrightarrow \mathcal{F}$$

such that for every open $U \subset X$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an $\mathcal{O}(U)$ -module structure on the abelian group $\mathcal{F}(U)$.

- (2) A *morphism* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules is a morphism of abelian presheaves $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ such that the diagram

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{F} & \longrightarrow & \mathcal{F} \\ \text{id} \times \varphi \downarrow & & \downarrow \varphi \\ \mathcal{O} \times \mathcal{G} & \longrightarrow & \mathcal{G} \end{array}$$

commutes.

- (3) The set of \mathcal{O} -module morphisms as above is denoted $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$.
 (4) The category of presheaves of \mathcal{O} -modules is denoted $\text{PMod}(\mathcal{O})$.

Suppose that $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ is a morphism of presheaves of rings on X . In this case, if \mathcal{F} is a presheaf of \mathcal{O}_2 -modules then we can think of \mathcal{F} as a presheaf of \mathcal{O}_1 -modules by using the composition

$$\mathcal{O}_1 \times \mathcal{F} \rightarrow \mathcal{O}_2 \times \mathcal{F} \rightarrow \mathcal{F}.$$

We sometimes denote this by $\mathcal{F}_{\mathcal{O}_1}$ to indicate the restriction of rings. We call this the *restriction of \mathcal{F}* . We obtain the restriction functor

$$\text{PMod}(\mathcal{O}_2) \longrightarrow \text{PMod}(\mathcal{O}_1)$$

On the other hand, given a presheaf of \mathcal{O}_1 -modules \mathcal{G} we can construct a presheaf of \mathcal{O}_2 -modules $\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}$ by the rule

$$(\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G})(U) = \mathcal{O}_2(U) \otimes_{\mathcal{O}_1(U)} \mathcal{G}(U)$$

The index p stands for “presheaf” and not “point”. This presheaf is called the tensor product presheaf. We obtain the *change of rings* functor

$$\text{PMod}(\mathcal{O}_1) \longrightarrow \text{PMod}(\mathcal{O}_2)$$

Lemma 6.6.2. *With $X, \mathcal{O}_1, \mathcal{O}_2, \mathcal{F}$ and \mathcal{G} as above there exists a canonical bijection*

$$\text{Hom}_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from the fact that for a ring map $A \rightarrow B$ the restriction functor and the change of ring functor are adjoint to each other. \square

6.7. Sheaves

In this section we explain the sheaf condition.

Definition 6.7.1. Let X be a topological space.

- (1) A *sheaf \mathcal{F} of sets on X* is a presheaf of sets which satisfies the following additional property: Given any open covering $U = \bigcup_{i \in I} U_i$ and any collection of sections $s_i \in \mathcal{F}(U_i)$, $i \in I$ such that $\forall i, j \in I$

$$s_i|_{U_i \cap U_j} = s_j|_{U_i \cap U_j}$$

there exists a unique section $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$ for all $i \in I$.

- (2) A *morphism of sheaves of sets* is simply a morphism of presheaves of sets.
 (3) The category of sheaves of sets on X is denoted $\text{Sh}(X)$.

Remark 6.7.2. There is always a bit of confusion as to whether it is necessary to say something about the set of sections of a sheaf over the empty set $\emptyset \subset X$. It is necessary, and we already did if you read the definition right. Namely, note that the empty set is covered by the empty open covering, and hence the “collection of section s_i ” from the definition above actually form an element of the empty product which is the final object of the category the sheaf has values in. In other words, if you read the definition right you automatically deduce that $\mathcal{F}(\emptyset) = a$ final object, which in the case of a sheaf of sets is a singleton. If you do not like this argument, then you can just require that $\mathcal{F}(\emptyset) = \{*\}$.

In particular, this condition will then ensure that if $U, V \subset X$ are open and disjoint then

$$\mathcal{F}(U \cup V) = \mathcal{F}(U) \times \mathcal{F}(V).$$

(Because the fibre product over a final object is a product.)

Example 6.7.3. Let X, Y be topological spaces. Consider the rule \mathcal{F} which associates to the open $U \subset X$ the set

$$\mathcal{F}(U) = \{f : U \rightarrow Y \mid f \text{ is continuous}\}$$

with the obvious restriction mappings. We claim that \mathcal{F} is a sheaf. To see this suppose that $U = \bigcup_{i \in I} U_i$ is an open covering, and $f_i \in \mathcal{F}(U_i)$, $i \in I$ with $f_i|_{U_i \cap U_j} = f_j|_{U_i \cap U_j}$ for all $i, j \in I$. In this case define $f : U \rightarrow Y$ by setting $f(u)$ equal to the value of $f_i(u)$ for any $i \in I$ such that $u \in U_i$. This is well defined by assumption. Moreover, $f : U \rightarrow Y$ is a map such that its restriction to U_i agrees with the continuous map U_i . Hence clearly f is continuous!

We can use the result of the example to define constant sheaves. Namely, suppose that A is a set. Endow A with the discrete topology. Let $U \subset X$ be an open subset. Then we have

$$\{f : U \rightarrow A \mid f \text{ continuous}\} = \{f : U \rightarrow A \mid f \text{ locally constant}\}.$$

Thus the rule which assigns to an open all locally constant maps into A is a sheaf.

Definition 6.7.4. Let X be a topological space. Let A be a set. The *constant sheaf with value A* denoted \underline{A} , or \underline{A}_X is the sheaf that assigns to an open $U \subset X$ the set of all locally constant maps $U \rightarrow A$ with restriction mappings given by restrictions of functions.

Example 6.7.5. Let X be a topological space. Let $(A_x)_{x \in X}$ be a family of sets A_x indexed by points $x \in X$. We are going to construct a sheaf of sets Π from this data. For $U \subset X$ open set

$$\Pi(U) = \prod_{x \in U} A_x.$$

For $V \subset U \subset X$ open define a restriction mapping by the following rule: An element $s = (a_x)_{x \in U} \in \Pi(U)$ restricts to $s|_V = (a_x)_{x \in V}$. It is obvious that this defines a presheaf of sets. We claim this is a sheaf. Namely, let $U = \bigcup U_i$ be an open covering. Suppose that $s_i \in \Pi(U_i)$ are such that s_i and s_j agree over $U_i \cap U_j$. Write $s_i = (a_{i,x})_{x \in U_i}$. The compatibility condition implies that $a_{i,x} = a_{j,x}$ in the set A_x whenever $x \in U_i \cap U_j$. Hence there exists a unique element $s = (a_x)_{x \in U}$ in $\Pi(U) = \prod_{x \in U} A_x$ with the property that $a_x = a_{i,x}$ whenever $x \in U_i$ for some i . Of course this element s has the property that $s|_{U_i} = s_i$ for all i .

Example 6.7.6. Let X be a topological space. Suppose for each $x \in X$ we are given an abelian group M_x . Consider the presheaf $\mathcal{F} : U \mapsto \bigoplus_{x \in U} M_x$ defined in Example 6.4.5. This is not a sheaf in general. For example, if X is an infinite set with the discrete topology, then the sheaf condition would imply that $\mathcal{F}(X) = \prod_{x \in X} \mathcal{F}(\{x\})$ but by definition we have $\mathcal{F}(X) = \bigoplus_{x \in X} M_x = \bigoplus_{x \in X} \mathcal{F}(\{x\})$. And an infinite direct sum is in general different from an infinite direct product.

However, if X is a topological space such that every open of X is quasi-compact, then \mathcal{F} is a sheaf. This is left as an exercise to the reader.

6.8. Abelian sheaves

Definition 6.8.1. Let X be a topological space.

- (1) An *abelian sheaf on X* or *sheaf of abelian groups on X* is an abelian presheaf on X such that the underlying presheaf of sets is a sheaf.
- (2) The category of sheaves of abelian groups is denoted $Ab(X)$.

Let X be a topological space. In the case of an abelian presheaf \mathcal{F} the sheaf condition with regards to an open covering $U = \bigcup U_i$ is often expressed by saying that the complex of abelian groups

$$0 \rightarrow \mathcal{F}(U) \rightarrow \prod_i \mathcal{F}(U_i) \rightarrow \prod_{(i_0, i_1)} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

is exact. The first map is the usual one, whereas the second maps the element $(s_i)_{i \in I}$ to the element

$$(s_{i_0}|_{U_{i_0} \cap U_{i_1}} - s_{i_1}|_{U_{i_0} \cap U_{i_1}})_{(i_0, i_1)} \in \prod_{(i_0, i_1)} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

6.9. Sheaves of algebraic structures

Let us clarify the definition of sheaves of certain types of structures. First, let us reformulate the sheaf condition. Namely, suppose that \mathcal{F} is a presheaf of sets on the topological space X . The sheaf condition can be reformulated as follows. Let $U = \bigcup_{i \in I} U_i$ be an open covering. Consider the diagram

$$\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i) \rightrightarrows \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

Here the left map is defined by the rule $s \mapsto \prod_{i \in I} s|_{U_i}$. The two maps on the right are the maps

$$\prod_i s_i \mapsto \prod_{(i_0, i_1)} s_{i_0}|_{U_{i_0} \cap U_{i_1}} \quad \text{resp.} \quad \prod_i s_i \mapsto \prod_{(i_0, i_1)} s_{i_1}|_{U_{i_0} \cap U_{i_1}}.$$

The sheaf condition exactly says that the left arrow is the equalizer of the right two. This generalizes immediately to the case of presheaves with values in a category as long as the category has products.

Definition 6.9.1. Let X be a topological space. Let \mathcal{C} be a category with products. A presheaf \mathcal{F} with values in \mathcal{C} on X is a *sheaf* if for every open covering the diagram

$$\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i) \rightrightarrows \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

is an equalizer diagram in the category \mathcal{C} .

Suppose that \mathcal{C} is a category and that $F : \mathcal{C} \rightarrow \mathbf{Sets}$ is a faithful functor. A good example to keep in mind is the case where \mathcal{C} is the category of abelian groups and F is the forgetful functor. Consider a presheaf \mathcal{F} with values in \mathcal{C} on X . We would like to reformulate the condition above in terms of the underlying presheaf of sets (Definition 6.5.2). Note that the underlying presheaf of sets is a sheaf of sets if and only if all the diagrams

$$F(\mathcal{F}(U)) \longrightarrow \prod_{i \in I} F(\mathcal{F}(U_i)) \rightrightarrows \prod_{(i_0, i_1) \in I \times I} F(\mathcal{F}(U_{i_0} \cap U_{i_1}))$$

of sets – after applying the forgetful functor F – are equalizer diagrams! Thus we would like \mathcal{C} to have products and equalizers and we would like F to commute with them. This is equivalent to the condition that \mathcal{C} has limits and that F commutes with them, see Categories, Lemma 4.14.10. But this is not yet good enough (see Example 6.9.4); we also need F to *reflect isomorphisms*. This property means that given a morphism $f : A \rightarrow A'$ in \mathcal{C} , then f is an isomorphism if (and only if) $F(f)$ is a bijection.

Lemma 6.9.2. *Suppose the category \mathcal{C} and the functor $F : \mathcal{C} \rightarrow \mathbf{Sets}$ have the following properties:*

- (1) F is faithful,
- (2) \mathcal{C} has limits and F commutes with them, and
- (3) the functor F reflects isomorphisms.

Let X be a topological space. Let \mathcal{F} be a presheaf with values in \mathcal{C} . Then \mathcal{F} is a sheaf if and only if the underlying presheaf of sets is a sheaf.

Proof. Assume that \mathcal{F} is a sheaf. Then $\mathcal{F}(U)$ is the equalizer of the diagram above and by assumption we see $F(\mathcal{F}(U))$ is the equalizer of the corresponding diagram of sets. Hence $F(\mathcal{F})$ is a sheaf of sets.

Assume that $F(\mathcal{F})$ is a sheaf. Let $E \in \text{Ob}(\mathcal{C})$ be the equalizer of the two parallel arrows in Definition 6.9.1. We get a canonical morphism $\mathcal{F}(U) \rightarrow E$, simply because \mathcal{F} is a presheaf. By assumption, the induced map $F(\mathcal{F}(U)) \rightarrow F(E)$ is an isomorphism, because $F(E)$ is the equalizer of the corresponding diagram of sets. Hence we see $\mathcal{F}(U) \rightarrow E$ is an isomorphism by condition (3) of the lemma. \square

The lemma in particular applies to *sheaves of groups, rings, algebras over a fixed ring, modules over a fixed ring, vector spaces over a fixed field, etc.* In other words, these are presheaves of groups, rings, modules over a fixed ring, vector spaces over a fixed field, etc such that the underlying presheaf of sets is a sheaf.

Example 6.9.3. Let X be a topological space. For each open $U \subset X$ consider the \mathbf{R} -algebra $\mathcal{C}^0(U) = \{f : U \rightarrow \mathbf{R} \mid f \text{ is continuous}\}$. There are obvious restriction mappings that turn this into a presheaf of \mathbf{R} -algebras over X . By Example 6.7.3 it is a sheaf of sets. Hence by the Lemma 6.9.2 it is a sheaf of \mathbf{R} -algebras over X .

Example 6.9.4. Consider the category of topological spaces Top . There is a natural faithful functor $Top \rightarrow \mathbf{Sets}$ which commutes with products and equalizers. But it does not reflect isomorphisms. And, in fact it turns out that the analogue of Lemma 6.9.2 is wrong. Namely, suppose $X = \mathbf{N}$ with the discrete topology. Let A_i , for $i \in \mathbf{N}$ be a discrete topological space. For any subset $U \subset \mathbf{N}$ define $\mathcal{F}(U) = \prod_{i \in U} A_i$ with the discrete topology. Then this is a presheaf of topological spaces whose underlying presheaf of sets is a sheaf, see Example 6.7.5. However, if each A_i

has at least two elements, then this is not a sheaf of topological spaces according to Definition 6.9.1. The reader may check that putting the *product topology* on each $\mathcal{F}(U) = \prod_{i \in U} A_i$ does lead to a sheaf of topological spaces over X .

6.10. Sheaves of modules

Definition 6.10.1. Let X be a topological space. Let \mathcal{O} be a sheaf of rings on X .

- (1) A *sheaf of \mathcal{O} -modules* is a presheaf of \mathcal{O} -modules \mathcal{F} , see Definition 6.6.1, such that the underlying presheaf of abelian groups \mathcal{F} is a sheaf.
- (2) A *morphism of sheaves of \mathcal{O} -modules* is a morphism of presheaves of \mathcal{O} -modules.
- (3) Given sheaves of \mathcal{O} -modules \mathcal{F} and \mathcal{G} we denote $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ the set of morphism of sheaves of \mathcal{O} -modules.
- (4) The category of sheaves of \mathcal{O} -modules is denoted $\text{Mod}(\mathcal{O})$.

This definition kind of makes sense even if \mathcal{O} is just a presheaf of rings, although we do not know any examples where this is useful, and we will avoid using the terminology “sheaves of \mathcal{O} -modules” in case \mathcal{O} is not a sheaf of rings.

6.11. Stalks

Let X be a topological space. Let $x \in X$ be a point. Let \mathcal{F} be a presheaf of sets on X . The *stalk of \mathcal{F} at x* is the set

$$\mathcal{F}_x = \text{colim}_{x \in U} \mathcal{F}(U)$$

where the colimit is over the set of open neighbourhoods U of x in X . The set of open neighbourhoods is (partially) ordered by (reverse) inclusion: We say $U \geq U' \Leftrightarrow U \subset U'$. The transition maps in the system are given by the restriction maps of \mathcal{F} . See Categories, Section 4.21 for notation and terminology regarding (co)limits over systems. Note that the colimit is a directed colimit. Thus it is easy to describe \mathcal{F}_x . Namely,

$$\mathcal{F}_x = \{(U, s) \mid x \in U, s \in \mathcal{F}(U)\} / \sim$$

with equivalence relation given by $(U, s) \sim (U', s')$ if and only if there exists an open $U'' \subset U \cap U'$ with $x \in U''$ and $s|_{U''} = s'|_{U''}$. By abuse of notation we will often denote (U, s) , s_x , or even s the corresponding element in \mathcal{F}_x . Also we will say $s = s'$ in \mathcal{F}_x for two local sections of \mathcal{F} defined in an open neighbourhood of x to denote that they have the same image in \mathcal{F}_x .

An obvious consequence of this definition is that for any open $U \subset X$ there is a canonical map

$$\mathcal{F}(U) \longrightarrow \prod_{x \in U} \mathcal{F}_x$$

defined by $s \mapsto \prod_{x \in U} (U, s)$. Think about it!

Lemma 6.11.1. *Let \mathcal{F} be a sheaf of sets on the topological space X . For every open $U \subset X$ the map*

$$\mathcal{F}(U) \longrightarrow \prod_{x \in U} \mathcal{F}_x$$

is injective.

Proof. Suppose that $s, s' \in \mathcal{F}(U)$ map to the same element in every stalk \mathcal{F}_x for all $x \in U$. This means that for every $x \in U$, there exists an open $V^x \subset U$, $x \in V^x$ such that $s|_{V^x} = s'|_{V^x}$. But then $U = \bigcup_{x \in U} V^x$ is an open covering. Thus by the uniqueness in the sheaf condition we see that $s = s'$. \square

Definition 6.11.2. Let X be a topological space. A presheaf of sets \mathcal{F} on X is *separated* if for every open $U \subset X$ the map $\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_x$ is injective.

Another observation is that the construction of the stalk \mathcal{F}_x is functorial in the presheaf \mathcal{F} . In other words, it gives a functor

$$PSh(X) \longrightarrow Sets, \mathcal{F} \longmapsto \mathcal{F}_x.$$

This functor is called the *stalk functor*. Namely, if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves, then we define $\varphi_x : \mathcal{F}_x \rightarrow \mathcal{G}_x$ by the rule $(U, s) \mapsto (U, \varphi(s))$. To see that this works we have to check that if $(U, s) = (U', s')$ in \mathcal{F}_x then also $(U, \varphi(s)) = (U', \varphi(s'))$ in \mathcal{G}_x . This is clear since φ is compatible with the restriction mappings.

Example 6.11.3. Let X be a topological space. Let A be a set. Denote temporarily A_p the constant presheaf with value A (p for presheaf – not for point). There is a canonical map of presheaves $A_p \rightarrow \underline{A}$ into the constant sheaf with value A . For every point we have canonical bijections $A = (A_p)_x = \underline{A}_x$, where the second map is induced by functoriality from the map $A_p \rightarrow \underline{A}$.

Example 6.11.4. Suppose $X = \mathbf{R}^n$ with the Euclidean topology. Consider the presheaf of \mathcal{C}^∞ functions on X , denoted $\mathcal{C}_{\mathbf{R}^n}^\infty$. In other words, $\mathcal{C}_{\mathbf{R}^n}^\infty(U)$ is the set of \mathcal{C}^∞ -functions $f : U \rightarrow \mathbf{R}$. As in Example 6.7.3 it is easy to show that this is a sheaf. In fact it is a sheaf of \mathbf{R} -vector spaces.

Next, let $x \in X = \mathbf{R}^n$ be a point. How do we think of an element in the stalk $\mathcal{C}_{\mathbf{R}^n, x}^\infty$? Such an element is given by a \mathcal{C}^∞ -function f whose domain contains x . And a pair of such functions f, g determine the same element of the stalk if they agree in a neighbourhood of x . In other words, an element in $\mathcal{C}_{\mathbf{R}^n, x}^\infty$ is the same thing as what is sometimes called a *germ of a \mathcal{C}^∞ -function at x* .

Example 6.11.5. Let X be a topological space. Let A_x be a set for each $x \in X$. Consider the sheaf $\mathcal{F} : U \mapsto \prod_{x \in U} A_x$ of Example 6.7.5. We would just like to point out here that the stalk \mathcal{F}_x of \mathcal{F} at x is in general *not* equal to the set A_x . Of course there is a map $\mathcal{F}_x \rightarrow A_x$, but that is in general the best you can say. For example, suppose $x = \lim x_n$ with $x_n \neq x_m$ for all $n \neq m$ and suppose that $A_y = \{0, 1\}$ for all $y \in X$. Then \mathcal{F}_x maps onto the (infinite) set of tails of sequences of 0s and 1s. Namely, every open neighbourhood of x contains almost all of the x_n . On the other hand, if every neighbourhood of x contains a point y such that $A_y = \emptyset$, then $\mathcal{F}_x = \emptyset$.

6.12. Stalks of abelian presheaves

We first deal with the case of abelian groups as a model for the general case.

Lemma 6.12.1. *Let X be a topological space. Let \mathcal{F} be a presheaf of abelian groups on X . There exists a unique structure of an abelian group on \mathcal{F}_x such that for every $U \subset X$ open, $x \in U$ the map $\mathcal{F}(U) \rightarrow \mathcal{F}_x$ is a group homomorphism. Moreover,*

$$\mathcal{F}_x = \operatorname{colim}_{x \in U} \mathcal{F}(U)$$

holds in the category of abelian groups.

Proof. We define addition of a pair of elements (U, s) and (V, t) as the pair $(U \cap V, s|_{U \cap V} + t|_{U \cap V})$. The rest is easy to check. \square

What is crucial in the proof above is that the partially ordered set of open neighbourhoods is a directed system (compare Categories, Definition 4.21.2). Namely, the coproduct of two abelian groups A, B is the direct sum $A \oplus B$, whereas the coproduct in the category of sets is the disjoint union $A \coprod B$, showing that colimits in the category of abelian groups do not agree with colimits in the category of sets in general.

6.13. Stalks of presheaves of algebraic structures

The proof of Lemma 6.12.1 will work for any type of algebraic structure such that directed colimits commute with the forgetful functor.

Lemma 6.13.1. *Let \mathcal{C} be a category. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Assume that*

- (1) *F is faithful, and*
- (2) *directed colimits exist in \mathcal{C} and F commutes with them.*

Let X be a topological space. Let $x \in X$. Let \mathcal{F} be a presheaf with values in \mathcal{C} . Then

$$\mathcal{F}_x = \text{colim}_{x \in U} \mathcal{F}(U)$$

exists in \mathcal{C} . Its underlying set is equal to the stalk of the underlying presheaf of sets of \mathcal{F} . Furthermore, the construction $\mathcal{F} \mapsto \mathcal{F}_x$ is a functor from the category of presheaves with values in \mathcal{C} to \mathcal{C} .

Proof. Omitted. \square

By the very definition, all the morphisms $\mathcal{F}(U) \rightarrow \mathcal{F}_x$ are morphisms in the category \mathcal{C} which (after applying the forgetful functor F) turn into the corresponding maps for the underlying sheaf of sets. As usual we will not distinguish between the morphism in \mathcal{C} and the underlying map of sets, which is permitted since F is faithful.

This lemma applies in particular to: *Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field.*

6.14. Stalks of presheaves of modules

Lemma 6.14.1. *Let X be a topological space. Let \mathcal{O} be a presheaf of rings on X . Let \mathcal{F} be a presheaf of \mathcal{O} -modules. Let $x \in X$. The canonical map $\mathcal{O}_x \times \mathcal{F}_x \rightarrow \mathcal{F}_x$ coming from the multiplication map $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ defines a \mathcal{O}_x -module structure on the abelian group \mathcal{F}_x .*

Proof. Omitted. \square

Lemma 6.14.2. *Let X be a topological space. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a morphism of presheaves of rings on X . Let \mathcal{F} be a presheaf of \mathcal{O} -modules. Let $x \in X$. We have*

$$\mathcal{F}_x \otimes_{\mathcal{O}_x} \mathcal{O}'_x = (\mathcal{F} \otimes_{\mathcal{O}} \mathcal{O}')_x$$

as \mathcal{O}'_x -modules.

Proof. Omitted. \square

6.15. Algebraic structures

In this section we mildly formalize the notions we have encountered in the sections above.

Definition 6.15.1. A *type of algebraic structure* is given by a category \mathcal{C} and a functor $F : \mathcal{C} \rightarrow \text{Sets}$ with the following properties

- (1) F is faithful,
- (2) \mathcal{C} has limits and F commutes with limits,
- (3) \mathcal{C} has filtered colimits and F commutes with them, and
- (4) F reflects isomorphisms.

We make this definition to point out the properties we will use in a number of arguments below. But we will not actually study this notion in any great detail, since we are prohibited from studying “big” categories by convention, except for those listed in Categories, Remark 4.2.2. Among those the following have the required properties.

Lemma 6.15.2. *The following categories, endowed with the obvious forgetful functor, define types of algebraic structures:*

- (1) *The category of pointed sets.*
- (2) *The category of abelian groups.*
- (3) *The category of groups.*
- (4) *The category of monoids.*
- (5) *The category of rings.*
- (6) *The category of R -modules for a fixed ring R .*
- (7) *The category of Lie algebras over a fixed field.*

Proof. Omitted. □

From now on we will think of a (pre)sheaf of algebraic structures and their stalks, in terms of the underlying (pre)sheaf of sets. This is allowable by Lemmas 6.9.2 and 6.13.1.

In the rest of this section we point out some results on algebraic structures that will be useful in the future.

Lemma 6.15.3. *Let (\mathcal{C}, F) be a type of algebraic structure.*

- (1) \mathcal{C} has a final object 0 and $F(0) = \{*\}$.
- (2) \mathcal{C} has products and $F(\prod A_i) = \prod F(A_i)$.
- (3) \mathcal{C} has fibre products and $F(A \times_B C) = F(A) \times_{F(B)} F(C)$.
- (4) \mathcal{C} has equalizers, and if $E \rightarrow A$ is the equalizer of $a, b : A \rightarrow B$, then $F(E) \rightarrow F(A)$ is the equalizer of $F(a), F(b) : F(A) \rightarrow F(B)$.
- (5) $A \rightarrow B$ is a monomorphism if and only if $F(A) \rightarrow F(B)$ is injective.
- (6) if $F(a) : F(A) \rightarrow F(B)$ is surjective, then a is an epimorphism.
- (7) given $A_1 \rightarrow A_2 \rightarrow A_3 \rightarrow \dots$, then $\text{colim } A_i$ exists and $F(\text{colim } A_i) = \text{colim } F(A_i)$, and more generally for any filtered colimit.

Proof. Omitted. The only interesting statement is (5) which follows because $A \rightarrow B$ is a monomorphism if and only if $A \rightarrow A \times_B A$ is an isomorphism, and then applying the fact that F reflects isomorphisms. □

Lemma 6.15.4. *Let (\mathcal{C}, F) be a type of algebraic structure. Suppose that $A, B, C \in \text{Ob}(\mathcal{C})$. Let $f : A \rightarrow B$ and $g : C \rightarrow B$ be morphisms of \mathcal{C} . If $F(g)$ is injective, and $\text{Im}(F(f)) \subset \text{Im}(F(g))$, then f factors as $f = g \circ t$ for some morphism $t : A \rightarrow C$.*

Proof. Consider $A \times_B C$. The assumptions imply that $F(A \times_B C) = F(A) \times_{F(B)} F(C) = F(A)$. Hence $A = A \times_B C$ because F reflects isomorphisms. The result follows. \square

Example 6.15.5. The lemma will be applied often to the following situation. Suppose that we have a diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ & & \downarrow \\ C & \longrightarrow & D \end{array}$$

in \mathcal{C} . Suppose $C \rightarrow D$ is injective on underlying sets, and suppose that the composition $A \rightarrow B \rightarrow D$ has image on underlying sets in the image of $C \rightarrow D$. Then we get a commutative diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow \\ C & \longrightarrow & D \end{array}$$

in \mathcal{C} .

Example 6.15.6. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a type of algebraic structures. Let X be a topological space. Suppose that for every $x \in X$ we are given an object $A_x \in \text{ob}(\mathcal{C})$. Consider the presheaf Π with values in \mathcal{C} on X defined by the rule $\Pi(U) = \prod_{x \in U} A_x$ (with obvious restriction mappings). Note that the associated presheaf of sets $U \mapsto F(\Pi(U)) = \prod_{x \in U} F(A_x)$ is a sheaf by Example 6.7.5. Hence Π is a sheaf of algebraic structures of type (\mathcal{C}, F) . This gives many examples of sheaves of abelian groups, groups, rings, etc.

6.16. Exactness and points

In any category we have the notion of epimorphism, monomorphism, isomorphism, etc.

Lemma 6.16.1. *Let X be a topological space. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of sheaves of sets on X .*

- (1) *The map φ is a monomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \rightarrow \mathcal{G}_x$ is injective.*
- (2) *The map φ is an epimorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \rightarrow \mathcal{G}_x$ is surjective.*
- (3) *The map φ is an isomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \rightarrow \mathcal{G}_x$ is bijective.*

Proof. Omitted. \square

It follows that in the category of sheaves of sets the notions epimorphism and monomorphism can be described as follows.

Definition 6.16.2. Let X be a topological space.

- (1) A presheaf \mathcal{F} is called a *subpresheaf* of a presheaf \mathcal{G} if $\mathcal{F}(U) \subset \mathcal{G}(U)$ for all open $U \subset X$ such that the restriction maps of \mathcal{G} induce the restriction maps of \mathcal{F} . If \mathcal{F} and \mathcal{G} are sheaves, then \mathcal{F} is called a *subsheaf* of \mathcal{G} . We sometimes indicate this by the notation $\mathcal{F} \subset \mathcal{G}$.
- (2) A morphism of presheaves of sets $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ on X is called *injective* if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective for all U open in X .
- (3) A morphism of presheaves of sets $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ on X is called *surjective* if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is surjective for all U open in X .
- (4) A morphism of sheaves of sets $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ on X is called *injective* if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective for all U open in X .
- (5) A morphism of sheaves of sets $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ on X is called *surjective* if and only if for every open U of X and every section s of $\mathcal{G}(U)$ there exists an open covering $U = \bigcup U_i$ such that $s|_{U_i}$ is in the image of $\mathcal{F}(U_i) \rightarrow \mathcal{G}(U)$ for all i .

Lemma 6.16.3. *Let X be a topological space.*

- (1) *Epimorphisms (resp. monomorphisms) in the category of presheaves are exactly the surjective (resp. injective) maps of presheaves.*
- (2) *Epimorphisms (resp. monomorphisms) in the category of sheaves are exactly the surjective (resp. injective) maps of sheaves, and are exactly those maps which are surjective (resp. injective) on all the stalks.*
- (3) *The sheafification of a surjective (resp. injective) morphism of presheaves of sets is surjective (resp. injective).*

Proof. Omitted. □

Lemma 6.16.4. *Let X be a topological space. Let (\mathcal{C}, F) be a type of algebraic structure. Suppose that \mathcal{F}, \mathcal{G} are sheaves on X with values in \mathcal{C} . Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of the underlying sheaves of sets. If for all points $x \in X$ the map $\mathcal{F}_x \rightarrow \mathcal{G}_x$ is a morphism of algebraic structures, then φ is a morphism of sheaves of algebraic structures.*

Proof. Let U be an open subset of X . Consider the diagram of (underlying) sets

$$\begin{array}{ccc} \mathcal{F}(U) & \longrightarrow & \prod_{x \in U} \mathcal{F}_x \\ \downarrow & & \downarrow \\ \mathcal{G}(U) & \longrightarrow & \prod_{x \in U} \mathcal{G}_x \end{array}$$

By assumption, and previous results, all but the left vertical arrow are morphisms of algebraic structures. In addition the bottom horizontal arrow is injective, see Lemma 6.11.1. Hence we conclude by Lemma 6.15.4, see also Example 6.15.5 □

Short exact sequences of abelian sheaves, etc will be discussed in the chapter on sheaves of modules. See Modules, Section 17.3.

6.17. Sheafification

In this section we explain how to get the sheafification of a presheaf on a topological space. We will use stalks to describe the sheafification in this case. This is different from the general procedure described in Sites, Section 7.10, and perhaps somewhat easier to understand.

The basic construction is the following. Let \mathcal{F} be a presheaf of sets \mathcal{F} on a topological space X . For every open $U \subset X$ we define

$$\mathcal{F}^\#(U) = \{(s_u) \in \prod_{u \in U} \mathcal{F}_u \text{ such that } (*)\}$$

where $(*)$ is the property:

- (*) For every $u \in U$, there exists an open neighbourhood $u \in V \subset U$, and a section $\sigma \in \mathcal{F}(V)$ such that for all $v \in V$ we have $s_v = (V, \sigma)$ in \mathcal{F}_v .

Note that $(*)$ is a condition for each $u \in U$, and that given $u \in U$ the truth of this condition depends only on the values s_v for v in any open neighbourhood of u . Thus it is clear that, if $V \subset U \subset X$ are open, the projection maps

$$\prod_{u \in U} \mathcal{F}_u \longrightarrow \prod_{v \in V} \mathcal{F}_v$$

maps elements of $\mathcal{F}^\#(U)$ into $\mathcal{F}^\#(V)$. In other words, we get the structure of a presheaf of sets on $\mathcal{F}^\#$.

Furthermore, the map $\mathcal{F}(U) \rightarrow \prod_{u \in U} \mathcal{F}_u$ described in Section 6.11 clearly has image in $\mathcal{F}^\#(U)$. In addition, if $V \subset U \subset X$ are open then we have the following commutative diagram

$$\begin{array}{ccccc} \mathcal{F}(U) & \longrightarrow & \mathcal{F}^\#(U) & \longrightarrow & \prod_{u \in U} \mathcal{F}_u \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{F}(V) & \longrightarrow & \mathcal{F}^\#(V) & \longrightarrow & \prod_{v \in V} \mathcal{F}_v \end{array}$$

where the vertical maps are induced from the restriction mappings. Thus we see that there is a canonical morphism of presheaves $\mathcal{F} \rightarrow \mathcal{F}^\#$.

In Example 6.7.5 we saw that the rule $\Pi(\mathcal{F}) : U \mapsto \prod_{u \in U} \mathcal{F}_u$ is a sheaf, with obvious restriction mappings. And by construction $\mathcal{F}^\#$ is a subpresheaf of this. In other words, we have morphisms of presheaves

$$\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \Pi(\mathcal{F}).$$

In addition the rule that associates to \mathcal{F} the sequence above is clearly functorial in the presheaf \mathcal{F} . This notation will be used in the proofs of the lemmas below.

Lemma 6.17.1. *The presheaf $\mathcal{F}^\#$ is a sheaf.*

Proof. It is probably better for the reader to find their own explanation of this than to read the proof here. In fact the lemma is true for the same reason as why the presheaf of continuous function is a sheaf, see Example 6.7.3 (and this analogy can be made precise using the “espace étalé”).

Anyway, let $U = \bigcup U_i$ be an open covering. Suppose that $s_i = (s_{i,u})_{u \in U_i} \in \mathcal{F}^\#(U_i)$ such that s_i and s_j agree over $U_i \cap U_j$. Because $\Pi(\mathcal{F})$ is a sheaf, we find an element $s = (s_u)_{u \in U}$ in $\prod_{u \in U} \mathcal{F}_u$ restricting to s_i on U_i . We have to check property $(*)$. Pick $u \in U$. Then $u \in U_i$ for some i . Hence by $(*)$ for s_i , there exists a V open, $u \in V \subset U_i$ and a $\sigma \in \mathcal{F}(V)$ such that $s_{i,v} = (V, \sigma)$ in \mathcal{F}_v for all $v \in V$. Since $s_{i,v} = s_v$ we get $(*)$ for s . \square

Lemma 6.17.2. *Let X be a topological space. Let \mathcal{F} be a presheaf of sets on X . Let $x \in X$. Then $\mathcal{F}_x = \mathcal{F}_x^\#$.*

Proof. The map $\mathcal{F}_x \rightarrow \mathcal{F}_x^\#$ is injective, since already the map $\mathcal{F}_x \rightarrow \Pi(\mathcal{F})_x$ is injective. Namely, there is a canonical map $\Pi(\mathcal{F})_x \rightarrow \mathcal{F}_x$ which is a left inverse to the map $\mathcal{F}_x \rightarrow \Pi(\mathcal{F})_x$, see Example 6.11.5. To show that it is surjective, suppose that $\bar{s} \in \mathcal{F}_x^\#$. We can find an open neighbourhood U of x such that \bar{s} is the equivalence class of (U, s) with $s \in \mathcal{F}^\#(U)$. By definition, this means there exists an open neighbourhood $V \subset U$ of x and a section $\sigma \in \mathcal{F}(V)$ such that $s|_V$ is the image of σ in $\Pi(\mathcal{F})(V)$. Clearly the class of (V, σ) defines an element of \mathcal{F}_x mapping to \bar{s} . \square

Lemma 6.17.3. *Let \mathcal{F} be a presheaf of sets on X . Any map $\mathcal{F} \rightarrow \mathcal{G}$ into a sheaf of sets factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$.*

Proof. Clearly, there is a commutative diagram

$$\begin{array}{ccccc} \mathcal{F} & \longrightarrow & \mathcal{F}^\# & \longrightarrow & \Pi(\mathcal{F}) \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{G} & \longrightarrow & \mathcal{G}^\# & \longrightarrow & \Pi(\mathcal{G}) \end{array}$$

So it suffices to prove that $\mathcal{G} = \mathcal{G}^\#$. To see this it suffices to prove, for every point $x \in X$ the map $\mathcal{G}_x \rightarrow \mathcal{G}_x^\#$ is bijective, by Lemma 6.16.1. And this is Lemma 6.17.2 above. \square

This lemma really says that there is an adjoint pair of functors: $i : Sh(X) \rightarrow PSh(X)$ (inclusion) and $\# : PSh(X) \rightarrow Sh(X)$ (sheafification). The formula is that

$$\text{Mor}_{PSh(X)}(\mathcal{F}, i(\mathcal{G})) = \text{Mor}_{Sh(X)}(\mathcal{F}^\#, \mathcal{G})$$

which says that sheafification is a left adjoint of the inclusion functor. See Categories, Section 4.24.

Example 6.17.4. See Example 6.11.3 for notation. The map $A_p \rightarrow \underline{A}$ induces a map $A_p^\# \rightarrow \underline{A}$. It is easy to see that this is an isomorphism. In words: The sheafification of the constant presheaf with value A is the constant sheaf with value A .

Lemma 6.17.5. *Let X be a topological space. A presheaf \mathcal{F} is separated (see Definition 6.11.2) if and only if the canonical map $\mathcal{F} \rightarrow \mathcal{F}^\#$ is injective.*

Proof. This is clear from the construction of $\mathcal{F}^\#$ in this section. \square

6.18. Sheafification of abelian presheaves

The following strange looking lemma is likely unnecessary, but very convenient to deal with sheafification of presheaves of algebraic structures.

Lemma 6.18.1. *Let X be a topological space. Let \mathcal{F} be a presheaf of sets on X . Let $U \subset X$ be open. There is a canonical fibre product diagram*

$$\begin{array}{ccc} \mathcal{F}^\#(U) & \longrightarrow & \Pi(\mathcal{F})(U) \\ \downarrow & & \downarrow \\ \prod_{x \in U} \mathcal{F}_x & \longrightarrow & \prod_{x \in U} \Pi(\mathcal{F})_x \end{array}$$

where the maps are the following:

- (1) The left vertical map has components $\mathcal{F}^\#(U) \rightarrow \mathcal{F}_x^\# = \mathcal{F}_x$ where the equality is Lemma 6.17.2.
- (2) The top horizontal map comes from the map of presheaves $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ described in Section 6.17.
- (3) The right vertical map has obvious component maps $\Pi(\mathcal{F})(U) \rightarrow \Pi(\mathcal{F})_x$.
- (4) The bottom horizontal map has components $\mathcal{F}_x \rightarrow \Pi(\mathcal{F})_x$ which come from the map of presheaves $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ described in Section 6.17.

Proof. It is clear that the diagram commutes. We have to show it is a fibre product diagram. The bottom horizontal arrow is injective since all the maps $\mathcal{F}_x \rightarrow \Pi(\mathcal{F})_x$ are injective (see beginning proof of Lemma 6.17.2). A section $s \in \Pi(\mathcal{F})(U)$ is in $\mathcal{F}^\#$ if and only if $(*)$ holds. But $(*)$ says that around every point the section s comes from a section of \mathcal{F} . By definition of the stalk functors, this is equivalent to saying that the value of s in every stalk $\Pi(\mathcal{F})_x$ comes from an element of the stalk \mathcal{F}_x . Hence the lemma. \square

Lemma 6.18.2. *Let X be a topological space. Let \mathcal{F} be an abelian presheaf on X . Then there exists a unique structure of abelian sheaf on $\mathcal{F}^\#$ such that $\mathcal{F} \rightarrow \mathcal{F}^\#$ is a morphism of abelian presheaves. Moreover, the following adjointness property holds*

$$\text{Mor}_{\text{PAb}(X)}(\mathcal{F}, i(\mathcal{G})) = \text{Mor}_{\text{Ab}(X)}(\mathcal{F}^\#, \mathcal{G}).$$

Proof. Recall the sheaf of sets $\Pi(\mathcal{F})$ defined in Section 6.17. All the stalks \mathcal{F}_x are abelian groups, see Lemma 6.12.1. Hence $\Pi(\mathcal{F})$ is a sheaf of abelian groups by Example 6.15.6. Also, it is clear that the map $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ is a morphism of abelian presheaves. If we show that condition $(*)$ of Section 6.17 defines a subgroup of $\Pi(\mathcal{F})(U)$ for all open subsets $U \subset X$, then $\mathcal{F}^\#$ canonically inherits the structure of abelian sheaf. This is quite easy to do by hand, and we leave it to the reader to find a good simple argument. The argument we use here, which generalizes to presheaves of algebraic structures is the following: Lemma 6.18.1 show that $\mathcal{F}^\#(U)$ is the fibre product of a diagram of abelian groups. Thus $\mathcal{F}^\#$ is an abelian subgroup as desired.

Note that at this point $\mathcal{F}_x^\#$ is an abelian group by Lemma 6.12.1 and that $\mathcal{F}_x \rightarrow \mathcal{F}_x^\#$ is a bijection (Lemma 6.17.2) and a homomorphism of abelian groups. Hence $\mathcal{F}_x \rightarrow \mathcal{F}_x^\#$ is an isomorphism of abelian groups. This will be used below without further mention.

To prove the adjointness property we use the adjointness property of sheafification of presheaves of sets. For example if $\psi : \mathcal{F} \rightarrow i(\mathcal{G})$ is morphism of presheaves then we obtain a morphism of sheaves $\psi' : \mathcal{F}^\# \rightarrow \mathcal{G}$. What we have to do is to check that this is a morphism of abelian sheaves. We may do this for example by noting that it is true on stalks, by Lemma 6.17.2, and then using Lemma 6.16.4 above. \square

6.19. Sheafification of presheaves of algebraic structures

Lemma 6.19.1. *Let X be a topological space. Let (\mathcal{C}, F) be a type of algebraic structure. Let \mathcal{F} be a presheaf with values in \mathcal{C} on X . Then there exists a sheaf $\mathcal{F}^\#$ with values in \mathcal{C} and a morphism $\mathcal{F} \rightarrow \mathcal{F}^\#$ of presheaves with values in \mathcal{C} with the following properties:*

- (1) The map $\mathcal{F} \rightarrow \mathcal{F}^\#$ identifies the underlying sheaf of sets of $\mathcal{F}^\#$ with the sheafification of the underlying presheaf of sets of \mathcal{F} .

- (2) For any morphism $\mathcal{F} \rightarrow \mathcal{G}$, where \mathcal{G} is a sheaf with values in \mathcal{C} there exists a unique factorization $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$.

Proof. The proof is the same as the proof of Lemma 6.18.2, with repeated application of Lemma 6.15.4 (see also Example 6.15.5). The main idea however, is to define $\mathcal{F}^\#(U)$ as the fibre product in \mathcal{C} of the diagram

$$\begin{array}{ccc} & \Pi(\mathcal{F})(U) & \\ & \downarrow & \\ \prod_{x \in U} \mathcal{F}_x & \longrightarrow & \prod_{x \in U} \Pi(\mathcal{F})_x \end{array}$$

compare Lemma 6.18.1. □

6.20. Sheafification of presheaves of modules

Lemma 6.20.1. Let X be a topological space. Let \mathcal{O} be a presheaf of rings on X . Let \mathcal{F} be a presheaf \mathcal{O} -modules. Let $\mathcal{O}^\#$ be the sheafification of \mathcal{O} . Let $\mathcal{F}^\#$ be the sheafification of \mathcal{F} as a presheaf of abelian groups. There exists a map of sheaves of sets

$$\mathcal{O}^\# \times \mathcal{F}^\# \longrightarrow \mathcal{F}^\#$$

which makes the diagram

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{F} & \longrightarrow & \mathcal{F} \\ \downarrow & & \downarrow \\ \mathcal{O}^\# \times \mathcal{F}^\# & \longrightarrow & \mathcal{F}^\# \end{array}$$

commute and which makes $\mathcal{F}^\#$ into a sheaf of $\mathcal{O}^\#$ -modules. In addition, if \mathcal{G} is a sheaf of $\mathcal{O}^\#$ -modules, then any morphism of presheaves of \mathcal{O} -modules $\mathcal{F} \rightarrow \mathcal{G}$ (into the restriction of \mathcal{G} to a \mathcal{O} -module) factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$ where $\mathcal{F}^\# \rightarrow \mathcal{G}$ is a morphism of $\mathcal{O}^\#$ -modules.

Proof. Omitted. □

This actually means that the functor $i : \text{Mod}(\mathcal{O}^\#) \rightarrow \text{PMod}(\mathcal{O})$ (combining restriction and including sheaves into presheaves) and the sheafification functor of the lemma $\# : \text{PMod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}^\#)$ are adjoint. In a formula

$$\text{Mor}_{\text{PMod}(\mathcal{O})}(\mathcal{F}, i\mathcal{G}) = \text{Mor}_{\text{Mod}(\mathcal{O}^\#)}(\mathcal{F}^\#, \mathcal{G})$$

Let X be a topological space. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a morphism of sheaves of rings on X . In Section 6.6 we defined a restriction functor and a change of rings functor on presheaves of modules associated to this situation.

If \mathcal{F} is a sheaf of \mathcal{O}_2 -modules then the restriction $\mathcal{F}_{\mathcal{O}_1}$ of \mathcal{F} is clearly a sheaf of \mathcal{O}_1 -modules. We obtain the restriction functor

$$\text{Mod}(\mathcal{O}_2) \longrightarrow \text{Mod}(\mathcal{O}_1)$$

On the other hand, given a sheaf of \mathcal{O}_1 -modules \mathcal{G} the presheaf of \mathcal{O}_2 -modules $\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}$ is in general not a sheaf. Hence we define the *tensor product sheaf* $\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}$ by the formula

$$\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G} = (\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G})^\#$$

as the sheafification of our construction for presheaves. We obtain the *change of rings* functor

$$\text{Mod}(\mathcal{O}_1) \longrightarrow \text{Mod}(\mathcal{O}_2)$$

Lemma 6.20.2. *With X , \mathcal{O}_1 , \mathcal{O}_2 , \mathcal{F} and \mathcal{G} as above there exists a canonical bijection*

$$\text{Hom}_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from Lemma 6.6.2 and the fact that $\text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}, \mathcal{F})$ because \mathcal{F} is a sheaf. \square

Lemma 6.20.3. *Let X be a topological space. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a morphism of sheaves of rings on X . Let \mathcal{F} be a sheaf \mathcal{O} -modules. Let $x \in X$. We have*

$$\mathcal{F}_x \otimes_{\mathcal{O}_x} \mathcal{O}'_x = (\mathcal{F} \otimes_{\mathcal{O}} \mathcal{O}')_x$$

as \mathcal{O}'_x -modules.

Proof. Follows directly from Lemma 6.14.2 and the fact that taking stalks commutes with sheafification. \square

6.21. Continuous maps and sheaves

Let $f : X \rightarrow Y$ be a continuous map of topological spaces. We will define the pushforward and pullback functors for presheaves and sheaves.

Let \mathcal{F} be a presheaf of sets on X . We define the *pushforward* of \mathcal{F} by the rule

$$f_*\mathcal{F}(V) = \mathcal{F}(f^{-1}(V))$$

for any open $V \subset Y$. Given $V_1 \subset V_2 \subset Y$ open the restriction map is given by the commutativity of the diagram

$$\begin{array}{ccc} f_*\mathcal{F}(V_2) & \xlongequal{\quad} & \mathcal{F}(f^{-1}(V_2)) \\ \downarrow & & \downarrow \text{restriction for } \mathcal{F} \\ f_*\mathcal{F}(V_1) & \xlongequal{\quad} & \mathcal{F}(f^{-1}(V_1)) \end{array}$$

It is clear that this defines a presheaf of sets. The construction is clearly functorial in the presheaf \mathcal{F} and hence we obtain a functor

$$f_* : PSh(X) \longrightarrow PSh(Y).$$

Lemma 6.21.1. *Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{F} be a sheaf of sets on X . Then $f_*\mathcal{F}$ is a sheaf on Y .*

Proof. This immediately follows from the fact that if $V = \bigcup V_j$ is an open covering in Y , then $f^{-1}(V) = \bigcup f^{-1}(V_j)$ is an open covering in X . \square

As a consequence we obtain a functor

$$f_* : Sh(X) \longrightarrow Sh(Y).$$

This is compatible with composition in the following strong sense.

Lemma 6.21.2. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be continuous maps of topological spaces. The functors $(g \circ f)_*$ and $g_* \circ f_*$ are equal (on both presheaves and sheaves of sets).*

Proof. This is because $(g \circ f)_*\mathcal{F}(W) = \mathcal{F}((g \circ f)^{-1}W)$ and $(g_* \circ f_*)\mathcal{F}(W) = \mathcal{F}(f^{-1}g^{-1}W)$ and $(g \circ f)^{-1}W = f^{-1}g^{-1}W$. \square

Let \mathcal{G} be a presheaf of sets on Y . The *pullback presheaf* $f_p\mathcal{G}$ of a given presheaf \mathcal{G} is defined as the left adjoint of the pushforward f_* on presheaves. In other words it should be a presheaf $f_p\mathcal{G}$ on X such that

$$\text{Mor}_{\text{PSh}(X)}(f_p\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{PSh}(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

By the Yoneda lemma this determines the pullback uniquely. It turns out that it actually exists.

Lemma 6.21.3. *Let $f : X \rightarrow Y$ be a continuous map. There exists a functor $f_p : \text{PSh}(Y) \rightarrow \text{PSh}(X)$ which is left adjoint to f_* . For a presheaf \mathcal{G} it is determined by the rule*

$$f_p\mathcal{G}(U) = \text{colim}_{f(U) \subset V} \mathcal{G}(V)$$

where the colimit is over the collection of open neighbourhoods V of $f(U)$ in Y . The colimits are over directed partially ordered sets. (The restriction mappings of $f_p\mathcal{G}$ are explained in the proof.)

Proof. The colimit is over the partially ordered set consisting of open subset $V \subset Y$ which contain $f(U)$ with ordering by reverse inclusion. This is a directed partially ordered set, since if V, V' are in it then so is $V \cap V'$. Furthermore, if $U_1 \subset U_2$, then every open neighbourhood of $f(U_2)$ is an open neighbourhood of $f(U_1)$. Hence the system defining $f_p\mathcal{G}(U_2)$ is a subsystem of the one defining $f_p\mathcal{G}(U_1)$ and we obtain a restriction map (for example by applying the generalities in Categories, Lemma 4.14.7).

Note that the construction of the colimit is clearly functorial in \mathcal{G} , and similarly for the restriction mappings. Hence we have defined f_p as a functor.

A small useful remark is that there exists a canonical map $\mathcal{G}(U) \rightarrow f_p\mathcal{G}(f^{-1}(U))$, because the system of open neighbourhoods of $f(f^{-1}(U))$ contains the element U . This is compatible with restriction mappings. In other words, there is a canonical map $i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*f_p\mathcal{G}$.

Let \mathcal{F} be a presheaf of sets on X . Suppose that $\psi : f_p\mathcal{G} \rightarrow \mathcal{F}$ is a map of presheaves of sets. The corresponding map $\mathcal{G} \rightarrow f_*\mathcal{F}$ is the map $f_*\psi \circ i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*f_p\mathcal{G} \rightarrow f_*\mathcal{F}$.

Another small useful remark is that there exists a canonical map $c_{\mathcal{F}} : f_p f_*\mathcal{F} \rightarrow \mathcal{F}$. Namely, let $U \subset X$ open. For every open neighbourhood $V \supset f(U)$ in Y there exists a map $f_*\mathcal{F}(V) = \mathcal{F}(f^{-1}(V)) \rightarrow \mathcal{F}(U)$, namely the restriction map on \mathcal{F} . And this is compatible with the restriction mappings between values of \mathcal{F} on f^{-1} of varying opens containing $f(U)$. Thus we obtain a canonical map $f_p f_*\mathcal{F}(U) \rightarrow \mathcal{F}(U)$. Another trivial verification shows that these maps are compatible with restriction maps and define a map $c_{\mathcal{F}}$ of presheaves of sets.

Suppose that $\varphi : \mathcal{G} \rightarrow f_*\mathcal{F}$ is a map of presheaves of sets. Consider $f_p\varphi : f_p\mathcal{G} \rightarrow f_p f_*\mathcal{F}$. Postcomposing with $c_{\mathcal{F}}$ gives the desired map $c_{\mathcal{F}} \circ f_p\varphi : f_p\mathcal{G} \rightarrow \mathcal{F}$. We omit the verification that this construction is inverse to the construction in the other direction given above. \square

Lemma 6.21.4. *Let $f : X \rightarrow Y$ be a continuous map. Let $x \in X$. Let \mathcal{G} be a presheaf of sets on Y . There is a canonical bijection of stalks $(f_p\mathcal{G})_x = \mathcal{G}_{f(x)}$.*

Proof. This you can see as follows

$$\begin{aligned} (f_p\mathcal{G})_x &= \operatorname{colim}_{x \in U} f_p\mathcal{G}(U) \\ &= \operatorname{colim}_{x \in U} \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\ &= \operatorname{colim}_{f(x) \in V} \mathcal{G}(V) \\ &= \mathcal{G}_{f(x)} \end{aligned}$$

Here we have used Categories, Lemma 4.14.9, and the fact that any V open in Y containing $f(x)$ occurs in the third description above. Details omitted. \square

Let \mathcal{G} be a sheaf of sets on Y . The *pullback sheaf* $f^{-1}\mathcal{G}$ is defined by the formula

$$f^{-1}\mathcal{G} = (f_p\mathcal{G})^\#.$$

Sheafification is a left adjoint to the inclusion of sheaves in presheaves, and f_p is a left adjoint to f_* on presheaves. As a formal consequence we obtain that f^{-1} is a left adjoint of pushforward on sheaves. In other words,

$$\operatorname{Mor}_{\operatorname{Sh}(X)}(f^{-1}\mathcal{G}, \mathcal{F}) = \operatorname{Mor}_{\operatorname{Sh}(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

The formal argument is given in the setting of abelian sheaves in the next section.

Lemma 6.21.5. *Let $x \in X$. Let \mathcal{G} be a sheaf of sets on Y . There is a canonical bijection of stalks $(f^{-1}\mathcal{G})_x = \mathcal{G}_{f(x)}$.*

Proof. This is a combination of Lemmas 6.17.2 and 6.21.4. \square

Lemma 6.21.6. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be continuous maps of topological spaces. The functors $(g \circ f)^{-1}$ and $f^{-1} \circ g^{-1}$ are canonically isomorphic. Similarly $(g \circ f)_p \cong f_p \circ g_p$ on presheaves.*

Proof. To see this use that adjoint functors are unique up to unique isomorphism, and Lemma 6.21.2. \square

Definition 6.21.7. Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{F} be a sheaf of sets on X and let \mathcal{G} be a sheaf of sets on Y . An *f-map* $\xi : \mathcal{G} \rightarrow \mathcal{F}$ is a collection of maps $\xi_V : \mathcal{G}(V) \rightarrow \mathcal{F}(f^{-1}(V))$ indexed by open subsets $V \subset Y$ such that

$$\begin{array}{ccc} \mathcal{G}(V) & \xrightarrow{\xi_V} & \mathcal{F}(f^{-1}V) \\ \text{restriction of } \mathcal{G} \downarrow & & \downarrow \text{restriction of } \mathcal{F} \\ \mathcal{G}(V') & \xrightarrow{\xi_{V'}} & \mathcal{F}(f^{-1}V') \end{array}$$

commutes for all $V' \subset V \subset Y$ open.

Lemma 6.21.8. *Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{F} be a sheaf of sets on X and let \mathcal{G} be a sheaf of sets on Y . There are canonical bijections between the following three sets:*

- (1) *The set of maps $\mathcal{G} \rightarrow f_*\mathcal{F}$.*
- (2) *The set of maps $f^{-1}\mathcal{G} \rightarrow \mathcal{F}$.*
- (3) *The set of f-maps $\xi : \mathcal{G} \rightarrow \mathcal{F}$.*

Proof. We leave the easy verification to the reader. \square

It is sometimes convenient to think about f -maps instead of maps between sheaves either on X or on Y . We define composition of f -maps as follows.

Definition 6.21.9. Suppose that $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous maps of topological spaces. Suppose that \mathcal{F} is a sheaf on X , \mathcal{G} is a sheaf on Y , and \mathcal{H} is a sheaf on Z . Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be an f -map. Let $\psi : \mathcal{H} \rightarrow \mathcal{G}$ be an g -map. The *composition of φ and ψ* is the $(g \circ f)$ -map $\varphi \circ \psi$ defined by the commutativity of the diagrams

$$\begin{array}{ccc} \mathcal{H}(W) & \xrightarrow{\quad (\varphi \circ \psi)_W \quad} & \mathcal{F}(f^{-1}g^{-1}W) \\ & \searrow \psi_W & \nearrow \varphi_{g^{-1}W} \\ & \mathcal{G}(g^{-1}W) & \end{array}$$

We leave it to the reader to verify that this works. Another way to think about this is to think of $\varphi \circ \psi$ as the composition

$$\mathcal{H} \xrightarrow{\psi} g_*\mathcal{G} \xrightarrow{g_*\varphi} g_*f_*\mathcal{F} = (g \circ f)_*\mathcal{F}$$

Now, doesn't it seem that thinking about f -maps is somehow easier?

Finally, given a continuous map $f : X \rightarrow Y$, and an f -map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ there is a natural map on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

for all $x \in X$. The image of a representative (V, s) of an element in $\mathcal{G}_{f(x)}$ is mapped to the element in \mathcal{F}_x with representative $(f^{-1}V, \varphi_V(s))$. We leave it to the reader to see that this is well defined. Another way to state it is that it is the unique map such that all diagrams

$$\begin{array}{ccc} \mathcal{F}(f^{-1}V) & \longrightarrow & \mathcal{F}_x \\ \varphi_V \uparrow & & \uparrow \varphi_x \\ \mathcal{G}(V) & \longrightarrow & \mathcal{G}_{f(x)} \end{array}$$

(for $x \in V \subset Y$ open) commute.

Lemma 6.21.10. Suppose that $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous maps of topological spaces. Suppose that \mathcal{F} is a sheaf on X , \mathcal{G} is a sheaf on Y , and \mathcal{H} is a sheaf on Z . Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be an f -map. Let $\psi : \mathcal{H} \rightarrow \mathcal{G}$ be an g -map. Let $x \in X$ be a point. The map on stalks $(\varphi \circ \psi)_x : \mathcal{H}_{g(f(x))} \rightarrow \mathcal{F}_x$ is the composition

$$\mathcal{H}_{g(f(x))} \xrightarrow{\psi_{f(x)}} \mathcal{G}_{f(x)} \xrightarrow{\varphi_x} \mathcal{F}_x$$

Proof. Immediate from Definition 6.21.9 and the definition of the map on stalks above. \square

6.22. Continuous maps and abelian sheaves

Let $f : X \rightarrow Y$ be a continuous map. We claim there are functors

$$\begin{aligned} f_* : PAb(X) &\longrightarrow PAb(Y) \\ f_* : Ab(X) &\longrightarrow Ab(Y) \\ f_p : PAb(Y) &\longrightarrow PAb(X) \\ f^{-1} : Ab(Y) &\longrightarrow Ab(X) \end{aligned}$$

with similar properties to their counterparts in Section 6.21. To see this we argue in the following way.

Each of the functors will be constructed in the same way as the corresponding functor in Section 6.21. This works because all the colimits in that section are directed colimits (but we will work through it below).

First off, given an abelian presheaf \mathcal{F} on X and an abelian presheaf \mathcal{G} on Y we define

$$\begin{aligned} f_*\mathcal{F}(V) &= \mathcal{F}(f^{-1}(V)) \\ f_p\mathcal{G}(U) &= \operatorname{colim}_{f(U)\subset V} \mathcal{G}(V) \end{aligned}$$

as abelian groups. The restriction mappings are the same as the restriction mappings for presheaves of sets (and they are all homomorphisms of abelian groups).

The assignments $\mathcal{F} \mapsto f_*\mathcal{F}$ and $\mathcal{G} \mapsto f_p\mathcal{G}$ are functors on the categories of presheaves of abelian groups. This is clear, as (for example) a map of abelian presheaves $\mathcal{G}_1 \rightarrow \mathcal{G}_2$ gives rise to a map of directed systems $\{\mathcal{G}_1(V)\}_{f(U)\subset V} \rightarrow \{\mathcal{G}_2(V)\}_{f(U)\subset V}$ all of whose maps are homomorphisms and hence gives rise to a homomorphism of abelian groups $f_p\mathcal{G}_1(U) \rightarrow f_p\mathcal{G}_2(U)$.

The functors f_* and f_p are adjoint on the category of presheaves of abelian groups, i.e., we have

$$\operatorname{Mor}_{\mathit{PAb}(X)}(f_p\mathcal{G}, \mathcal{F}) = \operatorname{Mor}_{\mathit{PAb}(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

To prove this, note that the map $i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*f_p\mathcal{G}$ from the proof of Lemma 6.21.3 is a map of abelian presheaves. Hence if $\psi : f_p\mathcal{G} \rightarrow \mathcal{F}$ is a map of abelian presheaves, then the corresponding map $\mathcal{G} \rightarrow f_*\mathcal{F}$ is the map $f_*\psi \circ i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*f_p\mathcal{G} \rightarrow f_*\mathcal{F}$ is also a map of abelian presheaves. For the other direction we point out that the map $c_{\mathcal{F}} : f_p f_*\mathcal{F} \rightarrow \mathcal{F}$ from the proof of Lemma 6.21.3 is a map of abelian presheaves as well (since it is made out of restriction mappings of \mathcal{F} which are all homomorphisms). Hence given a map of abelian presheaves $\varphi : \mathcal{G} \rightarrow f_*\mathcal{F}$ the map $c_{\mathcal{F}} \circ f_p\varphi : f_p\mathcal{G} \rightarrow \mathcal{F}$ is a map of abelian presheaves as well. Since these constructions $\psi \mapsto f_*\psi$ and $\varphi \mapsto c_{\mathcal{F}} \circ f_p\varphi$ are inverse to each other as constructions on maps of presheaves of sets we see they are also inverse to each other on maps of abelian presheaves.

If \mathcal{F} is an abelian sheaf on Y , then $f_*\mathcal{F}$ is an abelian sheaf on X . This is true because of the definition of an abelian sheaf and because this is true for sheaves of sets, see Lemma 6.21.1. This defines the functor f_* on the category of abelian sheaves.

We define $f^{-1}\mathcal{G} = (f_p\mathcal{G})^\#$ as before. Adjointness of f_* and f^{-1} follows formally as in the case of presheaves of sets. Here is the argument:

$$\begin{aligned} \operatorname{Mor}_{\mathit{Ab}(X)}(f^{-1}\mathcal{G}, \mathcal{F}) &= \operatorname{Mor}_{\mathit{PAb}(X)}(f_p\mathcal{G}, \mathcal{F}) \\ &= \operatorname{Mor}_{\mathit{PAb}(Y)}(\mathcal{G}, f_*\mathcal{F}) \\ &= \operatorname{Mor}_{\mathit{Ab}(Y)}(\mathcal{G}, f_*\mathcal{F}) \end{aligned}$$

Lemma 6.22.1. *Let $f : X \rightarrow Y$ be a continuous map.*

- (1) *Let \mathcal{G} be an abelian presheaf on Y . Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \rightarrow (f_p\mathcal{G})_x$ of Lemma 6.21.4 is an isomorphism of abelian groups.*
- (2) *Let \mathcal{G} be an abelian sheaf on Y . Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \rightarrow (f^{-1}\mathcal{G})_x$ of Lemma 6.21.5 is an isomorphism of abelian groups.*

Proof. Omitted. □

Given a continuous map $f : X \rightarrow Y$ and sheaves of abelian groups \mathcal{F} on X , \mathcal{G} on Y , the notion of an f -map $\mathcal{G} \rightarrow \mathcal{F}$ of sheaves of abelian groups makes sense. We can just define it exactly as in Definition 6.21.7 (replacing maps of sets with homomorphisms of abelian groups) or we can simply say that it is the same as a map of abelian sheaves $\mathcal{G} \rightarrow f_*\mathcal{F}$. We will use this notion freely in the following. The group of f -maps between \mathcal{G} and \mathcal{F} will be in canonical bijection with the groups $\text{Mor}_{\text{Ab}(X)}(f^{-1}\mathcal{G}, \mathcal{F})$ and $\text{Mor}_{\text{Ab}(Y)}(\mathcal{G}, f_*\mathcal{F})$.

Composition of f -maps is defined in exactly the same manner as in the case of f -maps of sheaves of sets. In addition, given an f -map $\mathcal{G} \rightarrow \mathcal{F}$ as above, the induced maps on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

are abelian group homomorphisms.

6.23. Continuous maps and sheaves of algebraic structures

Let (\mathcal{C}, F) be a type of algebraic structure. For a topological space X let us introduce the notation:

- (1) $PSh(X, \mathcal{C})$ will be the category of presheaves with values in \mathcal{C} .
- (2) $Sh(X, \mathcal{C})$ will be the category of sheaves with values in \mathcal{C} .

Let $f : X \rightarrow Y$ be a continuous map of topological spaces. The same arguments as in the previous section show there are functors

$$\begin{aligned} f_* : PSh(X, \mathcal{C}) &\longrightarrow PSh(Y, \mathcal{C}) \\ f_* : Sh(X, \mathcal{C}) &\longrightarrow Sh(Y, \mathcal{C}) \\ f_p : PSh(Y, \mathcal{C}) &\longrightarrow PSh(X, \mathcal{C}) \\ f^{-1} : Sh(Y, \mathcal{C}) &\longrightarrow Sh(X, \mathcal{C}) \end{aligned}$$

constructed in the same manner and with the same properties as the functors constructed for abelian (pre)sheaves. In particular there are commutative diagrams

$$\begin{array}{ccc} PSh(X, \mathcal{C}) & \xrightarrow{f_*} & PSh(Y, \mathcal{C}) \\ \downarrow F & & \downarrow F \\ PSh(X) & \xrightarrow{f_*} & PSh(Y) \end{array} \qquad \begin{array}{ccc} Sh(X, \mathcal{C}) & \xrightarrow{f_*} & Sh(Y, \mathcal{C}) \\ \downarrow F & & \downarrow F \\ Sh(X) & \xrightarrow{f_*} & Sh(Y) \end{array}$$

$$\begin{array}{ccc} PSh(Y, \mathcal{C}) & \xrightarrow{f_p} & PSh(X, \mathcal{C}) \\ \downarrow F & & \downarrow F \\ PSh(Y) & \xrightarrow{f_p} & PSh(X) \end{array} \qquad \begin{array}{ccc} Sh(Y, \mathcal{C}) & \xrightarrow{f^{-1}} & Sh(X, \mathcal{C}) \\ \downarrow F & & \downarrow F \\ Sh(Y) & \xrightarrow{f^{-1}} & Sh(X) \end{array}$$

The main formulas to keep in mind are the following

$$\begin{aligned} f_*\mathcal{F}(V) &= \mathcal{F}(f^{-1}(V)) \\ f_p\mathcal{G}(U) &= \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\ f^{-1}\mathcal{G} &= (f_p\mathcal{G})^\# \\ (f_p\mathcal{G})_x &= \mathcal{G}_{f(x)} \\ (f^{-1}\mathcal{G})_x &= \mathcal{G}_{f(x)} \end{aligned}$$

Each of these formulas has the property that they hold in the category \mathcal{C} and that upon taking underlying sets we get the corresponding formula for presheaves of sets. In addition we have the adjointness properties

$$\begin{aligned} \operatorname{Mor}_{PSh(X, \mathcal{C})}(f_p\mathcal{G}, \mathcal{F}) &= \operatorname{Mor}_{PSh(Y, \mathcal{C})}(\mathcal{G}, f_*\mathcal{F}) \\ \operatorname{Mor}_{Sh(X, \mathcal{C})}(f^{-1}\mathcal{G}, \mathcal{F}) &= \operatorname{Mor}_{Sh(Y, \mathcal{C})}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

To prove these, the main step is to construct the maps

$$i_{\mathcal{G}} : \mathcal{G} \longrightarrow f_*f_p\mathcal{G}$$

and

$$c_{\mathcal{F}} : f_p f_* \mathcal{F} \longrightarrow \mathcal{F}$$

which occur in the proof of Lemma 6.21.3 as morphisms of presheaves with values in \mathcal{C} . This may be safely left to the reader since the constructions are exactly the same as in the case of presheaves of sets.

Given a continuous map $f : X \rightarrow Y$ and sheaves of algebraic structures \mathcal{F} on X , \mathcal{G} on Y , the notion of an f -map $\mathcal{G} \rightarrow \mathcal{F}$ of sheaves of algebraic structures makes sense. We can just define it exactly as in Definition 6.21.7 (replacing maps of sets with morphisms in \mathcal{C}) or we can simply say that it is the same as a map of sheaves of algebraic structures $\mathcal{G} \rightarrow f_*\mathcal{F}$. We will use this notion freely in the following. The set of f -maps between \mathcal{G} and \mathcal{F} will be in canonical bijection with the sets $\operatorname{Mor}_{Sh(X, \mathcal{C})}(f^{-1}\mathcal{G}, \mathcal{F})$ and $\operatorname{Mor}_{Sh(Y, \mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$.

Composition of f -maps is defined in exactly the same manner as in the case of f -maps of sheaves of sets. In addition, given an f -map $\mathcal{G} \rightarrow \mathcal{F}$ as above, the induced maps on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

are homomorphisms of algebraic structures.

Lemma 6.23.1. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Suppose given sheaves of algebraic structures \mathcal{F} on X , \mathcal{G} on Y . Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be an f -map of underlying sheaves of sets. If for every $V \subset Y$ open the map of sets $\varphi_V : \mathcal{G}(V) \rightarrow \mathcal{F}(f^{-1}V)$ is the effect of a morphism in \mathcal{C} on underlying sets, then φ comes from a unique f -morphism between sheaves of algebraic structures.*

Proof. Omitted. □

6.24. Continuous maps and sheaves of modules

The case of sheaves of modules is more complicated. The reason is that the natural setting for defining the pullback and pushforward functors, is the setting of ringed spaces, which we will define below. First we state a few obvious lemmas.

Lemma 6.24.1. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a presheaf of rings on X . Let \mathcal{F} be a presheaf of \mathcal{O} -modules. There is a natural map of underlying presheaves of sets*

$$f_*\mathcal{O} \times f_*\mathcal{F} \longrightarrow f_*\mathcal{F}$$

which turns $f_\mathcal{F}$ into a presheaf of $f_*\mathcal{O}$ -modules. This construction is functorial in \mathcal{F} .*

Proof. Let $V \subset Y$ is open. We define the map of the lemma to be the map

$$f_*\mathcal{O}(V) \times f_*\mathcal{F}(V) = \mathcal{O}(f^{-1}V) \times \mathcal{F}(f^{-1}V) \rightarrow \mathcal{F}(f^{-1}V) = f_*\mathcal{F}(V).$$

Here the arrow in the middle is the multiplication map on X . We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_*\mathcal{O}$ -module on $f_*\mathcal{F}$. \square

Lemma 6.24.2. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a presheaf of rings on Y . Let \mathcal{G} be a presheaf of \mathcal{O} -modules. There is a natural map of underlying presheaves of sets*

$$f_p\mathcal{O} \times f_p\mathcal{G} \longrightarrow f_p\mathcal{G}$$

which turns $f_p\mathcal{G}$ into a presheaf of $f_p\mathcal{O}$ -modules. This construction is functorial in \mathcal{G} .

Proof. Let $U \subset X$ is open. We define the map of the lemma to be the map

$$\begin{aligned} f_p\mathcal{O}(U) \times f_p\mathcal{G}(U) &= \operatorname{colim}_{f(U) \subset V} \mathcal{O}(V) \times \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\ &= \operatorname{colim}_{f(U) \subset V} (\mathcal{O}(V) \times \mathcal{G}(V)) \\ &\rightarrow \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\ &= f_p\mathcal{G}(U). \end{aligned}$$

Here the arrow in the middle is the multiplication map on Y . The second equality holds because directed colimits commute with finite limits, see Categories, Lemma 4.19.2. We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_p\mathcal{O}$ -module on $f_p\mathcal{G}$. \square

Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{O}_X be a presheaf of rings on X and let \mathcal{O}_Y be a presheaf of rings on Y . So at the moment we have defined functors

$$\begin{aligned} f_* : P\operatorname{Mod}(\mathcal{O}_X) &\longrightarrow P\operatorname{Mod}(f_*\mathcal{O}_X) \\ f_p : P\operatorname{Mod}(\mathcal{O}_Y) &\longrightarrow P\operatorname{Mod}(f_p\mathcal{O}_Y) \end{aligned}$$

These satisfy some compatibilities as follows.

Lemma 6.24.3. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a presheaf of rings on Y . Let \mathcal{G} be a presheaf of \mathcal{O} -modules. Let \mathcal{F} be a presheaf of $f_p\mathcal{O}$ -modules. Then*

$$\operatorname{Mor}_{P\operatorname{Mod}(f_p\mathcal{O})}(f_p\mathcal{G}, \mathcal{F}) = \operatorname{Mor}_{P\operatorname{Mod}(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.2 and 6.24.1, and we think of $f_\mathcal{F}$ as an \mathcal{O} -module via the map $i_{\mathcal{O}} : \mathcal{O} \rightarrow f_*f_p\mathcal{O}$ (defined first in the proof of Lemma 6.21.3).*

Proof. Note that we have

$$\mathrm{Mor}_{\mathrm{PAb}(X)}(f_p\mathcal{G}, \mathcal{F}) = \mathrm{Mor}_{\mathrm{PAb}(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

according to Section 6.22. So what we have to prove is that under this correspondence, the subsets of module maps correspond. In addition, the correspondence is determined by the rule

$$(\psi : f_p\mathcal{G} \rightarrow \mathcal{F}) \mapsto (f_*\psi \circ i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*\mathcal{F})$$

and in the other direction by the rule

$$(\varphi : \mathcal{G} \rightarrow f_*\mathcal{F}) \mapsto (c_{\mathcal{F}} \circ f_p\varphi : f_p\mathcal{G} \rightarrow \mathcal{F})$$

where $i_{\mathcal{G}}$ and $c_{\mathcal{F}}$ are as in Section 6.22. Hence, using the functoriality of f_* and f_p we see that it suffices to check that the maps $i_{\mathcal{G}} : \mathcal{G} \rightarrow f_*f_p\mathcal{G}$ and $c_{\mathcal{F}} : f_p f_*\mathcal{F} \rightarrow \mathcal{F}$ are compatible with module structures, which we leave to the reader. \square

Lemma 6.24.4. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a presheaf of rings on X . Let \mathcal{F} be a presheaf of \mathcal{O} -modules. Let \mathcal{G} be a presheaf of $f_*\mathcal{O}$ -modules. Then*

$$\mathrm{Mor}_{\mathrm{PMod}(\mathcal{O})}(\mathcal{O} \otimes_{p, f_p f_* \mathcal{O}} f_p\mathcal{G}, \mathcal{F}) = \mathrm{Mor}_{\mathrm{PMod}(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.2 and 6.24.1, and we use the map $c_{\mathcal{O}} : f_p f_*\mathcal{O} \rightarrow \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$\begin{aligned} \mathrm{Mor}_{\mathrm{PMod}(\mathcal{O})}(\mathcal{O} \otimes_{p, f_p f_* \mathcal{O}} f_p\mathcal{G}, \mathcal{F}) &= \mathrm{Mor}_{\mathrm{PMod}(f_p f_* \mathcal{O})}(f_p\mathcal{G}, \mathcal{F}_{f_p f_* \mathcal{O}}) \\ &= \mathrm{Mor}_{\mathrm{PMod}(f_*\mathcal{O})}(\mathcal{G}, f_*(\mathcal{F}_{f_p f_* \mathcal{O}})) \\ &= \mathrm{Mor}_{\mathrm{PMod}(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

The first equality is Lemma 6.6.2. The second equality is Lemma 6.24.3. The third equality is given by the equality $f_*(\mathcal{F}_{f_p f_* \mathcal{O}}) = f_*\mathcal{F}$ of abelian sheaves which is $f_*\mathcal{O}$ -linear. Namely, $\mathrm{id}_{f_*\mathcal{O}}$ corresponds to $c_{\mathcal{O}}$ under the adjunction described in the proof of Lemma 6.21.3 and thus $\mathrm{id}_{f_*\mathcal{O}} = f_*c_{\mathcal{O}} \circ i_{f_*\mathcal{O}}$. \square

Lemma 6.24.5. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a sheaf of rings on X . Let \mathcal{F} be a sheaf of \mathcal{O} -modules. The pushforward $f_*\mathcal{F}$, as defined in Lemma 6.24.1 is a sheaf of $f_*\mathcal{O}$ -modules.*

Proof. Obvious from the definition and Lemma 6.21.1. \square

Lemma 6.24.6. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a sheaf of rings on Y . Let \mathcal{G} be a sheaf of \mathcal{O} -modules. There is a natural map of underlying presheaves of sets*

$$f^{-1}\mathcal{O} \times f^{-1}\mathcal{G} \longrightarrow f^{-1}\mathcal{G}$$

which turns $f^{-1}\mathcal{G}$ into a sheaf of $f^{-1}\mathcal{O}$ -modules.

Proof. Recall that f^{-1} is defined as the composition of the functor f_p and sheafification. Thus the lemma is a combination of Lemma 6.24.2 and Lemma 6.20.1. \square

Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{O}_X be a sheaf of rings on X and let \mathcal{O}_Y be a sheaf of rings on Y . So now we have defined functors

$$\begin{aligned} f_* : \mathrm{Mod}(\mathcal{O}_X) &\longrightarrow \mathrm{Mod}(f_*\mathcal{O}_X) \\ f^{-1} : \mathrm{Mod}(\mathcal{O}_Y) &\longrightarrow \mathrm{Mod}(f^{-1}\mathcal{O}_Y) \end{aligned}$$

These satisfy some compatibilities as follows.

Lemma 6.24.7. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a sheaf of rings on Y . Let \mathcal{G} be a sheaf of \mathcal{O} -modules. Let \mathcal{F} be a sheaf of $f^{-1}\mathcal{O}$ -modules. Then*

$$\mathrm{Mor}_{\mathrm{Mod}(f^{-1}\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}) = \mathrm{Mor}_{\mathrm{Mod}(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.6 and 6.24.5, and we think of $f_*\mathcal{F}$ as an \mathcal{O} -module by restriction via $\mathcal{O} \rightarrow f_*f^{-1}\mathcal{O}$.

Proof. Argue by the equalities

$$\begin{aligned} \mathrm{Mor}_{\mathrm{Mod}(f^{-1}\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}) &= \mathrm{Mor}_{\mathrm{Mod}(f_p\mathcal{O})}(f_p\mathcal{G}, \mathcal{F}) \\ &= \mathrm{Mor}_{\mathrm{Mod}(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

where the second is Lemmas 6.24.3 and the first is by Lemma 6.20.1. \square

Lemma 6.24.8. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let \mathcal{O} be a sheaf of rings on X . Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Let \mathcal{G} be a sheaf of $f_*\mathcal{O}$ -modules. Then*

$$\mathrm{Mor}_{\mathrm{Mod}(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) = \mathrm{Mor}_{\mathrm{Mod}(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.6 and 6.24.5, and we use the canonical map $f^{-1}f_*\mathcal{O} \rightarrow \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$\begin{aligned} \mathrm{Mor}_{\mathrm{Mod}(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) &= \mathrm{Mor}_{\mathrm{Mod}(f^{-1}f_*\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}f_*\mathcal{O}}) \\ &= \mathrm{Mor}_{\mathrm{Mod}(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

which are a combination of Lemma 6.20.2 and 6.24.7. \square

Let $f : X \rightarrow Y$ be a continuous map. Let \mathcal{O}_X be a (pre)sheaf of rings on X and let \mathcal{O}_Y be a (pre)sheaf of rings on Y . So at the moment we have defined functors

$$\begin{aligned} f_* : \mathrm{PMod}(\mathcal{O}_X) &\longrightarrow \mathrm{PMod}(f_*\mathcal{O}_X) \\ f_* : \mathrm{Mod}(\mathcal{O}_X) &\longrightarrow \mathrm{Mod}(f_*\mathcal{O}_X) \\ f_p : \mathrm{PMod}(\mathcal{O}_Y) &\longrightarrow \mathrm{PMod}(f_p\mathcal{O}_Y) \\ f^{-1} : \mathrm{Mod}(\mathcal{O}_Y) &\longrightarrow \mathrm{Mod}(f^{-1}\mathcal{O}_Y) \end{aligned}$$

Clearly, usually the pair of functors (f_*, f^{-1}) on sheaves of modules are not adjoint, because their target categories do not match. Namely, as we saw above, it works only if by some miracle the sheaves of rings $\mathcal{O}_X, \mathcal{O}_Y$ satisfy the relations $\mathcal{O}_X = f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_Y = f_*\mathcal{O}_X$. This is almost never true in practice. We interrupt the discussion to define the correct notion of morphism for which a suitable adjoint pair of functors on sheaves of modules exists.

6.25. Ringed spaces

Let X be a topological space and let \mathcal{O}_X be a sheaf of rings on X . We are supposed to think of the sheaf of rings \mathcal{O}_X as a sheaf of functions on X . And if $f : X \rightarrow Y$ is a “suitable” map, then by composition a function on Y turns into a function on X . Thus there should be a natural f -map from \mathcal{O}_Y to \mathcal{O}_X . See Definition 6.21.7, and the remarks in previous sections for terminology. For a precise example, see Example 6.25.2 below. Here is the relevant abstract definition.

Definition 6.25.1. A *ringed space* is a pair (X, \mathcal{O}_X) consisting of a topological space X and a sheaf of rings \mathcal{O}_X on X . A *morphism of ringed spaces* $(X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ is a pair consisting of a continuous map $f : X \rightarrow Y$ and an f -map of sheaves of rings $f^\# : \mathcal{O}_Y \rightarrow \mathcal{O}_X$.

Example 6.25.2. Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Consider the sheaves of continuous real valued functions \mathcal{C}_X^0 on X and \mathcal{C}_Y^0 on Y , see Example 6.9.3. We claim that there is a natural f -map $f^\# : \mathcal{C}_Y^0 \rightarrow \mathcal{C}_X^0$ associated to f . Namely, we simply define it by the rule

$$\begin{aligned} \mathcal{C}_Y^0(V) &\longrightarrow \mathcal{C}_X^0(f^{-1}V) \\ h &\longmapsto h \circ f \end{aligned}$$

Strictly speaking we should write $f^\#(h) = h \circ f|_{f^{-1}(V)}$. It is clear that this is a family of maps as in Definition 6.21.7 and compatible with the \mathbf{R} -algebra structures. Hence it is an f -map of sheaves of \mathbf{R} -algebras, see Lemma 6.23.1.

Of course there are lots of other situations where there is a canonical morphism of ringed spaces associated to a geometrical type of morphism. For example, if M, N are \mathcal{C}^∞ -manifolds and $f : M \rightarrow N$ is a infinitely differentiable map, then f induces a canonical morphism of ringed spaces $(M, \mathcal{C}_M^\infty) \rightarrow (N, \mathcal{C}_N^\infty)$. The construction (which is identical to the above) is left to the reader.

It may not be completely obvious how to compose morphisms of ringed spaces hence we spell it out here.

Definition 6.25.3. Let $(f, f^\#) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ and $(g, g^\#) : (Y, \mathcal{O}_Y) \rightarrow (Z, \mathcal{O}_Z)$ be morphisms of ringed spaces. Then we define the *composition of morphisms of ringed spaces* by the rule

$$(g, g^\#) \circ (f, f^\#) = (g \circ f, f^\# \circ g^\#).$$

Here we use composition of f -maps defined in Definition 6.21.9.

6.26. Morphisms of ringed spaces and modules

We have now introduced enough notation so that we are able to define the pullback and pushforward of modules along a morphism of ringed spaces.

Definition 6.26.1. Let $(f, f^\#) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces.

- (1) Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We define the *pushforward* of \mathcal{F} as the sheaf of \mathcal{O}_Y -modules which as a sheaf of abelian groups equals $f_*\mathcal{F}$ and with module structure given by the restriction via $f^\# : \mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$ of the module structure given in Lemma 6.24.5.
- (2) Let \mathcal{G} be a sheaf of \mathcal{O}_Y -modules. We define the *pullback* $f^*\mathcal{G}$ to be the sheaf of \mathcal{O}_X -modules defined by the formula

$$f^*\mathcal{G} = \mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{G}$$

where the ring map $f^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X$ is the map corresponding to $f^\#$, and where the module structure is given by Lemma 6.24.6.

Thus we have defined functors

$$\begin{aligned} f_* : \text{Mod}(\mathcal{O}_X) &\longrightarrow \text{Mod}(\mathcal{O}_Y) \\ f^* : \text{Mod}(\mathcal{O}_Y) &\longrightarrow \text{Mod}(\mathcal{O}_X) \end{aligned}$$

The final result on these functors is that they are indeed adjoint as expected.

Lemma 6.26.2. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let \mathcal{G} be a sheaf of \mathcal{O}_Y -modules. There is a canonical bijection*

$$\text{Hom}_{\mathcal{O}_X}(f^*\mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{O}_Y}(\mathcal{G}, f_*\mathcal{F}).$$

In other words: the functor f^ is the left adjoint to f_* .*

Proof. This follows from the work we did before:

$$\begin{aligned} \text{Hom}_{\mathcal{O}_X}(f^*\mathcal{G}, \mathcal{F}) &= \text{Mor}_{\text{Mod}(\mathcal{O}_X)}(\mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{G}, \mathcal{F}) \\ &= \text{Mor}_{\text{Mod}(f^{-1}\mathcal{O}_Y)}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}\mathcal{O}_Y}) \\ &= \text{Hom}_{\mathcal{O}_Y}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

Here we use Lemmas 6.20.2 and 6.24.7. \square

Lemma 6.26.3. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of ringed spaces. The functors $(g \circ f)_*$ and $g_* \circ f_*$ are equal. There is a canonical isomorphism of functors $(g \circ f)^* \cong f^* \circ g^*$.*

Proof. The result on pushforwards is a consequence of Lemma 6.21.2 and our definitions. The result on pullbacks follows from this by the same argument as in the proof of Lemma 6.21.6. \square

Given a morphism of ringed spaces $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$, and a sheaf of \mathcal{O}_X -modules \mathcal{F} , a sheaf of \mathcal{O}_Y -modules \mathcal{G} on Y , the notion of an f -map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ of sheaves of modules makes sense. We can just define it as an f -map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ of abelian sheaves such that for all open $V \subset Y$ the map

$$\mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$

is an $\mathcal{O}_Y(V)$ -module map. Here we think of $\mathcal{F}(f^{-1}V)$ as an $\mathcal{O}_Y(V)$ -module via the map $f_V^\sharp : \mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(f^{-1}V)$. The set of f -maps between \mathcal{G} and \mathcal{F} will be in canonical bijection with the sets $\text{Mor}_{\text{Mod}(\mathcal{O}_X)}(f^*\mathcal{G}, \mathcal{F})$ and $\text{Mor}_{\text{Mod}(\mathcal{O}_Y)}(\mathcal{G}, f_*\mathcal{F})$. See above.

Composition of f -maps is defined in exactly the same manner as in the case of f -maps of sheaves of sets. In addition, given an f -map $\mathcal{G} \rightarrow \mathcal{F}$ as above, and $x \in X$ the induced map on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

is an $\mathcal{O}_{Y,f(x)}$ -module map where the $\mathcal{O}_{Y,f(x)}$ -module structure on \mathcal{F}_x comes from the $\mathcal{O}_{X,x}$ -module structure via the map $f_x^\sharp : \mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$. Here is a related lemma.

Lemma 6.26.4. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{G} be a sheaf of \mathcal{O}_Y -modules. Let $x \in X$. Then*

$$(f^*\mathcal{G})_x = \mathcal{G}_{f(x)} \otimes_{\mathcal{O}_{Y,f(x)}} \mathcal{O}_{X,x}$$

as $\mathcal{O}_{X,x}$ -modules where the tensor product on the right uses $f_x^\sharp : \mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$.

Proof. This follows from Lemma 6.20.3 and the identification of the stalks of pullback sheaves at x with the corresponding stalks at $f(x)$. See the formulae in Section 6.23 for example. \square

6.27. Skyscraper sheaves and stalks

Definition 6.27.1. Let X be a topological space.

- (1) Let $x \in X$ be a point. Denote $i_x : \{x\} \rightarrow X$ the inclusion map. Let A be a set and think of A as a sheaf on the one point space $\{x\}$. We call $i_{x,*}A$ the *skyscraper sheaf at x with value A* .
- (2) If in (1) above A is an abelian group then we think of $i_{x,*}A$ as a sheaf of abelian groups on X .
- (3) If in (1) above A is an algebraic structure then we think of $i_{x,*}A$ as a sheaf of algebraic structures.
- (4) If (X, \mathcal{O}_X) is a ringed space, then we think of $i_x : \{x\} \rightarrow X$ as a morphism of ringed spaces $(\{x\}, \mathcal{O}_{\{x\}}) \rightarrow (X, \mathcal{O}_X)$ and if A is a $\mathcal{O}_{\{x\}}$ -module, then we think of $i_{x,*}A$ as a sheaf of \mathcal{O}_X -modules.
- (5) We say a sheaf of sets \mathcal{F} is a *skyscraper sheaf* if there exists a point x of X and a set A such that $\mathcal{F} \cong i_{x,*}A$.
- (6) We say a sheaf of abelian groups \mathcal{F} is a *skyscraper sheaf* if there exists a point x of X and an abelian group A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of abelian groups.
- (7) We say a sheaf of algebraic structures \mathcal{F} is a *skyscraper sheaf* if there exists a point x of X and an algebraic structure A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of algebraic structures.
- (8) If (X, \mathcal{O}_X) is a ringed space and \mathcal{F} is a sheaf of \mathcal{O}_X -modules, then we say \mathcal{F} is a *skyscraper sheaf* if there exists a point $x \in X$ and a $\mathcal{O}_{\{x\}}$ -module A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of \mathcal{O}_X -modules.

Lemma 6.27.2. Let X be a topological space, $x \in X$ a point, and A a set. For any point $x' \in X$ the stalk of the skyscraper sheaf at x with value A at x' is

$$(i_{x,*}A)_{x'} = \begin{cases} A & \text{if } x' \in \overline{\{x\}} \\ \{*\} & \text{if } x' \notin \overline{\{x\}} \end{cases}$$

A similar description holds for the case of abelian groups, algebraic structures and sheaves of modules.

Proof. Omitted. \square

Lemma 6.27.3. Let X be a topological space, and let $x \in X$ a point. The functors $\mathcal{F} \mapsto \mathcal{F}_x$ and $A \mapsto i_{x,*}A$ are adjoint. In a formula

$$\text{Mor}_{\text{Sets}}(\mathcal{F}_x, A) = \text{Mor}_{\text{Sh}(X)}(\mathcal{F}, i_{x,*}A).$$

A similar statement holds for the case of abelian groups, algebraic structures. In the case of sheaves of modules we have

$$\text{Hom}_{\mathcal{O}_{X,x}}(\mathcal{F}_x, A) = \text{Hom}_{\mathcal{O}_X}(\mathcal{F}, i_{x,*}A).$$

Proof. Omitted. Hint: The stalk functor can be seen as the pullback functor for the morphism $i_x : \{x\} \rightarrow X$. Then the adjointness follows from adjointness of i_x^{-1} and $i_{x,*}$ (resp. i_x^* and $i_{x,*}$ in the case of sheaves of modules). \square

6.28. Limits and colimits of presheaves

Let X be a topological space. Let $\mathcal{I} \rightarrow PSh(X)$, $i \mapsto \mathcal{F}_i$ be a diagram.

- (1) Both $\lim_i \mathcal{F}_i$ and $\operatorname{colim}_i \mathcal{F}_i$ exist.
- (2) For any open $U \subset X$ we have

$$(\lim_i \mathcal{F}_i)(U) = \lim_i \mathcal{F}_i(U)$$

and

$$(\operatorname{colim}_i \mathcal{F}_i)(U) = \operatorname{colim}_i \mathcal{F}_i(U).$$

- (3) Let $x \in X$ be a point. In general the stalk of $\lim_i \mathcal{F}_i$ at x is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact (see Categories, Definition 4.23.1).
- (4) Let $x \in X$. We always have

$$(\operatorname{colim}_i \mathcal{F}_i)_x = \operatorname{colim}_i \mathcal{F}_{i,x}.$$

The proofs are all easy.

6.29. Limits and colimits of sheaves

Let X be a topological space. Let $\mathcal{I} \rightarrow Sh(X)$, $i \mapsto \mathcal{F}_i$ be a diagram.

- (1) Both $\lim_i \mathcal{F}_i$ and $\operatorname{colim}_i \mathcal{F}_i$ exist.
- (2) The inclusion functor $i : Sh(X) \rightarrow PSh(X)$ commutes with limits. In other words, we may compute the limit in the category of sheaves as the limit in the category of presheaves. In particular, for any open $U \subset X$ we have

$$(\lim_i \mathcal{F}_i)(U) = \lim_i \mathcal{F}_i(U).$$

- (3) The inclusion functor $i : Sh(X) \rightarrow PSh(X)$ does not commute with colimits in general (not even with finite colimits – think surjections). The colimit is computed as the sheafification of the colimit in the category of presheaves:

$$\operatorname{colim}_i \mathcal{F}_i = \left(U \mapsto \operatorname{colim}_i \mathcal{F}_i(U) \right)^\#.$$

- (4) Let $x \in X$ be a point. In general the stalk of $\lim_i \mathcal{F}_i$ at x is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact.
- (5) Let $x \in X$. We always have

$$(\operatorname{colim}_i \mathcal{F}_i)_x = \operatorname{colim}_i \mathcal{F}_{i,x}.$$

- (6) The sheafification functor $\# : PSh(X) \rightarrow Sh(X)$ commutes with all colimits, and with finite limits. But it does not commute with all limits.

The proofs are all easy. Here is an example of what is true for directed colimits of sheaves.

Lemma 6.29.1. *Let X be a topological space. Let I be a directed partially ordered set. Let $(\mathcal{F}_i, \varphi_{ii'})$ be a system of sheaves of sets over I , see Categories, Section 4.21. Let $U \subset X$ be an open subset. Consider the canonical map*

$$\Psi : \operatorname{colim}_i \mathcal{F}_i(U) \longrightarrow (\operatorname{colim}_i \mathcal{F}_i)(U)$$

- (1) *If all the transition maps are injective then Ψ is injective for any open U .*

- (2) If U is quasi-compact, then Ψ is injective.
 (3) If U is quasi-compact and all the transition maps are injective then Ψ is an isomorphism.
 (4) If U has a cofinal system of open coverings $\mathcal{U} : U = \bigcup_{j \in J} U_j$ with J finite and $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$, then Ψ is bijective.

Proof. Assume all the transition maps are injective. In this case the presheaf $\mathcal{F}' : V \mapsto \text{colim}_i \mathcal{F}_i(V)$ is separated (see Definition 6.11.2). By the discussion above we have $(\mathcal{F}')^\# = \text{colim}_i \mathcal{F}_i$. By Lemma 6.17.5 we see that $\mathcal{F}' \rightarrow (\mathcal{F}')^\#$ is injective. This proves (1).

Assume U is quasi-compact. Suppose that $s \in \mathcal{F}_i(U)$ and $s' \in \mathcal{F}_{i'}(U)$ give rise to elements on the left hand side which have the same image under Ψ . Since U is quasi-compact this means there exists a finite open covering $U = \bigcup_{j=1, \dots, m} U_j$ and for each j an index $i_j \in I$, $i_j \geq i$, $i_j \geq i'$ such that $\varphi_{ii_j}(s) = \varphi_{i'i_j}(s')$. Let $i'' \in I$ be \geq than all of the i_j . We conclude that $\varphi_{ii''}(s)$ and $\varphi_{i'i''}(s')$ agree on the opens U_j for all j and hence that $\varphi_{ii''}(s) = \varphi_{i'i''}(s')$. This proves (2).

Assume U is quasi-compact and all transition maps injective. Let s be an element of the target of Ψ . Since U is quasi-compact there exists a finite open covering $U = \bigcup_{j=1, \dots, m} U_j$, for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ comes from s_j for all j . Pick $i \in I$ which is \geq than all of the i_j . By (1) the sections $\varphi_{i_j i}(s_j)$ agree over the overlaps $U_j \cap U_{j'}$. Hence they glue to a section $s' \in \mathcal{F}_i(U)$ which maps to s under Ψ . This proves (3).

Assume the hypothesis of (4). Let s be an element of the target of Ψ . By assumption there exists a finite open covering $U = \bigcup_{j=1, \dots, m} U_j$, with $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$ and for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ is the image of s_j for all j . Since $U_j \cap U_{j'}$ is quasi-compact we can apply (2) and we see that there exists an $i_{jj'} \in I$, $i_{jj'} \geq i_j$, $i_{jj'} \geq i_{j'}$ such that $\varphi_{i_j i_{jj'}}(s_j)$ and $\varphi_{i_{j'} i_{jj'}}(s_{j'})$ agree over $U_j \cap U_{j'}$. Choose an index $i \in I$ which is bigger or equal than all the $i_{jj'}$. Then we see that the sections $\varphi_{i_j i}(s_j)$ of \mathcal{F}_i glue to a section of \mathcal{F}_i over U . This section is mapped to the element s as desired. \square

Example 6.29.2. Let $X = \{s_1, s_2, \xi_1, \xi_2, \xi_3, \dots\}$ as a set. Declare a subset $U \subset X$ to be open if $s_1 \in U$ or $s_2 \in U$ implies U contains all of the ξ_i . Let $U_n = \{\xi_n, \xi_{n+1}, \dots\}$, and let $j_n : U_n \rightarrow X$ be the inclusion map. Set $\mathcal{F}_n = j_{n,*} \mathbf{Z}$. There are transition maps $\mathcal{F}_n \rightarrow \mathcal{F}_{n+1}$. Let $\mathcal{F} = \text{colim } \mathcal{F}_n$. Note that $\mathcal{F}_{n, \xi_m} = 0$ if $m < n$ because $\{\xi_m\}$ is an open subset of X which misses U_n . Hence we see that $\mathcal{F}_{\xi_n} = 0$ for all n . On the other hand the stalk \mathcal{F}_{s_i} , $i = 1, 2$ is the colimit

$$M = \text{colim}_n \prod_{m \geq n} \mathbf{Z}$$

which is not zero. We conclude that the sheaf \mathcal{F} is the direct sum of the skyscraper sheaves with value M at the closed points s_1 and s_2 . Hence $\Gamma(X, \mathcal{F}) = M \oplus M$. On the other hand, the reader can verify that $\text{colim}_n \Gamma(X, \mathcal{F}_n) = M$. Hence some condition is necessary in part (4) of Lemma 6.29.1 above.

There is a version of the previous lemma dealing with sheaves on a diagram of spectral spaces. To state it we introduce some notation. Let \mathcal{I} be a cofiltered index category. Let $i \mapsto X_i$ be a diagram of spectral spaces over \mathcal{I} such that for $a : j \rightarrow i$ in \mathcal{I} the corresponding map $f_a : X_j \rightarrow X_i$ is spectral. Set $X = \lim X_i$ and denote $p_i : X \rightarrow X_i$ the projection.

Lemma 6.29.3. *In the situation described above, let $i \in \text{Ob}(\mathcal{I})$ and let \mathcal{G} be a sheaf on X_i . For $U_i \subset X_i$ quasi-compact open we have*

$$p_i^{-1}\mathcal{G}(p_i^{-1}(U_i)) = \text{colim}_{a:j \rightarrow i} f_a^{-1}\mathcal{G}(f_a^{-1}(U_i))$$

Proof. Let us prove the canonical map $\text{colim}_{a:j \rightarrow i} f_a^{-1}\mathcal{G}(f_a^{-1}(U_i)) \rightarrow p_i^{-1}\mathcal{G}(p_i^{-1}(U_i))$ is injective. Let s, s' be sections of $f_a^{-1}\mathcal{G}$ over $f_a^{-1}(U_i)$ for some $a : j \rightarrow i$. For $b : k \rightarrow j$ let $Z_k \subset f_{a \circ b}^{-1}(U_i)$ be the closed subset of points x such that the image of s and s' in the stalk $(f_{a \circ b}^{-1}\mathcal{G})_x$ are different. If Z_k is nonempty for all $b : k \rightarrow j$, then by Topology, Lemma 5.23.2 we see that $\lim_{b:k \rightarrow j} Z_k$ is nonempty too. Then for $x \in \lim_{b:k \rightarrow j} Z_k \subset X$ (observe that $\mathcal{I}/j \rightarrow \mathcal{I}$ is initial) we see that the image of s and s' in the stalk of $p_i^{-1}\mathcal{G}$ at x are different too since $(p_i^{-1}\mathcal{G})_x = (f_{b \circ a}^{-1}\mathcal{G})_{p_k(x)}$ for all $b : k \rightarrow j$ as above. Thus if the images of s and s' in $p_i^{-1}\mathcal{G}(p_i^{-1}(U_i))$ are the same, then Z_k is empty for some $b : k \rightarrow j$. This proves injectivity.

Surjectivity. Let s be a section of $p_i^{-1}\mathcal{G}$ over $p_i^{-1}(U_i)$. By Topology, Lemma 5.23.5 the set $p_i^{-1}(U_i)$ is a quasi-compact open of the spectral space X . By construction of the pullback sheaf, we can find an open covering $p_i^{-1}(U_i) = \bigcup_{l \in L} W_l$, opens $V_{l,i} \subset X_i$, sections $s_{l,i} \in \mathcal{G}(V_{l,i})$ such that $p_i(W_l) \subset V_{l,i}$ and $p_i^{-1}s_{l,i}|_{W_l} = s|_{W_l}$. Because X and X_i are spectral and $p_i^{-1}(U_i)$ is quasi-compact open, we may assume L is finite and W_l and $V_{l,i}$ quasi-compact open for all l . Then we can apply Topology, Lemma 5.23.6 to find $a : j \rightarrow i$ and open covering $f_a^{-1}(U_i) = \bigcup_{l \in L} W_{l,j}$ by quasi-compact opens whose pullback to X is the covering $p_i^{-1}(U_i) = \bigcup_{l \in L} W_l$ and such that moreover $W_{l,j} \subset f_a^{-1}(V_{l,i})$. Write $s_{l,j}$ the restriction of the pullback of $s_{l,i}$ by f_a to $W_{l,j}$. Then we see that $s_{l,j}$ and $s_{l',j}$ restrict to elements of $(f_a^{-1}\mathcal{G})(W_{l,j} \cap W_{l',j})$ which pullback to the same element $(p_i^{-1}\mathcal{G})(W_l \cap W_{l'})$, namely, the restriction of s . Hence by injectivity, we can find $b : k \rightarrow j$ such that the sections $f_b^{-1}s_{l,j}$ glue to a section over $f_{a \circ b}^{-1}(U_i)$ as desired. \square

Next, in addition to the cofiltered system X_i of spectral spaces, assume given

- (1) a sheaf \mathcal{F}_i on X_i for all $i \in \text{Ob}(\mathcal{I})$,
- (2) for $a : j \rightarrow i$ an f_a -map $\varphi_a : \mathcal{F}_i \rightarrow \mathcal{F}_j$

such that $\varphi_c = \varphi_b \circ \varphi_a$ whenever $c = a \circ b$. Set $\mathcal{F} = \text{colim } p_i^{-1}\mathcal{F}_i$ on X .

Lemma 6.29.4. *In the situation described above, let $i \in \text{Ob}(\mathcal{I})$ and let $U_i \subset X_i$ be a quasi-compact open. Then*

$$\text{colim}_{a:j \rightarrow i} \mathcal{F}_j(f_a^{-1}(U_i)) = \mathcal{F}(p_i^{-1}(U_i))$$

Proof. Recall that $p_i^{-1}(U_i)$ is a quasi-compact open of the spectral space X , see Topology, Lemma 5.23.5. Hence Lemma 6.29.1 applies and we have

$$\mathcal{F}(p_i^{-1}(U_i)) = \text{colim}_{a:j \rightarrow i} p_j^{-1}\mathcal{F}_j(p_i^{-1}(U_i)).$$

A formal argument shows that

$$\text{colim}_{a:j \rightarrow i} \mathcal{F}_j(f_a^{-1}(U_i)) = \text{colim}_{a:j \rightarrow i} \text{colim}_{b:k \rightarrow j} f_b^{-1}\mathcal{F}_j(f_{a \circ b}^{-1}(U_i))$$

Thus it suffices to show that

$$p_j^{-1}\mathcal{F}_j(p_i^{-1}(U_i)) = \text{colim}_{b:k \rightarrow j} f_b^{-1}\mathcal{F}_j(f_{a \circ b}^{-1}(U_i))$$

This is Lemma 6.29.3 applied to \mathcal{F}_j and the quasi-compact open $f_a^{-1}(U_i)$. \square

6.30. Bases and sheaves

Sometimes there exists a basis for the topology consisting of opens that are easier to work with than general opens. For convenience we give here some definitions and simple lemmas in order to facilitate working with (pre)sheaves in such a situation.

Definition 6.30.1. Let X be a topological space. Let \mathcal{B} be a basis for the topology on X .

- (1) A *presheaf* \mathcal{F} of sets on \mathcal{B} is a rule which assigns to each $U \in \mathcal{B}$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ of elements of \mathcal{B} a map $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ such that whenever $W \subset V \subset U$ in \mathcal{B} we have $\rho_W^U = \rho_W^V \circ \rho_V^U$.
- (2) A *morphism* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on \mathcal{B} is a rule which assigns to each element $U \in \mathcal{B}$ a map of sets $\varphi : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps.

As in the case of usual presheaves we use the terminology of sections, restrictions of sections, etc. In particular, we may define the *stalk* of \mathcal{F} at a point $x \in X$ by the colimit

$$\mathcal{F}_x = \operatorname{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

As in the case of the stalk of a presheaf on X this limit is directed. The reason is that the collection of $U \in \mathcal{B}, x \in U$ is a fundamental system of open neighbourhoods of x .

It is easy to make examples to show that the notion of a presheaf on X is very different from the notion of a presheaf on a basis for the topology on X . This does not happen in the case of sheaves. A much more useful notion therefore, is the following.

Definition 6.30.2. Let X be a topological space. Let \mathcal{B} be a basis for the topology on X .

- (1) A *sheaf* \mathcal{F} of sets on \mathcal{B} is a presheaf of sets on \mathcal{B} which satisfies the following additional property: Given any $U \in \mathcal{B}$, and any covering $U = \bigcup_{i \in I} U_i$ with $U_i \in \mathcal{B}$, and any coverings $U_i \cap U_j = \bigcup_{k \in I_{ij}} U_{ijk}$ with $U_{ijk} \in \mathcal{B}$ the sheaf condition holds:
 - (**) For any collection of sections $s_i \in \mathcal{F}(U_i), i \in I$ such that $\forall i, j \in I, \forall k \in I_{ij}$

$$s_i|_{U_{ijk}} = s_j|_{U_{ijk}}$$

there exists a unique section $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$ for all $i \in I$.

- (2) A *morphism of sheaves of sets on \mathcal{B}* is simply a morphism of presheaves of sets.

First we explain that it suffices to check the sheaf condition (**) on a cofinal system of coverings. In the situation of the definition, suppose $U \in \mathcal{B}$. Let us temporarily denote $\operatorname{Cov}_{\mathcal{B}}(U)$ the set of all coverings of U by elements of \mathcal{B} . Note that $\operatorname{Cov}_{\mathcal{B}}(U)$ is partially ordered by refinement. A subset $C \subset \operatorname{Cov}_{\mathcal{B}}(U)$ is a cofinal system, if for every $\mathcal{U} \in \operatorname{Cov}_{\mathcal{B}}(U)$ there exists a covering $\mathcal{V} \in C$ which refines \mathcal{U} .

Lemma 6.30.3. *With notation as above. For each $U \in \mathcal{B}$, let $C(U) \subset \operatorname{Cov}_{\mathcal{B}}(U)$ be a cofinal system. For each $U \in \mathcal{B}$, and each $\mathcal{U} : U = \bigcup U_i$ in $C(U)$, let coverings $\mathcal{U}_{ij} : U_i \cap U_j = \bigcup U_{ijk}, U_{ijk} \in \mathcal{B}$ be given. Let \mathcal{F} be a presheaf of sets on \mathcal{B} . The following are equivalent*

- (1) The presheaf \mathcal{F} is a sheaf on \mathcal{B} .
- (2) For every $U \in \mathcal{B}$ and every covering $\mathcal{U} : U = \bigcup U_i$ in $C(U)$ the sheaf condition $(**)$ holds (for the given coverings $\mathcal{U}_{i,j}$).

Proof. We have to show that (2) implies (1). Suppose that $U \in \mathcal{B}$, and that $\mathcal{U} : U = \bigcup_{i \in I} U_i$ is an arbitrary covering by elements of \mathcal{B} . Because the system $C(U)$ is cofinal we can find an element $\mathcal{V} : U = \bigcup_{j \in J} V_j$ in $C(U)$ which refines \mathcal{U} . This means there exists a map $\alpha : J \rightarrow I$ such that $V_j \subset U_{\alpha(j)}$.

Note that if $s, s' \in \mathcal{F}(U)$ are sections such that $s|_{U_i} = s'|_{U_i}$, then

$$s|_{V_j} = (s|_{U_{\alpha(j)}})|_{V_j} = (s'|_{U_{\alpha(j)}})|_{V_j} = s'|_{V_j}$$

for all j . Hence by the uniqueness in $(**)$ for the covering \mathcal{V} we conclude that $s = s'$. Thus we have proved the uniqueness part of $(**)$ for our arbitrary covering \mathcal{U} .

Suppose furthermore that $U_i \cap U_{i'} = \bigcup_{k \in I_{i,i'}} U_{ii'k}$ are arbitrary coverings by $U_{ii'k} \in \mathcal{B}$. Let us try to prove the existence part of $(**)$ for the system $(\mathcal{U}, \mathcal{U}_{i,j})$. Thus let $s_i \in \mathcal{F}(U_i)$ and suppose we have

$$s_i|_{U_{ij k}} = s_{i'}|_{U_{ii'k}}$$

for all i, i', k . Set $t_j = s_{\alpha(j)}|_{V_j}$, where \mathcal{V} and α are as above.

There is one small kink in the argument here. Namely, let $\mathcal{V}_{jj'} : V_j \cap V_{j'} = \bigcup_{l \in J_{jj'}} V_{jj'l}$ be the covering given to us by the statement of the lemma. It is not a priori clear that

$$t_j|_{V_{jj'l}} = t_{j'}|_{V_{jj'l}}$$

for all j, j', l . To see this, note that we do have

$$t_j|_W = t_{j'}|_W \text{ for all } W \in \mathcal{B}, W \subset V_{jj'l} \cap U_{\alpha(j)\alpha(j')k}$$

for all $k \in I_{\alpha(j)\alpha(j')}$, by our assumption on the family of elements s_i . And since $V_j \cap V_{j'} \subset U_{\alpha(j)} \cap U_{\alpha(j')}$ we see that $t_j|_{V_{jj'l}}$ and $t_{j'}|_{V_{jj'l}}$ agree on the members of a covering of $V_{jj'l}$ by elements of \mathcal{B} . Hence by the uniqueness part proved above we finally deduce the desired equality of $t_j|_{V_{jj'l}}$ and $t_{j'}|_{V_{jj'l}}$. Then we get the existence of an element $t \in \mathcal{F}(U)$ by property $(**)$ for $(\mathcal{V}, \mathcal{V}_{jj'})$.

Again there is a small snag. We know that t restricts to t_j on V_j but we do not yet know that t restricts to s_i on U_i . To conclude this note that the sets $U_i \cap V_j$, $j \in J$ cover U_i . Hence also the sets $U_{i\alpha(j)k} \cap V_j$, $j \in J$, $k \in I_{i\alpha(j)}$ cover U_i . We leave it to the reader to see that t and s_i restrict to the same section of \mathcal{F} on any $W \in \mathcal{B}$ which is contained in one of the open sets $U_{i\alpha(j)k} \cap V_j$, $j \in J$, $k \in I_{i\alpha(j)}$. Hence by the uniqueness part seen above we win. \square

Lemma 6.30.4. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Assume that for every pair $U, U' \in \mathcal{B}$ we have $U \cap U' \in \mathcal{B}$. For each $U \in \mathcal{B}$, let $C(U) \subset \text{Cov}_{\mathcal{B}}(U)$ be a cofinal system. Let \mathcal{F} be a presheaf of sets on \mathcal{B} . The following are equivalent*

- (1) The presheaf \mathcal{F} is a sheaf on \mathcal{B} .
- (2) For every $U \in \mathcal{B}$ and every covering $\mathcal{U} : U = \bigcup U_i$ in $C(U)$ and for every family of sections $s_i \in \mathcal{F}(U_i)$ such that $s_i|_{U_i \cap U_j} = s_j|_{U_i \cap U_j}$ there exists a unique section $s \in \mathcal{F}(U)$ which restricts to s_i on U_i .

Proof. This is a reformulation of Lemma 6.30.3 above in the special case where the coverings \mathcal{U}_{ij} each consist of a single element. But also this case is much easier and is an easy exercise to do directly. \square

Lemma 6.30.5. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let $U \in \mathcal{B}$. Let \mathcal{F} be a sheaf of sets on \mathcal{B} . The map*

$$\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_x$$

identifies $\mathcal{F}(U)$ with the elements $(s_x)_{x \in U}$ with the property

- (*) *For any $x \in U$ there exists a $V \in \mathcal{B}$, $x \in V$ and a section $\sigma \in \mathcal{F}(V)$ such that for all $y \in V$ we have $s_y = (V, \sigma)$ in \mathcal{F}_y .*

Proof. First note that the map $\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_x$ is injective by the uniqueness in the sheaf condition of Definition 6.30.2. Let (s_x) be any element on the right hand side which satisfies (*). Clearly this means we can find a covering $U = \bigcup U_i$, $U_i \in \mathcal{B}$ such that $(s_x)_{x \in U_i}$ comes from certain $\sigma_i \in \mathcal{F}(U_i)$. For every $y \in U_i \cap U_j$ the sections σ_i and σ_j agree in the stalk \mathcal{F}_y . Hence there exists an element $V_{ijy} \in \mathcal{B}$, $y \in V_{ijy}$ such that $\sigma_i|_{V_{ijy}} = \sigma_j|_{V_{ijy}}$. Thus the sheaf condition (**) of Definition 6.30.2 applies to the system of σ_i and we obtain a section $s \in \mathcal{F}(U)$ with the desired property. \square

Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . There is a natural restriction functor from the category of sheaves of sets on X to the category of sheaves of sets on \mathcal{B} . It turns out that this is an equivalence of categories. In down to earth terms this means the following.

Lemma 6.30.6. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let \mathcal{F} be a sheaf of sets on \mathcal{B} . There exists a unique sheaf of sets \mathcal{F}^{ext} on X such that $\mathcal{F}^{ext}(U) = \mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.*

Proof. We first construct a presheaf \mathcal{F}^{ext} with the desired property. Namely, for an arbitrary open $U \subset X$ we define $\mathcal{F}^{ext}(U)$ as the set of elements $(s_x)_{x \in U}$ such that (*) of Lemma 6.30.5 holds. It is clear that there are restriction mappings that turn \mathcal{F}^{ext} into a presheaf of sets. Also, by Lemma 6.30.5 we see that $\mathcal{F}(U) = \mathcal{F}^{ext}(U)$ whenever U is an element of the basis \mathcal{B} . To see \mathcal{F}^{ext} is a sheaf one may argue as in the proof of Lemma 6.17.1. \square

Note that we have

$$\mathcal{F}_x = \mathcal{F}_x^{ext}$$

in the situation of the lemma. This is so because the collection of elements of \mathcal{B} containing x forms a fundamental system of open neighbourhoods of x .

Lemma 6.30.7. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Denote $Sh(\mathcal{B})$ the category of sheaves on \mathcal{B} . There is an equivalence of categories*

$$Sh(X) \longrightarrow Sh(\mathcal{B})$$

which assigns to a sheaf on X its restriction to the members of \mathcal{B} .

Proof. The inverse functor is given in Lemma 6.30.6 above. Checking the obvious functorialities is left to the reader. \square

This ends the discussion of sheaves of sets on a basis \mathcal{B} . Let (\mathcal{C}, F) be a type of algebraic structure. At the end of this section we would like to point out that the constructions above work for sheaves with values in \mathcal{C} . Let us briefly define the relevant notions.

Definition 6.30.8. Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let (\mathcal{C}, F) be a type of algebraic structure.

- (1) A *presheaf* \mathcal{F} with values in \mathcal{C} on \mathcal{B} is a rule which assigns to each $U \in \mathcal{B}$ an object $\mathcal{F}(U)$ of \mathcal{C} and to each inclusion $V \subset U$ of elements of \mathcal{B} a morphism $\rho_V^U : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ in \mathcal{C} such that whenever $W \subset V \subset U$ in \mathcal{B} we have $\rho_W^U = \rho_W^V \circ \rho_V^U$.
- (2) A *morphism* $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with values in \mathcal{C} on \mathcal{B} is a rule which assigns to each element $U \in \mathcal{B}$ a morphism of algebraic structures $\varphi : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps.
- (3) Given a presheaf \mathcal{F} with values in \mathcal{C} on \mathcal{B} we say that $U \mapsto F(\mathcal{F}(U))$ is the underlying presheaf of sets.
- (4) A *sheaf* \mathcal{F} with values in \mathcal{C} on \mathcal{B} is a presheaf with values in \mathcal{C} on \mathcal{B} whose underlying presheaf of sets is a sheaf.

At this point we can define the *stalk* at $x \in X$ of a presheaf with values in \mathcal{C} on \mathcal{B} as the directed colimit

$$\mathcal{F}_x = \operatorname{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

It exists as an object of \mathcal{C} because of our assumptions on \mathcal{C} . Also, we see that the underlying set of \mathcal{F}_x is the stalk of the underlying presheaf of sets on \mathcal{B} .

Note that Lemmas 6.30.3, 6.30.4 and 6.30.5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf with values in \mathcal{C} . The analogue of Lemma 6.30.6 need some care. Here it is.

Lemma 6.30.9. *Let X be a topological space. Let (\mathcal{C}, F) be a type of algebraic structure. Let \mathcal{B} be a basis for the topology on X . Let \mathcal{F} be a sheaf with values in \mathcal{C} on \mathcal{B} . There exists a unique sheaf \mathcal{F}^{ext} with values in \mathcal{C} on X such that $\mathcal{F}^{ext}(U) = \mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.*

Proof. By the conditions imposed on the pair (\mathcal{C}, F) it suffices to come up with a presheaf \mathcal{F}^{ext} which does the correct thing on the level of underlying presheaves of sets. Thus our first task is to construct a suitable object $\mathcal{F}^{ext}(U)$ for all open $U \subset X$. We could do this by imitating Lemma 6.18.1 in the setting of presheaves on \mathcal{B} . However, a slightly different method (but basically equivalent) is the following: Define it as the directed colimit

$$\mathcal{F}^{ext}(U) := \operatorname{colim}_{\mathcal{U}} FIB(\mathcal{U})$$

over all coverings $\mathcal{U} : U = \bigcup_{i \in I} U_i$ by $U_i \in \mathcal{B}$ of the fibre product

$$\begin{array}{ccc} FIB(\mathcal{U}) & \longrightarrow & \prod_{x \in U} \mathcal{F}_x \\ \downarrow & & \downarrow \\ \prod_{i \in I} \mathcal{F}(U_i) & \longrightarrow & \prod_{i \in I} \prod_{x \in U_i} \mathcal{F}_x \end{array}$$

By the usual arguments, see Lemma 6.15.4 and Example 6.15.5 it suffices to show that this construction on underlying sets is the same as the definition using (**) above. Details left to the reader. \square

Note that we have

$$\mathcal{F}_x = \mathcal{F}_x^{ext}$$

as objects in \mathcal{C} in the situation of the lemma. This is so because the collection of elements of \mathcal{B} containing x forms a fundamental system of open neighbourhoods of x .

Lemma 6.30.10. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let $(\mathcal{C}, \mathcal{F})$ be a type of algebraic structure. Denote $Sh(\mathcal{B}, \mathcal{C})$ the category of sheaves with values in \mathcal{C} on \mathcal{B} . There is an equivalence of categories*

$$Sh(X, \mathcal{C}) \longrightarrow Sh(\mathcal{B}, \mathcal{C})$$

which assigns to a sheaf on X its restriction to the members of \mathcal{B} .

Proof. The inverse functor is given in Lemma 6.30.9 above. Checking the obvious functorialities is left to the reader. \square

Finally we come to the case of (pre)sheaves of modules on a basis. We will use the easy fact that the category of presheaves of sets on a basis has products and that they are described by taking products of values on elements of the bases.

Definition 6.30.11. Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let \mathcal{O} be a presheaf of rings on \mathcal{B} .

- (1) A *presheaf of \mathcal{O} -modules \mathcal{F} on \mathcal{B}* is a presheaf of abelian groups on \mathcal{B} together with a morphism of presheaves of sets $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ such that for all $U \in \mathcal{B}$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ turns the group $\mathcal{F}(U)$ into an $\mathcal{O}(U)$ -module.
- (2) A *morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules on \mathcal{B}* is a morphism of abelian presheaves on \mathcal{B} which induces an $\mathcal{O}(U)$ -module homomorphism $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ for every $U \in \mathcal{B}$.
- (3) Suppose that \mathcal{O} is a sheaf of rings on \mathcal{B} . A *sheaf \mathcal{F} of \mathcal{O} -modules on \mathcal{B}* is a presheaf of \mathcal{O} -modules on \mathcal{B} whose underlying presheaf of abelian groups is a sheaf.

We can define the *stalk* at $x \in X$ of a presheaf of \mathcal{O} -modules on \mathcal{B} as the directed colimit

$$\mathcal{F}_x = \text{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

It is a \mathcal{O}_x -module.

Note that Lemmas 6.30.3, 6.30.4 and 6.30.5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf of \mathcal{O} -modules. The analogue of Lemma 6.30.6 is as follows.

Lemma 6.30.12. *Let X be a topological space. Let \mathcal{O} be a sheaf of rings on \mathcal{B} . Let \mathcal{B} be a basis for the topology on X . Let \mathcal{F} be a sheaf with values in \mathcal{C} on \mathcal{B} . Let \mathcal{O}^{ext} be the sheaf of rings on X extending \mathcal{O} and let \mathcal{F}^{ext} be the abelian sheaf on X extending \mathcal{F} , see Lemma 6.30.9. There exists a canonical map*

$$\mathcal{O}^{ext} \times \mathcal{F}^{ext} \longrightarrow \mathcal{F}^{ext}$$

which agrees with the given map over elements of \mathcal{B} and which endows \mathcal{F}^{ext} with the structure of an \mathcal{O}^{ext} -module.

Proof. It suffices to construct the multiplication map on the level of presheaves of sets. Perhaps the easiest way to see this is to prove directly that if $(f_x)_{x \in U}$, $f_x \in \mathcal{O}_x$ and $(m_x)_{x \in U}$, $m_x \in \mathcal{F}_x$ satisfy $(*)$, then the element $(f_x m_x)_{x \in U}$ also satisfies $(*)$. Then we get the desired result, because in the proof of Lemma 6.30.6 we construct the extension in terms of families of elements of stalks satisfying $(*)$. \square

Note that we have

$$\mathcal{F}_x = \mathcal{F}_x^{ext}$$

as \mathcal{O}_x -modules in the situation of the lemma. This is so because the collection of elements of \mathcal{B} containing x forms a fundamental system of open neighbourhoods of x , or simply because it is true on the underlying sets.

Lemma 6.30.13. *Let X be a topological space. Let \mathcal{B} be a basis for the topology on X . Let \mathcal{O} be a sheaf of rings on X . Denote $\text{Mod}(\mathcal{O}|_{\mathcal{B}})$ the category of sheaves of $\mathcal{O}|_{\mathcal{B}}$ -modules on \mathcal{B} . There is an equivalence of categories*

$$\text{Mod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O}|_{\mathcal{B}})$$

which assigns to a sheaf of \mathcal{O} -modules on X its restriction to the members of \mathcal{B} .

Proof. The inverse functor is given in Lemma 6.30.12 above. Checking the obvious functorialities is left to the reader. \square

Finally, we address the question of the relationship of this with continuous maps. This is now very easy thanks to the work above. First we do the case where there is a basis on the target given.

Lemma 6.30.14. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, \mathcal{F})$ be a type of algebraic structures. Let \mathcal{F} be a sheaf with values in \mathcal{C} on X . Let \mathcal{G} be a sheaf with values in \mathcal{C} on Y . Let \mathcal{B} be a basis for the topology on Y . Suppose given for every $V \in \mathcal{B}$ a morphism*

$$\varphi_V : \mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$

of \mathcal{C} compatible with restriction mappings. Then there is a unique f -map (see Definition 6.21.7 and discussion of f -maps in Section 6.23) $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ recovering φ_V for $V \in \mathcal{B}$.

Proof. This is trivial because the collection of maps amounts to a morphism between the restrictions of \mathcal{G} and $f_*\mathcal{F}$ to \mathcal{B} . By Lemma 6.30.10 this is the same as giving a morphism from \mathcal{G} to $f_*\mathcal{F}$, which by Lemma 6.21.8 is the same as an f -map. See also Lemma 6.23.1 and the discussion preceding it for how to deal with the case of sheaves of algebraic structures. \square

Here is the analogue for ringed spaces.

Lemma 6.30.15. *Let $(f, f^\#) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let \mathcal{G} be a sheaf of \mathcal{O}_Y -modules. Let \mathcal{B} be a basis for the topology on Y . Suppose given for every $V \in \mathcal{B}$ a $\mathcal{O}_Y(V)$ -module map*

$$\varphi_V : \mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$

(where $\mathcal{F}(f^{-1}V)$ has a module structure using $f_V^\sharp : \mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(f^{-1}V)$) compatible with restriction mappings. Then there is a unique f -map (see discussion of f -maps in Section 6.26) $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ recovering φ_V for $V \in \mathcal{B}$.

Proof. Same as the proof of the corresponding lemma for sheaves of algebraic structures above. \square

Lemma 6.30.16. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, \mathcal{F})$ be a type of algebraic structures. Let \mathcal{F} be a sheaf with values in \mathcal{C} on X . Let \mathcal{G} be a sheaf with values in \mathcal{C} on Y . Let \mathcal{B}_Y be a basis for the topology on Y . Let \mathcal{B}_X be a basis for the topology on X . Suppose given for every $V \in \mathcal{B}_Y$, and $U \in \mathcal{B}_X$ such that $f(U) \subset V$ a morphism*

$$\varphi_V^U : \mathcal{G}(V) \longrightarrow \mathcal{F}(U)$$

of \mathcal{C} compatible with restriction mappings. Then there is a unique f -map (see Definition 6.21.7 and the discussion of f -maps in Section 6.23) $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ recovering φ_V^U as the composition

$$\mathcal{G}(V) \xrightarrow{\varphi_V} \mathcal{F}(f^{-1}(V)) \xrightarrow{\text{restr.}} \mathcal{F}(U)$$

for every pair (U, V) as above.

Proof. Let us first prove this for sheaves of sets. Fix $V \subset Y$ open. Pick $s \in \mathcal{G}(V)$. We are going to construct an element $\varphi_V(s) \in \mathcal{F}(f^{-1}V)$. We can define a value $\varphi(s)_x$ in the stalk \mathcal{F}_x for every $x \in f^{-1}V$ by picking a $U \in \mathcal{B}_X$ with $x \in U \subset f^{-1}V$ and setting $\varphi(s)_x$ equal to the equivalence class of $(U, \varphi_V^U(s))$ in the stalk. Clearly, the family $(\varphi(s)_x)_{x \in f^{-1}V}$ satisfies condition $(*)$ because the maps φ_V^U for varying U are compatible with restrictions in the sheaf \mathcal{F} . Thus, by the proof of Lemma 6.30.6 we see that $(\varphi(s)_x)_{x \in f^{-1}V}$ corresponds to a unique element $\varphi_V(s)$ of $\mathcal{F}(f^{-1}V)$. Thus we have defined a set map $\varphi_V : \mathcal{G}(V) \rightarrow \mathcal{F}(f^{-1}V)$. The compatibility between φ_V and φ_V^U follows from Lemma 6.30.5.

We leave it to the reader to show that the construction of φ_V is compatible with restriction mappings as we vary $v \in \mathcal{B}_Y$. Thus we may apply Lemma 6.30.14 above to “glue” them to the desired f -map.

Finally, we note that the map of sheaves of sets so constructed satisfies the property that the map on stalks

$$\mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

is the colimit of the system of maps φ_V^U as $V \in \mathcal{B}_Y$ varies over those elements that contain $f(x)$ and $U \in \mathcal{B}_X$ varies over those elements that contain x . In particular, if \mathcal{G} and \mathcal{F} are the underlying sheaves of sheaves of algebraic structures, then we see that the maps on stalks is a morphism of algebraic structures. Hence we conclude that the associated map of sheaves of underlying sets $f^{-1}\mathcal{G} \rightarrow \mathcal{F}$ satisfies the assumptions of Lemma 6.23.1. We conclude that $f^{-1}\mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves with values in \mathcal{C} . And by adjointness this means that φ is an f -map of sheaves of algebraic structures. \square

Lemma 6.30.17. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let \mathcal{G} be a sheaf of \mathcal{O}_Y -modules. Let \mathcal{B}_Y be a basis for the topology on Y . Let \mathcal{B}_X be a basis for the topology on X . Suppose given for every $V \in \mathcal{B}_Y$, and $U \in \mathcal{B}_X$ such that $f(U) \subset V$ a $\mathcal{O}_Y(V)$ -module map*

$$\varphi_V^U : \mathcal{G}(V) \longrightarrow \mathcal{F}(U)$$

compatible with restriction mappings. Here the $\mathcal{O}_Y(V)$ -module structure on $\mathcal{F}(U)$ comes from the $\mathcal{O}_X(U)$ -module structure via the map $f_V^\sharp : \mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(f^{-1}V) \rightarrow \mathcal{O}_X(U)$. Then there is a unique f -map of sheaves of modules (see Definition 6.21.7 and the discussion of f -maps in Section 6.26) $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ recovering φ_V^U as the composition

$$\mathcal{G}(V) \xrightarrow{\varphi_V} \mathcal{F}(f^{-1}(V)) \xrightarrow{\text{restr.}} \mathcal{F}(U)$$

for every pair (U, V) as above.

Proof. Similar to the above and omitted. \square

6.31. Open immersions and (pre)sheaves

Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset U into X . In Section 6.21 we have defined functors j_* and j^{-1} such that j_* is right adjoint to j^{-1} . It turns out that for an open immersion there is a left adjoint for j^{-1} , which we will denote $j!$. First we point out that j^{-1} has a particularly simple description in the case of an open immersion.

Lemma 6.31.1. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset U into X .*

- (1) *Let \mathcal{G} be a presheaf of sets on X . The presheaf $j_p\mathcal{G}$ (see Section 6.21) is given by the rule $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open.*
- (2) *Let \mathcal{G} be a sheaf of sets on X . The sheaf $j^{-1}\mathcal{G}$ is given by the rule $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open.*
- (3) *For any point $u \in U$ and any sheaf \mathcal{G} on X we have a canonical identification of stalks*

$$j^{-1}\mathcal{G}_u = (\mathcal{G}|_U)_u = \mathcal{G}_u.$$

- (4) *On the category of presheaves of U we have $j_p j_* = \text{id}$.*
- (5) *On the category of sheaves of U we have $j^{-1} j_* = \text{id}$.*

The same description holds for (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures, and (pre)sheaves of modules.

Proof. The colimit in the definition of $j_p\mathcal{G}(V)$ is over collection of all $W \subset X$ open such that $V \subset W$ ordered by reverse inclusion. Hence this has a largest element, namely V . This proves (1). And (2) follows because the assignment $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open is clearly a sheaf if \mathcal{G} is a sheaf. Assertion (3) follows from (2) since the collection of open neighbourhoods of u which are contained in U is cofinal in the collection of all open neighbourhoods of u in X . Parts (4) and (5) follow by computing $j^{-1}j_*\mathcal{F}(V) = j_*\mathcal{F}(V) = \mathcal{F}(V)$.

The exact same arguments work for (pre)sheaves of abelian groups and (pre)sheaves of algebraic structures. \square

Definition 6.31.2. Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset.

- (1) Let \mathcal{G} be a presheaf of sets, abelian groups or algebraic structures on X . The presheaf $j_p\mathcal{G}$ described in Lemma 6.31.1 is called the *restriction of \mathcal{G} to U* and denoted $\mathcal{G}|_U$.
- (2) Let \mathcal{G} be a sheaf of sets on X , abelian groups or algebraic structures on X . The sheaf $j^{-1}\mathcal{G}$ is called the *restriction of \mathcal{G} to U* and denoted $\mathcal{G}|_U$.

- (3) If (X, \mathcal{O}) is a ringed space, then the pair $(U, \mathcal{O}|_U)$ is called the *open subspace of (X, \mathcal{O}) associated to U* .
- (4) If \mathcal{G} is a presheaf of \mathcal{O} -modules then $\mathcal{G}|_U$ together with the multiplication map $\mathcal{O}|_U \times \mathcal{G}|_U \rightarrow \mathcal{G}|_U$ (see Lemma 6.24.6) is called the *restriction of \mathcal{G} to U* .

We leave a definition of the restriction of presheaves of modules to the reader. Ok, so in this section we will discuss a left adjoint to the restriction functor. Here is the definition in the case of (pre)sheaves of sets.

Definition 6.31.3. Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset.

- (1) Let \mathcal{F} be a presheaf of sets on U . We define the *extension of \mathcal{F} by the empty set* $j_{p!}\mathcal{F}$ to be the presheaf of sets on X defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} \emptyset & \text{if } V \not\subset U \\ \mathcal{F}(V) & \text{if } V \subset U \end{cases}$$

with obvious restriction mappings.

- (2) Let \mathcal{F} be a sheaf of sets on U . We define the *extension of \mathcal{F} by the empty set* $j_!\mathcal{F}$ to be the sheafification of the presheaf $j_{p!}\mathcal{F}$.

Lemma 6.31.4. Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset.

- (1) The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).
- (2) The functor $j_!$ is a left adjoint to restriction, in a formula

$$\text{Mor}_{\text{Sh}(X)}(j_!\mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{Sh}(U)}(\mathcal{F}, j^{-1}\mathcal{G}) = \text{Mor}_{\text{Sh}(U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in \mathcal{F} and \mathcal{G} .

- (3) Let \mathcal{F} be a sheaf of sets on U . The stalks of the sheaf $j_!\mathcal{F}$ are described as follows

$$j_!\mathcal{F}_x = \begin{cases} \emptyset & \text{if } x \notin U \\ \mathcal{F}_x & \text{if } x \in U \end{cases}$$

- (4) On the category of presheaves of U we have $j_p j_{p!} = \text{id}$.
- (5) On the category of sheaves of U we have $j^{-1} j_! = \text{id}$.

Proof. To map $j_{p!}\mathcal{F}$ into \mathcal{G} it is enough to map $\mathcal{F}(V) \rightarrow \mathcal{G}(V)$ whenever $V \subset U$ compatibly with restriction mappings. And by Lemma 6.31.1 the same description holds for maps $\mathcal{F} \rightarrow \mathcal{G}|_U$. The adjointness of $j_!$ and restriction follows from this and the properties of sheafification. The identification of stalks is obvious from the definition of the extension by the empty set and the definition of a stalk. Statements (4) and (5) follow by computing the value of the sheaf on any open of U . \square

Note that if \mathcal{F} is a sheaf of abelian groups on U , then in general $j_!\mathcal{F}$ as defined above, is not a sheaf of abelian groups, for example because some of its stalks are empty (hence not abelian groups for sure). Thus we need to modify the definition of $j_!$ depending on the type of sheaves we consider. The reason for choosing the empty set in the definition of the extension by the empty set, is that it is the initial object in the category of sets. Thus in the case of abelian groups we use 0 (and more generally for sheaves with values in any abelian category).

Definition 6.31.5. Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset.

- (1) Let \mathcal{F} be an abelian presheaf on U . We define the *extension $j_{p!}\mathcal{F}$ of \mathcal{F} by 0* to be the abelian presheaf on X defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} 0 & \text{if } V \not\subset U \\ \mathcal{F}(V) & \text{if } V \subset U \end{cases}$$

with obvious restriction mappings.

- (2) Let \mathcal{F} be an abelian sheaf on U . We define the *extension $j_!\mathcal{F}$ of \mathcal{F} by 0* to be the sheafification of the abelian presheaf $j_{p!}\mathcal{F}$.
- (3) Let \mathcal{C} be a category having an initial object e . Let \mathcal{F} be a presheaf on U with values in \mathcal{C} . We define the *extension $j_{p!}\mathcal{F}$ of \mathcal{F} by e* to be the presheaf on X with values in \mathcal{C} defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} e & \text{if } V \not\subset U \\ \mathcal{F}(V) & \text{if } V \subset U \end{cases}$$

with obvious restriction mappings.

- (4) Let (\mathcal{C}, F) be a type of algebraic structure such that \mathcal{C} has an initial object e . Let \mathcal{F} be a sheaf of algebraic structures on U (of the give type). We define the *extension $j_!\mathcal{F}$ of \mathcal{F} by e* to be the sheafification of the presheaf $j_{p!}\mathcal{F}$ defined above.
- (5) Let \mathcal{O} be a presheaf of rings on X . Let \mathcal{F} be a presheaf of $\mathcal{O}|_U$ -modules. In this case we define the *extension by 0* to be the presheaf of \mathcal{O} -modules which is equal to $j_{p!}\mathcal{F}$ as an abelian presheaf endowed with the multiplication map $\mathcal{O} \times j_{p!}\mathcal{F} \rightarrow j_{p!}\mathcal{F}$.
- (6) Let \mathcal{O} be a sheaf of rings on X . Let \mathcal{F} be a sheaf of $\mathcal{O}|_U$ -modules. In this case we define the *extension by 0* to be the \mathcal{O} -module which is equal to $j_!\mathcal{F}$ as an abelian sheaf endowed with the multiplication map $\mathcal{O} \times j_!\mathcal{F} \rightarrow j_!\mathcal{F}$.

It is true that one can define $j_!$ in the setting of sheaves of algebraic structures (see below). However, it depends on the type of algebraic structures involved what the resulting object is. For example, if \mathcal{O} is a sheaf of rings on U , then $j_{!,rings}\mathcal{O} \neq j_{!,abelian}\mathcal{O}$ since the initial object in the category of rings is \mathbf{Z} and the initial object in the category of abelian groups is 0. In particular the functor $j_!$ *does not commute with taking underlying sheaves of sets*, in contrast to what we have seen so far! We separate out the case of (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures and (pre)sheaves of modules as usual.

Lemma 6.31.6. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset. Consider the functors of restriction and extension by 0 for abelian (pre)sheaves.*

- (1) *The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).*
- (2) *The functor $j_!$ is a left adjoint to restriction, in a formula*

$$\text{Mor}_{\text{Ab}(X)}(j_!\mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{Ab}(U)}(\mathcal{F}, j^{-1}\mathcal{G}) = \text{Mor}_{\text{Ab}(U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in \mathcal{F} and \mathcal{G} .

- (3) *Let \mathcal{F} be an abelian sheaf on U . The stalks of the sheaf $j_!\mathcal{F}$ are described as follows*

$$j_!\mathcal{F}_x = \begin{cases} 0 & \text{if } x \notin U \\ \mathcal{F}_x & \text{if } x \in U \end{cases}$$

- (4) On the category of abelian presheaves of U we have $j_p j_{p!} = id$.
 (5) On the category of abelian sheaves of U we have $j^{-1} j_! = id$.

Proof. Omitted. □

Lemma 6.31.7. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset. Let $(\mathcal{C}, \mathcal{F})$ be a type of algebraic structure such that \mathcal{C} has an initial object e . Consider the functors of restriction and extension by e for (pre)sheaves of algebraic structure defined above.*

- (1) The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).
 (2) The functor $j_!$ is a left adjoint to restriction, in a formula

$$\text{Mor}_{\text{Sh}(X, \mathcal{C})}(j_! \mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{Sh}(U, \mathcal{C})}(\mathcal{F}, j^{-1} \mathcal{G}) = \text{Mor}_{\text{Sh}(U, \mathcal{C})}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in \mathcal{F} and \mathcal{G} .

- (3) Let \mathcal{F} be a sheaf on U . The stalks of the sheaf $j_! \mathcal{F}$ are described as follows

$$j_! \mathcal{F}_x = \begin{cases} e & \text{if } x \notin U \\ \mathcal{F}_x & \text{if } x \in U \end{cases}$$

- (4) On the category of presheaves of algebraic structures on U we have $j_p j_{p!} = id$.
 (5) On the category of sheaves of algebraic structures on U we have $j^{-1} j_! = id$.

Proof. Omitted. □

Lemma 6.31.8. *Let (X, \mathcal{O}) be a ringed space. Let $j : (U, \mathcal{O}|_U) \rightarrow (X, \mathcal{O})$ be an open subspace. Consider the functors of restriction and extension by 0 for (pre)sheaves of modules defined above.*

- (1) The functor $j_{p!}$ is a left adjoint to restriction, in a formula

$$\text{Mor}_{\text{PMod}(\mathcal{O})}(j_{p!} \mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{PMod}(\mathcal{O}|_U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in \mathcal{F} and \mathcal{G} .

- (2) The functor $j_!$ is a left adjoint to restriction, in a formula

$$\text{Mor}_{\text{Mod}(\mathcal{O})}(j_! \mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{Mod}(\mathcal{O}|_U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in \mathcal{F} and \mathcal{G} .

- (3) Let \mathcal{F} be a sheaf of \mathcal{O} -modules on U . The stalks of the sheaf $j_! \mathcal{F}$ are described as follows

$$j_! \mathcal{F}_x = \begin{cases} 0 & \text{if } x \notin U \\ \mathcal{F}_x & \text{if } x \in U \end{cases}$$

- (4) On the category of sheaves of $\mathcal{O}|_U$ -modules on U we have $j^{-1} j_! = id$.

Proof. Omitted. □

Note that by the lemmas above, both the functors j_* and $j_!$ are fully faithful embeddings of the category of sheaves on U into the category of sheaves on X . It is only true for the functor $j_!$ that one can easily describe the essential image of this functor.

Lemma 6.31.9. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset. The functor*

$$j_! : Sh(U) \longrightarrow Sh(X)$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = \emptyset$ for all $x \in X \setminus U$.

Proof. Fully faithfulness follows formally from $j^{-1}j_! = \text{id}$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that \mathcal{G} has the indicated property. Then it is easy to check that

$$j_!j^{-1}\mathcal{G} \rightarrow \mathcal{G}$$

is an isomorphism on all stalks and hence an isomorphism. \square

Lemma 6.31.10. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset. The functor*

$$j_! : Ab(U) \longrightarrow Ab(X)$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = 0$ for all $x \in X \setminus U$.

Proof. Omitted. \square

Lemma 6.31.11. *Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subset. Let (\mathcal{C}, F) be a type of algebraic structure such that \mathcal{C} has an initial object e . The functor*

$$j_! : Sh(U, \mathcal{C}) \longrightarrow Sh(X, \mathcal{C})$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = e$ for all $x \in X \setminus U$.

Proof. Omitted. \square

Lemma 6.31.12. *Let (X, \mathcal{O}) be a ringed space. Let $j : (U, \mathcal{O}|_U) \rightarrow (X, \mathcal{O})$ be an open subspace. The functor*

$$j_! : Mod(\mathcal{O}|_U) \longrightarrow Mod(\mathcal{O})$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = 0$ for all $x \in X \setminus U$.

Proof. Omitted. \square

Remark 6.31.13. Let $j : U \rightarrow X$ be an open immersion of topological spaces as above. Let $x \in X$, $x \notin U$. Let \mathcal{F} be a sheaf of sets on U . Then $\mathcal{F}_x = \emptyset$ by Lemma 6.31.4. Hence $j_!$ does not transform a final object of $Sh(U)$ into a final object of $Sh(X)$ unless $U = X$. According to our conventions in Categories, Section 4.23 this means that the functor $j_!$ is not left exact as a functor between the categories of sheaves of sets. It will be shown later that $j_!$ on abelian sheaves is exact, see Modules, Lemma 17.3.4.

6.32. Closed immersions and (pre)sheaves

Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a closed subset Z into X . In Section 6.21 we have defined functors i_* and i^{-1} such that i_* is right adjoint to i^{-1} .

Lemma 6.32.1. *Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a closed subset Z into X . Let \mathcal{F} be a sheaf of sets on Z . The stalks of $i_*\mathcal{F}$ are described as follows*

$$i_*\mathcal{F}_x = \begin{cases} \{*\} & \text{if } x \notin Z \\ \mathcal{F}_x & \text{if } x \in Z \end{cases}$$

where $\{*\}$ denotes a singleton set. Moreover, $i^{-1}i_* = \text{id}$ on the category of sheaves of sets on Z . Moreover, the same holds for abelian sheaves on Z , resp. sheaves of algebraic structures on Z where $\{*\}$ has to be replaced by 0 , resp. a final object of the category of algebraic structures.

Proof. If $x \notin Z$, then there exist arbitrarily small open neighbourhoods U of x which do not meet Z . Because \mathcal{F} is a sheaf we have $\mathcal{F}(i^{-1}(U)) = \{*\}$ for any such U , see Remark 6.7.2. This proves the first case. The second case comes from the fact that for $z \in Z$ any open neighbourhood of z is of the form $Z \cap U$ for some open U of X . For the statement that $i^{-1}i_* = \text{id}$ consider the canonical map $i^{-1}i_*\mathcal{F} \rightarrow \mathcal{F}$. This is an isomorphism on stalks (see above) and hence an isomorphism.

For sheaves of abelian groups, and sheaves of algebraic structures you argue in the same manner. \square

Lemma 6.32.2. *Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a closed subset. The functor*

$$i_* : Sh(Z) \longrightarrow Sh(X)$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = \{*\}$ for all $x \in X \setminus Z$.

Proof. Fully faithfulness follows formally from $i^{-1}i_* = \text{id}$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that \mathcal{G} has the indicated property. Then it is easy to check that

$$\mathcal{G} \rightarrow i_*i^{-1}\mathcal{G}$$

is an isomorphism on all stalks and hence an isomorphism. \square

Lemma 6.32.3. *Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a closed subset. The functor*

$$i_* : Ab(Z) \longrightarrow Ab(X)$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = 0$ for all $x \in X \setminus Z$.

Proof. Omitted. \square

Lemma 6.32.4. *Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a closed subset. Let (\mathcal{C}, F) be a type of algebraic structure with final object 0 . The functor*

$$i_* : Sh(Z, \mathcal{C}) \longrightarrow Sh(X, \mathcal{C})$$

is fully faithful. Its essential image consists exactly of those sheaves \mathcal{G} such that $\mathcal{G}_x = 0$ for all $x \in X \setminus Z$.

Proof. Omitted. □

Remark 6.32.5. Let $i : Z \rightarrow X$ be a closed immersion of topological spaces as above. Let $x \in X$, $x \notin Z$. Let \mathcal{F} be a sheaf of sets on Z . Then $(i_*\mathcal{F})_x = \{*\}$ by Lemma 6.32.1. Hence if $\mathcal{F} = *\amalg*$, where $*$ is the singleton sheaf, then $i_*\mathcal{F}_x = \{*\} \neq i_*(*)_x \amalg i_*(*)_x$ because the latter is a two point set. According to our conventions in Categories, Section 4.23 this means that the functor i_* is not right exact as a functor between the categories of sheaves of sets. In particular, it cannot have a right adjoint, see Categories, Lemma 4.24.5.

On the other hand, we will see later (see Modules, Lemma 17.6.3) that i_* on abelian sheaves is exact, and does have a right adjoint, namely the functor that associates to an abelian sheaf on X the sheaf of sections supported in Z .

Remark 6.32.6. We have not discussed the relationship between closed immersions and ringed spaces. This is because the notion of a closed immersion of ringed spaces is best discussed in the setting of quasi-coherent sheaves, see Modules, Section 17.13.

6.33. Glueing sheaves

In this section we glue sheaves defined on the members of a covering of X . We first deal with maps.

Lemma 6.33.1. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let \mathcal{F}, \mathcal{G} be sheaves of sets on X . Given a collection*

$$\varphi_i : \mathcal{F}|_{U_i} \longrightarrow \mathcal{G}|_{U_i}$$

of maps of sheaves such that for all $i, j \in I$ the maps φ_i, φ_j restrict to the same map $\mathcal{F}|_{U_i \cap U_j} \rightarrow \mathcal{G}|_{U_i \cap U_j}$ then there exists a unique map of sheaves

$$\varphi : \mathcal{F} \longrightarrow \mathcal{G}$$

whose restriction to each U_i agrees with φ_i .

Proof. Omitted. □

The previous lemma implies that given two sheaves \mathcal{F}, \mathcal{G} on the topological space X the rule

$$U \longmapsto \text{Mor}_{\text{Sh}(U)}(\mathcal{F}|_U, \mathcal{G}|_U)$$

defines a sheaf. This is a kind of *internal hom sheaf*. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules, Section 17.19.

Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. For each $i \in I$ let \mathcal{F}_i be a sheaf of sets on U_i . For each pair $i, j \in I$, let

$$\varphi_{ij} : \mathcal{F}_i|_{U_i \cap U_j} \longrightarrow \mathcal{F}_j|_{U_i \cap U_j}$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

$$\begin{array}{ccc} \mathcal{F}_i|_{U_i \cap U_j \cap U_k} & \xrightarrow{\varphi_{ik}} & \mathcal{F}_k|_{U_i \cap U_j \cap U_k} \\ & \searrow \varphi_{ij} & \nearrow \varphi_{jk} \\ & \mathcal{F}_j|_{U_i \cap U_j \cap U_k} & \end{array}$$

We will call such a collection of data $(\mathcal{F}_i, \varphi_{ij})$ a *glueing data for sheaves of sets with respect to the covering* $X = \bigcup U_i$.

Lemma 6.33.2. *Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. Given any glueing data $(\mathcal{F}_i, \varphi_{ij})$ for sheaves of sets with respect to the covering $X = \bigcup U_i$ there exists a sheaf of sets \mathcal{F} on X together with isomorphisms*

$$\varphi_i : \mathcal{F}|_{U_i} \rightarrow \mathcal{F}_i$$

such that the diagrams

$$\begin{array}{ccc} \mathcal{F}|_{U_i \cap U_j} & \xrightarrow{\varphi_i} & \mathcal{F}_i|_{U_i \cap U_j} \\ id \downarrow & & \downarrow \varphi_{ij} \\ \mathcal{F}|_{U_i \cap U_j} & \xrightarrow{\varphi_j} & \mathcal{F}_j|_{U_i \cap U_j} \end{array}$$

are commutative.

Proof. Actually we can write a formula for the set of sections of \mathcal{F} over an open $W \subset X$. Namely, we define

$$\mathcal{F}(W) = \{(s_i)_{i \in I} \mid s_i \in \mathcal{F}_i(W \cap U_i), \varphi_{ij}(s_i|_{W \cap U_i \cap U_j}) = s_j|_{W \cap U_i \cap U_j}\}.$$

Restriction mappings for $W' \subset W$ are defined by the restricting each of the s_i to $W' \cap U_i$. The sheaf condition for \mathcal{F} follows immediately from the sheaf condition for each of the \mathcal{F}_i .

We still have to prove that $\mathcal{F}|_{U_i}$ maps isomorphically to \mathcal{F}_i . Let $W \subset U_i$. In this case the condition in the definition of $\mathcal{F}(W)$ implies that $s_j = \varphi_{ij}(s_i|_{W \cap U_j})$. And the commutativity of the diagrams in the definition of a glueing data assures that we may start with *any* section $s \in \mathcal{F}_i(W)$ and obtain a compatible collection by setting $s_i = s$ and $s_j = \varphi_{ij}(s_i|_{W \cap U_j})$. Thus the lemma follows. \square

Lemma 6.33.3. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let $(\mathcal{F}_i, \varphi_{ij})$ be a glueing data of sheaves of abelian groups, resp. sheaves of algebraic structures, resp. sheaves of \mathcal{O} -modules for some sheaf of rings \mathcal{O} on X . Then the construction in the proof of Lemma 6.33.2 above leads to a sheaf of abelian groups, resp. sheaf of algebraic structures, resp. sheaf of \mathcal{O} -modules.*

Proof. This is true because in the construction the set of sections $\mathcal{F}(W)$ over an open W is given as the equalizer of the maps

$$\prod_{i \in I} \mathcal{F}_i(W \cap U_i) \rightrightarrows \prod_{i, j \in I} \mathcal{F}_i(W \cap U_i \cap U_j)$$

And in each of the cases envisioned this equalizer gives an object in the relevant category whose underlying set is the object considered in the cited lemma. \square

Lemma 6.33.4. *Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. The functor which associates to a sheaf of sets \mathcal{F} the following collection of glueing data*

$$(\mathcal{F}|_{U_i}, (\mathcal{F}|_{U_i})|_{U_i \cap U_j} \rightarrow (\mathcal{F}|_{U_j})|_{U_i \cap U_j})$$

with respect to the covering $X = \bigcup U_i$ defines an equivalence of categories between $Sh(X)$ and the category of glueing data. A similar statement holds for abelian sheaves, resp. sheaves of algebraic structures, resp. sheaves of \mathcal{O} -modules.

Proof. The functor is fully faithful by Lemma 6.33.1 and essentially surjective (via an explicitly given quasi-inverse functor) by Lemma 6.33.2. \square

This lemma means that if the sheaf \mathcal{F} was constructed from the glueing data $(\mathcal{F}_i, \varphi_{ij})$ and if \mathcal{G} is a sheaf on X , then a morphism $f : \mathcal{F} \rightarrow \mathcal{G}$ is given by a collection of morphisms of sheaves

$$f_i : \mathcal{F}_i \longrightarrow \mathcal{G}|_{U_i}$$

compatible with the glueing maps φ_{ij} . Similarly, to give a morphism of sheaves $g : \mathcal{G} \rightarrow \mathcal{F}$ is the same as giving a collection of morphisms of sheaves

$$g_i : \mathcal{G}|_{U_i} \longrightarrow \mathcal{F}_i$$

compatible with the glueing maps φ_{ij} .

Sites and Sheaves

7.1. Introduction

The notion of a site was introduced by Grothendieck to be able to study sheaves in the étale topology of schemes. The basic reference for this notion is perhaps [AGV71]. Our notion of a site differs from that in [AGV71]; what we call a site is called a category endowed with a pretopology in [AGV71, Exposé II, Définition 1.3]. The reason we do this is that in algebraic geometry it is often convenient to work with a given class of coverings, for example when defining when a property of schemes is local in a given topology, see Descent, Section 34.11. Our exposition will closely follow [Art62]. We will not use universes.

7.2. Presheaves

Let \mathcal{C} be a category. A *presheaf of sets* is a contravariant functor \mathcal{F} from \mathcal{C} to *Sets* (see Categories, Remark 4.2.11). So for every object U of \mathcal{C} we have a set $\mathcal{F}(U)$. The elements of this set are called the *sections* of \mathcal{F} over U . For every morphism $f : V \rightarrow U$ the map $\mathcal{F}(f) : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is called the *restriction map* and is often denoted $f^* : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$. Another way of expressing this is to say that $f^*(s)$ is the *pullback* of s via f . Functoriality means that $g^*f^*(s) = (f \circ g)^*(s)$. Sometimes we use the notation $s|_V := f^*(s)$. This notation is consistent with the notion of restriction of functions from topology because if $W \rightarrow V \rightarrow U$ are morphisms in \mathcal{C} and s is a section of \mathcal{F} over U then $s|_W = (s|_V)|_W$ by the functorial nature of \mathcal{F} . Of course we have to be careful since it may very well happen that there is more than one morphism $V \rightarrow U$ and it is certainly not going to be the case that the corresponding pullback maps are equal.

Definition 7.2.1. A *presheaf of sets* on \mathcal{C} is a contravariant functor from \mathcal{C} to *Sets*. *Morphisms of presheaves* are transformations of functors. The category of presheaves of sets is denoted $PSh(\mathcal{C})$.

Note that for any object U of \mathcal{C} the functor of points h_U , see Categories, Example 4.3.4 is a presheaf. These are called the *representable presheaves*. These presheaves have the pleasing property that for any presheaf \mathcal{F} we have

$$(7.2.1.1) \quad \text{Mor}_{PSh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U).$$

This is the Yoneda lemma (Categories, Lemma 4.3.5).

Similarly, we can define the notion of a presheaf of abelian groups, rings, etc. More generally we may define a presheaf with values in a category.

Definition 7.2.2. Let \mathcal{C}, \mathcal{A} be categories. A *presheaf* \mathcal{F} on \mathcal{C} with values in \mathcal{A} is a contravariant functor from \mathcal{C} to \mathcal{A} , i.e., $\mathcal{F} : \mathcal{C}^{opp} \rightarrow \mathcal{A}$. A *morphism* of presheaves $\mathcal{F} \rightarrow \mathcal{G}$ on \mathcal{C} with values in \mathcal{A} is a transformation of functors from \mathcal{F} to \mathcal{G} .

These form the objects and morphisms of the category of presheaves on \mathcal{C} with values in \mathcal{A} .

Remark 7.2.3. As already pointed out we may consider the category presheaves with values in any of the “big” categories listed in Categories, Remark 4.2.2. These will be “big” categories as well and they will be listed in the above mentioned remark as we go along.

7.3. Injective and surjective maps of presheaves

Definition 7.3.1. Let \mathcal{C} be a category, and let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of presheaves of sets.

- (1) We say that φ is *injective* if for every object U of \mathcal{C} we have $\alpha : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective.
- (2) We say that φ is *surjective* if for every object U of \mathcal{C} we have $\alpha : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is surjective.

Lemma 7.3.2. *The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of $PSh(\mathcal{C})$. A map is an isomorphism if and only if it is both injective and surjective.*

Proof. Omitted. □

Definition 7.3.3. We say \mathcal{F} is a *subpresheaf* of \mathcal{G} if for every object $U \in \text{Ob}(\mathcal{C})$ the set $\mathcal{F}(U)$ is a subset of $\mathcal{G}(U)$, compatibly with the restriction mappings.

In other words, the inclusion maps $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ glue together to give an (injective) morphism of presheaves $\mathcal{F} \rightarrow \mathcal{G}$.

Lemma 7.3.4. *Let \mathcal{C} be a category. Suppose that $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets on \mathcal{C} . There exists a unique subpresheaf $\mathcal{G}' \subset \mathcal{G}$ such that φ factors as $\mathcal{F} \rightarrow \mathcal{G}' \rightarrow \mathcal{G}$ and such that the first map is surjective.*

Proof. Omitted. □

Definition 7.3.5. Notation as in Lemma 7.3.4. We say that \mathcal{G}' is the *image* of φ .

7.4. Limits and colimits of presheaves

Let \mathcal{C} be a category. Limits and colimits exist in the category $PSh(\mathcal{C})$. In addition, for any $U \in \text{ob}(\mathcal{C})$ the functor

$$PSh(\mathcal{C}) \longrightarrow \text{Sets}, \quad \mathcal{F} \longmapsto \mathcal{F}(U)$$

commutes with limits and colimits. Perhaps the easiest way to prove these statement is the following. Given a diagram $\mathcal{F} : \mathcal{I} \rightarrow PSh(\mathcal{C})$ define presheaves

$$\mathcal{F}_{\text{lim}} : U \longmapsto \lim_{i \in \mathcal{I}} \mathcal{F}_i(U) \quad \text{and} \quad \mathcal{F}_{\text{colim}} : U \longmapsto \text{colim}_{i \in \mathcal{I}} \mathcal{F}_i(U)$$

There are clearly projection maps $\mathcal{F}_{\text{lim}} \rightarrow \mathcal{F}_i$ and canonical maps $\mathcal{F}_i \rightarrow \mathcal{F}_{\text{colim}}$. These maps satisfy the requirements of the maps of a limit (resp. colimit) of Categories, Definition 4.14.1 (resp. Categories, Definition 4.14.2). Finally, if $(\mathcal{G}, q_i : \mathcal{G} \rightarrow \mathcal{F}_i)$ is another system (as in the definition of a limit), then we get for every U a system of maps $\mathcal{G}(U) \rightarrow \mathcal{F}_i(U)$ with suitable functoriality requirements. And thus a unique map $\mathcal{G}(U) \rightarrow \mathcal{F}_{\text{lim}}(U)$. It is easy to verify these are compatible as we vary U and arise from the desired map $\mathcal{G} \rightarrow \mathcal{F}_{\text{lim}}$. A similar argument works in the case of the colimit.

7.5. Functoriality of categories of presheaves

Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. In this case we denote

$$u^p : PSh(\mathcal{D}) \longrightarrow PSh(\mathcal{C})$$

the functor that associates to \mathcal{G} on \mathcal{D} the presheaf $u^p\mathcal{G} = \mathcal{G} \circ u$. Note that by the previous section this functor commutes with all limits.

For $V \in \text{ob}(\mathcal{D})$ let \mathcal{I}_V^u denote the category with

$$(7.5.0.1) \quad \begin{aligned} \text{Ob}(\mathcal{I}_V^u) &= \{(U, \phi) \mid U \in \text{Ob}(\mathcal{C}), \phi : V \rightarrow u(U)\} \\ \text{Mor}_{\mathcal{I}_V^u}((U, \phi), (U', \phi')) &= \{f : U \rightarrow U' \text{ in } \mathcal{C} \mid u(f) \circ \phi = \phi'\} \end{aligned}$$

We sometimes drop the subscript u from the notation and we simply write \mathcal{I}_V . We will use these categories to define a left adjoint to the functor u^p . Before we do so we prove a few technical lemmas.

Lemma 7.5.1. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Suppose that \mathcal{C} has fibre products and equalizers, and that u commutes with them. Then the categories $(\mathcal{I}_V)^{opp}$ satisfy the hypotheses of Categories, Lemma 4.19.7.*

Proof. There are two conditions to check.

First, suppose we are given three objects $\phi : V \rightarrow u(U)$, $\phi' : V \rightarrow u(U')$, and $\phi'' : V \rightarrow u(U'')$ and morphisms $a : U' \rightarrow U$, $b : U'' \rightarrow U$ such that $u(a) \circ \phi' = \phi$ and $u(b) \circ \phi'' = \phi$. We have to show there exists another object $\phi''' : V \rightarrow u(U''')$ and morphisms $c : U''' \rightarrow U'$ and $d : U''' \rightarrow U''$ such that $u(c) \circ \phi''' = \phi$, $u(d) \circ \phi''' = \phi$ and $a \circ c = b \circ d$. We take $U''' = U' \times_U U''$ with c and d the projection morphisms. This works as u commutes with fibre products; we omit the verification.

Second, suppose we are given two objects $\phi : V \rightarrow u(U)$ and $\phi' : V \rightarrow u(U')$ and morphisms $a, b : (U, \phi) \rightarrow (U', \phi')$. We have to find a morphism $c : (U'', \phi'') \rightarrow (U, \phi)$ which equalizes a and b . Let $c : U'' \rightarrow U$ be the equalizer of a and b in the category \mathcal{C} . As u commutes with equalizers and since $u(a) \circ \phi = u(b) \circ \phi = \phi'$ we obtain a morphism $\phi'' : V \rightarrow u(U'')$. \square

Lemma 7.5.2. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Assume*

- (1) *the category \mathcal{C} has a final object X and $u(X)$ is a final object of \mathcal{D} , and*
- (2) *the category \mathcal{C} has fibre products and u commutes with them.*

Then the index categories $(\mathcal{I}_V^u)^{opp}$ are filtered (see Categories, Definition 4.19.1).

Proof. The assumptions imply that the assumptions of Lemma 7.5.1 are satisfied (see the discussion in Categories, Section 4.18). By Categories, Lemma 4.19.7 we see that \mathcal{I}_V is a (possibly empty) disjoint union of directed categories. Hence it suffices to show that \mathcal{I}_V is connected.

First, we show that \mathcal{I}_V is nonempty. Namely, let X be the final object of \mathcal{C} , which exists by assumption. Let $V \rightarrow u(X)$ be the morphism coming from the fact that $u(X)$ is final in \mathcal{D} by assumption. This gives an object of \mathcal{I}_V .

Second, we show that \mathcal{I}_V is connected. Let $\phi_1 : V \rightarrow u(U_1)$ and $\phi_2 : V \rightarrow u(U_2)$ be in $\text{Ob}(\mathcal{I}_V)$. By assumption $U_1 \times U_2$ exists and $u(U_1 \times U_2) = u(U_1) \times u(U_2)$. Consider the morphism $\phi : V \rightarrow u(U_1 \times U_2)$ corresponding to (ϕ_1, ϕ_2) by the universal property of products. Clearly the object $\phi : V \rightarrow u(U_1 \times U_2)$ maps to both $\phi_1 : V \rightarrow u(U_1)$ and $\phi_2 : V \rightarrow u(U_2)$. \square

Given $g : V' \rightarrow V$ in \mathcal{D} we get a functor $\bar{g} : \mathcal{I}_V \rightarrow \mathcal{I}_{V'}$ by setting $\bar{g}(U, \phi) = (U, \phi \circ g)$ on objects. Given a presheaf \mathcal{F} on \mathcal{C} we obtain a functor

$$\mathcal{F}_V : \mathcal{I}_V^{opp} \rightarrow \text{Sets}, \quad (U, \phi) \mapsto \mathcal{F}(U).$$

In other words, \mathcal{F}_V is a presheaf of sets on \mathcal{I}_V . Note that we have $\mathcal{F}_{V'} \circ \bar{g} = \mathcal{F}_V$. We define

$$u_p \mathcal{F}(V) := \text{colim}_{\mathcal{I}_V^{opp}} \mathcal{F}_V$$

As a colimit we obtain for each $(U, \phi) \in \text{Ob}(\mathcal{I}_V)$ a canonical map $\mathcal{F}(U) \xrightarrow{c(\phi)} u_p \mathcal{F}(V)$. For $g : V' \rightarrow V$ as above there is a canonical restriction map $g^* : u_p \mathcal{F}(V) \rightarrow u_p \mathcal{F}(V')$ compatible with $\mathcal{F}_{V'} \circ \bar{g} = \mathcal{F}_V$ by Categories, Lemma 4.14.7. It is the unique map so that for all $(U, \phi) \in \text{Ob}(\mathcal{I}_V)$ the diagram

$$\begin{array}{ccc} \mathcal{F}(U) & \xrightarrow{c(\phi)} & u_p \mathcal{F}(V) \\ \text{id} \downarrow & & \downarrow g^* \\ \mathcal{F}(U) & \xrightarrow{c(\phi \circ g)} & u_p \mathcal{F}(V') \end{array}$$

commutes. The uniqueness of these maps implies that we obtain a presheaf. This presheaf will be denoted $u_p \mathcal{F}$.

Lemma 7.5.3. *There is a canonical map $\mathcal{F}(U) \rightarrow u_p \mathcal{F}(u(U))$, which is compatible with restriction maps (on \mathcal{F} and on $u_p \mathcal{F}$).*

Proof. This is just the map $c(\text{id}_{u(U)})$ introduced above. \square

Note that any map of presheaves $\mathcal{F} \rightarrow \mathcal{F}'$ gives rise to compatible systems of maps between functors $\mathcal{F}_Y \rightarrow \mathcal{F}'_Y$, and hence to a map of presheaves $u_p \mathcal{F} \rightarrow u_p \mathcal{F}'$. In other words, we have defined a functor

$$u_p : \text{PSh}(\mathcal{C}) \rightarrow \text{PSh}(\mathcal{D})$$

Lemma 7.5.4. *The functor u_p is a left adjoint to the functor u^p . In other words the formula*

$$\text{Mor}_{\text{PSh}(\mathcal{C})}(\mathcal{F}, u^p \mathcal{G}) = \text{Mor}_{\text{PSh}(\mathcal{D})}(u_p \mathcal{F}, \mathcal{G})$$

holds bifunctorially in \mathcal{F} and \mathcal{G} .

Proof. Let \mathcal{G} be a presheaf on \mathcal{D} and let \mathcal{F} be a presheaf on \mathcal{C} . We will show that the displayed formula holds by constructing maps either way. We will leave it to the reader to verify they are each others inverse.

Given a map $\alpha : u_p \mathcal{F} \rightarrow \mathcal{G}$ we get $u^p \alpha : u^p u_p \mathcal{F} \rightarrow u^p \mathcal{G}$. Lemma 7.5.3 says that there is a map $\mathcal{F} \rightarrow u^p u_p \mathcal{F}$. The composition of the two gives the desired map. (The good thing about this construction is that it is clearly functorial in everything in sight.)

Conversely, given a map $\beta : \mathcal{F} \rightarrow u^p \mathcal{G}$ we get a map $u_p \beta : u_p \mathcal{F} \rightarrow u_p u^p \mathcal{G}$. We claim that the functor $u^p \mathcal{G}_Y$ on \mathcal{I}_Y has a canonical map to the constant functor with value $\mathcal{G}(Y)$. Namely, for every object (X, ϕ) of \mathcal{I}_Y , the value of $u^p \mathcal{G}_Y$ on this object is $\mathcal{G}(u(X))$ which maps to $\mathcal{G}(Y)$ by $\mathcal{G}(\phi) = \phi^*$. This is a transformation of functors because \mathcal{G} is a functor itself. This leads to a map $u_p u^p \mathcal{G}(Y) \rightarrow \mathcal{G}(Y)$. Another trivial verification shows that this is functorial in Y leading to a map of presheaves $u_p u^p \mathcal{G} \rightarrow \mathcal{G}$. The composition $u_p \mathcal{F} \rightarrow u_p u^p \mathcal{G} \rightarrow \mathcal{G}$ is the desired map. \square

Remark 7.5.5. Suppose that \mathcal{A} is a category such that any diagram $\mathcal{I}_Y \rightarrow \mathcal{A}$ has a colimit in \mathcal{A} . In this case it is clear that there are functors u^p and u_p , defined in exactly the same way as above, on the categories of presheaves with values in \mathcal{A} . Moreover, the adjointness of the pair u^p and u_p continues to hold in this setting.

Lemma 7.5.6. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. For any object U of \mathcal{C} we have $u_p h_U = h_{u(U)}$.*

Proof. By adjointness of u_p and u^p we have

$$\text{Mor}_{\text{PSH}(\mathcal{D})}(u_p h_U, \mathcal{G}) = \text{Mor}_{\text{PSH}(\mathcal{C})}(h_U, u^p \mathcal{G}) = u^p \mathcal{G}(U) = \mathcal{G}(u(U))$$

and hence by Yoneda's lemma we see that $u_p h_U = h_{u(U)}$ as presheaves. \square

7.6. Sites

Our notion of a site uses the following type of structures.

Definition 7.6.1. Let \mathcal{C} be a category, see Conventions, Section 2.3. A *family of morphisms with fixed target* in \mathcal{C} is given by an object $U \in \text{Ob}(\mathcal{C})$, a set I and for each $i \in I$ a morphism $U_i \rightarrow U$ of \mathcal{C} with target U . We use the notation $\{U_i \rightarrow U\}_{i \in I}$ to indicate this.

It can happen that the set I is empty! This notation is meant to suggest an open covering as in topology.

Definition 7.6.2. A *site*¹ is given by a category \mathcal{C} and a set $\text{Cov}(\mathcal{C})$ of families of morphisms with fixed target $\{U_i \rightarrow U\}_{i \in I}$, called *coverings of \mathcal{C}* , satisfying the following axioms

- (1) If $V \rightarrow U$ is an isomorphism then $\{V \rightarrow U\} \in \text{Cov}(\mathcal{C})$.
- (2) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and for each i we have $\{V_{ij} \rightarrow U_i\}_{j \in J_i} \in \text{Cov}(\mathcal{C})$, then $\{V_{ij} \rightarrow U\}_{i \in I, j \in J_i} \in \text{Cov}(\mathcal{C})$.
- (3) If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of \mathcal{C} then $U_i \times_U V$ exists for all i and $\{U_i \times_U V \rightarrow V\}_{i \in I} \in \text{Cov}(\mathcal{C})$.

Remark 7.6.3. (On set theoretic issues – skip on a first reading.) The main reason for introducing sites is to study the category of sheaves on a site, because it is the generalization of the category of sheaves on a topological space that has been so important in algebraic geometry. In order to avoid thinking about things like “classes of classes” and so on, we will not allow sites to be “big” categories, in contrast to what we do for categories and 2-categories.

Suppose that \mathcal{C} is a category and that $\text{Cov}(\mathcal{C})$ is a proper class of coverings satisfying (1), (2) and (3) above. We will not allow this as a site either, mainly because we are going to take limits over coverings. However, there are several natural ways to replace $\text{Cov}(\mathcal{C})$ by a set of coverings or a slightly different structure that give rise to the same category of sheaves. For example:

- (1) In Sets, Section 3.11 we show how to pick a suitable set of coverings that gives the same category of sheaves.
- (2) Another thing we can do is to take the associated topology (see Definition 7.46.2). The resulting topology on \mathcal{C} has the same category of sheaves. Two topologies have the same categories of sheaves if and only if they

¹This notation differs from that of [AGV71], as explained in the introduction.

are equal, see Theorem 7.48.2. A topology on a category is given by a choice of sieves on objects. The collection of all possible sieves and even all possible topologies on \mathcal{C} is a set.

- (3) We could also slightly modify the notion of a site, see Remark 7.46.4 below, and end up with a canonical set of coverings which is contained in the powerset of the set of arrows of \mathcal{C} .

Each of these solutions has some minor drawback. For the first, one has to check that constructions later on do not depend on the choice of the set of coverings. For the second, one has to learn about topologies and redo many of the arguments for sites. For the third, see the last sentence of Remark 7.46.4.

Our approach will be to work with sites as in Definition 7.6.2 above. Given a category \mathcal{C} with a proper class of coverings as above, we will replace this by a set of coverings producing a site using Sets, Lemma 3.11.1. It is shown in Lemma 7.8.6 below that the resulting category of sheaves (the topos) is independent of this choice. We leave it to the reader to use one of the other two strategies to deal with these issues if he/she so desires.

Example 7.6.4. Let X be a topological space. Let X_{Zar} be the category whose objects consist of all the open sets U in X and whose morphisms are just the inclusion maps. That is, there is at most one morphism between any two objects in X_{Zar} . Now define $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(X_{Zar})$ if and only if $\bigcup U_i = U$. Conditions (1) and (2) above are clear, and (3) is also clear once we realize that in X_{Zar} we have $U \times V = U \cap V$. Note that in particular the empty set has to be an element of X_{Zar} since otherwise this would not work in general. Furthermore, it is equally important, as we will see later, to allow the *empty covering of the empty set as a covering!* We turn X_{Zar} into a site by choosing a suitable set of coverings $\text{Cov}(X_{Zar})_{\kappa, \alpha}$ as in Sets, Lemma 3.11.1. Presheaves and sheaves (as defined below) on the site X_{Zar} agree exactly with the usual notion of a presheaves and sheaves on a topological space, as defined in Sheaves, Section 6.1.

Example 7.6.5. Let G be a group. Consider the category $G\text{-Sets}$ whose objects are sets X with a left G -action, with G -equivariant maps as the morphisms. An important example is ${}_G G$ which is the G -set whose underlying set is G and action given by left multiplication. This category has fiber products, see Categories, Section 4.7. We declare $\{\varphi_i : U_i \rightarrow U\}_{i \in I}$ to be a covering if $\bigcup_{i \in I} \varphi_i(U_i) = U$. This gives a class of coverings on $G\text{-Sets}$ which is easily seen to satisfy conditions (1), (2), and (3) of Definition 7.6.2. The result is not a site since both the collection of objects of the underlying category and the collection of coverings form a proper class. We first replace by $G\text{-Sets}$ by a full subcategory $G\text{-Sets}_\alpha$ as in Sets, Lemma 3.10.1. After this the site $(G\text{-Sets}_\alpha, \text{Cov}_{\kappa, \alpha'}(G\text{-Sets}_\alpha))$ gotten by suitably restricting the collection of coverings as in Sets, Lemma 3.11.1 will be denoted \mathcal{T}_G .

As a special case, if the group G is countable, then we can let \mathcal{T}_G be the category of countable G -sets and coverings those jointly surjective families of morphisms $\{\varphi_i : U_i \rightarrow U\}_{i \in I}$ such that I is countable.

Example 7.6.6. Let \mathcal{C} be a category. There is a canonical way to turn this into a site where $\{\text{id}_U : U \rightarrow U\}$ are the coverings. Sheaves on this site are the presheaves on \mathcal{C} . This corresponding topology is called the *chaotic* or *indiscrete topology*.

7.7. Sheaves

Let \mathcal{C} be a site. Before we introduce the notion of a sheaf with values in a category we explain what it means for a presheaf of sets to be a sheaf. Let \mathcal{F} be a presheaf of sets on \mathcal{C} and let $\{U_i \rightarrow U\}_{i \in I}$ be an element of $\text{Cov}(\mathcal{C})$. By assumption all the fibre products $U_i \times_U U_j$ exist in \mathcal{C} . There are two natural maps

$$\prod_{i \in I} \mathcal{F}(U_i) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \times_U U_{i_1})$$

which we will denote pr_i^* , $i = 0, 1$ as indicated in the displayed equation. Namely, an element of the left hand side corresponds to a family $(s_i)_{i \in I}$, where each s_i is a section of \mathcal{F} over U_i . For each pair $(i_0, i_1) \in I \times I$ we have the projection morphisms

$$\text{pr}_{i_0}^{(i_0, i_1)} : U_{i_0} \times_U U_{i_1} \longrightarrow U_{i_0} \quad \text{and} \quad \text{pr}_{i_1}^{(i_0, i_1)} : U_{i_0} \times_U U_{i_1} \longrightarrow U_{i_1}.$$

Thus we may pull back either the section s_{i_0} via the first of these maps or the section s_{i_1} via the second. Explicitly the maps we referred to above are

$$\text{pr}_0^* : (s_i)_{i \in I} \longmapsto \left(\text{pr}_{i_0}^{(i_0, i_1), *}(s_{i_0}) \right)_{(i_0, i_1) \in I \times I}$$

and

$$\text{pr}_1^* : (s_i)_{i \in I} \longmapsto \left(\text{pr}_{i_1}^{(i_0, i_1), *}(s_{i_1}) \right)_{(i_0, i_1) \in I \times I}.$$

Finally consider the natural map

$$\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i), \quad s \longmapsto (s|_{U_i})_{i \in I}$$

where we have used the notation $s|_{U_i}$ to indicate the pullback of s via the map $U_i \rightarrow U$. It is clear from the functorial nature of \mathcal{F} and the commutativity of the fibre product diagrams that $\text{pr}_0^*((s|_{U_i})_{i \in I}) = \text{pr}_1^*((s|_{U_i})_{i \in I})$.

Definition 7.7.1. Let \mathcal{C} be a site, and let \mathcal{F} be a presheaf of sets on \mathcal{C} . We say \mathcal{F} is a *sheaf* if for every covering $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ the diagram

$$(7.7.1.1) \quad \mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \times_U U_{i_1})$$

represents the first arrow as the equalizer of pr_0^* and pr_1^* .

Loosely speaking this means that given sections $s_i \in \mathcal{F}(U_i)$ such that

$$s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$$

in $\mathcal{F}(U_i \times_U U_j)$ for all pairs $(i, j) \in I \times I$ then there exists a unique $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$.

Remark 7.7.2. If the covering $\{U_i \rightarrow U\}_{i \in I}$ is the empty family (this means that $I = \emptyset$), then the sheaf condition signifies that $\mathcal{F}(U) = \{*\}$ is a singleton set. This is true because in (7.7.1.1) the second and third sets are empty products in the category of sets, which are final objects in the category of sets, hence singletons.

Example 7.7.3. Let X be a topological space. Let X_{Zar} be the site constructed in Example 7.6.4. The notion of a sheaf on X_{Zar} coincides with the notion of a sheaf on X introduced in Sheaves, Definition 6.7.1.

Example 7.7.4. Let X be a topological space. Let us consider the site X'_{Zar} which is the same as the site X_{Zar} of Example 7.6.4 except that we disallow the empty covering of the empty set. In other words, we do allow the covering $\{\emptyset \rightarrow \emptyset\}$ but we do not allow the covering whose index set is empty. It is easy to show that this still defines a site. However, we claim that the sheaves on X'_{Zar} are different from the sheaves on X_{Zar} . For example, as an extreme case consider the situation where $X = \{p\}$ is a singleton. Then the objects of X'_{Zar} are \emptyset, X and every covering of \emptyset can be refined by $\{\emptyset \rightarrow \emptyset\}$ and every covering of X by $\{X \rightarrow X\}$. Clearly, a sheaf on this is given by any choice of a set $\mathcal{F}(\emptyset)$ and any choice of a set $\mathcal{F}(X)$, together with any restriction map $\mathcal{F}(X) \rightarrow \mathcal{F}(\emptyset)$. Thus sheaves on X'_{Zar} are the same as usual sheaves on the two point space $\{\eta, p\}$ with open sets $\{\emptyset, \{\eta\}, \{p, \eta\}\}$. In general sheaves on X'_{Zar} are the same as sheaves on the space $X \amalg \{\eta\}$, with opens given by the empty set and any set of the form $U \cup \{\eta\}$ for $U \subset X$ open.

Definition 7.7.5. The category $Sh(\mathcal{C})$ of sheaves of sets is the full subcategory of the category $PSh(\mathcal{C})$ whose objects are the sheaves of sets.

Let \mathcal{A} be a category. If products indexed by I , and $I \times I$ exist in \mathcal{A} for any I that occurs as an index set for covering families then Definition 7.7.1 above makes sense, and defines a notion of a sheaf on \mathcal{C} with values in \mathcal{A} . Note that the diagram in \mathcal{A}

$$\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}(U_i) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{(i_0, i_1) \in I \times I} \mathcal{F}(U_{i_0} \times_U U_{i_1})$$

is an equalizer diagram if and only if for every object X of \mathcal{A} the diagram of sets

$$\text{Mor}_{\mathcal{A}}(X, \mathcal{F}(U)) \longrightarrow \prod \text{Mor}_{\mathcal{A}}(X, \mathcal{F}(U_i)) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod \text{Mor}_{\mathcal{A}}(X, \mathcal{F}(U_{i_0} \times_U U_{i_1}))$$

is an equalizer diagram.

Suppose \mathcal{A} is arbitrary. Let \mathcal{F} be a presheaf with values in \mathcal{A} . Choose any object $X \in \text{Ob}(\mathcal{A})$. Then we get a presheaf of sets \mathcal{F}_X defined by the rule

$$\mathcal{F}_X(U) = \text{Mor}_{\mathcal{A}}(X, \mathcal{F}(U)).$$

From the above it follows that a good definition is obtained by requiring all the presheaves \mathcal{F}_X to be sheaves of sets.

Definition 7.7.6. Let \mathcal{C} be a site, let \mathcal{A} be a category and let \mathcal{F} be a presheaf on \mathcal{C} with values in \mathcal{A} . We say that \mathcal{F} is a *sheaf* if for all objects X of \mathcal{A} the presheaf of sets \mathcal{F}_X (defined above) is a sheaf.

7.8. Families of morphisms with fixed target

This section is meant to introduce some notions regarding families of morphisms with the same target.

Definition 7.8.1. Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms of \mathcal{C} with fixed target. Let $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be another.

- (1) A *morphism of families of maps with fixed target* of \mathcal{C} from \mathcal{U} to \mathcal{V} , or simply a *morphism from \mathcal{U} to \mathcal{V}* is given by a morphism $U \rightarrow V$, a map

of sets $\alpha : I \rightarrow J$ and for each $i \in I$ a morphism $U_i \rightarrow V_{\alpha(i)}$ such that the diagram

$$\begin{array}{ccc} U_i & \longrightarrow & V_{\alpha(i)} \\ \downarrow & & \downarrow \\ U & \longrightarrow & V \end{array}$$

is commutative.

- (2) In the special case that $U = V$ and $U \rightarrow V$ is the identity we call \mathcal{U} a *refinement* of the family \mathcal{V} .

A trivial but important remark is that if $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ is the *empty family of maps*, i.e., if $J = \emptyset$, then no family $\mathcal{U} = \{U_i \rightarrow V\}_{i \in I}$ with $I \neq \emptyset$ can refine \mathcal{V} !

Definition 7.8.2. Let \mathcal{C} be a category. Let $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \rightarrow U\}_{j \in J}$ be two families of morphisms with fixed target.

- (1) We say \mathcal{U} and \mathcal{V} are *combinatorially equivalent* if there exist maps $\alpha : I \rightarrow J$ and $\beta : J \rightarrow I$ such that $\varphi_i = \psi_{\alpha(i)}$ and $\psi_j = \varphi_{\beta(j)}$.
- (2) We say \mathcal{U} and \mathcal{V} are *tautologically equivalent* if there exist maps $\alpha : I \rightarrow J$ and $\beta : J \rightarrow I$ and for all $i \in I$ and $j \in J$ commutative diagrams

$$\begin{array}{ccc} U_i & \xrightarrow{\quad} & V_{\alpha(i)} \\ & \searrow & \swarrow \\ & & U \end{array} \qquad \begin{array}{ccc} V_j & \xrightarrow{\quad} & U_{\beta(j)} \\ & \searrow & \swarrow \\ & & U \end{array}$$

with isomorphisms as horizontal arrows.

Lemma 7.8.3. Let \mathcal{C} be a category. Let $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \rightarrow U\}_{j \in J}$ be two families of morphisms with the same fixed target.

- (1) If \mathcal{U} and \mathcal{V} are combinatorially equivalent then they are tautologically equivalent.
- (2) If \mathcal{U} and \mathcal{V} are tautologically equivalent then \mathcal{U} is a refinement of \mathcal{V} and \mathcal{V} is a refinement of \mathcal{U} .
- (3) The relation “being combinatorially equivalent” is an equivalence relation on all families of morphisms with fixed target.
- (4) The relation “being tautologically equivalent” is an equivalence relation on all families of morphisms with fixed target.
- (5) The relation “ \mathcal{U} refines \mathcal{V} and \mathcal{V} refines \mathcal{U} ” is an equivalence relation on all families of morphisms with fixed target.

Proof. Omitted. □

In the following lemma, given a category \mathcal{C} , a presheaf \mathcal{F} on \mathcal{C} , a family $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ such that all fibre products $U_i \times_U U_{i'}$ exist, we say that *the sheaf condition for \mathcal{F} with respect to \mathcal{U}* holds if the diagram (7.7.1.1) is an equalizer diagram.

Lemma 7.8.4. Let \mathcal{C} be a category. Let $\mathcal{U} = \{\varphi_i : U_i \rightarrow U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \rightarrow U\}_{j \in J}$ be two families of morphisms with the same fixed target. Assume that the fibre products $U_i \times_U U_{i'}$ and $V_j \times_U V_{j'}$ exist. If \mathcal{U} and \mathcal{V} are tautologically equivalent, then for any presheaf \mathcal{F} on \mathcal{C} the sheaf condition for \mathcal{F} with respect to \mathcal{U} is equivalent to the sheaf condition for \mathcal{F} with respect to \mathcal{V} .

Proof. First, note that if $\varphi : A \rightarrow B$ is an isomorphism in the category \mathcal{C} , then $\varphi^* : \mathcal{F}(B) \rightarrow \mathcal{F}(A)$ is an isomorphism. Let $\beta : J \rightarrow I$ be a map and let $\psi_j : V_j \rightarrow U_{\beta(j)}$ be isomorphisms over U which are assumed to exist by hypothesis. Let us show that the sheaf condition for \mathcal{V} implies the sheaf condition for \mathcal{U} . Suppose given sections $s_i \in \mathcal{F}(U_i)$ such that

$$s_i|_{U_i \times_U U_{i'}} = s_{i'}|_{U_i \times_U U_{i'}}$$

in $\mathcal{F}(U_i \times_U U_{i'})$ for all pairs $(i, i') \in I \times I$. Then we can define $s_j = \psi_j^* s_{\beta(j)}$. For any pair $(j, j') \in J \times J'$ the morphism $\psi_j \times_{\text{id}_U} \psi_{j'} : V_j \times_U V_{j'} \rightarrow U_{\beta(j)} \times_U U_{\beta(j')}$ is an isomorphism as well. Hence by transport of structure we see that

$$s_j|_{V_j \times_U V_{j'}} = s_{j'}|_{V_j \times_U V_{j'}}$$

as well. The sheaf condition w.r.t. \mathcal{V} implies there exists a unique s such that $s|_{V_j} = s_j$ for all $j \in J$. By the first remark of the proof this implies that $s|_{U_i} = s_i$ for all $i \in \text{Im}(\beta)$ as well. Suppose that $i \in I$, $i \notin \text{Im}(\beta)$. For such an i we have isomorphisms $U_i \rightarrow V_{\alpha(i)} \rightarrow U_{\beta(\alpha(i))}$ over U . This gives a morphism $U_i \rightarrow U_i \times_U U_{\beta(\alpha(i))}$ which is a section of the projection. Because s_i and $s_{\beta(\alpha(i))}$ restrict to the same element on the fibre product we conclude that $s_{\beta(\alpha(i))}$ pulls back to s_i via $U_i \rightarrow U_{\beta(\alpha(i))}$. Thus we see that also $s_i = s|_{U_i}$ as desired. \square

Lemma 7.8.5. *Let \mathcal{C} be a category. Let Cov_i , $i = 1, 2$ be two sets of families of morphisms with fixed target which each define the structure of a site on \mathcal{C} .*

- (1) *If every $\mathcal{U} \in \text{Cov}_1$ is tautologically equivalent to some $\mathcal{V} \in \text{Cov}_2$, then $\text{Sh}(\mathcal{C}, \text{Cov}_2) \subset \text{Sh}(\mathcal{C}, \text{Cov}_1)$. If also, every $\mathcal{U} \in \text{Cov}_2$ is tautologically equivalent to some $\mathcal{V} \in \text{Cov}_1$ then the categories of sheaves are equal.*
- (2) *Suppose that for each $\mathcal{U} \in \text{Cov}_1$ there exists a $\mathcal{V} \in \text{Cov}_2$ such that \mathcal{V} refines \mathcal{U} . In this case $\text{Sh}(\mathcal{C}, \text{Cov}_2) \subset \text{Sh}(\mathcal{C}, \text{Cov}_1)$. If also for every $\mathcal{U} \in \text{Cov}_2$ there exists a $\mathcal{V} \in \text{Cov}_1$ such that \mathcal{V} refines \mathcal{U} , then the categories of sheaves are equal.*

Proof. Part (1) follows directly from Lemma 7.8.4 and the definitions.

We advise the reader to **skip the proof of (2)** on a first reading. Let \mathcal{F} be a sheaf of sets for the site $(\mathcal{C}, \text{Cov}_2)$. Let $\mathcal{U} \in \text{Cov}_1$, say $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$. Choose a refinement $\mathcal{V} \in \text{Cov}_2$ of \mathcal{U} , say $\mathcal{V} = \{V_j \rightarrow U\}_{j \in J}$ and refinement given by $\alpha : J \rightarrow I$ and $f_j : V_j \rightarrow U_{\alpha(j)}$.

First let $s, s' \in \mathcal{F}(U)$. If for all $i \in I$ we have $s|_{U_i} = s'|_{U_i}$, then we also have $s|_{V_j} = s'|_{V_j}$ for all $j \in J$. This implies that $s = s'$ by the sheaf condition for \mathcal{F} with respect to Cov_2 . Hence we see that the unicity in the sheaf condition for \mathcal{F} and the site $(\mathcal{C}, \text{Cov}_1)$ holds.

Next, suppose given $s_i \in \mathcal{F}(U_i)$ such that $s_i|_{U_i \times_U U_{i'}} = s_{i'}|_{U_i \times_U U_{i'}}$ for all $i, i' \in I$. Set $s_j = f_j^*(s_{\alpha(j)}) \in \mathcal{F}(V_j)$. Since the morphisms f_j are morphisms over U we obtain induced morphisms $f_{jj'} : V_j \times_U V_{j'} \rightarrow U_{\alpha(j)} \times_U U_{\alpha(j')}$ compatible with the $f_j, f_{j'}$ via the projection maps. It follows that

$$s_j|_{V_j \times_U V_{j'}} = f_{jj'}^*(s_{\alpha(j)}|_{U_{\alpha(j)} \times_U U_{\alpha(j')}}) = f_{jj'}^*(s_{\alpha(j')}|_{U_{\alpha(j)} \times_U U_{\alpha(j')}}) = s_{j'}|_{V_j \times_U V_{j'}}$$

for all $j, j' \in J$. Hence, by the sheaf condition for \mathcal{F} with respect to Cov_2 , we get a section $s \in \mathcal{F}(U)$ which restricts to s_j on each V_j . We are done if we show s restricts to s_{i_0} on U_{i_0} for any $i_0 \in I$. For each $i_0 \in I$ the family $\mathcal{U}' = \{U_i \times_U U_{i_0} \rightarrow U_{i_0}\}_{i \in I}$ is an element of Cov_1 by the axioms of a site. Also, the family $\mathcal{V}' = \{V_j \times_U U_{i_0} \rightarrow$

$U_{i_0}\}_{j \in J}$ is an element of Cov_2 . Then \mathcal{V}' refines \mathcal{U}' via $\alpha : J \rightarrow I$ and the maps $f'_j = f_j \times \text{id}_{U_{i_0}}$. The element s_{i_0} restricts to $s_i|_{U_i \times_U U_{i_0}}$ on the members of the covering \mathcal{U}' and hence via $(f'_j)^*$ to the elements $s_j|_{V_j \times_U U_{i_0}}$ on the members of the covering \mathcal{V}' . By construction of s this is the same as the family of restrictions of $s|_{U_{i_0}}$ to the members of the covering \mathcal{V}' . Hence by the sheaf condition for \mathcal{F} with respect to Cov_2 we see that $s|_{U_{i_0}} = s_{i_0}$ as desired. \square

Lemma 7.8.6. *Let \mathcal{C} be a category. Let $\text{Cov}(\mathcal{C})$ be a proper class of coverings satisfying conditions (1), (2) and (3) of Definition 7.6.2. Let $\text{Cov}_1, \text{Cov}_2 \subset \text{Cov}(\mathcal{C})$ be two subsets of $\text{Cov}(\mathcal{C})$ which endow \mathcal{C} with the structure of a site. If every covering $U \in \text{Cov}(\mathcal{C})$ is combinatorially equivalent to a covering in Cov_1 and combinatorially equivalent to a covering in Cov_2 , then $\text{Sh}(\mathcal{C}, \text{Cov}_1) = \text{Sh}(\mathcal{C}, \text{Cov}_2)$.*

Proof. This is clear from Lemmas 7.8.5 and 7.8.3 above as the hypothesis implies that every covering $U \in \text{Cov}_1 \subset \text{Cov}(\mathcal{C})$ is combinatorially equivalent to an element of Cov_2 , and similarly with the roles of Cov_1 and Cov_2 reversed. \square

7.9. The example of G-sets

As an example, consider the site \mathcal{T}_G of Example 7.6.5. We will describe the category of sheaves on \mathcal{T}_G . The answer will turn out to be independent of the choices made in defining \mathcal{T}_G . In fact, during the proof we will need only the following properties of the site \mathcal{T}_G :

- (a) \mathcal{T}_G is a full subcategory of $G\text{-Sets}$,
- (b) \mathcal{T}_G contains the G -set ${}_G G$,
- (c) \mathcal{T}_G has fibre products and they are the same as in $G\text{-Sets}$,
- (d) given $U \in \text{Ob}(\mathcal{T}_G)$ and a G -invariant subset $O \subset U$, there exists an object of \mathcal{T}_G isomorphic to O , and
- (e) any surjective family of maps $\{U_i \rightarrow U\}_{i \in I}$, with $U, U_i \in \text{Ob}(\mathcal{T}_G)$ is combinatorially equivalent to a covering of \mathcal{T}_G .

These properties hold by Sets, Lemmas 3.10.2 and 3.11.1.

Remark that the map

$$\text{Hom}_G({}_G G, {}_G G) \longrightarrow G^{\text{opp}}, \varphi \longmapsto \varphi(1)$$

is an isomorphism of groups. The inverse map sends $g \in G$ to the map $R_g : s \mapsto sg$ (i.e. right multiplication). Note that $R_{g_1 g_2} = R_{g_2} \circ R_{g_1}$ so the opposite is necessary.

This implies that for every presheaf \mathcal{F} on \mathcal{T}_G the value $\mathcal{F}({}_G G)$ inherits the structure of a G -set as follows: $g \cdot s$ for $g \in G$ and $s \in \mathcal{F}({}_G G)$ defined by $\mathcal{F}(R_g)(s)$. This is a left action because

$$(g_1 g_2) \cdot s = \mathcal{F}(R_{g_1 g_2})(s) = \mathcal{F}(R_{g_2} \circ R_{g_1})(s) = \mathcal{F}(R_{g_1})(\mathcal{F}(R_{g_2})(s)) = g_1 \cdot (g_2 \cdot s).$$

Here we've used that \mathcal{F} is contravariant. Note that if $\mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets on \mathcal{T}_G then we get a map $\mathcal{F}({}_G G) \rightarrow \mathcal{G}({}_G G)$ which is compatible with the G -actions we have just defined. All in all we have constructed a functor

$$\text{PSh}(\mathcal{T}_G) \longrightarrow G\text{-Sets}, \quad \mathcal{F} \longmapsto \mathcal{F}({}_G G).$$

We leave it to the reader to verify that this construction has the pleasing property that the representable presheaf h_U is mapped to something canonically isomorphic to U . In a formula $h_U({}_G G) = \text{Hom}_G({}_G G, U) \cong U$.

Suppose that S is a G -set. We define a presheaf \mathcal{F}_S by the formula²

$$\mathcal{F}_S(U) = \text{Mor}_{G\text{-Sets}}(U, S).$$

This is clearly a presheaf. On the other hand, suppose that $\{U_i \rightarrow U\}_{i \in I}$ is a covering in \mathcal{T}_G . This implies that $\coprod_i U_i \rightarrow U$ is surjective. Thus it is clear that the map

$$\mathcal{F}_S(U) = \text{Mor}_{G\text{-Sets}}(U, S) \longrightarrow \prod \mathcal{F}_S(U_i) = \prod \text{Mor}_{G\text{-Sets}}(U_i, S)$$

is injective. And, given a family of G -equivariant maps $s_i : U_i \rightarrow S$, such that all the diagrams

$$\begin{array}{ccc} U_i \times_U U_j & \longrightarrow & U_j \\ \downarrow & & \downarrow s_j \\ U_i & \xrightarrow{s_i} & S \end{array}$$

commute, there is a unique G -equivariant map $s : U \rightarrow S$ such that s_i is the composition $U_i \rightarrow U \rightarrow S$. Namely, we just define $s(u) = s_i(u_i)$ where $i \in I$ is any index such that there exists some $u_i \in U_i$ mapping to u under the map $U_i \rightarrow U$. The commutativity of the diagrams above implies exactly that this construction is well defined. All in all we have constructed a functor

$$G\text{-Sets} \longrightarrow \text{Sh}(\mathcal{T}_G), \quad S \longmapsto \mathcal{F}_S.$$

We now have the following diagram of categories and functors

$$\begin{array}{ccc} P\text{Sh}(\mathcal{T}_G) & \xrightarrow{\mathcal{F} \mapsto \mathcal{F}_{(G G)}} & G\text{-Sets} \\ & \searrow & \swarrow S \mapsto \mathcal{F}_S \\ & \text{Sh}(\mathcal{T}_G) & \end{array}$$

It is immediate from the definitions that $\mathcal{F}_S(GG) = \text{Mor}_G(GG, S) = S$, the last equality by evaluation at 1. This almost proves the following.

Proposition 7.9.1. *The functors $\mathcal{F} \mapsto \mathcal{F}_{(G G)}$ and $S \mapsto \mathcal{F}_S$ define quasi-inverse equivalences between $\text{Sh}(\mathcal{T}_G)$ and $G\text{-Sets}$.*

Proof. We have already seen that composing the functors one way around is isomorphic to the identity functor. In the other direction, for any sheaf \mathcal{H} there is a natural map of sheaves

$$\text{can} : \mathcal{H} \longrightarrow \mathcal{F}_{\mathcal{H}(G G)}.$$

Namely, for any object U of \mathcal{T}_G we let can_U be the map

$$\begin{array}{ccc} \mathcal{H}(U) & \longrightarrow & \mathcal{F}_{\mathcal{H}(G G)}(U) = \text{Mor}_G(U, \mathcal{H}(G G)) \\ s & \longmapsto & (u \mapsto \alpha_u^* s). \end{array}$$

Here $\alpha_u : GG \rightarrow U$ is the map $\alpha_u(g) = gu$ and $\alpha_u^* : \mathcal{H}(U) \rightarrow \mathcal{H}(GG)$ is the pullback map. A trivial but confusing verification shows that this is indeed a map of presheaves. We have to show that can is an isomorphism. We do this by showing can_U is an isomorphism for all $U \in \text{ob}(\mathcal{T}_G)$. We leave the (important but easy) case that $U = GG$ to the reader. A general object U of \mathcal{T}_G is a disjoint union of G -orbits: $U = \coprod_{i \in I} O_i$. The family of maps $\{O_i \rightarrow U\}_{i \in I}$ is tautologically equivalent

²It may appear this is the representable presheaf defined by S . This may not be the case because S may not be an object of \mathcal{T}_G which was chosen to be a sufficiently large set of G -sets.

to a covering in \mathcal{T}_G (by the properties of \mathcal{T}_G listed at the beginning of this section). Hence by Lemma 7.8.4 the sheaf \mathcal{H} satisfies the sheaf property with respect to $\{O_i \rightarrow U\}_{i \in I}$. The sheaf property for this covering implies $\mathcal{H}(U) = \prod_i \mathcal{H}(O_i)$. Hence it suffices to show that can_U is an isomorphism when U consists of a single G -orbit. Let $u \in U$ and let $H \subset G$ be its stabilizer. Clearly, $\text{Mor}_G(U, \mathcal{H}({}_G G)) = \mathcal{H}({}_G G)^H$ equals the subset of H -invariant elements. On the other hand consider the covering $\{{}_G G \rightarrow U\}$ given by $g \mapsto gu$ (again it is just combinatorially equivalent to some covering of \mathcal{T}_G , and again this doesn't matter). Note that the fibre product $({}_G G) \times_U ({}_G G)$ is equal to $\{(g, gh), g \in G, h \in H\} \cong \prod_{h \in H} {}_G G$. Hence the sheaf property for this covering reads as

$$\mathcal{H}(U) \longrightarrow \mathcal{H}({}_G G) \begin{array}{c} \xrightarrow{\text{pr}_0^*} \\ \xrightarrow{\text{pr}_1^*} \end{array} \prod_{h \in H} \mathcal{H}({}_G G).$$

The two maps pr_i^* into the factor $\mathcal{H}({}_G G)$ differ by multiplication by h . Now the result follows from this and the fact that can is an isomorphism for $U = {}_G G$. \square

7.10. Sheafification

In order to define the sheafification we study the zeroth Čech cohomology group of a covering and its functoriality properties.

Let \mathcal{F} be a presheaf of sets on \mathcal{C} , and let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . Let us use the notation $\mathcal{F}(\mathcal{U})$ to indicate the equalizer

$$H^0(\mathcal{U}, \mathcal{F}) = \{(s_i)_{i \in I} \in \prod_i \mathcal{F}(U_i) \mid s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j} \ \forall i, j \in I\}.$$

As we will see later, this is the zeroth Čech cohomology of \mathcal{F} over U with respect to the covering \mathcal{U} . A small remark is that we can define $H^0(\mathcal{U}, \mathcal{F})$ as soon as all the morphisms $U_i \rightarrow U$ are representable, i.e., \mathcal{U} need not be a covering of the site. There is a canonical map $\mathcal{F}(U) \rightarrow H^0(\mathcal{U}, \mathcal{F})$. It is clear that a morphism of coverings $\mathcal{U} \rightarrow \mathcal{V}$ induces commutative diagrams

$$\begin{array}{ccccc} & & U_i & \xrightarrow{\quad} & V_{\alpha(i)} \\ & \nearrow & & & \nearrow \\ U_i \times_U U_j & \xrightarrow{\quad} & V_{\alpha(i)} \times_V V_{\alpha(j)} & & \\ & \searrow & & & \searrow \\ & & U_j & \xrightarrow{\quad} & V_{\alpha(j)} \end{array}$$

This in turn produces a map $H^0(\mathcal{V}, \mathcal{F}) \rightarrow H^0(\mathcal{U}, \mathcal{F})$, compatible with the map $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$.

By construction, a presheaf \mathcal{F} is a sheaf if and only if for every covering \mathcal{U} of \mathcal{C} the natural map $\mathcal{F}(U) \rightarrow H^0(\mathcal{U}, \mathcal{F})$ is bijective. We will use this notion to prove the following simple lemma about limits of sheaves.

Lemma 7.10.1. *Let $\mathcal{F} : \mathcal{I} \rightarrow \text{Sh}(\mathcal{C})$ be a diagram. Then $\lim_{\mathcal{I}} \mathcal{F}$ exists and is equal to the limit in the category of presheaves.*

Proof. Let $\lim_i \mathcal{F}_i$ be the limit as a presheaf. We will show that this is a sheaf and then it will trivially follow that it is a limit in the category of sheaves. To prove the sheaf property, let $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be a covering. Let $(s_j)_{j \in J}$ be an element of $H^0(\mathcal{V}, \lim_i \mathcal{F}_i)$. Using the projection maps we get elements $(s_{j,i})_{j \in J}$ in $H^0(\mathcal{V}, \mathcal{F}_i)$. By the sheaf property for \mathcal{F}_i we see that there is a unique $s_i \in \mathcal{F}_i(V)$ such that $s_{j,i} = s_i|_{V_j}$. Let $\phi : i \rightarrow i'$ be a morphism of the index category. We would like to show that $\mathcal{F}(\phi) : \mathcal{F}_i \rightarrow \mathcal{F}_{i'}$ maps s_i to $s_{i'}$. We know this is true for the sections $s_{i,j}$ and $s_{i',j}$ for all j and hence by the sheaf property for $\mathcal{F}_{i'}$ this is true. At this point we have an element $s = (s_i)_{i \in \text{Ob}(\mathcal{I})}$ of $(\lim_i \mathcal{F}_i)(V)$. We leave it to the reader to see this element has the required property that $s_j = s|_{V_j}$. \square

Example 7.10.2. A particular example is the limit over the empty diagram. This gives the final object in the category of (pre)sheaves. It is the sheaf that associates to each object U of \mathcal{C} a singleton set, with unique restriction mappings. We often denote this sheaf by $*$.

Let \mathcal{J}_U be the category of all coverings of U . In other words, the objects of \mathcal{J}_U are the coverings of U in \mathcal{C} , and the morphisms are the refinements. By our conventions on sites this is indeed a category, i.e., the collection of objects and morphisms forms a set. Note that $\text{Ob}(\mathcal{J}_U)$ is not empty since $\{\text{id}_U\}$ is an object of it. According to the remarks above the construction $\mathcal{U} \mapsto H^0(\mathcal{U}, \mathcal{F})$ is a contravariant functor on \mathcal{J}_U . We define

$$\mathcal{F}^+(U) = \text{colim}_{\mathcal{J}_U^{\text{opp}}} H^0(\mathcal{U}, \mathcal{F})$$

See Categories, Section 4.14 for a discussion of limits and colimits. We point out that later we will see that $\mathcal{F}^+(U)$ is the zeroth Čech cohomology of \mathcal{F} over U .

Before we say more about the structure of the colimit, we turn the collection of sets $\mathcal{F}^+(U)$, $U \in \text{Ob}(\mathcal{C})$ into a presheaf. Namely, let $V \rightarrow U$ be a morphism of \mathcal{C} . By the axioms of a site there is a functor³

$$\mathcal{J}_U \longrightarrow \mathcal{J}_V, \quad \{U_i \rightarrow U\} \longmapsto \{U_i \times_U V \rightarrow V\}.$$

Note that the projection maps furnish a functorial morphism of coverings $\{U_i \times_U V \rightarrow V\} \rightarrow \{U_i \rightarrow U\}$ and hence, by the construction above, a functorial map of sets $H^0(\{U_i \rightarrow U\}, \mathcal{F}) \rightarrow H^0(\{U_i \times_U V \rightarrow V\}, \mathcal{F})$. In other words, there is a transformation of functors from $H^0(-, \mathcal{F}) : \mathcal{J}_U \rightarrow \text{Sets}$ to the composition $\mathcal{J}_U \rightarrow \mathcal{J}_V \xrightarrow{H^0(-, \mathcal{F})} \text{Sets}$. Hence by generalities of colimits we obtain a canonical map $\mathcal{F}^+(U) \rightarrow \mathcal{F}^+(V)$. In terms of the description of the set $\mathcal{F}^+(U)$ above, it just takes the element associated with $s = (s_i) \in H^0(\{U_i \rightarrow U\}, \mathcal{F})$ to the element associated with $(s_i|_{V \times_U U_i}) \in H^0(\{U_i \times_U V \rightarrow V\}, \mathcal{F})$.

Lemma 7.10.3. *The constructions above define a presheaf \mathcal{F}^+ together with a canonical map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^+$.*

Proof. All we have to do is to show that given morphisms $W \rightarrow V \rightarrow U$ the composition $\mathcal{F}^+(U) \rightarrow \mathcal{F}^+(V) \rightarrow \mathcal{F}^+(W)$ equals the map $\mathcal{F}^+(U) \rightarrow \mathcal{F}^+(W)$. This can be shown directly by verifying that, given a covering $\{U_i \rightarrow U\}$ and $s = (s_i) \in H^0(\{U_i \rightarrow U\}, \mathcal{F})$, we have canonically $W \times_U U_i \cong W \times_V (V \times_U U_i)$, and $s_i|_{W \times_U U_i}$ corresponds to $(s_i|_{V \times_U U_i})|_{W \times_V (V \times_U U_i)}$ via this isomorphism. \square

³This construction actually involves a choice of the fibre products $U_i \times_U V$ and hence the axiom of choice. The resulting map does not depend on the choices made, see below.

More indirectly, the result of Lemma 7.10.6 shows that we may pullback an element s as above via any morphism from any covering of W to $\{U_i \rightarrow U\}$ and we will always end up with the same element in $\mathcal{F}^+(W)$.

Lemma 7.10.4. *The association $\mathcal{F} \mapsto (\mathcal{F} \rightarrow \mathcal{F}^+)$ is a functor.*

Proof. Instead of proving this we state exactly what needs to be proven. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a map of presheaves. Prove the commutativity of:

$$\begin{array}{ccc} \mathcal{F} & \longrightarrow & \mathcal{F}^+ \\ \downarrow & & \downarrow \\ \mathcal{G} & \longrightarrow & \mathcal{G}^+ \end{array}$$

□

The next two lemmas imply that the colimits above are colimits over a directed partially ordered set.

Lemma 7.10.5. *Given a pair of coverings $\{U_i \rightarrow U\}$ and $\{V_j \rightarrow U\}$ of a given object U of the site \mathcal{C} , there exists a covering which is a common refinement.*

Proof. Since \mathcal{C} is a site we have that for every i the family $\{V_j \times_U U_i \rightarrow U_i\}_j$ is a covering. And, then another axiom implies that $\{V_j \times_U U_i \rightarrow U\}_{i,j}$ is a covering of U . Clearly this covering refines both given coverings. □

Lemma 7.10.6. *Any two morphisms $f, g : \mathcal{U} \rightarrow \mathcal{V}$ of coverings inducing the same morphism $U \rightarrow V$ induce the same map $H^0(\mathcal{V}, \mathcal{F}) \rightarrow H^0(\mathcal{U}, \mathcal{F})$.*

Proof. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ and $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$. The morphism f consists of a map $U \rightarrow V$, a map $\alpha : I \rightarrow J$ and maps $f_i : U_i \rightarrow V_{\alpha(i)}$. Likewise, g determines a map $\beta : I \rightarrow J$ and maps $g_i : U_i \rightarrow V_{\beta(i)}$. As f and g induce the same map $U \rightarrow V$, the diagram

$$\begin{array}{ccc} & V_{\alpha(i)} & \\ f_i \nearrow & & \searrow \\ U_i & & V \\ g_i \searrow & & \nearrow \\ & V_{\beta(i)} & \end{array}$$

is commutative for every $i \in I$. Hence f and g factor through the fibre product

$$\begin{array}{ccc} & V_{\alpha(i)} & \\ f_i \nearrow & & \uparrow \text{pr}_1 \\ U_i & \xrightarrow{\varphi} & V_{\alpha(i)} \times_V V_{\beta(i)} \\ g_i \searrow & & \downarrow \text{pr}_2 \\ & & V_{\beta(i)} \end{array}$$

Now let $s = (s_j)_j \in H^0(\mathcal{V}, \mathcal{F})$. Then for all $i \in I$:

$$(f^*s)_i = f_i^*(s_{\alpha(i)}) = \varphi^* \text{pr}_1^*(s_{\alpha(i)}) = \varphi^* \text{pr}_2^*(s_{\beta(i)}) = g_i^*(s_{\beta(i)}) = (g^*s)_i,$$

where the middle equality is given by the definition of $H^0(\mathcal{V}, \mathcal{F})$. This shows that the maps $H^0(\mathcal{V}, \mathcal{F}) \rightarrow H^0(\mathcal{U}, \mathcal{F})$ induced by f and g are equal. \square

Remark 7.10.7. In particular this lemma shows that if \mathcal{U} is a refinement of \mathcal{V} , and if \mathcal{V} is a refinement of \mathcal{U} , then there is a canonical identification $H^0(\mathcal{U}, \mathcal{F}) = H^0(\mathcal{V}, \mathcal{F})$.

From these two lemmas, and the fact that \mathcal{J}_U is nonempty, it follows that the diagram $H^0(-, \mathcal{F}) : \mathcal{J}_U^{opp} \rightarrow \mathit{Sets}$ is filtered, see Categories, Definition 4.19.1. Hence, by Categories, Section 4.19 the colimit $\mathcal{F}^+(U)$ may be described in the following straightforward manner. Namely, every element in the set $\mathcal{F}^+(U)$ arises from an element $s \in H^0(\mathcal{U}, \mathcal{F})$ for some covering \mathcal{U} of U . Given a second element $s' \in H^0(\mathcal{U}', \mathcal{F})$ then s and s' determine the same element of the colimit if and only if there exists a covering \mathcal{V} of U and refinements $f : \mathcal{V} \rightarrow \mathcal{U}$ and $f' : \mathcal{V} \rightarrow \mathcal{U}'$ such that $f^*s = (f')^*s'$ in $H^0(\mathcal{V}, \mathcal{F})$. Since the trivial covering $\{\text{id}_U\}$ is an object of \mathcal{J}_U we get a canonical map $\mathcal{F}(U) \rightarrow \mathcal{F}^+(U)$.

Lemma 7.10.8. *The map $\theta : \mathcal{F} \rightarrow \mathcal{F}^+$ has the following property: For every object U of \mathcal{C} and every section $s \in \mathcal{F}^+(U)$ there exists a covering $\{U_i \rightarrow U\}$ such that $s|_{U_i}$ is in the image of $\theta : \mathcal{F}(U_i) \rightarrow \mathcal{F}^+(U_i)$.*

Proof. Namely, let $\{U_i \rightarrow U\}$ be a covering such that s arises from the element $(s_i) \in H^0(\{U_i \rightarrow U\}, \mathcal{F})$. According to Lemma 7.10.6 we may consider the covering $\{U_i \rightarrow U_i\}$ and the (obvious) morphism of coverings $\{U_i \rightarrow U_i\} \rightarrow \{U_i \rightarrow U\}$ to compute the pullback of s to an element of $\mathcal{F}^+(U_i)$. And indeed, using this covering we get exactly $\theta(s_i)$ for the restriction of s to U_i . \square

Definition 7.10.9. We say that a presheaf of sets \mathcal{F} on a site \mathcal{C} is *separated* if, for all coverings of $\{U_i \rightarrow U\}$, the map $\mathcal{F}(U) \rightarrow \prod \mathcal{F}(U_i)$ is injective.

Theorem 7.10.10. *With \mathcal{F} as above*

- (1) *The presheaf \mathcal{F}^+ is separated.*
- (2) *If \mathcal{F} is separated, then \mathcal{F}^+ is a sheaf and the map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^+$ is injective.*
- (3) *If \mathcal{F} is a sheaf, then $\mathcal{F} \rightarrow \mathcal{F}^+$ is an isomorphism.*
- (4) *The presheaf \mathcal{F}^{++} is always a sheaf.*

Proof. Proof of (1). Suppose that $s, s' \in \mathcal{F}^+(U)$ and suppose that there exists some covering $\{U_i \rightarrow U\}$ such that $s|_{U_i} = s'|_{U_i}$ for all i . We now have three coverings of U : the covering $\{U_i \rightarrow U\}$ above, a covering \mathcal{U} for s as in Lemma 7.10.8, and a similar covering \mathcal{U}' for s' . By Lemma 7.10.5, we can find a common refinement, say $\{W_j \rightarrow U\}$. This means we have $s_j, s'_j \in \mathcal{F}(W_j)$ such that $s|_{W_j} = \theta(s_j)$, similarly for $s'|_{W_j}$, and such that $\theta(s_j) = \theta(s'_j)$. This last equality means that there exists some covering $\{W_{jk} \rightarrow W_j\}$ such that $s_j|_{W_{jk}} = s'_j|_{W_{jk}}$. Then since $\{W_{jk} \rightarrow U\}$ is a covering we see that s, s' map to the same element of $H^0(\{W_{jk} \rightarrow U\}, \mathcal{F})$ as desired.

Proof of (2). It is clear that $\mathcal{F} \rightarrow \mathcal{F}^+$ is injective because all the maps $\mathcal{F}(U) \rightarrow H^0(\mathcal{U}, \mathcal{F})$ are injective. It is also clear that, if $\mathcal{U} \rightarrow \mathcal{U}'$ is a refinement, then $H^0(\mathcal{U}', \mathcal{F}) \rightarrow H^0(\mathcal{U}, \mathcal{F})$ is injective. Now, suppose that $\{U_i \rightarrow U\}$ is a covering, and let (s_i) be a family of elements of $\mathcal{F}^+(U_i)$ satisfying the sheaf condition $s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$ for all $i, j \in I$. Choose coverings (as in Lemma 7.10.8) $\{U_{ij} \rightarrow U_i\}$ such

that $s_i|_{U_{ij}}$ is the image of the (unique) element $s_{ij} \in \mathcal{F}(U_{ij})$. The sheaf condition implies that s_{ij} and $s_{i'j'}$ agree over $U_{ij} \times_U U_{i'j'}$ because it maps to $U_i \times_U U_i$ and we have the equality there. Hence $(s_{ij}) \in H^0(\{U_{ij} \rightarrow U\}, \mathcal{F})$ gives rise to an element $s \in \mathcal{F}^+(U)$. We leave it to the reader to verify that $s|_{U_i} = s_i$.

Proof of (3). This is immediate from the definitions because the sheaf property says exactly that every map $\mathcal{F} \rightarrow H^0(\mathcal{U}, \mathcal{F})$ is bijective (for every covering \mathcal{U} of U).

Statement (4) is now obvious. □

Definition 7.10.11. Let \mathcal{C} be a site and let \mathcal{F} be a presheaf of sets on \mathcal{C} . The sheaf $\mathcal{F}^\# := \mathcal{F}^{++}$ together with the canonical map $\mathcal{F} \rightarrow \mathcal{F}^\#$ is called the *sheaf associated to \mathcal{F}* .

Proposition 7.10.12. *The canonical map $\mathcal{F} \rightarrow \mathcal{F}^\#$ has the following universal property: For any map $\mathcal{F} \rightarrow \mathcal{G}$, where \mathcal{G} is a sheaf of sets, there is a unique map $\mathcal{F}^\# \rightarrow \mathcal{G}$ such that $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$ equals the given map.*

Proof. By Lemma 7.10.4 we get a commutative diagram

$$\begin{array}{ccccc} \mathcal{F} & \longrightarrow & \mathcal{F}^+ & \longrightarrow & \mathcal{F}^{++} \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{G} & \longrightarrow & \mathcal{G}^+ & \longrightarrow & \mathcal{G}^{++} \end{array}$$

and by Theorem 7.10.10 the lower horizontal maps are isomorphisms. The uniqueness follows from Lemma 7.10.8 which says that every section of $\mathcal{F}^\#$ locally comes from sections of \mathcal{F} . □

It is clear from this result that the functor $\mathcal{F} \mapsto (\mathcal{F} \rightarrow \mathcal{F}^\#)$ is unique up to unique isomorphism of functors. Actually, let us temporarily denote $i : Sh(\mathcal{C}) \rightarrow PSh(\mathcal{C})$ the functor of inclusion. The result above actually says that

$$\text{Mor}_{PSh(\mathcal{C})}(\mathcal{F}, i(\mathcal{G})) = \text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}^\#, \mathcal{G}).$$

In other words, the functor of sheafification is the left adjoint to the inclusion functor i . We finish this section with a couple of lemmas.

Lemma 7.10.13. *Let $\mathcal{F} : \mathcal{I} \rightarrow Sh(\mathcal{C})$ be a diagram. Then $\text{colim}_{\mathcal{I}} \mathcal{F}$ exists and is the sheafification of the colimit in the category of presheaves.*

Proof. Since the sheafification functor is a left adjoint it commutes with all colimits, see Categories, Lemma 4.24.4. Hence, since $PSh(\mathcal{C})$ has colimits, we deduce that $Sh(\mathcal{C})$ has colimits (which are the sheafifications of the colimits in presheaves). □

Lemma 7.10.14. *The functor $PSh(\mathcal{C}) \rightarrow Sh(\mathcal{C}), \mathcal{F} \mapsto \mathcal{F}^\#$ is exact.*

Proof. Since it is a left adjoint it is right exact, see Categories, Lemma 4.24.5. On the other hand, by Lemmas 7.10.5 and Lemma 7.10.6 the colimits in the construction of \mathcal{F}^+ are really over the directed partially ordered set $\text{Ob}(\mathcal{J}_U)$ where $\mathcal{U} \geq \mathcal{U}'$ if and only if \mathcal{U} is a refinement of \mathcal{U}' . Hence by Categories, Lemma 4.19.2 we see that $\mathcal{F} \rightarrow \mathcal{F}^+$ commutes with finite limits (as a functor from presheaves to presheaves). Then we conclude using Lemma 7.10.1. □

Lemma 7.10.15. *Let \mathcal{C} be a site. Let \mathcal{F} be a presheaf of sets on \mathcal{C} . Denote $\theta^2 : \mathcal{F} \rightarrow \mathcal{F}^\#$ the canonical map of \mathcal{F} into its sheafification. Let U be an object of \mathcal{C} . Let $s \in \mathcal{F}^\#(U)$. There exists a covering $\{U_i \rightarrow U\}$ and sections $s_i \in \mathcal{F}(U_i)$ such that*

- (1) $s|_{U_i} = \theta^2(s_i)$, and
- (2) for every i, j there exists a covering $\{U_{ijk} \rightarrow U_i \times_U U_j\}$ of \mathcal{C} such that the pullback of s_i and s_j to each U_{ijk} agree.

Conversely, given any covering $\{U_i \rightarrow U\}$, elements $s_i \in \mathcal{F}(U_i)$ such that (2) holds, then there exists a unique section $s \in \mathcal{F}^\#(U)$ such that (1) holds.

Proof. Omitted. □

7.11. Quasi-compact objects and colimits

To be able to use the same language as in the case of topological spaces we introduce the following terminology.

Definition 7.11.1. Let \mathcal{C} be a site. An object U of \mathcal{C} is *quasi-compact* if every covering of U in \mathcal{C} can be refined by a finite covering.

The following lemma is the analogue of Sheaves, Lemma 6.29.1 for sites.

Lemma 7.11.2. *Let \mathcal{C} be a site. Let $\mathcal{I} \rightarrow \text{Sh}(\mathcal{C})$, $i \mapsto \mathcal{F}_i$ be a filtered diagram of sheaves of sets. Let $U \in \text{Ob}(\mathcal{C})$. Consider the canonical map*

$$\Psi : \text{colim}_i \mathcal{F}_i(U) \longrightarrow (\text{colim}_i \mathcal{F}_i)(U)$$

With the terminology introduced above:

- (1) *If all the transition maps are injective then Ψ is injective for any U .*
- (2) *If U is quasi-compact, then Ψ is injective.*
- (3) *If U is quasi-compact and all the transition maps are injective then Ψ is an isomorphism.*
- (4) *If U has a cofinal system of coverings $\{U_j \rightarrow U\}_{j \in J}$ with J finite and $U_j \times_U U_{j'}$ quasi-compact for all $j, j' \in J$, then Ψ is bijective.*

Proof. Assume all the transition maps are injective. In this case the presheaf $\mathcal{F}' : V \mapsto \text{colim}_i \mathcal{F}_i(V)$ is separated (see Definition 7.10.9). By Lemma 7.10.13 we have $(\mathcal{F}')^\# = \text{colim}_i \mathcal{F}_i$. By Theorem 7.10.10 we see that $\mathcal{F}' \rightarrow (\mathcal{F}')^\#$ is injective. This proves (1).

Assume U is quasi-compact. Suppose that $s \in \mathcal{F}_i(U)$ and $s' \in \mathcal{F}_{i'}(U)$ give rise to elements on the left hand side which have the same image under Ψ . Since U is quasi-compact this means there exists a finite covering $\{U_j \rightarrow U\}_{j=1, \dots, m}$ and for each j an index $i_j \in I$, $i_j \geq i$, $i_j \geq i'$ such that $\varphi_{ii_j}(s) = \varphi_{i'i_j}(s')$. Let $i'' \in I$ be \geq than all of the i_j . We conclude that $\varphi_{ii''}(s)$ and $\varphi_{i'i''}(s')$ agree on U_j for all j and hence that $\varphi_{ii''}(s) = \varphi_{i'i''}(s')$. This proves (2).

Assume U is quasi-compact and all transition maps injective. Let s be an element of the target of Ψ . Since U is quasi-compact there exists a finite covering $\{U_j \rightarrow U\}_{j=1, \dots, m}$, for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ comes from s_j for all j . Pick $i \in I$ which is \geq than all of the i_j . By (1) the sections $\varphi_{i_j i}(s_j)$ agree over $U_j \times_U U_{j'}$. Hence they glue to a section $s' \in \mathcal{F}_i(U)$ which maps to s under Ψ . This proves (3).

Assume the hypothesis of (4). Let s be an element of the target of Ψ . By assumption there exists a finite covering $\{U_j \rightarrow U\}_{j=1,\dots,m}$ with $U_j \times_U U_{j'}$ quasi-compact for all $j, j' \in J$ and for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ is the image of s_j for all j . Since $U_j \times_U U_{j'}$ is quasi-compact we can apply (2) and we see that there exists an $i_{jj'} \in I$, $i_{jj'} \geq i_j$, $i_{jj'} \geq i_{j'}$ such that $\varphi_{i_{jj'}}(s_j)$ and $\varphi_{i_{jj'}}(s_{j'})$ agree over $U_j \times_U U_{j'}$. Choose an index $i \in I$ which is bigger or equal than all the $i_{jj'}$. Then we see that the sections $\varphi_{i_{jj'}}(s_j)$ of \mathcal{F}_i glue to a section of \mathcal{F}_i over U . This section is mapped to the element s as desired. \square

We need an analogue of the above result in the case that the site is the limit of an inverse system of sites. For simplicity we only explain the construction in case the index sets of coverings are finite.

Situation 7.11.3. Here we are given

- (1) a cofiltered index category \mathcal{I} ,
- (2) for $i \in \text{Ob}(\mathcal{I})$ a site \mathcal{C}_i such that every covering in \mathcal{C}_i has a finite index set,
- (3) for a morphism $a : i \rightarrow j$ in \mathcal{I} a morphism of sites $f_a : \mathcal{C}_i \rightarrow \mathcal{C}_j$ given by a continuous functor $u_a : \mathcal{C}_j \rightarrow \mathcal{C}_i$,

such that $f_a \circ f_b = f_c$ whenever $c = a \circ b$ in \mathcal{I} .

Lemma 7.11.4. *In Situation 7.11.3 we can construct a site $(\mathcal{C}, \text{Cov}(\mathcal{C}))$ as follows*

- (1) as a category $\mathcal{C} = \text{colim } \mathcal{C}_i$, and
- (2) $\text{Cov}(\mathcal{C})$ is the union of the images of $\text{Cov}(\mathcal{C}_i)$ by $u_i : \mathcal{C}_i \rightarrow \mathcal{C}$.

Proof. Our definition of composition of morphisms of sites implies that $u_b \circ u_a = u_c$ whenever $c = a \circ b$ in \mathcal{I} . The formula $\mathcal{C} = \text{colim } \mathcal{C}_i$ means that $\text{Ob}(\mathcal{C}) = \text{colim } \text{Ob}(\mathcal{C}_i)$ and $\text{Arrows}(\mathcal{C}) = \text{colim } \text{Arrows}(\mathcal{C}_i)$. Then source, target, and composition are inherited from the source, target, and composition on $\text{Arrows}(\mathcal{C}_i)$. In this way we obtain a category. Denote $u_i : \mathcal{C}_i \rightarrow \mathcal{C}$ the obvious functor. Remark that given any finite diagram in \mathcal{C} there exists an i such that this diagram is the image of a diagram in \mathcal{C}_i .

Let $\{U^t \rightarrow U\}$ be a covering of \mathcal{C} . We first prove that if $V \rightarrow U$ is a morphism of \mathcal{C} , then $U^t \times_U V$ exists. By our remark above and our definition of coverings, we can find an i , a covering $\{U_i^t \rightarrow U_i\}$ of \mathcal{C}_i and a morphism $V_i \rightarrow U_i$ whose image by u_i is the given data. We claim that $U^t \times_U V$ is the image of $U_i^t \times_{U_i} V_i$ by u_i . Namely, for every $a : j \rightarrow i$ in \mathcal{I} the functor u_a is continuous, hence $u_a(U_i^t \times_{U_i} V_i) = u_a(U_i^t) \times_{u_a(U_i)} u_a(V_i)$. In particular we can replace i by j , if we so desire. Thus, if W is another object of \mathcal{C} , then we may assume $W = u_i(W_i)$ and we see that

$$\begin{aligned} & \text{Mor}_{\mathcal{C}}(W, u_i(U_i^t \times_{U_i} V_i)) \\ &= \text{colim}_{a:j \rightarrow i} \text{Mor}_{\mathcal{C}_j}(u_a(W_i), u_a(U_i^t \times_{U_i} V_i)) \\ &= \text{colim}_{a:j \rightarrow i} \text{Mor}_{\mathcal{C}_j}(u_a(W_i), u_a(U_i^t)) \times_{\text{Mor}_{\mathcal{C}_j}(u_a(W_i), u_a(U_i))} \text{Mor}_{\mathcal{C}_j}(u_a(W_i), u_a(V_i)) \\ &= \text{Mor}_{\mathcal{C}}(W, U^t) \times_{\text{Mor}_{\mathcal{C}}(W, U)} \text{Mor}_{\mathcal{C}}(W, V) \end{aligned}$$

as filtered colimits commute with finite limits (Categories, Lemma 4.19.2). It also follows that $\{U^t \times_U V \rightarrow V\}$ is a covering in \mathcal{C} . In this way we see that axiom (3) of Definition 7.6.2 holds.

To verify axiom (2) of Definition 7.6.2 let $\{U^t \rightarrow U\}_{t \in T}$ be a covering of \mathcal{C} and for each t let $\{U^{ts} \rightarrow U^t\}$ be a covering of \mathcal{C} . Then we can find an i and a covering $\{U_i^t \rightarrow U_i\}_{t \in T}$ of \mathcal{C}_i whose image by u_i is $\{U^t \rightarrow U\}$. Since T is **finite** we may choose an $a : j \rightarrow i$ in \mathcal{I} and coverings $\{U_j^{ts} \rightarrow u_a(U_i^t)\}$ of \mathcal{C}_j whose image by u_j gives $\{U^{ts} \rightarrow U^t\}$. Then we conclude that $\{U^{ts} \rightarrow U\}$ is a covering of \mathcal{C} by an application of axiom (2) to the site \mathcal{C}_j .

We omit the proof of axiom (1) of Definition 7.6.2. \square

Lemma 7.11.5. *In Situation 7.11.3 let $u_i : \mathcal{C}_i \rightarrow \mathcal{C}$ be as constructed in Lemma 7.11.4. Then u_i defines a morphism of sites $f_i : \mathcal{C} \rightarrow \mathcal{C}_i$. For $U_i \in \text{Ob}(\mathcal{C}_i)$ and sheaf \mathcal{F} on \mathcal{C}_i we have*

$$(7.11.5.1) \quad f_i^{-1}\mathcal{F}(u_i(U_i)) = \text{colim}_{a:j \rightarrow i} f_a^{-1}\mathcal{F}(u_a(U_i))$$

Proof. It is immediate from the arguments in the proof of Lemma 7.11.4 that the functors u_i are continuous. To finish the proof we have to show that $f_i^{-1} := u_{i,s}^{-1}$ is an exact functor $Sh(\mathcal{C}_i) \rightarrow Sh(\mathcal{C})$. In fact it suffices to show that f_i^{-1} is left exact, because it is right exact as a left adjoint (Categories, Lemma 4.24.5). We first prove (7.11.5.1) and then we deduce exactness.

For an arbitrary object V of \mathcal{C} we can pick a $a : j \rightarrow i$ and an object $V_j \in \text{Ob}(\mathcal{C})$ with $V = u_j(V_j)$. Then we can set

$$\mathcal{G}(V) = \text{colim}_{b:k \rightarrow j} f_{a \circ b}^{-1}\mathcal{F}(u_b(V_j))$$

The value $\mathcal{G}(V)$ of the colimit is independent of the choice of $b : j \rightarrow i$ and of the object V_j with $u_j(V_j) = V$; we omit the verification. Moreover, if $\alpha : V \rightarrow V'$ is a morphism of \mathcal{C} , then we can choose $b : j \rightarrow i$ and a morphism $\alpha_j : V_j \rightarrow V'_j$ with $u_j(\alpha_j) = \alpha$. This induces a map $\mathcal{G}(V') \rightarrow \mathcal{G}(V)$ by using the restrictions along the morphisms $u_b(\alpha_j) : u_b(V_j) \rightarrow u_b(V'_j)$. A check shows that \mathcal{G} is a presheaf (omitted). In fact, \mathcal{G} satisfies the sheaf condition. Namely, any covering $\mathcal{U} = \{U^t \rightarrow U\}$ in \mathcal{C} comes from a finite level. Say $\mathcal{U}_j = \{U_j^t \rightarrow U_j\}$ is mapped to \mathcal{U} by u_j for some $a : j \rightarrow i$ in \mathcal{I} . Then we have

$$H^0(\mathcal{U}, \mathcal{G}) = \text{colim}_{b:k \rightarrow j} H^0(u_b(\mathcal{U}_j), f_{b \circ a}^{-1}\mathcal{F}) = \text{colim}_{b:k \rightarrow j} f_{b \circ a}^{-1}\mathcal{F}(u_b(U_j)) = \mathcal{G}(U)$$

as desired. The first equality holds because filtered colimits commute with finite limits (Categories, Lemma 4.19.2). By construction $\mathcal{G}(U)$ is given by the right hand side of (7.11.5.1). Hence (7.11.5.1) is true if we can show that \mathcal{G} is equal to $f_i^{-1}\mathcal{F}$.

In this paragraph we check that \mathcal{G} is canonically isomorphic to $f_i^{-1}\mathcal{F}$. We strongly encourage the reader to skip this paragraph. To check this we have to show there is a bijection $\text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, \mathcal{H}) = \text{Mor}_{Sh(\mathcal{C}_i)}(\mathcal{F}, f_{i,*}\mathcal{H})$ functorial in the sheaf \mathcal{H} on \mathcal{C} where $f_{i,*} = u_{i,*}^p$. A map $\mathcal{G} \rightarrow \mathcal{H}$ is the same thing as a compatible system of maps

$$\varphi_{a,b,V_j} : f_{a \circ b}^{-1}\mathcal{F}(u_b(V_j)) \longrightarrow \mathcal{H}(u_j(V_j))$$

for all $a : j \rightarrow i$, $b : k \rightarrow j$ and $V_j \in \text{Ob}(\mathcal{C}_j)$. The compatibilities force the maps φ_{a,b,V_j} to be equal to $\varphi_{a \circ b, \text{id}, u_b(V_j)}$. Given $a : j \rightarrow i$, the family of maps $\varphi_{a, \text{id}, V_j}$ corresponds to a map of sheaves $\varphi_a : f_a^{-1}\mathcal{F} \rightarrow f_{j,*}\mathcal{H}$. The compatibilities between the $\varphi_{a, \text{id}, u_a(V_i)}$ and the $\varphi_{\text{id}, \text{id}, V_i}$ implies that φ_a is the adjoint of the map φ_{id} via

$$\text{Mor}_{Sh(\mathcal{C}_j)}(f_a^{-1}\mathcal{F}, f_{j,*}\mathcal{H}) = \text{Mor}_{Sh(\mathcal{C}_i)}(\mathcal{F}, f_{a,*}f_{j,*}\mathcal{H}) = \text{Mor}_{Sh(\mathcal{C}_i)}(\mathcal{F}, f_{i,*}\mathcal{H})$$

Thus finally we see that the whole system of maps φ_{a,b,V_j} is determined by the map $\varphi_{\text{id}} : \mathcal{F} \rightarrow f_{i,*}\mathcal{H}$. Conversely, given such a map $\psi : \mathcal{F} \rightarrow f_{i,*}\mathcal{H}$ we can read

the argument just given backwards to construct the family of maps φ_{a,b,V_j} . This finishes the proof that $\mathcal{G} = f_i^{-1}\mathcal{F}$.

Assume (7.11.5.1) holds. Then the functor $\mathcal{F} \mapsto f_i^{-1}\mathcal{F}(U)$ commutes with finite limits because finite limits of sheaves are computed in the category of presheaves (Lemma 7.10.1), the functors f_a^{-1} commutes with finite limits, and filtered colimits commute with finite limits. To see that $\mathcal{F} \mapsto f_i^{-1}\mathcal{F}(V)$ commutes with finite limits for a general object V of \mathcal{C} , we can use the same argument using the formula for $f_i^{-1}\mathcal{F}(V) = \mathcal{G}(V)$ given above. Thus f_i^{-1} is left exact and the proof of the lemma is complete. \square

Lemma 7.11.6. *In Situation 7.11.3 assume given*

- (1) a sheaf \mathcal{F}_i on \mathcal{C}_i for all $i \in \text{Ob}(\mathcal{I})$,
- (2) for $a : j \rightarrow i$ a map $\varphi_a : f_a^{-1}\mathcal{F}_i \rightarrow \mathcal{F}_j$ of sheaves on \mathcal{C}_j

such that $\varphi_c = \varphi_b \circ f_b^{-1}\varphi_a$ whenever $c = a \circ b$. Set $\mathcal{F} = \text{colim } f_i^{-1}\mathcal{F}_i$ on the site \mathcal{C} of Lemma 7.11.4. Let $i \in \text{Ob}(\mathcal{I})$ and $X_i \in \text{Ob}(\mathcal{C}_i)$. Then

$$\text{colim}_{a:j \rightarrow i} \mathcal{F}_j(u_a(X_i)) = \mathcal{F}(u_i(X_i))$$

Proof. A formal argument shows that

$$\text{colim}_{a:j \rightarrow i} \mathcal{F}_i(u_a(X_i)) = \text{colim}_{a:j \rightarrow i} \text{colim}_{b:k \rightarrow j} f_b^{-1}\mathcal{F}_j(u_{a \circ b}(X_i))$$

By (7.11.5.1) we see that the inner colimit is equal to $f_j^{-1}\mathcal{F}_j(u_i(X_i))$ hence we conclude by Lemma 7.11.2. \square

7.12. Injective and surjective maps of sheaves

Definition 7.12.1. Let \mathcal{C} be a site, and let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves of sets.

- (1) We say that φ is *injective* if for every object U of \mathcal{C} the map $\varphi : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective.
- (2) We say that φ is *surjective* if for every object U of \mathcal{C} and every section $s \in \mathcal{G}(U)$ there exists a covering $\{U_i \rightarrow U\}$ such that for all i the restriction $s|_{U_i}$ is in the image of $\varphi : \mathcal{F}(U_i) \rightarrow \mathcal{G}(U_i)$.

Lemma 7.12.2. *The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of the category $\text{Sh}(\mathcal{C})$. A map of sheaves is an isomorphism if and only if it is both injective and surjective.*

Proof. Omitted. \square

Lemma 7.12.3. *Let \mathcal{C} be a site. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a surjection of sheaves of sets. Then the diagram*

$$\mathcal{F} \times_{\mathcal{G}} \mathcal{F} \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} \mathcal{F} \longrightarrow \mathcal{G}$$

represents \mathcal{G} as a coequalizer.

Proof. Let \mathcal{H} be a sheaf of sets and let $\varphi : \mathcal{F} \rightarrow \mathcal{H}$ be a map of sheaves equalizing the two maps $\mathcal{F} \times_{\mathcal{G}} \mathcal{F} \rightarrow \mathcal{F}$. Let $\mathcal{G}' \subset \mathcal{G}$ be the presheaf image of the map $\mathcal{F} \rightarrow \mathcal{G}$. As the product $\mathcal{F} \times_{\mathcal{G}} \mathcal{F}$ may be computed in the category of presheaves we see that it is equal to the presheaf product $\mathcal{F} \times_{\mathcal{G}'} \mathcal{F}$. Hence φ induces a unique map of presheaves $\psi' : \mathcal{G}' \rightarrow \mathcal{H}$. Since \mathcal{G} is the sheafification of \mathcal{G}' by Lemma 7.12.2 we conclude that ψ' extends uniquely to a map of sheaves $\psi : \mathcal{G} \rightarrow \mathcal{H}$. We omit the verification that φ is equal to the composition of ψ and the given map. \square

7.13. Representable sheaves

Let \mathcal{C} be a category. The canonical topology is the finest topology such that all representable presheaves are sheaves (it is formally defined in Definition 7.45.12 but we will not need this). This topology is not always the topology associated to the structure of a site on \mathcal{C} . We will give a collection of coverings that generates this topology in case \mathcal{C} has fibered products. First we give the following general definition.

Definition 7.13.1. Let \mathcal{C} be a category. We say that a family $\{U_i \rightarrow U\}_{i \in I}$ is an *effective epimorphism* if all the morphisms $U_i \rightarrow U$ are representable (see Categories, Definition 4.6.4), and for any $X \in \text{Ob}(\mathcal{C})$ the sequence

$$\text{Mor}_{\mathcal{C}}(U, X) \longrightarrow \prod_{i \in I} \text{Mor}_{\mathcal{C}}(U_i, X) \rightrightarrows \prod_{(i,j) \in I^2} \text{Mor}_{\mathcal{C}}(U_i \times_U U_j, X)$$

is an equalizer diagram. We say that a family $\{U_i \rightarrow U\}$ is a *universal effective epimorphism* if for any morphism $V \rightarrow U$ the base change $\{U_i \times_U V \rightarrow V\}$ is an effective epimorphism.

The class of families which are universal effective epimorphisms satisfies the axioms of Definition 7.6.2. If \mathcal{C} has fibre products, then the associated topology is the canonical topology. (In this case, to get a site argue as in Sets, Lemma 3.11.1.)

Conversely, suppose that \mathcal{C} is a site such that all representable presheaves are sheaves. Then clearly, all coverings are universal effective epimorphisms. Thus the following definition is the “correct” one in the setting of sites.

Definition 7.13.2. We say that the topology on a site \mathcal{C} is *weaker than the canonical topology*, or that the topology is *subcanonical* if all the coverings of \mathcal{C} are universal effective epimorphisms.

A representable sheaf is a representable presheaf which is also a sheaf. Since it is perhaps better to avoid this terminology when the topology is not subcanonical, we only define it formally in that case.

Definition 7.13.3. Let \mathcal{C} be a site whose topology is subcanonical. The Yoneda embedding h (see Categories, Section 4.3) presents \mathcal{C} as a full subcategory of the category of sheaves of \mathcal{C} . In this case we call sheaves of the form h_U with $U \in \text{Ob}(\mathcal{C})$ *representable sheaves* on \mathcal{C} . Notation: Sometimes, the representable sheaf h_U associated to U is denoted \underline{U} .

Note that we have in the situation of the definition

$$\text{Mor}_{Sh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U)$$

for every sheaf \mathcal{F} , since it holds for presheaves, see (7.2.1.1). In general the presheaves h_U are not sheaves and to get a sheaf you have to sheafify them. In this case we still have

$$(7.13.3.1) \quad \text{Mor}_{Sh(\mathcal{C})}(h_U^\#, \mathcal{F}) = \text{Mor}_{PSh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U)$$

for every sheaf \mathcal{F} . Namely, the first equality holds by the adjointness property of $\#$ and the second is (7.2.1.1).

Lemma 7.13.4. *Let \mathcal{C} be a site. If $\{U_i \rightarrow U\}_{i \in I}$ is a covering of the site \mathcal{C} , then the morphism of presheaves of sets*

$$\coprod_{i \in I} h_{U_i} \rightarrow h_U$$

becomes surjective after sheafification.

Proof. By Lemma 7.12.2 above we have to show that $\coprod_{i \in I} h_{U_i}^\# \rightarrow h_U^\#$ is an epimorphism. Let \mathcal{F} be a sheaf of sets. A morphism $h_U^\# \rightarrow \mathcal{F}$ corresponds to a section $s \in \mathcal{F}(U)$. Hence the injectivity of $\text{Mor}(h_U^\#, \mathcal{F}) \rightarrow \prod_i \text{Mor}(h_{U_i}^\#, \mathcal{F})$ follows directly from the sheaf property of \mathcal{F} . \square

The next lemma says, in the case the topology is weaker than the canonical topology, that every sheaf is made up out of representable sheaves in a way.

Lemma 7.13.5. *Let \mathcal{C} be a site. Let $E \subset \text{Ob}(\mathcal{C})$ be a subset such that every object of \mathcal{C} has a covering by elements of E . Let \mathcal{F} be a sheaf of sets. There exists a diagram of sheaves of sets*

$$\mathcal{F}_1 \rightrightarrows \mathcal{F}_0 \longrightarrow \mathcal{F}$$

which represents \mathcal{F} as a coequalizer, such that \mathcal{F}_i , $i = 0, 1$ are coproducts of sheaves of the form $h_U^\#$ with $U \in E$.

Proof. First we show there is an epimorphism $\mathcal{F}_0 \rightarrow \mathcal{F}$ of the desired type. Namely, just take

$$\mathcal{F}_0 = \coprod_{U \in E, s \in \mathcal{F}(U)} (h_U)^\# \longrightarrow \mathcal{F}$$

Here the arrow restricted to the component corresponding to (U, s) maps the element $\text{id}_U \in h_U^\#(U)$ to the section $s \in \mathcal{F}(U)$. This is an epimorphism according to Lemma 7.12.2 and our condition on E . To construct \mathcal{F}_1 first set $\mathcal{G} = \mathcal{F}_0 \times_{\mathcal{F}} \mathcal{F}_0$ and then construct an epimorphism $\mathcal{F}_1 \rightarrow \mathcal{G}$ as above. See Lemma 7.12.3. \square

7.14. Continuous functors

Definition 7.14.1. Let \mathcal{C} and \mathcal{D} be sites. A functor $u : \mathcal{C} \rightarrow \mathcal{D}$ is called *continuous* if for every $\{V_i \rightarrow V\}_{i \in I} \in \text{Cov}(\mathcal{C})$ we have the following

- (1) $\{u(V_i) \rightarrow u(V)\}_{i \in I}$ is in $\text{Cov}(\mathcal{D})$, and
- (2) for any morphism $T \rightarrow V$ in \mathcal{C} the morphism $u(T \times_V V_i) \rightarrow u(T) \times_{u(V)} u(V_i)$ is an isomorphism.

Recall that given a functor u as above, and a presheaf of sets \mathcal{F} on \mathcal{D} we have defined $u^p \mathcal{F}$ to be simply the presheaf $\mathcal{F} \circ u$, in other words

$$u^p \mathcal{F}(V) = \mathcal{F}(u(V))$$

for every object V of \mathcal{C} .

Lemma 7.14.2. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor. If \mathcal{F} is a sheaf on \mathcal{D} then $u^p \mathcal{F}$ is a sheaf as well.*

Proof. Let $\{V_i \rightarrow V\}$ be a covering. By assumption $\{u(V_i) \rightarrow u(V)\}$ is a covering in \mathcal{D} and $u(V_i \times_V V_j) = u(V_i) \times_{u(V)} u(V_j)$. Hence the sheaf condition for $u^p \mathcal{F}$ and the covering $\{V_i \rightarrow V\}$ is precisely the same as the sheaf condition for \mathcal{F} and the covering $\{u(V_i) \rightarrow u(V)\}$. \square

In order to avoid confusion we sometimes denote

$$u^s : \text{Sh}(\mathcal{D}) \longrightarrow \text{Sh}(\mathcal{C})$$

the functor u^p restricted to the subcategory of sheaves of sets.

Lemma 7.14.3. *In the situation of Lemma 7.14.2. The functor $u_s : \mathcal{G} \mapsto (u_p \mathcal{G})^\#$ is a left adjoint to u^s .*

Proof. Follows directly from Lemma 7.5.4 and Proposition 7.10.12. \square

Here is a technical lemma.

Lemma 7.14.4. *In the situation of Lemma 7.14.2. For any presheaf \mathcal{G} on \mathcal{C} we have $(u_p \mathcal{G})^\# = (u_p(\mathcal{G}^\#))^\#$.*

Proof. For any sheaf \mathcal{F} on \mathcal{D} we have

$$\begin{aligned} \text{Mor}_{Sh(\mathcal{D})}(u_s(\mathcal{G}^\#), \mathcal{F}) &= \text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}^\#, u^s \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{C})}(\mathcal{G}^\#, u^p \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{C})}(\mathcal{G}, u^p \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{D})}(u_p \mathcal{G}, \mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{D})}((u_p \mathcal{G})^\#, \mathcal{F}) \end{aligned}$$

and the result follows from the Yoneda lemma. \square

Lemma 7.14.5. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor between sites. For any object U of \mathcal{C} we have $u_s h_U^\# = h_{u(U)}^\#$.*

Proof. Follows from Lemmas 7.5.6 and 7.14.4. \square

Remark 7.14.6. (Skip on first reading.) Let \mathcal{C} and \mathcal{D} be sites. Let us use the definition of tautologically equivalent families of maps, see Definition 7.8.2 to (slightly) weaken the conditions defining continuity. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Let us call u *quasi-continuous* if for every $\mathcal{V} = \{V_i \rightarrow V\}_{i \in I} \in \text{Cov}(\mathcal{C})$ we have the following

- (1') the family of maps $\{u(V_i) \rightarrow u(V)\}_{i \in I}$ is tautologically equivalent to an element of $\text{Cov}(\mathcal{D})$, and
- (2) for any morphism $T \rightarrow V$ in \mathcal{C} the morphism $u(T \times_V V_i) \rightarrow u(T) \times_{u(V)} u(V_i)$ is an isomorphism.

We are going to see that Lemmas 7.14.2 and 7.14.3 hold in case u is quasi-continuous as well.

We first remark that the morphisms $u(V_i) \rightarrow u(V)$ are representable, since they are isomorphic to representable morphisms (by the first condition). In particular, the family $u(\mathcal{V}) = \{u(V_i) \rightarrow u(V)\}_{i \in I}$ gives rise to a zeroth Čech cohomology group $H^0(u(\mathcal{V}), \mathcal{F})$ for any presheaf \mathcal{F} on \mathcal{D} . Let $\mathcal{U} = \{U_j \rightarrow u(V)\}_{j \in J}$ be an element of $\text{Cov}(\mathcal{D})$ tautologically equivalent to $\{u(V_i) \rightarrow u(V)\}_{i \in I}$. Note that $u(\mathcal{V})$ is a refinement of \mathcal{U} and vice versa. Hence by Remark 7.10.7 we see that $H^0(u(\mathcal{V}), \mathcal{F}) = H^0(\mathcal{U}, \mathcal{F})$. In particular, if \mathcal{F} is a sheaf, then $\mathcal{F}(u(V)) = H^0(u(\mathcal{V}), \mathcal{F})$ because of the sheaf property expressed in terms of zeroth Čech cohomology groups. We conclude that $u^p \mathcal{F}$ is a sheaf if \mathcal{F} is a sheaf, since $H^0(\mathcal{V}, u^p \mathcal{F}) = H^0(u(\mathcal{V}), \mathcal{F})$ which we just observed is equal to $\mathcal{F}(u(V)) = u^p \mathcal{F}(V)$. Thus Lemma 7.14.2 holds. Lemma 7.14.3 follows immediately.

7.15. Morphisms of sites

Definition 7.15.1. Let \mathcal{C} and \mathcal{D} be sites. A *morphism of sites* $f : \mathcal{D} \rightarrow \mathcal{C}$ is given by a continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ such that the functor u_s is exact.

Notice how the functor u goes in the direction *opposite* the morphism f . If $f \leftrightarrow u$ is a morphism of sites then we use the notation $f^{-1} = u_s$ and $f_* = u^s$. The functor f^{-1} is called the *pullback functor* and the functor f_* is called the *pushforward functor*. As in topology we have the following adjointness property

$$\text{Mor}_{\text{Sh}(\mathcal{D})}(f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Sh}(\mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$$

The motivation for this definition comes from the following example.

Example 7.15.2. Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Recall that we have sites X_{Zar} and Y_{Zar} , see Example 7.6.4. Consider the functor $u : Y_{Zar} \rightarrow X_{Zar}$, $V \mapsto f^{-1}(V)$. This functor is clearly continuous because inverse images of open coverings are open coverings. (Actually, this depends on how you chose sets of coverings for X_{Zar} and Y_{Zar} . But in any case the functor is quasi-continuous, see Remark 7.14.6.) It is easy to verify that the functor u^s equals the usual pushforward functor f_* from topology. Hence, since u_s is an adjoint and since the usual topological pullback functor f^{-1} is an adjoint as well, we get a canonical isomorphism $f^{-1} \cong u_s$. Since f^{-1} is exact we deduce that u_s is exact. Hence u defines a morphism of sites $f : X_{Zar} \rightarrow Y_{Zar}$, which we may denote f as well since we've already seen the functors u_s, u^s agree with their usual notions anyway.

Lemma 7.15.3. Let \mathcal{C}_i , $i = 1, 2, 3$ be sites. Let $u : \mathcal{C}_2 \rightarrow \mathcal{C}_1$ and $v : \mathcal{C}_3 \rightarrow \mathcal{C}_2$ be continuous functors which induce morphisms of sites. Then the functor $u \circ v : \mathcal{C}_3 \rightarrow \mathcal{C}_1$ is continuous and defines a morphism of sites $\mathcal{C}_1 \rightarrow \mathcal{C}_3$.

Proof. It is immediate from the definitions that $u \circ v$ is a continuous functor. In addition, we clearly have $(u \circ v)^p = v^p \circ u^p$, and hence $(u \circ v)^s = v^s \circ u^s$. Hence functors $(u \circ v)_s$ and $u_s \circ v_s$ are both left adjoints of $(u \circ v)^s$. Therefore $(u \circ v)_s \cong u_s \circ v_s$ and we conclude that $(u \circ v)_s$ is exact as a composition of exact functors. \square

Definition 7.15.4. Let \mathcal{C}_i , $i = 1, 2, 3$ be sites. Let $f : \mathcal{C}_1 \rightarrow \mathcal{C}_2$ and $g : \mathcal{C}_2 \rightarrow \mathcal{C}_3$ be morphisms of sites given by continuous functors $u : \mathcal{C}_2 \rightarrow \mathcal{C}_1$ and $v : \mathcal{C}_3 \rightarrow \mathcal{C}_2$. The *composition* $g \circ f$ is the morphism of sites corresponding to the functor $u \circ v$.

In this situation we have $(g \circ f)_* = g_* \circ f_*$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ (see proof of Lemma 7.15.3).

Lemma 7.15.5. Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be continuous. Assume all the categories $(\mathcal{I}_V^u)^{opp}$ of Section 7.5 are filtered. Then u defines a morphism of sites $\mathcal{D} \rightarrow \mathcal{C}$, in other words u_s is exact.

Proof. Since u_s is the left adjoint of u^s we see that u_s is right exact, see Categories, Lemma 4.24.5. Hence it suffices to show that u_s is left exact. In other words we have to show that u_s commutes with finite limits. Because the categories \mathcal{I}_Y^{opp} are filtered we see that u_p commutes with finite limits, see Categories, Lemma 4.19.2 (this also uses the description of limits in PSh , see Section 7.4). And since sheafification commutes with finite limits as well (Lemma 7.10.14) we conclude because $u_s = \# \circ u_p$. \square

Proposition 7.15.6. Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be continuous. Assume furthermore the following:

- (1) the category \mathcal{C} has a final object X and $u(X)$ is a final object of \mathcal{D} , and
- (2) the category \mathcal{C} has fibre products and u commutes with them.

Then u defines a morphism of sites $\mathcal{D} \rightarrow \mathcal{C}$, in other words u_s is exact.

Proof. This follows from Lemmas 7.5.2 and 7.15.5. \square

Remark 7.15.7. The conditions of Proposition 7.15.6 above are equivalent to saying that u is left exact, i.e., commutes with finite limits. See Categories, Lemmas 4.18.4 and 4.23.2. It seems more natural to phrase it in terms of final objects and fibre products since this seems to have more geometric meaning in the examples.

Lemma 7.18.4 will provide another way to prove a continuous functor gives rise to a morphism of sites.

Remark 7.15.8. (Skip on first reading.) Let \mathcal{C} and \mathcal{D} be sites. Analogously to Definition 7.15.1 we say that a *quasi-morphism of sites* $f : \mathcal{D} \rightarrow \mathcal{C}$ is given by a quasi-continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ (see Remark 7.14.6) such that u_s is exact. The analogue of Proposition 7.15.6 in this setting is obtained by replacing the word “continuous” by the word “quasi-continuous”, and replacing the word “morphism” by “quasi-morphism”. The proof is literally the same.

In Definition 7.15.1 the condition that u_s be exact cannot be omitted. For example, the conclusion of the following lemma need not hold if one only assumes that u is continuous.

Lemma 7.15.9. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Given any object V of \mathcal{D} there exists a covering $\{V_j \rightarrow V\}$ such that for every j there exists a morphism $V_j \rightarrow u(U_j)$ for some object U_j of \mathcal{C} .*

Proof. Since $f^{-1} = u_s$ is exact we have $f^{-1}* = *$ where $*$ denotes the final object of the category of sheaves (Example 7.10.2). Since $f^{-1}* = u_s*$ is the sheafification of u_p* we see there exists a covering $\{V_j \rightarrow V\}$ such that $(u_p*)(V_j)$ is nonempty. Since $(u_p*)(V_j)$ is a colimit over the category $\mathcal{I}_{V_j}^u$ whose objects are morphisms $V_j \rightarrow u(U)$ the lemma follows. \square

7.16. Topoi

Here is a definition of a topos which is suitable for our purposes. Namely, a topos is the category of sheaves on a site. In order to specify a topos you just specify the site. The real difference between a topos and a site lies in the definition of morphisms. Namely, it turns out that there are lots of morphisms of topoi which do not come from morphisms of the underlying sites.

Definition 7.16.1 (Topoi). A *topos* is the category $Sh(\mathcal{C})$ of sheaves on a site \mathcal{C} .

- (1) Let \mathcal{C}, \mathcal{D} be sites. A *morphism of topoi* f from $Sh(\mathcal{D})$ to $Sh(\mathcal{C})$ is given by a pair of functors $f_* : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ and $f^{-1} : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ such that
- (a) we have

$$\text{Mor}_{Sh(\mathcal{D})}(f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$$

bifunctorially, and

- (b) the functor f^{-1} commutes with finite limits, i.e., is left exact.
- (2) Let $\mathcal{C}, \mathcal{D}, \mathcal{E}$ be sites. Given morphisms of topoi $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ and $g : Sh(\mathcal{E}) \rightarrow Sh(\mathcal{D})$ the *composition* $f \circ g$ is the morphism of topoi defined by the functors $(f \circ g)_* = f_* \circ g_*$ and $(f \circ g)^{-1} = g^{-1} \circ f^{-1}$.

Suppose that $\alpha : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ is an equivalence of (possibly “big”) categories. If $\mathcal{S}_1, \mathcal{S}_2$ are topoi, then setting $f_* = \alpha$ and f^{-1} equal to a quasi-inverse of α gives a

morphism $f : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ of topoi. Moreover this morphism is an equivalence in the 2-category of topoi (see Section 7.35). Thus it makes sense to say “ \mathcal{S} is a topos” if \mathcal{S} is equivalent to the category of sheaves on a site (and not necessarily equal to the category of sheaves on a site). We will occasionally use this abuse of notation.

Two examples of topoi. The *empty topos* is topos of sheaves on the site \mathcal{C} , where \mathcal{C} has a single object \emptyset and a single morphism id_\emptyset and a single covering, namely the empty covering of \emptyset . We will sometimes write \emptyset for this site. This is a site and every sheaf on \mathcal{C} assigns a singleton to \emptyset . Thus $Sh(\emptyset)$ is equivalent to the category having a single object and a single morphism. The *punctual topos* is the topos of sheaves on the site \mathcal{C} which has a single object pt and one morphism id_{pt} and whose only covering is the covering $\{\text{id}_{pt}\}$. We will simply write pt for this site. It is clear that the category of sheaves = the category of presheaves = the category of sets. In a formula $Sh(pt) = Sets$.

Let \mathcal{C} and \mathcal{D} be sites. Let $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ be a morphism of topoi. Note that f_* commutes with all limits and that f^{-1} commutes with all colimits, see Categories, Lemma 4.24.4. In particular, the condition on f^{-1} in the definition above guarantees that f^{-1} is exact. Morphisms of topoi are often constructed using either Lemma 7.20.1 or the following lemma.

Lemma 7.16.2. *Given a morphism of sites $f : \mathcal{D} \rightarrow \mathcal{C}$ corresponding to the functor $u : \mathcal{C} \rightarrow \mathcal{D}$ the pair of functors $(f^{-1} = u_s, f_* = u^s)$ is a morphism of topoi.*

Proof. This is obvious from Definition 7.15.1. \square

Remark 7.16.3. There are many sites that give rise to the topos $Sh(pt)$. A useful example is the following. Suppose that S is a set (of sets) which contains at least one nonempty element. Let \mathcal{S} be the category whose objects are elements of S and whose morphisms are arbitrary set maps. Assume that \mathcal{S} has fibre products. For example this will be the case if $S = \mathcal{P}(\text{infinite set})$ is the power set of any infinite set (exercise in set theory). Make \mathcal{S} into a site by declaring surjective families of maps to be coverings (and choose a suitable sufficiently large set of covering families as in Sets, Section 3.11). We claim that $Sh(\mathcal{S})$ is equivalent to the category of sets.

We first prove this in case S contains $e \in S$ which is a singleton. In this case, there is an equivalence of topoi $i : Sh(pt) \rightarrow Sh(\mathcal{S})$ given by the functors

$$(7.16.3.1) \quad i^{-1}\mathcal{F} = \mathcal{F}(e), \quad i_*E = (U \mapsto \text{Mor}_{Sets}(U, E))$$

Namely, suppose that \mathcal{F} is a sheaf on \mathcal{S} . For any $U \in \text{Ob}(\mathcal{S}) = S$ we can find a covering $\{\varphi_u : e \rightarrow U\}_{u \in U}$, where φ_u maps the unique element of e to $u \in U$. The sheaf condition implies in this case that $\mathcal{F}(U) = \prod_{u \in U} \mathcal{F}(e)$. In other words $\mathcal{F}(U) = \text{Mor}_{Sets}(U, \mathcal{F}(e))$. Moreover, this rule is compatible with restriction mappings. Hence the functor

$$i_* : Sets = Sh(pt) \longrightarrow Sh(\mathcal{S}), \quad E \longmapsto (U \mapsto \text{Mor}_{Sets}(U, E))$$

is an equivalence of categories, and its inverse is the functor i^{-1} given above.

If \mathcal{S} does not contain a singleton, then the functor i_* as defined above still makes sense. To show that it is still an equivalence in this case, choose any nonempty $\tilde{e} \in S$ and a map $\varphi : \tilde{e} \rightarrow \tilde{e}$ whose image is a singleton. For any sheaf \mathcal{F} set

$$\mathcal{F}(e) := \text{Im}(\mathcal{F}(\varphi) : \mathcal{F}(\tilde{e}) \longrightarrow \mathcal{F}(\tilde{e}))$$

and show that this is a quasi-inverse to i_* . Details omitted.

Remark 7.16.4. (Set theoretical issues related to morphisms of topoi. Skip on a first reading.) A morphism of topoi as defined above is not a set but a class. In other words it is given by a mathematical formula rather than a mathematical object. Although we may contemplate the collection of all morphisms between two given topoi, it is not a good idea to introduce it as a mathematical object. On the other hand, suppose \mathcal{C} and \mathcal{D} are given sites. Consider a functor $\Phi : \mathcal{C} \rightarrow Sh(\mathcal{D})$. Such a thing is a set, in other words, it is a mathematical object. We may, in succession, ask the following questions on Φ .

- (1) Is it true, given a sheaf \mathcal{F} on \mathcal{D} , that the rule $U \mapsto \text{Mor}_{Sh(\mathcal{D})}(\Phi(U), \mathcal{F})$ defines a sheaf on \mathcal{C} ? If so, this defines a functor $\Phi_* : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$.
- (2) Is it true that Φ_* has a left adjoint? If so, write Φ^{-1} for this left adjoint.
- (3) Is it true that Φ^{-1} is exact?

If the last question still has the answer “yes”, then we obtain a morphism of topoi (Φ_*, Φ^{-1}) . Moreover, given any morphism of topoi (f_*, f^{-1}) we may set $\Phi(U) = f^{-1}(h_U^\#)$ and obtain a functor Φ as above with $f_* \cong \Phi_*$ and $f^{-1} \cong \Phi^{-1}$ (compatible with adjoint property). The upshot is that by working with the collection of Φ instead of morphisms of topoi, we (a) replaced the notion of a morphism of topoi by a mathematical object, and (b) the collection of Φ forms a class (and not a collection of classes). Of course, more can be said, for example one can work out more precisely the significance of conditions (2) and (3) above; we do this in the case of points of topoi in Section 7.31.

Remark 7.16.5. (Skip on first reading.) Let \mathcal{C} and \mathcal{D} be sites. A quasi-morphism of sites $f : \mathcal{D} \rightarrow \mathcal{C}$ (see Remark 7.15.8) gives rise to a morphism of topoi f from $Sh(\mathcal{D})$ to $Sh(\mathcal{C})$ exactly as in Lemma 7.16.2.

7.17. G-sets and morphisms

Let $\varphi : G \rightarrow H$ be a homomorphism of groups. Choose (suitable) sites \mathcal{T}_G and \mathcal{T}_H as in Example 7.6.5 and Section 7.9. Let $u : \mathcal{T}_H \rightarrow \mathcal{T}_G$ be the functor which assigns to a H -set U the G -set U_φ which has the same underlying set but G action defined by $g \cdot u = \varphi(g)u$. It is clear that u commutes with finite limits and is continuous⁴. Applying Proposition 7.15.6 and Lemma 7.16.2 we obtain a morphism of topoi

$$f : Sh(\mathcal{T}_G) \longrightarrow Sh(\mathcal{T}_H)$$

associated with φ . Using Proposition 7.9.1 we see that we get a pair of adjoint functors

$$f_* : G\text{-Sets} \longrightarrow H\text{-Sets}, \quad f^{-1} : H\text{-Sets} \longrightarrow G\text{-Sets}.$$

Let's work out what are these functors in this case.

We first work out a formula for f_* . Recall that given a G -set S the corresponding sheaf \mathcal{F}_S on \mathcal{T}_G is given by the rule $\mathcal{F}_S(U) = \text{Mor}_G(U, S)$. And on the other hand, given a sheaf \mathcal{G} on \mathcal{T}_H the corresponding H -set is given by the rule $\mathcal{G}({}_H H)$. Hence we see that

$$f_* S = \text{Mor}_{G\text{-Sets}}(({}_H H)_\varphi, S).$$

⁴Set theoretical remark: First choose \mathcal{T}_H . Then choose \mathcal{T}_G to contain $u(\mathcal{T}_H)$ and such that every covering in \mathcal{T}_H corresponds to a covering in \mathcal{T}_G . This is possible by Sets, Lemmas 3.10.1, 3.10.2 and 3.11.1.

If we work this out a little bit more then we get

$$f_*S = \{a : H \rightarrow S \mid a(gh) = ga(h)\}$$

with left H -action given by $(h \cdot a)(h') = a(h'h)$ for any element $a \in f_*S$.

Next, we explicitly compute f^{-1} . Note that since the topology on \mathcal{T}_G and \mathcal{T}_H is subcanonical, all representable presheaves are sheaves. Moreover, given an object V of \mathcal{T}_H we see that $f^{-1}h_V$ is equal to $h_{u(V)}$ (see Lemma 7.14.5). Hence we see that $f^{-1}S = S_\varphi$ for representable sheaves. Since every sheaf on \mathcal{T}_H is a coproduct of representable sheaves we conclude that this is true in general. Hence we see that for any H -set T we have

$$f^{-1}T = T_\varphi.$$

The adjunction between f^{-1} and f_* is evidenced by the formula

$$\text{Mor}_{G\text{-Sets}}(T_\varphi, S) = \text{Mor}_{H\text{-Sets}}(T, f_*S)$$

with f_*S as above. This can be proved directly. Moreover, it is then clear that (f^{-1}, f_*) form an adjoint pair and that f^{-1} is exact. So alternatively to the above the morphism of topoi $f : G\text{-Sets} \rightarrow H\text{-Sets}$ can be defined directly in this manner.

7.18. More functoriality of presheaves

In this section we revisit the material of Section 7.5. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Recall that

$$u^p : \text{PSh}(\mathcal{D}) \longrightarrow \text{PSh}(\mathcal{C})$$

is the functor that associates to \mathcal{G} on \mathcal{D} the presheaf $u^p\mathcal{G} = \mathcal{G} \circ u$. It turns out that this functor not only has a left adjoint (namely u_p) but also a right adjoint.

Namely, for any $V \in \text{Ob}(\mathcal{D})$ we define a category ${}_V\mathcal{I} = {}_V^u\mathcal{I}$. Its objects are pairs $(U, \psi : u(U) \rightarrow V)$. Note that the arrow is in the opposite direction from the arrow we used in defining the category \mathcal{I}_V^u in Section 7.5. A morphism $(U, \psi) \rightarrow (U', \psi')$ is given by a morphism $\alpha : U \rightarrow U'$ such that $\psi = \psi' \circ u(\alpha)$. In addition, given any presheaf of sets \mathcal{F} on \mathcal{C} we introduce the functor ${}_V\mathcal{F} : {}_V\mathcal{I}^{\text{opp}} \rightarrow \text{Sets}$, which is defined by the rule ${}_V\mathcal{F}(U, \psi) = \mathcal{F}(U)$. We define

$${}_p u(\mathcal{F})(V) := \lim_{{}_V\mathcal{I}^{\text{opp}}} {}_V\mathcal{F}$$

As a limit there are projection maps $c(\psi) : {}_p u(\mathcal{F})(V) \rightarrow \mathcal{F}(U)$ for every object (U, ψ) of ${}_V\mathcal{I}$. In fact,

$${}_p u(\mathcal{F})(V) = \left\{ \begin{array}{l} \text{collections } s_{(U, \psi)} \in \mathcal{F}(U) \\ \forall \beta : (U_1, \psi_1) \rightarrow (U_2, \psi_2) \text{ in } {}_V\mathcal{I} \\ \text{we have } \beta^* s_{(U_2, \psi_2)} = s_{(U_1, \psi_1)} \end{array} \right\}$$

where the correspondence is given by $s \mapsto s_{(U, \psi)} = c(\psi)(s)$. We leave it to the reader to define the restriction mappings ${}_p u(\mathcal{F})(V) \rightarrow {}_p u(\mathcal{F})(V')$ associated to any morphism $V' \rightarrow V$ of \mathcal{D} . The resulting presheaf will be denoted ${}_p u\mathcal{F}$.

Lemma 7.18.1. *There is a canonical map ${}_p u\mathcal{F}(u(U)) \rightarrow \mathcal{F}(U)$, which is compatible with restriction maps.*

Proof. This is just the projection map $c(\text{id}_{u(U)})$ above. □

Note that any map of presheaves $\mathcal{F} \rightarrow \mathcal{F}'$ gives rise to compatible systems of maps between functors $v\mathcal{F} \rightarrow v\mathcal{F}'$, and hence to a map of presheaves ${}_p u\mathcal{F} \rightarrow {}_p u\mathcal{F}'$. In other words, we have defined a functor

$${}_p u : PSh(\mathcal{C}) \longrightarrow PSh(\mathcal{D})$$

Lemma 7.18.2. *The functor ${}_p u$ is a right adjoint to the functor u^p . In other words the formula*

$$\text{Mor}_{PSh(\mathcal{C})}(u^p \mathcal{G}, \mathcal{F}) = \text{Mor}_{PSh(\mathcal{D})}(\mathcal{G}, {}_p u\mathcal{F})$$

holds bifunctorially in \mathcal{F} and \mathcal{G} .

Proof. This is proved in exactly the same way as the proof of Lemma 7.5.4. We note that the map $u^p {}_p u\mathcal{F} \rightarrow \mathcal{F}$ from Lemma 7.18.1 is the map that is used to go from the right to the left.

Alternately, think of a presheaf of sets \mathcal{F} on \mathcal{C} as a presheaf \mathcal{F}' on \mathcal{C}^{opp} with values in Sets^{opp} , and similarly on \mathcal{D} . Check that $({}_p u\mathcal{F})' = u_p(\mathcal{F}')$, and that $(u^p \mathcal{G})' = u^p(\mathcal{G}')$. By Remark 7.5.5 we have the adjointness of u_p and u^p for presheaves with values in Sets^{opp} . The result then follows formally from this. \square

Thus given a functor $u : \mathcal{C} \rightarrow \mathcal{D}$ of categories we obtain a sequence of functors

$$u_p, u^p, {}_p u$$

between categories of presheaves where in each consecutive pair the first is left adjoint to the second.

Lemma 7.18.3. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ and $v : \mathcal{D} \rightarrow \mathcal{C}$ be functors of categories. Assume that v is right adjoint to u . Then we have*

- (1) $u^p h_V = h_{v(V)}$ for any V in \mathcal{D} ,
- (2) the category \mathcal{I}_U^v has an initial object,
- (3) the category ${}^u \mathcal{I}_V$ has a final object,
- (4) ${}_p u = v^p$, and
- (5) $u^p = v_p$.

Proof. Proof of (1). Let V be an object of \mathcal{D} . We have $u^p h_V = h_{v(V)}$ because $u^p h_V(U) = \text{Mor}_{\mathcal{D}}(u(U), V) = \text{Mor}_{\mathcal{C}}(U, v(V))$ by assumption.

Proof of (2). Let U be an object of \mathcal{C} . Let $\eta : U \rightarrow v(u(U))$ be the map adjoint to the map $\text{id} : u(U) \rightarrow u(U)$. Then we claim $(u(U), \eta)$ is an initial object of \mathcal{I}_U^v . Namely, given an object $(V, \phi : U \rightarrow v(V))$ of \mathcal{I}_U^v the morphism ϕ is adjoint to a map $\psi : u(U) \rightarrow V$ which then defines a morphism $(u(U), \eta) \rightarrow (V, \phi)$.

Proof of (3). Let V be an object of \mathcal{D} . Let $\xi : u(v(V)) \rightarrow V$ be the map adjoint to the map $\text{id} : v(V) \rightarrow v(V)$. Then we claim $(v(V), \xi)$ is a final object of ${}^u \mathcal{I}_V$. Namely, given an object $(U, \psi : u(U) \rightarrow V)$ of ${}^u \mathcal{I}_V$ the morphism ψ is adjoint to a map $\phi : U \rightarrow v(V)$ which then defines a morphism $(U, \psi) \rightarrow (v(V), \xi)$.

Hence for any presheaf \mathcal{F} on \mathcal{C} we have

$$\begin{aligned} v^p \mathcal{F}(V) &= \mathcal{F}(v(V)) \\ &= \text{Mor}_{PSh(\mathcal{C})}(h_{v(V)}, \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{C})}(u^p h_V, \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{D})}(h_V, {}_p u\mathcal{F}) \\ &= {}_p u\mathcal{F}(V) \end{aligned}$$

which proves part (2). Part (3) follows by the uniqueness of adjoint functors. \square

Lemma 7.18.4. *A continuous functor of sites which has a continuous left adjoint defines a morphism of sites.*

Proof. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $w : \mathcal{D} \rightarrow \mathcal{C}$ be a continuous left adjoint. Then $u_p = w^p$ by Lemma 7.18.3. Hence $u_s = w^s$ has a left adjoint, namely w_s (Lemma 7.14.3). Thus u_s has both a right and a left adjoint, whence is exact (Categories, Lemma 4.24.5). \square

7.19. Cocontinuous functors

There is another way to construct morphisms of topoi. This involves using cocontinuous functors between sites defined as follows.

Definition 7.19.1. Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. The functor u is called *cocontinuous* if for every $U \in \text{Ob}(\mathcal{C})$ and every covering $\{V_j \rightarrow u(U)\}_{j \in J}$ of \mathcal{D} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that the family of maps $\{u(U_i) \rightarrow u(U)\}_{i \in I}$ refines the covering $\{V_j \rightarrow u(U)\}_{j \in J}$.

Note that $\{u(U_i) \rightarrow u(U)\}_{i \in I}$ is in general *not* a covering of the site \mathcal{D} .

Lemma 7.19.2. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. Let \mathcal{F} be a sheaf on \mathcal{C} . Then ${}_p u \mathcal{F}$ is a sheaf on \mathcal{D} , which we will denote ${}_s u \mathcal{F}$.*

Proof. Let $\{V_j \rightarrow V\}_{j \in J}$ be a covering of the site \mathcal{D} . We have to show that

$${}_p u \mathcal{F}(V) \longrightarrow \prod {}_p u \mathcal{F}(V_j) \rightrightarrows \prod {}_p u \mathcal{F}(V_j \times_V V_{j'})$$

is an equalizer diagram. Since ${}_p u$ is right adjoint to u^p we have

$${}_p u \mathcal{F}(V) = \text{Mor}_{PSh(\mathcal{D})}(h_V, {}_p u \mathcal{F}) = \text{Mor}_{PSh(\mathcal{C})}(u^p h_V, \mathcal{F}) = \text{Mor}_{Sh(\mathcal{C})}((u^p h_V)^\#, \mathcal{F})$$

Hence it suffices to show that

$$(7.19.2.1) \quad \coprod u^p h_{V_j \times_V V_{j'}} \rightrightarrows \coprod u^p h_{V_j} \longrightarrow u^p h_V$$

becomes a coequalizer diagram after sheafification. (Recall that a coproduct in the category of sheaves is the sheafification of the coproduct in the category of presheaves, see Lemma 7.10.13.)

We first show that the second arrow of (7.19.2.1) becomes surjective after sheafification. To do this we use Lemma 7.12.2. Thus it suffices to show a section s of $u^p h_V$ over U lifts to a section of $\coprod u^p h_{V_j}$ on the members of a covering of U . Note that s is a morphism $s : u(U) \rightarrow V$. Then $\{V_j \times_{V,s} u(U) \rightarrow u(U)\}$ is a covering of \mathcal{D} . Hence, as u is cocontinuous, there is a covering $\{U_i \rightarrow U\}$ such that $\{u(U_i) \rightarrow u(U)\}$ refines $\{V_j \times_{V,s} u(U) \rightarrow u(U)\}$. This means that each restriction $s|_{U_i} : u(U_i) \rightarrow V$ factors through a morphism $s_i : u(U_i) \rightarrow V_j$ for some j , i.e., $s|_{U_i}$ is in the image of $u^p h_{V_j}(U_i) \rightarrow u^p h_V(U_i)$ as desired.

Let $s, s' \in (\coprod u^p h_{V_j})^\#(U)$ map to the same element of $(u^p h_V)^\#(U)$. To finish the proof of the lemma we show that after replacing U by the members of a covering that s, s' are the image of the same section of $\coprod u^p h_{V_j \times_V V_{j'}}$ by the two maps of (7.19.2.1). We may first replace U by the members of a covering and assume that $s \in u^p h_{V_j}(U)$ and $s' \in u^p h_{V_{j'}}(U)$. A second such replacement guarantees that s

and s' have the same image in $u^p h_V(U)$ instead of in the sheafification. Hence $s : u(U) \rightarrow V_j$ and $s' : u(U) \rightarrow V_{j'}$ are morphisms of \mathcal{D} such that

$$\begin{array}{ccc} u(U) & \xrightarrow{s'} & V_{j'} \\ s \downarrow & & \downarrow \\ V_j & \xrightarrow{\quad} & V \end{array}$$

is commutative. Thus we obtain $t = (s, s') : u(U) \rightarrow V_j \times_V V_{j'}$, i.e., a section $t \in u^p h_{V_j \times_V V_{j'}}(U)$ which maps to s, s' as desired. \square

Lemma 7.19.3. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. The functor $Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$, $\mathcal{G} \mapsto (u^p \mathcal{G})^\#$ is a left adjoint to the functor ${}_s u$ introduced in Lemma 7.19.2 above. Moreover, it is exact.*

Proof. Let us prove the adjointness property as follows

$$\begin{aligned} \text{Mor}_{Sh(\mathcal{C})}((u^p \mathcal{G})^\#, \mathcal{F}) &= \text{Mor}_{PSh(\mathcal{C})}(u^p \mathcal{G}, \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{D})}(\mathcal{G}, {}_p u \mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{D})}(\mathcal{G}, {}_s u \mathcal{F}). \end{aligned}$$

Thus it is a left adjoint and hence right exact, see Categories, Lemma 4.24.5. We have seen that sheafification is left exact, see Lemma 7.10.14. Moreover, the inclusion $i : Sh(\mathcal{D}) \rightarrow PSh(\mathcal{D})$ is left exact by Lemma 7.10.1. Finally, the functor u^p is left exact because it is a right adjoint (namely to u_p). Thus the functor is the composition $\# \circ u^p \circ i$ of left exact functors, hence left exact. \square

We finish this section with a technical lemma.

Lemma 7.19.4. *In the situation of Lemma 7.19.3. For any presheaf \mathcal{G} on \mathcal{D} we have $(u^p \mathcal{G})^\# = (u^p(\mathcal{G}^\#))^\#$.*

Proof. For any sheaf \mathcal{F} on \mathcal{C} we have

$$\begin{aligned} \text{Mor}_{Sh(\mathcal{C})}((u^p(\mathcal{G}^\#))^\#, \mathcal{F}) &= \text{Mor}_{Sh(\mathcal{D})}(\mathcal{G}^\#, {}_s u \mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{D})}(\mathcal{G}^\#, {}_p u \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{D})}(\mathcal{G}, {}_p u \mathcal{F}) \\ &= \text{Mor}_{PSh(\mathcal{C})}(u^p \mathcal{G}, \mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{C})}((u^p \mathcal{G})^\#, \mathcal{F}) \end{aligned}$$

and the result follows from the Yoneda lemma. \square

Remark 7.19.5. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Given morphisms $g : u(U) \rightarrow V$ and $f : W \rightarrow V$ in \mathcal{D} we can define consider the functor

$$\mathcal{C}^{opp} \longrightarrow \text{Sets}, \quad T \longmapsto \text{Mor}_{\mathcal{C}}(T, U) \times_{\text{Mor}_{\mathcal{D}}(u(T), V)} \text{Mor}_{\mathcal{D}}(u(T), W)$$

If this functor is representable, denote $U \times_{g, V, f} W$ the corresponding object of \mathcal{C} . Assume that \mathcal{C} and \mathcal{D} are sites. Consider the property P : for every covering $\{f_j : V_j \rightarrow V\}$ of \mathcal{D} and any morphism $g : u(U) \rightarrow V$ we have

- (1) $U \times_{g, V, f_i} V_i$ exists for all i , and
- (2) $\{U \times_{g, V, f_i} V_i \rightarrow U\}$ is a covering of \mathcal{C} .

Please note the similarity with the definition of continuous functors. If u has P then u is cocontinuous (details omitted). Many of the cocontinuous functors we will encounter satisfy P .

7.20. Cocontinuous functors and morphisms of topoi

It is clear from the above that a cocontinuous functor u gives a morphism of topoi in the same direction as u . Thus this is in the opposite direction from the morphism of topoi associated (under certain conditions) to a continuous u as in Definition 7.15.1, Proposition 7.15.6, and Lemma 7.16.2.

Lemma 7.20.1. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. The functors $g_* = {}_s u$ and $g^{-1} = (u^p)^\#$ define a morphism of topoi g from $Sh(\mathcal{C})$ to $Sh(\mathcal{D})$.*

Proof. This is exactly the content of Lemma 7.19.3. □

Lemma 7.20.2. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$, and $v : \mathcal{D} \rightarrow \mathcal{E}$ be cocontinuous functors. Then $v \circ u$ is cocontinuous and we have $h = g \circ f$ where $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$, resp. $g : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{E})$, resp. $h : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{E})$ is the morphism of topoi associated to u , resp. v , resp. $v \circ u$.*

Proof. Let $U \in \text{Ob}(\mathcal{C})$. Let $\{E_i \rightarrow v(u(U))\}$ be a covering of U in \mathcal{E} . By assumption there exists a covering $\{D_j \rightarrow u(U)\}$ in \mathcal{D} such that $\{v(D_j) \rightarrow v(u(U))\}$ refines $\{E_i \rightarrow v(u(U))\}$. Also by assumption there exists a covering $\{C_l \rightarrow U\}$ in \mathcal{C} such that $\{u(C_l) \rightarrow u(U)\}$ refines $\{D_j \rightarrow u(U)\}$. Then it is true that $\{v(u(C_l)) \rightarrow v(u(U))\}$ refines the covering $\{E_i \rightarrow v(u(U))\}$. This proves that $v \circ u$ is cocontinuous. To prove the last assertion it suffices to show that ${}_s v \circ {}_s u = {}_s (v \circ u)$. It suffices to prove that ${}_p v \circ {}_p u = {}_p (v \circ u)$, see Lemma 7.19.2. Since ${}_p u$, resp. ${}_p v$, resp. ${}_p (v \circ u)$ is right adjoint to u^p , resp. v^p , resp. $(v \circ u)^p$ it suffices to prove that $u^p \circ v^p = (v \circ u)^p$. And this is direct from the definitions. □

Example 7.20.3. Let X be a topological space. Let $j : U \rightarrow X$ be the inclusion of an open subspace. Recall that we have sites X_{Zar} and U_{Zar} , see Example 7.6.4. Recall that we have the functor $u : X_{Zar} \rightarrow U_{Zar}$ associated to j which is continuous and gives rise to a morphism of sites $U_{Zar} \rightarrow X_{Zar}$, see Example 7.15.2. This also gives a morphism of topoi (j_*, j^{-1}) . Next, consider the functor $v : U_{Zar} \rightarrow X_{Zar}$, $V \mapsto v(V) = V$ (just the same open but now thought of as an object of X_{Zar}). This functor is cocontinuous. Namely, if $v(V) = \bigcup_{j \in J} W_j$ is an open covering in X , then each W_j must be a subset of U and hence is of the form $v(V_j)$, and trivially $V = \bigcup_{j \in J} V_j$ is an open covering in U . We conclude by Lemma 7.20.1 above that there is a morphism of topoi associated to v

$$Sh(U) \longrightarrow Sh(X)$$

given by ${}_s v$ and $(v^p)^\#$. We claim that actually $(v^p)^\# = j^{-1}$ and that ${}_s v = j_*$, in other words, that this is the same morphism of topoi as the one given above. Perhaps the easiest way to see this is to realize that for any sheaf \mathcal{G} on X we have $v^p \mathcal{G}(V) = \mathcal{G}(V)$ which according to Sheaves, Lemma 6.31.1 is a description of $j^{-1} \mathcal{G}$ (and hence sheafification is superfluous in this case). The equality of ${}_s v$ and j_* follows by uniqueness of adjoint functors (but may also be computed directly).

Example 7.20.4. This example is a slight generalization of Example 7.20.3. Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Assume that f is open. Recall that we have sites X_{Zar} and Y_{Zar} , see Example 7.6.4. Recall that we have the functor $u : Y_{Zar} \rightarrow X_{Zar}$ associated to f which is continuous and gives rise to a morphism of sites $X_{Zar} \rightarrow Y_{Zar}$, see Example 7.15.2. This also gives a morphism of topoi (f_*, f^{-1}) . Next, consider the functor $v : X_{Zar} \rightarrow Y_{Zar}$, $U \mapsto v(U) = f(U)$. This functor is cocontinuous. Namely, if $f(U) = \bigcup_{j \in J} V_j$ is an open covering in Y , then setting $U_j = f^{-1}(V_j) \cap U$ we get an open covering $U = \bigcup U_j$ such that $f(U) = \bigcup f(U_j)$ is a refinement of $f(U) = \bigcup V_j$. We conclude by Lemma 7.20.1 above that there is a morphism of topoi associated to v

$$Sh(X) \longrightarrow Sh(Y)$$

given by ${}_s v$ and $(v^p)^\#$. We claim that actually $(v^p)^\# = f^{-1}$ and that ${}_s v = f_*$, in other words, that this is the same morphism of topoi as the one given above. For any sheaf \mathcal{G} on Y we have $v^p \mathcal{G}(U) = \mathcal{G}(f(U))$. On the other hand, we may compute $u_p \mathcal{G}(U) = \text{colim}_{f(U) \subset V} \mathcal{G}(V) = \mathcal{G}(f(U))$ because clearly $(f(U), U \subset f^{-1}(f(U)))$ is an initial object of the category \mathcal{I}_U^f of Section 7.5. Hence $u_p = v^p$ and we conclude $f^{-1} = u_s = (v^p)^\#$. The equality of ${}_s v$ and f_* follows by uniqueness of adjoint functors (but may also be computed directly).

In the first Example 7.20.3 the functor v is also continuous. But in the second Example 7.20.4 it is generally not continuous because condition (2) of Definition 7.14.1 may fail. Hence the following lemma applies to the first example, but not to the second.

Lemma 7.20.5. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous, and*
- (b) *u is continuous.*

Let $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be the associated morphism of topoi. Then

- (1) *sheafification in the formula $g^{-1} = (u^p)^\#$ is unnecessary, in other words $g^{-1}(\mathcal{G})(U) = \mathcal{G}(u(U))$,*
- (2) *g^{-1} has a left adjoint $g_! = (u_p)^\#$, and*
- (3) *g^{-1} commutes with arbitrary limits and colimits.*

Proof. By Lemma 7.14.2 for any sheaf \mathcal{G} on \mathcal{D} the presheaf $u^p \mathcal{G}$ is a sheaf on \mathcal{C} . And then we see the adjointness by the following string of equalities

$$\begin{aligned} \text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}, g^{-1} \mathcal{G}) &= \text{Mor}_{PSh(\mathcal{C})}(\mathcal{F}, u^p \mathcal{G}) \\ &= \text{Mor}_{PSh(\mathcal{D})}(u_p \mathcal{F}, \mathcal{G}) \\ &= \text{Mor}_{Sh(\mathcal{D})}(g_! \mathcal{F}, \mathcal{G}) \end{aligned}$$

The statement on limits and colimits follows from the discussion in Categories, Section 4.24. \square

In the situation of Lemma 7.20.5 above we see that we have a sequence of adjoint functors

$$g_!, g^{-1}, g_*$$

The functor $g_!$ is *not* exact in general, because it does not transform a final object of $Sh(\mathcal{C})$ into a final object of $Sh(\mathcal{D})$ in general. See Sheaves, Remark 6.31.13. On the other hand, in the topological setting of Example 7.20.3 the functor $j_!$ is exact

on abelian sheaves, see Modules, Lemma 17.3.4. The following lemma gives the generalization to the case of sites.

Lemma 7.20.6. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous,*
- (b) *u is continuous, and*
- (c) *fibre products and equalizers exist in \mathcal{C} and u commutes with them.*

In this case the functor $g_!$ above commutes with fibre products and equalizers (and more generally with finite connected limits).

Proof. Assume (a), (b), and (c). We have $g_! = (u_p)^{\#}$. Recall (Lemma 7.10.1) that limits of sheaves are equal to the corresponding limits as presheaves. And sheafification commutes with finite limits (Lemma 7.10.14). Thus it suffices to show that u_p commutes with fibre products and equalizers. To do this it suffices that colimits over the categories $(\mathcal{I}_V^u)^{opp}$ of Section 7.5 commute with fibre products and equalizers. This follows from Lemma 7.5.1 and Categories, Lemma 4.19.8. \square

The following lemma deals with a case that is even more like the morphism associated to an open immersion of topological spaces.

Lemma 7.20.7. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous,*
- (b) *u is continuous, and*
- (c) *u is fully faithful.*

For $g_!, g^{-1}, g_$ as above the canonical maps $\mathcal{F} \rightarrow g^{-1}g_!\mathcal{F}$ and $g^{-1}g_*\mathcal{F} \rightarrow \mathcal{F}$ are isomorphisms for all sheaves \mathcal{F} on \mathcal{C} .*

Proof. Let X be an object of \mathcal{C} . In Lemmas 7.19.2 and 7.20.5 we have seen that sheafification is not necessary for the functors $g^{-1} = (u^p)^{\#}$ and $g_* = ({}_p u)^{\#}$. We may compute $(g^{-1}g_*\mathcal{F})(X) = g_*\mathcal{F}(u(X)) = \lim \mathcal{F}(Y)$. Here the limit is over the category of pairs $(Y, u(Y) \rightarrow u(X))$ where the morphisms $u(Y) \rightarrow u(X)$ are not required to be of the form $u(\alpha)$ with α a morphism of \mathcal{C} . By assumption (c) we see that they automatically come from morphisms of \mathcal{C} and we deduce that the limit is the value on $(X, u(\text{id}_X))$, i.e., $\mathcal{F}(X)$. This proves that $g^{-1}g_*\mathcal{F} = \mathcal{F}$.

On the other hand, $(g^{-1}g_!\mathcal{F})(X) = g_!\mathcal{F}(u(X)) = (u_p\mathcal{F})^{\#}(u(X))$, and $u_p\mathcal{F}(u(X)) = \text{colim } \mathcal{F}(Y)$. Here the colimit is over the category of pairs $(Y, u(X) \rightarrow u(Y))$ where the morphisms $u(X) \rightarrow u(Y)$ are not required to be of the form $u(\alpha)$ with α a morphism of \mathcal{C} . By assumption (c) we see that they automatically come from morphisms of \mathcal{C} and we deduce that the colimit is the value on $(X, u(\text{id}_X))$, i.e., $\mathcal{F}(X)$. Thus for every $X \in \text{Ob}(\mathcal{C})$ we have $u_p\mathcal{F}(u(X)) = \mathcal{F}(X)$. Since u is cocontinuous and continuous any covering of $u(X)$ in \mathcal{D} can be refined by a covering (!) $\{u(X_i) \rightarrow u(X)\}$ of \mathcal{D} where $\{X_i \rightarrow X\}$ is a covering in \mathcal{C} . This implies that $(u_p\mathcal{F})^+(u(X)) = \mathcal{F}(X)$ also, since in the colimit defining the value of $(u_p\mathcal{F})^+$ on $u(X)$ we may restrict to the cofinal system of coverings $\{u(X_i) \rightarrow u(X)\}$ as above. Hence we see that $(u_p\mathcal{F})^+(u(X)) = \mathcal{F}(X)$ for all objects X of \mathcal{C} as well. Repeating this argument one more time gives the equality $(u_p\mathcal{F})^{\#}(u(X)) = \mathcal{F}(X)$ for all objects X of \mathcal{C} . This produces the desired equality $g^{-1}g_!\mathcal{F} = \mathcal{F}$. \square

Finally, here is a case that does not have any corresponding topological example. We will use this lemma to see what happens when we enlarge a “partial universe”

of schemes keeping the same topology. In the situation of the lemma, the morphism of topoi $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ identifies $Sh(\mathcal{C})$ as a subtopos of $Sh(\mathcal{D})$ (Section 7.42) and moreover, the given embedding has a retraction.

Lemma 7.20.8. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous,*
- (b) *u is continuous,*
- (c) *u is fully faithful,*
- (d) *fibre products exist in \mathcal{C} and u commutes with them, and*
- (e) *there exist final objects $e_{\mathcal{C}} \in \text{Ob}(\mathcal{C})$, $e_{\mathcal{D}} \in \text{Ob}(\mathcal{D})$ such that $u(e_{\mathcal{C}}) = e_{\mathcal{D}}$.*

Let $g_!, g^{-1}, g_$ be as above. Then, u defines a morphism of sites $f : \mathcal{D} \rightarrow \mathcal{C}$ with $f_* = g^{-1}$, $f^{-1} = g_!$. The composition*

$$Sh(\mathcal{C}) \xrightarrow{g} Sh(\mathcal{D}) \xrightarrow{f} Sh(\mathcal{C})$$

is isomorphic to the identity morphism of the topos $Sh(\mathcal{C})$. Moreover, the functor f^{-1} is fully faithful.

Proof. By assumption the functor u satisfies the hypotheses of Proposition 7.15.6. Hence u defines a morphism of sites and hence a morphism of topoi f as in Lemma 7.16.2. The formulas $f_* = g^{-1}$ and $f^{-1} = g_!$ are clear from the lemma cited and Lemma 7.20.5. We have $f_* \circ g_* = g^{-1} \circ g_* \cong \text{id}$, and $g^{-1} \circ f^{-1} = g^{-1} \circ g_! \cong \text{id}$ by Lemma 7.20.7.

We still have to show that f^{-1} is fully faithful. Let $\mathcal{F}, \mathcal{G} \in \text{Ob}(Sh(\mathcal{C}))$. We have to show that the map

$$\text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}, \mathcal{G}) \longrightarrow \text{Mor}_{Sh(\mathcal{D})}(f^{-1}\mathcal{F}, f^{-1}\mathcal{G})$$

is bijective. But the right hand side is equal to

$$\begin{aligned} \text{Mor}_{Sh(\mathcal{D})}(f^{-1}\mathcal{F}, f^{-1}\mathcal{G}) &= \text{Mor}_{Sh(\mathcal{C})}(f_*f^{-1}\mathcal{F}, \mathcal{G}) \\ &= \text{Mor}_{Sh(\mathcal{C})}(g^{-1}f^{-1}\mathcal{F}, \mathcal{G}) \\ &= \text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}, \mathcal{G}) \end{aligned}$$

(the first equality by adjunction) which proves what we want. \square

Example 7.20.9. Let X be a topological space. Let $i : Z \rightarrow X$ be the inclusion of a subset (with induced topology). Consider the functor $u : X_{Zar} \rightarrow Z_{Zar}$, $U \mapsto u(U) = Z \cap U$. At first glance it may appear that this functor is cocontinuous as well. After all, since Z has the induced topology, shouldn't any covering of $U \cap Z$ it come from a covering of U in X ? Not so! Namely, what if $U \cap Z = \emptyset$? In that case, the empty covering is a covering of $U \cap Z$, and the empty covering can only be refined by the empty covering. Thus we conclude that u cocontinuous \Rightarrow every nonempty open U of X has nonempty intersection with Z . But this is not sufficient. For example, if $X = \mathbf{R}$ the real number line with the usual topology, and $Z = \mathbf{R} \setminus \{0\}$, then there is an open covering of Z , namely $Z = \{x < 0\} \cup \bigcup_n \{1/n < x\}$ which cannot be refined by the restriction of any open covering of X .

7.21. Cocontinuous functors which have a right adjoint

It may happen that a cocontinuous functor u has a right adjoint v . In this case it is often the case that v is continuous, and if so, then it defines a morphism of topoi (which is the same as the one defined by u).

Lemma 7.21.1. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$, and $v : \mathcal{D} \rightarrow \mathcal{C}$ be functors. Assume that u is cocontinuous, and that v is a right adjoint to u . Let $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be the morphism of topoi associated to u , see Lemma 7.20.1. Then $g_*\mathcal{F}$ is equal to the presheaf $v^p\mathcal{F}$, in other words, $(g_*\mathcal{F})(V) = \mathcal{F}(v(V))$.*

Proof. We have $u^ph_V = h_{v(V)}$ by Lemma 7.18.3. By Lemma 7.19.4 this implies that $g^{-1}(h_V^\#) = (u^ph_V^\#)^\# = (h_{v(V)}^\#)^\# = h_{v(V)}^\#$. Hence for any sheaf \mathcal{F} on \mathcal{C} we have

$$\begin{aligned} (g_*\mathcal{F})(V) &= \text{Mor}_{Sh(\mathcal{D})}(h_V^\#, g_*\mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{C})}(g^{-1}(h_V^\#), \mathcal{F}) \\ &= \text{Mor}_{Sh(\mathcal{C})}(h_{v(V)}^\#, \mathcal{F}) \\ &= \mathcal{F}(v(V)) \end{aligned}$$

which proves the lemma. \square

In the situation of Lemma 7.21.1 we see that v^p transforms sheaves into sheaves. Hence we can define $v^s = v^p$ restricted to sheaves. Just as in Lemma 7.14.3 we see that $v_s : \mathcal{G} \mapsto (v_p\mathcal{G})^\#$ is a left adjoint to v^s . On the other hand, we have $v^s = g_*$ and g^{-1} is a left adjoint of g_* as well. We conclude that $g^{-1} = v_s$ is exact.

Lemma 7.21.2. *In the situation of Lemma 7.21.1. We have $g_* = v^s = v^p$ and $g^{-1} = v_s = (v_p)^\#$. If v is continuous then v defines a morphism of sites f from \mathcal{C} to \mathcal{D} whose associated morphism of topoi is equal to the morphism g associated to the cocontinuous functor u . In other words, a continuous functor which has a cocontinuous left adjoint defines a morphism of sites.*

Proof. Clear from the discussion above the lemma and Definitions 7.15.1 and Lemma 7.16.2. \square

7.22. Cocontinuous functors which have a left adjoint

It may happen that a cocontinuous functor u has a left adjoint w .

Lemma 7.22.1. *Let \mathcal{C} and \mathcal{D} be sites. Let $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be the morphism of topoi associated to a continuous and cocontinuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$, see Lemmas 7.20.1 and 7.20.5.*

- (1) *If $w : \mathcal{D} \rightarrow \mathcal{C}$ is a left adjoint to u , then*
 - (a) $g_!\mathcal{F}$ *is the sheaf associated to the presheaf $w^p\mathcal{F}$, and*
 - (b) $g_!$ *is exact.*
- (2) *if w is a continuous left adjoint, then $g_!$ has a left adjoint.*
- (3) *If w is a cocontinuous left adjoint, then $g_! = h^{-1}$ and $g^{-1} = h_*$ where $h : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ is the morphism of topoi associated to w .*

Proof. Recall that $g_!\mathcal{F}$ is the sheafification of $u_p\mathcal{F}$. Hence (1)(a) follows from the fact that $u_p = w^p$ by Lemma 7.18.3.

To see (1)(b) note that $g_!$ commutes with all colimits as $g_!$ is a left adjoint (Categories, Lemma 4.24.4). Let $i \mapsto \mathcal{F}_i$ be a finite diagram in $Sh(\mathcal{C})$. Then $\lim \mathcal{F}_i$ is

computed in the category of presheaves (Lemma 7.10.1). Since w^p is a right adjoint (Lemma 7.5.4) we see that $w^p \lim \mathcal{F}_i = \lim w^p \mathcal{F}_i$. Since sheafification is exact (Lemma 7.10.14) we conclude by (1)(a).

Assume w is continuous. Then $g_l = (w^p)^\# = w^s$ but sheafification isn't necessary and one has the left adjoint w_s , see Lemmas 7.14.2 and 7.14.3.

Assume w is cocontinuous. The equality $g_l = h^{-1}$ follows from (1)(a) and the definitions. The equality $g^{-1} = h_*$ follows from the equality $g_l = h^{-1}$ and uniqueness of adjoint functor. Alternatively one can deduce it from Lemma 7.21.1. \square

7.23. Existence of lower shriek

In this section we discuss some cases of morphisms of topoi f for which f^{-1} has a left adjoint $f_!$.

Lemma 7.23.1. *Let \mathcal{C}, \mathcal{D} be two sites. Let $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ be a morphism of topoi. Let $E \subset \text{Ob}(\mathcal{D})$ be a subset such that*

- (1) *for $V \in E$ there exists a sheaf \mathcal{G} on \mathcal{C} such that $f^{-1}\mathcal{F}(V) = \text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, \mathcal{F})$ functorially for \mathcal{F} in $Sh(\mathcal{C})$,*
- (2) *every object of \mathcal{D} has a covering by objects of E .*

Then f^{-1} has a left adjoint $f_!$.

Proof. By the Yoneda lemma (Categories, Lemma 4.3.5) the sheaf \mathcal{G}_V corresponding to $V \in E$ is defined up to unique isomorphism by the formula $f^{-1}\mathcal{F}(V) = \text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}_V, \mathcal{F})$. Recall that $f^{-1}\mathcal{F}(V) = \text{Mor}_{Sh(\mathcal{D})}(h_V^\#, f^{-1}\mathcal{F})$. Denote $i_V : h_V^\# \rightarrow f^{-1}\mathcal{G}_V$ the map corresponding to id in $\text{Mor}(\mathcal{G}_V, \mathcal{G}_V)$. Functoriality in (1) implies that the bijection is given by

$$\text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}_V, \mathcal{F}) \rightarrow \text{Mor}_{Sh(\mathcal{D})}(h_V^\#, f^{-1}\mathcal{F}), \quad \varphi \mapsto f^{-1}\varphi \circ i_V$$

For any $V_1, V_2 \in E$ there is a canonical map

$$\text{Mor}_{Sh(\mathcal{D})}(h_{V_2}^\#, h_{V_1}^\#) \rightarrow \text{Hom}_{Sh(\mathcal{C})}(\mathcal{G}_{V_2}, \mathcal{G}_{V_1}), \quad \varphi \mapsto f_!(\varphi)$$

which is characterized by $f^{-1}(f_!(\varphi)) \circ i_{V_2} = i_{V_1} \circ \varphi$. Note that $\varphi \mapsto f_!(\varphi)$ is compatible with composition; this can be seen directly from the characterization. Hence $h_V^\# \mapsto \mathcal{G}_V$ and $\varphi \mapsto f_!\varphi$ is a functor from the full subcategory of $Sh(\mathcal{D})$ whose objects are the $h_V^\#$.

Let J be a set and let $J \rightarrow E, j \mapsto V_j$ be a map. Then we have a functorial bijection

$$\text{Mor}_{Sh(\mathcal{C})}(\coprod \mathcal{G}_{V_j}, \mathcal{F}) \longrightarrow \text{Mor}_{Sh(\mathcal{D})}(\coprod h_{V_j}^\#, f^{-1}\mathcal{F})$$

using the product of the bijections above. Hence we can extend the functor $f_!$ to the full subcategory of $Sh(\mathcal{D})$ whose objects are coproducts of $h_V^\#$ with $V \in E$.

Given an arbitrary sheaf \mathcal{H} on \mathcal{D} we choose an coequalizer diagram

$$\mathcal{H}_1 \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} \mathcal{H}_0 \longrightarrow \mathcal{H}$$

where $\mathcal{H}_i = \coprod h_{V_{i,j}}^\#$ is a coproduct with $V_{i,j} \in E$. This is possible by assumption (2), see Lemma 7.13.5 (for those worried about set theoretical issues, note that the construction given in Lemma 7.13.5 is canonical). Define $f_!(\mathcal{H})$ to be the sheaf on \mathcal{C} which makes

$$f_!\mathcal{H}_1 \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} f_!\mathcal{H}_0 \longrightarrow f_!\mathcal{H}$$

Then

$$\begin{aligned} \text{Mor}(f_! \mathcal{H}, \mathcal{F}) &= \text{Equalizer}(\text{Mor}(f_! \mathcal{H}_0, \mathcal{F}) \rightrightarrows \text{Mor}(f_! \mathcal{H}_1, \mathcal{F})) \\ &= \text{Equalizer}(\text{Mor}(\mathcal{H}_0, f^{-1} \mathcal{F}) \rightrightarrows \text{Mor}(\mathcal{H}_1, f^{-1} \mathcal{F})) \\ &= \text{Hom}(\mathcal{H}, f^{-1} \mathcal{F}) \end{aligned}$$

Hence we see that we can extend $f_!$ to the whole category of sheaves on \mathcal{D} . \square

7.24. Localization

Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. See Categories, Example 4.2.13 for the definition of the category \mathcal{C}/U of objects over U . We turn \mathcal{C}/U into a site by declaring a family of morphisms $\{V_j \rightarrow V\}$ of objects over U to be a covering of \mathcal{C}/U if and only if it is a covering in \mathcal{C} . Consider the forgetful functor

$$j_U : \mathcal{C}/U \longrightarrow \mathcal{C}.$$

This is clearly cocontinuous and continuous. Hence by the results of the previous sections we obtain a morphism of topoi

$$j_U : \text{Sh}(\mathcal{C}/U) \longrightarrow \text{Sh}(\mathcal{C})$$

given by j_U^{-1} and j_{U*} , as well as a functor $j_{U!}$.

Definition 7.24.1. Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$.

- (1) The site \mathcal{C}/U is called the *localization of the site \mathcal{C} at the object U* .
- (2) The morphism of topoi $j_U : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})$ is called the *localization morphism*.
- (3) The functor j_{U*} is called the *direct image functor*.
- (4) For a sheaf \mathcal{F} on \mathcal{C} the sheaf $j_U^{-1} \mathcal{F}$ is called the *restriction of \mathcal{F} to \mathcal{C}/U* .
- (5) For a sheaf \mathcal{G} on \mathcal{C}/U the sheaf $j_{U!} \mathcal{G}$ is called the *extension of \mathcal{G} by the empty set*.

The restriction $j_U^{-1} \mathcal{F}$ is the sheaf defined by the rule $j_U^{-1} \mathcal{F}(X/U) = \mathcal{F}(X)$ as expected. The extension by the empty set also has a very easy description in this case; here it is.

Lemma 7.24.2. Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. Let \mathcal{G} be a presheaf on \mathcal{C}/U . Then $j_{U!}(\mathcal{G}^\#)$ is the sheaf associated to the presheaf

$$V \longmapsto \coprod_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

with obvious restriction mappings.

Proof. By Lemma 7.20.5 we have $j_{U!}(\mathcal{G}^\#) = ((j_U)_p \mathcal{G}^\#)^\#$. By Lemma 7.14.4 this is equal to $((j_U)_p \mathcal{G})^\#$. Hence it suffices to prove that $(j_U)_p$ is given by the formula above for any presheaf \mathcal{G} on \mathcal{C}/U . OK, and by the definition in Section 7.5 we have

$$(j_U)_p \mathcal{G}(V) = \text{colim}_{(W/U, V \rightarrow W)} \mathcal{G}(W)$$

Now it is clear that the category of pairs $(W/U, V \rightarrow W)$ has an object $O_\varphi = (\varphi : V \rightarrow U, \text{id} : V \rightarrow V)$ for every $\varphi : V \rightarrow U$, and moreover for any object there is a unique morphism from one of the O_φ into it. The result follows. \square

Lemma 7.24.3. Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. Let X/U be an object of \mathcal{C}/U . Then we have $j_{U!}(h_{X/U}^\#) = h_X^\#$.

Proof. Denote $p : X \rightarrow U$ the structure morphism of X . By Lemma 7.24.2 we see $j_{U!}(h_{X/U}^\#)$ is the sheaf associated to the presheaf

$$V \mapsto \coprod_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \{\psi : V \rightarrow X \mid p \circ \psi = \varphi\}$$

This is clearly the same thing as $\text{Mor}_{\mathcal{C}}(V, X)$. Hence the lemma follows. \square

We have $j_{U!}(\ast) = h_U^\#$ by either of the two lemmas above. Hence for every sheaf \mathcal{G} over \mathcal{C}/U there is a canonical map of sheaves $j_{U!}\mathcal{G} \rightarrow h_U^\#$. This characterizes sheaves in the essential image of $j_{U!}$.

Lemma 7.24.4. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. The functor $j_{U!}$ gives an equivalence of categories*

$$\text{Sh}(\mathcal{C}/U) \longrightarrow \text{Sh}(\mathcal{C})/h_U^\#$$

Proof. We explain how to get a functor from $\text{Sh}(\mathcal{C})/h_U^\#$ to $\text{Sh}(\mathcal{C}/U)$. Suppose that $\varphi : \mathcal{F} \rightarrow h_U^\#$ is given. For any object $a : X \rightarrow U$ of \mathcal{C}/U we consider the set $\mathcal{F}_\varphi(X \rightarrow U)$ of elements $s \in \mathcal{F}(X)$ which under φ map to the image of $a \in \text{Mor}_{\mathcal{C}}(X, U) = h_U(X)$ in $h_U^\#(X)$. It is easy to see that $(X \rightarrow U) \mapsto \mathcal{F}_\varphi(X \rightarrow U)$ is a sheaf on \mathcal{C}/U . The verification that $(\mathcal{F}, \varphi) \mapsto \mathcal{F}_\varphi$ is an inverse to the functor $j_{U!}$ is omitted. \square

The lemma says the functor $j_{U!}$ is the composition

$$\text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})/h_U^\# \rightarrow \text{Sh}(\mathcal{C})$$

where the first arrow is an equivalence.

Lemma 7.24.5. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. The functor $j_{U!}$ commutes with fibre products and equalizers (and more generally finite connected limits). In particular, if $\mathcal{F} \subset \mathcal{F}'$ in $\text{Sh}(\mathcal{C}/U)$, then $j_{U!}\mathcal{F} \subset j_{U!}\mathcal{F}'$.*

Proof. This follows from the fact that an isomorphism of categories commutes with all limits and the functor $\text{Sh}(\mathcal{C})/h_U^\# \rightarrow \text{Sh}(\mathcal{C})$ commutes with fibre products and equalizers. Alternatively, one can prove this directly using the description of $j_{U!}$ in Lemma 7.24.2 using that sheafification is exact. (Also, in case \mathcal{C} has fibre products and equalizers, the result follows from Lemma 7.20.6.) \square

Lemma 7.24.6. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. For any sheaf \mathcal{F} on \mathcal{C} we have $j_{U!}j_U^{-1}\mathcal{F} = \mathcal{F} \times h_U^\#$.*

Proof. This is clear from the description of $j_{U!}$ in Lemma 7.24.2. \square

Lemma 7.24.7. *Let \mathcal{C} be a site. Let $f : V \rightarrow U$ be a morphism of \mathcal{C} . Then there exists a commutative diagram*

$$\begin{array}{ccc} \mathcal{C}/V & \xrightarrow{j} & \mathcal{C}/U \\ & \searrow j_V & \swarrow j_U \\ & \mathcal{C} & \end{array}$$

of cocontinuous functors. Here $j : \mathcal{C}/V \rightarrow \mathcal{C}/U$, $(a : W \rightarrow V) \mapsto (f \circ a : W \rightarrow U)$ is identified with the functor $j_{V/U} : (\mathcal{C}/U)/(V/U) \rightarrow \mathcal{C}/U$ via the identification $(\mathcal{C}/U)/(V/U) = \mathcal{C}/V$. Moreover we have $j_{V!} = j_{U!} \circ j_!$, $j_V^{-1} = j^{-1} \circ j_U^{-1}$, and $j_{V^\ast} = j_{U^\ast} \circ j_\ast$.

Proof. The commutativity of the diagram is immediate. The agreement of j with $j_{V/U}$ follows from the definitions. By Lemma 7.20.2 we see that the following diagram of morphisms of topoi

$$(7.24.7.1) \quad \begin{array}{ccc} Sh(\mathcal{C}/V) & \xrightarrow{j} & Sh(\mathcal{C}/U) \\ & \searrow j_V & \swarrow j_U \\ & Sh(\mathcal{C}) & \end{array}$$

is commutative. This proves that $j_V^{-1} = j^{-1} \circ j_U^{-1}$ and $j_{V*} = j_{U*} \circ j_*$. The equality $j_{V!} = j_{U!} \circ j_!$ follows formally from adjointness properties. \square

Lemma 7.24.8. *Notation \mathcal{C} , $f : V \rightarrow U$, j_U , j_V , and j as in Lemma 7.24.7. Via the identifications $Sh(\mathcal{C}/V) = Sh(\mathcal{C})/h_V^\#$ and $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^\#$ of Lemma 7.24.4 the functor j^{-1} has the following description*

$$j^{-1}(\mathcal{H} \xrightarrow{\varphi} h_U^\#) = (\mathcal{H} \times_{\varphi, h_U^\#, f} h_V^\# \rightarrow h_V^\#).$$

Proof. Suppose that $\varphi : \mathcal{H} \rightarrow h_U^\#$ is an object of $Sh(\mathcal{C})/h_U^\#$. By the proof of Lemma 7.24.4 this corresponds to the sheaf \mathcal{H}_φ on \mathcal{C}/U defined by the rule

$$(a : W \rightarrow U) \mapsto \{s \in \mathcal{H}(W) \mid \varphi(s) = a\}$$

on \mathcal{C}/U . The pullback $j^{-1}\mathcal{H}_\varphi$ to \mathcal{C}/V is given by the rule

$$(a : W \rightarrow V) \mapsto \{s \in \mathcal{H}(W) \mid \varphi(s) = f \circ a\}$$

by the description of $j^{-1} = j_{U/V}^{-1}$ as the restriction of \mathcal{H}_φ to \mathcal{C}/V . On the other hand, applying the rule to the object

$$\mathcal{H}' = \mathcal{H} \times_{\varphi, h_U^\#, f} h_V^\# \xrightarrow{\varphi'} h_V^\#$$

of $Sh(\mathcal{C})/h_V^\#$ we get $\mathcal{H}'_{\varphi'}$ given by

$$\begin{aligned} (a : W \rightarrow V) &\mapsto \{s' \in \mathcal{H}'(W) \mid \varphi'(s') = a\} \\ &= \{(s, a') \in \mathcal{H}(W) \times h_V^\#(W) \mid a' = a \text{ and } \varphi(s) = f \circ a'\} \end{aligned}$$

which is exactly the same rule as the one describing $j^{-1}\mathcal{H}_\varphi$ above. \square

Remark 7.24.9. Localization and presheaves. Let \mathcal{C} be a category. Let U be an object of \mathcal{C} . Strictly speaking the functors j_U^{-1} , j_{U*} and $j_{U!}$ have not been defined for presheaves. But of course, we can think of a presheaf as a sheaf for the chaotic topology on \mathcal{C} (see Example 7.6.6). Hence we also obtain a functor

$$j_U^{-1} : PSh(\mathcal{C}) \longrightarrow PSh(\mathcal{C}/U)$$

and functors

$$j_{U*}, j_{U!} : PSh(\mathcal{C}/U) \longrightarrow PSh(\mathcal{C})$$

which are right, left adjoint to j_U^{-1} . By Lemma 7.24.2 we see that $j_{U!}\mathcal{G}$ is the presheaf

$$V \mapsto \coprod_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

In addition the functor $j_{U!}$ commutes with fibre products and equalizers.

Remark 7.24.10. Let \mathcal{C} be a site. Let $U \rightarrow V$ be a morphism of \mathcal{C} . The cocontinuous functors $\mathcal{C}/U \rightarrow \mathcal{C}$ and $j : \mathcal{C}/U \rightarrow \mathcal{C}/V$ (Lemma 7.24.7) satisfy property P of Remark 7.19.5. For example, if we have objects (X/U) , (W/V) , a morphism $g : j(X/U) \rightarrow (W/V)$, and a covering $\{f_i : (W_i/V) \rightarrow (W/V)\}$ then $(X \times_W W_i/U)$ is an avatar of $(X/U) \times_{g, (W/V), f_i} (W_i/V)$ and the family $\{(X \times_W W_i/U) \rightarrow (X/U)\}$ is a covering of \mathcal{C}/U .

7.25. Glueing sheaves

This section is the analogue of Sheaves, Section 6.33.

Lemma 7.25.1. *Let \mathcal{C} be a site. Let $\{U_i \rightarrow U\}$ be a covering of \mathcal{C} . Let \mathcal{F}, \mathcal{G} be sheaves on \mathcal{C} . Given a collection*

$$\varphi_i : \mathcal{F}|_{\mathcal{C}/U_i} \longrightarrow \mathcal{G}|_{\mathcal{C}/U_i}$$

of maps of sheaves such that for all $i, j \in I$ the maps φ_i, φ_j restrict to the same map $\mathcal{F}|_{\mathcal{C}/U_i \times_U U_j} \rightarrow \mathcal{G}|_{\mathcal{C}/U_i \times_U U_j}$ then there exists a unique map of sheaves

$$\varphi : \mathcal{F}|_{\mathcal{C}/U} \longrightarrow \mathcal{G}|_{\mathcal{C}/U}$$

whose restriction to each \mathcal{C}/U_i agrees with φ_i .

Proof. Omitted. Note that the restrictions are always those of Lemma 7.24.7. \square

The previous lemma implies that given two sheaves \mathcal{F}, \mathcal{G} on a site \mathcal{C} the rule

$$U \longmapsto \text{Mor}_{\text{Sh}(\mathcal{C}/U)}(\mathcal{F}|_{\mathcal{C}/U}, \mathcal{G}|_{\mathcal{C}/U})$$

defines a sheaf. This is a kind of *internal hom sheaf*. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules on Sites, Section 18.27.

Let \mathcal{C} be a site. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . For each $i \in I$ let \mathcal{F}_i be a sheaf of sets on \mathcal{C}/U_i . For each pair $i, j \in I$, let

$$\varphi_{ij} : \mathcal{F}_i|_{\mathcal{C}/U_i \times_U U_j} \longrightarrow \mathcal{F}_j|_{\mathcal{C}/U_i \times_U U_j}$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

$$\begin{array}{ccc} \mathcal{F}_i|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} & \xrightarrow{\varphi_{ik}} & \mathcal{F}_k|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} \\ & \searrow \varphi_{ij} & \nearrow \varphi_{jk} \\ & \mathcal{F}_j|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} & \end{array}$$

We will call such a collection of data $(\mathcal{F}_i, \varphi_{ij})$ a *glueing data for sheaves of sets with respect to the covering $\{U_i \rightarrow U\}_{i \in I}$* .

Lemma 7.25.2. *Let \mathcal{C} be a site. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . Given any glueing data $(\mathcal{F}_i, \varphi_{ij})$ for sheaves of sets with respect to the covering $\{U_i \rightarrow U\}_{i \in I}$ there exists a sheaf of sets \mathcal{F} on \mathcal{C}/U together with isomorphisms*

$$\varphi_i : \mathcal{F}|_{\mathcal{C}/U_i} \rightarrow \mathcal{F}_i$$

such that the diagrams

$$\begin{array}{ccc} \mathcal{F}|_{\mathcal{C}/U_i \times_U U_j} & \xrightarrow{\varphi_i} & \mathcal{F}_i|_{\mathcal{C}/U_i \times_U U_j} \\ \text{id} \downarrow & & \downarrow \varphi_{ij} \\ \mathcal{F}|_{\mathcal{C}/U_i \times_U U_j} & \xrightarrow{\varphi_j} & \mathcal{F}_j|_{\mathcal{C}/U_i \times_U U_j} \end{array}$$

are commutative.

Proof. Let us describe how to construct the sheaf \mathcal{F} on \mathcal{C}/U . Let $a : V \rightarrow U$ be an object of \mathcal{C}/U . Then

$$\mathcal{F}(V/U) = \{(s_i)_{i \in I} \in \prod_{i \in I} \mathcal{F}_i(U_i \times_U V/U_i) \mid \varphi_{ij}(s_i|_{U_i \times_U U_j \times_U V}) = s_j|_{U_i \times_U U_j \times_U V}\}$$

We omit the construction of the restriction mappings. We omit the verification that this is a sheaf. We omit the construction of the isomorphisms φ_i , and we omit proving the commutativity of the diagrams of the lemma. \square

Let \mathcal{C} be a site. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . Let \mathcal{F} be a sheaf on \mathcal{C}/U . Associated to \mathcal{F} we have its *canonical glueing data* given by the restrictions $\mathcal{F}|_{\mathcal{C}/U_i}$ and the canonical isomorphisms

$$(\mathcal{F}|_{\mathcal{C}/U_i})|_{\mathcal{C}/U_i \times_U U_j} = (\mathcal{F}|_{\mathcal{C}/U_j})|_{\mathcal{C}/U_i \times_U U_j}$$

coming from the fact that the composition of the functors $\mathcal{C}/U_i \times_U U_j \rightarrow \mathcal{C}/U_i \rightarrow \mathcal{C}/U$ and $\mathcal{C}/U_i \times_U U_j \rightarrow \mathcal{C}/U_j \rightarrow \mathcal{C}/U$ are equal.

Lemma 7.25.3. *Let \mathcal{C} be a site. Let $\{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . The category $\text{Sh}(\mathcal{C}/U)$ is equivalent to the category of glueing data via the functor that associates to \mathcal{F} on \mathcal{C}/U the canonical glueing data.*

Proof. In Lemma 7.25.1 we saw that the functor is fully faithful, and in Lemma 7.25.2 we proved that it is essentially surjective (by explicitly constructing a quasi-inverse functor). \square

7.26. More localization

In this section we prove a few lemmas on localization where we impose some additional hypotheses on the site on or the object we are localizing at.

Lemma 7.26.1. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. If the topology on \mathcal{C} is subcanonical, see Definition 7.13.2, and if \mathcal{G} is a sheaf on \mathcal{C}/U , then*

$$j_{U!}(\mathcal{G})(V) = \prod_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U),$$

in other words sheafification is not necessary in Lemma 7.24.2.

Proof. Let $\mathcal{V} = \{V_i \rightarrow V\}_{i \in I}$ be a covering of V in the site \mathcal{C} . We are going to check the sheaf condition for the presheaf \mathcal{H} of Lemma 7.24.2 directly. Let $(s_i, \varphi_i)_{i \in I} \in \prod_i \mathcal{H}(V_i)$. This means $\varphi_i : V_i \rightarrow U$ is a morphism in \mathcal{C} , and $s_i \in \mathcal{G}(V_i \xrightarrow{\varphi_i} U)$. The restriction of the pair (s_i, φ_i) to $V_i \times_V V_j$ is the pair $(s_i|_{V_i \times_V V_j/U}, \text{pr}_1 \circ \varphi_i)$, and likewise the restriction of the pair (s_j, φ_j) to $V_i \times_V V_j$ is the pair $(s_j|_{V_i \times_V V_j/U}, \text{pr}_2 \circ \varphi_j)$. Hence, if the family (s_i, φ_i) lies in $\check{H}^0(\mathcal{V}, \mathcal{H})$, then we see that $\text{pr}_1 \circ \varphi_i = \text{pr}_2 \circ \varphi_j$. The condition that the topology on \mathcal{C} is weaker than the canonical topology then implies that there exists a unique morphism $\varphi : V \rightarrow U$ such that φ_i is the

composition of $V_i \rightarrow V$ with φ . At this point the sheaf condition for \mathcal{G} guarantees that the sections s_i glue to a unique section $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$. Hence $(s, \varphi) \in \mathcal{H}(V)$ as desired. \square

Lemma 7.26.2. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. Assume \mathcal{C} has products of pairs of objects. Then*

- (1) *the functor j_U has a continuous right adjoint, namely the functor $v(X) = X \times U/U$,*
- (2) *the functor v defines a morphism of sites $\mathcal{C}/U \rightarrow \mathcal{C}$ whose associated morphism of topoi equals $j_U : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})$, and*
- (3) *we have $j_{U*}\mathcal{F}(X) = \mathcal{F}(X \times U/U)$.*

Proof. The functor v being right adjoint to j_U means that given Y/U and X we have

$$\text{Mor}_{\mathcal{C}}(Y, X) = \text{Mor}_{\mathcal{C}/U}(Y/U, X \times U/U)$$

which is clear. To check that v is continuous let $\{X_i \rightarrow X\}$ be a covering of \mathcal{C} . By the third axiom of a site (Definition 7.6.2) we see that

$$\{X_i \times_X (X \times U) \rightarrow X \times_X (X \times U)\} = \{X_i \times U \rightarrow X \times U\}$$

is a covering of \mathcal{C} also. Hence v is continuous. The other statements of the lemma follow from Lemmas 7.21.1 and 7.21.2. \square

Lemma 7.26.3. *Let \mathcal{C} be a site. Let $U \rightarrow V$ be a morphism of \mathcal{C} . Assume \mathcal{C} has fibre products. Let j be as in Lemma 7.24.7. Then*

- (1) *the functor $j : \mathcal{C}/U \rightarrow \mathcal{C}/V$ has a continuous right adjoint, namely the functor $v : (X/V) \mapsto (X \times_V U/U)$,*
- (2) *the functor v defines a morphism of sites $\mathcal{C}/U \rightarrow \mathcal{C}/V$ whose associated morphism of topoi equals j , and*
- (3) *we have $j_*\mathcal{F}(X/U) = \mathcal{F}(X \times_V U/U)$.*

Proof. Follows from Lemma 7.26.2 since j may be viewed as a localization functor by Lemma 7.24.7. \square

A fundamental property of an open immersion is that the restriction of the push-forward and the restriction of the extension by the empty set produces back the original sheaf. This is not always true for the functors associated to j_U above. It is true when U is a “subobject of the final object”.

Lemma 7.26.4. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. Assume that every X in \mathcal{C} has at most one morphism to U . Let \mathcal{F} be a sheaf on \mathcal{C}/U . The canonical maps $\mathcal{F} \rightarrow j_U^{-1}j_{U!}\mathcal{F}$ and $j_U^{-1}j_{U*}\mathcal{F} \rightarrow \mathcal{F}$ are isomorphisms.*

Proof. If \mathcal{C} has fibre products, then this is a special case of Lemma 7.20.7. In general we have the following direct proof.

Let X/U be an object over U . In Lemmas 7.19.2 and 7.20.5 we have seen that sheafification is not necessary for the functors $j_U^{-1} = (u^p)^\#$ and $j_{U*} = (p_!u)^\#$. We may compute $(j_U^{-1}j_{U*}\mathcal{F})(X/U) = j_{U*}\mathcal{F}(X) = \lim \mathcal{F}(Y/U)$. Here the limit is over the category of pairs $(Y/U, Y \rightarrow X)$ where the morphisms $Y \rightarrow X$ are not required to be over U . By our assumption however we see that they are automatically morphisms over U and we deduce that the limit is the value on id_X , i.e., $\mathcal{F}(X/U)$. This proves that $j_U^{-1}j_{U*}\mathcal{F} = \mathcal{F}$.

On the other hand, $(j_U^{-1}j_{U!}\mathcal{F})(X/U) = j_{U!}\mathcal{F}(X) = (u_p\mathcal{F})^\#(X)$, and $u_p\mathcal{F}(X) = \text{colim } \mathcal{F}(Y/U)$. Here the colimit is over the category of pairs $(Y/U, X \rightarrow Y)$ where the morphisms $X \rightarrow Y$ are not required to be over U . By our assumption however we see that they are automatically morphisms over U and we deduce that the colimit is the value on id_X , i.e., $\mathcal{F}(X/U)$. This shows that the sheafification is not necessary (since any object over X is automatically in a unique way an object over U) and the result follows. \square

7.27. Localization and morphisms

The following lemma is important in order to understand relation between localization and morphisms of sites and topoi.

Lemma 7.27.1. *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \text{Ob}(\mathcal{D})$ and set $U = u(V)$. Then the functor $u' : \mathcal{D}/V \rightarrow \mathcal{C}/U$, $V'/V \mapsto u(V')/U$ determines a morphism of sites $f' : \mathcal{C}/U \rightarrow \mathcal{D}/V$. The morphism f' fits into a commutative diagram of topoi*

$$\begin{array}{ccc} \text{Sh}(\mathcal{C}/U) & \xrightarrow{j_U} & \text{Sh}(\mathcal{C}) \\ f' \downarrow & & \downarrow f \\ \text{Sh}(\mathcal{D}/V) & \xrightarrow{j_V} & \text{Sh}(\mathcal{D}). \end{array}$$

Using the identifications $\text{Sh}(\mathcal{C}/U) = \text{Sh}(\mathcal{C})/h_U^\#$ and $\text{Sh}(\mathcal{D}/V) = \text{Sh}(\mathcal{D})/h_V^\#$ of Lemma 7.24.4 the functor $(f')^{-1}$ is described by the rule

$$(f')^{-1}(\mathcal{H} \xrightarrow{\varphi} h_V^\#) = (f^{-1}\mathcal{H} \xrightarrow{f^{-1}\varphi} h_U^\#).$$

Finally, we have $f'_*j_U^{-1} = j_V^{-1}f_*$.

Proof. It is clear that u' is continuous, and hence we get functors $f'_* = (u')^s = (u')^p$ (see Sections 7.5 and 7.14) and an adjoint $(f')^{-1} = (u')_s = ((u')_p)^\#$. The assertion $f'_*j_U^{-1} = j_V^{-1}f_*$ follows as

$$(j_V^{-1}f'_*\mathcal{F})(V'/V) = f'_*\mathcal{F}(V') = \mathcal{F}(u(V')) = (j_U^{-1}\mathcal{F})(u(V')/U) = (f'_*j_U^{-1}\mathcal{F})(V'/V)$$

which holds even for presheaves. What isn't clear a priori is that $(f')^{-1}$ is exact, that the diagram commutes, and that the description of $(f')^{-1}$ holds.

Let \mathcal{H} be a sheaf on \mathcal{D}/V . Let us compute $j_{U!}(f')^{-1}\mathcal{H}$. We have

$$\begin{aligned} j_{U!}(f')^{-1}\mathcal{H} &= ((j_U)_p(u'_p\mathcal{H})^\#)^\# \\ &= ((j_U)_p u'_p \mathcal{H})^\# \\ &= (u_p(j_V)_p \mathcal{H})^\# \\ &= f^{-1}j_{V!}\mathcal{H} \end{aligned}$$

The first equality by unwinding the definitions. The second equality by Lemma 7.14.4. The third equality because $u \circ j_V = j_U \circ u'$. The fourth equality by Lemma 7.14.4 again. All of the equalities above are isomorphisms of functors, and hence we may interpret this as saying that the following diagram of categories and functors

is commutative

$$\begin{array}{ccccc}
 Sh(\mathcal{C}/U) & \xrightarrow{j_{U!}} & Sh(\mathcal{C})/h_U^\# & \longrightarrow & Sh(\mathcal{C}) \\
 (f')^{-1} \uparrow & & f^{-1} \uparrow & & f^{-1} \uparrow \\
 Sh(\mathcal{D}/V) & \xrightarrow{j_{V!}} & Sh(\mathcal{D})/h_V^\# & \longrightarrow & Sh(\mathcal{D})
 \end{array}$$

The middle arrow makes sense as $f^{-1}h_V^\# = (h_{u(V)})^\# = h_U^\#$, see Lemma 7.14.5. In particular this proves the description of $(f')^{-1}$ given in the statement of the lemma. Since by Lemma 7.24.4 the left horizontal arrows are equivalences and since f^{-1} is exact by assumption we conclude that $(f')^{-1} = u'_s$ is exact. Namely, because it is a left adjoint it is already right exact (Categories, Lemma 4.24.4). Hence we only need to show that it transforms a final object into a final object and commutes with fibre products (Categories, Lemma 4.23.2). Both are clear for the induced functor $f^{-1} : Sh(\mathcal{D})/h_V^\# \rightarrow Sh(\mathcal{C})/h_U^\#$. This proves that f' is a morphism of sites.

We still have to verify that $(f')^{-1}j_V^{-1} = j_U^{-1}f^{-1}$. To see this use the formula above and the description in Lemma 7.24.6. Namely, combined these give, for any sheaf \mathcal{G} on \mathcal{D} , that

$$j_{U!}(f')^{-1}j_V^{-1}\mathcal{G} = f^{-1}j_{V!}j_V^{-1}\mathcal{G} = f^{-1}(\mathcal{G} \times h_V^\#) = f^{-1}\mathcal{G} \times h_U^\# = j_{U!}j_U^{-1}f^{-1}\mathcal{G}.$$

Since the functor $j_{U!}$ induces an equivalence $Sh(\mathcal{C}/U) \rightarrow Sh(\mathcal{C})/h_U^\#$ we conclude. \square

The following lemma is a special case of the more general Lemma 7.27.1 above.

Lemma 7.27.2. *Let \mathcal{C} , \mathcal{D} be sites. Let $u : \mathcal{D} \rightarrow \mathcal{C}$ be a functor. Let $V \in \text{Ob}(\mathcal{D})$. Set $U = u(V)$. Assume that*

- (1) \mathcal{C} and \mathcal{D} have all finite limits,
- (2) u is continuous, and
- (3) u commutes with finite limits.

There exists a commutative diagram of morphisms of sites

$$\begin{array}{ccc}
 \mathcal{C}/U & \xrightarrow{j_U} & \mathcal{C} \\
 f' \downarrow & & \downarrow f \\
 \mathcal{D}/V & \xrightarrow{j_V} & \mathcal{D}
 \end{array}$$

*where the right vertical arrow corresponds to u , the left vertical arrow corresponds to the functor $u' : \mathcal{D}/V \rightarrow \mathcal{C}/U$, $V'/V \mapsto u(V')/u(V)$ and the horizontal arrows correspond to the functors $\mathcal{C} \rightarrow \mathcal{C}/U$, $X \mapsto X \times U$ and $\mathcal{D} \rightarrow \mathcal{D}/V$, $Y \mapsto Y \times V$ as in Lemma 7.26.2. Moreover, the associated diagram of morphisms of topoi is equal to the diagram of Lemma 7.27.1. In particular we have $f'_*j_U^{-1} = j_V^{-1}f_*$.*

Proof. Note that u satisfies the assumptions of Proposition 7.15.6 and hence induces a morphism of sites $f : \mathcal{C} \rightarrow \mathcal{D}$ by that proposition. It is clear that u induces a functor u' as indicated. It is clear that this functor also satisfies the assumptions of Proposition 7.15.6. Hence we get a morphism of sites $f' : \mathcal{C}/U \rightarrow \mathcal{D}/V$. The diagram commutes by our definition of composition of morphisms of sites (see Definition 7.15.4) and because

$$u(Y \times V) = u(Y) \times u(V) = u(Y) \times U$$

which shows that the diagram of categories and functors opposite to the diagram of the lemma commutes. \square

At this point we can localize a site, we know how to relocalize, and we can localize a morphism of sites at an object of the site downstairs. If we combine these then we get the following kind of diagram.

Lemma 7.27.3. *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \text{Ob}(\mathcal{D})$, $U \in \text{Ob}(\mathcal{C})$ and $c : U \rightarrow u(V)$ a morphism of \mathcal{C} . There exists a commutative diagram of topoi*

$$\begin{array}{ccc} \text{Sh}(\mathcal{C}/U) & \xrightarrow{j_U} & \text{Sh}(\mathcal{C}) \\ f_c \downarrow & & \downarrow f \\ \text{Sh}(\mathcal{D}/V) & \xrightarrow{j_V} & \text{Sh}(\mathcal{D}). \end{array}$$

We have $f_c = f' \circ j_{U/u(V)}$ where $f' : \text{Sh}(\mathcal{C}/u(V)) \rightarrow \text{Sh}(\mathcal{D}/V)$ is as in Lemma 7.27.1 and $j_{U/u(V)} : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C}/u(V))$ is as in Lemma 7.24.7. Using the identifications $\text{Sh}(\mathcal{C}/U) = \text{Sh}(\mathcal{C})/h_U^\#$ and $\text{Sh}(\mathcal{D}/V) = \text{Sh}(\mathcal{D})/h_V^\#$ of Lemma 7.24.4 the functor $(f_c)^{-1}$ is described by the rule

$$(f_c)^{-1}(\mathcal{H} \xrightarrow{\varphi} h_V^\#) = (f^{-1}\mathcal{H} \times_{f^{-1}\varphi, h_{u(V)}^\#, c} h_U^\# \rightarrow h_U^\#).$$

Finally, given any morphisms $b : V' \rightarrow V$, $a : U' \rightarrow U$ and $c' : U' \rightarrow u(V')$ such that

$$\begin{array}{ccc} U' & \xrightarrow{c'} & u(V') \\ a \downarrow & & \downarrow u(b) \\ U & \xrightarrow{c} & u(V) \end{array}$$

commutes, then the diagram

$$\begin{array}{ccc} \text{Sh}(\mathcal{C}/U') & \xrightarrow{j_{U'/U}} & \text{Sh}(\mathcal{C}/U) \\ f_{c'} \downarrow & & \downarrow f_c \\ \text{Sh}(\mathcal{D}/V') & \xrightarrow{j_{V'/V}} & \text{Sh}(\mathcal{D}/V). \end{array}$$

commutes.

Proof. This lemma proves itself, and is more a collection of things we know at this stage of the development of theory. For example the commutativity of the first square follows from the commutativity of Diagram (7.24.7.1) and the commutativity of the diagram in Lemma 7.27.1. The description of f_c^{-1} follows on combining Lemma 7.24.8 with Lemma 7.27.1. The commutativity of the last square then follows from the equality

$$f^{-1}\mathcal{H} \times_{h_{u(V)}^\#, c} h_U^\# \times_{h_V^\#} h_{U'}^\# = f^{-1}(\mathcal{H} \times_{h_V^\#} h_{V'}^\#) \times_{h_{u(V')^\#, c'}} h_{U'}^\#,$$

which is formal using that $f^{-1}h_V^\# = h_{u(V)}^\#$ and $f^{-1}h_{V'}^\# = h_{u(V')}^\#$, see Lemma 7.14.5. \square

In the following lemma we find another kind of functoriality of localization, in case the morphism of topoi comes from a cocontinuous functor. This is a kind of diagram which is different from the diagram in Lemma 7.27.1, and in particular, in general the equality $f_* j_U^{-1} = j_V^{-1} f_*$ seen in Lemma 7.27.1 does not hold in the situation of the following lemma.

Lemma 7.27.4. *Let \mathcal{C} , \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a cocontinuous functor. Let U be an object of \mathcal{C} , and set $V = u(U)$. We have a commutative diagram*

$$\begin{array}{ccc} \mathcal{C}/U & \xrightarrow{\quad} & \mathcal{C} \\ u' \downarrow & & \downarrow u \\ \mathcal{D}/V & \xrightarrow{j_V} & \mathcal{D} \end{array}$$

where the left vertical arrow is $u' : \mathcal{C}/U \rightarrow \mathcal{D}/V$, $U'/U \mapsto V'/V$. Then u' is cocontinuous also and we get a commutative diagram of topoi

$$\begin{array}{ccc} \text{Sh}(\mathcal{C}/U) & \xrightarrow{j_U} & \text{Sh}(\mathcal{C}) \\ f' \downarrow & & \downarrow f \\ \text{Sh}(\mathcal{D}/V) & \xrightarrow{j_V} & \text{Sh}(\mathcal{D}) \end{array}$$

where f (resp. f') corresponds to u (resp. u').

Proof. The commutativity of the first diagram is clear. It implies the commutativity of the second diagram provided we show that u' is cocontinuous.

Let U'/U be an object of \mathcal{C}/U . Let $\{V_j/V \rightarrow u(U')/V\}_{j \in J}$ be a covering of $u(U')/V$ in \mathcal{D}/V . Since u is cocontinuous there exists a covering $\{U'_i \rightarrow U'\}_{i \in I}$ such that the family $\{u(U'_i) \rightarrow u(U')\}$ refines the covering $\{V_j \rightarrow u(U')\}$ in \mathcal{D} . In other words, there exists a map of index sets $\alpha : I \rightarrow J$ and morphisms $\phi_i : u(U'_i) \rightarrow V_{\alpha(i)}$ over U' . Think of U'_i as an object over U via the composition $U'_i \rightarrow U' \rightarrow U$. Then $\{U'_i/U \rightarrow U'/U\}$ is a covering of \mathcal{C}/U such that $\{u(U'_i)/V \rightarrow u(U')/V\}$ refines $\{V_j/V \rightarrow u(U')/V\}$ (use the same α and the same maps ϕ_i). Hence $u' : \mathcal{C}/U \rightarrow \mathcal{D}/V$ is cocontinuous. \square

7.28. Morphisms of topoi

In this section we show that any morphism of topoi is equivalent to a morphism of topoi which comes from a morphism of sites.

Lemma 7.28.1. *Let \mathcal{C} , \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (1) u is cocontinuous,
- (2) u is continuous,
- (3) given $a, b : U' \rightarrow U$ in \mathcal{C} such that $u(a) = u(b)$, then there exists a covering $\{f_i : U'_i \rightarrow U'\}$ in \mathcal{C} such that $a \circ f_i = b \circ f_i$,
- (4) given $U', U \in \text{Ob}(\mathcal{C})$ and a morphism $c : u(U') \rightarrow u(U)$ in \mathcal{D} there exists a covering $\{f_i : U'_i \rightarrow U'\}$ in \mathcal{C} and morphisms $c_i : U'_i \rightarrow U$ such that $u(c_i) = c \circ u(f_i)$, and
- (5) given $V \in \text{Ob}(\mathcal{D})$ there exists a covering of V in \mathcal{D} of the form $\{u(U_i) \rightarrow V\}_{i \in I}$.

Then the morphism of topoi

$$g : Sh(\mathcal{C}) \longrightarrow Sh(\mathcal{D})$$

associated to the cocontinuous functor u by Lemma 7.20.1 is an equivalence.

Proof. Assume u satisfies properties (1) – (5). We will show that the adjunction mappings

$$\mathcal{G} \longrightarrow g_*g^{-1}\mathcal{G} \quad \text{and} \quad g^{-1}g_*\mathcal{F} \longrightarrow \mathcal{F}$$

are isomorphisms.

Note that Lemma 7.20.5 applies and we have $g^{-1}\mathcal{G}(U) = \mathcal{G}(u(U))$ for any sheaf \mathcal{G} on \mathcal{D} . Next, let \mathcal{F} be a sheaf on \mathcal{C} , and let V be an object of \mathcal{D} . By definition we have $g_*\mathcal{F}(V) = \lim_{u(U) \rightarrow V} \mathcal{F}(U)$. Hence

$$g^{-1}g_*\mathcal{F}(U) = \lim_{U', u(U') \rightarrow u(U)} \mathcal{F}(U')$$

where the morphisms $\psi : u(U') \rightarrow u(U)$ need not be of the form $u(\alpha)$. The category of such pairs (U', ψ) has a final object, namely (U, id) , which gives rise to the map from the limit into $\mathcal{F}(U)$. Let $(s_{(U', \psi)})$ be an element of the limit. We want to show that $s_{(U', \psi)}$ is uniquely determined by the value $s_{(U, \text{id})} \in \mathcal{F}(U)$. By property (4) given any (U', ψ) there exists a covering $\{U'_i \rightarrow U'\}$ such that the compositions $u(U'_i) \rightarrow u(U') \rightarrow u(U)$ are of the form $u(c_i)$ for some $c_i : U'_i \rightarrow U$ in \mathcal{C} . Hence

$$s_{(U', \psi)}|_{U'_i} = c_i^*(s_{(U, \text{id})}).$$

Since \mathcal{F} is a sheaf it follows that indeed $s_{(U', \psi)}$ is determined by $s_{(U, \text{id})}$. This proves uniqueness. For existence, assume given any $s \in \mathcal{F}(U)$, $\psi : u(U') \rightarrow u(U)$, $\{f_i : U'_i \rightarrow U'\}$ and $c_i : U'_i \rightarrow U$ such that $\psi \circ u(f_i) = u(c_i)$ as above. We claim there exists a (unique) element $s_{(U', \psi)} \in \mathcal{F}(U')$ such that

$$s_{(U', \psi)}|_{U'_i} = c_i^*(s).$$

Namely, a priori it is not clear the elements $c_i^*(s)|_{U'_i \times_{U'} U'_j}$ and $c_j^*(s)|_{U'_i \times_{U'} U'_j}$ agree, since the diagram

$$\begin{array}{ccc} U'_i \times_{U'} U'_j & \xrightarrow{\text{pr}_2} & U'_j \\ \text{pr}_1 \downarrow & & \downarrow c_j \\ U'_i & \xrightarrow{c_i} & U \end{array}$$

need not commute. But condition (3) of the lemma guarantees that there exist coverings $\{f_{ijk} : U'_{ijk} \rightarrow U'_i \times_{U'} U'_j\}_{k \in K_{ij}}$ such that $c_i \circ \text{pr}_1 \circ f_{ijk} = c_j \circ \text{pr}_2 \circ f_{ijk}$. Hence

$$f_{ijk}^* \left(c_i^* s|_{U'_i \times_{U'} U'_j} \right) = f_{ijk}^* \left(c_j^* s|_{U'_i \times_{U'} U'_j} \right)$$

Hence $c_i^*(s)|_{U'_i \times_{U'} U'_j} = c_j^*(s)|_{U'_i \times_{U'} U'_j}$ by the sheaf condition for \mathcal{F} and hence the existence of $s_{(U', \psi)}$ also by the sheaf condition for \mathcal{F} . The uniqueness guarantees that the collection $(s_{(U', \psi)})$ so obtained is an element of the limit with $s_{(U, \psi)} = s$. This proves that $g^{-1}g_*\mathcal{F} \rightarrow \mathcal{F}$ is an isomorphism.

Let \mathcal{G} be a sheaf on \mathcal{D} . Let V be an object of \mathcal{D} . Then we see that

$$g_*g^{-1}\mathcal{G}(V) = \lim_{U, \psi: u(U) \rightarrow V} \mathcal{G}(u(U))$$

By the preceding paragraph we see that the value of the sheaf $g_*g^{-1}\mathcal{G}$ on an object V of the form $V = u(U)$ is equal to $\mathcal{G}(u(U))$. (Formally, this holds because we have $g^{-1}g_*g^{-1} \cong g^{-1}$, and the description of g^{-1} given at the beginning of the

proof; informally just by comparing limits here and above.) Hence the adjunction mapping $\mathcal{G} \rightarrow g_*g^{-1}\mathcal{G}$ has the property that it is a bijection on sections over any object of the form $u(U)$. Since by axiom (5) there exists a covering of V by objects of the form $u(U)$ we see easily that the adjunction map is an isomorphism. \square

It will be convenient to give cocontinuous functors as in Lemma 7.28.1 a name.

Definition 7.28.2. Let \mathcal{C}, \mathcal{D} be sites. A *special cocontinuous functor* u from \mathcal{C} to \mathcal{D} is a cocontinuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfying the assumptions and conclusions of Lemma 7.28.1.

Lemma 7.28.3. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a special cocontinuous functor. For every object U of \mathcal{C} we have a commutative diagram

$$\begin{array}{ccc} \mathcal{C}/U & \xrightarrow{\quad} & \mathcal{C} \\ \downarrow & \searrow^{j_U} & \downarrow u \\ \mathcal{D}/u(U) & \xrightarrow{j_{u(U)}} & \mathcal{D} \end{array}$$

as in Lemma 7.27.4. The left vertical arrow is a special cocontinuous functor. Hence in the commutative diagram of topoi

$$\begin{array}{ccc} Sh(\mathcal{C}/U) & \xrightarrow{\quad} & Sh(\mathcal{C}) \\ \downarrow & \searrow^{j_U} & \downarrow u \\ Sh(\mathcal{D}/u(U)) & \xrightarrow{j_{u(U)}} & Sh(\mathcal{D}) \end{array}$$

the vertical arrows are equivalences.

Proof. We have seen the existence and commutativity of the diagrams in Lemma 7.27.4. We have to check hypotheses (1) – (5) of Lemma 7.28.1 for the induced functor $u : \mathcal{C}/U \rightarrow \mathcal{D}/u(U)$. This is completely mechanical.

Property (1). This is Lemma 7.27.4.

Property (2). Let $\{U'_i/U \rightarrow U'/U\}_{i \in I}$ be a covering of U'/U in \mathcal{C}/U . Because u is continuous we see that $\{u(U'_i)/u(U) \rightarrow u(U')/u(U)\}_{i \in I}$ is a covering of $u(U')/u(U)$ in $\mathcal{D}/u(U)$. Hence (2) holds for $u : \mathcal{C}/U \rightarrow \mathcal{D}/u(U)$.

Property (3). Let $a, b : U''/U \rightarrow U'/U$ in \mathcal{C}/U be morphisms such that $u(a) = u(b)$ in $\mathcal{D}/u(U)$. Because u satisfies (3) we see there exists a covering $\{f_i : U''_i \rightarrow U''\}$ in \mathcal{C} such that $a \circ f_i = b \circ f_i$. This gives a covering $\{f_i : U''_i/U \rightarrow U''/U\}$ in \mathcal{C}/U such that $a \circ f_i = b \circ f_i$. Hence (3) holds for $u : \mathcal{C}/U \rightarrow \mathcal{D}/u(U)$.

Property (4). Let $U''/U, U'/U \in \text{Ob}(\mathcal{C}/U)$ and a morphism $c : u(U'')/u(U) \rightarrow u(U')/u(U)$ in $\mathcal{D}/u(U)$ be given. Because u satisfies property (4) there exists a covering $\{f_i : U''_i \rightarrow U''\}$ in \mathcal{C} and morphisms $c_i : U''_i \rightarrow U'$ such that $u(c_i) = c \circ u(f_i)$. We think of U''_i as an object over U via the composition $U''_i \rightarrow U'' \rightarrow U$. It may not be true that c_i is a morphism over U ! But since $u(c_i)$ is a morphism over $u(U)$ we may apply property (3) for u and find coverings $\{f_{ik} : U''_{ik} \rightarrow U''_i\}$ such that $c_{ik} = c_i \circ f_{ik} : U''_{ik} \rightarrow U'$ are morphisms over U . Hence $\{f_i \circ f_{ik} : U''_{ik}/U \rightarrow U''/U\}$ is a covering in \mathcal{C}/U such that $u(c_{ik}) = c \circ u(f_{ik})$. Hence (4) holds for $u : \mathcal{C}/U \rightarrow \mathcal{D}/u(U)$.

Property (5). Let $h : V \rightarrow u(U)$ be an object of $\mathcal{D}/u(U)$. Because u satisfies property (5) there exists a covering $\{c_i : u(U_i) \rightarrow V\}$ in \mathcal{D} . By property (4) we can find coverings $\{f_{ij} : U_{ij} \rightarrow U_i\}$ and morphisms $c_{ij} : U_{ij} \rightarrow U$ such that $u(c_{ij}) = h \circ c_i \circ u(f_{ij})$. Hence $\{u(U_{ij})/u(U) \rightarrow V/u(U)\}$ is a covering in $\mathcal{D}/u(U)$ of the desired shape and we conclude that (5) holds for $u : \mathcal{C}/U \rightarrow \mathcal{D}/u(U)$. \square

Lemma 7.28.4. *Let \mathcal{C} be a site. Let $\mathcal{C}' \subset Sh(\mathcal{C})$ be a full subcategory (with a set of objects) such that*

- (1) $h_U^\# \in \text{Ob}(\mathcal{C}')$ for all $U \in \text{Ob}(\mathcal{C})$, and
- (2) \mathcal{C}' is preserved under fibre products in $Sh(\mathcal{C})$.

Declare a covering of \mathcal{C}' to be any family $\{\mathcal{F}_i \rightarrow \mathcal{F}\}_{i \in I}$ of maps such that $\coprod_{i \in I} \mathcal{F}_i \rightarrow \mathcal{F}$ is a surjective map of sheaves. Then

- (1) \mathcal{C}' is a site (after choosing a set of coverings, see *Sets, Lemma 3.11.1*),
- (2) representable presheaves on \mathcal{C}' are sheaves (i.e., the topology on \mathcal{C}' is sub-canonical, see *Definition 7.13.2*),
- (3) the functor $v : \mathcal{C} \rightarrow \mathcal{C}'$, $U \mapsto h_U^\#$ is a special cocontinuous functor, hence induces an equivalence $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$,
- (4) for any $\mathcal{F} \in \text{Ob}(\mathcal{C}')$ we have $g^{-1}h_{\mathcal{F}} = \mathcal{F}$, and
- (5) for any $U \in \text{Ob}(\mathcal{C})$ we have $g_*h_U^\# = h_{v(U)} = h_{h_U^\#}$.

Proof. Warning: Some of the statements above may look be a bit confusing at first; this is because objects of \mathcal{C}' can also be viewed as sheaves on \mathcal{C} ! We omit the proof that the coverings of \mathcal{C}' as described in the lemma satisfy the conditions of *Definition 7.6.2*.

Suppose that $\{\mathcal{F}_i \rightarrow \mathcal{F}\}$ is a surjective family of morphisms of sheaves. Let \mathcal{G} be another sheaf. Part (2) of the lemma says that the equalizer of

$$\text{Mor}_{Sh(\mathcal{C})}(\coprod_{i \in I} \mathcal{F}_i, \mathcal{G}) \rightrightarrows \text{Mor}_{Sh(\mathcal{C})}(\coprod_{(i_0, i_1) \in I \times I} \mathcal{F}_{i_0} \times_{\mathcal{F}} \mathcal{F}_{i_1}, \mathcal{G})$$

is $\text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}, \mathcal{G})$. This is clear (for example use *Lemma 7.12.3*).

To prove (3) we have to check conditions (1) – (5) of *Lemma 7.28.1*. The fact that v is cocontinuous is equivalent to the description of surjective maps of sheaves in *Lemma 7.12.2*. The functor v is continuous because $U \mapsto h_U^\#$ commutes with fibre products, and transforms coverings into coverings (see *Lemma 7.10.14*, and *Lemma 7.13.4*). Properties (3), (4) of *Lemma 7.28.1* are statements about morphisms $f : h_{U'}^\# \rightarrow h_U^\#$. Such a morphism is the same thing as an element of $h_U^\#(U')$. Hence (3) and (4) are immediate from the construction of the sheafification. Property (5) of *Lemma 7.28.1* is *Lemma 7.13.5*. Denote $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ the equivalence of topoi associated with v by *Lemma 7.28.1*.

Let \mathcal{F} be as in part (4) of the lemma. For any $U \in \text{Ob}(\mathcal{C})$ we have

$$g^{-1}h_{\mathcal{F}}(U) = h_{\mathcal{F}}(v(U)) = \text{Mor}_{Sh(\mathcal{C})}(h_U^\#, \mathcal{F}) = \mathcal{F}(U)$$

The first equality by *Lemma 7.20.5*. Thus part (4) holds.

Let $\mathcal{F} \in \text{Ob}(\mathcal{C}')$. Let $U \in \text{Ob}(\mathcal{C})$. Then

$$\begin{aligned} g_* h_U^\#(\mathcal{F}) &= \text{Mor}_{Sh(\mathcal{C}')} (h_{\mathcal{F}}, g_* h_U^\#) \\ &= \text{Mor}_{Sh(\mathcal{C})} (g^{-1} h_{\mathcal{F}}, h_U^\#) \\ &= \text{Mor}_{Sh(\mathcal{C})} (\mathcal{F}, h_U^\#) \\ &= \text{Mor}_{\mathcal{C}'} (\mathcal{F}, h_U^\#) \end{aligned}$$

as desired (where the third equality was shown above). \square

Using this we can massage any topos to live over a site having all finite limits.

Lemma 7.28.5. *Let $Sh(\mathcal{C})$ be a topos. Let $\{\mathcal{F}_i\}_{i \in I}$ be a set of sheaves on \mathcal{C} . There exists an equivalence of topoi $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ induced by a special cocontinuous functor $u : \mathcal{C} \rightarrow \mathcal{C}'$ of sites such that*

- (1) \mathcal{C}' has a subcanonical topology,
- (2) a family $\{V_j \rightarrow V\}$ of morphisms of \mathcal{C}' is (combinatorially equivalent to) a covering of \mathcal{C}' if and only if $\coprod h_{V_j} \rightarrow h_V$ is surjective,
- (3) \mathcal{C}' has fibre products and a final object (i.e., \mathcal{C}' has all finite limits),
- (4) every subsheaf of a representable sheaf on \mathcal{C}' is representable, and
- (5) each $g_* \mathcal{F}_i$ is a representable sheaf.

Proof. Consider the full subcategory $\mathcal{C}_1 \subset Sh(\mathcal{C})$ consisting of all $h_U^\#$ for all $U \in \text{Ob}(\mathcal{C})$, the given sheaves \mathcal{F}_i and the final sheaf $*$ (see Example 7.10.2). We are going to inductively define full subcategories

$$\mathcal{C}_1 \subset \mathcal{C}_2 \subset \mathcal{C}_3 \subset \dots \subset Sh(\mathcal{C})$$

Namely, given \mathcal{C}_n let \mathcal{C}_{n+1} be the full subcategory consisting of all fibre products and subsheaves of objects of \mathcal{C}_n . (Note that \mathcal{C}_{n+1} has a set of objects.) Set $\mathcal{C}' = \bigcup_{n \geq 1} \mathcal{C}_n$. A covering in \mathcal{C}' is any family $\{\mathcal{G}_j \rightarrow \mathcal{G}\}_{j \in J}$ of morphisms of objects of \mathcal{C}' such that $\coprod \mathcal{G}_j \rightarrow \mathcal{G}$ is surjective as a map of sheaves on \mathcal{C} . The functor $v : \mathcal{C} \rightarrow \mathcal{C}'$ is given by $U \mapsto h_U^\#$. Apply Lemma 7.28.4. \square

Here is the goal of the current section.

Lemma 7.28.6. *Let \mathcal{C}, \mathcal{D} be sites. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Then there exists a site \mathcal{C}' and a diagram of functors*

$$\mathcal{C} \xrightarrow{v} \mathcal{C}' \xleftarrow{u} \mathcal{D}$$

such that

- (1) the functor v is a special cocontinuous functor,
- (2) the functor u commutes with fibre products, is continuous and defines a morphism of sites $\mathcal{C}' \rightarrow \mathcal{D}$, and
- (3) the morphism of topoi f agrees with the composition of morphisms of topoi

$$Sh(\mathcal{C}) \longrightarrow Sh(\mathcal{C}') \longrightarrow Sh(\mathcal{D})$$

where the first arrow comes from v via Lemma 7.28.1 and the second arrow from u via Lemma 7.16.2.

Proof. Consider the full subcategory $\mathcal{C}_1 \subset Sh(\mathcal{C})$ consisting of all $h_U^\#$ and all $f^{-1} h_V^\#$ for all $U \in \text{Ob}(\mathcal{C})$ and all $V \in \text{Ob}(\mathcal{D})$. Let \mathcal{C}_{n+1} be a full subcategory consisting of all fibre products of objects of \mathcal{C}_n . Set $\mathcal{C}' = \bigcup_{n \geq 1} \mathcal{C}_n$. A covering in \mathcal{C}' is any

family $\{\mathcal{F}_i \rightarrow \mathcal{F}\}_{i \in I}$ such that $\coprod_{i \in I} \mathcal{F}_i \rightarrow \mathcal{F}$ is surjective as a map of sheaves on \mathcal{C} . The functor $v : \mathcal{C} \rightarrow \mathcal{C}'$ is given by $U \mapsto h_U^\#$. The functor $u : \mathcal{D} \rightarrow \mathcal{C}'$ is given by $V \mapsto f^{-1}h_V^\#$.

Part (1) follows from Lemma 7.28.4.

Proof of (2) and (3) of the lemma. The functor u commutes with fibre products as both $V \mapsto h_V^\#$ and f^{-1} do. Moreover, since f^{-1} is exact and commutes with arbitrary colimits we see that it transforms a covering into a surjective family of morphisms of sheaves. Hence u is continuous. To see that it defines a morphism of sites we still have to see that u_s is exact. In order to do this we will show that $g^{-1} \circ u_s = f^{-1}$. Namely, then since g^{-1} is an equivalence and f^{-1} is exact we will conclude. Because g^{-1} is adjoint to g_* , and u_s is adjoint to u^s , and f^{-1} is adjoint to f_* it also suffices to prove that $u^s \circ g_* = f_*$. Let U be an object of \mathcal{C} and let V be an object of \mathcal{D} . Then

$$\begin{aligned} (u^s g_* h_U^\#)(V) &= g_* h_U^\#(f^{-1}h_V^\#) \\ &= \text{Mor}_{Sh(\mathcal{C})}(f^{-1}h_V^\#, h_U^\#) \\ &= \text{Mor}_{Sh(\mathcal{D})}(h_V^\#, f_* h_U^\#) \\ &= f_* h_U^\#(V) \end{aligned}$$

The first equality because $u^s = u^p$. The second equality by Lemma 7.28.4 (5). The third equality by adjointness of f_* and f^{-1} and the final equality by properties of sheafification and the Yoneda lemma. We omit the verification that these identities are functorial in U and V . Hence we see that we have $u^s \circ g_* = f_*$ for sheaves of the form $h_U^\#$. This implies that $u^s \circ g_* = f_*$ and we win (some details omitted). \square

Remark 7.28.7. Notation and assumptions as in Lemma 7.28.6. If the site \mathcal{D} has a final object and fibre products then the functor $u : \mathcal{D} \rightarrow \mathcal{C}'$ satisfies all the assumptions of Proposition 7.15.6. Namely, in addition to the properties mentioned in the lemma u also transforms the final object of \mathcal{D} into the final object of \mathcal{C}' . This is clear from the construction of u . Hence, if we first apply Lemmas 7.28.5 to \mathcal{D} and then Lemma 7.28.6 to the resulting morphism of topoi $Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D}')$ we obtain the following statement: Any morphism of topoi $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D}')$ fits into a commutative diagram

$$\begin{array}{ccc} Sh(\mathcal{C}) & \xrightarrow{f} & Sh(\mathcal{D}) \\ g \downarrow & & \downarrow e \\ Sh(\mathcal{C}') & \xrightarrow{f'} & Sh(\mathcal{D}') \end{array}$$

where the following properties hold:

- (1) the morphisms e and g are equivalences given by special cocontinuous functors $\mathcal{C} \rightarrow \mathcal{C}'$ and $\mathcal{D} \rightarrow \mathcal{D}'$,
- (2) the sites \mathcal{C}' and \mathcal{D}' have fibre products, final objects and have subcanonical topologies,
- (3) the morphism $f' : \mathcal{C}' \rightarrow \mathcal{D}'$ comes from a morphism of sites corresponding to a functor $u : \mathcal{D}' \rightarrow \mathcal{C}'$ to which Proposition 7.15.6 applies, and
- (4) given any set of sheaves \mathcal{F}_i (resp. \mathcal{G}_j) on \mathcal{C} (resp. \mathcal{D}) we may assume each of these is a representable sheaf on \mathcal{C}' (resp. \mathcal{D}').

It is often useful to replace \mathcal{C} and \mathcal{D} by \mathcal{C}' and \mathcal{D}' .

Remark 7.28.8. Notation and assumptions as in Lemma 7.28.6. Suppose that in addition the original morphism of topoi $Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ is an equivalence. Then the construction in the proof of Lemma 7.28.6 gives two functors

$$\mathcal{C} \rightarrow \mathcal{C}' \leftarrow \mathcal{D}$$

which are both special cocontinuous functors. Hence in this case we can actually factor the morphism of topoi as a composition

$$Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}') = Sh(\mathcal{D}') \leftarrow Sh(\mathcal{D})$$

as in Remark 7.28.7, but with the middle morphism an identity.

7.29. Localization of topoi

We repeat some of the material on localization to the apparently more general case of topoi. In reality this is not more general since we may always enlarge the underlying sites to assume that we are localizing at objects of the site.

Lemma 7.29.1. *Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf on \mathcal{C} . Then the category $Sh(\mathcal{C})/\mathcal{F}$ is a topos. There is a canonical morphism of topoi*

$$j_{\mathcal{F}} : Sh(\mathcal{C})/\mathcal{F} \longrightarrow Sh(\mathcal{C})$$

which is a localization as in Section 7.24 such that

- (1) the functor $j_{\mathcal{F}}^{-1}$ is the functor $\mathcal{H} \mapsto \mathcal{H} \times \mathcal{F}/\mathcal{F}$, and
- (2) the functor $j_{\mathcal{F}!}$ is the forgetful functor $\mathcal{G}/\mathcal{F} \mapsto \mathcal{G}$.

Proof. Apply Lemma 7.28.5. This means we may assume \mathcal{C} is a site with sub-canonical topology, and $\mathcal{F} = h_U = h_U^{\#}$ for some $U \in \text{Ob}(\mathcal{C})$. Hence the material of Section 7.24 applies. In particular, there is an equivalence $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^{\#}$ such that the composition

$$Sh(\mathcal{C}/U) \rightarrow Sh(\mathcal{C})/h_U^{\#} \rightarrow Sh(\mathcal{C})$$

is equal to $j_{U!}$, see Lemma 7.24.4. Denote $a : Sh(\mathcal{C})/h_U^{\#} \rightarrow Sh(\mathcal{C}/U)$ the inverse functor, so $j_{\mathcal{F}!} = j_{U!} \circ a$, $j_{\mathcal{F}}^{-1} = a^{-1} \circ j_U^{-1}$, and $j_{\mathcal{F},*} = j_{U,*} \circ a$. The description of $j_{\mathcal{F}!}$ follows from the above. The description of $j_{\mathcal{F}}^{-1}$ follows from Lemma 7.24.6. \square

Remark 7.29.2. In the situation of Lemma 7.29.1 we can also describe the functor $j_{\mathcal{F},*}$. It is the functor which associates to $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ the sheaf

$$U \longmapsto \{\alpha : \mathcal{F}|_U \rightarrow \mathcal{G}|_U \text{ such that } \alpha \text{ is a right inverse to } \varphi|_U\}$$

In order to prove that this works the introduction of *Hom*-sheaves is desirable, hence we postpone this to a later time.

Lemma 7.29.3. *Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf on \mathcal{C} . Let \mathcal{C}/\mathcal{F} be the category of pairs (U, s) where $U \in \text{Ob}(\mathcal{C})$ and $s \in \mathcal{F}(U)$. Let a covering in \mathcal{C}/\mathcal{F} be a family $\{(U_i, s_i) \rightarrow (U, s)\}$ such that $\{U_i \rightarrow U\}$ is a covering of \mathcal{C} . Then $j : \mathcal{C}/\mathcal{F} \rightarrow \mathcal{C}$ is a continuous and cocontinuous functor of sites which induces a morphism of topoi $j : Sh(\mathcal{C}/\mathcal{F}) \rightarrow Sh(\mathcal{C})$. In fact, there is an equivalence $Sh(\mathcal{C}/\mathcal{F}) = Sh(\mathcal{C})/\mathcal{F}$ which turns j into $j_{\mathcal{F}}$.*

Proof. We omit the verification that \mathcal{C}/\mathcal{F} is a site and that j is continuous and cocontinuous. By Lemma 7.20.5 there exists a morphism of topoi j as indicated, with $j^{-1}\mathcal{G}(U, s) = \mathcal{G}(U)$, and there is a left adjoint $j_!$ to j^{-1} . A morphism $\varphi : * \rightarrow j^{-1}\mathcal{G}$ on \mathcal{C}/\mathcal{F} is the same thing as a rule which assigns to every pair (U, s) a section $\varphi(s) \in \mathcal{G}(U)$ compatible with restriction maps. Hence this is the same thing as a morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ over \mathcal{C} . We conclude that $j_! * = \mathcal{F}$. In particular, for every $\mathcal{H} \in \text{Sh}(\mathcal{C}/\mathcal{F})$ there is a canonical map

$$j_! \mathcal{H} \rightarrow j_! * = \mathcal{F}$$

i.e., we obtain a functor $j_! : \text{Sh}(\mathcal{C}/\mathcal{F}) \rightarrow \text{Sh}(\mathcal{C})/\mathcal{F}$. An inverse to this functor is the rule which assigns to an object $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ of $\text{Sh}(\mathcal{C})/\mathcal{F}$ the sheaf

$$a(\mathcal{G}/\mathcal{F}) : (U, s) \mapsto \{t \in \mathcal{G}(U) \mid \varphi(t) = s\}$$

We omit the verification that $a(\mathcal{G}/\mathcal{F})$ is a sheaf and that a is inverse to $j_!$. \square

Definition 7.29.4. Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf on \mathcal{C} .

- (1) The topos $\text{Sh}(\mathcal{C})/\mathcal{F}$ is called the *localization of the topos $\text{Sh}(\mathcal{C})$ at \mathcal{F}* .
- (2) The morphism of topoi $j_{\mathcal{F}} : \text{Sh}(\mathcal{C})/\mathcal{F} \rightarrow \text{Sh}(\mathcal{C})$ of Lemma 7.29.1 is called the *localization morphism*.

We are going to show that whenever the sheaf \mathcal{F} is equal to $h_U^\#$ for some object U of the site, then the localization of the topos is equal to the category of sheaves on the localization of the site at U . Moreover, we are going to check that any functorialities are compatible with this identification.

Lemma 7.29.5. *Let \mathcal{C} be a site. Let $\mathcal{F} = h_U^\#$ for some object U of \mathcal{C} . Then $j_{\mathcal{F}} : \text{Sh}(\mathcal{C})/\mathcal{F} \rightarrow \text{Sh}(\mathcal{C})$ constructed in Lemma 7.29.1 agrees with the morphism of topoi $j_U : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})$ constructed in Section 7.24 via the identification $\text{Sh}(\mathcal{C}/U) = \text{Sh}(\mathcal{C})/h_U^\#$ of Lemma 7.24.4.*

Proof. We have seen in Lemma 7.24.4 that the composition $\text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})/h_U^\# \rightarrow \text{Sh}(\mathcal{C})$ is j_U . The functor $\text{Sh}(\mathcal{C})/h_U^\# \rightarrow \text{Sh}(\mathcal{C})$ is $j_{\mathcal{F}}$ by Lemma 7.29.1. Hence $j_{\mathcal{F}} = j_U$ via the identification. So $j_{\mathcal{F}}^{-1} = j_U^{-1}$ (by adjointness) and so $j_{\mathcal{F},*} = j_{U,*}$ (by adjointness again). \square

Lemma 7.29.6. *Let \mathcal{C} be a site. If $s : \mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves on \mathcal{C} then there exists a natural commutative diagram of morphisms of topoi*

$$\begin{array}{ccc} \text{Sh}(\mathcal{C})/\mathcal{G} & \xrightarrow{j} & \text{Sh}(\mathcal{C})/\mathcal{F} \\ & \searrow j_{\mathcal{G}} & \swarrow j_{\mathcal{F}} \\ & \text{Sh}(\mathcal{C}) & \end{array}$$

where $j = j_{\mathcal{G}/\mathcal{F}}$ is the localization of the topos $\text{Sh}(\mathcal{C})/\mathcal{F}$ at the object \mathcal{G}/\mathcal{F} . In particular we have

$$j^{-1}(\mathcal{H} \rightarrow \mathcal{F}) = (\mathcal{H} \times_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G})$$

and

$$j_!(\mathcal{E} \xrightarrow{e} \mathcal{F}) = (\mathcal{E} \xrightarrow{\text{soe}} \mathcal{G}).$$

Proof. The description of j^{-1} and $j_!$ comes from the description of those functors in Lemma 7.29.1. The equality of functors $j_{\mathcal{G}!} = j_{\mathcal{F}!} \circ j_!$ is clear from the description of these functors (as forgetful functors). By adjointness we also obtain the equalities $j_{\mathcal{G}}^{-1} = j^{-1} \circ j_{\mathcal{F}}^{-1}$, and $j_{\mathcal{G},*} = j_{\mathcal{F},*} \circ j_*$. \square

Lemma 7.29.7. *Assume \mathcal{C} and $s : \mathcal{G} \rightarrow \mathcal{F}$ are as in Lemma 7.29.6. If $\mathcal{G} = h_V^\#$ and $\mathcal{F} = h_U^\#$ and $s : \mathcal{G} \rightarrow \mathcal{F}$ comes from a morphism $V \rightarrow U$ of \mathcal{C} then the diagram in Lemma 7.29.6 is identified with diagram (7.24.7.1) via the identifications $Sh(\mathcal{C}/V) = Sh(\mathcal{C})/h_V^\#$ and $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^\#$ of Lemma 7.24.4.*

Proof. This is true because the descriptions of j^{-1} agree. See Lemma 7.24.8 and Lemma 7.29.6. \square

7.30. Localization and morphisms of topoi

This section is the analogue of Section 7.27 for morphisms of topoi.

Lemma 7.30.1. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Let \mathcal{G} be a sheaf on \mathcal{D} . Set $\mathcal{F} = f^{-1}\mathcal{G}$. Then there exists a commutative diagram of topoi*

$$\begin{array}{ccc} Sh(\mathcal{C})/\mathcal{F} & \xrightarrow{j_{\mathcal{F}}} & Sh(\mathcal{C}) \\ f' \downarrow & & \downarrow f \\ Sh(\mathcal{D})/\mathcal{G} & \xrightarrow{j_{\mathcal{G}}} & Sh(\mathcal{D}). \end{array}$$

The morphism f' is characterized by the property that

$$(f')^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G}) = (f^{-1}\mathcal{H} \xrightarrow{f^{-1}\varphi} \mathcal{F})$$

and we have $f'_*j_{\mathcal{F}}^{-1} = j_{\mathcal{G}}^{-1}f_*$.

Proof. Since the statement is about topoi and does not refer to the underlying sites we may change sites at will. Hence by the discussion in Remark 7.28.7 we may assume that f is given by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Proposition 7.15.6 between sites having all finite limits and subcanonical topologies, and such that $\mathcal{G} = h_V$ for some object V of \mathcal{D} . Then $\mathcal{F} = f^{-1}h_V = h_{u(V)}$ by Lemma 7.14.5. By Lemma 7.27.1 we obtain a commutative diagram of morphisms of topoi

$$\begin{array}{ccc} Sh(\mathcal{C}/U) & \xrightarrow{j_U} & Sh(\mathcal{C}) \\ f' \downarrow & & \downarrow f \\ Sh(\mathcal{D}/V) & \xrightarrow{j_V} & Sh(\mathcal{D}), \end{array}$$

and we have $f'_*j_U^{-1} = j_V^{-1}f_*$. By Lemma 7.29.5 we may identify $j_{\mathcal{F}}$ and j_U and $j_{\mathcal{G}}$ and j_V . The description of $(f')^{-1}$ is given in Lemma 7.27.1. \square

Lemma 7.30.2. *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let V be an object of \mathcal{D} . Set $U = u(V)$. Set $\mathcal{G} = h_V^\#$, and $\mathcal{F} = h_U^\# = f^{-1}h_V^\#$ (see Lemma 7.14.5). Then the diagram of morphisms of topoi of Lemma 7.30.1 agrees with the diagram of morphisms of topoi of Lemma 7.27.1 via the identifications $j_{\mathcal{F}} = j_U$ and $j_{\mathcal{G}} = j_V$ of Lemma 7.29.5.*

Proof. This is not a complete triviality as the choice of morphism of sites giving rise to f made in the proof of Lemma 7.30.1 may be different from the morphisms of sites given to us in the lemma. But in both cases the functor $(f')^{-1}$ is described by the same rule. Hence they agree and the associated morphism of topoi is the same. Some details omitted. \square

Lemma 7.30.3. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{G} \in Sh(\mathcal{D})$, $\mathcal{F} \in Sh(\mathcal{C})$ and $s : \mathcal{F} \rightarrow f^{-1}\mathcal{G}$ a morphism of sheaves. There exists a commutative diagram of topoi*

$$\begin{array}{ccc} Sh(\mathcal{C})/\mathcal{F} & \xrightarrow{j_{\mathcal{F}}} & Sh(\mathcal{C}) \\ f_s \downarrow & & \downarrow f \\ Sh(\mathcal{D})/\mathcal{G} & \xrightarrow{j_{\mathcal{G}}} & Sh(\mathcal{D}). \end{array}$$

We have $f_s = f' \circ j_{\mathcal{F}/f^{-1}\mathcal{G}}$ where $f' : Sh(\mathcal{C})/f^{-1}\mathcal{G} \rightarrow Sh(\mathcal{D})/\mathcal{F}$ is as in Lemma 7.30.1 and $j_{\mathcal{F}/f^{-1}\mathcal{G}} : Sh(\mathcal{C})/\mathcal{F} \rightarrow Sh(\mathcal{C})/f^{-1}\mathcal{G}$ is as in Lemma 7.29.6. The functor $(f_s)^{-1}$ is described by the rule

$$(f_s)^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G}) = (f^{-1}\mathcal{H} \times_{f^{-1}\varphi, f^{-1}\mathcal{G}, s} \mathcal{F} \rightarrow \mathcal{F}).$$

Finally, given any morphisms $b : \mathcal{G}' \rightarrow \mathcal{G}$, $a : \mathcal{F}' \rightarrow \mathcal{F}$ and $s' : \mathcal{F}' \rightarrow f^{-1}\mathcal{G}'$ such that

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{s'} & f^{-1}\mathcal{G}' \\ a \downarrow & & \downarrow f^{-1}b \\ \mathcal{F} & \xrightarrow{s} & f^{-1}\mathcal{G} \end{array}$$

commutes, then the diagram

$$\begin{array}{ccc} Sh(\mathcal{C})/\mathcal{F}' & \xrightarrow{j_{\mathcal{F}'/\mathcal{F}}} & Sh(\mathcal{C})/\mathcal{F} \\ f_{s'} \downarrow & & \downarrow f_s \\ Sh(\mathcal{D})/\mathcal{G}' & \xrightarrow{j_{\mathcal{G}'/\mathcal{G}}} & Sh(\mathcal{D})/\mathcal{G}. \end{array}$$

commutes.

Proof. The commutativity of the first square follows from the commutativity of the diagram in Lemma 7.29.6 and the commutativity of the diagram in Lemma 7.30.1. The description of f_s^{-1} follows on combining the descriptions of $(f')^{-1}$ in Lemma 7.30.1 with the description of $(j_{\mathcal{F}/f^{-1}\mathcal{G}})^{-1}$ in Lemma 7.29.6. The commutativity of the last square then follows from the equality

$$f^{-1}\mathcal{H} \times_{f^{-1}\mathcal{G}, s} \mathcal{F} \times_{\mathcal{F}} \mathcal{F}' = f^{-1}(\mathcal{H} \times_{\mathcal{G}} \mathcal{G}') \times_{f^{-1}\mathcal{G}', s'} \mathcal{F}'$$

which is formal. \square

Lemma 7.30.4. *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let V be an object of \mathcal{D} . Let $c : U \rightarrow u(V)$ be a morphism. Set $\mathcal{G} = h_V^{\#}$ and $\mathcal{F} = h_U^{\#} = f^{-1}h_V^{\#}$. Let $s : \mathcal{F} \rightarrow f^{-1}\mathcal{G}$ be the map induced by c . Then the diagram of morphisms of topoi of Lemma 7.27.3 agrees with the diagram of morphisms of topoi of Lemma 7.30.3 via the identifications $j_{\mathcal{F}} = j_U$ and $j_{\mathcal{G}} = j_V$ of Lemma 7.29.5.*

Proof. This follows on combining Lemmas 7.29.7 and 7.30.2. \square

7.31. Points

Definition 7.31.1. Let \mathcal{C} be a site. A *point of the topos* $Sh(\mathcal{C})$ is a morphism of topoi p from $Sh(pt)$ to $Sh(\mathcal{C})$.

We will define a point of a site in terms of a functor $u : \mathcal{C} \rightarrow Sets$. It will turn out later that u will define a morphism of sites which gives rise to a point of the topos associated to \mathcal{C} , see Lemma 7.31.8.

Let \mathcal{C} be a site. Let $p = u$ be a functor $u : \mathcal{C} \rightarrow Sets$. This curious language is introduced because it seems funny to talk about neighbourhoods of functors; so we think of a “point” p as a geometric thing which is given by a categorical datum, namely the functor u . The fact that p is actually equal to u does not matter. A *neighbourhood of p* is a pair (U, x) with $U \in \text{Ob}(\mathcal{C})$ and $x \in u(U)$. A *morphism of neighbourhoods* $(V, y) \rightarrow (U, x)$ is given by a morphism $\alpha : V \rightarrow U$ of \mathcal{C} such that $u(\alpha)(y) = x$. Note that the category of neighbourhoods isn’t a “big” category.

We define the *stalk* of a presheaf \mathcal{F} at p as

$$(7.31.1.1) \quad \mathcal{F}_p = \text{colim}_{\{(U,x)\}^{opp}} \mathcal{F}(U).$$

The colimit is over the opposite of the category of neighbourhoods of p . In other words, an element of \mathcal{F}_p is given by a triple (U, x, s) , where (U, x) is a neighbourhood of p and $s \in \mathcal{F}(U)$. Equality of triples is the equivalence relation generated by $(U, x, s) \sim (V, y, \alpha^*s)$ when α is as above.

Note that if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets, then we get a canonical map of stalks $\varphi_p : \mathcal{F}_p \rightarrow \mathcal{G}_p$. Thus we obtain a *stalk functor*

$$PSh(\mathcal{C}) \longrightarrow Sets, \quad \mathcal{F} \longmapsto \mathcal{F}_p.$$

We have defined the stalk functor using any functor $p = u : \mathcal{C} \rightarrow Sets$. No conditions are necessary for the definition to work⁵. On the other hand, it is probably better not to use this notion unless p actually is a point (see definition below), since in general the stalk functor does not have good properties.

Definition 7.31.2. Let \mathcal{C} be a site. A *point p of the site \mathcal{C}* is given by a functor $u : \mathcal{C} \rightarrow Sets$ such that

- (1) For every covering $\{U_i \rightarrow U\}$ of \mathcal{C} the map $\coprod u(U_i) \rightarrow u(U)$ is surjective.
- (2) For every covering $\{U_i \rightarrow U\}$ of \mathcal{C} and every morphism $V \rightarrow U$ the maps $u(U_i \times_U V) \rightarrow u(U_i) \times_{u(U)} u(V)$ are bijective.
- (3) The stalk functor $Sh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is left exact.

The conditions should be familiar since they are modeled after those of Definitions 7.14.1 and 7.15.1. Note that (3) implies that $*_p = \{*\}$, see Example 7.10.2. Hence $u(U) \neq \emptyset$ for at least some U (because the empty colimit produces the empty set). We will show below (Lemma 7.31.7) that this does give rise to a point of the topos $Sh(\mathcal{C})$. Before we do so, we prove some lemmas for general functors u .

Lemma 7.31.3. *Let \mathcal{C} be a site. Let $p = u : \mathcal{C} \rightarrow Sets$ be a functor. There are functorial isomorphisms $(h_U)_p = u(U)$ for $U \in \text{Ob}(\mathcal{C})$.*

⁵One should try to avoid the case where $u(U) = \emptyset$ for all U .

Proof. An element of $(h_U)_p$ is given by a triple (V, y, f) , where $V \in \text{Ob}(\mathcal{C})$, $y \in u(V)$ and $f \in h_U(V) = \text{Mor}_{\mathcal{C}}(V, U)$. Two such (V, y, f) , (V', y', f') determine the same object if there exists a morphism $\phi : V \rightarrow V'$ such that $u(\phi)(y) = y'$ and $f' \circ \phi = f$, and in general you have to take chains of identities like this to get the correct equivalence relation. In any case, every (V, y, f) is equivalent to the element $(U, u(f)(y), \text{id}_U)$. If ϕ exists as above, then the triples (V, y, f) , (V', y', f') determine the same triple $(U, u(f)(y), \text{id}_U) = (U, u(f')(y'), \text{id}_U)$. This proves that the map $u(U) \rightarrow (h_U)_p$, $x \mapsto \text{class of } (U, x, \text{id}_U)$ is bijective. \square

Let \mathcal{C} be a site. Let $p = u : \mathcal{C} \rightarrow \text{Sets}$ be a functor. In analogy with the constructions in Section 7.5 given a set E we define a presheaf $u^p E$ by the rule

$$(7.31.3.1) \quad U \longmapsto u^p E(U) = \text{Mor}_{\text{Sets}}(u(U), E) = \text{Map}(u(U), E).$$

This defines a functor $u^p : \text{Sets} \rightarrow \text{PSh}(\mathcal{C})$, $E \mapsto u^p E$.

Lemma 7.31.4. *For any functor $u : \mathcal{C} \rightarrow \text{Sets}$. The functor u^p is a right adjoint to the stalk functor on presheaves.*

Proof. Let \mathcal{F} be a presheaf on \mathcal{C} . Let E be a set. A morphism $\mathcal{F} \rightarrow u^p E$ is given by a compatible system of maps $\mathcal{F}(U) \rightarrow \text{Map}(u(U), E)$, i.e., a compatible system of maps $\mathcal{F}(U) \times u(U) \rightarrow E$. And by definition of \mathcal{F}_p a map $\mathcal{F}_p \rightarrow E$ is given by a rule associating with each triple (U, x, σ) an element in E such that equivalent triples map to the same element, see discussion surrounding Equation (7.31.1.1). This also means a compatible system of maps $\mathcal{F}(U) \times u(U) \rightarrow E$. \square

In analogy with Section 7.14 we have the following lemma.

Lemma 7.31.5. *Let \mathcal{C} be a site. Let $p = u : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Suppose that for every covering $\{U_i \rightarrow U\}$ of \mathcal{C}*

- (1) *the map $\coprod u(U_i) \rightarrow u(U)$ is surjective, and*
- (2) *the maps $u(U_i \times_U U_j) \rightarrow u(U_i) \times_{u(U)} u(U_j)$ are surjective.*

Then we have

- (1) *the presheaf $u^p E$ is a sheaf for all sets E , denote it $u^s E$,*
- (2) *the stalk functor $\text{Sh}(\mathcal{C}) \rightarrow \text{Sets}$ and the functor $u^s : \text{Sets} \rightarrow \text{Sh}(\mathcal{C})$ are adjoint, and*
- (3) *we have $\mathcal{F}_p = \mathcal{F}_p^\#$ for every presheaf of sets \mathcal{F} .*

Proof. The first assertion is immediate from the definition of a sheaf, assumptions (1) and (2), and the definition of $u^p E$. The second is a restatement of the adjointness of u^p and the stalk functor (but now restricted to sheaves). The third assertion follows as, for any set E , we have

$$\text{Map}(\mathcal{F}_p, E) = \text{Mor}_{\text{PSh}(\mathcal{C})}(\mathcal{F}, u^p E) = \text{Mor}_{\text{Sh}(\mathcal{C})}(\mathcal{F}^\#, u^s E) = \text{Map}(\mathcal{F}_p^\#, E)$$

by the adjointness property of sheafification. \square

In particular Lemma 7.31.5 holds when $p = u$ is a point. In this case we think of the sheaf $u^s E$ as the “skyscraper” sheaf with value E at p .

Definition 7.31.6. Let p be a point of the site \mathcal{C} given by the functor u . For a set E we define $p_* E = u^s E$ the sheaf described in Lemma 7.31.5 above. We sometimes call this a *skyscraper sheaf*.

In particular we have the following adjointness property of skyscraper sheaves and stalks:

$$\text{Mor}_{\text{Sh}(\mathcal{C})}(\mathcal{F}, p_*E) = \text{Map}(\mathcal{F}_p, E)$$

This motivates the notation $p^{-1}\mathcal{F} = \mathcal{F}_p$ which we will sometimes use.

Lemma 7.31.7. *Let \mathcal{C} be a site.*

- (1) *Let p be a point of the site \mathcal{C} . Then the pair of functors (p_*, p^{-1}) introduced above define a morphism of topoi $\text{Sh}(pt) \rightarrow \text{Sh}(\mathcal{C})$.*
- (2) *Let $p = (p_*, p^{-1})$ be a point of the topos $\text{Sh}(\mathcal{C})$. Then the functor $u : U \mapsto p^{-1}(h_U^\#)$ gives rise to a point p' of the site \mathcal{C} whose associated morphism of topoi $(p'_*, (p')^{-1})$ is equal to p .*

Proof. Proof of (1). By the above the functors p_* and p^{-1} are adjoint. The functor p^{-1} is required to be exact by Definition 7.31.2. Hence the conditions imposed in Definition 7.16.1 are all satisfied and we see that (1) holds.

Proof of (2). Let $\{U_i \rightarrow U\}$ be a covering of \mathcal{C} . Then $\coprod (h_{U_i}^\#) \rightarrow h_U^\#$ is surjective, see Lemma 7.13.4. Since p^{-1} is exact (by definition of a morphism of topoi) we conclude that $\coprod u(U_i) \rightarrow u(U)$ is surjective. This proves part (1) of Definition 7.31.2. Sheafification is exact, see Lemma 7.10.14. Hence if $U \times_V W$ exists in \mathcal{C} , then

$$h_{U \times_V W}^\# = h_U^\# \times_{h_V^\#} h_W^\#$$

and we see that $u(U \times_V W) = u(U) \times_{u(V)} u(W)$ since p^{-1} is exact. This proves part (2) of Definition 7.31.2. Let $p' = u$, and let $\mathcal{F}_{p'}$ be the stalk functor defined by Equation (7.31.1.1) using u . There is a canonical comparison map $c : \mathcal{F}_{p'} \rightarrow \mathcal{F}_p = p^{-1}\mathcal{F}$. Namely, given a triple (U, x, σ) representing an element ξ of $\mathcal{F}_{p'}$, we think of σ as a map $\sigma : h_U^\# \rightarrow \mathcal{F}$ and we can set $c(\xi) = p^{-1}(\sigma)(x)$ since $x \in u(U) = p^{-1}(h_U^\#)$. By Lemma 7.31.3 we see that $(h_U)_{p'} = u(U)$. Since conditions (1) and (2) of Definition 7.31.2 hold for p' we also have $(h_U^\#)_{p'} = (h_U)_{p'}$ by Lemma 7.31.5. Hence we have

$$(h_U^\#)_{p'} = (h_U)_{p'} = u(U) = p^{-1}(h_U^\#)$$

We claim this bijection equals the comparison map $c : (h_U^\#)_{p'} \rightarrow p^{-1}(h_U^\#)$ (verification omitted). Any sheaf on \mathcal{C} is a coequalizer of maps of coproducts of sheaves of the form $h_U^\#$, see Lemma 7.13.5. The stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p'}$ and the functor p^{-1} commute with arbitrary colimits (as they are both left adjoints). We conclude c is an isomorphism for every sheaf \mathcal{F} . Thus the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p'}$ is isomorphic to p^{-1} and we in particular see that it is exact. This proves condition (3) of Definition 7.31.2 holds and p' is a point. The final assertion has already been shown above, since we saw that $p^{-1} = (p')^{-1}$. \square

Actually a point always corresponds to a morphism of sites as we show in the following lemma.

Lemma 7.31.8. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} given by $u : \mathcal{C} \rightarrow \text{Sets}$. Let S_0 be an infinite set such that $u(U) \subset S_0$ for all $U \in \text{Ob}(\mathcal{C})$. Let \mathcal{S} be the site constructed out of the powerset $S = \mathcal{P}(S_0)$ in Remark 7.16.3. Then*

- (1) *there is an equivalence $i : \text{Sh}(pt) \rightarrow \text{Sh}(\mathcal{S})$,*
- (2) *the functor $u : \mathcal{C} \rightarrow \mathcal{S}$ induces a morphism of sites $f : \mathcal{S} \rightarrow \mathcal{C}$, and*

(3) *the composition*

$$Sh(pt) \rightarrow Sh(\mathcal{S}) \rightarrow Sh(\mathcal{C})$$

is the morphism of topoi (p_*, p^{-1}) of Lemma 7.31.7.

Proof. Part (1) we saw in Remark 7.16.3. Moreover, recall that the equivalence associates to the set E the sheaf i_*E on \mathcal{S} defined by the rule $V \mapsto \text{Mor}_{\text{Sets}}(V, E)$. Part (2) is clear from the definition of a point of \mathcal{C} (Definition 7.31.2) and the definition of a morphism of sites (Definition 7.15.1). Finally, consider f_*i_*E . By construction we have

$$f_*i_*E(U) = i_*E(u(U)) = \text{Mor}_{\text{Sets}}(u(U), E)$$

which is equal to $p_*E(U)$, see Equation (7.31.3.1). This proves (3). \square

Contrary to what happens in the topological case it is not always true that the stalk of the skyscraper sheaf with value E is E . Here is what is true in general.

Lemma 7.31.9. *Let \mathcal{C} be a site. Let $p : Sh(pt) \rightarrow Sh(\mathcal{C})$ be a point of the topos associated to \mathcal{C} . For any set E there are canonical maps*

$$E \longrightarrow (p_*E)_p \longrightarrow E$$

whose composition is id_E .

Proof. There is always an adjunction map $(p_*E)_p = p^{-1}p_*E \rightarrow E$. This map is an isomorphism when $E = \{*\}$ because p_* and p^{-1} are both left exact, hence transform the final object into the final object. Hence given $e \in E$ we can consider the map $i_e : \{*\} \rightarrow E$ which gives

$$\begin{array}{ccc} p^{-1}p_*\{*\} & \xrightarrow{p^{-1}p_*i_e} & p^{-1}p_*E \\ \cong \downarrow & & \downarrow \\ \{*\} & \xrightarrow{i_e} & E \end{array}$$

whence the map $E \rightarrow (p_*E)_p = p^{-1}p_*E$ as desired. \square

Lemma 7.31.10. *Let \mathcal{C} be a site. Let $p : Sh(pt) \rightarrow Sh(\mathcal{C})$ be a point of the topos associated to \mathcal{C} . The functor $p_* : \text{Sets} \rightarrow Sh(\mathcal{C})$ has the following properties: It commutes with arbitrary limits, it is left exact, it is faithful, it transforms surjections into surjections, it commutes with coequalizers, it reflects injections, it reflects surjections, and it reflects isomorphisms.*

Proof. Because p_* is a right adjoint it commutes with arbitrary limits and it is left exact. The fact that $p^{-1}p_*E \rightarrow E$ is a canonically split surjection implies that p_* is faithful, reflects injections, reflects surjections, and reflects isomorphisms. By Lemma 7.31.7 we may assume that p comes from a point $u : \mathcal{C} \rightarrow \text{Sets}$ of the underlying site \mathcal{C} . In this case the sheaf p_*E is given by

$$p_*E(U) = \text{Mor}_{\text{Sets}}(u(U), E)$$

see Equation (7.31.3.1) and Definition 7.31.6. It follows immediately from this formula that p_* transforms surjections into surjections and coequalizers into coequalizers. \square

7.32. Constructing points

In this section we give criteria for when a functor from a site to the category of sets defines a point of that site.

Lemma 7.32.1. *Let \mathcal{C} be a site. Assume that \mathcal{C} has a final object X and fibred products. Let $p = u : \mathcal{C} \rightarrow \text{Sets}$ be a functor such that*

- (1) $u(X)$ is a singleton set, and
- (2) for every pair of morphisms $U \rightarrow W$ and $V \rightarrow W$ with the same target the map $u(U \times_W V) \rightarrow u(U) \times_{u(W)} u(V)$ is bijective.

Then the opposite of the category of neighbourhoods of p is filtered. Moreover, the stalk functor $Sh(\mathcal{C}) \rightarrow \text{Sets}$, $\mathcal{F} \rightarrow \mathcal{F}_p$ commutes with finite limits.

Proof. This is analogous to the proof of Lemma 7.5.2 above. The assumptions on \mathcal{C} imply that \mathcal{C} has finite limits. See Categories, Lemma 4.18.4. Assumption (1) implies that the category of neighbourhoods is nonempty. Suppose (U, x) and (V, y) are neighbourhoods. Then $u(U \times V) = u(U \times_X V) = u(U) \times_{u(X)} u(V) = u(U) \times u(V)$ by (2). Hence there exists a neighbourhood $(U \times_X V, z)$ mapping to both (U, x) and (V, y) . Let $a, b : (V, y) \rightarrow (U, x)$ be two morphisms in the category of neighbourhoods. Let W be the equalizer of $a, b : V \rightarrow U$. As in the proof of Categories, Lemma 4.18.4 we may write W in terms of fibre products:

$$W = (V \times_{a,U,b} V) \times_{(pr_1, pr_2), V \times V, \Delta} V$$

The bijectivity in (2) guarantees there exists an element $z \in u(W)$ which maps to $((y, y), y)$. Then $(W, z) \rightarrow (V, y)$ equalizes a, b as desired.

Let $\mathcal{I} \rightarrow Sh(\mathcal{C})$, $i \mapsto \mathcal{F}_i$ be a finite diagram of sheaves. We have to show that the stalk of the limit of this system agrees with the limit of the stalks. Let \mathcal{F} be the limit of the system as a *presheaf*. According to Lemma 7.10.1 this is a sheaf and it is the limit in the category of sheaves. Hence we have to show that $\mathcal{F}_p = \lim_{\mathcal{I}} \mathcal{F}_{i,p}$. Recall also that \mathcal{F} has a simple description, see Section 7.4. Thus we have to show that

$$\lim_i \text{colim}_{\{(U,x)\}^{opp}} \mathcal{F}_i(U) = \text{colim}_{\{(U,x)\}^{opp}} \lim_i \mathcal{F}_i(U).$$

This holds, by Categories, Lemma 4.19.2, because we just showed the opposite of the category of neighbourhoods is filtered. \square

Proposition 7.32.2. *Let \mathcal{C} be a site. Assume that finite limits exist in \mathcal{C} . (I.e., \mathcal{C} has fibre products, and a final object.) A point p of such a site \mathcal{C} is given by a functor $u : \mathcal{C} \rightarrow \text{Sets}$ such that*

- (1) u commutes with finite limits, and
- (2) if $\{U_i \rightarrow U\}$ is a covering, then $\coprod_i u(U_i) \rightarrow u(U)$ is surjective.

Proof. Suppose first that p is a point (Definition 7.31.2) given by a functor u . Condition (2) is satisfied directly from the definition of a point. By Lemma 7.31.3 we have $(h_U)_p = u(U)$. By Lemma 7.31.5 we have $(h_U^\#)_p = (h_U)_p$. Thus we see that u is equal to the composition of functors

$$\mathcal{C} \xrightarrow{h} PSh(\mathcal{C}) \xrightarrow{\#} Sh(\mathcal{C}) \xrightarrow{()_p} \text{Sets}$$

Each of these functors is left exact, and hence we see u satisfies (1).

Conversely, suppose that u satisfies (1) and (2). In this case we immediately see that u satisfies the first two conditions of Definition 7.31.2. And its stalk functor

is exact, because it is a left adjoint by Lemma 7.31.5 and it commutes with finite limits by Lemma 7.32.1. \square

Remark 7.32.3. In fact, let \mathcal{C} be a site. Assume \mathcal{C} has a final object X and fibre products. Let $p = u : \mathcal{C} \rightarrow \mathit{Sets}$ be a functor such that

- (1) $u(X) = \{*\}$ a singleton, and
- (2) for every pair of morphisms $U \rightarrow W$ and $V \rightarrow W$ with the same target the map $u(U \times_W V) \rightarrow u(U) \times_{u(W)} u(V)$ is surjective.
- (3) for every covering $\{U_i \rightarrow U\}$ the map $\coprod u(U_i) \rightarrow u(U)$ is surjective.

Then, in general, p is **not** a point of \mathcal{C} . An example is the category \mathcal{C} with two objects $\{U, X\}$ and exactly one non-identity arrow, namely $U \rightarrow X$. We endow \mathcal{C} with the trivial topology, i.e., the only coverings are $\{U \rightarrow U\}$ and $\{X \rightarrow X\}$. A sheaf \mathcal{F} is the same thing as a presheaf and consists of a triple $(A, B, A \rightarrow B)$: namely $A = \mathcal{F}(X)$, $B = \mathcal{F}(U)$ and $A \rightarrow B$ is the restriction mapping corresponding to $U \rightarrow X$. Note that $U \times_X U = U$ so fibre products exist. Consider the functor $u = p$ with $u(X) = \{*\}$ and $u(U) = \{*_1, *_2\}$. This satisfies (1), (2), and (3), but the corresponding stalk functor (7.31.1.1) is the functor

$$(A, B, A \rightarrow B) \mapsto B \coprod_A B$$

which isn't exact. Namely, consider $(\emptyset, \{1\}, \emptyset \rightarrow \{1\}) \rightarrow (\{1\}, \{1\}, \{1\} \rightarrow \{1\})$ which is an injective map of sheaves, but is transformed into the noninjective map of sets

$$\{1\} \coprod \{1\} \rightarrow \{1\} \coprod_{\{1\}} \{1\}$$

by the stalk functor.

Example 7.32.4. Let X be a topological space. Let X_{Zar} be the site of Example 7.6.4. Let $x \in X$ be a point. Consider the functor

$$u : X_{Zar} \rightarrow \mathit{Sets}, \quad U \mapsto \begin{cases} \emptyset & \text{if } x \notin U \\ \{*\} & \text{if } x \in U \end{cases}$$

This functor commutes with product and fibred products, and turns coverings into surjective families of maps. Hence we obtain a point p of the site X_{Zar} . It is immediately verified that the stalk functor agrees with the stalk at x defined in Sheaves, Section 6.11.

Example 7.32.5. Let X be a topological space. What are the points of the topos $Sh(X)$? To see this, let X_{Zar} be the site of Example 7.6.4. By Lemma 7.31.7 a point of $Sh(X)$ corresponds to a point of this site. Let p be a point of the site X_{Zar} given by the functor $u : X_{Zar} \rightarrow \mathit{Sets}$. We are going to use the characterization of such a u in Proposition 7.32.2. This implies immediately that $u(\emptyset) = \emptyset$ and $u(U \cap V) = u(U) \times u(V)$. In particular we have $u(U) = u(U) \times u(U)$ via the diagonal map which implies that $u(U)$ is either a singleton or empty. Moreover, if $U = \bigcup U_i$ is an open covering then

$$u(U) = \emptyset \Rightarrow \forall i, u(U_i) = \emptyset \quad \text{and} \quad u(U) \neq \emptyset \Rightarrow \exists i, u(U_i) \neq \emptyset.$$

We conclude that there is a unique largest open $W \subset X$ with $u(W) = \emptyset$, namely the union of all the opens U with $u(U) = \emptyset$. Let $Z = X \setminus W$. If $Z = Z_1 \cup Z_2$ with $Z_i \subset Z$ closed, then $W = (X \setminus Z_1) \cap (X \setminus Z_2)$ so $\emptyset = u(W) = u(X \setminus Z_1) \times u(X \setminus Z_2)$ and we conclude that $u(X \setminus Z_1) = \emptyset$ or that $u(X \setminus Z_2) = \emptyset$. This means that

$X \setminus Z_1 = W$ or that $X \setminus Z_2 = W$. In other words, Z is irreducible. Now we see that u is described by the rule

$$u : X_{Zar} \longrightarrow Sets, \quad U \mapsto \begin{cases} \emptyset & \text{if } Z \cap U = \emptyset \\ \{*\} & \text{if } Z \cap U \neq \emptyset \end{cases}$$

Note that for any irreducible closed $Z \subset X$ this functor satisfies assumptions (1), (2) of Proposition 7.32.2 and hence defines a point. In other words we see that points of the site X_{Zar} are in one-to-one correspondence with irreducible closed subsets of X . In particular, if X is a sober topological space, then points of X_{Zar} and points of X are in one to one correspondence, see Example 7.32.4.

Example 7.32.6. Consider the site \mathcal{T}_G described in Example 7.6.5 and Section 7.9. The forgetful functor $u : \mathcal{T}_G \rightarrow Sets$ commutes with products and fibred products and turns coverings into surjective families. Hence it defines a point of \mathcal{T}_G . We identify $Sh(\mathcal{T}_G)$ and G -Sets. The stalk functor

$$p^{-1} : Sh(\mathcal{T}_G) = G\text{-Sets} \longrightarrow Sets$$

is the forgetful functor. The pushforward p_* is the functor

$$Sets \longrightarrow Sh(\mathcal{T}_G) = G\text{-Sets}$$

which maps a set S to the G -set $\text{Map}(G, S)$ with action $g \cdot \psi = \psi \circ R_g$ where R_g is right multiplication. In particular we have $p^{-1}p_*S = \text{Map}(G, S)$ as a set and the maps $S \rightarrow \text{Map}(G, S) \rightarrow S$ of Lemma 7.31.9 are the obvious ones.

Example 7.32.7. Let \mathcal{C} be a category endowed with the chaotic topology (Example 7.6.6). For every object U_0 of \mathcal{C} the functor $u : U \mapsto \text{Mor}_{\mathcal{C}}(U_0, U)$ defines a point p of \mathcal{C} . Namely, conditions (1) and (2) of Definition 7.31.2 are immediate as the only coverings are given by identity maps. Condition (2) holds because $\mathcal{F}_p = \mathcal{F}(U_0)$ and since the topology is discrete taking sections over U_0 is an exact functor.

7.33. Points and morphisms of topoi

In this section we make a few remarks about points and morphisms of topoi.

Lemma 7.33.1. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Let p be a point of \mathcal{D} given by the functor $v : \mathcal{D} \rightarrow Sets$, see Definition 7.31.2. Then the functor $v \circ u : \mathcal{C} \rightarrow Sets$ defines a point q of \mathcal{C} and moreover there is a canonical identification*

$$(f^{-1}\mathcal{F})_p = \mathcal{F}_q$$

for any sheaf \mathcal{F} on \mathcal{C} .

First proof Lemma 7.33.1. Note that since u is continuous and since v defines a point, it is immediate that $v \circ u$ satisfies conditions (1) and (2) of Definition 7.31.2. Let us prove the displayed equality. Let \mathcal{F} be a sheaf on \mathcal{C} . Then

$$\mathcal{F}_q = \text{colim}_{(U,x)} \mathcal{F}(U)$$

where the colimit is over objects U in \mathcal{C} and elements $x \in v(u(U))$. Similarly, we have

$$\begin{aligned} (f^{-1}\mathcal{F})_p &= (u_p\mathcal{F})_p \\ &= \operatorname{colim}_{(V,x)} \operatorname{colim}_{U,\phi:V \rightarrow u(U)} \mathcal{F}(U) \\ &= \operatorname{colim}_{(V,x,U,\phi:V \rightarrow u(U))} \mathcal{F}(U) \\ &= \operatorname{colim}_{(U,x)} \mathcal{F}(U) \\ &= \mathcal{F}_q \end{aligned}$$

Explanation: The first equality holds because $f^{-1}\mathcal{F} = (u_p\mathcal{F})^\#$ and because $\mathcal{G}_p = \mathcal{G}_p^\#$ for any presheaf \mathcal{G} , see Lemma 7.31.5. The second equality holds by the definition of u_p . In the third equality we simply combine colimits. To see the fourth equality we apply Categories, Lemma 4.17.5 to the functor F of diagram categories defined by the rule $F((V, x, U, \phi : V \rightarrow u(U))) = (U, v(\phi)(x))$. The lemma applies, because F has a right inverse, namely $(U, x) \mapsto (u(U), x, U, \operatorname{id} : u(U) \rightarrow u(U))$ and because there is always a morphism

$$(V, x, U, \phi : V \rightarrow u(U)) \longrightarrow (u(U), v(\phi)(x), U, \operatorname{id} : u(U) \rightarrow u(U))$$

in the fibre category over (U, x) which shows the fibre categories are connected. The fifth equality is clear. Hence now we see that q also satisfies condition (3) of Definition 7.31.2 because it is a composition of exact functors. This finishes the proof. \square

Second proof Lemma 7.33.1. By Lemma 7.31.8 we may factor (p_*, p^{-1}) as

$$\operatorname{Sh}(pt) \xrightarrow{i} \operatorname{Sh}(\mathcal{S}) \xrightarrow{h} \operatorname{Sh}(\mathcal{D})$$

where the second morphism of topoi comes from a morphism of sites $h : \mathcal{S} \rightarrow \mathcal{D}$ induced by the functor $v : \mathcal{D} \rightarrow \mathcal{S}$ (which makes sense as $\mathcal{S} \subset \operatorname{Sets}$ is a full subcategory containing every object in the image of v). By Lemma 7.15.3 the composition $v \circ u : \mathcal{C} \rightarrow \mathcal{S}$ defines a morphism of sites $g : \mathcal{S} \rightarrow \mathcal{C}$. In particular, the functor $v \circ u : \mathcal{C} \rightarrow \mathcal{S}$ is continuous which by the definition of the coverings in \mathcal{S} , see Remark 7.16.3, means that $v \circ u$ satisfies conditions (1) and (2) of Definition 7.31.2. On the other hand, we see that

$$g_*i_*E(U) = i_*E(v(u(U))) = \operatorname{Mor}_{\operatorname{Sets}}(v(u(U)), E)$$

by the construction of i in Remark 7.16.3. Note that this is the same as the formula for which is equal to $(v \circ u)^p E$, see Equation (7.31.3.1). By Lemma 7.31.5 the functor $g_*i_* = (v \circ u)^p = (v \circ u)^s$ is right adjoint to the stalk functor $\mathcal{F} \mapsto \mathcal{F}_q$. Hence we see that the stalk functor q^{-1} is canonically isomorphic to $i^{-1} \circ g^{-1}$. Hence it is exact and we conclude that q is a point. Finally, as we have $g = f \circ h$ by construction we see that $q^{-1} = i^{-1} \circ h^{-1} \circ f^{-1} = p^{-1} \circ f^{-1}$, i.e., we have the displayed formula of the lemma. \square

Lemma 7.33.2. *Let $f : \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Let $p : \operatorname{Sh}(pt) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a point. Then $q = f \circ p$ is a point of the topos $\operatorname{Sh}(\mathcal{C})$ and we have a canonical identification*

$$(f^{-1}\mathcal{F})_p = \mathcal{F}_q$$

for any sheaf \mathcal{F} on \mathcal{C} .

Proof. This is immediate from the definitions and the fact that we can compose morphisms of topoi. \square

7.34. Localization and points

In this section we show that points of a localization \mathcal{C}/U are constructed in a simple manner from the points of \mathcal{C} .

Lemma 7.34.1. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} given by $u : \mathcal{C} \rightarrow \mathbf{Sets}$. Let U be an object of \mathcal{C} and let $x \in u(U)$. The functor*

$$v : \mathcal{C}/U \longrightarrow \mathbf{Sets}, \quad (\varphi : V \rightarrow U) \longmapsto \{y \in u(V) \mid u(\varphi)(y) = x\}$$

defines a point q of the site \mathcal{C}/U such that the diagram

$$\begin{array}{ccc} & & Sh(pt) \\ & \swarrow q & \downarrow p \\ Sh(\mathcal{C}/U) & \xrightarrow{j_U} & Sh(\mathcal{C}) \end{array}$$

commutes. In other words $\mathcal{F}_p = (j_U^{-1}\mathcal{F})_q$ for any sheaf on \mathcal{C} .

Proof. Choose \mathcal{S} and \mathcal{S} as in Lemma 7.31.8. We may identify $Sh(pt) = Sh(\mathcal{S})$ as in that lemma, and we may write $p = f : Sh(\mathcal{S}) \rightarrow Sh(\mathcal{C})$ for the morphism of topoi induced by u . By Lemma 7.27.1 we get a commutative diagram of topoi

$$\begin{array}{ccc} Sh(\mathcal{S}/u(U)) & \xrightarrow{j_{u(U)}} & Sh(\mathcal{S}) \\ p' \downarrow & & \downarrow p \\ Sh(\mathcal{C}/U) & \xrightarrow{j_U} & Sh(\mathcal{C}), \end{array}$$

where p' is given by the functor $u' : \mathcal{C}/U \rightarrow \mathcal{S}/u(U)$, $V/U \mapsto u(V)/u(U)$. Consider the functor $j_x : \mathcal{S} \cong \mathcal{S}/x$ obtained by assigning to a set E the set E endowed with the constant map $E \rightarrow u(U)$ with value x . Then j_x is a fully faithful cocontinuous functor which has a continuous right adjoint $v_x : (\psi : E \rightarrow u(U)) \mapsto \psi^{-1}(\{x\})$. Note that $j_{u(U)} \circ j_x = \text{id}_{\mathcal{S}}$, and $v_x \circ u' = v$. These observations imply that we have the following commutative diagram of topoi

$$\begin{array}{ccccc} Sh(\mathcal{S}) & & & & \\ & \searrow a & & & \downarrow p \\ & & Sh(\mathcal{S}/u(U)) & \xrightarrow{j_{u(U)}} & Sh(\mathcal{S}) \\ & \searrow q & \downarrow p' & & \downarrow p \\ & & Sh(\mathcal{C}/U) & \xrightarrow{j_U} & Sh(\mathcal{C}) \end{array}$$

Namely:

- (1) The morphism $a : Sh(\mathcal{S}) \rightarrow Sh(\mathcal{S}/u(U))$ is the morphism of topoi associated to the cocontinuous functor j_x , which equals the morphism associated to the continuous functor v_x , see Lemma 7.20.1 and Section 7.21.
- (2) The composition $p \circ j_{u(U)} \circ a = p$ since $j_{u(U)} \circ j_x = \text{id}_{\mathcal{S}}$.

- (3) The composition $p' \circ a$ gives a morphism of topoi. Moreover, it is the morphism of topoi associated to the continuous functor $v_x \circ u' = v$. Hence v does indeed define a point q of \mathcal{C}/U which fits into the diagram above by construction.

This ends the proof of the lemma. \square

Lemma 7.34.2. *Let \mathcal{C} , p , u , U be as in Lemma 7.34.1. The construction of Lemma 7.34.1 gives a one to one correspondence between points q of \mathcal{C}/U lying over p and elements x of $u(U)$.*

Proof. Let q be a point of \mathcal{C}/U given by the functor $v : \mathcal{C}/U \rightarrow \mathbf{Sets}$ such that $j_U \circ q = p$ as morphisms of topoi. Recall that $u(V) = p^{-1}(h_V^\#)$ for any object V of \mathcal{C} , see Lemma 7.31.7. Similarly $v(V/U) = q^{-1}(h_{V/U}^\#)$ for any object V/U of \mathcal{C}/U . Consider the following two diagrams

$$\begin{array}{ccccc} \mathrm{Mor}_{\mathcal{C}/U}(W/U, V/U) & \longrightarrow & \mathrm{Mor}_{\mathcal{C}}(W, V) & h_{V/U}^\# & \longrightarrow & j_U^{-1}(h_V^\#) \\ \downarrow & & \downarrow & \downarrow & & \downarrow \\ \mathrm{Mor}_{\mathcal{C}/U}(W/U, U/U) & \longrightarrow & \mathrm{Mor}_{\mathcal{C}}(W, U) & h_{U/U}^\# & \longrightarrow & j_U^{-1}(h_U^\#) \end{array}$$

The right hand diagram is the sheafification of the diagram of presheaves on \mathcal{C}/U which maps W/U to the left hand diagram of sets. (There is a small technical point to make here, namely, that we have $(j_U^{-1}h_V)^\# = j_U^{-1}(h_V^\#)$ and similarly for h_U , see Lemma 7.19.4.) Note that the left hand diagram of sets is cartesian. Since sheafification is exact (Lemma 7.10.14) we conclude that the right hand diagram is cartesian.

Apply the exact functor q^{-1} to the right hand diagram to get a cartesian diagram

$$\begin{array}{ccc} v(V/U) & \longrightarrow & u(V) \\ \downarrow & & \downarrow \\ v(U/U) & \longrightarrow & u(U) \end{array}$$

of sets. Here we have used that $q^{-1} \circ j^{-1} = p^{-1}$. Since U/U is a final object of \mathcal{C}/U we see that $v(U/U)$ is a singleton. Hence the image of $v(U/U)$ in $u(U)$ is an element x , and the top horizontal map gives a bijection $v(V/U) \rightarrow \{y \in u(V) \mid y \mapsto x \text{ in } u(U)\}$ as desired. \square

Lemma 7.34.3. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} given by $u : \mathcal{C} \rightarrow \mathbf{Sets}$. Let U be an object of \mathcal{C} . For any sheaf \mathcal{G} on \mathcal{C}/U we have*

$$(j_{U!}\mathcal{G})_p = \coprod_q \mathcal{G}_q$$

where the coproduct is over the points q of \mathcal{C}/U associated to elements $x \in u(U)$ as in Lemma 7.34.1.

Proof. We use the description of $j_{U!}\mathcal{G}$ as the sheaf associated to the presheaf $V \mapsto \coprod_{\varphi \in \mathrm{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V/\varphi U)$ of Lemma 7.24.2. Also, the stalk of $j_{U!}\mathcal{G}$ at p is equal to the stalk of this presheaf, see Lemma 7.31.5. Hence we see that

$$(j_{U!}\mathcal{G})_p = \mathrm{colim}_{(V, y)} \coprod_{\varphi: V \rightarrow U} \mathcal{G}(V/\varphi U)$$

To each element (V, y, φ, s) of this colimit, we can assign $x = u(\varphi)(y) \in u(U)$. Hence we obtain

$$(j_U! \mathcal{G})_p = \coprod_{x \in u(U)} \operatorname{colim}_{(\varphi: V \rightarrow U, y), u(\varphi)(y)=x} \mathcal{G}(V/\varphi U).$$

This is equal to the expression of the lemma by our construction of the points q . \square

Remark 7.34.4. Warning: The result of Lemma 7.34.3 has no analogue for $j_{U,*}$.

7.35. 2-morphisms of topoi

This is a brief section concerning the notion of a 2-morphism of topoi.

Definition 7.35.1. Let $f, g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be two morphisms of topoi. A *2-morphism from f to g* is given by a transformation of functors $t : f_* \rightarrow g_*$.

Pictorially we sometimes represent t as follows:

$$\begin{array}{ccc} Sh(\mathcal{C}) & \begin{array}{c} \xrightarrow{f} \\ \Downarrow t \\ \xrightarrow{g} \end{array} & Sh(\mathcal{D}) \end{array}$$

Note that since f^{-1} is adjoint to f_* and g^{-1} is adjoint to g_* we see that t induces also a transformation of functors $t : g^{-1} \rightarrow f^{-1}$ (usually denoted by the same symbol) uniquely characterized by the condition that the diagram

$$\begin{array}{ccc} \operatorname{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, f_* \mathcal{F}) & \equiv & \operatorname{Mor}_{Sh(\mathcal{C})}(f^{-1} \mathcal{G}, \mathcal{F}) \\ \downarrow t \circ - & & \downarrow - \circ t \\ \operatorname{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, g_* \mathcal{F}) & \equiv & \operatorname{Mor}_{Sh(\mathcal{C})}(g^{-1} \mathcal{G}, \mathcal{F}) \end{array}$$

commutes. Because of set theoretic difficulties (see Remark 7.16.4) we do not obtain a 2-category of topoi. But we can still define horizontal and vertical composition and show that the axioms of a strict 2-category listed in Categories, Section 4.27 hold. Namely, vertical composition of 2-morphisms is clear (just compose transformations of functors), composition of 1-morphisms has been defined in Definition 7.16.1, and horizontal composition of

$$\begin{array}{ccccc} Sh(\mathcal{C}) & \begin{array}{c} \xrightarrow{f} \\ \Downarrow t \\ \xrightarrow{g} \end{array} & Sh(\mathcal{D}) & \begin{array}{c} \xrightarrow{f'} \\ \Downarrow s \\ \xrightarrow{g'} \end{array} & Sh(\mathcal{E}) \end{array}$$

is defined by the transformation of functors $s \star t$ introduced in Categories, Definition 4.26.1. Explicitly, $s \star t$ is given by

$$f'_* f_* \mathcal{F} \xrightarrow{f'_* t} f'_* g_* \mathcal{F} \xrightarrow{s} g'_* g_* \mathcal{F} \quad \text{or} \quad f'_* f_* \mathcal{F} \xrightarrow{s} g'_* f_* \mathcal{F} \xrightarrow{g'_* t} g'_* g_* \mathcal{F}$$

(these maps are equal). Since these definitions agree with the ones in Categories, Section 4.26 it follows from Categories, Lemma 4.26.2 that the axioms of a strict 2-category hold with these definitions.

7.36. Morphisms between points

Lemma 7.36.1. *Let \mathcal{C} be a site. Let $u, u' : \mathcal{C} \rightarrow \mathbf{Sets}$ be two functors, and let $t : u' \rightarrow u$ be a transformation of functors. Then we obtain a canonical transformation of stalk functors $t_{stalk} : \mathcal{F}_{p'} \rightarrow \mathcal{F}_p$ which agrees with t via the identifications of Lemma 7.31.3.*

Proof. Omitted. □

Definition 7.36.2. Let \mathcal{C} be a site. Let p, p' be points of \mathcal{C} given by functors $u, u' : \mathcal{C} \rightarrow \mathbf{Sets}$. A *morphism* $f : p \rightarrow p'$ is given by a transformation of functors

$$f_u : u' \rightarrow u.$$

Note how the transformation of functors goes the other way. This makes sense, as we will see later, by thinking of the morphism f as a kind of 2-arrow pictorially as follows:

$$\text{Sets} = \text{Sh}(pt) \begin{array}{c} \xrightarrow{p} \\ \Downarrow f \\ \xrightarrow{p'} \end{array} \text{Sh}(\mathcal{C})$$

Namely, we will see later that f_u induces a canonical transformation of functors $p_* \rightarrow p'_*$ between the skyscraper sheaf constructions.

This is a fairly important notion, and deserves a more complete treatment here. List of desiderata

- (1) Describe the automorphisms of the point of \mathcal{T}_G described in Example 7.32.6.
- (2) Describe $\text{Mor}(p, p')$ in terms of $\text{Mor}(p_*, p'_*)$.
- (3) Specialization of points in topological spaces. Show that if $x' \in \overline{\{x\}}$ in the topological space X , then there is a morphism $p \rightarrow p'$, where p (resp. p') is the point of X_{Zar} associated to x (resp. x').

7.37. Sites with enough points

Definition 7.37.1. Let \mathcal{C} be a site.

- (1) A family of points $\{p_i\}_{i \in I}$ is called *conservative* if for every map of sheaves $\phi : \mathcal{F} \rightarrow \mathcal{G}$ which is an isomorphism on all the fibres $\mathcal{F}_{p_i} \rightarrow \mathcal{G}_{p_i}$ is an isomorphism.
- (2) We say that \mathcal{C} *has enough points* if there exists a conservative family of points.

It turns out that you can then check “exactness” at the stalks.

Lemma 7.37.2. *Let \mathcal{C} be a site and let $\{p_i\}_{i \in I}$ be a conservative family of points. Then*

- (1) *Given any map of sheaves $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{p_i}$ injective implies φ injective.*
- (2) *Given any map of sheaves $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{p_i}$ surjective implies φ surjective.*
- (3) *Given any pair of maps of sheaves $\varphi_1, \varphi_2 : \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{1,p_i} = \varphi_{2,p_i}$ implies $\varphi_1 = \varphi_2$.*

- (4) Given a finite diagram $\mathcal{G} : \mathcal{J} \rightarrow \text{Sh}(\mathcal{C})$, a sheaf \mathcal{F} and morphisms $q_j : \mathcal{F} \rightarrow \mathcal{G}_j$ then (\mathcal{F}, q_j) is a limit of the diagram if and only if for each i the stalk $(\mathcal{F}_{p_i}, (q_j)_{p_i})$ is one.
- (5) Given a finite diagram $\mathcal{F} : \mathcal{J} \rightarrow \text{Sh}(\mathcal{C})$, a sheaf \mathcal{G} and morphisms $e_j : \mathcal{F}_j \rightarrow \mathcal{G}$ then (\mathcal{G}, e_j) is a colimit of the diagram if and only if for each i the stalk $(\mathcal{G}_{p_i}, (e_j)_{p_i})$ is one.

Proof. We will use over and over again that all the stalk functors commute with any finite limits and colimits and hence with products, fibred products, etc. We will also use that injective maps are the monomorphisms and the surjective maps are the epimorphisms. A map of sheaves $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is injective if and only if $\mathcal{F} \rightarrow \mathcal{F} \times_{\mathcal{G}} \mathcal{F}$ is an isomorphism. Hence (1). Similarly, $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is surjective if and only if $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism. Hence (2). The maps $a, b : \mathcal{F} \rightarrow \mathcal{G}$ are equal if and only if $\mathcal{F} \times_{a, \mathcal{G}, b} \mathcal{F} \rightarrow \mathcal{F} \times \mathcal{F}$ is an isomorphism. Hence (3). The assertions (4) and (5) follow immediately from the definitions and the remarks at the start of this proof. \square

Lemma 7.37.3. *Let \mathcal{C} be a site and let $\{(p_i, u_i)\}_{i \in I}$ be a family of points. The family is conservative if and only if for every sheaf \mathcal{F} and every $U \in \text{Ob}(\mathcal{C})$ and every pair of distinct sections $s, s' \in \mathcal{F}(U)$, $s \neq s'$ there exists an i and $x \in u_i(U)$ such that the triples (U, x, s) and (U, x, s') define distinct elements of \mathcal{F}_{p_i} .*

Proof. Suppose that the family is conservative and that \mathcal{F} , U , and s, s' are as in the lemma. The sections s, s' define maps $a, a' : (h_U)^\# \rightarrow \mathcal{F}$ which are distinct. Hence, by Lemma 7.37.2 there is an i such that $a_{p_i} \neq a'_{p_i}$. Recall that $(h_U)^\#_{p_i} = u_i(U)$, by Lemmas 7.31.3 and 7.31.5. Hence there exists an $x \in u_i(U)$ such that $a_{p_i}(x) \neq a'_{p_i}(x)$ in \mathcal{F}_{p_i} . Unwinding the definitions you see that (U, x, s) and (U, x, s') are as in the statement of the lemma.

To prove the converse, assume the condition on the existence of points of the lemma. Let $\phi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves which is an isomorphism at all the stalks. We have to show that ϕ is both injective and surjective, see Lemma 7.12.2. Injectivity is an immediate consequence of the assumption. To show surjectivity we have to show that $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism (Categories, Lemma 4.13.3). Since this map is clearly surjective, it suffices to check injectivity which follows as $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is injective on all stalks by assumption. \square

In the following lemma the points $q_{i,x}$ are exactly all the points of \mathcal{C}/U lying over the point p_i according to Lemma 7.34.2.

Lemma 7.37.4. *Let \mathcal{C} be a site. Let U be an object of \mathcal{C} . let $\{(p_i, u_i)\}_{i \in I}$ be a family of points of \mathcal{C} . For $x \in u_i(U)$ let $q_{i,x}$ be the point of \mathcal{C}/U constructed in Lemma 7.34.1. If $\{p_i\}$ is a conservative family of points, then $\{q_{i,x}\}_{i \in I, x \in u_i(U)}$ is a conservative family of points of \mathcal{C}/U . In particular, if \mathcal{C} has enough points, then so does every localization \mathcal{C}/U .*

Proof. We know that $j_{U!}$ induces an equivalence $j_{U!} : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})/h_U^\#$, see Lemma 7.24.4. Moreover, we know that $(j_{U!}\mathcal{G})_{p_i} = \coprod_x \mathcal{G}_{q_{i,x}}$, see Lemma 7.34.3. Hence the result follows formally. \square

The following lemma tells us we can check the existence of points locally on the site.

Lemma 7.37.5. *Let \mathcal{C} be a site. Let $\{U_i\}_{i \in I}$ be a family of objects of \mathcal{C} . Assume*

- (1) $\coprod h_{U_i}^\# \rightarrow *$ *is a surjective map of sheaves, and*
- (2) *each localization \mathcal{C}/U_i has enough points.*

Then \mathcal{C} has enough points.

Proof. For each $i \in I$ let $\{p_j\}_{j \in J_i}$ be a conservative family of points of \mathcal{C}/U_i . For $j \in J_i$ denote $q_j : Sh(pt) \rightarrow Sh(\mathcal{C})$ the composition of p_j with the localization morphism $Sh(\mathcal{C}/U_i) \rightarrow Sh(\mathcal{C})$. Then q_j is a point, see Lemma 7.33.2. We claim that the family of points $\{q_j\}_{j \in \coprod J_i}$ is conservative. Namely, let $\mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves on \mathcal{C} such that $\mathcal{F}_{q_j} \rightarrow \mathcal{G}_{q_j}$ is an isomorphism for all $j \in \coprod J_i$. Let W be an object of \mathcal{C} . By assumption (1) there exists a covering $\{W_a \rightarrow W\}$ and morphisms $W_a \rightarrow U_{i(a)}$. Since $(\mathcal{F}|_{\mathcal{C}/U_{i(a)}})_{p_j} = \mathcal{F}_{q_j}$ and $(\mathcal{G}|_{\mathcal{C}/U_{i(a)}})_{p_j} = \mathcal{G}_{q_j}$ by Lemma 7.33.2 we see that $\mathcal{F}|_{U_{i(a)}} \rightarrow \mathcal{G}|_{U_{i(a)}}$ is an isomorphism since the family of points $\{p_j\}_{j \in J_{i(a)}}$ is conservative. Hence $\mathcal{F}(W_a) \rightarrow \mathcal{G}(W_a)$ is bijective for each a . Similarly $\mathcal{F}(W_a \times_W W_b) \rightarrow \mathcal{G}(W_a \times_W W_b)$ is bijective for each a, b . By the sheaf condition this shows that $\mathcal{F}(W) \rightarrow \mathcal{G}(W)$ is bijective, i.e., $\mathcal{F} \rightarrow \mathcal{G}$ is an isomorphism. \square

7.38. Criterion for existence of points

This section corresponds to Deligne's appendix to [AGV71, Exposé VI]. In fact it is almost literally the same.

Let \mathcal{C} be a site. Suppose that (I, \geq) is a directed partially ordered set, and that $(U_i, f_{ii'})$ is an inverse system over I , see Categories, Definition 4.21.1. Given the data $(I, \geq, U_i, f_{ii'})$ we define

$$u : \mathcal{C} \longrightarrow Sets, \quad u(V) = \operatorname{colim}_i \operatorname{Mor}_{\mathcal{C}}(U_i, V)$$

Let $\mathcal{F} \mapsto \mathcal{F}_p$ be the stalk functor associated to u as in Section 7.31. It is direct from the definition that actually

$$\mathcal{F}_p = \operatorname{colim}_i \mathcal{F}(U_i)$$

in this special case. Note that u commutes with all finite limits (I mean those that are representable in \mathcal{C}) because each of the functors $V \mapsto \operatorname{Mor}_{\mathcal{C}}(U_i, V)$ do, see Categories, Lemma 4.19.2.

We say that a system $(I, \geq, U_i, f_{ii'})$ is a *refinement* of $(J, \geq, V_j, g_{jj'})$ if $J \subset I$, the ordering on J induced from that of I and $V_j = U_j$, $g_{jj'} = f_{jj'}$ (in words, the inverse system over J is induced by that over I). Let u be the functor associated to $(I, \geq, U_i, f_{ii'})$ and let u' be the functor associated to $(J, \geq, V_j, g_{jj'})$. This induces a transformation of functors

$$u' \longrightarrow u$$

simply because the colimits for u' are over a subsystem of the systems in the colimits for u . In particular we get an associated transformation of stalk functors $\mathcal{F}_{p'} \rightarrow \mathcal{F}_p$, see Lemma 7.36.1.

Lemma 7.38.1. *Let \mathcal{C} be a site. Let $(J, \geq, V_j, g_{jj'})$ be a system as above with associated pair of functors (u', p') . Let \mathcal{F} be a sheaf on \mathcal{C} . Let $s, s' \in \mathcal{F}_{p'}$ be distinct elements. Let $\{W_k \rightarrow W\}$ be a finite covering of \mathcal{C} . Let $f \in u'(W)$. There exists a refinement $(I, \geq, U_i, f_{ii'})$ of $(J, \geq, V_j, g_{jj'})$ such that s, s' map to distinct elements of \mathcal{F}_p and that the image of f in $u(W)$ is in the image of one of the $u(W_k)$.*

Proof. There exists a $j_0 \in J$ such that f is defined by $f' : V_{j_0} \rightarrow W$. For $j \geq j_0$ we set $V_{j,k} = V_j \times_{f' \circ f_{j j_0}, W} W_k$. Then $\{V_{j,k} \rightarrow V_j\}$ is a finite covering in the site \mathcal{C} . Hence $\mathcal{F}(V_j) \subset \prod_k \mathcal{F}(V_{j,k})$. By Categories, Lemma 4.19.2 once again we see that

$$\mathcal{F}_{p'} = \operatorname{colim}_j \mathcal{F}(V_j) \longrightarrow \prod_k \operatorname{colim}_j \mathcal{F}(V_{j,k})$$

is injective. Hence there exists a k such that s and s' have distinct image in $\operatorname{colim}_j \mathcal{F}(V_{j,k})$. Let $J_0 = \{j \in J, j \geq j_0\}$ and $I = J \amalg J_0$. We order I so that no element of the second summand is smaller than any element of the first, but otherwise using the ordering on J . If $j \in I$ is in the first summand then we use V_j and if $j \in I$ is in the second summand then we use $V_{j,k}$. We omit the definition of the transition maps of the inverse system. By the above it follows that s, s' have distinct image in \mathcal{F}_p . Moreover, the restriction of f' to $V_{j,k}$ factors through W_k by construction. \square

Lemma 7.38.2. *Let \mathcal{C} be a site. Let $(J, \geq, V_j, g_{jj'})$ be a system as above with associated pair of functors (u', p') . Let \mathcal{F} be a sheaf on \mathcal{C} . Let $s, s' \in \mathcal{F}_{p'}$ be distinct elements. There exists a refinement $(I, \geq, U_i, f_{ii'})$ of $(J, \geq, V_j, g_{jj'})$ such that s, s' map to distinct elements of \mathcal{F}_p and such that for every finite covering $\{W_k \rightarrow W\}$ of the site \mathcal{C} , and any $f \in u'(W)$ the image of f in $u(W)$ is in the image of one of the $u(W_k)$.*

Proof. Let E be the set of pairs $(\{W_k \rightarrow W\}, f \in u'(W))$. Consider pairs $(E' \subset E, (I, \geq, U_i, f_{ii'}))$ such that

- (1) $(I, \geq, U_i, g_{ii'})$ is a refinement of $(J, \geq, V_j, g_{jj'})$,
- (2) s, s' map to distinct elements of \mathcal{F}_p , and
- (3) for every pair $(\{W_k \rightarrow W\}, f \in u'(W)) \in E'$ we have that the image of f in $u(W)$ is in the image of one of the $u(W_k)$.

We order such pairs by inclusion in the first factor and by refinement in the second. Denote \mathcal{S} the class of all pairs $(E' \subset E, (I, \geq, U_i, f_{ii'}))$ as above. We claim that the hypothesis of Zorn's lemma holds for \mathcal{S} . Namely, suppose that $(E'_a, (I_a, \geq, U_i, f_{ii'}))_{a \in A}$ is a totally ordered subset of \mathcal{S} . Then we can define $E' = \bigcup_{a \in A} E'_a$ and we can set $I = \bigcup_{a \in A} I_a$. We claim that the corresponding pair $(E', (I, \geq, U_i, f_{ii'}))$ is an element of \mathcal{S} . Conditions (1) and (3) are clear. For condition (2) you note that

$$u = \operatorname{colim}_{a \in A} u_a \text{ and correspondingly } \mathcal{F}_p = \operatorname{colim}_{a \in A} \mathcal{F}_{p_a}$$

The distinctness of the images of s, s' in this stalk follows from the description of a directed colimit of sets, see Categories, Section 4.19. We will simply write $(E', (I, \dots)) = \bigcup_{a \in A} (E'_a, (I_a, \dots))$ in this situation.

OK, so Zorn's Lemma would apply if \mathcal{S} was a set, and this would, combined with Lemma 7.38.1 above easily prove the lemma. It doesn't since \mathcal{S} is a class. In order to circumvent this we choose a well ordering on E . For $e \in E$ set $E'_e = \{e' \in E \mid e' \leq e\}$. By transfinite induction we construct pairs $(E'_e, (I_e, \dots)) \in \mathcal{S}$ such that $e_1 \leq e_2 \Rightarrow (E'_{e_1}, (I_{e_1}, \dots)) \leq (E'_{e_2}, (I_{e_2}, \dots))$. Let $e \in E$, say $e = (\{W_k \rightarrow W\}, f \in u'(W))$. If e has a predecessor $e-1$, then we let (I_e, \dots) be a refinement of (I_{e-1}, \dots) as in Lemma 7.38.1 with respect to the system $e = (\{W_k \rightarrow W\}, f \in u'(W))$. If e does not have a predecessor, then we let (I_e, \dots) be a refinement of $\bigcup_{e' < e} (I_{e'}, \dots)$ with respect to the system $e = (\{W_k \rightarrow W\}, f \in u'(W))$. Finally, the union $\bigcup_{e \in E} I_e$ will be a solution to the problem posed in the lemma. \square

Proposition 7.38.3. *Let \mathcal{C} be a site. Assume that*

- (1) *finite limits exist in \mathcal{C} , and*
- (2) *every covering $\{U_i \rightarrow U\}_{i \in I}$ has a refinement by a finite covering of \mathcal{C} .*

Then \mathcal{C} has enough points.

Proof. We have to show that given any sheaf \mathcal{F} on \mathcal{C} , any $U \in \text{Ob}(\mathcal{C})$, and any distinct sections $s, s' \in \mathcal{F}(U)$, there exists a point p such that s, s' have distinct image in \mathcal{F}_p . See Lemma 7.37.3. Consider the system $(J, \geq, V_j, g_{jj'})$ with $J = \{1\}$, $V_1 = U$, $g_{11} = \text{id}_U$. Apply Lemma 7.38.2. By the result of that lemma we get a system $(I, \geq, U_i, f_{ii'})$ refining our system such that $s_p \neq s'_p$ and such that moreover for every finite covering $\{W_k \rightarrow W\}$ of the site \mathcal{C} the map $\coprod_k u(W_k) \rightarrow u(W)$ is surjective. Since every covering of \mathcal{C} can be refined by a finite covering we conclude that $\coprod_k u(W_k) \rightarrow u(W)$ is surjective for *any* covering $\{W_k \rightarrow W\}$ of the site \mathcal{C} . This implies that $u = p$ is a point, see Proposition 7.32.2 (and the discussion at the beginning of this section which guarantees that u commutes with finite limits). \square

7.39. Weakly contractible objects

A *weakly contractible* object of a site is one that satisfies the equivalent conditions of the following lemma.

Lemma 7.39.1. *Let \mathcal{C} be a site. Let U be an object of \mathcal{C} . The following conditions are equivalent*

- (1) *For every covering $\{U_i \rightarrow U\}$ there exists a map of sheaves $h_U^\# \rightarrow \coprod h_{U_i}^\#$ inverse to the sheafification of $\coprod h_{U_i} \rightarrow h_U$.*
- (2) *For every surjection of sheaves of sets $\mathcal{F} \rightarrow \mathcal{G}$ the map $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is surjective.*

Proof. Assume (1) and let $\mathcal{F} \rightarrow \mathcal{G}$ be a surjective map of sheaves of sets. For $s \in \mathcal{G}(U)$ there exists a covering $\{U_i \rightarrow U\}$ and $t_i \in \mathcal{F}(U_i)$ mapping to $s|_{U_i}$, see Definition 7.12.1. Think of t_i as a map $t_i : h_{U_i}^\# \rightarrow \mathcal{F}$ via (7.13.3.1). Then precomposing $\coprod t_i : \coprod h_{U_i}^\# \rightarrow \mathcal{F}$ with the map $h_U^\# \rightarrow \coprod h_{U_i}^\#$ we get from (1) we obtain a section $t \in \mathcal{F}(U)$ mapping to s . Thus (2) holds.

Assume (2) holds. Let $\{U_i \rightarrow U\}$ be a covering. Then $\coprod h_{U_i}^\# \rightarrow h_U^\#$ is surjective (Lemma 7.13.4). Hence by (2) there exists a section s of $\coprod h_{U_i}^\#$ mapping to the section id_U of $h_U^\#$. This section corresponds to a map $h_U^\# \rightarrow \coprod h_{U_i}^\#$ inverse to the sheafification of $\coprod h_{U_i} \rightarrow h_U$ which proves (1). \square

Definition 7.39.2. Let \mathcal{C} be a site.

- (1) We say an object U of \mathcal{C} is *weakly contractible* if the equivalent conditions of Lemma 7.39.1 hold.
- (2) We say a site has *enough weakly contractible objects* if every object U of \mathcal{C} has a covering $\{U_i \rightarrow U\}$ with U_i weakly contractible for all i .
- (3) More generally, if P is a property of objects of \mathcal{C} we say that \mathcal{C} has *enough P objects* if every object U of \mathcal{C} has a covering $\{U_i \rightarrow U\}$ such that U_i has P for all i .

The small étale site of $\mathbf{A}_{\mathbb{C}}^1$ does not have any weakly contractible objects. On the other hand, the small pro-étale site of any scheme has enough contractible objects.

7.40. Exactness properties of pushforward

Let f be a morphism of topoi. The functor f_* in general is only left exact. There are many additional conditions one can impose on this functor to single out particular classes of morphisms of topoi. We collect them here and note some of the logical dependencies. Some parts of the following lemma are purely category theoretical (i.e., they do not depend on having a morphism of topoi, just having a pair of adjoint functors is enough).

Lemma 7.40.1. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Consider the following properties (on sheaves of sets):*

- (1) f_* is faithful,
- (2) f_* is fully faithful,
- (3) $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is surjective for all \mathcal{F} in $Sh(\mathcal{C})$,
- (4) f_* transforms surjections into surjections,
- (5) f_* commutes with coequalizers,
- (6) f_* commutes with pushouts,
- (7) $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is an isomorphism for all \mathcal{F} in $Sh(\mathcal{C})$,
- (8) f_* reflects injections,
- (9) f_* reflects surjections,
- (10) f_* reflects bijections, and
- (11) for any surjection $\mathcal{F} \rightarrow f^{-1}\mathcal{G}$ there exists a surjection $\mathcal{G}' \rightarrow \mathcal{G}$ such that $f^{-1}\mathcal{G}' \rightarrow f^{-1}\mathcal{G}$ factors through $\mathcal{F} \rightarrow f^{-1}\mathcal{G}$.

Then we have the following implications

- (a) (2) \Rightarrow (1),
- (b) (3) \Rightarrow (1),
- (c) (7) \Rightarrow (1), (2), (3), (8), (9), (10).
- (d) (3) \Leftrightarrow (9),
- (e) (6) \Rightarrow (4) and (5) \Rightarrow (4),
- (f) (4) \Leftrightarrow (11),
- (g) (9) \Rightarrow (8), (10), and
- (h) (2) \Leftrightarrow (7).

Picture

Proof. Proof of (a): This is immediate from the definitions.

Proof of (b). Suppose that $a, b : \mathcal{F} \rightarrow \mathcal{F}'$ are maps of sheaves on \mathcal{C} . If $f_*a = f_*b$, then $f^{-1}f_*a = f^{-1}f_*b$. Consider the commutative diagram

$$\begin{array}{ccc} \mathcal{F} & \xrightarrow{\quad} & \mathcal{F}' \\ \uparrow & & \uparrow \\ f^{-1}f_*\mathcal{F} & \xrightarrow{\quad} & f^{-1}f_*\mathcal{F}' \end{array}$$

If the bottom two arrows are equal and the vertical arrows are surjective then the top two arrows are equal. Hence (b) follows.

Proof of (c). Suppose that $a : \mathcal{F} \rightarrow \mathcal{F}'$ is a map of sheaves on \mathcal{C} . Consider the commutative diagram

$$\begin{array}{ccc} \mathcal{F} & \xrightarrow{\quad} & \mathcal{F}' \\ \uparrow & & \uparrow \\ f^{-1}f_*\mathcal{F} & \xrightarrow{\quad} & f^{-1}f_*\mathcal{F}' \end{array}$$

If (7) holds, then the vertical arrows are isomorphisms. Hence if f_*a is injective (resp. surjective, resp. bijective) then the bottom arrow is injective (resp. surjective, resp. bijective) and hence the top arrow is injective (resp. surjective, resp. bijective). Thus we see that (7) implies (8), (9), (10). It is clear that (7) implies (3). The implications (7) \Rightarrow (2), (1) follow from (a) and (h) which we will see below.

Proof of (d). Assume (3). Suppose that $a : \mathcal{F} \rightarrow \mathcal{F}'$ is a map of sheaves on \mathcal{C} such that f_*a is surjective. As f^{-1} is exact this implies that $f^{-1}f_*a : f^{-1}f_*\mathcal{F} \rightarrow f^{-1}f_*\mathcal{F}'$ is surjective. Combined with (3) this implies that a is surjective. This means that (9) holds. Assume (9). Let \mathcal{F} be a sheaf on \mathcal{C} . We have to show that the map $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is surjective. It suffices to show that $f_*f^{-1}f_*\mathcal{F} \rightarrow f_*\mathcal{F}$ is surjective. And this is true because there is a canonical map $f_*\mathcal{F} \rightarrow f_*f^{-1}f_*\mathcal{F}$ which is a one-sided inverse.

Proof of (e). We use Categories, Lemma 4.13.3 without further mention. If $\mathcal{F} \rightarrow \mathcal{F}'$ is surjective then $\mathcal{F}' \amalg_{\mathcal{F}} \mathcal{F}' \rightarrow \mathcal{F}'$ is an isomorphism. Hence (6) implies that

$$f_*\mathcal{F}' \amalg_{f_*\mathcal{F}} f_*\mathcal{F}' = f_*(\mathcal{F}' \amalg_{\mathcal{F}} \mathcal{F}') \longrightarrow f_*\mathcal{F}'$$

is an isomorphism also. And this in turn implies that $f_*\mathcal{F} \rightarrow f_*\mathcal{F}'$ is surjective. Hence we see that (6) implies (4). If $\mathcal{F} \rightarrow \mathcal{F}'$ is surjective then \mathcal{F}' is the coequalizer of the two projections $\mathcal{F} \times_{\mathcal{F}'} \mathcal{F} \rightarrow \mathcal{F}$ by Lemma 7.12.3. Hence if (5) holds, then $f_*\mathcal{F}'$ is the coequalizer of the two projections

$$f_*(\mathcal{F} \times_{\mathcal{F}'} \mathcal{F}) = f_*\mathcal{F} \times_{f_*\mathcal{F}'} f_*\mathcal{F} \longrightarrow f_*\mathcal{F}$$

which clearly means that $f_*\mathcal{F} \rightarrow f_*\mathcal{F}'$ is surjective. Hence (5) implies (4) as well.

Proof of (f). Assume (4). Let $\mathcal{F} \rightarrow f^{-1}\mathcal{G}$ be a surjective map of sheaves on \mathcal{C} . By (4) we see that $f_*\mathcal{F} \rightarrow f_*f^{-1}\mathcal{G}$ is surjective. Let \mathcal{G}' be the fibre product

$$\begin{array}{ccc} f_*\mathcal{F} & \longrightarrow & f_*f^{-1}\mathcal{G} \\ \uparrow & & \uparrow \\ \mathcal{G}' & \longrightarrow & \mathcal{G} \end{array}$$

so that $\mathcal{G}' \rightarrow \mathcal{G}$ is surjective also. Consider the commutative diagram

$$\begin{array}{ccc} \mathcal{F} & \longrightarrow & f^{-1}\mathcal{G} \\ \uparrow & & \uparrow \\ f^{-1}f_*\mathcal{F} & \longrightarrow & f^{-1}f_*f^{-1}\mathcal{G} \\ \uparrow & & \uparrow \\ f^{-1}\mathcal{G}' & \longrightarrow & f^{-1}\mathcal{G} \end{array}$$

and we see the required result. Conversely, assume (11). Let $a : \mathcal{F} \rightarrow \mathcal{F}'$ be surjective map of sheaves on \mathcal{C} . Consider the fibre product diagram

$$\begin{array}{ccc} \mathcal{F} & \longrightarrow & \mathcal{F}' \\ \uparrow & & \uparrow \\ \mathcal{F}'' & \longrightarrow & f^{-1}f_*\mathcal{F}' \end{array}$$

Because the lower horizontal arrow is surjective and by (11) we can find a surjection $\gamma : \mathcal{G}' \rightarrow f_*\mathcal{F}'$ such that $f^{-1}\gamma$ factors through $\mathcal{F}'' \rightarrow f^{-1}f_*\mathcal{F}'$:

$$\begin{array}{ccc} \mathcal{F} & \longrightarrow & \mathcal{F}' \\ \uparrow & & \uparrow \\ f^{-1}\mathcal{G}' & \longrightarrow & \mathcal{F}'' \longrightarrow f^{-1}f_*\mathcal{F}' \end{array}$$

Pushing this down using f_* we get a commutative diagram

$$\begin{array}{ccccc} & & f_*\mathcal{F} & \longrightarrow & f_*\mathcal{F}' \\ & & \uparrow & & \uparrow \\ f_*f^{-1}\mathcal{G}' & \longrightarrow & f_*\mathcal{F}'' & \longrightarrow & f_*f^{-1}f_*\mathcal{F}' \\ \uparrow & & & & \uparrow \\ \mathcal{G}' & \longrightarrow & & & f_*\mathcal{F}' \end{array}$$

which proves that (4) holds.

Proof of (g). Assume (9). We use Categories, Lemma 4.13.3 without further mention. Let $a : \mathcal{F} \rightarrow \mathcal{F}'$ be a map of sheaves on \mathcal{C} such that f_*a is injective. This means that $f_*\mathcal{F} \rightarrow f_*\mathcal{F} \times_{f_*\mathcal{F}'} f_*\mathcal{F} = f_*(\mathcal{F} \times_{\mathcal{F}'} \mathcal{F})$ is an isomorphism. Thus by (9) we see that $\mathcal{F} \rightarrow \mathcal{F} \times_{\mathcal{F}'} \mathcal{F}$ is surjective, i.e., an isomorphism. Thus a is injective, i.e., (8) holds. Since (10) is trivially equivalent to (8) + (9) we are done with (g).

Proof of (h). This is Categories, Lemma 4.24.3. \square

Here is a condition on a morphism of sites which guarantees that the functor f_* transforms surjective maps into surjective maps.

Lemma 7.40.2. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Assume that for any object U of \mathcal{C} and any covering $\{V_j \rightarrow u(U)\}$ in \mathcal{D} there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} such that the map of sheaves*

$$\coprod h_{u(U_i)}^\# \rightarrow h_{u(U)}^\#$$

factors through the map of sheaves

$$\coprod h_{V_j}^\# \rightarrow h_{u(U)}^\#.$$

Then f_* transforms surjective maps of sheaves into surjective maps of sheaves.

Proof. Let $a : \mathcal{F} \rightarrow \mathcal{G}$ be a surjective map of sheaves on \mathcal{D} . Let U be an object of \mathcal{C} and let $s \in f_*\mathcal{G}(U) = \mathcal{G}(u(U))$. By assumption there exists a covering $\{V_j \rightarrow u(U)\}$ and sections $s_j \in \mathcal{F}(V_j)$ with $a(s_j) = s|_{V_j}$. Now we may think of the sections s, s_j and a as giving a commutative diagram of maps of sheaves

$$\begin{array}{ccc} \coprod h_{V_j}^\# & \xrightarrow{\coprod s_j} & \mathcal{F} \\ \downarrow & & \downarrow a \\ h_{u(U)}^\# & \xrightarrow{s} & \mathcal{G} \end{array}$$

By assumption there exists a covering $\{U_i \rightarrow U\}$ such that we can enlarge the commutative diagram above as follows

$$\begin{array}{ccccc} & & \coprod h_{V_j}^\# & \xrightarrow{\coprod s_j} & \mathcal{F} \\ & \nearrow & \downarrow & & \downarrow a \\ \coprod h_{u(U_i)}^\# & \longrightarrow & h_{u(U)}^\# & \xrightarrow{s} & \mathcal{G} \end{array}$$

Because \mathcal{F} is a sheaf the map from the left lower corner to the right upper corner corresponds to a family of sections $s_i \in \mathcal{F}(u(U_i))$, i.e., sections $s_i \in f_*\mathcal{F}(U_i)$. The commutativity of the diagram implies that $a(s_i)$ is equal to the restriction of s to U_i . In other words we have shown that f_*a is a surjective map of sheaves. \square

Example 7.40.3. Assume $f : \mathcal{D} \rightarrow \mathcal{C}$ satisfies the assumptions of Lemma 7.40.2. Then it is in general not the case that f_* commutes with coequalizers or pushouts. Namely, suppose that f is the morphism of sites associated to the morphism of topological spaces $X = \{1, 2\} \rightarrow Y = \{*\}$ (see Example 7.15.2), where Y is a singleton space, and $X = \{1, 2\}$ is a discrete space with two points. A sheaf \mathcal{F} on X is given by a pair (A_1, A_2) of sets. Then $f_*\mathcal{F}$ corresponds to the set $A_1 \times A_2$. Hence if $a = (a_1, a_2), b = (b_1, b_2) : (A_1, A_2) \rightarrow (B_1, B_2)$ are maps of sheaves on X , then the coequalizer of a, b is (C_1, C_2) where C_i is the coequalizer of a_i, b_i , and the coequalizer of f_*a, f_*b is the coequalizer of

$$a_1 \times a_2, b_1 \times b_2 : A_1 \times A_2 \longrightarrow B_1 \times B_2$$

which is in general different from $C_1 \times C_2$. Namely, if $A_2 = \emptyset$ then $A_1 \times A_2 = \emptyset$, and hence the coequalizer of the displayed arrows is $B_1 \times B_2$, but in general $C_1 \neq B_1$. A similar example works for pushouts.

The following lemma gives a criterion for when a morphism of sites has a functor f_* which reflects injections and surjections. Note that this also implies that f_* is faithful and that the map $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is always surjective.

Lemma 7.40.4. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Assume that for every object V of \mathcal{D} there exist objects U_i of \mathcal{C} and morphisms $u(U_i) \rightarrow V$ such that $\{u(U_i) \rightarrow V\}$ is a covering of \mathcal{D} . In this case the functor $f_* : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ reflects injections and surjections.*

Proof. Let $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ be maps of sheaves on \mathcal{D} . By assumption for every object V of \mathcal{D} we get $\mathcal{F}(V) \subset \prod \mathcal{F}(u(U_i)) = \prod f_*\mathcal{F}(U_i)$ by the sheaf condition for some $U_i \in \text{Ob}(\mathcal{C})$ and similarly for \mathcal{G} . Hence it is clear that if $f_*\alpha$ is injective, then α is injective. In other words f_* reflects injections.

Suppose that f_* is surjective. Then for $V, U_i, u(U_i) \rightarrow V$ as above and a section $s \in \mathcal{G}(V)$, there exist coverings $\{U_{ij} \rightarrow U_i\}$ such that $s|_{u(U_{ij})}$ is in the image of $\mathcal{F}(u(U_{ij}))$. Since $\{u(U_{ij}) \rightarrow V\}$ is a covering (as u is continuous and by the axioms of a site) we conclude that s is locally in the image. Thus α is surjective. In other words f_* reflects surjections. \square

Example 7.40.5. We construct a morphism $f : \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Lemma 7.40.4. Namely, let $\varphi : G \rightarrow H$ be a morphism of finite groups. Consider the sites $\mathcal{D} = \mathcal{T}_G$ and $\mathcal{C} = \mathcal{T}_H$ of countable G -sets and H -sets and coverings countable families of jointly surjective maps (Example 7.6.5). Let $u : \mathcal{T}_H \rightarrow \mathcal{T}_G$ be the functor described in Section 7.17 and $f : \mathcal{T}_G \rightarrow \mathcal{T}_H$ the corresponding morphism of sites. If φ is injective, then every countable G -set is, as a G -set, the quotient of a countable H -set (this fails if φ isn't injective). Thus f satisfies the hypothesis of Lemma 7.40.4. If the sheaf \mathcal{F} on \mathcal{T}_G corresponds to the G -set S , then the canonical map

$$f^{-1}f_*\mathcal{F} \longrightarrow \mathcal{F}$$

corresponds to the map

$$\text{Map}_G(H, S) \longrightarrow S, \quad a \longmapsto a(1_H)$$

If φ is injective but not surjective, then this map is surjective (as it should according to Lemma 7.40.4) but not injective in general (for example take $G = \{1\}$, $H = \{1, \sigma\}$, and $S = \{1, 2\}$). Moreover, the functor f_* does not commute with coequalizers or pushouts (for $G = \{1\}$ and $H = \{1, \sigma\}$).

7.41. Almost cocontinuous functors

Let \mathcal{C} be a site. The category $PSh(\mathcal{C})$ has an initial object, namely the presheaf which assigns the empty set to each object of \mathcal{C} . Let us denote this presheaf by \emptyset . It follows from the properties of sheafification that the sheafification $\emptyset^\#$ of \emptyset is an initial object of the category $Sh(\mathcal{C})$ of sheaves on \mathcal{C} .

Definition 7.41.1. Let \mathcal{C} be a site. We say an object U of \mathcal{C} is *sheaf theoretically empty* if $\emptyset^\# \rightarrow h_U^\#$ is an isomorphism of sheaves.

The following lemma makes this notion more explicit.

Lemma 7.41.2. *Let \mathcal{C} be a site. Let U be an object of \mathcal{C} . The following are equivalent:*

- (1) U is sheaf theoretically empty,
- (2) $\mathcal{F}(U)$ is a singleton for each sheaf \mathcal{F} ,
- (3) $\emptyset^\#(U)$ is a singleton,
- (4) $\emptyset^\#(U)$ is nonempty, and
- (5) the empty family is a covering of U in \mathcal{C} .

Moreover, if U is sheaf theoretically empty, then for any morphism $U' \rightarrow U$ of \mathcal{C} the object U' is sheaf theoretically empty.

Proof. For any sheaf \mathcal{F} we have $\mathcal{F}(U) = \text{Mor}_{\text{Sh}(\mathcal{C})}(h_U^\#, \mathcal{F})$. Hence, we see that (1) and (2) are equivalent. It is clear that (2) implies (3) implies (4). If every covering of U is given by a nonempty family, then $\emptyset^+(U)$ is empty by definition of the plus construction. Note that $\emptyset^+ = \emptyset^\#$ as \emptyset is a separated presheaf, see Theorem 7.10.10. Thus we see that (4) implies (5). If (5) holds, then $\mathcal{F}(U)$ is a singleton for every sheaf \mathcal{F} by the sheaf condition for \mathcal{F} , see Remark 7.7.2. Thus (5) implies (2) and (1) – (5) are equivalent. The final assertion of the lemma follows from Axiom (3) of Definition 7.6.2 applied the empty covering of U . \square

Definition 7.41.3. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. We say u is *almost cocontinuous* if for every object U of \mathcal{C} and every covering $\{V_j \rightarrow u(U)\}_{j \in J}$ there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ in \mathcal{C} such that for each i in I we have at least one of the following two conditions

- (1) $u(U_i)$ is sheaf theoretically empty, or
- (2) the morphism $u(U_i) \rightarrow u(U)$ factors through V_j for some $j \in J$.

The motivation for this definition comes from a closed immersion $i : Z \rightarrow X$ of topological spaces. As discussed in Example 7.20.9 the continuous functor $X_{Zar} \rightarrow Z_{Zar}, U \mapsto Z \cap U$ is not cocontinuous. But it is almost cocontinuous in the sense defined above. We know that i_* while not exact on sheaves of sets, is exact on sheaves of abelian groups, see Sheaves, Remark 6.32.5. And this holds in general for continuous and almost cocontinuous functors.

Lemma 7.41.4. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that u is continuous and almost cocontinuous. Let \mathcal{G} be a presheaf on \mathcal{D} such that $\mathcal{G}(V)$ is a singleton whenever V is sheaf theoretically empty. Then $(u^p \mathcal{G})^\# = u^p(\mathcal{G}^\#)$.

Proof. Let $U \in \text{Ob}(\mathcal{C})$. We have to show that $(u^p \mathcal{G})^\#(U) = u^p(\mathcal{G}^\#)(U)$. It suffices to show that $(u^p \mathcal{G})^+(U) = u^p(\mathcal{G}^+)(U)$ since \mathcal{G}^+ is another presheaf for which the assumption of the lemma holds. We have

$$u^p(\mathcal{G}^+)(U) = \mathcal{G}^+(u(U)) = \text{colim}_{\mathcal{V}} \check{H}^0(\mathcal{V}, \mathcal{G})$$

where the colimit is over the coverings \mathcal{V} of $u(U)$ in \mathcal{D} . On the other hand, we see that

$$u^p(\mathcal{G})^+(U) = \text{colim}_{\mathcal{U}} \check{H}^0(u(\mathcal{U}), \mathcal{G})$$

where the colimit is over the category of coverings $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ of U in \mathcal{C} and $u(\mathcal{U}) = \{u(U_i) \rightarrow u(U)\}_{i \in I}$. The condition that u is continuous means that each $u(\mathcal{U})$ is a covering. Write $I = I_1 \amalg I_2$, where

$$I_2 = \{i \in I \mid u(U_i) \text{ is sheaf theoretically empty}\}$$

Then $u(\mathcal{U})' = \{u(U_i) \rightarrow u(U)\}_{i \in I_1}$ is still a covering of because each of the other pieces can be covered by the empty family and hence can be dropped by Axiom (2) of Definition 7.6.2. Moreover, $\check{H}^0(u(\mathcal{U}), \mathcal{G}) = \check{H}^0(u(\mathcal{U})', \mathcal{G})$ by our assumption on \mathcal{G} . Finally, the condition that u is almost cocontinuous implies that for every covering \mathcal{V} of $u(U)$ there exists a covering \mathcal{U} of U such that $u(\mathcal{U})'$ refines \mathcal{V} . It follows that the two colimits displayed above have the same value as desired. \square

Lemma 7.41.5. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that u is continuous and almost cocontinuous. Then $u^s = u^p : \text{Sh}(\mathcal{D}) \rightarrow \text{Sh}(\mathcal{C})$ commutes with pushouts and coequalizers (and more generally finite connected colimits).

Proof. Let \mathcal{I} be a finite connected index category. Let $\mathcal{I} \rightarrow Sh(\mathcal{D})$, $i \mapsto \mathcal{G}_i$ by a diagram. We know that the colimit of this diagram is the sheafification of the colimit in the category of presheaves, see Lemma 7.10.13. Denote colim^{Psh} the colimit in the category of presheaves. Since \mathcal{I} is finite and connected we see that $\text{colim}_i^{Psh} \mathcal{G}_i$ is a presheaf satisfying the assumptions of Lemma 7.41.4 (because a finite connected colimit of singleton sets is a singleton). Hence that lemma gives

$$\begin{aligned} u^s(\text{colim}_i \mathcal{G}_i) &= u^s((\text{colim}_i^{Psh} \mathcal{G}_i)^\#) \\ &= (u^p(\text{colim}_i^{Psh} \mathcal{G}_i))^\# \\ &= (\text{colim}_i^{Psh} u^p(\mathcal{G}_i))^\# \\ &= \text{colim}_i u^s(\mathcal{G}_i) \end{aligned}$$

as desired. \square

Lemma 7.41.6. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$. If u is almost cocontinuous then f_* commutes with pushouts and coequalizers (and more generally finite connected colimits).*

Proof. This is a special case of Lemma 7.41.5. \square

7.42. Subtopoi

Here is the definition.

Definition 7.42.1. Let \mathcal{C} and \mathcal{D} be sites. A morphism of topoi $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ is called an *embedding* if f_* is fully faithful.

According to Lemma 7.40.1 this is equivalent to asking the adjunction map $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ to be an isomorphism for every sheaf \mathcal{F} on \mathcal{D} .

Definition 7.42.2. Let \mathcal{C} be a site. A strictly full subcategory $E \subset Sh(\mathcal{C})$ is a *subtopos* if there exists an embedding of topoi $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ such that E is equal to the essential image of the functor f_* .

The subtopoi constructed in the following lemma will be dubbed "open" in the definition later on.

Lemma 7.42.3. *Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf on \mathcal{C} . The following are equivalent*

- (1) \mathcal{F} is a subobject of the final object of \mathcal{C} , and
- (2) the topos $Sh(\mathcal{C})/\mathcal{F}$ is a subtopos of $Sh(\mathcal{C})$.

Proof. We have seen in Lemma 7.29.1 that $Sh(\mathcal{C})/\mathcal{F}$ is a topos. In fact, we recall the proof. First we apply Lemma 7.28.5 to see that we may assume \mathcal{C} is a site with a subcanonical topology, fibre products, a final object X , and an object U with $\mathcal{F} = h_U$. The proof of Lemma 7.29.1 shows that the morphism of topoi $j_{\mathcal{F}} : Sh(\mathcal{C})/\mathcal{F} \rightarrow Sh(\mathcal{C})$ is equal (modulo certain identifications) to the localization morphism $j_U : Sh(\mathcal{C}/U) \rightarrow Sh(\mathcal{C})$.

Assume (2). This means that $j_U^{-1}j_{U,*}\mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism for all sheaves \mathcal{G} on \mathcal{C}/U . For any object Z/U of \mathcal{C}/U we have

$$(j_{U,*}h_{Z/U})(U) = \text{Mor}_{\mathcal{C}/U}(U \times_X U/U, Z/U)$$

by Lemma 7.26.2. Setting $\mathcal{G} = h_{Z/U}$ in the equality above we obtain

$$\text{Mor}_{\mathcal{C}/U}(U \times_X U/U, Z/U) = \text{Mor}_{\mathcal{C}/U}(U, Z/U)$$

for all Z/U . By Yoneda's lemma (Categories, Lemma 4.3.5) this implies $U \times_X U = U$. By Categories, Lemma 4.13.3 $U \rightarrow X$ is a monomorphism, in other words (1) holds.

Assume (1). Then $j_U^{-1}j_{U,*} = \text{id}$ by Lemma 7.26.4. \square

Definition 7.42.4. Let \mathcal{C} be a site. A strictly full subcategory $E \subset Sh(\mathcal{C})$ is an *open subtopos* if there exists a subsheaf \mathcal{F} of the final object of $Sh(\mathcal{C})$ such that E is the subtopos $Sh(\mathcal{C})/\mathcal{F}$ described in Lemma 7.42.3.

This means there is a bijection between the collection of open subtopoi of $Sh(\mathcal{C})$ and the set of subobjects of the final object of $Sh(\mathcal{C})$. Given an open subtopos there is a "closed" complement.

Lemma 7.42.5. *Let \mathcal{C} be a site. Let \mathcal{F} be a subsheaf of the final object $*$ of $Sh(\mathcal{C})$. The full subcategory of sheaves \mathcal{G} such that $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ is an isomorphism is a subtopos of $Sh(\mathcal{C})$.*

Proof. We apply Lemma 7.28.5 to see that we may assume \mathcal{C} is a site with the properties listed in that lemma. In particular \mathcal{C} has a final object X (so that $* = h_X$) and an object U with $\mathcal{F} = h_U$.

Let $\mathcal{D} = \mathcal{C}$ as a category but a covering is a family $\{V_j \rightarrow V\}$ of morphisms such that $\{V_i \rightarrow V\} \cup \{U \times_X V \rightarrow V\}$ is a covering. By our choice of \mathcal{C} this means exactly that

$$h_{U \times_X V} \coprod \coprod h_{V_i} \longrightarrow h_V$$

is surjective. We claim that \mathcal{D} is a site, i.e., the coverings satisfy the conditions (1), (2), (3) of Definition 7.6.2. Condition (1) holds. For condition (2) suppose that $\{V_i \rightarrow V\}$ and $\{V_{ij} \rightarrow V_i\}$ are coverings of \mathcal{D} . Then the composition

$$\coprod \left(h_{U \times_X V_i} \coprod \coprod h_{V_{ij}} \right) \longrightarrow h_{U \times_X V} \coprod \coprod h_{V_i} \longrightarrow h_V$$

is surjective. Since each of the morphisms $U \times_X V_i \rightarrow V$ factors through $U \times_X V$ we see that

$$h_{U \times_X V} \coprod \coprod h_{V_{ij}} \longrightarrow h_V$$

is surjective, i.e., $\{V_{ij} \rightarrow V\}$ is a covering of V in \mathcal{D} . Condition (3) follows similarly as a base change of a surjective map of sheaves is surjective.

Note that the (identity) functor $u : \mathcal{C} \rightarrow \mathcal{D}$ is continuous and commutes with fibre products and final objects. Hence we obtain a morphism $f : \mathcal{D} \rightarrow \mathcal{C}$ of sites (Proposition 7.15.6). Observe that f_* is the identity functor on underlying presheaves, hence fully faithful. To finish the proof we have to show that the essential image of f_* is the full subcategory $E \subset Sh(\mathcal{C})$ singled out in the lemma. To do this, note that $\mathcal{G} \in \text{Ob}(Sh(\mathcal{C}))$ is in E if and only if $\mathcal{G}(U \times_X V)$ is a singleton for all objects V of \mathcal{C} . Thus such a sheaf satisfies the sheaf property for all coverings of \mathcal{D} (argument omitted). Conversely, if \mathcal{G} satisfies the sheaf property for all coverings of \mathcal{D} , then $\mathcal{G}(U \times_X V)$ is a singleton, as in \mathcal{D} the object $U \times_X V$ is covered by the empty covering. \square

Definition 7.42.6. Let \mathcal{C} be a site. A strictly full subcategory $E \subset Sh(\mathcal{C})$ is an *closed subtopos* if there exists a subsheaf \mathcal{F} of the final object of $Sh(\mathcal{C})$ such that E is the subtopos described in Lemma 7.42.5.

All right, and now we can define what it means to have a closed immersion and an open immersion of topoi.

Definition 7.42.7. Let $f : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ be a morphism of topoi.

- (1) We say f is an *open immersion* if f is an embedding and the essential image of f_* is an open subtopos.
- (2) We say f is a *closed immersion* if f is an embedding and the essential image of f_* is a closed subtopos.

Lemma 7.42.8. *Let $i : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$ be a closed immersion of topoi. Then i_* is fully faithful, transforms surjections into surjections, commutes with coequalizers, commutes with pushouts, reflects injections, reflects surjections, and reflects bijections.*

Proof. Let \mathcal{F} be a subsheaf of the final object $*$ of $Sh(\mathcal{C})$ and let $E \subset Sh(\mathcal{C})$ be the full subcategory consisting of those \mathcal{G} such that $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ is an isomorphism. By Lemma 7.42.5 the functor i_* is isomorphic to the inclusion functor $\iota : E \rightarrow Sh(\mathcal{C})$.

Let $j_{\mathcal{F}} : Sh(\mathcal{C})/\mathcal{F} \rightarrow Sh(\mathcal{C})$ be the localization functor (Lemma 7.29.1). Note that E can also be described as the collection of sheaves \mathcal{G} such that $j_{\mathcal{F}}^{-1}\mathcal{G} = *$.

Let $a, b : \mathcal{G}_1 \rightarrow \mathcal{G}_2$ be two morphism of E . To prove ι commutes with coequalizers it suffices to show that the coequalizer of a, b in $Sh(\mathcal{C})$ lies in E . This is clear because the coequalizer of two morphisms $* \rightarrow *$ is $*$ and because $j_{\mathcal{F}}^{-1}$ is exact. Similarly for pushouts.

Thus i_* satisfies properties (5), (6), and (7) of Lemma 7.40.1 and hence the morphism i satisfies all properties mentioned in that lemma, in particular the ones mentioned in this lemma. \square

7.43. Sheaves of algebraic structures

In Sheaves, Section 6.15 we introduced a type of algebraic structure to be a pair (\mathcal{A}, s) , where \mathcal{A} is a category, and $s : \mathcal{A} \rightarrow Sets$ is a functor such that

- (1) s is faithful,
- (2) \mathcal{A} has limits and s commutes with limits,
- (3) \mathcal{A} has filtered colimits and s commutes with them, and
- (4) s reflects isomorphisms.

For such a type of algebraic structure we saw that a presheaf \mathcal{F} with values in \mathcal{A} on a space X is a sheaf if and only if the associated presheaf of sets is a sheaf. Moreover, we worked out the notion of stalk, and given a continuous map $f : X \rightarrow Y$ we defined adjoint functors pushforward and pullback on sheaves of algebraic structures which agrees with pushforward and pullback on the underlying sheaves of sets. In addition extending a sheaf of algebraic structures from a basis to all opens of a space, works as expected.

Part of this material still works in the setting of sites and sheaves. Let (\mathcal{A}, s) be a type of algebraic structure. Let \mathcal{C} be a site. Let us denote $PSh(\mathcal{C}, \mathcal{A})$, resp. $Sh(\mathcal{C}, \mathcal{A})$ the category of presheaves, resp. sheaves with values in \mathcal{A} on \mathcal{C} .

- (α) A presheaf with values in \mathcal{A} is a sheaf if and only if its underlying presheaf of sets is a sheaf. See the proof of Sheaves, Lemma 6.9.2.

- (β) Given a presheaf \mathcal{F} with values in \mathcal{A} the presheaf $\mathcal{F}^\# = (\mathcal{F}^+)^+$ is a sheaf. This is true since the colimits in the sheafification process are filtered, and even colimits over directed partially ordered sets (see Section 7.10, especially the proof of Lemma 7.10.14) and since s commutes with filtered colimits.

(γ) We get the following commutative diagram

$$\begin{array}{ccc}
 Sh(\mathcal{C}, \mathcal{A}) & \xrightleftharpoons{\quad} & PSh(\mathcal{C}, \mathcal{A}) \\
 \downarrow s & & \downarrow s \\
 Sh(\mathcal{C}) & \xrightleftharpoons{\quad} & PSh(\mathcal{C})
 \end{array}$$

- (δ) We have $\mathcal{F} = \mathcal{F}^\#$ if and only if \mathcal{F} is a sheaf of algebraic structures.
- (ε) The functor $\#$ is adjoint to the inclusion functor:

$$\text{Mor}_{PSh(\mathcal{C}, \mathcal{A})}(\mathcal{G}, \mathcal{F}) = \text{Mor}_{Sh(\mathcal{C}, \mathcal{A})}(\mathcal{G}^\#, \mathcal{F})$$

The proof is the same as the proof of Proposition 7.10.12.

- (ζ) The functor $\mathcal{F} \mapsto \mathcal{F}^\#$ is left exact. The proof is the same as the proof of Lemma 7.10.14.

Definition 7.43.1. Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a functor $u : \mathcal{C} \rightarrow \mathcal{D}$. We define the *pushforward* functor for presheaves of algebraic structures by the rule $u^p \mathcal{F}(U) = \mathcal{F}(uU)$, and for sheaves of algebraic structures by the same rule, namely $f_* \mathcal{F}(U) = \mathcal{F}(uU)$.

The problem comes with trying to define the pullback. The reason is that the colimits defining the functor u_p in Section 7.5 may not be filtered. Thus the axioms above are not enough in general to define the pullback of a (pre)sheaf of algebraic structures. Nonetheless, in almost all cases the following lemma is sufficient to define pushforward, and pullback of (pre)sheaves of algebraic structures.

Lemma 7.43.2. *Suppose the functor $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfies the hypotheses of Proposition 7.15.6, and hence gives rise to a morphism of sites $f : \mathcal{D} \rightarrow \mathcal{C}$. In this case the pullback functor f^{-1} (resp. u_p) and the pushforward functor f_* (resp. u^p) extend to an adjoint pair of functors on the categories of sheaves (resp. presheaves) of algebraic structures. Moreover, these functors commute with taking the underlying sheaf (resp. presheaf) of sets.*

Proof. We have defined $f_* = u^p$ above. In the course of the proof of Proposition 7.15.6 we saw that all the colimits used to define u_p are filtered under the assumptions of the proposition. Hence we conclude from the definition of a type of algebraic structure that we may define u_p by exactly the same colimits as a functor on presheaves of algebraic structures. Adjointness of u_p and u^p is proved in exactly the same way as the proof of Lemma 7.5.4. The discussion of sheafification of presheaves of algebraic structures above then implies that we may define $f^{-1}(\mathcal{F}) = (u_p \mathcal{F})^\#$. □

We briefly discuss a method for dealing with pullback and pushforward for a general morphism of sites, and more generally for any morphism of topoi.

Let \mathcal{C} be a site. In the case $\mathcal{A} = Ab$, we may think of an abelian (pre)sheaf on \mathcal{C} as a quadruple $(\mathcal{F}, +, 0, i)$. Here the data are

- (D1) \mathcal{F} is a sheaf of sets,
- (D2) $+$: $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ is a morphism of sheaves of sets,
- (D3) $0 : * \rightarrow \mathcal{F}$ is a morphism from the singleton sheaf (see Example 7.10.2) to \mathcal{F} , and
- (D4) $i : \mathcal{F} \rightarrow \mathcal{F}$ is a morphism of sheaves of sets.

These data have to satisfy the following axioms

- (A1) $+$ is associative and commutative,
- (A2) 0 is a unit for $+$, and
- (A3) $+$ \circ $(1, i) = 0 \circ (\mathcal{F} \rightarrow *)$.

Compare Sheaves, Lemma 6.4.3. Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites. Note that since f^{-1} is exact we have $f^{-1}* = *$ and $f^{-1}(\mathcal{F} \times \mathcal{F}) = f^{-1}\mathcal{F} \times f^{-1}\mathcal{F}$. Thus we can define $f^{-1}\mathcal{F}$ simply as the quadruple $(f^{-1}\mathcal{F}, f^{-1}+, f^{-1}0, f^{-1}i)$. The axioms are going to be preserved because f^{-1} is a functor which commutes with finite limits. Finally it is not hard to check that f_* and f^{-1} are adjoint as usual.

In [AGV71] this method is used. They introduce something called an “*espèce the structure algébrique <<définie par limites projectives finie>>*”. For such an espèce you can use the method described above to define a pair of adjoint functors f^{-1} and f_* as above. This clearly works for most algebraic structures that one encounters in practice. Instead of formalizing this construction we simply list those algebraic structures for which this method works (to be verified case by case). In fact, this method works for any morphism of topoi.

Proposition 7.43.3. *Let \mathcal{C}, \mathcal{D} be sites. Let $f = (f^{-1}, f_*)$ be a morphism of topoi from $Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C})$. The method introduced above gives rise to an adjoint pair of functors (f^{-1}, f_*) on sheaves of algebraic structures compatible with taking the underlying sheaves of sets for the following types of algebraic structures:*

- (1) pointed sets,
- (2) abelian groups,
- (3) groups,
- (4) monoids,
- (5) rings,
- (6) modules over a fixed ring, and
- (7) lie algebras over a fixed field.

Moreover, in each of these cases the results above labeled (α) , (β) , (γ) , (δ) , (ϵ) , and (ζ) hold.

Proof. The final statement of the proposition holds simply since each of the listed categories, endowed with the obvious forgetful functor, is indeed a type of algebraic structure in the sense explained at the beginning of this section. See Sheaves, Lemma 6.15.2.

Proof of (2). We think of a sheaf of abelian groups as a quadruple $(\mathcal{F}, +, 0, i)$ as explained in the discussion preceding the proposition. If $(\mathcal{F}, +, 0, i)$ lives on \mathcal{C} , then its pullback is defined as $(f^{-1}\mathcal{F}, f^{-1}+, f^{-1}0, f^{-1}i)$. If $(\mathcal{G}, +, 0, i)$ lives on \mathcal{D} , then its pushforward is defined as $(f_*\mathcal{G}, f_*+, f_*0, f_*i)$. This works because $f_*(\mathcal{G} \times \mathcal{G}) = f_*\mathcal{G} \times f_*\mathcal{G}$. Adjointness follows from adjointness of the set based functors, since

$$\text{Mor}_{Ab(\mathcal{C})}((\mathcal{F}_1, +, 0, i), (\mathcal{F}_2, +, 0, i)) = \left\{ \begin{array}{l} \varphi \in \text{Mor}_{Sh(\mathcal{C})}(\mathcal{F}_1, \mathcal{F}_2) \\ \varphi \text{ is compatible with } +, 0, i \end{array} \right\}$$

Details left to the reader.

This method also works for sheaves of rings by thinking of a sheaf of rings (with unit) as a sextuple $(\mathcal{O}, +, 0, i, \cdot, 1)$ satisfying a list of axioms that you can find in any elementary algebra book.

A sheaf of pointed sets is a pair (\mathcal{F}, p) , where \mathcal{F} is a sheaf of sets, and $p : * \rightarrow \mathcal{F}$ is a map of sheaves of sets.

A sheaf of groups is given by a quadruple $(\mathcal{F}, \cdot, 1, i)$ with suitable axioms.

A sheaf of monoids is given by a pair (\mathcal{F}, \cdot) with suitable axiom.

Let R be a ring. An sheaf of R -modules is given by a quintuple $(\mathcal{F}, +, 0, i, \{\lambda_r\}_{r \in R})$, where the quadruple $(\mathcal{F}, +, 0, i)$ is a sheaf of abelian groups as above, and $\lambda_r : \mathcal{F} \rightarrow \mathcal{F}$ is a family of morphisms of sheaves of sets such that $\lambda_r \circ 0 = 0$, $\lambda_r \circ + = + \circ (\lambda_r, \lambda_r)$, $\lambda_{r+r'} = + \circ \lambda_r \times \lambda_{r'} \circ (\text{id}, \text{id})$, $\lambda_{rr'} = \lambda_r \circ \lambda_{r'}$, $\lambda_1 = \text{id}$, $\lambda_0 = 0 \circ (\mathcal{F} \rightarrow *)$. \square

We will discuss the category of sheaves of modules over a sheaf of rings in Modules on Sites, Section 18.10.

Remark 7.43.4. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{D} \rightarrow \mathcal{C}$ be a continuous functor which gives rise to a morphism of sites $\mathcal{C} \rightarrow \mathcal{D}$. Note that even in the case of abelian groups we have not defined a pullback functor for presheaves of abelian groups. Since all colimits are representable in the category of abelian groups, we certainly may define a functor u_p^{ab} on abelian presheaves by the same colimits as we have used to define u_p on presheaves of sets. It will also be the case that u_p^{ab} is adjoint to u^p on the categories of abelian presheaves. However, it will not always be the case that u_p^{ab} agrees with u_p on the underlying presheaves of sets.

7.44. Pullback maps

It sometimes happens that a site \mathcal{C} does not have a final object. In this case we define the global section functor as follows.

Definition 7.44.1. The *global sections* of a presheaf of sets \mathcal{F} over a site \mathcal{C} is the set

$$\Gamma(\mathcal{C}, \mathcal{F}) = \text{Mor}_{\text{PSh}(\mathcal{C})}(*, \mathcal{F})$$

where $*$ is the final object in the category of presheaves on \mathcal{C} , i.e., the presheaf which associates to every object a singleton.

Of course the same definition applies to sheaves as well. Here is one way to compute global sections.

Lemma 7.44.2. Let \mathcal{C} be a site. Let $a, b : V \rightarrow U$ be objects of \mathcal{C} such that

$$h_V^\# \rightrightarrows h_U^\# \longrightarrow *$$

is a coequalizer in $\text{Sh}(\mathcal{C})$. Then $\Gamma(\mathcal{C}, \mathcal{F})$ is the equalizer of $a^*, b^* : \mathcal{F}(U) \rightarrow \mathcal{F}(V)$.

Proof. Since $\text{Mor}_{\text{Sh}(\mathcal{C})}(h_U^\#, \mathcal{F}) = \mathcal{F}(U)$ this is clear from the definitions. \square

Now, let $f : \text{Sh}(\mathcal{D}) \rightarrow \text{Sh}(\mathcal{C})$ be a morphism of topoi. Then for any sheaf \mathcal{F} on \mathcal{C} there is a pullback map

$$f^{-1} : \Gamma(\mathcal{C}, \mathcal{F}) \longrightarrow \Gamma(\mathcal{D}, f^{-1}\mathcal{F})$$

Namely, as f^{-1} is exact it transforms $*$ into $*$. We can generalize this a bit by considering a pair of sheaves \mathcal{F}, \mathcal{G} on \mathcal{C}, \mathcal{D} together with a map $f^{-1}\mathcal{F} \rightarrow \mathcal{G}$. Then we compose to get a map

$$\Gamma(\mathcal{C}, \mathcal{F}) \longrightarrow \Gamma(\mathcal{D}, \mathcal{G})$$

A slightly more general construction which occurs frequently in nature is the following. Suppose that we have a commutative diagram of morphisms of topoi

$$\begin{array}{ccc} Sh(\mathcal{D}) & \xrightarrow{f} & Sh(\mathcal{C}) \\ & \searrow h & \swarrow g \\ & & Sh(\mathcal{B}) \end{array}$$

Next, suppose that we have a sheaf \mathcal{F} on \mathcal{C} . Then there is a *pullback map*

$$f^{-1} : g_*\mathcal{F} \longrightarrow h_*f^{-1}\mathcal{F}$$

Namely, it is just the map coming from the identification $h_*f^{-1}\mathcal{F} = g_*f_*f^{-1}\mathcal{F}$ together with the canonical map $\mathcal{F} \rightarrow f_*f^{-1}\mathcal{F}$ pushed down to \mathcal{B} . Again, if we have a pair of sheaves \mathcal{F}, \mathcal{G} on \mathcal{C}, \mathcal{D} together with a map $f^{-1}\mathcal{F} \rightarrow \mathcal{G}$, then we compose to get a map

$$g_*\mathcal{F} \longrightarrow h_*\mathcal{G}$$

Restricting to sections over an object of \mathcal{B} one recovers the pullback map on global sections in many cases, see (insert future reference here). A seemingly more general situation is where we have a commutative diagram of topoi

$$\begin{array}{ccc} Sh(\mathcal{D}) & \xrightarrow{f} & Sh(\mathcal{C}) \\ h \downarrow & & \downarrow g \\ Sh(\mathcal{B}) & \xrightarrow{e} & Sh(\mathcal{A}) \end{array}$$

and a sheaf \mathcal{G} on \mathcal{C} . Then there is a map $e^{-1}g_*\mathcal{G} \rightarrow h_*f^{-1}\mathcal{G}$. Namely, this map is adjoint to a map $g_*\mathcal{G} \rightarrow e_*h_*f^{-1}\mathcal{G} = (e \circ h)_*f^{-1}\mathcal{G}$ which is the pullback map just described.

7.45. Topologies

In this section we define what a topology on a category is as defined in [AGV71]. One can develop all of the machinery of sheaves and topoi in this language. A modern exposition of this material can be found in [KS06]. However, the case of most interest for algebraic geometry is the topology defined by a site on its underlying category. Thus we strongly suggest the first time reader **skip this section and all other sections of this chapter!**

Definition 7.45.1. Let \mathcal{C} be a category. Let $U \in \text{Ob}(\mathcal{C})$. A *sieve* S on U is a subpresheaf $S \subset h_U$.

In other words, a sieve on U picks out for each object $T \in \text{Ob}(\mathcal{C})$ a subset $S(T)$ of the set of all morphisms $T \rightarrow U$. In fact, the only condition on the collection of subsets $S(T) \subset h_U(T) = \text{Mor}_{\mathcal{C}}(T, U)$ is the following rule

$$(7.45.1.1) \quad \left. \begin{array}{l} (\alpha : T \rightarrow U) \in S(T) \\ g : T' \rightarrow T \end{array} \right\} \Rightarrow (\alpha \circ g : T' \rightarrow U) \in S(T')$$

A good mental picture to keep in mind is to think of the map $S \rightarrow h_U$ as a “morphism from S to U ”.

Lemma 7.45.2. *Let \mathcal{C} be a category. Let $U \in \text{Ob}(\mathcal{C})$.*

- (1) *The collection of sieves on U is a set.*
- (2) *Inclusion defines a partial ordering on this set.*
- (3) *Unions and intersections of sieves are sieves.*
- (4) *Given a family of morphisms $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} with target U there exists a unique smallest sieve S on U such that each $U_i \rightarrow U$ belongs to $S(U_i)$.*
- (5) *The sieve $S = h_U$ is the maximal sieve.*
- (6) *The empty subpresheaf is the minimal sieve.*

Proof. By our definition of subpresheaf, the collection of all subpresheaves of a presheaf \mathcal{F} is a subset of $\prod_{U \in \text{Ob}(\mathcal{C})} \mathcal{P}(\mathcal{F}(U))$. And this is a set. (Here $\mathcal{P}(A)$ denotes the powerset of A .) Hence the collection of sieves on U is a set.

The partial ordering is defined by: $S \leq S'$ if and only if $S(T) \subset S'(T)$ for all $T \rightarrow U$. Notation: $S \subset S'$.

Given a collection of sieves S_i , $i \in I$ on U we can define $\bigcup S_i$ as the sieve with values $(\bigcup S_i)(T) = \bigcup S_i(T)$ for all $T \in \text{Ob}(\mathcal{C})$. We define the intersection $\bigcap S_i$ in the same way.

Given $\{U_i \rightarrow U\}_{i \in I}$ as in the statement, consider the morphisms of presheaves $h_{U_i} \rightarrow h_U$. We simply define S as the union of the images (Definition 7.3.5) of these maps of presheaves.

The last two statements of the lemma are obvious. \square

Definition 7.45.3. Let \mathcal{C} be a category. Given a family of morphisms $\{f_i : U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} with target U we say the sieve S on U described in Lemma 7.45.2 part (4) is the *sieve on U generated by the morphisms f_i* .

Definition 7.45.4. Let \mathcal{C} be a category. Let $f : V \rightarrow U$ be a morphism of \mathcal{C} . Let $S \subset h_U$ be a sieve. We define the *pullback of S by f* to be the sieve $S \times_U V$ of V defined by the rule

$$(\alpha : T \rightarrow V) \in (S \times_U V)(T) \Leftrightarrow (f \circ \alpha : T \rightarrow U) \in S(T)$$

We leave it to the reader to see that this is indeed a sieve (hint: use Equation 7.45.1.1). We also sometimes call $S \times_U V$ the *base change of S by $f : V \rightarrow U$* .

Lemma 7.45.5. *Let \mathcal{C} be a category. Let $U \in \text{Ob}(\mathcal{C})$. Let S be a sieve on U . If $f : V \rightarrow U$ is in S , then $S \times_U V = h_V$ is maximal.*

Proof. Trivial from the definitions. \square

Definition 7.45.6. Let \mathcal{C} be a category. A *topology on \mathcal{C}* is given by a rule which assigns to every $U \in \text{Ob}(\mathcal{C})$ a subset $J(U)$ of the set of all sieves on U satisfying the following conditions

- (1) For every morphism $f : V \rightarrow U$ in \mathcal{C} , and every element $S \in J(U)$ the pullback $S \times_U V$ is an element of $J(V)$.
- (2) If S and S' are sieves on $U \in \text{Ob}(\mathcal{C})$, if $S \in J(U)$, and if for all $f \in S(V)$ the pullback $S' \times_U V$ belongs to $J(V)$, then S' belongs to $J(U)$.
- (3) For every $U \in \text{Ob}(\mathcal{C})$ the maximal sieve $S = h_U$ belongs to $J(U)$.

In this case, the sieves belonging to $J(U)$ are called the *covering sieves*.

Lemma 7.45.7. *Let \mathcal{C} be a category. Let J be a topology on \mathcal{C} . Let $U \in \text{Ob}(\mathcal{C})$.*

- (1) *Finite intersections of elements of $J(U)$ are in $J(U)$.*
- (2) *If $S \in J(U)$ and $S' \supset S$, then $S' \in J(U)$.*

Proof. Let $S, S' \in J(U)$. Consider $S'' = S \cap S'$. For every $V \rightarrow U$ in $S(U)$ we have

$$S' \times_U V = S'' \times_U V$$

simply because $V \rightarrow U$ already is in S . Hence by the second axiom of the definition we see that $S'' \in J(U)$.

Let $S \in J(U)$ and $S' \supset S$. For every $V \rightarrow U$ in $S(U)$ we have $S' \times_U V = h_V$ by Lemma 7.45.5. Thus $S' \times_U V \in J(V)$ by the third axiom. Hence $S' \in J(U)$ by the second axiom. \square

Definition 7.45.8. Let \mathcal{C} be a category. Let J, J' be two topologies on \mathcal{C} . We say that J is *finer* than J' if and only if for every object U of \mathcal{C} we have $J'(U) \subset J(U)$.

In other words, any covering sieve of J' is a covering sieve of J . There exists a finest topology on \mathcal{C} , namely that topology where any sieve is a covering sieve. This is called the *discrete topology* of \mathcal{C} . There also exists a coarsest topology. Namely, the topology where $J(U) = \{h_U\}$ for all objects U . This is called the *chaotic* or *indiscrete topology*.

Lemma 7.45.9. *Let \mathcal{C} be a category. Let $\{J_i\}_{i \in I}$ be a set of topologies.*

- (1) *The rule $J(U) = \bigcap J_i(U)$ defines a topology on \mathcal{C} .*
- (2) *There is a coarsest topology finer than all of the topologies J_i .*

Proof. The first part is direct from the definitions. The second follows by taking the intersection of all topologies finer than all of the J_i . \square

At this point we can define without any motivation what a sheaf is.

Definition 7.45.10. Let \mathcal{C} be a category endowed with a topology J . Let \mathcal{F} be a presheaf of sets on \mathcal{C} . We say that \mathcal{F} is a *sheaf* on \mathcal{C} if for every $U \in \text{Ob}(\mathcal{C})$ and for every covering sieve S of U the canonical map

$$\text{Mor}_{\text{PSh}(\mathcal{C})}(h_U, \mathcal{F}) \longrightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F})$$

is bijective.

Recall that the left hand side of the displayed formula equals $\mathcal{F}(U)$. In other words, \mathcal{F} is a sheaf if and only if a section of \mathcal{F} over U is the same thing as a compatible collection of sections $s_{T,\alpha} \in \mathcal{F}(T)$ parametrized by $(\alpha : T \rightarrow U) \in S(T)$, and this for every covering sieve S on U .

Lemma 7.45.11. *Let \mathcal{C} be a category. Let $\{\mathcal{F}_i\}_{i \in I}$ be a collection of presheaves of sets on \mathcal{C} . For each $U \in \text{Ob}(\mathcal{C})$ denote $J(U)$ the set of sieves S with the following property: For every morphism $V \rightarrow U$, the maps*

$$\text{Mor}_{\text{PSh}(\mathcal{C})}(h_V, \mathcal{F}_i) \longrightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S \times_U V, \mathcal{F}_i)$$

are bijective for all $i \in I$. Then J defines a topology on \mathcal{C} . This topology is the finest topology in which all of the \mathcal{F}_i are sheaves.

Proof. If we show that J is a topology, then the last statement of the lemma immediately follows. The first and second axioms of a topology are immediately verified. Thus, assume that we have an object U , and sieves S, S' of U such that $S \in J(U)$, and for all $V \rightarrow U$ in $S(V)$ we have $S' \times_U V \in J(V)$. We have to show that $S' \in J(U)$. In other words, we have to show that for any $f : W \rightarrow U$, the maps

$$\mathcal{F}_i(W) = \text{Mor}_{\text{PSh}(\mathcal{C})}(h_W, \mathcal{F}_i) \longrightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S' \times_U W, \mathcal{F}_i)$$

are bijective for all $i \in I$. Pick an element $i \in I$ and pick an element $\varphi \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S' \times_U W, \mathcal{F}_i)$. We will construct a section $s \in \mathcal{F}_i(W)$ mapping to φ .

Suppose $\alpha : V \rightarrow W$ is an element of $S \times_U W$. According to the definition of pullbacks we see that the composition $f \circ \alpha : V \rightarrow W \rightarrow U$ is in S . Hence $S' \times_U V$ is in $J(W)$ by assumption on the pair of sieves S, S' . Now we have a commutative diagram of presheaves

$$\begin{array}{ccc} S' \times_U V & \longrightarrow & h_V \\ \downarrow & & \downarrow \\ S' \times_U W & \longrightarrow & h_W \end{array}$$

The restriction of φ to $S' \times_U V$ corresponds to an element $s_{V,\alpha} \in \mathcal{F}_i(V)$. This we see from the definition of J , and because $S' \times_U V$ is in $J(W)$. We leave it to the reader to check that the rule $(V, \alpha) \mapsto s_{V,\alpha}$ defines an element $\psi \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S \times_U W, \mathcal{F}_i)$. Since $S \in J(U)$ we see immediately from the definition of J that ψ corresponds to an element s of $\mathcal{F}_i(W)$.

We leave it to the reader to verify that the construction $\varphi \mapsto s$ is inverse to the natural map displayed above. \square

Definition 7.45.12. Let \mathcal{C} be a category. The finest topology on \mathcal{C} such that all representable presheaves are sheaves, see Lemma 7.45.11, is called the *canonical topology* of \mathcal{C} .

7.46. The topology defined by a site

Suppose that \mathcal{C} is a category, and suppose that $\text{Cov}_1(\mathcal{C})$ and $\text{Cov}_2(\mathcal{C})$ are sets of coverings that define the structure of a site on \mathcal{C} . In this situation it can happen that the categories of sheaves (of sets) for $\text{Cov}_1(\mathcal{C})$ and $\text{Cov}_2(\mathcal{C})$ are the same, see for example Lemma 7.8.5.

It turns out that the category of sheaves on \mathcal{C} with respect to some topology J determines and is determined by the topology J . This is a nontrivial statement which we will address later, see Theorem 7.48.2.

Accepting this for the moment it makes sense to study the topology determined by a site.

Lemma 7.46.1. *Let \mathcal{C} be a site with coverings $\text{Cov}(\mathcal{C})$. For every object U of \mathcal{C} , let $J(U)$ denote the set of sieves S on U with the following property: there exists a covering $\{f_i : U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ so that the sieve S' generated by the f_i (see Definition 7.45.3) is contained in S .*

- (1) *This J is a topology on \mathcal{C} .*
- (2) *A presheaf \mathcal{F} is a sheaf for this topology (see Definition 7.45.10) if and only if it is a sheaf on the site (see Definition 7.7.1).*

Proof. To prove the first assertion we just note that axioms (1), (2) and (3) of the definition of a site (Definition 7.6.2) directly imply the axioms (3), (2) and (1) of the definition of a topology (Definition 7.45.6). As an example we prove J has property (2). Namely, let U be an object of \mathcal{C} , let S, S' be sieves on U such that $S \in J(U)$, and such that for every $V \rightarrow U$ in $S(V)$ we have $S' \times_U V \in J(V)$. By definition of $J(U)$ we can find a covering $\{f_i : U_i \rightarrow U\}$ of the site such that S the image of $h_{U_i} \rightarrow h_U$ is contained in S . Since each $S' \times_U U_i$ is in $J(U_i)$ we see that there are coverings $\{U_{ij} \rightarrow U_i\}$ of the site such that $h_{U_{ij}} \rightarrow h_{U_i}$ is contained in $S' \times_U U_i$. By definition of the base change this means that $h_{U_{ij}} \rightarrow h_U$ is contained in the subsheaf $S' \subset h_U$. By axiom (2) for sites we see that $\{U_{ij} \rightarrow U\}$ is a covering of U and we conclude that $S' \in J(U)$ by definition of J .

Let \mathcal{F} be a presheaf. Suppose that \mathcal{F} is a sheaf in the topology J . We will show that \mathcal{F} is a sheaf on the site as well. Let $\{f_i : U_i \rightarrow U\}_{i \in I}$ be a covering of the site. Let $s_i \in \mathcal{F}(U_i)$ be a family of sections such that $s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$ for all i, j . We have to show that there exists a unique section $s \in \mathcal{F}(U)$ restricting back to the s_i on the U_i . Let $S \subset h_U$ be the sieve generated by the f_i . Note that $S \in J(U)$ by definition. In stead of constructing s , by the sheaf condition in the topology, it suffices to construct an element

$$\varphi \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F}).$$

Take $\alpha \in S(T)$ for some object $T \in \mathcal{U}$. This means exactly that $\alpha : T \rightarrow U$ is a morphism which factors through f_i for some $i \in I$ (and maybe more than 1). Pick such an index i and a factorization $\alpha = f_i \circ \alpha_i$. Define $\varphi(\alpha) = \alpha_i^* s_i$. If i' , $\alpha = f_i \circ \alpha_{i'}$ is a second choice, then $\alpha_i^* s_i = (\alpha_{i'}^*)^* s_{i'}$ exactly because of our condition $s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$ for all i, j . Thus $\varphi(\alpha)$ is well defined. We leave it to the reader to verify that φ , which in turn determines s is correct in the sense that s restricts back to s_i .

Let \mathcal{F} be a presheaf. Suppose that \mathcal{F} is a sheaf on the site $(\mathcal{C}, \text{Cov}(\mathcal{C}))$. We will show that \mathcal{F} is a sheaf for the topology J as well. Let U be an object of \mathcal{C} . Let S be a covering sieve on U with respect to the topology J . Let

$$\varphi \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F}).$$

We have to show there is a unique element in $\mathcal{F}(U) = \text{Mor}_{\text{PSh}(\mathcal{C})}(h_U, \mathcal{F})$ which restricts back to φ . By definition there exists a covering $\{f_i : U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ such that $f_i : U_i \in U$ belongs to $S(U_i)$. Hence we can set $s_i = \varphi(f_i) \in \mathcal{F}(U_i)$. Then it is a pleasant exercise to see that $s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$ for all i, j . Thus we obtain the desired section s by the sheaf condition for \mathcal{F} on the site $(\mathcal{C}, \text{Cov}(\mathcal{C}))$. Details left to the reader. \square

Definition 7.46.2. Let \mathcal{C} be a site with coverings $\text{Cov}(\mathcal{C})$. The *topology associated to \mathcal{C}* is the topology J constructed in Lemma 7.46.1 above.

Let \mathcal{C} be a category. Let $\text{Cov}_1(\mathcal{C})$ and $\text{Cov}_2(\mathcal{C})$ be two coverings defining the structure of a site on \mathcal{C} . It may very well happen that the topologies defined by these are the same. If this happens then we say $\text{Cov}_1(\mathcal{C})$ and $\text{Cov}_2(\mathcal{C})$ *define the same topology on \mathcal{C}* . And if this happens then the categories of sheaves are the same, by Lemma 7.46.1.

It is usually the case that we only care about the topology defined by a collection of coverings, and we view the possibility of choosing different sets of coverings as a tool to study the topology.

Remark 7.46.3. Enlarging the class of coverings. Clearly, if $\text{Cov}(\mathcal{C})$ defines the structure of a site on \mathcal{C} then we may add to \mathcal{C} any set of families of morphisms with fixed target tautologically equivalent (see Definition 7.8.2) to elements of $\text{Cov}(\mathcal{C})$ without changing the topology.

Remark 7.46.4. Shrinking the class of coverings. Let \mathcal{C} be a site. Consider the power set $\mathcal{S} = P(\text{Arrow}(\mathcal{C}))$ (power set) of the set of morphisms, i.e., the set of all sets of morphisms. Let $\mathcal{S}_\tau \subset \mathcal{S}$ be the subset consisting of those $T \in \mathcal{S}$ such that (a) all $\varphi \in T$ have the same target, (b) the collection $\{\varphi\}_{\varphi \in T}$ is tautologically equivalent (see Definition 7.8.2) to some covering in $\text{Cov}(\mathcal{C})$. Clearly, considering the elements of \mathcal{S}_τ as the coverings, we do not get exactly the notion of a site as defined in Definition 7.6.2. The structure $(\mathcal{C}, \mathcal{S}_\tau)$ we get satisfies slightly modified conditions. The modified conditions are:

- (0') $\text{Cov}(\mathcal{C}) \subset P(\text{Arrow}(\mathcal{C}))$,
- (1') If $V \rightarrow U$ is an isomorphism then $\{V \rightarrow U\} \in \text{Cov}(\mathcal{C})$.
- (2') If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and for each i we have $\{V_{ij} \rightarrow U_i\}_{j \in J_i} \in \text{Cov}(\mathcal{C})$, then $\{V_{ij} \rightarrow U\}_{i \in I, j \in J_i}$ is tautologically equivalent to an element of $\text{Cov}(\mathcal{C})$.
- (3') If $\{U_i \rightarrow U\}_{i \in I} \in \text{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of \mathcal{C} then $U_i \times_U V$ exists for all i and $\{U_i \times_U V \rightarrow V\}_{i \in I}$ is tautologically equivalent to an element of $\text{Cov}(\mathcal{C})$.

And it is easy to verify that, given a structure satisfying (0') – (3') above, then after suitably enlarging $\text{Cov}(\mathcal{C})$ (compare Sets, Section 3.11) we get a site. Obviously there is little difference between this notion and the actual notion of a site, at least from the point of view of the topology. There are two benefits: because of condition (0') above the coverings automatically form a set, and because of (0') the totality of all structures of this type forms a set as well. The price you pay for this is that you have to keep writing “tautologically equivalent” everywhere.

7.47. Sheafification in a topology

In this section we explain the analogue of the sheafification construction in a topology.

Let \mathcal{C} be a category. Let J be a topology on \mathcal{C} . Let \mathcal{F} be a presheaf of sets. For every $U \in \text{Ob}(\mathcal{C})$ we define

$$L\mathcal{F}(U) = \text{colim}_{S \in J(U)^{\text{opp}}} \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F})$$

as a colimit. Here we think of $J(U)$ as a partially ordered set, ordered by inclusion, see Lemma 7.45.2. The transition maps in the system are defined as follows. If $S \subset S'$ are in $J(U)$, then $S \rightarrow S'$ is a morphism of presheaves. Hence there is a natural restriction mapping

$$\text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F}) \longrightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S', \mathcal{F}).$$

Thus we see that $S \mapsto \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F})$ is a directed system as in Categories, Definition 4.21.1 provided we reverse the ordering on $J(U)$ (which is what the

superscript opp is supposed to indicate). In particular, since $h_U \in J(U)$ there is a canonical map

$$\ell : \mathcal{F}(U) \longrightarrow L\mathcal{F}(U)$$

coming from the identification $\mathcal{F}(U) = \text{Mor}_{\text{PSh}(\mathcal{C})}(h_U, \mathcal{F})$. In addition, the colimit defining $L\mathcal{F}(U)$ is directed since for any pair of covering sieves S, S' on U the sieve $S \cap S'$ is a covering sieve too, see Lemma 7.45.2.

Let $f : V \rightarrow U$ be a morphism in \mathcal{C} . Let $S \in J(U)$. There is a commutative diagram

$$\begin{array}{ccc} S \times_U V & \longrightarrow & h_V \\ \downarrow & & \downarrow \\ S & \longrightarrow & h_U \end{array}$$

We can use the left vertical map to get canonical restriction maps

$$\text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F}) \rightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S \times_U V, \mathcal{F}).$$

Base change $S \mapsto S \times_U V$ induces an order preserving map $J(U) \rightarrow J(V)$. And the restriction maps define a transformation of functors as in Categories, Lemma categories-lemma-functorial-colimit. Hence we get a natural restriction map

$$L\mathcal{F}(U) \longrightarrow L\mathcal{F}(V).$$

Lemma 7.47.1. *In the situation above.*

- (1) *The assignment $U \mapsto L\mathcal{F}(U)$ combined with the restriction mappings defined above is a presheaf.*
- (2) *The maps ℓ glue to give a morphism of presheaves $\ell : \mathcal{F} \rightarrow L\mathcal{F}$.*
- (3) *The rule $\mathcal{F} \mapsto (\mathcal{F} \xrightarrow{\ell} L\mathcal{F})$ is a functor.*
- (4) *If \mathcal{F} is a subpresheaf of \mathcal{G} , then $L\mathcal{F}$ is a subpresheaf of $L\mathcal{G}$.*
- (5) *The map $\ell : \mathcal{F} \rightarrow L\mathcal{F}$ has the following property: For every section $s \in L\mathcal{F}(U)$ there exists a covering sieve S on U and an element $\varphi \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F})$ such that $\ell(\varphi)$ equals the restriction of s to S .*

Proof. Omitted. □

Definition 7.47.2. Let \mathcal{C} be a category. Let J be a topology on \mathcal{C} . We say that a presheaf of sets \mathcal{F} is *separated* if for every object U and every covering sieve S on U the canonical map $\mathcal{F}(U) \rightarrow \text{Mor}_{\text{PSh}(\mathcal{C})}(S, \mathcal{F})$ is injective.

Theorem 7.47.3. *Let \mathcal{C} be a category. Let J be a topology on \mathcal{C} . Let \mathcal{F} be a presheaf of sets.*

- (1) *The presheaf $L\mathcal{F}$ is separated.*
- (2) *If \mathcal{F} is separated, then $L\mathcal{F}$ is a sheaf and the map of presheaves $\mathcal{F} \rightarrow L\mathcal{F}$ is injective.*
- (3) *If \mathcal{F} is a sheaf, then $\mathcal{F} \rightarrow L\mathcal{F}$ is an isomorphism.*
- (4) *The presheaf $LL\mathcal{F}$ is always a sheaf.*

Proof. Part (3) is trivial from the definition of L and the definition of a sheaf (Definition 7.45.10). Part (4) follows formally from the others.

We sketch the proof of (1). Suppose S is a covering sieve of the object U . Suppose that $\varphi_i \in L\mathcal{F}(U)$, $i = 1, 2$ map to the same element in $\text{Mor}_{\text{PSh}(\mathcal{C})}(S, L\mathcal{F})$. We may find a single covering sieve S' on U such that both φ_i are represented by elements

$\varphi_i \in \text{Mor}_{\text{PSh}(\mathcal{C})}(S', \mathcal{F})$. We may assume that $S' = S$ by replacing both S and S' by $S' \cap S$ which is also a covering sieve, see Lemma 7.45.2. Suppose $V \in \text{Ob}(\mathcal{C})$, and $\alpha : V \rightarrow U$ in $S(V)$. Then we have $S \times_U V = h_V$, see Lemma 7.45.5. Thus the restrictions of φ_i via $V \rightarrow U$ correspond to sections $s_{i,V,\alpha}$ of \mathcal{F} over V . The assumption is that there exist a covering sieve $S_{V,\alpha}$ of V such that $s_{i,V,\alpha}$ restrict to the same element of $\text{Mor}_{\text{PSh}(\mathcal{C})}(S_{V,\alpha}, \mathcal{F})$. Consider the sieve S'' on U defined by the rule

$$(7.47.3.1) \quad \begin{aligned} (f : T \rightarrow U) \in S''(T) &\Leftrightarrow \exists V, \alpha : V \rightarrow U, \alpha \in S(V), \\ &\exists g : T \rightarrow V, g \in S_{V,\alpha}(T), \\ &f = \alpha \circ g \end{aligned}$$

By axiom (2) of a topology we see that S'' is a covering sieve on U . By construction we see that φ_1 and φ_2 restrict to the same element of $\text{Mor}_{\text{PSh}(\mathcal{C})}(S'', L\mathcal{F})$ as desired.

We sketch the proof of (2). Assume that \mathcal{F} is a separated presheaf of sets on \mathcal{C} with respect to the topology J . Let S be a covering sieve of the object U of \mathcal{C} . Suppose that $\varphi \in \text{Mor}_{\mathcal{C}}(S, L\mathcal{F})$. We have to find an element $s \in L\mathcal{F}(U)$ restricting to φ . Suppose $V \in \text{Ob}(\mathcal{C})$, and $\alpha : V \rightarrow U$ in $S(V)$. The value $\varphi(\alpha) \in L\mathcal{F}(V)$ is given by a covering sieve $S_{V,\alpha}$ of V and a morphism of presheaves $\varphi_{V,\alpha} : S_{V,\alpha} \rightarrow \mathcal{F}$. As in the proof above, define a covering sieve S'' on U by Equation (7.47.3.1). We define

$$\varphi'' : S'' \rightarrow \mathcal{F}$$

by the following simple rule: For every $f : T \rightarrow U$, $f \in S''(T)$ choose V, α, g as in Equation (7.47.3.1). Then set

$$\varphi''(f) = \varphi_{V,\alpha}(g).$$

We claim this is independent of the choice of V, α, g . Consider a second such choice V', α', g' . The restrictions of $\varphi_{V,\alpha}$ and $\varphi_{V',\alpha'}$ to the intersection of the following covering sieves on T

$$(S_{V,\alpha} \times_{V,g} T) \cap (S_{V',\alpha'} \times_{V',g'} T)$$

agree. Namely, these restrictions both correspond to the restriction of φ to T (via f) and the desired equality follows because \mathcal{F} is separated. Denote the common restriction ψ . The independence of choice follows because $\varphi_{V,\alpha}(g) = \psi(\text{id}_T) = \varphi_{V',\alpha'}(g')$. OK, so now φ'' gives an element $s \in L\mathcal{F}(U)$. We leave it to the reader to check that s restricts to φ . \square

Definition 7.47.4. Let \mathcal{C} be a category endowed with a topology J . Let \mathcal{F} be a presheaf of sets on \mathcal{C} . The sheaf $\mathcal{F}^\# := LL\mathcal{F}$ together with the canonical map $\mathcal{F} \rightarrow \mathcal{F}^\#$ is called the *sheaf associated to \mathcal{F}* .

Proposition 7.47.5. *Let \mathcal{C} be a category endowed with a topology. Let \mathcal{F} be a presheaf of sets on \mathcal{C} . The canonical map $\mathcal{F} \rightarrow \mathcal{F}^\#$ has the following universal property: For any map $\mathcal{F} \rightarrow \mathcal{G}$, where \mathcal{G} is a sheaf of sets, there is a unique map $\mathcal{F}^\# \rightarrow \mathcal{G}$ such that $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$ equals the given map.*

Proof. Same as the proof of Proposition 7.10.12. \square

7.48. Topologies and sheaves

Lemma 7.48.1. *Let \mathcal{C} be a category endowed with a topology J . Let U be an object of \mathcal{C} . Let S be a sieve on U . The following are equivalent*

- (1) *The sieve S is a covering sieve.*
- (2) *The sheafification $S^\# \rightarrow h_U^\#$ of the map $S \rightarrow h_U$ is an isomorphism.*

Proof. First we make a couple of general remarks. We will use that $S^\# = LLS$, and $h_U^\# = LLh_U$. In particular, by Lemma 7.47.1, we see that $S^\# \rightarrow h_U^\#$ is injective. Note that $\text{id}_U \in h_U(U)$. Hence it gives rise to sections of Lh_U and $h_U^\# = LLh_U$ over U which we will also denote id_U .

Suppose S is a covering sieve. It clearly suffices to find a morphism $h_U \rightarrow S^\#$ such that the composition $h_U \rightarrow h_U^\#$ is the canonical map. To find such a map it suffices to find a section $s \in S^\#(U)$ which restricts to id_U . But since S is a covering sieve, the element $\text{id}_S \in \text{Mor}_{PSh(\mathcal{C})}(S, S)$ gives rise to a section of LS over U which restricts to id_U in Lh_U . Hence we win.

Suppose that $S^\# \rightarrow h_U^\#$ is an isomorphism. Let $1 \in S^\#(U)$ be the element corresponding to id_U in $h_U^\#(U)$. Because $S^\# = LLS$ there exists a covering sieve S' on U such that 1 comes from a

$$\varphi \in \text{Mor}_{PSh(\mathcal{C})}(S', LS).$$

This in turn means that for every $\alpha : V \rightarrow U$, $\alpha \in S'(V)$ there exists a covering sieve $S_{V,\alpha}$ on V such that $\varphi(\text{id}_V)$ corresponds to a morphism of presheaves $S_{V,\alpha} \rightarrow S$. In other words $S_{V,\alpha}$ is contained in $S \times_U V$. By the second axiom of a topology we see that S is a covering sieve. \square

Theorem 7.48.2. *Let \mathcal{C} be a category. Let J, J' be topologies on \mathcal{C} . The following are equivalent*

- (1) $J = J'$,
- (2) *sheaves for the topology J are the same as sheaves for the topology J' .*

Proof. It is a tautology that if $J = J'$ then the notions of sheaves are the same. Conversely, Lemma 7.48.1 characterizes covering sieves in terms of the sheafification functor. But the sheafification functor $PSh(\mathcal{C}) \rightarrow Sh(\mathcal{C}, J)$ is the right adjoint of the inclusion functor $Sh(\mathcal{C}, J) \rightarrow PSh(\mathcal{C})$. Hence if the subcategories $Sh(\mathcal{C}, J)$ and $Sh(\mathcal{C}, J')$ are the same, then the sheafification functors are the same and hence the collections of covering sieves are the same. \square

Lemma 7.48.3. *Assumption and notation as in Theorem 7.48.2. Then $J \subset J'$ if and only if every sheaf for the topology J' is a sheaf for the topology J .*

Proof. One direction is clear. For the other direction suppose that $Sh(\mathcal{C}, J') \subset Sh(\mathcal{C}, J)$. By formal nonsense this implies that if \mathcal{F} is a presheaf of sets, and $\mathcal{F} \rightarrow \mathcal{F}^\#$, resp. $\mathcal{F} \rightarrow \mathcal{F}^{\#,'}$ is the sheafification wrt J , resp. J' then there is a canonical map $\mathcal{F}^\# \rightarrow \mathcal{F}^{\#,'}$ such that $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{F}^{\#,'}$ equals the canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#,'}$. Of course, $\mathcal{F}^\# \rightarrow \mathcal{F}^{\#,'}$ identifies the second sheaf as the sheafification of the first with respect to the topology J' . Apply this to the map $S \rightarrow h_U$ of

Lemma 7.48.1. We get a commutative diagram

$$\begin{array}{ccccc} S & \longrightarrow & S^\# & \longrightarrow & S^{\#,'} \\ \downarrow & & \downarrow & & \downarrow \\ h_U & \longrightarrow & h_U^\# & \longrightarrow & h_U^{\#,'} \end{array}$$

And clearly, if S is a covering sieve for the topology J then the middle vertical map is an isomorphism (by the lemma) and we conclude that the right vertical map is an isomorphism as it is the sheafification of the one in the middle wrt J' . By the lemma again we conclude that S is a covering sieve for J' as well. \square

7.49. Topologies and continuous functors

Explain how a continuous functor gives an adjoint pair of functors on sheaves.

7.50. Points and topologies

Recall from Section 7.31 that given a functor $p = u : \mathcal{C} \rightarrow \mathit{Sets}$ we can define a stalk functor

$$PSh(\mathcal{C}) \longrightarrow \mathit{Sets}, \mathcal{F} \longmapsto \mathcal{F}_p.$$

Definition 7.50.1. Let \mathcal{C} be a category. Let J be a topology on \mathcal{C} . A *point* p of the topology is given by a functor $u : \mathcal{C} \rightarrow \mathit{Sets}$ such that

- (1) For every covering sieve S on U the map $S_p \rightarrow (h_U)_p$ is surjective.
- (2) The stalk functor $Sh(\mathcal{C}) \rightarrow \mathit{Sets}, \mathcal{F} \rightarrow \mathcal{F}_p$ is exact.

CHAPTER 8

Stacks

8.1. Introduction

In this very short chapter we introduce stacks, and stacks in groupoids. See [DM69], and [Vis04].

8.2. Presheaves of morphisms associated to fibred categories

Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.31. Suppose that $x, y \in \text{Ob}(\mathcal{S}_U)$ are objects in the fibre category over U . We are going to define a functor

$$\text{Mor}(x, y) : (\mathcal{C}/U)^{\text{opp}} \longrightarrow \text{Sets}.$$

In other words this will be a presheaf on \mathcal{C}/U , see Sites, Definition 7.2.2. Make a choice of pullbacks as in Categories, Definition 4.31.6. Then, for $f : V \rightarrow U$ we set

$$\text{Mor}(x, y)(f : V \rightarrow U) = \text{Mor}_{\mathcal{S}_V}(f^*x, f^*y).$$

Let $f' : V' \rightarrow U$ be a second object of \mathcal{C}/U . We also have to define the restriction map corresponding to a morphism $g : V'/U \rightarrow V/U$ in \mathcal{C}/U , in other words $g : V' \rightarrow V$ and $f' = f \circ g$. This will be a map

$$\text{Mor}_{\mathcal{S}_V}(f^*x, f^*y) \longrightarrow \text{Mor}_{\mathcal{S}_{V'}}(f'^*x, f'^*y), \quad \phi \longmapsto \phi|_{V'}$$

This map will basically be g^* , except that this transforms an element ϕ of the left hand side into an element $g^*\phi$ of $\text{Mor}_{\mathcal{S}_{V'}}(g^*f^*x, g^*f^*y)$. At this point we use the transformation $\alpha_{g,f}$ of Categories, Lemma 4.31.7. In a formula, the restriction map is described by

$$\phi|_{V'} = (\alpha_{g,f})_y^{-1} \circ g^*\phi \circ (\alpha_{g,f})_x.$$

Of course, nobody thinks of this restriction map in this way. We will only do this once in order to verify the following lemma.

Lemma 8.2.1. *This actually does give a presheaf.*

Proof. Let $g : V'/U \rightarrow V/U$ be as above and similarly $g' : V''/U \rightarrow V'/U$ be morphisms in \mathcal{C}/U . So $f' = f \circ g$ and $f'' = f' \circ g' = f \circ g \circ g'$. Let $\phi \in \text{Mor}_{\mathcal{S}_V}(f^*x, f^*y)$. Then we have

$$\begin{aligned} & (\alpha_{g \circ g', f})_y^{-1} \circ (g \circ g')^*\phi \circ (\alpha_{g \circ g', f})_x \\ &= (\alpha_{g \circ g', f})_y^{-1} \circ (\alpha_{g', g})_{f^*y}^{-1} \circ (g')^*g^*\phi \circ (\alpha_{g', g})_{f^*x} \circ (\alpha_{g \circ g', f})_x \\ &= (\alpha_{g', f'})_y^{-1} \circ (g')^*(\alpha_{g, f})_y^{-1} \circ (g')^*g^*\phi \circ (g')^*(\alpha_{g, f})_x \circ (\alpha_{g', f'})_x \\ &= (\alpha_{g', f'})_y^{-1} \circ (g')^*\left((\alpha_{g, f})_y^{-1} \circ g^*\phi \circ (\alpha_{g, f})_x\right) \circ (\alpha_{g', f'})_x \end{aligned}$$

which is what we want, namely $\phi|_{V''} = (\phi|_{V'})|_{V''}$. The first equality holds because $\alpha_{g',g}$ is a transformation of functors, and hence

$$\begin{array}{ccc} (g \circ g')^* f^* x & \xrightarrow{(g \circ g')^* \phi} & (g \circ g')^* f^* y \\ (\alpha_{g',g})_{f^* x} \downarrow & & \downarrow (\alpha_{g',g})_{f^* y} \\ (g')^* g^* f^* x & \xrightarrow{(g')^* g^* \phi} & (g')^* g^* f^* y \end{array}$$

commutes. The second equality holds because of property (d) of a pseudo functor since $f' = f \circ g$ (see Categories, Definition 4.27.5). The last equality follows from the fact that $(g')^*$ is a functor. \square

From now on we often omit mentioning the transformations $\alpha_{g,f}$ and we simply identify the functors $g^* \circ f^*$ and $(f \circ g)^*$. In particular, given $g : V'/U \rightarrow V/U$ the restriction mappings for the presheaf $Mor(x, y)$ will sometimes be denoted $\phi \mapsto g^* \phi$. We formalize the construction in a definition.

Definition 8.2.2. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.31. Given an object U of \mathcal{C} and objects x, y of the fibre category, the *presheaf of morphisms from x to y* is the presheaf

$$(f : V \rightarrow U) \mapsto \text{Mor}_{\mathcal{S}_V}(f^* x, f^* y)$$

described above. It is denoted $Mor(x, y)$. The subpresheaf $Isom(x, y)$ whose values over V is the set of isomorphisms $f^* x \rightarrow f^* y$ in the fibre category \mathcal{S}_V is called the *presheaf of isomorphisms from x to y* .

If \mathcal{S} is fibred in groupoids then of course $Isom(x, y) = Mor(x, y)$, and it is customary to use the $Isom$ notation.

Lemma 8.2.3. Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ be a 1-morphism of fibred categories over the category \mathcal{C} . Let $U \in \text{Ob}(\mathcal{C})$ and $x, y \in \text{Ob}(\mathcal{S}_U)$. Then F defines a canonical morphism of presheaves

$$Mor_{\mathcal{S}_1}(x, y) \longrightarrow Mor_{\mathcal{S}_2}(F(x), F(y))$$

on \mathcal{C}/U .

Proof. By Categories, Definition 4.31.9 the functor F maps strongly cartesian morphisms to strongly cartesian morphisms. Hence if $f : V \rightarrow U$ is a morphism in \mathcal{C} , then there are canonical isomorphisms $\alpha_V : f^* F(x) \rightarrow F(f^* x)$, $\beta_V : f^* F(y) \rightarrow F(f^* y)$ such that $f^* F(x) \rightarrow F(f^* x) \rightarrow F(x)$ is the canonical morphism $f^* F(x) \rightarrow F(x)$, and similarly for β_V . Thus we may define

$$\begin{array}{ccc} Mor_{\mathcal{S}_1}(x, y)(f : V \rightarrow U) & \xlongequal{\quad} & \text{Mor}_{\mathcal{S}_{1,V}}(f^* x, f^* y) \\ & & \downarrow \\ Mor_{\mathcal{S}_2}(F(x), F(y))(f : V \rightarrow U) & \xlongequal{\quad} & \text{Mor}_{\mathcal{S}_{2,V}}(f^* F(x), f^* F(y)) \end{array}$$

by $\phi \mapsto \beta_V^{-1} \circ F(\phi) \circ \alpha_V$. We omit the verification that this is compatible with the restriction mappings. \square

Remark 8.2.4. Suppose that $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids. In this case we can prove Lemma 8.2.1 using Categories, Lemma 4.34.4 which says that $\mathcal{S} \rightarrow \mathcal{C}$ is equivalent to the category associated to a contravariant functor $F : \mathcal{C} \rightarrow \text{Groupoids}$.

In the case of the fibred category associated to F we have $g^* \circ f^* = (f \circ g)^*$ on the nose and there is no need to use the maps $\alpha_{g,f}$. In this case the lemma is (even more) trivial. Of course then one uses that the $Mor(x, y)$ presheaf is unchanged when passing to an equivalent fibred category which follows from Lemma 8.2.3.

Lemma 8.2.5. *Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.31. Let $U \in \text{Ob}(\mathcal{C})$ and let $x, y \in \text{Ob}(\mathcal{S}_U)$. Denote $x, y : \mathcal{C}/U \rightarrow \mathcal{S}$ also the corresponding 1-morphisms, see Categories, Lemma 4.39.1. Then*

- (1) *the 2-fibre product $\mathcal{S} \times_{\mathcal{S} \times_{\mathcal{S}, (x, y)}} \mathcal{C}/U$ is fibred in setoids over \mathcal{C}/U , and*
- (2) *Isom(x, y) is the presheaf of sets corresponding to this category fibred in setoids, see Categories, Lemma 4.37.6.*

Proof. Omitted. Hint: Objects of the 2-fibre product are $(a : V \rightarrow U, z, a : V \rightarrow U, (\alpha, \beta))$ where $\alpha : z \rightarrow a^*x$ and $\beta : z \rightarrow a^*y$ are isomorphisms in \mathcal{S}_V . Thus the relationship with $Isom(x, y)$ comes by assigning to such an object the isomorphism $\beta \circ \alpha^{-1}$. \square

8.3. Descent data in fibred categories

In this section we define the notion of a descent datum in the abstract setting of a fibred category. Before we do so we point out that this is completely analogous to descent data for quasi-coherent sheaves (Descent, Section 34.2) and descent data for schemes over schemes (Descent, Section 34.30).

We will use the convention where the projection maps $\text{pr}_i : X \times \dots \times X \rightarrow X$ are labeled starting with $i = 0$. Hence we have $\text{pr}_0, \text{pr}_1 : X \times X \rightarrow X$, $\text{pr}_0, \text{pr}_1, \text{pr}_2 : X \times X \times X \rightarrow X$, etc.

Definition 8.3.1. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.31.6. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a family of morphisms of \mathcal{C} . Assume all the fibre products $U_i \times_U U_j$, and $U_i \times_U U_j \times_U U_k$ exist.

- (1) A *descent datum* (X_i, φ_{ij}) in \mathcal{S} relative to the family $\{f_i : U_i \rightarrow U\}$ is given by an object X_i of \mathcal{S}_{U_i} for each $i \in I$, an isomorphism $\varphi_{ij} : \text{pr}_0^* X_i \rightarrow \text{pr}_1^* X_j$ in $\mathcal{S}_{U_i \times_U U_j}$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{array}{ccc} \text{pr}_0^* X_i & \xrightarrow{\quad \text{pr}_{02}^* \varphi_{ik} \quad} & \text{pr}_2^* X_k \\ & \searrow \text{pr}_{01}^* \varphi_{ij} & \nearrow \text{pr}_{12}^* \varphi_{jk} \\ & \text{pr}_1^* X_j & \end{array}$$

in the category $\mathcal{S}_{U_i \times_U U_j \times_U U_k}$ commutes. This is called the *cocycle condition*.

- (2) A *morphism* $\psi : (X_i, \varphi_{ij}) \rightarrow (X'_i, \varphi'_{ij})$ of descent data is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms $\psi_i : X_i \rightarrow X'_i$ in \mathcal{S}_{U_i} such that all the diagrams

$$\begin{array}{ccc} \text{pr}_0^* X_i & \xrightarrow{\quad \varphi_{ij} \quad} & \text{pr}_1^* X_j \\ \text{pr}_0^* \psi_i \downarrow & & \downarrow \text{pr}_1^* \psi_j \\ \text{pr}_0^* X'_i & \xrightarrow{\quad \varphi'_{ij} \quad} & \text{pr}_1^* X'_j \end{array}$$

in the categories $\mathcal{S}_{U_i \times_U U_j}$ commute.

(3) The category of descent data relative to \mathcal{U} is denoted $DD(\mathcal{U})$.

The fibre products $U_i \times_U U_j$ and $U_i \times_U U_j \times_U U_k$ will exist if each of the morphisms $f_i : U_i \rightarrow U$ is *representable*, see Categories, Definition 4.6.4. Recall that in a site one of the conditions for a covering $\{U_i \rightarrow U\}$ is that each of the morphisms is representable, see Sites, Definition 7.6.2 part (3). In fact the main interest in the definition above is where \mathcal{C} is a site and $\{U_i \rightarrow U\}$ is a covering of \mathcal{C} . However, a descent datum is just an abstract gadget that can be defined as above. This is useful: for example, given a fibred category over \mathcal{C} one can look at the collection of families with respect to which descent data are effective, and try to use these as the family of coverings for a site.

Remarks 8.3.2. Two remarks on Definition 8.3.1 are in order. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $\{f_i : U_i \rightarrow U\}_{i \in I}$, and (X_i, φ_{ij}) be as in Definition 8.3.1.

- (1) There is a diagonal morphism $\Delta : U_i \rightarrow U_i \times_U U_i$. We can pull back φ_{ii} via this morphism to get an automorphism $\Delta^* \varphi_{ii} \in \text{Aut}_{U_i}(x_i)$. On pulling back the cocycle condition for the triple (i, i, i) by $\Delta_{123} : U_i \rightarrow U_i \times_U U_i \times_U U_i$ we deduce that $\Delta^* \varphi_{ii} \circ \Delta^* \varphi_{ii} = \Delta^* \varphi_{ii}$; thus $\Delta^* \varphi_{ii} = \text{id}_{x_i}$.
- (2) There is a morphism $\Delta_{13} : U_i \times_U U_j \rightarrow U_i \times_U U_j \times_U U_i$ and we can pull back the cocycle condition for the triple (i, j, i) to get the identity $(\sigma^* \varphi_{ji}) \circ \varphi_{ij} = \text{id}_{\text{pr}_0^* x_i}$, where $\sigma : U_i \times_U U_j \rightarrow U_j \times_U U_i$ is the switching morphism.

Lemma 8.3.3. (*Pullback of descent data.*) Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice pullbacks as in Categories, Definition 4.31.6. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$, and $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be a families of morphisms of \mathcal{C} with fixed target. Assume all the fibre products $U_i \times_U U_{i'}$, $U_i \times_U U_{i'} \times_U U_{i''}$, $V_j \times_V V_{j'}$, and $V_j \times_V V_{j'} \times_V V_{j''}$ exist. Let $\alpha : I \rightarrow J$, $h : U \rightarrow V$ and $g_i : U_i \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.

- (1) Let $(Y_j, \varphi_{jj'})$ be a descent datum relative to the family $\{V_j \rightarrow V\}$. The system

$$(g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$

is a descent datum relative to \mathcal{U} .

- (2) This construction defines a functor between descent data relative to \mathcal{V} and descent data relative to \mathcal{U} .
- (3) Given a second $\alpha' : I \rightarrow J$, $h' : U \rightarrow V$ and $g'_i : U_i \rightarrow V_{\alpha'(i)}$ morphism of families of maps with fixed target, then if $h = h'$ the two resulting functors between descent data are canonically isomorphic.

Proof. Omitted. □

Definition 8.3.4. With $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$, $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$, $\alpha : I \rightarrow J$, $h : U \rightarrow V$, and $g_i : U_i \rightarrow V_{\alpha(i)}$ as in Lemma 8.3.3 the functor

$$(Y_j, \varphi_{jj'}) \longmapsto (g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$

constructed in that lemma is called the *pullback functor* on descent data.

Given $h : U \rightarrow V$, if there exists a morphism $\tilde{h} : \mathcal{U} \rightarrow \mathcal{V}$ covering h then \tilde{h}^* is independent of the choice of \tilde{h} as we saw in Lemma 8.3.3. Hence we will sometimes simply write h^* to indicate the pullback functor.

Definition 8.3.5. Let \mathcal{C} be a category. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.31.6. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with target U . Assume all the fibre products $U_i \times_U U_j$ and $U_i \times_U U_j \times_U U_k$ exist.

- (1) Given an object X of \mathcal{S}_U the *trivial descent datum* is the descent datum (X, id_X) with respect to the family $\{\text{id}_U : U \rightarrow U\}$.
- (2) Given an object X of \mathcal{S}_U we have a *canonical descent datum* on the family of objects $f_i^* X$ by pulling back the trivial descent datum (X, id_X) via the obvious map $\{f_i : U_i \rightarrow U\} \rightarrow \{\text{id}_U : U \rightarrow U\}$. We denote this descent datum $(f_i^* X, \text{can})$.
- (3) A descent datum (X_i, φ_{ij}) relative to $\{f_i : U_i \rightarrow U\}$ is called *effective* if there exists an object X of \mathcal{S}_U such that (X_i, φ_{ij}) is isomorphic to $(f_i^* X, \text{can})$.

Note that the rule that associates to $X \in \mathcal{S}_U$ its canonical descent datum relative to \mathcal{U} defines a functor

$$\mathcal{S}_U \longrightarrow DD(\mathcal{U}).$$

A descent datum is effective if and only if it is in the essential image of this functor. Let us make explicit the canonical descent datum as follows.

Lemma 8.3.6. *In the situation of Definition 8.3.5 part (2) the maps $\text{can}_{ij} : pr_0^* f_i^* X \rightarrow pr_1^* f_j^* X$ are equal to $(\alpha_{pr_1, f_j})_X \circ (\alpha_{pr_0, f_i})_X^{-1}$ where $\alpha_{\cdot, \cdot}$ is as in Categories, Lemma 4.31.7 and where we use the equality $f_i \circ pr_0 = f_j \circ pr_1$ as maps $U_i \times_U U_j \rightarrow U$.*

Proof. Omitted. □

8.4. Stacks

Here is the definition of a stack. It mixes the notion of a fibred category with the notion of descent.

Definition 8.4.1. Let \mathcal{C} be a site. A *stack* over \mathcal{C} is a category $p : \mathcal{S} \rightarrow \mathcal{C}$ over \mathcal{C} which satisfies the following conditions:

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category, see Categories, Definition 4.31.5,
- (2) for any $U \in \text{Ob}(\mathcal{C})$ and any $x, y \in \mathcal{S}_U$ the presheaf $\text{Mor}(x, y)$ (see Definition 8.2.2) is a sheaf on the site \mathcal{C}/U , and
- (3) for any covering $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ of the site \mathcal{C} , any descent datum in \mathcal{S} relative to \mathcal{U} is effective.

We find the formulation above the most convenient way to think about a stack. Namely, given a category over \mathcal{C} in order to verify that it is a stack you proceed to check properties (1), (2) and (3) in that order. Certainly properties (2) and (3) do not make sense if the category isn't fibred. Without (2) we cannot prove that the descent in (3) is unique up to unique isomorphism and functorial.

The following lemma provides an alternative definition.

Lemma 8.4.2. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over \mathcal{C} . The following are equivalent*

- (1) \mathcal{S} is a stack over \mathcal{C} , and

(2) for any covering $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ of the site \mathcal{C} the functor

$$\mathcal{S}_U \longrightarrow DD(\mathcal{U})$$

which associates to an object its canonical descent datum is an equivalence.

Proof. Omitted. \square

Lemma 8.4.3. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a stack over the site \mathcal{C} . Let \mathcal{S}' be a subcategory of \mathcal{S} . Assume

- (1) if $\varphi : y \rightarrow x$ is a strongly cartesian morphism of \mathcal{S} and x is an object of \mathcal{S}' , then y is isomorphic to an object of \mathcal{S}' ,
- (2) \mathcal{S}' is a full subcategory of \mathcal{S} , and
- (3) if $\{f_i : U_i \rightarrow U\}$ is a covering of \mathcal{C} , and x an object of \mathcal{S} over U such that f_i^*x is isomorphic to an object of \mathcal{S}' for each i , then x is isomorphic to an object of \mathcal{S}' .

Then $\mathcal{S}' \rightarrow \mathcal{C}$ is a stack.

Proof. Omitted. Hints: The first condition guarantees that \mathcal{S}' is a fibred category. The second condition guarantees that the *Isom*-presheaves of \mathcal{S}' are sheaves (as they are identical to their counter parts in \mathcal{S}). The third condition guarantees that the descent condition holds in \mathcal{S}' as we can first descend in \mathcal{S} and then (3) implies the resulting object is isomorphic to an object of \mathcal{S}' . \square

Lemma 8.4.4. Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be categories over \mathcal{C} . Suppose that \mathcal{S}_1 and \mathcal{S}_2 are equivalent as categories over \mathcal{C} . Then \mathcal{S}_1 is a stack over \mathcal{C} if and only if \mathcal{S}_2 is a stack over \mathcal{C} .

Proof. Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2, G : \mathcal{S}_2 \rightarrow \mathcal{S}_1$ be functors over \mathcal{C} , and let $i : F \circ G \rightarrow \text{id}_{\mathcal{S}_2}, j : G \circ F \rightarrow \text{id}_{\mathcal{S}_1}$ be isomorphisms of functors over \mathcal{C} . By Categories, Lemma 4.31.8 we see that \mathcal{S}_1 is fibred if and only if \mathcal{S}_2 is fibred over \mathcal{C} . Hence we may assume that both \mathcal{S}_1 and \mathcal{S}_2 are fibred. Moreover, the proof of Categories, Lemma 4.31.8 shows that F and G map strongly cartesian morphisms to strongly cartesian morphisms, i.e., F and G are 1-morphisms of fibred categories over \mathcal{C} . This means that given $U \in \text{Ob}(\mathcal{C})$, and $x, y \in \mathcal{S}_{1,U}$ then the presheaves

$$\text{Mor}_{\mathcal{S}_1}(x, y), \text{Mor}_{\mathcal{S}_1}(F(x), F(y)) : (\mathcal{C}/U)^{\text{opp}} \longrightarrow \text{Sets}$$

are identified, see Lemma 8.2.3. Hence the first is a sheaf if and only if the second is a sheaf. Finally, we have to show that if every descent datum in \mathcal{S}_1 is effective, then so is every descent datum in \mathcal{S}_2 . To do this, let $(X_i, \varphi_{ii'})$ be a descent datum in \mathcal{S}_2 relative the covering $\{U_i \rightarrow U\}$ of the site \mathcal{C} . Then $(G(X_i), G(\varphi_{ii'}))$ is a descent datum in \mathcal{S}_1 relative the covering $\{U_i \rightarrow U\}$. Let X be an object of $\mathcal{S}_{1,U}$ such that the descent datum (f_i^*X, can) is isomorphic to $(G(X_i), G(\varphi_{ii'}))$. Then $F(X)$ is an object of $\mathcal{S}_{2,U}$ such that the descent datum $(f_i^*F(X), \text{can})$ is isomorphic to $(F(G(X_i)), F(G(\varphi_{ii'})))$ which in turn is isomorphic to the original descent datum $(X_i, \varphi_{ii'})$ using i . \square

The 2-category of stacks over \mathcal{C} is defined as follows.

Definition 8.4.5. Let \mathcal{C} be a site. The 2-category of stacks over \mathcal{C} is the sub 2-category of the 2-category of fibred categories over \mathcal{C} (see Categories, Definition 4.31.9) defined as follows:

- (1) Its objects will be stacks $p : \mathcal{S} \rightarrow \mathcal{C}$.

- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$ and such that G maps strongly cartesian morphisms to strongly cartesian morphisms.
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Lemma 8.4.6. *Let \mathcal{C} be a site. The $(2, 1)$ -category of stacks over \mathcal{C} has 2-fibre products, and they are described as in Categories, Lemma 4.30.3.*

Proof. Let $f : \mathcal{X} \rightarrow \mathcal{S}$ and $g : \mathcal{Y} \rightarrow \mathcal{S}$ be 1-morphisms of stacks over \mathcal{C} as defined above. The category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ described in Categories, Lemma 4.30.3 is a fibred category according to Categories, Lemma 4.31.10. (This is where we use that f and g preserve strongly cartesian morphisms.) It remains to show that the morphism presheaves are sheaves and that descent relative to coverings of \mathcal{C} is effective.

Recall that an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is given by a quadruple (U, x, y, ϕ) . It lies over the object U of \mathcal{C} . Next, let (U, x', y', ϕ') be second object lying over U . Recall that $\phi : f(x) \rightarrow g(y)$, and $\phi' : f(x') \rightarrow g(y')$ are isomorphisms in the category \mathcal{S}_U . Let us use these isomorphisms to identify $z = f(x) = g(y)$ and $z' = f(x') = g(y')$. With this identifications it is clear that

$$\text{Mor}((U, x, y, \phi), (U, x', y', \phi')) = \text{Mor}(x, x') \times_{\text{Mor}(z, z')} \text{Mor}(y, y')$$

as presheaves. However, as the fibred product in the category of presheaves preserves sheaves (Sites, Lemma 7.10.1) we see that this is a sheaf.

Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a covering of the site \mathcal{C} . Let (X_i, χ_{ij}) be a descent datum in $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ relative to \mathcal{U} . Write $X_i = (U_i, x_i, y_i, \phi_i)$ as above. Write $\chi_{ij} = (\varphi_{ij}, \psi_{ij})$ as in the definition of the category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ (see Categories, Lemma 4.30.3). It is clear that (x_i, φ_{ij}) is a descent datum in \mathcal{X} and that (y_i, ψ_{ij}) is a descent datum in \mathcal{Y} . Since \mathcal{X} and \mathcal{Y} are stacks these descent data are effective. Thus we get $x \in \text{Ob}(\mathcal{X}_U)$, and $y \in \text{Ob}(\mathcal{Y}_U)$ with $x_i = x|_{U_i}$, and $y_i = y|_{U_i}$ compatibly with descent data. Set $z = f(x)$ and $z' = g(y)$ which are both objects of \mathcal{S}_U . The morphisms ϕ_i are elements of $\text{Isom}(z, z')(U_i)$ with the property that $\phi_i|_{U_i \times_U U_j} = \phi_j|_{U_i \times_U U_j}$. Hence by the sheaf property of $\text{Isom}(z, z')$ we obtain an isomorphism $\phi : z = f(x) \rightarrow z' = g(y)$. We omit the verification that the canonical descent datum associated to the object (U, x, y, ϕ) of $(\mathcal{X} \times_{\mathcal{S}} \mathcal{Y})_U$ is isomorphic to the descent datum we started with. \square

Lemma 8.4.7. *Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be stacks over \mathcal{C} . Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ be a 1-morphism. Then the following are equivalent*

- (1) F is fully faithful,
- (2) for every $U \in \text{Ob}(\mathcal{C})$ and for every $x, y \in \text{Ob}(\mathcal{S}_{1,U})$ the map

$$F : \text{Mor}_{\mathcal{S}_1}(x, y) \longrightarrow \text{Mor}_{\mathcal{S}_2}(F(x), F(y))$$

is an isomorphism of sheaves on \mathcal{C}/U .

Proof. Assume (1). For U, x, y as in (2) the displayed map F evaluates to the map $F : \text{Mor}_{\mathcal{S}_{1,V}}(x|_V, y|_V) \rightarrow \text{Mor}_{\mathcal{S}_{2,V}}(F(x|_V), F(y|_V))$ on an object V of \mathcal{C} lying over U . Now, since F is fully faithful, the corresponding map $\text{Mor}_{\mathcal{S}_1}(x|_V, y|_V) \rightarrow \text{Mor}_{\mathcal{S}_2}(F(x|_V), F(y|_V))$ is a bijection. Morphisms in the fibre category $\mathcal{S}_{1,V}$ are exactly those morphisms between $x|_V$ and $y|_V$ in \mathcal{S}_1 lying over id_V . Similarly, morphisms in the fibre category $\mathcal{S}_{2,V}$ are exactly those morphisms between $F(x|_V)$

and $F(y|_V)$ in \mathcal{S}_2 lying over id_V . Thus we find that F induces a bijection between these also. Hence (2) holds.

Assume (2). Suppose given objects U, V of \mathcal{C} and $x \in \text{Ob}(\mathcal{S}_{1,U})$ and $y \in \text{Ob}(\mathcal{S}_{1,V})$. To show that F is fully faithful, it suffices to prove it induces a bijection on morphisms lying over a fixed $f : U \rightarrow V$. Choose a strongly Cartesian $f^*y \rightarrow y$ in \mathcal{S}_1 lying above f . This results in a bijection between the set of morphisms $x \rightarrow y$ in \mathcal{S}_1 lying over f and $\text{Mor}_{\mathcal{S}_{1,U}}(x, f^*y)$. Since F preserves strongly Cartesian morphisms as a 1-morphism in the 2-category of stacks over \mathcal{C} , we also get a bijection between the set of morphisms $F(x) \rightarrow F(y)$ in \mathcal{S}_2 lying over f and $\text{Mor}_{\mathcal{S}_{2,U}}(F(x), F(f^*y))$. Since F induces a bijection $\text{Mor}_{\mathcal{S}_{1,U}}(x, f^*y) \rightarrow \text{Mor}_{\mathcal{S}_{2,U}}(F(x), F(f^*y))$ we conclude (1) holds. \square

Lemma 8.4.8. *Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be stacks over \mathcal{C} . Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2$ be a 1-morphism which is fully faithful. Then the following are equivalent*

- (1) F is an equivalence,
- (2) for every $U \in \text{Ob}(\mathcal{C})$ and for every $x \in \text{Ob}(\mathcal{S}_{2,U})$ there exists a covering $\{f_i : U_i \rightarrow U\}$ such that f_i^*x is in the essential image of the functor $F : \mathcal{S}_{1,U_i} \rightarrow \mathcal{S}_{2,U_i}$.

Proof. The implication (1) \Rightarrow (2) is immediate. To see that (2) implies (1) we have to show that every x as in (2) is in the essential image of the functor F . To do this choose a covering as in (2), $x_i \in \text{Ob}(\mathcal{S}_{1,U_i})$, and isomorphisms $\varphi_i : F(x_i) \rightarrow f_i^*x$. Then we get a descent datum for \mathcal{S}_1 relative to $\{f_i : U_i \rightarrow U\}$ by taking

$$\varphi_{ij} : x_i|_{U_i \times_U U_j} \longrightarrow x_j|_{U_i \times_U U_j}$$

the arrow such that $F(\varphi_{ij}) = \varphi_j^{-1} \circ \varphi_i$. This descent datum is effective by the axioms of a stack, and hence we obtain an object x_1 of \mathcal{S}_1 over U . We omit the verification that $F(x_1)$ is isomorphic to x over U . \square

Remark 8.4.9. (Cutting down a “big” stack to get a stack.) Let \mathcal{C} be a site. Suppose that $p : \mathcal{S} \rightarrow \mathcal{C}$ is functor from a “big” category to \mathcal{C} , i.e., suppose that the collection of objects of \mathcal{S} forms a proper class. Finally, suppose that $p : \mathcal{S} \rightarrow \mathcal{C}$ satisfies conditions (1), (2), (3) of Definition 8.4.1. In general there is no way to replace $p : \mathcal{S} \rightarrow \mathcal{C}$ by an equivalent category such that we obtain a stack. The reason is that it can happen that a fibre categories \mathcal{S}_U may have a proper class of isomorphism classes of objects. On the other hand, suppose that

- (4) for every $U \in \text{Ob}(\mathcal{C})$ there exists a set $S_U \subset \text{Ob}(\mathcal{S}_U)$ such that every object of \mathcal{S}_U is isomorphic in \mathcal{S}_U to an element of S_U .

In this case we can find a full subcategory \mathcal{S}_{small} of \mathcal{S} such that, setting $p_{small} = p|_{\mathcal{S}_{small}}$, we have

- (a) the functor $p_{small} : \mathcal{S}_{small} \rightarrow \mathcal{C}$ defines a stack, and
- (b) the inclusion $\mathcal{S}_{small} \rightarrow \mathcal{S}$ is fully faithful and essentially surjective.

(Hint: For every $U \in \text{Ob}(\mathcal{C})$ let $\alpha(U)$ denote the smallest ordinal such that $\text{Ob}(\mathcal{S}_U) \cap V_{\alpha(U)}$ surjects onto the set of isomorphism classes of \mathcal{S}_U , and set $\alpha = \sup_{U \in \text{Ob}(\mathcal{C})} \alpha(U)$. Then take $\text{Ob}(\mathcal{S}_{small}) = \text{Ob}(\mathcal{S}) \cap V_{\alpha}$. For notation used see Sets, Section 3.5.)

8.5. Stacks in groupoids

Among stacks those which are fibred in groupoids are somewhat easier to comprehend. We redefine them as follows.

Definition 8.5.1. A *stack in groupoids* over a site \mathcal{C} is a category $p : \mathcal{S} \rightarrow \mathcal{C}$ over \mathcal{C} such that

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids over \mathcal{C} (see Categories, Definition 4.33.1),
- (2) for all $U \in \text{Ob}(\mathcal{C})$, for all $x, y \in \text{Ob}(\mathcal{S}_U)$ the presheaf $\text{Isom}(x, y)$ is a sheaf on the site \mathcal{C}/U , and
- (3) for all coverings $\mathcal{U} = \{U_i \rightarrow U\}$ in \mathcal{C} , all descent data (x_i, ϕ_{ij}) for \mathcal{U} are effective.

Usually the hardest part to check is the third condition. Here is the lemma comparing this with the notion of a stack.

Lemma 8.5.2. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . The following are equivalent*

- (1) \mathcal{S} is a stack in groupoids over \mathcal{C} ,
- (2) \mathcal{S} is a stack over \mathcal{C} and all fibre categories are groupoids, and
- (3) \mathcal{S} is fibred in groupoids over \mathcal{C} and is a stack over \mathcal{C} .

Proof. Omitted, but see Categories, Lemma 4.33.2. □

Lemma 8.5.3. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a stack. Let $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be the category fibred in groupoids associated to \mathcal{S} constructed in Categories, Lemma 4.33.3. Then $p' : \mathcal{S}' \rightarrow \mathcal{C}$ is a stack in groupoids.*

Proof. Recall that the morphisms in \mathcal{S}' are exactly the strongly cartesian morphisms of \mathcal{S} , and that any isomorphism of \mathcal{S} is such a morphism. Hence descent data in \mathcal{S}' are exactly the same thing as descent data in \mathcal{S} . Now apply Lemma 8.4.2. Some details omitted. □

Lemma 8.5.4. *Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be categories over \mathcal{C} . Suppose that \mathcal{S}_1 and \mathcal{S}_2 are equivalent as categories over \mathcal{C} . Then \mathcal{S}_1 is a stack in groupoids over \mathcal{C} if and only if \mathcal{S}_2 is a stack in groupoids over \mathcal{C} .*

Proof. Follows by combining Lemmas 8.5.2 and 8.4.4. □

The 2-category of stacks in groupoids over \mathcal{C} is defined as follows.

Definition 8.5.5. Let \mathcal{C} be a site. The *2-category of stacks in groupoids over \mathcal{C}* is the sub 2-category of the 2-category of stacks over \mathcal{C} (see Definition 8.4.5) defined as follows:

- (1) Its objects will be stacks in groupoids $p : \mathcal{S} \rightarrow \mathcal{C}$.
- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$. (Since every morphism is strongly cartesian every functor preserves them.)
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Note that any 2-morphism is automatically an isomorphism, so that in fact the 2-category of stacks in groupoids over \mathcal{C} is a (strict) $(2, 1)$ -category.

Lemma 8.5.6. *Let \mathcal{C} be a category. The 2-category of stacks in groupoids over \mathcal{C} has 2-fibre products, and they are described as in Categories, Lemma 4.30.3.*

Proof. This is clear from Categories, Lemma 4.33.7 and Lemmas 8.5.2 and 8.4.6. \square

8.6. Stacks in setoids

This is just a brief section saying that a stack in sets is the same thing as a sheaf of sets. Please consult Categories, Section 4.37 for notation.

Definition 8.6.1. Let \mathcal{C} be a site.

- (1) A *stack in setoids* over \mathcal{C} is a stack over \mathcal{C} all of whose fibre categories are setoids.
- (2) A *stack in sets*, or a *stack in discrete categories* is a stack over \mathcal{C} all of whose fibre categories are discrete.

From the discussion in Section 8.5 this is the same thing as a stack in groupoids whose fibre categories are setoids (resp. discrete). Moreover, it is also the same thing as a category fibred in setoids (resp. sets) which is a stack.

Lemma 8.6.2. *Let \mathcal{C} be a site. Under the equivalence*

$$\left\{ \begin{array}{l} \text{the category of presheaves} \\ \text{of sets over } \mathcal{C} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{the category of categories} \\ \text{fibred in sets over } \mathcal{C} \end{array} \right\}$$

of Categories, Lemma 4.36.6 the stacks in sets correspond precisely to the sheaves.

Proof. Omitted. Hint: Show that effectivity of descent corresponds exactly to the sheaf condition. \square

Lemma 8.6.3. *Let \mathcal{C} be a site. Let \mathcal{S} be a category fibred in setoids over \mathcal{C} . Then \mathcal{S} is a stack in setoids if and only if the unique equivalent category \mathcal{S}' fibred in sets (see Categories, Lemma 4.37.5) is a stack in sets. In other words, if and only if the presheaf*

$$U \mapsto \text{Ob}(\mathcal{S}_U)/\cong$$

is a sheaf.

Proof. Omitted. \square

Lemma 8.6.4. *Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be categories over \mathcal{C} . Suppose that \mathcal{S}_1 and \mathcal{S}_2 are equivalent as categories over \mathcal{C} . Then \mathcal{S}_1 is a stack in setoids over \mathcal{C} if and only if \mathcal{S}_2 is a stack in setoids over \mathcal{C} .*

Proof. By Categories, Lemma 4.37.5 we see that a category \mathcal{S} over \mathcal{C} is fibred in setoids over \mathcal{C} if and only if it is equivalent over \mathcal{C} to a category fibred in sets. Hence we see that \mathcal{S}_1 is fibred in setoids over \mathcal{C} if and only if \mathcal{S}_2 is fibred in setoids over \mathcal{C} . Hence now the lemma follows from Lemma 8.6.3. \square

The 2-category of stacks in setoids over \mathcal{C} is defined as follows.

Definition 8.6.5. Let \mathcal{C} be a site. The 2-category of stacks in setoids over \mathcal{C} is the sub 2-category of the 2-category of stacks over \mathcal{C} (see Definition 8.4.5) defined as follows:

- (1) Its objects will be stacks in setoids $p : \mathcal{S} \rightarrow \mathcal{C}$.

- (2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \rightarrow \mathcal{S}'$ such that $p' \circ G = p$. (Since every morphism is strongly cartesian every functor preserves them.)
- (3) Its 2-morphisms $t : G \rightarrow H$ for $G, H : (\mathcal{S}, p) \rightarrow (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \text{id}_{p(x)}$ for all $x \in \text{Ob}(\mathcal{S})$.

Note that any 2-morphism is automatically an isomorphism, so that in fact the 2-category of stacks in setoids over \mathcal{C} is a (strict) $(2, 1)$ -category.

Lemma 8.6.6. *Let \mathcal{C} be a site. The 2-category of stacks in setoids over \mathcal{C} has 2-fibre products, and they are described as in Categories, Lemma 4.30.3.*

Proof. This is clear from Categories, Lemmas 4.33.7 and 4.37.4 and Lemmas 8.5.2 and 8.4.6. \square

Lemma 8.6.7. *Let \mathcal{C} be a site. Let \mathcal{S}, \mathcal{T} be stacks in groupoids over \mathcal{C} and let \mathcal{R} be a stack in setoids over \mathcal{C} . Let $f : \mathcal{T} \rightarrow \mathcal{S}$ and $g : \mathcal{R} \rightarrow \mathcal{S}$ be 1-morphisms. If f is faithful, then the 2-fibre product*

$$\mathcal{T} \times_{f, \mathcal{S}, g} \mathcal{R}$$

is a stack in setoids over \mathcal{C} .

Proof. Immediate from the explicit description of the 2-fibre product in Categories, Lemma 4.30.3. \square

Lemma 8.6.8. *Let \mathcal{C} be a site. Let \mathcal{S} be a stack in groupoids over \mathcal{C} and let \mathcal{S}_i , $i = 1, 2$ be stacks in setoids over \mathcal{C} . Let $f_i : \mathcal{S}_i \rightarrow \mathcal{S}$ be 1-morphisms. Then the 2-fibre product*

$$\mathcal{S}_1 \times_{f_1, \mathcal{S}, f_2} \mathcal{S}_2$$

is a stack in setoids over \mathcal{C} .

Proof. This is a special case of Lemma 8.6.7 as f_2 is faithful. \square

Lemma 8.6.9. *Let \mathcal{C} be a site. Let*

$$\begin{array}{ccc} \mathcal{T}_2 & \longrightarrow & \mathcal{T}_1 \\ G' \downarrow & & \downarrow G \\ \mathcal{S}_2 & \xrightarrow{F} & \mathcal{S}_1 \end{array}$$

be a 2-cartesian diagram of stacks in groupoids over \mathcal{C} . Assume

- (1) *for every $U \in \text{Ob}(\mathcal{C})$ and $x \in \text{Ob}((\mathcal{S}_1)_U)$ there exists a covering $\{U_i \rightarrow U\}$ such that $x|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \rightarrow (\mathcal{S}_1)_{U_i}$, and*
- (2) *G' is faithful,*

then G is faithful.

Proof. We may assume that \mathcal{T}_2 is the category $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ described in Categories, Lemma 4.30.3. By Categories, Lemma 4.33.8 the faithfulness of G, G' can be checked on fibre categories. Suppose that y, y' are objects of \mathcal{T}_1 over the object U of \mathcal{C} . Let $\alpha, \beta : y \rightarrow y'$ be morphisms of $(\mathcal{T}_1)_U$ such that $G(\alpha) = G(\beta)$. Our object is to show that $\alpha = \beta$. Considering instead $\gamma = \alpha^{-1} \circ \beta$ we see that $G(\gamma) = \text{id}_{G(y)}$ and we have to show that $\gamma = \text{id}_y$. By assumption we can find a covering $\{U_i \rightarrow U\}$ such that $G(y)|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \rightarrow (\mathcal{S}_1)_{U_i}$. Since it suffices to show that $\gamma|_{U_i} = \text{id}$ for each i , we may therefore assume that we

have $f : F(x) \rightarrow G(y)$ for some object x of \mathcal{S}_2 over U and morphisms f of $(\mathcal{S}_1)_U$. In this case we get a morphism

$$(1, \gamma) : (U, x, y, f) \longrightarrow (U, x, y, f)$$

in the fibre category of $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ over U whose image under G' in \mathcal{S}_1 is id_x . As G' is faithful we conclude that $\gamma = \text{id}_y$ and we win. \square

Lemma 8.6.10. *Let \mathcal{C} be a site. Let*

$$\begin{array}{ccc} \mathcal{T}_2 & \longrightarrow & \mathcal{T}_1 \\ \downarrow & & \downarrow G \\ \mathcal{S}_2 & \xrightarrow{F} & \mathcal{S}_1 \end{array}$$

be a 2-cartesian diagram of stacks in groupoids over \mathcal{C} . If

- (1) $F : \mathcal{S}_2 \rightarrow \mathcal{S}_1$ is fully faithful,
- (2) for every $U \in \text{Ob}(\mathcal{C})$ and $x \in \text{Ob}((\mathcal{S}_1)_U)$ there exists a covering $\{U_i \rightarrow U\}$ such that $x|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \rightarrow (\mathcal{S}_1)_{U_i}$, and
- (3) \mathcal{T}_2 is a stack in setoids.

then \mathcal{T}_1 is a stack in setoids.

Proof. We may assume that \mathcal{T}_2 is the category $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ described in Categories, Lemma 4.30.3. Pick $U \in \text{Ob}(\mathcal{C})$ and $y \in \text{Ob}((\mathcal{T}_1)_U)$. We have to show that the sheaf $\text{Aut}(y)$ on \mathcal{C}/U is trivial. To do this we may replace U by the members of a covering of U . Hence by assumption (2) we may assume that there exists an object $x \in \text{Ob}((\mathcal{S}_2)_U)$ and an isomorphism $f : F(x) \rightarrow G(y)$. Then $y' = (U, x, y, f)$ is an object of \mathcal{T}_2 over U which is mapped to y under the projection $\mathcal{T}_2 \rightarrow \mathcal{T}_1$. Because F is fully faithful by (1) the map $\text{Aut}(y') \rightarrow \text{Aut}(y)$ is surjective, use the explicit description of morphisms in \mathcal{T}_2 in Categories, Lemma 4.30.3. Since by (3) the sheaf $\text{Aut}(y')$ is trivial we get the result of the lemma. \square

8.7. The inertia stack

Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be fibred categories over the category \mathcal{C} . Let $F : \mathcal{S} \rightarrow \mathcal{S}'$ be a 1-morphism of fibred categories over \mathcal{C} . Recall that we have defined in Categories, Definition 4.32.2 an *relative inertia fibred category* $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \rightarrow \mathcal{C}$ as the category whose objects are pairs (x, α) where $x \in \text{Ob}(\mathcal{S})$ and $\alpha : x \rightarrow x$ with $F(\alpha) = \text{id}_{F(x)}$. There is also an absolute version, namely the *inertia* $\mathcal{I}_{\mathcal{S}}$ of \mathcal{S} . These inertia categories are actually stacks over \mathcal{C} provided that \mathcal{S} and \mathcal{S}' are stacks.

Lemma 8.7.1. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $p' : \mathcal{S}' \rightarrow \mathcal{C}$ be stacks over the site \mathcal{C} . Let $F : \mathcal{S} \rightarrow \mathcal{S}'$ be a 1-morphism of stacks over \mathcal{C} .*

- (1) *The inertia $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$ are stacks over \mathcal{C} .*
- (2) *If $\mathcal{S}, \mathcal{S}'$ are stacks in groupoids over \mathcal{S} , then so are $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$.*
- (3) *If $\mathcal{S}, \mathcal{S}'$ are stacks in setoids over \mathcal{S} , then so are $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$.*

Proof. The first three assertions follow from Lemmas 8.4.6, 8.5.6, and 8.6.6 and the equivalence in Categories, Lemma 4.32.1 part (1). \square

Lemma 8.7.2. *Let \mathcal{C} be a site. If \mathcal{S} is a stack in groupoids, then the canonical 1-morphism $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$ is an equivalence if and only if \mathcal{S} is a stack in setoids.*

Proof. Follows directly from Categories, Lemma 4.37.7. \square

8.8. Stackification of fibred categories

Here is the result.

Lemma 8.8.1. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over \mathcal{C} . There exists a stack $p' : \mathcal{S}' \rightarrow \mathcal{C}$ and a 1-morphism $G : \mathcal{S} \rightarrow \mathcal{S}'$ of fibred categories over \mathcal{C} (see *Categories*, Definition 4.31.9) such that*

- (1) *for every $U \in \text{Ob}(\mathcal{C})$, and any $x, y \in \text{Ob}(\mathcal{S}_U)$ the map*

$$\text{Mor}(x, y) \longrightarrow \text{Mor}(G(x), G(y))$$

induced by G identifies the right hand side with the sheafification of the left hand side, and

- (2) *for every $U \in \text{Ob}(\mathcal{C})$, and any $x' \in \text{Ob}(\mathcal{S}'_U)$ there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ such that for every $i \in I$ the object $x'|_{U_i}$ is in the essential image of the functor $G : \mathcal{S}_U \rightarrow \mathcal{S}'_U$.*

Moreover the stack \mathcal{S}' is determined up to unique 2-isomorphism by these conditions.

Proof by naive method. In this proof method we proceed in stages:

First, given x lying over U and any object y of \mathcal{S} , we say that two morphisms $a, b : x \rightarrow y$ of \mathcal{S} lying over the same arrow of \mathcal{C} are *locally equal* if there exists a covering $\{f_i : U_i \rightarrow U\}$ of \mathcal{C} such that the compositions

$$f_i^* x \rightarrow x \xrightarrow{a} y, \quad f_i^* x \rightarrow x \xrightarrow{b} y$$

are equal. This gives an equivalence relation \sim on arrows of \mathcal{S} . If $b \sim b'$ then $a \circ b \circ c \sim a \circ b' \circ c$ (verification omitted). Hence we can quotient out by this equivalence relation to obtain a new category \mathcal{S}^1 over \mathcal{C} together with a morphism $G^1 : \mathcal{S} \rightarrow \mathcal{S}^1$.

One checks that G^1 preserves strongly cartesian morphisms and that \mathcal{S}^1 is a fibred category over \mathcal{C} . Checks omitted. Thus we reduce to the case where locally equal morphisms are equal.

Next, we add morphisms as follows. Given x lying over U and any object y of lying over V a *locally defined morphism from x to y* is given by

- (1) a morphism $f : U \rightarrow V$,
- (2) a covering $\{f_i : U_i \rightarrow U\}$ of U , and
- (3) morphisms $a_i : f_i^* x \rightarrow Y$ with $p(a_i) = h \circ f_i$

with the property that the compositions

$$(f_i \times f_j)^* x \rightarrow f_i^* x \xrightarrow{a_i} y, \quad (f_i \times f_j)^* x \rightarrow f_j^* x \xrightarrow{a_j} y$$

are equal. Note that a usual morphism $a : x \rightarrow y$ gives a locally defined morphism $(p(a) : U \rightarrow V, \{\text{id}_U\}, a)$. We say two locally defined morphisms $(f, \{f_i : U_i \rightarrow U\}, a_i)$ and $(g, \{g_j : U_j \rightarrow U\}, b_j)$ are *equal* if $f = g$ and the compositions

$$(f_i \times g_j)^* x \rightarrow f_i^* x \xrightarrow{a_i} y, \quad (f_i \times g_j)^* x \rightarrow g_j^* x \xrightarrow{b_j} y$$

are equal (this is the right condition since we are in the situation where locally equal morphisms are equal). To compose locally defined morphisms $(f, \{f_i : U_i \rightarrow$

$U\}, a_i)$ from x to y and $(g, \{g_j : V_j \rightarrow V\}, b_j)$ from y to z lying over W , just take $g \circ f : U \rightarrow W$, the covering $\{U_i \times_V V_j \rightarrow U\}$, and as maps the compositions

$$x|_{U_i \times_V V_j} \xrightarrow{\text{pr}_0^* a_i} y|_{V_j} \xrightarrow{b_j} z$$

We omit the verification that this is a locally defined morphism.

One checks that \mathcal{S}^2 with the same objects as \mathcal{S} and with locally defined morphisms as morphisms is a category over \mathcal{C} , that there is a functor $G^2 : \mathcal{S} \rightarrow \mathcal{S}^2$ over \mathcal{C} , that this functor preserves strongly cartesian objects, and that \mathcal{S}^2 is a fibred category over \mathcal{C} . Checks omitted. This reduces one to the case where the morphism presheaves of \mathcal{S} are all sheaves, by checking that the effect of using locally defined morphisms is to take the sheafification of the (separated) morphisms presheaves.

Finally, in the case where the morphism presheaves are all sheaves we have to add objects in order to make sure descent conditions are effective in the end result. The simplest way to do this is to consider the category \mathcal{S}' whose objects are pairs (\mathcal{U}, ξ) where $\mathcal{U} = \{U_i \rightarrow U\}$ is a covering of \mathcal{C} and $\xi = (X_i, \varphi_{ii'})$ is a descent datum relative \mathcal{U} . Suppose given two such data $(\mathcal{U}, \xi) = (\{f_i : U_i \rightarrow U\}, x_i, \varphi_{ii'})$ and $(\mathcal{V}, \eta) = (\{g_j : V_j \rightarrow V\}, y_j, \psi_{jj'})$. We define

$$\text{Mor}_{\mathcal{S}'}((\mathcal{U}, \xi), (\mathcal{V}, \eta))$$

as the set of (f, a_{ij}) , where $f : U \rightarrow V$ and

$$a_{ij} : x_i|_{U_i \times_V V_j} \longrightarrow y_j$$

are morphisms of \mathcal{S} lying over $U_i \times_V V_j \rightarrow V_j$. These have to satisfy the following condition: for any $i, i' \in I$ and $j, j' \in J$ set $W = (U_i \times_U U_{i'}) \times_V (V_j \times_V V_{j'})$. Then

$$\begin{array}{ccc} x_i|_W & \xrightarrow{a_{ij}|_W} & y_j|_W \\ \varphi_{ii'}|_W \downarrow & & \downarrow \psi_{jj'}|_W \\ x_{i'}|_W & \xrightarrow{a_{i'j'}|_W} & y_{j'}|_W \end{array}$$

commutes. At this point you have to verify the following things:

- (1) there is a well defined composition on morphisms as above,
- (2) this turns \mathcal{S}' into a category over \mathcal{C} ,
- (3) there is a functor $G : \mathcal{S} \rightarrow \mathcal{S}'$ over \mathcal{C} ,
- (4) for x, y objects of \mathcal{S} we have $\text{Mor}_{\mathcal{S}}(x, y) = \text{Mor}_{\mathcal{S}'}(G(x), G(y))$,
- (5) any object of \mathcal{S}' locally comes from an object of \mathcal{S} , i.e., part (2) of the lemma holds,
- (6) G preserves strongly cartesian morphisms,
- (7) \mathcal{S}' is a fibred category over \mathcal{C} , and
- (8) \mathcal{S}' is a stack over \mathcal{C} .

This is all not hard but there is a lot of it. Details omitted. □

Less naive proof. Here is a less naive proof. By Categories, Lemma 4.34.4 there exists an equivalence of fibred categories $\mathcal{S} \rightarrow \mathcal{S}'$ where \mathcal{S}' is a split fibred category, i.e., one in which the pullback functors compose on the nose. Obviously the lemma for \mathcal{S}' implies the lemma for \mathcal{S} . Hence we may think of \mathcal{S} as a presheaf in categories.

Consider the 2-category Cat temporarily as a category by forgetting about 2-morphisms. Let us think of a category as a quintuple $(\text{Ob}, \text{Arrows}, s, t, \circ)$ as in Categories, Section 4.2. Consider the forgetful functor

$$\text{forget} : Cat \rightarrow \text{Sets}, \quad (\text{Ob}, \text{Arrows}, s, t, \circ) \mapsto \text{Ob} \amalg \text{Arrows}.$$

Then forget is faithful, Cat has limits and forget commutes with them, Cat has directed colimits and forget commutes with them, and forget reflects isomorphisms. Hence, according to the first part of Sites, Section 7.43 we can sheafify presheaves with values in Cat , and the result commutes with forget . Applying this to \mathcal{S} we obtain a sheafification $\mathcal{S}^\#$ which has a sheaf of objects and a sheaf of morphisms both of which are the sheafifications of the corresponding presheaves for \mathcal{S} . In this case it is quite easy to see that the map $\mathcal{S} \rightarrow \mathcal{S}^\#$ has the properties (1) and (2) of the lemma.

However, the category $\mathcal{S}^\#$ may not yet be a stack since, although the presheaf of objects is a sheaf, the descent condition may not yet be satisfied. To remedy this we have to add more objects. But the argument above does reduce us to the case where $\mathcal{S} = \mathcal{S}_F$ for some sheaf(!) $F : \mathcal{C}^{opp} \rightarrow Cat$ of categories. In this case consider the functor $F' : \mathcal{C}^{opp} \rightarrow Cat$ defined by

- (1) The set $\text{Ob}(F'(U))$ is the set of pairs (\mathcal{U}, ξ) where $\mathcal{U} = \{U_i \rightarrow U\}$ is a covering of U and $\xi = (x_i, \varphi_{ii'})$ is a descent datum relative to \mathcal{U} .
- (2) A morphism in $F'(U)$ from (\mathcal{U}, ξ) to (\mathcal{V}, η) is an element of

$$\text{colim Mor}_{DD(\mathcal{W})}(a^*\xi, b^*\eta)$$

where the colimit is over all common refinements $a : \mathcal{W} \rightarrow \mathcal{U}$, $b : \mathcal{W} \rightarrow \mathcal{V}$. This colimit is filtered (verification omitted). Hence composition of morphisms in $F(U)$ is defined by finding a common refinement and composing in $DD(\mathcal{W})$.

- (3) Given $h : V \rightarrow U$ and an object (\mathcal{U}, ξ) of $F'(U)$ we set $F'(h)(\mathcal{U}, \xi)$ equal to $(V \times_U \mathcal{U}, \text{pr}_1^*\xi)$. More precisely, if $\mathcal{U} = \{U_i \rightarrow U\}$ and $\xi = (x_i, \varphi_{ii'})$, then $V \times_U \mathcal{U} = \{V \times_U U_i \rightarrow V\}$ which comes with a canonical morphism $\text{pr}_1 : V \times_U \mathcal{U} \rightarrow \mathcal{U}$ and $\text{pr}_1^*\xi$ is the pullback of ξ with respect to this morphism (see Definition 8.3.4).
- (4) Given $h : V \rightarrow U$, objects (\mathcal{U}, ξ) and (\mathcal{V}, η) and a morphism between them, represented by $a : \mathcal{W} \rightarrow \mathcal{U}$, $b : \mathcal{W} \rightarrow \mathcal{V}$, and $\alpha : a^*\xi \rightarrow b^*\eta$, then $F'(h)(\alpha)$ is represented by $a' : V \times_U \mathcal{W} \rightarrow V \times_U \mathcal{U}$, $b' : V \times_U \mathcal{W} \rightarrow V \times_U \mathcal{V}$, and the pullback α' of the morphism α via the map $V \times_U \mathcal{W} \rightarrow \mathcal{W}$. This works since pullbacks in \mathcal{S}_F commute on the nose.

There is a map $F \rightarrow F'$ given by associating to an object x of $F(U)$ the object $(\{U \rightarrow U\}, (x, \text{triv}))$ of $F'(U)$. At this point you have to check that the corresponding functor $\mathcal{S}_F \rightarrow \mathcal{S}_{F'}$ has properties (1) and (2) of the lemma, and finally that $\mathcal{S}_{F'}$ is a stack. Details omitted. \square

Lemma 8.8.2. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over \mathcal{C} . Let $p' : \mathcal{S}' \rightarrow \mathcal{C}$ and $G : \mathcal{S} \rightarrow \mathcal{S}'$ the stack and 1-morphism constructed in Lemma 8.8.1. This construction has the following universal property: Given a stack $q : \mathcal{X} \rightarrow \mathcal{C}$ and a 1-morphism $F : \mathcal{S} \rightarrow \mathcal{S}'$ of fibred categories over \mathcal{C} there exists a 1-morphism*

$H : \mathcal{S}' \rightarrow \mathcal{X}$ such that the diagram

is 2-commutative.

Proof. Omitted. Hint: Suppose that $x' \in \text{Ob}(\mathcal{S}'_U)$. By the result of Lemma 8.8.1 there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ such that $x'|_{U_i} = G(x_i)$ for some $x_i \in \text{Ob}(\mathcal{S}_{U_i})$. Moreover, there exist coverings $\{U_{ijk} \rightarrow U_i \times_U U_j\}$ and isomorphisms $\alpha_{ijk} : x_i|_{U_{ijk}} \rightarrow x_j|_{U_{ijk}}$ with $G(\alpha_{ijk}) = \text{id}_{x'|_{U_{ijk}}}$. Set $y_i = F(x_i)$. Then you can check that

$$F(\alpha_{ijk}) : y_i|_{U_{ijk}} \rightarrow y_j|_{U_{ijk}}$$

agree on overlaps and therefore (as \mathcal{X} is a stack) define a morphism $\beta_{ij} : y_i|_{U_i \times_U U_j} \rightarrow y_j|_{U_i \times_U U_j}$. Next, you check that the β_{ij} define a descent datum. Since \mathcal{X} is a stack these descent data are effective and we find an object y of \mathcal{X}_U agreeing with $G(x_i)$ over U_i . The hint is to set $H(x') = y$. \square

Lemma 8.8.3. *Notation and assumptions as in Lemma 8.8.2. There is a canonical equivalence of categories*

$$\text{Mor}_{\text{Fib}/\mathcal{C}}(\mathcal{S}, \mathcal{X}) = \text{Mor}_{\text{Stacks}/\mathcal{C}}(\mathcal{S}', \mathcal{X})$$

given by the constructions in the proof of the aforementioned lemma.

Proof. Omitted. \square

Lemma 8.8.4. *Let \mathcal{C} be a site. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Z} \rightarrow \mathcal{Y}$ be morphisms of fibred categories over \mathcal{C} . In this case the stackification of the 2-fibre product is the 2-fibre product of the stackifications.*

Proof. Let us denote $\mathcal{X}', \mathcal{Y}', \mathcal{Z}'$ the stackifications and \mathcal{W} the stackification of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$. By construction of 2-fibre products there is a canonical 1-morphism $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$. As the second 2-fibre product is a stack (see Lemma 8.4.6) this 1-morphism induces a 1-morphism $h : \mathcal{W} \rightarrow \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ by the universal property of stackification, see Lemma 8.8.2. Now h is a morphism of stacks, and we may check that it is an equivalence using Lemmas 8.4.7 and 8.4.8.

Thus we first prove that h induces isomorphisms of *Mor*-sheaves. Let ξ, ξ' be objects of \mathcal{W} over $U \in \text{Ob}(\mathcal{C})$. We want to show that

$$h : \text{Mor}(\xi, \xi') \longrightarrow \text{Mor}(h(\xi), h(\xi'))$$

is an isomorphism. To do this we may work locally on U (see Sites, Section 7.25). Hence by construction of \mathcal{W} (see Lemma 8.8.1) we may assume that ξ, ξ' actually come from objects (x, y, α) and (x', y', α') of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U . By the same lemma once more we see that in this case $\text{Mor}(\xi, \xi')$ is the sheafification of

$$V/U \longmapsto \text{Mor}_{\mathcal{X}_V}(x|_V, x'|_V) \times_{\text{Mor}_{\mathcal{Z}_V}(f(x)|_V, f(x')|_V)} \text{Mor}_{\mathcal{Y}_V}(y|_V, y'|_V)$$

and that $\text{Mor}(h(\xi), h(\xi'))$ is equal to the fibre product

$$\text{Mor}(i(x), i(x')) \times_{\text{Mor}(k(f(x)), k(f(x')))} \text{Mor}(j(x), j(x'))$$

where $i : \mathcal{X} \rightarrow \mathcal{X}'$, $j : \mathcal{Y} \rightarrow \mathcal{Y}'$, and $k : \mathcal{Z} \rightarrow \mathcal{Z}'$ are the canonical functors. Thus the first displayed map of this paragraph is an isomorphism as sheafification is exact

(and hence the sheafification of a fibre product of presheaves is the fibre product of the sheafifications).

Finally, we have to check that any object of $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ over U is locally on U in the essential image of h . Write such an object as a triple (x', y', α) . Then x' locally comes from an object of \mathcal{X} , y' locally comes from an object of \mathcal{Y} , and having made suitable replacements for x', y' the morphism α of \mathcal{Z}'_U locally comes from a morphism of \mathcal{Z} . In other words, we have shown that any object of $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ over U is locally on U in the essential image of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$, hence a fortiori it is locally in the essential image of h . \square

Lemma 8.8.5. *Let \mathcal{C} be a site. Let \mathcal{X} be a fibred category over \mathcal{C} . The stackification of the inertia fibred category $\mathcal{I}_{\mathcal{X}}$ is inertia of the stackification of \mathcal{X} .*

Proof. This follows from the fact that stackification is compatible with 2-fibre products by Lemma 8.8.4 and the fact that there is a formula for the inertia in terms of 2-fibre products of categories over \mathcal{C} , see Categories, Lemma 4.32.1. \square

8.9. Stackification of categories fibred in groupoids

Here is the result.

Lemma 8.9.1. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids over \mathcal{C} . There exists a stack in groupoids $p' : \mathcal{S}' \rightarrow \mathcal{C}$ and a 1-morphism $G : \mathcal{S} \rightarrow \mathcal{S}'$ of categories fibred in groupoids over \mathcal{C} (see Categories, Definition 4.33.6) such that*

- (1) *for every $U \in \text{Ob}(\mathcal{C})$, and any $x, y \in \text{Ob}(\mathcal{S}_U)$ the map*

$$\text{Mor}(x, y) \longrightarrow \text{Mor}(G(x), G(y))$$

induced by G identifies the right hand side with the sheafification of the left hand side, and

- (2) *for every $U \in \text{Ob}(\mathcal{C})$, and any $x' \in \text{Ob}(\mathcal{S}'_U)$ there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ such that for every $i \in I$ the object $x'|_{U_i}$ is in the essential image of the functor $G : \mathcal{S}_{U_i} \rightarrow \mathcal{S}'_{U_i}$.*

Moreover the stack in groupoids \mathcal{S}' is determined up to unique 2-isomorphism by these conditions.

Proof. Apply Lemma 8.8.1. The result will be a stack in groupoids by applying Lemma 8.5.2. \square

Lemma 8.9.2. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids over \mathcal{C} . Let $p' : \mathcal{S}' \rightarrow \mathcal{C}$ and $G : \mathcal{S} \rightarrow \mathcal{S}'$ the stack in groupoids and 1-morphism constructed in Lemma 8.9.1. This construction has the following universal property: Given a stack in groupoids $q : \mathcal{X} \rightarrow \mathcal{C}$ and a 1-morphism $F : \mathcal{S} \rightarrow \mathcal{X}$ of categories over \mathcal{C} there exists a 1-morphism $H : \mathcal{S}' \rightarrow \mathcal{X}$ such that the diagram*

$$\begin{array}{ccc} \mathcal{S} & \xrightarrow{F} & \mathcal{X} \\ & \searrow G & \nearrow H \\ & & \mathcal{S}' \end{array}$$

is 2-commutative.

Proof. This is a special case of Lemma 8.8.2. \square

Lemma 8.9.3. *Let \mathcal{C} be a site. Let $f : \mathcal{X} \rightarrow \mathcal{Y}$ and $g : \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms categories fibred in groupoids over \mathcal{C} . In this case the stackification of the 2-fibre product is the 2-fibre product of the stackifications.*

Proof. This is a special case of Lemma 8.8.4. \square

8.10. Inherited topologies

It turns out that a fibred category over a site inherits a canonical topology from the underlying site.

Lemma 8.10.1. *Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $\text{Cov}(\mathcal{S})$ be the set of families $\{x_i \rightarrow x\}_{i \in I}$ of morphisms in \mathcal{S} with fixed target such that (a) each $x_i \rightarrow x$ is strongly cartesian, and (b) $\{p(x_i) \rightarrow p(x)\}_{i \in I}$ is a covering of \mathcal{C} . Then $(\mathcal{S}, \text{Cov}(\mathcal{S}))$ is a site.*

Proof. We have to check the three conditions of Sites, Definition 7.6.2.

- (1) If $x \rightarrow y$ is an isomorphism of \mathcal{S} , then it is strongly cartesian by Categories, Lemma 4.31.2 and $p(x) \rightarrow p(y)$ is an isomorphism of \mathcal{C} . Thus $\{p(x) \rightarrow p(y)\}$ is a covering of \mathcal{C} whence $\{x \rightarrow y\} \in \text{Cov}(\mathcal{S})$.
- (2) If $\{x_i \rightarrow x\}_{i \in I} \in \text{Cov}(\mathcal{S})$ and for each i we have $\{y_{ij} \rightarrow x_i\}_{j \in J_i} \in \text{Cov}(\mathcal{S})$, then each composition $p(y_{ij}) \rightarrow p(x)$ is strongly cartesian by Categories, Lemma 4.31.2 and $\{p(y_{ij}) \rightarrow p(x)\}_{i \in I, j \in J_i} \in \text{Cov}(\mathcal{C})$. Hence also $\{y_{ij} \rightarrow x\}_{i \in I, j \in J_i} \in \text{Cov}(\mathcal{S})$.
- (3) Suppose $\{x_i \rightarrow x\}_{i \in I} \in \text{Cov}(\mathcal{S})$ and $y \rightarrow x$ is a morphism of \mathcal{S} . As $\{p(x_i) \rightarrow p(x)\}$ is a covering of \mathcal{C} we see that $p(x_i) \times_{p(x)} p(y)$ exists. Hence Categories, Lemma 4.31.13 implies that $x_i \times_x y$ exists, that $p(x_i \times_x y) = p(x_i) \times_{p(x)} p(y)$, and that $x_i \times_x y \rightarrow y$ is strongly cartesian. Since also $\{p(x_i) \times_{p(x)} p(y) \rightarrow p(y)\}_{i \in I} \in \text{Cov}(\mathcal{C})$ we conclude that $\{x_i \times_x y \rightarrow y\}_{i \in I} \in \text{Cov}(\mathcal{S})$.

This finishes the proof. \square

Note that if $p : \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids, then the coverings of the site \mathcal{S} in Lemma 8.10.1 are characterized by

$$\{x_i \rightarrow x\} \in \text{Cov}(\mathcal{S}) \Leftrightarrow \{p(x_i) \rightarrow p(x)\} \in \text{Cov}(\mathcal{C})$$

because every morphism of \mathcal{S} is strongly cartesian.

Definition 8.10.2. Let \mathcal{C} be a site. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. We say $(\mathcal{S}, \text{Cov}(\mathcal{S}))$ as in Lemma 8.10.1 is the *structure of site on \mathcal{S} inherited from \mathcal{C}* . We sometimes indicate this by saying that \mathcal{S} is endowed with the topology inherited from \mathcal{C} .

In particular we obtain a topos of sheaves $Sh(\mathcal{S})$ in this situation. It turns out that this topos is functorial with respect to 1-morphisms of fibred categories.

Lemma 8.10.3. *Let \mathcal{C} be a site. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of fibred categories over \mathcal{C} . Then F is a continuous and cocontinuous functor between the structure of sites inherited from \mathcal{C} . Hence F induces a morphism of topoi $f : Sh(\mathcal{X}) \rightarrow Sh(\mathcal{Y})$ with $f_* = {}_s F = {}_p F$ and $f^{-1} = F^s = F^p$. In particular $f^{-1}(\mathcal{G})(x) = \mathcal{G}(F(x))$ for a sheaf \mathcal{G} on \mathcal{Y} and object x of \mathcal{X} .*

Proof. We first prove that F is continuous. Let $\{x_i \rightarrow x\}_{i \in I}$ be a covering of \mathcal{X} . By Categories, Definition 4.31.9 the functor F transforms strongly cartesian morphisms into strongly cartesian morphisms, hence $\{F(x_i) \rightarrow F(x)\}_{i \in I}$ is a covering of \mathcal{Y} . This proves part (1) of Sites, Definition 7.14.1. Moreover, let $x' \rightarrow x$ be a morphism of \mathcal{X} . By Categories, Lemma 4.31.13 the fibre product $x_i \times_x x'$ exists and $x_i \times_x x' \rightarrow x'$ is strongly cartesian. Hence $F(x_i \times_x x') \rightarrow F(x')$ is strongly cartesian. By Categories, Lemma 4.31.13 applied to \mathcal{Y} this means that $F(x_i \times_x x') = F(x_i) \times_{F(x)} F(x')$. This proves part (2) of Sites, Definition 7.14.1 and we conclude that F is continuous.

Next we prove that F is cocontinuous. Let $x \in \text{Ob}(\mathcal{X})$ and let $\{y_i \rightarrow F(x)\}_{i \in I}$ be a covering in \mathcal{Y} . Denote $\{U_i \rightarrow U\}_{i \in I}$ the corresponding covering of \mathcal{C} . For each i choose a strongly cartesian morphism $x_i \rightarrow x$ in \mathcal{X} lying over $U_i \rightarrow U$. Then $F(x_i) \rightarrow F(x)$ and $y_i \rightarrow F(x)$ are both a strongly cartesian morphisms in \mathcal{Y} lying over $U_i \rightarrow U$. Hence there exists a unique isomorphism $F(x_i) \rightarrow y_i$ in \mathcal{Y}_{U_i} compatible with the maps to $F(x)$. Thus $\{x_i \rightarrow x\}_{i \in I}$ is a covering of \mathcal{X} such that $\{F(x_i) \rightarrow F(x)\}_{i \in I}$ is isomorphic to $\{y_i \rightarrow F(x)\}_{i \in I}$. Hence F is cocontinuous, see Sites, Definition 7.19.1.

The final assertion follows from the first two, see Sites, Lemmas 7.20.1, 7.19.2, and 7.20.5. \square

Lemma 8.10.4. *Let \mathcal{C} be a site. Let $p : \mathcal{X} \rightarrow \mathcal{C}$ and $q : \mathcal{Y} \rightarrow \mathcal{C}$ be stacks in groupoids. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over \mathcal{C} . If F turns \mathcal{X} into a category fibred in groupoids over \mathcal{Y} , then \mathcal{X} is a stack in groupoids over \mathcal{Y} (with topology inherited from \mathcal{C}).*

Proof. Let us prove descent for objects. Let $\{y_i \rightarrow y\}$ be a covering of \mathcal{Y} . Let (x_i, φ_{ij}) be a descent datum in \mathcal{X} with respect to this covering. Then (x_i, φ_{ij}) is also a descent datum with respect to the covering $\{q(y_i) \rightarrow q(y)\}$ of \mathcal{C} . As \mathcal{X} is a stack in groupoids we obtain an object x over $q(y)$ and isomorphisms $\psi_i : x|_{q(y_i)} \rightarrow x_i$ over $q(y_i)$ compatible with the φ_{ij} , i.e., such that

$$\varphi_{ij} = \psi_j|_{q(y_i) \times_{q(y)} q(y_j)} \circ \psi_i^{-1}|_{q(y_i) \times_{q(y)} q(y_j)}.$$

Consider the sheaf $I = \text{Isom}_{\mathcal{Y}}(F(x), y)$ on $\mathcal{C}/p(x)$. Note that $s_i = F(\psi_i) \in I(q(x_i))$ because $F(x_i) = y_i$. Because $F(\varphi_{ij}) = \text{id}$ (as we started with a descent datum over $\{y_i \rightarrow y\}$) the displayed formula shows that $s_i|_{q(y_i) \times_{q(y)} q(y_j)} = s_j|_{q(y_i) \times_{q(y)} q(y_j)}$. Hence the local sections s_i glue to $s : F(x) \rightarrow y$. As F is fibred in groupoids we see that x is isomorphic to an object x' with $F(x') = y$. We omit the verification that x' in the fibre category of \mathcal{X} over y is a solution to the problem of descent posed by the descent datum (x_i, φ_{ij}) . We also omit the proof of the sheaf property of the Isom -presheaves of \mathcal{X}/\mathcal{Y} . \square

Lemma 8.10.5. *Let \mathcal{C} be a site. Let $p : \mathcal{X} \rightarrow \mathcal{C}$ be a stack. Endow \mathcal{X} with the topology inherited from \mathcal{C} and let $q : \mathcal{Y} \rightarrow \mathcal{X}$ be a stack. Then \mathcal{Y} is a stack over \mathcal{C} . If p and q define stacks in groupoids, then \mathcal{Y} is a stack in groupoids over \mathcal{C} .*

Proof. We check the three conditions in Definition 8.4.1 to prove that \mathcal{Y} is a stack over \mathcal{C} . By Categories, Lemma 4.31.12 we find that \mathcal{Y} is a fibred category over \mathcal{C} . Thus condition (1) holds.

Let U be an object of \mathcal{C} and let y_1, y_2 be objects of \mathcal{Y} over U . Denote $x_i = q(y_i)$ in \mathcal{X} . Consider the map of presheaves

$$q : \text{Mor}_{\mathcal{Y}/\mathcal{C}}(y_1, y_2) \longrightarrow \text{Mor}_{\mathcal{X}/\mathcal{C}}(x_1, x_2)$$

on \mathcal{C}/U , see Lemma 8.2.3. Let $\{U_i \rightarrow U\}$ be a covering and let φ_i be a section of the presheaf on the left over U_i such that φ_i and φ_j restrict to the same section over $U_i \times_U U_j$. We have to find a morphism $\varphi : x_1 \rightarrow x_2$ restricting to φ_i . Note that $q(\varphi_i) = \psi|_{U_i}$ for some morphism $\psi : x_1 \rightarrow x_2$ over U because the second presheaf is a sheaf (by assumption). Let $y_{12} \rightarrow y_2$ be the strongly \mathcal{X} -cartesian morphism of \mathcal{Y} lying over ψ . Then φ_i corresponds to a morphism $\varphi'_i : y_1|_{U_i} \rightarrow y_{12}|_{U_i}$ over $x_1|_{U_i}$. In other words, φ'_i now define local sections of the presheaf

$$\text{Mor}_{\mathcal{Y}/\mathcal{X}}(y_1, y_{12})$$

over the members of the covering $\{x_1|_{U_i} \rightarrow x_1\}$. By assumption these glue to a unique morphism $y_1 \rightarrow y_{12}$ which composed with the given morphism $y_{12} \rightarrow y_2$ produces the desired morphism $y_1 \rightarrow y_2$.

Finally, we show that descent data are effective. Let $\{f_i : U_i \rightarrow U\}$ be a covering of \mathcal{C} and let (y_i, φ_{ij}) be a descent datum relative to this covering (Definition 8.3.1). Setting $x_i = q(y_i)$ and $\psi_{ij} = q(\varphi_{ij})$ we obtain a descent datum (x_i, ψ_{ij}) for the covering in \mathcal{X} . By assumption on \mathcal{X} we may assume $x_i = x|_{U_i}$ and the ψ_{ij} equal to the canonical descent datum (Definition 8.3.5). In this case $\{x|_{U_i} \rightarrow x\}$ is a covering and we can view (y_i, φ_{ij}) as a descent datum relative to this covering. By our assumption that \mathcal{Y} is a stack over \mathcal{C} we see that it is effective which finishes the proof of condition (3).

The final assertion follows because \mathcal{Y} is a stack over \mathcal{C} and is fibred in groupoids by Categories, Lemma 4.33.13. \square

8.11. Gerbes

Gerbes are a special kind of stacks in groupoids.

Definition 8.11.1. A *gerbe* over a site \mathcal{C} is a category $p : \mathcal{S} \rightarrow \mathcal{C}$ over \mathcal{C} such that

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is a stack in groupoids over \mathcal{C} (see Definition 8.5.1),
- (2) for $U \in \text{Ob}(\mathcal{C})$ there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} such that \mathcal{S}_{U_i} is nonempty, and
- (3) for $U \in \text{Ob}(\mathcal{C})$ and $x, y \in \text{Ob}(\mathcal{S}_U)$ there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} such that $x|_{U_i} \cong y|_{U_i}$ in \mathcal{S}_{U_i} .

In other words, a gerbe is a stack in groupoids such that any two objects are locally isomorphic and such that objects exist locally.

Lemma 8.11.2. Let \mathcal{C} be a site. Let $\mathcal{S}_1, \mathcal{S}_2$ be categories over \mathcal{C} . Suppose that \mathcal{S}_1 and \mathcal{S}_2 are equivalent as categories over \mathcal{C} . Then \mathcal{S}_1 is a gerbe over \mathcal{C} if and only if \mathcal{S}_2 is a gerbe over \mathcal{C} .

Proof. Assume \mathcal{S}_1 is a gerbe over \mathcal{C} . By Lemma 8.5.4 we see \mathcal{S}_2 is a stack in groupoids over \mathcal{C} . Let $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2, G : \mathcal{S}_2 \rightarrow \mathcal{S}_1$ be equivalences of categories over \mathcal{C} . Given $U \in \text{Ob}(\mathcal{C})$ we see that there exists a covering $\{U_i \rightarrow U\}$ such that $(\mathcal{S}_1)_{U_i}$ is nonempty. Applying F we see that $(\mathcal{S}_2)_{U_i}$ is nonempty. Given $U \in \text{Ob}(\mathcal{C})$ and $x, y \in \text{Ob}((\mathcal{S}_2)_U)$ there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} such that $G(x)|_{U_i} \cong G(y)|_{U_i}$ in $(\mathcal{S}_1)_{U_i}$. By Categories, Lemma 4.33.8 this implies $x|_{U_i} \cong y|_{U_i}$ in $(\mathcal{S}_2)_{U_i}$. \square

We want to generalize the definition of gerbes a bit. Namely, let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of stacks in groupoids over a site \mathcal{C} . We want to say what it means for \mathcal{X} to be a gerbe over \mathcal{Y} . By Section 8.10 the category \mathcal{Y} inherits the structure of a site from \mathcal{C} . A naive guess is: Just require that $\mathcal{X} \rightarrow \mathcal{Y}$ is a gerbe in the sense above. Except the notion so obtained is not invariants under replacing \mathcal{X} by an equivalent stack in groupoids over \mathcal{C} ; this is even the case for the property of being fibred in groupoids over \mathcal{Y} . However, it turns out that we can replace \mathcal{X} by an equivalent stack in groupoids over \mathcal{Y} which is fibred in groupoids over \mathcal{Y} , and then the property of being a gerbe over \mathcal{Y} is independent of this choice. Here is the precise formulation.

Lemma 8.11.3. *Let \mathcal{C} be a site. Let $p : \mathcal{X} \rightarrow \mathcal{C}$ and $q : \mathcal{Y} \rightarrow \mathcal{C}$ be stacks in groupoids. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over \mathcal{C} . The following are equivalent*

- (1) *For some (equivalently any) factorization $F = F' \circ a$ where $a : \mathcal{X} \rightarrow \mathcal{X}'$ is an equivalence of categories over \mathcal{C} and F' is fibred in groupoids, the map $F' : \mathcal{X}' \rightarrow \mathcal{Y}$ is a gerbe (with the topology on \mathcal{Y} inherited from \mathcal{C}).*
- (2) *The following two conditions are satisfied*
 - (a) *for $y \in \text{Ob}(\mathcal{Y})$ lying over $U \in \text{Ob}(\mathcal{C})$ there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} and objects x_i of \mathcal{X} over U_i such that $F(x_i) \cong y|_{U_i}$ in \mathcal{Y}_{U_i} , and*
 - (b) *for $U \in \text{Ob}(\mathcal{C})$, $x, x' \in \text{Ob}(\mathcal{X}_U)$, and $b : F(x) \rightarrow F(x')$ in \mathcal{Y}_U there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} and morphisms $a_i : x|_{U_i} \rightarrow x'|_{U_i}$ in \mathcal{X}_{U_i} with $F(a_i) = b|_{U_i}$.*

Proof. By Categories, Lemma 4.33.15 there exists a factorization $F = F' \circ a$ where $a : \mathcal{X} \rightarrow \mathcal{X}'$ is an equivalence of categories over \mathcal{C} and F' is fibred in groupoids. By Categories, Lemma 4.33.16 given any two such factorizations $F = F' \circ a = F'' \circ b$ we have that \mathcal{X}' is equivalent to \mathcal{X}'' as categories over \mathcal{Y} . Hence Lemma 8.11.2 guarantees that the condition (1) is independent of the choice of the factorization. Moreover, this means that we may assume $\mathcal{X}' = \mathcal{X} \times_{F, \mathcal{Y}, \text{id}} \mathcal{Y}$ as in the proof of Categories, Lemma 4.33.15

Let us prove that (a) and (b) imply that $\mathcal{X}' \rightarrow \mathcal{Y}$ is a gerbe. First of all, by Lemma 8.10.4 we see that $\mathcal{X}' \rightarrow \mathcal{Y}$ is a stack in groupoids. Next, let y be an object of \mathcal{Y} lying over $U \in \text{Ob}(\mathcal{C})$. By (a) we can find a covering $\{U_i \rightarrow U\}$ in \mathcal{C} and objects x_i of \mathcal{X} over U_i and isomorphisms $f_i : F(x_i) \rightarrow y|_{U_i}$ in \mathcal{Y}_{U_i} . Then $(U_i, x_i, y|_{U_i}, f_i)$ are objects of \mathcal{X}'_{U_i} , i.e., the second condition of Definition 8.11.1 holds. Finally, let (U, x, y, f) and (U, x', y, f') be objects of \mathcal{X}' lying over the same object $y \in \text{Ob}(\mathcal{Y})$. Set $b = (f')^{-1} \circ f$. By condition (b) we can find a covering $\{U_i \rightarrow U\}$ and isomorphisms $a_i : x|_{U_i} \rightarrow x'|_{U_i}$ in \mathcal{X}_{U_i} with $F(a_i) = b|_{U_i}$. Then

$$(a_i, \text{id}) : (U, x, y, f)|_{U_i} \rightarrow (U, x', y, f')|_{U_i}$$

is a morphism in \mathcal{X}'_{U_i} as desired. This proves that (2) implies (1).

To prove that (1) implies (2) one reads the arguments in the preceding paragraph backwards. Details omitted. \square

Definition 8.11.4. Let \mathcal{C} be a site. Let \mathcal{X} and \mathcal{Y} be stacks in groupoids over \mathcal{C} . Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over \mathcal{C} . We say \mathcal{X} is a *gerbe over \mathcal{Y}* if the equivalent conditions of Lemma 8.11.3 are satisfied.

This definition does not conflict with Definition 8.11.1 when $\mathcal{Y} = \mathcal{C}$ because in this case we may take $\mathcal{X}' = \mathcal{X}$ in part (1) of Lemma 8.11.3. Note that conditions (2)(a) and (2)(b) of Lemma 8.11.3 are quite close in spirit to conditions (2) and (3) of Definition 8.11.1. Namely, (2)(a) says that the map of presheaves of isomorphism classes of objects becomes a surjection after sheafification. Moreover, (2)(b) says that

$$\text{Isom}_{\mathcal{X}}(x, x') \longrightarrow \text{Isom}_{\mathcal{Y}}(F(x), F(x'))$$

is a surjection of sheaves on \mathcal{C}/U for any U and $x, x' \in \text{Ob}(\mathcal{X}_U)$.

Lemma 8.11.5. *Let \mathcal{C} be a site. Let*

$$\begin{array}{ccc} \mathcal{X}' & \xrightarrow{G'} & \mathcal{X} \\ F' \downarrow & & \downarrow F \\ \mathcal{Y}' & \xrightarrow{G} & \mathcal{Y} \end{array}$$

be a 2-fibre product of stacks in groupoids over \mathcal{C} . If \mathcal{X} is a gerbe over \mathcal{Y} , then \mathcal{X}' is a gerbe over \mathcal{Y}' .

Proof. By the uniqueness property of a 2-fibre product may assume that $\mathcal{X}' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ as in Categories, Lemma 4.30.3. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11.3 for $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{Y}'$.

Let y' be an object of \mathcal{Y}' lying over the object U of \mathcal{C} . By assumption there exists a covering $\{U_i \rightarrow U\}$ of U and objects $x_i \in \mathcal{X}_{U_i}$ with isomorphisms $\alpha_i : G(y')|_{U_i} \rightarrow F(x_i)$. Then $(U_i, y'|_{U_i}, x_i, \alpha_i)$ is an object of $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ over U_i whose image in \mathcal{Y}' is $y'|_{U_i}$. Thus (2)(a) holds.

Let $U \in \text{Ob}(\mathcal{C})$, let x'_1, x'_2 be objects of $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ over U , and let $b' : F'(x'_1) \rightarrow F'(x'_2)$ be a morphism in \mathcal{Y}'_U . Write $x'_i = (U, y'_i, x_i, \alpha_i)$. Note that $F'(x'_i) = x_i$ and $G'(x'_i) = y'_i$. By assumption there exists a covering $\{U_i \rightarrow U\}$ in \mathcal{C} and morphisms $a_i : x_1|_{U_i} \rightarrow x_2|_{U_i}$ in \mathcal{X}_{U_i} with $F(a_i) = G(b')|_{U_i}$. Then $(b'|_{U_i}, a_i)$ is a morphism $x'_1|_{U_i} \rightarrow x'_2|_{U_i}$ as required in (2)(b). \square

Lemma 8.11.6. *Let \mathcal{C} be a site. Let $F : \mathcal{X} \rightarrow \mathcal{Y}$ and $G : \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of stacks in groupoids over \mathcal{C} . If \mathcal{X} is a gerbe over \mathcal{Y} and \mathcal{Y} is a gerbe over \mathcal{Z} , then \mathcal{X} is a gerbe over \mathcal{Z} .*

Proof. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11.3 for $\mathcal{X} \rightarrow \mathcal{Z}$.

Let z be an object of \mathcal{Z} lying over the object U of \mathcal{C} . By assumption on G there exists a covering $\{U_i \rightarrow U\}$ of U and objects $y_i \in \mathcal{Y}_{U_i}$ such that $G(y_i) \cong z|_{U_i}$. By assumption on F there exist coverings $\{U_{ij} \rightarrow U_i\}$ and objects $x_{ij} \in \mathcal{X}_{U_{ij}}$ such that $F(x_{ij}) \cong y_i|_{U_{ij}}$. Then $\{U_{ij} \rightarrow U\}$ is a covering of \mathcal{C} and $(G \circ F)(x_{ij}) \cong z|_{U_{ij}}$. Thus (2)(a) holds.

Let $U \in \text{Ob}(\mathcal{C})$, let x_1, x_2 be objects of \mathcal{X} over U , and let $c : (G \circ F)(x_1) \rightarrow (G \circ F)(x_2)$ be a morphism in \mathcal{Z}_U . By assumption on G there exists a covering $\{U_i \rightarrow U\}$ of U and morphisms $b_i : F(x_1)|_{U_i} \rightarrow F(x_2)|_{U_i}$ in \mathcal{Y}_{U_i} such that $G(b_i) = c|_{U_i}$. By assumption on F there exist coverings $\{U_{ij} \rightarrow U_i\}$ and morphisms $a_{ij} : x_1|_{U_{ij}} \rightarrow x_2|_{U_{ij}}$ in $\mathcal{X}_{U_{ij}}$ such that $F(a_{ij}) = b_i|_{U_{ij}}$. Then $\{U_{ij} \rightarrow U\}$ is a covering of \mathcal{C} and $(G \circ F)(a_{ij}) = c|_{U_{ij}}$ as required in (2)(b). \square

Lemma 8.11.7. *Let \mathcal{C} be a site. Let*

$$\begin{array}{ccc} \mathcal{X}' & \xrightarrow{G'} & \mathcal{X} \\ F' \downarrow & & \downarrow F \\ \mathcal{Y}' & \xrightarrow{G} & \mathcal{Y} \end{array}$$

be a 2-cartesian diagram of stacks in groupoids over \mathcal{C} . If for every $U \in \text{Ob}(\mathcal{C})$ and $x \in \text{Ob}(\mathcal{Y}_U)$ there exists a covering $\{U_i \rightarrow U\}$ such that $x|_{U_i}$ is in the essential image of $G : \mathcal{Y}'_{U_i} \rightarrow \mathcal{Y}_{U_i}$ and \mathcal{X}' is a gerbe over \mathcal{Y}' , then \mathcal{X} is a gerbe over \mathcal{Y} .

Proof. By the uniqueness property of a 2-fibre product may assume that $\mathcal{X}' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ as in Categories, Lemma 4.30.3. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11.3 for $\mathcal{X} \rightarrow \mathcal{Y}$.

Let y be an object of \mathcal{Y} lying over the object U of \mathcal{C} . By assumption there exists a covering $\{U_i \rightarrow U\}$ of U and objects $y'_i \in \mathcal{Y}'_{U_i}$ with $G(y'_i) \cong y|_{U_i}$. By (2)(a) for $\mathcal{X}' \rightarrow \mathcal{Y}'$ there exist coverings $\{U_{ij} \rightarrow U_i\}$ and objects x'_{ij} of \mathcal{X}' over U_{ij} with $F'(x'_{ij})$ isomorphic to the restriction of y'_i to U_{ij} . Then $\{U_{ij} \rightarrow U\}$ is a covering of \mathcal{C} and $G'(x'_{ij})$ are objects of \mathcal{X} over U_{ij} whose images in \mathcal{Y} are isomorphic to the restrictions $y|_{U_{ij}}$. This proves (2)(a) for $\mathcal{X} \rightarrow \mathcal{Y}$.

Let $U \in \text{Ob}(\mathcal{C})$, let x_1, x_2 be objects of \mathcal{X} over U , and let $b : F(x_1) \rightarrow F(x_2)$ be a morphism in \mathcal{Y}_U . By assumption we may choose a covering $\{U_i \rightarrow U\}$ and objects y'_{1i}, y'_{2i} of \mathcal{Y}' over U_i such that there exist isomorphisms $\alpha_{1i} : G(y'_{1i}) \cong F(x_1)|_{U_i}$ and $\alpha_{2i} : G(y'_{2i}) \cong F(x_2)|_{U_i}$. Then we get objects $x'_{1i} = (U_i, y'_{1i}, x_1|_{U_i}, \alpha_{1i})$ and $x'_{2i} = (U_i, y'_{2i}, x_1|_{U_i}, \alpha_{2i})$ of \mathcal{X}' over U_i . The restriction $b|_{U_i}$ is a morphism $F'(x'_{1i}) \rightarrow F'(x'_{2i})$. By (2)(b) for $\mathcal{X}' \rightarrow \mathcal{Y}'$ there exist coverings $\{U_{ij} \rightarrow U_i\}$ and morphisms $a'_{ij} : x'_{1i}|_{U_{ij}} \rightarrow x'_{2i}|_{U_{ij}}$ such that $F'(a'_{ij}) = b|_{U_{ij}}$. Unwinding the definition of morphisms in $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ we see that $G'(a'_{ij}) : x_1|_{U_{ij}} \rightarrow x_2|_{U_{ij}}$ are the morphism we're looking for, i.e., (2)(b) holds for $\mathcal{X} \rightarrow \mathcal{Y}$. \square

8.12. Functoriality for stacks

In this section we study what happens if we want to change the base site of a stack. This section can be skipped on a first reading.

Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Let $p : \mathcal{S} \rightarrow \mathcal{D}$ be a category over \mathcal{D} . In this situation we denote $u^p\mathcal{S}$ the category over \mathcal{C} defined as follows

- (1) An object of $u^p\mathcal{S}$ is a pair (U, y) consisting of an object U of \mathcal{C} and an object y of $\mathcal{S}_{u(U)}$.
- (2) A morphism $(a, \beta) : (U, y) \rightarrow (U', y')$ is given by a morphism $a : U \rightarrow U'$ of \mathcal{C} and a morphism $\beta : y \rightarrow y'$ of \mathcal{S} such that $p(\beta) = u(a)$.

Note that with these definitions the fibre category of $u^p\mathcal{S}$ over U is equal to the fibre category of \mathcal{S} over $u(U)$.

Lemma 8.12.1. *In the situation above, if \mathcal{S} is a fibred category over \mathcal{D} then $u^p\mathcal{S}$ is a fibred category over \mathcal{C} .*

Proof. Please take a look at the discussion surrounding Categories, Definitions 4.31.1 and 4.31.5 before reading this proof. Let $(a, \beta) : (U, y) \rightarrow (U', y')$ be a morphism of $u^p\mathcal{S}$. We claim that (a, β) is strongly cartesian if and only if β is

strongly cartesian. First, assume β is strongly cartesian. Consider any second morphism $(a_1, \beta_1) : (U_1, y_1) \rightarrow (U', y')$ of $u^p\mathcal{S}$. Then

$$\begin{aligned} & \text{Mor}_{u^p\mathcal{S}}((U_1, y_1), (U, y)) \\ &= \text{Mor}_{\mathcal{C}}(U_1, U) \times_{\text{Mor}_{\mathcal{D}}(u(U_1), u(U))} \text{Mor}_{\mathcal{S}}(y_1, y) \\ &= \text{Mor}_{\mathcal{C}}(U_1, U) \times_{\text{Mor}_{\mathcal{D}}(u(U_1), u(U))} \text{Mor}_{\mathcal{S}}(y_1, y') \times_{\text{Mor}_{\mathcal{D}}(u(U_1), u(U'))} \text{Mor}_{\mathcal{D}}(u(U_1), u(U)) \\ &= \text{Mor}_{\mathcal{S}}(y_1, y') \times_{\text{Mor}_{\mathcal{D}}(u(U_1), u(U'))} \text{Mor}_{\mathcal{C}}(U_1, U) \\ &= \text{Mor}_{u^p\mathcal{S}}((U_1, y_1), (U', y')) \times_{\text{Mor}_{\mathcal{C}}(U_1, U')} \text{Mor}_{\mathcal{C}}(U_1, U) \end{aligned}$$

the second equality as β is strongly cartesian. Hence we see that indeed (a, β) is strongly cartesian. Conversely, suppose that (a, β) is strongly cartesian. Choose a strongly cartesian morphism $\beta' : y'' \rightarrow y'$ in \mathcal{S} with $p(\beta') = u(a)$. Then both $(a, \beta) : (U, y) \rightarrow (U, y')$ and $(a, \beta') : (U, y'') \rightarrow (U, y)$ are strongly cartesian and lift a . Hence, by the uniqueness of strongly cartesian morphisms (see discussion in Categories, Section 4.31) there exists an isomorphism $\iota : y \rightarrow y''$ in $\mathcal{S}_{u(U)}$ such that $\beta = \beta' \circ \iota$, which implies that β is strongly cartesian in \mathcal{S} by Categories, Lemma 4.31.2.

Finally, we have to show that given (U', y') and $U \rightarrow U'$ we can find a strongly cartesian morphism $(U, y) \rightarrow (U', y')$ in $u^p\mathcal{S}$ lifting the morphism $U \rightarrow U'$. This follows from the above as by assumption we can find a strongly cartesian morphism $y \rightarrow y'$ lifting the morphism $u(U) \rightarrow u(U')$. \square

Lemma 8.12.2. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $p : \mathcal{S} \rightarrow \mathcal{D}$ be a stack over \mathcal{D} . Then $u^p\mathcal{S}$ is a stack over \mathcal{C} .*

Proof. We have seen in Lemma 8.12.1 that $u^p\mathcal{S}$ is a fibred category over \mathcal{C} . Moreover, in the proof of that lemma we have seen that a morphism (a, β) of $u^p\mathcal{S}$ is strongly cartesian if and only if β is strongly cartesian in \mathcal{S} . Hence, given a morphism $a : U \rightarrow U'$ of \mathcal{C} , not only do we have the equalities $(u^p\mathcal{S})_U = \mathcal{S}_U$ and $(u^p\mathcal{S})_{U'} = \mathcal{S}_{U'}$, but via these equalities the pullback functors agree; in a formula $a^*(U', y') = (U, u(a)^*y')$.

Having said this, let $\mathcal{U} = \{U_i \rightarrow U\}$ be a covering of \mathcal{C} . As u is continuous we see that $\mathcal{V} = \{u(U_i) \rightarrow u(U)\}$ is a covering of \mathcal{D} , and that $u(U_i \times_U U_j) = u(U_i) \times_{u(U)} u(U_j)$ and similarly for the triple fibre products $U_i \times_U U_j \times_U U_k$. As we have the identifications of fibre categories and pullbacks we see that descend data relative to \mathcal{U} are identical to descend data relative to \mathcal{V} . Since by assumption we have effective descent in \mathcal{S} we conclude the same holds for $u^p\mathcal{S}$. \square

Lemma 8.12.3. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $p : \mathcal{S} \rightarrow \mathcal{D}$ be a stack in groupoids over \mathcal{D} . Then $u^p\mathcal{S}$ is a stack in groupoids over \mathcal{C} .*

Proof. This follows immediately from Lemma 8.12.2 and the fact that all fibre categories are groupoids. \square

Definition 8.12.4. Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Let \mathcal{S} be a fibred category over \mathcal{D} . In this setting we write $f_*\mathcal{S}$ for the fibred category $u^p\mathcal{S}$ defined above. We say that $f_*\mathcal{S}$ is the *pushforward of \mathcal{S} along f* .

By the results above we know that $f_*\mathcal{S}$ is a stack (in groupoids) if \mathcal{S} is a stack (in groupoids). It is harder to define the pullback of a stack (and we'll need additional assumptions for our particular construction – feel free to write up and submit a more general construction). We do this in several steps.

Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ be a category over \mathcal{C} . In this setting we define a category $u_{pp}\mathcal{S}$ as follows:

- (1) An object of $u_{pp}\mathcal{S}$ is a triple $(U, \phi : V \rightarrow u(U), x)$ where $U \in \text{Ob}(\mathcal{C})$, the map $\phi : V \rightarrow u(U)$ is a morphism in \mathcal{D} , and $x \in \text{Ob}(\mathcal{S}_U)$.
- (2) A morphism

$$(U_1, \phi_1 : V_1 \rightarrow u(U_1), x_1) \longrightarrow (U_2, \phi_2 : V_2 \rightarrow u(U_2), x_2)$$

of $u_{pp}\mathcal{S}$ is given by a (a, b, α) where $a : U_1 \rightarrow U_2$ is a morphism of \mathcal{C} , $b : V_1 \rightarrow V_2$ is a morphism of \mathcal{D} , and $\alpha : x_1 \rightarrow x_2$ is morphism of \mathcal{S} , such that $p(\alpha) = a$ and the diagram

$$\begin{array}{ccc} V_1 & \xrightarrow{\quad b \quad} & V_2 \\ \phi_1 \downarrow & & \downarrow \phi_2 \\ u(U_1) & \xrightarrow{\quad u(a) \quad} & u(U_2) \end{array}$$

commutes in \mathcal{D} .

We think of $u_{pp}\mathcal{S}$ as a category over \mathcal{D} via

$$p_{pp} : u_{pp}\mathcal{S} \longrightarrow \mathcal{D}, \quad (U, \phi : V \rightarrow u(U), x) \longmapsto V.$$

The fibre category of $u_{pp}\mathcal{S}$ over an object V of \mathcal{D} does not have a simple description. Moreover, it is in general not the case that $u_{pp}\mathcal{S}$ is a fibred category over \mathcal{D} if \mathcal{S} is a fibred category over \mathcal{C} .

Lemma 8.12.5. *In the situation above assume*

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category,
- (2) \mathcal{C} has nonempty finite limits, and
- (3) $u : \mathcal{C} \rightarrow \mathcal{D}$ commutes with nonempty finite limits.

Consider the set $R \subset \text{Arrows}(u_{pp}\mathcal{S})$ of morphisms of the form

$$(a, \text{id}_V, \alpha) : (U', \phi' : V \rightarrow u(U'), x') \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

with α strongly cartesian. Then R is a right multiplicative system.

Proof. According to Categories, Definition 4.25.1 we have to check RMS1, RMS2, RMS3. Condition RMS1 holds as a composition of strongly cartesian morphisms is strongly cartesian, see Categories, Lemma 4.31.2.

To check RMS2 suppose we have a morphism

$$(a, b, \alpha) : (U_1, \phi_1 : V_1 \rightarrow u(U_1), x_1) \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

of $u_{pp}\mathcal{S}$ and a morphism

$$(c, \text{id}_V, \gamma) : (U', \phi' : V \rightarrow u(U'), x') \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

with γ strongly cartesian from R . In this situation set $U'_1 = U_1 \times_U U'$, and denote $a' : U'_1 \rightarrow U'$ and $c' : U'_1 \rightarrow U_1$ the projections. As $u(U'_1) = u(U_1) \times_{u(U)} u(U')$ we see that $\phi'_1 = (\phi_1, \phi') : V_1 \rightarrow u(U'_1)$ is a morphism in \mathcal{D} . Let $\gamma_1 : x'_1 \rightarrow x_1$ be a strongly cartesian morphism of \mathcal{S} with $p(\gamma_1) = \phi'_1$ (which exists because \mathcal{S} is a

fibred category over \mathcal{C}). Then as $\gamma : x' \rightarrow x$ is strongly cartesian there exists a unique morphism $\alpha' : x'_1 \rightarrow x'$ with $p(\alpha') = a'$. At this point we see that

$$(a', b, \alpha') : (U_1, \phi_1 : V_1 \rightarrow u(U'_1), x'_1) \longrightarrow (U, \phi : V \rightarrow u(U'), x')$$

is a morphism and that

$$(c', \text{id}_{V_1}, \gamma_1) : (U'_1, \phi'_1 : V_1 \rightarrow u(U'_1), x'_1) \longrightarrow (U_1, \phi : V_1 \rightarrow u(U_1), x_1)$$

is an element of R which form a solution of the existence problem posed by RMS2.

Finally, suppose that

$$(a, b, \alpha), (a', b', \alpha') : (U_1, \phi_1 : V_1 \rightarrow u(U_1), x_1) \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

are two morphisms of $u_{pp}\mathcal{S}$ and suppose that

$$(c, \text{id}_V, \gamma) : (U, \phi : V \rightarrow u(U), x) \longrightarrow (U', \phi : V \rightarrow u(U'), x')$$

is an element of R which equalizes the morphisms (a, b, α) and (a', b', α') . This implies in particular that $b = b'$. Let $d : U_2 \rightarrow U_1$ be the equalizer of a, a' which exists (see Categories, Lemma 4.18.3). Moreover, $u(d) : u(U_2) \rightarrow u(U_1)$ is the equalizer of $u(a), u(a')$ hence (as $b = b'$) there is a morphism $\phi_2 : V_1 \rightarrow u(U_2)$ such that $\phi_1 = u(d) \circ \phi_2$. Let $\delta : x_2 \rightarrow x_1$ be a strongly cartesian morphism of \mathcal{S} with $p(\delta) = u(d)$. Now we claim that $\alpha \circ \delta = \alpha' \circ \delta$. This is true because γ is strongly cartesian, $\gamma \circ \alpha \circ \delta = \gamma \circ \alpha' \circ \delta$, and $p(\alpha \circ \delta) = p(\alpha' \circ \delta)$. Hence the arrow

$$(d, \text{id}_{V_1}, \delta) : (U_2, \phi_2 : V_1 \rightarrow u(U_2), x_2) \longrightarrow (U_1, \phi_1 : V_1 \rightarrow u(U_1), x_1)$$

is an element of R and equalizes (a, b, α) and (a', b', α') . Hence R satisfies RMS3 as well. \square

Lemma 8.12.6. *With notation and assumptions as in Lemma 8.12.5. Set $u_p\mathcal{S} = R^{-1}u_{pp}\mathcal{S}$, see Categories, Section 4.25. Then $u_p\mathcal{S}$ is a fibred category over \mathcal{D} .*

Proof. We use the description of $u_p\mathcal{S}$ given just above Categories, Lemma 4.25.9. Note that the functor $p_{pp} : u_{pp}\mathcal{S} \rightarrow \mathcal{D}$ transforms every element of R to an identity morphism. Hence by Categories, Lemma 4.25.13 we obtain a canonical functor $p_p : u_p\mathcal{S} \rightarrow \mathcal{D}$ extending the given functor. This is how we think of $u_p\mathcal{S}$ as a category over \mathcal{D} .

First we want to characterize the \mathcal{D} -strongly cartesian morphisms in $u_p\mathcal{S}$. A morphism $f : X \rightarrow Y$ of $u_p\mathcal{S}$ is the equivalence class of a pair $(f' : X' \rightarrow Y, r : X' \rightarrow X)$ with $r \in R$. In fact, in $u_p\mathcal{S}$ we have $f = (f', 1) \circ (r, 1)^{-1}$ with obvious notation. Note that an isomorphism is always strongly cartesian, as are compositions of strongly cartesian morphisms, see Categories, Lemma 4.31.2. Hence f is strongly cartesian if and only if $(f', 1)$ is so. Thus the following claim completely characterizes strongly cartesian morphisms. Claim: A morphism

$$(a, b, \alpha) : X_1 = (U_1, \phi_1 : V_1 \rightarrow u(U_1), x_1) \longrightarrow (U_2, \phi_2 : V_2 \rightarrow u(U_2), x_2) = X_2$$

of $u_{pp}\mathcal{S}$ has image $f = ((a, b, \alpha), 1)$ strongly cartesian in $u_p\mathcal{S}$ if and only if α is a strongly cartesian morphism of \mathcal{S} .

Assume α strongly cartesian. Let $X = (U, \phi : V \rightarrow u(U), x)$ be another object, and let $f_2 : X \rightarrow X_2$ be a morphism of $u_p\mathcal{S}$ such that $p_p(f_2) = b \circ b_1$ for some $b_1 : U \rightarrow U_1$. To show that f is strongly cartesian we have to show that there exists a unique morphism $f_1 : X \rightarrow X_1$ in $u_p\mathcal{S}$ such that $p_p(f_1) = b_1$ and $f_2 = f \circ f_1$ in $u_p\mathcal{S}$. Write $f_2 = (f'_2 : X' \rightarrow X_2, r : X' \rightarrow X)$. Again we can write $f_2 = (f'_2, 1) \circ (r, 1)^{-1}$

in $u_p\mathcal{S}$. Since $(r, 1)$ is an isomorphism whose image in \mathcal{D} is an identity we see that finding a morphism $f_1 : X \rightarrow X_1$ with the required properties is the same thing as finding a morphism $f'_1 : X' \rightarrow X_1$ in $u_p\mathcal{S}$ with $p(f'_1) = b_1$ and $f'_2 = f \circ f'_1$. Hence we may assume that f_2 is of the form $f_2 = ((a_2, b_2, \alpha_2), 1)$ with $b_2 = b \circ b_1$. Here is a picture

$$\begin{array}{ccc} & (U_1, V_1 \rightarrow u(U_1), x_1) & \\ & \downarrow (a, b, \alpha) & \\ (U, V \rightarrow u(U), x) & \xrightarrow{(a_2, b_2, \alpha_2)} & (U_2, V_2 \rightarrow u(U_2), x_2) \end{array}$$

Now it is clear how to construct the morphism f_1 . Namely, set $U' = U \times_{U_2} U_1$ with projections $c : U' \rightarrow U$ and $a_1 : U' \rightarrow U_1$. Pick a strongly cartesian morphism $\gamma : x' \rightarrow x$ lifting the morphism c . Since $b_2 = b \circ b_1$, and since $u(U') = u(U) \times_{u(U_2)} u(U_1)$ we see that $\phi' = (\phi, \phi_1 \circ b_1) : V \rightarrow u(U')$. Since α is strongly cartesian, and $a \circ a_1 = a_2 \circ c = p(\alpha_2 \circ \gamma)$ there exists a morphism $\alpha_1 : x' \rightarrow x_1$ lifting a_1 such that $\alpha \circ \alpha_1 = \alpha_2 \circ \gamma$. Set $X' = (U', \phi' : V \rightarrow u(U'), x')$. Thus we see that

$$f_1 = ((a_1, b_1, \alpha_1) : X' \rightarrow X_1, (c, \text{id}_V, \gamma) : X' \rightarrow X) : X \rightarrow X_1$$

works, in fact the diagram

$$\begin{array}{ccc} (U', \phi' : V \rightarrow u(U'), x') & \xrightarrow{(a_1, b_1, \alpha_1)} & (U_1, V_1 \rightarrow u(U_1), x_1) \\ (c, \text{id}_V, \gamma) \downarrow & & \downarrow (a, b, \alpha) \\ (U, V \rightarrow u(U), x) & \xrightarrow{(a_2, b_2, \alpha_2)} & (U_2, V_2 \rightarrow u(U_2), x_2) \end{array}$$

is commutative by construction. This proves existence.

Next we prove uniqueness, still in the special case $f = ((a, b, \alpha), 1)$ and $f_2 = ((a_2, b_2, \alpha_2), 1)$. We strongly advise the reader to skip this part. Suppose that $g_1, g'_1 : X \rightarrow X_1$ are two morphisms of $u_p\mathcal{S}$ such that $p_p(g_1) = p_p(g'_1) = b_1$ and $f_2 = f \circ g_1 = f \circ g'_1$. Our goal is to show that $g_1 = g'_1$. By Categories, Lemma 4.25.10 we may represent g_1 and g'_1 as the equivalence classes of $(f_1 : X' \rightarrow X_1, r : X' \rightarrow X)$ and $(f'_1 : X' \rightarrow X_1, r' : X' \rightarrow X)$ for some $r \in R$. By Categories, Lemma 4.25.11 we see that $f_2 = f \circ g_1 = f \circ g'_1$ means that there exists a morphism $r' : X'' \rightarrow X'$ in $u_{pp}\mathcal{S}$ such that $r' \circ r \in R$ and

$$(a, b, \alpha) \circ f_1 \circ r' = (a, b, \alpha) \circ f'_1 \circ r' = (a_2, b_2, \alpha_2) \circ r'$$

in $u_{pp}\mathcal{S}$. Note that now g_1 is represented by $(f_1 \circ r', r \circ r')$ and similarly for g'_1 . Hence we may assume that

$$(a, b, \alpha) \circ f_1 = (a, b, \alpha) \circ f'_1 = (a_2, b_2, \alpha_2).$$

Write $r = (c, \text{id}_V, \gamma) : (U', \phi' : V \rightarrow u(U'), x')$, $f_1 = (a_1, b_1, \alpha_1)$, and $f'_1 = (a'_1, b_1, \alpha'_1)$. Here we have used the condition that $p_p(g_1) = p_p(g'_1)$. The equalities above are now equivalent to $a \circ a_1 = a \circ a'_1 = a_2 \circ c$ and $\alpha \circ \alpha_1 = \alpha \circ \alpha'_1 = \alpha_2 \circ \gamma$. It need not be the case that $a_1 = a'_1$ in this situation. Thus we have to precompose by one more morphism from R . Namely, let $U'' = \text{Eq}(a_1, a'_1)$ be the equalizer of a_1 and a'_1 which is a subobject of U' . Denote $c' : U'' \rightarrow U'$ the canonical monomorphism. Because of the relations among the morphisms above we see that $V \rightarrow u(U')$ maps into $u(U'') = u(\text{Eq}(a_1, a'_1)) = \text{Eq}(u(a_1), u(a'_1))$. Hence we get a new object $(U'', \phi'' : V \rightarrow u(U''), x'')$, where $\gamma' : x'' \rightarrow x'$ is a strongly cartesian

morphism lifting γ . Then we see that we may precompose f_1 and f'_1 with the element $(c', \text{id}_V, \gamma')$ of R . After doing this, i.e., replacing $(U', \phi' : V \rightarrow u(U'), x')$ with $(U'', \phi'' : V \rightarrow u(U''), x'')$, we get back to the previous situation where in addition we now have that $a_1 = a'_1$. In this case it follows formally from the fact that α is strongly cartesian (!) that $\alpha_1 = \alpha'_1$. This shows that $g_1 = g'_1$ as desired.

We omit the proof of the fact that for any strongly cartesian morphism of $u_p\mathcal{S}$ of the form $((a, b, \alpha), 1)$ the morphism α is strongly cartesian in \mathcal{S} . (We do not need the characterization of strongly cartesian morphisms in the rest of the proof, although we do use it later in this section.)

Let $(U, \phi : V \rightarrow u(U), x)$ be an object of $u_p\mathcal{S}$. Let $b : V' \rightarrow V$ be a morphism of \mathcal{D} . Then the morphism

$$(\text{id}_U, b, \text{id}_x) : (U, \phi \circ b : V' \rightarrow u(U), x) \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

is strongly cartesian by the result of the preceding paragraphs and we win. \square

Lemma 8.12.7. *With notation and assumptions as in Lemma 8.12.6. If \mathcal{S} is fibred in groupoids, then $u_p\mathcal{S}$ is fibred in groupoids.*

Proof. By Lemma 8.12.6 we know that $u_p\mathcal{S}$ is a fibred category. Let $f : X \rightarrow Y$ be a morphism of $u_p\mathcal{S}$ with $p_p(f) = \text{id}_V$. We are done if we can show that f is invertible, see Categories, Lemma 4.33.2. Write f as the equivalence class of a pair $((a, b, \alpha), r)$ with $r \in R$. Then $p_p(r) = \text{id}_V$, hence $p_{pp}((a, b, \alpha)) = \text{id}_V$. Hence $b = \text{id}_V$. But any morphism of \mathcal{S} is strongly cartesian, see Categories, Lemma 4.33.2 hence we see that $(a, b, \alpha) \in R$ is invertible in $u_p\mathcal{S}$ as desired. \square

Lemma 8.12.8. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $q : \mathcal{T} \rightarrow \mathcal{D}$ be categories over \mathcal{C} and \mathcal{D} . Assume that*

- (1) $p : \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category,
- (2) $q : \mathcal{T} \rightarrow \mathcal{D}$ is a fibred category,
- (3) \mathcal{C} has nonempty finite limits, and
- (4) $u : \mathcal{C} \rightarrow \mathcal{D}$ commutes with nonempty finite limits.

Then we have a canonical equivalence of categories

$$\text{Mor}_{\text{Fib}/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) = \text{Mor}_{\text{Fib}/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

of morphism categories.

Proof. In this proof we use the notation x/U to denote an object x of \mathcal{S} which lies over U in \mathcal{C} . Similarly y/V denotes an object y of \mathcal{T} which lies over V in \mathcal{D} . In the same vein $\alpha/a : x/U \rightarrow x'/U'$ denotes the morphism $\alpha : x \rightarrow x'$ with image $a : U \rightarrow U'$ in \mathcal{C} .

Let $G : u_p\mathcal{S} \rightarrow \mathcal{T}$ be a 1-morphism of fibred categories over \mathcal{D} . Denote $G' : u_{pp}\mathcal{S} \rightarrow \mathcal{T}$ the composition of G with the canonical (localization) functor $u_{pp}\mathcal{S} \rightarrow u_p\mathcal{S}$. Then consider the functor $H : \mathcal{S} \rightarrow u^p\mathcal{T}$ given by

$$H(x/U) = (U, G'(U, \text{id}_{u(U)} : u(U) \rightarrow u(U), x))$$

on objects and by

$$H((\alpha, a) : x/U \rightarrow x'/U') = G'(a, u(a), \alpha)$$

on morphisms. Since G transforms strongly cartesian morphisms into strongly cartesian morphisms, we see that if α is strongly cartesian, then $H(\alpha)$ is strongly

cartesian. Namely, we've seen in the proof of Lemma 8.12.6 that in this case the map $(a, u(a), \alpha)$ becomes strongly cartesian in $u_p\mathcal{S}$. Clearly this construction is functorial in G and we obtain a functor

$$A : \text{Mor}_{\text{Fib}/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T}) \longrightarrow \text{Mor}_{\text{Fib}/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T})$$

Conversely, let $H : \mathcal{S} \rightarrow u^p\mathcal{T}$ be a 1-morphism of fibred categories. Recall that an object of $u^p\mathcal{T}$ is a pair (U, y) with $y \in \text{Ob}(\mathcal{T}_{u(U)})$. We denote $\text{pr} : u^p\mathcal{T} \rightarrow \mathcal{T}$ the functor $(U, y) \mapsto y$. In this case we define a functor $G' : u_{pp}\mathcal{S} \rightarrow \mathcal{T}$ by the rules

$$G'(U, \phi : V \rightarrow u(U), x) = \phi^* \text{pr}(H(x))$$

on objects and we let

$$G'((a, b, \alpha) : (U, \phi : V \rightarrow u(U), x) \rightarrow (U', \phi' : V' \rightarrow u(U'), x')) = \beta$$

be the unique morphism $\beta : \phi^* \text{pr}(H(x)) \rightarrow (\phi')^* \text{pr}(H(x'))$ such that $q(\beta) = b$ and the diagram

$$\begin{array}{ccc} \phi^* \text{pr}(H(x)) & \xrightarrow{\beta} & (\phi')^* \text{pr}(H(x')) \\ \downarrow & & \downarrow \\ \text{pr}(H(x)) & \xrightarrow{\text{pr}(H(a, \alpha))} & \text{pr}(H(x')) \end{array}$$

Such a morphism exists and is unique because \mathcal{T} is a fibred category.

We check that $G'(r)$ is an isomorphism if $r \in R$. Namely, if

$$(a, \text{id}_V, \alpha) : (U', \phi' : V \rightarrow u(U'), x') \longrightarrow (U, \phi : V \rightarrow u(U), x)$$

with α strongly cartesian is an element of the right multiplicative system R of Lemma 8.12.5 then $H(\alpha)$ is strongly cartesian, and $\text{pr}(H(\alpha))$ is strongly cartesian, see proof of Lemma 8.12.1. Hence in this case the morphism β has $q(\beta) = \text{id}_V$ and is strongly cartesian. Hence β is an isomorphism by Categories, Lemma 4.31.2. Thus by Categories, Lemma 4.25.13 we obtain a canonical extension $G : u_p\mathcal{S} \rightarrow \mathcal{T}$.

Next, let us prove that G transforms strongly cartesian morphisms into strongly cartesian morphisms. Suppose that $f : X \rightarrow Y$ is a strongly cartesian. By the characterization of strongly cartesian morphisms in $u_p\mathcal{S}$ we can write f as $((a, b, \alpha) : X' \rightarrow Y, r : X' \rightarrow Y)$ where $r \in R$ and α strongly cartesian in \mathcal{S} . By the above it suffices to show that $G'(a, b, \alpha)$ is strongly cartesian. As before the condition that α is strongly cartesian implies that $\text{pr}(H(a, \alpha)) : \text{pr}(H(x)) \rightarrow \text{pr}(H(x'))$ is strongly cartesian in \mathcal{T} . Since in the commutative square above now all arrows except possibly β is strongly cartesian it follows that also β is strongly cartesian as desired. Clearly the construction $H \mapsto G$ is functorial in H and we obtain a functor

$$B : \text{Mor}_{\text{Fib}/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) \longrightarrow \text{Mor}_{\text{Fib}/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

To finish the proof of the lemma we have to show that the functors A and B are mutually quasi-inverse. We omit the verifications. \square

Definition 8.12.9. Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let \mathcal{S} be a stack over \mathcal{C} . In this setting we write $f^{-1}\mathcal{S}$ for the stackification of the fibred category $u_p\mathcal{S}$ over \mathcal{D} constructed above. We say that $f^{-1}\mathcal{S}$ is the *pullback of \mathcal{S} along f* .

Of course, if \mathcal{S} is a stack in groupoids, then $f^{-1}\mathcal{S}$ is a stack in groupoids by Lemmas 8.9.1 and 8.12.7.

Lemma 8.12.10. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let $p : \mathcal{S} \rightarrow \mathcal{C}$ and $q : \mathcal{T} \rightarrow \mathcal{D}$ be stacks. Then we have a canonical equivalence of categories*

$$\mathrm{Mor}_{\mathrm{Stacks}/\mathcal{C}}(\mathcal{S}, f_*\mathcal{T}) = \mathrm{Mor}_{\mathrm{Stacks}/\mathcal{D}}(f^{-1}\mathcal{S}, \mathcal{T})$$

of morphism categories.

Proof. For $i = 1, 2$ an i -morphism of stacks is the same thing as a i -morphism of fibred categories, see Definition 8.4.5. By Lemma 8.12.8 we have already

$$\mathrm{Mor}_{\mathrm{Fib}/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) = \mathrm{Mor}_{\mathrm{Fib}/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

Hence the result follows from Lemma 8.8.3 as $u^p\mathcal{T} = f_*\mathcal{T}$ and $f^{-1}\mathcal{S}$ is the stackification of $u_p\mathcal{S}$. \square

Lemma 8.12.11. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let $\mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, and let $\mathcal{S} \rightarrow \mathcal{S}'$ be the stackification of \mathcal{S} . Then $f^{-1}\mathcal{S}'$ is the stackification of $u_p\mathcal{S}$.*

Proof. Omitted. Hint: This is the analogue of Sites, Lemma 7.14.4. \square

The following lemma tells us that the 2-category of stacks over Sch_{fppf} is a “full 2-sub category” of the 2-category of stacks over Sch'_{fppf} provided that Sch'_{fppf} contains Sch_{fppf} (see Topologies, Section 33.10).

Lemma 8.12.12. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor satisfying the assumptions of Sites, Lemma 7.20.8. Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be the corresponding morphism of sites. Then*

- (1) *for every stack $p : \mathcal{S} \rightarrow \mathcal{C}$ the canonical functor $\mathcal{S} \rightarrow f_*f^{-1}\mathcal{S}$ is an equivalence of stacks,*
- (2) *given stacks $\mathcal{S}, \mathcal{S}'$ over \mathcal{C} the construction f^{-1} induces an equivalence*

$$\mathrm{Mor}_{\mathrm{Stacks}/\mathcal{C}}(\mathcal{S}, \mathcal{S}') \longrightarrow \mathrm{Mor}_{\mathrm{Stacks}/\mathcal{D}}(f^{-1}\mathcal{S}, f^{-1}\mathcal{S}')$$

of morphism categories.

Proof. Note that by Lemma 8.12.10 we have an equivalence of categories

$$\mathrm{Mor}_{\mathrm{Stacks}/\mathcal{D}}(f^{-1}\mathcal{S}, f^{-1}\mathcal{S}') = \mathrm{Mor}_{\mathrm{Stacks}/\mathcal{C}}(\mathcal{S}, f_*f^{-1}\mathcal{S}')$$

Hence (2) follows from (1).

To prove (1) we are going to use Lemma 8.4.8. This lemma tells us that we have to show that $can : \mathcal{S} \rightarrow f_*f^{-1}\mathcal{S}$ is fully faithful and that all objects of $f_*f^{-1}\mathcal{S}$ are locally in the essential image.

We quickly describe the functor can , see proof of Lemma 8.12.8. To do this we introduce the functor $c'' : \mathcal{S} \rightarrow u_{pp}\mathcal{S}$ defined by $c''(x/U) = (U, \mathrm{id} : u(U) \rightarrow u(U), x)$, and $c''(\alpha/a) = (a, u(a), \alpha)$. We set $c' : \mathcal{S} \rightarrow u_p\mathcal{S}$ equal to the composition of c'' and the canonical functor $u_{pp}\mathcal{S} \rightarrow u_p\mathcal{S}$. We set $c : \mathcal{S} \rightarrow f^{-1}\mathcal{S}$ equal to the composition of c' and the canonical functor $u_p\mathcal{S} \rightarrow f^{-1}\mathcal{S}$. Then $can : \mathcal{S} \rightarrow f_*f^{-1}\mathcal{S}$ is the functor which to x/U associates the pair $(U, c(x))$ and to α/a the morphism $(a, c(\alpha))$.

Fully faithfulness. To prove this we are going to use Lemma 8.4.7. Let $U \in \text{Ob}(\mathcal{C})$. Let $x, y \in \mathcal{S}_U$. First off, as u is fully faithful, we have

$$\text{Mor}_{(f_* f^{-1}\mathcal{S})_U}(\text{can}(x), \text{can}(y)) = \text{Mor}_{(f^{-1}\mathcal{S})_{u(U)}}(c(x), c(y))$$

directly from the definition of f_* . Similar holds after pulling back to any U'/U . Because $f^{-1}\mathcal{S}$ is the stackification of $u_p\mathcal{S}$, and since u is continuous and cocontinuous the presheaf

$$U'/U \mapsto \text{Mor}_{(f^{-1}\mathcal{S})_{u(U')}}(c(x|_{U'}), c(y|_{U'}))$$

is the sheafification of the presheaf

$$U'/U \mapsto \text{Mor}_{(u_p\mathcal{S})_{u(U')}}(c'(x|_{U'}), c'(y|_{U'}))$$

Hence to finish the proof of fully faithfulness it suffices to show that for any U and x, y the map

$$\text{Mor}_{\mathcal{S}_U}(x, y) \longrightarrow \text{Mor}_{(u_p\mathcal{S})_U}(c'(x), c'(y))$$

is bijective. A morphism $f : x \rightarrow y$ in $u_p\mathcal{S}$ over $u(U)$ is given by an equivalence class of diagrams

$$\begin{array}{ccc} (U', \phi : u(U) \rightarrow u(U'), x') & \xrightarrow{(a,b,\alpha)} & (U, \text{id} : u(U) \rightarrow u(U), y) \\ \downarrow (c, \text{id}_{u(U)}, \gamma) & & \\ (U, \text{id} : u(U) \rightarrow u(U), x) & & \end{array}$$

with γ strongly cartesian and $b = \text{id}_{u(U)}$. But since u is fully faithful we can write $\phi = u(c')$ for some morphism $c' : U \rightarrow U'$ and then we see that $a \circ c' = \text{id}_U$ and $c \circ c' = \text{id}_{U'}$. Because γ is strongly cartesian we can find a morphism $\gamma' : x \rightarrow x'$ lifting c' such that $\gamma \circ \gamma' = \text{id}_x$. By definition of the equivalence classes defining morphisms in $u_p\mathcal{S}$ it follows that the morphism

$$(U, \text{id} : u(U) \rightarrow u(U), x) \xrightarrow{(\text{id}, \text{id}, \alpha \circ \gamma')} (U, \text{id} : u(U) \rightarrow u(U), y)$$

of $u_{pp}\mathcal{S}$ induces the morphism f in $u_p\mathcal{S}$. This proves that the map is surjective. We omit the proof that it is injective.

Finally, we have to show that any object of $f_* f^{-1}\mathcal{S}$ locally comes from an object of \mathcal{S} . This is clear from the constructions (details omitted). \square

8.13. Stacks and localization

Let \mathcal{C} be a site. Let U be an object of \mathcal{C} . We want to understand stacks over \mathcal{C}/U as stacks over \mathcal{C} together with a morphism towards U . The following lemma is the reason why this is easier to do when the presheaf h_U is a sheaf.

Lemma 8.13.1. *Let \mathcal{C} be a site. Let $U \in \text{Ob}(\mathcal{C})$. Then $j_U : \mathcal{C}/U \rightarrow \mathcal{C}$ is a stack over \mathcal{C} if and only if h_U is a sheaf.*

Proof. Combine Lemma 8.6.3 with Categories, Example 4.36.7. \square

Assume that \mathcal{C} is a site, and U is an object of \mathcal{C} whose associated representable presheaf is a sheaf. We denote $j : \mathcal{C}/U \rightarrow \mathcal{C}$ the localization functor.

Construction A. Let $p : \mathcal{S} \rightarrow \mathcal{C}/U$ be a stack over the site \mathcal{C}/U . We define a stack $j_!p : j_!\mathcal{S} \rightarrow \mathcal{C}$ as follows:

- (1) As a category $j_!\mathcal{S} = \mathcal{S}$, and

(2) the functor $j_!p : j_!\mathcal{S} \rightarrow \mathcal{C}$ is just the composition $j \circ p$.

We omit the verification that this is a stack (hint: Use that h_U is a sheaf to glue morphisms to U). There is a canonical functor

$$j_!\mathcal{S} \longrightarrow \mathcal{C}/U$$

namely the functor p which is a 1-morphism of stacks over \mathcal{C} .

Construction B. Let $q : \mathcal{T} \rightarrow \mathcal{C}$ be a stack over \mathcal{C} which is endowed with a morphism of stacks $p : \mathcal{T} \rightarrow \mathcal{C}/U$ over \mathcal{C} . In this case it is automatically the case that $p : \mathcal{T} \rightarrow \mathcal{C}/U$ is a stack over \mathcal{C}/U .

Lemma 8.13.2. *Assume that \mathcal{C} is a site, and U is an object of \mathcal{C} whose associated representable presheaf is a sheaf. Constructions A and B above define mutually inverse (!) functors of 2-categories*

$$\left\{ \begin{array}{l} \text{2-category of} \\ \text{stacks over } \mathcal{C}/U \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{2-category of pairs } (\mathcal{T}, p) \text{ consisting} \\ \text{of a stack } \mathcal{T} \text{ over } \mathcal{C} \text{ and a morphism} \\ p : \mathcal{T} \rightarrow \mathcal{C}/U \text{ of stacks over } \mathcal{C} \end{array} \right\}$$

Proof. This is clear. □

CHAPTER 9

Fields

9.1. Introduction

In this chapter, we shall discuss the theory of fields. Recall that a *field* is a ring in which all nonzero elements are invertible. Equivalently, the only two ideals of a field are (0) and (1) since any nonzero element is a unit. Consequently fields will be the simplest cases of much of the theory developed later.

The theory of field extensions has a different feel from standard commutative algebra since, for instance, any morphism of fields is injective. Nonetheless, it turns out that questions involving rings can often be reduced to questions about fields. For instance, any domain can be embedded in a field (its quotient field), and any *local ring* (that is, a ring with a unique maximal ideal; we have not defined this term yet) has associated to it its residue field (that is, its quotient by the maximal ideal). A knowledge of field extensions will thus be useful.

9.2. Basic definitions

Because we have placed this chapter before the chapter discussing commutative algebra we need to introduce some of the basic definitions here before we discuss these in greater detail in the algebra chapters.

Definition 9.2.1. An *field* is a nonzero ring where every nonzero element is invertible. Given a field a *subfield* is a subring that is itself a field.

For a field k , we write k^* for the subset $k \setminus \{0\}$. This generalizes the usual notation R^* that refers to the group of invertible elements in a ring R .

Definition 9.2.2. A *domain* or an *integral domain* is a nonzero ring where 0 is the only zerodivisor.

9.3. Examples of fields

To get started, let us begin by providing several examples of fields. The reader should recall that if R is a ring and $I \subset R$ an ideal, then R/I is a field precisely when I is a maximal ideal.

Example 9.3.1 (Rational numbers). The rational numbers form a field. It is called the *field of rational numbers* and denoted \mathbf{Q} .

Example 9.3.2 (Prime fields). If p is a prime number, then $\mathbf{Z}/(p)$ is a field, denoted \mathbf{F}_p . Indeed, (p) is a maximal ideal in \mathbf{Z} . Thus, fields may be finite: \mathbf{F}_p contains p elements.

Example 9.3.3. In a principal ideal domain, an ideal generated by an irreducible element is maximal. Now, if k is a field, then the polynomial ring $k[x]$ is a principal ideal domain. It follows that if $P \in k[x]$ is an irreducible polynomial (that is, a nonconstant polynomial that does not admit a factorization into terms of smaller degrees), then $k[x]/(P)$ is a field. It contains a copy of k in a natural way. This is a very general way of constructing fields. For instance, the complex numbers \mathbf{C} can be constructed as $\mathbf{R}[x]/(x^2 + 1)$.

Example 9.3.4 (Quotient fields). Recall that, given a domain A , there is an imbedding $A \rightarrow K(A)$ into a field $K(A)$ constructed from A in exactly the same manner that \mathbf{Q} is constructed from \mathbf{Z} . Formally the elements of $K(A)$ are (equivalence classes of) fractions a/b , $a, b \in A$, $b \neq 0$. As usual $a/b = a'/b'$ if and only if $ab' = ba'$. This is called the *quotient field* or *field of fractions* or the *fraction field* of A . The quotient field has the following universal property: given an injective ring map $\varphi : A \rightarrow K$ to a field K , there is a unique map $\psi : K(A) \rightarrow K$ making

$$\begin{array}{ccc} K(A) & \xrightarrow{\quad} & K \\ \uparrow & \searrow \varphi & \nearrow \psi \\ A & & \end{array}$$

commute. Indeed, it is clear how to define such a map: we set $\psi(a/b) = \varphi(a)\varphi(b)^{-1}$ where injectivity of φ assures that $\varphi(b) \neq 0$ if $b \neq 0$.

Example 9.3.5 (Field of rational functions). If k is a field, then we can consider the field $k(x)$ of rational functions over k . This is the quotient field of the polynomial ring $k[x]$. In other words, it is the set of quotients F/G for $F, G \in k[x]$, $G \neq 0$ with the obvious equivalence relation.

Example 9.3.6. Let X be a Riemann surface. Let $\mathbf{C}(X)$ denote the set of meromorphic functions on X . Then $\mathbf{C}(X)$ is a ring under multiplication and addition of functions. It turns out that in fact $\mathbf{C}(X)$ is a field. Namely, if a nonzero function $f(z)$ is meromorphic, so is $1/f(z)$. For example, let S^2 be the Riemann sphere; then we know from complex analysis that the ring of meromorphic functions $\mathbf{C}(S^2)$ is the field of rational functions $\mathbf{C}(z)$.

9.4. Vector spaces

One reason fields are so nice is that the theory of modules over fields (i.e. vector spaces), is very simple.

Lemma 9.4.1. *If k is a field, then every k -module is free.*

Proof. Indeed, by linear algebra we know that a k -module (i.e. vector space) V has a *basis* $\mathcal{B} \subset V$, which defines an isomorphism from the free vector space on \mathcal{B} to V . \square

Lemma 9.4.2. *Every exact sequence of modules over a field splits.*

Proof. This follows from Lemma 9.4.1 as every vector space is a projective module. \square

This is another reason why much of the theory in future chapters will not say very much about fields, since modules behave in such a simple manner. Note

that Lemma 9.4.2 is a statement about the *category* of k -modules (for k a field), because the notion of exactness is inherently arrow-theoretic, i.e., makes use of purely categorical notions, and can in fact be phrased within a so-called *abelian category*.

Henceforth, since the study of modules over a field is linear algebra, and since the ideal theory of fields is not very interesting, we shall study what this chapter is really about: *extensions* of fields.

9.5. The characteristic of a field

In the category of rings, there is an *initial object* \mathbf{Z} : any ring R has a map from \mathbf{Z} into it in precisely one way. For fields, there is no such initial object. Nonetheless, there is a family of objects such that every field can be mapped into in exactly one way by exactly one of them, and in no way by the others.

Let F be a field. Think of F as a ring to get a ring map $f : \mathbf{Z} \rightarrow F$. The image of this ring map is a domain (as a subring of a field) hence the kernel of f is a prime ideal in \mathbf{Z} . Hence the kernel of f is either (0) or (p) for some prime number p .

In the first case we see that f is injective, and in this case we think of \mathbf{Z} as a subring of F . Moreover, since every nonzero element of F is invertible we see that it makes sense to talk about $p/q \in F$ for $p, q \in \mathbf{Z}$ with $q \neq 0$. Hence in this case we may and we do think of \mathbf{Q} as a subring of F . One can easily see that this is the smallest subfield of F in this case.

In the second case, i.e., when $\text{Ker}(f) = (p)$ we see that $\mathbf{Z}/(p) = \mathbf{F}_p$ is a subring of F . Clearly it is the smallest subfield of F .

Arguing in this way we see that every field contains a smallest subfield which is either \mathbf{Q} or finite equal to \mathbf{F}_p for some prime number p .

Definition 9.5.1. The *characteristic* of a field F is 0 if $\mathbf{Z} \subset F$, or is a prime p if $p = 0$ in F . The *prime subfield* of F is the smallest subfield of F which is either $\mathbf{Q} \subset F$ if the characteristic is zero, or $\mathbf{F}_p \subset F$ if the characteristic is $p > 0$.

It is easy to see that if $E \subset F$ is a subfield, then the characteristic of E is the same as the characteristic of F .

Example 9.5.2. The characteristic of \mathbf{F}_p is p , and that of \mathbf{Q} is 0.

9.6. Field extensions

In general, though, we are interested not so much in fields by themselves but in field *extensions*. This is perhaps analogous to studying not rings but *algebras* over a fixed ring. The nice thing for fields is that the notion of a “field over another field” just recovers the notion of a field extension, by the next result.

Proposition 9.6.1. *If F is a field and R is a nonzero ring, then any ring homomorphism $\varphi : F \rightarrow R$ is injective.*

Proof. Indeed, let $a \in \text{Ker}(\varphi)$ be a nonzero element. Then we have $\varphi(1) = \varphi(a^{-1}a) = \varphi(a^{-1})\varphi(a) = 0$. Thus $1 = \varphi(1) = 0$ and R is the zero ring. \square

Definition 9.6.2. If F is a field contained in a field E , then E is said to be a *field extension* of F . We shall write E/F to indicate that E is an extension of F .

So if F, F' are fields, and $F \rightarrow F'$ is any ring-homomorphism, we see by Lemma 9.6.1 that it is injective, and F' can be regarded as an extension of F , by a slight abuse of language. Alternatively, a field extension of F is just an F -algebra that happens to be a field. This is completely different than the situation for general rings, since a ring homomorphism is not necessarily injective.

Let k be a field. There is a *category* of field extensions of k . An object of this category is an extension E/k , that is a (necessarily injective) morphism of fields

$$k \rightarrow E,$$

while a morphism between extensions E/k and E'/k is a k -algebra morphism $E \rightarrow E'$; alternatively, it is a commutative diagram

$$\begin{array}{ccc} E & \longrightarrow & E' \\ & \searrow & \nearrow \\ & k & \end{array}$$

The set of morphisms from $E \rightarrow E'$ in the category of extensions of k will be denoted by $\text{Mor}_k(E, E')$.

Definition 9.6.3. A *tower* of fields $E_n/E_{n-1}/\dots/E_0$ consists of a sequence of extensions of fields $E_n/E_{n-1}, E_{n-1}/E_{n-2}, \dots, E_1/E_0$.

Let us give a few examples of field extensions.

Example 9.6.4. Let k be a field, and $P \in k[x]$ an irreducible polynomial. We have seen that $k[x]/(P)$ is a field (Example 9.3.3). Since it is also a k -algebra in the obvious way, it is an extension of k .

Example 9.6.5. If X is a Riemann surface, then the field of meromorphic functions $\mathbf{C}(X)$ (Example 9.3.6) is an extension field of \mathbf{C} , because any element of \mathbf{C} induces a meromorphic — indeed, holomorphic — constant function on X .

Let F/k be a field extension. Let $S \subset F$ be any subset. Then there is a *smallest* subextension of F (that is, a subfield of F containing k) that contains S . To see this, consider the family of subfields of F containing S and k , and take their intersection; one checks that this is a field. By a standard argument one shows, in fact, that this is the set of elements of F that can be obtained via a finite number of elementary algebraic operations (addition, multiplication, subtraction, and division) involving elements of k and S .

Definition 9.6.6. If F/k is an extension and $S \subset F$, we write $k(S)$ for the smallest subextension of F containing S . We will say that S *generates* the extension $k(S)/k$.

For instance, \mathbf{C} is generated by i over \mathbf{R} .

Exercise 9.6.7. Show that \mathbf{C} does not have a countable set of generators over \mathbf{Q} .

Let us now classify extensions generated by one element.

Lemma 9.6.8 (Classification of simple extensions). *If a field extension F/k is generated by one element, then it is k -isomorphic either to the rational function field $k(t)/k$ or to one of the extensions $k[t]/(P)$ for $P \in k[t]$ irreducible.*

We will see that many of the most important cases of field extensions are generated by one element, so this is actually useful.

Proof. Let $\alpha \in F$ be such that $F = k(\alpha)$; by assumption, such an α exists. There is a morphism of rings

$$k[t] \rightarrow F$$

sending the indeterminate t to α . The image is a domain, so the kernel is a prime ideal. Thus, it is either (0) or (P) for $P \in k[t]$ irreducible.

If the kernel is (P) for $P \in k[t]$ irreducible, then the map factors through $k[t]/(P)$, and induces a morphism of fields $k[t]/(P) \rightarrow F$. Since the image contains α , we see easily that the map is surjective, hence an isomorphism. In this case, $k[t]/(P) \simeq F$.

If the kernel is trivial, then we have an injection $k[t] \rightarrow F$. One may thus define a morphism of the quotient field $k(t)$ into F ; given a quotient $R(t)/Q(t)$ with $R(t), Q(t) \in k[t]$, we map this to $R(\alpha)/Q(\alpha)$. The hypothesis that $k[t] \rightarrow F$ is injective implies that $Q(\alpha) \neq 0$ unless Q is the zero polynomial. The quotient field of $k[t]$ is the rational function field $k(t)$, so we get a morphism $k(t) \rightarrow F$ whose image contains α . It is thus surjective, hence an isomorphism. \square

9.7. Finite extensions

If F/E is a field extension, then evidently F is also a vector space over E (the scalar action is just multiplication in F).

Definition 9.7.1. Let F/E be an extension of fields. The dimension of F considered as an E -vector space is called the *degree* of the extension and is denoted $[F : E]$. If $[F : E] < \infty$ then F is said to be a *finite* extension of E .

Example 9.7.2. The field \mathbf{C} is a two dimensional vector space over \mathbf{R} with basis $1, i$. Thus \mathbf{C} is a finite extension of \mathbf{R} of degree 2.

Lemma 9.7.3. Let $K/E/F$ be a tower of algebraic field extensions. If K is finite over F , then K is finite over E .

Proof. Direct from the definition. \square

Let us now consider the degree in the most important special example, that given by Lemma 9.6.8, in the next two examples.

Example 9.7.4 (Degree of a rational function field). If k is any field, then the rational function field $k(t)$ is *not* a finite extension. For example the elements $\{t^n, n \in \mathbf{Z}\}$ are linearly independent over k .

In fact, if k is uncountable, then $k(t)$ is *uncountably* dimensional as a k -vector space. To show this, we claim that the family of elements $\{1/(t - \alpha), \alpha \in k\} \subset k(t)$ is linearly independent over k . A nontrivial relation between them would lead to a contradiction: for instance, if one works over \mathbf{C} , then this follows because $\frac{1}{t - \alpha}$, when considered as a meromorphic function on \mathbf{C} , has a pole at α and nowhere else. Consequently any sum $\sum c_i \frac{1}{t - \alpha_i}$ for the $c_i \in k^*$, and $\alpha_i \in k$ distinct, would have poles at each of the α_i . In particular, it could not be zero.

Amusingly, this leads to a quick proof of the Hilbert Nullstellensatz over the complex numbers. For a slightly more general result, see Algebra, Theorem 10.34.11.

Example 9.7.5 (Degree of a simple algebraic extension). Consider a monogenic field extension E/k of the form discussed in Example 9.6.4. In other words, $E =$

$k[t]/(P)$ for $P \in k[t]$ an irreducible polynomial. Then the degree $[E : k]$ is just the degree $d = \deg(P)$ of the polynomial P . Indeed, say

$$(9.7.5.1) \quad P = a_d t^d + a_1 t^{d-1} + \dots + a_0.$$

with $a_d \neq 0$. Then the images of $1, t, \dots, t^{d-1}$ in $k[t]/(P)$ are linearly independent over k , because any relation involving them would have degree strictly smaller than that of P , and P is the element of smallest degree in the ideal (P) .

Conversely, the set $S = \{1, t, \dots, t^{d-1}\}$ (or more properly their images) spans $k[t]/(P)$ as a vector space. Indeed, we have by (9.7.5.1) that $a_d t^d$ lies in the span of S . Since a_d is invertible, we see that t^d is in the span of S . Similarly, the relation $tP(t) = 0$ shows that the image of t^{d+1} lies in the span of $\{1, t, \dots, t^d\}$ — by what was just shown, thus in the span of S . Working upward inductively, we find that the image of t^n for $n \geq d$ lies in the span of S .

This confirms the observation that $[\mathbf{C} : \mathbf{R}] = 2$, for instance. More generally, if k is a field, and $\alpha \in k$ is not a square, then the irreducible polynomial $x^2 - \alpha \in k[x]$ allows one to construct an extension $k[x]/(x^2 - \alpha)$ of degree two. We shall write this as $k(\sqrt{\alpha})$. Such extensions will be called *quadratic*, for obvious reasons.

The basic fact about the degree is that it is *multiplicative in towers*.

Lemma 9.7.6 (Multiplicativity). *Suppose given a tower of fields $F/E/k$. Then*

$$[F : k] = [F : E][E : k]$$

Proof. Let $\alpha_1, \dots, \alpha_n \in F$ be an E -basis for F . Let $\beta_1, \dots, \beta_m \in E$ be a k -basis for E . Then the claim is that the set of products $\{\alpha_i \beta_j, 1 \leq i \leq n, 1 \leq j \leq m\}$ is a k -basis for F . Indeed, let us check first that they span F over k .

By assumption, the $\{\alpha_i\}$ span F over E . So if $f \in F$, there are $a_i \in E$ with

$$f = \sum_i a_i \alpha_i,$$

and, for each i , we can write $a_i = \sum b_{ij} \beta_j$ for some $b_{ij} \in k$. Putting these together, we find

$$f = \sum_{i,j} b_{ij} \alpha_i \beta_j,$$

proving that the $\{\alpha_i \beta_j\}$ span F over k .

Suppose now that there existed a nontrivial relation

$$\sum_{i,j} c_{ij} \alpha_i \beta_j = 0$$

for the $c_{ij} \in k$. In that case, we would have

$$\sum_i \alpha_i \left(\sum_j c_{ij} \beta_j \right) = 0,$$

and the inner terms lie in E as the β_j do. Now E -linear independence of the $\{\alpha_i\}$ shows that the inner sums are all zero. Then k -linear independence of the $\{\beta_j\}$ shows that the c_{ij} all vanish. \square

We sidetrack to a slightly tangential definition.

Definition 9.7.7. A field K is said to be a *number field* if it has characteristic 0 and the extension $\mathbf{Q} \subset K$ is finite.

Number fields are the basic objects in algebraic number theory. We shall see later that, for the analog of the integers \mathbf{Z} in a number field, something kind of like unique factorization still holds (though strict unique factorization generally does not!).

9.8. Algebraic extensions

An important class of extensions are those where every element generates a finite extension.

Definition 9.8.1. Consider a field extension F/E . An element $\alpha \in F$ is said to be *algebraic* over E if α is the root of some nonzero polynomial with coefficients in E . If all elements of F are algebraic then F is said to be an *algebraic extension* of E .

By Lemma 9.6.8, the subextension $E(\alpha)$ is isomorphic either to the rational function field $E(t)$ or to a quotient ring $E[t]/(P)$ for $P \in E[t]$ an irreducible polynomial. In the latter case, α is algebraic over E (in fact, the proof of Lemma 9.6.8 shows that we can pick P such that α is a root of P); in the former case, it is not.

Example 9.8.2. The field \mathbf{C} is algebraic over \mathbf{R} . Namely, if $\alpha = a + ib$ in \mathbf{C} , then $\alpha^2 - 2a\alpha + a^2 + b^2 = 0$ is a polynomial equation for α over \mathbf{R} .

Example 9.8.3. Let X be a compact Riemann surface, and let $f \in \mathbf{C}(X) - \mathbf{C}$ any nonconstant meromorphic function on X (see Example 9.3.6). Then it is known that $\mathbf{C}(X)$ is algebraic over the subextension $\mathbf{C}(f)$ generated by f . We shall not prove this.

Lemma 9.8.4. *Let $K/E/F$ be a tower of field extensions.*

- (1) *If $\alpha \in K$ is algebraic over F , then α is algebraic over E .*
- (2) *if K is algebraic over F , then K is algebraic over E .*

Proof. This is immediate from the definitions. □

We now show that there is a deep connection between finiteness and being algebraic.

Lemma 9.8.5. *A finite extension is algebraic. In fact, an extension E/k is algebraic if and only if every subextension $k(\alpha)/k$ generated by some $\alpha \in E$ is finite.*

In general, it is very false that an algebraic extension is finite.

Proof. Let E/k be finite, say of degree n . Choose $\alpha \in E$. Then the elements $\{1, \alpha, \dots, \alpha^n\}$ are linearly dependent over E , or we would necessarily have $[E : k] > n$. A relation of linear dependence now gives the desired polynomial that α must satisfy.

For the last assertion, note that a monogenic extension $k(\alpha)/k$ is finite if and only if α is algebraic over k , by Examples 9.7.4 and 9.7.5. So if E/k is algebraic, then each $k(\alpha)/k$, $\alpha \in E$, is a finite extension, and conversely. □

We can extract a lemma of the last proof (really of Examples 9.7.4 and 9.7.5): a monogenic extension is finite if and only if it is algebraic. We shall use this observation in the next result.

Lemma 9.8.6. *Let k be a field, and let $\alpha_1, \alpha_2, \dots, \alpha_n$ be elements of some extension field such that each α_i is algebraic over k . Then the extension $k(\alpha_1, \dots, \alpha_n)/k$ is finite. That is, a finitely generated algebraic extension is finite.*

Proof. Indeed, each extension $k(\alpha_1, \dots, \alpha_{i+1})/k(\alpha_1, \dots, \alpha_i)$ is generated by one element and algebraic, hence finite. By multiplicativity of degree (Lemma 9.7.6) we obtain the result. \square

The set of complex numbers that are algebraic over \mathbf{Q} are simply called the *algebraic numbers*. For instance, $\sqrt{2}$ is algebraic, i is algebraic, but π is not. It is a basic fact that the algebraic numbers form a field, although it is not obvious how to prove this from the definition that a number is algebraic precisely when it satisfies a nonzero polynomial equation with rational coefficients (e.g. by polynomial equations).

Lemma 9.8.7. *Let E/k be a field extension. Then the elements of E algebraic over k form a subextension of E/k .*

Proof. Let $\alpha, \beta \in E$ be algebraic over k . Then $k(\alpha, \beta)/k$ is a finite extension by Lemma 9.8.6. It follows that $k(\alpha + \beta) \subset k(\alpha, \beta)$ is a finite extension, which implies that $\alpha + \beta$ is algebraic by Lemma 9.8.5. Similarly for the difference, product and quotient of α and β . \square

Many nice properties of field extensions, like those of rings, will have the property that they will be preserved by towers and composita.

Lemma 9.8.8. *Let E/k and F/E be algebraic extensions of fields. Then F/k is an algebraic extension of fields.*

Proof. Choose $\alpha \in F$. Then α is algebraic over E . The key observation is that α is algebraic over a finitely generated subextension of k . That is, there is a finite set $S \subset E$ such that α is algebraic over $k(S)$: this is clear because being algebraic means that a certain polynomial in $E[x]$ that α satisfies exists, and as S we can take the coefficients of this polynomial. It follows that α is algebraic over $k(S)$. In particular, the extension $k(S, \alpha)/k(S)$ is finite. Since S is a finite set, and $k(S)/k$ is algebraic, Lemma 9.8.6 shows that $k(S)/k$ is finite. Using multiplicativity (Lemma 9.7.6) we find that $k(S, \alpha)/k$ is finite, so α is algebraic over k . \square

The method of proof in the previous argument — that being algebraic over E was a property that *descended* to a finitely generated subextension of E — is an idea that recurs throughout algebra. It often allows one to reduce general commutative algebra questions to the Noetherian case for example.

Lemma 9.8.9. *Let E/F be an algebraic extension of fields. Then the cardinality $|E|$ of E is at most $\max(\aleph_0, |F|)$.*

Proof. Let S be the set of nonconstant polynomials with coefficients in F . For every $P \in S$ the set of roots $r(P, E) = \{\alpha \in E \mid P(\alpha) = 0\}$ is finite (details omitted). Moreover, the fact that E is algebraic over F implies that $E = \bigcup_{P \in S} r(P, E)$. It is clear that S has cardinality bounded by $\max(\aleph_0, |F|)$ because the cardinality of a finite product of copies of F has cardinality at most $\max(\aleph_0, |F|)$. Thus so does E . \square

9.9. Minimal polynomials

Let E/k be a field extension, and let $\alpha \in E$ be algebraic over k . Then α satisfies a (nontrivial) polynomial equation in $k[x]$. Consider the set of polynomials $P \in k[x]$ such that $P(\alpha) = 0$; by hypothesis, this set does not just contain the zero

polynomial. It is easy to see that this set is an *ideal*. Indeed, it is the kernel of the map

$$k[x] \rightarrow E, \quad x \mapsto \alpha$$

Since $k[x]$ is a PID, there is a *generator* $P \in k[x]$ of this ideal. If we assume P monic, without loss of generality, then P is uniquely determined.

Definition 9.9.1. The polynomial P above is called the *minimal polynomial* of α over k .

The minimal polynomial has the following characterization: it is the monic polynomial, of smallest degree, that annihilates α . Any nonconstant multiple of P will have larger degree, and only multiples of P can annihilate α . This explains the name *minimal*.

Clearly the minimal polynomial is *irreducible*. This is equivalent to the assertion that the ideal in $k[x]$ consisting of polynomials annihilating α is prime. This follows from the fact that the map $k[x] \rightarrow E, x \mapsto \alpha$ is a map into a domain (even a field), so the kernel is a prime ideal.

Lemma 9.9.2. *The degree of the minimal polynomial is $[k(\alpha) : k]$.*

Proof. This is just a restatement of the argument in Lemma 9.6.8: the observation is that if P is the minimal polynomial of α , then the map

$$k[x]/(P) \rightarrow k(\alpha), \quad x \mapsto \alpha$$

is an isomorphism as in the aforementioned proof, and we have counted the degree of such an extension (see Example 9.7.5). \square

So the observation of the above proof is that if $\alpha \in E$ is algebraic, then $k(\alpha) \subset E$ is isomorphic to $k[x]/(P)$.

9.10. Algebraic closure

The “fundamental theorem of algebra” states that \mathbf{C} is algebraically closed. A beautiful proof of this result uses Liouville’s theorem in complex analysis, we shall give another proof (see Lemma 9.20.1).

Definition 9.10.1. A field F is said to be *algebraically closed* if every algebraic extension E/F is trivial, i.e., $E = F$.

This may not be the definition in every text. Here is the lemma comparing it with the other one.

Lemma 9.10.2. *Let F be a field. The following are equivalent*

- (1) F is algebraically closed,
- (2) every irreducible polynomial over F is linear,
- (3) every nonconstant polynomial over F has a root,
- (4) every nonconstant polynomial over F is a product of linear factors.

Proof. If F is algebraically closed, then every irreducible polynomial is linear. Namely, if there exists an irreducible polynomial of degree > 1 , then this generates a nontrivial finite (hence algebraic) field extension, see Example 9.7.5. Thus (1) implies (2). If every irreducible polynomial is linear, then every irreducible polynomial has a root, whence every nonconstant polynomial has a root. Thus (2) implies (3).

Assume every nonconstant polynomial has a root. Let $P \in F[x]$ be nonconstant. If $P(\alpha) = 0$ with $\alpha \in F$, then we see that $P = (x - \alpha)Q$ for some $Q \in F[x]$ (by division with remainder). Thus we can argue by induction on the degree that any nonconstant polynomial can be written as a product $c \prod (x - \alpha_i)$.

Finally, suppose that every nonconstant polynomial over F is a product of linear factors. Let E/F be an algebraic extension. Then all the simple subextensions $F(\alpha)/F$ of E are necessarily trivial (because the only irreducible polynomials are linear by assumption). Thus $E = F$. We see that (4) implies (1) and we are done. \square

Now we want to define a “universal” algebraic extension of a field. Actually, we should be careful: the algebraic closure is *not* a universal object. That is, the algebraic closure is not unique up to *unique* isomorphism: it is only unique up to isomorphism. But still, it will be very handy, if not functorial.

Definition 9.10.3. Let F be a field. We say F is *algebraically closed* if every algebraic extension E/F is trivial, i.e., $E = F$. An *algebraic closure* of F is a field \bar{F} containing F such that:

- (1) \bar{F} is algebraic over F .
- (2) \bar{F} is algebraically closed.

If F is algebraically closed, then F is its own algebraic closure. We now prove the basic existence result.

Theorem 9.10.4. *Every field has an algebraic closure.*

The proof will mostly be a red herring to the rest of the chapter. However, we will want to know that it is *possible* to embed a field inside an algebraically closed field, and we will often assume it done.

Proof. Let F be a field. By Lemma 9.8.9 the cardinality of an algebraic extension of F is bounded by $\max(\aleph_0, |F|)$. Choose a set S containing F with $|S| > \max(\aleph_0, |F|)$. Let's consider triples (E, σ_E, μ_E) where

- (1) E is a set with $F \subset E \subset S$, and
- (2) $\sigma_E : E \times E \rightarrow E$ and $\mu_E : E \times E \rightarrow E$ are maps of sets such that (E, σ_E, μ_E) defines the structure of a field extension of F (in particular $\sigma_E(a, b) = a +_F b$ for $a, b \in F$ and similarly for μ_E), and
- (3) $F \subset E$ is an algebraic field extension.

The collection of all triples (E, σ_E, μ_E) forms a set I . For $i \in I$ we will denote $E_i = (E_i, \sigma_i, \mu_i)$ the corresponding field extension to F . We define a partial ordering on I by declaring $i \leq i'$ if and only if $E_i \subset E_{i'}$ (this makes sense as E_i and $E_{i'}$ are subsets of the same set S) and we have $\sigma_i = \sigma_{i'}|_{E_i \times E_i}$ and $\mu_i = \mu_{i'}|_{E_i \times E_i}$, in other words, $E_{i'}$ is a field extension of E_i .

Let $T \subset I$ be a totally ordered subset. Then it is clear that $E_T = \bigcup_{i \in T} E_i$ with induced maps $\sigma_T = \bigcup \sigma_i$ and $\mu_T = \bigcup \mu_i$ is another element of I . In other words every totally order subset of I has an upper bound in I . By Zorn's lemma there exists a maximal element (E, σ_E, μ_E) in I . We claim that E is an algebraic closure. Since by definition of I the extension E/F is algebraic, it suffices to show that E is algebraically closed.

To see this we argue by contradiction. Namely, suppose that E is not algebraically closed. Then there exists an irreducible polynomial P over E of degree > 1 , see Lemma 9.10.2. By Lemma 9.8.5 we obtain a nontrivial finite extension $E' = E[x]/(P)$. Observe that E'/F is algebraic by Lemma 9.8.8. Thus the cardinality of E' is $\leq \max(\aleph_0, |F|)$. By elementary set theory we can extend the given injection $E \subset S$ to an injection $E' \rightarrow S$. In other words, we may think of E' as an element of our set I contradicting the maximality of E . This contradiction completes the proof. \square

Lemma 9.10.5. *Let F be a field. Let \overline{F} be an algebraic closure of F . Let M/F be an algebraic extension. Then there is a morphism of F -extensions $M \rightarrow \overline{F}$.*

Proof. Consider the set I of pairs (E, φ) where $F \subset E \subset M$ is a subextension and $\varphi : E \rightarrow \overline{F}$ is a morphism of F -extensions. We partially order the set I by declaring $(E, \varphi) \leq (E', \varphi')$ if and only if $E \subset E'$ and $\varphi'|_E = \varphi$. If $T = \{(E_t, \varphi_t)\} \subset I$ is a totally ordered subset, then $\bigcup \varphi_t : \bigcup E_t \rightarrow \overline{F}$ is an element of I . Thus every totally ordered subset of I has an upper bound. By Zorn's lemma there exists a maximal element (E, φ) in I . We claim that $E = M$, which will finish the proof. If not, then pick $\alpha \in M$, $\alpha \notin E$. The α is algebraic over E , see Lemma 9.8.4. Let P be the minimal polynomial of α over E . Let P^φ be the image of P by φ in $\overline{F}[x]$. Since \overline{F} is algebraically closed there is a root β of P^φ in \overline{F} . Then we can extend φ to $\varphi' : E(\alpha) = E[x]/(P) \rightarrow \overline{F}$ by mapping x to β . This contradicts the maximality of (E, φ) as desired. \square

Lemma 9.10.6. *Any two algebraic closures of a field are isomorphic.*

Proof. Let F be a field. If M and \overline{F} are algebraic closures of F , then there exists a morphism of F -extensions $\varphi : M \rightarrow \overline{F}$ by Lemma 9.10.5. Now the image $\varphi(M)$ is algebraically closed. On the other hand, the extension $\varphi(M) \subset \overline{F}$ is algebraic by Lemma 9.8.4. Thus $\varphi(M) = \overline{F}$. \square

9.11. Relatively prime polynomials

Let K be an algebraically closed field. Then the ring $K[x]$ has a very simple ideal structure as we saw in Lemma 9.10.2. In particular, every polynomial $P \in K[x]$ can be written as

$$P = c(x - \alpha_1) \dots (x - \alpha_n),$$

where c is the constant term and the $\alpha_1, \dots, \alpha_n \in k$ are the roots of P (counted with multiplicity). Clearly, the only irreducible polynomials in $K[x]$ are the linear polynomials $c(x - \alpha)$, $c, \alpha \in K$ (and $c \neq 0$).

Definition 9.11.1. If k is any field, we say that two polynomials in $k[x]$ are *relatively prime* if they generate the unit ideal in $k[x]$.

Continuing the discussion above, if K is an algebraically closed field, two polynomials in $K[x]$ are relatively prime if and only if they have no common roots. This follows because the maximal ideals of $K[x]$ are of the form $(x - \alpha)$, $\alpha \in K$. So if $F, G \in K[x]$ have no common root, then (F, G) cannot be contained in any $(x - \alpha)$ (as then they would have a common root at α).

If k is *not* algebraically closed, then this still gives information about when two polynomials in $k[x]$ generate the unit ideal.

Lemma 9.11.2. *Two polynomials in $k[x]$ are relatively prime precisely when they have no common roots in an algebraic closure \bar{k} of k .*

Proof. The claim is that any two polynomials P, Q generate (1) in $k[x]$ if and only if they generate (1) in $\bar{k}[x]$. This is a piece of linear algebra: a system of linear equations with coefficients in k has a solution if and only if it has a solution in any extension of k . Consequently, we can reduce to the case of an algebraically closed field, in which case the result is clear from what we have already proved. \square

9.12. Separable extensions

In characteristic p something funny happens with irreducible polynomials over fields. We explain this in the following lemma.

Lemma 9.12.1. *Let F be a field. Let $P \in F[x]$ be an irreducible polynomial over F . Let $P' = dP/dx$ be the derivative of P with respect to x . Then one of the following two cases happens*

- (1) P and P' are relatively prime, or
- (2) P' is the zero polynomial.

Then second case can only happen if F has characteristic $p > 0$. In this case $P(x) = Q(x^q)$ where $q = p^f$ is a power of p and $Q \in F[x]$ is an irreducible polynomial such that Q and Q' are relatively prime.

Proof. Note that P' has degree $< \deg(P)$. Hence if P and P' are not relatively prime, then $(P, P') = (R)$ where R is a polynomial of degree $< \deg(P)$ contradicting the irreducibility of P . This proves we have the dichotomy between (1) and (2).

Assume we are in case (2) and $P = a_d x^d + \dots + a_0$. Then $P' = da_d x^{d-1} + \dots + a_1$. In characteristic 0 we see that this forces $a_d, \dots, a_1 = 0$ which would mean P is constant a contradiction. Thus we conclude that the characteristic p is positive. In this case the condition $P' = 0$ forces $a_i = 0$ whenever $p \nmid i$. In other words, $P(x) = P_1(x^p)$ for some nonconstant polynomial P_1 . Clearly, P_1 is irreducible as well. By induction on the degree we see that $P_1(x) = Q(x^q)$ as in the statement of the lemma, hence $P(x) = Q(x^{p^q})$ and the lemma is proved. \square

Definition 9.12.2. Let F be a field. Let K/F be an extension of fields.

- (1) We say an irreducible polynomial P over F is *separable* if it is relatively prime to its derivative.
- (2) Given $\alpha \in K$ algebraic over F we say α is *separable* over F if its minimal polynomial is separable over F .
- (3) If K is an algebraic extension of F , we say K is *separable*¹ over F if every element of K is separable over F .

By Lemma 9.12.1 in characteristic 0 every irreducible polynomial is separable, every algebraic element in an extension is separable, and every algebraic extension is separable.

Lemma 9.12.3. *Let $K/E/F$ be a tower of algebraic field extensions.*

- (1) *If $\alpha \in K$ is separable over F , then α is separable over E .*
- (2) *if K is separable over F , then K is separable over E .*

¹For nonalgebraic extensions this definition does not make sense and is not the correct one.

Proof. We will use Lemma 9.12.1 without further mention. Let P be the minimal polynomial of α over F . Let Q be the minimal polynomial of α over E . Then Q divides P in the polynomial ring $E[x]$, say $P = QR$. Then $P' = Q'R + QR'$. Thus if $Q' = 0$, then Q divides P and P' hence $P' = 0$ by the lemma. This proves (1). Part (2) follows immediately from (1) and the definitions. \square

Lemma 9.12.4. *Let F be a field. An irreducible polynomial P over F is separable if and only if P has pairwise distinct roots in an algebraic closure of F .*

Proof. Suppose that $\alpha \in F$ is a root of both P and P' . Then $P = (x - \alpha)Q$ for some polynomial Q . Taking derivatives we obtain $P' = Q + (x - \alpha)Q'$. Thus α is a root of Q . Hence we see that if P and P' have a common root, then P does not have pairwise distinct roots. Conversely, if P has a repeated root, i.e., $(x - \alpha)^2$ divides P , then α is a root of both P and P' . Combined with Lemma 9.11.2 this proves the lemma. \square

Lemma 9.12.5. *Let F be a field and let \bar{F} be an algebraic closure of F . Let $p > 0$ be the characteristic of F . Let P be a polynomial over F . Then the set of roots of P and $P(x^p)$ in \bar{F} have the same cardinality (not counting multiplicity).*

Proof. Clearly, α is a root of $P(x^p)$ if and only if α^p is a root of P . In other words, the roots of $P(x^p)$ are the roots of $x^p - \beta$, where β is a root of P . Thus it suffices to show that the map $\bar{F} \rightarrow \bar{F}$, $\alpha \mapsto \alpha^p$ is bijective. It is surjective, as \bar{F} is algebraically closed which means that every element has a p th root. It is injective because $\alpha^p = \beta^p$ implies $(\alpha - \beta)^p = 0$ because the characteristic is p . And of course in a field $x^p = 0$ implies $x = 0$. \square

Let F be a field and let P be an irreducible polynomial over F . Then we know that $P = Q(x^q)$ for some separable irreducible polynomial Q (Lemma 9.12.1) where q is a power of the characteristic p (and if the characteristic is zero, then $q = 1^2$ and $Q = P$). By Lemma 9.12.5 the number of roots of P and Q in any algebraic closure of F is the same. By Lemma 9.12.4 this number is equal to the degree of Q .

Definition 9.12.6. Let F be a field. Let P be an irreducible polynomial over F . The *separable degree* of P is the cardinality of the set of roots of P in any algebraic closure of F (see discussion above). Notation $\deg_s(P)$.

The separable degree of P always divides the degree and the quotient is a power of the characteristic. If the characteristic is zero, then $\deg_s(P) = \deg(P)$.

Situation 9.12.7. Here F be a field and K/F is a finite extension generated by elements $\alpha_1, \dots, \alpha_n \in K$. We set $K_0 = F$ and

$$K_i = F(\alpha_1, \dots, \alpha_i)$$

to obtain a tower of finite extensions $K = K_r/K_{r-1}/\dots/K_0 = F$. Denote P_i the minimal polynomial of α_i over K_{i-1} . Finally, we fix an algebraic closure \bar{F} of F .

Let F , K , α_i , and \bar{F} be as in Situation 9.12.7. Suppose that $\varphi : K \rightarrow \bar{F}$ is a morphism of extensions of F . Then we obtain maps $\varphi_i : K_i \rightarrow \bar{F}$. In particular, we can take the image of $P_i \in K_{i-1}[x]$ by φ_{i-1} to get a polynomial $P_i^\varphi \in \bar{F}[x]$.

²A good convention for this chapter is to set $0^0 = 1$.

Lemma 9.12.8. *In Situation 9.12.7 the correspondence*

$$\text{Mor}_F(K, \overline{F}) \longrightarrow \{(\beta_1, \dots, \beta_n) \text{ as below}\}, \quad \varphi \longmapsto (\varphi(\alpha_1), \dots, \varphi(\alpha_n))$$

is a bijection. Here the right hand side is the set of n -tuples $(\beta_1, \dots, \beta_n)$ of elements of \overline{F} such that β_i is a root of P_i^φ .

Proof. Let $(\beta_1, \dots, \beta_n)$ be an element of the right hand side. We construct a map of fields corresponding to it by induction. Namely, we set $\varphi_0 : K_0 \rightarrow \overline{F}$ equal to the given map $K_0 = F \subset \overline{F}$. Having constructed $\varphi_{i-1} : K_{i-1} \rightarrow \overline{F}$ we observe that $K_i = K_{i-1}[x]/(P_i)$. Hence we can set φ_i equal to the unique map $K_i \rightarrow \overline{F}$ inducing φ_{i-1} on K_{i-1} and mapping x to β_i . This works precisely as β_i is a root of P_i^φ . Uniqueness implies that the two constructions are mutually inverse. \square

Lemma 9.12.9. *In Situation 9.12.7 we have $|\text{Mor}_F(K, \overline{F})| = \prod_{i=1}^n \deg_s(P_i)$.*

Proof. This follows immediately from Lemma 9.12.8. Observe that a key ingredient we are tacitly using here is the well-definedness of the separable degree of an irreducible polynomial which was observed just prior to Definition 9.12.6. \square

We now use the result above to characterize separable field extensions.

Lemma 9.12.10. *Assumptions and notation as in Situation 9.12.7. If each P_i is separable, i.e., each α_i is separable over K_{i-1} , then*

$$|\text{Mor}_F(K, \overline{F})| = [K : F]$$

and the field extension K/F is separable. If one of the α_i is not separable over K_{i-1} , then $|\text{Mor}_F(K, \overline{F})| < [K : F]$.

Proof. If α_i is separable over K_{i-1} then $\deg_s(P_i) = \deg(P_i) = [K_i : K_{i-1}]$ (last equality by Lemma 9.9.2). By multiplicativity (Lemma 9.7.6) we have

$$[K : F] = \prod [K_i : K_{i-1}] = \prod \deg(P_i) = \prod \deg_s(P_i) = |\text{Mor}_F(K, \overline{F})|$$

where the last equality is Lemma 9.12.9. By the exact same argument we get the strict inequality $|\text{Mor}_F(K, \overline{F})| < [K : F]$ if one of the α_i is not separable over K_{i-1} .

Finally, assume again that each α_i is separable over K_{i-1} . Let $\gamma = \gamma_1 \in K$ be arbitrary. Then we can find additional elements $\gamma_2, \dots, \gamma_m$ such that $K = F(\gamma_1, \dots, \gamma_m)$ (for example we could take $\gamma_2 = \alpha_1, \dots, \gamma_{n+1} = \alpha_n$). Then we see by the last part of the lemma (already proven above) that if γ is not separable over F we would have the strict inequality $|\text{Mor}_F(K, \overline{F})| < [K : F]$ contradicting the very first part of the lemma (already prove above as well). \square

Lemma 9.12.11. *Let K/F be a finite extension of fields. Let \overline{F} be an algebraic closure of F . Then we have*

$$|\text{Mor}_F(K, \overline{F})| \leq [K : F]$$

with equality if and only if K is separable over F .

Proof. This is a corollary of Lemma 9.12.10. Namely, since K/F is finite we can find finitely many elements $\alpha_1, \dots, \alpha_n \in K$ generating K over F (for example we can choose the α_i to be a basis of K over F). If K/F is separable, then each α_i is separable over $F(\alpha_1, \dots, \alpha_{i-1})$ by Lemma 9.12.3 and we get equality by Lemma 9.12.10. On the other hand, if we have equality, then no matter how we choose $\alpha_1, \dots, \alpha_n$ we get that α_1 is separable over F by Lemma 9.12.10. Since we can

start the sequence with an arbitrary element of K it follows that K is separable over F . \square

Lemma 9.12.12. *Let E/k and F/E be separable algebraic extensions of fields. Then F/k is a separable extension of fields.*

Proof. Choose $\alpha \in F$. Then α is separable algebraic over E . Let $P = x^d + \sum_{i < d} a_i x^i$ be the minimal polynomial of α over E . Each a_i is separable algebraic over k . Consider the tower of fields

$$k \subset k(a_0) \subset k(a_0, a_1) \subset \dots \subset k(a_0, \dots, a_{d-1}) \subset k(a_0, \dots, a_{d-1}, \alpha)$$

Because a_i is separable algebraic over k it is separable algebraic over $k(a_0, \dots, a_{i-1})$ by Lemma 9.12.3. Finally, α is separable algebraic over $k(a_0, \dots, a_{d-1})$ because it is a root of P which is irreducible (as it is irreducible over the possibly bigger field E) and separable (as it is separable over E). Thus $k(a_0, \dots, a_{d-1}, \alpha)$ is separable over k by Lemma 9.12.10 and we conclude that α is separable over k as desired. \square

Lemma 9.12.13. *Let E/k be a field extension. Then the elements of E separable over k form a subextension of E/k .*

Proof. Let $\alpha, \beta \in E$ be separable over k . Then β is separable over $k(\alpha)$ by Lemma 9.12.3. Thus we can apply Lemma 9.12.12 to $k(\alpha, \beta)$ to see that $k(\alpha, \beta)$ is separable over k . \square

9.13. Purely inseparable extensions

Purely inseparable extensions are the opposite of the separable extensions defined in the previous section. These extensions only show up in positive characteristic.

Definition 9.13.1. Let F be a field of characteristic $p > 0$. Let K/F be an extension.

- (1) An element $\alpha \in K$ is *purely inseparable* over F if there exists a power q of p such that $\alpha^q \in F$.
- (2) The extension K/F is said to be *purely inseparable* if and only if every element of K is purely inseparable over F .

Observe that a purely inseparable extension is necessarily algebraic. Let F be a field of characteristic $p > 0$. An example of a purely inseparable extension is gotten by adjoining the p th root of an element $t \in F$ which does not yet have one. Namely, the lemma below shows that $P = x^p - t$ is irreducible, and hence

$$K = F[x]/(P) = F[t^{1/p}]$$

is a field. And K is purely inseparable over F because every element

$$a_0 + a_1 t^{1/p} + \dots + a_{p-1} t^{(p-1)/p}, a_i \in F$$

has p th power equal to

$$(a_0 + a_1 t^{1/p} + \dots + a_{p-1} t^{(p-1)/p})^p = a_0^p + a_1^p t + \dots + a_{p-1}^p t^{p-1} \in F$$

This situation occurs for the field $\mathbf{F}_p(t)$ of rational functions over \mathbf{F}_p .

Lemma 9.13.2. *Let p be a prime number. Let F be a field of characteristic p . Let $t \in F$ be an element which does not have a p th root in F . Then the polynomial $x^p - t$ is irreducible over F .*

Proof. To see this, suppose that we have a factorization $x^p - t = fg$. Taking derivatives we get $f'g + fg' = 0$. Note that neither $f' = 0$ nor $g' = 0$ as the degrees of f and g are smaller than p . Moreover, $\deg(f') < \deg(f)$ and $\deg(g') < \deg(g)$. We conclude that f and g have a factor in common. Thus if $x^p - t$ is reducible, then it is of the form $x^p - t = cf^n$ for some irreducible f , $c \in F^*$, and $n > 1$. Since p is a prime number this implies $n = p$ and f linear, which would imply $x^p - t$ has a root in F . Contradiction. \square

We will see that taking p th roots is a very important operation in characteristic p .

Lemma 9.13.3. *Let E/k and F/E be purely inseparable extensions of fields. Then F/k is a purely inseparable extension of fields.*

Proof. Say the characteristic of k is p . Choose $\alpha \in F$. Then $\alpha^q \in E$ for some p -power q . Whereupon $(\alpha^q)^{q'} \in k$ for some p -power q' . Hence $\alpha^{qq'} \in k$. \square

Lemma 9.13.4. *Let E/k be a field extension. Then the elements of E purely inseparable over k form a subextension of E/k .*

Proof. Let p be the characteristic of k . Let $\alpha, \beta \in E$ be purely inseparable over k . Say $\alpha^q \in k$ and $\beta^{q'} \in k$ for some p -powers q, q' . If q'' is a p -power, then $(\alpha + \beta)^{q''} = \alpha^{q''} + \beta^{q''}$. Hence if $q'' \geq q, q'$, then we conclude that $\alpha + \beta$ is purely inseparable over k . Similarly for the difference, product and quotient of α and β . \square

Lemma 9.13.5. *Let E/F be a finite purely inseparable field extension of characteristic $p > 0$. Then there exists a sequence of elements $\alpha_1, \dots, \alpha_n \in E$ such that we obtain a tower of fields*

$$E = F(\alpha_1, \dots, \alpha_n) \supset F(\alpha_1, \dots, \alpha_{n-1}) \supset \dots \supset F(\alpha_1) \supset F$$

such that each intermediate extension is of degree p and comes from adjoining a p th root. Namely, $\alpha_i^p \in F(\alpha_1, \dots, \alpha_{i-1})$ is an element which does not have a p th root in $F(\alpha_1, \dots, \alpha_{i-1})$ for $i = 1, \dots, n$.

Proof. By induction on the degree of E/F . If the degree of the extension is 1 then the result is clear (with $n = 0$). If not, then choose $\alpha \in E$, $\alpha \notin F$. Say $\alpha^{p^r} \in F$ for some $r > 0$. Pick r minimal and replace α by $\alpha^{p^{r-1}}$. Then $\alpha \notin F$, but $\alpha^p \in F$. Then $t = \alpha^p$ is not a p th power in F (because that would imply $\alpha \in F$, see Lemma 9.12.5 or its proof). Thus $F \subset F(\alpha)$ is a subextension of degree p (Lemma 9.13.2). By induction we find $\alpha_1, \dots, \alpha_n \in E$ generating $E/F(\alpha)$ satisfying the conclusions of the lemma. The sequence $\alpha, \alpha_1, \dots, \alpha_n$ does the job for the extension E/F . \square

Lemma 9.13.6. *Let E/F be an algebraic field extension. There exists a unique subextension $F \subset E_{sep} \subset E$ such that E_{sep}/F is separable and E/E_{sep} is purely inseparable.*

Proof. If the characteristic is zero we set $E_{sep} = E$. Assume the characteristic if $p > 0$. Let E_{sep} be the set of elements of E which are separable over F . This is a subextension by Lemma 9.12.13 and of course E_{sep} is separable over F . Given an α in E there exists a p -power q such that α^q is separable over F . Namely, q is that power of p such that the minimal polynomial of α is of the form $P(x^q)$ with P separable algebraic, see Lemma 9.12.1. Hence E/E_{sep} is purely inseparable. Uniqueness is clear. \square

Definition 9.13.7. Let E/F be an algebraic field extension. Let E_{sep} be the subextension found in Lemma 9.13.6.

- (1) The integer $[E_{sep} : F]$ is called the *separable degree* of the extension. Notation $[E : F]_s$.
- (2) The integer $[E : E_{sep}]$ is called the *inseparable degree*, or the *degree of inseparability* of the extension. Notation $[E : F]_i$.

Of course in characteristic 0 we have $[E : F] = [E : F]_s$ and $[E : F]_i = 1$. By multiplicativity (Lemma 9.7.6) we have

$$[E : F] = [E : F]_s [E : F]_i$$

even in case some of these degrees are infinite. In fact, the separable degree and the inseparable degree are multiplicative too (see Lemma 9.13.9).

Lemma 9.13.8. Let K/F be a finite extension. Let \bar{F} be an algebraic closure of F . Then $[K : F]_s = |\text{Mor}_F(K, \bar{F})|$.

Proof. We first prove this when K/F is purely inseparable. Namely, we claim that in this case there is a unique map $K \rightarrow \bar{F}$. This can be seen by choosing a sequence of elements $\alpha_1, \dots, \alpha_n \in K$ as in Lemma 9.13.5. The irreducible polynomial of α_i over $F(\alpha_1, \dots, \alpha_{i-1})$ is $x^p - \alpha_i^p$. Applying Lemma 9.12.9 we see that $|\text{Mor}_F(K, \bar{F})| = 1$. On the other hand, $[K : F]_s = 1$ in this case hence the equality holds.

Let's return to a general finite extension K/F . In this case choose $F \subset K_s \subset K$ as in Lemma 9.13.6. By Lemma 9.12.11 we have $|\text{Mor}_F(K_s, \bar{F})| = [K_s : F] = [K : F]_s$. On the other hand, every field map $\sigma' : K_s \rightarrow \bar{F}$ extends to a unique field map $\sigma : K \rightarrow \bar{F}$ by the result of the previous paragraph. In other words $|\text{Mor}_F(K, \bar{F})| = |\text{Mor}_F(K_s, \bar{F})|$ and the proof is done. \square

Lemma 9.13.9 (Multiplicativity). Suppose given a tower of algebraic field extensions $K/E/F$. Then

$$[K : F]_s = [K : E]_s [E : F]_s \quad \text{and} \quad [K : F]_i = [K : E]_i [E : F]_i$$

Proof. We first prove this in case K is finite over F . Since we have multiplicativity for the usual degree (by Lemma 9.7.6) it suffices to prove one of the two formulas. By Lemma 9.13.8 we have $[K : F]_s = |\text{Mor}_F(K, \bar{F})|$. By the same lemma, given any $\sigma \in \text{Mor}_F(E, \bar{F})$ the number of extensions of σ to a map $\tau : K \rightarrow \bar{F}$ is $[K : E]_s$. Namely, via $E \cong \sigma(E) \subset \bar{F}$ we can view \bar{F} as an algebraic closure of E . Combined with the fact that there are $[E : F]_s = |\text{Mor}_F(E, \bar{F})|$ choices for σ we obtain the result.

If the extensions are infinite one can write K as the union of all finite subextension $F \subset K' \subset K$. For each K' we set $E' = E \cap K'$. Then we have the formulas of the lemma for $K'/E'/F$ by the first paragraph. Since $[K : F]_s = \sup\{[K' : F]_s\}$ and similarly for the other degrees (some details omitted) we obtain the result in general. \square

9.14. Normal extensions

Let $P \in F[x]$ be a nonconstant polynomial over a field F . We say P *splits completely into linear factors over F* or *splits completely over F* if there exist $c \in F^*$, $n \geq 1$,

$\alpha_1, \dots, \alpha_n \in F$ such that

$$P = c(x - \alpha_1) \dots (x - \alpha_n)$$

in $F[x]$. Normal extensions are defined as follows.

Definition 9.14.1. Let E/F be an algebraic field extension. We say E is *normal* over F if for all $\alpha \in E$ the minimal polynomial P of α over F splits completely into linear factors over E .

As in the case of separable extensions, it takes a bit of work to establish the basic properties of this notion.

Lemma 9.14.2. *Let $K/E/F$ be a tower of algebraic field extensions. If K is normal over F , then K is normal over E .*

Proof. Let $\alpha \in K$. Let P be the minimal polynomial of α over F . Let Q be the minimal polynomial of α over E . Then Q divides P in the polynomial ring $E[x]$, say $P = QR$. Hence, if P splits completely over K , then so does Q . \square

Lemma 9.14.3. *Let F be a field. Let M/F be an algebraic extension. Let $F \subset E_i \subset M$, $i \in I$ be subextensions with E_i/F normal. Then $\bigcap E_i$ is normal over F .*

Proof. Direct from the definitions. \square

Lemma 9.14.4. *Let E/F be an algebraic extension of fields. Let \overline{F} be an algebraic closure of F . The following are equivalent*

- (1) E is normal over F , and
- (2) for every pair $\sigma, \sigma' \in \text{Mor}_F(E, \overline{F})$ we have $\sigma(E) = \sigma'(E)$.

Proof. Let \mathcal{P} be the set of all minimal polynomials over F of all elements of E . Set

$$T = \{\beta \in \overline{F} \mid P(\beta) = 0 \text{ for some } P \in \mathcal{P}\}$$

It is clear that if E is normal over F , then $\sigma(E) = T$ for all $\sigma \in \text{Mor}_F(E, \overline{F})$. Thus we see that (1) implies (2).

Conversely, assume (2). Pick $\beta \in T$. We can find a corresponding $\alpha \in E$ whose minimal polynomial $P \in \mathcal{P}$ annihilates β . Because $F(\alpha) = F[x]/(P)$ we can find an element $\sigma_0 \in \text{Mor}_F(F(\alpha), \overline{F})$ mapping α to β . By Lemma 9.10.5 we can extend σ_0 to a $\sigma \in \text{Mor}_F(E, \overline{F})$. Whence we see that β is in the common image of all embeddings $\sigma : E \rightarrow \overline{F}$. It follows that $\sigma(E) = T$ for any σ . Fix a σ . Now let $P \in \mathcal{P}$. Then we can write

$$P = (x - \beta_1) \dots (x - \beta_n)$$

for some n and $\beta_i \in \overline{F}$ by Lemma 9.10.2. Observe that $\beta_i \in T$. Thus $\beta_i = \sigma(\alpha_i)$ for some $\alpha_i \in E$. Thus $P = (x - \alpha_1) \dots (x - \alpha_n)$ splits completely over E . This finishes the proof. \square

Definition 9.14.5. Let E/F be an extension of fields. Then $\text{Aut}(E/F)$ or $\text{Aut}_F(E)$ denotes the automorphism group of E as an object of the category of F -extensions. Elements of $\text{Aut}(E/F)$ are called *automorphisms of E over F* or *automorphisms of E/F* .

Here is a characterization of normal extensions in terms of automorphisms.

Lemma 9.14.6. *Let E/F be a finite extension. We have*

$$|\text{Aut}(E/F)| \leq [E : F]_s$$

with equality if and only if E is normal over F .

Proof. Choose an algebraic closure \overline{F} of F . Recall that $[E : F] = |\text{Mor}_F(E, \overline{F})|$. Pick an element $\sigma_0 \in \text{Mor}_F(E, \overline{F})$. Then the map

$$\text{Aut}(E/F) \longrightarrow \text{Mor}_F(E, \overline{F}), \quad \tau \longmapsto \sigma_0 \circ \tau$$

is injective. Thus the inequality. If equality holds, then every $\sigma \in \text{Mor}_F(E, \overline{F})$ is gotten by precomposing σ_0 by an automorphism. Hence $\sigma(E) = \sigma_0(E)$. Thus E is normal over F by Lemma 9.14.4.

Conversely, assume that E/F is normal. Then by Lemma 9.14.4 we have $\sigma(E) = \sigma_0(E)$ for all $\sigma \in \text{Mor}_F(E, \overline{F})$. Thus we get an automorphism of E over F by setting $\tau = \sigma_0^{-1} \circ \sigma$. Whence the map displayed above is surjective. \square

9.15. Splitting fields

The following lemma is a useful tool for constructing normal field extensions.

Lemma 9.15.1. *Let F be a field. Let $P \in F[x]$ be a nonconstant polynomial. There exists a smallest field extension E/F such that P splits completely over E . Moreover, the field extension E/F is normal and unique up to (nonunique) isomorphism.*

Proof. Choose an algebraic closure \overline{F} . Then we can write $P = c(x - \beta_1) \dots (x - \beta_n)$ in $\overline{F}[x]$, see Lemma 9.10.2. Note that $c \in F^*$. Set $E = F(\beta_1, \dots, \beta_n)$. Then it is clear that E is minimal with the requirement that P splits completely over E .

Next, let E' be another minimal field extension of F such that P splits completely over E' . Write $P = c(x - \alpha_1) \dots (x - \alpha_n)$ with $c \in F$ and $\alpha_i \in E'$. Again it follows from minimality that $E' = F(\alpha_1, \dots, \alpha_n)$. Moreover, if we pick any $\sigma : E' \rightarrow \overline{F}$ (Lemma 9.10.5) then we immediately see that $\sigma(\alpha_i) = \beta_{\tau(i)}$ for some permutation $\tau : \{1, \dots, n\} \rightarrow \{1, \dots, n\}$. Thus $\sigma(E') = E$. This implies that E' is a normal extension of F by Lemma 9.14.4 and that $E \cong E'$ as extensions of F thereby finishing the proof. \square

Definition 9.15.2. Let F be a field. Let $P \in F[x]$ be a nonconstant polynomial. The field extension E/F constructed in Lemma 9.15.1 is called the *splitting field of P over F* .

The field constructed in the next lemma is sometimes called the *normal closure* of E over F .

Lemma 9.15.3. *Let E/F be a finite extension of fields. There exists a unique (up to nonunique isomorphism) smallest finite extension K/E such that K is normal over F .*

Proof. Choose generators $\alpha_1, \dots, \alpha_n$ of E over F . Let P_1, \dots, P_n be the minimal polynomials of $\alpha_1, \dots, \alpha_n$ over F . Set $P = P_1 \dots P_n$. Observe that $(x - \alpha_1) \dots (x - \alpha_n)$ divides P , since each $(x - \alpha_i)$ divides P_i . Say $P = (x - \alpha_1) \dots (x - \alpha_n)Q$. Let K/E be the splitting field of P over E . We claim that K is the splitting field of P over F as well (which implies that K is normal over F). This is clear because

K/E is generated by the roots of Q over E and E is generated by the roots of $(x - \alpha_1) \dots (x - \alpha_n)$ over F , hence K is generated by the roots of P over F .

Uniqueness. Suppose that K'/E is a second smallest extension such that K'/F is normal. Choose an algebraic closure \overline{F} and an embedding $\sigma_0 : E \rightarrow \overline{F}$. By Lemma 9.10.5 we can extend σ_0 to $\sigma : K \rightarrow \overline{F}$ and $\sigma' : K' \rightarrow \overline{F}$. By Lemma 9.14.3 we see that $\sigma(K) \cap \sigma'(K')$ is normal over F . By minimality we conclude that $\sigma(K) = \sigma'(K')$. Thus $\sigma \circ (\sigma')^{-1} : K' \rightarrow K$ gives an isomorphism of extensions of E . \square

9.16. Roots of unity

Let F be a field. For an integer $n \geq 1$ we set

$$\mu_n(F) = \{\zeta \in F \mid \zeta^n = 1\}$$

This is called the *group of n th roots of unity* or *n th roots of 1*. It is an abelian group under multiplication with neutral element given by 1. Observe that in a field the number of roots of a polynomial of degree d is always at most d . Hence we see that $|\mu_n(F)| \leq n$ as it is defined by a polynomial equation of degree n . Of course every element of $\mu_n(F)$ has order dividing n . Moreover, the subgroups

$$\mu_d(F) \subset \mu_n(F), \quad d|n$$

each have at most d elements. This implies that $\mu_n(F)$ is cyclic.

Lemma 9.16.1. *Let A be an abelian group of exponent dividing n such that $\{x \in A \mid dx = 0\}$ has cardinality at most d for all $d|n$. Then A is cyclic of order dividing n .*

Proof. The conditions imply that $|A| \leq n$, in particular A is finite. The structure of finite abelian groups shows that $A = \mathbf{Z}/e_1\mathbf{Z} \oplus \dots \oplus \mathbf{Z}/e_r\mathbf{Z}$ for some integers $1 < e_1|e_2|\dots|e_r$. This would imply that $\{x \in A \mid e_x = 0\}$ has cardinality e_1^r . Hence $r = 1$. \square

Applying this to the field \mathbf{F}_p we obtain the celebrated result that the group $(\mathbf{Z}/p\mathbf{Z})^*$ is a cyclic group. More about this in the section on finite fields.

One more observation is often useful: If F has characteristic $p > 0$, then $\mu_{p^n}(F) = \{1\}$. This is true because raising to the p th power is an injective map on fields of characteristic p as we have seen in the proof of Lemma 9.12.5. (Of course, it also follows from the statement of that lemma itself.)

9.17. Finite fields

Let F be a finite field. It is clear that F has positive characteristic as we cannot have an injection $\mathbf{Q} \rightarrow F$. Say the characteristic of F is p . The extension $\mathbf{F}_p \subset F$ is finite. Hence we see that F has $q = p^f$ elements for some $f \geq 1$.

Let us think about the group of units F^* . This is a finite abelian group, so it has some exponent e . Then $F^* = \mu_e(F)$ and we see from the discussion in Section 9.16 that F^* is a cyclic group of order $q - 1$. (A posteriori it follows that $e = q - 1$ as well.) In particular, if $\alpha \in F^*$ is a generator then it clearly is true that

$$F = \mathbf{F}_p(\alpha)$$

In other words, the extension F/\mathbf{F}_p is generated by a single element. Of course, the same thing is true for any extension of finite fields E/F (because E is already generated by a single element over the prime field).

9.18. Primitive elements

Let E/F be a finite extension of fields. An element $\alpha \in E$ is called a *primitive element of E over F* if $E = F(\alpha)$.

Lemma 9.18.1 (Primitive element). *Let E/F be a finite extension of fields. The following are equivalent*

- (1) *there exists a primitive element for E over F , and*
- (2) *there are finitely many subextensions $E/K/F$.*

Moreover, (1) and (2) hold if E/F is separable.

Proof. Let $\alpha \in E$ be a primitive element. Let P be the minimal polynomial of α over F . Let $E \subset M$ be a splitting field for P over E , so that $P(x) = (x - \alpha)(x - \alpha_2) \dots (x - \alpha_n)$ over M . For ease of notation we set $\alpha_1 = \alpha$. Next, let $E/K/F$ be a subextension. Let Q be the minimal polynomial of α over K . Observe that $\deg(Q) = [E : K]$. Writing $Q = x^d + \sum_{i < d} a_i x^i$ we claim that K is equal to $L = F(a_0, \dots, a_{d-1})$. Indeed α has degree d over L and $L \subset K$. Hence $[E : L] = [E : K]$ and it follows that $[K : L] = 1$, i.e., $K = L$. Thus it suffices to show there are at most finitely many possibilities for the polynomial Q . This is clear because we have a factorization $P = QR$ in $K[x]$ in particular in $E[x]$. Since we have unique factorization in $E[x]$ there are at most finitely many monic factors of P in $E[x]$.

If F is a finite field (equivalently E is a finite field), then E/F has a primitive element by the discussion in Section 9.17. Next, assume F is infinite and there are at most finitely many proper subfields $E/K/F$. List them, say K_1, \dots, K_N . Then each $K_i \subset E$ is a proper sub F -vector space. As F is infinite we can find a vector $\alpha \in E$ with $\alpha \notin K_i$ for all i (a finite union of proper subvector spaces is never a subvector space; details omitted). Then α is a primitive element for E over F .

Having established the equivalence of (1) and (2) we now turn to the final statement of the lemma. Choose an algebraic closure \overline{F} of F . Enumerate the elements $\sigma_1, \dots, \sigma_n \in \text{Mor}_F(E, \overline{F})$. Since E/F is separable we have $n = [E : F]$ by Lemma 9.12.11. Note that if $i \neq j$, then

$$V_{ij} = \text{Ker}(\sigma_i - \sigma_j : E \rightarrow \overline{F})$$

is not equal to E . Hence arguing as in the preceding paragraph we can find $\alpha \in E$ with $\alpha \notin V_{ij}$ for all $i \neq j$. It follows that $|\text{Mor}_F(F(\alpha), \overline{F})| \geq n$. On the other hand $[F(\alpha) : F] \leq [E : F]$. Hence equality by Lemma 9.12.11 and we conclude that $E = F(\alpha)$. \square

9.19. Galois theory

Here is the definition.

Definition 9.19.1. A field extension E/F is called *Galois* if it is algebraic, separable, and normal.

It turns out that a finite extension is Galois if and only if it has the “correct” number of automorphisms.

Lemma 9.19.2. *Let E/F be a finite extension of fields. Then E is Galois over F if and only if $|\text{Aut}(E/F)| = [E : F]$.*

Proof. Assume $|\text{Aut}(E/F)| = [E : F]$. By Lemma 9.14.6 this implies that E/F is separable and normal, hence Galois. Conversely, if E/F is separable then $[E : F] = [E : F]_s$ and if E/F is in addition normal, then Lemma 9.14.6 implies that $|\text{Aut}(E/F)| = [E : F]$. \square

Motivated by the lemma above we introduce the Galois group as follows.

Definition 9.19.3. If E/F is a Galois extension, then the group $\text{Aut}(E/F)$ is called the *Galois group* and it is denoted $\text{Gal}(E/F)$.

It turns out that if L/K is an infinite Galois extension, then one should think of the Galois group as a topological group. We will return to this later (insert future reference here). In this chapter we mainly restrict ourselves to finite Galois extensions.

Lemma 9.19.4. *Let $K/E/F$ be a tower of algebraic field extensions. If K is Galois over F , then K is Galois over E .*

Proof. Combine Lemmas 9.14.2 and 9.12.3. \square

Let G be a group acting on a field K (by field automorphisms). We will often use the notation

$$K^G = \{x \in K \mid \sigma(x) = x \ \forall \sigma \in G\}$$

and we will call this the *fixed field* for the action of G on K .

Lemma 9.19.5. *Let K be a field. Let G be a finite group acting faithfully on K . Then the extension K/K^G is Galois, we have $[K : K^G] = |G|$, and the Galois group of the extension is G .*

Proof. Given $\alpha \in K$ consider the orbit $G \cdot \alpha \subset K$ of α under the group action. Consider the polynomial

$$P = \prod_{\beta \in G \cdot \alpha} (x - \beta) \in K[x]$$

The key to the whole lemma is that this polynomial is invariant under the action of G and hence has coefficients in K^G . Namely, for $\sigma \in G$ we have

$$P^\sigma = \prod_{\beta \in G \cdot \alpha} (x - \tau(\beta)) = \prod_{\beta \in G \cdot \alpha} (x - \beta) = P$$

because the map $\beta \mapsto \tau(\beta)$ is a permutation of the orbit $G \cdot \alpha$. Thus $P \in K^G$. Since also $P(\alpha) = 0$ as α is an element of its orbit we conclude that the extension K/K^G is algebraic. Moreover, the minimal polynomial Q of α over K^G divides the polynomial P just constructed. Hence Q is separable (by Lemma 9.12.4 for example) and we conclude that K/K^G is separable. Thus K/K^G is Galois. To finish the proof it suffices to show that $[K : K^G] = |G|$ since then G will be the Galois group by Lemma 9.19.2.

Pick finitely many elements $\alpha_i \in K$, $i = 1, \dots, n$ such that $\sigma(\alpha_i) = \alpha_i$ for $i = 1, \dots, n$ implies σ is the neutral element of G . Set

$$L = K^G(\{\sigma(\alpha_i); 1 \leq i \leq n, \sigma \in G\}) \subset K$$

and observe that the action of G on K induces an action of G on L . We will show that L has degree $|G|$ over K^G . This will finish the proof, since if $L \subset K$ is proper,

then we can add an element $\alpha \in K$, $\alpha \notin L$ to our list of elements $\alpha_1, \dots, \alpha_n$ without increasing L which is absurd. This reduces us to the case that K/K^G is finite which is treated in the next paragraph.

Assume K/K^G is finite. By Lemma 9.18.1 we can find $\alpha \in K$ such that $K = K^G(\alpha)$. By the construction in the first paragraph of this proof we see that α has degree at most $|G|$ over K . However, the degree cannot be less than $|G|$ as G acts faithfully on $K^G(\alpha) = L$ by construction and the inequality of Lemma 9.14.6. \square

Theorem 9.19.6 (Fundamental theorem of Galois theory). *Let L/K be a finite Galois extension with Galois group G . Then we have $K = L^G$ and the map*

$$\{\text{subgroups of } G\} \longrightarrow \{\text{subextensions } K \subset M \subset L\}, \quad H \longmapsto L^H$$

is a bijection whose inverse maps M to $\text{Gal}(L/M)$.

Proof. By Lemma 9.19.4 given a subextension $L/M/K$ the extension L/M is Galois. Of course L/M is also finite (Lemma 9.7.3). Thus $|\text{Gal}(L/M)| = [L : M]$ by Lemma 9.19.2. Conversely, if $H \subset G$ is a finite subgroup, then $[L : L^H] = |H|$ by Lemma 9.19.5. It follows formally from these two observations that we obtain a bijective correspondence as in the theorem. \square

9.20. The complex numbers

The fundamental theorem of algebra states that the field of complex numbers is an algebraically closed field. In this section we discuss this briefly.

The first remark we'd like to make is that you need to use a little bit of input from calculus in order to prove this. We will use the intuitively clear fact that every odd degree polynomial over the reals has a real root. Namely, let $P(x) = a_{2k+1}x^{2k+1} + \dots + a_0 \in \mathbf{R}[x]$ for some $k \geq 0$ and $a_{2k+1} \neq 0$. We may and do assume $a_{2k+1} > 0$. Then for $x \in \mathbf{R}$ very large (positive) we see that $P(x) > 0$ as the term $a_{2k+1}x^{2k+1}$ dominates all the other terms. Similarly, if $x \ll 0$, then $P(x) < 0$ by the same reason (and this is where we use that the degree is odd). Hence by the intermediate value theorem there is an $x \in \mathbf{R}$ with $P(x) = 0$.

A conclusion we can draw from the above is that \mathbf{R} has no nontrivial odd degree field extensions, as elements of such extensions would have odd degree minimal polynomials.

Next, let K/\mathbf{R} be a finite Galois extension with Galois group G . Let $P \subset G$ be a 2-sylow subgroup. Then K^P/\mathbf{R} is an odd degree extension, hence by the above $K^P = K$, which in turn implies $G = P$. (All of these arguments rely on Galois theory of course.) Thus G is a 2-group. If G is nontrivial, then we see that $\mathbf{C} \subset K$ as \mathbf{C} is (up to isomorphism) the only degree 2 extension of \mathbf{R} . If G has more than 2 elements we would obtain a quadratic extension of \mathbf{C} . This is absurd as every complex number has a square root.

The conclusion: \mathbf{C} is algebraically closed. Namely, if not then we'd get a nontrivial finite extension $\mathbf{C} \subset K$ which we could assume normal (hence Galois) over \mathbf{R} by Lemma 9.15.3. But we've seen above that then $K = \mathbf{C}$.

Lemma 9.20.1 (Fundamental theorem of algebra). *The field \mathbf{C} is algebraically closed.*

Proof. See discussion above. \square

9.21. Kummer extensions

Let K be a field. Let $n \geq 2$ be an integer such that K contains a primitive n th root of 1. Let $a \in K$. Let L be an extension of K obtained by adjoining a root b of the equation $x^n = a$. Then L/K is Galois. If $G = \text{Gal}(L/K)$ is the Galois group, then the map

$$G \longrightarrow \mu_n(K), \quad \sigma \longmapsto \sigma(b)/b$$

is an injective homomorphism of groups. In particular, G is cyclic of order dividing n as a subgroup of the cyclic group $\mu_n(K)$. Kummer theory gives a converse.

Lemma 9.21.1 (Kummer extensions). *Let $K \subset L$ be a Galois extension of fields whose Galois group is $\mathbf{Z}/n\mathbf{Z}$. Assume moreover that the characteristic of K is prime to n and that K contains a primitive n th root of 1. Then $L = K[z]$ with $z^n \in K$.*

Proof. Omitted. □

9.22. Artin-Schreier extensions

Let K be a field of characteristic $p > 0$. Let $a \in K$. Let L be an extension of K obtained by adjoining a root b of the equation $x^p - x = a$. Then L/K is Galois. If $G = \text{Gal}(L/K)$ is the Galois group, then the map

$$G \longrightarrow \mathbf{Z}/p\mathbf{Z}, \quad \sigma \longmapsto \sigma(b) - b$$

is an injective homomorphism of groups. In particular, G is cyclic of order dividing p as a subgroup of $\mathbf{Z}/p\mathbf{Z}$. The theory of Artin-Schreier extensions gives a converse.

Lemma 9.22.1 (Artin-Schreier extensions). *Let $K \subset L$ be a Galois extension of fields of characteristic $p > 0$ with Galois group $\mathbf{Z}/p\mathbf{Z}$. Then $L = K[z]$ with $z^p - z \in K$.*

Proof. Omitted. □

9.23. Transcendence

We recall the standard definitions.

Definition 9.23.1. Let $k \subset K$ be a field extension.

- (1) A collection of elements $\{x_i\}_{i \in I}$ of K is called *algebraically independent* over k if the map

$$k[X_i; i \in I] \longrightarrow K$$

which maps X_i to x_i is injective.

- (2) The field of fractions of a polynomial ring $k[x_i; i \in I]$ is denoted $k(x_i; i \in I)$.
- (3) A *purely transcendental extension* of k is any field extension $k \subset K$ isomorphic to the field of fractions of a polynomial ring over k .
- (4) A *transcendence basis* of K/k is a collection of elements $\{x_i\}_{i \in I}$ which are algebraically independent over k and such that the extension $k(x_i; i \in I) \subset K$ is algebraic.

Example 9.23.2. The field $\mathbf{Q}(\pi)$ is purely transcendental because π isn't the root of a nonzero polynomial with rational coefficients. In particular, $\mathbf{Q}(\pi) \cong \mathbf{Q}(x)$.

Lemma 9.23.3. *Let E/F be a field extension. A transcendence basis of E over F exists. Any two transcendence bases have the same cardinality.*

Proof. Let A be an algebraically independent subset of E . Let G be a subset of E containing A that generates E/F . We claim we can find a transcendence basis B such that $A \subset B \subset G$. To prove this consider the collection of algebraically independent subsets \mathcal{B} whose members are subsets of G that contain A . Define a partial ordering on \mathcal{B} using inclusion. Then \mathcal{B} contains at least one element A . The union of the elements of a totally ordered subset T of \mathcal{B} is an algebraically independent subset of E over F since any algebraic dependence relation would have occurred in one of the elements of T (since polynomials only involve finitely many variables). The union also contains A and is contained in G . By Zorn's lemma, there is a maximal element $B \in \mathcal{B}$. Now we claim E is algebraic over $F(B)$. This is because if it wasn't then there would be an element $f \in G$ transcendental over $F(B)$ since $E(G) = F$. Then $B \cup \{f\}$ would be algebraically independent contradicting the maximality of B . Thus B is our transcendence basis.

Let B and B' be two transcendence bases. Without loss of generality, we can assume that $|B'| \leq |B|$. Now we divide the proof into two cases: the first case is that B is an infinite set. Then for each $\alpha \in B'$, there is a finite set B_α such that α is algebraic over $E(B_\alpha)$ since any algebraic dependence relation only uses finitely many indeterminates. Then we define $B^* = \bigcup_{\alpha \in B'} B_\alpha$. By construction, $B^* \subset B$, but we claim that in fact the two sets are equal. To see this, suppose that they are not equal, say there is an element $\beta \in B \setminus B^*$. We know β is algebraic over $E(B')$ which is algebraic over $E(B^*)$. Therefore β is algebraic over $E(B^*)$, a contradiction. So $|B| \leq |\bigcup_{\alpha \in B'} B_\alpha|$. Now if B' is finite, then so is B so we can assume B' is infinite; this means

$$|B| \leq \left| \bigcup_{\alpha \in B'} B_\alpha \right| = |B'|$$

because each B_α is finite and B' is infinite. Therefore in the infinite case, $|B| = |B'|$.

Now we need to look at the case where B is finite. In this case, B' is also finite, so suppose $B = \{\alpha_1, \dots, \alpha_n\}$ and $B' = \{\beta_1, \dots, \beta_m\}$ with $m \leq n$. We perform induction on m : if $m = 0$ then E/F is algebraic so $B = \emptyset$ so $n = 0$. If $m > 0$, there is an irreducible polynomial $f \in E[x, y_1, \dots, y_n]$ such that $f(\beta_1, \alpha_1, \dots, \alpha_n) = 0$ and such that x occurs in f . Since β_1 is not algebraic over F , f must involve some y_i so without loss of generality, assume f uses y_1 . Let $B^* = \{\beta_1, \alpha_2, \dots, \alpha_n\}$. We claim that B^* is a basis for E/F . To prove this claim, we see that we have a tower of algebraic extensions

$$E/F(B^*, \alpha_1)/F(B^*)$$

since α_1 is algebraic over $F(B^*)$. Now we claim that B^* (counting multiplicity of elements) is algebraically independent over E because if it weren't, then there would be an irreducible $g \in E[x, y_2, \dots, y_n]$ such that $g(\beta_1, \alpha_2, \dots, \alpha_n) = 0$ which must involve x making β_1 algebraic over $E(\alpha_2, \dots, \alpha_n)$ which would make α_1 algebraic over $E(\alpha_2, \dots, \alpha_n)$ which is impossible. So this means that $\{\alpha_2, \dots, \alpha_n\}$ and $\{\beta_2, \dots, \beta_m\}$ are bases for E over $F(\beta_1)$ which means by induction, $m = n$. \square

Definition 9.23.4. Let $k \subset K$ be a field extension. The *transcendence degree* of K over k is the cardinality of a transcendence basis of K over k . It is denoted $\text{trdeg}_k(K)$.

Lemma 9.23.5. *Let $k \subset K \subset L$ be field extensions. Then*

$$\operatorname{trdeg}_k(L) = \operatorname{trdeg}_K(L) + \operatorname{trdeg}_k(K).$$

Proof. Choose a transcendence basis $A \subset K$ of K over k . Choose a transcendence basis $B \subset L$ of L over K . Then it is straightforward to see that $A \cup B$ is a transcendence basis of L over k . \square

Example 9.23.6. Consider the field extension $\mathbf{Q}(e, \pi)$ formed by adjoining the numbers e and π . This field extension has transcendence degree at least 1 since both e and π are transcendental over the rationals. However, this field extension might have transcendence degree 2 if e and π are algebraically independent. Whether or not this is true is unknown and whence the problem of determining $\operatorname{trdeg}(\mathbf{Q}(e, \pi))$ is open.

Example 9.23.7. Let F be a field and $E = F(t)$. Then $\{t\}$ is a transcendence basis since $E = F(t)$. However, $\{t^2\}$ is also a transcendence basis since $F(t)/F(t^2)$ is algebraic. This illustrates that while we can always decompose an extension E/F into an algebraic extension E/F' and a purely transcendental extension F'/F , this decomposition is not unique and depends on choice of transcendence basis.

Example 9.23.8. Let X be a compact Riemann surface. Then the function field $\mathbf{C}(X)$ (see Example 9.3.6) has transcendence degree one over \mathbf{C} . In fact, *any* finitely generated extension of \mathbf{C} of transcendence degree one arises from a Riemann surface. There is even an equivalence of categories between the category of compact Riemann surfaces and (non-constant) holomorphic maps and the opposite of the category of finitely generated extensions of \mathbf{C} of transcendence degree 1 and morphisms of \mathbf{C} -algebras. See [For91].

There is an algebraic version of the above statement as well. Given an (irreducible) algebraic curve in projective space over an algebraically closed field k (e.g. the complex numbers), one can consider its “field of rational functions”: basically, functions that look like quotients of polynomials, where the denominator does not identically vanish on the curve. There is a similar anti-equivalence of categories (insert future reference here) between smooth projective curves and non-constant morphisms of curves and finitely generated extensions of k of transcendence degree one. See [Har77].

Definition 9.23.9. Let $k \subset K$ be a field extension.

- (1) The *algebraic closure of k in K* is the subfield k' of K consisting of elements of K which are algebraic over k .
- (2) We say k is *algebraically closed in K* if every element of K which is algebraic over k is contained in k .

Lemma 9.23.10. *Let $k \subset K$ be a finitely generated field extension. The algebraic closure of k in K is finite over k .*

Proof. Let $x_1, \dots, x_r \in K$ be a transcendence basis for K over k . Then $n = [K : k(x_1, \dots, x_r)] < \infty$. Suppose that $k \subset k' \subset K$ with k'/k finite. In this case $[k'(x_1, \dots, x_r) : k(x_1, \dots, x_r)] = [k' : k] < \infty$. Hence

$$[k' : k] = [k'(x_1, \dots, x_r) : k(x_1, \dots, x_r)] < [K : k(x_1, \dots, x_r)] = n.$$

In other words, the degrees of finite subextensions are bounded and the lemma follows. \square

9.24. Linearly disjoint extensions

Let k be a field, K and L field extensions of k . Suppose also that K and L are embedded in some larger field Ω .

Definition 9.24.1. Consider a diagram

$$(9.24.1.1) \quad \begin{array}{ccc} L & \longrightarrow & \Omega \\ \uparrow & & \uparrow \\ k & \longrightarrow & K \end{array}$$

of field extensions. The *compositum* of K and L in Ω written KL is the smallest subfield of Ω containing both L and K .

It is clear that KL is generated by the set $K \cup L$ over k , generated by the set K over L , and generated by the set L over K .

Warning: The (isomorphism class of the) composition depends on the choice of the embeddings of K and L into Ω . For example consider the number fields $K = \mathbf{Q}(2^{1/8}) \subset \mathbf{R}$ and $L = \mathbf{Q}(2^{1/12}) \subset \mathbf{R}$. The compositum inside \mathbf{R} is the field $\mathbf{Q}(2^{1/24})$ of degree 24 over \mathbf{Q} . However, if we embed $K = \mathbf{Q}[x]/(x^8 - 2)$ into \mathbf{C} by mapping x to $2^{1/8}e^{2\pi i/8}$, then the compositum $\mathbf{Q}(2^{1/12}, 2^{1/8}e^{2\pi i/8})$ contains $i = e^{2\pi i/4}$ and has degree 48 over \mathbf{Q} (we omit showing the degree is 48, but the existence of i certainly proves the two composita are not isomorphic).

Definition 9.24.2. Consider a diagram of fields as in (9.24.1.1). We say that K and L are *linearly disjoint over k in Ω* if the map

$$K \otimes_k L \longrightarrow KL, \quad \sum x_i \otimes y_i \longmapsto \sum x_i y_i$$

is injective.

The following lemma does not seem to fit anywhere else.

Lemma 9.24.3. *Let E/F be a normal algebraic field extension. There exist subextensions $E/E_{sep}/F$ and $E/E_{insep}/F$ such that*

- (1) $F \subset E_{sep}$ is Galois and $E_{sep} \subset E$ is purely inseparable,
- (2) $F \subset E_{insep}$ is purely inseparable and $E_{insep} \subset E$ is Galois,
- (3) $E = E_{sep} \otimes_F E_{insep}$.

Proof. We found the subfield E_{sep} in Lemma 9.13.6. We set $E_{insep} = E^{\text{Aut}(E/F)}$. Details omitted. \square

9.25. Review

In this section we give a quick review of what has transpired above.

Let $k \subset K$ be a field extension. Let $\alpha \in K$. Then we have the following possibilities:

- (1) The element α is transcendental over k .
- (2) The element α is algebraic over k . Denote $P(T) \in k[T]$ its *minimal polynomial*. This is a monic polynomial $P(T) = T^d + a_1 T^{d-1} + \dots + a_d$ with coefficients in k . It is irreducible and $P(\alpha) = 0$. These properties uniquely determine P , and the integer d is called the *degree of α over k* . There are two subcases:

- (a) The polynomial dP/dT is not identically zero. This is equivalent to the condition that $P(T) = \prod_{i=1, \dots, d} (T - \alpha_i)$ for pairwise distinct elements $\alpha_1, \dots, \alpha_d$ in the algebraic closure of k . In this case we say that α is *separable* over k .
- (b) The dP/dT is identically zero. In this case the characteristic p of k is > 0 , and P is actually a polynomial in T^p . Clearly there exists a largest power $q = p^e$ such that P is a polynomial in T^q . Then the element α^q is separable over k .

Definition 9.25.1. Algebraic field extensions.

- (1) A field extension $k \subset K$ is called *algebraic* if every element of K is algebraic over k .
- (2) An algebraic extension $k \subset k'$ is called *separable* if every $\alpha \in k'$ is separable over k .
- (3) An algebraic extension $k \subset k'$ is called *purely inseparable* if the characteristic of k is $p > 0$ and for every element $\alpha \in k'$ there exists a power q of p such that $\alpha^q \in k$.
- (4) An algebraic extension $k \subset k'$ is called *normal* if for every $\alpha \in k'$ the minimal polynomial $P(T) \in k[T]$ of α over k splits completely into linear factors over k' .
- (5) An algebraic extension $k \subset k'$ is called *Galois* if it is separable and normal.

The following lemma does not seem to fit anywhere else.

Lemma 9.25.2. *Let K be a field of characteristic $p > 0$. Let $K \subset L$ be a separable algebraic extension. Let $\alpha \in L$.*

- (1) *If the coefficients of the minimal polynomial of α over K are p th powers in K then α is a p th power in L .*
- (2) *More generally, if $P \in K[T]$ is a polynomial such that (a) α is a root of P , (b) P has pairwise distinct roots in an algebraic closure, and (c) all coefficients of P are p th powers, then α is a p th power in L .*

Proof. It follows from the definitions that (2) implies (1). Assume P is as in (2). Write $P(T) = \sum_{i=0}^d a_i T^{d-i}$ and $a_i = b_i^p$. The polynomial $Q(T) = \sum_{i=0}^d b_i T^{d-i}$ has distinct roots in an algebraic closure as well, because the roots of Q are the p th roots of the roots of P . If α is not a p th power, then $T^p - \alpha$ is an irreducible polynomial over L (Lemma 9.13.2). Moreover Q and $T^p - \alpha$ have a root in common in an algebraic closure \bar{L} . Thus Q and $T^p - \alpha$ are not relatively prime, which implies $T^p - \alpha | Q$ in $L[T]$. This contradicts the fact that the roots of Q are pairwise distinct. \square

Commutative Algebra

10.1. Introduction

Basic commutative algebra will be explained in this document. A reference is [Mat70].

10.2. Conventions

A ring is commutative with 1. The zero ring is a ring. In fact it is the only ring that does not have a prime ideal. The Kronecker symbol δ_{ij} will be used. If $R \rightarrow S$ is a ring map and \mathfrak{q} a prime of S , then we use the notation “ $\mathfrak{p} = R \cap \mathfrak{q}$ ” to indicate the prime which is the inverse image of \mathfrak{q} under $R \rightarrow S$ even if R is not a subring of S and even if $R \rightarrow S$ is not injective.

10.3. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

- (1) R is a *ring*,
- (2) $x \in R$ is *nilpotent*,
- (3) $x \in R$ is a *zerodivisor*,
- (4) $x \in R$ is a *unit*,
- (5) $e \in R$ is an *idempotent*,
- (6) an idempotent $e \in R$ is called *trivial* if $e = 1$ or $e = 0$,
- (7) $\varphi : R_1 \rightarrow R_2$ is a *ring homomorphism*,
- (8) $\varphi : R_1 \rightarrow R_2$ is of *finite presentation*, or R_2 is a *finitely presented R_1 -algebra*, see Definition 10.6.1,
- (9) $\varphi : R_1 \rightarrow R_2$ is of *finite type*, or R_2 is a *finite type R_1 -algebra*, see Definition 10.6.1,
- (10) $\varphi : R_1 \rightarrow R_2$ is *finite*, or R_2 is a *finite R_1 -algebra*,
- (11) R is a (*integral*) *domain*,
- (12) R is *reduced*,
- (13) R is *Noetherian*,
- (14) R is a *principal ideal domain* or a *PID*,
- (15) R is a *Euclidean domain*,
- (16) R is a *unique factorization domain* or a *UFD*,
- (17) R is a *discrete valuation ring* or a *dvr*,
- (18) K is a *field*,
- (19) $K \subset L$ is a *field extension*,
- (20) $K \subset L$ is an *algebraic field extension*,
- (21) $\{t_i\}_{i \in I}$ is a *transcendence basis* for L over K ,
- (22) the *transcendence degree* $\text{trdeg}(L/K)$ of L over K ,

- (23) the field k is *algebraically closed*,
- (24) if $K \subset L$ is algebraic, and $K \subset k$ an extension with k algebraically closed, then there exists a map ring map $L \rightarrow k$ extending the map on K ,
- (25) $I \subset R$ is an *ideal*,
- (26) $I \subset R$ is *radical*,
- (27) if I is an ideal then we have its *radical* \sqrt{I} ,
- (28) $I \subset R$ is *nilpotent* means that $I^n = 0$ for some $n \in \mathbf{N}$,
- (29) $I \subset R$ is *locally nilpotent* means that every element of I is nilpotent,
- (30) $\mathfrak{p} \subset R$ is a *prime ideal*,
- (31) if $\mathfrak{p} \subset R$ is prime and if $I, J \subset R$ are ideal, and if $IJ \subset \mathfrak{p}$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$.
- (32) $\mathfrak{m} \subset R$ is a *maximal ideal*,
- (33) any nonzero ring has a maximal ideal,
- (34) the *Jacobson radical* of R is $\text{rad}(R) = \bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$ the intersection of all the maximal ideals of R ,
- (35) the ideal (T) *generated* by a subset $T \subset R$,
- (36) the *quotient ring* R/I ,
- (37) an ideal I in the ring R is prime if and only if R/I is a domain,
- (38) an ideal I in the ring R is maximal if and only if the ring R/I is a field,
- (39) if $\varphi : R_1 \rightarrow R_2$ is a ring homomorphism, and if $I \subset R_2$ is an ideal, then $\varphi^{-1}(I)$ is an ideal of R_1 ,
- (40) if $\varphi : R_1 \rightarrow R_2$ is a ring homomorphism, and if $I \subset R_1$ is an ideal, then $\varphi(I) \cdot R_2$ (sometimes denoted $I \cdot R_2$, or IR_2) is the ideal of R_2 generated by $\varphi(I)$,
- (41) if $\varphi : R_1 \rightarrow R_2$ is a ring homomorphism, and if $\mathfrak{p} \subset R_2$ is a prime ideal, then $\varphi^{-1}(\mathfrak{p})$ is a prime ideal of R_1 ,
- (42) M is an *R -module*,
- (43) for $m \in M$ the *annihilator* $I = \{f \in R \mid fm = 0\}$ of m in R ,
- (44) $N \subset M$ is an *R -submodule*,
- (45) M is an *Noetherian R -module*,
- (46) M is a *finite R -module*,
- (47) M is a *finitely generated R -module*,
- (48) M is a *finitely presented R -module*,
- (49) M is a *free R -module*,
- (50) if $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is a short exact sequence of R -modules and K, M are free, then L is free,
- (51) if $N \subset M \subset L$ are R -modules, then $L/M = (L/N)/(M/N)$,
- (52) S is a *multiplicative subset of R* ,
- (53) the *localization* $R \rightarrow S^{-1}R$ of R ,
- (54) if R is a ring and S is a multiplicative subset of R then $S^{-1}R$ is the zero ring if and only if S contains 0,
- (55) if R is a ring and if the multiplicative subset S consists completely of nonzerodivisors, then $R \rightarrow S^{-1}R$ is injective,
- (56) if $\varphi : R_1 \rightarrow R_2$ is a ring homomorphism, and S is a multiplicative subsets of R_1 , then $\varphi(S)$ is a multiplicative subset of R_2 ,
- (57) if S, S' are multiplicative subsets of R , and if SS' denotes the set of products $SS' = \{r \in R \mid \exists s \in S, \exists s' \in S', r = ss'\}$ then SS' is a multiplicative subset of R ,

- (58) if S, S' are multiplicative subsets of R , and if \bar{S} denotes the image of S in $(S')^{-1}R$, then $(SS')^{-1}R = \bar{S}^{-1}((S')^{-1}R)$,
- (59) the localization $S^{-1}M$ of the R -module M ,
- (60) the functor $M \mapsto S^{-1}M$ preserves injective maps, surjective maps, and exactness,
- (61) if S, S' are multiplicative subsets of R , and if M is an R -module, then $(SS')^{-1}M = S^{-1}((S')^{-1}M)$,
- (62) if R is a ring, I and ideal of R and S a multiplicative subset of R , then $S^{-1}I$ is an ideal of $S^{-1}R$, and we have $S^{-1}R/S^{-1}I = \bar{S}^{-1}(R/I)$, where \bar{S} is the image of S in R/I ,
- (63) if R is a ring, and S a multiplicative subset of R , then any ideal I' of $S^{-1}R$ is of the form $S^{-1}I$, where one can take I to be the inverse image of I' in R ,
- (64) if R is a ring, M an R -module, and S a multiplicative subset of R , then any submodule N' of $S^{-1}M$ is of the form $S^{-1}N$ for some submodule $N \subset M$, where one can take N to be the inverse image of N' in M ,
- (65) if $S = \{1, f, f^2, \dots\}$ then $R_f = S^{-1}R$ and $M_f = S^{-1}M$,
- (66) if $S = R \setminus \mathfrak{p} = \{x \in R \mid x \notin \mathfrak{p}\}$ for some prime ideal \mathfrak{p} , then it is customary to denote $R_{\mathfrak{p}} = S^{-1}R$ and $M_{\mathfrak{p}} = S^{-1}M$,
- (67) a *local ring* is a ring with exactly one maximal ideal,
- (68) a *semi-local ring* is a ring with finitely many maximal ideals,
- (69) if \mathfrak{p} is a prime in R , then $R_{\mathfrak{p}}$ is a local ring with maximal ideal $\mathfrak{p}R_{\mathfrak{p}}$,
- (70) the *residue field*, denoted $\kappa(\mathfrak{p})$, of the prime \mathfrak{p} in the ring R is the quotient $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} = (R \setminus \mathfrak{p})^{-1}R/\mathfrak{p}$,
- (71) given R and M_1, M_2 the *tensor product* $M_1 \otimes_R M_2$,
- (72) etc.

10.4. Snake lemma

The snake lemma and its variants are discussed in the setting of abelian categories in Homology, Section 12.5.

Lemma 10.4.1. *Suppose given a commutative diagram*

$$\begin{array}{ccccccc}
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & 0 \\
 & & \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma \\
 0 & \longrightarrow & U & \longrightarrow & V & \longrightarrow & W
 \end{array}$$

of abelian groups with exact rows, then there is a canonical exact sequence

$$\text{Ker}(\alpha) \rightarrow \text{Ker}(\beta) \rightarrow \text{Ker}(\gamma) \rightarrow \text{Coker}(\alpha) \rightarrow \text{Coker}(\beta) \rightarrow \text{Coker}(\gamma)$$

Moreover, if $X \rightarrow Y$ is injective, then the first map is injective, and if $V \rightarrow W$ is surjective, then the last map is surjective.

Proof. The map $\partial : \text{Ker}(\gamma) \rightarrow \text{Coker}(\alpha)$ is defined as follows. Take $z \in \text{Ker}(\gamma)$. Choose $y \in Y$ mapping to z . Then $\beta(y) \in V$ maps to zero in W . Hence $\beta(y)$ is the image of some $u \in U$. Set $\partial z = \bar{u}$ the class of u in the cokernel of α . Proof of exactness is omitted. \square

10.5. Finite modules and finitely presented modules

Just some basic notation and lemmas.

Definition 10.5.1. Let R be a ring. Let M be an R -module

- (1) We say M is a *finite R -module*, or a *finitely generated R -module* if there exist $n \in \mathbf{N}$ and $x_1, \dots, x_n \in M$ such that every element of M is a R -linear combination of the x_i . Equivalently, this means there exists a surjection $R^{\oplus n} \rightarrow M$ for some $n \in \mathbf{N}$.
- (2) We say M is a *finitely presented R -module* or an *R -module of finite presentation* if there exist integers $n, m \in \mathbf{N}$ and an exact sequence

$$R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0$$

Informally this means that M is finitely generated and that the module of relations among these generators is finitely generated as well. A choice of an exact sequence as in the definition is called a *presentation* of M .

Lemma 10.5.2. Let R be a ring. Let $\alpha : R^{\oplus n} \rightarrow M$ and $\beta : N \rightarrow M$ be module maps. If $\text{Im}(\alpha) \subset \text{Im}(\beta)$, then there exists an R -module map $\gamma : R^{\oplus n} \rightarrow N$ such that $\alpha = \beta \circ \gamma$.

Proof. Let $e_i = (0, \dots, 0, 1, 0, \dots, 0)$ be the i th basis vector of $R^{\oplus n}$. Let $x_i \in N$ be an element with $\alpha(e_i) = \beta(x_i)$ which exists by assumption. Set $\gamma(a_1, \dots, a_n) = \sum a_i x_i$. By construction $\alpha = \beta \circ \gamma$. \square

Lemma 10.5.3. Let R be a ring. Let

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

be a short exact sequence of R -modules.

- (1) If M_1 and M_3 are finite R -modules, then M_2 is a finite R -module.
- (2) If M_1 and M_3 are finitely presented R -modules, then M_2 is a finitely presented R -module.
- (3) If M_2 is a finite R -module, then M_3 is a finite R -module.
- (4) If M_2 is a finitely presented R -module and M_1 is a finite R -module, then M_3 is a finitely presented R -module.
- (5) If M_3 is a finitely presented R -module and M_2 is a finite R -module, then M_1 is a finite R -module.

Proof. Proof of (1). If x_1, \dots, x_n are generators of M_1 and $y_1, \dots, y_m \in M_2$ are elements whose images in M_3 are generators of M_3 , then $x_1, \dots, x_n, y_1, \dots, y_m$ generate M_2 .

Part (3) is immediate from the definition.

Proof of (5). Assume M_3 is finitely presented and M_2 finite. Choose a presentation

$$R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M_3 \rightarrow 0$$

By Lemma 10.5.2 there exists a map $R^{\oplus n} \rightarrow M_2$ such that the solid diagram

$$\begin{array}{ccccccc} R^{\oplus m} & \longrightarrow & R^{\oplus n} & \longrightarrow & M_3 & \longrightarrow & 0 \\ \vdots & & \downarrow & & \downarrow \text{id} & & \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0 \end{array}$$

commutes. This produces the dotted arrow. By the snake lemma (Lemma 10.4.1) we see that we get an isomorphism

$$\text{Coker}(R^{\oplus m} \rightarrow M_1) \cong \text{Coker}(R^{\oplus n} \rightarrow M_2)$$

In particular we conclude that $\text{Coker}(R^{\oplus m} \rightarrow M_1)$ is a finite R -module. Since $\text{Im}(R^{\oplus m} \rightarrow M_1)$ is finite by (3), we see that M_1 is finite by part (1).

Proof of (4). Assume M_2 is finitely presented and M_1 is finite. Choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M_2 \rightarrow 0$. Choose a surjection $R^{\oplus k} \rightarrow M_1$. By Lemma 10.5.2 there exists a factorization $R^{\oplus k} \rightarrow R^{\oplus n} \rightarrow M_2$ of the composition $R^{\oplus k} \rightarrow M_1 \rightarrow M_2$. Then $R^{\oplus k+m} \rightarrow R^{\oplus n} \rightarrow M_3 \rightarrow 0$ is a presentation.

Proof of (2). Assume that M_1 and M_3 are finitely presented. The argument in the proof of part (1) produces a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & R^{\oplus n} & \longrightarrow & R^{\oplus n+m} & \longrightarrow & R^{\oplus m} & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 & \longrightarrow & 0 \end{array}$$

with surjective vertical arrows. By the snake lemma we obtain a short exact sequence

$$0 \rightarrow \text{Ker}(R^{\oplus n} \rightarrow M_1) \rightarrow \text{Ker}(R^{\oplus n+m} \rightarrow M_2) \rightarrow \text{Ker}(R^{\oplus m} \rightarrow M_3) \rightarrow 0$$

By part (5) we see that the outer two modules are finite. Hence the middle one is finite too. By (4) we see that M_2 is of finite presentation. \square

Lemma 10.5.4. *Let R be a ring, and let M be a finite R -module. There exists a filtration by R -submodules*

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/I_i for some ideal I_i of R .

Proof. By induction on the number of generators of M . Let $x_1, \dots, x_r \in M$ be a minimal number of generators. Let $M' = Rx_1 \subset M$. Then M/M' has $r-1$ generators and the induction hypothesis applies. And clearly $M' \cong R/I_1$ with $I_1 = \{f \in R \mid fx_1 = 0\}$. \square

Lemma 10.5.5. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. If M is finite as an R -module, then M is finite as an S -module.*

Proof. In fact, any R -generating set of M is also an S -generating set of M , since the R -module structure is induced by the image of R in S . \square

10.6. Ring maps of finite type and of finite presentation

Definition 10.6.1. Let $R \rightarrow S$ be a ring map.

- (1) We say $R \rightarrow S$ is of *finite type*, or that S is a *finite type R -algebra* if there exists an $n \in \mathbf{N}$ and an surjection of R -algebras $R[x_1, \dots, x_n] \rightarrow S$.
- (2) We say $R \rightarrow S$ is of *finite presentation* if there exist integers $n, m \in \mathbf{N}$ and polynomials $f_1, \dots, f_m \in R[x_1, \dots, x_n]$ and an isomorphism of R -algebras $R[x_1, \dots, x_n]/(f_1, \dots, f_m) \cong S$.

Informally this means that S is finitely generated as an R -algebra and that the ideal of relations among the generators is finitely generated. A choice of a surjection $R[x_1, \dots, x_n] \rightarrow S$ as in the definition is sometimes called a *presentation* of S .

Lemma 10.6.2. *The notions finite type and finite presentation have the following permanence properties.*

- (1) *A composition of ring maps of finite type is of finite type.*
- (2) *A composition of ring maps of finite presentation is of finite presentation.*
- (3) *Given $R \rightarrow S' \rightarrow S$ with $R \rightarrow S$ of finite type, then $S' \rightarrow S$ is of finite type.*
- (4) *Given $R \rightarrow S' \rightarrow S$, with $R \rightarrow S$ of finite presentation, and $R \rightarrow S'$ of finite type, then $S' \rightarrow S$ is of finite presentation.*

Proof. We only prove the last assertion. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and $S' = R[y_1, \dots, y_a]/I$. Say that the class \bar{y}_i of y_i maps to $h_i \bmod (f_1, \dots, f_m)$ in S . Then it is clear that $S = S'[x_1, \dots, x_n]/(f_1, \dots, f_m, h_1 - \bar{y}_1, \dots, h_a - \bar{y}_a)$. \square

Lemma 10.6.3. *Let $R \rightarrow S$ be a ring map of finite presentation. For any surjection $\alpha : R[x_1, \dots, x_n] \rightarrow S$ the kernel of α is a finitely generated ideal in $R[x_1, \dots, x_n]$.*

Proof. Write $S = R[y_1, \dots, y_m]/(f_1, \dots, f_k)$. Choose $g_i \in R[y_1, \dots, y_m]$ which are lifts of $\alpha(x_i)$. Then we see that $S = R[x_i, y_j]/(f_j, x_i - g_i)$. Choose $h_j \in R[x_1, \dots, x_n]$ such that $\alpha(h_j)$ corresponds to $y_j \bmod (f_1, \dots, f_k)$. Consider the map $\psi : R[x_i, y_j] \rightarrow R[x_i]$, $x_i \mapsto x_i$, $y_j \mapsto h_j$. Then the kernel of α is the image of $(f_j, x_i - g_i)$ under ψ and we win. \square

Lemma 10.6.4. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume $R \rightarrow S$ is of finite type and M is finitely presented as an R -module. Then M is finitely presented as an S -module.*

Proof. This is similar to the proof of part (4) of Lemma 10.6.2. We may assume $S = R[x_1, \dots, x_n]/J$. Choose $y_1, \dots, y_m \in M$ which generate M as an R -module and choose relations $\sum a_{ij} y_j = 0$, $i = 1, \dots, t$ which generate the kernel of $R^{\oplus n} \rightarrow M$. For any $i = 1, \dots, n$ and $j = 1, \dots, m$ write

$$x_i y_j = \sum a_{ijk} y_k$$

for some $a_{ijk} \in R$. Consider the S -module N generated by y_1, \dots, y_m subject to the relations $\sum a_{ij} y_j = 0$, $i = 1, \dots, t$ and $x_i y_j = \sum a_{ijk} y_k$, $i = 1, \dots, n$ and $j = 1, \dots, m$. Then N has a presentation

$$S^{\oplus nm+t} \longrightarrow S^{\oplus m} \longrightarrow N \longrightarrow 0$$

By construction there is a surjective map $\varphi : N \rightarrow M$. To finish the proof we show φ is injective. Suppose $z = \sum b_j y_j \in N$ for some $b_j \in S$. We may think of b_j as a polynomial in x_1, \dots, x_n with coefficients in R . By applying the relations of the form $x_i y_j = \sum a_{ijk} y_k$ we can inductively lower the degree of the polynomials. Hence we see that $z = \sum c_j y_j$ for some $c_j \in R$. Hence if $\varphi(z) = 0$ then the vector (c_1, \dots, c_m) is an R -linear combination of the vectors (a_{i1}, \dots, a_{im}) and we conclude that $z = 0$ as desired. \square

10.7. Finite ring maps

Definition 10.7.1. Let $\varphi : R \rightarrow S$ be a ring map. We say $\varphi : R \rightarrow S$ is *finite* if S is finite as an R -module.

Lemma 10.7.2. Let $R \rightarrow S$ be a finite ring map. Let M be an S -module. Then M is finite as an R -module if and only if M is finite as an S -module.

Proof. One of the implications follows from Lemma 10.5.5. To see the other assume that M is finite as an S -module. Pick $x_1, \dots, x_n \in S$ which generate S as an R -module. Pick $y_1, \dots, y_m \in M$ which generate M as an S -module. Then $x_j y_j$ generate M as an R -module. \square

Lemma 10.7.3. Suppose that $R \rightarrow S$ and $S \rightarrow T$ are finite ring maps. Then $R \rightarrow T$ is finite.

Proof. If t_i generate T as an S -module and s_j generate S as an R -module, then $t_i s_j$ generate T as an R -module. (Also follows from Lemma 10.7.2.) \square

Lemma 10.7.4. Let $R \rightarrow S$ be a finite and finitely presented ring map. Let M be an S -module. Then M is finitely presented as an R -module if and only if M is finitely presented as an S -module.

Proof. One of the implications follows from Lemma 10.6.4. To see the other assume that M is finitely presented as an S -module. Pick a presentation

$$S^{\oplus m} \longrightarrow S^{\oplus n} \longrightarrow M \longrightarrow 0$$

As S is finite as an R -module, the kernel of $S^{\oplus n} \rightarrow M$ is a finite R -module. Thus from Lemma 10.5.3 we see that it suffices to prove that S is finitely presented as an R -module.

Pick $x_1, \dots, x_n \in S$ which generate S as an R -module. Write $x_i^2 = \sum a_{ik} x_k$ for some $a_{ik} \in R$. Let $J = \text{Ker}(R[X_1, \dots, X_n] \rightarrow S)$ where $R[X_1, \dots, X_n] \rightarrow S$ is the R -algebra map determined by $X_i \mapsto x_i$. Let $h_i = X_i^2 - \sum a_{ik} X_k$ which is an element of J . Let $I = (h_1, \dots, h_n)$ so that $I \subset J$. Note that

$$S' = R[X_1, \dots, X_n]/I$$

is free as an R -module with basis the I -congruence classes of $X^E = X_1^{e_1} \dots X_n^{e_n}$ where $E = (e_1, \dots, e_n)$ is a multi-index with $e_i \in \{0, 1\}$. (Details omitted.) By Lemma 10.6.3 there exist finitely many $g_1, \dots, g_m \in J$ such that $J = (g_1, \dots, g_m)$. Denote g'_j the image of g_j in S' . Then $S = S'/(g'_1, \dots, g'_m)$. Hence as an R -module we have

$$S = S' / \sum_{j=1, \dots, m} \sum_{E=(e_1, \dots, e_n), e_i \in \{0, 1\}} R X^E g'_j$$

which is a finitely presented R -module. \square

10.8. Colimits

Some of the material in this section overlaps with the general discussion on colimits in Categories, Sections 4.14 – 4.21.

Definition 10.8.1. A *partially ordered set* is a set I together with a relation \leq which is associative (if $i \leq j$ and $j \leq k$ then $i \leq k$) and reflexive ($i \leq i$ for all $i \in I$). A *directed set* (I, \leq) is a partially ordered set (I, \leq) such that I is not empty and such that $\forall i, j \in I$, there exists $k \in I$ with $i \leq k, j \leq k$.

It is customary to drop the \leq from the notation when talking about a partially ordered set. This is the same as the notion defined in Categories, Section 4.21.

Definition 10.8.2. Let (I, \leq) be a partially ordered set. A *system* (M_i, μ_{ij}) of R -modules over I consists of a family of R -modules $\{M_i\}_{i \in I}$ indexed by I and a family of R -module maps $\{\mu_{ij} : M_i \rightarrow M_j\}_{i \leq j}$ such that for all $i \leq j \leq k$

$$\mu_{ii} = \text{id}_{M_i} \quad \mu_{ik} = \mu_{jk} \circ \mu_{ij}$$

We say (M_i, μ_{ij}) is a *directed system* if I is a directed set.

This is the same as the notion defined in Categories, Definition 4.21.1 and Section 4.21. We refer to Categories, Definition 4.14.2 for the definition of a colimit of a diagram/system in any category.

Lemma 10.8.3. Let (M_i, μ_{ij}) be a system of R -modules over the partially ordered set I . The colimit of the system (M_i, μ_{ij}) is the quotient R -module $(\bigoplus_{i \in I} M_i)/Q$ where Q is the R -submodule generated by all elements

$$\iota_i(x_i) - \iota_j(\mu_{ij}(x_i))$$

where $\iota_i : M_i \rightarrow \bigoplus_{i \in I} M_i$ is the natural inclusion. We denote the colimit $M = \text{colim}_i M_i$. We denote $\pi : \bigoplus_{i \in I} M_i \rightarrow M$ the projection map and $\phi_i = \pi \circ \iota_i : M_i \rightarrow M$.

Proof. This lemma is a special case of Categories, Lemma 4.14.11 but we will also prove it directly in this case. Namely, note that $\phi_i = \phi_j \circ \mu_{ij}$ in the above construction. To show the pair (M, ϕ_i) is the colimit we have to show it satisfies the universal property: for any other such pair (Y, ψ_i) with $\psi_i : M_i \rightarrow Y$, $\psi_i = \psi_j \circ \mu_{ij}$, there is a unique R -module homomorphism $g : M \rightarrow Y$ such that the following diagram commutes:

$$\begin{array}{ccc} M_i & \xrightarrow{\mu_{ij}} & M_j \\ & \searrow \phi_i & \swarrow \phi_j \\ & & M \\ & \swarrow \psi_i & \searrow \psi_j \\ & & Y \end{array}$$

$\downarrow g$

And this is clear because we can define g by taking the map ψ_i on the summand M_i in the direct sum $\bigoplus M_i$. \square

Lemma 10.8.4. Let (M_i, μ_{ij}) be a system of R -modules over the partially ordered set I . Assume that I is directed. The colimit of the system (M_i, μ_{ij}) is canonically isomorphic to the module M defined as follows:

- (1) as a set let

$$M = \left(\prod_{i \in I} M_i \right) / \sim$$

where for $m \in M_i$ and $m' \in M_{i'}$ we have

$$m \sim m' \Leftrightarrow \mu_{ij}(m) = \mu_{i'j}(m') \text{ for some } j \geq i, i'$$

- (2) as an abelian group for $m \in M_i$ and $m' \in M_{i'}$ we define the sum of the classes of m and m' in M to be the class of $\mu_{ij}(m) + \mu_{i'j}(m')$ where $j \in I$ is any index with $i \leq j$ and $i' \leq j$, and

- (3) as an R -module define for $m \in M_i$ and $x \in R$ the product of x and the class of m in M to be the class of xm in M .

The canonical maps $\phi_i : M_i \rightarrow M$ are induced by the canonical maps $M_i \rightarrow \coprod_{i \in I} M_i$.

Proof. Omitted. Compare with Categories, Section 4.19. \square

Lemma 10.8.5. Let (M_i, μ_{ij}) be a directed system. Let $M = \operatorname{colim} M_i$ with $\mu_i : M_i \rightarrow M$, then $\mu_i(x_i) = 0$ for $x_i \in M_i$ if and only if there exists $j \geq i$ such that $\mu_{ij}(x_i) = 0$.

Proof. This is clear from the description of the directed colimit in Lemma 10.8.4. \square

Example 10.8.6. Consider the partially ordered set $I = \{a, b, c\}$ with $a < b$ and $a < c$ and no other strict inequalities. A system $(M_a, M_b, M_c, \mu_{ab}, \mu_{ac})$ over I consists of three R -modules M_a, M_b, M_c and two R -module homomorphisms $\mu_{ab} : M_a \rightarrow M_b$ and $\mu_{ac} : M_a \rightarrow M_c$. The colimit of the system is just

$$M := \operatorname{colim}_{i \in I} M_i = \operatorname{Coker}(M_a \rightarrow M_b \oplus M_c)$$

where the map is $\mu_{ab} \oplus -\mu_{ac}$. Thus the kernel of the canonical map $M_a \rightarrow M$ is $\operatorname{Ker}(\mu_{ab}) + \operatorname{Ker}(\mu_{ac})$. And the kernel of the canonical map $M_b \rightarrow M$ is the image of $\operatorname{Ker}(\mu_{ac})$ under the map μ_{ab} . Hence clearly the result of Lemma 10.8.5 is false for general systems.

Definition 10.8.7. Let $(M_i, \mu_{ij}), (N_i, \nu_{ij})$ be systems of R -modules over the same partially ordered set I . A *homomorphism of systems* Φ from (M_i, μ_{ij}) to (N_i, ν_{ij}) is by definition a family of R -module homomorphisms $\phi_i : M_i \rightarrow N_i$ such that $\phi_j \circ \mu_{ij} = \nu_{ij} \circ \phi_i$ for all $i \leq j$.

This is the same notion as a transformation of functors between the associated diagrams $M : I \rightarrow \operatorname{Mod}_R$ and $N : I \rightarrow \operatorname{Mod}_R$, in the language of categories. The following lemma is a special case of Categories, Lemma 4.14.7.

Lemma 10.8.8. Let $(M_i, \mu_{ij}), (N_i, \nu_{ij})$ be systems of R -modules over the same partially ordered set. A morphism of systems $\Phi = (\phi_i)$ from (M_i, μ_{ij}) to (N_i, ν_{ij}) induces a unique homomorphism

$$\operatorname{colim} \phi_i : \operatorname{colim} M_i \longrightarrow \operatorname{colim} N_i$$

such that

$$\begin{array}{ccc} M_i & \longrightarrow & \operatorname{colim} M_i \\ \phi_i \downarrow & & \downarrow \operatorname{colim} \phi_i \\ N_i & \longrightarrow & \operatorname{colim} N_i \end{array}$$

commutes for all $i \in I$.

Proof. Write $M = \operatorname{colim} M_i$ and $N = \operatorname{colim} N_i$ and $\phi = \operatorname{colim} \phi_i$ (as yet to be constructed). We will use the explicit description of M and N in Lemma 10.8.3 without further mention. The condition of the lemma is equivalent to the condition

that

$$\begin{array}{ccc} \bigoplus_{i \in I} M_i & \longrightarrow & M \\ \bigoplus \phi_i \downarrow & & \downarrow \phi \\ \bigoplus_{i \in I} N_i & \longrightarrow & N \end{array}$$

commutes. Hence it is clear that if ϕ exists, then it is unique. To see that ϕ exists, it suffices to show that the kernel of the upper horizontal arrow is mapped by $\bigoplus \phi_i$ to the kernel of the lower horizontal arrow. To see this, let $j \leq k$ and $x_j \in M_j$. Then

$$\left(\bigoplus \phi_i\right)(x_j - \mu_{jk}(x_j)) = \phi_j(x_j) - \phi_k(\mu_{jk}(x_j)) = \phi_j(x_j) - \nu_{jk}(\phi_i(x_j))$$

which is in the kernel of the lower horizontal arrow as required. \square

Lemma 10.8.9. *Let I be a directed partially ordered set. Let (L_i, λ_{ij}) , (M_i, μ_{ij}) , and (N_i, ν_{ij}) be systems of R -modules over I . Let $\varphi_i : L_i \rightarrow M_i$ and $\psi_i : M_i \rightarrow N_i$ be morphisms of systems over I . Assume that for all $i \in I$ the sequence of R -modules*

$$L_i \xrightarrow{\varphi_i} M_i \xrightarrow{\psi_i} N_i$$

is a complex with homology H_i . Then the R -modules H_i form a system over I , the sequence of R -modules

$$\operatorname{colim}_i L_i \xrightarrow{\varphi} \operatorname{colim}_i M_i \xrightarrow{\psi} \operatorname{colim}_i N_i$$

is a complex as well, and denoting H its homology we have

$$H = \operatorname{colim}_i H_i.$$

Proof. We are going to repeatedly use the description of colimits over I as in Lemma 10.8.4 without further mention. Let $h \in H$. Since $H = \operatorname{Ker}(\varphi)/\operatorname{Im}(\psi)$ we see that h is the class mod $\operatorname{Im}(\psi)$ of an element $[m]$ in $\operatorname{Ker}(\psi) \subset \operatorname{colim}_i M_i$. Choose an i such that $[m]$ comes from an element $m \in M_i$. Choose a $j \geq i$ such that $\nu_{ij}(\psi_i(m)) = 0$ which is possible since $[m] \in \operatorname{Ker}(\psi)$. After replacing i by j and m by $\mu_{ij}(m)$ we see that we may assume $m \in \operatorname{Ker}(\psi_i)$. This shows that the map $\operatorname{colim}_i H_i \rightarrow H$ is surjective.

Suppose that $h_i \in H_i$ has image zero on H . Since $H_i = \operatorname{Ker}(\psi_i)/\operatorname{Im}(\varphi_i)$ we may represent h_i by an element $m \in \operatorname{Ker}(\psi_i) \subset M_i$. The assumption on the vanishing of h_i in H means that the class of m in $\operatorname{colim}_i M_i$ lies in the image of φ . Hence there exists an $j \geq i$ and a $l \in L_j$ such that $\varphi_j(l) = \mu_{ij}(m)$. Clearly this shows that the image of h_i in H_j is zero. This proves the injectivity of $\operatorname{colim}_i H_i \rightarrow H$. \square

Example 10.8.10. Taking colimits is not exact in general. Consider the partially ordered set $I = \{a, b, c\}$ with $a < b$ and $a < c$ and no other strict inequalities, as in Example 10.8.6. Consider the map of systems $(0, \mathbf{Z}, \mathbf{Z}, 0, 0) \rightarrow (\mathbf{Z}, \mathbf{Z}, \mathbf{Z}, 1, 1)$. From the description of the colimit in Example 10.8.6 we see that the associated map of colimits is not injective, even though the map of systems is injective on each object. Hence the result of Lemma 10.8.9 is false for general systems.

Lemma 10.8.11. *Let \mathcal{I} be an index category satisfying the assumptions of Categories, Lemma 4.19.7. Then taking colimits of diagrams of abelian groups over \mathcal{I} is exact (i.e., the analogue of Lemma 10.8.9 holds in this situation).*

Proof. By Categories, Lemma 4.19.7 we may write $\mathcal{I} = \coprod_{j \in J} \mathcal{I}_j$ with each \mathcal{I}_j a filtered category, and J possibly empty. By Categories, Lemma 4.21.3 taking colimits over the index categories \mathcal{I}_j is the same as taking the colimit over some directed partially ordered set. Hence Lemma 10.8.9 applies to these colimits. This reduces the problem to showing that coproducts in the category of R -modules over the set J are exact. In other words, exact sequences $L_j \rightarrow M_j \rightarrow N_j$ of R modules we have to show that

$$\bigoplus_{j \in J} L_j \longrightarrow \bigoplus_{j \in J} M_j \longrightarrow \bigoplus_{j \in J} N_j$$

is exact. This can be verified by hand, and holds even if J is empty. \square

For purposes of reference, we define what it means to have a relation between elements of a module.

Definition 10.8.12. Let R be a ring. Let M be an R -module. Let $n \geq 0$ and $x_i \in M$ for $i = 1, \dots, n$. A *relation* between x_1, \dots, x_n in M is a sequence of elements $f_1, \dots, f_n \in R$ such that $\sum_{i=1, \dots, n} f_i x_i = 0$.

Lemma 10.8.13. Let R be a ring and let M be an R -module. Then M is the colimit of a directed system (M_i, μ_{ij}) of R -modules with all M_i finitely presented R -modules.

Proof. Consider any finite subset $S \subset M$ and any finite collection of relations E among the elements of S . So each $s \in S$ corresponds to $x_s \in M$ and each $e \in E$ consists of a vector of elements $f_{e,s} \in R$ such that $\sum f_{e,s} x_s = 0$. Let $M_{S,E}$ be the cokernel of the map

$$R^{\#E} \longrightarrow R^{\#S}, \quad (g_e)_{e \in E} \longmapsto \left(\sum g_e f_{e,s} \right)_{s \in S}.$$

There are canonical maps $M_{S,E} \rightarrow M$. If $S \subset S'$ and if the elements of E correspond, via this map, to relations in E' , then there is an obvious map $M_{S,E} \rightarrow M_{S',E'}$ commuting with the maps to M . Let I be the set of pairs (S, E) with ordering by inclusion as above. It is clear that the colimit of this directed system is M . \square

10.9. Localization

Definition 10.9.1. Let R be a ring, S a subset of R . We say S is a *multiplicative subset* of R if $1 \in S$ and S is closed under multiplication, i.e., $s, s' \in S \Rightarrow ss' \in S$.

Given a ring A and a multiplicative subset S , we define a relation on $A \times S$ as follows:

$$(x, s) \sim (y, t) \Leftrightarrow \exists u \in S \text{ such that } (xt - ys)u = 0$$

It is easily checked that this is an equivalence relation. Let x/s (or $\frac{x}{s}$) be the equivalence class of (x, s) and $S^{-1}A$ be the set of all equivalence classes. Define addition and multiplication in $S^{-1}A$ as follows:

$$x/s + y/t = (xt + ys)/st, \quad x/s \cdot y/t = xy/st$$

One can check that $S^{-1}A$ becomes a ring under these operations.

Definition 10.9.2. This ring is called the *localization of A with respect to S* .

We have a natural ring map from A to its localization $S^{-1}A$,

$$A \longrightarrow S^{-1}A, \quad x \longmapsto x/1$$

which is sometimes called the *localization map*. In general the localization map is not injective, unless S contains no zerodivisors. For, if $x/1 = 0$, then there is a $u \in S$ such that $xu = 0$ in A and hence $x = 0$ since there are no zerodivisors in S . The localization of a ring has the following universal property.

Proposition 10.9.3. *Let $f : A \rightarrow B$ be a ring map that sends every element in S to a unit of B . Then there is a unique homomorphism $g : S^{-1}A \rightarrow B$ such that the following diagram commutes.*

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ & \searrow & \nearrow g \\ & S^{-1}A & \end{array}$$

Proof. Existence. We define a map g as follows. For $x/s \in S^{-1}A$, let $g(x/s) = f(x)f(s)^{-1} \in B$. It is easily checked from the definition that this is a well-defined ring map. And it is also clear that this makes the diagram commutative.

Uniqueness. We now show that if $g' : S^{-1}A \rightarrow B$ satisfies $g'(x/1) = f(x)$, then $g = g'$. Hence $f(s) = g'(s/1)$ for $s \in S$ by the commutativity of the diagram. But then $g'(1/s)f(s) = 1$ in B , which implies that $g'(1/s) = f(s)^{-1}$ and hence $g'(x/s) = g'(x/1)g'(1/s) = f(x)f(s)^{-1} = g(x/s)$. \square

Lemma 10.9.4. *The localization $S^{-1}A$ is the zero ring if and only if $0 \in S$.*

Proof. If $0 \in S$, any pair $(a, s) \sim (0, 1)$ by definition. If $0 \notin S$, then clearly $1/1 \neq 0/1$ in $S^{-1}A$. \square

Lemma 10.9.5. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. The category of $S^{-1}R$ -modules is equivalent to the category of R -modules N with the property that every $s \in S$ acts as an automorphism on N .*

Proof. The functor which defines the equivalence associates to an $S^{-1}R$ -module M the same module but now viewed as an R -module via the localization map $R \rightarrow S^{-1}R$. Conversely, if N is an R -module, such that every $s \in S$ acts via an automorphism s_N , then we can think of N as an $S^{-1}R$ -module by letting x/s act via $x_N \circ s_N^{-1}$. We omit the verification that these two functors are quasi-inverse to each other. \square

The notion of localization of a ring can be generalized to the localization of a module. Let A be a ring, S a multiplicative subset of A and M an A -module. We define a relation on $M \times S$ as follows

$$(m, s) \sim (n, t) \Leftrightarrow \exists u \in S \text{ such that } (mt - ns)u = 0$$

This is clearly an equivalence relation. Denote by m/s (or $\frac{m}{s}$) be the equivalence class of (m, s) and $S^{-1}M$ be the set of all equivalence classes. Define the addition and scalar multiplication as follows

$$m/s + n/t = (mt + ns)/st, \quad m/s \cdot n/t = mn/st$$

It is clear that this makes $S^{-1}M$ an $S^{-1}A$ module.

Definition 10.9.6. The $S^{-1}A$ -module $S^{-1}M$ is called the *localization* of M at S .

Note that there is an A -module map $M \rightarrow S^{-1}M$, $m \mapsto m/1$ which is sometimes called the *localization map*. It satisfies the following universal property.

Lemma 10.9.7. *Let R be a ring. Let $S \subset R$ a multiplicative subset. Let M, N be R -modules. Assume all the elements of S act as automorphisms on N . Then the canonical map*

$$\mathrm{Hom}_R(S^{-1}M, N) \longrightarrow \mathrm{Hom}_R(M, N)$$

induced by the localization map, is an isomorphism.

Proof. It is clear that the map is well-defined and R -linear. Injectivity: Let $\alpha \in \mathrm{Hom}_R(S^{-1}M, N)$ and take an arbitrary element $m/s \in S^{-1}M$. Then, since $s \cdot \alpha(m/s) = \alpha(m/1)$, we have $\alpha(m/s) = s^{-1}(\alpha(m/1))$, so α is completely determined by what it does on the image of M in $S^{-1}M$. Surjectivity: Let $\beta : M \rightarrow N$ be a given R -linear map. We need to show that it can be "extended" to $S^{-1}M$. Define a map of sets

$$M \times S \rightarrow N, \quad (m, s) \mapsto s^{-1}(m)$$

Clearly, this map respects the equivalence relation from above, so it descends to a well-defined map $\alpha : S^{-1}M \rightarrow N$. It remains to show that this map is R -linear, so take $r, r' \in R$ as well as $s, s' \in S$ and $m, m' \in M$. Then

$$\begin{aligned} \alpha(r \cdot m/s + r' \cdot m'/s') &= \alpha((r \cdot st \cdot m + r' \cdot s \cdot m')/(ss')) \\ &= (ss')^{-1}(\beta(r \cdot st \cdot m + r' \cdot s \cdot m')) \\ &= (ss')^{-1}(r \cdot s' \beta(m) + r' \cdot s \beta(m')) \\ &= r\alpha(m/s) + r'\alpha(m'/s') \end{aligned}$$

and we win. \square

Example 10.9.8. Let A be a ring and let M be an A -module. Here are some important examples of localizations.

- (1) Given \mathfrak{p} a prime ideal of A consider $S = A \setminus \mathfrak{p}$. It is immediately checked that S is a multiplicative set. In this case we denote $A_{\mathfrak{p}}$ and $M_{\mathfrak{p}}$ the localization of A and M with respect to S respectively. These are called the *localization of A , resp. M at \mathfrak{p}* .
- (2) Let $f \in A$. Consider $S = \{1, f, f^2, \dots\}$. This is clearly a multiplicative subset of A . In this case we denote A_f (resp. M_f) the localization $S^{-1}A$ (resp. $S^{-1}M$). This is called the *localization of A , resp. M with respect to f* . Note that $A_f = 0$ if and only if f is nilpotent in A .
- (3) Let $S = \{f \in A \mid f \text{ is not a zerodivisor in } A\}$. This is a multiplicative subset of A . In this case the ring $Q(A) = S^{-1}A$ is called either the *total quotient ring*, or the *total ring of fractions* of A .

Lemma 10.9.9. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Let M be an R -module. Then*

$$S^{-1}M = \mathrm{colim}_{f \in S} M_f$$

where the partial ordering on S is given by $f \geq f' \Leftrightarrow f = f'f''$ for some $f'' \in R$ in which case the map $M_{f'} \rightarrow M_f$ is given by $m/(f')^e \mapsto m(f'')^e/f^e$.

Proof. Omitted. Hint: Use the universal property of Lemma 10.9.7. \square

In the following paragraph, let A denote a ring, and M, N denote modules over A . If S and S' are multiplicative sets of A , then it is clear that

$$SS' = \{ss' : s \in S, s' \in S'\}$$

is also a multiplicative set of A . Then the following holds.

Proposition 10.9.10. *Let \bar{S} be the image of S in $S'^{-1}A$, then $(SS')^{-1}A$ is isomorphic to $\bar{S}^{-1}(S'^{-1}A)$.*

Proof. The map sending $x \in A$ to $x/1 \in (SS'^{-1})A$ induces a map sending $x/s \in S'^{-1}A$ to $x/s \in (SS'^{-1})A$, by universal property. The image of the elements in \bar{S} are invertible in $(SS'^{-1})A$. By the universal property we get a map $f : \bar{S}^{-1}(S'^{-1}A) \rightarrow (SS'^{-1})A$ which maps $(x/t')/(s/s')$ to $(x/t') \cdot (s/s')^{-1}$.

On the other hand, the map from A to $\bar{S}^{-1}(S'^{-1}A)$ sending $x \in A$ to $(x/1)/(1/1)$ also induces a map $g : (SS'^{-1})A \rightarrow \bar{S}^{-1}(S'^{-1}A)$ which sends x/ss' to $(x/s')/(s/1)$, by the universal property again. It is immediately checked that f and g are inverse to each other, hence they are both isomorphisms. \square

For the module M we have

Proposition 10.9.11. *View $S'^{-1}M$ as an A -module, then $S^{-1}(S'^{-1}M)$ is isomorphic to $(SS')^{-1}M$.*

Proof. Note that given a A -module M , we have not proved any universal property for $S^{-1}M$. Hence we cannot reason as in the preceding proof; we have to construct the isomorphism explicitly.

We define the maps as follows

$$f : S^{-1}(S'^{-1}M) \longrightarrow (SS')^{-1}M, \quad \frac{x/s'}{s} \mapsto x/ss'$$

$$g : (SS')^{-1}M \longrightarrow S^{-1}(S'^{-1}M), \quad x/t \mapsto \frac{x/s'}{s} \text{ for some } s \in S, s' \in S', \text{ and } t = ss'$$

We have to check that these homomorphisms are well-defined, that is, independent the choice of the fraction. This is easily checked and it is also straightforward to show that they are inverse to each other. \square

If $u : M \rightarrow N$ is an A homomorphism, then the localization indeed induces a well-defined $S^{-1}A$ homomorphism $S^{-1}u : S^{-1}M \rightarrow S^{-1}N$ which sends x/s to $u(x)/s$. It is immediately checked that this construction is functorial, so that S^{-1} is actually a functor from the category of A -modules to the category of $S^{-1}A$ -modules. Moreover this functor is exact, as we show in the following proposition.

Proposition 10.9.12. *Let $L \xrightarrow{u} M \xrightarrow{v} N$ is an exact sequence of R -modules. Then $S^{-1}L \rightarrow S^{-1}M \rightarrow S^{-1}N$ is also exact.*

Proof. First it is clear that $S^{-1}L \rightarrow S^{-1}M \rightarrow S^{-1}N$ is a complex since localization is a functor. Next suppose that x/s maps to zero in $S^{-1}N$ for some $x/s \in S^{-1}M$. Then by definition there is a $t \in S$ such that $v(xt) = v(x)t = 0$ in N , which means $xt \in \text{Ker}(v)$. By the exactness of $L \rightarrow M \rightarrow N$ we have $xt = u(y)$ for some y in L . Then x/s is the image of y/st . This proves the exactness. \square

Lemma 10.9.13. *Localization respects quotients, i.e. if N is a submodule of M , then $S^{-1}(M/N) \simeq (S^{-1}M)/(S^{-1}N)$.*

Proof. From the exact sequence

$$0 \longrightarrow N \longrightarrow M \longrightarrow M/N \longrightarrow 0$$

we have

$$0 \longrightarrow S^{-1}N \longrightarrow S^{-1}M \longrightarrow S^{-1}(M/N) \longrightarrow 0$$

The corollary then follows. \square

If, in the preceding Corollary, we take $N = I$ and $M = A$ for an ideal I of A , we see that $S^{-1}A/S^{-1}I \simeq S^{-1}(A/I)$ as A -modules. The next proposition shows that they are isomorphic as rings.

Proposition 10.9.14. *Let I be an ideal of A , S a multiplicative set of A . Then $S^{-1}I$ is an ideal of $S^{-1}A$ and $\overline{S}^{-1}(A/I)$ is isomorphic to $S^{-1}A/S^{-1}I$, where \overline{S} is the image of S in A/I .*

Proof. The fact that $S^{-1}I$ is an ideal is clear since I itself is an ideal. Define

$$f : S^{-1}A \longrightarrow \overline{S}^{-1}(A/I), \quad x/s \mapsto \overline{x}/\overline{s}$$

where \overline{x} and \overline{s} are the images of x and s in A/I . We shall keep similar notations in this proof. This map is well-defined by the universal property of $S^{-1}A$, and $S^{-1}I$ is contained in the kernel of it, therefore it induces a map

$$\overline{f} : S^{-1}A/S^{-1}I \longrightarrow \overline{S}^{-1}(A/I), \quad \overline{x/s} \mapsto \overline{x}/\overline{s}$$

On the other hand, the map $A \rightarrow S^{-1}A/S^{-1}I$ sending x to $\overline{x/1}$ induces a map $A/I \rightarrow S^{-1}A/S^{-1}I$ sending \overline{x} to $\overline{x/1}$. The image of \overline{S} is invertible in $S^{-1}A/S^{-1}I$, thus induces a map

$$g : \overline{S}^{-1}(A/I) \longrightarrow S^{-1}A/S^{-1}I, \quad \frac{\overline{x}}{\overline{s}} \mapsto \overline{x/s}$$

by the universal property. It is then clear that \overline{f} and g are inverse to each other, hence are both isomorphisms. \square

We now consider how submodules behave in localization.

Lemma 10.9.15. *Any submodule N' of $S^{-1}M$ is of the form $S^{-1}N$ for some $N \subset M$. Indeed one can take N to be the inverse image of N' in M .*

Proof. Let N be the inverse image of N' in M . Then one can see that $S^{-1}N \supset N'$. To show they are equal, take x/s in $S^{-1}N$, where $s \in S$ and $x \in N$. This yields that $x/1 \in N'$. Since N' is an $S^{-1}R$ -submodule we have $x/s = x/1 \cdot 1/s \in N'$. This finishes the proof. \square

Taking $M = A$ and $N = I$ an ideal of A , we have the following corollary, which can be viewed as a converse of the first part of Proposition 10.9.14.

Lemma 10.9.16. *Each ideal I' of $S^{-1}A$ takes the form $S^{-1}I$, where one can take I to be the inverse image of I' in A .*

Proof. Immediate from Lemma 10.9.15. \square

The next lemma concerns the spectrum and localization. FIXME: This should be moved later in the manuscript.

Lemma 10.9.17. *Let S be a multiplicative set of A . Then the map*

$$f : \operatorname{Spec}(S^{-1}A) \longrightarrow \operatorname{Spec}(A)$$

induced by the canonical ring map $A \rightarrow S^{-1}A$ is a homeomorphism onto its image and $\operatorname{Im}(f) = \{\mathfrak{p} \in \operatorname{Spec}(A) : \mathfrak{p} \cap S = \emptyset\}$.

Proof. Denote the localization map by $\varphi : A \rightarrow S^{-1}A$. We first show that $\operatorname{Im}(f) = \{\mathfrak{p} \in \operatorname{Spec}(A) : \mathfrak{p} \cap S = \emptyset\}$. For any ideal \mathfrak{q} of $S^{-1}A$, $\varphi^{-1}(\mathfrak{q}) \cap S = 0$. Otherwise if $x \neq 0 \in \varphi^{-1}(\mathfrak{q}) \cap S$, then $x/1 \in \mathfrak{q}$. But $x \in S$, hence $x/1$ is invertible in $S^{-1}A$ which is impossible since \mathfrak{q} is a prime ideal. For any prime ideal \mathfrak{p} in A which does not meet S , $S^{-1}\mathfrak{p}$ is an ideal in $S^{-1}A$. Moreover it is a prime ideal. This is because $S^{-1}A/S^{-1}\mathfrak{p}$ is isomorphic to $\overline{S^{-1}}(A/\mathfrak{p})$ and the localization of an integral domain is again an integral domain.

We still have to show that this map is open, i.e. we have to show that the image of a standard open set is again open. For any $x/s \in S^{-1}A$, we claim that the image of $D(x/s)$ is $D(x) \cap \operatorname{Im}(f)$. First if $x/s \notin S^{-1}\mathfrak{p}$ for some prime ideal \mathfrak{p} of A , then $x \notin \mathfrak{p}$. Conversely, if $x \notin \mathfrak{p}$ and \mathfrak{p} does not meet S , then $x/s \notin S^{-1}\mathfrak{p}$. This is due to that fact that $\mathfrak{p} \cap S = \emptyset$.

Thus f is indeed an homeomorphism onto its image. \square

10.10. Internal Hom

If R is a ring, and M, N are R -modules, then

$$\operatorname{Hom}_R(M, N) = \{\varphi : M \rightarrow N\}$$

is the set of R -linear maps from M to N . This set comes with the structure of an abelian group by setting $(\varphi + \psi)(m) = \varphi(m) + \psi(m)$, as usual. In fact, $\operatorname{Hom}_R(M, N)$ is also an R -module via the rule $(x\varphi)(m) = x\varphi(m) = \varphi(xm)$.

Given maps $a : M \rightarrow M'$ and $b : N \rightarrow N'$ of R -modules, we can pre-compose and post-compose homomorphisms by a and b . This leads to the following commutative diagram

$$\begin{array}{ccc} \operatorname{Hom}_R(M', N) & \xrightarrow{b \circ -} & \operatorname{Hom}_R(M', N') \\ \begin{array}{c} \downarrow - \circ a \\ \operatorname{Hom}_R(M, N) \end{array} & & \begin{array}{c} \downarrow - \circ a \\ \operatorname{Hom}_R(M, N') \end{array} \\ & \xrightarrow{b \circ -} & \end{array}$$

In fact, the maps in this diagram are R -module maps. Thus Hom_R defines an additive functor

$$\operatorname{Mod}_R^{\operatorname{opp}} \times \operatorname{Mod}_R \longrightarrow \operatorname{Mod}_R, \quad (M, N) \longmapsto \operatorname{Hom}_R(M, N)$$

Lemma 10.10.1. *Exactness and Hom_R . Let R be a ring.*

- (1) *Let $M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a complex of R -modules. Then $M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is exact if and only if $0 \rightarrow \operatorname{Hom}_R(M_3, N) \rightarrow \operatorname{Hom}_R(M_2, N) \rightarrow \operatorname{Hom}_R(M_1, N)$ is exact for all R -modules N .*
- (2) *Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3$ be a complex of R -modules. Then $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3$ is exact if and only if $0 \rightarrow \operatorname{Hom}_R(N, M_1) \rightarrow \operatorname{Hom}_R(N, M_2) \rightarrow \operatorname{Hom}_R(N, M_3)$ is exact for all R -modules N .*

Proof. Omitted. \square

Lemma 10.10.2. *Let R be a ring. Let M be a finitely presented R -module. Let N be an R -module.*

- (1) *For $f \in R$ we have $\text{Hom}_R(M, N)_f = \text{Hom}_{R_f}(M_f, N_f) = \text{Hom}_R(M_f, N_f)$,*
 (2) *for a multiplicative subset S of R we have*

$$S^{-1} \text{Hom}_R(M, N) = \text{Hom}_{S^{-1}R}(S^{-1}M, S^{-1}N) = \text{Hom}_R(S^{-1}M, S^{-1}N).$$

Proof. Part (1) is a special case of part (2). The second equality in (2) follows from Lemma 10.9.7. Choose a presentation

$$\bigoplus_{j=1, \dots, m} R \longrightarrow \bigoplus_{i=1, \dots, n} R \rightarrow M \rightarrow 0.$$

By Lemma 10.10.1 this gives an exact sequence

$$0 \rightarrow \text{Hom}_R(M, N) \rightarrow \bigoplus_{i=1, \dots, n} N \longrightarrow \bigoplus_{j=1, \dots, m} N.$$

Inverting S and using Proposition 10.9.12 we get an exact sequence

$$0 \rightarrow S^{-1} \text{Hom}_R(M, N) \rightarrow \bigoplus_{i=1, \dots, n} S^{-1}N \longrightarrow \bigoplus_{j=1, \dots, m} S^{-1}N$$

and the result follows since $S^{-1}M$ sits in an exact sequence

$$\bigoplus_{j=1, \dots, m} S^{-1}R \longrightarrow \bigoplus_{i=1, \dots, n} S^{-1}R \rightarrow S^{-1}M \rightarrow 0$$

which induces (by Lemma 10.10.1) the exact sequence

$$0 \rightarrow \text{Hom}_{S^{-1}R}(S^{-1}M, S^{-1}N) \rightarrow \bigoplus_{i=1, \dots, n} S^{-1}N \longrightarrow \bigoplus_{j=1, \dots, m} S^{-1}N$$

which is the same as the one above. \square

10.11. Tensor products

Definition 10.11.1. Let R be a ring, M, N, P be three R -modules. A mapping $f : M \times N \rightarrow P$ (where $M \times N$ is viewed only as Cartesian product of two R -modules) is said to be *R -bilinear* if for each $x \in M$ the mapping $y \mapsto f(x, y)$ of N into P is R -linear, and for each $y \in N$ the mapping $x \mapsto f(x, y)$ is also R -linear.

Lemma 10.11.2. *Let M, N be R -modules. Then there exists a pair (T, g) where T is an R -module, and $g : M \times N \rightarrow T$ an R -bilinear mapping, with the following universal property: For any R -module P and any R -bilinear mapping $f : M \times N \rightarrow P$, there exists a unique R -linear mapping $\tilde{f} : T \rightarrow P$ such that $f = \tilde{f} \circ g$. In other words, the following diagram commutes:*

$$\begin{array}{ccc} M \times N & \xrightarrow{f} & P \\ & \searrow g & \nearrow f' \\ & & T \end{array}$$

Moreover, if (T, g) and (T', g') are two pairs with this property, then there exists a unique isomorphism $j : T \rightarrow T'$ such that $j \circ g = g'$.

The R -module T which satisfies the above universal property is called the *tensor product* of R -modules M and N , denoted as $M \otimes_R N$.

Proof. We first prove the existence of such R -module T . Let M, N be R -modules. Let T be the quotient module P/Q , where P is the free R -module $R^{(M \times N)}$ and Q is the R -module generated by all elements of the following types: ($x \in M, y \in N$)

$$\begin{aligned} (x + x', y) - (x, y) - (x', y), \\ (x, y + y') - (x, y) - (x, y'), \\ (ax, y) - a(x, y), \\ (x, ay) - a(x, y) \end{aligned}$$

Let $\pi : M \times N \rightarrow T$ denote the natural map. This map is R -bilinear, as implied by the above relations when we check the bilinearity conditions. Denote the image $\pi(x, y) = x \otimes y$, then these elements generate T . Now let $f : M \times N \rightarrow P$ be an R -bilinear map, then we can define $f' : T \rightarrow P$ by extending the mapping $f'(x \otimes y) = f(x, y)$. Clearly $f = f' \circ \pi$. Moreover, f' is uniquely determined by the value on the generating sets $\{x \otimes y : x \in M, y \in N\}$. Suppose there is another pair (T', g') satisfying the same properties. Then there is a unique $j : T \rightarrow T'$ and also $j' : T' \rightarrow T$ such that $g' = j \circ g$, $g = j' \circ g'$. But then both the maps $(j \circ j') \circ g$ and g satisfies the universal properties, so by uniqueness they are equal, and hence $j' \circ j$ is identity on T . Similarly $(j' \circ j) \circ g' = g'$ and $j \circ j'$ is identity on T' . So j is an isomorphism. \square

Lemma 10.11.3. *Let M, N, P be R -modules, then the bilinear maps*

$$\begin{aligned} (x, y) &\mapsto y \otimes x \\ (x + y, z) &\mapsto x \otimes z + y \otimes z \\ (r, x) &\mapsto rx \end{aligned}$$

induce unique isomorphisms

$$\begin{aligned} M \otimes_R N &\rightarrow N \otimes_R M, \\ (M \oplus N) \otimes_R P &\rightarrow (M \otimes_R P) \oplus (N \otimes_R P), \\ R \otimes_R M &\rightarrow M \end{aligned}$$

Proof. Omitted. \square

We may generalize the tensor product of two R -modules to finitely many R -modules, and set up a correspondence between the multi-tensor product with multilinear mappings. Using almost the same construction one can prove that:

Lemma 10.11.4. *Let M_1, \dots, M_r be R -modules. Then there exists a pair (T, g) consisting of an R -module T and an R -multilinear mapping $g : M_1 \times \dots \times M_r \rightarrow T$ with the universal property: For any R -multilinear mapping $f : M_1 \times \dots \times M_r \rightarrow P$ there exists a unique R -module homomorphism $f' : T \rightarrow P$ such that $f' \circ g = f$. Such a module T is unique up to unique isomorphism. We denote it $M_1 \otimes_R \dots \otimes_R M_r$ and we denote the universal multilinear map $(m_1, \dots, m_r) \mapsto m_1 \otimes \dots \otimes m_r$.*

Proof. Omitted. \square

Lemma 10.11.5. *The homomorphisms*

$$(M \otimes_R N) \otimes_R P \rightarrow M \otimes_R N \otimes_R P \rightarrow M \otimes_R (N \otimes_R P)$$

such that $f((x \otimes y) \otimes z) = x \otimes y \otimes z$ and $g(x \otimes y \otimes z) = x \otimes (y \otimes z)$, $x \in M, y \in N, z \in P$ are well-defined and are isomorphisms.

Proof. We shall prove f is well-defined and is an isomorphism, and this proof carries analogously to g . Fix any $z \in P$, then the mapping $(x, y) \mapsto x \otimes y \otimes z$, $x \in M, y \in N$, is R -bilinear in x and y , and hence induces homomorphism $f_z : M \otimes N \rightarrow M \otimes N \otimes P$ $f_z(x \otimes y) = x \otimes y \otimes z$. Then consider $(M \otimes N) \times P \rightarrow M \otimes N \otimes P$ given by $(w, z) \mapsto f_z(w)$. The map is R -bilinear and thus induces $f : (M \otimes_R N) \otimes_R P \rightarrow M \otimes_R N \otimes_R P$ and $f((x \otimes y) \otimes z) = x \otimes y \otimes z$. To construct the inverse, we note that the map $\pi : M \times N \times P \rightarrow (M \otimes N) \otimes P$ is R -trilinear. Therefore, it induces an R -linear map $h : M \otimes N \otimes P \rightarrow (M \otimes N) \otimes P$ which agrees with the universal property. Here we see that $h(x \otimes y \otimes z) = (x \otimes y) \otimes z$. From the explicit expression of f and h , $f \circ h$ and $h \circ f$ are identity maps of $M \otimes N \otimes P$ and $(M \otimes N) \otimes P$ respectively, hence f is our desired isomorphism. \square

Doing induction we see that this extends to multi-tensor products. Combined with Lemma 10.11.3 we see that the tensor product operation on the category of R -modules is associative, commutative and distributive.

Definition 10.11.6. An abelian group N is called an (A, B) -bimodule if it is both an A -module and a B -module, and the actions $A \rightarrow \text{End}(M)$ and $B \rightarrow \text{End}(M)$ are compatible in the sense that $(ax)b = a(xb)$ for all $a \in A, b \in B, x \in N$. Usually we denote it as ${}_A N_B$.

Lemma 10.11.7. For A -module M , B -module P and (A, B) -bimodule N , the modules $(M \otimes_A N) \otimes_B P$ and $M \otimes_A (N \otimes_B P)$ can both be given (A, B) -bimodule structure, and moreover

$$(M \otimes_A N) \otimes_B P \cong M \otimes_A (N \otimes_B P).$$

Proof. A priori $M \otimes_A N$ is an A -module, but we can give it a B -module structure by letting

$$(x \otimes y)b = x \otimes yb, \quad x \in M, y \in N, b \in B$$

Thus $M \otimes_A N$ becomes an (A, B) -bimodule. Similarly for $N \otimes_B P$, and thus for $(M \otimes_A N) \otimes_B P$ and $M \otimes_A (N \otimes_B P)$. By Lemma 10.11.5, these two modules are isomorphic as both as A -module and B -module via the same mapping. \square

Lemma 10.11.8. For any three R -modules M, N, P ,

$$\text{Hom}_R(M \otimes_R N, P) \cong \text{Hom}_R(M, \text{Hom}_R(N, P))$$

Proof. An R -linear map $\hat{f} \in \text{Hom}_R(M \otimes_R N, P)$ corresponds to an R -bilinear map $f : M \times N \rightarrow P$. For each $x \in M$ the mapping $y \mapsto f(x, y)$ is R -linear by the universal property. Thus f corresponds to a map $\phi_f : M \rightarrow \text{Hom}_R(N, P)$. This map is R -linear since

$$\phi_f(ax + y)(z) = f(ax + y, z) = af(x, z) + f(y, z) = (a\phi_f(x) + \phi_f(y))(z),$$

for all $y \in N$ and for all $a \in R, x, z \in M$. Conversely, any $f \in \text{Hom}_R(M, \text{Hom}_R(N, P))$ defines an R -bilinear map $M \times N \rightarrow P$, namely $(x, y) \mapsto f(x)(y)$. So this is a natural one-to-one correspondence between the two modules. \square

Lemma 10.11.9 (Tensor products commute with colimits). Let (M_i, μ_{ij}) be a system over the partially ordered set I . Let N be an R -module. Then

$$\text{colim}(M_i \otimes N) \cong (\text{colim } M_i) \otimes N.$$

Moreover, the isomorphism is induced by the homomorphisms $\mu_i \otimes 1 : M_i \otimes N \rightarrow M \otimes N$ where $M = \text{colim}_i M_i$ with natural maps $\mu_i : M_i \rightarrow M$.

Proof. First proof. The functor $M' \mapsto M' \otimes_R N$ is left adjoint to the functor $N' \mapsto \text{Hom}_R(N, N')$ by Lemma 10.11.8. Thus $M' \mapsto M' \otimes_R N$ commutes with all colimits, see Categories, Lemma 4.24.4.

Second direct proof. Let $P = \text{colim}(M_i \otimes N)$, $M = \text{colim} M_i$. Then for all $i \leq j$, the following diagram commutes:

$$\begin{array}{ccc} M_i \otimes N & \xrightarrow{\mu_i \otimes 1} & M \otimes N \\ \mu_{ij} \otimes 1 \downarrow & & \downarrow \text{id} \\ M_j \otimes N & \xrightarrow{\mu_j \otimes 1} & M \otimes N \end{array}$$

By Lemma 10.8.8, these maps induce a unique homomorphism $\psi : P \rightarrow M \otimes N$, with $\lambda_i : M_i \otimes N \rightarrow P$ given by $\lambda_i = \pi \circ (\iota_i \otimes 1)$.

To construct the inverse map, for each $i \in I$, there is the canonical R -bilinear mapping $g_i : M_i \times N \rightarrow M_i \otimes N$. This induces a unique mapping $\widehat{\phi} : M \times N \rightarrow P$ such that $\widehat{\phi} \circ (\mu_i \times 1) = \lambda_i \circ g_i$. It is R -bilinear. Thus it induces an R -linear mapping $\phi : M \otimes N \rightarrow P$. From the commutative diagram below:

$$\begin{array}{ccccccc} M_i \times N & \xrightarrow{g_i} & M_i \otimes N & \xrightarrow{\text{id}} & M_i \otimes N & & \\ \downarrow \mu_i \times \text{id} & & \downarrow \lambda_i & & \downarrow \mu_i \otimes \text{id} & \searrow \lambda_i & \\ M \times N & \xrightarrow{\widehat{\phi}} & P & \xrightarrow{\psi} & M \otimes N & \xrightarrow{\phi} & P \end{array}$$

we see that $\psi \circ \widehat{\phi} = g$, the canonical R -bilinear mapping $g : M \times N \rightarrow M \otimes N$. So $\psi \circ \phi$ is identity on $M \otimes N$. From the right-hand square and triangle, $\phi \circ \psi$ is also identity on P . \square

Lemma 10.11.10. *Let*

$$M_1 \xrightarrow{f} M_2 \xrightarrow{g} M_3 \rightarrow 0$$

be an exact sequence of R -modules and homomorphisms, and let N be any R -module. Then the sequence

$$(10.11.10.1) \quad M_1 \otimes N \xrightarrow{f \otimes 1} M_2 \otimes N \xrightarrow{g \otimes 1} M_3 \otimes N \rightarrow 0$$

is exact. In other words, the functor $- \otimes_R N$ is right exact, in the sense that tensoring each term in the original right exact sequence preserves the exactness.

Proof. We apply the functor $\text{Hom}(-, \text{Hom}(N, P))$ to the first exact sequence. We obtain

$$0 \rightarrow \text{Hom}(M_3, \text{Hom}(N, P)) \rightarrow \text{Hom}(M_2, \text{Hom}(N, P)) \rightarrow \text{Hom}(M_1, \text{Hom}(N, P))$$

By Lemma 10.11.8, we have

$$0 \rightarrow \text{Hom}(M_3 \otimes N, P) \rightarrow \text{Hom}(M_2 \otimes N, P) \rightarrow \text{Hom}(M_1 \otimes N, P)$$

Using the pullback property again, we arrive at the desired exact sequence. \square

Remark 10.11.11. However, tensor product does NOT preserve exact sequences in general. In other words, if $M_1 \rightarrow M_2 \rightarrow M_3$ is exact, then it is not necessarily true that $M_1 \otimes N \rightarrow M_2 \otimes N \rightarrow M_3 \otimes N$ is exact for arbitrary R -module N .

Example 10.11.12. Consider the injective map $2 : \mathbf{Z} \rightarrow \mathbf{Z}$ viewed as a map of \mathbf{Z} -modules. Let $N = \mathbf{Z}/2$. Then the induced map $\mathbf{Z} \otimes \mathbf{Z}/2 \rightarrow \mathbf{Z} \otimes \mathbf{Z}/2$ is NOT injective. This is because for $x \otimes y \in \mathbf{Z} \otimes \mathbf{Z}/2$,

$$(2 \otimes 1)(x \otimes y) = 2x \otimes y = x \otimes 2y = x \otimes 0 = 0$$

Therefore the induced map is the zero map while $\mathbf{Z} \otimes N \neq 0$.

Remark 10.11.13. For R -modules N , if the functor $-\otimes_R N$ is exact, i.e. tensoring with N preserves all exact sequences, then N is said to be *flat* R -module. We will discuss this later.

Lemma 10.11.14. *Let R be a ring. Let M and N be R -modules.*

- (1) *If N and M are finite, then so is $M \otimes_R N$.*
- (2) *If N and M are finitely presented, then so is $M \otimes_R N$.*

Proof. Suppose M is finite. Then choose a presentation $0 \rightarrow K \rightarrow R^{\otimes n} \rightarrow M \rightarrow 0$. This gives an exact sequence $K \otimes_R N \rightarrow N^{\oplus n} \rightarrow M \otimes_R N \rightarrow 0$ by Lemma 10.11.10. We conclude that if N is finite too then $M \otimes_R N$ is a quotient of a finite module, hence finite, see Lemma 10.5.3. Similarly, if both N and M are finitely presented, then we see that K is finite and that $M \otimes_R N$ is a quotient of the finitely presented module $N^{\oplus n}$ by a finite module, namely $K \otimes_R N$, and hence finitely presented, see Lemma 10.5.3. \square

Lemma 10.11.15. *Let M be an R -module. Then the $S^{-1}R$ modules $S^{-1}M$ and $S^{-1}R \otimes_R M$ are canonically isomorphic, and the unique isomorphism $f : S^{-1}R \otimes_R M \rightarrow S^{-1}M$ is given by*

$$f((a/s) \otimes m) = am/s, \forall a \in R, m \in M, s \in S$$

Proof. Obviously, the map $f' : S^{-1}R \times M \rightarrow S^{-1}M$ given by $f'((a/s), m) = am/s$ is bilinear, and thus by the universal property, this map induces a unique $S^{-1}R$ -module homomorphism $f : S^{-1}R \otimes_R M \rightarrow S^{-1}M$ as in the statement of the lemma. Actually every element in $S^{-1}M$ is of the form m/s , $m \in M, s \in S$ and every element in $S^{-1}R \otimes_R M$ is of the form $1/s \otimes m$. To see the latter fact, write an element in $S^{-1}R \otimes_R M$ as

$$\sum_k \frac{a_k}{s_k} \otimes m_k = \sum_k \frac{a_k t_k}{s} \otimes m_k = \frac{1}{s} \otimes \sum_k a_k t_k m_k = \frac{1}{s} \otimes m$$

Where $m = \sum_k a_k t_k m_k$. Then it is obvious that f is surjective, and if $f(\frac{1}{s} \otimes m) = m/s = 0$ then there exists $t' \in S$ with $t'm = 0$ in M . Then we have

$$\frac{1}{s} \otimes m = \frac{1}{st} \otimes tm = \frac{1}{st} \otimes 0 = 0$$

Therefore f is injective. \square

Lemma 10.11.16. *Let M, N be R -modules, then there is a canonical $S^{-1}R$ -module isomorphism $f : S^{-1}M \otimes_{S^{-1}R} S^{-1}N \rightarrow S^{-1}(M \otimes_R N)$, given by*

$$f((m/s) \otimes (n/t)) = (m \otimes n)/st$$

Proof. We may use Lemma 10.11.7 and Lemma 10.11.15 repeatedly to see that these two $S^{-1}R$ -modules are isomorphic, noting that $S^{-1}R$ is an $(R, S^{-1}R)$ -bimodule:

$$\begin{aligned} S^{-1}(M \otimes_R N) &\cong S^{-1}R \otimes_R (M \otimes_R N) \\ &\cong S^{-1}M \otimes_R N \\ &\cong (S^{-1}M \otimes_{S^{-1}R} S^{-1}R) \otimes_R N \\ &\cong S^{-1}M \otimes_{S^{-1}R} (S^{-1}R \otimes_R N) \\ &\cong S^{-1}M \otimes_{S^{-1}R} S^{-1}N \end{aligned}$$

This isomorphism is easily seen to be the one stated in the lemma. \square

10.12. Tensor algebra

Let R be a ring. Let M be an R -module. We define the *tensor algebra of M over R* to be the noncommutative R -algebra

$$T(M) = T_R(M) = \bigoplus_{n \geq 0} T^n(M)$$

with $T^0(M) = R$, $T^1(M) = M$, $T^2(M) = M \otimes_R M$, $T^3(M) = M \otimes_R M \otimes_R M$, and so on. Multiplication is defined by the rule that on pure tensors we have

$$(x_1 \otimes x_2 \otimes \dots \otimes x_n) \cdot (y_1 \otimes y_2 \otimes \dots \otimes y_m) = x_1 \otimes x_2 \otimes \dots \otimes x_n \otimes y_1 \otimes y_2 \otimes \dots \otimes y_m$$

and we extend this by linearity.

We define the *exterior algebra $\wedge(M)$ of M over R* to be the quotient of $T(M)$ by the two sided ideal generated by the elements $x \otimes x \in T^2(M)$. The image of a pure tensor $x_1 \otimes \dots \otimes x_n$ in $\wedge^n(M)$ is denoted $x_1 \wedge \dots \wedge x_n$. These elements generate $\wedge^n(M)$, they are R -linear in each x_i and they are zero when two of the x_i are equal (i.e., alternating). The multiplication on $\wedge(M)$ is graded commutative, i.e., $x \wedge y = -y \wedge x$.

An example of this is when $M = Rx_1 \oplus \dots \oplus Rx_n$ is a finite free module. In this case $\wedge(M)$ is free over R with basis the elements

$$x_{i_1} \wedge \dots \wedge x_{i_r}$$

with $0 \leq r \leq n$ and $1 \leq i_1 < i_2 < \dots < i_r \leq n$.

We define the *symmetric algebra $\text{Sym}(M)$ of M over R* to be the quotient of $T(M)$ by the two sided ideal generated by the elements $x \otimes y - y \otimes x \in T^2(M)$. The image of a pure tensor $x_1 \otimes \dots \otimes x_n$ in $\text{Sym}^n(M)$ is denoted just $x_1 \dots x_n$. These elements generate $\text{Sym}^n(M)$, these are R -linear in each x_i and $x_1 \dots x_n = x'_1 \dots x'_n$ if the sequence of elements x_1, \dots, x_n is a permutation of the sequence x'_1, \dots, x'_n . Thus we see that $\text{Sym}(M)$ is commutative.

An example of this is when $M = Rx_1 \oplus \dots \oplus Rx_n$ is a finite free module. In this case $\text{Sym}(M) = R[x_1, \dots, x_n]$ is a polynomial algebra.

Lemma 10.12.1. *Let R be a ring. Let M be an R -module. If M is a free R -module, so is each symmetric and exterior power.*

Proof. Omitted, but see above for the finite free case. \square

Lemma 10.12.2. *Let R be a ring. Let $M_2 \rightarrow M_1 \rightarrow M \rightarrow 0$ be an exact sequence of R -modules. There are exact sequences*

$$M_2 \otimes_R \text{Sym}^{n-1}(M_1) \rightarrow \text{Sym}^n(M_1) \rightarrow \text{Sym}^n(M) \rightarrow 0$$

and similarly

$$M_2 \otimes_R \wedge^{n-1}(M_1) \rightarrow \wedge^n(M_1) \rightarrow \wedge^n(M) \rightarrow 0$$

Proof. Omitted. \square

Lemma 10.12.3. *Let R be a ring. Let M be an R -module. Let $x_i, i \in I$ be a given system of generators of M as an R -module. Let $n \geq 2$. There exists a canonical exact sequence*

$$\bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i_1, i_2 \in I} T^{n-2}(M) \oplus \bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i \in I} T^{n-2}(M) \rightarrow T^n(M) \rightarrow \wedge^n(M) \rightarrow 0$$

where the pure tensor $m_1 \otimes \dots \otimes m_{n-2}$ in the first summand maps to

$$m_1 \otimes \dots \otimes x_{i_1} \otimes \dots \otimes x_{i_2} \otimes \dots \otimes m_{n-2} + m_1 \otimes \dots \otimes x_{i_2} \otimes \dots \otimes x_{i_1} \otimes \dots \otimes m_{n-2}$$

and $m_1 \otimes \dots \otimes m_{n-2}$ in the second summand maps to

$$m_1 \otimes \dots \otimes x_i \otimes \dots \otimes x_i \otimes \dots \otimes m_{n-2}$$

There is also a canonical exact sequence

$$\bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i_1, i_2 \in I} T^{n-2}(M) \rightarrow T^n(M) \rightarrow \text{Sym}^n(M) \rightarrow 0$$

where the pure tensor $m_1 \otimes \dots \otimes m_{n-2}$ maps to

$$m_1 \otimes \dots \otimes x_{i_1} \otimes \dots \otimes x_{i_2} \otimes \dots \otimes m_{n-2} - m_1 \otimes \dots \otimes x_{i_2} \otimes \dots \otimes x_{i_1} \otimes \dots \otimes m_{n-2}$$

Proof. Omitted. \square

Lemma 10.12.4. *Let R be a ring. Let M_i be a directed system of R -modules. Then $\text{colim}_i T(M) = T(\text{colim}_i M_i)$ and similarly for the symmetric and exterior algebras.*

Proof. Omitted. \square

10.13. Base change

We formally introduce base change in algebra as follows.

Definition 10.13.1. Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Let $R \rightarrow R'$ be any ring map. The *base change* of φ by $R \rightarrow R'$ is the ring map $R' \rightarrow S \otimes_R R'$. In this situation we often write $S' = S \otimes_R R'$. The *base change* of the S -module M is the S' -module $M \otimes_R R'$.

If $S = R[x_i]/(f_j)$ for some collection of variables $x_i, i \in I$ and some collection of polynomials $f_j \in R[x_i], j \in J$, then $S \otimes_R R' = R'[x_i]/(f'_j)$, where $f'_j \in R'[x_i]$ is the image of f_j under the map $R[x_i] \rightarrow R'[x_i]$ induced by $R \rightarrow R'$. This simple remark is the key to understanding base change.

Lemma 10.13.2. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Let $R \rightarrow R'$ be a ring map and let $S' = S \otimes_R R'$ and $M' = M \otimes_R R'$ be the base changes.*

- (1) *If M is a finite S -module, then the base change M' is a finite S' -module.*
- (2) *If M is an S -module finite presentation, then the base change M' is an S' -module of finite presentation.*

- (3) If $R \rightarrow S$ is of finite type, then the base change $R' \rightarrow S'$ is of finite type.
 (4) If $R \rightarrow S$ is of finite presentation, then the base change $R' \rightarrow S'$ is of finite presentation.

Proof. Proof of (1). Take a surjective, R -linear map $R^{\oplus n} \rightarrow M \rightarrow 0$. By Lemma 10.11.3 and 10.11.10 the result after tensoring with R' is a surjection $R'^{\oplus n} \rightarrow M' \rightarrow 0$, so M' is a finitely generated R' -module. Proof of (2). Take a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. By Lemma 10.11.3 and 10.11.10 the result after tensoring with R' gives a finite presentation $R'^{\oplus m} \rightarrow R'^{\oplus n} \rightarrow M' \rightarrow 0$, of the R' -module M' . Proof of (3). This follows by the remark preceding the lemma as we can take I to be finite by assumption. Proof of (4). This follows by the remark preceding the lemma as we can take I and J to be finite by assumption. \square

Let $\varphi : R \rightarrow S$ be a ring map. Given a S -module N we obtain an R -module N_R by the rule $r \cdot n = \varphi(r)n$. This is sometimes called the *restriction* of N to R .

Lemma 10.13.3. *Let $R \rightarrow S$ be a ring map. The functors $\text{Mod}_S \rightarrow \text{Mod}_R$, $N \mapsto N_R$ (restriction) and $\text{Mod}_R \rightarrow \text{Mod}_S$, $M \mapsto M \otimes_R S$ (base change) are adjoint functors. In a formula*

$$\text{Hom}_R(M, N_R) = \text{Hom}_S(M \otimes_R S, N)$$

Proof. If $\alpha : M \rightarrow N_R$ is an R -module map, then we define $\alpha' : M \otimes_R S \rightarrow N$ by the rule $\alpha'(m \otimes s) = s\alpha(m)$. If $\beta : M \otimes_R S \rightarrow N$ is an S -module map, we define $\beta' : M \rightarrow N_R$ by the rule $\beta'(m) = \beta(m \otimes 1)$. We omit the verification that these constructions are mutually inverse. \square

The lemma above tells us that restriction has a left adjoint, namely base change. It also has a right adjoint.

Lemma 10.13.4. *Let $R \rightarrow S$ be a ring map. The functors $\text{Mod}_S \rightarrow \text{Mod}_R$, $N \mapsto N_R$ (restriction) and $\text{Mod}_R \rightarrow \text{Mod}_S$, $M \mapsto \text{Hom}_R(S, M)$ are adjoint functors. In a formula*

$$\text{Hom}_R(N_R, M) = \text{Hom}_S(N, \text{Hom}_R(S, M))$$

Proof. If $\alpha : N_R \rightarrow M$ is an R -module map, then we define $\alpha' : N \rightarrow \text{Hom}_R(S, M)$ by the rule $\alpha'(n) = (s \mapsto \alpha(sn))$. If $\beta : N \rightarrow \text{Hom}_R(S, M)$ is an S -module map, we define $\beta' : N_R \rightarrow M$ by the rule $\beta'(n) = \beta(n)(1)$. We omit the verification that these constructions are mutually inverse. \square

Lemma 10.13.5. *Let $R \rightarrow S$ be a ring map. Given S -modules M, N and an R -module P we have*

$$\text{Hom}_R(M \otimes_S N, P) = \text{Hom}_S(M, \text{Hom}_R(N, P))$$

Proof. This can be proved directly, but it is also a consequence of Lemmas 10.13.4 and 10.11.8. Namely, we have

$$\begin{aligned} \text{Hom}_R(M \otimes_S N, P) &= \text{Hom}_S(M \otimes_S N, \text{Hom}_R(S, P)) \\ &= \text{Hom}_S(M, \text{Hom}_S(N, \text{Hom}_R(S, P))) \\ &= \text{Hom}_S(M, \text{Hom}_R(N, P)) \end{aligned}$$

as desired. \square

10.14. Miscellany

The proofs in this section should not refer to any results except those from the section on basic notions, Section 10.3.

Lemma 10.14.1. *Let R be a ring, I and J two ideals and \mathfrak{p} a prime ideal containing the product IJ . Then \mathfrak{p} contains I or J .*

Proof. Assume the contrary and take $x \in I \setminus \mathfrak{p}$ and $y \in I \setminus \mathfrak{p}$. Their product is an element of $IJ \subset \mathfrak{p}$, which contradicts the assumption that \mathfrak{p} was prime. \square

Lemma 10.14.2 (Prime avoidance). *Let R be a ring. Let $I_i \subset R$, $i = 1, \dots, r$, and $J \subset R$ be ideals. Assume*

- (1) $J \not\subset I_i$ for $i = 1, \dots, r$, and
- (2) all but two of I_i are prime ideals.

Then there exists an $x \in J$, $x \notin I_i$ for all i .

Proof. The result is true for $r = 1$. If $r = 2$, then let $x, y \in J$ with $x \notin I_1$ and $y \notin I_2$. We are done unless $x \in I_2$ and $y \in I_1$. Then the element $x + y$ cannot be in I_1 (since that would mean $x + y - y \in I_1$) and it also cannot be in I_2 .

For $r \geq 3$, assume the result holds for $r - 1$. After renumbering we may assume that I_r is prime. We may also assume there are no inclusions among the I_i . Pick $x \in J$, $x \notin I_i$ for all $i = 1, \dots, r - 1$. If $x \notin I_r$ we are done. So assume $x \in I_r$. If $JI_1 \dots I_{r-1} \subset I_r$ then $J \subset I_r$ (by Lemma 10.14.1) a contradiction. Pick $y \in JI_1 \dots I_{r-1}$, $y \notin I_r$. Then $x + y$ works. \square

Lemma 10.14.3 (Chinese remainder). *Let R be a ring.*

- (1) *If I_1, \dots, I_r are ideals such that $I_a + I_b = R$ when $a \neq b$, then $I_1 \cap \dots \cap I_r = I_1 I_2 \dots I_r$ and $R/(I_1 I_2 \dots I_r) \cong R/I_1 \times \dots \times R/I_r$.*
- (2) *If $\mathfrak{m}_1, \dots, \mathfrak{m}_r$ are pairwise distinct maximal ideals then $\mathfrak{m}_a + \mathfrak{m}_b = R$ for $a \neq b$ and the above applies.*

Proof. Let us first prove $I_1 \cap \dots \cap I_r = I_1 \dots I_r$ as this will also imply the injectivity of the induced ring homomorphism $R/(I_1 \dots I_r) \rightarrow R/I_1 \times \dots \times R/I_r$. The inclusion $I_1 \cap \dots \cap I_r \supset I_1 \dots I_r$ is always fulfilled since ideals are closed under multiplication with arbitrary ring elements. To prove the other inclusion, we claim that the ideals

$$I_1 \dots \hat{I}_i \dots I_r, \quad i = 1, \dots, r$$

generate the ring R . We prove this by induction on r . It holds when $r = 2$. If $r > 2$, then we see that R is the sum of the ideals $I_1 \dots \hat{I}_i \dots I_r$, $i = 1, \dots, r - 1$. Hence I_r is the sum of the ideals $I_1 \dots \hat{I}_i \dots I_r$, $i = 1, \dots, r - 1$. Applying the same argument with the reverse ordering on the ideals we see that I_1 is the sum of the ideals $I_1 \dots \hat{I}_i \dots I_r$, $i = 2, \dots, r$. Since $R = I_1 + I_r$ by assumption we see that R is the sum of the ideals displayed above. Therefore we can find elements $a_i \in I_1 \dots \hat{I}_i \dots I_r$ such that their sum is one. Multiplying this equation by an element of $I_1 \cap \dots \cap I_r$ gives the other inclusion. It remains to show that the canonical map $R/(I_1 \dots I_r) \rightarrow R/I_1 \times \dots \times R/I_r$ is surjective. For this, consider its action on the equation $1 = \sum_{i=1}^r a_i$ we derived above. On the one hand, a ring morphism sends 1 to 1 and on the other hand, the image of any a_i is zero in R/I_j for $j \neq i$. Therefore, the image of a_i in R/I_i is the identity. So given any element $(\bar{b}_1, \dots, \bar{b}_r) \in R/I_1 \times \dots \times R/I_r$, the element $\sum_{i=1}^r a_i \cdot b_i$ is an inverse image in R .

To see (2), by the very definition of being distinct maximal ideals, we have $\mathfrak{m}_a + \mathfrak{m}_b = R$ for $a \neq b$ and so the above applies. \square

Lemma 10.14.4. *Let R be a ring. Let $n \geq m$. Let $A = (a_{ij})$ be an $n \times m$ matrix with coefficients in R . Let $J \subset R$ be the ideal generated by the $m \times m$ minors of A .*

- (1) *For any $f \in J$ there exists a $m \times n$ matrix B such that $BA = f1_{m \times m}$.*
- (2) *If $f \in R$ and $BA = f1_{m \times m}$ for some $m \times m$ matrix B , then $f^m \in J$.*

Proof. For $I \subset \{1, \dots, n\}$ with $|I| = m$ denote E_I the $m \times n$ matrix of the projection

$$R^{\oplus n} = \bigoplus_{i \in \{1, \dots, n\}} R \longrightarrow \bigoplus_{i \in I} R$$

and set $A_I = E_I A$, i.e., A_I is the $m \times m$ matrix whose rows are the rows of A with indices in I . Let B_I be the adjugate (transpose of cofactor) matrix to A_I , i.e., such that $A_I B_I = B_I A_I = \det(A_I)$. If $f \in J$ then we can write $f = \sum c_I \det(A_I)$ for some $c_I \in R$. Set $B = \sum c_I B_I E_I$ to see that (1) holds.

If $f1_{m \times m} = BA$ then by the Cauchy-Binet formula we have $f^m = \sum b_I \det(A_I)$ where b_I is the determinant of the $m \times m$ matrix whose columns are the columns of B with indices in I . \square

Lemma 10.14.5. *Let R be a ring. Let $n \geq m$. Let $A = (a_{ij})$ be an $n \times m$ matrix with coefficients in R , written in block form as*

$$A = \begin{pmatrix} A_1 \\ A_2 \end{pmatrix}$$

where A_1 has size $m \times m$. Let B be the adjugate (transpose of cofactor) matrix to A_1 . Then

$$AB = \begin{pmatrix} f1_{m \times m} \\ C \end{pmatrix}$$

where $f = \det(A_1)$ and c_{ij} is (up to sign) the determinant of the $m \times m$ minor of A corresponding to the rows $1, \dots, \hat{j}, \dots, m, i$.

Proof. Since the adjugate has the property $A_1 B = B A_1 = f$ the first block of the expression for AB is correct. Note that

$$c_{ij} = \sum_k a_{ik} b_{kj} = \sum_k (-1)^{j+k} a_{ik} \det(A_1^{jk})$$

where A_1^{ij} means A_1 with the j th row and k th column removed. This last expression is the row expansion of the determinant of the matrix in the statement of the lemma. \square

10.15. Cayley-Hamilton

Lemma 10.15.1. *Let R be a ring. Let $A = (a_{ij})$ be an $n \times n$ matrix with coefficients in R . Let $P(x) \in R[x]$ be the characteristic polynomial of A (defined as $\det(xid_{n \times n} - A)$). Then $P(A) = 0$ in $Mat(n \times n, R)$.*

Proof. We reduce the question to the well-known Cayley-Hamilton theorem from linear algebra in several steps:

- (1) If $\phi : S \rightarrow R$ is a ring morphism and b_{ij} are inverse images of the a_{ij} under this map, then it suffices to show the statement for S and (b_{ij}) since ϕ is a ring morphism.

- (2) If $\psi : R \hookrightarrow S$ is an injective ring morphism, it clearly suffices to show the result for S and the a_{ij} considered as elements of S .
- (3) Thus we may first reduce to the case $R = \mathbf{Z}[X_{ij}]$, $a_{ij} = X_{ij}$ of a polynomial ring and then further to the case $R = \mathbf{Q}(X_{ij})$ where we may finally apply Cayley-Hamilton.

□

Lemma 10.15.2. *Let R be a ring. Let M be a finite R -module. Let $\varphi : M \rightarrow M$ be an endomorphism. Then there exists a monic polynomial $P \in R[T]$ such that $P(\varphi) = 0$ as an endomorphism of M .*

Proof. Choose a surjective R -module map $R^{\oplus n} \rightarrow M$, given by $(a_1, \dots, a_n) \mapsto \sum a_i x_i$ for some generators $x_i \in M$. Choose $(a_{i1}, \dots, a_{in}) \in R^{\oplus n}$ such that $\varphi(x_i) = \sum a_{ij} x_j$. In other words the diagram

$$\begin{array}{ccc} R^{\oplus n} & \longrightarrow & M \\ A \downarrow & & \downarrow \varphi \\ R^{\oplus n} & \longrightarrow & M \end{array}$$

is commutative where $A = (a_{ij})$. By Lemma 10.15.1 there exists a monic polynomial P such that $P(A) = 0$. Then it follows that $P(\varphi) = 0$. □

Lemma 10.15.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be a finite R -module. Let $\varphi : M \rightarrow M$ be an endomorphism such that $\varphi(M) \subset IM$. Then there exists a monic polynomial $P = t^n + a_1 t^{n-1} + \dots + a_n \in R[T]$ such that $a_j \in I^j$ and $P(\varphi) = 0$ as an endomorphism of M .*

Proof. Choose a surjective R -module map $R^{\oplus n} \rightarrow M$, given by $(a_1, \dots, a_n) \mapsto \sum a_i x_i$ for some generators $x_i \in M$. Choose $(a_{i1}, \dots, a_{in}) \in I^{\oplus n}$ such that $\varphi(x_i) = \sum a_{ij} x_j$. In other words the diagram

$$\begin{array}{ccc} R^{\oplus n} & \longrightarrow & M \\ A \downarrow & & \downarrow \varphi \\ I^{\oplus n} & \longrightarrow & M \end{array}$$

is commutative where $A = (a_{ij})$. By Lemma 10.15.1 the polynomial $P(t) = \det(\text{id}_{n \times n} - A)$ has all the desired properties. □

As a fun example application we prove the following surprising lemma.

Lemma 10.15.4. *Let R be a ring. Let M be a finite R -module. Let $\varphi : M \rightarrow M$ be a surjective R -module map. Then φ is an isomorphism.*

First proof. Write $R' = R[x]$ and think of M as a finite R' -module with x acting via φ . Set $I = (x) \subset R'$. By our assumption that φ is surjective we have $IM = M$. Hence we may apply Lemma 10.15.3 to M as an R' module, the ideal I and the endomorphism id_M . We conclude that $(1 + a_1 + \dots + a_n)\text{id}_M = 0$ with $a_j \in I$. Write $a_j = b_j(x)x$ for some $b_j(x) \in R[x]$. Translating back into φ we see that $\text{id}_M = -(\sum_{j=1, \dots, n} b_j(\varphi)\varphi$ and hence φ is invertible. □

Second proof. We perform induction on the number of generators of M over R . If M is generated by one element, then $M \cong R/I$ for some ideal $I \subset R$. In this case we may replace R by R/I so that $M = R$. In this case $\varphi : R \rightarrow R$ is given by multiplication on M by an element $r \in R$. The surjectivity of φ forces r invertible, since φ must hit 1, which implies that φ is invertible.

Now assume that we have proven the lemma in the case of modules generated by $n - 1$ elements, and are examining a module M generated by n elements. Let A mean the ring $R[t]$, and regard the module M as an A -module by letting t act via φ ; since M is finite over R , it is finite over $R[t]$ as well, and since we're trying to prove φ injective, a set-theoretic property, we might as well prove the endomorphism $t : M \rightarrow M$ over A injective. We have reduced our problem to the case our endomorphism is multiplication by an element of the ground ring. Let $M' \subset M$ denote the sub- A -module generated by the first $n - 1$ of the generators of M , and consider the diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & M' & \longrightarrow & M & \longrightarrow & M/M' \longrightarrow 0 \\ & & \downarrow \varphi|_{M'} & & \downarrow \varphi & & \downarrow \varphi \text{ mod } M' \\ 0 & \longrightarrow & M' & \longrightarrow & M & \longrightarrow & M/M' \longrightarrow 0, \end{array}$$

where the restriction of φ to M' and the map induced by φ on the quotient M/M' are well-defined since φ is multiplication by an element in the base, and M' and M/M' are A -modules in their own right. By the case $n = 1$ the map $M/M' \rightarrow M/M'$ is an isomorphism. A diagram chase implies that $\varphi|_{M'}$ is surjective hence by induction $\varphi|_{M'}$ is an isomorphism. This forces the middle column to be an isomorphism by the snake lemma. \square

10.16. The spectrum of a ring

We arbitrarily decide that the spectrum of a ring as a topological space is part of the algebra chapter, whereas an affine scheme is part of the chapter on schemes.

Definition 10.16.1. Let R be a ring.

- (1) The *spectrum* of R is the set of prime ideals of R . It is usually denoted $\text{Spec}(R)$.
- (2) Given a subset $T \subset R$ we let $V(T) \subset \text{Spec}(R)$ be the set of primes containing T , i.e., $V(T) = \{\mathfrak{p} \in \text{Spec}(R) \mid \forall f \in T, f \in \mathfrak{p}\}$.
- (3) Given an element $f \in R$ we let $D(f) \subset \text{Spec}(R)$ be the set of primes not containing f .

Lemma 10.16.2. Let R be a ring.

- (1) The spectrum of a ring R is empty if and only if R is the zero ring.
- (2) Every nonzero ring has a maximal ideal.
- (3) Every nonzero ring has a minimal prime ideal.
- (4) Given an ideal $I \subset R$ and a prime ideal $I \subset \mathfrak{p}$ there exists a prime $I \subset \mathfrak{q} \subset \mathfrak{p}$ such that \mathfrak{q} is minimal over I .
- (5) If $T \subset R$, and if (T) is the ideal generated by T in R , then $V((T)) = V(T)$.
- (6) If I is an ideal and \sqrt{I} is its radical, see basic notion (27), then $V(I) = V(\sqrt{I})$.
- (7) Given an ideal I of R we have $\sqrt{I} = \bigcap_{I \subset \mathfrak{p}} \mathfrak{p}$.

- (8) If I is an ideal then $V(I) = \emptyset$ if and only if I is the unit ideal.
 (9) If I, J are ideals of R then $V(I) \cup V(J) = V(I \cap J)$.
 (10) If $(I_a)_{a \in A}$ is a set of ideals of R then $\bigcap_{a \in A} V(I_a) = V(\bigcup_{a \in A} I_a)$.
 (11) If $f \in R$, then $D(f) \coprod V(f) = \text{Spec}(R)$.
 (12) If $f \in R$ then $D(f) = \emptyset$ if and only if f is nilpotent.
 (13) If $f = uf'$ for some unit $u \in R$, then $D(f) = D(f')$.
 (14) If $I \subset R$ is an ideal, and \mathfrak{p} is a prime of R with $\mathfrak{p} \notin V(I)$, then there exists an $f \in R$ such that $\mathfrak{p} \in D(f)$, and $D(f) \cap V(I) = \emptyset$.
 (15) If $f, g \in R$, then $D(fg) = D(f) \cap D(g)$.
 (16) If $f_i \in R$ for $i \in I$, then $\bigcup_{i \in I} D(f_i)$ is the complement of $V(\{f_i\}_{i \in I})$ in $\text{Spec}(R)$.
 (17) If $f \in R$ and $D(f) = \text{Spec}(R)$, then f is a unit.

Proof. We address each part in the corresponding item below.

- (1) This is a direct consequence of (2) or (3).
 (2) Let \mathfrak{A} be the set of all proper ideals of R . This set is ordered by inclusion and is non-empty, since (0) $\in \mathfrak{A}$ is a proper ideal. Let A be a totally ordered subset of R . $\bigcup_{I \in A} I$ is in fact an ideal. Since $1 \notin I$ for all $I \in A$, the union does not contain 1 and thus is proper. Hence $\bigcup_{I \in A} I$ is in \mathfrak{A} and is an upper bound for the set A . Thus by Zorn's lemma \mathfrak{A} has a maximal element, which is the sought-after maximal ideal.
 (3) Since R is nonzero, it contains a maximal ideal which is a prime ideal. Thus the set \mathfrak{A} of all prime ideals of R is nonempty. \mathfrak{A} is ordered by reverse-inclusion. Let A be a totally ordered subset of \mathfrak{A} . It's pretty clear that $J = \bigcap_{I \in A} I$ is in fact an ideal. Not so clear, however, is that it is prime. Let $xy \in J$. Then $xy \in I$ for all $I \in A$. Now let $B = \{I \in A \mid y \in I\}$. Let $K = \bigcap_{I \in B} I$. Since A is totally ordered, either $K = J$ (and we're done, since then $y \in J$) or $K \supset J$ and for all $I \in A$ such that I is properly contained in K , we have $y \notin I$. But that means that for all those I , $x \in I$, since they are prime. Hence $x \in J$. In either case, J is prime as desired. Hence by Zorn's lemma we get a maximal element which in this case is a minimal prime ideal.
 (4) This is the same exact argument as (3) except you only consider prime ideals contained in \mathfrak{p} and containing I .
 (5) (T) is the smallest ideal containing T . Hence if $T \subset I$, some ideal, then $(T) \subset I$ as well. Hence if $I \in V(T)$, then $I \in V((T))$ as well. The other inclusion is obvious.
 (6) Since $I \subset \sqrt{I}$, $V(\sqrt{I}) \subset V(I)$. Now let $\mathfrak{p} \in V(I)$. Let $x \in \sqrt{I}$. Then $x^n \in I$ for some n . Hence $x^n \in \mathfrak{p}$. But since \mathfrak{p} is prime, a boring induction argument gets you that $x \in \mathfrak{p}$. Hence $\sqrt{I} \subset \mathfrak{p}$ and $\mathfrak{p} \in V(\sqrt{I})$.
 (7) Let $f \in R \setminus \sqrt{I}$. Then $f^n \notin I$ for all n . Hence $S = \{1, f, f^2, \dots\}$ is a multiplicative subset, not containing 0. Take a prime ideal $\bar{\mathfrak{p}} \subset S^{-1}R$ containing $S^{-1}I$. Then the pull-back \mathfrak{p} in R of $\bar{\mathfrak{p}}$ is a prime ideal containing I that does not intersect S . This shows that $\bigcap_{I \subset \mathfrak{p}} \mathfrak{p} \subset \sqrt{I}$. Now if $a \in \sqrt{I}$, then $a^n \in I$ for some n . Hence if $I \subset \mathfrak{p}$, then $a^n \in \mathfrak{p}$. But since \mathfrak{p} is prime, we have $a \in \mathfrak{p}$. Thus the equality is shown.
 (8) I is not the unit ideal if and only if I is contained in some maximal ideal (to see this, apply (2) to the ring R/I) which is therefore prime.

- (9) If $\mathfrak{p} \in V(I) \cup V(J)$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$ which means that $I \cap J \subset \mathfrak{p}$. Now if $I \cap J \subset \mathfrak{p}$, then $IJ \subset \mathfrak{p}$ and hence either I or J is in \mathfrak{p} , since \mathfrak{p} is prime.
- (10) $\mathfrak{p} \in \bigcap_{a \in A} V(I_a) \Leftrightarrow I_a \subset \mathfrak{p}, \forall a \in A \Leftrightarrow \mathfrak{p} \in V(\bigcup_{a \in A} I_a)$
- (11) If \mathfrak{p} is a prime ideal and $f \in R$, then either $f \in \mathfrak{p}$ or $f \notin \mathfrak{p}$ (strictly) which is what the disjoint union says.
- (12) If $a \in R$ is nilpotent, then $a^n = 0$ for some n . Hence $a^n \in \mathfrak{p}$ for any prime ideal. Thus $a \in \mathfrak{p}$ as can be shown by induction and $D(f) = \emptyset$. Now, as shown in (7), if $a \in R$ is not nilpotent, then there is a prime ideal that does not contain it.
- (13) $f \in \mathfrak{p} \Leftrightarrow uf \in \mathfrak{p}$, since u is invertible.
- (14) If $\mathfrak{p} \notin V(I)$, then $\exists f \in I \setminus \mathfrak{p}$. Then $f \notin \mathfrak{p}$ so $\mathfrak{p} \in D(f)$. Also if $\mathfrak{q} \in D(f)$, then $f \notin \mathfrak{q}$ and thus I is not contained in \mathfrak{q} . Thus $D(f) \cap V(I) = \emptyset$.
- (15) If $fg \in \mathfrak{p}$, then $f \in \mathfrak{p}$ or $g \in \mathfrak{p}$. Hence if $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$, then $fg \notin \mathfrak{p}$. Since \mathfrak{p} is an ideal, if $fg \notin \mathfrak{p}$, then $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$.
- (16) $\mathfrak{p} \in \bigcup_{i \in I} D(f_i) \Leftrightarrow \exists i \in I, f_i \notin \mathfrak{p} \Leftrightarrow \mathfrak{p} \in \text{Spec}(R) \setminus V(\{f_i\}_{i \in I})$
- (17) If $D(f) = \text{Spec}(R)$, then $V(f) = \emptyset$ and hence $fR = R$, so f is a unit. □

The lemma implies that the subsets $V(T)$ from Definition 10.16.1 form the closed subsets of a topology on $\text{Spec}(R)$. And it also shows that the sets $D(f)$ are open and form a basis for this topology.

Definition 10.16.3. Let R be a ring. The topology on $\text{Spec}(R)$ whose closed sets are the sets $V(T)$ is called the *Zariski topology*. The open subsets $D(f)$ are called the *standard opens* of $\text{Spec}(R)$.

It should be clear from context whether we consider $\text{Spec}(R)$ just as a set or as a topological space.

Lemma 10.16.4. Suppose that $\varphi : R \rightarrow R'$ is a ring homomorphism. The induced map

$$\text{Spec}(\varphi) : \text{Spec}(R') \longrightarrow \text{Spec}(R), \quad \mathfrak{p}' \longmapsto \varphi^{-1}(\mathfrak{p}')$$

is continuous for the Zariski topologies. In fact, for any element $f \in R$ we have $\text{Spec}(\varphi)^{-1}(D(f)) = D(\varphi(f))$.

Proof. It is basic notion (41) that $\mathfrak{p} := \varphi^{-1}(\mathfrak{p}')$ is indeed a prime ideal of R . The last assertion of the lemma follows directly from the definitions, and implies the first. □

If $\varphi' : R' \rightarrow R''$ is a second ring homomorphism then the composition

$$\text{Spec}(R') \longrightarrow \text{Spec}(R') \longrightarrow \text{Spec}(R'')$$

equals $\text{Spec}(\varphi' \circ \varphi)$. In other words, Spec is a contravariant functor from the category of rings to the category of topological spaces.

Lemma 10.16.5. Let R be a ring. Let $S \subset R$ be a multiplicative subset. The map $R \rightarrow S^{-1}R$ induces via the functoriality of Spec a homeomorphism

$$\text{Spec}(S^{-1}R) \longrightarrow \{\mathfrak{p} \in \text{Spec}(R) \mid S \cap \mathfrak{p} = \emptyset\}$$

where the topology on the right hand side is that induced from the Zariski topology on $\text{Spec}(R)$. The inverse map is given by $\mathfrak{p} \mapsto S^{-1}\mathfrak{p}$.

Proof. Denote the right hand side of the arrow of the lemma by D . Choose a prime $\mathfrak{p}' \subset S^{-1}R$ and let \mathfrak{p} the inverse image of \mathfrak{p}' in R . Since \mathfrak{p}' does not contain 1 we see that \mathfrak{p} does not contain any element of S . Hence $\mathfrak{p} \in D$ and we see that the image is contained in D . Let $\mathfrak{p} \in D$. By assumption the image \overline{S} does not contain 0. By basic notion (54) $\overline{S}^{-1}(R/\mathfrak{p})$ is not the zero ring. By basic notion (62) we see $S^{-1}R/S^{-1}\mathfrak{p} = \overline{S}^{-1}(R/\mathfrak{p})$ is a domain, and hence $S^{-1}\mathfrak{p}$ is a prime. The equality of rings also shows that the inverse image of $S^{-1}\mathfrak{p}$ in R is equal to \mathfrak{p} , because $R/\mathfrak{p} \rightarrow \overline{S}^{-1}(R/\mathfrak{p})$ is injective by basic notion (55). This proves that the map $\text{Spec}(S^{-1}R) \rightarrow \text{Spec}(R)$ is bijective onto D with inverse as given. It is continuous by Lemma 10.16.4. Finally, let $D(g) \subset \text{Spec}(S^{-1}R)$ be a standard open. Write $g = h/s$ for some $h \in R$ and $s \in S$. Since g and $h/1$ differ by a unit we have $D(g) = D(h/1)$ in $\text{Spec}(S^{-1}R)$. Hence by Lemma 10.16.4 and the bijectivity above the image of $D(g) = D(h/1)$ is $D \cap D(h)$. This proves the map is open as well. \square

Lemma 10.16.6. *Let R be a ring. Let $f \in R$. The map $R \rightarrow R_f$ induces via the functoriality of Spec a homeomorphism*

$$\text{Spec}(R_f) \longrightarrow D(f) \subset \text{Spec}(R).$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p} \cdot R_f$.

Proof. This is a special case of Lemma 10.16.5. \square

It is not the case that every “affine open” of a spectrum is a standard open. See Example 10.26.4.

Lemma 10.16.7. *Let R be a ring. Let $I \subset R$ be an ideal. The map $R \rightarrow R/I$ induces via the functoriality of Spec a homeomorphism*

$$\text{Spec}(R/I) \longrightarrow V(I) \subset \text{Spec}(R).$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p}/I$.

Proof. It is immediate that the image is contained in $V(I)$. On the other hand, if $\mathfrak{p} \in V(I)$ then $\mathfrak{p} \supset I$ and we may consider the ideal $\mathfrak{p}/I \subset R/I$. Using basic notion (51) we see that $(R/I)/(\mathfrak{p}/I) = R/\mathfrak{p}$ is a domain and hence \mathfrak{p}/I is a prime ideal. From this it is immediately clear that the image of $D(f + I)$ is $D(f) \cap V(I)$, and hence the map is a homeomorphism. \square

Remark 10.16.8. A fundamental commutative diagram associated to $\varphi : R \rightarrow S$, $\mathfrak{q} \subset S$ and $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$ is the following

$$\begin{array}{ccccccc} \kappa(\mathfrak{q}) = S_{\mathfrak{q}}/\mathfrak{q}S_{\mathfrak{q}} & \longleftarrow & S_{\mathfrak{q}} & \longleftarrow & S & \longrightarrow & S/\mathfrak{q} & \longrightarrow & \kappa(\mathfrak{q}) = \text{f.f.}(S/\mathfrak{q}) \\ \uparrow & & \uparrow & & \uparrow & & \uparrow & & \uparrow \\ \kappa(\mathfrak{p}) \otimes_R S = S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}} & \longleftarrow & S_{\mathfrak{p}} & \longleftarrow & S & \longrightarrow & S/\mathfrak{p}S & \longrightarrow & (R \setminus \mathfrak{p})^{-1}S/\mathfrak{p}S \\ \uparrow & & \uparrow & & \uparrow & & \uparrow & & \uparrow \\ \kappa(\mathfrak{p}) = R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} & \longleftarrow & R_{\mathfrak{p}} & \longleftarrow & R & \longrightarrow & R/\mathfrak{p} & \longrightarrow & \kappa(\mathfrak{p}) = \text{f.f.}(R/\mathfrak{p}) \end{array}$$

In this diagram the arrows in the outer left and outer right columns are identical. The horizontal maps induce on the associated spectra always a homeomorphism onto the image. The lower two rows of the diagram make sense without assuming \mathfrak{q} exists. The lower squares induce fibre squares of topological spaces. This diagram

shows that \mathfrak{p} is in the image of the map on Spec if and only if $S \otimes_R \kappa(\mathfrak{p})$ is not the zero ring.

Lemma 10.16.9. *Let $\varphi : R \rightarrow S$ be a ring map. Let \mathfrak{p} be a prime of R . The following are equivalent*

- (1) \mathfrak{p} is in the image of $\text{Spec}(S) \rightarrow \text{Spec}(R)$,
- (2) $S \otimes_R \kappa(\mathfrak{p}) \neq 0$,
- (3) $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}} \neq 0$,
- (4) $(S/\mathfrak{p}S)_{\mathfrak{p}} \neq 0$, and
- (5) $\mathfrak{p} = \varphi^{-1}(\mathfrak{p}S)$.

Proof. We have already seen the equivalence of the first two in Remark 10.16.8. The others are just reformulations of this. \square

Lemma 10.16.10. *Let R be a ring. The space $\text{Spec}(R)$ is quasi-compact.*

Proof. It suffices to prove that any covering of $\text{Spec}(R)$ by standard opens can be refined by a finite covering. Thus suppose that $\text{Spec}(R) = \cup D(f_i)$ for a set of elements $\{f_i\}_{i \in I}$ of R . This means that $\cap V(f_i) = \emptyset$. According to Lemma 10.16.2 this means that $V(\{f_i\}) = \emptyset$. According to the same lemma this means that the ideal generated by the f_i is the unit ideal of R . This means that we can write 1 as a finite sum: $1 = \sum_{i \in J} r_i f_i$ with $J \subset I$ finite. And then it follows that $\text{Spec}(R) = \cup_{i \in J} D(f_i)$. \square

Lemma 10.16.11. *Let R be a ring. The topology on $X = \text{Spec}(R)$ has the following properties:*

- (1) X is quasi-compact,
- (2) X has a basis for the topology consisting of quasi-compact opens, and
- (3) the intersection of any two quasi-compact opens is quasi-compact.

Proof. The spectrum of a ring is quasi-compact, see Lemma 10.16.10. It has a basis for the topology consisting of the standard opens $D(f) = \text{Spec}(R_f)$ (Lemma 10.16.6) which are quasi-compact by the first remark. The intersection of two standard opens is quasi-compact as $D(f) \cap D(g) = D(fg)$. Given any two quasi-compact opens $U, V \subset X$ we may write $U = D(f_1) \cup \dots \cup D(f_n)$ and $V = D(g_1) \cup \dots \cup D(g_m)$. Then $U \cap V = \cup D(f_i g_j)$ which is quasi-compact. \square

10.17. Local rings

Local rings are the bread and butter of algebraic geometry.

Definition 10.17.1. A *local ring* is a ring with exactly one maximal ideal. The maximal ideal is often denoted \mathfrak{m}_R in this case. We often say “let $(R, \mathfrak{m}, \kappa)$ be a local ring” to indicate that R is local, \mathfrak{m} is its unique maximal ideal and $\kappa = R/\mathfrak{m}$ is its residue field. A *local homomorphism of local rings* is a ring map $\varphi : R \rightarrow S$ such that R and S are local rings and such that $\varphi(\mathfrak{m}_R) \subset \mathfrak{m}_S$. If it is given that R and S are local rings, then the phrase “local ring map $\varphi : R \rightarrow S$ ” means that φ is a local homomorphism of local rings.

A field is a local ring. Any ring map between fields is a local homomorphism of local rings.

Lemma 10.17.2. *Let R be a ring. The following are equivalent:*

- (1) R is a local ring,
- (2) $\text{Spec}(R)$ has exactly one closed point,
- (3) R has a maximal ideal \mathfrak{m} and every element of $R \setminus \mathfrak{m}$ is a unit, and
- (4) R is not the zero ring and for every $x \in R$ either x or $1 - x$ is invertible or both.

Proof. Let R be a ring, and \mathfrak{m} a maximal ideal. If $x \in R \setminus \mathfrak{m}$, and x is not a unit then there is a maximal ideal \mathfrak{m}' containing x . Hence R has at least two maximal ideals. Conversely, if \mathfrak{m}' is another maximal ideal, then choose $x \in \mathfrak{m}'$, $x \notin \mathfrak{m}$. Clearly x is not a unit. This proves the equivalence of (1) and (3). The equivalence (1) and (2) is tautological. If R is local then (4) holds since x is either in \mathfrak{m} or not. If (4) holds, and $\mathfrak{m}, \mathfrak{m}'$ are distinct maximal ideals then we may choose $x \in R$ such that $x \bmod \mathfrak{m}' = 0$ and $x \bmod \mathfrak{m} = 1$ by the Chinese remainder theorem (Lemma 10.14.3). This element x is not invertible and neither is $1 - x$ which is a contradiction. Thus (4) and (1) are equivalent. \square

The localization $R_{\mathfrak{p}}$ of a ring R at a prime \mathfrak{p} is a local ring with maximal ideal $\mathfrak{p}R_{\mathfrak{p}}$. Namely, the quotient $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}$ is the fraction field of the domain R/\mathfrak{p} and every element of $R_{\mathfrak{p}}$ which is not contained in $\mathfrak{p}R_{\mathfrak{p}}$ is invertible.

Lemma 10.17.3. *Let $\varphi : R \rightarrow S$ be a ring map. Assume R and S are local rings. The following are equivalent:*

- (1) φ is a local ring map,
- (2) $\varphi(\mathfrak{m}_R) \subset \mathfrak{m}_S$, and
- (3) $\varphi^{-1}(\mathfrak{m}_S) = \mathfrak{m}_R$.
- (4) For any $x \in R$, if $\varphi(x)$ is invertible in S , then x is invertible in R .

Proof. Conditions (1) and (2) are equivalent by definition. If (3) holds then (2) holds. Conversely, if (2) holds, then $\varphi^{-1}(\mathfrak{m}_S)$ is a prime ideal containing the maximal ideal \mathfrak{m}_R , hence $\varphi^{-1}(\mathfrak{m}_S) = \mathfrak{m}_R$. Finally, (4) is the contrapositive of (2) by Lemma 10.17.2. \square

Let $\varphi : R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime and set $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$. Then the induced ring map $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is a local ring map.

10.18. The Jacobson radical of a ring

We recall that the *Jacobson radical* $\text{rad}(R)$ of a ring R is the intersection of all maximal ideals of R . If R is local then $\text{rad}(R)$ is the maximal ideal of R .

Lemma 10.18.1. *Let R be a ring and let $I \subset R$ be an ideal. The following are equivalent*

- (1) $I \subset \text{rad}(R)$, and
- (2) every element of $1 + I$ is a unit in R .

Proof. If $f \in \text{rad}(R)$, then $f \in \mathfrak{m}$ for all maximal ideals \mathfrak{m} of R . Hence $1 + f \notin \mathfrak{m}$ for all maximal ideals \mathfrak{m} of R . Thus the closed subset $V(1 + f)$ of $\text{Spec}(R)$ is empty. This implies that $1 + f$ is a unit, see Lemma 10.16.2.

Conversely, assume that $1 + f$ is a unit for all $f \in I$. If \mathfrak{m} is a maximal ideal and $I \not\subset \mathfrak{m}$, then $I + \mathfrak{m} = R$. Hence $1 = f + g$ for some $g \in \mathfrak{m}$ and $f \in I$. Then $g = 1 + (-f)$ is not a unit, contradiction. \square

10.19. Nakayama's lemma

We quote from [Mat70]: “This simple but important lemma is due to T. Nakayama, G. Azumaya and W. Krull. Priority is obscure, and although it is usually called the Lemma of Nakayama, late Prof. Nakayama did not like the name.”

Lemma 10.19.1 (Nakayama's lemma). *Let R be a ring, let M be an R -module, and let $I \subset R$ be an ideal.*

- (1) *If $IM = M$ and M is finite, then there exists a $f \in 1 + I$ such that $fM = 0$.*
- (2) *If $IM = M$, M is finite, and $I \subset \text{rad}(R)$, then $M = 0$.*
- (3) *If $N, N' \subset M$, $M = N + IN'$, and N' is finite, then there exists a $f \in 1 + I$ such that $M_f = N_f$.*
- (4) *If $N, N' \subset M$, $M = N + IN'$, N' is finite, and $I \subset \text{rad}(R)$, then $M = N$.*
- (5) *If $N \rightarrow M$ is a module map, $N/IN \rightarrow M/IM$ is surjective, and M is finite, then there exists a $f \in 1 + I$ such that $N_f \rightarrow M_f$ is surjective.*
- (6) *If $N \rightarrow M$ is a module map, $N/IN \rightarrow M/IM$ is surjective, M is finite, and $I \subset \text{rad}(R)$, then $N \rightarrow M$ is surjective.*
- (7) *If $x_1, \dots, x_n \in M$ generate M/IM and M is finite, then there exists an $f \in 1 + I$ such that x_1, \dots, x_n generate M_f over R_f .*
- (8) *If $x_1, \dots, x_n \in M$ generate M/IM , M is finite, and $I \subset \text{rad}(R)$, then M is generated by x_1, \dots, x_n .*
- (9) *If $IM = M$, I is nilpotent, then $M = 0$.*
- (10) *If $N, N' \subset M$, $M = N + IN'$, and I is nilpotent then $M = N$.*
- (11) *If $N \rightarrow M$ is a module map, I is nilpotent, and $N/IN \rightarrow M/IM$ is surjective, then $N \rightarrow M$ is surjective.*
- (12) *If $\{x_\alpha\}_{\alpha \in A}$ is a set of elements of M which generate M/IM and I is nilpotent, then M is generated by the x_α .*

Proof. Proof of (1). Choose generators y_1, \dots, y_m of M over R . For each i we can write $y_i = \sum z_{ij}y_j$ with $z_{ij} \in I$. In other words $\sum_j (\delta_{ij} - z_{ij})y_j = 0$. Let f be the determinant of the $m \times m$ matrix $A = (\delta_{ij} - z_{ij})$. Note that $f \in 1 + I$. By Lemma 10.14.4 there exists an $m \times m$ matrix B such that $BA = f1_{m \times m}$. Writing out we see that $f y_j = \sum_{i,j} b_{ni} a_{ij} y_j = 0$ for every j . This implies that f annihilates M .

By Lemma 10.16.2 an element of $1 + \text{rad}(R)$ is invertible element of R . Hence we see that (1) implies (2). We obtain (3) by applying (1) to M/N which is finite as N' is finite. We obtain (4) by applying (2) to M/N which is finite as N' is finite. We obtain (5) by applying (3) to M and the submodules $\text{Im}(N \rightarrow M)$ and M . We obtain (6) by applying (4) to M and the submodules $\text{Im}(N \rightarrow M)$ and M . We obtain (7) by applying (5) to the map $R^{\oplus n} \rightarrow M$, $(a_1, \dots, a_n) \mapsto a_1x_1 + \dots + a_nx_n$. We obtain (8) by applying (6) to the map $R^{\oplus n} \rightarrow M$, $(a_1, \dots, a_n) \mapsto a_1x_1 + \dots + a_nx_n$.

Part (9) holds because if $M = IM$ then $M = I^n M$ for all $n \geq 0$ and I being nilpotent means $I^n = 0$ for some $n \gg 0$. Parts (10), (11), and (12) follow from (9) by the arguments used above. \square

10.20. Open and closed subsets of spectra

It turns out that open and closed subsets of a spectrum correspond to idempotents of the ring.

Lemma 10.20.1. *Let R be a ring. Let $e \in R$ be an idempotent. In this case*

$$\mathrm{Spec}(R) = D(e) \coprod D(1 - e).$$

Proof. Note that an idempotent e of a domain is either 1 or 0. Hence we see that

$$\begin{aligned} D(e) &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid e \notin \mathfrak{p}\} \\ &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid e \neq 0 \text{ in } \kappa(\mathfrak{p})\} \\ &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid e = 1 \text{ in } \kappa(\mathfrak{p})\} \end{aligned}$$

Similarly we have

$$\begin{aligned} D(1 - e) &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid 1 - e \notin \mathfrak{p}\} \\ &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid e \neq 1 \text{ in } \kappa(\mathfrak{p})\} \\ &= \{\mathfrak{p} \in \mathrm{Spec}(R) \mid e = 0 \text{ in } \kappa(\mathfrak{p})\} \end{aligned}$$

Since the image of e in any residue field is either 1 or 0 we deduce that $D(e)$ and $D(1 - e)$ cover all of $\mathrm{Spec}(R)$. \square

Lemma 10.20.2. *Let R_1 and R_2 be rings. Let $R = R_1 \times R_2$. The maps $R \rightarrow R_1$, $(x, y) \mapsto x$ and $R \rightarrow R_2$, $(x, y) \mapsto y$ induce continuous maps $\mathrm{Spec}(R_1) \rightarrow \mathrm{Spec}(R)$ and $\mathrm{Spec}(R_2) \rightarrow \mathrm{Spec}(R)$. The induced map*

$$\mathrm{Spec}(R_1) \coprod \mathrm{Spec}(R_2) \longrightarrow \mathrm{Spec}(R)$$

is a homeomorphism. In other words, the spectrum of $R = R_1 \times R_2$ is the disjoint union of the spectrum of R_1 and the spectrum of R_2 .

Proof. Write $1 = e_1 + e_2$ with $e_1 = (1, 0)$ and $e_2 = (0, 1)$. Note that e_1 and $e_2 = 1 - e_1$ are idempotents. We leave it to the reader to show that $R_1 = R_{e_1}$ is the localization of R at e_1 . Similarly for e_2 . Thus the statement of the lemma follows from Lemma 10.20.1 combined with Lemma 10.16.6. \square

We reprove the following lemma later after introducing a glueing lemma for functions. See Section 10.22.

Lemma 10.20.3. *Let R be a ring. For each $U \subset \mathrm{Spec}(R)$ which is open and closed there exists a unique idempotent $e \in R$ such that $U = D(e)$. This induces a 1-1 correspondence between open and closed subsets $U \subset \mathrm{Spec}(R)$ and idempotents $e \in R$.*

First proof of Lemma 10.20.3. Let $U \subset \mathrm{Spec}(R)$ be open and closed. Since U is closed it is quasi-compact by Lemma 10.16.10, and similarly for its complement. Write $U = \bigcup_{i=1}^n D(f_i)$ as a finite union of standard opens. Similarly, write $\mathrm{Spec}(R) \setminus U = \bigcup_{j=1}^m D(g_j)$ as a finite union of standard opens. Since $\emptyset = D(f_i) \cap D(g_j) = D(f_i g_j)$ we see that $f_i g_j$ is nilpotent by Lemma 10.16.2. Let $I = (f_1, \dots, f_n) \subset R$ and let $J = (g_1, \dots, g_m) \subset R$. Note that $V(J)$ equals U , that $V(I)$ equals the complement of U , so $\mathrm{Spec}(R) = V(I) \coprod V(J)$. By the remark on nilpotency above, we see that $(IJ)^N = (0)$ for some sufficiently large integer N . Since $\bigcup D(f_i) \cup \bigcup D(g_j) = \mathrm{Spec}(R)$ we see that $I + J = R$, see Lemma 10.16.2. By raising this equation to the $2N$ th power we conclude that $I^{2N} + J^{2N} = R$. Write $1 = x + y$ with

$x \in I^N$ and $y \in J^N$. Then $1 = (x + y)^2 = x^2 + y^2$ because $I^N J^N = (0)$. Then $z = x - x^2 \in I^N \cap J^N$. Thus $zx = 0$ and $z^2 = 0$. Hence $(x - z) - (x - z)^2 = x - x^2 - z = 0$. In other words, $e = x - z$ is an idempotent contained in $I^N \subset I$, and the idempotent $e' = 1 - e = y + z$ is contained in $J^N \subset J$. This shows that the idempotent e maps to 1 in every residue field $\kappa(\mathfrak{p})$ for $\mathfrak{p} \in V(J)$ and that e maps to 0 in $\kappa(\mathfrak{p})$ for every $\mathfrak{p} \in V(I)$.

To see uniqueness suppose that e_1, e_2 are distinct idempotents in R . We have to show there exists a prime \mathfrak{p} such that $e_1 \in \mathfrak{p}$ and $e_2 \notin \mathfrak{p}$, or conversely. Write $e'_i = 1 - e_i$. If $e_1 \neq e_2$, then $0 \neq e_1 - e_2 = e_1(e_2 + e'_2) - (e_1 + e'_1)e_2 = e_1e'_2 - e'_1e_2$. Hence either the idempotent $e_1e'_2 \neq 0$ or $e'_1e_2 \neq 0$. An idempotent is not nilpotent, and hence we find a prime \mathfrak{p} such that either $e_1e'_2 \notin \mathfrak{p}$ or $e'_1e_2 \notin \mathfrak{p}$, by Lemma 10.16.2. It is easy to see this gives the desired prime. \square

Lemma 10.20.4. *Let R be a nonzero ring. Then $\text{Spec}(R)$ is connected if and only if R has no nontrivial idempotents.*

Proof. Obvious from Lemma 10.20.3. \square

Lemma 10.20.5. *Let R be a ring. Let I be a finitely generated ideal. Assume that $I = I^2$. Then $V(I)$ is open and closed in $\text{Spec}(R)$, and $R/I \cong R_e$ for some idempotent $e \in R$.*

Proof. By Nakayama's Lemma 10.19.1 there exists an element $f = 1 + i$, $i \in I$ in R such that $fI = 0$. It follows that $V(I) = D(f)$ by a simple argument. Also, $0 = fi = i + i^2$, and hence $f^2 = 1 + i + i + i^2 = 1 + i = f$, so f is an idempotent. Consider the canonical map $R \rightarrow R_f$. It is surjective since $x/f^n = x/f = xf/f^2 = xf/f = x/1$ in R_f . Any element of I is in the kernel since $fI = 0$. If $x \mapsto 0$ in R_f , then $f^n x = 0$ for some $n > 0$ and hence $(1 + i)x = 0$ hence $x \in I$. \square

10.21. Connected components of spectra

Connected components of spectra are not as easy to understand as one may think at first. This is because we are used to the topology of locally connected spaces, but the spectrum of a ring is in general not locally connected.

Lemma 10.21.1. *Let R be a ring. Let $T \subset \text{Spec}(R)$ be a subset of the spectrum. The following are equivalent*

- (1) T is closed and is a union of connected components of $\text{Spec}(R)$,
- (2) T is an intersection of open and closed subsets of $\text{Spec}(R)$, and
- (3) $T = V(I)$ where $I \subset R$ is an ideal generated by idempotents.

Moreover, the ideal in (3) if it exists is unique.

Proof. By Lemma 10.16.11 and Topology, Lemma 5.11.12 we see that (1) and (2) are equivalent. Assume (2) and write $T = \bigcap U_\alpha$ with $U_\alpha \subset \text{Spec}(R)$ open and closed. Then $U_\alpha = D(e_\alpha)$ for some idempotent $e_\alpha \in A$ by Lemma 10.20.3. Then setting $I = (1 - e_\alpha)$ we see that $T = V(I)$, i.e., (3) holds. Finally, assume (3). Write $T = V(I)$ and $I = (e_\alpha)$ for some collection of idempotents e_α . Then it is clear that $T = \bigcap V(e_\alpha) = \bigcap D(1 - e_\alpha)$.

Suppose that I is an ideal generated by idempotents. Let $e \in R$ be an idempotent such that $V(I) \subset V(e)$. Then by Lemma 10.16.2 we see that $e^n \in I$ for some $n \geq 1$. As e is an idempotent this means that $e \in I$. Hence we see that I is generated

by exactly those idempotents e such that $T \subset V(e)$. In other words, the ideal I is completely determined by the closed subset T which proves uniqueness. \square

Lemma 10.21.2. *Let R be a ring. A connected component of $\text{Spec}(R)$ is of the form $V(I)$, where I is an ideal generated by idempotents such that every idempotent of R either maps to 0 or 1 in R/I .*

Proof. Let \mathfrak{p} be a prime of R . By Lemma 10.16.11 we have seen that the hypotheses of Topology, Lemma 5.11.10 are satisfied for the topological space $\text{Spec}(R)$. Hence the connected component of \mathfrak{p} in $\text{Spec}(R)$ is the intersection of open and closed subsets of $\text{Spec}(R)$ containing \mathfrak{p} . Hence it equals $V(I)$ where I is generated by the idempotents $e \in R$ such that e maps to 0 in $\kappa(\mathfrak{p})$, see Lemma 10.20.3. Any idempotent e which is not in this collection clearly maps to 1 in R/I . \square

10.22. Glueing functions

In this section we show that given an open covering

$$\text{Spec}(R) = \bigcup_{i=1}^n D(f_i)$$

by standard opens, and given an element $h_i \in R_{f_i}$ for each i such that $h_i = h_j$ as elements of $R_{f_i f_j}$ then there exists a unique $h \in R$ such that the image of h in R_{f_i} is h_i . This result can be interpreted in two ways:

- (1) The rule $D(f) \mapsto R_f$ is a sheaf of rings on the standard opens, see Sheaves, Section 6.30.
- (2) If we think of elements of R_f as the “algebraic” or “regular” functions on $D(f)$, then these glue as would continuous, resp. differentiable functions on a topological, resp. differentiable manifold.

At the end of this section we use this result to reprove the lemma describing open and closed subsets in terms of idempotents.

Lemma 10.22.1. *Let R be a ring, and let $f_1, f_2, \dots, f_n \in R$ generate the unit ideal in R . Then the following sequence is exact:*

$$0 \longrightarrow R \longrightarrow \bigoplus_i R_{f_i} \longrightarrow \bigoplus_{i,j} R_{f_i f_j}$$

where the maps $\alpha : R \longrightarrow \bigoplus_i R_{f_i}$ and $\beta : \bigoplus_i R_{f_i} \longrightarrow \bigoplus_{i,j} R_{f_i f_j}$ are defined as

$$\alpha(x) = \left(\frac{x}{1}, \dots, \frac{x}{1} \right) \text{ and } \beta \left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n} \right) = \left(\frac{x_i}{f_i} - \frac{x_j}{f_j} \text{ in } R_{f_i f_j} \right).$$

Proof. We first show that α is injective, and then that the image of α equals the kernel of β . Assume there exists $x \in R$ such that $\alpha(x) = (0, \dots, 0)$. Then $\frac{x}{1} = 0$ in R_{f_i} for all i . This means, for all i , there exists a number n_i such that

$$f_i^{n_i} x = 0$$

Since the f_i generate R , we can pick a_i so

$$1 = \sum_{i=1}^n a_i f_i$$

Then for all $M \geq \sum n_i$, we have

$$1^M = \left(\sum a_i f_i \right)^M,$$

where each term has a factor of at least $f_i^{n_i}$ for some i . Therefore,

$$x = 1x = 1^M x = \left(\sum a_i f_i \right)^M x = 0.$$

Thus, if $\alpha(x) = 0$, $x = 0$ and α is injective. We check that the image of α equals the kernel of β . First, note that for $x \in R$,

$$\beta(\alpha(x)) = \beta\left(\frac{x}{1}, \dots, \frac{x}{1}\right) = \left(\frac{x}{1} - \frac{x}{1} \text{ in } R_{f_i f_j}\right) = 0.$$

Therefore, the image of α is in the kernel of β , and it remains only to verify that if

$$\beta\left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right) = 0,$$

then there exists $x \in R$ so that for all i ,

$$\frac{x}{1} = \frac{x_i}{f_i}$$

Assume we have x_1, \dots, x_n such that

$$\beta\left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right) = 0.$$

Then, for all pairs i, j , there exists an n_{ij} such that

$$f_i^{n_{ij}} f_j^{n_{ij}} (f_j x_i - f_i x_j) = 0$$

Choosing N so $N \geq n_{ij}$ for all i, j , we see that

$$f_i^N f_j^N (f_j x_i - f_i x_j) = 0$$

Define elements \tilde{x}_i and \tilde{f}_i as follows:

$$\tilde{f}_i = f_i^{N+1}, \quad \tilde{x}_i = f_i^N x_i.$$

Notice that

$$\frac{\tilde{x}_i}{\tilde{f}_i} = \frac{x_i}{f_i}.$$

Also, we can use this to rewrite the above equation to get the following equality, for all i, j ,

$$\tilde{f}_j \tilde{x}_i = \tilde{f}_i \tilde{x}_j.$$

Since f_1, \dots, f_n generate R , we clearly have that $\tilde{f}_1, \dots, \tilde{f}_n$ also generate R . Therefore, there exist a_1, \dots, a_n in R so that

$$1 = \sum_{i=1}^n a_i \tilde{f}_i$$

Therefore, we finally conclude that for all i ,

$$\frac{x_i}{f_i} = \frac{\tilde{x}_i}{\tilde{f}_i} = \sum_{j=1}^n \frac{a_j \tilde{f}_j \tilde{x}_i}{\tilde{f}_i} = \sum_{j=1}^n \frac{a_j \tilde{f}_i \tilde{x}_j}{\tilde{f}_i} = \frac{\sum_{j=1}^n a_j \tilde{x}_j}{1}.$$

Thus, we have

$$\alpha\left(\sum_{j=1}^n a_j \tilde{x}_j\right) = \left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right),$$

as required. There the sequence is exact. \square

Lemma 10.22.2. *Let R be a ring. Let f_1, \dots, f_n be elements of R generating the unit ideal. Let M be an R -module. The sequence*

$$0 \rightarrow M \xrightarrow{\alpha} \bigoplus_{i=1}^n M_{f_i} \xrightarrow{\beta} \bigoplus_{i,j=1}^n M_{f_i f_j}$$

is exact, where $\alpha(m) = (m/1, \dots, m/1)$ and $\beta(m_1/f_1^{e_1}, \dots, m_n/f_n^{e_n}) = (m_i/f_i^{e_i} - m_j/f_j^{e_j})_{(i,j)}$.

Proof. The same as the proof of Lemma 10.22.1. \square

Second proof of Lemma 10.20.3. Having assured ourselves (Lemma 10.22.1) that for generators f_1, \dots, f_n for the unit ideal of a ring R the sequence

$$0 \rightarrow R \rightarrow \bigoplus_{i=1}^n R_{f_i} \rightarrow \bigoplus_{i,j} R_{f_i f_j}$$

is exact, we now provide an alternate proof of the surjectivity of the map from idempotents e of R to open and closed subsets of $\text{Spec}(R)$ presented in Lemma 10.20.3. Let $U \subset \text{Spec}(R)$ be open and closed, and W be its complement. We can write U and V as unions of standard opens such that $U = \bigcup_{i=1}^n D(f_i)$ and $W = \bigcup_{j=1}^m D(g_j)$. Since $\text{Spec}(R) = \bigcup D(f_i) \cup \bigcup D(g_j)$, we observe that the collection $\{f_i; g_j\}$ must generate the unit ideal in R by Lemma 10.16.2. So the following sequence is exact.

(10.22.2.1)

$$0 \rightarrow R \xrightarrow{\alpha} \bigoplus_{i=1}^n R_{f_i} \oplus \bigoplus_{j=1}^m R_{g_j} \rightarrow \bigoplus_{i_1, i_2} R_{f_{i_1} f_{i_2}} \oplus \bigoplus_{i,j} R_{f_i g_j} \oplus \bigoplus_{j_1, j_2} R_{g_{j_1} g_{j_2}}$$

However, notice that for any pair i, j , $D(f_i) \cap D(g_j) = \emptyset$ since $D(f_i) \subset U$ and $D(g_j) \subset W$. From part (15) of Lemma 10.16.2 we recall that $D(f_i g_j) = D(f_i) \cap D(g_j) = \emptyset$. Therefore by Lemma 10.16.5 $\text{Spec}(R_{f_i g_j}) = D(f_i g_j) = \emptyset$, implying that $R_{f_i g_j}$ is the zero ring for each pair i, j by part (3) of Lemma 10.16.2. Consider the element $(1, \dots, 1, 0, \dots, 0) \in \bigoplus_{i=1}^n R_{f_i} \oplus \bigoplus_{j=1}^m R_{g_j}$ whose coordinates are 1 in each R_{f_i} and 0 in each R_{g_j} . This is sent to 0 under the map

$$\beta : \bigoplus_{i=1}^n R_{f_i} \oplus \bigoplus_{j=1}^m R_{g_j} \rightarrow \bigoplus_{i_1, i_2} R_{f_{i_1} f_{i_2}} \oplus \bigoplus_{j_1, j_2} R_{g_{j_1} g_{j_2}}$$

so by the exactness of the sequence (10.22.2.1), there must be some element of R whose image under α is $(1, \dots, 1, 0, \dots, 0)$. Call it e . We see that $\alpha(e^2) = \alpha(e)^2 = (1, \dots, 1, 0, \dots, 0) = \alpha(e)$. Since α is injective, $e = e^2$ in R and e is an idempotent of R . We claim that $U = D(e)$. Notice that for arbitrary j , the map $R \rightarrow R_{g_j}$ maps e to 0. Therefore there must be some positive integer k_j such that $g_j^{k_j}(e - 0) = 0$ in R . Multiplying by e as necessary, we see that $(g_j e)^{k_j} = 0$, so $g_j e$ is nilpotent in R . By Lemma 10.16.2 $D(g_j) \cap D(e) = D(g_j e) = \emptyset$. So since $V = \bigcup D(g_j)$, $D(e) \cap V = \emptyset$ and $D(e) \subset U$. Furthermore, for arbitrary i , the map $R \rightarrow R_{f_i}$ maps e to 1, so there must be some l_i such that $f_i^{l_i}(e - 1) = 0$ in R . Hence $f_i^{l_i} e = f_i^{l_i}$. Suppose $\mathfrak{p} \in \text{Spec}(R)$ contains e , then \mathfrak{p} contains $f_i^{l_i} e = f_i^{l_i}$, and since \mathfrak{p} is prime, $f_i \in \mathfrak{p}$. So $V(e) \subset V(f_i)$, implying that $D(f_i) \subset D(e)$. Therefore $U = \bigcup D(f_i) \subset D(e)$, and $U = D(e)$. Therefore any open and closed subset of $\text{Spec}(R)$ is the standard open of an idempotent as desired. \square

The following we have already seen above, but we state it explicitly here for convenience.

Lemma 10.22.3. *Let R be a ring. If $\text{Spec}(R) = U \amalg V$ with both U and V open then $R \cong R_1 \times R_2$ with $U \cong \text{Spec}(R_1)$ and $V \cong \text{Spec}(R_2)$ via the maps in Lemma 10.20.2. Moreover, both R_1 and R_2 are localizations as well as quotients of the ring R .*

Proof. By Lemma 10.20.3 we have $U = D(e)$ and $V = D(1 - e)$ for some idempotent e . By Lemma 10.22.1 we see that $R \cong R_e \times R_{1-e}$ (since clearly $R_{e(1-e)} = 0$ so the glueing condition is trivial; of course it is trivial to prove the product decomposition directly in this case). The lemma follows. \square

Lemma 10.22.4. *Let R be a ring. Let $f_1, \dots, f_n \in R$. Let M be an R -module. Then $M \rightarrow \bigoplus M_{f_i}$ is injective if and only if*

$$M \longrightarrow \bigoplus_{i=1, \dots, n} M, \quad m \longmapsto (f_1 m, \dots, f_n m)$$

is injective.

Proof. The map $M \rightarrow \bigoplus M_{f_i}$ is injective if and only if for all $m \in M$ and $e_1, \dots, e_n \geq 1$ such that $f_i^{e_i} m = 0$, $i = 1, \dots, n$ we have $m = 0$. This clearly implies the displayed map is injective. Conversely, suppose the displayed map is injective and $m \in M$ and $e_1, \dots, e_n \geq 1$ are such that $f_i^{e_i} m = 0$, $i = 1, \dots, n$. If $e_i = 1$ for all i , then we immediately conclude that $m = 0$ from the injectivity of the displayed map. Next, we prove this holds for any such data by induction on $e = \sum e_i$. The base case is $e = n$, and we have just dealt with this. If some $e_i > 1$, then set $m' = f_i m$. By induction we see that $m' = 0$. Hence we see that $f_i m = 0$, i.e., we may take $e_i = 1$ which decreases e and we win. \square

10.23. More glueing results

In this section we put a number of standard results of the form: if something is true for all members of a standard open covering then it is true. In fact, it often suffices to check things on the level of local rings as in the following lemma.

Lemma 10.23.1. *Let R be a ring.*

- (1) *For an element x of an R -module M the following are equivalent*
 - (a) $x = 0$,
 - (b) x maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \in \text{Spec}(R)$,
 - (c) x maps to zero in $M_{\mathfrak{m}}$ for all maximal ideals \mathfrak{m} of R .*In other words, the map $M \rightarrow \prod_{\mathfrak{m}} M_{\mathfrak{m}}$ is injective.*
- (2) *Given an R -module M the following are equivalent*
 - (a) M is zero,
 - (b) $M_{\mathfrak{p}}$ is zero for all $\mathfrak{p} \in \text{Spec}(R)$,
 - (c) $M_{\mathfrak{m}}$ is zero for all maximal ideals \mathfrak{m} of R .
- (3) *Given a complex $M_1 \rightarrow M_2 \rightarrow M_3$ of R -modules the following are equivalent*
 - (a) $M_1 \rightarrow M_2 \rightarrow M_3$ is exact,
 - (b) for every prime \mathfrak{p} of R the localization $M_{1,\mathfrak{p}} \rightarrow M_{2,\mathfrak{p}} \rightarrow M_{3,\mathfrak{p}}$ is exact,
 - (c) for every maximal ideal \mathfrak{m} of R the localization $M_{1,\mathfrak{m}} \rightarrow M_{2,\mathfrak{m}} \rightarrow M_{3,\mathfrak{m}}$ is exact.
- (4) *Given a map $f : M \rightarrow M'$ of R -modules the following are equivalent*
 - (a) f is injective,
 - (b) $f_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow M'_{\mathfrak{p}}$ is injective for all primes \mathfrak{p} of R ,

- (c) $f_{\mathfrak{m}} : M_{\mathfrak{m}} \rightarrow M'_{\mathfrak{m}}$ is injective for all maximal ideals \mathfrak{m} of R .
- (5) Given a map $f : M \rightarrow M'$ of R -modules the following are equivalent
- f is surjective,
 - $f_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow M'_{\mathfrak{p}}$ is surjective for all primes \mathfrak{p} of R ,
 - $f_{\mathfrak{m}} : M_{\mathfrak{m}} \rightarrow M'_{\mathfrak{m}}$ is surjective for all maximal ideals \mathfrak{m} of R .
- (6) Given a map $f : M \rightarrow M'$ of R -modules the following are equivalent
- f is bijective,
 - $f_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow M'_{\mathfrak{p}}$ is bijective for all primes \mathfrak{p} of R ,
 - $f_{\mathfrak{m}} : M_{\mathfrak{m}} \rightarrow M'_{\mathfrak{m}}$ is bijective for all maximal ideals \mathfrak{m} of R .

Proof. Let $x \in M$ as in (1). Let $I = \{f \in R \mid fx = 0\}$. It is easy to see that I is an ideal (it is the annihilator of x). Condition (1)(c) means that for all maximal ideals \mathfrak{m} there exists an $f \in R \setminus \mathfrak{m}$ such that $fx = 0$. In other words, $V(I)$ does not contain a closed point. By Lemma 10.16.2 we see I is the unit ideal. Hence x is zero, i.e., (1)(a) holds. This proves (1).

Part (2) follows by applying (1) to all elements of M simultaneously.

Proof of (3). Let H be the homology of the sequence, i.e., $H = \text{Ker}(M_2 \rightarrow M_3)/\text{Im}(M_1 \rightarrow M_2)$. By Proposition 10.9.12 we have that $H_{\mathfrak{p}}$ is the homology of the sequence $M_{1,\mathfrak{p}} \rightarrow M_{2,\mathfrak{p}} \rightarrow M_{3,\mathfrak{p}}$. Hence (3) is a consequence of (2).

Parts (4) and (5) are special cases of (3). Part (6) follows formally on combining (4) and (5). \square

Lemma 10.23.2. *Let R be a ring. Let M be an R -module. Let S be an R -algebra. Suppose that f_1, \dots, f_n is a finite list of elements of R such that $\bigcup D(f_i) = \text{Spec}(R)$ in other words $(f_1, \dots, f_n) = R$.*

- If each $M_{f_i} = 0$ then $M = 0$.
- If each M_{f_i} is a finite R_{f_i} -module, then M is a finite R -module.
- If each M_{f_i} is a finitely presented R_{f_i} -module, then M is a finitely presented R -module.
- Let $M \rightarrow N$ be a map of R -modules. If $M_{f_i} \rightarrow N_{f_i}$ is an isomorphism for each i then $M \rightarrow N$ is an isomorphism.
- Let $0 \rightarrow M'' \rightarrow M \rightarrow M' \rightarrow 0$ be a complex of R -module. If $0 \rightarrow M''_{f_i} \rightarrow M_{f_i} \rightarrow M'_{f_i} \rightarrow 0$ is exact for each i , then $0 \rightarrow M'' \rightarrow M \rightarrow M' \rightarrow 0$ is exact.
- If each R_{f_i} is Noetherian, then R is Noetherian.
- If each S_{f_i} is a finite type R -algebra, so is S .
- If each S_{f_i} is of finite presentation over R , so is S .

Proof. We prove each of the parts in turn.

- By Proposition 10.9.10 this implies $M_{\mathfrak{p}} = 0$ for all $\mathfrak{p} \in \text{Spec}(R)$, so we conclude by Lemma 10.23.1.
- For each i take a finite generating set X_i of M_{f_i} . Without loss of generality, we may assume that the elements of X_i are in the image of the localization map $M \rightarrow M_{f_i}$, so we take a finite set Y_i of preimages of the elements of X_i in M . Let Y be the union of these sets. This is still a finite set. Consider the obvious R -linear map $R^Y \rightarrow M$ sending the basis element e_y to y . By assumption this map is surjective after localizing at an arbitrary prime ideal \mathfrak{p} of R , so it is surjective by Lemma 10.23.1 and M is finitely generated.

(3) By (2) we have a short exact sequence

$$0 \rightarrow K \rightarrow R^n \rightarrow M \rightarrow 0$$

Since localization is an exact functor and M_{f_i} is finitely presented we see that K_{f_i} is finitely generated for all $1 \leq i \leq n$ by Lemma 10.5.3. By (2) this implies that K is a finite R -module and therefore M is finitely presented.

- (4) By Proposition 10.9.10 the assumption implies that the induced morphism on localizations at all prime ideals is an isomorphism, so we conclude by Lemma 10.23.1.
- (5) By Proposition 10.9.10 the assumption implies that the induced sequence of localizations at all prime ideals is short exact, so we conclude by Lemma 10.23.1.
- (6) We will show that every ideal of R has a finite generating set: For this, let $I \subset R$ be an arbitrary ideal. By Proposition 10.9.12 each $I_{f_i} \subset R_{f_i}$ is an ideal. These are all finitely generated by assumption, so we conclude by (2).
- (7) For each i take a finite generating set X_i of S_{f_i} . Without loss of generality, we may assume that the elements of X_i are in the image of the localization map $S \rightarrow S_{f_i}$, so we take a finite set Y_i of preimages of the elements of X_i in S . Let Y be the union of these sets. This is still a finite set. Consider the algebra homomorphism $R[X_y]_{y \in Y} \rightarrow S$ induced by Y . Since it is an algebra homomorphism, the image T is an R -submodule of the R -module S , so we can consider the quotient module S/T . By assumption, this is zero if we localize at the f_i , so it is zero by (1) and therefore S is an R -algebra of finite type.
- (8) By the previous item, there exists a surjective R -algebra homomorphism $R[X_1, \dots, X_n] \rightarrow S$. Let K be the kernel of this map. This is an ideal in $R[X_1, \dots, X_n]$, finitely generated in each localization at f_i . Since the f_i generate the unit ideal in R , they also generate the unit ideal in $R[X_1, \dots, X_n]$, so an application of (2) finishes the proof. □

Lemma 10.23.3. *Let $R \rightarrow S$ be a ring map. Suppose that g_1, \dots, g_m is a finite list of elements of S such that $\bigcup D(g_j) = \text{Spec}(S)$ in other words $(g_1, \dots, g_m) = S$.*

- (1) *If each S_{g_i} is of finite type over R , then S is of finite type over R .*
- (2) *If each S_{g_i} is of finite presentation over R , then S is of finite presentation over R .*

Proof. Omitted. □

The following lemma is better stated and proved in the more general context of flat descent. However, it makes sense to state it here since it fits well with the above.

Lemma 10.23.4. *Let R be a ring. Let $f_1, \dots, f_n \in R$ be elements which generate the unit ideal in R . Suppose we are given the following data:*

- (1) *For each i an R_{f_i} -module M_i .*
- (2) *For each pair i, j an $R_{f_i f_j}$ -module isomorphism $\psi_{ij} : (M_i)_{f_j} \rightarrow (M_j)_{f_i}$.*

which satisfy the “cocycle condition” that all the diagrams

$$\begin{array}{ccc} (M_i)_{f_j f_k} & \xrightarrow{\psi_{ik}} & (M_k)_{f_i f_j} \\ & \searrow \psi_{ij} & \nearrow \psi_{jk} \\ & (M_j)_{f_i f_k} & \end{array}$$

commute (for all triples i, j, k). Given this data define

$$M = \text{Ker} \left(\bigoplus_{1 \leq i \leq n} M_i \longrightarrow \bigoplus_{1 \leq i, j \leq n} (M_i)_{f_i} \right)$$

where (m_1, \dots, m_n) maps to the element whose (i, j) th entry is $m_i/1 - \psi_{ji}(m_j/1)$. Then the natural map $M \rightarrow M_i$ identifies M_i with M_{f_i} . Moreover $\psi_{ij}(m/1) = m/1$ for all $m \in M$ (with obvious notation).

Proof. Omitted. □

10.24. Zerodivisors and total rings of fractions

The local ring at a minimal prime has the following properties.

Lemma 10.24.1. *Let \mathfrak{p} be a minimal prime of a ring R . Every element of the maximal ideal of $R_{\mathfrak{p}}$ is nilpotent. If R is reduced then $R_{\mathfrak{p}}$ is a field.*

Proof. If some element x of $\mathfrak{p}R_{\mathfrak{p}}$ is not nilpotent, then $D(x) \neq \emptyset$, see Lemma 10.16.2. This contradicts the minimality of \mathfrak{p} . If R is reduced, then $\mathfrak{p}R_{\mathfrak{p}} = 0$ and hence it is a field. □

Lemma 10.24.2. *Let R be a reduced ring. Then*

- (1) R is a subring of a product of fields,
- (2) $R \rightarrow \prod_{\mathfrak{p} \text{ minimal}} R_{\mathfrak{p}}$ is an embedding into a product of fields,
- (3) $\bigcup_{\mathfrak{p} \text{ minimal}} \mathfrak{p}$ is the set of zerodivisors of R .

Proof. By Lemma 10.24.1 each of the rings $R_{\mathfrak{p}}$ is a field. In particular, the kernel of the ring map $R \rightarrow R_{\mathfrak{p}}$ is \mathfrak{p} . By Lemma 10.16.2 we have $\bigcap_{\mathfrak{p}} \mathfrak{p} = (0)$. Hence (2) and (1) are true. If $xy = 0$ and $y \neq 0$, then $y \notin \mathfrak{p}$ for some minimal prime \mathfrak{p} . Hence $x \in \mathfrak{p}$. Thus every zerodivisor of R is contained in $\bigcup_{\mathfrak{p} \text{ minimal}} \mathfrak{p}$. Conversely, suppose that $x \in \mathfrak{p}$ for some minimal prime \mathfrak{p} . Then x maps to zero in $R_{\mathfrak{p}}$, hence there exists $y \in R$, $y \notin \mathfrak{p}$ such that $xy = 0$. In other words, x is a zerodivisor. This finishes the proof of (3) and the lemma. □

The total ring of fractions $Q(R)$ of a ring R was introduced in Example 10.9.8.

Lemma 10.24.3. *Let R be a ring. Let $S \subset R$ be a multiplicative subset consisting of nonzerodivisors. Then $Q(R) \cong Q(S^{-1}R)$. In particular $Q(R) \cong Q(Q(R))$.*

Proof. If $x \in S^{-1}R$ is a nonzerodivisor, and $x = r/f$ for some $r \in R$, $f \in S$, then r is a nonzerodivisor in R . Whence the lemma. □

We can apply glueing results to prove something about total rings of fractions $Q(R)$ which we introduced in Example 10.9.8.

Lemma 10.24.4. *Let R be a ring. Assume that R has finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, and that $\mathfrak{q}_1 \cup \dots \cup \mathfrak{q}_t$ is the set of zerodivisors of R . Then the total ring of fractions $Q(R)$ is equal to $R_{\mathfrak{q}_1} \times \dots \times R_{\mathfrak{q}_t}$.*

Proof. There are natural maps $Q(R) \rightarrow R_{\mathfrak{q}_i}$ since any nonzerodivisor is contained in $R \setminus \mathfrak{q}_i$. Hence a natural map $Q(R) \rightarrow R_{\mathfrak{q}_1} \times \dots \times R_{\mathfrak{q}_t}$. For any nonminimal prime $\mathfrak{p} \subset R$ we see that $\mathfrak{p} \not\subset \mathfrak{q}_1 \cup \dots \cup \mathfrak{q}_t$ by Lemma 10.14.2. Hence $\text{Spec}(Q(R)) = \{\mathfrak{q}_1, \dots, \mathfrak{q}_t\}$ (as subsets of $\text{Spec}(R)$, see Lemma 10.16.5). Therefore $\text{Spec}(Q(R))$ is a finite discrete set and it follows that $Q(R) = A_1 \times \dots \times A_t$ with $\text{Spec}(A_i) = \{\mathfrak{q}_i\}$, see Lemma 10.22.3. Moreover A_i is a local ring, which is a localization of R . Hence $A_i \cong R_{\mathfrak{q}_i}$. \square

10.25. Irreducible components of spectra

We show that irreducible components of the spectrum of a ring correspond to the minimal primes in the ring.

Lemma 10.25.1. *Let R be a ring.*

- (1) *For a prime $\mathfrak{p} \subset R$ the closure of $\{\mathfrak{p}\}$ in the Zariski topology is $V(\mathfrak{p})$. In a formula $\overline{\{\mathfrak{p}\}} = V(\mathfrak{p})$.*
- (2) *The irreducible closed subsets of $\text{Spec}(R)$ are exactly the subsets $V(\mathfrak{p})$, with $\mathfrak{p} \subset R$ a prime.*
- (3) *The irreducible components (see Topology, Definition 5.7.1) of $\text{Spec}(R)$ are exactly the subsets $V(\mathfrak{p})$, with $\mathfrak{p} \subset R$ a minimal prime.*

Proof. Note that if $\mathfrak{p} \in V(I)$, then $I \subset \mathfrak{p}$. Hence, clearly $\overline{\{\mathfrak{p}\}} = V(\mathfrak{p})$. In particular $V(\mathfrak{p})$ is the closure of a singleton and hence irreducible. The second assertion implies the third. To show the second, let $V(I) \subset \text{Spec}(R)$ with I a radical ideal. If I is not prime, then choose $a, b \in R$, $a, b \notin I$ with $ab \in I$. In this case $V(I, a) \cup V(I, b) = V(I)$, but neither $V(I, b) = V(I)$ nor $V(I, a) = V(I)$, by Lemma 10.16.2. Hence $V(I)$ is not irreducible. \square

In other words, this lemma shows that every irreducible closed subset of $\text{Spec}(R)$ is of the form $V(\mathfrak{p})$ for some prime \mathfrak{p} . Since $V(\mathfrak{p}) = \overline{\{\mathfrak{p}\}}$ we see that each irreducible closed subset has a unique generic point, see Topology, Definition 5.7.4. In particular, $\text{Spec}(R)$ is a sober topological space. We record this fact in the following lemma.

Lemma 10.25.2. *The spectrum of a ring is a spectral space, see Topology, Definition 5.22.1.*

Proof. Formally this follows from Lemma 10.25.1 and Lemma 10.16.11. See also discussion above. \square

Lemma 10.25.3. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime.*

- (1) *the set of irreducible closed subsets of $\text{Spec}(R)$ passing through \mathfrak{p} is in one-to-one correspondence with primes $\mathfrak{q} \subset R_{\mathfrak{p}}$.*
- (2) *The set of irreducible components of $\text{Spec}(R)$ passing through \mathfrak{p} is in one-to-one correspondence with minimal primes $\mathfrak{q} \subset R_{\mathfrak{p}}$.*

Proof. Omitted. \square

Lemma 10.25.4. *Let R be a ring. Let \mathfrak{p} be a minimal prime of R . Let $W \subset \text{Spec}(R)$ be a quasi-compact open not containing the point \mathfrak{p} . Then there exists an $f \in R$, $f \notin \mathfrak{p}$ such that $D(f) \cap W = \emptyset$.*

Proof. Since W is quasi-compact we may write it as a finite union of standard affine opens $D(g_i)$, $i = 1, \dots, n$. Since $\mathfrak{p} \notin W$ we have $g_i \in \mathfrak{p}$ for all i . By Lemma 10.24.1 each g_i is nilpotent in $R_{\mathfrak{p}}$. Hence we can find an $f \in R$, $f \notin \mathfrak{p}$ such that for all i we have $fg_i^{n_i} = 0$ for some $n_i > 0$. Then $D(f)$ works. \square

Lemma 10.25.5. *Let R be a ring. Let $X = \text{Spec}(R)$ as a topological space. The following are equivalent*

- (1) X is profinite,
- (2) X is Hausdorff,
- (3) X is totally disconnected.
- (4) every quasi-compact open of X is closed,
- (5) there are no nontrivial inclusions between its prime ideals,
- (6) every prime ideal is a maximal ideal,
- (7) every prime ideal is minimal,
- (8) every standard open $D(f) \subset X$ is closed, and
- (9) add more here.

Proof. First proof. It is clear that (5), (6), and (7) are equivalent. It is clear that (4) and (8) are equivalent as every quasi-compact open is a finite union of standard opens. The implication (7) \Rightarrow (4) follows from Lemma 10.25.4. Assume (4) holds. Let $\mathfrak{p}, \mathfrak{p}'$ be distinct primes of R . Choose an $f \in \mathfrak{p}'$, $f \notin \mathfrak{p}$ (if needed switch \mathfrak{p} with \mathfrak{p}'). Then $\mathfrak{p}' \notin D(f)$ and $\mathfrak{p} \in D(f)$. By (4) the open $D(f)$ is also closed. Hence \mathfrak{p} and \mathfrak{p}' are in disjoint open neighbourhoods whose union is X . Thus X is Hausdorff and totally disconnected. Thus (4) \Rightarrow (2) and (3). If (3) holds then there cannot be any specializations between points of $\text{Spec}(R)$ and we see that (5) holds. If X is Hausdorff then every point is closed, so (2) implies (6). Thus (2), (3), (4), (5), (6), (7) and (8) are equivalent. Any profinite space is Hausdorff, so (1) implies (2). If X satisfies (2) and (3), then X (being quasi-compact by Lemma 10.16.10) is profinite by Topology, Lemma 5.21.2.

Second proof. Besides the equivalence of (4) and (8) this follows from Lemma 10.25.2 and purely topological facts, see Topology, Lemma 5.22.7. \square

10.26. Examples of spectra of rings

In this section we put some examples of spectra.

Example 10.26.1. In this example we describe $X = \text{Spec}(\mathbf{Z}[x]/(x^2 - 4))$. Let \mathfrak{p} be an arbitrary prime in X . Let $\phi : \mathbf{Z} \rightarrow \mathbf{Z}[x]/(x^2 - 4)$ be the natural ring map. Then, $\phi^{-1}(\mathfrak{p})$ is a prime in \mathbf{Z} . If $\phi^{-1}(\mathfrak{p}) = (2)$, then since \mathfrak{p} contains 2, it corresponds to a prime ideal in $\mathbf{Z}[x]/(x^2 - 4, 2) \cong (\mathbf{Z}/2\mathbf{Z})[x]/(x^2)$ via the map $\mathbf{Z}[x]/(x^2 - 4) \rightarrow \mathbf{Z}[x]/(x^2 - 4, 2)$. Any prime in $(\mathbf{Z}/2\mathbf{Z})[x]/(x^2)$ corresponds to a prime in $(\mathbf{Z}/2\mathbf{Z})[x]$ containing (x^2) . Such primes will then contain x . Since $(\mathbf{Z}/2\mathbf{Z}) \cong (\mathbf{Z}/2\mathbf{Z})[x]/(x)$ is a field, (x) is a maximal ideal. Since any prime contains (x) and (x) is maximal, the ring contains only one prime (x) . Thus, in this case, $\mathfrak{p} = (2, x)$. Now, if $\phi^{-1}(\mathfrak{p}) = (q)$ for $q > 2$, then since \mathfrak{p} contains q , it corresponds to a prime ideal in $\mathbf{Z}[x]/(x^2 - 4, q) \cong (\mathbf{Z}/q\mathbf{Z})[x]/(x^2 - 4)$ via the map $\mathbf{Z}[x]/(x^2 - 4) \rightarrow \mathbf{Z}[x]/(x^2 - 4, q)$. Any prime in $(\mathbf{Z}/q\mathbf{Z})[x]/(x^2 - 4)$ corresponds to a prime in $(\mathbf{Z}/q\mathbf{Z})[x]$ containing $(x^2 - 4) = (x - 2)(x + 2)$. Hence, these primes must contain either $x - 2$ or $x + 2$. Since $(\mathbf{Z}/q\mathbf{Z})[x]$ is a PID, all nonzero primes are maximal, and so there are precisely 2 primes in $(\mathbf{Z}/q\mathbf{Z})[x]$ containing $(x - 2)(x + 2)$, namely $(x - 2)$ and $(x + 2)$. In

conclusion, there exist two primes $(q, x - 2)$ and $(q, x + 2)$ since $2 \neq -2 \in \mathbf{Z}/(q)$. Finally, we treat the case where $\phi^{-1}(\mathfrak{p}) = (0)$. Notice that \mathfrak{p} corresponds to a prime ideal in $\mathbf{Z}[x]$ that contains $(x^2 - 4) = (x - 2)(x + 2)$. Hence, \mathfrak{p} contains either $(x - 2)$ or $(x + 2)$. Hence, \mathfrak{p} corresponds to a prime in $\mathbf{Z}[x]/(x - 2)$ or one in $\mathbf{Z}[x]/(x + 2)$ that intersects \mathbf{Z} only at 0, by assumption. Since $\mathbf{Z}[x]/(x - 2) \cong \mathbf{Z}$ and $\mathbf{Z}[x]/(x + 2) \cong \mathbf{Z}$, this means that \mathfrak{p} must correspond to 0 in one of these rings. Thus, $\mathfrak{p} = (x - 2)$ or $\mathfrak{p} = (x + 2)$ in the original ring.

Example 10.26.2. In this example we describe $X = \text{Spec}(\mathbf{Z}[x])$. Fix $\mathfrak{p} \in X$. Let $\phi : \mathbf{Z} \rightarrow \mathbf{Z}[x]$ and notice that $\phi^{-1}(\mathfrak{p}) \in \text{Spec}(\mathbf{Z})$. If $\phi^{-1}(\mathfrak{p}) = (q)$ for q a prime number $q > 0$, then \mathfrak{p} corresponds to a prime in $(\mathbf{Z}/(q))[x]$, which must be generated by a polynomial that is irreducible in $(\mathbf{Z}/(q))[x]$. If we choose a representative of this polynomial with minimal degree, then it will also be irreducible in $\mathbf{Z}[x]$. Hence, in this case $\mathfrak{p} = (q, f_q)$ where f_q is an irreducible polynomial in $\mathbf{Z}[x]$ that is irreducible when viewed in $(\mathbf{Z}/(q))[x]$. Now, assume that $\phi^{-1}(\mathfrak{p}) = (0)$. In this case, \mathfrak{p} must be generated by nonconstant polynomials which, since \mathfrak{p} is prime, may be assumed to be irreducible in $\mathbf{Z}[x]$. By Gauss' lemma, these polynomials are also irreducible in $\mathbf{Q}[x]$. Since $\mathbf{Q}[x]$ is a Euclidean domain, if there are at least two distinct irreducibles f, g generating \mathfrak{p} , then $1 = af + bg$ for $a, b \in \mathbf{Q}[x]$. Multiplying through by a common denominator, we see that $m = \bar{a}f + \bar{b}g$ for $\bar{a}, \bar{b} \in \mathbf{Z}[x]$ and nonzero $m \in \mathbf{Z}$. This is a contradiction. Hence, \mathfrak{p} is generated by one irreducible polynomial in $\mathbf{Z}[x]$.

Example 10.26.3. In this example we describe $X = \text{Spec}(k[x, y])$ when k is an arbitrary field. Clearly (0) is prime, and any principal ideal generated by an irreducible polynomial will also be a prime since $k[x, y]$ is a unique factorization domain. Now assume \mathfrak{p} is an element of X that is not principal. Since $k[x, y]$ is a Noetherian UFD, the prime ideal \mathfrak{p} can be generated by a finite number of irreducible polynomials (f_1, \dots, f_n) . Now, I claim that if f, g are irreducible polynomials in $k[x, y]$ that are not associates, then $(f, g) \cap k[x] \neq 0$. To do this, it is enough to show that f and g are relatively prime when viewed in $k(x)[y]$. In this case, $k(x)[y]$ is a Euclidean domain, so by applying the Euclidean algorithm and clearing denominators, we obtain $p = af + bg$ for $p, a, b \in k[x]$. Thus, assume this is not the case, that is, that some nonunit $h \in k(x)[y]$ divides both f and g . Then, by Gauss's lemma, for some $a, b \in k(x)$ we have $ah|f$ and $bh|g$ for $ah, bh \in k[x]$ since $f.f.(k[x]) = k(x)$. By irreducibility, $ah = f$ and $bh = g$ (since $h \notin k(x)$). So, back in $k(x)[y]$, f, g are associates, as $\frac{a}{b}g = f$. Since $k(x) = f.f.(k[x])$, we can write $g = \frac{r}{s}f$ for elements $r, s \in k[x]$ sharing no common factors. This implies that $sg = rf$ in $k[x, y]$ and so s must divide f since $k[x, y]$ is a UFD. Hence, $s = 1$ or $s = f$. If $s = f$, then $r = g$, implying $f, g \in k[x]$ and thus must be units in $k(x)$ and relatively prime in $k(x)[y]$, contradicting our hypothesis. If $s = 1$, then $g = rf$, another contradiction. Thus, we must have f, g relatively prime in $k(x)[y]$, a Euclidean domain. Thus, we have reduced to the case \mathfrak{p} contains some irreducible polynomial $p \in k[x] \subset k[x, y]$. By the above, \mathfrak{p} corresponds to a prime in the ring $k[x, y]/(p) = k(\alpha)[y]$, where α is an element algebraic over k with minimum polynomial p . This is a PID, and so any prime ideal corresponds to (0) or an irreducible polynomial in $k(\alpha)[y]$. Thus, \mathfrak{p} is of the form (p) or (p, f) where f is a polynomial in $k[x, y]$ that is irreducible in the quotient $k[x, y]/(p)$.

Example 10.26.4. Consider the ring

$$R = \{f \in \mathbf{Q}[z] \text{ with } f(0) = f(1)\}.$$

Consider the map

$$\varphi : \mathbf{Q}[A, B] \rightarrow R$$

defined by $\varphi(A) = z^2 - z$ and $\varphi(B) = z^3 - z^2$. It is easily checked that $(A^3 - B^2 + AB) \subset \text{Ker}(\varphi)$ and that $A^3 - B^2 + AB$ is irreducible. Assume that φ is surjective; then since R is an integral domain (it is a subring of an integral domain), $\text{Ker}(\varphi)$ must be a prime ideal of $\mathbf{Q}[A, B]$. The prime ideals which contain $(A^3 - B^2 + AB)$ are $(A^3 - B^2 + AB)$ itself and any maximal ideal (f, g) with $f, g \in \mathbf{Q}[A, B]$ such that f is irreducible mod g . But R is not a field, so the kernel must be $(A^3 - B^2 + AB)$; hence φ gives an isomorphism $R \rightarrow \mathbf{Q}[A, B]/(A^3 - B^2 + AB)$.

To see that φ is surjective, we must express any $f \in R$ as a \mathbf{Q} -coefficient polynomial in $A(z) = z^2 - z$ and $B(z) = z^3 - z^2$. Note the relation $zA(z) = B(z)$. Let $a = f(0) = f(1)$. Then $z(z - 1)$ must divide $f(z) - a$, so we can write $f(z) = z(z - 1)g(z) + a = A(z)g(z) + a$. If $\deg(g) < 2$, then $h(z) = c_1z + c_0$ and $f(z) = A(z)(c_1z + c_0) + a = c_1B(z) + c_0A(z) + a$, so we are done. If $\deg(g) \geq 2$, then by the polynomial division algorithm, we can write $g(z) = A(z)h(z) + b_1z + b_0$ ($\deg(h) \leq \deg(g) - 2$), so $f(z) = A(z)^2h(z) + b_1B(z) + b_0A(z)$. Applying division to $h(z)$ and iterating, we obtain an expression for $f(z)$ as a polynomial in $A(z)$ and $B(z)$; hence φ is surjective.

Now let $a \in \mathbf{Q}$, $a \neq 0, \frac{1}{2}, 1$ and consider

$$R_a = \{f \in \mathbf{Q}[z, \frac{1}{z-a}] \text{ with } f(0) = f(1)\}.$$

This is a finitely generated \mathbf{Q} -algebra as well: it is easy to check that the functions $z^2 - z$, $z^3 - z$, and $\frac{a^2 - a}{z - a} + z$ generate R_a as a \mathbf{Q} -algebra. We have the following inclusions:

$$R \subset R_a \subset \mathbf{Q}[z, \frac{1}{z-a}], \quad R \subset \mathbf{Q}[z] \subset \mathbf{Q}[z, \frac{1}{z-a}].$$

Recall (Lemma 10.16.5) that for a ring T and a multiplicative subset $S \subset T$, the ring map $T \rightarrow S^{-1}T$ induces a map on spectra $\text{Spec}(S^{-1}T) \rightarrow \text{Spec}(T)$ which is a homeomorphism onto the subset

$$\{\mathfrak{p} \in \text{Spec}(T) \mid S \cap \mathfrak{p} = \emptyset\} \subset \text{Spec}(T).$$

When $S = \{1, f, f^2, \dots\}$ for some $f \in T$, this is the open set $D(f) \subset T$. We now verify a corresponding property for the ring map $R \rightarrow R_a$: we will show that the map $\theta : \text{Spec}(R_a) \rightarrow \text{Spec}(R)$ induced by inclusion $R \subset R_a$ is a homeomorphism onto an open subset of $\text{Spec}(R)$ by verifying that θ is an injective local homeomorphism. We do so with respect to an open cover of $\text{Spec}(R_a)$ by two distinguished opens, as we now describe. For any $r \in \mathbf{Q}$, let $\text{ev}_r : R \rightarrow \mathbf{Q}$ be the homomorphism given by evaluation at r . Note that for $r = 0$ and $r = 1 - a$, this can be extended to a homomorphism $\text{ev}'_r : R_a \rightarrow \mathbf{Q}$ (the latter because $\frac{1}{z-a}$ is well-defined at $z = 1 - a$, since $a \neq \frac{1}{2}$). However, ev_a does not extend to R_a . Write $\mathfrak{m}_r = \text{Ker}(\text{ev}_r)$. We have

$$\begin{aligned} \mathfrak{m}_0 &= (z^2 - z, z^3 - z), \\ \mathfrak{m}_a &= ((z - 1 + a)(z - a), (z^2 - 1 + a)(z - a)), \text{ and} \\ \mathfrak{m}_{1-a} &= ((z - 1 + a)(z - a), (z - 1 + a)(z^2 - a)). \end{aligned}$$

To verify this, note that the right-hand sides are clearly contained in the left-hand sides. Then check that the right-hand sides are maximal ideals by writing the generators in terms of A and B , and viewing R as $\mathbf{Q}[A, B]/(A^3 - B^2 + AB)$. Note that \mathfrak{m}_a is not in the image of θ : we have

$$(z^2 - z)^2(z - a)\left(\frac{a^2 - a}{z - a} + z\right) = (z^2 - z)^2(a^2 - a) + (z^2 - z)^2(z - a)z$$

The left hand side is in $\mathfrak{m}_a R_a$ because $(z^2 - z)(z - a)$ is in \mathfrak{m}_a and because $(z^2 - z)\left(\frac{a^2 - a}{z - a} + z\right)$ is in R_a . Similarly the element $(z^2 - z)^2(z - a)z$ is in $\mathfrak{m}_a R_a$ because $(z^2 - z)$ is in R_a and $(z^2 - z)(z - a)$ is in \mathfrak{m}_a . As $a \notin \{0, 1\}$ we conclude that $(z^2 - z)^2 \in \mathfrak{m}_a R_a$. Hence no ideal I of R_a can satisfy $I \cap R = \mathfrak{m}_a$, as such an I would have to contain $(z^2 - z)^2$, which is in R but not in \mathfrak{m}_a . The distinguished open set $D((z - 1 + a)(z - a)) \subset \text{Spec}(R)$ is equal to the complement of the closed set $\{\mathfrak{m}_a, \mathfrak{m}_{1-a}\}$. Then check that $R_{(z-1+a)(z-a)} = (R_a)_{(z-1+a)(z-a)}$; calling this localized ring R' , then, it follows that the map $R \rightarrow R'$ factors as $R \rightarrow R_a \rightarrow R'$. By Lemma 10.16.5, then, these maps express $\text{Spec}(R') \subset \text{Spec}(R_a)$ and $\text{Spec}(R') \subset \text{Spec}(R)$ as open subsets; hence $\theta : \text{Spec}(R_a) \rightarrow \text{Spec}(R)$, when restricted to $D((z - 1 + a)(z - a))$, is a homeomorphism onto an open subset. Similarly, θ restricted to $D((z^2 + z + 2a - 2)(z - a)) \subset \text{Spec}(R_a)$ is a homeomorphism onto the open subset $D((z^2 + z + 2a - 2)(z - a)) \subset \text{Spec}(R)$. Depending on whether $z^2 + z + 2a - 2$ is irreducible or not over \mathbf{Q} , this former distinguished open set has complement equal to one or two closed points along with the closed point \mathfrak{m}_a . Furthermore, the ideal in R_a generated by the elements $(z^2 + z + 2a - a)(z - a)$ and $(z - 1 + a)(z - a)$ is all of R_a , so these two distinguished open sets cover $\text{Spec}(R_a)$. Hence in order to show that θ is a homeomorphism onto $\text{Spec}(R) - \{\mathfrak{m}_a\}$, it suffices to show that these one or two points can never equal \mathfrak{m}_{1-a} . And this is indeed the case, since $1 - a$ is a root of $z^2 + z + 2a - 2$ if and only if $a = 0$ or $a = 1$, both of which do not occur.

Despite this homeomorphism which mimics the behavior of a localization at an element of R , while $\mathbf{Q}[z, \frac{1}{z-a}]$ is the localization of $\mathbf{Q}[z]$ at the maximal ideal $(z - a)$, the ring R_a is *not* a localization of R : Any localization $S^{-1}R$ results in more units than the original ring R . The units of R are \mathbf{Q}^\times , the units of \mathbf{Q} . In fact, it is easy to see that the units of R_a are \mathbf{Q}^* . Namely, the units of $\mathbf{Q}[z, \frac{1}{z-a}]$ are $c(z - a)^n$ for $c \in \mathbf{Q}^*$ and $n \in \mathbf{Z}$ and it is clear that these are in R_a only if $n = 0$. Hence R_a has no more units than R does, and thus cannot be a localization of R .

We used the fact that $a \neq 0, 1$ to ensure that $\frac{1}{z-a}$ makes sense at $z = 0, 1$. We used the fact that $a \neq 1/2$ in a few places: (1) In order to be able to talk about the kernel of ev_{1-a} on R_a , which ensures that \mathfrak{m}_{1-a} is a point of R_a (i.e., that R_a is missing just one point of R). (2) At the end in order to conclude that $(z - a)^{k+\ell}$ can only be in R for $k = \ell = 0$; indeed, if $a = 1/2$, then this is in R as long as $k + \ell$ is even. Hence there would indeed be more units in R_a than in R , and R_a could possibly be a localization of R .

10.27. A meta-observation about prime ideals

This section is taken from the CRing project. Let R be a ring and let $S \subset R$ be a multiplicative subset. A consequence of Lemma 10.16.5 is that an ideal $I \subset R$ maximal with respect to the property of not intersecting S is prime. The reason

is that $I = R \cap \mathfrak{m}$ for some maximal ideal \mathfrak{m} of the ring $S^{-1}R$. It turns out that for many properties of ideals, the maximal ones are prime. A general method of seeing this was developed in [LR08]. In this section, we digress to explain this phenomenon.

Let R be a ring. If I is an ideal of R and $a \in R$, we define

$$(I : a) = \{x \in R \mid xa \in I\}.$$

More generally, if $J \subset R$ is an ideal, we define

$$(I : J) = \{x \in R \mid xJ \subset I\}.$$

Lemma 10.27.1. *Let R be a ring. For a principal ideal $J \subset R$, and for any ideal $I \subset J$ we have $I = J(I : J)$.*

Proof. Say $J = (a)$. Then $(I : J) = (I : a)$. Since $I \subset J$ we see that any $y \in I$ is of the form $y = xa$ for some $x \in (I : a)$. Hence $I \subset J(I : J)$. Conversely, if $x \in (I : a)$, then $xJ = (xa) \subset I$, which proves the other inclusion. \square

Let \mathcal{F} be a collection of ideals of R . We are interested in conditions that will guarantee that the maximal elements in the complement of \mathcal{F} are prime.

Definition 10.27.2. Let R be a ring. Let \mathcal{F} be a set of ideals of R . We say \mathcal{F} is an *Oka family* if $R \in \mathcal{F}$ and whenever $I \subset R$ is an ideal and $(I : a), (I, a) \in \mathcal{F}$ for some $a \in R$, then $I \in \mathcal{F}$.

Let us give some examples of Oka families. The first example is the basic example discussed in the introduction to this section.

Example 10.27.3. Let R be a ring and let S be a multiplicative subset of R . We claim that $\mathcal{F} = \{I \subset R \mid I \cap S \neq \emptyset\}$ is an Oka family. Namely, suppose that $(I : a), (I, a) \in \mathcal{F}$ for some $a \in R$. Then pick $s \in (I, a) \cap S$ and $s' \in (I : a) \cap S$. Then $ss' \in I \cap S$ and hence $I \in \mathcal{F}$. Thus \mathcal{F} is an Oka family.

Example 10.27.4. Let R be a ring, $I \subset R$ an ideal, and $a \in R$. If $(I : a)$ is generated by a_1, \dots, a_n and (I, a) is generated by a, b_1, \dots, b_m with $b_1, \dots, b_m \in I$, then I is generated by $aa_1, \dots, aa_n, b_1, \dots, b_m$. To see this, note that if $x \in I$, then $x \in (I, a)$ is a linear combination of a, b_1, \dots, b_m , but the coefficient of a must lie in $(I : a)$. As a result, we deduce that the family of finitely generated ideals is an Oka family.

Example 10.27.5. Let us show that the family of principal ideals of a ring R is an Oka family. Indeed, suppose $I \subset R$ is an ideal, $a \in R$, and (I, a) and $(I : a)$ are principal. Note that $(I : a) = (I : (I, a))$. Setting $J = (I, a)$, we find that J is principal and $(I : J)$ is too. By Lemma 10.27.1 we have $I = J(I : J)$. Thus we find in our situation that since $J = (I, a)$ and $(I : J)$ are principal, I is principal.

Example 10.27.6. Let R be a ring. Let κ be an infinite cardinal. The family of ideals which can be generated by at most κ elements is an Oka family. The argument is analogous to the argument in Example 10.27.4 and is omitted.

Proposition 10.27.7. *If \mathcal{F} is an Oka family of ideals, then any maximal element of the complement of \mathcal{F} is prime.*

Proof. Suppose $I \notin \mathcal{F}$ is maximal with respect to not being in \mathcal{F} but I is not prime. Note that $I \neq R$ because $R \in \mathcal{F}$. Since I is not prime we can find $a, b \in R - I$ with $ab \in I$. It follows that $(I, a) \neq I$ and $(I : a)$ contains $b \notin I$ so also $(I : a) \neq I$. Thus $(I : a), (I, a)$ both strictly contain I , so they must belong to \mathcal{F} . By the Oka condition, we have $I \in \mathcal{F}$, a contradiction. \square

At this point we are able to turn most of the examples above into a lemma about prime ideals in a ring.

Lemma 10.27.8. *Let R be a ring. Let S be a multiplicative subset of R . An ideal $I \subset R$ which is maximal with respect to the property that $I \cap S = \emptyset$ is prime.*

Proof. This is the example discussed in the introduction to this section. For an alternative proof, combine Example 10.27.3 with Proposition 10.27.7. \square

Lemma 10.27.9. *Let R be a ring.*

- (1) *An ideal $I \subset R$ maximal with respect to not being finitely generated is prime.*
- (2) *If every prime ideal of R is finitely generated, then every ideal of R is finitely generated¹.*

Proof. The first assertion is an immediate consequence of Example 10.27.4 and Proposition 10.27.7. For the second, suppose that there exists an ideal $I \subset R$ which is not finitely generated. The union of a totally ordered chain $\{I_\alpha\}$ of ideals that are not finitely generated is not finitely generated; indeed, if $I = \bigcup I_\alpha$ were generated by a_1, \dots, a_n , then all the generators would belong to some I_α and would consequently generate it. By Zorn's lemma, there is an ideal maximal with respect to being not finitely generated. By the first part this ideal is prime. \square

Lemma 10.27.10. *Let R be a ring.*

- (1) *An ideal $I \subset R$ maximal with respect to not being principal is prime.*
- (2) *If every prime ideal of R is principal, then every ideal of R is principal.*

Proof. The first part follows from Example 10.27.5 and Proposition 10.27.7. For the second, suppose that there exists an ideal $I \subset R$ which is not principal. The union of a totally ordered chain $\{I_\alpha\}$ of ideals that not principal is not principal; indeed, if $I = \bigcup I_\alpha$ were generated by a , then a would belong to some I_α and a would generate it. By Zorn's lemma, there is an ideal maximal with respect to not being principal. This ideal is necessarily prime by the first part. \square

Lemma 10.27.11. *Let R be a ring.*

- (1) *An ideal maximal among the ideals which do not contain a nonzerodivisor is prime.*
- (2) *If every nonzero prime ideal in R contains a nonzerodivisor, then R is a domain.*

Proof. Consider the set S of nonzerodivisors. It is a multiplicative subset of R . Hence any ideal maximal with respect to not intersecting S is prime, see Lemma 10.27.8. Thus, if every nonzero prime ideal contains a nonzerodivisor, then (0) is prime, i.e., R is a domain. \square

¹Later we will say that R is Noetherian.

Remark 10.27.12. Let R be a ring. Let κ be an infinite cardinal. By applying Example 10.27.6 and Proposition 10.27.7 we see that any ideal maximal with respect to the property of not being generated by κ elements is prime. This result is not so useful because there exists a ring for which every prime ideal of R can be generated by \aleph_0 elements, but some ideal cannot. Namely, let k be a field, let T be a set whose cardinality is greater than \aleph_0 and let

$$R = k[\{x_n\}_{n \geq 1}, \{z_{t,n}\}_{t \in T, n \geq 0}] / (x_n^2, z_{t,n}^2, x_n z_{t,n} - z_{t,n-1})$$

This is a local ring with unique prime ideal $\mathfrak{m} = (x_n)$. But the ideal $(z_{t,n})$ cannot be generated by countably many elements.

10.28. Images of ring maps of finite presentation

In this section we prove some results on the topology of maps $\text{Spec}(S) \rightarrow \text{Spec}(R)$ induced by ring maps $R \rightarrow S$, mainly Chevalley's Theorem. In order to do this we will use the notions of constructible sets, quasi-compact sets, retrocompact sets, and so on which are defined in Topology, Section 5.11.

Lemma 10.28.1. *Let $U \subset \text{Spec}(R)$ be open. The following are equivalent:*

- (1) U is retrocompact in $\text{Spec}(R)$,
- (2) U is quasi-compact,
- (3) U is a finite union of standard opens, and
- (4) there exists a finitely generated ideal $I \subset R$ such that $X \setminus V(I) = U$.

Proof. We have (1) \Rightarrow (2) because $\text{Spec}(R)$ is quasi-compact, see Lemma 10.16.10. We have (2) \Rightarrow (3) because standard opens form a basis for the topology. Proof of (3) \Rightarrow (1). Let $U = \bigcup_{i=1 \dots n} D(f_i)$. To show that U is retrocompact in $\text{Spec}(R)$ it suffices to show that $U \cap V$ is quasi-compact for any quasi-compact open V of $\text{Spec}(R)$. Write $V = \bigcup_{j=1 \dots m} D(g_j)$ which is possible by (2) \Rightarrow (3). Each standard open is homeomorphic to the spectrum of a ring and hence quasi-compact, see Lemmas 10.16.6 and 10.16.10. Thus $U \cap V = (\bigcup_{i=1 \dots n} D(f_i)) \cap (\bigcup_{j=1 \dots m} D(g_j)) = \bigcup_{i,j} D(f_i g_j)$ is a finite union of quasi-compact opens hence quasi-compact. To finish the proof note that (4) is equivalent to (3) by Lemma 10.16.2. \square

Lemma 10.28.2. *Let $\varphi : R \rightarrow S$ be a ring map. The induced continuous map $f : \text{Spec}(S) \rightarrow \text{Spec}(R)$ is quasi-compact. For any constructible set $E \subset \text{Spec}(R)$ the inverse image $f^{-1}(E)$ is constructible in $\text{Spec}(S)$.*

Proof. We first show that the inverse image of any quasi-compact open $U \subset \text{Spec}(R)$ is quasi-compact. By Lemma 10.28.1 we may write U as a finite union of standard opens. Thus by Lemma 10.16.4 we see that $f^{-1}(U)$ is a finite union of standard opens. Hence $f^{-1}(U)$ is quasi-compact by Lemma 10.28.1 again. The second assertion now follows from Topology, Lemma 5.14.3. \square

Lemma 10.28.3. *Let R be a ring and let $T \subset \text{Spec}(R)$ be constructible. Then there exists a ring map $R \rightarrow S$ of finite presentation such that T is the image of $\text{Spec}(S)$ in $\text{Spec}(R)$.*

Proof. Let $T \subset \text{Spec}(R)$ be constructible. The spectrum of a finite product of rings is the disjoint union of the spectra, see Lemma 10.20.2. Hence if $T = T_1 \cup T_2$ and the result holds for T_1 and T_2 , then the result holds for T . In particular we may assume that $T = U \cap V^c$, where $U, V \subset \text{Spec}(R)$ are retrocompact open. By Lemma

10.28.1 we may write $T = (\bigcup D(f_i)) \cap (\bigcup D(g_j))^c = \bigcup (D(f_i) \cap V(g_1, \dots, g_m))$. In fact we may assume that $T = D(f) \cap V(g_1, \dots, g_m)$ (by the argument on unions above). In this case T is the image of the map $R \rightarrow (R/(g_1, \dots, g_m))_f$, see Lemmas 10.16.6 and 10.16.7. \square

Lemma 10.28.4. *Let R be a ring. Let f be an element of R . Let $S = R_f$. Then the image of a constructible subset of $\text{Spec}(S)$ is constructible in $\text{Spec}(R)$.*

Proof. We repeatedly use Lemma 10.28.1 without mention. Let U, V be quasi-compact open in $\text{Spec}(S)$. We will show that the image of $U \cap V^c$ is constructible. Under the identification $\text{Spec}(S) = D(f)$ of Lemma 10.16.6 the sets U, V correspond to quasi-compact opens U', V' of $\text{Spec}(R)$. Hence it suffices to show that $U' \cap (V')^c$ is constructible in $\text{Spec}(R)$ which is clear. \square

Lemma 10.28.5. *Let R be a ring. Let I be a finitely generated ideal of R . Let $S = R/I$. Then the image of a constructible of $\text{Spec}(S)$ is constructible in $\text{Spec}(R)$.*

Proof. If $I = (f_1, \dots, f_m)$, then we see that $V(I)$ is the complement of $\bigcup D(f_i)$, see Lemma 10.16.2. Hence it is constructible, by Lemma 10.28.1. Denote the map $R \rightarrow S$ by $f \mapsto \bar{f}$. We have to show that if \bar{U}, \bar{V} are retrocompact opens of $\text{Spec}(S)$, then the image of $\bar{U} \cap \bar{V}^c$ in $\text{Spec}(R)$ is constructible. By Lemma 10.28.1 we may write $\bar{U} = \bigcup D(\bar{g}_i)$. Setting $U = \bigcup D(g_i)$ we see \bar{U} has image $U \cap V(I)$ which is constructible in $\text{Spec}(R)$. Similarly the image of \bar{V} equals $V \cap V(I)$ for some retrocompact open V of $\text{Spec}(R)$. Hence the image of $\bar{U} \cap \bar{V}^c$ equals $U \cap V(I) \cap V^c$ as desired. \square

Lemma 10.28.6. *Let R be a ring. The map $\text{Spec}(R[x]) \rightarrow \text{Spec}(R)$ is open, and the image of any standard open is a quasi-compact open.*

Proof. It suffices to show that the image of a standard open $D(f)$, $f \in R[x]$ is quasi-compact open. The image of $D(f)$ is the image of $\text{Spec}(R[x]_f) \rightarrow \text{Spec}(R)$. Let $\mathfrak{p} \subset R$ be a prime ideal. Let \bar{f} be the image of f in $\kappa(\mathfrak{p})[x]$. Recall, see Lemma 10.16.9, that \mathfrak{p} is in the image if and only if $R[x]_f \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]_{\bar{f}}$ is not the zero ring. This is exactly the condition that f does not map to zero in $\kappa(\mathfrak{p})[x]$, in other words, that some coefficient of f is not in \mathfrak{p} . Hence we see: if $f = a_d x^d + \dots + a_0$, then the image of $D(f)$ is $D(a_d) \cup \dots \cup D(a_0)$. \square

We prove a property of characteristic polynomials which will be used below.

Lemma 10.28.7. *Let $R \rightarrow A$ be a ring homomorphism. Assume $A \cong R^{\oplus n}$ as an R -module. Let $f \in A$. The multiplication map $m_f : A \rightarrow A$ is R -linear and hence has a characteristic polynomial $P(T) = T^n + r_{n-1}T^{n-1} + \dots + r_0 \in R[T]$. For any prime $\mathfrak{p} \in \text{Spec}(R)$, f acts nilpotently on $A \otimes_R \kappa(\mathfrak{p})$ if and only if $\mathfrak{p} \in V(r_0, \dots, r_{n-1})$.*

Proof. This follows quite easily once we prove that the characteristic polynomial $\bar{P}(T) \in \kappa(\mathfrak{p})[T]$ of the multiplication map $m_{\bar{f}} : A \otimes_R \kappa(\mathfrak{p}) \rightarrow A \otimes_R \kappa(\mathfrak{p})$ which multiplies elements of $A \otimes_R \kappa(\mathfrak{p})$ by \bar{f} , the image of f viewed in $\kappa(\mathfrak{p})$, is just the image of $P(T)$ in $\kappa(\mathfrak{p})[T]$. Let (a_{ij}) be the matrix of the map m_f with entries in R , using a basis e_1, \dots, e_n of A as an R -module. Then, $A \otimes_R \kappa(\mathfrak{p}) \cong (R \otimes_R \kappa(\mathfrak{p}))^{\oplus n} = \kappa(\mathfrak{p})^n$, which is an n -dimensional vector space over $\kappa(\mathfrak{p})$ with basis $e_1 \otimes 1, \dots, e_n \otimes 1$. The image $\bar{f} = f \otimes 1$, and so the multiplication map $m_{\bar{f}}$ has matrix $(a_{ij} \otimes 1)$. Thus, the characteristic polynomial is precisely the image of $P(T)$.

From linear algebra, we know that a linear transformation acts nilpotently on an n -dimensional vector space if and only if the characteristic polynomial is T^n (since the characteristic polynomial divides some power of the minimal polynomial). Hence, f acts nilpotently on $A \otimes_R \kappa(\mathfrak{p})$ if and only if $\bar{P}(T) = T^n$. This occurs if and only if $r_i \in \mathfrak{p}$ for all $0 \leq i \leq n - 1$, that is when $\mathfrak{p} \in V(r_0, \dots, r_{n-1})$. \square

Lemma 10.28.8. *Let R be a ring. Let $f, g \in R[x]$ be polynomials. Assume the leading coefficient of g is a unit of R . There exists elements $r_i \in R$, $i = 1 \dots, n$ such that the image of $D(f) \cap V(g)$ in $\text{Spec}(R)$ is $\bigcup_{i=1, \dots, n} D(r_i)$.*

Proof. Write $g = ux^d + a_{d-1}x^{d-1} + \dots + a_0$, where d is the degree of g , and hence $u \in R^*$. Consider the ring $A = R[x]/(g)$. It is, as an R -module, finite free with basis the images of $1, x, \dots, x^{d-1}$. Consider multiplication by (the image of) f on A . This is an R -module map. Hence we can let $P(T) \in R[T]$ be the characteristic polynomial of this map. Write $P(T) = T^d + r_{d-1}T^{d-1} + \dots + r_0$. We claim that r_0, \dots, r_{d-1} have the desired property. We will use below the property of characteristic polynomials that

$$\mathfrak{p} \in V(r_0, \dots, r_{d-1}) \Leftrightarrow \text{multiplication by } f \text{ is nilpotent on } A \otimes_R \kappa(\mathfrak{p}).$$

This was proved in Lemma 10.28.7.

Suppose $\mathfrak{q} \in D(f) \cap V(g)$, and let $\mathfrak{p} = \mathfrak{q} \cap R$. Then there is a nonzero map $A \otimes_R \kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{q})$ which is compatible with multiplication by f . And f acts as a unit on $\kappa(\mathfrak{q})$. Thus we conclude $\mathfrak{p} \notin V(r_0, \dots, r_{d-1})$.

On the other hand, suppose that $r_i \notin \mathfrak{p}$ for some prime \mathfrak{p} of R and some $0 \leq i \leq d-1$. Then multiplication by f is not nilpotent on the algebra $A \otimes_R \kappa(\mathfrak{p})$. Hence there exists a maximal ideal $\bar{\mathfrak{q}} \subset A \otimes_R \kappa(\mathfrak{p})$ not containing the image of f . The inverse image of $\bar{\mathfrak{q}}$ in $R[x]$ is an element of $D(f) \cap V(g)$ mapping to \mathfrak{p} . \square

Theorem 10.28.9 (Chevalley’s Theorem). *Suppose that $R \rightarrow S$ is of finite presentation. The image of a constructible subset of $\text{Spec}(S)$ in $\text{Spec}(R)$ is constructible.*

Proof. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. We may factor $R \rightarrow S$ as $R \rightarrow R[x_1] \rightarrow R[x_1, x_2] \rightarrow \dots \rightarrow R[x_1, \dots, x_{n-1}] \rightarrow S$. Hence we may assume that $S = R[x]/(f_1, \dots, f_m)$. In this case we factor the map as $R \rightarrow R[x] \rightarrow S$, and by Lemma 10.28.5 we reduce to the case $S = R[x]$. By Lemma 10.28.1 suffices to show that if $T = (\bigcup_{i=1, \dots, n} D(f_i)) \cap V(g_1, \dots, g_m)$ for $f_i, g_j \in R[x]$ then the image in $\text{Spec}(R)$ is constructible. Since finite unions of constructible sets are constructible, it suffices to deal with the case $n = 1$, i.e., when $T = D(f) \cap V(g_1, \dots, g_m)$.

Note that if $c \in R$, then we have

$$\text{Spec}(R) = V(c) \coprod D(c) = \text{Spec}(R/(c)) \coprod \text{Spec}(R_c),$$

and correspondingly $\text{Spec}(R[x]) = V(c) \coprod D(c) = \text{Spec}(R/(c)[x]) \coprod \text{Spec}(R_c[x])$. The intersection of $T = D(f) \cap V(g_1, \dots, g_m)$ with each part still has the same shape, with f, g_i replaced by their images in $R/(c)[x]$, respectively $R_c[x]$. Note that the image of T in $\text{Spec}(R)$ is the union of the image of $T \cap V(c)$ and $T \cap D(c)$. Using Lemmas 10.28.4 and 10.28.5 it suffices to prove the images of both parts are constructible in $\text{Spec}(R/(c))$, respectively $\text{Spec}(R_c)$.

Let us assume we have $T = D(f) \cap V(g_1, \dots, g_m)$ as above, with $\deg(g_1) \leq \deg(g_2) \leq \dots \leq \deg(g_m)$. We are going to use descending induction on m , and

on the degrees of the g_i . Let $d = \deg(g_1)$, i.e., $g_1 = cx^{d_1} + l.o.t$ with $c \in R$ not zero. Cutting R up into the pieces $R/(c)$ and R_c we either lower the degree of g_1 (and this is covered by induction) or we reduce to the case where c is invertible. If c is invertible, and $m > 1$, then write $g_2 = c'x^{d_2} + l.o.t$. In this case consider $g'_2 = g_2 - (c'/c)x^{d_2-d_1}g_1$. Since the ideals (g_1, g_2, \dots, g_m) and $(g_1, g'_2, g_3, \dots, g_m)$ are equal we see that $T = D(f) \cap V(g_1, g'_2, g_3, \dots, g_m)$. But here the degree of g'_2 is strictly less than the degree of g_2 and hence this case is covered by induction.

The bases case for the induction above are the cases (a) $T = D(f) \cap V(g)$ where the leading coefficient of g is invertible, and (b) $T = D(f)$. These two cases are dealt with in Lemmas 10.28.8 and 10.28.6. \square

10.29. More on images

In this section we collect a few additional lemmas concerning the image on Spec for ring maps. See also Section 10.40 for example.

Lemma 10.29.1. *Let $R \subset S$ be an inclusion of domains. Assume that $R \rightarrow S$ is of finite type. There exists a nonzero $f \in R$, and a nonzero $g \in S$ such that $R_f \rightarrow S_{fg}$ is of finite presentation.*

Proof. By induction on the number of generators of S over R .

Suppose that S is generated by a single element over R . Then $S = R[x]/\mathfrak{q}$ for some prime ideal $\mathfrak{q} \subset R[x]$. If $\mathfrak{q} = (0)$ there is nothing to prove. If $\mathfrak{q} \neq (0)$, then let $g \in \mathfrak{q}$ be an element with minimal degree in x . Since $K[x] = f.f.(R)[x]$ is a PID we see that g is irreducible over K and that $f.f.(S) = K[x]/(g)$. Write $g = a_dx^d + \dots + a_0$ with $a_i \in R$ and $a_d \neq 0$. After inverting a_d in R we may assume that g is monic. Hence we see that $R \rightarrow R[x]/(g) \rightarrow S$ with the last map surjective. But $R[x]/(g) = R \oplus Rx \oplus \dots \oplus Rx^{d-1}$ maps injectively into $f.f.(S) = K[x]/(g) = K \oplus Kx \oplus \dots \oplus Kx^{d-1}$. Thus $S \cong R[x]/(g)$ is finitely presented.

Suppose that S is generated by $n > 1$ elements over R . Say $x_1, \dots, x_n \in S$ generate S . Denote $S' \subset S$ the subring generated by x_1, \dots, x_{n-1} . By induction hypothesis we see that there exist $f \in R$ and $g \in S'$ nonzero such that $R_f \rightarrow S'_{fg}$ is of finite presentation. Next we apply the induction hypothesis to $S'_{fg} \rightarrow S_{fg}$ to see that there exist $f' \in S'_{fg}$ and $g' \in S_{fg}$ such that $S'_{fgf'} \rightarrow S_{fgf'g'}$ is of finite presentation. We leave it to the reader to conclude. \square

Lemma 10.29.2. *Let $R \rightarrow S$ be a finite type ring map. Denote $X = \text{Spec}(R)$ and $Y = \text{Spec}(S)$. Write $f : Y \rightarrow X$ the induced map of spectra. Let $E \subset Y = \text{Spec}(S)$ be a constructible set. If a point $\xi \in X$ is in $f(E)$, then $\overline{\{\xi\}} \cap f(E)$ contains an open dense subset of $\overline{\{\xi\}}$.*

Proof. Let $\xi \in X$ be a point of $f(E)$. Choose a point $\eta \in E$ mapping to ξ . Let $\mathfrak{p} \subset R$ be the prime corresponding to ξ and let $\mathfrak{q} \subset S$ be the prime corresponding to η . Consider the diagram

$$\begin{array}{ccccccc} \eta & \longrightarrow & E \cap Y' & \longrightarrow & Y' = \text{Spec}(S/\mathfrak{q}) & \longrightarrow & Y \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \xi & \longrightarrow & f(E) \cap X' & \longrightarrow & X' = \text{Spec}(R/\mathfrak{p}) & \longrightarrow & X \end{array}$$

By Lemma 10.28.2 the set $E \cap Y'$ is constructible in Y' . It follows that we may replace X by X' and Y by Y' . Hence we may assume that $R \subset S$ is an inclusion of domains, ξ is the generic point of X , and η is the generic point of Y . By Lemma 10.29.1 combined with Chevalley's theorem (Theorem 10.28.9) we see that there exist dense opens $U \subset X$, $V \subset Y$ such that $f(V) \subset U$ and such that $f : V \rightarrow U$ maps constructible sets to constructible sets. Note that $E \cap V$ is constructible in V , see Topology, Lemma 5.14.4. Hence $f(E \cap V)$ is constructible in U and contains ξ . By Topology, Lemma 5.14.14 we see that $f(E \cap V)$ contains a dense open $U' \subset U$. \square

At the end of this section we present a few more results on images of maps on Spectra that have nothing to do with constructible sets.

Lemma 10.29.3. *Let $\varphi : R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) *The map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective.*
- (2) *For any radical ideal $I \subset R$ the inverse image of IS in R is equal to I .*
- (3) *For every prime \mathfrak{p} of R the inverse image of $\mathfrak{p}S$ in R is \mathfrak{p} .*

In this case the same is true after any base change: Given a ring map $R \rightarrow R'$ the ring map $R' \rightarrow R' \otimes_R S$ has the equivalent properties (1), (2), (3) also.

Proof. The implication (2) \Rightarrow (3) is immediate. If $I \subset R$ is a radical ideal, then Lemma 10.16.2 guarantees that $I = \bigcap_{I \subset \mathfrak{p}} \mathfrak{p}$. Hence (3) \Rightarrow (2). By Lemma 10.16.9 we have $\mathfrak{p} = \varphi^{-1}(\mathfrak{p}S)$ if and only if \mathfrak{p} is in the image. Hence (1) \Leftrightarrow (3). Thus (1), (2), and (3) are equivalent.

Assume (1) holds. Let $R \rightarrow R'$ be a ring map. Let $\mathfrak{p}' \subset R'$ be a prime ideal lying over the prime \mathfrak{p} of R . To see that \mathfrak{p}' is in the image of $\text{Spec}(R' \otimes_R S) \rightarrow \text{Spec}(R')$ we have to show that $(R' \otimes_R S) \otimes_{R'} \kappa(\mathfrak{p}')$ is not zero, see Lemma 10.16.9. But we have

$$(R' \otimes_R S) \otimes_{R'} \kappa(\mathfrak{p}') = S \otimes_R \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$$

which is not zero as $S \otimes_R \kappa(\mathfrak{p})$ is not zero by assumption and $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p}')$ is an extension of fields. \square

Lemma 10.29.4. *Let R be a domain. Let $\varphi : R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) *The ring map $R \rightarrow S$ is injective.*
- (2) *The image $\text{Spec}(S) \rightarrow \text{Spec}(R)$ contains a dense set of points.*
- (3) *There exists a prime ideal $\mathfrak{q} \subset S$ whose inverse image in R is (0).*

Proof. Let K be the field of fractions of the domain R . Assume that $R \rightarrow S$ is injective. Since localization is exact we see that $K \rightarrow S \otimes_R K$ is injective. Hence there is a prime mapping to (0) by Lemma 10.16.9.

Note that (0) is dense in $\text{Spec}(R)$, so that the last condition implies the second.

Suppose the second condition holds. Let $f \in R$, $f \neq 0$. As R is a domain we see that $V(f)$ is a proper closed subset of R . By assumption there exists a prime \mathfrak{q} of S such that $\varphi(f) \notin \mathfrak{q}$. Hence $\varphi(f) \neq 0$. Hence $R \rightarrow S$ is injective. \square

Lemma 10.29.5. *Let $R \subset S$ be an injective ring map. Then $\text{Spec}(S) \rightarrow \text{Spec}(R)$ hits all the minimal primes of $\text{Spec}(R)$.*

Proof. Let $\mathfrak{p} \subset R$ be a minimal prime. In this case $R_{\mathfrak{p}}$ has a unique prime ideal. Hence it suffices to show that $S_{\mathfrak{p}}$ is not zero. And this follows from the fact that localization is exact, see Proposition 10.9.12. \square

Lemma 10.29.6. *Let $R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) *The kernel of $R \rightarrow S$ consists of nilpotent elements.*
- (2) *The minimal primes of R are in the image of $\text{Spec}(S) \rightarrow \text{Spec}(R)$.*
- (3) *The image of $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is dense in $\text{Spec}(R)$.*

Proof. Let $I = \text{Ker}(R \rightarrow S)$. Note that $\sqrt{(0)} = \bigcap_{\mathfrak{q} \subset S} \mathfrak{q}$, see Lemma 10.16.2. Hence $\sqrt{I} = \bigcap_{\mathfrak{q} \subset S} R \cap \mathfrak{q}$. Thus $V(I) = V(\sqrt{I})$ is the closure of the image of $\text{Spec}(S) \rightarrow \text{Spec}(R)$. This shows that (1) is equivalent to (3). It is clear that (2) implies (3). Finally, assume (1). We may replace R by R/I and S by S/IS without affecting the topology of the spectra and the map. Hence the implication (1) \Rightarrow (2) follows from Lemma 10.29.5. \square

10.30. Noetherian rings

A ring R is *Noetherian* if any ideal of R is finitely generated. This is clearly equivalent to the ascending chain condition for ideals of R . By Lemma 10.27.9 it suffices to check that every prime ideal of R is finitely generated.

Lemma 10.30.1. *Any finitely generated ring over a Noetherian ring is Noetherian. Any localization of a Noetherian ring is Noetherian.*

Proof. The statement on localizations follows from the fact that any ideal $J \subset S^{-1}R$ is of the form $I \cdot S^{-1}R$. Any quotient R/I of a Noetherian ring R is Noetherian because any ideal $\bar{J} \subset R/I$ is of the form J/I for some ideal $I \subset J \subset R$. Thus it suffices to show that if R is Noetherian so is $R[X]$. Suppose $J_1 \subset J_2 \subset \dots$ is an ascending chain of ideals in $R[X]$. Consider the ideals $I_{i,d}$ defined as the ideal of elements of R which occur as leading coefficients of degree d polynomials in J_i . Clearly $I_{i,d} \subset I_{i',d'}$ whenever $i \leq i'$ and $d \leq d'$. By the ascending chain condition in R there are at most finitely many distinct ideals among all of the $I_{i,d}$. (Hint: Any infinite set of elements of $\mathbf{N} \times \mathbf{N}$ contains an increasing infinite sequence.) Take i_0 so large that $I_{i,d} = I_{i_0,d}$ for all $i \geq i_0$ and all d . Suppose $f \in J_i$ for some $i \geq i_0$. By induction on the degree $d = \deg(f)$ we show that $f \in J_{i_0}$. Namely, there exists a $g \in J_{i_0}$ whose degree is d and which has the same leading coefficient as f . By induction $f - g \in J_{i_0}$ and we win. \square

Lemma 10.30.2. *If R is a Noetherian ring, then so is the formal power series ring $R[[x_1, \dots, x_n]]$.*

Proof. Since $R[[x_1, \dots, x_{n+1}]] \cong R[[x_1, \dots, x_n]][[x_{n+1}]]$ it suffices to prove the statement that $R[[x]]$ is Noetherian if R is Noetherian. Let $I \subset R[[x]]$ be an ideal. We have to show that I is a finitely generated ideal. For each integer d denote $I_d = \{a \in R \mid ax^d + \text{h.o.t.} \in I\}$. Then we see that $I_0 \subset I_1 \subset \dots$ stabilizes as R is Noetherian. Choose d_0 such that $I_{d_0} = I_{d_0+1} = \dots$. For each $d \leq d_0$ choose elements $f_{d,j} \in I \cap (x^d)$, $j = 1, \dots, n_d$ such that if we write $f_{d,j} = a_{d,j}x^d + \text{h.o.t.}$ then $I_d = (a_{d,j})$. Denote $I' = (\{f_{d,j}\}_{d=0, \dots, d_0, j=1, \dots, n_d})$. Then it is clear that $I' \subset I$. Pick $f \in I$. First we may choose $c_{d,i} \in R$ such that

$$f - \sum c_{d,i} f_{d,i} \in (x^{d_0+1}) \cap I.$$

Next, we can choose $c_{i,1} \in R$, $i = 1, \dots, n_{d_0}$ such that

$$f - \sum c_{d,i} f_{d,i} - \sum c_{i,1} x f_{d_0,i} \in (x^{d_0+2}) \cap I.$$

Next, we can choose $c_{i,2} \in R$, $i = 1, \dots, n_{d_0}$ such that

$$f - \sum c_{d,i} f_{d,i} - \sum c_{i,1} x f_{d_0,i} - \sum c_{i,2} x^2 f_{d_0,i} \in (x^{d_0+3}) \cap I.$$

And so on. In the end we see that

$$f = \sum c_{d,i} f_{d,i} + \sum_i \left(\sum_e c_{i,e} x^e \right) f_{d_0,i}$$

is contained in I' as desired. \square

The following lemma, although easy, is useful because finite type \mathbf{Z} -algebras come up quite often in a technique called “absolute Noetherian reduction”.

Lemma 10.30.3. *Any finite type algebra over a field is Noetherian. Any finite type algebra over \mathbf{Z} is Noetherian.*

Proof. This is immediate from Lemma 10.30.1 and the fact that fields are Noetherian rings and that \mathbf{Z} is Noetherian ring (because it is a principal ideal domain). \square

Lemma 10.30.4. *Let R be a Noetherian ring.*

- (1) *Any finite R -module is of finite presentation.*
- (2) *Any finite type R -algebra is of finite presentation over R .*

Proof. Let M be a finite R -module. By Lemma 10.5.4 we can find a finite filtration of M whose successive quotients are of the form R/I . Since any ideal is finitely generated, each of the quotients R/I is finitely presented. Hence M is finitely presented by Lemma 10.5.3. This proves (1). To see (2) note that any ideal of $R[x_1, \dots, x_n]$ is finitely generated by Lemma 10.30.1. \square

Lemma 10.30.5. *If R is a Noetherian ring then $\text{Spec}(R)$ is a Noetherian topological space, see Topology, Definition 5.8.1.*

Proof. This is because any closed subset of $\text{Spec}(R)$ is uniquely of the form $V(I)$ with I a radical ideal, see Lemma 10.16.2. And this correspondence is inclusion reversing. Thus the result follows from the definitions. \square

Lemma 10.30.6. *If R is a Noetherian ring then $\text{Spec}(R)$ has finitely many irreducible components. In other words R has finitely many minimal primes.*

Proof. By Lemma 10.30.5 and Topology, Lemma 5.8.2 we see there are finitely many irreducible components. By Lemma 10.25.1 these correspond to minimal primes of R . \square

Lemma 10.30.7. *Let k be a field and let R be a Noetherian k -algebra. If $k \subset K$ is a finitely generated field extension the $K \otimes_k R$ is Noetherian.*

Proof. Write $K = S^{-1}B$ where B is a finite type k -algebra, and $S \subset B$ is a multiplicative subset. Then we have $K \otimes_k R = S^{-1}(B \otimes_k R)$. Hence $K \otimes_k R$ is a localization of the finite type R -algebra $B \otimes_k R$ which is Noetherian by Lemma 10.30.1. \square

Here is fun lemma that is sometimes useful.

Lemma 10.30.8. *Any surjective endomorphism of a Noetherian ring is an isomorphism.*

Proof. If $f : R \rightarrow R$ were such an endomorphism but not injective, then

$$\text{Ker}(f) \subset \text{Ker}(f \circ f) \subset \text{Ker}(f \circ f \circ f) \subset \dots$$

would be a strictly increasing chain of ideals. \square

10.31. Locally nilpotent ideals

Here is the definition.

Definition 10.31.1. Let R be a ring. Let $I \subset R$ be an ideal. We say I is *locally nilpotent* if for every $x \in I$ there exists an $n \in \mathbf{N}$ such that $x^n = 0$. We say I is *nilpotent* if there exists an $n \in \mathbf{N}$ such that $I^n = 0$.

Lemma 10.31.2. *Let $R \rightarrow R'$ be a ring map and let $I \subset R$ be a locally nilpotent ideal. Then IR' is a locally nilpotent ideal of R' .*

Proof. This follows from the fact that if $x, y \in R'$ are nilpotent, then $x + y$ is nilpotent too. Namely, if $x^n = 0$ and $y^m = 0$, then $(x + y)^{n+m-1} = 0$. \square

Lemma 10.31.3. *Let R be a ring map and let $I \subset R$ be a locally nilpotent. An element x of R is a unit if and only if the image of x in R/I is a unit.*

Proof. Assume the image of $y \in R$ in R/I is the inverse of the image of x . Then $xy = 1 + z$ for some $z \in I$. Then

$$(1 + z)(1 - z)(1 + z^2)(1 - z^4) \dots (1 + (-1)^k z^{2^{k-1}}) = 1 + (-1)^k z^{2^k}$$

which is equal to 1 for sufficiently large k . Thus x is invertible in R . \square

Lemma 10.31.4. *Let R be a Noetherian ring. Let I, J be ideals of R . Suppose $J \subset \sqrt{I}$. Then $J^n \subset I$ for some n . In particular, in a Noetherian ring the notions of “locally nilpotent ideal” and “nilpotent ideal” coincide.*

Proof. Say $J = (f_1, \dots, f_s)$. By assumption $f_i^{d_i} \in I$. Take $n = d_1 + d_2 + \dots + d_s + 1$. \square

Lemma 10.31.5. *Let R be a ring. Let $I \subset R$ be a locally nilpotent ideal. Then $R \rightarrow R/I$ induces a bijection on idempotents.*

First proof of Lemma 10.31.5. As I is locally nilpotent it is contained in every prime ideal. Hence $\text{Spec}(R/I) = V(I) = \text{Spec}(R)$. Hence the lemma follows from Lemma 10.20.3. \square

Second proof of Lemma 10.31.5. First assume I is nilpotent. Suppose $\bar{e} \in R/I$ is an idempotent. We have to lift \bar{e} to an idempotent of R . Choose a lift $e \in R$ such that $x = e^2 - e \in I^k$ for some $k \geq 1$. Let $e' = e - (2e - 1)x = 3e^2 - 2e^3$, which is another lift of \bar{e} . Then

$$(e')^2 - e' = (4e^2 - 4e - 3)(e^2 - e)^2 \in I^{2k}$$

by a simple computation. Hence e' is an idempotent in R/I^{2k} . By successively improving the approximation as above we reach a stage where $I^k = 0$, and we win.

Next, suppose I is locally nilpotent. Let $\bar{e} \in R/I$ be an idempotent. Let $f \in R$ be any element lifting \bar{e} . Denote $R' \subset R$ the \mathbf{Z} -subalgebra of R generated by f .

Denote $I' = R' \cap I$. Since R' is Noetherian, see Lemma 10.30.3 we see that I' is nilpotent, see Lemma 10.31.4. On the other hand we have $R'/I' \subset R/I$ and hence the image $\bar{f} \in R'/I'$ of f is an idempotent. Thus by the first part of the proof we see that we can find an idempotent $e \in R'$ which is a lift of \bar{f} . Then $e \in R$ is also a lift of \bar{e} in R/I . \square

Lemma 10.31.6. *Let A be a possibly noncommutative algebra. Let $e \in A$ be an element such that $x = e^2 - e$ is nilpotent. Then there exists an idempotent of the form $e' = e + x(\sum a_{i,j}e^i x^j) \in A$ with $a_{i,j} \in \mathbf{Z}$.*

Proof. Consider the ring $R_n = \mathbf{Z}[e]/((e^2 - e)^n)$. It is clear that if we can prove the result for each R_n then the lemma follows. In R_n consider the ideal $I = (e^2 - e)$ and apply Lemma 10.31.5. \square

10.32. Curiosity

Lemma 10.22.3 explains what happens if $V(I)$ is open for some ideal $I \subset R$. But what if $\text{Spec}(S^{-1}R)$ is closed in $\text{Spec}(R)$? The next two lemmas give a partial answer. For more information see Section 10.104.

Lemma 10.32.1. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $\text{Spec}(S^{-1}R) \rightarrow \text{Spec}(R)$ is closed. Then $S^{-1}R \cong R/I$ for some ideal $I \subset R$.*

Proof. Let $I = \text{Ker}(R \rightarrow S^{-1}R)$ so that $V(I)$ contains the image. Say the image is the closed subset $V(I') \subset \text{Spec}(R)$ for some ideal $I' \subset R$. So $V(I') \subset V(I)$. For $f \in I'$ we see that $f/1 \in S^{-1}R$ is contained in every prime ideal. Hence f^n maps to zero in $S^{-1}R$ for some $n \geq 1$ (Lemma 10.16.2). Hence $V(I') = V(I)$. Then this implies every $g \in S$ is invertible mod I . Hence we get ring maps $R/I \rightarrow S^{-1}R$ and $S^{-1}R \rightarrow R/I$. The first map is injective by choice of I . The second is the map $S^{-1}R \rightarrow S^{-1}(R/I) = R/I$ which has kernel $S^{-1}I$ because localization is exact. Since $S^{-1}I = 0$ we see also the second map is injective. Hence $S^{-1}R \cong R/I$. \square

Lemma 10.32.2. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $\text{Spec}(S^{-1}R) \rightarrow \text{Spec}(R)$ is closed. If R is Noetherian, or $\text{Spec}(R)$ is a Noetherian topological space, or S is finitely generated as a monoid, then $R \cong S^{-1}R \times R'$ for some ring R' .*

Proof. By Lemma 10.32.1 we have $S^{-1}R \cong R/I$ for some ideal $I \subset R$. By Lemma 10.22.3 it suffices to show that $V(I)$ is open. If R is Noetherian then $\text{Spec}(R)$ is a Noetherian topological space, see Lemma 10.30.5. If $\text{Spec}(R)$ is a Noetherian topological space, then the complement $\text{Spec}(R) \setminus V(I)$ is quasi-compact, see Topology, Lemma 5.11.13. Hence there exist finitely many $f_1, \dots, f_n \in I$ such that $V(I) = V(f_1, \dots, f_n)$. Since each f_i maps to zero in $S^{-1}R$ there exists a $g \in S$ such that $gf_i = 0$ for $i = 1, \dots, n$. Hence $D(g) = V(I)$ as desired. In case S is finitely generated as a monoid, say S is generated by g_1, \dots, g_m , then $S^{-1}R \cong R_{g_1 \dots g_m}$ and we conclude that $V(I) = D(g_1 \dots g_m)$. \square

10.33. Hilbert Nullstellensatz

Theorem 10.33.1 (Hilbert Nullstellensatz). *Let k be a field.*

- (1) *For any maximal ideal $\mathfrak{m} \subset k[x_1, \dots, x_n]$ the field extension $k \subset \kappa(\mathfrak{m})$ is finite.*

- (2) Any radical ideal $I \subset k[x_1, \dots, x_n]$ is the intersection of maximal ideals containing it.

The same is true in any finite type k -algebra.

Proof. It is enough to prove part (1) of the theorem for the case of a polynomial algebra $k[x_1, \dots, x_n]$, because any finitely generated k -algebra is a quotient of such a polynomial algebra. We prove this by induction on n . The case $n = 0$ is clear. Suppose that \mathfrak{m} is a maximal ideal in $k[x_1, \dots, x_n]$. Let $\mathfrak{p} \subset k[x_n]$ be the intersection of \mathfrak{m} with $k[x_n]$.

If $\mathfrak{p} \neq (0)$, then \mathfrak{p} is maximal and generated by an irreducible monic polynomial P (because of the Euclidean algorithm in $k[x_n]$). Then $k' = k[x_n]/\mathfrak{p}$ is a finite field extension of k and contained in $\kappa(\mathfrak{m})$. In this case we get a surjection

$$k'[x_1, \dots, x_{n-1}] \rightarrow k'[x_1, \dots, x_n] = k' \otimes_k k[x_1, \dots, x_n] \rightarrow \kappa(\mathfrak{m})$$

and hence we see that $\kappa(\mathfrak{m})$ is a finite extension of k' by induction hypothesis. Thus $\kappa(\mathfrak{m})$ is finite over k as well.

If $\mathfrak{p} = (0)$ we consider the ring extension $k[x_n] \subset k[x_1, \dots, x_n]/\mathfrak{m}$. This is a finitely generated ring extension, hence of finite presentation by Lemmas 10.30.3 and 10.30.4. Thus the image of $\text{Spec}(k[x_1, \dots, x_n]/\mathfrak{m})$ in $\text{Spec}(k[x_n])$ is constructible by Theorem 10.28.9. Since the image contains (0) we conclude that it contains a standard open $D(f)$ for some $f \in k[x_n]$ nonzero. Since clearly $D(f)$ is infinite we get a contradiction with the assumption that $k[x_1, \dots, x_n]/\mathfrak{m}$ is a field (and hence has a spectrum consisting of one point).

To prove part (2) let $I \subset R$ be radical, with R of finite type over k . Let $f \in R$, $f \notin I$. Pick a maximal ideal \mathfrak{m}' in the nonzero ring $R_f/IR_f = (R/I)_f$. Let $\mathfrak{m} \subset R$ be the inverse image of \mathfrak{m}' in R . We see that $I \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. If we show that \mathfrak{m} is a maximal ideal of R , then we are done. We clearly have

$$k \subset R/\mathfrak{m} \subset \kappa(\mathfrak{m}').$$

By part (1) the field extension $k \subset \kappa(\mathfrak{m}')$ is finite. By elementary field theory we conclude that R/\mathfrak{m} is a field. \square

Lemma 10.33.2. *Let R be a ring. Let K be a field. If $R \subset K$ and K is of finite type over R , then there exists a $f \in R$ such that R_f is a field, and $R_f \subset K$ is a finite field extension.*

Proof. By Lemma 10.29.2 there exist a nonempty open $U \subset \text{Spec}(R)$ contained in the image $\{(0)\}$ of $\text{Spec}(K) \rightarrow \text{Spec}(R)$. Choose $f \in R$, $f \neq 0$ such that $D(f) \subset U$, i.e., $D(f) = \{(0)\}$. Then R_f is a domain whose spectrum has exactly one point and R_f is a field. Then K is a finitely generated algebra over the field R_f and hence a finite field extension of R_f by the Hilbert Nullstellensatz (Theorem 10.33.1). \square

10.34. Jacobson rings

Let R be a ring. The closed points of $\text{Spec}(R)$ are the maximal ideals of R . Often rings which occur naturally in algebraic geometry have lots of maximal ideals. For example finite type algebras over a field or over \mathbf{Z} . We will show that these are examples of Jacobson rings.

Definition 10.34.1. Let R be a ring. We say that R is a *Jacobson ring* if every radical ideal I is the intersection of the maximal ideals containing it.

Lemma 10.34.2. *Any algebra of finite type over a field is Jacobson.*

Proof. This follows from Theorem 10.33.1 and Definition 10.34.1. \square

Lemma 10.34.3. *Let R be a ring. If every prime ideal of R is the intersection of the maximal ideals containing it, then R is Jacobson.*

Proof. This is immediately clear from the fact that every radical ideal $I \subset R$ is the intersection of the primes containing it. See Lemma 10.16.2. \square

Lemma 10.34.4. *A ring R is Jacobson if and only if $\text{Spec}(R)$ is Jacobson, see Topology, Definition 5.17.1.*

Proof. Suppose R is Jacobson. Let $Z \subset \text{Spec}(R)$ be a closed subset. We have to show that the set of closed points in Z is dense in Z . Let $U \subset \text{Spec}(R)$ be an open such that $U \cap Z$ is nonempty. We have to show $Z \cap U$ contains a closed point of $\text{Spec}(R)$. We may assume $U = D(f)$ as standard opens form a basis for the topology on $\text{Spec}(R)$. According to Lemma 10.16.2 we may assume that $Z = V(I)$, where I is a radical ideal. We see also that $f \notin I$. By assumption, there exists a maximal ideal $\mathfrak{m} \subset R$ such that $I \subset \mathfrak{m}$ but $f \notin \mathfrak{m}$. Hence $\mathfrak{m} \in D(f) \cap V(I) = U \cap Z$ as desired.

Conversely, suppose that $\text{Spec}(R)$ is Jacobson. Let $I \subset R$ be a radical ideal. Let $J = \bigcap_{I \subset \mathfrak{m}} \mathfrak{m}$ be the intersection of the maximal ideals containing I . Clearly J is radical, $V(J) \subset V(I)$, and $V(J)$ is the smallest closed subset of $V(I)$ containing all the closed points of $V(I)$. By assumption we see that $V(J) = V(I)$. But Lemma 10.16.2 shows there is a bijection between Zariski closed sets and radical ideals, hence $I = J$ as desired. \square

Lemma 10.34.5. *Let R be a ring. If R is not Jacobson there exist a prime $\mathfrak{p} \subset R$, an element $f \in R$ such that the following hold*

- (1) \mathfrak{p} is not a maximal ideal,
- (2) $f \notin \mathfrak{p}$,
- (3) $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$, and
- (4) $(R/\mathfrak{p})_f$ is a field.

On the other hand, if R is Jacobson, then for any pair (\mathfrak{p}, f) such that (1) and (2) hold the set $V(\mathfrak{p}) \cap D(f)$ is infinite.

Proof. Assume R is not Jacobson. By Lemma 10.34.4 this means there exists an closed subset $T \subset \text{Spec}(R)$ whose set $T_0 \subset T$ of closed points is not dense in T . Choose an $f \in R$ such that $T_0 \subset V(f)$ but $T \not\subset V(f)$. Note that $T \cap D(f)$ is homeomorphic to $\text{Spec}((R/I)_f)$ if $T = V(I)$, see Lemmas 10.16.7 and 10.16.6. As any ring has a maximal ideal (Lemma 10.16.2) we can choose a closed point t of space $T \cap D(f)$. Then t corresponds to a prime ideal $\mathfrak{p} \subset R$ which is not maximal (as $t \notin T_0$). Thus (1) holds. By construction $f \notin \mathfrak{p}$, hence (2). As t is a closed point of $T \cap D(f)$ we see that $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$, i.e., (3) holds. Hence we conclude that $(R/\mathfrak{p})_f$ is a domain whose spectrum has one point, hence (4) holds (for example combine Lemmas 10.17.2 and 10.24.1).

Conversely, suppose that R is Jacobson and (\mathfrak{p}, f) satisfy (1) and (2). If $V(\mathfrak{p}) \cap V(f) = \{\mathfrak{p}, \mathfrak{q}_1, \dots, \mathfrak{q}_t\}$ then $\mathfrak{p} \neq \mathfrak{q}_i$ implies there exists an element $g \in R$ such that $g \notin \mathfrak{p}$ but $g \in \mathfrak{q}_i$ for all i . Hence $V(\mathfrak{p}) \cap D(fg) = \{\mathfrak{p}\}$ which is impossible since each

locally closed subset of $\text{Spec}(R)$ contains at least one closed point as $\text{Spec}(R)$ is a Jacobson topological space. \square

Lemma 10.34.6. *The ring \mathbf{Z} is a Jacobson ring. More generally, let R be a ring such that*

- (1) R is a domain,
- (2) R is Noetherian,
- (3) any nonzero prime ideal is a maximal ideal, and
- (4) R has infinitely many maximal ideals.

Then R is a Jacobson ring.

Proof. Let R satisfy (1), (2), (3) and (4). The statement means that $(0) = \bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$. Since R has infinitely many maximal ideals it suffices to show that any nonzero $x \in R$ is contained in at most finitely many maximal ideals, in other words that $V(x)$ is finite. By Lemma 10.16.7 we see that $V(x)$ is homeomorphic to $\text{Spec}(R/xR)$. By assumption (3) every prime of R/xR is minimal and hence corresponds to an irreducible component of $\text{Spec}(R)$ (Lemma 10.25.1). As R/xR is Noetherian, the topological space $\text{Spec}(R/xR)$ is Noetherian (Lemma 10.30.5) and has finitely many irreducible components (Topology, Lemma 5.8.2). Thus $V(x)$ is finite as desired. \square

Example 10.34.7. Let A be an infinite set. For each $\alpha \in A$, let k_α be a field. We claim that $R = \prod_{\alpha \in A} k_\alpha$ is Jacobson. First, note that any element $f \in R$ has the form $f = ue$, with $u \in R$ a unit and $e \in R$ an idempotent (left to the reader). Hence $D(f) = D(e)$, and $R_f = R_e = R/(1 - e)$ is a quotient of R . Actually, any ring with this property is Jacobson. Namely, say $\mathfrak{p} \subset R$ is a prime ideal and $f \in R$, $f \notin \mathfrak{p}$. We have to find a maximal ideal \mathfrak{m} of R such that $\mathfrak{p} \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. Because R_f is a quotient of R we see that any maximal ideal of R_f corresponds to a maximal ideal of R not containing f . Hence the result follows by choosing a maximal ideal of R_f containing $\mathfrak{p}R_f$.

Example 10.34.8. A domain R with finitely many maximal ideals \mathfrak{m}_i , $i = 1, \dots, n$ is not a Jacobson ring, except when it is a field. Namely, in this case (0) is not the intersection of the maximal ideals $(0) \neq \mathfrak{m}_1 \cap \mathfrak{m}_2 \cap \dots \cap \mathfrak{m}_n \supset \mathfrak{m}_1 \cdot \mathfrak{m}_2 \cdot \dots \cdot \mathfrak{m}_n \neq (0)$. In particular a discrete valuation ring, or any local ring with at least two prime ideals is not a Jacobson ring.

Lemma 10.34.9. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{m} \subset R$ be a maximal ideal. Let $\mathfrak{q} \subset S$ be a prime ideal lying over \mathfrak{m} such that $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is an algebraic field extension. Then \mathfrak{q} is a maximal ideal of S .*

Proof. Consider the diagram

$$\begin{array}{ccccc} S & \longrightarrow & S/\mathfrak{q} & \longrightarrow & \kappa(\mathfrak{q}) \\ \uparrow & & \uparrow & & \\ R & \longrightarrow & R/\mathfrak{m} & & \end{array}$$

We see that $\kappa(\mathfrak{m}) \subset S/\mathfrak{q} \subset \kappa(\mathfrak{q})$. Because the field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is algebraic, any ring between $\kappa(\mathfrak{m})$ and $\kappa(\mathfrak{q})$ is a field (by elementary field theory). Thus S/\mathfrak{q} is a field, and a posteriori equal to $\kappa(\mathfrak{q})$. \square

Lemma 10.34.10. *Suppose that k is a field and suppose that V is a nonzero vector space over k . Assume the dimension of V (which is a cardinal number) is smaller than the cardinality of k . Then for any linear operator $T : V \rightarrow V$ there exists some monic polynomial $P(t) \in k[t]$ such that $P(T)$ is not invertible.*

Proof. If not then V inherits the structure of a vector space over the field $k(t)$. But the dimension of $k(t)$ over k is at least the cardinality of k for example due to the fact that the elements $\frac{1}{t-\lambda}$ are k -linearly independent. \square

Here is another version of Hilbert's Nullstellensatz.

Theorem 10.34.11. *Let k be a field. Let S be a k -algebra generated over k by the elements $\{x_i\}_{i \in I}$. Assume the cardinality of I is smaller than the cardinality of k . Then*

- (1) *for all maximal ideals $\mathfrak{m} \subset S$ the field extension $k \subset \kappa(\mathfrak{m})$ is algebraic, and*
- (2) *S is a Jacobson ring.*

Proof. If I is finite then the result follows from the Hilbert Nullstellensatz, Theorem 10.33.1. In the rest of the proof we assume I is infinite. It suffices to prove the result for $\mathfrak{m} \subset k[\{x_i\}_{i \in I}]$ maximal in the polynomial ring on variables x_i , since S is a quotient of this. As I is infinite the set of monomials $x_{i_1}^{e_1} \dots x_{i_r}^{e_r}$, $i_1, \dots, i_r \in I$ and $e_1, \dots, e_r \geq 0$ has cardinality at most equal to the cardinality of I . Because the cardinality of $I \times \dots \times I$ is the cardinality of I , and also the cardinality of $\bigcup_{n \geq 0} I^n$ has the same cardinality. (If I is finite, then this is not true and in that case this proof only works if k is uncountable.)

To arrive at a contradiction pick $T \in \kappa(\mathfrak{m})$ transcendental over k . Note that the k -linear map $T : \kappa(\mathfrak{m}) \rightarrow \kappa(\mathfrak{m})$ given by multiplication by T has the property that $P(T)$ is invertible for all monic polynomials $P(t) \in k[t]$. Also, $\kappa(\mathfrak{m})$ has dimension at most the cardinality of I over k since it is a quotient of the vector space $k[\{x_i\}_{i \in I}]$ over k (whose dimension is $\#I$ as we saw above). This is impossible by Lemma 10.34.10.

To show that S is Jacobson we argue as follows. If not then there exists a prime $\mathfrak{q} \subset S$ and an element $f \in S$, $f \notin \mathfrak{q}$ such that \mathfrak{q} is not maximal and $(S/\mathfrak{q})_f$ is a field, see Lemma 10.34.5. But note that $(S/\mathfrak{q})_f$ is generated by at most $\#I + 1$ elements. Hence the field extension $k \subset (R/\mathfrak{q})_f$ is algebraic (by the first part of the proof). This implies that $\kappa(\mathfrak{q})$ is an algebraic extension of k hence \mathfrak{q} is maximal by Lemma 10.34.9. This contradiction finishes the proof. \square

Lemma 10.34.12. *Let k be a field. Let S be a k -algebra. For any field extension $k \subset K$ whose cardinality is larger than the cardinality of S we have*

- (1) *for every maximal ideal \mathfrak{m} of S_K the field $\kappa(\mathfrak{m})$ is algebraic over K , and*
- (2) *S_K is a Jacobson ring.*

Proof. Choose $k \subset K$ such that the cardinality of K is greater than the cardinality of S . Since the elements of S generate the K -algebra S_K we see that Theorem 10.34.11 applies. \square

Example 10.34.13. The trick in the proof of Theorem 10.34.11 really does not work if k is a countable field and I is countable too. Let k be a countable field. Let x be a variable, and let $k(x)$ be the field of rational functions in x . Consider the

polynomial algebra $R = k[x, \{x_f\}_{f \in k[x] - \{0\}}]$. Let $I = (\{fx_f - 1\}_{f \in k[x] - \{0\}})$. Note that I is a proper ideal in R . Choose a maximal ideal $I \subset \mathfrak{m}$. Then $k \subset R/\mathfrak{m}$ is isomorphic to $k(x)$, and is not algebraic over k .

Lemma 10.34.14. *Let R be a Jacobson ring. Let $f \in R$. The ring R_f is Jacobson and maximal ideals of R_f correspond to maximal ideals of R not containing f .*

Proof. By Topology, Lemma 5.17.5 we see that $D(f) = \text{Spec}(R_f)$ is Jacobson and that closed points of $D(f)$ correspond to closed points in $\text{Spec}(R)$ which happen to lie in $D(f)$. Thus R_f is Jacobson by Lemma 10.34.4. \square

Example 10.34.15. Here is a simple example that shows Lemma 10.34.14 to be false if R is not Jacobson. Consider the ring $R = \mathbf{Z}_{(2)}$, i.e., the localization of \mathbf{Z} at the prime (2) . The localization of R at the element 2 is isomorphic to \mathbf{Q} , in a formula: $R_2 \cong \mathbf{Q}$. Clearly the map $R \rightarrow R_2$ maps the closed point of $\text{Spec}(\mathbf{Q})$ to the generic point of $\text{Spec}(R)$.

Example 10.34.16. Here is a simple example that shows Lemma 10.34.14 is false if R is Jacobson but we localize at infinitely many elements. Namely, let $R = \mathbf{Z}$ and consider the localization $(R \setminus \{0\})^{-1}R \cong \mathbf{Q}$ of R at the set of all nonzero elements. Clearly the map $\mathbf{Z} \rightarrow \mathbf{Q}$ maps the closed point of $\text{Spec}(\mathbf{Q})$ to the generic point of $\text{Spec}(\mathbf{Z})$.

Lemma 10.34.17. *Let R be a Jacobson ring. Let $I \subset R$ be an ideal. The ring R/I is Jacobson and maximal ideals of R/I correspond to maximal ideals of R containing I .*

Proof. The proof is the same as the proof of Lemma 10.34.14. \square

Proposition 10.34.18. *Let R be a Jacobson ring. Let $R \rightarrow S$ be a ring map of finite type. Then*

- (1) *The ring S is Jacobson.*
- (2) *The map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ transforms closed points to closed points.*
- (3) *For $\mathfrak{m}' \subset S$ maximal lying over $\mathfrak{m} \subset R$ the field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite.*

Proof. Let $A \rightarrow B \rightarrow C$ be finite type ring maps. Suppose $\text{Spec}(C) \rightarrow \text{Spec}(B)$ and $\text{Spec}(B) \rightarrow \text{Spec}(A)$ map closed points to closed points, and induce finite residue field extensions on residue fields at closed points. Then so does $\text{Spec}(C) \rightarrow \text{Spec}(A)$. Thus it is clear that if we factor $R \rightarrow S$ as $R \rightarrow S' \rightarrow S$ for some finite type R -algebra S' , then it suffices to prove the lemma for $R \rightarrow S'$ and then $S' \rightarrow S$. Writing $S = R[x_1, \dots, x_n]/I$ we see that it suffices to prove the lemma in the cases $S = R[x]$ and $S = R/I$. The case $S = R/I$ is Lemma 10.34.17.

The case $S = R[x]$. Take an irreducible closed subset $Z \subset \text{Spec}(R[x])$. In other words $Z = V(\mathfrak{q})$ for some prime $\mathfrak{q} \subset R[x]$. Set $\mathfrak{p} = \mathfrak{q} \cap R$. Let $U \subset \text{Spec}(R[x])$ be open such that $U \cap Z \neq \emptyset$. We have to find a closed point in $U \cap Z$. In fact, we will find

- (*) a closed point y of $U \cap Z$ which maps to a closed point x of $\text{Spec}(R)$ such that additionally $\kappa(x) \subset \kappa(y)$ is finite.

To do this we may assume $U = D(f)$ for some $f \in R[x]$. In this case $U \cap V(\mathfrak{q}) \neq \emptyset$ means $f \notin \mathfrak{q}$. Consider the diagram

$$\begin{array}{ccc} R[x] & \longrightarrow & R/\mathfrak{p}[x] \\ \uparrow & & \uparrow \\ R & \longrightarrow & R/\mathfrak{p} \end{array}$$

It suffices to solve the problem on the right hand side of this diagram. Thus we see we may assume R is Jacobson, a domain and $\mathfrak{p} = (0)$.

In case $\mathfrak{q} = (0)$, write $f = a_d x^d + \dots + a_0$. We see that not all a_i are zero. Take any maximal ideal \mathfrak{m} of R such that $a_i \notin \mathfrak{m}$ for some i (here we use R is Jacobson). Next, choose a maximal ideal $\overline{\mathfrak{m}}' \subset (R/\mathfrak{m})[x]$ not containing the image of f (possible because $\kappa(\mathfrak{m})[x]$ is Jacobson). Then the inverse image $\mathfrak{m}' \subset R[x]$ defines a closed point of $U \cap Z$ and maps to \mathfrak{m} . Also, by construction $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite. Thus we have shown $(*)$ in this case.

In case $\mathfrak{q} \neq (0)$, let K be the fraction field of R . Write $\mathfrak{q}K[x] = (g)$ for some irreducible $g \in K[x]$. Clearing denominators, we may assume that $g \in R[x]$, and hence in \mathfrak{q} . Write $g = b_e x^e + \dots + b_0$, $b_i \in R$ with $b_e \neq 0$. The maps $R \rightarrow R_{b_e}$ and $R[x] \rightarrow R[x]_{b_e}$ satisfies the conclusion of the lemma, by Lemma 10.34.14 and moreover induce isomorphisms on residue fields. Hence, in order to prove $(*)$, we may replace R by R_{b_e} and assume that g is monic. In this case we see that $R[x]/\mathfrak{q}$ is a quotient of the finite free R -module $R[x]/(g) = R \oplus Rx \oplus \dots \oplus Rx^{e-1}$. But on the other hand we have $R[x]/(g) \subset K[x]/(g) = K[x]/\mathfrak{q}K[x]$. Hence $\mathfrak{q} = (g)$, and $Z = V(\mathfrak{q}) = V(g)$. At this point, by Lemma 10.28.8 the image of $D(f) \cap V(g)$ in $\text{Spec}(R)$ is $D(r_1) \cup \dots \cup D(r_d)$ for some $r_i \in R$ (of course it is nonempty). Take any maximal ideal $\mathfrak{m} \subset R$ in this image (possible because R is Jacobson) and take any prime $\mathfrak{m}' \subset R[x]$ corresponding to a point of $D(f) \cap V(g)$ lying over \mathfrak{m} . Note that the residue field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite (because $g \in \mathfrak{m}'$). By Lemma 10.34.9 we see that \mathfrak{m}' is a closed point. This proves $(*)$ in this case.

At this point we are done. Namely, $(*)$ implies that $\text{Spec}(R[x])$ is Jacobson (via Lemma 10.34.4). Also, if Z is a singleton closed set, then $(*)$ implies that $Z = \{\mathfrak{m}'\}$ with \mathfrak{m}' lying over a maximal ideal $\mathfrak{m} \subset R$ such that $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite. \square

Lemma 10.34.19. *Any finite type algebra over \mathbf{Z} is Jacobson.*

Proof. Combine Lemma 10.34.6 and Proposition 10.34.18. \square

Lemma 10.34.20. *Let $R \rightarrow S$ be a finite type ring map of Jacobson rings. Denote $X = \text{Spec}(R)$ and $Y = \text{Spec}(S)$. Write $f : Y \rightarrow X$ the induced map of spectra. Let $E \subset Y = \text{Spec}(S)$ be a constructible set. Denote with a subscript $_0$ the set of closed points of a topological space.*

- (1) *We have $f(E)_0 = f(E_0) = X_0 \cap f(E)$.*
- (2) *A point $\xi \in X$ is in $f(E)$ if and only if $\overline{\{\xi\}} \cap f(E_0)$ is dense in $\overline{\{\xi\}}$.*

Proof. We have a commutative diagram of continuous maps

$$\begin{array}{ccc} E & \longrightarrow & Y \\ \downarrow & & \downarrow \\ f(E) & \longrightarrow & X \end{array}$$

Suppose $x \in f(E)$ is closed in $f(E)$. Then $f^{-1}(\{x\}) \cap E$ is nonempty and closed in E . Applying Topology, Lemma 5.17.5 to both inclusions

$$f^{-1}(\{x\}) \cap E \subset E \subset Y$$

we find there exists a point $y \in f^{-1}(\{x\}) \cap E$ which is closed in Y . In other words, there exists $y \in Y_0$ and $y \in E_0$ mapping to x . Hence $x \in f(E_0)$. This proves that $f(E)_0 \subset f(E_0)$. Proposition 10.34.18 implies that $f(E_0) \subset X_0 \cap f(E)$. The inclusion $X_0 \cap f(E) \subset f(E)_0$ is trivial. This proves the first assertion.

Suppose that $\xi \in f(E)$. According to Lemma 10.29.2 the set $f(E) \cap \overline{\{\xi\}}$ contains a dense open subset of $\overline{\{\xi\}}$. Since X is Jacobson we conclude that $f(E) \cap \overline{\{\xi\}}$ contains a dense set of closed points, see Topology, Lemma 5.17.5. We conclude by part (1) of the lemma.

On the other hand, suppose that $\overline{\{\xi\}} \cap f(E_0)$ is dense in $\overline{\{\xi\}}$. By Lemma 10.28.3 there exists a ring map $S \rightarrow S'$ of finite presentation such that E is the image of $Y' := \text{Spec}(S') \rightarrow Y$. Then E_0 is the image of Y'_0 by the first part of the lemma applied to the ring map $S \rightarrow S'$. Thus we may assume that $E = Y$ by replacing S by S' . Suppose ξ corresponds to $\mathfrak{p} \subset R$. Consider the diagram

$$\begin{array}{ccc} S & \longrightarrow & S/\mathfrak{p}S \\ \uparrow & & \uparrow \\ R & \longrightarrow & R/\mathfrak{p} \end{array}$$

This diagram and the density of $f(Y_0) \cap V(\mathfrak{p})$ in $V(\mathfrak{p})$ shows that the morphism $R/\mathfrak{p} \rightarrow S/\mathfrak{p}S$ satisfies condition (2) of Lemma 10.29.4. Hence we conclude there exists a prime $\bar{\mathfrak{q}} \subset S/\mathfrak{p}S$ mapping to (0) . In other words the inverse image \mathfrak{q} of $\bar{\mathfrak{q}}$ in S maps to \mathfrak{p} as desired. \square

The conclusion of the lemma above is that we can read off the image of f from the set of closed points of the image. This is a little nicer in case the map is of finite presentation because then we know that images of a constructible is constructible. Before we state it we introduce some notation. Denote $\text{Constr}(X)$ the set of constructible. Let $R \rightarrow S$ be a ring map. Denote $X = \text{Spec}(R)$ and $Y = \text{Spec}(S)$. Write $f : Y \rightarrow X$ the induced map of spectra. Denote with a subscript $_0$ the set of closed points of a topological space.

Lemma 10.34.21. *With notation as above. Assume that R is a Noetherian Jacobson ring. Further assume $R \rightarrow S$ is of finite type. There is a commutative diagram*

$$\begin{array}{ccc} \text{Constr}(Y) & \xrightarrow{E \mapsto E_0} & \text{Constr}(Y_0) \\ \downarrow E \mapsto f(E) & & \downarrow E \mapsto f(E) \\ \text{Constr}(X) & \xrightarrow{E \mapsto E_0} & \text{Constr}(X_0) \end{array}$$

where the horizontal arrows are the bijections from Topology, Lemma 5.17.7.

Proof. Since $R \rightarrow S$ is of finite type, it is of finite presentation, see Lemma 10.30.4. Thus the image of a constructible set in X is constructible in Y by Chevalley's theorem (Theorem 10.28.9). Combined with Lemma 10.34.20 the lemma follows. \square

To illustrate the use of Jacobson rings, we give the following two examples.

Example 10.34.22. Let k be a field. The space $\text{Spec}(k[x, y]/(xy))$ has two irreducible components: namely the x -axis and the y -axis. As a generalization, let

$$R = k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]/\mathfrak{a},$$

where \mathfrak{a} is the ideal in $k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]$ generated by the entries of the 2×2 product matrix

$$\begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix} \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix}.$$

In this example we will describe $\text{Spec}(R)$.

To prove the statement about $\text{Spec}(k[x, y]/(xy))$ we argue as follows. If $\mathfrak{p} \subset k[x, y]$ is any ideal containing xy , then either x or y would be contained in \mathfrak{p} . Hence the minimal such prime ideals are just (x) and (y) . In case k is algebraically closed, the max-Spec of these components can then be visualized as the point sets of y - and x -axis.

For the generalization, note that we may identify the closed points of the spectrum of $k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]$ with the space of matrices

$$\left\{ (X, Y) \in \text{Mat}(2, k) \times \text{Mat}(2, k) \mid X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix}, Y = \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix} \right\}$$

at least if k is algebraically closed. Now define a group action of $\text{GL}(2, k) \times \text{GL}(2, k) \times \text{GL}(2, k)$ on the space of matrices $\{(X, Y)\}$ by

$$(g_1, g_2, g_3) \times (X, Y) \mapsto ((g_1 X g_2^{-1}, g_2 Y g_3^{-1})).$$

Here, also observe that the algebraic set

$$\text{GL}(2, k) \times \text{GL}(2, k) \times \text{GL}(2, k) \subset \text{Mat}(2, k) \times \text{Mat}(2, k) \times \text{Mat}(2, k)$$

is irreducible since it is the max spectrum of the domain

$$k[x_{11}, x_{12}, \dots, z_{21}, z_{22}, (x_{11}x_{22} - x_{12}x_{21})^{-1}, (y_{11}y_{22} - y_{12}y_{21})^{-1}, (z_{11}z_{22} - z_{12}z_{21})^{-1}].$$

Since the image of irreducible an algebraic set is still irreducible, it suffices to classify the orbits of the set $\{(X, Y) \in \text{Mat}(2, k) \times \text{Mat}(2, k) \mid XY = 0\}$ and take their closures. From standard linear algebra, we are reduced to the following three cases:

- (1) $\exists (g_1, g_2)$ such that $g_1 X g_2^{-1} = I_{2 \times 2}$. Then Y is necessarily 0, which as an algebraic set is invariant under the group action. It follows that this orbit is contained in the irreducible algebraic set defined by the prime ideal $(y_{11}, y_{12}, y_{21}, y_{22})$. Taking the closure, we see that $(y_{11}, y_{12}, y_{21}, y_{22})$ is actually a component.

(2) $\exists(g_1, g_2)$ such that

$$g_1 X g_2^{-1} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}.$$

This case occurs if and only if X is a rank 1 matrix, and furthermore, Y is killed by such an X if and only if

$$\begin{aligned} x_{11}y_{11} + x_{12}y_{21} &= 0; & x_{11}y_{12} + x_{12}y_{22} &= 0; \\ x_{21}y_{11} + x_{22}y_{21} &= 0; & x_{21}y_{12} + x_{22}y_{22} &= 0. \end{aligned}$$

Fix a rank 1 X , such non zero Y 's satisfying the above equations form an irreducible algebraic set for the following reason ($Y = 0$ is contained the previous case): $0 = g_1 X g_2^{-1} g_2 Y$ implies that

$$g_2 Y = \begin{pmatrix} 0 & 0 \\ y'_{21} & y'_{22} \end{pmatrix}.$$

With a further $\text{GL}(2, k)$ -action on the right by g_3 , $g_2 Y$ can be brought into

$$g_2 Y g_3^{-1} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix},$$

and thus such Y 's form an irreducible algebraic set isomorphic to the image of $\text{GL}(2, k)$ under this action. Finally, notice that the "rank 1" condition for X 's forms an open dense subset of the irreducible algebraic set $\det X = x_{11}x_{22} - x_{12}x_{21} = 0$. It now follows that all the five equations define an irreducible component $(x_{11}y_{11} + x_{12}y_{21}, x_{11}y_{12} + x_{12}y_{22}, x_{21}y_{11} + x_{22}y_{21}, x_{21}y_{12} + x_{22}y_{22}, x_{11}x_{22} - x_{12}x_{21})$ in the open subset of the space of pairs of nonzero matrices. It can be shown that the pair of equations $\det X = 0, \det Y = 0$ cuts $\text{Spec}(R)$ in an irreducible component with the above locus an open dense subset.

(3) $\exists(g_1, g_2)$ such that $g_1 X g_2^{-1} = 0$, or equivalently, $X = 0$. Then Y can be arbitrary and this component is thus defined by $(x_{11}, x_{12}, x_{21}, x_{22})$.

Example 10.34.23. For another example, consider $R = k[\{t_{ij}\}_{i,j=1}^n]/\mathfrak{a}$, where \mathfrak{a} is the ideal generated by the entries of the product matrix $T^2 - T$, $T = (t_{ij})$. From linear algebra, we know that under the $\text{GL}(n, k)$ -action defined by $g, T \mapsto gTg^{-1}$, T is classified by the its rank and each T is conjugate to some $\text{diag}(1, \dots, 1, 0, \dots, 0)$, which has r 1's and $n - r$ 0's. Thus each orbit of such a $\text{diag}(1, \dots, 1, 0, \dots, 0)$ under the group action forms an irreducible component and every idempotent matrix is contained in one such orbit. Next we will show that any two different orbits are necessarily disjoint. For this purpose we only need to cook up polynomial functions that take different values on different orbits. In characteristic 0 cases, such a function can be taken to be $f(t_{ij}) = \text{trace}(T) = \sum_{i=1}^n t_{ii}$. In positive characteristic cases, things are slightly more tricky since we might have $\text{trace}(T) = 0$ even if $T \neq 0$. For instance, $\text{char} = 3$

$$\text{trace} \begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix} = 3 = 0$$

Anyway, these components can be separated using other functions. For instance, in the characteristic 3 case, $\text{tr}(\wedge^3 T)$ takes value 1 on the components corresponding to $\text{diag}(1, 1, 1)$ and 0 on other components.

10.35. Finite and integral ring extensions

Trivial lemmas concerning finite and integral ring maps. We recall the definition.

Definition 10.35.1. Let $\varphi : R \rightarrow S$ be a ring map.

- (1) An element $s \in S$ is *integral over R* if there exists a monic polynomial $P(x) \in R[x]$ such that $P^\varphi(s) = 0$, where $P^\varphi(x) \in S[x]$ is the image of P under $\varphi : R[x] \rightarrow S[x]$.
- (2) The ring map φ is *integral* if every $s \in S$ is integral over R .

Lemma 10.35.2. Let $\varphi : R \rightarrow S$ be a ring map. Let $y \in S$. If there exists a finite R -submodule M of S such that $1 \in M$ and $yM \subset M$, then y is integral over R .

Proof. Let $x_1 = 1 \in M$ and $x_i \in M$, $i = 2, \dots, n$ be a finite set of elements generating M as an R -module. Write $yx_i = \sum \varphi(a_{ij})x_j$ for some $a_{ij} \in R$. Let $P(T) \in R[T]$ be the characteristic polynomial of the $n \times n$ matrix $A = (a_{ij})$. By Lemma 10.15.1 we see $P(A) = 0$. By construction the map $\pi : R^n \rightarrow M$, $(a_1, \dots, a_n) \mapsto \sum \varphi(a_i)x_i$ commutes with $A : R^n \rightarrow R^n$ and multiplication by y . In a formula $\pi(Av) = y\pi(v)$. Thus $P(y) = P(y) \cdot 1 = P(y) \cdot x_1 = P(y) \cdot \pi((1, 0, \dots, 0)) = \pi(P(A)(1, 0, \dots, 0)) = 0$. \square

Lemma 10.35.3. A finite ring extension is integral.

Proof. Let $R \rightarrow S$ be finite. Let $y \in S$. Apply Lemma 10.35.2 to $M = S$ to see that y is integral over R . \square

Lemma 10.35.4. Let $\varphi : R \rightarrow S$ be a ring map. Let s_1, \dots, s_n be a finite set of elements of S . In this case s_i is integral over R for all $i = 1, \dots, n$ if and only if there exists an R -subalgebra $S' \subset S$ finite over R containing all of the s_i .

Proof. If each s_i is integral, then the subalgebra generated by $\varphi(R)$ and the s_i is finite over R . Namely, if s_i satisfies a monic equation of degree d_i over R , then this subalgebra is generated as an R -module by the elements $s_1^{e_1} \dots s_n^{e_n}$ with $0 \leq e_i \leq d_i - 1$. Conversely, suppose given a finite R -subalgebra S' containing all the s_i . Then all of the s_i are integral by Lemma 10.35.3. \square

Lemma 10.35.5. Let $R \rightarrow S$ be a ring map. The following are equivalent

- (1) $R \rightarrow S$ is finite,
- (2) $R \rightarrow S$ is integral and of finite type, and
- (3) there exist $x_1, \dots, x_n \in S$ which generate S as an algebra over R such that each x_i is integral over R .

Proof. Clear from Lemma 10.35.4. \square

Lemma 10.35.6. Suppose that $R \rightarrow S$ and $S \rightarrow T$ are integral ring maps. Then $R \rightarrow T$ is integral.

Proof. Let $t \in T$. Let $P(x) \in S[x]$ be a monic polynomial such that $P(t) = 0$. Apply Lemma 10.35.4 to the finite set of coefficients of P . Hence t is integral over some subalgebra $S' \subset S$ finite over R . Apply Lemma 10.35.4 again to find a subalgebra $T' \subset T$ finite over S' and containing t . Lemma 10.7.3 applied to $R \rightarrow S' \rightarrow T'$ shows that T' is finite over R . The integrality of t over R now follows from Lemma 10.35.3. \square

Lemma 10.35.7. *Let $R \rightarrow S$ be a ring homomorphism. The set*

$$S' = \{s \in S \mid s \text{ is integral over } R\}$$

is an R -subalgebra of S .

Proof. This is clear from Lemmas 10.35.4 and 10.35.3. \square

Definition 10.35.8. Let $R \rightarrow S$ be a ring map. The ring $S' \subset S$ of elements integral over R , see Lemma 10.35.7, is called the *integral closure* of R in S . If $R \subset S$ we say that R is *integrally closed* in S if $R = S'$.

In particular, we see that $R \rightarrow S$ is integral if and only if the integral closure of R in S is all of S .

Lemma 10.35.9. *Integral closure commutes with localization: If $A \rightarrow B$ is a ring map, and $S \subset A$ is a multiplicative subset, then the integral closure of $S^{-1}A$ in $S^{-1}B$ is $S^{-1}B'$, where $B' \subset B$ is the integral closure of A in B .*

Proof. Since localization is exact we see that $S^{-1}B' \subset S^{-1}B$. Suppose $x \in B'$ and $f \in S$. Then $x^d + \sum_{i=1, \dots, d} a_i x^{d-i} = 0$ in B for some $a_i \in A$. Hence also

$$(x/f)^d + \sum_{i=1, \dots, d} a_i/f^i (x/f)^{d-i} = 0$$

in $S^{-1}B$. In this way we see that $S^{-1}B'$ is contained in the integral closure of $S^{-1}A$ in $S^{-1}B$. Conversely, suppose that $x/f \in S^{-1}B$ is integral over $S^{-1}A$. Then we have

$$(x/f)^d + \sum_{i=1, \dots, d} (a_i/f_i)(x/f)^{d-i} = 0$$

in $S^{-1}B$ for some $a_i \in A$ and $f_i \in S$. This means that

$$(f' f_1 \dots f_d x)^d + \sum_{i=1, \dots, d} f^i (f')^i f_1^i \dots f_i^{i-1} \dots f_d^i a_i (f' f_1 \dots f_d x)^{d-i} = 0$$

for a suitable $f' \in S$. Hence $f' f_1 \dots f_d x \in B'$ and thus $x/f \in S^{-1}B'$ as desired. \square

Lemma 10.35.10. *Let $\varphi : R \rightarrow S$ be a ring map. Let $x \in S$. The following are equivalent:*

- (1) x is integral over R , and
- (2) for every prime ideal $\mathfrak{p} \subset R$ the element $x \in S_{\mathfrak{p}}$ is integral over $R_{\mathfrak{p}}$.

Proof. It is clear that (1) implies (2). Assume (2). Consider the R -algebra $S' \subset S$ generated by $\varphi(R)$ and x . Let \mathfrak{p} be a prime ideal of R . Then we know that $x^d + \sum_{i=1, \dots, d} \varphi(a_i) x^{d-i} = 0$ in $S_{\mathfrak{p}}$ for some $a_i \in R_{\mathfrak{p}}$. Hence we see, by looking at which denominators occur, that for some $f \in R$, $f \notin \mathfrak{p}$ we have $a_i \in R_f$ and $x^d + \sum_{i=1, \dots, d} \varphi(a_i) x^{d-i} = 0$ in S_f . This implies that S'_f is finite over R_f . Since \mathfrak{p} was arbitrary and $\text{Spec}(R)$ is quasi-compact (Lemma 10.16.10) we can find finitely many elements $f_1, \dots, f_n \in R$ which generate the unit ideal of R such that S'_{f_i} is finite over R . Hence we conclude from Lemma 10.23.2 that S' is finite over R . Hence x is integral over R by Lemma 10.35.4. \square

Lemma 10.35.11. *Let $R \rightarrow S$ and $R \rightarrow R'$ be ring maps. Set $S' = R' \otimes_R S$.*

- (1) *If $R \rightarrow S$ is integral so is $R' \rightarrow S'$.*
- (2) *If $R \rightarrow S$ is finite so is $R' \rightarrow S'$.*

Proof. We prove (1). Let $s_i \in S$ be generators for S over R . Each of these satisfies a monic polynomial equation P_i over R . Hence the elements $1 \otimes s_i \in S'$ generate S' over R' and satisfy the corresponding polynomial P'_i over R' . Since these elements generate S' over R' we see that S' is integral over R' . Proof of (2) omitted. \square

Lemma 10.35.12. *Let $R \rightarrow S$ be a ring map. Let $f_1, \dots, f_n \in R$ generate the unit ideal.*

- (1) *If each $R_{f_i} \rightarrow S_{f_i}$ is integral, so is $R \rightarrow S$.*
- (2) *If each $R_{f_i} \rightarrow S_{f_i}$ is finite, so is $R \rightarrow S$.*

Proof. Proof of (1). Let $s \in S$. Consider the ideal $I \subset R[x]$ of polynomials P such that $P(s) = 0$. Let $J \subset R$ denote the ideal (!) of leading coefficients of elements of I . By assumption and clearing denominators we see that $f_i^{n_i} \in J$ for all i and certain $n_i \geq 0$. Hence J contains 1 and we see s is integral over R . Proof of (2) omitted. \square

Lemma 10.35.13. *Let $A \rightarrow B \rightarrow C$ be ring maps.*

- (1) *If $A \rightarrow C$ is integral so is $B \rightarrow C$.*
- (2) *If $A \rightarrow C$ is finite so is $B \rightarrow C$.*

Proof. Omitted. \square

Lemma 10.35.14. *Let $A \rightarrow B \rightarrow C$ be ring maps. Let B' be the integral closure of A in B , let C' be the integral closure of B' in C . Then C' is the integral closure of A in C .*

Proof. Omitted. \square

Lemma 10.35.15. *Suppose that $R \rightarrow S$ is an integral ring extension with $R \subset S$. Then $\varphi : \text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective.*

Proof. Let $\mathfrak{p} \subset R$ be a prime ideal. We have to show $\mathfrak{p}S_{\mathfrak{p}} \neq S_{\mathfrak{p}}$, see Lemma 10.16.9. The localization $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{p}}$ is injective (as localization is exact) and integral by Lemma 10.35.9 or 10.35.11. Hence we may replace R, S by $R_{\mathfrak{p}}, S_{\mathfrak{p}}$ and we may assume R is local with maximal ideal \mathfrak{m} and it suffices to show that $\mathfrak{m}S \neq S$. Suppose $1 = \sum f_i s_i$ with $f_i \in \mathfrak{m}$ and $s_i \in S$ in order to get a contradiction. Let $R \subset S' \subset S$ be such that $R \rightarrow S'$ is finite and $s_i \in S'$, see Lemma 10.35.4. The equation $1 = \sum f_i s_i$ implies that the finite R -module S' satisfies $S' = \mathfrak{m}S'$. Hence by Nakayama's Lemma 10.19.1 we see $S' = 0$. Contradiction. \square

Lemma 10.35.16. *Let R be a ring. Let K be a field. If $R \subset K$ and K is integral over R , then R is a field and K is an algebraic extension. If $R \subset K$ and K is finite over R , then R is a field and K is a finite algebraic extension.*

Proof. Assume that $R \subset K$ is integral. By Lemma 10.35.15 we see that $\text{Spec}(R)$ has 1 point. Since clearly R is a domain we see that $R = R_{(0)}$ is a field. The other assertions are immediate from this. \square

Lemma 10.35.17. *Let k be a field. Let S be a k -algebra over k .*

- (1) *If S is a domain and finite dimensional over k , then S is a field.*
- (2) *If S is integral over k and a domain, then S is a field.*
- (3) *If S is integral over k then every prime of S is a maximal ideal (see Lemma 10.25.5 for more consequences).*

Proof. The statement on primes follows from the statement “integral + domain \Rightarrow field”. Let S integral over k and assume S is a domain. Take $s \in S$. By Lemma 10.35.4 we may find a finite dimensional k -subalgebra $k \subset S' \subset S$ containing s . Hence S is a field if we can prove the first statement. Assume S finite dimensional over k and a domain. Pick $s \in S$. Since S is a domain the multiplication map $s : S \rightarrow S$ is surjective by dimension reasons. Hence there exists an element $s_1 \in S$ such that $ss_1 = 1$. So S is a field. \square

Lemma 10.35.18. *Suppose $R \rightarrow S$ is integral. Let $\mathfrak{q}, \mathfrak{q}' \in \text{Spec}(S)$ be distinct primes having the same image in $\text{Spec}(R)$. Then neither $\mathfrak{q} \subset \mathfrak{q}'$ nor $\mathfrak{q}' \subset \mathfrak{q}$.*

Proof. Let $\mathfrak{p} \subset R$ be the image. By Remark 10.16.8 the primes $\mathfrak{q}, \mathfrak{q}'$ correspond to ideals in $S \otimes_R \kappa(\mathfrak{p})$. Thus the lemma follows from Lemma 10.35.17. \square

Lemma 10.35.19. *Suppose $R \rightarrow S$ is finite. Then the fibres of $\text{Spec}(S) \rightarrow \text{Spec}(R)$ are finite.*

Proof. By the discussion in Remark 10.16.8 the fibres are the spectra of the rings $S \otimes_R \kappa(\mathfrak{p})$. As $R \rightarrow S$ is finite, these fibre rings are finite over $\kappa(\mathfrak{p})$ hence Noetherian by Lemma 10.30.1. By Lemma 10.35.18 every prime of $S \otimes_R \kappa(\mathfrak{p})$ is a minimal prime. Hence by Lemma 10.30.6 there are at most finitely many. \square

Lemma 10.35.20. *Let $R \rightarrow S$ be a ring map such that S is integral over R . Let $\mathfrak{p} \subset \mathfrak{p}' \subset R$ be primes. Let \mathfrak{q} be a prime of S mapping to \mathfrak{p} . Then there exists a prime \mathfrak{q}' with $\mathfrak{q} \subset \mathfrak{q}'$ mapping to \mathfrak{p}' .*

Proof. We may replace R by R/\mathfrak{p} and S by S/\mathfrak{q} . This reduces us to the situation of having an integral extension of domains $R \subset S$ and a prime $\mathfrak{p}' \subset R$. By Lemma 10.35.15 we win. \square

The property expressed in the lemma above is called the “going up property” for the ring map $R \rightarrow S$, see Definition 10.40.1.

Lemma 10.35.21. *Let R be a ring. Let $x, y \in R$ be nonzerodivisors. Let $R[x/y] \subset R_{xy}$ be the R -subalgebra generated by x/y , and similarly for the subalgebras $R[y/x]$ and $R[x/y, y/x]$. If R is integrally closed in R_x or R_y , then the sequence*

$$0 \rightarrow R \xrightarrow{(-1,1)} R[x/y] \oplus R[y/x] \xrightarrow{(1,1)} R[x/y, y/x] \rightarrow 0$$

is a short exact sequence of R -modules.

Proof. Since $x/y \cdot y/x = 1$ it is clear that the map $R[x/y] \oplus R[y/x] \rightarrow R[x/y, y/x]$ is surjective. Let $\alpha \in R[x/y] \cap R[y/x]$. To show exactness in the middle we have to prove that $\alpha \in R$. By assumption we may write

$$\alpha = a_0 + a_1x/y + \dots + a_n(x/y)^n = b_0 + b_1y/x + \dots + b_m(y/x)^m$$

for some $n, m \geq 0$ and $a_i, b_j \in R$. Pick some $N > \max(n, m)$. Consider the finite R -submodule M of R_{xy} generated by the elements

$$(x/y)^N, (x/y)^{N-1}, \dots, x/y, 1, y/x, \dots, (y/x)^{N-1}, (y/x)^N$$

We claim that $\alpha M \subset M$. Namely, it is clear that $(x/y)^i(b_0 + b_1y/x + \dots + b_m(y/x)^m) \in M$ for $0 \leq i \leq N$ and that $(y/x)^i(a_0 + a_1x/y + \dots + a_n(x/y)^n) \in M$ for $0 \leq i \leq N$. Hence α is integral over R by Lemma 10.35.2. Note that $\alpha \in R_x$, so if R is integrally closed in R_x then $\alpha \in R$ as desired. \square

10.36. Normal rings

We first introduce the notion of a normal domain, and then we introduce the (very general) notion of a normal ring.

Definition 10.36.1. A domain R is called *normal* if it is integrally closed in its field of fractions.

Lemma 10.36.2. *Let $R \rightarrow S$ be a ring map. If S is a normal domain, then the integral closure of R in S is a normal domain.*

Proof. Omitted. □

The following notion is occasionally useful when studying normality.

Definition 10.36.3. Let R be a domain.

- (1) An element g of the fraction field of R is called *almost integral over R* if there exists an element $r \in R$, $r \neq 0$ such that $rg^n \in R$ for all $n \geq 0$.
- (2) The domain R is called *completely normal* if every almost integral element of the fraction field of R is contained in R .

The following lemma shows that a Noetherian domain is normal if and only if it is completely normal.

Lemma 10.36.4. *Let R be a domain with fraction field K . If $u, v \in K$ are almost integral over R , then so are $u+v$ and uv . Any element $g \in K$ which is integral over R is almost integral over R . If R is Noetherian then the converse holds as well.*

Proof. If $ru^n \in R$ for all $n \geq 0$ and $v^n r' \in R$ for all $n \geq 0$, then $(uv)^n r r'$ and $(u+v)^n r r'$ are in R for all $n \geq 0$. Hence the first assertion. Suppose $g \in K$ is integral over R . In this case there exists an $d > 0$ such that the ring $R[g]$ is generated by $1, g, \dots, g^d$ as an R -module. Let $r \in R$ be a common denominator of the elements $1, g, \dots, g^d \in K$. It follows that $rR[g] \subset R$, and hence g is almost integral over R .

Suppose R is Noetherian and $g \in K$ is almost integral over R . Let $r \in R$, $r \neq 0$ be as in the definition. Then $R[g] \subset \frac{1}{r}R$ as an R -module. Since R is Noetherian this implies that $R[g]$ is finite over R . Hence g is integral over R , see Lemma 10.35.3. □

Lemma 10.36.5. *Any localization of a normal domain is normal.*

Proof. Let R be a normal domain, and let $S \subset R$ be a multiplicative subset. Suppose g is an element of the fraction field of R which is integral over $S^{-1}R$. Let $P = x^d + \sum_{j < d} a_j x^j$ be a polynomial with $a_i \in S^{-1}R$ such that $P(g) = 0$. Choose $s \in S$ such that $sa_i \in R$ for all i . Then sg satisfies the monic polynomial $x^d + \sum_{j < d} s^{d-j} a_j x^j$ which has coefficients $s^{d-j} a_j$ in R . Hence $sg \in R$ because R is normal. Hence $g \in S^{-1}R$. □

Lemma 10.36.6. *A principal ideal domain is normal.*

Proof. Let R be a principal ideal domain. Let $g = a/b$ be an element of the fraction field of R integral over R . Because R is a principal ideal domain we may divide out a common factor of a and b and assume $(a, b) = R$. In this case, any equation $(a/b)^n + r_{n-1}(a/b)^{n-1} + \dots + r_0 = 0$ with $r_i \in R$ would imply $a^n \in (b)$. This contradicts $(a, b) = R$ unless b is a unit in R . □

Lemma 10.36.7. *Let R be a domain with fraction field K . Suppose $f = \sum \alpha_i x^i$ is an element of $K[x]$.*

- (1) *If f is integral over $R[x]$ then all α_i are integral over R , and*
- (2) *If f is almost integral over $R[x]$ then all α_i are almost integral over R .*

Proof. We first prove the second statement. Write $f = \alpha_0 + \alpha_1 x + \dots + \alpha_r x^r$ with $\alpha_r \neq 0$. By assumption there exists $h = b_0 + b_1 x + \dots + b_s x^s \in R[x]$, $b_s \neq 0$ such that $f^n h \in R[x]$ for all $n \geq 0$. This implies that $b_s \alpha_r^n \in R$ for all $n \geq 0$. Hence α_r is almost integral over R . Since the set of almost integral elements form a subring (Lemma 10.36.4) we deduce that $f - \alpha_r x^r = \alpha_0 + \alpha_1 x + \dots + \alpha_{r-1} x^{r-1}$ is almost integral over $R[x]$. By induction on r we win.

In order to prove the first statement we will use absolute Noetherian reduction. Namely, write $\alpha_i = a_i/b_i$ and let $P(t) = t^d + \sum_{j < d} f_j t^j$ be a polynomial with coefficients $f_j \in R[x]$ such that $P(f) = 0$. Let $f_j = \sum f_{ji} x^i$. Consider the subring $R_0 \subset R$ generated by the finite list of elements a_i, b_i, f_{ji} of R . It is a domain; let K_0 be its field of fractions. Since R_0 is a finite type \mathbf{Z} -algebra it is Noetherian, see Lemma 10.30.3. It is still the case that $f \in K_0[x]$ is integral over $R_0[x]$, because all the identities in R among the elements a_i, b_i, f_{ji} also hold in R_0 . By Lemma 10.36.4 the element f is almost integral over $R_0[x]$. By the second statement of the lemma, the elements α_i are almost integral over R_0 . And since R_0 is Noetherian, they are integral over R_0 , see Lemma 10.36.4. Of course, then they are integral over R . \square

Lemma 10.36.8. *Let R be a normal domain. Then $R[x]$ is a normal domain.*

Proof. The result is true if R is a field K because $K[x]$ is a euclidean domain and hence a principal ideal domain and hence normal by Lemma 10.36.6. Let g be an element of the fraction field of $R[x]$ which is integral over $R[x]$. Because g is integral over $K[x]$ where K is the fraction field of R we may write $g = \alpha_d x^d + \alpha_{d-1} x^{d-1} + \dots + \alpha_0$ with $\alpha_i \in K$. By Lemma 10.36.7 the elements α_i are integral over R and hence are in R . \square

Lemma 10.36.9. *Let R be a domain. The following are equivalent:*

- (1) *The domain R is a normal domain,*
- (2) *for every prime $\mathfrak{p} \subset R$ the local ring $R_{\mathfrak{p}}$ is a normal domain, and*
- (3) *for every maximal ideal \mathfrak{m} the ring $R_{\mathfrak{m}}$ is a normal domain.*

Proof. This follows easily from the fact that for any domain R we have

$$R = \bigcap_{\mathfrak{m}} R_{\mathfrak{m}}$$

inside the fraction field of R . Namely, if g is an element of the right hand side then the ideal $I = \{x \in R \mid xg \in R\}$ is not contained in any maximal ideal \mathfrak{m} , whence $I = R$. \square

Lemma 10.36.9 shows that the following definition is compatible with Definition 10.36.1. (It is the definition from EGA – see [DG67, IV, 5.13.5 and 0, 4.1.4].)

Definition 10.36.10. A ring R is called *normal* if for every prime $\mathfrak{p} \subset R$ the localization $R_{\mathfrak{p}}$ is a normal domain (see Definition 10.36.1).

Note that a normal ring is a reduced ring, as R is a subring of the product of its localizations at all primes (see for example Lemma 10.23.1).

Lemma 10.36.11. *A normal ring is integrally closed in its total ring of fractions.*

Proof. Let R be a normal ring. Let $x \in Q(R)$ be an element of the total ring of fractions of R integral over R . Set $I = \{f \in R, fx \in R\}$. Let $\mathfrak{p} \subset R$ be a prime. As $R \subset R_{\mathfrak{p}}$ is flat we see that $R_{\mathfrak{p}} \subset Q(R) \otimes R_{\mathfrak{p}}$. As $R_{\mathfrak{p}}$ is a normal domain we see that $x \otimes 1$ is an element of $R_{\mathfrak{p}}$. Hence we can find $a, f \in R, f \notin \mathfrak{p}$ such that $x \otimes 1 = a \otimes 1/f$. This means that $fx - a$ maps to zero in $Q(R) \otimes_R R_{\mathfrak{p}} = Q(R)_{\mathfrak{p}}$, which in turn means that there exists an $f' \in R, f' \notin \mathfrak{p}$ such that $f'fx = f'a$ in R . In other words, $ff' \in I$. Thus I is an ideal which isn't contained in any of the prime ideals of R , i.e., $I = R$ and $x \in R$. \square

Lemma 10.36.12. *A localization of a normal ring is a normal ring.*

Proof. Omitted. \square

Lemma 10.36.13. *Let R be a normal ring. Then $R[x]$ is a normal ring.*

Proof. Let \mathfrak{q} be a prime of $R[x]$. Set $\mathfrak{p} = R \cap \mathfrak{q}$. Then we see that $R_{\mathfrak{p}}[x]$ is a normal domain by Lemma 10.36.8. Hence $(R[x])_{\mathfrak{q}}$ is a normal domain by Lemma 10.36.5. \square

Lemma 10.36.14. *Let R be a ring. Assume R is reduced and has finitely many minimal primes. Then the following are equivalent:*

- (1) R is a normal ring,
- (2) R is integrally closed in its total ring of fractions, and
- (3) R is a finite product of normal domains.

Proof. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_t$ be the minimal primes of R . By Lemmas 10.24.2 and 10.24.4 we have $Q(R) = R_{\mathfrak{q}_1} \times \dots \times R_{\mathfrak{q}_t}$, and by Lemma 10.24.1 each factor is a field. Denote $e_i = (0, \dots, 0, 1, 0, \dots, 0)$ the i th idempotent of $Q(R)$.

If R is integrally closed in $Q(R)$, then it contains in particular the idempotents e_i , and we see that R is a product of t domains (see Sections 10.21 and 10.22). Hence it is clear that R is a finite product of normal domains.

If R is normal, then it is clear that $e_i \in R_{\mathfrak{p}}$ for every prime ideal \mathfrak{p} of R . Hence we see that R contains the elements e_i (see proof of Lemma 10.36.9). We conclude that R is a product of t domains as before. Each of these t domains is normal by Lemma 10.36.9 and the assumption that R is a normal ring. Hence it follows that R is a finite product of normal domains.

We omit the verification that (3) implies (1) and (2). \square

Lemma 10.36.15. *Let $(R_i, \varphi_{ii'})$ be a directed system (Categories, Definition 10.8.2) of rings. If each R_i is a normal ring so is $R = \text{colim}_i R_i$.*

Proof. Let $\mathfrak{p} \subset R$ be a prime ideal. Set $\mathfrak{p}_i = R_i \cap \mathfrak{p}$ (usual abuse of notation). Then we see that $R_{\mathfrak{p}} = \text{colim}_i (R_i)_{\mathfrak{p}_i}$. Since each $(R_i)_{\mathfrak{p}_i}$ is a normal domain we reduce to proving the statement of the lemma for normal domains. If $a, b \in R$ and a/b satisfies a monic polynomial $P(T) \in R[T]$, then we can find a (sufficiently large) $i \in I$ such that a, b, P all come from objects a_i, b_i, P_i over R_i . Since R_i is normal we see $a_i/b_i \in R_i$ and hence also $a/b \in R$. \square

10.37. Going down for integral over normal

We first play around a little bit with the notion of elements integral over an ideal, and then we prove the theorem referred to in the section title.

Definition 10.37.1. Let $\varphi : R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. We say an element $g \in S$ is *integral over I* if there exists a monic polynomial $P = x^d + \sum_{j < d} a_j x^j$ with coefficients $a_j \in I^{d-j}$ such that $P^\varphi(g) = 0$ in S .

This is mostly used when $\varphi = \text{id}_R : R \rightarrow R$. In this case the set I' of elements integral over I is called the *integral closure of I* . We will see that I' is an ideal of R (and of course $I \subset I'$).

Lemma 10.37.2. Let $\varphi : R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $A = \sum I^n t^n \subset R[t]$ be the subring of the polynomial ring generated by $R \oplus It \subset R[t]$. An element $s \in S$ is integral over I if and only if the element $st \in S[t]$ is integral over A .

Proof. Suppose st is integral over A . Let $P = x^d + \sum_{j < d} a_j x^j$ be a monic polynomial with coefficients in A such that $P^\varphi(st) = 0$. Let $a'_j \in A$ be the degree $d-j$ part of a_j , in other words $a'_j = a''_j t^{d-j}$ with $a''_j \in I^{d-j}$. For degree reasons we still have $(st)^d + \sum_{j < d} \varphi(a''_j) t^{d-j} (st)^j = 0$. Hence we see that s is integral over I .

Suppose that s is integral over I . Say $P = x^d + \sum_{j < d} a_j x^j$ with $a_j \in I^{d-j}$. Then we immediately find a polynomial $Q = x^d + \sum_{j < d} (a_j t^{d-j}) x^j$ with coefficients in A which proves that st is integral over A . \square

Lemma 10.37.3. Let $\varphi : R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. The set of elements of S which are integral over I form a R -submodule of S . Furthermore, if $s \in S$ is integral over R , and s' is integral over I , then ss' is integral over I .

Proof. Closure under addition is clear from the characterization of Lemma 10.37.2. Any element $s \in S$ which is integral over R corresponds to the degree 0 element s of $S[x]$ which is integral over A (because $R \subset A$). Hence we see that multiplication by s on $S[x]$ preserves the property of being integral over A , by Lemma 10.35.7. \square

Lemma 10.37.4. Suppose $\varphi : R \rightarrow S$ is integral. Suppose $I \subset R$ is an ideal. Then every element of IS is integral over I .

Proof. Immediate from Lemma 10.37.3. \square

Lemma 10.37.5. Let R be a domain with field of fractions K . Let $n, m \in \mathbf{N}$ and $a_0, \dots, a_{n-1}, b_0, \dots, b_{m-1} \in R$. If the polynomial $x^n + a_{n-1}x^{n-1} + \dots + a_0$ divides the polynomial $x^m + b_{m-1}x^{m-1} + \dots + b_0$ in $K[x]$ then

- (1) a_0, \dots, a_{n-1} are integral over the subring of R generated by b_0, \dots, b_{m-1} , and
- (2) each a_i lies in $\sqrt{(b_0, \dots, b_m)}$.

Proof. Let $K \supset R$ be the fraction field of R . Let $L \supset K$ be a field extension such that we can write $x^m + b_{m-1}x^{m-1} + \dots + b_0 = \prod_{i=1}^m (x - \beta_i)$ with $\beta_i \in L$. Each β_i is integral over the subring generated by b_0, \dots, b_{m-1} . Since each a_i is a homogeneous polynomial in β_1, \dots, β_m we deduce the same for the a_i .

Choose $c_0, \dots, c_{m-n-1} \in K$ such that

$$(x^n + a_{n-1}x^{n-1} + \dots + a_0)(x^{m-n} + c_{m-n-1}x^{m-n-1} + \dots + c_0) = x^m + b_{m-1}x^{m-1} + \dots + b_0$$

By the first part we see that the elements c_i are integral over R . Let R' be the sub R -algebra of K generated by c_0, \dots, c_{m-n-1} . By Lemmas 10.35.15 and 10.29.3 we see that $R \cap \sqrt{(b_0, \dots, b_m)R'} = \sqrt{(b_0, \dots, b_m)}$. Thus we may replace R by R' and assume $c_i \in R$. Dividing out the radical $\sqrt{(b_0, \dots, b_m)}$ we get a reduced ring \overline{R} . We have to show that the images $\overline{a_i} \in \overline{R}$ are zero. And in $\overline{R}[x]$ we have the relation

$$(x^n + \overline{a_{n-1}}x^{n-1} + \dots + \overline{a_0})(x^{m-n} + \overline{c_{m-n-1}}x^{m-n-1} + \dots + \overline{c_0}) = x^m + \overline{b_{m-1}}x^{m-1} + \dots + \overline{b_0}$$

It is easy to see that this implies $\overline{a_i} = 0$ for all i . For example one can see this by localizing at all the minimal primes, see Lemma 10.24.2. \square

Lemma 10.37.6. *Let $R \subset S$ be an inclusion of domains. Assume R is normal. Let $g \in S$ be integral over R . Then the minimal polynomial of g has coefficients in R .*

Proof. Let $P = x^m + b_{m-1}x^{m-1} + \dots + b_0$ be a polynomial with coefficients in R such that $P(g) = 0$. Let $Q = x^n + a_{n-1}x^{n-1} + \dots + a_0$ be the minimal polynomial for g over the fraction field K of R . Then Q divides P in $K[x]$. By Lemma 10.37.5 we see the a_i are integral over R . Since R is normal this means they are in R . \square

Proposition 10.37.7. *Let $R \subset S$ be an inclusion of domains. Assume R is normal and S integral over R . Let $\mathfrak{p} \subset \mathfrak{p}' \subset R$ be primes. Let \mathfrak{q}' be a prime of S with $\mathfrak{p}' = R \cap \mathfrak{q}'$. Then there exists a prime \mathfrak{q} with $\mathfrak{q} \subset \mathfrak{q}'$ such that $\mathfrak{p} = R \cap \mathfrak{q}$. In other words: the going down property holds for $R \rightarrow S$, see Definition 10.40.1.*

Proof. Let \mathfrak{p} , \mathfrak{p}' and \mathfrak{q}' be as in the statement. We have to show there is a prime \mathfrak{q} , $\mathfrak{q} \subset \mathfrak{q}'$ such that $R \cap \mathfrak{q} = \mathfrak{p}$. This is the same as finding a prime of $S_{\mathfrak{q}'}$ mapping to \mathfrak{p} . According to Lemma 10.16.9 we have to show that $\mathfrak{p}S_{\mathfrak{q}'} \cap R = \mathfrak{p}$. Pick $z \in \mathfrak{p}S_{\mathfrak{q}'} \cap R$. We may write $z = y/g$ with $y \in \mathfrak{p}S$ and $g \in S$, $g \notin \mathfrak{q}'$. Written differently we have $zg = y$.

By Lemma 10.37.4 there exists a monic polynomial $P = x^m + b_{m-1}x^{m-1} + \dots + b_0$ with $b_i \in \mathfrak{p}$ such that $P(y) = 0$.

By Lemma 10.37.6 the minimal polynomial of g over K has coefficients in R . Write it as $Q = x^n + a_{n-1}x^{n-1} + \dots + a_0$. Note that not all a_i , $i = n-1, \dots, 0$ are in \mathfrak{p} since that would imply $g^n = \sum_{j < n} a_j g^j \in \mathfrak{p}S \subset \mathfrak{p}'S \subset \mathfrak{q}'$ which is a contradiction.

Since $y = zg$ we see immediately from the above that $Q' = x^n + za_{n-1}x^{n-1} + \dots + z^n a_0$ is the minimal polynomial for y . Hence Q' divides P and by Lemma 10.37.5 we see that $z^j a_{n-j} \in \sqrt{(b_0, \dots, b_{m-1})} \subset \mathfrak{p}$, $j = 1, \dots, n$. Because not all a_i , $i = n-1, \dots, 0$ are in \mathfrak{p} we conclude $z \in \mathfrak{p}$ as desired. \square

10.38. Flat modules and flat ring maps

One often used result is that if $M = \text{colim}_{i \in \mathcal{I}} M_i$ is a colimit of R -modules and if N is an R -module then

$$M \otimes N = \text{colim}_{i \in \mathcal{I}} M_i \otimes_R N,$$

see Lemma 10.11.9. This property is usually expressed by saying that \otimes *commutes with colimits*. Another often used result is that if $0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3 \rightarrow 0$ is an exact sequence and if M is any R -module, then

$$M \otimes_R N_1 \rightarrow M \otimes_R N_2 \rightarrow M \otimes_R N_3 \rightarrow 0$$

is still exact, see Lemma 10.11.10. Both of these properties tell us that the functor $N \mapsto M \otimes_R N$ is *right exact*. See Categories, Section 4.23 and Homology, Section 12.7. An R -module M is flat if $N \mapsto N \otimes_R M$ is also left exact, i.e., if it is exact. Here is the precise definition.

Definition 10.38.1. Let R be a ring.

- (1) An R -module M is called *flat* if whenever $N_1 \rightarrow N_2 \rightarrow N_3$ is an exact sequence of R -modules the sequence $M \otimes_R N_1 \rightarrow M \otimes_R N_2 \rightarrow M \otimes_R N_3$ is exact as well.
- (2) An R -module M is called *faithfully flat* if the complex of R -modules $N_1 \rightarrow N_2 \rightarrow N_3$ is exact if and only if the sequence $M \otimes_R N_1 \rightarrow M \otimes_R N_2 \rightarrow M \otimes_R N_3$ is exact.
- (3) A ring map $R \rightarrow S$ is called *flat* if S is flat as an R -module.
- (4) A ring map $R \rightarrow S$ is called *faithfully flat* if S is faithfully flat as an R -module.

Lemma 10.38.2. Let R be a ring. Let $\{M_i, \varphi_{ii'}\}$ be a directed system of flat R -modules. Then $\operatorname{colim}_i M_i$ is a flat R -module.

Proof. This follows as \otimes commutes with colimits and because directed colimits are exact, see Lemma 10.8.9. \square

Lemma 10.38.3. A composition of (faithfully) flat ring maps is (faithfully) flat. If $R \rightarrow R'$ is flat, and M' is a flat R' -module, then M' is a flat R -module.

Proof. Omitted. \square

Lemma 10.38.4. Let M be an R -module. The following are equivalent:

- (1) M is flat over R .
- (2) for every injection of R -modules $N \subset N'$ the map $N \otimes_R M \rightarrow N' \otimes_R M$ is injective.
- (3) for every ideal $I \subset R$ the map $I \otimes_R M \rightarrow R \otimes_R M = M$ is injective.
- (4) for every finitely generated ideal $I \subset R$ the map $I \otimes_R M \rightarrow R \otimes_R M = M$ is injective.

Proof. The implications (1) implies (2) implies (3) implies (4) are all trivial. Thus we prove (4) implies (1). Suppose that $N_1 \rightarrow N_2 \rightarrow N_3$ is exact. Let $K = \operatorname{Ker}(N_2 \rightarrow N_3)$ and $Q = \operatorname{Im}(N_2 \rightarrow N_3)$. Then we get maps

$$N_1 \otimes_R M \rightarrow K \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow Q \otimes_R M \rightarrow N_3 \otimes_R M$$

Observe that the first and third arrows are surjective. Thus if we show that the second and fourth arrows are injective, then we are done. Hence it suffices to show that $- \otimes_R M$ transforms injective R -module maps into injective R -module maps.

Assume $K \rightarrow M$ is an injective R -module map and let $x \in \operatorname{Ker}(K \otimes_R M \rightarrow N \otimes_R M)$. We have to show that x is zero. It is clear that the module $N = \bigcup N_i$ is the union of its finitely generated R -submodules N_i . Set $K_i = K \cap N_i$. For some i our x comes from an element $x_i \in K_i \otimes_R M$. After increasing i the element x_i

maps to zero in $M_i \otimes_R M$ (because tensor product commutes with colimits). Thus we may assume N is a finite R -module.

Assume N is a finite R -module. Write $N = R^{\oplus n}/L$ and $K = L'/L$. It suffices to prove that $L \otimes_R M \rightarrow M^{\oplus n}$ and $L' \otimes_R M \rightarrow M^{\oplus n}$ are injective. Namely, if so, then we see that $K \otimes_R M = L' \otimes_R M/L \otimes_R M \rightarrow M^{\oplus n}/L \otimes_R M$ is injective too.

Thus it suffices to show that $L \otimes_R M \rightarrow M^{\oplus n}$ is injective when $L \subset R^{\oplus n}$ is an R -submodule. We do this by induction on n . The base case $n = 1$ we handle below. For the induction step assume $n > 1$ and set $L' = L \cap R \oplus 0^{\oplus n-1}$. Then $L'' = L/L'$ is a submodule of $R^{\oplus n-1}$. We obtain a diagram

$$\begin{array}{ccccccc}
 L' \otimes_R M & \longrightarrow & L \otimes_R M & \longrightarrow & L'' \otimes_R M & \longrightarrow & 0 \\
 \downarrow & & \downarrow & & \downarrow & & \\
 0 \longrightarrow & M & \longrightarrow & M^{\oplus n} & \longrightarrow & M^{\oplus n-1} & \longrightarrow 0
 \end{array}$$

By induction hypothesis and the base case the left and right vertical arrows are injective. The rows are exact. It follows that the middle vertical arrow is injective too.

The base case of the induction above is when $L \subset R$ is an ideal. In other words, we have to show that $I \otimes_R M \rightarrow M$ is injective for any ideal I of R . We know this is true when I is finitely generated. However, $I = \bigcup I_\alpha$ is the union of the finitely generated ideals I_α contained in it. In other words, $I = \text{colim } I_\alpha$. Since \otimes commutes with colimits we see that $I \otimes_R M = \text{colim } I_\alpha \otimes_R M$ and since all the morphisms $I_\alpha \otimes_R M \rightarrow M$ are injective by assumption, the same is true for $I \otimes_R M \rightarrow M$. \square

Lemma 10.38.5. *Let $\{R_i, \varphi_{ii'}\}$ be a system of rings of the directed partially ordered set I . Let $R = \text{colim}_i R_i$. Let M be an R -module such that M is flat as an R_i -module for all i . Then M is flat as an R -module.*

Proof. Let $\mathfrak{a} \subset R$ be a finitely generated ideal. By Lemma 10.38.4 it suffices to show that $\mathfrak{a} \otimes_R M \rightarrow M$ is injective. We can find an $i \in I$ and a finitely generated ideal $\mathfrak{a}' \subset R_i$ such that $\mathfrak{a} = \mathfrak{a}'R$. Then $\mathfrak{a} = \text{colim}_{i' \geq i} \mathfrak{a}'R_{i'}$. Hence the map $\mathfrak{a} \otimes_R M \rightarrow M$ is the colimit of the maps

$$\mathfrak{a}'R_{i'} \otimes_{R_{i'}} M \longrightarrow M$$

which are all injective by assumption. Since \otimes commutes with colimits and since colimits over I are exact by Lemma 10.8.9 we win. \square

Lemma 10.38.6. *Suppose that M is flat over R , and that $R \rightarrow R'$ is a ring map. Then $M \otimes_R R'$ is flat over R' .*

Proof. For any R' -module N we have a canonical isomorphism $N \otimes_{R'} (R' \otimes_R M) = N \otimes_R M$. Hence the exactness of $- \otimes_{R'} (R' \otimes_R M)$ follows from the exactness of $- \otimes_R M$. \square

Lemma 10.38.7. *Let $R \rightarrow R'$ be a faithfully flat ring map. Let M be a module over R , and set $M' = R' \otimes_R M$. Then M is flat over R if and only if M' is flat over R' .*

Proof. By Lemma 10.38.6 we see that if M is flat then M' is flat. For the converse, suppose that M' is flat. Let $N_1 \rightarrow N_2 \rightarrow N_3$ be an exact sequence of R -modules. We want to show that $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$ is exact. We know that $N_1 \otimes_R R' \rightarrow N_2 \otimes_R R' \rightarrow N_3 \otimes_R R'$ is exact, because $R \rightarrow R'$ is flat. Flatness of M' implies that $N_1 \otimes_R R' \otimes_{R'} M' \rightarrow N_2 \otimes_R R' \otimes_{R'} M' \rightarrow N_3 \otimes_R R' \otimes_{R'} M'$ is exact. We may write this as $N_1 \otimes_R M \otimes_R R' \rightarrow N_2 \otimes_R M \otimes_R R' \rightarrow N_3 \otimes_R M \otimes_R R'$. Finally, faithful flatness implies that $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$ is exact. \square

Lemma 10.38.8. *Let R be a ring. Let $S \rightarrow S'$ be a faithfully flat map of R -algebras. Let M be a module over S , and set $M' = S' \otimes_S M$. Then M is flat over R if and only if M' is flat over R .*

Proof. Let $N \rightarrow N'$ be an injection of R -modules. By the faithful flatness of $S \rightarrow S'$ we have

$$\text{Ker}(N \otimes_R M \rightarrow N' \otimes_R M) \otimes_S S' = \text{Ker}(N \otimes_R M' \rightarrow N' \otimes_R M')$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Lemma 10.38.4. \square

Lemma 10.38.9. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. If M is flat as an R -module and faithfully flat as an S -module, then $R \rightarrow S$ is flat.*

Proof. Let $N_1 \rightarrow N_2 \rightarrow N_3$ be an exact sequence of R -modules. By assumption $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$ is exact. We may write this as

$$N_1 \otimes_R S \otimes_S M \rightarrow N_2 \otimes_R S \otimes_S M \rightarrow N_3 \otimes_R S \otimes_S M.$$

By faithful flatness of M over S we conclude that $N_1 \otimes_R S \rightarrow N_2 \otimes_R S \rightarrow N_3 \otimes_R S$ is exact. Hence $R \rightarrow S$ is flat. \square

Let R be a ring. Let M be an R -module. Let $\sum f_i x_i = 0$ be a relation in M . We say the relation $\sum f_i x_i$ is *trivial* if there exist an integer $m \geq 0$, elements $y_j \in M$, $j = 1, \dots, m$, and elements $a_{ij} \in R$, $i = 1, \dots, n$, $j = 1, \dots, m$ such that

$$x_i = \sum_j a_{ij} y_j, \forall i, \quad \text{and} \quad 0 = \sum_i f_i a_{ij}, \forall j.$$

Lemma 10.38.10 (Equational criterion of flatness). *A module M over R is flat if and only if every relation in M is trivial.*

Proof. Assume M is flat and let $\sum f_i x_i = 0$ be a relation. Let $I = (f_1, \dots, f_n)$, and let $K = \text{Ker}(R^n \rightarrow I)$. So we have the short exact sequence $0 \rightarrow K \rightarrow R^n \rightarrow I \rightarrow 0$. Then $\sum f_i \otimes x_i$ is an element of $I \otimes_R M$ which maps to zero in $R \otimes_R M = M$. By flatness $\sum f_i \otimes x_i$ is zero in $I \otimes_R M$. Thus there exists an element of $K \otimes_R M$ mapping to $\sum e_i \otimes x_i \in R^n \otimes_R M$. Write this element as $\sum k_j \otimes y_j$ and then write the image of k_j in R^n as $\sum a_{ij} e_i$ to get the result.

Assume every relation is trivial, let I be a finitely generated ideal, and let $x = \sum f_i \otimes x_i$ be an element of $I \otimes_R M$ mapping to zero in $R \otimes_R M = M$. This just means exactly that $\sum f_i x_i$ is a relation in M . And the fact that it is trivial implies easily that x is zero, because

$$x = \sum f_i \otimes x_i = \sum f_i \otimes \left(\sum a_{ij} y_j \right) = \sum \left(\sum f_i a_{ij} \right) \otimes y_j = 0$$

\square

Lemma 10.38.11. *Suppose that R is a ring, $0 \rightarrow M'' \rightarrow M' \rightarrow M \rightarrow 0$ a short exact sequence, and N an R -module. If M is flat then $N \otimes_R M'' \rightarrow N \otimes_R M'$ is injective, i.e., the sequence*

$$0 \rightarrow N \otimes_R M'' \rightarrow N \otimes_R M' \rightarrow N \otimes_R M \rightarrow 0$$

is a short exact sequence.

Proof. Let $R^{(I)} \rightarrow N$ be a surjection from a free module onto N with kernel K . The result follows from the snake lemma applied to the following diagram

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M'' \otimes_R N & \rightarrow & M' \otimes_R N & \rightarrow & M \otimes_R N \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 0 & \rightarrow & (M'')^{(I)} & \rightarrow & (M')^{(I)} & \rightarrow & M^{(I)} \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M'' \otimes_R K & \rightarrow & M' \otimes_R K & \rightarrow & M \otimes_R K \rightarrow 0 \\
 & & & & & & \uparrow \\
 & & & & & & 0
 \end{array}$$

with exact rows and columns. The middle row is exact because tensoring with the free module $R^{(I)}$ is exact. □

Lemma 10.38.12. *Suppose that $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ is a short exact sequence of R -modules. If M' and M'' are flat so is M . If M and M'' are flat so is M' .*

Proof. We will use the criterion that a module N is flat if for every ideal $I \subset R$ the map $N \otimes_R I \rightarrow N$ is injective, see Lemma 10.38.4. Consider an ideal $I \subset R$. Consider the diagram

$$\begin{array}{ccccccc}
 0 & \rightarrow & M' & \rightarrow & M & \rightarrow & M'' \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M' \otimes_R I & \rightarrow & M \otimes_R I & \rightarrow & M'' \otimes_R I \rightarrow 0
 \end{array}$$

with exact rows. This immediately proves the first assertion. The second follows because if M'' is flat then the lower left horizontal arrow is injective by Lemma 10.38.11. □

Lemma 10.38.13. *Let R be a ring. Let M be an R -module. The following are equivalent*

- (1) M is faithfully flat, and
- (2) M is flat and for all R -module homomorphisms $\alpha : N \rightarrow N'$ we have $\alpha = 0$ if and only if $\alpha \otimes id_M = 0$.

Proof. If M is faithfully flat, then $0 \rightarrow \text{Ker}(\alpha) \rightarrow N \rightarrow 0$ is exact if and only if the same holds after tensoring with M . This proves (1) implies (2). For the other, assume (2). Let $N_1 \rightarrow N_2 \rightarrow N_3$ be a complex, and assume the complex $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$ is exact. Take $x \in \text{Ker}(N_2 \rightarrow N_3)$, and consider the map $\alpha : R \rightarrow N_2/\text{Im}(N_1)$, $r \mapsto rx + \text{Im}(N_1)$. By the exactness of the complex $-\otimes_R M$ we see that $\alpha \otimes id_M$ is zero. By assumption we get that α is zero. Hence x is in the image of $N_1 \rightarrow N_2$. □

Lemma 10.38.14. *Let M be a flat R -module. The following are equivalent:*

- (1) M is faithfully flat,
- (2) for all $\mathfrak{p} \in \text{Spec}(R)$ the tensor product $M \otimes_R \kappa(\mathfrak{p})$ is nonzero, and
- (3) for all maximal ideals \mathfrak{m} of R the tensor product $M \otimes_R \kappa(\mathfrak{m}) = M/\mathfrak{m}M$ is nonzero.

Proof. Assume M faithfully flat. Since $R \rightarrow \kappa(\mathfrak{p})$ is not zero we deduce that $M \rightarrow M \otimes_R \kappa(\mathfrak{p})$ is not zero, see Lemma 10.38.13.

Conversely assume that M is flat and that $M/\mathfrak{m}M$ is never zero. Suppose that $N_1 \rightarrow N_2 \rightarrow N_3$ is a complex and suppose that $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$ is exact. Let H be the cohomology of the complex, so $H = \text{Ker}(N_2 \rightarrow N_3)/\text{Im}(N_1 \rightarrow N_2)$. By flatness we see that $H \otimes_R M = 0$. Take $x \in H$ and let $I = \{f \in R \mid fx = 0\}$ be its annihilator. Since $R/I \subset H$ we get $M/IM \subset H \otimes_R M = 0$ by flatness of M . If $I \neq R$ we may choose a maximal ideal $I \subset \mathfrak{m} \subset R$. This immediately gives a contradiction. \square

Lemma 10.38.15. *Let $R \rightarrow S$ be a flat ring map. The following are equivalent:*

- (1) $R \rightarrow S$ is faithfully flat,
- (2) the induced map on Spec is surjective, and
- (3) any closed point $x \in \text{Spec}(R)$ is in the image of the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$.

Proof. This follows quickly from Lemma 10.38.14, because we saw in Remark 10.16.8 that \mathfrak{p} is in the image if and only if the ring $S \otimes_R \kappa(\mathfrak{p})$ is nonzero. \square

Lemma 10.38.16. *A flat local ring homomorphism of local rings is faithfully flat.*

Proof. Immediate from Lemma 10.38.15. \square

Lemma 10.38.17. *Let $R \rightarrow S$ be flat. Let $\mathfrak{p} \subset \mathfrak{p}'$ be primes of R . Let $\mathfrak{q}' \subset S$ be a prime of S mapping to \mathfrak{p}' . Then there exists a prime $\mathfrak{q} \subset \mathfrak{q}'$ mapping to \mathfrak{p} .*

Proof. Namely, consider the flat local ring map $R_{\mathfrak{p}'} \rightarrow S_{\mathfrak{q}'}$. By Lemma 10.38.16 this is faithfully flat. By Lemma 10.38.15 there is a prime mapping to $\mathfrak{p}R_{\mathfrak{p}'}$. The inverse image of this prime in S does the job. \square

The property of $R \rightarrow S$ described in the lemma is called the “going down property”. See Definition 10.40.1.

Lemma 10.38.18. *If $R \rightarrow S$ is a faithfully flat ring map then for every R -module M the map $M \rightarrow S \otimes_R M$, $x \mapsto 1 \otimes x$ is injective.*

Proof. This is true because the base change $S \otimes_R M \rightarrow S \otimes_R S \otimes_R M$ by the faithfully flat ring map $R \rightarrow S$ is injective: It has a section, namely $s \otimes s' \otimes m \mapsto ss' \otimes m$. \square

We finish with some remarks on flatness and localization.

Lemma 10.38.19. *Let R be a ring. Let $S \subset R$ be a multiplicative subset.*

- (1) The localization $S^{-1}R$ is a flat R -algebra.
- (2) If M is a $S^{-1}R$ -module, then M is a flat R -module if and only if M is a flat $S^{-1}R$ -module.
- (3) Suppose M is an R -module. Then M is a flat R -module if and only if $M_{\mathfrak{p}}$ is a flat $R_{\mathfrak{p}}$ -module for all primes \mathfrak{p} of R .

- (4) Suppose M is an R -module. Then M is a flat R -module if and only if $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{m}}$ -module for all maximal ideals \mathfrak{m} of R .
- (5) Suppose $R \rightarrow A$ is a ring map, M is an A -module, and $g_1, \dots, g_m \in A$ are elements generating the unit ideal of A . Then M is flat over R if and only if each localization M_{g_i} is flat over R .
- (6) Suppose $R \rightarrow A$ is a ring map, and M is an A -module. Then M is a flat R -module if and only if the localization $M_{\mathfrak{q}}$ is a flat $R_{\mathfrak{p}}$ -module (with \mathfrak{p} the prime of R lying under \mathfrak{q}) for all primes \mathfrak{q} of A .
- (7) Suppose $R \rightarrow A$ is a ring map, and M is an A -module. Then M is a flat R -module if and only if the localization $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{p}}$ -module (with $\mathfrak{p} = R \cap \mathfrak{m}$) for all maximal ideals \mathfrak{m} of A .

Proof. Let us prove the last statement of the lemma. In the proof we will use repeatedly that localization is exact and commutes with tensor product, see Sections 10.9 and 10.11.

Suppose $R \rightarrow A$ is a ring map, and M is an A -module. Assume that $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{p}}$ -module for all maximal ideals \mathfrak{m} of A (with $\mathfrak{p} = R \cap \mathfrak{m}$). Let $I \subset R$ be an ideal. We have to show the map $I \otimes_R M \rightarrow M$ is injective. We can think of this as a map of A -modules. By assumption the localization $(I \otimes_R M)_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}$ is injective because $(I \otimes_R M)_{\mathfrak{m}} = I_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{m}}$. Hence the kernel of $I \otimes_R M \rightarrow M$ is zero by Lemma 10.23.1. Hence M is flat over R .

Conversely, assume M is flat over R . Pick a prime \mathfrak{q} of A lying over the prime \mathfrak{p} of R . Suppose that $I \subset R_{\mathfrak{p}}$ is an ideal. We have to show that $I \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$ is injective. We can write $I = J_{\mathfrak{p}}$ for some ideal $J \subset R$. Then the map $I \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$ is just the localization (at \mathfrak{q}) of the map $J \otimes_R M \rightarrow M$ which is injective. Since localization is exact we see that $M_{\mathfrak{q}}$ is a flat $R_{\mathfrak{p}}$ -module.

This proves (7) and (6). The other statements follow in a straightforward way from the last statement (proofs omitted). \square

Lemma 10.38.20. Let R be a ring. Let $\{S_i, \varphi_{ii'}\}$ be a directed system of faithfully flat R -algebras. Then $S = \operatorname{colim}_i S_i$ is a faithfully flat R -algebra.

Proof. By Lemma 10.38.2 we see that S is flat. Let $\mathfrak{m} \subset R$ be a maximal ideal. By Lemma 10.38.15 none of the rings $S_i/\mathfrak{m}S_i$ is zero. Hence $S/\mathfrak{m}S = \operatorname{colim} S_i/\mathfrak{m}S_i$ is nonzero either as 1 is not equal to zero. Thus the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ contains \mathfrak{m} and we see that $R \rightarrow S$ is faithfully flat by Lemma 10.38.15. \square

10.39. Supports and annihilators

Some very basic definitions and lemmas.

Definition 10.39.1. Let R be a ring and let M be an R -module. The *support* of M is the set

$$\operatorname{Supp}(M) = \{\mathfrak{p} \in \operatorname{Spec}(R) \mid M_{\mathfrak{p}} \neq 0\}$$

Lemma 10.39.2. Let R be a ring. Let M be an R -module. Then

$$M = (0) \Leftrightarrow \operatorname{Supp}(M) = \emptyset.$$

Proof. Actually, Lemma 10.23.1 even shows that $\operatorname{Supp}(M)$ always contains a maximal ideal if M is not zero. \square

Definition 10.39.3. Let R be a ring. Let M be an R -module.

(1) Given an element $m \in M$ the *annihilator of m* is the ideal

$$\text{Ann}_R(m) = \text{Ann}(m) = \{f \in R \mid fm = 0\}.$$

(2) The *annihilator of M* is the ideal

$$\text{Ann}_R(M) = \text{Ann}(M) = \{f \in R \mid fm = 0 \forall m \in M\}.$$

Lemma 10.39.4. *Let $R \rightarrow S$ be a flat ring map. Let M be an R -module and $m \in M$. Then $\text{Ann}_R(m)S = \text{Ann}_S(m \otimes 1)$. If M is a finite R -module, then $\text{Ann}_R(M)S = \text{Ann}_S(M \otimes_R S)$.*

Proof. Set $I = \text{Ann}_R(m)$. By definition there is an exact sequence $0 \rightarrow I \rightarrow R \rightarrow M$ where the map $R \rightarrow M$ sends f to fm . Using flatness we obtain an exact sequence $0 \rightarrow I \otimes_R S \rightarrow S \rightarrow M \otimes_R S$ which proves the first assertion. If m_1, \dots, m_n is a set of generators of M then $\text{Ann}_R(M) = \bigcap \text{Ann}_R(m_i)$. Similarly $\text{Ann}_S(M \otimes_R S) = \bigcap \text{Ann}_S(m_i \otimes 1)$. Set $I_i = \text{Ann}_R(m_i)$. Then it suffices to show that $\bigcap_{i=1, \dots, n} (I_i S) = (\bigcap_{i=1, \dots, n} I_i)S$. This follows by tensoring the injective map $R/(\bigcap_{i=1, \dots, n} I_i) \rightarrow \bigoplus_{i=1, \dots, n} R/I_i$ with S . \square

Lemma 10.39.5. *Let R be a ring and let M be an R -module. If M is finite, then $\text{Supp}(M)$ is closed. More precisely, if $I = \text{Ann}(M)$ is the annihilator of M , then $V(I) = \text{Supp}(M)$.*

Proof. We will show that $V(I) = \text{Supp}(M)$.

Suppose $\mathfrak{p} \in \text{Supp}(M)$. Then $M_{\mathfrak{p}} \neq 0$. Hence by Nakayama's Lemma 10.19.1 we have $M \otimes_R \kappa(\mathfrak{p}) \neq 0$. Hence $I \subset \mathfrak{p}$.

Conversely, suppose that $\mathfrak{p} \notin \text{Supp}(M)$. Then $M_{\mathfrak{p}} = 0$. Let $x_1, \dots, x_r \in M$ be generators. By Lemma 10.9.9 there exists an $f \in R$, $f \notin \mathfrak{p}$ such that $x_i/1 = 0$ in M_f . Hence $f^{n_i} x_i = 0$ for some $n_i \geq 1$. Hence $f^n M = 0$ for $n = \max\{n_i\}$ as desired. \square

Lemma 10.39.6. *Let R be a ring, let M be an R -module, and let $x \in M$. Then $\mathfrak{p} \in V(\text{Ann}(m))$ if and only if x does not map to zero in $M_{\mathfrak{p}}$.*

Proof. We may replace M by $Rm \subset M$. Then (1) $\text{Ann}(m) = \text{Ann}(M)$ and (2) x does not map to zero in $M_{\mathfrak{p}}$ if and only if $\mathfrak{p} \in \text{Supp}(M)$. The result now follows from Lemma 10.39.5. \square

Lemma 10.39.7. *Let R be a ring and let M be an R -module. If M is a finitely presented R -module, then $\text{Supp}(M)$ is a closed subset of $\text{Spec}(R)$ whose complement is quasi-compact.*

Proof. Choose a presentation

$$R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \rightarrow 0$$

Let $A \in \text{Mat}(n \times m, R)$ be the matrix of the first map. By Nakayama's Lemma 10.19.1 we see that

$$M_{\mathfrak{p}} \neq 0 \Leftrightarrow M \otimes \kappa(\mathfrak{p}) \neq 0 \Leftrightarrow \text{rank}(A \bmod \mathfrak{p}) < n.$$

Hence, if I is the ideal of R generated by the $n \times n$ minors of A , then $\text{Supp}(M) = V(I)$. Since I is finitely generated, say $I = (f_1, \dots, f_t)$, we see that $\text{Spec}(R) \setminus V(I)$ is a finite union of the standard opens $D(f_i)$, hence quasi-compact. \square

Lemma 10.39.8. *Let R be a ring and let M be an R -module.*

- (1) If M is finite then the support of M/IM is $\text{Supp}(M) \cap V(I)$.
- (2) If $N \subset M$, then $\text{Supp}(N) \subset \text{Supp}(M)$.
- (3) If Q is a quotient module of M then $\text{Supp}(Q) \subset \text{Supp}(M)$.
- (4) If $0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0$ is a short exact sequence then $\text{Supp}(M) = \text{Supp}(Q) \cup \text{Supp}(N)$.

Proof. The functors $M \mapsto M_{\mathfrak{p}}$ are exact. This immediately implies all but the first assertion. For the first assertion we need to show that $M_{\mathfrak{p}} \neq 0$ and $I \subset \mathfrak{p}$ implies $(M/IM)_{\mathfrak{p}} = M_{\mathfrak{p}}/IM_{\mathfrak{p}} \neq 0$. This follows from Nakayama's Lemma 10.19.1. \square

10.40. Going up and going down

Suppose $\mathfrak{p}, \mathfrak{p}'$ are primes of the ring R . Let $X = \text{Spec}(R)$ with the Zariski topology. Denote $x \in X$ the point corresponding to \mathfrak{p} and $x' \in X$ the point corresponding to \mathfrak{p}' . Then we have:

$$x' \rightsquigarrow x \Leftrightarrow \mathfrak{p}' \subset \mathfrak{p}.$$

In words: x is a specialization of x' if and only if $\mathfrak{p}' \subset \mathfrak{p}$. See Topology, Section 5.18 for terminology and notation.

Definition 10.40.1. Let $\varphi : R \rightarrow S$ be a ring map.

- (1) We say a $\varphi : R \rightarrow S$ satisfies *going up* if given primes $\mathfrak{p} \subset \mathfrak{p}'$ in R and a prime \mathfrak{q} in S lying over \mathfrak{p} there exists a prime \mathfrak{q}' of S such that (a) $\mathfrak{q} \subset \mathfrak{q}'$, and (b) \mathfrak{q}' lies over \mathfrak{p}' .
- (2) We say a $\varphi : R \rightarrow S$ satisfies *going down* if given primes $\mathfrak{p} \subset \mathfrak{p}'$ in R and a prime \mathfrak{q}' in S lying over \mathfrak{p}' there exists a prime \mathfrak{q} of S such that (a) $\mathfrak{q} \subset \mathfrak{q}'$, and (b) \mathfrak{q} lies over \mathfrak{p} .

So far we have seen the following cases of this:

- (1) An integral ring map satisfies going up, see Lemma 10.35.20.
- (2) As a special case finite ring maps satisfy going up.
- (3) As a special case quotient maps $R \rightarrow R/I$ satisfy going up.
- (4) A flat ring map satisfies going down, see Lemma 10.38.17
- (5) As a special case any localization satisfies going down.
- (6) An extension $R \subset S$ of domains, with R normal and S integral over R satisfies going down, see Proposition 10.37.7.

Here is another case where going down holds.

Lemma 10.40.2. Let $R \rightarrow S$ be a ring map. If the induced map $\varphi : \text{Spec}(S) \rightarrow \text{Spec}(R)$ is open, then $R \rightarrow S$ satisfies going down.

Proof. Suppose that $\mathfrak{p} \subset \mathfrak{p}' \subset R$ and $\mathfrak{q}' \subset S$ lies over \mathfrak{p}' . As φ is open, for every $g \in S$, $g \notin \mathfrak{q}'$ we see that \mathfrak{p} is in the image of $D(g) \subset \text{Spec}(S)$. In other words $S_g \otimes_R \kappa(\mathfrak{p})$ is not zero. Since $S_{\mathfrak{q}'}$ is the directed colimit of these S_g this implies that $S_{\mathfrak{q}'} \otimes_R \kappa(\mathfrak{p})$ is not zero, see Lemmas 10.9.9 and 10.11.9. Hence \mathfrak{p} is in the image of $\text{Spec}(S_{\mathfrak{q}'}) \rightarrow \text{Spec}(R)$ as desired. \square

Lemma 10.40.3. Let $R \rightarrow S$ be a ring map.

- (1) $R \rightarrow S$ satisfies going down if and only if generalizations lift along the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$, see Topology, Definition 5.18.3.
- (2) $R \rightarrow S$ satisfies going up if and only if specializations lift along the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$, see Topology, Definition 5.18.3.

Proof. Omitted. □

Lemma 10.40.4. *Suppose $R \rightarrow S$ and $S \rightarrow T$ are ring maps satisfying going down. Then so does $R \rightarrow T$. Similarly for going up.*

Proof. According to Lemma 10.40.3 this follows from Topology, Lemma 5.18.4 □

Lemma 10.40.5. *Let $R \rightarrow S$ be a ring map. Let $T \subset \text{Spec}(R)$ be the image of $\text{Spec}(S)$. If T is stable under specialization, then T is closed.*

Proof. We give two proofs.

First proof. Let $\mathfrak{p} \subset R$ be a prime ideal such that the corresponding point of $\text{Spec}(R)$ is in the closure of T . This means that for every $f \in R$, $f \notin \mathfrak{p}$ we have $D(f) \cap T \neq \emptyset$. Note that $D(f) \cap T$ is the image of $\text{Spec}(S_f)$ in $\text{Spec}(R)$. Hence we conclude that $S_f \neq 0$. In other words, $1 \neq 0$ in the ring S_f . Since $S_{\mathfrak{p}}$ is the directed limit of the rings S_f we conclude that $1 \neq 0$ in $S_{\mathfrak{p}}$. In other words, $S_{\mathfrak{p}} \neq 0$ and considering the image of $\text{Spec}(S_{\mathfrak{p}}) \rightarrow \text{Spec}(S) \rightarrow \text{Spec}(R)$ we see there exists a $\mathfrak{p}' \in T$ with $\mathfrak{p}' \subset \mathfrak{p}$. As we assumed T closed under specialization we conclude \mathfrak{p} is a point of T as desired.

Second proof. Let $I = \text{Ker}(R \rightarrow S)$. We may replace R by R/I . In this case the ring map $R \rightarrow S$ is injective. By Lemma 10.29.5 all the minimal primes of R are contained in the image T . Hence if T is stable under specialization then it contains all primes. □

Lemma 10.40.6. *Let $R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) *Going up holds for $R \rightarrow S$, and*
- (2) *the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is closed.*

Proof. It is a general fact that specializations lift along a closed map of topological spaces, see Topology, Lemma 5.18.6. Hence the second condition implies the first.

Assume that going up holds for $R \rightarrow S$. Let $V(I) \subset \text{Spec}(S)$ be a closed set. We want to show that the image of $V(I)$ in $\text{Spec}(R)$ is closed. The ring map $S \rightarrow S/I$ obviously satisfies going up. Hence $R \rightarrow S \rightarrow S/I$ satisfies going up, by Lemma 10.40.4. Replacing S by S/I it suffices to show the image T of $\text{Spec}(S)$ in $\text{Spec}(R)$ is closed. By Topology, Lemmas 5.18.2 and 5.18.5 this image is stable under specialization. Thus the result follows from Lemma 10.40.5. □

Lemma 10.40.7. *Let R be a ring. Let $E \subset \text{Spec}(R)$ be a constructible subset.*

- (1) *If E is stable under specialization, then E is closed.*
- (2) *If E is stable under generalization, then E is open.*

Proof. First proof. The first assertion follows from Lemma 10.40.5 combined with Lemma 10.28.3. The second follows because the complement of a constructible set is constructible (see Topology, Lemma 5.14.2), the first part of the lemma and Topology, Lemma 5.18.2.

Second proof. Since $\text{Spec}(R)$ is a spectral space by Lemma 10.25.2 this is a special case of Topology, Lemma 5.22.5. □

Proposition 10.40.8. *Let $R \rightarrow S$ be flat and of finite presentation. Then $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is open. More generally this holds for any ring map $R \rightarrow S$ of finite presentation which satisfies going down.*

Proof. Assume that $R \rightarrow S$ has finite presentation and satisfies going down. It suffices to prove that the image of a standard open $D(f)$ is open. Since $S \rightarrow S_f$ satisfies going down as well, we see that $R \rightarrow S_f$ satisfies going down. Thus after replacing S by S_f we see it suffices to prove the image is open. By Chevalley's theorem (Theorem 10.28.9) the image is a constructible set E . And E is stable under generalization because $R \rightarrow S$ satisfies going down, see Topology, Lemmas 5.18.2 and 5.18.5. Hence E is open by Lemma 10.40.7. \square

Lemma 10.40.9. *Let k be a field, and let R, S be k -algebras. Let $S' \subset S$ be a sub k -algebra, and let $f \in S' \otimes_k R$. In the commutative diagram*

$$\begin{array}{ccc} \text{Spec}((S \otimes_k R)_f) & \xrightarrow{\hspace{2cm}} & \text{Spec}((S' \otimes_k R)_f) \\ & \searrow & \swarrow \\ & \text{Spec}(R) & \end{array}$$

the images of the diagonal arrows are the same.

Proof. Let $\mathfrak{p} \subset R$ be in the image of the south-west arrow. This means (Lemma 10.16.9) that

$$(S' \otimes_k R)_f \otimes_R \kappa(\mathfrak{p}) = (S' \otimes_k \kappa(\mathfrak{p}))_f$$

is not the zero ring, i.e., $S' \otimes_k \kappa(\mathfrak{p})$ is not the zero ring and the image of f in it is not nilpotent. The ring map $S' \otimes_k \kappa(\mathfrak{p}) \rightarrow S \otimes_k \kappa(\mathfrak{p})$ is injective. Hence also $S \otimes_k \kappa(\mathfrak{p})$ is not the zero ring and the image of f in it is not nilpotent. Hence $(S \otimes_k R)_f \otimes_R \kappa(\mathfrak{p})$ is not the zero ring. Thus (Lemma 10.16.9) we see that \mathfrak{p} is in the image of the south-east arrow as desired. \square

Lemma 10.40.10. *Let k be a field. Let R and S be k -algebras. The map $\text{Spec}(S \otimes_k R) \rightarrow \text{Spec}(R)$ is open.*

Proof. Let $f \in R \otimes_k S$. It suffices to prove that the image of the standard open $D(f)$ is open. Let $S' \subset S$ be a finite type k -subalgebra such that $f \in S' \otimes_k R$. The map $R \rightarrow S' \otimes_k R$ is flat and of finite presentation, hence the image U of $\text{Spec}((S' \otimes_k R)_f) \rightarrow \text{Spec}(R)$ is open by Proposition 10.40.8. By Lemma 10.40.9 this is also the image of $D(f)$ and we win. \square

Here is a tricky lemma that is sometimes useful.

Lemma 10.40.11. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume that*

- (1) *there exists a unique prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} , and*
- (2) *either*
 - (a) *going up holds for $R \rightarrow S$, or*
 - (b) *going down holds for $R \rightarrow S$ and there is at most one prime of S above every prime of R .*

Then $S_{\mathfrak{p}} = S_{\mathfrak{q}}$.

Proof. Consider any prime $\mathfrak{q}' \subset S$ which corresponds to a point of $\text{Spec}(S_{\mathfrak{p}})$. This means that $\mathfrak{p}' = R \cap \mathfrak{q}'$ is contained in \mathfrak{p} . Here is a picture

$$\begin{array}{ccccc} \mathfrak{q}' & \text{---} & ? & \text{---} & S \\ | & & | & & | \\ \mathfrak{p}' & \text{---} & \mathfrak{p} & \text{---} & R \end{array}$$

Assume (1) and (2)(a). By going up there exists a prime $\mathfrak{q}'' \subset S$ with $\mathfrak{q}' \subset \mathfrak{q}''$ and \mathfrak{q}'' lying over \mathfrak{p} . By the uniqueness of \mathfrak{q} we conclude that $\mathfrak{q}'' = \mathfrak{q}$. In other words \mathfrak{q}' defines a point of $\text{Spec}(S_{\mathfrak{q}})$.

Assume (1) and (2)(b). By going down there exists a prime $\mathfrak{q}'' \subset \mathfrak{q}$ lying over \mathfrak{p}' . By the uniqueness of primes lying over \mathfrak{p}' we see that $\mathfrak{q}' = \mathfrak{q}''$. In other words \mathfrak{q}' defines a point of $\text{Spec}(S_{\mathfrak{q}})$.

In both cases we conclude that the map $\text{Spec}(S_{\mathfrak{q}}) \rightarrow \text{Spec}(S_{\mathfrak{p}})$ is bijective. Clearly this means all the elements of $S - \mathfrak{q}$ are all invertible in $S_{\mathfrak{p}}$, in other words $S_{\mathfrak{p}} = S_{\mathfrak{q}}$. \square

The following lemma is a generalization of going down for flat ring maps.

Lemma 10.40.12. *Let $R \rightarrow S$ be a ring map. Let N be a finite S -module flat over R . Endow $\text{Supp}(N) \subset \text{Spec}(S)$ with the induced topology. Then generalizations lift along $\text{Supp}(N) \rightarrow \text{Spec}(R)$.*

Proof. The meaning of the statement is as follows. Let $\mathfrak{p} \subset \mathfrak{p}' \subset R$ be primes. Let $\mathfrak{q}' \subset S$ be a prime $\mathfrak{q}' \in \text{Supp}(N)$. Then there exists a prime $\mathfrak{q} \subset \mathfrak{q}'$, $\mathfrak{q} \in \text{Supp}(N)$ lying over \mathfrak{p} . As N is flat over R we see that $N_{\mathfrak{q}'}$ is flat over $R_{\mathfrak{p}'}$, see Lemma 10.38.19. As $N_{\mathfrak{q}'}$ is finite over $S_{\mathfrak{q}'}$ and not zero since $\mathfrak{q}' \in \text{Supp}(N)$ we see that $N_{\mathfrak{q}'} \otimes_{S_{\mathfrak{q}'}} \kappa(\mathfrak{q}')$ is nonzero by Nakayama's Lemma 10.19.1. Thus $N_{\mathfrak{q}'} \otimes_{R_{\mathfrak{p}'}} \kappa(\mathfrak{p}')$ is also not zero. We conclude from Lemma 10.38.14 that $N_{\mathfrak{q}'} \otimes_{R_{\mathfrak{p}'}} \kappa(\mathfrak{p})$ is nonzero. Let $J \subset S_{\mathfrak{q}'} \otimes_{R_{\mathfrak{p}'}} \kappa(\mathfrak{p})$ be the annihilator of the finite nonzero module $N_{\mathfrak{q}'} \otimes_{R_{\mathfrak{p}'}} \kappa(\mathfrak{p})$. Since J is a proper ideal we can choose a prime $\mathfrak{q} \subset S$ which corresponds to a prime of $S_{\mathfrak{q}'} \otimes_{R_{\mathfrak{p}'}} \kappa(\mathfrak{p})/J$. This prime is in the support of N , lies over \mathfrak{p} , and is contained in \mathfrak{q}' as desired. \square

10.41. Separable extensions

In this section we talk about separability for nonalgebraic field extensions. This is closely related to the concept of geometrically reduced algebras, see Definition 10.42.1.

Definition 10.41.1. Let $k \subset K$ be a field extension.

- (1) We say K is *separably generated over k* if there exists a transcendence basis $\{x_i; i \in I\}$ of K/k such that the extension $k(x_i; i \in I) \subset K$ is a separable algebraic extension.
- (2) We say K is *separable over k* if for every subextension $k \subset K' \subset K$ with K' finitely generated over k , the extension $k \subset K'$ is separably generated.

With this awkward definition it is not clear that a separably generated field extension is itself separable. It will turn out that this is the case, see Lemma 10.43.2.

Lemma 10.41.2. *Let $k \subset K$ be a separable field extension. For any subextension $k \subset K' \subset K$ the field extension $k \subset K'$ is separable.*

Proof. This is direct from the definition. \square

Lemma 10.41.3. *Let $k \subset K$ be a separably generated, and finitely generated field extension. Set $r = \text{trdeg}_k(K)$. Then there exist elements x_1, \dots, x_{r+1} of K such that*

- (1) x_1, \dots, x_r is a transcendence basis of K over k ,

- (2) $K = k(x_1, \dots, x_{r+1})$, and
 (3) x_{r+1} is separable over $k(x_1, \dots, x_r)$.

Proof. Combine the definition with Fields, Lemma 9.18.1. \square

Lemma 10.41.4. *Let $k \subset K$ be a finitely generated field extension. There exists a diagram*

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is a separably generated field extension.

Proof. This lemma is only interesting when the characteristic of k is $p > 0$. Choose x_1, \dots, x_r a transcendence basis of K over k . As K is finitely generated over k the extension $k(x_1, \dots, x_r) \subset K$ is finite. Let $k(x_1, \dots, x_r) \subset K_{sep} \subset K$ be the subextension found in Fields, Lemma 9.13.6. If $K = K_{sep}$ then we are done. We will use induction on $d = [K : K_{sep}]$.

Assume that $d > 1$. Choose a $\beta \in K$ with $\alpha = \beta^p \in K_{sep}$ and $\beta \notin K_{sep}$. Let $P = T^d + a_1T^{d-1} + \dots + a_d$ be the minimal polynomial of α over $k(x_1, \dots, x_r)$. Let $k \subset k'$ be a finite purely inseparable extension obtained by adjoining p th roots such that each a_i is a p th power in $k'(x_1^{1/p}, \dots, x_r^{1/p})$. Such an extension exists; details omitted. Let L be a field fitting into the diagram

$$\begin{array}{ccc} K & \longrightarrow & L \\ \uparrow & & \uparrow \\ k(x_1, \dots, x_r) & \longrightarrow & k'(x_1^{1/p}, \dots, x_r^{1/p}) \end{array}$$

We may and do assume L is the compositum of K and $k'(x_1^{1/p}, \dots, x_r^{1/p})$. Let $k'(x_1^{1/p}, \dots, x_r^{1/p}) \subset L_{sep} \subset L$ be the subextension found in Fields, Lemma 9.13.6. Then L_{sep} is the compositum of K_{sep} and $k'(x_1^{1/p}, \dots, x_r^{1/p})$. The element $\alpha \in L_{sep}$ is a zero of the polynomial P all of whose coefficients are p th powers in $k'(x_1^{1/p}, \dots, x_r^{1/p})$ and whose roots are pairwise distinct. By Fields, Lemma 9.25.2 we see that $\alpha = (\alpha')^p$ for some $\alpha' \in L_{sep}$. Clearly, this means that β maps to

$\alpha' \in L_{sep}$. In other words, we get the tower of fields

$$\begin{array}{ccc}
 K & \longrightarrow & L \\
 \uparrow & & \uparrow \\
 K_{sep}(\beta) & \longrightarrow & L_{sep} \\
 \uparrow & & \parallel \\
 K_{sep} & \longrightarrow & L_{sep} \\
 \uparrow & & \uparrow \\
 k(x_1, \dots, x_r) & \longrightarrow & k'(x_1^{1/p}, \dots, x_r^{1/p}) \\
 \uparrow & & \uparrow \\
 k & \longrightarrow & k'
 \end{array}$$

Thus this construction leads to a new situation with $[L : L_{sep}] < [K : K_{sep}]$. By induction we can find $k' \subset k''$ and $L \subset L'$ as in the lemma for the extension $k' \subset L$. Then the extensions $k \subset k''$ and $K \subset L'$ work for the extension $k \subset K$. This proves the lemma. \square

10.42. Geometrically reduced algebras

The main result on geometrically reduced algebras is Lemma 10.43.3. We suggest the reader skip to the lemma after reading the definition.

Definition 10.42.1. Let k be a field. Let S be a k -algebra. We say S is *geometrically reduced over k* if for every field extension $k \subset K$ the K -algebra $K \otimes_k S$ is reduced.

Let k be a field and let S be a reduced k algebra. To check that S is geometrically reduced it will suffice to check that $\bar{k} \otimes_k S$ is reduced (where \bar{k} denotes the algebraic closure of k). In fact it is enough to check this for finite purely inseparable field extensions $k \subset k'$. See Lemma 10.43.3.

Lemma 10.42.2. *Elementary properties of geometrically reduced algebras. Let k be a field. Let S be a k -algebra.*

- (1) *If S is geometrically reduced over k so is every k -subalgebra.*
- (2) *If all finitely generated k -subalgebras of S are geometrically reduced, then S is geometrically reduced.*
- (3) *A directed colimit of geometrically reduced k -algebras is geometrically reduced.*
- (4) *If S is geometrically reduced over k , then any localization of S is geometrically reduced over k .*

Proof. Omitted. The second and third property follow from the fact that tensor product commutes with colimits. \square

Lemma 10.42.3. *Let k be a field. If R is geometrically reduced over k , and $S \subset R$ is a multiplicative subset, then the localization $S^{-1}R$ is geometrically reduced over k . If R is geometrically reduced over k , then $R[x]$ is geometrically reduced over k .*

Proof. Omitted. Hints: A localization of a reduced ring is reduced, and localization commutes with tensor products. \square

In the proofs of the following lemmas we will repeatedly use the following observation: Suppose that $R' \subset R$ and $S' \subset S$ are inclusions of k -algebras. Then the map $R' \otimes_k S' \rightarrow R \otimes_k S$ is injective.

Lemma 10.42.4. *Let k be a field. Let R, S be k -algebras.*

- (1) *If $R \otimes_k S$ is nonreduced, then there exist finitely generated subalgebras $R' \subset R, S' \subset S$ such that $R' \otimes_k S'$ is not reduced.*
- (2) *If $R \otimes_k S$ contains a nonzero zerodivisor, then there exist finitely generated subalgebras $R' \subset R, S' \subset S$ such that $R' \otimes_k S'$ contains a nonzero zerodivisor.*
- (3) *If $R \otimes_k S$ contains a nontrivial idempotent, then there exist finitely generated subalgebras $R' \subset R, S' \subset S$ such that $R' \otimes_k S'$ contains a nontrivial idempotent.*

Proof. Suppose $z \in R \otimes_k S$ is nilpotent. We may write $z = \sum_{i=1, \dots, n} x_i \otimes y_i$. Thus we may take R' the k -subalgebra generated by the x_i and S' the k -subalgebra generated by the y_i . The second and third statements are proved in the same way. \square

Lemma 10.42.5. *Let k be a field. Let S be a geometrically reduced k -algebra. Let R be any reduced k -algebra. Then $R \otimes_k S$ is reduced.*

Proof. By Lemma 10.42.4 we may assume that R is of finite type over k . Then R , as a reduced Noetherian ring, embeds into a finite product of fields (see Lemmas 10.24.4, 10.30.6, and 10.24.1). Hence we may assume R is a finite product of fields. In this case it follows from Definition 10.42.1 that $R \otimes_k S$ is reduced. \square

Lemma 10.42.6. *Let k be a field. Let S be a reduced k -algebra. Let $k \subset K$ be either a separable field extension, or a separably generated field extension. Then $K \otimes_k S$ is reduced.*

Proof. Assume $k \subset K$ is separable. By Lemma 10.42.4 we may assume that S is of finite type over k and K is finitely generated over k . Then S embeds into a finite product of fields, namely its total ring of fractions (see Lemmas 10.24.1 and 10.24.4). Hence we may actually assume that S is a domain. We choose $x_1, \dots, x_{r+1} \in K$ as in Lemma 10.41.3. Let $P \in k(x_1, \dots, x_r)[T]$ be the minimal polynomial of x_{r+1} . It is a separable polynomial. It is easy to see that $k[x_1, \dots, x_r] \otimes_k S = S[x_1, \dots, x_r]$ is a domain. This implies $k(x_1, \dots, x_r) \otimes_k S$ is a domain as it is a localization of $S[x_1, \dots, x_r]$. The ring extension $k(x_1, \dots, x_r) \otimes_k S \subset K \otimes_k S$ is generated by a single element x_{r+1} with a single equation, namely P . Hence $K \otimes_k S$ embeds into $f.f.(k(x_1, \dots, x_n) \otimes_k S)[T]/(P)$. Since P is separable this is a finite product of fields and we win.

At this point we do not yet know that a separably generated field extension is separable, so we have to prove the lemma in this case also. To do this suppose that $\{x_i\}_{i \in I}$ is a separating transcendence basis for K over k . For any finite set of elements $\lambda_j \in K$ there exists a finite subset $T \subset I$ such that $k(\{x_i\}_{i \in T}) \subset k(\{x_i\}_{i \in T} \cup \{\lambda_j\})$ is finite separable. Hence we see that K is a directed colimit of finitely generated and separably generated extensions of k . Thus the argument of the preceding paragraph applies to this case as well. \square

Lemma 10.42.7. *Let k be a field and let S be a k -algebra. Assume that S is reduced and that $S_{\mathfrak{p}}$ is geometrically reduced for every minimal prime \mathfrak{p} of S . Then S is geometrically reduced.*

Proof. Since S is reduced the map $S \rightarrow \prod_{\mathfrak{p} \text{ minimal}} S_{\mathfrak{p}}$ is injective, see Lemma 10.24.2. If $k \subset K$ is a field extension, then the maps

$$S \otimes_k K \rightarrow \left(\prod_{\mathfrak{p}} S_{\mathfrak{p}} \right) \otimes_k K \rightarrow \prod_{\mathfrak{p}} S_{\mathfrak{p}} \otimes_k K$$

are injective: the first as $k \rightarrow K$ is flat and the second by inspection because K is a free k -module. As $S_{\mathfrak{p}}$ is geometrically reduced the ring on the right is reduced. Thus we see that $S \otimes_k K$ is reduced as a subring of a reduced ring. \square

10.43. Separable extensions, continued

In this section we continue the discussion started in Section 10.41. Let p be a prime number and let k be a field of characteristic p . In this case we write $k^{1/p}$ for the extension of k gotten by adjoining p th roots of all the elements of k to k . (In other words it is the subfield of an algebraic closure of k generated by the p th roots of elements of k .)

Lemma 10.43.1. *Let k be a field of characteristic $p > 0$. Let $k \subset K$ be a field extension. The following are equivalent:*

- (1) K is separable over k ,
- (2) the ring $K \otimes_k k^{1/p}$ is reduced, and
- (3) K is geometrically reduced over k .

Proof. The implication (1) \Rightarrow (3) follows from Lemma 10.42.6. The implication (3) \Rightarrow (2) is immediate.

Assume (2). Let $k \subset L \subset K$ be a subextension such that L is a finitely generated field extension of k . We have to show that we can find a separating transcendence basis of L . The assumption implies that $L \otimes_k k^{1/p}$ is reduced. Let x_1, \dots, x_r be a transcendence basis of L over k such that the degree of inseparability of the finite extension $k(x_1, \dots, x_r) \subset L$ is minimal. If L is separable over $k(x_1, \dots, x_r)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in L$ which is not separable over $k(x_1, \dots, x_r)$. Let $P(T) \in k(x_1, \dots, x_r)[T]$ be the minimal polynomial of α over $k(x_1, \dots, x_r)$. After replacing α by $f\alpha$ for some nonzero $f \in k[x_1, \dots, x_r]$ we may and do assume that P lies in $k[x_1, \dots, x_r, T]$. Because α is not separable P is a polynomial in T^p , see Fields, Lemma 9.12.1. Let dp be the degree of P as a polynomial in T . Since P is the minimal polynomial of α the monomials

$$x_1^{e_1} \dots x_r^{e_r} \alpha^e$$

for $e < dp$ are linearly independent over k in L . We claim that the element $\partial P / \partial x_i \in k[x_1, \dots, x_r, T]$ is not zero for at least one i . Namely, if this was not the case, then P is actually a polynomial in x_1^p, \dots, x_r^p, T^p . In that case we can consider $P^{1/p} \in k^{1/p}[x_1, \dots, x_r, T]$. This would map to $P^{1/p}(x_1, \dots, x_r, \alpha)$ which is a nilpotent element of $k^{1/p} \otimes_k L$ and hence zero. On the other hand, $P^{1/p}(x_1, \dots, x_r, \alpha)$ is a $k^{1/p}$ -linear combination the monomials listed above, hence nonzero in $k^{1/p} \otimes_k L$. This is a contradiction which proves our claim.

Thus, after renumbering, we may assume that $\partial P / \partial x_1$ is not zero. As P is an irreducible polynomial in T over $k(x_1, \dots, x_r)$ it is irreducible as a polynomial in

x_1, \dots, x_r, T , hence by Gauss's lemma it is irreducible as a polynomial in x_1 over $k(x_2, \dots, x_r, T)$. Since the transcendence degree of L is r we see that x_2, \dots, x_r, α are algebraically independent. Hence $P(X, x_2, \dots, x_r, \alpha) \in k(x_2, \dots, x_r, \alpha)[X]$ is irreducible. It follows that x_1 is separably algebraic over $k(x_2, \dots, x_r, \alpha)$. This means that the degree of inseparability of the finite extension $k(x_2, \dots, x_r, \alpha) \subset L$ is less than the degree of inseparability of the finite extension $k(x_1, \dots, x_r) \subset L$, which is a contradiction. \square

Lemma 10.43.2. *A separably generated field extension is separable.*

Proof. Combine Lemma 10.42.6 with Lemma 10.43.1. \square

In the following lemma we will use the notion of the perfect closure which is defined in Definition 10.44.5.

Lemma 10.43.3. *Let k be a field. Let S be a k -algebra. The following are equivalent:*

- (1) $k' \otimes_k S$ is reduced for every finite purely inseparable extension k' of k ,
- (2) $k^{1/p} \otimes_k S$ is reduced,
- (3) $k^{perf} \otimes_k S$ is reduced, where k^{perf} is the perfect closure of k ,
- (4) $\bar{k} \otimes_k S$ is reduced, where \bar{k} is the algebraic closure of k , and
- (5) S is geometrically reduced over k .

Proof. Note that any finite purely inseparable extension $k \subset k'$ embeds in k^{perf} . Moreover, $k^{1/p}$ embeds into k^{perf} which embeds into \bar{k} . Thus it is clear that (5) \Rightarrow (4) \Rightarrow (3) \Rightarrow (2) and that (3) \Rightarrow (1).

We prove that (1) \Rightarrow (5). Assume $k' \otimes_k S$ is reduced for every finite purely inseparable extension k' of k . Let $k \subset K$ be an extension of fields. We have to show that $K \otimes_k S$ is reduced. By Lemma 10.42.4 we reduce to the case where $k \subset K$ is a finitely generated field extension. Choose a diagram

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

as in Lemma 10.41.4. By assumption $k' \otimes_k S$ is reduced. By Lemma 10.42.6 it follows that $K' \otimes_k S$ is reduced. Hence we conclude that $K \otimes_k S$ is reduced as desired.

Finally we prove that (2) \Rightarrow (5). Assume $k^{1/p} \otimes_k S$ is reduced. Then S is reduced. Moreover, for each localization $S_{\mathfrak{p}}$ at a minimal prime \mathfrak{p} , the ring $k^{1/p} \otimes_k S_{\mathfrak{p}}$ is a localization of $k^{1/p} \otimes_k S$ hence is reduced. But $S_{\mathfrak{p}}$ is a field by Lemma 10.24.1, hence $S_{\mathfrak{p}}$ is geometrically reduced by Lemma 10.43.1. It follows from Lemma 10.42.7 that S is geometrically reduced. \square

10.44. Perfect fields

Here is the definition.

Definition 10.44.1. Let k be a field. We say k is *perfect* if every field extension of k is separable over k .

Lemma 10.44.2. *A field k is perfect if and only if it is a field of characteristic 0 or a field of characteristic $p > 0$ such that every element has a p th root.*

Proof. The characteristic zero case is clear. Assume the characteristic of k is $p > 0$. If k is perfect, then all the field extensions where we adjoin a p th root of an element of k have to be trivial, hence every element of k has a p th root. Conversely if every element has a p th root, then $k = k^{1/p}$ and every field extension of k is separable by Lemma 10.43.1. \square

Lemma 10.44.3. *Let $k \subset K$ be a finitely generated field extension. There exists a diagram*

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is a separable field extension. In this situation we can assume that $K' = k'K$ is the compositum, and also that $K' = (k' \otimes_k K)_{red}$.

Proof. By Lemma 10.41.4 we can find such a diagram with $k' \subset K'$ separably generated. By Lemma 10.43.2 this implies that K' is separable over k' . The compositum $k'K$ is a subextension of $k' \subset K'$ and hence $k' \subset k'K$ is separable by Lemma 10.41.2. The ring $(k' \otimes_k K)_{red}$ is a domain as for some $n \gg 0$ the map $x \mapsto x^{p^n}$ maps it into K . Hence it is a field by Lemma 10.35.17. Thus $(k' \otimes_k K)_{red} \rightarrow K'$ maps it isomorphically onto $k'K$. \square

Lemma 10.44.4. *For every field k there exists a purely inseparable extension $k \subset k'$ such that k' is perfect. The field extension $k \subset k'$ is unique up to unique isomorphism.*

Proof. If the characteristic of k is zero, then $k' = k$ is the unique choice. Assume the characteristic of k is $p > 0$. For every $n > 0$ there exists a unique algebraic extension $k \subset k^{1/p^n}$ such that (a) every element $\lambda \in k$ has a p^n th root in k^{1/p^n} and (b) for every element $\mu \in k^{1/p^n}$ we have $\mu^{p^n} \in k$. Namely, consider the ring map $k \rightarrow k^{1/p^n} = k$, $x \mapsto x^{p^n}$. This is injective and satisfies (a) and (b). It is clear that $k^{1/p^n} \subset k^{1/p^{n+1}}$ as extensions of k via the map $y \mapsto y^p$. Then we can take $k' = \bigcup k^{1/p^n}$. Some details omitted. \square

Definition 10.44.5. Let k be a field. The field extension $k \subset k'$ of Lemma 10.44.4 is called the *perfect closure* of k . Notation $k \subset k^{perf}$.

Note that if $k \subset k'$ is any algebraic purely inseparable extension, then $k' \subset k^{perf}$. Namely, $(k')^{perf}$ is isomorphic to k^{perf} by the uniqueness of Lemma 10.44.4.

Lemma 10.44.6. *Let k be a perfect field. Any reduced k algebra is geometrically reduced over k . Let R, S be k -algebras. Assume both R and S are reduced. Then the k -algebra $R \otimes_k S$ is reduced.*

Proof. The first statement follows from Lemma 10.43.3. For the second statement use the first statement and Lemma 10.42.5. \square

10.45. Geometrically irreducible algebras

Let $k \subset k'$ be an algebraic purely inseparable field extension. Then for any k -algebra R the ring map $R \rightarrow k' \otimes_k R$ induces a homeomorphism of spectra. The reason for this is the slightly more general Lemma 10.45.2 below.

Lemma 10.45.1. *Let p be a prime number. Let $n, m > 0$ be two integers. There exists an integer a such that $(x + y)^{p^a}, p^a(x + y) \in \mathbf{Z}[x^{p^n}, p^n x, y^{p^m}, p^m y]$.*

Proof. This is clear for $p^a(x + y)$ as soon as $a \geq n, m$. In fact, pick $a \gg n, m$. Write

$$(x + y)^{p^a} = \sum_{i, j \geq 0, i+j=p^a} \binom{p^a}{i, j} x^i y^j$$

The condition $(x + y)^{p^a} \in \mathbf{Z}[x^{p^n}, p^n x, y^{p^m}, p^m y]$ holds if

$$p^{nr+mr'} \mid \binom{p^a}{i, j}$$

where $i = qp^n + r$ with $r \in \{0, \dots, p^n - 1\}$ and $j = q'p^m + r'$ with $r' \in \{0, \dots, p^m - 1\}$. If $r = r' = 0$ then the divisibility holds. If $r \neq 0$, then we write

$$\binom{p^a}{i, j} = \frac{p^a}{i} \binom{p^a - 1}{i - 1, j}$$

Since $r \neq 0$ the rational number p^a/i has p -adic valuation at least $a - (n - 1)$ (because i is not divisible by p^n). Thus $\binom{p^a}{i, j}$ is divisible by p^{a-n+1} in this case. Similarly, we see that if $r' \neq 0$, then $\binom{p^a}{i, j}$ is divisible by p^{a-m+1} . Picking $a = np^n + mp^m + n + m$ will work. \square

Lemma 10.45.2. *Let $\varphi : R \rightarrow S$ be a ring map. If*

- (1) *for any $x \in S$ there exists $n > 0$ such that x^n is in the image of φ , and*
- (2) *for any $x \in \text{Ker}(\varphi)$ there exists $n > 0$ such that $x^n = 0$,*

then φ induces a homeomorphism on spectra. Given a prime number p such that

- (a) *S is generated as an R -algebra by elements x such that there exists an $n > 0$ with $x^{p^n} \in \varphi(R)$ and $p^n x \in \varphi(R)$, and*
- (b) *the kernel of φ is generated by nilpotent elements,*

then (1) and (2) hold, and for any ring map $R \rightarrow R'$ the ring map $R' \rightarrow R' \otimes_R S$ also satisfies (a), (b), (1), and (2) and in particular induces a homeomorphism on spectra.

Proof. Assume (1) and (2). Let $\mathfrak{q}, \mathfrak{q}'$ be primes of S lying over the same prime ideal \mathfrak{p} of R . Suppose $x \in S$ with $x \in \mathfrak{q}$, $x \notin \mathfrak{q}'$. Then $x^n \in \mathfrak{q}$ and $x^n \notin \mathfrak{q}'$ for all $n > 0$. If $x^n = \varphi(y)$ with $y \in R$ for some $n > 0$ then

$$x^n \in \mathfrak{q} \Rightarrow y \in \mathfrak{p} \Rightarrow x^n \in \mathfrak{q}'$$

which is a contradiction. Hence there does not exist an x as above and we conclude that $\mathfrak{q} = \mathfrak{q}'$, i.e., the map on spectra is injective. By assumption (2) the kernel $I = \text{Ker}(\varphi)$ is contained in every prime, hence $\text{Spec}(R) = \text{Spec}(R/I)$ as topological spaces. As the induced map $R/I \rightarrow S$ is integral by assumption (1) Lemma 10.35.15 shows that $\text{Spec}(S) \rightarrow \text{Spec}(R/I)$ is surjective. Combining the above we see that $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is bijective. If $x \in S$ is arbitrary, and we pick $y \in R$ such that $\varphi(y) = x^n$ for some $n > 0$, then we see that the open $D(x) \subset \text{Spec}(S)$ corresponds

to the open $D(y) \subset \text{Spec}(R)$ via the bijection above. Hence we see that the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is a homeomorphism.

Assume (a) and (b). Note that (b) is equivalent to (2). We claim that for any $x \in S$ there exists an integer $n > 0$ such that $x^{p^n}, p^n x \in \varphi(R)$. By assumption (a) it suffices to show that the set of elements with this property forms a R -subalgebra. Suppose $x, y \in S$ and $n, m > 0$ such that $x^{p^n}, y^{p^m}, p^n x, p^m y \in \varphi(R)$. Then $(xy)^{p^{n+m}}, p^{n+m} xy \in \varphi(R)$ and we see that xy satisfies the condition. The condition holds for $x + y$ by Lemma 10.45.1 and the claim is proved. In particular it follows from the first part of the lemma that $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is a homeomorphism. In particular it is surjective which is a property preserved under any base change, see Lemma 10.29.3. Therefore for any $R \rightarrow R'$ the kernel of the ring map $R' \rightarrow R' \otimes_R S$ consists of nilpotent elements, see Lemma 10.29.6, in other words (b) holds for $R' \rightarrow R' \otimes_R S$. Finally, it is clear that (a) is preserved under base change which finishes the proof. \square

Lemma 10.45.3. *Let $R \rightarrow S$ be a ring map. Assume*

- (a) $\text{Spec}(R)$ is irreducible,
- (b) $R \rightarrow S$ is flat,
- (c) $R \rightarrow S$ is of finite presentation,
- (d) the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ have irreducible spectra for a dense collection of primes \mathfrak{p} of R .

Then $\text{Spec}(S)$ is irreducible. This is true more generally with (b) + (c) replaced by “the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is open”.

Proof. The assumptions (b) and (c) imply that the map on spectra is open, see Proposition 10.40.8. Hence the lemma follows from Topology, Lemma 5.7.7. \square

Lemma 10.45.4. *Let k be a separably algebraically closed field. Let R, S be k -algebras. If R, S have a unique minimal prime, so does $R \otimes_k S$.*

Proof. Let $k \subset \bar{k}$ be a perfect closure, see Definition 10.44.5. By assumption \bar{k} is algebraically closed. The ring maps $R \rightarrow R \otimes_k \bar{k}$ and $S \rightarrow S \otimes_k \bar{k}$ and $R \otimes_k S \rightarrow (R \otimes_k S) \otimes_k \bar{k} = (R \otimes_k \bar{k}) \otimes_{\bar{k}} (S \otimes_k \bar{k})$ satisfy the assumptions of Lemma 10.45.2. Hence we may assume k is algebraically closed.

We may replace R and S by their reductions. Hence we may assume that R and S are domains. By Lemma 10.44.6 we see that $R \otimes_k S$ is reduced. Hence its spectrum is reducible if and only if it contains a nonzero zerodivisor. By Lemma 10.42.4 we reduce to the case where R and S are domains of finite type over k algebraically closed.

Note that the ring map $R \rightarrow R \otimes_k S$ is of finite presentation and flat. Moreover, for every maximal ideal \mathfrak{m} of R we have $(R \otimes_k S) \otimes_R R/\mathfrak{m} \cong S$ because $k \cong R/\mathfrak{m}$ by the Hilbert Nullstellensatz Theorem 10.33.1. Moreover, the set of maximal ideals is dense in the spectrum of R since $\text{Spec}(R)$ is Jacobson, see Lemma 10.34.2. Hence we see that Lemma 10.45.3 applies to the ring map $R \rightarrow R \otimes_k S$ and we conclude that the spectrum of $R \otimes_k S$ is irreducible as desired. \square

Lemma 10.45.5. *Let k be a field. Let R be a k -algebra. The following are equivalent*

- (1) for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is irreducible, and

- (2) for every finite separable field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is irreducible.

Proof. Let $k \subset k^{perf}$ be a perfect closure of k , see Definition 10.44.5. By Lemma 10.45.2 we may replace R by $(R \otimes_k k^{perf})_{reduction}$ and k by k^{perf} (some details omitted). Hence we may assume that R is geometrically reduced over k .

Assume R is geometrically reduced over k . For any extension of fields $k \subset k'$ we see irreducibility of the spectrum of $R \otimes_k k'$ is equivalent to $R \otimes_k k'$ being a domain. Assume (2). Let $k \subset \bar{k}$ be a separable algebraic closure of k . Using Lemma 10.42.4 we see that (2) is equivalent to $R \otimes_k \bar{k}$ being a domain. For any field extension $k \subset k'$, there exists a field extension $\bar{k} \subset \bar{k}'$ with $k' \subset \bar{k}'$. By Lemma 10.45.4 we see that $R \otimes_k \bar{k}'$ is a domain. If $R \otimes_k k'$ is not a domain, then also $R \otimes_k \bar{k}'$ is not a domain, contradiction. \square

Definition 10.45.6. Let k be a field. Let S be a k -algebra. We say S is *geometrically irreducible over k* if for every field extension $k \subset k'$ the spectrum of $S \otimes_k k'$ is irreducible².

By Lemma 10.45.5 it suffices to check this for finite separable field extensions $k \subset k'$.

Lemma 10.45.7. *Let k be a field. Let R be a k -algebra. If k is separably algebraically closed then R is geometrically irreducible over k if and only if the spectrum of R is irreducible.*

Proof. Immediate from the remark following Definition 10.45.6. \square

Lemma 10.45.8. *Let k be a field. Let S be a k -algebra.*

- (1) *If S is geometrically irreducible over k so is every k -subalgebra.*
- (2) *If all finitely generated k -subalgebras of S are geometrically irreducible, then S is geometrically irreducible.*
- (3) *A directed colimit of geometrically irreducible k -algebras is geometrically irreducible.*

Proof. Let $S' \subset S$ be a subalgebra. Then for any extension $k \subset k'$ the ring map $S' \otimes_k k' \rightarrow S \otimes_k k'$ is injective also. Hence (1) follows from Lemma 10.29.5 (and the fact that the image of an irreducible space under a continuous map is irreducible). The second and third property follow from the fact that tensor product commutes with colimits. \square

Lemma 10.45.9. *Let k be a field. Let S be a geometrically irreducible k -algebra. Let R be any k -algebra. The map*

$$\mathrm{Spec}(R \otimes_k S) \longrightarrow \mathrm{Spec}(R)$$

induces a bijection on irreducible components.

Proof. Recall that irreducible components correspond to minimal primes (Lemma 10.25.1). As $R \rightarrow R \otimes_k S$ is flat we see by going down (Lemma 10.38.17) that any minimal prime of $R \otimes_k S$ lies over a minimal prime of R . Conversely, if $\mathfrak{p} \subset R$ is a (minimal) prime then

$$R \otimes_k S/\mathfrak{p}(R \otimes_k S) = (R/\mathfrak{p}) \otimes_k S \subset f.f.(R/\mathfrak{p}) \otimes_k S$$

²An irreducible space is nonempty.

by flatness of $R \rightarrow R \otimes_k S$. The ring $f.f.(R/\mathfrak{p}) \otimes_k S$ has irreducible spectrum by assumption. It follows that $R \otimes_k S/\mathfrak{p}(R \otimes_k S)$ has a single minimal prime (Lemma 10.29.5). In other words, the inverse image of the irreducible set $V(\mathfrak{p})$ is irreducible. Hence the lemma follows. \square

Let us make some remarks on the notion of geometrically irreducible field extensions.

Lemma 10.45.10. *Let $k \subset K$ be a field extension. If k is algebraically closed in K , then K is geometrically irreducible over k .*

Proof. Let $k \subset k'$ be a finite separable extension, say generated by $\alpha \in k'$ over k (see Fields, Lemma 9.18.1). Let $P = T^d + a_1 T^{d-1} + \dots + a_d \in k[T]$ be the minimal polynomial of α . Then $K \otimes_k k' \cong K[T]/(P)$. The only way the spectrum of $K[T]/(P)$ can be reducible is if P is reducible in $K[T]$. Say $P = P_1 P_2$ is a nontrivial factorization of P into monic polynomials. Let $b_1, \dots, b_t \in K$ be the coefficients of P_1 . Then we see that b_i is algebraic over k by Lemma 10.37.5. Hence the lemma follows. \square

Lemma 10.45.11. *Let $k \subset K$ be a field extension. Consider the subextension $k \subset k' \subset K$ such that $k \subset k'$ is separable algebraic and $k' \subset K$ maximal with this property. Then K is geometrically irreducible over k' . If K/k is a finitely generated field extension, then $[k' : k] < \infty$.*

Proof. Let $k'' \subset K$ be the algebraic closure of k in K . By Lemma 10.45.10 we see that K is geometrically irreducible over k'' . Since $k' \subset k''$ is purely inseparable we see from Lemma 10.45.2 that also the extension $k' \subset K$ is geometrically irreducible (some details omitted). If $k \subset K$ is finitely generated, then k' is finite over k by Fields, Lemma 9.23.10. \square

Lemma 10.45.12. *Let $k \subset K$ be an extension of fields. Let $k \subset \bar{k}$ be a separable algebraic closure. Then $\text{Gal}(\bar{k}/k)$ acts transitively on the primes of $\bar{k} \otimes_k K$.*

Proof. Let $k \subset k' \subset K$ be the subextension found in Lemma 10.45.11. Note that as $k \subset \bar{k}$ is integral all the prime ideals of $\bar{k} \otimes_k K$ and $\bar{k} \otimes_k k'$ are maximal, see Lemma 10.35.18. By Lemma 10.45.9 the map

$$\text{Spec}(\bar{k} \otimes_k K) \rightarrow \text{Spec}(\bar{k} \otimes_k k')$$

is bijective because (1) all primes are minimal primes, (1) $\bar{k} \otimes_k K = (\bar{k} \otimes_k k') \otimes_{k'} K$, and (3) K is geometrically irreducible over k' . Hence it suffices to prove the lemma for the action of $\text{Gal}(\bar{k}/k)$ on the primes of $\bar{k} \otimes_k k'$.

As every prime of $\bar{k} \otimes_k k'$ is maximal, the residue fields are isomorphic to \bar{k} . Hence the prime ideals of $\bar{k} \otimes_k k'$ correspond one to one to elements of $\text{Hom}_k(k', \bar{k})$ with $\sigma \in \text{Hom}_k(k', \bar{k})$ corresponding to the kernel \mathfrak{p}_σ of $1 \otimes \sigma : \bar{k} \otimes_k k' \rightarrow \bar{k}$. In particular $\text{Gal}(\bar{k}/k)$ acts transitively on this set as desired. \square

10.46. Geometrically connected algebras

Lemma 10.46.1. *Let k be a separably algebraically closed field. Let R, S be k -algebras. If $\text{Spec}(R)$, and $\text{Spec}(S)$ are connected, then so is $\text{Spec}(R \otimes_k S)$.*

Proof. Recall that $\text{Spec}(R)$ is connected if and only if R has no nontrivial idempotents, see Lemma 10.20.4. Hence, by Lemma 10.42.4 we may assume R and S are of finite type over k . In this case R and S are Noetherian, and have finitely many minimal primes, see Lemma 10.30.6. Thus we may argue by induction on $n + m$ where n , resp. m is the number of irreducible components of $\text{Spec}(R)$, resp. $\text{Spec}(S)$. Of course the case where either n or m is zero is trivial. If $n = m = 1$, i.e., $\text{Spec}(R)$ and $\text{Spec}(S)$ both have one irreducible component, then the result holds by Lemma 10.45.4. Suppose that $n > 1$. Let $\mathfrak{p} \subset R$ be a minimal prime corresponding to the irreducible closed subset $T \subset \text{Spec}(R)$. Let $I \subset R$ be such that $T' = V(I) \subset \text{Spec}(R)$ is the closure of the complement of T . Note that this means that $T' = \text{Spec}(R/I)$ (Lemma 10.16.7) has $n - 1$ irreducible components. Then $T \cup T' = \text{Spec}(R)$, and $T \cap T' = V(\mathfrak{p} + I) = \text{Spec}(R/(\mathfrak{p} + I))$ is not empty as $\text{Spec}(R)$ is assumed connected. The inverse image of T in $\text{Spec}(R \otimes_k S)$ is $\text{Spec}(R/\mathfrak{p} \otimes_k S)$, and the inverse of T' in $\text{Spec}(R \otimes_k S)$ is $\text{Spec}(R/I \otimes_k S)$. By induction these are both connected. The inverse image of $T \cap T'$ is $\text{Spec}(R/(\mathfrak{p} + I) \otimes_k S)$ which is nonempty. Hence $\text{Spec}(R \otimes_k S)$ is connected. \square

Lemma 10.46.2. *Let k be a field. Let R be a k -algebra. The following are equivalent*

- (1) *for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is connected, and*
- (2) *for every finite separable field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is connected.*

Proof. For any extension of fields $k \subset k'$ the connectivity of the spectrum of $R \otimes_k k'$ is equivalent to $R \otimes_k k'$ having no nontrivial idempotents, see Lemma 10.20.4. Assume (2). Let $k \subset \bar{k}$ be a separable algebraic closure of k . Using Lemma 10.42.4 we see that (2) is equivalent to $R \otimes_k \bar{k}$ having no nontrivial idempotents. For any field extension $k \subset k'$, there exists a field extension $\bar{k} \subset \bar{k}'$ with $k' \subset \bar{k}'$. By Lemma 10.46.1 we see that $R \otimes_k \bar{k}'$ has no nontrivial idempotents. If $R \otimes_k k'$ has a nontrivial idempotent, then also $R \otimes_k \bar{k}'$, contradiction. \square

Definition 10.46.3. Let k be a field. Let S be a k -algebra. We say S is *geometrically connected over k* if for every field extension $k \subset k'$ the spectrum of $S \otimes_k k'$ is connected.

By Lemma 10.46.2 it suffices to check this for finite separable field extensions $k \subset k'$.

Lemma 10.46.4. *Let k be a field. Let R be a k -algebra. If k is separably algebraically closed then R is geometrically connected over k if and only if the spectrum of R is connected.*

Proof. Immediate from the remark following Definition 10.46.3. \square

Lemma 10.46.5. *Let k be a field. Let S be a k -algebra.*

- (1) *If S is geometrically connected over k so is every k -subalgebra.*
- (2) *If all finitely generated k -subalgebras of S are geometrically connected, then S is geometrically connected.*
- (3) *A directed colimit of geometrically connected k -algebras is geometrically connected.*

Proof. This follows from the characterization of connectedness in terms of the nonexistence of nontrivial idempotents. The second and third property follow from the fact that tensor product commutes with colimits. \square

The following lemma will be superseded by the more general Varieties, Lemma 32.5.4.

Lemma 10.46.6. *Let k be a field. Let S be a geometrically connected k -algebra. Let R be any k -algebra. The map*

$$R \longrightarrow R \otimes_k S$$

induces a bijection on idempotents, and the map

$$\mathrm{Spec}(R \otimes_k S) \longrightarrow \mathrm{Spec}(R)$$

induces a bijection on connected components.

Proof. The second assertion follows from the first combined with Lemma 10.21.2. By Lemmas 10.46.5 and 10.42.4 we may assume that R and S are of finite type over k . Then we see that also $R \otimes_k S$ is of finite type over k . Note that in this case all the rings are Noetherian and hence their spectra have finitely many connected components (since they have finitely many irreducible components, see Lemma 10.30.6). In particular, all connected components in question are open! Hence via Lemma 10.22.3 we see that the first statement of the lemma in this case is equivalent to the second. Let's prove this. As the algebra S is geometrically connected and nonzero we see that all fibres of $X = \mathrm{Spec}(R \otimes_k S) \rightarrow \mathrm{Spec}(R) = Y$ are connected and nonempty. Also, as $R \rightarrow R \otimes_k S$ is flat of finite presentation the map $X \rightarrow Y$ is open (Proposition 10.40.8). Topology, Lemma 5.6.5 shows that $X \rightarrow Y$ induces bijection on connected components. \square

10.47. Geometrically integral algebras

Definition 10.47.1. Let k be a field. Let S be a k -algebra. We say S is *geometrically integral over k* if for every field extension $k \subset k'$ the ring of $S \otimes_k k'$ is a domain.

Any question about geometrically integral algebras can be translated in a question about geometrically reduced and irreducible algebras.

Lemma 10.47.2. *Let k be a field. Let S be a k -algebra. In this case S is geometrically integral over k if and only if S is geometrically irreducible as well as geometrically reduced over k .*

Proof. Omitted. \square

Lemma 10.47.3. *Let k be a field. Let S be a geometrically integral k -algebra. Let R be a k -algebra and an integral domain. Then $R \otimes_k S$ is an integral domain.*

Proof. By Lemma 10.42.5 the ring $R \otimes_k S$ is reduced and by Lemma 10.45.9 the ring $R \otimes_k S$ is irreducible (the spectrum has just one irreducible component), so $R \otimes_k S$ is an integral domain. \square

10.48. Valuation rings

Here are some definitions.

Definition 10.48.1. Valuation rings.

- (1) Let K be a field. Let A, B be local rings contained in K . We say that B *dominates* A if $A \subset B$ and $\mathfrak{m}_A = A \cap \mathfrak{m}_B$.

- (2) Let A be a ring. We say A is a *valuation ring* if A is a local domain and if A is maximal for the relation of domination among local rings contained in the fraction field of A .
- (3) Let A be a valuation ring with fraction field K . If $R \subset K$ is a subring of K , then we say A is *centered* on R if $R \subset A$.

With this definition a field is a valuation ring.

Lemma 10.48.2. *Let K be a field. Let $A \subset K$ be a local subring. Then there exists a valuation ring with fraction field K dominating A .*

Proof. We consider the collection of local subrings of K as a partially ordered set using the relation of domination. Suppose that $\{A_i\}_{i \in I}$ is a totally ordered collection of local subrings of K . Then $B = \bigcup A_i$ is a local subring which dominates all of the A_i . Hence by Zorn's Lemma, it suffices to show that if $A \subset K$ is a local ring whose fraction field is not K , then there exists a local ring $B \subset K$, $B \neq A$ dominating A .

Pick $t \in K$ which is not in the fraction field of A . If t is transcendental over A , then $A[t] \subset K$ and hence $A[t]_{(t, \mathfrak{m})} \subset K$ is a local ring dominating A . Suppose t is algebraic over A . Then for some $a \in A$ the element at is integral over A . In this case the subring $A' \subset K$ generated by A and ta is finite over A . By Lemma 10.35.15 there exists a prime ideal $\mathfrak{m}' \subset A'$ lying over \mathfrak{m} . Then $A'_{\mathfrak{m}'}$ clearly dominates A and we win. \square

Lemma 10.48.3. *Let A be a valuation ring with maximal ideal \mathfrak{m} and fraction field K . Let $x \in K$. Then either $x \in A$ or $x^{-1} \in A$ or both.*

Proof. Assume that x is not in A . Let A' denote the subring of K generated by A and x . Since A is a valuation ring we see that there is no prime of A' lying over \mathfrak{m} . Hence we can write $1 = \sum_{i=0}^d t_i x^i$ with $t_i \in \mathfrak{m}$. This implies that $(1 - t_0)(x^{-1})^d - \sum_{i=1}^d t_i (x^{-1})^{d-i} = 0$. In particular we see that x^{-1} is integral over A . Thus the subring A'' of K generated by A and x^{-1} is finite over A and we see there exists a prime ideal $\mathfrak{m}'' \subset A''$ lying over \mathfrak{m} by Lemma 10.35.15. Since A is a valuation ring we conclude that $A = (A'')_{\mathfrak{m}''}$ and hence $x^{-1} \in A$. \square

Lemma 10.48.4. *Let $A \subset K$ be a subring of a field K such that for all $x \in K$ either $x \in A$ or $x^{-1} \in A$ or both. Then A is a valuation ring with fraction field K .*

Proof. If A is not K , then A is not a field and there is a nonzero maximal ideal \mathfrak{m} . If \mathfrak{m}' is a second maximal ideal, then choose $x, y \in A$ with $x \in \mathfrak{m}$, $y \notin \mathfrak{m}$, $x \notin \mathfrak{m}'$, and $y \in \mathfrak{m}'$ (see Lemma 10.14.2). Then neither $x/y \in A$ nor $y/x \in A$ contradicting the assumption of the lemma. Thus we see that A is a local ring. Suppose that A' is a local ring contained in K which dominates A . Let $x \in A'$. We have to show that $x \in A$. If not, then $x^{-1} \in A$, and of course $x^{-1} \in \mathfrak{m}_A$. But then $x^{-1} \in \mathfrak{m}_{A'}$ which contradicts $x \in A'$. \square

Lemma 10.48.5. *Let I be a directed partially ordered set. Let (A_i, φ_{ij}) be a system of valuation rings over I whose transition maps φ_{ij} are local. Then $A = \text{colim } A_i$ is a valuation ring.*

Proof. It is clear that A is a domain. Let $a, b \in A$. Lemma 10.48.4 tells us we have to show that either $a|b$ or $b|a$ in A . Choose i so large that there exist $a_i, b_i \in A_i$

mapping to a, b . Then Lemma 10.48.3 applied to a_i, b_i in A_i implies the result for a, b in A . \square

Lemma 10.48.6. *Let $K \subset L$ be an extension of fields. If $B \subset L$ is a valuation ring, then $A = K \cap B$ is a valuation ring.*

Proof. We can replace L by $f.f.(B)$ and K by $K \cap f.f.(B)$. Then the lemma follows from a combination of Lemmas 10.48.3 and 10.48.4. \square

Lemma 10.48.7. *Let $K \subset L$ be an algebraic extension of fields. If $B \subset L$ is a valuation ring with fraction field L and not a field, then $A = K \cap B$ is a valuation ring and not a field.*

Proof. By Lemma 10.48.6 the ring A is a valuation ring. If A is a field, then $A = K$. Then $A = K \subset B$ is an integral extension, hence there are no proper inclusions among the primes of B (Lemma 10.35.18). This contradicts the assumption that B is a local domain and not a field. \square

Lemma 10.48.8. *Let A be a valuation ring. For any prime ideal $\mathfrak{p} \subset A$ the quotient A/\mathfrak{p} is a valuation ring. The same is true for the localization $A_{\mathfrak{p}}$ and in fact any localization of A .*

Proof. Use the characterization of valuation rings given in Lemma 10.48.4. \square

Lemma 10.48.9. *Let A' be a valuation ring with residue field K . Let A be a valuation ring with fraction field K . Then $C = \{\lambda \in A' \mid \lambda \bmod \mathfrak{m}_{A'} \in A\}$ is a valuation ring.*

Proof. Note that $\mathfrak{m}_{A'} \subset C$ and $C/\mathfrak{m}_{A'} = A$. In particular, the fraction field of C is equal to the fraction field of A' . We will use the criterion of Lemma 10.48.4 to prove the lemma. Let x be an element of the fraction field of C . By the lemma we may assume $x \in A'$. If $x \in \mathfrak{m}_{A'}$, then we see $x \in C$. If not, then x is a unit of A' and we also have $x^{-1} \in A'$. Hence either x or x^{-1} maps to an element of A by the lemma again. \square

Lemma 10.48.10. *Let A be a valuation ring. Then A is a normal domain.*

Proof. Suppose x is in the field of fractions of A and integral over A , say $x^d + \sum_{i < d} a_i x^i = 0$. By Lemma 10.48.4 either $x \in A$ (and we're done) or $x^{-1} \in A$. In the second case we see that $x = -\sum a_i x^{i-d} \in A$ as well. \square

Lemma 10.48.11. *Let A be a normal domain with fraction field K . For every $x \in K$, $x \notin A$ there exists a valuation ring $A \subset V \subset K$ with fraction field K such that $x \notin V$. In other words, A is the intersection of all valuation rings in K containing A .*

Proof. Suppose $x \in K$, $x \notin A$. Consider $B = A[x^{-1}]$. Then $x \notin B$. Namely, if $x = a_0 + a_1 x^{-1} + \dots + a_d x^{-d}$ then $x^{d+1} - a_0 x^d - \dots - a_d = 0$ and x is integral over A in contradiction with the fact that A is normal. Thus x^{-1} is not a unit in B . Thus $V(x^{-1}) \subset \text{Spec}(B)$ is not empty (Lemma 10.16.2), and we can choose a prime $\mathfrak{p} \subset B$ with $x^{-1} \in \mathfrak{p}$. Choose a valuation ring $V \subset K$ dominating $B_{\mathfrak{p}}$ (Lemma 10.48.2). Then $x \notin V$ as $x^{-1} \in \mathfrak{m}_V$. \square

An *totally ordered abelian group* is a pair (Γ, \geq) consisting of an abelian group Γ endowed with a total ordering \geq such that $\gamma \geq \gamma' \Rightarrow \gamma + \gamma'' \geq \gamma' + \gamma''$ for all $\gamma, \gamma', \gamma'' \in \Gamma$.

Lemma 10.48.12. *Let A be a valuation ring with field of fractions K . Set $\Gamma = K^*/A^*$ (with group law written additively). For $\gamma, \gamma' \in \Gamma$ define $\gamma \geq \gamma'$ if and only if $\gamma - \gamma'$ is in the image of $A - \{0\} \rightarrow \Gamma$. Then (Γ, \geq) is a totally ordered abelian group.*

Proof. Omitted, but follows easily from Lemma 10.48.3. Note that in case $A = K$ we obtain the zero group $\Gamma = \{0\}$ endowed with its unique total ordering. \square

Definition 10.48.13. Let A be a valuation ring.

- (1) The totally ordered abelian group (Γ, \geq) of Lemma 10.48.12 is called the *value group* of the valuation ring A .
- (2) The map $v : A - \{0\} \rightarrow \Gamma$ and also $v : K^* \rightarrow \Gamma$ is called the *valuation* associated to A .
- (3) The valuation ring A is called a *discrete valuation ring* if $\Gamma \cong \mathbf{Z}$.

Note that if $\Gamma \cong \mathbf{Z}$ then there is a unique such isomorphism such that $1 \geq 0$. If the isomorphism is chosen in this way, then the ordering becomes the usual ordering of the integers.

Lemma 10.48.14. *Let A be a valuation ring. The valuation $v : A - \{0\} \rightarrow \Gamma_{\geq 0}$ has the following properties:*

- (1) $v(a) = 0 \Leftrightarrow a \in A^*$,
- (2) $v(ab) = v(a) + v(b)$,
- (3) $v(a + b) \geq \min(v(a), v(b))$.

Proof. Omitted. \square

Lemma 10.48.15. *Let A be a ring. The following are equivalent*

- (1) A is a valuation ring,
- (2) A is a local domain and every finitely generated ideal of A is principal.

Proof. Assume A is a valuation ring and let $f_1, \dots, f_n \in A$. Choose i such that $v(f_i)$ is minimal among $v(f_j)$. Then $(f_i) = (f_1, \dots, f_n)$. Conversely, assume A is a local domain and every finitely generated ideal of A is principal. Pick $f, g \in A$ and write $(f, g) = (h)$. Then $f = ah$ and $g = bh$ and $h = cf + dg$ for some $a, b, c, d \in A$. Thus $ac + bd = 1$ and we see that either a or b is a unit, i.e., either g/f or f/g is an element of A . This shows A is a valuation ring by Lemma 10.48.4. \square

Lemma 10.48.16. *Let (Γ, \geq) be a totally ordered abelian group. Let K be a field. Let $v : K^* \rightarrow \Gamma$ be a homomorphism of abelian groups such that $v(a + b) \geq \min(v(a), v(b))$ for $a, b \in K$ with $a, b, a + b$ not zero. Then*

$$A = \{x \in K \mid x = 0 \text{ or } v(x) \geq 0\}$$

is a valuation ring with value group $\text{Im}(v) \subset \Gamma$, with maximal ideal

$$\mathfrak{m} = \{x \in K \mid x = 0 \text{ or } v(x) > 0\}$$

and with group of units

$$A^* = \{x \in K^* \mid v(x) = 0\}.$$

Proof. Omitted. \square

Let (Γ, \geq) be a totally ordered abelian group. An *ideal* of Γ is a subset $I \subset \Gamma$ such that all elements of I are ≥ 0 and $\gamma \in I, \gamma' \geq \gamma$ implies $\gamma' \in I$. We say that such an ideal is *prime* if $\gamma + \gamma' \in I, \gamma, \gamma' \geq 0 \Rightarrow \gamma \in I$ or $\gamma' \in I$.

Lemma 10.48.17. *Let A be a valuation ring. Ideals in A correspond 1 – 1 with ideals of Γ . This bijection is inclusion preserving, and maps prime ideals to prime ideals.*

Proof. Omitted. □

Lemma 10.48.18. *A valuation ring is Noetherian if and only if it is a discrete valuation ring or a field.*

Proof. Suppose A is a discrete valuation ring with valuation $v : A \setminus \{0\} \rightarrow \mathbf{Z}$ normalized so that $\text{Im}(v) \subset \mathbf{Z}_{\geq 0}$. By Lemma 10.48.17 the ideals of A are the subsets $I_n = \{0\} \cup v^{-1}(\mathbf{Z}_{\geq n})$. It is clear that any element $x \in A$ with $v(x) = n$ generates I_n . Hence A is a PID so certainly Noetherian.

Suppose A is a Noetherian valuation ring with value group Γ . By Lemma 10.48.17 we see the ascending chain condition holds for ideals in Γ . We may assume A is not a field, i.e., there is a $\gamma \in \Gamma$ with $\gamma > 0$. Applying the ascending chain condition to the subsets $\gamma + \Gamma_{\geq 0}$ with $\gamma > 0$ we see there exists a smallest element γ_0 which is bigger than 0. Let $\gamma \in \Gamma$ be an element $\gamma > 0$. Consider the sequence of elements $\gamma, \gamma - \gamma_0, \gamma - 2\gamma_0$, etc. By the ascending chain condition these cannot all be > 0 . Let $\gamma - n\gamma_0$ be the last one ≥ 0 . By minimality of γ_0 we see that $0 = \gamma - n\gamma_0$. Hence Γ is a cyclic group as desired. □

10.49. More Noetherian rings

Lemma 10.49.1. *Let R be a Noetherian ring. Any finite R -module is of finite presentation. Any submodule of a finite R -module is finite. The ascending chain condition holds for R -submodules of a finite R -module.*

Proof. We first show that any submodule N of a finite R -module M is finite. We do this by induction on the number of generators of M . If this number is 1, then $N = J/I \subset M = R/I$ for some ideals $I \subset J \subset R$. Thus the definition of Noetherian implies the result. If the number of generators of M is greater than 1, then we can find a short exact sequence $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ where M' and M'' have fewer generators. Note that setting $N' = M' \cap N$ and $N'' = \text{Im}(N \rightarrow M'')$ gives a similar short exact sequence for N . Hence the result follows from the induction hypothesis since the number of generators of N is at most the number of generators of N' plus the number of generators of N'' .

To show that M is finitely presented just apply the previous result to the kernel of a presentation $R^n \rightarrow M$.

It is well known and easy to prove that the ascending chain condition for R -submodules of M is equivalent to the condition that every submodule of M is a finite R -module. We omit the proof. □

Lemma 10.49.2 (Artin-Rees). *Suppose that R is Noetherian, $I \subset R$ an ideal. Let $N \subset M$ be finite R -modules. There exists a constant $c > 0$ such that $I^n M \cap N = I^{n-c}(I^c M \cap N)$ for all $n \geq c$.*

Proof. Consider the ring $S = R \oplus I \oplus I^2 \oplus \dots = \bigoplus_{n \geq 0} I^n$. Convention: $I^0 = R$. Multiplication maps $I^n \times I^m$ into I^{n+m} by multiplication in R . Note that if $I = (f_1, \dots, f_t)$ then S is a quotient of the Noetherian ring $R[X_1, \dots, X_t]$. The map just sends the monomial $X_1^{e_1} \dots X_t^{e_t}$ to $f_1^{e_1} \dots f_t^{e_t}$. Thus S is Noetherian.

Similarly, consider the module $M \oplus IM \oplus I^2M \oplus \dots = \bigoplus_{n \geq 0} I^n M$. This is a finitely generated S -module. Namely, if x_1, \dots, x_r generate M over R , then they also generate $\bigoplus_{n \geq 0} I^n M$ over S . Next, consider the submodule $\bigoplus_{n \geq 0} I^n M \cap N$. This is an S -submodule, as is easily verified. By Lemma 10.49.1 it is finitely generated as an S -module, say by $\xi_j \in \bigoplus_{n \geq 0} I^n M \cap N$, $j = 1, \dots, s$. We may assume by decomposing each ξ_j into its homogeneous pieces that each $\xi_j \in I^{d_j} M \cap N$ for some d_j . Set $c = \max\{d_j\}$. Then for all $n \geq c$ every element in $I^n M \cap N$ is of the form $\sum h_j \xi_j$ with $h_j \in I^{n-d_j}$. The lemma now follows from this and the trivial observation that $I^{n-d_j}(I^{d_j} M \cap N) \subset I^{n-c}(I^c M \cap N)$. \square

Lemma 10.49.3. *Suppose that $0 \rightarrow K \rightarrow M \xrightarrow{f} N$ is an exact sequence of finitely generated modules over a Noetherian ring R . Let $I \subset R$ be an ideal. Then there exists a c such that*

$$f^{-1}(I^n N) = K + I^{n-c} f^{-1}(I^c N) \quad \text{and} \quad f(M) \cap I^n N \subset f(I^{n-c} M)$$

for all $n \geq c$.

Proof. Apply Lemma 10.49.2 to $\text{Im}(f) \subset N$ and note that $f : I^{n-c} M \rightarrow I^{n-c} f(M)$ is surjective. \square

Lemma 10.49.4 (Krull's intersection theorem). *Let R be a Noetherian local ring. Let $I \subset R$ be a proper ideal. Let M be a finite R -module. Then $\bigcap_{n \geq 0} I^n M = 0$.*

Proof. Let $N = \bigcap_{n \geq 0} I^n M$. Then $N = I^n M \cap N$ for all $n \geq 0$. By the Artin-Rees Lemma 10.49.2 we see that $N = I^n M \cap N \subset IN$ for some suitably large n . By Nakayama's Lemma 10.19.1 we see that $N = 0$. \square

Lemma 10.49.5. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal. Let M be a finite R -module. Let $N = \bigcap_n I^n M$.*

- (1) *For every prime \mathfrak{p} , $I \subset \mathfrak{p}$ there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $N_f = 0$.*
- (2) *If $I \subset \text{rad}(R)$ is contained in the Jacobson radical of R , then $N = 0$.*

Proof. Proof of (1). Let x_1, \dots, x_n be generators for the module N , see Lemma 10.49.1. For every prime \mathfrak{p} , $I \subset \mathfrak{p}$ we see that the image of N in the localization $M_{\mathfrak{p}}$ is zero, by Lemma 10.49.4. Hence we can find $g_i \in R$, $g_i \notin \mathfrak{p}$ such that x_i maps to zero in N_{g_i} . Thus $N_{g_1 g_2 \dots g_n} = 0$.

Part (2) follows from (1) and Lemma 10.23.1. \square

Remark 10.49.6. Lemma 10.49.4 in particular implies that $\bigcap_n I^n = (0)$ when $I \subset R$ is a non-unit ideal in a Noetherian local ring R . More generally, let R be a Noetherian ring and $I \subset R$ an ideal. Suppose that $f \in \bigcap_{n \in \mathbf{N}} I^n$. Then Lemma 10.49.5 says that for every prime ideal $I \subset \mathfrak{p}$ there exists a $g \in R$, $g \notin \mathfrak{p}$ such that f maps to zero in R_g . In algebraic geometry we express this by saying that “ f is zero in an open neighbourhood of the closed set $V(I)$ of $\text{Spec}(R)$ ”.

Lemma 10.49.7 (Artin-Tate). *Let R be a Noetherian ring. Let S be a finitely generated R -algebra. If $T \subset S$ is an R -subalgebra such that S is finitely generated as a T -module, then T is a finite type over R .*

Proof. Choose elements $x_1, \dots, x_n \in S$ which generate S as an R -algebra. Choose y_1, \dots, y_m in S which generate S as a T -module. Thus there exist $a_{ij} \in T$ such that $x_i = \sum a_{ij} y_j$. There also exist $b_{ijk} \in T$ such that $y_i y_j = \sum b_{ijk} y_k$. Let $T' \subset T$ be

the sub R -algebra generated by a_{ij} and b_{ijk} . This is a finitely generated R -algebra, hence Noetherian. Consider the algebra

$$S' = T'[Y_1, \dots, Y_m]/(Y_i Y_j - \sum b_{ijk} Y_k).$$

Note that S' is finite over T' , namely as a T' -module it is generated by the classes of $1, Y_1, \dots, Y_m$. Consider the T' -algebra homomorphism $S' \rightarrow S$ which maps Y_i to y_i . Because $a_{ij} \in T'$ we see that x_j is in the image of this map. Thus $S' \rightarrow S$ is surjective. Therefore S is finite over T' as well. Since T' is Noetherian and we conclude that $T \subset S$ is finite over T' and we win. \square

10.50. Length

Definition 10.50.1. Let R be a ring. For any R -module M we define the *length* of M over R by the formula

$$\text{length}_R(M) = \sup\{n \mid \exists 0 = M_0 \subset M_1 \subset \dots \subset M_n = M, M_i \neq M_{i+1}\}.$$

In other words it is the supremum of the lengths of chains of submodules. There is an obvious notion of when a chain of submodules is a refinement of another. This gives a partial ordering on the collection of all chains of submodules, with the smallest chain having the shape $0 = M_0 \subset M_1 = M$ if M is not zero. We note the obvious fact that if the length of M is finite, then every chain can be refined to a maximal chain. But it is not as obvious that all maximal chains have the same length (as we will see later).

Lemma 10.50.2. *Let R be a ring. Let M be an R -module. If $\text{length}_R(M) < \infty$ then M is a finite R -module.*

Proof. Omitted. \square

Lemma 10.50.3. *If $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ is a short exact sequence of modules over R then the length of M is the sum of the lengths of M' and M'' .*

Proof. Given filtrations of M' and M'' of lengths n', n'' it is easy to make a corresponding filtration of M of length $n' + n''$. Thus we see that $\text{length}_R M \geq \text{length}_R M' + \text{length}_R M''$. Conversely, given a filtration $M_0 \subset M_1 \subset \dots \subset M_n$ of M consider the induced filtrations $M'_i = M_i \cap M'$ and $M''_i = \text{Im}(M_i \rightarrow M'')$. Let n' (resp. n'') be the number of steps in the filtration $\{M'_i\}$ (resp. $\{M''_i\}$). If $M'_i = M'_{i+1}$ and $M''_i = M''_{i+1}$ then $M_i = M_{i+1}$. Hence we conclude that $n' + n'' \geq n$. Combined with the earlier result we win. \square

Lemma 10.50.4. *Let R be a local ring with maximal ideal \mathfrak{m} . Let M be an R -module.*

- (1) *If M is a finite module and $\mathfrak{m}^n M \neq 0$ for all $n \geq 0$, then $\text{length}_R(M) = \infty$.*
- (2) *If M has finite length then $\mathfrak{m}^n M = 0$ for some n .*

Proof. Assume $\mathfrak{m}^n M \neq 0$ for all $n \geq 0$. Choose $x \in M$ and $f_1, \dots, f_n \in \mathfrak{m}$ such that $f_1 f_2 \dots f_n x \neq 0$. By Nakayama's Lemma 10.19.1 the first n steps in the filtration

$$0 \subset Rf_1 \dots f_n x \subset Rf_1 \dots f_{n-1} x \subset \dots \subset Rx \subset M$$

are distinct. This can also be seen directly. For example, if $Rf_1 x = Rf_1 f_2 x$, then $f_1 x = gf_1 f_2 x$ for some g , hence $(1 - gf_2)f_1 x = 0$ hence $f_1 x = 0$ as $1 - gf_2$ is a unit which is a contradiction with the choice of x and f_1, \dots, f_n . Hence the length is infinite, i.e., (1) holds. Combine (1) and Lemma 10.50.2 to see (2). \square

Lemma 10.50.5. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. We always have $\text{length}_R(M) \geq \text{length}_S(M)$. If $R \rightarrow S$ is surjective then equality holds.*

Proof. A filtration of M by S -submodules gives rise a filtration of M by R -submodules. This proves the inequality. And if $R \rightarrow S$ is surjective, then any R -submodule of M is automatically a S -submodule. Hence equality in this case. \square

Lemma 10.50.6. *Let R be a ring with maximal ideal \mathfrak{m} . Suppose that M is an R -module with $\mathfrak{m}M = 0$. Then the length of M as an R -module agrees with the dimension of M as a R/\mathfrak{m} vector space. The length is finite if and only if M is a finite R -module.*

Proof. The first part is a special case of Lemma 10.50.5. Thus the length is finite if and only if M has a finite basis as a R/\mathfrak{m} -vector space if and only if M has a finite set of generators as an R -module. \square

Lemma 10.50.7. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset. Then $\text{length}_R(M) \geq \text{length}_{S^{-1}R}(S^{-1}M)$.*

Proof. Any submodule $N' \subset S^{-1}M$ is of the form $S^{-1}N$ for some R -submodule $N \subset M$, by Lemma 10.9.15. The lemma follows. \square

Lemma 10.50.8. *Let R be a ring with finitely generated maximal ideal \mathfrak{m} . (For example R Noetherian.) Suppose that M is a finite R -module with $\mathfrak{m}^n M = 0$ for some n . Then $\text{length}_R(M) < \infty$.*

Proof. Consider the filtration $0 = \mathfrak{m}^n M \subset \mathfrak{m}^{n-1} M \subset \dots \subset \mathfrak{m} M \subset M$. All of the subquotients are finitely generated R -modules to which Lemma 10.50.6 applies. We conclude by additivity, see Lemma 10.50.3. \square

Definition 10.50.9. Let R be a ring. Let M be an R -module. We say M is *simple* if $M \neq 0$ and every submodule of M is either equal to M or to 0.

Lemma 10.50.10. *Let R be a ring. Let M be an R -module. The following are equivalent:*

- (1) M is simple,
- (2) $\text{length}_R(M) = 1$, and
- (3) $M \cong R/\mathfrak{m}$ for some maximal ideal $\mathfrak{m} \subset R$.

Proof. Let \mathfrak{m} be a maximal ideal of R . By Lemma 10.50.6 the module R/\mathfrak{m} has length 1. The equivalence of the first two assertions is tautological. Suppose that M is simple. Choose $x \in M$, $x \neq 0$. As M is simple we have $M = R \cdot x$. Let $I \subset R$ be the annihilator of x , i.e., $I = \{f \in R \mid fx = 0\}$. The map $R/I \rightarrow M$, $f \bmod I \mapsto fx$ is an isomorphism, hence R/I is a simple R -module. Since $R/I \neq 0$ we see $I \neq R$. Let $I \subset \mathfrak{m}$ be a maximal ideal containing I . If $I \neq \mathfrak{m}$, then $\mathfrak{m}/I \subset R/I$ is a nontrivial submodule contradicting the simplicity of R/I . Hence we see $I = \mathfrak{m}$ as desired. \square

Lemma 10.50.11. *Let R be a ring. Let M be a finite length R -module. Let $\ell = \text{length}_R(M)$. Choose any maximal chain of submodules*

$$0 = M_0 \subset M_1 \subset M_2 \subset \dots \subset M_n = M$$

with $M_i \neq M_{i-1}$, $i = 1, \dots, n$. Then

- (1) $n = \ell$,

- (2) each M_i/M_{i-1} is simple,
 (3) each M_i/M_{i-1} is of the form R/\mathfrak{m}_i for some maximal ideal \mathfrak{m}_i ,
 (4) given a maximal ideal $\mathfrak{m} \subset R$ we have

$$\#\{i \mid \mathfrak{m}_i = \mathfrak{m}\} = \text{length}_{R_{\mathfrak{m}}}(M_{\mathfrak{m}}).$$

Proof. If M_i/M_{i-1} is not simple then we can refine the filtration and the filtration is not maximal. Thus we see that M_i/M_{i-1} is simple. By Lemma 10.50.10 the modules M_i/M_{i-1} have length 1 and are of the form R/\mathfrak{m}_i for some maximal ideals \mathfrak{m}_i . By additivity of length, Lemma 10.50.3, we see $n = \ell$. Since localization is exact, we see that

$$0 = (M_0)_{\mathfrak{m}} \subset (M_1)_{\mathfrak{m}} \subset (M_2)_{\mathfrak{m}} \subset \dots \subset (M_n)_{\mathfrak{m}} = M_{\mathfrak{m}}$$

is a filtration of $M_{\mathfrak{m}}$ with successive quotients $(M_i/M_{i-1})_{\mathfrak{m}}$. Thus the last statement follows directly from the fact that given maximal ideals $\mathfrak{m}, \mathfrak{m}'$ of R we have

$$(R/\mathfrak{m}')_{\mathfrak{m}} \cong \begin{cases} 0 & \text{if } \mathfrak{m} \neq \mathfrak{m}', \\ R_{\mathfrak{m}}/\mathfrak{m}R_{\mathfrak{m}} & \text{if } \mathfrak{m} = \mathfrak{m}' \end{cases}$$

This we leave to the reader. \square

Lemma 10.50.12. *Let A be a local ring with maximal ideal \mathfrak{m} . Let B be a semi-local ring with maximal ideals $\mathfrak{m}_i, i = 1, \dots, n$. Suppose that $A \rightarrow B$ is a homomorphism such that each \mathfrak{m}_i lies over \mathfrak{m} and such that*

$$[\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m})] < \infty.$$

Let M be a B -module of finite length. Then

$$\text{length}_A(M) = \sum_{i=1, \dots, n} [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m})] \text{length}_{B_{\mathfrak{m}_i}}(M_{\mathfrak{m}_i}),$$

in particular $\text{length}_A(M) < \infty$.

Proof. Choose a maximal chain

$$0 = M_0 \subset M_1 \subset M_2 \subset \dots \subset M_n = M$$

by B -submodules as in Lemma 10.50.11. Then each quotient M_i/M_{i-1} is isomorphic to $\kappa(\mathfrak{m}_{j(i)})$ for some $j(i) \in \{1, \dots, n\}$. Moreover $\text{length}_A(\kappa(\mathfrak{m}_i)) = [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m})]$ by Lemma 10.50.6. The lemma follows by additivity of lengths (Lemma 10.50.3). \square

Lemma 10.50.13. *Let $A \rightarrow B$ be a flat local homomorphism of local rings. Then for any A -module M we have*

$$\text{length}_A(M) \text{length}_B(B/\mathfrak{m}_A B) = \text{length}_B(M \otimes_A B).$$

In particular, if $\text{length}_B(B/\mathfrak{m}_A B) < \infty$ then M has finite length if and only if $M \otimes_A B$ has finite length.

Proof. The ring map $A \rightarrow B$ is faithfully flat by Lemma 10.38.16. Hence if $0 = M_0 \subset M_1 \subset \dots \subset M_n = M$ is a chain of length n in M , then the corresponding chain $0 = M_0 \otimes_A B \subset M_1 \otimes_A B \subset \dots \subset M_n \otimes_A B = M \otimes_A B$ has length n also. This proves $\text{length}_A(M) = \infty \Rightarrow \text{length}_B(M \otimes_A B) = \infty$. Next, assume $\text{length}_A(M) < \infty$. In this case we see that M has a filtration of length $\ell = \text{length}_A(M)$ whose quotients are A/\mathfrak{m}_A . Arguing as above we see that $M \otimes_A B$ has a filtration of length ℓ whose quotients are isomorphic to $B \otimes_A A/\mathfrak{m}_A = B/\mathfrak{m}_A B$. Thus the lemma follows. \square

Lemma 10.50.14. *Let $A \rightarrow B \rightarrow C$ be flat local homomorphisms of local rings. Let M be an A -module of finite length. Then*

$$\text{length}_B(B/\mathfrak{m}_A B) \text{length}_C(C/\mathfrak{m}_B C) = \text{length}_C(C/\mathfrak{m}_A C)$$

Proof. Follows from Lemma 10.50.13 applied to the ring map $B \rightarrow C$ and the B -module $M = B/\mathfrak{m}_A B$ \square

10.51. Artinian rings

Artinian rings, and especially local Artinian rings, play an important role in algebraic geometry, for example in deformation theory.

Definition 10.51.1. A ring R is *Artinian* if it satisfies the descending chain condition for ideals.

Lemma 10.51.2. *Suppose R is a finite dimensional algebra over a field. Then R is Artinian.*

Proof. The descending chain condition for ideals obviously holds. \square

Lemma 10.51.3. *If R is Artinian then R has only finitely many maximal ideals.*

Proof. Suppose that $\mathfrak{m}_i, i = 1, 2, 3, \dots$ are maximal ideals. Then $\mathfrak{m}_1 \supset \mathfrak{m}_1 \cap \mathfrak{m}_2 \supset \mathfrak{m}_1 \cap \mathfrak{m}_2 \cap \mathfrak{m}_3 \supset \dots$ is an infinite descending sequence (because by the Chinese remainder theorem all the maps $R \rightarrow \bigoplus_{i=1}^n R/\mathfrak{m}_i$ are surjective). \square

Lemma 10.51.4. *Let R be Artinian. The radical $\text{rad}(R)$ of R is a nilpotent ideal.*

Proof. Denote the radical I . Note that $I \supset I^2 \supset I^3 \supset \dots$ is a descending sequence. Thus $I^n = I^{n+1}$ for some n . Set $J = \{x \in R \mid xI^n = 0\}$. We have to show $J = R$. If not, choose an ideal $J' \neq J, J \subset J'$ minimal (possible by the Artinian property). Then $J' = J + Rx$ for some $x \in R$. By NAK, Lemma 10.19.1, we have $IJ' \subset J$. Hence $xI^{n+1} \subset xI \cdot I^n \subset J \cdot I^n = 0$. Since $I^{n+1} = I^n$ we conclude $x \in J$. Contradiction. \square

Lemma 10.51.5. *Any ring with finitely many maximal ideals and locally nilpotent radical is the product of its localizations at its maximal ideals. Also, all primes are maximal.*

Proof. Let R be a ring with finitely many maximal ideals $\mathfrak{m}_1, \dots, \mathfrak{m}_n$. Let $I = \bigcap_{i=1}^n \mathfrak{m}_i$ be the radical of R . Assume I is locally nilpotent. Let \mathfrak{p} be a prime ideal of R . Since every prime contains every nilpotent element of R we see $\mathfrak{p} \supset \mathfrak{m}_1 \cap \dots \cap \mathfrak{m}_n$. Since $\mathfrak{m}_1 \cap \dots \cap \mathfrak{m}_n \supset \mathfrak{m}_1 \dots \mathfrak{m}_n$ we conclude $\mathfrak{p} \supset \mathfrak{m}_1 \dots \mathfrak{m}_n$. Hence $\mathfrak{p} \supset \mathfrak{m}_i$ for some i , and so $\mathfrak{p} = \mathfrak{m}_i$. By the Chinese remainder theorem (Lemma 10.14.3) we have $R/I \cong \bigoplus R/\mathfrak{m}_i$ which is a product of fields. Hence by Lemma 10.31.5 there are idempotents $e_i, i = 1, \dots, n$ with $e_i \bmod \mathfrak{m}_j = \delta_{ij}$. Hence $R = \prod Re_i$, and each Re_i is a ring with exactly one maximal ideal. \square

Lemma 10.51.6. *A ring R is Artinian if and only if it has finite length as a module over itself. Any such ring R is both Artinian and Noetherian, any prime ideal of R is a maximal ideal, and R is equal to the (finite) product of its localizations at its maximal ideals.*

Proof. If R has finite length over itself then it satisfies both the ascending chain condition and the descending chain condition for ideals. Hence it is both Noetherian and Artinian. Any Artinian ring is equal to product of its localizations at maximal ideals by Lemmas 10.51.3, 10.51.4, and 10.51.5.

Suppose that R is Artinian. We will show R has finite length over itself. It suffices to exhibit a chain of submodules whose successive quotients have finite length. By what we said above we may assume that R is local, with maximal ideal \mathfrak{m} . By Lemma 10.51.4 we have $\mathfrak{m}^n = 0$ for some n . Consider the sequence $0 = \mathfrak{m}^n \subset \mathfrak{m}^{n-1} \subset \dots \subset \mathfrak{m} \subset R$. By Lemma 10.50.6 the length of each subquotient $\mathfrak{m}^j/\mathfrak{m}^{j+1}$ is the dimension of this as a vector space over $\kappa(\mathfrak{m})$. This has to be finite since otherwise we would have an infinite descending chain of sub vector spaces which would correspond to an infinite descending chain of ideals in R . \square

10.52. Homomorphisms essentially of finite type

Some simple remarks on localizations of finite type ring maps.

Definition 10.52.1. Let $R \rightarrow S$ be a ring map.

- (1) We say that $R \rightarrow S$ is *essentially of finite type* if S is the localization of an R -algebra of finite type.
- (2) We say that $R \rightarrow S$ is *essentially of finite presentation* if S is the localization of an R -algebra of finite presentation.

Lemma 10.52.2. *The class of ring maps which are essentially of finite type is preserved under composition. Similarly for essentially of finite presentation.*

Proof. Omitted. \square

Lemma 10.52.3. *Let $R \rightarrow S$ be a ring map. Assume S is an Artinian local ring with maximal ideal \mathfrak{m} . Then*

- (1) $R \rightarrow S$ is finite if and only if $R \rightarrow S/\mathfrak{m}$ is finite,
- (2) $R \rightarrow S$ is of finite type if and only if $R \rightarrow S/\mathfrak{m}$ is of finite type.
- (3) $R \rightarrow S$ is essentially of finite type if and only if the composition $R \rightarrow S/\mathfrak{m}$ is essentially of finite type.

Proof. If $R \rightarrow S$ is finite, then $R \rightarrow S/\mathfrak{m}$ is finite by Lemma 10.7.3. Conversely, assume $R \rightarrow S/\mathfrak{m}$ is finite. As S has finite length over itself (Lemma 10.51.6) we can choose a filtration

$$0 \subset I_1 \subset \dots \subset I_n = S$$

by ideals such that $I_i/I_{i-1} \cong S/\mathfrak{m}$ as S -modules. Thus S has a filtration by R -submodules I_i such that each successive quotient is a finite R -module. Thus S is a finite R -module by Lemma 10.5.3.

If $R \rightarrow S$ is of finite type, then $R \rightarrow S/\mathfrak{m}$ is of finite type by Lemma 10.6.2. Conversely, assume that $R \rightarrow S/\mathfrak{m}$ is of finite type. Choose $f_1, \dots, f_n \in S$ which map to generators of S/\mathfrak{m} . Then $A = R[x_1, \dots, x_n] \rightarrow S$, $x_i \mapsto f_i$ is a ring map such that $A \rightarrow S/\mathfrak{m}$ is surjective (in particular finite). Hence $A \rightarrow S$ is finite by part (1) and we see that $R \rightarrow S$ is of finite type by Lemma 10.6.2.

If $R \rightarrow S$ is essentially of finite type, then $R \rightarrow S/\mathfrak{m}$ is essentially of finite type by Lemma 10.52.2. Conversely, assume that $R \rightarrow S/\mathfrak{m}$ is essentially of finite type. Suppose S/\mathfrak{m} is the localization of $R[x_1, \dots, x_n]/I$. Choose $f_1, \dots, f_n \in S$ whose

congruence classes modulo \mathfrak{m} correspond to the congruence classes of x_1, \dots, x_n modulo I . Consider the map $R[x_1, \dots, x_n] \rightarrow S$, $x_i \mapsto f_i$ with kernel J . Set $A = R[x_1, \dots, x_n]/J \subset S$ and $\mathfrak{p} = A \cap \mathfrak{m}$. Note that $A/\mathfrak{p} \subset S/\mathfrak{m}$ is equal to the image of $R[x_1, \dots, x_n]/I$ in S/\mathfrak{m} . Hence $\kappa(\mathfrak{p}) = S/\mathfrak{m}$. Thus $A_{\mathfrak{p}} \rightarrow S$ is finite by part (1). We conclude that S is essentially of finite type by Lemma 10.52.2. \square

10.53. K-groups

Let R be a ring. We will introduce two abelian groups associated to R . The first of the two is denoted $K'_0(R)$ and has the following properties:

- (1) For every finite R -module M there is given an element $[M]$ in $K'_0(R)$,
- (2) for every short exact sequence $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ we have the relation $[M] = [M'] + [M'']$,
- (3) the group $K'_0(R)$ is generated by the elements $[M]$, and
- (4) all relations in $K'_0(R)$ are \mathbf{Z} -linear combinations of the relations coming from exact sequences as above.

The actual construction is a bit more annoying since one has to take care that the collection of all finitely generated R -modules is a proper class. However, this problem can be overcome by taking as set of generators of the group $K'_0(R)$ the elements $[R^n/K]$ where n ranges over all integers and K ranges over all submodules $K \subset R^n$. The generators for the subgroup of relations imposed on these elements will be the relations coming from short exact sequences whose terms are of the form R^n/K . The element $[M]$ is defined by choosing n and K such that $M \cong R^n/K$ and putting $[M] = [R^n/K]$. Details left to the reader.

Lemma 10.53.1. *If R is an Artinian local ring then the length function defines a natural abelian group homomorphism $\text{length}_R : K'_0(R) \rightarrow \mathbf{Z}$.*

Proof. The length of any finite R -module is finite, because it is the quotient of R^n which has finite length by Lemma 10.51.6. And the length function is additive, see Lemma 10.50.3. \square

The second of the two is denoted $K_0(R)$ and has the following properties:

- (1) For every finite projective R -module M there is given an element $[M]$ in $K_0(R)$,
- (2) for every short exact sequence $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ of finite projective R -modules we have the relation $[M] = [M'] + [M'']$,
- (3) the group $K_0(R)$ is generated by the elements $[M]$, and
- (4) all relations in $K_0(R)$ are \mathbf{Z} -linear combinations of the relations coming from exact sequences as above.

The construction of this group is done as above.

We note that there is an obvious map $K_0(R) \rightarrow K'_0(R)$ which is not an isomorphism in general.

Example 10.53.2. Note that if $R = k$ is a field then we clearly have $K_0(k) = K'_0(k) \cong \mathbf{Z}$ with the isomorphism given by the dimension function (which is also the length function).

Example 10.53.3. Let k be a field. Then $K_0(k[x]) = K'_0(k[x]) = \mathbf{Z}$.

Since $R = k[x]$ is a principal ideal domain, any finite projective R -module is free. In a short exact sequence of modules

$$0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$$

we have $\text{rank}(M) = \text{rank}(M') + \text{rank}(M'')$, which gives $K_0(k[x]) = \mathbf{Z}$.

As for K'_0 , the structure theorem for modules of a PID says that any finitely generated R -module is of the form $M = R^r \times R/(d_1) \times \dots \times R/(d_k)$. Consider the short exact sequence

$$0 \rightarrow (d_i) \rightarrow R \rightarrow R/(d_i) \rightarrow 0$$

Since the ideal (d_i) is isomorphic to R as a module (it is free with generator d_i), in $K'_0(R)$ we have $[(d_i)] = [R]$. Then $[R/(d_i)] = [(d_i)] - [R] = 0$. From this it follows that any torsion part “disappears” in K'_0 . Again the rank of the free part determines that $K'_0(k[x]) = \mathbf{Z}$, and the canonical homomorphism from K_0 to K'_0 is an isomorphism.

Example 10.53.4. Let k be a field. Let $R = \{f \in k[x] \mid f(0) = f(1)\}$, compare Example 10.26.4. In this case $K_0(R) \cong k^* \oplus \mathbf{Z}$, but $K'_0(R) = \mathbf{Z}$.

Lemma 10.53.5. *Let $R = R_1 \times R_2$. Then $K_0(R) = K_0(R_1) \times K_0(R_2)$ and $K'_0(R) = K'_0(R_1) \times K'_0(R_2)$*

Proof. Omitted. □

Lemma 10.53.6. *Let R be an Artinian local ring. The map $\text{length}_R : K'_0(R) \rightarrow \mathbf{Z}$ of Lemma 10.53.1 is an isomorphism.*

Proof. Omitted. □

Lemma 10.53.7. *Let R be a local ring. Every finite projective R -module is finite free. The map $\text{rank}_R : K_0(R) \rightarrow \mathbf{Z}$ defined by $[M] \rightarrow \text{rank}_R(M)$ is well defined and an isomorphism.*

Proof. Let P be a finite projective R -module. The n generators of P give a surjection $R^n \rightarrow P$, and since P is projective it follows that $R^n \cong P \oplus Q$ for some projective module Q .

If $\mathfrak{m} \subset R$ is the maximal ideal, then P/\mathfrak{m} and Q/\mathfrak{m} are R/\mathfrak{m} -vector spaces, with $P/\mathfrak{m} \oplus Q/\mathfrak{m} \cong (R/\mathfrak{m})^n$. Say that $\dim P = p$, $\dim Q = q$, so $p + q = n$.

Choose elements a_1, \dots, a_p in P and b_1, \dots, b_q in Q lying above bases for P/\mathfrak{m} and Q/\mathfrak{m} . The homomorphism $R^n \rightarrow P \oplus Q \cong R^n$ given by $(r_1, \dots, r_n) \mapsto r_1 a_1 + \dots + r_p a_p + r_{p+1} b_1 + \dots + r_n b_q$ is a matrix A which is invertible over R/\mathfrak{m} . Let B be a matrix over R lying over the inverse of A in R/\mathfrak{m} . $AB = I + M$, where M is a matrix whose entries all lie in \mathfrak{m} . Thus $\det AB = 1 + x$, for $x \in \mathfrak{m}$, so AB is invertible, so A is invertible.

The homomorphism $R^p \rightarrow P$ given by $(r_1, \dots, r_p) \mapsto r_1 a_1 + \dots + r_p a_p$ inherits injectivity and surjectivity from A . Hence, $P \cong R^p$.

Next we show that the rank of a finite projective module over R is well defined: if $P \cong R^\alpha \cong R^\beta$, then $\alpha = \beta$. This is immediate in the vector space case, and so it is true in the general module case as well, by dividing out the maximal ideal on both sides. If $0 \rightarrow R^\alpha \rightarrow R^\beta \rightarrow R^\gamma \rightarrow 0$ is exact, the sequence splits, so $R^\beta \cong R^\alpha \oplus R^\gamma$, so $\beta = \alpha + \gamma$.

So far we have seen that the map $\text{rank}_R : K_0(R) \rightarrow \mathbf{Z}$ is a well-defined homomorphism. It is surjective because $\text{rank}_R[R] = 1$. It is injective because the element of $K_0(R)$ with rank $\pm\alpha$ is uniquely $\pm[R^\alpha]$. \square

Lemma 10.53.8. *Let R be a local Artinian ring. There is a commutative diagram*

$$\begin{array}{ccc} K_0(R) & \longrightarrow & K'_0(R) \\ \text{rank}_R \downarrow & & \downarrow \text{length}_R \\ \mathbf{Z} & \xrightarrow{\text{length}_R(R)} & \mathbf{Z} \end{array}$$

where the vertical maps are isomorphisms by Lemmas 10.53.6 and 10.53.7.

Proof. By induction on the rank of M . Suppose $[M] \in K_0(R)$. Then M is a finite projective R -module over a local ring, so M is free; $M \cong R^n$ for some n . The claim is that $\text{rank}(M)\text{length}_R(R) = \text{length}_R(M)$, or equivalently that $n\text{length}_R(R) = \text{length}_R(R^n)$ for all $n \geq 1$. When $n = 1$, this is clearly true. Suppose that $(n-1)\text{length}_R(R) = \text{length}_R(R^{n-1})$. Then since there is a split short exact sequence

$$0 \rightarrow R \rightarrow R^n \rightarrow R^{n-1} \rightarrow 0$$

by Lemma 10.50.3 we have

$$\begin{aligned} \text{length}_R(R^n) &= \text{length}_R(R) + \text{length}_R(R^{n-1}) \\ &= \text{length}_R(R) + (n-1)\text{length}_R(R) \\ &= n\text{length}_R(R) \end{aligned}$$

as desired. \square

10.54. Graded rings

A *graded ring* will be for us a ring S endowed with a direct sum decomposition $S = \bigoplus_{d \geq 0} S_d$ such that $S_d \cdot S_e \subset S_{d+e}$. Note that we do not allow nonzero elements in negative degrees. The *irrelevant ideal* is the ideal $S_+ = \bigoplus_{d > 0} S_d$. A *graded module* will be an S -module M endowed with a direct sum decomposition $M = \bigoplus_{n \in \mathbf{Z}} M_n$ such that $S_d \cdot M_e \subset M_{d+e}$. Note that for modules we do allow nonzero elements in negative degrees. We think of S as a graded S -module by setting $S_{-k} = (0)$ for $k > 0$. An element x (resp. f) of M (resp. S) is called *homogeneous* if $x \in M_d$ (resp. $f \in S_d$) for some d . A *map of graded S -modules* is a map of S -modules $\varphi : M \rightarrow M'$ such that $\varphi(M_d) \subset M'_d$. We do not allow maps to shift degrees. Let us denote $\text{GrHom}_0(M, N)$ the S_0 -module of homomorphisms of graded modules from M to N .

At this point there are the notions of graded ideal, graded quotient ring, graded submodule, graded quotient module, graded tensor product, etc. We leave it to the reader to find the relevant definitions, and lemmas. For example: A short exact sequence of graded modules is short exact in every degree.

Given a graded ring S , a graded S -module M and $n \in \mathbf{Z}$ we denote $M(n)$ the graded S -module with $M(n)_d = M_{n+d}$. This is called the *twist of M by n* . In particular we get modules $S(n)$, $n \in \mathbf{Z}$ which will play an important role in the study of projective schemes. There are some obvious functorial isomorphisms such

as $(M \oplus N)(n) = M(n) \oplus N(n)$, $(M \otimes_S N)(n) = M \otimes_S N(n) = M(n) \otimes_S N$. In addition we can define a graded S -module structure on the S_0 -module

$$\text{GrHom}(M, N) = \bigoplus_{n \in \mathbf{Z}} \text{GrHom}_n(M, N), \quad \text{GrHom}_n(M, N) = \text{GrHom}_0(M, N(n)).$$

We omit the definition of the multiplication.

Let S be a graded ring. Let $d \geq 1$ be an integer. We set $S^{(d)} = \bigoplus_{n \geq 0} S_{nd}$. We think of $S^{(d)}$ as a graded ring with degree n summand $(S^{(d)})_n = S_{nd}$. Given a graded S -module M we can similarly consider $M^{(d)} = \bigoplus_{n \in \mathbf{Z}} M_{nd}$ which is a graded $S^{(d)}$ -module.

Lemma 10.54.1. *Let $R \rightarrow S$ be a homomorphism of graded rings. Let $S' \subset S$ be the integral closure of R in S . Then*

$$S' = \bigoplus_{d \geq 0} S' \cap S_d,$$

i.e., S' is a graded R -subalgebra of S .

Proof. We have to show the following: If $s = s_n + s_{n+1} + \dots + s_m \in S'$, then each homogeneous part $s_j \in S'$. We will prove this by induction on $m - n$ over all homomorphisms $R \rightarrow S$ of graded rings. First note that it is immediate that s_0 is integral over R_0 (hence over R) as there is a ring map $S \rightarrow S_0$ compatible with the ring map $R \rightarrow R_0$. Thus, after replacing s by $s - s_0$, we may assume $n > 0$. Consider the extension of graded rings $R[t, t^{-1}] \rightarrow S[t, t^{-1}]$ where t has degree 0. There is a commutative diagram

$$\begin{array}{ccc} S[t, t^{-1}] & \xrightarrow{s \mapsto t^{\deg(s)} s} & S[t, t^{-1}] \\ \uparrow & & \uparrow \\ R[t, t^{-1}] & \xrightarrow{r \mapsto t^{\deg(r)} r} & R[t, t^{-1}] \end{array}$$

where the horizontal maps are ring automorphisms. Hence the integral closure C of $S[t, t^{-1}]$ over $R[t, t^{-1}]$ maps into itself. Thus we see that

$$t^m(s_n + s_{n+1} + \dots + s_m) - (t^n s_n + t^{n+1} s_{n+1} + \dots + t^m s_m) \in C$$

which implies by induction hypothesis that each $(t^m - t^i)s_i \in C$ for $i = n, \dots, m-1$. Note that for any ring A and $m > i \geq n > 0$ we have $A[t, t^{-1}]/(t^m - t^i - 1) \cong A[t]/(t^m - t^i - 1) \supset A$ because $t(t^{m-1} - t^{i-1}) = 1$ in $A[t]/(t^m - t^i - 1)$. Since $t^m - t^i$ maps to 1 we see the image of s_i in the ring $S[t]/(t^m - t^i - 1)$ is integral over $R[t]/(t^m - t^i - 1)$ for $i = n, \dots, m-1$. Since $R \rightarrow R[t]/(t^m - t^i - 1)$ is finite we see that s_i is integral over R by transitivity, see Lemma 10.35.6. Finally, we also conclude that $s_m = s - \sum_{i=n, \dots, m-1} s_i$ is integral over R . \square

10.55. Proj of a graded ring

Let S be a graded ring. A *homogeneous ideal* is simply an ideal $I \subset S$ which is also a graded submodule of S . Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$f = f_0 + f_1 + \dots + f_n$$

is the decomposition of f into homogeneous parts in S then $f_i \in I$ for each i . To check that a homogeneous ideal \mathfrak{p} is prime it suffices to check that if $ab \in \mathfrak{p}$ with a, b homogeneous then either $a \in \mathfrak{p}$ or $b \in \mathfrak{p}$.

Definition 10.55.1. Let S be a graded ring. We define $\text{Proj}(S)$ to be the set of homogeneous, prime ideals \mathfrak{p} of S such that $S_+ \not\subset \mathfrak{p}$. As $\text{Proj}(S)$ is a subset of $\text{Spec}(S)$ and we endow it with the induced topology. The topological space $\text{Proj}(S)$ is called the *homogeneous spectrum* of the graded ring S .

Note that by construction there is a continuous map

$$\text{Proj}(S) \longrightarrow \text{Spec}(S_0)$$

Let $S = \bigoplus_{d \geq 0} S_d$ be a graded ring. Let $f \in S_d$ and assume that $d \geq 1$. We define $S_{(f)}$ to be the subring of S_f consisting of elements of the form r/f^n with r homogeneous and $\deg(r) = nd$. If M is a graded S -module, then we define the $S_{(f)}$ -module $M_{(f)}$ as the sub module of M_f consisting of elements of the form x/f^n with x homogeneous of degree nd .

Lemma 10.55.2. *Let S be a \mathbf{Z} -graded ring. Let $f \in S_d$, $d > 0$ and assume f is invertible in S . The set $G \subset \text{Spec}(S)$ of \mathbf{Z} -graded primes of S (with induced topology) maps homeomorphically to $\text{Spec}(S_0)$.*

Proof. First we show that the map is a bijection by constructing an inverse. Namely, if \mathfrak{p}_0 is a prime of S_0 , then $\mathfrak{p}_0 S$ is a \mathbf{Z} -graded ideal of S such that $\mathfrak{p}_0 S \cap S_0 = \mathfrak{p}_0$. And if $ab \in \mathfrak{p}_0 S$ with a, b homogeneous, then $a^d b^d / f^{\deg(a)+\deg(b)} \in \mathfrak{p}_0$. Thus either $a^d / f^{\deg(a)} \in \mathfrak{p}_0$ or $b^d / f^{\deg(b)} \in \mathfrak{p}_0$, in other words either $a^d \in \mathfrak{p}_0 S$ or $b^d \in \mathfrak{p}_0 S$. It follows that $\sqrt{\mathfrak{p}_0 S}$ is a \mathbf{Z} -graded prime ideal of S whose intersection with S_0 is \mathfrak{p}_0 .

To show that the map is a homeomorphism we show that the image of $G \cap D(g)$ is open. If $g = \sum g_i$ with $g_i \in S_i$, then by the above $G \cap D(g)$ maps onto the set $\bigcup D(g_i^d / f^i)$ which is open. \square

For $f \in S$ homogeneous of degree > 0 we define

$$D_+(f) = \{\mathfrak{p} \in \text{Proj}(S) \mid f \notin \mathfrak{p}\}.$$

Finally, for a homogeneous ideal $I \subset S$ we define

$$V_+(I) = \{\mathfrak{p} \in \text{Proj}(S) \mid I \subset \mathfrak{p}\}.$$

We will use more generally the notation $V_+(E)$ for any set E of homogeneous elements $E \subset S$.

Lemma 10.55.3 (Topology on Proj). *Let $S = \bigoplus_{d \geq 0} S_d$ be a graded ring.*

- (1) *The sets $D_+(f)$ are open in $\text{Proj}(S)$.*
- (2) *We have $D_+(ff') = D_+(f) \cap D_+(f')$.*
- (3) *Let $g = g_0 + \dots + g_m$ be an element of S with $g_i \in S_i$. Then*

$$D(g) \cap \text{Proj}(S) = (D(g_0) \cap \text{Proj}(S)) \cup \bigcup_{i \geq 1} D_+(g_i).$$

- (4) *Let $g_0 \in S_0$ be a homogeneous element of degree 0. Then*

$$D(g_0) \cap \text{Proj}(S) = \bigcup_{f \in S_d, d \geq 1} D_+(g_0 f).$$

- (5) *The open sets $D_+(f)$ form a basis for the topology of $\text{Proj}(S)$.*
- (6) *Let $f \in S$ be homogeneous of positive degree. The ring S_f has a natural \mathbf{Z} -grading. The ring maps $S \rightarrow S_f \leftarrow S_{(f)}$ induce homeomorphisms*

$$D_+(f) \leftarrow \{\mathbf{Z}\text{-graded primes of } S_f\} \rightarrow \text{Spec}(S_{(f)}).$$

- (7) *There exists an S such that $\text{Proj}(S)$ is not quasi-compact.*
 (8) *The sets $V_+(I)$ are closed.*
 (9) *Any closed subset $T \subset \text{Proj}(S)$ is of the form $V_+(I)$ for some homogeneous ideal $I \subset S$.*
 (10) *For any graded ideal $I \subset S$ we have $V_+(I) = \emptyset$ if and only if $S_+ \subset \sqrt{I}$.*

Proof. Since $D_+(f) = \text{Proj}(S) \cap D(f)$, these sets are open. Similarly the sets $V_+(I) = \text{Proj}(S) \cap V(E)$ are closed.

Suppose that $T \subset \text{Proj}(S)$ is closed. Then we can write $T = \text{Proj}(S) \cap V(J)$ for some ideal $J \subset S$. By definition of a homogeneous ideal if $g \in J$, $g = g_0 + \dots + g_m$ with $g_d \in S_d$ then $g_d \in \mathfrak{p}$ for all $\mathfrak{p} \in T$. Thus, letting $I \subset S$ be the ideal generated by the homogeneous parts of the elements of J we have $T = V_+(I)$.

The formula for $\text{Proj}(S) \cap D(g)$, with $g \in S$ is direct from the definitions. Consider the formula for $\text{Proj}(S) \cap D(g_0)$. The inclusion of the right hand side in the left hand side is obvious. For the other inclusion, suppose $g_0 \notin \mathfrak{p}$ with $\mathfrak{p} \in \text{Proj}(S)$. If all $g_0 f \in \mathfrak{p}$ for all homogeneous f of positive degree, then we see that $S_+ \subset \mathfrak{p}$ which is a contradiction. This gives the other inclusion.

The collection of opens $D(g) \cap \text{Proj}(S)$ forms a basis for the topology since the standard opens $D(g) \subset \text{Spec}(S)$ form a basis for the topology on $\text{Spec}(S)$. By the formulas above we can express $D(g) \cap \text{proj}(S)$ as a union of opens $D_+(f)$. Hence the collection of opens $D_+(f)$ forms a basis for the topology also.

First we note that $D_+(f)$ may be identified with a subset (with induced topology) of $D(f) = \text{Spec}(S_f)$ via Lemma 10.16.6. Note that the ring S_f has a \mathbf{Z} -grading. The homogeneous elements are of the form r/f^n with $r \in S$ homogeneous and have degree $\deg(r/f^n) = \deg(r) - n \deg(f)$. The subset $D_+(f)$ corresponds exactly to those prime ideals $\mathfrak{p} \subset S_f$ which are \mathbf{Z} -graded ideals (i.e., generated by homogeneous elements). Hence we have to show that the set of \mathbf{Z} -graded prime ideals of S_f maps homeomorphically to $\text{Spec}(S_{(f)})$. This follows from Lemma 10.55.2.

Let $S = \mathbf{Z}[X_1, X_2, X_3, \dots]$ with grading such that each X_i has degree 1. Then it is easy to see that

$$\text{Proj}(S) = \bigcup_{i=1}^{\infty} D_+(X_i)$$

does not have a finite refinement.

Let $I \subset S$ be a graded ideal. If $\sqrt{I} \supset S_+$ then $V_+(I) = \emptyset$ since every prime $\mathfrak{p} \in \text{Proj}(S)$ does not contain S_+ by definition. Conversely, suppose that $S_+ \not\subset \sqrt{I}$. Then we can find an element $f \in S_+$ such that f is not nilpotent modulo I . Clearly this means that one of the homogeneous parts of f is not nilpotent modulo I , in other words we may (and do) assume that f is homogeneous. This implies that $IS_f \neq 0$, in other words that $(S/I)_f$ is not zero. Hence $(S/I)_{(f)} \neq 0$ since it is a ring which maps into $(S/I)_f$. Pick a prime $\mathfrak{q} \subset (S/I)_{(f)}$. This corresponds to a graded prime of S/I , not containing the irrelevant ideal $(S/I)_+$. And this in turn corresponds to a graded prime ideal \mathfrak{p} of S , containing I but not containing S_+ as desired. \square

Example 10.55.4. Let R be a ring. If $S = R[X]$ with $\deg(X) = 1$, then the natural map $\text{Proj}(S) \rightarrow \text{Spec}(R)$ is a bijection and in fact a homeomorphism. Namely, suppose $\mathfrak{p} \in \text{Proj}(S)$. Since $S_+ \not\subset \mathfrak{p}$ we see that $X \notin \mathfrak{p}$. Thus if $aX^n \in \mathfrak{p}$ with $a \in R$ and $n > 0$, then $a \in \mathfrak{p}$. It follows that $\mathfrak{p} = \mathfrak{p}_0 S$ with $\mathfrak{p}_0 = \mathfrak{p} \cap R$.

If $\mathfrak{p} \in \text{Proj}(S)$, then we define $S_{(\mathfrak{p})}$ to be the ring whose elements are fractions r/f where $r, f \in S$ are homogeneous elements of the same degree such that $f \notin \mathfrak{p}$. As usual we say $r/f = r'/f'$ if and only if there exists some $f'' \in S$ homogeneous, $f'' \notin \mathfrak{p}$ such that $f''(rf' - r'f) = 0$. Given a graded S -module M we let $M_{(\mathfrak{p})}$ be the $S_{(\mathfrak{p})}$ -module whose elements are fractions x/f with $x \in M$ and $f \in S$ homogeneous of the same degree such that $f \notin \mathfrak{p}$. We say $x/f = x'/f'$ if and only if there exists some $f'' \in S$ homogeneous, $f'' \notin \mathfrak{p}$ such that $f''(xf' - x'f) = 0$.

Lemma 10.55.5. *Let S be a graded ring. Let M be a graded S -module. Let \mathfrak{p} be an element of $\text{Proj}(S)$. Let $f \in S$ be a homogeneous element of positive degree such that $f \notin \mathfrak{p}$, i.e., $\mathfrak{p} \in D_+(f)$. Let $\mathfrak{p}' \subset S_{(f)}$ be the element of $\text{Spec}(S_{(f)})$ corresponding to \mathfrak{p} as in Lemma 10.55.3. Then $S_{(\mathfrak{p})} = (S_{(f)})_{\mathfrak{p}'}$ and compatibly $M_{(\mathfrak{p})} = (M_{(f)})_{\mathfrak{p}'}$.*

Proof. We define a map $\psi : M_{(\mathfrak{p})} \rightarrow (M_{(f)})_{\mathfrak{p}'}$. Let $x/g \in M_{(\mathfrak{p})}$. We set

$$\psi(x/g) = (xg^{\deg(f)-1}/f^{\deg(x)})/(g^{\deg(f)}/f^{\deg(g)}).$$

This makes sense since $\deg(x) = \deg(g)$ and since $g^{\deg(f)}/f^{\deg(g)} \notin \mathfrak{p}'$. We omit the verification that ψ is well defined, a module map and an isomorphism. Hint: the inverse sends $(x/f^n)/(g/f^m)$ to $(xf^m)/(gf^n)$. \square

Here is a graded variant of Lemma 10.14.2.

Lemma 10.55.6. *Suppose S is a graded ring, \mathfrak{p}_i , $i = 1, \dots, r$ homogeneous prime ideals and $I \subset S_+$ a graded ideal. Assume $I \not\subset \mathfrak{p}_i$ for all i . Then there exists a homogeneous element $x \in I$ of positive degree such that $x \notin \mathfrak{p}_i$ for all i .*

Proof. We may assume there are no inclusions among the \mathfrak{p}_i . The result is true for $r = 1$. Suppose the result holds for $r - 1$. Pick $x \in I$ homogeneous of positive degree such that $x \notin \mathfrak{p}_i$ for all $i = 1, \dots, r - 1$. If $x \notin \mathfrak{p}_r$ we are done. So assume $x \in \mathfrak{p}_r$. If $I\mathfrak{p}_1 \dots \mathfrak{p}_{r-1} \subset \mathfrak{p}_r$ then $I \subset \mathfrak{p}_r$ a contradiction. Pick $y \in I\mathfrak{p}_1 \dots \mathfrak{p}_{r-1}$ homogeneous and $y \notin \mathfrak{p}_r$. Then $x^{\deg(y)} + y^{\deg(x)}$ works. \square

Lemma 10.55.7. *Let S be a graded ring. Let $\mathfrak{p} \subset S$ be a prime. Let \mathfrak{q} be the homogeneous ideal of S generated by the homogeneous elements of \mathfrak{p} . Then \mathfrak{q} is a prime ideal of S .*

Proof. Suppose $f, g \in S$ are such that $fg \in \mathfrak{q}$. Let f_d (resp. g_e) be the homogeneous part of f (resp. g) of degree d (resp. e). Assume d, e are maxima such that $f_d \neq 0$ and $g_e \neq 0$. By assumption we can write $fg = \sum a_i f_i$ with $f_i \in \mathfrak{p}$ homogeneous. Say $\deg(f_i) = d_i$. Then $f_d g_e = \sum a'_i f_i$ with a'_i to homogeneous part of degree $d + e - d_i$ (or 0 if $d + e - d_i < 0$). Hence $f_d \in \mathfrak{p}$ or $g_e \in \mathfrak{p}$. Hence $f_d \in \mathfrak{q}$ or $g_e \in \mathfrak{q}$. In the first case replace f by $f - f_d$, in the second case replace g by $g - g_e$. Then still $fg \in \mathfrak{q}$ but the discrete invariant $d + e$ has been decreased. Thus we may continue in this fashion until either f or g is zero. This clearly shows that $fg \in \mathfrak{q}$ implies either $f \in \mathfrak{q}$ or $g \in \mathfrak{q}$ as desired. \square

Lemma 10.55.8. *Let S be a graded ring.*

- (1) *Any minimal prime of S is a homogeneous ideal of S .*
- (2) *Given a homogeneous ideal $I \subset S$ any minimal prime over I is homogeneous.*

Proof. The first assertion holds because the prime \mathfrak{q} constructed in Lemma 10.55.7 satisfies $\mathfrak{q} \subset \mathfrak{p}$. The second because we may consider S/I and apply the first part. \square

Lemma 10.55.9. *Let R be a ring. Let S be a graded R -algebra. Assume that S is of finite type over R . Then for every homogeneous $f \in S_+$ the ring $S_{(f)}$ is of finite type over R .*

Proof. Choose $f_1, \dots, f_n \in S$ which generate S as an R -algebra. We may assume that each f_i is homogeneous (by decomposing each f_i into its homogeneous components). An element of $S_{(f)}$ is a sum of the form

$$\sum_{e \deg(f) = \sum e_i \deg(f_i)} \lambda_{e_1 \dots e_n} f_1^{e_1} \dots f_n^{e_n} / f^e$$

with $\lambda_{e_1 \dots e_n} \in R$. Thus $S_{(f)}$ is generated as an R -algebra by the $f_1^{e_1} \dots f_n^{e_n} / f^e$ with the property that $e \deg(f) = \sum e_i \deg(f_i)$. If $e_i \geq \deg(f)$ then we can write this as

$$f_1^{e_1} \dots f_n^{e_n} / f^e = f_i^{\deg(f)} / f^{\deg(f_i)} \cdot f_1^{e_1} \dots f_i^{e_i - \deg(f)} \dots f_n^{e_n} / f^{e - \deg(f_i)}$$

Thus we only need the elements $f_i^{\deg(f)} / f^{\deg(f_i)}$ as well as the elements $f_1^{e_1} \dots f_n^{e_n} / f^e$ with $e \deg(f) = \sum e_i \deg(f_i)$ and $e_i \leq \deg(f)$. This is a finite list and we win. \square

Lemma 10.55.10. *Let R be a ring. Let R' be a finite type R -algebra, and let M be a finite R' -module. There exists a graded R -algebra S , a graded S -module N and an element $f \in S$ homogeneous of degree 1 such that*

- (1) $R' \cong S_{(f)}$ and $M \cong N_{(f)}$ (as modules),
- (2) $S_0 = R$ and S is generated by finitely many elements of degree 1 over R ,
and
- (3) N is a finite S -module.

Proof. We may write $R' = R[x_1, \dots, x_n]/I$ for some ideal I . For an element $g \in R[x_1, \dots, x_n]$ denote $\tilde{g} \in R[x_0, \dots, x_n]$ the element homogeneous of minimal degree such that $g = \tilde{g}(1, x_1, \dots, x_n)$. Let $\tilde{I} \subset R[X_0, \dots, X_n]$ generated by all elements $\tilde{g}, g \in I$. Set $S = R[X_0, \dots, X_n]/\tilde{I}$ and denote f the image of X_0 in S . By construction we have an isomorphism

$$S_{(f)} \longrightarrow R', \quad X_i/X_0 \longmapsto x_i.$$

To do the same thing with the module M we choose a presentation

$$M = (R')^{\oplus r} / \sum_{j \in J} R' k_j$$

with $k_j = (k_{1j}, \dots, k_{rj})$. Let $d_{ij} = \deg(\tilde{k}_{ij})$. Set $d_j = \max\{d_{ij}\}$. Set $K_{ij} = X_0^{d_j - d_{ij}} \tilde{k}_{ij}$ which is homogeneous of degree d_j . With this notation we set

$$N = \text{Coker} \left(\bigoplus_{j \in J} S(-d_j) \xrightarrow{(K_{ij})} S^{\oplus r} \right)$$

which works. Some details omitted. \square

10.56. Blow up algebras

In this section we make some elementary observations about blowing up.

Definition 10.56.1. Let R be a ring. Let $I \subset R$ be an ideal.

- (1) The *blowup algebra*, or the *Rees algebra*, associated to the pair (R, I) is the graded R -algebra

$$\text{Bl}_I(R) = \bigoplus_{n \geq 0} I^n = R \oplus I \oplus I^2 \oplus \dots$$

where the summand I^n is placed in degree n .

- (2) Let $a \in I$ be an element. Denote $a^{(1)}$ the element a seen as an element of degree 1 in the Rees algebra. Then the *affine blowup algebra* $R[\frac{I}{a}]$ is the algebra $(\text{Bl}_I(R))_{(a^{(1)})}$ constructed in Section 10.55.

In other words, an element of $R[\frac{I}{a}]$ is represented by an expression of the form x/a^n with $x \in I^n$. Two representatives x/a^n and y/a^m define the same element if and only if $a^k(a^m x - a^n y) = 0$ for some $k \geq 0$.

Lemma 10.56.2. *Let R be a ring, $I \subset R$ an ideal, and $a \in I$. The image of a in the blowup algebra $R' = R[\frac{I}{a}]$ is a nonzerodivisor and $IR' = aR'$.*

Proof. Immediate from the description of $R[\frac{I}{a}]$ above. □

Lemma 10.56.3. *Let R be a ring, $I \subset R$ an ideal, and $a \in I$. Set $R' = R[\frac{I}{a}]$. If $f \in R$ is such that $V(f) = V(I)$, then f maps to a nonzerodivisor in R' and $R'_f = R'_a = R_f$.*

Proof. We will use the results of Lemma 10.56.2 without further mention. The assumption $V(f) = V(I)$ implies $V(fR') = V(IR') = V(aR')$. Hence $a^n = fb$ and $f^m = ac$ for some $b, c \in R'$. The lemma follows. □

Lemma 10.56.4. *If R is a domain then every (affine) blowup algebra of R is a domain.*

Proof. Omitted. □

Lemma 10.56.5. *If R is reduced then every (affine) blowup algebra of R is reduced.*

Proof. Omitted. □

Lemma 10.56.6. *Let R be a ring. Let $I \subset R$ be an ideal. Let $a \in I$. If a is not contained in any minimal prime of R , then $\text{Spec}(R[\frac{I}{a}]) \rightarrow \text{Spec}(R)$ has dense image.*

Proof. If $a^k x = 0$ for $x \in R$, then x is contained in all the minimal primes of R and hence nilpotent, see Lemma 10.16.2. Thus the kernel of $R \rightarrow R[\frac{I}{a}]$ consists of nilpotent elements. Hence the result follows from Lemma 10.29.6. □

Lemma 10.56.7. *Let (R, \mathfrak{m}) be a local domain with fraction field K . Let $R \subset A \subset K$ be a valuation ring which dominates R . Then*

$$A = \text{colim } R[\frac{I}{a}]$$

is a directed colimit of affine blowups $R \rightarrow R[\frac{I}{a}]$ with the following two properties

- (1) $a \in I \subset \mathfrak{m}$,
- (2) I is finitely generated, and
- (3) the fibre ring of $R \rightarrow R[\frac{I}{a}]$ at \mathfrak{m} is not zero.

Proof. Consider a finite subset $E \subset A$. Say $E = \{e_1, \dots, e_n\}$. Choose a nonzero $a \in R$ such that we can write $e_i = f_i/a$ for all $i = 1, \dots, n$. Set $I = (f_1, \dots, f_n, a)$. We claim that $R[\frac{I}{a}] \subset A$. This is clear as an element of $R[\frac{I}{a}]$ can be represented as a polynomial in the elements e_i . The lemma follows immediately from this observation. □

10.57. Noetherian graded rings

A bit of theory on Noetherian graded rings including some material on Hilbert polynomials.

Lemma 10.57.1. *Let S be a graded ring. A set of homogeneous elements $f_i \in S_+$ generates S as an algebra over S_0 if and only if they generate S_+ as an ideal of S .*

Proof. If the f_i generate S as an algebra over S_0 then every element in S_+ is a polynomial without constant term in the f_i and hence S_+ is generated by the f_i as an ideal. Conversely, suppose that $S_+ = \sum S f_i$. We will prove that any element f of S can be written as a polynomial in the f_i with coefficients in S_0 . It suffices to do this for homogeneous elements. Say f has degree d . Then we may perform induction on d . The case $d = 0$ is immediate. If $d > 0$ then $f \in S_+$ hence we can write $f = \sum g_i f_i$ for some $g_i \in S$. As S is graded we can replace g_i by its homogeneous component of degree $d - \deg(f_i)$. By induction we see that each g_i is a polynomial in the f_i and we win. \square

Lemma 10.57.2. *A graded ring S is Noetherian if and only if S_0 is Noetherian and S_+ is finitely generated as an ideal of S .*

Proof. It is clear that if S is Noetherian then $S_0 = S/S_+$ is Noetherian and S_+ is finitely generated. Conversely, assume S_0 is Noetherian and S_+ finitely generated as an ideal of S . Pick generators $S_+ = (f_1, \dots, f_n)$. By decomposing the f_i into homogeneous pieces we may assume each f_i is homogeneous. By Lemma 10.57.1 we see that $S_0[X_1, \dots, X_n] \rightarrow S$ sending X_i to f_i is surjective. Thus S is Noetherian by Lemma 10.30.1. \square

Definition 10.57.3. Let A be an abelian group. We say that a function $f : n \mapsto f(n) \in A$ defined for all sufficient large integers n is a *numerical polynomial* if there exists $r \geq 0$, elements $a_0, \dots, a_r \in A$ such that

$$f(n) = \sum_{i=0}^r \binom{n}{i} a_i$$

for all $n \gg 0$.

The reason for using the binomial coefficients is the elementary fact that any polynomial $P \in \mathbf{Q}[T]$ all of whose values at integer points are integers, is equal to a sum $P(T) = \sum a_i \binom{T}{i}$ with $a_i \in \mathbf{Z}$. Note that in particular the expressions $\binom{T+1}{i+1}$ are of this form.

Lemma 10.57.4. *If $A \rightarrow A'$ is a homomorphism of abelian groups and if $f : n \mapsto f(n) \in A$ is a numerical polynomial, then so is the composition.*

Proof. This is immediate from the definitions. \square

Lemma 10.57.5. *Suppose that $f : n \mapsto f(n) \in A$ is defined for all n sufficiently large and suppose that $n \mapsto f(n) - f(n-1)$ is a numerical polynomial. Then f is a numerical polynomial.*

Proof. Let $f(n) - f(n-1) = \sum_{i=0}^r \binom{n}{i} a_i$ for all $n \gg 0$. Set $g(n) = f(n) - \sum_{i=0}^r \binom{n+1}{i+1} a_i$. Then $g(n) - g(n-1) = 0$ for all $n \gg 0$. Hence g is eventually constant, say equal to a_{-1} . We leave it to the reader to show that $a_{-1} + \sum_{i=0}^r \binom{n+1}{i+1} a_i$ has the required shape (see remark above the lemma). \square

Lemma 10.57.6. *If M is a finitely generated graded S -module, and if S is finitely generated over S_0 , then each M_n is a finite S_0 -module.*

Proof. Suppose the generators of M are m_i and the generators of S are f_i . By taking homogeneous components we may assume that the m_i and the f_i are homogeneous and we may assume $f_i \in S_+$. In this case it is clear that each M_n is generated over S_0 by the “monomials” $\prod f_i^{e_i} m_j$ whose degree is n . \square

Proposition 10.57.7. *Suppose that S is a Noetherian graded ring and M a finite graded S -module. Consider the function*

$$\mathbf{Z} \longrightarrow K'_0(S_0), \quad n \longmapsto [M_n]$$

see Lemma 10.57.6. If S_+ is generated by elements of degree 1, then this function is a numerical polynomial.

Proof. We prove this by induction on the minimal number of generators of S_1 . If this number is 0, then $M_n = 0$ for all $n \gg 0$ and the result holds. To prove the induction step, let $x \in S_1$ be one of a minimal set of generators, such that the induction hypothesis applies to the graded ring $S/(x)$.

First we show the result holds if x is nilpotent on M . This we do by induction on the minimal integer r such that $x^r M = 0$. If $r = 1$, then M is a module over S/xS and the result holds (by the other induction hypothesis). If $r > 1$, then we can find a short exact sequence $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ such that the integers r', r'' are strictly smaller than r . Thus we know the result for M'' and M' . Hence we get the result for M because of the relation $[M_d] = [M'_d] + [M''_d]$ in $K'_0(S_0)$.

If x is not nilpotent on M , let $M' \subset M$ be the largest submodule on which x is nilpotent. Consider the exact sequence $0 \rightarrow M' \rightarrow M \rightarrow M/M' \rightarrow 0$ we see again it suffices to prove the result for M/M' . In other words we may assume that multiplication by x is injective.

Let $\overline{M} = M/xM$. Note that the map $x : M \rightarrow M$ is *not* a map of graded S -modules, since it does not map M_d into M_d . Namely, for each d we have the following short exact sequence

$$0 \rightarrow M_d \xrightarrow{x} M_{d+1} \rightarrow \overline{M}_{d+1} \rightarrow 0$$

This proves that $[M_{d+1}] - [M_d] = [\overline{M}_{d+1}]$. Hence we win by Lemma 10.57.5. \square

Remark 10.57.8. If S is still Noetherian but S is not generated in degree 1, then the function associated to a graded S -module is a periodic polynomial (i.e., it is a numerical polynomial on the congruence classes of integers modulo n for some n).

Example 10.57.9. Suppose that $S = k[X_1, \dots, X_d]$. By Example 10.53.2 we may identify $K_0(k) = K'_0(k) = \mathbf{Z}$. Hence any finitely generated graded $k[X_1, \dots, X_d]$ -module gives rise to a numerical polynomial $n \mapsto \dim_k(M_n)$.

Lemma 10.57.10. *Let k be a field. Suppose that $I \subset k[X_1, \dots, X_d]$ is a nonzero graded ideal. Let $M = k[X_1, \dots, X_d]/I$. Then the numerical polynomial $n \mapsto \dim_k(M_n)$ (see Example 10.57.9) has degree $< d - 1$ (or is zero if $d = 1$).*

Proof. The numerical polynomial associated to the graded module $k[X_1, \dots, X_n]$ is $n \mapsto \binom{n-1+d}{d-1}$. For any nonzero homogeneous $f \in I$ of degree e and any degree $n \gg e$ we have $I_n \supset f \cdot k[X_1, \dots, X_d]_{n-e}$ and hence $\dim_k(I_n) \geq \binom{n-e-1+d}{d-1}$. Hence

$\dim_k(M_n) \leq \binom{n-1+d}{d-1} - \binom{n-e-1+d}{d-1}$. We win because the last expression has degree $< d-1$ (or is zero if $d=1$). \square

10.58. Noetherian local rings

In all of this section $(R, \mathfrak{m}, \kappa)$ is a Noetherian local ring. We develop some theory on Hilbert functions of modules in this section. Let M be a finite R -module. We define the *Hilbert function* of M to be the function

$$\varphi_M : n \mapsto \text{length}_R(\mathfrak{m}^n M / \mathfrak{m}^{n+1} M)$$

defined for all integers $n \geq 0$. Another important invariant is the function

$$\chi_M : n \mapsto \text{length}_R(M / \mathfrak{m}^{n+1} M)$$

defined for all integers $n \geq 0$. Note that we have by Lemma 10.50.3 that

$$\chi_M(n) = \sum_{i=0}^n \varphi_M(i).$$

There is a variant of this construction which uses an ideal of definition.

Definition 10.58.1. Let (R, \mathfrak{m}) be a local Noetherian ring. An ideal $I \subset R$ such that $\sqrt{I} = \mathfrak{m}$ is called an *ideal of definition* of R .

Let $I \subset R$ be an ideal of definition. Because R is Noetherian this means that $\mathfrak{m}^r \subset I$ for some r , see Lemma 10.31.4. Hence any finite R -module annihilated by a power of I has a finite length, see Lemma 10.50.8. Thus it makes sense to define

$$\varphi_{I,M}(n) = \text{length}_R(I^n M / I^{n+1} M) \quad \text{and} \quad \chi_{I,M}(n) = \text{length}_R(M / I^{n+1} M)$$

for all $n \geq 0$. Again we have that

$$\chi_{I,M}(n) = \sum_{i=0}^n \varphi_{I,M}(i).$$

Lemma 10.58.2. *Suppose that $M' \subset M$ are finite R -modules with finite length quotient. Then there exists a constants c_1, c_2 such that for all $n \geq c_2$ we have*

$$c_1 + \chi_{I,M'}(n - c_2) \leq \chi_{I,M}(n) \leq c_1 + \chi_{I,M'}(n)$$

Proof. Since M/M' has finite length there is a $c_2 \geq 0$ such that $I^{c_2} M \subset M'$. Let $c_1 = \text{length}_R(M/M')$. For $n \geq c_2$ we have

$$\begin{aligned} \chi_{I,M}(n) &= \text{length}_R(M / I^{n+1} M) \\ &= c_1 + \text{length}_R(M' / I^{n+1} M) \\ &\leq c_1 + \text{length}_R(M' / I^{n+1} M') \\ &= c_1 + \chi_{I,M'}(n) \end{aligned}$$

On the other hand, since $I^{c_2} M \subset M'$, we have $I^n M \subset I^{n-c_2} M'$ for $n \geq c_2$. Thus for $n \geq c_2$ we get

$$\begin{aligned} \chi_{I,M}(n) &= \text{length}_R(M / I^{n+1} M) \\ &= c_1 + \text{length}_R(M' / I^{n+1} M) \\ &\geq c_1 + \text{length}_R(M' / I^{n+1-c_2} M') \\ &= c_1 + \chi_{I,M'}(n - c_2) \end{aligned}$$

which finishes the proof. \square

Lemma 10.58.3. *Suppose that $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ is a short exact sequence of finite R -modules. Then there exists a submodule $N \subset M'$ with finite colength l and $c \geq 0$ such that*

$$\chi_{I,M}(n) = \chi_{I,M''}(n) + \chi_{I,N}(n - c) + l$$

and

$$\varphi_{I,M}(n) = \varphi_{I,M''}(n) + \varphi_{I,N}(n - c)$$

for all $n \geq c$.

Proof. Note that $M/I^n M \rightarrow M''/I^n M''$ is surjective with kernel $M'/M' \cap I^n M$. By the Artin-Rees Lemma 10.49.2 there exists a constant c such that $M' \cap I^n M = I^{n-c}(M' \cap I^c M)$. Denote $N = M' \cap I^c M$. Note that $I^c M' \subset N \subset M'$. Hence $\text{length}_R(M'/M' \cap I^n M) = \text{length}_R(M'/N) + \text{length}_R(N/I^{n-c}N)$ for $n \geq c$. From the short exact sequence

$$0 \rightarrow M'/M' \cap I^n M \rightarrow M/I^n M \rightarrow M''/I^n M'' \rightarrow 0$$

and additivity of lengths (Lemma 10.50.3) we obtain the equality

$$\chi_{I,M}(n - 1) = \chi_{I,M''}(n - 1) + \chi_{I,N}(n - c - 1) + \text{length}_R(M'/N)$$

for $n \geq c$. We have $\varphi_{I,M}(n) = \chi_{I,M}(n) - \chi_{I,M}(n - 1)$ and similarly for the modules M'' and N . Hence we get $\varphi_{I,M}(n) = \varphi_{I,M''}(n) + \varphi_{I,N}(n - c)$ for $n \geq c$. \square

Lemma 10.58.4. *Suppose that I, I' are two ideals of definition for the Noetherian local ring R . Let M be a finite R -module. There exists a constant a such that $\chi_{I,M}(n) \leq \chi_{I',M}(an)$ for $n \geq 1$.*

Proof. There exists an integer c such that $(I')^c \subset I$. Hence we get a surjection $M/(I')^{c(n+1)}M \rightarrow M/I^{n+1}M$. Whence the result with $a = c + 1$. \square

Proposition 10.58.5. *Let R be a Noetherian local ring. Let M be a finite R -module. Let $I \subset R$ be an ideal of definition. The Hilbert function $\varphi_{I,M}$ and the function $\chi_{I,M}$ are numerical polynomials.*

Proof. Consider the graded ring $S = R/I \oplus I/I^2 \oplus I^2/I^3 \oplus \dots = \bigoplus_{d \geq 0} I^d/I^{d+1}$. Consider the graded S -module $N = M/IM \oplus IM/I^2M \oplus \dots = \bigoplus_{d \geq 0} I^d M/I^{d+1}M$. This pair (S, N) satisfies the hypotheses of Proposition 10.57.7. Hence the result for $\varphi_{I,M}$ follows from that proposition and Lemma 10.53.1. The result for $\chi_{I,M}$ follows from this and Lemma 10.57.5. \square

Definition 10.58.6. Let R be a Noetherian local ring. Let M be a finite R -module. The *Hilbert polynomial* of M over R is the element $P(t) \in \mathbf{Q}[t]$ such that $P(n) = \varphi_M(n)$ for $n \gg 0$.

By Proposition 10.58.5 we see that the Hilbert polynomial exists.

Lemma 10.58.7. *Let R be a Noetherian local ring. Let M be a finite R -module.*

- (1) *The degree of the numerical polynomial $\varphi_{I,M}$ is independent of the ideal of definition I .*
- (2) *The degree of the numerical polynomial $\chi_{I,M}$ is independent of the ideal of definition I .*

Proof. Part (2) follows immediately from Lemma 10.58.4. Part (1) follows from (2) because $\varphi_{I,M}(n) = \chi_{I,M}(n) - \chi_{I,M}(n - 1)$ for $n \geq 1$. \square

Definition 10.58.8. Let R be a local Noetherian ring and M a finite R -module. We denote $d(M)$ the element of $\{-\infty, 0, 1, 2, \dots\}$ defined as follows:

- (1) If $M = 0$ we set $d(M) = -\infty$,
- (2) if $M \neq 0$ then $d(M)$ is the degree of the numerical polynomial χ_M .

If $\mathfrak{m}^n M \neq 0$ for all n , then we see that $d(M)$ is the degree $+1$ of the Hilbert polynomial of M .

Lemma 10.58.9. Let R be a Noetherian local ring. Let $I \subset R$ be an ideal of definition. Let M be a finite R -module which does not have finite length. If $M' \subset M$ is a submodule with finite colength, then $\chi_{I,M} - \chi_{I,M'}$ is a polynomial of degree $<$ degree of either polynomial.

Proof. Follows from Lemma 10.58.2 by elementary calculus. \square

Lemma 10.58.10. Let R be a Noetherian local ring. Let $I \subset R$ be an ideal of definition. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence of finite R -modules. Then

- (1) if M' does not have finite length, then $\chi_{I,M} - \chi_{I,M''} - \chi_{I,M'}$ is a numerical polynomial of degree $<$ the degree of $\chi_{I,M'}$,
- (2) $\max\{\deg(\chi_{I,M'}), \deg(\chi_{I,M''})\} = \deg(\chi_{I,M})$, and
- (3) $\max\{d(M'), d(M'')\} = d(M)$,

Proof. We first prove (1). Let $N \subset M'$ be as in Lemma 10.58.3. By Lemma 10.58.9 the numerical polynomial $\chi_{I,M'} - \chi_{I,N}$ has degree $<$ the common degree of $\chi_{I,M'}$ and $\chi_{I,N}$. By Lemma 10.58.3 the difference

$$\chi_{I,M}(n) - \chi_{I,M''}(n) - \chi_{I,N}(n - c)$$

is constant for $n \gg 0$. By elementary calculus the difference $\chi_{I,N}(n) - \chi_{I,N}(n - c)$ has degree $<$ the degree of $\chi_{I,N}$ which is bigger than zero (see above). Putting everything together we obtain (1).

Note that the leading coefficients of $\chi_{I,M'}$ and $\chi_{I,M''}$ are nonnegative. Thus the degree of $\chi_{I,M'} + \chi_{I,M''}$ is equal to the maximum of the degrees. Thus if M' does not have finite length, then (2) follows from (1). If M' does have finite length, then $I^n M \rightarrow I^n M''$ is an isomorphism for all $n \gg 0$ by Artin-Rees (Lemma 10.49.2). Thus $M/I^n M \rightarrow M''/I^n M''$ is a surjection with kernel M' for $n \gg 0$ and we see that $\chi_{I,M}(n) - \chi_{I,M''}(n) = \text{length}(M')$ for all $n \gg 0$. Thus (2) holds in this case also.

Proof of (3). This follows from (2) except if one of M , M' , or M'' is zero. We omit the proof in these special cases. \square

10.59. Dimension

Definition 10.59.1. The *Krull dimension* of the ring R is the Krull dimension of the topological space $\text{Spec}(R)$, see Topology, Definition 5.9.1. In other words it is the supremum of the integers $n \geq 0$ such that there exists a chain of prime ideals of length n :

$$\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_n, \quad \mathfrak{p}_i \neq \mathfrak{p}_{i+1}.$$

Definition 10.59.2. The *height* of a prime ideal \mathfrak{p} of a ring R is the dimension of the local ring $R_{\mathfrak{p}}$.

Lemma 10.59.3. *The Krull dimension of R is the supremum of the heights of its (maximal) primes.*

Proof. This is so because we can always add a maximal ideal at the end of a chain of prime ideals. \square

Lemma 10.59.4. *A Noetherian ring of dimension 0 is Artinian. Conversely, any Artinian ring is Noetherian of dimension zero.*

Proof. By Lemma 10.30.5 the space $\text{Spec}(R)$ is Noetherian. By Topology, Lemma 5.8.2 we see that $\text{Spec}(R)$ has finitely many irreducible components, say $\text{Spec}(R) = Z_1 \cup \dots \cup Z_r$. According to Lemma 10.25.1, each $Z_i = V(\mathfrak{p}_i)$ with \mathfrak{p}_i a minimal ideal. Since the dimension is 0 these \mathfrak{p}_i are also maximal. Thus $\text{Spec}(R)$ is the discrete topological space with elements \mathfrak{p}_i . All elements f of the radical $I = \bigcap \mathfrak{p}_i$ are nilpotent since otherwise R_f would not be the zero ring and we would have another prime. Since I is finitely generated we conclude that I is nilpotent, Lemma 10.31.4. By Lemma 10.51.5 R is the product of its local rings. By Lemma 10.50.8 each of these has finite length over R . Hence we conclude that R is Artinian by Lemma 10.51.6.

If R is Artinian then by Lemma 10.51.6 it is Noetherian. All of its primes are maximal by a combination of Lemmas 10.51.3, 10.51.4 and 10.51.5. \square

In the following we will use the invariant $d(-)$ defined in Definition 10.58.8. Here is a warm up lemma.

Lemma 10.59.5. *Let R be a Noetherian local ring. Then $\dim(R) = 0 \Leftrightarrow d(R) = 0$.*

Proof. This is because $d(R) = 0$ if and only if R has finite length as an R -module. See Lemma 10.51.6. \square

Proposition 10.59.6. *Let R be a ring. The following are equivalent:*

- (1) R is Artinian,
- (2) R is Noetherian and $\dim(R) = 0$,
- (3) R has finite length as a module over itself,
- (4) R is a finite product of Artinian local rings,
- (5) R is Noetherian and $\text{Spec}(R)$ is a finite discrete topological space,
- (6) R is a finite product of Noetherian local rings of dimension 0,
- (7) R is a finite product of Noetherian local rings R_i with $d(R_i) = 0$,
- (8) R is a finite product of Noetherian local rings R_i whose maximal ideals are nilpotent,
- (9) R is Noetherian, has finitely many maximal ideals and its radical ideal is nilpotent, and
- (10) R is Noetherian and there are no strict inclusions among its primes.

Proof. This is a combination of Lemmas 10.51.5, 10.51.6, 10.59.4, and 10.59.5. \square

Lemma 10.59.7. *Let R be a local Noetherian ring. The following are equivalent:*

- (1) $\dim(R) = 1$,
- (2) $d(R) = 1$,
- (3) there exists an $x \in \mathfrak{m}$, x not nilpotent such that $V(x) = \{\mathfrak{m}\}$,
- (4) there exists an $x \in \mathfrak{m}$, x not nilpotent such that $\mathfrak{m} = \sqrt{(x)}$, and

- (5) *there exists an ideal of definition generated by 1 element, and no ideal of definition is generated by 0 elements.*

Proof. First, assume that $\dim(R) = 1$. Let \mathfrak{p}_i be the minimal primes of R . Because the dimension is 1 the only other prime of R is \mathfrak{m} . According to Lemma 10.30.6 there are finitely many. Hence we can find $x \in \mathfrak{m}$, $x \notin \mathfrak{p}_i$, see Lemma 10.14.2. Thus the only prime containing x is \mathfrak{m} and hence (3).

If (3) then $\mathfrak{m} = \sqrt{(x)}$ by Lemma 10.16.2, and hence (4). The converse is clear as well. The equivalence of (4) and (5) follows from directly the definitions.

Assume (5). Let $I = (x)$ be an ideal of definition. Note that I^n/I^{n+1} is a quotient of R/I via multiplication by x^n and hence $\text{length}_R(I^n/I^{n+1})$ is bounded. Thus $d(R) = 0$ or $d(R) = 1$, but $d(R) = 0$ is excluded by the assumption that 0 is not an ideal of definition.

Assume (2). To get a contradiction, assume there exist primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$, with both inclusions strict. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 10.58.10. First of all it implies, via the exact sequence $0 \rightarrow \mathfrak{p} \rightarrow R \rightarrow R/\mathfrak{p} \rightarrow 0$, that $d(R/\mathfrak{p}) \leq 1$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}$, $x \notin \mathfrak{p}$. Consider the short exact sequence

$$0 \rightarrow R/\mathfrak{p} \rightarrow R/\mathfrak{p} \rightarrow R/(xR + \mathfrak{p}) \rightarrow 0.$$

This implies that $\chi_{I, R/\mathfrak{p}} - \chi_{I, R/\mathfrak{p}} - \chi_{I, R/(xR + \mathfrak{p})} = -\chi_{I, R/(xR + \mathfrak{p})}$ has degree < 1 . In other words, $d(R/(xR + \mathfrak{p})) = 0$, and hence $\dim(R/(xR + \mathfrak{p})) = 0$, by Lemma 10.59.5. But $R/(xR + \mathfrak{p})$ has the distinct primes $\mathfrak{q}/(xR + \mathfrak{p})$ and $\mathfrak{m}/(xR + \mathfrak{p})$ which gives the desired contradiction. \square

Proposition 10.59.8. *Let R be a local Noetherian ring. Let $d \geq 0$ be an integer. The following are equivalent:*

- (1) $\dim(R) = d$,
- (2) $d(R) = d$,
- (3) *there exists an ideal of definition generated by d elements, and no ideal of definition is generated by fewer than d elements.*

Proof. This proof is really just the same as the proof of Lemma 10.59.7. We will prove the proposition by induction on d . By Lemmas 10.59.5 and 10.59.7 we may assume that $d > 1$. Denote the minimal number of generators for an ideal of definition of R by $d'(R)$. We will prove that the inequalities $\dim(R) \geq d'(R) \geq d(R) \geq \dim(R)$, and hence they are all equal.

First, assume that $\dim(R) = d$. Let \mathfrak{p}_i be the minimal primes of R . According to Lemma 10.30.6 there are finitely many. Hence we can find $x \in \mathfrak{m}$, $x \notin \mathfrak{p}_i$, see Lemma 10.14.2. Note that every maximal chain of primes starts with some \mathfrak{p}_i , hence the dimension of R/xR is at most $d - 1$. By induction there are x_2, \dots, x_d which generate an ideal of definition in R/xR . Hence R has an ideal of definition generated by (at most) d elements.

Assume $d'(R) = d$. Let $I = (x_1, \dots, x_d)$ be an ideal of definition. Note that I^n/I^{n+1} is a quotient of a direct sum of $\binom{d+n-1}{d-1}$ copies R/I via multiplication by all degree n monomials in x_1, \dots, x_n . Hence $\text{length}_R(I^n/I^{n+1})$ is bounded by a polynomial of degree $d - 1$. Thus $d(R) \leq d$.

Assume $d(R) = d$. Consider a chain of primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{q}_2 \subset \dots \subset \mathfrak{p}_e = \mathfrak{m}$, with all inclusions strict, and $e \geq 2$. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 10.58.10. First of all it implies, via the exact sequence $0 \rightarrow \mathfrak{p} \rightarrow R \rightarrow R/\mathfrak{p} \rightarrow 0$, that $d(R/\mathfrak{p}) \leq d$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}$, $x \notin \mathfrak{p}$. Consider the short exact sequence

$$0 \rightarrow R/\mathfrak{p} \rightarrow R/\mathfrak{p} \rightarrow R/(xR + \mathfrak{p}) \rightarrow 0.$$

This implies that $\chi_{I, R/\mathfrak{p}} - \chi_{I, R/\mathfrak{p}} - \chi_{I, R/(xR + \mathfrak{p})} = -\chi_{I, R/(xR + \mathfrak{p})}$ has degree $< d$. In other words, $d(R/(xR + \mathfrak{p})) \leq d - 1$, and hence $\dim(R/(xR + \mathfrak{p})) \leq d - 1$, by induction. Now $R/(xR + \mathfrak{p})$ has the chain of prime ideals $\mathfrak{q}/(xR + \mathfrak{p}) \subset \mathfrak{q}_2/(xR + \mathfrak{p}) \subset \dots \subset \mathfrak{q}_e/(xR + \mathfrak{p})$ which gives $e - 1 \leq d - 1$. Since we started with an arbitrary chain of primes this proves that $\dim(R) \leq d(R)$.

Reading back the reader will see we proved the circular inequalities as desired. \square

Let (R, \mathfrak{m}) be a Noetherian local ring. From the above it is clear that \mathfrak{m} cannot be generated by fewer than $\dim(R)$ variables. By Nakayama's Lemma 10.19.1 the minimal number of generators of \mathfrak{m} equals $\dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2$. Hence we have the following fundamental inequality

$$\dim(R) \leq \dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2.$$

It turns out that the rings where equality holds have a lot of good properties. They are called regular local rings.

Definition 10.59.9. Let (R, \mathfrak{m}) be a Noetherian local ring of dimension d .

- (1) A *system of parameters* of R is a sequence of elements $x_1, \dots, x_d \in \mathfrak{m}$ which generates an ideal of definition of R ,
- (2) if there exist $x_1, \dots, x_d \in \mathfrak{m}$ such that $\mathfrak{m} = (x_1, \dots, x_d)$ then we call R a *regular local ring* and x_1, \dots, x_d a *regular system of parameters*.

The following two lemmas are clear from the proofs of the lemmas and proposition above, but we spell them out so we have convenient references.

Lemma 10.59.10. Let R be a Noetherian ring.

- (1) Let $x \in R$, $\mathfrak{p}, \mathfrak{q} \in \text{Spec}(R)$. Suppose that $\mathfrak{p} \subset (\mathfrak{p}, x) \subset \mathfrak{q}$ and \mathfrak{q} minimal over (\mathfrak{p}, x) . Then there is no prime strictly between \mathfrak{p} and \mathfrak{q} .
- (2) If $x \in R$ and $x \in \mathfrak{p}$ is minimal over (x) then the height of \mathfrak{p} is 0 or 1.

Proof. Consider the situation of the first assertion. The primes containing \mathfrak{p} and contained in \mathfrak{q} correspond to primes of $R_{\mathfrak{q}}/\mathfrak{p}R_{\mathfrak{q}}$, and the primes containing x correspond to the ones containing the image of x . Thus we may assume R is a Noetherian local domain, $\mathfrak{p} = (0)$ and \mathfrak{q} maximal. Now since $\sqrt{(x)}$ is the intersection of the prime ideals containing it, and since \mathfrak{q} is the only prime containing x by minimality, we see that $\sqrt{(x)} = \mathfrak{q}$. Hence Lemma 10.59.7 applies. The second assertion follows from the first. \square

Lemma 10.59.11. Suppose that R is a Noetherian local ring and $x \in \mathfrak{m}$ an element of its maximal ideal. Then $\dim R \leq \dim R/xR + 1$. If x is not contained in any of the minimal primes of R then equality holds. (For example if x is a nonzerodivisor.)

Proof. If $x_1, \dots, x_{\dim R/xR} \in R$ map to elements of R/xR which generate an ideal of definition for R/xR , then $x, x_1, \dots, x_{\dim R/xR}$ generate an ideal of definition for R . Hence the inequality by Proposition 10.59.8. On the other hand, if x is not

contained in any minimal prime of R , then the chains of primes in R/xR all give rise to chains in R which are at least one step away from being maximal. \square

Lemma 10.59.12. *Let (R, \mathfrak{m}) be a Noetherian local ring. Suppose $x_1, \dots, x_d \in \mathfrak{m}$ generate an ideal of definition and $d = \dim(R)$. Then $\dim(R/(x_1, \dots, x_i)) = d - i$ for all $i = 1, \dots, d$.*

Proof. Follows either from the proof of Proposition 10.59.8, or by using induction on d and Lemma 10.59.11. \square

10.60. Applications of dimension theory

We can use the results on dimension to prove certain rings have infinite spectra and to produce more Jacobson rings.

Lemma 10.60.1. *Let R be a Noetherian local domain of dimension ≥ 2 . A nonempty open subset $U \subset \operatorname{Spec}(R)$ is infinite.*

Proof. To get a contradiction, assume that $U \subset \operatorname{Spec}(R)$ is finite. In this case $(0) \in U$ and $\{(0)\}$ is an open subset of U (because the complement of $\{(0)\}$ is the union of the closures of the other points). Thus we may assume $U = \{(0)\}$. Let $\mathfrak{m} \subset R$ be the maximal ideal. We can find an $x \in \mathfrak{m}$, $x \neq 0$ such that $V(x) \cup U = \operatorname{Spec}(R)$. In other words we see that $D(x) = \{(0)\}$. In particular we see that $\dim(R/xR) = \dim(R) - 1 \geq 1$, see Lemma 10.59.11. Let $\bar{y}_2, \dots, \bar{y}_{\dim(R)} \in R/xR$ generate an ideal of definition of R/xR , see Proposition 10.59.8. Choose lifts $y_2, \dots, y_{\dim(R)} \in R$, so that $x, y_2, \dots, y_{\dim(R)}$ generate an ideal of definition in R . This implies that $\dim(R/(y_2)) = \dim(R) - 1$ and $\dim(R/(y_2, x)) = \dim(R) - 2$, see Lemma 10.59.12. Hence there exists a prime \mathfrak{p} containing y_2 but not x . This contradicts the fact that $D(x) = \{(0)\}$. \square

The rings $k[[t]]$ where k is a field, or the ring of p -adic numbers are Noetherian rings of dimension 1 with finitely many primes. This is the maximal.

Lemma 10.60.2. *A Noetherian ring with finitely many primes has dimension ≤ 1 .*

Proof. Let R be a Noetherian ring with finitely many primes. If R is a local domain, then the lemma follows from Lemma 10.60.1. If R is a domain, then $R_{\mathfrak{m}}$ has dimension ≤ 1 for all maximal ideals \mathfrak{m} by the local case. Hence $\dim(R) \leq 1$ by Lemma 10.59.3. If R is general, then $\dim(R/\mathfrak{q}) \leq 1$ for every minimal prime \mathfrak{q} of R . Since every prime contains a minimal prime (Lemma 10.16.2), this implies $\dim(R) \leq 1$. \square

Lemma 10.60.3. *Let S be a nonzero finite type algebra over a field k . Then $\dim(S) = 0$ if and only if S has finitely many primes.*

Proof. Recall that $\operatorname{Spec}(S)$ is sober, Noetherian, and Jacobson, see Lemmas 10.25.2, 10.30.5, 10.34.2, and 10.34.4. If it has dimension 0, then every point defines an irreducible component and there are only a finite number of irreducible components (Topology, Lemma 5.8.2). Conversely, if $\operatorname{Spec}(S)$ is finite, then it is discrete by Topology, Lemma 5.17.6 and hence the dimension is 0. \square

Lemma 10.60.4. *Noetherian Jacobson rings.*

- (1) *Any Noetherian domain R of dimension 1 with infinitely many primes is Jacobson.*

- (2) Any Noetherian ring such that every prime \mathfrak{p} is either maximal or contained in infinitely many prime ideals is Jacobson.

Proof. Part (1) is a reformulation of Lemma 10.34.6.

Let R be a Noetherian ring such that every non-maximal prime \mathfrak{p} is contained in infinitely many prime ideals. Assume $\text{Spec}(R)$ is not Jacobson to get a contradiction. By Lemmas 10.25.1 and 10.30.5 we see that $\text{Spec}(R)$ is a sober, Noetherian topological space. By Topology, Lemma 5.17.3 we see that there exists a non-maximal ideal $\mathfrak{p} \subset R$ such that $\{\mathfrak{p}\}$ is a locally closed subset of $\text{Spec}(R)$. In other words, \mathfrak{p} is not maximal and $\{\mathfrak{p}\}$ is an open subset of $V(\mathfrak{p})$. Consider a prime $\mathfrak{q} \subset R$ with $\mathfrak{p} \subset \mathfrak{q}$. Recall that the topology on the spectrum of $(R/\mathfrak{p})_{\mathfrak{q}} = R_{\mathfrak{q}}/\mathfrak{p}R_{\mathfrak{q}}$ is induced from that of $\text{Spec}(R)$, see Lemmas 10.16.5 and 10.16.7. Hence we see that $\{(0)\}$ is a locally closed subset of $\text{Spec}((R/\mathfrak{p})_{\mathfrak{q}})$. By Lemma 10.60.1 we conclude that $\dim((R/\mathfrak{p})_{\mathfrak{q}}) = 1$. Since this holds for every $\mathfrak{q} \supset \mathfrak{p}$ we conclude that $\dim(R/\mathfrak{p}) = 1$. At this point we use the assumption that \mathfrak{p} is contained in infinitely many primes to see that $\text{Spec}(R/\mathfrak{p})$ is infinite. Hence by part (1) of the lemma we see that $V(\mathfrak{p}) \cong \text{Spec}(R/\mathfrak{p})$ is the closure of its closed points. This is the desired contradiction since it means that $\{\mathfrak{p}\} \subset V(\mathfrak{p})$ cannot be open. \square

10.61. Support and dimension of modules

Lemma 10.61.1. *Let R be a Noetherian ring, and let M be a finite R -module. There exists a filtration by R -submodules*

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/\mathfrak{p}_i for some prime ideal \mathfrak{p}_i of R .

Proof. By Lemma 10.5.4 it suffices to do the case $M = R/I$ for some ideal I . Consider the set S of ideals J such that the lemma does not hold for the module R/J , and order it by inclusion. To arrive at a contradiction, assume that S is not empty. Because R is Noetherian, S has a maximal element J . By definition of S , the ideal J cannot be prime. Pick $a, b \in R$ such that $ab \in J$, but neither $a \in J$ nor $b \in J$. Consider the filtration $0 \subset aR/(J \cap aR) \subset R/J$. Note that $aR/(J \cap aR)$ is a quotient of $R/(J + bR)$ and the second quotient equals $R/(aR + J)$. Hence by maximality of J , each of these has a filtration as above and hence so does R/J . Contradiction. \square

Lemma 10.61.2. *Let $R, M, M_i, \mathfrak{p}_i$ as in Lemma 10.61.1. Then $\text{Supp}(M) = \bigcup V(\mathfrak{p}_i)$ and in particular $\mathfrak{p}_i \in \text{Supp}(M)$.*

Proof. This follows from Lemmas 10.39.5 and 10.39.8. \square

Lemma 10.61.3. *Suppose that R is a Noetherian local ring with maximal ideal \mathfrak{m} . Let M be a nonzero finite R -module. Then $\text{Supp}(M) = \{\mathfrak{m}\}$ if and only if M has finite length over R .*

Proof. Assume that $\text{Supp}(M) = \{\mathfrak{m}\}$. It suffices to show that all the primes \mathfrak{p}_i in the filtration of Lemma 10.61.1 are the maximal ideal. This is clear by Lemma 10.61.2.

Suppose that M has finite length over R . Then $\mathfrak{m}^n M = 0$ by Lemma 10.50.4. Since some element of \mathfrak{m} maps to a unit in $R_{\mathfrak{p}}$ for any prime $\mathfrak{p} \neq \mathfrak{m}$ in R we see $M_{\mathfrak{p}} = 0$. \square

Lemma 10.61.4. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal. Let M be a finite R -module. Then $I^n M = 0$ for some $n \geq 0$ if and only if $\text{Supp}(M) \subset V(I)$.*

Proof. It is clear that $I^n M = 0$ for some $n \geq 0$ implies $\text{Supp}(M) \subset V(I)$. Suppose that $\text{Supp}(M) \subset V(I)$. Choose a filtration $0 = M_0 \subset M_1 \subset \dots \subset M_n = M$ as in Lemma 10.61.1. Each of the primes \mathfrak{p}_i is contained in $V(I)$ by Lemma 10.61.2. Hence $I \subset \mathfrak{p}_i$ and I annihilates M_i/M_{i-1} . Hence I^n annihilates M . \square

Lemma 10.61.5. *Let $R, M, M_i, \mathfrak{p}_i$ as in Lemma 10.61.1. The minimal elements of the set $\{\mathfrak{p}_i\}$ are the minimal elements of $\text{Supp}(M)$. The number of times a minimal prime \mathfrak{p} occurs is*

$$\#\{i \mid \mathfrak{p}_i = \mathfrak{p}\} = \text{length}_{R_{\mathfrak{p}}} M_{\mathfrak{p}}.$$

Proof. The first statement follows because $\text{Supp}(M) = \bigcup V(\mathfrak{p}_i)$, see Lemma 10.61.2. Let $\mathfrak{p} \in \text{Supp}(M)$ be minimal. The support of $M_{\mathfrak{p}}$ is the set consisting of the maximal ideal $\mathfrak{p}R_{\mathfrak{p}}$. Hence by Lemma 10.61.3 the length of $M_{\mathfrak{p}}$ is finite and > 0 . Next we note that $M_{\mathfrak{p}}$ has a filtration with subquotients $(R/\mathfrak{p}_i)_{\mathfrak{p}} = R_{\mathfrak{p}}/\mathfrak{p}_i R_{\mathfrak{p}}$. These are zero if $\mathfrak{p}_i \not\subset \mathfrak{p}$ and equal to $\kappa(\mathfrak{p})$ if $\mathfrak{p}_i \subset \mathfrak{p}$ because by minimality of \mathfrak{p} we have $\mathfrak{p}_i = \mathfrak{p}$ in this case. The result follows since $\kappa(\mathfrak{p})$ has length 1. \square

Lemma 10.61.6. *Let R be a Noetherian local ring. Let M be a finite R -module. Then $d(M) = \dim(\text{Supp}(M))$.*

Proof. Let M_i, \mathfrak{p}_i be as in Lemma 10.61.1. By Lemma 10.58.10 we obtain the equality $d(M) = \max\{d(R/\mathfrak{p}_i)\}$. By Proposition 10.59.8 we have $d(R/\mathfrak{p}_i) = \dim(R/\mathfrak{p}_i)$. Trivially $\dim(R/\mathfrak{p}_i) = \dim V(\mathfrak{p}_i)$. Since all minimal primes of $\text{Supp}(M)$ occur among the \mathfrak{p}_i we win. \square

10.62. Associated primes

Here is the standard definition. For non-Noetherian rings and non-finite modules it may be more appropriate to use the definition in Section 10.65.

Definition 10.62.1. Let R be a ring. Let M be an R -module. A prime \mathfrak{p} of R is *associated* to M if there exists an element $m \in M$ whose annihilator is \mathfrak{p} . The set of all such primes is denoted $\text{Ass}_R(M)$ or $\text{Ass}(M)$.

Lemma 10.62.2. *Let R be a ring. Let M be an R -module. Then $\text{Ass}(M) \subset \text{Supp}(M)$.*

Proof. If $m \in M$ has annihilator \mathfrak{p} , then in particular no element of $R \setminus \mathfrak{p}$ annihilates m . Hence m is a nonzero element of $M_{\mathfrak{p}}$, i.e., $\mathfrak{p} \in \text{Supp}(M)$. \square

Lemma 10.62.3. *Let R be a ring. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence of R -modules. Then $\text{Ass}(M') \subset \text{Ass}(M)$ and $\text{Ass}(M) \subset \text{Ass}(M') \cup \text{Ass}(M'')$.*

Proof. Omitted. \square

Lemma 10.62.4. *Let R be a ring, and M an R -module. Suppose there exists a filtration by R -submodules*

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/\mathfrak{p}_i for some prime ideal \mathfrak{p}_i of R . Then $\text{Ass}(M) \subset \{\mathfrak{p}_1, \dots, \mathfrak{p}_n\}$.

Proof. By induction on the length n of the filtration $\{M_i\}$. Pick $m \in M$ whose annihilator is a prime \mathfrak{p} . If $m \in M_{n-1}$ we are done by induction. If not, then m maps to a nonzero element of $M/M_{n-1} \cong R/\mathfrak{p}_n$. Hence we have $\mathfrak{p} \subset \mathfrak{p}_n$. If equality does not hold, then we can find $f \in \mathfrak{p}_n$, $f \notin \mathfrak{p}$. In this case the annihilator of fm is still \mathfrak{p} and $fm \in M_{n-1}$. Thus we win by induction. \square

Lemma 10.62.5. *Let R be a Noetherian ring. Let M be a finite R -module. Then $\text{Ass}(M)$ is finite.*

Proof. Immediate from Lemma 10.62.4 and Lemma 10.61.1. \square

Proposition 10.62.6. *Let R be a Noetherian ring. Let M be a finite R -module. The following sets of primes are the same:*

- (1) *The minimal primes in the support of M .*
- (2) *The minimal primes in $\text{Ass}(M)$.*
- (3) *For any filtration $0 = M_0 \subset M_1 \subset \dots \subset M_{n-1} \subset M_n = M$ with $M_i/M_{i-1} \cong R/\mathfrak{p}_i$ the minimal primes of the set $\{\mathfrak{p}_i\}$.*

Proof. Choose a filtration as in (3). In Lemma 10.61.5 we have seen that the sets in (1) and (3) are equal.

Let \mathfrak{p} be a minimal element of the set $\{\mathfrak{p}_i\}$. Let i be minimal such that $\mathfrak{p} = \mathfrak{p}_i$. Pick $m \in M_i$, $m \notin M_{i-1}$. The annihilator of m is contained in $\mathfrak{p}_i = \mathfrak{p}$ and contains $\mathfrak{p}_1\mathfrak{p}_2 \dots \mathfrak{p}_i$. By our choice of i and \mathfrak{p} we have $\mathfrak{p}_j \not\subset \mathfrak{p}$ for $j < i$ and hence we have $\mathfrak{p}_1\mathfrak{p}_2 \dots \mathfrak{p}_{i-1} \not\subset \mathfrak{p}_i$. Pick $f \in \mathfrak{p}_1\mathfrak{p}_2 \dots \mathfrak{p}_{i-1}$, $f \notin \mathfrak{p}$. Then fm has annihilator \mathfrak{p} . In this way we see that \mathfrak{p} is an associated prime of M . By Lemma 10.62.2 we have $\text{Ass}(M) \subset \text{Supp}(M)$ and hence \mathfrak{p} is minimal in $\text{Ass}(M)$. Thus the set of primes in (1) is contained in the set of primes of (2).

Let \mathfrak{p} be a minimal element of $\text{Ass}(M)$. Since $\text{Ass}(M) \subset \text{Supp}(M)$ there is a minimal element \mathfrak{q} of $\text{Supp}(M)$ with $\mathfrak{q} \subset \mathfrak{p}$. We have just shown that $\mathfrak{q} \in \text{Ass}(M)$. Hence $\mathfrak{q} = \mathfrak{p}$ by minimality of \mathfrak{p} . Thus the set of primes in (2) is contained in the set of primes of (1). \square

Lemma 10.62.7. *Let R be a Noetherian ring. Let M be an R -module. Then*

$$M = (0) \Leftrightarrow \text{Ass}(M) = \emptyset.$$

Proof. If $M = (0)$, then $\text{Ass}(M) = \emptyset$ by definition. If $M \neq 0$, pick any nonzero finitely generated submodule $M' \subset M$, for example a submodule generated by a single nonzero element. By Lemma 10.39.2 we see that $\text{Supp}(M')$ is nonempty. By Proposition 10.62.6 this implies that $\text{Ass}(M')$ is nonempty. By Lemma 10.62.3 this implies $\text{Ass}(M) \neq \emptyset$. \square

Lemma 10.62.8. *Let R be a Noetherian ring. Let M be an R -module. Any $\mathfrak{p} \in \text{Supp}(M)$ which is minimal among the elements of $\text{Supp}(M)$ is an element of $\text{Ass}(M)$.*

Proof. If M is a finite R -module, then this is a consequence of Proposition 10.62.6. In general write $M = \bigcup M_\lambda$ as the union of its finite submodules, and use that $\text{Supp}(M) = \bigcup \text{Supp}(M_\lambda)$ and $\text{Ass}(M) = \bigcup \text{Ass}(M_\lambda)$. \square

Lemma 10.62.9. *Let R be a Noetherian ring. Let M be an R -module. The union $\bigcup_{\mathfrak{q} \in \text{Ass}(M)} \mathfrak{q}$ is the set of elements of R which are zerodivisors on M .*

Proof. Any element in any associated prime clearly is a zerodivisor on M . Conversely, suppose $x \in R$ is a zerodivisor on M . Consider the submodule $N = \{m \in M \mid xm = 0\}$. Since N is not zero it has an associated prime \mathfrak{q} by Lemma 10.62.7. Then $x \in \mathfrak{q}$ and \mathfrak{q} is an associated prime of M by Lemma 10.62.3. \square

Lemma 10.62.10. *Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Then $\text{Spec}(\varphi)(\text{Ass}_S(M)) \subset \text{Ass}_R(M)$.*

Proof. If $\mathfrak{q} \in \text{Ass}_S(M)$, then there exists an m in M such that the annihilator of m in S is \mathfrak{q} . Then the annihilator of m in R is $\mathfrak{q} \cap R$. \square

Remark 10.62.11. Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Then it is not always the case that $\text{Spec}(\varphi)(\text{Ass}_S(M)) \supset \text{Ass}_R(M)$. For example, consider the ring map $R = k \rightarrow S = k[x_1, x_2, x_3, \dots]/(x_i^2)$ and $M = S$. Then $\text{Ass}_R(M)$ is not empty, but $\text{Ass}_S(S)$ is empty.

Lemma 10.62.12. *Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. If S is Noetherian, then $\text{Spec}(\varphi)(\text{Ass}_S(M)) = \text{Ass}_R(M)$.*

Proof. We have already seen in Lemma 10.62.10 that $\text{Spec}(\varphi)(\text{Ass}_S(M)) \subset \text{Ass}_R(M)$. For the converse, choose a prime $\mathfrak{p} \in \text{Ass}_R(M)$. Let $m \in M$ be an element such that the annihilator of x in R is \mathfrak{p} . Let $I = \{g \in S \mid gm = 0\}$ be the annihilator of m in S . Then $R/\mathfrak{p} \subset S/I$ is injective, hence there exists a prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} , see Lemma 10.29.5. By Proposition 10.62.6 we see that \mathfrak{q} is an associated prime of S/I , hence an associated prime of M by Lemma 10.62.3 and we win. \square

Lemma 10.62.13. *Let R be a ring. Let I be an ideal. Let M be an R/I -module. Via the canonical injection $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$ we have $\text{Ass}_{R/I}(M) = \text{Ass}_R(M)$.*

Proof. Omitted. \square

Lemma 10.62.14. *Let R be a ring. Let M be an R -module. Let $\mathfrak{p} \subset R$ be a prime.*

- (1) *If $\mathfrak{p} \in \text{Ass}(M)$ then $\mathfrak{p}R_{\mathfrak{p}} \in \text{Ass}(M_{\mathfrak{p}})$.*
- (2) *If \mathfrak{p} is finitely generated then the converse holds as well.*

Proof. If $\mathfrak{p} \in \text{Ass}(M)$ there exists an element $m \in M$ whose annihilator is \mathfrak{p} . As localization is exact (Proposition 10.9.12) we see that the annihilator of $m/1$ in $M_{\mathfrak{p}}$ is $\mathfrak{p}R_{\mathfrak{p}}$ hence (1) holds. Assume $\mathfrak{p}R_{\mathfrak{p}} \in \text{Ass}(M_{\mathfrak{p}})$ and $\mathfrak{p} = (f_1, \dots, f_n)$. Let m/g be an element of $M_{\mathfrak{p}}$ whose annihilator is $\mathfrak{p}R_{\mathfrak{p}}$. This implies that the annihilator of m is contained in \mathfrak{p} . As $f_i m/g = 0$ in $M_{\mathfrak{p}}$ we see there exists a $g_i \in R$, $g_i \notin \mathfrak{p}$ such that $g_i f_i m = 0$ in M . Combined we see the annihilator of $g_1 \dots g_n m$ is \mathfrak{p} . Hence $\mathfrak{p} \in \text{Ass}(M)$. \square

Lemma 10.62.15. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $\text{Spec}(S^{-1}R) \rightarrow \text{Spec}(R)$ we have*

- (1) $\text{Ass}_R(S^{-1}M) = \text{Ass}_{S^{-1}R}(S^{-1}M)$,
- (2) $\text{Ass}_R(M) \cap \text{Spec}(S^{-1}R) \subset \text{Ass}_R(S^{-1}M)$, and

(3) if R is Noetherian this inclusion is an equality.

Proof. The first equality follows, since if $m \in S^{-1}M$, then the annihilator of m in R is the intersection of the annihilator of m in $S^{-1}R$ with R . The displayed inclusion and equality in the Noetherian case follows from Lemma 10.62.14 since for $\mathfrak{p} \in R$, $S \cap \mathfrak{p} = \emptyset$ we have $M_{\mathfrak{p}} = (S^{-1}M)_{S^{-1}\mathfrak{p}}$. \square

Lemma 10.62.16. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset. Assume that every $s \in S$ is a nonzerodivisor on M . Then*

$$\text{Ass}_R(M) = \text{Ass}_R(S^{-1}M).$$

Proof. As $M \subset S^{-1}M$ by assumption we get the inclusion $\text{Ass}(M) = \text{Ass}(S^{-1}M)$ from Lemma 10.62.3. Conversely, suppose that $n/s \in S^{-1}M$ is an element whose annihilator is a prime ideal \mathfrak{p} . Then the annihilator of $n \in M$ is also \mathfrak{p} . \square

Lemma 10.62.17. *Let R be a Noetherian local ring with maximal ideal \mathfrak{m} . Let $I \subset \mathfrak{m}$ be an ideal. Let M be a finite R -module. The following are equivalent:*

- (1) *There exists an $x \in I$ which is not a zerodivisor on M .*
- (2) *We have $I \not\subset \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(M)$.*

Proof. If there exists a nonzerodivisor x in I , then x clearly cannot be in any associated prime of M . Conversely, suppose $I \subset \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(M)$. In this case we can choose $x \in I$, $x \notin \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(M)$ by Lemmas 10.62.5 and 10.14.2. By Lemma 10.62.9 the element x is not a zerodivisor on M . \square

Lemma 10.62.18. *Let R be a ring. Let M be an R -module. If R is Noetherian the map*

$$M \longrightarrow \prod_{\mathfrak{p} \in \text{Ass}(M)} M_{\mathfrak{p}}$$

is injective.

Proof. Let $x \in M$ be an element of the kernel of the map. Then if \mathfrak{p} is an associated prime of $Rx \subset M$ we see on the one hand that $\mathfrak{p} \in \text{Ass}(M)$ (Lemma 10.62.3) and on the other hand that $(Rx)_{\mathfrak{p}} \subset M_{\mathfrak{p}}$ is not zero. This contradiction shows that $\text{Ass}(Rx) = \emptyset$. Hence $Rx = 0$ by Lemma 10.62.7. \square

10.63. Symbolic powers

We only make the following definition in the case of a Noetherian ring although the formula itself makes sense in general.

Definition 10.63.1. Let R be a Noetherian ring. Let \mathfrak{p} be a prime ideal. For $n \geq 0$ the n th symbolic power of \mathfrak{p} is the ideal $\mathfrak{p}^{(n)} = \text{Ker}(R \rightarrow R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}})$.

Note that $\mathfrak{p}^n \subset \mathfrak{p}^{(n)}$ but equality does not always hold.

Lemma 10.63.2. *Let R be a Noetherian ring. Let \mathfrak{p} be a prime ideal. Let $n > 0$. Then $\text{Ass}(R/\mathfrak{p}^{(n)}) = \{\mathfrak{p}\}$.*

Proof. If \mathfrak{q} is an associated prime of $R/\mathfrak{p}^{(n)}$ then clearly $\mathfrak{p} \subset \mathfrak{q}$. On the other hand, any element $x \in R$, $x \notin \mathfrak{p}$ is a nonzerodivisor on $R/\mathfrak{p}^{(n)}$. Namely, if $y \in R$ and $xy \in \mathfrak{p}^{(n)} = R \cap \mathfrak{p}^n R_{\mathfrak{p}}$ then $y \in \mathfrak{p}^n R_{\mathfrak{p}}$, hence $y \in \mathfrak{p}^{(n)}$. Hence the lemma follows. \square

10.64. Relative assassins

Discussion of relative assassins. Let $R \rightarrow S$ be a ring map. Let N be an S -module. In this situation we can introduce the following sets of primes \mathfrak{q} of S :

- A with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p}))$,
- A' with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that \mathfrak{q} is in the image of $\text{Ass}_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$ under the canonical map $\text{Spec}(S \otimes_R \kappa(\mathfrak{p})) \rightarrow \text{Spec}(S)$,
- A_{fin} with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \text{Ass}_S(N/\mathfrak{p}N)$,
- A'_{fin} for some prime $\mathfrak{p}' \subset R$ we have $\mathfrak{q} \in \text{Ass}_S(N/\mathfrak{p}'N)$,
- B for some R -module M we have $\mathfrak{q} \in \text{Ass}_S(N \otimes_R M)$, and
- B_{fin} for some finite R -module M we have $\mathfrak{q} \in \text{Ass}_S(N \otimes_R M)$.

Let us determine some of the relations between these sets.

Lemma 10.64.1. *Let $R \rightarrow S$ be a ring map. Let N be an S -module. Let $A, A', A_{fin}, B,$ and B_{fin} be the subsets of $\text{Spec}(S)$ introduced above.*

- (1) *We always have $A = A'$.*
- (2) *We always have $A_{fin} \subset A, B_{fin} \subset B, A_{fin} \subset A'_{fin} \subset B_{fin}$ and $A \subset B$.*
- (3) *If S is Noetherian, then $A = A_{fin}$ and $B = B_{fin}$.*
- (4) *If N is flat over R , then $A = A_{fin} = A'_{fin}$ and $B = B_{fin}$.*
- (5) *If R is Noetherian and N is flat over R , then all of the sets are equal, i.e., $A = A' = A_{fin} = A'_{fin} = B = B_{fin}$.*

Proof. Some of the arguments in the proof will be repeated in the proofs of later lemmas which are more precise than this one (because they deal with a given module M or a given prime \mathfrak{p} and not with the collection of all of them).

Proof of (1). Let \mathfrak{p} be a prime of R . Then we have

$$\text{Ass}_S(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S/\mathfrak{p}S}(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$$

the first equality by Lemma 10.62.13 and the second by Lemma 10.62.15 part (1). This proves that $A = A'$. The inclusion $A_{fin} \subset A'_{fin}$ is clear.

Proof of (2). Each of the inclusions is immediate from the definitions except perhaps $A_{fin} \subset A$ which follows from Lemma 10.62.15 and the fact that we require $\mathfrak{p} = R \cap \mathfrak{q}$ in the formulation of A_{fin} .

Proof of (3). The equality $A = A_{fin}$ follows from Lemma 10.62.15 part (3) if S is Noetherian. Let $\mathfrak{q} = (g_1, \dots, g_m)$ be a finitely generated prime ideal of S . Say $z \in N \otimes_R M$ is an element whose annihilator is \mathfrak{q} . We may pick a finite submodule $M' \subset M$ such that z is the image of $z' \in N \otimes_R M'$. Then $\text{Ann}_S(z') \subset \mathfrak{q} = \text{Ann}_S(z)$. Since $N \otimes_R -$ commutes with colimits and since M is the directed colimit of finite R -modules we can find $M' \subset M'' \subset M$ such that the image $z'' \in N \otimes_R M''$ is annihilated by g_1, \dots, g_m . Hence $\text{Ann}_S(z'') = \mathfrak{q}$. This proves that $B = B_{fin}$ if S is Noetherian.

Proof of (4). If N is flat, then the functor $N \otimes_R -$ is exact. In particular, if $M' \subset M$, then $N \otimes_R M' \subset N \otimes_R M$. Hence if $z \in N \otimes_R M$ is an element whose annihilator $\mathfrak{q} = \text{Ann}_S(z)$ is a prime, then we can pick any finite R -submodule $M' \subset M$ such that $z \in N \otimes_R M'$ and we see that the annihilator of z as an element of $N \otimes_R M'$ is equal to \mathfrak{q} . Hence $B = B_{fin}$. Let \mathfrak{p}' be a prime of R and let \mathfrak{q} be a prime of S which is an associated prime of $N/\mathfrak{p}'N$. This implies that $\mathfrak{p}'S \subset \mathfrak{q}$. As N is flat over R we see that $N/\mathfrak{p}'N$ is flat over the integral domain R/\mathfrak{p}' . Hence every nonzero element

of R/\mathfrak{p}' is a nonzerodivisor on N/\mathfrak{p}' . Hence none of these elements can map to an element of \mathfrak{q} and we conclude that $\mathfrak{p}' = R \cap \mathfrak{q}$. Hence $A_{fin} = A'_{fin}$. Finally, by Lemma 10.62.16 we see that $\text{Ass}_S(N/\mathfrak{p}'N) = \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p}'))$, i.e., $A'_{fin} = A$.

Proof of (5). We only need to prove $A'_{fin} = B_{fin}$ as the other equalities have been proved in (4). To see this let M be a finite R -module. By Lemma 10.61.1 there exists a filtration by R -submodules

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/\mathfrak{p}_i for some prime ideal \mathfrak{p}_i of R . Since N is flat we obtain a filtration by S -submodules

$$0 = N \otimes_R M_0 \subset N \otimes_R M_1 \subset \dots \subset N \otimes_R M_n = N \otimes_R M$$

such that each subquotient is isomorphic to $N/\mathfrak{p}_i N$. By Lemma 10.62.3 we conclude that $\text{Ass}_S(N \otimes_R M) \subset \bigcup \text{Ass}_S(N/\mathfrak{p}_i N)$. Hence we see that $B_{fin} \subset A'_{fin}$. Since the other inclusion is part of (2) we win. \square

We define the relative assassin of N over S/R to be the set $A = A'$ above. As a motivation we point out that it depends only on the fibre modules $N \otimes_R \kappa(\mathfrak{p})$ over the fibre rings. As in the case of the assassin of a module we warn the reader that this notion makes most sense when the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are Noetherian, for example if $R \rightarrow S$ is of finite type.

Definition 10.64.2. Let $R \rightarrow S$ be a ring map. Let N be an S -module. The *relative assassin of N over S/R* is the set

$$\text{Ass}_{S/R}(N) = \{\mathfrak{q} \subset S \mid \mathfrak{q} \in \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p})) \text{ with } \mathfrak{p} = R \cap \mathfrak{q}\}.$$

This is the set named A in Lemma 10.64.1.

The spirit of the next few results is that they are about the relative assassin, even though this may not be apparent.

Lemma 10.64.3. Let $R \rightarrow S$ be a ring map. Let M be an R -module, and let N be an S -module. If N is flat as R -module, then

$$\text{Ass}_S(M \otimes_R N) \supset \bigcup_{\mathfrak{p} \in \text{Ass}_R(M)} \text{Ass}_S(N/\mathfrak{p}N)$$

and if R is Noetherian then we have equality.

Proof. If $\mathfrak{p} \in \text{Ass}_R(M)$ then there exists an injection $R/\mathfrak{p} \rightarrow M$. As N is flat over R we obtain an injection $R/\mathfrak{p} \otimes_R N \rightarrow M \otimes_R N$. Since $R/\mathfrak{p} \otimes_R N = N/\mathfrak{p}N$ we conclude that $\text{Ass}_S(N/\mathfrak{p}N) \subset \text{Ass}_S(M \otimes_R N)$, see Lemma 10.62.3. Hence the right hand side is contained in the left hand side.

Write $M = \bigcup M_\lambda$ as the union of its finitely generated R -submodules. Then also $N \otimes_R M = \bigcup N \otimes_R M_\lambda$ (as N is R -flat). By definition of associated primes we see that $\text{Ass}_S(N \otimes_R M) = \bigcup \text{Ass}_S(N \otimes_R M_\lambda)$ and $\text{Ass}_R(M) = \bigcup \text{Ass}(M_\lambda)$. Hence we may assume M is finitely generated.

Let $\mathfrak{q} \in \text{Ass}_S(M \otimes_R N)$, and assume R is Noetherian and M is a finite R -module. To finish the proof we have to show that \mathfrak{q} is an element of the right hand side. First we observe that $\mathfrak{q}S_{\mathfrak{q}} \in \text{Ass}_{S_{\mathfrak{q}}}(M \otimes_R N)_{\mathfrak{q}}$, see Lemma 10.62.14. Let \mathfrak{p} be the corresponding prime of R . Note that

$$(M \otimes_R N)_{\mathfrak{q}} = M \otimes_R N_{\mathfrak{q}} = M_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} N_{\mathfrak{q}}$$

If $\mathfrak{p}R_{\mathfrak{p}} \notin \text{Ass}_{R_{\mathfrak{p}}}(M_{\mathfrak{p}})$ then there exists an element $x \in \mathfrak{p}R_{\mathfrak{p}}$ which is a nonzerodivisor in $M_{\mathfrak{p}}$ (see Lemma 10.62.17). Since $N_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ we see that the image of x in $\mathfrak{q}S_{\mathfrak{q}}$ is a nonzerodivisor on $(M \otimes_R N)_{\mathfrak{q}}$. This is a contradiction with the assumption that $\mathfrak{q}S_{\mathfrak{q}} \in \text{Ass}_S((M \otimes_R N)_{\mathfrak{q}})$. Hence we conclude that \mathfrak{p} is one of the associated primes of M .

Continuing the argument we choose a filtration

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/\mathfrak{p}_i for some prime ideal \mathfrak{p}_i of R , see Lemma 10.61.1. (By Lemma 10.62.4 we have $\mathfrak{p}_i = \mathfrak{p}$ for at least one i .) This gives a filtration

$$0 = M_0 \otimes_R N \subset M_1 \otimes_R N \subset \dots \subset M_n \otimes_R N = M \otimes_R N$$

with subquotients isomorphic to $N/\mathfrak{p}_i N$. If $\mathfrak{p}_i \neq \mathfrak{p}$ then \mathfrak{q} cannot be associated to the module $N/\mathfrak{p}_i N$ by the result of the preceding paragraph (as $\text{Ass}_R(R/\mathfrak{p}_i) = \{\mathfrak{p}_i\}$). Hence we conclude that \mathfrak{q} is associated to $N/\mathfrak{p}N$ as desired. \square

Lemma 10.64.4. *Let $R \rightarrow S$ be a ring map. Let N be an S -module. Assume N is flat as an R -module and R is a domain with fraction field K . Then*

$$\text{Ass}_S(N) = \text{Ass}_S(N \otimes_R K) = \text{Ass}_{S \otimes_R K}(N \otimes_R K)$$

via the canonical inclusion $\text{Spec}(S \otimes_R K) \subset \text{Spec}(S)$.

Proof. Note that $S \otimes_R K = (R \setminus \{0\})^{-1}S$ and $N \otimes_R K = (R \setminus \{0\})^{-1}N$. For any nonzero $x \in R$ multiplication by x on N is injective as N is flat over R . Hence the lemma follows from Lemma 10.62.16 combined with Lemma 10.62.15 part (1). \square

Lemma 10.64.5. *Let $R \rightarrow S$ be a ring map. Let M be an R -module, and let N be an S -module. Assume N is flat as R -module. Then*

$$\text{Ass}_S(M \otimes_R N) \supset \bigcup_{\mathfrak{p} \in \text{Ass}_R(M)} \text{Ass}_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$$

where we use Remark 10.16.8 to think of the spectra of fibre rings as subsets of $\text{Spec}(S)$. If R is Noetherian then this inclusion is an equality.

Proof. This is equivalent to Lemma 10.64.3 by Lemmas 10.62.13, 10.38.6, and 10.64.4. \square

Remark 10.64.6. Let $R \rightarrow S$ be a ring map. Let N be an S -module. Let \mathfrak{p} be a prime of R . Then

$$\text{Ass}_S(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S/\mathfrak{p}S}(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p})).$$

The first equality by Lemma 10.62.13 and the second by Lemma 10.62.15 part (1).

10.65. Weakly associated primes

This is a variant on the notion of an associated prime that is useful for non-Noetherian ring and non-finite modules.

Definition 10.65.1. Let R be a ring. Let M be an R -module. A prime \mathfrak{p} of R is *weakly associated* to M if there exists an element $m \in M$ such that \mathfrak{p} is minimal among the prime ideals containing the annihilator $\text{Ann}(m) = \{f \in R \mid fm = 0\}$. The set of all such primes is denoted $\text{WeakAss}_R(M)$ or $\text{WeakAss}(M)$.

Thus an associated prime is a weakly associated prime. Here is a characterization in terms of the localization at the prime.

Lemma 10.65.2. *Let R be a ring. Let M be an R -module. Let \mathfrak{p} be a prime of R . The following are equivalent:*

- (1) \mathfrak{p} is weakly associated to M ,
- (2) $\mathfrak{p}R_{\mathfrak{p}}$ is weakly associated to $M_{\mathfrak{p}}$, and
- (3) $M_{\mathfrak{p}}$ contains an element whose annihilator has radical equal to $\mathfrak{p}R_{\mathfrak{p}}$.

Proof. Assume (1). Then there exists an element $m \in M$ such that \mathfrak{p} is minimal among the primes containing the annihilator $I = \{x \in R \mid xm = 0\}$ of m . As localization is exact, the annihilator of m in $M_{\mathfrak{p}}$ is $I_{\mathfrak{p}}$. Hence $\mathfrak{p}R_{\mathfrak{p}}$ is a minimal prime of $R_{\mathfrak{p}}$ containing the annihilator $I_{\mathfrak{p}}$ of m in $M_{\mathfrak{p}}$. This implies (2) holds, and also (3) as it implies that $\sqrt{I_{\mathfrak{p}}} = \mathfrak{p}R_{\mathfrak{p}}$.

Applying the implication (1) \Rightarrow (3) to $M_{\mathfrak{p}}$ over $R_{\mathfrak{p}}$ we see that (2) \Rightarrow (3).

Finally, assume (3). This means there exists an element $m/f \in M_{\mathfrak{p}}$ whose annihilator has radical equal to $\mathfrak{p}R_{\mathfrak{p}}$. Then the annihilator $I = \{x \in R \mid xm = 0\}$ of m in M is such that $\sqrt{I_{\mathfrak{p}}} = \mathfrak{p}R_{\mathfrak{p}}$. Clearly this means that \mathfrak{p} contains I and is minimal among the primes containing I , i.e., (1) holds. \square

Lemma 10.65.3. *Let R be a ring. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence of R -modules. Then $\text{WeakAss}(M') \subset \text{WeakAss}(M)$ and $\text{WeakAss}(M) \subset \text{WeakAss}(M') \cup \text{WeakAss}(M'')$.*

Proof. We will use the characterization of weakly associated primes of Lemma 10.65.2. Let \mathfrak{p} be a prime of R . As localization is exact we obtain the short exact sequence $0 \rightarrow M'_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}} \rightarrow M''_{\mathfrak{p}} \rightarrow 0$. Suppose that $m \in M_{\mathfrak{p}}$ is an element whose annihilator has radical $\mathfrak{p}R_{\mathfrak{p}}$. Then either the image \bar{m} of m in $M''_{\mathfrak{p}}$ is zero and $m \in M'_{\mathfrak{p}}$, or the annihilator of \bar{m} is $\mathfrak{p}R_{\mathfrak{p}}$. This proves that $\text{WeakAss}(M) \subset \text{WeakAss}(M') \cup \text{WeakAss}(M'')$. The inclusion $\text{WeakAss}(M') \subset \text{WeakAss}(M)$ is immediate from the definitions. \square

Lemma 10.65.4. *Let R be a ring. Let M be an R -module. Then*

$$M = (0) \Leftrightarrow \text{WeakAss}(M) = \emptyset$$

Proof. If $M = (0)$ then $\text{WeakAss}(M) = \emptyset$ by definition. Conversely, suppose that $M \neq 0$. Pick a nonzero element $m \in M$. Write $I = \{x \in R \mid xm = 0\}$ the annihilator of m . Then $R/I \subset M$. Hence $\text{WeakAss}(R/I) \subset \text{WeakAss}(M)$ by Lemma 10.65.3. But as $I \neq R$ we have $V(I) = \text{Spec}(R/I)$ contains a minimal prime, see Lemmas 10.16.2 and 10.16.7, and we win. \square

Lemma 10.65.5. *Let R be a ring. Let M be an R -module. Then*

$$\text{Ass}(M) \subset \text{WeakAss}(M) \subset \text{Supp}(M).$$

Proof. The first inclusion is immediate from the definitions. If $\mathfrak{p} \in \text{WeakAss}(M)$, then by Lemma 10.65.2 we have $M_{\mathfrak{p}} \neq 0$, hence $\mathfrak{p} \in \text{Supp}(M)$. \square

Lemma 10.65.6. *Let R be a ring. Let M be an R -module. The union $\bigcup_{\mathfrak{q} \in \text{WeakAss}(M)} \mathfrak{q}$ is the set elements of R which are zerodivisors on M .*

Proof. Suppose $f \in \mathfrak{q} \in \text{WeakAss}(M)$. Then there exists an element $m \in M$ such that \mathfrak{q} is minimal over $I = \{x \in R \mid xm = 0\}$. Hence there exists a $g \in R$, $g \notin \mathfrak{q}$ and $n > 0$ such that $f^n gm = 0$. Note that $gm \neq 0$ as $g \notin I$. If we take n minimal as above, then $f(f^{n-1}gm) = 0$ and $f^{n-1}gm \neq 0$, so f is a zerodivisor on M . Conversely, suppose $f \in R$ is a zerodivisor on M . Consider the submodule $N = \{m \in M \mid fm = 0\}$. Since N is not zero it has a weakly associated prime \mathfrak{q} by Lemma 10.65.4. Clearly $f \in \mathfrak{q}$ and by Lemma 10.65.3 \mathfrak{q} is a weakly associated prime of M . \square

Lemma 10.65.7. *Let R be a ring. Let M be an R -module. Any $\mathfrak{p} \in \text{Supp}(M)$ which is minimal among the elements of $\text{Supp}(M)$ is an element of $\text{WeakAss}(M)$.*

Proof. Note that $\text{Supp}(M_{\mathfrak{p}}) = \{\mathfrak{p}R_{\mathfrak{p}}\}$ in $\text{Spec}(R_{\mathfrak{p}})$. In particular $M_{\mathfrak{p}}$ is nonzero, and hence $\text{WeakAss}(M_{\mathfrak{p}}) \neq \emptyset$ by Lemma 10.65.4. Since $\text{WeakAss}(M_{\mathfrak{p}}) \subset \text{Supp}(M_{\mathfrak{p}})$ by Lemma 10.65.5 we conclude that $\text{WeakAss}(M_{\mathfrak{p}}) = \{\mathfrak{p}R_{\mathfrak{p}}\}$, whence $\mathfrak{p} \in \text{WeakAss}(M)$ by Lemma 10.65.2. \square

Lemma 10.65.8. *Let R be a ring. Let M be an R -module. Let \mathfrak{p} be a prime ideal of R which is finitely generated. Then*

$$\mathfrak{p} \in \text{Ass}(M) \Leftrightarrow \mathfrak{p} \in \text{WeakAss}(M).$$

In particular, if R is Noetherian, then $\text{Ass}(M) = \text{WeakAss}(M)$.

Proof. Write $\mathfrak{p} = (g_1, \dots, g_n)$ for some $g_i \in R$. It is enough to prove the implication “ \Leftarrow ” as the other implication holds in general, see Lemma 10.65.5. Assume $\mathfrak{p} \in \text{WeakAss}(M)$. By Lemma 10.65.2 there exists an element $m \in M_{\mathfrak{p}}$ such that $I = \{x \in R_{\mathfrak{p}} \mid xm = 0\}$ has radical $\mathfrak{p}R_{\mathfrak{p}}$. Hence for each i there exists a smallest $e_i > 0$ such that $g_i^{e_i}m = 0$ in $M_{\mathfrak{p}}$. If $e_i > 1$ for some i , then we can replace m by $g_i^{e_i-1}m \neq 0$ and decrease $\sum e_i$. Hence we may assume that the annihilator of $m \in M_{\mathfrak{p}}$ is $(g_1, \dots, g_n)R_{\mathfrak{p}} = \mathfrak{p}R_{\mathfrak{p}}$. By Lemma 10.62.14 we see that $\mathfrak{p} \in \text{Ass}(M)$. \square

Remark 10.65.9. Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Then it is not always the case that $\text{Spec}(\varphi)(\text{WeakAss}_S(M)) \subset \text{WeakAss}_R(M)$ contrary to the case of associated primes (see Lemma 10.62.10). An example is to consider the ring map

$$R = k[x_1, x_2, x_3, \dots] \rightarrow S = k[x_1, x_2, x_3, \dots, y_1, y_2, y_3, \dots] / (x_1y_1, x_2y_2, x_3y_3, \dots)$$

and $M = S$. In this case $\mathfrak{q} = \sum x_i S$ is a minimal prime of S , hence a weakly associated prime of $M = S$ (see Lemma 10.65.7). But on the other hand, for any nonzero element of S the annihilator in R is finitely generated, and hence does not have radical equal to $R \cap \mathfrak{q} = (x_1, x_2, x_3, \dots)$ (details omitted).

Lemma 10.65.10. *Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Then we have $\text{Spec}(\varphi)(\text{WeakAss}_S(M)) \supset \text{WeakAss}_R(M)$.*

Proof. Let \mathfrak{p} be an element of $\text{WeakAss}_R(M)$. Then there exists an $m \in M_{\mathfrak{p}}$ whose annihilator $I = \{x \in R_{\mathfrak{p}} \mid xm = 0\}$ has radical $\mathfrak{p}R_{\mathfrak{p}}$. Consider the radical $J = \{x \in S_{\mathfrak{p}} \mid xm = 0\}$ of m in $S_{\mathfrak{p}}$. As $IS_{\mathfrak{p}} \subset J$ we see that any minimal prime $\mathfrak{q} \subset S_{\mathfrak{p}}$ over J lies over \mathfrak{p} . Moreover such a \mathfrak{q} corresponds to a weakly associated prime of M for example by Lemma 10.65.2. \square

Remark 10.65.11. Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Denote $f : \text{Spec}(S) \rightarrow \text{Spec}(R)$ the associated map on spectra. Then we have

$$f(\text{Ass}_S(M)) \subset \text{Ass}_R(M) \subset \text{WeakAss}_R(M) \subset f(\text{WeakAss}_S(M))$$

see Lemmas 10.62.10, 10.65.10, and 10.65.5. In general all of the inclusions may be strict, see Remarks 10.62.11 and 10.65.9. If S is Noetherian, then all the inclusions are equalities as the outer two are equal by Lemma 10.65.8.

Lemma 10.65.12. *Let $\varphi : R \rightarrow S$ be a ring map. Let M be an S -module. Denote $f : \text{Spec}(S) \rightarrow \text{Spec}(R)$ the associated map on spectra. If φ is a finite ring map, then*

$$\text{WeakAss}_R(M) = f(\text{WeakAss}_S(M)).$$

Proof. One of the inclusions has already been proved, see Remark 10.65.11. To prove the other assume $\mathfrak{q} \in \text{WeakAss}_S(M)$ and let \mathfrak{p} be the corresponding prime of R . Let $m \in M$ be an element such that \mathfrak{q} is a minimal prime over $J = \{g \in S \mid gm = 0\}$. Thus the radical of $JS_{\mathfrak{q}}$ is $\mathfrak{q}S_{\mathfrak{q}}$. As $R \rightarrow S$ is finite there are finitely many primes $\mathfrak{q} = \mathfrak{q}_1, \mathfrak{q}_2, \dots, \mathfrak{q}_l$ over \mathfrak{p} , see Lemma 10.35.19. Pick $x \in \mathfrak{q}$ with $x \notin \mathfrak{q}_i$ for $i > 1$, see Lemma 10.14.2. By the above there exists an element $y \in S$, $y \notin \mathfrak{q}$ and an integer $t > 0$ such that $yx^t m = 0$. Thus the element $ym \in M$ is annihilated by x^t , hence ym maps to zero in $M_{\mathfrak{q}_i}$, $i = 2, \dots, l$. To be sure, ym does not map to zero in $S_{\mathfrak{q}}$.

The ring $S_{\mathfrak{p}}$ is semi-local with maximal ideals $\mathfrak{q}_i S_{\mathfrak{p}}$ by going up for finite ring maps, see Lemma 10.35.20. If $f \in \mathfrak{p}R_{\mathfrak{p}}$ then some power of f ends up in $JS_{\mathfrak{q}}$ hence for some $n > 0$ we see that $f^t y m$ maps to zero in $M_{\mathfrak{q}}$. As ym vanishes at the other maximal ideals of $S_{\mathfrak{p}}$ we conclude that $f^t y m$ is zero in $M_{\mathfrak{p}}$, see Lemma 10.23.1. In this way we see that \mathfrak{p} is a minimal prime over the annihilator of ym in R and we win. \square

Lemma 10.65.13. *Let R be a ring. Let I be an ideal. Let M be an R/I -module. Via the canonical injection $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$ we have $\text{WeakAss}_{R/I}(M) = \text{WeakAss}_R(M)$.*

Proof. Omitted. \square

Lemma 10.65.14. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $\text{Spec}(S^{-1}R) \rightarrow \text{Spec}(R)$ we have $\text{WeakAss}_R(S^{-1}M) = \text{WeakAss}_{S^{-1}R}(S^{-1}M)$ and*

$$\text{WeakAss}(M) \cap \text{Spec}(S^{-1}R) = \text{WeakAss}(S^{-1}M).$$

Proof. Suppose that $m \in S^{-1}M$. Let $I = \{x \in R \mid xm = 0\}$ and $I' = \{x' \in S^{-1}R \mid x'm = 0\}$. Then $I' = S^{-1}I$ and $I \cap S = \emptyset$ unless $I = R$ (verifications omitted). Thus primes in $S^{-1}R$ minimal over I' correspond bijectively to primes in R minimal over I and avoiding S . This proves the equality $\text{WeakAss}_R(S^{-1}M) = \text{WeakAss}_{S^{-1}R}(S^{-1}M)$. The second equality follows from Lemma 10.62.14 since for $\mathfrak{p} \in R$, $S \cap \mathfrak{p} = \emptyset$ we have $M_{\mathfrak{p}} = (S^{-1}M)_{S^{-1}\mathfrak{p}}$. \square

Lemma 10.65.15. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset. Assume that every $s \in S$ is a nonzerodivisor on M . Then*

$$\text{WeakAss}(M) = \text{WeakAss}(S^{-1}M).$$

Proof. As $M \subset S^{-1}M$ by assumption we obtain $\text{WeakAss}(M) \subset \text{WeakAss}(S^{-1}M)$ from Lemma 10.65.3. Conversely, suppose that $n/s \in S^{-1}M$ is an element with annihilator I and \mathfrak{p} a prime which is minimal over I . Then the annihilator of $n \in M$ is I and \mathfrak{p} is a prime minimal over I . \square

Lemma 10.65.16. *Let R be a ring. Let M be an R -module. The map*

$$M \longrightarrow \prod_{\mathfrak{p} \in \text{WeakAss}(M)} M_{\mathfrak{p}}$$

is injective.

Proof. Let $x \in M$ be an element of the kernel of the map. Set $N = Rx \subset M$. If \mathfrak{p} is a weakly associated prime of N we see on the one hand that $\mathfrak{p} \in \text{WeakAss}(M)$ (Lemma 10.65.3) and on the other hand that $N_{\mathfrak{p}} \subset M_{\mathfrak{p}}$ is not zero. This contradiction shows that $\text{WeakAss}(N) = \emptyset$. Hence $N = 0$, i.e., $x = 0$ by Lemma 10.65.4. \square

Lemma 10.65.17. *Let $R \rightarrow S$ be a ring map. Let N be an S -module. Assume N is flat as an R -module and R is a domain with fraction field K . Then*

$$\text{WeakAss}_S(N) = \text{WeakAss}_{S \otimes_R K}(N \otimes_R K)$$

via the canonical inclusion $\text{Spec}(S \otimes_R K) \subset \text{Spec}(S)$.

Proof. Note that $S \otimes_R K = (R \setminus \{0\})^{-1}S$ and $N \otimes_R K = (R \setminus \{0\})^{-1}N$. For any nonzero $x \in R$ multiplication by x on N is injective as N is flat over R . Hence the lemma follows from Lemma 10.65.15. \square

10.66. Embedded primes

Here is the definition.

Definition 10.66.1. Let R be a ring. Let M be an R -module.

- (1) The associated primes of M which are not minimal among the associated primes of M are called the *embedded associated primes* of M .
- (2) The *embedded primes* of R are the embedded associated primes of R as an R -module.

Here is a way to get rid of these.

Lemma 10.66.2. *Let R be a Noetherian ring. Let M be a finite R -module. Consider the set of R -submodules*

$$\{K \subset M \mid \text{Supp}(K) \text{ nowhere dense in } \text{Supp}(M)\}.$$

This set has a maximal element K and the quotient $M' = M/K$ has the following properties

- (1) $\text{Supp}(M) = \text{Supp}(M')$,
- (2) M' has no embedded associated primes,
- (3) for any $f \in R$ which is contained in all embedded associated primes of M we have $M_f \cong M'_f$.

Proof. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_t$ denote the minimal primes in the support of M . Let $\mathfrak{p}_1, \dots, \mathfrak{p}_s$ denote the embedded associated primes of M . Then $\text{Ass}(M) = \{\mathfrak{q}_j, \mathfrak{p}_i\}$. There are finitely many of these, see Lemma 10.62.5. Set $I = \prod_{i=1, \dots, s} \mathfrak{p}_i$. Then $I \not\subset \mathfrak{q}_j$ for any j . Hence by Lemma 10.14.2 we can find an $f \in I$ such that $f \notin \mathfrak{q}_j$ for

all $j = 1, \dots, t$. Set $M' = \text{Im}(M \rightarrow M_f)$. This implies that $M_f \cong M'_f$. Since $M' \subset M_f$ we see that $\text{Ass}(M') \subset \text{Ass}(M_f) = \{\mathfrak{q}_j\}$. Thus M' has no embedded associated primes.

Moreover, the support of $K = \text{Ker}(M \rightarrow M')$ is contained in $V(\mathfrak{p}_1) \cup \dots \cup V(\mathfrak{p}_s)$, because $\text{Ass}(K) \subset \text{Ass}(M)$ (see Lemma 10.62.3) and $\text{Ass}(K)$ contains none of the \mathfrak{q}_i by construction. Clearly, K is in fact the largest submodule of M whose support is contained in $V(\mathfrak{p}_1) \cup \dots \cup V(\mathfrak{p}_t)$. This implies that K is the maximal element of the set displayed in the lemma. \square

Lemma 10.66.3. *Let R be a Noetherian ring. Let M be a finite R -module. For any $f \in R$ we have $(M')_f = (M_f)'$ where $M \rightarrow M'$ and $M_f \rightarrow (M_f)'$ are the quotients constructed in Lemma 10.66.2.*

Proof. Omitted. \square

Lemma 10.66.4. *Let R be a Noetherian ring. Let M be a finite R -module without embedded associated primes. Let $I = \{x \in R \mid xM = 0\}$. Then the ring R/I has no embedded primes.*

Proof. We may replace R by R/I . Hence we may assume every nonzero element of R acts nontrivially on M . By Lemma 10.39.5 this implies that $\text{Spec}(R)$ equals the support of M . Suppose that \mathfrak{p} is an embedded prime of R . Let $x \in R$ be an element whose annihilator is \mathfrak{p} . Consider the nonzero module $N = xM \subset M$. It is annihilated by \mathfrak{p} . Hence any associated prime \mathfrak{q} of N contains \mathfrak{p} and is also an associated prime of M . Then \mathfrak{q} would be an embedded associated prime of M which contradicts the assumption of the lemma. \square

10.67. Regular sequences and depth

There is a characterization of depth in terms of Ext-groups that we will discuss in Section 10.69. Here we develop some basic properties of regular sequences and we prove the inequality between depth and dimension.

Definition 10.67.1. Let R be a ring. Let M be an R -module. A sequence of elements f_1, \dots, f_r of R is called *M -regular* if the following conditions hold:

- (1) f_i is a nonzerodivisor on $M/(f_1, \dots, f_{i-1})M$ for each $i = 1, \dots, r$, and
- (2) the module $M/(f_1, \dots, f_r)M$ is not zero.

If I is an ideal of R and $f_1, \dots, f_r \in I$ then we call f_1, \dots, f_r a *M -regular sequence in I* . If $M = R$, we call f_1, \dots, f_r simply a *regular sequence (in I)*.

Please pay attention to the fact that the definition depends on the order of the elements f_1, \dots, f_r (see examples below). Some papers/books drop the requirement that the module $M/(f_1, \dots, f_r)M$ is nonzero. This has the advantage that being a regular sequence is preserved under localization. However, we will use this definition mainly to define the depth of a module in case R is local; in that case the f_i are required to be in the maximal ideal – a condition which is not preserved under going from R to a localization $R_{\mathfrak{p}}$.

Example 10.67.2. Let k be a field. In the ring $k[x, y, z]$ the sequence $x, y(1-x), z(1-x)$ is regular but the sequence $y(1-x), z(1-x), x$ is not.

Example 10.67.3. Let k be a field. Consider the ring $k[x, y, w_0, w_1, w_2, \dots]/I$ where I is generated by yw_i , $i = 0, 1, 2, \dots$ and $w_i - xw_{i+1}$, $i = 0, 1, 2, \dots$. The sequence x, y is regular, but y is a zerodivisor. Moreover you can localize at the maximal ideal (x, y, w_i) and still get an example.

Definition 10.67.4. Let R be a ring, and $I \subset R$ an ideal. Let M be an R -module. The I -depth of M is the supremum in $\{-\infty, 0, 1, 2, \dots, \infty\}$ of the lengths of M -regular sequences in I . We denote it $\text{depth}_I(M)$. If (R, \mathfrak{m}) is local we call $\text{depth}_{\mathfrak{m}}(M)$ simply the *depth* of M .

Elucidation: By Definition 10.67.1 the empty sequence is not a regular sequence on the zero module. Hence $\text{depth}_I(0) = -\infty$ and in fact the zero module is the only module whose I -depth is $-\infty$ (in references using the modified definition of regular sequences — see discussion above — the depth of the zero module is $+\infty$). A module M has I -depth 0 if and only if M is nonzero and I does not contain an M -regular element.

Example 10.67.2 shows depth does not behave well even if the ring is Noetherian, and Example 10.67.3 shows that it does not behave well if the ring is local but non-Noetherian. We will see later depth behaves well if the ring is local Noetherian. The following two lemmas are an indication of this.

Lemma 10.67.5. *Let R be a local Noetherian ring. Let M be a finite R -module. Let x_1, \dots, x_c be an M -regular sequence. Then any permutation of the x_i is a regular sequence as well.*

Proof. First we do the case $c = 2$. Consider $K \subset M$ the kernel of $x_2 : M \rightarrow M$. For any $z \in K$ we know that $z = x_1 z'$ for some $z' \in M$ because x_2 is a nonzerodivisor on $M/x_1 M$. Because x_1 is a nonzerodivisor on M we see that $x_2 z' = 0$ as well. Hence $x_1 : K \rightarrow K$ is surjective. Thus $K = 0$ by Nakayama's Lemma 10.19.1. Next, consider multiplication by x_1 on $M/x_2 M$. If $z \in M$ maps to an element $\bar{z} \in M/x_2 M$ in the kernel of this map, then $x_1 z = x_2 y$ for some $y \in M$. But then since x_1, x_2 is a regular sequence we see that $y = x_1 y'$ for some $y' \in M$. Hence $x_1(z - x_2 y') = 0$ and hence $z = x_2 y'$ and hence $\bar{z} = 0$ as desired.

For the general case, observe that any permutation is a composition of transpositions of adjacent indices. Hence it suffices to prove that

$$x_1, \dots, x_{i-2}, x_i, x_{i-1}, x_{i+1}, \dots, x_c$$

is an M -regular sequence. This follows from the case we just did applied to the module $M/(x_1, \dots, x_{i-2})$ and the length 2 regular sequence x_{i-1}, x_i . \square

Lemma 10.67.6. *Let R be a Noetherian local ring. Let M be a finite R -module. Then $\dim(\text{Supp}(M)) \geq \text{depth}(M)$.*

Proof. By Lemma 10.61.6 it suffices to prove that if $f \in \mathfrak{m}$ is a nonzerodivisor on M , then $d(M/fM) \leq d(M) - 1$. The existence of f shows that M does not have finite length. Consider the exact sequence

$$0 \rightarrow M \xrightarrow{f} M \rightarrow M/fM \rightarrow 0$$

and apply Lemma 10.58.10. It shows that $d(M/fM) < d(M)$. \square

Here are a few more results on depth.

Lemma 10.67.7. *Let R, S be local rings. Let $R \rightarrow S$ be a flat local ring homomorphism. Let x_1, \dots, x_r be a sequence in R . Let M be an R -module. The following are equivalent*

- (1) x_1, \dots, x_r is an M -regular sequence in R , and
- (2) the images of x_1, \dots, x_r in S form a $M \otimes_R S$ -regular sequence.

Proof. This is so because $R \rightarrow S$ is faithfully flat by Lemma 10.38.16. \square

Lemma 10.67.8. *Let R be a Noetherian ring. Let M be a finite R -module. Let \mathfrak{p} be a prime. Let x_1, \dots, x_r be a sequence in R whose image in $R_{\mathfrak{p}}$ forms an $M_{\mathfrak{p}}$ -regular sequence. Then there exists a $g \in R$, $g \notin \mathfrak{p}$ such that the image of x_1, \dots, x_r in R_g forms an M_g -regular sequence.*

Proof. Set

$$K_i = \text{Ker}(x_i : M/(x_1, \dots, x_{i-1})M \rightarrow M/(x_1, \dots, x_{i-1})M).$$

This is a finite R -module whose localization at \mathfrak{p} is zero by assumption. Hence there exists a $g \in R$, $g \notin \mathfrak{p}$ such that $(K_i)_g = 0$ for all $i = 1, \dots, r$. This g works. \square

Lemma 10.67.9. *Let A be a ring. Let I be an ideal generated by a regular sequence f_1, \dots, f_n in A . Let $g_1, \dots, g_m \in A$ be elements whose images $\bar{g}_1, \dots, \bar{g}_m$ form a regular sequence in A/I . Then $f_1, \dots, f_n, g_1, \dots, g_m$ is a regular sequence in A .*

Proof. This follows immediately from the definitions. \square

Lemma 10.67.10. *Let R be a ring. Let M be an R -module. Let $f_1, \dots, f_r \in R$ be M -regular. Then for $e_1, \dots, e_r > 0$ the sequence $f_1^{e_1}, \dots, f_r^{e_r}$ is M -regular too.*

Proof. We will prove this by induction on r . If $r = 1$ this follows from the fact that a power of an M -regular element is an M -regular element. If $r > 1$, then by induction applied to M/f_1M we have that $f_1, f_2^{e_2}, \dots, f_r^{e_r}$ is an M -regular sequence. Thus it suffices to show that f_1^e, f_2, \dots, f_r is an M -regular sequence if f_1, \dots, f_r is an M -regular sequence. We will prove this by induction on e . The case $e = 1$ is trivial. Since f_1 is a nonzerodivisor we have a short exact sequence

$$0 \rightarrow M/f_1M \xrightarrow{f_1^{e-1}} M/f_1^eM \rightarrow M/f_1^{e-1}M \rightarrow 0$$

By induction the elements f_2, \dots, f_r are M/f_1M and $M/f_1^{e-1}M$ -regular sequences. It follows from the snake lemma that they are also M/f_1^eM -regular sequences. \square

Lemma 10.67.11. *Let R be a ring. Let $f_1, \dots, f_r \in R$ which do not generate the unit ideal. The following are equivalent:*

- (1) any permutation of f_1, \dots, f_r is a regular sequence,
- (2) any subsequence of f_1, \dots, f_r (in the given order) is a regular sequence, and
- (3) f_1x_1, \dots, f_rx_r is a regular sequence in the polynomial ring $R[x_1, \dots, x_r]$.

Proof. It is clear that (1) implies (2). We prove (2) implies (1) by induction on r . The case $r = 1$ is trivial. The case $r = 2$ says that if $a, b \in R$ are a regular sequence and b is a nonzerodivisor, then b, a is a regular sequence. This is clear because the kernel of $a : R/(b) \rightarrow R/(b)$ is isomorphic to the kernel of $b : R/(a) \rightarrow R/(a)$ if both a and b are nonzerodivisors. The case $r > 2$. Assume (2) holds and say we want to prove $f_{\sigma(1)}, \dots, f_{\sigma(r)}$ is a regular sequence for some permutation σ . We already know that $f_{\sigma(1)}, \dots, f_{\sigma(r-1)}$ is a regular sequence by induction. Hence it suffices to

show that f_s where $s = \sigma(r)$ is a nonzerodivisor modulo $f_1, \dots, \hat{f}_s, \dots, f_r$. If $s = r$ we are done. If $s < r$, then note that f_s and f_r are both nonzerodivisors in the ring $R/(f_1, \dots, \hat{f}_s, \dots, f_{r-1})$ (by induction hypothesis again). Since we know f_s, f_r is a regular sequence in that ring we conclude by the case of sequence of length 2 that f_r, f_s is too.

Note that $R[x_1, \dots, x_r]/(f_1x_1, \dots, f_ix_i)$ as an R -module is a direct sum of the modules

$$R/I_E \cdot x_1^{e_1} \dots x_r^{e_r}$$

indexed by multi-indices $E = (e_1, \dots, e_r)$ where I_E is the ideal generated by f_j for $1 \leq j \leq i$ with $e_j > 0$. Hence $f_{i+1}x_i$ is a nonzerodivisor on this if and only if f_{i+1} is a nonzerodivisor on R/I_E for all E . Taking E with all positive entries, we see that f_{i+1} is a nonzerodivisor on $R/(f_1, \dots, f_i)$. Thus (3) implies (2). Conversely, if (2) holds, then any subsequence of f_1, \dots, f_i, f_{i+1} is a regular sequence by Lemma 10.67.10, i.e., hence f_{i+1} is a nonzerodivisor on all R/I_E . In this way we see that (2) implies (3). \square

10.68. Quasi-regular sequences

There is a notion of regular sequence which is slightly weaker than that of a regular sequence and easier to use. Let R be a ring and let $f_1, \dots, f_c \in R$. Set $J = (f_1, \dots, f_c)$. Let M be an R -module. Then there is a canonical map

$$(10.68.0.1) \quad M/JM \otimes_{R/J} R/J[X_1, \dots, X_c] \longrightarrow \bigoplus_{n \geq 0} J^n M / J^{n+1} M$$

of graded $R/J[X_1, \dots, X_c]$ -modules defined by the rule

$$\bar{m} \otimes X_1^{e_1} \dots X_c^{e_c} \longmapsto f_1^{e_1} \dots f_c^{e_c} m \bmod J^{e_1 + \dots + e_c + 1} M.$$

Note that (10.68.0.1) is always surjective.

Definition 10.68.1. Let R be a ring. Let M be an R -module. A sequence of elements f_1, \dots, f_c of R is called *M -quasi-regular* if (10.68.0.1) is an isomorphism. If $M = R$, we call f_1, \dots, f_c simply a *quasi-regular sequence*.

So if f_1, \dots, f_c is a quasi-regular sequence, then

$$R/J[X_1, \dots, X_c] = \bigoplus_{n \geq 0} J^n / J^{n+1}$$

where $J = (f_1, \dots, f_c)$. It is clear that being a quasi-regular sequence is independent of the order of f_1, \dots, f_c .

Lemma 10.68.2. *Let R be a ring.*

- (1) *A regular sequence f_1, \dots, f_c of R is a quasi-regular sequence.*
- (2) *Suppose that M is an R -module and that f_1, \dots, f_c is an M -regular sequence. Then f_1, \dots, f_c is an M -quasi-regular sequence.*

Proof. Set $J = (f_1, \dots, f_c)$. We prove the first assertion by induction on c . We have to show that given any relation $\sum_{|I|=n} a_I f^I \in J^{n+1}$ with $a_I \in R$ we actually have $a_I \in J$ for all multi-indices I . Since any element of J^{n+1} is of the form $\sum_{|I|=n} b_I f^I$ with $b_I \in J$ we may assume, after replacing a_I by $a_I - b_I$, the relation reads $\sum_{|I|=n} a_I f^I = 0$. We can rewrite this as

$$\sum_{e=0}^n \left(\sum_{|I'|=n-e} a_{I',e} f^{I'} \right) f_c^e = 0$$

Here and below the “primed” multi-indices I' are required to be of the form $I' = (i_1, \dots, i_{d-1}, 0)$. We will show by descending induction on $l \in \{0, \dots, n\}$ that if we have a relation

$$\sum_{e=0}^l \left(\sum_{|I'|=n-e} a_{I',e} f^{I'} \right) f_c^e = 0$$

then $a_{I',e} \in J$ for all I', e . Namely, set $J' = (f_1, \dots, f_{c-1})$. Observe that $\sum_{|I'|=n-l} a_{I',l} f^{I'}$ is mapped into $(J')^{n-l+1}$ by f_c^l . By induction hypothesis (for the induction on c) we see that $f_c^l a_{I',l} \in J'$. Because f_c is not a zerodivisor on R/J' (as f_1, \dots, f_c is a regular sequence) we conclude that $a_{I',l} \in J'$. This allows us to rewrite the term $(\sum_{|I'|=n-l} a_{I',l} f^{I'}) f_c^l$ in the form $(\sum_{|I'|=n-l+1} f_c b_{I',l-1} f^{I'}) f_c^{l-1}$. This gives a new relation of the form

$$\sum_{|I'|=n-l+1} (a_{I',l-1} + f_c b_{I',l-1}) f^{I'} f_c^{l-1} + \sum_{e=0}^{l-2} \left(\sum_{|I'|=n-e} a_{I',e} f^{I'} \right) f_c^e = 0$$

Now by the induction hypothesis (on l this time) we see that all $a_{I',l-1} + f_c b_{I',l-1} \in J$ and all $a_{I',e} \in J$ for $e \leq l-2$. This, combined with $a_{I',l} \in J' \subset J$ seen above, finishes the proof of the induction step.

The second assertion means that given any formal expression $F = \sum_{|I|=n} m_I X^I$, $m_I \in M$ with $\sum m_I f^I \in J^{n+1}M$, then all the coefficients m_I are in J . This is proved in exactly the same way as we prove the corresponding result for the first assertion above. \square

Lemma 10.68.3. *Let $R \rightarrow R'$ be a flat ring map. Let M be an R -module. Suppose that $f_1, \dots, f_r \in R$ form an M -quasi-regular sequence. Then the images of f_1, \dots, f_r in R' form a $M \otimes_R R'$ -quasi-regular sequence.*

Proof. Set $J = (f_1, \dots, f_r)$, $J' = JR'$ and $M' = M \otimes_R R'$. We have to show the canonical map $\mu : R'/J'[X_1, \dots, X_n] \otimes_{R'/J'} M'/J'M' \rightarrow \bigoplus (J')^n M' / (J')^{n+1} M'$ is an isomorphism. Because $R \rightarrow R'$ is flat the sequences $0 \rightarrow J^n M \rightarrow M$ and $0 \rightarrow J^{n+1} M \rightarrow J^n M \rightarrow J^n M / J^{n+1} M \rightarrow 0$ remain exact on tensoring with R' . This first implies that $J^n M \otimes_R R' = (J')^n M'$ and then that $(J')^n M' / (J')^{n+1} M' = J^n M / J^{n+1} M \otimes_R R'$. Thus μ is the tensor product of (10.68.0.1), which is an isomorphism by assumption, with $\text{id}_{R'}$ and we conclude. \square

Lemma 10.68.4. *Let R be a Noetherian ring. Let M be a finite R -module. Let \mathfrak{p} be a prime. Let x_1, \dots, x_c be a sequence in R whose image in $R_{\mathfrak{p}}$ forms an $M_{\mathfrak{p}}$ -quasi-regular sequence. Then there exists a $g \in R$, $g \notin \mathfrak{p}$ such that the image of x_1, \dots, x_c in R_g forms an M_g -quasi-regular sequence.*

Proof. Consider the kernel K of the map (10.68.0.1). As $M/JM \otimes_{R/J} R/J[X_1, \dots, X_c]$ is a finite $R/J[X_1, \dots, X_c]$ -module and as $R/J[X_1, \dots, X_c]$ is Noetherian, we see that K is also a finite $R/J[X_1, \dots, X_c]$ -module. Pick homogeneous generators $k_1, \dots, k_t \in K$. By assumption for each $i = 1, \dots, t$ there exists a $g_i \in R$, $g_i \notin \mathfrak{p}$ such that $g_i k_i = 0$. Hence $g = g_1 \dots g_t$ works. \square

Lemma 10.68.5. *Let R be a ring. Let M be an R -module. Let $f_1, \dots, f_c \in R$ be an M -quasi-regular sequence. For any i the sequence $\bar{f}_{i+1}, \dots, \bar{f}_c$ of $\bar{R} = R/(f_1, \dots, f_i)$ is an $\bar{M} = M/(f_1, \dots, f_i)M$ -quasi-regular sequence.*

Proof. It suffices to prove this for $i = 1$. Set $\bar{J} = (\bar{f}_2, \dots, \bar{f}_c) \subset \bar{R}$. Then

$$\begin{aligned} \bar{J}^n \bar{M} / \bar{J}^{n+1} \bar{M} &= (J^n M + f_1 M) / (J^{n+1} M + f_1 M) \\ &= J^n M / (J^{n+1} M + J^n M \cap f_1 M). \end{aligned}$$

Thus, in order to prove the lemma it suffices to show that $J^{n+1} M + J^n M \cap f_1 M = J^{n+1} M + f_1 J^n M$ because that will show that $\bigoplus_{n \geq 0} \bar{J}^n \bar{M} / \bar{J}^{n+1} \bar{M}$ is the quotient of $\bigoplus_{n \geq 0} J^n M / J^{n+1} M \cong M / JM[X_1, \dots, X_c]$ by X_1 . Actually, we have $J^n M \cap f_1 M = f_1 J^{n-1} M$. Namely, if $m \notin J^{n-1} M$, then $f_1 m \notin J^n M$ because $\bigoplus J^n M / J^{n+1} M$ is the polynomial algebra $M/J[X_1, \dots, X_c]$ by assumption. \square

Lemma 10.68.6. *Let (R, \mathfrak{m}) be a local Noetherian ring. Let M be a nonzero finite R -module. Let $f_1, \dots, f_c \in \mathfrak{m}$ be an M -quasi-regular sequence. Then f_1, \dots, f_c is an M -regular sequence.*

Proof. Set $J = (f_1, \dots, f_c)$. Let us show that f_1 is a nonzerodivisor on M . Suppose $x \in M$ is not zero. By the Artin-Rees lemma there exists an integer r such that $x \in J^r M$ but $x \notin J^{r+1} M$, see Lemma 10.49.4. Then $f_1 x \in J^{r+1} M$ is an element whose class in $J^{r+1} M / J^{r+2} M$ is nonzero by the assumed structure of $\bigoplus J^n M / J^{n+1} M$. Whence $f_1 x \neq 0$.

Now we can finish the proof by induction on c using Lemma 10.68.5. \square

Remark 10.68.7 (Koszul regular sequences). In the paper [Kab71] the author introduces two more regularity conditions for sequences x_1, \dots, x_r of elements of a ring R . Namely, we say the sequence is *Koszul-regular* if $H_i(K_\bullet(R, x_\bullet)) = 0$ for $i \geq 1$ where $K_\bullet(R, x_\bullet)$ is the Koszul complex. The sequence is called *H_1 -regular* if $H_1(K_\bullet(R, x_\bullet)) = 0$. If R is a local ring (possibly nonnoetherian) and the sequence consists of elements of the maximal ideal, then one has the implications regular \Rightarrow Koszul-regular $\Rightarrow H_1$ -regular \Rightarrow quasi-regular. By examples the author shows that these implications cannot be reversed in general. We introduce these notions in more detail in More on Algebra, Section 15.21.

Remark 10.68.8. Let k be a field. Consider the ring

$$A = k[x, y, w, z_0, z_1, z_2, \dots] / (y^2 z_0 - wx, z_0 - yz_1, z_1 - yz_2, \dots)$$

In this ring x is a nonzerodivisor and the image of y in A/xA gives a quasi-regular sequence. But it is not true that x, y is a quasi-regular sequence in A because $(x, y)/(x, y)^2$ isn't free of rank two over $A/(x, y)$ due to the fact that $wx = 0$ in $(x, y)/(x, y)^2$ but w isn't zero in $A/(x, y)$. Hence the analogue of Lemma 10.67.9 does not hold for quasi-regular sequences.

Lemma 10.68.9. *Let R be a ring. Let $J = (f_1, \dots, f_r)$ be an ideal of R . Let M be an R -module. Set $\bar{R} = R / \bigcap_{n \geq 0} J^n$, $\bar{M} = M / \bigcap_{n \geq 0} J^n M$, and denote \bar{f}_i the image of f_i in \bar{R} . Then f_1, \dots, f_r is M -quasi-regular if and only if $\bar{f}_1, \dots, \bar{f}_r$ is \bar{M} -quasi-regular.*

Proof. This is true because $J^n M / J^{n+1} M \cong \bar{J}^n \bar{M} / \bar{J}^{n+1} \bar{M}$. \square

10.69. Ext groups and depth

In this section we do a tiny bit of homological algebra, in order to establish some fundamental properties of depth over Noetherian local rings.

Lemma 10.69.1. *Let R be a ring. Let M be an R -module.*

- (1) *There exists an exact complex*

$$\dots \rightarrow F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0.$$

with F_i free R -modules.

- (2) *If R is Noetherian and M finite over R , then we can choose the complex such that F_i is finite free. In other words, we can find an exact complex*

$$\dots \rightarrow R^{\oplus n_2} \rightarrow R^{\oplus n_1} \rightarrow R^{\oplus n_0} \rightarrow M \rightarrow 0.$$

Proof. Let us explain only the Noetherian case. As a first step choose a surjection $R^{n_0} \rightarrow M$. Then having constructed an exact complex of length e we simply choose a surjection $R^{n_{e+1}} \rightarrow \text{Ker}(R^{n_e} \rightarrow R^{n_{e-1}})$ which is possible because R is Noetherian. \square

Definition 10.69.2. Let R be a ring. Let M be an R -module.

- (1) A (left) *resolution* $F_\bullet \rightarrow M$ of M is an exact complex

$$\dots \rightarrow F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

of R -modules.

- (2) A *resolution of M by free R -modules* is a resolution $F_\bullet \rightarrow M$ where each F_i is a free R -module.
 (3) A *resolution of M by finite free R -modules* is a resolution $F_\bullet \rightarrow M$ where each F_i is a finite free R -module.

We often use the notation F_\bullet to denote a complex of R -modules

$$\dots \rightarrow F_i \rightarrow F_{i-1} \rightarrow \dots$$

In this case we often use d_i or $d_{F,i}$ to denote the map $F_i \rightarrow F_{i-1}$. In this section we are always going to assume that F_0 is the last nonzero term in the complex. The *i th homology group of the complex F_\bullet* is the group $H_i = \text{Ker}(d_{F,i})/\text{Im}(d_{F,i+1})$. A *map of complexes* $\alpha : F_\bullet \rightarrow G_\bullet$ is given by maps $\alpha_i : F_i \rightarrow G_i$ such that $\alpha_{i-1} \circ d_{F,i} = d_{G,i-1} \circ \alpha_i$. Such a map induces a map on homology $H_i(\alpha) : H_i(F_\bullet) \rightarrow H_i(G_\bullet)$. If $\alpha, \beta : F_\bullet \rightarrow G_\bullet$ are maps of complexes, then a *homotopy* between α and β is given by a collection of maps $h_i : F_i \rightarrow G_{i+1}$ such that $\alpha_i - \beta_i = d_{G,i+1} \circ h_i + h_{i-1} \circ d_{F,i}$.

We will use a very similar notation regarding complexes of the form F^\bullet which look like

$$\dots \rightarrow F^i \xrightarrow{d^i} F^{i+1} \rightarrow \dots$$

There are maps of complexes, homotopies, etc. In this case we set $H^i(F^\bullet) = \text{Ker}(d^i)/\text{Im}(d^{i-1})$ and we call it the *i th cohomology group*.

Lemma 10.69.3. *Any two homotopic maps of complexes induce the same maps on (co)homology groups.*

Proof. Omitted. \square

Lemma 10.69.4. *Let R be a ring. Let $M \rightarrow N$ be a map of R -modules. Let $F_\bullet \rightarrow M$ be a resolution by free R -modules and let $N_\bullet \rightarrow N$ be an arbitrary resolution. Then*

- (1) *there exists a map of complexes $F_\bullet \rightarrow N_\bullet$ inducing the given map*

$$M = \operatorname{Coker}(F_1 \rightarrow F_0) \rightarrow \operatorname{Coker}(N_1 \rightarrow N_0) = N$$

- (2) *two maps $\alpha, \beta : F_\bullet \rightarrow N_\bullet$ inducing the same map $M \rightarrow N$ are homotopic.*

Proof. Proof of (1). Because F_0 is free we can find a map $F_0 \rightarrow N_0$ lifting the map $F_0 \rightarrow M \rightarrow N$. We obtain an induced map $F_1 \rightarrow F_0 \rightarrow N_0$ which ends up in the image of $N_1 \rightarrow N_0$. Since F_1 is free we may lift this to a map $F_1 \rightarrow N_1$. This in turn induces a map $F_2 \rightarrow F_1 \rightarrow N_1$ which maps to zero into N_0 . Since N_\bullet is exact we see that the image of this map is contained in the image of $N_2 \rightarrow N_1$. Hence we may lift to get a map $F_2 \rightarrow N_2$. Repeat.

Proof of (2). To show that α, β are homotopic it suffices to show the difference $\gamma = \alpha - \beta$ is homotopic to zero. Note that the image of $\gamma_0 : F_0 \rightarrow N_0$ is contained in the image of $N_1 \rightarrow N_0$. Hence we may lift γ_0 to a map $h_0 : F_0 \rightarrow N_1$. Consider the map $\gamma'_1 = \gamma_1 - h_0 \circ d_{F,1}$. By our choice of h_0 we see that the image of γ'_1 is contained in the kernel of $N_1 \rightarrow N_0$. Since N_\bullet is exact we may lift γ'_1 to a map $h_1 : F_1 \rightarrow N_2$. At this point we have $\gamma_1 = h_0 \circ d_{F,1} + d_{N,2} \circ h_1$. Repeat. \square

At this point we are ready to define the groups $\operatorname{Ext}_R^i(M, N)$. Namely, choose a resolution F_\bullet of M by free R -modules, see Lemma 10.69.1. Consider the (cohomological) complex

$$\operatorname{Hom}_R(F_\bullet, N) : \operatorname{Hom}_R(F_0, N) \rightarrow \operatorname{Hom}_R(F_1, N) \rightarrow \operatorname{Hom}_R(F_2, N) \rightarrow \dots$$

We define $\operatorname{Ext}_R^i(M, N)$ to be the i th cohomology group of this complex.³ The following lemma explains in what sense this is well defined.

Lemma 10.69.5. *Let R be a ring. Let M_1, M_2, N be R -modules. Suppose that F_\bullet is a free resolution of the module M_1 , and G_\bullet is a free resolution of the module M_2 . Let $\varphi : M_1 \rightarrow M_2$ be a module map. Let $\alpha : F_\bullet \rightarrow G_\bullet$ be a map of complexes inducing φ on $M_1 = \operatorname{Coker}(d_{F,1}) \rightarrow M_2 = \operatorname{Coker}(d_{G,1})$, see Lemma 10.69.4. Then the induced maps*

$$H^i(\alpha) : H^i(\operatorname{Hom}_R(F_\bullet, N)) \longrightarrow H^i(\operatorname{Hom}_R(G_\bullet, N))$$

are independent of the choice of α . If φ is an isomorphism, so are all the maps $H^i(\alpha)$. If $M_1 = M_2$, $F_\bullet = G_\bullet$, and φ is the identity, so are all the maps $H^i(\alpha)$.

Proof. Another map $\beta : F_\bullet \rightarrow G_\bullet$ inducing φ is homotopic to α by Lemma 10.69.4. Hence the maps $\operatorname{Hom}_R(F_\bullet, N) \rightarrow \operatorname{Hom}_R(G_\bullet, N)$ are homotopic. Hence the independence result follows from Lemma 10.69.3.

Suppose that φ is an isomorphism. Let $\psi : M_2 \rightarrow M_1$ be an inverse. Choose $\beta : G_\bullet \rightarrow F_\bullet$ be a map inducing $\psi : M_2 = \operatorname{Coker}(d_{G,1}) \rightarrow M_1 = \operatorname{Coker}(d_{F,1})$, see Lemma 10.69.4. OK, and now consider the map $H^i(\alpha) \circ H^i(\beta) = H^i(\alpha \circ \beta)$. By the above the map $H^i(\alpha \circ \beta)$ is the same as the map $H^i(\operatorname{id}_{F_\bullet}) = \operatorname{id}$. Similarly for the composition $H^i(\beta) \circ H^i(\alpha)$. Hence $H^i(\alpha)$ and $H^i(\beta)$ are inverses of each other. \square

³At this point it would perhaps be more appropriate to say “an” in stead of “the” Ext-group.

Lemma 10.69.6. *Let R be a ring. Let M be an R -module. Let $0 \rightarrow N' \rightarrow N \rightarrow N'' \rightarrow 0$ be a short exact sequence. Then we get a long exact sequence*

$$\begin{aligned} 0 \rightarrow \operatorname{Hom}_R(M, N') &\rightarrow \operatorname{Hom}_R(M, N) \rightarrow \operatorname{Hom}_R(M, N'') \\ &\rightarrow \operatorname{Ext}_R^1(M, N') \rightarrow \operatorname{Ext}_R^1(M, N) \rightarrow \operatorname{Ext}_R^1(M, N'') \rightarrow \dots \end{aligned}$$

Proof. Pick a free resolution $F_\bullet \rightarrow M$. Since each of the F_i are free we see that we get a short exact sequence of complexes

$$0 \rightarrow \operatorname{Hom}_R(F_\bullet, N') \rightarrow \operatorname{Hom}_R(F_\bullet, N) \rightarrow \operatorname{Hom}_R(F_\bullet, N'') \rightarrow 0$$

Thus we get the long exact sequence from the snake lemma applied to this. \square

Lemma 10.69.7. *Let R be a ring. Let N be an R -module. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence. Then we get a long exact sequence*

$$\begin{aligned} 0 \rightarrow \operatorname{Hom}_R(M'', N) &\rightarrow \operatorname{Hom}_R(M, N) \rightarrow \operatorname{Hom}_R(M', N) \\ &\rightarrow \operatorname{Ext}_R^1(M'', N) \rightarrow \operatorname{Ext}_R^1(M, N) \rightarrow \operatorname{Ext}_R^1(M', N) \rightarrow \dots \end{aligned}$$

Proof. Pick sets of generators $\{m'_{i'}\}_{i' \in I'}$ and $\{m''_{i''}\}_{i'' \in I''}$ of M' and M'' . For each $i'' \in I''$ choose a lift $\tilde{m}''_{i''} \in M$ of the element $m''_{i''} \in M''$. Set $F' = \bigoplus_{i' \in I'} R$, $F'' = \bigoplus_{i'' \in I''} R$ and $F = F' \oplus F''$. Mapping the generators of these free modules to the corresponding chosen generators gives surjective R -module maps $F' \rightarrow M'$, $F'' \rightarrow M''$, and $F \rightarrow M$. We obtain a map of short exact sequences

$$\begin{array}{ccccccccc} 0 & \rightarrow & M' & \rightarrow & M & \rightarrow & M'' & \rightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \rightarrow & F' & \rightarrow & F & \rightarrow & F'' & \rightarrow & 0 \end{array}$$

By the snake lemma we see that the sequence of kernels $0 \rightarrow K' \rightarrow K \rightarrow K'' \rightarrow 0$ is short exact sequence of R -modules. Hence we can continue this process indefinitely. In other words we obtain a short exact sequence of resolutions fitting into the diagram

$$\begin{array}{ccccccccc} 0 & \rightarrow & M' & \rightarrow & M & \rightarrow & M'' & \rightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \rightarrow & F'_\bullet & \rightarrow & F_\bullet & \rightarrow & F''_\bullet & \rightarrow & 0 \end{array}$$

Because each of the sequences $0 \rightarrow F'_n \rightarrow F_n \rightarrow F''_n \rightarrow 0$ is split exact (by construction) we obtain a short exact sequence of complexes

$$0 \rightarrow \operatorname{Hom}_R(F''_\bullet, N) \rightarrow \operatorname{Hom}_R(F_\bullet, N) \rightarrow \operatorname{Hom}_R(F'_\bullet, N) \rightarrow 0$$

by applying the $\operatorname{Hom}_R(-, N)$ functor. Thus we get the long exact sequence from the snake lemma applied to this. \square

Lemma 10.69.8. *Let R be a ring. Let M, N be R -modules. Any $x \in R$ such that either $xN = 0$, or $xM = 0$ annihilates each of the modules $\operatorname{Ext}_R^i(M, N)$.*

Proof. Pick a free resolution F_\bullet of M . Since $\operatorname{Ext}_R^i(M, N)$ is defined as the cohomology of the complex $\operatorname{Hom}_R(F_\bullet, N)$ the lemma is clear when $xN = 0$. If $xM = 0$, then we see that multiplication by x on F_\bullet lifts the zero map on M . Hence by Lemma 10.69.5 we see that it induces the same map on Ext groups as the zero map. \square

Lemma 10.69.9. *Let R be a Noetherian ring. Let M, N be finite R -modules. Then $\operatorname{Ext}_R^i(M, N)$ is a finite R -module for all i .*

Proof. This holds because $\text{Ext}_R^i(M, N)$ is computed as the cohomology groups of a complex $\text{Hom}_R(F_\bullet, N)$ with each F_n a finite free R -module. \square

Lemma 10.69.10. *Let R be a Noetherian local ring with maximal ideal \mathfrak{m} . Let M be a nonzero finite R -module. Then $\text{depth}_R(M)$ is equal to the smallest integer i such that $\text{Ext}_R^i(R/\mathfrak{m}, M)$ is nonzero.*

Proof. Let $\delta(M)$ denote the depth of M and let $i(M)$ denote the smallest integer i such that $\text{Ext}_R^i(R/\mathfrak{m}, M)$ is nonzero. We will see in a moment that $i(M) < \infty$. By Lemma 10.62.17 we have $\delta(M) = 0$ if and only if $i(M) = 0$, because $\mathfrak{m} \in \text{Ass}(M)$ exactly means that $i(M) = 0$. Hence if $\delta(M)$ or $i(M)$ is > 0 , then we may choose $x \in \mathfrak{m}$ such that (a) x is a nonzerodivisor on M , and (b) $\text{depth}(M/xM) = \delta(M) - 1$. Consider the long exact sequence of Ext-groups associated to the short exact sequence $0 \rightarrow M \rightarrow M \rightarrow M/xM \rightarrow 0$ by Lemma 10.69.6:

$$\begin{aligned} 0 &\rightarrow \text{Hom}_R(\kappa, M) \rightarrow \text{Hom}_R(\kappa, M) \rightarrow \text{Hom}_R(\kappa, M/xM) \\ &\rightarrow \text{Ext}_R^1(\kappa, M) \rightarrow \text{Ext}_R^1(\kappa, M) \rightarrow \text{Ext}_R^1(\kappa, M/xM) \rightarrow \dots \end{aligned}$$

Since $x \in \mathfrak{m}$ all the maps $\text{Ext}_R^i(\kappa, M) \rightarrow \text{Ext}_R^i(\kappa, M)$ are zero, see Lemma 10.69.8. Thus it is clear that $i(M/xM) = i(M) - 1$. Induction on $\delta(M)$ finishes the proof. \square

Lemma 10.69.11. *Let R be a local Noetherian ring. Let $0 \rightarrow N' \rightarrow N \rightarrow N'' \rightarrow 0$ be a short exact sequence of nonzero finite R -modules.*

- (1) $\text{depth}(N'') \geq \min\{\text{depth}(N), \text{depth}(N') - 1\}$
- (2) $\text{depth}(N') \geq \min\{\text{depth}(N), \text{depth}(N'') + 1\}$

Proof. This is easy using the results above. Hint: Use the characterization of depth using the Ext groups $\text{Ext}_R^i(\kappa, N)$, see Lemma 10.69.10, and use the long exact cohomology sequence

$$\begin{aligned} 0 &\rightarrow \text{Hom}_R(\kappa, N') \rightarrow \text{Hom}_R(\kappa, N) \rightarrow \text{Hom}_R(\kappa, N'') \\ &\rightarrow \text{Ext}_R^1(\kappa, N') \rightarrow \text{Ext}_R^1(\kappa, N) \rightarrow \text{Ext}_R^1(\kappa, N'') \rightarrow \dots \end{aligned}$$

from Lemma 10.69.6. \square

Lemma 10.69.12. *Let R be a local Noetherian ring. Let M be a finite R -module. If $x \in \mathfrak{m}$ is a nonzerodivisor on M , then $\text{depth}(M/xM) = \text{depth}(M) - 1$.*

Proof. By the short exact sequence $0 \rightarrow M \rightarrow M \rightarrow M/xM \rightarrow 0$ and Lemma 10.69.11 we see that the depth drops by at most 1. On the other hand, if $x_1, \dots, x_\delta \in \mathfrak{m}$ is a regular sequence for M/xM , then x, x_1, \dots, x_δ is a regular sequence for M . Hence we see that the depth drops by at least 1. \square

10.70. Functorialities for Ext

In this section we briefly discuss the functoriality of Ext with respect to change of ring, etc. Here is a list of items to work out.

- (1) Given $R \rightarrow R'$, an R -module M and an R' -module N' the R -module $\text{Ext}_R^i(M, N')$ has a natural R' -module structure. Moreover, there is a canonical R' -linear map $\text{Ext}_{R'}^i(M \otimes_R R', N') \rightarrow \text{Ext}_R^i(M, N')$.
- (2) Given $R \rightarrow R'$ and R -modules M, N there is a natural R -module map $\text{Ext}_R^i(M, N) \rightarrow \text{Ext}_R^i(M, N \otimes_R R')$.

Lemma 10.70.1. *Given a flat ring map $R \rightarrow R'$, an R -module M , and an R' -module N' the natural map*

$$\text{Ext}_{R'}^i(M \otimes_R R', N') \rightarrow \text{Ext}_R^i(M, N')$$

is an isomorphism for $i \geq 0$.

Proof. Choose a free resolution F_\bullet of M . Since $R \rightarrow R'$ is flat we see that $F_\bullet \otimes_R R'$ is a free resolution of $M \otimes_R R'$ over R' . The statement is that the map

$$\text{Hom}_{R'}(F_\bullet \otimes_R R', N') \rightarrow \text{Hom}_R(F_\bullet, N')$$

induces an isomorphism on homology groups, which is true because it is an isomorphism of complexes by Lemma 10.13.3. \square

10.71. An application of Ext groups

This section should briefly discuss the relationship between $\text{Ext}_R^1(Q, N)$ and extensions (see Homology, Section 12.6). Omitted.

Lemma 10.71.1. *Let R be a Noetherian local ring with maximal ideal \mathfrak{m} . Let $N \rightarrow M$ be a homomorphism of finite R -modules. Suppose that there exists arbitrarily large n such that $N/\mathfrak{m}^n N \rightarrow M/\mathfrak{m}^n M$ is a split injection. Then $N \rightarrow M$ is a split injection.*

Proof. Assume $\varphi : N \rightarrow M$ satisfies the assumptions of the lemma. Note that this implies that $\text{Ker}(\varphi) \subset \mathfrak{m}^n N$ for arbitrarily large n . Hence by Lemma 10.49.4 we see that φ is injection. Let $Q = M/N$ so that we have a short exact sequence

$$0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0.$$

Let

$$F_2 \xrightarrow{d_2} F_1 \xrightarrow{d_1} F_0 \rightarrow Q \rightarrow 0$$

be a finite free resolution of Q . We can choose a map $\alpha : F_0 \rightarrow M$ lifting the map $F_0 \rightarrow Q$. This induces a map $\beta : F_1 \rightarrow N$ such that $\beta \circ d_2 = 0$. The extension above is split if and only if there exists a map $\gamma : F_0 \rightarrow N$ such that $\beta = \gamma \circ d_1$. In other words, the class of β in $\text{Ext}_R^1(Q, N)$ is the obstruction to splitting the short exact sequence above.

Suppose n is a large integer such that $N/\mathfrak{m}^n N \rightarrow M/\mathfrak{m}^n M$ is a split injection. This implies

$$0 \rightarrow N/\mathfrak{m}^n N \rightarrow M/\mathfrak{m}^n M \rightarrow Q/\mathfrak{m}^n Q \rightarrow 0.$$

is still short exact. Also, the sequence

$$F_1/\mathfrak{m}^n F_1 \xrightarrow{d_1} F_0/\mathfrak{m}^n F_0 \rightarrow Q/\mathfrak{m}^n Q \rightarrow 0$$

is still exact. Arguing as above we see that the map $\bar{\beta} : F_1/\mathfrak{m}^n F_1 \rightarrow N/\mathfrak{m}^n N$ induced by β is equal to $\gamma_n \circ d_1$ for some map $\bar{\gamma}_n : F_0/\mathfrak{m}^n F_0 \rightarrow N/\mathfrak{m}^n N$. Since F_0 is free we can lift $\bar{\gamma}_n$ to a map $\gamma_n : F_0 \rightarrow N$ and then we see that $\beta - \gamma_n \circ d_1$ is a map from F_1 into $\mathfrak{m}^n N$. In other words we conclude that

$$\beta \in \text{Im}\left(\text{Hom}_R(F_0, N) \rightarrow \text{Hom}_R(F_1, N)\right) + \mathfrak{m}^n \text{Hom}_R(F_1, N).$$

for this n .

Since we have this property for arbitrarily large n by assumption we conclude (by Lemma 10.49.2) that β is actually in the image of the map $\text{Hom}_R(F_0, N) \rightarrow \text{Hom}_R(F_1, N)$ as desired. \square

10.72. Tor groups and flatness

In this section we use some of the homological algebra developed in the previous section to explain what Tor groups are. Namely, suppose that R is a ring and that M, N are two R -modules. Choose a resolution F_\bullet of M by free R -modules. See Lemma 10.69.1. Consider the homological complex

$$F_\bullet \otimes_R N : \dots \rightarrow F_2 \otimes_R N \rightarrow F_1 \otimes_R N \rightarrow F_0 \otimes_R N$$

We define $\text{Tor}_i^R(M, N)$ to be the i th homology group of this complex. The following lemma explains in what sense this is well defined.

Lemma 10.72.1. *Let R be a ring. Let M_1, M_2, N be R -modules. Suppose that F_\bullet is a free resolution of the module M_1 and that G_\bullet is a free resolution of the module M_2 . Let $\varphi : M_1 \rightarrow M_2$ be a module map. Let $\alpha : F_\bullet \rightarrow G_\bullet$ be a map of complexes inducing φ on $M_1 = \text{Coker}(d_{F,1}) \rightarrow M_2 = \text{Coker}(d_{G,1})$, see Lemma 10.69.4. Then the induced maps*

$$H_i(\alpha) : H_i(F_\bullet \otimes_R N) \longrightarrow H_i(G_\bullet \otimes_R N)$$

are independent of the choice of α . If φ is an isomorphism, so are all the maps $H_i(\alpha)$. If $M_1 = M_2$, $F_\bullet = G_\bullet$, and φ is the identity, so are all the maps $H_i(\alpha)$.

Proof. The proof of this lemma is identical to the proof of Lemma 10.69.5. \square

Not only does this lemma imply that the Tor modules are well defined, but it also provides for the functoriality of the constructions $(M, N) \mapsto \text{Tor}_i^R(M, N)$ in the first variable. Of course the functoriality in the second variable is evident. We leave it to the reader to see that each of the Tor_i^R is in fact a functor

$$\text{Mod}_R \times \text{Mod}_R \rightarrow \text{Mod}_R.$$

Here Mod_R denotes the category of R -modules, and for the definition of the product category see Categories, Definition 4.2.20. Namely, given morphisms of R -modules $M_1 \rightarrow M_2$ and $N_1 \rightarrow N_2$ we get a commutative diagram

$$\begin{array}{ccc} \text{Tor}_i^R(M_1, N_1) & \longrightarrow & \text{Tor}_i^R(M_1, N_2) \\ \downarrow & & \downarrow \\ \text{Tor}_i^R(M_2, N_1) & \longrightarrow & \text{Tor}_i^R(M_2, N_2) \end{array}$$

Lemma 10.72.2. *Let R be a ring and let M be an R -module. Suppose that $0 \rightarrow N' \rightarrow N \rightarrow N'' \rightarrow 0$ is a short exact sequence of R -modules. There exists a long exact sequence*

$$\begin{array}{ccccccc} M \otimes_R N' & \rightarrow & M \otimes_R N & \rightarrow & M \otimes_R N'' & \rightarrow & 0 \\ \text{Tor}_1^R(M, N') & \rightarrow & \text{Tor}_1^R(M, N) & \rightarrow & \text{Tor}_1^R(M, N'') & \rightarrow & \end{array}$$

Proof. The proof of this is the same as the proof of Lemma 10.69.6. \square

Consider a homological double complex of R -modules

$$\begin{array}{ccccccc}
 \dots & \xrightarrow{d} & A_{2,0} & \xrightarrow{d} & A_{1,0} & \xrightarrow{d} & A_{0,0} \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 \dots & \xrightarrow{d} & A_{2,1} & \xrightarrow{d} & A_{1,1} & \xrightarrow{d} & A_{0,1} \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 \dots & \xrightarrow{d} & A_{2,2} & \xrightarrow{d} & A_{1,2} & \xrightarrow{d} & A_{0,2} \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 & & \dots & & \dots & & \dots
 \end{array}$$

This means that $d_{i,j} : A_{i,j} \rightarrow A_{i-1,j}$ and $\delta_{i,j} : A_{i,j} \rightarrow A_{i,j-1}$ have the following properties

- (1) Any composition of two $d_{i,j}$ is zero. In other words the rows of the double complex are complexes.
- (2) Any composition of two $\delta_{i,j}$ is zero. In other words the columns of the double complex are complexes.
- (3) For any pair (i, j) we have $\delta_{i-1,j} \circ d_{i,j} = d_{i,j-1} \circ \delta_{i,j}$. In other words, all the squares commute.

The correct thing to do is to associate a spectral sequence to any such double complex. However, for the moment we can get away with doing something slightly easier.

Namely, for the purposes of this section only, given a double complex $(A_{\bullet,\bullet}, d, \delta)$ set $R(A)_j = \text{Coker}(A_{1,j} \rightarrow A_{0,j})$ and $U(A)_i = \text{Coker}(A_{i,1} \rightarrow A_{i,0})$. (The letters R and U are meant to suggest Right and Up.) We endow $R(A)_\bullet$ with the structure of a complex using the maps δ . Similarly we endow $U(A)_\bullet$ with the structure of a complex using the maps d . In other words we obtain the following huge commutative diagram

$$\begin{array}{ccccccc}
 \dots & \xrightarrow{d} & U(A)_2 & \xrightarrow{d} & U(A)_1 & \xrightarrow{d} & U(A)_0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 \dots & \xrightarrow{d} & A_{2,0} & \xrightarrow{d} & A_{1,0} & \xrightarrow{d} & A_{0,0} & \longrightarrow & R(A)_0 \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 \dots & \xrightarrow{d} & A_{2,1} & \xrightarrow{d} & A_{1,1} & \xrightarrow{d} & A_{0,1} & \longrightarrow & R(A)_1 \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 \dots & \xrightarrow{d} & A_{2,2} & \xrightarrow{d} & A_{1,2} & \xrightarrow{d} & A_{0,2} & \longrightarrow & R(A)_2 \\
 & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow & & \delta \uparrow \\
 & & \dots & & \dots & & \dots & & \dots
 \end{array}$$

(This is no longer a double complex of course.) It is clear what a morphism $\Phi : (A_{\bullet,\bullet}, d, \delta) \rightarrow (B_{\bullet,\bullet}, d, \delta)$ of double complexes is, and it is clear that this induces morphisms of complexes $R(\Phi) : R(A)_\bullet \rightarrow R(B)_\bullet$ and $U(\Phi) : U(A)_\bullet \rightarrow U(B)_\bullet$.

Lemma 10.72.3. *Let $(A_{\bullet,\bullet}, d, \delta)$ be a double complex such that*

- (1) *Each row $A_{\bullet,j}$ is a resolution of $R(A)_j$.*
- (2) *Each column $A_{i,\bullet}$ is a resolution of $U(A)_i$.*

Then there are canonical isomorphisms

$$H_i(R(A)_\bullet) \cong H_i(U(A)_\bullet).$$

The isomorphisms are functorial with respect to morphisms of double complexes with the properties above.

Proof. We will show that $H_i(R(A)_\bullet)$ and $H_i(U(A)_\bullet)$ are canonically isomorphic to a third group. Namely

$$\mathbf{H}_i(A) := \frac{\{(a_{i,0}, a_{i-1,1}, \dots, a_{0,i}) \mid d(a_{i,0}) = \delta(a_{i-1,1}), \dots, d(a_{1,i-1}) = \delta(a_{0,i})\}}{\{d(a_{i+1,0}) - \delta(a_{i,1}), d(a_{i,1}) - \delta(a_{i-1,2}), \dots, d(a_{1,i}) - \delta(a_{0,i+1})\}}$$

Here we use the notational convention that $a_{i,j}$ denotes an element of $A_{i,j}$. In other words, an element of \mathbf{H}_i is represented by a zig-zag, represented as follows for $i = 2$

$$\begin{array}{ccc} a_{2,0} & \longmapsto & d(a_{2,0}) = \delta(a_{1,1}) \\ & & \uparrow \\ & & a_{1,1} \longmapsto d(a_{1,1}) = \delta(a_{0,2}) \\ & & \uparrow \\ & & a_{0,2} \end{array}$$

Naturally, we divide out by “trivial” zig-zags, namely the submodule generated by elements of the form $(0, \dots, 0, -\delta(a_{t+1,t-i}), d(a_{t+1,t-i}), 0, \dots, 0)$. Note that there are canonical homomorphisms

$$\mathbf{H}_i(A) \rightarrow H_i(R(A)_\bullet), \quad (a_{i,0}, a_{i-1,1}, \dots, a_{0,i}) \mapsto \text{class of image of } a_{0,i}$$

and

$$\mathbf{H}_i(A) \rightarrow H_i(U(A)_\bullet), \quad (a_{i,0}, a_{i-1,1}, \dots, a_{0,i}) \mapsto \text{class of image of } a_{i,0}$$

First we show that these maps are surjective. Suppose that $\bar{r} \in H_i(R(A)_\bullet)$. Let $r \in R(A)_i$ be a cocycle representing the class of \bar{r} . Let $a_{0,i} \in A_{0,i}$ be an element which maps to r . Because $\delta(r) = 0$, we see that $\delta(a_{0,i})$ is in the image of d . Hence there exists an element $a_{1,i-1} \in A_{1,i-1}$ such that $d(a_{1,i-1}) = \delta(a_{0,i})$. This in turn implies that $\delta(a_{1,i-1})$ is in the kernel of d (because $d(\delta(a_{1,i-1})) = \delta(d(a_{1,i-1})) = \delta(\delta(a_{0,i})) = 0$). By exactness of the rows we find an element $a_{2,i-2}$ such that $d(a_{2,i-2}) = \delta(a_{1,i-1})$. And so on until a full zig-zag is found. Of course surjectivity of $\mathbf{H}_i \rightarrow H_i(U(A)_\bullet)$ is shown similarly.

To prove injectivity we argue in exactly the same way. Namely, suppose we are given a zig-zag $(a_{i,0}, a_{i-1,1}, \dots, a_{0,i})$ which maps to zero in $H_i(R(A)_\bullet)$. This means that $a_{0,i}$ maps to an element of $\text{Coker}(A_{i,1} \rightarrow A_{i,0})$ which is in the image of $\delta : \text{Coker}(A_{i+1,1} \rightarrow A_{i+1,0}) \rightarrow \text{Coker}(A_{i,1} \rightarrow A_{i,0})$. In other words, $a_{0,i}$ is in the image of $\delta \oplus d : A_{0,i+1} \oplus A_{1,i} \rightarrow A_{0,i}$. From the definition of trivial zig-zags we see that we may modify our zig-zag by a trivial one and assume that $a_{0,i} = 0$. This immediately implies that $d(a_{1,i-1}) = 0$. As the rows are exact this implies that $a_{1,i-1}$ is in the image of $d : A_{2,i-1} \rightarrow A_{1,i-1}$. Thus we may modify our zig-zag once again by a

trivial zig-zag and assume that our zig-zag looks like $(a_{i,0}, a_{i-1,1}, \dots, a_{2,i-2}, 0, 0)$. Continuing like this we obtain the desired injectivity.

If $\Phi : (A_{\bullet, \bullet}, d, \delta) \rightarrow (B_{\bullet, \bullet}, d, \delta)$ is a morphism of double complexes both of which satisfy the conditions of the lemma, then we clearly obtain a commutative diagram

$$\begin{array}{ccccc} H_i(U(A)_{\bullet}) & \longleftarrow & \mathbf{H}_i(A) & \longrightarrow & H_i(R(A)_{\bullet}) \\ \downarrow & & \downarrow & & \downarrow \\ H_i(U(B)_{\bullet}) & \longleftarrow & \mathbf{H}_i(B) & \longrightarrow & H_i(R(B)_{\bullet}) \end{array}$$

This proves the functoriality. □

Remark 10.72.4. The isomorphism constructed above is the “correct” one only up to signs. A good part of homological algebra is concerned with choosing signs for various maps and showing commutativity of diagrams with intervention of suitable signs. For the moment we will simply use the isomorphism as given in the proof above, and worry about signs later.

Lemma 10.72.5. *Let R be a ring. For any $i \geq 0$ the functors $\text{Mod}_R \times \text{Mod}_R \rightarrow \text{Mod}_R$, $(M, N) \mapsto \text{Tor}_i^R(M, N)$ and $(M, N) \mapsto \text{Tor}_i^R(N, M)$ are canonically isomorphic.*

Proof. Let F_{\bullet} be a free resolution of the module M and let G_{\bullet} be a free resolution of the module N . Consider the double complex $(A_{i,j}, d, \delta)$ defined as follows:

- (1) set $A_{i,j} = F_i \otimes_R G_j$,
- (2) set $d_{i,j} : F_i \otimes_R G_j \rightarrow F_{i-1} \otimes_R G_j$ equal to $d_{F_i} \otimes \text{id}$, and
- (3) set $\delta_{i,j} : F_i \otimes_R G_j \rightarrow F_i \otimes_R G_{j-1}$ equal to $\text{id} \otimes d_{G_j}$.

This double complex is usually simply denoted $F_{\bullet} \otimes_R G_{\bullet}$.

Since each G_j is free, and hence flat we see that each row of the double complex is exact except in homological degree 0. Since each F_i is free and hence flat we see that each column of the double complex is exact except in homological degree 0. Hence the double complex satisfies the conditions of Lemma 10.72.3.

To see what the lemma says we compute $R(A)_{\bullet}$ and $U(A)_{\bullet}$. Namely,

$$\begin{aligned} R(A)_i &= \text{Coker}(A_{1,i} \rightarrow A_{0,i}) \\ &= \text{Coker}(F_1 \otimes_R G_i \rightarrow F_0 \otimes_R G_i) \\ &= \text{Coker}(F_1 \rightarrow F_0) \otimes_R G_i \\ &= M \otimes_R G_i \end{aligned}$$

In fact these isomorphisms are compatible with the differentials δ and we see that $R(A)_{\bullet} = M \otimes_R G_{\bullet}$ as homological complexes. In exactly the same way we see that $U(A)_{\bullet} = F_{\bullet} \otimes_R N$. We get

$$\begin{aligned} \text{Tor}_i^R(M, N) &= H_i(F_{\bullet} \otimes_R N) \\ &= H_i(U(A)_{\bullet}) \\ &= H_i(R(A)_{\bullet}) \\ &= H_i(M \otimes_R G_{\bullet}) \\ &= H_i(G_{\bullet} \otimes_R M) \\ &= \text{Tor}_i^R(N, M) \end{aligned}$$

Here the third equality is Lemma 10.72.3, and the fifth equality uses the isomorphism $V \otimes W = W \otimes V$ of the tensor product.

Functoriality. Suppose that we have R -modules $M_\nu, N_\nu, \nu = 1, 2$. Let $\varphi : M_1 \rightarrow M_2$ and $\psi : N_1 \rightarrow N_2$ be morphisms of R -modules. Suppose that we have free resolutions $F_{\nu, \bullet}$ for M_ν and free resolutions $G_{\nu, \bullet}$ for N_ν . By Lemma 10.69.4 we may choose maps of complexes $\alpha : F_{1, \bullet} \rightarrow F_{2, \bullet}$ and $\beta : G_{1, \bullet} \rightarrow G_{2, \bullet}$ compatible with φ and ψ . We claim that the pair (α, β) induces a morphism of double complexes

$$\alpha \otimes \beta : F_{1, \bullet} \otimes_R G_{1, \bullet} \longrightarrow F_{2, \bullet} \otimes_R G_{2, \bullet}$$

This is really a very straightforward check using the rule that $F_{1,i} \otimes_R G_{1,j} \rightarrow F_{2,i} \otimes_R G_{2,j}$ is given by $\alpha_i \otimes \beta_j$ where α_i , resp. β_j is the degree i , resp. j component of α , resp. β . The reader also readily verifies that the induced maps $R(F_{1, \bullet} \otimes_R G_{1, \bullet})_\bullet \rightarrow R(F_{2, \bullet} \otimes_R G_{2, \bullet})_\bullet$ agrees with the map $M_1 \otimes_R G_{1, \bullet} \rightarrow M_2 \otimes_R G_{2, \bullet}$ induced by $\varphi \otimes \beta$. Similarly for the map induced on the $U(-)_\bullet$ complexes. Thus the statement on functoriality follows from the statement on functoriality in Lemma 10.72.3. \square

Remark 10.72.6. An interesting case occurs when $M = N$ in the above. In this case we get a canonical map $\text{Tor}_i^R(M, M) \rightarrow \text{Tor}_i^R(M, M)$. Note that this map is not the identity, because even when $i = 0$ this map is not the identity! For example, if V is a vector space of dimension n over a field, then the switch map $V \otimes_k V \rightarrow V \otimes_k V$ has $(n^2 + n)/2$ eigenvalues $+1$ and $(n^2 - n)/2$ eigenvalues -1 . In characteristic 2 it is not even diagonalizable. Note that even changing the sign of the map will not get rid of this.

Lemma 10.72.7. *Let R be a ring. Let M be an R -module. The following are equivalent:*

- (1) *The module M is flat over R .*
- (2) *For all $i > 0$ the functor $\text{Tor}_i^R(M, -)$ is zero.*
- (3) *The functor $\text{Tor}_1^R(M, -)$ is zero.*
- (4) *For all ideals $I \subset R$ we have $\text{Tor}_1^R(M, R/I) = 0$.*
- (5) *For all finitely generated ideals $I \subset R$ we have $\text{Tor}_1^R(M, R/I) = 0$.*

Proof. Suppose M is flat. Let N be an R -module. Let F_\bullet be a free resolution of N . Then $F_\bullet \otimes_R M$ is a resolution of $N \otimes_R M$, by flatness of M . Hence all higher Tor groups vanish.

It now suffices to show that the last condition implies that M is flat. Let $I \subset R$ be an ideal. Consider the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow R/I \rightarrow 0$. Apply Lemma 10.72.2. We get an exact sequence

$$\text{Tor}_1^R(M, R/I) \rightarrow M \otimes_R I \rightarrow M \otimes_R R \rightarrow M \otimes_R R/I \rightarrow 0$$

Since obviously $M \otimes_R R = M$ we conclude that the last hypothesis implies that $M \otimes_R I \rightarrow M$ is injective for every finitely generated ideal I . Thus M is flat by Lemma 10.38.4. \square

Remark 10.72.8. The proof of Lemma 10.72.7 actually shows that

$$\text{Tor}_1^R(M, R/I) = \text{Ker}(I \otimes_R M \rightarrow M).$$

10.73. Functorialities for Tor

In this section we briefly discuss the functoriality of Tor with respect to change of ring, etc. Here is a list of items to work out.

- (1) Given a ring map $R \rightarrow R'$, an R -module M and an R' -module N' the R -modules $\text{Tor}_i^R(M, N')$ have a natural R' -module structure.
- (2) Given a ring map $R \rightarrow R'$ and R -modules M, N there is a natural R -module map $\text{Tor}_i^R(M, N) \rightarrow \text{Tor}_i^{R'}(M \otimes_R R', N \otimes_R R')$.
- (3) Given a ring map $R \rightarrow R'$ an R -module M and an R' -module N' there exists a natural R' -module map $\text{Tor}_i^R(M, N') \rightarrow \text{Tor}_i^{R'}(M \otimes_R R', N')$.

Lemma 10.73.1. *Given a flat ring map $R \rightarrow R'$ and R -modules M, N the natural R -module map $\text{Tor}_i^R(M, N) \otimes_R R' \rightarrow \text{Tor}_i^{R'}(M \otimes_R R', N \otimes_R R')$ is an isomorphism for all i .*

Proof. Omitted. This is true because a free resolution F_\bullet of M over R stays exact when tensoring with R' over R and hence $(F_\bullet \otimes_R N) \otimes_R R'$ computes the Tor groups over R' . \square

10.74. Projective modules

Some lemmas on projective modules.

Definition 10.74.1. Let R be a ring. An R -module P is *projective* if and only if the functor $\text{Hom}_R(P, -) : \text{Mod}_R \rightarrow \text{Mod}_R$ is an exact functor.

The functor $\text{Hom}_R(M, -)$ is left exact for any R -module M , see Lemma 10.10.1. Hence the condition for P to be projective really signifies that given a surjection of R -modules $N \rightarrow N'$ the map $\text{Hom}_R(P, N) \rightarrow \text{Hom}_R(P, N')$ is surjective.

Lemma 10.74.2. *Let R be a ring. Let P be an R -module. The following are equivalent*

- (1) P is projective,
- (2) P is a direct summand of a free R -module, and
- (3) $\text{Ext}_R^1(P, M) = 0$ for every R -module M .

Proof. Assume P is projective. Choose a surjection $\pi : F \rightarrow P$ where F is a free R -module. As P is projective there exists a $i \in \text{Hom}_R(P, F)$ such that $i \circ \pi = \text{id}_P$. In other words $F \cong \text{Ker}(\pi) \oplus i(P)$ and we see that P is a direct summand of F .

Conversely, assume that $P \oplus Q = F$ is a free R -module. Note that the free module $F = \bigoplus_{i \in I} R$ is projective as $\text{Hom}_R(F, M) = \prod_{i \in I} M$ and the functor $M \mapsto \prod_{i \in I} M$ is exact. Then $\text{Hom}_R(F, -) = \text{Hom}_R(P, -) \times \text{Hom}_R(Q, -)$ as functors, hence both P and Q are projective.

Assume $P \oplus Q = F$ is a free R -module. Then we have a free resolution F_\bullet of the form

$$\dots F \xrightarrow{a} F \xrightarrow{b} F \rightarrow P \rightarrow 0$$

where the maps a, b alternate and are equal to the projector onto P and Q . Hence the complex $\text{Hom}_R(F_\bullet, M)$ is split exact in degrees ≥ 1 , whence we see the vanishing in (3).

Assume $\text{Ext}_R^1(P, M) = 0$ for every R -module M . Pick a free resolution $F_\bullet \rightarrow P$. Set $M = \text{Im}(F_1 \rightarrow F_0) = \text{Ker}(F_0 \rightarrow P)$. Consider the element $\xi \in \text{Ext}_R^1(P, M)$

given by the class of the quotient map $\pi : F_1 \rightarrow M$. Since ξ is zero there exists a map $s : F_0 \rightarrow M$ such that $\pi = s \circ (F_1 \rightarrow F_0)$. Clearly, this means that

$$F_0 = \text{Ker}(s) \oplus \text{Ker}(F_0 \rightarrow P) = P \oplus \text{Ker}(F_0 \rightarrow P)$$

and we win. \square

Lemma 10.74.3. *A direct sum of projective modules is projective.*

Proof. This is true by the characterization of projectives as direct summands of free modules in Lemma 10.74.2. \square

Lemma 10.74.4. *Let R be a ring. Let $I \subset R$ be a nilpotent ideal. Let \bar{P} be a projective R -module. Then there exists a projective R -module P such that $P/IP \cong \bar{P}$.*

Proof. We can choose a set A and a direct sum decomposition $\bigoplus_{\alpha \in A} R/I = \bar{P} \oplus \bar{K}$ for some R/I -module \bar{K} . Write $F = \bigoplus_{\alpha \in A} R$ for the free R -module on A . Choose a lift $p : F \rightarrow F$ of the projector \bar{p} associated to the direct summand \bar{P} of $\bigoplus_{\alpha \in A} R/I$. Note that $p^2 - p \in \text{End}_R(F)$ is a nilpotent endomorphism of F (as I is nilpotent and the matrix entries of $p^2 - p$ are in I ; more precisely, if $I^n = 0$, then $(p^2 - p)^n = 0$). Hence by Lemma 10.31.6 we can modify our choice of p and assume that p is a projector. Set $P = \text{Im}(p)$. \square

Lemma 10.74.5. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. Assume*

- (1) I is nilpotent,
- (2) M/IM is a projective R/I -module,
- (3) M is a flat R -module.

Then M is a projective R -module.

Proof. By Lemma 10.74.4 we can find a projective R -module P and an isomorphism $P/IP \rightarrow M/IM$. We are going to show that M is isomorphic to P which will finish the proof. Because P is projective we can lift the map $P \rightarrow P/IP \rightarrow M/IM$ to an R -module map $P \rightarrow M$ which is an isomorphism modulo I . By Nakayama's Lemma 10.19.1 the map $P \rightarrow M$ is surjective. It remains to show that $P \rightarrow M$ is injective. Since $I^n = 0$ for some n , we can use the filtrations

$$\begin{aligned} 0 &= I^n M \subset I^{n-1} M \subset \dots \subset IM \subset M \\ 0 &= I^n P \subset I^{n-1} P \subset \dots \subset IP \subset P \end{aligned}$$

to see that it suffices to show that the induced maps $I^a P/I^{a+1} P \rightarrow I^a M/I^{a+1} M$ are injective. Since both P and M are flat R -modules we can identify this with the map

$$I^a/I^{a+1} \otimes_{R/I} P/IP \longrightarrow I^a/I^{a+1} \otimes_{R/I} M/IM$$

induced by $P \rightarrow M$. Since we chose $P \rightarrow M$ such that the induced map $P/IP \rightarrow M/IM$ is an isomorphism, we win. \square

10.75. Finite projective modules

Definition 10.75.1. Let R be a ring and M an R -module. We say that M is *locally free* if we can cover $\text{Spec}(R)$ by standard opens $D(f_i)$, $i \in I$ such that M_{f_i} is a free R_{f_i} -module for all $i \in I$. We say that M is *finite locally free* if each M_{f_i} is finite free.

Note that a finite locally free R -module is automatically finitely presented by Lemma 10.23.2.

Lemma 10.75.2. *Let R be a ring and let M be an R -module. The following are equivalent*

- (1) M is finitely presented and R -flat,
- (2) M is finite projective,
- (3) M is a direct summand of a finite free R -module,
- (4) M is finitely presented and for all $\mathfrak{p} \in \text{Spec}(R)$ the localization $M_{\mathfrak{p}}$ is free,
- (5) M is finitely presented and for all maximal ideals $\mathfrak{m} \subset R$ the localization $M_{\mathfrak{m}}$ is free,
- (6) M is finite and locally free,
- (7) M is finite locally free, and
- (8) M is finite, for every prime \mathfrak{p} the module $M_{\mathfrak{p}}$ is free, and the function

$$\rho_M : \text{Spec}(R) \rightarrow \mathbf{Z}, \quad \mathfrak{p} \mapsto \dim_{\kappa(\mathfrak{p})} M \otimes_R \kappa(\mathfrak{p})$$

is locally constant in the Zariski topology.

Proof. First suppose M is finite projective, i.e., (2) holds. Take a surjection $R^n \rightarrow M$ and let K be the kernel. Since M is projective, $0 \rightarrow K \rightarrow R^n \rightarrow M \rightarrow 0$ splits. Hence (2) \Rightarrow (3). The implication (3) \Rightarrow (2) follows from the fact that a direct summand of a projective is projective, see Lemma 10.74.2.

Assume (3), so we can write $K \oplus M \cong R^{\oplus n}$. So K is a direct summand of R^n and thus finitely generated. This shows $M = R^{\oplus n}/K$ is finitely presented. In other words, (3) \Rightarrow (1).

Assume M is finitely presented and flat, i.e., (1) holds. We will prove that (7) holds. Pick any prime \mathfrak{p} and $x_1, \dots, x_r \in M$ which map to a basis of $M \otimes_R \kappa(\mathfrak{p})$. By Nakayama's Lemma 10.19.1 these elements generate $M_{\mathfrak{g}}$ for some $g \in R$, $g \notin \mathfrak{p}$. The corresponding surjection $\varphi : R_g^{\oplus r} \rightarrow M_g^{\oplus r}$ has the following two properties: (a) $\text{Ker}(\varphi)$ is a finite R_g -module (see Lemma 10.5.3) and (b) $\text{Ker}(\varphi) \otimes \kappa(\mathfrak{p}) = 0$ by flatness of M_g over R_g (see Lemma 10.38.11). Hence by Nakayama's lemma again there exists a $g' \in R_g$ such that $\text{Ker}(\varphi)_{g'} = 0$. In other words, $M_{gg'}$ is free.

A finite locally free module is a finite module, see Lemma 10.23.2, hence (7) \Rightarrow (6). It is clear that (6) \Rightarrow (7) and that (7) \Rightarrow (8).

A finite locally free module is a finitely presented module, see Lemma 10.23.2, hence (7) \Rightarrow (4). Of course (4) implies (5). Since we may check flatness locally (see Lemma 10.38.19) we conclude that (5) implies (1). At this point we have

Suppose that M satisfies (1), (4), (5), (6), and (7). We will prove that (3) holds. It suffices to show that M is projective. We have to show that $\text{Hom}_R(M, -)$ is exact. Let $0 \rightarrow N'' \rightarrow N \rightarrow N' \rightarrow 0$ be a short exact sequence of R -module. We have to show that $0 \rightarrow \text{Hom}_R(M, N'') \rightarrow \text{Hom}_R(M, N) \rightarrow \text{Hom}_R(M, N') \rightarrow 0$ is exact. As M is finite locally free there exist a covering $\text{Spec}(R) = \bigcup D(f_i)$ such that M_{f_i} is finite free. By Lemma 10.10.2 we see that

$$0 \rightarrow \text{Hom}_R(M, N'')_{f_i} \rightarrow \text{Hom}_R(M, N)_{f_i} \rightarrow \text{Hom}_R(M, N')_{f_i} \rightarrow 0$$

is equal to $0 \rightarrow \text{Hom}_{R_{f_i}}(M_{f_i}, N''_{f_i}) \rightarrow \text{Hom}_{R_{f_i}}(M_{f_i}, N_{f_i}) \rightarrow \text{Hom}_{R_{f_i}}(M_{f_i}, N'_{f_i}) \rightarrow 0$ which is exact as M_{f_i} is free and as the localization $0 \rightarrow N''_{f_i} \rightarrow N_{f_i} \rightarrow N'_{f_i} \rightarrow 0$ is exact (as localization is exact). Whence we see that $0 \rightarrow \text{Hom}_R(M, N'') \rightarrow \text{Hom}_R(M, N) \rightarrow \text{Hom}_R(M, N') \rightarrow 0$ is exact by Lemma 10.23.2.

Finally, assume that (8) holds. Pick a maximal ideal $\mathfrak{m} \subset R$. Pick $x_1, \dots, x_r \in M$ which map to a $\kappa(\mathfrak{m})$ -basis of $M \otimes_R \kappa(\mathfrak{m}) = M/\mathfrak{m}M$. In particular $\rho_M(\mathfrak{m}) = r$. By Nakayama's Lemma 10.19.1 there exists an $f \in R$, $f \notin \mathfrak{m}$ such that x_1, \dots, x_r generate M_f over R_f . By the assumption that ρ_M is locally constant there exists a $g \in R$, $g \notin \mathfrak{m}$ such that ρ_M is constant equal to r on $D(g)$. We claim that

$$\Psi : R_{fg}^{\oplus r} \longrightarrow M_{fg}, \quad (a_1, \dots, a_r) \longmapsto \sum a_i x_i$$

is an isomorphism. This claim will show that M is finite locally free, i.e., that (7) holds. To see the claim it suffices to show that the induced map on localizations $\Psi_{\mathfrak{p}} : R_{\mathfrak{p}}^{\oplus r} \rightarrow M_{\mathfrak{p}}$ is an isomorphism for all $\mathfrak{p} \in D(fg)$, see Lemma 10.23.1. By our choice of f the map $\Psi_{\mathfrak{p}}$ is surjective. By assumption (8) we have $M_{\mathfrak{p}} \cong R_{\mathfrak{p}}^{\oplus \rho_M(\mathfrak{p})}$ and by our choice of g we have $\rho_M(\mathfrak{p}) = r$. Hence $\Psi_{\mathfrak{p}}$ determines a surjection $R_{\mathfrak{p}}^{\oplus r} \rightarrow M_{\mathfrak{p}} \cong R_{\mathfrak{p}}^{\oplus r}$ whence is an isomorphism by Lemma 10.15.4. (Of course this last fact follows from a simple matrix argument also.) \square

Remark 10.75.3. It is not true that a finite R -module which is R -flat is automatically projective. A counter example is where $R = \mathcal{C}^\infty(\mathbf{R})$ is the ring of infinitely differentiable functions on \mathbf{R} , and $M = R_{\mathfrak{m}} = R/I$ where $\mathfrak{m} = \{f \in R \mid f(0) = 0\}$ and $I = \{f \in R \mid \exists \epsilon, \epsilon > 0 : f(x) = 0 \forall x, |x| < \epsilon\}$.

Lemma 10.75.4. (*Warning: see Remark 10.75.3.*) *Suppose R is a local ring, and M is a finite flat R -module. Then M is finite free.*

Proof. Follows from the equational criterion of flatness, see Lemma 10.38.10. Namely, suppose that $x_1, \dots, x_r \in M$ map to a basis of $M/\mathfrak{m}M$. By Nakayama's Lemma 10.19.1 these elements generate M . We want to show there is no relation among the x_i . Instead, we will show by induction on n that if $x_1, \dots, x_n \in M$ are linearly independent in the vector space $M/\mathfrak{m}M$ then they are independent over R .

The base case of the induction is where we have $x \in M$, $x \notin \mathfrak{m}M$ and a relation $fx = 0$. By the equational criterion there exist $y_j \in M$ and $a_j \in R$ such that $x = \sum a_j y_j$ and $fa_j = 0$ for all j . Since $x \notin \mathfrak{m}M$ we see that at least one a_j is a unit and hence $f = 0$.

Suppose that $\sum f_i x_i$ is a relation among x_1, \dots, x_n . By our choice of x_i we have $f_i \in \mathfrak{m}$. According to the equational criterion of flatness there exist $a_{ij} \in R$ and $y_j \in M$ such that $x_i = \sum a_{ij} y_j$ and $\sum f_i a_{ij} = 0$. Since $x_n \notin \mathfrak{m}M$ we see that $a_{nj} \notin \mathfrak{m}$ for at least one j . Since $\sum f_i a_{ij} = 0$ we get $f_n = \sum_{i=1}^{n-1} (-a_{ij}/a_{nj}) f_i$. The relation $\sum f_i x_i = 0$ now can be rewritten as $\sum_{i=1}^{n-1} f_i (x_i + (-a_{ij}/a_{nj}) x_n) = 0$. Note

that the elements $x_i + (-a_{ij}/a_{nj})x_n$ map to $n - 1$ linearly independent elements of $M/\mathfrak{m}M$. By induction assumption we get that all the f_i , $i \leq n - 1$ have to be zero, and also $f_n = \sum_{i=1}^{n-1} (-a_{ij}/a_{nj})f_i$. This proves the induction step. \square

Lemma 10.75.5. *Let $R \rightarrow S$ be a flat local homomorphism of local rings. Let M be a finite R -module. Then M is finite projective over R if and only if $M \otimes_R S$ is finite projective over S .*

Proof. Suppose that $M \otimes_R S$ is finite projective over S . By Lemma 10.75.2 it is finite free. Pick $x_1, \dots, x_r \in M$ whose residue classes generate $M/\mathfrak{m}_R M$. Clearly we see that $x_1 \otimes 1, \dots, x_r \otimes 1$ are a basis for $M \otimes_R S$. This implies that the map $R^{\oplus r} \rightarrow M$, $(a_i) \mapsto \sum a_i x_i$ becomes an isomorphism after tensoring with S . By faithful flatness of $R \rightarrow S$, see Lemma 10.38.16 we see that it is an isomorphism. \square

Lemma 10.75.6. *Let R be a semi-local ring. Let M be a finite locally free module. If M has constant rank, then M is free. In particular, if R has connected spectrum, then M is free.*

Proof. Omitted. Hints: First show that $M/\mathfrak{m}_i M$ has the same dimension d for all maximal ideal $\mathfrak{m}_1, \dots, \mathfrak{m}_n$ of R using the spectrum is connected. Next, show that there exist elements $x_1, \dots, x_d \in M$ which form a basis for each $M/\mathfrak{m}_i M$ by the Chinese remainder theorem. Finally show that x_1, \dots, x_d is a basis for M . \square

Here is a technical lemma that is used in the chapter on groupoids.

Lemma 10.75.7. *Let R be a local ring with maximal ideal \mathfrak{m} and infinite residue field. Let $R \rightarrow S$ be a ring map. Let M be an S -module and let $N \subset M$ be an R -submodule. Assume*

- (1) S is semi-local and $\mathfrak{m}S$ is contained in the radical of S ,
- (2) M is a finite free S -module, and
- (3) N generates M as an S -module.

Then N contains an S -basis of M .

Proof. Assume M is free of rank n . Let $I = \text{rad}(S)$. By Nakayama's Lemma 10.19.1 a sequence of elements m_1, \dots, m_n is a basis for M if and only if $\overline{m}_i \in M/IM$ generate M/IM . Hence we may replace M by M/IM , N by $N/(N \cap IM)$, R by R/\mathfrak{m} , and S by S/IS . In this case we see that S is a finite product of fields $S = k_1 \times \dots \times k_r$ and $M = k_1^{\oplus n} \times \dots \times k_r^{\oplus n}$. The fact that $N \subset M$ generates M as an S -module means that there exist $x_j \in N$ such that a linear combination $\sum a_j x_j$ with $a_j \in S$ has a nonzero component in each factor $k_i^{\oplus n}$. Because $R = k$ is an infinite field, this means that also some linear combination $y = \sum c_j x_j$ with $c_j \in k$ has a nonzero component in each factor. Hence $y \in N$ generates a free direct summand $Sy \subset M$. By induction on n the result holds for M/Sy and the submodule $\overline{N} = N/(N \cap Sy)$. In other words there exist $\overline{y}_2, \dots, \overline{y}_n$ in \overline{N} which (freely) generate M/Sy . Then y, y_2, \dots, y_n (freely) generate M and we win. \square

10.76. Open loci defined by module maps

The set of primes where a given module map is surjective, or an isomorphism is sometimes open. In the case of finite projective modules we can look at the rank of the map.

Lemma 10.76.1. *Let R be a ring. Let $\varphi : M \rightarrow N$ be a map of R -modules with N a finite R -module. Then we have the equality*

$$\begin{aligned} U &= \{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}} \text{ is surjective}\} \\ &= \{\mathfrak{p} \subset R \mid \varphi \otimes \kappa(\mathfrak{p}) : M \otimes \kappa(\mathfrak{p}) \rightarrow N \otimes \kappa(\mathfrak{p}) \text{ is surjective}\} \end{aligned}$$

and U is an open subset of $\text{Spec}(R)$. Moreover, for any $f \in R$ such that $D(f) \subset U$ the map $M_f \rightarrow N_f$ is surjective.

Proof. The equality in the displayed formula follows from Nakayama's lemma. Nakayama's lemma also implies that U is open. See Lemma 10.19.1 especially part (3). If $D(f) \subset U$, then $M_f \rightarrow N_f$ is surjective on all localizations at primes of R_f , and hence it is surjective by Lemma 10.23.1. \square

Lemma 10.76.2. *Let R be a ring. Let $\varphi : M \rightarrow N$ be a map of finitely presented R -modules. Then*

$$U = \{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}} : M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}} \text{ is an isomorphism}\}$$

is an open subset of $\text{Spec}(R)$.

Proof. Let $\mathfrak{p} \in U$. Pick a presentation $N = R^{\oplus n} / \sum_{j=1, \dots, m} Rk_j$. Denote e_i the image in N of the i th basis vector of $R^{\oplus n}$. For each $i \in \{1, \dots, n\}$ choose an element $m_i \in M_{\mathfrak{p}}$ such that $\varphi(m_i) = f_i e_i$ for some $f_i \in R$, $f_i \notin \mathfrak{p}$. This is possible as $\varphi_{\mathfrak{p}}$ is an isomorphism. Set $f = f_1 \dots f_n$ and let $\psi : R_f^{\oplus n} \rightarrow M$ be the map which maps the i th basis vector to m_i/f_i . Note that $\varphi_f \circ \psi$ is the localization at f of the given map $R^{\oplus n} \rightarrow N$. As $\varphi_{\mathfrak{p}}$ is an isomorphism we see that $\psi(k_j)$ is an element of M which maps to zero in $M_{\mathfrak{p}}$. Hence we see that there exist $g_j \in R$, $g_j \notin \mathfrak{p}$ such that $g_j \psi(k_j) = 0$. Setting $g = g_1 \dots g_m$, we see that ψ_g factors through N_{fg} to give a map $N_{fg} \rightarrow M_{fg}$. By construction this map is inverse to φ_{fg} . Hence φ_{fg} is an isomorphism, which implies that $D(fg) \subset U$ as desired. \square

Lemma 10.76.3. *Let R be a ring. Let $\varphi : P_1 \rightarrow P_2$ be a map of finite projective modules. Then*

- (1) *The set U of primes $\mathfrak{p} \in \text{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is injective is open and for any $f \in R$ such that $D(f) \subset U$ we have*
 - (a) $P_{1,f} \rightarrow P_{2,f}$ is injective, and
 - (b) the module $\text{Coker}(\varphi)_f$ is finite projective over R_f .
- (2) *The set W of primes $\mathfrak{p} \in \text{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is surjective is open and for any $f \in R$ such that $D(f) \subset W$ we have*
 - (a) $P_{1,f} \rightarrow P_{2,f}$ is surjective, and
 - (b) the module $\text{Ker}(\varphi)_f$ is finite projective over R_f .
- (3) *The set V of primes $\mathfrak{p} \in \text{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is an isomorphism is open and for any $f \in R$ such that $D(f) \subset V$ the map $\varphi : P_{1,f} \rightarrow P_{2,f}$ is an isomorphism of modules over R_f .*

Proof. To prove the set U is open we may work locally on $\text{Spec}(R)$. Thus we may replace R by a suitable localization and assume that $P_1 = R^{n_1}$ and $P_2 = R^{n_2}$, see Lemma 10.75.2. In this case injectivity of $\varphi \otimes \kappa(\mathfrak{p})$ is equivalent to $n_1 \leq n_2$ and some $n_1 \times n_1$ minor f of the matrix of φ being invertible in $\kappa(\mathfrak{p})$. Thus $D(f) \subset U$. This argument also shows that $P_{1,\mathfrak{p}} \rightarrow P_{2,\mathfrak{p}}$ is injective for $\mathfrak{p} \in U$.

Now suppose $D(f) \subset U$. By the remark in the previous paragraph and Lemma 10.23.1 we see that $P_{1,f} \rightarrow P_{2,f}$ is injective, i.e., (1)(a) holds. By Lemma 10.75.2 to

prove (1)(b) it suffices to prove that $\text{Coker}(\varphi)$ is finite projective locally on $D(f)$. Thus, as we saw above, we may assume that $P_1 = R^{n_1}$ and $P_2 = R^{n_2}$ and that some minor of the matrix of φ is invertible in R . If the minor in question corresponds to the first n_1 basis vectors of R^{n_2} , then using the last $n_2 - n_1$ basis vectors we get a map $R^{n_2 - n_1} \rightarrow R^{n_2} \rightarrow \text{Coker}(\varphi)$ which is easily seen to be an isomorphism.

Openness of W and (2)(a) for $d(f) \subset W$ follow from Lemma 10.76.1. Since $P_{2,f}$ is projective over R_f we see that $\varphi_f : P_{1,f} \rightarrow P_{2,f}$ has a section and it follows that $\text{Ker}(\varphi)_f$ is a direct summand of $P_{2,f}$. Therefore $\text{Ker}(\varphi)_f$ is finite projective. Thus (2)(b) holds as well.

It is clear that $V = U \cap W$ is open and the other statement in (3) follows from (1)(a) and (2)(a). \square

10.77. Faithfully flat descent for projectivity of modules

In the next few sections we prove, following Raynaud and Gruson [GR71], that the projectivity of modules descends along faithfully flat ring maps. The idea of the proof is to use dévissage à la Kaplansky [Kap58] to reduce to the case of countably generated modules. Given a well-behaved filtration of a module M , dévissage allows us to express M as a direct sum of successive quotients of the filtering submodules (see Section 10.81). Using this technique, we prove that a projective module is a direct sum of countably generated modules (Theorem 10.81.5). To prove descent of projectivity for countably generated modules, we introduce a “Mittag-Leffler” condition on modules, prove that a countably generated module is projective if and only if it is flat and Mittag-Leffler (Theorem 10.90.3), and then show that the property of being a flat Mittag-Leffler module descends (Lemma 10.92.1). Finally, given an arbitrary module M whose base change by a faithfully flat ring map is projective, we filter M by submodules whose successive quotients are countably generated projective modules, and then by dévissage conclude M is a direct sum of projectives, hence projective itself (Theorem 10.92.5).

We note that there is an error in the proof of faithfully flat descent of projectivity in [GR71]. There, descent of projectivity along faithfully flat ring maps is deduced from descent of projectivity along a more general type of ring map ([GR71, Example 3.1.4(1) of Part II]). However, the proof of descent along this more general type of map is incorrect. In [Gru73], Gruson explains what went wrong, although he does not provide a fix for the case of interest. Patching this hole in the proof of faithfully flat descent of projectivity comes down to proving that the property of being a flat Mittag-Leffler module descends along faithfully flat ring maps. We do this in Lemma 10.92.1.

10.78. Characterizing flatness

In this section we discuss criteria for flatness. The main result in this section is Lazard’s theorem (Theorem 10.78.4 below), which says that a flat module is the colimit of a directed system of free finite modules. We remind the reader of the “equational criterion for flatness”, see Lemma 10.38.10. It turns out that this can be massaged into a seemingly much stronger property.

Lemma 10.78.1. *Let M be an R -module. The following are equivalent:*

- (1) M is flat.

- (2) If $f : R^n \rightarrow M$ is a module map and $x \in \text{Ker}(f)$, then there are module maps $h : R^n \rightarrow R^m$ and $g : R^m \rightarrow M$ such that $f = g \circ h$ and $x \in \text{Ker}(h)$.
- (3) Suppose $f : R^n \rightarrow M$ is a module map, $N \subset \text{Ker}(f)$ any submodule, and $h : R^n \rightarrow R^m$ a map such that $N \subset \text{Ker}(h)$ and f factors through h . Then given any $x \in \text{Ker}(f)$ we can find a map $h' : R^n \rightarrow R^{m'}$ such that $N + Rx \subset \text{Ker}(h')$ and f factors through h' .
- (4) If $f : R^n \rightarrow M$ is a module map and $N \subset \text{Ker}(f)$ is a finitely generated submodule, then there are module maps $h : R^n \rightarrow R^m$ and $g : R^m \rightarrow M$ such that $f = g \circ h$ and $N \subset \text{Ker}(h)$.

Proof. That (1) is equivalent to (2) is just a reformulation of the equational criterion for flatness. To show (2) implies (3), let $g : R^m \rightarrow M$ be the map such that f factors as $f = g \circ h$. By (2) find $h'' : R^m \rightarrow R^{m'}$ such that h'' kills $h(x)$ and $g : R^m \rightarrow M$ factors through h'' . Then taking $h' = h'' \circ h$ works. (3) implies (4) by induction on the number of generators of $N \subset \text{Ker}(f)$ in (4). Clearly (4) implies (2). \square

Lemma 10.78.2. *Let M be an R -module. Then M is flat if and only if the following condition holds: if P is a finitely presented R -module and $f : P \rightarrow M$ a module map, then there is a free finite R -module F and module maps $h : P \rightarrow F$ and $g : F \rightarrow M$ such that $f = g \circ h$.*

Proof. This is just a reformulation of condition (4) from Lemma 10.78.1. \square

Lemma 10.78.3. *Let M be an R -module. Then M is flat if and only if the following condition holds: for every finitely presented R -module P , if $N \rightarrow M$ is a surjective R -module map, then the induced map $\text{Hom}_R(P, N) \rightarrow \text{Hom}_R(P, M)$ is surjective.*

Proof. First suppose M is flat. We must show that if P is finitely presented, then given a map $f : P \rightarrow M$, it factors through the map $N \rightarrow M$. By Lemma 10.78.2 the map f factors through a map $F \rightarrow M$ where F is free and finite. Since F is free, this map factors through $N \rightarrow M$. Thus f factors through $N \rightarrow M$.

Conversely, suppose the condition of the lemma holds. Let $f : P \rightarrow M$ be a map from a finitely presented module P . Choose a free module N with a surjection $N \rightarrow M$ onto M . Then f factors through $N \rightarrow M$, and since P is finitely generated, f factors through a free finite submodule of N . Thus M satisfies the condition of Lemma 10.78.2, hence is flat. \square

Theorem 10.78.4 (Lazard's theorem). *Let M be an R -module. Then M is flat if and only if it is the colimit of a directed system of free finite R -modules.*

Proof. A colimit of a directed system of flat modules is flat, as taking directed colimits is exact and commutes with tensor product. Hence if M is the colimit of a directed system of free finite modules then M is flat.

For the converse, first recall that any module M can be written as the colimit of a directed system of finitely presented modules, in the following way. Choose a surjection $f : R^I \rightarrow M$ for some set I , and let K be the kernel. Let E be the set of ordered pairs (J, N) where J is a finite subset of I and N is a finitely generated submodule of $R^J \cap K$. Then E is made into a directed partially ordered set by defining $(J, N) \leq (J', N')$ if and only if $J \subset J'$ and $N \subset N'$. Define $M_e = R^J / N$

for $e = (J, N)$, and define $f_{ee'} : M_e \rightarrow M_{e'}$ to be the natural map for $e \leq e'$. Then $(M_e, f_{ee'})$ is a directed system and the natural maps $f_e : M_e \rightarrow M$ induce an isomorphism $\text{colim}_{e \in E} M_e \xrightarrow{\cong} M$.

Now suppose M is flat. Let $I = M \times \mathbf{Z}$, write (x_i) for the canonical basis of R^I , and take in the above discussion $f : R^I \rightarrow M$ to be the map sending x_i to the projection of i onto M . To prove the theorem it suffices to show that the $e \in E$ such that M_e is free form a cofinal subset of E . So let $e = (J, N) \in E$ be arbitrary. By Lemma 10.78.2 there is a free finite module F and maps $h : R^J/N \rightarrow F$ and $g : F \rightarrow M$ such that the natural map $f_e : R^J/N \rightarrow M$ factors as $R^J/N \xrightarrow{h} F \xrightarrow{g} M$. We are going to realize F as $M_{e'}$ for some $e' \geq e$.

Let $\{b_1, \dots, b_n\}$ be a finite basis of F . Choose n distinct elements $i_1, \dots, i_n \in I$ such that $i_\ell \notin J$ for all ℓ , and such that the image of x_{i_ℓ} under $f : R^I \rightarrow M$ equals the image of b_ℓ under $g : F \rightarrow M$. This is possible by our choice of I . Now let $J' = J \cup \{i_1, \dots, i_n\}$, and define $R^{J'} \rightarrow F$ by $x_i \mapsto h(x_i)$ for $i \in J$ and $x_{i_\ell} \mapsto b_\ell$ for $\ell = 1, \dots, n$. Let $N' = \text{Ker}(R^{J'} \rightarrow F)$. Observe:

- (1) $R^{J'} \rightarrow F$ factors $f : R^I \rightarrow M$, hence $N' \subset K = \text{Ker}(f)$;
- (2) $R^{J'} \rightarrow F$ is a surjection onto a free finite module, hence it splits and so N' is finitely generated;
- (3) $J \subset J'$ and $N \subset N'$.

By (1) and (2) $e' = (J', N')$ is in E , by (3) $e' \geq e$, and by construction $M_{e'} = R^{J'}/N' \cong F$ is free. □

10.79. Universally injective module maps

Next we discuss universally injective module maps, which are in a sense complementary to flat modules (see Lemma 10.79.5). We follow Lazard's thesis [Laz67]; also see [Lam99].

Definition 10.79.1. Let $f : M \rightarrow N$ be a map of R -modules. Then f is called *universally injective* if for every R -module Q , the map $f \otimes_R \text{id}_Q : M \otimes_R Q \rightarrow N \otimes_R Q$ is injective. A sequence $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ of R -modules is called *universally exact* if it is exact and $M_1 \rightarrow M_2$ is universally injective.

Example 10.79.2. Examples of universally exact sequences.

- (1) A split short exact sequence is universally exact since tensoring commutes with taking direct sums.
- (2) The colimit of a directed system of universally exact sequences is universally exact. This follows from the fact that taking directed colimits is exact and that tensoring commutes with taking colimits. In particular the colimit of a directed system of split exact sequences is universally exact. We will see below that, conversely, any universally exact sequence arises in this way.

Next we give a list of criteria for a short exact sequence to be universally exact. They are analogues of criteria for flatness given above. Parts (3)-(6) below correspond, respectively, to the criteria for flatness given in Lemmas 10.38.10, 10.78.1, 10.78.3, and Theorem 10.78.4.

Theorem 10.79.3. *Let*

$$0 \rightarrow M_1 \xrightarrow{f_1} M_2 \xrightarrow{f_2} M_3 \rightarrow 0$$

be an exact sequence of R -modules. The following are equivalent:

- (1) *The sequence $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is universally exact.*
- (2) *For every finitely presented R -module Q , the sequence*

$$0 \rightarrow M_1 \otimes_R Q \rightarrow M_2 \otimes_R Q \rightarrow M_3 \otimes_R Q \rightarrow 0$$

is exact.

- (3) *Given elements $x_i \in M_1$ ($i = 1, \dots, n$), $y_j \in M_2$ ($j = 1, \dots, m$), and $a_{ij} \in R$ ($i = 1, \dots, n, j = 1, \dots, m$) such that for all i*

$$f_1(x_i) = \sum_j a_{ij} y_j,$$

there exists $z_j \in M_1$ ($j = 1, \dots, m$) such that for all i ,

$$x_i = \sum_j a_{ij} z_j.$$

- (4) *Given a commutative diagram of R -module maps*

$$\begin{array}{ccc} R^n & \longrightarrow & R^m \\ \downarrow & & \downarrow \\ M_1 & \xrightarrow{f_1} & M_2 \end{array}$$

where m and n are integers, there exists a map $R^m \rightarrow M_1$ making the top triangle commute.

- (5) *For every finitely presented R -module P , the R -module map $\text{Hom}_R(P, M_2) \rightarrow \text{Hom}_R(P, M_3)$ is surjective.*
- (6) *The sequence $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is the colimit of a directed system of split exact sequences of the form*

$$0 \rightarrow M_1 \rightarrow M_{2,i} \rightarrow M_{3,i} \rightarrow 0$$

where the $M_{3,i}$ are finitely presented.

Proof. Obviously (1) implies (2).

Next we show (2) implies (3). Let $f_1(x_i) = \sum_j a_{ij} y_j$ be relations as in (3). Let (f_j) be a basis for R^m , (e_i) a basis for R^n , and $R^m \rightarrow R^n$ the map given by $f_j \mapsto \sum_i a_{ij} e_i$. Let Q be the cokernel of $R^m \rightarrow R^n \rightarrow Q \rightarrow 0$ by the map $f_1 : M_1 \rightarrow M_2$, we get a commutative diagram

$$\begin{array}{ccccccc} M_1^{\oplus m} & \longrightarrow & M_1^{\oplus n} & \longrightarrow & M_1 \otimes_R Q & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ M_2^{\oplus m} & \longrightarrow & M_2^{\oplus n} & \longrightarrow & M_2 \otimes_R Q & \longrightarrow & 0 \end{array}$$

where $M_1^{\oplus m} \rightarrow M_1^{\oplus n}$ is given by

$$(z_1, \dots, z_m) \mapsto \left(\sum_j a_{1j} z_j, \dots, \sum_j a_{nj} z_j \right),$$

and $M_2^{\oplus m} \rightarrow M_2^{\oplus n}$ is given similarly. We want to show $x = (x_1, \dots, x_n) \in M_1^{\oplus n}$ is in the image of $M_1^{\oplus m} \rightarrow M_1^{\oplus n}$. By (2) the map $M_1 \otimes Q \rightarrow M_2 \otimes Q$ is injective, hence by exactness of the top row it is enough to show x maps to 0 in $M_2 \otimes Q$, and

so by exactness of the bottom row it is enough to show the image of x in $M_2^{\oplus n}$ is in the image of $M_2^{\oplus m} \rightarrow M_2^{\oplus n}$. This is true by assumption.

Condition (4) is just a translation of (3) into diagram form.

Next we show (4) implies (5). Let $\varphi : P \rightarrow M_3$ be a map from a finitely presented R -module P . We must show that φ lifts to a map $P \rightarrow M_2$. Choose a presentation of P ,

$$R^n \xrightarrow{g_1} R^m \xrightarrow{g_2} P \rightarrow 0.$$

Using freeness of R^n and R^m , we can construct $h_2 : R^m \rightarrow M_2$ and then $h_1 : R^n \rightarrow M_1$ such that the following diagram commutes

$$\begin{array}{ccccccc} R^n & \xrightarrow{g_1} & R^m & \xrightarrow{g_2} & P & \longrightarrow & 0 \\ \downarrow h_1 & & \downarrow h_2 & & \downarrow \varphi & & \\ 0 & \longrightarrow & M_1 & \xrightarrow{f_1} & M_2 & \xrightarrow{f_2} & M_3 \longrightarrow 0. \end{array}$$

By (4) there is a map $k_1 : R^m \rightarrow M_1$ such that $k_1 \circ g_1 = h_1$. Now define $h'_2 : R^m \rightarrow M_2$ by $h'_2 = h_2 - f_1 \circ k_1$. Then

$$h'_2 \circ g_1 = h_2 \circ g_1 - f_1 \circ k_1 \circ g_1 = h_2 \circ g_1 - f_1 \circ h_1 = 0.$$

Hence by passing to the quotient h'_2 defines a map $\varphi' : P \rightarrow M_2$ such that $\varphi' \circ g_2 = h'_2$. In a diagram, we have

$$\begin{array}{ccc} R^m & \xrightarrow{g_2} & P \\ h'_2 \downarrow & \swarrow \varphi' & \downarrow \varphi \\ M_2 & \xrightarrow{f_2} & M_3. \end{array}$$

where the top triangle commutes. We claim that φ' is the desired lift, i.e. that $f_2 \circ \varphi' = \varphi$. From the definitions we have

$$f_2 \circ \varphi' \circ g_2 = f_2 \circ h'_2 = f_2 \circ h_2 - f_2 \circ f_1 \circ k_1 = f_2 \circ h_2 = \varphi \circ g_2.$$

Since g_2 is surjective, this finishes the proof.

Now we show (5) implies (6). Write M_3 as the colimit of a directed system of finitely presented modules $M_{3,i}$. Let $M_{2,i}$ be the fiber product of $M_{3,i}$ and M_2 over M_3 —by definition this is the submodule of $M_2 \times M_{3,i}$ consisting of elements whose two projections onto M_3 are equal. Let $M_{1,i}$ be the kernel of the projection $M_{2,i} \rightarrow M_{3,i}$. Then we have a directed system of exact sequences

$$0 \rightarrow M_{1,i} \rightarrow M_{2,i} \rightarrow M_{3,i} \rightarrow 0,$$

and for each i a map of exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & M_{1,i} & \longrightarrow & M_{2,i} & \longrightarrow & M_{3,i} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0 \end{array}$$

compatible with the directed system. From the definition of the fiber product $M_{2,i}$, it follows that the map $M_{1,i} \rightarrow M_1$ is an isomorphism. By (5) there is a map $M_{3,i} \rightarrow M_2$ lifting $M_{3,i} \rightarrow M_3$, and by the universal property of the fiber product this gives rise to a section of $M_{2,i} \rightarrow M_{3,i}$. Hence the sequences

$$0 \rightarrow M_{1,i} \rightarrow M_{2,i} \rightarrow M_{3,i} \rightarrow 0$$

split. Passing to the colimit, we have a commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \operatorname{colim} M_{1,i} & \longrightarrow & \operatorname{colim} M_{2,i} & \longrightarrow & \operatorname{colim} M_{3,i} \longrightarrow 0 \\
 & & \downarrow \cong & & \downarrow & & \downarrow \cong \\
 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0
 \end{array}$$

with exact rows and outer vertical maps isomorphisms. Hence $\operatorname{colim} M_{2,i} \rightarrow M_2$ is also an isomorphism and (6) holds.

Condition (6) implies (1) by Example 10.79.2 (2). \square

The previous theorem shows that a universally exact sequence is always a colimit of split short exact sequences. If the cokernel of a universally injective map is finitely presented, then in fact the map itself splits:

Lemma 10.79.4. *Let*

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

be an exact sequence of R -modules. Suppose M_3 is of finite presentation. Then

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

is universally exact if and only if it is split.

Proof. A split sequence is always universally exact. Conversely, if the sequence is universally exact, then by Theorem 10.79.3 (5) applied to $P = M_3$, the map $M_2 \rightarrow M_3$ admits a section. \square

The following lemma shows how universally injective maps are complementary to flat modules.

Lemma 10.79.5. *Let M be an R -module. Then M is flat if and only if any exact sequence of R -modules*

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M \rightarrow 0$$

is universally exact.

Proof. This follows from Lemma 10.78.3 and Theorem 10.79.3 (5). \square

Example 10.79.6. Non-split and non-flat universally exact sequences.

- (1) In spite of Lemma 10.79.4, it is possible to have a short exact sequence of R -modules

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

that is universally exact but non-split. For instance, take $R = \mathbf{Z}$, let $M_1 = \bigoplus_{n=1}^{\infty} \mathbf{Z}$, let $M_2 = \prod_{n=1}^{\infty} \mathbf{Z}$, and let M_3 be the cokernel of the inclusion $M_1 \rightarrow M_2$. Then M_1, M_2, M_3 are all flat since they are torsion-free, so by Lemma 10.79.5,

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

is universally exact. However there can be no section $s : M_3 \rightarrow M_2$. In fact, if x is the image of $(2, 2^2, 2^3, \dots) \in M_2$ in M_3 , then any module map $s : M_3 \rightarrow M_2$ must kill x . This is because $x \in 2^n M_3$ for any $n \geq 1$, hence $s(x)$ is divisible by 2^n for all $n \geq 1$ and so must be 0.

- (2) In spite of Lemma 10.79.5, it is possible to have a short exact sequence of R -modules

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

that is universally exact but with M_1, M_2, M_3 all non-flat. In fact if M is any non-flat module, just take the split exact sequence

$$0 \rightarrow M \rightarrow M \oplus M \rightarrow M \rightarrow 0.$$

For instance over $R = \mathbf{Z}$, take M to be any torsion module.

- (3) Taking the direct sum of an exact sequence as in (1) with one as in (2), we get a short exact sequence of R -modules

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

that is universally exact, non-split, and such that M_1, M_2, M_3 are all non-flat.

We end this section with a simple observation.

Lemma 10.79.7. *Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a universally exact sequence of R -modules, and suppose M_2 is flat. Then M_1 and M_3 are flat.*

Proof. Let $0 \rightarrow N \rightarrow N' \rightarrow N'' \rightarrow 0$ be a short exact sequence of R -modules. Consider the commutative diagram

$$\begin{array}{ccccc} M_1 \otimes_R N & \longrightarrow & M_2 \otimes_R N & \longrightarrow & M_3 \otimes_R N \\ \downarrow & & \downarrow & & \downarrow \\ M_1 \otimes_R N' & \longrightarrow & M_2 \otimes_R N' & \longrightarrow & M_3 \otimes_R N' \\ \downarrow & & \downarrow & & \downarrow \\ M_1 \otimes_R N'' & \longrightarrow & M_2 \otimes_R N'' & \longrightarrow & M_3 \otimes_R N'' \end{array}$$

(we have dropped the 0's on the boundary). By assumption the rows give short exact sequences and the arrow $M_2 \otimes N \rightarrow M_2 \otimes N'$ is injective. Clearly this implies that $M_1 \otimes N \rightarrow M_1 \otimes N'$ is injective and we see that M_1 is flat. In particular the left and middle columns give rise to short exact sequences. It follows from a diagram chase that the arrow $M_3 \otimes N \rightarrow M_3 \otimes N'$ is injective. Hence M_3 is flat. \square

Lemma 10.79.8. *Let R be a ring. Let $M \rightarrow M'$ be a universally injective R -module map. Then for any R -module N the map $M \otimes_R N \rightarrow M' \otimes_R N$ is universally injective.*

Proof. Omitted. \square

Lemma 10.79.9. *Let R be a ring. A composition of universally injective R -module maps is universally injective.*

Proof. Omitted. \square

Lemma 10.79.10. *Let R be a ring. Let $M \rightarrow M'$ and $M \rightarrow M''$ be R -module maps. If $M \rightarrow M''$ is universally injective, then $M \rightarrow M'$ is universally injective.*

Proof. Omitted. \square

Lemma 10.79.11. *Let $R \rightarrow S$ be a faithfully flat ring map. Then $R \rightarrow S$ is universally injective as a map of R -modules. In particular $R \cap IS = I$ for any ideal $I \subset R$.*

Proof. Let N be an R -module. We have to show that $N \rightarrow N \otimes_R S$ is injective. As S is faithfully flat as an R -module, it suffices to prove this after tensoring with S . Hence it suffices to show that $N \otimes_R S \rightarrow N \otimes_R S \otimes_R S$, $n \otimes s \mapsto N \otimes 1 \otimes s$ is injective. This is true because there is a section, namely, $n \otimes s \otimes s' \mapsto n \otimes ss'$. \square

Lemma 10.79.12. *Let $R \rightarrow S$ be a ring map. Let $M \rightarrow M'$ be a map of S -modules. The following are equivalent*

- (1) $M \rightarrow M'$ is universally injective as a map of R -modules,
- (2) for each prime \mathfrak{q} of S the map $M_{\mathfrak{q}} \rightarrow M'_{\mathfrak{q}}$ is universally injective as a map of R -modules,
- (3) for each maximal ideal \mathfrak{m} of S the map $M_{\mathfrak{m}} \rightarrow M'_{\mathfrak{m}}$ is universally injective as a map of R -modules,
- (4) for each prime \mathfrak{q} of S the map $M_{\mathfrak{q}} \rightarrow M'_{\mathfrak{q}}$ is universally injective as a map of $R_{\mathfrak{p}}$ -modules, where \mathfrak{p} is the inverse image of \mathfrak{q} in R , and
- (5) for each maximal ideal \mathfrak{m} of S the map $M_{\mathfrak{m}} \rightarrow M'_{\mathfrak{m}}$ is universally injective as a map of $R_{\mathfrak{p}}$ -modules, where \mathfrak{p} is the inverse image of \mathfrak{m} in R .

Proof. Let N be an R -module. Let \mathfrak{q} be a prime of S lying over the prime \mathfrak{p} of R . Then we have

$$(M \otimes_R N)_{\mathfrak{q}} = M_{\mathfrak{q}} \otimes_R N = M_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} N_{\mathfrak{p}}.$$

Moreover, the same thing holds for M' and localization is exact. Also, if N is an $R_{\mathfrak{p}}$ -module, then $N_{\mathfrak{p}} = N$. Using this the equivalences can be proved in a straightforward manner.

For example, suppose that (5) holds. Let $K = \text{Ker}(M \otimes_R N \rightarrow M' \otimes_R N)$. By the remarks above we see that $K_{\mathfrak{m}} = 0$ for each maximal ideal \mathfrak{m} of S . Hence $K = 0$ by Lemma 10.23.1. Thus (1) holds. Conversely, suppose that (1) holds. Take any $\mathfrak{q} \subset S$ lying over $\mathfrak{p} \subset R$. Take any module N over $R_{\mathfrak{p}}$. Then by assumption $\text{Ker}(M \otimes_R N \rightarrow M' \otimes_R N) = 0$. Hence by the formulae above and the fact that $N = N_{\mathfrak{p}}$ we see that $\text{Ker}(M_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} N \rightarrow M'_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} N) = 0$. In other words (4) holds. Of course (4) \Rightarrow (5) is immediate. Hence (1), (4) and (5) are all equivalent. We omit the proof of the other equivalences. \square

Lemma 10.79.13. *Let $\varphi : A \rightarrow B$ be a ring map. Let $S \subset A$ and $S' \subset B$ be multiplicative subsets such that $\varphi(S) \subset S'$. Let $M \rightarrow M'$ be a map of B -modules.*

- (1) *If $M \rightarrow M'$ is universally injective as a map of A -modules, then $(S')^{-1}M \rightarrow (S')^{-1}M'$ is universally injective as a map of A -modules and as a map of $S^{-1}A$ -modules.*
- (2) *If M and M' are $(S')^{-1}B$ -modules, then $M \rightarrow M'$ is universally injective as a map of A -modules if and only if it is universally injective as a map of $S^{-1}A$ -modules.*

Proof. You can prove this using Lemma 10.79.12 but you can also prove it directly as follows. Assume $M \rightarrow M'$ is A -universally injective. Let Q be an A -module. Then $Q \otimes_A M \rightarrow Q \otimes_A M'$ is injective. Since localization is exact we see that $(S')^{-1}(Q \otimes_A M) \rightarrow (S')^{-1}(Q \otimes_A M')$ is injective. As $(S')^{-1}(Q \otimes_A M) = Q \otimes_A (S')^{-1}M$ and similarly for M' we see that $Q \otimes_A (S')^{-1}M \rightarrow Q \otimes_A (S')^{-1}M'$

is injective, hence $(S')^{-1}M \rightarrow (S')^{-1}M'$ is universally injective as a map of A -modules. This proves the first part of (1). To see (2) we can use the following two facts: (a) if Q is an $S^{-1}A$ -module, then $Q \otimes_A S^{-1}A = Q$, i.e., tensoring with Q over A is the same thing as tensoring with Q over $S^{-1}A$, (b) if M is any A -module on which the elements of S are invertible, then $M \otimes_A Q = M \otimes_{S^{-1}A} S^{-1}Q$. Part (2) follows from this immediately. \square

Lemma 10.79.14. *Let R be a ring and let $M \rightarrow M'$ be a map of R -modules. If M' is flat, then $M \rightarrow M'$ is universally injective if and only if $M/IM \rightarrow M'/IM'$ is injective for every finitely generated ideal I of R .*

Proof. It suffices to show that $M \otimes_R Q \rightarrow M' \otimes_R Q$ is injective for every finite R -module Q , see Theorem 10.79.3. Then Q has a finite filtration $0 = Q_0 \subset Q_1 \subset \dots \subset Q_n = Q$ by submodules whose subquotients are isomorphic to cyclic modules R/I_i , see Lemma 10.5.4. Since M' is flat, we obtain a filtration

$$\begin{array}{ccccccc} M \otimes Q_1 & \longrightarrow & M \otimes Q_2 & \longrightarrow & \dots & \longrightarrow & M \otimes Q \\ \downarrow & & \downarrow & & & & \downarrow \\ M' \otimes Q_1 & \hookrightarrow & M' \otimes Q_2 & \hookrightarrow & \dots & \hookrightarrow & M' \otimes Q \end{array}$$

of $M' \otimes_R Q$ by submodules $M' \otimes_R Q_i$ whose successive quotients are $M' \otimes_R R/I_i = M'/I_i M'$. A simple induction argument shows that it suffices to check $M/I_i M \rightarrow M'/I_i M'$ is injective. Note that the collection of finitely generated ideals $I'_i \subset I_i$ is a directed set. Thus $M/I_i M = \operatorname{colim} M/I'_i M$ is a filtered colimit, similarly for M' , the maps $M/I'_i M \rightarrow M'/I'_i M'$ are injective by assumption, and since filtered colimits are exact (Lemma 10.8.9) we conclude. \square

10.80. Descent for finite projective modules

In this section we give an elementary proof of the fact that the property of being a *finite* projective module descends along faithfully flat ring maps. The proof does not apply when we drop the finiteness condition. However, the method is indicative of the one we shall use to prove descent for the property of being a *countably generated* projective module—see the comments at the end of this section.

Lemma 10.80.1. *Let M be an R -module. Then M is finite projective if and only if M is finitely presented and flat.*

Proof. This is part of Lemma 10.75.2. However, at this point we can give a more elegant proof of the implication (1) \Rightarrow (2) of that lemma as follows. If M is finitely presented and flat, then take a surjection $R^n \rightarrow M$. By Lemma 10.78.3 applied to $P = M$, the map $R^n \rightarrow M$ admits a section. So M is a direct summand of a free module and hence projective. \square

Here are some properties of modules that descend.

Lemma 10.80.2. *Let $R \rightarrow S$ be a faithfully flat ring map. Let M be an R -module. Then*

- (1) *if the S -module $M \otimes_R S$ is of finite type, then M is of finite type,*
- (2) *if the S -module $M \otimes_R S$ is of finite presentation, then M is of finite presentation,*
- (3) *if the S -module $M \otimes_R S$ is flat, then M is flat, and*

(4) *add more here as needed.*

Proof. Assume $M \otimes_R S$ is of finite type. Let y_1, \dots, y_m be generators of $M \otimes_R S$ over S . Write $y_j = \sum x_i \otimes f_i$ for some $x_1, \dots, x_n \in M$. Then we see that the map $\varphi : R^{\oplus n} \rightarrow M$ has the property that $\varphi \otimes \text{id}_S : S^{\oplus n} \rightarrow M \otimes_R S$ is surjective. Since $R \rightarrow S$ is faithfully flat we see that φ is surjective, and M is finitely generated.

Assume $M \otimes_R S$ is of finite presentation. By (1) we see that M is of finite type. Choose a surjection $R^{\oplus n} \rightarrow M$ and denote K the kernel. As $R \rightarrow S$ is flat we see that $K \otimes_R S$ is the kernel of the base change $S^{\oplus n} \rightarrow M \otimes_R S$. As $M \otimes_R S$ is of finite presentation we conclude that $K \otimes_R S$ is of finite type. Hence by (1) we see that K is of finite type and hence M is of finite presentation.

Part (3) is Lemma 10.38.7. □

Proposition 10.80.3. *Let $R \rightarrow S$ be a faithfully flat ring map. Let M be an R -module. If the S -module $M \otimes_R S$ is finite projective, then M is finite projective.*

Proof. Follows from Lemmas 10.80.1 and 10.80.2. □

The next few sections are about removing the finiteness assumption by using dévissage to reduce to the countably generated case. In the countably generated case, the strategy is to find a characterization of countably generated projective modules analogous to Lemma 10.80.1, and then to prove directly that this characterization descends. We do this by introducing the notion of a Mittag-Leffler module and proving that if a module M is countably generated, then it is projective if and only if it is flat and Mittag-Leffler (Theorem 10.90.3). When M is finitely generated, this statement reduces to Lemma 10.80.1 (since, according to Example 10.88.1 (1), a finitely generated module is Mittag-Leffler if and only if it is finitely presented).

10.81. Transfinite dévissage of modules

In this section we introduce a dévissage technique for decomposing a module into a direct sum. The main result is that a projective module is a direct sum of countably generated modules (Theorem 10.81.5 below). We follow [Kol96].

Definition 10.81.1. Let M be an R -module. A *direct sum dévissage* of M is a family of submodules $(M_\alpha)_{\alpha \in S}$, indexed by an ordinal S and increasing (with respect to inclusion), such that:

- (0) $M_0 = 0$;
- (1) $M = \bigcup_{\alpha} M_\alpha$;
- (2) if $\alpha \in S$ is a limit ordinal, then $M_\alpha = \bigcup_{\beta < \alpha} M_\beta$;
- (3) if $\alpha + 1 \in S$, then M_α is a direct summand of $M_{\alpha+1}$.

If moreover

- (4) $M_{\alpha+1}/M_\alpha$ is countably generated for $\alpha + 1 \in S$,

then $(M_\alpha)_{\alpha \in S}$ is called a *Kaplansky dévissage* of M .

The terminology is justified by the following lemma.

Lemma 10.81.2. *Let M be an R -module. If $(M_\alpha)_{\alpha \in S}$ is a direct sum dévissage of M , then $M \cong \bigoplus_{\alpha+1 \in S} M_{\alpha+1}/M_\alpha$.*

Proof. By property (3) of a direct sum dévissage, there is an inclusion $M_{\alpha+1}/M_\alpha \rightarrow M$ for each $\alpha \in S$. Consider the map

$$f : \bigoplus_{\alpha+1 \in S} M_{\alpha+1}/M_\alpha \rightarrow M$$

given by the sum of these inclusions. Transfinite induction on S shows that the image contains M_α for every $\alpha \in S$: for $\alpha = 0$ this is true by (0); if $\alpha + 1$ is a successor ordinal then it is clearly true; and if α is a limit ordinal and it is true for $\beta < \alpha$, then it is true for α by (2). Hence f is surjective by (1).

Transfinite induction on S also shows that for every $\beta \in S$ the restriction

$$f_\beta : \bigoplus_{\alpha+1 \leq \beta} M_{\alpha+1}/M_\alpha \rightarrow M$$

of f is injective: For $\beta = 0$ it is true. If it is true for all $\beta' < \beta$, then let x be in the kernel and write $x = (x_{\alpha+1})_{\alpha+1 \leq \beta}$ in terms of its components $x_{\alpha+1} \in M_{\alpha+1}/M_\alpha$. By property (3) both $(x_{\alpha+1})_{\alpha+1 < \beta}$ and $x_{\beta+1}$ map to 0. Hence $x_{\beta+1} = 0$ and, by the assumption that the restriction $f_{\beta'}$ is injective for all $\beta' < \beta$, also $x_{\alpha+1} = 0$ for every $\alpha + 1 < \beta$. So $x = 0$ and f_β is injective, which finishes the induction. We conclude that f is injective since f_β is for each $\beta \in S$. \square

Lemma 10.81.3. *Let M be an R -module. Then M is a direct sum of countably generated R -modules if and only if it admits a Kaplansky dévissage.*

Proof. The lemma takes care of the “if” direction. Conversely, suppose $M = \bigoplus_{i \in I} N_i$ where each N_i is a countably generated R -module. Well-order I so that we can think of it as an ordinal. Then setting $M_i = \bigoplus_{j < i} N_j$ gives a Kaplansky dévissage $(M_i)_{i \in I}$ of M . \square

Theorem 10.81.4. *Suppose M is a direct sum of countably generated R -modules. If P is a direct summand of M , then P is also a direct sum of countably generated R -modules.*

Proof. Write $M = P \oplus Q$. We are going to construct a Kaplansky dévissage $(M_\alpha)_{\alpha \in S}$ of M which, in addition to the defining properties (0)-(4), satisfies:

- (5) Each M_α is a direct summand of M ;
- (6) $M_\alpha = P_\alpha \oplus Q_\alpha$, where $P_\alpha = P \cap M_\alpha$ and $Q_\alpha = Q \cap M_\alpha$.

(Note: if properties (0)-(2) hold, then in fact property (3) is equivalent to property (5).)

To see how this implies the theorem, it is enough to show that $(P_\alpha)_{\alpha \in S}$ forms a Kaplansky dévissage of P . Properties (0), (1), and (2) are clear. By (5) and (6) for (M_α) , each P_α is a direct summand of M . Since $P_\alpha \subset P_{\alpha+1}$, this implies P_α is a direct summand of $P_{\alpha+1}$; hence (3) holds for (P_α) . For (4), note that

$$M_{\alpha+1}/M_\alpha \cong P_{\alpha+1}/P_\alpha \oplus Q_{\alpha+1}/Q_\alpha,$$

so $P_{\alpha+1}/P_\alpha$ is countably generated because this is true of $M_{\alpha+1}/M_\alpha$.

It remains to construct the M_α . Write $M = \bigoplus_{i \in I} N_i$ where each N_i is a countably generated R -module. Choose a well-ordering of I . By transfinite induction we are going to define an increasing family of submodules M_α of M , one for each ordinal α , such that M_α is a direct sum of some subset of the N_i .

For $\alpha = 0$ let $M_0 = 0$. If α is a limit ordinal and M_β has been defined for all $\beta < \alpha$, then define $M_\alpha = \bigcup_{\beta < \alpha} M_\beta$. Since each M_β for $\beta < \alpha$ is a direct sum of a subset of the N_i , the same will be true of M_α . If $\alpha + 1$ is a successor ordinal and M_α has been defined, then define $M_{\alpha+1}$ as follows. If $M_\alpha = M$, then let $M_{\alpha+1} = M$. If not, choose the smallest $j \in I$ such that N_j is not contained in M_α . We will construct an infinite matrix $(x_{mn}), m, n = 1, 2, 3, \dots$ such that:

- (1) N_j is contained in the submodule of M generated by the entries x_{mn} ;
- (2) if we write any entry $x_{k\ell}$ in terms of its P - and Q -components, $x_{k\ell} = y_{k\ell} + z_{k\ell}$, then the matrix (x_{mn}) contains a set of generators for each N_i for which $y_{k\ell}$ or $z_{k\ell}$ has nonzero component.

Then we define $M_{\alpha+1}$ to be the submodule of M generated by M_α and all x_{mn} ; by property (2) of the matrix (x_{mn}) , $M_{\alpha+1}$ will be a direct sum of some subset of the N_i . To construct the matrix (x_{mn}) , let $x_{11}, x_{12}, x_{13}, \dots$ be a countable set of generators for N_j . Then if $x_{11} = y_{11} + z_{11}$ is the decomposition into P - and Q -components, let $x_{21}, x_{22}, x_{23}, \dots$ be a countable set of generators for the sum of the N_i for which y_{11} or z_{11} have nonzero component. Repeat this process on x_{12} to get elements x_{31}, x_{32}, \dots , the third row of our matrix. Repeat on x_{21} to get the fourth row, on x_{13} to get the fifth, and so on, going down along successive anti-diagonals as indicated below:

$$\begin{pmatrix} x_{11} & x_{12} & x_{13} & x_{14} & \dots \\ & \swarrow & \swarrow & \swarrow & \\ x_{21} & x_{22} & x_{23} & \dots & \\ & \swarrow & \swarrow & & \\ x_{31} & x_{32} & \dots & & \\ & \swarrow & & & \\ x_{41} & \dots & & & \\ \dots & & & & \end{pmatrix}.$$

Transfinite induction on I (using the fact that we constructed $M_{\alpha+1}$ to contain N_j for the smallest j such that N_j is not contained in M_α) shows that for each $i \in I$, N_i is contained in some M_α . Thus, there is some large enough ordinal S satisfying: for each $i \in I$ there is $\alpha \in S$ such that N_i is contained in M_α . This means $(M_\alpha)_{\alpha \in S}$ satisfies property (1) of a Kaplansky dévissage of M . The family $(M_\alpha)_{\alpha \in S}$ moreover satisfies the other defining properties, and also (5) and (6) above: properties (0), (2), (4), and (6) are clear by construction; property (5) is true because each M_α is by construction a direct sum of some N_i ; and (3) is implied by (5) and the fact that $M_\alpha \subset M_{\alpha+1}$. \square

As a corollary we get the result for projective modules stated at the beginning of the section.

Theorem 10.81.5. *If P is a projective R -module, then P is a direct sum of countably generated projective R -modules.*

Proof. A module is projective if and only if it is a direct summand of a free module, so this follows from Theorem 10.81.4. \square

10.82. Projective modules over a local ring

In this section we prove a very cute result: a projective module M over a local ring is free (Theorem 10.82.4 below). Note that with the additional assumption that M is finite, this result is Lemma 10.75.4. In general we have:

Lemma 10.82.1. *Let R be a ring. Then every projective R -module is free if and only if every countably generated projective R -module is free.*

Proof. Follows immediately from Theorem 10.81.5. □

Here is a criterion for a countably generated module to be free.

Lemma 10.82.2. *Let M be a countably generated R -module. Suppose any direct summand N of M satisfies: any element of N is contained in a free direct summand of N . Then M is free.*

Proof. Let x_1, x_2, \dots be a countable set of generators for M . By the assumption on M , we can construct by induction free R -modules F_1, F_2, \dots such that for every positive integer n , $\bigoplus_{i=1}^n F_i$ is a direct summand of M and contains x_1, \dots, x_n . Then $M = \bigoplus_{i=1}^{\infty} F_i$. □

Lemma 10.82.3. *Let P be a projective module over a local ring R . Then any element of P is contained in a free direct summand of P .*

Proof. Since P is projective it is a direct summand of some free R -module F , say $F = P \oplus Q$. Let $x \in P$ be the element that we wish to show is contained in a free direct summand of P . Let B be a basis of F such that the number of basis elements needed in the expression of x is minimal, say $x = \sum_{i=1}^n a_i e_i$ for some $e_i \in B$ and $a_i \in R$. Then no a_j can be expressed as a linear combination of the other a_i ; for if $a_j = \sum_{i \neq j} a_i b_i$ for some $b_i \in R$, then replacing e_i by $e_i + b_i e_j$ for $i \neq j$ and leaving unchanged the other elements of B , we get a new basis for F in terms of which x has a shorter expression.

Let $e_i = y_i + z_i$, $y_i \in P$, $z_i \in Q$ be the decomposition of e_i into its P - and Q -components. Write $y_i = \sum_{j=1}^n b_{ij} e_j + t_i$, where t_i is a linear combination of elements in B other than e_1, \dots, e_n . To finish the proof it suffices to show that the matrix (b_{ij}) is invertible. For then the map $F \rightarrow F$ sending $e_i \mapsto y_i$ for $i = 1, \dots, n$ and fixing $B \setminus \{e_1, \dots, e_n\}$ is an isomorphism, so that y_1, \dots, y_n together with $B \setminus \{e_1, \dots, e_n\}$ form a basis for F . Then the submodule N spanned by y_1, \dots, y_n is a free submodule of P ; N is a direct summand of P since $N \subset P$ and both N and P are direct summands of F ; and $x \in N$ since $x \in P$ implies $x = \sum_{i=1}^n a_i e_i = \sum_{i=1}^n a_i y_i$.

Now we prove that (b_{ij}) is invertible. Plugging $y_i = \sum_{j=1}^n b_{ij} e_j + t_i$ into $\sum_{i=1}^n a_i e_i = \sum_{i=1}^n a_i y_i$ and equating the coefficients of e_j gives $a_j = \sum_{i=1}^n a_i b_{ij}$. But as noted above, our choice of B guarantees that no a_j can be written as a linear combination of the other a_i . Thus b_{ij} is a non-unit for $i \neq j$, and $1 - b_{ii}$ is a non-unit—so in particular b_{ii} is a unit—for all i . But a matrix over a local ring having units along the diagonal and non-units elsewhere is invertible, as its determinant is a unit. □

Theorem 10.82.4. *If P is a projective module over a local ring R , then P is free.*

Proof. Follows from Lemmas 10.82.1, 10.82.2, and 10.82.3. □

10.83. Mittag-Leffler systems

The purpose of this section is to define Mittag-Leffler systems and why it is a useful property.

In the following, I will be a directed partially ordered set, see Categories, Definition 4.21.2. Let $(A_i, \varphi_{ji} : A_j \rightarrow A_i)$ be an inverse system of sets or of modules indexed by I , see Categories, Definition 4.21.2. This is a directed inverse system as we assumed I directed. For each $i \in I$, the images $\varphi_{ji}(A_j) \subset A_i$ for $j \geq i$ form a decreasing family. Let $A'_i = \bigcap_{j \geq i} \varphi_{ji}(A_j)$. Then $\varphi_{ji}(A'_j) \subset A'_i$ for $j \geq i$, hence by restricting we get a directed inverse system $(A'_i, \varphi_{ji}|_{A'_j})$. From the construction of the limit of an inverse system in the category of sets or modules, we have $\lim A_i = \lim A'_i$. The Mittag-Leffler condition on (A_i, φ_{ji}) is that A'_i equals $\varphi_{ji}(A_j)$ for some $j \geq i$ (and hence equals $\varphi_{ki}(A_k)$ for all $k \geq j$):

Definition 10.83.1. Let (A_i, φ_{ji}) be a directed inverse system of sets over I . Then we say (A_i, φ_{ji}) is *Mittag-Leffler inverse system* if for each $i \in I$, the decreasing family $\varphi_{ji}(A_j) \subset A_i$ for $j \geq i$ stabilizes. Explicitly, this means that for each $i \in I$, there exists $j \geq i$ such that for $k \geq j$ we have $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$. If (A_i, φ_{ji}) is a directed inverse system of modules over a ring R , we say that it is Mittag-Leffler if the underlying inverse system of sets is Mittag-Leffler.

Example 10.83.2. If (A_i, φ_{ji}) is a directed inverse system of sets or of modules and the maps φ_{ji} are surjective, then clearly the system is Mittag-Leffler. Conversely, suppose (A_i, φ_{ji}) is Mittag-Leffler. Let $A'_i \subset A_i$ be the stable image of $\varphi_{ji}(A_j)$ for $j \geq i$. Then $\varphi_{ji}|_{A'_j} : A'_j \rightarrow A'_i$ is surjective for $j \geq i$ and $\lim A_i = \lim A'_i$. Hence the limit of the Mittag-Leffler system (A_i, φ_{ji}) can also be written as the limit of a directed inverse system over I with surjective maps.

Lemma 10.83.3. *Let (A_i, φ_{ji}) be a directed inverse system over I . Suppose I is countable. If (A_i, φ_{ji}) is Mittag-Leffler and the A_i are nonempty, then $\lim A_i$ is nonempty.*

Proof. Let i_1, i_2, i_3, \dots be an enumeration of the elements of I . Define inductively a sequence of elements $j_n \in I$ for $n = 1, 2, 3, \dots$ by the conditions: $j_1 = i_1$, and $j_n \geq i_n$ and $j_n \geq j_m$ for $m < n$. Then the sequence j_n is increasing and forms a cofinal subset of I . Hence we may assume $I = \{1, 2, 3, \dots\}$. So by Example 10.83.2 we are reduced to showing that the limit of an inverse system of nonempty sets with surjective maps indexed by the positive integers is nonempty. This is obvious. \square

The Mittag-Leffler condition will be important for us because of the following exactness property.

Lemma 10.83.4. *Let*

$$0 \rightarrow A_i \xrightarrow{f_i} B_i \xrightarrow{g_i} C_i \rightarrow 0$$

be an exact sequence of directed inverse systems of abelian groups over I . Suppose I is countable. If (A_i) is Mittag-Leffler, then

$$0 \rightarrow \lim A_i \rightarrow \lim B_i \rightarrow \lim C_i \rightarrow 0$$

is exact.

Proof. Taking limits of directed inverse systems is left exact, hence we only need to prove surjectivity of $\lim B_i \rightarrow \lim C_i$. So let $(c_i) \in \lim C_i$. For each $i \in I$, let $E_i = g_i^{-1}(c_i)$, which is nonempty since $g_i : B_i \rightarrow C_i$ is surjective. The system of maps $\varphi_{ji} : B_j \rightarrow B_i$ for (B_i) restrict to maps $E_j \rightarrow E_i$ which make (E_i) into an inverse system of nonempty sets. It is enough to show that (E_i) is Mittag-Leffler.

For then Lemma 10.83.3 would show $\lim E_i$ is nonempty, and taking any element of $\lim E_i$ would give an element of $\lim B_i$ mapping to (c_i) .

By the injection $f_i : A_i \rightarrow B_i$ we will regard A_i as a subset of B_i . Since (A_i) is Mittag-Leffler, if $i \in I$ then there exists $j \geq i$ such that $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$ for $k \geq j$. We claim that also $\varphi_{ki}(E_k) = \varphi_{ji}(E_j)$ for $k \geq j$. Always $\varphi_{ki}(E_k) \subset \varphi_{ji}(E_j)$ for $k \geq j$. For the reverse inclusion let $e_j \in E_j$, and we need to find $x_k \in E_k$ such that $\varphi_{ki}(x_k) = \varphi_{ji}(e_j)$. Let $e'_k \in E_k$ be any element, and set $e'_j = \varphi_{kj}(e'_k)$. Then $g_j(e_j - e'_j) = c_j - c_j = 0$, hence $e_j - e'_j = a_j \in A_j$. Since $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$, there exists $a_k \in A_k$ such that $\varphi_{ki}(a_k) = \varphi_{ji}(a_j)$. Hence

$$\varphi_{ki}(e'_k + a_k) = \varphi_{ji}(e'_j) + \varphi_{ji}(a_j) = \varphi_{ji}(e_j),$$

so we can take $x_k = e'_k + a_k$. □

10.84. Inverse systems

In many papers (and in this section) the term *inverse system* is used to indicate an inverse system over the partially ordered set (\mathbf{N}, \geq) . We briefly discuss such systems in this section. This material will be discussed more broadly in Homology, Section 12.27. Suppose we are given a ring R and a sequence of R -modules

$$M_1 \xleftarrow{\varphi_2} M_2 \xleftarrow{\varphi_3} M_3 \leftarrow \dots$$

with maps as indicated. By composing successive maps we obtain maps $\varphi_{ii'} : M_i \rightarrow M_{i'}$ whenever $i \geq i'$ such that moreover $\varphi_{ii''} = \varphi_{i'i''} \circ \varphi_{ii'}$ whenever $i \geq i' \geq i''$. Conversely, given the system of maps $\varphi_{ii'}$ we can set $\varphi_i = \varphi_{i(i-1)}$ and recover the maps displayed above. In this case

$$\lim M_i = \{(x_i) \in \prod M_i \mid \varphi_i(x_i) = x_{i-1}, i = 2, 3, \dots\}$$

compare with Categories, Section 4.15. As explained in Homology, Section 12.27 this is actually a limit in the category of R -modules, as defined in Categories, Section 4.14.

Lemma 10.84.1. *Let R be a ring. Let $0 \rightarrow K_i \rightarrow L_i \rightarrow M_i \rightarrow 0$ be short exact sequences of R -modules, $i \geq 1$ which fit into maps of short exact sequences*

$$\begin{array}{ccccccc} 0 & \longrightarrow & K_i & \longrightarrow & L_i & \longrightarrow & M_i \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & K_{i+1} & \longrightarrow & L_{i+1} & \longrightarrow & M_{i+1} \longrightarrow 0 \end{array}$$

If for every i there exists a $c = c(i) \geq i$ such that $\text{Im}(K_c \rightarrow K_i) = \text{Im}(K_j \rightarrow K_i)$ for all $j \geq c$, then the sequence

$$0 \rightarrow \lim K_i \rightarrow \lim L_i \rightarrow \lim M_i \rightarrow 0$$

is exact.

Proof. This is a special case of the more general Lemma 10.83.4. □

10.85. Mittag-Leffler modules

A Mittag-Leffler module is (very roughly) a module which can be written as a directed limit whose dual is a Mittag-Leffler system. To be able to give a precise definition we need to do a bit of work.

Definition 10.85.1. Let (M_i, f_{ij}) be a directed system of R -modules. We say that (M_i, f_{ij}) is a *Mittag-Leffler directed system of modules* if each M_i is an R -module of finite presentation and if for every R -module N , the inverse system

$$(\mathrm{Hom}_R(M_i, N), \mathrm{Hom}_R(f_{ij}, N))$$

is Mittag-Leffler.

We are going to characterize those R -modules that are colimits of Mittag-Leffler directed systems of modules.

Definition 10.85.2. Let $f : M \rightarrow N$ and $g : M \rightarrow M'$ be maps of R -modules. Then we say g *dominates* f if for any R -module Q , we have $\mathrm{Ker}(f \otimes_R \mathrm{id}_Q) \subset \mathrm{Ker}(g \otimes_R \mathrm{id}_Q)$.

It is enough to check this condition for finitely presented modules.

Lemma 10.85.3. *Let $f : M \rightarrow N$ and $g : M \rightarrow M'$ be maps of R -modules. Then g dominates f if and only if for any finitely presented R -module Q , we have $\mathrm{Ker}(f \otimes_R \mathrm{id}_Q) \subset \mathrm{Ker}(g \otimes_R \mathrm{id}_Q)$.*

Proof. Suppose $\mathrm{Ker}(f \otimes_R \mathrm{id}_Q) \subset \mathrm{Ker}(g \otimes_R \mathrm{id}_Q)$ for all finitely presented modules Q . If Q is an arbitrary module, write $Q = \mathrm{colim}_{i \in I} Q_i$ as a colimit of a directed system of finitely presented modules Q_i . Then $\mathrm{Ker}(f \otimes_R \mathrm{id}_{Q_i}) \subset \mathrm{Ker}(g \otimes_R \mathrm{id}_{Q_i})$ for all i . Since taking directed colimits is exact and commutes with tensor product, it follows that $\mathrm{Ker}(f \otimes_R \mathrm{id}_Q) \subset \mathrm{Ker}(g \otimes_R \mathrm{id}_Q)$. \square

The above definition of domination is related to the usual notion of domination of maps as follows.

Lemma 10.85.4. *Let $f : M \rightarrow N$ and $g : M \rightarrow M'$ be maps of R -modules. Suppose $\mathrm{Coker}(f)$ is of finite presentation. Then g dominates f if and only if g factors through f , i.e. there exists a module map $h : N \rightarrow M'$ such that $g = h \circ f$.*

Proof. Consider the pushout of f and g ,

$$\begin{array}{ccc} M & \xrightarrow{f} & N \\ g \downarrow & & \downarrow g' \\ M' & \xrightarrow{f'} & N' \end{array}$$

where N' is $M' \oplus N$ modulo the submodule consisting of elements $(g(x), -f(x))$ for $x \in M$. We are going to show that the two conditions we wish to prove equivalent are each equivalent to f' being universally injective.

From the definition of N' we have a short exact sequence

$$0 \rightarrow \mathrm{Ker}(f) \cap \mathrm{Ker}(g) \rightarrow \mathrm{Ker}(f) \rightarrow \mathrm{Ker}(f') \rightarrow 0.$$

Since tensoring commutes with taking pushouts, we have such a short exact sequence

$$0 \rightarrow \mathrm{Ker}(f \otimes \mathrm{id}_Q) \cap \mathrm{Ker}(g \otimes \mathrm{id}_Q) \rightarrow \mathrm{Ker}(f \otimes \mathrm{id}_Q) \rightarrow \mathrm{Ker}(f' \otimes \mathrm{id}_Q) \rightarrow 0$$

for every R -module Q . So f' is universally injective if and only if $\text{Ker}(f \otimes \text{id}_Q) \subset \text{Ker}(g \otimes \text{id}_Q)$ for every Q , if and only if g dominates f .

On the other hand, from the definition of the pushout it follows that $\text{Coker}(f') = \text{Coker}(f)$, so $\text{Coker}(f')$ is of finite presentation. Then by Lemma 10.79.4, f' is universally injective if and only if

$$0 \rightarrow M' \xrightarrow{f'} N' \rightarrow \text{Coker}(f') \rightarrow 0$$

splits. This is the case if and only if there is a map $h' : N' \rightarrow M'$ such that $h' \circ f' = \text{id}_{M'}$. From the universal property of the pushout, the existence of such an h' is equivalent to g factoring through f . \square

Proposition 10.85.5. *Let M be an R -module. Let (M_i, f_{ij}) be a directed system of finitely presented R -modules, indexed by I , such that $M = \text{colim } M_i$. Let $f_i : M_i \rightarrow M$ be the canonical map. The following are equivalent:*

- (1) *For every finitely presented R -module P and module map $f : P \rightarrow M$, there exists a finitely presented R -module Q and a module map $g : P \rightarrow Q$ such that g and f dominate each other, i.e., $\text{Ker}(f \otimes_R \text{id}_N) = \text{Ker}(g \otimes_R \text{id}_N)$ for every R -module N .*
- (2) *For each $i \in I$, there exists $j \geq i$ such that $f_{ij} : M_i \rightarrow M_j$ dominates $f_i : M_i \rightarrow M$.*
- (3) *For each $i \in I$, there exists $j \geq i$ such that $f_{ij} : M_i \rightarrow M_j$ factors through $f_{ik} : M_i \rightarrow M_k$ for all $k \geq i$.*
- (4) *For every R -module N , the inverse system $(\text{Hom}_R(M_i, N), \text{Hom}_R(f_{ij}, N))$ is Mittag-Leffler.*
- (5) *For $N = \prod_{s \in I} M_s$, the inverse system $(\text{Hom}_R(M_i, N), \text{Hom}_R(f_{ij}, N))$ is Mittag-Leffler.*

Proof. First we prove the equivalence of (1) and (2). Suppose (1) holds and let $i \in I$. Corresponding to the map $f_i : M_i \rightarrow M$, we can choose $g : M_i \rightarrow Q$ as in (1). Since M_i and Q are of finite presentation, so is $\text{Coker}(g)$. Then by Lemma 10.85.4, $f_i : M_i \rightarrow M$ factors through $g : M_i \rightarrow Q$, say $f_i = h \circ g$ for some $h : Q \rightarrow M$. Then since Q is finitely presented, h factors through $M_j \rightarrow M$ for some $j \geq i$, say $h = f_j \circ h'$ for some $h' : Q \rightarrow M_j$. In total we have a commutative diagram

Thus f_{ij} dominates g . But g dominates f_i , so f_{ij} dominates f_i .

Conversely, suppose (2) holds. Let P be of finite presentation and $f : P \rightarrow M$ a module map. Then f factors through $f_i : M_i \rightarrow M$ for some $i \in I$, say $f = f_i \circ g'$ for some $g' : P \rightarrow M_i$. Choose by (2) a $j \geq i$ such that f_{ij} dominates f_i . We have

a commutative diagram

$$\begin{array}{ccc}
 P & \xrightarrow{f} & M \\
 g' \downarrow & \nearrow f_i & \uparrow f_j \\
 M_i & \xrightarrow{f_{ij}} & M_j
 \end{array}$$

From the diagram and the fact that f_{ij} dominates f_i , we find that f and $f_{ij} \circ g'$ dominate each other. Hence taking $g = f_{ij} \circ g' : P \rightarrow M_j$ works.

Next we prove (2) is equivalent to (3). Let $i \in I$. It is always true that f_i dominates f_{ik} for $k \geq i$, since f_i factors through f_{ik} . If (2) holds, choose $j \geq i$ such that f_{ij} dominates f_i . Then since domination is a transitive relation, f_{ij} dominates f_{ik} for $k \geq i$. All M_i are of finite presentation, so $\text{Coker}(f_{ik})$ is of finite presentation for $k \geq i$. By Lemma 10.85.4, f_{ij} factors through f_{ik} for all $k \geq i$. Thus (2) implies (3). On the other hand, if (3) holds then for any R -module N , $f_{ij} \otimes_R \text{id}_N$ factors through $f_{ik} \otimes_R \text{id}_N$ for $k \geq i$. So $\text{Ker}(f_{ik} \otimes_R \text{id}_N) \subset \text{Ker}(f_{ij} \otimes_R \text{id}_N)$ for $k \geq i$. But $\text{Ker}(f_i \otimes_R \text{id}_N : M_i \otimes_R N \rightarrow M \otimes_R N)$ is the union of $\text{Ker}(f_{ik} \otimes_R \text{id}_N)$ for $k \geq i$. Thus $\text{Ker}(f_i \otimes_R \text{id}_N) \subset \text{Ker}(f_{ij} \otimes_R \text{id}_N)$ for any R -module N , which by definition means f_{ij} dominates f_i .

It is trivial that (3) implies (4) implies (5). We show (5) implies (3). Let $N = \prod_{s \in I} M_s$. If (5) holds, then given $i \in I$ choose $j \geq i$ such that

$$\text{Im}(\text{Hom}(M_j, N) \rightarrow \text{Hom}(M_i, N)) = \text{Im}(\text{Hom}(M_k, N) \rightarrow \text{Hom}(M_i, N))$$

for all $k \geq j$. Passing the product over $s \in I$ outside of the Hom's and looking at the maps on each component of the product, this says

$$\text{Im}(\text{Hom}(M_j, M_s) \rightarrow \text{Hom}(M_i, M_s)) = \text{Im}(\text{Hom}(M_k, M_s) \rightarrow \text{Hom}(M_i, M_s))$$

for all $k \geq j$ and $s \in I$. Taking $s = j$ we have

$$\text{Im}(\text{Hom}(M_j, M_j) \rightarrow \text{Hom}(M_i, M_j)) = \text{Im}(\text{Hom}(M_k, M_j) \rightarrow \text{Hom}(M_i, M_j))$$

for all $k \geq j$. Since f_{ij} is the image of $\text{id} \in \text{Hom}(M_j, M_j)$ under $\text{Hom}(M_j, M_j) \rightarrow \text{Hom}(M_i, M_j)$, this shows that for any $k \geq j$ there is $h \in \text{Hom}(M_k, M_j)$ such that $f_{ij} = h \circ f_{ik}$. If $j \geq k$ then we can take $h = f_{kj}$. Hence (3) holds. \square

Definition 10.85.6. Let M be an R -module. We say that M is *Mittag-Leffler* if the equivalent conditions of Proposition 10.85.5 hold.

In particular a finitely presented module is Mittag-Leffler.

Remark 10.85.7. Let M be a flat R -module. By Lazard's theorem (Theorem 10.78.4) we can write $M = \text{colim } M_i$ as the colimit of a directed system (M_i, f_{ij}) where the M_i are free finite R -modules. For M to be Mittag-Leffler, it is enough for the inverse system of duals $(\text{Hom}_R(M_i, R), \text{Hom}_R(f_{ij}, R))$ to be Mittag-Leffler. This follows from criterion (4) of Proposition 10.85.5 and the fact that for a free finite R -module F , there is a functorial isomorphism $\text{Hom}_R(F, R) \otimes_R N \cong \text{Hom}_R(F, N)$ for any R -module N .

Lemma 10.85.8. *If R is a ring and M, N are Mittag-Leffler modules over R , then $M \otimes_R N$ is a Mittag-Leffler module.*

Proof. Write $M = \operatorname{colim}_{i \in I} M_i$ and $N = \operatorname{colim}_{j \in J} N_j$ as directed colimits of finitely presented R -modules. Denote $f_{ii'} : M_i \rightarrow M_{i'}$ and $g_{jj'} : N_j \rightarrow N_{j'}$ the transition maps. Then $M_i \otimes_R N_j$ is a finitely presented R -module (see Lemma 10.11.14), and $M \otimes_R N = \operatorname{colim}_{(i,j) \in I \times J} M_i \otimes_R N_j$. Pick $(i, j) \in I \times J$. By the definition of a Mittag-Leffler module we have Proposition 10.85.5 (3) for both systems. In other words there exist $i' \geq i$ and $j' \geq j$ such that for every choice of $i'' \geq i$ and $j'' \geq j$ there exist maps $a : M_{i''} \rightarrow M_{i'}$ and $b : M_{j''} \rightarrow M_{j'}$ such that $f_{ii'} = a \circ f_{ii''}$ and $g_{jj'} = b \circ g_{jj''}$. Then it is clear that $a \otimes b : M_{i''} \otimes_R N_{j''} \rightarrow M_{i'} \otimes_R N_{j'}$ serves the same purpose for the system $(M_i \otimes_R N_j, f_{ii'} \otimes g_{jj'})$. Thus by the characterization Proposition 10.85.5 (3) we conclude that $M \otimes_R N$ is Mittag-Leffler. \square

Lemma 10.85.9. *Let R be a ring and M an R -module. Then M is Mittag-Leffler if and only if for every finite free R -module F and module map $f : F \rightarrow M$, there exists a finitely presented R -module Q and a module map $g : F \rightarrow Q$ such that g and f dominate each other, i.e., $\operatorname{Ker}(f \otimes_R \operatorname{id}_N) = \operatorname{Ker}(g \otimes_R \operatorname{id}_N)$ for every R -module N .*

Proof. Since the condition is clear weaker than condition (1) of Proposition 10.85.5 we see that a Mittag-Leffler module satisfies the condition. Conversely, suppose that M satisfies the condition and that $f : P \rightarrow M$ is an R -module map from a finitely presented R -module P into M . Choose a surjection $F \rightarrow P$ where F is a finite free R -module. By assumption we can find a map $F \rightarrow Q$ where Q is a finitely presented R -module such that $F \rightarrow Q$ and $F \rightarrow M$ dominate each other. In particular, the kernel of $F \rightarrow Q$ contains the kernel of $F \rightarrow P$, hence we obtain an R -module map $g : P \rightarrow Q$ such that $F \rightarrow Q$ is equal to the composition $F \rightarrow P \rightarrow Q$. Let N be any R -module and consider the commutative diagram

$$\begin{array}{ccc} F \otimes_R N & \longrightarrow & Q \otimes_R N \\ \downarrow & \nearrow & \\ P \otimes_R N & \longrightarrow & M \otimes_R N \end{array}$$

By assumption the kernels of $F \otimes_R N \rightarrow Q \otimes_R N$ and $F \otimes_R N \rightarrow M \otimes_R N$ are equal. Hence, as $F \otimes_R N \rightarrow P \otimes_R N$ is surjective, also the kernels of $P \otimes_R N \rightarrow Q \otimes_R N$ and $P \otimes_R N \rightarrow M \otimes_R N$ are equal. \square

Lemma 10.85.10. *Let $R \rightarrow S$ be a finite and finitely presented ring map. Let M be an S -module. If M is a Mittag-Leffler module over S then M is a Mittag-Leffler module over R .*

Proof. Assume M is a Mittag-Leffler module over S . Write $M = \operatorname{colim} M_i$ as a directed colimit of finitely presented S -modules M_i . As M is Mittag-Leffler over S there exists for each i an index $j \geq i$ such that for all $k \geq j$ there is a factorization $f_{ij} = h \circ f_{ik}$ (where h depends on i , the choice of j and k). Note that by Lemma 10.7.4 the modules M_i are also finitely presented as R -modules. Moreover, all the maps f_{ij}, f_{ik}, h are maps of R -modules. Thus we see that the system (M_i, f_{ij}) satisfies the same condition when viewed as a system of R -modules. Thus M is Mittag-Leffler as an R -module. \square

Lemma 10.85.11. *Let R be a ring. Let $S = R/I$ for some finitely generated ideal I . Let M be an S -module. Then M is a Mittag-Leffler module over R if and only if M is a Mittag-Leffler module over S .*

Proof. One implication follows from Lemma 10.85.10. To prove the other, assume M is Mittag-Leffler as an R -module. Write $M = \operatorname{colim} M_i$ as a directed colimit of finitely presented S -modules. As I is finitely generated, the ring S is finite and finitely presented as an R -algebra, hence the modules M_i are finitely presented as R -modules, see Lemma 10.7.4. Next, let N be any S -module. Note that for each i we have $\operatorname{Hom}_R(M_i, N) = \operatorname{Hom}_S(M_i, N)$ as $R \rightarrow S$ is surjective. Hence the condition that the inverse system $(\operatorname{Hom}_R(M_i, N))_i$ satisfies Mittag-Leffler, implies that the system $(\operatorname{Hom}_S(M_i, N))_i$ satisfies Mittag-Leffler. Thus M is Mittag-Leffler over S by definition. \square

Remark 10.85.12. Let $R \rightarrow S$ be a finite and finitely presented ring map. Let M be an S -module which is Mittag-Leffler as an R -module. Then it is in general not the case that if M is Mittag-Leffler as an S -module. For example suppose that S is the ring of dual numbers over R , i.e., $S = R \oplus R\epsilon$ with $\epsilon^2 = 0$. Then an S -module consists of an R -module M endowed with a square zero R -linear endomorphism $\epsilon : M \rightarrow M$. Now suppose that M_0 is an R -module which is not Mittag-Leffler. Choose a presentation $F_1 \xrightarrow{u} F_0 \rightarrow M_0 \rightarrow 0$ with F_1 and F_0 free R -modules. Set $M = F_1 \oplus F_0$ with

$$\epsilon = \begin{pmatrix} 0 & 0 \\ u & 0 \end{pmatrix} : M \longrightarrow M.$$

Then $M/\epsilon M \cong F_1 \oplus M_0$ is not Mittag-Leffler over $R = S/\epsilon S$, hence not Mittag-Leffler over S (see Lemma 10.85.11). On the other hand, $M/\epsilon M = M \otimes_S S/\epsilon S$ which would be Mittag-Leffler over S if M was, see Lemma 10.85.8.

10.86. Interchanging direct products with tensor

Let M be an R -module and let $(Q_\alpha)_{\alpha \in A}$ be a family of R -modules. Then there is a canonical map $M \otimes_R (\prod_{\alpha \in A} Q_\alpha) \rightarrow \prod_{\alpha \in A} (M \otimes_R Q_\alpha)$ given on pure tensors by $x \otimes (q_\alpha) \mapsto (x \otimes q_\alpha)$. This map is not necessarily injective or surjective, as the following example shows.

Example 10.86.1. Take $R = \mathbf{Z}$, $M = \mathbf{Q}$, and consider the family $Q_n = \mathbf{Z}/n$ for $n \geq 1$. Then $\prod_n (M \otimes Q_n) = 0$. However there is an injection $\mathbf{Q} \rightarrow M \otimes (\prod_n Q_n)$ obtained by tensoring the injection $\mathbf{Z} \rightarrow \prod_n Q_n$ by M , so $M \otimes (\prod_n Q_n)$ is nonzero. Thus $M \otimes (\prod_n Q_n) \rightarrow \prod_n (M \otimes Q_n)$ is not injective.

On the other hand, take again $R = \mathbf{Z}$, $M = \mathbf{Q}$, and let $Q_n = \mathbf{Z}$ for $n \geq 1$. The image of $M \otimes (\prod_n Q_n) \rightarrow \prod_n (M \otimes Q_n) = \prod_n M$ consists precisely of sequences of the form $(a_n/m)_{n \geq 1}$ with $a_n \in \mathbf{Z}$ and m some nonzero integer. Hence the map is not surjective.

We determine below the precise conditions needed on M for the map $M \otimes_R (\prod_\alpha Q_\alpha) \rightarrow \prod_\alpha (M \otimes_R Q_\alpha)$ to be surjective, bijective, or injective for all choices of $(Q_\alpha)_{\alpha \in A}$. This is relevant because the modules for which it is injective turn out to be exactly Mittag-Leffler modules (Proposition 10.86.5). In what follows, if M is an R -module and A a set, we write M^A for the product $\prod_{\alpha \in A} M$.

Proposition 10.86.2. *Let M be an R -module. The following are equivalent:*

- (1) M is finitely generated.
- (2) For every family $(Q_\alpha)_{\alpha \in A}$ of R -modules, the canonical map $M \otimes_R (\prod_\alpha Q_\alpha) \rightarrow \prod_\alpha (M \otimes_R Q_\alpha)$ is surjective.

- (3) For every R -module Q and every set A , the canonical map $M \otimes_R Q^A \rightarrow (M \otimes_R Q)^A$ is surjective.
- (4) For every set A , the canonical map $M \otimes_R R^A \rightarrow M^A$ is surjective.

Proof. First we prove (1) implies (2). Choose a surjection $R^n \rightarrow M$ and consider the commutative diagram

$$\begin{array}{ccc} R^n \otimes_R (\prod_{\alpha} Q_{\alpha}) & \xrightarrow{\cong} & \prod_{\alpha} (R^n \otimes_R Q_{\alpha}) \\ \downarrow & & \downarrow \\ M \otimes_R (\prod_{\alpha} Q_{\alpha}) & \longrightarrow & \prod_{\alpha} (M \otimes_R Q_{\alpha}). \end{array}$$

The top arrow is an isomorphism and the vertical arrows are surjections. We conclude that the bottom arrow is a surjection.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). In fact for (1) to hold it suffices that the element $d = (x)_{x \in M}$ of M^M is in the image of the map $f : M \otimes_R R^M \rightarrow M^M$. In this case $d = \sum_{i=1}^n f(x_i \otimes a_i)$ for some $x_i \in M$ and $a_i \in R^M$. If for $x \in M$ we write $p_x : M^M \rightarrow M$ for the projection onto the x -th factor, then

$$x = p_x(d) = \sum_{i=1}^n p_x(f(x_i \otimes a_i)) = \sum_{i=1}^n p_x(a_i)x_i.$$

Thus x_1, \dots, x_n generate M . □

Proposition 10.86.3. *Let M be an R -module. The following are equivalent:*

- (1) M is finitely presented.
- (2) For every family $(Q_{\alpha})_{\alpha \in A}$ of R -modules, the canonical map $M \otimes_R (\prod_{\alpha} Q_{\alpha}) \rightarrow \prod_{\alpha} (M \otimes_R Q_{\alpha})$ is bijective.
- (3) For every R -module Q and every set A , the canonical map $M \otimes_R Q^A \rightarrow (M \otimes_R Q)^A$ is bijective.
- (4) For every set A , the canonical map $M \otimes_R R^A \rightarrow M^A$ is bijective.

Proof. First we prove (1) implies (2). Choose a presentation $R^m \rightarrow R^n \rightarrow M$ and consider the commutative diagram

$$\begin{array}{ccccccc} R^m \otimes_R (\prod_{\alpha} Q_{\alpha}) & \longrightarrow & R^n \otimes_R (\prod_{\alpha} Q_{\alpha}) & \longrightarrow & M \otimes_R (\prod_{\alpha} Q_{\alpha}) & \longrightarrow & 0 \\ \downarrow \cong & & \downarrow \cong & & \downarrow & & \\ \prod_{\alpha} (R^m \otimes_R Q_{\alpha}) & \longrightarrow & \prod_{\alpha} (R^n \otimes_R Q_{\alpha}) & \longrightarrow & \prod_{\alpha} (M \otimes_R Q_{\alpha}) & \longrightarrow & 0. \end{array}$$

The first two vertical arrows are isomorphisms and the rows are exact. This implies that the map $M \otimes_R (\prod_{\alpha} Q_{\alpha}) \rightarrow \prod_{\alpha} (M \otimes_R Q_{\alpha})$ is surjective and, by a diagram chase, also injective. Hence (2) holds.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). From Proposition 10.86.2, if (4) holds we already know that M is finitely generated. So we can choose a surjection $F \rightarrow M$ where F is free and finite. Let K be the kernel. We must show K is finitely generated. For any set A , we have a commutative

diagram

$$\begin{array}{ccccccc}
 K \otimes_R R^A & \longrightarrow & F \otimes_R R^A & \longrightarrow & M \otimes_R R^A & \longrightarrow & 0 \\
 f_3 \downarrow & & f_2 \downarrow \cong & & f_1 \downarrow \cong & & \\
 0 \longrightarrow & K^A & \longrightarrow & F^A & \longrightarrow & M^A & \longrightarrow 0.
 \end{array}$$

The map f_1 is an isomorphism by assumption, the map f_2 is an isomorphism since F is free and finite, and the rows are exact. A diagram chase shows that f_3 is surjective, hence by Proposition 10.86.2 we get that K is finitely generated. \square

We need the following lemma for the next proposition.

Lemma 10.86.4. *Let M be an R -module, P a finitely presented R -module, and $f : P \rightarrow M$ a map. Let Q be an R -module and suppose $x \in \text{Ker}(P \otimes Q \rightarrow M \otimes Q)$. Then there exists a finitely presented R -module P' and a map $f' : P \rightarrow P'$ such that f factors through f' and $x \in \text{Ker}(P \otimes Q \rightarrow P' \otimes Q)$.*

Proof. Write M as a colimit $M = \text{colim}_{i \in I} M_i$ of a directed system of finitely presented modules M_i . Since P is finitely presented, the map $f : P \rightarrow M$ factors through $M_j \rightarrow M$ for some $j \in I$. Upon tensoring by Q we have a commutative diagram

$$\begin{array}{ccc}
 & M_j \otimes Q & \\
 & \nearrow & \searrow \\
 P \otimes Q & \longrightarrow & M \otimes Q.
 \end{array}$$

The image y of x in $M_j \otimes Q$ is in the kernel of $M_j \otimes Q \rightarrow M \otimes Q$. Since $M \otimes Q = \text{colim}_{i \in I} (M_i \otimes Q)$, this means y maps to 0 in $M_{j'} \otimes Q$ for some $j' \geq j$. Thus we may take $P' = M_{j'}$ and f' to be the composite $P \rightarrow M_j \rightarrow M_{j'}$. \square

Proposition 10.86.5. *Let M be an R -module. The following are equivalent:*

- (1) M is Mittag-Leffler.
- (2) For every family $(Q_\alpha)_{\alpha \in A}$ of R -modules, the canonical map $M \otimes_R (\prod_\alpha Q_\alpha) \rightarrow \prod_\alpha (M \otimes_R Q_\alpha)$ is injective.

Proof. First we prove (1) implies (2). Suppose M is Mittag-Leffler and let x be in the kernel of $M \otimes_R (\prod_\alpha Q_\alpha) \rightarrow \prod_\alpha (M \otimes_R Q_\alpha)$. Write M as a colimit $M = \text{colim}_{i \in I} M_i$ of a directed system of finitely presented modules M_i . Then $M \otimes_R (\prod_\alpha Q_\alpha)$ is the colimit of $M_i \otimes_R (\prod_\alpha Q_\alpha)$. So x is the image of an element $x_i \in M_i \otimes_R (\prod_\alpha Q_\alpha)$. We must show that x_i maps to 0 in $M_j \otimes_R (\prod_\alpha Q_\alpha)$ for some $j \geq i$. Since M is Mittag-Leffler, we may choose $j \geq i$ such that $M_i \rightarrow M_j$ and $M_i \rightarrow M$ dominate each other. Then consider the commutative diagram

$$\begin{array}{ccc}
 M \otimes_R (\prod_\alpha Q_\alpha) & \longrightarrow & \prod_\alpha (M \otimes_R Q_\alpha) \\
 \uparrow & & \uparrow \\
 M_i \otimes_R (\prod_\alpha Q_\alpha) & \xrightarrow{\cong} & \prod_\alpha (M_i \otimes_R Q_\alpha) \\
 \downarrow & & \downarrow \\
 M_j \otimes_R (\prod_\alpha Q_\alpha) & \xrightarrow{\cong} & \prod_\alpha (M_j \otimes_R Q_\alpha)
 \end{array}$$

whose bottom two horizontal maps are isomorphisms, according to Proposition 10.86.3. Since x_i maps to 0 in $\prod_{\alpha}(M \otimes_R Q_{\alpha})$, its image in $\prod_{\alpha}(M_i \otimes_R Q_{\alpha})$ is in the kernel of the map $\prod_{\alpha}(M_i \otimes_R Q_{\alpha}) \rightarrow \prod_{\alpha}(M \otimes_R Q_{\alpha})$. But this kernel equals the kernel of $\prod_{\alpha}(M_i \otimes_R Q_{\alpha}) \rightarrow \prod_{\alpha}(M_j \otimes_R Q_{\alpha})$ according to the choice of j . Thus x_i maps to 0 in $\prod_{\alpha}(M_j \otimes_R Q_{\alpha})$ and hence to 0 in $M_j \otimes_R (\prod_{\alpha} Q_{\alpha})$.

Now suppose (2) holds. We prove M satisfies formulation (1) of being Mittag-Leffler from Proposition 10.85.5. Let $f : P \rightarrow M$ be a map from a finitely presented module P to M . Choose a set B of representatives of the isomorphism classes of finitely presented R -modules. Let A be the set of pairs (Q, x) where $Q \in B$ and $x \in \text{Ker}(P \otimes Q \rightarrow M \otimes Q)$. For $\alpha = (Q, x) \in A$, we write Q_{α} for Q and x_{α} for x . Consider the commutative diagram

$$\begin{array}{ccc} M \otimes_R (\prod_{\alpha} Q_{\alpha}) & \longrightarrow & \prod_{\alpha} (M \otimes_R Q_{\alpha}) \\ \uparrow & & \uparrow \\ P \otimes_R (\prod_{\alpha} Q_{\alpha}) & \xrightarrow{\cong} & \prod_{\alpha} (P \otimes_R Q_{\alpha}) \end{array}$$

The top arrow is an injection by assumption, and the bottom arrow is an isomorphism by Proposition 10.86.3. Let $x \in P \otimes_R (\prod_{\alpha} Q_{\alpha})$ be the element corresponding to $(x_{\alpha}) \in \prod_{\alpha} (P \otimes_R Q_{\alpha})$ under this isomorphism. Then $x \in \text{Ker}(P \otimes_R (\prod_{\alpha} Q_{\alpha}) \rightarrow M \otimes_R (\prod_{\alpha} Q_{\alpha}))$ since the top arrow in the diagram is injective. By Lemma 10.86.4, we get a finitely presented module P' and a map $f' : P \rightarrow P'$ such that $f : P \rightarrow M$ factors through f' and $x \in \text{Ker}(P \otimes_R (\prod_{\alpha} Q_{\alpha}) \rightarrow P' \otimes_R (\prod_{\alpha} Q_{\alpha}))$. We have a commutative diagram

$$\begin{array}{ccc} P' \otimes_R (\prod_{\alpha} Q_{\alpha}) & \xrightarrow{\cong} & \prod_{\alpha} (P' \otimes_R Q_{\alpha}) \\ \uparrow & & \uparrow \\ P \otimes_R (\prod_{\alpha} Q_{\alpha}) & \xrightarrow{\cong} & \prod_{\alpha} (P \otimes_R Q_{\alpha}) \end{array}$$

where both the top and bottom arrows are isomorphisms by Proposition 10.86.3. Thus since x is in the kernel of the left vertical map, (x_{α}) is in the kernel of the right vertical map. This means $x_{\alpha} \in \text{Ker}(P \otimes_R Q_{\alpha} \rightarrow P' \otimes_R Q_{\alpha})$ for every $\alpha \in A$. By the definition of A this means $\text{Ker}(P \otimes_R Q \rightarrow P' \otimes_R Q) \supset \text{Ker}(P \otimes_R Q \rightarrow M \otimes_R Q)$ for all finitely presented Q and, since $f : P \rightarrow M$ factors through $f' : P \rightarrow P'$, actually equality holds. By Lemma 10.85.3, f and f' dominate each other. \square

Lemma 10.86.6. *Let M be a flat Mittag-Leffler module over R . Let F be an R -module and let $x \in F \otimes_R M$. Then there exists a smallest submodule $F' \subset F$ such that $x \in F' \otimes_R M$.*

Proof. Since M is flat we have $F' \otimes_R M \subset F \otimes_R M$ if $F' \subset F$ is a submodule, hence the statement makes sense. Let $I = \{F' \subset F \mid x \in F' \otimes_R M\}$ and for $i \in I$ denote $F_i \subset F$ the corresponding submodule. Then x maps to zero under the map

$$F \otimes_R M \longrightarrow \prod (F/F_i \otimes_R M)$$

whence by Proposition 10.86.5 x maps to zero under the map

$$F \otimes_R M \longrightarrow \left(\prod F/F_i \right) \otimes_R M$$

Since M is flat the kernel of this arrow is $(\bigcap F_i) \otimes_R M$ which proves the lemma. \square

Lemma 10.86.7. *Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a universally exact sequence of R -modules. Then:*

- (1) *If M_2 is Mittag-Leffler, then M_1 is Mittag-Leffler.*
- (2) *If M_1 and M_3 are Mittag-Leffler, then M_2 is Mittag-Leffler.*

Proof. For any family $(Q_\alpha)_{\alpha \in A}$ of R -modules we have a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & M_1 \otimes_R (\prod_\alpha Q_\alpha) & \longrightarrow & M_2 \otimes_R (\prod_\alpha Q_\alpha) & \longrightarrow & M_3 \otimes_R (\prod_\alpha Q_\alpha) & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & \prod_\alpha (M_1 \otimes Q_\alpha) & \longrightarrow & \prod_\alpha (M_2 \otimes Q_\alpha) & \longrightarrow & \prod_\alpha (M_3 \otimes Q_\alpha) & \longrightarrow & 0 \end{array}$$

with exact rows. Thus (1) and (2) follow from Proposition 10.86.5. \square

Lemma 10.86.8. *If $M = \operatorname{colim} M_i$ is the colimit of a directed system of Mittag-Leffler R -modules M_i with universally injective transition maps, then M is Mittag-Leffler.*

Proof. Let $(Q_\alpha)_{\alpha \in A}$ be a family of R -modules. We have to show that $M \otimes_R (\prod Q_\alpha) \rightarrow \prod M \otimes_R Q_\alpha$ is injective and we know that $M_i \otimes_R (\prod Q_\alpha) \rightarrow \prod M_i \otimes_R Q_\alpha$ is injective for each i , see Proposition 10.86.5. Since \otimes commutes with filtered colimits, it suffices to show that $\prod M_i \otimes_R Q_\alpha \rightarrow \prod M \otimes_R Q_\alpha$ is injective. This is clear as each of the maps $M_i \otimes_R Q_\alpha \rightarrow M \otimes_R Q_\alpha$ is injective by our assumption that the transition maps are universally injective. \square

Lemma 10.86.9. *If $M = \bigoplus_{i \in I} M_i$ is a direct sum of R -modules, then M is Mittag-Leffler if and only if each M_i is Mittag-Leffler.*

Proof. The “only if” direction follows from Lemma 10.86.7 (1) and the fact that a split short exact sequence is universally exact. The converse follows from Lemma 10.86.8 but we can also argue it directly as follows. First note that if I is finite then this follows from Lemma 10.86.7 (2). For general I , if all M_i are Mittag-Leffler then we prove the same of M by verifying condition (1) of Proposition 10.85.5. Let $f : P \rightarrow M$ be a map from a finitely presented module P . Then f factors as $P \xrightarrow{f'} \bigoplus_{i' \in I'} M_{i'} \hookrightarrow \bigoplus_{i \in I} M_i$ for some finite subset I' of I . By the finite case $\bigoplus_{i' \in I'} M_{i'}$ is Mittag-Leffler and hence there exists a finitely presented module Q and a map $g : P \rightarrow Q$ such that g and f' dominate each other. Then also g and f dominate each other. \square

Lemma 10.86.10. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. If S is Mittag-Leffler as an R -module, and M is flat and Mittag-Leffler as an S -module, then M is Mittag-Leffler as an R -module.*

Proof. We deduce this from the characterization of Proposition 10.86.5. Namely, suppose that Q_α is a family of R -modules. Consider the composition

$$\begin{array}{c} M \otimes_R \prod_\alpha Q_\alpha = M \otimes_S S \otimes_R \prod_\alpha Q_\alpha \\ \downarrow \\ M \otimes_S \prod_\alpha (S \otimes_R Q_\alpha) \\ \downarrow \\ \prod_\alpha (M \otimes_S \otimes_R Q_\alpha) = \prod_\alpha (M \otimes_R Q_\alpha) \end{array}$$

The first arrow is injective as M is flat over S and S is Mittag-Leffler over R and the second arrow is injective as M is Mittag-Leffler over S . Hence M is Mittag-Leffler over R . \square

10.87. Coherent rings

We use the discussion on interchanging \prod and \otimes to determine for which rings products of flat modules are flat. It turns out that these are the so-called coherent rings. You may be more familiar with the notion of a coherent \mathcal{O}_X -module on a ringed space, see Modules, Section 17.12.

Definition 10.87.1. Let R be a ring. Let M be an R -module.

- (1) We say M is a *coherent module* if it is finitely generated and every finitely generated submodule of M is finitely presented over R .
- (2) We say R is a *coherent ring* if it is coherent as a module over itself.

Thus a ring is coherent if and only if every finitely generated ideal is finitely presented as a module. The category of coherent modules is abelian.

Lemma 10.87.2. Let R be a ring.

- (1) A finite submodule of a coherent module is coherent.
- (2) Let $\varphi : N \rightarrow M$ be a homomorphism from a finite module to a coherent module. Then $\text{Ker}(\varphi)$ is finite.
- (3) Let $\varphi : N \rightarrow M$ be a homomorphism of coherent modules. Then $\text{Ker}(\varphi)$ and $\text{Coker}(\varphi)$ are coherent modules.
- (4) The category of coherent modules is an abelian subcategory of Mod_R .
- (5) Given a short exact sequence of R -modules $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ if two out of three are coherent so is the third.

Proof. The first statement is immediate from the definition. During the rest of the proof we will use the results of Lemma 10.5.3 without further mention.

Let $\varphi : N \rightarrow M$ satisfy the assumptions of (2). Suppose that N is generated by x_1, \dots, x_n . By Definition 10.87.1 the kernel K of the induced map $\bigoplus_{i=1}^n R \rightarrow M$, $e_i \mapsto \varphi(x_i)$ is of finite type. Hence $\text{Ker}(\varphi)$ which is the image of the composition $K \rightarrow \bigoplus_{i=1}^n R \rightarrow N$ is of finite type. This proves (2).

Let $\varphi : N \rightarrow M$ satisfy the assumptions of (3). By (2) the kernel of φ is of finite type and hence by (1) it is coherent.

With the same hypotheses let us show that $\text{Coker}(\varphi)$ is coherent. Since M is finite so is $\text{Coker}(\varphi)$. Let $\bar{x}_i \in \text{Coker}(\varphi)$. We have to show that the kernel of the

associated morphism $\bar{\Psi} : \bigoplus_{i=1}^n R \rightarrow \text{Coker}(\varphi)$ is finite. Choose $x_i \in M$ lifting \bar{x}_i . Thus $\bar{\Psi}$ lifts to $\Psi : \bigoplus_{i=1}^n R \rightarrow M$. Consider the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(\Psi) & \longrightarrow & \bigoplus_{i=1}^n R & \longrightarrow & M \longrightarrow 0 \\ & & \downarrow & & \parallel & & \downarrow \\ 0 & \longrightarrow & \text{Ker}(\bar{\Psi}) & \longrightarrow & \bigoplus_{i=1}^n R & \longrightarrow & \text{Coker}(\varphi) \longrightarrow 0 \end{array}$$

By the snake lemma we get a short exact sequence $0 \rightarrow \text{Ker}(\Psi) \rightarrow \text{Ker}(\bar{\Psi}) \rightarrow \text{Im}(\varphi) \rightarrow 0$. Hence we see that $\text{Ker}(\bar{\Psi})$ is finite.

Statement (4) follows from (3).

Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a short exact sequence of R -modules. It suffices to prove that if M_1 and M_3 are coherent so is M_2 . By Lemma 10.5.3 we see that M_2 is finite. Let x_1, \dots, x_n be finitely many elements of M_2 . We have to show that the module of relations K between them is finite. Consider the following commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & 0 & \longrightarrow & \bigoplus_{i=1}^n R & \longrightarrow & \bigoplus_{i=1}^n R \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0 \end{array}$$

with obvious notation. By the snake lemma we get an exact sequence $0 \rightarrow K \rightarrow K_3 \rightarrow M_1$ where K_3 is the module of relations among the images of the x_i in M_3 . Since M_3 is coherent we see that K_3 is a finite module. Since M_1 is coherent we see that the image I of $K_3 \rightarrow M_1$ is coherent. Hence K is the kernel of the map $K_3 \rightarrow I$ between a finite module and a coherent module and hence finite by (2). \square

Lemma 10.87.3. *Let R be a ring. If R is coherent, then a module is coherent if and only if it is finitely presented.*

Proof. It is clear that a coherent module is finitely presented (over any ring). Conversely, if R is coherent, then $R^{\oplus n}$ is coherent and so is the cokernel of any map $R^{\oplus m} \rightarrow R^{\oplus n}$, see Lemma 10.87.2. \square

Lemma 10.87.4. *A Noetherian ring is a coherent ring.*

Proof. By Lemma 10.30.4 any finite R -module is finitely presented. In particular any ideal of R is finitely presented. \square

Proposition 10.87.5. *Let R be a ring. The following are equivalent*

- (1) R is coherent,
- (2) any product of flat R -modules is flat, and
- (3) for every set A the module R^A is flat.

Proof. Assume R coherent, and let Q_α , $\alpha \in A$ be a set of flat R -modules. We have to show that $I \otimes_R \prod_\alpha Q_\alpha \rightarrow \prod Q_\alpha$ is injective for every finitely generated ideal I of R , see Lemma 10.38.4. Since R is coherent I is an R -module of finite presentation. Hence $I \otimes_R \prod_\alpha Q_\alpha = \prod I \otimes_R Q_\alpha$ by Proposition 10.86.3. The desired injectivity follows as $I \otimes_R Q_\alpha \rightarrow Q_\alpha$ is injective by flatness of Q_α .

The implication (2) \Rightarrow (3) is trivial.

Assume that the R -module R^A is flat for every set A . Let I be a finitely generated ideal in R . Then $I \otimes_R R^A \rightarrow R^A$ is injective by assumption. By Proposition 10.86.2 and the finiteness of I the image is equal to I^A . Hence $I \otimes_R R^A = I^A$ for every set A and we conclude that I is finitely presented by Proposition 10.86.3. \square

10.88. Examples and non-examples of Mittag-Leffler modules

We end this section with some examples and non-examples of Mittag-Leffler modules.

Example 10.88.1. Mittag-Leffler modules.

- (1) Any finitely presented module is Mittag-Leffler. This follows, for instance, from Proposition 10.85.5 (1). In general, it is true that a finitely generated module is Mittag-Leffler if and only if it is finitely presented. This follows from Propositions 10.86.2, 10.86.3, and 10.86.5.
- (2) A free module is Mittag-Leffler since it satisfies condition (1) of Proposition 10.85.5.
- (3) By the previous example together with Lemma 10.86.9, projective modules are Mittag-Leffler.

We also want to add to our list of examples power series rings over a Noetherian ring R . This will be a consequence of the following lemma.

Lemma 10.88.2. *Let M be a flat R -module. The following are equivalent*

- (1) M is Mittag-Leffler, and
- (2) if F is a finite free R -module and $x \in F \otimes_R M$, then there exists a smallest submodule F' of F such that $x \in F' \otimes_R M$.

Proof. The implication (1) \Rightarrow (2) is a special case of Lemma 10.86.6. Assume (2). By Theorem 10.78.4 we can write M as the colimit $M = \text{colim}_{i \in I} M_i$ of a directed system (M_i, f_{ij}) of finite free R -modules. By Remark 10.85.7, it suffices to show that the inverse system $(\text{Hom}_R(M_i, R), \text{Hom}_R(f_{ij}, R))$ is Mittag-Leffler. In other words, fix $i \in I$ and for $j \geq i$ let Q_j be the image of $\text{Hom}_R(M_j, R) \rightarrow \text{Hom}_R(M_i, R)$; we must show that the Q_j stabilize.

Since M_i is free and finite, we can make the identification $\text{Hom}_R(M_i, M_j) = \text{Hom}_R(M_i, R) \otimes_R M_j$ for all j . Using the fact that the M_j are free, it follows that for $j \geq i$, Q_j is the smallest submodule of $\text{Hom}_R(M_i, R)$ such that $f_{ij} \in Q_j \otimes_R M_j$. Under the identification $\text{Hom}_R(M_i, M) = \text{Hom}_R(M_i, R) \otimes_R M$, the canonical map $f_i : M_i \rightarrow M$ is in $\text{Hom}_R(M_i, R) \otimes_R M$. By the assumption on M , there exists a smallest submodule Q of $\text{Hom}_R(M_i, R)$ such that $f_i \in Q \otimes_R M$. We are going to show that the Q_j stabilize to Q .

For $j \geq i$ we have a commutative diagram

$$\begin{array}{ccc} Q_j \otimes_R M_j & \longrightarrow & \text{Hom}_R(M_i, R) \otimes_R M_j \\ \downarrow & & \downarrow \\ Q_j \otimes_R M & \longrightarrow & \text{Hom}_R(M_i, R) \otimes_R M. \end{array}$$

Since $f_{ij} \in Q_j \otimes_R M_j$ maps to $f_i \in \text{Hom}_R(M_i, R) \otimes_R M$, it follows that $f_i \in Q_j \otimes_R M$. Hence, by the choice of Q , we have $Q \subset Q_j$ for all $j \geq i$.

Since the Q_j are decreasing and $Q \subset Q_j$ for all $j \geq i$, to show that the Q_j stabilize to Q it suffices to find a $j \geq i$ such that $Q_j \subset Q$. As an element of

$$\mathrm{Hom}_R(M_i, R) \otimes_R M = \mathrm{colim}_{j \in J} (\mathrm{Hom}_R(M_i, R) \otimes_R M_j),$$

f_i is the colimit of f_{ij} for $j \geq i$, and f_i also lies in the submodule

$$\mathrm{colim}_{j \in J} (Q \otimes_R M_j) \subset \mathrm{colim}_{j \in J} (\mathrm{Hom}_R(M_i, R) \otimes_R M_j).$$

It follows that for some $j \geq i$, f_{ij} lies in $Q \otimes_R M_j$. Since Q_j is the smallest submodule of $\mathrm{Hom}_R(M_i, R)$ with $f_{ij} \in Q_j \otimes_R M_j$, we conclude $Q_j \subset Q$. \square

Lemma 10.88.3. *Let R be a Noetherian ring and A a set. Then $M = R^A$ is a flat and Mittag-Leffler R -module.*

Proof. Combining Lemma 10.87.4 and Proposition 10.87.5 we see that M is flat over R . We show that M satisfies the condition of Lemma 10.88.2. Let F be a free finite R -module. If F' is any submodule of F then it is finitely presented since R is Noetherian. So by Proposition 10.86.3 we have a commutative diagram

$$\begin{array}{ccc} F' \otimes_R M & \longrightarrow & F \otimes_R M \\ \downarrow \cong & & \downarrow \cong \\ (F')^A & \longrightarrow & F^A \end{array}$$

by which we can identify the map $F' \otimes_R M \rightarrow F \otimes_R M$ with $(F')^A \rightarrow F^A$. Hence if $x \in F \otimes_R M$ corresponds to $(x_\alpha) \in F^A$, then the submodule of F' of F generated by the x_α is the smallest submodule of F such that $x \in F' \otimes_R M$. \square

Lemma 10.88.4. *Let R be a Noetherian ring and n a positive integer. Then the R -module $M = R[[t_1, \dots, t_n]]$ is flat and Mittag-Leffler.*

Proof. As an R -module, we have $M = R^A$ for a (countable) set A . Hence this lemma is a special case of Lemma 10.88.3. \square

Example 10.88.5. Non Mittag-Leffler modules.

- (1) By Example 10.86.1 and Proposition 10.86.5, \mathbf{Q} is not a Mittag-Leffler \mathbf{Z} -module.
- (2) We prove below (Theorem 10.90.3) that for a flat and countably generated module, projectivity is equivalent to being Mittag-Leffler. Thus any flat, countably generated, non-projective module M is an example of a non-Mittag-Leffler module. For such an example, see Remark 10.75.3.
- (3) Let k be a field. Let $R = k[[x]]$. The R -module $M = \prod_{n \in \mathbf{N}} R/(x^n)$ is not Mittag-Leffler. Namely, consider the element $\xi = (\xi_1, \xi_2, \xi_3, \dots)$ defined by $\xi_{2^m} = x^{2^{m-1}}$ and $\xi_n = 0$ else, so

$$\xi = (0, x, 0, x^2, 0, 0, 0, x^4, 0, 0, 0, 0, 0, 0, x^8, \dots)$$

Then the annihilator of ξ in $M/x^{2^m}M$ is generated $x^{2^{m-1}}$ for $m \gg 0$. But if M was Mittag-Leffler, then there would exist a finite R -module Q and an element $\xi' \in Q$ such that the annihilator of ξ' in Q/x^lQ agrees with the annihilator of ξ in M/x^lM for all $l \geq 1$, see Proposition 10.85.5 (1). Now you can prove there exists an integer $a \geq 0$ such that the annihilator of ξ' in Q/x^lQ is generated by either x^a or x^{l-a} for all $l \gg 0$ (depending on whether $\xi' \in Q$ is torsion or not). The combination of the above would

give for all $l = 2^m \gg 0$ the equality $a = l/2$ or $l - a = l/2$ which is nonsensical.

- (4) The same argument shows that (x) -adic completion of $\bigoplus_{n \in \mathbb{N}} R/(x^n)$ is not Mittag-Leffler over $R = k[[x]]$ (hint: ξ is actually an element of this completion).
- (5) Let $R = k[a, b]/(a^2, ab, b^2)$. Let S be the finitely presented R -algebra with presentation $S = R[t]/(at - b)$. Then as an R -module S is countably generated and indecomposable (details omitted). On the other hand, R is Artinian local, hence complete local, hence a henselian local ring, see Lemma 10.145.10. If S was Mittag-Leffler as an R -module, then it would be a direct sum of finite R -modules by Lemma 10.145.32. Thus we conclude that S is not Mittag-Leffler as an R -module.

10.89. Countably generated Mittag-Leffler modules

It turns out that countably generated Mittag-Leffler modules have a particularly simple structure.

Lemma 10.89.1. *Let M be an R -module. Write $M = \text{colim}_{i \in I} M_i$ where (M_i, f_{ij}) is a directed system of finitely presented R -modules. If M is Mittag-Leffler and countably generated, then there is a directed countable subset $I' \subset I$ such that $M \cong \text{colim}_{i \in I'} M_i$.*

Proof. Let x_1, x_2, \dots be a countable set of generators for M . For each x_n choose $i \in I$ such that x_n is in the image of the canonical map $f_i : M_i \rightarrow M$; let $I'_0 \subset I$ be the set of all these i . Now since M is Mittag-Leffler, for each $i \in I'_0$ we can choose $j \in I$ such that $j \geq i$ and $f_{ij} : M_i \rightarrow M_j$ factors through $f_{ik} : M_i \rightarrow M_k$ for all $k \geq i$ (condition (3) of Proposition 10.85.5); let I'_1 be the union of I'_0 with all of these j . Since I'_1 is a countable, we can enlarge it to a countable directed set $I'_2 \subset I$. Now we can apply the same procedure to I'_2 as we did to I'_0 to get a new countable set $I'_3 \subset I$. Then we enlarge I'_3 to a countable directed set I'_4 . Continuing in this way—adding in a j as in Proposition 10.85.5 (3) for each $i \in I'_\ell$ if ℓ is odd and enlarging I'_ℓ to a directed set if ℓ is even—we get a sequence of subsets $I'_\ell \subset I$ for $\ell \geq 0$. The union $I' = \bigcup I'_\ell$ satisfies:

- (1) I' is countable and directed;
- (2) each x_n is in the image of $f_i : M_i \rightarrow M$ for some $i \in I'$;
- (3) if $i \in I'$, then there is $j \in I'$ such that $j \geq i$ and $f_{ij} : M_i \rightarrow M_j$ factors through $f_{ik} : M_i \rightarrow M_k$ for all $k \in I$ with $k \geq i$. In particular $\text{Ker}(f_{ik}) \subset \text{Ker}(f_{ij})$ for $k \geq i$.

We claim that the canonical map $\text{colim}_{i \in I'} M_i \rightarrow \text{colim}_{i \in I} M_i = M$ is an isomorphism. By (2) it is surjective. For injectivity, suppose $x \in \text{colim}_{i \in I'} M_i$ maps to 0 in $\text{colim}_{i \in I} M_i$. Representing x by an element $\tilde{x} \in M_i$ for some $i \in I'$, this means that $f_{ik}(\tilde{x}) = 0$ for some $k \in I, k \geq i$. But then by (3) there is $j \in I', j \geq i$, such that $f_{ij}(\tilde{x}) = 0$. Hence $x = 0$ in $\text{colim}_{i \in I'} M_i$. \square

Lemma 10.89.1 implies that a countably generated Mittag-Leffler module M over R is the colimit of a system

$$M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow M_4 \rightarrow \dots$$

with each M_n a finitely presented R -module. To see this argue as in the proof of Lemma 10.83.3 to see that a countable directed partially ordered set has a cofinal

subset isomorphic to (\mathbf{N}, \geq) . Suppose $R = k[x_1, x_2, x_3, \dots]$ and $M = R/(x_i)$. Then M is finitely generated but not finitely presented, hence not Mittag-Leffler (see Example 10.88.1 part (1)). But of course you can write $M = \operatorname{colim}_n M_n$ by taking $M_n = R/(x_1, \dots, x_n)$, hence the condition that you can write M as such a limit does not imply that M is Mittag-Leffler.

Lemma 10.89.2. *Let R be a ring. Let M be an R -module. Assume M is Mittag-Leffler and countably generated. For any R -module map $f : P \rightarrow M$ with P finitely generated there exists an endomorphism $\alpha : M \rightarrow M$ such that*

- (1) $\alpha : M \rightarrow M$ factors through a finitely presented R -module, and
- (2) $\alpha \circ f = f$.

Proof. Write $M = \operatorname{colim}_{i \in I} M_i$ as a directed colimit of finitely presented R -modules with I countable, see Lemma 10.89.1. The transition maps are denoted f_{ij} and we use $f_i : M_i \rightarrow M$ to denote the canonical maps into M . Set $N = \prod_{s \in I} M_s$. Denote

$$M_i^* = \operatorname{Hom}_R(M_i, N) = \prod_{s \in I} \operatorname{Hom}_R(M_i, M_s)$$

so that (M_i^*) is an inverse system of R -modules over I . Note that $\operatorname{Hom}_R(M, N) = \lim M_i^*$. As M is Mittag-Leffler, we find for every $i \in I$ an index $k(i) \geq i$ such that

$$E_i := \bigcap_{i' \geq i} \operatorname{Im}(M_{i'}^* \rightarrow M_i^*) = \operatorname{Im}(M_{k(i)}^* \rightarrow M_i^*)$$

Choose and fix $j \in I$ such that $\operatorname{Im}(P \rightarrow M) \subset \operatorname{Im}(M_j \rightarrow M)$. This is possible as P is finitely generated. Set $k = k(j)$. Let $x = (0, \dots, 0, \operatorname{id}_{M_k}, 0, \dots, 0) \in M_k^*$ and note that this maps to $y = (0, \dots, 0, f_{jk}, 0, \dots, 0) \in M_j^*$. By our choice of k we see that $y \in E_j$. By Example 10.83.2 the transition maps $E_i \rightarrow E_j$ are surjective for each $i \geq j$ and $\lim E_i = \lim M_i^* = \operatorname{Hom}_R(M, N)$. Hence Lemma 10.83.3 guarantees there exists an element $z \in \operatorname{Hom}_R(M, N)$ which maps to y in $E_j \subset M_j^*$. Let z_k be the k th component of z . Then $z_k : M \rightarrow M_k$ is a homomorphism such that

$$\begin{array}{ccc} M & \xrightarrow{z_k} & M_k \\ \uparrow f_j & \nearrow f_{jk} & \\ M_j & & \end{array}$$

commutes. Let $\alpha : M \rightarrow M$ be the composition $f_k \circ z_k : M \rightarrow M_k \rightarrow M$. Then α factors through a finitely presented module by construction and $\alpha \circ f_j = f_j$. Since the image of f is contained in the image of f_j this also implies that $\alpha \circ f = f$. \square

We will see later (see Lemma 10.145.32) that Lemma 10.89.2 means that a countably generated Mittag-Leffler module over a henselian local ring is a direct sum of finitely presented modules.

10.90. Characterizing projective modules

The goal of this section is to prove that a module is projective if and only if it is flat, Mittag-Leffler, and a direct sum of countably generated modules (Theorem 10.90.3 below).

Lemma 10.90.1. *Let M be an R -module. If M is flat, Mittag-Leffler, and countably generated, then M is projective.*

Proof. By Lazard's theorem (Theorem 10.78.4), we can write $M = \operatorname{colim}_{i \in I} M_i$ for a directed system of finite free R -modules (M_i, f_{ij}) indexed by a set I . By Lemma 10.89.1, we may assume I is countable. Now let

$$0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3 \rightarrow 0$$

be an exact sequence of R -modules. We must show that applying $\operatorname{Hom}_R(M, -)$ preserves exactness. Since M_i is finite free,

$$0 \rightarrow \operatorname{Hom}_R(M_i, N_1) \rightarrow \operatorname{Hom}_R(M_i, N_2) \rightarrow \operatorname{Hom}_R(M_i, N_3) \rightarrow 0$$

is exact for each i . Since M is Mittag-Leffler, $(\operatorname{Hom}_R(M_i, N_1))$ is a Mittag-Leffler inverse system. So by Lemma 10.83.4,

$$0 \rightarrow \lim_{i \in I} \operatorname{Hom}_R(M_i, N_1) \rightarrow \lim_{i \in I} \operatorname{Hom}_R(M_i, N_2) \rightarrow \lim_{i \in I} \operatorname{Hom}_R(M_i, N_3) \rightarrow 0$$

is exact. But for any R -module N there is a functorial isomorphism $\operatorname{Hom}_R(M, N) \cong \lim_{i \in I} \operatorname{Hom}_R(M_i, N)$, so

$$0 \rightarrow \operatorname{Hom}_R(M, N_1) \rightarrow \operatorname{Hom}_R(M, N_2) \rightarrow \operatorname{Hom}_R(M, N_3) \rightarrow 0$$

is exact. \square

Remark 10.90.2. Lemma 10.90.1 does not hold without the countable generation assumption. For example, the \mathbf{Z} -module $M = \mathbf{Z}[[x]]$ is flat and Mittag-Leffler but not projective. It is Mittag-Leffler by Lemma 10.88.4. Subgroups of free abelian groups are free, hence a projective \mathbf{Z} -module is in fact free and so are its submodules. Thus to show M is not projective it suffices to produce a non-free submodule. Fix a prime p and consider the submodule N consisting of power series $f(x) = \sum a_i x^i$ such that for every integer $m \geq 1$, p^m divides a_i for all but finitely many i . Then $\sum a_i p^i x^i$ is in N for all $a_i \in \mathbf{Z}$, so N is uncountable. Thus if N were free it would have uncountable rank and the dimension of N/pN over \mathbf{Z}/p would be uncountable. This is not true as the elements $x^i \in N/pN$ for $i \geq 0$ span N/pN .

Theorem 10.90.3. *Let M be an R -module. Then M is projective if and only if it satisfies:*

- (1) M is flat,
- (2) M is Mittag-Leffler,
- (3) M is a direct sum of countably generated R -modules.

Proof. First suppose M is projective. Then M is a direct summand of a free module, so M is flat and Mittag-Leffler since these properties pass to direct summands. By Kaplansky's theorem (Theorem 10.81.5), M satisfies (3).

Conversely, suppose M satisfies (1)-(3). Since being flat and Mittag-Leffler passes to direct summands, M is a direct sum of flat, Mittag-Leffler, countably generated R -modules. Lemma 10.90.1 implies M is a direct sum of projective modules. Hence M is projective. \square

Lemma 10.90.4. *Let $f : M \rightarrow N$ be a universally injective map of R -modules. Suppose M is a direct sum of countably generated R -modules, and suppose N is flat and Mittag-Leffler. Then M is projective.*

Proof. By Lemmas 10.79.7 and 10.86.7, M is flat and Mittag-Leffler, so the conclusion follows from Theorem 10.90.3. \square

Lemma 10.90.5. *Let R be a Noetherian ring and let M be a R -module. Suppose M is a direct sum of countably generated R -modules, and suppose there is a universally injective map $M \rightarrow R[[t_1, \dots, t_n]]$ for some n . Then M is projective.*

Proof. Follows from Lemmas 10.90.4 and 10.88.4. \square

10.91. Ascending properties of modules

All of the properties of a module in Theorem 10.90.3 ascend along arbitrary ring maps:

Lemma 10.91.1. *Let $R \rightarrow S$ be a ring map. Let M be an R -module. Then:*

- (1) *If M is flat, then the S -module $M \otimes_R S$ is flat.*
- (2) *If M is Mittag-Leffler, then the S -module $M \otimes_R S$ is Mittag-Leffler.*
- (3) *If M is a direct sum of countably generated R -modules, then the S -module $M \otimes_R S$ is a direct sum of countably generated S -modules.*
- (4) *If M is projective, then the S -module $M \otimes_R S$ is projective.*

Proof. All are obvious except (2). For this, use formulation (3) of being Mittag-Leffler from Proposition 10.85.5 and the fact that tensoring commutes with taking colimits. \square

10.92. Descending properties of modules

We address the faithfully flat descent of the properties from Theorem 10.90.3 that characterize projectivity. In the presence of flatness, the property of being a Mittag-Leffler module descends:

Lemma 10.92.1. *Let $R \rightarrow S$ be a faithfully flat ring map. Let M be an R -module. If the S -module $M \otimes_R S$ is flat and Mittag-Leffler, then M is flat and Mittag-Leffler.*

Proof. By Lemma 10.80.2, flatness descends, so M is flat. Thus by Lazard's theorem (Theorem 10.78.4) we can write $M = \operatorname{colim}_{i \in I} M_i$ where (M_i, f_{ij}) is a directed system of free finite R -modules. According to Remark 10.85.7, to prove M is Mittag-Leffler it is enough to show that $(\operatorname{Hom}_R(M_i, R))$ is a Mittag-Leffler inverse system.

Since tensoring commutes with colimits, $M \otimes_R S = \operatorname{colim}(M_i \otimes_R S)$. Since $M \otimes_R S$ is Mittag-Leffler this means $(\operatorname{Hom}_S(M_i \otimes_R S, S))$ is a Mittag-Leffler inverse system. So for every $i \in I$, the family $\operatorname{Im}(\operatorname{Hom}_S(M_j \otimes_R S, S) \rightarrow \operatorname{Hom}_S(M_i \otimes_R S, S))$ for $j \geq i$ stabilizes. Because M_i is free and finite there is a functorial isomorphism $\operatorname{Hom}_S(M_i \otimes_R S, S) \cong \operatorname{Hom}_R(M_i, R) \otimes_R S$, and because $R \rightarrow S$ is faithfully flat, tensoring by S commutes with taking the image of a module map. Thus we find that for every $i \in I$, the family $\operatorname{Im}(\operatorname{Hom}_R(M_j, R) \rightarrow \operatorname{Hom}_R(M_i, R)) \otimes_R S$ for $j \geq i$ stabilizes. But if N is an R -module and $N' \subset N$ a submodule such that $N' \otimes_R S = N \otimes_R S$, then $N' = N$ by faithful flatness of S . We conclude that for every $i \in I$, the family $\operatorname{Im}(\operatorname{Hom}_R(M_j, R) \rightarrow \operatorname{Hom}_R(M_i, R))$ for $j \geq i$ stabilizes. So M is Mittag-Leffler. \square

At this point the faithfully flat descent of countably generated projective modules follows easily.

Lemma 10.92.2. *Let $R \rightarrow S$ be a faithfully flat ring map. Let M be an R -module. If the S -module $M \otimes_R S$ is countably generated and projective, then M is countably generated and projective.*

Proof. Follows from Lemma 10.92.1, the fact that countable generation descends, and Theorem 10.90.3. \square

All that remains is to use dévissage to reduce descent of projectivity in the general case to the countably generated case. First, two simple lemmas.

Lemma 10.92.3. *Let $R \rightarrow S$ be a ring map, let M be an R -module, and let Q be a countably generated S -submodule of $M \otimes_R S$. Then there exists a countably generated R -submodule P of M such that $\text{Im}(P \otimes_R S \rightarrow M \otimes_R S)$ contains Q .*

Proof. Let y_1, y_2, \dots be generators for Q and write $y_j = \sum_k x_{jk} \otimes s_{jk}$ for some $x_{jk} \in M$ and $s_{jk} \in S$. Then take P be the submodule of M generated by the x_{jk} . \square

Lemma 10.92.4. *Let $R \rightarrow S$ be a ring map, and let M be an R -module. Suppose $M \otimes_R S = \bigoplus_{i \in I} Q_i$ is a direct sum of countably generated S -modules Q_i . If N is a countably generated submodule of M , then there is a countably generated submodule N' of M such that $N' \supset N$ and $\text{Im}(N' \otimes_R S \rightarrow M \otimes_R S) = \bigoplus_{i \in I'} Q_i$ for some subset $I' \subset I$.*

Proof. Let $N'_0 = N$. We construct by induction an increasing sequence of countably generated submodules $N'_\ell \subset M$ for $\ell = 0, 1, 2, \dots$ such that: if I'_ℓ is the set of $i \in I$ such that the projection of $\text{Im}(N'_\ell \otimes_R S \rightarrow M \otimes_R S)$ onto Q_i is nonzero, then $\text{Im}(N'_{\ell+1} \otimes_R S \rightarrow M \otimes_R S)$ contains Q_i for all $i \in I'_\ell$. To construct $N'_{\ell+1}$ from N'_ℓ , let Q be the sum of (the countably many) Q_i for $i \in I'_\ell$, choose P as in Lemma 10.92.3, and then let $N'_{\ell+1} = N'_\ell + P$. Having constructed the N'_ℓ , just take $N' = \bigcup_\ell N'_\ell$ and $I' = \bigcup_\ell I'_\ell$. \square

Theorem 10.92.5. *Let $R \rightarrow S$ be a faithfully flat ring map. Let M be an R -module. If the S -module $M \otimes_R S$ is projective, then M is projective.*

Proof. We are going to construct a Kaplansky dévissage of M to show that it is a direct sum of projective modules and hence projective. By Theorem 10.81.5 we can write $M \otimes_R S = \bigoplus_{i \in I} Q_i$ as a direct sum of countably generated S -modules Q_i . Choose a well-ordering on M . By transfinite induction we are going to define an increasing family of submodules M_α of M , one for each ordinal α , such that $M_\alpha \otimes_R S$ is a direct sum of some subset of the Q_i .

For $\alpha = 0$ let $M_0 = 0$. If α is a limit ordinal and M_β has been defined for all $\beta < \alpha$, then define $M_\alpha = \bigcup_{\beta < \alpha} M_\beta$. Since each $M_\beta \otimes_R S$ for $\beta < \alpha$ is a direct sum of a subset of the Q_i , the same will be true of $M_\alpha \otimes_R S$. If $\alpha + 1$ is a successor ordinal and M_α has been defined, then define $M_{\alpha+1}$ as follows. If $M_\alpha = M$, then let $M_{\alpha+1} = M$. Otherwise choose the smallest $x \in M$ (with respect to the fixed well-ordering) such that $x \notin M_\alpha$. Since S is flat over R , $(M/M_\alpha) \otimes_R S = M \otimes_R S / M_\alpha \otimes_R S$, so since $M_\alpha \otimes_R S$ is a direct sum of some Q_i , the same is true of $(M/M_\alpha) \otimes_R S$. By Lemma 10.92.4, we can find a countably generated R -submodule P of M/M_α containing the image of x in M/M_α and such that $P \otimes_R S$ (which equals $\text{Im}(P \otimes_R S \rightarrow M \otimes_R S)$ since S is flat over R) is a direct sum of some Q_i . Since $M \otimes_R S = \bigoplus_{i \in I} Q_i$ is projective and projectivity passes to direct summands, $P \otimes_R S$ is also projective. Thus by Lemma 10.92.2, P is projective. Finally we define $M_{\alpha+1}$ to be the preimage of P in M , so that $M_{\alpha+1}/M_\alpha = P$ is countably generated and projective. In particular M_α is a direct summand of $M_{\alpha+1}$ since projectivity of $M_{\alpha+1}/M_\alpha$ implies the sequence $0 \rightarrow M_\alpha \rightarrow M_{\alpha+1} \rightarrow M_{\alpha+1}/M_\alpha \rightarrow 0$ splits.

Transfinite induction on M (using the fact that we constructed $M_{\alpha+1}$ to contain the smallest $x \in M$ not contained in M_α) shows that each $x \in M$ is contained in some M_α . Thus, there is some large enough ordinal S satisfying: for each $x \in M$ there is $\alpha \in S$ such that $x \in M_\alpha$. This means $(M_\alpha)_{\alpha \in S}$ satisfies property (1) of a Kaplansky dévissage of M . The other properties are clear by construction. We conclude $M = \bigoplus_{\alpha+1 \in S} M_{\alpha+1}/M_\alpha$. Since each $M_{\alpha+1}/M_\alpha$ is projective by construction, M is projective. \square

10.93. Completion

Suppose that R is a ring and I is an ideal. We define the *completion of R with respect to I* to be the limit

$$R^\wedge = \lim_n R/I^n.$$

An element of R^\wedge is simply given by a sequence of elements $f_n \in R/I^n$ such that $f_n \equiv f_{n+1} \pmod{I^n}$ for all n . Similarly, if M is an R -module then we define the *completion of M with respect to I* to be the limit

$$M^\wedge = \lim_n M/I^n M.$$

An element of M^\wedge is simply given by a sequence of elements $m_n \in M/I^n M$ such that $m_n \equiv m_{n+1} \pmod{I^n M}$ for all n . From this description it is clear that there are always canonical maps

$$M \longrightarrow M^\wedge, \quad \text{and} \quad M \otimes_R R^\wedge \longrightarrow M^\wedge.$$

Moreover, given a map $\varphi : M \rightarrow N$ of modules we get an induced map $\varphi^\wedge : M^\wedge \rightarrow N^\wedge$ on completions making the diagram

$$\begin{array}{ccc} M & \longrightarrow & N \\ \downarrow & & \downarrow \\ M^\wedge & \longrightarrow & N^\wedge \end{array}$$

commute. In general completion is not an exact functor, see Examples, Section 82.8. Here are some initial positive results.

Lemma 10.93.1. *Let R be a ring. Let $I \subset R$ be an ideal. Let $\varphi : M \rightarrow N$ be a map of R -modules.*

- (1) *If $M/IM \rightarrow N/IN$ is surjective, then $M^\wedge \rightarrow N^\wedge$ is surjective.*
- (2) *If $M \rightarrow N$ is surjective, then $M^\wedge \rightarrow N^\wedge$ is surjective.*
- (3) *If $0 \rightarrow K \rightarrow M \rightarrow N \rightarrow 0$ is a short exact sequence of R -modules and N is flat, then $0 \rightarrow K^\wedge \rightarrow M^\wedge \rightarrow N^\wedge \rightarrow 0$ is a short exact sequence.*
- (4) *The map $M \otimes_R R^\wedge \rightarrow M^\wedge$ is surjective for any finite R -module M .*

Proof. Assume $M/IM \rightarrow N/IN$ is surjective. Then the map $M/I^n M \rightarrow N/I^n N$ is surjective for each $n \geq 1$ by Nakayama's lemma. More precisely, apply Lemma 10.19.1 part (11) to the map $M/I^n M \rightarrow N/I^n N$ over the ring R/I^n and the nilpotent ideal I/I^n to see this. Set $K_n = \{x \in M \mid \varphi(x) \in I^n N\}$. Thus we get short exact sequences

$$0 \rightarrow K_n/I^n M \rightarrow M/I^n M \rightarrow N/I^n N \rightarrow 0$$

We claim that the canonical map $K_{n+1}/I^{n+1}M \rightarrow K_n/I^nM$ is surjective. Namely, if $x \in K_n$ write $\varphi(x) = \sum z_j n_j$ with $z_j \in I^n$, $n_j \in N$. By assumption we can write $n_j = \varphi(m_j) + \sum z_{jk} n_{jk}$ with $m_j \in M$, $z_{jk} \in I$ and $n_{jk} \in N$. Hence

$$\varphi(x - \sum z_j m_j) = \sum z_j z_{jk} n_{jk}.$$

This means that $x' = x - \sum z_j m_j \in K_{n+1}$ maps to x which proves the claim. Now we may apply Lemma 10.84.1 to the inverse system of short exact sequences above to see (1). Part (2) is a special case of (1). If the assumptions of (3) hold, then for each n the sequence

$$0 \rightarrow K/I^n K \rightarrow M/I^n M \rightarrow N/I^n N \rightarrow 0$$

is short exact by Lemma 10.38.11. Hence we can directly apply Lemma 10.84.1 to conclude (3) is true. To see (4) choose generators $x_i \in M$, $i = 1, \dots, n$. Then the map $R^{\oplus n} \rightarrow M$, $(a_1, \dots, a_n) \mapsto \sum a_i x_i$ is surjective. Hence by (2) we see $(R^\wedge)^{\oplus n} \rightarrow M^\wedge$, $(a_1, \dots, a_n) \mapsto \sum a_i x_i$ is surjective. Assertion (4) follows from this. \square

Lemma 10.93.2. *Suppose R is Noetherian.*

- (1) *If $N \rightarrow M$ is an injective map of finite R -modules, then the map on completions $N^\wedge \rightarrow M^\wedge$ is injective.*
- (2) *If M is a finite R -module, then $M^\wedge = M \otimes_R R^\wedge$.*

Proof. For the first statement, by the Artin-Rees Lemma 10.49.2, we have a constant c such that $I^n M \cap N$ equals $I^{n-c}(I^c M \cap N) \subset I^{n-c}N$. Thus if $(n_i) \in N^\wedge$ maps to zero in M^\wedge , then each n_i maps to zero in $N/I^{i-c}N$. And hence $n_{i-c} = 0$. Thus $N^\wedge \rightarrow M^\wedge$ is injective.

For the second statement let $0 \rightarrow K \rightarrow R^t \rightarrow M \rightarrow 0$ be the presentation of M corresponding to the generators x_1, \dots, x_t of M . By Lemma 10.93.1 $(R^t)^\wedge \rightarrow M^\wedge$ is surjective, and for any finitely generated R -module the canonical map $M \otimes_R R^\wedge \rightarrow M^\wedge$ is surjective. Hence to prove the second statement it suffices to prove the kernel of $(R^t)^\wedge \rightarrow M^\wedge$ is exactly K^\wedge .

Let $(x_n) \in (R^t)^\wedge$ be in the kernel. Note that each x_n is in the image of the map $K/I^n K \rightarrow (R/I^n)^t$. Choose c such that $(I^n)^t \cap K \subset I^{n-c}K$, which is possible by Artin-Rees (Lemma 10.49.2). For each $n \geq 0$ choose $y_n \in K/I^{n+c}K$ mapping to x_{n+c} , and set $z_n = y_n \bmod I^n K$. The elements z_n satisfy $z_{n+1} - z_n \bmod I^n K = y_{n+1} - y_n \bmod I^n K$, and $y_{n+1} - y_n \in I^{n+c}R^t$ by construction. Hence $z_{n+1} = z_n \bmod I^n K$ by the choice of c above. In other words $(z_n) \in K^\wedge$ maps to (x_n) as desired. \square

Lemma 10.93.3. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal.*

- (1) *The ring map $R \rightarrow R^\wedge$ is flat.*
- (2) *The functor $M \mapsto M^\wedge$ is exact on the category of finitely generated R -modules.*

Proof. Consider $I \otimes_R R^\wedge \rightarrow R \otimes_R R^\wedge = R^\wedge$. According to Lemma 10.93.2 this is identified with $I^\wedge \rightarrow R^\wedge$ and $I^\wedge \rightarrow R^\wedge$ is injective. Part (1) follows from Lemma 10.38.4. Part (2) follows from part (1) and Lemma 10.93.2 part (2). \square

Lemma 10.93.4. *Let R be a Noetherian local ring. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let $I \subset \mathfrak{m}$ be an ideal. The ring map $R \rightarrow R^\wedge$ is faithfully flat. In particular the completion with respect to \mathfrak{m} , namely $\lim_n R/\mathfrak{m}^n$ is faithfully flat.*

Proof. By Lemma 10.93.3 it is flat. The composition $R \rightarrow R^\wedge \rightarrow R/\mathfrak{m}$ where the last map is the projection map $R^\wedge \rightarrow R/I$ combined with $R/I \rightarrow R/\mathfrak{m}$ shows that \mathfrak{m} is in the image of $\text{Spec}(R^\wedge) \rightarrow \text{Spec}(R)$. Hence the map is faithfully flat by Lemma 10.38.14. \square

Definition 10.93.5. Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. We say M is I -adically complete if the map

$$M \longrightarrow M^\wedge = \lim_n M/I^n M$$

is an isomorphism⁴. We say R is I -adically complete if R is complete as an R -module.

It is not true that the completion of an R -module M with respect to I is I -adically complete. For an example see Examples, Section 82.6. Here is a lemma from an unpublished note of Lenstra and de Smit.

Lemma 10.93.6. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. Denote $K_n = \text{Ker}(M^\wedge \rightarrow M/I^n M)$. Then M^\wedge is I -adically complete if and only if K_n is equal to $I^n M^\wedge$ for all $n \geq 1$.*

Proof. The module $I^n M^\wedge$ is contained in K_n . Thus for each $n \geq 1$ there is a canonical exact sequence

$$0 \rightarrow K_n/I^n M^\wedge \rightarrow M^\wedge/I^n M^\wedge \rightarrow M/I^n M \rightarrow 0.$$

As $I^n M^\wedge$ maps onto $I^n M/I^{n+1} M$ we see that $K_{n+1} + I^n M^\wedge = K_n$. Thus the inverse system $\{K_n/I^n M^\wedge\}_{n \geq 1}$ has surjective transition maps. By Lemma 10.84.1 we see that there is a short exact sequence

$$0 \rightarrow \lim_n K_n/I^n M^\wedge \rightarrow (M^\wedge)^\wedge \rightarrow M^\wedge \rightarrow 0$$

Hence M^\wedge is complete if and only if $K_n/I^n M^\wedge = 0$ for all $n \geq 1$. \square

Lemma 10.93.7. *Let R be a ring. Let I be a finitely generated ideal of R . For any R -module M the completion M^\wedge is complete. In particular R^\wedge is complete.*

Proof. Let $K_n = \text{Ker}(M^\wedge \rightarrow M/I^n M)$. By Lemma 10.93.6 we have to show that $K_n = I^n M^\wedge$. Write $I = (f_1, \dots, f_t)$. Let $z \in K_n$. Write $z = (\bar{z}_m)$ with $\bar{z}_m \in M/I^m M$. Choose $z_m \in M$ mapping to \bar{z}_m in $M/I^m M$. Then $z_{m+1} = z_m \bmod I^m$. Write $z_{n+1} = z_n + \delta_n$, $z_{n+2} = z_{n+1} + \delta_{n+1}$, etc. Then $\delta_m \in I^m M$. Thus the infinite sum

$$z = z_n + \delta_n + \delta_{n+1} + \delta_{n+2} + \dots$$

converges in M^\wedge . For $m \geq n$ we have $\delta_m \in I^m M$ hence we can write

$$\delta_m = \sum_{j_1 + \dots + j_t = n} f_1^{j_1} \dots f_t^{j_t} \alpha_{J,m}$$

with $\alpha_{J,m} \in I^{m-n} M$. Our assumption $z \in K_n$ means $z_n \in I^n M$ hence we can also write

$$z_n = \sum_{j_1 + \dots + j_t = n} f_1^{j_1} \dots f_t^{j_t} \alpha_J$$

⁴This includes the condition that $\bigcap I^n M = (0)$.

with $\alpha_J \in M$. Then we can set

$$z_J = \alpha_J + \alpha_{J,n} + \alpha_{J,n+1} + \alpha_{J,n+2} + \dots$$

as an element of M^\wedge . By construction $z = \sum_J f_1^{j_1} \dots f_t^{j_t} z_J$. Hence z is an element of $I^n M^\wedge$ as desired. \square

Lemma 10.93.8. *Let R be a Noetherian ring. Let I be an ideal of R . Let M be an R -module. Then the completion M^\wedge of M with respect to I is I -adically complete.*

Proof. This is a special case of Lemma 10.93.7 because I is a finitely generated ideal. \square

Lemma 10.93.9. *Let R be a ring. Let $I \subset R$ be an ideal. Assume*

- (1) R/I is a Noetherian ring,
- (2) I is finitely generated.

Then R^\wedge is a Noetherian ring complete with respect to IR^\wedge .

Proof. By Lemma 10.93.7 we see that R^\wedge is I -adically complete. Hence it is also IR^\wedge -adically complete. Since $R^\wedge/IR^\wedge = R/I$ is Noetherian we see that after replacing R by R^\wedge we may in addition to assumptions (1) and (2) assume that also R is I -adically complete.

Let f_1, \dots, f_t be generators of I . Then there is a surjection of rings $R/I[T_1, \dots, T_t] \rightarrow \bigoplus I^n/I^{n+1}$ mapping T_i to the element $\bar{f}_i \in I/I^2$. Hence $\bigoplus I^n/I^{n+1}$ is a Noetherian ring. Let $J \subset R$ be an ideal. Consider the ideal

$$\bigoplus J \cap I^n / J \cap I^{n+1} \subset \bigoplus I^n / I^{n+1}.$$

Let $\bar{g}_1, \dots, \bar{g}_m$ be generators of this ideal. We may choose \bar{g}_j to be a homogeneous element of degree d_j and we may pick $g_j \in J \cap I^{d_j}$ mapping to $\bar{g}_j \in J \cap I^{d_j} / J \cap I^{d_j+1}$. We claim that g_1, \dots, g_m generate J .

Let $x \in J \cap I^n$. There exist $a_j \in I^{\max(0, n-d_j)}$ such that $x - \sum a_j g_j \in J \cap I^{n+1}$. The reason is that $J \cap I^n / J \cap I^{n+1}$ is equal to $\sum \bar{g}_j I^{n-d_j} / I^{n-d_j+1}$ by our choice of g_1, \dots, g_m . Hence starting with $x \in J$ we can find a sequence of vectors $(a_{1,n}, \dots, a_{m,n})_{n \geq 0}$ with $a_{j,n} \in I^{\max(0, n-d_j)}$ such that

$$x = \sum_{n=0, \dots, N} \sum_{j=1, \dots, m} a_{j,n} g_j \text{ mod } I^{N+1}$$

Setting $A_j = \sum_{n \geq 0} a_{j,n}$ we see that $x = \sum A_j g_j$ as R is complete. Hence J is finitely generated and we win. \square

Lemma 10.93.10. *Let R be a Noetherian ring. Let I be an ideal of R . The completion R^\wedge of R with respect to I is Noetherian.*

Proof. This is a consequence of Lemma 10.93.9. It can also be seen directly as follows. Choose generators f_1, \dots, f_n of I . Consider the map

$$R[[x_1, \dots, x_n]] \longrightarrow R^\wedge, \quad x_i \longmapsto f_i.$$

This is a well defined and surjective ring map (details omitted). Since $R[[x_1, \dots, x_n]]$ is Noetherian (see Lemma 10.30.2) we win. \square

Lemma 10.93.11. *Let R be a ring, let $I \subset R$ be an ideal, and let $R^\wedge = \lim R/I^n$.*

- (1) any element of R^\wedge which maps to a unit of R/I is a unit,
- (2) any element of $1 + I$ maps to an invertible element of R^\wedge ,

- (3) any element of $1 + IR^\wedge$ is invertible in R^\wedge , and
 (4) the ideals IR^\wedge and $\text{Ker}(R^\wedge \rightarrow R/I)$ are contained in the radical of R^\wedge .

Proof. Let $x \in R^\wedge$ map to a unit x_1 in R/I . Then x maps to a unit x_n in R/I^n for every n by Lemma 10.31.3. Hence $y = (x_n^{-1}) \in \lim R/I^n = R^\wedge$ is an inverse to x . Parts (2) and (3) follow immediately from (1). Part (4) follows from (1) and Lemma 10.18.1. \square

Lemma 10.93.12. *Let A be a ring. Let $I = (f_1, \dots, f_r)$ be a finitely generated ideal. If $M \rightarrow \lim M/f_i^n M$ is surjective for each i , then $M \rightarrow \lim M/I^n M$ is surjective.*

Proof. Note that $\lim M/I^n M = \lim M/(f_1^n, \dots, f_r^n)M$ as $I^n \supset (f_1^n, \dots, f_r^n) \supset I^{rn}$. An element ξ of $\lim M/(f_1^n, \dots, f_r^n)M$ can be symbolically written as

$$\xi = \sum_{n \geq 0} \sum_i f_i^n x_{n,i}$$

with $x_{n,i} \in M$. If $M \rightarrow \lim M/f_i^n M$ is surjective, then there is an $x_i \in M$ mapping to $\sum x_{n,i} f_i^n$ in $\lim M/f_i^n M$. Then $x = \sum x_i$ maps to ξ in $\lim M/I^n M$. \square

Lemma 10.93.13. *Let A be a ring. Let $I \subset J \subset A$ be ideals. If M is J -adically complete and I is finitely generated, then M is I -adically complete.*

Proof. Assume M is J -adically complete and I is finitely generated. We have $\bigcap I^n M = 0$ because $\bigcap J^n M = 0$. By Lemma 10.93.12 it suffices to prove the surjectivity of $M \rightarrow \lim M/I^n M$ in case I is generated by a single element. Say $I = (f)$. Let $x_n \in M$ with $x_{n+1} - x_n \in f^n M$. We have to show there exists an $x \in M$ such that $x_n - x \in f^n M$ for all n . As $x_{n+1} - x_n \in J^n M$ and as M is J -adically complete, there exists an element $x \in M$ such that $x_n - x \in J^n M$. Replacing x_n by $x_n - x$ we may assume that $x_n \in J^n M$. To finish the proof we will show that this implies $x_n \in I^n M$. Namely, write $x_n - x_{n+1} = f^n z_n$. Then

$$x_n = f^n(z_n + fz_{n+1} + f^2 z_{n+2} + \dots)$$

The sum $z_n + fz_{n+1} + f^2 z_{n+2} + \dots$ converges in M as $f^c \in J^c$. The sum $f^n(z_n + fz_{n+1} + f^2 z_{n+2} + \dots)$ converges in M to x_n because the partial sums equal $x_n - x_{n+c}$ and $x_{n+c} \in J^{n+c} M$. \square

Lemma 10.93.14. *Let R be a ring. Let I, J be ideals of R . Assume there exist integers $c, d > 0$ such that $I^c \subset J$ and $J^d \subset I$. Then completion with respect to I agrees with completion with respect to J for any R -module. In particular an R -module M is I -adically complete if and only if it is J -adically complete.*

Proof. Consider the system of maps $M/I^n M \rightarrow M/J^{\lfloor n/d \rfloor} M$ and the system of maps $M/J^m M \rightarrow M/I^{\lfloor m/c \rfloor} M$ to get mutually inverse maps between the completions. \square

Lemma 10.93.15. *Let R be a ring. Let I be an ideal of R . Let M be an I -adically complete R -module, and let $K \subset M$ be an R -submodule. The following are equivalent*

- (1) $K = \bigcap (K + I^n M)$ and
 (2) M/K is I -adically complete.

Proof. Set $N = M/K$. By Lemma 10.93.1 the map $M = M^\wedge \rightarrow N^\wedge$ is surjective. Hence $N \rightarrow N^\wedge$ is surjective. It is easy to see that the kernel of $N \rightarrow N^\wedge$ is the module $\bigcap (K + I^n M)/K$. \square

Lemma 10.93.16. *Let R be a ring. Let I be an ideal of R . Let M be an R -module. If (a) R is I -adically complete, (b) M is a finite R -module, and (c) $\bigcap I^n M = (0)$, then M is I -adically complete.*

Proof. By Lemma 10.93.1 the map $M = M \otimes_R R = M \otimes_R R^\wedge \rightarrow M^\wedge$ is surjective. The kernel of this map is $\bigcap I^n M$ hence zero by assumption. Hence $M \cong M^\wedge$ and M is complete. \square

Lemma 10.93.17. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. Assume*

- (1) R is I -adically complete,
- (2) $\bigcap_{n \geq 1} I^n M = (0)$, and
- (3) M/IM is a finite R/I -module.

Then M is a finite R -module.

Proof. Let $x_1, \dots, x_n \in M$ be elements whose images in M/IM generate M/IM as a R/I -module. Denote $M' \subset M$ the R -submodule generated by x_1, \dots, x_n . By Lemma 10.93.1 the map $(M')^\wedge \rightarrow M^\wedge$ is surjective. Since $\bigcap I^n M = 0$ we see in particular that $\bigcap I^n M' = (0)$. Hence by Lemma 10.93.16 we see that M' is complete, and we conclude that $M' \rightarrow M^\wedge$ is surjective. Finally, the kernel of $M \rightarrow M^\wedge$ is zero since it is equal to $\bigcap I^n M = (0)$. Hence we conclude that $M \cong M' \cong M^\wedge$ is finitely generated. \square

Suppose $R \rightarrow S$ is a local homomorphism of local rings (R, \mathfrak{m}) and (S, \mathfrak{n}) . Let S^\wedge be the completion of S with respect to \mathfrak{n} . In general S^\wedge is not the \mathfrak{m} -adic completion of S . If $\mathfrak{n}^t \subset \mathfrak{m}S$ for some $t \geq 1$ then we do have $S^\wedge = \lim S/\mathfrak{m}^n S$ by Lemma 10.93.14. In some cases this even implies that S^\wedge is finite over R^\wedge .

Lemma 10.93.18. *Let $R \rightarrow S$ be a local homomorphism of local rings (R, \mathfrak{m}) and (S, \mathfrak{n}) . Let R^\wedge , resp. S^\wedge be the completion of R , resp. S with respect to \mathfrak{m} , resp. \mathfrak{n} . If \mathfrak{m} and \mathfrak{n} are finitely generated and $\dim_{\kappa(\mathfrak{m})} S/\mathfrak{m}S < \infty$, then*

- (1) S^\wedge is equal to the \mathfrak{m} -adic completion of S , and
- (2) S^\wedge is a finite R^\wedge -module.

Proof. We have $\mathfrak{m}S \subset \mathfrak{n}$ because $R \rightarrow S$ is a local ring map. The assumption $\dim_{\kappa(\mathfrak{m})} S/\mathfrak{m}S < \infty$ implies that $S/\mathfrak{m}S$ is an Artinian ring, see Lemma 10.51.2. Hence has dimension 0, see Lemma 10.59.4, hence $\mathfrak{n} = \sqrt{\mathfrak{m}S}$. This and the fact that \mathfrak{n} is finitely generated implies that $\mathfrak{n}^t \subset \mathfrak{m}S$ for some $t \geq 1$. By Lemma 10.93.14 we see that S^\wedge can be identified with the \mathfrak{m} -adic completion of S . As \mathfrak{m} is finitely generated we see from Lemma 10.93.7 that S^\wedge and R^\wedge are \mathfrak{m} -adically complete. At this point we may apply Lemma 10.93.17 to S^\wedge as an R^\wedge -module to conclude. \square

Lemma 10.93.19. *Let R be a Noetherian ring. Let $R \rightarrow S$ be a finite ring map. Let $\mathfrak{p} \subset R$ be a prime and let $\mathfrak{q}_1, \dots, \mathfrak{q}_m$ be the primes of S lying over \mathfrak{p} (Lemma 10.35.19). Then*

$$R_{\mathfrak{p}}^\wedge \otimes_R S = S_{\mathfrak{q}_1}^\wedge \times \dots \times S_{\mathfrak{q}_m}^\wedge$$

where the local rings $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}_i}$ are completed with respect to their maximal ideals.

Proof. We may replace R by the localization $R_{\mathfrak{p}}$ and S by $S_{\mathfrak{p}} = S \otimes_R R_{\mathfrak{p}}$. Hence we may assume that R is a local Noetherian ring and that $\mathfrak{p} = \mathfrak{m}$ is its maximal ideal. The $\mathfrak{q}_i S_{\mathfrak{q}_i}$ -adic completion $S_{\mathfrak{q}_i}^{\wedge}$ is equal to the \mathfrak{m} -adic completion by Lemma 10.93.18. For every $n \geq 1$ prime ideals of $S/\mathfrak{m}^n S$ are in 1-to-1 correspondence with the maximal ideals $\mathfrak{q}_1, \dots, \mathfrak{q}_m$ of S (by going up for S over R , see Lemma 10.35.20). Hence $S/\mathfrak{m}^n S = \prod S_{\mathfrak{q}_i}/\mathfrak{m}^n S_{\mathfrak{q}_i}$ by Lemma 10.51.6 (using for example Proposition 10.59.6 to see that $S/\mathfrak{m}^n S$ is Artinian). Hence the \mathfrak{m} -adic completion S^{\wedge} of S is equal to $\prod S_{\mathfrak{q}_i}^{\wedge}$. Finally, we have $R^{\wedge} \otimes_R S = S^{\wedge}$ by Lemma 10.93.2. \square

Lemma 10.93.20. *Let R be a ring. Let $I \subset R$ be an ideal. Let $0 \rightarrow K \rightarrow P \rightarrow M \rightarrow 0$ be a short exact sequence of R -modules. If M is flat over R and M/IM is a projective R/I -module, then the sequence of I -adic completions*

$$0 \rightarrow K^{\wedge} \rightarrow P^{\wedge} \rightarrow M^{\wedge} \rightarrow 0$$

is a split exact sequence.

Proof. As M is flat, each of the sequences

$$0 \rightarrow K/I^n K \rightarrow P/I^n P \rightarrow M/I^n M \rightarrow 0$$

is short exact, see Lemma 10.38.11 and the sequence $0 \rightarrow K^{\wedge} \rightarrow P^{\wedge} \rightarrow M^{\wedge} \rightarrow 0$ is a short exact sequence, see Lemma 10.93.1. It suffices to show that we can find splittings $s_n : M/I^n M \rightarrow P/I^n P$ such that $s_{n+1} \bmod I^n = s_n$. We will construct these s_n by induction on n . Pick any splitting s_1 , which exists as M/IM is a projective R/I -module. Assume given s_n for some $n > 0$. Set $P_{n+1} = \{x \in P \mid x \bmod I^n P \in \text{Im}(s_n)\}$. The map $\pi : P_{n+1}/I^{n+1}P_{n+1} \rightarrow M/I^{n+1}M$ is surjective (details omitted). As $M/I^{n+1}M$ is projective as a R/I^{n+1} -module by Lemma 10.74.5 we may choose a section $t : M/I^{n+1}M \rightarrow P_{n+1}/I^{n+1}P_{n+1}$ of π . Setting s_{n+1} equal to the composition of t with the canonical map $P_{n+1}/I^{n+1}P_{n+1} \rightarrow P/I^{n+1}P$ works. \square

10.94. Taking limits of modules

In this section we discuss what happens when we take a limit of modules.

Lemma 10.94.1. *Let A be a ring. Let $I \subset A$ be an ideal. Let (M_n) be an inverse system of A -modules. Set $M = \lim M_n$. If $M_n = M_{n+1}/I^n M_{n+1}$ and I is finitely generated then $M/I^n M = M_n$ and M is I -adically complete.*

Proof. As $M_{n+1} \rightarrow M_n$ is surjective, the map $M \rightarrow M_1$ is surjective. Pick $x_t \in M$, $t \in T$ mapping to generators of M_1 . This gives a map $\bigoplus_{t \in T} A \rightarrow M$. Note that the images of x_t in M_n generate M_n for all n too. Consider the exact sequences

$$0 \rightarrow K_n \rightarrow \bigoplus_{t \in T} A/I^n \rightarrow M_n \rightarrow 0$$

We claim the map $K_{n+1} \rightarrow K_n$ is surjective. Namely, if $y \in K_n$ choose a lift $y' \in \bigoplus_{t \in T} A/I^{n+1}$. Then y' maps to an element of $I^n M_{n+1}$ by our assumption $M_n = M_{n+1}/I^n M_{n+1}$. Hence we can modify our choice of y' by an element of $\bigoplus_{t \in T} I^n/I^{n+1}$ so that y' maps to zero in M_{n+1} . Then $y' \in K_{n+1}$ maps to y . Hence (K_n) is a sequence of modules with surjective transition maps and we obtain an exact sequence

$$0 \rightarrow \lim K_n \rightarrow \left(\bigoplus_{t \in T} A \right)^{\wedge} \rightarrow M \rightarrow 0$$

by Lemma 10.84.1. Fix an integer m . As I is finitely generated, the completion with respect to I is complete (Lemma 10.93.7) which implies that $(\bigoplus_{t \in T} A)^\wedge / I^m (\bigoplus_{t \in T} A)^\wedge = \bigoplus_{t \in T} A / I^m$ (Lemma 10.93.6). We obtain a short exact sequence

$$(\lim K_n) / I^m (\lim K_n) \rightarrow \bigoplus_{t \in T} A / I^m \rightarrow M / I^m M \rightarrow 0$$

Since $\lim K_n \rightarrow K_m$ is surjective we conclude that $M / I^m M = M_m$. It follows in particular that M is I -adically complete. \square

10.95. Criteria for flatness

In this section we prove some important technical lemmas in the Noetherian case. We will (partially) generalize these to the non-Noetherian case in Section 10.124.

Lemma 10.95.1. *Suppose that $R \rightarrow S$ is a local homomorphism of Noetherian local rings. Denote \mathfrak{m} the maximal ideal of R . Let M be a flat R -module and N a finite S -module. Let $u : N \rightarrow M$ be a map of R -modules. If $\bar{u} : N/\mathfrak{m}N \rightarrow M/\mathfrak{m}M$ is injective then u is injective. In this case $M/u(N)$ is flat over R .*

Proof. First we claim that $u_n : N/\mathfrak{m}^n N \rightarrow M/\mathfrak{m}^n M$ is injective for all $n \geq 1$. We proceed by induction, the base case is that $\bar{u} = u_1$ is injective. By our assumption that M is flat over R we have a short exact sequence $0 \rightarrow M \otimes_R \mathfrak{m}^n / \mathfrak{m}^{n+1} \rightarrow M/\mathfrak{m}^{n+1} M \rightarrow M/\mathfrak{m}^n M \rightarrow 0$. Also, $M \otimes_R \mathfrak{m}^n / \mathfrak{m}^{n+1} = M/\mathfrak{m}M \otimes_{R/\mathfrak{m}} \mathfrak{m}^n / \mathfrak{m}^{n+1}$. We have a similar exact sequence $N \otimes_R \mathfrak{m}^n / \mathfrak{m}^{n+1} \rightarrow N/\mathfrak{m}^{n+1} N \rightarrow N/\mathfrak{m}^n N \rightarrow 0$ for N except we do not have the zero on the left. We also have $N \otimes_R \mathfrak{m}^n / \mathfrak{m}^{n+1} = N/\mathfrak{m}N \otimes_{R/\mathfrak{m}} \mathfrak{m}^n / \mathfrak{m}^{n+1}$. Thus the map u_{n+1} is injective as both u_n and the map $\bar{u} \otimes \text{id}_{\mathfrak{m}^n / \mathfrak{m}^{n+1}}$ are.

By Krull's intersection theorem (Lemma 10.49.4) applied to N over the ring S and the ideal $\mathfrak{m}S$ we have $\bigcap \mathfrak{m}^n N = 0$. Thus the injectivity of u_n for all n implies u is injective.

To show that $M/u(N)$ is flat over R , it suffices to show that $I \otimes_R M/u(N) \rightarrow M/u(N)$ is injective for every ideal $I \subset R$, see Lemma 10.38.4. Consider the diagram

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & N/IN & \rightarrow & M/IM & \rightarrow & M/(IN + u(N)) \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 0 & \rightarrow & N & \rightarrow & M & \rightarrow & M/u(N) \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & N \otimes_R I & \rightarrow & M \otimes_R I & \rightarrow & M/u(N) \otimes_R I \rightarrow 0
 \end{array}$$

The arrow $M \otimes_R I \rightarrow M$ is injective. By the snake lemma (Lemma 10.4.1) we see that it suffices to prove that N/IN injects into M/IM . Note that $R/I \rightarrow S/IS$ is a local homomorphism of Noetherian local rings, $N/IN \rightarrow M/IM$ is a map of R/I -modules, N/IN is finite over S/IS , and M/IM is flat over R/I and $u \bmod I : N/IN \rightarrow M/IM$ is injective modulo \mathfrak{m} . Thus we may apply the first part of the proof to $u \bmod I$ and we conclude. \square

Lemma 10.95.2. *Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Denote \mathfrak{m} the maximal ideal of R . Suppose $f \in S$ is a*

nonzerodivisor in $S/\mathfrak{m}S$. Then S/fS is flat over R , and f is a nonzerodivisor in S .

Proof. Follows directly from Lemma 10.95.1. \square

Lemma 10.95.3. *Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Denote \mathfrak{m} the maximal ideal of R . Suppose f_1, \dots, f_c is a sequence of elements of S such that the images $\bar{f}_1, \dots, \bar{f}_c$ form a regular sequence in $S/\mathfrak{m}S$. Then f_1, \dots, f_c is a regular sequence in S and each of the quotients $S/(f_1, \dots, f_i)$ is flat over R .*

Proof. Induction and Lemma 10.95.2. \square

Lemma 10.95.4. *Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Let \mathfrak{m} be the maximal ideal of R . Let M be a finite S -module. Suppose that (a) $M/\mathfrak{m}M$ is a free $S/\mathfrak{m}S$ -module, and (b) M is flat over R . Then M is free and S is flat over R .*

Proof. Let $\bar{x}_1, \dots, \bar{x}_n$ be a basis for the free module $M/\mathfrak{m}M$. Choose $x_1, \dots, x_n \in M$ with x_i mapping to \bar{x}_i . Let $u : S^{\oplus n} \rightarrow M$ be the map which maps the i th standard basis vector to x_i . By Lemma 10.95.1 we see that u is injective. On the other hand, by Nakayama's Lemma 10.19.1 the map is surjective. The lemma follows. \square

Lemma 10.95.5. *Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Let \mathfrak{m} be the maximal ideal of R . Let $0 \rightarrow F_e \rightarrow F_{e-1} \rightarrow \dots \rightarrow F_0$ be a finite complex of finite S -modules. Assume that each F_i is R -flat, and that the complex $0 \rightarrow F_e/\mathfrak{m}F_e \rightarrow F_{e-1}/\mathfrak{m}F_{e-1} \rightarrow \dots \rightarrow F_0/\mathfrak{m}F_0$ is exact. Then $0 \rightarrow F_e \rightarrow F_{e-1} \rightarrow \dots \rightarrow F_0$ is exact, and moreover the module $\text{Coker}(F_1 \rightarrow F_0)$ is R -flat.*

Proof. By induction on e . If $e = 1$, then this is exactly Lemma 10.95.1. If $e > 1$, we see by Lemma 10.95.1 that $F_e \rightarrow F_{e-1}$ is injective and that $C = \text{Coker}(F_e \rightarrow F_{e-1})$ is a finite S -module flat over R . Hence we can apply the induction hypothesis to the complex $0 \rightarrow C \rightarrow F_{e-2} \rightarrow \dots \rightarrow F_0$. We deduce that $C \rightarrow F_{e-2}$ is injective and the exactness of the complex follows, as well as the flatness of the cokernel of $F_1 \rightarrow F_0$. \square

In the rest of this section we prove two versions of what is called the “local criterion of flatness”. Note also the interesting Lemma 10.124.1 below.

Lemma 10.95.6. *Let R be a local ring with maximal ideal \mathfrak{m} and residue field $\kappa = R/\mathfrak{m}$. Let M be an R -module. If $\text{Tor}_1^R(\kappa, M) = 0$, then for every finite length R -module N we have $\text{Tor}_1^R(N, M) = 0$.*

Proof. By descending induction on the length of N . If the length of N is 1, then $N \cong \kappa$ and we are done. If the length of N is more than 1, then we can fit N into a short exact sequence $0 \rightarrow N' \rightarrow N \rightarrow N'' \rightarrow 0$ where N', N'' are finite length R -modules of smaller length. The vanishing of $\text{Tor}_1^R(N, M)$ follows from the vanishing of $\text{Tor}_1^R(N', M)$ and $\text{Tor}_1^R(N'', M)$ (induction hypothesis) and the long exact sequence of Tor groups, see Lemma 10.72.2. \square

Lemma 10.95.7 (Local criterion for flatness). *Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Let \mathfrak{m} be the maximal ideal of R , and let $\kappa = R/\mathfrak{m}$. Let M be a finite S -module. If $\text{Tor}_1^R(\kappa, M) = 0$, then M is flat over R .*

Proof. Let $I \subset R$ be an ideal. By Lemma 10.38.4 it suffices to show that $I \otimes_R M \rightarrow M$ is injective. By Remark 10.72.8 we see that this kernel is equal to $\text{Tor}_1^R(M, R/I)$. By Lemma 10.95.6 we see that $J \otimes_R M \rightarrow M$ is injective for all ideals of finite colength.

Choose $n \gg 0$ and consider the following short exact sequence

$$0 \rightarrow I \cap \mathfrak{m}^n \rightarrow I \oplus \mathfrak{m}^n \rightarrow I + \mathfrak{m}^n \rightarrow 0$$

This is a sub sequence of the short exact sequence $0 \rightarrow R \rightarrow R^{\oplus 2} \rightarrow R \rightarrow 0$. Thus we get the diagram

$$\begin{array}{ccccc} (I \cap \mathfrak{m}^n) \otimes_R M & \longrightarrow & I \otimes_R M \oplus \mathfrak{m}^n \otimes_R M & \longrightarrow & (I + \mathfrak{m}^n) \otimes_R M \\ \downarrow & & \downarrow & & \downarrow \\ M & \longrightarrow & M \oplus M & \longrightarrow & M \end{array}$$

Note that $I + \mathfrak{m}^n$ and \mathfrak{m}^n are ideals of finite colength. Thus a diagram chase shows that $\text{Ker}((I \cap \mathfrak{m}^n) \otimes_R M \rightarrow M) \rightarrow \text{Ker}(I \otimes_R M \rightarrow M)$ is surjective. We conclude in particular that $K = \text{Ker}(I \otimes_R M \rightarrow M)$ is contained in the image of $(I \cap \mathfrak{m}^n) \otimes_R M$ in $I \otimes_R M$. By Artin-Rees, Lemma 10.49.2 we see that K is contained in $\mathfrak{m}^{n-c}(I \otimes_R M)$ for some $c > 0$ and all $n \gg 0$. Since $I \otimes_R M$ is a finite S -module (!) and since S is Noetherian, we see that this implies $K = 0$. Namely, the above implies K maps to zero in the $\mathfrak{m}S$ -adic completion of $I \otimes_R M$. But the map from S to its $\mathfrak{m}S$ -adic completion is faithfully flat by Lemma 10.93.4. Hence $K = 0$, as desired. \square

In the following we often encounter the conditions “ M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$ ”. The following lemma gives some consequences of these conditions (it is a generalization of Lemma 10.95.6).

Lemma 10.95.8. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. If M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$ then*

- (1) $M/I^n M$ is flat over R/I^n for all $n \geq 1$, and
- (2) for any module N which is annihilated by I^m for some $m \geq 0$ we have $\text{Tor}_1^R(N, M) = 0$.

In particular, if I is nilpotent, then M is flat over R .

Proof. Assume M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$. Let N be an R/I -module. Choose a short exact sequence

$$0 \rightarrow K \rightarrow \bigoplus_{i \in I} R/I \rightarrow N \rightarrow 0$$

By the long exact sequence of Tor and the vanishing of $\text{Tor}_1^R(R/I, M)$ we get

$$0 \rightarrow \text{Tor}_1^R(N, M) \rightarrow K \otimes_R M \rightarrow \left(\bigoplus_{i \in I} R/I\right) \otimes_R M \rightarrow N \otimes_R M \rightarrow 0$$

But since K , $\bigoplus_{i \in I} R/I$, and N are all annihilated by I we see that

$$\begin{aligned} K \otimes_R M &= K \otimes_{R/I} M/IM, \\ \left(\bigoplus_{i \in I} R/I\right) \otimes_R M &= \left(\bigoplus_{i \in I} R/I\right) \otimes_{R/I} M/IM, \\ N \otimes_R M &= N \otimes_{R/I} M/IM. \end{aligned}$$

As M/IM is flat over R/I we conclude that

$$0 \rightarrow K \otimes_{R/I} M/IM \rightarrow \left(\bigoplus_{i \in I} R/I \right) \otimes_{R/I} M/IM \rightarrow N \otimes_{R/I} M/IM \rightarrow 0$$

is exact. Combining this with the above we conclude that $\text{Tor}_1^R(N, M) = 0$ for any R -module N annihilated by I .

In particular, if we apply this to the module I/I^2 , then we conclude that the sequence

$$0 \rightarrow I^2 \otimes_R M \rightarrow I \otimes_R M \rightarrow I/I^2 \otimes_R M \rightarrow 0$$

is short exact. This implies that $I^2 \otimes_R M \rightarrow M$ is injective and it implies that $I/I^2 \otimes_{R/I} M/IM = IM/I^2M$.

Let us prove that M/I^2M is flat over R/I^2 . Let $I^2 \subset J$ be an ideal. We have to show that $J/I^2 \otimes_{R/I^2} M/I^2M \rightarrow M/I^2M$ is injective, see Lemma 10.38.4. As M/IM is flat over R/I we know that the map $(I+J)/I \otimes_{R/I} M/IM \rightarrow M/IM$ is injective. The sequence

$$(I \cap J)/I^2 \otimes_{R/I^2} M/I^2M \rightarrow J/I^2 \otimes_{R/I^2} M/I^2M \rightarrow (I+J)/I \otimes_{R/I} M/IM \rightarrow 0$$

is exact, as you get it by tensoring the exact sequence $0 \rightarrow (I \cap J) \rightarrow J \rightarrow (I+J)/I \rightarrow 0$ by M/I^2M . Hence suffices to prove the injectivity of the map $(I \cap J)/I^2 \otimes_{R/I^2} M/I^2M \rightarrow IM/I^2M$. However, the map $(I \cap J)/I^2 \rightarrow I/I^2$ is injective and as M/IM is flat over R/I the map $(I \cap J)/I^2 \otimes_{R/I} M/IM \rightarrow I/I^2 \otimes_{R/I} M/IM$ is injective. Since we have previously seen that $I/I^2 \otimes_{R/I} M/IM = IM/I^2M$ we obtain the desired injectivity.

Hence we have proven that the assumptions imply: (a) $\text{Tor}_1^R(N, M) = 0$ for all N annihilated by I , (b) $I^2 \otimes_R M \rightarrow M$ is injective, and (c) M/I^2M is flat over R/I^2 . Thus we can continue by induction to get the same results for I^n for all $n \geq 1$. \square

Lemma 10.95.9. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module.*

- (1) *If M/IM is flat over R/I and $M \otimes_R I/I^2 \rightarrow IM/I^2M$ is injective, then M/I^2M is flat over R/I^2 .*
- (2) *If M/IM is flat over R/I and $M \otimes_R I^n/I^{n+1} \rightarrow I^nM/I^{n+1}M$ is injective for $n = 1, \dots, k$, then $M/I^{k+1}M$ is flat over R/I^{k+1} .*

Proof. The first statement is a consequence of Lemma 10.95.8 applied with R replaced by R/I^2 and M replaced by M/I^2M using that

$$\text{Tor}_1^{R/I^2}(M/I^2M, R/I) = \text{Ker}(M \otimes_R I/I^2 \rightarrow IM/I^2M),$$

see Remark 10.72.8. The second statement follows in the same manner using induction on n to show that $M/I^{n+1}M$ is flat over R/I^{n+1} for $n = 1, \dots, k$. Here we use that

$$\text{Tor}_1^{R/I^{n+1}}(M/I^{n+1}M, R/I) = \text{Ker}(M \otimes_R I^n/I^{n+1} \rightarrow I^nM/I^{n+1}M)$$

for every n . \square

Lemma 10.95.10 (Variant of the local criterion). *Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Let $I \neq R$ be an ideal in R . Let M be a finite S -module. If $\text{Tor}_1^R(M, R/I) = 0$ and M/IM is flat over R/I , then M is flat over R .*

Proof. First proof: By Lemma 10.95.8 we see that $\text{Tor}_1^R(\kappa, M)$ is zero where κ is the residue field of R . Hence we see that M is flat over R by Lemma 10.95.7.

Second proof: Let \mathfrak{m} be the maximal ideal of R . We will show that $\mathfrak{m} \otimes_R M \rightarrow M$ is injective, and then apply Lemma 10.95.7. Suppose that $\sum f_i \otimes x_i \in \mathfrak{m} \otimes_R M$ and that $\sum f_i x_i = 0$ in M . By the equational criterion for flatness Lemma 10.38.10 applied to M/IM over R/I we see there exist $\bar{a}_{ij} \in R/I$ and $\bar{y}_j \in M/IM$ such that $x_i \bmod IM = \sum_j \bar{a}_{ij} \bar{y}_j$ and $0 = \sum_i (f_i \bmod I) \bar{a}_{ij}$. Let $a_{ij} \in R$ be a lift of \bar{a}_{ij} and similarly let $y_j \in M$ be a lift of \bar{y}_j . Then we see that

$$\begin{aligned} \sum f_i \otimes x_i &= \sum f_i \otimes x_i + \sum f_i a_{ij} \otimes y_j - \sum f_i \otimes a_{ij} y_j \\ &= \sum f_i \otimes (x_i - \sum a_{ij} y_j) + \sum (\sum f_i a_{ij}) \otimes y_j \end{aligned}$$

Since $x_i - \sum a_{ij} y_j \in IM$ and $\sum f_i a_{ij} \in I$ we see that there exists an element in $I \otimes_R M$ which maps to our given element $\sum f_i \otimes x_i$ in $\mathfrak{m} \otimes_R M$. But $I \otimes_R M \rightarrow M$ is injective by assumption (see Remark 10.72.8) and we win. \square

In particular, in the situation of Lemma 10.95.10, suppose that $I = (x)$ is generated by a single element x which is a nonzerodivisor in R . Then $\text{Tor}_1^R(M, R/(x)) = (0)$ if and only if x is a nonzerodivisor on M .

Lemma 10.95.11. *Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let M be an S -module. Assume*

- (1) R is a Noetherian ring,
- (2) S is a Noetherian ring,
- (3) M is a finite S -module, and
- (4) for each $n \geq 1$ the module $M/I^n M$ is flat over R/I^n .

Then for every $\mathfrak{q} \in V(IS)$ the localization $M_{\mathfrak{q}}$ is flat over R . In particular, if S is local and IS is contained in its maximal ideal, then M is flat over R .

Proof. We are going to use Lemma 10.95.10. By assumption M/IM is flat over R/I . Hence it suffices to check that $\text{Tor}_1^R(M, R/I)$ is zero on localization at \mathfrak{q} . By Remark 10.72.8 this Tor group is equal to $K = \text{Ker}(I \otimes_R M \rightarrow M)$. We know for each $n \geq 1$ that the kernel $\text{Ker}(I/I^n \otimes_{R/I^n} M/I^n M \rightarrow M/I^n M)$ is zero. Since there is a module map $I/I^n \otimes_{R/I^n} M/I^n M \rightarrow (I \otimes_R M)/I^{n-1}(I \otimes_R M)$ we conclude that $K \subset I^{n-1}(I \otimes_R M)$ for each n . By the Artin-Rees lemma, and more precisely Lemma 10.49.5 we conclude that $K_{\mathfrak{q}} = 0$, as desired. \square

Lemma 10.95.12. *Let $R \rightarrow R' \rightarrow R''$ be ring maps. Let M be an R -module. Suppose that $M \otimes_R R'$ is flat over R' . Then the natural map $\text{Tor}_1^R(M, R') \otimes_{R'} R'' \rightarrow \text{Tor}_1^R(M, R'')$ is onto.*

Proof. Let F_{\bullet} be a free resolution of M over R . The complex $F_2 \otimes_R R' \rightarrow F_1 \otimes_R R' \rightarrow F_0 \otimes_R R'$ computes $\text{Tor}_1^R(M, R')$. The complex $F_2 \otimes_R R'' \rightarrow F_1 \otimes_R R'' \rightarrow F_0 \otimes_R R''$ computes $\text{Tor}_1^R(M, R'')$. Note that $F_i \otimes_R R' \otimes_{R'} R'' = F_i \otimes_R R''$. Let $K' = \text{Ker}(F_1 \otimes_R R' \rightarrow F_0 \otimes_R R')$ and similarly $K'' = \text{Ker}(F_1 \otimes_R R'' \rightarrow F_0 \otimes_R R'')$. Thus we have an exact sequence

$$0 \rightarrow K' \rightarrow F_1 \otimes_R R' \rightarrow F_0 \otimes_R R' \rightarrow M \otimes_R R' \rightarrow 0.$$

By the assumption that $M \otimes_R R'$ is flat over R' , the sequence $0 \rightarrow K' \otimes_{R'} R'' \rightarrow F_1 \otimes_R R'' \rightarrow F_0 \otimes_R R'' \rightarrow M \otimes_R R'' \rightarrow 0$ is still exact. This means that $K'' =$

$K' \otimes_{R'} R''$. Since $\text{Tor}_1^R(M, R')$ is a quotient of K' and $\text{Tor}_1^R(M, R'')$ is a quotient of K'' we win. \square

Lemma 10.95.13. *Let $R \rightarrow R'$ be a ring map. Let $I \subset R$ be an ideal and $I' = IR'$. Let M be an R -module and set $M' = M \otimes_R R'$. The natural map $\text{Tor}_1^R(R'/I', M) \rightarrow \text{Tor}_1^{R'}(R'/I', M')$ is surjective.*

Proof. Let $F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$ be a free resolution of M over R . Set $F'_i = F_i \otimes_R R'$. The sequence $F'_2 \rightarrow F'_1 \rightarrow F'_0 \rightarrow M' \rightarrow 0$ may no longer be exact at F'_1 . A free resolution of M' over R' therefore looks like

$$F'_2 \oplus F''_2 \rightarrow F'_1 \rightarrow F'_0 \rightarrow M' \rightarrow 0$$

for a suitable free module F''_2 over R' . Next, note that $F_i \otimes_R R'/I' = F'_i/IF'_i = F'_i/I'F'_i$. So the complex $F'_2/I'F'_2 \rightarrow F'_1/I'F'_1 \rightarrow F'_0/I'F'_0$ computes $\text{Tor}_1^R(M, R'/I')$. On the other hand $F'_i \otimes_{R'} R'/I' = F'_i/I'F'_i$ and similarly for F''_2 . Thus the complex $F'_2/I'F'_2 \oplus F''_2/I'F''_2 \rightarrow F'_1/I'F'_1 \rightarrow F'_0/I'F'_0$ computes $\text{Tor}_1^{R'}(M', R'/I')$. Since the vertical map on complexes

$$\begin{array}{ccccc} F'_2/I'F'_2 & \longrightarrow & F'_1/I'F'_1 & \longrightarrow & F'_0/I'F'_0 \\ \downarrow & & \downarrow & & \downarrow \\ F'_2/I'F'_2 \oplus F''_2/I'F''_2 & \longrightarrow & F'_1/I'F'_1 & \longrightarrow & F'_0/I'F'_0 \end{array}$$

clearly induces a surjection on cohomology we win. \square

Lemma 10.95.14. *Let*

$$\begin{array}{ccc} S & \longrightarrow & S' \\ \uparrow & & \uparrow \\ R & \longrightarrow & R' \end{array}$$

be a commutative diagram of local homomorphisms of local Noetherian rings. Let $I \subset R$ be an ideal. Let M be an S -module. Denote $I' = IR'$ and $M' = M \otimes_S S'$. Assume that

- (1) S' is a localization of the tensor product $S \otimes_R R'$,
- (2) M/IM is flat over R/I ,
- (3) $\text{Tor}_1^R(M, R/I) \rightarrow \text{Tor}_1^{R'}(M', R'/I')$ is zero.

Then M' is flat over R' .

Proof. Since S' is a localization of $S \otimes_R R'$ we see that M' is a localization of $M \otimes_R R'$. Note that by Lemma 10.38.6 the module $M/IM \otimes_{R/I} R'/I' = M \otimes_R R'/I'(M \otimes_R R')$ is flat over R'/I' . Hence also $M'/I'M'$ is flat over R'/I' as the localization of a flat module is flat. By Lemma 10.95.10 it suffices to show that $\text{Tor}_1^{R'}(M', R'/I')$ is zero. Since M' is a localization of $M \otimes_R R'$, the last assumption implies that it suffices to show that $\text{Tor}_1^R(M, R/I) \otimes_R R' \rightarrow \text{Tor}_1^{R'}(M \otimes_R R', R'/I')$ is surjective.

By Lemma 10.95.13 we see that $\text{Tor}_1^R(M, R'/I') \rightarrow \text{Tor}_1^{R'}(M \otimes_R R', R'/I')$ is surjective. So now it suffices to show that $\text{Tor}_1^R(M, R/I) \otimes_R R' \rightarrow \text{Tor}_1^R(M, R'/I')$ is surjective. This follows from Lemma 10.95.12 by looking at the ring maps $R \rightarrow R/I \rightarrow R'/I'$ and the module M . \square

Please compare the lemma below to Lemma 10.97.8 (the case of a nilpotent ideal) and Lemma 10.124.8 (the case of finitely presented algebras).

Lemma 10.95.15 (Critère de platitude par fibres; Noetherian case). *Let R, S, S' be Noetherian local rings and let $R \rightarrow S \rightarrow S'$ be local ring homomorphisms. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let M be an S' -module. Assume*

- (1) *The module M is finite over S' .*
- (2) *The module M is not zero.*
- (3) *The module $M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$ -module.*
- (4) *The module M is a flat R -module.*

Then S is flat over R and M is a flat S -module.

Proof. Set $I = \mathfrak{m}S \subset S$. Then we see that M/IM is a flat S/I -module because of (3). Since $\mathfrak{m} \otimes_R S' \rightarrow I \otimes_S S'$ is surjective we see that also $\mathfrak{m} \otimes_R M \rightarrow I \otimes_S M$ is surjective. Consider

$$\mathfrak{m} \otimes_R M \rightarrow I \otimes_S M \rightarrow M.$$

As M is flat over R the composition is injective and so both arrows are injective. In particular $\mathrm{Tor}_1^S(S/I, M) = 0$ see Remark 10.72.8. By Lemma 10.95.10 we conclude that M is flat over S . Note that since $M/\mathfrak{m}_{S'}M$ is not zero by Nakayama's Lemma 10.19.1 we see that actually M is faithfully flat over S by Lemma 10.38.14 (since it forces $M/\mathfrak{m}_S M \neq 0$).

Consider the exact sequence $0 \rightarrow \mathfrak{m} \rightarrow R \rightarrow \kappa \rightarrow 0$. This gives an exact sequence $0 \rightarrow \mathrm{Tor}_1^R(\kappa, S) \rightarrow \mathfrak{m} \otimes_R S \rightarrow I \rightarrow 0$. Since M is flat over S this gives an exact sequence $0 \rightarrow \mathrm{Tor}_1^R(\kappa, S) \otimes_S M \rightarrow \mathfrak{m} \otimes_R M \rightarrow I \otimes_S M \rightarrow 0$. By the above this implies that $\mathrm{Tor}_1^R(\kappa, S) \otimes_S M = 0$. Since M is faithfully flat over S this implies that $\mathrm{Tor}_1^R(\kappa, S) = 0$ and we conclude that S is flat over R by Lemma 10.95.7. \square

10.96. Base change and flatness

Some lemmas which deal with what happens with flatness when doing a base change.

Lemma 10.96.1. *Let*

$$\begin{array}{ccc} S & \longrightarrow & S' \\ \uparrow & & \uparrow \\ R & \longrightarrow & R' \end{array}$$

be a commutative diagram of local homomorphisms of local rings. Assume that S' is a localization of the tensor product $S \otimes_R R'$. Let M be an S -module and set $M' = S' \otimes_S M$.

- (1) *If M is flat over R then M' is flat over R' .*
- (2) *If M' is flat over R' and $R \rightarrow R'$ is flat then M is flat over R .*

In particular we have

- (3) *If S is flat over R then S' is flat over R' .*
- (4) *If $R' \rightarrow S'$ and $R \rightarrow R'$ are flat then S is flat over R .*

Proof. Proof of (1). If M is flat over R , then $M \otimes_R R'$ is flat over R' by Lemma 10.38.6. If $W \subset S \otimes_R R'$ is the multiplicative subset such that $W^{-1}(S \otimes_R R') = S'$ then $M' = W^{-1}(M \otimes_R R')$. Hence M' is flat over R' as the localization of a flat

module, see Lemma 10.38.19 part (5). This proves (1) and in particular, we see that (3) holds.

Proof of (2). Suppose that M' is flat over R' and $R \rightarrow R'$ is flat. By (3) applied to the diagram reflected in the northwest diagonal we see that $S \rightarrow S'$ is flat. Thus $S \rightarrow S'$ is faithfully flat by Lemma 10.38.16. We are going to use the criterion of Lemma 10.38.4 (3) to show that M is flat. Let $I \subset R$ be an ideal. If $I \otimes_R M \rightarrow M$ has a kernel, so does $(I \otimes_R M) \otimes_S S' \rightarrow M \otimes_S S' = M'$. Note that $I \otimes_R R' = IR'$ as $R \rightarrow R'$ is flat, and that

$$(I \otimes_R M) \otimes_S S' = (I \otimes_R R') \otimes_{R'} (M \otimes_S S') = IR' \otimes_{R'} M'.$$

From flatness of M' over R' we conclude that this maps injectively into M' . This concludes the proof of (2), and hence (4) is true as well. \square

10.97. Flatness criteria over Artinian rings

We discuss some flatness criteria for modules over Artinian rings. Note that an Artinian local ring has a nilpotent maximal ideal so that the following two lemmas apply to Artinian local rings.

Lemma 10.97.1. *Let (R, \mathfrak{m}) be a local ring with nilpotent maximal ideal \mathfrak{m} . Let M be a flat R -module. If A is a set and $x_\alpha \in M$, $\alpha \in A$ is a collection of elements of M , then the following are equivalent:*

- (1) $\{\bar{x}_\alpha\}_{\alpha \in A}$ forms a basis for the vector space $M/\mathfrak{m}M$ over R/\mathfrak{m} , and
- (2) $\{x_\alpha\}_{\alpha \in A}$ forms a basis for M over R .

Proof. The implication (2) \Rightarrow (1) is immediate. We will prove the other implication by using induction on n to show that $\{x_\alpha\}_{\alpha \in A}$ forms a basis for $M/\mathfrak{m}^n M$ over R/\mathfrak{m}^n . The case $n = 1$ holds by assumption (1). Assume the statement holds for some $n \geq 1$. By Nakayama's Lemma 10.19.1 the elements x_α generate M , in particular $M/\mathfrak{m}^{n+1}M$. The exact sequence $0 \rightarrow \mathfrak{m}^n/\mathfrak{m}^{n+1} \rightarrow R/\mathfrak{m}^{n+1} \rightarrow R/\mathfrak{m}^n \rightarrow 0$ gives on tensoring with M the exact sequence

$$0 \rightarrow \mathfrak{m}^n M/\mathfrak{m}^{n+1}M \rightarrow M/\mathfrak{m}^{n+1}M \rightarrow M/\mathfrak{m}^n M \rightarrow 0$$

Here we are using that M is flat. Moreover, we have $\mathfrak{m}^n M/\mathfrak{m}^{n+1}M = M/\mathfrak{m}M \otimes_{R/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1}$ by flatness of M again. Now suppose that $\sum f_\alpha x_\alpha = 0$ in $M/\mathfrak{m}^{n+1}M$. Then by induction hypothesis $f_\alpha \in \mathfrak{m}^n$ for each α . By the short exact sequence above we then conclude that $\sum \bar{f}_\alpha \otimes \bar{x}_\alpha$ is zero in $\mathfrak{m}^n/\mathfrak{m}^{n+1} \otimes_{R/\mathfrak{m}} M/\mathfrak{m}M$. Since \bar{x}_α forms a basis we conclude that each of the congruence classes $\bar{f}_\alpha \in \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is zero and we win. \square

Lemma 10.97.2. *Let R be a local ring with nilpotent maximal ideal. Let M be an R -module. The following are equivalent*

- (1) M is flat over R ,
- (2) M is a free R -module, and
- (3) M is a projective R -module.

Proof. Since any projective module is flat (as a direct summand of a free module) and every free module is projective, it suffices to prove that a flat module is free. Let M be a flat module. Let A be a set and let $x_\alpha \in M$, $\alpha \in A$ be elements such that $\bar{x}_\alpha \in M/\mathfrak{m}M$ forms a basis over the residue field of R . By Lemma 10.97.1 the x_α are a basis for M over R and we win. \square

Lemma 10.97.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. Let A be a set and let $x_\alpha \in M$, $\alpha \in A$ be a collection of elements of M . Assume*

- (1) I is nilpotent,
- (2) $\{\bar{x}_\alpha\}_{\alpha \in A}$ forms a basis for M/IM over R/I , and
- (3) $\text{Tor}_1^R(R/I, M) = 0$.

Then M is free on $\{x_\alpha\}_{\alpha \in A}$ over R .

Proof. Let $R, I, M, \{x_\alpha\}_{\alpha \in A}$ be as in the lemma and satisfy assumptions (1), (2), and (3). By Nakayama's Lemma 10.19.1 the elements x_α generate M over R . The assumption $\text{Tor}_1^R(R/I, M) = 0$ implies that we have a short exact sequence

$$0 \rightarrow I \otimes_R M \rightarrow M \rightarrow M/IM \rightarrow 0.$$

Let $\sum f_\alpha x_\alpha = 0$ be a relation in M . By choice of x_α we see that $f_\alpha \in I$. Hence we conclude that $\sum f_\alpha \otimes x_\alpha = 0$ in $I \otimes_R M$. The map $I \otimes_R M \rightarrow I/I^2 \otimes_{R/I} M/IM$ and the fact that $\{x_\alpha\}_{\alpha \in A}$ forms a basis for M/IM implies that $f_\alpha \in I^2$. Hence we conclude that there are no relations among the images of the x_α in M/I^2M . In other words, we see that M/I^2M is free with basis the images of the x_α . Using the map $I \otimes_R M \rightarrow I/I^3 \otimes_{R/I^2} M/I^2M$ we then conclude that $f_\alpha \in I^3$. And so on. Since $I^n = 0$ for some n by assumption (1) we win. \square

Lemma 10.97.4. *Let $\varphi : R \rightarrow R'$ be a ring map. Let $I \subset R$ be an ideal. Let M be an R -module. Assume*

- (1) M/IM is flat over R/I , and
- (2) $R' \otimes_R M$ is flat over R' .

Set $I_2 = \varphi^{-1}(\varphi(I^2)R')$. Then M/I_2M is flat over R/I_2 .

Proof. We may replace R, M , and R' by $R/I_2, M/I_2M$, and $R'/\varphi(I)^2R'$. Then $I^2 = 0$ and φ is injective. By Lemma 10.95.8 and the fact that $I^2 = 0$ it suffices to prove that $\text{Tor}_1^R(R/I, M) = K = \text{Ker}(I \otimes_R M \rightarrow M)$ is zero. Set $M' = M \otimes_R R'$ and $I' = IR'$. By assumption the map $I' \otimes_{R'} M' \rightarrow M'$ is injective. Hence K maps to zero in

$$I' \otimes_{R'} M' = I' \otimes_R M = I' \otimes_{R/I} M/IM.$$

Then $I \rightarrow I'$ is an injective map of R/I -modules. Since M/IM is flat over R/I the map

$$I \otimes_{R/I} M/IM \longrightarrow I' \otimes_{R/I} M/IM$$

is injective. This implies that K is zero in $I \otimes_R M = I \otimes_{R/I} M/IM$ as desired. \square

Lemma 10.97.5. *Let $\varphi : R \rightarrow R'$ be a ring map. Let $I \subset R$ be an ideal. Let M be an R -module. Assume*

- (1) I is nilpotent,
- (2) $R \rightarrow R'$ is injective,
- (3) M/IM is flat over R/I , and
- (4) $R' \otimes_R M$ is flat over R' .

Then M is flat over R .

Proof. Define inductively $I_1 = I$ and $I_{n+1} = \varphi^{-1}(\varphi(I_n)^2R')$ for $n \geq 1$. Note that by Lemma 10.97.4 we find that M/I_nM is flat over R/I_n for each $n \geq 1$. It is clear that $\varphi(I_n) \subset \varphi(I)^{2^n}R'$. Since I is nilpotent we see that $\varphi(I_n) = 0$ for some n . As φ is injective we conclude that $I_n = 0$ for some n and we win. \square

Here is the local Artinian version of the local criterion for flatness.

Lemma 10.97.6. *Let R be an Artinian local ring. Let M be an R -module. Let $I \subset R$ be a proper ideal. The following are equivalent*

- (1) M is flat over R , and
- (2) M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$.

Proof. The implication (1) \Rightarrow (2) follows immediately from the definitions. Assume M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$. By Lemma 10.97.2 this implies that M/IM is free over R/I . Pick a set A and elements $x_\alpha \in M$ such that the images in M/IM form a basis. By Lemma 10.97.3 we conclude that M is free and in particular flat. \square

It turns out that flatness descends along injective homomorphism whose source is an Artinian ring.

Lemma 10.97.7. *Let $R \rightarrow S$ be a ring map. Let M be an R -module. Assume*

- (1) R is Artinian
- (2) $R \rightarrow S$ is injective, and
- (3) $M \otimes_R S$ is a flat S -module.

Then M is a flat R -module.

Proof. First proof: Let $I \subset R$ be the radical of R . Then I is nilpotent and M/IM is flat over R/I as R/I is a product of fields, see Section 10.51. Hence M is flat by an application of Lemma 10.97.5.

Second proof: By Lemma 10.51.6 we may write $R = \prod R_i$ as a finite product of local Artinian rings. This induces similar product decompositions for both R and S . Hence we reduce to the case where R is local Artinian (details omitted).

Assume that $R \rightarrow S$, M are as in the lemma satisfying (1), (2), and (3) and in addition that R is local with maximal ideal \mathfrak{m} . Let A be a set and $x_\alpha \in A$ be elements such that \bar{x}_α forms a basis for $M/\mathfrak{m}M$ over R/\mathfrak{m} . By Nakayama's Lemma 10.19.1 we see that the elements x_α generate M as an R -module. Set $N = S \otimes_R M$ and $I = \mathfrak{m}S$. Then $\{1 \otimes x_\alpha\}_{\alpha \in A}$ is a family of elements of N which form a basis for N/IN . Moreover, since N is flat over S we have $\text{Tor}_1^S(S/I, N) = 0$. Thus we conclude from Lemma 10.97.3 that N is free on $\{1 \otimes x_\alpha\}_{\alpha \in A}$. The injectivity of $R \rightarrow S$ then guarantees that there cannot be a nontrivial relation among the x_α with coefficients in R . \square

Please compare the lemma below to Lemma 10.95.15 (the case of Noetherian local rings) and Lemma 10.124.8 (the case of finitely presented algebras).

Lemma 10.97.8 (Critère de platitude par fibres: Nilpotent case). *Let*

$$\begin{array}{ccc} S & \xrightarrow{\quad} & S' \\ & \swarrow \quad \searrow & \\ & R & \end{array}$$

be a commutative diagram in the category of rings. Let $I \subset R$ be a nilpotent ideal and M an S' -module. Assume

- (1) *The module M/IM is a flat S/IS -module.*
- (2) *The module M is a flat R -module.*

Then M is a flat S -module and $S_{\mathfrak{q}}$ is flat over R for every $\mathfrak{q} \subset S$ such that $M \otimes_S \kappa(\mathfrak{q})$ is nonzero.

Proof. As M is flat over R tensoring with the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow R/I \rightarrow 0$ gives a short exact sequence

$$0 \rightarrow I \otimes_R M \rightarrow M \rightarrow M/IM \rightarrow 0.$$

Note that $I \otimes_R M \rightarrow IS \otimes_S M$ is surjective. Combined with the above this means both maps in

$$I \otimes_R M \rightarrow IS \otimes_S M \rightarrow M$$

are injective. Hence $\text{Tor}_1^S(IS, M) = 0$ (see Remark 10.72.8) and we conclude that M is a flat S -module by Lemma 10.95.8. To finish we need to show that $S_{\mathfrak{q}}$ is flat over R for any prime $\mathfrak{q} \subset S$ such that $M \otimes_S \kappa(\mathfrak{q})$ is nonzero. This follows from Lemma 10.38.14 and 10.38.9. \square

10.98. What makes a complex exact?

Some of this material can be found in the paper [BE73] by Buchsbaum and Eisenbud.

Situation 10.98.1. Here R is a ring, and we have a complex

$$0 \rightarrow R^{n_e} \xrightarrow{\varphi_e} R^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \dots \xrightarrow{\varphi_{i+1}} R^{n_i} \xrightarrow{\varphi_i} R^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \dots \xrightarrow{\varphi_1} R^{n_0}$$

In other words we require $\varphi_i \circ \varphi_{i+1} = 0$ for $i = 1, \dots, e-1$.

Lemma 10.98.2. *In Situation 10.98.1. Suppose R is a local ring with maximal ideal \mathfrak{m} . Suppose that for some i , $e \leq i \leq 1$ some matrix coefficient of the map φ_i is invertible. Then the complex $0 \rightarrow R^{n_e} \rightarrow R^{n_{e-1}} \rightarrow \dots \rightarrow R^{n_0}$ is isomorphic to the direct sum of a complex $0 \rightarrow R^{n_e} \rightarrow \dots \rightarrow R^{n_{i-1}} \rightarrow R^{n_{i-1}-1} \rightarrow \dots \rightarrow R^{n_0}$ and the complex $0 \rightarrow 0 \rightarrow \dots \rightarrow R \rightarrow R \rightarrow 0 \rightarrow \dots \rightarrow 0$ where the map $R \rightarrow R$ is the identity map.*

Proof. The assumption means, after a change of basis of R^{n_i} and $R^{n_{i-1}}$ that the first basis vector of R^{n_i} is mapped via φ_i to the first basis vector of $R^{n_{i-1}}$. Let e_j denote the j th basis vector of R^{n_i} and f_k the k th basis vector of $R^{n_{i-1}}$. Write $\varphi_i(e_j) = \sum a_{jk} f_k$. So $a_{1k} = 0$ unless $k = 1$ and $a_{11} = 1$. Change basis on R^{n_i} again by setting $e'_j = e_j - a_{j1} e_1$ for $j > 1$. After this change of coordinates we have $a_{j1} = 0$ for $j > 1$. Note the image of $R^{n_{i+1}} \rightarrow R^{n_i}$ is contained in the subspace spanned by e_j , $j > 1$. Note also that $R^{n_{i-1}} \rightarrow R^{n_{i-2}}$ has to annihilate f_1 since it is in the image. These conditions and the shape of the matrix (a_{jk}) for φ_i imply the lemma. \square

Let us say that an acyclic complex of the form $\dots \rightarrow 0 \rightarrow R \rightarrow R \rightarrow 0 \rightarrow \dots$ is *trivial*. The lemma above clearly says that any finite complex of finite free modules over a local ring is up to direct sums with trivial complexes the same as a complex all of whose maps have all matrix coefficients in the maximal ideal.

Lemma 10.98.3. *In Situation 10.98.1. Let R be a Artinian local ring. Suppose that $0 \rightarrow R^{n_e} \rightarrow R^{n_{e-1}} \rightarrow \dots \rightarrow R^{n_0}$ is an exact complex. Then the complex is isomorphic to a direct sum of trivial complexes.*

Proof. By induction on the integer $\sum n_i$. Clearly $\text{Ass}(R) = \{\mathfrak{m}\}$. Pick $x \in R$, $x \neq 0$, $\mathfrak{m}x = 0$. Pick a basis vector $e_i \in R^{n_i}$. Since xe_i is not mapped to zero by exactness of the complex we deduce that some matrix coefficient of the map $R^{n_i} \rightarrow R^{n_{i-1}}$ is not in \mathfrak{m} . Lemma 10.98.2 then allows us to decrease $\sum n_i$. \square

Below we define the rank of a map of finite free modules. This is just one possible definition of rank. It is just the definition that works in this section; there are others that may be more convenient in other settings.

Definition 10.98.4. Let R be a ring. Suppose that $\varphi : R^m \rightarrow R^n$ is a map of finite free modules.

- (1) The *rank* of φ is the maximal r such that $\wedge^r \varphi : \wedge^r R^m \rightarrow \wedge^r R^n$ is nonzero.
- (2) We let $I(\varphi) \subset R$ be the ideal generated by the $r \times r$ minors of the matrix of φ , where r is the rank as defined above.

Lemma 10.98.5. *In Situation 10.98.1, suppose the complex is isomorphic to a direct sum of trivial complexes. Then we have*

- (1) *the maps φ_i have rank $r_i = n_i - n_{i+1} + \dots + (-1)^{e-i-1}n_{e-1} + (-1)^{e-i}n_e$,*
- (2) *for all i , $1 \leq i \leq e$ we have $\text{rank}(\varphi_{i+1}) + \text{rank}(\varphi_i) = n_i$,*
- (3) *each $I(\varphi_i) = R$.*

Proof. We may assume the complex is the direct sum of trivial complexes. Then for each i we can split the standard basis elements of R^{n_i} into those that map to a basis element of $R^{n_{i-1}}$ and those that are mapped to zero (and these are mapped onto by basis elements of $R^{n_{i+1}}$). Using descending induction starting with $i = e$ it is easy to prove that there are r_{i+1} -basis elements of R^{n_i} which are mapped to zero and r_i which are mapped to basis elements of $R^{n_{i-1}}$. From this the result follows. \square

Lemma 10.98.6. *Let R be a local Noetherian ring. Suppose that $\varphi : R^m \rightarrow R^n$ is a map of finite free modules. The following are equivalent*

- (1) *φ is injective.*
- (2) *the rank of φ is m and either $I(\varphi) = R$ or it contains a nonzerodivisor.*

Proof. If any matrix coefficient of φ is not in \mathfrak{m} , then we apply Lemma 10.98.2 to write φ as the sum of $1 : R \rightarrow R$ and a map $\varphi' : R^{m-1} \rightarrow R^{n-1}$. It is easy to see that the lemma for φ' implies the lemma for φ . Thus we may assume from the outset that all the matrix coefficients of φ are in \mathfrak{m} .

Suppose φ is injective. We may assume $m > 0$. Let $\mathfrak{q} \in \text{Ass}(R)$. Let $x \in R$ be an element whose annihilator is \mathfrak{q} . Note that φ induces an injective map $xR^m \rightarrow xR^n$ which is isomorphic to the map $\varphi_{\mathfrak{q}} : (R/\mathfrak{q})^m \rightarrow (R/\mathfrak{q})^n$ induced by φ . Since R/\mathfrak{q} is a domain we deduce immediately by localizing to its fraction field that the rank of $\varphi_{\mathfrak{q}}$ is m and that $I(\varphi_{\mathfrak{q}})$ is not the zero ideal. Hence we conclude by Lemma 10.62.17.

Conversely, assume that the rank of φ is m and that $I(\varphi)$ contains a nonzerodivisor x . The rank being m implies $n \geq m$. By Lemma 10.14.4 we can find a map $\psi : R^n \rightarrow R^m$ such that $\psi \circ \varphi = \text{id}_{R^m}$. Thus φ is injective. \square

Lemma 10.98.7. *In Situation 10.98.1. Suppose R is a local Noetherian ring with maximal ideal \mathfrak{m} . Assume $\mathfrak{m} \in \text{Ass}(R)$, in other words R has depth 0. Suppose*

that the complex is exact. In this case the complex is isomorphic to a direct sum of trivial complexes.

Proof. The proof is the same as in Lemma 10.98.3, except using Lemma 10.98.6 to guarantee that $I(\varphi_e) = R$, and hence some matrix coefficient of φ_e is not in \mathfrak{m} . \square

Lemma 10.98.8. *In Situation 10.98.1, suppose R is a local Noetherian ring, and suppose that the complex is exact. Let x be an element of the maximal ideal which is a nonzerodivisor. The complex $0 \rightarrow (R/xR)^{n_e} \rightarrow \dots \rightarrow (R/xR)^{n_1}$ is still exact.*

Proof. Follows easily from the snake lemma. \square

Lemma 10.98.9 (Acyclicity lemma). *Let R be a local Noetherian ring. Let $0 \rightarrow M_e \rightarrow M_{e-1} \rightarrow \dots \rightarrow M_0$ be a complex of finite R -modules. Assume $\text{depth}(M_i) \geq i$. Let i be the largest index such that the complex is not exact at M_i . If $i > 0$ then $\text{Ker}(M_i \rightarrow M_{i-1})/\text{Im}(M_{i+1} \rightarrow M_i)$ has $\text{depth} \geq 1$.*

Proof. Let $H = \text{Ker}(M_i \rightarrow M_{i-1})/\text{Im}(M_{i+1} \rightarrow M_i)$ be the cohomology group in question. We may break the complex into short exact sequences $0 \rightarrow M_e \rightarrow M_{e-1} \rightarrow K_{e-2} \rightarrow 0$, $0 \rightarrow K_j \rightarrow M_j \rightarrow K_{j-1} \rightarrow 0$, for $i+2 \leq j \leq e-2$, $0 \rightarrow K_{i+1} \rightarrow M_{i+1} \rightarrow B_i \rightarrow 0$, $0 \rightarrow K_i \rightarrow M_i \rightarrow M_{i-1}$, and $0 \rightarrow B_i \rightarrow K_i \rightarrow H \rightarrow 0$. We proceed up through these complexes to prove the statements about depths, repeatedly using Lemma 10.69.11. First of all, since $\text{depth}(M_e) \geq e$, and $\text{depth}(M_{e-1}) \geq e-1$ we deduce that $\text{depth}(K_{e-2}) \geq e-1$. At this point the sequences $0 \rightarrow K_j \rightarrow M_j \rightarrow K_{j-1} \rightarrow 0$ for $i+2 \leq j \leq e-2$ imply similarly that $\text{depth}(K_{j-1}) \geq j$ for $i+2 \leq j \leq e-2$. The sequence $0 \rightarrow K_{i+1} \rightarrow M_{i+1} \rightarrow B_i \rightarrow 0$ then shows that $\text{depth}(B_i) \geq i+1$. The sequence $0 \rightarrow K_i \rightarrow M_i \rightarrow M_{i-1}$ shows that $\text{depth}(K_i) \geq 1$ since M_i has $\text{depth} \geq i \geq 1$ by assumption. The sequence $0 \rightarrow B_i \rightarrow K_i \rightarrow H \rightarrow 0$ then implies the result. \square

Proposition 10.98.10. *In Situation 10.98.1, suppose R is a local Noetherian ring. The complex is exact if and only if for all i , $1 \leq i \leq e$ the following two conditions are satisfied:*

- (1) we have $\text{rank}(\varphi_{i+1}) + \text{rank}(\varphi_i) = n_i$, and
- (2) $I(\varphi_i) = R$, or $I(\varphi_i)$ contains a regular sequence of length i .

Proof. This proof is very similar to the proof of Lemma 10.98.6. As in the proof of Lemma 10.98.6 we may assume that all matrix entries of each φ_i are elements of the maximal ideal. We may also assume that $e \geq 1$.

Assume the complex is exact. Let $\mathfrak{q} \in \text{Ass}(R)$. (There is at least one such prime.) Note that the ring $R_{\mathfrak{q}}$ has $\text{depth} 0$. We apply Lemmas 10.98.7 and 10.98.5 to the localized complex over $R_{\mathfrak{q}}$. All of the ideals $I(\varphi_i)_{\mathfrak{q}}$, $e \geq i \geq 1$ are equal to $R_{\mathfrak{q}}$. Thus none of the ideals $I(\varphi_i)$ is contained in \mathfrak{q} . This implies that $I(\varphi_e)I(\varphi_{e-1}) \dots I(\varphi_1)$ is not contained in any of the associated primes of R . By Lemma 10.14.2 we may choose $x \in I(\varphi_e)I(\varphi_{e-1}) \dots I(\varphi_1)$, $x \notin \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(R)$. According to Lemma 10.98.8 the complex $0 \rightarrow (R/xR)^{n_e} \rightarrow \dots \rightarrow (R/xR)^{n_1}$ is exact. By induction on e all the ideals $I(\varphi_i)/xR$ have a regular sequence of length $i-1$. This proves that $I(\varphi_i)$ contains a regular sequence of length i .

Assume the two conditions on the ranks of φ_i and the ideals $I(\varphi_i)$ is satisfied. Note that $I(\varphi_i) \subset \mathfrak{m}$ for all i because of what was said in the first paragraph of the proof. Hence the assumption in particular implies that $\text{depth}(R) \geq e$. By induction on

the dimension of R we may assume the complex is exact when localized at any nonmaximal prime of R . Thus $\text{Ker}(\varphi_i)/\text{Im}(\varphi_{i+1})$ has support $\{\mathfrak{m}\}$ and hence (if nonzero) depth 0. By Lemma 10.98.9 we see that the complex is exact. \square

10.99. Cohen-Macaulay modules

Here we show that Cohen-Macaulay modules have good properties. We postpone using Ext groups to establish the connection with duality and so on.

Definition 10.99.1. Let R be a Noetherian local ring. Let M be a finite R -module. We say M is *Cohen-Macaulay* if $\dim(\text{Support}(M)) = \text{depth}(M)$.

We start with an innocuous observation.

Lemma 10.99.2. *Let $R \rightarrow S$ be a surjective homomorphism of Noetherian local rings. Let N be a finite S -module. Then N is Cohen-Macaulay as an S -module if and only if N is Cohen-Macaulay as an R -module.*

Proof. Omitted. \square

Let R be a local Noetherian ring. Let M be a Cohen-Macaulay module, and let f_1, \dots, f_d be an M -regular sequence with $d = \dim(\text{Support}(M))$. We say that $g \in \mathfrak{m}$ is *good with respect to* (M, f_1, \dots, f_d) if for all $i = 0, 1, \dots, d-1$ we have $\dim(\text{Support}(M) \cap V(g, f_1, \dots, f_i)) = d-i-1$. This is equivalent to the condition that $\dim(\text{Support}(M/(f_1, \dots, f_i)M) \cap V(g)) = d-i-1$ for $i = 0, 1, \dots, d-1$.

Lemma 10.99.3. *Notation and assumptions as above. If g is good with respect to (M, f_1, \dots, f_d) , then (a) g is a nonzerodivisor on M , and (b) M/gM is Cohen-Macaulay with maximal regular sequence f_1, \dots, f_{d-1} .*

Proof. We prove the lemma by induction on d . If $d = 0$, then M is finite and there is no case to which the lemma applies. If $d = 1$, then we have to show that $g : M \rightarrow M$ is injective. The kernel K has support $\{\mathfrak{m}\}$ because by assumption $\dim \text{Supp}(M) \cap V(g) = 0$. Hence K has finite length. Hence $f_1 : K \rightarrow K$ injective implies the length of the image is the length of K , and hence $f_1 K = K$, which by Nakayama's Lemma 10.19.1 implies $K = 0$. Also, $\dim \text{Supp}(M/gM) = 0$ and so M/gM is Cohen-Macaulay of depth 0.

For $d > 1$ we essentially argue in the same way. Let $K \subset M$ be the kernel of multiplication by g . As above $f_1 : K \rightarrow K$ cannot be surjective if $K \neq 0$. Consider the commutative diagram

$$\begin{array}{ccccccc} 0 & \rightarrow & M & \xrightarrow{f_1} & M & \rightarrow & M/f_1M \rightarrow 0 \\ & & \downarrow g & & \downarrow g & & \downarrow g \\ 0 & \rightarrow & M & \xrightarrow{f_1} & M & \rightarrow & M/f_1M \rightarrow 0 \end{array}$$

This shows that the kernel K_1 of $g : M/f_1M \rightarrow M/f_1M$ cannot be zero if K is not zero. But g is good for $(M/f_1M, f_2, \dots, f_d)$, as is easy seen from the definition. We conclude that $K_1 = 0$, and so $K = 0$. From the snake lemma we see that $0 \rightarrow M/gM \rightarrow M/gM \rightarrow M/(f_1, g)M \rightarrow 0$ is exact. By induction, we have that $M/(g, f_1)M$ is Cohen-Macaulay with regular sequence f_2, \dots, f_{d-1} . Thus M/gM is Cohen-Macaulay with regular sequence f_1, \dots, f_{d-1} . \square

Lemma 10.99.4. *Let R be a Noetherian local ring. Let M be a Cohen-Macaulay module over R . Suppose $g \in \mathfrak{m}$ is such that $\dim(\text{Supp}(M) \cap V(g)) = \dim(\text{Supp}(M)) - 1$. Then (a) g is a nonzerodivisor on M , and (b) M/gM is Cohen-Macaulay of depth one less.*

Proof. Choose a M -regular sequence f_1, \dots, f_d with $d = \dim(\text{Supp}(M))$. If g is good with respect to (M, f_1, \dots, f_d) we win by Lemma 10.99.3. In particular the lemma holds if $d = 1$. (The case $d = 0$ does not occur.) Assume $d > 1$. Choose an element $h \in R$ such that (a) h is good with respect to (M, f_1, \dots, f_d) , and (b) $\dim(\text{Supp}(M) \cap V(h, g)) = d - 2$. To see h exists, let $\{\mathfrak{q}_i\}$ be the (finite) set of minimal primes of the closed sets $\text{Supp}(M)$, $\text{Supp}(M) \cap V(f_1, \dots, f_i)$, $i = 1, \dots, d - 1$, and $\text{Supp}(M) \cap V(g)$. None of these \mathfrak{q}_i is equal to \mathfrak{m} and hence we may find $h \in \mathfrak{m}$, $h \notin \mathfrak{q}_i$ by Lemma 10.14.2. It is clear that h satisfies (a) and (b). At this point we may apply Lemma 10.99.3 to conclude that M/hM is Cohen-Macaulay. By (b) we see that the pair $(M/hM, g)$ satisfies the induction hypothesis. Hence $M/(h, g)M$ is Cohen-Macaulay, and $g : M/hM \rightarrow M/hM$ is injective. From this it follows easily that $g : M \rightarrow M$ is injective, by a snake lemma argument. This in its turn implies that $h : M/gM \rightarrow M/gM$ is injective. Combined with the fact that $M/(g, h)M$ is Cohen-Macaulay this finishes the proof. \square

Proposition 10.99.5. *Let R be a Noetherian local ring, with maximal ideal \mathfrak{m} . Let M be a Cohen-Macaulay module over R whose support has dimension d . Suppose that g_1, \dots, g_c are elements of \mathfrak{m} such that $\dim(\text{Supp}(M/(g_1, \dots, g_c)M)) = d - c$. Then g_1, \dots, g_c is an M -regular sequence, and can be extended to a maximal M -regular sequence.*

Proof. Let $Z = \text{Supp}(M) \subset \text{Spec}(R)$. By Lemma 10.59.11 in the chain $Z \supset Z \cap V(g_1) \supset \dots \supset Z \cap V(g_1, \dots, g_c)$ each step decreases the dimension at most by 1. Hence by assumption each step decreases the dimension by exactly 1 each time. Thus we may successively apply Lemma 10.99.4 to the modules $M/(g_1, \dots, g_i)$ and the element g_{i+1} .

To extend g_1, \dots, g_c by one element if $c < d$ we simply choose an element $g_{c+1} \in \mathfrak{m}$ which is not in any of the finitely many minimal primes of $Z \cap V(g_1, \dots, g_c)$, using Lemma 10.14.2. \square

Definition 10.99.6. Let R be a Noetherian local ring. A finite module M over R is called a *maximal Cohen-Macaulay* module if $\text{depth}(M) = \dim(R)$.

In other words, a maximal Cohen-Macaulay module over a Noetherian local ring is a finite module with the largest possible depth over that ring. Equivalently, a maximal Cohen-Macaulay module over a Noetherian local ring R is a Cohen-Macaulay module of dimension equal to the dimension of the ring. In particular, if M is a Cohen-Macaulay R -module with $\text{Spec}(R) = \text{Supp}(M)$, then M is maximal Cohen-Macaulay. Thus the following two lemmas are on maximal Cohen-Macaulay modules.

Lemma 10.99.7. *Let R be a Noetherian local ring. Assume there exists a Cohen-Macaulay module M with $\text{Spec}(R) = \text{Supp}(M)$. Then any maximal chain of ideals $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_n$ has length $n = \dim(R)$.*

Proof. We will prove this by induction on $\dim(R)$. If $\dim(R) = 0$, then the statement is clear. Assume $\dim(R) > 0$. Then $n > 0$. Choose an element $x \in \mathfrak{p}_1$,

with x not in any of the minimal primes of R , and in particular $x \notin \mathfrak{p}_0$. (See Lemma 10.14.2.) Then $\dim(R/xR) = \dim(R) - 1$ by Lemma 10.59.11. The module M/xM is Cohen-Macaulay over R/xR by Proposition 10.99.5 and Lemma 10.99.2. The support of M/xM is $\text{Spec}(R/xR)$ by Lemma 10.39.8. By induction the chain $\mathfrak{p}_1/xR \subset \dots \subset \mathfrak{p}_n/xR$ in R/xR has length $\dim(R/xR) = \dim(R) - 1$. \square

Lemma 10.99.8. *Suppose R is a Noetherian local ring. Assume there exists a Cohen-Macaulay module M with $\text{Spec}(R) = \text{Supp}(M)$. Then for a prime $\mathfrak{p} \subset R$ we have*

$$\dim(R) = \dim(R_{\mathfrak{p}}) + \dim(R/\mathfrak{p}).$$

Proof. Follows immediately from Lemma 10.99.7. \square

Lemma 10.99.9. *Suppose R is a Noetherian local ring. Let M be a Cohen-Macaulay module over R . For any prime $\mathfrak{p} \subset R$ the module $M_{\mathfrak{p}}$ is Cohen-Macaulay over $R_{\mathfrak{p}}$.*

Proof. Choose a maximal chain of primes $\mathfrak{p} = \mathfrak{p}_c \subset \mathfrak{p}_{c-1} \subset \dots \subset \mathfrak{p}_1 \subset \mathfrak{m}$. If we prove the result for $M_{\mathfrak{p}_1}$ over $R_{\mathfrak{p}_1}$, then the lemma will follow by induction on c . Thus we may assume that there is no prime strictly between \mathfrak{p} and \mathfrak{m} .

If $M_{\mathfrak{p}} = 0$, then the lemma holds. If $M_{\mathfrak{p}} \neq 0$, then $\dim(\text{Supp}(M_{\mathfrak{p}})) \leq \dim(M) - 1$ as a chain of primes in the support of $M_{\mathfrak{p}}$ is a chain of primes in the support of M not including \mathfrak{m} . Thus it suffices to show that the depth of $M_{\mathfrak{p}}$ is at least the depth of M minus 1. We will prove this by induction on the depth of M . If the depth of M is 1, then this is trivial. Assume the depth of M is at least 2.
