$$K \otimes_A^L \kappa = K \otimes_A^L A/I \otimes_{A/I}^L \kappa = K_1 \otimes_{A/I}^L \kappa$$

and we get what we want as K_1 has finite tor dimension by Lemma 15.56.2. \square

15.66. Miscellany

Some results which do not fit anywhere else.

Lemma 15.66.1. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let M, N be finite A -modules. Set $M_n = M/I^n M$ and $N_n = N/I^n N$. Then the systems $(\text{Hom}_A(M_n, N_n))$ and $(\text{Isom}_A(M_n, N_n))$ are Mittag-Leffler.*

Proof. Note that $\text{Hom}_A(M_n, N_n) = \text{Hom}_A(M, N_n)$. Choose a presentation

$$A^{\oplus t} \xrightarrow{T} A^{\oplus s} \rightarrow M \rightarrow 0$$

The transpose of T induces a map $\varphi : N^{\oplus s} \rightarrow N^{\oplus t}$ such that

$$\text{Hom}_A(M, N_n) = \varphi^{-1}(I^n N^{\oplus t})/I^n N^{\oplus s}.$$

By Artin-Rees there exists an integer c such that

$$\varphi^{-1}(I^n N^{\oplus t}) = \text{Ker}(\varphi) + I^{n-c} \varphi^{-1}(I^c N^{\oplus t})$$

for all $n \geq c$, see Algebra, Lemma 10.49.3. Thus it is clear that the images of $\text{Hom}_A(M, N_n) \rightarrow \text{Hom}_A(M, N_m)$ stabilize for $n \geq m + c$.

The result for isomorphisms follows from the case of homomorphisms applied to both $(\text{Hom}(M_n, N_n))$ and $(\text{Hom}(N_n, M_n))$ and the following fact: for $n > m > 0$, if we have maps $\alpha : M_n \rightarrow N_n$ and $\beta : N_n \rightarrow M_n$ which induce an isomorphisms $M_m \rightarrow N_m$ and $N_m \rightarrow M_m$, then α and β are isomorphisms. Namely, then $\alpha \circ \beta$

is surjective by Nakayama's lemma (Algebra, Lemma 10.19.1) hence $\alpha \circ \beta$ is an isomorphism by Algebra, Lemma 10.15.4. \square

Lemma 15.66.2. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let M, N be finite A -modules. Set $M_n = M/I^n M$ and $N_n = N/I^n N$. If $M_n \cong N_n$ for all n , then $M^\wedge \cong N^\wedge$ as A^\wedge -modules.*

Proof. By Lemma 15.66.1 the system $(\text{Isom}_A(M_n, N_n))$ is Mittag-Leffler. By assumption each of the sets $\text{Isom}_A(M_n, N_n)$ is nonempty. Hence $\lim \text{Isom}_A(M_n, N_n)$ is nonempty. Since $\lim \text{Isom}_A(M_n, N_n) = \text{Isom}(M^\wedge, N^\wedge)$ (use Algebra, Lemma 10.94.1) we obtain an isomorphism. \square

Lemma 15.66.3. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let M, N be finite A -modules with N annihilated by I . For each $p > 0$ there exists an n such that the map $\text{Ext}_A^p(M, N) \rightarrow \text{Ext}_A^p(I^n M, N)$ is zero.*

Proof. The result is clear for $p = 0$ (with $n = 1$). Choose a short exact sequence $0 \rightarrow K \rightarrow A^{\oplus t} \rightarrow M \rightarrow 0$. For n pick a short exact sequence $0 \rightarrow L \rightarrow A^{\oplus s} \rightarrow I^n M \rightarrow 0$. It is clear that we can construct a map of short exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & L & \longrightarrow & A^{\oplus s} & \longrightarrow & I^n M \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & K & \longrightarrow & A^{\oplus s} & \longrightarrow & M \longrightarrow 0 \end{array}$$

such that $A^{\oplus s} \rightarrow A^{\oplus t}$ has image in $(I^n)^{\oplus t}$. By Artin-Rees (Algebra, Lemma 10.49.2) we see that $L \rightarrow K$ has image contained in $I^{n-c}K$ if $n \geq c$. At this point the exact sequence

$$\text{Hom}_A(A^{\oplus t}, N) \rightarrow \text{Hom}_A(K, N) \rightarrow \text{Ext}_A^1(M, N) \rightarrow 0$$

and the corresponding sequence for $\text{Ext}_A^1(I^n M, N)$ show that the lemma holds for $p = 1$ with $n = c + 1$. Moreover, we see that the result for $p - 1$ and the module K implies the result for p and the module M by the commutativity of the diagram

$$\begin{array}{ccccc} & & \text{Ext}_A^{p-1}(L, N) & \xrightarrow{\cong} & \text{Ext}_A^p(I^n M, N) \\ & \swarrow & & & \downarrow \\ \text{Ext}_A^{p-1}(I^{n-c}K, N) & \longrightarrow & \text{Ext}_A^{p-1}(K, N) & \longrightarrow & \text{Ext}_A^p(M, N) \end{array}$$

for $p > 1$. Some details omitted. \square

Lemma 15.66.4. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let M be a finite A -module. There exists an integer $n > 0$ such that $I^n M \rightarrow M$ factors through the map $I \otimes_A^{\mathbf{L}} M \rightarrow M$ in $D(A)$.*

Proof. Consider the distinguished triangle

$$I \otimes_A^{\mathbf{L}} M \rightarrow M \rightarrow A/I \otimes_A^{\mathbf{L}} M \rightarrow I \otimes_A^{\mathbf{L}} M[1]$$

By the axioms of a triangulated category it suffices to prove that $I^n M \rightarrow A/I \otimes_A^{\mathbf{L}} M$ is zero in $D(A)$ for some n . Choose generators f_1, \dots, f_r of I and let $K = K_\bullet(A, f_1, \dots, f_r)$ be the Koszul complex. and consider the factorization $A \rightarrow K \rightarrow A/I$ of the quotient map. Then we see that it suffices to show that $I^n M \rightarrow K \otimes_A M$ is zero in $D(A)$ for some $n > 0$. Suppose that we have found an $n > 0$ such that

$I^n M \rightarrow K \otimes_A M$ factors through $\tau_{\geq t}(K \otimes_A M)$ in $D(A)$. Then the obstruction to factoring through $\tau_{\geq t+1}(K \otimes_A M)$ is an element in $\text{Ext}^t(I^n M, H_t(K \otimes_A M))$. The finite A -module $H_t(K \otimes_A M)$ is annihilated by I . Then by Lemma 15.66.3 we can after increasing n assume this obstruction element is zero. Repeating this a finite number of times we find n such that $I^n M \rightarrow K \otimes_A M$ factors through $0 = \tau_{\geq r+1}(K \otimes_A M)$ in $D(A)$ and we win. \square

Lemma 15.66.5. *Let R be a Noetherian local ring. Let $I \subset R$ be an ideal and let E be a nonzero module over R/I . If R/I has finite projective dimension and E has finite projective dimension over R/I , then E has finite projective dimension over R and*

$$\text{pd}_R(E) = \text{pd}_R(R/I) + \text{pd}_{R/I}(E)$$

Proof. We will use that, for a finite module, having finite projective dimension over R , resp. R/I is the same as being a perfect module, see discussion following Definition 15.56.1. We see that E has finite projective dimension over R by Lemma 15.56.7. Thus we can apply Auslander-Buchsbaum (Algebra, Proposition 10.107.1) to see that

$$\text{pd}_R(E) + \text{depth}_R(E) = \text{depth}(R), \quad \text{pd}_{R/I}(E) + \text{depth}_{R/I}(E) = \text{depth}(R/I),$$

and

$$\text{pd}_R(R/I) + \text{depth}_R(R/I) = \text{depth}(R)$$

Combined with the trivial observation that $\text{depth}_R(E) = \text{depth}_{R/I}(E)$ this concludes the proof. \square

15.67. Weakly étale ring maps

Most of the results in this section are from the paper [Oli83] by Olivier. See also the related paper [Fer67].

Definition 15.67.1. A ring A is called *absolutely flat* if every A -module is flat over A . A ring map $A \rightarrow B$ is *weakly étale* or *absolutely flat* if both $A \rightarrow B$ and $B \rightarrow B \otimes_A B$ are flat.

For example a localization is weakly étale. An étale ring map is weakly étale. Here is a simple, yet key property.

Lemma 15.67.2. *Let $A \rightarrow B$ be a ring map such that $B \otimes_A B \rightarrow B$ is flat. Let N be a B -module. If N is flat as an A -module, then N is flat as a B -module.*

Proof. Assume N is a flat as an A -module. Then the functor

$$\text{Mod}_B \longrightarrow \text{Mod}_{B \otimes_A B}, \quad N' \mapsto N \otimes_A N'$$

is exact. As $B \otimes_A B \rightarrow B$ is flat we conclude that the functor

$$\text{Mod}_B \longrightarrow \text{Mod}_B, \quad N' \mapsto (N \otimes_A N') \otimes_{B \otimes_A B} B = N \otimes_B N'$$

is exact, hence N is flat over B . \square

Definition 15.67.3. Let A be a ring. Let $d \geq 0$ be an integer. We say that A has *weak dimension* $\leq d$ if every A -module has tor dimension $\leq d$.

Lemma 15.67.4. *Let $A \rightarrow B$ be a weakly étale ring map. If A has weak dimension at most d , then so does B .*

Proof. Let N be a B -module. If $d = 0$, then N is flat as an A -module, hence flat as a B -module by Lemma 15.67.2. Assume $d > 0$. Choose a resolution $F_\bullet \rightarrow N$ by free B -modules. Our assumption implies that $K = \text{Im}(F_d \rightarrow F_{d-1})$ is A -flat, see Lemma 15.51.2. Hence it is B -flat by Lemma 15.67.2. Thus $0 \rightarrow K \rightarrow F_{d-1} \rightarrow \dots \rightarrow F_0 \rightarrow N \rightarrow 0$ is a flat resolution of length d and we see that N has tor dimension at most d . \square

Lemma 15.67.5. *Let A be a ring. The following are equivalent*

- (1) A has weak dimension ≤ 0 ,
- (2) A is absolutely flat, and
- (3) A is reduced and every prime is maximal.

In this case every local ring of A is a field.

Proof. The equivalence of (1) and (2) is immediate. Assume A is absolutely flat. This implies every ideal of A is pure, see Algebra, Definition 10.104.1. Hence every finitely generated ideal is generated by an idempotent by Algebra, Lemma 10.104.5. If $f \in A$, then $(f) = (e)$ for some idempotent $e \in A$ and $D(f) = D(e)$ is open and closed (Algebra, Lemma 10.20.1). This already implies every ideal of A is maximal for example by Algebra, Lemma 10.25.5. Moreover, if f is nilpotent, then $e = 0$ hence $f = 0$. Thus A is reduced.

Assume A is reduced and every prime of A is maximal. Let M be an A -module. Our goal is to show that M is flat. We may write M as a filtered colimit of finite A -modules, hence we may assume M is finite (Algebra, Lemma 10.38.2). There is a finite filtration of M by modules of the form A/I (Algebra, Lemma 10.5.4), hence we may assume that $M = A/I$ (Algebra, Lemma 10.38.12). Thus it suffices to show every ideal of A is pure. Since every local ring of A is a field (by Algebra, Lemma 10.24.1 and the fact that every prime of A is minimal), we see that every ideal $I \subset A$ is radical. Note that every closed subset of $\text{Spec}(A)$ is closed under specialization. Thus every (radical) ideal of A is pure by Algebra, Lemma 10.104.4. \square

Lemma 15.67.6. *A product of fields is an absolutely flat ring.*

Proof. Let K_i be a family of fields. If $f = (f_i) \in \prod K_i$, then the ideal generated by f is the same as the ideal generated by the idempotent $e = (e_i)$ with $e_i = 0, 1$ according to whether f_i is $0, 1$. Thus $D(f) = D(e)$ is open and closed and we conclude by Lemma 15.67.5 and Algebra, Lemma 10.25.5. \square

Lemma 15.67.7. *Let $A \rightarrow B$ and $A \rightarrow A'$ be ring maps. Let $B' = B \otimes_A A'$ be the base change of B .*

- (1) *If $B \otimes_A B \rightarrow B$ is flat, then $B' \otimes_{A'} B' \rightarrow B'$ is flat.*
- (2) *If $A \rightarrow B$ is weakly étale, then $A' \rightarrow B'$ is weakly étale.*

Proof. Assume $B \otimes_A B \rightarrow B$ is flat. The ring map $B' \otimes_{A'} B' \rightarrow B'$ is the base change of $B \otimes_A B \rightarrow B$ by $A \rightarrow A'$. Hence it is flat by Algebra, Lemma 10.38.6. This proves (1). Part (2) follows from (1) and the fact (just used) that the base change of a flat ring map is flat. \square

Lemma 15.67.8. *Let $A \rightarrow B$ be a ring map such that $B \otimes_A B \rightarrow B$ is flat.*

- (1) *If A is an absolutely flat ring, then so is B .*
- (2) *If A is reduced and $A \rightarrow B$ is weakly étale, then B is reduced.*

Proof. Part (1) follows immediately from Lemma 15.67.2 and the definitions. If A is reduced, then there exists an injection $A \rightarrow A' = \prod_{\mathfrak{p} \subset A \text{ minimal}} A_{\mathfrak{p}}$ of A into an absolutely flat ring (Algebra, Lemma 10.24.2 and Lemma 15.67.6). If $A \rightarrow B$ is flat, then the induced map $B \rightarrow B' = B \otimes_A A'$ is injective too. By Lemma 15.67.7 the ring map $A' \rightarrow B'$ is weakly étale. By part (1) we see that B' is absolutely flat. By Lemma 15.67.5 the ring B' is reduced. Hence B is reduced. \square

Lemma 15.67.9. *Let $A \rightarrow B$ and $B \rightarrow C$ be ring maps.*

- (1) *If $B \otimes_A B \rightarrow B$ and $C \otimes_B C \rightarrow C$ are flat, then $C \otimes_A C \rightarrow C$ is flat.*
- (2) *If $A \rightarrow B$ and $B \rightarrow C$ are weakly étale, then $A \rightarrow C$ is weakly étale.*

Proof. Part (1) follows from the factorization

$$C \otimes_A C \longrightarrow C \otimes_B C \longrightarrow C$$

of the multiplication map, the fact that

$$C \otimes_B C = (C \otimes_A C) \otimes_{B \otimes_A B} B,$$

the fact that a base change of a flat map is flat, and the fact that the composition of flat ring maps is flat. See Algebra, Lemmas 10.38.6 and 10.38.3. Part (2) follows from (1) and the fact (just used) that the composition of flat ring maps is flat. \square

Lemma 15.67.10. *Let $A \rightarrow B \rightarrow C$ be ring maps.*

- (1) *If $B \rightarrow C$ is faithfully flat and $C \otimes_A C \rightarrow C$ is flat, then $B \otimes_A B \rightarrow B$ is flat.*
- (2) *If $B \rightarrow C$ is faithfully flat and $A \rightarrow C$ is weakly étale, then $A \rightarrow B$ is weakly étale.*

Proof. Assume $B \rightarrow C$ is faithfully flat and $C \otimes_A C \rightarrow C$ is flat. Consider the commutative diagram

$$\begin{array}{ccc} C \otimes_A C & \longrightarrow & C \\ \uparrow & & \uparrow \\ B \otimes_A B & \longrightarrow & B \end{array}$$

The vertical arrows are flat, the top horizontal arrow is flat. Hence C is flat as a $B \otimes_A B$ -module. The map $B \rightarrow C$ is faithfully flat and $C = B \otimes_B C$. Hence B is flat as a $B \otimes_A B$ -module by Algebra, Lemma 10.38.8. This proves (1). Part (2) follows from (1) and the fact that $A \rightarrow B$ is flat if $A \rightarrow C$ is flat and $B \rightarrow C$ is faithfully flat (Algebra, Lemma 10.38.8). \square

Lemma 15.67.11. *Let A be a ring. Let $B \rightarrow C$ be an A -algebra map of weakly étale A -algebras. Then $B \rightarrow C$ is weakly étale.*

Proof. Write $B \rightarrow C$ as the composition $B \rightarrow B \otimes_A C \rightarrow C$. The first map is flat as the base change of the flat ring map $A \rightarrow C$. The second is the base change of the flat ring map $B \otimes_A B \rightarrow B$ by the ring map $B \otimes_A B \rightarrow B \otimes_A C$, hence flat. Thus $B \rightarrow C$ is flat. The ring map $C \otimes_A C \rightarrow C \otimes_B C$ is surjective, hence an epimorphism. Thus Lemma 15.67.2 implies, that since C is flat over $C \otimes_A C$ it follows that C is flat over $C \otimes_B C$. \square

Lemma 15.67.12. *Let $A \rightarrow B$ be a ring map such that $B \otimes_A B \rightarrow B$ is flat. Then $\Omega_{B/A} = 0$, i.e., B is formally unramified over A .*

Proof. Let $I \subset B \otimes_A B$ be the kernel of the flat surjective map $B \otimes_A B \rightarrow B$. Then I is a pure ideal (Algebra, Definition 10.104.1), so $I^2 = I$ (Algebra, Lemma 10.104.2). Since $\Omega_{B/A} = I/I^2$ (Algebra, Lemma 10.127.13) we obtain the vanishing. This means B is formally unramified over A by Algebra, Lemma 10.141.2. \square

Lemma 15.67.13. *Let $A \rightarrow B$ be a ring map. Then $A \rightarrow B$ is weakly étale in each of the following cases*

- (1) $B = S^{-1}A$ is a localization of A ,
- (2) $A \rightarrow B$ is étale,
- (3) B is a filtered colimit of weakly étale A -algebras.

Proof. An étale ring map is flat and the map $B \otimes_A B \rightarrow B$ is also étale as a map between étale A -algebras (Algebra, Lemma 10.138.9). This proves (2).

Let B_i be a directed system of weakly étale A -algebras. Then $B = \operatorname{colim} B_i$ is flat over A by Algebra, Lemma 10.38.2. Note that the transition maps $B_i \rightarrow B_{i'}$ are flat by Lemma 15.67.11. Hence B is flat over B_i for each i , and we see that B is flat over $B_i \otimes_A B_i$ by Algebra, Lemma 10.38.3. Thus B is flat over $B \otimes_A B = \operatorname{colim} B_i \otimes_A B_i$ by Algebra, Lemma 10.38.5.

Part (1) can be proved directly, but also follows by combining (2) and (3). \square

Lemma 15.67.14. *Let $K \subset L$ be an extension of fields. If $L \otimes_K L \rightarrow L$ is flat, then L is an algebraic separable extension of K .*

Proof. By Lemma 15.67.10 we see that any subfield $K \subset L' \subset L$ the map $L' \otimes_K L' \rightarrow L'$ is flat. Thus we may assume L is a finitely generated field extension of K . In this case the fact that L/K is formally unramified (Lemma 15.67.12) implies that L/K is finite separable, see Algebra, Lemma 10.147.1. \square

Lemma 15.67.15. *Let K be a field. Let $K \rightarrow B$ be a ring map such that $B \otimes_K B \rightarrow B$ is flat. Then B is a filtered colimit of étale K -algebras.*

Proof. A field is absolutely flat ring, hence B is a absolutely flat ring by Lemma 15.67.8. Hence B is reduced and every local ring is a field, see Lemma 15.67.5.

Let $\mathfrak{q} \subset B$ be a prime. The ring map $B \rightarrow B_{\mathfrak{q}}$ is weakly étale, hence $B_{\mathfrak{q}}$ is weakly étale over K (Lemma 15.67.9). Thus $B_{\mathfrak{q}}$ is a separable algebraic extension of K by Lemma 15.67.14.

Let $K \subset A \subset B$ be a finitely generated K -sub algebra. Then every minimal prime $\mathfrak{p} \subset A$ is the image of a prime \mathfrak{q} of B , see Algebra, Lemma 10.29.5. Thus $\kappa(\mathfrak{p})$ as a subfield of $B_{\mathfrak{q}} = \kappa(\mathfrak{q})$ is separable algebraic over K . Hence every generic point of $\operatorname{Spec}(A)$ is closed (Algebra, Lemma 10.34.9). Thus $\dim(A) = 0$. Then A is the product of its local rings, e.g., by Algebra, Proposition 10.59.6. Moreover, since A is reduced, all local rings are equal to their residue fields which are finite separable over K . This means that A is étale over K by Algebra, Lemma 10.138.4 and finishes the proof. \square

Lemma 15.67.16. *Let $A \rightarrow B$ be a ring map. If $A \rightarrow B$ is weakly étale, then $A \rightarrow B$ induces separable algebraic residue field extensions.*

Proof. Let \mathfrak{p} be a prime of A . Then $\kappa(\mathfrak{p}) \rightarrow B \otimes_A \kappa(\mathfrak{p})$ is weakly étale by Lemma 15.67.7. Hence $B \otimes_A \kappa(\mathfrak{p})$ is a filtered colimit of étale $\kappa(\mathfrak{p})$ -algebras by Lemma

15.67.15. Hence for $\mathfrak{q} \subset B$ lying over \mathfrak{p} the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is a filtered colimit of finite separable extensions by Algebra, Lemma 10.138.4. \square

Lemma 15.67.17. *Let A be a ring. The following are equivalent*

- (1) A has weak dimension ≤ 1 ,
- (2) every ideal of A is flat,
- (3) every finitely generated ideal of A is flat,
- (4) every submodule of a flat A -module is flat, and
- (5) every local ring of A is a valuation ring.

Proof. If A has weak dimension ≤ 1 , then the resolution $0 \rightarrow I \rightarrow A \rightarrow A/I \rightarrow 0$ shows that every ideal I is flat by Lemma 15.51.2. Hence (1) \Rightarrow (2).

Assume (4). Let M be an A -module. Choose a surjection $F \rightarrow M$ where F is a free A -module. Then $\text{Ker}(F \rightarrow M)$ is flat by assumption, and we see that M has tor dimension ≤ 1 by Lemma 15.51.5. Hence (4) \Rightarrow (1).

Every ideal is the union of the finitely generated ideals contained in it. Hence (3) implies (2) by Algebra, Lemma 10.38.2. Thus (3) \Leftrightarrow (2).

Assume (2). Suppose that $N \subset M$ with M a flat A -module. We will prove that N is flat. We can write $M = \text{colim } M_i$ with each M_i finite free, see Algebra, Theorem 10.78.4. Setting $N_i \subset M_i$ the inverse image of N we see that $N = \text{colim } N_i$. By Algebra, Lemma 10.38.2. it suffices to prove N_i is flat and we reduce to the case $M = R^{\oplus n}$. In this case the module N has a finite filtration by the submodules $R^{\oplus j} \cap N$ whose subquotients are ideals. By (2) these ideals are flat and hence N is flat by Algebra, Lemma 10.38.12. Thus (2) \Rightarrow (4).

Assume A satisfies (1) and let $\mathfrak{p} \subset A$ be a prime ideal. By Lemmas 15.67.13 and 15.67.4 we see that $A_{\mathfrak{p}}$ satisfies (1). We will show A is a valuation ring if A is a local ring satisfying (3). Let $f \in \mathfrak{m}$ be a nonzero element. Then (f) is a flat nonzero module generated by one element. Hence it is a free A -module by Algebra, Lemma 10.75.4. It follows that f is a nonzerodivisor and A is a domain. If $I \subset A$ is a finitely generated ideal, then we similarly see that I is a finite free A -module, hence (by considering the rank) free of rank 1 and I is a principal ideal. Thus A is a valuation ring by Algebra, Lemma 10.48.15. Thus (1) \Rightarrow (5).

Assume (5). Let $I \subset A$ be a finitely generated ideal. Then $I_{\mathfrak{p}} \subset A_{\mathfrak{p}}$ is a finitely generated ideal in a valuation ring, hence principal (Algebra, Lemma 10.48.15), hence flat. Thus I is flat by Algebra, Lemma 10.38.19. Thus (5) \Rightarrow (3). This finishes the proof of the lemma. \square

Lemma 15.67.18. *Let J be a set. For each $j \in J$ let A_j be a valuation ring with fraction field K_j . Set $A = \prod A_j$ and $K = \prod K_j$. Then A has weak dimension at most 1 and $A \rightarrow K$ is a localization.*

Proof. Let $I \subset A$ be a finitely generated ideal. By Lemma 15.67.17 it suffices to show that I is a flat A -module. Let $I_j \subset A_j$ be the image of I . Observe that $I_j = I \otimes_A A_j$, hence $I \rightarrow \prod I_j$ is surjective by Algebra, Proposition 10.86.2. Thus $I = \prod I_j$. Since A_j is a valuation ring, the ideal I_j is generated by a single element (Algebra, Lemma 10.48.15). Say $I_j = (f_j)$. Then I is generated by the element $f = (f_j)$. Let $e \in A$ be the idempotent which has a 0 or 1 in A_j depending on whether f_j is 0 or 1. Then $f = ge$ for some nonzero divisor $g \in A$: take $g = (g_j)$ with $g_j = 1$ if $f_j = 0$ and $g_j = f_j$ else. Thus $I \cong (e)$ as a module. We conclude I is

flat as (e) is a direct summand of A . The final statement is true because $K = S^{-1}A$ where $S = \prod(A_j \setminus \{0\})$. \square

Lemma 15.67.19. *Let A be a normal domain with fraction field K . There exists a cartesian diagram*

$$\begin{array}{ccc} A & \longrightarrow & K \\ \downarrow & & \downarrow \\ V & \longrightarrow & L \end{array}$$

of rings where V has weak dimension at most 1 and $V \rightarrow L$ is a flat, injective, epimorphism of rings.

Proof. For every $x \in K$, $x \notin A$ pick $V_x \subset K$ as in Algebra, Lemma 10.48.11. Set $V = \prod_{x \in K \setminus A} V_x$ and $L = \prod_{x \in K \setminus A} K$. The ring V has weak dimension at most 1 by Lemma 15.67.18 which also shows that $V \rightarrow K$ is a localization. A localization is flat and an epimorphism, see Algebra, Lemmas 10.38.19 and 10.103.5. \square

Lemma 15.67.20. *Let A be a ring of weak dimension at most 1. If $A \rightarrow B$ is a flat, injective, epimorphism of rings, then A is integrally closed in B .*

Proof. Let $x \in B$ be integral over A . Let $A' = A[x] \subset B$. Then A' is a finite ring extension of A by Algebra, Lemma 10.35.5. To show $A = A'$ it suffices to show $A \rightarrow A'$ is an epimorphism by Algebra, Lemma 10.103.6. Note that A' is flat over A by assumption on A and the fact that B is flat over A (Lemma 15.67.17). Hence the composition

$$A' \otimes_A A' \rightarrow B \otimes_A A' \rightarrow B \otimes_A B \rightarrow B$$

is injective, i.e., $A' \otimes_A A' \cong A'$ and the lemma is proved. \square

Lemma 15.67.21. *Let A be a normal domain with fraction field K . Let $A \rightarrow B$ be weakly étale. Then B is integrally closed in $B \otimes_A K$.*

Proof. Choose a diagram as in Lemma 15.67.19. As $A \rightarrow B$ is flat, the base change gives a cartesian diagram

$$\begin{array}{ccc} B & \longrightarrow & B \otimes_A K \\ \downarrow & & \downarrow \\ B \otimes_A V & \longrightarrow & B \otimes_A L \end{array}$$

of rings. Note that $V \rightarrow B \otimes_A V$ is weakly étale (Lemma 15.67.7), hence $B \otimes_A V$ has weak dimension at most 1 by Lemma 15.67.4. Note that $B \otimes_A V \rightarrow B \otimes_A L$ is a flat, injective, epimorphism of rings as a flat base change of such (Algebra, Lemmas 10.38.6 and 10.103.3). By Lemma 15.67.20 we see that $B \otimes_A V$ is integrally closed in $B \otimes_A L$. It follows from the cartesian property of the diagram that B is integrally closed in $B \otimes_A K$. \square

Lemma 15.67.22. *Let $A \rightarrow B$ be a ring homomorphism. Assume*

- (1) A is a henselian local ring,
- (2) $A \rightarrow B$ is integral,
- (3) B is a domain.

Then B is a henselian local ring and $A \rightarrow B$ is a local homomorphism. If A is strictly henselian, then B is a strictly henselian local ring and the extension $\kappa(\mathfrak{m}_A) \subset \kappa(\mathfrak{m}_B)$ of residue fields is purely inseparable.

Proof. Write B as a filtered colimit $B = \operatorname{colim} B_i$ of finite A -sub algebras. If we prove the results for each B_i , then the result follows for B . See Algebra, Lemma 10.145.5. If $A \rightarrow B$ is finite, then B is a product of local henselian rings by Algebra, Lemma 10.145.4. Since B is a domain we see that B is a local ring. The maximal ideal of B lies over the maximal ideal of A by going up for $A \rightarrow B$ (Algebra, Lemma 10.35.20). If A is strictly henselian, then the field extension $\kappa(\mathfrak{m}_A) \subset \kappa(\mathfrak{m}_B)$ being algebraic, has to be purely inseparable. Of course, then $\kappa(\mathfrak{m}_B)$ is separably algebraically closed and B is strictly henselian. \square

Lemma 15.67.23. *Let $A \rightarrow B$ and $A \rightarrow C$ be local homomorphisms of local rings. If $A \rightarrow C$ is integral and $\kappa(\mathfrak{m}_A) \subset \kappa(\mathfrak{m}_C)$ is purely inseparable, then $D = B \otimes_A C$ is a local ring and $B \rightarrow D$ and $C \rightarrow D$ are local.*

Proof. Any maximal ideal of D lies over the maximal ideal of B by going up for the integral ring map $B \rightarrow D$ (Algebra, Lemma 10.35.20). Now $D/\mathfrak{m}_B D = \kappa(\mathfrak{m}_B) \otimes_A C = \kappa(\mathfrak{m}_B) \otimes_{\kappa(\mathfrak{m}_A)} C/\mathfrak{m}_A C$. The spectrum of $C/\mathfrak{m}_A C$ consists of a single point, namely \mathfrak{m}_C . Thus the spectrum of $D/\mathfrak{m}_B D$ is the same as the spectrum of $\kappa(\mathfrak{m}_B) \otimes_{\kappa(\mathfrak{m}_A)} \kappa(\mathfrak{m}_C)$ which is a single point by our assumption that $\kappa(\mathfrak{m}_A) \subset \kappa(\mathfrak{m}_C)$ is purely inseparable. This proves that D is local and that the ring maps $B \rightarrow D$ and $C \rightarrow D$ are local. \square

Theorem 15.67.24 (Olivier). *Let $A \rightarrow B$ be a local homomorphism of local rings. If A is strictly henselian and $A \rightarrow B$ is weakly étale, then $A = B$.*

Proof. We will show that for all $\mathfrak{p} \subset A$ there is a unique prime $\mathfrak{q} \subset B$ lying over \mathfrak{p} and $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$. This implies that $B \otimes_A B \rightarrow B$ is bijective on spectra as well as surjective and flat. Hence it is an isomorphism for example by the description of pure ideals in Algebra, Lemma 10.104.4. Hence $A \rightarrow B$ is a faithfully flat epimorphism of rings. We get $A = B$ by Algebra, Lemma 10.103.7.

Note that the fibre ring $B \otimes_A \kappa(\mathfrak{p})$ is a colimit of étale extensions of $\kappa(\mathfrak{p})$ by Lemmas 15.67.7 and 15.67.15. Hence, if there exists more than one prime lying over \mathfrak{p} or if $\kappa(\mathfrak{p}) \neq \kappa(\mathfrak{q})$ for some \mathfrak{q} , then $B \otimes_A L$ has a nontrivial idempotent for some (separable) algebraic field extension $L \supset \kappa(\mathfrak{p})$.

Let $\kappa(\mathfrak{p}) \subset L$ be an algebraic field extension. Let $A' \subset L$ be the integral closure of A/\mathfrak{p} in L . By Lemma 15.67.22 we see that A' is a strictly henselian local ring whose residue field is a purely inseparable extension of the residue field of A . Thus $B \otimes_A A'$ is a local ring by Lemma 15.67.23. On the other hand, $B \otimes_A A'$ is integrally closed in $B \otimes_A L$ by Lemma 15.67.21. Since $B \otimes_A A'$ is local, it follows that the ring $B \otimes_A L$ does not have nontrivial idempotents which is what we wanted to prove. \square

15.68. Ramification theory

In this section and the next we use the following definitions.

Definition 15.68.1. We say that $A \rightarrow B$ or $A \subset B$ is an *extension of discrete valuation rings* if A and B are discrete valuation rings and $A \rightarrow B$ is injective and local. In particular, if π_A and π_B are uniformizers of A and B , then $\pi_A = u\pi_B^e$ for

some $e \geq 1$ and unit u of B . The integer e does not depend on the choice of the uniformizers as it is also the unique integer ≥ 1 such that

$$\mathfrak{m}_A B = \mathfrak{m}_B^e$$

The integer e is called the *ramification index* of B over A . We say that B is *weakly unramified* over A if $e = 1$. If the extension of residue fields $\kappa_A = A/\mathfrak{m}_A \subset \kappa_B = B/\mathfrak{m}_B$ is finite, then we set $f = [\kappa_B : \kappa_A]$ and we call it the *residual degree* or *residue degree* of the extension $A \subset B$.

Note that we do not require the extension of fraction fields to be finite.

Lemma 15.68.2. *Let $A \subset B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If the extension $K \subset L$ is finite, then the residue field extension is finite and we have $ef \leq [L : K]$.*

Proof. Finiteness of the residue field extension is Algebra, Lemma 10.115.9. The inequality follows from Algebra, Lemmas 10.115.8 and 10.50.12. \square

Lemma 15.68.3. *Let $A \subset B$ be an extension of discrete valuation rings inducing the field extension $K \subset L$. If the characteristic of K is $p > 0$ and L is purely inseparable over K , then the ramification index e is a power of p .*

Proof. Write $\pi_A = u\pi_B^e$ for some $u \in B^*$. On the other hand, we have $\pi_B^q \in K$ for some p -power q . Write $\pi_B^q = v\pi_A^k$ for some $v \in A^*$ and $k \in \mathbf{Z}$. Then $\pi_A^q = u^q \pi_B^{qe} = u^q v^e \pi_A^{ke}$. Taking valuations in B we conclude that $ke = q$. \square

Lemma 15.68.4. *Let $A \subset B$ be an extension of discrete valuation rings. The following are equivalent*

- (1) $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology, and
- (2) $A \rightarrow B$ is weakly unramified and $\kappa_A \subset \kappa_B$ is a separable field extension.

Proof. This follows from Proposition 15.29.4 and Algebra, Proposition 10.147.9. \square

Remark 15.68.5. Let A be a discrete valuation ring with fraction field K . Let $K \subset L$ be a finite separable field extension. Let $B \subset L$ be the integral closure of A in L . Picture:

$$\begin{array}{ccc} B & \longrightarrow & L \\ \uparrow & & \uparrow \\ A & \longrightarrow & K \end{array}$$

By Algebra, Lemma 10.150.8 the ring extension $A \subset B$ is finite, hence B is Noetherian. By Algebra, Lemma 10.108.4 the dimension of B is 1, hence B is a Dedekind domain, see Algebra, Lemma 10.116.13. Let $\mathfrak{m}_1, \dots, \mathfrak{m}_n$ be the maximal ideals of B (i.e., the primes lying over \mathfrak{m}_A). We obtain extensions of discrete valuation rings

$$A \subset B_{\mathfrak{m}_i}$$

and hence ramification indices e_i and residue degrees f_i . We have

$$[L : K] = \sum e_i f_i$$

by Algebra, Lemma 10.120.1. We observe that $n = 1$ if A is henselian (by Algebra, Lemma 10.145.4), e.g. if A is complete.

Definition 15.68.6. Let A be a discrete valuation ring with fraction field K . Let $L \supset K$ be a finite separable extension. With B and \mathfrak{m}_i , $i = 1, \dots, n$ as in Remark 15.68.5 we say the extension L/K is

- (1) *unramified* if $e_i = 1$ and the extension $\kappa_A \subset \kappa(\mathfrak{m}_i)$ is separable for all i ,
- (2) *totally ramified* if $n = 1$ and the residue field extension $\kappa_A \subset \kappa(\mathfrak{m}_1)$ is trivial,
- (3) *tamely ramified* if either the characteristic of κ_A is 0 or the characteristic of κ_A is $p > 0$ and the field extensions $\kappa_A \subset \kappa(\mathfrak{m}_i)$ are separable and the ramification indices e_i are prime to p .

Lemma 15.68.7. Let A be a discrete valuation ring with fraction field K . Let $K \subset L$ be a Galois extension with Galois group G . Then G acts on the ring B of Remark 15.68.5 and acts transitively on the set of maximal ideals of B .

Proof. If there are two or more orbits of the action, then we can find an element $b \in B$ which vanishes at all the maximal ideals of one orbit and has residue 1 at all the maximal ideals in another orbit. Then $b' = \prod_{\sigma \in G} \sigma(b)$ is a G -invariant element of $B \subset L$ which is in some maximal ideals of B but not in all maximal ideals of B . Since $K = L^G$ we conclude that $b' \in K$. Since b' maps to an element of B we see that $b' \in A$. Then on the one hand it must be true that $b' \in \mathfrak{m}_A$ as b' is in some maximal ideal of B and on the other hand it must be true that $b' \notin \mathfrak{m}_A$ as b' is not in all maximal ideals of B . This contradiction finishes the proof of the lemma. \square

Lemma 15.68.8. Let A be a discrete valuation ring with fraction field K . Let $K \subset L$ be a Galois extension. Then there are $e \geq 1$ and $f \geq 1$ such that $e_i = e$ and $f_i = f$ for all i (notation as in Remark 15.68.5). In particular $[L : K] = nef$.

Proof. Immediate consequence of Lemma 15.68.7 and the definitions. \square

Definition 15.68.9. Let A be a discrete valuation ring with fraction field K . Let $K \subset L$ be a Galois extension with Galois group G . Let B be the integral closure of A in L .

- (1) For a maximal ideal $\mathfrak{m} \subset B$ the *decomposition group* associated to \mathfrak{m} is the subgroup $D = \{\sigma \in G \mid \sigma(\mathfrak{m}) = \mathfrak{m}\}$ of G .
- (2) The kernel I of the map $D \rightarrow \text{Aut}(\kappa(\mathfrak{m})/\kappa_A)$ is called the *inertia group*.

Note that the field $\kappa(\mathfrak{m})$ may be inseparable over κ_A . In particular the field extension $\kappa_A \subset \kappa(\mathfrak{m})$ need not be Galois. If κ_A is perfect, then it is.

Lemma 15.68.10. Let A be a discrete valuation ring with fraction field K and residue field κ . Let $K \subset L$ be a Galois extension with Galois group G . Let B be the integral closure of A in L .

- (1) the field extension $\kappa \subset \kappa(\mathfrak{m})$ is normal, and
- (2) $D \rightarrow \text{Aut}(\kappa(\mathfrak{m})/\kappa)$ is surjective.

If for some (equivalently all) maximal ideal(s) $\mathfrak{m} \subset B$ the field extension $\kappa \subset \kappa(\mathfrak{m})$ is separable, then

- (3) $\kappa \subset \kappa(\mathfrak{m})$ is Galois, and
- (4) $D \rightarrow \text{Gal}(\kappa(\mathfrak{m})/\kappa)$ is surjective.

Here $D \subset G$ is the decomposition group of \mathfrak{m} .

Proof. Pick an element $\theta \in \kappa(\mathfrak{m})$. Pick $b \in B$ mapping to θ and with zero residue modulo all other maximal ideals of B . Let $P(t) \in K[t]$ be the minimal polynomial of b over K . By Algebra, Lemma 10.37.6 the polynomial P has coefficients in A . Thus θ is a root of the image $\overline{P} \in \kappa[t]$. Thus the minimal polynomial of θ divides \overline{P} . Since P splits completely as $P(t) = \prod(t - b_i)$ over B where the b_i are the conjugates of b in L , we conclude that the minimal polynomial of θ over κ splits completely in $\kappa(\mathfrak{m})$. This shows $\kappa(\mathfrak{m})$ is a normal extension of κ .

Since $\kappa(\mathfrak{m})/\kappa_A$ is normal we may assume $\kappa(\mathfrak{m}) = \kappa_1 \otimes_{\kappa} \kappa_2$ with $\kappa \subset \kappa_1$ purely inseparable and $\kappa \subset \kappa_2$ Galois, see Fields, Lemma 9.24.3. Pick $\theta \in \kappa_2$ which generates κ_2 over κ . If $\theta' \in \kappa_2$ is a conjugate of θ , then the above shows there exists a $\sigma \in G$ such that $\sigma(b)$ maps to θ' . By our choice of b (vanishing at other maximal ideals) this implies $\sigma \in D$ and that the image of σ in $\text{Aut}(\kappa(\mathfrak{m})/\kappa_A)$ maps θ to θ' . Hence the surjectivity.

The "equivalently all" part of the lemma follows from Lemma 15.68.7. Assume $\kappa_A \subset \kappa(\mathfrak{m})$ is separable. Parts (3) and (4) follow immediately from (1) and (2). \square

Lemma 15.68.11. *Let A be a discrete valuation ring with fraction field K . Let $K \subset L$ be a Galois extension with Galois group G . Let B be the integral closure of A in L . Let $\mathfrak{m} \subset B$ be a maximal ideal. The inertia group I of \mathfrak{m} has the following structure*

- (1) *if the characteristic of κ_A is 0, then I is finite cyclic of order e ,*
- (2) *if the characteristic of κ_A is $p > 0$, then there is a short exact sequence of groups $1 \rightarrow P \rightarrow I \rightarrow I_t \rightarrow 0$ where P is a p -group and I_t is cyclic of order prime to p . In fact, the order of I_t is the prime to p part of the integer e .*

Here e is the integer of Lemma 15.68.8.

Proof. Recall that $|G| = [L : K] = nef$, see Lemma 15.68.8. Since G acts transitively on the set $\{\mathfrak{m}_1, \dots, \mathfrak{m}_n\}$ of maximal ideals of B (Lemma 15.68.7) and since D is the stabilizer of an element we see that $|D| = ef$. By Lemma 15.68.10 we have

$$ef = |D| = |I| \cdot |\text{Aut}(\kappa(\mathfrak{m})/\kappa_A)|$$

As $\kappa(\mathfrak{m})$ is normal over κ_A the order of $\text{Aut}(\kappa(\mathfrak{m})/\kappa_A)$ differs from f by a power of p (small detail omitted). Hence the prime to p part of $|I|$ is equal to the prime to p part of e .

Set $C = B_{\mathfrak{m}}$. Then I acts on C over A and trivially on the residue field of C . Let $\pi_A \in A$ and $\pi_C \in C$ be uniformizers. Write $\pi_A = u\pi_C^e$ for some unit u in B . For $\sigma \in I$ write $\sigma(\pi_C) = u_{\sigma}\pi_C$. Then we have

$$\pi_A = \sigma(\pi_A) = \sigma(u)(u_{\sigma}\pi_C)^e = \sigma(u)u_{\sigma}^e\pi_C^e = \frac{\sigma(u)}{u}u_{\sigma}^e\pi_A$$

Since $\sigma(u) \equiv u \pmod{\mathfrak{m}_C}$ we see that u_{σ} maps to an e th root of unity in κ_C . We obtain a homomorphism

$$\chi : I \longrightarrow \mu_e(\kappa_C)$$

Since κ_C has characteristic p , the group $\mu_e(\kappa_C)$ is cyclic of order at most the prime to p part of e (some facts about roots of unity in fields omitted). Thus it suffices to prove that the kernel of χ is a p -group. Let σ be a nontrivial element of the

kernel. Then $\sigma(\mathfrak{m}_C^i) \subset \mathfrak{m}_C^{i+1}$ for all i . Let m be the order of σ . Pick $c \in C$ such that $\sigma(c) \neq c$. Then $\sigma(c) - c \in \mathfrak{m}_C^i$, $\sigma(c) - c \notin \mathfrak{m}_C^{i+1}$ for some i and we have

$$\begin{aligned} 0 &= \sigma^m(c) - c \\ &= \sigma^m(c) - \sigma^{m-1}(c) + \dots + \sigma(c) - c \\ &= \sum_{j=0, \dots, m-1} \sigma^j(\sigma(c) - c) \\ &\equiv m(\sigma(c) - c) \pmod{\mathfrak{m}_C^{i+1}} \end{aligned}$$

It follows that $p|m$ (or $m = 0$ if $p = 1$). Thus every element of the kernel of χ has order divisible by p , i.e., $\text{Ker}(\chi)$ is a p -group. \square

Lemma 15.68.12. *Let $\varphi : R \rightarrow S$ be a ring map such that*

- (1) *the kernel of φ is locally nilpotent, and*
- (2) *S is generated as an R -algebra by elements $s \in S$ for which there exists a polynomial $P(T) \in R[T]$ whose image in $S[T]$ is $(T - s)^n$ for some $n = n(s) > 0$.*

Then $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is a homeomorphism and $R \rightarrow S$ induces purely inseparable extensions of residue fields. Moreover, conditions (1) and (2) remain true on arbitrary base change.

Proof. We may replace R by $R/\text{Ker}(\varphi)$, see Algebra, Lemma 10.45.2. Assumption (2) implies S is generated over R by elements which are integral over R . Hence $R \subset S$ is integral (Algebra, Lemma 10.35.7). In particular $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective and closed (Algebra, Lemmas 10.35.15, 10.40.6, and 10.35.20). Let $\mathfrak{p} \subset R$ be a prime and let $k \supset \kappa(\mathfrak{p})$ be the perfection. Set $A = S \otimes_R k$. By the surjectivity the ring $A' = S \otimes_R \kappa(\mathfrak{p})$ is not zero (Algebra, Lemma 10.16.9) whence $A = A' \otimes_{\kappa(\mathfrak{p})} k$ is nonzero. Assumption (2) implies that A is generated over k by elements $a \in A$ for which there exist a $P(T) \in k[T]$ with $P(T) \mapsto (T - a)^{n(a)}$ in $A[T]$. Since $A \neq 0$ and k is perfect, this implies that $P = (T - \lambda_a)^{n(a)}$ for some $\lambda_a \in k$ (some details omitted). Hence $k = A_{\text{red}}$ because a and λ_a map to the same element of A_{red} for all of these generators. It follows that $\text{Spec}(A)$ is a singleton. Hence $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is bijective and all residue field extensions are purely inseparable. Since a bijective, continuous, closed map of topological spaces is a homeomorphism the proof is finished. \square

Lemma 15.68.13. *Let R be a ring. Let G be a finite group acting on R . Let $I \subset R$ be an ideal such that $\sigma(I) \subset I$ for all $\sigma \in G$. The ring maps*

$$R^G/I^G \longrightarrow R^G/(R^G \cap I) \longrightarrow (R/I)^G$$

induce homeomorphisms on spectra and purely inseparable extensions of residue fields.

Proof. Let n be the order of G . Let $x \in R^G \cap I$. Then $x^n = \prod_{\sigma \in G} \sigma(x)$ is in I^G . Hence the kernel of the first map is locally nilpotent. Since the first map is also surjective, we see that the result of the lemma is true for the first map.

The second map is injective. Let $x \in R$ be an element which maps to an element of $(R/I)^G$. Consider the polynomial $P(T) = \prod (T - \sigma(x)) \in R^G[T]$. The image of P in $(R/I)^G[T]$ is $(T - x)^n$. Thus Lemma 15.68.12 applies to both the second map and the composition. \square

Lemma 15.68.14. *Let A be a discrete valuation ring with fraction field K . Let L be a Galois extension of K . Let $\mathfrak{m} \subset B$ be a maximal ideal of the integral closure of A in L . Let $I \subset G$ be the corresponding inertia subgroup. Then B^I is the integral closure of A in L^I and $A \rightarrow (B^I)_{B^I \cap \mathfrak{m}}$ is étale.*

Proof. It follows from the definitions that B^I is the integral closure of A in L^I .

We first prove the final statement in case B is a discrete valuation ring, i.e., when G is the decomposition group of \mathfrak{m} . As I acts trivially on κ_B it follows from Lemma 15.68.13 that the extension $\kappa_{B^I} = B^I/(B^I \cap \mathfrak{m}) \subset \kappa_B$ is purely inseparable. Since G/I acts faithfully on κ_B , we conclude that G/I acts faithfully on κ_{B^I} over κ_A . By Galois theory we see that $[\kappa_{B^I} : \kappa_A] \geq |G/I|$. On the other hand, we have $[L^I : K] = |G/I|$ by Galois theory. By Lemma 15.68.2 we see that $A \subset B^I$ is weakly unramified and that $[\kappa_{B^I} : \kappa_A] = |G/I|$. Thus κ_{B^I} is Galois over κ_A (with group G/I) and we conclude that L^I is unramified over K as desired.

In general we reduce to the case discussed in the previous paragraph by splitting B using Algebra, Lemma 10.138.23. (An alternative is to use completion to do this.) We omit the details. \square

Lemma 15.68.15 (Krasner's lemma). *Let A be a complete local domain of dimension 1. Let $P(t) \in A[t]$ be a polynomial with coefficients in A . Let $\alpha \in A$ be a root of P but not a root of the derivative $P' = dP/dt$. For every $c \geq 0$ there exists an integer n such that for any $Q \in A[t]$ whose coefficients are in \mathfrak{m}_A^n the polynomial $P + Q$ has a root $\beta \in A$ with $\beta - \alpha \in \mathfrak{m}_A^c$.*

Proof. Choose a nonzero $\pi \in \mathfrak{m}$. Since the dimension of A is 1 we have $\mathfrak{m} = \sqrt{(\pi)}$. By assumption we may write $P'(\alpha)^{-1} = \pi^{-m}a$ for some $m \geq 0$ and $a \in A$. We may and do assume that $c \geq m + 1$. Pick n such that $\mathfrak{m}_A^n \subset (\pi^{c+m})$. Pick any Q as in the statement. For later use we observe that we can write

$$P(x + y) = P(x) + P'(x)y + R(x, y)y^2$$

for some $R(x, y) \in A[x, y]$. We will show by induction that we can find a sequence $\alpha_m, \alpha_{m+1}, \alpha_{m+2}, \dots$ such that

- (1) $\alpha_k \equiv \alpha \pmod{\pi^c}$,
- (2) $\alpha_{k+1} - \alpha_k \in (\pi^k)$, and
- (3) $(P + Q)(\alpha_k) \in (\pi^{m+k})$.

Setting $\beta = \lim \alpha_k$ will finish the proof.

Base case. Since the coefficients of Q are in (π^{c+m}) we have $(P + Q)(\alpha) \in (\pi^{c+m})$. Hence $\alpha_m = \alpha$ works. This choice guarantees that $\alpha_k \equiv \alpha \pmod{\pi^c}$ for all $k \geq m$.

Induction step. Given α_k we write $\alpha_{k+1} = \alpha_k + \delta$ for some $\delta \in (\pi^k)$. Then we have

$$(P + Q)(\alpha_{k+1}) = P(\alpha_k + \delta) + Q(\alpha_k + \delta)$$

Because the coefficients of Q are in (π^{c+m}) we see that $Q(\alpha_k + \delta) \equiv Q(\alpha_k) \pmod{\pi^{c+m+k}}$. On the other hand we have

$$P(\alpha_k + \delta) = P(\alpha_k) + P'(\alpha_k)\delta + R(\alpha_k, \delta)\delta^2$$

Note that $P'(\alpha_k) \equiv P'(\alpha) \pmod{(\pi^{m+1})}$ as $\alpha_k \equiv \alpha \pmod{\pi^{m+1}}$. Hence we obtain

$$P(\alpha_k + \delta) \equiv P(\alpha_k) + P'(\alpha)\delta \pmod{\pi^{k+m+1}}$$

Recombining the two terms we see that

$$(P + Q)(\alpha_{k+1}) \equiv (P + Q)(\alpha_k) + P'(\alpha)\delta \pmod{\pi^{k+m+1}}$$

Thus a solution is to take $\delta = -P'(\alpha)^{-1}(P + Q)(\alpha_k) = -\pi^{-m}a(P + Q)(\alpha_k)$ which is contained in (π^k) by induction assumption. \square

Lemma 15.68.16. *Let A be a discrete valuation ring with field of fractions K . Let A^\wedge be the completion of A with fraction field K^\wedge . If $K^\wedge \subset M$ is a finite separable extension, then there exists a finite separable extension $K \subset L$ such that $M = K^\wedge \otimes_K L$.*

Proof. Note that A^\wedge is a discrete valuation ring too (by Lemmas 15.32.4 and 15.32.1). In particular A^\wedge is a domain. The proof will work more generally for Noetherian local rings A such that A^\wedge is a local domain of dimension 1.

Let $\theta \in M$ be an element that generates M over K^\wedge . (Theorem of the primitive element.) Let $P(t) \in K^\wedge[t]$ be the minimal polynomial of θ over K^\wedge . Let $\pi \in \mathfrak{m}_A$ be a nonzero element. After replacing θ by $\pi^n\theta$ we may assume that the coefficients of $P(t)$ are in A^\wedge . Let $B = A^\wedge[\theta] = A^\wedge[t]/(P(t))$. Note that B is a complete local domain of dimension 1 because it is finite over A and contained in M . Since M is separable over K the element θ is not a root of the derivative of P . For any integer n we can find a monic polynomial $P_1 \in A[t]$ such that $P - P_1$ has coefficients in $\pi^n A^\wedge[t]$. By Krasner's lemma (Lemma 15.68.15) we see that P_1 has a root β in B for n sufficiently large. Moreover, we may assume (if n is chosen large enough) that $\theta - \beta \in \pi B$. Consider the map $\Phi : A^\wedge[t]/(P_1) \rightarrow B$ of A^\wedge -algebras which maps t to β . Since $B = \pi B + \sum_{i < \deg(P)} A^\wedge \theta^i$, the map Φ is surjective by Nakayama's lemma. As $\deg(P_1) = \deg(P)$ it follows that Φ is an isomorphism. We conclude that the ring extension $L = K[t]/(P_1(t))$ satisfies $K^\wedge \otimes_K L \cong M$. This implies that L is a field and the proof is complete. \square

Definition 15.68.17. Let A be a discrete valuation ring. We say A has *mixed characteristic* if the characteristic of the residue field of A is $p > 0$ and the characteristic of the fraction field of A is 0. In this case we obtain an extension of discrete valuation rings $\mathbf{Z}_{(p)} \subset A$ and the *absolute ramification index* of A is the ramification index of this extension.

15.69. Eliminating ramification

In this section we discuss a result of Helmut Epp, see [Epp73]. We strongly encourage the reader to read the original. Our approach is slightly different as we try to handle the mixed and equicharacteristic cases by the same method. For related results, see also [Pon98], [Pon99], [Kuh03], and [ZK99].

Remark 15.69.1. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Let $K \subset K_1$ be a finite extension of fields. Let $A_1 \subset K_1$ be the integral closure of A in K_1 . On the other hand, let $L_1 = (L \otimes_K K_1)_{red}$. Then L_1 is a nonempty finite product of finite field extensions of L . Let B_1 be the integral closure of B in L_1 . We obtain compatible commutative diagrams

$$\begin{array}{ccc} L & \longrightarrow & L_1 \\ \uparrow & & \uparrow \\ K & \longrightarrow & K_1 \end{array} \quad \text{and} \quad \begin{array}{ccc} B & \longrightarrow & B_1 \\ \uparrow & & \uparrow \\ A & \longrightarrow & A_1 \end{array}$$

In this situation we have the following

- (1) By Algebra, Lemma 10.116.14 the ring A_1 is a Dedekind domain and B_1 is a finite product of Dedekind domains.
- (2) Note that $L \otimes_K K_1 = (B \otimes_A A_1)_\pi$ where $\pi \in A$ is a uniformizer and that π is a nonzero divisor on $B \otimes_A A_1$. Thus the ring map $B \otimes_A A_1 \rightarrow B_1$ is integral with kernel consisting of nilpotent elements. Hence $\text{Spec}(B_1) \rightarrow \text{Spec}(B \otimes_A A_1)$ is surjective on spectra (Algebra, Lemma 10.35.15). The map $\text{Spec}(B \otimes_A A_1) \rightarrow \text{Spec}(A_1)$ is surjective as $A_1/\mathfrak{m}_A A_1 \rightarrow B/\mathfrak{m}_A B \otimes_{\kappa_A} A_1/\mathfrak{m}_A A_1$ is an injective ring map with $A_1/\mathfrak{m}_A A_1$ Artinian. We conclude that $\text{Spec}(B_1) \rightarrow \text{Spec}(A_1)$ is surjective.
- (3) Let $\mathfrak{m}_i, i = 1, \dots, n$ with $n \geq 1$ be the maximal ideals of A_1 . For each $i = 1, \dots, n$ let $\mathfrak{m}_{ij}, j = 1, \dots, m_i$ with $m_i \geq 1$ be the maximal ideals of B_1 lying over \mathfrak{m}_i . We obtain diagrams

$$\begin{array}{ccc} B & \longrightarrow & (B_1)_{\mathfrak{m}_{ij}} \\ \uparrow & & \uparrow \\ A & \longrightarrow & (A_1)_{\mathfrak{m}_i} \end{array}$$

of extensions of discrete valuation rings.

- (4) If A is henselian (for example complete), then A_1 is a discrete valuation ring, i.e., $n = 1$. Namely, A_1 is a union of finite extensions of A which are domains, hence local by Algebra, Lemma 10.145.4.
- (5) If B is henselian (for example complete), then B_1 is a product of discrete valuation rings, i.e., $m_i = 1$ for $i = 1, \dots, n$.
- (6) If $K \subset K_1$ is purely inseparable, then A_1 and B_1 are both discrete valuation rings, i.e., $n = 1$ and $m_1 = 1$. This is true because for every $b \in B_1$ a p -power power of b is in B , hence B_1 can only have one maximal ideal.
- (7) If $K \subset K_1$ is finite separable, then $L_1 = L \otimes_K K_1$ and is a finite product of finite separable extensions too. Hence $A \subset A_1$ and $B \subset B_1$ are finite by Algebra, Lemma 10.150.8.
- (8) If A is Nagata, then $A \subset A_1$ is finite.
- (9) If B is Nagata, then $B \subset B_1$ is finite.

The goal in this section is to find extensions $K \subset K_1$ as in Remark 15.69.1 such that the extensions $(A_1)_{\mathfrak{m}_i} \subset (B_1)_{\mathfrak{m}_{ij}}$ are all weakly unramified or even formally smooth.

Definition 15.69.2. Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$.

- (1) We say a finite field extension $K \subset K_1$ is a *weak solution for $A \subset B$* if all the extensions $(A_1)_{\mathfrak{m}_i} \subset (B_1)_{\mathfrak{m}_{ij}}$ of Remark 15.69.1 are weakly unramified.
- (2) We say a finite field extension $K \subset K_1$ is a *solution for $A \subset B$* if each extension $(A_1)_{\mathfrak{m}_i} \subset (B_1)_{\mathfrak{m}_{ij}}$ of Remark 15.69.1 is formally smooth in the \mathfrak{m}_{ij} -adic topology.

We say a solution $K \subset K_1$ is a *separable solution* if $K \subset K_1$ is separable.

In general (weak) solutions do not exist. The following example shows that in general one needs inseparable extensions to get a solution.

Example 15.69.3. Let k be a perfect field of characteristic $p > 0$. Let $A = k[[x]]$ and $K = k((x))$. Let $B = A[x^{1/p}]$. Any weak solution $K \subset K_1$ for $A \rightarrow B$ is inseparable (and any finite inseparable extension of K is a solution). We omit the proof.

Solutions are stable under further extensions, but this may not be true for weak solutions. Weak solutions are stable under totally ramified solutions.

Lemma 15.69.4. *Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume that $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology. Then for any finite extension $K \subset K_1$ we have $L_1 = L \otimes_K K_1$, $B_1 = B \otimes_A A_1$, and each extension $(A_1)_{\mathfrak{m}_i} \subset (B_1)_{\mathfrak{m}_{ij}}$ (see Remark 15.69.1) is formally smooth in the \mathfrak{m}_{ij} -adic topology.*

Proof. We will use the equivalence of Lemma 15.68.4 without further mention. Let $\pi \in A$ and $\pi_i \in (A_1)_{\mathfrak{m}_i}$ be uniformizers. As $\kappa_A \subset \kappa_B$ is separable, the ring

$$(B \otimes_A (A_1)_{\mathfrak{m}_i}) / \pi_i (B \otimes_A (A_1)_{\mathfrak{m}_i}) = B / \pi B \otimes_{A/\pi A} (A_1)_{\mathfrak{m}_i} / \pi_i (A_1)_{\mathfrak{m}_i}$$

is a product of fields each separable over $\kappa_{\mathfrak{m}_i}$. Hence the element π_i in $B \otimes_A (A_1)_{\mathfrak{m}_i}$ is a nonzerodivisor and the quotient by this element is a product of fields. It follows that $B \otimes_A A_1$ is a Dedekind domain in particular reduced. Thus $B \otimes_A A_1 \subset B_1$ is an equality. \square

Lemma 15.69.5. *Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume that $A \rightarrow B$ is weakly unramified. Then for any totally ramified separable extension $K \subset K_1$ we have that $L_1 = L \otimes_K K_1$ is a field, A_1 and $B_1 = B \otimes_A A_1$ are discrete valuation rings, and the extension $A_1 \subset B_1$ (see Remark 15.69.1) is weakly unramified.*

Proof. Let $\pi \in A$ and $\pi_1 \in A_1$ be uniformizers. As $K \subset K_1$ is totally ramified we have $\pi_1^e = u\pi$ for some unit u_1 in A_1 . Hence A_1 is generated by π_1 over A and the minimal polynomial $P(t)$ of π_1 over K has the form

$$P(t) = t^e + a_{e-1}t^{e-1} + \dots + a_0$$

with $a_i \in (\pi)$ and $a_0 = u\pi$ for some unit u of A . Note that $e = [K_1 : K]$ as well. Since $A \rightarrow B$ is weakly unramified we see that π is a uniformizer of B and hence $B_1 = B[t]/(P(t))$ is a discrete valuation ring with uniformizer the class of t . Thus the lemma is clear. \square

Lemma 15.69.6. *Let $A \rightarrow B \rightarrow C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Let $K \subset K_1$ be a finite extension.*

- (1) *If K_1 is a (weak) solution for $A \rightarrow C$, then K_1 is a (weak) solution for $A \rightarrow B$.*
- (2) *If K_1 is a (weak) solution for $A \rightarrow B$ and $L_1 = (L \otimes_K K_1)_{red}$ is a product of fields which are (weak) solutions for $B \rightarrow C$, then K_1 is a weak solution for $A \rightarrow C$.*

Proof. Let $L_1 = (L \otimes_K K_1)_{red}$ and $M_1 = (M \otimes_K K_1)_{red}$ and let $B_1 \subset L_1$ and $C_1 \subset M_1$ be the integral closure of B and C . Note that $M_1 = (M \otimes_L L_1)_{red}$ and that L_1 is a (nonempty) finite product of finite extensions of L . Hence the ring map $B_1 \rightarrow C_1$ is a finite product of ring maps of the form discussed in Remark 15.69.1.

In particular, the map $\text{Spec}(C_1) \rightarrow \text{Spec}(B_1)$ is surjective. Choose a maximal ideal $\mathfrak{m} \subset C_1$ and consider the extensions of discrete valuation rings

$$(A_1)_{A_1 \cap \mathfrak{m}} \rightarrow (B_1)_{B_1 \cap \mathfrak{m}} \rightarrow (C_1)_{\mathfrak{m}}$$

If the composition is weakly unramified, so is the map $(A_1)_{A_1 \cap \mathfrak{m}} \rightarrow (B_1)_{B_1 \cap \mathfrak{m}}$. If the residue field extension $\kappa_{A_1 \cap \mathfrak{m}} \rightarrow \kappa_{\mathfrak{m}}$ is separable, so is the subextension $\kappa_{A_1 \cap \mathfrak{m}} \rightarrow \kappa_{B_1 \cap \mathfrak{m}}$. Taking into account Lemma 15.68.4 this proves (1). A similar argument works for (2). \square

Lemma 15.69.7. *Let $A \rightarrow B$ be an extension of discrete valuation rings. There exists a commutative diagram*

$$\begin{array}{ccc} B & \longrightarrow & B' \\ \uparrow & & \uparrow \\ A & \longrightarrow & A' \end{array}$$

of extensions of discrete valuation rings such that

- (1) the extensions $K \subset K'$ and $L \subset L'$ of fraction fields are separable algebraic,
- (2) the residue fields of A' and B' are separable algebraic closures of the residue fields of A and B , and
- (3) if a solution, weak solution, or separable solution exists for $A' \rightarrow B'$, then a solution, weak solution, or separable solution exists for $A \rightarrow B$.

Proof. By Algebra, Lemma 10.148.2 there exists an extension $A \subset A'$ which is a filtered colimit of finite étale extensions such that the residue field of A' is a separable algebraic closure of the residue field of A . Then $A \subset A'$ is an extension of discrete valuation rings such that the induced extension $K \subset K'$ of fraction fields is separable algebraic.

Let $B \subset B'$ be a strict henselization of B . Then $B \subset B'$ is an extension of discrete valuation rings whose fraction field extension is separable algebraic. By Algebra, Lemma 10.145.25 there exists a commutative diagram as in the statement of the lemma. Parts (1) and (2) of the lemma are clear.

Let $K' \subset K'_1$ be a (weak) solution for $A' \rightarrow B'$. Since A' is a colimit, we can find a finite étale extension $A \subset A'_1$ and a finite extension $f.f.(A'_1) \subset K_1$ such that $K'_1 = K' \otimes_{f.f.(A'_1)} K_1$. As $A \subset A'_1$ is finite étale and B' strictly henselian, it follows that $B' \otimes_A A'_1$ is a finite product of rings isomorphic to B' . Hence

$$L' \otimes_K K_1 = L' \otimes_K f.f.(A'_1) \otimes_{f.f.(A'_1)} K_1$$

is a finite product of rings isomorphic to $L' \otimes_{K'} K'_1$. Thus we see that $K \subset K_1$ is a (weak) solution for $A \rightarrow B'$. Hence it is also a (weak) solution for $A \rightarrow B$ by Lemma 15.69.6. \square

Lemma 15.69.8. *Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Let $K \subset K_1$ be a normal extension. Say $G = \text{Aut}(K_1/K)$. Then G acts on the rings K_1, L_1, A_1 and B_1 of Remark 15.69.1 and acts transitively on the set of maximal ideals of B_1 .*

Proof. Everything is clear apart from the last assertion. If there are two or more orbits of the action, then we can find an element $b \in B_1$ which vanishes at all the maximal ideals of one orbit and has residue 1 at all the maximal ideals in another

orbit. Then $b' = \prod_{\sigma \in G} \sigma(b)$ is a G -invariant element of $B_1 \subset L_1 = (L \otimes_K K_1)_{red}$ which is in some maximal ideals of B_1 but not in all maximal ideals of B_1 . Lifting it to an element of $L \otimes_K K_1$ and raising to a high power we obtain a G -invariant element b'' of $L \otimes_K K_1$ mapping to $(b')^N$ for some $N > 0$; in fact, we only need to do this in case the characteristic is $p > 0$ and in this case raising to a suitably large p -power q defines a canonical map $(L \otimes_K K_1)_{red} \rightarrow L \otimes_K K_1$. Since $K = (K_1)^G$ we conclude that $b'' \in L$. Since b'' maps to an element of B_1 we see that $b'' \in B$ (as B is normal). Then on the one hand it must be true that $b'' \in \mathfrak{m}_B$ as b' is in some maximal ideal of B_1 and on the other hand it must be true that $b'' \notin \mathfrak{m}_B$ as b' is not in all maximal ideals of B_1 . This contradiction finishes the proof of the lemma. \square

Lemma 15.69.9. *Let A be a discrete valuation ring with uniformizer π . Let $n \geq 2$. Then $K_1 = K[\pi^{1/n}]$ is a degree n extension of K and the integral closure A_1 of A in K_1 is the ring $A[\pi^{1/n}]$ which is a discrete valuation ring with ramification index n over A .*

Proof. This lemma proves itself. \square

Lemma 15.69.10. *Let A be a discrete valuation ring with uniformizer π . If the residue characteristic of A is $p > 0$, then for every $n > 1$ and p -power q there exists a degree q separable totally ramified extension $K \subset L$ such that the integral closure B of A in L has ramification index q and a uniformizer π_B such that $\pi_B^q = \pi + \pi^n b$ and $\pi_B^q = \pi + (\pi_B)^{nq} b'$ for some $b, b' \in B$.*

Proof. If the characteristic of K is zero, then we can take the extension given by $\pi_B^q = \pi$, see Lemma 15.69.9. If the characteristic of K is $p > 0$, then we can take the extension of K given by $z^q - \pi^n z = \pi^{1-q}$. Namely, then we see that $y^q - \pi^{n+q-1} y = \pi$ where $y = \pi z$. Taking $\pi_B = y$ we obtain the desired result. \square

Lemma 15.69.11. *Let A be a discrete valuation ring. Assume the residue field κ_A has characteristic $p > 0$ and that $a \in A$ is an element whose residue class in κ_A is not a p th power. Then a is not a p th power in K and the integral closure of A in $K[a^{1/p}]$ is the ring $A[a^{1/p}]$ which is a discrete valuation ring weakly unramified over A .*

Proof. This lemma proves itself. \square

Lemma 15.69.12. *Let $A \subset B \subset C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Let $\pi \in A$ be a uniformizer. Assume*

- (1) B is a Nagata ring,
- (2) $A \subset B$ is weakly unramified,
- (3) M is a degree p purely inseparable extension of L .

Then either

- (1) $A \rightarrow C$ is weakly unramified, or
- (2) $C = B[\pi^{1/p}]$, or
- (3) there exists a degree p separable, totally ramified extension $K \subset K_1$ such that $L_1 = L \otimes_K K_1$ and $M_1 = M \otimes_K K_1$ are fields and the maps of integral closures $A_1 \rightarrow B_1 \rightarrow C_1$ are weakly unramified extensions of discrete valuation rings.

Proof. Let e be the ramification index of C over B . If $e = 1$, then we are done. If not, then $e = p$ by Lemmas 15.68.2 and 15.68.3. This in turn implies that the residue fields of B and C agree. Choose a uniformizer π_C of C . Write $\pi_C^p = u\pi$ for some unit u of C . Since $\pi_C^p \in L$, we see that $u \in B^*$. Also $M = L[\pi_C]$.

Suppose there exists an integer $m \geq 0$ such that

$$u = \sum_{0 \leq i < m} b_i^p \pi^i + b\pi^m$$

with $b_i \in B$ and with $b \in B$ an element whose image in κ_B is not a p th power. Choose an extension $K \subset K_1$ as in Lemma 15.69.10 with $n = m + 2$ and denote π' the uniformizer of the integral closure A_1 of A in K_1 such that $\pi = (\pi')^p + (\pi')^{np}a$ for some $a \in A_1$. Let B_1 be the integral closure of B in $L \otimes_K K_1$. Observe that $A_1 \rightarrow B_1$ is weakly unramified by Lemma 15.69.5. In B_1 we have

$$u\pi = \left(\sum_{0 \leq i < m} b_i (\pi')^{i+1} \right)^p + b(\pi')^{(m+1)p} + (\pi')^{np}b_1$$

for some $b_1 \in B_1$ (computation omitted). We conclude that M_1 is obtained from L_1 by adjoining a p th root of

$$b + (\pi')^{n-m-1}b_1$$

Since the residue field of B_1 equals the residue field of B we see from Lemma 15.69.11 that M_1/L_1 has degree p and the integral closure C_1 of B_1 is weakly unramified over B_1 . Thus we conclude in this case.

If there does not exist an integer m as in the preceding paragraph, then u is a p th power in the π -adic completion of B_1 . Since B is Nagata, this means that u is a p th power in B_1 by Algebra, Lemma 10.150.33. Whence the second case of the statement of the lemma holds. \square

Lemma 15.69.13. *Let A be a local ring annihilated by a prime p whose maximal ideal is nilpotent. There exists a ring map $\sigma : \kappa_A \rightarrow A$ which is a section to the residue map $A \rightarrow \kappa_A$. If $A \rightarrow A'$ is a local homomorphism of local rings, then we can choose a similar ring map $\sigma' : \kappa_{A'} \rightarrow A'$ compatible with σ provided that the extension $\kappa_A \subset \kappa_{A'}$ is separable.*

Proof. Separable extensions are formally smooth by Algebra, Proposition 10.147.9. Thus the existence of σ follows from the fact that $\mathbf{F}_p \rightarrow \kappa_A$ is separable. Similarly for the existence of σ' compatible with σ . \square

Lemma 15.69.14. *Let A be a discrete valuation ring with fraction field K of characteristic $p > 0$. Let $\xi \in K$. Let L be an extension of K obtained by adjoining a root of $z^p - z = \xi$. Then L/K is Galois and one of the following happens*

- (1) $L = K$,
- (2) L/K is unramified of degree p ,
- (3) L/K is totally ramified with ramification index p , and
- (4) L/K is weakly unramified, the integral closure B of A in L is a discrete valuation ring and $A \rightarrow B$ induces a purely inseparable residue field extension of degree p .

Let π be a uniformizer of A . We have the following implications:

- (A) If $\xi \in A$, then we are in case (1) or (2).
- (B) If $\xi = \pi^{-n}a$ where $n > 0$ is not divisible by p and a is a unit in A , then we are in case (3)

(C) If $\xi = \pi^{-n}a$ where $n > 0$ is divisible by p and the image of a in κ_A is not a p th power, then we are in case (4).

Proof. The extension is Galois of order dividing p by the discussion in Fields, Section 9.22. It immediately follows from the discussion in Section 15.68 that we are in one of the cases (1) – (4) listed in the lemma.

Case (A). Here we see that $A \rightarrow A[x]/(x^p - x - \xi)$ is a finite étale ring extension. Hence we are in cases (1) or (2).

Case (B). Write $\xi = \pi^{-n}a$ where p does not divide n . Let $B \subset L$ be the integral closure of A in L . If $C = B_{\mathfrak{m}}$ for some maximal ideal \mathfrak{m} , then it is clear that $\text{pord}_C(z) = -\text{nord}_C(\pi)$. In particular $A \subset C$ has ramification index divisible by p . It follows that it is p and that $B = C$.

Case (C). Set $k = n/p$. Then we can rewrite the equation as

$$(\pi^k z)^p - \pi^{n-k}(\pi^k z) = a$$

Since $A[y]/(y^p - \pi^{n-k}y - a)$ is a discrete valuation ring weakly unramified over A , the lemma follows. \square

Lemma 15.69.15. *Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Assume*

- (1) $A \subset B$ weakly unramified,
- (2) the characteristic of K is p ,
- (3) M is a degree p Galois extension of L , and
- (4) $\kappa_A = \bigcap_{n \geq 1} \kappa_B^{p^n}$.

Then there exists a totally ramified Galois extension K_1 of K which is a weak solution for $A \rightarrow C$.

Proof. Since the characteristic of L is p we know that M is an Artin-Schreier extension of L (Fields, Lemma 9.22.1). Thus we may pick $z \in M$, $z \notin L$ such that $\xi = z^p - z \in L$. Choose $n \geq 0$ such that $\pi^n \xi \in B$. We pick z such that n is minimal. If $n = 0$, then M is unramified over L (Lemma 15.69.14) and we are done. Thus we have $n > 0$.

Assumption (4) implies that κ_A is perfect. Thus we may choose compatible ring maps $\bar{\sigma} : \kappa_A \rightarrow A/\pi^n A$ and $\bar{\sigma} : \kappa_B \rightarrow B/\pi^n B$ as in Lemma 15.69.13. We lift the second of these to a map of sets $\sigma : \kappa_B \rightarrow B^8$. Then we can write

$$\xi = \sum_{i=n, \dots, 1} \sigma(\lambda_i) \pi^{-i} + b$$

for some $\lambda_i \in \kappa_B$ and $b \in B$. Let

$$I = \{i \in \{n, \dots, 1\} \mid \lambda_i \in \kappa_A\}$$

and

$$J = \{j \in \{n, \dots, 1\} \mid \lambda_j \notin \kappa_A\}$$

We will argue by induction on the size of the finite set J .

The case $J = \emptyset$. Here for all $i \in \{n, \dots, 1\}$ we have $\sigma(\lambda_i) = a_i + \pi^n b_i$ for some $a_i \in A$ and $b_i \in B$ by our choice of σ . Thus $\xi = \pi^{-n}a + b$ for some $a \in A$ and

⁸If B is complete, then we can choose σ to be a ring map. If A is also complete and σ is a ring map, then σ maps κ_A into A .

$b \in B$. If $p|n$, then we write $a = a_0^p + \pi a_1$ for some $a_0, a_1 \in A$ (as the residue field of A is perfect). We compute

$$(z - \pi^{-n/p}a_0)^p - (z - \pi^{-n/p}a_0) = \pi^{-(n-1)}(a_1 + \pi^{n-1-n/p}a_0) + b'$$

for some $b' \in B$. This would contradict the minimality of n . Thus p does not divide n . Consider the degree p extension K_1 of K given by $w^p - w = \pi^{-n}a$. By Lemma 15.69.14 this extension is a totally ramified Galois extension. Thus $L_1 = L \otimes_K K_1$ is a field and $A_1 \subset B_1$ is weakly unramified (Lemma 15.69.5). By Lemma 15.69.14 the ring $M_1 = M \otimes_K K_1$ is either a product of p copies of L_1 (in which case we are done) or a field extension of L_1 of degree p . Moreover, in the second case, M_1 is either weakly unramified over L_1 (in which case we are done) or a degree p totally ramified Galois extension. In this last case the extension M_1/L_1 is generated by the element $z - w$ and

$$(z - w)^p - (z - w) = z^p - z - (w^p - w) = b$$

with $b \in B$ (see above). Thus by Lemma 15.69.14 once more the extension M_1/L_1 is unramified and we conclude that K_1 is a weak solution for $A \rightarrow C$. From now on we assume $J \neq \emptyset$.

Suppose that $j', j \in J$ such that $j' = p^r j$ for some $r > 0$. Then we change our choice of z into

$$z' = z - (\sigma(\lambda_j)\pi^{-j} + \sigma(\lambda_j^p)\pi^{-pj} + \dots + \sigma(\lambda_j^{p^{r-1}})\pi^{-p^{r-1}j})$$

Then ξ changes into $\xi' = (z')^p - (z')$ as follows

$$\xi' = \xi - \sigma(\lambda_j)\pi^{-j} + \sigma(\lambda_j^{p^r})\pi^{-j'} + \text{something in } B$$

Writing $\xi' = \sum_{i=n, \dots, 1} \sigma(\lambda'_i)\pi^{-i} + b'$ as before we find that $\lambda'_i = \lambda_i$ for $i \neq j, j'$ and $\lambda'_j = 0$. Thus the set J has gotten smaller. By induction on the size of J we may assume no such pair j, j' exists. (Please observe that in this procedure we may get thrown back into the case that $J = \emptyset$ we treated above.)

For $j \in J$ write $\lambda_j = \mu_j^{p^{r_j}}$ for some $r_j \geq 0$ and $\mu_j \in \kappa_B$ which is not a p th power. This is possible by our assumption (4). Let $j \in J$ be the unique index such that $j p^{-r_j}$ is maximal. (The index is unique by the result of the preceding paragraph.) Choose $r > \max(r_j + 1)$ and such that $j p^{r-r_j} > n$ for $j \in J$. Choose a separable totally ramified extension $K \subset K_1$ of degree p^r such that the corresponding discrete valuation ring $A_1 \subset K_1$ has uniformizer π' with $(\pi')^{p^r} = \pi + \pi^{n+1}a$ for some $a \in A_1$ (Lemma 15.69.10). Observe that $L_1 = L \otimes_K K_1$ is a field and $B_1 \subset L_1$ a discrete valuation ring totally ramified over B (Lemma 15.69.5). Computing in B_1 we get

$$\xi = \sum_{i \in I} \sigma(\lambda_i)(\pi')^{-ip^r} + \sum_{j \in J} \sigma(\mu_j)^{p^{r_j}} (\pi')^{-jp^r} + b_1$$

for some $b_1 \in B_1$. Note that $\sigma(\lambda_i)$ for $i \in I$ is a q th power modulo π^n , i.e., modulo $(\pi')^{np^r}$. Hence we can rewrite the above as

$$\xi = \sum_{i \in I} x_i^{p^r} (\pi')^{-ip^r} + \sum_{j \in J} \sigma(\mu_j)^{p^{r_j}} (\pi')^{-jp^r} + b_1$$

As in the previous paragraph we change our choice of z into

$$\begin{aligned} z' &= z \\ &- \sum_{i \in I} \left(x_i(\pi')^{-i} + \dots + x_i^{p^{r-1}}(\pi')^{-ip^{r-1}} \right) \\ &- \sum_{j \in J} \left(\sigma(\mu_j)(\pi')^{-jp^{r-r_j}} + \dots + \sigma(\mu_j)^{p^{r_j-1}}(\pi')^{-jp^{r-1}} \right) \end{aligned}$$

to obtain

$$(z')^p - z' = \sum_{i \in I} x_i(\pi')^{-i} + \sum_{j \in J} \sigma(\mu_j)(\pi')^{-jp^{r-r_j}} + b'_1$$

for some $b'_1 \in B_1$. Since there is a unique j such that jp^{r-r_j} is maximal and since jp^{r-r_j} is bigger than $i \in I$ and divisible by p , we see that M_1/L_1 falls into case (C) of Lemma 15.69.14. This finishes the proof. \square

Lemma 15.69.16. *Let A be a ring which contains a primitive p th root of unity ζ . Set $w = 1 - \zeta$. Then*

$$P(z) = \frac{(1 + wz)^p - 1}{w^p} = z^p - z + \sum_{0 < i < p} a_i z^i$$

is an element of $A[z]$ and in fact $a_i \in (w)$. Moreover, we have

$$P(z_1 + z_2 + wz_1z_2) = P(z_1) + P(z_2) + w^p P(z_1)P(z_2)$$

in the polynomial ring $A[z_1, z_2]$.

Proof. It suffices to prove this when

$$A = \mathbf{Z}[\zeta] = \mathbf{Z}[x]/(x^{p-1} + \dots + x + 1)$$

is the ring of integers of the cyclotomic field. The polynomial identity $t^p - 1 = (t - 1)(t - \zeta) \dots (t - \zeta^{p-1})$ (which is proved by looking at the roots on both sides) shows that $t^{p-1} + \dots + t + 1 = (t - \zeta) \dots (t - \zeta^{p-1})$. Substituting $t = 1$ we obtain $p = (1 - \zeta)(1 - \zeta^2) \dots (1 - \zeta^{p-1})$. The maximal ideal $(p, w) = (w)$ is the unique prime ideal of A lying over p (as fields of characteristic p do not have nontrivial p th roots of 1). It follows that $p = uw^{p-1}$ for some unit u . This implies that

$$a_i = \frac{1}{p} \binom{p}{i} uw^{i-1}$$

for $p > i > 1$ and $-1 + a_1 = pw/w^p = u$. Since $P(-1) = 0$ we see that $0 = (-1)^p - u$ modulo (w) . Hence $a_1 \in (w)$ and the proof if the first part is done. The second part follows from a direct computation we omit. \square

Lemma 15.69.17. *Let A be a discrete valuation ring of mixed characteristic $(0, p)$ which contains a primitive p th root of 1. Let $P(t) \in A[t]$ be the polynomial of Lemma 15.69.16. Let $\xi \in K$. Let L be an extension of K obtained by adjoining a root of $P(z) = \xi$. Then L/K is Galois and one of the following happens*

- (1) $L = K$,
- (2) L/K is unramified of degree p ,
- (3) L/K is totally ramified with ramification index p , and
- (4) L/K is weakly unramified, the integral closure B of A in L is a discrete valuation ring and $A \rightarrow B$ induces a purely inseparable residue field extension of degree p .

Let π be a uniformizer of A . We have the following implications:

- (A) If $\xi \in A$, then we are in case (1) or (2).
 (B) If $\xi = \pi^{-n}a$ where $n > 0$ is not divisible by p and a is a unit in A , then we are in case (3).
 (C) If $\xi = \pi^{-n}a$ where $n > 0$ is divisible by p and the image of a in κ_A is not a p th power, then we are in case (4).

Proof. Adjoining a root of $P(z) = \xi$ is the same thing as adjoining a root of $y^p = w^p(1 + \xi)$. Since K contains a primitive p th root of 1 the extension is Galois of order dividing p by the discussion in Fields, Section 9.21. It immediately follows from the discussion in Section 15.68 that we are in one of the cases (1) – (4) listed in the lemma.

Case (A). Here we see that $A \rightarrow A[x]/(P(x) - \xi)$ is a finite étale ring extension. Hence we are in cases (1) or (2).

Case (B). Write $\xi = \pi^{-n}a$ where p does not divide n . Let $B \subset L$ be the integral closure of A in L . If $C = B_{\mathfrak{m}}$ for some maximal ideal \mathfrak{m} , then it is clear that $\text{pord}_C(z) = -\text{nord}_C(\pi)$. In particular $A \subset C$ has ramification index divisible by p . It follows that it is p and that $B = C$.

Case (C). Set $k = n/p$. Then we can rewrite the equation as

$$(\pi^k z)^p - \pi^{n-k}(\pi^k z) + \sum a_i \pi^{n-ik} (\pi^k z)^i = a$$

Since $A[y]/(y^p - \pi^{n-k}y - \sum a_i \pi^{n-ik}y^i - a)$ is a discrete valuation ring weakly unramified over A , the lemma follows. \square

Let A be a discrete valuation ring of mixed characteristic $(0, p)$ containing a primitive p th root of 1. Let $w \in A$ and $P(t) \in A[t]$ be as in Lemma 15.69.16. Let L be a finite extension of K . We say L/K is a *degree p extension of finite level* if L is a degree p extension of K obtained by adjoining a root of the equation $P(z) = \xi$ where $\xi \in K$ is an element with $w^p \xi \in \mathfrak{m}_A$.

This definition is relevant to the discussion in this section due to the following straightforward lemma.

Lemma 15.69.18. *Let $A \subset B \subset C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Assume that*

- (1) A has mixed characteristic $(0, p)$,
- (2) $A \subset B$ is weakly unramified,
- (3) B contains a primitive p th root of 1, and
- (4) M/L is Galois of degree p .

Then there exists a totally ramified Galois extension $K \subset K_1$ which is either a weak solution for $A \rightarrow C$ or is such that M_1/L_1 is a degree p extension of finite level.

Proof. Let $\pi \in A$ be a uniformizer. By Kummer theory (Fields, Lemma 9.21.1) M is obtained from L by adjoining the root of $y^p = b$ for some $b \in L$.

If $\text{ord}_B(b)$ is prime to p , then we choose a degree p separable, totally ramified extension $K \subset K_1$ (for example using Lemma 15.69.10). Let A_1 be the integral closure of A in K_1 . By Lemma 15.69.5 the integral closure B_1 of B in $L_1 = L \otimes_K K_1$ is a discrete valuation ring weakly unramified over A_1 . If $K \subset K_1$ is not a weak solution for $A \rightarrow C$, then the integral closure C_1 of C in $M_1 = M \otimes_K K_1$ is a discrete valuation ring and $B_1 \rightarrow C_1$ has ramification index p . In this case, the

field M_1 is obtained from L_1 by adjoining the p th root of b with $\text{ord}_{B_1}(b)$ divisible by p . Replacing A by A_1 , etc we may assume that $b = \pi^n u$ where $u \in B$ is a unit and n is divisible by p . Of course, in this case the extension M is obtained from L by adjoining the p th root of a unit.

Suppose M is obtained from L by adjoining the root of $y^p = u$ for some unit u of B . If the residue class of u in κ_B is not a p th power, then $B \subset C$ is weakly unramified (Lemma 15.69.11) and we are done. Otherwise, we can replace our choice of y by y/v where v^p and u have the same image in κ_B . After such a replacement we have

$$y^p = 1 + \pi b$$

for some $b \in B$. Then we see that $P(z) = \pi b/w^p$ where $z = (y - 1)/w$. Thus we see that the extension is a degree p extension of finite level with $\xi = \pi b/w^p$. \square

Let A be a discrete valuation ring of mixed characteristic $(0, p)$ containing a primitive p th root of 1. Let $w \in A$ and $P(t) \in A[t]$ be as in Lemma 15.69.16. Let L be a degree p extension of K of finite level. Choose $z \in L$ generating L over K with $\xi = P(z) \in K$. Choose a uniformizer π for A and write $w = u\pi^{e_1}$ for some integer $e_1 = \text{ord}_A(w)$ and unit $u \in A$. Finally, pick $n \geq 0$ such that

$$\pi^n \xi \in A$$

The *level* of L/K is the smallest value of the quantity n/e_1 taking over all z generating L/K with $\xi = P(z) \in K$.

We make a couple of remarks. Since the extension is of finite level we know that we can choose z such that $n < pe_1$. Thus the level is a rational number contained in $[0, p)$. If the level is zero then L/K is unramified by Lemma 15.69.17. Our next goal is to lower the level.

Lemma 15.69.19. *Let $A \subset B \subset C$ be extensions of discrete valuation rings with fractions fields $K \subset L \subset M$. Assume*

- (1) A has mixed characteristic $(0, p)$,
- (2) $A \subset B$ weakly unramified,
- (3) B contains a primitive p th root of 1,
- (4) M/L is a degree p extension of finite level $l > 0$,
- (5) $\kappa_A = \bigcap_{n \geq 1} \kappa_B^{p^n}$.

Then there exists a separable, totally ramified extension K_1 of K such that either K_1 is a weak solution for $A \rightarrow C$, or the extension M_1/L_1 is a degree p extension of finite level $\leq \max(0, l - 1, 2l - p)$.

Proof. Let $\pi \in A$ be a uniformizer. Let $w \in B$ and $P \in B[t]$ be as in Lemma 15.69.16 (for B). Set $e_1 = \text{ord}_B(w)$, so that w and π^{e_1} are associates in B . Pick $z \in M$ generating M over L with $\xi = P(z) \in K$ and n such that $\pi^n \xi \in B$ as in the definition of the level of M over L , i.e., $l = n/e_1$.

The proof of this lemma is completely similar to the proof of Lemma 15.69.15. To explain what is going on, observe that

$$(15.69.19.1) \quad P(z) \equiv z^p - z \pmod{\pi^{-n+e_1} B}$$

for any $z \in L$ such that $\pi^{-n} P(z) \in B$ (use that z has valuation at worst $-n/p$ and the shape of the polynomial P). Moreover, we have

$$(15.69.19.2) \quad \xi_1 + \xi_2 + w^p \xi_1 \xi_2 \equiv \xi_1 + \xi_2 \pmod{\pi^{-2n+pe_1} B}$$

for $\xi_1, \xi_2 \in \pi^{-n}B$. Finally, observe that $n - e_1 = (l - 1)/e_1$ and $-2n + pe_1 = -(2l - p)e_1$. Write $m = n - e_1 \max(0, l - 1, 2l - p)$. The above shows that doing calculations in $\pi^{-n}B/\pi^{-n+m}B$ the polynomial P behaves exactly as the polynomial $z^p - z$. This explains why the lemma is true but we also give the details below.

Assumption (4) implies that κ_A is perfect. Observe that $m \leq e_1$ and hence A/π^m is annihilated by w and hence p . Thus we may choose compatible ring maps $\bar{\sigma} : \kappa_A \rightarrow A/\pi^m A$ and $\bar{\sigma} : \kappa_B \rightarrow B/\pi^m B$ as in Lemma 15.69.13. We lift the second of these to a map of sets $\sigma : \kappa_B \rightarrow B$. Then we can write

$$\xi = \sum_{i=n, \dots, n-m+1} \sigma(\lambda_i) \pi^{-i} + \pi^{-n+m} b$$

for some $\lambda_i \in \kappa_B$ and $b \in B$. Let

$$I = \{i \in \{n, \dots, n - m + 1\} \mid \lambda_i \in \kappa_A\}$$

and

$$J = \{j \in \{n, \dots, n - m + 1\} \mid \lambda_j \notin \kappa_A\}$$

We will argue by induction on the size of the finite set J .

The case $J = \emptyset$. Here for all $i \in \{n, \dots, n - m + 1\}$ we have $\sigma(\lambda_i) = a_i + \pi^{n-m} b_i$ for some $a_i \in A$ and $b_i \in B$ by our choice of $\bar{\sigma}$. Thus $\xi = \pi^{-n} a + \pi^{-n+m} b$ for some $a \in A$ and $b \in B$. If $p|n$, then we write $a = a_0^p + \pi a_1$ for some $a_0, a_1 \in A$ (as the residue field of A is perfect). Set $z_1 = -\pi^{-n/p} a_0$. Note that $P(z_1) \in \pi^{-n} B$ and that $z + z_1 + w z z_1$ is an element generating M over L (note that $w z_1 \neq -1$ as $n < p e_1$). Moreover, by Lemma 15.69.16 we have

$$P(z + z_1 + w z z_1) = P(z) + P(z_1) + w^p P(z) P(z_1) \in K$$

and by equations (15.69.19.1) and (15.69.19.2) we have

$$P(z) + P(z_1) + w^p P(z) P(z_1) \equiv \xi + z_1^p - z_1 \pmod{\pi^{-n+m} B}$$

for some $b' \in B$. This contradict the minimality of $n!$ Thus p does not divide n . Consider the degree p extension K_1 of K given by $P(y) = -\pi^{-n} a$. By Lemma 15.69.17 this extension is separable, totally ramified. Thus $L_1 = L \otimes_K K_1$ is a field and $A_1 \subset B_1$ is weakly unramified (Lemma 15.69.5). By Lemma 15.69.17 the ring $M_1 = M \otimes_K K_1$ is either a product of p copies of L_1 (in which case we are done) or a field extension of L_1 of degree p . Moreover, in the second case, M_1 is either weakly unramified over L_1 (in which case we are done) or a degree p totally ramified Galois extension. In this last case the extension M_1/L_1 is generated by the element $z + y + w z y$ and we see that $P(z + y + w z y) \in L_1$ and

$$\begin{aligned} P(z + y + w z y) &= P(z) + P(y) + w^p P(z) P(y) \\ &\equiv \xi - \pi^{-n} a \pmod{\pi^{-n+m} B_1} \\ &\equiv 0 \pmod{\pi^{-n+m} B_1} \end{aligned}$$

in exactly the same manner as above. By our choice of m this means exactly that M_1/L_1 has level at most $\max(0, l - 1, 2l - p)$. From now on we assume that $J \neq \emptyset$.

Suppose that $j', j \in J$ such that $j' = p^r j$ for some $r > 0$. Then we set

$$z_1 = -\sigma(\lambda_j) \pi^{-j} - \sigma(\lambda_j^p) \pi^{-pj} - \dots - \sigma(\lambda_j^{p^{r-1}}) \pi^{-p^{r-1}j}$$

and we change z into $z' = z + z_1 + wz z_1$. Observe that $z' \in M$ generates M over L and that we have $\xi' = P(z') = P(z) + P(z_1) + wP(z)P(z_1) \in L$ with

$$\xi' \equiv \xi - \sigma(\lambda_j)\pi^{-j} + \sigma(\lambda_j^{p^r})\pi^{-j'} \pmod{\pi^{-n+m}B}$$

by using equations (15.69.19.1) and (15.69.19.2) as above. Writing

$$\xi' = \sum_{i=n, \dots, n-m+1} \sigma(\lambda'_i)\pi^{-i} + \pi^{-n+m}b'$$

as before we find that $\lambda'_i = \lambda_i$ for $i \neq j, j'$ and $\lambda'_j = 0$. Thus the set J has gotten smaller. By induction on the size of J we may assume there is no pair j, j' of J such that j'/j is a power of p . (Please observe that in this procedure we may get thrown back into the case that $J = \emptyset$ we treated above.)

For $j \in J$ write $\lambda_j = \mu_j^{p^{r_j}}$ for some $r_j \geq 0$ and $\mu_j \in \kappa_B$ which is not a p th power. This is possible by our assumption (4). Let $j \in J$ be the unique index such that jp^{-r_j} is maximal. (The index is unique by the result of the preceding paragraph.) Choose $r > \max(r_j + 1)$ and such that $jp^{r-r_j} > n$ for $j \in J$. Let $K \subset K_1$ be the totally ramified extension of degree p^r defined by $(\pi')^{p^r} = \pi$. Observe that π' is the uniformizer of the corresponding discrete valuation ring $A_1 \subset K_1$. Observe that $L_1 = L \otimes_K K_1$ is a field and $B_1 \subset L_1$ a discrete valuation ring totally ramified over B (Lemma 15.69.5). Computing in B_1 we get

$$\xi = \sum_{i \in I} \sigma(\lambda_i)(\pi')^{-ip^r} + \sum_{j \in J} \sigma(\mu_j)^{p^{r_j}} (\pi')^{-jp^r} + \pi^{-n+m}b_1$$

for some $b_1 \in B_1$. Note that $\sigma(\lambda_i)$ for $i \in I$ is a q th power modulo π^m , i.e., modulo $(\pi')^{mp^r}$. Hence we can rewrite the above as

$$\xi = \sum_{i \in I} x_i^{p^r} (\pi')^{-ip^r} + \sum_{j \in J} \sigma(\mu_j)^{p^{r_j}} (\pi')^{-jp^r} + \pi^{-n+m}b_1$$

Similar to our choice in the previous paragraph we set

$$z_1 - \sum_{i \in I} \left(x_i (\pi')^{-i} + \dots + x_i^{p^{r-1}} (\pi')^{-ip^{r-1}} \right) - \sum_{j \in J} \left(\sigma(\mu_j) (\pi')^{-jp^{r-r_j}} + \dots + \sigma(\mu_j)^{p^{r_j-1}} (\pi')^{-jp^{r-1}} \right)$$

and we change our choice of z into $z' = z + z_1 + wz z_1$. Then z' generates M_1 over L_1 and $\xi' = P(z') = P(z) + P(z_1) + w^p P(z)P(z_1) \in L_1$ and a calculation shows that

$$\xi' \equiv \sum_{i \in I} x_i (\pi')^{-i} + \sum_{j \in J} \sigma(\mu_j) (\pi')^{-jp^{r-r_j}} + (\pi')^{(-n+m)p^r} b'_1$$

for some $b'_1 \in B_1$. There is a unique j such that jp^{r-r_j} is maximal and jp^{r-r_j} is bigger than $i \in I$. If $jp^{r-r_j} \leq (n-m)p^r$ then the level of the extension M_1/L_1 is less than $\max(0, l-1, 2l-p)$. If not, then, as p divides jp^{r-r_j} , we see that M_1/L_1 falls into case (C) of Lemma 15.69.17. This finishes the proof. \square

Lemma 15.69.20. *Let $A \subset B \subset C$ be extensions of discrete valuation rings with fraction fields $K \subset L \subset M$. Assume*

- (1) *the residue field k of A is algebraically closed of characteristic $p > 0$,*
- (2) *A and B are complete,*
- (3) *$A \rightarrow B$ is weakly unramified,*
- (4) *M is a finite extension of L ,*
- (5) *$k = \bigcap_{n \geq 1} \kappa_B^{p^n}$*

Then there exists a finite extension $K \subset K_1$ which is a weak solution for $A \rightarrow C$.

Proof. Let M' be any finite extension of L and consider the integral closure C' of B in M' . Then C' is finite over B as B is Nagata by Algebra, Lemma 10.150.22. Moreover, C' is a discrete valuation ring, see discussion in Remark 15.69.1. Moreover C' is complete as a B -module, hence complete as a discrete valuation ring, see Algebra, Section 10.93. It follows in particular that C is the integral closure of B in M (by definition of valuation rings as maximal for the relation of domination).

Let $M \subset M'$ be a finite extension and let $C' \subset M'$ be the integral closure of B as above. By Lemma 15.69.6 it suffices to prove the result for $A \rightarrow B \rightarrow C'$. Hence we may assume that M/L is normal, see Fields, Lemma 9.15.3.

If M/L is normal, we can find a chain of finite extensions

$$L = L^0 \subset L^1 \subset L^2 \subset \dots \subset L^r = M$$

such that each extension L^{j+1}/L^j is either: (a) purely inseparable of degree p , (b) totally ramified Galois of degree p , (c) totally ramified Galois cyclic of order prime to p , or (d) Galois and unramified. Namely, since M/L is normal we can write it as a compositum of a Galois extension and a purely inseparable extension (Fields, Lemma 9.24.3). For the purely inseparable extension the existence of the filtration is clear. In the Galois case, note that G is “the” decomposition group and let $I \subset G$ be the inertia group. Then on the one hand I is solvable by Lemma 15.68.11 and on the other hand the extension M^I/L is unramified by Lemma 15.68.14. This proves we have a filtration as stated.

We are going to argue by induction on the integer r . Suppose that we can find a finite extension $K \subset K_1$ which is a weak solution for $A \rightarrow B^1$ where B^1 is the integral closure of B in L^1 . Let K'_1 be the normal closure of K_1/K (Fields, Lemma 9.15.3). Since A is complete and the residue field of A is algebraically closed we see that $K_1 \subset K'_1$ is separable and totally ramified (some details omitted). Hence $K \subset K'_1$ is a weak solution for $A \rightarrow B^1$ as well by Lemma 15.69.5. In other words, we may and do assume that K_1 is a normal extension of K . Having done so we consider the sequence

$$L_1^0 = (L^0 \otimes_K K_1)_{red} \subset L_1^1 = (L^1 \otimes_K K_1)_{red} \subset \dots \subset L_1^r = (L^r \otimes_K K_1)_{red}$$

and the corresponding integral closures B_1^i . Note that $C_1 = B_1^r$ is a product of discrete valuation rings which are transitively permuted by $G = \text{Aut}(K_1/K)$ by Lemma 15.69.8. In particular all the extensions of discrete valuation rings $A_1 \rightarrow (C_1)_{\mathfrak{m}}$ are isomorphic and a solution for one will be a solution for all of them. We can apply the induction hypothesis to the sequence

$$A_1 \rightarrow (B_1^1)_{B_1^1 \cap \mathfrak{m}} \rightarrow (B_1^2)_{B_1^2 \cap \mathfrak{m}} \rightarrow \dots \rightarrow (B_1^r)_{B_1^r \cap \mathfrak{m}} = (C_1)_{\mathfrak{m}}$$

to get a solution $K_1 \subset K_2$ for $A_1 \rightarrow (C_1)_{\mathfrak{m}}$. The extension $K \subset K_2$ will then be a solution for $A \rightarrow C$ by what we said before. Note that the induction hypothesis applies: the ring map $A_1 \rightarrow (B_1^1)_{B_1^1 \cap \mathfrak{m}}$ is weakly unramified by our choice of K_1 and the sequence of fraction field extensions each still have one of the properties (a), (b), (c), or (d) listed above. Moreover, observe that for any finite extension $\kappa_B \subset \kappa$ we still have $k = \bigcap \kappa^{p^n}$.

Thus everything boils down to finding a weak solution when the field extension $L \subset M$ satisfies one of the properties (a), (b), (c), or (d).

Case (d). This case is trivial as here $B \rightarrow C$ is unramified already.

Case (c). This is the tamely ramified case. Say M/L is cyclic of order n prime to p . Choose uniformizers $\pi \in A$ and $\pi_C \in C$. Then $\pi_C^n = u\pi$ for some unit u of C . Let $K_1 = K[\pi^{1/n}]$. Then the ring $M_1 = M \otimes_K K_1$ is a product of fields each of which is obtained from M by adjoining a root of $z^n - u = 0$. Since $C[x]/(x^n - u)$ is finite étale over C we conclude that each of these extensions is unramified over M . Considering the commutative diagram

$$\begin{array}{ccc} M & \longrightarrow & M_1 \\ \uparrow & & \uparrow \\ L & \longrightarrow & L_1 \end{array}$$

and using multiplicativity of ramification indices, it follows that each factor of M_1 is unramified over L_1 as well.

Case (b). We divide this case into the mixed characteristic case and the equicharacteristic case. In the equicharacteristic case this is Lemma 15.69.15. In the mixed characteristic case, we first replace K by a finite extension to get to the situation where M/L is a degree p extension of finite level using Lemma 15.69.18. Then the level is a rational number $l \in [0, p)$, see discussion preceding Lemma 15.69.19. If the level is 0, then $B \rightarrow C$ is weakly unramified and we're done. If not, then we can replacing the field K by a finite extension to obtain a new situation with level $l' \leq \max(0, l - 1, 2l - p)$ by Lemma 15.69.19. If $l = p - \epsilon$ for $\epsilon < 1$ then we see that $l' \leq p - 2\epsilon$. Hence after a finite number of replacements we obtain a case with level $\leq p - 1$. Then after at most $p - 1$ more such replacements we reach the situation where the level is zero.

Case (a) is Lemma 15.69.12. This is the only case where we possibly need a purely inseparable extension of K , namely, in case (2) of the statement of the lemma we win by adjoining a p th power of the element π . This finishes the proof of the lemma. \square

At this point we have collected all the lemmas we need to prove the main result of this section.

Theorem 15.69.21 (Epp). *Let $A \subset B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If the characteristic of κ_A is $p > 0$, assume that every element of*

$$\bigcap_{n \geq 1} \kappa_B^{p^n}$$

is separable algebraic over κ_A . Then there exists a finite extension $K \subset K_1$ which is a weak solution for $A \rightarrow B$ as defined in Definition 15.69.2.

Proof. We first prove the result in case the characteristic of κ_A is zero as the result is easy in that case. Namely, suppose the ramification index is e . Choose a uniformizer $\pi_B \in B$ and a uniformizer $\pi \in A$. Write $\pi_B^e = u\pi$ for some unit $u \in B$. Let $K \subset K_1$ be the totally ramified extension obtained by adjoining an e th root of π (see Lemma 15.69.9). Then $L_1 = L \otimes_K K_1$ is a product of fields, each obtained by adjoining a root of $z^e = u$ to L . However, since $B[x]/(x^e - u)$ is finite étale over B (since the characteristic is zero) we conclude that each of these extensions

is unramified over L . Considering the commutative diagram

$$\begin{array}{ccc} L & \longrightarrow & L_1 \\ \uparrow & & \uparrow \\ K & \longrightarrow & K_1 \end{array}$$

and using multiplicativity of ramification indices, it follows that each factor of L_1 is unramified over K_1 as well. This finishes the proof in residue characteristic 0.

From now on we let p be a prime number and we assume that κ_A has characteristic p . We first apply Lemma 15.69.7 to reduce to the case that A and B have separably closed residue fields. Since κ_A and κ_B are replaced by their separable algebraic closures by this procedure we see that we obtain

$$\kappa_A \supset \bigcap_{n \geq 1} \kappa_B^{p^n}$$

from the condition of the theorem.

Let $\pi \in A$ be a uniformizer. Let A^\wedge and B^\wedge be the completions of A and B . We have a commutative diagram

$$\begin{array}{ccc} B & \longrightarrow & B^\wedge \\ \uparrow & & \uparrow \\ A & \longrightarrow & A^\wedge \end{array}$$

of extensions of discrete valuation rings. Let K^\wedge be the fraction field of A^\wedge . Suppose that we can find a finite extension $K^\wedge \subset M$ which is (a) a weak solution for $A^\wedge \rightarrow B^\wedge$ and (b) a compositum of a separable extension and an extension obtained by adjoining a p -power root of π . Then by Lemma 15.68.16 we can find a finite extension $K \subset K_1$ such that $K^\wedge \otimes_K K_1 = M$. Let A_1 , resp. A_1^\wedge be the integral closure of A , resp. A^\wedge in K_1 , resp. M . Since $A \rightarrow A^\wedge$ is formally smooth (Lemma 15.68.4) we see that $A_1 \rightarrow A_1^\wedge$ is formally smooth (Lemma 15.69.4 and A_1 and A_1^\wedge are discrete valuation rings by discussion in Remark 15.69.1). We conclude from Lemma 15.69.6 part (2) that $K \subset K_1$ is a weak solution for $A \rightarrow B^\wedge$. Applying Lemma 15.69.6 part (1) we see that $K \subset K_1$ is a weak solution for $A \rightarrow B$.

Thus we may assume A and B are complete discrete valuation rings with separably closed residue fields of characteristic p and with $\kappa_A \supset \bigcap_{n \geq 1} \kappa_B^{p^n}$. We are also given a uniformizer $\pi \in A$ and we have to find a weak solution for $A \rightarrow B$ which is a compositum of a separable extension and a field obtained by taking p -power roots of π . Note that the second condition is automatic if A has mixed characteristic.

Set $k = \bigcap_{n \geq 1} \kappa_B^{p^n}$. Observe that k is an algebraically closed field of characteristic p . If A has mixed characteristic let Λ be a Cohen ring for k and in the equicharacteristic case set $\Lambda = k[[t]]$. We can choose a ring map $\Lambda \rightarrow A$ which maps t to π in the equicharacteristic case. In the equicharacteristic case this follows from the Cohen structure theorem (Algebra, Theorem 10.149.8) and in the mixed characteristic case this follows as $\mathbf{Z}_p \rightarrow \Lambda$ is formally smooth in the adic topology (Lemmas 15.68.4 and 15.27.5). Applying Lemma 15.69.6 we see that it suffices to prove the existence of a weak solution for $\Lambda \rightarrow B$ which in the equicharacteristic p case is a compositum of a separable extension and a field obtained by taking p -power roots of t . However,

since $\Lambda = k[[t]]$ in the equicharacteristic case and any extension of $k((t))$ is such a compositum, we can now drop this requirement!

Thus we arrive at the situation where A and B are complete, the residue field k of A is algebraically closed of characteristic $p > 0$, we have $k = \bigcap \kappa_B^{p^n}$, and in the mixed characteristic case p is a uniformizer of A (i.e., A is a Cohen ring for k). If A has mixed characteristic choose a Cohen ring Λ for κ_B and in the equicharacteristic case set $\Lambda = \kappa_B[[t]]$. Arguing as above we may choose a ring map $A \rightarrow \Lambda$ lifting $k \rightarrow \kappa_B$ and mapping a uniformizer to a uniformizer. Since $k \subset \kappa_B$ is separable the ring map $A \rightarrow \Lambda$ is formally smooth in the adic topology (Lemma 15.68.4). Hence we can find a ring map $\Lambda \rightarrow B$ such that the composition $A \rightarrow \Lambda \rightarrow B$ is the given ring map $A \rightarrow B$ (see Lemma 15.27.5). Since Λ and B are complete discrete valuation rings with the same residue field, B is finite over Λ (Algebra, Lemma 10.93.17). This reduces us to the special case discussed in Lemma 15.69.20. \square

Lemma 15.69.22. *Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. Assume B is essentially of finite type over A . Let $K \subset K'$ be an algebraic extension of fields such that the integral closure A' of A in K' is Noetherian. Then the integral closure B' of B in $L' = (L \otimes_K K')_{red}$ is Noetherian as well. Moreover, the map $\text{Spec}(B') \rightarrow \text{Spec}(A')$ is surjective and the corresponding residue field extensions are finitely generated field extensions.*

Proof. Let $A \rightarrow C$ be a finite type ring map such that B is a localization of C at a prime \mathfrak{p} . Then $C' = C \otimes_A A'$ is a finite type A' -algebra, in particular Noetherian. Since $A \rightarrow A'$ is integral, so is $C \rightarrow C'$. Thus $B = C_{\mathfrak{p}} \subset C'_{\mathfrak{p}}$ is integral too. It follows that the dimension of $C'_{\mathfrak{p}}$ is 1 (Algebra, Lemma 10.108.4). Of course $C'_{\mathfrak{p}}$ is Noetherian. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_n$ be the minimal primes of $C'_{\mathfrak{p}}$. Let B'_i be the integral closure of $B = C_{\mathfrak{p}}$, or equivalently by the above of $C'_{\mathfrak{p}}$ in the field of fractions of $C'_{\mathfrak{p}}/\mathfrak{q}_i$. It follows from Krull-Akizuki (Algebra, Lemma 10.115.11 applied to the finitely many localizations of $C'_{\mathfrak{p}}$ at its maximal ideals) that each B'_i is Noetherian. Moreover the residue field extensions in $C'_{\mathfrak{p}} \rightarrow B'_i$ are finite by Algebra, Lemma 10.115.9. Finally, we observe that $B' = \prod B'_i$ is the integral closure of B in $L' = (L \otimes_K K')_{red}$. \square

Proposition 15.69.23. *Let $A \rightarrow B$ be an extension of discrete valuation rings with fraction fields $K \subset L$. If B is essentially of finite type over A , then there exists a finite extension $K \subset K_1$ which is a solution for $A \rightarrow B$ as defined in Definition 15.69.2.*

Proof. Observe that a weak solution is a solution if the residue field of A is perfect, see Lemma 15.68.4. Thus the proposition follows immediately from Theorem 15.69.21 if the residue characteristic of A is 0 (and in fact we do not need the assumption that $A \rightarrow B$ is essentially of finite type). If the residue characteristic of A is $p > 0$ we will also deduce it from Epp's theorem.

Let $x_i \in A$, $i \in I$ be a set of elements mapping to a p -base of the residue field κ of A . Set

$$A' = \bigcup_{n \geq 1} A[t_{i,n}]/(t_{i,n}^p - x_i)$$

where the transition maps send $t_{i,n+1}$ to $t_{i,n}^p$. Observe that A' is a filtered colimit of weakly unramified finite extensions of discrete valuation rings over A . Thus A'

is a discrete valuation ring and $A \rightarrow A'$ is weakly unramified. By construction the residue field $\kappa' = A'/\mathfrak{m}_A A'$ is the perfection of κ .

Let $K' = f.f.(A')$. We may apply Lemma 15.69.22 to the extension $K \subset K'$. Thus B' is a finite product of Dedekind domains. Let $\mathfrak{m}_1, \dots, \mathfrak{m}_n$ be the maximal ideals of B' . Using Epp's theorem (Theorem 15.69.21) we find a weak solution $K' = f.f.(A') \subset K'_i$ for each of the extensions $A' \subset B'_{\mathfrak{m}_i}$. Since the residue field of A' is perfect, these are actually solutions. Let $K' \subset K'_1$ be a finite extension which contains each K'_i . Then $K' \subset K'_1$ is still a solution for each $A' \subset B'_{\mathfrak{m}_i}$ by Lemma 15.69.4.

Let A'_1 be the integral closure of A in K'_1 . Note that A'_1 is a Dedekind domain by the discussion in Remark 15.69.1 applied to $K' \subset K'_1$. Thus Lemma 15.69.22 applies to $K \subset K'_1$. Therefore the integral closure B'_1 of B in $L'_1 = (L \otimes_K K'_1)_{red}$ is a Dedekind domain and because $K' \subset K'_1$ is a solution for each $A' \subset B'_{\mathfrak{m}_i}$ we see that $(A'_1)_{A'_1 \cap \mathfrak{m}} \rightarrow (B'_1)_{\mathfrak{m}}$ is formally smooth for each maximal ideal $\mathfrak{m} \subset B'_1$.

By construction, the field K'_1 is a filtered colimit of finite extensions of K . Say $K'_1 = \text{colim}_{i \in I} K_i$. For each i let A_i , resp. B_i be the integral closure of A , resp. B in K_i , resp. $L_i = (L \otimes_K K_i)_{red}$. Then it is clear that

$$A'_1 = \text{colim } A_i \quad \text{and} \quad B'_1 = \text{colim } B_i$$

Since the ring maps $A_i \rightarrow A'_1$ and $B_i \rightarrow B'_1$ are injective integral ring maps and since A'_1 and B'_1 have finite spectra, we see that for all i large enough the ring maps $A_i \rightarrow A'_1$ and $B_i \rightarrow B'_1$ are bijective on spectra. Once this is true, for all i large enough the maps $A_i \rightarrow A'_1$ and $B_i \rightarrow B'_1$ will be weakly unramified (once the uniformizer is in the image). It follows from multiplicativity of ramification indices that $A_i \rightarrow B_i$ induces weakly unramified maps on all localizations at maximal ideals of B_i for such i . Increasing i a bit more we see that

$$B_i \otimes_{A_i} A'_1 \longrightarrow B'_1$$

induces surjective maps on residue fields (because the residue fields of B'_1 are finitely generated over those of A'_1 by Lemma 15.69.22). Picture of residue fields at maximal ideals lying under a chosen maximal ideal of B'_1 :

$$\begin{array}{ccccccc} \kappa_{B_i} & \longrightarrow & \kappa_{B_{i'}} & \longrightarrow & \dots & & \kappa_{B'_1} \\ \uparrow & & \uparrow & & & & \uparrow \\ \kappa_{A_i} & \longrightarrow & \kappa_{A_{i'}} & \longrightarrow & \dots & & \kappa_{A'_1} \end{array}$$

Thus κ_{B_i} is a finitely generated extension of κ_{A_i} such that the compositum of κ_{B_i} and $\kappa_{A'_1}$ in $\kappa_{B'_1}$ is separable over $\kappa_{A'_1}$. Then that happens already at a finite stage: for example, say $\kappa_{B'_1}$ is finite separable over $\kappa_{A'_1}(x_1, \dots, x_n)$, then just increase i such that x_1, \dots, x_n are in κ_{B_i} and such that all generators satisfy separable polynomial equations over $\kappa_{A_i}(x_1, \dots, x_n)$. This means that $A_i \rightarrow B_i$ is formally smooth at all maximal ideals of B_i and the proof is complete. \square

15.70. Picard groups of rings

Let R be a ring. An *invertible* R -module is a finite locally free module of rank 1. The set of isomorphism classes of these modules is often called the *class group* or *Picard group* of R . The group structure is determined by assigning to the isomorphism

classes of the invertible modules L and L' the isomorphism class of $L \otimes_R L'$. The inverse of an invertible module L is the module

$$L^{-1} = \text{Hom}_R(L, R),$$

namely, the evaluation map $L \otimes_R L^{-1} \rightarrow R$ is an isomorphism. Let us denote the Picard group of R by $\text{Pic}(R)$.

Recall that we have defined in Algebra, Section 10.53 a group $K_0(R)$ as the free group on isomorphism classes of finite projective R -modules modulo the relations $[M'] + [M''] = [M' \oplus M'']$.

Lemma 15.70.1. *Let R be a ring. There is a map*

$$\det : K_0(R) \longrightarrow \text{Pic}(R)$$

which maps $[M]$ to the class of the invertible module $\wedge^n(M)$ if M is a finite locally free module of rank n .

Proof. Let M be a finite projective R -module. There exists a product decomposition $R = R_0 \times \dots \times R_t$ such that in the corresponding decomposition $M = M_0 \times \dots \times M_t$ of M we have that M_i is finite locally free of rank i over R_i . This follows from Algebra, Lemma 10.75.2 (to see that the rank is locally constant) and Algebra, Lemmas 10.20.3 and 10.22.3 (to decompose R into a product). In this situation we define

$$\det(M) = \wedge_{R_0}^0(M_0) \times \dots \times \wedge_{R_t}^t(M_t)$$

as an R -module. This is a finite locally free module of rank 1 as each term is finite locally free of rank 1. To finish the proof we have to show that

$$\det(M' \oplus M'') \cong \det(M') \otimes \det(M'')$$

whenever M' and M'' are finite projective R -modules. Decompose R into a product of rings R_{ij} such that $M' = \prod M'_{ij}$ and $M'' = \prod M''_{ij}$ where M'_{ij} has rank i and M''_{ij} has rank j . This reduces us to the case where M' and M'' have constant rank say i and j . In this case we have to prove that

$$\wedge^{i+j}(M' \oplus M'') \cong \wedge^i(M') \otimes \wedge^j(M'')$$

the proof of which we omit. □

Lemma 15.70.2. *Let R be a ring. There is a map*

$$c : \text{perfect complexes over } R \longrightarrow K_0(R)$$

with the following properties

- (1) $c(K[n]) = (-1)^n c(K)$ for a perfect complex K ,
- (2) if $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle of perfect complexes, then $c(L) = c(K) + c(M)$,
- (3) if K is represented by a finite complex M^\bullet consisting of finite projective modules, then $c(K) = \sum (-1)^i [M_i]$.

Proof. Let K be a perfect object of $D(R)$. By definition we can represent K by a finite complex M^\bullet of finite projective R -modules. We define c by setting

$$c(K) = \sum (-1)^i [M_i]$$

in $K_0(R)$. Of course we have to show that this is well defined, but once it is well defined, then (1) and (3) are immediate. For the moment we view the map c as defined on complexes of finite projective R -modules.

Suppose that $L^\bullet \rightarrow M^\bullet$ is a surjective map of finite complexes of finite projective R -modules. Let K^\bullet be the kernel. Then we obtain short exact sequences of R -modules

$$0 \rightarrow K^n \rightarrow L^n \rightarrow M^n \rightarrow 0$$

which are split because M^n is projective. Hence K^\bullet is also a finite complex of finite projective R -modules and $c(L^\bullet) = c(K^\bullet) + c(M^\bullet)$ in $K_0(R)$.

Suppose given finite complex M^\bullet of finite projective R -modules which is acyclic. Say $M^n = 0$ for $n \notin [a, b]$. Then we can break M^\bullet into short exact sequences

$$\begin{aligned} 0 \rightarrow M^a \rightarrow M^{a+1} \rightarrow N^{a+1} \rightarrow 0, \\ 0 \rightarrow N^{a+1} \rightarrow M^{a+2} \rightarrow N^{a+3} \rightarrow 0, \\ \dots \\ 0 \rightarrow N^{b-3} \rightarrow M^{b-2} \rightarrow N^{b-2} \rightarrow 0, \\ 0 \rightarrow N^{b-2} \rightarrow M^{b-1} \rightarrow M^b \rightarrow 0 \end{aligned}$$

Arguing by descending induction we see that N^{b-2}, \dots, N^{a+1} are finite projective R -modules, the sequences are split exact, and

$$c(M^\bullet) = \sum (-1)[M^n] = \sum (-1)^n ([N^{n-1}] + [N^n]) = 0$$

Thus our construction gives zero on acyclic complexes.

It follows formally from the results of the preceding two paragraphs that c is well defined and satisfies (2). Namely, suppose the finite complexes M^\bullet and L^\bullet of finite projective R -modules represent the same object of $D(R)$. Then we can represent the isomorphism by a map $f : M^\bullet \rightarrow L^\bullet$ of complexes, see *Derived Categories*, Lemma 13.19.8. We obtain a short exact sequence of complexes

$$0 \rightarrow L^\bullet \rightarrow C(f)^\bullet \rightarrow K^\bullet[1] \rightarrow 0$$

see *Derived Categories*, Definition 13.9.1. Since f is a quasi-isomorphism, the cone $C(f)^\bullet$ is acyclic (this follows for example from the discussion in *Derived Categories*, Section 13.12). Hence

$$0 = c(C(f)^\bullet) = c(L^\bullet) + c(K^\bullet[1]) = c(L^\bullet) - c(K^\bullet)$$

as desired. We omit the proof of (2) which is similar. \square

Lemma 15.70.3. *Let R be a regular local ring. Let $f \in R$. Then $\text{Pic}(R_f) = 0$.*

Proof. Let L be an invertible R_f -module. In particular L is a finite R_f -module. There exists a finite R -module M such that $M_f \cong L$, see *Algebra*, Lemma 10.122.3. By *Algebra*, Proposition 10.106.1 we see that M has a finite free resolution F_\bullet over R . It follows that L is quasi-isomorphic to a finite complex of free R_f -modules. Hence by Lemma 15.70.2 we see that $[L] = n[R_f]$ in $K_0(R)$ for some $n \in \mathbf{Z}$. Applying the map of Lemma 15.70.1 we see that L is trivial. \square

Lemma 15.70.4. *A regular local ring is a UFD.*

Proof. Recall that a regular local ring is a domain, see Algebra, Lemma 10.102.2. We will prove the unique factorization property by induction on the dimension of the regular local ring R . If $\dim(R) = 0$, then R is a field and in particular a UFD. Assume $\dim(R) > 0$. Let $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$. Then $R/(x)$ is regular by Algebra, Lemma 10.102.3, hence a domain by Algebra, Lemma 10.102.2, hence x is a prime element. Let $\mathfrak{p} \subset R$ be a height 1 prime. We have to show that \mathfrak{p} is principal, see Algebra, Lemma 10.116.6. We may assume $x \notin \mathfrak{p}$, since if $x \in \mathfrak{p}$, then $\mathfrak{p} = (x)$ and we are done. For every nonmaximal prime $\mathfrak{q} \subset R$ the local ring $R_{\mathfrak{q}}$ is a regular local ring, see Algebra, Lemma 10.106.6. By induction we see that $\mathfrak{p}R_{\mathfrak{q}}$ is principal. In particular, the R_x -module $\mathfrak{p}_x = \mathfrak{p}R_x \subset R_x$ is a finitely presented R_x -module whose localization at any prime is free of rank 1. By Algebra, Lemma 10.75.2 we see that \mathfrak{p}_x is an invertible R_x -module. By Lemma 15.70.3 we see that $\mathfrak{p}_x = (y)$ for some $y \in R_x$. We can write $y = x^e f$ for some $f \in \mathfrak{p}$ and $e \in \mathbf{Z}$. Factor $f = a_1 \dots a_r$ into irreducible elements of R (Algebra, Lemma 10.116.3). Since \mathfrak{p} is prime, we see that $a_i \in \mathfrak{p}$ for some i . Since $\mathfrak{p}_x = (y)$ is prime and $a_i|y$ in R_x , it follows that \mathfrak{p}_x is generated by a_i in R_x , i.e., the image of a_i in R_x is prime. As x is a prime element, we find that a_i is prime in R by Algebra, Lemma 10.116.7. Since $(a_i) \subset \mathfrak{p}$ and \mathfrak{p} has height 1 we conclude that $(a_i) = \mathfrak{p}$ as desired. \square

15.71. Extensions of valuation rings

This section is the analogue of Section 15.68 for general valuation rings.

Definition 15.71.1. We say that $A \rightarrow B$ or $A \subset B$ is an *extension of valuation rings* if A and B are valuation rings and $A \rightarrow B$ is injective and local. Such an extension induces a commutative diagram

$$\begin{array}{ccc} A \setminus \{0\} & \longrightarrow & B \setminus \{0\} \\ v \downarrow & & \downarrow v \\ \Gamma_A & \longrightarrow & \Gamma_B \end{array}$$

where Γ_A and Γ_B are the value groups. We say that B is *weakly unramified* over A if the lower horizontal arrow is a bijection. If the extension of residue fields $\kappa_A = A/\mathfrak{m}_A \subset \kappa_B = B/\mathfrak{m}_B$ is finite, then we set $f = [\kappa_B : \kappa_A]$ and we call it the *residual degree* or *residue degree* of the extension $A \subset B$.

Note that $\Gamma_A \rightarrow \Gamma_B$ is injective, because the units of A are the inverse of the units of B under the map $A \rightarrow B$. Note also, that we do not require the extension of fraction fields to be finite.

Lemma 15.71.2. *Let $A \subset B$ be an extension of valuation rings with fraction fields $K \subset L$. If the extension $K \subset L$ is finite, then the residue field extension is finite, the index of Γ_A in Γ_B is finite, and*

$$[\Gamma_B : \Gamma_A][\kappa_B : \kappa_A] \leq [L : K].$$

Proof. Let $b_1, \dots, b_n \in B$ be units whose images in κ_B are linearly independent over κ_A . Let $c_1, \dots, c_m \in B$ be nonzero elements whose images in Γ_B/Γ_A are pairwise distinct. We claim that $b_i c_j$ are K -linearly independent in L . Namely, we claim a sum

$$\sum a_{ij} b_i c_j$$

with $a_{ij} \in K$ not all zero cannot be zero. Choose (i_0, j_0) with $v(a_{i_0 j_0} b_{i_0} c_{j_0})$ minimal. Replace a_{ij} by $a_{ij}/a_{i_0 j_0}$, so that $a_{i_0 j_0} = 1$. Let

$$P = \{(i, j) \mid v(a_{ij} b_i c_j) = v(a_{i_0 j_0} b_{i_0} c_{j_0})\}$$

By our choice of c_1, \dots, c_m we see that $(i, j) \in P$ implies $j = j_0$. Hence if $(i, j) \in P$, then $v(a_{ij}) = v(a_{i_0 j_0}) = 0$, i.e., a_{ij} is a unit. By our choice of b_1, \dots, b_n we see that

$$\sum_{(i,j) \in P} a_{ij} b_i$$

is a unit in B . Thus the valuation of $\sum_{(i,j) \in P} a_{ij} b_i c_j$ is $v(c_{j_0}) = v(a_{i_0 j_0} b_{i_0} c_{j_0})$. Since the terms with $(i, j) \notin P$ in the first displayed sum have strictly bigger valuation, we conclude that this sum cannot be zero, thereby proving the lemma. \square

Lemma 15.71.3. *Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local normal domains. Let $f \in A$ and $h \in B$ such that $f = wh^n$ for some $n > 1$ and some unit w of B . Assume that for every height 1 prime $\mathfrak{p} \subset A$ there is a height 1 prime $\mathfrak{q} \subset B$ lying over \mathfrak{p} such that the extension $A_{\mathfrak{p}} \subset B_{\mathfrak{q}}$ is weakly unramified. Then $f = ug^n$ for some $g \in A$ and unit u of A .*

Proof. The local rings of A and B at height 1 primes are discrete valuation rings (Algebra, Lemma 10.115.6). Thus the assumption makes sense (via Definition 15.68.1). Let $\mathfrak{p}_1, \dots, \mathfrak{p}_r$ be the primes of A minimal over f . These have height 1 by Algebra, Lemma 10.59.10. For each i let $\mathfrak{q}_{i,j} \subset B$, $j = 1, \dots, r_i$ be the height 1 primes of B lying over \mathfrak{p}_i . Say we number them so that $A_{\mathfrak{p}_i} \rightarrow B_{\mathfrak{q}_{i,1}}$ is weakly unramified. Since f maps to an n th power times a unit in $B_{\mathfrak{q}_{i,1}}$ we see that the valuation v_i of f in $A_{\mathfrak{p}_i}$ is divisible by n . Consider the exact sequence

$$0 \rightarrow I \rightarrow A \rightarrow \prod_{i=1, \dots, r} A_{\mathfrak{p}_i} / \mathfrak{p}_i^{v_i/n} A_{\mathfrak{p}_i}$$

Applying the exact functor $- \otimes_A B$ we obtain

$$0 \rightarrow I \otimes_A B \rightarrow B \rightarrow \prod_{i=1, \dots, r} \prod_{j=1, \dots, r_i} B_{\mathfrak{q}_{i,j}} / \mathfrak{q}_{i,j}^{e_{i,j} v_i/n} A_{\mathfrak{p}_i}$$

where $e_{i,j}$ is the ramification index of $A_{\mathfrak{p}_i} \rightarrow B_{\mathfrak{q}_{i,j}}$. It follows that $I \otimes_A B$ is the set of elements h' of B which have valuation $\geq e_{i,j} v_i/n$ at $\mathfrak{q}_{i,j}$. Since $f = wh^n$ in B we see that h has valuation $e_{i,j} v_i/n$ at $\mathfrak{q}_{i,j}$. Thus $h'/h \in B$ by Algebra, Lemma 10.146.6. It follows that $I \otimes_A B$ is a free B -module of rank 1. Therefore I is a free A -module of rank 1, see Algebra, Lemma 10.75.5. Let $g \in I$ be a generator. Then we see that g and h differ by a unit in B . Working backwards we conclude that the valuation of g in $A_{\mathfrak{p}_i}$ is v_i/n . Hence g^n and f differ by a unit in A (by Algebra, Lemma 10.146.6) as desired. \square

Lemma 15.71.4. *Let A be a valuation ring. Let $A \rightarrow B$ be an étale ring map and let $\mathfrak{m} \subset B$ be a prime lying over the maximal ideal of A . Then $A \subset B_{\mathfrak{m}}$ is an extension of valuation rings which is weakly unramified.*

Proof. The ring A has weak dimension ≤ 1 by Lemma 15.67.17. Then B has weak dimension ≤ 1 by Lemmas 15.67.4 and 15.67.13. hence the local ring $B_{\mathfrak{m}}$ is a valuation ring by Lemma 15.67.17. Since the extension $f.f.(A) \subset f.f.(B_{\mathfrak{m}})$ is finite, we see that the Γ_A has finite index in the value group of $B_{\mathfrak{m}}$. Thus for every $h \in B_{\mathfrak{m}}$ there exists an $n > 0$, an element $f \in A$, and a unit $w \in B_{\mathfrak{m}}$ such that $f = wh^n$ in $B_{\mathfrak{m}}$. We will show that this implies $f = ug^n$ for some $g \in A$ and unit

$u \in A$; this will show that the value groups of A and $B_{\mathfrak{m}}$ agree, as claimed in the lemma.

Write $A = \text{colim } A_i$ as the colimit of its local subrings which are essentially of finite type over \mathbf{Z} . Since A is a normal domain (Algebra, Lemma 10.48.10), we may assume that each A_i is normal (here we use that taking normalizations the local rings remain essentially of finite type over \mathbf{Z} by Algebra, Proposition 10.150.31). For some i we can find an étale extension $A_i \rightarrow B_i$ such that $B = A \otimes_{A_i} B_i$, see Algebra, Lemma 10.138.3. Let \mathfrak{m}_i be the intersection of B_i with \mathfrak{m} . Then we may apply Lemma 15.71.3 to the ring map $A_i \rightarrow (B_i)_{\mathfrak{m}_i}$ to conclude. The hypotheses of the lemma are satisfied because:

- (1) A_i and $(B_i)_{\mathfrak{m}_i}$ are Noetherian as they are essentially of finite type over \mathbf{Z} ,
- (2) $A_i \rightarrow (B_i)_{\mathfrak{m}_i}$ is flat as $A_i \rightarrow B_i$ is étale,
- (3) B_i is normal as $A_i \rightarrow B_i$ is étale, see Algebra, Lemma 10.151.7,
- (4) for every height 1 prime of A_i there exists a height 1 prime of $(B_i)_{\mathfrak{m}_i}$ lying over it by Algebra, Lemma 10.109.2 and the fact that $\text{Spec}((B_i)_{\mathfrak{m}_i}) \rightarrow \text{Spec}(A_i)$ is surjective,
- (5) the induced extensions $(A_i)_{\mathfrak{p}} \rightarrow (B_i)_{\mathfrak{q}}$ are unramified for every prime \mathfrak{q} lying over a prime \mathfrak{p} as $A_i \rightarrow B_i$ is étale.

This concludes the proof of the lemma. \square

Lemma 15.71.5. *Let A be a valuation ring. Let A^h , resp. A^{sh} be its henselization, resp. strict henselization. Then*

$$A \subset A^h \subset A^{sh}$$

are extensions of valuation rings which induce bijections on value groups, i.e., which are weakly unramified.

Proof. Write $A^h = \text{colim}(B_i)_{\mathfrak{q}_i}$ where $A \rightarrow B_i$ is étale and $\mathfrak{q}_i \subset B_i$ is a prime ideal lying over \mathfrak{m}_A , see Algebra, Lemma 10.145.21. Then Lemma 15.71.4 tells us that $(B_i)_{\mathfrak{q}_i}$ is a valuation ring and that the induced map

$$(A \setminus \{0\})/A^* \longrightarrow ((B_i)_{\mathfrak{q}_i} \setminus \{0\})/(B_i)_{\mathfrak{q}_i}^*$$

is bijective. By Algebra, Lemma 10.48.5 we conclude that A^h is a valuation ring. It also follows that $(A \setminus \{0\})/A^* \rightarrow (A^h \setminus \{0\})/(A^h)^*$ is bijective. This proves the lemma for the inclusion $A \subset A^h$. To prove it for $A \subset A^{sh}$ we can use exactly the same argument except we replace Algebra, Lemma 10.145.21 by Algebra, Lemma 10.145.27. Since $A^{sh} = (A^h)^{sh}$ we see that this also proves the assertions of the lemma for the inclusion $A^h \subset A^{sh}$. \square

15.72. Structure of modules over a PID

We work a little bit more generally (following the papers [War69] and [War70] by Warfield) so that the proofs work over valuation rings.

Lemma 15.72.1. *Let P be a module over a ring R . The following are equivalent*

- (1) P is a direct summand of a direct sum of modules of the form R/fR , for $f \in R$ varying.
- (2) for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of R -modules such that $fA = A \cap fB$ for all $f \in R$ the map $\text{Hom}_R(P, B) \rightarrow \text{Hom}_R(P, C)$ is surjective.

Proof. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be an exact sequence as in (2). To prove that (1) implies (2) it suffices to prove that $\text{Hom}_R(R/fR, B) \rightarrow \text{Hom}_R(R/fR, C)$ is surjective for every $f \in R$. Let $\psi : R/fR \rightarrow C$ be a map. Say $\psi(1)$ is the image of $b \in B$. Then $fb \in A$. Hence there exists an $a \in A$ such that $fa = fb$. Then $f(b - a) = 0$ hence we get a morphism $\varphi : R/fR \rightarrow B$ mapping 1 to $b - a$ which lifts ψ .

Conversely, assume that (2) holds. Let I be the set of pairs (f, φ) where $f \in R$ and $\varphi : R/fR \rightarrow P$. For $i \in I$ denote (f_i, φ_i) the corresponding pair. Consider the map

$$B = \bigoplus_{i \in I} R/f_iR \longrightarrow P$$

which sends the element r in the summand R/f_iR to $\varphi_i(r)$ in P . Let $A = \text{Ker}(F \rightarrow P)$. Then we see that (1) is true if the sequence

$$0 \rightarrow A \rightarrow B \rightarrow P \rightarrow 0$$

is an exact sequence as in (2). To see this suppose $f \in R$ and $a \in A$ maps to fb in B . Write $b = (r_i)_{i \in I}$ with almost all $r_i = 0$. Then we see that

$$f \sum \varphi_i(r_i) = 0$$

in P . Hence there is an $i_0 \in I$ such that $f_{i_0} = f$ and $\varphi_{i_0}(1) = \sum \varphi_i(r_i)$. Let $x_{i_0} \in R/f_{i_0}R$ be the class of 1. Then we see that

$$a = (r_i)_{i \in I} - (0, \dots, 0, x_{i_0}, 0, \dots)$$

is an element of A and $fa = b$ as desired. \square

Lemma 15.72.2 (Generalized valuation rings). *Let R be a ring. The following are equivalent*

- (1) For $a, b \in R$ either a divides b or b divides a .
- (2) Every finitely generated ideal is principal and R is local.
- (3) The set of ideals of R are linearly ordered by inclusion.

This holds in particular if R is a valuation ring.

Proof. Assume (2) and let $a, b \in R$. Then $(a, b) = (c)$. If $c = 0$, then $a = b = 0$ and a divides b . Assume $c \neq 0$. Write $c = ua + vb$ and $a = wc$ and $b = zc$. Then $c(1 - uw - vz) = 0$. Since R is local, this implies that $1 - uw - vz \in \mathfrak{m}$. Hence either w or z is a unit, so either a divides b or b divides a . Thus (2) implies (1).

Assume (1). If R has two maximal ideals \mathfrak{m}_i we can choose $a \in \mathfrak{m}_1$ with $a \notin \mathfrak{m}_2$ and $b \in \mathfrak{m}_2$ with $b \notin \mathfrak{m}_1$. Then a does not divide b and b does not divide a . Hence R has a unique maximal ideal and is local. It follows easily from condition (1) and induction that every finitely generated ideal is principal. Thus (1) implies (2).

It is straightforward to prove that (1) and (3) are equivalent. The final statement is Algebra, Lemma 10.48.3. \square

Lemma 15.72.3. *Let R be a ring satisfying the equivalent conditions of Lemma 15.72.2. Then every finitely presented R -module is isomorphic to a finite direct sum of modules of the form R/fR .*

Proof. Let M be a finitely presented R -module. Let $x_1, \dots, x_n \in M$ be a minimal set of generators. Let $I \subset R$ be the annihilator of M . For some i the annihilator I_i of x_i is I : we have $I = \bigcap I_i$ and the set of ideals are linearly ordered. After renumbering we may assume $I_1 = I$. We set $A = Rx_1 \subset M$. Consider the exact sequence $0 \rightarrow A \rightarrow M \rightarrow M/A \rightarrow 0$. Since A is finite, we see that M/A is a finitely presented R -module (Algebra, Lemma 10.5.3) with fewer generators. Hence $M/A \cong \bigoplus_{j=1, \dots, m} R/f_j R$ by induction. On the other hand, we claim that $A \rightarrow M$ satisfies the property: if $f \in R$, then $fA = A \cap fM$. Namely, if $x \in A \cap fM$, then $x = \sum f r_i x_i$ and $x = g x_1$. Hence $g = f r_1$ and we see that $x \in fA$. By Lemma 15.72.1 the sequence is split and we find $M \cong A \oplus \bigoplus_{j=1, \dots, m} R/f_j R$. Then $A = R/I$ is finitely presented (as a summand of M) and hence I is finitely generated, hence principal. This finishes the proof. \square

Lemma 15.72.4. *Let R be a ring such that every local ring of R at a maximal ideal satisfies the equivalent conditions of Lemma 15.72.2. Then every finitely presented R -module is a summand of a finite direct sum of modules of the form R/fR for f in R varying.*

Proof. Let M be a finitely presented R -module. We first show that M is a summand of a direct sum of modules of the form R/fR and at the end we argue the direct sum can be taken to be finite. Let

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$$

be a short exact sequence of R -modules such that $fA = A \cap fB$ for all $f \in R$. By Lemma 15.72.1 we have to show that $\text{Hom}_R(M, B) \rightarrow \text{Hom}_R(M, C)$ is surjective. It suffices to prove this after localization at maximal ideals \mathfrak{m} , see Algebra, Lemma 10.23.1. Note that the localized sequences $0 \rightarrow A_{\mathfrak{m}} \rightarrow B_{\mathfrak{m}} \rightarrow C_{\mathfrak{m}} \rightarrow 0$ satisfy the condition that $fA_{\mathfrak{m}} = A_{\mathfrak{m}} \cap fB_{\mathfrak{m}}$ for all $f \in R_{\mathfrak{m}}$ (because we can write $f = uf'$ with $u \in R_{\mathfrak{m}}$ a unit and $f' \in R$ and because localization is exact). Since M is finitely presented, we see that

$$\text{Hom}_R(M, B)_{\mathfrak{m}} = \text{Hom}_{R_{\mathfrak{m}}}(M_{\mathfrak{m}}, B_{\mathfrak{m}}) \quad \text{and} \quad \text{Hom}_R(M, C)_{\mathfrak{m}} = \text{Hom}_{R_{\mathfrak{m}}}(M_{\mathfrak{m}}, C_{\mathfrak{m}})$$

by Algebra, Lemma 10.10.2. The module $M_{\mathfrak{m}}$ is a finitely presented $R_{\mathfrak{m}}$ -module. By Lemma 15.72.3 we see that $M_{\mathfrak{m}}$ is a direct sum of modules of the form $R_{\mathfrak{m}}/fR_{\mathfrak{m}}$. Thus we conclude by Lemma 15.72.1 that the map on localizations is surjective.

At this point we know that M is a summand of $\bigoplus_{i \in I} R/f_i R$. Consider the map $M \rightarrow \bigoplus_{i \in I} R/f_i R$. Since M is a finite R -module, the image is contained in $\bigoplus_{i \in I'} R/f_i R$ for some finite subset $I' \subset I$. This finishes the proof. \square

Definition 15.72.5. Let R be a domain.

- (1) We say R is a *Bézout domain* if every finitely generated ideal of R is principal.
- (2) We say R is an *elementary divisor domain* if for all $n, m \geq 1$ and every $n \times m$ matrix A , there exist invertible matrices U, V of size $n \times n, m \times m$ such that

$$UAV = \begin{pmatrix} f_1 & 0 & 0 & \dots \\ 0 & f_2 & 0 & \dots \\ 0 & 0 & f_3 & \dots \\ \dots & \dots & \dots & \dots \end{pmatrix}$$

with $f_1, \dots, f_{\min(n, m)} \in R$ and $f_1 | f_2 | \dots$

It is apparently still an open question as to whether every Bézout domain R is an elementary divisor domain (or not). This is equivalent to the question of whether every finitely presented module over R is a direct sum of cyclic modules. The converse implication is true.

Lemma 15.72.6. *An elementary divisor domain is Bézout.*

Proof. Let $a, b \in R$ be nonzero. Consider the 1×2 matrix $A = (a \ b)$. Then we see that $u(a \ b)V = (f \ 0)$ with $u \in R$ invertible and $V = (g_{ij})$ an invertible 2×2 matrix. Then $f = uag_{11} + ubg_{21}$ and $(g_{11}, g_{21}) = R$. It follows that $(a, b) = (f)$. An induction argument (omitted) then shows any finitely generated ideal in R is generated by one element. \square

Lemma 15.72.7. *The localization of a Bézout domain is Bézout. Every local ring of a Bézout domain is a valuation ring. A local domain is Bézout if and only if it is a valuation ring.*

Proof. We omit the proof of the statement on localizations. The final statement is Algebra, Lemma 10.48.15. The second statement follows from the other two. \square

Lemma 15.72.8. *Let R be a Bézout domain.*

- (1) *Every finite submodule of a free module is finite free.*
- (2) *Every finitely presented R -module M is a direct sum of a finite free module and a torsion module M_{tors} which is a summand of a module of the form $\bigoplus_{i=1, \dots, n} R/f_i R$ with $f_1, \dots, f_n \in R$ nonzero.*

Proof. Proof of (1). Let $M \subset F$ be a finite submodule of a free module F . Since M is finite, we may assume F is a finite free module (details omitted). Say $F = R^{\oplus n}$. We argue by induction on n . If $n = 1$, then M is a finitely generated ideal, hence principal by our assumption that R is Bézout. If $n > 1$, then we consider the image I of M under the projection $R^{\oplus n} \rightarrow R$ onto the last summand. If $I = (0)$, then $M \subset R^{\oplus n-1}$ and we are done by induction. If $I \neq 0$, then $I = (f) \cong R$. Hence $M \cong R \oplus \text{Ker}(M \rightarrow I)$ and we are done by induction as well.

Let M be a finitely presented R -module. Since the localizations of R are maximal ideals are valuation rings (Lemma 15.72.7) we may apply Lemma 15.72.4. Thus M is a summand of a module of the form $R^{\oplus r} \oplus \bigoplus_{i=1, \dots, n} R/f_i R$ with $f_i \neq 0$. Since taking the torsion submodule is a functor we see that M_{tors} is a summand of the module $\bigoplus_{i=1, \dots, n} R/f_i R$ and M/M_{tors} is a summand of $R^{\oplus r}$. By the first part of the proof we see that M/M_{tors} is finite free. Hence $M \cong M_{tors} \oplus M/M_{tors}$ as desired. \square

Lemma 15.72.9. *Let R be a PID. Every finite R -module M is isomorphic to a module of the form*

$$R^{\oplus r} \oplus \bigoplus_{i=1, \dots, n} R/f_i R$$

for some $r, n \geq 0$ and $f_1, \dots, f_n \in R$ nonzero.

Proof. A PID is a Noetherian Bézout ring. By Lemma 15.72.8 it suffices to prove the result if M is torsion. Since M is finite, this means that the annihilator of M is nonzero. Say $fM = 0$ for some $f \in R$ nonzero. Then we can think of M as a module over R/fR . Since R/fR is Noetherian of dimension 0 (small detail omitted) we see that $R/fR = \prod R_j$ is a finite product of Artinian local rings

R_i (Algebra, Proposition 10.59.6). Each R_i , being a local ring and a quotient of a PID, is a generalized valuation ring in the sense of Lemma 15.72.2 (small detail omitted). Write $M = \prod M_j$ with $M_j = e_j M$ where $e_j \in R/fR$ is the idempotent corresponding to the factor R_j . By Lemma 15.72.3 we see that $M_j = \bigoplus_{i=1, \dots, n_j} R_j/\bar{f}_{ji}R_j$ for some $\bar{f}_{ji} \in R_j$. Choose lifts $f_{ji} \in R$ and choose $g_{ji} \in R$ with $(g_{ji}) = (f_j, f_{ji})$. Then we conclude that

$$M \cong \bigoplus R/g_{ji}R$$

as an R -module which finishes the proof. □

One can also prove that a PID is a elementary divisor domain (insert future reference here), by proving lemmas similar to the following.

Lemma 15.72.10. *Let R be a Bézout domain. Let $n \geq 1$ and $f_1, \dots, f_n \in R$ generate the unit ideal. There exists an invertible $n \times n$ matrix in R whose first row is $f_1 \dots f_n$.*

Proof. This follows from Lemma 15.72.8 but we can also prove it directly as follows. By induction on n . The result holds for $n = 1$. Assume $n > 1$. We may assume $f_1 \neq 0$ after renumbering. Choose $f \in R$ such that $(f) = (f_1, \dots, f_{n-1})$. Let A be an $(n - 1) \times (n - 1)$ matrix whose first row is $f_1/f, \dots, f_{n-1}/f$. Choose $a, b \in R$ such that $af - bf_n = 1$ which is possible because $1 \in (f_1, \dots, f_n) = (f, f_n)$. Then a solution is the matrix

$$\begin{pmatrix} f & 0 & \dots & 0 & f_n \\ 0 & 1 & \dots & 0 & 0 \\ & & \dots & & \\ 0 & 0 & \dots & 1 & 0 \\ b & 0 & \dots & 0 & a \end{pmatrix} \begin{pmatrix} & & & & 0 \\ & A & & & \\ & & & & 0 \\ 0 & \dots & 0 & & 1 \end{pmatrix}$$

Observe that the left matrix is invertible because it has determinant 1. □

Smoothing Ring Maps

16.1. Introduction

The main result of this chapter is the following:

A regular map of Noetherian rings is a filtered colimit of smooth ones.

This theorem is due to Popescu, see [Pop90]. A readable exposition of Popescu’s proof was given by Richard Swan, see [Swa98] who used notes by André and a paper of Ogoma, see [Ogo94].

Our exposition follows Swan’s, but we first prove an intermediate result which lets us work in a slightly simpler situation. Here is an overview. We first solve the following “lifting problem”: A flat infinitesimal deformation of a filtered colimit of smooth algebras is a filtered colimit of smooth algebras. This result essentially says that it suffices to prove the main theorem for maps between reduced Noetherian rings. Next we prove two very clever lemmas called the “lifting lemma” and the “desingularization lemma”. We show that these lemmas combined reduce the main theorem to proving a Noetherian, geometrically regular k -algebra A is a filtered limit of smooth k -algebras. Next, we discuss the necessary local tricks that go into the Popescu-Ogoma-Swan-André proof. Finally, in the last three sections we give the proof.

We end this introduction with some pointers to references. Let A be a henselian Noetherian local ring. We say A has the *approximation property* if for any $f_1, \dots, f_m \in A[x_1, \dots, x_n]$ the system of equations $f_1 = 0, \dots, f_m = 0$ has a solution in the completion of A if and only if it has a solution in A . This definition is due to Artin. Artin first proved the approximation property for analytic systems of equations, see [Art68]. In [Art69a] Artin proved the approximation property for local rings essentially of finite type over an excellent discrete valuation ring. Artin conjectured (page 26 of [Art69a]) that every excellent henselian local ring should have the approximation property.

At some point in time it became a conjecture that every regular homomorphism of Noetherian rings is a filtered colimit of smooth algebras (see for example [Ray72], [Pop81], [Art82], [AD83]). We’re not sure who this conjecture¹ is due to. The relationship with the approximation property is that if $A \rightarrow A^\wedge$ is a colimit of smooth algebras, then the approximation property holds (insert future reference here). Moreover, the main theorem applies to the map $A \rightarrow A^\wedge$ if A is an excellent local ring, as one of the conditions of an excellent local ring is that the formal

¹The question/conjecture as formulated in [Art82], [AD83], and [Pop81] is stronger and was shown to be equivalent to the original version in [CP84].

fibres are geometrically regular. Note that excellent local rings were defined by Grothendieck and their definition appeared in print in 1965.

In [Art82] it was shown that $R \rightarrow R^\wedge$ is a filtered colimit of smooth algebras for any local ring R essentially of finite type over a field. In [AR88] it was shown that $R \rightarrow R^\wedge$ is a filtered colimit of smooth algebras for any local ring R essentially of finite type over an excellent discrete valuation ring. Finally, the main theorem was shown in [Pop85], [Pop86], [Pop90], [Ogo94], and [Swa98] as discussed above.

Conversely, using some of the results above, in [Rot90] it was shown that any local ring with the approximation property is excellent.

The paper [Spi99] provides an alternative approach to the main theorem, but it seems hard to read (for example [Spi99, Lemma 5.2] appears to be an incorrectly reformulated version of [Elk73, Lemma 3]). There is also a Bourbaki lecture about this material, see [Tei95].

16.2. Colimits

In Categories, Section 4.19 we discuss filtered colimits. In particular, note that Categories, Lemma 4.21.3 tells us that colimits over filtered index categories are the same thing as colimits over directed partially ordered sets.

Lemma 16.2.1. *Let $R \rightarrow \Lambda$ be a ring map. Let \mathcal{E} be a set of R -algebras such that each $A \in \mathcal{E}$ is of finite presentation over R . Then the following two statements are equivalent*

- (1) Λ is a filtered colimit of elements of \mathcal{E} , and
- (2) for any R algebra map $A \rightarrow \Lambda$ with A of finite presentation over R we can find a factorization $A \rightarrow B \rightarrow \Lambda$ with $B \in \mathcal{E}$.

Proof. Suppose that $\mathcal{I} \rightarrow \mathcal{E}$, $i \mapsto A_i$ is a diagram such that $\Lambda = \operatorname{colim}_i A_i$. Let $A \rightarrow \Lambda$ with A of finite presentation over R . Pick a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Say $A \rightarrow \Lambda$ maps x_s to $\lambda_s \in \Lambda$. We can find an $i \in \operatorname{Ob}(\mathcal{I})$ and elements $a_s \in A_i$ whose image in Λ is λ_s . Increasing i if necessary we may also assume that $f_t(a_1, \dots, a_n) = 0$ in A_i . Hence we can factor $A \rightarrow \Lambda$ through A_i by mapping x_s to a_s .

Conversely, suppose that (2) holds. Consider the category \mathcal{I} whose objects are R -algebra maps $A \rightarrow \Lambda$ with $A \in \mathcal{E}$ and whose morphisms are commutative diagrams

$$\begin{array}{ccc} A & \longrightarrow & A' \\ & \searrow & \swarrow \\ & \Lambda & \end{array}$$

of R -algebras. We claim that \mathcal{I} is a filtered index category and that $\Lambda = \operatorname{colim}_{\mathcal{I}} A$. To see that \mathcal{I} is filtered, let $A \rightarrow \Lambda$ and $A' \rightarrow \Lambda$ be two objects. Then we can factor $A \otimes_R A' \rightarrow \Lambda$ through an object of \mathcal{I} by assumption (2) and the fact that the elements of \mathcal{E} are of finite presentation over R . Suppose that $\varphi, \psi : A \rightarrow A'$ are two morphisms of \mathcal{I} . Let x_1, \dots, x_n be generators of A as an R -algebra. By assumption (2) we can factor the R -algebra map $A'/(\varphi(x_i) - \psi(x_i)) \rightarrow \Lambda$ through an object of \mathcal{I} . This proves that \mathcal{I} is filtered. We omit the proof that $\Lambda = \operatorname{colim}_{\mathcal{I}} A$. \square

16.3. Singular ideals

Let $R \rightarrow A$ be a ring map. The singular ideal of A over R is the radical ideal in A cutting out the singular locus of the morphism $\text{Spec}(A) \rightarrow \text{Spec}(R)$. Here is a formal definition.

Definition 16.3.1. Let $R \rightarrow A$ be a ring map. The *singular ideal of A over R* , denoted $H_{A/R}$ is the unique radical ideal $H_{A/R} \subset A$ with

$$V(H_{A/R}) = \{\mathfrak{q} \in \text{Spec}(A) \mid R \rightarrow A \text{ not smooth at } \mathfrak{q}\}$$

This makes sense because the set of primes where $R \rightarrow A$ is smooth is open, see Algebra, Definition 10.132.11. In order to find an explicit set of generators for the singular ideal we first prove the following lemma.

Lemma 16.3.2. *Let R be a ring. Let $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Let $\mathfrak{q} \subset A$. Assume $R \rightarrow A$ is smooth at \mathfrak{q} . Then there exists an $a \in A$, $a \notin \mathfrak{q}$, an integer c , $0 \leq c \leq \min(n, m)$, subsets $U \subset \{1, \dots, n\}$, $V \subset \{1, \dots, m\}$ of cardinality c such that*

$$a = a' \det(\partial f_j / \partial x_i)_{j \in V, i \in U}$$

for some $a' \in A$ and

$$af_\ell \in (f_j, j \in V) + (f_1, \dots, f_m)^2$$

for all $\ell \in \{1, \dots, m\}$.

Proof. Set $I = (f_1, \dots, f_m)$ so that the naive cotangent complex of A over R is homotopy equivalent to $I/I^2 \rightarrow \bigoplus Adx_i$, see Algebra, Lemma 10.129.2. We will use the formation of the naive cotangent complex commutes with localization, see Algebra, Section 10.129, especially Algebra, Lemma 10.129.13. By Algebra, Definitions 10.132.1 and 10.132.11 we see that $(I/I^2)_a \rightarrow \bigoplus A_a dx_i$ is a split injection for some $a \in A$, $a \notin \mathfrak{p}$. After renumbering x_1, \dots, x_n and f_1, \dots, f_m we may assume that f_1, \dots, f_c form a basis for the vector space $(I/I^2)_a \otimes_A \kappa(\mathfrak{q})$ and that dx_{c+1}, \dots, dx_n map to a basis of $\Omega_{A/R} \otimes_A \kappa(\mathfrak{q})$. Hence after replacing a by aa' for some $a' \in A$, $a' \notin \mathfrak{q}$ we may assume f_1, \dots, f_c form a basis for $(I/I^2)_a$ and that dx_{c+1}, \dots, dx_n map to a basis of $(\Omega_{A/R})_a$. In this situation a^N for some large integer N satisfies the conditions of the lemma (with $U = V = \{1, \dots, c\}$). \square

We will use the notion of a *strictly standard* element in a A over R . Our notion is slightly weaker than the one in Swan's paper [Swa98]. We also define an *elementary standard* element to be one of the type we found in the lemma above. We compare the different types of elements in Lemma 16.4.7.

Definition 16.3.3. Let $R \rightarrow A$ be a ring map of finite presentation. We say an element $a \in A$ is *elementary standard in A over R* if there exists a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and $0 \leq c \leq \min(n, m)$ such that

$$(16.3.3.1) \quad a = a' \det(\partial f_j / \partial x_i)_{i,j=1,\dots,c}$$

for some $a' \in A$ and

$$(16.3.3.2) \quad af_{c+j} \in (f_1, \dots, f_c) + (f_1, \dots, f_m)^2$$

for $j = 1, \dots, m - c$. We say $a \in A$ is *strictly standard in A over R* if there exists a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and $0 \leq c \leq \min(n, m)$ such that

$$(16.3.3.3) \quad a = \sum_{I \subset \{1, \dots, n\}, |I|=c} a_I \det(\partial f_j / \partial x_i)_{j=1,\dots,c, i \in I}$$

for some $a_I \in A$ and

$$(16.3.3.4) \quad af_{c+j} \in (f_1, \dots, f_c) + (f_1, \dots, f_m)^2$$

for $j = 1, \dots, m - c$.

The following lemma is useful to find implications of (16.3.3.3).

Lemma 16.3.4. *Let R be a ring. Let $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and write $I = (f_1, \dots, f_m)$. Let $a \in A$. Then (16.3.3.3) implies there exists an A -linear map $\psi : \bigoplus_{i=1, \dots, n} A dx_i \rightarrow A^{\oplus c}$ such that the composition*

$$A^{\oplus c} \xrightarrow{(f_1, \dots, f_c)} I/I^2 \xrightarrow{f \mapsto df} \bigoplus_{i=1, \dots, n} A dx_i \xrightarrow{\psi} A^{\oplus c}$$

is multiplication by a . Conversely, if such a ψ exists, then a^c satisfies (16.3.3.3).

Proof. This is a special case of Algebra, Lemma 10.14.4. □

Lemma 16.3.5 (Elkik). *Let $R \rightarrow A$ be a ring map of finite presentation. The singular ideal $H_{A/R}$ is the radical of the ideal generated by strictly standard elements in A over R and also the radical of the ideal generated by elementary standard elements in A over R .*

Proof. Assume a is strictly standard in A over R . We claim that A_a is smooth over R , which proves that $a \in H_{A/R}$. Namely, let $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$, c , and $a' \in A$ be as in Definition 16.3.3. Write $I = (f_1, \dots, f_m)$ so that the naive cotangent complex of A over R is given by $I/I^2 \rightarrow \bigoplus A dx_i$. Assumption (16.3.3.4) implies that $(I/I^2)_a$ is generated by the classes of f_1, \dots, f_c . Assumption (16.3.3.3) implies that the differential $(I/I^2)_a \rightarrow \bigoplus A_a dx_i$ has a left inverse, see Lemma 16.3.4. Hence $R \rightarrow A_a$ is smooth by definition and Algebra, Lemma 10.129.13.

Let $H_e, H_s \subset A$ be the radical of the ideal generated by elementary, resp. strictly standard elements of A over R . By definition and what we just proved we have $H_e \subset H_s \subset H_{A/R}$. The inclusion $H_{A/R} \subset H_e$ follows from Lemma 16.3.2. □

Example 16.3.6. The set of points where a finitely presented ring map is smooth needn't be a quasi-compact open. For example, let $R = k[x, y_1, y_2, y_3, \dots]/(xy_i)$ and $A = R/(x)$. Then the smooth locus of $R \rightarrow A$ is $\bigcup D(y_i)$ which is not quasi-compact.

Lemma 16.3.7. *Let $R \rightarrow A$ be a ring map of finite presentation. Let $R \rightarrow R'$ be a ring map. If $a \in A$ is elementary, resp. strictly standard in A over R , then $a \otimes 1$ is elementary, resp. strictly standard in $A \otimes_R R'$ over R' .*

Proof. If $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ is a presentation of A over R , then $A \otimes_R R' = R'[x_1, \dots, x_n]/(f'_1, \dots, f'_m)$ is a presentation of $A \otimes_R R'$ over R' . Here f'_j is the image of f_j in $R'[x_1, \dots, x_n]$. Hence the result follows from the definitions. □

Lemma 16.3.8. *Let $R \rightarrow A \rightarrow \Lambda$ be ring maps with A of finite presentation over R . Assume that $H_{A/R}\Lambda = \Lambda$. Then there exists a factorization $A \rightarrow B \rightarrow \Lambda$ with B smooth over R .*

Proof. Choose $f_1, \dots, f_r \in H_{A/R}$ and $\lambda_1, \dots, \lambda_r \in \Lambda$ such that $\sum f_i \lambda_i = 1$ in Λ . Set $B = A[x_1, \dots, x_r]/(f_1 x_1 + \dots + f_r x_r - 1)$ and define $B \rightarrow \Lambda$ by mapping x_i to λ_i . Details omitted. □

16.4. Presentations of algebras

Some of the results in this section are due to Elkik. Note that the algebra C in the following lemma is a symmetric algebra over A . Moreover, if R is Noetherian, then C is of finite presentation over R .

Lemma 16.4.1. *Let R be a ring and let A be a finitely presented R -algebra. There exists finite type R -algebra map $A \rightarrow C$ which has a retraction with the following two properties*

- (1) *for each $a \in A$ such that $R \rightarrow A_a$ is a local complete intersection (More on Algebra, Definition 15.23.2) the ring C_a is smooth over A_a and has a presentation $C_a = R[y_1, \dots, y_m]/J$ such that J/J^2 is free over C_a , and*
- (2) *for each $a \in A$ such that A_a is smooth over R the module $\Omega_{C_a/R}$ is free over C_a .*

Proof. Choose a presentation $A = R[x_1, \dots, x_n]/I$ and write $I = (f_1, \dots, f_m)$. Define the A -module K by the short exact sequence

$$0 \rightarrow K \rightarrow A^{\oplus m} \rightarrow I/I^2 \rightarrow 0$$

where the j th basis vector e_j in the middle is mapped to the class of f_j on the right. Set

$$C = \text{Sym}_A^*(I/I^2).$$

The retraction is just the projection onto the degree 0 part of C . We have a surjection $R[x_1, \dots, x_n, y_1, \dots, y_m] \rightarrow C$ which maps y_j to the class of f_j in I/I^2 . The kernel J of this map is generated by the elements f_1, \dots, f_m and by elements $\sum h_j y_j$ with $h_j \in R[x_1, \dots, x_n]$ such that $\sum h_j e_j$ defines an element of K . By Algebra, Lemma 10.129.4 applied to $R \rightarrow A \rightarrow C$ and the presentations above and More on Algebra, Lemma 15.6.11 there is a short exact sequence

$$(16.4.1.1) \quad I/I^2 \otimes_A C \rightarrow J/J^2 \rightarrow K \otimes_A C \rightarrow 0$$

of C -modules. Let $h \in R[x_1, \dots, x_n]$ be an element with image $a \in A$. We will use as presentations for the localized rings

$$A_a = R[x_0, x_1, \dots, x_n]/I' \quad \text{and} \quad C_a = R[x_0, x_1, \dots, x_n, y_1, \dots, y_m]/J'$$

where $I' = (hx_0 - 1, I)$ and $J' = (hx_0 - 1, J)$. Hence $I'/(I')^2 = C_a \oplus I/I^2 \otimes_A C_a$ and $J'/(J')^2 = C_a \oplus (J/J^2)_a$ as C_a -modules. Thus we obtain

$$(16.4.1.2) \quad C_a \oplus I/I^2 \otimes_A C_a \rightarrow C_a \oplus (J/J^2)_a \rightarrow K \otimes_A C_a \rightarrow 0$$

as the sequence of Algebra, Lemma 10.129.4 corresponding to $R \rightarrow A_a \rightarrow C_a$ and the presentations above.

Next, assume that $a \in A$ is such that A_a is a local complete intersection over R . Then $(I/I^2)_a$ is finite projective over A_a , see More on Algebra, Lemma 15.22.3. Hence we see $K_a \oplus (I/I^2)_a \cong A_a^{\oplus m}$ is free. In particular K_a is finite projective too. By More on Algebra, Lemma 15.23.6 the sequence (16.4.1.2) is exact on the left. Hence

$$J'/(J')^2 \cong C_a \oplus I/I^2 \otimes_A C_a \oplus K \otimes_A C_a \cong C_a^{\oplus m+1}$$

This proves (1). Finally, suppose that in addition A_a is smooth over R . Then the same presentation shows that $\Omega_{C_a/R}$ is the cokernel of the map

$$J'/(J')^2 \longrightarrow \bigoplus_i C_a dx_i \oplus \bigoplus_j C_a dy_j$$

The summand C_a of $J'/(J')^2$ in the decomposition above corresponds to $hx_0 - 1$ and hence maps isomorphically to the summand $C_a dx_0$. The summand $I/I^2 \otimes_A C_a$ of $J'/(J')^2$ maps injectively to $\bigoplus_{i=1, \dots, n} C_a dx_i$ with quotient $\Omega_{A_a/R} \otimes_{A_a} C_a$. The summand $K \otimes_A C_a$ maps injectively to $\bigoplus_{j \geq 1} C_a dy_j$ with quotient isomorphic to $I/I^2 \otimes_A C_a$. Thus the cokernel of the last displayed map is the module $I/I^2 \otimes_A C_a \oplus \Omega_{A_a/R} \otimes_{A_a} C_a$. Since $(I/I^2)_a \oplus \Omega_{A_a/R}$ is free (from the definition of smooth ring maps) we see that (2) holds. \square

The following proposition was proved for smooth ring maps over henselian pairs by Elkik in [Elk73]. For smooth ring maps it can be found in [Ara01], where it is also proven that ring maps between smooth algebras can be lifted.

Proposition 16.4.2. *Let $R \rightarrow R_0$ be a surjective ring map with kernel I .*

- (1) *If $R_0 \rightarrow A_0$ is a syntomic ring map, then there exists a syntomic ring map $R \rightarrow A$ such that $A/IA \cong A_0$.*
- (2) *If $R_0 \rightarrow A_0$ is a smooth ring map, then there exists a smooth ring map $R \rightarrow A$ such that $A/IA \cong A_0$.*

Proof. Assume $R_0 \rightarrow A_0$ syntomic, in particular a local complete intersection (More on Algebra, Lemma 15.23.5). Choose a presentation $A_0 = R_0[x_1, \dots, x_n]/J_0$. Set $C_0 = \text{Sym}_{A_0}^*(J_0/J_0^2)$. Note that J_0/J_0^2 is a finite projective A_0 -module (Algebra, Lemma 10.131.16). By Lemma 16.4.1 the ring map $A_0 \rightarrow C_0$ is smooth and we can find a presentation $C_0 = R_0[y_1, \dots, y_m]/K_0$ with K_0/K_0^2 free over C_0 . By Algebra, Lemma 10.131.6 we can assume $C_0 = R_0[y_1, \dots, y_m]/(\bar{f}_1, \dots, \bar{f}_c)$ where $\bar{f}_1, \dots, \bar{f}_c$ maps to a basis of K_0/K_0^2 over C_0 . Choose $f_1, \dots, f_c \in R[y_1, \dots, y_c]$ lifting $\bar{f}_1, \dots, \bar{f}_c$ and set

$$C = R[y_1, \dots, y_m]/(f_1, \dots, f_c)$$

By construction $C_0 = C/IC$. By Algebra, Lemma 10.131.11 we can after replacing C by C_g assume that C is a relative global complete intersection over R . We conclude that there exists a finite projective A_0 -module P_0 such that $C_0 = \text{Sym}_{A_0}^*(P_0)$ is isomorphic to C/IC for some syntomic R -algebra C .

Choose an integer n and a direct sum decomposition $A_0^{\oplus n} = P_0 \oplus Q_0$. By More on Algebra, Lemma 15.6.10 we can find an étale ring map $C \rightarrow C'$ which induces an isomorphism $C/IC \rightarrow C'/IC'$ and a finite projective C' -module Q such that Q/IQ is isomorphic to $Q_0 \otimes_{A_0} C/IC$. Then $D = \text{Sym}_{C'}^*(Q)$ is a smooth C' -algebra (see More on Algebra, Lemma 15.6.12). Picture

$$\begin{array}{ccccccc}
 R & \longrightarrow & C & \longrightarrow & C' & \longrightarrow & D \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 R/I & \longrightarrow & A_0 & \longrightarrow & C'/IC' & \longrightarrow & D/ID \\
 & & & \xrightarrow{\cong} & & &
 \end{array}$$

Observe that our choice of Q gives

$$\begin{aligned}
 D/ID &= \mathrm{Sym}_{C/IC}^*(Q_0 \otimes_{A_0} C/IC) \\
 &= \mathrm{Sym}_{A_0}^*(Q_0) \otimes_{A_0} C/IC \\
 &= \mathrm{Sym}_{A_0}^*(Q_0) \otimes_{A_0} \mathrm{Sym}_{A_0}^*(P_0) \\
 &= \mathrm{Sym}_{A_0}^*(Q_0 \oplus P_0) \\
 &= \mathrm{Sym}_{A_0}^*(A_0^{\oplus n}) \\
 &= A_0[x_1, \dots, x_n]
 \end{aligned}$$

Choose $f_1, \dots, f_n \in D$ which map to x_1, \dots, x_n in $D/ID = A_0[x_1, \dots, x_n]$. Set $A = D/(f_1, \dots, f_n)$. Note that $A_0 = A/IA$. We claim that $R \rightarrow A$ is syntomic in a neighbourhood of $V(IA)$. If the claim is true, then we can find a $f \in A$ mapping to $1 \in A_0$ such that A_f is syntomic over R and the proof of (1) is finished.

Proof of the claim. Observe that $R \rightarrow D$ is syntomic as a composition of the syntomic ring map $R \rightarrow C$, the étale ring map $C \rightarrow C'$ and the smooth ring map $C' \rightarrow D$ (Algebra, Lemmas 10.131.17 and 10.132.10). The question is local on $\mathrm{Spec}(D)$, hence we may assume that D is a relative global complete intersection (Algebra, Lemma 10.131.15). Say $D = R[y_1, \dots, y_m]/(g_1, \dots, g_s)$. Let $f'_1, \dots, f'_n \in R[y_1, \dots, y_m]$ be lifts of f_1, \dots, f_n . Then we can apply Algebra, Lemma 10.131.11 to get the claim.

Proof of (2). Since a smooth ring map is syntomic, we can find a syntomic ring map $R \rightarrow A$ such that $A_0 = A/IA$. By assumption the fibres of $R \rightarrow A$ are smooth over primes in $V(I)$ hence $R \rightarrow A$ is smooth in an open neighbourhood of $V(IA)$ (Algebra, Lemma 10.132.16). Thus we can replace A by a localization to obtain the result we want. \square

We know that any syntomic ring map $R \rightarrow A$ is locally a relative global complete intersection, see Algebra, Lemma 10.131.15. The next lemma says that a vector bundle over $\mathrm{Spec}(A)$ is a relative global complete intersection.

Lemma 16.4.3. *Let $R \rightarrow A$ be a syntomic ring map. Then there exists a smooth R -algebra map $A \rightarrow C$ with a retraction such that C is a global relative complete intersection over R , i.e.,*

$$C \cong R[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

flat over R and all fibres of dimension $n - c$.

Proof. Apply Lemma 16.4.1 to get $A \rightarrow C$. By Algebra, Lemma 10.131.6 we can write $C = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ with f_i mapping to a basis of J/J^2 . The ring map $R \rightarrow C$ is syntomic (hence flat) as it is a composition of a syntomic and a smooth ring map. The dimension of the fibres is $n - c$ by Algebra, Lemma 10.130.4 (the fibres are local complete intersections, so the lemma applies). \square

Lemma 16.4.4. *Let $R \rightarrow A$ be a smooth ring map. Then there exists a smooth R -algebra map $A \rightarrow B$ with a retraction such that B is standard smooth over R , i.e.,*

$$B \cong R[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

and $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ is invertible in B .

Proof. Apply Lemma 16.4.3 to get a smooth R -algebra map $A \rightarrow C$ with a retraction such that $C = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a relative global complete intersection over R . As C is smooth over R we have a short exact sequence

$$0 \rightarrow \bigoplus_{j=1, \dots, c} C f_j \rightarrow \bigoplus_{i=1, \dots, n} C dx_i \rightarrow \Omega_{C/R} \rightarrow 0$$

Since $\Omega_{C/R}$ is a projective C -module this sequence is split. Choose a left inverse t to the first map. Say $t(dx_i) = \sum c_{ij} f_j$ so that $\sum_i \frac{\partial f_j}{\partial x_i} c_{i\ell} = \delta_{j\ell}$ (Kronecker delta). Let

$$B' = C[y_1, \dots, y_c] = R[x_1, \dots, x_n, y_1, \dots, y_c]/(f_1, \dots, f_c)$$

The R -algebra map $C \rightarrow B'$ has a retraction given by mapping y_j to zero. We claim that the map

$$R[z_1, \dots, z_n] \rightarrow B', \quad z_i \mapsto x_i - \sum_j c_{ij} y_j$$

is étale at every point in the image of $\text{Spec}(C) \rightarrow \text{Spec}(B')$. In $\Omega_{B'/R[z_1, \dots, z_n]}$ we have

$$0 = df_j - \sum_i \frac{\partial f_j}{\partial x_i} dz_i \equiv \sum_{i,\ell} \frac{\partial f_j}{\partial x_i} c_{i\ell} dy_\ell \equiv dy_j \pmod{(y_1, \dots, y_c)\Omega_{B'/R[z_1, \dots, z_n]}}$$

Since $0 = dz_i = dx_i$ modulo $\sum B' dy_j + (y_1, \dots, y_c)\Omega_{B'/R[z_1, \dots, z_n]}$ we conclude that

$$\Omega_{B'/R[z_1, \dots, z_n]}/(y_1, \dots, y_c)\Omega_{B'/R[z_1, \dots, z_n]} = 0.$$

As $\Omega_{B'/R[z_1, \dots, z_n]}$ is a finite B' -module by Nakayama's lemma there exists a $g \in 1 + (y_1, \dots, y_c)$ that $(\Omega_{B'/R[z_1, \dots, z_n]})_g = 0$. This proves that $R[z_1, \dots, z_n] \rightarrow B'_g$ is unramified, see Algebra, Definition 10.144.1. For any ring map $R \rightarrow k$ where k is a field we obtain an unramified ring map $k[z_1, \dots, z_n] \rightarrow (B'_g) \otimes_R k$ between smooth k -algebras of dimension n . It follows that $k[z_1, \dots, z_n] \rightarrow (B'_g) \otimes_R k$ is flat by Algebra, Lemmas 10.124.1 and 10.135.2. By the critère de platitude par fibre (Algebra, Lemma 10.124.8) we conclude that $R[z_1, \dots, z_n] \rightarrow B'_g$ is flat. Finally, Algebra, Lemma 10.138.7 implies that $R[z_1, \dots, z_n] \rightarrow B'_g$ is étale. Set $B = B'_g$. Note that $C \rightarrow B$ is smooth and has a retraction, so also $A \rightarrow B$ is smooth and has a retraction. Moreover, $R[z_1, \dots, z_n] \rightarrow B$ is étale. By Algebra, Lemma 10.138.2 we can write

$$B = R[z_1, \dots, z_n, w_1, \dots, w_c]/(g_1, \dots, g_c)$$

with $\det(\partial g_j / \partial w_i)$ invertible in B . This proves the lemma. □

Lemma 16.4.5. *Let $R \rightarrow \Lambda$ be a ring map. If Λ is a filtered colimit of smooth R -algebras, then Λ is a filtered colimit of standard smooth R -algebras.*

Proof. Let $A \rightarrow \Lambda$ be an R -algebra map with A of finite presentation over R . According to Lemma 16.2.1 we have to factor this map through a standard smooth algebra, and we know we can factor it as $A \rightarrow B \rightarrow \Lambda$ with B smooth over R . Choose an R -algebra map $B \rightarrow C$ with a retraction $C \rightarrow B$ such that C is standard smooth over R , see Lemma 16.4.4. Then the desired factorization is $A \rightarrow B \rightarrow C \rightarrow B \rightarrow \Lambda$. □

Lemma 16.4.6. *Let $R \rightarrow A$ be a standard smooth ring map. Let $E \subset A$ be a finite subset of order $|E| = n$. Then there exists a presentation $A = R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$ with $c \geq n$, with $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ invertible in A , and such that E is the set of congruence classes of x_1, \dots, x_n .*

Proof. Choose a presentation $A = R[y_1, \dots, y_m]/(g_1, \dots, g_d)$ such that the image of $\det(\partial g_j / \partial y_i)_{i,j=1, \dots, d}$ is invertible in A . Choose an enumerations $E = \{a_1, \dots, a_n\}$ and choose $h_i \in R[y_1, \dots, y_m]$ whose image in A is a_i . Consider the presentation

$$A = R[x_1, \dots, x_n, y_1, \dots, y_m]/(x_1 - h_1, \dots, x_n - h_n, g_1, \dots, g_d)$$

and set $c = n + d$. \square

Lemma 16.4.7. *Let $R \rightarrow A$ be a ring map of finite presentation. Let $a \in A$. Consider the following conditions on a :*

- (1) A_a is smooth over R ,
- (2) A_a is smooth over R and $\Omega_{A_a/R}$ is stably free,
- (3) A_a is smooth over R and $\Omega_{A_a/R}$ is free,
- (4) A_a is standard smooth over R ,
- (5) a is strictly standard in A over R ,
- (6) a is elementary standard in A over R .

Then we have

- (a) (4) \Rightarrow (3) \Rightarrow (2) \Rightarrow (1),
- (b) (6) \Rightarrow (5),
- (c) (6) \Rightarrow (4),
- (d) (5) \Rightarrow (2),
- (e) (2) \Rightarrow the elements a^e , $e \geq e_0$ are strictly standard in A over R ,
- (f) (4) \Rightarrow the elements a^e , $e \geq e_0$ are elementary standard in A over R .

Proof. Part (a) is clear from the definitions and Algebra, Lemma 10.132.7. Part (b) is clear from Definition 16.3.3.

Proof of (c). Choose a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ such that (16.3.3.1) and (16.3.3.2) hold. Choose $h \in R[x_1, \dots, x_n]$ mapping to a . Then

$$A_a = R[x_0, x_1, \dots, x_n]/(x_0h - 1, f_1, \dots, f_n).$$

Write $J = (x_0h - 1, f_1, \dots, f_n)$. By (16.3.3.2) we see that the A_a -module J/J^2 is generated by $x_0h - 1, f_1, \dots, f_n$ over A_a . Hence, as in the proof of Algebra, Lemma 10.131.6, we can choose a $g \in 1 + J$ such that

$$A_a = R[x_0, \dots, x_n, x_{n+1}]/(x_0h - 1, f_1, \dots, f_n, gx_{n+1} - 1).$$

At this point (16.3.3.1) implies that $R \rightarrow A_a$ is standard smooth (use the coordinates $x_0, x_1, \dots, x_n, x_{n+1}$ to take derivatives).

Proof of (d). Choose a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ such that (16.3.3.3) and (16.3.3.4) hold. We already know that A_a is smooth over R , see Lemma 16.3.5. As above we get a presentation $A_a = R[x_0, x_1, \dots, x_n]/J$ with J/J^2 free. Then $\Omega_{A_a/R} \oplus J/J^2 \cong A_a^{\oplus n+1}$ by the definition of smooth ring maps, hence we see that $\Omega_{A_a/R}$ is stably free.

Proof of (e). Choose a presentation $A = R[x_1, \dots, x_n]/I$ with I finitely generated. By assumption we have a short exact sequence

$$0 \rightarrow (I/I^2)_a \rightarrow \bigoplus_{i=1, \dots, n} A_a dx_i \rightarrow \Omega_{A_a/R} \rightarrow 0$$

which is split exact. Hence we see that $(I/I^2)_a \oplus \Omega_{A_a/R}$ is a free A_a -module. Since $\Omega_{A_a/R}$ is stably free we see that $(I/I^2)_a$ is stably free as well. Thus replacing the presentation chosen above by $A = R[x_1, \dots, x_n, x_{n+1}, \dots, x_{n+r}]/J$ with

$J = (I, x_{n+1}, \dots, x_{n+r})$ for some r we get that $(J/J^2)_a$ is (finite) free. Choose $f_1, \dots, f_c \in J$ which map to a basis of $(J/J^2)_a$. Extend this to a list of generators $f_1, \dots, f_m \in J$. Consider the presentation $A = R[x_1, \dots, x_{n+r}]/(f_1, \dots, f_m)$. Then (16.3.3.4) holds for a^e for all sufficiently large e by construction. Moreover, since $(J/J^2)_a \rightarrow \bigoplus_{i=1, \dots, n} A_a dx_i$ is a split injection we can find an A_a -linear left inverse. Writing this left inverse in terms of the basis f_1, \dots, f_c and clearing denominators we find a linear map $\psi_0 : A^{\oplus n} \rightarrow A^{\oplus c}$ such that

$$A^{\oplus c} \xrightarrow{(f_1, \dots, f_c)} J/J^2 \xrightarrow{f \mapsto df} \bigoplus_{i=1, \dots, n} A dx_i \xrightarrow{\psi_0} A^{\oplus c}$$

is multiplication by a^{e_0} for some $e_0 \geq 1$. By Lemma 16.3.4 we see (16.3.3.3) holds for all a^{ce_0} and hence for a^e for all e with $e \geq ce_0$.

Proof of (f). Choose a presentation $A_a = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ such that $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ is invertible in A_a . We may assume that for some $m < n$ the classes of the elements x_1, \dots, x_m correspond $a_i/1$ where $a_1, \dots, a_m \in A$ are generators of A over R , see Lemma 16.4.6. After replacing x_i by $a^N x_i$ for $m < i \leq n$ we may assume the class of x_i is $a_i/1 \in A_a$ for some $a_i \in A$. Consider the ring map

$$\Psi : R[x_1, \dots, x_n] \rightarrow A, \quad x_i \mapsto a_i.$$

This is a surjective ring map. By replacing f_j by $a^N f_j$ we may assume that $f_j \in R[x_1, \dots, x_n]$ and that $\Psi(f_j) = 0$ (since after all $f_j(a_1/1, \dots, a_n/1) = 0$ in A_a). Let $J = \text{Ker}(\Psi)$. Then $A = R[x_1, \dots, x_n]/J$ is a presentation and $f_1, \dots, f_c \in J$ are elements such that $(J/J^2)_a$ is freely generated by f_1, \dots, f_c and such that $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ maps to an invertible element of A_a . It follows that (16.3.3.1) and (16.3.3.2) hold for a^e and all large enough e as desired. \square

16.5. The lifting problem

The goal in this section is to prove (Proposition 16.5.3) that the collection of algebras which are filtered colimits of smooth algebras is closed under infinitesimal flat deformations. The proof is elementary and only uses the results on presentations of smooth algebras from Section 16.4.

Lemma 16.5.1. *Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that*

- (1) $I^2 = 0$, and
- (2) $\Lambda/I\Lambda$ is a filtered colimit of smooth R/I -algebras.

Let $\varphi : A \rightarrow \Lambda$ be an R -algebra map with A of finite presentation over R . Then there exists a factorization

$$A \rightarrow B/J \rightarrow \Lambda$$

where B is a smooth R -algebra and $J \subset IB$ is a finitely generated ideal.

Proof. Choose a factorization

$$A/IA \rightarrow \bar{B} \rightarrow \Lambda/IA$$

with \bar{B} standard smooth over R/I ; this is possible by assumption and Lemma 16.4.5. Write

$$\bar{B} = A/IA[t_1, \dots, t_r]/(\bar{g}_1, \dots, \bar{g}_s)$$

and say $\bar{B} \rightarrow \Lambda/I\Lambda$ maps t_i to the class of λ_i modulo $I\Lambda$. Choose $g_1, \dots, g_s \in A[t_1, \dots, t_r]$ lifting $\bar{g}_1, \dots, \bar{g}_s$. Write $\varphi(g_i)(\lambda_1, \dots, \lambda_r) = \sum \epsilon_{ij} \mu_{ij}$ for some $\epsilon_{ij} \in I$ and $\mu_{ij} \in \Lambda$. Define

$$A' = A[t_1, \dots, t_r, \delta_{i,j}]/(g_i - \sum \epsilon_{ij} \delta_{ij})$$

and consider the map

$$A' \longrightarrow \Lambda, \quad a \longmapsto \varphi(a), \quad t_i \longmapsto \lambda_i, \quad \delta_{ij} \longmapsto \mu_{ij}$$

We have

$$A'/IA' = A/IA[t_1, \dots, t_r]/(\bar{g}_1, \dots, \bar{g}_s)[\delta_{ij}] \cong \bar{B}[\delta_{ij}]$$

This is a standard smooth algebra over R/I as \bar{B} is standard smooth. Choose a presentation $A'/IA' = R/I[x_1, \dots, x_n]/(\bar{f}_1, \dots, \bar{f}_c)$ with $\det(\partial \bar{f}_j / \partial x_i)_{i,j=1, \dots, c}$ invertible in A'/IA' . Choose lifts $f_1, \dots, f_c \in R[x_1, \dots, x_n]$ of $\bar{f}_1, \dots, \bar{f}_c$. Then

$$B = R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, x_{n+1} \det(\partial f_j / \partial x_i)_{i,j=1, \dots, c} - 1)$$

is smooth over R . Since smooth ring maps are formally smooth (Algebra, Proposition 10.133.13) there exists an R -algebra map $B \rightarrow A'$ which is an isomorphism modulo I . Then $B \rightarrow A'$ is surjective by Nakayama's lemma (Algebra, Lemma 10.19.1). Thus $A' = B/J$ with $J \subset IB$ finitely generated (see Algebra, Lemma 10.6.3). \square

Lemma 16.5.2. *Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that*

- (1) $I^2 = 0$,
- (2) $\Lambda/I\Lambda$ is a filtered colimit of smooth R/I -algebras, and
- (3) $R \rightarrow \Lambda$ is flat.

Let $\varphi : B \rightarrow \Lambda$ be an R -algebra map with B smooth over R . Let $J \subset IB$ be a finitely generated ideal. Then there exists R -algebra maps

$$B \xrightarrow{\alpha} B' \xrightarrow{\beta} \Lambda$$

such that B' is smooth over R , such that $\alpha(J) = 0$ and such that $\beta \circ \alpha = \varphi \bmod I\Lambda$.

Proof. If we can prove the lemma in case $J = (h)$, then we can prove the lemma by induction on the number of generators of J . Namely, suppose that J can be generated by n elements h_1, \dots, h_n and the lemma holds for all cases where J is generated by $n-1$ elements. Then we apply the case $n = 1$ to produce $B \rightarrow B' \rightarrow \Lambda$ where the first map kills h_n . Then we let J' be the ideal of B' generated by the images of h_1, \dots, h_{n-1} and we apply the case for $n-1$ to produce $B' \rightarrow B'' \rightarrow \Lambda$. It is easy to verify that $B \rightarrow B'' \rightarrow \Lambda$ does the job.

Assume $J = (h)$ and write $h = \sum \epsilon_i b_i$ for some $\epsilon_i \in I$ and $b_i \in B$. Note that $0 = \varphi(h) = \sum \epsilon_i \varphi(b_i)$. As Λ is flat over R , the equational criterion for flatness (Algebra, Lemma 10.38.10) implies that we can find $\lambda_j \in \Lambda$, $j = 1, \dots, m$ and $a_{ij} \in R$ such that $\varphi(b_i) = \sum_j a_{ij} \lambda_j$ and $\sum_i \epsilon_i a_{ij} = 0$. Set

$$C = B[x_1, \dots, x_m]/(b_i - \sum a_{ij} x_j)$$

with $C \rightarrow \Lambda$ given by φ and $x_j \mapsto \lambda_j$. Choose a factorization

$$C \rightarrow B'/J' \rightarrow \Lambda$$

as in Lemma 16.5.1. Since B is smooth over R we can lift the map $B \rightarrow C \rightarrow B'/J'$ to a map $\psi : B \rightarrow B'$. We claim that $\psi(h) = 0$. Namely, the fact that ψ agrees with $B \rightarrow C \rightarrow B'/J'$ mod I implies that

$$\psi(b_i) = \sum a_{ij}\xi_j + \theta_i$$

for some $\xi_i \in B'$ and $\theta_i \in IB'$. Hence we see that

$$\psi(h) = \psi\left(\sum \epsilon_i b_i\right) = \sum \epsilon_i a_{ij}\xi_j + \sum \epsilon_i \theta_i = 0$$

because of the relations above and the fact that $I^2 = 0$. □

Proposition 16.5.3. *Let $R \rightarrow \Lambda$ be a ring map. Let $I \subset R$ be an ideal. Assume that*

- (1) I is nilpotent,
- (2) $\Lambda/I\Lambda$ is a filtered colimit of smooth R/I -algebras, and
- (3) $R \rightarrow \Lambda$ is flat.

Then Λ is a colimit of smooth R -algebras.

Proof. Since $I^n = 0$ for some n , it follows by induction on n that it suffices to consider the case where $I^2 = 0$. Let $\varphi : A \rightarrow \Lambda$ be an R -algebra map with A of finite presentation over R . We have to find a factorization $A \rightarrow B \rightarrow \Lambda$ with B smooth over R , see Lemma 16.2.1. By Lemma 16.5.1 we may assume that $A = B/J$ with B smooth over R and $J \subset IB$ a finitely generated ideal. By Lemma 16.5.2 we can find a (possibly noncommutative) diagram

$$\begin{array}{ccc} B & \xrightarrow{\alpha} & B' \\ & \searrow \varphi & \swarrow \beta \\ & \Lambda & \end{array}$$

of R -algebras which commutes modulo I and such that $\alpha(J) = 0$. The map

$$D : B \rightarrow I\Lambda, \quad b \mapsto \varphi(b) - \beta(\alpha(b))$$

is a derivation over R hence we can write it as $D = \xi \circ d_{B/R}$ for some B -linear map $\xi : \Omega_{B/R} \rightarrow I\Lambda$. Since $\Omega_{B/R}$ is a finite projective B -module we can write $\xi = \sum_{i=1, \dots, n} \epsilon_i \Xi_i$ for some $\epsilon_i \in I$ and B -linear maps $\Xi_i : \Omega_{B/R} \rightarrow \Lambda$. (Details omitted. Hint: write $\Omega_{B/R}$ as a direct sum of a finite free module to reduce to the finite free case.) We define

$$B'' = \text{Sym}_{B'}^* \left(\bigoplus_{i=1, \dots, n} \Omega_{B/R} \otimes_{B, \alpha} B' \right)$$

and we define $\beta' : B'' \rightarrow \Lambda$ by β on B' and by

$$\beta'|_{i\text{th summand } \Omega_{B/R} \otimes_{B, \alpha} B'} = \Xi_i \otimes \beta$$

and $\alpha' : B \rightarrow B''$ by

$$\alpha'(b) = \alpha(b) \oplus \sum \epsilon_i d_{B/R}(b) \otimes 1 \oplus 0 \oplus \dots$$

At this point the diagram

$$\begin{array}{ccc} B & \xrightarrow{\alpha'} & B'' \\ & \searrow \varphi & \swarrow \beta' \\ & \Lambda & \end{array}$$

does commute. Moreover, it is direct from the definitions that $\alpha'(J) = 0$ as $I^2 = 0$. Hence the desired factorization. \square

16.6. The lifting lemma

Here is a fiendishly clever lemma.

Lemma 16.6.1. *Let R be a Noetherian ring. Let Λ be an R -algebra. Let $\pi \in R$ and assume that $\text{Ann}_R(\pi) = \text{Ann}_R(\pi^2)$ and $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$. Suppose we have R -algebra maps $R/\pi^2 R \rightarrow \bar{C} \rightarrow \Lambda/\pi^2 \Lambda$ with \bar{C} of finite presentation. Then there exists an R -algebra homomorphism $D \rightarrow \Lambda$ and a commutative diagram*

$$\begin{array}{ccccc} R/\pi^2 R & \longrightarrow & \bar{C} & \longrightarrow & \Lambda/\pi^2 \Lambda \\ \downarrow & & \downarrow & & \downarrow \\ R/\pi R & \longrightarrow & D/\pi D & \longrightarrow & \Lambda/\pi \Lambda \end{array}$$

with the following properties

- (a) D is of finite presentation,
- (b) $R \rightarrow D$ is smooth at any prime \mathfrak{q} with $\pi \notin \mathfrak{q}$,
- (c) $R \rightarrow D$ is smooth at any prime \mathfrak{q} with $\pi \in \mathfrak{q}$ lying over a prime of \bar{C} where $R/\pi^2 R \rightarrow \bar{C}$ is smooth, and
- (d) $\bar{C}/\pi \bar{C} \rightarrow D/\pi D$ is smooth at any prime lying over a prime of \bar{C} where $R/\pi^2 R \rightarrow \bar{C}$ is smooth.

Proof. We choose a presentation

$$\bar{C} = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$$

We also denote $I = (f_1, \dots, f_m)$ and \bar{I} the image of I in $R/\pi^2 R[x_1, \dots, x_n]$. Since R is Noetherian, so is \bar{C} . Hence the smooth locus of $R/\pi^2 R \rightarrow \bar{C}$ is quasi-compact, see Topology, Lemma 5.8.2. Applying Lemma 16.3.2 we may choose a finite list of elements $a_1, \dots, a_r \in R[x_1, \dots, x_n]$ such that

- (1) the union of the open subspaces $\text{Spec}(\bar{C}_{a_k}) \subset \text{Spec}(\bar{C})$ cover the smooth locus of $R/\pi^2 R \rightarrow \bar{C}$, and
- (2) for each $k = 1, \dots, r$ there exists a finite subset $E_k \subset \{1, \dots, m\}$ such that $(\bar{I}/\bar{I}^2)_{a_k}$ is freely generated by the classes of $f_j, j \in E_k$.

Set $I_k = (f_j, j \in E_k) \subset I$ and denote \bar{I}_k the image of I_k in $R/\pi^2 R[x_1, \dots, x_n]$. By (2) and Nakayama's lemma we see that $(\bar{I}/\bar{I}_k)_{a_k}$ is annihilated by $1 + b'_k$ for some $b'_k \in \bar{I}_{a_k}$. Suppose b'_k is the image of $b_k/(a_k)^N$ for some $b_k \in I$ and some integer N . After replacing a_k by $a_k b_k$ we get

$$(3) (\bar{I}_k)_{a_k} = (\bar{I})_{a_k}.$$

Thus, after possibly replacing a_k by a high power, we may write

$$(4) a_k f_\ell = \sum_{j \in E_k} h_{k,\ell}^j f_j + \pi^2 g_{k,\ell}$$

for any $\ell \in \{1, \dots, m\}$ and some $h_{i,\ell}^j, g_{i,\ell} \in R[x_1, \dots, x_n]$. If $\ell \in E_k$ we choose $h_{k,\ell}^j = a_k \delta_{\ell,j}$ (Kronecker delta) and $g_{k,\ell} = 0$. Set

$$D = R[x_1, \dots, x_n, z_1, \dots, z_m]/(f_j - \pi z_j, p_{k,\ell}).$$

Here $j \in \{1, \dots, m\}, k \in \{1, \dots, r\}, \ell \in \{1, \dots, m\}$, and

$$p_{k,\ell} = a_k z_\ell - \sum_{j \in E_k} h_{k,\ell}^j z_j - \pi g_{k,\ell}.$$

Note that for $\ell \in E_k$ we have $p_{k,\ell} = 0$ by our choices above.

The map $R \rightarrow D$ is the given one. Say $\bar{C} \rightarrow \Lambda/\pi^2\Lambda$ maps x_i to the class of λ_i modulo π^2 . For an element $f \in R[x_1, \dots, x_n]$ we denote $f(\lambda) \in \Lambda$ the result of substituting λ_i for x_i . Then we know that $f_j(\lambda) = \pi^2\mu_j$ for some $\mu_j \in \Lambda$. Define $D \rightarrow \Lambda$ by the rules $x_i \mapsto \lambda_i$ and $z_j \mapsto \pi\mu_j$. This is well defined because

$$\begin{aligned} p_{k,\ell} &\mapsto a_k(\lambda)\pi\mu_\ell - \sum_{j \in E_k} h_{k,\ell}^j(\lambda)\pi\mu_j - \pi g_{k,\ell}(\lambda) \\ &= \pi \left(a_k(\lambda)\mu_\ell - \sum_{j \in E_k} h_{k,\ell}^j(\lambda)\mu_j - g_{k,\ell}(\lambda) \right) \end{aligned}$$

Substituting $x_i = \lambda_i$ in (4) above we see that the expression inside the brackets is annihilated by π^2 , hence it is annihilated by π as we have assumed $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$. The map $\bar{C} \rightarrow D/\pi D$ is determined by $x_i \mapsto \lambda_i$ (clearly well defined). Thus we are done if we can prove (b), (c), and (d).

Using (4) we obtain the following key equality

$$\begin{aligned} \pi p_{k,\ell} &= \pi a_k z_\ell - \sum_{j \in E_k} \pi h_{k,\ell}^j z_j - \pi^2 g_{k,\ell} \\ &= -a_k(f_\ell - \pi z_\ell) + a_k f_\ell + \sum_{j \in E_k} h_{k,\ell}^j(f_j - \pi z_j) - \sum_{j \in E_k} h_{k,\ell}^j f_j - \pi^2 g_{k,\ell} \\ &= -a_k(f_\ell - \pi z_\ell) + \sum_{j \in E_k} h_{k,\ell}^j(f_j - \pi z_j) \end{aligned}$$

The end result is an element of the ideal generated by $f_j - \pi z_j$. In particular, we see that $D[1/\pi]$ is isomorphic to $R[1/\pi][x_1, \dots, x_n, z_1, \dots, z_m]/(f_j - \pi z_j)$ which is isomorphic to $R[1/\pi][x_1, \dots, x_n]$ hence smooth over R . This proves (b).

For fixed $k \in \{1, \dots, r\}$ consider the ring

$$D_k = R[x_1, \dots, x_n, z_1, \dots, z_m]/(f_j - \pi z_j, j \in E_k, p_{k,\ell})$$

The number of equations is $m = |E_k| + (m - |E_k|)$ as $p_{k,\ell}$ is zero if $\ell \in E_k$. Also, note that

$$\begin{aligned} (D_k/\pi D_k)_{a_k} &= R/\pi R[x_1, \dots, x_n, 1/a_k, z_1, \dots, z_m]/(f_j, j \in E_k, p_{k,\ell}) \\ &= (\bar{C}/\pi\bar{C})_{a_k}[z_1, \dots, z_m]/(a_k z_\ell - \sum_{j \in E_k} h_{k,\ell}^j z_j) \\ &\cong (\bar{C}/\pi\bar{C})_{a_k}[z_j, j \in E_k] \end{aligned}$$

In particular $(D_k/\pi D_k)_{a_k}$ is smooth over $(\bar{C}/\pi\bar{C})_{a_k}$. By our choice of a_k we have that $(\bar{C}/\pi\bar{C})_{a_k}$ is smooth over $R/\pi R$ of relative dimension $n - |E_k|$, see (2). Hence for a prime $\mathfrak{q}_k \subset D_k$ containing π and lying over $\text{Spec}(\bar{C}_{a_k})$ the fibre ring of $R \rightarrow D_k$ is smooth at \mathfrak{q}_k of dimension n . Thus $R \rightarrow D_k$ is syntomic at \mathfrak{q}_k by our count of the number of equations above, see Algebra, Lemma 10.131.11. Hence $R \rightarrow D_k$ is smooth at \mathfrak{q}_k , see Algebra, Lemma 10.132.16.

To finish the proof, let $\mathfrak{q} \subset D$ be a prime containing π lying over a prime where $R/\pi^2 R \rightarrow \bar{C}$ is smooth. Then $a_k \notin \mathfrak{q}$ for some k by (1). We will show that the surjection $D_k \rightarrow D$ induces an isomorphism on local rings at \mathfrak{q} . Since we know that the ring maps $\bar{C}/\pi\bar{C} \rightarrow D_k/\pi D_k$ and $R \rightarrow D_k$ are smooth at the corresponding prime \mathfrak{q}_k by the preceding paragraph this will prove (c) and (d) and thus finish the proof.

First, note that for any ℓ the equation $\pi p_{k,\ell} = -a_k(f_\ell - \pi z_\ell) + \sum_{j \in E_k} h_{k,\ell}^j(f_j - \pi z_j)$ proved above shows that $f_\ell - \pi z_\ell$ maps to zero in $(D_k)_{a_k}$ and in particular in $(D_k)_{\mathfrak{q}_k}$.

The relations (4) imply that $a_k f_\ell = \sum_{j \in E_k} h_{k,\ell}^j f_j$ in I/I^2 . Since $(\bar{I}_k/\bar{I}_k^2)_{a_k}$ is free on $f_j, j \in E_k$ we see that

$$a_{k'} h_{k,\ell}^j - \sum_{j' \in E_{k'}} h_{k',\ell}^{j'} h_{k,j'}^j$$

is zero in \bar{C}_{a_k} for every k, k', ℓ and $j \in E_k$. Hence we can find a large integer N such that

$$a_k^N \left(a_{k'} h_{k,\ell}^j - \sum_{j' \in E_{k'}} h_{k',\ell}^{j'} h_{k,j'}^j \right)$$

is in $I_k + \pi^2 R[x_1, \dots, x_n]$. Computing modulo π we have

$$\begin{aligned} & a_k p_{k',\ell} - a_{k'} p_{k,\ell} + \sum h_{k',\ell}^{j'} p_{k,j'} \\ &= -a_k \sum h_{k',\ell}^{j'} z_{j'} + a_{k'} \sum h_{k,\ell}^j z_j + \sum h_{k',\ell}^{j'} a_k z_{j'} - \sum \sum h_{k',\ell}^{j'} h_{k,j'}^j z_j \\ &= \sum \left(a_{k'} h_{k,\ell}^j - \sum h_{k',\ell}^{j'} h_{k,j'}^j \right) z_j \end{aligned}$$

with Einstein summation convention. Combining with the above we see $a_k^{N+1} p_{k',\ell}$ is contained in the ideal generated by I_k and π in $R[x_1, \dots, x_n, z_1, \dots, z_m]$. Thus $p_{k',\ell}$ maps into $\pi(D_k)_{a_k}$. On the other hand, the equation

$$\pi p_{k',\ell} = -a_{k'}(f_\ell - \pi z_\ell) + \sum_{j' \in E_{k'}} h_{k',\ell}^{j'} (f_{j'} - \pi z_{j'})$$

shows that $\pi p_{k',\ell}$ is zero in $(D_k)_{a_k}$. Since we have assumed that $\text{Ann}_R(\pi) = \text{Ann}_R(\pi^2)$ and since $(D_k)_{q_k}$ is smooth hence flat over R we see that $\text{Ann}_{(D_k)_{q_k}}(\pi) = \text{Ann}_{(D_k)_{q_k}}(\pi^2)$. We conclude that $p_{k',\ell}$ maps to zero as well, hence $D_q = (D_k)_{q_k}$ and we win. \square

16.7. The desingularization lemma

Here is another fiendishly clever lemma.

Lemma 16.7.1. *Let R be a Noetherian ring. Let Λ be an R -algebra. Let $\pi \in R$ and assume that $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$. Let $A \rightarrow \Lambda$ be an R -algebra map with A of finite presentation. Assume*

- (1) *the image of π is strictly standard in A over R , and*
- (2) *there exists a section $\rho : A/\pi^4 A \rightarrow R/\pi^4 R$ which is compatible with the map to $\Lambda/\pi^4 \Lambda$.*

Then we can find R -algebra maps $A \rightarrow B \rightarrow \Lambda$ with B of finite presentation such that $\mathfrak{a}B \subset H_{B/R}$ where $\mathfrak{a} = \text{Ann}_R(\text{Ann}_R(\pi^2)/\text{Ann}_R(\pi))$.

Proof. Choose a presentation

$$A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$$

and $0 \leq c \leq \min(n, m)$ such that (16.3.3.3) holds for π and such that

$$(16.7.1.1) \quad \pi f_{c+j} \in (f_1, \dots, f_c) + (f_1, \dots, f_m)^2$$

for $j = 1, \dots, m-c$. Say ρ maps x_i to the class of $r_i \in R$. Then we can replace x_i by $x_i - r_i$. Hence we may assume $\rho(x_i) = 0$ in $R/\pi^4 R$. This implies that $f_j(0) \in \pi^4 R$ and that $A \rightarrow \Lambda$ maps x_i to $\pi^4 \lambda_i$ for some $\lambda_i \in \Lambda$. Write

$$f_j = f_j(0) + \sum_{i=1, \dots, n} r_{ji} x_i + \text{h.o.t.}$$

This implies that the constant term of $\partial f_j / \partial x_i$ is r_{ji} . Apply ρ to (16.3.3.3) for π and we see that

$$\pi = \sum_{I \subset \{1, \dots, n\}, |I|=c} r_I \det(r_{ji})_{j=1, \dots, c, i \in I} \pmod{\pi^4 R}$$

for some $r_I \in R$. Thus we have

$$u\pi = \sum_{I \subset \{1, \dots, n\}, |I|=c} r_I \det(r_{ji})_{j=1, \dots, c, i \in I}$$

for some $u \in 1 + \pi^3 R$. By Algebra, Lemma 10.14.4 this implies there exists a $n \times c$ matrix (s_{ik}) such that

$$u\pi \delta_{jk} = \sum_{i=1, \dots, n} r_{ji} s_{ik} \quad \text{for all } j, k = 1, \dots, c$$

(Kronecker delta). We introduce auxiliary variables $v_1, \dots, v_c, w_1, \dots, w_n$ and we set

$$h_i = x_i - \pi^2 \sum_{j=1, \dots, c} s_{ij} v_j - \pi^3 w_i$$

In the following we will use that

$$R[x_1, \dots, x_n, v_1, \dots, v_c, w_1, \dots, w_n] / (h_1, \dots, h_n) = R[v_1, \dots, v_c, w_1, \dots, w_n]$$

without further mention. In $R[x_1, \dots, x_n, v_1, \dots, v_c, w_1, \dots, w_n] / (h_1, \dots, h_n)$ we have

$$\begin{aligned} f_j &= f_j(x_1 - h_1, \dots, x_n - h_n) \\ &= \sum_i \pi^2 r_{ji} s_{ik} v_k + \sum_i \pi^3 r_{ji} w_i \pmod{\pi^4} \\ &= \pi^3 v_j + \sum \pi^3 r_{ji} w_i \pmod{\pi^4} \end{aligned}$$

for $1 \leq j \leq c$. Hence we can choose elements $g_j \in R[v_1, \dots, v_c, w_1, \dots, w_n]$ such that $g_j = v_j + \sum r_{ji} w_i \pmod{\pi}$ and such that $f_j = \pi^3 g_j$ in the R -algebra $R[x_1, \dots, x_n, v_1, \dots, v_c, w_1, \dots, w_n] / (h_1, \dots, h_n)$. We set

$$B = R[x_1, \dots, x_n, v_1, \dots, v_c, w_1, \dots, w_n] / (f_1, \dots, f_n, h_1, \dots, h_n, g_1, \dots, g_c).$$

The map $A \rightarrow B$ is clear. We define $B \rightarrow \Lambda$ by mapping $x_i \rightarrow \pi^4 \lambda_i$, $v_i \mapsto 0$, and $w_i \mapsto \pi \lambda_i$. Then it is clear that the elements f_j and h_i are mapped to zero in Λ . Moreover, it is clear that g_i is mapped to an element t of $\pi \Lambda$ such that $\pi^3 t = 0$ (as $f_i = \pi^3 g_i$ modulo the ideal generated by the h 's). Hence our assumption that $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$ implies that $t = 0$. Thus we are done if we can prove the statement about smoothness.

Note that $B_\pi \cong A_\pi[v_1, \dots, v_c]$ because the equations $g_i = 0$ are implied by $f_i = 0$. Hence B_π is smooth over R as A_π is smooth over R by the assumption that π is strictly standard in A over R , see Lemma 16.3.5.

Set $B' = R[v_1, \dots, v_c, w_1, \dots, w_n] / (g_1, \dots, g_c)$. As $g_i = v_i + \sum r_{ji} w_i \pmod{\pi}$ we see that $B' / \pi B' = R / \pi R[w_1, \dots, w_n]$. Hence $R \rightarrow B'$ is smooth of relative dimension n at every point of $V(\pi)$ by Algebra, Lemmas 10.131.11 and 10.132.16 (the first lemma shows it is syntomic at those primes, in particular flat, whereupon the second lemma shows it is smooth).

Let $\mathfrak{q} \subset B$ be a prime with $\pi \in \mathfrak{q}$ and for some $r \in \mathfrak{a}$, $r \notin \mathfrak{q}$. Denote $\mathfrak{q}' = B' \cap \mathfrak{q}$. We claim the surjection $B' \rightarrow B$ induces an isomorphism of local rings $(B')_{\mathfrak{q}'} \rightarrow B_{\mathfrak{q}}$. This will conclude the proof of the lemma. Note that $B_{\mathfrak{q}}$ is the quotient of $(B')_{\mathfrak{q}'}$ by the ideal generated by f_{c+j} , $j = 1, \dots, m - c$. We observe two things: first the

image of f_{c+j} in $(B')_{\mathfrak{q}'}$ is divisible by π^2 and second the image of πf_{c+j} in $(B')_{\mathfrak{q}'}$ can be written as $\sum b_{j_1 j_2} f_{c+j_1} f_{c+j_2}$ by (16.7.1.1). Thus we see that the image of each πf_{c+j} is contained in the ideal generated by the elements $\pi^2 f_{c+j'}$. Hence $\pi f_{c+j} = 0$ in $(B')_{\mathfrak{q}'}$ as this is a Noetherian local ring, see Algebra, Lemma 10.49.4. As $R \rightarrow (B')_{\mathfrak{q}'}$ is flat we see that

$$(\text{Ann}_R(\pi^2)/\text{Ann}_R(\pi)) \otimes_R (B')_{\mathfrak{q}'} = \text{Ann}_{(B')_{\mathfrak{q}'}}(\pi^2)/\text{Ann}_{(B')_{\mathfrak{q}'}}(\pi)$$

Because $r \in \mathfrak{a}$ is invertible in $(B')_{\mathfrak{q}'}$ we see that this module is zero. Hence we see that the image of f_{c+j} is zero in $(B')_{\mathfrak{q}'}$ as desired. \square

Lemma 16.7.2. *Let R be a Noetherian ring. Let Λ be an R -algebra. Let $\pi \in R$ and assume that $\text{Ann}_R(\pi) = \text{Ann}_R(\pi^2)$ and $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$. Let $A \rightarrow \Lambda$ and $D \rightarrow \Lambda$ be R -algebra maps with A and D of finite presentation. Assume*

- (1) π is strictly standard in A over R , and
- (2) there exists an R -algebra map $A/\pi^4 A \rightarrow D/\pi^4 D$ compatible with the maps to $\Lambda/\pi^4 \Lambda$.

Then we can find an R -algebra map $B \rightarrow \Lambda$ with B of finite presentation and R -algebra maps $A \rightarrow B$ and $D \rightarrow B$ compatible with the maps to Λ such that $H_{D/R}B \subset H_{B/D}$ and $H_{D/R}B \subset H_{B/R}$.

Proof. We apply Lemma 16.7.1 to

$$D \longrightarrow A \otimes_R D \longrightarrow \Lambda$$

and the image of π in D . By Lemma 16.3.7 we see that π is strictly standard in $A \otimes_R D$ over D . As our section $\rho : (A \otimes_R D)/\pi^4(A \otimes_R D) \rightarrow D/\pi^4 D$ we take the map induced by the map in (2). Thus Lemma 16.7.1 applies and we obtain a factorization $A \otimes_R D \rightarrow B \rightarrow \Lambda$ with B of finite presentation and $\mathfrak{a}B \subset H_{B/D}$ where

$$\mathfrak{a} = \text{Ann}_D(\text{Ann}_D(\pi^2)/\text{Ann}_D(\pi)).$$

For any prime \mathfrak{q} of D such that $D_{\mathfrak{q}}$ is flat over R we have $\text{Ann}_{D_{\mathfrak{q}}}(\pi^2)/\text{Ann}_{D_{\mathfrak{q}}}(\pi) = 0$ because annihilators of elements commutes with flat base change and we assumed $\text{Ann}_R(\pi) = \text{Ann}_R(\pi^2)$. Because D is Noetherian we see that $\text{Ann}_D(\pi^2)/\text{Ann}_D(\pi)$ is a finite D -module, hence formation of its annihilator commutes with localization. Thus we see that $\mathfrak{a} \not\subset \mathfrak{q}$. Hence we see that $D \rightarrow B$ is smooth at any prime of B lying over \mathfrak{q} . Since any prime of D where $R \rightarrow D$ is smooth is one where $D_{\mathfrak{q}}$ is flat over R we conclude that $H_{D/R}B \subset H_{B/D}$. The final inclusion $H_{D/R}B \subset H_{B/R}$ follows because compositions of smooth ring maps are smooth (Algebra, Lemma 10.132.14). \square

Lemma 16.7.3. *Let R be a Noetherian ring. Let Λ be an R -algebra. Let $\pi \in R$ and assume that $\text{Ann}_R(\pi) = \text{Ann}_R(\pi^2)$ and $\text{Ann}_\Lambda(\pi) = \text{Ann}_\Lambda(\pi^2)$. Let $A \rightarrow \Lambda$ be an R -algebra map with A of finite presentation and assume π is strictly standard in A over R . Let*

$$A/\pi^8 A \rightarrow \bar{C} \rightarrow \Lambda/\pi^8 \Lambda$$

be a factorization with \bar{C} of finite presentation. Then we can find a factorization $A \rightarrow B \rightarrow \Lambda$ with B of finite presentation such that $R_\pi \rightarrow B_\pi$ is smooth and such that

$$H_{\bar{C}/(R/\pi^8 R)} \cdot \Lambda/\pi^8 \Lambda \subset \sqrt{H_{B/R}\Lambda} \bmod \pi^8 \Lambda.$$

Proof. Apply Lemma 16.6.1 to get $R \rightarrow D \rightarrow \Lambda$ with a factorization $\bar{C}/\pi^4\bar{C} \rightarrow D/\pi^4D \rightarrow \Lambda/\pi^4\Lambda$ such that $R \rightarrow D$ is smooth at any prime not containing π and at any prime lying over a prime of $\bar{C}/\pi^4\bar{C}$ where $R/\pi^8R \rightarrow \bar{C}$ is smooth. By Lemma 16.7.2 we can find a finitely presented R -algebra B and factorizations $A \rightarrow B \rightarrow \Lambda$ and $D \rightarrow B \rightarrow \Lambda$ such that $H_{D/R}B \subset H_{B/R}$. We omit the verification that this is a solution to the problem posed by the lemma. \square

16.8. Warmup: reduction to a base field

In this section we apply the lemmas in the previous sections to prove that it suffices to prove the main result when the base ring is a field, see Lemma 16.8.4.

Situation 16.8.1. Here $R \rightarrow \Lambda$ is a regular ring map of Noetherian rings.

Let $R \rightarrow \Lambda$ be as in Situation 16.8.1. We say *PT holds for $R \rightarrow \Lambda$* if Λ is a filtered colimit of smooth R -algebras.

Lemma 16.8.2. *Let $R_i \rightarrow \Lambda_i, i = 1, 2$ be as in Situation 16.8.1. If PT holds for $R_i \rightarrow \Lambda_i, i = 1, 2$, then PT holds for $R_1 \times R_2 \rightarrow \Lambda_1 \times \Lambda_2$.*

Proof. Omitted. Hint: A product of colimits is a colimit. \square

Lemma 16.8.3. *Let $R \rightarrow A \rightarrow \Lambda$ be ring maps with A of finite presentation over R . Let $S \subset R$ be a multiplicative set. Let $S^{-1}A \rightarrow B' \rightarrow S^{-1}\Lambda$ be a factorization with B' smooth over $S^{-1}R$. Then we can find a factorization $A \rightarrow B \rightarrow \Lambda$ such that some $s \in S$ maps to an elementary standard element in B over R .*

Proof. We first apply Lemma 16.4.4 to $S^{-1}R \rightarrow B'$. Thus we may assume B' is standard smooth over $S^{-1}R$. Write $A = R[x_1, \dots, x_n]/(g_1, \dots, g_t)$ and say $x_i \mapsto \lambda_i$ in Λ . We may write $B' = S^{-1}R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$ for some $c \geq n$ where $\det(\partial f_j/\partial x_i)_{i,j=1, \dots, c}$ is invertible in B' and such that $A \rightarrow B'$ is given by $x_i \mapsto x_i$, see Lemma 16.4.6. After multiplying $x_i, i > n$ by an element of S and correspondingly modifying the equations f_j we may assume $B' \rightarrow S^{-1}\Lambda$ maps x_i to $\lambda_i/1$ for some $\lambda_i \in \Lambda$ for $i > n$. Choose a relation

$$1 = a_0 \det(\partial f_j/\partial x_i)_{i,j=1, \dots, c} + \sum_{j=1, \dots, c} a_j f_j$$

for some $a_j \in S^{-1}R[x_1, \dots, x_{n+m}]$. Since each element of S is invertible in B' we may (by clearing denominators) assume that $f_j, a_j \in R[x_1, \dots, x_{n+m}]$ and that

$$s_0 = a_0 \det(\partial f_j/\partial x_i)_{i,j=1, \dots, c} + \sum_{j=1, \dots, c} a_j f_j$$

for some $s_0 \in S$. Since g_j maps to zero in $S^{-1}R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$ we can find elements $s_j \in S$ such that $s_j g_j = 0$ in $R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$. Since f_j maps to zero in $S^{-1}\Lambda$ we can find $s'_j \in S$ such that $s'_j f_j(\lambda_1, \dots, \lambda_{n+m}) = 0$ in Λ . Consider the ring

$$B = R[x_1, \dots, x_{n+m}]/(s'_1 f_1, \dots, s'_c f_c, g_1, \dots, g_t)$$

and the factorization $A \rightarrow B \rightarrow \Lambda$ with $B \rightarrow \Lambda$ given by $x_i \mapsto \lambda_i$. We claim that $s = s_0 s_1 \dots s_t s'_1 \dots s'_c$ is elementary standard in B over R which finishes the proof. Namely, $s_j g_j \in (f_1, \dots, f_c)$ and hence $sg_j \in (s'_1 f_1, \dots, s'_c f_c)$. Finally, we have

$$a_0 \det(\partial s'_j f_j/\partial x_i)_{i,j=1, \dots, c} + \sum_{j=1, \dots, c} (s'_1 \dots \hat{s}'_j \dots s'_c) a_j s'_j f_j = s_0 s'_1 \dots s'_c$$

which divides s as desired. \square

Lemma 16.8.4. *If for every Situation 16.8.1 where R is a field PT holds, then PT holds in general.*

Proof. Assume PT holds for any Situation 16.8.1 where R is a field. Let $R \rightarrow \Lambda$ be as in Situation 16.8.1 arbitrary. Note that $R/I \rightarrow \Lambda/I\Lambda$ is another regular ring map of Noetherian rings, see More on Algebra, Lemma 15.30.3. Consider the set of ideals

$$\mathcal{I} = \{I \subset R \mid R/I \rightarrow \Lambda/I\Lambda \text{ does not have PT}\}$$

We have to show that \mathcal{I} is empty. If this set is nonempty, then it contains a maximal element because R is Noetherian. Replacing R by R/I and Λ by Λ/I we obtain a situation where PT holds for $R/I \rightarrow \Lambda/I\Lambda$ for any nonzero ideal of R . In particular, we see by applying Proposition 16.5.3 that R is a reduced ring.

Let $A \rightarrow \Lambda$ be an R -algebra homomorphism with A of finite presentation. We have to find a factorization $A \rightarrow B \rightarrow \Lambda$ with B smooth over R , see Lemma 16.2.1.

Let $S \subset R$ be the set of nonzerodivisors and consider the total ring of fractions $Q = S^{-1}R$ of R . We know that $Q = K_1 \times \dots \times K_n$ is a product of fields, see Algebra, Lemmas 10.24.4 and 10.30.6. By Lemma 16.8.2 and our assumption PT holds for the ring map $S^{-1}R \rightarrow S^{-1}\Lambda$. Hence we can find a factorization $S^{-1}A \rightarrow B' \rightarrow \Lambda$ with B' smooth over $S^{-1}R$.

We apply Lemma 16.8.3 and find a factorization $A \rightarrow B \rightarrow \Lambda$ such that some $\pi \in S$ is elementary standard in B over R . After replacing A by B we may assume that π is elementary standard, hence strictly standard in A . We know that $R/\pi^8 R \rightarrow \Lambda/\pi^8 \Lambda$ satisfies PT. Hence we can find a factorization $R/\pi^8 R \rightarrow A/\pi^8 A \rightarrow \bar{C} \rightarrow \Lambda/\pi^8 \Lambda$ with $R/\pi^8 R \rightarrow \bar{C}$ smooth. By Lemma 16.6.1 we can find an R -algebra map $D \rightarrow \Lambda$ with D smooth over R and a factorization $R/\pi^4 R \rightarrow A/\pi^4 A \rightarrow D/\pi^4 D \rightarrow \Lambda/\pi^4 \Lambda$. By Lemma 16.7.2 we can find $A \rightarrow B \rightarrow \Lambda$ with B smooth over R which finishes the proof. \square

16.9. Local tricks

Situation 16.9.1. We are given a Noetherian ring R and an R -algebra map $A \rightarrow \Lambda$ and a prime $\mathfrak{q} \subset \Lambda$. We assume A is of finite presentation over R . In this situation we denote $\mathfrak{h}_A = \sqrt{H_{A/R}\Lambda}$.

Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1. We say $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved if there exists a factorization $A \rightarrow B \rightarrow \Lambda$ with B of finite presentation and $\mathfrak{h}_A \subset \mathfrak{h}_B \not\subset \mathfrak{q}$. In this case we will call the factorization $A \rightarrow B \rightarrow \Lambda$ a resolution of $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

Lemma 16.9.2. *Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1. Let $r \geq 1$ and $\pi_1, \dots, \pi_r \in R$ map to elements of \mathfrak{q} . Assume*

- (1) *for $i = 1, \dots, r$ we have*

$$\text{Ann}_{R/(\pi_1^s, \dots, \pi_{i-1}^s)R}(\pi_i) = \text{Ann}_{R/(\pi_1^s, \dots, \pi_{i-1}^s)R}(\pi_i^2)$$

and

$$\text{Ann}_{\Lambda/(\pi_1^s, \dots, \pi_{i-1}^s)\Lambda}(\pi_i) = \text{Ann}_{\Lambda/(\pi_1^s, \dots, \pi_{i-1}^s)\Lambda}(\pi_i^2)$$

- (2) *for $i = 1, \dots, r$ the element π_i maps to a strictly standard element in A over R .*

Then, if

$$R/(\pi_1^s, \dots, \pi_r^s)R \rightarrow A/(\pi_1^s, \dots, \pi_r^s)A \rightarrow \Lambda/(\pi_1^s, \dots, \pi_r^s)\Lambda \supset \mathfrak{q}/(\pi_1^s, \dots, \pi_r^s)\Lambda$$

can be resolved, so can $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

Proof. We are going to prove this by induction on r .

The case $r = 1$. Here the assumption is that there exists a factorization $A/\pi_1^s \rightarrow \bar{C} \rightarrow \Lambda/\pi_1^s$ which resolves the situation modulo π_1^s . Conditions (1) and (2) are the assumptions needed to apply Lemma 16.7.3. Thus we can “lift” the resolution \bar{C} to a resolution of $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

The case $r > 1$. In this case we apply the induction hypothesis for $r - 1$ to the situation $R/\pi_1^s \rightarrow A/\pi_1^s \rightarrow \Lambda/\pi_1^s \supset \mathfrak{q}/\pi_1^s\Lambda$. Note that property (2) is preserved by Lemma 16.3.7. \square

Lemma 16.9.3. *Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1. Let $\mathfrak{p} = R \cap \mathfrak{q}$. Assume that \mathfrak{q} is minimal over \mathfrak{h}_A and that $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}$ can be resolved. Then there exists a factorization $A \rightarrow C \rightarrow \Lambda$ with C of finite presentation such that $H_{C/R}\Lambda \not\subset \mathfrak{q}$.*

Proof. Let $A_{\mathfrak{p}} \rightarrow C \rightarrow \Lambda_{\mathfrak{q}}$ be a resolution of $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}$. By our assumption that \mathfrak{q} is minimal over \mathfrak{h}_A this means that $H_{C/R_{\mathfrak{p}}}\Lambda_{\mathfrak{q}} = \Lambda_{\mathfrak{q}}$. By Lemma 16.3.8 we may assume that C is smooth over $\Lambda_{\mathfrak{p}}$. By Lemma 16.4.4 we may assume that C is standard smooth over $R_{\mathfrak{p}}$. Write $A = R[x_1, \dots, x_n]/(g_1, \dots, g_t)$ and say $A \rightarrow \Lambda$ is given by $x_i \mapsto \lambda_i$. Write $C = R_{\mathfrak{p}}[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$ for some $c \geq n$ such that $A \rightarrow C$ maps x_i to x_i and such that $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ is invertible in C , see Lemma 16.4.6. After clearing denominators we may assume f_1, \dots, f_c are elements of $R[x_1, \dots, x_{n+m}]$. Of course $\det(\partial f_j / \partial x_i)_{i,j=1, \dots, c}$ is not invertible in $R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$ but it becomes invertible after inverting some element $s_0 \in R$, $s_0 \notin \mathfrak{p}$. As g_j maps to zero under $R[x_1, \dots, x_n] \rightarrow A \rightarrow C$ we can find $s_j \in R$, $s_j \notin \mathfrak{p}$ such that $s_j g_j$ is zero in $R[x_1, \dots, x_{n+m}]/(f_1, \dots, f_c)$. Write $f_j = F_j(x_1, \dots, x_{n+m}, 1)$ for some polynomial $F_j \in R[x_1, \dots, x_n, X_{n+1}, \dots, X_{n+m+1}]$ homogeneous in $X_{n+1}, \dots, X_{n+m+1}$. Pick $\lambda_{n+i} \in \Lambda$, $i = 1, \dots, m+1$ with $\lambda_{n+m+1} \notin \mathfrak{q}$ such that x_{n+i} maps to $\lambda_{n+i}/\lambda_{n+m+1}$ in $\Lambda_{\mathfrak{q}}$. Then

$$\begin{aligned} F_j(\lambda_1, \dots, \lambda_{n+m+1}) &= (\lambda_{n+m+1})^{\deg(F_j)} F_j(\lambda_1, \dots, \lambda_n, \frac{\lambda_{n+1}}{\lambda_{n+m+1}}, \dots, \frac{\lambda_{n+m}}{\lambda_{n+m+1}}, 1) \\ &= (\lambda_{n+m+1})^{\deg(F_j)} f_j(\lambda_1, \dots, \lambda_n, \frac{\lambda_{n+1}}{\lambda_{n+m+1}}, \dots, \frac{\lambda_{n+m}}{\lambda_{n+m+1}}) \\ &= 0 \end{aligned}$$

in $\Lambda_{\mathfrak{q}}$. Thus we can find $\lambda_0 \in \Lambda$, $\lambda_0 \notin \mathfrak{q}$ such that $\lambda_0 F_j(\lambda_1, \dots, \lambda_{n+m+1}) = 0$ in Λ . Now we set B equal to

$$R[x_0, \dots, x_{n+m+1}]/(g_1, \dots, g_t, x_0 F_1(x_1, \dots, x_{n+m+1}), \dots, x_0 F_c(x_1, \dots, x_{n+m+1}))$$

which we map to Λ by mapping x_i to λ_i . Let b be the image of $x_0 x_1 s_0 s_1 \dots s_t$ in B . Then B_b is isomorphic to

$$R_{s_0 s_1}[x_0, x_1, \dots, x_{n+m+1}, 1/x_0 x_{n+m+1}]/(f_1, \dots, f_c)$$

which is smooth over R by construction. Since b does not map to an element of \mathfrak{q} , we win. \square

Lemma 16.9.4. *Let $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1. Let $\mathfrak{p} = R \cap \mathfrak{q}$. Assume*

- (1) \mathfrak{q} is minimal over \mathfrak{h}_A ,
- (2) $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}$ can be resolved, and
- (3) $\dim(\Lambda_{\mathfrak{q}}) = 0$.

Then $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.

Proof. By (3) the ring $\Lambda_{\mathfrak{q}}$ is Artinian local hence $\mathfrak{q}\Lambda_{\mathfrak{q}}$ is nilpotent. Thus $(\mathfrak{h}_A)^N \Lambda_{\mathfrak{q}} = 0$ for some $N > 0$. Thus there exists a $\lambda \in \Lambda$, $\lambda \notin \mathfrak{q}$ such that $\lambda(\mathfrak{h}_A)^N = 0$ in Λ . Say $H_{A/R} = (a_1, \dots, a_r)$ so that $\lambda a_i^N = 0$ in Λ . By Lemma 16.9.3 we can find a factorization $A \rightarrow C \rightarrow \Lambda$ with C of finite presentation such that $\mathfrak{h}_C \not\subset \mathfrak{q}$. Write $C = A[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Set

$$B = A[x_1, \dots, x_n, y_1, \dots, y_r, z, t_{ij}]/(f_j - \sum y_i t_{ij}, z y_i)$$

where t_{ij} is a set of rm variables. Note that there is a map $B \rightarrow C[y_i, z]/(y_i z)$ given by setting t_{ij} equal to zero. The map $B \rightarrow \Lambda$ is the composition $B \rightarrow C[y_i, z]/(y_i z) \rightarrow \Lambda$ where $C[y_i, z]/(y_i z) \rightarrow \Lambda$ is the given map $C \rightarrow \Lambda$, maps z to λ , and maps y_i to the image of a_i^N in Λ .

We claim that B is a solution for $R \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$. First note that B_z is isomorphic to $C[y_1, \dots, y_r, z, z^{-1}]$ and hence is smooth. On the other hand, $B_{y_\ell} \cong A[x_i, y_i, y_\ell^{-1}, t_{ij}, i \neq \ell]$ which is smooth over A . Thus we see that z and $a_\ell y_\ell$ (compositions of smooth maps are smooth) are all elements of $H_{B/R}$. This proves the lemma. \square

16.10. Separable residue fields

In this section we explain how to solve a local problem in the case of a separable residue field extension.

Lemma 16.10.1 (Ogoma). *Let A be a Noetherian ring and let M be a finite A -module. Let $S \subset A$ be a multiplicative set. If $\pi \in A$ and $\text{Ker}(\pi : S^{-1}M \rightarrow S^{-1}M) = \text{Ker}(\pi^2 : S^{-1}M \rightarrow S^{-1}M)$ then there exists an $s \in S$ such that for any $n > 0$ we have $\text{Ker}(s^n \pi : M \rightarrow M) = \text{Ker}((s^n \pi)^2 : M \rightarrow M)$.*

Proof. Let $K = \text{Ker}(\pi : M \rightarrow M)$ and $K' = \{m \in M \mid \pi^2 m = 0 \text{ in } S^{-1}M\}$ and $Q = K'/K$. Note that $S^{-1}Q = 0$ by assumption. Since A is Noetherian we see that Q is a finite A -module. Hence we can find an $s \in S$ such that s annihilates Q . Then s works. \square

Lemma 16.10.2. *Let Λ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Let $I \subset \mathfrak{q}$ be a prime. Let n, e be positive integers Assume that $\mathfrak{q}^n \Lambda_{\mathfrak{q}} \subset I \Lambda_{\mathfrak{q}}$ and that $\Lambda_{\mathfrak{q}}$ is a regular local ring of dimension d . Then there exists an $n > 0$ and $\pi_1, \dots, \pi_d \in \Lambda$ such that*

- (1) $(\pi_1, \dots, \pi_d) \Lambda_{\mathfrak{q}} = \mathfrak{q} \Lambda_{\mathfrak{q}}$,
- (2) $\pi_1^n, \dots, \pi_d^n \in I$, and
- (3) for $i = 1, \dots, d$ we have

$$\text{Ann}_{\Lambda/(\pi_1^e, \dots, \pi_{i-1}^e) \Lambda}(\pi_i) = \text{Ann}_{\Lambda/(\pi_1^e, \dots, \pi_{i-1}^e) \Lambda}(\pi_i^2).$$

Proof. Set $S = \Lambda \setminus \mathfrak{q}$ so that $\Lambda_{\mathfrak{q}} = S^{-1}\Lambda$. First pick π_1, \dots, π_d with (1) which is possible as $\Lambda_{\mathfrak{q}}$ is regular. By assumption $\pi_i^n \in I\Lambda_{\mathfrak{q}}$. Thus we can find $s_1, \dots, s_d \in S$ such that $s_i\pi_i^n \in I$. Replacing π_i by $s_i\pi_i$ we get (2). Note that (1) and (2) are preserved by further multiplying by elements of S . Suppose that (3) holds for $i = 1, \dots, t$ for some $t \in \{0, \dots, d\}$. Note that π_1, \dots, π_d is a regular sequence in $S^{-1}\Lambda$, see Algebra, Lemma 10.102.3. In particular $\pi_1^e, \dots, \pi_t^e, \pi_{t+1}$ is a regular sequence in $S^{-1}\Lambda = \Lambda_{\mathfrak{q}}$ by Algebra, Lemma 10.67.10. Hence we see that

$$\text{Ann}_{S^{-1}\Lambda/(\pi_1^e, \dots, \pi_{i-1}^e)}(\pi_i) = \text{Ann}_{S^{-1}\Lambda/(\pi_1^e, \dots, \pi_{i-1}^e)}(\pi_i^2).$$

Thus we get (3) for $i = t+1$ after replacing π_{t+1} by $s\pi_{t+1}$ for some $s \in S$ by Lemma 16.10.1. By induction on t this produces a sequence satisfying (1), (2), and (3). \square

Lemma 16.10.3. *Let $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1 where*

- (1) k is a field,
- (2) Λ is Noetherian,
- (3) \mathfrak{q} is minimal over \mathfrak{h}_A ,
- (4) $\Lambda_{\mathfrak{q}}$ is a regular local ring, and
- (5) the field extension $k \subset \kappa(\mathfrak{q})$ is separable.

Then $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.

Proof. Set $d = \dim \Lambda_{\mathfrak{q}}$. Set $R = k[x_1, \dots, x_d]$. Choose $n > 0$ such that $\mathfrak{q}^n \Lambda_{\mathfrak{q}} \subset \mathfrak{h}_A \Lambda_{\mathfrak{q}}$ which is possible as \mathfrak{q} is minimal over \mathfrak{h}_A . Choose generators a_1, \dots, a_r of $H_{A/R}$. Set

$$B = A[x_1, \dots, x_d, z_{ij}]/(x_i^n - \sum z_{ij}a_j)$$

Each B_{a_j} is smooth over R it is a polynomial algebra over $A_{a_j}[x_1, \dots, x_d]$ and A_{a_j} is smooth over k . Hence B_{x_i} is smooth over R . Let $B \rightarrow C$ be the R -algebra map constructed in Lemma 16.4.1 which comes with a R -algebra retraction $C \rightarrow B$. In particular a map $C \rightarrow \Lambda$ fitting into the diagram above. By construction C_{x_i} is a smooth R -algebra with $\Omega_{C_{x_i}/R}$ free. Hence we can find $c > 0$ such that x_i^c is strictly standard in C/R , see Lemma 16.4.7. Now choose $\pi_1, \dots, \pi_d \in \Lambda$ as in Lemma 16.10.2 where $n = n$, $e = 8c$, $\mathfrak{q} = \mathfrak{q}$ and $I = \mathfrak{h}_A$. Write $\pi_i^n = \sum \lambda_{ij}a_j$ for some $\pi_{ij} \in \Lambda$. There is a map $B \rightarrow \Lambda$ given by $x_i \mapsto \pi_i$ and $z_{ij} \mapsto \lambda_{ij}$. Set $R = k[x_1, \dots, x_d]$. Diagram

$$\begin{array}{ccc} R & \longrightarrow & B \\ \uparrow & & \searrow \\ k & \longrightarrow & A \longrightarrow \Lambda \end{array}$$

Now we apply Lemma 16.9.2 to $R \rightarrow C \rightarrow \Lambda \supset \mathfrak{q}$ and the sequence of elements x_1^c, \dots, x_d^c of R . Assumption (2) is clear. Assumption (1) holds for R by inspection and for Λ by our choice of π_1, \dots, π_d . (Note that if $\text{Ann}_{\Lambda}(\pi) = \text{Ann}_{\Lambda}(\pi^2)$, then we have $\text{Ann}_{\Lambda}(\pi) = \text{Ann}_{\Lambda}(\pi^c)$ for all $c > 0$.) Thus it suffices to resolve

$$R/(x_1^e, \dots, x_d^e) \rightarrow C/(x_1^e, \dots, x_d^e) \rightarrow \Lambda/(\pi_1^e, \dots, \pi_d^e) \supset \mathfrak{q}/(\pi_1^e, \dots, \pi_d^e)$$

for $e = 8c$. By Lemma 16.9.4 it suffices to resolve this after localizing at \mathfrak{q} . But since x_1, \dots, x_d map to a regular sequence in $\Lambda_{\mathfrak{q}}$ we see that $R \rightarrow \Lambda$ is flat, see Algebra, Lemma 10.124.2. Hence

$$R/(x_1^e, \dots, x_d^e) \rightarrow \Lambda_{\mathfrak{q}}/(\pi_1^e, \dots, \pi_d^e)$$

is a flat ring map of Artinian local rings. Moreover, this map induces a separable field extension on residue fields by assumption. Thus this map is a filtered colimit of smooth algebras by Algebra, Lemma 10.147.11 and Proposition 16.5.3. Existence of the desired solution follows from Lemma 16.2.1. \square

16.11. Inseparable residue fields

In this section we explain how to solve a local problem in the case of an inseparable residue field extension.

Lemma 16.11.1. *Let k be a field of characteristic $p > 0$. Let $(\Lambda, \mathfrak{m}, K)$ be an Artinian local k -algebra. Assume that $\dim H_1(L_{K/k}) < \infty$. Then Λ is a filtered colimit of Artinian local k -algebras A with each map $A \rightarrow \Lambda$ flat, with $\mathfrak{m}_A \Lambda = \mathfrak{m}$, and with A essentially of finite type over k .*

Proof. Note that the flatness of $A \rightarrow \Lambda$ implies that $A \rightarrow \Lambda$ is injective, so the lemma really tells us that Λ is a directed union of these types of subrings $A \subset \Lambda$. Let n be the minimal integer such that $\mathfrak{m}^n = 0$. We will prove this lemma by induction on n . The case $n = 1$ is clear as a field extension is a union of finitely generated field extensions.

Pick $\lambda_1, \dots, \lambda_d \in \mathfrak{m}$ which generate \mathfrak{m} . As K is formally smooth over \mathbf{F}_p (see Algebra, Lemma 10.147.7) we can find a ring map $\sigma : K \rightarrow \Lambda$ which is a section of the quotient map $\Lambda \rightarrow K$. In general σ is **not** a k -algebra map. Given σ we define

$$\Psi_\sigma : K[x_1, \dots, x_d] \longrightarrow \Lambda$$

using σ on elements of K and mapping x_i to λ_i . Claim: there exists a $\sigma : K \rightarrow \Lambda$ and a subfield $k \subset F \subset K$ finitely generated over k such that the image of k in Λ is contained in $\Psi_\sigma(F[x_1, \dots, x_d])$.

We will prove the claim by induction on the least integer n such that $\mathfrak{m}^n = 0$. It is clear for $n = 1$. If $n > 1$ set $I = \mathfrak{m}^{n-1}$ and $\Lambda' = \Lambda/I$. By induction we may assume given $\sigma' : K \rightarrow \Lambda'$ and $k \subset F' \subset K$ finitely generated such that the image of $k \rightarrow \Lambda \rightarrow \Lambda'$ is contained in $A' = \Psi_{\sigma'}(F'[x_1, \dots, x_d])$. Denote $\tau' : k \rightarrow A'$ the induced map. Choose a lift $\sigma : K \rightarrow \Lambda$ of σ' (this is possible by the formal smoothness of K/\mathbf{F}_p we mentioned above). For later reference we note that we can change σ to $\sigma + D$ for some derivation $D : K \rightarrow I$. Set $A = F[x_1, \dots, x_d]/(x_1, \dots, x_d)^n$. Then Ψ_σ induces a ring map $\Psi_\sigma : A \rightarrow \Lambda$. The composition with the quotient map $\Lambda \rightarrow \Lambda'$ induces a surjective map $A \rightarrow A'$ with nilpotent kernel. Choose a lift $\tau : k \rightarrow A$ of τ' (possible as k/\mathbf{F}_p is formally smooth). Thus we obtain two maps $k \rightarrow \Lambda$, namely $\Psi_\sigma \circ \tau : k \rightarrow \Lambda$ and the given map $i : k \rightarrow \Lambda$. These maps agree modulo I , whence the difference is a derivation $\theta = i - \Psi_\sigma \circ \tau : k \rightarrow I$. Note that if we change σ into $\sigma + D$ then we change θ into $\theta - D|_k$.

Choose a set of elements $\{y_j\}_{j \in J}$ of k whose differentials dy_j form a basis of Ω_{k/\mathbf{F}_p} . The Jacobi-Zariski sequence for $\mathbf{F}_p \subset k \subset K$ is

$$0 \rightarrow H_1(L_{K/k}) \rightarrow \Omega_{k/\mathbf{F}_p} \otimes K \rightarrow \Omega_{K/\mathbf{F}_p} \rightarrow \Omega_{K/k} \rightarrow 0$$

As $\dim H_1(L_{K/k}) < \infty$ we can find a finite subset $J_0 \subset J$ such that the image of the first map is contained in $\bigoplus_{j \in J_0} K dy_j$. Hence the elements dy_j , $j \in J \setminus J_0$ map to

K -linearly independent elements of Ω_{K/\mathbb{F}_p} . Therefore we can choose a $D : K \rightarrow I$ such that $\theta - D|_k = \xi \circ d$ where ξ is a composition

$$\Omega_{k/\mathbb{F}_p} = \bigoplus_{j \in J} k dy_j \longrightarrow \bigoplus_{j \in J_0} k dy_j \longrightarrow I$$

Let $f_j = \xi(dy_j) \in I$ for $j \in J_0$. Change σ into $\sigma + D$ as above. Then we see that $\theta(a) = \sum_{j \in J_0} a_j f_j$ for $a \in k$ where $da = \sum a_j dy_j$ in Ω_{k/\mathbb{F}_p} . Note that I is generated by the monomials $\lambda^E = \lambda_1^{e_1} \dots \lambda_d^{e_d}$ of total degree $|E| = \sum e_i = n - 1$ in $\lambda_1, \dots, \lambda_d$. Write $f_j = \sum_E c_{j,E} \lambda^E$ with $c_{j,E} \in K$. Replace F' by $F = F'(c_{j,E})$. Then the claim holds.

Choose σ and F as in the claim. The kernel of Ψ_σ is generated by finitely many polynomials $g_1, \dots, g_t \in K[x_1, \dots, x_d]$ and we may assume their coefficients are in F after enlarging F by adjoining finitely many elements. In this case it is clear that the map $A = F[x_1, \dots, x_d]/(g_1, \dots, g_t) \rightarrow K[x_1, \dots, x_d]/(g_1, \dots, g_t) = \Lambda$ is flat. By the claim A is a k -subalgebra of Λ . It is clear that Λ is the filtered colimit of these algebras, as K is the filtered union of the subfields F . Finally, these algebras are essentially of finite type over k by Algebra, Lemma 10.52.3. \square

Lemma 16.11.2. *Let k be a field of characteristic $p > 0$. Let Λ be a Noetherian geometrically regular k -algebra. Let $\mathfrak{q} \subset \Lambda$ be a prime ideal. Let $n \geq 1$ be an integer and let $E \subset \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$ be a finite subset. Then we can find $m \geq 0$ and $\varphi : k[y_1, \dots, y_m] \rightarrow \Lambda$ with the following properties*

- (1) *setting $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$ we have $\mathfrak{q} \Lambda_{\mathfrak{q}} = \mathfrak{p} \Lambda_{\mathfrak{q}}$ and $k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat,*
- (2) *there is a factorization by homomorphisms of local Artinian rings*

$$k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow D \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$$

where the first arrow is essentially smooth and the second is flat,

- (3) *E is contained in D modulo $\mathfrak{q}^n \Lambda_{\mathfrak{q}}$.*

Proof. Set $\bar{\Lambda} = \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$. Note that $\dim H_1(L_{\kappa(\mathfrak{q})/k}) < \infty$ by More on Algebra, Proposition 15.25.1. Pick $A \subset \bar{\Lambda}$ containing E such that A is local Artinian, essentially of finite type over k , the map $A \rightarrow \bar{\Lambda}$ is flat, and \mathfrak{m}_A generates the maximal ideal of $\bar{\Lambda}$, see Lemma 16.11.1. Denote $F = A/\mathfrak{m}_A$ the residue field so that $k \subset F \subset K$. Pick $\lambda_1, \dots, \lambda_t \in \Lambda$ which map to elements of A in $\bar{\Lambda}$ such that moreover the images of $d\lambda_1, \dots, d\lambda_t$ form a basis of $\Omega_{F/k}$. Consider the map $\varphi' : k[y_1, \dots, y_t] \rightarrow \Lambda$ sending y_j to λ_j . Set $\mathfrak{p}' = (\varphi')^{-1}(\mathfrak{q})$. By More on Algebra, Lemma 15.25.2 the ring map $k[y_1, \dots, y_t]_{\mathfrak{p}'} \rightarrow \Lambda_{\mathfrak{q}}$ is flat and $\Lambda_{\mathfrak{q}}/\mathfrak{p}' \Lambda_{\mathfrak{q}}$ is regular. Thus we can choose further elements $\lambda_{t+1}, \dots, \lambda_m \in \Lambda$ which map into $A \subset \bar{\Lambda}$ and which map to a regular system of parameters of $\Lambda_{\mathfrak{q}}/\mathfrak{p}' \Lambda_{\mathfrak{q}}$. We obtain $\varphi : k[y_1, \dots, y_m] \rightarrow \Lambda$ having property (1) such that $k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow \bar{\Lambda}$ factors through A . Thus $k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow A$ is flat by Algebra, Lemma 10.38.8. By construction the residue field extension $\kappa(\mathfrak{p}) \subset F$ is finitely generated and $\Omega_{F/\kappa(\mathfrak{p})} = 0$. Hence it is finite separable by More on Algebra, Lemma 15.24.1. Thus $k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow A$ is finite by Algebra, Lemma 10.52.3. Finally, we conclude that it is étale by Algebra, Lemma 10.138.7. Since an étale ring map is certainly essentially smooth we win. \square

Lemma 16.11.3. *Let $\varphi : k[y_1, \dots, y_m] \rightarrow \Lambda$, n , \mathfrak{q} , \mathfrak{p} and*

$$k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n \rightarrow D \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$$

be as in Lemma 16.11.2. Then for any $\lambda \in \Lambda \setminus \mathfrak{q}$ there exists an integer $q > 0$ and a factorization

$$k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n \rightarrow D \rightarrow D' \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$$

such that $D \rightarrow D'$ is an essentially smooth map of local Artinian rings, the last arrow is flat, and λ^q is in D' .

Proof. Set $\bar{\Lambda} = \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$. Let $\bar{\lambda}$ be the image of λ in $\bar{\Lambda}$. Let $\alpha \in \kappa(\mathfrak{q})$ be the image of λ in the residue field. Let $k \subset F \subset \kappa(\mathfrak{q})$ be the residue field of D . If α is in F then we can find an $x \in D$ such that $x\bar{\lambda} = 1 \pmod{\mathfrak{q}}$. Hence $(x\bar{\lambda})^q = 1 \pmod{(\mathfrak{q})^q}$ if q is divisible by p . Hence $\bar{\lambda}^q$ is in D . If α is transcendental over F , then we can take $D' = (D[\bar{\lambda}])_{\mathfrak{m}}$ equal to the subring generated by D and $\bar{\lambda}$ localized at $\mathfrak{m} = D[\bar{\lambda}] \cap \mathfrak{q}\bar{\Lambda}$. This works because $D[\bar{\lambda}]$ is in fact a polynomial algebra over D in this case. Finally, if $\lambda \pmod{\mathfrak{q}}$ is algebraic over F , then we can find a p -power q such that α^q is separable algebraic over F , see Fields, Section 9.25. Note that D and $\bar{\Lambda}$ are henselian local rings, see Algebra, Lemma 10.145.11. Let $D \rightarrow D'$ be a finite étale extension whose residue field extension is $F \subset F(\alpha^q)$, see Algebra, Lemma 10.145.8. Since $\bar{\Lambda}$ is henselian and $F(\alpha^q)$ is contained in its residue field we can find a factorization $D' \rightarrow \bar{\Lambda}$. By the first part of the argument we see that $\bar{\lambda}^{qq'} \in D'$ for some $q' > 0$. \square

Lemma 16.11.4. *Let $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ be as in Situation 16.9.1 where*

- (1) *k is a field of characteristic $p > 0$,*
- (2) *Λ is Noetherian and geometrically regular over k ,*
- (3) *\mathfrak{q} is minimal over \mathfrak{h}_A .*

Then $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ can be resolved.

Proof. The lemma is proven by the following steps in the given order. We will justify each of these steps below.

- (1) Pick an integer $N > 0$ such that $\mathfrak{q}^N \Lambda_{\mathfrak{q}} \subset H_{A/k} \Lambda_{\mathfrak{q}}$.
- (2) Pick generators $a_1, \dots, a_t \in A$ of the ideal $H_{A/R}$.
- (3) Set $d = \dim(\Lambda_{\mathfrak{q}})$.
- (4) Set $B = A[x_1, \dots, x_d, z_{ij}]/(x_i^{2N} - \sum z_{ij} a_j)$.
- (5) Consider B as a $k[x_1, \dots, x_d]$ -algebra and let $B \rightarrow C$ be as in Lemma 16.4.1. We also obtain a section $C \rightarrow B$.
- (6) Choose $c > 0$ such that each x_i^c is strictly standard in C over $k[x_1, \dots, x_d]$.
- (7) Set $n = N + dc$ and $e = 8c$.
- (8) Let $E \subset \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$ be the images of generators of A as a k -algebra.
- (9) Choose an integer m and a k -algebra map $\varphi : k[y_1, \dots, y_m] \rightarrow \Lambda$ and a factorization by local Artinian rings

$$k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow D \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$$

such that the first arrow is essentially smooth, the second is flat, E is contained in D , with $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$ the map $k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat, and $\mathfrak{p}\Lambda_{\mathfrak{q}} = \mathfrak{q}\Lambda_{\mathfrak{q}}$.

- (10) Choose $\pi_1, \dots, \pi_d \in \mathfrak{p}$ which map to a regular system of parameters of $k[y_1, \dots, y_m]_{\mathfrak{p}}$.
- (11) Let $R = k[y_1, \dots, y_m, t_1, \dots, t_m]$ and $\gamma_i = \pi_i t_i$.
- (12) If necessary modify the choice of π_i such that for $i = 1, \dots, d$ we have

$$\text{Ann}_{R/(\gamma_1^e, \dots, \gamma_{i-1}^e)R}(\gamma_i) = \text{Ann}_{R/(\gamma_1^e, \dots, \gamma_{i-1}^e)R}(\gamma_i^2)$$

- (13) There exist $\delta_1, \dots, \delta_d \in \Lambda$, $\delta_i \notin \mathfrak{q}$ and a factorization $D \rightarrow D' \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$ with D' local Artinian, $D \rightarrow D'$ essentially smooth, the map $D' \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$ flat such that, with $\pi'_i = \delta_i\pi_i$, we have for $i = 1, \dots, d$
- (a) $(\pi'_i)^{2N} = \sum a_j \lambda_{ij}$ in Λ where $\lambda_{ij} \bmod \mathfrak{q}^n\Lambda_{\mathfrak{q}}$ is an element of D' ,
 - (b) $\text{Ann}_{\Lambda/(\pi'_1, \dots, \pi'_{i-1})}(\pi'_i) = \text{Ann}_{\Lambda/(\pi'_1, \dots, \pi'_{i-1})}(\pi'^2_i)$,
 - (c) $\delta_i \bmod \mathfrak{q}^n\Lambda_{\mathfrak{q}}$ is an element of D' .
- (14) Define $B \rightarrow \Lambda$ by sending x_i to π'_i and z_{ij} to λ_{ij} found above. Define $C \rightarrow \Lambda$ by composing the map $B \rightarrow \Lambda$ with the retraction $C \rightarrow B$.
- (15) Map $R \rightarrow \Lambda$ by φ on $k[y_1, \dots, y_m]$ and by sending t_i to δ_i . Further introduce a map

$$k[x_1, \dots, x_d] \longrightarrow R = k[y_1, \dots, y_m, t_1, \dots, t_d]$$

by sending x_i to $\gamma_i = \pi_i t_i$.

- (16) It suffices to resolve

$$R \rightarrow C \otimes_{k[x_1, \dots, x_d]} R \rightarrow \Lambda \supset \mathfrak{q}$$

- (17) Set $I = (\gamma_1^e, \dots, \gamma_d^e) \subset R$.

- (18) It suffices to resolve

$$R/I \rightarrow C \otimes_{k[x_1, \dots, x_d]} R/I \rightarrow \Lambda/I\Lambda \supset \mathfrak{q}/I\Lambda$$

- (19) We denote $\mathfrak{r} \subset R = k[y_1, \dots, y_m, t_1, \dots, t_d]$ the inverse image of \mathfrak{q} .

- (20) It suffices to resolve

$$(R/I)_{\mathfrak{r}} \rightarrow C \otimes_{k[x_1, \dots, x_d]} (R/I)_{\mathfrak{r}} \rightarrow \Lambda_{\mathfrak{q}}/I\Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}/I\Lambda_{\mathfrak{q}}$$

- (21) Set $J = (\pi_1^e, \dots, \pi_d^e)$ in $k[y_1, \dots, y_m]$.

- (22) It suffices to resolve

$$(R/JR)_{\mathfrak{p}} \rightarrow C \otimes_{k[x_1, \dots, x_d]} (R/JR)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}/J\Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}/J\Lambda_{\mathfrak{q}}$$

- (23) It suffices to resolve

$$(R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow C \otimes_{k[x_1, \dots, x_d]} (R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$$

- (24) It suffices to resolve

$$(R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow B \otimes_{k[x_1, \dots, x_d]} (R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$$

- (25) The ring $D'[t_1, \dots, t_d]$ is given the structure of an $R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}}$ -algebra by the given map $k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow D'$ and by sending t_i to t_i . It suffices to find a factorization

$$B \otimes_{k[x_1, \dots, x_d]} (R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow D'[t_1, \dots, t_d] \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$$

where the second arrow sends t_i to δ_i and induces the given homomorphism $D' \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$.

- (26) Such a factorization exists by our choice of D' above.

We now give the justification for each of the steps, except that we skip justifying the steps which just introduce notation.

Ad (1). This is possible as \mathfrak{q} is minimal over $\mathfrak{h}_A = \sqrt{H_{A/k}\Lambda}$.

Ad (6). Note that A_{α_i} is smooth over k . Hence B_{α_j} , which is isomorphic to a polynomial algebra over $A_{\alpha_j}[x_1, \dots, x_d]$, is smooth over $k[x_1, \dots, x_d]$. Thus B_{x_i} is smooth over $k[x_1, \dots, x_d]$. By Lemma 16.4.1 we see that C_{x_i} is smooth over $k[x_1, \dots, x_d]$ with finite free module of differentials. Hence some power of x_i is strictly standard in C over $k[x_1, \dots, x_n]$ by Lemma 16.4.7.

Ad (9). This follows by applying Lemma 16.11.2.

Ad (10). Since $k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is flat and $\mathfrak{p}\Lambda_{\mathfrak{q}} = \mathfrak{q}\Lambda_{\mathfrak{q}}$ by construction we see that $\dim(k[y_1, \dots, y_m]_{\mathfrak{p}}) = d$ by Algebra, Lemma 10.108.7. Thus we can find $\pi_1, \dots, \pi_d \in \Lambda$ which map to a regular system of parameters in $\Lambda_{\mathfrak{q}}$.

Ad (12). By Algebra, Lemma 10.102.3 any permutation of the sequence π_1, \dots, π_d is a regular sequence in $k[y_1, \dots, y_m]_{\mathfrak{p}}$. Hence $\gamma_1 = \pi_1 t_1, \dots, \gamma_d = \pi_d t_d$ is a regular sequence in $R_{\mathfrak{p}} = k[y_1, \dots, y_m]_{\mathfrak{p}}[t_1, \dots, t_d]$, see Algebra, Lemma 10.67.11. Let $S = k[y_1, \dots, y_m] \setminus \mathfrak{p}$ so that $R_{\mathfrak{p}} = S^{-1}R$. Note that π_1, \dots, π_d and $\gamma_1, \dots, \gamma_d$ remain regular sequences if we multiply our π_i by elements of S . Suppose that

$$\text{Ann}_{R/(\gamma_1^e, \dots, \gamma_{i-1}^e)R}(\gamma_i) = \text{Ann}_{R/(\gamma_1^e, \dots, \gamma_{i-1}^e)R}(\gamma_i^2)$$

holds for $i = 1, \dots, t$ for some $t \in \{0, \dots, d\}$. Note that $\gamma_1^e, \dots, \gamma_t^e, \gamma_{t+1}$ is a regular sequence in $S^{-1}R$ by Algebra, Lemma 10.67.10. Hence we see that

$$\text{Ann}_{S^{-1}R/(\gamma_1^e, \dots, \gamma_{i-1}^e)}(\gamma_i) = \text{Ann}_{S^{-1}R/(\gamma_1^e, \dots, \gamma_{i-1}^e)}(\gamma_i^2).$$

Thus we get

$$\text{Ann}_{R/(\gamma_1^e, \dots, \gamma_t^e)R}(\gamma_{t+1}) = \text{Ann}_{R/(\gamma_1^e, \dots, \gamma_t^e)R}(\gamma_{t+1}^2)$$

after replacing π_{t+1} by $s\pi_{t+1}$ for some $s \in S$ by Lemma 16.10.1. By induction on t this produces the desired sequence.

Ad (13). Let $S = \Lambda \setminus \mathfrak{q}$ so that $\Lambda_{\mathfrak{q}} = S^{-1}\Lambda$. Set $\bar{\Lambda} = \Lambda_{\mathfrak{q}}/\mathfrak{q}^n\Lambda_{\mathfrak{q}}$. Suppose that we have a $t \in \{0, \dots, d\}$ and $\delta_1, \dots, \delta_t \in S$ and a factorization $D \rightarrow D' \rightarrow \bar{\Lambda}$ as in (13) such that (a), (b), (c) hold for $i = 1, \dots, t$. We have $\pi_{t+1}^N \in H_{A/k}\Lambda_{\mathfrak{q}}$ as $\mathfrak{q}^N\Lambda_{\mathfrak{q}} \subset H_{A/k}\Lambda_{\mathfrak{q}}$ by (1). Hence $\pi_{t+1}^N \in H_{A/k}\bar{\Lambda}$. Hence $\pi_{t+1}^N \in H_{A/k}D'$ as $D' \rightarrow \bar{\Lambda}$ is faithfully flat, see Algebra, Lemma 10.79.11. Recall that $H_{A/k} = (a_1, \dots, a_t)$. Say $\pi_{t+1}^N = \sum a_j d_j$ in D' and choose $c_j \in \Lambda_{\mathfrak{q}}$ lifting $d_j \in D'$. Then $\pi_{t+1}^N = \sum c_j a_j + \epsilon$ with $\epsilon \in \mathfrak{q}^n\Lambda_{\mathfrak{q}} \subset \mathfrak{q}^{n-N}H_{A/k}\Lambda_{\mathfrak{q}}$. Write $\epsilon = \sum a_j c'_j$ for some $c'_j \in \mathfrak{q}^{n-N}\Lambda_{\mathfrak{q}}$. Hence $\pi_{t+1}^{2N} = \sum (\pi_{t+1}^N c_j + \pi_{t+1}^N c'_j) a_j$. Note that $\pi_{t+1}^N c'_j$ maps to zero in $\bar{\Lambda}$; this trivial but key observation will ensure later that (a) holds. Now we choose $s \in S$ such that there exist $\mu_{t+1j} \in \Lambda$ such that on the one hand $\pi_{t+1}^N c_j + \pi_{t+1}^N c'_j = \mu_{t+1j}/s^{2N}$ in $S^{-1}\Lambda$ and on the other $(s\pi_{t+1})^{2N} = \sum \mu_{t+1j} a_j$ in Λ (minor detail omitted). We may further replace s by a power and enlarge D' such that s maps to an element of D' . With these choices μ_{t+1j} maps to $s^{2N} d_j$ which is an element of D' . Note that π_1, \dots, π_d are a regular sequence of parameters in $S^{-1}\Lambda$ by our choice of φ . Hence π_1, \dots, π_d forms a regular sequence in $\Lambda_{\mathfrak{q}}$ by Algebra, Lemma 10.102.3. It follows that $\pi_1^e, \dots, \pi_t^e, s\pi_{t+1}$ is a regular sequence in $S^{-1}\Lambda$ by Algebra, Lemma 10.67.10. Thus we get

$$\text{Ann}_{S^{-1}\Lambda/(\pi_1^e, \dots, \pi_t^e)}(s\pi_{t+1}) = \text{Ann}_{S^{-1}\Lambda/(\pi_1^e, \dots, \pi_t^e)}((s\pi_{t+1})^2).$$

Hence we may apply Lemma 16.10.1 to find an $s' \in S$ such that

$$\text{Ann}_{\Lambda/(\pi_1^e, \dots, \pi_t^e)}((s')^q s\pi_{t+1}) = \text{Ann}_{\Lambda/(\pi_1^e, \dots, \pi_t^e)}(((s')^q s\pi_{t+1})^2).$$

for any $q > 0$. By Lemma 16.11.3 we can choose q and enlarge D' such that $(s')^q$ maps to an element of D' . Setting $\delta_{t+1} = (s')^q s$ and we conclude that (a), (b), (c) hold for $i = 1, \dots, t + 1$. For (a) note that $\lambda_{t+1j} = (s')^{2Nq} \mu_{t+1j}$ works. By induction on t we win.

Ad (16). By construction the radical of $H_{(C \otimes_k [x_1, \dots, x_d]R)/R}\Lambda$ contains \mathfrak{h}_A . Namely, the elements $a_j \in H_{A/k}$ map to elements of $H_{B/k[x_1, \dots, x_n]}$, hence map to elements

of $H_C/k[x_1, \dots, x_n]$, hence $a_j \otimes 1$ map to elements of $H_{C \otimes_{k[x_1, \dots, x_d]} R/R}$. Moreover, if we have a solution $C \otimes_{k[x_1, \dots, x_n]} R \rightarrow T \rightarrow \Lambda$ of

$$R \rightarrow C \otimes_{k[x_1, \dots, x_d]} R \rightarrow \Lambda \supset \mathfrak{q}$$

then $H_{T/R} \subset H_{T/k}$ as R is smooth over k . Hence T will also be a solution for the original situation $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$.

Ad (18). Follows on applying Lemma 16.9.2 to $R \rightarrow C \otimes_{k[x_1, \dots, x_d]} R \rightarrow \Lambda \supset \mathfrak{q}$ and the sequence of elements $\gamma_1^c, \dots, \gamma_d^c$. We note that since x_i^c are strictly standard in C over $k[x_1, \dots, x_d]$ the elements γ_i^c are strictly standard in $C \otimes_{k[x_1, \dots, x_d]} R$ over R by Lemma 16.3.7. The other assumption of Lemma 16.9.2 holds by steps (12) and (13).

Ad (20). Apply Lemma 16.9.4 to the situation in (18). In the rest of the arguments the target ring is local Artinian, hence we are looking for a factorization by a smooth algebra T over the source ring.

Ad (22). Suppose that $C \otimes_{k[x_1, \dots, x_d]} (R/JR)_{\mathfrak{p}} \rightarrow T \rightarrow \Lambda_{\mathfrak{q}}/J\Lambda_{\mathfrak{q}}$ is a solution to

$$(R/JR)_{\mathfrak{p}} \rightarrow C \otimes_{k[x_1, \dots, x_d]} (R/JR)_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}/J\Lambda_{\mathfrak{q}} \supset \mathfrak{q}\Lambda_{\mathfrak{q}}/J\Lambda_{\mathfrak{q}}$$

Then $C \otimes_{k[x_1, \dots, x_d]} (R/I)_{\mathfrak{r}} \rightarrow T_{\mathfrak{r}} \rightarrow \Lambda_{\mathfrak{q}}/I\Lambda_{\mathfrak{q}}$ is a solution to the situation in (20).

Ad (23). Our $n = N + dc$ is large enough so that $\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}} \subset J_{\mathfrak{p}}$ and $\mathfrak{q}^n \Lambda_{\mathfrak{q}} \subset J\Lambda_{\mathfrak{q}}$. Hence if we have a solution $C \otimes_{k[x_1, \dots, x_d]} (R/\mathfrak{p}^n R)_{\mathfrak{p}} \rightarrow T \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$ of (22) then we can take T/JT as the solution for (23).

Ad (24). This is true because we have a section $C \rightarrow B$ in the category of R -algebras.

Ad (25). This is true because D' is essentially smooth over the local Artinian ring $k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}}$ and

$$R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}} = k[y_1, \dots, y_m]_{\mathfrak{p}}/\mathfrak{p}^n k[y_1, \dots, y_m]_{\mathfrak{p}}[t_1, \dots, t_d].$$

Hence $D'[t_1, \dots, t_d]$ is a filtered colimit of smooth $R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}}$ -algebras and $B \otimes_{k[x_1, \dots, x_d]} (R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}})$ factors through one of these.

Ad (26). The final twist of the proof is that we cannot just use the map $B \rightarrow D'$ which maps x_i to the image of π'_i in D' and z_{ij} to the image of λ_{ij} in D' because we need the diagram

$$\begin{array}{ccc} B & \longrightarrow & D'[t_1, \dots, t_d] \\ \uparrow & & \uparrow \\ k[x_1, \dots, x_d] & \longrightarrow & R_{\mathfrak{p}}/\mathfrak{p}^n R_{\mathfrak{p}} \end{array}$$

to commute and we need the composition $B \rightarrow D'[t_1, \dots, t_d] \rightarrow \Lambda_{\mathfrak{q}}/\mathfrak{q}^n \Lambda_{\mathfrak{q}}$ to be the map of (14). This requires us to map x_i to the image of $\pi_i t_i$ in $D'[t_1, \dots, t_d]$. Hence we map z_{ij} to the image of $\lambda_{ij} t_i^{2N}/\delta_i^{2N}$ in $D'[t_1, \dots, t_d]$ and everything is clear. \square

16.12. The main theorem

In this section we wrap up the discussion.

Theorem 16.12.1 (Popescu). *Any regular homomorphism of Noetherian rings is a filtered colimit of smooth ring maps.*

Proof. By Lemma 16.8.4 it suffices to prove this for $k \rightarrow \Lambda$ where Λ is Noetherian and geometrically regular over k . Let $k \rightarrow A \rightarrow \Lambda$ be a factorization with A a finite type k -algebra. It suffices to construct a factorization $A \rightarrow B \rightarrow \Lambda$ with B of finite type such that $\mathfrak{h}_B = \Lambda$, see Lemma 16.3.8. Hence we may perform Noetherian induction on the ideal \mathfrak{h}_A . Pick a prime $\mathfrak{q} \supset \mathfrak{h}_A$ such that \mathfrak{q} is minimal over \mathfrak{h}_A . It now suffices to resolve $k \rightarrow A \rightarrow \Lambda \supset \mathfrak{q}$ (as defined in the text following Situation 16.9.1). If the characteristic of k is zero, this follows from Lemma 16.10.3. If the characteristic of k is $p > 0$, this follows from Lemma 16.11.4. \square

16.13. The approximation property for G-rings

Let R be a Noetherian local ring. In this case R is a G-ring if and only if the ring map $R \rightarrow R^\wedge$ is regular, see More on Algebra, Lemma 15.39.7. In this case it is true that the henselization R^h and the strict henselization R^{sh} of R are G-rings, see More on Algebra, Lemma 15.39.8. Moreover, any algebra essentially of finite type over a field, over a complete local ring, over \mathbf{Z} , or over a characteristic zero Dedekind ring is a G-ring, see More on Algebra, Proposition 15.39.12. This gives an ample supply of rings to which the result below applies.

Let R be a ring. Let $f_1, \dots, f_m \in R[x_1, \dots, x_n]$. Let S be an R -algebra. In this situation we say a vector $(a_1, \dots, a_n) \in S^n$ is a *solution in S* if and only if

$$f_j(a_1, \dots, a_n) = 0 \text{ in } S, \text{ for } j = 1, \dots, m$$

Of course an important question in algebraic geometry is to see when systems of polynomial equations have solutions. The following theorem tells us that having solutions in the completion of a local Noetherian ring is often enough to show there exist solutions in the henselization of the ring.

Theorem 16.13.1. *Let R be a Noetherian local ring. Let $f_1, \dots, f_m \in R[x_1, \dots, x_n]$. Suppose that $(a_1, \dots, a_n) \in (R^\wedge)^n$ is a solution in R^\wedge . If R is a henselian G-ring, then for every integer N there exists a solution $(b_1, \dots, b_n) \in R^n$ in R such that $a_i - b_i \in \mathfrak{m}^N R^\wedge$.*

Proof. Let $c_i \in R$ be an element such that $a_i - c_i \in \mathfrak{m}^N$. Choose generators $\mathfrak{m}^N = (d_1, \dots, d_M)$. Write $a_i = c_i + \sum a_{i,l} d_l$. Consider the polynomial ring $R[x_{i,l}]$ and the elements

$$g_j = f_j(c_1 + \sum x_{1,l} d_l, \dots, c_n + \sum x_{n,l} d_{n,l}) \in R[x_{i,l}]$$

The system of equations $g_j = 0$ has the solution $(a_{i,l})$. Suppose that we can show that g_j as a solution $(b_{i,l})$ in R . Then it follows that $b_i = c_i + \sum b_{i,l} d_l$ is a solution of $f_j = 0$ which is congruent to a_i modulo \mathfrak{m}^N . Thus it suffices to show that solvability over R^\wedge implies solvability over R .

Let $A \subset R^\wedge$ be the R -subalgebra generated by a_1, \dots, a_n . Since we've assumed R is a G-ring, i.e., that $R \rightarrow R^\wedge$ is regular, we see that there exists a factorization

$$A \rightarrow B \rightarrow R^\wedge$$

with B smooth over R , see Theorem 16.12.1. Denote $\kappa = R/\mathfrak{m}$ the residue field. It is also the residue field of R^\wedge , so we get a commutative diagram

$$\begin{array}{ccc} B & \cdots \rightarrow & R' \\ \uparrow & \searrow & \downarrow \\ R & \longrightarrow & \kappa \end{array}$$

Since the vertical arrow is smooth, More on Algebra, Lemma 15.6.13 implies that there exists an étale ring map $R \rightarrow R'$ which induces an isomorphism $R/\mathfrak{m} \rightarrow R'/\mathfrak{m}R'$ and an R -algebra map $B \rightarrow R'$ making the diagram above commute. Since R is henselian we see that $R \rightarrow R'$ has a section, see Algebra, Lemma 10.145.3. Let $b_i \in R$ be the image of a_i under the ring maps $A \rightarrow B \rightarrow R' \rightarrow R$. Since all of these maps are R -algebra maps, we see that (b_1, \dots, b_n) is a solution in R . \square

Given a Noetherian local ring (R, \mathfrak{m}) , an étale ring map $R \rightarrow R'$, and a maximal ideal $\mathfrak{m}' \subset R'$ lying over \mathfrak{m} with $\kappa(\mathfrak{m}) = \kappa(\mathfrak{m}')$, then we have inclusions

$$R \subset R_{\mathfrak{m}'} \subset R^h \subset R^\wedge,$$

by Algebra, Lemma 10.145.19 and More on Algebra, Lemma 15.34.3.

Theorem 16.13.2. *Let R be a Noetherian local ring. Let $f_1, \dots, f_m \in R[x_1, \dots, x_n]$. Suppose that $(a_1, \dots, a_n) \in (R^\wedge)^n$ is a solution. If R is a G-ring, then for every integer N there exist*

- (1) an étale ring map $R \rightarrow R'$,
- (2) a maximal ideal $\mathfrak{m}' \subset R'$ lying over \mathfrak{m}
- (3) a solution $(b_1, \dots, b_n) \in (R')^n$ in R'

such that $\kappa(\mathfrak{m}) = \kappa(\mathfrak{m}')$ and $a_i - b_i \in (\mathfrak{m}')^N R^\wedge$.

Proof. We could deduce this theorem from Theorem 16.13.1 using that the henselization R^h is a G-ring by More on Algebra, Lemma 15.39.8 and writing R^h as a directed colimit of étale extensions R' . Instead we prove this by redoing the proof of the previous theorem in this case.

Let $c_i \in R$ be an element such that $a_i - c_i \in \mathfrak{m}^N$. Choose generators $\mathfrak{m}^N = (d_1, \dots, d_M)$. Write $a_i = c_i + \sum a_{i,l} d_l$. Consider the polynomial ring $R[x_{i,l}]$ and the elements

$$g_j = f_j(c_1 + \sum x_{1,l} d_l, \dots, c_n + \sum x_{n,l} d_{n,l}) \in R[x_{i,l}]$$

The system of equations $g_j = 0$ has the solution $(a_{i,l})$. Suppose that we can show that g_j as a solution $(b_{i,l})$ in R' for some étale ring map $R \rightarrow R'$ endowed with a maximal ideal \mathfrak{m}' such that $\kappa(\mathfrak{m}) = \kappa(\mathfrak{m}')$. Then it follows that $b_i = c_i + \sum b_{i,l} d_l$ is a solution of $f_j = 0$ which is congruent to a_i modulo $(\mathfrak{m}')^N$. Thus it suffices to show that solvability over R^\wedge implies solvability over some étale ring extension which induces a trivial residue field extension at some prime over \mathfrak{m} .

Let $A \subset R^\wedge$ be the R -subalgebra generated by a_1, \dots, a_n . Since we've assumed R is a G-ring, i.e., that $R \rightarrow R^\wedge$ is regular, we see that there exists a factorization

$$A \rightarrow B \rightarrow R^\wedge$$

with B smooth over R , see Theorem 16.12.1. Denote $\kappa = R/\mathfrak{m}$ the residue field. It is also the residue field of R^\wedge , so we get a commutative diagram

$$\begin{array}{ccc} B & \cdots\cdots\rightarrow & R' \\ \uparrow & \searrow & \downarrow \\ R & \longrightarrow & \kappa \end{array}$$

Since the vertical arrow is smooth, More on Algebra, Lemma 15.6.13 implies that there exists an étale ring map $R \rightarrow R'$ which induces an isomorphism $R/\mathfrak{m} \rightarrow R'/\mathfrak{m}R'$ and an R -algebra map $B \rightarrow R'$ making the diagram above commute. Let $b_i \in R'$ be the image of a_i under the ring maps $A \rightarrow B \rightarrow R'$. Since all of these maps are R -algebra maps, we see that (b_1, \dots, b_n) is a solution in R' . \square

Example 16.13.3. Let (R, \mathfrak{m}) be a Noetherian local ring with henselization R^h . The map on completions $R^\wedge \rightarrow (R^h)^\wedge$ is an isomorphism, see More on Algebra, Lemma 15.34.3. Since also R^h is Noetherian (ibid.) we may think of R^h as a subring of its completion (because the completion is faithfully flat). In this way we see that we may identify R^h with a subring of R^\wedge .

Let us try to understand which elements of R^\wedge are in R^h . For simplicity we assume R is a domain with fraction field K . Clearly, every element f of R^h is algebraic over R , in the sense that there exists an equation of the form $a_n f^n + \dots + a_1 f + a_0 = 0$ for some $a_i \in R$ with $n > 0$ and $a_n \neq 0$.

Conversely, assume that $f \in R^\wedge$, $n \in \mathbf{N}$, and $a_0, \dots, a_n \in R$ with $a_n \neq 0$ such that $a_n f^n + \dots + a_1 f + a_0 = 0$. If R is a G-ring, then, for every $N > 0$ there exists an element $g \in R^h$ with $a_n g^n + \dots + a_1 g + a_0 = 0$ and $f - g \in \mathfrak{m}^N R^\wedge$, see Theorem 16.13.2. We'd like to conclude that $f = g$ when $N \gg 0$. If this is not true, then we find infinitely many roots g of $P(T)$ in R^h . This is impossible because (1) $R^h \subset R^h \otimes_R K$ and (2) $R^h \otimes_R K$ is a finite product of field extensions of K . Namely, $R \rightarrow K$ is injective and $R \rightarrow R^h$ is flat, hence $R^h \rightarrow R^h \otimes_R K$ is injective and (2) follows from More on Algebra, Lemma 15.34.13.

Conclusion: If R is a Noetherian local domain with fraction field K and a G-ring, then $R^h \subset R^\wedge$ is the set of all elements which are algebraic over K .

16.14. Approximation for henselian pairs

We can generalize the discussion of Section 16.13 to the case of henselian pairs. Henselian pairs were defined in More on Algebra, Section 15.7.

Lemma 16.14.1. *Let (A, I) be a henselian pair with A Noetherian. Let A^\wedge be the I -adic completion of A . Assume at least one of the following conditions holds*

- (1) $A \rightarrow A^\wedge$ is a regular ring map,
- (2) A is a Noetherian G-ring, or
- (3) (A, I) is the henselization (More on Algebra, Lemma 15.7.13) of a pair (B, J) where B is a Noetherian G-ring.

Given $f_1, \dots, f_m \in A[x_1, \dots, x_n]$ and $\hat{a}_1, \dots, \hat{a}_n \in A^\wedge$ such that $f_j(\hat{a}_1, \dots, \hat{a}_n) = 0$ for $j = 1, \dots, m$, for every $N \geq 1$ there exist $a_1, \dots, a_n \in A$ such that $\hat{a}_i - a_i \in I^N$ and such that $f_j(a_1, \dots, a_n) = 0$ for $j = 1, \dots, m$.

Proof. By More on Algebra, Lemma 15.39.15 we see that (3) implies (2). By More on Algebra, Lemma 15.39.14 we see that (2) implies (1). Thus it suffices to prove the lemma in case $A \rightarrow A^\wedge$ is a regular ring map.

Let $\hat{a}_1, \dots, \hat{a}_n$ be as in the statement of the lemma. By Theorem 16.12.1 we can find a factorization $A \rightarrow B \rightarrow A^\wedge$ with $A \rightarrow B$ smooth and $b_1, \dots, b_n \in B$ with $f_j(b_1, \dots, b_n) = 0$ in B . Denote $\sigma : B \rightarrow A^\wedge \rightarrow A/I^N$ the composition. By More on Algebra, Lemma 15.6.13 we can find an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I^N \rightarrow A'/I^N A'$ and an A -algebra map $\tilde{\sigma} : B \rightarrow A'$ lifting σ . Since (A, I) is henselian, there is an A -algebra map $\chi : A' \rightarrow A$, see More on Algebra, Lemma 15.7.7. Then setting $a_i = \chi(\tilde{\sigma}(b_i))$ gives a solution. \square

Sheaves of Modules

17.1. Introduction

In this chapter we work out basic notions of sheaves of modules. This in particular includes the case of abelian sheaves, since these may be viewed as sheaves of \mathbf{Z} -modules. Basic references are [Ser55b], [DG67] and [AGV71].

We work out what happens for sheaves of modules on ringed topoi in another chapter (see Modules on Sites, Section 18.1), although there we will mostly just duplicate the discussion from this chapter.

17.2. Pathology

A ringed space is a pair consisting of a topological space X and a sheaf of rings \mathcal{O} . We allow $\mathcal{O} = 0$ in the definition. In this case the category of modules has a single object (namely 0). It is still an abelian category etc, but it is a little degenerate. Similarly the sheaf \mathcal{O} may be zero over open subsets of X , etc.

This doesn't happen when considering locally ringed spaces (as we will do later).

17.3. The abelian category of sheaves of modules

Let (X, \mathcal{O}_X) be a ringed space, see Sheaves, Definition 6.25.1. Let \mathcal{F}, \mathcal{G} be sheaves of \mathcal{O}_X -modules, see Sheaves, Definition 6.10.1. Let $\varphi, \psi : \mathcal{F} \rightarrow \mathcal{G}$ be morphisms of sheaves of \mathcal{O}_X -modules. We define $\varphi + \psi : \mathcal{F} \rightarrow \mathcal{G}$ to be the map which on each open $U \subset X$ is the sum of the maps induced by φ, ψ . This is clearly again a map of sheaves of \mathcal{O}_X -modules. It is also clear that composition of maps of \mathcal{O}_X -modules is bilinear with respect to this addition. Thus $Mod(\mathcal{O}_X)$ is a pre-additive category, see Homology, Definition 12.3.1.

We will denote 0 the sheaf of \mathcal{O}_X -modules which has constant value $\{0\}$ for all open $U \subset X$. Clearly this is both a final and an initial object of $Mod(\mathcal{O}_X)$. Given a morphism of \mathcal{O}_X -modules $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ the following are equivalent: (a) φ is zero, (b) φ factors through 0 , (c) φ is zero on sections over each open U , and (d) $\varphi_x = 0$ for all $x \in X$. See Sheaves, Lemma 6.16.1.

Moreover, given a pair \mathcal{F}, \mathcal{G} of sheaves of \mathcal{O}_X -modules we may define the direct sum as

$$\mathcal{F} \oplus \mathcal{G} = \mathcal{F} \times \mathcal{G}$$

with obvious maps (i, j, p, q) as in Homology, Definition 12.3.5. Thus $Mod(\mathcal{O}_X)$ is an additive category, see Homology, Definition 12.3.8.

Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of \mathcal{O}_X -modules. We may define $\text{Ker}(\varphi)$ to be the subsheaf of \mathcal{F} with sections

$$\text{Ker}(\varphi)(U) = \{s \in \mathcal{F}(U) \mid \varphi(s) = 0 \text{ in } \mathcal{G}(U)\}$$

for all open $U \subset X$. It is easy to see that this is indeed a kernel in the category of \mathcal{O}_X -modules. In other words, a morphism $\alpha : \mathcal{H} \rightarrow \mathcal{F}$ factors through $\text{Ker}(\varphi)$ if and only if $\varphi \circ \alpha = 0$. Moreover, on the level of stalks we have $\text{Ker}(\varphi)_x = \text{Ker}(\varphi_x)$.

On the other hand, we define $\text{Coker}(\varphi)$ as the sheaf of \mathcal{O}_X -modules associated to the presheaf of \mathcal{O}_X -modules defined by the rule

$$U \longmapsto \text{Coker}(\mathcal{G}(U) \rightarrow \mathcal{F}(U)) = \mathcal{F}(U)/\varphi(\mathcal{G}(U)).$$

Since taking stalks commutes with taking sheafification, see Sheaves, Lemma 6.17.2 we see that $\text{Coker}(\varphi)_x = \text{Coker}(\varphi_x)$. Thus the map $\mathcal{G} \rightarrow \text{Coker}(\varphi)$ is surjective (as a map of sheaves of sets), see Sheaves, Section 6.16. To show that this is a cokernel, note that if $\beta : \mathcal{G} \rightarrow \mathcal{H}$ is a morphism of \mathcal{O}_X -modules such that $\beta \circ \varphi$ is zero, then you get for every open $U \subset X$ a map induced by β from $\mathcal{G}(U)/\varphi(\mathcal{F}(U))$ into $\mathcal{H}(U)$. By the universal property of sheafification (see Sheaves, Lemma 6.20.1) we obtain a canonical map $\text{Coker}(\varphi) \rightarrow \mathcal{H}$ such that the original β is equal to the composition $\mathcal{G} \rightarrow \text{Coker}(\varphi) \rightarrow \mathcal{H}$. The morphism $\text{Coker}(\varphi) \rightarrow \mathcal{H}$ is unique because of the surjectivity mentioned above.

Lemma 17.3.1. *Let (X, \mathcal{O}_X) be a ringed space. The category $\text{Mod}(\mathcal{O}_X)$ is an abelian category. Moreover a complex*

$$\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$$

is exact at \mathcal{G} if and only if for all $x \in X$ the complex

$$\mathcal{F}_x \rightarrow \mathcal{G}_x \rightarrow \mathcal{H}_x$$

is exact at \mathcal{G}_x .

Proof. By Homology, Definition 12.5.1 we have to show that image and coimage agree. By Sheaves, Lemma 6.16.1 it is enough to show that image and coimage have the same stalk at every $x \in X$. By the constructions of kernels and cokernels above these stalks are the coimage and image in the categories of $\mathcal{O}_{X,x}$ -modules. Thus we get the result from the fact that the category of modules over a ring is abelian. \square

Actually the category $\text{Mod}(\mathcal{O}_X)$ has many more properties. Here are two constructions we can do.

- (1) Given any set I and for each $i \in I$ a \mathcal{O}_X -module we can form the product

$$\prod_{i \in I} \mathcal{F}_i$$

which is the sheaf that associates to each open U the product of the modules $\mathcal{F}_i(U)$. This is also the categorical product, as in Categories, Definition 4.14.5.

- (2) Given any set I and for each $i \in I$ a \mathcal{O}_X -module we can form the direct sum

$$\bigoplus_{i \in I} \mathcal{F}_i$$

which is the *sheafification* of the presheaf that associates to each open U the direct sum of the modules $\mathcal{F}_i(U)$. This is also the categorical coproduct, as in Categories, Definition 4.14.6. To see this you use the universal property of sheafification.

Using these we conclude that all limits and colimits exist in $\text{Mod}(\mathcal{O}_X)$.

Lemma 17.3.2. *Let (X, \mathcal{O}_X) be a ringed space.*

- (1) *All limits exist in $\text{Mod}(\mathcal{O}_X)$. Limits are the same as the corresponding limits of presheaves of \mathcal{O}_X -modules (i.e., commute with taking sections over opens).*
- (2) *All colimits exist in $\text{Mod}(\mathcal{O}_X)$. Colimits are the sheafification of the corresponding colimit in the category of presheaves. Taking colimits commutes with taking stalks.*
- (3) *Filtered colimits are exact.*
- (4) *Finite direct sums are the same as the corresponding finite direct sums of presheaves of \mathcal{O}_X -modules.*

Proof. As $\text{Mod}(\mathcal{O}_X)$ is abelian (Lemma 17.3.1) it has all finite limits and colimits (Homology, Lemma 12.5.5). Thus the existence of limits and colimits and their description follows from the existence of products and coproducts and their description (see discussion above) and Categories, Lemmas 4.14.10 and 4.14.11. Since sheafification commutes with taking stalks we see that colimits commute with taking stalks. Part (3) signifies that given a system $0 \rightarrow \mathcal{F}_i \rightarrow \mathcal{G}_i \rightarrow \mathcal{H}_i \rightarrow 0$ of exact sequences of \mathcal{O}_X -modules over a directed partially ordered set I the sequence $0 \rightarrow \text{colim } \mathcal{F}_i \rightarrow \text{colim } \mathcal{G}_i \rightarrow \text{colim } \mathcal{H}_i \rightarrow 0$ is exact as well. Since we can check exactness on stalks (Lemma 17.3.1) this follows from the case of modules which is Algebra, Lemma 10.8.9. We omit the proof of (4). \square

The existence of limits and colimits allows us to consider exactness properties of functors defined on the category of \mathcal{O} -modules in terms of limits and colimits, as in Categories, Section 4.23. See Homology, Lemma 12.7.1 for a description of exactness properties in terms of short exact sequences.

Lemma 17.3.3. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces.*

- (1) *The functor $f_* : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_Y)$ is left exact. In fact it commutes with all limits.*
- (2) *The functor $f^* : \text{Mod}(\mathcal{O}_Y) \rightarrow \text{Mod}(\mathcal{O}_X)$ is right exact. In fact it commutes with all colimits.*
- (3) *Pullback $f^{-1} : \text{Ab}(Y) \rightarrow \text{Ab}(X)$ on abelian sheaves is exact.*

Proof. Parts (1) and (2) hold because (f^*, f_*) is an adjoint pair of functors, see Sheaves, Lemma 6.26.2 and Categories, Section 4.24. Part (3) holds because exactness can be checked on stalks (Lemma 17.3.1) and the description of stalks of the pullback, see Sheaves, Lemma 6.22.1. \square

Lemma 17.3.4. *Let $j : U \rightarrow X$ be an open immersion of topological spaces. The functor $j_! : \text{Ab}(U) \rightarrow \text{Ab}(X)$ is exact.*

Proof. Follows from the description of stalks given in Sheaves, Lemma 6.31.6. \square

Lemma 17.3.5. *Let (X, \mathcal{O}_X) be a ringed space. Let I be a set. For $i \in I$, let \mathcal{F}_i be a sheaf of \mathcal{O}_X -modules. For $U \subset X$ quasi-compact open the map*

$$\bigoplus_{i \in I} \mathcal{F}_i(U) \longrightarrow \left(\bigoplus_{i \in I} \mathcal{F}_i \right) (U)$$

is bijective.

Proof. If s is an element of the right hand side, then there exists an open covering $U = \bigcup_{j \in J} U_j$ such that $s|_{U_j}$ is a finite sum $\sum_{i \in I_j} s_{ji}$ with $s_{ji} \in \mathcal{F}_i(U_j)$. Because

U is quasi-compact we may assume that the covering is finite, i.e., that J is finite. Then $I' = \bigcup_{j \in J} I_j$ is a finite subset of I . Clearly, s is a section of the subsheaf $\bigoplus_{i \in I'} \mathcal{F}_i$. The result follows from the fact that for a finite direct sum sheafification is not needed, see Lemma 17.3.2 above. \square

17.4. Sections of sheaves of modules

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let $s \in \Gamma(X, \mathcal{F}) = \mathcal{F}(X)$ be a global section. There is a unique *map of \mathcal{O}_X -modules*

$$\mathcal{O}_X \longrightarrow \mathcal{F}, f \longmapsto fs$$

associated to s . The notation above signifies that a local section f of \mathcal{O}_X , i.e., a section f over some open U , is mapped to the multiplication of f with the restriction of s to U . Conversely, any map $\varphi : \mathcal{O}_X \rightarrow \mathcal{F}$ gives rise to a section $s = \varphi(1)$ such that φ is the morphism associated to s .

Definition 17.4.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is *generated by global sections* if there exist a set I , and global sections $s_i \in \Gamma(X, \mathcal{F})$, $i \in I$ such that the map

$$\bigoplus_{i \in I} \mathcal{O}_X \longrightarrow \mathcal{F}$$

which is the map associated to s_i on the summand corresponding to i , is surjective. In this case we say that the sections s_i *generate* \mathcal{F} .

We often use the abuse of notation introduced in Sheaves, Section 6.11 where, given a local section s of \mathcal{F} defined in an open neighbourhood of a point $x \in X$, we denote s_x , or even s the image of s in the stalk \mathcal{F}_x .

Lemma 17.4.2. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let I be a set. Let $s_i \in \Gamma(X, \mathcal{F})$, $i \in I$ be global sections. The sections s_i generate \mathcal{F} if and only if for all $x \in X$ the elements $s_{i,x} \in \mathcal{F}_x$ generate the $\mathcal{O}_{X,x}$ -module \mathcal{F}_x .*

Proof. Omitted. \square

Lemma 17.4.3. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be sheaves of \mathcal{O}_X -modules. If \mathcal{F} and \mathcal{G} are generated by global sections then so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.*

Proof. Omitted. \square

Lemma 17.4.4. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let I be a set. Let s_i , $i \in I$ be a collection of local sections of \mathcal{F} , i.e., $s_i \in \mathcal{F}(U_i)$ for some opens $U_i \subset X$. There exists a unique smallest subsheaf of \mathcal{O}_X -modules \mathcal{G} such that each s_i corresponds to a local section of \mathcal{G} .*

Proof. Consider the subpresheaf of \mathcal{O}_X -modules defined by the rule

$$U \longmapsto \left\{ \text{sums } \sum_{i \in J} f_i(s_i|_U) \text{ where } J \text{ is finite, } U \subset U_i \text{ for } i \in J, \text{ and } f_i \in \mathcal{O}_X(U) \right\}$$

Let \mathcal{G} be the sheafification of this subpresheaf. This is a subsheaf of \mathcal{F} by Sheaves, Lemma 6.16.3. Since all the finite sums clearly have to be in \mathcal{G} this is the smallest subsheaf as desired. \square

Definition 17.4.5. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Given a set I , and local sections s_i , $i \in I$ of \mathcal{F} we say that the subsheaf \mathcal{G} of Lemma 17.4.4 above is the *subsheaf generated by the s_i* .

Lemma 17.4.6. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Given a set I , and local sections s_i , $i \in I$ of \mathcal{F} . Let \mathcal{G} be the subsheaf generated by the s_i and let $x \in X$. Then \mathcal{G}_x is the $\mathcal{O}_{X,x}$ -submodule of \mathcal{F}_x generated by the elements $s_{i,x}$ for those i such that s_i is defined at x .*

Proof. This is clear from the construction of \mathcal{G} in the proof of Lemma 17.4.4. \square

17.5. Supports of modules and sections

Definition 17.5.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.

- (1) The *support* of \mathcal{F} is the set of points $x \in X$ such that $\mathcal{F}_x \neq 0$.
- (2) We denote $\text{Supp}(\mathcal{F})$ the support of \mathcal{F} .
- (3) Let $s \in \Gamma(X, \mathcal{F})$ be a global section. The *support* of s is the set of points $x \in X$ such that the image $s_x \in \mathcal{F}_x$ of s is not zero.

Of course the support of a local section is then defined also since a local section is a global section of the restriction of \mathcal{F} .

Lemma 17.5.2. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let $U \subset X$ open.*

- (1) *The support of $s \in \mathcal{F}(U)$ is closed in U .*
- (2) *The support of fs is contained in the intersections of the supports of $f \in \mathcal{O}_X(U)$ and $s \in \mathcal{F}(U)$*
- (3) *The support of $s + s'$ is contained in the union of the supports of $s, s' \in \mathcal{F}(U)$.*
- (4) *The support of \mathcal{F} is the union of the supports of all local sections of \mathcal{F} .*
- (5) *If $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of \mathcal{O}_X -modules, then the support of $\varphi(s)$ is contained in the support of $s \in \mathcal{F}(U)$.*

Proof. This is true because if $s_x = 0$, then s is zero in an open neighbourhood of x by definition of stalks. Similarly for f . Details omitted. \square

In general the support of a sheaf of modules is not closed. Namely, the sheaf could be an abelian sheaf on \mathbf{R} (with the usual archimedean topology) which is the direct sum of infinitely many nonzero skyscraper sheaves each supported at a single point p_i of \mathbf{R} . Then the support would be the set of points p_i which may not be closed.

Another example is to consider the open immersion $j : U = (0, \infty) \rightarrow \mathbf{R} = X$, and the abelian sheaf $j_! \underline{\mathbf{Z}}_U$. By Sheaves, Section 6.31 the support of this sheaf is exactly U .

Lemma 17.5.3. *Let X be a topological space. The support of a sheaf of rings is closed.*

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1 = 0$, and hence the support of a sheaf of rings is the support of the unit section. \square

17.6. Closed immersions and abelian sheaves

Recall that we think of an abelian sheaf on a topological space X as a sheaf of $\underline{\mathbf{Z}}_X$ -modules. Thus we may apply any results, definitions for sheaves of modules to abelian sheaves.

Lemma 17.6.1. *Let X be a topological space. Let $Z \subset X$ be a closed subset. Denote $i : Z \rightarrow X$ the inclusion map. The functor*

$$i_* : \text{Ab}(Z) \longrightarrow \text{Ab}(X)$$

is exact, fully faithful, with essential image exactly those abelian sheaves whose support is contained in Z . The functor i^{-1} is a left inverse to i_ .*

Proof. Exactness follows from the description of stalks in Sheaves, Lemma 6.32.1 and Lemma 17.3.1. The rest was shown in Sheaves, Lemma 6.32.3. \square

Let \mathcal{F} be a sheaf on X . There is a canonical subsheaf of \mathcal{F} which consists of exactly those sections whose support is contained in Z . Here is the exact statement.

Lemma 17.6.2. *Let X be a topological space. Let $Z \subset X$ be a closed subset. Let \mathcal{F} be a sheaf on X . For $U \subset X$ open set*

$$\Gamma(U, \mathcal{H}_Z(\mathcal{F})) = \{s \in \mathcal{F}(U) \mid \text{the support of } s \text{ is contained in } Z \cap U\}$$

Then $\mathcal{H}_Z(\mathcal{F})$ is an abelian subsheaf of \mathcal{F} . It is the largest abelian subsheaf of \mathcal{F} whose support is contained in Z . The construction $\mathcal{F} \mapsto \mathcal{H}_Z(\mathcal{F})$ is functorial in the abelian sheaf \mathcal{F} .

Proof. This follows from Lemma 17.5.2. \square

This seems like a good opportunity to show that the functor i_* has a right adjoint on abelian sheaves.

Lemma 17.6.3. *Let $i : Z \rightarrow X$ be the inclusion of a closed subset into the topological space X . Denote¹ $i^! : \text{Ab}(X) \rightarrow \text{Ab}(Z)$ the functor $\mathcal{F} \mapsto i^{-1}\mathcal{H}_Z(\mathcal{F})$. Then $i^!$ is a right adjoint to i_* , in a formula*

$$\text{Mor}_{\text{Ab}(X)}(i_*\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Ab}(Z)}(\mathcal{G}, i^!\mathcal{F}).$$

In particular i_ commutes with arbitrary colimits.*

Proof. Note that $i_*i^!\mathcal{F} = \mathcal{H}_Z(\mathcal{F})$. Since i_* is fully faithful we are reduced to showing that

$$\text{Mor}_{\text{Ab}(X)}(i_*\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Ab}(X)}(i_*\mathcal{G}, \mathcal{H}_Z(\mathcal{F})).$$

This follows since the support of the image via any homomorphism of a section of $i_*\mathcal{G}$ is supported on Z , see Lemma 17.5.2. \square

Remark 17.6.4. In Sheaves, Remark 6.32.5 we showed that i_* as a functor on the categories of sheaves of sets does not have a right adjoint simply because it is not exact. However, it is very close to being true, in fact, the functor i_* is exact on sheaves of pointed sets, sections with support in Z can be defined for sheaves of pointed sets, and $i^!$ makes sense and is a right adjoint to i_* .

¹This is likely nonstandard notation.

17.7. A canonical exact sequence

We give this exact sequence its own section.

Lemma 17.7.1. *Let X be a topological space. Let $U \subset X$ be an open subset with complement $Z \subset X$. Denote $j : U \rightarrow X$ the open immersion and $i : Z \rightarrow X$ the closed immersion. For any sheaf of abelian groups \mathcal{F} on X the adjunction mappings $j_!j^*\mathcal{F} \rightarrow \mathcal{F}$ and $\mathcal{F} \rightarrow i_*i^*\mathcal{F}$ give a short exact sequence*

$$0 \rightarrow j_!j^*\mathcal{F} \rightarrow \mathcal{F} \rightarrow i_*i^*\mathcal{F} \rightarrow 0$$

of sheaves of abelian groups. For any morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of abelian sheaves on X we obtain a morphism of short exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & j_!j^*\mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & i_*i^*\mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & j_!j^*\mathcal{G} & \longrightarrow & \mathcal{G} & \longrightarrow & i_*i^*\mathcal{G} \longrightarrow 0 \end{array}$$

Proof. We may check exactness on stalks (Lemma 17.3.1). For a description of the stalks in question see Sheaves, Lemmas 6.31.6 and 6.32.1. We omit the proof of the functorial behaviour of the exact sequence. \square

17.8. Modules locally generated by sections

Let (X, \mathcal{O}_X) be a ringed space. In this and the following section we will often restrict sheaves to open subspaces $U \subset X$, see Sheaves, Section 6.31. In particular, we will often denote the open subspace by (U, \mathcal{O}_U) instead of the more correct notation $(U, \mathcal{O}_X|_U)$, see Sheaves, Definition 6.31.2.

Consider the open immersion $j : U = (0, \infty) \rightarrow \mathbf{R} = X$, and the abelian sheaf $j_!\mathbf{Z}_U$. By Sheaves, Section 6.31 the stalk of $j_!\mathbf{Z}_U$ at $x = 0$ is 0. In fact the sections of this sheaf over any open interval containing 0 are 0. Thus there is no open neighbourhood of the point 0 over which the sheaf can be generated by sections.

Definition 17.8.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is *locally generated by sections* if for every $x \in X$ there exists an open neighbourhood U such that $\mathcal{F}|_U$ is globally generated as a sheaf of \mathcal{O}_U -modules.

In other words there exists a set I and for each i a section $s_i \in \mathcal{F}(U)$ such that the associated map

$$\bigoplus_{i \in I} \mathcal{O}_U \longrightarrow \mathcal{F}|_U$$

is surjective.

Lemma 17.8.2. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The pullback $f^*\mathcal{G}$ is locally generated by sections if \mathcal{G} is locally generated by sections.*

Proof. Given an open subspace V of Y we may consider the commutative diagram of ringed spaces

$$\begin{array}{ccc} (f^{-1}V, \mathcal{O}_{f^{-1}V}) & \xrightarrow{j'} & (X, \mathcal{O}_X) \\ f' \downarrow & & \downarrow f \\ (V, \mathcal{O}_V) & \xrightarrow{j} & (Y, \mathcal{O}_Y) \end{array}$$

We know that $f^*\mathcal{G}|_{f^{-1}V} \cong (f')^*(\mathcal{G}|_V)$, see Sheaves, Lemma 6.26.3. Thus we may assume that \mathcal{G} is globally generated.

We have seen that f^* commutes with all colimits, and is right exact, see Lemma 17.3.3. Thus if we have a surjection

$$\bigoplus_{i \in I} \mathcal{O}_Y \rightarrow \mathcal{G} \rightarrow 0$$

then upon applying f^* we obtain the surjection

$$\bigoplus_{i \in I} \mathcal{O}_X \rightarrow f^*\mathcal{G} \rightarrow 0.$$

This implies the lemma. \square

17.9. Modules of finite type

Definition 17.9.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is of *finite type* if for every $x \in X$ there exists an open neighbourhood U such that $\mathcal{F}|_U$ is generated by finitely many sections.

Lemma 17.9.2. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The pullback $f^*\mathcal{G}$ of a finite type \mathcal{O}_Y -module is a finite type \mathcal{O}_X -module.*

Proof. Arguing as in the proof of Lemma 17.8.2 we may assume \mathcal{G} is globally generated by finitely many sections. We have seen that f^* commutes with all colimits, and is right exact, see Lemma 17.3.3. Thus if we have a surjection

$$\bigoplus_{i=1, \dots, n} \mathcal{O}_Y \rightarrow \mathcal{G} \rightarrow 0$$

then upon applying f^* we obtain the surjection

$$\bigoplus_{i=1, \dots, n} \mathcal{O}_X \rightarrow f^*\mathcal{G} \rightarrow 0.$$

This implies the lemma. \square

Lemma 17.9.3. *Let X be a ringed space. The image of a morphism of \mathcal{O}_X -modules of finite type is of finite type. Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of \mathcal{O}_X -modules. If \mathcal{F}_1 and \mathcal{F}_3 are of finite type, so is \mathcal{F}_2 .*

Proof. The statement on images is trivial. The statement on short exact sequences comes from the fact that sections of \mathcal{F}_3 locally lift to sections of \mathcal{F}_2 and the corresponding result in the category of modules over a ring (applied to the stalks for example). \square

Lemma 17.9.4. *Let X be a ringed space. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of \mathcal{O}_X -modules. Let $x \in X$. Assume \mathcal{F} of finite type and the map on stalks $\varphi_x : \mathcal{G}_x \rightarrow \mathcal{F}_x$ surjective. Then there exists an open neighbourhood $x \in U \subset X$ such that $\varphi|_U$ is surjective.*

Proof. Choose an open neighbourhood $U \subset X$ such that \mathcal{F} is generated by $s_1, \dots, s_n \in \mathcal{F}(U)$ over U . By assumption of surjectivity of φ_x , after shrinking U we may assume that $s_i = \varphi(t_i)$ for some $t_i \in \mathcal{G}(U)$. Then U works. \square

Lemma 17.9.5. *Let X be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module. Let $x \in X$. Assume \mathcal{F} of finite type and $\mathcal{F}_x = 0$. Then there exists an open neighbourhood $x \in U \subset X$ such that $\mathcal{F}|_U$ is zero.*

Proof. This is a special case of Lemma 17.9.4 applied to the morphism $0 \rightarrow \mathcal{F}$. \square

Lemma 17.9.6. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. If \mathcal{F} is of finite type then support of \mathcal{F} is closed.*

Proof. This is a reformulation of Lemma 17.9.5. □

Lemma 17.9.7. *Let X be a ringed space. Let I be a partially ordered set and let $(\mathcal{F}_i, f_{ii'})$ be a system over I consisting of sheaves of \mathcal{O}_X -modules (see Categories, Section 4.21). Let $\mathcal{F} = \text{colim } \mathcal{F}_i$ be the colimit. Assume (a) I is directed, (b) \mathcal{F} is a finite type \mathcal{O}_X -module, and (c) X is quasi-compact. Then there exists an i such that $\mathcal{F}_i \rightarrow \mathcal{F}$ is surjective. If the transition maps $f_{ii'}$ are injective then we conclude that $\mathcal{F} = \mathcal{F}_i$ for some $i \in I$.*

Proof. Let $x \in X$. There exists an open neighbourhood $U \subset X$ of x and finitely many sections $s_j \in \mathcal{F}(U)$, $j = 1, \dots, m$ such that s_1, \dots, s_m generate \mathcal{F} as \mathcal{O}_U -module. After possibly shrinking U to a smaller open neighbourhood of x we may assume that each s_j comes from a section of \mathcal{F}_i for some $i \in I$. Hence, since X is quasi-compact we can find a finite open covering $X = \bigcup_{j=1, \dots, m} U_j$, and for each j an index i_j and finitely many sections $s_{jl} \in \mathcal{F}_{i_j}(U_j)$ whose images generate the restriction of \mathcal{F} to U_j . Clearly, the lemma holds for any index $i \in I$ which is \geq all i_j . □

Lemma 17.9.8. *Let X be a ringed space. There exists a set of \mathcal{O}_X -modules $\{\mathcal{F}_i\}_{i \in I}$ of finite type such that each finite type \mathcal{O}_X -module on X is isomorphic to exactly one of the \mathcal{F}_i .*

Proof. For each open covering $\mathcal{U} : X = \bigcup U_j$ consider the sheaves of \mathcal{O}_X -modules \mathcal{F} such that each restriction $\mathcal{F}|_{U_j}$ is a quotient of $\mathcal{O}_{U_j}^{\oplus r}$ for some $r_j \geq 0$. These are parametrized by subsheaves $\mathcal{K}_i \subset \mathcal{O}_{U_j}^{\oplus r_j}$ and glueing data

$$\varphi_{jj'} : \mathcal{O}_{U_j \cap U_{j'}}^{\oplus r_j} / (\mathcal{K}_j|_{U_j \cap U_{j'}}) \longrightarrow \mathcal{O}_{U_j \cap U_{j'}}^{\oplus r_{j'}} / (\mathcal{K}_{j'}|_{U_j \cap U_{j'}})$$

see Sheaves, Section 6.33. Note that the collection of all glueing data forms a set. The collection of all coverings $\mathcal{U} : X = \bigcup_{j \in J} U_j$ where $J \rightarrow \mathcal{P}(X)$, $j \mapsto U_j$ is injective forms a set as well. Hence the collection of all sheaves of \mathcal{O}_X -modules gotten from glueing quotients as above forms a set \mathcal{I} . By definition every finite type \mathcal{O}_X -module is isomorphic to an element of \mathcal{I} . Choosing an element out of each isomorphism class inside \mathcal{I} gives the desired set of sheaves (uses axiom of choice). □

17.10. Quasi-coherent modules

In this section we introduce an abstract notion of quasi-coherent \mathcal{O}_X -module. This notion is very useful in algebraic geometry, since quasi-coherent modules on a scheme have a good description on any affine open. However, we warn the reader that in the general setting of (locally) ringed spaces this notion is not well behaved at all. The category of quasi-coherent sheaves is not abelian in general, infinite direct sums of quasi-coherent sheaves aren't quasi-coherent, etc, etc.

Definition 17.10.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is a *quasi-coherent sheaf of \mathcal{O}_X -modules* if for every point

$x \in X$ there exists an open neighbourhood $x \in U \subset X$ such that $\mathcal{F}|_U$ is isomorphic to the cokernel of a map

$$\bigoplus_{j \in J} \mathcal{O}_U \longrightarrow \bigoplus_{i \in I} \mathcal{O}_U$$

The category of quasi-coherent \mathcal{O}_X -modules is denoted $QCoh(\mathcal{O}_X)$.

The definition means that X is covered by open sets U such that $\mathcal{F}|_U$ has a *pre-sentation* of the form

$$\bigoplus_{j \in J} \mathcal{O}_U \longrightarrow \bigoplus_{i \in I} \mathcal{O}_U \rightarrow \mathcal{F}|_U \rightarrow 0.$$

Here presentation signifies that the displayed sequence is exact. In other words

- (1) for every point x of X there exists an open neighbourhood such that $\mathcal{F}|_U$ is generated by global sections, and
- (2) for a suitable choice of these sections the kernel of the associated surjection is also generated by global sections.

Lemma 17.10.2. *Let (X, \mathcal{O}_X) be a ringed space. The direct sum of two quasi-coherent \mathcal{O}_X -modules is a quasi-coherent \mathcal{O}_X -module.*

Proof. Omitted. □

Remark 17.10.3. Warning: It is not true in general that an infinite direct sum of quasi-coherent \mathcal{O}_X -modules is quasi-coherent. For more esoteric behaviour of quasi-coherent modules see Example 17.10.9.

Lemma 17.10.4. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The pullback $f^*\mathcal{G}$ of a quasi-coherent \mathcal{O}_Y -module is quasi-coherent.*

Proof. Arguing as in the proof of Lemma 17.8.2 we may assume \mathcal{G} has a global presentation by direct sums of copies of \mathcal{O}_Y . We have seen that f^* commutes with all colimits, and is right exact, see Lemma 17.3.3. Thus if we have an exact sequence

$$\bigoplus_{j \in J} \mathcal{O}_Y \longrightarrow \bigoplus_{i \in I} \mathcal{O}_Y \rightarrow \mathcal{G} \rightarrow 0$$

then upon applying f^* we obtain the exact sequence

$$\bigoplus_{j \in J} \mathcal{O}_X \longrightarrow \bigoplus_{i \in I} \mathcal{O}_X \rightarrow f^*\mathcal{G} \rightarrow 0.$$

This implies the lemma. □

This gives plenty of examples of quasi-coherent sheaves.

Lemma 17.10.5. *Let (X, \mathcal{O}_X) be ringed space. Let $\alpha : R \rightarrow \Gamma(X, \mathcal{O}_X)$ be a ring homomorphism from a ring R into the ring of global sections on X . Let M be an R -module. The following three constructions give canonically isomorphic sheaves of \mathcal{O}_X -modules:*

- (1) Let $\pi : (X, \mathcal{O}_X) \rightarrow (\{*\}, R)$ be the morphism of ringed spaces with $\pi : X \rightarrow \{*\}$ the unique map and with π -map $\pi^\#$ the given map $\alpha : R \rightarrow \Gamma(X, \mathcal{O}_X)$. Set $\mathcal{F}_1 = \pi^*M$.
- (2) Choose a presentation $\bigoplus_{j \in J} R \rightarrow \bigoplus_{i \in I} R \rightarrow M \rightarrow 0$. Set

$$\mathcal{F}_2 = \text{Coker} \left(\bigoplus_{j \in J} \mathcal{O}_X \rightarrow \bigoplus_{i \in I} \mathcal{O}_X \right).$$

Here the map on the component \mathcal{O}_X corresponding to $j \in J$ given by the section $\sum_i \alpha(r_{ij})$ where the r_{ij} are the matrix coefficients of the map in the presentation of M .

- (3) Set \mathcal{F}_3 equal to the sheaf associated to the presheaf $U \mapsto \mathcal{O}_X(U) \otimes_R M$, where the map $R \rightarrow \mathcal{O}_X(U)$ is the composition of α and the restriction map $\mathcal{O}_X(X) \rightarrow \mathcal{O}_X(U)$.

This construction has the following properties:

- (1) The resulting sheaf of \mathcal{O}_X -modules $\mathcal{F}_M = \mathcal{F}_1 = \mathcal{F}_2 = \mathcal{F}_3$ is quasi-coherent.
- (2) The construction gives a functor from the category of R -modules to the category of quasi-coherent sheaves on X which commutes with arbitrary colimits.
- (3) For any $x \in X$ we have $\mathcal{F}_{M,x} = \mathcal{O}_{X,x} \otimes_R M$ functorial in M .
- (4) Given any \mathcal{O}_X -module \mathcal{G} we have

$$\text{Mor}_{\mathcal{O}_X}(\mathcal{F}_M, \mathcal{G}) = \text{Hom}_R(M, \Gamma(X, \mathcal{G}))$$

where the R -module structure on $\Gamma(X, \mathcal{G})$ comes from the $\Gamma(X, \mathcal{O}_X)$ -module structure via α .

Proof. The isomorphism between \mathcal{F}_1 and \mathcal{F}_3 comes from the fact that π^* is defined as the sheafification of the presheaf in (3), see Sheaves, Section 6.26. The isomorphism between the constructions in (2) and (1) comes from the fact that the functor π^* is right exact, so $\pi^*(\bigoplus_{j \in J} R) \rightarrow \pi^*(\bigoplus_{i \in I} R) \rightarrow \pi^*M \rightarrow 0$ is exact, π^* commutes with arbitrary direct sums, see Lemma 17.3.3, and finally the fact that $\pi^*(R) = \mathcal{O}_X$.

Assertion (1) is clear from construction (2). Assertion (2) is clear since π^* has these properties. Assertion (3) follows from the description of stalks of pullback sheaves, see Sheaves, Lemma 6.26.4. Assertion (4) follows from adjointness of π_* and π^* . □

Definition 17.10.6. In the situation of Lemma 17.10.5 we say \mathcal{F}_M is the sheaf associated to the module M and the ring map α . If $R = \Gamma(X, \mathcal{O}_X)$ and $\alpha = \text{id}_R$ we simply say \mathcal{F}_M is the sheaf associated to the module M .

Lemma 17.10.7. Let (X, \mathcal{O}_X) be ringed space. Set $R = \Gamma(X, \mathcal{O}_X)$. Let M be an R -module. Let \mathcal{F}_M be the quasi-coherent sheaf of \mathcal{O}_X -modules associated to M . If $g : (Y, \mathcal{O}_Y) \rightarrow (X, \mathcal{O}_X)$ is a morphism of ringed spaces, then $g^*\mathcal{F}_M$ is the sheaf associated to the $\Gamma(Y, \mathcal{O}_Y)$ -module $\Gamma(Y, \mathcal{O}_Y) \otimes_R M$.

Proof. The assertion follows from the first description of \mathcal{F}_M in Lemma 17.10.5 as π^*M , and the following commutative diagram of ringed spaces

$$\begin{array}{ccc} (Y, \mathcal{O}_Y) & \xrightarrow{\pi} & (\{*\}, \Gamma(Y, \mathcal{O}_Y)) \\ g \downarrow & & \downarrow \text{induced by } g^\# \\ (X, \mathcal{O}_X) & \xrightarrow{\pi} & (\{*\}, \Gamma(X, \mathcal{O}_X)) \end{array}$$

(Also use Sheaves, Lemma 6.26.3.) □

Lemma 17.10.8. Let (X, \mathcal{O}_X) be a ringed space. Let $x \in X$ be a point. Assume that x has a fundamental system of quasi-compact neighbourhoods. Consider any quasi-coherent \mathcal{O}_X -module \mathcal{F} . Then there exists an open neighbourhood U of x such

that $\mathcal{F}|_U$ is isomorphic to the sheaf of modules \mathcal{F}_M on (U, \mathcal{O}_U) associated to some $\Gamma(U, \mathcal{O}_U)$ -module M .

Proof. First we may replace X by an open neighbourhood of x and assume that \mathcal{F} is isomorphic to the cokernel of a map

$$\Psi : \bigoplus_{j \in J} \mathcal{O}_X \longrightarrow \bigoplus_{i \in I} \mathcal{O}_X.$$

The problem is that this map may not be given by a “matrix”, because the module of global sections of a direct sum is in general different from the direct sum of the modules of global sections.

Let $x \in E \subset X$ be a quasi-compact neighbourhood of x (note: E may not be open). Let $x \in U \subset E$ be an open neighbourhood of x contained in E . Next, we proceed as in the proof of Lemma 17.3.5. For each $j \in J$ denote $s_j \in \Gamma(X, \bigoplus_{i \in I} \mathcal{O}_X)$ the image of the section 1 in the summand \mathcal{O}_X corresponding to j . There exists a finite collection of opens U_{jk} , $k \in K_j$ such that $E \subset \bigcup_{k \in K_j} U_{jk}$ and such that each restriction $s_j|_{U_{jk}}$ is a finite sum $\sum_{i \in I_{jk}} f_{jki}$ with $I_{jk} \subset I$, and f_{jki} in the summand \mathcal{O}_X corresponding to $i \in I$. Set $I_j = \bigcup_{k \in K_j} I_{jk}$. This is a finite set. Since $U \subset E \subset \bigcup_{k \in K_j} U_{jk}$ the section $s_j|_U$ is a section of the finite direct sum $\bigoplus_{i \in I_j} \mathcal{O}_X$. By Lemma 17.3.2 we see that actually $s_j|_U$ is a sum $\sum_{i \in I_j} f_{ij}$ and $f_{ij} \in \mathcal{O}_X(U) = \Gamma(U, \mathcal{O}_U)$.

At this point we can define a module M as the cokernel of the map

$$\bigoplus_{j \in J} \Gamma(U, \mathcal{O}_U) \longrightarrow \bigoplus_{i \in I} \Gamma(U, \mathcal{O}_U)$$

with matrix given by the (f_{ij}) . By construction (2) of Lemma 17.10.5 we see that \mathcal{F}_M has the same presentation as $\mathcal{F}|_U$ and therefore $\mathcal{F}_M \cong \mathcal{F}|_U$. \square

Example 17.10.9. Let X be countably many copies L_1, L_2, L_3, \dots of the real line all glued together at 0; a fundamental system of neighbourhoods of 0 being the collection $\{U_n\}_{n \in \mathbf{N}}$, with $U_n \cap L_i = (-1/n, 1/n)$. Let \mathcal{O}_X be the sheaf of continuous real valued functions. Let $f : \mathbf{R} \rightarrow \mathbf{R}$ be a continuous function which is identically zero on $(-1, 1)$ and identically 1 on $(-\infty, -2) \cup (2, \infty)$. Denote f_n the continuous function on X which is equal to $x \mapsto f(nx)$ on each $L_j = \mathbf{R}$. Let 1_{L_j} be the characteristic function of L_j . We consider the map

$$\bigoplus_{j \in \mathbf{N}} \mathcal{O}_X \longrightarrow \bigoplus_{j, i \in \mathbf{N}} \mathcal{O}_X, \quad e_j \mapsto \sum_{i \in \mathbf{N}} f_j 1_{L_i} e_{ij}$$

with obvious notation. This makes sense because this sum is locally finite as f_j is zero in a neighbourhood of 0. Over U_n the image of e_j , for $j > 2n$ is not a finite linear combination $\sum g_{ij} e_{ij}$ with g_{ij} continuous. Thus there is no neighbourhood of $0 \in X$ such that the displayed map is given by a “matrix” as in the proof of Lemma 17.10.8 above.

Note that $\bigoplus_{j \in \mathbf{N}} \mathcal{O}_X$ is the sheaf associated to the free module with basis e_j and similarly for the other direct sum. Thus we see that a morphism of sheaves associated to modules in general even locally on X does not come from a morphism of modules. Similarly there should be an example of a ringed space X and a quasi-coherent \mathcal{O}_X -module \mathcal{F} such that \mathcal{F} is not locally of the form \mathcal{F}_M . (Please email if you find one.) Moreover, there should be examples of locally compact spaces X

and maps $\mathcal{F}_M \rightarrow \mathcal{F}_N$ which also do not locally come from maps of modules (the proof of Lemma 17.10.8 shows this cannot happen if N is free).

17.11. Modules of finite presentation

Definition 17.11.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is of *finite presentation* if for every point $x \in X$ there exists an open neighbourhood $x \in U \subset X$, and $n, m \in \mathbf{N}$ such that $\mathcal{F}|_U$ is isomorphic to the cokernel of a map

$$\bigoplus_{j=1, \dots, m} \mathcal{O}_U \longrightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_U$$

This means that X is covered by open sets U such that $\mathcal{F}|_U$ has a *presentation* of the form

$$\bigoplus_{j=1, \dots, m} \mathcal{O}_U \longrightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{F}|_U \rightarrow 0.$$

Here presentation signifies that the displayed sequence is exact. In other words

- (1) for every point x of X there exists an open neighbourhood such that $\mathcal{F}|_U$ is generated by finitely many global sections, and
- (2) for a suitable choice of these sections the kernel of the associated surjection is also generated by finitely many global sections.

Lemma 17.11.2. *Let (X, \mathcal{O}_X) be a ringed space. Any \mathcal{O}_X -module of finite presentation is quasi-coherent.*

Proof. Immediate from definitions. \square

Lemma 17.11.3. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a \mathcal{O}_X -module of finite presentation.*

- (1) *If $\psi : \mathcal{O}_X^{\oplus r} \rightarrow \mathcal{F}$ is a surjection, then $\text{Ker}(\psi)$ is of finite type.*
- (2) *If $\theta : \mathcal{G} \rightarrow \mathcal{F}$ is surjective with \mathcal{G} of finite type, then $\text{Ker}(\theta)$ is of finite type.*

Proof. Proof of (1). Let $x \in X$. Choose an open neighbourhood $U \subset X$ of x such that there exists a presentation

$$\mathcal{O}_U^{\oplus m} \xrightarrow{\chi} \mathcal{O}_U^{\oplus n} \xrightarrow{\varphi} \mathcal{F}|_U \rightarrow 0.$$

Let e_k be the section generating the k th factor of $\mathcal{O}_U^{\oplus r}$. For every $k = 1, \dots, r$ we can, after shrinking U to a small neighbourhood of x , lift $\psi(e_k)$ to a section \tilde{e}_k of $\mathcal{O}_U^{\oplus n}$ over U . This gives a morphism of sheaves $\alpha : \mathcal{O}_U^{\oplus r} \rightarrow \mathcal{O}_U^{\oplus n}$ such that $\varphi \circ \alpha = \psi$. Similarly, after shrinking U , we can find a morphism $\beta : \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{O}_U^{\oplus r}$ such that $\psi \circ \beta = \varphi$. Then the map

$$\mathcal{O}_U^{\oplus m} \oplus \mathcal{O}_U^{\oplus r} \xrightarrow{\beta \circ \chi, 1 - \beta \circ \alpha} \mathcal{O}_U^{\oplus r}$$

is a surjection onto the kernel of ψ .

To prove (2) we may locally choose a surjection $\eta : \mathcal{O}_X^{\oplus r} \rightarrow \mathcal{G}$. By part (1) we see $\text{Ker}(\theta \circ \eta)$ is of finite type. Since $\text{Ker}(\theta) = \eta(\text{Ker}(\theta \circ \eta))$ we win. \square

Lemma 17.11.4. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The pullback $f^*\mathcal{G}$ of a module of finite presentation is of finite presentation.*

Proof. Exactly the same as the proof of Lemma 17.10.4 but with finite index sets. \square

Lemma 17.11.5. *Let (X, \mathcal{O}_X) be a ringed space. Set $R = \Gamma(X, \mathcal{O}_X)$. Let M be an R -module. The \mathcal{O}_X -module \mathcal{F}_M associated to M is a directed colimit of finitely presented \mathcal{O}_X -modules.*

Proof. This follows immediately from Lemma 17.10.5 and the fact that any module is a directed colimit of finitely presented modules, see Algebra, Lemma 10.8.13. \square

Lemma 17.11.6. *Let X be a ringed space. Let I be a partially ordered set and let $(\mathcal{F}_i, \varphi_{ii'})$ be a system over I consisting of sheaves of \mathcal{O}_X -modules (see Categories, Section 4.21). Assume*

- (1) I is directed,
- (2) \mathcal{G} is an \mathcal{O}_X -module of finite presentation, and
- (3) X has a cofinal system of open coverings $\mathcal{U} : X = \bigcup_{j \in J} U_j$ with J finite and $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$.

Then we have

$$\operatorname{colim}_i \operatorname{Hom}_X(\mathcal{G}, \mathcal{F}_i) = \operatorname{Hom}_X(\mathcal{G}, \operatorname{colim}_i \mathcal{F}_i).$$

Proof. Let α be an element of the right hand side. For every point $x \in X$ we may choose an open neighbourhood $U \subset X$ and finitely many sections $s_j \in \mathcal{G}(U)$ which generate \mathcal{G} over U and finitely many relations $\sum f_{kj} s_j = 0$, $k = 1, \dots, n$ with $f_{kj} \in \mathcal{O}_X(U)$ which generate the kernel of $\bigoplus_{j=1, \dots, m} \mathcal{O}_U \rightarrow \mathcal{G}$. After possibly shrinking U to a smaller open neighbourhood of x we may assume there exists an index $i \in I$ such that the sections $\alpha(s_j)$ all come from sections $s'_j \in \mathcal{F}_i(U)$. After possibly shrinking U to a smaller open neighbourhood of x and increasing i we may assume the relations $\sum f_{kj} s'_j = 0$ hold in $\mathcal{F}_i(U)$. Hence we see that $\alpha|_U$ lifts to a morphism $\mathcal{G}|_U \rightarrow \mathcal{F}_i|_U$ for some index $i \in I$.

By condition (3) and the preceding arguments, we may choose a finite open covering $X = \bigcup_{j=1, \dots, m} U_j$ such that (a) $\mathcal{G}|_{U_j}$ is generated by finitely many sections $s_{jk} \in \mathcal{G}(U_j)$, (b) the restriction $\alpha|_{U_j}$ comes from a morphism $\alpha_j : \mathcal{G} \rightarrow \mathcal{F}_{i_j}$ for some $i_j \in I$, and (c) the intersections $U_j \cap U_{j'}$ are all quasi-compact. For every pair $(j, j') \in \{1, \dots, m\}^2$ and any k we can find we can find an index $i \geq \max(i_j, i_{j'})$ such that

$$\varphi_{i_j i}(\alpha_j(s_{jk}|_{U_j \cap U_{j'}})) = \varphi_{i_{j'} i}(\alpha_{j'}(s_{jk}|_{U_j \cap U_{j'}}))$$

see Sheaves, Lemma 6.29.1 (2). Since there are finitely many of these pairs (j, j') and finitely many s_{jk} we see that we can find a single i which works for all of them. For this index i all of the maps $\varphi_{i_j i} \circ \alpha_j$ agree on the overlaps $U_j \cap U_{j'}$ as the sections s_{jk} generate \mathcal{G} over this overlap. Hence we get a morphism $\mathcal{G} \rightarrow \mathcal{F}_i$ as desired. \square

Remark 17.11.7. In the lemma above some condition beyond the condition that X is quasi-compact is necessary. See Sheaves, Example 6.29.2.

17.12. Coherent modules

The category of coherent sheaves on a ringed space X is a more reasonable object than the category of quasi-coherent sheaves, in the sense that it is at least an abelian subcategory of $\operatorname{Mod}(\mathcal{O}_X)$ no matter what X is. On the other hand, the pullback of a coherent module is “almost never” coherent in the general setting of ringed spaces.

Definition 17.12.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. We say that \mathcal{F} is a *coherent \mathcal{O}_X -module* if the following two conditions hold:

- (1) \mathcal{F} is of finite type, and
- (2) for every open $U \subset X$ and every finite collection $s_i \in \mathcal{F}(U)$, $i = 1, \dots, n$ the kernel of the associated map $\bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{F}|_U$ is of finite type.

The category of coherent \mathcal{O}_X -modules is denoted $\text{Coh}(\mathcal{O}_X)$.

Lemma 17.12.2. *Let (X, \mathcal{O}_X) be a ringed space. Any coherent \mathcal{O}_X -module is of finite presentation and hence quasi-coherent.*

Proof. Let \mathcal{F} be a coherent sheaf on X . Pick a point $x \in X$. By (1) of the definition of coherent, we may find an open neighbourhood U and sections s_i , $i = 1, \dots, n$ of \mathcal{F} over U such that $\Psi : \bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{F}$ is surjective. By (2) of the definition of coherent, we may find an open neighbourhood V , $x \in V \subset U$ and sections t_1, \dots, t_m of $\bigoplus_{i=1, \dots, n} \mathcal{O}_V$ which generate the kernel of $\Psi|_V$. Then over V we get the presentation

$$\bigoplus_{j=1, \dots, m} \mathcal{O}_V \longrightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_V \rightarrow \mathcal{F}|_V \rightarrow 0$$

as desired. □

Example 17.12.3. Suppose that X is a point. In this case the definition above gives a notion for modules over rings. What does the definition of coherent mean? It is closely related to the notion of Noetherian, but it is not the same: Namely, the ring $R = \mathbf{C}[x_1, x_2, x_3, \dots]$ is coherent as a module over itself but not Noetherian as a module over itself. See Algebra, Section 10.87 for more discussion.

Lemma 17.12.4. *Let (X, \mathcal{O}_X) be a ringed space.*

- (1) *Any finite type subsheaf of a coherent sheaf is coherent.*
- (2) *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism from a finite type sheaf \mathcal{F} to a coherent sheaf \mathcal{G} . Then $\text{Ker}(\varphi)$ is finite type.*
- (3) *Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of coherent \mathcal{O}_X -modules. Then $\text{Ker}(\varphi)$ and $\text{Coker}(\varphi)$ are coherent.*
- (4) *Given a short exact sequence of \mathcal{O}_X -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ if two out of three are coherent so is the third.*
- (5) *The category $\text{Coh}(\mathcal{O}_X)$ is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_X)$. In particular, the category of coherent modules is abelian and the inclusion functor $\text{Coh}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_X)$ is exact.*

Proof. Condition (2) of Definition 17.12.1 holds for any subsheaf of a coherent sheaf. Thus we get (1).

Assume the hypotheses of (2). Let us show that $\text{Ker}(\varphi)$ is of finite type. Pick $x \in X$. Choose an open neighbourhood U of x in X such that $\mathcal{F}|_U$ is generated by s_1, \dots, s_n . By Definition 17.12.1 the kernel \mathcal{K} of the induced map $\bigoplus_{i=1}^n \mathcal{O}_U \rightarrow \mathcal{G}$, $e_i \mapsto \varphi(s_i)$ is of finite type. Hence $\text{Ker}(\varphi)$ which is the image of the composition $\mathcal{K} \rightarrow \bigoplus_{i=1}^n \mathcal{O}_U \rightarrow \mathcal{F}$ is of finite type.

Assume the hypotheses of (3). By (2) the kernel of φ is of finite type and hence by (1) it is coherent.

With the same hypotheses let us show that $\text{Coker}(\varphi)$ is coherent. Since \mathcal{G} is of finite type so is $\text{Coker}(\varphi)$. Let $U \subset X$ be open and let $\bar{s}_i \in \text{Coker}(\varphi)(U)$, $i =$

$1, \dots, n$ be sections. We have to show that the kernel of the associated morphism $\bar{\Psi} : \bigoplus_{i=1}^n \mathcal{O}_U \rightarrow \text{Coker}(\varphi)$ has finite type. There exists an open covering of U such that on each open all the sections \bar{s}_i lift to sections s_i of \mathcal{G} . Hence we may assume this is the case over U . Thus $\bar{\Psi}$ lifts to $\Psi : \bigoplus_{i=1}^n \mathcal{O}_U \rightarrow \mathcal{G}$. Consider the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(\Psi) & \longrightarrow & \bigoplus_{i=1}^n \mathcal{O}_U & \longrightarrow & \mathcal{G} \longrightarrow 0 \\ & & \downarrow & & \parallel & & \downarrow \\ 0 & \longrightarrow & \text{Ker}(\bar{\Psi}) & \longrightarrow & \bigoplus_{i=1}^n \mathcal{O}_U & \longrightarrow & \text{Coker}(\varphi) \longrightarrow 0 \end{array}$$

By the snake lemma we get a short exact sequence $0 \rightarrow \text{Ker}(\Psi) \rightarrow \text{Ker}(\bar{\Psi}) \rightarrow \text{Im}(\varphi) \rightarrow 0$. Hence by Lemma 17.9.3 we see that $\text{Ker}(\bar{\Psi})$ has finite type.

Proof of part (4). Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of \mathcal{O}_X -modules. By part (3) it suffices to prove that if \mathcal{F}_1 and \mathcal{F}_3 are coherent so is \mathcal{F}_2 . By Lemma 17.9.3 we see that \mathcal{F}_2 has finite type. Let s_1, \dots, s_n be finitely many local sections of \mathcal{F}_2 defined over a common open U of X . We have to show that the module of relations \mathcal{K} between them is of finite type. Consider the following commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & 0 & \longrightarrow & \bigoplus_{i=1}^n \mathcal{O}_U & \longrightarrow & \bigoplus_{i=1}^n \mathcal{O}_U \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{F}_1 & \longrightarrow & \mathcal{F}_2 & \longrightarrow & \mathcal{F}_3 \longrightarrow 0 \end{array}$$

with obvious notation. By the snake lemma we get a short exact sequence $0 \rightarrow \mathcal{K} \rightarrow \mathcal{K}_3 \rightarrow \mathcal{F}_1$ where \mathcal{K}_3 is the module of relations among the images of the sections s_i in \mathcal{F}_3 . Since \mathcal{F}_3 is coherent we see that \mathcal{K}_3 is finite type. Since \mathcal{F}_1 is coherent we see that the image \mathcal{I} of $\mathcal{K}_3 \rightarrow \mathcal{F}_1$ is coherent. Hence \mathcal{K} is the kernel of the map $\mathcal{K}_3 \rightarrow \mathcal{I}$ between a finite type sheaf and a coherent sheaves and hence finite type by (2).

Proof of (5). This follows because (3) and (4) show that Homology, Lemma 12.9.3 applies. \square

Lemma 17.12.5. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module. Assume \mathcal{O}_X is a coherent \mathcal{O}_X -module. Then \mathcal{F} is coherent if and only if it is of finite presentation.*

Proof. Omitted. \square

Lemma 17.12.6. *Let X be a ringed space. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of \mathcal{O}_X -modules. Let $x \in X$. Assume \mathcal{G} of finite type, \mathcal{F} coherent and the map on stalks $\varphi_x : \mathcal{G}_x \rightarrow \mathcal{F}_x$ injective. Then there exists an open neighbourhood $x \in U \subset X$ such that $\varphi|_U$ is injective.*

Proof. Denote $\mathcal{K} \subset \mathcal{G}$ the kernel of φ . By Lemma 17.12.4 we see that \mathcal{K} is a finite type \mathcal{O}_X -module. Our assumption is that $\mathcal{K}_x = 0$. By Lemma 17.9.5 there exists an open neighbourhood U of x such that $\mathcal{K}|_U = 0$. Then U works. \square

17.13. Closed immersions of ringed spaces

When do we declare a morphism of ringed spaces $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ to be a closed immersion?

Motivated by the example of a closed immersion of normal topological spaces (ringed with the sheaf of continuous functions), or differential manifolds (ringed with the sheaf of differentiable functions), it seems natural to assume at least:

- (1) The map i is a closed immersion of topological spaces.
- (2) The associated map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective. Denote the kernel by \mathcal{I} .

Already these conditions imply a number of pleasing results: For example we prove that the category of \mathcal{O}_Z -modules is equivalent to the category of \mathcal{O}_X -modules annihilated by \mathcal{I} generalizing the result on abelian sheaves of Section 17.6

However, in the Stacks project we choose the definition that guarantees that if i is a closed immersion and (X, \mathcal{O}_X) is a scheme, then also (Z, \mathcal{O}_Z) is a scheme. Moreover, in this situation we want i_* and i^* to provide an equivalence between the category of quasi-coherent \mathcal{O}_Z -modules and the category of quasi-coherent \mathcal{O}_X -modules annihilated by \mathcal{I} . A minimal condition is that $i_*\mathcal{O}_Z$ is a quasi-coherent sheaf of \mathcal{O}_X -modules. A good way to guarantee that $i_*\mathcal{O}_Z$ is a quasi-coherent \mathcal{O}_X -module is to assume that \mathcal{I} is locally generated by sections. We can interpret this condition as saying “ (Z, \mathcal{O}_Z) is locally on (X, \mathcal{O}_X) defined by setting some regular functions f_i , i.e., local sections of \mathcal{O}_X , equal to zero”. This leads to the following definition.

Definition 17.13.1. A *closed immersion of ringed spaces*² is a morphism $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ with the following properties:

- (1) The map i is a closed immersion of topological spaces.
- (2) The associated map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective. Denote the kernel by \mathcal{I} .
- (3) The \mathcal{O}_X -module \mathcal{I} is locally generated by sections.

Actually, this definition still does not guarantee that i_* of a quasi-coherent \mathcal{O}_Z -module is a quasi-coherent \mathcal{O}_X -module. The problem is that it is not clear how to convert a local presentation of a quasi-coherent \mathcal{O}_Z -module into a local presentation for the pushforward. However, the following is trivial.

Lemma 17.13.2. *Let $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ be a closed immersion of locally ringed spaces. Let \mathcal{F} be a quasi-coherent \mathcal{O}_Z -module. Then $i_*\mathcal{F}$ is locally on X the cokernel of a map of quasi-coherent \mathcal{O}_X -modules.*

Proof. This is true because $i_*\mathcal{O}_Z$ is quasi-coherent by definition. And locally on Z the sheaf \mathcal{F} is a cokernel of a map between direct sums of copies of \mathcal{O}_Z . Moreover, any direct sum of copies of the *the same* quasi-coherent sheaf is quasi-coherent. And finally, i_* commutes with arbitrary colimits, see Lemma 17.6.3. Some details omitted. \square

Lemma 17.13.3. *Let $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ be a morphism of ringed spaces. Assume i is a homeomorphism onto a closed subset of X and that $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective. Let \mathcal{F} be an \mathcal{O}_Z -module. Then $i_*\mathcal{F}$ is of finite type if and only if \mathcal{F} is of finite type.*

²This is nonstandard notation; see discussion above.

Proof. Suppose that \mathcal{F} is of finite type. Pick $x \in X$. If $x \notin Z$, then $i_*\mathcal{F}$ is zero in a neighbourhood of x and hence finitely generated in a neighbourhood of x . If $x = i(z)$, then choose an open neighbourhood $z \in V \subset Z$ and sections $s_1, \dots, s_n \in \mathcal{F}(V)$ which generate \mathcal{F} over V . Write $V = Z \cap U$ for some open $U \subset X$. Note that U is a neighbourhood of x . Clearly the sections s_i give sections s_i of $i_*\mathcal{F}$ over U . The resulting map

$$\bigoplus_{i=1, \dots, n} \mathcal{O}_U \longrightarrow i_*\mathcal{F}|_U$$

is surjective by inspection of what it does on stalks (here we use that $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective). Hence $i_*\mathcal{F}$ is of finite type.

Conversely, suppose that $i_*\mathcal{F}$ is of finite type. Choose $z \in Z$. Set $x = i(z)$. By assumption there exists an open neighbourhood $U \subset X$ of x , and sections $s_1, \dots, s_n \in (i_*\mathcal{F})(U)$ which generate $i_*\mathcal{F}$ over U . Set $V = Z \cap U$. By definition of i_* the sections s_i correspond to sections s_i of \mathcal{F} over V . The resulting map

$$\bigoplus_{i=1, \dots, n} \mathcal{O}_V \longrightarrow \mathcal{F}|_V$$

is surjective by inspection of what it does on stalks. Hence \mathcal{F} is of finite type. \square

Lemma 17.13.4. *Let $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ be a morphism of ringed spaces. Assume i is a homeomorphism onto a closed subset of X and $i^\sharp : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective. Denote $\mathcal{I} \subset \mathcal{O}_X$ the kernel of i^\sharp . The functor*

$$i_* : \text{Mod}(\mathcal{O}_Z) \longrightarrow \text{Mod}(\mathcal{O}_X)$$

is exact, fully faithful, with essential image those \mathcal{O}_X -modules \mathcal{G} such that $\mathcal{I}\mathcal{G} = 0$.

Proof. We claim that for a \mathcal{O}_Z -module \mathcal{F} the canonical map

$$i^*i_*\mathcal{F} \longrightarrow \mathcal{F}$$

is an isomorphism. We check this on stalks. Say $z \in Z$ and $x = i(z)$. We have

$$(i^*i_*\mathcal{F})_z = (i_*\mathcal{F})_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{Z,z} = \mathcal{F}_z \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{Z,z} = \mathcal{F}_z$$

by Sheaves, Lemma 6.26.4, the fact that $\mathcal{O}_{Z,z}$ is a quotient of $\mathcal{O}_{X,x}$, and Sheaves, Lemma 6.32.1. It follows that i_* is fully faithful.

Let \mathcal{G} be a \mathcal{O}_X -module with $\mathcal{I}\mathcal{G} = 0$. If $x \in X$, $x \notin i(Z)$, then $\mathcal{G}_x = 0$ because $\mathcal{I}_x = \mathcal{O}_{X,x}$ in this case. Thus we see that \mathcal{G} is supported on Z . By Lemma 17.6.1 we can write $\mathcal{G} = i_*\mathcal{F}$ for a unique abelian sheaf \mathcal{F} on Z . Let $W \subset Z$ be open, $f \in \mathcal{O}_Z(W)$ and $s \in \mathcal{F}(W)$. We define $fs \in \mathcal{F}(W)$. Since i^\sharp is surjective we can find opens $U_j \subset X$ such that $W = \bigcup i^{-1}(U_j)$ and $f|_{i^{-1}(U_j)}$ is the image of $f_j \in \mathcal{O}_X(U_j)$. Note that $s|_{i^{-1}(U_j)}$ is an element of $\mathcal{F}(i^{-1}(U_j)) = \mathcal{G}(U_j)$. Thus we can form $s_j = f_j s \in \mathcal{F}(i^{-1}(U_j)) = \mathcal{G}(U_j)$. By our assumption that $\mathcal{I}\mathcal{G} = 0$ the sections s_j are independent of the choice of f_j lifting $f|_{i^{-1}(U_j)}$ and glue to a section fs of \mathcal{F} over W . In this way \mathcal{F} becomes an \mathcal{O}_Z -module such that $\mathcal{G} \cong i_*\mathcal{F}$. \square

17.14. Locally free sheaves

Let (X, \mathcal{O}_X) be a ringed space. Our conventions allow (some of) the stalks $\mathcal{O}_{X,x}$ to be the zero ring. This means we have to be a little careful when defining the rank of a locally free sheaf.

Definition 17.14.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.

- (1) We say \mathcal{F} is *locally free* if for every point $x \in X$ there exists a set I and an open neighbourhood $x \in U \subset X$ such that $\mathcal{F}|_U$ is isomorphic to $\bigoplus_{i \in I} \mathcal{O}_X|_U$ as an $\mathcal{O}_X|_U$ -module.
- (2) We say \mathcal{F} is *finite locally free* if we may choose the index sets I to be finite.
- (3) We say \mathcal{F} is *finite locally free of rank r* if we may choose the index sets I to have cardinality r .

A finite direct sum of (finite) locally free sheaves is (finite) locally free. However, it may not be the case that an infinite direct sum of locally free sheaves is locally free.

Lemma 17.14.2. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. If \mathcal{F} is locally free then it is quasi-coherent.*

Proof. Omitted. □

Lemma 17.14.3. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. If \mathcal{G} is a locally free \mathcal{O}_Y -module, then $f^*\mathcal{G}$ is a locally free \mathcal{O}_X -module.*

Proof. Omitted. □

Lemma 17.14.4. *Let (X, \mathcal{O}_X) be a ringed space. Suppose that the support of \mathcal{O}_X is X , i.e., all stalk of \mathcal{O}_X are nonzero rings. Let \mathcal{F} be a locally free sheaf of \mathcal{O}_X -modules. There exists a locally constant function*

$$\text{rank}_{\mathcal{F}} : X \longrightarrow \{0, 1, 2, \dots\} \cup \{\infty\}$$

such that for any point $x \in X$ the cardinality of any set I such that \mathcal{F} is isomorphic to $\bigoplus_{i \in I} \mathcal{O}_X$ in a neighbourhood of x is $\text{rank}_{\mathcal{F}}(x)$.

Proof. Under the assumption of the lemma the cardinality of I can be read off from the rank of the free module \mathcal{F}_x over the nonzero ring $\mathcal{O}_{X,x}$, and it is constant in a neighbourhood of x . □

Lemma 17.14.5. *Let (X, \mathcal{O}_X) be a ringed space. Let $r \geq 0$. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of finite locally free \mathcal{O}_X -modules of rank r . Then φ is an isomorphism if and only if φ is surjective.*

Proof. Assume φ is surjective. Pick $x \in X$. There exists an open neighbourhood U of x such that both $\mathcal{F}|_U$ and $\mathcal{G}|_U$ are isomorphic to $\mathcal{O}_U^{\oplus r}$. Pick lifts of the free generators of $\mathcal{G}|_U$ to obtain a map $\psi : \mathcal{G}|_U \rightarrow \mathcal{F}|_U$ such that $\varphi|_U \circ \psi = \text{id}$. Hence we conclude that the map $\Gamma(U, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{G})$ induced by φ is surjective. Since both $\Gamma(U, \mathcal{F})$ and $\Gamma(U, \mathcal{G})$ are isomorphic to $\Gamma(U, \mathcal{O}_U)^{\oplus r}$ as an $\Gamma(U, \mathcal{O}_U)$ -module we may apply Algebra, Lemma 10.15.4 to see that $\Gamma(U, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{G})$ is injective. This finishes the proof. □

17.15. Tensor product

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. We have briefly discussed the tensor product in the setting of change of rings in Sheaves, Sections 6.6 and 6.20. In exactly the same way we define first the *tensor product presheaf*

$$\mathcal{F} \otimes_{p, \mathcal{O}_X} \mathcal{G}$$

as the rule which assigns to $U \subset X$ open the $\mathcal{O}_X(U)$ -module $\mathcal{F}(U) \otimes_{\mathcal{O}_X(U)} \mathcal{G}(U)$. Having defined this we define the *tensor product sheaf* as the sheafification of the above:

$$\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} = (\mathcal{F} \otimes_{p, \mathcal{O}_X} \mathcal{G})^\#$$

This can be characterized as the sheaf of \mathcal{O}_X -modules such that for any third sheaf of \mathcal{O}_X -modules \mathcal{H} we have

$$\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}, \mathcal{H}) = \mathrm{Bilin}_{\mathcal{O}_X}(\mathcal{F} \times \mathcal{G}, \mathcal{H}).$$

Here the right hand side indicates the set of bilinear maps of sheaves of \mathcal{O}_X -modules (definition omitted).

The tensor product of modules M, N over a ring R satisfies symmetry, namely $M \otimes_R N = N \otimes_R M$, hence the same holds for tensor products of sheaves of modules, i.e., we have

$$\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} = \mathcal{G} \otimes_{\mathcal{O}_X} \mathcal{F}$$

functorial in \mathcal{F}, \mathcal{G} . And since tensor product of modules satisfies associativity we also get canonical functorial isomorphisms

$$(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}) \otimes_{\mathcal{O}_X} \mathcal{H} = \mathcal{F} \otimes_{\mathcal{O}_X} (\mathcal{G} \otimes_{\mathcal{O}_X} \mathcal{H})$$

functorial in \mathcal{F}, \mathcal{G} , and \mathcal{H} .

Lemma 17.15.1. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. Let $x \in X$. There is a canonical isomorphism of $\mathcal{O}_{X,x}$ -modules*

$$(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G})_x = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{G}_x$$

functorial in \mathcal{F} and \mathcal{G} .

Proof. Omitted. □

Lemma 17.15.2. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{F}', \mathcal{G}'$ be presheaves of \mathcal{O}_X -modules with sheafifications \mathcal{F}, \mathcal{G} . Then $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} = (\mathcal{F}' \otimes_{p, \mathcal{O}_X} \mathcal{G}')^\#$.*

Proof. Omitted. □

Lemma 17.15.3. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{G} be an \mathcal{O}_X -module. If $\mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ is an exact sequence of \mathcal{O}_X -modules then the induced sequence*

$$\mathcal{F}_1 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F}_2 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F}_3 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow 0$$

is exact.

Proof. This follows from the fact that exactness may be checked at stalks (Lemma 17.3.1), the description of stalks (Lemma 17.15.1) and the corresponding result for tensor products of modules (Algebra, Lemma 10.11.10). □

Lemma 17.15.4. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_Y -modules. Then $f^*(\mathcal{F} \otimes_{\mathcal{O}_Y} \mathcal{G}) = f^*\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}$ functorially in \mathcal{F}, \mathcal{G} .*

Proof. Omitted. □

Lemma 17.15.5. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules.*

- (1) *If \mathcal{F}, \mathcal{G} are locally generated by sections, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.*
- (2) *If \mathcal{F}, \mathcal{G} are of finite type, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.*
- (3) *If \mathcal{F}, \mathcal{G} are quasi-coherent, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.*
- (4) *If \mathcal{F}, \mathcal{G} are of finite presentation, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.*

- (5) If \mathcal{F} is of finite presentation and \mathcal{G} is coherent, then $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ is coherent.
- (6) If \mathcal{F}, \mathcal{G} are coherent, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.
- (7) If \mathcal{F}, \mathcal{G} are locally free, so is $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$.

Proof. We first prove that the tensor product of locally free \mathcal{O}_X -modules is locally free. This follows if we show that $(\bigoplus_{i \in I} \mathcal{O}_X) \otimes_{\mathcal{O}_X} (\bigoplus_{j \in J} \mathcal{O}_X) \cong \bigoplus_{(i,j) \in I \times J} \mathcal{O}_X$. The sheaf $\bigoplus_{i \in I} \mathcal{O}_X$ is the sheaf associated to the presheaf $U \mapsto \bigoplus_{i \in I} \mathcal{O}_X(U)$. Hence the tensor product is the sheaf associated to the presheaf

$$U \mapsto \left(\bigoplus_{i \in I} \mathcal{O}_X(U) \right) \otimes_{\mathcal{O}_X(U)} \left(\bigoplus_{j \in J} \mathcal{O}_X(U) \right).$$

We deduce what we want since for any ring R we have $(\bigoplus_{i \in I} R) \otimes_R (\bigoplus_{j \in J} R) = \bigoplus_{(i,j) \in I \times J} R$.

If $\mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow 0$ is exact, then by Lemma 17.15.3 the complex $\mathcal{F}_2 \otimes \mathcal{G} \rightarrow \mathcal{F}_1 \otimes \mathcal{G} \rightarrow \mathcal{F} \otimes \mathcal{G} \rightarrow 0$ is exact. Using this we can prove (5). Namely, in this case there exists locally such an exact sequence with $\mathcal{F}_i, i = 1, 2$ finite free. Hence the two terms $\mathcal{F}_2 \otimes \mathcal{G}$ are isomorphic to finite direct sums of \mathcal{G} . Since finite direct sums are coherent sheaves, these are coherent and so is the cokernel of the map, see Lemma 17.12.4.

And if also $\mathcal{G}_2 \rightarrow \mathcal{G}_1 \rightarrow \mathcal{G} \rightarrow 0$ is exact, then we see that

$$\mathcal{F}_2 \otimes_{\mathcal{O}_X} \mathcal{G}_1 \oplus \mathcal{F}_1 \otimes_{\mathcal{O}_X} \mathcal{G}_2 \rightarrow \mathcal{F}_1 \otimes_{\mathcal{O}_X} \mathcal{G}_1 \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow 0$$

is exact. Using this we can for example prove (3). Namely, the assumption means that we can locally find presentations as above with \mathcal{F}_i and \mathcal{G}_i free \mathcal{O}_X -modules. Hence the displayed presentation is a presentation of the tensor product by free sheaves as well.

The proof of the other statements is omitted. □

Lemma 17.15.6. *Let (X, \mathcal{O}_X) be a ringed space. For any \mathcal{O}_X -module \mathcal{F} the functor*

$$Mod(\mathcal{O}_X) \longrightarrow Mod(\mathcal{O}_X), \quad \mathcal{G} \longmapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$$

commutes with arbitrary colimits.

Proof. Let I be a partially ordered set and let $\{\mathcal{G}_i\}$ be a system over I . Set $\mathcal{G} = \text{colim}_i \mathcal{G}_i$. Recall that \mathcal{G} is the sheaf associated to the presheaf $\mathcal{G}' : U \mapsto \text{colim}_i \mathcal{G}_i(U)$, see Sheaves, Section 6.29. By Lemma 17.15.2 the tensor product $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ is the sheafification of the presheaf

$$U \mapsto \mathcal{F}(U) \otimes_{\mathcal{O}_X(U)} \text{colim}_i \mathcal{G}_i(U) = \text{colim}_i \mathcal{F}(U) \otimes_{\mathcal{O}_X(U)} \mathcal{G}_i(U)$$

where the equality sign is Algebra, Lemma 10.11.9. Hence the lemma follows from the description of colimits in $Mod(\mathcal{O}_X)$. □

17.16. Flat modules

We can define flat modules exactly as in the case of modules over rings.

Definition 17.16.1. Let (X, \mathcal{O}_X) be a ringed space. An \mathcal{O}_X -module \mathcal{F} is *flat* if the functor

$$Mod(\mathcal{O}_X) \longrightarrow Mod(\mathcal{O}_X), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}$$

is exact.

We can characterize flatness by looking at the stalks.

Lemma 17.16.2. *Let (X, \mathcal{O}_X) be a ringed space. An \mathcal{O}_X -module \mathcal{F} is flat if and only if the stalk \mathcal{F}_x is a flat $\mathcal{O}_{X,x}$ -module for all $x \in X$.*

Proof. Assume \mathcal{F}_x is a flat $\mathcal{O}_{X,x}$ -module for all $x \in X$. In this case, if $\mathcal{G} \rightarrow \mathcal{H} \rightarrow \mathcal{K}$ is exact, then also $\mathcal{G} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{H} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{K} \otimes_{\mathcal{O}_X} \mathcal{F}$ is exact because we can check exactness at stalks and because tensor product commutes with taking stalks, see Lemma 17.15.1. Conversely, suppose that \mathcal{F} is flat, and let $x \in X$. Consider the skyscraper sheaves $i_{x,*}M$ where M is a $\mathcal{O}_{X,x}$ -module. Note that

$$M \otimes_{\mathcal{O}_{X,x}} \mathcal{F}_x = (i_{x,*}M \otimes_{\mathcal{O}_X} \mathcal{F})_x$$

again by Lemma 17.15.1. Since $i_{x,*}$ is exact, we see that the fact that \mathcal{F} is flat implies that $M \mapsto M \otimes_{\mathcal{O}_{X,x}} \mathcal{F}_x$ is exact. Hence \mathcal{F}_x is a flat $\mathcal{O}_{X,x}$ -module. \square

Thus the following definition makes sense.

Definition 17.16.3. Let (X, \mathcal{O}_X) be a ringed space. Let $x \in X$. An \mathcal{O}_X -module \mathcal{F} is *flat at x* if \mathcal{F}_x is a flat $\mathcal{O}_{X,x}$ -module.

Hence we see that \mathcal{F} is a flat \mathcal{O}_X -module if and only if it is flat at every point.

Lemma 17.16.4. *Let (X, \mathcal{O}_X) be a ringed space. A filtered colimit of flat \mathcal{O}_X -modules is flat. A direct sum of flat \mathcal{O}_X -modules is flat.*

Proof. This follows from Lemma 17.15.6, Lemma 17.15.1, Algebra, Lemma 10.8.9, and the fact that we can check exactness at stalks. \square

Lemma 17.16.5. *Let (X, \mathcal{O}_X) be a ringed space. Let $U \subset X$ be open. The sheaf $j_{U!}\mathcal{O}_U$ is a flat sheaf of \mathcal{O}_X -modules.*

Proof. The stalks of $j_{U!}\mathcal{O}_U$ are either zero or equal to $\mathcal{O}_{X,x}$. Apply Lemma 17.16.2. \square

Lemma 17.16.6. *Let (X, \mathcal{O}_X) be a ringed space.*

- (1) *Any sheaf of \mathcal{O}_X -modules is a quotient of a direct sum $\bigoplus j_{U_i!}\mathcal{O}_{U_i}$.*
- (2) *Any \mathcal{O}_X -module is a quotient of a flat \mathcal{O}_X -module.*

Proof. Let \mathcal{F} be an \mathcal{O}_X -module. For every open $U \subset X$ and every $s \in \mathcal{F}(U)$ we get a morphism $j_{U!}\mathcal{O}_U \rightarrow \mathcal{F}$, namely the adjoint to the morphism $\mathcal{O}_U \rightarrow \mathcal{F}|_U$, $1 \mapsto s$. Clearly the map

$$\bigoplus_{(U,s)} j_{U!}\mathcal{O}_U \longrightarrow \mathcal{F}$$

is surjective, and the source is flat by combining Lemmas 17.16.4 and 17.16.5. \square

Lemma 17.16.7. *Let (X, \mathcal{O}_X) be a ringed space. Let*

$$0 \rightarrow \mathcal{F}'' \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

be a short exact sequence of \mathcal{O}_X -modules. Assume \mathcal{F} is flat. Then for any \mathcal{O}_X -module \mathcal{G} the sequence

$$0 \rightarrow \mathcal{F}'' \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow 0$$

is exact.

Proof. Using that \mathcal{F}_x is a flat $\mathcal{O}_{X,x}$ -module for every $x \in X$ and that exactness can be checked on stalks, this follows from Algebra, Lemma 10.38.11. \square

Lemma 17.16.8. *Let (X, \mathcal{O}_X) be a ringed space. Let*

$$0 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_0 \rightarrow 0$$

be a short exact sequence of \mathcal{O}_X -modules.

- (1) *If \mathcal{F}_2 and \mathcal{F}_0 are flat so is \mathcal{F}_1 .*
- (2) *If \mathcal{F}_1 and \mathcal{F}_0 are flat so is \mathcal{F}_2 .*

Proof. Since exactness and flatness may be checked at the level of stalks this follows from Algebra, Lemma 10.38.12. \square

Lemma 17.16.9. *Let (X, \mathcal{O}_X) be a ringed space. Let*

$$\dots \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_0 \rightarrow \mathcal{Q} \rightarrow 0$$

be an exact complex of \mathcal{O}_X -modules. If \mathcal{Q} and all \mathcal{F}_i are flat \mathcal{O}_X -modules, then for any \mathcal{O}_X -module \mathcal{G} the complex

$$\dots \rightarrow \mathcal{F}_2 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F}_1 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F}_0 \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{Q} \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow 0$$

is exact also.

Proof. Follows from Lemma 17.16.7 by splitting the complex into short exact sequences and using Lemma 17.16.8 to prove inductively that $\text{Im}(\mathcal{F}_{i+1} \rightarrow \mathcal{F}_i)$ is flat. \square

The following lemma gives one direction of the equational criterion of flatness (Algebra, Lemma 10.38.10).

Lemma 17.16.10. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a flat \mathcal{O}_X -module. Let $U \subset X$ be open and let*

$$\mathcal{O}_U \xrightarrow{(f_1, \dots, f_n)} \mathcal{O}_U^{\oplus n} \xrightarrow{(s_1, \dots, s_n)} \mathcal{F}|_U$$

be a complex of \mathcal{O}_U -modules. For every $x \in U$ there exists an open neighbourhood $V \subset U$ of x and a factorization

$$\mathcal{O}_V^{\oplus n} \xrightarrow{A} \mathcal{O}_V^{\oplus m} \xrightarrow{(t_1, \dots, t_m)} \mathcal{F}|_V$$

of $(s_1, \dots, s_n)|_V$ such that $A \circ (f_1, \dots, f_n)|_V = 0$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals generated by f_1, \dots, f_n . Then $\sum f_i \otimes s_i$ is a section of $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U$ which maps to zero in $\mathcal{F}|_U$. As $\mathcal{F}|_U$ is flat the map $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U \rightarrow \mathcal{F}|_U$ is injective. Since $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U$ is the sheaf associated to the presheaf tensor product, we see there exists an open neighbourhood $V \subset U$ of x such that $\sum f_i|_V \otimes s_i|_V$ is zero in $\mathcal{I}(V) \otimes_{\mathcal{O}(V)} \mathcal{F}(V)$. Unwinding the definitions using Algebra, Lemma 10.103.10 we find $t_1, \dots, t_m \in \mathcal{F}(V)$ and $a_{ij} \in \mathcal{O}(V)$ such that $\sum a_{ij} f_i|_V = 0$ and $s_i|_V = \sum a_{ij} t_j$. \square

Lemma 17.16.11. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be locally of finite presentation and flat. Then \mathcal{F} is locally a direct summand of a finite free \mathcal{O}_X -module.*

Proof. After replacing X by the members of an open covering, we may assume there exists a presentation

$$\mathcal{O}_X^{\oplus r} \rightarrow \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{F} \rightarrow 0$$

Let $x \in X$. By Lemma 17.16.10 we can, after shrinking X to an open neighbourhood of x , assume there exists a factorization

$$\mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X^{\oplus n_1} \rightarrow \mathcal{F}$$

such that the composition $\mathcal{O}_X^{\oplus r} \rightarrow \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X^{\oplus n_1}$ annihilates the first summand of $\mathcal{O}_X^{\oplus r}$. Repeating this argument $r - 1$ more times we obtain a factorization

$$\mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X^{\oplus n_r} \rightarrow \mathcal{F}$$

such that the composition $\mathcal{O}_X^{\oplus r} \rightarrow \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X^{\oplus n_r}$ is zero. This means that the surjection $\mathcal{O}_X^{\oplus n_r} \rightarrow \mathcal{F}$ has a section and we win. \square

17.17. Flat morphisms of ringed spaces

The pointwise definition is motivated by Lemma 17.16.2 and Definition 17.16.3 above.

Definition 17.17.1. Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let $x \in X$. We say f is said to be *flat at x* if the map of rings $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$ is flat. We say f is *flat* if f is flat at every $x \in X$.

Consider the map of sheaves of rings $f^\sharp : f^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X$. We see that the stalk at x is the ring map $f_x^\sharp : \mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$. Hence f is flat at x if and only if \mathcal{O}_X is flat at x as an $f^{-1}\mathcal{O}_Y$ -module. And f is flat if and only if \mathcal{O}_X is flat as an $f^{-1}\mathcal{O}_Y$ -module. A very special case of a flat morphism is an open immersion.

Lemma 17.17.2. Let $f : X \rightarrow Y$ be a flat morphism of ringed spaces. Then the pullback functor $f^* : \text{Mod}(\mathcal{O}_Y) \rightarrow \text{Mod}(\mathcal{O}_X)$ is exact.

Proof. The functor f^* is the composition of the exact functor $f^{-1} : \text{Mod}(\mathcal{O}_Y) \rightarrow \text{Mod}(f^{-1}\mathcal{O}_Y)$ and the change of rings functor

$$\text{Mod}(f^{-1}\mathcal{O}_Y) \rightarrow \text{Mod}(\mathcal{O}_X), \quad \mathcal{F} \mapsto \mathcal{F} \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X.$$

Thus the result follows from the discussion following Definition 17.17.1. \square

Definition 17.17.3. Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.

- (1) We say that \mathcal{F} is *flat over Y at a point $x \in X$* if the stalk \mathcal{F}_x is a flat $\mathcal{O}_{Y,f(x)}$ -module.
- (2) We say that \mathcal{F} is *flat over Y* if \mathcal{F} is flat over Y at every point x of X .

With this definition we see that \mathcal{F} is flat over Y at x if and only if \mathcal{F} is flat at x as an $f^{-1}\mathcal{O}_Y$ -module because $(f^{-1}\mathcal{O}_Y)_x = \mathcal{O}_{Y,f(x)}$ by Sheaves, Lemma 6.21.5.

17.18. Symmetric and exterior powers

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -algebra. We define the *tensor algebra* of \mathcal{F} to be the sheaf of noncommutative \mathcal{O}_X -algebras

$$\mathbb{T}(\mathcal{F}) = \mathbb{T}_{\mathcal{O}_X}(\mathcal{F}) = \bigoplus_{n \geq 0} \mathbb{T}^n(\mathcal{F}).$$

Here $\mathbb{T}^0(\mathcal{F}) = \mathcal{O}_X$, $\mathbb{T}^1(\mathcal{F}) = \mathcal{F}$ and for $n \geq 2$ we have

$$\mathbb{T}^n(\mathcal{F}) = \mathcal{F} \otimes_{\mathcal{O}_X} \dots \otimes_{\mathcal{O}_X} \mathcal{F} \quad (n \text{ factors})$$

We define $\wedge(\mathcal{F})$ to be the quotient of $\mathbb{T}(\mathcal{F})$ by the two sided ideal generated by local sections $s \otimes s$ of $\mathbb{T}^2(\mathcal{F})$ where s is a local section of \mathcal{F} . This is called the

exterior algebra of \mathcal{F} . Similarly, we define $\text{Sym}(\mathcal{F})$ to be the quotient of $T(\mathcal{F})$ by the two sided ideal generated by local sections of the form $s \otimes t - t \otimes s$ of $T^2(\mathcal{F})$.

Both $\wedge(\mathcal{F})$ and $\text{Sym}(\mathcal{F})$ are graded \mathcal{O}_X -algebras, with grading inherited from $T(\mathcal{F})$. Moreover $\text{Sym}(\mathcal{F})$ is commutative, and $\wedge(\mathcal{F})$ is graded commutative.

Lemma 17.18.1. *In the situation described above. The sheaf $\wedge^n \mathcal{F}$ is the sheafification of the presheaf*

$$U \mapsto \wedge^n_{\mathcal{O}_X(U)}(\mathcal{F}(U)).$$

See Algebra, Section 10.12. Similarly, the sheaf $\text{Sym}^n \mathcal{F}$ is the sheafification of the presheaf

$$U \mapsto \text{Sym}^n_{\mathcal{O}_X(U)}(\mathcal{F}(U)).$$

Proof. Omitted. It may be more efficient to define $\text{Sym}(\mathcal{F})$ and $\wedge(\mathcal{F})$ in this way instead of the method given above. \square

Lemma 17.18.2. *In the situation described above. Let $x \in X$. There are canonical isomorphisms of $\mathcal{O}_{X,x}$ -modules $T(\mathcal{F})_x = T(\mathcal{F}_x)$, $\text{Sym}(\mathcal{F})_x = \text{Sym}(\mathcal{F}_x)$, and $\wedge(\mathcal{F})_x = \wedge(\mathcal{F}_x)$.*

Proof. Clear from Lemma 17.18.1 above, and Algebra, Lemma 10.12.4. \square

Lemma 17.18.3. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_Y -modules. Then $f^*T(\mathcal{F}) = T(f^*\mathcal{F})$, and similarly for the exterior and symmetric algebras associated to \mathcal{F} .*

Proof. Omitted. \square

Lemma 17.18.4. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow 0$ be an exact sequence of sheaves of \mathcal{O}_X -modules. For each $n \geq 1$ there is an exact sequence*

$$\mathcal{F}_2 \otimes_{\mathcal{O}_X} \text{Sym}^{n-1}(\mathcal{F}_1) \rightarrow \text{Sym}^n(\mathcal{F}_1) \rightarrow \text{Sym}^n(\mathcal{F}) \rightarrow 0$$

and similarly an exact sequence

$$\mathcal{F}_2 \otimes_{\mathcal{O}_X} \wedge^{n-1}(\mathcal{F}_1) \rightarrow \wedge^n(\mathcal{F}_1) \rightarrow \wedge^n(\mathcal{F}) \rightarrow 0$$

Proof. See Algebra, Lemma 10.12.2. \square

Lemma 17.18.5. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.*

- (1) *If \mathcal{F} is locally generated by sections, then so is each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$.*
- (2) *If \mathcal{F} is of finite type, then so is each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$.*
- (3) *If \mathcal{F} is of finite presentation, then so is each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$.*
- (4) *If \mathcal{F} is coherent, then for $n > 0$ each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$ is coherent.*
- (5) *If \mathcal{F} is quasi-coherent, then so is each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$.*
- (6) *If \mathcal{F} is locally free, then so is each $T^n(\mathcal{F})$, $\wedge^n(\mathcal{F})$, and $\text{Sym}^n(\mathcal{F})$.*

Proof. These statements for $T^n(\mathcal{F})$ follow from Lemma 17.15.5.

Statements (1) and (2) follow from the fact that $\wedge^n(\mathcal{F})$ and $\text{Sym}^n(\mathcal{F})$ are quotients of $T^n(\mathcal{F})$.

Statement (6) follows from Algebra, Lemma 10.12.1.

For (3) and (5) we will use Lemma 17.18.4 above. By locally choosing a presentation $\mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow 0$ with \mathcal{F}_i free, or finite free and applying the lemma we see that $\text{Sym}^n(\mathcal{F}), \wedge^n(\mathcal{F})$ has a similar presentation; here we use (6) and Lemma 17.15.5.

To prove (4) we will use Algebra, Lemma 10.12.3. We may localize on X and assume that \mathcal{F} is generated by a finite set $(s_i)_{i \in I}$ of global sections. The lemma mentioned above combined with Lemma 17.18.1 above implies that for $n \geq 2$ there exists an exact sequence

$$\bigoplus_{j \in J} T^{n-2}(\mathcal{F}) \rightarrow T^n(\mathcal{F}) \rightarrow \text{Sym}^n(\mathcal{F}) \rightarrow 0$$

where the index set J is finite. Now we know that $T^{n-2}(\mathcal{F})$ is finitely generated and hence the image of the first arrow is a coherent subsheaf of $T^n(\mathcal{F})$, see Lemma 17.12.4. By that same lemma we conclude that $\text{Sym}^n(\mathcal{F})$ is coherent. \square

Lemma 17.18.6. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.*

- (1) *If \mathcal{F} is quasi-coherent, then so is each $T(\mathcal{F}), \wedge(\mathcal{F}),$ and $\text{Sym}(\mathcal{F})$.*
- (2) *If \mathcal{F} is locally free, then so is each $T(\mathcal{F}), \wedge(\mathcal{F}),$ and $\text{Sym}(\mathcal{F})$.*

Proof. It is not true that an infinite direct sum $\bigoplus \mathcal{G}_i$ of locally free modules is locally free, or that an infinite direct sum of quasi-coherent modules is quasi-coherent. The problem is that given a point $x \in X$ the open neighbourhoods U_i of x on which \mathcal{G}_i becomes free (resp. has a suitable presentation) may have an intersection which is not an open neighbourhood of x . However, in the proof of Lemma 17.18.5 we saw that once a suitable open neighbourhood for \mathcal{F} has been chosen, then this open neighbourhood works for each of the sheaves $T^n(\mathcal{F}), \wedge^n(\mathcal{F})$ and $\text{Sym}^n(\mathcal{F})$. The lemma follows. \square

17.19. Internal Hom

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. Consider the rule

$$U \longmapsto \text{Hom}_{\mathcal{O}_X|_U}(\mathcal{F}|_U, \mathcal{G}|_U).$$

It follows from the discussion in Sheaves, Section 6.33 that this is a sheaf of abelian groups. In addition, given an element $\varphi \in \text{Hom}_{\mathcal{O}_X|_U}(\mathcal{F}|_U, \mathcal{G}|_U)$ and a section $f \in \mathcal{O}_X(U)$ then we can define $f\varphi \in \text{Hom}_{\mathcal{O}_X|_U}(\mathcal{F}|_U, \mathcal{G}|_U)$ by either precomposing with multiplication by f on $\mathcal{F}|_U$ or postcomposing with multiplication by f on $\mathcal{G}|_U$ (it gives the same result). Hence we in fact get a sheaf of \mathcal{O}_X -modules. We will denote this sheaf $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$. There is a canonical “evaluation” morphism

$$\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}.$$

For every $x \in X$ there is also a canonical morphism

$$\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})_x \rightarrow \text{Hom}_{\mathcal{O}_{X,x}}(\mathcal{F}_x, \mathcal{G}_x)$$

which is rarely an isomorphism.

Lemma 17.19.1. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{F}, \mathcal{G}, \mathcal{H}$ be \mathcal{O}_X -modules. There is a canonical isomorphism*

$$\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}, \mathcal{H}) \longrightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}_X}(\mathcal{G}, \mathcal{H}))$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular, to give a morphism $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{H}$ is the same as giving a morphism $\mathcal{F} \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{G}, \mathcal{H})$.

Proof. This is the analogue of Algebra, Lemma 10.11.8. The proof is the same, and is omitted. \square

Lemma 17.19.2. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules.*

(1) *If $\mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow 0$ is an exact sequence of \mathcal{O}_X -modules, then*

$$0 \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}_1, \mathcal{G}) \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}_2, \mathcal{G})$$

is exact.

(2) *If $0 \rightarrow \mathcal{G} \rightarrow \mathcal{G}_1 \rightarrow \mathcal{G}_2$ is an exact sequence of \mathcal{O}_X -modules, then*

$$0 \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}_1) \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}_2)$$

is exact.

Proof. Omitted. \square

Lemma 17.19.3. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. If \mathcal{F} is finitely presented then the canonical map*

$$\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})_x \rightarrow \mathcal{H}om_{\mathcal{O}_{X,x}}(\mathcal{F}_x, \mathcal{G}_x)$$

is an isomorphism.

Proof. By localizing on X we may assume that \mathcal{F} has a presentation

$$\bigoplus_{j=1, \dots, m} \mathcal{O}_X \longrightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_X \rightarrow \mathcal{F} \rightarrow 0.$$

By Lemma 17.19.2 this gives an exact sequence $0 \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \rightarrow \bigoplus_{i=1, \dots, n} \mathcal{G} \rightarrow \bigoplus_{j=1, \dots, m} \mathcal{G}$. Taking stalks we get an exact sequence $0 \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})_x \rightarrow \bigoplus_{i=1, \dots, n} \mathcal{G}_x \rightarrow \bigoplus_{j=1, \dots, m} \mathcal{G}_x$ and the result follows since \mathcal{F}_x sits in an exact sequence $\bigoplus_{j=1, \dots, m} \mathcal{O}_{X,x} \longrightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_{X,x} \rightarrow \mathcal{F}_x \rightarrow 0$ which induces the exact sequence $0 \rightarrow \mathcal{H}om_{\mathcal{O}_{X,x}}(\mathcal{F}_x, \mathcal{G}_x) \rightarrow \bigoplus_{i=1, \dots, n} \mathcal{G}_x \rightarrow \bigoplus_{j=1, \dots, m} \mathcal{G}_x$ which is the same as the one above. \square

Lemma 17.19.4. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. If \mathcal{F} is finitely presented then the sheaf $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is locally a kernel of a map between finite direct sums of copies of \mathcal{G} . In particular, if \mathcal{G} is coherent then $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is coherent too.*

Proof. The first assertion we saw in the proof of Lemma 17.19.3. And the result for coherent sheaves then follows from Lemma 17.12.4. \square

Lemma 17.19.5. *Let X be a topological space. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. Then we have*

$$\mathcal{H}om_{\mathcal{O}_1}(\mathcal{F}_{\mathcal{O}_1}, \mathcal{G}) = \mathcal{H}om_{\mathcal{O}_2}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{G}))$$

bifunctorially in $\mathcal{F} \in \text{Mod}(\mathcal{O}_2)$ and $\mathcal{G} \in \text{Mod}(\mathcal{O}_1)$.

Proof. Omitted. This is the analogue of Algebra, Lemma 10.13.4 and is proved in exactly the same way. \square

17.20. Koszul complexes

We suggest first reading the section on Koszul complexes in More on Algebra, Section 15.20. We define the Koszul complex in the category of \mathcal{O}_X -modules as follows.

Definition 17.20.1. Let X be a ringed space. Let $\varphi : \mathcal{E} \rightarrow \mathcal{O}_X$ be an \mathcal{O}_X -module map. The *Koszul complex* $K_\bullet(\varphi)$ associated to φ is the sheaf of commutative differential graded algebras defined as follows:

- (1) the underlying graded algebra is the exterior algebra $K_\bullet(\varphi) = \wedge(\mathcal{E})$,
- (2) the differential $d : K_\bullet(\varphi) \rightarrow K_\bullet(\varphi)$ is the unique derivation such that $d(e) = \varphi(e)$ for all local sections e of $\mathcal{E} = K_1(\varphi)$.

Explicitly, if $e_1 \wedge \dots \wedge e_n$ is a wedge product of local sections of \mathcal{E} , then

$$d(e_1 \wedge \dots \wedge e_n) = \sum_{i=1, \dots, n} (-1)^{i+1} \varphi(e_i) e_1 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_n.$$

It is straightforward to see that this gives a well defined derivation on the tensor algebra, which annihilates $e \wedge e$ and hence factors through the exterior algebra.

Definition 17.20.2. Let X be a ringed space and let $f_1, \dots, f_n \in \Gamma(X, \mathcal{O}_X)$. The *Koszul complex on f_1, \dots, f_r* is the Koszul complex associated to the map $(f_1, \dots, f_n) : \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{O}_X$. Notation $K_\bullet(\mathcal{O}_X, f_1, \dots, f_n)$, or $K_\bullet(\mathcal{O}_X, f_\bullet)$.

Of course, given an \mathcal{O}_X -module map $\varphi : \mathcal{E} \rightarrow \mathcal{O}_X$, if \mathcal{E} is finite locally free, then $K_\bullet(\varphi)$ is locally on X isomorphic to a Koszul complex $K_\bullet(\mathcal{O}_X, f_1, \dots, f_n)$.

17.21. Invertible sheaves

Definition 17.21.1. Let (X, \mathcal{O}_X) be a ringed space. Assume that all stalks $\mathcal{O}_{X,x}$ are local rings³. An *invertible \mathcal{O}_X -module* is a sheaf of \mathcal{O}_X -modules \mathcal{L} such that for each point $x \in X$ there exists an open neighbourhood $U \subset X$ and an isomorphism $\mathcal{L}|_U \cong \mathcal{O}_X|_U$. We say that \mathcal{L} is *trivial* if it is isomorphic as an \mathcal{O}_X -module to \mathcal{O}_X .

Lemma 17.21.2. Let (X, \mathcal{O}_X) be a ringed space. Assume that all stalks $\mathcal{O}_{X,x}$ are local rings.

- (1) If \mathcal{L}, \mathcal{N} are invertible \mathcal{O}_X -modules, then so is $\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{N}$.
- (2) If \mathcal{L} is an invertible \mathcal{O}_X -module, then so is $\mathcal{L}^{\otimes -1} = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{L}, \mathcal{O}_X)$.
- (3) If \mathcal{L} is an invertible \mathcal{O}_X -module, then the evaluation map $\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$ is an isomorphism.

Proof. Omitted. □

Definition 17.21.3. Let (X, \mathcal{O}_X) be a ringed space. Assume that all stalks $\mathcal{O}_{X,x}$ are local rings. Given an invertible sheaf \mathcal{L} on X we define the *n th tensor power of \mathcal{L}* by the rule

$$\mathcal{L}^{\otimes n} = \begin{cases} \mathcal{O}_X & \text{if } n = 0 \\ \mathcal{H}om_{\mathcal{O}_X}(\mathcal{L}, \mathcal{O}_X) & \text{if } n = -1 \\ \mathcal{L} \otimes_{\mathcal{O}_X} \dots \otimes_{\mathcal{O}_X} \mathcal{L} & \text{if } n > 0 \\ \mathcal{L}^{\otimes -1} \otimes_{\mathcal{O}_X} \dots \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes -1} & \text{if } n < -1 \end{cases}$$

³We should at least assume that they are nonzero. However, in this generality the stalks $\mathcal{O}_{X,x}$ can have nontrivial Picard groups, and then there are two possible definitions. One were we require \mathcal{L} to be locally free of rank 1, and the other where we require \mathcal{L} to be a flat, finite presentation \mathcal{O}_X -module such that there exists a second such sheaf $\mathcal{L}^{\otimes -1}$ with $\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes -1} \cong \mathcal{O}_X$.

With this definition we have canonical isomorphisms $\mathcal{L}^{\otimes n} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes m} \rightarrow \mathcal{L}^{\otimes n+m}$, and these isomorphisms satisfy a commutativity and an associativity constraint (formulation omitted). Thus we can define a \mathbf{Z} -graded ring structure on $\bigoplus \Gamma(X, \mathcal{L}^{\otimes n})$ by mapping $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ and $t \in \Gamma(X, \mathcal{L}^{\otimes m})$ to the section corresponding to $s \otimes t$ in $\Gamma(X, \mathcal{L}^{\otimes n+m})$. We omit the verification that this defines a commutative and associative ring with 1. However, by our conventions in Algebra, Section 10.54 a graded ring has no nonzero elements in negative degrees. This leads to the following definition.

Definition 17.21.4. Let (X, \mathcal{O}_X) be a ringed space. Assume that all stalks $\mathcal{O}_{X,x}$ are local rings. Given an invertible sheaf \mathcal{L} on X we define the *associated graded ring* to be

$$\Gamma_*(X, \mathcal{L}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{L}^{\otimes n})$$

Given a sheaf of \mathcal{O}_X -modules \mathcal{F} we set

$$\Gamma_*(X, \mathcal{L}, \mathcal{F}) = \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$$

which we think of as a graded $\Gamma_*(X, \mathcal{L})$ -module.

We often write simply $\Gamma_*(\mathcal{L})$ and $\Gamma_*(\mathcal{F})$ (although this is ambiguous if \mathcal{F} is invertible). The multiplication of $\Gamma_*(\mathcal{L})$ on $\Gamma_*(\mathcal{F})$ is defined using the isomorphisms above. If $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is a \mathcal{O}_X -module map, then we get an $\Gamma_*(\mathcal{L})$ -module homomorphism $\gamma : \Gamma_*(\mathcal{F}) \rightarrow \Gamma_*(\mathcal{G})$. If $\alpha : \mathcal{L} \rightarrow \mathcal{N}$ is an \mathcal{O}_X -module map between invertible \mathcal{O}_X -modules, then we obtain a graded ring homomorphism $\Gamma_*(\mathcal{L}) \rightarrow \Gamma_*(\mathcal{N})$. If $f : (Y, \mathcal{O}_Y) \rightarrow (X, \mathcal{O}_X)$ is a morphism of locally ringed spaces (see Schemes, Definition 25.2.1), and if \mathcal{L} is invertible on X , then we get an invertible sheaf $f^*\mathcal{L}$ on Y and an induced homomorphism of graded rings

$$f^* : \Gamma_*(X, \mathcal{L}) \longrightarrow \Gamma_*(Y, f^*\mathcal{L})$$

Furthermore, there are some compatibilities between the constructions above whose statements we omit.

Lemma 17.21.5. *Let (X, \mathcal{O}_X) be a ringed space. Assume that all stalks $\mathcal{O}_{X,x}$ are local rings. There exists a set of invertible modules $\{\mathcal{L}_i\}_{i \in I}$ such that each invertible module on X is isomorphic to exactly one of the \mathcal{L}_i .*

Proof. For each open covering $\mathcal{U} : X = \bigcup U_j$ consider the sheaves of \mathcal{O}_X -modules gotten from glueing the sheaves $\mathcal{O}_X|_{U_j}$, see Sheaves, Section 6.33. Note that the collection of all glueing data forms a set. The collection of all coverings $\mathcal{U} : X = \bigcup_{j \in J} U_j$ where $J \rightarrow \mathcal{P}(X)$, $j \mapsto U_j$ is injective forms a set as well. Hence the collection of all sheaves of \mathcal{O}_X -modules gotten from glueing trivial invertible \mathcal{O}_X -modules forms a set \mathcal{I} . By definition every invertible \mathcal{O}_X -module is isomorphic to an element of \mathcal{I} . Choosing an element out of each isomorphism class inside \mathcal{I} gives the desired set of invertible sheaves (uses axiom of choice). \square

This lemma says roughly speaking that the collection of isomorphism classes of invertible sheaves forms a set. Lemma 17.21.2 says that tensor product defines the structure of an abelian group on this set.

Definition 17.21.6. Let (X, \mathcal{O}_X) be a ringed space. Assume all stalks $\mathcal{O}_{X,x}$ are local rings. The *Picard group* $\text{Pic}(X)$ of X is the abelian group whose elements are isomorphism classes of invertible \mathcal{O}_X -modules, with addition corresponding to tensor product.

Lemma 17.21.7. *Let X be a ringed space. Assume that each stalk $\mathcal{O}_{X,x}$ is a local ring with maximal ideal \mathfrak{m}_x . Let \mathcal{L} be an invertible \mathcal{O}_X -module. For any section $s \in \Gamma(X, \mathcal{L})$ the set*

$$X_s = \{x \in X \mid \text{image } s \notin \mathfrak{m}_x \mathcal{L}_x\}$$

is open in X . The map $s : \mathcal{O}_{X_s} \rightarrow \mathcal{L}|_{X_s}$ is an isomorphism, and there exists a section s' of $\mathcal{L}^{\otimes -1}$ over X_s such that $s'(s|_{X_s}) = 1$.

Proof. Suppose $x \in X_s$. We have an isomorphism

$$\mathcal{L}_x \otimes_{\mathcal{O}_{X,x}} (\mathcal{L}^{\otimes -1})_x \longrightarrow \mathcal{O}_{X,x}$$

by Lemma 17.21.2. Both \mathcal{L}_x and $(\mathcal{L}^{\otimes -1})_x$ are free $\mathcal{O}_{X,x}$ -modules of rank 1. We conclude from Algebra, Nakayama's Lemma 10.19.1 that s_x is a basis for \mathcal{L}_x . Hence there exists a basis element $t_x \in (\mathcal{L}^{\otimes -1})_x$ such that $s_x \otimes t_x$ maps to 1. Choose an open neighbourhood U of x such that t_x comes from a section t of $(\mathcal{L}^{\otimes -1})_x$ over U and such that $s \otimes t$ maps to $1 \in \mathcal{O}_X(U)$. Clearly, for every $x' \in U$ we see that s generates the module $\mathcal{L}_{x'}$. Hence $U \subset X_s$. This proves that X_s is open. Moreover, the section t constructed over U above is unique, and hence these glue to give the section s' of the lemma. \square

It is also true that, given a morphism of locally ringed spaces $f : Y \rightarrow X$ (see Schemes, Definition 25.2.1) that the inverse image $f^{-1}(X_s)$ is equal to Y_{f^*s} , where $f^*s \in \Gamma(Y, f^*\mathcal{L})$ is the pullback of s .

17.22. Localizing sheaves of rings

Let X be a topological space and let \mathcal{O}_X be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_X$ be a presheaf of sets contained in \mathcal{O}_X . Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ is a multiplicative subset, see Algebra, Definition 10.9.1. In this case we can consider the presheaf of rings

$$\mathcal{S}^{-1}\mathcal{O}_X : U \mapsto \mathcal{S}(U)^{-1}\mathcal{O}_X(U).$$

The restriction mapping sends the section f/s , $f \in \mathcal{O}_X(U)$, $s \in \mathcal{S}(U)$ to $(f|_V)/(s|_V)$ if $V \subset U$ are opens of X .

Lemma 17.22.1. *Let X be a topological space and let \mathcal{O}_X be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_X$ be a pre-sheaf of sets contained in \mathcal{O}_X . Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ is a multiplicative subset.*

- (1) *There is a map of presheaves of rings $\mathcal{O}_X \rightarrow \mathcal{S}^{-1}\mathcal{O}_X$ such that every local section of \mathcal{S} maps to an invertible section of \mathcal{O}_X .*
- (2) *For any homomorphism of presheaves of rings $\mathcal{O}_X \rightarrow \mathcal{A}$ such that each local section of \mathcal{S} maps to an invertible section of \mathcal{A} there exists a unique factorization $\mathcal{S}^{-1}\mathcal{O}_X \rightarrow \mathcal{A}$.*
- (3) *For any $x \in X$ we have*

$$(\mathcal{S}^{-1}\mathcal{O}_X)_x = \mathcal{S}_x^{-1}\mathcal{O}_{X,x}.$$

- (4) *The sheafification $(\mathcal{S}^{-1}\mathcal{O}_X)^\#$ is a sheaf of rings with a map of sheaves of rings $(\mathcal{O}_X)^\# \rightarrow (\mathcal{S}^{-1}\mathcal{O}_X)^\#$ which is universal for maps of $(\mathcal{O}_X)^\#$ into sheaves of rings such that each local section of \mathcal{S} maps to an invertible section.*
- (5) *For any $x \in X$ we have*

$$(\mathcal{S}^{-1}\mathcal{O}_X)_x^\# = \mathcal{S}_x^{-1}\mathcal{O}_{X,x}.$$

Proof. Omitted. □

Let X be a topological space and let \mathcal{O}_X be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_X$ be a presheaf of sets contained in \mathcal{O}_X . Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ is a multiplicative subset. Let \mathcal{F} be a presheaf of \mathcal{O}_X -modules. In this case we can consider the presheaf of $\mathcal{S}^{-1}\mathcal{O}_X$ -modules

$$\mathcal{S}^{-1}\mathcal{F} : U \mapsto \mathcal{S}(U)^{-1}\mathcal{F}(U).$$

The restriction mapping sends the section t/s , $t \in \mathcal{F}(U)$, $s \in \mathcal{S}(U)$ to $(t|_V)/(s|_V)$ if $V \subset U$ are opens of X .

Lemma 17.22.2. *Let X be a topological space. Let \mathcal{O}_X be a presheaf of rings. Let $\mathcal{S} \subset \mathcal{O}_X$ be a pre-sheaf of sets contained in \mathcal{O}_X . Suppose that for every open $U \subset X$ the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ is a multiplicative subset. For any presheaf of \mathcal{O}_X -modules \mathcal{F} we have*

$$\mathcal{S}^{-1}\mathcal{F} = \mathcal{S}^{-1}\mathcal{O}_X \otimes_{p, \mathcal{O}_X} \mathcal{F}$$

(see *Sheaves, Section 6.6* for notation) and if \mathcal{F} and \mathcal{O}_X are sheaves then

$$(\mathcal{S}^{-1}\mathcal{F})^\# = (\mathcal{S}^{-1}\mathcal{O}_X)^\# \otimes_{\mathcal{O}_X} \mathcal{F}$$

(see *Sheaves, Section 6.20* for notation).

Proof. Omitted. □

17.23. Modules of differentials

In this section we briefly explain how to define the module of relative differentials for a morphism of ringed spaces. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (*Algebra, Section 10.127*).

Definition 17.23.1. Let X be a topological space. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. Let \mathcal{F} be an \mathcal{O}_2 -module. A \mathcal{O}_1 -*derivation* or more precisely a φ -*derivation* into \mathcal{F} is a map $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ which is additive, annihilates the image of $\mathcal{O}_1 \rightarrow \mathcal{O}_2$, and satisfies the *Leibniz rule*

$$D(ab) = aD(b) + D(a)b$$

for all a, b local sections of \mathcal{O}_2 (wherever they are both defined). We denote $\text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$ the set of φ -derivations into \mathcal{F} .

This is the sheaf theoretic analogue of *Algebra, Definition 17.23.1*. Given a derivation $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ as in the definition the map on global sections

$$D : \Gamma(X, \mathcal{O}_2) \longrightarrow \Gamma(X, \mathcal{F})$$

is a $\Gamma(X, \mathcal{O}_1)$ -derivation as in the algebra definition. Note that if $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a map of \mathcal{O}_2 -modules, then there is an induced map

$$\text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F}) \longrightarrow \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{G})$$

given by the rule $D \mapsto \alpha \circ D$. In other words we obtain a functor.

Lemma 17.23.2. *Let X be a topological space. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. The functor*

$$\text{Mod}(\mathcal{O}_2) \longrightarrow \text{Ab}, \quad \mathcal{F} \mapsto \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$$

is representable.

Proof. This is proved in exactly the same way as the analogous statement in algebra. During this proof, for any sheaf of sets \mathcal{F} on X , let us denote $\mathcal{O}_2[\mathcal{F}]$ the sheafification of the presheaf $U \mapsto \mathcal{O}_2(U)[\mathcal{F}(U)]$ where this denotes the free $\mathcal{O}_1(U)$ -module on the set $\mathcal{F}(U)$. For $s \in \mathcal{F}(U)$ we denote $[s]$ the corresponding section of $\mathcal{O}_2[\mathcal{F}]$ over U . If \mathcal{F} is a sheaf of \mathcal{O}_2 -modules, then there is a canonical map

$$c : \mathcal{O}_2[\mathcal{F}] \longrightarrow \mathcal{F}$$

which on the presheaf level is given by the rule $\sum f_s[s] \mapsto \sum f_s s$. We will employ the short hand $[s] \mapsto s$ to describe this map and similarly for other maps below. Consider the map of \mathcal{O}_2 -modules

$$(17.23.2.1) \quad \begin{array}{ccc} \mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_1] & \longrightarrow & \mathcal{O}_2[\mathcal{O}_2] \\ [(a, b)] \oplus [(f, g)] \oplus [h] & \longmapsto & [a + b] - [a] - [b] + \\ & & [fg] - g[f] - f[g] + \\ & & [\varphi(h)] \end{array}$$

with short hand notation as above. Set $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ equal to the cokernel of this map. Then it is clear that there exists a map of sheaves of sets

$$d : \mathcal{O}_2 \longrightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1}$$

mapping a local section f to the image of $[f]$ in $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$. By construction d is a \mathcal{O}_1 -derivation. Next, let \mathcal{F} be a sheaf of \mathcal{O}_2 -modules and let $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ be a \mathcal{O}_1 -derivation. Then we can consider the \mathcal{O}_2 -linear map $\mathcal{O}_2[\mathcal{O}_2] \rightarrow \mathcal{F}$ which sends $[g]$ to $D(g)$. It follows from the definition of a derivation that this map annihilates sections in the image of the map (17.23.2.1) and hence defines a map

$$\alpha_D : \Omega_{\mathcal{O}_2/\mathcal{O}_1} \longrightarrow \mathcal{F}$$

Since it is clear that $D = \alpha_D \circ d$ the lemma is proved. □

Definition 17.23.3. Let X be a topological space. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings on X . The *module of differentials* of φ is the object representing the functor $\mathcal{F} \mapsto \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$ which exists by Lemma 17.23.2. It is denoted $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$, and the *universal φ -derivation* is denoted $d : \mathcal{O}_2 \rightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1}$.

Note that $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the cokernel of the map (17.23.2.1) of \mathcal{O}_2 -modules. Moreover the map d is described by the rule that df is the image of the local section $[f]$.

Lemma 17.23.4. *Let X be a topological space. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings on X . Then $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the sheaf associated to the presheaf $U \mapsto \Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}$.*

Proof. Consider the map (17.23.2.1). There is a similar map of presheaves whose value on the open U is

$$\mathcal{O}_2(U)[\mathcal{O}_2(U) \times \mathcal{O}_2(U)] \oplus \mathcal{O}_2(U)[\mathcal{O}_2(U) \times \mathcal{O}_2(U)] \oplus \mathcal{O}_2(U)[\mathcal{O}_1(U)] \longrightarrow \mathcal{O}_2(U)[\mathcal{O}_2(U)]$$

The cokernel of this map has value $\Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}$ over U by the construction of the module of differentials in Algebra, Definition 10.127.2. On the other hand, the sheaves in (17.23.2.1) are the sheafifications of the presheaves above. Thus the result follows as sheafification is exact. □

Lemma 17.23.5. *Let X be a topological space. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. For $U \subset X$ open there is a canonical isomorphism*

$$\Omega_{\mathcal{O}_2/\mathcal{O}_1}|_U = \Omega_{(\mathcal{O}_2|_U)/(\mathcal{O}_1|_U)}$$

compatible with universal derivations.

Proof. Holds because $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the cokernel of the map (17.23.2.1). \square

Lemma 17.23.6. *Let $f : Y \rightarrow X$ be a continuous map of topological spaces. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings on X . Then there is a canonical identification $f^{-1}\Omega_{\mathcal{O}_2/\mathcal{O}_1} = \Omega_{f^{-1}\mathcal{O}_2/f^{-1}\mathcal{O}_1}$ compatible with universal derivations.*

Proof. This holds because the sheaf $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the cokernel of the map (17.23.2.1) and a similar statement holds for $\Omega_{f^{-1}\mathcal{O}_2/f^{-1}\mathcal{O}_1}$, because the functor f^{-1} is exact, and because $f^{-1}(\mathcal{O}_2[\mathcal{O}_2]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_2]$, $f^{-1}(\mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_2 \times f^{-1}\mathcal{O}_2]$, and $f^{-1}(\mathcal{O}_2[\mathcal{O}_1]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_1]$. \square

Lemma 17.23.7. *Let X be a topological space. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings on X . Let $x \in X$. Then we have $\Omega_{\mathcal{O}_2/\mathcal{O}_1, x} = \Omega_{\mathcal{O}_{2,x}/\mathcal{O}_{1,x}}$.*

Proof. This is a special case of Lemma 17.23.6 for the inclusion map $\{x\} \rightarrow X$. An alternative proof is the use Lemma 17.23.4, Sheaves, Lemma 6.17.2, and Algebra, Lemma 10.127.4 \square

Lemma 17.23.8. *Let X be a topological space. Let*

$$\begin{array}{ccc} \mathcal{O}_2 & \xrightarrow{\varphi} & \mathcal{O}'_2 \\ \uparrow & & \uparrow \\ \mathcal{O}_1 & \longrightarrow & \mathcal{O}'_1 \end{array}$$

be a commutative diagram of sheaves of rings on X . The map $\mathcal{O}_2 \rightarrow \mathcal{O}'_2$ composed with the map $d : \mathcal{O}'_2 \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$ is a \mathcal{O}_1 -derivation. Hence we obtain a canonical map of \mathcal{O}_2 -modules $\Omega_{\mathcal{O}_2/\mathcal{O}_1} \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$. It is uniquely characterized by the property that $d(f)$ mapsto $d(\varphi(f))$ for any local section f of \mathcal{O}_2 . In this way $\Omega_{-/-}$ becomes a functor on the category of arrows of sheaves of rings.

Proof. This lemma proves itself. \square

Lemma 17.23.9. *In Lemma 17.23.8 suppose that $\mathcal{O}_2 \rightarrow \mathcal{O}'_2$ is surjective with kernel $\mathcal{I} \subset \mathcal{O}_2$ and assume that $\mathcal{O}_1 = \mathcal{O}'_1$. Then there is a canonical exact sequence of \mathcal{O}'_2 -modules*

$$\mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1} \otimes_{\mathcal{O}_2} \mathcal{O}'_2 \longrightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}_1} \longrightarrow 0$$

The leftmost map is characterized by the rule that a local section f of \mathcal{I} maps to $df \otimes 1$.

Proof. For a local section f of \mathcal{I} denote \bar{f} the image of f in $\mathcal{I}/\mathcal{I}^2$. To show that the map $\bar{f} \mapsto df \otimes 1$ is well defined we just have to check that $df_1 f_2 \otimes 1 = 0$ if f_1, f_2 are local sections of \mathcal{I} . And this is clear from the Leibniz rule $df_1 f_2 \otimes 1 = (f_1 df_2 + f_2 df_1) \otimes 1 = df_2 \otimes f_1 + df_2 \otimes f_1 = 0$. A similar computation show this map is $\mathcal{O}'_2 = \mathcal{O}_2/\mathcal{I}$ -linear. The map on the right is the one from Lemma 17.23.8. To see that the sequence is exact, we can check on stalks (Lemma 17.3.1). By Lemma 17.23.7 this follows from Algebra, Lemma 10.127.9. \square

Definition 17.23.10. Let $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$ be a morphism of ringed spaces.

- (1) Let \mathcal{F} be an \mathcal{O}_X -module. An S -derivation into \mathcal{F} is a $f^{-1}\mathcal{O}_S$ -derivation, or more precisely a f^\sharp -derivation in the sense of Definition 17.23.1. We denote $\text{Der}_S(\mathcal{O}_X, \mathcal{F})$ the set of S -derivations into \mathcal{F} .
- (2) The sheaf of differentials $\Omega_{X/S}$ of X over S is the module of differentials $\Omega_{\mathcal{O}_X/f^{-1}\mathcal{O}_S}$ endowed with its universal S -derivation $d_{X/S} : \mathcal{O}_X \rightarrow \Omega_{X/S}$.

Here is a particular situation where derivations come up naturally.

Lemma 17.23.11. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$ be a morphism of ringed spaces. Consider a short exact sequence*

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_X \rightarrow 0$$

Here \mathcal{A} is a sheaf of $f^{-1}\mathcal{O}_S$ -algebras, $\pi : \mathcal{A} \rightarrow \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_S$ -algebras, and $\mathcal{I} = \text{Ker}(\pi)$ is its kernel. Assume \mathcal{I} an ideal sheaf with square zero in \mathcal{A} . So \mathcal{I} has a natural structure of an \mathcal{O}_X -module. A section $s : \mathcal{O}_X \rightarrow \mathcal{A}$ of π is a $f^{-1}\mathcal{O}_S$ -algebra map such that $\pi \circ s = \text{id}$. Given any section $s : \mathcal{O}_X \rightarrow \mathcal{A}$ of π and any S -derivation $D : \mathcal{O}_X \rightarrow \mathcal{I}$ the map

$$s + D : \mathcal{O}_X \rightarrow \mathcal{A}$$

is a section of π and every section s' is of the form $s + D$ for a unique S -derivation D .

Proof. Recall that the \mathcal{O}_X -module structure on \mathcal{I} is given by $h\tau = \tilde{h}\tau$ (multiplication in \mathcal{A}) where h is a local section of \mathcal{O}_X , and \tilde{h} is a local lift of h to a local section of \mathcal{A} , and τ is a local section of \mathcal{I} . In particular, given s , we may use $\tilde{h} = s(h)$. To verify that $s + D$ is a homomorphism of sheaves of rings we compute

$$\begin{aligned} (s + D)(ab) &= s(ab) + D(ab) \\ &= s(a)s(b) + aD(b) + D(a)b \\ &= s(a)s(b) + s(a)D(b) + D(a)s(b) \\ &= (s(a) + D(a))(s(b) + D(b)) \end{aligned}$$

by the Leibniz rule. In the same manner one shows $s + D$ is a $f^{-1}\mathcal{O}_S$ -algebra map because D is an S -derivation. Conversely, given s' we set $D = s' - s$. Details omitted. \square

Lemma 17.23.12. *Let*

$$\begin{array}{ccc} X' & \xrightarrow{f} & X \\ h' \downarrow & & \downarrow h \\ S' & \xrightarrow{g} & S \end{array}$$

be a commutative diagram of ringed spaces.

- (1) The canonical map $\mathcal{O}_X \rightarrow f_*\mathcal{O}_{X'}$ composed with $f_*d_{X'/S'} : f_*\mathcal{O}_{X'} \rightarrow f_*\Omega_{X'/S'}$ is a S -derivation and we obtain a canonical map of \mathcal{O}_X -modules $\Omega_{X/S} \rightarrow f_*\Omega_{X'/S'}$.
- (2) The commutative diagram

$$\begin{array}{ccc} f^{-1}\mathcal{O}_X & \longrightarrow & \mathcal{O}_{X'} \\ \uparrow & & \uparrow \\ f^{-1}h^{-1}\mathcal{O}_S & \longrightarrow & (h')^{-1}\mathcal{O}_{S'} \end{array}$$

induces by Lemmas 17.23.6 and 17.23.8 a canonical map $f^{-1}\Omega_{X/S} \rightarrow \Omega_{X'/S'}$.

These two maps correspond (via adjointness of f_* and f^* and via $f^*\Omega_{X/S} = f^{-1}\Omega_{X/S} \otimes_{f^{-1}\mathcal{O}_X} \mathcal{O}_{X'}$ and Sheaves, Lemma 6.20.2) to the same $\mathcal{O}_{X'}$ -module homomorphism

$$c_f : f^*\Omega_{X/S} \longrightarrow \Omega_{X'/S'}$$

which is uniquely characterized by the property that $f^*d_{X/S}(a)$ maps to $d_{X'/S'}(f^*a)$ for any local section a of \mathcal{O}_X .

Proof. Omitted. □

Lemma 17.23.13. *Let*

$$\begin{array}{ccccc} X'' & \xrightarrow{g} & X' & \xrightarrow{f} & X \\ \downarrow & & \downarrow & & \downarrow \\ S'' & \longrightarrow & S' & \longrightarrow & S \end{array}$$

be a commutative diagram of ringed spaces. With notation as in Lemma 17.23.12 we have

$$c_{f \circ g} = c_g \circ g^*c_f$$

as maps $(f \circ g)^*\Omega_{X/S} \rightarrow \Omega_{X''/S''}$.

Proof. Omitted. □

17.24. The naive cotangent complex

This section is the analogue of Algebra, Section 10.129 for morphisms of ringed spaces. We urge the reader to read that section first.

Let X be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. In this section, for any sheaf of sets \mathcal{E} on X we denote $\mathcal{A}[\mathcal{E}]$ the sheafification of the presheaf $U \mapsto \mathcal{A}(U)[\mathcal{E}(U)]$. Here $\mathcal{A}(U)[\mathcal{E}(U)]$ denotes the polynomial algebra over $\mathcal{A}(U)$ whose variables correspond to the elements of $\mathcal{E}(U)$. We denote $[e] \in \mathcal{A}(U)[\mathcal{E}(U)]$ the variable corresponding to $e \in \mathcal{E}(U)$. There is a canonical surjection of \mathcal{A} -algebras

$$(17.24.0.1) \quad \mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{B}, \quad [b] \longmapsto b$$

whose kernel we denote $\mathcal{I} \subset \mathcal{A}[\mathcal{B}]$. It is a simple observation that \mathcal{I} is generated by the local sections $[b][b'] - [bb']$ and $[a] - a$. According to Lemma 17.23.9 there is a canonical map

$$(17.24.0.2) \quad \mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$$

whose cokernel is canonically isomorphic to $\Omega_{\mathcal{B}/\mathcal{A}}$.

Definition 17.24.1. Let X be a topological space. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings. The *naive cotangent complex* $NL_{\mathcal{B}/\mathcal{A}}$ is the chain complex (17.24.0.2)

$$NL_{\mathcal{B}/\mathcal{A}} = (\mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B})$$

with $\mathcal{I}/\mathcal{I}^2$ placed in (homological) degree 1 and $\Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$ placed in degree 0.

This construction satisfies a functoriality similar to that discussed in Lemma 17.23.8 for modules of differentials. Namely, given a commutative diagram

$$(17.24.1.1) \quad \begin{array}{ccc} \mathcal{B} & \longrightarrow & \mathcal{B}' \\ \uparrow & & \uparrow \\ \mathcal{A} & \longrightarrow & \mathcal{A}' \end{array}$$

of sheaves of rings on X there is a canonical \mathcal{B} -linear map of complexes

$$NL_{\mathcal{B}/\mathcal{A}} \longrightarrow NL_{\mathcal{B}'/\mathcal{A}'}$$

Namely, the maps in the commutative diagram give rise to a canonical map $\mathcal{A}[\mathcal{B}] \rightarrow \mathcal{A}'[\mathcal{B}']$ which maps \mathcal{I} into $\mathcal{I}' = \text{Ker}(\mathcal{A}'[\mathcal{B}'] \rightarrow \mathcal{B}')$. Thus a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{I}'/(\mathcal{I}')^2$ and a map between modules of differentials, which together give the desired map between the naive cotangent complexes.

We can choose a different presentation of \mathcal{B} as a quotient of a polynomial algebra over \mathcal{A} and still obtain the same object of $D(\mathcal{B})$. To explain this, suppose that \mathcal{E} is a sheaves of sets on X and $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ a map of sheaves of sets. Then we obtain an \mathcal{A} -algebra homomorphism $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$. Assume this map is surjective, and let $\mathcal{J} \subset \mathcal{A}[\mathcal{E}]$ be the kernel. Set

$$NL(\alpha) = (\mathcal{J}/\mathcal{J}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B})$$

Here is the result.

Lemma 17.24.2. *In the situation above there is a canonical isomorphism $NL(\alpha) = NL_{\mathcal{B}/\mathcal{A}}$ in $D(\mathcal{B})$.*

Proof. Observe that $NL_{\mathcal{B}/\mathcal{A}} = NL(\text{id}_{\mathcal{B}})$. Thus it suffices to show that given two maps $\alpha_i : \mathcal{E}_i \rightarrow \mathcal{B}$ as above, there is a canonical quasi-isomorphism $NL(\alpha_1) = NL(\alpha_2)$ in $D(\mathcal{B})$. To see this set $\mathcal{E} = \mathcal{E}_1 \amalg \mathcal{E}_2$ and $\alpha = \alpha_1 \amalg \alpha_2 : \mathcal{E} \rightarrow \mathcal{B}$. Set $\mathcal{J}_i = \text{Ker}(\mathcal{A}[\mathcal{E}_i] \rightarrow \mathcal{B})$ and $\mathcal{J} = \text{Ker}(\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B})$. We obtain maps $\mathcal{A}[\mathcal{E}_i] \rightarrow \mathcal{A}[\mathcal{E}]$ which send \mathcal{J}_i into \mathcal{J} . Thus we obtain canonical maps of complexes

$$NL(\alpha_i) \longrightarrow NL(\alpha)$$

and it suffices to show these maps are quasi-isomorphism. To see this it suffices to check on stalks (Lemma 17.3.1). Here by Lemma 17.23.7 we see the result holds by Algebra, Lemma 10.129.2. \square

Lemma 17.24.3. *Let $f : X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on Y . Then $f^{-1}NL_{\mathcal{B}/\mathcal{A}} = NL_{f^{-1}\mathcal{B}/f^{-1}\mathcal{A}}$.*

Proof. Omitted. Hint: Use Lemma 17.23.6. \square

The cotangent complex of a morphism of ringed spaces is defined in terms of the cotangent complex we defined above.

Definition 17.24.4. The naive cotangent complex $NL_f = NL_{X/Y}$ of a morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ is $NL_{\mathcal{O}_X/f^{-1}\mathcal{O}_Y}$.

Modules on Sites

18.1. Introduction

In this document we work out basic notions of sheaves of modules on ringed topoi or ringed sites. We first work out some basic facts on abelian sheaves. After this we introduce ringed sites and ringed topoi. We work through some of the very basic notions on (pre)sheaves of \mathcal{O} -modules, analogous to the material on (pre)sheaves of \mathcal{O} -modules in the chapter on sheaves on spaces. Having done this, we duplicate much of the discussion in the chapter on sheaves of modules (see Modules, Section 17.1). Basic references are [Ser55b], [DG67] and [AGV71].

18.2. Abelian presheaves

Let \mathcal{C} be a category. Abelian presheaves were introduced in Sites, Sections 7.2 and 7.7 and discussed a bit more in Sites, Section 7.43. We will follow the convention of this last reference, in that we think of an abelian presheaf as a presheaf of sets endowed with addition rules on all sets of sections compatible with the restriction mappings. Recall that the category of abelian presheaves on \mathcal{C} is denoted $PAb(\mathcal{C})$.

The category $PAb(\mathcal{C})$ is abelian as defined in Homology, Definition 12.5.1. Given a map of presheaves $\varphi : \mathcal{G}_1 \rightarrow \mathcal{G}_2$ the kernel of φ is the abelian presheaf $U \mapsto \text{Ker}(\mathcal{G}_1(U) \rightarrow \mathcal{G}_2(U))$ and the cokernel of φ is the presheaf $U \mapsto \text{Coker}(\mathcal{G}_1(U) \rightarrow \mathcal{G}_2(U))$. Since the category of abelian groups is abelian it follows that $\text{Coim} = \text{Im}$ because this holds over each U . A sequence of abelian presheaves

$$\mathcal{G}_1 \longrightarrow \mathcal{G}_2 \longrightarrow \mathcal{G}_3$$

is exact if and only if $\mathcal{G}_1(U) \rightarrow \mathcal{G}_2(U) \rightarrow \mathcal{G}_3(U)$ is an exact sequence of abelian groups for all $U \in \text{Ob}(\mathcal{C})$. We leave the verifications to the reader.

Lemma 18.2.1. *Let \mathcal{C} be a category.*

- (1) *All limits and colimits exist in $PAb(\mathcal{C})$.*
- (2) *All limits and colimits commute with taking sections over objects of \mathcal{C} .*

Proof. Let $\mathcal{I} \rightarrow PAb(\mathcal{C})$, $i \mapsto \mathcal{F}_i$ be a diagram. We can simply define abelian presheaves L and C by the rules

$$L : U \longmapsto \lim_i \mathcal{F}_i(U)$$

and

$$C : U \longmapsto \text{colim}_i \mathcal{F}_i(U).$$

It is clear that there are maps of abelian presheaves $L \rightarrow \mathcal{F}_i$ and $\mathcal{F}_i \rightarrow C$, by using the corresponding maps on groups of sections over each U . It is straightforward to check that L and C endowed with these maps are the limit and colimit of the diagram in $PAb(\mathcal{C})$. This proves (1) and (2). Details omitted. \square

18.3. Abelian sheaves

Let \mathcal{C} be a site. The category of abelian sheaves on \mathcal{C} is denoted $Ab(\mathcal{C})$. It is the full subcategory of $PAb(\mathcal{C})$ consisting of those abelian presheaves whose underlying presheaves of sets are sheaves. Properties $(\alpha) - (\zeta)$ of Sites, Section 7.43 hold, see Sites, Proposition 7.43.3. In particular the inclusion functor $Ab(\mathcal{C}) \rightarrow PAb(\mathcal{C})$ has a left adjoint, namely the sheafification functor $\mathcal{G} \mapsto \mathcal{G}^\#$.

We suggest the reader prove the lemma on a piece of scratch paper rather than reading the proof.

Lemma 18.3.1. *Let \mathcal{C} be a site. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of abelian sheaves on \mathcal{C} .*

- (1) *The category $Ab(\mathcal{C})$ is an abelian category.*
- (2) *The kernel $\text{Ker}(\varphi)$ of φ is the same as the kernel of φ as a morphism of presheaves.*
- (3) *The morphism φ is injective (Homology, Definition 12.5.3) if and only if φ is injective as a map of presheaves (Sites, Definition 7.3.1), if and only if φ is injective as a map of sheaves (Sites, Definition 7.12.1).*
- (4) *The cokernel $\text{Coker}(\varphi)$ of φ is the sheafification of the cokernel of φ as a morphism of presheaves.*
- (5) *The morphism φ is surjective (Homology, Definition 12.5.3) if and only if φ is surjective as a map of sheaves (Sites, Definition 7.12.1).*
- (6) *A complex of abelian sheaves*

$$\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$$

is exact at \mathcal{G} if and only if for all $U \in \text{Ob}(\mathcal{C})$ and all $s \in \mathcal{G}(U)$ mapping to zero in $\mathcal{H}(U)$ there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ in \mathcal{C} such that each $s|_{U_i}$ is in the image of $\mathcal{F}(U_i) \rightarrow \mathcal{G}(U_i)$.

Proof. We claim that Homology, Lemma 12.7.3 applies to the categories $\mathcal{A} = Ab(\mathcal{C})$ and $\mathcal{B} = PAb(\mathcal{C})$, and the functors $a : \mathcal{A} \rightarrow \mathcal{B}$ (inclusion), and $b : \mathcal{B} \rightarrow \mathcal{A}$ (sheafification). Let us check the assumptions of Homology, Lemma 12.7.3. Assumption (1) is that \mathcal{A}, \mathcal{B} are additive categories, a, b are additive functors, and a is right adjoint to b . The first two statements are clear and adjointness is Sites, Section 7.43 (ϵ) . Assumption (2) says that $PAb(\mathcal{C})$ is abelian which we saw in Section 18.2 and that sheafification is left exact, which is Sites, Section 7.43 (ζ) . The final assumption is that $ba \cong \text{id}_{\mathcal{A}}$ which is Sites, Section 7.43 (δ) . Hence Homology, Lemma 12.7.3 applies and we conclude that $Ab(\mathcal{C})$ is abelian.

In the proof of Homology, Lemma 12.7.3 it is shown that $\text{Ker}(\varphi)$ and $\text{Coker}(\varphi)$ are equal to the sheafification of the kernel and cokernel of φ as a morphism of abelian presheaves. This proves (4). Since the kernel is a equalizer (i.e., a limit) and since sheafification commutes with finite limits, we conclude that (2) holds.

Statement (2) implies (3). Statement (4) implies (5) by our description of sheafification. The characterization of exactness in (6) follows from (2) and (5), and the fact that the sequence is exact if and only if $\text{Im}(\mathcal{F} \rightarrow \mathcal{G}) = \text{Ker}(\mathcal{G} \rightarrow \mathcal{H})$. \square

Another way to say part (6) of the lemma is that a sequence of abelian sheaves

$$\mathcal{F}_1 \longrightarrow \mathcal{F}_2 \longrightarrow \mathcal{F}_3$$

is exact if and only if the sheafification of $U \mapsto \mathcal{F}_2(U)/\mathcal{F}_1(U)$ is equal to the kernel of $\mathcal{F}_2 \rightarrow \mathcal{F}_3$.

Lemma 18.3.2. *Let \mathcal{C} be a site.*

- (1) *All limits and colimits exist in $Ab(\mathcal{C})$.*
- (2) *Limits are the same as the corresponding limits of abelian presheaves over \mathcal{C} (i.e., commute with taking sections over objects of \mathcal{C}).*
- (3) *Finite direct sums are the same as the corresponding finite direct sums in the category of abelian pre-sheaves over \mathcal{C} .*
- (4) *A colimit is the sheafification of the corresponding colimit in the category of abelian presheaves.*
- (5) *Filtered colimits are exact.*

Proof. By Lemma 18.2.1 limits and colimits of abelian presheaves exist, and are described by taking limits and colimits on the level of sections over objects.

Let $\mathcal{I} \rightarrow Ab(\mathcal{C})$, $i \mapsto \mathcal{F}_i$ be a diagram. Let $\lim_i \mathcal{F}_i$ be the limit of the diagram as an abelian presheaf. By Sites, Lemma 7.10.1 this is an abelian sheaf. Then it is quite easy to see that $\lim_i \mathcal{F}_i$ is the limit of the diagram in $Ab(\mathcal{C})$. This proves limits exist and (2) holds.

By Categories, Lemma 4.24.4, and because sheafification is left adjoint to the inclusion functor we see that $\text{colim}_i \mathcal{F}$ exists and is the sheafification of the colimit in $PAb(\mathcal{C})$. This proves colimits exist and (4) holds.

Finite direct sums are the same thing as finite products in any abelian category. Hence (3) follows from (2).

Proof of (5). The statement means that given a system $0 \rightarrow \mathcal{F}_i \rightarrow \mathcal{G}_i \rightarrow \mathcal{H}_i \rightarrow 0$ of exact sequences of abelian sheaves over a directed partially ordered set I the sequence $0 \rightarrow \text{colim } \mathcal{F}_i \rightarrow \text{colim } \mathcal{G}_i \rightarrow \text{colim } \mathcal{H}_i \rightarrow 0$ is exact as well. A formal argument using Homology, Lemma 12.5.8 and the definition of colimits shows that the sequence $\text{colim } \mathcal{F}_i \rightarrow \text{colim } \mathcal{G}_i \rightarrow \text{colim } \mathcal{H}_i \rightarrow 0$ is exact. Note that $\text{colim } \mathcal{F}_i \rightarrow \text{colim } \mathcal{G}_i$ is the sheafification of the map of presheaf colimits which is injective as each of the maps $\mathcal{F}_i \rightarrow \mathcal{G}_i$ is injective. Since sheafification is exact we conclude. \square

18.4. Free abelian presheaves

In order to prepare notation for the following definition, let us agree to denote the free abelian group on a set S as¹ $\mathbf{Z}[S] = \bigoplus_{s \in S} \mathbf{Z}$. It is characterized by the property

$$\text{Mor}_{Ab}(\mathbf{Z}[S], A) = \text{Mor}_{Sets}(S, A)$$

In other words the construction $S \mapsto \mathbf{Z}[S]$ is a left adjoint to the forgetful functor $Ab \rightarrow Sets$.

Definition 18.4.1. Let \mathcal{C} be a category. Let \mathcal{G} be a presheaf of sets. The *free abelian presheaf* $\mathbf{Z}_{\mathcal{G}}$ on \mathcal{G} is the abelian presheaf defined by the rule

$$U \mapsto \mathbf{Z}[\mathcal{G}(U)].$$

In the special case $\mathcal{G} = h_X$ of a representable presheaf associated to an object X of \mathcal{C} we use the notation $\mathbf{Z}_X = \mathbf{Z}_{h_X}$. In other words

$$\mathbf{Z}_X(U) = \mathbf{Z}[\text{Mor}_{\mathcal{C}}(U, X)].$$

¹In other chapters the notation $\mathbf{Z}[S]$ sometimes indicates the polynomial ring over \mathbf{Z} on S .

This construction is clearly functorial in the presheaf \mathcal{G} . In fact it is adjoint to the forgetful functor $PAb(\mathcal{C}) \rightarrow PSh(\mathcal{C})$. Here is the precise statement.

Lemma 18.4.2. *Let \mathcal{C} be a category. Let \mathcal{G}, \mathcal{F} be a presheaves of sets. Let \mathcal{A} be an abelian presheaf. Let U be an object of \mathcal{C} . Then we have*

$$\begin{aligned}\text{Mor}_{PSh(\mathcal{C})}(h_U, \mathcal{F}) &= \mathcal{F}(U), \\ \text{Mor}_{PAb(\mathcal{C})}(\mathbf{Z}_{\mathcal{G}}, \mathcal{A}) &= \text{Mor}_{PSh(\mathcal{C})}(\mathcal{G}, \mathcal{A}), \\ \text{Mor}_{PAb(\mathcal{C})}(\mathbf{Z}_U, \mathcal{A}) &= \mathcal{A}(U).\end{aligned}$$

All of these equalities are functorial.

Proof. Omitted. □

Lemma 18.4.3. *Let \mathcal{C} be a category. Let I be a set. For each $i \in I$ let \mathcal{G}_i be a presheaf of sets. Then*

$$\mathbf{Z}_{\coprod_i \mathcal{G}_i} = \bigoplus_{i \in I} \mathbf{Z}_{\mathcal{G}_i}$$

in $PAb(\mathcal{C})$.

Proof. Omitted. □

18.5. Free abelian sheaves

Here is the notion of a free abelian sheaf on a sheaf of sets.

Definition 18.5.1. Let \mathcal{C} be a site. Let \mathcal{G} be a presheaf of sets. The *free abelian sheaf* $\mathbf{Z}_{\mathcal{G}}^{\#}$ on \mathcal{G} is the abelian sheaf $\mathbf{Z}_{\mathcal{G}}^{\#}$ which is the sheafification of the abelian presheaf on \mathcal{G} . In the special case $\mathcal{G} = h_X$ of a representable presheaf associated to an object X of \mathcal{C} we use the notation $\mathbf{Z}_X^{\#}$.

This construction is clearly functorial in the presheaf \mathcal{G} . In fact it provides an adjoint to the forgetful functor $Ab(\mathcal{C}) \rightarrow Sh(\mathcal{C})$. Here is the precise statement.

Lemma 18.5.2. *Let \mathcal{C} be a site. Let \mathcal{G}, \mathcal{F} be a sheaves of sets. Let \mathcal{A} be an abelian sheaf. Let U be an object of \mathcal{C} . Then we have*

$$\begin{aligned}\text{Mor}_{Sh(\mathcal{C})}(h_U^{\#}, \mathcal{F}) &= \mathcal{F}(U), \\ \text{Mor}_{Ab(\mathcal{C})}(\mathbf{Z}_{\mathcal{G}}^{\#}, \mathcal{A}) &= \text{Mor}_{Sh(\mathcal{C})}(\mathcal{G}, \mathcal{A}), \\ \text{Mor}_{Ab(\mathcal{C})}(\mathbf{Z}_U^{\#}, \mathcal{A}) &= \mathcal{A}(U).\end{aligned}$$

All of these equalities are functorial.

Proof. Omitted. □

Lemma 18.5.3. *Let \mathcal{C} be a site. Let \mathcal{G} be a presheaf of sets. Then $\mathbf{Z}_{\mathcal{G}}^{\#} = (\mathbf{Z}_{\mathcal{G}^{\#}})^{\#}$.*

Proof. Omitted. □

18.6. Ringed sites

In this chapter we mainly work with sheaves of modules on a ringed site. Hence we need to define this notion.

Definition 18.6.1. Ringed sites.

- (1) A *ringed site* is a pair $(\mathcal{C}, \mathcal{O})$ where \mathcal{C} is a site and \mathcal{O} is a sheaf of rings on \mathcal{C} . The sheaf \mathcal{O} is called the *structure sheaf* of the ringed site.

- (2) Let $(\mathcal{C}, \mathcal{O})$, $(\mathcal{C}', \mathcal{O}')$ be ringed sites. A *morphism of ringed sites*

$$(f, f^\sharp) : (\mathcal{C}, \mathcal{O}) \longrightarrow (\mathcal{C}', \mathcal{O}')$$

is given by a morphism of sites $f : \mathcal{C} \rightarrow \mathcal{C}'$ (see Sites, Definition 7.15.1) together with a map of sheaves of rings $f^\sharp : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$, which by adjunction is the same thing as a map of sheaves of rings $f^\sharp : \mathcal{O}' \rightarrow f_*\mathcal{O}$.

- (3) Let $(f, f^\sharp) : (\mathcal{C}_1, \mathcal{O}_1) \rightarrow (\mathcal{C}_2, \mathcal{O}_2)$ and $(g, g^\sharp) : (\mathcal{C}_2, \mathcal{O}_2) \rightarrow (\mathcal{C}_3, \mathcal{O}_3)$ be morphisms of ringed sites. Then we define the *composition of morphisms of ringed sites* by the rule

$$(g, g^\sharp) \circ (f, f^\sharp) = (g \circ f, f^\sharp \circ g^\sharp).$$

Here we use composition of morphisms of sites defined in Sites, Definition 7.15.4 and $f^\sharp \circ g^\sharp$ indicates the morphism of sheaves of rings

$$\mathcal{O}_3 \xrightarrow{g^\sharp} g_*\mathcal{O}_2 \xrightarrow{g_*f^\sharp} g_*f_*\mathcal{O}_1 = (g \circ f)_*\mathcal{O}_1$$

18.7. Ringed topoi

A ringed topos is just a ringed site, except that the notion of a morphism of ringed topoi is different from the notion of a morphism of ringed sites.

Definition 18.7.1. Ringed topoi.

- (1) A *ringed topos* is a pair $(Sh(\mathcal{C}), \mathcal{O})$ where \mathcal{C} is a site and \mathcal{O} is a sheaf of rings on \mathcal{C} . The sheaf \mathcal{O} is called the *structure sheaf* of the ringed site.
- (2) Let $(Sh(\mathcal{C}), \mathcal{O})$, $(Sh(\mathcal{C}'), \mathcal{O}')$ be ringed topoi. A *morphism of ringed topoi*

$$(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}) \longrightarrow (Sh(\mathcal{C}'), \mathcal{O}')$$

is given by a morphism of topoi $f : \mathcal{C} \rightarrow \mathcal{C}'$ (see Sites, Definition 7.16.1) together with a map of sheaves of rings $f^\sharp : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$, which by adjunction is the same thing as a map of sheaves of rings $f^\sharp : \mathcal{O}' \rightarrow f_*\mathcal{O}$.

- (3) Let $(f, f^\sharp) : (Sh(\mathcal{C}_1), \mathcal{O}_1) \rightarrow (Sh(\mathcal{C}_2), \mathcal{O}_2)$ and $(g, g^\sharp) : (Sh(\mathcal{C}_2), \mathcal{O}_2) \rightarrow (Sh(\mathcal{C}_3), \mathcal{O}_3)$ be morphisms of ringed topoi. Then we define the *composition of morphisms of ringed topoi* by the rule

$$(g, g^\sharp) \circ (f, f^\sharp) = (g \circ f, f^\sharp \circ g^\sharp).$$

Here we use composition of morphisms of topoi defined in Sites, Definition 7.16.1 and $f^\sharp \circ g^\sharp$ indicates the morphism of sheaves of rings

$$\mathcal{O}_3 \xrightarrow{g^\sharp} g_*\mathcal{O}_2 \xrightarrow{g_*f^\sharp} g_*f_*\mathcal{O}_1 = (g \circ f)_*\mathcal{O}_1$$

Every morphism of ringed topoi is the composition of an equivalence of ringed topoi with a morphism of ringed topoi associated to a morphism of ringed sites. Here is the precise statement.

Lemma 18.7.2. *Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. There exists a factorization*

$$\begin{array}{ccc} (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) & \xrightarrow{\quad\quad\quad} & (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \\ (g, g^\sharp) \downarrow & \searrow (f, f^\sharp) & \downarrow (e, e^\sharp) \\ (Sh(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{(h, h^\sharp)} & (Sh(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) \end{array}$$

where

- (1) $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}')$ is an equivalence of topoi induced by a special cocontinuous functor $\mathcal{C} \rightarrow \mathcal{C}'$ (see Sites, Definition 7.28.2),
- (2) $e : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{D}')$ is an equivalence of topoi induced by a special cocontinuous functor $\mathcal{D} \rightarrow \mathcal{D}'$ (see Sites, Definition 7.28.2),
- (3) $\mathcal{O}_{\mathcal{C}'} = g_*\mathcal{O}_{\mathcal{C}}$ and g^\sharp is the obvious map,
- (4) $\mathcal{O}_{\mathcal{D}'} = e_*\mathcal{O}_{\mathcal{D}}$ and e^\sharp is the obvious map,
- (5) the sites \mathcal{C}' and \mathcal{D}' have final objects and fibre products (i.e., all finite limits),
- (6) h is a morphism of sites induced by a continuous functor $u : \mathcal{D}' \rightarrow \mathcal{C}'$ which commutes with all finite limits (i.e., it satisfies the assumptions of Sites, Proposition 7.15.6), and
- (7) given any set of sheaves \mathcal{F}_i (resp. \mathcal{G}_j) on \mathcal{C} (resp. \mathcal{D}) we may assume each of these is a representable sheaf on \mathcal{C}' (resp. \mathcal{D}').

Moreover, if (f, f^\sharp) is an equivalence of ringed topoi, then we can choose the diagram such that $\mathcal{C}' = \mathcal{D}'$, $\mathcal{O}_{\mathcal{C}'} = \mathcal{O}_{\mathcal{D}'}$ and (h, h^\sharp) is the identity.

Proof. This follows from Sites, Lemma 7.28.6, and Sites, Remarks 7.28.7 and 7.28.8. You just have to carry along the sheaves of rings. Some details omitted. \square

18.8. 2-morphisms of ringed topoi

This is a brief section concerning the notion of a 2-morphism of ringed topoi.

Definition 18.8.1. Let $f, g : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be two morphisms of ringed topoi. A 2-morphism from f to g is given by a transformation of functors $t : f_* \rightarrow g_*$ such that

$$\begin{array}{ccc}
 & \mathcal{O}_{\mathcal{D}} & \\
 f^\sharp \swarrow & & \searrow g^\sharp \\
 f_*\mathcal{O}_{\mathcal{C}} & \xrightarrow{t} & g_*\mathcal{O}_{\mathcal{C}}
 \end{array}$$

is commutative.

Pictorially we sometimes represent t as follows:

$$(Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \begin{array}{c} \xrightarrow{f} \\ \Downarrow t \\ \xrightarrow{g} \end{array} (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$$

As in Sites, Section 7.35 giving a 2-morphism $t : f_* \rightarrow g_*$ is equivalent to giving $t : g^{-1} \rightarrow f^{-1}$ (usually denoted by the same symbol) such that the diagram

$$\begin{array}{ccc}
 f^{-1}\mathcal{O}_{\mathcal{D}} & \xleftarrow{t} & g^{-1}\mathcal{O}_{\mathcal{D}} \\
 f^\sharp \searrow & & \swarrow g^\sharp \\
 & \mathcal{O}_{\mathcal{C}} &
 \end{array}$$

is commutative. As in Sites, Section 7.35 the axioms of a strict 2-category hold with horizontal and vertical compositions defined as explained in loc. cit.

18.9. Presheaves of modules

Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings on \mathcal{C} . At this point we have not yet defined a presheaf of \mathcal{O} -modules. Thus we do so right now.

Definition 18.9.1. Let \mathcal{C} be a category, and let \mathcal{O} be a presheaf of rings on \mathcal{C} .

- (1) A *presheaf of \mathcal{O} -modules* is given by an abelian presheaf \mathcal{F} together with a map of presheaves of sets

$$\mathcal{O} \times \mathcal{F} \longrightarrow \mathcal{F}$$

such that for every object U of \mathcal{C} the map $\mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an $\mathcal{O}(U)$ -module structure on the abelian group $\mathcal{F}(U)$.

- (2) A *morphism $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of \mathcal{O} -modules* is a morphism of abelian presheaves $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ such that the diagram

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{F} & \longrightarrow & \mathcal{F} \\ \text{id} \times \varphi \downarrow & & \downarrow \varphi \\ \mathcal{O} \times \mathcal{G} & \longrightarrow & \mathcal{G} \end{array}$$

commutes.

- (3) The set of \mathcal{O} -module morphisms as above is denoted $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$.
- (4) The category of presheaves of \mathcal{O} -modules is denoted $\text{PMod}(\mathcal{O})$.

Suppose that $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ is a morphism of presheaves of rings on the category \mathcal{C} . In this case, if \mathcal{F} is a presheaf of \mathcal{O}_2 -modules then we can think of \mathcal{F} as a presheaf of \mathcal{O}_1 -modules by using the composition

$$\mathcal{O}_1 \times \mathcal{F} \rightarrow \mathcal{O}_2 \times \mathcal{F} \rightarrow \mathcal{F}.$$

We sometimes denote this by $\mathcal{F}_{\mathcal{O}_1}$ to indicate the restriction of rings. We call this the *restriction of \mathcal{F}* . We obtain the restriction functor

$$\text{PMod}(\mathcal{O}_2) \longrightarrow \text{PMod}(\mathcal{O}_1)$$

On the other hand, given a presheaf of \mathcal{O}_1 -modules \mathcal{G} we can construct a presheaf of \mathcal{O}_2 -modules $\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}$ by the rule

$$U \longmapsto (\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G})(U) = \mathcal{O}_2(U) \otimes_{\mathcal{O}_1(U)} \mathcal{G}(U)$$

where $U \in \text{Ob}(\mathcal{C})$, with obvious restriction mappings. The index p stands for “presheaf” and not “point”. This presheaf is called the *tensor product presheaf*. We obtain the *change of rings* functor

$$\text{PMod}(\mathcal{O}_1) \longrightarrow \text{PMod}(\mathcal{O}_2)$$

Lemma 18.9.2. *With \mathcal{C} , $\mathcal{O}_1 \rightarrow \mathcal{O}_2$, \mathcal{F} and \mathcal{G} as above there exists a canonical bijection*

$$\text{Hom}_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors defined above are adjoint to each other.

Proof. This follows from the fact that for a ring map $A \rightarrow B$ the restriction functor and the change of ring functor are adjoint to each other. □

18.10. Sheaves of modules

Definition 18.10.1. Let \mathcal{C} be a site. Let \mathcal{O} be a sheaf of rings on \mathcal{C} .

- (1) A *sheaf of \mathcal{O} -modules* is a presheaf of \mathcal{O} -modules \mathcal{F} , see Definition 18.9.1, such that the underlying presheaf of abelian groups \mathcal{F} is a sheaf.
- (2) A *morphism of sheaves of \mathcal{O} -modules* is a morphism of presheaves of \mathcal{O} -modules.
- (3) Given sheaves of \mathcal{O} -modules \mathcal{F} and \mathcal{G} we denote $\text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ the set of morphism of sheaves of \mathcal{O} -modules.
- (4) The category of sheaves of \mathcal{O} -modules is denoted $\text{Mod}(\mathcal{O})$.

This definition kind of makes sense even if \mathcal{O} is just a presheaf of rings, although we do not know any examples where this is useful, and we will avoid using the terminology “sheaves of \mathcal{O} -modules” in case \mathcal{O} is not a sheaf of rings.

18.11. Sheafification of presheaves of modules

Lemma 18.11.1. *Let \mathcal{C} be a site. Let \mathcal{O} be a presheaf of rings on \mathcal{C} . Let \mathcal{F} be a presheaf \mathcal{O} -modules. Let $\mathcal{O}^\#$ be the sheafification of \mathcal{O} as a presheaf of rings, see Sites, Section 7.4.3. Let $\mathcal{F}^\#$ be the sheafification of \mathcal{F} as a presheaf of abelian groups. There exists a map of sheaves of sets*

$$\mathcal{O}^\# \times \mathcal{F}^\# \longrightarrow \mathcal{F}^\#$$

which makes the diagram

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{F} & \longrightarrow & \mathcal{F} \\ \downarrow & & \downarrow \\ \mathcal{O}^\# \times \mathcal{F}^\# & \longrightarrow & \mathcal{F}^\# \end{array}$$

commute and which makes $\mathcal{F}^\#$ into a sheaf of $\mathcal{O}^\#$ -modules. In addition, if \mathcal{G} is a sheaf of $\mathcal{O}^\#$ -modules, then any morphism of presheaves of \mathcal{O} -modules $\mathcal{F} \rightarrow \mathcal{G}$ (into the restriction of \mathcal{G} to a \mathcal{O} -module) factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^\# \rightarrow \mathcal{G}$ where $\mathcal{F}^\# \rightarrow \mathcal{G}$ is a morphism of $\mathcal{O}^\#$ -modules.

Proof. Omitted. □

This actually means that the functor $i : \text{Mod}(\mathcal{O}^\#) \rightarrow \text{PMod}(\mathcal{O})$ (combining restriction and including sheaves into presheaves) and the sheafification functor of the lemma $\# : \text{PMod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}^\#)$ are adjoint. In a formula

$$\text{Mor}_{\text{PMod}(\mathcal{O})}(\mathcal{F}, i\mathcal{G}) = \text{Mor}_{\text{Mod}(\mathcal{O}^\#)}(\mathcal{F}^\#, \mathcal{G})$$

An important case happens when \mathcal{O} is already a sheaf of rings. In this case the formula reads

$$\text{Mor}_{\text{PMod}(\mathcal{O})}(\mathcal{F}, i\mathcal{G}) = \text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{F}^\#, \mathcal{G})$$

because $\mathcal{O} = \mathcal{O}^\#$ in this case.

Lemma 18.11.2. *Let \mathcal{C} be a site. Let \mathcal{O} be a presheaf of rings on \mathcal{C} . The sheafification functor*

$$\text{PMod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O}^\#), \quad \mathcal{F} \longmapsto \mathcal{F}^\#$$

is exact.

Proof. This is true because it holds for sheafification $\text{PAb}(\mathcal{C}) \rightarrow \text{Ab}(\mathcal{C})$. See the discussion in Section 18.3. □

Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a morphism of sheaves of rings on \mathcal{C} . In Section 18.9 we defined a restriction functor and a change of rings functor on presheaves of modules associated to this situation.

If \mathcal{F} is a sheaf of \mathcal{O}_2 -modules then the restriction $\mathcal{F}_{\mathcal{O}_1}$ of \mathcal{F} is clearly a sheaf of \mathcal{O}_1 -modules. We obtain the restriction functor

$$\text{Mod}(\mathcal{O}_2) \longrightarrow \text{Mod}(\mathcal{O}_1)$$

On the other hand, given a sheaf of \mathcal{O}_1 -modules \mathcal{G} the presheaf of \mathcal{O}_2 -modules $\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}$ is in general not a sheaf. Hence we define the *tensor product sheaf* $\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}$ by the formula

$$\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G} = (\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G})^\#$$

as the sheafification of our construction for presheaves. We obtain the *change of rings* functor

$$\text{Mod}(\mathcal{O}_1) \longrightarrow \text{Mod}(\mathcal{O}_2)$$

Lemma 18.11.3. *With X , \mathcal{O}_1 , \mathcal{O}_2 , \mathcal{F} and \mathcal{G} as above there exists a canonical bijection*

$$\text{Hom}_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from Lemma 18.9.2 and the fact that $\text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p, \mathcal{O}_1} \mathcal{G}, \mathcal{F})$ because \mathcal{F} is a sheaf. \square

Lemma 18.11.4. *Let \mathcal{C} be a site. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be an epimorphism of sheaves of rings. Let $\mathcal{G}_1, \mathcal{G}_2$ be \mathcal{O}' -modules. Then*

$$\text{Hom}_{\mathcal{O}'}(\mathcal{G}_1, \mathcal{G}_2) = \text{Hom}_{\mathcal{O}}(\mathcal{G}_1, \mathcal{G}_2).$$

In other words, the restriction functor $\text{Mod}(\mathcal{O}') \rightarrow \text{Mod}(\mathcal{O})$ is fully faithful.

Proof. This is the sheaf version of Algebra, Lemma 10.103.14 and is proved in exactly the same way. \square

18.12. Morphisms of topoi and sheaves of modules

All of this material is completely straightforward. We formulate everything in the case of morphisms of topoi, but of course the results also hold in the case of morphisms of sites.

Lemma 18.12.1. *Let \mathcal{C} , \mathcal{D} be sites. Let $f : \text{Sh}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{D})$ be a morphism of topoi. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . Let \mathcal{F} be a sheaf of \mathcal{O} -modules. There is a natural map of sheaves of sets*

$$f_*\mathcal{O} \times f_*\mathcal{F} \longrightarrow f_*\mathcal{F}$$

which turns $f_\mathcal{F}$ into a sheaf of $f_*\mathcal{O}$ -modules. This construction is functorial in \mathcal{F} .*

Proof. Denote $\mu : \mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ the multiplication map. Recall that f_* (on sheaves of sets) is left exact and hence commutes with products. Hence $f_*\mu$ is a map as indicated. This proves the lemma. \square

Lemma 18.12.2. *Let \mathcal{C}, \mathcal{D} be sites. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Let \mathcal{O} be a sheaf of rings on \mathcal{D} . Let \mathcal{G} be a sheaf of \mathcal{O} -modules. There is a natural map of sheaves of sets*

$$f^{-1}\mathcal{O} \times f^{-1}\mathcal{G} \longrightarrow f^{-1}\mathcal{G}$$

which turns $f^{-1}\mathcal{G}$ into a sheaf of $f^{-1}\mathcal{O}$ -modules. This construction is functorial in \mathcal{G} .

Proof. Denote $\mu : \mathcal{O} \times \mathcal{G} \rightarrow \mathcal{G}$ the multiplication map. Recall that f^{-1} (on sheaves of sets) is exact and hence commutes with products. Hence $f^{-1}\mu$ is a map as indicated. This proves the lemma. \square

Lemma 18.12.3. *Let \mathcal{C}, \mathcal{D} be sites. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Let \mathcal{O} be a sheaf of rings on \mathcal{D} . Let \mathcal{G} be a sheaf of \mathcal{O} -modules. Let \mathcal{F} be a sheaf of $f^{-1}\mathcal{O}$ -modules. Then*

$$\text{Mor}_{\text{Mod}(f^{-1}\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 18.12.2 and 18.12.1, and we think of $f_*\mathcal{F}$ as an \mathcal{O} -module by restriction via $\mathcal{O} \rightarrow f_*f^{-1}\mathcal{O}$.

Proof. First we note that we have

$$\text{Mor}_{\text{Ab}(\mathcal{C})}(f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Ab}(\mathcal{D})}(\mathcal{G}, f_*\mathcal{F}).$$

by Sites, Proposition 7.43.3. Suppose that $\alpha : f^{-1}\mathcal{G} \rightarrow \mathcal{F}$ and $\beta : \mathcal{G} \rightarrow f_*\mathcal{F}$ are morphisms of abelian sheaves which correspond via the formula above. We have to show that α is $f^{-1}\mathcal{O}$ -linear if and only if β is \mathcal{O} -linear. For example, suppose α is $f^{-1}\mathcal{O}$ -linear, then clearly $f_*\alpha$ is $f_*f^{-1}\mathcal{O}$ -linear, and hence (as restriction is a functor) is \mathcal{O} -linear. Hence it suffices to prove that the adjunction map $\mathcal{G} \rightarrow f_*f^{-1}\mathcal{G}$ is \mathcal{O} -linear. Using that both f_* and f^{-1} commute with products (on sheaves of sets) this comes down to showing that

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{G} & \longrightarrow & f_*f^{-1}(\mathcal{O} \times \mathcal{G}) \\ \downarrow & & \downarrow \\ \mathcal{G} & \longrightarrow & f_*f^{-1}\mathcal{G} \end{array}$$

is commutative. This holds because the adjunction mapping $\text{id}_{Sh(\mathcal{D})} \rightarrow f_*f^{-1}$ is a transformation of functors. We omit the proof of the implication β linear \Rightarrow α linear. \square

Lemma 18.12.4. *Let \mathcal{C}, \mathcal{D} be sites. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Let \mathcal{G} be a sheaf of $f_*\mathcal{O}$ -modules. Then*

$$\text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Mod}(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 18.12.2 and 18.12.1, and we use the canonical map $f^{-1}f_*\mathcal{O} \rightarrow \mathcal{O}$ in the definition of the tensor product.

Proof. Note that we have

$$\text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Mod}(f^{-1}f_*\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}f_*\mathcal{O}})$$

by Lemma 18.11.3. Hence the result follows from Lemma 18.12.3. \square

18.13. Morphisms of ringed topoi and modules

We have now introduced enough notation so that we are able to define the pullback and pushforward of modules along a morphism of ringed topoi.

Definition 18.13.1. Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi or ringed sites.

- (1) Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{C}}$ -modules. We define the *pushforward* of \mathcal{F} as the sheaf of $\mathcal{O}_{\mathcal{D}}$ -modules which as a sheaf of abelian groups equals $f_*\mathcal{F}$ and with module structure given by the restriction via $f^\sharp : \mathcal{O}_{\mathcal{D}} \rightarrow f_*\mathcal{O}_{\mathcal{C}}$ of the module structure

$$f_*\mathcal{O}_{\mathcal{C}} \times f_*\mathcal{F} \longrightarrow f_*\mathcal{F}$$

from Lemma 18.12.1.

- (2) Let \mathcal{G} be a sheaf of $\mathcal{O}_{\mathcal{D}}$ -modules. We define the *pullback* $f^*\mathcal{G}$ to be the sheaf of $\mathcal{O}_{\mathcal{C}}$ -modules defined by the formula

$$f^*\mathcal{F} = \mathcal{O}_{\mathcal{C}} \otimes_{f^{-1}\mathcal{O}_{\mathcal{D}}} f^{-1}\mathcal{F}$$

where the ring map $f^{-1}\mathcal{O}_{\mathcal{D}} \rightarrow \mathcal{O}_{\mathcal{C}}$ is f^\sharp , and where the module structure is given by Lemma 18.12.2.

Thus we have defined functors

$$\begin{aligned} f_* : Mod(\mathcal{O}_{\mathcal{C}}) &\longrightarrow Mod(\mathcal{O}_{\mathcal{D}}) \\ f^* : Mod(\mathcal{O}_{\mathcal{D}}) &\longrightarrow Mod(\mathcal{O}_{\mathcal{C}}) \end{aligned}$$

The final result on these functors is that they are indeed adjoint as expected.

Lemma 18.13.2. Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi or ringed sites. Let \mathcal{F} be a sheaf of $\mathcal{O}_{\mathcal{C}}$ -modules. Let \mathcal{G} be a sheaf of $\mathcal{O}_{\mathcal{D}}$ -modules. There is a canonical bijection

$$\mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(f^*\mathcal{G}, \mathcal{F}) = \mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, f_*\mathcal{F}).$$

In other words: the functor f^* is the left adjoint to f_* .

Proof. This follows from the work we did before:

$$\begin{aligned} \mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(f^*\mathcal{G}, \mathcal{F}) &= \mathrm{Mor}_{Mod(\mathcal{O}_{\mathcal{C}})}(\mathcal{O}_{\mathcal{C}} \otimes_{f^{-1}\mathcal{O}_{\mathcal{D}}} f^{-1}\mathcal{G}, \mathcal{F}) \\ &= \mathrm{Mor}_{Mod(f^{-1}\mathcal{O}_{\mathcal{D}})}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}\mathcal{O}_{\mathcal{D}}}) \\ &= \mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

Here we use Lemmas 18.11.3 and 18.12.3. □

Lemma 18.13.3. $(f, f^\sharp) : (Sh(\mathcal{C}_1), \mathcal{O}_1) \rightarrow (Sh(\mathcal{C}_2), \mathcal{O}_2)$ and $(g, g^\sharp) : (Sh(\mathcal{C}_2), \mathcal{O}_2) \rightarrow (Sh(\mathcal{C}_3), \mathcal{O}_3)$ be morphisms of ringed topoi. There are canonical isomorphisms of functors $(g \circ f)_* \cong g_* \circ f_*$ and $(g \circ f)^* \cong f^* \circ g^*$.

Proof. This is clear from the definitions. □

18.14. The abelian category of sheaves of modules

Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let \mathcal{F}, \mathcal{G} be sheaves of \mathcal{O} -modules, see Sheaves, Definition 6.10.1. Let $\varphi, \psi : \mathcal{F} \rightarrow \mathcal{G}$ be morphisms of sheaves of \mathcal{O} -modules. We define $\varphi + \psi : \mathcal{F} \rightarrow \mathcal{G}$ to be the sum of φ and ψ as morphisms of abelian sheaves. This is clearly again a map of \mathcal{O} -modules. It is also clear that composition of maps of \mathcal{O} -modules is bilinear with respect to this addition. Thus $Mod(\mathcal{O})$ is a pre-additive category, see Homology, Definition 12.3.1.

We will denote 0 the sheaf of \mathcal{O} -modules which has constant value $\{0\}$ for all objects U of \mathcal{C} . Clearly this is both a final and an initial object of $Mod(\mathcal{O})$. Given a morphism of \mathcal{O} -modules $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ the following are equivalent: (a) φ is zero, (b) φ factors through 0 , (c) φ is zero on sections over each object U .

Moreover, given a pair \mathcal{F}, \mathcal{G} of sheaves of \mathcal{O} -modules we may define the direct sum as

$$\mathcal{F} \oplus \mathcal{G} = \mathcal{F} \times \mathcal{G}$$

with obvious maps (i, j, p, q) as in Homology, Definition 12.3.5. Thus $Mod(\mathcal{O})$ is an additive category, see Homology, Definition 12.3.8.

Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of \mathcal{O} -modules. We may define $\text{Ker}(\varphi)$ to be the kernel of φ as a map of abelian sheaves. By Section 18.3 this is the subsheaf of \mathcal{F} with sections

$$\text{Ker}(\varphi)(U) = \{s \in \mathcal{F}(U) \mid \varphi(s) = 0 \text{ in } \mathcal{G}(U)\}$$

for all objects U of \mathcal{C} . It is easy to see that this is indeed a kernel in the category of \mathcal{O} -modules. In other words, a morphism $\alpha : \mathcal{H} \rightarrow \mathcal{F}$ factors through $\text{Ker}(\varphi)$ if and only if $\varphi \circ \alpha = 0$.

Similarly, we define $\text{Coker}(\varphi)$ as the cokernel of φ as a map of abelian sheaves. There is a unique multiplication map

$$\mathcal{O} \times \text{Coker}(\varphi) \longrightarrow \text{Coker}(\varphi)$$

such that the map $\mathcal{G} \rightarrow \text{Coker}(\varphi)$ becomes a morphism of \mathcal{O} -modules (verification omitted). The map $\mathcal{G} \rightarrow \text{Coker}(\varphi)$ is surjective (as a map of sheaves of sets, see Section 18.3). To show that $\text{Coker}(\varphi)$ is a cokernel in $Mod(\mathcal{O})$, note that if $\beta : \mathcal{G} \rightarrow \mathcal{H}$ is a morphism of \mathcal{O} -modules such that $\beta \circ \varphi$ is zero, then you get for every object U of \mathcal{C} a map induced by β from $\mathcal{G}(U)/\varphi(\mathcal{F}(U))$ into $\mathcal{H}(U)$. By the universal property of sheafification (see Sheaves, Lemma 6.20.1) we obtain a canonical map $\text{Coker}(\varphi) \rightarrow \mathcal{H}$ such that the original β is equal to the composition $\mathcal{G} \rightarrow \text{Coker}(\varphi) \rightarrow \mathcal{H}$. The morphism $\text{Coker}(\varphi) \rightarrow \mathcal{H}$ is unique because of the surjectivity mentioned above.

Lemma 18.14.1. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. The category $Mod(\mathcal{O})$ is an abelian category. The forgetful functor $Mod(\mathcal{O}) \rightarrow Ab(\mathcal{C})$ is exact, hence kernels, cokernels and exactness of \mathcal{O} -modules, correspond to the corresponding notions for abelian sheaves.*

Proof. Above we have seen that $Mod(\mathcal{O})$ is an additive category, with kernels and cokernels and that $Mod(\mathcal{O}) \rightarrow Ab(\mathcal{C})$ preserves kernels and cokernels. By Homology, Definition 12.5.1 we have to show that image and coimage agree. This is clear because it is true in $Ab(\mathcal{C})$. The lemma follows. \square

Lemma 18.14.2. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. All limits and colimits exist in $Mod(\mathcal{O})$ and the forgetful functor $Mod(\mathcal{O}) \rightarrow Ab(\mathcal{C})$ commutes with them. Moreover, filtered colimits are exact.*

Proof. The final statement follows from the first as filtered colimits are exact in $Ab(\mathcal{C})$ by Lemma 18.3.2. Let $\mathcal{I} \rightarrow Mod(\mathcal{C}), i \mapsto \mathcal{F}_i$ be a diagram. Let $\lim_i \mathcal{F}_i$ be the limit of the diagram in $Ab(\mathcal{C})$. By the description of this limit in Lemma 18.3.2 we see immediately that there exists a multiplication

$$\mathcal{O} \times \lim_i \mathcal{F}_i \longrightarrow \lim_i \mathcal{F}_i$$

which turns $\lim_i \mathcal{F}_i$ into a sheaf of \mathcal{O} -modules. It is easy to see that this is the limit of the diagram in $Mod(\mathcal{C})$. Let $\text{colim}_i \mathcal{F}_i$ be the colimit of the diagram in $PAb(\mathcal{C})$. By the description of this colimit in the proof of Lemma 18.2.1 we see immediately that there exists a multiplication

$$\mathcal{O} \times \text{colim}_i \mathcal{F}_i \longrightarrow \text{colim}_i \mathcal{F}_i$$

which turns $\text{colim}_i \mathcal{F}_i$ into a presheaf of \mathcal{O} -modules. Applying sheafification we get a sheaf of \mathcal{O} -modules $(\text{colim}_i \mathcal{F}_i)^\#$, see Lemma 18.11.1. It is easy to see that $(\text{colim}_i \mathcal{F}_i)^\#$ is the colimit of the diagram in $Mod(\mathcal{O})$, and by Lemma 18.3.2 forgetting the \mathcal{O} -module structure is the colimit in $Ab(\mathcal{C})$. \square

The existence of limits and colimits allows us to consider exactness properties of functors defined on the category of \mathcal{O} -modules in terms of limits and colimits, as in Categories, Section 4.23. See Homology, Lemma 12.7.1 for a description of exactness properties in terms of short exact sequences.

Lemma 18.14.3. *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi.*

- (1) *The functor f_* is left exact. In fact it commutes with all limits.*
- (2) *The functor f^* is right exact. In fact it commutes with all colimits.*

Proof. This is true because (f^*, f_*) is an adjoint pair of functors, see Lemma 18.13.2. See Categories, Section 4.24. \square

Lemma 18.14.4. *Let \mathcal{C} be a site. If $\{p_i\}_{i \in I}$ is a conservative family of points, then we may check exactness of a sequence of abelian sheaves on the stalks at the points $p_i, i \in I$. If \mathcal{C} has enough points, then exactness of a sequence of abelian sheaves may be checked on stalks.*

Proof. This is immediate from Sites, Lemma 7.37.2. \square

18.15. Exactness of pushforward

Some technical lemmas concerning exactness properties of pushforward.

Lemma 18.15.1. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. The following are equivalent:*

- (1) *$f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is surjective for all \mathcal{F} in $Ab(\mathcal{C})$, and*
- (2) *$f_* : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ reflects surjections.*

In this case the functor $f_ : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ is faithful.*

Proof. Assume (1). Suppose that $a : \mathcal{F} \rightarrow \mathcal{F}'$ is a map of abelian sheaves on \mathcal{C} such that f_*a is surjective. As f^{-1} is exact this implies that $f^{-1}f_*a : f^{-1}f_*\mathcal{F} \rightarrow f^{-1}f_*\mathcal{F}'$ is surjective. Combined with (1) this implies that a is surjective. This means that (2) holds.

Assume (2). Let \mathcal{F} be an abelian sheaf on \mathcal{C} . We have to show that the map $f^{-1}f_*\mathcal{F} \rightarrow \mathcal{F}$ is surjective. By (2) it suffices to show that $f_*f^{-1}f_*\mathcal{F} \rightarrow f_*\mathcal{F}$ is surjective. And this is true because there is a canonical map $f_*\mathcal{F} \rightarrow f_*f^{-1}f_*\mathcal{F}$ which is a one-sided inverse.

We omit the proof of the final assertion. \square

Lemma 18.15.2. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. Assume at least one of the following properties holds*

- (1) f_* transforms surjections of sheaves of sets into surjections,
- (2) f_* transforms surjections of abelian sheaves into surjections,
- (3) f_* commutes with coequalizers on sheaves of sets,
- (4) f_* commutes with pushouts on sheaves of sets,

Then $f_ : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ is exact.*

Proof. Since $f_* : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ is a right adjoint we already know that it transforms a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ of abelian sheaves on \mathcal{C} into an exact sequence

$$0 \rightarrow f_*\mathcal{F}_1 \rightarrow f_*\mathcal{F}_2 \rightarrow f_*\mathcal{F}_3$$

see Categories, Sections 4.23 and 4.24 and Homology, Section 12.7. Hence it suffices to prove that the map $f_*\mathcal{F}_2 \rightarrow f_*\mathcal{F}_3$ is surjective. If (1), (2) holds, then this is clear from the definitions. By Sites, Lemma 7.40.1 we see that either (3) or (4) formally implies (1), hence in these cases we are done also. \square

Lemma 18.15.3. *Let $f : \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$. Assume u is almost cocontinuous. Then*

- (1) $f_* : Ab(\mathcal{D}) \rightarrow Ab(\mathcal{C})$ is exact.
- (2) if $f^\# : f^{-1}\mathcal{O}_{\mathcal{C}} \rightarrow \mathcal{O}_{\mathcal{D}}$ is given so that f becomes a morphism of ringed sites, then $f_* : Mod(\mathcal{O}_{\mathcal{D}}) \rightarrow Mod(\mathcal{O}_{\mathcal{C}})$ is exact.

Proof. Part (2) follows from part (1) by Lemma 18.14.2. Part (1) follows from Sites, Lemmas 7.41.6 and 7.40.1. \square

18.16. Exactness of lower shriek

Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between sites. Assume that

- (a) u is cocontinuous, and
- (b) u is continuous.

Let $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be the morphism of topoi associated with u , see Sites, Lemma 7.20.1. Recall that $g^{-1} = u^p$, i.e., g^{-1} is given by the simple formula $(g^{-1}\mathcal{G})(U) = \mathcal{G}(u(U))$, see Sites, Lemma 7.20.5. We would like to show that $g^{-1} : Ab(\mathcal{D}) \rightarrow Ab(\mathcal{C})$ has a left adjoint $g_!$. By Sites, Lemma 7.20.5 the functor $g_!^{Sh} = (u_p)^\#$ is a left adjoint on sheaves of sets. Moreover, we know that $g_!^{Sh}\mathcal{F}$ is the sheaf associated to the presheaf

$$V \mapsto \operatorname{colim}_{V \rightarrow u(U)} \mathcal{F}(U)$$

where the colimit is over $(\mathcal{I}_V^u)^{opp}$ and is taken in the category of sets. Hence the following definition is natural.

Definition 18.16.1. With $u : \mathcal{C} \rightarrow \mathcal{D}$ satisfying (a), (b) above. For $\mathcal{F} \in PAb(\mathcal{C})$ we define $g_{p!}\mathcal{F}$ as the presheaf

$$V \longmapsto \operatorname{colim}_{V \rightarrow u(U)} \mathcal{F}(U)$$

with colimits over $(\mathcal{I}_V^u)^{opp}$ taken in Ab . For $\mathcal{F} \in PAb(\mathcal{C})$ we set $g_!\mathcal{F} = (g_{p!}\mathcal{F})^\#$.

The reason for being so explicit with this is that the functors $g_!^{Sh}$ and $g_!$ are different. Whenever we use both we have to be careful to make the distinction clear.

Lemma 18.16.2. *The functor $g_{p!}$ is a left adjoint to the functor u^p . The functor $g_!$ is a left adjoint to the functor g^{-1} . In other words the formulas*

$$\begin{aligned} \operatorname{Mor}_{PAb(\mathcal{C})}(\mathcal{F}, u^p\mathcal{G}) &= \operatorname{Mor}_{PAb(\mathcal{D})}(g_{p!}\mathcal{F}, \mathcal{G}), \\ \operatorname{Mor}_{Ab(\mathcal{C})}(\mathcal{F}, g^{-1}\mathcal{G}) &= \operatorname{Mor}_{Ab(\mathcal{D})}(g_!\mathcal{F}, \mathcal{G}) \end{aligned}$$

hold bifunctorially in \mathcal{F} and \mathcal{G} .

Proof. The second formula follows formally from the first, since if \mathcal{F} and \mathcal{G} are abelian sheaves then

$$\begin{aligned} \operatorname{Mor}_{Ab(\mathcal{C})}(\mathcal{F}, g^{-1}\mathcal{G}) &= \operatorname{Mor}_{PAb(\mathcal{D})}(g_{p!}\mathcal{F}, \mathcal{G}) \\ &= \operatorname{Mor}_{Ab(\mathcal{D})}(g_!\mathcal{F}, \mathcal{G}) \end{aligned}$$

by the universal property of sheafification.

To prove the first formula, let \mathcal{F}, \mathcal{G} be abelian presheaves. To prove the lemma we will construct maps from the group on the left to the group on the right and omit the verification that these are mutually inverse.

Note that there is a canonical map of abelian presheaves $\mathcal{F} \rightarrow u^p g_{p!}\mathcal{F}$ which on sections over U is the natural map $\mathcal{F}(U) \rightarrow \operatorname{colim}_{u(U) \rightarrow u(U')} \mathcal{F}(U')$, see Sites, Lemma 7.5.3. Given a map $\alpha : g_{p!}\mathcal{F} \rightarrow \mathcal{G}$ we get $u^p\alpha : u^p g_{p!}\mathcal{F} \rightarrow u^p\mathcal{G}$. which we can precompose by the map $\mathcal{F} \rightarrow u^p g_{p!}\mathcal{F}$.

Note that there is a canonical map of abelian presheaves $g_{p!}u^p\mathcal{G} \rightarrow \mathcal{G}$ which on sections over V is the natural map $\operatorname{colim}_{V \rightarrow u(U)} \mathcal{G}(u(U)) \rightarrow \mathcal{G}(V)$. It maps a section $s \in u(U)$ in the summand corresponding to $t : V \rightarrow u(U)$ to $t^*s \in \mathcal{G}(V)$. Hence, given a map $\beta : \mathcal{F} \rightarrow u^p\mathcal{G}$ we get a map $g_{p!}\beta : g_{p!}\mathcal{F} \rightarrow g_{p!}u^p\mathcal{G}$ which we can postcompose with the map $g_{p!}u^p\mathcal{G} \rightarrow \mathcal{G}$ above. \square

Lemma 18.16.3. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous,*
- (b) *u is continuous, and*
- (c) *fibre products and equalizers exist in \mathcal{C} and u commutes with them.*

In this case the functor $g_! : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ is exact.

Proof. Compare with Sites, Lemma 7.20.6. Assume (a), (b), and (c). We already know that $g_!$ is right exact as it is a left adjoint, see Categories, Lemma 4.24.5 and Homology, Section 12.7. We have $g_! = (g_{p!})^\#$. We have to show that $g_!$ transforms injective maps of abelian sheaves into injective maps of abelian presheaves. Recall that sheafification of abelian presheaves is exact, see Lemma 18.3.2. Thus it suffices to show that $g_{p!}$ transforms injective maps of abelian presheaves into injective maps

of abelian presheaves. To do this it suffices that colimits over the categories $(\mathcal{I}_V^u)^{opp}$ of Sites, Section 7.5 transform injective maps between diagrams into injections. This follows from Sites, Lemma 7.5.1 and Algebra, Lemma 10.8.11. \square

Lemma 18.16.4. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that*

- (a) *u is cocontinuous,*
- (b) *u is continuous, and*
- (c) *u is fully faithful.*

For g and $g_!$ as above the canonical map $\mathcal{F} \rightarrow g^{-1}g_!\mathcal{F}$ is an isomorphism for all abelian sheaves \mathcal{F} on \mathcal{C} .

Proof. Pick $U \in \text{Ob}(\mathcal{C})$. We will show that $g^{-1}g_!\mathcal{F}(U) = \mathcal{F}(U)$. First, note that $g^{-1}g_!\mathcal{F}(U) = g_!\mathcal{F}(u(U))$. Hence it suffices to show that $g_!\mathcal{F}(u(U)) = \mathcal{F}(U)$. We know that $g_!\mathcal{F}$ is the (abelian) sheaf associated to the presheaf $g_{p!}\mathcal{F}$ which is defined by the rule

$$V \mapsto \text{colim}_{V \rightarrow u(U')} \mathcal{F}(U')$$

with colimit taken in *Ab*. If $V = u(U)$, then, as u is fully faithful this colimit is over $U \rightarrow U'$. Hence we conclude that $g_{p!}\mathcal{F}(u(U)) = \mathcal{F}(U)$. Since u is cocontinuous and continuous any covering of $u(U)$ in \mathcal{D} can be refined by a covering $(!) \{u(U_i) \rightarrow u(U)\}$ of \mathcal{D} where $\{U_i \rightarrow U\}$ is a covering in \mathcal{C} . This implies that $(g_{p!}\mathcal{F})^+(u(U)) = \mathcal{F}(U)$ also, since in the colimit defining the value of $(g_{p!}\mathcal{F})^+$ on $u(U)$ we may restrict to the cofinal system of coverings $\{u(U_i) \rightarrow u(U)\}$ as above. Hence we see that $(g_{p!}\mathcal{F})^+(u(U)) = \mathcal{F}(U)$ for all objects U of \mathcal{C} as well. Repeating this argument one more time gives the equality $(g_{p!}\mathcal{F})^\#(u(U)) = \mathcal{F}(U)$ for all objects U of \mathcal{C} . This produces the desired equality $g^{-1}g_!\mathcal{F} = \mathcal{F}$. \square

Remark 18.16.5. In general the functor $g_!$ cannot be extended to categories of modules in case g is (part of) a morphism of ringed topoi. Namely, given any ring map $A \rightarrow B$ the functor $M \mapsto B \otimes_A M$ has a right adjoint (restriction) but not in general a left adjoint (because its existence would imply that $A \rightarrow B$ is flat). We will see in Section 18.19 below that it is possible to define $j_!$ on sheaves of modules in the case of a localization of sites. We will discuss this in greater generality in Section 18.40 below.

Lemma 18.16.6. *Let \mathcal{C} and \mathcal{D} be sites. Let $g : \text{Sh}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{D})$ be the morphism of topoi associated to a continuous and cocontinuous functor $u : \mathcal{C} \rightarrow \mathcal{D}$.*

- (1) *If u has a left adjoint w , then $g_!$ agrees with $g_!^{Sh}$ on underlying sheaves of sets and $g_!$ is exact.*
- (2) *If in addition w is cocontinuous, then $g_! = h^{-1}$ and $g^{-1} = h_*$ where $h : \text{Sh}(\mathcal{D}) \rightarrow \text{Sh}(\mathcal{C})$ is the morphism of topoi associated to w .*

Proof. This Lemma is the analogue of Sites, Lemma 7.22.1. From Sites, Lemma 7.18.3 we see that the categories \mathcal{I}_V^u have an initial object. Thus the underlying set of a colimit of a system of abelian groups over $(\mathcal{I}_V^u)^{opp}$ is the colimit of the underlying sets. Whence the agreement of $g_!^{Sh}$ and $g_!$ by our construction of $g_!$ in Definition 18.16.1. The exactness and (2) follow immediately from the corresponding statements of Sites, Lemma 7.22.1. \square

18.17. Global types of modules

Definition 18.17.1. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topoi. Let \mathcal{F} be a sheaf of \mathcal{O} -modules.

- (1) We say \mathcal{F} is a *free \mathcal{O} -module* if \mathcal{F} is isomorphic as an \mathcal{O} -module to a sheaf of the form $\bigoplus_{i \in I} \mathcal{O}$.
- (2) We say \mathcal{F} is *finite free* if \mathcal{F} is isomorphic as an \mathcal{O} -module to a sheaf of the form $\bigoplus_{i \in I} \mathcal{O}$ with a finite index set I .
- (3) We say \mathcal{F} is *generated by global sections* if there exists a surjection

$$\bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F}$$

from a free \mathcal{O} -module onto \mathcal{F} .

- (4) Given $r \geq 0$ we say \mathcal{F} is *generated by r global sections* if there exists a surjection $\mathcal{O}^{\oplus r} \rightarrow \mathcal{F}$.
- (5) We say \mathcal{F} is *generated by finitely many global sections* if it is generated by r global sections for some $r \geq 0$.
- (6) We say \mathcal{F} has a *global presentation* if there exists an exact sequence

$$\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F}$$

of \mathcal{O} -modules.

- (7) We say \mathcal{F} has a *global finite presentation* if there exists an exact sequence

$$\bigoplus_{j \in J} \mathcal{O} \longrightarrow \bigoplus_{i \in I} \mathcal{O} \longrightarrow \mathcal{F}$$

of \mathcal{O} -modules with I and J finite sets.

Note that for any set I the direct sum $\bigoplus_{i \in I} \mathcal{O}$ exists (Lemma 18.14.2) and is the sheafification of the presheaf $U \mapsto \bigoplus_{i \in I} \mathcal{O}(U)$. This module is called the *free \mathcal{O} -module on the set I* .

Lemma 18.17.2. Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let \mathcal{F} be an $\mathcal{O}_{\mathcal{D}}$ -module.

- (1) If \mathcal{F} is free then $f^*\mathcal{F}$ is free.
- (2) If \mathcal{F} is finite free then $f^*\mathcal{F}$ is finite free.
- (3) If \mathcal{F} is generated by global sections then $f^*\mathcal{F}$ is generated by global sections.
- (4) Given $r \geq 0$ if \mathcal{F} is generated by r global sections, then $f^*\mathcal{F}$ is generated by r global sections.
- (5) If \mathcal{F} is generated by finitely many global sections then $f^*\mathcal{F}$ is generated by finitely many global sections.
- (6) If \mathcal{F} has a global presentation then $f^*\mathcal{F}$ has a global presentation.
- (7) If \mathcal{F} has a finite global presentation then $f^*\mathcal{F}$ has a finite global presentation.

Proof. This is true because f^* commutes with arbitrary colimits (Lemma 18.14.3) and $f^*\mathcal{O}_{\mathcal{D}} = \mathcal{O}_{\mathcal{C}}$. \square

18.18. Intrinsic properties of modules

Let \mathcal{P} be a property of sheaves of modules on ringed topoi. We say \mathcal{P} is an *intrinsic property* if we have $\mathcal{P}(\mathcal{F}) \Leftrightarrow \mathcal{P}(f^*\mathcal{F})$ whenever $(f, f^\sharp) : (Sh(\mathcal{C}'), \mathcal{O}') \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ is

an equivalence of ringed topoi. For example, the property of being free is intrinsic. Indeed, the free \mathcal{O} -module on the set I is characterized by the property that

$$\mathrm{Mor}_{\mathrm{Mod}(\mathcal{O})}\left(\bigoplus_{i \in I} \mathcal{O}, \mathcal{F}\right) = \prod_{i \in I} \mathrm{Mor}_{\mathrm{Sh}(\mathcal{C})}(\{*\}, \mathcal{F})$$

for a variable \mathcal{F} in $\mathrm{Mod}(\mathcal{O})$. Alternatively, we can also use Lemma 18.17.2 to see that being free is intrinsic. In fact, each of the properties defined in Definition 18.17.1 is intrinsic for the same reason. How will we go about defining other intrinsic properties of \mathcal{O} -modules?

The upshot of Lemma 18.7.2 is the following: Suppose you want to define an intrinsic property \mathcal{P} of an \mathcal{O} -module on a topos. Then you can proceed as follows:

- (1) Given any site \mathcal{C} , any sheaf of rings \mathcal{O} on \mathcal{C} and any \mathcal{O} -module \mathcal{F} define the corresponding property $\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F})$.
- (2) For any pair of sites $\mathcal{C}, \mathcal{C}'$, any special cocontinuous functor $u : \mathcal{C} \rightarrow \mathcal{C}'$, any sheaf of rings \mathcal{O} on \mathcal{C} any \mathcal{O} -module \mathcal{F} , show that

$$\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F}) \Leftrightarrow \mathcal{P}(\mathcal{C}', g_*\mathcal{O}, g_*\mathcal{F})$$

where $g : \mathrm{Sh}(\mathcal{C}) \rightarrow \mathrm{Sh}(\mathcal{C}')$ is the equivalence of topoi associated to u .

In this case, given any ringed topos $(\mathrm{Sh}(\mathcal{C}), \mathcal{O})$ and any sheaf of \mathcal{O} -modules \mathcal{F} we simply say that \mathcal{F} has property \mathcal{P} if $\mathcal{P}(\mathcal{C}, \mathcal{O}, \mathcal{F})$ is true. And Lemma 18.7.2 combined with (2) above guarantees that this is well defined.

Moreover, the same Lemma 18.7.2 also guarantees that if in addition

- (3) For any morphism of ringed sites $(f, f^\#) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ such that f is given by a functor $u : \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Sites, Proposition 7.15.6, and any $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{G} we have

$$\mathcal{P}(\mathcal{D}, \mathcal{O}_{\mathcal{D}}, \mathcal{G}) \Rightarrow \mathcal{P}(\mathcal{C}, \mathcal{O}_{\mathcal{C}}, f^*\mathcal{G})$$

then it is true that \mathcal{P} is preserved under pullback of modules w.r.t. arbitrary morphisms of ringed topoi.

We will use this method in the following sections to see that: locally free, locally generated by sections, locally generated by r sections, finite type, finite presentation, quasi-coherent, and coherent are intrinsic properties of modules.

Perhaps a more satisfying method would be to find an intrinsic definition of these notions, rather than the laborious process sketched here. On the other hand, in many geometric situations where we want to apply these definitions we are given a definite ringed site, and a definite sheaf of modules, and it is nice to have a definition already adapted to this language.

18.19. Localization of ringed sites

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \mathrm{Ob}(\mathcal{C})$. We explain the counterparts of the results in Sites, Section 7.24 in this setting.

Denote $\mathcal{O}_U = j_U^{-1}\mathcal{O}$ the restriction of \mathcal{O} to the site \mathcal{C}/U . It is described by the simple rule $\mathcal{O}_U(V/U) = \mathcal{O}(V)$. With this notation the localization morphism j_U becomes a morphism of ringed topoi

$$(j_U, j_U^\#) : (\mathrm{Sh}(\mathcal{C}/U), \mathcal{O}_U) \longrightarrow (\mathrm{Sh}(\mathcal{C}), \mathcal{O})$$

namely, we take $j_U^\# : j_U^{-1}\mathcal{O} \rightarrow \mathcal{O}_U$ the identity map. Moreover, we obtain the following descriptions for pushforward and pullback of modules.

Definition 18.19.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \text{Ob}(\mathcal{C})$.

- (1) The ringed site $(\mathcal{C}/U, \mathcal{O}_U)$ is called the *localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object U* .
- (2) The morphism of ringed topoi $(j_U, j_U^\#) : (\text{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\text{Sh}(\mathcal{C}), \mathcal{O})$ is called the *localization morphism*.
- (3) The functor $j_{U*} : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$ is called the *direct image functor*.
- (4) For a sheaf of \mathcal{O} -modules \mathcal{F} on \mathcal{C} the sheaf $j_U^* \mathcal{F}$ is called the *restriction of \mathcal{F} to \mathcal{C}/U* . We will sometimes denote it by $\mathcal{F}|_{\mathcal{C}/U}$ or even $\mathcal{F}|_U$. It is described by the simple rule $j_U^*(\mathcal{F})(X/U) = \mathcal{F}(X)$.
- (5) The left adjoint $j_{U!} : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$ of restriction is called *extension by zero*. It exists and is exact by Lemmas 18.19.2 and 18.19.3.

As in the topological case, see Sheaves, Section 6.31, the extension by zero $j_{U!}$ functor is different from extension by the empty set $j_{U!}$ defined on sheaves of sets. Here is the lemma defining extension by zero.

Lemma 18.19.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \text{Ob}(\mathcal{C})$. The restriction functor $j_U^* : \text{Mod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}_U)$ has a left adjoint $j_{U!} : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$. So

$$\text{Mor}_{\text{Mod}(\mathcal{O}_U)}(\mathcal{G}, j_U^* \mathcal{F}) = \text{Mor}_{\text{Mod}(\mathcal{O})}(j_{U!} \mathcal{G}, \mathcal{F})$$

for $\mathcal{F} \in \text{Ob}(\text{Mod}(\mathcal{O}))$ and $\mathcal{G} \in \text{Ob}(\text{Mod}(\mathcal{O}_U))$. Moreover, the extension by zero $j_{U!} \mathcal{G}$ of \mathcal{G} is the sheaf associated to the presheaf

$$V \longmapsto \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

with obvious restriction mappings and an obvious \mathcal{O} -module structure.

Proof. The \mathcal{O} -module structure on the presheaf is defined as follows. If $f \in \mathcal{O}(V)$ and $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$, then we define $f \cdot s = fs$ where $f \in \mathcal{O}_U(\varphi : V \rightarrow U) = \mathcal{O}(V)$ (because \mathcal{O}_U is the restriction of \mathcal{O} to \mathcal{C}/U).

Similarly, let $\alpha : \mathcal{G} \rightarrow \mathcal{F}|_U$ be a morphism of \mathcal{O}_U -modules. In this case we can define a map from the presheaf of the lemma into \mathcal{F} by mapping

$$\bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U) \longrightarrow \mathcal{F}(V)$$

by the rule that $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$ maps to $\alpha(s) \in \mathcal{F}(V)$. It is clear that this is \mathcal{O} -linear, and hence induces a morphism of \mathcal{O} -modules $\alpha' : j_{U!} \mathcal{G} \rightarrow \mathcal{F}$ by the properties of sheafification of modules (Lemma 18.11.1).

Conversely, let $\beta : j_{U!} \mathcal{G} \rightarrow \mathcal{F}$ by a map of \mathcal{O} -modules. Recall from Sites, Section 7.24 that there exists an extension by the empty set $j_{U!}^{Sh} : \text{Sh}(\mathcal{C}/U) \rightarrow \text{Sh}(\mathcal{C})$ on sheaves of sets which is left adjoint to j_U^{-1} . Moreover, $j_{U!}^{Sh} \mathcal{G}$ is the sheaf associated to the presheaf

$$V \longmapsto \prod_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

Hence there is a natural map $j_{U!}^{Sh} \mathcal{G} \rightarrow j_{U!} \mathcal{G}$ of sheaves of sets. Hence precomposing β by this map we get a map of sheaves of sets $j_{U!}^{Sh} \mathcal{G} \rightarrow \mathcal{F}$ which by adjunction corresponds to a map of sheaves of sets $\beta' : \mathcal{G} \rightarrow \mathcal{F}|_U$. We claim that β' is \mathcal{O}_U -linear. Namely, suppose that $\varphi : V \rightarrow U$ is an object of \mathcal{C}/U and that $s, s' \in \mathcal{G}(\varphi : V \rightarrow U)$, and $f \in \mathcal{O}(V) = \mathcal{O}_U(\varphi : V \rightarrow U)$. Then by the discussion above we see that $\beta'(s + s')$, resp. $\beta'(fs)$ in $\mathcal{F}|_U(\varphi : V \rightarrow U)$ correspond to $\beta(s + s')$, resp. $\beta(fs)$ in $\mathcal{F}(V)$. Since β is a homomorphism we conclude.

To conclude the proof of the lemma we have to show that the constructions $\alpha \mapsto \alpha'$ and $\beta \mapsto \beta'$ are mutually inverse. We omit the verifications. \square

Lemma 18.19.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U \in \text{Ob}(\mathcal{C})$. The functor $j_{U!} : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$ is exact.*

Proof. Since $j_{U!}$ is a left adjoint to j_U^* we see that it is right exact (see Categories, Lemma 4.24.5 and Homology, Section 12.7). Hence it suffices to show that if $\mathcal{G}_1 \rightarrow \mathcal{G}_2$ is an injective map of \mathcal{O}_U -modules, then $j_{U!}\mathcal{G}_1 \rightarrow j_{U!}\mathcal{G}_2$ is injective. The map on sections of presheaves over an object V (as in Lemma 18.19.2) is the map

$$\bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \mathcal{G}_1(V \xrightarrow{\varphi} U) \longrightarrow \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \mathcal{G}_2(V \xrightarrow{\varphi} U)$$

which is injective by assumption. Since sheafification is exact by Lemma 18.11.2 we conclude $j_{U!}\mathcal{G}_1 \rightarrow j_{U!}\mathcal{G}_2$ is injective and we win. \square

Lemma 18.19.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $f : V \rightarrow U$ be a morphism of \mathcal{C} . Then there exists a commutative diagram*

$$\begin{array}{ccc} (Sh(\mathcal{C}/V), \mathcal{O}_V) & \xrightarrow{(j, j^\#)} & (Sh(\mathcal{C}/U), \mathcal{O}_U) \\ & \searrow (j_V, j_V^\#) & \swarrow (j_U, j_U^\#) \\ & (Sh(\mathcal{C}), \mathcal{O}) & \end{array}$$

of ringed topoi. Here $(j, j^\#)$ is the localization morphism associated to the object U/V of the ringed site $(\mathcal{C}/V, \mathcal{O}_V)$.

Proof. The only thing to check is that $j_V^\# = j^\# \circ j^{-1}(j_U^\#)$, since everything else follows directly from Sites, Lemma 7.24.7 and Sites, Equation (7.24.7.1). We omit the verification of the equality. \square

Remark 18.19.5. In the situation of Lemma 18.19.2 the diagram

$$\begin{array}{ccc} \text{Mod}(\mathcal{O}_U) & \xrightarrow{j_{U!}} & \text{Mod}(\mathcal{O}_{\mathcal{C}}) \\ \text{forget} \downarrow & & \downarrow \text{forget} \\ \text{Ab}(\mathcal{C}/U) & \xrightarrow{j_{U!}^{Ab}} & \text{Ab}(\mathcal{C}) \end{array}$$

commutes. This is clear from the explicit description of the functor $j_{U!}$ in the lemma.

Remark 18.19.6. Localization and presheaves of modules; see Sites, Remark 7.24.9. Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let U be an object of \mathcal{C} . Strictly speaking the functors j_U^* , j_{U*} and $j_{U!}$ have not been defined for presheaves of \mathcal{O} -modules. But of course, we can think of a presheaf as a sheaf for the chaotic topology on \mathcal{C} (see Sites, Examples 7.6.6). Hence we also obtain a functor

$$j_U^* : P\text{Mod}(\mathcal{O}) \longrightarrow P\text{Mod}(\mathcal{O}_U)$$

and functors

$$j_{U*}, j_{U!} : P\text{Mod}(\mathcal{O}_U) \longrightarrow P\text{Mod}(\mathcal{O})$$

which are right, left adjoint to j_U^* . Inspecting the proof of Lemma 18.19.2 we see that $j_{U!}\mathcal{G}$ is the presheaf

$$V \mapsto \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

In addition the functor $j_{U!}$ is exact (by Lemma 18.19.3 in the case of the discrete topologies). Moreover, if \mathcal{C} is actually a site, and \mathcal{O} is actually a sheaf of rings, then the diagram

$$\begin{array}{ccc} \text{Mod}(\mathcal{O}_U) & \xrightarrow{j_{U!}} & \text{Mod}(\mathcal{O}) \\ \text{forget} \downarrow & & \uparrow (\)^\# \\ \text{PMod}(\mathcal{O}_U) & \xrightarrow{j_{U!}} & \text{PMod}(\mathcal{O}) \end{array}$$

commutes.

Remark 18.19.7 (Map from lower shriek to pushforward). Let U be an object of \mathcal{C} . For any abelian sheaf \mathcal{G} on \mathcal{C}/U there is a canonical map

$$c : j_{U!}\mathcal{G} \longrightarrow j_{U*}\mathcal{G}$$

Namely, this is the same thing as a map $j_U^{-1}j_{U!}\mathcal{G} \rightarrow \mathcal{G}$. Note that restriction commutes with sheafification. Thus we can use the presheaf of Lemma 18.19.2. Hence it suffices to define for V/U a map

$$\bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \mathcal{G}(V) \longrightarrow \mathcal{G}(V)$$

compatible with restrictions. We simply take the map which is zero on all summands except for the one where φ is the structure morphism $V \rightarrow U$ where we take 1. Moreover, if \mathcal{O} is a sheaf of rings on \mathcal{C} and \mathcal{G} is an \mathcal{O}_U -module, then the displayed map above is a map of \mathcal{O} -modules.

18.20. Localization of morphisms of ringed sites

This section is the analogue of Sites, Section 7.27.

Lemma 18.20.1. *Let $(f, f^\#) : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{D}, \mathcal{O}')$ be a morphism of ringed sites where f is given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let V be an object of \mathcal{D} and set $U = u(V)$. Then there is a canonical map of sheaves of rings $(f')^\#$ such that the diagram of Sites, Lemma 7.27.1 is turned into a commutative diagram of ringed topoi*

$$\begin{array}{ccc} (\text{Sh}(\mathcal{C}/U), \mathcal{O}_U) & \xrightarrow{(j_U, j_U^\#)} & (\text{Sh}(\mathcal{C}), \mathcal{O}) \\ (f', (f')^\#) \downarrow & & \downarrow (f, f^\#) \\ (\text{Sh}(\mathcal{D}/V), \mathcal{O}'_V) & \xrightarrow{(j_V, j_V^\#)} & (\text{Sh}(\mathcal{D}), \mathcal{O}') \end{array}$$

Moreover, in this situation we have $f'_*j_U^{-1} = j_V^{-1}f_*$ and $f'_!j_U^* = j_V^*f_*$.

Proof. Just take $(f')^\#$ to be

$$(f')^{-1}\mathcal{O}'_V = (f')^{-1}j_V^{-1}\mathcal{O}' = j_U^{-1}f^{-1}\mathcal{O}' \xrightarrow{j_U^{-1}f^\#} j_U^{-1}\mathcal{O} = \mathcal{O}_U$$

and everything else follows from Sites, Lemma 7.27.1. (Note that $j^{-1} = j^*$ on sheaves of modules if j is a localization morphism, hence the first equality of functors implies the second.) □

Lemma 18.20.2. *Let $(f, f^\#) : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{D}, \mathcal{O}')$ be a morphism of ringed sites where f is given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \text{Ob}(\mathcal{D})$, $U \in \text{Ob}(\mathcal{C})$*

and $c : U \rightarrow u(V)$ a morphism of \mathcal{C} . There exists a commutative diagram of ringed topoi

$$\begin{array}{ccc} (Sh(\mathcal{C}/U), \mathcal{O}_U) & \xrightarrow{(j_U, j_U^\sharp)} & (Sh(\mathcal{C}), \mathcal{O}) \\ (f_c, f_c^\sharp) \downarrow & & \downarrow (f, f^\sharp) \\ (Sh(\mathcal{D}/V), \mathcal{O}'_V) & \xrightarrow{(j_V, j_V^\sharp)} & (Sh(\mathcal{D}), \mathcal{O}') \end{array}$$

The morphism (f_c, f_c^\sharp) is equal to the composition of the morphism

$$(f', (f')^\sharp) : (Sh(\mathcal{C}/u(V)), \mathcal{O}_{u(V)}) \longrightarrow (Sh(\mathcal{D}/V), \mathcal{O}'_V)$$

of Lemma 18.20.1 and the morphism

$$(j, j^\sharp) : (Sh(\mathcal{C}/U), \mathcal{O}_U) \longrightarrow (Sh(\mathcal{C}/u(V)), \mathcal{O}_{u(V)})$$

of Lemma 18.19.4. Given any morphisms $b : V' \rightarrow V$, $a : U' \rightarrow U$ and $c' : U' \rightarrow u(V')$ such that

$$\begin{array}{ccc} U' & \xrightarrow{c'} & u(V') \\ a \downarrow & & \downarrow u(b) \\ U & \xrightarrow{c} & u(V) \end{array}$$

commutes, then the following diagram of ringed topoi

$$\begin{array}{ccc} (Sh(\mathcal{C}/U'), \mathcal{O}_{U'}) & \xrightarrow{(j_{U'/U}, j_{U'/U}^\sharp)} & (Sh(\mathcal{C}/U), \mathcal{O}_U) \\ (f_{c'}, f_{c'}^\sharp) \downarrow & & \downarrow (f_c, f_c^\sharp) \\ (Sh(\mathcal{D}/V'), \mathcal{O}'_{V'}) & \xrightarrow{(j_{V'/V}, j_{V'/V}^\sharp)} & (Sh(\mathcal{D}/V), \mathcal{O}'_V) \end{array}$$

commutes.

Proof. On the level of morphisms of topoi this is Sites, Lemma 7.27.3. To check that the diagrams commute as morphisms of ringed topoi use Lemmas 18.19.4 and 18.20.1 exactly as in the proof of Sites, Lemma 7.27.3. \square

18.21. Localization of ringed topoi

This section is the analogue of Sites, Section 7.29 in the setting of ringed topoi.

Lemma 18.21.1. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F} \in Sh(\mathcal{C})$ be a sheaf. For a sheaf \mathcal{H} on \mathcal{C} denote $\mathcal{H}_{\mathcal{F}}$ the sheaf $\mathcal{H} \times \mathcal{F}$ seen as an object of the category $Sh(\mathcal{C})/\mathcal{F}$. The pair $(Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}})$ is a ringed topos and there is a canonical morphism of ringed topoi*

$$(j_{\mathcal{F}}, j_{\mathcal{F}}^\sharp) : (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \longrightarrow (Sh(\mathcal{C}), \mathcal{O})$$

which is a localization as in Section 18.19 such that

- (1) the functor $j_{\mathcal{F}}^{-1}$ is the functor $\mathcal{H} \mapsto \mathcal{H}_{\mathcal{F}}$,
- (2) the functor $j_{\mathcal{F}}^*$ is the functor $\mathcal{H} \mapsto \mathcal{H}_{\mathcal{F}}$,
- (3) the functor $j_{\mathcal{F}!}$ on sheaves of sets is the forgetful functor $\mathcal{G}/\mathcal{F} \mapsto \mathcal{G}$,
- (4) the functor $j_{\mathcal{F}!}$ on sheaves of modules associates to the $\mathcal{O}_{\mathcal{F}}$ -module $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ the \mathcal{O} -module which is the sheafification of the presheaf

$$V \mapsto \bigoplus_{s \in \mathcal{F}(V)} \{\sigma \in \mathcal{G}(V) \mid \varphi(\sigma) = s\}$$

for $V \in \text{Ob}(\mathcal{C})$.

Proof. By Sites, Lemma 7.29.1 we see that $Sh(\mathcal{C})/\mathcal{F}$ is a topos and that (1) and (3) are true. In particular this shows that $j_{\mathcal{F}}^{-1}\mathcal{O} = \mathcal{O}_{\mathcal{F}}$ and shows that $\mathcal{O}_{\mathcal{F}}$ is a sheaf of rings. Thus we may choose the map $j_{\mathcal{F}}^{\sharp}$ to be the identity, in particular we see that (2) is true. Moreover, the proof of Sites, Lemma 7.29.1 shows that we may assume \mathcal{C} is a site with all finite limits and a subcanonical topology and that $\mathcal{F} = h_U$ for some object U of \mathcal{C} . Then (4) follows from the description of $j_{\mathcal{F}!}$ in Lemma 18.19.2. Alternatively one could show directly that the functor described in (4) is a left adjoint to $j_{\mathcal{F}}^*$. \square

Definition 18.21.2. Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let $\mathcal{F} \in Sh(\mathcal{C})$.

- (1) The ringed topos $(Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}})$ is called the *localization of the ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ at \mathcal{F}* .
- (2) The morphism of ringed topoi $(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}) : (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ of Lemma 18.21.1 is called the *localization morphism*.

We continue the tradition, established in the chapter on sites, that we check the localization constructions on topoi are compatible with the constructions of localization on sites, whenever this makes sense.

Lemma 18.21.3. *With $(Sh(\mathcal{C}), \mathcal{O})$ and $\mathcal{F} \in Sh(\mathcal{C})$ as in Lemma 18.21.1. If $\mathcal{F} = h_U^{\sharp}$ for some object U of \mathcal{C} then via the identification $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^{\sharp}$ of Sites, Lemma 7.24.4 we have*

- (1) *canonically $\mathcal{O}_U = \mathcal{O}_{\mathcal{F}}$, and*
- (2) *with these identifications we have $(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}) = (j_U, j_U^{\sharp})$.*

Proof. The assertion for underlying topoi is Sites, Lemma 7.29.5. Note that \mathcal{O}_U is the restriction of \mathcal{O} which by Sites, Lemma 7.24.6 corresponds to $\mathcal{O} \times h_U^{\sharp}$ under the equivalence of Sites, Lemma 7.24.4. By definition of $\mathcal{O}_{\mathcal{F}}$ we get (1). What's left is to prove that $j_{\mathcal{F}}^{\sharp} = j_U^{\sharp}$ under this identification. We omit the verification. \square

Localization is functorial in the following two ways: We can “relocalize” a localization (see Lemma 18.21.4) or we can given a morphism of ringed topoi, localize upstairs at the inverse image of a sheaf downstairs and get a commutative diagram of locally ringed spaces (see Lemma 18.22.1).

Lemma 18.21.4. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. If $s : \mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves on \mathcal{C} then there exists a natural commutative diagram of morphisms of ringed topoi*

$$\begin{array}{ccc}
 (Sh(\mathcal{C})/\mathcal{G}, \mathcal{O}_{\mathcal{G}}) & \xrightarrow{(j, j^{\sharp})} & (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \\
 & \searrow (j_{\mathcal{G}}, j_{\mathcal{G}}^{\sharp}) & \swarrow (j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}) \\
 & (Sh(\mathcal{C}), \mathcal{O}) &
 \end{array}$$

where (j, j^{\sharp}) is the localization morphism of the ringed topos $(Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}})$ at the object \mathcal{G}/\mathcal{F} .

Proof. All assertions follow from Sites, Lemma 7.29.6 except the assertion that $j_{\mathcal{G}}^{\sharp} = j^{\sharp} \circ j^{-1}(j_{\mathcal{F}}^{\sharp})$. We omit the verification. \square

Lemma 18.21.5. *With $(Sh(\mathcal{C}), \mathcal{O})$, $s : \mathcal{G} \rightarrow \mathcal{F}$ as in Lemma 18.21.4. If there exist a morphism $f : V \rightarrow U$ of \mathcal{C} such that $\mathcal{G} = h_V^{\sharp}$ and $\mathcal{F} = h_U^{\sharp}$ and s is*

induced by f , then the diagrams of Lemma 18.19.4 and Lemma 18.21.4 agree via the identifications $(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp}) = (j_U, j_U^{\sharp})$ and $(j_{\mathcal{G}}, j_{\mathcal{G}}^{\sharp}) = (j_V, j_V^{\sharp})$ of Lemma 18.21.3.

Proof. All assertions follow from Sites, Lemma 7.29.7 except for the assertion that the two maps j^{\sharp} agree. This holds since in both cases the map j^{\sharp} is simply the identity. Some details omitted. \square

18.22. Localization of morphisms of ringed topoi

This section is the analogue of Sites, Section 7.30.

Lemma 18.22.1. *Let*

$$f : (Sh(\mathcal{C}), \mathcal{O}) \longrightarrow (Sh(\mathcal{D}), \mathcal{O}')$$

be a morphism of ringed topoi. Let \mathcal{G} be a sheaf on \mathcal{D} . Set $\mathcal{F} = f^{-1}\mathcal{G}$. Then there exists a commutative diagram of ringed topoi

$$\begin{array}{ccc} (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) & \xrightarrow{(j_{\mathcal{F}}, j_{\mathcal{F}}^{\sharp})} & (Sh(\mathcal{C}), \mathcal{O}) \\ (f', (f')^{\sharp}) \downarrow & & \downarrow (f, f^{\sharp}) \\ (Sh(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}}) & \xrightarrow{(j_{\mathcal{G}}, j_{\mathcal{G}}^{\sharp})} & (Sh(\mathcal{D}), \mathcal{O}') \end{array}$$

We have $f'_*j_{\mathcal{F}}^{-1} = j_{\mathcal{G}}^{-1}f_*$ and $f'_*j_{\mathcal{F}}^* = j_{\mathcal{G}}^*f_*$. Moreover, the morphism f' is characterized by the rule

$$(f')^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G}) = (f^{-1}\mathcal{H} \xrightarrow{f^{-1}\varphi} \mathcal{F}).$$

Proof. By Sites, Lemma 7.30.1 we have the diagram of underlying topoi, the equality $f'_*j_{\mathcal{F}}^{-1} = j_{\mathcal{G}}^{-1}f_*$, and the description of $(f')^{-1}$. To define $(f')^{\sharp}$ we use the map

$$(f')^{\sharp} : \mathcal{O}'_{\mathcal{G}} = j_{\mathcal{G}}^{-1}\mathcal{O}' \xrightarrow{j_{\mathcal{G}}^{-1}f^{\sharp}} j_{\mathcal{G}}^{-1}f_*\mathcal{O} = f'_*j_{\mathcal{F}}^{-1}\mathcal{O} = f'_*\mathcal{O}_{\mathcal{F}}$$

or equivalently the map

$$(f')^{\sharp} : (f')^{-1}\mathcal{O}'_{\mathcal{G}} = (f')^{-1}j_{\mathcal{G}}^{-1}\mathcal{O}' = j_{\mathcal{F}}^{-1}f^{-1}\mathcal{O}' \xrightarrow{j_{\mathcal{F}}^{-1}f^{\sharp}} j_{\mathcal{F}}^{-1}\mathcal{O} = \mathcal{O}_{\mathcal{F}}.$$

We omit the verification that these two maps are indeed adjoint to each other. The second construction of $(f')^{\sharp}$ shows that the diagram commutes in the 2-category of ringed topoi (as the maps $j_{\mathcal{F}}^{\sharp}$ and $j_{\mathcal{G}}^{\sharp}$ are identities). Finally, the equality $f'_*j_{\mathcal{F}}^* = j_{\mathcal{G}}^*f_*$ follows from the equality $f'_*j_{\mathcal{F}}^{-1} = j_{\mathcal{G}}^{-1}f_*$ and the fact that pullbacks of sheaves of modules and sheaves of sets agree, see Lemma 18.21.1. \square

Lemma 18.22.2. *Let*

$$f : (Sh(\mathcal{C}), \mathcal{O}) \longrightarrow (Sh(\mathcal{D}), \mathcal{O}')$$

be a morphism of ringed topoi. Let \mathcal{G} be a sheaf on \mathcal{D} . Set $\mathcal{F} = f^{-1}\mathcal{G}$. If f is given by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ and $\mathcal{G} = h_V^{\sharp}$, then the commutative diagrams of Lemma 18.20.1 and Lemma 18.22.1 agree via the identifications of Lemma 18.21.3.

Proof. At the level of morphisms of topoi this is Sites, Lemma 7.30.2. This works also on the level of morphisms of ringed topoi since the formulas defining $(f')^{\sharp}$ in the proofs of Lemma 18.20.1 and Lemma 18.22.1 agree. \square

Lemma 18.22.3. *Let $(f, f^\#) : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Let \mathcal{G} be a sheaf on \mathcal{D} , let \mathcal{F} be a sheaf on \mathcal{C} , and let $s : \mathcal{F} \rightarrow f^{-1}\mathcal{G}$ a morphism of sheaves. There exists a commutative diagram of ringed topoi*

$$\begin{array}{ccc} (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) & \xrightarrow{(j_{\mathcal{F}}, j_{\mathcal{F}}^\#)} & (Sh(\mathcal{C}), \mathcal{O}) \\ (f_c, f_c^\#) \downarrow & & \downarrow (f, f^\#) \\ (Sh(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}}) & \xrightarrow{(j_{\mathcal{G}}, j_{\mathcal{G}}^\#)} & (Sh(\mathcal{D}), \mathcal{O}'). \end{array}$$

The morphism $(f_s, f_s^\#)$ is equal to the composition of the morphism

$$(f', (f')^\#) : (Sh(\mathcal{C})/f^{-1}\mathcal{G}, \mathcal{O}_{f^{-1}\mathcal{G}}) \rightarrow (Sh(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}})$$

of Lemma 18.22.1 and the morphism

$$(j, j^\#) : (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \rightarrow (Sh(\mathcal{C})/f^{-1}\mathcal{G}, \mathcal{O}_{f^{-1}\mathcal{G}})$$

of Lemma 18.21.4. Given any morphisms $b : \mathcal{G}' \rightarrow \mathcal{G}$, $a : \mathcal{F}' \rightarrow \mathcal{F}$, and $s' : \mathcal{F}' \rightarrow f^{-1}\mathcal{G}'$ such that

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{s'} & f^{-1}\mathcal{G}' \\ a \downarrow & & \downarrow f^{-1}b \\ \mathcal{F} & \xrightarrow{s} & f^{-1}\mathcal{G} \end{array}$$

commutes, then the following diagram of ringed topoi

$$\begin{array}{ccc} (Sh(\mathcal{C})/\mathcal{F}', \mathcal{O}_{\mathcal{F}'}) & \xrightarrow{(j_{\mathcal{F}'/\mathcal{F}}, j_{\mathcal{F}'/\mathcal{F}}^\#)} & (Sh(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \\ (f_{s'}, f_{s'}^\#) \downarrow & & \downarrow (f_s, f_s^\#) \\ (Sh(\mathcal{D})/\mathcal{G}', \mathcal{O}'_{\mathcal{G}'}) & \xrightarrow{(j_{\mathcal{G}'/\mathcal{G}}, j_{\mathcal{G}'/\mathcal{G}}^\#)} & (Sh(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}}) \end{array}$$

commutes.

Proof. On the level of morphisms of topoi this is Sites, Lemma 7.30.3. To check that the diagrams commute as morphisms of ringed topoi use the commutative diagrams of Lemmas 18.21.4 and 18.22.1. \square

Lemma 18.22.4. *Let $(f, f^\#) : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$, $s : \mathcal{F} \rightarrow f^{-1}\mathcal{G}$ be as in Lemma 18.22.3. If f is given by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ and $\mathcal{G} = h_{V'}^\#$, $\mathcal{F} = h_U^\#$ and s comes from a morphism $c : U \rightarrow u(V)$, then the commutative diagrams of Lemma 18.20.2 and Lemma 18.22.3 agree via the identifications of Lemma 18.21.3.*

Proof. This is formal using Lemmas 18.21.5 and 18.22.2. \square

18.23. Local types of modules

According to our general strategy explained in Section 18.18 we first define the local types for sheaves of modules on a ringed site, and then we immediately show that these types are intrinsic, hence make sense for sheaves of modules on ringed topoi.

Definition 18.23.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. We will freely use the notions defined in Definition 18.17.1.

- (1) We say \mathcal{F} is *locally free* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is a free \mathcal{O}_{U_i} -module.
- (2) We say \mathcal{F} is *finite locally free* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is a finite free \mathcal{O}_{U_i} -module.
- (3) We say \mathcal{F} is *locally generated by sections* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is an \mathcal{O}_{U_i} -module generated by global sections.
- (4) Given $r \geq 0$ we say \mathcal{F} is *locally generated by r sections* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is an \mathcal{O}_{U_i} -module generated by r global sections.
- (5) We say \mathcal{F} is *of finite type* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is an \mathcal{O}_{U_i} -module generated by finitely many global sections.
- (6) We say \mathcal{F} is *quasi-coherent* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is an \mathcal{O}_{U_i} -module which has a global presentation.
- (7) We say \mathcal{F} is *of finite presentation* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is an \mathcal{O}_{U_i} -module which has a finite global presentation.
- (8) We say \mathcal{F} is *coherent* if and only if \mathcal{F} is of finite type, and for every object U of \mathcal{C} and any $s_1, \dots, s_n \in \mathcal{F}(U)$ the kernel of the map $\bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{F}|_U$ is of finite type on $(\mathcal{C}/U, \mathcal{O}_U)$.

Lemma 18.23.2. *Any of the properties (1) – (8) of Definition 18.23.1 is intrinsic (see discussion in Section 18.18).*

Proof. Let \mathcal{C}, \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a special cocontinuous functor. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . Let \mathcal{F} be a sheaf of \mathcal{O} -modules on \mathcal{C} . Let $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be the equivalence of topoi associated to u . Set $\mathcal{O}' = g_*\mathcal{O}$, and let $g^\sharp : \mathcal{O}' \rightarrow g_*\mathcal{O}$ be the identity. Finally, set $\mathcal{F}' = g_*\mathcal{F}$. Let \mathcal{P}_l be one of the properties (1) – (7) listed in Definition 18.23.1. (We will discuss the coherent case at the end of the proof.) Let \mathcal{P}_g denote the corresponding property listed in Definition 18.17.1. We have already seen that \mathcal{P}_g is intrinsic. We have to show that $\mathcal{P}_l(\mathcal{C}, \mathcal{O}, \mathcal{F})$ holds if and only if $\mathcal{P}_l(\mathcal{D}, \mathcal{O}', \mathcal{F}')$ holds.

Assume that \mathcal{F} has \mathcal{P}_l . Let V be an object of \mathcal{D} . One of the properties of a special cocontinuous functor is that there exists a covering $\{u(U_i) \rightarrow V\}_{i \in I}$ in the site \mathcal{D} . By assumption, for each i there exists a covering $\{U_{ij} \rightarrow U_i\}_{j \in J_i}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{U_{ij}}$ is \mathcal{P}_g . By Sites, Lemma 7.28.3 we have commutative diagrams of ringed topoi

$$\begin{array}{ccc}
 (Sh(\mathcal{C}/U_{ij}), \mathcal{O}_{U_{ij}}) & \longrightarrow & (Sh(\mathcal{C}), \mathcal{O}) \\
 \downarrow & & \downarrow \\
 (Sh(\mathcal{D}/u(U_{ij})), \mathcal{O}'_{u(U_{ij})}) & \longrightarrow & (Sh(\mathcal{D}), \mathcal{O}')
 \end{array}$$

where the vertical arrows are equivalences. Hence we conclude that $\mathcal{F}'|_{u(U_{ij})}$ has property \mathcal{P}_g also. And moreover, $\{u(U_{ij}) \rightarrow V\}_{i \in I, j \in J_i}$ is a covering of the site \mathcal{D} . Hence \mathcal{F}' has property \mathcal{P}_l .

Assume that \mathcal{F}' has \mathcal{P}_l . Let U be an object of \mathcal{C} . By assumption, there exists a covering $\{V_i \rightarrow u(U)\}_{i \in I}$ such that $\mathcal{F}'|_{V_i}$ has property \mathcal{P}_g . Because u is cocontinuous we can refine this covering by a family $\{u(U_j) \rightarrow u(U)\}_{j \in J}$ where $\{U_j \rightarrow U\}_{j \in J}$ is a covering in \mathcal{C} . Say the refinement is given by $\alpha : J \rightarrow I$ and $u(U_j) \rightarrow V_{\alpha(j)}$. Restricting is transitive, i.e., $(\mathcal{F}'|_{V_{\alpha(j)}})|_{u(U_j)} = \mathcal{F}'|_{u(U_j)}$. Hence by Lemma 18.17.2 we see that $\mathcal{F}'|_{u(U_j)}$ has property \mathcal{P}_g . Hence the diagram

$$\begin{array}{ccc} (Sh(\mathcal{C}/U_j), \mathcal{O}_{U_j}) & \longrightarrow & (Sh(\mathcal{C}), \mathcal{O}) \\ \downarrow & & \downarrow \\ (Sh(\mathcal{D}/u(U_j)), \mathcal{O}'_{u(U_j)}) & \longrightarrow & (Sh(\mathcal{D}), \mathcal{O}') \end{array}$$

where the vertical arrows are equivalences shows that $\mathcal{F}|_{U_j}$ has property \mathcal{P}_g also. Thus \mathcal{F} has property \mathcal{P}_l as desired.

Finally, we prove the lemma in case $\mathcal{P}_l = \text{coherent}^2$. Assume \mathcal{F} is coherent. This implies that \mathcal{F} is of finite type and hence \mathcal{F}' is of finite type also by the first part of the proof. Let V be an object of \mathcal{D} and let $s_1, \dots, s_n \in \mathcal{F}'(V)$. We have to show that the kernel \mathcal{K}' of $\bigoplus_{j=1, \dots, n} \mathcal{O}_V \rightarrow \mathcal{F}'|_V$ is of finite type on \mathcal{D}/V . This means we have to show that for any V'/V there exists a covering $\{V'_i \rightarrow V'\}$ such that $\mathcal{F}'|_{V'_i}$ is generated by finitely many sections. Replacing V by V' (and restricting the sections s_j to V') we reduce to the case where $V' = V$. Since u is a special cocontinuous functor, there exists a covering $\{u(U_i) \rightarrow V\}_{i \in I}$ in the site \mathcal{D} . Using the isomorphism of topoi $Sh(\mathcal{C}/U_i) = Sh(\mathcal{D}/u(U_i))$ we see that $\mathcal{K}'|_{u(U_i)}$ corresponds to the kernel \mathcal{K}_i of a map $\bigoplus_{j=1, \dots, n} \mathcal{O}_{U_i} \rightarrow \mathcal{F}|_{U_i}$. Since \mathcal{F} is coherent we see that \mathcal{K}_i is of finite type. Hence we conclude (by the first part of the proof again) that $\mathcal{K}|_{u(U_i)}$ is of finite type. Thus there exist coverings $\{V_{il} \rightarrow u(U_i)\}$ such that $\mathcal{K}|_{V_{il}}$ is generated by finitely many global sections. Since $\{V_{il} \rightarrow V\}$ is a covering of \mathcal{D} we conclude that \mathcal{K} is of finite type as desired.

Assume \mathcal{F}' is coherent. This implies that \mathcal{F}' is of finite type and hence \mathcal{F} is of finite type also by the first part of the proof. Let U be an object of \mathcal{C} , and let $s_1, \dots, s_n \in \mathcal{F}(U)$. We have to show that the kernel \mathcal{K} of $\bigoplus_{j=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{F}|_U$ is of finite type on \mathcal{C}/U . Using the isomorphism of topoi $Sh(\mathcal{C}/U) = Sh(\mathcal{D}/u(U))$ we see that $\mathcal{K}|_U$ corresponds to the kernel \mathcal{K}' of a map $\bigoplus_{j=1, \dots, n} \mathcal{O}_{u(U)} \rightarrow \mathcal{F}'|_{u(U)}$. As \mathcal{F}' is coherent, we see that \mathcal{K}' is of finite type. Hence, by the first part of the proof again, we conclude that \mathcal{K} is of finite type. \square

Hence from now on we may refer to the properties of \mathcal{O} -modules defined in Definition 18.23.1 without specifying a site.

Lemma 18.23.3. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let \mathcal{F} be an \mathcal{O} -module. Assume that the site \mathcal{C} has a final object X . Then*

- (1) *The following are equivalent*
 - (a) *\mathcal{F} is locally free,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a locally free \mathcal{O}_{X_i} -module, and*

²The mechanics of this are a bit awkward, and we suggest the reader skip this part of the proof.

- (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a free \mathcal{O}_{X_i} -module.*
- (2) *The following are equivalent*
 - (a) *\mathcal{F} is finite locally free,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a finite locally free \mathcal{O}_{X_i} -module, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a finite free \mathcal{O}_{X_i} -module.*
- (3) *The following are equivalent*
 - (a) *\mathcal{F} is locally generated by sections,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module locally generated by sections, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module globally generated by sections.*
- (4) *Given $r \geq 0$, the following are equivalent*
 - (a) *\mathcal{F} is locally generated by r sections,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module locally generated by r sections, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module globally generated by r sections.*
- (5) *The following are equivalent*
 - (a) *\mathcal{F} is of finite type,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module of finite type, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module globally generated by finitely many sections.*
- (6) *The following are equivalent*
 - (a) *\mathcal{F} is quasi-coherent,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a quasi-coherent \mathcal{O}_{X_i} -module, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module which has a global presentation.*
- (7) *The following are equivalent*
 - (a) *\mathcal{F} is of finite presentation,*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module of finite presentation, and*
 - (c) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is an \mathcal{O}_{X_i} -module has a finite global presentation.*
- (8) *The following are equivalent*
 - (a) *\mathcal{F} is coherent, and*
 - (b) *there exists a covering $\{X_i \rightarrow X\}$ in \mathcal{C} such that each restriction $\mathcal{F}|_{\mathcal{C}/X_i}$ is a coherent \mathcal{O}_{X_i} -module.*

Proof. In each case we have (a) \Rightarrow (b). In each of the cases (1) - (6) condition (b) implies condition (c) by axiom (2) of a site (see Sites, Definition 7.6.2) and the definition of the local types of modules. Suppose $\{X_i \rightarrow X\}$ is a covering. Then for every object U of \mathcal{C} we get an induced covering $\{X_i \times_X U \rightarrow U\}$. Moreover, the global property for $\mathcal{F}|_{\mathcal{C}/X_i}$ in part (c) implies the corresponding global property for

$\mathcal{F}|_{\mathcal{C}/X_i \times_X U}$ by Lemma 18.17.2, hence the sheaf has property (a) by definition. We omit the proof of (b) \Rightarrow (a) in case (7). \square

Lemma 18.23.4. *Let $(f, f^\#) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let \mathcal{F} be an $\mathcal{O}_{\mathcal{D}}$ -module.*

- (1) *If \mathcal{F} is locally free then $f^*\mathcal{F}$ is locally free.*
- (2) *If \mathcal{F} is finite locally free then $f^*\mathcal{F}$ is finite locally free.*
- (3) *If \mathcal{F} is locally generated by sections then $f^*\mathcal{F}$ is locally generated by sections.*
- (4) *If \mathcal{F} is locally generated by r sections then $f^*\mathcal{F}$ is locally generated by r sections.*
- (5) *If \mathcal{F} is of finite type then $f^*\mathcal{F}$ is of finite type.*
- (6) *If \mathcal{F} is quasi-coherent then $f^*\mathcal{F}$ is quasi-coherent.*
- (7) *If \mathcal{F} is of finite presentation then $f^*\mathcal{F}$ is of finite presentation.*

Proof. According to the discussion in Section 18.18 we need only check preservation under pullback for a morphism of ringed sites $(f, f^\#) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ such that f is given by a left exact, continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ between sites which have all finite limits. Let \mathcal{G} be a sheaf of $\mathcal{O}_{\mathcal{D}}$ -modules which has one of the properties (1) – (6) of Definition 18.23.1. We know \mathcal{D} has a final object Y and $X = u(Y)$ is a final object for \mathcal{C} . By assumption we have a covering $\{Y_i \rightarrow Y\}$ such that $\mathcal{G}|_{\mathcal{D}/Y_i}$ has the corresponding global property. Set $X_i = u(Y_i)$ so that $\{X_i \rightarrow X\}$ is a covering in \mathcal{C} . We get a commutative diagram of morphisms ringed sites

$$\begin{array}{ccc} (\mathcal{C}/X_i, \mathcal{O}_{\mathcal{C}}|_{X_i}) & \longrightarrow & (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \\ \downarrow & & \downarrow \\ (\mathcal{D}/Y_i, \mathcal{O}_{\mathcal{D}}|_{Y_i}) & \longrightarrow & (\mathcal{D}, \mathcal{O}_{\mathcal{D}}) \end{array}$$

by Sites, Lemma 7.27.2. Hence by Lemma 18.17.2 that $f^*\mathcal{G}|_{X_i}$ has the corresponding global property. Hence we conclude that \mathcal{G} has the local property we started out with by Lemma 18.23.3. \square

18.24. Basic results on local types of modules

Basic lemmas related to the definitions made above.

Lemma 18.24.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\theta : \mathcal{G} \rightarrow \mathcal{F}$ be a surjective \mathcal{O} -module map with \mathcal{F} of finite presentation and \mathcal{G} of finite type. Then $\text{Ker}(\theta)$ is of finite type.*

Proof. Omitted. Hint: See Modules, Lemma 17.11.3. \square

18.25. Closed immersions of ringed topoi

When do we declare a morphism of ringed topoi $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ to be a closed immersion? By analogy with the discussion in Modules, Section 17.13 it seems natural to assume at least:

- (1) The functor i is a closed immersion of topoi (Sites, Definition 7.42.7).
- (2) The associated map $\mathcal{O}' \rightarrow i_*\mathcal{O}$ is surjective.

These conditions already imply a number of pleasing results which we discuss in this section. However, it seems prudent to not actually define the notion of a closed immersion of ringed topoi as there are many different definitions we could use.

Lemma 18.25.1. *Let $i : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Assume i is a closed immersion of topoi and $i^\sharp : \mathcal{O}' \rightarrow i_*\mathcal{O}$ is surjective. Denote $\mathcal{I} \subset \mathcal{O}'$ the kernel of i^\sharp . The functor*

$$i_* : Mod(\mathcal{O}) \longrightarrow Mod(\mathcal{O}')$$

is exact, fully faithful, with essential image those \mathcal{O}' -modules \mathcal{G} such that $\mathcal{I}\mathcal{G} = 0$.

Proof. By Lemma 18.15.2 and Sites, Lemma 7.42.8 we see that i_* is exact. From the fact that i_* is fully faithful on sheaves of sets, and the fact that i^\sharp is surjective it follows that i_* is fully faithful as a functor $Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}')$. Namely, suppose that $\alpha : i_*\mathcal{F}_1 \rightarrow i_*\mathcal{F}_2$ is an \mathcal{O}' -module map. By the fully faithfulness of i_* we obtain a map $\beta : \mathcal{F}_1 \rightarrow \mathcal{F}_2$ of sheaves of sets. To prove β is a map of modules we have to show that

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{F}_1 & \longrightarrow & \mathcal{F}_1 \\ \downarrow & & \downarrow \\ \mathcal{O} \times \mathcal{F}_2 & \longrightarrow & \mathcal{F}_2 \end{array}$$

commutes. It suffices to prove commutativity after applying i_* . Consider

$$\begin{array}{ccccc} \mathcal{O}' \times i_*\mathcal{F}_1 & \longrightarrow & i_*\mathcal{O} \times i_*\mathcal{F}_1 & \longrightarrow & i_*\mathcal{F}_1 \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{O}' \times i_*\mathcal{F}_2 & \longrightarrow & i_*\mathcal{O} \times i_*\mathcal{F}_2 & \longrightarrow & i_*\mathcal{F}_2 \end{array}$$

We know the outer rectangle commutes. Since i^\sharp is surjective we conclude.

To finish the proof we have to prove the statement on the essential image of i_* . It is clear that $i_*\mathcal{F}$ is annihilated by \mathcal{I} for any \mathcal{O} -module \mathcal{F} . Conversely, let \mathcal{G} be a \mathcal{O}' -module with $\mathcal{I}\mathcal{G} = 0$. By definition of a closed subtopos there exists a subsheaf \mathcal{U} of the final object of \mathcal{D} such that the essential image of i_* on sheaves of sets is the class of sheaves of sets \mathcal{H} such that $\mathcal{H} \times \mathcal{U} \rightarrow \mathcal{U}$ is an isomorphism. In particular, $i_*\mathcal{O} \times \mathcal{U} = \mathcal{U}$. This implies that $\mathcal{I} \times \mathcal{U} = \mathcal{O} \times \mathcal{U}$. Hence our module \mathcal{G} satisfies $\mathcal{G} \times \mathcal{U} = \{0\} \times \mathcal{U} = \mathcal{U}$ (because the zero module is isomorphic to the final object of sheaves of sets). Thus there exists a sheaf of sets \mathcal{F} on \mathcal{C} with $i_*\mathcal{F} = \mathcal{G}$. Since i_* is fully faithful on sheaves of sets, we see that in order to define the addition $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ and the multiplication $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ it suffices to use the addition

$$\mathcal{G} \times \mathcal{G} \longrightarrow \mathcal{G}$$

(given to us as \mathcal{G} is a \mathcal{O}' -module) and the multiplication

$$i_*\mathcal{O} \times \mathcal{G} \rightarrow \mathcal{G}$$

which is given to us as we have the multiplication by \mathcal{O}' which annihilates \mathcal{I} by assumption and $i_*\mathcal{O} = \mathcal{O}'/\mathcal{I}$. By construction \mathcal{G} is isomorphic to the pushforward of the \mathcal{O} -module \mathcal{F} so constructed. \square

18.26. Tensor product

In Sections 18.9 and 18.11 we defined the change of rings functor by a tensor product construction. To be sure this construction makes sense also to define the tensor product of presheaves of \mathcal{O} -modules. To be precise, suppose \mathcal{C} is a category, \mathcal{O} is a presheaf of rings, and \mathcal{F}, \mathcal{G} are presheaves of \mathcal{O} -modules. In this case we define $\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}$ to be the presheaf

$$U \mapsto (\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G})(U) = \mathcal{F}(U) \otimes_{\mathcal{O}(U)} \mathcal{G}(U)$$

If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings and \mathcal{F}, \mathcal{G} are sheaves of \mathcal{O} -modules then we define

$$\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} = (\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G})^\#$$

to be the sheaf of \mathcal{O} -modules associated to the presheaf $\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}$.

Here are some formulas which we will use below without further mention:

$$(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}) \otimes_{p, \mathcal{O}} \mathcal{H} = \mathcal{F} \otimes_{p, \mathcal{O}} (\mathcal{G} \otimes_{p, \mathcal{O}} \mathcal{H}),$$

and similarly for sheaves. If $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ is a map of presheaves of rings, then

$$(\mathcal{F} \otimes_{p, \mathcal{O}_1} \mathcal{G}) \otimes_{p, \mathcal{O}_1} \mathcal{O}_2 = (\mathcal{F} \otimes_{p, \mathcal{O}_1} \mathcal{O}_2) \otimes_{p, \mathcal{O}_2} (\mathcal{G} \otimes_{p, \mathcal{O}_1} \mathcal{O}_2),$$

and similarly for sheaves. These follow from their algebraic counterparts and sheafification.

Let \mathcal{C} be a site, let \mathcal{O} be a sheaf of rings and let $\mathcal{F}, \mathcal{G}, \mathcal{H}$ be sheaves of \mathcal{O} -modules. In this case we define

$$\text{Bilin}_{\mathcal{O}}(\mathcal{F} \times \mathcal{G}, \mathcal{H}) = \{\varphi \in \text{Mor}_{\text{Sh}(\mathcal{C})}(\mathcal{F} \times \mathcal{G}, \mathcal{H}) \mid \varphi \text{ is } \mathcal{O}\text{-bilinear}\}.$$

With this definition we have

$$\text{Hom}_{\mathcal{O}}(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}) = \text{Bilin}_{\mathcal{O}}(\mathcal{F} \times \mathcal{G}, \mathcal{H}).$$

In other words $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$ represents the functor which associates to \mathcal{H} the set of bilinear maps $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{H}$. In particular, since the notion of a bilinear map makes sense for a pair of modules on a ringed topos, we see that the tensor product of sheaves of modules is intrinsic to the topos (compare the discussion in Section 18.18). In fact we have the following.

Lemma 18.26.1. *Let $f : (\text{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let \mathcal{F}, \mathcal{G} be $\mathcal{O}_{\mathcal{D}}$ -modules. Then $f^*(\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}) = f^*\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{C}}} f^*\mathcal{G}$ functorially in \mathcal{F}, \mathcal{G} .*

Proof. For a sheaf \mathcal{H} of $\mathcal{O}_{\mathcal{C}}$ modules we have

$$\begin{aligned} \text{Hom}_{\mathcal{O}_{\mathcal{C}}}(f^*(\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}), \mathcal{H}) &= \text{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{F} \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}, f_*\mathcal{H}) \\ &= \text{Bilin}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{F} \times \mathcal{G}, f_*\mathcal{H}) \\ &= \text{Bilin}_{f^{-1}\mathcal{O}_{\mathcal{D}}}(f^{-1}\mathcal{F} \times f^{-1}\mathcal{G}, \mathcal{H}) \\ &= \text{Hom}_{f^{-1}\mathcal{O}_{\mathcal{D}}}(f^{-1}\mathcal{F} \otimes_{f^{-1}\mathcal{O}_{\mathcal{D}}} f^{-1}\mathcal{G}, \mathcal{H}) \\ &= \text{Hom}_{\mathcal{O}_{\mathcal{C}}}(f^*\mathcal{F} \otimes_{f^*\mathcal{O}_{\mathcal{D}}} f^*\mathcal{G}, \mathcal{H}) \end{aligned}$$

The interesting “=” in this sequence of equalities is the third equality. It follows from the definition and adjointness of f_* and f^{-1} (as discussed in previous sections) in a straightforward manner. \square

Lemma 18.26.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F}, \mathcal{G} be sheaves of \mathcal{O} -modules.*

- (1) If \mathcal{F}, \mathcal{G} are locally free, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (2) If \mathcal{F}, \mathcal{G} are finite locally free, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (3) If \mathcal{F}, \mathcal{G} are locally generated by sections, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (4) If \mathcal{F}, \mathcal{G} are of finite type, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (5) If \mathcal{F}, \mathcal{G} are quasi-coherent, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (6) If \mathcal{F}, \mathcal{G} are of finite presentation, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.
- (7) If \mathcal{F} is of finite presentation and \mathcal{G} is coherent, then $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$ is coherent.
- (8) If \mathcal{F}, \mathcal{G} are coherent, so is $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$.

Proof. Omitted. Hint: Compare with Sheaves of Modules, Lemma 17.15.5. \square

18.27. Internal Hom

Let \mathcal{C} be a category and let \mathcal{O} be a presheaf of rings. Let \mathcal{F}, \mathcal{G} be presheaves of \mathcal{O} -modules. Consider the rule

$$U \mapsto \mathrm{Hom}_{\mathcal{O}|_U}(\mathcal{F}|_U, \mathcal{G}|_U).$$

For $\varphi : V \rightarrow U$ in \mathcal{C} we define a restriction mapping

$$\mathrm{Hom}_{\mathcal{O}|_U}(\mathcal{F}|_U, \mathcal{G}|_U) \longrightarrow \mathrm{Hom}_{\mathcal{O}|_V}(\mathcal{F}|_V, \mathcal{G}|_V)$$

by restricting via the relocalization morphism $j : \mathcal{C}/V \rightarrow \mathcal{C}/U$, see Sites, Lemma 7.24.7. Hence this defines a presheaf $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$. In addition, given an element $\varphi \in \mathrm{Hom}_{\mathcal{O}|_U}(\mathcal{F}|_U, \mathcal{G}|_U)$ and a section $f \in \mathcal{O}(U)$ then we can define $f\varphi \in \mathrm{Hom}_{\mathcal{O}|_U}(\mathcal{F}|_U, \mathcal{G}|_U)$ by either precomposing with multiplication by f on $\mathcal{F}|_U$ or postcomposing with multiplication by f on $\mathcal{G}|_U$ (it gives the same result). Hence we in fact get a presheaf of \mathcal{O} -modules. There is a canonical “evaluation” morphism

$$\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}.$$

Lemma 18.27.1. *If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings, \mathcal{F} is a presheaf of \mathcal{O} -modules, and \mathcal{G} is a sheaf of \mathcal{O} -modules, then $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ is a sheaf of \mathcal{O} -modules.*

Proof. Omitted. Hints: Note first that $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = \mathcal{H}om_{\mathcal{O}}(\mathcal{F}^{\#}, \mathcal{G})$, which reduces the question to the case where both \mathcal{F} and \mathcal{G} are sheaves. The result for sheaves of sets is Sites, Lemma 7.25.1. \square

In the situation of the lemma the “evaluation” morphism factors through the tensor product of sheaves of modules

$$\mathcal{F} \otimes_{\mathcal{O}} \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) \longrightarrow \mathcal{G}.$$

Lemma 18.27.2. *Internal hom and (co)limits. Let \mathcal{C} be a category and let \mathcal{O} be a presheaf of rings.*

- (1) *For any presheaf of \mathcal{O} -modules \mathcal{F} the functor*

$$P\mathrm{Mod}(\mathcal{O}) \longrightarrow P\mathrm{Mod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$$

commutes with arbitrary limits.

- (2) *For any presheaf of \mathcal{O} -modules \mathcal{G} the functor*

$$P\mathrm{Mod}(\mathcal{O}) \longrightarrow P\mathrm{Mod}(\mathcal{O})^{\mathrm{opp}}, \quad \mathcal{F} \mapsto \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$$

commutes with arbitrary colimits, in a formula

$$\mathcal{H}om_{\mathcal{O}}(\mathrm{colim}_i \mathcal{F}_i, \mathcal{G}) = \lim_i \mathcal{H}om_{\mathcal{O}}(\mathcal{F}_i, \mathcal{G}).$$

Suppose that \mathcal{C} is a site, and \mathcal{O} is a sheaf of rings.

(3) For any sheaf of \mathcal{O} -modules \mathcal{F} the functor

$$\text{Mod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$$

commutes with arbitrary limits.

(4) For any sheaf of \mathcal{O} -modules \mathcal{G} the functor

$$\text{Mod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O})^{\text{opp}}, \quad \mathcal{F} \longmapsto \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$$

commutes with arbitrary colimits, in a formula

$$\mathcal{H}om_{\mathcal{O}}(\text{colim}_i \mathcal{F}_i, \mathcal{G}) = \lim_i \mathcal{H}om_{\mathcal{O}}(\mathcal{F}_i, \mathcal{G}).$$

Proof. Let $\mathcal{I} \rightarrow \text{PMod}(\mathcal{O})$, $i \mapsto \mathcal{G}_i$ be a diagram. Let U be an object of the category \mathcal{C} . As j_U^* is both a left and a right adjoint we see that $\lim_i j_U^* \mathcal{G}_i = j_U^* \lim_i \mathcal{G}_i$. Hence we have

$$\begin{aligned} \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \lim_i \mathcal{G}_i)(U) &= \text{Hom}_{\mathcal{O}_U}(\mathcal{F}|_U, \lim_i \mathcal{G}_i|_U) \\ &= \lim_i \text{Hom}_{\mathcal{O}_U}(\mathcal{F}|_U, \mathcal{G}_i|_U) \\ &= \lim_i \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G}_i)(U) \end{aligned}$$

by definition of a limit. This proves (1). Part (2) is proved in exactly the same way. Part (3) follows from (1) because the limit of a diagram of sheaves is the same as the limit in the category of presheaves. Finally, (4) follow because, in the formula we have

$$\text{Mor}_{\text{Mod}(\mathcal{O})}(\text{colim}_i \mathcal{F}_i, \mathcal{G}) = \text{Mor}_{\text{PMod}(\mathcal{O})}(\text{colim}_i^{\text{PSh}} \mathcal{F}_i, \mathcal{G})$$

as the colimit $\text{colim}_i \mathcal{F}_i$ is the sheafification of the colimit $\text{colim}_i^{\text{PSh}} \mathcal{F}_i$ in $\text{PMod}(\mathcal{O})$. Hence (4) follows from (2) (by the remark on limits above again). \square

Lemma 18.27.3. Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings.

(1) Let $\mathcal{F}, \mathcal{G}, \mathcal{H}$ be presheaves of \mathcal{O} -modules. There is a canonical isomorphism

$$\mathcal{H}om_{\mathcal{O}}(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}, \mathcal{H}) \longrightarrow \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{G}, \mathcal{H}))$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular,

$$\text{Mor}_{\text{PMod}(\mathcal{O})}(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}, \mathcal{H}) = \text{Mor}_{\text{PMod}(\mathcal{O})}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{G}, \mathcal{H}))$$

(2) Suppose that \mathcal{C} is a site, \mathcal{O} is a sheaf of rings, and $\mathcal{F}, \mathcal{G}, \mathcal{H}$ are sheaves of \mathcal{O} -modules. There is a canonical isomorphism

$$\mathcal{H}om_{\mathcal{O}}(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}) \longrightarrow \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{G}, \mathcal{H}))$$

which is functorial in all three entries (sheaf Hom in all three spots). In particular,

$$\text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}, \mathcal{H}) = \text{Mor}_{\text{Mod}(\mathcal{O})}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{G}, \mathcal{H}))$$

Proof. This is the analogue of Algebra, Lemma 10.11.8. The proof is the same, and is omitted. \square

Lemma 18.27.4. Tensor product and (co)limits. Let \mathcal{C} be a category and let \mathcal{O} be a presheaf of rings.

(1) For any presheaf of \mathcal{O} -modules \mathcal{F} the functor

$$\text{PMod}(\mathcal{O}) \longrightarrow \text{PMod}(\mathcal{O}), \quad \mathcal{G} \longmapsto \mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{G}$$

commutes with arbitrary colimits.

- (2) Suppose that \mathcal{C} is a site, and \mathcal{O} is a sheaf of rings. For any sheaf of \mathcal{O} -modules \mathcal{F} the functor

$$\text{Mod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$$

commutes with arbitrary colimits.

Proof. This is because tensor product is adjoint to internal hom according to Lemma 18.27.3. See Categories, Lemma 4.24.4. \square

Lemma 18.27.5. Let \mathcal{C} be a category, resp. a site. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a map of presheaves, resp. sheaves of rings. Then

$$\text{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{O}'}(\mathcal{G}, \text{Hom}_{\mathcal{O}}(\mathcal{O}', \mathcal{F}))$$

for any \mathcal{O}' -module \mathcal{G} and \mathcal{O} -module \mathcal{F} .

Proof. This is the analogue of Algebra, Lemma 10.13.4. The proof is the same, and is omitted. \square

18.28. Flat modules

We can define flat modules exactly as in the case of modules over rings.

Definition 18.28.1. Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings.

- (1) A presheaf \mathcal{F} of \mathcal{O} -modules is called *flat* if the functor

$$P\text{Mod}(\mathcal{O}) \longrightarrow P\text{Mod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{p, \mathcal{O}} \mathcal{F}$$

is exact.

- (2) A map $\mathcal{O} \rightarrow \mathcal{O}'$ of presheaves of rings is called *flat* if \mathcal{O}' is flat as a presheaf of \mathcal{O} -modules.
 (3) If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings and \mathcal{F} is a sheaf of \mathcal{O} -modules, then we say \mathcal{F} is *flat* if the functor

$$\text{Mod}(\mathcal{O}) \longrightarrow \text{Mod}(\mathcal{O}), \quad \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}$$

is exact.

- (4) A map $\mathcal{O} \rightarrow \mathcal{O}'$ of sheaves of rings on a site is called *flat* if \mathcal{O}' is flat as a sheaf of \mathcal{O} -modules.

The notion of a flat module or flat ring map is intrinsic (Section 18.18).

Lemma 18.28.2. Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let \mathcal{F} be a presheaf of \mathcal{O} -modules. If each $\mathcal{F}(U)$ is a flat $\mathcal{O}(U)$ -module, then \mathcal{F} is flat.

Proof. This is immediate from the definitions. \square

Lemma 18.28.3. Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let \mathcal{F} be a presheaf of \mathcal{O} -modules. If \mathcal{F} is a flat \mathcal{O} -module, then $\mathcal{F}^{\#}$ is a flat $\mathcal{O}^{\#}$ -module.

Proof. Omitted. (Hint: Sheafification is exact.) \square

Lemma 18.28.4. Colimits and tensor product.

- (1) A filtered colimit of flat presheaves of modules is flat. A direct sum of flat presheaves of modules is flat.
 (2) A filtered colimit of flat sheaves of modules is flat. A direct sum of flat sheaves of modules is flat.

Proof. Part (1) follows from Lemma 18.27.4 and Algebra, Lemma 10.8.9 by looking at sections over objects. To see part (2), use Lemma 18.27.4 and the fact that a filtered colimit of exact complexes is an exact complex (this uses that sheafification is exact and commutes with colimits). Some details omitted. \square

Lemma 18.28.5. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let U be an object of \mathcal{C} . Consider the functor $j_U : \mathcal{C}/U \rightarrow \mathcal{C}$.*

- (1) *The presheaf of \mathcal{O} -modules $j_{U!}\mathcal{O}_U$ (see Remark 18.19.6) is flat.*
- (2) *If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings, $j_{U!}\mathcal{O}_U$ is a flat sheaf of \mathcal{O} -modules.*

Proof. Proof of (1). By the discussion in Remark 18.19.6 we see that

$$j_{U!}\mathcal{O}_U(V) = \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V,U)} \mathcal{O}(V)$$

which is a flat $\mathcal{O}(V)$ -module. Hence (1) follows from Lemma 18.28.2. Then (2) follows as $j_{U!}\mathcal{O}_U = (j_{U!}\mathcal{O}_U)^\#$ (the first $j_{U!}$ on sheaves, the second on presheaves) and Lemma 18.28.3. \square

Lemma 18.28.6. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings.*

- (1) *Any presheaf of \mathcal{O} -modules is a quotient of a direct sum $\bigoplus j_{U_i!}\mathcal{O}_{U_i}$.*
- (2) *Any presheaf of \mathcal{O} -modules is a quotient of a flat presheaf of \mathcal{O} -modules.*
- (3) *If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings, then any sheaf of \mathcal{O} -modules is a quotient of a direct sum $\bigoplus j_{U_i!}\mathcal{O}_{U_i}$.*
- (4) *If \mathcal{C} is a site, \mathcal{O} is a sheaf of rings, then any sheaf of \mathcal{O} -modules is a quotient of a flat sheaf of \mathcal{O} -modules.*

Proof. Proof of (1). For every object U of \mathcal{C} and every $s \in \mathcal{F}(U)$ we get a morphism $j_{U!}\mathcal{O}_U \rightarrow \mathcal{F}$, namely the adjoint to the morphism $\mathcal{O}_U \rightarrow \mathcal{F}|_U, 1 \mapsto s$. Clearly the map

$$\bigoplus_{(U,s)} j_{U!}\mathcal{O}_U \longrightarrow \mathcal{F}$$

is surjective. The source is flat by combining Lemmas 18.28.4 and 18.28.5 which proves (2). The sheaf case follows from this either by sheafifying or repeating the same argument. \square

Lemma 18.28.7. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let*

$$0 \rightarrow \mathcal{F}'' \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow 0$$

be a short exact sequence of presheaves of \mathcal{O} -modules. Assume \mathcal{F} is flat. Then

- (1) *For any presheaf \mathcal{G} of \mathcal{O} -modules, the sequence*

$$0 \rightarrow \mathcal{F}'' \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}' \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow 0$$

is exact.

- (2) *If \mathcal{C} is a site, and $\mathcal{O}, \mathcal{F}, \mathcal{F}', \mathcal{F}''$, and \mathcal{G} are all sheaves, the sequence*

$$0 \rightarrow \mathcal{F}'' \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}' \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow 0$$

is exact.

Proof. Choose a flat presheaf of \mathcal{O} -modules \mathcal{G}' which surjects onto \mathcal{G} . This is possible by Lemma 18.28.6. Let $\mathcal{G}'' = \text{Ker}(\mathcal{G}' \rightarrow \mathcal{G})$. The lemma follows by applying the snake lemma to the following diagram

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & \mathcal{F}'' \otimes_{p,\mathcal{O}} \mathcal{G} & \rightarrow & \mathcal{F}' \otimes_{p,\mathcal{O}} \mathcal{G} & \rightarrow & \mathcal{F} \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 0 & \rightarrow & \mathcal{F}'' \otimes_{p,\mathcal{O}} \mathcal{G}' & \rightarrow & \mathcal{F}' \otimes_{p,\mathcal{O}} \mathcal{G}' & \rightarrow & \mathcal{F} \otimes_{p,\mathcal{O}} \mathcal{G}' \rightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & \mathcal{F}'' \otimes_{p,\mathcal{O}} \mathcal{G}'' & \rightarrow & \mathcal{F}' \otimes_{p,\mathcal{O}} \mathcal{G}'' & \rightarrow & \mathcal{F} \otimes_{p,\mathcal{O}} \mathcal{G}'' \rightarrow 0 \\
 & & & & & & \uparrow \\
 & & & & & & 0
 \end{array}$$

with exact rows and columns. The middle row is exact because tensoring with the flat module \mathcal{G}' is exact. The sheaf case follows from the presheaf case as sheafification is exact. \square

Lemma 18.28.8. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let*

$$0 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_0 \rightarrow 0$$

be a short exact sequence of presheaves of \mathcal{O} -modules.

- (1) *If \mathcal{F}_2 and \mathcal{F}_0 are flat so is \mathcal{F}_1 .*
- (2) *If \mathcal{F}_1 and \mathcal{F}_0 are flat so is \mathcal{F}_2 .*

If \mathcal{C} is a site and \mathcal{O} is a sheaf of rings then the same result holds $\text{Mod}(\mathcal{O})$.

Proof. Let \mathcal{G}^\bullet be an arbitrary exact complex of presheaves of \mathcal{O} -modules. Assume that \mathcal{F}_0 is flat. By Lemma 18.28.7 we see that

$$0 \rightarrow \mathcal{G}^\bullet \otimes_{p,\mathcal{O}} \mathcal{F}_2 \rightarrow \mathcal{G}^\bullet \otimes_{p,\mathcal{O}} \mathcal{F}_1 \rightarrow \mathcal{G}^\bullet \otimes_{p,\mathcal{O}} \mathcal{F}_0 \rightarrow 0$$

is a short exact sequence of complexes of presheaves of \mathcal{O} -modules. Hence (1) and (2) follow from the snake lemma. The case of sheaves of modules is proved in the same way. \square

Lemma 18.28.9. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings. Let*

$$\dots \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_0 \rightarrow \mathcal{Q} \rightarrow 0$$

be an exact complex of presheaves of \mathcal{O} -modules. If \mathcal{Q} and all \mathcal{F}_i are flat \mathcal{O} -modules, then for any presheaf \mathcal{G} of \mathcal{O} -modules the complex

$$\dots \rightarrow \mathcal{F}_2 \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}_1 \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F}_0 \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow \mathcal{Q} \otimes_{p,\mathcal{O}} \mathcal{G} \rightarrow 0$$

is exact also. If \mathcal{C} is a site and \mathcal{O} is a sheaf of rings then the same result holds $\text{Mod}(\mathcal{O})$.

Proof. Follows from Lemma 18.28.7 by splitting the complex into short exact sequences and using Lemma 18.28.8 to prove inductively that $\text{Im}(\mathcal{F}_{i+1} \rightarrow \mathcal{F}_i)$ is flat. \square

Lemma 18.28.10. *Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a map of sheaves of rings on a site \mathcal{C} . If \mathcal{G} is a flat \mathcal{O}_1 -module, then $\mathcal{G} \otimes_{\mathcal{O}_1} \mathcal{O}_2$ is a flat \mathcal{O}_2 -module.*

Proof. This is true because

$$(\mathcal{G} \otimes_{\mathcal{O}_1} \mathcal{O}_2) \otimes_{\mathcal{O}_2} \mathcal{H} = \mathcal{G} \otimes_{\mathcal{O}_1} \mathcal{F}$$

(as sheaves of abelian groups for example). □

The following lemma gives one direction of the equational criterion of flatness (Algebra, Lemma 10.38.10).

Lemma 18.28.11. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a flat \mathcal{O} -module. Let U be an object of \mathcal{C} and let*

$$\mathcal{O}_U \xrightarrow{(f_1, \dots, f_n)} \mathcal{O}_U^{\oplus n} \xrightarrow{(s_1, \dots, s_n)} \mathcal{F}|_U$$

be a complex of \mathcal{O}_U -modules. There exists a covering $\{U_i \rightarrow U\}$ and for each i a factorization

$$\mathcal{O}_{U_i}^{\oplus n} \xrightarrow{A} \mathcal{O}_{U_i}^{\oplus m} \xrightarrow{(t_1, \dots, t_m)} \mathcal{F}|_{U_i}$$

of $(s_1, \dots, s_n)|_{U_i}$ such that $A \circ (f_1, \dots, f_n)|_{U_i} = 0$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals generated by f_1, \dots, f_n . Then $\sum f_j \otimes s_j$ is a section of $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U$ which maps to zero in $\mathcal{F}|_U$. As $\mathcal{F}|_U$ is flat the map $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U \rightarrow \mathcal{F}|_U$ is injective. Since $\mathcal{I} \otimes_{\mathcal{O}_U} \mathcal{F}|_U$ is the sheaf associated to the presheaf tensor product, we see there exists a covering $\{U_i \rightarrow U\}$ such that $\sum f_j|_{U_i} \otimes s_j|_{U_i}$ is zero in $\mathcal{I}(U_i) \otimes_{\mathcal{O}(U_i)} \mathcal{F}(U_i)$. Unwinding the definitions using Algebra, Lemma 10.103.10 we find $t_1, \dots, t_m \in \mathcal{F}(U_i)$ and $a_{jk} \in \mathcal{O}(U_i)$ such that $\sum a_{jk} f_j|_{U_i} = 0$ and $s_j|_{U_i} = \sum a_{jk} t_k$. □

Lemma 18.28.12. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be locally of finite presentation and flat. Then given an object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ such that $\mathcal{F}|_{U_i}$ is a direct summand of a finite free \mathcal{O}_{U_i} -module.*

Proof. Choose an object U of \mathcal{C} . After replacing U by the members of a covering, we may assume there exists a presentation

$$\mathcal{O}_U^{\oplus r} \rightarrow \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{F} \rightarrow 0$$

By Lemma 18.28.11 we may assume, after replacing U by the members of a covering, assume there exists a factorization

$$\mathcal{O}_U^{\oplus n} \rightarrow \mathcal{O}_U^{\oplus n_1} \rightarrow \mathcal{F}$$

such that the composition $\mathcal{O}_U^{\oplus r} \rightarrow \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{O}_U^{\oplus n_1}$ annihilates the first summand of $\mathcal{O}_U^{\oplus r}$. Repeating this argument $r - 1$ more times we obtain a factorization

$$\mathcal{O}_U^{\oplus n} \rightarrow \mathcal{O}_U^{\oplus n_r} \rightarrow \mathcal{F}$$

such that the composition $\mathcal{O}_U^{\oplus r} \rightarrow \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{O}_U^{\oplus n_r}$ is zero. This means that the surjection $\mathcal{O}_U^{\oplus n_r} \rightarrow \mathcal{F}$ has a section and we win. □

Lemma 18.28.13. *Let \mathcal{C} be a site. Let $\mathcal{O}' \rightarrow \mathcal{O}$ be a surjection of sheaves of rings whose kernel \mathcal{I} is an ideal of square zero. Let \mathcal{F}' be an \mathcal{O}' -module and set $\mathcal{F} = \mathcal{F}'/\mathcal{I}\mathcal{F}'$. The following are equivalent*

- (1) \mathcal{F}' is a flat \mathcal{O}' -module, and
- (2) \mathcal{F} is a flat \mathcal{O} -module and $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{F}'$ is injective.

Proof. If (1) holds, then $\mathcal{F} = \mathcal{F}' \otimes_{\mathcal{O}'} \mathcal{O}$ is flat over \mathcal{O} by Lemma 18.28.10 and we see the map $\mathcal{I} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{F}'$ is injective by applying $-\otimes_{\mathcal{O}'} \mathcal{F}'$ to the exact sequence $0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}' \rightarrow \mathcal{O} \rightarrow 0$, see Lemma 18.28.7. Assume (2). In the rest of the proof we will use without further mention that $\mathcal{K} \otimes_{\mathcal{O}'} \mathcal{F}' = \mathcal{K} \otimes_{\mathcal{O}} \mathcal{F}$ for any \mathcal{O}' -module \mathcal{K} annihilated by \mathcal{I} . Let $\alpha : \mathcal{G}' \rightarrow \mathcal{H}'$ be an injective map of \mathcal{O}' -modules. Let $\mathcal{G} \subset \mathcal{G}'$, resp. $\mathcal{H} \subset \mathcal{H}'$ be the subsheaf of sections annihilated by \mathcal{I} . Consider the diagram

$$\begin{array}{ccccccc} \mathcal{G} \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & \mathcal{G}' \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & \mathcal{G}'/\mathcal{G} \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \mathcal{H} \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & \mathcal{H}' \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & \mathcal{H}'/\mathcal{H} \otimes_{\mathcal{O}'} \mathcal{F}' & \longrightarrow & 0 \end{array}$$

Note that \mathcal{G}'/\mathcal{G} and \mathcal{H}'/\mathcal{H} are annihilated by \mathcal{I} and that $\mathcal{G}'/\mathcal{G} \rightarrow \mathcal{H}'/\mathcal{H}$ is injective. Thus the right vertical arrow is injective as \mathcal{F} is flat over \mathcal{O} . The same is true for the left vertical arrow. Hence the middle vertical arrow is injective and \mathcal{F}' is flat. \square

18.29. Towards constructible modules

Recall that a quasi-compact object of a site is one such that every covering of it can be refined by a finite covering. It turns out that if every object of a site has a covering by quasi-compact objects, then the modules $j_! \mathcal{O}_U$ with U quasi-compact form a particularly nice set of generators for the category of all modules.

Lemma 18.29.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\{U_i \rightarrow U\}$ be a covering of \mathcal{C} . Then the sequence*

$$\bigoplus j_{U_i \times_U U_j!} \mathcal{O}_{U_i \times_U U_j} \rightarrow \bigoplus j_{U_i!} \mathcal{O}_{U_i} \rightarrow j_! \mathcal{O}_U \rightarrow 0$$

is exact.

Proof. This holds because for any \mathcal{O} -module \mathcal{F} the functor $\text{Hom}_{\mathcal{O}}(-, \mathcal{F})$ turns our sequence into the exact sequence $0 \rightarrow \mathcal{F}(U) \rightarrow \prod \mathcal{F}(U_i) \rightarrow \prod \mathcal{F}(U_i \times_U U_j)$. Then the lemma follows from Homology, Lemma 12.5.8. \square

Lemma 18.29.2. *Let \mathcal{C} be a site. Let W be a quasi-compact object of \mathcal{C} .*

- (1) *The functor $\text{Sh}(\mathcal{C}) \rightarrow \text{Sets}$, $\mathcal{F} \mapsto \mathcal{F}(W)$ commutes with coproducts.*
- (2) *Let \mathcal{O} be a sheaf of rings on \mathcal{C} . The functor $\text{Mod}(\mathcal{O}) \rightarrow \text{Ab}$, $\mathcal{F} \mapsto \mathcal{F}(W)$ commutes with direct sums.*

Proof. Proof of (1). Taking sections over W commutes with filtered colimits with injective transition maps by Sites, Lemma 7.11.2. If \mathcal{F}_i is a family of sheaves of sets indexed by a set I . Then $\coprod \mathcal{F}_i$ is the filtered colimit over the partially ordered set of finite subsets $E \subset I$ of the coproducts $\mathcal{F}_E = \coprod_{i \in E} \mathcal{F}_i$. Since the transition maps are injective we conclude.

Proof of (2). Let \mathcal{F}_i be a family of sheaves of \mathcal{O} -modules indexed by a set I . Then $\bigoplus \mathcal{F}_i$ is the filtered colimit over the partially ordered set of finite subsets $E \subset I$ of the direct sums $\mathcal{F}_E = \bigoplus_{i \in E} \mathcal{F}_i$. A filtered colimit of abelian sheaves can be computed in the category of sheaves of sets. Moreover, for $E \subset E'$ the transition map $\mathcal{F}_E \rightarrow \mathcal{F}_{E'}$ is injective (as sheafification is exact and the injectivity is clear on underlying presheaves). Hence it suffices to show the result for a finite index set by Sites, Lemma 7.11.2. The finite case is dealt with in Lemma 18.3.2 (it holds over any object of \mathcal{C}). \square

Lemma 18.29.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be a quasi-compact object of \mathcal{C} . Then the functor $\text{Hom}_{\mathcal{O}}(j_! \mathcal{O}_U, -)$ commutes with direct sums.*

Proof. This is true because $\text{Hom}_{\mathcal{O}}(j_! \mathcal{O}_U, \mathcal{F}) = \mathcal{F}(U)$ and because the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ commutes with direct sums by Lemma 18.29.2. \square

In order to state the sharpest possible results in the following we introduce some notation.

Situation 18.29.4. Let \mathcal{C} be a site. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a set of objects. We consider the following conditions

- (1) Every object of \mathcal{C} has a covering by elements of \mathcal{B} .
- (2) Every $U \in \mathcal{B}$ is quasi-compact.
- (3) For a finite covering $\{U_i \rightarrow U\}$ with $U_i, U \in \mathcal{B}$ the fibre products $U_i \times_U U_j$ are quasi-compact.

Lemma 18.29.5. *In Situation 18.29.4 assume (1) holds.*

- (1) *Every sheaf of sets is the target of a surjective map whose source is a coproduct $\coprod h_{U_i}^\#$ with U_i in \mathcal{B} .*
- (2) *If \mathcal{O} is a sheaf of rings, then every \mathcal{O} -module is a quotient of a direct sum $\bigoplus j_{U_i!} \mathcal{O}_{U_i}$ with U_i in \mathcal{B} .*

Proof. Follows immediately from Lemmas 18.28.6 and 18.29.1. \square

Lemma 18.29.6. *In Situation 18.29.4 assume (1) and (2) hold.*

- (1) *Every sheaf of sets is a filtered colimit of sheaves of the form*

$$(18.29.6.1) \quad \text{Coequalizer} \left(\coprod_{j=1, \dots, m} h_{V_j}^\# \rightrightarrows \coprod_{i=1, \dots, n} h_{U_i}^\# \right)$$

with U_i and V_j in \mathcal{B} .

- (2) *If \mathcal{O} is a sheaf of rings, then every \mathcal{O} -module is a filtered colimit of sheaves of the form*

$$(18.29.6.2) \quad \text{Coker} \left(\bigoplus_{j=1, \dots, m} j_{V_j!} \mathcal{O}_{V_j} \longrightarrow \bigoplus_{i=1, \dots, n} j_{U_i!} \mathcal{O}_{U_i} \right)$$

with U_i and V_j in \mathcal{B} .

Proof. Proof of (1). By Lemma 18.29.5 every sheaf of sets \mathcal{F} is the target of a surjection whose source is a coprod \mathcal{F}_0 of sheaves the form $h_U^\#$ with $U \in \mathcal{B}$. Applying this to $\mathcal{F}_0 \times_{\mathcal{F}} \mathcal{F}_0$ we find that \mathcal{F} is a coequalizer of a pair of maps

$$\coprod_{j \in J} h_{V_j}^\# \rightrightarrows \coprod_{i \in I} h_{U_i}^\#$$

for some index sets I, J and V_j and U_i in \mathcal{B} . For every finite subset $J' \subset J$ there is a finite subset $I' \subset I$ such that the coproduct over $j \in J'$ maps into the coprod over $i \in I'$ via both maps, see Lemma 18.29.3. Thus our sheaf is the colimit of the cokernels of these maps between finite coproducts.

Proof of (2). By Lemma 18.29.5 every module is a quotient of a direct sum of modules of the form $j_U! \mathcal{O}_U$ with $U \in \mathcal{B}$. Thus every module is a cokernel

$$\text{Coker} \left(\bigoplus_{j \in J} j_{V_j!} \mathcal{O}_{V_j} \longrightarrow \bigoplus_{i \in I} j_{U_i!} \mathcal{O}_{U_i} \right)$$

for some index sets I, J and V_j and U_i in \mathcal{B} . For every finite subset $J' \subset J$ there is a finite subset $I' \subset I$ such that the direct sum over $j \in J'$ maps into the direct sum

over $i \in I'$, see Lemma 18.29.3. Thus our module is the colimit of the cokernels of these maps between finite direct sums. \square

Lemma 18.29.7. *In Situation 18.29.4 assume (1) and (2) hold. Let \mathcal{O} be a sheaf of rings. Then a cokernel of a map between modules as in (18.29.6.2) is another module as in (18.29.6.2).*

Proof. Let $\mathcal{F} = \text{Coker}(\bigoplus j_{V_j}! \mathcal{O}_{V_j} \rightarrow \bigoplus j_{U_i}! \mathcal{O}_{U_i})$ as in (18.29.6.2). It suffices to show that the cokernel of a map $\varphi : j_{W!} \mathcal{O}_W \rightarrow \mathcal{F}$ with $W \in \mathcal{B}$ is another module of the same type. The map φ corresponds to $s \in \mathcal{F}(W)$. Since W is quasi-compact we can find a finite covering $\{W_k \rightarrow W\}$ with $W_k \in \mathcal{B}$ such that $s|_{W_k}$ comes from a section $\sum s_{k_i}$ of $\bigoplus j_{U_i}! \mathcal{O}_{U_i}$. This determines maps $j_{W_k}! \mathcal{O}_{W_k} \rightarrow \bigoplus j_{U_i}! \mathcal{O}_{U_i}$. Since $\bigoplus j_{W_k}! \mathcal{O}_{W_k} \rightarrow j_{W!} \mathcal{O}_W$ is surjective (Lemma 18.29.1) we see that $\text{Coker}(\varphi)$ is equal to

$$\text{Coker} \left(\bigoplus j_{W_k}! \mathcal{O}_{W_k} \oplus \bigoplus j_{V_j}! \mathcal{O}_{V_j} \longrightarrow \bigoplus j_{U_i}! \mathcal{O}_{U_i} \right)$$

as desired. \square

Lemma 18.29.8. *In Situation 18.29.4 assume (1), (2), and (3) hold. Let \mathcal{O} be a sheaf of rings. Then given a map*

$$\bigoplus_{j=1, \dots, m} j_{V_j}! \mathcal{O}_{V_j} \longrightarrow \bigoplus_{i=1, \dots, n} j_{U_i}! \mathcal{O}_{U_i}$$

with U_i and V_j in \mathcal{B} , and finite coverings $\{U_{i_k} \rightarrow U_i\}$ by $U_{i_k} \in \mathcal{B}$, there exist a finite set of $W_l \in \mathcal{B}$ and a commutative diagram

$$\begin{array}{ccc} \bigoplus j_{W_l}! \mathcal{O}_{W_l} & \longrightarrow & \bigoplus j_{U_{i_k}}! \mathcal{O}_{U_{i_k}} \\ \downarrow & & \downarrow \\ \bigoplus j_{V_j}! \mathcal{O}_{V_j} & \longrightarrow & \bigoplus j_{U_i}! \mathcal{O}_{U_i} \end{array}$$

inducing an isomorphism on cokernels of the horizontal maps.

Proof. Since $\bigoplus j_{U_{i_k}}! \mathcal{O}_{U_{i_k}} \rightarrow \bigoplus j_{U_i}! \mathcal{O}_{U_i}$ is surjective (Lemma 18.29.1), we can find finite coverings $\{V_{j_m} \rightarrow V_j\}$ with $V_{j_m} \in \mathcal{B}$ such that we can find a commutative diagram

$$\begin{array}{ccc} \bigoplus j_{V_{j_m}}! \mathcal{O}_{V_{j_m}} & \longrightarrow & \bigoplus j_{U_{i_k}}! \mathcal{O}_{U_{i_k}} \\ \downarrow & & \downarrow \\ \bigoplus j_{V_j}! \mathcal{O}_{V_j} & \longrightarrow & \bigoplus j_{U_i}! \mathcal{O}_{U_i} \end{array}$$

Adding

$$\bigoplus j_{U_{i_k} \times_{U_i} U_{i_k}'}! \mathcal{O}_{U_{i_k} \times_{U_i} U_{i_k}'}$$

to the upper left corner finishes the proof by Lemma 18.29.1. \square

Lemma 18.29.9. *In Situation 18.29.4 assume (1), (2), and (3) hold. Let \mathcal{O} be a sheaf of rings. Then an extension of modules as in (18.29.6.2) is another module as in (18.29.6.2).*

Proof. Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of \mathcal{O} -modules with \mathcal{F}_1 and \mathcal{F}_3 as in (18.29.6.2). Choose presentations

$$\bigoplus A_{V_j} \rightarrow \bigoplus A_{U_i} \rightarrow \mathcal{F}_1 \rightarrow 0 \quad \text{and} \quad \bigoplus A_{T_j} \rightarrow \bigoplus A_{W_i} \rightarrow \mathcal{F}_3 \rightarrow 0$$

In this proof the direct sums are always finite, and we write $A_U = j_{U!}\mathcal{O}_U$ for $U \in \mathcal{B}$. By Lemma 18.29.8 we may replace W_i by finite coverings $\{W_{ik} \rightarrow W_i\}$ with $W_{ik} \in \mathcal{B}$. Thus we may assume the map $\bigoplus A_{W_i} \rightarrow \mathcal{F}_3$ lifts to a map into \mathcal{F}_2 . Consider the kernel

$$\mathcal{K}_2 = \text{Ker}(\bigoplus A_{U_i} \oplus \bigoplus A_{W_i} \longrightarrow \mathcal{F}_2)$$

By the snake lemma this kernel surjections onto $\mathcal{K}_3 = \text{Ker}(\bigoplus A_{W_i} \rightarrow \mathcal{F}_3)$. Thus after replacing each T_j by a finite covering with elements of \mathcal{B} (permissible by Lemma 18.29.1) we may assume there is a map $\bigoplus A_{T_j} \rightarrow \mathcal{K}_2$ lifting the given map $\bigoplus A_{T_j} \rightarrow \mathcal{K}_3$. Then $\bigoplus A_{V_j} \oplus \bigoplus A_{T_j} \rightarrow \mathcal{K}_2$ is surjective which finishes the proof. \square

Lemma 18.29.10. *In Situation 18.29.4 assume (1), (2), and (3) hold. Let \mathcal{O} be a sheaf of rings. Let $\mathcal{A} \subset \text{Mod}(\mathcal{O})$ be the full subcategory of modules isomorphic to a cokernel as in (18.29.6.2). If the kernel of every map of \mathcal{O} -modules of the form*

$$\bigoplus_{j=1,\dots,m} j_{V_j!}\mathcal{O}_{V_j} \longrightarrow \bigoplus_{i=1,\dots,n} j_{U_i!}\mathcal{O}_{U_i}$$

with U_i and V_j in \mathcal{B} , is in \mathcal{A} , then \mathcal{A} is weak Serre subcategory of $\text{Mod}(\mathcal{O})$.

Proof. We will use the criterion of Homology, Lemma 12.9.3. By the results of Lemmas 18.29.7 and 18.29.9 it suffices to see that the kernel of a map $\mathcal{F} \rightarrow \mathcal{G}$ between objects of \mathcal{A} is in \mathcal{A} . To prove this choose presentations

$$\bigoplus A_{V_j} \rightarrow \bigoplus A_{U_i} \rightarrow \mathcal{F} \rightarrow 0 \quad \text{and} \quad \bigoplus A_{T_j} \rightarrow \bigoplus A_{W_i} \rightarrow \mathcal{G} \rightarrow 0$$

In this proof the direct sums are always finite, and we write $A_U = j_{U!}\mathcal{O}_U$ for $U \in \mathcal{B}$. Using Lemmas 18.29.1 and 18.29.8 and arguing as in the proof of Lemma 18.29.9 we may assume that the map $\mathcal{F} \rightarrow \mathcal{G}$ lifts to a map of presentations

$$\begin{array}{ccccccc} \bigoplus A_{V_j} & \longrightarrow & \bigoplus A_{U_i} & \longrightarrow & \mathcal{F} & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \bigoplus A_{T_j} & \longrightarrow & \bigoplus A_{W_i} & \longrightarrow & \mathcal{G} & \longrightarrow & 0 \end{array}$$

Then we see that

$$\text{Ker}(\mathcal{F} \rightarrow \mathcal{G}) = \text{Coker} \left(\bigoplus A_{V_j} \rightarrow \text{Ker} \left(\bigoplus A_{T_j} \oplus \bigoplus A_{U_i} \rightarrow \bigoplus A_{W_i} \right) \right)$$

and the lemma follows from the assumption and Lemma 18.29.7. \square

18.30. Flat morphisms

Definition 18.30.1. Let $(f, f^\sharp) : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. We say (f, f^\sharp) is *flat* if the ring map $f^\sharp : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$ is flat. We say a morphism of ringed sites is *flat* if the associated morphism of ringed topoi is flat.

Lemma 18.30.2. *Let $f : \text{Sh}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{C}')$ be a morphism of ringed topoi. Then*

$$f^{-1} : \text{Ab}(\mathcal{C}') \longrightarrow \text{Ab}(\mathcal{C}), \quad \mathcal{F} \longmapsto f^{-1}\mathcal{F}$$

is exact. If $(f, f^\sharp) : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{C}'), \mathcal{O}')$ is a flat morphism of ringed topoi then

$$f^* : \text{Mod}(\mathcal{O}') \longrightarrow \text{Mod}(\mathcal{O}), \quad \mathcal{F} \longmapsto f^*\mathcal{F}$$

is exact.

Proof. Given an abelian sheaf \mathcal{G} on \mathcal{C}' the underlying sheaf of sets of $f^{-1}\mathcal{G}$ is the same as f^{-1} of the underlying sheaf of sets of \mathcal{G} , see Sites, Section 7.43. Hence the exactness of f^{-1} for sheaves of sets (required in the definition of a morphism of topoi, see Sites, Definition 7.16.1) implies the exactness of f^{-1} as a functor on abelian sheaves.

To see the statement on modules recall that $f^*\mathcal{F}$ is defined as the tensor product $f^{-1}\mathcal{F} \otimes_{f^{-1}\mathcal{O}', f^\#} \mathcal{O}$. Hence f^* is a composition of functors both of which are exact. \square

Definition 18.30.3. Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. We say that \mathcal{F} is *flat over* $(Sh(\mathcal{D}), \mathcal{O}')$ if \mathcal{F} is flat as an $f^{-1}\mathcal{O}'$ -module.

This is compatible with the notion as defined for morphisms of ringed spaces, see Modules, Definition 17.17.3 and the discussion following.

18.31. Invertible modules

Here is the definition.

Definition 18.31.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site.

- (1) A finite locally free \mathcal{O} -module \mathcal{F} is said to have *rank* r if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ of U such that $\mathcal{F}|_{U_i}$ is isomorphic to $\mathcal{O}_{U_i}^{\oplus r}$ as an \mathcal{O}_{U_i} -module.
- (2) An *invertible \mathcal{O} -module* is a finite locally free \mathcal{O} -module of rank 1.
- (3) The sheaf \mathcal{O}^* is the subsheaf of \mathcal{O} defined by the rule

$$U \longmapsto \mathcal{O}^*(U) = \{f \in \mathcal{O}(U) \mid \exists g \in \mathcal{O}(U) \text{ such that } fg = 1\}$$

It is a sheaf of abelian groups with multiplication as the group law.

Lemma 18.31.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed space.*

- (1) *If \mathcal{L}, \mathcal{N} are invertible \mathcal{O} -modules, then so is $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{N}$.*
- (2) *If \mathcal{L} is an invertible \mathcal{O} -modules, then so is $\mathcal{L}^{\otimes -1} = \mathcal{H}om_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$.*
- (3) *If \mathcal{L} is an invertible \mathcal{O} -module, then the evaluation map $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}$ is an isomorphism.*

Proof. Omitted. \square

Lemma 18.31.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed space. There exists a set of invertible modules $\{\mathcal{L}_i\}_{i \in I}$ such that each invertible module on $(\mathcal{C}, \mathcal{O})$ is isomorphic to exactly one of the \mathcal{L}_i .*

Proof. Omitted, but see Sheaves of Modules, Lemma 17.21.5. \square

This lemma says roughly speaking that the collection of isomorphism classes of invertible sheaves forms a set. Lemma 18.31.2 says that tensor product defines the structure of an abelian group on this set.

Definition 18.31.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The *Picard group* $\text{Pic}(\mathcal{O})$ the ringed site is the abelian group whose elements are isomorphism classes of invertible \mathcal{O} -modules, with addition corresponding to tensor product.

18.32. Modules of differentials

In this section we briefly explain how to define the module of relative differentials for a morphism of ringed topoi. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.127).

Definition 18.32.1. Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. Let \mathcal{F} be an \mathcal{O}_2 -module. A \mathcal{O}_1 -*derivation* or more precisely a φ -*derivation* into \mathcal{F} is a map $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ which is additive, annihilates the image of $\mathcal{O}_1 \rightarrow \mathcal{O}_2$, and satisfies the *Leibniz rule*

$$D(ab) = aD(b) + D(a)b$$

for all a, b local sections of \mathcal{O}_2 (wherever they are both defined). We denote $\text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$ the set of φ -derivations into \mathcal{F} .

This is the sheaf theoretic analogue of Algebra, Definition 18.32.1. Given a derivation $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ as in the definition the map on global sections

$$D : \Gamma(\mathcal{O}_2) \longrightarrow \Gamma(\mathcal{F})$$

clearly is a $\Gamma(\mathcal{O}_1)$ -derivation as in the algebra definition. Note that if $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a map of \mathcal{O}_2 -modules, then there is an induced map

$$\text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F}) \longrightarrow \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{G})$$

given by the rule $D \mapsto \alpha \circ D$. In other words we obtain a functor.

Lemma 18.32.2. *Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. The functor*

$$\text{Mod}(\mathcal{O}_2) \longrightarrow \text{Ab}, \quad \mathcal{F} \longmapsto \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$$

is representable.

Proof. This is proved in exactly the same way as the analogous statement in algebra. During this proof, for any sheaf of sets \mathcal{F} on \mathcal{C} , let us denote $\mathcal{O}_2[\mathcal{F}]$ the sheafification of the presheaf $U \mapsto \mathcal{O}_2(U)[\mathcal{F}(U)]$ where this denotes the free $\mathcal{O}_1(U)$ -module on the set $\mathcal{F}(U)$. For $s \in \mathcal{F}(U)$ we denote $[s]$ the corresponding section of $\mathcal{O}_2[\mathcal{F}]$ over U . If \mathcal{F} is a sheaf of \mathcal{O}_2 -modules, then there is a canonical map

$$c : \mathcal{O}_2[\mathcal{F}] \longrightarrow \mathcal{F}$$

which on the presheaf level is given by the rule $\sum f_s[s] \mapsto \sum f_s s$. We will employ the short hand $[s] \mapsto s$ to describe this map and similarly for other maps below. Consider the map of \mathcal{O}_2 -modules

$$(18.32.2.1) \quad \begin{array}{ccc} \mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_1] & \longrightarrow & \mathcal{O}_2[\mathcal{O}_2] \\ [(a, b)] \oplus [(f, g)] \oplus [h] & \longmapsto & [a + b] - [a] - [b] + \\ & & [fg] - g[f] - f[g] + \\ & & [\varphi(h)] \end{array}$$

with short hand notation as above. Set $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ equal to the cokernel of this map. Then it is clear that there exists a map of sheaves of sets

$$d : \mathcal{O}_2 \longrightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1}$$

mapping a local section f to the image of $[f]$ in $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$. By construction d is a \mathcal{O}_1 -derivation. Next, let \mathcal{F} be a sheaf of \mathcal{O}_2 -modules and let $D : \mathcal{O}_2 \rightarrow \mathcal{F}$ be a \mathcal{O}_1 -derivation. Then we can consider the \mathcal{O}_2 -linear map $\mathcal{O}_2[\mathcal{O}_2] \rightarrow \mathcal{F}$ which sends

$[g]$ to $D(g)$. It follows from the definition of a derivation that this map annihilates sections in the image of the map (18.32.2.1) and hence defines a map

$$\alpha_D : \Omega_{\mathcal{O}_2/\mathcal{O}_1} \longrightarrow \mathcal{F}$$

Since it is clear that $D = \alpha_D \circ d$ the lemma is proved. □

Definition 18.32.3. Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. The *module of differentials* of the ring map φ is the object representing the functor $\mathcal{F} \mapsto \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$ which exists by Lemma 18.32.2. It is denoted $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$, and the *universal φ -derivation* is denoted $d : \mathcal{O}_2 \rightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1}$.

Since this module and the derivation form the universal object representing a functor, this notion is clearly intrinsic (i.e., does not depend on the choice of the site underlying the ringed topos, see Section 18.18). Note that $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the cokernel of the map (18.32.2.1) of \mathcal{O}_2 -modules. Moreover the map d is described by the rule that $d f$ is the image of the local section $[f]$.

Lemma 18.32.4. *Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of presheaves of rings. Then $\Omega_{\mathcal{O}_2^\#/\mathcal{O}_1^\#}$ is the sheaf associated to the presheaf $U \mapsto \Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}$.*

Proof. Consider the map (18.32.2.1). There is a similar map of presheaves whose value on $U \in \text{Ob}(\mathcal{C})$ is

$$\mathcal{O}_2(U)[\mathcal{O}_2(U) \times \mathcal{O}_2(U)] \oplus \mathcal{O}_2(U)[\mathcal{O}_2(U) \times \mathcal{O}_2(U)] \oplus \mathcal{O}_2(U)[\mathcal{O}_1(U)] \longrightarrow \mathcal{O}_2(U)[\mathcal{O}_2(U)]$$

The cokernel of this map has value $\Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}$ over U by the construction of the module of differentials in Algebra, Definition 10.127.2. On the other hand, the sheaves in (18.32.2.1) are the sheaffications of the presheaves above. Thus the result follows as sheaffication is exact. □

Lemma 18.32.5. *Let $f : \text{Sh}(\mathcal{D}) \rightarrow \text{Sh}(\mathcal{C})$ be a morphism of topoi. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings on \mathcal{C} . Then there is a canonical identification $f^{-1}\Omega_{\mathcal{O}_2/\mathcal{O}_1} = \Omega_{f^{-1}\mathcal{O}_2/f^{-1}\mathcal{O}_1}$ compatible with universal derivations.*

Proof. This holds because the sheaf $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ is the cokernel of the map (18.32.2.1) and a similar statement holds for $\Omega_{f^{-1}\mathcal{O}_2/f^{-1}\mathcal{O}_1}$, because the functor f^{-1} is exact, and because $f^{-1}(\mathcal{O}_2[\mathcal{O}_2]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_2]$, $f^{-1}(\mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_2 \times f^{-1}\mathcal{O}_2]$, and $f^{-1}(\mathcal{O}_2[\mathcal{O}_1]) = f^{-1}\mathcal{O}_2[f^{-1}\mathcal{O}_1]$. □

Lemma 18.32.6. *Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. For any object U of \mathcal{C} there is a canonical isomorphism*

$$\Omega_{\mathcal{O}_2/\mathcal{O}_1}|_U = \Omega_{(\mathcal{O}_2|_U)/(\mathcal{O}_1|_U)}$$

compatible with universal derivations.

Proof. This is a special case of Lemma 18.32.5. □

Lemma 18.32.7. *Let \mathcal{C} be a site. Let*

$$\begin{array}{ccc} \mathcal{O}_2 & \xrightarrow{\varphi} & \mathcal{O}'_2 \\ \uparrow & & \uparrow \\ \mathcal{O}_1 & \longrightarrow & \mathcal{O}'_1 \end{array}$$

be a commutative diagram of sheaves of rings on \mathcal{C} . The map $\mathcal{O}_2 \rightarrow \mathcal{O}'_2$ composed with the map $d : \mathcal{O}'_2 \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$ is a \mathcal{O}_1 -derivation. Hence we obtain a canonical map of \mathcal{O}_2 -modules $\Omega_{\mathcal{O}_2/\mathcal{O}_1} \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$. It is uniquely characterized by the property that $d(f)$ maps to $d(\varphi(f))$ for any local section f of \mathcal{O}_2 . In this way $\Omega_{-/-}$ becomes a functor on the category of arrows of sheaves of rings.

Proof. This lemma proves itself. □

Lemma 18.32.8. *In Lemma 18.32.7 suppose that $\mathcal{O}_2 \rightarrow \mathcal{O}'_2$ is surjective with kernel $\mathcal{I} \subset \mathcal{O}_2$ and assume that $\mathcal{O}_1 = \mathcal{O}'_1$. Then there is a canonical exact sequence of \mathcal{O}'_2 -modules*

$$\mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1} \otimes_{\mathcal{O}_2} \mathcal{O}'_2 \longrightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}_1} \longrightarrow 0$$

The leftmost map is characterized by the rule that a local section f of \mathcal{I} maps to $df \otimes 1$.

Proof. For a local section f of \mathcal{I} denote \bar{f} the image of f in $\mathcal{I}/\mathcal{I}^2$. To show that the map $\bar{f} \mapsto df \otimes 1$ is well defined we just have to check that $df_1 f_2 \otimes 1 = 0$ if f_1, f_2 are local sections of \mathcal{I} . And this is clear from the Leibniz rule $df_1 f_2 \otimes 1 = (f_1 df_2 + f_2 df_1) \otimes 1 = df_2 \otimes f_1 + df_1 \otimes f_2 = 0$. A similar computation show this map is $\mathcal{O}'_2 = \mathcal{O}_2/\mathcal{I}$ -linear. The map on the right is the one from Lemma 18.32.7.

To see that the sequence is exact, we argue as follows. Let $\mathcal{O}''_2 \subset \mathcal{O}'_2$ be the presheaf of \mathcal{O}_1 -algebras whose value on U is the image of $\mathcal{O}_2(U) \rightarrow \mathcal{O}'_2(U)$. By Algebra, Lemma 10.127.9 the sequences

$$\mathcal{I}(U)/\mathcal{I}(U)^2 \longrightarrow \Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)} \otimes_{\mathcal{O}_2(U)} \mathcal{O}''_2(U) \longrightarrow \Omega_{\mathcal{O}''_2(U)/\mathcal{O}_1(U)} \longrightarrow 0$$

are exact for all objects U of \mathcal{C} . Since sheafification is exact this gives an exact sequence of sheaves of $(\mathcal{O}'_2)^\#$ -modules. By Lemma 18.32.4 and the fact that $(\mathcal{O}''_2)^\# = \mathcal{O}'_2$ we conclude. □

Here is a particular situation where derivations come up naturally.

Lemma 18.32.9. *Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. Consider a short exact sequence*

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_2 \rightarrow 0$$

Here \mathcal{A} is a sheaf of \mathcal{O}_1 -algebras, $\pi : \mathcal{A} \rightarrow \mathcal{O}_2$ is a surjection of sheaves of \mathcal{O}_1 -algebras, and $\mathcal{F} = \text{Ker}(\pi)$ is its kernel. Assume \mathcal{F} an ideal sheaf with square zero in \mathcal{A} . So \mathcal{F} has a natural structure of an \mathcal{O}_2 -module. A section $s : \mathcal{O}_2 \rightarrow \mathcal{A}$ of π is a \mathcal{O}_1 -algebra map such that $\pi \circ s = \text{id}$. Given any section $s : \mathcal{O}_2 \rightarrow \mathcal{F}$ of π and any φ -derivation $D : \mathcal{O}_1 \rightarrow \mathcal{F}$ the map

$$s + D : \mathcal{O}_1 \rightarrow \mathcal{A}$$

is a section of π and every section s' is of the form $s + D$ for a unique φ -derivation D .

Proof. Recall that the \mathcal{O}_2 -module structure on \mathcal{F} is given by $h\tau = \tilde{h}\tau$ (multiplication in \mathcal{A}) where h is a local section of \mathcal{O}_2 , and \tilde{h} is a local lift of h to a local section of \mathcal{A} , and τ is a local section of \mathcal{F} . In particular, given s , we may use $\tilde{h} = s(h)$. To

verify that $s + D$ is a homomorphism of sheaves of rings we compute

$$\begin{aligned} (s + D)(ab) &= s(ab) + D(ab) \\ &= s(a)s(b) + aD(b) + D(a)b \\ &= s(a)s(b) + s(a)D(b) + D(a)s(b) \\ &= (s(a) + D(a))(s(b) + D(b)) \end{aligned}$$

by the Leibniz rule. In the same manner one shows $s + D$ is a \mathcal{O}_1 -algebra map because D is an \mathcal{O}_1 -derivation. Conversely, given s' we set $D = s' - s$. Details omitted. \square

Definition 18.32.10. Let $X = (Sh(\mathcal{C}), \mathcal{O})$ and $Y = (Sh(\mathcal{C}'), \mathcal{O}')$ be ringed topoi. Let $(f, f^\#) : X \rightarrow Y$ be a morphism of ringed topoi. In this situation

- (1) for a sheaf \mathcal{F} of \mathcal{O} -modules a Y -derivation $D : \mathcal{O} \rightarrow \mathcal{F}$ is just a $f^\#$ -derivation, and
- (2) the sheaf of differentials $\Omega_{X/Y}$ of X over Y is the module of differentials of $f^\# : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$, see Definition 18.32.3.

Thus $\Omega_{X/Y}$ comes equipped with a universal Y -derivation $d_{X/Y} : \mathcal{O} \rightarrow \Omega_{X/Y}$. We sometimes write $\Omega_{X/Y} = \Omega_f$.

Recall that $f^\# : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$ so that this definition makes sense.

Lemma 18.32.11. Let $X = (Sh(\mathcal{C}_X), \mathcal{O}_X)$, $Y = (Sh(\mathcal{C}_Y), \mathcal{O}_Y)$, $X' = (Sh(\mathcal{C}_{X'}), \mathcal{O}_{X'})$, and $Y' = (Sh(\mathcal{C}_{Y'}), \mathcal{O}_{Y'})$ be ringed topoi. Let

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & f & \downarrow \\ Y' & \xrightarrow{\quad} & Y \end{array}$$

be a commutative diagram of morphisms of ringed topoi. The map $f^\# : \mathcal{O}_X \rightarrow f_*\mathcal{O}_{X'}$ composed with the map $f_*d_{X'/Y'} : f_*\mathcal{O}_{X'} \rightarrow f_*\Omega_{X'/Y'}$ is a Y -derivation. Hence we obtain a canonical map of \mathcal{O}_X -modules $\Omega_{X/Y} \rightarrow f_*\Omega_{X'/Y'}$, and by adjointness of f_* and f^* a canonical $\mathcal{O}_{X'}$ -module homomorphism

$$c_f : f^*\Omega_{X/Y} \rightarrow \Omega_{X'/Y'}.$$

It is uniquely characterized by the property that $f^*d_{X/Y}(t)$ maps to $d_{X'/Y'}(f^*t)$ for any local section t of \mathcal{O}_X .

Proof. This is clear except for the last assertion. Let us explain the meaning of this. Let $U \in \text{Ob}(\mathcal{C}_X)$ and let $t \in \mathcal{O}_X(U)$. This is what it means for t to be a local section of \mathcal{O}_X . Now, we may think of t as a map of sheaves of sets $t : h_U^\# \rightarrow \mathcal{O}_X$. Then $f^{-1}t : f^{-1}h_U^\# \rightarrow f^{-1}\mathcal{O}_X$. By f^*t we mean the composition

$$f^{-1}h_U^\# \xrightarrow{f^{-1}t} f^{-1}\mathcal{O}_X \xrightarrow{f^\#} \mathcal{O}_{X'}$$

f^*t (curved arrow above)

Note that $d_{X/Y}(t) \in \Omega_{X/Y}(U)$. Hence we may think of $d_{X/Y}(t)$ as a map $d_{X/Y}(t) : h_U^\# \rightarrow \Omega_{X/Y}$. Then $f^{-1}d_{X/Y}(t) : f^{-1}h_U^\# \rightarrow f^{-1}\Omega_{X/Y}$. By $f^*d_{X/Y}(t)$ we mean the

composition

$$\begin{array}{ccc}
 & \xrightarrow{f^*d_{X/Y}(t)} & \\
 f^{-1}h_U^\# & \xrightarrow{f^{-1}d_{X/Y}(t)} f^{-1}\Omega_{X/Y} \xrightarrow{1 \otimes \text{id}} & f^*\Omega_{X/Y}
 \end{array}$$

OK, and now the statement of the lemma means that we have

$$c_f \circ f^*t = f^*d_{X/Y}(t)$$

as maps from $f^{-1}h_U^\#$ to $\Omega_{X'/Y'}$. We omit the verification that this property holds for c_f as defined in the lemma. (Hint: The first map $c'_f : \Omega_{X/Y} \rightarrow f_*\Omega_{X'/Y'}$ satisfies $c'_f(d_{X/Y}(t)) = f_*d_{X'/Y'}(f^\#(t))$ as sections of $f_*\Omega_{X'/Y'}$ over U , and you have to turn this into the equality above by using adjunction.) The reason that this uniquely characterizes c_f is that the images of $f^*d_{X/Y}(t)$ generate the $\mathcal{O}_{X'}$ -module $f^*\Omega_{X/Y}$ simply because the local sections $d_{X/Y}(t)$ generate the \mathcal{O}_X -module $\Omega_{X/Y}$. \square

18.33. Finite order differential operators

In this section we introduce differential operators of finite order. We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.128).

Definition 18.33.1. Let \mathcal{C} be a site. Let $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of sheaves of rings. Let $k \geq 0$ be an integer. Let \mathcal{F}, \mathcal{G} be sheaves of \mathcal{O}_2 -modules. A *differential operator* $D : \mathcal{F} \rightarrow \mathcal{G}$ of order k is an \mathcal{O}_1 -linear map such that for all local sections g of \mathcal{O}_2 the map $s \mapsto D(gs) - gD(s)$ is a differential operator of order $k - 1$. For the base case $k = 0$ we define a differential operator of order 0 to be an \mathcal{O}_2 -linear map.

If $D : \mathcal{F} \rightarrow \mathcal{G}$ is a differential operator of order k , then for all local sections g of \mathcal{O}_2 the map gD is a differential operator of order k . The sum of two differential operators of order k is another. Hence the set of all these

$$\text{Diff}^k(\mathcal{F}, \mathcal{G}) = \text{Diff}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F}, \mathcal{G})$$

is a $\Gamma(\mathcal{C}, \mathcal{O}_2)$ -module. We have

$$\text{Diff}^0(\mathcal{F}, \mathcal{G}) \subset \text{Diff}^1(\mathcal{F}, \mathcal{G}) \subset \text{Diff}^2(\mathcal{F}, \mathcal{G}) \subset \dots$$

The rule which maps $U \in \text{Ob}(\mathcal{C})$ to the module of differential operators $D : \mathcal{F}|_U \rightarrow \mathcal{G}|_U$ of order k is a sheaf of \mathcal{O}_2 -modules on the site \mathcal{C} . Thus we obtain a sheaf of differential operators (if we ever need this we will add a definition here).

Lemma 18.33.2. Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a map of sheaves of rings. Let $\mathcal{E}, \mathcal{F}, \mathcal{G}$ be sheaves of \mathcal{O}_2 -modules. If $D : \mathcal{E} \rightarrow \mathcal{F}$ and $D' : \mathcal{F} \rightarrow \mathcal{G}$ are differential operators of order k and k' , then $D' \circ D$ is a differential operator of order $k + k'$.

Proof. Let g be a local section of \mathcal{O}_2 . Then the map which sends a local section x of \mathcal{E} to

$$D'(D(gx)) - gD'(D(x)) = D'(D(gx)) - D'(gD(x)) + D'(gD(x)) - gD'(D(x))$$

is a sum of two compositions of differential operators of lower order. Hence the lemma follows by induction on $k + k'$. \square

Lemma 18.33.3. *Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a map of sheaves of rings. Let \mathcal{F} be a sheaf of \mathcal{O}_2 -modules. Let $k \geq 0$. There exists a sheaf of \mathcal{O}_2 -modules $\mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F})$ and a canonical isomorphism*

$$\mathrm{Diff}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F}, \mathcal{G}) = \mathrm{Hom}_{\mathcal{O}_2}(\mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F}), \mathcal{G})$$

functorial in the \mathcal{O}_2 -module \mathcal{G} .

Proof. The existence follows from general category theoretic arguments (insert future reference here), but we will also give a direct construction as this construction will be useful in the future proofs. We will freely use the notation introduced in the proof of Lemma 18.32.2. Given any differential operator $D : \mathcal{F} \rightarrow \mathcal{G}$ we obtain an \mathcal{O}_2 -linear map $L_D : \mathcal{O}_2[\mathcal{F}] \rightarrow \mathcal{G}$ sending $[m]$ to $D(m)$. If D has order 0 then L_D annihilates the local sections

$$[m + m'] - [m] - [m'], \quad g_0[m] - [g_0m]$$

where g_0 is a local section of \mathcal{O}_2 and m, m' are local sections of \mathcal{F} . If D has order 1, then L_D annihilates the local sections

$$[m + m' - [m] - [m']], \quad f[m] - [fm], \quad g_0g_1[m] - g_0[g_1m] - g_1[g_0m] + [g_1g_0m]$$

where f is a local section of \mathcal{O}_1 , g_0, g_1 are local sections of \mathcal{O}_2 , and m, m' are local sections of \mathcal{F} . If D has order k , then L_D annihilates the local sections $[m + m'] - [m] - [m']$, $f[m] - [fm]$, and the local sections

$$g_0g_1 \dots g_k[m] - \sum g_0 \dots \hat{g}_i \dots g_k[g_i m] + \dots + (-1)^{k+1}[g_0 \dots g_k m]$$

Conversely, if $L : \mathcal{O}_2[\mathcal{F}] \rightarrow \mathcal{G}$ is an \mathcal{O}_2 -linear map annihilating all the local sections listed in the previous sentence, then $m \mapsto L([m])$ is a differential operator of order k . Thus we see that $\mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F})$ is the quotient of $\mathcal{O}_2[\mathcal{F}]$ by the \mathcal{O}_2 -submodule generated by these local sections. \square

Definition 18.33.4. Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a map of sheaves of rings. Let \mathcal{F} be a sheaf of \mathcal{O}_2 -modules. The module $\mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^k(\mathcal{F})$ constructed in Lemma 18.33.3 is called the *module of principal parts of order k of \mathcal{F}* .

Note that the inclusions

$$\mathrm{Diff}^0(\mathcal{F}, \mathcal{G}) \subset \mathrm{Diff}^1(\mathcal{F}, \mathcal{G}) \subset \mathrm{Diff}^2(\mathcal{F}, \mathcal{G}) \subset \dots$$

correspond via Yoneda's lemma (Categories, Lemma 4.3.5) to surjections

$$\dots \rightarrow \mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^2(\mathcal{F}) \rightarrow \mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^1(\mathcal{F}) \rightarrow \mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^0(\mathcal{F}) = \mathcal{F}$$

Lemma 18.33.5. *Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of presheaves of rings. Let \mathcal{F} be a presheaf of \mathcal{O}_2 -modules. Then $\mathcal{P}_{\mathcal{O}_2^\#/\mathcal{O}_1^\#}^k(\mathcal{F}^\#)$ is the sheaf associated to the presheaf $U \mapsto \mathcal{P}_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}^k(\mathcal{F}(U))$.*

Proof. This can be proved in exactly the same way as is done for the sheaf of differentials in Lemma 18.32.4. Perhaps a more pleasing approach is to use the universal property of Lemma 18.33.3 directly to see the equality. We omit the details. \square

Lemma 18.33.6. *Let \mathcal{C} be a site. Let $\mathcal{O}_1 \rightarrow \mathcal{O}_2$ be a homomorphism of presheaves of rings. Let \mathcal{F} be a presheaf of \mathcal{O}_2 -modules. There is a canonical short exact sequence*

$$0 \rightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1} \otimes_{\mathcal{O}_2} \mathcal{F} \rightarrow \mathcal{P}_{\mathcal{O}_2/\mathcal{O}_1}^1(\mathcal{F}) \rightarrow \mathcal{F} \rightarrow 0$$

functorial in \mathcal{F} called the sequence of principal parts.

Proof. Follows from the commutative algebra version (Algebra, Lemma 10.128.6) and Lemmas 18.32.4 and 18.33.5. \square

Remark 18.33.7. Let \mathcal{C} be a site. Suppose given a commutative diagram of sheaves of rings

$$\begin{array}{ccc} \mathcal{B} & \longrightarrow & \mathcal{B}' \\ \uparrow & & \uparrow \\ \mathcal{A} & \longrightarrow & \mathcal{A}' \end{array}$$

a \mathcal{B} -module \mathcal{F} , a \mathcal{B}' -module \mathcal{F}' , and a \mathcal{B} -linear map $\mathcal{F} \rightarrow \mathcal{F}'$. Then we get a compatible system of module maps

$$\begin{array}{ccccccc} \dots & \longrightarrow & \mathcal{P}_{\mathcal{B}'/\mathcal{A}'}^2(\mathcal{F}') & \longrightarrow & \mathcal{P}_{\mathcal{B}'/\mathcal{A}'}^1(\mathcal{F}') & \longrightarrow & \mathcal{P}_{\mathcal{B}'/\mathcal{A}'}^0(\mathcal{F}') \\ & & \uparrow & & \uparrow & & \uparrow \\ \dots & \longrightarrow & \mathcal{P}_{\mathcal{B}/\mathcal{A}}^2(\mathcal{F}) & \longrightarrow & \mathcal{P}_{\mathcal{B}/\mathcal{A}}^1(\mathcal{F}) & \longrightarrow & \mathcal{P}_{\mathcal{B}/\mathcal{A}}^0(\mathcal{F}) \end{array}$$

These maps are compatible with further composition of maps of this type. The easiest way to see this is to use the description of the modules $\mathcal{P}_{\mathcal{B}/\mathcal{A}}^k(\mathcal{M})$ in terms of (local) generators and relations in the proof of Lemma 18.33.3 but it can also be seen directly from the universal property of these modules. Moreover, these maps are compatible with the short exact sequences of Lemma 18.33.6.

18.34. The naive cotangent complex

This section is the analogue of Algebra, Section 10.129 and Modules, Section 17.24. We advise the reader to read those sections first.

Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . In this section, for any sheaf of sets \mathcal{E} on \mathcal{C} we denote $\mathcal{A}[\mathcal{E}]$ the sheafification of the presheaf $U \mapsto \mathcal{A}(U)[\mathcal{E}(U)]$. Here $\mathcal{A}(U)[\mathcal{E}(U)]$ denotes the polynomial algebra over $\mathcal{A}(U)$ whose variables correspond to the elements of $\mathcal{E}(U)$. We denote $[e] \in \mathcal{A}(U)[\mathcal{E}(U)]$ the variable corresponding to $e \in \mathcal{E}(U)$. There is a canonical surjection of \mathcal{A} -algebras

$$(18.34.0.1) \quad \mathcal{A}[\mathcal{B}] \longrightarrow \mathcal{B}, \quad [b] \longmapsto b$$

whose kernel we denote $\mathcal{I} \subset \mathcal{A}[\mathcal{B}]$. It is a simple observation that \mathcal{I} is generated by the local sections $[b][b'] - [bb']$ and $[a] - a$. According to Lemma 18.32.8 there is a canonical map

$$(18.34.0.2) \quad \mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$$

whose cokernel is canonically isomorphic to $\Omega_{\mathcal{B}/\mathcal{A}}$.

Definition 18.34.1. Let \mathcal{C} be a site. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{C} . The *naive cotangent complex* $NL_{\mathcal{B}/\mathcal{A}}$ is the chain complex (18.34.0.2)

$$NL_{\mathcal{B}/\mathcal{A}} = (\mathcal{I}/\mathcal{I}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B})$$

with $\mathcal{I}/\mathcal{I}^2$ placed in (homological) degree 1 and $\Omega_{\mathcal{A}[\mathcal{B}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{B}]} \mathcal{B}$ placed in degree 0.

This construction satisfies a functoriality similar to that discussed in Lemma 18.32.7 for modules of differentials. Namely, given a commutative diagram

$$(18.34.1.1) \quad \begin{array}{ccc} \mathcal{B} & \longrightarrow & \mathcal{B}' \\ \uparrow & & \uparrow \\ \mathcal{A} & \longrightarrow & \mathcal{A}' \end{array}$$

of sheaves of rings on \mathcal{C} there is a canonical \mathcal{B} -linear map of complexes

$$NL_{\mathcal{B}/\mathcal{A}} \longrightarrow NL_{\mathcal{B}'/\mathcal{A}'}$$

Namely, the maps in the commutative diagram give rise to a canonical map $\mathcal{A}[\mathcal{B}] \rightarrow \mathcal{A}'[\mathcal{B}']$ which maps \mathcal{I} into $\mathcal{I}' = \text{Ker}(\mathcal{A}'[\mathcal{B}'] \rightarrow \mathcal{B}')$. Thus a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{I}'/(\mathcal{I}')^2$ and a map between modules of differentials, which together give the desired map between the naive cotangent complexes.

We can choose a different presentation of \mathcal{B} as a quotient of a polynomial algebra over \mathcal{A} and still obtain the same object of $D(\mathcal{B})$. To explain this, suppose that \mathcal{E} is a sheaves of sets on \mathcal{C} and $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ a map of sheaves of sets. Then we obtain an \mathcal{A} -algebra homomorphism $\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B}$. Assume this map is surjective, and let $\mathcal{J} \subset \mathcal{A}[\mathcal{E}]$ be the kernel. Set

$$NL(\alpha) = (\mathcal{J}/\mathcal{J}^2 \longrightarrow \Omega_{\mathcal{A}[\mathcal{E}]/\mathcal{A}} \otimes_{\mathcal{A}[\mathcal{E}]} \mathcal{B})$$

Here is the result.

Lemma 18.34.2. *In the situation above there is a canonical isomorphism $NL(\alpha) = NL_{\mathcal{B}/\mathcal{A}}$ in $D(\mathcal{B})$.*

Proof. Observe that $NL_{\mathcal{B}/\mathcal{A}} = NL(\text{id}_{\mathcal{B}})$. Thus it suffices to show that given two maps $\alpha_i : \mathcal{E}_i \rightarrow \mathcal{B}$ as above, there is a canonical quasi-isomorphism $NL(\alpha_1) = NL(\alpha_2)$ in $D(\mathcal{B})$. To see this set $\mathcal{E} = \mathcal{E}_1 \amalg \mathcal{E}_2$ and $\alpha = \alpha_1 \amalg \alpha_2 : \mathcal{E} \rightarrow \mathcal{B}$. Set $\mathcal{J}_i = \text{Ker}(\mathcal{A}[\mathcal{E}_i] \rightarrow \mathcal{B})$ and $\mathcal{J} = \text{Ker}(\mathcal{A}[\mathcal{E}] \rightarrow \mathcal{B})$. We obtain maps $\mathcal{A}[\mathcal{E}_i] \rightarrow \mathcal{A}[\mathcal{E}]$ which send \mathcal{J}_i into \mathcal{J} . Thus we obtain canonical maps of complexes

$$NL(\alpha_i) \longrightarrow NL(\alpha)$$

and it suffices to show these maps are quasi-isomorphism. To see this we argue as follows. First, observe that $H_0(NL(\alpha_i)) = \Omega_{\mathcal{B}/\mathcal{A}}$ and $H_0(NL(\alpha)) = \Omega_{\mathcal{B}/\mathcal{A}}$ by Lemma 18.32.8 hence the map is an isomorphism on 0th homology sheaves. Similarly, we claim that $H_1(NL(\alpha_i))$ and $H_1(NL(\alpha))$ are the sheaves associated to the presheaf $U \mapsto H_1(L_{\mathcal{B}(U)/\mathcal{A}(U)})$. If the claim holds, then the proof is finished.

Proof of the claim. Let $\alpha : \mathcal{E} \rightarrow \mathcal{B}$ be as above. Let $\mathcal{B}' \subset \mathcal{B}$ be the subsheaf of \mathcal{A} -algebras whose value on U is the image of $\mathcal{A}(U)[\mathcal{E}(U)] \rightarrow \mathcal{B}(U)$. Let \mathcal{I}' be the presheaf whose value on U is the kernel of $\mathcal{A}(U)[\mathcal{E}(U)] \rightarrow \mathcal{B}(U)$. Then \mathcal{I} is the

sheafification of \mathcal{I}' and \mathcal{B} is the sheafification of \mathcal{B}' . Similarly, $H_1(NL(\alpha))$ is the sheafification of the presheaf

$$U \mapsto \text{Ker}(\mathcal{I}'(U)/\mathcal{I}'(U)^2 \rightarrow \Omega_{\mathcal{A}(U)[\mathcal{E}(U)]/\mathcal{A}(U)} \otimes_{\mathcal{A}(U)[\mathcal{E}(U)]} \mathcal{B}'(U))$$

by Lemma 18.32.4. By Algebra, Lemma 10.129.2 we conclude $H_1(NL(\alpha))$ is the sheaf associated to the presheaf $U \mapsto H_1(L_{\mathcal{B}'(U)/\mathcal{A}(U)})$. Thus we have to show that the maps $H_1(L_{\mathcal{B}'(U)/\mathcal{A}(U)}) \rightarrow H_1(L_{\mathcal{B}(U)/\mathcal{A}(U)})$ induce an isomorphism $\mathcal{H}'_1 \rightarrow \mathcal{H}_1$ of sheafifications.

Injectivity of $\mathcal{H}'_1 \rightarrow \mathcal{H}_1$. Let $f \in H_1(L_{\mathcal{B}'(U)/\mathcal{A}(U)})$ map to zero in $\mathcal{H}_1(U)$. To show: f maps to zero in $\mathcal{H}'_1(U)$. The assumption means there is a covering $\{U_i \rightarrow U\}$ such that f maps to zero in $H_1(L_{\mathcal{B}(U_i)/\mathcal{A}(U_i)})$ for all i . Replace U by U_i to get to the point where f maps to zero in $H_1(L_{\mathcal{B}(U)/\mathcal{A}(U)})$. By Algebra, Lemma 10.129.9 we can find a finitely generated subalgebra $\mathcal{B}'(U) \subset B \subset \mathcal{B}(U)$ such that f maps to zero in $H_1(L_{B/\mathcal{A}(U)})$. Since $\mathcal{B} = (\mathcal{B}')^\#$ we can find a covering $\{U_i \rightarrow U\}$ such that $B \rightarrow \mathcal{B}(U_i)$ factors through $\mathcal{B}'(U_i)$. Hence f maps to zero in $H_1(L_{\mathcal{B}'(U_i)/\mathcal{A}(U_i)})$ as desired.

The surjectivity of $\mathcal{H}'_1 \rightarrow \mathcal{H}_1$ is proved in exactly the same way. □

Lemma 18.34.3. *Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be morphism of topoi. Let $\mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of sheaves of rings on \mathcal{D} . Then $f^{-1}NL_{\mathcal{B}/\mathcal{A}} = NL_{f^{-1}\mathcal{B}/f^{-1}\mathcal{A}}$.*

Proof. Omitted. Hint: Use Lemma 18.32.5. □

The cotangent complex of a morphism of ringed topoi is defined in terms of the cotangent complex we defined above.

Definition 18.34.4. Let $X = (Sh(\mathcal{C}), \mathcal{O})$ and $Y = (Sh(\mathcal{C}'), \mathcal{O}')$ be ringed topoi. Let $(f, f^\#) : X \rightarrow Y$ be a morphism of ringed topoi. The *naive cotangent complex* $NL_f = NL_{X/Y}$ of the given morphism of ringed topoi is $NL_{\mathcal{O}_X/f^{-1}\mathcal{O}_Y}$. We sometimes write $NL_{X/Y} = NL_{\mathcal{O}_X/\mathcal{O}_Y}$.

18.35. Stalks of modules

We have to be a bit careful when taking stalks at points, since the colimit defining a stalk (see Sites, Equation 7.31.1.1) may not be filtered³. On the other hand, by definition of a point of a site the stalk functor is exact and commutes with arbitrary colimits. In other words, it behaves exactly as if the colimit were filtered.

Lemma 18.35.1. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} .*

- (1) *We have $(\mathcal{F}^\#)_p = \mathcal{F}_p$ for any presheaf of sets on \mathcal{C} .*
- (2) *The stalk functor $Sh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is exact (see Categories, Definition 4.23.1) and commutes with arbitrary colimits.*
- (3) *The stalk functor $PSh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is exact (see Categories, Definition 4.23.1) and commutes with arbitrary colimits.*

Proof. By Sites, Lemma 7.31.5 we have (1). By Sites, Lemmas 7.31.4 we see that $PSh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is a left adjoint, and by Sites, Lemma 7.31.5 we see the same thing for $PSh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$. Hence the stalk functor commutes with arbitrary colimits (see Categories, Lemma 4.24.4). It follows from the definition of

³Of course in almost any naturally occurring case the colimit is filtered and some of the discussion in this section may be simplified.

a point of a site, see Sites, Definition 7.31.2 that $Sh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is exact. Since sheafification is exact (Sites, Lemma 7.10.14) it follows that $PSh(\mathcal{C}) \rightarrow Sets, \mathcal{F} \mapsto \mathcal{F}_p$ is exact. \square

In particular, since the stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ on presheaves commutes with all finite limits and colimits we may apply the reasoning of the proof of Sites, Proposition 7.43.3. The result of such an argument is that if \mathcal{F} is a (pre)sheaf of algebraic structures listed in Sites, Proposition 7.43.3 then the stalk \mathcal{F}_p is naturally an algebraic structure of the same kind. Let us explain this in detail when \mathcal{F} is an abelian presheaf. In this case the addition map $+$: $\mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ induces a map

$$+ : \mathcal{F}_p \times \mathcal{F}_p = (\mathcal{F} \times \mathcal{F})_p \longrightarrow \mathcal{F}_p$$

where the equal sign uses that stalk functor on presheaves of sets commutes with finite limits. This defines a group structure on the stalk \mathcal{F}_p . In this way we obtain our stalk functor

$$PAb(\mathcal{C}) \longrightarrow Ab, \quad \mathcal{F} \longmapsto \mathcal{F}_p$$

By construction the underlying set of \mathcal{F}_p is the stalk of the underlying presheaf of sets. This also defines our stalk functor for sheaves of abelian groups by precomposing with the inclusion $Ab(\mathcal{C}) \subset PAb(\mathcal{C})$.

Lemma 18.35.2. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} .*

- (1) *The functor $Ab(\mathcal{C}) \rightarrow Ab, \mathcal{F} \mapsto \mathcal{F}_p$ is exact.*
- (2) *The stalk functor $PAb(\mathcal{C}) \rightarrow Ab, \mathcal{F} \mapsto \mathcal{F}_p$ is exact.*
- (3) *For $\mathcal{F} \in \text{Ob}(PAb(\mathcal{C}))$ we have $\mathcal{F}_p = \mathcal{F}_p^\#$.*

Proof. This is formal from the results of Lemma 18.35.1 and the construction of the stalk functor above. \square

Next, we turn to the case of sheaves of modules. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. (It suffices for the discussion that \mathcal{O} be a presheaf of rings.) Let \mathcal{F} be a presheaf of \mathcal{O} -modules. Let p be a point of \mathcal{C} . In this case we get a map

$$\cdot : \mathcal{O}_p \times \mathcal{O}_p = (\mathcal{O} \times \mathcal{O})_p \longrightarrow \mathcal{O}_p$$

which is the stalk of the multiplication map and

$$\cdot : \mathcal{O}_p \times \mathcal{F}_p = (\mathcal{O} \times \mathcal{F})_p \longrightarrow \mathcal{F}_p$$

which is the stalk of the multiplication map. We omit the verification that this defines a ring structure on \mathcal{O}_p and an \mathcal{O}_p -module structure on \mathcal{F}_p . In this way we obtain a functor

$$PMod(\mathcal{O}) \longrightarrow Mod(\mathcal{O}_p), \quad \mathcal{F} \longmapsto \mathcal{F}_p$$

By construction the underlying set of \mathcal{F}_p is the stalk of the underlying presheaf of sets. This also defines our stalk functor for sheaves of \mathcal{O} -modules by precomposing with the inclusion $Mod(\mathcal{O}) \subset PMod(\mathcal{O})$.

Lemma 18.35.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let p be a point of \mathcal{C} .*

- (1) *The functor $Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_p), \mathcal{F} \mapsto \mathcal{F}_p$ is exact.*
- (2) *The stalk functor $PMod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_p), \mathcal{F} \mapsto \mathcal{F}_p$ is exact.*
- (3) *For $\mathcal{F} \in \text{Ob}(PMod(\mathcal{O}))$ we have $\mathcal{F}_p = \mathcal{F}_p^\#$.*

Proof. This is formal from the results of Lemma 18.35.2, the construction of the stalk functor above, and Lemma 18.14.1. \square

Lemma 18.35.4. *Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi or ringed sites. Let p be a point of \mathcal{C} or $Sh(\mathcal{C})$ and set $q = f \circ p$. Then*

$$(f^* \mathcal{F})_p = \mathcal{F}_q \otimes_{\mathcal{O}_{\mathcal{D}, q}} \mathcal{O}_{\mathcal{C}, p}$$

for any $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{F} .

Proof. We have

$$f^* \mathcal{F} = f^{-1} \mathcal{F} \otimes_{f^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O}_{\mathcal{C}}$$

by definition. Since taking stalks at p (i.e., applying p^{-1}) commutes with \otimes by Lemma 18.26.1 we win by the relation between the stalk of pullbacks at p and stalks at q explained in Sites, Lemma 7.33.1 or Sites, Lemma 7.33.2. \square

18.36. Skyscraper sheaves

Let p be a point of a site \mathcal{C} or a topos $Sh(\mathcal{C})$. In this section we study the exactness properties of the functor which associates to an abelian group A the skyscraper sheaf $p_* A$. First, recall that $p_* : Sets \rightarrow Sh(\mathcal{C})$ has a lot of exactness properties, see Sites, Lemmas 7.31.9 and 7.31.10.

Lemma 18.36.1. *Let \mathcal{C} be a site. Let p be a point of \mathcal{C} or of its associated topos.*

- (1) *The functor $p_* : Ab \rightarrow Ab(\mathcal{C})$, $A \mapsto p_* A$ is exact.*
- (2) *There is a functorial direct sum decomposition*

$$p^{-1} p_* A = A \oplus I(A)$$

for $A \in \text{Ob}(Ab)$.

Proof. By Sites, Lemma 7.31.9 there are functorial maps $A \rightarrow p^{-1} p_* A \rightarrow A$ whose composition equals id_A . Hence a functorial direct sum decomposition as in (2) with $I(A)$ the kernel of the adjunction map $p^{-1} p_* A \rightarrow A$. The functor p_* is left exact by Lemma 18.14.3. The functor p_* transforms surjections into surjections by Sites, Lemma 7.31.10. Hence (1) holds. \square

To do the same thing for sheaves of modules, suppose given a point p of a ringed topos $(Sh(\mathcal{C}), \mathcal{O})$. Recall that p^{-1} is just the stalk functor. Hence we can think of p as a morphism of ringed topoi

$$(p, \text{id}_{\mathcal{O}_p}) : (Sh(pt), \mathcal{O}_p) \longrightarrow (Sh(\mathcal{C}), \mathcal{O}).$$

Thus we get a pullback functor $p^* : Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_p)$ which equals the stalk functor, and which we discussed in Lemma 18.35.3. In this section we consider the functor $p_* : Mod(\mathcal{O}_p) \rightarrow Mod(\mathcal{O})$.

Lemma 18.36.2. *Let $(Sh(\mathcal{C}), \mathcal{O})$ be a ringed topos. Let p be a point of the topos $Sh(\mathcal{C})$.*

- (1) *The functor $p_* : Mod(\mathcal{O}_p) \rightarrow Mod(\mathcal{O})$, $M \mapsto p_* M$ is exact.*
- (2) *There is a functorial direct sum decomposition of \mathcal{O}_p -modules*

$$p^{-1} p_* M = M \oplus I(M)$$

for M a \mathcal{O}_p -module.

Proof. This follows immediately from the corresponding result for abelian sheaves in Lemma 18.36.1. \square

Example 18.36.3. Let G be a group. Consider the site \mathcal{T}_G and its point p , see Sites, Example 7.32.6. Let R be a ring with a G -action which corresponds to a sheaf of rings \mathcal{O} on \mathcal{T}_G . Then $\mathcal{O}_p = R$ where we forget the G -action. In this case $p^{-1}p_*M = \text{Map}(G, M)$ and $I(M) = \{f : G \rightarrow M \mid f(1_G) = 0\}$ and $M \rightarrow \text{Map}(G, M)$ assigns to $m \in M$ the constant function with value m .

18.37. Localization and points

Lemma 18.37.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let p be a point of \mathcal{C} . Let U be an object of \mathcal{C} . For \mathcal{G} in $\text{Mod}(\mathcal{O}_U)$ we have*

$$(j_{U!}\mathcal{G})_p = \bigoplus_q \mathcal{G}_q$$

where the coproduct is over the points q of \mathcal{C}/U lying over p , see Sites, Lemma 7.34.2.

Proof. We use the description of $j_{U!}\mathcal{G}$ as the sheaf associated to the presheaf $V \mapsto \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V/\varphi U)$ of Lemma 18.19.2. The stalk of $j_{U!}\mathcal{G}$ at p is equal to the stalk of this presheaf, see Lemma 18.35.3. Let $u : \mathcal{C} \rightarrow \text{Sets}$ be the functor corresponding to p (see Sites, Section 7.31). Hence we see that

$$(j_{U!}\mathcal{G})_p = \text{colim}_{(V, y)} \bigoplus_{\varphi : V \rightarrow U} \mathcal{G}(V/\varphi U)$$

where the colimit is taken in the category of abelian groups. To a quadruple (V, y, φ, s) occurring in this colimit, we can assign $x = u(\varphi)(y) \in u(U)$. Hence we obtain

$$(j_{U!}\mathcal{G})_p = \bigoplus_{x \in u(U)} \text{colim}_{(\varphi : V \rightarrow U, y, u(\varphi)(y)=x)} \mathcal{G}(V/\varphi U).$$

This is equal to the expression of the lemma by the description of the points q lying over x in Sites, Lemma 7.34.2. \square

Remark 18.37.2. Warning: The result of Lemma 18.37.1 has no analogue for $j_{U,*}$.

18.38. Pullbacks of flat modules

The pullback of a flat module along a morphism of ringed topoi is flat. This is quite tricky to prove, except when there are enough points. Here we prove it only in this case and we will add the general case if we ever need it.

Lemma 18.38.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let p be a point of \mathcal{C} . If \mathcal{F} is a flat \mathcal{O} -module, then \mathcal{F}_p is a flat \mathcal{O}_p -module.*

Proof. Let M be an \mathcal{O}_p -module. Then

$$\begin{aligned} (p_*M \otimes_{\mathcal{O}} \mathcal{F})_p &= p^{-1}(p_*M \otimes_{\mathcal{O}} \mathcal{F}) \\ &= p^{-1}p_*M \otimes_{\mathcal{O}_p} \mathcal{F}_p \\ &= M \otimes_{\mathcal{O}_p} \mathcal{F}_p \oplus I(M) \otimes_{\mathcal{O}_p} \mathcal{F}_p \end{aligned}$$

where we have used the description of the stalk functor as a pullback, Lemma 18.26.1, and Lemma 18.36.2. Since p_* is exact by Lemma 18.36.2, it is clear that if \mathcal{F} is flat, then also the functor $M \mapsto M \otimes_{\mathcal{O}_p} \mathcal{F}_p$ is exact, i.e., \mathcal{F}_p is flat. \square

Lemma 18.38.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Let $\{p_i\}_{i \in I}$ be a conservative family of points of \mathcal{C} . Then \mathcal{F} is flat if and only if \mathcal{F}_{p_i} is a flat \mathcal{O}_{p_i} -module for all $i \in I$.*

Proof. By Lemma 18.38.1 we see one of the implications. For the converse, use that $(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G})_p = \mathcal{F}_p \otimes_{\mathcal{O}_p} \mathcal{G}_p$ by Lemma 18.26.1 (as taking stalks at p is given by p^{-1}) and Lemma 18.14.4. \square

Lemma 18.38.3. *Let $(f, f^\#) : (\mathcal{S}h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{S}h(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi or ringed sites. Assume \mathcal{C} has enough points⁴. Then $f^*\mathcal{F}$ is a flat $\mathcal{O}_{\mathcal{C}}$ -module whenever \mathcal{F} is a flat $\mathcal{O}_{\mathcal{D}}$ -module.*

Proof. Let p be a point of \mathcal{C} and set $q = f \circ p$. Then

$$(f^*\mathcal{F})_p = \mathcal{F}_q \otimes_{\mathcal{O}_{\mathcal{D},q}} \mathcal{O}_{\mathcal{C},p}$$

by Lemma 18.35.4. Hence if \mathcal{F} is flat, then \mathcal{F}_q is a flat $\mathcal{O}_{\mathcal{D},q}$ -module by Lemma 18.38.1 and hence by Algebra, Lemma 10.38.6 we see that $(f^*\mathcal{F})_p$ is a flat $\mathcal{O}_{\mathcal{C},p}$ -module. This implies that $f^*\mathcal{F}$ is a flat $\mathcal{O}_{\mathcal{C}}$ -module by Lemma 18.38.2. \square

18.39. Locally ringed topoi

A reference for this section is [AGV71, Exposé IV, Exercice 13.9].

Lemma 18.39.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The following are equivalent*

- (1) *For every object U of \mathcal{C} and $f \in \mathcal{O}(U)$ there exists a covering $\{U_j \rightarrow U\}$ such that for each j either $f|_{U_j}$ is invertible or $(1-f)|_{U_j}$ is invertible.*
- (2) *For every object U of \mathcal{C} and $f_1, \dots, f_n \in \mathcal{O}(U)$ which generate the unit ideal in $\mathcal{O}(U)$ there exists a covering $\{U_j \rightarrow U\}$ such that for each j there exists an i such that $f_i|_{U_j}$ is invertible.*
- (3) *The map of sheaves of sets*

$$(\mathcal{O} \times \mathcal{O}) \amalg (\mathcal{O} \times \mathcal{O}) \longrightarrow \mathcal{O} \times \mathcal{O}$$

which maps (f, a) in the first component to (f, af) and (f, b) in the second component to $(f, b(1-f))$ is surjective.

Proof. It is clear that (2) implies (1). To show that (1) implies (2) we argue by induction on n . The first case is $n = 2$ (since $n = 1$ is trivial). In this case we have $a_1f_1 + a_2f_2 = 1$ for some $a_1, a_2 \in \mathcal{O}(U)$. By assumption we can find a covering $\{U_j \rightarrow U\}$ such that for each j either $a_1f_1|_{U_j}$ is invertible or $a_2f_2|_{U_j}$ is invertible. Hence either $f_1|_{U_j}$ is invertible or $f_2|_{U_j}$ is invertible as desired. For $n > 2$ we have $a_1f_1 + \dots + a_nf_n = 1$ for some $a_1, \dots, a_n \in \mathcal{O}(U)$. By the case $n = 2$ we see that we have some covering $\{U_j \rightarrow U\}_{j \in J}$ such that for each j either $f_n|_{U_j}$ is invertible or $a_1f_1 + \dots + a_{n-1}f_{n-1}|_{U_j}$ is invertible. Say the first case happens for $j \in J_n$. Set $J' = J \setminus J_n$. By induction hypothesis, for each $j \in J'$ we can find a covering $\{U_{jk} \rightarrow U_j\}_{k \in K_j}$ such that for each $k \in K_j$ there exists an $i \in \{1, \dots, n-1\}$ such that $f_i|_{U_{jk}}$ is invertible. By the axioms of a site the family of morphisms $\{U_j \rightarrow U\}_{j \in J_n} \cup \{U_{jk} \rightarrow U\}_{j \in J', k \in K_j}$ is a covering which has the desired property.

Assume (1). To see that the map in (3) is surjective, let (f, c) be a section of $\mathcal{O} \times \mathcal{O}$ over U . By assumption there exists a covering $\{U_j \rightarrow U\}$ such that for each j either f or $1-f$ restricts to an invertible section. In the first case we can take $a = c|_{U_j}(f|_{U_j})^{-1}$, and in the second case we can take $b = c|_{U_j}(1-f|_{U_j})^{-1}$. Hence (f, c) is in the image of the map on each of the members. Conversely, assume (3) holds. For any U and $f \in \mathcal{O}(U)$ there exists a covering $\{U_j \rightarrow U\}$ of U such that the section $(f, 1)|_{U_j}$ is in the image of the map in (3) on sections over U_j . This

⁴This assumption is not necessary, see introduction to this section.

means precisely that either f or $1 - f$ restricts to an invertible section over U_j , and we see that (1) holds. \square

Lemma 18.39.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the following conditions*

- (1) *For every object U of \mathcal{C} and $f \in \mathcal{O}(U)$ there exists a covering $\{U_j \rightarrow U\}$ such that for each j either $f|_{U_j}$ is invertible or $(1 - f)|_{U_j}$ is invertible.*
- (2) *For every point p of \mathcal{C} the stalk \mathcal{O}_p is either the zero ring or a local ring.*

We always have (1) \Rightarrow (2). If \mathcal{C} has enough points then (1) and (2) are equivalent.

Proof. Assume (1). Let p be a point of \mathcal{C} given by a functor $u : \mathcal{C} \rightarrow \text{Sets}$. Let $f_p \in \mathcal{O}_p$. Since \mathcal{O}_p is computed by Sites, Equation (7.31.1.1) we may represent f_p by a triple (U, x, f) where $x \in u(U)$ and $f \in \mathcal{O}(U)$. By assumption there exists a covering $\{U_i \rightarrow U\}$ such that for each i either f or $1 - f$ is invertible on U_i . Because u defines a point of the site we see that for some i there exists an $x_i \in u(U_i)$ which maps to $x \in u(U)$. By the discussion surrounding Sites, Equation (7.31.1.1) we see that (U, x, f) and $(U_i, x_i, f|_{U_i})$ define the same element of \mathcal{O}_p . Hence we conclude that either f_p or $1 - f_p$ is invertible. Thus \mathcal{O}_p is a ring such that for every element a either a or $1 - a$ is invertible. This means that \mathcal{O}_p is either zero or a local ring, see Algebra, Lemma 10.17.2.

Assume (2) and assume that \mathcal{C} has enough points. Consider the map of sheaves of sets

$$\mathcal{O} \times \mathcal{O} \amalg \mathcal{O} \times \mathcal{O} \longrightarrow \mathcal{O} \times \mathcal{O}$$

of Lemma 18.39.1 part (3). For any local ring R the corresponding map $(R \times R) \amalg (R \times R) \rightarrow R \times R$ is surjective, see for example Algebra, Lemma 10.17.2. Since each \mathcal{O}_p is a local ring or zero the map is surjective on stalks. Hence, by our assumption that \mathcal{C} has enough points it is surjective and we win. \square

In Modules, Section 17.2 we pointed out how in a ringed space (X, \mathcal{O}_X) there can be an open subspace over which the structure sheaf is zero. To prevent this we can require the sections 1 and 0 to have different values in every stalk of the space X . In the setting of ringed topoi and ringed sites the condition is that

$$(18.39.2.1) \quad \emptyset^\# \longrightarrow \text{Equalizer}(0, 1 : * \longrightarrow \mathcal{O})$$

is an isomorphism of sheaves. Here $*$ is the singleton sheaf, resp. $\emptyset^\#$ is the “empty sheaf”, i.e., the final, resp. initial object in the category of sheaves, see Sites, Example 7.10.2, resp. Section 7.41. In other words, the condition is that whenever $U \in \text{Ob}(\mathcal{C})$ is not sheaf theoretically empty, then $1, 0 \in \mathcal{O}(U)$ are not equal. Let us state the obligatory lemma.

Lemma 18.39.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the statements*

- (1) *(18.39.2.1) is an isomorphism, and*
- (2) *for every point p of \mathcal{C} the stalk \mathcal{O}_p is not the zero ring.*

We always have (1) \Rightarrow (2) and if \mathcal{C} has enough points then (1) \Leftrightarrow (2).

Proof. Omitted. \square

Lemmas 18.39.1, 18.39.2, and 18.39.3 motivate the following definition.

Definition 18.39.4. A ringed site $(\mathcal{C}, \mathcal{O})$ is said to be *locally ringed site* if (18.39.2.1) is an isomorphism, and the equivalent properties of Lemma 18.39.1 are satisfied.

In [AGV71, Exposé IV, Exercice 13.9] the condition that (18.39.2.1) be an isomorphism is missing leading to a slightly different notion of a locally ringed site and locally ringed topos. As we are motivated by the notion of a locally ringed space we decided to add this condition (see explanation above).

Lemma 18.39.5. *Being a locally ringed site is an intrinsic property. More precisely,*

- (1) *if $f : Sh(\mathcal{C}') \rightarrow Sh(\mathcal{C})$ is a morphism of topoi and $(\mathcal{C}, \mathcal{O})$ is a locally ringed site, then $(\mathcal{C}', f^{-1}\mathcal{O})$ is a locally ringed site, and*
- (2) *if $(f, f^\#) : (Sh(\mathcal{C}'), \mathcal{O}') \rightarrow (Sh(\mathcal{C}), \mathcal{O})$ is an equivalence of ringed topoi, then $(\mathcal{C}, \mathcal{O})$ is locally ringed if and only if $(\mathcal{C}', \mathcal{O}')$ is locally ringed.*

Proof. It is clear that (2) follows from (1). To prove (1) note that as f^{-1} is exact we have $f^{-1}* = *$, $f^{-1}\emptyset^\# = \emptyset^\#$, and f^{-1} commutes with products, equalizers and transforms isomorphisms and surjections into isomorphisms and surjections. Thus f^{-1} transforms the isomorphism (18.39.2.1) into its analogue for $f^{-1}\mathcal{O}$ and transforms the surjection of Lemma 18.39.1 part (3) into the corresponding surjection for $f^{-1}\mathcal{O}$. □

In fact Lemma 18.39.5 part (2) is the analogue of Schemes, Lemma 25.2.2. It assures us that the following definition makes sense.

Definition 18.39.6. A ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ is said to be *locally ringed* if the underlying ringed site $(\mathcal{C}, \mathcal{O})$ is locally ringed.

Next, we want to work out what it means to have a morphism of locally ringed spaces. In order to do this we have the following lemma.

Lemma 18.39.7. *Let $(f, f^\#) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Consider the following conditions*

- (1) *The diagram of sheaves*

$$\begin{array}{ccc} f^{-1}(\mathcal{O}_{\mathcal{D}}^*) & \xrightarrow{f^\#} & \mathcal{O}_{\mathcal{C}}^* \\ \downarrow & & \downarrow \\ f^{-1}(\mathcal{O}_{\mathcal{D}}) & \xrightarrow{f^\#} & \mathcal{O}_{\mathcal{C}} \end{array}$$

is cartesian.

- (2) *For any point p of \mathcal{C} , setting $q = f \circ p$, the diagram*

$$\begin{array}{ccc} \mathcal{O}_{\mathcal{D},q}^* & \longrightarrow & \mathcal{O}_{\mathcal{C},p}^* \\ \downarrow & & \downarrow \\ \mathcal{O}_{\mathcal{D},q} & \longrightarrow & \mathcal{O}_{\mathcal{C},p} \end{array}$$

of sets is cartesian.

We always have (1) \Rightarrow (2). If \mathcal{C} has enough points then (1) and (2) are equivalent. If $(Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$ and $(Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ are locally ringed topoi then (2) is equivalent to

- (3) *For any point p of \mathcal{C} , setting $q = f \circ p$, the ring map $\mathcal{O}_{\mathcal{D},q} \rightarrow \mathcal{O}_{\mathcal{C},p}$ is a local ring map.*

In fact, properties (2), or (3) for a conservative family of points implies (1).

Proof. This lemma proves itself, in other words, it follows by unwinding the definitions. \square

Definition 18.39.8. Let $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Assume $(Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$ and $(Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ are locally ringed topoi. We say that (f, f^\sharp) is a *morphism of locally ringed topoi* if and only if the diagram of sheaves

$$\begin{array}{ccc} f^{-1}(\mathcal{O}_{\mathcal{D}}^*) & \xrightarrow{f^\sharp} & \mathcal{O}_{\mathcal{C}}^* \\ \downarrow & & \downarrow \\ f^{-1}(\mathcal{O}_{\mathcal{D}}) & \xrightarrow{f^\sharp} & \mathcal{O}_{\mathcal{C}} \end{array}$$

(see Lemma 18.39.7) is cartesian. If (f, f^\sharp) is a morphism of ringed sites, then we say that it is a *morphism of locally ringed sites* if the associated morphism of ringed topoi is a morphism of locally ringed topoi.

It is clear that an isomorphism of ringed topoi between locally ringed topoi is automatically an isomorphism of locally ringed topoi.

Lemma 18.39.9. Let $(f, f^\sharp) : (Sh(\mathcal{C}_1), \mathcal{O}_1) \rightarrow (Sh(\mathcal{C}_2), \mathcal{O}_2)$ and $(g, g^\sharp) : (Sh(\mathcal{C}_2), \mathcal{O}_2) \rightarrow (Sh(\mathcal{C}_3), \mathcal{O}_3)$ be morphisms of locally ringed topoi. Then the composition $(g, g^\sharp) \circ (f, f^\sharp)$ (see Definition 18.7.1) is also a morphism of locally ringed topoi.

Proof. Omitted. \square

Lemma 18.39.10. If $f : Sh(\mathcal{C}') \rightarrow Sh(\mathcal{C})$ is a morphism of topoi. If \mathcal{O} is a sheaf of rings on \mathcal{C} , then

$$f^{-1}(\mathcal{O}^*) = (f^{-1}\mathcal{O})^*.$$

In particular, if \mathcal{O} turns \mathcal{C} into a locally ringed site, then setting $f^\sharp = id$ the morphism of ringed topoi

$$(f, f^\sharp) : (Sh(\mathcal{C}'), f^{-1}\mathcal{O}) \rightarrow (Sh(\mathcal{C}), \mathcal{O})$$

is a morphism of locally ringed topoi.

Proof. Note that the diagram

$$\begin{array}{ccc} \mathcal{O}^* & \xrightarrow{\quad} & * \\ u \rightarrow (u, u^{-1}) \downarrow & & \downarrow 1 \\ \mathcal{O} \times \mathcal{O} & \xrightarrow{(a,b) \mapsto ab} & \mathcal{O} \end{array}$$

is cartesian. Since f^{-1} is exact we conclude that

$$\begin{array}{ccc} f^{-1}(\mathcal{O}^*) & \xrightarrow{\quad} & * \\ u \rightarrow (u, u^{-1}) \downarrow & & \downarrow 1 \\ f^{-1}\mathcal{O} \times f^{-1}\mathcal{O} & \xrightarrow{(a,b) \mapsto ab} & f^{-1}\mathcal{O} \end{array}$$

is cartesian which implies the first assertion. For the second, note that $(\mathcal{C}', f^{-1}\mathcal{O})$ is a locally ringed site by Lemma 18.39.5 so that the assertion makes sense. Now the first part implies that the morphism is a morphism of locally ringed topoi. \square

Lemma 18.39.11. *Localization of locally ringed sites and topoi.*

- (1) Let $(\mathcal{C}, \mathcal{O})$ be a locally ringed site. Let U be an object of \mathcal{C} . Then the localization $(\mathcal{C}/U, \mathcal{O}_U)$ is a locally ringed site, and the localization morphism

$$(j_U, j_U^\sharp) : (\mathit{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\mathit{Sh}(\mathcal{C}), \mathcal{O})$$

is a morphism of locally ringed topoi.

- (2) Let $(\mathcal{C}, \mathcal{O})$ be a locally ringed site. Let $f : V \rightarrow U$ be a morphism of \mathcal{C} . Then the morphism

$$(j, j^\sharp) : (\mathit{Sh}(\mathcal{C}/V), \mathcal{O}_V) \rightarrow (\mathit{Sh}(\mathcal{C}/U), \mathcal{O}_U)$$

of Lemma 18.19.4 is a morphism of locally ringed topoi.

- (3) Let $(f, f^\sharp) : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{D}, \mathcal{O}')$ be a morphism of locally ringed sites where f is given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let V be an object of \mathcal{D} and let $U = u(V)$. Then the morphism

$$(f', (f')^\sharp) : (\mathit{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\mathit{Sh}(\mathcal{D}/V), \mathcal{O}'_V)$$

of Lemma 18.20.1 is a morphism of locally ringed sites.

- (4) Let $(f, f^\sharp) : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{D}, \mathcal{O}')$ be a morphism of locally ringed sites where f is given by the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \text{Ob}(\mathcal{D})$, $U \in \text{Ob}(\mathcal{C})$, and $c : U \rightarrow u(V)$. Then the morphism

$$(f_c, (f_c)^\sharp) : (\mathit{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\mathit{Sh}(\mathcal{D}/V), \mathcal{O}'_V)$$

of Lemma 18.20.2 is a morphism of locally ringed topoi.

- (5) Let $(\mathit{Sh}(\mathcal{C}), \mathcal{O})$ be a locally ringed topos. Let \mathcal{F} be a sheaf on \mathcal{C} . Then the localization $(\mathit{Sh}(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}})$ is a locally ringed topos and the localization morphism

$$(j_{\mathcal{F}}, j_{\mathcal{F}}^\sharp) : (\mathit{Sh}(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \rightarrow (\mathit{Sh}(\mathcal{C}), \mathcal{O})$$

is a morphism of locally ringed topoi.

- (6) Let $(\mathit{Sh}(\mathcal{C}), \mathcal{O})$ be a locally ringed topos. Let $s : \mathcal{G} \rightarrow \mathcal{F}$ be a map of sheaves on \mathcal{C} . Then the morphism

$$(j, j^\sharp) : (\mathit{Sh}(\mathcal{C})/\mathcal{G}, \mathcal{O}_{\mathcal{G}}) \rightarrow (\mathit{Sh}(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}})$$

of Lemma 18.21.4 is a morphism of locally ringed topoi.

- (7) Let $f : (\mathit{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathit{Sh}(\mathcal{D}), \mathcal{O}')$ be a morphism of locally ringed topoi. Let \mathcal{G} be a sheaf on \mathcal{D} . Set $\mathcal{F} = f^{-1}\mathcal{G}$. Then the morphism

$$(f', (f')^\sharp) : (\mathit{Sh}(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \rightarrow (\mathit{Sh}(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}})$$

of Lemma 18.22.1 is a morphism of locally ringed topoi.

- (8) Let $f : (\mathit{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathit{Sh}(\mathcal{D}), \mathcal{O}')$ be a morphism of locally ringed topoi. Let \mathcal{G} be a sheaf on \mathcal{D} , let \mathcal{F} be a sheaf on \mathcal{C} , and let $s : \mathcal{F} \rightarrow f^{-1}\mathcal{G}$ be a morphism of sheaves. Then the morphism

$$(f_s, (f_s)^\sharp) : (\mathit{Sh}(\mathcal{C})/\mathcal{F}, \mathcal{O}_{\mathcal{F}}) \rightarrow (\mathit{Sh}(\mathcal{D})/\mathcal{G}, \mathcal{O}'_{\mathcal{G}})$$

of Lemma 18.22.3 is a morphism of locally ringed topoi.

Proof. Part (1) is clear since \mathcal{O}_U is just the restriction of \mathcal{O} , so Lemmas 18.39.5 and 18.39.10 apply. Part (2) is clear as the morphism (j, j^\sharp) is actually a localization of a locally ringed site so (1) applies. Part (3) is clear also since $(f')^\sharp$ is just the restriction of f^\sharp to the topos $\mathit{Sh}(\mathcal{C})/\mathcal{F}$, see proof of Lemma 18.22.1 (hence the diagram of Definition 18.39.8 for the morphism f' is just the restriction of the corresponding diagram for f , and restriction is an exact functor). Part (4)

follows formally on combining (2) and (3). Parts (5), (6), (7), and (8) follow from their counterparts (1), (2), (3), and (4) by enlarging the sites as in Lemma 18.7.2 and translating everything in terms of sites and morphisms of sites using the comparisons of Lemmas 18.21.3, 18.21.5, 18.22.2, and 18.22.4. (Alternatively one could use the same arguments as in the proofs of (1), (2), (3), and (4) to prove (5), (6), (7), and (8) directly.) \square

18.40. Lower shriek for modules

In this section we extend the construction of $g_!$ discussed in Section 18.16 to the case of sheaves of modules.

Lemma 18.40.1. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous and cocontinuous functor between sites. Denote $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{O}_{\mathcal{D}})$ the associated morphism of topoi. Let $\mathcal{O}_{\mathcal{D}}$ be a sheaf of rings on \mathcal{D} . Set $\mathcal{O}_{\mathcal{C}} = g^{-1}\mathcal{O}_{\mathcal{D}}$. Hence g becomes a morphism of ringed topoi with $g^* = g^{-1}$. In this case there exists a functor*

$$g_! : Mod(\mathcal{O}_{\mathcal{C}}) \longrightarrow Mod(\mathcal{O}_{\mathcal{D}})$$

which is left adjoint to g^* .

Proof. Let U be an object of \mathcal{C} . For any $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{G} we have

$$\begin{aligned} \text{Hom}_{\mathcal{O}_{\mathcal{C}}}(j_{U!}\mathcal{O}_U, g^{-1}\mathcal{G}) &= g^{-1}\mathcal{G}(U) \\ &= \mathcal{G}(u(U)) \\ &= \text{Hom}_{\mathcal{O}_{\mathcal{D}}}(j_{u(U)!}\mathcal{O}_{u(U)}, \mathcal{G}) \end{aligned}$$

because g^{-1} is described by restriction, see Sites, Lemma 7.20.5. Of course a similar formula holds a direct sum of modules of the form $j_{U!}\mathcal{O}_U$. By Homology, Lemma 12.25.6 and Lemma 18.28.6 we see that $g_!$ exists. \square

Remark 18.40.2. Warning! Let $u : \mathcal{C} \rightarrow \mathcal{D}$, g , $\mathcal{O}_{\mathcal{D}}$, and $\mathcal{O}_{\mathcal{C}}$ be as in Lemma 18.40.1. In general it is **not** the case that the diagram

$$\begin{array}{ccc} Mod(\mathcal{O}_{\mathcal{C}}) & \xrightarrow{g_!} & Mod(\mathcal{O}_{\mathcal{D}}) \\ \text{forget} \downarrow & & \downarrow \text{forget} \\ Ab(\mathcal{C}) & \xrightarrow{g_!^{Ab}} & Ab(\mathcal{D}) \end{array}$$

commutes (here $g_!^{Ab}$ is the one from Lemma 18.16.2). There is a transformation of functors

$$g_!^{Ab} \circ \text{forget} \longrightarrow \text{forget} \circ g_!$$

From the proof of Lemma 18.40.1 we see that this is an isomorphism if and only if $g_!j_{U!}\mathcal{O}_U = g_!^{Ab}j_{U!}\mathcal{O}_U$ for all objects U of \mathcal{C} , in other words, if and only if

$$g_!^{Ab}j_{U!}\mathcal{O}_U = j_{u(U)!}\mathcal{O}_{u(U)}$$

for all objects U of \mathcal{C} . Note that for such a U we obtain a commutative diagram

$$\begin{array}{ccc} \mathcal{C}/U & \xrightarrow{u'} & \mathcal{D}/u(U) \\ j_U \downarrow & & \downarrow j_{u(U)} \\ \mathcal{C} & \xrightarrow{u} & \mathcal{D} \end{array}$$

of cocontinuous functors of sites, see Sites, Lemma 7.27.4. Hence we see that $g_! = g_!^{Ab}$ if the canonical map

$$(18.40.2.1) \quad (g')_!^{Ab} \mathcal{O}_U \longrightarrow \mathcal{O}_{u(U)}$$

is an isomorphism for all objects U of \mathcal{C} . Here $g' : Sh(\mathcal{C}/U) \rightarrow Sh(\mathcal{D}/u(U))$ is the morphism of topoi induced by the cocontinuous functor u' .

18.41. Constant sheaves

Let E be a set and let \mathcal{C} be a site. We will denote \underline{E} the constant sheaf with value E on \mathcal{C} . If E is an abelian group, ring, module, etc, then \underline{E} is a sheaf of abelian groups, rings, modules, etc.

Lemma 18.41.1. *Let \mathcal{C} be a site. If $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is a short exact sequence of abelian groups, then $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C} \rightarrow 0$ is an exact sequence of abelian sheaves and in fact it is even exact as a sequence of abelian presheaves.*

Proof. Since sheafification is exact it is clear that $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C} \rightarrow 0$ is an exact sequence of abelian sheaves. Thus $0 \rightarrow \underline{A} \rightarrow \underline{B} \rightarrow \underline{C}$ is an exact sequence of abelian presheaves. To see that $\underline{B} \rightarrow \underline{C}$ is surjective, pick a set theoretical section $s : C \rightarrow B$. This induces a section $\underline{s} : \underline{C} \rightarrow \underline{B}$ of sheaves of sets left inverse to the surjection $\underline{B} \rightarrow \underline{C}$. \square

Lemma 18.41.2. *Let \mathcal{C} be a site. Let Λ be a ring and let M and Q be Λ -modules. If Q is a finitely presented Λ -module, then we have $\underline{M} \otimes_{\Lambda} \underline{Q}(U) = \underline{M}(U) \otimes_{\Lambda} Q$ for all $U \in \text{Ob}(\mathcal{C})$.*

Proof. Choose a presentation $\Lambda^{\oplus m} \rightarrow \Lambda^{\oplus n} \rightarrow Q \rightarrow 0$. This gives an exact sequence $M^{\oplus m} \rightarrow M^{\oplus n} \rightarrow M \otimes Q \rightarrow 0$. By Lemma 18.41.1 we obtain an exact sequence

$$\underline{M}(U)^{\oplus m} \rightarrow \underline{M}(U)^{\oplus n} \rightarrow \underline{M} \otimes Q(U) \rightarrow 0$$

which proves the lemma. (Note that taking sections over U always commutes with finite direct sums, but not arbitrary direct sums.) \square

Lemma 18.41.3. *Let \mathcal{C} be a site. Let Λ be a coherent ring. Let M be a flat Λ -module. For $U \in \text{Ob}(\mathcal{C})$ the module $\underline{M}(U)$ is a flat Λ -module.*

Proof. Let $I \subset \Lambda$ be a finitely generated ideal. By Algebra, Lemma 10.38.4 it suffices to show that $\underline{M}(U) \otimes_{\Lambda} I \rightarrow \underline{M}(U)$ is injective. As Λ is coherent I is finitely presented as a Λ -module. By Lemma 18.41.2 we see that $\underline{M}(U) \otimes I = \underline{M} \otimes I$. Since M is flat the map $M \otimes I \rightarrow M$ is injective, whence $\underline{M} \otimes I \rightarrow \underline{M}$ is injective. \square

Lemma 18.41.4. *Let \mathcal{C} be a site. Let Λ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. The sheaf $\underline{\Lambda}^{\wedge} = \lim \underline{\Lambda/I^n}$ is a flat $\underline{\Lambda}$ -algebra. Moreover we have canonical identifications*

$$\underline{\Lambda}/I\underline{\Lambda} = \underline{\Lambda}/\underline{I} = \underline{\Lambda}^{\wedge}/I\underline{\Lambda}^{\wedge} = \underline{\Lambda}^{\wedge}/\underline{I} \cdot \underline{\Lambda}^{\wedge} = \underline{\Lambda}^{\wedge}/\underline{I}^{\wedge} = \underline{\Lambda}/\underline{I}$$

where $\underline{I}^{\wedge} = \lim \underline{I/I^n}$.

Proof. To prove $\underline{\Lambda}^{\wedge}$ is flat, it suffices to show that $\underline{\Lambda}^{\wedge}(U)$ is flat as a $\underline{\Lambda}$ -module for each $U \in \text{Ob}(\mathcal{C})$, see Lemmas 18.28.2 and 18.28.3. By Lemma 18.41.3 we see that

$$\underline{\Lambda}^{\wedge}(U) = \lim \underline{\Lambda/I^n}(U)$$

is a limit of a system of flat Λ/I^n -modules. By Lemma 18.41.1 we see that the transition maps are surjective. We conclude by More on Algebra, Lemma 15.19.4.

To see the equalities, note that $\underline{\Lambda}(U)/I\underline{\Lambda}(U) = \underline{\Lambda}/I(U)$ by Lemma 18.41.2. It follows that $\underline{\Lambda}/I\underline{\Lambda} = \underline{\Lambda}/I = \underline{\Lambda}/I$. The system of short exact sequences

$$0 \rightarrow \underline{I}/I^n(U) \rightarrow \underline{\Lambda}/I^n(U) \rightarrow \underline{\Lambda}/I(U) \rightarrow 0$$

has surjective transition maps, hence gives a short exact sequence

$$0 \rightarrow \lim \underline{I}/I^n(U) \rightarrow \lim \underline{\Lambda}/I^n(U) \rightarrow \lim \underline{\Lambda}/I(U) \rightarrow 0$$

see Homology, Lemma 12.27.3. Thus we see that $\underline{\Lambda}^\wedge/\underline{I}^\wedge = \underline{\Lambda}/I$. Since

$$I\underline{\Lambda}^\wedge \subset \underline{I} \cdot \underline{\Lambda}^\wedge \subset \underline{I}^\wedge$$

it suffices to show that $I\underline{\Lambda}^\wedge(U) = \underline{I}^\wedge(U)$ for all U . Choose generators $I = (f_1, \dots, f_r)$. This gives a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus r} \rightarrow I \rightarrow 0$. We obtain short exact sequences

$$0 \rightarrow (K \cap I^n)/I^n K(U) \rightarrow (\Lambda/I^n)^{\oplus r}(U) \rightarrow I/I^n(U) \rightarrow 0$$

By Artin-Rees (Algebra, Lemma 10.49.2) the system of modules on the left hand side has ML. (It is zero as a pro-object.) Thus we see that $(\underline{\Lambda}^\wedge)^{\oplus r}(U) \rightarrow \underline{I}^\wedge(U)$ is surjective by Homology, Lemma 12.27.3 which is what we wanted to show. \square

Lemma 18.41.5. *Let \mathcal{C} be a site. Let Λ be a ring and let M be a Λ -module. Assume $Sh(\mathcal{C})$ is not the empty topos. Then*

- (1) \underline{M} is a finite type sheaf of $\underline{\Lambda}$ -modules if and only if M is a finite Λ -module, and
- (2) \underline{M} is a finitely presented sheaf of $\underline{\Lambda}$ -modules if and only if M is a finitely presented Λ -module.

Proof. Proof of (1). If M is generated by x_1, \dots, x_r then x_1, \dots, x_r define global sections of \underline{M} which generate it, hence \underline{M} is of finite type. Conversely, assume \underline{M} is of finite type. Let $U \in \mathcal{C}$ be an object which is not sheaf theoretically empty (Sites, Definition 7.41.1). Such an object exists as we assumed $Sh(\mathcal{C})$ is not the empty topos. Then there exists a covering $\{U_i \rightarrow U\}$ and finitely many sections $s_{ij} \in \underline{M}(U_i)$ generating $\underline{M}|_{U_i}$. After refining the covering we may assume that s_{ij} come from elements x_{ij} of M . Then x_{ij} define global sections of \underline{M} whose restriction to U generate \underline{M} .

Assume there exist elements x_1, \dots, x_r of M which define global sections of \underline{M} generating \underline{M} as a sheaf of $\underline{\Lambda}$ -modules. We will show that x_1, \dots, x_r generate M as a Λ -module. Let $x \in M$. We can find a covering $\{U_i \rightarrow U\}_{i \in I}$ and $f_{i,j} \in \underline{\Lambda}(U_i)$ such that $x|_{U_i} = \sum f_{i,j} x_j|_{U_i}$. After refining the covering we may assume $f_{i,j} \in \Lambda$. Since U is not sheaf theoretically empty we see that $I \neq \emptyset$. Thus we can pick $i \in I$ and we see that $x = \sum f_{i,j} x_j$ in M as desired.

Proof of (2). Assume \underline{M} is a $\underline{\Lambda}$ -module of finite presentation. By (1) we see that M is of finite type. Choose generators x_1, \dots, x_r of M as a Λ -module. This determines a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus r} \rightarrow M \rightarrow 0$ which turns into a short exact sequence

$$0 \rightarrow \underline{K} \rightarrow \underline{\Lambda}^{\oplus r} \rightarrow \underline{M} \rightarrow 0$$

by Lemma 18.41.1. By Lemma 18.24.1 we see that \underline{K} is of finite type. Hence K is a finite Λ -module by (1). Thus M is a Λ -module of finite presentation. \square

18.42. Locally constant sheaves

Here is the general definition.

Definition 18.42.1. Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf of sets, groups, abelian groups, rings, modules over a fixed ring Λ , etc.

- (1) We say \mathcal{F} is a *constant sheaf* of sets, groups, abelian groups, rings, modules over a fixed ring Λ , etc if it is isomorphic as a sheaf of sets, groups, abelian groups, rings, modules over a fixed ring Λ , etc to a constant sheaf \underline{E} as in Section 18.41.
- (2) We say \mathcal{F} is *locally constant* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ such that $\mathcal{F}|_{U_i}$ is a constant sheaf.
- (3) If \mathcal{F} is a sheaf of sets or groups, then we say \mathcal{F} is *finite locally constant* if the constant values are finite sets or finite groups.

Lemma 18.42.2. Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi. If \mathcal{G} is a locally constant sheaf of sets, groups, abelian groups, rings, modules over a fixed ring Λ , etc on \mathcal{D} , the same is true for $f^{-1}\mathcal{G}$ on \mathcal{C} .

Proof. Omitted. □

Lemma 18.42.3. Let \mathcal{C} be a site with a final object X .

- (1) Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of sets on \mathcal{C} . If \mathcal{F} is finite locally constant, there exists a covering $\{U_i \rightarrow X\}$ such that $\varphi|_{U_i}$ is the map of constant sheaves associated to a map of sets.
- (2) Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of abelian groups on \mathcal{C} . If \mathcal{F} is finite locally constant, there exists a covering $\{U_i \rightarrow X\}$ such that $\varphi|_{U_i}$ is the map of constant abelian sheaves associated to a map of abelian groups.
- (3) Let Λ be a ring. Let $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ be a map of locally constant sheaves of Λ -modules on \mathcal{C} . If \mathcal{F} is of finite type, then there exists a covering $\{U_i \rightarrow X\}$ such that $\varphi|_{U_i}$ is the map of constant sheaves of Λ -modules associated to a map of Λ -modules.

Proof. Proof omitted. □

Lemma 18.42.4. Let \mathcal{C} be a site. Let Λ be a ring. Let M, N be Λ -modules. Let \mathcal{F}, \mathcal{G} be a locally constant sheaves of Λ -modules.

- (1) If M is of finite presentation, then

$$\underline{\mathrm{Hom}}_{\Lambda}(M, N) = \underline{\mathcal{H}om}_{\Lambda}(\underline{M}, \underline{N})$$

- (2) If M and N are both of finite presentation, then

$$\underline{\mathrm{Isom}}_{\Lambda}(M, N) = \underline{\mathrm{Isom}}_{\Lambda}(\underline{M}, \underline{N})$$

- (3) If \mathcal{F} is of finite presentation, then $\underline{\mathcal{H}om}_{\Lambda}(\mathcal{F}, \mathcal{G})$ is a locally constant sheaf of Λ -modules.
- (4) If \mathcal{F} and \mathcal{G} are both of finite presentation, then $\underline{\mathrm{Isom}}_{\Lambda}(\mathcal{F}, \mathcal{G})$ is a locally constant sheaf of sets.

Proof. Proof of (1). Set $E = \mathrm{Hom}_{\Lambda}(M, N)$. We want to show the canonical map

$$\underline{E} \longrightarrow \underline{\mathcal{H}om}_{\Lambda}(\underline{M}, \underline{N})$$

is an isomorphism. The module M has a presentation $\Lambda^{\oplus s} \rightarrow \Lambda^{\oplus t} \rightarrow M \rightarrow 0$. Then E sits in an exact sequence

$$0 \rightarrow E \rightarrow \text{Hom}_\Lambda(\Lambda^{\oplus t}, N) \rightarrow \text{Hom}_\Lambda(\Lambda^{\oplus s}, N)$$

and we have similarly

$$0 \rightarrow \mathcal{H}om_\Lambda(\underline{M}, \underline{N}) \rightarrow \mathcal{H}om_\Lambda(\underline{\Lambda}^{\oplus t}, \underline{N}) \rightarrow \mathcal{H}om_\Lambda(\underline{\Lambda}^{\oplus s}, \underline{N})$$

This reduces the question to the case where M is a finite free module where the result is clear.

Proof of (3). The question is local on \mathcal{C} , hence we may assume $\mathcal{F} = \underline{M}$ and $\mathcal{G} = \underline{N}$ for some Λ -modules M and N . By Lemma 18.41.5 the module M is of finite presentation. Thus the result follows from (1).

Parts (2) and (4) follow from parts (1) and (3) and the fact that $Isom$ can be viewed as the subsheaf of sections of $\mathcal{H}om_\Lambda(\mathcal{F}, \mathcal{G})$ which have an inverse in $\mathcal{H}om_\Lambda(\mathcal{G}, \mathcal{F})$. \square

Lemma 18.42.5. *Let \mathcal{C} be a site.*

- (1) *The category of finite locally constant sheaves of sets is closed under finite limits and colimits inside $Sh(\mathcal{C})$.*
- (2) *The category of finite locally constant abelian sheaves is a weak Serre subcategory of $Ab(\mathcal{C})$.*
- (3) *Let Λ be a Noetherian ring. The category of finite type, locally constant sheaves of Λ -modules on \mathcal{C} is a weak Serre subcategory of $Mod(\mathcal{C}, \Lambda)$.*

Proof. Proof of (1). We may work locally on \mathcal{C} . Hence by Lemma 18.42.3 we may assume we are given a finite diagram of finite sets such that our diagram of sheaves is the associated diagram of constant sheaves. Then we just take the limit or colimit in the category of sets and take the associated constant sheaf. Some details omitted.

To prove (2) and (3) we use the criterion of Homology, Lemma 12.9.3. Existence of kernels and cokernels is argued in the same way as above. Of course, the reason for using a Noetherian ring in (3) is to assure us that the kernel of a map of finite Λ -modules is a finite Λ -module. To see that the category is closed under extensions (in the case of sheaves Λ -modules), assume given an extension of sheaves of Λ -modules

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0$$

on \mathcal{C} with \mathcal{F}, \mathcal{G} finite type and locally constant. Localizing on \mathcal{C} we may assume \mathcal{F} and \mathcal{G} are constant, i.e., we get

$$0 \rightarrow \underline{M} \rightarrow \mathcal{E} \rightarrow \underline{N} \rightarrow 0$$

for some Λ -modules M, N . Choose generators y_1, \dots, y_m of N , so that we get a short exact sequence $0 \rightarrow K \rightarrow \Lambda^{\oplus m} \rightarrow N \rightarrow 0$ of Λ -modules. Localizing further we may assume y_j lifts to a section s_j of \mathcal{E} . Thus we see that \mathcal{E} is a pushout as in the following diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \underline{K} & \longrightarrow & \underline{\Lambda}^{\oplus m} & \longrightarrow & \underline{N} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \underline{M} & \longrightarrow & \mathcal{E} & \longrightarrow & \underline{N} \longrightarrow 0 \end{array}$$

By Lemma 18.42.3 again (and the fact that K is a finite Λ -module as Λ is Noetherian) we see that the map $\underline{K} \rightarrow \underline{M}$ is locally constant, hence we conclude. \square

Lemma 18.42.6. *Let \mathcal{C} be a site. Let Λ be a ring. The tensor product of two locally constant sheaves of Λ -modules on \mathcal{C} is a locally constant sheaf of Λ -modules.*

Proof. Omitted. \square

Injectives

19.1. Introduction

In future chapters we will use the existence of injectives and K-injective complexes to do cohomology of sheaves of modules on ringed sites. In this chapter we explain how to produce injectives and K-injective complexes first for modules on sites and later more generally for Grothendieck abelian categories.

We observe that we already know that the category of abelian groups and the category of modules over a ring have enough injectives, see More on Algebra, Sections 15.41 and 15.42

19.2. Baer's argument for modules

There is another, more set-theoretic approach to showing that any R -module M can be imbedded in an injective module. This approach constructs the injective module by a transfinite colimit of push-outs. While this method is somewhat abstract and more complicated than the one of More on Algebra, Section 15.42, it is also more general. Apparently this method originates with Baer, and was revisited by Cartan and Eilenberg in [CE56] and by Grothendieck in [Gro57]. There Grothendieck uses it to show that many other abelian categories have enough injectives. We will get back to the general case later (insert future reference here).

We begin with a few set theoretic remarks. Let $\{B_\beta\}_{\beta \in \alpha}$ be an inductive system of objects in some category \mathcal{C} , indexed by an ordinal α . Assume that $\operatorname{colim}_{\beta \in \alpha} B_\beta$ exists in \mathcal{C} . If A is an object of \mathcal{C} , then there is a natural map

$$(19.2.0.1) \quad \operatorname{colim}_{\beta \in \alpha} \operatorname{Mor}_{\mathcal{C}}(A, B_\beta) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(A, \operatorname{colim}_{\beta \in \alpha} B_\beta).$$

because if one is given a map $A \rightarrow B_\beta$ for some β , one naturally gets a map from A into the colimit by composing with $B_\beta \rightarrow \operatorname{colim}_{\beta \in \alpha} B_\alpha$. Note that the left colimit is one of sets! In general, (19.2.0.1) is neither injective or surjective.

Example 19.2.1. Consider the category of sets. Let $A = \mathbf{N}$ and $B_n = \{1, \dots, n\}$ be the inductive system indexed by the natural numbers where $B_n \rightarrow B_m$ for $n \leq m$ is the obvious map. Then $\operatorname{colim} B_n = \mathbf{N}$, so there is a map $A \rightarrow \operatorname{colim} B_n$, which does not factor as $A \rightarrow B_m$ for any m . Consequently, $\operatorname{colim} \operatorname{Mor}(A, B_n) \rightarrow \operatorname{Mor}(A, \operatorname{colim} B_n)$ is not surjective.

Example 19.2.2. Next we give an example where the map fails to be injective. Let $B_n = \mathbf{N}/\{1, 2, \dots, n\}$, that is, the quotient set of \mathbf{N} with the first n elements collapsed to one element. There are natural maps $B_n \rightarrow B_m$ for $n \leq m$, so the $\{B_n\}$ form a system of sets over \mathbf{N} . It is easy to see that $\operatorname{colim} B_n = \{*\}$: it is the one-point set. So it follows that $\operatorname{Mor}(A, \operatorname{colim} B_n)$ is a one-element set for every set A . However, $\operatorname{colim} \operatorname{Mor}(A, B_n)$ is **not** a one-element set. Consider the family

of maps $A \rightarrow B_n$ which are just the natural projections $\mathbf{N} \rightarrow \mathbf{N}/\{1, 2, \dots, n\}$ and the family of maps $A \rightarrow B_n$ which map the whole of A to the class of 1. These two families of maps are distinct at each step and thus are distinct in $\text{colim Mor}(A, B_n)$, but they induce the same map $A \rightarrow \text{colim } B_n$.

Nonetheless, if we map out of a finite set then (19.2.0.1) is an isomorphism always.

Lemma 19.2.3. *Suppose that, in (19.2.0.1), \mathcal{C} is the category of sets and A is a finite set, then the map is a bijection.*

Proof. Let $f : A \rightarrow \text{colim } B_\beta$. The range of f is finite, containing say elements $c_1, \dots, c_r \in \text{colim } B_\beta$. These all come from some elements in B_β for $\beta \in \alpha$ large by definition of the colimit. Thus we can define $\tilde{f} : A \rightarrow B_\beta$ lifting f at a finite stage. This proves that (19.2.0.1) is surjective. Next, suppose two maps $f : A \rightarrow B_\gamma, f' : A \rightarrow B_{\gamma'}$ define the same map $A \rightarrow \text{colim } B_\beta$. Then each of the finitely many elements of A gets sent to the same point in the colimit. By definition of the colimit for sets, there is $\beta \geq \gamma, \gamma'$ such that the finitely many elements of A get sent to the same points in B_β under f and f' . This proves that (19.2.0.1) is injective. \square

The most interesting case of the lemma is when $\alpha = \omega$, i.e., when the system $\{B_\beta\}$ is a system $\{B_n\}_{n \in \mathbf{N}}$ over the natural numbers as in Examples 19.2.1 and 19.2.2. The essential idea is that A is “small” relative to the long chain of compositions $B_1 \rightarrow B_2 \rightarrow \dots$, so that it has to factor through a finite step. A more general version of this lemma can be found in Sets, Lemma 3.7.1. Next, we generalize this to the category of modules.

Definition 19.2.4. Let \mathcal{C} be a category, let $I \subset \text{Arrow}(\mathcal{C})$, and let α be an ordinal. An object A of \mathcal{C} is said to be α -small with respect to I if whenever $\{B_\beta\}$ is a system over α with transition maps in I , then the map (19.2.0.1) is an isomorphism.

In the rest of this section we shall restrict ourselves to the category of R -modules for a fixed commutative ring R . We shall also take I to be the collection of injective maps, i.e., the *monomorphisms* in the category of modules over R . In this case, for any system $\{B_\beta\}$ as in the definition each of the maps

$$B_\beta \rightarrow \text{colim}_{\beta \in \alpha} B_\beta$$

is an injection. It follows that the map (19.2.0.1) is an *injection*. We can in fact interpret the B_β 's as submodules of the module $B = \text{colim}_{\beta \in \alpha} B_\beta$, and then we have $B = \bigcup_{\beta \in \alpha} B_\beta$. This is not an abuse of notation if we identify B_α with the image in the colimit. We now want to show that modules are always small for “large” ordinals α .

Proposition 19.2.5. *Let R be a ring. Let M be an R -module. Let κ the cardinality of the set of submodules of M . If α is an ordinal whose cofinality is bigger than κ , then M is α -small with respect to injections.*

Proof. The proof is straightforward, but let us first think about a special case. If M is finite, then the claim is that for any inductive system $\{B_\beta\}$ with injections between them, parametrized by a limit ordinal, any map $M \rightarrow \text{colim } B_\beta$ factors through one of the B_β . And this we proved in Lemma 19.2.3.

Now we start the proof in the general case. We need only show that the map (19.2.0.1) is a surjection. Let $f : M \rightarrow \text{colim } B_\beta$ be a map. Consider the subobjects

$\{f^{-1}(B_\beta)\}$ of M , where B_β is considered as a subobject of the colimit $B = \bigcup_\beta B_\beta$. If one of these, say $f^{-1}(B_\beta)$, fills M , then the map factors through B_β .

So suppose to the contrary that all of the $f^{-1}(B_\beta)$ were proper subobjects of M . However, we know that

$$\bigcup f^{-1}(B_\beta) = f^{-1}\left(\bigcup B_\beta\right) = M.$$

Now there are at most κ different subobjects of M that occur among the $f^{-1}(B_\alpha)$, by hypothesis. Thus we can find a subset $S \subset \alpha$ of cardinality at most κ such that as β' ranges over S , the $f^{-1}(B_{\beta'})$ range over *all* the $f^{-1}(B_\alpha)$.

However, S has an upper bound $\tilde{\alpha} < \alpha$ as α has cofinality bigger than κ . In particular, all the $f^{-1}(B_{\beta'})$, $\beta' \in S$ are contained in $f^{-1}(B_{\tilde{\alpha}})$. It follows that $f^{-1}(B_{\tilde{\alpha}}) = M$. In particular, the map f factors through $B_{\tilde{\alpha}}$. \square

From this lemma we will be able to deduce the existence of lots of injectives. Let us recall the criterion of Baer.

Lemma 19.2.6. *Let R be a ring. An R -module Q is injective if and only if in every commutative diagram*

$$\begin{array}{ccc} \mathfrak{a} & \longrightarrow & Q \\ \downarrow & \nearrow & \\ R & & \end{array}$$

for $\mathfrak{a} \subset R$ an ideal, the dotted arrow exists.

Proof. Assume Q satisfies the assumption of the lemma. Let $M \subset N$ be R -modules, and let $\varphi : M \rightarrow Q$ be an R -module map. Arguing as in the proof of More on Algebra, Lemma 15.41.1 we see that it suffices to prove that if $M \neq N$, then we can find an R -module M' , $M \subset M' \subset N$ such that (a) the inclusion $M \subset M'$ is strict, and (b) φ can be extended to M' . To find M' , let $x \in N$, $x \notin M$. Let $\psi : R \rightarrow N$, $r \mapsto rx$. Set $\mathfrak{a} = \psi^{-1}(M)$. By assumption the morphism

$$\mathfrak{a} \xrightarrow{\psi} M \xrightarrow{\varphi} Q$$

can be extended to a morphism $\varphi' : R \rightarrow Q$. Note that φ' annihilates the kernel of ψ (as this is true for φ). Thus φ' gives rise to a morphism $\varphi'' : \text{Im}(\psi) \rightarrow Q$ which agrees with φ on the intersection $M \cap \text{Im}(\psi)$ by construction. Thus φ and φ'' glue to give an extension of φ to the strictly bigger module $M' = \mathcal{F} + \text{Im}(\psi)$. \square

If M is an R -module, then in general we may have a semi-complete diagram as in Lemma 19.2.6. In it, we can form the *push-out*

$$\begin{array}{ccc} \mathfrak{a} & \longrightarrow & Q \\ \downarrow & & \downarrow \\ R & \longrightarrow & R \oplus_{\mathfrak{a}} Q. \end{array}$$

Here the vertical map is injective, and the diagram commutes. The point is that we can extend $\mathfrak{a} \rightarrow Q$ to R if we extend Q to the larger module $R \oplus_{\mathfrak{a}} Q$.

The key point of Baer’s argument is to repeat this procedure transfinitely many times. To do this we first define, given an R -module M the following (huge) pushout

$$(19.2.6.1) \quad \begin{array}{ccc} \bigoplus_{\mathfrak{a}} \bigoplus_{\varphi \in \text{Hom}_R(\mathfrak{a}, M)} \mathfrak{a} & \longrightarrow & M \\ \downarrow & & \downarrow \\ \bigoplus_{\mathfrak{a}} \bigoplus_{\varphi \in \text{Hom}_R(\mathfrak{a}, M)} R & \longrightarrow & \mathbf{M}(M). \end{array}$$

Here the top horizontal arrow maps the element $a \in \mathfrak{a}$ in the summand corresponding to φ to the element $\varphi(a) \in M$. The left vertical arrow maps $a \in \mathfrak{a}$ in the summand corresponding to φ simply to the element $a \in R$ in the summand corresponding to φ . The fundamental properties of this construction are formulated in the following lemma.

Lemma 19.2.7. *Let R be a ring.*

- (1) *The construction $M \mapsto (M \rightarrow \mathbf{M}(M))$ is functorial in M .*
- (2) *The map $M \rightarrow \mathbf{M}(M)$ is injective.*
- (3) *For any ideal \mathfrak{a} and any R -module map $\varphi : \mathfrak{a} \rightarrow M$ there is an R -module map $\varphi' : R \rightarrow \mathbf{M}(M)$ such that*

$$\begin{array}{ccc} \mathfrak{a} & \xrightarrow{\varphi} & M \\ \downarrow & & \downarrow \\ R & \xrightarrow{\varphi'} & \mathbf{M}(M) \end{array}$$

commutes.

Proof. Parts (2) and (3) are immediate from the construction. To see (1), let $\chi : M \rightarrow N$ be an R -module map. We claim there exists a canonical commutative diagram

$$\begin{array}{ccccc} \bigoplus_{\mathfrak{a}} \bigoplus_{\varphi \in \text{Hom}_R(\mathfrak{a}, M)} \mathfrak{a} & \longrightarrow & M & \xrightarrow{\chi} & N \\ \downarrow & \searrow & \downarrow & \searrow & \downarrow \\ \bigoplus_{\mathfrak{a}} \bigoplus_{\varphi \in \text{Hom}_R(\mathfrak{a}, M)} R & \longrightarrow & \bigoplus_{\mathfrak{a}} \bigoplus_{\psi \in \text{Hom}_R(\mathfrak{a}, N)} \mathfrak{a} & \longrightarrow & N \\ & \searrow & \downarrow & & \\ & & \bigoplus_{\mathfrak{a}} \bigoplus_{\psi \in \text{Hom}_R(\mathfrak{a}, N)} R & & \end{array}$$

which induces the desired map $\mathbf{M}(M) \rightarrow \mathbf{M}(N)$. The middle east-south-east arrow maps the summand \mathfrak{a} corresponding to φ via $\text{id}_{\mathfrak{a}}$ to the summand \mathfrak{a} corresponding to $\psi = \chi \circ \varphi$. Similarly for the lower east-south-east arrow. Details omitted. \square

The idea will now be to apply the functor \mathbf{M} a transfinite number of times. We define for each ordinal α a functor \mathbf{M}_{α} on the category of R -modules, together with a natural injection $N \rightarrow \mathbf{M}_{\alpha}(N)$. We do this by transfinite induction. First, $\mathbf{M}_1 = \mathbf{M}$ is the functor defined above. Now, suppose given an ordinal α , and suppose $\mathbf{M}_{\alpha'}$ is defined for $\alpha' < \alpha$. If α has an immediate predecessor $\bar{\alpha}$, we let

$$\mathbf{M}_{\alpha} = \mathbf{M} \circ \mathbf{M}_{\bar{\alpha}}.$$

If not, i.e., if α is a limit ordinal, we let

$$\mathbf{M}_\alpha(N) = \operatorname{colim}_{\alpha' < \alpha} \mathbf{M}_{\alpha'}(N).$$

It is clear (e.g., inductively) that the $\mathbf{M}_\alpha(N)$ form an inductive system over ordinals, so this is reasonable.

Theorem 19.2.8. *Let κ be the cardinality of the set of ideals in R , and let α be an ordinal whose cofinality is greater than κ . Then $\mathbf{M}_\alpha(N)$ is an injective R -module, and $N \rightarrow \mathbf{M}_\alpha(N)$ is a functorial injective embedding.*

Proof. By Baer's criterion Lemma 19.2.6, it suffices to show that if $\mathfrak{a} \subset R$ is an ideal, then any map $f : \mathfrak{a} \rightarrow \mathbf{M}_\alpha(N)$ extends to $R \rightarrow \mathbf{M}_\alpha(N)$. However, we know since α is a limit ordinal that

$$\mathbf{M}_\alpha(N) = \operatorname{colim}_{\beta < \alpha} \mathbf{M}_\beta(N),$$

so by Proposition 19.2.5, we find that

$$\operatorname{Hom}_R(\mathfrak{a}, \mathbf{M}_\alpha(N)) = \operatorname{colim}_{\beta < \alpha} \operatorname{Hom}_R(\mathfrak{a}, \mathbf{M}_\beta(N)).$$

This means in particular that there is some $\beta' < \alpha$ such that f factors through the submodule $\mathbf{M}_{\beta'}(N)$, as

$$f : \mathfrak{a} \rightarrow \mathbf{M}_{\beta'}(N) \rightarrow \mathbf{M}_\alpha(N).$$

However, by the fundamental property of the functor \mathbf{M} , see Lemma 19.2.7 part (3), we know that the map $\mathfrak{a} \rightarrow \mathbf{M}_{\beta'}(N)$ can be extended to

$$R \rightarrow \mathbf{M}(\mathbf{M}_{\beta'}(N)) = \mathbf{M}_{\beta'+1}(N),$$

and the last object imbeds in $\mathbf{M}_\alpha(N)$ (as $\beta' + 1 < \alpha$ since α is a limit ordinal). In particular, f can be extended to $\mathbf{M}_\alpha(N)$. \square

19.3. G-modules

We will see later (Differential Graded Algebra, Section 22.12) that the category of modules over an algebra has functorial injective embeddings. The construction is exactly the same as the construction in More on Algebra, Section 15.42.

Lemma 19.3.1. *Let G be a topological group. The category Mod_G of discrete G -modules, see *Étale Cohomology*, Definition 44.58.1 has functorial injective hulls.*

Proof. By the remark above the lemma the category $\operatorname{Mod}_{\mathbf{Z}[G]}$ has functorial injective embeddings. Consider the forgetful functor $v : \operatorname{Mod}_G \rightarrow \operatorname{Mod}_{\mathbf{Z}[G]}$. This functor is fully faithful, transforms injective maps into injective maps and has a right adjoint, namely

$$u : M \mapsto u(M) = \{x \in M \mid \text{stabilizer of } x \text{ is open}\}$$

Since it is true that $v(M) = 0 \Rightarrow M = 0$ we conclude by Homology, Lemma 12.25.5. \square

19.4. Abelian sheaves on a space

Lemma 19.4.1. *Let X be a topological space. The category of abelian sheaves on X has enough injectives. In fact it has functorial injective embeddings.*

Proof. For an abelian group A we denote $j : A \rightarrow J(A)$ the functorial injective embedding constructed in More on Algebra, Section 15.42. Let \mathcal{F} be an abelian sheaf on X . By Sheaves, Example 6.7.5 the assignment

$$\mathcal{I} : U \mapsto \mathcal{I}(U) = \prod_{x \in U} J(\mathcal{F}_x)$$

is an abelian sheaf. There is a canonical map $\mathcal{F} \rightarrow \mathcal{I}$ given by mapping $s \in \mathcal{F}(U)$ to $\prod_{x \in U} j(s_x)$ where $s_x \in \mathcal{F}_x$ denotes the germ of s at x . This map is injective, see Sheaves, Lemma 6.11.1 for example.

It remains to prove the following: Given a rule $x \mapsto I_x$ which assigns to each point $x \in X$ an injective abelian group the sheaf $\mathcal{I} : U \mapsto \prod_{x \in U} I_x$ is injective. Note that

$$\mathcal{I} = \prod_{x \in X} i_{x,*} I_x$$

is the product of the skyscraper sheaves $i_{x,*} I_x$ (see Sheaves, Section 6.27 for notation.) We have

$$\text{Mor}_{\text{Ab}}(\mathcal{F}_x, I_x) = \text{Mor}_{\text{Ab}(X)}(\mathcal{F}, i_{x,*} I_x).$$

see Sheaves, Lemma 6.27.3. Hence it is clear that each $i_{x,*} I_x$ is injective. Hence the injectivity of \mathcal{I} follows from Homology, Lemma 12.23.3. \square

19.5. Sheaves of modules on a ringed space

Lemma 19.5.1. *Let (X, \mathcal{O}_X) be a ringed space, see Sheaves, Section 6.25. The category of sheaves of \mathcal{O}_X -modules on X has enough injectives. In fact it has functorial injective embeddings.*

Proof. For any ring R and any R -module M we denote $j : M \rightarrow J_R(M)$ the functorial injective embedding constructed in More on Algebra, Section 15.42. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules on X . By Sheaves, Examples 6.7.5 and 6.15.6 the assignment

$$\mathcal{I} : U \mapsto \mathcal{I}(U) = \prod_{x \in U} J_{\mathcal{O}_{X,x}}(\mathcal{F}_x)$$

is an abelian sheaf. There is a canonical map $\mathcal{F} \rightarrow \mathcal{I}$ given by mapping $s \in \mathcal{F}(U)$ to $\prod_{x \in U} j(s_x)$ where $s_x \in \mathcal{F}_x$ denotes the germ of s at x . This map is injective, see Sheaves, Lemma 6.11.1 for example.

It remains to prove the following: Given a rule $x \mapsto I_x$ which assigns to each point $x \in X$ an injective $\mathcal{O}_{X,x}$ -module the sheaf $\mathcal{I} : U \mapsto \prod_{x \in U} I_x$ is injective. Note that

$$\mathcal{I} = \prod_{x \in X} i_{x,*} I_x$$

is the product of the skyscraper sheaves $i_{x,*} I_x$ (see Sheaves, Section 6.27 for notation.) We have

$$\text{Hom}_{\mathcal{O}_{X,x}}(\mathcal{F}_x, I_x) = \text{Hom}_{\mathcal{O}_X}(\mathcal{F}, i_{x,*} I_x).$$

see Sheaves, Lemma 6.27.3. Hence it is clear that each $i_{x,*} I_x$ is an injective \mathcal{O}_X -module (see Homology, Lemma 12.25.1 or argue directly). Hence the injectivity of \mathcal{I} follows from Homology, Lemma 12.23.3. \square

19.6. Abelian presheaves on a category

Let \mathcal{C} be a category. Recall that this means that $\text{Ob}(\mathcal{C})$ is a set. On the one hand, consider abelian presheaves on \mathcal{C} , see Sites, Section 7.2. On the other hand, consider families of abelian groups indexed by elements of $\text{Ob}(\mathcal{C})$; in other words presheaves on the discrete category with underlying set of objects $\text{Ob}(\mathcal{C})$. Let us denote this discrete category simply $\text{Ob}(\mathcal{C})$. There is a natural functor

$$i : \text{Ob}(\mathcal{C}) \longrightarrow \mathcal{C}$$

and hence there is a natural restriction or forgetful functor

$$v = i^p : PAb(\mathcal{C}) \longrightarrow PAb(\text{Ob}(\mathcal{C}))$$

compare Sites, Section 7.5. We will denote presheaves on \mathcal{C} by B and presheaves on $\text{Ob}(\mathcal{C})$ by A .

There are also two functors, namely i_p and ${}_p i$ which assign an abelian presheaf on \mathcal{C} to an abelian presheaf on $\text{Ob}(\mathcal{C})$, see Sites, Sections 7.5 and 7.18. Here we will use $u = {}_p i$ which is defined (in the case at hand) as follows:

$$uA(U) = \prod_{U' \rightarrow U} A(U').$$

So an element is a family $(a_\phi)_\phi$ with ϕ ranging through all morphisms in \mathcal{C} with target U . The restriction map on uA corresponding to $g : V \rightarrow U$ maps our element $(a_\phi)_\phi$ to the element $(a_{g \circ \psi})_\psi$.

There is a canonical surjective map $vuA \rightarrow A$ and a canonical injective map $B \rightarrow uvB$. We leave it to the reader to show that

$$\text{Mor}_{PAb(\text{Ob}(\mathcal{C}))}(B, uA) = \text{Mor}_{PAb(\mathcal{C})}(vB, A).$$

in this simple case; the general case is in Sites, Section 7.5. Thus the pair (u, v) is an example of a pair of adjoint functors, see Categories, Section 4.24.

At this point we can list the following facts about the situation above.

- (1) The functors u and v are exact. This follows from the explicit description of these functors given above.
- (2) In particular the functor v transforms injective maps into injective maps.
- (3) The category $PAb(\text{Ob}(\mathcal{C}))$ has enough injectives.
- (4) In fact there is a functorial injective embedding $A \mapsto (A \rightarrow J(A))$ as in Homology, Definition 12.23.5. Namely, we can take $J(A)$ to be the presheaf $U \mapsto J(A(U))$, where $J(-)$ is the functor constructed in More on Algebra, Section 15.42 for the ring \mathbf{Z} .

Putting all of this together gives us the following procedure for embedding objects B of $PAb(\mathcal{C})$ into an injective object: $B \rightarrow uJ(vB)$. See Homology, Lemma 12.25.5.

Proposition 19.6.1. *For abelian presheaves on a category there is a functorial injective embedding.*

Proof. See discussion above. □

19.7. Abelian Sheaves on a site

Let \mathcal{C} be a site. In this section we prove that there are enough injectives for abelian sheaves on \mathcal{C} .

Denote $i : Ab(\mathcal{C}) \rightarrow PAb(\mathcal{C})$ the forgetful functor from abelian sheaves to abelian presheaves. Let $\# : PAb(\mathcal{C}) \rightarrow Ab(\mathcal{C})$ denote the sheafification functor. Recall that $\#$ is a left adjoint to i , that $\#$ is exact, and that $i\mathcal{F}^\# = \mathcal{F}$ for any abelian sheaf \mathcal{F} . Finally, let $\mathcal{G} \rightarrow J(\mathcal{G})$ denote the canonical embedding into an injective presheaf we found in Section 19.6.

For any sheaf \mathcal{F} in $Ab(\mathcal{C})$ and any ordinal β we define a sheaf $J_\beta(\mathcal{F})$ by transfinite induction. We set $J_0(\mathcal{F}) = \mathcal{F}$. We define $J_1(\mathcal{F}) = J(i\mathcal{F})^\#$. Sheafification of the canonical map $i\mathcal{F} \rightarrow J(i\mathcal{F})$ gives a functorial map

$$\mathcal{F} \rightarrow J_1(\mathcal{F})$$

which is injective as $\#$ is exact. We set $J_{\alpha+1}(\mathcal{F}) = J_1(J_\alpha(\mathcal{F}))$. So that there are canonical injective maps $J_\alpha(\mathcal{F}) \rightarrow J_{\alpha+1}(\mathcal{F})$. For a limit ordinal β , we define

$$J_\beta(\mathcal{F}) = \text{colim}_{\alpha < \beta} J_\alpha(\mathcal{F}).$$

Note that this is a directed colimit. Hence for any ordinals $\alpha < \beta$ we have an injective map $J_\alpha(\mathcal{F}) \rightarrow J_\beta(\mathcal{F})$.

Lemma 19.7.1. *With notation as above. Suppose that $\mathcal{G}_1 \rightarrow \mathcal{G}_2$ is an injective map of abelian sheaves on \mathcal{C} . Let α be an ordinal and let $\mathcal{G}_1 \rightarrow J_\alpha(\mathcal{F})$ be a morphism of sheaves. There exists a morphism $\mathcal{G}_2 \rightarrow J_{\alpha+1}(\mathcal{F})$ such that the following diagram commutes*

$$\begin{array}{ccc} \mathcal{G}_1 & \longrightarrow & \mathcal{G}_2 \\ \downarrow & & \downarrow \\ J_\alpha(\mathcal{F}) & \longrightarrow & J_{\alpha+1}(\mathcal{F}) \end{array}$$

Proof. This is because the map $i\mathcal{G}_1 \rightarrow i\mathcal{G}_2$ is injective and hence $i\mathcal{G}_1 \rightarrow iJ_\alpha(\mathcal{F})$ extends to $i\mathcal{G}_2 \rightarrow J(iJ_\alpha(\mathcal{F}))$ which gives the desired map after applying the sheafification functor. \square

This lemma says that somehow the system $\{J_\alpha(\mathcal{F})\}$ is an injective embedding of \mathcal{F} . Of course we cannot take the limit over all α because they form a class and not a set. However, the idea is now that you don't have to check injectivity on all injections $\mathcal{G}_1 \rightarrow \mathcal{G}_2$, plus the following lemma.

Lemma 19.7.2. *Suppose that $\mathcal{G}_i, i \in I$ is set of abelian sheaves on \mathcal{C} . There exists an ordinal β such that for any sheaf \mathcal{F} , any $i \in I$, and any map $\varphi : \mathcal{G}_i \rightarrow J_\beta(\mathcal{F})$ there exists an $\alpha < \beta$ such that φ factors through $J_\alpha(\mathcal{F})$.*

Proof. This reduces to the case of a single sheaf \mathcal{G} by taking the direct sum of all the \mathcal{G}_i .

Consider the sets

$$S = \coprod_{U \in \text{Ob}(\mathcal{C})} \mathcal{G}(U).$$

and

$$T_\beta = \coprod_{U \in \text{Ob}(\mathcal{C})} J_\beta(\mathcal{F})(U)$$

Then $T_\beta = \text{colim}_{\alpha < \beta} T_\alpha$ with injective transition maps. A morphism $\mathcal{G} \rightarrow J_\beta(\mathcal{F})$ factors through $J_\alpha(\mathcal{F})$ if and only if the associated map $S \rightarrow T_\beta$ factors through T_α . By Sets, Lemma 3.7.1 if the cofinality of β is bigger than the cardinality of S , then the result of the lemma is true. Hence the lemma follows from the fact that there are ordinals with arbitrarily large cofinality, see Sets, Proposition 3.7.2. \square

Recall that for an object X of \mathcal{C} we denote \mathbf{Z}_X the presheaf of abelian groups $\Gamma(U, \mathbf{Z}_X) = \bigoplus_{U \rightarrow X} \mathbf{Z}$, see Modules on Sites, Section 18.4. The sheaf associated to this presheaf is denoted $\mathbf{Z}_X^\#$, see Modules on Sites, Section 18.5. It can be characterized by the property

$$(19.7.2.1) \quad \text{Mor}_{\text{Ab}(\mathcal{C})}(\mathbf{Z}_X^\#, \mathcal{G}) = \mathcal{G}(X)$$

where the element φ of the left hand side is mapped to $\varphi(1 \cdot \text{id}_X)$ in the right hand side. We can use these sheaves to characterize injective abelian sheaves.

Lemma 19.7.3. *Suppose \mathcal{J} is a sheaf of abelian groups with the following property: For all $X \in \text{Ob}(\mathcal{C})$, for any abelian subsheaf $\mathcal{S} \subset \mathbf{Z}_X^\#$ and any morphism $\varphi : \mathcal{S} \rightarrow \mathcal{J}$, there exists a morphism $\mathbf{Z}_X^\# \rightarrow \mathcal{J}$ extending φ . Then \mathcal{J} is an injective sheaf of abelian groups.*

Proof. Let $\mathcal{F} \rightarrow \mathcal{G}$ be an injective map of abelian sheaves. Suppose $\varphi : \mathcal{F} \rightarrow \mathcal{J}$ is a morphism. Arguing as in the proof of More on Algebra, Lemma 15.41.1 we see that it suffices to prove that if $\mathcal{F} \neq \mathcal{G}$, then we can find an abelian sheaf \mathcal{F}' , $\mathcal{F} \subset \mathcal{F}' \subset \mathcal{G}$ such that (a) the inclusion $\mathcal{F} \subset \mathcal{F}'$ is strict, and (b) φ can be extended to \mathcal{F}' . To find \mathcal{F}' , let X be an object of \mathcal{C} such that the inclusion $\mathcal{F}(X) \subset \mathcal{G}(X)$ is strict. Pick $s \in \mathcal{G}(X)$, $s \notin \mathcal{F}(X)$. Let $\psi : \mathbf{Z}_X^\# \rightarrow \mathcal{G}$ be the morphism corresponding to the section s via (19.7.2.1). Set $\mathcal{S} = \psi^{-1}(\mathcal{F})$. By assumption the morphism

$$\mathcal{S} \xrightarrow{\psi} \mathcal{F} \xrightarrow{\varphi} \mathcal{J}$$

can be extended to a morphism $\varphi' : \mathbf{Z}_X^\# \rightarrow \mathcal{J}$. Note that φ' annihilates the kernel of ψ (as this is true for φ). Thus φ' gives rise to a morphism $\varphi'' : \text{Im}(\psi) \rightarrow \mathcal{J}$ which agrees with φ on the intersection $\mathcal{F} \cap \text{Im}(\psi)$ by construction. Thus φ and φ'' glue to give an extension of φ to the strictly bigger subsheaf $\mathcal{F}' = \mathcal{F} + \text{Im}(\psi)$. \square

Theorem 19.7.4. *The category of sheaves of abelian groups on a site has enough injectives. In fact there exists a functorial injective embedding, see Homology, Definition 12.23.5.*

Proof. Let \mathcal{G}_i , $i \in I$ be a set of abelian sheaves such that every subsheaf of every $\mathbf{Z}_X^\#$ occurs as one of the \mathcal{G}_i . Apply Lemma 19.7.2 to this collection to get an ordinal β . We claim that for any sheaf of abelian groups \mathcal{F} the map $\mathcal{F} \rightarrow J_\beta(\mathcal{F})$ is an injection of \mathcal{F} into an injective. Note that by construction the assignment $\mathcal{F} \mapsto (\mathcal{F} \rightarrow J_\beta(\mathcal{F}))$ is indeed functorial.

The proof of the claim comes from the fact that by Lemma 19.7.3 it suffices to extend any morphism $\gamma : \mathcal{G} \rightarrow J_\beta(\mathcal{F})$ from a subsheaf \mathcal{G} of some $\mathbf{Z}_X^\#$ to all of $\mathbf{Z}_X^\#$. Then by Lemma 19.7.2 the map γ lifts into $J_\alpha(\mathcal{F})$ for some $\alpha < \beta$. Finally, we apply Lemma 19.7.1 to get the desired extension of γ to a morphism into $J_{\alpha+1}(\mathcal{F}) \rightarrow J_\beta(\mathcal{F})$. \square

19.8. Modules on a ringed site

Let \mathcal{C} be a site. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . By analogy with More on Algebra, Section 15.42 let us try to prove that there are enough injective \mathcal{O} -modules. First of all, we pick an injective embedding

$$\bigoplus_{U, \mathcal{I}} j_{U!} \mathcal{O}_U / \mathcal{I} \longrightarrow \mathcal{J}$$

where \mathcal{J} is an injective abelian sheaf (which exists by the previous section). Here the direct sum is over all objects U of \mathcal{C} and over all \mathcal{O} -submodules $\mathcal{I} \subset j_{U!} \mathcal{O}_U$. Please see Modules on Sites, Section 18.19 to read about the functors restriction and extension by 0 for the localization functor $j_U : \mathcal{C}/U \rightarrow \mathcal{C}$.

For any sheaf of \mathcal{O} -modules \mathcal{F} denote

$$\mathcal{F}^\vee = \mathcal{H}om(\mathcal{F}, \mathcal{J})$$

with its natural \mathcal{O} -module structure. Insert here future reference to internal hom. We will also need a canonical flat resolution of a sheaf of \mathcal{O} -modules. This we can do as follows: For any \mathcal{O} -module \mathcal{F} we denote

$$F(\mathcal{F}) = \bigoplus_{U \in \text{Ob}(\mathcal{C}), s \in \mathcal{F}(U)} j_{U!} \mathcal{O}_U.$$

This is a flat sheaf of \mathcal{O} -modules which comes equipped with a canonical surjection $F(\mathcal{F}) \rightarrow \mathcal{F}$, see Modules on Sites, Lemma 18.28.6. Moreover the construction $\mathcal{F} \mapsto F(\mathcal{F})$ is functorial in \mathcal{F} .

Lemma 19.8.1. *The functor $\mathcal{F} \mapsto \mathcal{F}^\vee$ is exact.*

Proof. This because \mathcal{J} is an injective abelian sheaf. \square

There is a canonical map $ev : \mathcal{F} \rightarrow (\mathcal{F}^\vee)^\vee$ given by evaluation: given $x \in \mathcal{F}(U)$ we let $ev(x) \in (\mathcal{F}^\vee)^\vee = \mathcal{H}om(\mathcal{F}^\vee, \mathcal{J})$ be the map $\varphi \mapsto \varphi(x)$.

Lemma 19.8.2. *For any \mathcal{O} -module \mathcal{F} the evaluation map $ev : \mathcal{F} \rightarrow (\mathcal{F}^\vee)^\vee$ is injective.*

Proof. You can check this using the definition of \mathcal{J} . Namely, if $s \in \mathcal{F}(U)$ is not zero, then let $j_{U!} \mathcal{O}_U \rightarrow \mathcal{F}$ be the map of \mathcal{O} -modules it corresponds to via adjunction. Let \mathcal{I} be the kernel of this map. There exists a nonzero map $\mathcal{F} \supset j_{U!} \mathcal{O}_U / \mathcal{I} \rightarrow \mathcal{J}$ which does not annihilate s . As \mathcal{J} is an injective \mathcal{O} -module, this extends to a map $\varphi : \mathcal{F} \rightarrow \mathcal{J}$. Then $ev(s)(\varphi) = \varphi(s) \neq 0$ which is what we had to prove. \square

The canonical surjection $F(\mathcal{F}) \rightarrow \mathcal{F}$ of \mathcal{O} -modules turns into a canonical injection, see above, of \mathcal{O} -modules

$$(\mathcal{F}^\vee)^\vee \longrightarrow (F(\mathcal{F}^\vee))^\vee.$$

Set $J(\mathcal{F}) = (F(\mathcal{F}^\vee))^\vee$. The composition of ev with this the displayed map gives $\mathcal{F} \rightarrow J(\mathcal{F})$ functorially in \mathcal{F} .

Lemma 19.8.3. *Let \mathcal{O} be a sheaf of rings. For every \mathcal{O} -module \mathcal{F} the \mathcal{O} -module $J(\mathcal{F})$ is injective.*

Proof. We have to show that the functor $\text{Hom}_{\mathcal{O}}(\mathcal{G}, J(\mathcal{F}))$ is exact. Note that

$$\begin{aligned} \text{Hom}_{\mathcal{O}}(\mathcal{G}, J(\mathcal{F})) &= \text{Hom}_{\mathcal{O}}(\mathcal{G}, (F(\mathcal{F}^\vee))^\vee) \\ &= \text{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{H}om(F(\mathcal{F}^\vee), \mathcal{J})) \\ &= \text{Hom}(\mathcal{G} \otimes_{\mathcal{O}} F(\mathcal{F}^\vee), \mathcal{J}) \end{aligned}$$

Thus what we want follows from the fact that $F(\mathcal{F}^\vee)$ is flat and \mathcal{J} is injective. \square

Theorem 19.8.4. *Let \mathcal{C} be a site. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . The category of sheaves of \mathcal{O} -modules on a site has enough injectives. In fact there exists a functorial injective embedding, see Homology, Definition 12.23.5.*

Proof. From the discussion in this section. \square

Proposition 19.8.5. *Let \mathcal{C} be a category. Let \mathcal{O} be a presheaf of rings on \mathcal{C} . The category $PMod(\mathcal{O})$ of presheaves of \mathcal{O} -modules has functorial injective embeddings.*

Proof. We could prove this along the lines of the discussion in Section 19.6. But instead we argue using the theorem above. Endow \mathcal{C} with the structure of a site by letting the set of coverings of an object U consist of all singletons $\{f : V \rightarrow U\}$ where f is an isomorphism. We omit the verification that this defines a site. A sheaf for this topology is the same as a presheaf (proof omitted). Hence the theorem applies. \square

19.9. Embedding abelian categories

In this section we show that an abelian category embeds in the category of abelian sheaves on a site having enough points. The site will be the one described in the following lemma.

Lemma 19.9.1. *Let \mathcal{A} be an abelian category. Let*

$$Cov = \{\{f : V \rightarrow U\} \mid f \text{ is surjective}\}.$$

Then (\mathcal{A}, Cov) is a site, see Sites, Definition 7.6.2.

Proof. Note that $Ob(\mathcal{A})$ is a set by our conventions about categories. An isomorphism is a surjective morphism. The composition of surjective morphisms is surjective. And the base change of a surjective morphism in \mathcal{A} is surjective, see Homology, Lemma 12.5.14. \square

Let \mathcal{A} be a pre-additive category. In this case the Yoneda embedding $\mathcal{A} \rightarrow PSh(\mathcal{A})$, $X \mapsto h_X$ factors through a functor $\mathcal{A} \rightarrow PAb(\mathcal{A})$.

Lemma 19.9.2. *Let \mathcal{A} be an abelian category. Let $\mathcal{C} = (\mathcal{A}, Cov)$ be the site defined in Lemma 19.9.1. Then $X \mapsto h_X$ defines a fully faithful, exact functor*

$$\mathcal{A} \longrightarrow Ab(\mathcal{C}).$$

Moreover, the site \mathcal{C} has enough points.

Proof. Suppose that $f : V \rightarrow U$ is a surjective morphism of \mathcal{A} . Let $K = \text{Ker}(f)$. Recall that $V \times_U V = \text{Ker}((f, -f) : V \oplus V \rightarrow U)$, see Homology, Example 12.5.6. In particular there exists an injection $K \oplus K \rightarrow V \times_U V$. Let $p, q : V \times_U V \rightarrow V$ be the two projection morphisms. Note that $p - q : V \times_U V \rightarrow V$ is a morphism such that $f \circ (p - q) = 0$. Hence $p - q$ factors through $K \rightarrow V$. Let us denote this morphism by $c : V \times_U V \rightarrow K$. And since the composition $K \oplus K \rightarrow V \times_U V \rightarrow K$ is surjective, we conclude that c is surjective. It follows that

$$V \times_U V \xrightarrow{p-q} V \rightarrow U \rightarrow 0$$

is an exact sequence of \mathcal{A} . Hence for an object X of \mathcal{A} the sequence

$$0 \rightarrow \text{Hom}_{\mathcal{A}}(U, X) \rightarrow \text{Hom}_{\mathcal{A}}(V, X) \rightarrow \text{Hom}_{\mathcal{A}}(V \times_U V, X)$$

is an exact sequence of abelian groups, see Homology, Lemma 12.5.8. This means that h_X satisfies the sheaf condition on \mathcal{C} .

The functor is fully faithful by Categories, Lemma 4.3.5. The functor is a left exact functor between abelian categories by Homology, Lemma 12.5.8. To show that it is right exact, let $X \rightarrow Y$ be a surjective morphism of \mathcal{A} . Let U be an object of \mathcal{A} , and let $s \in h_Y(U) = \text{Mor}_{\mathcal{A}}(U, Y)$ be a section of h_Y over U . By Homology, Lemma 12.5.14 the projection $U \times_Y X \rightarrow U$ is surjective. Hence $\{V = U \times_Y X \rightarrow U\}$ is a covering of U such that $s|_V$ lifts to a section of h_X . This proves that $h_X \rightarrow h_Y$ is a surjection of abelian sheaves, see Sites, Lemma 7.12.2.

The site \mathcal{C} has enough points by Sites, Proposition 7.38.3. \square

Remark 19.9.3. The Freyd-Mitchell embedding theorem says there exists a fully faithful exact functor from any abelian category \mathcal{A} to the category of modules over a ring. Lemma 19.9.2 is not quite as strong. But the result is suitable for the stacks project as we have to understand sheaves of abelian groups on sites in detail anyway. Moreover, “diagram chasing” works in the category of abelian sheaves on \mathcal{C} , for example by working with sections over objects, or by working on the level of stalks using that \mathcal{C} has enough points. To see how to deduce the Freyd-Mitchell embedding theorem from Lemma 19.9.2 see Remark 19.9.5.

Remark 19.9.4. If \mathcal{A} is a “big” abelian category, i.e., if \mathcal{A} has a class of objects, then Lemma 19.9.2 does not work. In this case, given any set of objects $E \subset \text{Ob}(\mathcal{A})$ there exists an abelian full subcategory $\mathcal{A}' \subset \mathcal{A}$ such that $\text{Ob}(\mathcal{A}')$ is a set and $E \subset \text{Ob}(\mathcal{A}')$. Then one can apply Lemma 19.9.2 to \mathcal{A}' . One can use this to prove that results depending on a diagram chase hold in \mathcal{A} .

Remark 19.9.5. Let \mathcal{C} be a site. Note that $Ab(\mathcal{C})$ has enough injectives, see Theorem 19.7.4. (In the case that \mathcal{C} has enough points this is straightforward because p_*I is an injective sheaf if I is an injective \mathbf{Z} -module and p is a point.) Also, $Ab(\mathcal{C})$ has a cogenerator (details omitted). Hence Lemma 19.9.2 proves that we have a fully faithful, exact embedding $\mathcal{A} \rightarrow \mathcal{B}$ where \mathcal{B} has a cogenerator and enough injectives. We can apply this to \mathcal{A}^{opp} and we get a fully faithful exact functor $i : \mathcal{A} \rightarrow \mathcal{D} = \mathcal{B}^{opp}$ where \mathcal{D} has enough projectives and a generator. Hence \mathcal{D} has a projective generator P . Set $R = \text{Mor}_{\mathcal{D}}(P, P)$. Then

$$\mathcal{A} \longrightarrow \text{Mod}_R, \quad X \longmapsto \text{Hom}_{\mathcal{D}}(P, X).$$

One can check this is a fully faithful, exact functor. In other words, one retrieves the Freyd-Mitchell theorem mentioned in Remark 19.9.3 above.

Remark 19.9.6. The arguments proving Lemmas 19.9.1 and 19.9.2 work also for *exact categories*, see [Büh10, Appendix A] and [BBD82, 1.1.4]. We quickly review this here and we add more details if we ever need it in the stacks project.

Let \mathcal{A} be an additive category. A *kernel-cokernel pair* is a pair (i, p) of morphisms of \mathcal{A} with $i : A \rightarrow B$, $p : B \rightarrow C$ such that i is the kernel of p and p is the cokernel of i . Given a set \mathcal{E} of kernel-cokernel pairs we say $i : A \rightarrow B$ is an *admissible monomorphism* if $(i, p) \in \mathcal{E}$ for some morphism p . Similarly we say a morphism $p : B \rightarrow C$ is an *admissible epimorphism* if $(i, p) \in \mathcal{E}$ for some morphism i . The pair $(\mathcal{A}, \mathcal{E})$ is said to be an *exact category* if the following axioms hold

- (1) \mathcal{E} is closed under isomorphisms of kernel-cokernel pairs,

- (2) for any object A the morphism 1_A is both an admissible epimorphism and an admissible monomorphism,
- (3) admissible monomorphisms are stable under composition,
- (4) admissible epimorphisms are stable under composition,
- (5) the push-out of an admissible monomorphism $i : A \rightarrow B$ via any morphism $A \rightarrow A'$ exist and the induced morphism $i' : A' \rightarrow B'$ is an admissible monomorphism, and
- (6) the base change of an admissible epimorphism $p : B \rightarrow C$ via any morphism $C' \rightarrow C$ exist and the induced morphism $p' : B' \rightarrow C'$ is an admissible epimorphism.

Given such a structure let $\mathcal{C} = (\mathcal{A}, \text{Cov})$ where coverings (i.e., elements of Cov) are given by admissible epimorphisms. The axioms listed above immediately imply that this is a site. Consider the functor

$$F : \mathcal{A} \longrightarrow \text{Ab}(\mathcal{C}), \quad X \longmapsto h_X$$

exactly as in Lemma 19.9.2. It turns out that this functor is fully faithful, exact, and reflects exactness. Moreover, any extension of objects in the essential image of F is in the essential image of F .

19.10. Grothendieck's AB conditions

This and the next few sections are mostly interesting for “big” abelian categories, i.e., those categories listed in Categories, Remark 4.2.2. A good case to keep in mind is the category of sheaves of modules on a ringed site.

Grothendieck proved the existence of injectives in great generality in the paper [Gro57]. He used the following conditions to single out abelian categories with special properties.

Definition 19.10.1. Let \mathcal{A} be an abelian category. We name some conditions

- AB3 \mathcal{A} has direct sums,
- AB4 \mathcal{A} has AB3 and direct sums are exact,
- AB5 \mathcal{A} has AB3 and filtered colimits are exact.

Here are the dual notions

- AB3* \mathcal{A} has products,
- AB4* \mathcal{A} has AB3* and products are exact,
- AB5* \mathcal{A} has AB3* and filtered limits are exact.

We say an object U of \mathcal{A} is a *generator* if for every $N \subset M$, $N \neq M$ in \mathcal{A} there exists a morphism $U \rightarrow M$ which does not factor through N . We say \mathcal{A} is a *Grothendieck abelian category* if it has AB5 and a generator.

Discussion: A direct sum in an abelian category is a coproduct. If an abelian category has direct sums (i.e., AB3), then it has colimits, see Categories, Lemma 4.14.11. Similarly if \mathcal{A} has AB3* then it has limits, see Categories, Lemma 4.14.10. Exactness of direct sums means the following: given an index set I and short exact sequences

$$0 \rightarrow A_i \rightarrow B_i \rightarrow C_i \rightarrow 0, \quad i \in I$$

in \mathcal{A} then the sequence

$$0 \rightarrow \bigoplus_{i \in I} A_i \rightarrow \bigoplus_{i \in I} B_i \rightarrow \bigoplus_{i \in I} C_i \rightarrow 0$$

is exact as well. Without assuming AB4 it is only true in general that the sequence is exact on the right (i.e., taking direct sums is a right exact functor if direct sums exist). Similarly, exactness of filtered colimits means the following: given a directed partially ordered set I and a system of short exact sequences

$$0 \rightarrow A_i \rightarrow B_i \rightarrow C_i \rightarrow 0$$

over I in \mathcal{A} then the sequence

$$0 \rightarrow \operatorname{colim}_{i \in I} A_i \rightarrow \operatorname{colim}_{i \in I} B_i \rightarrow \operatorname{colim}_{i \in I} C_i \rightarrow 0$$

is exact as well. Without assuming AB5 it is only true in general that the sequence is exact on the right (i.e., taking colimits is a right exact functor if colimits exist). A similar explanation holds for AB4* and AB5*.

19.11. Injectives in Grothendieck categories

The existence of a generator implies that given an object M of a Grothendieck abelian category \mathcal{A} there is a set of subobjects. (This may not be true for a general “big” abelian category.)

Definition 19.11.1. Let \mathcal{A} be a Grothendieck abelian category. Let M be an object of \mathcal{A} . The *size* $|M|$ of M is the cardinality of the set of subobjects of M .

Lemma 19.11.2. Let \mathcal{A} be a Grothendieck abelian category. If $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ is a short exact sequence of \mathcal{A} , then $|M'|, |M''| \leq |M|$.

Proof. Immediate from the definitions. \square

Lemma 19.11.3. Let \mathcal{A} be a Grothendieck abelian category with generator U .

- (1) If $|M| \leq \kappa$, then M is the quotient of a direct sum of at most κ copies of U .
- (2) For every cardinal κ there exists a set of isomorphism classes of objects M with $|M| \leq \kappa$.

Proof. For (1) choose for every proper subobject $M' \subset M$ a morphism $\varphi_{M'} : U \rightarrow M$ whose image is not contained in M' . Then $\bigoplus_{M' \subset M} \varphi_{M'} : \bigoplus_{M' \subset M} U \rightarrow M$ is surjective. It is clear that (1) implies (2). \square

Proposition 19.11.4. Let \mathcal{A} be a Grothendieck abelian category. Let M be an object of \mathcal{A} . Let $\kappa = |M|$. If α is an ordinal whose cofinality is bigger than κ , then M is α -small with respect to injections.

Proof. Please compare with Proposition 19.2.5. We need only show that the map (19.2.0.1) is a surjection. Let $f : M \rightarrow \operatorname{colim} B_\beta$ be a map. Consider the subobjects $\{f^{-1}(B_\beta)\}$ of M , where B_β is considered as a subobject of the colimit $B = \bigcup_\beta B_\beta$. If one of these, say $f^{-1}(B_\beta)$, fills M , then the map factors through B_β .

So suppose to the contrary that all of the $f^{-1}(B_\beta)$ were proper subobjects of M . However, because \mathcal{A} has AB5 we have

$$\operatorname{colim} f^{-1}(B_\beta) = f^{-1}(\operatorname{colim} B_\beta) = M.$$

Now there are at most κ different subobjects of M that occur among the $f^{-1}(B_\alpha)$, by hypothesis. Thus we can find a subset $S \subset \alpha$ of cardinality at most κ such that as β' ranges over S , the $f^{-1}(B_{\beta'})$ range over all the $f^{-1}(B_\alpha)$.

However, S has an upper bound $\tilde{\alpha} < \alpha$ as α has cofinality bigger than κ . In particular, all the $f^{-1}(B_{\beta'})$, $\beta' \in S$ are contained in $f^{-1}(B_{\tilde{\alpha}})$. It follows that $f^{-1}(B_{\tilde{\alpha}}) = M$. In particular, the map f factors through $B_{\tilde{\alpha}}$. \square

Lemma 19.11.5. *Let \mathcal{A} be a Grothendieck abelian category with generator U . An object I of \mathcal{A} is injective if and only if in every commutative diagram*

$$\begin{array}{ccc} M & \longrightarrow & I \\ \downarrow & \nearrow \text{dotted} & \\ U & & \end{array}$$

for $M \subset U$ a subobject, the dotted arrow exists.

Proof. Please see Lemma 19.2.6 for the case of modules. Choose an injection $A \subset B$ and a morphism $\varphi : A \rightarrow I$. Consider the set S of pairs (A', φ') consisting of subobjects $A \subset A' \subset B$ and a morphism $\varphi' : A' \rightarrow I$ extending φ . Define a partial ordering on this set in the obvious manner. Choose a totally ordered subset $T \subset S$. Then

$$A' = \operatorname{colim}_{t \in T} A_t \xrightarrow{\operatorname{colim}_{t \in T} \varphi_t} I$$

is an upper bound. Hence by Zorn's lemma the set S has a maximal element (A', φ') . We claim that $A' = B$. If not, then choose a morphism $\psi : U \rightarrow B$ which does not factor through A' . Set $N = A' \cap \psi(U)$. Set $M = \psi^{-1}(N)$. Then the map

$$M \rightarrow N \rightarrow A' \xrightarrow{\varphi'} I$$

can be extended to a morphism $\chi : U \rightarrow I$. Since $\chi|_{\operatorname{Ker}(\psi)} = 0$ we see that χ factors as

$$U \rightarrow \operatorname{Im}(\psi) \xrightarrow{\varphi''} I$$

Since φ' and φ'' agree on $N = A' \cap \operatorname{Im}(\psi)$ we see that combined they define a morphism $A' + \operatorname{Im}(\psi) \rightarrow I$ contradicting the assumed maximality of A' . \square

Theorem 19.11.6. *Let \mathcal{A} be a Grothendieck abelian category. Then \mathcal{A} has functorial injective embeddings.*

Proof. Please compare with the proof of Theorem 19.2.8. Choose a generator U of \mathcal{A} . For an object M we define $\mathbf{M}(M)$ by the following pushout diagram

$$\begin{array}{ccc} \bigoplus_{N \subset U} \bigoplus_{\varphi \in \operatorname{Hom}(N, M)} N & \longrightarrow & M \\ \downarrow & & \downarrow \\ \bigoplus_{N \subset U} \bigoplus_{\varphi \in \operatorname{Hom}(U, M)} U & \longrightarrow & \mathbf{M}(M). \end{array}$$

Note that $M \rightarrow \mathbf{M}(M)$ is a functor and that there exist functorial injective maps $M \rightarrow \mathbf{M}(M)$. By transfinite induction we define functors $\mathbf{M}_\alpha(M)$ for every ordinal α . Namely, set $\mathbf{M}_0(M) = M$. Given $\mathbf{M}_\alpha(M)$ set $\mathbf{M}_{\alpha+1}(M) = \mathbf{M}(\mathbf{M}_\alpha(M))$. For a limit ordinal β set

$$\mathbf{M}_\beta(M) = \operatorname{colim}_{\alpha < \beta} \mathbf{M}_\alpha(M).$$

Finally, choose an ordinal α whose cofinality is greater than $|U|$, see Sets, Proposition 3.7.2. We claim that $M \rightarrow \mathbf{M}_\alpha(M)$ is the desired functorial injective embedding. Namely, if $N \subset U$ is a subobject and $\varphi : N \rightarrow \mathbf{M}_\alpha(M)$ is a morphism, then we

see that φ factors through $\mathbf{M}_{\alpha'}(M)$ for some $\alpha' < \alpha$ by Proposition 19.11.4. By construction of $\mathbf{M}(-)$ we see that φ extends to a morphism from U into $\mathbf{M}_{\alpha'+1}(M)$ and hence into $\mathbf{M}_\alpha(M)$. By Lemma 19.11.5 we conclude that $\mathbf{M}_\alpha(M)$ is injective. \square

19.12. K-injectives in Grothendieck categories

The material in this section is taken from the paper [Ser03] authored by Serpé. This paper generalizes some of the results of [Spa88] by Spaltenstein to general Grothendieck abelian categories. Our Lemma 19.12.3 is only implicit in the paper by Serpé. Our approach is to mimic Grothendieck’s proof of Theorem 19.11.6.

Lemma 19.12.1. *Let \mathcal{A} be a Grothendieck abelian category with generator U . Let c be the function on cardinals defined by $c(\kappa) = |\bigoplus_{\alpha \in \kappa} U|$. If $\pi : M \rightarrow N$ is a surjection then there exists a subobject $M' \subset M$ which surjects onto N with $|N'| \leq c(|N|)$.*

Proof. For every proper subobject $N' \subset N$ choose a morphism $\varphi_{N'} : U \rightarrow M$ such that $U \rightarrow M \rightarrow N$ does not factor through N' . Set

$$N' = \text{Im} \left(\bigoplus_{N' \subset N} \varphi_{N'} : \bigoplus_{N' \subset N} U \longrightarrow M \right)$$

Then N' works. \square

Lemma 19.12.2. *Let \mathcal{A} be a Grothendieck abelian category. There exists a cardinal κ such that given any acyclic complex M^\bullet we have*

- (1) *if M^\bullet is nonzero, there is a nonzero subcomplex N^\bullet which is bounded above, acyclic, and $|N^n| \leq \kappa$,*
- (2) *there exists a surjection of complexes*

$$\bigoplus_{i \in I} M_i^\bullet \longrightarrow M^\bullet$$

where M_i^\bullet is bounded above, acyclic, and $|M_i^n| \leq \kappa$.

Proof. Choose a generator U of \mathcal{A} . Denote c the function of Lemma 19.12.1. Set $\kappa = \sup\{c^n(|U|), n = 1, 2, 3, \dots\}$. Let $n \in \mathbf{Z}$ and let $\psi : U \rightarrow M^n$ be a morphism. In order to prove (1) and (2) it suffices to prove there exists a subcomplex $N^\bullet \subset M^\bullet$ which is bounded above, acyclic, and $|N^m| \leq \kappa$, such that ψ factors through N^n . To do this set $N^n = \text{Im}(\psi)$, $N^{n+1} = \text{Im}(U \rightarrow M^n \rightarrow M^{n+1})$, and $N^m = 0$ for $m \geq n + 2$. Suppose we have constructed $N^m \subset M^m$ for all $m \geq k$ such that

- (1) $d(N^m) \subset N^{m+1}$, $m \geq k$,
- (2) $\text{Im}(N^{m-1} \rightarrow N^m) = \text{Ker}(N^m \rightarrow N^{m+1})$ for all $m \geq k + 1$, and
- (3) $|N^m| \leq c^{\max\{n-m, 0\}}(|U|)$.

for some $k \leq n$. Because M^\bullet is acyclic, we see that the subobject $d^{-1}(\text{Ker}(N^k \rightarrow N^{k+1})) \subset M^{k-1}$ surjects onto $\text{Ker}(N^k \rightarrow N^{k+1})$. Thus we can choose $N^{k-1} \subset M^{k-1}$ surjecting onto $\text{Ker}(N^k \rightarrow N^{k+1})$ with $|N^{k-1}| \leq c^{n-k+1}(|U|)$ by Lemma 19.12.1. The proof is finished by induction on k . \square

Lemma 19.12.3. *Let \mathcal{A} be a Grothendieck abelian category. Let κ be a cardinal as in Lemma 19.12.2. Suppose that I^\bullet is a complex such that*

- (1) *each I^j is injective, and*
- (2) *for every bounded above acyclic complex M^\bullet such that $|M^n| \leq \kappa$ we have $\text{Hom}_{K(\mathcal{A})}(M^\bullet, I^\bullet) = 0$.*

Then I^\bullet is an K-injective complex.

Proof. Let M^\bullet be an acyclic complex. We are going to construct by induction on the ordinal α an acyclic subcomplex $K_\alpha^\bullet \subset M^\bullet$ as follows. For $\alpha = 0$ we set $N_0^\bullet = 0$. For $\alpha > 0$ we proceed as follows:

- (1) If $\alpha = \beta + 1$ and $K_\beta^\bullet = M^\bullet$ then we choose $K_\alpha^\bullet = K_\beta^\bullet$.
- (2) If $\alpha = \beta + 1$ and $K_\beta^\bullet \neq M^\bullet$ then $M^\bullet/K_\beta^\bullet$ is a nonzero acyclic complex. We choose a subcomplex $N_\alpha^\bullet \subset M^\bullet/K_\beta^\bullet$ as in Lemma 19.12.2. Finally, we let $K_\alpha^\bullet \subset M^\bullet$ be the inverse image of N_α^\bullet .
- (3) If α is a limit ordinal we set $N_\beta^\bullet = \text{colim } N_\alpha^\bullet$.

It is clear that $M^\bullet = K_\alpha^\bullet$ for a suitably large ordinal α . We will prove that

$$\text{Hom}_{K(\mathcal{A})}(K_\alpha^\bullet, I^\bullet)$$

is zero by transfinite induction on α . It holds for $\alpha = 0$ since K_0^\bullet is zero. Suppose it holds for β and $\alpha = \beta + 1$. In case (1) of the list above the result is clear. In case (2) there is a short exact sequence of complexes

$$0 \rightarrow K_\beta^\bullet \rightarrow K_\alpha^\bullet \rightarrow N_\alpha^\bullet \rightarrow 0$$

Since each component of I^\bullet is injective we see that we obtain an exact sequence

$$\text{Hom}_{K(\mathcal{A})}(K_\beta^\bullet, I^\bullet) \rightarrow \text{Hom}_{K(\mathcal{A})}(K_\alpha^\bullet, I^\bullet) \rightarrow \text{Hom}_{K(\mathcal{A})}(N_\alpha^\bullet, I^\bullet)$$

By induction the term on the left is zero and by assumption on I^\bullet the term on the right is zero. Thus the middle group is zero too. Finally, suppose that α is a limit ordinal. Then we see that

$$\text{Hom}^\bullet(K_\alpha^\bullet, I^\bullet) = \lim_{\beta < \alpha} \text{Hom}^\bullet(K_\beta^\bullet, I^\bullet)$$

with notation as in More on Algebra, Section 15.54. These complexes compute morphisms in $K(\mathcal{A})$ by More on Algebra, Equation (15.54.0.1). Note that the transition maps in the system are surjective because I^j is surjective for each j . Moreover, for a limit ordinal α we have equality of limit and value (see displayed formula above). Thus we may apply Homology, Lemma 12.27.8 to conclude. \square

Lemma 19.12.4. *Let \mathcal{A} be a Grothendieck abelian category. Let $(K_i^\bullet)_{i \in I}$ be a set of acyclic complexes. There exists a functor $M^\bullet \mapsto \mathbf{M}^\bullet(M^\bullet)$ and a natural transformation $j_{M^\bullet} : M^\bullet \rightarrow \mathbf{M}^\bullet(M^\bullet)$ such*

- (1) j_{M^\bullet} is a (termwise) injective quasi-isomorphism, and
- (2) for every $i \in I$ and $w : K_i^\bullet \rightarrow M^\bullet$ the morphism $j_{M^\bullet} \circ w$ is homotopic to zero.

Proof. For every $i \in I$ choose a (termwise) injective map of complexes $K_i^\bullet \rightarrow L_i^\bullet$ which is homotopic to zero with L_i^\bullet quasi-isomorphic to zero. For example, take L_i^\bullet to be the cone on the identity of K_i^\bullet . We define $\mathbf{M}^\bullet(M^\bullet)$ by the following pushout diagram

$$\begin{array}{ccc} \bigoplus_{i \in I} \bigoplus_{w:K_i^\bullet \rightarrow M^\bullet} K_i^\bullet & \longrightarrow & M^\bullet \\ \downarrow & & \downarrow \\ \bigoplus_{i \in I} \bigoplus_{w:K_i^\bullet \rightarrow M^\bullet} L_i^\bullet & \longrightarrow & \mathbf{M}^\bullet(M^\bullet). \end{array}$$

Then $M^\bullet \rightarrow \mathbf{M}^\bullet(M^\bullet)$ is a functor. The right vertical arrow defines the functorial injective map j_{M^\bullet} . The cokernel of j_{M^\bullet} is isomorphic to the direct sum of the cokernels of the maps $K_i^\bullet \rightarrow L_i^\bullet$ hence acyclic. Thus j_{M^\bullet} is a quasi-isomorphism. Part (2) holds by construction. \square

Lemma 19.12.5. *Let \mathcal{A} be a Grothendieck abelian category. There exists a functor $M^\bullet \mapsto \mathbf{N}^\bullet(M^\bullet)$ and a natural transformation $j_{M^\bullet} : M^\bullet \rightarrow \mathbf{N}^\bullet(M^\bullet)$ such*

- (1) j_{M^\bullet} is a (termwise) injective quasi-isomorphism, and
- (2) for every $n \in \mathbf{Z}$ the map $M^n \rightarrow \mathbf{N}^n(M^\bullet)$ factors through a subobject $I^n \subset \mathbf{N}^n(M^\bullet)$ where I^n is an injective object of \mathcal{A} .

Proof. Choose a functorial injective embeddings $i_M : M \rightarrow I(M)$, see Theorem 19.11.6. For every complex M^\bullet denote $J^\bullet(M^\bullet)$ the complex with terms $J^n(M^\bullet) = I(M^n) \oplus I(M^{n+1})$ and differential

$$d_{J^\bullet(M^\bullet)} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$$

There exists a canonical injective map of complexes $u_{M^\bullet} : M^\bullet \rightarrow J^\bullet(M^\bullet)$ by mapping M^n to $I(M^n) \oplus I(M^{n+1})$ via the maps $i_{M^n} : M^n \rightarrow I(M^n)$ and $i_{M^{n+1}} \circ d : M^n \rightarrow M^{n+1} \rightarrow I(M^{n+1})$. Hence a short exact sequence of complexes

$$0 \rightarrow M^\bullet \xrightarrow{u_{M^\bullet}} J^\bullet(M^\bullet) \xrightarrow{v_{M^\bullet}} Q^\bullet(M^\bullet) \rightarrow 0$$

functorial in M^\bullet . Set

$$\mathbf{N}^\bullet(M^\bullet) = C(v_{M^\bullet})^\bullet[-1].$$

Note that

$$\mathbf{N}^n(M^\bullet) = Q^{n-1}(M^\bullet) \oplus J^n(M^\bullet)$$

with differential

$$\begin{pmatrix} -d_{Q^\bullet(M^\bullet)}^{n-1} & -v_{M^\bullet}^n \\ 0 & d_{J^\bullet(M^\bullet)}^n \end{pmatrix}$$

Hence we see that there is a map of complexes $j_{M^\bullet} : M^\bullet \rightarrow \mathbf{N}^\bullet(M^\bullet)$ induced by u . It is injective and factors through an injective subobject by construction. The map j_{M^\bullet} is a quasi-isomorphism as one can prove by looking at the long exact sequence of cohomology associated to the short exact sequences of complexes above. \square

Theorem 19.12.6. *Let \mathcal{A} be a Grothendieck abelian category. For every complex M^\bullet there exists a quasi-isomorphism $M^\bullet \rightarrow I^\bullet$ where I^\bullet is a K -injective complex. In fact, we may also assume that I^n is an injective object of \mathcal{A} for all n . Moreover, there exists a functorial injective quasi-isomorphism into such a K -injective complex.*

Proof. Please compare with the proof of Theorem 19.2.8 and Theorem 19.11.6. Choose a cardinal κ as in Lemmas 19.12.2 and 19.12.3. Choose a set $(K_i^\bullet)_{i \in I}$ of bounded above, acyclic complexes such that every bounded above acyclic complex K^\bullet such that $|K^n| \leq \kappa$ is isomorphic to K_i^\bullet for some $i \in I$. This is possible by Lemma 19.11.3. Denote $\mathbf{M}^\bullet(-)$ the functor constructed in Lemma 19.12.4. Denote $\mathbf{N}^\bullet(-)$ the functor constructed in Lemma 19.12.5. Both of these functors come with injective transformations $\text{id} \rightarrow \mathbf{M}$ and $\text{id} \rightarrow \mathbf{N}$.

By transfinite induction we define a sequence of functors $\mathbf{T}_\alpha(-)$ and corresponding transformations $\text{id} \rightarrow \mathbf{T}_\alpha$. Namely we set $\mathbf{T}_0(M^\bullet) = M^\bullet$. If \mathbf{T}_α is given then we set

$$\mathbf{T}_{\alpha+1}(M^\bullet) = \mathbf{N}^\bullet(\mathbf{M}^\bullet(\mathbf{T}_\alpha(M^\bullet)))$$

If β is a limit ordinal we set

$$\mathbf{T}_\beta(M^\bullet) = \text{colim}_{\alpha < \beta} \mathbf{T}_\alpha(M^\bullet)$$

The transition maps of the system are injective quasi-isomorphisms. By AB5 we see that the colimit is still quasi-isomorphic to M^\bullet . We claim that $M^\bullet \rightarrow \mathbf{T}_\alpha(M^\bullet)$ does the job if the cofinality of α is larger than $\max(\kappa, |U|)$ where U is a generator of \mathcal{A} . Namely, it suffices to check conditions (1) and (2) of Lemma 19.12.3.

For (1) we use the criterion of Lemma 19.11.5. Suppose that $M \subset U$ and $\varphi : M \rightarrow \mathbf{T}_\alpha^n(M^\bullet)$ is a morphism for some $n \in \mathbf{Z}$. By Proposition 19.11.4 we see that φ factor through $\mathbf{T}_{\alpha'}^n(M^\bullet)$ for some $\alpha' < \alpha$. In particular, by the construction of the functor $\mathbf{N}^\bullet(-)$ we see that φ factors through an injective object of \mathcal{A} which shows that φ lifts to a morphism on U .

For (2) let $w : K^\bullet \rightarrow \mathbf{T}_\alpha(M^\bullet)$ be a morphism of complexes where K^\bullet is a bounded above acyclic complex such that $|K^n| \leq \kappa$. Then $K^\bullet \cong K_i^\bullet$ for some $i \in I$. Moreover, by Proposition 19.11.4 once again we see that w factor through $\mathbf{T}_{\alpha'}^n(M^\bullet)$ for some $\alpha' < \alpha$. In particular, by the construction of the functor $\mathbf{M}^\bullet(-)$ we see that w is homotopic to zero. This finishes the proof. \square

19.13. Additional remarks on Grothendieck abelian categories

In this section we put some results on Grothendieck abelian categories which are folklore.

Lemma 19.13.1. *Let \mathcal{A} be a Grothendieck abelian category. Let $F : \mathcal{A}^{opp} \rightarrow \mathbf{Sets}$ be a functor. Then F is representable if and only if F commutes with colimits, i.e.,*

$$F(\operatorname{colim}_i N_i) = \lim F(N_i)$$

for any diagram $\mathcal{I} \rightarrow \mathcal{A}$, $i \in \mathcal{I}$.

Proof. If F is representable, then it commutes with colimits by definition of colimits.

Assume that F commutes with colimits. Then $F(M \oplus N) = F(M) \amalg F(N)$ and we can use this to define a group structure on $F(M)$. Hence we get $F : \mathcal{A} \rightarrow \mathbf{Ab}$ which is additive and right exact, i.e., transforms a short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ into an exact sequence $F(K) \leftarrow F(L) \leftarrow F(M) \leftarrow 0$ (compare with Homology, Section 12.7).

Let U be a generator for \mathcal{A} . Set $A = \bigoplus_{s \in F(U)} U$. Let $s_{univ} = (s)_{s \in F(U)} \in F(A) = \prod_{s \in F(U)} F(U)$. Let $A' \subset A$ be the largest subobject such that s_{univ} restricts to zero on A' . This exists because \mathcal{A} is a grothendieck category and because F commutes with colimits. Because F commutes with colimits there exists a unique element $\bar{s}_{univ} \in F(A/A')$ which maps to s_{univ} in $F(A)$. We claim that A/A' represents F , in other words, the Yoneda map

$$\bar{s}_{univ} : h_{A/A'} \longrightarrow F$$

is an isomorphism. Let $M \in \operatorname{Ob}(\mathcal{A})$ and $s \in F(M)$. Consider the surjection

$$c_M : A_M = \bigoplus_{\varphi \in \operatorname{Hom}_{\mathcal{A}}(U, M)} U \longrightarrow M.$$

This gives $F(c_M)(s) = (s_\varphi) \in \prod_\varphi F(U)$. Consider the map

$$\psi : A_M = \bigoplus_{\varphi \in \operatorname{Hom}_{\mathcal{A}}(U, M)} U \longrightarrow \bigoplus_{s \in F(U)} U = A$$

which maps the summand corresponding to φ to the summand corresponding to s_φ by the identity map on U . Then s_{univ} maps to $(s_\varphi)_\varphi$ by construction. In other words the right square in the diagram

$$\begin{array}{ccccc}
 A' & \longrightarrow & A & \xrightarrow{\quad s_{univ} \quad} & F \\
 \uparrow ? & & \uparrow \psi & & \uparrow s \\
 K & \longrightarrow & A_M & \longrightarrow & M
 \end{array}$$

commutes. Let $K = \text{Ker}(A_M \rightarrow M)$. Since s restricts to zero on K we see that $\psi(K) \subset A'$ by definition of A' . Hence there is an induced morphism $M \rightarrow A/A'$. This construction gives an inverse to the map $h_{A/A'}(M) \rightarrow F(M)$ (details omitted). \square

Lemma 19.13.2. *A Grothendieck abelian category has $Ab3^*$.*

Proof. Let $M_i, i \in I$ be a family of objects of \mathcal{A} indexed by a set I . The functor $F = \prod_{i \in I} h_{M_i}$ commutes with colimits. Hence Lemma 19.13.1 applies. \square

Remark 19.13.3. In the chapter on derived categories we consistently work with “small” abelian categories (as is the convention in the Stacks project). For a “big” abelian category \mathcal{A} it isn’t clear that the derived category $D(\mathcal{A})$ exists because it isn’t clear that morphisms in the derived category are sets. In general this isn’t true, see Examples, Lemma 82.52.1. However, if \mathcal{A} is a Grothendieck abelian category, and given K^\bullet, L^\bullet in $K(\mathcal{A})$, then by Theorem 19.12.6 there exists a quasi-isomorphism $L^\bullet \rightarrow I^\bullet$ to a K-injective complex I^\bullet and Derived Categories, Lemma 13.29.2 shows that

$$\text{Hom}_{D(\mathcal{A})}(K^\bullet, L^\bullet) = \text{Hom}_{K(\mathcal{A})}(K^\bullet, I^\bullet)$$

which is a set. Some examples of Grothendieck abelian categories are the category of modules over a ring, or more generally the category of sheaves of modules on a ringed site.

Lemma 19.13.4. *Let \mathcal{A} be a Grothendieck abelian category. Then*

- (1) $D(\mathcal{A})$ has both direct sums and products,
- (2) direct sums are obtained by taking termwise direct sums of any complexes,
- (3) products are obtained by taking termwise products of K-injective complexes.

Proof. Let $K_i^\bullet, i \in I$ be a family of objects of $D(\mathcal{A})$ indexed by a set I . We claim that the termwise direct sum $\bigoplus_{i \in I} K_i^\bullet$ is a direct sum in $D(\mathcal{A})$. Namely, let I^\bullet be a K-injective complex. Then we have

$$\begin{aligned}
 \text{Hom}_{D(\mathcal{A})}\left(\bigoplus_{i \in I} K_i^\bullet, I^\bullet\right) &= \text{Hom}_{K(\mathcal{A})}\left(\bigoplus_{i \in I} K_i^\bullet, I^\bullet\right) \\
 &= \prod_{i \in I} \text{Hom}_{K(\mathcal{A})}(K_i^\bullet, I^\bullet) \\
 &= \prod_{i \in I} \text{Hom}_{D(\mathcal{A})}(K_i^\bullet, I^\bullet)
 \end{aligned}$$

as desired. This is sufficient since any complex can be represented by a K-injective complex by Theorem 19.12.6. To construct the product, choose a K-injective resolution $K_i^\bullet \rightarrow I_i^\bullet$ for each i . Then we claim that $\prod_{i \in I} I_i^\bullet$ is a product in $D(\mathcal{A})$.

Namely, let K^\bullet be an complex. Note that a product of K-injective complexes is K-injective (follows immediately from the definition). Thus we have

$$\begin{aligned} \text{Hom}_{D(\mathcal{A})}(K^\bullet, \prod_{i \in I} I_i^\bullet) &= \text{Hom}_{K(\mathcal{A})}(K^\bullet, \prod_{i \in I} I_i^\bullet) \\ &= \prod_{i \in I} \text{Hom}_{K(\mathcal{A})}(K^\bullet, I_i^\bullet) \\ &= \prod_{i \in I} \text{Hom}_{D(\mathcal{A})}(K^\bullet, I_i^\bullet) \end{aligned}$$

which proves the result. □

Remark 19.13.5. Let R be a ring. Suppose that $M_n, n \in \mathbf{Z}$ are R -modules. Denote $E_n = M_n[-n] \in D(R)$. We claim that $E = \bigoplus M_n[-n]$ is both the direct sum and the product of the objects E_n in $D(R)$. To see that it is the direct sum, take a look at the proof of Lemma 19.13.4. To see that it is the direct product, take injective resolutions $M_n \rightarrow I_n^\bullet$. By the proof of Lemma 19.13.4 we have

$$\prod E_n = \prod I_n^\bullet[-n]$$

in $D(R)$. Since products in Mod_R are exact, we see that $\prod I_n^\bullet$ is quasi-isomorphic to E . This works more generally in $D(\mathcal{A})$ where \mathcal{A} is a Grothendieck abelian category with Ab4^* .

Lemma 19.13.6. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor of abelian categories. Assume*

- (1) \mathcal{A} is a Grothendieck abelian category,
- (2) \mathcal{B} has exact countable products, and
- (3) F commutes with countable products.

Then $RF : D(\mathcal{A}) \rightarrow D(\mathcal{B})$ commutes with derived limits.

Proof. Observe that RF exists as \mathcal{A} has enough K-injectives (Theorem 19.12.6 and Derived Categories, Lemma 13.29.5). The statement means that if $K = R \lim K_n$, then $RF(K) = R \lim RF(K_n)$. See Derived Categories, Definition 13.32.1 for notation. Since RF is an exact functor of triangulated categories it suffices to see that RF commutes with countable products of objects of $D(\mathcal{A})$. In the proof of Lemma 19.13.4 we have seen that products in $D(\mathcal{A})$ are computed by taking products of K-injective complexes and moreover that a product of K-injective complexes is K-injective. Moreover, in Derived Categories, Lemma 13.32.2 we have seen that products in $D(\mathcal{B})$ are computed by taking termwise products. Since RF is computed by applying F to a K-injective representative and since we've assumed F commutes with countable products, the lemma follows. □

Cohomology of Sheaves

20.1. Introduction

In this document we work out some topics on cohomology of sheaves on topological spaces. We mostly work in the generality of modules over a sheaf of rings and we work with morphisms of ringed spaces. To see what happens for sheaves on sites take a look at the chapter Cohomology on Sites, Section 21.1. Basic references are [God73] and [Ive86].

20.2. Topics

Here are some topics that should be discussed in this chapter, and have not yet been written.

- (1) Ext-groups.
- (2) Ext sheaves.
- (3) Tor functors.
- (4) Derived pullback for morphisms between ringed spaces.
- (5) Cup-product.
- (6) Etc, etc, etc.

20.3. Cohomology of sheaves

Let X be a topological space. Let \mathcal{F} be an abelian sheaf. We know that the category of abelian sheaves on X has enough injectives, see Injectives, Lemma 19.4.1. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$. As is customary we define

$$(20.3.0.1) \quad H^i(X, \mathcal{F}) = H^i(\Gamma(X, \mathcal{I}^\bullet))$$

to be the i th cohomology group of the abelian sheaf \mathcal{F} . The family of functors $H^i((X, -))$ forms a universal δ -functor from $Ab(X) \rightarrow Ab$.

Let $f : X \rightarrow Y$ be a continuous map of topological spaces. With $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$ as above we define

$$(20.3.0.2) \quad R^i f_* \mathcal{F} = H^i(f_* \mathcal{I}^\bullet)$$

to be the i th higher direct image of \mathcal{F} . The family of functors $R^i f_*$ forms a universal δ -functor from $Ab(X) \rightarrow Ab(Y)$.

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module. We know that the category of \mathcal{O}_X -modules on X has enough injectives, see Injectives, Lemma 19.5.1. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$. As is customary we define

$$(20.3.0.3) \quad H^i(X, \mathcal{F}) = H^i(\Gamma(X, \mathcal{I}^\bullet))$$

to be the i th cohomology group of \mathcal{F} . The family of functors $H^i((X, -))$ forms a universal δ -functor from $Mod(\mathcal{O}_X) \rightarrow Mod_{\mathcal{O}_X(X)}$.

Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. With $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$ as above we define

$$(20.3.0.4) \quad R^i f_* \mathcal{F} = H^i(f_* \mathcal{I}^\bullet)$$

to be the i th higher direct image of \mathcal{F} . The family of functors $R^i f_*$ forms a universal δ -functor from $\text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_Y)$.

20.4. Derived functors

We briefly explain an approach to right derived functors using resolution functors. Let (X, \mathcal{O}_X) be a ringed space. The category $\text{Mod}(\mathcal{O}_X)$ is abelian, see Modules, Lemma 17.3.1. In this chapter we will write

$$K(X) = K(\mathcal{O}_X) = K(\text{Mod}(\mathcal{O}_X)) \quad \text{and} \quad D(X) = D(\mathcal{O}_X) = D(\text{Mod}(\mathcal{O}_X)).$$

and similarly for the bounded versions for the triangulated categories introduced in Derived Categories, Definition 13.8.1 and Definition 13.11.3. By Derived Categories, Remark 13.24.3 there exists a resolution functor

$$j = j_X : K^+(\text{Mod}(\mathcal{O}_X)) \longrightarrow K^+(\mathcal{I})$$

where \mathcal{I} is the strictly full additive subcategory of $\text{Mod}(\mathcal{O}_X)$ consisting of injective sheaves. For any left exact functor $F : \text{Mod}(\mathcal{O}_X) \rightarrow \mathcal{B}$ into any abelian category \mathcal{B} we will denote RF the right derived functor described in Derived Categories, Section 13.20 and constructed using the resolution functor j_X just described:

$$(20.4.0.5) \quad RF = F \circ j'_X : D^+(X) \longrightarrow D^+(\mathcal{B})$$

see Derived Categories, Lemma 13.25.1 for notation. Note that we may think of RF as defined on $\text{Mod}(\mathcal{O}_X)$, $\text{Comp}^+(\text{Mod}(\mathcal{O}_X))$, $K^+(X)$, or $D^+(X)$ depending on the situation. According to Derived Categories, Definition 13.17.2 we obtain the i th right derived functor

$$(20.4.0.6) \quad R^i F = H^i \circ RF : \text{Mod}(\mathcal{O}_X) \longrightarrow \mathcal{B}$$

so that $R^0 F = F$ and $\{R^i F, \delta\}_{i \geq 0}$ is universal δ -functor, see Derived Categories, Lemma 13.20.4.

Here are two special cases of this construction. Given a ring R we write $K(R) = K(\text{Mod}_R)$ and $D(R) = D(\text{Mod}_R)$ and similarly for bounded versions. For any open $U \subset X$ we have a left exact functor $\Gamma(U, -) : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}_{\mathcal{O}_X(U)}$ which gives rise to

$$(20.4.0.7) \quad R\Gamma(U, -) : D^+(X) \longrightarrow D^+(\mathcal{O}_X(U))$$

by the discussion above. We set $H^i(U, -) = R^i \Gamma(U, -)$. If $U = X$ we recover (20.3.0.3). If $f : X \rightarrow Y$ is a morphism of ringed spaces, then we have the left exact functor $f_* : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_Y)$ which gives rise to the *derived pushforward*

$$(20.4.0.8) \quad Rf_* : D^+(X) \longrightarrow D^+(Y)$$

The i th cohomology sheaf of $Rf_* \mathcal{F}^\bullet$ is denoted $R^i f_* \mathcal{F}^\bullet$ and called the i th higher direct image in accordance with (20.3.0.4). The two displayed functors above are exact functor of derived categories.

Abuse of notation: When the functor Rf_* , or any other derived functor, is applied to a sheaf \mathcal{F} on X or a complex of sheaves it is understood that \mathcal{F} has been replaced by a suitable resolution of \mathcal{F} . To facilitate this kind of operation we will say, given an object $\mathcal{F}^\bullet \in D(X)$, that a bounded below complex \mathcal{I}^\bullet of injectives of

$Mod(\mathcal{O}_X)$ represents \mathcal{F}^\bullet in the derived category if there exists a quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$. In the same vein the phrase “let $\alpha : \mathcal{F}^\bullet \rightarrow \mathcal{G}^\bullet$ be a morphism of $D(X)$ ” does not mean that α is represented by a morphism of complexes. If we have an actual morphism of complexes we will say so.

20.5. First cohomology and torsors

Definition 20.5.1. Let X be a topological space. Let \mathcal{G} be a sheaf of (possibly non-commutative) groups on X . A *torsor*, or more precisely a \mathcal{G} -torsor, is a sheaf of sets \mathcal{F} on X endowed with an action $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$ such that

- (1) whenever $\mathcal{F}(U)$ is nonempty the action $\mathcal{G}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ is simply transitive, and
- (2) for every $x \in X$ the stalk \mathcal{F}_x is nonempty.

A *morphism of \mathcal{G} -torsors* $\mathcal{F} \rightarrow \mathcal{F}'$ is simply a morphism of sheaves of sets compatible with the \mathcal{G} -actions. The *trivial \mathcal{G} -torsor* is the sheaf \mathcal{G} endowed with the obvious left \mathcal{G} -action.

It is clear that a morphism of torsors is automatically an isomorphism.

Lemma 20.5.2. *Let X be a topological space. Let \mathcal{G} be a sheaf of (possibly non-commutative) groups on X . A \mathcal{G} -torsor \mathcal{F} is trivial if and only if $\mathcal{F}(X) \neq \emptyset$.*

Proof. Omitted. □

Lemma 20.5.3. *Let X be a topological space. Let \mathcal{H} be an abelian sheaf on X . There is a canonical bijection between the set of isomorphism classes of \mathcal{H} -torsors and $H^1(X, \mathcal{H})$.*

Proof. Let \mathcal{F} be a \mathcal{H} -torsor. Consider the free abelian sheaf $\mathbf{Z}[\mathcal{F}]$ on \mathcal{F} . It is the sheafification of the rule which associates to $U \subset X$ open the collection of finite formal sums $\sum n_i[s_i]$ with $n_i \in \mathbf{Z}$ and $s_i \in \mathcal{F}(U)$. There is a natural map

$$\sigma : \mathbf{Z}[\mathcal{F}] \longrightarrow \underline{\mathbf{Z}}$$

which to a local section $\sum n_i[s_i]$ associates $\sum n_i$. The kernel of σ is generated by the local section of the form $[s] - [s']$. There is a canonical map $a : \text{Ker}(\sigma) \rightarrow \mathcal{H}$ which maps $[s] - [s'] \mapsto h$ where h is the local section of \mathcal{H} such that $h \cdot s = s'$. Consider the pushout diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(\sigma) & \longrightarrow & \mathbf{Z}[\mathcal{F}] & \longrightarrow & \underline{\mathbf{Z}} \longrightarrow 0 \\ & & \downarrow a & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{H} & \longrightarrow & \mathcal{E} & \longrightarrow & \underline{\mathbf{Z}} \longrightarrow 0 \end{array}$$

Here \mathcal{E} is the extension obtained by pushout. From the long exact cohomology sequence associated to the lower short exact sequence we obtain an element $\xi = \xi_{\mathcal{F}} \in H^1(X, \mathcal{H})$ by applying the boundary operator to $1 \in H^0(X, \underline{\mathbf{Z}})$.

Conversely, given $\xi \in H^1(X, \mathcal{H})$ we can associate to ξ a torsor as follows. Choose an embedding $\mathcal{H} \rightarrow \mathcal{I}$ of \mathcal{H} into an injective abelian sheaf \mathcal{I} . We set $\mathcal{Q} = \mathcal{I}/\mathcal{H}$ so that we have a short exact sequence

$$0 \longrightarrow \mathcal{H} \longrightarrow \mathcal{I} \longrightarrow \mathcal{Q} \longrightarrow 0$$

The element ξ is the image of a global section $q \in H^0(X, \mathcal{Q})$ because $H^1(X, \mathcal{I}) = 0$ (see Derived Categories, Lemma 13.20.4). Let $\mathcal{F} \subset \mathcal{I}$ be the subsheaf (of sets) of sections that map to q in the sheaf \mathcal{Q} . It is easy to verify that \mathcal{F} is a torsor.

We omit the verification that the two constructions given above are mutually inverse. □

20.6. First cohomology and invertible sheaves

The Picard group of a ringed space is defined in Modules, Section 17.21.

Lemma 20.6.1. *Let (X, \mathcal{O}_X) be a ringed space. There is a canonical isomorphism*

$$H^1(X, \mathcal{O}_X^*) = \text{Pic}(X).$$

of abelian groups.

Proof. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Consider the presheaf \mathcal{L}^* defined by the rule

$$U \mapsto \{s \in \mathcal{L}(U) \text{ such that } \mathcal{O}_U \xrightarrow{s \cdot} \mathcal{L}_U \text{ is an isomorphism}\}$$

This presheaf satisfies the sheaf condition. Moreover, if $f \in \mathcal{O}_X^*(U)$ and $s \in \mathcal{L}^*(U)$, then clearly $fs \in \mathcal{L}^*(U)$. By the same token, if $s, s' \in \mathcal{L}^*(U)$ then there exists a unique $f \in \mathcal{O}_X^*(U)$ such that $fs = s'$. Moreover, the sheaf \mathcal{L}^* has sections locally by the very definition of an invertible sheaf. In other words we see that \mathcal{L}^* is a \mathcal{O}_X^* -torsor. Thus we get a map

$$\begin{array}{ccc} \text{invertible sheaves on } (X, \mathcal{O}_X) & \longrightarrow & \mathcal{O}_X^*\text{-torsors} \\ \text{up to isomorphism} & & \text{up to isomorphism} \end{array}$$

We omit the verification that this is a homomorphism of abelian groups. By Lemma 20.5.3 the right hand side is canonically bijective to $H^1(X, \mathcal{O}_X^*)$. Thus we have to show this map is injective and surjective.

Injective. If the torsor \mathcal{L}^* is trivial, this means by Lemma 20.5.2 that \mathcal{L}^* has a global section. Hence this means exactly that $\mathcal{L} \cong \mathcal{O}_X$ is the neutral element in $\text{Pic}(X)$.

Surjective. Let \mathcal{F} be an \mathcal{O}_X^* -torsor. Consider the presheaf of sets

$$\mathcal{L}_1 : U \mapsto (\mathcal{F}(U) \times \mathcal{O}_X(U)) / \mathcal{O}_X^*(U)$$

where the action of $f \in \mathcal{O}_X^*(U)$ on (s, g) is $(fs, f^{-1}g)$. Then \mathcal{L}_1 is a presheaf of \mathcal{O}_X -modules by setting $(s, g) + (s', g') = (s, g + (s'/s)g')$ where s'/s is the local section f of \mathcal{O}_X^* such that $fs = s'$, and $h(s, g) = (s, hg)$ for h a local section of \mathcal{O}_X . We omit the verification that the sheafification $\mathcal{L} = \mathcal{L}_1^\#$ is an invertible \mathcal{O}_X -module whose associated \mathcal{O}_X^* -torsor \mathcal{L}^* is isomorphic to \mathcal{F} . □

20.7. Locality of cohomology

The following lemma says there is no ambiguity in defining the cohomology of a sheaf \mathcal{F} over an open.

Lemma 20.7.1. *Let X be a ringed space. Let $U \subset X$ be an open subspace.*

- (1) *If \mathcal{I} is an injective \mathcal{O}_X -module then $\mathcal{I}|_U$ is an injective \mathcal{O}_U -module.*
- (2) *For any sheaf of \mathcal{O}_X -modules \mathcal{F} we have $H^p(U, \mathcal{F}) = H^p(U, \mathcal{F}|_U)$.*

Proof. Denote $j : U \rightarrow X$ the open immersion. Recall that the functor j^{-1} of restriction to U is a right adjoint to the functor $j_!$ of extension by 0, see Sheaves, Lemma 6.31.8. Moreover, $j_!$ is exact. Hence (1) follows from Homology, Lemma 12.25.1.

By definition $H^p(U, \mathcal{F}) = H^p(\Gamma(U, \mathcal{I}^\bullet))$ where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $\text{Mod}(\mathcal{O}_X)$. By the above we see that $\mathcal{F}|_U \rightarrow \mathcal{I}^\bullet|_U$ is an injective resolution in $\text{Mod}(\mathcal{O}_U)$. Hence $H^p(U, \mathcal{F}|_U)$ is equal to $H^p(\Gamma(U, \mathcal{I}^\bullet|_U))$. Of course $\Gamma(U, \mathcal{F}) = \Gamma(U, \mathcal{F}|_U)$ for any sheaf \mathcal{F} on X . Hence the equality in (2). \square

Let X be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let $U \subset V \subset X$ be open subsets. Then there is a canonical *restriction mapping*

$$(20.7.1.1) \quad H^n(V, \mathcal{F}) \longrightarrow H^n(U, \mathcal{F}), \quad \xi \longmapsto \xi|_U$$

functorial in \mathcal{F} . Namely, choose any injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. The restriction mappings of the sheaves \mathcal{I}^p give a morphism of complexes

$$\Gamma(V, \mathcal{I}^\bullet) \longrightarrow \Gamma(U, \mathcal{I}^\bullet)$$

The LHS is a complex representing $R\Gamma(V, \mathcal{F})$ and the RHS is a complex representing $R\Gamma(U, \mathcal{F})$. We get the map on cohomology groups by applying the functor H^n . As indicated we will use the notation $\xi \mapsto \xi|_U$ to denote this map. Thus the rule $U \mapsto H^n(U, \mathcal{F})$ is a presheaf of \mathcal{O}_X -modules. This presheaf is customarily denoted $\underline{H}^n(\mathcal{F})$. We will give another interpretation of this presheaf in Lemma 20.12.3.

Lemma 20.7.2. *Let X be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let $U \subset X$ be an open subspace. Let $n > 0$ and let $\xi \in H^n(U, \mathcal{F})$. Then there exists an open covering $U = \bigcup_{i \in I} U_i$ such that $\xi|_{U_i} = 0$ for all $i \in I$.*

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Then

$$H^n(U, \mathcal{F}) = \frac{\text{Ker}(\mathcal{I}^n(U) \rightarrow \mathcal{I}^{n+1}(U))}{\text{Im}(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^n(U))}.$$

Pick an element $\tilde{\xi} \in \mathcal{I}^n(U)$ representing the cohomology class in the presentation above. Since \mathcal{I}^\bullet is an injective resolution of \mathcal{F} and $n > 0$ we see that the complex \mathcal{I}^\bullet is exact in degree n . Hence $\text{Im}(\mathcal{I}^{n-1} \rightarrow \mathcal{I}^n) = \text{Ker}(\mathcal{I}^n \rightarrow \mathcal{I}^{n+1})$ as sheaves. Since $\tilde{\xi}$ is a section of the kernel sheaf over U we conclude there exists an open covering $U = \bigcup_{i \in I} U_i$ such that $\tilde{\xi}|_{U_i}$ is the image under d of a section $\xi_i \in \mathcal{I}^{n-1}(U_i)$. By our definition of the restriction $\xi|_{U_i}$ as corresponding to the class of $\tilde{\xi}|_{U_i}$ we conclude. \square

Lemma 20.7.3. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F} be a \mathcal{O}_X -module. The sheaves $R^i f_* \mathcal{F}$ are the sheaves associated to the presheaves*

$$V \longmapsto H^i(f^{-1}(V), \mathcal{F})$$

with restriction mappings as in Equation (20.7.1.1). There is a similar statement for $R^i f_$ applied to a bounded below complex \mathcal{F}^\bullet .*

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Then $R^i f_* \mathcal{F}$ is by definition the i th cohomology sheaf of the complex

$$f_* \mathcal{I}^0 \rightarrow f_* \mathcal{I}^1 \rightarrow f_* \mathcal{I}^2 \rightarrow \dots$$

By definition of the abelian category structure on \mathcal{O}_Y -modules this cohomology sheaf is the sheaf associated to the presheaf

$$V \mapsto \frac{\text{Ker}(f_*\mathcal{I}^i(V) \rightarrow f_*\mathcal{I}^{i+1}(V))}{\text{Im}(f_*\mathcal{I}^{i-1}(V) \rightarrow f_*\mathcal{I}^i(V))}$$

and this is obviously equal to

$$\frac{\text{Ker}(\mathcal{I}^i(f^{-1}(V)) \rightarrow \mathcal{I}^{i+1}(f^{-1}(V)))}{\text{Im}(\mathcal{I}^{i-1}(f^{-1}(V)) \rightarrow \mathcal{I}^i(f^{-1}(V)))}$$

which is equal to $H^i(f^{-1}(V), \mathcal{F})$ and we win. □

Lemma 20.7.4. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F} be an \mathcal{O}_X -module. Let $V \subset Y$ be an open subspace. Denote $g : f^{-1}(V) \rightarrow V$ the restriction of f . Then we have*

$$R^p g_*(\mathcal{F}|_{f^{-1}(V)}) = (R^p f_*\mathcal{F})|_V$$

There is a similar statement for the derived image $Rf_\mathcal{F}^\bullet$ where \mathcal{F}^\bullet is a bounded below complex of \mathcal{O}_X -modules.*

Proof. First proof. Apply Lemmas 20.7.3 and 20.7.1 to see the displayed equality. Second proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ and use that $\mathcal{F}|_{f^{-1}(V)} \rightarrow \mathcal{I}^\bullet|_{f^{-1}(V)}$ is an injective resolution also. □

Remark 20.7.5. Here is a different approach to the proofs of Lemmas 20.7.2 and 20.7.3 above. Let (X, \mathcal{O}_X) be a ringed space. Let $i_X : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_X)$ be the inclusion functor and let $\#$ be the sheafification functor. Recall that i_X is left exact and $\#$ is exact.

- (1) First prove Lemma 20.12.3 below which says that the right derived functors of i_X are given by $R^p i_X \mathcal{F} = \underline{H}^p(\mathcal{F})$. Here is another proof: The equality is clear for $p = 0$. Both $(R^p i_X)_{p \geq 0}$ and $(\underline{H}^p)_{p \geq 0}$ are delta functors vanishing on injectives, hence both are universal, hence they are isomorphic. See Homology, Section 12.11.
- (2) A restatement of Lemma 20.7.2 is that $(\underline{H}^p(\mathcal{F}))^\# = 0, p > 0$ for any sheaf of \mathcal{O}_X -modules \mathcal{F} . To see this is true, use that $\#$ is exact so

$$(\underline{H}^p(\mathcal{F}))^\# = (R^p i_X \mathcal{F})^\# = R^p(\# \circ i_X)(\mathcal{F}) = 0$$

because $\# \circ i_X$ is the identity functor.

- (3) Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F} be an \mathcal{O}_X -module. The presheaf $V \mapsto H^p(f^{-1}V, \mathcal{F})$ is equal to $R^p(i_Y \circ f_*)\mathcal{F}$. You can prove this by noticing that both give universal delta functors as in the argument of (1) above. Hence Lemma 20.7.3 says that $R^p f_*\mathcal{F} = (R^p(i_Y \circ f_*)\mathcal{F})^\#$. Again using that $\#$ is exact a that $\# \circ i_Y$ is the identity functor we see that

$$R^p f_*\mathcal{F} = R^p(\# \circ i_Y \circ f_*)\mathcal{F} = (R^p(i_Y \circ f_*)\mathcal{F})^\#$$

as desired.

20.8. Projection formula

In this section we collect variants of the projection formula. The most basic version is Lemma 20.8.2.

Lemma 20.8.1. *Let X be a ringed space. Let \mathcal{I} be an injective \mathcal{O}_X -module. Let \mathcal{E} be an \mathcal{O}_X -module. Assume \mathcal{E} is finite locally free on X , see Modules, Definition 17.14.1. Then $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{I}$ is an injective \mathcal{O}_X -module.*

Proof. This is true because under the assumptions of the lemma we have

$$\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{I}) = \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{E}^\wedge, \mathcal{I})$$

where $\mathcal{E}^\wedge = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{O}_X)$ is the dual of \mathcal{E} which is finite locally free also. Since tensoring with a finite locally free sheaf is an exact functor we win by Homology, Lemma 12.23.2. \square

Lemma 20.8.2. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F} be an \mathcal{O}_X -module. Let \mathcal{E} be an \mathcal{O}_Y -module. Assume \mathcal{E} is finite locally free on Y , see Modules, Definition 17.14.1. Then there exist isomorphisms*

$$\mathcal{E} \otimes_{\mathcal{O}_Y} R^q f_* \mathcal{F} \longrightarrow R^q f_*(f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F})$$

for all $q \geq 0$. In fact there exists an isomorphism

$$\mathcal{E} \otimes_{\mathcal{O}_Y} Rf_* \mathcal{F} \longrightarrow Rf_*(f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F})$$

in $D^+(Y)$ functorial in \mathcal{F} .

Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ on X . Note that $f^* \mathcal{E}$ is finite locally free also, hence we get a resolution

$$f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F} \longrightarrow f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{I}^\bullet$$

which is an injective resolution by Lemma 20.8.1. Apply f_* to see that

$$Rf_*(f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) = f_*(f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{I}^\bullet).$$

Hence the lemma follows if we can show that $f_*(f^* \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) = \mathcal{E} \otimes_{\mathcal{O}_Y} f_*(\mathcal{F})$ functorially in the \mathcal{O}_X -module \mathcal{F} . This is clear when $\mathcal{E} = \mathcal{O}_Y^{\oplus n}$, and follows in general by working locally on Y . Details omitted. \square

20.9. Mayer-Vietoris

Below will construct the Čech-to-cohomology spectral sequence, see Lemma 20.12.4. A special case of that spectral sequence is the Mayer-Vietoris long exact sequence. Since it is such a basic, useful and easy to understand variant of the spectral sequence we treat it here separately.

Lemma 20.9.1. *Let X be a ringed space. Let $U' \subset U \subset X$ be open subspaces. For any injective \mathcal{O}_X -module \mathcal{I} the restriction mapping $\mathcal{I}(U) \rightarrow \mathcal{I}(U')$ is surjective.*

Proof. Let $j : U \rightarrow X$ and $j' : U' \rightarrow X$ be the open immersions. Recall that $j_! \mathcal{O}_U$ is the extension by zero of $\mathcal{O}_U = \mathcal{O}_X|_U$, see Sheaves, Section 6.31. Since $j_!$ is a left adjoint to restriction we see that for any sheaf \mathcal{F} of \mathcal{O}_X -modules

$$\mathrm{Hom}_{\mathcal{O}_X}(j_! \mathcal{O}_U, \mathcal{F}) = \mathrm{Hom}_{\mathcal{O}_U}(\mathcal{O}_U, \mathcal{F}|_U) = \mathcal{F}(U)$$

see Sheaves, Lemma 6.31.8. Similarly, the sheaf $j'_! \mathcal{O}_{U'}$ represents the functor $\mathcal{F} \mapsto \mathcal{F}(U')$. Moreover there is an obvious canonical map of \mathcal{O}_X -modules

$$j'_! \mathcal{O}_{U'} \longrightarrow j_! \mathcal{O}_U$$

which corresponds to the restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}(U')$ via Yoneda's lemma (Categories, Lemma 4.3.5). By the description of the stalks of the sheaves $j'_! \mathcal{O}_{U'}$, $j_! \mathcal{O}_U$ we see that the displayed map above is injective (see lemma cited above). Hence if \mathcal{I} is an injective \mathcal{O}_X -module, then the map

$$\mathrm{Hom}_{\mathcal{O}_X}(j_! \mathcal{O}_U, \mathcal{I}) \longrightarrow \mathrm{Hom}_{\mathcal{O}_X}(j'_! \mathcal{O}_{U'}, \mathcal{I})$$

is surjective, see Homology, Lemma 12.23.2. Putting everything together we obtain the lemma. \square

Lemma 20.9.2 (Mayer-Vietoris). *Let X be a ringed space. Suppose that $X = U \cup V$ is a union of two open subsets. For every \mathcal{O}_X -module \mathcal{F} there exists a long exact cohomology sequence*

$$0 \rightarrow H^0(X, \mathcal{F}) \rightarrow H^0(U, \mathcal{F}) \oplus H^0(V, \mathcal{F}) \rightarrow H^0(U \cap V, \mathcal{F}) \rightarrow H^1(X, \mathcal{F}) \rightarrow \dots$$

This long exact sequence is functorial in \mathcal{F} .

Proof. The sheaf condition says that the kernel of $(1, -1) : \mathcal{F}(U) \oplus \mathcal{F}(V) \rightarrow \mathcal{F}(U \cap V)$ is equal to the image of $\mathcal{F}(X)$ by the first map for any abelian sheaf \mathcal{F} . Lemma 20.9.1 above implies that the map $(1, -1) : \mathcal{I}(U) \oplus \mathcal{I}(V) \rightarrow \mathcal{I}(U \cap V)$ is surjective whenever \mathcal{I} is an injective \mathcal{O}_X -module. Hence if $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution of \mathcal{F} , then we get a short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet(X) \rightarrow \mathcal{I}^\bullet(U) \oplus \mathcal{I}^\bullet(V) \rightarrow \mathcal{I}^\bullet(U \cap V) \rightarrow 0.$$

Taking cohomology gives the result (use Homology, Lemma 12.12.12). We omit the proof of the functoriality of the sequence. \square

Lemma 20.9.3 (Relative Mayer-Vietoris). *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Suppose that $X = U \cup V$ is a union of two open subsets. Denote $a = f|_U : U \rightarrow Y$, $b = f|_V : V \rightarrow Y$, and $c = f|_{U \cap V} : U \cap V \rightarrow Y$. For every \mathcal{O}_X -module \mathcal{F} there exists a long exact sequence*

$$0 \rightarrow f_* \mathcal{F} \rightarrow a_*(\mathcal{F}|_U) \oplus b_*(\mathcal{F}|_V) \rightarrow c_*(\mathcal{F}|_{U \cap V}) \rightarrow R^1 f_* \mathcal{F} \rightarrow \dots$$

This long exact sequence is functorial in \mathcal{F} .

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution of \mathcal{F} . We claim that we get a short exact sequence of complexes

$$0 \rightarrow f_* \mathcal{I}^\bullet \rightarrow a_* \mathcal{I}^\bullet|_U \oplus b_* \mathcal{I}^\bullet|_V \rightarrow c_* \mathcal{I}^\bullet|_{U \cap V} \rightarrow 0.$$

Namely, for any open $W \subset Y$, and for any $n \geq 0$ the corresponding sequence of groups of sections over W

$$0 \rightarrow \mathcal{I}^n(f^{-1}(W)) \rightarrow \mathcal{I}^n(U \cap f^{-1}(W)) \oplus \mathcal{I}^n(V \cap f^{-1}(W)) \rightarrow \mathcal{I}^n(U \cap V \cap f^{-1}(W)) \rightarrow 0$$

was shown to be short exact in the proof of Lemma 20.9.2. The lemma follows by taking cohomology sheaves and using the fact that $\mathcal{I}^\bullet|_U$ is an injective resolution of $\mathcal{F}|_U$ and similarly for $\mathcal{I}^\bullet|_V$, $\mathcal{I}^\bullet|_{U \cap V}$ see Lemma 20.7.1. \square

20.10. The Čech complex and Čech cohomology

Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering, see Topology, Basic notion (10). As is customary we denote $U_{i_0 \dots i_p} = U_{i_0} \cap \dots \cap U_{i_p}$ for the $(p+1)$ -fold intersection of members of \mathcal{U} . Let \mathcal{F} be an abelian presheaf on X . Set

$$\check{C}^p(\mathcal{U}, \mathcal{F}) = \prod_{(i_0, \dots, i_p) \in I^{p+1}} \mathcal{F}(U_{i_0 \dots i_p}).$$

This is an abelian group. For $s \in \check{C}^p(\mathcal{U}, \mathcal{F})$ we denote $s_{i_0 \dots i_p}$ its value in $\mathcal{F}(U_{i_0 \dots i_p})$. Note that if $s \in \check{C}^1(\mathcal{U}, \mathcal{F})$ and $i, j \in I$ then s_{ij} and s_{ji} are both elements of $\mathcal{F}(U_i \cap U_j)$ but there is no imposed relation between s_{ij} and s_{ji} . In other words, we are *not* working with alternating cochains (these will be defined in Section 20.24). We define

$$d : \check{C}^p(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}^{p+1}(\mathcal{U}, \mathcal{F})$$

by the formula

$$(20.10.0.1) \quad d(s)_{i_0 \dots i_{p+1}} = \sum_{j=0}^{p+1} (-1)^j s_{i_0 \dots \hat{i}_j \dots i_{p+1}}|_{U_{i_0 \dots i_{p+1}}}$$

It is straightforward to see that $d \circ d = 0$. In other words $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$ is a complex.

Definition 20.10.1. Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Let \mathcal{F} be an abelian presheaf on X . The complex $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$ is the *Čech complex* associated to \mathcal{F} and the open covering \mathcal{U} . Its cohomology groups $H^i(\check{C}^\bullet(\mathcal{U}, \mathcal{F}))$ are called the *Čech cohomology groups* associated to \mathcal{F} and the covering \mathcal{U} . They are denoted $\check{H}^i(\mathcal{U}, \mathcal{F})$.

Lemma 20.10.2. *Let X be a topological space. Let \mathcal{F} be an abelian presheaf on X . The following are equivalent*

- (1) \mathcal{F} is an abelian sheaf and
- (2) for every open covering $\mathcal{U} : U = \bigcup_{i \in I} U_i$ the natural map

$$\mathcal{F}(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{F})$$

is bijective.

Proof. This is true since the sheaf condition is exactly that $\mathcal{F}(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{F})$ is bijective for every open covering. \square

20.11. Čech cohomology as a functor on presheaves

Warning: In this section we work almost exclusively with presheaves and categories of presheaves and the results are completely wrong in the setting of sheaves and categories of sheaves!

Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Let \mathcal{F} be a presheaf of \mathcal{O}_X -modules. We have the Čech complex $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$ of \mathcal{F} just by thinking of \mathcal{F} as a presheaf of abelian groups. However, each term $\check{C}^p(\mathcal{U}, \mathcal{F})$ has a natural structure of a $\mathcal{O}_X(U)$ -module and the differential is given by $\mathcal{O}_X(U)$ -module maps. Moreover, it is clear that the construction

$$\mathcal{F} \longmapsto \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

is functorial in \mathcal{F} . In fact, it is a functor

$$(20.11.0.1) \quad \check{C}^\bullet(\mathcal{U}, -) : PMod(\mathcal{O}_X) \longrightarrow \text{Comp}^+(\text{Mod}_{\mathcal{O}_X(U)})$$

see Derived Categories, Definition 13.8.1 for notation. Recall that the category of bounded below complexes in an abelian category is an abelian category, see Homology, Lemma 12.12.9.

Lemma 20.11.1. *The functor given by Equation (20.11.0.1) is an exact functor (see Homology, Lemma 12.7.1).*

Proof. For any open $W \subset U$ the functor $\mathcal{F} \mapsto \mathcal{F}(W)$ is an additive exact functor from $PMod(\mathcal{O}_X)$ to $Mod_{\mathcal{O}_X(U)}$. The terms $\check{C}^p(\mathcal{U}, \mathcal{F})$ of the complex are products of these exact functors and hence exact. Moreover a sequence of complexes is exact if and only if the sequence of terms in a given degree is exact. Hence the lemma follows. \square

Lemma 20.11.2. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. The functors $\mathcal{F} \mapsto \check{H}^n(\mathcal{U}, \mathcal{F})$ form a δ -functor from the abelian category of presheaves of \mathcal{O}_X -modules to the category of $\mathcal{O}_X(U)$ -modules (see Homology, Definition 12.11.1).*

Proof. By Lemma 20.11.1 a short exact sequence of presheaves of \mathcal{O}_X -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ is turned into a short exact sequence of complexes of $\mathcal{O}_X(U)$ -modules. Hence we can use Homology, Lemma 12.12.12 to get the boundary maps $\delta_{\mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3} : \check{H}^n(\mathcal{U}, \mathcal{F}_3) \rightarrow \check{H}^{n+1}(\mathcal{U}, \mathcal{F}_1)$ and a corresponding long exact sequence. We omit the verification that these maps are compatible with maps between short exact sequences of presheaves. \square

In the formulation of the following lemma we use the functor $j_{p!}$ of extension by 0 for presheaves of modules relative to an open immersion $j : U \rightarrow X$. See Sheaves, Section 6.31. For any open $W \subset X$ and any presheaf \mathcal{G} of $\mathcal{O}_X|_U$ -modules we have

$$(j_{p!}\mathcal{G})(W) = \begin{cases} \mathcal{G}(W) & \text{if } W \subset U \\ 0 & \text{else.} \end{cases}$$

Moreover, the functor $j_{p!}$ is a left adjoint to the restriction functor see Sheaves, Lemma 6.31.8. In particular we have the following formula

$$\text{Hom}_{\mathcal{O}_X}(j_{p!}\mathcal{O}_U, \mathcal{F}) = \text{Hom}_{\mathcal{O}_U}(\mathcal{O}_U, \mathcal{F}|_U) = \mathcal{F}(U).$$

Since the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ is an exact functor on the category of presheaves we conclude that the presheaf $j_{p!}\mathcal{O}_U$ is a projective object in the category $PMod(\mathcal{O}_X)$, see Homology, Lemma 12.24.2.

Note that if we are given open subsets $U \subset V \subset X$ with associated open immersions j_U, j_V , then we have a canonical map $(j_U)_{p!}\mathcal{O}_U \rightarrow (j_V)_{p!}\mathcal{O}_V$. It is the identity on sections over any open $W \subset U$ and 0 else. In terms of the identification $\text{Hom}_{\mathcal{O}_X}((j_U)_{p!}\mathcal{O}_U, (j_V)_{p!}\mathcal{O}_V) = (j_V)_{p!}\mathcal{O}_V(U) = \mathcal{O}_V(U)$ it corresponds to the element $1 \in \mathcal{O}_V(U)$.

Lemma 20.11.3. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. Denote $j_{i_0 \dots i_p} : U_{i_0 \dots i_p} \rightarrow X$ the open immersion. Consider the chain complex $K(\mathcal{U})_\bullet$ of presheaves of \mathcal{O}_X -modules*

$$\dots \rightarrow \bigoplus_{i_0 i_1 i_2} (j_{i_0 i_1 i_2})_{p!}\mathcal{O}_{U_{i_0 i_1 i_2}} \rightarrow \bigoplus_{i_0 i_1} (j_{i_0 i_1})_{p!}\mathcal{O}_{U_{i_0 i_1}} \rightarrow \bigoplus_{i_0} (j_{i_0})_{p!}\mathcal{O}_{U_{i_0}} \rightarrow 0 \rightarrow \dots$$

where the last nonzero term is placed in degree 0 and where the map

$$(j_{i_0 \dots i_{p+1}})_{p!}\mathcal{O}_{U_{i_0 \dots i_{p+1}}} \longrightarrow (j_{i_0 \dots \hat{i}_j \dots i_{p+1}})_{p!}\mathcal{O}_{U_{i_0 \dots \hat{i}_j \dots i_{p+1}}}$$

is given by $(-1)^j$ times the canonical map. Then there is an isomorphism

$$\mathrm{Hom}_{\mathcal{O}_X}(K(\mathcal{U})_\bullet, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$$

functorial in $\mathcal{F} \in \mathrm{Ob}(\mathrm{PMod}(\mathcal{O}_X))$.

Proof. We saw in the discussion just above the lemma that

$$\mathrm{Hom}_{\mathcal{O}_X}((j_{i_0 \dots i_p})_{p!} \mathcal{O}_{U_{i_0 \dots i_p}}, \mathcal{F}) = \mathcal{F}(U_{i_0 \dots i_p}).$$

Hence we see that it is indeed the case that the direct sum

$$\bigoplus_{i_0 \dots i_p} (j_{i_0 \dots i_p})_{p!} \mathcal{O}_{U_{i_0 \dots i_p}}$$

represents the functor

$$\mathcal{F} \longmapsto \prod_{i_0 \dots i_p} \mathcal{F}(U_{i_0 \dots i_p}).$$

Hence by Categories, Yoneda Lemma 4.3.5 we see that there is a complex $K(\mathcal{U})_\bullet$ with terms as given. It is a simple matter to see that the maps are as given in the lemma. \square

Lemma 20.11.4. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. Let $\mathcal{O}_{\mathcal{U}} \subset \mathcal{O}_X$ be the image presheaf of the map $\bigoplus j_{p!} \mathcal{O}_{U_i} \rightarrow \mathcal{O}_X$. The chain complex $K(\mathcal{U})_\bullet$ of presheaves of Lemma 20.11.3 above has homology presheaves*

$$H_i(K(\mathcal{U})_\bullet) = \begin{cases} 0 & \text{if } i \neq 0 \\ \mathcal{O}_{\mathcal{U}} & \text{if } i = 0 \end{cases}$$

Proof. Consider the extended complex K_\bullet^{ext} one gets by putting $\mathcal{O}_{\mathcal{U}}$ in degree -1 with the obvious map $K(\mathcal{U})_0 = \bigoplus_{i_0} (j_{i_0})_{p!} \mathcal{O}_{U_{i_0}} \rightarrow \mathcal{O}_{\mathcal{U}}$. It suffices to show that taking sections of this extended complex over any open $W \subset X$ leads to an acyclic complex. In fact, we claim that for every $W \subset X$ the complex $K_\bullet^{\mathrm{ext}}(W)$ is homotopy equivalent to the zero complex. Write $I = I_1 \amalg I_2$ where $W \subset U_i$ if and only if $i \in I_1$.

If $I_1 = \emptyset$, then the complex $K_\bullet^{\mathrm{ext}}(W) = 0$ so there is nothing to prove.

If $I_1 \neq \emptyset$, then $\mathcal{O}_{\mathcal{U}}(W) = \mathcal{O}_X(W)$ and

$$K_p^{\mathrm{ext}}(W) = \bigoplus_{i_0 \dots i_p \in I_1} \mathcal{O}_X(W).$$

This is true because of the simple description of the presheaves $(j_{i_0 \dots i_p})_{p!} \mathcal{O}_{U_{i_0 \dots i_p}}$. Moreover, the differential of the complex $K_\bullet^{\mathrm{ext}}(W)$ is given by

$$d(s)_{i_0 \dots i_p} = \sum_{j=0, \dots, p+1} \sum_{i \in I_1} (-1)^j s_{i_0 \dots i_{j-1} i i_j \dots i_p}.$$

The sum is finite as the element s has finite support. Fix an element $i_{\mathrm{fix}} \in I_1$. Define a map

$$h : K_p^{\mathrm{ext}}(W) \longrightarrow K_{p+1}^{\mathrm{ext}}(W)$$

by the rule

$$h(s)_{i_0 \dots i_{p+1}} = \begin{cases} 0 & \text{if } i_0 \neq i \\ s_{i_1 \dots i_{p+1}} & \text{if } i_0 = i_{\mathrm{fix}} \end{cases}$$

We will use the shorthand $h(s)_{i_0 \dots i_{p+1}} = (i_0 = i_{\text{fix}})s_{i_1 \dots i_p}$ for this. Then we compute

$$\begin{aligned} & (dh + hd)(s)_{i_0 \dots i_p} \\ &= \sum_j \sum_{i \in I_1} (-1)^j h(s)_{i_0 \dots i_{j-1} i i_j \dots i_p} + (i = i_0) d(s)_{i_1 \dots i_p} \\ &= s_{i_0 \dots i_p} + \sum_{j \geq 1} \sum_{i \in I_1} (-1)^j (i_0 = i_{\text{fix}}) s_{i_1 \dots i_{j-1} i i_j \dots i_p} + (i_0 = i_{\text{fix}}) d(s)_{i_1 \dots i_p} \end{aligned}$$

which is equal to $s_{i_0 \dots i_p}$ as desired. □

Lemma 20.11.5. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering of $U \subset X$. The Čech cohomology functors $\check{H}^p(\mathcal{U}, -)$ are canonically isomorphic as a δ -functor to the right derived functors of the functor*

$$\check{H}^0(\mathcal{U}, -) : PMod(\mathcal{O}_X) \longrightarrow Mod_{\mathcal{O}_X(U)}.$$

Moreover, there is a functorial quasi-isomorphism

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow R\check{H}^0(\mathcal{U}, \mathcal{F})$$

where the right hand side indicates the right derived functor

$$R\check{H}^0(\mathcal{U}, -) : D^+(PMod(\mathcal{O}_X)) \longrightarrow D^+(\mathcal{O}_X(U))$$

of the left exact functor $\check{H}^0(\mathcal{U}, -)$.

Proof. Note that the category of presheaves of \mathcal{O}_X -modules has enough injectives, see Injectives, Proposition 19.8.5. Note that $\check{H}^0(\mathcal{U}, -)$ is a left exact functor from the category of presheaves of \mathcal{O}_X -modules to the category of $\mathcal{O}_X(U)$ -modules. Hence the derived functor and the right derived functor exist, see Derived Categories, Section 13.20.

Let \mathcal{I} be an injective presheaf of \mathcal{O}_X -modules. In this case the functor $\text{Hom}_{\mathcal{O}_X}(-, \mathcal{I})$ is exact on $PMod(\mathcal{O}_X)$. By Lemma 20.11.3 we have

$$\text{Hom}_{\mathcal{O}_X}(K(\mathcal{U})_\bullet, \mathcal{I}) = \check{C}^\bullet(\mathcal{U}, \mathcal{I}).$$

By Lemma 20.11.4 we have that $K(\mathcal{U})_\bullet$ is quasi-isomorphic to $\mathcal{O}_U[0]$. Hence by the exactness of Hom into \mathcal{I} mentioned above we see that $\check{H}^i(\mathcal{U}, \mathcal{I}) = 0$ for all $i > 0$. Thus the δ -functor (\check{H}^n, δ) (see Lemma 20.11.2) satisfies the assumptions of Homology, Lemma 12.11.4, and hence is a universal δ -functor.

By Derived Categories, Lemma 13.20.4 also the sequence $R^i \check{H}^0(\mathcal{U}, -)$ forms a universal δ -functor. By the uniqueness of universal δ -functors, see Homology, Lemma 12.11.5 we conclude that $R^i \check{H}^0(\mathcal{U}, -) = \check{H}^i(\mathcal{U}, -)$. This is enough for most applications and the reader is suggested to skip the rest of the proof.

Let \mathcal{F} be any presheaf of \mathcal{O}_X -modules. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in the category $PMod(\mathcal{O}_X)$. Consider the double complex $A^{\bullet, \bullet}$ with terms

$$A^{p,q} = \check{C}^p(\mathcal{U}, \mathcal{I}^q).$$

Consider the simple complex sA^\bullet associated to this double complex. There is a map of complexes

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow sA^\bullet$$

coming from the maps $\check{C}^p(\mathcal{U}, \mathcal{F}) \rightarrow A^{p,0} = \check{C}^p(\mathcal{U}, \mathcal{I}^0)$ and there is a map of complexes

$$\check{H}^0(\mathcal{U}, \mathcal{I}^\bullet) \longrightarrow sA^\bullet$$

coming from the maps $\check{H}^0(\mathcal{U}, \mathcal{I}^q) \rightarrow A^{0,q} = \check{C}^0(\mathcal{U}, \mathcal{I}^q)$. Both of these maps are quasi-isomorphisms by an application of Homology, Lemma 12.22.7. Namely, the columns of the double complex are exact in positive degrees because the Čech complex as a functor is exact (Lemma 20.11.1) and the rows of the double complex are exact in positive degrees since as we just saw the higher Čech cohomology groups of the injective presheaves \mathcal{I}^q are zero. Since quasi-isomorphisms become invertible in $D^+(\mathcal{O}_X(U))$ this gives the last displayed morphism of the lemma. We omit the verification that this morphism is functorial. \square

20.12. Čech cohomology and cohomology

Lemma 20.12.1. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. Let \mathcal{I} be an injective \mathcal{O}_X -module. Then*

$$\check{H}^p(\mathcal{U}, \mathcal{I}) = \begin{cases} \mathcal{I}(U) & \text{if } p = 0 \\ 0 & \text{if } p > 0 \end{cases}$$

Proof. An injective \mathcal{O}_X -module is also injective as an object in the category $PMod(\mathcal{O}_X)$ (for example since sheafification is an exact left adjoint to the inclusion functor, using Homology, Lemma 12.25.1). Hence we can apply Lemma 20.11.5 (or its proof) to see the result. \square

Lemma 20.12.2. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. There is a transformation*

$$\check{C}^\bullet(\mathcal{U}, -) \longrightarrow R\Gamma(U, -)$$

of functors $Mod(\mathcal{O}_X) \rightarrow D^+(\mathcal{O}_X(U))$. In particular this provides canonical maps $\check{H}^p(\mathcal{U}, \mathcal{F}) \rightarrow H^p(U, \mathcal{F})$ for \mathcal{F} ranging over $Mod(\mathcal{O}_X)$.

Proof. Let \mathcal{F} be an \mathcal{O}_X -module. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. Consider the double complex $\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)$ with terms $\check{C}^p(\mathcal{U}, \mathcal{I}^q)$. There is a map of complexes

$$\alpha : \Gamma(U, \mathcal{I}^\bullet) \longrightarrow \text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet))$$

coming from the maps $\mathcal{I}^q(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{I}^q)$ and a map of complexes

$$\beta : \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet))$$

coming from the map $\mathcal{F} \rightarrow \mathcal{I}^0$. We can apply Homology, Lemma 12.22.7 to see that α is a quasi-isomorphism. Namely, Lemma 20.12.1 implies that the q th row of the double complex $\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)$ is a resolution of $\Gamma(U, \mathcal{I}^q)$. Hence α becomes invertible in $D^+(\mathcal{O}_X(U))$ and the transformation of the lemma is the composition of β followed by the inverse of α . We omit the verification that this is functorial. \square

Lemma 20.12.3. *Let X be a ringed space. Consider the functor $i : Mod(\mathcal{O}_X) \rightarrow PMod(\mathcal{O}_X)$. It is a left exact functor with right derived functors given by*

$$R^p i(\mathcal{F}) = \underline{H}^p(\mathcal{F}) : U \longmapsto H^p(U, \mathcal{F})$$

see discussion in Section 20.7.

Proof. It is clear that i is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. By definition $R^p i$ is the p th cohomology presheaf of the complex \mathcal{I}^\bullet . In other words, the sections of $R^p i(\mathcal{F})$ over an open U are given by

$$\frac{\text{Ker}(\mathcal{I}^n(U) \rightarrow \mathcal{I}^{n+1}(U))}{\text{Im}(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^n(U))}.$$

which is the definition of $H^p(U, \mathcal{F})$. □

Lemma 20.12.4. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. For any sheaf of \mathcal{O}_X -modules \mathcal{F} there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(U, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} .

Proof. This is a Grothendieck spectral sequence (see Derived Categories, Lemma 13.22.2) for the functors

$$i : \text{Mod}(\mathcal{O}_X) \rightarrow \text{PMod}(\mathcal{O}_X) \quad \text{and} \quad \check{H}^0(\mathcal{U}, -) : \text{PMod}(\mathcal{O}_X) \rightarrow \text{Mod}_{\mathcal{O}_X(U)}.$$

Namely, we have $\check{H}^0(\mathcal{U}, i(\mathcal{F})) = \mathcal{F}(U)$ by Lemma 20.10.2. We have that $i(\mathcal{I})$ is Čech acyclic by Lemma 20.12.1. And we have that $\check{H}^p(\mathcal{U}, -) = R^p \check{H}^0(\mathcal{U}, -)$ as functors on $\text{PMod}(\mathcal{O}_X)$ by Lemma 20.11.5. Putting everything together gives the lemma. □

Lemma 20.12.5. *Let X be a ringed space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be a covering. Let \mathcal{F} be an \mathcal{O}_X -module. Assume that $H^i(U_{i_0, \dots, i_p}, \mathcal{F}) = 0$ for all $i > 0$, all $p \geq 0$ and all $i_0, \dots, i_p \in I$. Then $\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(U, \mathcal{F})$ as $\mathcal{O}_X(U)$ -modules.*

Proof. We will use the spectral sequence of Lemma 20.12.4. The assumptions mean that $E_2^{p,q} = 0$ for all (p, q) with $q \neq 0$. Hence the spectral sequence degenerates at E_2 and the result follows. □

Lemma 20.12.6. *Let X be a ringed space. Let*

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$$

be a short exact sequence of \mathcal{O}_X -modules. Let $U \subset X$ be an open subset. If there exists a cofinal system of open coverings \mathcal{U} of U such that $\check{H}^1(\mathcal{U}, \mathcal{F}) = 0$, then the map $\mathcal{G}(U) \rightarrow \mathcal{H}(U)$ is surjective.

Proof. Take an element $s \in \mathcal{H}(U)$. Choose an open covering $\mathcal{U} : U = \bigcup_{i \in I} U_i$ such that (a) $\check{H}^1(\mathcal{U}, \mathcal{F}) = 0$ and (b) $s|_{U_i}$ is the image of a section $s_i \in \mathcal{G}(U_i)$. Since we can certainly find a covering such that (b) holds it follows from the assumptions of the lemma that we can find a covering such that (a) and (b) both hold. Consider the sections

$$s_{i_0 i_1} = s_{i_1}|_{U_{i_0 i_1}} - s_{i_0}|_{U_{i_0 i_1}}.$$

Since s_i lifts s we see that $s_{i_0 i_1} \in \mathcal{F}(U_{i_0 i_1})$. By the vanishing of $\check{H}^1(\mathcal{U}, \mathcal{F})$ we can find sections $t_i \in \mathcal{F}(U_i)$ such that

$$s_{i_0 i_1} = t_{i_1}|_{U_{i_0 i_1}} - t_{i_0}|_{U_{i_0 i_1}}.$$

Then clearly the sections $s_i - t_i$ satisfy the sheaf condition and glue to a section of \mathcal{G} over U which maps to s . Hence we win. □

Lemma 20.12.7. *Let X be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module such that*

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$$

for all $p > 0$ and any open covering $\mathcal{U} : U = \bigcup_{i \in I} U_i$ of an open of X . Then $H^p(U, \mathcal{F}) = 0$ for all $p > 0$ and any open $U \subset X$.

Proof. Let \mathcal{F} be a sheaf satisfying the assumption of the lemma. We will indicate this by saying “ \mathcal{F} has vanishing higher Čech cohomology for any open covering”. Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective \mathcal{O}_X -module. By Lemma 20.12.1 \mathcal{I} has vanishing higher Čech cohomology for any open covering. Let $\mathcal{Q} = \mathcal{I}/\mathcal{F}$ so that we have a short exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0.$$

By Lemma 20.12.6 and our assumptions this sequence is actually exact as a sequence of presheaves! In particular we have a long exact sequence of Čech cohomology groups for any open covering \mathcal{U} , see Lemma 20.11.2 for example. This implies that \mathcal{Q} is also an \mathcal{O}_X -module with vanishing higher Čech cohomology for all open coverings.

Next, we look at the long exact cohomology sequence

$$\begin{array}{ccccccc} 0 & \longrightarrow & H^0(U, \mathcal{F}) & \longrightarrow & H^0(U, \mathcal{I}) & \longrightarrow & H^0(U, \mathcal{Q}) \\ & & & & & \searrow & \\ & & H^1(U, \mathcal{F}) & \longrightarrow & H^1(U, \mathcal{I}) & \longrightarrow & H^1(U, \mathcal{Q}) \\ & & & & & \searrow & \\ \dots & & \dots & & \dots & & \dots \end{array}$$

for any open $U \subset X$. Since \mathcal{I} is injective we have $H^n(U, \mathcal{I}) = 0$ for $n > 0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^0(U, \mathcal{I}) \rightarrow H^0(U, \mathcal{Q})$ is surjective and hence $H^1(U, \mathcal{F}) = 0$. Since \mathcal{F} was an arbitrary \mathcal{O}_X -module with vanishing higher Čech cohomology we conclude that also $H^1(U, \mathcal{Q}) = 0$ since \mathcal{Q} is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^2(U, \mathcal{F}) = 0$. And so on and so forth. \square

Lemma 20.12.8. (Variant of Lemma 20.12.7.) *Let X be a ringed space. Let \mathcal{B} be a basis for the topology on X . Let \mathcal{F} be an \mathcal{O}_X -module. Assume there exists a set of open coverings Cov with the following properties:*

- (1) *For every $\mathcal{U} \in \text{Cov}$ with $\mathcal{U} : U = \bigcup_{i \in I} U_i$ we have $U, U_i \in \mathcal{B}$ and every $U_{i_0 \dots i_p} \in \mathcal{B}$.*
- (2) *For every $U \in \mathcal{B}$ the open coverings of U occurring in Cov is a cofinal system of open coverings of U .*
- (3) *For every $\mathcal{U} \in \text{Cov}$ we have $\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$ for all $p > 0$.*

Then $H^p(U, \mathcal{F}) = 0$ for all $p > 0$ and any $U \in \mathcal{B}$.

Proof. Let \mathcal{F} and Cov be as in the lemma. We will indicate this by saying “ \mathcal{F} has vanishing higher Čech cohomology for any $\mathcal{U} \in \text{Cov}$ ”. Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective \mathcal{O}_X -module. By Lemma 20.12.1 \mathcal{I} has vanishing higher Čech cohomology for any $\mathcal{U} \in \text{Cov}$. Let $\mathcal{Q} = \mathcal{I}/\mathcal{F}$ so that we have a short exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0.$$

By Lemma 20.12.6 and our assumption (2) this sequence gives rise to an exact sequence

$$0 \rightarrow \mathcal{F}(U) \rightarrow \mathcal{I}(U) \rightarrow \mathcal{Q}(U) \rightarrow 0.$$

for every $U \in \mathcal{B}$. Hence for any $\mathcal{U} \in \text{Cov}$ we get a short exact sequence of Čech complexes

$$0 \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{I}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{Q}) \rightarrow 0$$

since each term in the Čech complex is made up out of a product of values over elements of \mathcal{B} by assumption (1). In particular we have a long exact sequence of Čech cohomology groups for any open covering $\mathcal{U} \in \text{Cov}$. This implies that \mathcal{Q} is also an \mathcal{O}_X -module with vanishing higher Čech cohomology for all $\mathcal{U} \in \text{Cov}$.

Next, we look at the long exact cohomology sequence

$$\begin{array}{ccccccc} 0 & \longrightarrow & H^0(U, \mathcal{F}) & \longrightarrow & H^0(U, \mathcal{I}) & \longrightarrow & H^0(U, \mathcal{Q}) \\ & & & & & \swarrow & \\ & & H^1(U, \mathcal{F}) & \longrightarrow & H^1(U, \mathcal{I}) & \longrightarrow & H^1(U, \mathcal{Q}) \\ & & & & & \swarrow & \\ & & \dots & & \dots & & \dots \end{array}$$

for any $U \in \mathcal{B}$. Since \mathcal{I} is injective we have $H^n(U, \mathcal{I}) = 0$ for $n > 0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^0(U, \mathcal{I}) \rightarrow H^0(U, \mathcal{Q})$ is surjective and hence $H^1(U, \mathcal{F}) = 0$. Since \mathcal{F} was an arbitrary \mathcal{O}_X -module with vanishing higher Čech cohomology for all $\mathcal{U} \in \text{Cov}$ we conclude that also $H^1(U, \mathcal{Q}) = 0$ since \mathcal{Q} is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^2(U, \mathcal{F}) = 0$. And so on and so forth. \square

Lemma 20.12.9. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{I} be an injective \mathcal{O}_X -module. Then*

- (1) $\check{H}^p(\mathcal{V}, f_*\mathcal{I}) = 0$ for all $p > 0$ and any open covering $\mathcal{V} : V = \bigcup_{j \in J} V_j$ of Y .
- (2) $H^p(V, f_*\mathcal{I}) = 0$ for all $p > 0$ and every open $V \subset Y$.

In other words, $f_\mathcal{I}$ is right acyclic for $\Gamma(U, -)$ (see Derived Categories, Definition 13.16.3) for any $U \subset X$ open.*

Proof. Set $\mathcal{U} : f^{-1}(V) = \bigcup_{j \in J} f^{-1}(V_j)$. It is an open covering of X and

$$\check{C}^\bullet(\mathcal{V}, f_*\mathcal{I}) = \check{C}^\bullet(\mathcal{U}, \mathcal{I}).$$

This is true because

$$f_*\mathcal{I}(V_{j_0 \dots j_p}) = \mathcal{I}(f^{-1}(V_{j_0 \dots j_p})) = \mathcal{I}(f^{-1}(V_{j_0}) \cap \dots \cap f^{-1}(V_{j_p})) = \mathcal{I}(U_{j_0 \dots j_p}).$$

Thus the first statement of the lemma follows from Lemma 20.12.1. The second statement follows from the first and Lemma 20.12.7. \square

The following lemma implies in particular that $f_* : Ab(X) \rightarrow Ab(Y)$ transforms injective abelian sheaves into injective abelian sheaves.

Lemma 20.12.10. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Assume f is flat. Then $f_*\mathcal{I}$ is an injective \mathcal{O}_Y -module for any injective \mathcal{O}_X -module \mathcal{I} .*

Proof. In this case the functor f^* transforms injections into injections (Modules, Lemma 17.17.2). Hence the result follows from Homology, Lemma 12.25.1. \square

20.13. Flasque sheaves

Here is the definition.

Definition 20.13.1. Let X be a topological space. We say a presheaf of sets \mathcal{F} is *flasque* or *flabby* if for every $U \subset V$ open in X the restriction map $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$ is surjective.

We will use this terminology also for abelian sheaves and sheaves of modules if X is a ringed space. Clearly it suffices to assume the restriction maps $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$ is surjective for every open $U \subset V$.

Lemma 20.13.2. *Let (X, \mathcal{O}_X) be a ringed space. Then any injective \mathcal{O}_X -module is flasque.*

Proof. This is a reformulation of Lemma 20.9.1. \square

Lemma 20.13.3. *Let (X, \mathcal{O}_X) be a ringed space. Any flasque \mathcal{O}_X -module is acyclic for $R\Gamma(X, -)$ as well as $R\Gamma(U, -)$ for any open U of X .*

Proof. We will prove this using Derived Categories, Lemma 13.16.6. Since every injective module is flasque we see that we can embed every \mathcal{O}_X -module into a flasque module, see Injectives, Lemma 19.4.1. Thus it suffices to show that given a short exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$$

with \mathcal{F}, \mathcal{G} flasque, then \mathcal{H} is flasque and the sequence remains short exact after taking sections on any open of X . In fact, the second statement implies the first. Thus, let $U \subset X$ be an open subspace. Let $s \in \mathcal{H}(U)$. We will show that we can lift s to a sequence of \mathcal{G} over U . To do this consider the set T of pairs (V, t) where $V \subset U$ is open and $t \in \mathcal{G}(V)$ is a section mapping to $s|_V$ in \mathcal{H} . We put a partial ordering on T by setting $(V, t) \leq (V', t')$ if and only if $V \subset V'$ and $t'|_V = t$. If (V_α, t_α) , $\alpha \in A$ is a totally ordered subset of T , then $V = \bigcup V_\alpha$ is open and there is a unique section $t \in \mathcal{G}(V)$ restricting to t_α over V_α by the sheaf condition on \mathcal{G} . Thus by Zorn's lemma there exists a maximal element (V, t) in T . We will show that $V = U$ thereby finishing the proof. Namely, pick any $x \in U$. We can find a small open neighbourhood $W \subset U$ of x and $t' \in \mathcal{H}(W)$ mapping to $s|_W$ in \mathcal{H} . Then $t'|_{W \cap V} - t|_{W \cap V}$ maps to zero in \mathcal{H} , hence comes from some section $r' \in \mathcal{F}(W \cap V)$. Using that \mathcal{F} is flasque we find a section $r \in \mathcal{F}(W)$ restricting to r' over $W \cap V$. Modifying t' by the image of r we may assume that t and t' restrict to the same section over $W \cap V$. By the sheaf condition of \mathcal{G} we can find a section \tilde{t} of \mathcal{G} over $W \cup V$ restricting to t and t' . By maximality of (V, t) we see that $V \cup W = V$. Thus $x \in V$ and we are done. \square

The following lemma does not hold for flasque presheaves.

Lemma 20.13.4. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Let $\mathcal{U} : U = \bigcup U_i$ be an open covering. If \mathcal{F} is flasque, then $\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$ for $p > 0$.*

Proof. The presheaves $\underline{H}^q(\mathcal{F})$ used in the statement of Lemma 20.12.4 are zero by Lemma 20.13.3. Hence $\check{H}^p(U, \mathcal{F}) = H^p(U, \mathcal{F}) = 0$ by Lemma 20.13.3 again. \square

Lemma 20.13.5. *Let $(X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. If \mathcal{F} is flasque, then $R^p f_* \mathcal{F} = 0$ for $p > 0$.*

Proof. Immediate from Lemma 20.7.3 and Lemma 20.13.3. \square

The following lemma can be proved by an elementary induction argument for finite coverings, compare with the discussion of Čech cohomology in [Vak].

Lemma 20.13.6. *Let X be a topological space. Let \mathcal{F} be an abelian sheaf on X . Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Assume the restriction mappings $\mathcal{F}(U) \rightarrow \mathcal{F}(U')$ are surjective for U' an arbitrary union of opens of the form $U_{i_0 \dots i_p}$. Then $\check{H}^p(\mathcal{U}, \mathcal{F})$ vanishes for $p > 0$.*

Proof. Let Y be the set of nonempty subsets of I . We will use the letters A, B, C, \dots to denote elements of Y , i.e., nonempty subsets of I . For a finite nonempty subset $J \subset I$ let

$$V_J = \{A \in Y \mid J \subset A\}$$

This means that $V_{\{i\}} = \{A \in Y \mid i \in A\}$ and $V_J = \bigcap_{j \in J} V_{\{j\}}$. Then $V_J \subset V_K$ if and only if $J \supset K$. There is a unique topology on Y such that the collection of subsets V_J is a basis for the topology on Y . Any open is of the form

$$V = \bigcup_{t \in T} V_{J_t}$$

for some family of finite subsets J_t . If $J_t \subset J_{t'}$ then we may remove $J_{t'}$ from the family without changing V . Thus we may assume there are no inclusions among the J_t . In this case the minimal elements of V are the sets $A = J_t$. Hence we can read off the family $(J_t)_{t \in T}$ from the open V .

We can completely understand open coverings in Y . First, because the elements $A \in Y$ are nonempty subsets of I we have

$$Y = \bigcup_{i \in I} V_{\{i\}}$$

To understand other coverings, let V be as above and let $V_s \subset Y$ be an open corresponding to the family $(J_{s,t})_{t \in T_s}$. Then

$$V = \bigcup_{s \in S} V_s$$

if and only if for each $t \in T$ there exists an $s \in S$ and $t_s \in T_s$ such that $J_t = J_{s,t_s}$. Namely, as the family $(J_t)_{t \in T}$ is minimal, the minimal element $A = J_t$ has to be in V_s for some s , hence $A \in V_{J_{t_s}}$ for some $t_s \in T_s$. But since A is also minimal in V_s we conclude that $J_{t_s} = J_t$.

Next we map the set of opens of Y to opens of X . Namely, we send Y to U , we use the rule

$$V_J \mapsto U_J = \bigcap_{i \in J} U_i$$

on the opens V_J , and we extend it to arbitrary opens V by the rule

$$V = \bigcup_{t \in T} V_{J_t} \mapsto \bigcup_{t \in T} U_{J_t}$$

The classification of open coverings of Y given above shows that this rule transforms open coverings into open coverings. Thus we obtain an abelian sheaf \mathcal{G} on Y by setting $\mathcal{G}(Y) = \mathcal{F}(U)$ and for $V = \bigcup_{t \in T} V_{J_t}$ setting

$$\mathcal{G}(V) = \mathcal{F}\left(\bigcup_{t \in T} U_{J_t}\right)$$

and using the restriction maps of \mathcal{F} .

With these preliminaries out of the way we can prove our lemma as follows. We have an open covering $\mathcal{V} : Y = \bigcup_{i \in I} V_{\{i\}}$ of Y . By construction we have an equality

$$\check{C}^\bullet(\mathcal{V}, \mathcal{G}) = \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

of Čech complexes. Since the sheaf \mathcal{G} is flasque on Y (by our assumption on \mathcal{F} in the statement of the lemma) the vanishing follows from Lemma 20.13.4. \square

20.14. The Leray spectral sequence

Lemma 20.14.1. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. There is a commutative diagram*

$$\begin{array}{ccc} D^+(X) & \xrightarrow{R\Gamma(X, -)} & D^+(\mathcal{O}_X(X)) \\ Rf_* \downarrow & & \downarrow \text{restriction} \\ D^+(Y) & \xrightarrow{R\Gamma(Y, -)} & D^+(\mathcal{O}_Y(Y)) \end{array}$$

More generally for any $V \subset Y$ open and $U = f^{-1}(V)$ there is a commutative diagram

$$\begin{array}{ccc} D^+(X) & \xrightarrow{R\Gamma(U, -)} & D^+(\mathcal{O}_X(U)) \\ Rf_* \downarrow & & \downarrow \text{restriction} \\ D^+(Y) & \xrightarrow{R\Gamma(V, -)} & D^+(\mathcal{O}_Y(V)) \end{array}$$

See also Remark 20.14.2 for more explanation.

Proof. Let $\Gamma_{res} : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}_{\mathcal{O}_Y(Y)}$ be the functor which associates to an \mathcal{O}_X -module \mathcal{F} the global sections of \mathcal{F} viewed as a $\mathcal{O}_Y(Y)$ -module via the map $f^\# : \mathcal{O}_Y(Y) \rightarrow \mathcal{O}_X(X)$. Let $restriction : \text{Mod}_{\mathcal{O}_X(X)} \rightarrow \text{Mod}_{\mathcal{O}_Y(Y)}$ be the restriction functor induced by $f^\# : \mathcal{O}_Y(Y) \rightarrow \mathcal{O}_X(X)$. Note that $restriction$ is exact so that its right derived functor is computed by simply applying the restriction functor, see Derived Categories, Lemma 13.17.8. It is clear that

$$\Gamma_{res} = restriction \circ \Gamma(X, -) = \Gamma(Y, -) \circ f_*$$

We claim that Derived Categories, Lemma 13.22.1 applies to both compositions. For the first this is clear by our remarks above. For the second, it follows from Lemma 20.12.9 which implies that injective \mathcal{O}_X -modules are mapped to $\Gamma(Y, -)$ -acyclic sheaves on Y . \square

Remark 20.14.2. Here is a down-to-earth explanation of the meaning of Lemma 20.14.1. It says that given $f : X \rightarrow Y$ and $\mathcal{F} \in \text{Mod}(\mathcal{O}_X)$ and given an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ we have

$$\begin{array}{lll} R\Gamma(X, \mathcal{F}) & \text{is represented by} & \Gamma(X, \mathcal{I}^\bullet) \\ Rf_* \mathcal{F} & \text{is represented by} & f_* \mathcal{I}^\bullet \\ R\Gamma(Y, Rf_* \mathcal{F}) & \text{is represented by} & \Gamma(Y, f_* \mathcal{I}^\bullet) \end{array}$$

the last fact coming from Leray’s acyclicity lemma (Derived Categories, Lemma 13.17.7) and Lemma 20.12.9. Finally, it combines this with the trivial observation that

$$\Gamma(X, \mathcal{I}^\bullet) = \Gamma(Y, f_* \mathcal{I}^\bullet).$$

to arrive at the commutativity of the diagram of the lemma.

Lemma 20.14.3. *Let X be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module.*

- (1) *The cohomology groups $H^i(U, \mathcal{F})$ for $U \subset X$ open of \mathcal{F} computed as an \mathcal{O}_X -module, or computed as an abelian sheaf are identical.*
- (2) *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. The higher direct images $R^i f_* \mathcal{F}$ of \mathcal{F} computed as an \mathcal{O}_X -module, or computed as an abelian sheaf are identical.*

There are similar statements in the case of bounded below complexes of \mathcal{O}_X -modules.

Proof. Consider the morphism of ringed spaces $(X, \mathcal{O}_X) \rightarrow (X, \underline{\mathbf{Z}}_X)$ given by the identity on the underlying topological space and by the unique map of sheaves of rings $\underline{\mathbf{Z}}_X \rightarrow \mathcal{O}_X$. Let \mathcal{F} be an \mathcal{O}_X -module. Denote \mathcal{F}_{ab} the same sheaf seen as an $\underline{\mathbf{Z}}_X$ -module, i.e., seen as a sheaf of abelian groups. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. By Remark 20.14.2 we see that $\Gamma(X, \mathcal{I}^\bullet)$ computes both $R\Gamma(X, \mathcal{F})$ and $R\Gamma(X, \mathcal{F}_{ab})$. This proves (1).

To prove (2) we use (1) and Lemma 20.7.3. The result follows immediately. \square

Lemma 20.14.4 (Leray spectral sequence). *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F}^\bullet be a bounded below complex of \mathcal{O}_X -modules. There is a spectral sequence*

$$E_2^{p,q} = H^p(Y, R^q f_*(\mathcal{F}^\bullet))$$

converging to $H^{p+q}(X, \mathcal{F}^\bullet)$.

Proof. This is just the Grothendieck spectral sequence Derived Categories, Lemma 13.22.2 coming from the composition of functors $\Gamma_{res} = \Gamma(Y, -) \circ f_*$ where Γ_{res} is as in the proof of Lemma 20.14.1. To see that the assumptions of Derived Categories, Lemma 13.22.2 are satisfied, see the proof of Lemma 20.14.1 or Remark 20.14.2. \square

Remark 20.14.5. The Leray spectral sequence, the way we proved it in Lemma 20.14.4 is a spectral sequence of $\Gamma(Y, \mathcal{O}_Y)$ -modules. However, it is quite easy to see that it is in fact a spectral sequence of $\Gamma(X, \mathcal{O}_X)$ -modules. For example f gives rise to a morphism of ringed spaces $f' : (X, \mathcal{O}_X) \rightarrow (Y, f_* \mathcal{O}_X)$. By Lemma 20.14.3 the terms $E_r^{p,q}$ of the Leray spectral sequence for an \mathcal{O}_X -module \mathcal{F} and f are identical with those for \mathcal{F} and f' at least for $r \geq 2$. Namely, they both agree with the terms of the Leray spectral sequence for \mathcal{F} as an abelian sheaf. And since $(f_* \mathcal{O}_X)(Y) = \mathcal{O}_X(X)$ we see the result. It is often the case that the Leray spectral sequence carries additional structure.

Lemma 20.14.6. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{F} be an \mathcal{O}_X -module.*

- (1) *If $R^q f_* \mathcal{F} = 0$ for $q > 0$, then $H^p(X, \mathcal{F}) = H^p(Y, f_* \mathcal{F})$ for all p .*
- (2) *If $H^p(Y, R^q f_* \mathcal{F}) = 0$ for all q and $p > 0$, then $H^q(X, \mathcal{F}) = H^0(Y, R^q f_* \mathcal{F})$ for all q .*

Proof. These are two simple conditions that force the Leray spectral sequence to converge. You can also prove these facts directly (without using the spectral sequence) which is a good exercise in cohomology of sheaves. \square

Lemma 20.14.7. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of ringed spaces. In this case $Rg_* \circ Rf_* = R(g \circ f)_*$ as functors from $D^+(X) \rightarrow D^+(Z)$.*

Proof. We are going to apply Derived Categories, Lemma 13.22.1. It is clear that $g_* \circ f_* = (g \circ f)_*$, see Sheaves, Lemma 6.21.2. It remains to show that $f_*\mathcal{I}$ is g_* -acyclic. This follows from Lemma 20.12.9 and the description of the higher direct images $R^i g_*$ in Lemma 20.7.3. \square

Lemma 20.14.8 (Relative Leray spectral sequence). *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of ringed spaces. Let \mathcal{F} be an \mathcal{O}_X -module. There is a spectral sequence with*

$$E_2^{p,q} = R^p g_*(R^q f_* \mathcal{F})$$

converging to $R^{p+q}(g \circ f)_ \mathcal{F}$. This spectral sequence is functorial in \mathcal{F} , and there is a version for bounded below complexes of \mathcal{O}_X -modules.*

Proof. This is a Grothendieck spectral sequence for composition of functors and follows from Lemma 20.14.7 and Derived Categories, Lemma 13.22.2. \square

20.15. Functoriality of cohomology

Lemma 20.15.1. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{G}^\bullet , resp. \mathcal{F}^\bullet be a bounded below complex of \mathcal{O}_Y -modules, resp. \mathcal{O}_X -modules. Let $\varphi : \mathcal{G}^\bullet \rightarrow f_* \mathcal{F}^\bullet$ be a morphism of complexes. There is a canonical morphism*

$$\mathcal{G}^\bullet \longrightarrow Rf_*(\mathcal{F}^\bullet)$$

in $D^+(Y)$. Moreover this construction is functorial in the triple $(\mathcal{G}^\bullet, \mathcal{F}^\bullet, \varphi)$.

Proof. Choose an injective resolution $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$. By definition $Rf_*(\mathcal{F}^\bullet)$ is represented by $f_* \mathcal{I}^\bullet$ in $K^+(\mathcal{O}_Y)$. The composition

$$\mathcal{G}^\bullet \rightarrow f_* \mathcal{F}^\bullet \rightarrow f_* \mathcal{I}^\bullet$$

is a morphism in $K^+(Y)$ which turns into the morphism of the lemma upon applying the localization functor $j_Y : K^+(Y) \rightarrow D^+(Y)$. \square

Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{G} be an \mathcal{O}_Y -module and let \mathcal{F} be an \mathcal{O}_X -module. Recall that an f -map φ from \mathcal{G} to \mathcal{F} is a map $\varphi : \mathcal{G} \rightarrow f_* \mathcal{F}$, or what is the same thing, a map $\varphi : f^* \mathcal{G} \rightarrow \mathcal{F}$. See Sheaves, Definition 6.21.7. Such an f -map gives rise to a morphism of complexes

$$(20.15.1.1) \quad \varphi : R\Gamma(Y, \mathcal{G}) \longrightarrow R\Gamma(X, \mathcal{F})$$

in $D^+(\mathcal{O}_Y(Y))$. Namely, we use the morphism $\mathcal{G} \rightarrow Rf_* \mathcal{F}$ in $D^+(Y)$ of Lemma 20.15.1, and we apply $R\Gamma(Y, -)$. By Lemma 20.14.1 we see that $R\Gamma(X, \mathcal{F}) = R\Gamma(Y, Rf_* \mathcal{F})$ and we get the displayed arrow. We spell this out completely in Remark 20.15.2 below. In particular it gives rise to maps on cohomology

$$(20.15.1.2) \quad \varphi : H^i(Y, \mathcal{G}) \longrightarrow H^i(X, \mathcal{F}).$$

Remark 20.15.2. Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let \mathcal{G} be an \mathcal{O}_Y -module. Let \mathcal{F} be an \mathcal{O}_X -module. Let φ be an f -map from \mathcal{G} to \mathcal{F} . Choose a resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ by a complex of injective \mathcal{O}_X -modules. Choose resolutions $\mathcal{G} \rightarrow \mathcal{J}^\bullet$ and $f_* \mathcal{I} \rightarrow (\mathcal{J}')^\bullet$ by complexes of injective \mathcal{O}_Y -modules. By Derived Categories, Lemma 13.18.6 there exists a map of complexes β such that the diagram

$$(20.15.2.1) \quad \begin{array}{ccccc} \mathcal{G} & \longrightarrow & f_* \mathcal{F} & \longrightarrow & f_* \mathcal{I}^\bullet \\ \downarrow & & & & \downarrow \\ \mathcal{J}^\bullet & \xrightarrow{\beta} & & \longrightarrow & (\mathcal{J}')^\bullet \end{array}$$

commutes. Applying global section functors we see that we get a diagram

$$\begin{array}{ccc} & \Gamma(Y, f_*\mathcal{I}^\bullet) & \xlongequal{\quad} & \Gamma(X, \mathcal{I}^\bullet) \\ & \downarrow \text{qis} & & \\ \Gamma(Y, \mathcal{J}^\bullet) & \xrightarrow{\quad \beta \quad} & \Gamma(Y, (\mathcal{J}')^\bullet) & \end{array}$$

The complex on the bottom left represents $R\Gamma(Y, \mathcal{G})$ and the complex on the top right represents $R\Gamma(X, \mathcal{F})$. The vertical arrow is a quasi-isomorphism by Lemma 20.14.1 which becomes invertible after applying the localization functor $K^+(\mathcal{O}_Y(Y)) \rightarrow D^+(\mathcal{O}_Y(Y))$. The arrow (20.15.1.1) is given by the composition of the horizontal map by the inverse of the vertical map.

20.16. Refinements and Čech cohomology

Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ and $\mathcal{V} : X = \bigcup_{j \in J} V_j$ be open coverings. Assume that \mathcal{U} is a refinement of \mathcal{V} . Choose a map $c : I \rightarrow J$ such that $U_i \subset V_{c(i)}$ for all $i \in I$. This induces a map of Čech complexes

$$\gamma : \check{C}^\bullet(\mathcal{V}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F}), \quad (\xi_{j_0 \dots j_p}) \longmapsto (\xi_{c(i_0) \dots c(i_p)}|_{U_{i_0 \dots i_p}})$$

functorial in the sheaf of \mathcal{O}_X -modules \mathcal{F} . Suppose that $c' : I \rightarrow J$ is a second map such that $U_i \subset V_{c'(i)}$ for all $i \in I$. Then the corresponding maps γ and γ' are homotopic. Namely, $\gamma - \gamma' = d \circ h + h \circ d$ with $h : \check{C}^{p+1}(\mathcal{V}, \mathcal{F}) \rightarrow \check{C}^p(\mathcal{U}, \mathcal{F})$ given by the rule

$$h(\xi)_{i_0 \dots i_p} = \sum_{a=0}^p (-1)^a \alpha_{c(i_0) \dots c(i_a) c'(i_a) \dots c'(i_p)}$$

We omit the computation showing this works; please see the discussion following (20.26.0.2) for the proof in a more general case. In particular, the map on Čech cohomology groups is independent of the choice of c . Moreover, it is clear that if $\mathcal{W} : X = \bigcup_{k \in K} W_k$ is a third open covering and \mathcal{V} is a refinement of \mathcal{W} , then the composition of the maps

$$\check{C}^\bullet(\mathcal{W}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{V}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

associated to maps $I \rightarrow J$ and $J \rightarrow K$ is the map associated to the composition $I \rightarrow K$. In particular, we can define the Čech cohomology groups

$$\check{H}^p(X, \mathcal{F}) = \operatorname{colim}_{\mathcal{U}} \check{H}^p(\mathcal{U}, \mathcal{F})$$

where the colimit is over all open coverings of X partially ordered by refinement.

It turns out that the maps γ defined above are compatible with the map to cohomology, in other words, the composition

$$\check{H}^p(\mathcal{V}, \mathcal{F}) \rightarrow \check{H}^p(\mathcal{U}, \mathcal{F}) \xrightarrow{\text{Lemma 20.12.2}} H^p(X, \mathcal{F})$$

is the canonical map from the first group to cohomology of Lemma 20.12.2. In the lemma below we will prove this in a slightly more general setting. A consequence is that we obtain a well defined map

$$(20.16.0.2) \quad \check{H}^p(X, \mathcal{F}) = \operatorname{colim}_{\mathcal{U}} \check{H}^p(\mathcal{U}, \mathcal{F}) \longrightarrow H^p(X, \mathcal{F})$$

from Čech cohomology to cohomology.

Lemma 20.16.1. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Let $\varphi : f^*\mathcal{G} \rightarrow \mathcal{F}$ be an f -map from an \mathcal{O}_Y -module \mathcal{G} to an \mathcal{O}_X -module \mathcal{F} . Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ and $\mathcal{V} : Y = \bigcup_{j \in J} V_j$ be open coverings. Assume that \mathcal{U} is a refinement of $f^{-1}\mathcal{V} : X = \bigcup_{j \in J} f^{-1}(V_j)$. In this case there exists a commutative diagram*

$$\begin{array}{ccc} \check{C}^\bullet(\mathcal{U}, \mathcal{F}) & \longrightarrow & R\Gamma(X, \mathcal{F}) \\ \uparrow \gamma & & \uparrow \\ \check{C}^\bullet(\mathcal{V}, \mathcal{G}) & \longrightarrow & R\Gamma(Y, \mathcal{G}) \end{array}$$

in $D^+(\mathcal{O}_X(X))$ with horizontal arrows given by Lemma 20.12.2 and right vertical arrow by (20.15.1.1). In particular we get commutative diagrams of cohomology groups

$$\begin{array}{ccc} \check{H}^p(\mathcal{U}, \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}) \\ \uparrow \gamma & & \uparrow \\ \check{H}^p(\mathcal{V}, \mathcal{G}) & \longrightarrow & H^p(Y, \mathcal{G}) \end{array}$$

where the right vertical arrow is (20.15.1.2)

Proof. We first define the left vertical arrow. Namely, choose a map $c : I \rightarrow J$ such that $U_i \subset f^{-1}(V_{c(i)})$ for all $i \in I$. In degree p we define the map by the rule

$$\gamma(s)_{i_0 \dots i_p} = \varphi(s)_{c(i_0) \dots c(i_p)}$$

This makes sense because φ does indeed induce maps $\mathcal{G}(V_{c(i_0) \dots c(i_p)}) \rightarrow \mathcal{F}(U_{i_0 \dots i_p})$ by assumption. It is also clear that this defines a morphism of complexes. Choose injective resolutions $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ on X and $\mathcal{G} \rightarrow \mathcal{J}^\bullet$ on Y . According to the proof of Lemma 20.12.2 we introduce the double complexes $A^{\bullet, \bullet}$ and $B^{\bullet, \bullet}$ with terms

$$B^{p,q} = \check{C}^p(\mathcal{V}, \mathcal{J}^q) \quad \text{and} \quad A^{p,q} = \check{C}^p(\mathcal{U}, \mathcal{I}^q).$$

As in Remark 20.15.2 above we also choose an injective resolution $f_*\mathcal{I} \rightarrow (\mathcal{J}')^\bullet$ on Y and a morphism of complexes $\beta : \mathcal{J} \rightarrow (\mathcal{J}')^\bullet$ making (20.15.2.1) commutes. We introduce some more double complexes, namely $(B')^{\bullet, \bullet}$ and $(B'')^{\bullet, \bullet}$ with

$$(B')^{p,q} = \check{C}^p(\mathcal{V}, (\mathcal{J}')^q) \quad \text{and} \quad (B'')^{p,q} = \check{C}^p(\mathcal{V}, f_*\mathcal{I}^q).$$

Note that there is an f -map of complexes from $f_*\mathcal{I}^\bullet$ to \mathcal{I}^\bullet . Hence it is clear that the same rule as above defines a morphism of double complexes

$$\gamma : (B'')^{\bullet, \bullet} \longrightarrow A^{\bullet, \bullet}.$$

Consider the diagram of complexes

$$\begin{array}{ccccccc} \check{C}^\bullet(\mathcal{U}, \mathcal{F}) & \longrightarrow & sA^\bullet & \longleftarrow & \Gamma(X, \mathcal{I}^\bullet) & & \\ \uparrow \gamma & & & & \swarrow s\gamma & \longleftarrow & \\ \check{C}^\bullet(\mathcal{V}, \mathcal{G}) & \longrightarrow & sB^\bullet & \xrightarrow{\beta} & s(B')^\bullet & \longleftarrow & s(B'')^\bullet \\ & & \uparrow qis & & \uparrow & & \uparrow \\ & & \Gamma(Y, \mathcal{J}^\bullet) & \xrightarrow{\beta} & \Gamma(Y, (\mathcal{J}')^\bullet) & \xleftarrow{qis} & \Gamma(Y, f_*\mathcal{I}^\bullet) \end{array}$$

The two horizontal arrows with targets sA^\bullet and sB^\bullet are the ones explained in Lemma 20.12.2. The left upper shape (a pentagon) is commutative simply because (20.15.2.1) is commutative. The two lower squares are trivially commutative. It is also immediate from the definitions that the right upper shape (a square) is commutative. The result of the lemma now follows from the definitions and the fact that going around the diagram on the outer sides from $\check{C}^\bullet(\mathcal{V}, \mathcal{G})$ to $\Gamma(X, \mathcal{I}^\bullet)$ either on top or on bottom is the same (where you have to invert any quasi-isomorphisms along the way). \square

20.17. Cohomology on Hausdorff quasi-compact spaces

For such a space Čech cohomology agrees with cohomology.

Lemma 20.17.1. *Let X be a topological space. Let \mathcal{F} be an abelian sheaf. Then the map $\check{H}^1(X, \mathcal{F}) \rightarrow H^1(X, \mathcal{F})$ defined in (20.16.0.2) is an isomorphism.*

Proof. Let \mathcal{U} be an open covering of X . By Lemma 20.12.4 there is an exact sequence

$$0 \rightarrow \check{H}^1(\mathcal{U}, \mathcal{F}) \rightarrow H^1(X, \mathcal{F}) \rightarrow \check{H}^0(\mathcal{U}, \underline{H}^1(\mathcal{F}))$$

Thus the map is injective. To show surjectivity it suffices to show that any element of $\check{H}^0(\mathcal{U}, \underline{H}^1(\mathcal{F}))$ maps to zero after replacing \mathcal{U} by a refinement. This is immediate from the definitions and the fact that $\underline{H}^1(\mathcal{F})$ is a presheaf of abelian groups whose sheafification is zero by locality of cohomology, see Lemma 20.7.2. \square

Lemma 20.17.2. *Let X be a Hausdorff and quasi-compact topological space. Let \mathcal{F} be an abelian sheaf on X . Then the map $\check{H}^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F})$ defined in (20.16.0.2) is an isomorphism for all p .*

Proof. We argue by induction on p that the map $c_{\mathcal{F}}^p : \check{H}^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F})$ is an isomorphism. For $p = 0$ the result is clear and for $p = 1$ the result holds by Lemma 20.17.1. Thus we may assume $p > 1$.

Choose an injective map $a : \mathcal{F} \rightarrow \mathcal{I}$, where \mathcal{I} is an injective abelian sheaf. Let $b : \mathcal{I} \rightarrow \mathcal{G}$ be the quotient by \mathcal{F} . Let $\xi = (\xi_{i_0 \dots i_p})$ be a cocycle of the Čech complex, giving rise to an element $\bar{\xi}$ of $\check{H}^p(\mathcal{U}, \mathcal{F})$. Then $a(\xi) = d(\eta)$ for some cochain η for \mathcal{I} by Lemma 20.12.1. The image $\theta = b(\eta)$ of η in the Čech complex for \mathcal{G} is a cocycle, hence gives rise to an element $\bar{\theta}$ in $\check{H}^{p-1}(\mathcal{U}, \mathcal{G})$. A straightforward argument (using $p \geq 2$ and hence the Čech complex of \mathcal{I} is acyclic in degree $p-1$) shows that the rule which assigns the element $\bar{\theta} \in \check{H}^{p-1}(\mathcal{U}, \mathcal{G})$ of θ to the class is well defined. It follows from the construction that $c_{\mathcal{F}}^p(\bar{\xi}) = \partial(c_{\mathcal{G}}^{p-1}(\bar{\theta}))$ where $\partial : H^{p-1}(X, \mathcal{G}) \rightarrow H^p(X, \mathcal{F})$ is the boundary coming from the short exact sequence $0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{G} \rightarrow 0$ (details omitted).

Conversely, let $\theta = (\theta_{i_0 \dots i_{p-1}})$ a cocycle of the Čech complex of \mathcal{G} for some open covering \mathcal{U} . We would like to lift θ to a cochain for \mathcal{I} . The problem is that the sequence of complexes

$$0 \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{I}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{G}) \rightarrow 0$$

may not be exact on the right. However, we know that for all p -tuples $i_0 \dots i_{p-1}$ of I there exists an open covering

$$U_{i_0} \cap \dots \cap U_{i_{p-1}} = \bigcup W_{i_0 \dots i_{p-1}, k}$$

such that $\theta_{i_0 \dots i_{p-1}}|_{W_{i_0 \dots i_{p-1}, k}}$ does lift to a section of \mathcal{I} over $W_{i_0 \dots i_{p-1}, k}$. Thus, by Topology, Lemma 5.12.4 after refining \mathcal{U} , we can lift θ to a $(p - 1)$ -cochain η in the Čech complex of \mathcal{I} . Then $d(\eta) = a(\xi)$ for some p -cocycle ξ for \mathcal{F} . In other words, every element of $\text{colim } \check{H}^{p-1}(\mathcal{U}, \mathcal{G})$ comes about by the construction of the previous paragraph from an element of $\text{colim } \check{H}^p(\mathcal{U}, \mathcal{F})$.

By the compatibility of the construction with the boundary map $\partial : H^{p-1}(X, \mathcal{G}) \rightarrow H^p(X, \mathcal{F})$, the surjectivity of the map, the induction hypothesis saying $\gamma_{\mathcal{G}}^{p-1}$ is an isomorphism, and the fact that $H^{p-1}(X, \mathcal{I}) = H^p(X, \mathcal{I}) = 0$, it follows formally that $c_{\mathcal{F}}^p$ is surjective. To show injectivity one has to show that, given ξ, η, θ linked as above, if θ is a boundary, then ξ becomes a boundary after replacing \mathcal{U} by a refinement. To do this argue as above, once more appealing to Topology, Lemma 5.12.4. Some details omitted. \square

Lemma 20.17.3. *Let X be a Hausdorff and locally quasi-compact space. Let $Z \subset X$ be a quasi-compact (hence closed) subset. For every abelian sheaf \mathcal{F} on X we have*

$$\text{colim } H^p(U, \mathcal{F}) \longrightarrow H^p(Z, \mathcal{F}|_Z)$$

where the colimit is over open neighbourhoods U of Z in X .

Proof. We first prove this for $p = 0$. Injectivity follows from the definition of $\mathcal{F}|_Z$ and holds in general (for any subset of any topological space X). Next, suppose that $s \in H^0(Z, \mathcal{F}|_Z)$. Then we can find opens $U_i \subset X$ such that $Z \subset \bigcup U_i$ and such that $s|_{Z \cap U_i}$ comes from $s_i \in \mathcal{F}(U_i)$. It follows that there exist opens $W_{ij} \subset U_i \cap U_j$ with $W_{ij} \cap Z = U_i \cap U_j \cap Z$ such that $s_i|_{W_{ij}} = s_j|_{W_{ij}}$. Applying Topology, Lemma 5.12.5 we find opens V_i of X such that $V_i \subset U_i$ and such that $V_i \cap V_j \subset W_{ij}$. Hence we see that $s_i|_{V_i}$ glue to a section of \mathcal{F} over the open neighbourhood $\bigcup V_i$ of Z .

To finish the proof, it suffices to show that if \mathcal{I} is an injective abelian sheaf on X , then $H^p(Z, \mathcal{I}|_Z) = 0$ for $p > 0$. This follows using short exact sequences and dimension shifting; details omitted. Thus, suppose $\bar{\xi}$ is an element of $H^p(Z, \mathcal{I}|_Z)$ for some $p > 0$. By Lemma 20.17.2 the element $\bar{\xi}$ comes from $\check{H}^p(\mathcal{V}, \mathcal{I}|_Z)$ for some open covering $\mathcal{V} : Z = \bigcup V_i$ of Z . Say $\bar{\xi}$ is the image of the class of a cocycle $\xi = (\xi_{i_0 \dots i_p})$ in $\check{C}^p(\mathcal{V}, \mathcal{I}|_Z)$.

Let $\mathcal{I}' \subset \mathcal{I}|_Z$ be the subsheaf defined by the rule

$$\mathcal{I}'(V) = \{s \in \mathcal{I}|_Z(V) \mid \exists (U, t), U \subset X \text{ open}, t \in \mathcal{I}(U), V = Z \cap U, s = t|_{Z \cap U}\}$$

Then $\mathcal{I}|_Z$ is the sheafification of \mathcal{I}' . Thus for every $(p + 1)$ -tuple $i_0 \dots i_p$ we can find an open covering $V_{i_0 \dots i_p} = \bigcup W_{i_0 \dots i_p, k}$ such that $\xi_{i_0 \dots i_p}|_{W_{i_0 \dots i_p, k}}$ is a section of \mathcal{I}' . Applying Topology, Lemma 5.12.4 we may after refining \mathcal{V} assume that each $\xi_{i_0 \dots i_p}$ is a section of the presheaf \mathcal{I}' .

Write $V_i = Z \cap U_i$ for some opens $U_i \subset X$. Since \mathcal{I} is flasque (Lemma 20.13.2) and since $\xi_{i_0 \dots i_p}$ is a section of \mathcal{I}' for every $(p + 1)$ -tuple $i_0 \dots i_p$ we can choose a section $s_{i_0 \dots i_p} \in \mathcal{I}(U_{i_0 \dots i_p})$ which restricts to $\xi_{i_0 \dots i_p}$ on $V_{i_0 \dots i_p} = Z \cap U_{i_0 \dots i_p}$. (This appeal to injectives being flasque can be avoided by an additional application of Topology, Lemma 5.12.5.) Let $s = (s_{i_0 \dots i_p})$ be the corresponding cochain for the open covering $U = \bigcup U_i$. Since $d(\xi) = 0$ we see that the sections $d(s)_{i_0 \dots i_{p+1}}$ restrict to zero on $Z \cap U_{i_0 \dots i_{p+1}}$. Hence, by the initial remarks of the proof, there exists open subsets $W_{i_0 \dots i_{p+1}} \subset U_{i_0 \dots i_{p+1}}$ with $Z \cap W_{i_0 \dots i_{p+1}} = Z \cap U_{i_0 \dots i_{p+1}}$ such

that $d(s)_{i_0 \dots i_{p+1}}|_{W_{i_0 \dots i_{p+1}}} = 0$. By Topology, Lemma 5.12.5 we can find $U'_i \subset U_i$ such that $Z \subset \bigcup U'_i$ and such that $U'_{i_0 \dots i_{p+1}} \subset W_{i_0 \dots i_{p+1}}$. Then $s' = (s'_{i_0 \dots i_p})$ with $s'_{i_0 \dots i_p} = s_{i_0 \dots i_p}|_{U'_{i_0 \dots i_p}}$ is a cocycle for \mathcal{I} for the open covering $U' = \bigcup U'_i$ of an open neighbourhood of Z . Since \mathcal{I} has trivial higher Čech cohomology groups (Lemma 20.12.1) we conclude that s' is a coboundary. It follows that the image of ξ in the Čech complex for the open covering $Z = \bigcup Z \cap U'_i$ is a coboundary and we are done. \square

20.18. The base change map

We will need to know how to construct the base change map in some cases. Since we have not yet discussed derived pullback we only discuss this in the case of a base change by a flat morphism of ringed spaces. Before we state the result, let us discuss flat pullback on the derived category. Namely, suppose that $g : X \rightarrow Y$ is a flat morphism of ringed spaces. By Modules, Lemma 17.17.2 the functor $g^* : Mod(\mathcal{O}_Y) \rightarrow Mod(\mathcal{O}_X)$ is exact. Hence it has a derived functor

$$g^* : D^+(Y) \rightarrow D^+(X)$$

which is computed by simply pulling back an representative of a given object in $D^+(Y)$, see Derived Categories, Lemma 13.17.8. Hence as indicated we indicate this functor by g^* rather than Lg^* .

Lemma 20.18.1. *Let*

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

be a commutative diagram of ringed spaces. Let \mathcal{F}^\bullet be a bounded below complex of \mathcal{O}_X -modules. Assume both g and g' are flat. Then there exists a canonical base change map

$$g^* Rf_* \mathcal{F}^\bullet \longrightarrow R(f')_*(g')^* \mathcal{F}^\bullet$$

in $D^+(S')$.

Proof. Choose injective resolutions $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ and $(g')^* \mathcal{F}^\bullet \rightarrow \mathcal{J}^\bullet$. By Lemma 20.12.10 we see that $(g')_* \mathcal{J}^\bullet$ is a complex of injectives representing $R(g')_*(g')^* \mathcal{F}^\bullet$. Hence by Derived Categories, Lemmas 13.18.6 and 13.18.7 the arrow β in the diagram

$$\begin{array}{ccc} (g')_*(g')^* \mathcal{F}^\bullet & \longrightarrow & (g')_* \mathcal{J}^\bullet \\ \text{adjunction} \uparrow & & \uparrow \beta \\ \mathcal{F}^\bullet & \longrightarrow & \mathcal{I}^\bullet \end{array}$$

exists and is unique up to homotopy. Pushing down to S we get

$$f_* \beta : f_* \mathcal{I}^\bullet \longrightarrow f_*(g')_* \mathcal{J}^\bullet = g_*(f')_* \mathcal{J}^\bullet$$

By adjunction of g^* and g_* we get a map of complexes $g^* f_* \mathcal{I}^\bullet \rightarrow (f')_* \mathcal{J}^\bullet$. Note that this map is unique up to homotopy since the only choice in the whole process was the choice of the map β and everything was done on the level of complexes. \square

Remark 20.18.2. The “correct” version of the base change map is map

$$Lg^*Rf_*\mathcal{F}^\bullet \longrightarrow R(f')_*L(g')^*\mathcal{F}^\bullet.$$

The construction of this map involves unbounded complexes, see Remark 20.29.2.

20.19. Proper base change in topology

In this section we prove a very general version of the proper base change theorem in topology. It tells us that the stalks of the higher direct images $R^p f_*$ can be computed on the fibre.

Lemma 20.19.1. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let $y \in Y$. Assume that*

- (1) X is Hausdorff and locally quasi-compact,
- (2) $f^{-1}(y)$ is quasi-compact, and
- (3) f is closed.

*Then for E in $D^+(\mathcal{O}_X)$ we have $(Rf_*E)_y = R\Gamma(f^{-1}(y), E|_{f^{-1}(y)})$ in $D^+(\mathcal{O}_{Y,y})$.*

Proof. The base change map of Lemma 20.18.1 gives a canonical map $(Rf_*E)_y \rightarrow R\Gamma(f^{-1}(y), E|_{f^{-1}(y)})$. To prove this map is an isomorphism, we represent E by a bounded below complex of injectives \mathcal{I}^\bullet . By Lemma 20.17.3 the restrictions $\mathcal{I}^n|_{f^{-1}(y)}$ are acyclic for $\Gamma(f^{-1}(y), -)$. Thus $R\Gamma(f^{-1}(y), E|_{f^{-1}(y)})$ is represented by the complex $\Gamma(f^{-1}(y), \mathcal{I}^\bullet|_{f^{-1}(y)})$, see Derived Categories, Lemma 13.17.7. In other words, we have to show the map

$$\text{colim}_V \mathcal{I}^\bullet(f^{-1}(V)) \longrightarrow \Gamma(f^{-1}(y), \mathcal{I}^\bullet|_{f^{-1}(y)})$$

is an isomorphism. Using Lemma 20.17.3 we see that it suffices to show that the collection of open neighbourhoods $f^{-1}(V)$ of $f^{-1}(y)$ is cofinal in the system of all open neighbourhoods. If $f^{-1}(y) \subset U$ is an open neighbourhood, then as f is closed the set $V = Y \setminus f(X \setminus U)$ is an open neighbourhood of y with $f^{-1}(V) \subset U$. This proves the lemma. \square

Theorem 20.19.2 (Proper base change). *Consider a cartesian square of Hausdorff, locally quasi-compact topological spaces*

$$\begin{array}{ccc} X' = Y' \times_Y X & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

and assume that f is proper. Let E be an object of $D^+(X)$. Then the base change map

$$g^{-1}Rf_*E \longrightarrow Rf'_*(g')^{-1}E$$

of Lemma 20.18.1 is an isomorphism in $D^+(Y')$.

Proof. Let $y' \in Y'$ be a point with image $y \in Y$. It suffices to show that the base change map induces an isomorphism on stalks at y' . As f is proper it follows that f' is proper, the fibres of f and f' are quasi-compact and f and f' are closed, see Topology, Theorem 5.16.5. Thus we can apply Lemma 20.19.1 twice to see that

$$(Rf'_*(g')^{-1}E)_{y'} = R\Gamma((f')^{-1}(y'), (g')^{-1}E|_{(f')^{-1}(y')})$$

and

$$(Rf_*E)_y = R\Gamma(f^{-1}(y), E|_{f^{-1}(y)})$$

The induced map of fibres $(f')^{-1}(y') \rightarrow f^{-1}(y)$ is a homeomorphism of topological spaces and the pull back of $E|_{f^{-1}(y)}$ is $(g')^{-1}E|_{(f')^{-1}(y')}$. The desired result follows. \square

20.20. Cohomology and colimits

Let X be a ringed space. Let $(\mathcal{F}_i, \varphi_{ii'})$ be a directed system of sheaves of \mathcal{O}_X -modules over the partially ordered set I , see Categories, Section 4.21. Since for each i there is a canonical map $\mathcal{F}_i \rightarrow \operatorname{colim}_i \mathcal{F}_i$ we get a canonical map

$$\operatorname{colim}_i H^p(X, \mathcal{F}_i) \longrightarrow H^p(X, \operatorname{colim}_i \mathcal{F}_i)$$

for every $p \geq 0$. Of course there is a similar map for every open $U \subset X$. These maps are in general not isomorphisms, even for $p = 0$. In this section we generalize the results of Sheaves, Lemma 6.29.1. See also Modules, Lemma 17.11.6 (in the special case $\mathcal{G} = \mathcal{O}_X$).

Lemma 20.20.1. *Let X be a ringed space. Assume that the underlying topological space of X has the following properties:*

- (1) *there exists a basis of quasi-compact open subsets, and*
- (2) *the intersection of any two quasi-compact opens is quasi-compact.*

Then for any directed system $(\mathcal{F}_i, \varphi_{ii'})$ of sheaves of \mathcal{O}_X -modules and for any quasi-compact open $U \subset X$ the canonical map

$$\operatorname{colim}_i H^q(U, \mathcal{F}_i) \longrightarrow H^q(U, \operatorname{colim}_i \mathcal{F}_i)$$

is an isomorphism for every $q \geq 0$.

Proof. It is important in this proof to argue for all quasi-compact opens $U \subset X$ at the same time. The result is true for $i = 0$ and any quasi-compact open $U \subset X$ by Sheaves, Lemma 6.29.1 (combined with Topology, Lemma 5.26.1). Assume that we have proved the result for all $q \leq q_0$ and let us prove the result for $q = q_0 + 1$.

By our conventions on directed systems the index set I is directed, and any system of \mathcal{O}_X -modules $(\mathcal{F}_i, \varphi_{ii'})$ over I is directed. By Injectives, Lemma 19.5.1 the category of \mathcal{O}_X -modules has functorial injective embeddings. Thus for any system $(\mathcal{F}_i, \varphi_{ii'})$ there exists a system $(\mathcal{I}_i, \varphi_{ii'})$ with each \mathcal{I}_i an injective \mathcal{O}_X -module and a morphism of systems given by injective \mathcal{O}_X -module maps $\mathcal{F}_i \rightarrow \mathcal{I}_i$. Denote \mathcal{Q}_i the cokernel so that we have short exact sequences

$$0 \rightarrow \mathcal{F}_i \rightarrow \mathcal{I}_i \rightarrow \mathcal{Q}_i \rightarrow 0.$$

We claim that the sequence

$$0 \rightarrow \operatorname{colim}_i \mathcal{F}_i \rightarrow \operatorname{colim}_i \mathcal{I}_i \rightarrow \operatorname{colim}_i \mathcal{Q}_i \rightarrow 0.$$

is also a short exact sequence of \mathcal{O}_X -modules. We may check this on stalks. By Sheaves, Sections 6.28 and 6.29 taking stalks commutes with colimits. Since a directed colimit of short exact sequences of abelian groups is short exact (see Algebra, Lemma 10.8.9) we deduce the result. We claim that $H^q(U, \operatorname{colim}_i \mathcal{I}_i) = 0$ for all quasi-compact open $U \subset X$ and all $q \geq 1$. Accepting this claim for the moment

consider the diagram

$$\begin{array}{ccccccc}
 \operatorname{colim}_i H^{q_0}(U, \mathcal{I}_i) & \longrightarrow & \operatorname{colim}_i H^{q_0}(U, \mathcal{Q}_i) & \longrightarrow & \operatorname{colim}_i H^{q_0+1}(U, \mathcal{F}_i) & \longrightarrow & 0 \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 H^{q_0}(U, \operatorname{colim}_i \mathcal{I}_i) & \longrightarrow & H^{q_0}(U, \operatorname{colim}_i \mathcal{Q}_i) & \longrightarrow & H^{q_0+1}(U, \operatorname{colim}_i \mathcal{F}_i) & \longrightarrow & 0
 \end{array}$$

The zero at the lower right corner comes from the claim and the zero at the upper right corner comes from the fact that the sheaves \mathcal{I}_i are injective. The top row is exact by an application of Algebra, Lemma 10.8.9. Hence by the snake lemma we deduce the result for $q = q_0 + 1$.

It remains to show that the claim is true. We will use Lemma 20.12.8. Let \mathcal{B} be the collection of all quasi-compact open subsets of X . This is a basis for the topology on X by assumption. Let Cov be the collection of finite open coverings $\mathcal{U} : U = \bigcup_{j=1, \dots, m} U_j$ with each of U, U_j quasi-compact open in X . By the result for $q = 0$ we see that for $\mathcal{U} \in \operatorname{Cov}$ we have

$$\check{C}^\bullet(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i) = \operatorname{colim}_i \check{C}^\bullet(\mathcal{U}, \mathcal{I}_i)$$

because all the multiple intersections $U_{j_0 \dots j_p}$ are quasi-compact. By Lemma 20.12.1 each of the complexes in the colimit of Čech complexes is acyclic in degree ≥ 1 . Hence by Algebra, Lemma 10.8.9 we see that also the Čech complex $\check{C}^\bullet(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i)$ is acyclic in degrees ≥ 1 . In other words we see that $\check{H}^p(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i) = 0$ for all $p \geq 1$. Thus the assumptions of Lemma 20.12.8 are satisfied and the claim follows. \square

Next we formulate the analogy of Sheaves, Lemma 6.29.4 for cohomology. Let X be a spectral space which is written as a cofiltered limit of spectral spaces X_i for a diagram with spectral transition morphisms as in Topology, Lemma 5.23.5. Assume given

- (1) an abelian sheaf \mathcal{F}_i on X_i for all $i \in \operatorname{Ob}(\mathcal{I})$,
- (2) for $a : j \rightarrow i$ an f_a -map $\varphi_a : \mathcal{F}_i \rightarrow \mathcal{F}_j$ of abelian sheaves (see Sheaves, Definition 6.21.7)

such that $\varphi_c = \varphi_b \circ \varphi_a$ whenever $c = a \circ b$. Set $\mathcal{F} = \operatorname{colim} p_i^{-1} \mathcal{F}_i$ on X .

Lemma 20.20.2. *In the situation discussed above. Let $i \in \operatorname{Ob}(\mathcal{I})$ and let $U_i \subset X_i$ be quasi-compact open. Then*

$$\operatorname{colim}_{a:j \rightarrow i} H^p(f_a^{-1}(U_i), \mathcal{F}_j) = H^p(p_i^{-1}(U_i), \mathcal{F})$$

for all $p \geq 0$. In particular we have $H^p(X, \mathcal{F}) = \operatorname{colim} H^p(X_i, \mathcal{F}_i)$.

Proof. The case $p = 0$ is Sheaves, Lemma 6.29.4.

In this paragraph we show that we can find a map of systems $(\gamma_i) : (\mathcal{F}_i, \varphi_a) \rightarrow (\mathcal{G}_i, \psi_a)$ with \mathcal{G}_i an injective abelian sheaf and γ_i injective. For each i we pick an injection $\mathcal{F}_i \rightarrow \mathcal{I}_i$ where \mathcal{I}_i is an injective abelian sheaf on X_i . Then we can consider the family of maps

$$\gamma_i : \mathcal{F}_i \longrightarrow \prod_{b:k \rightarrow i} f_{b,*} \mathcal{I}_k = \mathcal{G}_i$$

where the component maps are the maps adjoint to the maps $f_b^{-1} \mathcal{F}_i \rightarrow \mathcal{F}_k \rightarrow \mathcal{I}_k$. For $a : j \rightarrow i$ in \mathcal{I} there is a canonical map

$$\psi_a : f_a^{-1} \mathcal{G}_i \rightarrow \mathcal{G}_j$$

whose components are the canonical maps $f_b^{-1}f_{a \circ b, *} \mathcal{I}_k \rightarrow f_{b, *} \mathcal{I}_k$ for $b : k \rightarrow j$. Thus we find an injection $\{\gamma_i\} : \{\mathcal{F}_i, \varphi_a\} \rightarrow (\mathcal{G}_i, \psi_a)$ of systems of abelian sheaves. Note that \mathcal{G}_i is an injective sheaf of abelian groups on \mathcal{C}_i , see Lemma 20.12.10 and Homology, Lemma 12.23.3. This finishes the construction.

Arguing exactly as in the proof of Lemma 20.20.1 we see that it suffices to prove that $H^p(X, \operatorname{colim} f_i^{-1} \mathcal{G}_i) = 0$ for $p > 0$.

Set $\mathcal{G} = \operatorname{colim} f_i^{-1} \mathcal{G}_i$. To show vanishing of cohomology of \mathcal{G} on every quasi-compact open of X , it suffices to show that the Čech cohomology of \mathcal{G} for any covering \mathcal{U} of a quasi-compact open of X by finitely many quasi-compact opens is zero, see Lemma 20.12.8. Such a covering is the inverse by p_i of such a covering \mathcal{U}_i on the space X_i for some i by Topology, Lemma 5.23.6. We have

$$\check{C}^\bullet(\mathcal{U}, \mathcal{G}) = \operatorname{colim}_{a: j \rightarrow i} \check{C}^\bullet(f_a^{-1}(\mathcal{U}_i), \mathcal{G}_j)$$

by the case $p = 0$. The right hand side is a filtered colimit of complexes each of which is acyclic in positive degrees by Lemma 20.12.1. Thus we conclude by Algebra, Lemma 10.8.9. \square

20.21. Vanishing on Noetherian topological spaces

The aim is to prove a theorem of Grothendieck namely Proposition 20.21.6. See [Gro57].

Lemma 20.21.1. *Let $i : Z \rightarrow X$ be a closed immersion of topological spaces. For any abelian sheaf \mathcal{F} on Z we have $H^p(Z, \mathcal{F}) = H^p(X, i_* \mathcal{F})$.*

Proof. This is true because i_* is exact (see Modules, Lemma 17.6.1), and hence $R^p i_* = 0$ as a functor (Derived Categories, Lemma 13.17.8). Thus we may apply Lemma 20.14.6. \square

Lemma 20.21.2. *Let X be an irreducible topological space. Then $H^p(X, \underline{A}) = 0$ for all $p > 0$ and any abelian group A .*

Proof. Recall that \underline{A} is the constant sheaf as defined in Sheaves, Definition 6.7.4. It is clear that for any nonempty open $U \subset X$ we have $\underline{A}(U) = A$ as X is irreducible (and hence U is connected). We will show that the higher Čech cohomology groups $H^p(\mathcal{U}, \underline{A})$ are zero for any open covering $\mathcal{U} : U = \bigcup_{i \in I} U_i$ of an open $U \subset X$. Then the lemma will follow from Lemma 20.12.7.

Recall that the value of an abelian sheaf on the empty open set is 0. Hence we may clearly assume $U_i \neq \emptyset$ for all $i \in I$. In this case we see that $U_i \cap U_{i'} \neq \emptyset$ for all $i, i' \in I$. Hence we see that the Čech complex is simply the complex

$$\prod_{i_0 \in I} A \rightarrow \prod_{(i_0, i_1) \in I^2} A \rightarrow \prod_{(i_0, i_1, i_2) \in I^3} A \rightarrow \dots$$

We have to see this has trivial higher cohomology groups. We can see this for example because this is the Čech complex for the covering of a 1-point space and Čech cohomology agrees with cohomology on such a space. (You can also directly verify it by writing an explicit homotopy.) \square

Lemma 20.21.3. *Let X be a topological space such that the intersection of any two quasi-compact opens is quasi-compact. Let $\mathcal{F} \subset \underline{\mathbf{Z}}$ be a subsheaf generated by finitely many sections over quasi-compact opens. Then there exists a finite filtration*

$$(0) = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_n = \mathcal{F}$$

by abelian subsheaves such that for each $0 < i \leq n$ there exists a short exact sequence

$$0 \rightarrow j'_! \underline{\mathbf{Z}}_V \rightarrow j'_! \underline{\mathbf{Z}}_U \rightarrow \mathcal{F}_i / \mathcal{F}_{i-1} \rightarrow 0$$

with $j : U \rightarrow X$ and $j' : V \rightarrow X$ the inclusion of quasi-compact opens into X .

Proof. Say \mathcal{F} is generated by the sections s_1, \dots, s_t over the quasi-compact opens U_1, \dots, U_t . Since U_i is quasi-compact and s_i a locally constant function to \mathbf{Z} we may assume, after possibly replacing U_i by the parts of a finite decomposition into open and closed subsets, that s_i is a constant section. Say $s_i = n_i$ with $n_i \in \mathbf{Z}$. Of course we can remove (U_i, n_i) from the list if $n_i = 0$. Flipping signs if necessary we may also assume $n_i > 0$. Next, for any subset $I \subset \{1, \dots, t\}$ we may add $\bigcup_{i \in I} U_i$ and $\gcd(n_i, i \in I)$ to the list. After doing this we see that our list $(U_1, n_1), \dots, (U_t, n_t)$ satisfies the following property: For $x \in X$ set $I_x = \{i \in \{1, \dots, t\} \mid x \in U_i\}$. Then $\gcd(n_i, i \in I_x)$ is attained by n_i for some $i \in I_x$.

As our filtration we take $\mathcal{F}_0 = (0)$ and \mathcal{F}_n generated by the sections n_i over U_i for those i such that $n_i \leq n$. It is clear that $\mathcal{F}_n = \mathcal{F}$ for $n \gg 0$. Moreover, the quotient $\mathcal{F}_n / \mathcal{F}_{n-1}$ is generated by the section n over $U = \bigcup_{n_i \leq n} U_i$ and the kernel of the map $j'_! \underline{\mathbf{Z}}_U \rightarrow \mathcal{F}_n / \mathcal{F}_{n-1}$ is generated by the section n over $V = \bigcup_{n_i \leq n-1} U_i$. Thus a short exact sequence as in the statement of the lemma. \square

Lemma 20.21.4. *Let X be a topological space. Let $d \geq 0$ be an integer. Assume*

- (1) *X is quasi-compact,*
- (2) *the quasi-compact opens form a basis for X , and*
- (3) *the intersection of two quasi-compact opens is quasi-compact.*
- (4) *$H^p(X, j'_! \underline{\mathbf{Z}}_U) = 0$ for all $p > d$ and any quasi-compact open $j : U \rightarrow X$.*

Then $H^p(X, \mathcal{F}) = 0$ for all $p > d$ and any abelian sheaf \mathcal{F} on X .

Proof. Let $S = \coprod_{U \subset X} \mathcal{F}(U)$ where U runs over the quasi-compact opens of X . For any finite subset $A = \{s_1, \dots, s_n\} \subset S$, let \mathcal{F}_A be the subsheaf of \mathcal{F} generated by all s_i (see Modules, Definition 17.4.5). Note that if $A \subset A'$, then $\mathcal{F}_A \subset \mathcal{F}_{A'}$. Hence $\{\mathcal{F}_A\}$ forms a system over the directed partially ordered set of finite subsets of S . By Modules, Lemma 17.4.6 it is clear that

$$\text{colim}_A \mathcal{F}_A = \mathcal{F}$$

by looking at stalks. By Lemma 20.20.1 we have

$$H^p(X, \mathcal{F}) = \text{colim}_A H^p(X, \mathcal{F}_A)$$

Hence it suffices to prove the vanishing for the abelian sheaves \mathcal{F}_A . In other words, it suffices to prove the result when \mathcal{F} is generated by finitely many local sections over quasi-compact opens of X .

Suppose that \mathcal{F} is generated by the local sections s_1, \dots, s_n . Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf generated by s_1, \dots, s_{n-1} . Then we have a short exact sequence

$$0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F} / \mathcal{F}' \rightarrow 0$$

From the long exact sequence of cohomology we see that it suffices to prove the vanishing for the abelian sheaves \mathcal{F}' and \mathcal{F}/\mathcal{F}' which are generated by fewer than n local sections. Hence it suffices to prove the vanishing for sheaves generated by at most one local section. These sheaves are exactly the quotients of the sheaves $j_!\underline{\mathbf{Z}}_U$ where U is a quasi-compact open of X .

Assume now that we have a short exact sequence

$$0 \rightarrow \mathcal{K} \rightarrow j_!\underline{\mathbf{Z}}_U \rightarrow \mathcal{F} \rightarrow 0$$

with U quasi-compact open in X . It suffices to show that $H^q(X, \mathcal{K})$ is zero for $q \geq d+1$. As above we can write \mathcal{K} as the filtered colimit of subsheaves \mathcal{K}' generated by finitely many sections over quasi-compact opens. Then \mathcal{F} is the filtered colimit of the sheaves $j_!\underline{\mathbf{Z}}_U/\mathcal{K}'$. In this way we reduce to the case that \mathcal{K} is generated by finitely many sections over quasi-compact opens. Note that \mathcal{K} is a subsheaf of $\underline{\mathbf{Z}}_X$. Thus by Lemma 20.21.3 there exists a finite filtration of \mathcal{K} whose successive quotients \mathcal{Q} fit into a short exact sequence

$$0 \rightarrow j''_!\underline{\mathbf{Z}}_W \rightarrow j'_!\underline{\mathbf{Z}}_V \rightarrow \mathcal{Q} \rightarrow 0$$

with $j'' : W \rightarrow X$ and $j' : V \rightarrow X$ the inclusions of quasi-compact opens. Hence the vanishing of $H^p(X, \mathcal{Q})$ for $p > d$ follows from our assumption (in the lemma) on the vanishing of the cohomology groups of $j''_!\underline{\mathbf{Z}}_W$ and $j'_!\underline{\mathbf{Z}}_V$. Returning to \mathcal{K} this, via an induction argument using the long exact cohomology sequence, implies the desired vanishing for it as well. \square

Lemma 20.21.5. *Let X be an irreducible topological space. Let $\mathcal{H} \subset \underline{\mathbf{Z}}$ be an abelian subsheaf of the constant sheaf. Then there exists a nonempty open $U \subset X$ such that $\mathcal{H}|_U = d\underline{\mathbf{Z}}_U$ for some $d \in \mathbf{Z}$.*

Proof. Recall that $\underline{\mathbf{Z}}(V) = \mathbf{Z}$ for any nonempty open V of X (see proof of Lemma 20.21.2). If $\mathcal{H} = 0$, then the lemma holds with $d = 0$. If $\mathcal{H} \neq 0$, then there exists a nonempty open $U \subset X$ such that $\mathcal{H}(U) \neq 0$. Say $\mathcal{H}(U) = n\mathbf{Z}$ for some $n \geq 1$. Hence we see that $n\underline{\mathbf{Z}}_U \subset \mathcal{H}|_U \subset \underline{\mathbf{Z}}_U$. If the first inclusion is strict we can find a nonempty $U' \subset U$ and an integer $1 \leq n' < n$ such that $n'\underline{\mathbf{Z}}_{U'} \subset \mathcal{H}|_{U'} \subset \underline{\mathbf{Z}}_{U'}$. This process has to stop after a finite number of steps, and hence we get the lemma. \square

Proposition 20.21.6 (Grothendieck). *Let X be a Noetherian topological space. If $\dim(X) \leq d$, then $H^p(X, \mathcal{F}) = 0$ for all $p > d$ and any abelian sheaf \mathcal{F} on X .*

Proof. We prove this lemma by induction on d . So fix d and assume the lemma holds for all Noetherian topological spaces of dimension $< d$.

Let \mathcal{F} be an abelian sheaf on X . Suppose $U \subset X$ is an open. Let $Z \subset X$ denote the closed complement. Denote $j : U \rightarrow X$ and $i : Z \rightarrow X$ the inclusion maps. Then there is a short exact sequence

$$0 \rightarrow j_!j^*\mathcal{F} \rightarrow \mathcal{F} \rightarrow i_*i^*\mathcal{F} \rightarrow 0$$

see Modules, Lemma 17.7.1. Note that $j_!j^*\mathcal{F}$ is supported on the topological closure Z' of U , i.e., it is of the form $i'_*\mathcal{F}'$ for some abelian sheaf \mathcal{F}' on Z' , where $i' : Z' \rightarrow X$ is the inclusion.

We can use this to reduce to the case where X is irreducible. Namely, according to Topology, Lemma 5.8.2 X has finitely many irreducible components. If X has more than one irreducible component, then let $Z \subset X$ be an irreducible component

of X and set $U = X \setminus Z$. By the above, and the long exact sequence of cohomology, it suffices to prove the vanishing of $H^p(X, i_* i^* \mathcal{F})$ and $H^p(X, i'_* \mathcal{F}')$ for $p > d$. By Lemma 20.21.1 it suffices to prove $H^p(Z, i^* \mathcal{F})$ and $H^p(Z', \mathcal{F}')$ vanish for $p > d$. Since Z' and Z have fewer irreducible components we indeed reduce to the case of an irreducible X .

If $d = 0$ and $X = \{*\}$, then every sheaf is constant and higher cohomology groups vanish (for example by Lemma 20.21.2).

Suppose X is irreducible of dimension d . By Lemma 20.21.4 we reduce to the case where $\mathcal{F} = j_! \underline{\mathcal{Z}}_U$ for some open $U \subset X$. In this case we look at the short exact sequence

$$0 \rightarrow j_!(\underline{\mathcal{Z}}_U) \rightarrow \underline{\mathcal{Z}}_X \rightarrow i_* \underline{\mathcal{Z}}_Z \rightarrow 0$$

where $Z = X \setminus U$. By Lemma 20.21.2 we have the vanishing of $H^p(X, \underline{\mathcal{Z}}_X)$ for all $p \geq 1$. By induction we have $H^p(X, i_* \underline{\mathcal{Z}}_Z) = H^p(Z, \underline{\mathcal{Z}}_Z) = 0$ for $p \geq d$. Hence we win by the long exact cohomology sequence. \square

20.22. Cohomology with support in a closed

Let X be a topological space and let $Z \subset X$ be a closed subset. Let \mathcal{F} be an abelian sheaf on X . We let

$$\Gamma_Z(X, \mathcal{F}) = \{s \in \mathcal{F}(X) \mid \text{Supp}(s) \subset Z\}$$

be the sections with support in Z (Modules, Definition 17.5.1). This is a left exact functor which is not exact in general. Hence we obtain a derived functor

$$R\Gamma_Z(X, -) : D(X) \longrightarrow D(\text{Ab})$$

and cohomology groups with support in Z defined by $H_Z^q(X, \mathcal{F}) = R^q \Gamma_Z(X, \mathcal{F})$.

Let \mathcal{I} be an injective abelian sheaf on X . Let $U = X \setminus Z$. Then the restriction map $\mathcal{I}(X) \rightarrow \mathcal{I}(U)$ is surjective (Lemma 20.9.1) with kernel $\Gamma_Z(X, \mathcal{I})$. It immediately follows that for $K \in D(X)$ there is a distinguished triangle

$$R\Gamma_Z(X, K) \rightarrow R\Gamma(X, K) \rightarrow R\Gamma(U, K) \rightarrow R\Gamma_Z(X, K)[1]$$

in $D(\text{Ab})$. As a consequence we obtain a long exact cohomology sequence

$$\dots \rightarrow H_Z^i(X, K) \rightarrow H^i(X, K) \rightarrow H^i(U, K) \rightarrow H_Z^{i+1}(X, K) \rightarrow \dots$$

for any K in $D(X)$.

For an abelian sheaf \mathcal{F} on X we can consider the *subsheaf of sections with support in Z* , denoted $\mathcal{H}_Z(\mathcal{F})$, defined by the rule

$$\mathcal{H}_Z(\mathcal{F})(U) = \{s \in \mathcal{F}(U) \mid \text{Supp}(s) \subset U \cap Z\}$$

Using the equivalence of Modules, Lemma 17.6.1 we may view $\mathcal{H}_Z(\mathcal{F})$ as an abelian sheaf on Z (see also Modules, Lemmas 17.6.2 and 17.6.3). Thus we obtain a functor

$$\text{Ab}(X) \longrightarrow \text{Ab}(Z), \quad \mathcal{F} \longmapsto \mathcal{H}_Z(\mathcal{F}) \text{ viewed as a sheaf on } Z$$

which is left exact, but in general not exact.

Lemma 20.22.1. *Let $i : Z \rightarrow X$ be the inclusion of a closed subset. Let \mathcal{I} be an injective abelian sheaf on X . Then $\mathcal{H}_Z(\mathcal{I})$ is an injective abelian sheaf on Z .*

Proof. Observe that for any abelian sheaf \mathcal{G} on Z we have

$$\mathrm{Hom}_Z(\mathcal{G}, \mathcal{H}_Z(\mathcal{F})) = \mathrm{Hom}_X(i_*\mathcal{G}, \mathcal{F})$$

because after all any section of $i_*\mathcal{G}$ has support in Z . Since i_* is exact (Modules, Lemma 17.6.1) and \mathcal{I} injective on X we conclude that $\mathcal{H}_Z(\mathcal{I})$ is injective on Z . \square

Denote

$$R\mathcal{H}_Z : D(X) \longrightarrow D(Z)$$

the derived functor. We set $\mathcal{H}_Z^q(\mathcal{F}) = R^q\mathcal{H}_Z(\mathcal{F})$ so that $\mathcal{H}_Z^0(\mathcal{F}) = \mathcal{H}_Z(\mathcal{F})$. By the lemma above we have a Grothendieck spectral sequence

$$E_2^{p,q} = H^p(Z, \mathcal{H}_Z^q(\mathcal{F})) \Rightarrow H_Z^{p+q}(X, \mathcal{F})$$

Lemma 20.22.2. *Let $i : Z \rightarrow X$ be the inclusion of a closed subset. Let \mathcal{G} be an injective abelian sheaf on Z . Then $\mathcal{H}_Z^p(i_*\mathcal{G}) = 0$ for $p > 0$.*

Proof. This is true because the functor i_* is exact and transforms injective abelian sheaves into injective abelian sheaves by Lemma 20.12.10. \square

Let X be a topological space and let $Z \subset X$ be a closed subset. We denote $D_Z(X)$ the strictly full saturated triangulated subcategory of $D(X)$ consisting of complexes whose cohomology sheaves are supported on Z .

Lemma 20.22.3. *Let $i : Z \rightarrow X$ be the inclusion of a closed subset of a topological space X . The map $Ri_* = i_* : D(Z) \rightarrow D(X)$ induces an equivalence $D(Z) \rightarrow D_Z(X)$ with quasi-inverse*

$$i^{-1}|_{D_Z(X)} = R\mathcal{H}_Z|_{D_Z(X)}$$

Proof. Recall that i^{-1} and i_* is an adjoint pair of exact functors such that $i^{-1}i_*$ is isomorphic to the identity functor on abelian sheaves. See Modules, Lemmas 17.3.3 and 17.6.1. Thus $i_* : D(Z) \rightarrow D_Z(X)$ is fully faithful and i^{-1} determines a left inverse. On the other hand, suppose that K is an object of $D_Z(X)$ and consider the adjunction map $K \rightarrow i_*i^{-1}K$. Using exactness of i_* and i^{-1} this induces the adjunction maps $H^n(K) \rightarrow i_*i^{-1}H^n(K)$ on cohomology sheaves. Since these cohomology sheaves are supported on Z we see these adjunction maps are isomorphisms and we conclude that $D(Z) \rightarrow D_Z(X)$ is an equivalence.

To finish the proof we have to show that $R\mathcal{H}_Z(K) = i^{-1}K$ if K is an object of $D_Z(X)$. To do this we can use that $K = i_*i^{-1}K$ as we've just proved this is the case. Then we can choose a K -injective representative \mathcal{I}^\bullet for $i^{-1}K$. Since i_* is the right adjoint to the exact functor i^{-1} , the complex $i_*\mathcal{I}^\bullet$ is K -injective (Derived Categories, Lemma 13.29.10). We see that $R\mathcal{H}_Z(K)$ is computed by $\mathcal{H}_Z(i_*\mathcal{I}^\bullet) = \mathcal{I}^\bullet$ as desired. \square

20.23. Cohomology on spectral spaces

A key result on the cohomology of spectral spaces is Lemma 20.20.2 which loosely speaking says that cohomology commutes with cofiltered limits in the category of spectral spaces as defined in Topology, Definition 5.22.1. This can be applied to give analogues of Lemmas 20.17.3 and 20.19.1 as follows.

Lemma 20.23.1. *Let X be a spectral space. Let \mathcal{F} be an abelian sheaf on X . Let $E \subset X$ be a quasi-compact subset. Let $W \subset X$ be the set of points of X which specialize to a point of E .*

- (1) $H^p(W, \mathcal{F}|_W) = \operatorname{colim} H^p(U, \mathcal{F})$ where the colimit is over quasi-compact open neighbourhoods of E ,
- (2) $H^p(W \setminus E, \mathcal{F}|_{W \setminus E}) = \operatorname{colim} H^p(U \setminus E, \mathcal{F}|_{U \setminus E})$ if E is a constructible subset.

Proof. From Topology, Lemma 5.23.7 we see that $W = \lim U$ where the limit is over the quasi-compact opens containing E . Each U is a spectral space by Topology, Lemma 5.22.4. Thus we may apply Lemma 20.20.2 to conclude that (1) holds. The same proof works for part (2) except we use Topology, Lemma 5.23.8. \square

Lemma 20.23.2. *Let $f : X \rightarrow Y$ be a spectral map of spectral spaces. Let $y \in Y$. Let $E \subset Y$ be the set of points specializing to y . Let \mathcal{F} be an abelian sheaf on X . Then $(R^p f_* \mathcal{F})_y = H^p(f^{-1}(E), \mathcal{F}|_{f^{-1}(E)})$.*

Proof. Observe that $E = \bigcap V$ where V runs over the quasi-compact open neighbourhoods of y in Y . Hence $f^{-1}(E) = \bigcap f^{-1}(V)$. This implies that $f^{-1}(E) = \lim f^{-1}(V)$ as topological spaces. Since f is spectral, each $f^{-1}(V)$ is a spectral space too (Topology, Lemma 5.22.4). We conclude that $f^{-1}(E)$ is a spectral space and that

$$H^p(f^{-1}(E), \mathcal{F}|_{f^{-1}(E)}) = \operatorname{colim} H^p(f^{-1}(V), \mathcal{F})$$

by Lemma 20.20.2. On the other hand, the stalk of $R^p f_* \mathcal{F}$ at y is given by the colimit on the right. \square

Lemma 20.23.3. *Let X be a profinite topological space. Then $H^q(X, \mathcal{F}) = 0$ for all $q > 0$ and all abelian sheaves \mathcal{F} .*

Proof. Any open covering of X can be refined by a finite disjoint union decomposition with open parts, see Topology, Lemma 5.21.3. Hence if $\mathcal{F} \rightarrow \mathcal{G}$ is a surjection of abelian sheaves on X , then $\mathcal{F}(X) \rightarrow \mathcal{G}(X)$ is surjective. In other words, the global sections functor is an exact functor. Therefore its higher derived functors are zero, see Derived Categories, Lemma 13.17.8. \square

The following result on cohomological vanishing improves Grothendieck’s result (Proposition 20.21.6) and can be found in [Sch92].

Proposition 20.23.4. *Let X be a spectral space of Krull dimension d . Let \mathcal{F} be an abelian sheaf on X .*

- (1) $H^q(X, \mathcal{F}) = 0$ for $q > d$,
- (2) $H^d(X, \mathcal{F}) \rightarrow H^d(U, \mathcal{F})$ is surjective for every quasi-compact open $U \subset X$,
- (3) $H^q_Z(X, \mathcal{F}) = 0$ for $q > d$ and any constructible closed subset $Z \subset X$.

Proof. We prove this result by induction on d .

If $d = 0$, then X is a profinite space, see Topology, Lemma 5.22.7. Thus (1) holds by Lemma 20.23.3. If $U \subset X$ is quasi-compact open, then U is also closed as a quasi-compact subset of a Hausdorff space. Hence $X = U \coprod (X \setminus U)$ as a topological space and we see that (2) holds. Given Z as in (3) we consider the long exact sequence

$$H^{q-1}(X, \mathcal{F}) \rightarrow H^{q-1}(X \setminus Z, \mathcal{F}) \rightarrow H^q_Z(X, \mathcal{F}) \rightarrow H^q(X, \mathcal{F})$$

Since X and $U = X \setminus Z$ are profinite (namely U is quasi-compact because Z is constructible) and since we have (2) and (1) we obtain the desired vanishing of the cohomology groups with support in Z .

Induction step. Assume $d \geq 1$ and assume the proposition is valid for all spectral spaces of dimension $< d$. We first prove part (2) for X . Let U be a quasi-compact

open. Let $\xi \in H^d(U, \mathcal{F})$. Set $Z = X \setminus U$. Let $W \subset X$ be the set of points specializing to Z . By Lemma 20.23.1 we have

$$H^d(W \setminus Z, \mathcal{F}|_{W \setminus Z}) = \operatorname{colim}_{Z \subset V} H^d(V \setminus Z, \mathcal{F})$$

where the colimit is over the quasi-compact open neighbourhoods V of Z in X . By Topology, Lemma 5.23.7 we see that $W \setminus Z$ is a spectral space. Since every point of W specializes to a point of Z , we see that $W \setminus Z$ is a spectral space of Krull dimension $< d$. By induction hypothesis we see that the image of ξ in $H^d(W \setminus Z, \mathcal{F}|_{W \setminus Z})$ is zero. By the displayed formula, there exists a $Z \subset V \subset X$ quasi-compact open such that $\xi|_{V \setminus Z} = 0$. Since $V \setminus Z = V \cap U$ we conclude by the Mayer-Vietoris (Lemma 20.9.2) for the covering $X = U \cup V$ that there exists a $\tilde{\xi} \in H^d(X, \mathcal{F})$ which restricts to ξ on U and to zero on V . In other words, part (2) is true.

Proof of part (1) assuming (2). Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. Set

$$\mathcal{G} = \operatorname{Im}(\mathcal{I}^{d-1} \rightarrow \mathcal{I}^d) = \operatorname{Ker}(\mathcal{I}^d \rightarrow \mathcal{I}^{d+1})$$

For $U \subset X$ quasi-compact open we have a map of exact sequences as follows

$$\begin{array}{ccccccc} \mathcal{I}^{d-1}(X) & \longrightarrow & \mathcal{G}(X) & \longrightarrow & H^d(X, \mathcal{F}) & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \mathcal{I}^{d-1}(U) & \longrightarrow & \mathcal{G}(U) & \longrightarrow & H^d(U, \mathcal{F}) & \longrightarrow & 0 \end{array}$$

The sheaf \mathcal{I}^{d-1} is flasque by Lemma 20.13.2 and the fact that $d \geq 1$. By part (2) we see that the right vertical arrow is surjective. We conclude by a diagram chase that the map $\mathcal{G}(X) \rightarrow \mathcal{G}(U)$ is surjective. By Lemma 20.13.6 we conclude that $\check{H}^q(\mathcal{U}, \mathcal{G}) = 0$ for $q > 0$ and any finite covering $\mathcal{U} : U = U_1 \cup \dots \cup U_n$ of a quasi-compact open by quasi-compact opens. Applying Lemma 20.12.8 we find that $H^q(U, \mathcal{G}) = 0$ for all $q > 0$ and all quasi-compact opens U of X . By Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) we conclude that

$$H^q(X, \mathcal{F}) = H^q(\Gamma(X, \mathcal{I}^0) \rightarrow \dots \rightarrow \Gamma(X, \mathcal{I}^{d-1}) \rightarrow \Gamma(X, \mathcal{G}))$$

In particular the cohomology group vanishes if $q > d$.

Proof of (3). Given Z as in (3) we consider the long exact sequence

$$H^{q-1}(X, \mathcal{F}) \rightarrow H^{q-1}(X \setminus Z, \mathcal{F}) \rightarrow H^q_Z(X, \mathcal{F}) \rightarrow H^q(X, \mathcal{F})$$

Since X and $U = X \setminus Z$ are spectral spaces (Topology, Lemma 5.22.4) of dimension $\leq d$ and since we have (2) and (1) we obtain the desired vanishing. \square

20.24. The alternating Čech complex

This section compares the Čech complex with the alternating Čech complex and some related complexes.

Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. For $p \geq 0$ set

$$\check{\mathcal{C}}_{alt}^p(\mathcal{U}, \mathcal{F}) = \left\{ s \in \check{\mathcal{C}}^p(\mathcal{U}, \mathcal{F}) \text{ such that } s_{i_0 \dots i_p} = 0 \text{ if } i_n = i_m \text{ for some } n \neq m \right. \\ \left. \text{and } s_{i_0 \dots i_n \dots i_m \dots i_p} = -s_{i_0 \dots i_m \dots i_n \dots i_p} \text{ in any case.} \right\}$$

We omit the verification that the differential d of Equation (20.10.0.1) maps $\check{\mathcal{C}}_{alt}^p(\mathcal{U}, \mathcal{F})$ into $\check{\mathcal{C}}_{alt}^{p+1}(\mathcal{U}, \mathcal{F})$.

Definition 20.24.1. Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Let \mathcal{F} be an abelian presheaf on X . The complex $\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$ is the *alternating Čech complex* associated to \mathcal{F} and the open covering \mathcal{U} .

Hence there is a canonical morphism of complexes

$$\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$$

namely the inclusion of the alternating Čech complex into the usual Čech complex.

Suppose our covering $\mathcal{U} : U = \bigcup_{i \in I} U_i$ comes equipped with a total ordering $<$ on I . In this case, set

$$\check{\mathcal{C}}_{ord}^p(\mathcal{U}, \mathcal{F}) = \prod_{(i_0, \dots, i_p) \in I^{p+1}, i_0 < \dots < i_p} \mathcal{F}(U_{i_0 \dots i_p}).$$

This is an abelian group. For $s \in \check{\mathcal{C}}_{ord}^p(\mathcal{U}, \mathcal{F})$ we denote $s_{i_0 \dots i_p}$ its value in $\mathcal{F}(U_{i_0 \dots i_p})$. We define

$$d : \check{\mathcal{C}}_{ord}^p(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}_{ord}^{p+1}(\mathcal{U}, \mathcal{F})$$

by the formula

$$d(s)_{i_0 \dots i_{p+1}} = \sum_{j=0}^{p+1} (-1)^j s_{i_0 \dots \hat{i}_j \dots i_{p+1}}|_{U_{i_0 \dots i_{p+1}}}$$

for any $i_0 < \dots < i_{p+1}$. Note that this formula is identical to Equation (20.10.0.1). It is straightforward to see that $d \circ d = 0$. In other words $\check{\mathcal{C}}_{ord}^\bullet(\mathcal{U}, \mathcal{F})$ is a complex.

Definition 20.24.2. Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Assume given a total ordering on I . Let \mathcal{F} be an abelian presheaf on X . The complex $\check{\mathcal{C}}_{ord}^\bullet(\mathcal{U}, \mathcal{F})$ is the *ordered Čech complex* associated to \mathcal{F} , the open covering \mathcal{U} and the given total ordering on I .

This complex is sometimes called the alternating Čech complex. The reason is that there is an obvious comparison map between the ordered Čech complex and the alternating Čech complex. Namely, consider the map

$$c : \check{\mathcal{C}}_{ord}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$$

given by the rule

$$c(s)_{i_0 \dots i_p} = \begin{cases} 0 & \text{if } i_n = i_m \text{ for some } n \neq m \\ \text{sgn}(\sigma) s_{i_{\sigma(0)} \dots i_{\sigma(p)}} & \text{if } i_{\sigma(0)} < i_{\sigma(1)} < \dots < i_{\sigma(p)} \end{cases}$$

Here σ denotes a permutation of $\{0, \dots, p\}$ and $\text{sgn}(\sigma)$ denotes its sign. The alternating and ordered Čech complexes are often identified in the literature via the map c . Namely we have the following easy lemma.

Lemma 20.24.3. *Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Assume I comes equipped with a total ordering. The map c is a morphism of complexes. In fact it induces an isomorphism*

$$c : \check{\mathcal{C}}_{ord}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$$

of complexes.

Proof. Omitted. □

There is also a map

$$\pi : \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{F})$$

which is described by the rule

$$\pi(s)_{i_0 \dots i_p} = s_{i_0 \dots i_p}$$

whenever $i_0 < i_1 < \dots < i_p$.

Lemma 20.24.4. *Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Assume I comes equipped with a total ordering. The map $\pi : \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{F})$ is a morphism of complexes. It induces an isomorphism*

$$\pi : \check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{F})$$

of complexes which is a left inverse to the morphism c .

Proof. Omitted. □

Remark 20.24.5. This means that if we have two total orderings $<_1$ and $<_2$ on the index set I , then we get an isomorphism of complexes $\tau = \pi_2 \circ c_1 : \check{C}_{ord-1}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}_{ord-2}^\bullet(\mathcal{U}, \mathcal{F})$. It is clear that

$$\tau(s)_{i_0 \dots i_p} = \text{sign}(\sigma) s_{i_{\sigma(0)} \dots i_{\sigma(p)}}$$

where $i_0 <_1 i_1 <_1 \dots <_1 i_p$ and $i_{\sigma(0)} <_2 i_{\sigma(1)} <_2 \dots <_2 i_{\sigma(p)}$. This is the sense in which the ordered Čech complex is independent of the chosen total ordering.

Lemma 20.24.6. *Let X be a topological space. Let $\mathcal{U} : U = \bigcup_{i \in I} U_i$ be an open covering. Assume I comes equipped with a total ordering. The map $c \circ \pi$ is homotopic to the identity on $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$. In particular the inclusion map $\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F})$ is a homotopy equivalence.*

Proof. For any multi-index $(i_0, \dots, i_p) \in I^{p+1}$ there exists a unique permutation $\sigma : \{0, \dots, p\} \rightarrow \{0, \dots, p\}$ such that

$$i_{\sigma(0)} \leq i_{\sigma(1)} \leq \dots \leq i_{\sigma(p)} \quad \text{and} \quad \sigma(j) < \sigma(j+1) \quad \text{if} \quad i_{\sigma(j)} = i_{\sigma(j+1)}.$$

We denote this permutation $\sigma = \sigma^{i_0 \dots i_p}$.

For any permutation $\sigma : \{0, \dots, p\} \rightarrow \{0, \dots, p\}$ and any $a, 0 \leq a \leq p$ we denote σ_a the permutation of $\{0, \dots, p\}$ such that

$$\sigma_a(j) = \begin{cases} \sigma(j) & \text{if } 0 \leq j < a, \\ \min\{j' \mid j' > \sigma_a(j-1), j' \neq \sigma(k), \forall k < a\} & \text{if } a \leq j \end{cases}$$

So if $p = 3$ and σ, τ are given by

$$\begin{array}{cccc} \text{id} & 0 & 1 & 2 & 3 \\ \sigma & 3 & 2 & 1 & 0 \end{array} \quad \text{and} \quad \begin{array}{cccc} \text{id} & 0 & 1 & 2 & 3 \\ \tau & 3 & 0 & 2 & 1 \end{array}$$

then we have

$$\begin{array}{cccc} \text{id} & 0 & 1 & 2 & 3 \\ \sigma_0 & 0 & 1 & 2 & 3 \\ \sigma_1 & 3 & 0 & 1 & 2 \\ \sigma_2 & 3 & 2 & 0 & 1 \\ \sigma_3 & 3 & 2 & 1 & 0 \end{array} \quad \text{and} \quad \begin{array}{cccc} \text{id} & 0 & 1 & 2 & 3 \\ \tau_0 & 0 & 1 & 2 & 3 \\ \tau_1 & 3 & 0 & 1 & 2 \\ \tau_2 & 3 & 0 & 1 & 2 \\ \tau_3 & 3 & 0 & 2 & 1 \end{array}$$

It is clear that always $\sigma_0 = \text{id}$ and $\sigma_p = \sigma$.

Having introduced this notation we define for $s \in \check{C}^{p+1}(\mathcal{U}, \mathcal{F})$ the element $h(s) \in \check{C}^p(\mathcal{U}, \mathcal{F})$ to be the element with components

$$(20.24.6.1) \quad h(s)_{i_0 \dots i_p} = \sum_{0 \leq a \leq p} (-1)^a \text{sign}(\sigma_a) s_{i_{\sigma(0)} \dots i_{\sigma(a)} i_{\sigma_a(a)} \dots i_{\sigma_a(p)}}$$

where $\sigma = \sigma^{i_0 \dots i_p}$. The index $i_{\sigma(a)}$ occurs twice in $i_{\sigma(0)} \dots i_{\sigma(a)} i_{\sigma_a(a)} \dots i_{\sigma_a(p)}$ once in the first group of $a + 1$ indices and once in the second group of $p - a + 1$ indices since $\sigma_a(j) = \sigma(a)$ for some $j \geq a$ by definition of σ_a . Hence the sum makes sense since each of the elements $s_{i_{\sigma(0)} \dots i_{\sigma(a)} i_{\sigma_a(a)} \dots i_{\sigma_a(p)}}$ is defined over the open $U_{i_0 \dots i_p}$. Note also that for $a = 0$ we get $s_{i_0 \dots i_p}$ and for $a = p$ we get $(-1)^p \text{sign}(\sigma) s_{i_{\sigma(0)} \dots i_{\sigma(p)}}$.

We claim that

$$(dh + hd)(s)_{i_0 \dots i_p} = s_{i_0 \dots i_p} - \text{sign}(\sigma) s_{i_{\sigma(0)} \dots i_{\sigma(p)}}$$

where $\sigma = \sigma^{i_0 \dots i_p}$. We omit the verification of this claim. (There is a PARI/gp script called first-homotopy.gp in the stacks-project subdirectory scripts which can be used to check finitely many instances of this claim. We wrote this script to make sure the signs are correct.) Write

$$\kappa : \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

for the operator given by the rule

$$\kappa(s)_{i_0 \dots i_p} = \text{sign}(\sigma^{i_0 \dots i_p}) s_{i_{\sigma(0)} \dots i_{\sigma(p)}}.$$

The claim above implies that κ is a morphism of complexes and that κ is homotopic to the identity map of the Čech complex. This does not immediately imply the lemma since the image of the operator κ is not the alternating subcomplex. Namely, the image of κ is the “semi-alternating” complex $\check{C}_{semi-alt}^p(\mathcal{U}, \mathcal{F})$ where s is a p -cochain of this complex if and only if

$$s_{i_0 \dots i_p} = \text{sign}(\sigma) s_{i_{\sigma(0)} \dots i_{\sigma(p)}}$$

for any $(i_0, \dots, i_p) \in I^{p+1}$ with $\sigma = \sigma^{i_0 \dots i_p}$. We introduce yet another variant Čech complex, namely the semi-ordered Čech complex defined by

$$\check{C}_{semi-ord}^p(\mathcal{U}, \mathcal{F}) = \prod_{i_0 \leq i_1 \leq \dots \leq i_p} \mathcal{F}(U_{i_0 \dots i_p})$$

It is easy to see that Equation (20.10.0.1) also defines a differential and hence that we get a complex. It is also clear (analogous to Lemma 20.24.4) that the projection map

$$\check{C}_{semi-alt}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}_{semi-ord}^\bullet(\mathcal{U}, \mathcal{F})$$

is an isomorphism of complexes.

Hence the Lemma follows if we can show that the obvious inclusion map

$$\check{C}_{ord}^p(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}_{semi-ord}^p(\mathcal{U}, \mathcal{F})$$

is a homotopy equivalence. To see this we use the homotopy

(20.24.6.2)

$$h(s)_{i_0 \dots i_p} = \begin{cases} 0 & \text{if } i_0 < i_1 < \dots < i_p \\ (-1)^a s_{i_0 \dots i_{a-1} i_a i_{a+1} \dots i_p} & \text{if } i_0 < i_1 < \dots < i_{a-1} < i_a = i_{a+1} \end{cases}$$

We claim that

$$(dh + hd)(s)_{i_0 \dots i_p} = \begin{cases} 0 & \text{if } i_0 < i_1 < \dots < i_p \\ s_{i_0 \dots i_p} & \text{else} \end{cases}$$

We omit the verification. (There is a PARI/gp script called second-homotopy.gp in the stacks-project subdirectory scripts which can be used to check finitely many instances of this claim. We wrote this script to make sure the signs are correct.) The claim clearly shows that the composition

$$\check{C}_{semi-ord}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow \check{C}_{semi-ord}^\bullet(\mathcal{U}, \mathcal{F})$$

of the projection with the natural inclusion is homotopic to the identity map as desired. \square

20.25. Alternative view of the Čech complex

In this section we discuss an alternative way to establish the relationship between the Čech complex and cohomology.

Lemma 20.25.1. *Let X be a ringed space. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering of X . Let \mathcal{F} be an \mathcal{O}_X -module. Denote $\mathcal{F}_{i_0 \dots i_p}$ the restriction of \mathcal{F} to $U_{i_0 \dots i_p}$. There exists a complex $\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ of \mathcal{O}_X -modules with*

$$\mathfrak{C}^p(\mathcal{U}, \mathcal{F}) = \prod_{i_0 \dots i_p} (j_{i_0 \dots i_p})_* \mathcal{F}_{i_0 \dots i_p}$$

and differential $d : \mathfrak{C}^p(\mathcal{U}, \mathcal{F}) \rightarrow \mathfrak{C}^{p+1}(\mathcal{U}, \mathcal{F})$ as in Equation (20.10.0.1). Moreover, there exists a canonical map

$$\mathcal{F} \rightarrow \mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$$

which is a quasi-isomorphism, i.e., $\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ is a resolution of \mathcal{F} .

Proof. We check

$$0 \rightarrow \mathcal{F} \rightarrow \mathfrak{C}^0(\mathcal{U}, \mathcal{F}) \rightarrow \mathfrak{C}^1(\mathcal{U}, \mathcal{F}) \rightarrow \dots$$

is exact on stalks. Let $x \in X$ and choose $i_{\text{fix}} \in I$ such that $x \in U_{i_{\text{fix}}}$. Then define

$$h : \mathfrak{C}^p(\mathcal{U}, \mathcal{F})_x \rightarrow \mathfrak{C}^{p-1}(\mathcal{U}, \mathcal{F})_x$$

as follows: If $s \in \mathfrak{C}^p(\mathcal{U}, \mathcal{F})_x$, take a representative

$$\tilde{s} \in \mathfrak{C}^p(\mathcal{U}, \mathcal{F})(V) = \prod_{i_0 \dots i_p} \mathcal{F}(V \cap U_{i_0} \cap \dots \cap U_{i_p})$$

defined on some neighborhood V of x , and set

$$h(s)_{i_0 \dots i_{p-1}} = \tilde{s}_{i_{\text{fix}} i_0 \dots i_{p-1}, x}.$$

By the same formula (for $p = 0$) we get a map $\mathfrak{C}^0(\mathcal{U}, \mathcal{F})_x \rightarrow \mathcal{F}_x$. We compute formally as follows:

$$\begin{aligned} (dh + hd)(s)_{i_0 \dots i_p} &= \sum_{j=0}^p (-1)^j h(s)_{i_0 \dots \hat{i}_j \dots i_p} + d(s)_{i_{\text{fix}} i_0 \dots i_p} \\ &= \sum_{j=0}^p (-1)^j s_{i_{\text{fix}} i_0 \dots \hat{i}_j \dots i_p} + s_{i_0 \dots i_p} + \sum_{j=0}^p (-1)^{j+1} s_{i_{\text{fix}} i_0 \dots \hat{i}_j \dots i_p} \\ &= s_{i_0 \dots i_p} \end{aligned}$$

This shows h is a homotopy from the identity map of the extended complex

$$0 \rightarrow \mathcal{F}_x \rightarrow \mathfrak{C}^0(\mathcal{U}, \mathcal{F})_x \rightarrow \mathfrak{C}^1(\mathcal{U}, \mathcal{F})_x \rightarrow \dots$$

to zero and we conclude. \square

With this lemma it is easy to reprove the Čech to cohomology spectral sequence of Lemma 20.12.4. Namely, let $X, \mathcal{U}, \mathcal{F}$ as in Lemma 20.25.1 and let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Then we may consider the double complex

$$A^{\bullet, \bullet} = \Gamma(X, \mathfrak{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)).$$

By construction we have

$$A^{p, q} = \prod_{i_0 \dots i_p} \mathcal{I}^q(U_{i_0 \dots i_p})$$

Consider the two spectral sequences of Homology, Section 12.22 associated to this double complex, see especially Homology, Lemma 12.22.4. For the spectral sequence $({}'E_r, {}'d_r)_{r \geq 0}$ we get $'E_2^{p, q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$ because taking products is exact (Homology, Lemma 12.28.1). For the spectral sequence $({}''E_r, {}''d_r)_{r \geq 0}$ we get $''E_2^{p, q} = 0$ if $p > 0$ and $''E_2^{0, q} = H^q(X, \mathcal{F})$. Namely, for fixed q the complex of sheaves $\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{I}^q)$ is a resolution (Lemma 20.25.1) of the injective sheaf \mathcal{I}^q by injective sheaves (by Lemmas 20.7.1 and 20.12.10 and Homology, Lemma 12.23.3). Hence the cohomology of $\Gamma(X, \mathfrak{C}^\bullet(\mathcal{U}, \mathcal{I}^q))$ is zero in positive degrees and equal to $\Gamma(X, \mathcal{I}^q)$ in degree 0. Taking cohomology of the next differential we get our claim about the spectral sequence $({}''E_r, {}''d_r)_{r \geq 0}$. Whence the result since both spectral sequences converge to the cohomology of the associated total complex of $A^{\bullet, \bullet}$.

Definition 20.25.2. Let X be a topological space. An open covering $X = \bigcup_{i \in I} U_i$ is said to be *locally finite* if for every $x \in X$ there exists an open neighbourhood W of x such that $\{i \in I \mid W \cap U_i \neq \emptyset\}$ is finite.

Remark 20.25.3. Let $X = \bigcup_{i \in I} U_i$ be a locally finite open covering. Denote $j_i : U_i \rightarrow X$ the inclusion map. Suppose that for each i we are given an abelian sheaf \mathcal{F}_i on U_i . Consider the abelian sheaf $\mathcal{G} = \bigoplus_{i \in I} (j_i)_* \mathcal{F}_i$. Then for $V \subset X$ open we actually have

$$\Gamma(V, \mathcal{G}) = \prod_{i \in I} \mathcal{F}_i(V \cap U_i).$$

In other words we have

$$\bigoplus_{i \in I} (j_i)_* \mathcal{F}_i = \prod_{i \in I} (j_i)_* \mathcal{F}_i$$

This seems strange until you realize that the direct sum of a collection of sheaves is the sheafification of what you think it should be. See discussion in Modules, Section 17.3. Thus we conclude that in this case the complex of Lemma 20.25.1 has terms

$$\mathfrak{C}^p(\mathcal{U}, \mathcal{F}) = \bigoplus_{i_0 \dots i_p} (j_{i_0 \dots i_p})_* \mathcal{F}_{i_0 \dots i_p}$$

which is sometimes useful.

20.26. Čech cohomology of complexes

In general for sheaves of abelian groups \mathcal{F} and \mathcal{G} on X there is a cupproduct map

$$H^i(X, \mathcal{F}) \times H^j(X, \mathcal{G}) \longrightarrow H^{i+j}(X, \mathcal{F} \otimes_{\mathbb{Z}} \mathcal{G}).$$

In this section we define it using Čech cocycles by an explicit formula for the cup product. If you are worried about the fact that cohomology may not equal Čech cohomology, then you can use hypercoverings and still use the cocycle notation. This also has the advantage that it works to define the cup product for hypercohomology on any topos (insert future reference here).

Let \mathcal{F}^\bullet be a bounded below complex of presheaves of abelian groups on X . We can often compute $H^n(X, \mathcal{F}^\bullet)$ using Čech cocycles. Namely, let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering of X . Since the Čech complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ (Definition 20.10.1) is functorial in the presheaf \mathcal{F} we obtain a double complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)$. The associated total complex to $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)$ is the complex with degree n term

$$\text{Tot}^n(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) = \bigoplus_{p+q=n} \prod_{i_0 \dots i_p} \mathcal{F}^q(U_{i_0 \dots i_p})$$

see Homology, Definition 12.22.3. A typical element in Tot^n will be denoted $\alpha = \{\alpha_{i_0 \dots i_p}\}$ where $\alpha_{i_0 \dots i_p} \in \mathcal{F}^q(U_{i_0 \dots i_p})$. In other words the \mathcal{F} -degree of $\alpha_{i_0 \dots i_p}$ is $q = n - p$. This notation requires us to be aware of the degree α lives in at all times. We indicate this situation by the formula $\text{deg}_{\mathcal{F}}(\alpha_{i_0 \dots i_p}) = q$. According to our conventions in Homology, Definition 12.22.3 the differential of an element α of degree n is given by

$$d(\alpha)_{i_0 \dots i_{p+1}} = \sum_{j=0}^{p+1} (-1)^j \alpha_{i_0 \dots \hat{i}_j \dots i_{p+1}} + (-1)^{p+1} d_{\mathcal{F}}(\alpha_{i_0 \dots i_{p+1}})$$

where $d_{\mathcal{F}}$ denotes the differential on the complex \mathcal{F}^\bullet . The expression $\alpha_{i_0 \dots \hat{i}_j \dots i_{p+1}}$ means the restriction of $\alpha_{i_0 \dots \hat{i}_j \dots i_{p+1}} \in \mathcal{F}(U_{i_0 \dots \hat{i}_j \dots i_{p+1}})$ to $U_{i_0 \dots i_{p+1}}$.

The construction of $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$ is functorial in \mathcal{F}^\bullet . As well there is a functorial transformation

$$(20.26.0.1) \quad \Gamma(X, \mathcal{F}^\bullet) \longrightarrow \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$$

of complexes defined by the following rule: The section $s \in \Gamma(X, \mathcal{F}^n)$ is mapped to the element $\alpha = \{\alpha_{i_0 \dots i_p}\}$ with $\alpha_{i_0} = s|_{U_{i_0}}$ and $\alpha_{i_0 \dots i_p} = 0$ for $p > 0$.

Refinements. Let $\mathcal{V} = \{V_j\}_{j \in J}$ be a refinement of \mathcal{U} . This means there is a map $t : J \rightarrow I$ such that $V_j \subset U_{t(j)}$ for all $j \in J$. This gives rise to a functorial transformation

$$(20.26.0.2) \quad T_t : \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F}^\bullet)).$$

defined by the rule

$$T_t(\alpha)_{j_0 \dots j_p} = \alpha_{t(j_0) \dots t(j_p)}|_{V_{j_0 \dots j_p}}.$$

Given two maps $t, t' : J \rightarrow I$ as above the maps T_t and $T_{t'}$ constructed above are homotopic. The homotopy is given by

$$h(\alpha)_{j_0 \dots j_p} = \sum_{a=0}^p (-1)^a \alpha_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(j_p)}$$

for an element α of degree n . This works because of the following computation, again with α an element of degree n (so $d(\alpha)$ has degree $n + 1$ and $h(\alpha)$ has degree

$n - 1$):

$$\begin{aligned}
 (d(h(\alpha)) + h(d(\alpha)))_{j_0 \dots j_p} &= \sum_{k=0}^p (-1)^k h(\alpha)_{j_0 \dots \hat{j}_k \dots j_p} + \\
 &\quad (-1)^p d_{\mathcal{F}}(h(\alpha))_{j_0 \dots j_p} + \\
 &\quad \sum_{a=0}^p (-1)^a d(\alpha)_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(j_p)} \\
 &= \sum_{k=0}^p \sum_{a=0}^{k-1} (-1)^{k+a} \alpha_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(\hat{j}_k) \dots t'(j_p)} + \\
 &\quad \sum_{k=0}^p \sum_{a=k+1}^p (-1)^{k+a-1} \alpha_{t(j_0) \dots t(\hat{j}_k) \dots t(j_a) t'(j_a) \dots t'(j_p)} + \\
 &\quad \sum_{a=0}^p (-1)^{p+a} d_{\mathcal{F}}(\alpha_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(j_p)}) + \\
 &\quad \sum_{a=0}^p \sum_{k=0}^a (-1)^{a+k} \alpha_{t(j_0) \dots t(\hat{j}_k) \dots t(j_a) t'(j_a) \dots t'(j_p)} + \\
 &\quad \sum_{a=0}^p \sum_{k=a}^p (-1)^{a+k+1} \alpha_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(\hat{j}_k) \dots t'(j_p)} + \\
 &\quad \sum_{a=0}^p (-1)^{a+p+1} d_{\mathcal{F}}(\alpha_{t(j_0) \dots t(j_a) t'(j_a) \dots t'(j_p)}) \\
 &= \alpha_{t'(j_0) \dots t'(j_p)} + (-1)^{2p+1} \alpha_{t(j_0) \dots t(j_p)} \\
 &= T_{t'}(\alpha)_{j_0 \dots j_p} - T_t(\alpha)_{j_0 \dots j_p}
 \end{aligned}$$

We leave it to the reader to verify the cancellations. (Note that the terms having both k and a in the 1st, 2nd and 4th, 5th summands cancel, except the ones where $a = k$ which only occur in the 4th and 5th and these cancel against each other except for the two desired terms.) It follows that the induced map

$$H^n(T_t) : H^n(\text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))) \rightarrow H^n(\text{Tot}(\check{C}^\bullet(\mathcal{V}, \mathcal{F}^\bullet)))$$

is independent of the choice of t . We define Čech hypercohomology as the limit of the Čech cohomology groups over all refinements via the maps $H^\bullet(T_t)$.

In the limit (over all open coverings of X) the following lemma provides a map of Čech hypercohomology into cohomology, which is often an isomorphism and is always an isomorphism if we use hypercoverings.

Lemma 20.26.1. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering. For a bounded below complex \mathcal{F}^\bullet of \mathcal{O}_X -modules there is a canonical map*

$$\text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow R\Gamma(X, \mathcal{F}^\bullet)$$

functorial in \mathcal{F}^\bullet and compatible with (20.26.0.1) and (20.26.0.2). There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with

$$E_2^{p,q} = H^p(\text{Tot}(\check{C}^\bullet(\mathcal{U}, \underline{H}^q(\mathcal{F}^\bullet))))$$

converging to $H^{p+q}(X, \mathcal{F}^\bullet)$.

Proof. Let \mathcal{I}^\bullet be a bounded below complex of injectives. The map (20.26.0.1) for \mathcal{I}^\bullet is a map $\Gamma(X, \mathcal{I}^\bullet) \rightarrow \text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet))$. This is a quasi-isomorphism of complexes of abelian groups as follows from Homology, Lemma 12.22.7 applied to the double complex $\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)$ using Lemma 20.12.1. Suppose $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ is a quasi-isomorphism of \mathcal{F}^\bullet into a bounded below complex of injectives. Since $R\Gamma(X, \mathcal{F}^\bullet)$ is represented by the complex $\Gamma(X, \mathcal{I}^\bullet)$ we obtain the map of the lemma using

$$\text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow \text{Tot}(\check{C}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)).$$

We omit the verification of functoriality and compatibilities. To construct the spectral sequence of the lemma, choose a Cartan-Eilenberg resolution $\mathcal{F}^\bullet \rightarrow \mathcal{I}^{\bullet,\bullet}$, see Derived Categories, Lemma 13.21.2. In this case $\mathcal{F}^\bullet \rightarrow \text{Tot}(\mathcal{I}^{\bullet,\bullet})$ is an injective resolution and hence

$$\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \text{Tot}(\mathcal{I}^{\bullet,\bullet})))$$

computes $R\Gamma(X, \mathcal{F}^\bullet)$ as we've seen above. By Homology, Remark 12.22.9 we can view this as the total complex associated to the triple complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{I}^{\bullet,\bullet})$ hence, using the same remark we can view it as the total complex associate to the double complex $A^{\bullet,\bullet}$ with terms

$$A^{n,m} = \bigoplus_{p+q=n} \check{\mathcal{C}}^p(\mathcal{U}, \mathcal{I}^{q,m})$$

Since $\mathcal{I}^{q,\bullet}$ is an injective resolution of \mathcal{F}^q we can apply the first spectral sequence associated to $A^{\bullet,\bullet}$ (Homology, Lemma 12.22.4) to get a spectral sequence with

$$E_1^{n,m} = \bigoplus_{p+q=n} \check{\mathcal{C}}^p(\mathcal{U}, \underline{H}^m(\mathcal{F}^q))$$

which is the n th term of the complex $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \underline{H}^m(\mathcal{F}^\bullet)))$. Hence we obtain E_2 terms as described in the lemma. Convergence by Homology, Lemma 12.22.6. \square

Let X be a topological space, let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering, and let \mathcal{F}^\bullet be a bounded below complex of presheaves of abelian groups. Consider the map $\tau : \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \rightarrow \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$ defined by

$$\tau(\alpha)_{i_0 \dots i_p} = (-1)^{p(p+1)/2} \alpha_{i_p \dots i_0}.$$

Then we have for an element α of degree n that

$$\begin{aligned} & d(\tau(\alpha))_{i_0 \dots i_{p+1}} \\ &= \sum_{j=0}^{p+1} (-1)^j \tau(\alpha)_{i_0 \dots \hat{i}_j \dots i_{p+1}} + (-1)^{p+1} d_{\mathcal{F}}(\tau(\alpha)_{i_0 \dots i_{p+1}}) \\ &= \sum_{j=0}^{p+1} (-1)^{j + \frac{p(p+1)}{2}} \alpha_{i_{p+1} \dots \hat{i}_j \dots i_0} + (-1)^{p+1 + \frac{(p+1)(p+2)}{2}} d_{\mathcal{F}}(\alpha_{i_{p+1} \dots i_0}) \end{aligned}$$

On the other hand we have

$$\begin{aligned} & \tau(d(\alpha))_{i_0 \dots i_{p+1}} \\ &= (-1)^{\frac{(p+1)(p+2)}{2}} d(\alpha)_{i_{p+1} \dots i_0} \\ &= (-1)^{\frac{(p+1)(p+2)}{2}} \left(\sum_{j=0}^{p+1} (-1)^j \alpha_{i_{p+1} \dots \hat{i}_{p+1-j} \dots i_0} + (-1)^{p+1} d_{\mathcal{F}}(\alpha_{i_{p+1} \dots i_0}) \right) \end{aligned}$$

Thus we conclude that $d(\tau(\alpha)) = \tau(d(\alpha))$ because $p(p+1)/2 \equiv (p+1)(p+2)/2 + p+1 \pmod{2}$. In other words τ is an endomorphism of the complex $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$. Note that the diagram

$$\begin{array}{ccc} \Gamma(X, \mathcal{F}^\bullet) & \longrightarrow & \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \\ \downarrow \text{id} & & \downarrow \tau \\ \Gamma(X, \mathcal{F}^\bullet) & \longrightarrow & \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \end{array}$$

commutes. In addition τ is clearly compatible with refinements. This suggests that τ acts as the identity on Čech cohomology (i.e., in the limit – provided Čech hypercohomology agrees with hypercohomology, which is always the case if we use

hypercoverings). We claim that τ actually is homotopic to the identity on the total Čech complex $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$. To prove this, we use as homotopy

$$h(\alpha)_{i_0 \dots i_p} = \sum_{a=0}^p \epsilon_p(a) \alpha_{i_0 \dots i_a i_p \dots i_a} \quad \text{with} \quad \epsilon_p(a) = (-1)^{\frac{(p-a)(p-a-1)}{2} + p}$$

for α of degree n . As usual we omit writing $|_{U_{i_0 \dots i_p}}$. This works because of the following computation, again with α an element of degree n :

$$\begin{aligned} (d(h(\alpha)) + h(d(\alpha)))_{i_0 \dots i_p} &= \sum_{k=0}^p (-1)^k h(\alpha)_{i_0 \dots \hat{i}_k \dots i_p} + \\ &\quad (-1)^p d_{\mathcal{F}}(h(\alpha)_{i_0 \dots i_p}) + \\ &\quad \sum_{a=0}^p \epsilon_p(a) d(\alpha)_{i_0 \dots i_a i_p \dots i_a} \\ &= \sum_{k=0}^p \sum_{a=0}^{k-1} (-1)^k \epsilon_{p-1}(a) \alpha_{i_0 \dots i_a i_p \dots \hat{i}_k \dots i_a} + \\ &\quad \sum_{k=0}^p \sum_{a=k+1}^p (-1)^k \epsilon_{p-1}(a-1) \alpha_{i_0 \dots \hat{i}_k \dots i_a i_p \dots i_a} + \\ &\quad \sum_{a=0}^p (-1)^p \epsilon_p(a) d_{\mathcal{F}}(\alpha_{i_0 \dots i_a i_p \dots i_a}) + \\ &\quad \sum_{a=0}^p \sum_{k=0}^a \epsilon_p(a) (-1)^k \alpha_{i_0 \dots \hat{i}_k \dots i_a i_p \dots i_a} + \\ &\quad \sum_{a=0}^p \sum_{k=a}^p \epsilon_p(a) (-1)^{p+a+1-k} \alpha_{i_0 \dots i_a i_p \dots \hat{i}_k \dots i_a} + \\ &\quad \sum_{a=0}^p \epsilon_p(a) (-1)^{p+1} d_{\mathcal{F}}(\alpha_{i_0 \dots i_a i_p \dots i_a}) \\ &= \epsilon_p(0) \alpha_{i_p \dots i_0} + \epsilon_p(p) (-1)^{p+1} \alpha_{i_0 \dots i_p} \\ &= (-1)^{\frac{p(p+1)}{2}} \alpha_{i_p \dots i_0} - \alpha_{i_0 \dots i_p} \end{aligned}$$

The cancellations follow because

$$(-1)^k \epsilon_{p-1}(a) + \epsilon_p(a) (-1)^{p+a+1-k} = 0 \quad \text{and} \quad (-1)^k \epsilon_{p-1}(a-1) + \epsilon_p(a) (-1)^k = 0$$

We leave it to the reader to verify the cancellations.

Suppose we have two bounded below complexes of abelian sheaves \mathcal{F}^\bullet and \mathcal{G}^\bullet . We define the complex $\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathcal{G}^\bullet)$ to be the complex with terms $\bigoplus_{p+q=n} \mathcal{F}^p \otimes \mathcal{G}^q$ and differential according to the rule

$$(20.26.1.1) \quad d(\alpha \otimes \beta) = d(\alpha) \otimes \beta + (-1)^{\deg(\alpha)} \alpha \otimes d(\beta)$$

when α and β are homogeneous, see Homology, Definition 12.22.3.

Suppose that M^\bullet and N^\bullet are two bounded below complexes of abelian groups. Then if m , resp. n is a cocycle for M^\bullet , resp. N^\bullet , it is immediate that $m \otimes n$ is a cocycle for $\text{Tot}(M^\bullet \otimes N^\bullet)$. Hence a cupproduct

$$H^i(M^\bullet) \times H^j(N^\bullet) \longrightarrow H^{i+j}(\text{Tot}(M^\bullet \otimes N^\bullet)).$$

This is discussed also in More on Algebra, Section 15.49.

So the construction of the cup product in hypercohomology of complexes rests on a construction of a map of complexes

$$(20.26.1.2) \quad \text{Tot}(\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \otimes_{\mathbf{Z}} \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}^\bullet))) \longrightarrow \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathcal{G}^\bullet)))$$

This map is denoted \cup and is given by the rule

$$(\alpha \cup \beta)_{i_0 \dots i_p} = \sum_{r=0}^p \epsilon(n, m, p, r) \alpha_{i_0 \dots i_r} \otimes \beta_{i_r \dots i_p}.$$

where α has degree n and β has degree m and with

$$\epsilon(n, m, p, r) = (-1)^{(p+r)n+rp+r}.$$

Note that $\epsilon(n, m, p, n) = 1$. Hence if $\mathcal{F}^\bullet = \mathcal{F}[0]$ is the complex consisting in a single abelian sheaf \mathcal{F} placed in degree 0, then there no signs in the formula for \cup (as in that case $\alpha_{i_0 \dots i_r} = 0$ unless $r = n$). For an explanation of why there has to be a sign and how to compute it see [AGV71, Exposee XVII] by Deligne. To check (20.26.1.2) is a map of complexes we have to show that

$$d(\alpha \cup \beta) = d(\alpha) \cup \beta + (-1)^{\deg(\alpha)} \alpha \cup d(\beta)$$

by the definition of the differential on $\text{Tot}(\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \otimes_{\mathbf{Z}} \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}^\bullet)))$ as given in Homology, Definition 12.22.3. We compute first

$$\begin{aligned} d(\alpha \cup \beta)_{i_0 \dots i_{p+1}} &= \sum_{j=0}^{p+1} (-1)^j (\alpha \cup \beta)_{i_0 \dots \hat{i}_j \dots i_{p+1}} + (-1)^{p+1} d_{\mathcal{F} \otimes \mathcal{G}}((\alpha \cup \beta)_{i_0 \dots i_{p+1}}) \\ &= \sum_{j=0}^{p+1} \sum_{r=0}^{j-1} (-1)^j \epsilon(n, m, p, r) \alpha_{i_0 \dots i_r} \otimes \beta_{i_r \dots \hat{i}_j \dots i_{p+1}} + \\ &\quad \sum_{j=0}^{p+1} \sum_{r=j+1}^{p+1} (-1)^j \epsilon(n, m, p, r-1) \alpha_{i_0 \dots \hat{i}_j \dots i_r} \otimes \beta_{i_r \dots i_{p+1}} + \\ &\quad \sum_{r=0}^{p+1} (-1)^{p+1} \epsilon(n, m, p+1, r) d_{\mathcal{F} \otimes \mathcal{G}}(\alpha_{i_0 \dots i_r} \otimes \beta_{i_r \dots i_{p+1}}) \end{aligned}$$

and note that the summands in the last term equal

$$(-1)^{p+1} \epsilon(n, m, p+1, r) (d_{\mathcal{F}}(\alpha_{i_0 \dots i_r}) \otimes \beta_{i_r \dots i_{p+1}} + (-1)^{n-r} \alpha_{i_0 \dots i_r} \otimes d_{\mathcal{G}}(\beta_{i_r \dots i_{p+1}})).$$

because $\deg_{\mathcal{F}}(\alpha_{i_0 \dots i_r}) = n - r$. On the other hand

$$\begin{aligned} (d(\alpha) \cup \beta)_{i_0 \dots i_{p+1}} &= \sum_{r=0}^{p+1} \epsilon(n+1, m, p+1, r) d(\alpha)_{i_0 \dots i_r} \otimes \beta_{i_r \dots i_{p+1}} \\ &= \sum_{r=0}^{p+1} \sum_{j=0}^r \epsilon(n+1, m, p+1, r) (-1)^j \alpha_{i_0 \dots \hat{i}_j \dots i_r} \otimes \beta_{i_r \dots i_{p+1}} + \\ &\quad \sum_{r=0}^{p+1} \epsilon(n+1, m, p+1, r) (-1)^r d_{\mathcal{F}}(\alpha_{i_0 \dots i_r}) \otimes \beta_{i_r \dots i_{p+1}} \end{aligned}$$

and

$$\begin{aligned} (\alpha \cup d(\beta))_{i_0 \dots i_{p+1}} &= \sum_{r=0}^{p+1} \epsilon(n, m+1, p+1, r) \alpha_{i_0 \dots i_r} \otimes d(\beta)_{i_r \dots i_{p+1}} \\ &= \sum_{r=0}^{p+1} \sum_{j=r}^{p+1} \epsilon(n, m+1, p+1, r) (-1)^{j-r} \alpha_{i_0 \dots i_r} \otimes \beta_{i_r \dots \hat{i}_j \dots i_{p+1}} + \\ &\quad \sum_{r=0}^{p+1} \epsilon(n, m+1, p+1, r) (-1)^{p+1-r} \alpha_{i_0 \dots i_r} \otimes d_{\mathcal{G}}(\beta_{i_r \dots i_{p+1}}) \end{aligned}$$

The desired equality holds if we have

$$\begin{aligned} (-1)^{p+1} \epsilon(n, m, p+1, r) &= \epsilon(n+1, m, p+1, r) (-1)^r \\ (-1)^{p+1} \epsilon(n, m, p+1, r) (-1)^{n-r} &= (-1)^n \epsilon(n, m+1, p+1, r) (-1)^{p+1-r} \\ \epsilon(n+1, m, p+1, r) (-1)^r &= (-1)^{1+n} \epsilon(n, m+1, p+1, r-1) \\ (-1)^j \epsilon(n, m, p, r) &= (-1)^n \epsilon(n, m+1, p+1, r) (-1)^{j-r} \\ (-1)^j \epsilon(n, m, p, r-1) &= \epsilon(n+1, m, p+1, r) (-1)^j \end{aligned}$$

(The third equality is necessary to get the terms with $r = j$ from $d(\alpha) \cup \beta$ and $(-1)^n \alpha \cup d(\beta)$ to cancel each other.) We leave the verifications to the reader. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Associativity of the cupproduct. Suppose that \mathcal{F}^\bullet , \mathcal{G}^\bullet and \mathcal{H}^\bullet are bounded below complexes of abelian groups on X . The obvious map (without the intervention of signs) is an isomorphism of complexes

$$\mathrm{Tot}(\mathrm{Tot}(\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathcal{G}^\bullet) \otimes_{\mathbf{Z}} \mathcal{H}^\bullet) \longrightarrow \mathrm{Tot}(\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathrm{Tot}(\mathcal{G}^\bullet \otimes_{\mathbf{Z}} \mathcal{H}^\bullet)).$$

Another way to say this is that the triple complex $\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathcal{G}^\bullet \otimes_{\mathbf{Z}} \mathcal{H}^\bullet$ gives rise to a well defined total complex with differential satisfying

$$d(\alpha \otimes \beta \otimes \gamma) = d(\alpha) \otimes \beta \otimes \gamma + (-1)^{\deg(\alpha)} \alpha \otimes d(\beta) \otimes \gamma + (-1)^{\deg(\alpha) + \deg(\beta)} \alpha \otimes \beta \otimes d(\gamma)$$

for homogeneous elements. Using this map it is easy to verify that

$$(\alpha \cup \beta) \cup \gamma = \alpha \cup (\beta \cup \gamma)$$

namely, if α has degree a , β has degree b and γ has degree c , then

$$\begin{aligned} ((\alpha \cup \beta) \cup \gamma)_{i_0 \dots i_p} &= \sum_{r=0}^p \epsilon(a+b, c, p, r) (\alpha \cup \beta)_{i_0 \dots i_r} \otimes \gamma_{i_r \dots i_p} \\ &= \sum_{r=0}^p \sum_{s=0}^r \epsilon(a+b, c, p, r) \epsilon(a, b, r, s) \alpha_{i_0 \dots i_s} \otimes \beta_{i_s \dots i_r} \otimes \gamma_{i_r \dots i_p} \end{aligned}$$

and

$$\begin{aligned} (\alpha \cup (\beta \cup \gamma))_{i_0 \dots i_p} &= \sum_{s=0}^p \epsilon(a, b+c, p, s) \alpha_{i_0 \dots i_s} \otimes (\beta \cup \gamma)_{i_s \dots i_p} \\ &= \sum_{s=0}^p \sum_{r=s}^p \epsilon(a, b+c, p, s) \epsilon(b, c, p-s, r-s) \alpha_{i_0 \dots i_s} \otimes \beta_{i_s \dots i_r} \otimes \gamma_{i_r \dots i_p} \end{aligned}$$

and a trivial mod 2 calculation shows the signs match up. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Finally, we indicate why the cup product preserves a graded commutative structure, at least on a cohomological level. For this we use the operator τ introduced above. Let \mathcal{F}^\bullet be a bounded below complex of abelian groups, and assume we are given a graded commutative multiplication

$$\wedge^\bullet : \mathrm{Tot}(\mathcal{F}^\bullet \otimes \mathcal{F}^\bullet) \longrightarrow \mathcal{F}^\bullet.$$

This means the following: For s a local section of \mathcal{F}^a , and t a local section of \mathcal{F}^b we have $s \wedge t$ a local section of \mathcal{F}^{a+b} . Graded commutative means we have $s \wedge t = (-1)^{ab} t \wedge s$. Since \wedge is a map of complexes we have $d(s \wedge t) = d(s) \wedge t + (-1)^a s \wedge t$. The composition

$$\mathrm{Tot}(\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \otimes \mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))) \rightarrow \mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathrm{Tot}(\mathcal{F}^\bullet \otimes_{\mathbf{Z}} \mathcal{F}^\bullet))) \rightarrow \mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$$

induces a cup product on cohomology

$$H^n(\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))) \times H^m(\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))) \longrightarrow H^{n+m}(\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)))$$

and so in the limit also a product on Čech cohomology and therefore (using hypercoverings if needed) a product in cohomology of \mathcal{F}^\bullet . We claim this product (on cohomology) is graded commutative as well. To prove this we first consider an element α of degree n in $\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$ and an element β of degree m in $\mathrm{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$ and we compute

$$\begin{aligned} \wedge^\bullet(\alpha \cup \beta)_{i_0 \dots i_p} &= \sum_{r=0}^p \epsilon(n, m, p, r) \alpha_{i_0 \dots i_r} \wedge \beta_{i_r \dots i_p} \\ &= \sum_{r=0}^p \epsilon(n, m, p, r) (-1)^{\deg(\alpha_{i_0 \dots i_r}) \deg(\beta_{i_r \dots i_p})} \beta_{i_r \dots i_p} \wedge \alpha_{i_0 \dots i_r} \end{aligned}$$

because \wedge is graded commutative. On the other hand we have

$$\begin{aligned} \tau(\wedge^\bullet(\tau(\beta) \cup \tau(\alpha)))_{i_0 \dots i_p} &= \chi(p) \sum_{r=0}^p \epsilon(m, n, p, r) \tau(\beta)_{i_p \dots i_{p-r}} \wedge \tau(\alpha)_{i_{p-r} \dots i_0} \\ &= \chi(p) \sum_{r=0}^p \epsilon(m, n, p, r) \chi(r) \chi(p-r) \beta_{i_p \dots i_{p-r}} \wedge \alpha_{i_0 \dots i_{p-r}} \\ &= \chi(p) \sum_{r=0}^p \epsilon(m, n, p, p-r) \chi(r) \chi(p-r) \beta_{i_r \dots i_p} \wedge \alpha_{i_0 \dots i_r} \end{aligned}$$

where $\chi(t) = (-1)^{\frac{t(t+1)}{2}}$. Since we proved earlier that τ acts as the identity on cohomology we have to verify that

$$\epsilon(n, m, p, r) (-1)^{(n-r)(m-(p-r))} = (-1)^{nm} \chi(p) \epsilon(m, n, p, p-r) \chi(r) \chi(p-r)$$

A trivial mod 2 calculation shows these signs match up. (Alternatively, check the script signs.gp in the scripts subdirectory of the stacks project.)

Finally, we study the compatibility of cup product with boundary maps. Suppose that

$$0 \rightarrow \mathcal{F}_1^\bullet \rightarrow \mathcal{F}_2^\bullet \rightarrow \mathcal{F}_3^\bullet \rightarrow 0 \quad \text{and} \quad 0 \leftarrow \mathcal{G}_1^\bullet \leftarrow \mathcal{G}_2^\bullet \leftarrow \mathcal{G}_3^\bullet \leftarrow 0$$

are short exact sequences of bounded below complexes of abelian sheaves on X . Let \mathcal{H}^\bullet be another bounded below complex of abelian sheaves, and suppose we have maps of complexes

$$\gamma_i : \text{Tot}(\mathcal{F}_i^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_i^\bullet) \rightarrow \mathcal{H}^\bullet$$

which are compatible with the maps between the complexes, namely such that the diagrams

$$\begin{array}{ccc} \text{Tot}(\mathcal{F}_1^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_1^\bullet) & \longleftarrow & \text{Tot}(\mathcal{F}_1^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_2^\bullet) \\ \gamma_1 \downarrow & & \downarrow \\ \mathcal{H}^\bullet & \xleftarrow{\gamma_2} & \text{Tot}(\mathcal{F}_2^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_2^\bullet) \end{array}$$

and

$$\begin{array}{ccc} \text{Tot}(\mathcal{F}_2^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_2^\bullet) & \longleftarrow & \text{Tot}(\mathcal{F}_2^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_3^\bullet) \\ \gamma_2 \downarrow & & \downarrow \\ \mathcal{H}^\bullet & \xleftarrow{\gamma_3} & \text{Tot}(\mathcal{F}_3^\bullet \otimes_{\mathbf{Z}} \mathcal{G}_3^\bullet) \end{array}$$

are commutative.

Lemma 20.26.2. *In the situation above, assume Čech cohomology agrees with cohomology for the sheaves \mathcal{F}_i^p and \mathcal{G}_j^q . Let $a_3 \in H^n(X, \mathcal{F}_3^\bullet)$ and $b_1 \in H^m(X, \mathcal{G}_1^\bullet)$. Then we have*

$$\gamma_1(\partial a_3 \cup b_1) = (-1)^{n+1} \gamma_3(a_3 \cup \partial b_1)$$

in $H^{n+m}(X, \mathcal{H}^\bullet)$ where ∂ indicates the boundary map on cohomology associated to the short exact sequences of complexes above.

Proof. We will use the following conventions and notation. We think of \mathcal{F}_1^p as a subsheaf of \mathcal{F}_2^p and we think of \mathcal{G}_3^q as a subsheaf of \mathcal{G}_2^q . Hence if s is a local section of \mathcal{F}_1^p we use s to denote the corresponding section of \mathcal{F}_2^p as well. Similarly for local sections of \mathcal{G}_3^q . Furthermore, if s is a local section of \mathcal{F}_2^p then we denote \bar{s} its image in \mathcal{F}_3^p . Similarly for the map $\mathcal{G}_2^q \rightarrow \mathcal{G}_1^q$. In particular if s is a local section of \mathcal{F}_2^p and $\bar{s} = 0$ then s is a local section of \mathcal{F}_1^p . The commutativity of the diagrams above implies, for local sections s of \mathcal{F}_2^p and t of \mathcal{G}_3^q that $\gamma_2(s \otimes t) = \gamma_3(\bar{s} \otimes t)$ as sections of \mathcal{H}^{p+q} .

Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering of X . Suppose that α_3 , resp. β_1 is a degree n , resp. m cocycle of $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}_3^\bullet))$, resp. $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}_1^\bullet))$ representing a_3 , resp. b_1 . After refining \mathcal{U} if necessary, we can find cochains α_2 , resp. β_2 of degree n , resp. m in $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}_2^\bullet))$, resp. $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}_2^\bullet))$ mapping to α_3 , resp. β_1 . Then we see that

$$\overline{d(\alpha_2)} = d(\bar{\alpha}_2) = 0 \quad \text{and} \quad \overline{d(\beta_2)} = d(\bar{\beta}_2) = 0.$$

This means that $\alpha_1 = d(\alpha_2)$ is a degree $n+1$ cocycle in $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}_1^\bullet))$ representing ∂a_3 . Similarly, $\beta_3 = d(\beta_2)$ is a degree $m+1$ cocycle in $\text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}_3^\bullet))$ representing ∂b_1 . Thus we may compute

$$\begin{aligned} d(\gamma_2(\alpha_2 \cup \beta_2)) &= \gamma_2(d(\alpha_2 \cup \beta_2)) \\ &= \gamma_2(d(\alpha_2) \cup \beta_2 + (-1)^n \alpha_2 \cup d(\beta_2)) \\ &= \gamma_2(\alpha_1 \cup \beta_2) + (-1)^n \gamma_2(\alpha_2 \cup \beta_3) \\ &= \gamma_1(\alpha_1 \cup \beta_1) + (-1)^n \gamma_3(\alpha_3 \cup \beta_3) \end{aligned}$$

So this even tells us that the sign is $(-1)^{n+1}$ as indicated in the lemma¹. □

20.27. Flat resolutions

A reference for the material in this section is [Spa88]. Let (X, \mathcal{O}_X) be a ringed space. By Modules, Lemma 17.16.6 any \mathcal{O}_X -module is a quotient of a flat \mathcal{O}_X -module. By Derived Categories, Lemma 13.16.5 any bounded above complex of \mathcal{O}_X -modules has a left resolution by a bounded above complex of flat \mathcal{O}_X -modules. However, for unbounded complexes, it turns out that flat resolutions aren't good enough.

Lemma 20.27.1. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{G}^\bullet be a complex of \mathcal{O}_X -modules. The functor*

$$K(\text{Mod}(\mathcal{O}_X)) \longrightarrow K(\text{Mod}(\mathcal{O}_X)), \quad \mathcal{F}^\bullet \longmapsto \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{G}^\bullet)$$

is an exact functor of triangulated categories.

Proof. Omitted. Hint: See More on Algebra, Lemmas 15.45.1 and 15.45.2. □

Definition 20.27.2. Let (X, \mathcal{O}_X) be a ringed space. A complex \mathcal{K}^\bullet of \mathcal{O}_X -modules is called *K-flat* if for every acyclic complex \mathcal{F}^\bullet of \mathcal{O}_X -modules the complex

$$\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet)$$

is acyclic.

Lemma 20.27.3. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{K}^\bullet be a K-flat complex. Then the functor*

$$K(\text{Mod}(\mathcal{O}_X)) \longrightarrow K(\text{Mod}(\mathcal{O}_X)), \quad \mathcal{F}^\bullet \longmapsto \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet)$$

transforms quasi-isomorphisms into quasi-isomorphisms.

Proof. Follows from Lemma 20.27.1 and the fact that quasi-isomorphisms are characterized by having acyclic cones. □

¹The sign depends on the convention for the signs in the long exact sequence in cohomology associated to a triangle in $D(X)$. The conventions in the stacks project are (a) distinguished triangles correspond to termwise split exact sequences and (b) the boundary maps in the long exact sequence are given by the maps in the snake lemma without the intervention of signs. See Derived Categories, Section 13.10.

Lemma 20.27.4. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{K}^\bullet be a complex of \mathcal{O}_X -modules. Then \mathcal{K}^\bullet is K -flat if and only if for all $x \in X$ the complex \mathcal{K}_x^\bullet of $\mathcal{O}_{X,x}$ is K -flat (More on Algebra, Definition 15.45.3).*

Proof. If \mathcal{K}_x^\bullet is K -flat for all $x \in X$ then we see that \mathcal{K}^\bullet is K -flat because \otimes and direct sums commute with taking stalks and because we can check exactness at stalks, see Modules, Lemma 17.3.1. Conversely, assume \mathcal{K}^\bullet is K -flat. Pick $x \in X$. M^\bullet be an acyclic complex of $\mathcal{O}_{X,x}$ -modules. Then $i_{x,*}M^\bullet$ is an acyclic complex of \mathcal{O}_X -modules. Thus $\text{Tot}(i_{x,*}M^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet)$ is acyclic. Taking stalks at x shows that $\text{Tot}(M^\bullet \otimes_{\mathcal{O}_{X,x}} \mathcal{K}_x^\bullet)$ is acyclic. \square

Lemma 20.27.5. *Let (X, \mathcal{O}_X) be a ringed space. If $\mathcal{K}^\bullet, \mathcal{L}^\bullet$ are K -flat complexes of \mathcal{O}_X -modules, then $\text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet)$ is a K -flat complex of \mathcal{O}_X -modules.*

Proof. Follows from the isomorphism

$$\text{Tot}(\mathcal{M}^\bullet \otimes_{\mathcal{O}_X} \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet)) = \text{Tot}(\text{Tot}(\mathcal{M}^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet) \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet)$$

and the definition. \square

Lemma 20.27.6. *Let (X, \mathcal{O}_X) be a ringed space. Let $(\mathcal{K}_1^\bullet, \mathcal{K}_2^\bullet, \mathcal{K}_3^\bullet)$ be a distinguished triangle in $K(\text{Mod}(\mathcal{O}_X))$. If two out of three of \mathcal{K}_i^\bullet are K -flat, so is the third.*

Proof. Follows from Lemma 20.27.1 and the fact that in a distinguished triangle in $K(\text{Mod}(\mathcal{O}_X))$ if two out of three are acyclic, so is the third. \square

Lemma 20.27.7. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The pullback of a K -flat complex of \mathcal{O}_Y -modules is a K -flat complex of \mathcal{O}_X -modules.*

Proof. We can check this on stalks, see Lemma 20.27.4. Hence this follows from Sheaves, Lemma 6.26.4 and More on Algebra, Lemma 15.45.5. \square

Lemma 20.27.8. *Let (X, \mathcal{O}_X) be a ringed space. A bounded above complex of flat \mathcal{O}_X -modules is K -flat.*

Proof. We can check this on stalks, see Lemma 20.27.4. Thus this lemma follows from Modules, Lemma 17.16.2 and More on Algebra, Lemma 15.45.8. \square

In the following lemma by a colimit of a system of complexes we mean the termwise colimit.

Lemma 20.27.9. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{K}_1^\bullet \rightarrow \mathcal{K}_2^\bullet \rightarrow \dots$ be a system of K -flat complexes. Then $\text{colim}_i \mathcal{K}_i^\bullet$ is K -flat.*

Proof. Because we are taking termwise colimits it is clear that

$$\text{colim}_i \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}_i^\bullet) = \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \text{colim}_i \mathcal{K}_i^\bullet)$$

Hence the lemma follows from the fact that filtered colimits are exact. \square

Lemma 20.27.10. *Let (X, \mathcal{O}_X) be a ringed space. For any complex \mathcal{G}^\bullet of \mathcal{O}_X -modules there exists a commutative diagram of complexes of \mathcal{O}_X -modules*

$$\begin{array}{ccccccc} \mathcal{K}_1^\bullet & \longrightarrow & \mathcal{K}_2^\bullet & \longrightarrow & \dots & & \\ \downarrow & & \downarrow & & & & \\ \tau_{\leq 1} \mathcal{G}^\bullet & \longrightarrow & \tau_{\leq 2} \mathcal{G}^\bullet & \longrightarrow & \dots & & \end{array}$$

with the following properties: (1) the vertical arrows are quasi-isomorphisms, (2) each \mathcal{K}_n^\bullet is a bounded above complex whose terms are direct sums of \mathcal{O}_X -modules of the form $j_{U!}\mathcal{O}_U$, and (3) the maps $\mathcal{K}_n^\bullet \rightarrow \mathcal{K}_{n+1}^\bullet$ are termwise split injections whose cokernels are direct sums of \mathcal{O}_X -modules of the form $j_{U!}\mathcal{O}_U$. Moreover, the map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism.

Proof. The existence of the diagram and properties (1), (2), (3) follows immediately from Modules, Lemma 17.16.6 and Derived Categories, Lemma 13.28.1. The induced map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism because filtered colimits are exact. \square

Lemma 20.27.11. *Let (X, \mathcal{O}_X) be a ringed space. For any complex \mathcal{G}^\bullet there exists a K-flat complex \mathcal{K}^\bullet and a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{G}^\bullet$.*

Proof. Choose a diagram as in Lemma 20.27.10. Each complex \mathcal{K}_n^\bullet is a bounded above complex of flat modules, see Modules, Lemma 17.16.5. Hence \mathcal{K}_n^\bullet is K-flat by Lemma 20.27.8. The induced map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism by construction. Since $\operatorname{colim} \mathcal{K}_n^\bullet$ is K-flat by Lemma 20.27.9 we win. \square

Lemma 20.27.12. *Let (X, \mathcal{O}_X) be a ringed space. Let $\alpha : \mathcal{P}^\bullet \rightarrow \mathcal{Q}^\bullet$ be a quasi-isomorphism of K-flat complexes of \mathcal{O}_X -modules. For every complex \mathcal{F}^\bullet of \mathcal{O}_X -modules the induced map*

$$\operatorname{Tot}(\operatorname{id}_{\mathcal{F}^\bullet} \otimes \alpha) : \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{P}^\bullet) \longrightarrow \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{Q}^\bullet)$$

is a quasi-isomorphism.

Proof. Choose a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{F}^\bullet$ with \mathcal{K}^\bullet a K-flat complex, see Lemma 20.27.11. Consider the commutative diagram

$$\begin{array}{ccc} \operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{P}^\bullet) & \longrightarrow & \operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{Q}^\bullet) \\ \downarrow & & \downarrow \\ \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{P}^\bullet) & \longrightarrow & \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} \mathcal{Q}^\bullet) \end{array}$$

The result follows as by Lemma 20.27.3 the vertical arrows and the top horizontal arrow are quasi-isomorphisms. \square

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}^\bullet be an object of $D(\mathcal{O}_X)$. Choose a K-flat resolution $\mathcal{K}^\bullet \rightarrow \mathcal{F}^\bullet$, see Lemma 20.27.11. By Lemma 20.27.1 we obtain an exact functor of triangulated categories

$$K(\mathcal{O}_X) \longrightarrow K(\mathcal{O}_X), \quad \mathcal{G}^\bullet \longmapsto \operatorname{Tot}(\mathcal{G}^\bullet \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet)$$

By Lemma 20.27.3 this functor induces a functor $D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_X)$ simply because $D(\mathcal{O}_X)$ is the localization of $K(\mathcal{O}_X)$ at quasi-isomorphisms. By Lemma 20.27.12 the resulting functor (up to isomorphism) does not depend on the choice of the K-flat resolution.

Definition 20.27.13. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}^\bullet be an object of $D(\mathcal{O}_X)$. The *derived tensor product*

$$- \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}^\bullet : D(\mathcal{O}_X) \longrightarrow D(\mathcal{O}_X)$$

is the exact functor of triangulated categories described above.

It is clear from our explicit constructions that there is a canonical isomorphism

$$\mathcal{F}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}^\bullet \cong \mathcal{G}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}^\bullet$$

for \mathcal{G}^\bullet and \mathcal{F}^\bullet in $D(\mathcal{O}_X)$. Hence when we write $\mathcal{F}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}^\bullet$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

Definition 20.27.14. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}, \mathcal{G} be \mathcal{O}_X -modules. The *Tor*'s of \mathcal{F} and \mathcal{G} are define by the formula

$$\mathrm{Tor}_p^{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) = H^{-p}(\mathcal{F} \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$$

with derived tensor product as defined above.

This definition implies that for every short exact sequence of \mathcal{O}_X -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ we have a long exact cohomology sequence

$$\begin{array}{ccccccc} \mathcal{F}_1 \otimes_{\mathcal{O}_X} \mathcal{G} & \longrightarrow & \mathcal{F}_2 \otimes_{\mathcal{O}_X} \mathcal{G} & \longrightarrow & \mathcal{F}_3 \otimes_{\mathcal{O}_X} \mathcal{G} & \longrightarrow & 0 \\ & & & & \swarrow & & \\ \mathrm{Tor}_1^{\mathcal{O}_X}(\mathcal{F}_1, \mathcal{G}) & \longrightarrow & \mathrm{Tor}_1^{\mathcal{O}_X}(\mathcal{F}_2, \mathcal{G}) & \longrightarrow & \mathrm{Tor}_1^{\mathcal{O}_X}(\mathcal{F}_3, \mathcal{G}) & & \end{array}$$

for every \mathcal{O}_X -module \mathcal{G} . This will be called the long exact sequence of Tor associated to the situation.

Lemma 20.27.15. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be an \mathcal{O}_X -module. The following are equivalent*

- (1) \mathcal{F} is a flat \mathcal{O}_X -module, and
- (2) $\mathrm{Tor}_1^{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) = 0$ for every \mathcal{O}_X -module \mathcal{G} .

Proof. If \mathcal{F} is flat, then $\mathcal{F} \otimes_{\mathcal{O}_X} -$ is an exact functor and the satellites vanish. Conversely assume (2) holds. Then if $\mathcal{G} \rightarrow \mathcal{H}$ is injective with cokernel \mathcal{Q} , the long exact sequence of Tor shows that the kernel of $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{H}$ is a quotient of $\mathrm{Tor}_1^{\mathcal{O}_X}(\mathcal{F}, \mathcal{Q})$ which is zero by assumption. Hence \mathcal{F} is flat. \square

20.28. Derived pullback

Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. We can use K-flat resolutions to define a derived pullback functor

$$Lf^* : D(\mathcal{O}_Y) \rightarrow D(\mathcal{O}_X)$$

Namely, for every complex of \mathcal{O}_Y -modules \mathcal{G}^\bullet we can choose a K-flat resolution $\mathcal{K}^\bullet \rightarrow \mathcal{G}^\bullet$ and set $Lf^*\mathcal{G}^\bullet = f^*\mathcal{K}^\bullet$. You can use Lemmas 20.27.7, 20.27.11, and 20.27.12 to see that this is well defined. However, to cross all the t's and dot all the i's it is perhaps more convenient to use some general theory.

Lemma 20.28.1. *The construction above is independent of choices and defines an exact functor of triangulated categories $Lf^* : D(\mathcal{O}_Y) \rightarrow D(\mathcal{O}_X)$.*

Proof. To see this we use the general theory developed in Derived Categories, Section 13.15. Set $\mathcal{D} = K(\mathcal{O}_Y)$ and $\mathcal{D}' = D(\mathcal{O}_X)$. Let us write $F : \mathcal{D} \rightarrow \mathcal{D}'$ the exact functor of triangulated categories defined by the rule $F(\mathcal{G}^\bullet) = f^*\mathcal{G}^\bullet$. We let S be the set of quasi-isomorphisms in $\mathcal{D} = K(\mathcal{O}_Y)$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15.2 applies. We claim that LF is everywhere defined. This follows from Derived Categories,

Lemma 13.15.15 with $\mathcal{P} \subset \text{Ob}(\mathcal{D})$ the collection of K -flat complexes: (1) follows from Lemma 20.27.11 and to see (2) we have to show that for a quasi-isomorphism $\mathcal{K}_1^\bullet \rightarrow \mathcal{K}_2^\bullet$ between K -flat complexes of \mathcal{O}_Y -modules the map $f^*\mathcal{K}_1^\bullet \rightarrow f^*\mathcal{K}_2^\bullet$ is a quasi-isomorphism. To see this write this as

$$f^{-1}\mathcal{K}_1^\bullet \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X \longrightarrow f^{-1}\mathcal{K}_2^\bullet \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X$$

The functor f^{-1} is exact, hence the map $f^{-1}\mathcal{K}_1^\bullet \rightarrow f^{-1}\mathcal{K}_2^\bullet$ is a quasi-isomorphism. By Lemma 20.27.7 applied to the morphism $(X, f^{-1}\mathcal{O}_Y) \rightarrow (Y, \mathcal{O}_Y)$ the complexes $f^{-1}\mathcal{K}_1^\bullet$ and $f^{-1}\mathcal{K}_2^\bullet$ are K -flat complexes of $f^{-1}\mathcal{O}_Y$ -modules. Hence Lemma 20.27.12 guarantees that the displayed map is a quasi-isomorphism. Thus we obtain a derived functor

$$LF : D(\mathcal{O}_Y) = S^{-1}\mathcal{D} \longrightarrow \mathcal{D}' = D(\mathcal{O}_X)$$

see Derived Categories, Equation (13.15.9.1). Finally, Derived Categories, Lemma 13.15.15 also guarantees that $LF(\mathcal{K}^\bullet) = F(\mathcal{K}^\bullet) = f^*\mathcal{K}^\bullet$ when \mathcal{K}^\bullet is K -flat, i.e., $Lf^* = LF$ is indeed computed in the way described above. \square

Lemma 20.28.2. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. There is a canonical bifunctorial isomorphism*

$$Lf^*(\mathcal{F}^\bullet \otimes_{\mathcal{O}_Y}^{\mathbf{L}} \mathcal{G}^\bullet) = Lf^*\mathcal{F}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*\mathcal{G}^\bullet$$

for $\mathcal{F}^\bullet, \mathcal{G}^\bullet \in \text{Ob}(D(X))$.

Proof. We may assume that \mathcal{F}^\bullet and \mathcal{G}^\bullet are K -flat complexes. In this case $\mathcal{F}^\bullet \otimes_{\mathcal{O}_Y}^{\mathbf{L}} \mathcal{G}^\bullet$ is just the total complex associated to the double complex $\mathcal{F}^\bullet \otimes_{\mathcal{O}_Y} \mathcal{G}^\bullet$. By Lemma 20.27.5 $\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_Y} \mathcal{G}^\bullet)$ is K -flat also. Hence the isomorphism of the lemma comes from the isomorphism

$$\text{Tot}(f^*\mathcal{F}^\bullet \otimes_{\mathcal{O}_X} f^*\mathcal{G}^\bullet) \longrightarrow f^*\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}_Y} \mathcal{G}^\bullet)$$

whose constituents are the isomorphisms $f^*\mathcal{F}^p \otimes_{\mathcal{O}_X} f^*\mathcal{G}^q \rightarrow f^*(\mathcal{F}^p \otimes_{\mathcal{O}_Y} \mathcal{G}^q)$ of Modules, Lemma 17.15.4. \square

Lemma 20.28.3. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. There is a canonical bifunctorial isomorphism*

$$\mathcal{F}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*\mathcal{G}^\bullet = \mathcal{F}^\bullet \otimes_{f^{-1}\mathcal{O}_Y}^{\mathbf{L}} f^{-1}\mathcal{G}^\bullet$$

for \mathcal{F}^\bullet in $D(X)$ and \mathcal{G}^\bullet in $D(Y)$.

Proof. Let \mathcal{F} be an \mathcal{O}_X -module and let \mathcal{G} be an \mathcal{O}_Y -module. Then $\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G} = \mathcal{F} \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{G}$ because $f^*\mathcal{G} = \mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{G}$. The lemma follows from this and the definitions. \square

20.29. Cohomology of unbounded complexes

Let (X, \mathcal{O}_X) be a ringed space. The category $\text{Mod}(\mathcal{O}_X)$ is a Grothendieck abelian category: it has all colimits, filtered colimits are exact, and it has a generator, namely

$$\bigoplus_{U \subset X \text{ open}} j_{U!}\mathcal{O}_U,$$

see Modules, Section 17.3 and Lemmas 17.16.5 and 17.16.6. By Injectives, Theorem 19.12.6 for every complex \mathcal{F}^\bullet of \mathcal{O}_X -modules there exists an injective quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ to a K -injective complex of \mathcal{O}_X -modules. Hence we can define

$$R\Gamma(X, \mathcal{F}^\bullet) = \Gamma(X, \mathcal{I}^\bullet)$$

and similarly for any left exact functor, see Derived Categories, Lemma 13.29.6. For any morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ we obtain

$$Rf_* : D(X) \longrightarrow D(Y)$$

on the unbounded derived categories.

Lemma 20.29.1. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. The functor Rf_* defined above and the functor Lf^* defined in Lemma 20.28.1 are adjoint:*

$$\mathrm{Hom}_{D(X)}(Lf^*\mathcal{G}^\bullet, \mathcal{F}^\bullet) = \mathrm{Hom}_{D(Y)}(\mathcal{G}^\bullet, Rf_*\mathcal{F}^\bullet)$$

bifunctorially in $\mathcal{F}^\bullet \in \mathrm{Ob}(D(X))$ and $\mathcal{G}^\bullet \in \mathrm{Ob}(D(Y))$.

Proof. This follows formally from the fact that Rf_* and Lf^* exist, see Derived Categories, Lemma 13.28.4. □

Remark 20.29.2. The construction of unbounded derived functor Lf^* and Rf_* allows one to construct the base change map in full generality. Namely, suppose that

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

is a commutative diagram of ringed spaces. Let \mathcal{F}^\bullet be a complex of \mathcal{O}_X -modules. Then there exists a canonical base change map

$$Lg^*Rf_*\mathcal{F}^\bullet \longrightarrow R(f')_*L(g')^*\mathcal{F}^\bullet$$

in $D(\mathcal{O}_{S'})$. Namely, this map is adjoint to a map $L(f')^*Lg^*Rf_*\mathcal{F}^\bullet \rightarrow L(g')^*\mathcal{F}^\bullet$. Since $L(f')^*Lg^* = L(g')^*Lf^*$ we see this is the same as a map $L(g')^*Lf^*Rf_*\mathcal{F}^\bullet \rightarrow L(g')^*\mathcal{F}^\bullet$ which we can take to be $L(g')^*$ of the adjunction map $Lf^*Rf_*\mathcal{F}^\bullet \rightarrow \mathcal{F}^\bullet$.

20.30. Unbounded Mayer-Vietoris

Let (X, \mathcal{O}_X) be a ringed space. Let $U \subset X$ be an open subset. Denote $j : (U, \mathcal{O}_U) \rightarrow (X, \mathcal{O}_X)$ the corresponding open immersion. The pullback functor j^* is exact as it is just the restriction functor. Thus derived pullback Lj^* is computed on any complex by simply restricting the complex. We often simply denote the corresponding functor

$$D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_U), \quad E \mapsto j^*E = E|_U$$

Similarly, extension by zero $j_! : \mathrm{Mod}(\mathcal{O}_U) \rightarrow \mathrm{Mod}(\mathcal{O}_X)$ (see Sheaves, Section 6.31) is an exact functor (Modules, Lemma 17.3.4). Thus it induces a functor

$$j_! : D(\mathcal{O}_U) \rightarrow D(\mathcal{O}_X), \quad F \mapsto j_!F$$

by simply applying $j_!$ to any complex representing the object F .

Lemma 20.30.1. *Let X be a ringed space. Let $U \subset X$ be an open subspace. The restriction of a K -injective complex of \mathcal{O}_X -modules to U is a K -injective complex of \mathcal{O}_U -modules.*

Proof. Follows immediately from Derived Categories, Lemma 13.29.10 and the fact that the restriction functor has the exact adjoint $j_!$. See discussion above. □

Lemma 20.30.2. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Given an open subspace $V \subset Y$, set $U = f^{-1}(V)$ and denote $g : U \rightarrow V$ the induced morphism. Then $(Rf_*E)|_V = Rg_*(E|_U)$ for E in $D(\mathcal{O}_X)$.*

Proof. Represent E by a K-injective complex \mathcal{I}^\bullet of \mathcal{O}_X -modules. Then $Rf_*(E) = f_*\mathcal{I}^\bullet$ and $Rg_*(E|_U) = g_*(\mathcal{I}^\bullet|_U)$ by Lemma 20.30.1. Hence the result follows from Lemma 20.7.4 (with $p = 0$). \square

Lemma 20.30.3. *Let (X, \mathcal{O}_X) be a ringed space. Let $U \subset X$ be an open subset. Denote $j : (U, \mathcal{O}_U) \rightarrow (X, \mathcal{O}_X)$ the corresponding open immersion. The restriction functor $D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_U)$ is a right adjoint to extension by zero $j_! : D(\mathcal{O}_U) \rightarrow D(\mathcal{O}_X)$.*

Proof. We have to show that

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(j_!E, F) = \mathrm{Hom}_{D(\mathcal{O}_U)}(E, F|_U)$$

Choose a complex \mathcal{E}^\bullet of \mathcal{O}_U -modules representing E and choose a K-injective complex \mathcal{I}^\bullet representing F . By Lemma 20.30.1 the complex $\mathcal{I}^\bullet|_U$ is K-injective as well. Hence we see that the formula above becomes

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(j_!\mathcal{E}^\bullet, \mathcal{I}^\bullet) = \mathrm{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet, \mathcal{I}^\bullet|_U)$$

which holds as $|_U$ and $j_!$ are adjoint functors (Sheaves, Lemma 6.31.8) and Derived Categories, Lemma 13.29.2. \square

Lemma 20.30.4. *Let (X, \mathcal{O}_X) be a ringed space. Let $X = U \cup V$ be the union of two open subspaces. For any object E of $D(\mathcal{O}_X)$ we have a distinguished triangle*

$$j_{U \cap V}!E|_{U \cap V} \rightarrow j_U!E|_U \oplus j_V!E|_V \rightarrow E \rightarrow j_{U \cap V}!E|_{U \cap V}[1]$$

in $D(\mathcal{O}_X)$.

Proof. We have seen above that the restriction functors and the extension by zero functors are computed by just applying the functors to any complex. Let \mathcal{E}^\bullet be a complex of \mathcal{O}_X -modules representing E . The distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes of \mathcal{O}_X -modules

$$0 \rightarrow j_{U \cap V}!\mathcal{E}^\bullet|_{U \cap V} \rightarrow j_U!\mathcal{E}^\bullet|_U \oplus j_V!\mathcal{E}^\bullet|_V \rightarrow \mathcal{E}^\bullet \rightarrow 0$$

To see this sequence is exact one checks on stalks using Sheaves, Lemma 6.31.8 (computation omitted). \square

Lemma 20.30.5. *Let (X, \mathcal{O}_X) be a ringed space. Let $X = U \cup V$ be the union of two open subspaces. For any object E of $D(\mathcal{O}_X)$ we have a distinguished triangle*

$$E \rightarrow Rj_{U,*}E|_U \oplus Rj_{V,*}E|_V \rightarrow Rj_{U \cap V,*}E|_{U \cap V} \rightarrow E[1]$$

in $D(\mathcal{O}_X)$.

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing E whose terms \mathcal{I}^n are injective objects of $\mathrm{Mod}(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. We have seen that $\mathcal{I}^\bullet|_U$ is a K-injective complex as well (Lemma 20.30.1). Hence $Rj_{U,*}E|_U$ is represented by $j_{U,*}\mathcal{I}^\bullet|_U$. Similarly for V and $U \cap V$. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet \rightarrow j_{U,*}\mathcal{I}^\bullet|_U \oplus j_{V,*}\mathcal{I}^\bullet|_V \rightarrow j_{U \cap V,*}\mathcal{I}^\bullet|_{U \cap V} \rightarrow 0.$$

This sequence is exact because for any $W \subset X$ open and any n the sequence

$$0 \rightarrow \mathcal{I}^n(W) \rightarrow \mathcal{I}^n(W \cap U) \oplus \mathcal{I}^n(W \cap V) \rightarrow \mathcal{I}^n(W \cap U \cap V) \rightarrow 0$$

is exact (see proof of Lemma 20.9.2). □

Lemma 20.30.6. *Let (X, \mathcal{O}_X) be a ringed space. Let $X = U \cup V$ be the union of two open subspaces of X . For objects E, F of $D(\mathcal{O}_X)$ we have a Mayer-Vietoris sequence*

$$\begin{array}{ccc} & \dots & \longrightarrow \text{Ext}^{-1}(E_{U \cap V}, F_{U \cap V}) \\ & \nearrow & \\ \text{Hom}(E, F) & \longleftarrow \text{Hom}(E_U, F_U) \oplus \text{Hom}(E_V, F_V) & \longrightarrow \text{Hom}(E_{U \cap V}, F_{U \cap V}) \end{array}$$

where the subscripts denote restrictions to the relevant opens and the Hom's are taken in the relevant derived categories.

Proof. Use the distinguished triangle of Lemma 20.30.4 to obtain a long exact sequence of Hom's (from Derived Categories, Lemma 13.4.2) and use that $\text{Hom}(j_{U!}E|_U, F) = \text{Hom}(E|_U, F|_U)$ by Lemma 20.30.3. □

Lemma 20.30.7. *Let (X, \mathcal{O}_X) be a ringed space. Suppose that $X = U \cup V$ is a union of two open subsets. For an object E of $D(\mathcal{O}_X)$ we have a distinguished triangle*

$$R\Gamma(X, E) \rightarrow R\Gamma(U, E) \oplus R\Gamma(V, E) \rightarrow R\Gamma(U \cap V, E) \rightarrow R\Gamma(X, E)[1]$$

and in particular a long exact cohomology sequence

$$\dots \rightarrow H^n(X, E) \rightarrow H^n(U, E) \oplus H^n(V, E) \rightarrow H^n(U \cap V, E) \rightarrow H^{n+1}(X, E) \rightarrow \dots$$

The construction of the distinguished triangle and the long exact sequence is functorial in E .

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing E . We may assume \mathcal{I}^n is an injective object of $\text{Mod}(\mathcal{O}_X)$ for all n , see Injectives, Theorem 19.12.6. Then $R\Gamma(X, E)$ is computed by $\Gamma(X, \mathcal{I}^\bullet)$. Similarly for U, V , and $U \cap V$ by Lemma 20.30.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet(X) \rightarrow \mathcal{I}^\bullet(U) \oplus \mathcal{I}^\bullet(V) \rightarrow \mathcal{I}^\bullet(U \cap V) \rightarrow 0.$$

We have seen this is a short exact sequence in the proof of Lemma 20.9.2. The final statement follows from the functoriality of the construction in Injectives, Theorem 19.12.6. □

Lemma 20.30.8. *Let $f : X \rightarrow Y$ be a morphism of ringed spaces. Suppose that $X = U \cup V$ is a union of two open subsets. Denote $a = f|_U : U \rightarrow Y$, $b = f|_V : V \rightarrow Y$, and $c = f|_{U \cap V} : U \cap V \rightarrow Y$. For every object E of $D(\mathcal{O}_X)$ there exists a distinguished triangle*

$$Rf_*E \rightarrow Ra_*(E|_U) \oplus Rb_*(E|_V) \rightarrow Rc_*(E|_{U \cap V}) \rightarrow Rf_*E[1]$$

This triangle is functorial in E .

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing E . We may assume \mathcal{I}^n is an injective object of $\text{Mod}(\mathcal{O}_X)$ for all n , see Injectives, Theorem 19.12.6. Then Rf_*E is computed by $f_*\mathcal{I}^\bullet$. Similarly for U , V , and $U \cap V$ by Lemma 20.30.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow f_*\mathcal{I}^\bullet \rightarrow a_*\mathcal{I}^\bullet|_U \oplus b_*\mathcal{I}^\bullet|_V \rightarrow c_*\mathcal{I}^\bullet|_{U \cap V} \rightarrow 0.$$

This is a short exact sequence of complexes by Lemma 20.9.3 and the fact that $R^1f_*\mathcal{I} = 0$ for an injective object \mathcal{I} of $\text{Mod}(\mathcal{O}_X)$. The final statement follows from the functoriality of the construction in Injectives, Theorem 19.12.6. \square

Lemma 20.30.9. *Let (X, \mathcal{O}_X) be a ringed space. Let $j : U \rightarrow X$ be an open subspace. Let $T \subset X$ be a closed subset contained in U .*

- (1) *If E is an object of $D(\mathcal{O}_X)$ whose cohomology sheaves are supported on T , then $E \rightarrow Rj_*(E|_U)$ is an isomorphism.*
- (2) *If F is an object of $D(\mathcal{O}_U)$ whose cohomology sheaves are supported on T , then $j_!F \rightarrow Rj_*F$ is an isomorphism.*

Proof. Let $V = X \setminus T$ and $W = U \cap V$. Note that $X = U \cup V$ is an open covering of X . Denote $j_W : W \rightarrow V$ the open immersion. Let E be an object of $D(\mathcal{O}_X)$ whose cohomology sheaves are supported on T . By Lemma 20.30.2 we have $(Rj_*E|_U)|_V = Rj_{W,*}(E|_W) = 0$ because $E|_W = 0$ by our assumption. On the other hand, $Rj_*(E|_U)|_U = E|_U$. Thus (1) is clear. Let F be an object of $D(\mathcal{O}_U)$ whose cohomology sheaves are supported on T . By Lemma 20.30.2 we have $(Rj_*F)|_V = Rj_{W,*}(F|_W) = 0$ because $F|_W = 0$ by our assumption. We also have $(j_!F)|_V = j_{W!}(F|_W) = 0$ (the first equality is immediate from the definition of extension by zero). Since both $(Rj_*F)|_U = F$ and $(j_!F)|_U = F$ we see that (2) holds. \square

We can glue complexes!

Lemma 20.30.10. *Let (X, \mathcal{O}_X) be a ringed space. Let $X = U \cup V$ be the union of two open subspaces of X . Suppose given*

- (1) *an object E of $D(\mathcal{O}_X)$,*
- (2) *a morphism $a : A \rightarrow E|_U$ of $D(\mathcal{O}_U)$,*
- (3) *a morphism $b : B \rightarrow E|_V$ of $D(\mathcal{O}_V)$,*
- (4) *an isomorphism $c : A|_{U \cap V} \rightarrow B|_{U \cap V}$*

such that

$$a|_{U \cap V} = b|_{U \cap V} \circ c.$$

Then there exists a morphism $F \rightarrow E$ in $D(\mathcal{O}_X)$ whose restriction to U is isomorphic to a and whose restriction to V is isomorphic to b .

Proof. Denote $j_U, j_V, j_{U \cap V}$ the corresponding open immersions. Choose a distinguished triangle

$$F \rightarrow Rj_{U,*}A \oplus Rj_{V,*}B \rightarrow Rj_{U \cap V,*}(B|_{U \cap V}) \rightarrow F[1]$$

where the map $Rj_{V,*}B \rightarrow Rj_{U \cap V,*}(B|_{U \cap V})$ is the obvious one and where $Rj_{U,*}A \rightarrow Rj_{U \cap V,*}(B|_{U \cap V})$ is the composition of $Rj_{U,*}A \rightarrow Rj_{U \cap V,*}(A|_{U \cap V})$ with $Rj_{U \cap V,*}c$. Restricting to U we obtain

$$F|_U \rightarrow A \oplus (Rj_{V,*}B)|_U \rightarrow (Rj_{U \cap V,*}(B|_{U \cap V}))|_U \rightarrow F|_U[1]$$

Denote $j : U \cap V \rightarrow U$. Compatibility of restriction to opens and cohomology shows that both $(Rj_{V,*}B)|_U$ and $(Rj_{U \cap V,*}(B|_{U \cap V}))|_U$ are canonically isomorphic to $Rj_*(B|_{U \cap V})$. Hence the second arrow of the last displayed diagram has a section, and we conclude that the morphism $F|_U \rightarrow A$ is an isomorphism. Similarly, the morphism $F|_V \rightarrow B$ is an isomorphism. The existence of the morphism $F \rightarrow E$ follows from the Mayer-Vietoris sequence for Hom, see Lemma 20.30.6. \square

20.31. Producing K-injective resolutions

First a technical lemma about the cohomology sheaves of the inverse limit of a system of complexes of sheaves. In some sense this lemma is the wrong thing to try to prove as one should take derived limits and not actual inverse limits. This will be discussed in Cohomology on Sites, Section 21.22.

Lemma 20.31.1. *Let (X, \mathcal{O}_X) be a ringed space. Let (\mathcal{F}_n^\bullet) be an inverse system of complexes of \mathcal{O}_X -modules. Let $m \in \mathbf{Z}$. Assume there exist a set \mathcal{B} of open subsets of X and an integer n_0 such that*

- (1) every open in X has a covering whose members are elements of \mathcal{B} ,
- (2) for every $U \in \mathcal{B}$
 - (a) the systems of abelian groups $\mathcal{F}_n^{m-2}(U)$ and $\mathcal{F}_n^{m-1}(U)$ have vanishing $R^1 \lim$ (for example these have the Mittag-Leffler condition),
 - (b) the system of abelian groups $H^{m-1}(\mathcal{F}_n^\bullet(U))$ has vanishing $R^1 \lim$ (for example it has the Mittag-Leffler condition), and
 - (c) we have $H^m(\mathcal{F}_n^\bullet(U)) = H^m(\mathcal{F}_{n_0}^\bullet(U))$ for all $n \geq n_0$.

Then the maps $H^m(\mathcal{F}^\bullet) \rightarrow \lim H^m(\mathcal{F}_n^\bullet) \rightarrow H^m(\mathcal{F}_{n_0}^\bullet)$ are isomorphisms of sheaves where $\mathcal{F}^\bullet = \lim \mathcal{F}_n^\bullet$ is the termwise inverse limit.

Proof. Let $U \in \mathcal{B}$. Note that $H^m(\mathcal{F}^\bullet(U))$ is the cohomology of

$$\lim_n \mathcal{F}_n^{m-2}(U) \rightarrow \lim_n \mathcal{F}_n^{m-1}(U) \rightarrow \lim_n \mathcal{F}_n^m(U) \rightarrow \lim_n \mathcal{F}_n^{m+1}(U)$$

in the third spot from the left. By assumptions (2)(a) and (2)(b) we may apply More on Algebra, Lemma 15.61.2 to conclude that

$$H^m(\mathcal{F}^\bullet(U)) = \lim H^m(\mathcal{F}_n^\bullet(U))$$

By assumption (2)(c) we conclude

$$H^m(\mathcal{F}^\bullet(U)) = H^m(\mathcal{F}_{n_0}^\bullet(U))$$

for all $n \geq n_0$. By assumption (1) we conclude that the sheafification of $U \mapsto H^m(\mathcal{F}^\bullet(U))$ is equal to the sheafification of $U \mapsto H^m(\mathcal{F}_n^\bullet(U))$ for all $n \geq n_0$. Thus the inverse system of sheaves $H^m(\mathcal{F}_n^\bullet)$ is constant for $n \geq n_0$ with value $H^m(\mathcal{F}^\bullet)$ which proves the lemma. \square

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}^\bullet be a complex of \mathcal{O}_X -modules. The category $Mod(\mathcal{O}_X)$ has enough injectives, hence we can use Derived Categories, Lemma 13.28.3 produce a diagram

$$\begin{array}{ccccc} \dots & \longrightarrow & \tau_{\geq -2} \mathcal{F}^\bullet & \longrightarrow & \tau_{\geq -1} \mathcal{F}^\bullet \\ & & \downarrow & & \downarrow \\ \dots & \longrightarrow & \mathcal{I}_2^\bullet & \longrightarrow & \mathcal{I}_1^\bullet \end{array}$$

in the category of complexes of \mathcal{O}_X -modules such that

- (1) the vertical arrows are quasi-isomorphisms,
- (2) \mathcal{I}_n^\bullet is a bounded above complex of injectives,
- (3) the arrows $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections.

The category of \mathcal{O}_X -modules has limits (they are computed on the level of presheaves), hence we can form the termwise limit $\mathcal{I}^\bullet = \lim_n \mathcal{I}_n^\bullet$. By Derived Categories, Lemmas 13.29.4 and 13.29.7 this is a K-injective complex. In general the canonical map

$$(20.31.1.1) \quad \mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$$

may not be a quasi-isomorphism. In the following lemma we describe some conditions under which it is.

Lemma 20.31.2. *In the situation described above. Denote $\mathcal{H}^m = H^m(\mathcal{F}^\bullet)$ the m th cohomology sheaf. Let \mathcal{B} be a set of open subsets of X . Let $d \in \mathbf{N}$. Assume*

- (1) every open in X has a covering whose members are elements of \mathcal{B} ,
- (2) for every $U \in \mathcal{B}$ we have $H^p(U, \mathcal{H}^q) = 0$ for $p > d^2$.

Then (20.31.1.1) is a quasi-isomorphism.

Proof. Let $m \in \mathbf{Z}$. We have to show that the map $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ induces an isomorphism $\mathcal{H}^m \rightarrow H^m(\mathcal{I}^\bullet)$. Since \mathcal{I}_n^\bullet is quasi-isomorphic to $\tau_{\geq -n}\mathcal{F}^\bullet$ it suffices to show that $H^m(\mathcal{I}^\bullet) \rightarrow H^m(\mathcal{I}_n^\bullet)$ is an isomorphism for n large enough. To do this we will verify the hypotheses (1), (2)(a), (2)(b), (2)(c) of Lemma 20.31.1.

Hypothesis (1) is assumption (1) above. Hypothesis (2)(a) follows from the fact that the maps $\mathcal{I}_{n+1}^k \rightarrow \mathcal{I}_n^k$ are split surjections. We will prove hypothesis (2)(b) and (2)(c) simultaneously by proving that for $U \in \mathcal{B}$ the system $H^m(\mathcal{I}_n^\bullet(U))$ becomes constant for $n \geq -m + d$. Namely, recalling that \mathcal{I}_n^\bullet is quasi-isomorphic to $\tau_{\geq -n}\mathcal{F}^\bullet$ we obtain for all n a distinguished triangle

$$\mathcal{H}^{-n}[n] \rightarrow \mathcal{I}_n^\bullet \rightarrow \mathcal{I}_{n-1}^\bullet \rightarrow \mathcal{H}^{-n}[n+1]$$

(Derived Categories, Remark 13.12.4) in $D(\mathcal{O}_X)$. By assumption (2) we see that if $m > d - n$ then

$$H^m(U, \mathcal{H}^{-n}[n]) = 0 \quad \text{and} \quad H^m(U, \mathcal{H}^{-n}[n+1]) = 0.$$

Observe that $H^m(\mathcal{I}_n^\bullet(U)) = H^m(U, \mathcal{I}_n^\bullet)$ as \mathcal{I}_n^\bullet is a bounded below complex of injectives. Unwinding the long exact sequence of cohomology associated to the distinguished triangle above this implies that

$$H^m(\mathcal{I}_n^\bullet(U)) \rightarrow H^m(\mathcal{I}_{n-1}^\bullet(U))$$

is an isomorphism for $m > d - n$, i.e., $n > d - m$ and we win. □

Lemma 20.31.3. *With assumptions and notation as in Lemma 20.31.2. Let K denote the object of $D(\mathcal{O}_X)$ represented by the complex \mathcal{F}^\bullet . Then there exists a distinguished triangle*

$$K \rightarrow \prod_{n \geq 0} \tau_{\geq -n}K \rightarrow \prod_{n \geq 0} \tau_{\geq -n}K \rightarrow K[1]$$

in $D(\mathcal{O}_X)$. In other words, K is the derived limit of its canonical truncations.

²In fact, analyzing the proof we see that it suffices if there exists a function $d : \mathbf{Z} \rightarrow \mathbf{Z} \cup \{+\infty\}$ such that $H^p(U, \mathcal{H}^q) = 0$ for $p > d(q)$ where $q + d(q) \rightarrow -\infty$ as $q \rightarrow -\infty$

Proof. The proof of Injectives, Lemma 19.13.4 shows that $\prod \tau_{\geq -n} K$ is represented by the complex $\prod \mathcal{I}_n^\bullet$. Because the transition maps $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections, we have a short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow 0$$

Since \mathcal{I}^\bullet represents K by Lemma 20.31.2 the distinguished triangle of the lemma is the distinguished triangle associated to the short exact sequence above (Derived Categories, Lemma 13.12.1). \square

20.32. Čech cohomology of unbounded complexes

The construction of Section 20.26 isn't the "correct" one for unbounded complexes. The problem is that in the Stacks project we use direct sums in the totalization of a double complex and we would have to replace this by a product. Instead of doing so in this section we assume the covering is finite and we use the alternating Čech complex.

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F}^\bullet be a complex of presheaves of \mathcal{O}_X -modules. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be a **finite** open covering of X . Since the alternating Čech complex $\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$ (Section 20.24) is functorial in the presheaf \mathcal{F} we obtain a double complex $\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)$. In this section we work with the associated total complex. The construction of $\text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$ is functorial in \mathcal{F}^\bullet . As well there is a functorial transformation

$$(20.32.0.1) \quad \Gamma(X, \mathcal{F}^\bullet) \longrightarrow \text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$$

of complexes defined by the following rule: The section $s \in \Gamma(X, \mathcal{F}^n)$ is mapped to the element $\alpha = \{\alpha_{i_0 \dots i_p}\}$ with $\alpha_{i_0} = s|_{U_{i_0}}$ and $\alpha_{i_0 \dots i_p} = 0$ for $p > 0$.

Lemma 20.32.1. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be a finite open covering. For a complex \mathcal{F}^\bullet of \mathcal{O}_X -modules there is a canonical map*

$$\text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow R\Gamma(X, \mathcal{F}^\bullet)$$

functorial in \mathcal{F}^\bullet and compatible with (20.32.0.1).

Proof. Let \mathcal{I}^\bullet be a K-injective complex whose terms are injective \mathcal{O}_X -modules. The map (20.32.0.1) for \mathcal{I}^\bullet is a map $\Gamma(X, \mathcal{I}^\bullet) \rightarrow \text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{I}^\bullet))$. This is a quasi-isomorphism of complexes of abelian groups as follows from Homology, Lemma 12.22.7 applied to the double complex $\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)$ using Lemmas 20.12.1 and 20.24.6. Suppose $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ is a quasi-isomorphism of \mathcal{F}^\bullet into a K-injective complex whose terms are injectives (Injectives, Theorem 19.12.6). Since $R\Gamma(X, \mathcal{F}^\bullet)$ is represented by the complex $\Gamma(X, \mathcal{I}^\bullet)$ we obtain the map of the lemma using

$$\text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow \text{Tot}(\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)).$$

We omit the verification of functoriality and compatibilities. \square

Lemma 20.32.2. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be a finite open covering. Let \mathcal{F}^\bullet be a complex of \mathcal{O}_X -modules. Let \mathcal{B} be a set of open subsets of X . Assume*

- (1) every open in X has a covering whose members are elements of \mathcal{B} ,
- (2) we have $U_{i_0 \dots i_p} \in \mathcal{B}$ for all $i_0, \dots, i_p \in I$,
- (3) for every $U \in \mathcal{B}$ and $p > 0$ we have
 - (a) $H^p(U, \mathcal{F}^q) = 0$,

- (b) $H^p(U, \text{Coker}(\mathcal{F}^{q-1} \rightarrow \mathcal{F}^q)) = 0$, and
- (c) $H^p(U, H^q(\mathcal{F})) = 0$.

Then the map

$$\text{Tot}(\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow R\Gamma(X, \mathcal{F}^\bullet)$$

of Lemma 20.32.1 is an isomorphism in $D(\text{Ab})$.

Proof. If \mathcal{F}^\bullet is bounded below, this follows from assumption (3)(a) and the spectral sequence of Lemma 20.26.1 and the fact that

$$\text{Tot}(\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow \text{Tot}(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$$

is a quasi-isomorphism by Lemma 20.24.6 (some details omitted). In general, by assumption (3)(c) we may choose a resolution $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet = \lim \mathcal{I}_n^\bullet$ as in Lemma 20.31.2. Then the map of the lemma becomes

$$\lim_n \text{Tot}(\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \tau_{\geq -n} \mathcal{F}^\bullet)) \longrightarrow \lim_n \Gamma(X, \mathcal{I}_n^\bullet)$$

Note that (3)(b) shows that $\tau_{\geq -n} \mathcal{F}^\bullet$ is a bounded below complex satisfying the hypothesis of the lemma. Thus the case of bounded below complexes shows each of the maps

$$\text{Tot}(\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \tau_{\geq -n} \mathcal{F}^\bullet)) \longrightarrow \Gamma(X, \mathcal{I}_n^\bullet)$$

is a quasi-isomorphism. The cohomologies of the complexes on the left hand side in given degree are eventually constant (as the alternating Čech complex is finite). Hence the same is true on the right hand side. Thus the cohomology of the limit on the right hand side is this constant value by Homology, Lemma 12.27.7 and we win. \square

20.33. Hom complexes

Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{L}^\bullet and \mathcal{M}^\bullet be two complexes of \mathcal{O}_X -modules. We construct a complex of \mathcal{O}_X -modules $\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$. Namely, for each n we set

$$\mathcal{H}om^n(\mathcal{L}^\bullet, \mathcal{M}^\bullet) = \prod_{n=p+q} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{L}^{-q}, \mathcal{M}^p)$$

It is a good idea to think of $\mathcal{H}om^n$ as the sheaf of \mathcal{O}_X -modules of all \mathcal{O}_X -linear maps from \mathcal{L}^\bullet to \mathcal{M}^\bullet (viewed as graded \mathcal{O}_X -modules) which are homogenous of degree n . In this terminology, we define the differential by the rule

$$d(f) = d_{\mathcal{M}} \circ f - (-1)^n f \circ d_{\mathcal{L}}$$

for $f \in \mathcal{H}om_{\mathcal{O}_X}^n(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$. We omit the verification that $d^2 = 0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have

$$(20.33.0.1) \quad H^n(\Gamma(U, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet))) = \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{L}^\bullet, \mathcal{M}^\bullet[n])$$

for all $n \in \mathbf{Z}$ and every open $U \subset X$.

Lemma 20.33.1. *Let (X, \mathcal{O}_X) be a ringed space. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O}_X -modules there is an isomorphism*

$$\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)) = \mathcal{H}om^\bullet(\text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet), \mathcal{M}^\bullet)$$

of complexes of \mathcal{O}_X -modules functorial in $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.1. \square

Lemma 20.33.2. *Let (X, \mathcal{O}_X) be a ringed space. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O}_X -modules there is a canonical morphism*

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \otimes_{\mathcal{O}_X} \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{L}^\bullet)) \longrightarrow \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{M}^\bullet)$$

of complexes of \mathcal{O}_X -modules.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.2. \square

Lemma 20.33.3. *Let (X, \mathcal{O}_X) be a ringed space. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O}_X -modules there is a canonical morphism*

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet) \longrightarrow \mathcal{H}om^\bullet(\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{L}^\bullet), \mathcal{M}^\bullet)$$

of complexes of \mathcal{O}_X -modules functorial in all three complexes.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.3. \square

Lemma 20.33.4. *Let (X, \mathcal{O}_X) be a ringed space. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O}_X -modules there is a canonical morphism*

$$\mathcal{K}^\bullet \longrightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet))$$

of complexes of \mathcal{O}_X -modules functorial in both complexes.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.5. \square

Lemma 20.33.5. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{I}^\bullet be a K -injective complex of \mathcal{O}_X -modules. Let \mathcal{L}^\bullet be a complex of \mathcal{O}_X -modules. Then*

$$H^0(\Gamma(U, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet))) = \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

for all $U \subset X$ open.

Proof. We have

$$\begin{aligned} H^0(\Gamma(U, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet))) &= \mathrm{Hom}_{K(\mathcal{O}_U)}(L|_U, M|_U) \\ &= \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U) \end{aligned}$$

The first equality is (20.33.0.1). The second equality is true because $\mathcal{I}^\bullet|_U$ is K -injective by Lemma 20.30.1. \square

Lemma 20.33.6. *Let (X, \mathcal{O}_X) be a ringed space. Let $(\mathcal{I}')^\bullet \rightarrow \mathcal{I}^\bullet$ be a quasi-isomorphism of K -injective complexes of \mathcal{O}_X -modules. Let $(\mathcal{L}')^\bullet \rightarrow \mathcal{L}^\bullet$ be a quasi-isomorphism of complexes of \mathcal{O}_X -modules. Then*

$$\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}')^\bullet) \longrightarrow \mathcal{H}om^\bullet((\mathcal{L}')^\bullet, \mathcal{I}^\bullet)$$

is a quasi-isomorphism.

Proof. Let M be the object of $D(\mathcal{O}_X)$ represented by \mathcal{I}^\bullet and $(\mathcal{I}')^\bullet$. Let L be the object of $D(\mathcal{O}_X)$ represented by \mathcal{L}^\bullet and $(\mathcal{L}')^\bullet$. By Lemma 20.33.5 we see that the sheaves

$$H^0(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}')^\bullet)) \quad \text{and} \quad H^0(\mathcal{H}om^\bullet((\mathcal{L}')^\bullet, \mathcal{I}^\bullet))$$

are both equal to the sheaf associated to the presheaf

$$U \longmapsto \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

Thus the map is a quasi-isomorphism. \square

Lemma 20.33.7. *Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{I}^\bullet be a K -injective complex of \mathcal{O}_X -modules. Let \mathcal{L}^\bullet be a K -flat complex of \mathcal{O}_X -modules. Then $\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$ is a K -injective complex of \mathcal{O}_X -modules.*

Proof. Namely, if \mathcal{K}^\bullet is an acyclic complex of \mathcal{O}_X -modules, then

$$\begin{aligned} \mathrm{Hom}_{K(\mathcal{O}_X)}(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)) &= H^0(\Gamma(X, \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)))) \\ &= H^0(\Gamma(X, \mathcal{H}om^\bullet(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet), \mathcal{I}^\bullet))) \\ &= \mathrm{Hom}_{K(\mathcal{O}_X)}(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet), \mathcal{I}^\bullet) \\ &= 0 \end{aligned}$$

The first equality by (20.33.0.1). The second equality by Lemma 20.33.1. The third equality by (20.33.0.1). The final equality because $\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet)$ is acyclic because \mathcal{L}^\bullet is K -flat (Definition 20.27.2) and because \mathcal{I}^\bullet is K -injective. \square

20.34. Internal hom in the derived category

Let (X, \mathcal{O}_X) be a ringed space. Let L, M be objects of $D(\mathcal{O}_X)$. We would like to construct an object $R\mathcal{H}om(L, M)$ of $D(\mathcal{O}_X)$ such that for every third object K of $D(\mathcal{O}_X)$ there exists a canonical bijection

$$(20.34.0.1) \quad \mathrm{Hom}_{D(\mathcal{O}_X)}(K, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O}_X)}(K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L, M)$$

Observe that this formula defines $R\mathcal{H}om(L, M)$ up to unique isomorphism by the Yoneda lemma (Categories, Lemma 4.3.5).

To construct such an object, choose a K -injective complex \mathcal{I}^\bullet representing M and any complex of \mathcal{O}_X -modules \mathcal{L}^\bullet representing L . Then we set

$$R\mathcal{H}om(L, M) = \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$$

where the right hand side is the complex of \mathcal{O}_X -modules constructed in Section 20.33. This is well defined by Lemma 20.33.6. We get a functor

$$D(\mathcal{O}_X)^{opp} \times D(\mathcal{O}_X) \longrightarrow D(\mathcal{O}_X), \quad (K, L) \longmapsto R\mathcal{H}om(K, L)$$

As a prelude to proving (20.34.0.1) we compute the cohomology groups of $R\mathcal{H}om(K, L)$.

Lemma 20.34.1. *Let (X, \mathcal{O}_X) be a ringed space. Let L, M be objects of $D(\mathcal{O}_X)$. For every open U we have*

$$H^0(U, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

and in particular $H^0(X, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O}_X)}(L, M)$.

Proof. Choose a K -injective complex \mathcal{I}^\bullet of \mathcal{O}_X -modules representing M and a K -flat complex \mathcal{L}^\bullet representing L . Then $\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$ is K -injective by Lemma 20.33.7. Hence we can compute cohomology over U by simply taking sections over U and the result follows from Lemma 20.33.5. \square

Lemma 20.34.2. *Let (X, \mathcal{O}_X) be a ringed space. Let K, L, M be objects of $D(\mathcal{O}_X)$. With the construction as described above there is a canonical isomorphism*

$$R\mathcal{H}om(K, R\mathcal{H}om(L, M)) = R\mathcal{H}om(K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L, M)$$

in $D(\mathcal{O}_X)$ functorial in K, L, M which recovers (20.34.0.1) by taking $H^0(X, -)$.

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing M and a K-flat complex of \mathcal{O}_X -modules \mathcal{L}^\bullet representing L . Let \mathcal{H}^\bullet be the complex described above. For any complex of \mathcal{O}_X -modules \mathcal{K}^\bullet we have

$$\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)) = \mathcal{H}om^\bullet(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet), \mathcal{I}^\bullet)$$

by Lemma 20.33.1. Note that the left hand side represents $R\mathcal{H}om(K, R\mathcal{H}om(L, M))$ (use Lemma 20.33.7) and that the right hand side represents $R\mathcal{H}om(K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L, M)$. This proves the displayed formula of the lemma. Taking global sections and using Lemma 20.34.1 we obtain (20.34.0.1). \square

Lemma 20.34.3. *Let (X, \mathcal{O}_X) be a ringed space. Let K, L be objects of $D(\mathcal{O}_X)$. The construction of $R\mathcal{H}om(K, L)$ commutes with restrictions to opens, i.e., for every open U we have $R\mathcal{H}om(K|_U, L|_U) = R\mathcal{H}om(K, L)|_U$.*

Proof. This is clear from the construction and Lemma 20.30.1. \square

Lemma 20.34.4. *Let (X, \mathcal{O}_X) be a ringed space. The bifunctor $R\mathcal{H}om(-, -)$ transforms distinguished triangles into distinguished triangles in both variables.*

Proof. This follows from the observation that the assignment

$$(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \longmapsto \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$$

transforms a termwise split short exact sequences of complexes in either variable into a termwise split short exact sequence. Details omitted. \square

Lemma 20.34.5. *Let (X, \mathcal{O}_X) be a ringed space. Let K, L, M be objects of $D(\mathcal{O}_X)$. There is a canonical morphism*

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} K \longrightarrow R\mathcal{H}om(R\mathcal{H}om(K, L), M)$$

in $D(\mathcal{O}_X)$ functorial in K, L, M .

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing M , a K-injective complex \mathcal{J}^\bullet representing L , and a K-flat complex \mathcal{K}^\bullet representing K . The map is defined using the map

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{J}^\bullet, \mathcal{I}^\bullet) \otimes_{\mathcal{O}_X} \mathcal{K}^\bullet) \longrightarrow \mathcal{H}om^\bullet(\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{J}^\bullet), \mathcal{I}^\bullet)$$

of Lemma 20.33.3. By our particular choice of complexes the left hand side represents $R\mathcal{H}om(L, M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} K$ and the right hand side represents $R\mathcal{H}om(R\mathcal{H}om(K, L), M)$. We omit the proof that this is functorial in all three objects of $D(\mathcal{O}_X)$. \square

Lemma 20.34.6. *Let (X, \mathcal{O}_X) be a ringed space. Given K, L, M in $D(\mathcal{O}_X)$ there is a canonical morphism*

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(K, M)$$

in $D(\mathcal{O}_X)$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 20.33.2. Instead, we use the maps

$$\begin{array}{c} R\mathcal{H}om(L, M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} R\mathcal{H}om(K, L) \otimes_{\mathcal{O}_X}^{\mathbf{L}} K \\ \downarrow \\ R\mathcal{H}om(R\mathcal{H}om(K, L), M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} R\mathcal{H}om(K, L) \\ \downarrow \\ M \end{array}$$

gotten by applying Lemma 20.34.5 twice. Finally, we use Lemma 20.34.2 to translate the composition

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}_X}^{\mathbf{L}} R\mathcal{H}om(K, L) \otimes_{\mathcal{O}_X}^{\mathbf{L}} K \longrightarrow M$$

into a map as in the statement of the lemma. □

Lemma 20.34.7. *Let (X, \mathcal{O}_X) be a ringed space. Given K, L in $D(\mathcal{O}_X)$ there is a canonical morphism*

$$K \longrightarrow R\mathcal{H}om(L, K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L)$$

in $D(\mathcal{O}_X)$ functorial in both K and L .

Proof. Choose K -flat complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet representing K and L . Choose a K -injective complex \mathcal{I}^\bullet and a quasi-isomorphism $\text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet) \rightarrow \mathcal{I}^\bullet$. Then we use

$$\mathcal{K}^\bullet \rightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet)) \rightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$$

where the first map comes from Lemma 20.33.4. □

Lemma 20.34.8. *Let (X, \mathcal{O}_X) be a ringed space. Let L be an object of $D(\mathcal{O}_X)$. Set $L^\wedge = R\mathcal{H}om(L, \mathcal{O}_X)$. For M in $D(\mathcal{O}_X)$ there is a canonical map*

$$(20.34.8.1) \quad L^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M \longrightarrow R\mathcal{H}om(L, M)$$

which induces a canonical map

$$H^0(X, L^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M) \longrightarrow \text{Hom}_{D(\mathcal{O}_X)}(L, M)$$

functorial in M in $D(\mathcal{O}_X)$.

Proof. The map (20.34.8.1) is a special case of Lemma 20.34.6 using the identification $M = R\mathcal{H}om(\mathcal{O}_X, M)$. □

Remark 20.34.9. Let $h : X \rightarrow Y$ be a morphism of ringed spaces. Let K, L be objects of $D(\mathcal{O}_Y)$. We claim there is a canonical map

$$Lh^* R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(Lh^* K, Lh^* L)$$

in $D(\mathcal{O}_X)$. Namely, by (20.34.0.1) proved in Lemma 20.34.2 such a map is the same thing as a map

$$Lh^* R\mathcal{H}om(K, L) \otimes^{\mathbf{L}} Lh^* K \longrightarrow Lh^* L$$

The source of this arrow is $Lh^*(\mathcal{H}om(K, L) \otimes^{\mathbf{L}} K)$ by Lemma 20.28.2 hence it suffices to construct a canonical map

$$R\mathcal{H}om(K, L) \otimes^{\mathbf{L}} K \longrightarrow L.$$

For this we take the arrow corresponding to

$$\text{id} : R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(K, L)$$

via (20.34.0.1).

Remark 20.34.10. Suppose that

$$\begin{array}{ccc} X' & \longrightarrow & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

is a commutative diagram of ringed spaces. Let K, L be objects of $D(\mathcal{O}_X)$. We claim there exists a canonical base change map

$$Lg^*Rf_*R\mathcal{H}om(K, L) \longrightarrow R(f')_*R\mathcal{H}om(Lh^*K, Lh^*L)$$

in $D(\mathcal{O}_{S'})$. Namely, we take the map adjoint to the composition

$$\begin{aligned} L(f')^*Lg^*Rf_*R\mathcal{H}om(K, L) &= Lh^*Lf^*Rf_*R\mathcal{H}om(K, L) \\ &\rightarrow Lh^*R\mathcal{H}om(K, L) \\ &\rightarrow R\mathcal{H}om(Lh^*K, Lh^*L) \end{aligned}$$

where the first arrow uses the adjunction mapping $Lf^*Rf_* \rightarrow \text{id}$ and the second arrow is the canonical map constructed in Remark 20.34.9.

20.35. Strictly perfect complexes

Strictly perfect complexes of modules are used to define the notions of pseudo-coherent and perfect complexes later on. They are defined as follows.

Definition 20.35.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{E}^\bullet be a complex of \mathcal{O}_X -modules. We say \mathcal{E}^\bullet is *strictly perfect* if \mathcal{E}^i is zero for all but finitely many i and \mathcal{E}^i is a direct summand of a finite free \mathcal{O}_X -module for all i .

Warning: Since we do not assume that X is a locally ringed space, it may not be true that a direct summand of a finite free \mathcal{O}_X -module is finite locally free.

Lemma 20.35.2. *The cone on a morphism of strictly perfect complexes is strictly perfect.*

Proof. This is immediate from the definitions. □

Lemma 20.35.3. *The total complex associated to the tensor product of two strictly perfect complexes is strictly perfect.*

Proof. Omitted. □

Lemma 20.35.4. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. If \mathcal{F}^\bullet is a strictly perfect complex of \mathcal{O}_Y -modules, then $f^*\mathcal{F}^\bullet$ is a strictly perfect complex of \mathcal{O}_X -modules.*

Proof. The pullback of a finite free module is finite free. The functor f^* is additive functor hence preserves direct summands. The lemma follows. □

Lemma 20.35.5. *Let (X, \mathcal{O}_X) be a ringed space. Given a solid diagram of \mathcal{O}_X -modules*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \mathcal{F} \\ & \searrow \text{dotted} & \uparrow p \\ & & \mathcal{G} \end{array}$$

with \mathcal{E} a direct summand of a finite free \mathcal{O}_X -module and p surjective, then a dotted arrow making the diagram commute exists locally on X .

Proof. We may assume $\mathcal{E} = \mathcal{O}_X^{\oplus n}$ for some n . In this case finding the dotted arrow is equivalent to lifting the images of the basis elements in $\Gamma(X, \mathcal{F})$. This is locally possible by the characterization of surjective maps of sheaves (Sheaves, Section 6.16). \square

Lemma 20.35.6. *Let (X, \mathcal{O}_X) be a ringed space.*

- (1) *Let $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ be a morphism of complexes of \mathcal{O}_X -modules with \mathcal{E}^\bullet strictly perfect and \mathcal{F}^\bullet acyclic. Then α is locally on X homotopic to zero.*
- (2) *Let $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ be a morphism of complexes of \mathcal{O}_X -modules with \mathcal{E}^\bullet strictly perfect, $\mathcal{E}^i = 0$ for $i < a$, and $H^i(\mathcal{F}^\bullet) = 0$ for $i \geq a$. Then α is locally on X homotopic to zero.*

Proof. The first statement follows from the second, hence we only prove (2). We will prove this by induction on the length of the complex \mathcal{E}^\bullet . If $\mathcal{E}^\bullet \cong \mathcal{E}[-n]$ for some direct summand \mathcal{E} of a finite free \mathcal{O}_X -module and integer $n \geq a$, then the result follows from Lemma 20.35.5 and the fact that $\mathcal{F}^{n-1} \rightarrow \text{Ker}(\mathcal{F}^n \rightarrow \mathcal{F}^{n+1})$ is surjective by the assumed vanishing of $H^n(\mathcal{F}^\bullet)$. If \mathcal{E}^i is zero except for $i \in [a, b]$, then we have a split exact sequence of complexes

$$0 \rightarrow \mathcal{E}^b[-b] \rightarrow \mathcal{E}^\bullet \rightarrow \sigma_{\leq b-1} \mathcal{E}^\bullet \rightarrow 0$$

which determines a distinguished triangle in $K(\mathcal{O}_X)$. Hence an exact sequence

$$\text{Hom}_{K(\mathcal{O}_X)}(\sigma_{\leq b-1} \mathcal{E}^\bullet, \mathcal{F}^\bullet) \rightarrow \text{Hom}_{K(\mathcal{O}_X)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \rightarrow \text{Hom}_{K(\mathcal{O}_X)}(\mathcal{E}^b[-b], \mathcal{F}^\bullet)$$

by the axioms of triangulated categories. The composition $\mathcal{E}^b[-b] \rightarrow \mathcal{F}^\bullet$ is locally homotopic to zero, whence we may assume our map comes from an element in the left hand side of the displayed exact sequence above. This element is locally zero by induction hypothesis. \square

Lemma 20.35.7. *Let (X, \mathcal{O}_X) be a ringed space. Given a solid diagram of complexes of \mathcal{O}_X -modules*

$$\begin{array}{ccc} \mathcal{E}^\bullet & \xrightarrow{\alpha} & \mathcal{F}^\bullet \\ & \searrow \text{dotted} & \uparrow f \\ & & \mathcal{G}^\bullet \end{array}$$

with \mathcal{E}^\bullet strictly perfect, $\mathcal{E}^j = 0$ for $j < a$ and $H^j(f)$ an isomorphism for $j > a$ and surjective for $j = a$, then a dotted arrow making the diagram commute up to homotopy exists locally on X .

Proof. Our assumptions on f imply the cone $C(f)^\bullet$ has vanishing cohomology sheaves in degrees $\geq a$. Hence Lemma 20.35.6 guarantees there is an open covering

$X = \bigcup U_i$ such that the composition $\mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet \rightarrow C(f)^\bullet$ is homotopic to zero over U_i . Since

$$\mathcal{G}^\bullet \rightarrow \mathcal{F}^\bullet \rightarrow C(f)^\bullet \rightarrow \mathcal{G}^\bullet[1]$$

restricts to a distinguished triangle in $K(\mathcal{O}_{U_i})$ we see that we can lift $\alpha|_{U_i}$ up to homotopy to a map $\alpha_i : \mathcal{E}^\bullet|_{U_i} \rightarrow \mathcal{G}^\bullet|_{U_i}$ as desired. \square

Lemma 20.35.8. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O}_X -modules with \mathcal{E}^\bullet strictly perfect.*

- (1) *For any element $\alpha \in \text{Hom}_{D(\mathcal{O}_X)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ there exists an open covering $X = \bigcup U_i$ such that $\alpha|_{U_i}$ is given by a morphism of complexes $\alpha_i : \mathcal{E}^\bullet|_{U_i} \rightarrow \mathcal{F}^\bullet|_{U_i}$.*
- (2) *Given a morphism of complexes $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ whose image in the group $\text{Hom}_{D(\mathcal{O}_X)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is zero, there exists an open covering $X = \bigcup U_i$ such that $\alpha|_{U_i}$ is homotopic to zero.*

Proof. Proof of (1). By the construction of the derived category we can find a quasi-isomorphism $f : \mathcal{F}^\bullet \rightarrow \mathcal{G}^\bullet$ and a map of complexes $\beta : \mathcal{E}^\bullet \rightarrow \mathcal{G}^\bullet$ such that $\alpha = f^{-1}\beta$. Thus the result follows from Lemma 20.35.7. We omit the proof of (2). \square

Lemma 20.35.9. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O}_X -modules with \mathcal{E}^\bullet strictly perfect. Then the internal hom $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex \mathcal{H}^\bullet with terms*

$$\mathcal{H}^n = \bigoplus_{n=p+q} \text{Hom}_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

and differential as described in Section 20.34.

Proof. Choose a quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ into a K-injective complex. Let $(\mathcal{H}')^\bullet$ be the complex with terms

$$(\mathcal{H}')^n = \prod_{n=p+q} \text{Hom}_{\mathcal{O}_X}(\mathcal{L}^{-q}, \mathcal{I}^p)$$

which represents $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ by the construction in Section 20.34. It suffices to show that the map

$$\mathcal{H}^\bullet \longrightarrow (\mathcal{H}')^\bullet$$

is a quasi-isomorphism. Given an open $U \subset X$ we have by inspection

$$H^0(\mathcal{H}^\bullet(U)) = \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{E}^\bullet|_U, \mathcal{K}^\bullet|_U) \rightarrow H^0((\mathcal{H}')^\bullet(U)) = \text{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet|_U, \mathcal{K}^\bullet|_U)$$

By Lemma 20.35.8 the sheafification of $U \mapsto H^0(\mathcal{H}^\bullet(U))$ is equal to the sheafification of $U \mapsto H^0((\mathcal{H}')^\bullet(U))$. A similar argument can be given for the other cohomology sheaves. Thus \mathcal{H}^\bullet is quasi-isomorphic to $(\mathcal{H}')^\bullet$ which proves the lemma. \square

Lemma 20.35.10. *Let (X, \mathcal{O}_X) be a ringed space. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O}_X -modules with*

- (1) $\mathcal{F}^n = 0$ for $n \ll 0$,
- (2) $\mathcal{E}^n = 0$ for $n \gg 0$, and
- (3) \mathcal{E}^n isomorphic to a direct summand of a finite free \mathcal{O}_X -module.

Then the internal hom $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex \mathcal{H}^\bullet with terms

$$\mathcal{H}^n = \bigoplus_{n=p+q} \text{Hom}_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

and differential as described in Section 20.34.

Proof. Choose a quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ where \mathcal{I}^\bullet is a bounded below complex of injectives. Note that \mathcal{I}^\bullet is K-injective (Derived Categories, Lemma 13.29.4). Hence the construction in Section 20.34 shows that $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex $(\mathcal{H}')^\bullet$ with terms

$$(\mathcal{H}')^n = \prod_{n=p+q} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{I}^p) = \bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{I}^p)$$

(equality because there are only finitely many nonzero terms). Note that \mathcal{H}^\bullet is the total complex associated to the double complex with terms $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{F}^p)$ and similarly for $(\mathcal{H}')^\bullet$. The natural map $(\mathcal{H}')^\bullet \rightarrow \mathcal{H}^\bullet$ comes from a map of double complexes. Thus to show this map is a quasi-isomorphism, we may use the spectral sequence of a double complex (Homology, Lemma 12.22.6)

$${}^1E_1^{p,q} = H^p(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{F}^\bullet))$$

converging to $H^{p+q}(\mathcal{H}^\bullet)$ and similarly for $(\mathcal{H}')^\bullet$. To finish the proof of the lemma it suffices to show that $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ induces an isomorphism

$$H^p(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}^\bullet)) \longrightarrow H^p(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{I}^\bullet))$$

on cohomology sheaves whenever \mathcal{E} is a direct summand of a finite free \mathcal{O}_X -module. Since this is clear when \mathcal{E} is finite free the result follows. \square

20.36. Pseudo-coherent modules

In this section we discuss pseudo-coherent complexes.

Definition 20.36.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{E}^\bullet be a complex of \mathcal{O}_X -modules. Let $m \in \mathbf{Z}$.

- (1) We say \mathcal{E}^\bullet is *m-pseudo-coherent* if there exists an open covering $X = \bigcup U_i$ and for each i a morphism of complexes $\alpha_i : \mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{U_i}$ where \mathcal{E}_i is strictly perfect on U_i and $H^j(\alpha_i)$ is an isomorphism for $j > m$ and $H^m(\alpha_i)$ is surjective.
- (2) We say \mathcal{E}^\bullet is *pseudo-coherent* if it is *m-pseudo-coherent* for all m .
- (3) We say an object E of $D(\mathcal{O}_X)$ is *m-pseudo-coherent* (resp. *pseudo-coherent*) if and only if it can be represented by a *m-pseudo-coherent* (resp. *pseudo-coherent*) complex of \mathcal{O}_X -modules.

If X is quasi-compact, then an *m-pseudo-coherent* object of $D(\mathcal{O}_X)$ is in $D^-(\mathcal{O}_X)$. But this need not be the case if X is not quasi-compact.

Lemma 20.36.2. Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$.

- (1) If there exists an open covering $X = \bigcup U_i$, strictly perfect complexes \mathcal{E}_i^\bullet on U_i , and maps $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with $H^j(\alpha_i)$ an isomorphism for $j > m$ and $H^m(\alpha_i)$ surjective, then E is *m-pseudo-coherent*.
- (2) If E is *m-pseudo-coherent*, then any complex representing E is *m-pseudo-coherent*.

Proof. Let \mathcal{F}^\bullet be any complex representing E and let $X = \bigcup U_i$ and $\alpha_i : \mathcal{E}_i \rightarrow E|_{U_i}$ be as in (1). We will show that \mathcal{F}^\bullet is *m-pseudo-coherent* as a complex, which will prove (1) and (2) simultaneously. By Lemma 20.35.8 we can after refining the open covering $X = \bigcup U_i$ represent the maps α_i by maps of complexes $\alpha_i : \mathcal{E}_i^\bullet \rightarrow \mathcal{F}^\bullet|_{U_i}$. By assumption $H^j(\alpha_i)$ are isomorphisms for $j > m$, and $H^m(\alpha_i)$ is surjective whence \mathcal{F}^\bullet is *m-pseudo-coherent*. \square

Lemma 20.36.3. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let E be an object of $D(\mathcal{O}_Y)$. If E is m -pseudo-coherent, then Lf^*E is m -pseudo-coherent.*

Proof. Represent E by a complex \mathcal{E}^\bullet of \mathcal{O}_Y -modules and choose an open covering $Y = \bigcup V_i$ and $\alpha_i : \mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{V_i}$ as in Definition 20.36.1. Set $U_i = f^{-1}(V_i)$. By Lemma 20.36.2 it suffices to show that $Lf^*\mathcal{E}^\bullet|_{U_i}$ is m -pseudo-coherent. Choose a distinguished triangle

$$\mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{V_i} \rightarrow C \rightarrow \mathcal{E}_i^\bullet[1]$$

The assumption on α_i means exactly that the cohomology sheaves $H^j(C)$ are zero for all $j \geq m$. Denote $f_i : U_i \rightarrow V_i$ the restriction of f . Note that $Lf^*\mathcal{E}^\bullet|_{U_i} = Lf_i^*(\mathcal{E}_i^\bullet|_{V_i})$. Applying Lf_i^* we obtain the distinguished triangle

$$Lf_i^*\mathcal{E}_i^\bullet \rightarrow Lf_i^*\mathcal{E}_i^\bullet|_{V_i} \rightarrow Lf_i^*C \rightarrow Lf_i^*\mathcal{E}_i^\bullet[1]$$

By the construction of Lf_i^* as a left derived functor we see that $H^j(Lf_i^*C) = 0$ for $j \geq m$ (by the dual of Derived Categories, Lemma 13.17.1). Hence $H^j(Lf_i^*\alpha_i)$ is an isomorphism for $j > m$ and $H^m(Lf_i^*\alpha_i)$ is surjective. On the other hand, $Lf_i^*\mathcal{E}_i^\bullet = f_i^*\mathcal{E}_i^\bullet$ is strictly perfect by Lemma 20.35.4. Thus we conclude. \square

Lemma 20.36.4. *Let (X, \mathcal{O}_X) be a ringed space and $m \in \mathbf{Z}$. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O}_X)$.*

- (1) *If K is $(m+1)$ -pseudo-coherent and L is m -pseudo-coherent then M is m -pseudo-coherent.*
- (2) *If K and M are m -pseudo-coherent, then L is m -pseudo-coherent.*
- (3) *If L is $(m+1)$ -pseudo-coherent and M is m -pseudo-coherent, then K is $(m+1)$ -pseudo-coherent.*

Proof. Proof of (1). Choose an open covering $X = \bigcup U_i$ and maps $\alpha_i : \mathcal{K}_i^\bullet \rightarrow K|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with \mathcal{K}_i^\bullet strictly perfect and $H^j(\alpha_i)$ isomorphisms for $j > m+1$ and surjective for $j = m+1$. We may replace \mathcal{K}_i^\bullet by $\sigma_{\geq m+1}\mathcal{K}_i^\bullet$ and hence we may assume that $\mathcal{K}_i^j = 0$ for $j < m+1$. After refining the open covering we may choose maps $\beta_i : \mathcal{L}_i^\bullet \rightarrow L|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with \mathcal{L}_i^\bullet strictly perfect such that $H^j(\beta)$ is an isomorphism for $j > m$ and surjective for $j = m$. By Lemma 20.35.7 we can, after refining the covering, find maps of complexes $\gamma_i : \mathcal{K}^\bullet \rightarrow \mathcal{L}^\bullet$ such that the diagrams

$$\begin{array}{ccc} K|_{U_i} & \longrightarrow & L|_{U_i} \\ \alpha_i \uparrow & & \uparrow \beta_i \\ \mathcal{K}_i^\bullet & \xrightarrow{\gamma_i} & \mathcal{L}_i^\bullet \end{array}$$

are commutative in $D(\mathcal{O}_{U_i})$ (this requires representing the maps α_i, β_i and $K|_{U_i} \rightarrow L|_{U_i}$ by actual maps of complexes; some details omitted). The cone $C(\gamma_i)^\bullet$ is strictly perfect (Lemma 20.35.2). The commutativity of the diagram implies that there exists a morphism of distinguished triangles

$$(\mathcal{K}_i^\bullet, \mathcal{L}_i^\bullet, C(\gamma_i)^\bullet) \longrightarrow (K|_{U_i}, L|_{U_i}, M|_{U_i}).$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5.19 and 12.5.20 that $C(\gamma_i)^\bullet \rightarrow M|_{U_i}$ induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . Hence M is m -pseudo-coherent by Lemma 20.36.2.

Assertions (2) and (3) follow from (1) by rotating the distinguished triangle. \square

Lemma 20.36.5. *Let (X, \mathcal{O}_X) be a ringed space. Let K, L be objects of $D(\mathcal{O}_X)$.*

- (1) *If K is n -pseudo-coherent and $H^i(K) = 0$ for $i > a$ and L is m -pseudo-coherent and $H^j(L) = 0$ for $j > b$, then $K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$ is t -pseudo-coherent with $t = \max(m + a, n + b)$.*
- (2) *If K and L are pseudo-coherent, then $K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$ is pseudo-coherent.*

Proof. Proof of (1). By replacing X by the members of an open covering we may assume there exist strictly perfect complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet and maps $\alpha : \mathcal{K}^\bullet \rightarrow K$ and $\beta : \mathcal{L}^\bullet \rightarrow L$ with $H^i(\alpha)$ and isomorphism for $i > n$ and surjective for $i = n$ and with $H^i(\beta)$ and isomorphism for $i > m$ and surjective for $i = m$. Then the map

$$\alpha \otimes^{\mathbf{L}} \beta : \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}_X} \mathcal{L}^\bullet) \rightarrow K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$$

induces isomorphisms on cohomology sheaves in degree i for $i > t$ and a surjection for $i = t$. This follows from the spectral sequence of tors (details omitted).

Proof of (2). We may first replace X by the members of an open covering to reduce to the case that K and L are bounded above. Then the statement follows immediately from case (1). \square

Lemma 20.36.6. *Let (X, \mathcal{O}_X) be a ringed space. Let $m \in \mathbf{Z}$. If $K \oplus L$ is m -pseudo-coherent (resp. pseudo-coherent) in $D(\mathcal{O}_X)$ so are K and L .*

Proof. Assume that $K \oplus L$ is m -pseudo-coherent. After replacing X by the members of an open covering we may assume $K \oplus L \in D^-(\mathcal{O}_X)$, hence $L \in D^-(\mathcal{O}_X)$. Note that there is a distinguished triangle

$$(K \oplus L, K \oplus L, L \oplus L[1]) = (K, K, 0) \oplus (L, L, L \oplus L[1])$$

see Derived Categories, Lemma 13.4.9. By Lemma 20.36.4 we see that $L \oplus L[1]$ is m -pseudo-coherent. Hence also $L[1] \oplus L[2]$ is m -pseudo-coherent. By induction $L[n] \oplus L[n + 1]$ is m -pseudo-coherent. Since L is bounded above we see that $L[n]$ is m -pseudo-coherent for large n . Hence working backwards, using the distinguished triangles

$$(L[n], L[n] \oplus L[n - 1], L[n - 1])$$

we conclude that $L[n - 1], L[n - 2], \dots, L$ are m -pseudo-coherent as desired. \square

Lemma 20.36.7. *Let (X, \mathcal{O}_X) be a ringed space. Let $m \in \mathbf{Z}$. Let \mathcal{F}^\bullet be a (locally) bounded above complex of \mathcal{O}_X -modules such that \mathcal{F}^i is $(m - i)$ -pseudo-coherent for all i . Then \mathcal{F}^\bullet is m -pseudo-coherent.*

Proof. Omitted. Hint: use Lemma 20.36.4 and truncations as in the proof of More on Algebra, Lemma 15.50.9. \square

Lemma 20.36.8. *Let (X, \mathcal{O}_X) be a ringed space. Let $m \in \mathbf{Z}$. Let E be an object of $D(\mathcal{O}_X)$. If E is (locally) bounded above and $H^i(E)$ is $(m - i)$ -pseudo-coherent for all i , then E is m -pseudo-coherent.*

Proof. Omitted. Hint: use Lemma 20.36.4 and truncations as in the proof of More on Algebra, Lemma 15.50.10. \square

Lemma 20.36.9. *Let (X, \mathcal{O}_X) be a ringed space. Let K be an object of $D(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$.*

- (1) *If K is m -pseudo-coherent and $H^i(K) = 0$ for $i > m$, then $H^m(K)$ is a finite type \mathcal{O}_X -module.*

- (2) If K is m -pseudo-coherent and $H^i(K) = 0$ for $i > m + 1$, then $H^{m+1}(K)$ is a finitely presented \mathcal{O}_X -module.

Proof. Proof of (1). We may work locally on X . Hence we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow K$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . It suffices to prove the result for \mathcal{E}^\bullet . Let n be the largest integer such that $\mathcal{E}^n \neq 0$. If $n = m$, then $H^m(\mathcal{E}^\bullet)$ is a quotient of \mathcal{E}^n and the result is clear. If $n > m$, then $\mathcal{E}^{n-1} \rightarrow \mathcal{E}^n$ is surjective as $H^n(\mathcal{E}^\bullet) = 0$. By Lemma 20.35.5 we can locally find a section of this surjection and write $\mathcal{E}^{n-1} = \mathcal{E}' \oplus \mathcal{E}^n$. Hence it suffices to prove the result for the complex $(\mathcal{E}')^\bullet$ which is the same as \mathcal{E}^\bullet except has \mathcal{E}' in degree $n - 1$ and 0 in degree n . We win by induction on n .

Proof of (2). We may work locally on X . Hence we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow K$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . As in the proof of (1) we can reduce to the case that $\mathcal{E}^i = 0$ for $i > m + 1$. Then we see that $H^{m+1}(K) \cong H^{m+1}(\mathcal{E}^\bullet) = \text{Coker}(\mathcal{E}^m \rightarrow \mathcal{E}^{m+1})$ which is of finite presentation. \square

Lemma 20.36.10. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.

- (1) \mathcal{F} viewed as an object of $D(\mathcal{O}_X)$ is 0-pseudo-coherent if and only if \mathcal{F} is a finite type \mathcal{O}_X -module, and
- (2) \mathcal{F} viewed as an object of $D(\mathcal{O}_X)$ is (-1) -pseudo-coherent if and only if \mathcal{F} is an \mathcal{O}_X -module of finite presentation.

Proof. Use Lemma 20.36.9 to prove the implications in one direction and Lemma 20.36.8 for the other. \square

20.37. Tor dimension

In this section we take a closer look at resolutions by flat modules.

Definition 20.37.1. Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$.

- (1) We say E has *tor-amplitude* in $[a, b]$ if $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}) = 0$ for all \mathcal{O}_X -modules \mathcal{F} and all $i \notin [a, b]$.
- (2) We say E has *finite tor dimension* if it has tor-amplitude in $[a, b]$ for some a, b .
- (3) We say E *locally has finite tor dimension* if there exists an open covering $X = \bigcup U_i$ such that $E|_{U_i}$ has finite tor dimension for all i .

Note that if E has finite tor dimension, then E is an object of $D^b(\mathcal{O}_X)$ as can be seen by taking $\mathcal{F} = \mathcal{O}_X$ in the definition above.

Lemma 20.37.2. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{E}^\bullet be a bounded above complex of flat \mathcal{O}_X -modules with tor-amplitude in $[a, b]$. Then $\text{Coker}(d_{\mathcal{E}^\bullet}^{a-1})$ is a flat \mathcal{O}_X -module.

Proof. As \mathcal{E}^\bullet is a bounded above complex of flat modules we see that $\mathcal{E}^\bullet \otimes_{\mathcal{O}_X} \mathcal{F} = \mathcal{E}^\bullet \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}$ for any \mathcal{O}_X -module \mathcal{F} . Hence for every \mathcal{O}_X -module \mathcal{F} the sequence

$$\mathcal{E}^{a-2} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{E}^a \otimes_{\mathcal{O}_X} \mathcal{F}$$

is exact in the middle. Since $\mathcal{E}^{a-2} \rightarrow \mathcal{E}^{a-1} \rightarrow \mathcal{E}^a \rightarrow \text{Coker}(d^{a-1}) \rightarrow 0$ is a flat resolution this implies that $\text{Tor}_1^{\mathcal{O}_X}(\text{Coker}(d^{a-1}), \mathcal{F}) = 0$ for all \mathcal{O}_X -modules \mathcal{F} . This means that $\text{Coker}(d^{a-1})$ is flat, see Lemma 20.27.15. \square

Lemma 20.37.3. *Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent*

- (1) *E has tor-amplitude in $[a, b]$.*
- (2) *E is represented by a complex \mathcal{E}^\bullet of flat \mathcal{O}_X -modules with $\mathcal{E}^i = 0$ for $i \notin [a, b]$.*

Proof. If (2) holds, then we may compute $E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F} = \mathcal{E}^\bullet \otimes_{\mathcal{O}_X} \mathcal{F}$ and it is clear that (1) holds.

Assume that (1) holds. We may represent E by a bounded above complex of flat \mathcal{O}_X -modules \mathcal{K}^\bullet , see Section 20.27. Let n be the largest integer such that $\mathcal{K}^n \neq 0$. If $n > b$, then $\mathcal{K}^{n-1} \rightarrow \mathcal{K}^n$ is surjective as $H^n(\mathcal{K}^\bullet) = 0$. As \mathcal{K}^n is flat we see that $\text{Ker}(\mathcal{K}^{n-1} \rightarrow \mathcal{K}^n)$ is flat (Modules, Lemma 17.16.8). Hence we may replace \mathcal{K}^\bullet by $\tau_{\leq n-1} \mathcal{K}^\bullet$. Thus, by induction on n , we reduce to the case that \mathcal{K}^\bullet is a complex of flat \mathcal{O}_X -modules with $\mathcal{K}^i = 0$ for $i > b$.

Set $\mathcal{E}^\bullet = \tau_{\geq a} \mathcal{K}^\bullet$. Everything is clear except that \mathcal{E}^a is flat which follows immediately from Lemma 20.37.2 and the definitions. \square

Lemma 20.37.4. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let E be an object of $D(\mathcal{O}_Y)$. If E has tor amplitude in $[a, b]$, then Lf^*E has tor amplitude in $[a, b]$.*

Proof. Assume E has tor amplitude in $[a, b]$. By Lemma 20.37.3 we can represent E by a complex of \mathcal{E}^\bullet of flat \mathcal{O} -modules with $\mathcal{E}^i = 0$ for $i \notin [a, b]$. Then Lf^*E is represented by $f^*\mathcal{E}^\bullet$. By Modules, Lemma 17.17.2 the modules $f^*\mathcal{E}^i$ are flat. Thus by Lemma 20.37.3 we conclude that Lf^*E has tor amplitude in $[a, b]$. \square

Lemma 20.37.5. *Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent*

- (1) *E has tor-amplitude in $[a, b]$.*
- (2) *for every $x \in X$ the object E_x of $D(\mathcal{O}_{X,x})$ has tor-amplitude in $[a, b]$.*

Proof. Taking stalks at x is the same thing as pulling back by the morphism of ringed spaces $(x, \mathcal{O}_{X,x}) \rightarrow (X, \mathcal{O}_X)$. Hence the implication (1) \Rightarrow (2) follows from Lemma 20.37.4. For the converse, note that taking stalks commutes with tensor products (Modules, Lemma 17.15.1). Hence

$$(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F})_x = E_x \otimes_{\mathcal{O}_{X,x}}^{\mathbf{L}} \mathcal{F}_x$$

On the other hand, taking stalks is exact, so

$$H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F})_x = H^i((E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F})_x) = H^i(E_x \otimes_{\mathcal{O}_{X,x}}^{\mathbf{L}} \mathcal{F}_x)$$

and we can check whether $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F})$ is zero by checking whether all of its stalks are zero (Modules, Lemma 17.3.1). Thus (2) implies (1). \square

Lemma 20.37.6. *Let (X, \mathcal{O}_X) be a ringed space. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O}_X)$. Let $a, b \in \mathbf{Z}$.*

- (1) *If K has tor-amplitude in $[a+1, b+1]$ and L has tor-amplitude in $[a, b]$ then M has tor-amplitude in $[a, b]$.*

- (2) If K and M have tor-amplitude in $[a, b]$, then L has tor-amplitude in $[a, b]$.
 (3) If L has tor-amplitude in $[a + 1, b + 1]$ and M has tor-amplitude in $[a, b]$, then K has tor-amplitude in $[a + 1, b + 1]$.

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation. \square

Lemma 20.37.7. Let (X, \mathcal{O}_X) be a ringed space. Let K, L be objects of $D(\mathcal{O}_X)$. If K has tor-amplitude in $[a, b]$ and L has tor-amplitude in $[c, d]$ then $K \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$ has tor amplitude in $[a + c, b + d]$.

Proof. Omitted. Hint: use the spectral sequence for tors. \square

Lemma 20.37.8. Let (X, \mathcal{O}_X) be a ringed space. Let $a, b \in \mathbf{Z}$. For K, L objects of $D(\mathcal{O}_X)$ if $K \oplus L$ has tor amplitude in $[a, b]$ so do K and L .

Proof. Clear from the fact that the Tor functors are additive. \square

20.38. Perfect complexes

In this section we discuss properties of perfect complexes on ringed spaces.

Definition 20.38.1. Let (X, \mathcal{O}_X) be a ringed space. Let \mathcal{E}^\bullet be a complex of \mathcal{O}_X -modules. We say \mathcal{E}^\bullet is *perfect* if there exists an open covering $X = \bigcup U_i$ such that for each i there exists a morphism of complexes $\mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{U_i}$ which is a quasi-isomorphism with \mathcal{E}_i^\bullet strictly perfect. An object E of $D(\mathcal{O}_X)$ is *perfect* if it can be represented by a perfect complex of \mathcal{O}_X -modules.

Lemma 20.38.2. Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$.

- (1) If there exists an open covering $X = \bigcup U_i$, strictly perfect complexes \mathcal{E}_i^\bullet on U_i , and isomorphisms $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ in $D(\mathcal{O}_{U_i})$, then E is perfect.
 (2) If E is perfect, then any complex representing E is perfect.

Proof. Identical to the proof of Lemma 20.36.2. \square

Lemma 20.38.3. Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$. Let $a \leq b$ be integers. If E has tor amplitude in $[a, b]$ and is $(a-1)$ -pseudo-coherent, then E is perfect.

Proof. After replacing X by the members of an open covering we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow E$ such that $H^i(\alpha)$ is an isomorphism for $i \geq a$. We may and do replace \mathcal{E}^\bullet by $\sigma_{\geq a-1} \mathcal{E}^\bullet$. Choose a distinguished triangle

$$\mathcal{E}^\bullet \rightarrow E \rightarrow C \rightarrow \mathcal{E}^\bullet[1]$$

From the vanishing of cohomology sheaves of E and \mathcal{E}^\bullet and the assumption on α we obtain $C \cong \mathcal{K}[a-2]$ with $\mathcal{K} = \text{Ker}(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^a)$. Let \mathcal{F} be an \mathcal{O}_X -module. Applying $-\otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}$ the assumption that E has tor amplitude in $[a, b]$ implies $\mathcal{K} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}_X} \mathcal{F}$ has image $\text{Ker}(\mathcal{E}^{a-1} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{E}^a \otimes_{\mathcal{O}_X} \mathcal{F})$. It follows that $\text{Tor}_1^{\mathcal{O}_X}(\mathcal{E}', \mathcal{F}) = 0$ where $\mathcal{E}' = \text{Coker}(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^a)$. Hence \mathcal{E}' is flat (Lemma 20.27.15). Thus \mathcal{E}' is locally a direct summand of a finite free module by Modules, Lemma 17.16.11. Thus locally the complex

$$\mathcal{E}' \rightarrow \mathcal{E}^{a-1} \rightarrow \dots \rightarrow \mathcal{E}^b$$

is quasi-isomorphic to E and E is perfect. \square

Lemma 20.38.4. *Let (X, \mathcal{O}_X) be a ringed space. Let E be an object of $D(\mathcal{O}_X)$. The following are equivalent*

- (1) E is perfect, and
- (2) E is pseudo-coherent and locally has finite tor dimension.

Proof. Assume (1). By definition this means there exists an open covering $X = \bigcup U_i$ such that $E|_{U_i}$ is represented by a strictly perfect complex. Thus E is pseudo-coherent (i.e., m -pseudo-coherent for all m) by Lemma 20.36.2. Moreover, a direct summand of a finite free module is flat, hence $E|_{U_i}$ has finite Tor dimension by Lemma 20.37.3. Thus (2) holds.

Assume (2). After replacing X by the members of an open covering we may assume there exist integers $a \leq b$ such that E has tor amplitude in $[a, b]$. Since E is m -pseudo-coherent for all m we conclude using Lemma 20.38.3. \square

Lemma 20.38.5. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let E be an object of $D(\mathcal{O}_Y)$. If E is perfect in $D(\mathcal{O}_Y)$, then Lf^*E is perfect in $D(\mathcal{O}_X)$.*

Proof. This follows from Lemma 20.38.4, 20.37.4, and 20.36.3. (An alternative proof is to copy the proof of Lemma 20.36.3.) \square

Lemma 20.38.6. *Let (X, \mathcal{O}_X) be a ringed space. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O}_X)$. If two out of three of K, L, M are perfect then the third is also perfect.*

Proof. First proof: Combine Lemmas 20.38.4, 20.36.4, and 20.37.6. Second proof (sketch): Say K and L are perfect. After replacing X by the members of an open covering we may assume that K and L are represented by strictly perfect complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet . After replacing X by the members of an open covering we may assume the map $K \rightarrow L$ is given by a map of complexes $\alpha : \mathcal{K}^\bullet \rightarrow \mathcal{L}^\bullet$, see Lemma 20.35.8. Then M is isomorphic to the cone of α which is strictly perfect by Lemma 20.35.2. \square

Lemma 20.38.7. *Let (X, \mathcal{O}_X) be a ringed space. If K, L are perfect objects of $D(\mathcal{O}_X)$, then so is $K \otimes_{\mathcal{O}_X}^L L$.*

Proof. Follows from Lemmas 20.38.4, 20.36.5, and 20.37.7. \square

Lemma 20.38.8. *Let (X, \mathcal{O}_X) be a ringed space. If $K \oplus L$ is a perfect object of $D(\mathcal{O}_X)$, then so are K and L .*

Proof. Follows from Lemmas 20.38.4, 20.36.6, and 20.37.8. \square

Lemma 20.38.9. *Let (X, \mathcal{O}_X) be a ringed space. Let $j : U \rightarrow X$ be an open subspace. Let E be a perfect object of $D(\mathcal{O}_U)$ whose cohomology sheaves are supported on a closed subset $T \subset U$ with $j(T)$ closed in X . Then Rj_*E is a perfect object of $D(\mathcal{O}_X)$.*

Proof. Being a perfect complex is local on X . Thus it suffices to check that Rj_*E is perfect when restricted to U and $V = X \setminus j(T)$. We have $Rj_*E|_U = E$ which is perfect. We have $Rj_*E|_V = 0$ because $E|_{U \setminus T} = 0$. \square

Lemma 20.38.10. *Let (X, \mathcal{O}_X) be a ringed space. Let K be a perfect object of $D(\mathcal{O}_X)$. Then $K^\wedge = R\mathcal{H}om(K, \mathcal{O}_X)$ is a perfect object too and $(K^\wedge)^\wedge = K$. There are functorial isomorphisms*

$$H^0(X, K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M) = \mathrm{Hom}_{D(\mathcal{O}_X)}(K, M)$$

for M in $D(\mathcal{O}_X)$.

Proof. We will use without further mention that formation of internal hom commutes with restriction to opens (Lemma 20.34.3). In particular we may check the first two statements locally on X . By Lemma 20.34.8 to see the final statement it suffices to check that the map (20.34.8.1)

$$K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M \longrightarrow R\mathcal{H}om(K, M)$$

is an isomorphism. This is local on X as well. Hence it suffices to prove the lemma when K is represented by a strictly perfect complex.

Assume K is represented by the strictly perfect complex \mathcal{E}^\bullet . Then it follows from Lemma 20.35.9 that K^\wedge is represented by the complex whose terms are $(\mathcal{E}^{-n})^\wedge = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-n}, \mathcal{O}_X)$ in degree n . Since \mathcal{E}^{-n} is a direct summand of a finite free \mathcal{O}_X -module, so is $(\mathcal{E}^{-n})^\wedge$. Hence K^\wedge is represented by a strictly perfect complex too. It is also clear that $(K^\wedge)^\wedge = K$ as we have $((\mathcal{E}^{-n})^\wedge)^\wedge = \mathcal{E}^{-n}$. To see that (20.34.8.1) is an isomorphism, represent M by a K -flat complex \mathcal{F}^\bullet . By Lemma 20.35.9 the complex $R\mathcal{H}om(K, M)$ is represented by the complex with terms

$$\bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

On the other hand, then object $K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M$ is represented by the complex with terms

$$\bigoplus_{n=p+q} \mathcal{F}^p \otimes_{\mathcal{O}_X} (\mathcal{E}^{-q})^\wedge$$

Thus the assertion that (20.34.8.1) is an isomorphism reduces to the assertion that the canonical map

$$\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{O}_X) \longrightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F})$$

is an isomorphism when \mathcal{E} is a direct summand of a finite free \mathcal{O}_X -module and \mathcal{F} is any \mathcal{O}_X -module. This follows immediately from the corresponding statement when \mathcal{E} is finite free. \square

20.39. Compact objects

In this section we study compact objects in the derived category of modules on a ringed space. We recall that compact objects are defined in Derived Categories, Definition 13.34.1. On suitable ringed spaces the perfect objects are compact.

Lemma 20.39.1. *Let X be a ringed space. Assume that the underlying topological space of X has the following properties:*

- (1) X is quasi-compact,
- (2) there exists a basis of quasi-compact open subsets, and
- (3) the intersection of any two quasi-compact opens is quasi-compact.

Then any perfect object of $D(\mathcal{O}_X)$ is compact.

Proof. Let K be a perfect object and let K^\wedge be its dual, see Lemma 20.38.10. Then we have

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(K, M) = H^0(X, K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M)$$

functorially in M in $D(\mathcal{O}_X)$. Since $K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} -$ commutes with direct sums (by construction) and H^0 does by Lemma 20.20.1 and the construction of direct sums in Injectives, Lemma 19.13.4 we obtain the result of the lemma. \square

Cohomology on Sites

21.1. Introduction

In this document we work out some topics on cohomology of sheaves. We work out what happens for sheaves on sites, although often we will simply duplicate the discussion, the constructions, and the proofs from the topological case in the case. Basic references are [AGV71], [God73] and [Ive86].

21.2. Topics

Here are some topics that should be discussed in this chapter, and have not yet been written.

- (1) Cohomology of a sheaf of modules on a site is the same as the cohomology of the underlying abelian sheaf.
- (2) Hypercohomology on a site.
- (3) Ext-groups.
- (4) Ext sheaves.
- (5) Tor functors.
- (6) Higher direct images for a morphism of sites.
- (7) Derived pullback for morphisms between ringed sites.
- (8) Cup-product.
- (9) Group cohomology.
- (10) Comparison of group cohomology and cohomology on \mathcal{T}_G .
- (11) Čech cohomology on sites.
- (12) Čech to cohomology spectral sequence on sites.
- (13) Leray Spectral sequence for a morphism between ringed sites.
- (14) Etc, etc, etc.

21.3. Cohomology of sheaves

Let \mathcal{C} be a site, see Sites, Definition 7.6.2. Let \mathcal{F} be an abelian sheaf on \mathcal{C} . We know that the category of abelian sheaves on \mathcal{C} has enough injectives, see Injectives, Theorem 19.7.4. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$. For any object U of the site \mathcal{C} we define

$$(21.3.0.1) \quad H^i(U, \mathcal{F}) = H^i(\Gamma(U, \mathcal{I}^\bullet))$$

to be the *i*th cohomology group of the abelian sheaf \mathcal{F} over the object U . In other words, these are the right derived functors of the functor $\mathcal{F} \mapsto \mathcal{F}(U)$. The family of functors $H^i(U, -)$ forms a universal δ -functor $Ab(\mathcal{C}) \rightarrow Ab$.

It sometimes happens that the site \mathcal{C} does not have a final object. In this case we define the *global sections* of a presheaf of sets \mathcal{F} over \mathcal{C} to be the set

$$(21.3.0.2) \quad \Gamma(\mathcal{C}, \mathcal{F}) = \text{Mor}_{\text{PSh}(\mathcal{C})}(e, \mathcal{F})$$

where e is a final object in the category of presheaves on \mathcal{C} . In this case, given an abelian sheaf \mathcal{F} on \mathcal{C} , we define the *ith cohomology group of \mathcal{F} on \mathcal{C}* as follows

$$(21.3.0.3) \quad H^i(\mathcal{C}, \mathcal{F}) = H^i(\Gamma(\mathcal{C}, \mathcal{I}^\bullet))$$

in other words, it is the *ith* right derived functor of the global sections functor. The family of functors $H^i(\mathcal{C}, -)$ forms a universal δ -functor $Ab(\mathcal{C}) \rightarrow Ab$.

Let $f : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ be a morphism of topoi, see Sites, Definition 7.16.1. With $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$ as above we define

$$(21.3.0.4) \quad R^i f_* \mathcal{F} = H^i(f_* \mathcal{I}^\bullet)$$

to be the *ith higher direct image of \mathcal{F}* . These are the right derived functors of f_* . The family of functors $R^i f_*$ forms a universal δ -functor from $Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$.

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site, see Modules on Sites, Definition 18.6.1. Let \mathcal{F} be an \mathcal{O} -module. We know that the category of \mathcal{O} -modules has enough injectives, see Injectives, Theorem 19.8.4. Hence we can choose an injective resolution $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$. For any object U of the site \mathcal{C} we define

$$(21.3.0.5) \quad H^i(U, \mathcal{F}) = H^i(\Gamma(U, \mathcal{I}^\bullet))$$

to be the *the ith cohomology group of \mathcal{F} over U* . The family of functors $H^i(U, -)$ forms a universal δ -functor $Mod(\mathcal{O}) \rightarrow Mod_{\mathcal{O}(U)}$. Similarly

$$(21.3.0.6) \quad H^i(\mathcal{C}, \mathcal{F}) = H^i(\Gamma(\mathcal{C}, \mathcal{I}^\bullet))$$

it the *ith cohomology group of \mathcal{F} on \mathcal{C}* . The family of functors $H^i(\mathcal{C}, -)$ forms a universal δ -functor $Mod(\mathcal{C}) \rightarrow Mod_{\Gamma(\mathcal{C}, \mathcal{O})}$.

Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi, see Modules on Sites, Definition 18.7.1. With $\mathcal{F}[0] \rightarrow \mathcal{I}^\bullet$ as above we define

$$(21.3.0.7) \quad R^i f_* \mathcal{F} = H^i(f_* \mathcal{I}^\bullet)$$

to be the *ith higher direct image of \mathcal{F}* . These are the right derived functors of f_* . The family of functors $R^i f_*$ forms a universal δ -functor from $Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}')$.

21.4. Derived functors

We briefly explain an approach to right derived functors using resolution functors. Namely, suppose that $(\mathcal{C}, \mathcal{O})$ is a ringed site. In this chapter we will write

$$K(\mathcal{O}) = K(Mod(\mathcal{O})) \quad \text{and} \quad D(\mathcal{O}) = D(Mod(\mathcal{O}))$$

and similarly for the bounded versions for the triangulated categories introduced in Derived Categories, Definition 13.8.1 and Definition 13.11.3. By Derived Categories, Remark 13.24.3 there exists a resolution functor

$$j = j_{(\mathcal{C}, \mathcal{O})} : K^+(Mod(\mathcal{O})) \longrightarrow K^+(\mathcal{I})$$

where \mathcal{I} is the strictly full additive subcategory of $Mod(\mathcal{O})$ which consists of injective \mathcal{O} -modules. For any left exact functor $F : Mod(\mathcal{O}) \rightarrow \mathcal{B}$ into any abelian category

\mathcal{B} we will denote RF the right derived functor of Derived Categories, Section 13.20 constructed using the resolution functor j just described:

$$(21.4.0.8) \quad RF = F \circ j' : D^+(\mathcal{O}) \longrightarrow D^+(\mathcal{B})$$

see Derived Categories, Lemma 13.25.1 for notation. Note that we may think of RF as defined on $Mod(\mathcal{O})$, $Comp^+(Mod(\mathcal{O}))$, or $K^+(\mathcal{O})$ depending on the situation. According to Derived Categories, Definition 13.17.2 we obtain the i th right derived functor

$$(21.4.0.9) \quad R^i F = H^i \circ RF : Mod(\mathcal{O}) \longrightarrow \mathcal{B}$$

so that $R^0 F = F$ and $\{R^i F, \delta\}_{i \geq 0}$ is universal δ -functor, see Derived Categories, Lemma 13.20.4.

Here are two special cases of this construction. Given a ring R we write $K(R) = K(Mod_R)$ and $D(R) = D(Mod_R)$ and similarly for the bounded versions. For any object U of \mathcal{C} have a left exact functor $\Gamma(U, -) : Mod(\mathcal{O}) \longrightarrow Mod_{\mathcal{O}(U)}$ which gives rise to

$$R\Gamma(U, -) : D^+(\mathcal{O}) \longrightarrow D^+(\mathcal{O}(U))$$

by the discussion above. Note that $H^i(U, -) = R^i \Gamma(U, -)$ is compatible with (21.3.0.5) above. We similarly have

$$R\Gamma(\mathcal{C}, -) : D^+(\mathcal{O}) \longrightarrow D^+(\Gamma(\mathcal{C}, \mathcal{O}))$$

compatible with (21.3.0.6). If $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ is a morphism of ringed topoi then we get a left exact functor $f_* : Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}')$ which gives rise to *derived pushforward*

$$Rf_* : D^+(\mathcal{O}) \rightarrow D^+(\mathcal{O}')$$

The i th cohomology sheaf of $Rf_* \mathcal{F}^\bullet$ is denoted $R^i f_* \mathcal{F}^\bullet$ and called the i th *higher direct image* in accordance with (21.3.0.7). The displayed functors above are exact functor of derived categories.

21.5. First cohomology and torsors

Definition 21.5.1. Let \mathcal{C} be a site. Let \mathcal{G} be a sheaf of (possibly non-commutative) groups on \mathcal{C} . A *pseudo torsor*, or more precisely a *pseudo \mathcal{G} -torsor*, is a sheaf of sets \mathcal{F} on \mathcal{C} endowed with an action $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$ such that

- (1) whenever $\mathcal{F}(U)$ is nonempty the action $\mathcal{G}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ is simply transitive.

A *morphism of pseudo \mathcal{G} -torsors* $\mathcal{F} \rightarrow \mathcal{F}'$ is simply a morphism of sheaves of sets compatible with the \mathcal{G} -actions. A *torsor*, or more precisely a *\mathcal{G} -torsor*, is a pseudo \mathcal{G} -torsor such that in addition

- (2) for every $U \in \text{Ob}(\mathcal{C})$ there exists a covering $\{U_i \rightarrow U\}_{i \in I}$ of U such that $\mathcal{F}(U_i)$ is nonempty for all $i \in I$.

A *morphism of \mathcal{G} -torsors* is simply a morphism of pseudo \mathcal{G} -torsors. The *trivial \mathcal{G} -torsor* is the sheaf \mathcal{G} endowed with the obvious left \mathcal{G} -action.

It is clear that a morphism of torsors is automatically an isomorphism.

Lemma 21.5.2. *Let \mathcal{C} be a site. Let \mathcal{G} be a sheaf of (possibly non-commutative) groups on \mathcal{C} . A \mathcal{G} -torsor \mathcal{F} is trivial if and only if $\Gamma(\mathcal{C}, \mathcal{F}) \neq \emptyset$.*

Proof. Omitted. □

Lemma 21.5.3. *Let \mathcal{C} be a site. Let \mathcal{H} be an abelian sheaf on \mathcal{C} . There is a canonical bijection between the set of isomorphism classes of \mathcal{H} -torsors and $H^1(\mathcal{C}, \mathcal{H})$.*

Proof. Let \mathcal{F} be a \mathcal{H} -torsor. Consider the free abelian sheaf $\mathbf{Z}[\mathcal{F}]$ on \mathcal{F} . It is the sheafification of the rule which associates to $U \in \text{Ob}(\mathcal{C})$ the collection of finite formal sums $\sum n_i[s_i]$ with $n_i \in \mathbf{Z}$ and $s_i \in \mathcal{F}(U)$. There is a natural map

$$\sigma : \mathbf{Z}[\mathcal{F}] \longrightarrow \underline{\mathbf{Z}}$$

which to a local section $\sum n_i[s_i]$ associates $\sum n_i$. The kernel of σ is generated by sections of the form $[s] - [s']$. There is a canonical map $a : \text{Ker}(\sigma) \rightarrow \mathcal{H}$ which maps $[s] - [s'] \mapsto h$ where h is the local section of \mathcal{H} such that $h \cdot s = s'$. Consider the pushout diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(\sigma) & \longrightarrow & \mathbf{Z}[\mathcal{F}] & \longrightarrow & \underline{\mathbf{Z}} \longrightarrow 0 \\ & & \downarrow a & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{H} & \longrightarrow & \mathcal{E} & \longrightarrow & \underline{\mathbf{Z}} \longrightarrow 0 \end{array}$$

Here \mathcal{E} is the extension obtained by pushout. From the long exact cohomology sequence associated to the lower short exact sequence we obtain an element $\xi = \xi_{\mathcal{F}} \in H^1(\mathcal{C}, \mathcal{H})$ by applying the boundary operator to $1 \in H^0(\mathcal{C}, \underline{\mathbf{Z}})$.

Conversely, given $\xi \in H^1(\mathcal{C}, \mathcal{H})$ we can associate to ξ a torsor as follows. Choose an embedding $\mathcal{H} \rightarrow \mathcal{I}$ of \mathcal{H} into an injective abelian sheaf \mathcal{I} . We set $\mathcal{Q} = \mathcal{I}/\mathcal{H}$ so that we have a short exact sequence

$$0 \longrightarrow \mathcal{H} \longrightarrow \mathcal{I} \longrightarrow \mathcal{Q} \longrightarrow 0$$

The element ξ is the image of a global section $q \in H^0(\mathcal{C}, \mathcal{Q})$ because $H^1(\mathcal{C}, \mathcal{I}) = 0$ (see Derived Categories, Lemma 13.20.4). Let $\mathcal{F} \subset \mathcal{I}$ be the subsheaf (of sets) of sections that map to q in the sheaf \mathcal{Q} . It is easy to verify that \mathcal{F} is a \mathcal{H} -torsor.

We omit the verification that the two constructions given above are mutually inverse. \square

21.6. First cohomology and extensions

Lemma 21.6.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules on \mathcal{C} . There is a canonical bijection*

$$\text{Ext}_{\text{Mod}(\mathcal{O})}^1(\mathcal{O}, \mathcal{F}) \longrightarrow H^1(\mathcal{C}, \mathcal{F})$$

which associates to the extension

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{O} \rightarrow 0$$

the image of $1 \in \Gamma(\mathcal{C}, \mathcal{O})$ in $H^1(\mathcal{C}, \mathcal{F})$.

Proof. Let us construct the inverse of the map given in the lemma. Let $\xi \in H^1(\mathcal{C}, \mathcal{F})$. Choose an injection $\mathcal{F} \subset \mathcal{I}$ with \mathcal{I} injective in $\text{Mod}(\mathcal{O})$. Set $\mathcal{Q} = \mathcal{I}/\mathcal{F}$. By the long exact sequence of cohomology, we see that ξ is the image of a section $\tilde{\xi} \in \Gamma(\mathcal{C}, \mathcal{Q}) = \text{Hom}_{\mathcal{O}}(\mathcal{O}, \mathcal{Q})$. Now, we just form the pullback

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{E} & \longrightarrow & \mathcal{O} \longrightarrow 0 \\ & & \parallel & & \downarrow & & \downarrow \tilde{\xi} \\ 0 & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{I} & \longrightarrow & \mathcal{Q} \longrightarrow 0 \end{array}$$

see Homology, Section 12.6. □

The following lemma will be superseded by the more general Lemma 21.12.4.

Lemma 21.6.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules on \mathcal{C} . Let \mathcal{F}_{ab} denote the underlying sheaf of abelian groups. Then there is a functorial isomorphism*

$$H^1(\mathcal{C}, \mathcal{F}_{ab}) = H^1(\mathcal{C}, \mathcal{F})$$

where the left hand side is cohomology computed in $Ab(\mathcal{C})$ and the right hand side is cohomology computed in $Mod(\mathcal{O})$.

Proof. Let $\underline{\mathbf{Z}}$ denote the constant sheaf \mathbf{Z} . As $Ab(\mathcal{C}) = Mod(\underline{\mathbf{Z}})$ we may apply Lemma 21.6.1 twice, and it follows that we have to show

$$\text{Ext}_{Mod(\mathcal{O})}^1(\mathcal{O}, \mathcal{F}) = \text{Ext}_{Mod(\underline{\mathbf{Z}})}^1(\underline{\mathbf{Z}}, \mathcal{F}_{ab}).$$

Suppose that $0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{O} \rightarrow 0$ is an extension in $Mod(\mathcal{O})$. Then we can use the obvious map of abelian sheaves $1 : \underline{\mathbf{Z}} \rightarrow \mathcal{O}$ and pullback to obtain an extension \mathcal{E}_{ab} , like so:

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{F}_{ab} & \longrightarrow & \mathcal{E}_{ab} & \longrightarrow & \underline{\mathbf{Z}} \longrightarrow 0 \\ & & \parallel & & \downarrow & & \downarrow 1 \\ 0 & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{E} & \longrightarrow & \mathcal{O} \longrightarrow 0 \end{array}$$

The converse is a little more fun. Suppose that $0 \rightarrow \mathcal{F}_{ab} \rightarrow \mathcal{E}_{ab} \rightarrow \underline{\mathbf{Z}} \rightarrow 0$ is an extension in $Mod(\underline{\mathbf{Z}})$. Since $\underline{\mathbf{Z}}$ is a flat $\underline{\mathbf{Z}}$ -module we see that the sequence

$$0 \rightarrow \mathcal{F}_{ab} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} \rightarrow \mathcal{E}_{ab} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} \rightarrow \underline{\mathbf{Z}} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} \rightarrow 0$$

is exact, see Modules on Sites, Lemma 18.28.7. Of course $\underline{\mathbf{Z}} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} = \mathcal{O}$. Hence we can form the pushout via the (\mathcal{O} -linear) multiplication map $\mu : \mathcal{F} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} \rightarrow \mathcal{F}$ to get an extension of \mathcal{O} by \mathcal{F} , like this

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{F}_{ab} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} & \longrightarrow & \mathcal{E}_{ab} \otimes_{\underline{\mathbf{Z}}} \mathcal{O} & \longrightarrow & \mathcal{O} \longrightarrow 0 \\ & & \downarrow \mu & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{E} & \longrightarrow & \mathcal{O} \longrightarrow 0 \end{array}$$

which is the desired extension. We omit the verification that these constructions are mutually inverse. □

21.7. First cohomology and invertible sheaves

The Picard group of a ringed site is defined in Modules on Sites, Section 18.31.

Lemma 21.7.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. There is a canonical isomorphism*

$$H^1(\mathcal{C}, \mathcal{O}^*) = Pic(\mathcal{O}).$$

of abelian groups.

Proof. Let \mathcal{L} be an invertible \mathcal{O} -module. Consider the presheaf \mathcal{L}^* defined by the rule

$$U \longmapsto \{s \in \mathcal{L}(U) \text{ such that } \mathcal{O}_U \xrightarrow{s \cdot -} \mathcal{L}_U \text{ is an isomorphism}\}$$

This presheaf satisfies the sheaf condition. Moreover, if $f \in \mathcal{O}^*(U)$ and $s \in \mathcal{L}^*(U)$, then clearly $fs \in \mathcal{L}^*(U)$. By the same token, if $s, s' \in \mathcal{L}^*(U)$ then there exists a unique $f \in \mathcal{O}^*(U)$ such that $fs = s'$. Moreover, the sheaf \mathcal{L}^* has sections locally

by the very definition of an invertible sheaf. In other words we see that \mathcal{L}^* is a \mathcal{O}^* -torsor. Thus we get a map

$$\begin{array}{ccc} \text{set of invertible sheaves on } (\mathcal{C}, \mathcal{O}) & \longrightarrow & \text{set of } \mathcal{O}^*\text{-torsors} \\ \text{up to isomorphism} & & \text{up to isomorphism} \end{array}$$

We omit the verification that this is a homomorphism of abelian groups. By Lemma 21.5.3 the right hand side is canonically bijective to $H^1(\mathcal{C}, \mathcal{O}^*)$. Thus we have to show this map is injective and surjective.

Injective. If the torsor \mathcal{L}^* is trivial, this means by Lemma 21.5.2 that \mathcal{L}^* has a global section. Hence this means exactly that $\mathcal{L} \cong \mathcal{O}$ is the neutral element in $\text{Pic}(\mathcal{O})$.

Surjective. Let \mathcal{F} be an \mathcal{O}^* -torsor. Consider the presheaf of sets

$$\mathcal{L}_1 : U \longmapsto (\mathcal{F}(U) \times \mathcal{O}(U)) / \mathcal{O}^*(U)$$

where the action of $f \in \mathcal{O}^*(U)$ on (s, g) is $(fs, f^{-1}g)$. Then \mathcal{L}_1 is a presheaf of \mathcal{O} -modules by setting $(s, g) + (s', g') = (s, g + (s'/s)g')$ where s'/s is the local section f of \mathcal{O}^* such that $fs = s'$, and $h(s, g) = (s, hg)$ for h a local section of \mathcal{O} . We omit the verification that the sheafification $\mathcal{L} = \mathcal{L}_1^\#$ is an invertible \mathcal{O} -module whose associated \mathcal{O}^* -torsor \mathcal{L}^* is isomorphic to \mathcal{F} . \square

21.8. Locality of cohomology

The following lemma says there is no ambiguity in defining the cohomology of a sheaf \mathcal{F} over an object of the site.

Lemma 21.8.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} .*

- (1) *If \mathcal{I} is an injective \mathcal{O} -module then $\mathcal{I}|_U$ is an injective \mathcal{O}_U -module.*
- (2) *For any sheaf of \mathcal{O} -modules \mathcal{F} we have $H^p(U, \mathcal{F}) = H^p(\mathcal{C}/U, \mathcal{F}|_U)$.*

Proof. Recall that the functor j_U^{-1} of restriction to U is a right adjoint to the functor $j_{U!}$ of extension by 0, see Modules on Sites, Section 18.19. Moreover, $j_{U!}$ is exact. Hence (1) follows from Homology, Lemma 12.25.1.

By definition $H^p(U, \mathcal{F}) = H^p(\mathcal{I}^\bullet(U))$ where $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ is an injective resolution in $\text{Mod}(\mathcal{O})$. By the above we see that $\mathcal{F}|_U \rightarrow \mathcal{I}^\bullet|_U$ is an injective resolution in $\text{Mod}(\mathcal{O}_U)$. Hence $H^p(U, \mathcal{F}|_U)$ is equal to $H^p(\mathcal{I}^\bullet|_U(U))$. Of course $\mathcal{F}(U) = \mathcal{F}|_U(U)$ for any sheaf \mathcal{F} on \mathcal{C} . Hence the equality in (2). \square

The following lemma will be use to see what happens if we change a partial universe, or to compare cohomology of the small and big étale sites.

Lemma 21.8.2. *Let \mathcal{C} and \mathcal{D} be sites. Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume u satisfies the hypotheses of Sites, Lemma 7.20.8. Let $g : \text{Sh}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{D})$ be the associated morphism of topoi. For any abelian sheaf \mathcal{F} on \mathcal{D} we have isomorphisms*

$$R\Gamma(\mathcal{C}, g^{-1}\mathcal{F}) = R\Gamma(\mathcal{D}, \mathcal{F}),$$

in particular $H^p(\mathcal{C}, g^{-1}\mathcal{F}) = H^p(\mathcal{D}, \mathcal{F})$ and for any $U \in \text{Ob}(\mathcal{C})$ we have isomorphisms

$$R\Gamma(U, g^{-1}\mathcal{F}) = R\Gamma(u(U), \mathcal{F}),$$

in particular $H^p(U, g^{-1}\mathcal{F}) = H^p(u(U), \mathcal{F})$. All of these isomorphisms are functorial in \mathcal{F} .

Proof. Since it is clear that $\Gamma(\mathcal{C}, g^{-1}\mathcal{F}) = \Gamma(\mathcal{D}, \mathcal{F})$ by hypothesis (e), it suffices to show that g^{-1} transforms injective abelian sheaves into injective abelian sheaves. As usual we use Homology, Lemma 12.25.1 to see this. The left adjoint to g^{-1} is $g_! = f^{-1}$ with the notation of Sites, Lemma 7.20.8 which is an exact functor. Hence the lemma does indeed apply. \square

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Let $\varphi : U \rightarrow V$ be a morphism of \mathcal{O} . Then there is a canonical *restriction mapping*

$$(21.8.2.1) \quad H^n(V, \mathcal{F}) \longrightarrow H^n(U, \mathcal{F}), \quad \xi \longmapsto \xi|_U$$

functorial in \mathcal{F} . Namely, choose any injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. The restriction mappings of the sheaves \mathcal{I}^p give a morphism of complexes

$$\Gamma(V, \mathcal{I}^\bullet) \longrightarrow \Gamma(U, \mathcal{I}^\bullet)$$

The LHS is a complex representing $R\Gamma(V, \mathcal{F})$ and the RHS is a complex representing $R\Gamma(U, \mathcal{F})$. We get the map on cohomology groups by applying the functor H^n . As indicated we will use the notation $\xi \mapsto \xi|_U$ to denote this map. Thus the rule $U \mapsto H^n(U, \mathcal{F})$ is a presheaf of \mathcal{O} -modules. This presheaf is customarily denoted $\underline{H}^n(\mathcal{F})$. We will give another interpretation of this presheaf in Lemma 21.11.5.

The following lemma says that it is possible to kill higher cohomology classes by going to a covering.

Lemma 21.8.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Let U be an object of \mathcal{C} . Let $n > 0$ and let $\xi \in H^n(U, \mathcal{F})$. Then there exists a covering $\{U_i \rightarrow U\}$ of \mathcal{C} such that $\xi|_{U_i} = 0$ for all $i \in I$.*

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Then

$$H^n(U, \mathcal{F}) = \frac{\text{Ker}(\mathcal{I}^n(U) \rightarrow \mathcal{I}^{n+1}(U))}{\text{Im}(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^n(U))}.$$

Pick an element $\tilde{\xi} \in \mathcal{I}^n(U)$ representing the cohomology class in the presentation above. Since \mathcal{I}^\bullet is an injective resolution of \mathcal{F} and $n > 0$ we see that the complex \mathcal{I}^\bullet is exact in degree n . Hence $\text{Im}(\mathcal{I}^{n-1} \rightarrow \mathcal{I}^n) = \text{Ker}(\mathcal{I}^n \rightarrow \mathcal{I}^{n+1})$ as sheaves. Since $\tilde{\xi}$ is a section of the kernel sheaf over U we conclude there exists a covering $\{U_i \rightarrow U\}$ of the site such that $\tilde{\xi}|_{U_i}$ is the image under d of a section $\xi_i \in \mathcal{I}^{n-1}(U_i)$. By our definition of the restriction $\xi|_{U_i}$ as corresponding to the class of $\tilde{\xi}|_{U_i}$ we conclude. \square

Lemma 21.8.4. *Let $f : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed sites corresponding to the continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$. For any $\mathcal{F} \in \text{Ob}(\text{Mod}(\mathcal{O}_{\mathcal{C}}))$ the sheaf $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf*

$$V \longmapsto H^i(u(V), \mathcal{F})$$

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Then $R^i f_* \mathcal{F}$ is by definition the i th cohomology sheaf of the complex

$$f_* \mathcal{I}^0 \rightarrow f_* \mathcal{I}^1 \rightarrow f_* \mathcal{I}^2 \rightarrow \dots$$

By definition of the abelian category structure on $\mathcal{O}_{\mathcal{D}}$ -modules this cohomology sheaf is the sheaf associated to the presheaf

$$V \longmapsto \frac{\text{Ker}(f_* \mathcal{I}^i(V) \rightarrow f_* \mathcal{I}^{i+1}(V))}{\text{Im}(f_* \mathcal{I}^{i-1}(V) \rightarrow f_* \mathcal{I}^i(V))}$$

and this is obviously equal to

$$\frac{\text{Ker}(\mathcal{I}^i(u(V)) \rightarrow \mathcal{I}^{i+1}(u(V)))}{\text{Im}(\mathcal{I}^{i-1}(u(V)) \rightarrow \mathcal{I}^i(u(V)))}$$

which is equal to $H^i(u(V), \mathcal{F})$ and we win. \square

21.9. The Čech complex and Čech cohomology

Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target, see Sites, Definition 7.6.1. Assume that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Let \mathcal{F} be an abelian presheaf on \mathcal{C} . Set

$$\check{\mathcal{C}}^p(\mathcal{U}, \mathcal{F}) = \prod_{(i_0, \dots, i_p) \in I^{p+1}} \mathcal{F}(U_{i_0} \times_U \dots \times_U U_{i_p}).$$

This is an abelian group. For $s \in \check{\mathcal{C}}^p(\mathcal{U}, \mathcal{F})$ we denote $s_{i_0 \dots i_p}$ its value in the factor $\mathcal{F}(U_{i_0} \times_U \dots \times_U U_{i_p})$. We define

$$d : \check{\mathcal{C}}^p(\mathcal{U}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{p+1}(\mathcal{U}, \mathcal{F})$$

by the formula

$$(21.9.0.1) \quad d(s)_{i_0 \dots i_{p+1}} = \sum_{j=0}^{p+1} (-1)^j s_{i_0 \dots \hat{i}_j \dots i_{p+1}}|_{U_{i_0} \times_U \dots \times_U U_{i_{p+1}}}$$

where the restriction is via the projection map

$$U_{i_0} \times_U \dots \times_U U_{i_{p+1}} \longrightarrow U_{i_0} \times_U \dots \times_U \widehat{U_{i_j}} \times_U \dots \times_U U_{i_{p+1}}.$$

It is straightforward to see that $d \circ d = 0$. In other words $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ is a complex.

Definition 21.9.1. Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Let \mathcal{F} be an abelian presheaf on \mathcal{C} . The complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ is the *Čech complex* associated to \mathcal{F} and the family \mathcal{U} . Its cohomology groups $H^i(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}))$ are called the *Čech cohomology groups* of \mathcal{F} with respect to \mathcal{U} . They are denoted $\check{H}^i(\mathcal{U}, \mathcal{F})$.

We observe that any covering $\{U_i \rightarrow U\}$ of a site \mathcal{C} is a family of morphisms with fixed target to which the definition applies.

Lemma 21.9.2. *Let \mathcal{C} be a site. Let \mathcal{F} be an abelian presheaf on \mathcal{C} . The following are equivalent*

- (1) \mathcal{F} is an abelian sheaf on \mathcal{C} and
- (2) for every covering $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ of the site \mathcal{C} the natural map

$$\mathcal{F}(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{F})$$

(see Sites, Section 7.10) is bijective.

Proof. This is true since the sheaf condition is exactly that $\mathcal{F}(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{F})$ is bijective for every covering of \mathcal{C} . \square

Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms of \mathcal{C} with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Let $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be another. Let $f : U \rightarrow V$, $\alpha : I \rightarrow J$ and $f_i : U_i \rightarrow V_{\alpha(i)}$ be a morphism of families of morphisms with fixed target, see Sites, Section 7.8. In this case we get a map of Čech complexes

$$(21.9.2.1) \quad \varphi : \check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$$

which in degree p is given by

$$\varphi(s)_{i_0 \dots i_p} = (f_{i_0} \times \dots \times f_{i_p})^* s_{\alpha(i_0) \dots \alpha(i_p)}$$

21.10. Čech cohomology as a functor on presheaves

Warning: In this section we work exclusively with abelian presheaves on a category. The results are completely wrong in the setting of sheaves and categories of sheaves!

Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Let \mathcal{F} be an abelian presheaf on \mathcal{C} . The construction

$$\mathcal{F} \mapsto \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

is functorial in \mathcal{F} . In fact, it is a functor

$$(21.10.0.2) \quad \check{C}^\bullet(\mathcal{U}, -) : PAb(\mathcal{C}) \longrightarrow \text{Comp}^+(Ab)$$

see Derived Categories, Definition 13.8.1 for notation. Recall that the category of bounded below complexes in an abelian category is an abelian category, see Homology, Lemma 12.12.9.

Lemma 21.10.1. *The functor given by Equation (21.10.0.2) is an exact functor (see Homology, Lemma 12.7.1).*

Proof. For any object W of \mathcal{C} the functor $\mathcal{F} \mapsto \mathcal{F}(W)$ is an additive exact functor from $PAb(\mathcal{C})$ to Ab . The terms $\check{C}^p(\mathcal{U}, \mathcal{F})$ of the complex are products of these exact functors and hence exact. Moreover a sequence of complexes is exact if and only if the sequence of terms in a given degree is exact. Hence the lemma follows. \square

Lemma 21.10.2. *Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . The functors $\mathcal{F} \mapsto \check{H}^n(\mathcal{U}, \mathcal{F})$ form a δ -functor from the abelian category $PAb(\mathcal{C})$ to the category of \mathbf{Z} -modules (see Homology, Definition 12.11.1).*

Proof. By Lemma 21.10.1 a short exact sequence of abelian presheaves $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ is turned into a short exact sequence of complexes of \mathbf{Z} -modules. Hence we can use Homology, Lemma 12.12.12 to get the boundary maps $\delta_{\mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3} : \check{H}^n(\mathcal{U}, \mathcal{F}_3) \rightarrow \check{H}^{n+1}(\mathcal{U}, \mathcal{F}_1)$ and a corresponding long exact sequence. We omit the verification that these maps are compatible with maps between short exact sequences of presheaves. \square

Lemma 21.10.3. *Let \mathcal{C} be a category. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Consider the chain complex $\mathbf{Z}_{\mathcal{U}, \bullet}$ of abelian presheaves*

$$\dots \rightarrow \bigoplus_{i_0 i_1 i_2} \mathbf{Z}_{U_{i_0} \times_U U_{i_1} \times_U U_{i_2}} \rightarrow \bigoplus_{i_0 i_1} \mathbf{Z}_{U_{i_0} \times_U U_{i_1}} \rightarrow \bigoplus_{i_0} \mathbf{Z}_{U_{i_0}} \rightarrow 0 \rightarrow \dots$$

where the last nonzero term is placed in degree 0 and where the map

$$\mathbf{Z}_{U_{i_0} \times_U \dots \times_U U_{i_p+1}} \longrightarrow \mathbf{Z}_{U_{i_0} \times_U \dots \widehat{U_{i_j}} \dots \times_U U_{i_p+1}}$$

is given by $(-1)^j$ times the canonical map. Then there is an isomorphism

$$\text{Hom}_{PAb(\mathcal{C})}(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{F}) = \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

functorial in $\mathcal{F} \in \text{Ob}(PAb(\mathcal{C}))$.

Proof. This is a tautology based on the fact that

$$\begin{aligned} \mathrm{Hom}_{\mathrm{PAb}(\mathcal{C})}\left(\bigoplus_{i_0 \dots i_p} \mathbf{Z}_{U_{i_0} \times_U \dots \times_U U_{i_p}}, \mathcal{F}\right) &= \prod_{i_0 \dots i_p} \mathrm{Hom}_{\mathrm{PAb}(\mathcal{C})}(\mathbf{Z}_{U_{i_0} \times_U \dots \times_U U_{i_p}}, \mathcal{F}) \\ &= \prod_{i_0 \dots i_p} \mathcal{F}(U_{i_0} \times_U \dots \times_U U_{i_p}) \end{aligned}$$

see Modules on Sites, Lemma 18.4.2. \square

Lemma 21.10.4. *Let \mathcal{C} be a category. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . The chain complex $\mathbf{Z}_{\mathcal{U}, \bullet}$ of presheaves of Lemma 21.10.3 above is exact in positive degrees, i.e., the homology presheaves $H_i(\mathbf{Z}_{\mathcal{U}, \bullet})$ are zero for $i > 0$.*

Proof. Let V be an object of \mathcal{C} . We have to show that the chain complex of abelian groups $\mathbf{Z}_{\mathcal{U}, \bullet}(V)$ is exact in degrees > 0 . This is the complex

$$\begin{array}{c} \dots \\ \downarrow \\ \bigoplus_{i_0 i_1 i_2} \mathbf{Z}[\mathrm{Mor}_{\mathcal{C}}(V, U_{i_0} \times_U U_{i_1} \times_U U_{i_2})] \\ \downarrow \\ \bigoplus_{i_0 i_1} \mathbf{Z}[\mathrm{Mor}_{\mathcal{C}}(V, U_{i_0} \times_U U_{i_1})] \\ \downarrow \\ \bigoplus_{i_0} \mathbf{Z}[\mathrm{Mor}_{\mathcal{C}}(V, U_{i_0})] \\ \downarrow \\ 0 \end{array}$$

For any morphism $\varphi : V \rightarrow U$ denote $\mathrm{Mor}_{\varphi}(V, U_i) = \{\varphi_i : V \rightarrow U_i \mid f_i \circ \varphi_i = \varphi\}$. We will use a similar notation for $\mathrm{Mor}_{\varphi}(V, U_{i_0} \times_U \dots \times_U U_{i_p})$. Note that composing with the various projection maps between the fibred products $U_{i_0} \times_U \dots \times_U U_{i_p}$ preserves these morphism sets. Hence we see that the complex above is the same as the complex

$$\begin{array}{c} \dots \\ \downarrow \\ \bigoplus_{\varphi} \bigoplus_{i_0 i_1 i_2} \mathbf{Z}[\mathrm{Mor}_{\varphi}(V, U_{i_0} \times_U U_{i_1} \times_U U_{i_2})] \\ \downarrow \\ \bigoplus_{\varphi} \bigoplus_{i_0 i_1} \mathbf{Z}[\mathrm{Mor}_{\varphi}(V, U_{i_0} \times_U U_{i_1})] \\ \downarrow \\ \bigoplus_{\varphi} \bigoplus_{i_0} \mathbf{Z}[\mathrm{Mor}_{\varphi}(V, U_{i_0})] \\ \downarrow \\ 0 \end{array}$$

Next, we make the remark that we have

$$\text{Mor}_\varphi(V, U_{i_0} \times_U \dots \times_U U_{i_p}) = \text{Mor}_\varphi(V, U_{i_0}) \times \dots \times \text{Mor}_\varphi(V, U_{i_p})$$

Using this and the fact that $\mathbf{Z}[A] \oplus \mathbf{Z}[B] = \mathbf{Z}[A \amalg B]$ we see that the complex becomes

$$\begin{array}{c} \dots \\ \downarrow \\ \bigoplus_\varphi \mathbf{Z} [\amalg_{i_0 i_1 i_2} \text{Mor}_\varphi(V, U_{i_0}) \times \text{Mor}_\varphi(V, U_{i_2})] \\ \downarrow \\ \bigoplus_\varphi \mathbf{Z} [\amalg_{i_0 i_1} \text{Mor}_\varphi(V, U_{i_0}) \times \text{Mor}_\varphi(V, U_{i_1})] \\ \downarrow \\ \bigoplus_\varphi \mathbf{Z} [\amalg_{i_0} \text{Mor}_\varphi(V, U_{i_0})] \\ \downarrow \\ 0 \end{array}$$

Finally, on setting $S_\varphi = \amalg_{i \in I} \text{Mor}_\varphi(V, U_i)$ we see that we get

$$\bigoplus_\varphi (\dots \rightarrow \mathbf{Z}[S_\varphi \times S_\varphi \times S_\varphi] \rightarrow \mathbf{Z}[S_\varphi \times S_\varphi] \rightarrow \mathbf{Z}[S_\varphi] \rightarrow 0 \rightarrow \dots)$$

Thus we have simplified our task. Namely, it suffices to show that for any nonempty set S the (extended) complex of free abelian groups

$$\dots \rightarrow \mathbf{Z}[S \times S \times S] \rightarrow \mathbf{Z}[S \times S] \rightarrow \mathbf{Z}[S] \xrightarrow{\Sigma} \mathbf{Z} \rightarrow 0 \rightarrow \dots$$

is exact in all degrees. To see this fix an element $s \in S$, and use the homotopy

$$n_{(s_0, \dots, s_p)} \longmapsto n_{(s, s_0, \dots, s_p)}$$

with obvious notations. □

Lemma 21.10.5. *Let \mathcal{C} be a category. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . Let \mathcal{O} be a presheaf of rings on \mathcal{C} . The chain complex*

$$\mathbf{Z}_{\mathcal{U}, \bullet} \otimes_{p, \mathbf{Z}} \mathcal{O}$$

is exact in positive degrees. Here $\mathbf{Z}_{\mathcal{U}, \bullet}$ is the cochain complex of Lemma 21.10.3, and the tensor product is over the constant presheaf of rings with value \mathbf{Z} .

Proof. Let V be an object of \mathcal{C} . In the proof of Lemma 21.10.4 we saw that $\mathbf{Z}_{\mathcal{U}, \bullet}(V)$ is isomorphic as a complex to a direct sum of complexes which are homotopic to \mathbf{Z} placed in degree zero. Hence also $\mathbf{Z}_{\mathcal{U}, \bullet}(V) \otimes_{\mathbf{Z}} \mathcal{O}(V)$ is isomorphic as a complex to a direct sum of complexes which are homotopic to $\mathcal{O}(V)$ placed in degree zero. Or you can use Modules on Sites, Lemma 18.28.9, which applies since the presheaves $\mathbf{Z}_{\mathcal{U}, i}$ are flat, and the proof of Lemma 21.10.4 shows that $H_0(\mathbf{Z}_{\mathcal{U}, \bullet})$ is a flat presheaf also. □

Lemma 21.10.6. *Let \mathcal{C} be a category. Let $\mathcal{U} = \{f_i : U_i \rightarrow U\}_{i \in I}$ be a family of morphisms with fixed target such that all fibre products $U_{i_0} \times_U \dots \times_U U_{i_p}$ exist in \mathcal{C} . The Čech cohomology functors $\check{H}^p(\mathcal{U}, -)$ are canonically isomorphic as a δ -functor to the right derived functors of the functor*

$$\check{H}^0(\mathcal{U}, -) : PAb(\mathcal{C}) \longrightarrow Ab.$$

Moreover, there is a functorial quasi-isomorphism

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow R\check{H}^0(\mathcal{U}, \mathcal{F})$$

where the right hand side indicates the derived functor

$$R\check{H}^0(\mathcal{U}, -) : D^+(PAb(\mathcal{C})) \longrightarrow D^+(\mathbf{Z})$$

of the left exact functor $\check{H}^0(\mathcal{U}, -)$.

Proof. Note that the category of abelian presheaves has enough injectives, see Injectives, Proposition 19.6.1. Note that $\check{H}^0(\mathcal{U}, -)$ is a left exact functor from the category of abelian presheaves to the category of \mathbf{Z} -modules. Hence the derived functor and the right derived functor exist, see Derived Categories, Section 13.20.

Let \mathcal{I} be an injective abelian presheaf. In this case the functor $\text{Hom}_{PAb(\mathcal{C})}(-, \mathcal{I})$ is exact on $PAb(\mathcal{C})$. By Lemma 21.10.3 we have

$$\text{Hom}_{PAb(\mathcal{C})}(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}) = \check{C}^\bullet(\mathcal{U}, \mathcal{I}).$$

By Lemma 21.10.4 we have that $\mathbf{Z}_{\mathcal{U}, \bullet}$ is exact in positive degrees. Hence by the exactness of Hom into \mathcal{I} mentioned above we see that $\check{H}^i(\mathcal{U}, \mathcal{I}) = 0$ for all $i > 0$. Thus the δ -functor (\check{H}^n, δ) (see Lemma 21.10.2) satisfies the assumptions of Homology, Lemma 12.11.4, and hence is a universal δ -functor.

By Derived Categories, Lemma 13.20.4 also the sequence $R^i\check{H}^0(\mathcal{U}, -)$ forms a universal δ -functor. By the uniqueness of universal δ -functors, see Homology, Lemma 12.11.5 we conclude that $R^i\check{H}^0(\mathcal{U}, -) = \check{H}^i(\mathcal{U}, -)$. This is enough for most applications and the reader is suggested to skip the rest of the proof.

Let \mathcal{F} be any abelian presheaf on \mathcal{C} . Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in the category $PAb(\mathcal{C})$. Consider the double complex $A^{\bullet, \bullet}$ with terms

$$A^{p, q} = \check{C}^p(\mathcal{U}, \mathcal{I}^q).$$

Consider the simple complex sA^\bullet associated to this double complex. There is a map of complexes

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow sA^\bullet$$

coming from the maps $\check{C}^p(\mathcal{U}, \mathcal{F}) \rightarrow A^{p, 0} = \check{C}^p(\mathcal{U}, \mathcal{I}^0)$ and there is a map of complexes

$$\check{H}^0(\mathcal{U}, \mathcal{I}^\bullet) \longrightarrow sA^\bullet$$

coming from the maps $\check{H}^0(\mathcal{U}, \mathcal{I}^q) \rightarrow A^{0, q} = \check{C}^0(\mathcal{U}, \mathcal{I}^q)$. Both of these maps are quasi-isomorphisms by an application of Homology, Lemma 12.22.7. Namely, the columns of the double complex are exact in positive degrees because the Čech complex as a functor is exact (Lemma 21.10.1) and the rows of the double complex are exact in positive degrees since as we just saw the higher Čech cohomology groups of the injective presheaves \mathcal{I}^q are zero. Since quasi-isomorphisms become invertible in $D^+(\mathbf{Z})$ this gives the last displayed morphism of the lemma. We omit the verification that this morphism is functorial. \square

21.11. Cech cohomology and cohomology

The relationship between cohomology and Cech cohomology comes from the fact that the Cech cohomology of an injective abelian sheaf is zero. To see this we note that an injective abelian sheaf is an injective abelian presheaf and then we apply results in Cech cohomology in the preceding section.

Lemma 21.11.1. *Let \mathcal{C} be a site. An injective abelian sheaf is also injective as an object in the category $PAb(\mathcal{C})$.*

Proof. Apply Homology, Lemma 12.25.1 to the categories $\mathcal{A} = Ab(\mathcal{C})$, $\mathcal{B} = PAb(\mathcal{C})$, the inclusion functor and sheafification. (See Modules on Sites, Section 18.3 to see that all assumptions of the lemma are satisfied.) \square

Lemma 21.11.2. *Let \mathcal{C} be a site. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . Let \mathcal{I} be an injective abelian sheaf, i.e., an injective object of $Ab(\mathcal{C})$. Then*

$$\check{H}^p(\mathcal{U}, \mathcal{I}) = \begin{cases} \mathcal{I}(U) & \text{if } p = 0 \\ 0 & \text{if } p > 0 \end{cases}$$

Proof. By Lemma 21.11.1 we see that \mathcal{I} is an injective object in $PAb(\mathcal{C})$. Hence we can apply Lemma 21.10.6 (or its proof) to see the vanishing of higher Cech cohomology group. For the zeroth see Lemma 21.9.2. \square

Lemma 21.11.3. *Let \mathcal{C} be a site. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . There is a transformation*

$$\check{C}^\bullet(\mathcal{U}, -) \longrightarrow R\Gamma(U, -)$$

of functors $Ab(\mathcal{C}) \rightarrow D^+(\mathbf{Z})$. In particular this gives a transformation of functors $\check{H}^p(U, \mathcal{F}) \rightarrow H^p(U, \mathcal{F})$ for \mathcal{F} ranging over $Ab(\mathcal{C})$.

Proof. Let \mathcal{F} be an abelian sheaf. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. Consider the double complex $A^{\bullet, \bullet}$ with terms $A^{p, q} = \check{C}^p(\mathcal{U}, \mathcal{I}^q)$. Moreover, consider the associated simple complex sA^\bullet , see Homology, Definition 12.22.3. There is a map of complexes

$$\alpha : \Gamma(U, \mathcal{I}^\bullet) \longrightarrow sA^\bullet$$

coming from the maps $\mathcal{I}^q(U) \rightarrow \check{H}^0(\mathcal{U}, \mathcal{I}^q)$ and a map of complexes

$$\beta : \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \longrightarrow sA^\bullet$$

coming from the map $\mathcal{F} \rightarrow \mathcal{I}^0$. We can apply Homology, Lemma 12.22.7 to see that α is a quasi-isomorphism. Namely, Lemma 21.11.2 implies that the q th row of the double complex $A^{\bullet, \bullet}$ is a resolution of $\Gamma(U, \mathcal{I}^q)$. Hence α becomes invertible in $D^+(\mathbf{Z})$ and the transformation of the lemma is the composition of β followed by the inverse of α . We omit the verification that this is functorial. \square

Lemma 21.11.4. *Let \mathcal{C} be a site. Let \mathcal{G} be an abelian sheaf on \mathcal{C} . Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . The map*

$$\check{H}^1(\mathcal{U}, \mathcal{G}) \longrightarrow H^1(U, \mathcal{G})$$

is injective and identifies $\check{H}^1(\mathcal{U}, \mathcal{G})$ via the bijection of Lemma 21.5.3 with the set of isomorphism classes of $\mathcal{G}|_U$ -torsors which restrict to trivial torsors over each U_i .

Proof. To see this we construct an inverse map. Namely, let \mathcal{F} be a $\mathcal{G}|_U$ -torsor on \mathcal{C}/U whose restriction to \mathcal{C}/U_i is trivial. By Lemma 21.5.2 this means there exists a section $s_i \in \mathcal{F}(U_i)$. On $U_{i_0} \times_U U_{i_1}$ there is a unique section $s_{i_0 i_1}$ of \mathcal{G} such that $s_{i_0 i_1} \cdot s_{i_0}|_{U_{i_0} \times_U U_{i_1}} = s_{i_1}|_{U_{i_0} \times_U U_{i_1}}$. An easy computation shows that $s_{i_0 i_1}$ is a Čech cocycle and that its class is well defined (i.e., does not depend on the choice of the sections s_i). The inverse maps the isomorphism class of \mathcal{F} to the cohomology class of the cocycle $(s_{i_0 i_1})$.

We omit the verification that this map is indeed an inverse. □

Lemma 21.11.5. *Let \mathcal{C} be a site. Consider the functor $i : Ab(\mathcal{C}) \rightarrow PAb(\mathcal{C})$. It is a left exact functor with right derived functors given by*

$$R^p i(\mathcal{F}) = \underline{H}^p(\mathcal{F}) : U \longmapsto H^p(U, \mathcal{F})$$

see discussion in Section 21.8.

Proof. It is clear that i is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$. By definition $R^p i$ is the p th cohomology presheaf of the complex \mathcal{I}^\bullet . In other words, the sections of $R^p i(\mathcal{F})$ over an object U of \mathcal{C} are given by

$$\frac{\text{Ker}(\mathcal{I}^n(U) \rightarrow \mathcal{I}^{n+1}(U))}{\text{Im}(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^n(U))}$$

which is the definition of $H^p(U, \mathcal{F})$. □

Lemma 21.11.6. *Let \mathcal{C} be a site. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . For any abelian sheaf \mathcal{F} there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(U, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} .

Proof. This is a Grothendieck spectral sequence (see Derived Categories, Lemma 13.22.2) for the functors

$$i : Ab(\mathcal{C}) \rightarrow PAb(\mathcal{C}) \quad \text{and} \quad \check{H}^0(\mathcal{U}, -) : PAb(\mathcal{C}) \rightarrow Ab.$$

Namely, we have $\check{H}^0(\mathcal{U}, i(\mathcal{F})) = \mathcal{F}(U)$ by Lemma 21.9.2. We have that $i(\mathcal{I})$ is Čech acyclic by Lemma 21.11.2. And we have that $\check{H}^p(\mathcal{U}, -) = R^p \check{H}^0(\mathcal{U}, -)$ as functors on $PAb(\mathcal{C})$ by Lemma 21.10.6. Putting everything together gives the lemma. □

Lemma 21.11.7. *Let \mathcal{C} be a site. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering. Let $\mathcal{F} \in \text{Ob}(Ab(\mathcal{C}))$. Assume that $H^i(U_{i_0} \times_U \dots \times_U U_{i_p}, \mathcal{F}) = 0$ for all $i > 0$, all $p \geq 0$ and all $i_0, \dots, i_p \in I$. Then $\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(U, \mathcal{F})$.*

Proof. We will use the spectral sequence of Lemma 21.11.6. The assumptions mean that $E_2^{p,q} = 0$ for all (p, q) with $q \neq 0$. Hence the spectral sequence degenerates at E_2 and the result follows. □

Lemma 21.11.8. *Let \mathcal{C} be a site. Let*

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$$

be a short exact sequence of abelian sheaves on \mathcal{C} . Let U be an object of \mathcal{C} . If there exists a cofinal system of coverings \mathcal{U} of U such that $\check{H}^1(\mathcal{U}, \mathcal{F}) = 0$, then the map $\mathcal{G}(U) \rightarrow \mathcal{H}(U)$ is surjective.

Proof. Take an element $s \in \mathcal{H}(U)$. Choose a covering $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ such that (a) $\check{H}^1(\mathcal{U}, \mathcal{F}) = 0$ and (b) $s|_{U_i}$ is the image of a section $s_i \in \mathcal{G}(U_i)$. Since we can certainly find a covering such that (b) holds it follows from the assumptions of the lemma that we can find a covering such that (a) and (b) both hold. Consider the sections

$$s_{i_0 i_1} = s_{i_1}|_{U_{i_0} \times_U U_{i_1}} - s_{i_0}|_{U_{i_0} \times_U U_{i_1}}.$$

Since s_i lifts s we see that $s_{i_0 i_1} \in \mathcal{F}(U_{i_0} \times_U U_{i_1})$. By the vanishing of $\check{H}^1(\mathcal{U}, \mathcal{F})$ we can find sections $t_i \in \mathcal{F}(U_i)$ such that

$$s_{i_0 i_1} = t_{i_1}|_{U_{i_0} \times_U U_{i_1}} - t_{i_0}|_{U_{i_0} \times_U U_{i_1}}.$$

Then clearly the sections $s_i - t_i$ satisfy the sheaf condition and glue to a section of \mathcal{G} over U which maps to s . Hence we win. \square

Lemma 21.11.9. (*Variant of Cohomology, Lemma 20.12.7.*) *Let \mathcal{C} be a site. Let $\text{Cov}_{\mathcal{C}}$ be the set of coverings of \mathcal{C} (see Sites, Definition 7.6.2). Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$, and $\text{Cov} \subset \text{Cov}_{\mathcal{C}}$ be subsets. Let \mathcal{F} be an abelian sheaf on \mathcal{C} . Assume that*

- (1) *For every $\mathcal{U} \in \text{Cov}$, $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ we have $U, U_i \in \mathcal{B}$ and every $U_{i_0} \times_U \dots \times_U U_{i_p} \in \mathcal{B}$.*
- (2) *For every $U \in \mathcal{B}$ the coverings of U occurring in Cov is a cofinal system of coverings of U .*
- (3) *For every $\mathcal{U} \in \text{Cov}$ we have $\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$ for all $p > 0$.*

Then $H^p(U, \mathcal{F}) = 0$ for all $p > 0$ and any $U \in \mathcal{B}$.

Proof. Let \mathcal{F} and Cov be as in the lemma. We will indicate this by saying “ \mathcal{F} has vanishing higher Cech cohomology for any $\mathcal{U} \in \text{Cov}$ ”. Choose an embedding $\mathcal{F} \rightarrow \mathcal{I}$ into an injective abelian sheaf. By Lemma 21.11.2 \mathcal{I} has vanishing higher Cech cohomology for any $\mathcal{U} \in \text{Cov}$. Let $\mathcal{Q} = \mathcal{I}/\mathcal{F}$ so that we have a short exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0.$$

By Lemma 21.11.8 and our assumption (2) this sequence gives rise to an exact sequence

$$0 \rightarrow \mathcal{F}(U) \rightarrow \mathcal{I}(U) \rightarrow \mathcal{Q}(U) \rightarrow 0.$$

for every $U \in \mathcal{B}$. Hence for any $\mathcal{U} \in \text{Cov}$ we get a short exact sequence of Cech complexes

$$0 \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{I}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{Q}) \rightarrow 0$$

since each term in the Cech complex is made up out of a product of values over elements of \mathcal{B} by assumption (1). In particular we have a long exact sequence of Cech cohomology groups for any covering $\mathcal{U} \in \text{Cov}$. This implies that \mathcal{Q} is also an abelian sheaf with vanishing higher Cech cohomology for all $\mathcal{U} \in \text{Cov}$.

Next, we look at the long exact cohomology sequence

$$\begin{array}{ccccccc} 0 & \longrightarrow & H^0(U, \mathcal{F}) & \longrightarrow & H^0(U, \mathcal{I}) & \longrightarrow & H^0(U, \mathcal{Q}) \\ & & & & & \swarrow & \\ & & H^1(U, \mathcal{F}) & \longrightarrow & H^1(U, \mathcal{I}) & \longrightarrow & H^1(U, \mathcal{Q}) \\ & & & & & \swarrow & \\ & & \dots & & \dots & & \dots \end{array}$$

for any $U \in \mathcal{B}$. Since \mathcal{I} is injective we have $H^n(U, \mathcal{I}) = 0$ for $n > 0$ (see Derived Categories, Lemma 13.20.4). By the above we see that $H^0(U, \mathcal{I}) \rightarrow H^0(U, \mathcal{Q})$ is surjective and hence $H^1(U, \mathcal{F}) = 0$. Since \mathcal{F} was an arbitrary abelian sheaf with vanishing higher Čech cohomology for all $U \in \text{Cov}$ we conclude that also $H^1(U, \mathcal{Q}) = 0$ since \mathcal{Q} is another of these sheaves (see above). By the long exact sequence this in turn implies that $H^2(U, \mathcal{F}) = 0$. And so on and so forth. \square

21.12. Cohomology of modules

Everything that was said for cohomology of abelian sheaves goes for cohomology of modules, since the two agree.

Lemma 21.12.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. An injective sheaf of modules is also injective as an object in the category $P\text{Mod}(\mathcal{O})$.*

Proof. Apply Homology, Lemma 12.25.1 to the categories $\mathcal{A} = \text{Mod}(\mathcal{O})$, $\mathcal{B} = P\text{Mod}(\mathcal{O})$, the inclusion functor and sheafification. (See Modules on Sites, Section 18.11 to see that all assumptions of the lemma are satisfied.) \square

Lemma 21.12.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Consider the functor $i : \text{Mod}(\mathcal{C}) \rightarrow P\text{Mod}(\mathcal{C})$. It is a left exact functor with right derived functors given by*

$$R^p i(\mathcal{F}) = \underline{H}^p(\mathcal{F}) : U \longmapsto H^p(U, \mathcal{F})$$

see discussion in Section 21.8.

Proof. It is clear that i is left exact. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in $\text{Mod}(\mathcal{O})$. By definition $R^p i$ is the p th cohomology presheaf of the complex \mathcal{I}^\bullet . In other words, the sections of $R^p i(\mathcal{F})$ over an object U of \mathcal{C} are given by

$$\frac{\text{Ker}(\mathcal{I}^n(U) \rightarrow \mathcal{I}^{n+1}(U))}{\text{Im}(\mathcal{I}^{n-1}(U) \rightarrow \mathcal{I}^n(U))}.$$

which is the definition of $H^p(U, \mathcal{F})$. \square

Lemma 21.12.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ be a covering of \mathcal{C} . Let \mathcal{I} be an injective \mathcal{O} -module, i.e., an injective object of $\text{Mod}(\mathcal{O})$. Then*

$$\check{H}^p(\mathcal{U}, \mathcal{I}) = \begin{cases} \mathcal{I}(U) & \text{if } p = 0 \\ 0 & \text{if } p > 0 \end{cases}$$

Proof. Lemma 21.10.3 gives the first equality in the following sequence of equalities

$$\begin{aligned} \check{C}^\bullet(\mathcal{U}, \mathcal{I}) &= \text{Mor}_{P\text{Ab}(\mathcal{C})}(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}) \\ &= \text{Mor}_{P\text{Mod}(\mathbf{Z})}(\mathbf{Z}_{\mathcal{U}, \bullet}, \mathcal{I}) \\ &= \text{Mor}_{P\text{Mod}(\mathcal{O})}(\mathbf{Z}_{\mathcal{U}, \bullet} \otimes_{p, \mathbf{Z}} \mathcal{O}, \mathcal{I}) \end{aligned}$$

The third equality by Modules on Sites, Lemma 18.9.2. By Lemma 21.12.1 we see that \mathcal{I} is an injective object in $P\text{Mod}(\mathcal{O})$. Hence $\text{Hom}_{P\text{Mod}(\mathcal{O})}(-, \mathcal{I})$ is an exact functor. By Lemma 21.10.5 we see the vanishing of higher Čech cohomology groups. For the zeroth see Lemma 21.9.2. \square

Lemma 21.12.4. *Let \mathcal{C} be a site. Let \mathcal{O} be a sheaf of rings on \mathcal{C} . Let \mathcal{F} be an \mathcal{O} -module, and denote \mathcal{F}_{ab} the underlying sheaf of abelian groups. Then we have*

$$H^i(\mathcal{C}, \mathcal{F}_{ab}) = H^i(\mathcal{C}, \mathcal{F})$$

and for any object U of \mathcal{C} we also have

$$H^i(U, \mathcal{F}_{ab}) = H^i(U, \mathcal{F}).$$

Here the left hand side is cohomology computed in $Ab(\mathcal{C})$ and the right hand side is cohomology computed in $Mod(\mathcal{O})$.

Proof. By Derived Categories, Lemma 13.20.4 the δ -functor $(\mathcal{F} \mapsto H^p(U, \mathcal{F}))_{p \geq 0}$ is universal. The functor $Mod(\mathcal{O}) \rightarrow Ab(\mathcal{C}), \mathcal{F} \mapsto \mathcal{F}_{ab}$ is exact. Hence $(\mathcal{F} \mapsto H^p(U, \mathcal{F}_{ab}))_{p \geq 0}$ is a δ -functor also. Suppose we show that $(\mathcal{F} \mapsto H^p(U, \mathcal{F}_{ab}))_{p \geq 0}$ is also universal. This will imply the second statement of the lemma by uniqueness of universal δ -functors, see Homology, Lemma 12.11.5. Since $Mod(\mathcal{O})$ has enough injectives, it suffices to show that $H^i(U, \mathcal{I}_{ab}) = 0$ for any injective object \mathcal{I} in $Mod(\mathcal{O})$, see Homology, Lemma 12.11.4.

Let \mathcal{I} be an injective object of $Mod(\mathcal{O})$. Apply Lemma 21.11.9 with $\mathcal{F} = \mathcal{I}, \mathcal{B} = \mathcal{C}$ and $Cov = Cov_{\mathcal{C}}$. Assumption (3) of that lemma holds by Lemma 21.12.3. Hence we see that $H^i(U, \mathcal{I}_{ab}) = 0$ for every object U of \mathcal{C} .

If \mathcal{C} has a final object then this also implies the first equality. If not, then according to Sites, Lemma 7.28.5 we see that the ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ is equivalent to a ringed topos where the underlying site does have a final object. Hence the lemma follows. \square

Lemma 21.12.5. *Let \mathcal{C} be a site. Let I be a set. For $i \in I$ let \mathcal{F}_i be an abelian sheaf on \mathcal{C} . Let $U \in Ob(\mathcal{C})$. The canonical map*

$$H^p(U, \prod_{i \in I} \mathcal{F}_i) \longrightarrow \prod_{i \in I} H^p(U, \mathcal{F}_i)$$

is an isomorphism for $p = 0$ and injective for $p = 1$.

Proof. The statement for $p = 0$ is true because the product of sheaves is equal to the product of the underlying presheaves, see Sites, Lemma 7.10.1. Proof for $p = 1$. Set $\mathcal{F} = \prod \mathcal{F}_i$. Let $\xi \in H^1(U, \mathcal{F})$ map to zero in $\prod H^1(U, \mathcal{F}_i)$. By locality of cohomology, see Lemma 21.8.3, there exists a covering $\mathcal{U} = \{U_j \rightarrow U\}$ such that $\xi|_{U_j} = 0$ for all j . By Lemma 21.11.4 this means ξ comes from an element $\check{\xi} \in \check{H}^1(\mathcal{U}, \mathcal{F})$. Since the maps $\check{H}^1(\mathcal{U}, \mathcal{F}_i) \rightarrow H^1(U, \mathcal{F}_i)$ are injective for all i (by Lemma 21.11.4), and since the image of ξ is zero in $\prod H^1(U, \mathcal{F}_i)$ we see that the image $\check{\xi}_i = 0$ in $\check{H}^1(\mathcal{U}, \mathcal{F}_i)$. However, since $\mathcal{F} = \prod \mathcal{F}_i$ we see that $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$ is the product of the complexes $\check{C}^\bullet(\mathcal{U}, \mathcal{F}_i)$, hence by Homology, Lemma 12.28.1 we conclude that $\check{\xi} = 0$ as desired. \square

Lemma 21.12.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $a : U' \rightarrow U$ be a monomorphism in \mathcal{C} . Then for any injective \mathcal{O} -module \mathcal{I} the restriction mapping $\mathcal{I}(U) \rightarrow \mathcal{I}(U')$ is surjective.*

Proof. Let $j : \mathcal{C}/U \rightarrow \mathcal{C}$ and $j' : \mathcal{C}/U' \rightarrow \mathcal{C}$ be the localization morphisms (Modules on Sites, Section 18.19). Since $j_!$ is a left adjoint to restriction we see that for any sheaf \mathcal{F} of \mathcal{O} -modules

$$\mathrm{Hom}_{\mathcal{O}}(j_! \mathcal{O}_U, \mathcal{F}) = \mathrm{Hom}_{\mathcal{O}_U}(\mathcal{O}_U, \mathcal{F}|_U) = \mathcal{F}(U)$$

Similarly, the sheaf $j'_! \mathcal{O}_{U'}$ represents the functor $\mathcal{F} \mapsto \mathcal{F}(U')$. Moreover below we describe a canonical map of \mathcal{O} -modules

$$j'_! \mathcal{O}_{U'} \longrightarrow j_! \mathcal{O}_U$$

which corresponds to the restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}(U')$ via Yoneda's lemma (Categories, Lemma 4.3.5). It suffices to prove the displayed map of modules is injective, see Homology, Lemma 12.23.2.

To construct our map it suffices to construct a map between the presheaves which assign to an object V of \mathcal{C} the $\mathcal{O}(V)$ -module

$$\bigoplus_{\varphi' \in \text{Mor}_{\mathcal{C}}(V, U')} \mathcal{O}(V) \quad \text{and} \quad \bigoplus_{\varphi \in \text{Mor}_{\mathcal{C}}(V, U)} \mathcal{O}(V)$$

see Modules on Sites, Lemma 18.19.2. We take the map which maps the summand corresponding to φ' to the summand corresponding to $\varphi = a \circ \varphi'$ by the identity map on $\mathcal{O}(V)$. As a is a monomorphism, this map is injective. As sheafification is exact, the result follows. \square

21.13. Limp sheaves

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K be a sheaf of sets on \mathcal{C} (we intentionally use a roman capital here to distinguish from abelian sheaves). Given an abelian sheaf \mathcal{F} we denote $\mathcal{F}(K) = \text{Mor}_{\text{Sh}(\mathcal{C})}(K, \mathcal{F})$. The functor $\mathcal{F} \mapsto \mathcal{F}(K)$ is a left exact functor $\text{Mod}(\mathcal{O}) \rightarrow \text{Ab}$ hence we have its right derived functors. We will denote these $H^p(K, \mathcal{F})$ so that $H^0(K, \mathcal{F}) = \mathcal{F}(K)$.

We mention two special cases. The first is the case where $K = h_U^\#$ for some object U of \mathcal{C} . In this case $H^p(K, \mathcal{F}) = H^p(U, \mathcal{F})$, because $\text{Mor}_{\text{Sh}(\mathcal{C})}(h_U^\#, \mathcal{F}) = \mathcal{F}(U)$, see Sites, Section 7.13. The second is the case $\mathcal{O} = \mathbf{Z}$ (the constant sheaf). In this case the cohomology groups are functors $H^p(K, -) : \text{Ab}(\mathcal{C}) \rightarrow \text{Ab}$. Here is the analogue of Lemma 21.12.4.

Lemma 21.13.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K be a sheaf of sets on \mathcal{C} . Let \mathcal{F} be an \mathcal{O} -module and denote \mathcal{F}_{ab} the underlying sheaf of abelian groups. Then $H^p(K, \mathcal{F}) = H^p(K, \mathcal{F}_{ab})$.*

Proof. Note that both $H^p(K, \mathcal{F})$ and $H^p(K, \mathcal{F}_{ab})$ depend only on the topos, not on the underlying site. Hence by Sites, Lemma 7.28.5 we may replace \mathcal{C} by a “larger” site such that $K = h_U$ for some object U of \mathcal{C} . In this case the result follows from Lemma 21.12.4. \square

Lemma 21.13.2. *Let \mathcal{C} be a site. Let $K' \rightarrow K$ be a surjective map of sheaves of sets on \mathcal{C} . Set $K'_p = K' \times_K \dots \times_K K'$ ($p+1$ -factors). For every abelian sheaf \mathcal{F} there is a spectral sequence with $E_1^{p,q} = H^q(K'_p, \mathcal{F})$ converging to $H^{p+q}(K, \mathcal{F})$.*

Proof. After replacing \mathcal{C} by a “larger” site as in Sites, Lemma 7.28.5 we may assume that K, K' are objects of \mathcal{C} and that $\mathcal{U} = \{K' \rightarrow K\}$ is a covering. Then we have the Čech to cohomology spectral sequence of Lemma 21.11.6 whose E_1 page is as indicated in the statement of the lemma. \square

Lemma 21.13.3. *Let \mathcal{C} be a site. Let K be a sheaf of sets on \mathcal{C} . Consider the morphism of topoi $j : \text{Sh}(\mathcal{C}/K) \rightarrow \text{Sh}(\mathcal{C})$, see Sites, Lemma 7.29.3. Then j^{-1} preserves injectives and $H^p(K, \mathcal{F}) = H^p(\mathcal{C}/K, j^{-1}\mathcal{F})$ for any abelian sheaf \mathcal{F} on \mathcal{C} .*

Proof. By Sites, Lemmas 7.29.1 and 7.29.3 the morphism of topoi j is equivalent to a localization. Hence this follows from Lemma 21.8.1. \square

Keeping in mind Lemma 21.13.1 we see that the following definition is the “correct one” also for sheaves of modules on ringed sites.

Definition 21.13.4. Let \mathcal{C} be a site. We say an abelian sheaf \mathcal{F} is *limp*¹ if for every sheaf of sets K we have $H^p(K, \mathcal{F}) = 0$ for all $p \geq 1$.

It is clear that being limp is an intrinsic property, i.e., preserved under equivalences of topoi. A limp sheaf has vanishing higher cohomology on all objects of the site, but in general the condition of being limp is strictly stronger. Here is a characterization of limp sheaves which is sometimes useful.

Lemma 21.13.5. *Let \mathcal{C} be a site. Let \mathcal{F} be an abelian sheaf. If*

- (1) $H^p(U, \mathcal{F}) = 0$ for $p > 0$ and $U \in \text{Ob}(\mathcal{C})$, and
- (2) for every surjection $K' \rightarrow K$ of sheaves of sets the extended Čech complex

$$0 \rightarrow H^0(K, \mathcal{F}) \rightarrow H^0(K', \mathcal{F}) \rightarrow H^0(K' \times_K K', \mathcal{F}) \rightarrow \dots$$

is exact,

then \mathcal{F} is limp (and the converse holds too).

Proof. By assumption (1) we have $H^p(h_U^\#, g^{-1}\mathcal{I}) = 0$ for all $p > 0$ and all objects U of \mathcal{C} . Note that if $K = \coprod K_i$ is a coproduct of sheaves of sets on \mathcal{C} then $H^p(K, g^{-1}\mathcal{I}) = \prod H^p(K_i, g^{-1}\mathcal{I})$. For any sheaf of sets K there exists a surjection

$$K' = \coprod h_{U_i}^\# \rightarrow K$$

see Sites, Lemma 7.13.5. Thus we conclude that: (*) for every sheaf of sets K there exists a surjection $K' \rightarrow K$ of sheaves of sets such that $H^p(K', \mathcal{F}) = 0$ for $p > 0$. We claim that (*) and condition (2) imply that \mathcal{F} is limp. Note that conditions (*) and (2) only depend on \mathcal{F} as an object of the topos $Sh(\mathcal{C})$ and not on the underlying site. (We will not use property (1) in the rest of the proof.)

We are going to prove by induction on $n \geq 0$ that (*) and (2) imply the following induction hypothesis IH_n : $H^p(K, \mathcal{F}) = 0$ for all $0 < p \leq n$ and all sheaves of sets K . Note that IH_0 holds. Assume IH_n . Pick a sheaf of sets K . Pick a surjection $K' \rightarrow K$ such that $H^p(K', \mathcal{F}) = 0$ for all $p > 0$. We have a spectral sequence with

$$E_1^{p,q} = H^q(K'_p, \mathcal{F})$$

covering to $H^{p+q}(K, \mathcal{F})$, see Lemma 21.13.2. By IH_n we see that $E_1^{p,q} = 0$ for $0 < q \leq n$ and by assumption (2) we see that $E_2^{p,0} = 0$ for $p > 0$. Finally, we have $E_1^{0,q} = 0$ for $q > 0$ because $H^q(K', \mathcal{F}) = 0$ by choice of K' . Hence we conclude that $H^{n+1}(K, \mathcal{F}) = 0$ because all the terms $E_2^{p,q}$ with $p+q = n+1$ are zero. \square

21.14. The Leray spectral sequence

The key to proving the existence of the Leray spectral sequence is the following lemma.

Lemma 21.14.1. *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Then for any injective object \mathcal{I} in $\text{Mod}(\mathcal{O}_{\mathcal{C}})$ the pushforward $f_*\mathcal{I}$ is limp.*

Proof. Let K be a sheaf of sets on \mathcal{D} . By Modules on Sites, Lemma 18.7.2 we may replace \mathcal{C} , \mathcal{D} by “larger” sites such that f comes from a morphism of ringed sites induced by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ such that $K = h_V$ for some object V of \mathcal{D} .

¹This is probably nonstandard notation. Please email stacks.project@gmail.com if you know the correct terminology.

Thus we have to show that $H^q(V, f_*\mathcal{I})$ is zero for $q > 0$ and all objects V of \mathcal{D} when f is given by a morphism of ringed sites. Let $\mathcal{V} = \{V_j \rightarrow V\}$ be any covering of \mathcal{D} . Since u is continuous we see that $\mathcal{U} = \{u(V_j) \rightarrow u(V)\}$ is a covering of \mathcal{C} . Then we have an equality of Čech complexes

$$\check{C}^\bullet(\mathcal{V}, f_*\mathcal{I}) = \check{C}^\bullet(\mathcal{U}, \mathcal{I})$$

by the definition of f_* . By Lemma 21.12.3 we see that the cohomology of this complex is zero in positive degrees. We win by Lemma 21.11.9. \square

For flat morphisms the functor f_* preserves injective modules. In particular the functor $f_* : Ab(\mathcal{C}) \rightarrow Ab(\mathcal{D})$ always transforms injective abelian sheaves into injective abelian sheaves.

Lemma 21.14.2. *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. If f is flat, then $f_*\mathcal{I}$ is an injective $\mathcal{O}_{\mathcal{D}}$ -module for any injective $\mathcal{O}_{\mathcal{C}}$ -module \mathcal{I} .*

Proof. In this case the functor f^* is exact, see Modules on Sites, Lemma 18.30.2. Hence the result follows from Homology, Lemma 12.25.1. \square

Lemma 21.14.3. *Let $(Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$ be a ringed topos. A limp sheaf is right acyclic for the following functors:*

- (1) *the functor $H^0(U, -)$ for any object U of \mathcal{C} ,*
- (2) *the functor $\mathcal{F} \mapsto \mathcal{F}(K)$ for any presheaf of sets K ,*
- (3) *the functor $\Gamma(\mathcal{C}, -)$ of global sections,*
- (4) *the functor f_* for any morphism $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ of ringed topoi.*

Proof. Part (2) is the definition of a limp sheaf. Part (1) is a consequence of (2) as pointed out in the discussion following the definition of limp sheaves. Part (3) is a special case of (2) where $K = e$ is the final object of $Sh(\mathcal{C})$.

To prove (4) we may assume, by Modules on Sites, Lemma 18.7.2 that f is given by a morphism of sites. In this case we see that $R^i f_*$, $i > 0$ of a limp sheaf are zero by the description of higher direct images in Lemma 21.8.4. \square

Remark 21.14.4. As a consequence of the results above we find that Derived Categories, Lemma 13.22.1 applies to a number of situations. For example, given a morphism $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ of ringed topoi we have

$$R\Gamma(\mathcal{D}, Rf_*\mathcal{F}) = R\Gamma(\mathcal{C}, \mathcal{F})$$

for any sheaf of $\mathcal{O}_{\mathcal{C}}$ -modules \mathcal{F} . Namely, for an injective $\mathcal{O}_{\mathcal{C}}$ -module \mathcal{I} the $\mathcal{O}_{\mathcal{D}}$ -module $f_*\mathcal{I}$ is limp by Lemma 21.14.1 and a limp sheaf is acyclic for $\Gamma(\mathcal{D}, -)$ by Lemma 21.14.3.

Lemma 21.14.5 (Leray spectral sequence). *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let \mathcal{F}^\bullet be a bounded below complex of $\mathcal{O}_{\mathcal{C}}$ -modules. There is a spectral sequence*

$$E_2^{p,q} = H^p(\mathcal{D}, R^q f_*(\mathcal{F}^\bullet))$$

converging to $H^{p+q}(\mathcal{C}, \mathcal{F}^\bullet)$.

Proof. This is just the Grothendieck spectral sequence Derived Categories, Lemma 13.22.2 coming from the composition of functors $\Gamma(\mathcal{C}, -) = \Gamma(\mathcal{D}, -) \circ f_*$. To see that the assumptions of Derived Categories, Lemma 13.22.2 are satisfied, see Lemmas 21.14.1 and 21.14.3. \square

Lemma 21.14.6. *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let \mathcal{F} be an $\mathcal{O}_{\mathcal{C}}$ -module.*

- (1) *If $R^q f_* \mathcal{F} = 0$ for $q > 0$, then $H^p(\mathcal{C}, \mathcal{F}) = H^p(\mathcal{D}, f_* \mathcal{F})$ for all p .*
- (2) *If $H^p(\mathcal{D}, R^q f_* \mathcal{F}) = 0$ for all q and $p > 0$, then $H^q(\mathcal{C}, \mathcal{F}) = H^0(\mathcal{D}, R^q f_* \mathcal{F})$ for all q .*

Proof. These are two simple conditions that force the Leray spectral sequence to converge. You can also prove these facts directly (without using the spectral sequence) which is a good exercise in cohomology of sheaves. \square

Lemma 21.14.7 (Relative Leray spectral sequence). *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ and $g : (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \rightarrow (Sh(\mathcal{E}), \mathcal{O}_{\mathcal{E}})$ be morphisms of ringed topoi. Let \mathcal{F} be an $\mathcal{O}_{\mathcal{C}}$ -module. There is a spectral sequence with*

$$E_2^{p,q} = R^p g_*(R^q f_* \mathcal{F})$$

converging to $R^{p+q}(g \circ f)_ \mathcal{F}$. This spectral sequence is functorial in \mathcal{F} , and there is a version for bounded below complexes of $\mathcal{O}_{\mathcal{C}}$ -modules.*

Proof. This is a Grothendieck spectral sequence for composition of functors, see Derived Categories, Lemma 13.22.2 and Lemmas 21.14.1 and 21.14.3. \square

21.15. The base change map

In this section we construct the base change map in some cases; the general case is treated in Remark 21.19.2. The discussion in this section avoids using derived pullback by restricting to the case of a base change by a flat morphism of ringed sites. Before we state the result, let us discuss flat pullback on the derived category. Suppose $g : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ is a flat morphism of ringed topoi. By Modules on Sites, Lemma 18.30.2 the functor $g^* : Mod(\mathcal{O}_{\mathcal{D}}) \rightarrow Mod(\mathcal{O}_{\mathcal{C}})$ is exact. Hence it has a derived functor

$$g^* : D(\mathcal{O}_{\mathcal{C}}) \rightarrow D(\mathcal{O}_{\mathcal{D}})$$

which is computed by simply pulling back an representative of a given object in $D(\mathcal{O}_{\mathcal{D}})$, see Derived Categories, Lemma 13.17.8. It preserved the bounded (above, below) subcategories. Hence as indicated we indicate this functor by g^* rather than Lg^* .

Lemma 21.15.1. *Let*

$$\begin{array}{ccc} (Sh(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g'} & (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ f' \downarrow & & \downarrow f \\ (Sh(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) & \xrightarrow{g} & (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \end{array}$$

be a commutative diagram of ringed topoi. Let \mathcal{F}^\bullet be a bounded below complex of $\mathcal{O}_{\mathcal{C}}$ -modules. Assume both g and g' are flat. Then there exists a canonical base change map

$$g^* Rf_* \mathcal{F}^\bullet \longrightarrow R(f')_*(g')^* \mathcal{F}^\bullet$$

in $D^+(\mathcal{O}_{\mathcal{D}'})$.

Proof. Choose injective resolutions $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ and $(g')^*\mathcal{F}^\bullet \rightarrow \mathcal{J}^\bullet$. By Lemma 21.14.2 we see that $(g')_*\mathcal{J}^\bullet$ is a complex of injectives representing $R(g')_*(g')^*\mathcal{F}^\bullet$. Hence by Derived Categories, Lemmas 13.18.6 and 13.18.7 the arrow β in the diagram

$$\begin{array}{ccc} (g')_*(g')^*\mathcal{F}^\bullet & \longrightarrow & (g')_*\mathcal{J}^\bullet \\ \uparrow \text{adjunction} & & \uparrow \beta \\ \mathcal{F}^\bullet & \longrightarrow & \mathcal{I}^\bullet \end{array}$$

exists and is unique up to homotopy. Pushing down to \mathcal{D} we get

$$f_*\beta : f_*\mathcal{I}^\bullet \longrightarrow f_*(g')_*\mathcal{J}^\bullet = g_*(f')_*\mathcal{J}^\bullet$$

By adjunction of g^* and g_* we get a map of complexes $g^*f_*\mathcal{I}^\bullet \rightarrow (f')_*\mathcal{J}^\bullet$. Note that this map is unique up to homotopy since the only choice in the whole process was the choice of the map β and everything was done on the level of complexes. \square

21.16. Cohomology and colimits

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \rightarrow \text{Mod}(\mathcal{O})$, $i \mapsto \mathcal{F}_i$ be a diagram over the index category \mathcal{I} , see Categories, Section 4.14. For each i there is a canonical map $\mathcal{F}_i \rightarrow \text{colim}_i \mathcal{F}_i$ which induces a map on cohomology. Hence we get a canonical map

$$\text{colim}_i H^p(U, \mathcal{F}_i) \longrightarrow H^p(U, \text{colim}_i \mathcal{F}_i)$$

for every $p \geq 0$ and every object U of \mathcal{C} . These maps are in general not isomorphisms, even for $p = 0$.

The following lemma is the analogue of Sites, Lemma 7.11.2 for cohomology.

Lemma 21.16.1. *Let \mathcal{C} be a site. Let $\text{Cov}_{\mathcal{C}}$ be the set of coverings of \mathcal{C} (see Sites, Definition 7.6.2). Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$, and $\text{Cov} \subset \text{Cov}_{\mathcal{C}}$ be subsets. Assume that*

- (1) *For every $U \in \text{Cov}$ we have $U = \{U_i \rightarrow U\}_{i \in I}$ with I finite, $U, U_i \in \mathcal{B}$ and every $U_{i_0} \times_U \dots \times_U U_{i_p} \in \mathcal{B}$.*
- (2) *For every $U \in \mathcal{B}$ the coverings of U occurring in Cov is a cofinal system of coverings of U .*

Then the map

$$\text{colim}_i H^p(U, \mathcal{F}_i) \longrightarrow H^p(U, \text{colim}_i \mathcal{F}_i)$$

is an isomorphism for every $p \geq 0$, every $U \in \mathcal{B}$, and every filtered diagram $\mathcal{I} \rightarrow \text{Ab}(\mathcal{C})$.

Proof. To prove the lemma we will argue by induction on p . Note that we require in (1) the coverings $U \in \text{Cov}$ to be finite, so that all the elements of \mathcal{B} are quasi-compact. Hence (2) and (1) imply that any $U \in \mathcal{B}$ satisfies the hypothesis of Sites, Lemma 7.11.2 (4). Thus we see that the result holds for $p = 0$. Now we assume the lemma holds for p and prove it for $p + 1$.

Choose a filtered diagram $\mathcal{F} : \mathcal{I} \rightarrow \text{Ab}(\mathcal{C})$, $i \mapsto \mathcal{F}_i$. Since $\text{Ab}(\mathcal{C})$ has functorial injective embeddings, see Injectives, Theorem 19.7.4, we can find a morphism of filtered diagrams $\mathcal{F} \rightarrow \mathcal{I}$ such that each $\mathcal{F}_i \rightarrow \mathcal{I}_i$ is an injective map of abelian sheaves into an injective abelian sheaf. Denote \mathcal{Q}_i the cokernel so that we have short exact sequences

$$0 \rightarrow \mathcal{F}_i \rightarrow \mathcal{I}_i \rightarrow \mathcal{Q}_i \rightarrow 0.$$

Since colimits of sheaves are the sheaffication of colimits on the level of presheaves, since sheaffication is exact, and since filtered colimits of abelian groups are exact (see Algebra, Lemma 10.8.9), we see the sequence

$$0 \rightarrow \operatorname{colim}_i \mathcal{F}_i \rightarrow \operatorname{colim}_i \mathcal{I}_i \rightarrow \operatorname{colim}_i \mathcal{Q}_i \rightarrow 0.$$

is also a short exact sequence. We claim that $H^q(U, \operatorname{colim}_i \mathcal{I}_i) = 0$ for all $U \in \mathcal{B}$ and all $q \geq 1$. Accepting this claim for the moment consider the diagram

$$\begin{array}{ccccccc} \operatorname{colim}_i H^p(U, \mathcal{I}_i) & \longrightarrow & \operatorname{colim}_i H^p(U, \mathcal{Q}_i) & \longrightarrow & \operatorname{colim}_i H^{p+1}(U, \mathcal{F}_i) & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ H^p(U, \operatorname{colim}_i \mathcal{I}_i) & \longrightarrow & H^p(U, \operatorname{colim}_i \mathcal{Q}_i) & \longrightarrow & H^{p+1}(U, \operatorname{colim}_i \mathcal{F}_i) & \longrightarrow & 0 \end{array}$$

The zero at the lower right corner comes from the claim and the zero at the upper right corner comes from the fact that the sheaves \mathcal{I}_i are injective. The top row is exact by an application of Algebra, Lemma 10.8.9. Hence by the snake lemma we deduce the result for $p + 1$.

It remains to show that the claim is true. We will use Lemma 21.11.9. By the result for $p = 0$ we see that for $\mathcal{U} \in \operatorname{Cov}$ we have

$$\check{C}^\bullet(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i) = \operatorname{colim}_i \check{C}^\bullet(\mathcal{U}, \mathcal{I}_i)$$

because all the $U_{j_0} \times_U \dots \times_U U_{j_p}$ are in \mathcal{B} . By Lemma 21.11.2 each of the complexes in the colimit of Čech complexes is acyclic in degree ≥ 1 . Hence by Algebra, Lemma 10.8.9 we see that also the Čech complex $\check{C}^\bullet(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i)$ is acyclic in degrees ≥ 1 . In other words we see that $\check{H}^p(\mathcal{U}, \operatorname{colim}_i \mathcal{I}_i) = 0$ for all $p \geq 1$. Thus the assumptions of Lemma 21.11.9. are satisfied and the claim follows. \square

Let \mathcal{C} be a limit of sites \mathcal{C}_i as in Sites, Situation 7.11.3 and Lemmas 7.11.4, 7.11.5, and 7.11.6. In particular, all coverings in \mathcal{C} and \mathcal{C}_i have finite index sets. Moreover, assume given

- (1) an abelian sheaf \mathcal{F}_i on \mathcal{C}_i for all $i \in \operatorname{Ob}(\mathcal{I})$,
- (2) for $a : j \rightarrow i$ a map $\varphi_a : f_a^{-1} \mathcal{F}_i \rightarrow \mathcal{F}_j$ of abelian sheaves on \mathcal{C}_j

such that $\varphi_c = \varphi_b \circ f_b^{-1} \varphi_a$ whenever $c = a \circ b$.

Lemma 21.16.2. *In the situation discussed above set $\mathcal{F} = \operatorname{colim} f_i^{-1} \mathcal{F}_i$. Let $i \in \operatorname{Ob}(\mathcal{I})$, $X_i \in \operatorname{Ob}(\mathcal{C}_i)$. Then*

$$\operatorname{colim}_{a:j \rightarrow i} H^p(u_a(X_i), \mathcal{F}_j) = H^p(u_i(X_i), \mathcal{F})$$

for all $p \geq 0$.

Proof. The case $p = 0$ is Sites, Lemma 7.11.6.

In this paragraph we show that we can find a map of systems $(\gamma_i) : (\mathcal{F}_i, \varphi_a) \rightarrow (\mathcal{G}_i, \psi_a)$ with \mathcal{G}_i an injective abelian sheaf and γ_i injective. For each i we pick an injection $\mathcal{F}_i \rightarrow \mathcal{I}_i$ where \mathcal{I}_i is an injective abelian sheaf on \mathcal{C}_i . Then we can consider the family of maps

$$\gamma_i : \mathcal{F}_i \longrightarrow \prod_{b:k \rightarrow i} f_{b,*} \mathcal{I}_k = \mathcal{G}_i$$

where the component maps are the maps adjoint to the maps $f_b^{-1} \mathcal{F}_i \rightarrow \mathcal{F}_k \rightarrow \mathcal{I}_k$. For $a : j \rightarrow i$ in \mathcal{I} there is a canonical map

$$\psi_a : f_a^{-1} \mathcal{G}_i \rightarrow \mathcal{G}_j$$

whose components are the canonical maps $f_b^{-1}f_{a \circ b, *} \mathcal{I}_k \rightarrow f_{b, *} \mathcal{I}_k$ for $b : k \rightarrow j$. Thus we find an injection $\{\gamma_i\} : \{\mathcal{F}_i, \varphi_a\} \rightarrow (\mathcal{G}_i, \psi_a)$ of systems of abelian sheaves. Note that \mathcal{G}_i is an injective sheaf of abelian groups on \mathcal{C}_i , see Lemma 21.14.2 and Homology, Lemma 12.23.3. This finishes the construction.

Arguing exactly as in the proof of Lemma 21.16.1 we see that it suffices to prove that $H^p(X, \operatorname{colim} f_i^{-1} \mathcal{G}_i) = 0$ for $p > 0$.

Set $\mathcal{G} = \operatorname{colim} f_i^{-1} \mathcal{G}_i$. To show vanishing of cohomology of \mathcal{G} on every object of \mathcal{C} we show that the Čech cohomology of \mathcal{G} for any covering \mathcal{U} of \mathcal{C} is zero (Lemma 21.11.9). The covering \mathcal{U} comes from a covering \mathcal{U}_i of \mathcal{C}_i for some i . We have

$$\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{G}) = \operatorname{colim}_{a: j \rightarrow i} \check{\mathcal{C}}^\bullet(u_a(\mathcal{U}_i), \mathcal{G}_j)$$

by the case $p = 0$. The right hand side is acyclic in positive degrees as a filtered colimit of acyclic complexes by Lemma 21.11.2. See Algebra, Lemma 10.8.9. \square

21.17. Flat resolutions

In this section we redo the arguments of Cohomology, Section 20.27 in the setting of ringed sites and ringed topoi.

Lemma 21.17.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{G}^\bullet be a complex of \mathcal{O} -modules. The functor*

$$K(\operatorname{Mod}(\mathcal{O})) \longrightarrow K(\operatorname{Mod}(\mathcal{O})), \quad \mathcal{F}^\bullet \longmapsto \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{G}^\bullet)$$

is an exact functor of triangulated categories.

Proof. Omitted. Hint: See More on Algebra, Lemmas 15.45.1 and 15.45.2. \square

Definition 21.17.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. A complex \mathcal{K}^\bullet of \mathcal{O} -modules is called *K-flat* if for every acyclic complex \mathcal{F}^\bullet of \mathcal{O} -modules the complex

$$\operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{K}^\bullet)$$

is acyclic.

Lemma 21.17.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{K}^\bullet be a K-flat complex. Then the functor*

$$K(\operatorname{Mod}(\mathcal{O})) \longrightarrow K(\operatorname{Mod}(\mathcal{O})), \quad \mathcal{F}^\bullet \longmapsto \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{K}^\bullet)$$

transforms quasi-isomorphisms into quasi-isomorphisms.

Proof. Follows from Lemma 21.17.1 and the fact that quasi-isomorphisms are characterized by having acyclic cones. \square

Lemma 21.17.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If $\mathcal{K}^\bullet, \mathcal{L}^\bullet$ are K-flat complexes of \mathcal{O} -modules, then $\operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet)$ is a K-flat complex of \mathcal{O} -modules.*

Proof. Follows from the isomorphism

$$\operatorname{Tot}(\mathcal{M}^\bullet \otimes_{\mathcal{O}} \operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet)) = \operatorname{Tot}(\operatorname{Tot}(\mathcal{M}^\bullet \otimes_{\mathcal{O}} \mathcal{K}^\bullet) \otimes_{\mathcal{O}} \mathcal{L}^\bullet)$$

and the definition. \square

Lemma 21.17.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(\mathcal{K}_1^\bullet, \mathcal{K}_2^\bullet, \mathcal{K}_3^\bullet)$ be a distinguished triangle in $K(\operatorname{Mod}(\mathcal{O}))$. If two out of three of \mathcal{K}_i^\bullet are K-flat, so is the third.*

Proof. Follows from Lemma 21.17.1 and the fact that in a distinguished triangle in $K(\operatorname{Mod}(\mathcal{O}))$ if two out of three are acyclic, so is the third. \square

Lemma 21.17.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. A bounded above complex of flat \mathcal{O} -modules is K -flat.*

Proof. Let \mathcal{K}^\bullet be a bounded above complex of flat \mathcal{O} -modules. Let \mathcal{L}^\bullet be an acyclic complex of \mathcal{O} -modules. Note that $\mathcal{L}^\bullet = \operatorname{colim}_m \tau_{\leq m} \mathcal{L}^\bullet$ where we take termwise colimits. Hence also

$$\operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet) = \operatorname{colim}_m \operatorname{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \tau_{\leq m} \mathcal{L}^\bullet)$$

termwise. Hence to prove the complex on the left is acyclic it suffices to show each of the complexes on the right is acyclic. Since $\tau_{\leq m} \mathcal{L}^\bullet$ is acyclic this reduces us to the case where \mathcal{L}^\bullet is bounded above. In this case the spectral sequence of Homology, Lemma 12.22.6 has

$${}^i E_1^{p,q} = H^p(\mathcal{L}^\bullet \otimes_R \mathcal{K}^q)$$

which is zero as \mathcal{K}^q is flat and \mathcal{L}^\bullet acyclic. Hence we win. \square

Lemma 21.17.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{K}_1^\bullet \rightarrow \mathcal{K}_2^\bullet \rightarrow \dots$ be a system of K -flat complexes. Then $\operatorname{colim}_i \mathcal{K}_i^\bullet$ is K -flat.*

Proof. Because we are taking termwise colimits it is clear that

$$\operatorname{colim}_i \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{K}_i^\bullet) = \operatorname{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \operatorname{colim}_i \mathcal{K}_i^\bullet)$$

Hence the lemma follows from the fact that filtered colimits are exact. \square

Lemma 21.17.8. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. For any complex \mathcal{G}^\bullet of \mathcal{O} -modules there exists a commutative diagram of complexes of \mathcal{O} -modules*

$$\begin{array}{ccccc} \mathcal{K}_1^\bullet & \longrightarrow & \mathcal{K}_2^\bullet & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \\ \tau_{\leq 1} \mathcal{G}^\bullet & \longrightarrow & \tau_{\leq 2} \mathcal{G}^\bullet & \longrightarrow & \dots \end{array}$$

with the following properties: (1) the vertical arrows are quasi-isomorphisms, (2) each \mathcal{K}_n^\bullet is a bounded above complex whose terms are direct sums of \mathcal{O} -modules of the form $j_{U!} \mathcal{O}_U$, and (3) the maps $\mathcal{K}_n^\bullet \rightarrow \mathcal{K}_{n+1}^\bullet$ are termwise split injections whose cokernels are direct sums of \mathcal{O} -modules of the form $j_{U!} \mathcal{O}_U$. Moreover, the map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism.

Proof. The existence of the diagram and properties (1), (2), (3) follows immediately from Modules on Sites, Lemma 18.28.6 and Derived Categories, Lemma 13.28.1. The induced map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism because filtered colimits are exact. \square

Lemma 21.17.9. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. For any complex \mathcal{G}^\bullet of \mathcal{O} -modules there exists a K -flat complex \mathcal{K}^\bullet and a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{G}^\bullet$.*

Proof. Choose a diagram as in Lemma 21.17.8. Each complex \mathcal{K}_n^\bullet is a bounded above complex of flat modules, see Modules on Sites, Lemma 18.28.5. Hence \mathcal{K}_n^\bullet is K -flat by Lemma 21.17.6. The induced map $\operatorname{colim} \mathcal{K}_n^\bullet \rightarrow \mathcal{G}^\bullet$ is a quasi-isomorphism by construction. Since $\operatorname{colim} \mathcal{K}_n^\bullet$ is K -flat by Lemma 21.17.7 we win. \square

Lemma 21.17.10. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\alpha : \mathcal{P}^\bullet \rightarrow \mathcal{Q}^\bullet$ be a quasi-isomorphism of K-flat complexes of \mathcal{O} -modules. For every complex \mathcal{F}^\bullet of \mathcal{O} -modules the induced map*

$$\text{Tot}(id_{\mathcal{F}^\bullet} \otimes \alpha) : \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{P}^\bullet) \longrightarrow \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{Q}^\bullet)$$

is a quasi-isomorphism.

Proof. Choose a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{F}^\bullet$ with \mathcal{K}^\bullet a K-flat complex, see Lemma 21.17.9. Consider the commutative diagram

$$\begin{array}{ccc} \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{P}^\bullet) & \longrightarrow & \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{Q}^\bullet) \\ \downarrow & & \downarrow \\ \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{P}^\bullet) & \longrightarrow & \text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{Q}^\bullet) \end{array}$$

The result follows as by Lemma 21.17.3 the vertical arrows and the top horizontal arrow are quasi-isomorphisms. \square

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F}^\bullet be an object of $D(\mathcal{O})$. Choose a K-flat resolution $\mathcal{K}^\bullet \rightarrow \mathcal{F}^\bullet$, see Lemma 21.17.9. By Lemma 21.17.1 we obtain an exact functor of triangulated categories

$$K(\mathcal{O}) \longrightarrow K(\mathcal{O}), \quad \mathcal{G}^\bullet \longmapsto \text{Tot}(\mathcal{G}^\bullet \otimes_{\mathcal{O}} \mathcal{K}^\bullet)$$

By Lemma 21.17.3 this functor induces a functor $D(\mathcal{O}) \rightarrow D(\mathcal{O})$ simply because $D(\mathcal{O})$ is the localization of $K(\mathcal{O})$ at quasi-isomorphisms. By Lemma 21.17.10 the resulting functor (up to isomorphism) does not depend on the choice of the K-flat resolution.

Definition 21.17.11. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F}^\bullet be an object of $D(\mathcal{O})$. The *derived tensor product*

$$- \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}^\bullet : D(\mathcal{O}) \longrightarrow D(\mathcal{O})$$

is the exact functor of triangulated categories described above.

It is clear from our explicit constructions that there is a canonical isomorphism

$$\mathcal{F}^\bullet \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G}^\bullet \cong \mathcal{G}^\bullet \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}^\bullet$$

for \mathcal{G}^\bullet and \mathcal{F}^\bullet in $D(\mathcal{O})$. Hence when we write $\mathcal{F}^\bullet \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G}^\bullet$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

Definition 21.17.12. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F}, \mathcal{G} be \mathcal{O} -modules. The *Tor*'s of \mathcal{F} and \mathcal{G} are define by the formula

$$\text{Tor}_p^{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = H^{-p}(\mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{G})$$

with derived tensor product as defined above.

This definition implies that for every short exact sequence of \mathcal{O} -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ we have a long exact cohomology sequence

$$\begin{array}{ccccccc} \mathcal{F}_1 \otimes_{\mathcal{O}} \mathcal{G} & \longrightarrow & \mathcal{F}_2 \otimes_{\mathcal{O}} \mathcal{G} & \longrightarrow & \mathcal{F}_3 \otimes_{\mathcal{O}} \mathcal{G} & \longrightarrow & 0 \\ & & & & \swarrow & & \\ \text{Tor}_1^{\mathcal{O}}(\mathcal{F}_1, \mathcal{G}) & \longrightarrow & \text{Tor}_1^{\mathcal{O}}(\mathcal{F}_2, \mathcal{G}) & \longrightarrow & \text{Tor}_1^{\mathcal{O}}(\mathcal{F}_3, \mathcal{G}) & & \end{array}$$

for every \mathcal{O} -module \mathcal{G} . This will be called the long exact sequence of Tor associated to the situation.

Lemma 21.17.13. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F} be an \mathcal{O} -module. The following are equivalent*

- (1) \mathcal{F} is a flat \mathcal{O} -module, and
- (2) $\mathrm{Tor}_1^{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = 0$ for every \mathcal{O} -module \mathcal{G} .

Proof. If \mathcal{F} is flat, then $\mathcal{F} \otimes_{\mathcal{O}} -$ is an exact functor and the satellites vanish. Conversely assume (2) holds. Then if $\mathcal{G} \rightarrow \mathcal{H}$ is injective with cokernel \mathcal{Q} , the long exact sequence of Tor shows that the kernel of $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G} \rightarrow \mathcal{F} \otimes_{\mathcal{O}} \mathcal{H}$ is a quotient of $\mathrm{Tor}_1^{\mathcal{O}}(\mathcal{F}, \mathcal{Q})$ which is zero by assumption. Hence \mathcal{F} is flat. \square

21.18. Derived pullback

Let $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. We can use K-flat resolutions to define a derived pullback functor

$$Lf^* : D(\mathcal{O}') \rightarrow D(\mathcal{O})$$

However, we have to be a little careful since we haven't yet proved the pullback of a flat module is flat in complete generality, see Modules on Sites, Section 18.38. In this section, we will use the hypothesis that our sites have enough points, but once we improve the result of the aforementioned section, all of the results in this section will hold without the assumption on the existence of points.

Lemma 21.18.1. *Let $f : \mathrm{Sh}(\mathcal{C}) \rightarrow \mathrm{Sh}(\mathcal{C}')$ be a morphism of topoi. Let \mathcal{O}' be a sheaf of rings on \mathcal{C}' . Assume \mathcal{C} has enough points. For any complex of \mathcal{O}' -modules \mathcal{G}^\bullet , there exists a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{G}^\bullet$ such that \mathcal{K}^\bullet is a K-flat complex of \mathcal{O}' -modules and $f^{-1}\mathcal{K}^\bullet$ is a K-flat complex of $f^{-1}\mathcal{O}'$ -modules.*

Proof. In the proof of Lemma 21.17.9 we find a quasi-isomorphism $\mathcal{K}^\bullet = \mathrm{colim}_i \mathcal{K}_i^\bullet \rightarrow \mathcal{G}^\bullet$ where each \mathcal{K}_i^\bullet is a bounded above complex of flat \mathcal{O}' -modules. By Modules on Sites, Lemma 18.38.3 applied to the morphism of ringed topoi $(\mathrm{Sh}(\mathcal{C}), f^{-1}\mathcal{O}') \rightarrow (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}')$ we see that $f^{-1}\mathcal{K}_i^\bullet$ is a bounded above complex of flat $f^{-1}\mathcal{O}'$ -modules. Hence $f^{-1}\mathcal{K}^\bullet = \mathrm{colim}_i f^{-1}\mathcal{K}_i^\bullet$ is K-flat by Lemmas 21.17.6 and 21.17.7. \square

Remark 21.18.2. It is straightforward to show that the pullback of a K-flat complex is K-flat for a morphism of ringed topoi with enough points; this slightly improves the result of Lemma 21.18.1. However, in applications it seems rather that the explicit form of the K-flat complexes constructed in Lemma 21.17.9 is what is useful (as in the proof above) and not the plain fact that they are K-flat. Note for example that the terms of the complex constructed are each direct sums of modules of the form $j_{U!}\mathcal{O}_U$, see Lemma 21.17.8.

Lemma 21.18.3. *Let $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. Assume \mathcal{C} has enough points. There exists an exact functor*

$$Lf^* : D(\mathcal{O}') \longrightarrow D(\mathcal{O})$$

of triangulated categories so that $Lf^\mathcal{K}^\bullet = f^*\mathcal{K}^\bullet$ for any complex as in Lemma 21.18.1 in particular for any bounded above complex of flat \mathcal{O}' -modules.*

Proof. To see this we use the general theory developed in Derived Categories, Section 13.15. Set $\mathcal{D} = K(\mathcal{O}')$ and $\mathcal{D}' = D(\mathcal{O})$. Let us write $F : \mathcal{D} \rightarrow \mathcal{D}'$ the exact functor of triangulated categories defined by the rule $F(\mathcal{G}^\bullet) = f^*\mathcal{G}^\bullet$. We let S be the set of quasi-isomorphisms in $\mathcal{D} = K(\mathcal{O}')$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15.2 applies. We claim that LF is everywhere defined. This follows from Derived Categories, Lemma 13.15.15 with $\mathcal{P} \subset \text{Ob}(\mathcal{D})$ the collection of complexes \mathcal{K}^\bullet such that $f^{-1}\mathcal{K}^\bullet$ is a K-flat complex of $f^{-1}\mathcal{O}'$ -modules: (1) follows from Lemma 21.18.1 and to see (2) we have to show that for a quasi-isomorphism $\mathcal{K}_1^\bullet \rightarrow \mathcal{K}_2^\bullet$ between elements of \mathcal{P} the map $f^*\mathcal{K}_1^\bullet \rightarrow f^*\mathcal{K}_2^\bullet$ is a quasi-isomorphism. To see this write this as

$$f^{-1}\mathcal{K}_1^\bullet \otimes_{f^{-1}\mathcal{O}'} \mathcal{O} \longrightarrow f^{-1}\mathcal{K}_2^\bullet \otimes_{f^{-1}\mathcal{O}'} \mathcal{O}$$

The functor f^{-1} is exact, hence the map $f^{-1}\mathcal{K}_1^\bullet \rightarrow f^{-1}\mathcal{K}_2^\bullet$ is a quasi-isomorphism. The complexes $f^{-1}\mathcal{K}_1^\bullet$ and $f^{-1}\mathcal{K}_2^\bullet$ are K-flat complexes of $f^{-1}\mathcal{O}'$ -modules by our choice of \mathcal{P} . Hence Lemma 21.17.10 guarantees that the displayed map is a quasi-isomorphism. Thus we obtain a derived functor

$$LF : D(\mathcal{O}') = S^{-1}\mathcal{D} \longrightarrow \mathcal{D}' = D(\mathcal{O})$$

see Derived Categories, Equation (13.15.9.1). Finally, Derived Categories, Lemma 13.15.15 also guarantees that $LF(\mathcal{K}^\bullet) = F(\mathcal{K}^\bullet) = f^*\mathcal{K}^\bullet$ when \mathcal{K}^\bullet is in \mathcal{P} . Since the proof of Lemma 21.18.1 shows that bounded above complexes of flat modules are in \mathcal{P} we win. \square

Lemma 21.18.4. *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Assume \mathcal{C} has enough points. There is a canonical bifunctorial isomorphism*

$$Lf^*(\mathcal{F}^\bullet \otimes_{\mathcal{O}}^L \mathcal{G}^\bullet) = Lf^*\mathcal{F}^\bullet \otimes_{\mathcal{O}'}^L Lf^*\mathcal{G}^\bullet$$

for $\mathcal{F}^\bullet, \mathcal{G}^\bullet \in \text{Ob}(D(\mathcal{O}'))$.

Proof. By Lemma 21.18.1 we may assume that \mathcal{F}^\bullet and \mathcal{G}^\bullet are K-flat complexes of \mathcal{O}' -modules such that $f^*\mathcal{F}^\bullet$ and $f^*\mathcal{G}^\bullet$ are K-flat complexes of \mathcal{O} -modules. In this case $\mathcal{F}^\bullet \otimes_{\mathcal{O}}^L \mathcal{G}^\bullet$ is just the total complex associated to the double complex $\mathcal{F}^\bullet \otimes_{\mathcal{O}'} \mathcal{G}^\bullet$. By Lemma 21.17.4 $\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}'} \mathcal{G}^\bullet)$ is K-flat also. Hence the isomorphism of the lemma comes from the isomorphism

$$\text{Tot}(f^*\mathcal{F}^\bullet \otimes_{\mathcal{O}} f^*\mathcal{G}^\bullet) \longrightarrow f^*\text{Tot}(\mathcal{F}^\bullet \otimes_{\mathcal{O}'} \mathcal{G}^\bullet)$$

whose constituents are the isomorphisms $f^*\mathcal{F}^p \otimes_{\mathcal{O}} f^*\mathcal{G}^q \rightarrow f^*(\mathcal{F}^p \otimes_{\mathcal{O}'} \mathcal{G}^q)$ of Modules on Sites, Lemma 18.26.1. \square

Lemma 21.18.5. *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. There is a canonical bifunctorial isomorphism*

$$\mathcal{F}^\bullet \otimes_{\mathcal{O}}^L Lf^*\mathcal{G}^\bullet = \mathcal{F}^\bullet \otimes_{f^{-1}\mathcal{O}'}^L f^{-1}\mathcal{G}^\bullet$$

for \mathcal{F}^\bullet in $D(\mathcal{O})$ and \mathcal{G}^\bullet in $D(\mathcal{O}')$.

Proof. Let \mathcal{F} be an \mathcal{O} -module and let \mathcal{G} be an \mathcal{O}' -module. Then $\mathcal{F} \otimes_{\mathcal{O}} f^*\mathcal{G} = \mathcal{F} \otimes_{f^{-1}\mathcal{O}'} f^{-1}\mathcal{G}$ because $f^*\mathcal{G} = \mathcal{O} \otimes_{f^{-1}\mathcal{O}'} f^{-1}\mathcal{G}$. The lemma follows from this and the definitions. \square

21.19. Cohomology of unbounded complexes

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The category $\text{Mod}(\mathcal{O})$ is a Grothendieck abelian category: it has all colimits, filtered colimits are exact, and it has a generator, namely

$$\bigoplus_{U \in \text{Ob}(\mathcal{C})} j_{U!} \mathcal{O}_U,$$

see Modules on Sites, Section 18.14 and Lemmas 18.28.5 and 18.28.6. By Injectives, Theorem 19.12.6 for every complex \mathcal{F}^\bullet of \mathcal{O} -modules there exists an injective quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ to a K-injective complex of \mathcal{O} -modules. Hence we can define

$$R\Gamma(\mathcal{C}, \mathcal{F}^\bullet) = \Gamma(\mathcal{C}, \mathcal{I}^\bullet)$$

and similarly for any left exact functor, see Derived Categories, Lemma 13.29.6. For any morphism of ringed topoi $f : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}')$ we obtain

$$Rf_* : D(\mathcal{O}) \longrightarrow D(\mathcal{O}')$$

on the unbounded derived categories.

Lemma 21.19.1. *Let $f : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Assume \mathcal{C} has enough points. The functor Rf_* defined above and the functor Lf^* defined in Lemma 21.18.3 are adjoint:*

$$\text{Hom}_{D(\mathcal{O}')} (Lf^* \mathcal{G}^\bullet, \mathcal{F}^\bullet) = \text{Hom}_{D(\mathcal{O})} (\mathcal{G}^\bullet, Rf_* \mathcal{F}^\bullet)$$

bifunctorially in $\mathcal{F}^\bullet \in \text{Ob}(D(\mathcal{O}))$ and $\mathcal{G}^\bullet \in \text{Ob}(D(\mathcal{O}'))$.

Proof. This follows formally from the fact that Rf_* and Lf^* exist, see Derived Categories, Lemma 13.28.4. \square

Remark 21.19.2. The construction of unbounded derived functor Lf^* and Rf_* allows one to construct the base change map in full generality. Namely, suppose that

$$\begin{array}{ccc} (\text{Sh}(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g'} & (\text{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ f' \downarrow & & \downarrow f \\ (\text{Sh}(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) & \xrightarrow{g} & (\text{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \end{array}$$

is a commutative diagram of ringed topoi. Let \mathcal{F}^\bullet be a complex of $\mathcal{O}_{\mathcal{C}}$ -modules. Then there exists a canonical base change map

$$Lg^* Rf_* \mathcal{F}^\bullet \longrightarrow R(f')_* L(g')^* \mathcal{F}^\bullet$$

in $D(\mathcal{O}_{\mathcal{D}'})$. Namely, this map is adjoint to a map $L(f')^* Lg^* Rf_* \mathcal{F}^\bullet \rightarrow L(g')^* \mathcal{F}^\bullet$. Since $L(f')^* Lg^* = L(g')^* Lf^*$ we see this is the same as a map $L(g')^* Lf^* Rf_* \mathcal{F}^\bullet \rightarrow L(g')^* \mathcal{F}^\bullet$ which we can take to be $L(g')^*$ of the adjunction map $Lf^* Rf_* \mathcal{F}^\bullet \rightarrow \mathcal{F}^\bullet$.

21.20. Some properties of K-injective complexes

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . Denote $j : (\text{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\text{Sh}(\mathcal{C}), \mathcal{O})$ the corresponding localization morphism. The pullback functor j^* is exact as it is just the restriction functor. Thus derived pullback Lj^* is computed on any complex by simply restricting the complex. We often simply denote the corresponding functor

$$D(\mathcal{O}) \rightarrow D(\mathcal{O}_U), \quad E \mapsto j^* E = E|_U$$

Similarly, extension by zero $j_! : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$ (see Modules on Sites, Definition 18.19.1) is an exact functor (Modules on Sites, Lemma 18.19.3). Thus it induces a functor

$$j_! : D(\mathcal{O}_U) \rightarrow D(\mathcal{O}), \quad F \mapsto j_!F$$

by simply applying $j_!$ to any complex representing the object F .

Lemma 21.20.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . The restriction of a K -injective complex of \mathcal{O} -modules to \mathcal{C}/U is a K -injective complex of \mathcal{O}_U -modules.*

Proof. Follows immediately from Derived Categories, Lemma 13.29.10 and the fact that the restriction functor has the exact left adjoint $j_!$. See discussion above. \square

Lemma 21.20.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . Denote $j : (\text{Sh}(\mathcal{C}/U), \mathcal{O}_U) \rightarrow (\text{Sh}(\mathcal{C}), \mathcal{O})$ the corresponding localization morphism. The restriction functor $D(\mathcal{O}) \rightarrow D(\mathcal{O}_U)$ is a right adjoint to extension by zero $j_! : D(\mathcal{O}_U) \rightarrow D(\mathcal{O})$.*

Proof. We have to show that

$$\text{Hom}_{D(\mathcal{O})}(j_!E, F) = \text{Hom}_{D(\mathcal{O}_U)}(E, F|_U)$$

Choose a complex \mathcal{E}^\bullet of \mathcal{O}_U -modules representing E and choose a K -injective complex \mathcal{I}^\bullet representing F . By Lemma 21.20.1 the complex $\mathcal{I}^\bullet|_U$ is K -injective as well. Hence we see that the formula above becomes

$$\text{Hom}_{D(\mathcal{O})}(j_!\mathcal{E}^\bullet, \mathcal{I}^\bullet) = \text{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet, \mathcal{I}^\bullet|_U)$$

which holds as $|_U$ and $j_!$ are adjoint functors (Modules on Sites, Lemma 18.19.2) and Derived Categories, Lemma 13.29.2. \square

Lemma 21.20.3. *Let \mathcal{C} be a site. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a flat map of sheaves of rings. If \mathcal{I}^\bullet is a K -injective complex of \mathcal{O}' -modules, then \mathcal{I}^\bullet is K -injective as a complex of \mathcal{O} -modules.*

Proof. This is true because $\text{Hom}_{K(\mathcal{O})}(\mathcal{F}^\bullet, \mathcal{I}^\bullet) = \text{Hom}_{K(\mathcal{O}')}(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{O}', \mathcal{I}^\bullet)$ by Modules on Sites, Lemma 18.11.3 and the fact that tensoring with \mathcal{O}' is exact. \square

Lemma 21.20.4. *Let \mathcal{C} be a site. Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a map of sheaves of rings. If \mathcal{I}^\bullet is a K -injective complex of \mathcal{O} -modules, then $\text{Hom}_{\mathcal{O}}(\mathcal{O}', \mathcal{I}^\bullet)$ is a K -injective complex of \mathcal{O}' -modules.*

Proof. This is true because $\text{Hom}_{K(\mathcal{O}')}(\mathcal{G}^\bullet, \text{Hom}_{\mathcal{O}}(\mathcal{O}', \mathcal{I}^\bullet)) = \text{Hom}_{K(\mathcal{O})}(\mathcal{G}^\bullet, \mathcal{I}^\bullet)$ by Modules on Sites, Lemma 18.27.5. \square

21.21. Derived and homotopy limits

Let \mathcal{C} be a site. Consider the category $\mathcal{C} \times \mathbf{N}$ with $\text{Mor}((U, n), (V, m)) = \emptyset$ if $n > m$ and $\text{Mor}((U, n), (V, m)) = \text{Mor}(U, V)$ else. We endow this with the structure of a site by letting coverings be families $\{(U_i, n) \rightarrow (U, n)\}$ such that $\{U_i \rightarrow U\}$ is a covering of \mathcal{C} . Then the reader verifies immediately that sheaves on $\mathcal{C} \times \mathbf{N}$ are the same thing as inverse systems of sheaves on \mathcal{C} . In particular $\text{Ab}(\mathcal{C} \times \mathbf{N})$ is inverse systems of abelian sheaves on \mathcal{C} . Consider now the functor

$$\lim : \text{Ab}(\mathcal{C} \times \mathbf{N}) \rightarrow \text{Ab}(\mathcal{C})$$

which takes an inverse system to its limit. This is nothing but g_* where $g : Sh(\mathcal{C} \times \mathbf{N}) \rightarrow Sh(\mathcal{C})$ is the morphism of topoi associated to the continuous and cocontinuous functor $\mathcal{C} \times \mathbf{N} \rightarrow \mathcal{C}$. (Observe that g^{-1} assigns to a sheaf on \mathcal{C} the corresponding constant inverse system.)

By the general machinery explained above we obtain a derived functor

$$R\lim = Rg_* : D(\mathcal{C} \times \mathbf{N}) \rightarrow D(\mathcal{C}).$$

As indicated this functor is often denoted $R\lim$.

On the other hand, the continuous and cocontinuous functors $\mathcal{C} \rightarrow \mathcal{C} \times \mathbf{N}$, $U \mapsto (U, n)$ define morphisms of topoi $i_n : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C} \times \mathbf{N})$. Of course i_n^{-1} is the functor which picks the n th term of the inverse system. Thus there are transformations of functors $i_{n+1}^{-1} \rightarrow i_n^{-1}$. Hence given $K \in D(\mathcal{C} \times \mathbf{N})$ we get $K_n = i_n^{-1}K \in D(\mathcal{C})$ and maps $K_{n+1} \rightarrow K_n$. In Derived Categories, Definition 13.32.1 we have defined the notion of a homotopy limit

$$R\lim K_n \in D(\mathcal{C})$$

We claim the two notions agree (as far as it makes sense).

Lemma 21.21.1. *Let \mathcal{C} be a site. Let K be an object of $D(\mathcal{C} \times \mathbf{N})$. Set $K_n = i_n^{-1}K$ as above. Then*

$$R\lim K \cong R\lim K_n$$

in $D(\mathcal{C})$.

Proof. To calculate $R\lim$ on an object K of $D(\mathcal{C} \times \mathbf{N})$ we choose a K-injective representative \mathcal{I}^\bullet whose terms are injective objects of $Ab(\mathcal{C} \times \mathbf{N})$, see Injectives, Theorem 19.12.6. We may and do think of \mathcal{I}^\bullet as an inverse system of complexes (\mathcal{I}_n^\bullet) and then we see that

$$R\lim K = \lim \mathcal{I}_n^\bullet$$

where the right hand side is the termwise inverse limit.

Let $\mathcal{J} = (\mathcal{J}_n)$ be an injective object of $Ab(\mathcal{C} \times \mathbf{N})$. The morphisms $(U, n) \rightarrow (U, n+1)$ are monomorphisms of $\mathcal{C} \times \mathbf{N}$, hence $\mathcal{J}(U, n+1) \rightarrow \mathcal{J}(U, n)$ is surjective (Lemma 21.12.6). It follows that $\mathcal{J}_{n+1} \rightarrow \mathcal{J}_n$ is surjective as a map of presheaves.

Note that the functor i_n^{-1} has an exact left adjoint $i_{n,!}$. Namely, $i_{n,!}\mathcal{F}$ is the inverse system $\dots \rightarrow 0 \rightarrow \mathcal{F} \rightarrow \dots \rightarrow \mathcal{F}$. Thus the complexes $i_n^{-1}\mathcal{I}^\bullet = \mathcal{I}_n^\bullet$ are K-injective by Derived Categories, Lemma 13.29.10.

Because we chose our K-injective complex to have injective terms we conclude that

$$0 \rightarrow \lim \mathcal{I}_n^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow 0$$

is a short exact sequence of complexes of abelian sheaves as it is a short exact sequence of complexes of abelian presheaves. Moreover, the products in the middle and the right represent the products in $D(\mathcal{C})$, see Injectives, Lemma 19.13.4 and its proof (this is where we use that \mathcal{I}_n^\bullet is K-injective). Thus $R\lim K$ is a homotopy limit of the inverse system (K_n) by definition of homotopy limits in triangulated categories. \square

Lemma 21.21.2. *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}')$ be a morphism of ringed topoi. Then Rf_* commutes with $R\lim$, i.e., Rf_* commutes with derived limits.*

Proof. Let (K_n) be an inverse system of objects of $D(\mathcal{O})$. By induction on n we may choose actual complexes \mathcal{K}_n^\bullet of \mathcal{O} -modules and maps of complexes $\mathcal{K}_{n+1}^\bullet \rightarrow \mathcal{K}_n^\bullet$ representing the maps $K_{n+1} \rightarrow K_n$ in $D(\mathcal{O})$. In other words, there exists an object K in $D(\mathcal{C} \times \mathbf{N})$ whose associated inverse system is the given one. Next, consider the commutative diagram

$$\begin{array}{ccc} Sh(\mathcal{C} \times \mathbf{N}) & \xrightarrow{g} & Sh(\mathcal{C}) \\ f \times 1 \downarrow & & \downarrow f \\ Sh(\mathcal{C}' \times \mathbf{N}) & \xrightarrow{g'} & Sh(\mathcal{C}') \end{array}$$

of morphisms of topoi. It follows that $R\lim R(f \times 1)_*K = Rf_*R\lim K$. Working through the definitions and using Lemma 21.21.1 we obtain that $R\lim(Rf_*K_n) = Rf_*(R\lim K_n)$.

Alternate proof in case \mathcal{C} has enough points. Consider the defining distinguished triangle

$$R\lim K_n \rightarrow \prod K_n \rightarrow \prod K_n$$

in $D(\mathcal{O})$. Applying the exact functor Rf_* we obtain the distinguished triangle

$$Rf_*(R\lim K_n) \rightarrow Rf_*\left(\prod K_n\right) \rightarrow Rf_*\left(\prod K_n\right)$$

in $D(\mathcal{O}')$. Thus we see that it suffices to prove that Rf_* commutes with products in the derived category (which are not just given by products of complexes, see Injectives, Lemma 19.13.4). However, since Rf_* is a right adjoint by Lemma 21.19.1 this follows formally (see Categories, Lemma 4.24.4). Caution: Note that we cannot apply Categories, Lemma 4.24.4 directly as $R\lim K_n$ is not a limit in $D(\mathcal{O})$. \square

21.22. Producing K-injective resolutions

First a technical lemma about cohomology sheaves of termwise limits of inverse systems of complexes of modules.

Lemma 21.22.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (\mathcal{F}_n^\bullet) be an inverse system of complexes of \mathcal{O} -modules. Let $m \in \mathbf{Z}$. Suppose given $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ and an integer n_0 such that*

- (1) every object of \mathcal{C} has a covering whose members are elements of \mathcal{B} ,
- (2) for every $U \in \mathcal{B}$
 - (a) the systems of abelian groups $\mathcal{F}_n^{m-2}(U)$ and $\mathcal{F}_n^{m-1}(U)$ have vanishing $R^1\lim$ (for example these have the Mittag-Leffler property),
 - (b) the system of abelian groups $H^{m-1}(\mathcal{F}_n^\bullet(U))$ has vanishing $R^1\lim$ (for example it has the Mittag-Leffler property), and
 - (c) we have $H^m(\mathcal{F}_n^\bullet(U)) = H^m(\mathcal{F}_{n_0}^\bullet(U))$ for all $n \geq n_0$.

Then the maps $H^m(\mathcal{F}^\bullet) \rightarrow \lim H^m(\mathcal{F}_n^\bullet) \rightarrow H^m(\mathcal{F}_{n_0}^\bullet)$ are isomorphisms of sheaves where $\mathcal{F}^\bullet = \lim \mathcal{F}_n^\bullet$ be the termwise inverse limit.

Proof. Let $U \in \mathcal{B}$. Note that $H^m(\mathcal{F}^\bullet(U))$ is the cohomology of

$$\lim_n \mathcal{F}_n^{m-2}(U) \rightarrow \lim_n \mathcal{F}_n^{m-1}(U) \rightarrow \lim_n \mathcal{F}_n^m(U) \rightarrow \lim_n \mathcal{F}_n^{m+1}(U)$$

in the third spot from the left. By assumptions (2)(a) and (2)(b) we may apply More on Algebra, Lemma 15.61.2 to conclude that

$$H^m(\mathcal{F}^\bullet(U)) = \lim H^m(\mathcal{F}_n^\bullet(U))$$

By assumption (2)(c) we conclude

$$H^m(\mathcal{F}^\bullet(U)) = H^m(\mathcal{F}_n^\bullet(U))$$

for all $n \geq n_0$. By assumption (1) we conclude that the sheafification of $U \mapsto H^m(\mathcal{F}^\bullet(U))$ is equal to the sheafification of $U \mapsto H^m(\mathcal{F}_n^\bullet(U))$ for all $n \geq n_0$. Thus the inverse system of sheaves $H^m(\mathcal{F}_n^\bullet)$ is constant for $n \geq n_0$ with value $H^m(\mathcal{F}^\bullet)$ which proves the lemma. \square

The following lemma computes the cohomology sheaves of the derived limit in a special case.

Lemma 21.22.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (K_n) be an inverse system of objects of $D^-(\mathcal{O})$. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Let $d \in \mathbf{N}$. Assume*

- (1) K_n is an object of $D^-(\mathcal{O})$ for all n ,
- (2) for $q \in \mathbf{Z}$ there exists $n(q)$ such that $H^q(K_{n+1}) \rightarrow H^q(K_n)$ is an isomorphism for $n \geq n(q)$,
- (3) every object of \mathcal{C} has a covering whose members are elements of \mathcal{B} ,
- (4) for every $U \in \mathcal{B}$ we have $H^p(U, H^q(K_n)) = 0$ for $p > d$ and all q .

Then we have $H^m(R \lim K_n) = \lim H^m(K_n)$ for all $m \in \mathbf{Z}$.

Proof. Set $K = R \lim K_n$. Let $U \in \mathcal{B}$. For each n there is a spectral sequence

$$H^p(U, H^q(K_n)) \Rightarrow H^{p+q}(U, K_n)$$

which converges as K_n is bounded below, see Derived Categories, Lemma 13.21.3. If we fix $m \in \mathbf{Z}$, then we see from our assumption (4) that only $H^p(U, H^q(K_n))$ contribute to $H^m(U, K_n)$ for $0 \leq p \leq d$ and $m - d \leq q \leq m$. By assumption (2) this implies that $H^m(U, K_{n+1}) \rightarrow H^m(U, K_n)$ is an isomorphism as soon as $n \geq \max n(m), \dots, n(m - d)$. The functor $R\Gamma(U, -)$ commutes with derived limits by Injectives, Lemma 19.13.6. Thus we have

$$H^m(U, K) = H^m(R \lim R\Gamma(U, K_n))$$

On the other hand we have just seen that the complexes $R\Gamma(U, K_n)$ have eventually constant cohomology groups. Thus by More on Algebra, Remark 15.61.16 we find that $H^m(U, K)$ is equal to $H^m(U, K_n)$ for all $n \gg 0$ for some bound independent of $U \in \mathcal{B}$. Pick such an n . Finally, recall that $H^m(K)$ is the sheafification of the presheaf $U \mapsto H^m(U, K)$ and $H^m(K_n)$ is the sheafification of the presheaf $U \mapsto H^m(U, K_n)$. On the elements of \mathcal{B} these presheaves have the same values. Therefore assumption (3) guarantees that the sheafifications are the same too. The lemma follows. \square

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{F}^\bullet be a complex of \mathcal{O} -modules. The category $\text{Mod}(\mathcal{O})$ has enough injectives, hence we can use Derived Categories, Lemma 13.28.3 produce a diagram

$$\begin{array}{ccc} \dots & \longrightarrow & \tau_{\geq -2} \mathcal{F}^\bullet & \longrightarrow & \tau_{\geq -1} \mathcal{F}^\bullet \\ & & \downarrow & & \downarrow \\ \dots & \longrightarrow & \mathcal{I}_2^\bullet & \longrightarrow & \mathcal{I}_1^\bullet \end{array}$$

in the category of complexes of \mathcal{O} -modules such that

- (1) the vertical arrows are quasi-isomorphisms,
- (2) \mathcal{I}_n^\bullet is a bounded below complex of injectives,

(3) the arrows $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections.

The category of \mathcal{O} -modules has limits (they are computed on the level of presheaves), hence we can form the termwise limit $\mathcal{I}^\bullet = \lim_n \mathcal{I}_n^\bullet$. By Derived Categories, Lemmas 13.29.4 and 13.29.7 this is a K-injective complex. In general the canonical map

$$(21.22.2.1) \quad \mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$$

may not be a quasi-isomorphism. In the following lemma we describe some conditions under which it is.

Lemma 21.22.3. *In the situation described above. Denote $\mathcal{H}^i = H^i(\mathcal{F}^\bullet)$ the i th cohomology sheaf. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Let $d \in \mathbf{N}$. Assume*

- (1) every object of \mathcal{C} has a covering whose members are elements of \mathcal{B} ,
- (2) for every $U \in \mathcal{B}$ we have $H^p(U, \mathcal{H}^q) = 0$ for $p > d^2$.

Then (21.22.2.1) is a quasi-isomorphism.

Proof. Let $m \in \mathbf{Z}$. We have to show that the map $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ induces an isomorphism $\mathcal{H}^m \rightarrow H^m(\mathcal{I}^\bullet)$. Since \mathcal{I}_n^\bullet is quasi-isomorphic to $\tau_{\geq -n} \mathcal{F}^\bullet$ it suffices to show that $H^m(\mathcal{I}^\bullet) \rightarrow H^m(\mathcal{I}_n^\bullet)$ is an isomorphism for n large enough. To do this we will verify the hypotheses (1), (2)(a), (2)(b), (2)(c) of Lemma 21.22.1.

Hypothesis (1) is assumption (1) above. Hypothesis (2)(a) follows from the fact that the maps $\mathcal{I}_{n+1}^k \rightarrow \mathcal{I}_n^k$ are split surjections. We will prove hypothesis (2)(b) and (2)(c) simultaneously by proving that for $U \in \mathcal{B}$ the system $H^m(\mathcal{I}_n^\bullet(U))$ becomes constant for $n \geq -m + d$. Namely, recalling that \mathcal{I}_n^\bullet is quasi-isomorphic to $\tau_{\geq -n} \mathcal{F}^\bullet$ we obtain for all n a distinguished triangle

$$\mathcal{H}^{-n}[n] \rightarrow \mathcal{I}_n^\bullet \rightarrow \mathcal{I}_{n-1}^\bullet \rightarrow \mathcal{H}^{-n}[n+1]$$

(Derived Categories, Remark 13.12.4) in $D(\mathcal{O})$. By assumption (2) we see that if $m > d - n$ then

$$H^m(U, \mathcal{H}^{-n}[n]) = 0 \quad \text{and} \quad H^m(U, \mathcal{H}^{-n}[n+1]) = 0.$$

Observe that $H^m(\mathcal{I}_n^\bullet(U)) = H^m(U, \mathcal{I}_n^\bullet)$ as \mathcal{I}_n^\bullet is a bounded below complex of injectives. Unwinding the long exact sequence of cohomology associated to the distinguished triangle above this implies that

$$H^m(\mathcal{I}_n^\bullet(U)) \rightarrow H^m(\mathcal{I}_{n-1}^\bullet(U))$$

is an isomorphism for $m > d - n$, i.e., $n > d - m$ and we win. □

Lemma 21.22.4. *With assumptions and notation as in Lemma 21.22.3. Let K denote the object of $D(\mathcal{O})$ represented by the complex \mathcal{F}^\bullet . Then $K = R \lim \tau_{\geq -n} K$, i.e., K is the derived limit of its canonical truncations.*

Proof. First proof. Injectives, Lemma 19.13.4 shows that $\prod \tau_{\geq -n} K$ is represented by the complex $\prod \mathcal{I}_n^\bullet$. Because the transition maps $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections, we have a short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow \prod \mathcal{I}_n^\bullet \rightarrow 0$$

²In fact, analyzing the proof we see that it suffices if there exists a function $d : \mathbf{Z} \rightarrow \mathbf{Z} \cup \{+\infty\}$ such that $H^p(U, \mathcal{H}^q) = 0$ for $p > d(q)$ where $q + d(q) \rightarrow -\infty$ as $q \rightarrow -\infty$

Since \mathcal{I}^\bullet represents K by Lemma 21.22.3 the distinguished triangle of the lemma is the distinguished triangle associated to the short exact sequence above (Derived Categories, Lemma 13.12.1).

Second proof. Apply Lemma 21.22.2 to see that the cohomology sheaves of $R \lim_{\leftarrow} \tau_{\geq -n} K$ are isomorphic to the cohomology sheaves of K . \square

Here is another case where we can describe the derived limit.

Lemma 21.22.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (K_n) be an inverse system of objects of $D(\mathcal{O})$. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Assume*

- (1) *every object of \mathcal{C} has a covering whose members are elements of \mathcal{B} ,*
- (2) *for all $U \in \mathcal{B}$ and all $q \in \mathbf{Z}$ we have*
 - (a) *$H^p(U, H^q(K_n)) = 0$ for $p > 0$,*
 - (b) *the inverse system $H^0(U, H^q(K_n))$ has vanishing $R^1 \lim$.*

Then $H^q(R \lim K_n) = \lim H^q(K_n)$ for $q \in \mathbf{Z}$ and $R^t \lim H^q(K_n) = 0$ for $t > 0$.

Proof. Observe that $K_n = R \lim_m \tau_{\geq -m} K_n$ by Lemma 21.22.4. Let $U \in \mathcal{B}$. Then we get $H^q(U, K_n) = H^q(R \lim_m R\Gamma(U, \tau_{\geq -m} K_n))$ because $R\Gamma(U, -)$ commutes with derived limits by Injectives, Lemma 19.13.6. For each m condition (2)(a) imply $H^q(U, \tau_{\geq -m} K_n) = H^0(U, H^q(\tau_{\geq -m} K_n))$ for all q, n by using the spectral sequence of Derived Categories, Lemma 13.21.3. The spectral sequence converges because $\tau_{\geq -m} K_n$ is bounded below (and so this argument simplifies considerably when K_n is bounded below). This value is constant and equal to $H^0(U, H^q(K_n))$ for $m > |q|$. We conclude that $H^q(U, K_n) = H^0(U, H^q(K_n))$.

Using again that the functor $R\Gamma(U, -)$ commutes with derived limits we have

$$H^q(U, K) = H^q(R \lim R\Gamma(U, K_n)) = \lim H^0(U, H^q(K_n))$$

where the final equality follows from More on Algebra, Remark 15.61.16 and assumption (2)(b). Thus $H^q(U, K)$ is the inverse limit the sections of the sheaves $H^q(K_n)$ over U . Since $\lim H^q(K_n)$ is a sheaf we find using assumption (1) that $H^q(K)$, which is the sheafification of the presheaf $U \mapsto H^q(U, K)$, is equal to $\lim H^q(K_n)$. This proves the first statement. Applying this to the inverse system $(H^q(K_n)[0])$ the second assertion follows also. \square

The construction above can be used in the following setting. Let \mathcal{C} be a category. Let $\text{Cov}(\mathcal{C}) \supset \text{Cov}'(\mathcal{C})$ be two ways to endow \mathcal{C} with the structure of a site. Denote τ the topology corresponding to $\text{Cov}(\mathcal{C})$ and τ' the topology corresponding to $\text{Cov}'(\mathcal{C})$. Then the identity functor on \mathcal{C} defines a morphism of sites

$$\epsilon : \mathcal{C}_\tau \longrightarrow \mathcal{C}_{\tau'}$$

where ϵ_* is the identity functor on underlying presheaves and where ϵ^{-1} is the τ -sheafification of a τ' -sheaf (hence clearly exact). Let \mathcal{O} be a sheaf of rings for the τ -topology. Then \mathcal{O} is also a sheaf for the τ' -topology and ϵ becomes a morphism of ringed sites

$$\epsilon : (\mathcal{C}_\tau, \mathcal{O}_\tau) \longrightarrow (\mathcal{C}_{\tau'}, \mathcal{O}_{\tau'})$$

In this situation we can sometimes point out subcategories of $D(\mathcal{O}_\tau)$ and $D(\mathcal{O}_{\tau'})$ which are identified by the functors ϵ^* and $R\epsilon_*$.

Lemma 21.22.6. *With $\epsilon : (\mathcal{C}_\tau, \mathcal{O}_\tau) \longrightarrow (\mathcal{C}_{\tau'}, \mathcal{O}_{\tau'})$ as above. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Let $\mathcal{A} \subset \text{PMod}(\mathcal{O})$ be a full subcategory. Assume*

- (1) every object of \mathcal{A} is a sheaf for the τ -topology,
- (2) \mathcal{A} is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_\tau)$,
- (3) every object of \mathcal{C} has a τ' -covering whose members are elements of \mathcal{B} , and
- (4) for every $U \in \mathcal{B}$ we have $H^p_\tau(U, \mathcal{F}) = 0, p > 0$ for all $\mathcal{F} \in \mathcal{A}$.

Then \mathcal{A} is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_\tau)$ and there is an equivalence of triangulated categories $D_{\mathcal{A}}(\mathcal{O}_\tau) = D_{\mathcal{A}}(\mathcal{O}_{\tau'})$ given by ϵ^* and $R\epsilon_*$.

Proof. Note that for $A \in \mathcal{A}$ we can think of A as a sheaf in either topology and (abusing notation) that $\epsilon_*A = A$ and $\epsilon^*A = A$. Consider an exact sequence

$$A_0 \rightarrow A_1 \rightarrow A_2 \rightarrow A_3 \rightarrow A_4$$

in $\text{Mod}(\mathcal{O}_{\tau'})$ with A_0, A_1, A_3, A_4 in \mathcal{A} . We have to show that A_2 is an element of \mathcal{A} , see Homology, Definition 12.9.1. Apply the exact functor $\epsilon^* = \epsilon^{-1}$ to conclude that ϵ^*A_2 is an object of \mathcal{A} . Consider the map of sequences

$$\begin{array}{ccccccccc} A_0 & \longrightarrow & A_1 & \longrightarrow & A_2 & \longrightarrow & A_3 & \longrightarrow & A_4 \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ A_0 & \longrightarrow & A_1 & \longrightarrow & \epsilon_*\epsilon^*A_2 & \longrightarrow & A_3 & \longrightarrow & A_4 \end{array}$$

to conclude that $A_2 = \epsilon_*\epsilon^*A_2$ is an object of \mathcal{A} . At this point it makes sense to talk about the derived categories $D_{\mathcal{A}}(\mathcal{O}_\tau)$ and $D_{\mathcal{A}}(\mathcal{O}_{\tau'})$, see Derived Categories, Section 13.13.

Since ϵ^* is exact and preserves \mathcal{A} , it is clear that we obtain a functor $\epsilon^* : D_{\mathcal{A}}(\mathcal{O}_{\tau'}) \rightarrow D_{\mathcal{A}}(\mathcal{O}_\tau)$. We claim that $R\epsilon_*$ is a quasi-inverse. Namely, let \mathcal{F}^\bullet be an object of $D_{\mathcal{A}}(\mathcal{O}_\tau)$. Construct a map $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet = \lim_n \mathcal{I}_n^\bullet$ as in (21.22.2.1). By Lemma 21.22.3 and assumption (4) we see that $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ is a quasi-isomorphism. Then

$$R\epsilon_*\mathcal{F}^\bullet = \epsilon_*\mathcal{I}^\bullet = \lim_n \epsilon_*\mathcal{I}_n^\bullet$$

For every $U \in \mathcal{B}$ we have

$$H^m(\epsilon_*\mathcal{I}_n^\bullet(U)) = H^m(\mathcal{I}_n^\bullet(U)) = \begin{cases} H^m(\mathcal{F}^\bullet)(U) & \text{if } m \geq -n \\ 0 & \text{if } m < n \end{cases}$$

by the assumed vanishing of (4), the spectral sequence Derived Categories, Lemma 13.21.3, and the fact that $\tau_{\geq -n}\mathcal{F}^\bullet \rightarrow \mathcal{I}_n^\bullet$ is a quasi-isomorphism. The maps $\epsilon_*\mathcal{I}_{n+1}^\bullet \rightarrow \epsilon_*\mathcal{I}_n^\bullet$ are termwise split surjections as ϵ_* is a functor. Hence we can apply Homology, Lemma 12.27.7 to the sequence of complexes

$$\lim_n \epsilon_*\mathcal{I}_n^{m-2}(U) \rightarrow \lim_n \epsilon_*\mathcal{I}_n^{m-1}(U) \rightarrow \lim_n \epsilon_*\mathcal{I}_n^m(U) \rightarrow \lim_n \epsilon_*\mathcal{I}_n^{m+1}(U)$$

to conclude that $H^m(\epsilon_*\mathcal{I}^\bullet(U)) = H^m(\mathcal{F}^\bullet)(U)$ for $U \in \mathcal{B}$. Sheafifying and using property (3) this proves that $H^m(\epsilon_*\mathcal{I}^\bullet)$ is isomorphic to $\epsilon_*H^m(\mathcal{F}^\bullet)$, i.e., is an object of \mathcal{A} . Thus $R\epsilon_*$ indeed gives rise to a functor

$$R\epsilon_* : D_{\mathcal{A}}(\mathcal{O}_{\tau'}) \longrightarrow D_{\mathcal{A}}(\mathcal{O}_\tau)$$

For $\mathcal{F}^\bullet \in D_{\mathcal{A}}(\mathcal{O}_\tau)$ the adjunction map $\epsilon^*R\epsilon_*\mathcal{F}^\bullet \rightarrow \mathcal{F}^\bullet$ is a quasi-isomorphism as we've seen above that the cohomology sheaves of $R\epsilon_*\mathcal{F}^\bullet$ are $\epsilon_*H^m(\mathcal{F}^\bullet)$. For $\mathcal{G}^\bullet \in D_{\mathcal{A}}(\mathcal{O}_{\tau'})$ the adjunction map $\mathcal{G}^\bullet \rightarrow R\epsilon_*\epsilon^*\mathcal{G}^\bullet$ is a quasi-isomorphism for the same reason, i.e., because the cohomology sheaves of $R\epsilon_*\epsilon^*\mathcal{G}^\bullet$ are isomorphic to $\epsilon_*H^m(\epsilon^*\mathcal{G}^\bullet) = H^m(\mathcal{G}^\bullet)$. \square

21.23. Cohomology on Hausdorff and locally quasi-compact spaces

We continue our convention to say “Hausdorff and locally quasi-compact” instead of saying “locally compact” as is often done in the literature. Let LC denote the category whose objects are Hausdorff and locally quasi-compact topological spaces and whose morphisms are continuous maps.

Lemma 21.23.1. *The category LC has fibre products and a final object and hence has arbitrary finite limits. Given morphisms $X \rightarrow Z$ and $Y \rightarrow Z$ in LC with X and Y quasi-compact, then $X \times_Z Y$ is quasi-compact.*

Proof. The final object is the singleton space. Given morphisms $X \rightarrow Z$ and $Y \rightarrow Z$ of LC the fibre product $X \times_Z Y$ is a subspace of $X \times Y$. Hence $X \times_Z Y$ is Hausdorff as $X \times Y$ is Hausdorff by Topology, Section 5.3.

If X and Y are quasi-compact, then $X \times Y$ is quasi-compact by Topology, Theorem 5.13.4. Since $X \times_Z Y$ is a closed subset of $X \times Y$ (Topology, Lemma 5.3.4) we find that $X \times_Z Y$ is quasi-compact by Topology, Lemma 5.11.3.

Finally, returning to the general case, if $x \in X$ and $y \in Y$ we can pick quasi-compact neighbourhoods $x \in E \subset X$ and $y \in F \subset Y$ and we find that $E \times_Z F$ is a quasi-compact neighbourhood of (x, y) by the result above. Thus $X \times_Z Y$ is an object of LC by Topology, Lemma 5.12.2. \square

We can endow LC with a stronger topology than the usual one.

Definition 21.23.2. Let $\{f_i : X_i \rightarrow X\}$ be a family of morphisms with fixed target in the category LC . We say this family is a *qc covering*³ if for every $x \in X$ there exist $i_1, \dots, i_n \in I$ and quasi-compact subsets $E_j \subset X_{i_j}$ such that $\bigcup f_{i_j}(E_j)$ is a neighbourhood of x .

Observe that an open covering $X = \bigcup U_i$ of an object of LC gives a qc covering $\{U_i \rightarrow X\}$ because X is locally quasi-compact. We start with the obligatory lemma.

Lemma 21.23.3. *Let X be a Hausdorff and locally quasi-compact space, in other words, an object of LC .*

- (1) *If $X' \rightarrow X$ is an isomorphism in LC then $\{X' \rightarrow X\}$ is a qc covering.*
- (2) *If $\{f_i : X_i \rightarrow X\}_{i \in I}$ is a qc covering and for each i we have a qc covering $\{g_{ij} : X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a qc covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is a qc covering and $X' \rightarrow X$ is a morphism of LC then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is a qc covering.*

Proof. Part (1) holds by the remark above that open coverings are qc coverings.

Proof of (2). Let $x \in X$. Choose $i_1, \dots, i_n \in I$ and $E_a \subset X_{i_a}$ quasi-compact such that $\bigcup f_{i_a}(E_a)$ is a neighbourhood of x . For every $e \in E_a$ we can find a finite subset $J_e \subset J_{i_a}$ and quasi-compact $F_{e,j} \subset X_{ij}$, $j \in J_e$ such that $\bigcup g_{ij}(F_{e,j})$ is a neighbourhood of e . Since E_a is quasi-compact we find a finite collection e_1, \dots, e_{m_a} such that

$$E_a \subset \bigcup_{k=1, \dots, m_a} \bigcup_{j \in J_{e_k}} g_{ij}(F_{e_k, j})$$

Then we find that

$$\bigcup_{a=1, \dots, n} \bigcup_{k=1, \dots, m_a} \bigcup_{j \in J_{e_k}} f_i(g_{ij}(F_{e_k, j}))$$

³This is nonstandard notation. We chose it to remind the reader of fpqc coverings of schemes.

is a neighbourhood of x .

Proof of (3). Let $x' \in X'$ be a point. Let $x \in X$ be its image. Choose $i_1, \dots, i_n \in I$ and quasi-compact subsets $E_j \subset X_{i_j}$ such that $\bigcup f_{i_j}(E_j)$ is a neighbourhood of x . Choose a quasi-compact neighbourhood $F \subset X'$ of x' which maps into the quasi-compact neighbourhood $\bigcup f_{i_j}(E_j)$ of x . Then $F \times_X E_j \subset X' \times_X X_{i_j}$ is a quasi-compact subset and F is the image of the map $\coprod F \times_X E_j \rightarrow F$. Hence the base change is a qc covering and the proof is finished. \square

Besides some set theoretic issues the lemma above shows that LC with the collection of qc coverings forms a site. We will denote this site (suitably modified to overcome the set theoretical issues) LC_{qc} .

Remark 21.23.4 (Set theoretic issues). The category LC is a “big” category as its objects form a proper class. Similarly, the coverings form a proper class. Let us define the *size* of a topological space X to be the cardinality of the set of points of X . Choose a function *Bound* on cardinals, for example as in Sets, Equation (3.9.1.1). Finally, let S_0 be an initial set of objects of LC , for example $S_0 = \{(\mathbf{R}, \text{euclidean topology})\}$. Exactly as in Sets, Lemma 3.9.2 we can choose a limit ordinal α such that $LC_\alpha = LC \cap V_\alpha$ contains S_0 and is preserved under all countable limits and colimits which exist in LC . Moreover, if $X \in LC_\alpha$ and if $Y \in LC$ and $\text{size}(Y) \leq \text{Bound}(\text{size}(X))$, then Y is isomorphic to an object of LC_α . Next, we apply Sets, Lemma 3.11.1 to choose set Cov of qc covering on LC_α such that every qc covering in LC_α is combinatorially equivalent to a covering this set. In this way we obtain a site (LC_α, Cov) which we will denote LC_{qc} .

There is a second topology on the site LC_{qc} of Remark 21.23.4. Namely, given an object X we can consider all coverings $\{X_i \rightarrow X\}$ of LC_{qc} such that $X_i \rightarrow X$ is an open immersion. We denote this site LC_{Zar} . The identity functor $LC_{Zar} \rightarrow LC_{qc}$ is continuous and defines a morphism of sites

$$\epsilon : LC_{qc} \rightarrow LC_{Zar}$$

by an application of Sites, Proposition 7.15.6.

Consider an object X of the site LC_{qc} constructed in Remark 21.23.4. (Translation for those not worried about set theoretic issues: Let X be a Hausdorff and locally quasi-compact space.) Let X_{Zar} be the site whose objects are opens of X , see Sites, Example 7.6.4. There is a morphism of sites

$$\pi : LC_{Zar}/X \rightarrow X_{Zar}$$

given by the continuous functor

$$X_{Zar} \longrightarrow LC_{Zar}/X, \quad U \longmapsto U$$

Namely, X_{Zar} has fibre products and a final object and the functor above commutes with these and Sites, Proposition 7.15.6 applies.

Lemma 21.23.5. *Let X be an object of LC_{qc} . Let \mathcal{F} be a sheaf on X_{Zar} . Then the sheaf $\pi^{-1}\mathcal{F}$ on LC_{Zar}/X is given by the rule*

$$\pi^{-1}\mathcal{F}(Y) = \Gamma(Y_{Zar}, f^{-1}\mathcal{F})$$

for $f : Y \rightarrow X$ in LC_{qc} . Moreover $\pi^{-1}\mathcal{F}$ is a sheaf for the qc topology, i.e., the sheaf $\epsilon^{-1}\pi^{-1}\mathcal{F}$ on LC_{qc} is given by the same formula.

Proof. Of course the pullback f^{-1} on the right hand side indicates usual pullback of sheaves on topological spaces (Sites, Example 7.15.2). The equality of the lemma follows directly from the definitions.

Let $\mathcal{V} = \{g_i : Y_i \rightarrow Y\}_{i \in I}$ be a covering of LC_{qc}/X . It suffices to show that $\pi^{-1}\mathcal{F}(Y) \rightarrow H^0(\mathcal{V}, \pi^{-1}\mathcal{F})$ is an isomorphism, see Sites, Section 7.10. We first point out that the map is injective as a qc covering is surjective and we can detect equality of sections at stalks (use Sheaves, Lemmas 6.11.1 and 6.21.4). Thus we see that $\pi^{-1}\mathcal{F}$ is a separated presheaf on LC_{qc} hence it suffices to show that any element $(s_i) \in H^0(\mathcal{V}, \pi^{-1}\mathcal{F})$ maps to an element in the image of $\pi^{-1}\mathcal{F}(Y)$ after replacing \mathcal{V} by a refinement (Sites, Theorem 7.10.10).

Observe that $\pi^{-1}\mathcal{F}|_{Y_i, Zar}$ is the pullback of $f^{-1}\mathcal{F} = \pi^{-1}\mathcal{F}|_{Y, Zar}$ under the continuous map $g_i : Y_i \rightarrow Y$. Thus we can choose an open covering $Y_i = \bigcup V_{ij}$ such that for each j there is an open $W_{ij} \subset Y$ and a section $t_{ij} \in \pi^{-1}\mathcal{F}(W_{ij})$ such that $s|_{V_{ij}}$ is the pullback of t_{ij} . In other words, after refining the covering $\{Y_i \rightarrow Y\}$ we may assume there are opens $W_i \subset Y$ such that $Y_i \rightarrow Y$ factors through W_i and sections t_i of $\pi^{-1}\mathcal{F}$ over W_i which restrict to the given sections s_i . Moreover, if $y \in Y$ is in the image of both $Y_i \rightarrow Y$ and $Y_j \rightarrow Y$, then the images $t_{i,y}$ and $t_{j,y}$ in the stalk $f^{-1}\mathcal{F}_y$ agree (because s_i and s_j agree over $Y_i \times_Y Y_j$). Thus for $y \in Y$ there is a well defined element t_y of $f^{-1}\mathcal{F}_y$ agreeing with $t_{i,y}$ whenever $y \in Y_i$. We will show that the element (t_y) comes from a global section of $f^{-1}\mathcal{F}$ over Y which will finish the proof of the lemma.

It suffices to show that this is true locally on Y , see Sheaves, Section 6.17. Let $y_0 \in Y$. Pick $i_1, \dots, i_n \in I$ and quasi-compact subsets $E_j \subset Y_{i_j}$ such that $\bigcup g_{i_j}(E_j)$ is a neighbourhood of y_0 . Then we can find an open neighbourhood $V \subset Y$ of y_0 contained in $W_{i_1} \cap \dots \cap W_{i_n}$ such that the sections $t_{i_j}|_V$, $j = 1, \dots, n$ agree. Hence we see that $(t_y)_{y \in V}$ comes from this section and the proof is finished. \square

Lemma 21.23.6. *Let X be an object of LC_{qc} . Let \mathcal{F} be an abelian sheaf on X_{Zar} . Then we have*

$$H^q(X_{Zar}, \mathcal{F}) = H^q(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F})$$

In particular, if A is an abelian group, then we have $H^q(X, \underline{A}) = H^q(LC_{qc}/X, \underline{A})$.

Proof. The statement is more precisely that the canonical map

$$H^q(X_{Zar}, \mathcal{F}) \longrightarrow H^q(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F})$$

is an isomorphism for all q . The result holds for $q = 0$ by Lemma 21.23.5. We argue by induction on q . Pick $q_0 > 0$. We will assume the result holds for $q < q_0$ and prove it for q_0 .

Injective. Let $\xi \in H^{q_0}(X, \mathcal{F})$. We may choose an open covering $\mathcal{U} : X = \bigcup U_i$ such that $\xi|_{U_i}$ is zero for all i (Cohomology, Lemma 20.7.2). Then \mathcal{U} is also a covering for the qc topology. Hence we obtain a map

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F})) \longrightarrow E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\epsilon^{-1}\pi^{-1}\mathcal{F}))$$

between the spectral sequences of Cohomology, Lemma 20.12.4 and Lemma 21.11.6. Since the maps $\underline{H}^q(\mathcal{F})(U_{i_0 \dots i_p}) \rightarrow \underline{H}^q(\epsilon^{-1}\pi^{-1}\mathcal{F})(U_{i_0 \dots i_p})$ are isomorphisms for $q < q_0$ we see that

$$\text{Ker}(H^{q_0}(X, \mathcal{F}) \rightarrow \prod H^{q_0}(U_i, \mathcal{F}))$$

maps isomorphically to the corresponding subgroup of $H^{q_0}(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F})$. In this way we conclude that our map is injective for q_0 .

Surjective. Let $\xi \in H^{q_0}(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F})$. If for every $x \in X$ we can find a neighbourhood $U \subset X$ such that $\xi|_U = 0$, then we can use the Čech complex argument of the previous paragraph to conclude that ξ is in the image of our map. Fix $x \in X$. We can find a qc covering $\{f_i : X_i \rightarrow X\}_{i \in I}$ such that $\xi|_{X_i}$ is zero (Lemma 21.8.3). Pick $i_1, \dots, i_n \in I$ and $E_j \subset X_{i_j}$ such that $\bigcup f_{i_j}(E_j)$ is a neighbourhood of x . We may replace X by $\bigcup f_{i_j}(E_j)$ and set $Y = \coprod E_{i_j}$. Then $Y \rightarrow X$ is a surjective continuous map of Hausdorff and quasi-compact topological spaces, $\xi \in H^{q_0}(LC_{qc}/X, \epsilon^{-1}\pi^{-1}\mathcal{F})$, and $\xi|_Y = 0$. Set $Y_p = Y \times_X \dots \times_X Y$ ($p+1$ -factors) and denote \mathcal{F}_p the pullback of \mathcal{F} to Y_p . Then the spectral sequence

$$E_1^{p,q} = \check{C}^p(\{Y \rightarrow X\}, \underline{H}^q(\epsilon^{-1}\pi^{-1}\mathcal{F}))$$

of Lemma 21.11.6 has rows for $q < q_0$ which are (by induction) the complexes

$$H^q(Y_0, \mathcal{F}_0) \rightarrow H^q(Y_1, \mathcal{F}_1) \rightarrow H^q(Y_2, \mathcal{F}_2) \rightarrow \dots$$

If these complexes were exact in degree $p = q_0 - q$, then the spectral sequence would collapse and ξ would be zero. This is not true in general, but we don't need to show ξ is zero, we just need to show ξ becomes zero after restricting X to a neighbourhood of x . Thus it suffices to show that the complexes

$$\operatorname{colim}_{x \in U \subset X} (H^q(Y_0 \times_X U, \mathcal{F}_0) \rightarrow H^q(Y_1 \times_X U, \mathcal{F}_1) \rightarrow H^q(Y_2 \times_X U, \mathcal{F}_2) \rightarrow \dots)$$

are exact (some details omitted). By the proper base change theorem in topology (for example Cohomology, Lemma 20.19.1) the colimit is equal to

$$H^q(Y_x, \underline{\mathcal{F}}_x) \rightarrow H^q(Y_x^2, \underline{\mathcal{F}}_x) \rightarrow H^q(Y_x^3, \underline{\mathcal{F}}_x) \rightarrow \dots$$

where $Y_x \subset Y$ is the fibre of $Y \rightarrow X$ over x and where $\underline{\mathcal{F}}_x$ denotes the constant sheaf with value \mathcal{F}_x . But the simplicial topological space (Y_x^n) is homotopy equivalent to the constant simplicial space on the singleton $\{x\}$, see Simplicial, Lemma 14.25.9. Since $H^q(-, \underline{\mathcal{F}}_x)$ is a functor on the category of topological spaces, we conclude that the cosimplicial abelian group with values $H^q(Y_x^n, \underline{\mathcal{F}}_x)$ is homotopy equivalent to the constant cosimplicial abelian group with value

$$H^q(\{x\}, \underline{\mathcal{F}}_x) = \begin{cases} \mathcal{F}_x & \text{if } q = 0 \\ 0 & \text{else} \end{cases}$$

As the complex associated to a constant cosimplicial group has the required exactness properties this finishes the proof of the lemma. □

Lemma 21.23.7. *Let $f : X \rightarrow Y$ be a morphism of LC. If f is proper and surjective, then $\{f : X \rightarrow Y\}$ is a qc covering.*

Proof. Let $y \in Y$ be a point. For each $x \in X_y$ choose a quasi-compact neighbourhood $E_x \subset X$. Choose $x \in U_x \subset E_x$ open. Since f is proper the fibre X_y is quasi-compact and we find $x_1, \dots, x_n \in X_y$ such that $X_y \subset U_{x_1} \cup \dots \cup U_{x_n}$. We claim that $f(E_{x_1}) \cup \dots \cup f(E_{x_n})$ is a neighbourhood of y . Namely, as f is closed (Topology, Theorem 5.16.5) we see that $Z = f(X \setminus U_{x_1} \cup \dots \cup U_{x_n})$ is a closed subset of Y not containing y . As f is surjective we see that $Y \setminus Z$ is contained in $f(E_{x_1}) \cup \dots \cup f(E_{x_n})$ as desired. □

21.24. Spectral sequences for Ext

In this section we collect various spectral sequences that come up when considering the Ext functors. For any pair of complexes $\mathcal{G}^\bullet, \mathcal{F}^\bullet$ of complexes of modules on a ringed site $(\mathcal{C}, \mathcal{O})$ we denote

$$\text{Ext}_{\mathcal{O}}^n(\mathcal{G}^\bullet, \mathcal{F}^\bullet) = \text{Hom}_{D(\mathcal{O})}(\mathcal{G}^\bullet, \mathcal{F}^\bullet[n])$$

according to our general conventions in Derived Categories, Section 13.27.

Example 21.24.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{K}^\bullet be a bounded above complex of \mathcal{O} -modules. Let \mathcal{F} be an \mathcal{O} -module. Then there is a spectral sequence with E_2 -page

$$E_2^{i,j} = \text{Ext}_{\mathcal{O}}^i(H^{-j}(\mathcal{K}^\bullet), \mathcal{F}) \Rightarrow \text{Ext}_{\mathcal{O}}^{i+j}(\mathcal{K}^\bullet, \mathcal{F})$$

and another spectral sequence with E_1 -page

$$E_1^{i,j} = \text{Ext}_{\mathcal{O}}^j(\mathcal{K}^{-i}, \mathcal{F}) \Rightarrow \text{Ext}_{\mathcal{O}}^{i+j}(\mathcal{K}^\bullet, \mathcal{F}).$$

To construct these spectral sequences choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ and consider the two spectral sequences coming from the double complex $\text{Hom}_{\mathcal{O}}(\mathcal{K}^\bullet, \mathcal{I}^\bullet)$, see Homology, Section 12.22.

21.25. Hom complexes

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{L}^\bullet and \mathcal{M}^\bullet be two complexes of \mathcal{O} -modules. We construct a complex of \mathcal{O} -modules $\text{Hom}^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$. Namely, for each n we set

$$\text{Hom}^n(\mathcal{L}^\bullet, \mathcal{M}^\bullet) = \prod_{n=p+q} \text{Hom}_{\mathcal{O}}(\mathcal{L}^{-q}, \mathcal{M}^p)$$

It is a good idea to think of Hom^n as the sheaf of \mathcal{O} -modules of all \mathcal{O} -linear maps from \mathcal{L}^\bullet to \mathcal{M}^\bullet (viewed as graded \mathcal{O} -modules) which are homogenous of degree n . In this terminology, we define the differential by the rule

$$d(f) = d_{\mathcal{M}} \circ f - (-1)^n f \circ d_{\mathcal{L}}$$

for $f \in \text{Hom}_{\mathcal{O}}^n(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$. We omit the verification that $d^2 = 0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have

$$(21.25.0.1) \quad H^n(\Gamma(U, \text{Hom}^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet))) = \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{L}^\bullet, \mathcal{M}^\bullet[n])$$

for all $n \in \mathbf{Z}$ and every $U \in \text{Ob}(\mathcal{C})$. Similarly, we have

$$(21.25.0.2) \quad H^n(\Gamma(\mathcal{C}, \text{Hom}^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet))) = \text{Hom}_{K(\mathcal{O})}(\mathcal{L}^\bullet, \mathcal{M}^\bullet[n])$$

for the complex of global sections.

Lemma 21.25.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O} -modules there is an isomorphism*

$$\text{Hom}^\bullet(\mathcal{K}^\bullet, \text{Hom}^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)) = \text{Hom}^\bullet(\text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet), \mathcal{M}^\bullet)$$

of complexes of \mathcal{O} -modules functorial in $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.1. □

Lemma 21.25.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O} -modules there is a canonical morphism*

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \otimes_{\mathcal{O}} \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{L}^\bullet)) \longrightarrow \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{M}^\bullet)$$

of complexes of \mathcal{O} -modules.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.2. \square

Lemma 21.25.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O} -modules there is a canonical morphism*

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \otimes_{\mathcal{O}} \mathcal{K}^\bullet) \longrightarrow \mathcal{H}om^\bullet(\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{L}^\bullet), \mathcal{M}^\bullet)$$

of complexes of \mathcal{O} -modules functorial in all three complexes.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.3. \square

Lemma 21.25.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given complexes $\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet$ of \mathcal{O} -modules there is a canonical morphism*

$$\mathcal{K}^\bullet \longrightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet))$$

of complexes of \mathcal{O} -modules functorial in both complexes.

Proof. Omitted. Hint: This is proved in exactly the same way as More on Algebra, Lemma 15.54.5. \square

Lemma 21.25.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{I}^\bullet be a K -injective complex of \mathcal{O} -modules. Let \mathcal{L}^\bullet be a complex of \mathcal{O} -modules. Then*

$$H^0(\Gamma(U, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet))) = \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

for all $U \in \mathrm{Ob}(\mathcal{C})$. Similarly, $H^0(\Gamma(\mathcal{C}, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet))) = \mathrm{Hom}_{D(\mathcal{O}_U)}(L, M)$.

Proof. We have

$$\begin{aligned} H^0(\Gamma(U, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet))) &= \mathrm{Hom}_{K(\mathcal{O}_U)}(L|_U, M|_U) \\ &= \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U) \end{aligned}$$

The first equality is (21.25.0.1). The second equality is true because $\mathcal{I}^\bullet|_U$ is K -injective by Lemma 21.20.1. The proof of the last equation is similar except that it uses (21.25.0.2). \square

Lemma 21.25.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(\mathcal{I}')^\bullet \rightarrow \mathcal{I}^\bullet$ be a quasi-isomorphism of K -injective complexes of \mathcal{O} -modules. Let $(\mathcal{L}')^\bullet \rightarrow \mathcal{L}^\bullet$ be a quasi-isomorphism of complexes of \mathcal{O} -modules. Then*

$$\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}')^\bullet) \longrightarrow \mathcal{H}om^\bullet((\mathcal{L}')^\bullet, \mathcal{I}^\bullet)$$

is a quasi-isomorphism.

Proof. Let M be the object of $D(\mathcal{O})$ represented by \mathcal{I}^\bullet and $(\mathcal{I}')^\bullet$. Let L be the object of $D(\mathcal{O})$ represented by \mathcal{L}^\bullet and $(\mathcal{L}')^\bullet$. By Lemma 21.25.5 we see that the sheaves

$$H^0(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}')^\bullet)) \quad \text{and} \quad H^0(\mathcal{H}om^\bullet((\mathcal{L}')^\bullet, \mathcal{I}^\bullet))$$

are both equal to the sheaf associated to the presheaf

$$U \longmapsto \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

Thus the map is a quasi-isomorphism. □

Lemma 21.25.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{I}^\bullet be a K-injective complex of \mathcal{O} -modules. Let \mathcal{L}^\bullet be a K-flat complex of \mathcal{O} -modules. Then $\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$ is a K-injective complex of \mathcal{O} -modules.*

Proof. Namely, if \mathcal{K}^\bullet is an acyclic complex of \mathcal{O} -modules, then

$$\begin{aligned} \mathrm{Hom}_{K(\mathcal{O})}(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)) &= H^0(\Gamma(\mathcal{C}, \mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)))) \\ &= H^0(\Gamma(\mathcal{C}, \mathcal{H}om^\bullet(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet), \mathcal{I}^\bullet))) \\ &= \mathrm{Hom}_{K(\mathcal{O})}(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet), \mathcal{I}^\bullet) \\ &= 0 \end{aligned}$$

The first equality by (21.25.0.2). The second equality by Lemma 21.25.1. The third equality by (21.25.0.2). The final equality because $\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet)$ is acyclic because \mathcal{L}^\bullet is K-flat (Definition 21.17.2) and because \mathcal{I}^\bullet is K-injective. □

21.26. Internal hom in the derived category

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let L, M be objects of $D(\mathcal{O})$. We would like to construct an object $R\mathcal{H}om(L, M)$ of $D(\mathcal{O})$ such that for every third object K of $D(\mathcal{O})$ there exists a canonical bijection

$$(21.26.0.1) \quad \mathrm{Hom}_{D(\mathcal{O})}(K, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O})}(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M)$$

Observe that this formula defines $R\mathcal{H}om(L, M)$ up to unique isomorphism by the Yoneda lemma (Categories, Lemma 4.3.5).

To construct such an object, choose a K-injective complex of \mathcal{O} -modules \mathcal{I}^\bullet representing M and any complex of \mathcal{O} -modules \mathcal{L}^\bullet representing L . Then we set Then we set

$$R\mathcal{H}om(L, M) = \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$$

where the right hand side is the complex of \mathcal{O} -modules constructed in Section 21.25. This is well defined by Lemma 21.25.6. We get a functor

$$D(\mathcal{O})^{opp} \times D(\mathcal{O}) \longrightarrow D(\mathcal{O}), \quad (K, L) \longmapsto R\mathcal{H}om(K, L)$$

As a prelude to proving (21.26.0.1) we compute the cohomology groups of $R\mathcal{H}om(K, L)$.

Lemma 21.26.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L be objects of $D(\mathcal{O})$. For every object U of \mathcal{C} we have*

$$H^0(U, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O}_U)}(L|_U, M|_U)$$

and we have $H^0(\mathcal{C}, R\mathcal{H}om(L, M)) = \mathrm{Hom}_{D(\mathcal{O})}(L, M)$.

Proof. Choose a K-injective complex \mathcal{I}^\bullet of \mathcal{O} -modules representing M and a K-flat complex \mathcal{L}^\bullet representing L . Then $\mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$ is K-injective by Lemma 21.25.7. Hence we can compute cohomology over U by simply taking sections over U and the result follows from Lemma 21.25.5. □

Lemma 21.26.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L, M be objects of $D(\mathcal{O})$. With the construction as described above there is a canonical isomorphism*

$$R\mathcal{H}om(K, R\mathcal{H}om(L, M)) = R\mathcal{H}om(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M)$$

in $D(\mathcal{O})$ functorial in K, L, M which recovers (21.26.0.1) on taking $H^0(\mathcal{C}, -)$.

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing M and a K-flat complex of \mathcal{O} -modules \mathcal{L}^\bullet representing L . Let \mathcal{H}^\bullet be the complex described above. For any complex of \mathcal{O} -modules \mathcal{K}^\bullet we have

$$\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)) = \mathcal{H}om^\bullet(\mathrm{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet), \mathcal{I}^\bullet)$$

by Lemma 21.25.1. Note that the left hand side represents $R\mathcal{H}om(K, R\mathcal{H}om(L, M))$ (use Lemma 21.25.7) and that the right hand side represents $R\mathcal{H}om(K \otimes_{\mathcal{O}}^{\mathbf{L}} L, M)$. This proves the displayed formula of the lemma. Taking global sections and using Lemma 21.26.1 we obtain (21.26.0.1). \square

Lemma 21.26.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L be objects of $D(\mathcal{O})$. The construction of $R\mathcal{H}om(K, L)$ commutes with restrictions, i.e., for every object U of \mathcal{C} we have $R\mathcal{H}om(K|_U, L|_U) = R\mathcal{H}om(K, L)|_U$.*

Proof. This is clear from the construction and Lemma 21.20.1. \square

Lemma 21.26.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. The bifunctor $R\mathcal{H}om(-, -)$ transforms distinguished triangles into distinguished triangles in both variables.*

Proof. This follows from the observation that the assignment

$$(\mathcal{L}^\bullet, \mathcal{M}^\bullet) \longmapsto \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{M}^\bullet)$$

transforms a termwise split short exact sequences of complexes in either variable into a termwise split short exact sequence. Details omitted. \square

Lemma 21.26.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L, M be objects of $D(\mathcal{O})$. There is a canonical morphism*

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} K \longrightarrow R\mathcal{H}om(R\mathcal{H}om(K, L), M)$$

in $D(\mathcal{O})$ functorial in K, L, M .

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing M , a K-injective complex \mathcal{J}^\bullet representing L , and a K-flat complex \mathcal{K}^\bullet representing K . The map is defined using the map

$$\mathrm{Tot}(\mathcal{H}om^\bullet(\mathcal{J}^\bullet, \mathcal{I}^\bullet) \otimes_{\mathcal{O}} \mathcal{K}^\bullet) \longrightarrow \mathcal{H}om^\bullet(\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{J}^\bullet), \mathcal{I}^\bullet)$$

of Lemma 21.25.3. By our particular choice of complexes the left hand side represents $R\mathcal{H}om(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} K$ and the right hand side represents $R\mathcal{H}om(R\mathcal{H}om(K, L), M)$. We omit the proof that this is functorial in all three objects of $D(\mathcal{O})$. \square

Lemma 21.26.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given K, L, M in $D(\mathcal{O})$ there is a canonical morphism*

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(K, M)$$

in $D(\mathcal{O})$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 21.25.2. Instead, we use the maps

$$\begin{array}{c} R\mathcal{H}om(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} R\mathcal{H}om(K, L) \otimes_{\mathcal{O}}^{\mathbf{L}} K \\ \downarrow \\ R\mathcal{H}om(R\mathcal{H}om(K, L), M) \otimes_{\mathcal{O}}^{\mathbf{L}} R\mathcal{H}om(K, L) \\ \downarrow \\ M \end{array}$$

gotten by applying Lemma 21.26.5 twice. Finally, we use Lemma 21.26.2 to translate the composition

$$R\mathcal{H}om(L, M) \otimes_{\mathcal{O}}^{\mathbf{L}} R\mathcal{H}om(K, L) \otimes_{\mathcal{O}}^{\mathbf{L}} K \longrightarrow M$$

into a map as in the statement of the lemma. □

Lemma 21.26.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Given K, L in $D(\mathcal{O})$ there is a canonical morphism*

$$K \longrightarrow R\mathcal{H}om(L, K \otimes_{\mathcal{O}}^{\mathbf{L}} L)$$

in $D(\mathcal{O})$ functorial in both K and L .

Proof. Choose K -flat complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet representing K and L . Choose a K -injective complex \mathcal{I}^\bullet and a quasi-isomorphism $\text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet) \rightarrow \mathcal{I}^\bullet$. Then we use

$$\mathcal{K}^\bullet \rightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet)) \rightarrow \mathcal{H}om^\bullet(\mathcal{L}^\bullet, \mathcal{I}^\bullet)$$

where the first map comes from Lemma 21.25.4. □

Lemma 21.26.8. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let L be an object of $D(\mathcal{O})$. Set $L^\wedge = R\mathcal{H}om(L, \mathcal{O})$. For M in $D(\mathcal{O})$ there is a canonical map*

$$(21.26.8.1) \quad L^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M \longrightarrow R\mathcal{H}om(L, M)$$

which induces a canonical map

$$H^0(\mathcal{C}, L^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M) \longrightarrow \text{Hom}_{D(\mathcal{O})}(L, M)$$

functorial in M in $D(\mathcal{O})$.

Proof. The map (21.26.8.1) is a special case of Lemma 21.26.6 using the identification $M = R\mathcal{H}om(\mathcal{O}, M)$. □

Remark 21.26.9. Let $h : (\mathcal{S}h(\mathcal{C}), \mathcal{O}) \rightarrow (\mathcal{S}h(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. Let K, L be objects of $D(\mathcal{O}')$. We claim there is a canonical map

$$Lh^* R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(Lh^* K, Lh^* L)$$

in $D(\mathcal{O})$. Namely, by (21.26.0.1) proved in Lemma 21.26.2 such a map is the same thing as a map

$$Lh^* R\mathcal{H}om(K, L) \otimes^{\mathbf{L}} Lh^* K \longrightarrow Lh^* L$$

The source of this arrow is $Lh^*(\mathcal{H}om(K, L) \otimes^{\mathbf{L}} K)$ by Lemma 21.18.4 hence it suffices to construct a canonical map

$$R\mathcal{H}om(K, L) \otimes^{\mathbf{L}} K \longrightarrow L.$$

For this we take the arrow corresponding to

$$\text{id} : R\mathcal{H}om(K, L) \longrightarrow R\mathcal{H}om(K, L)$$

via (21.26.0.1).

Remark 21.26.10. Suppose that

$$\begin{array}{ccc} (Sh(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{h} & (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ f' \downarrow & & \downarrow f \\ (Sh(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) & \xrightarrow{g} & (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \end{array}$$

is a commutative diagram of ringed topoi. Let K, L be objects of $D(\mathcal{O}_{\mathcal{C}})$. We claim there exists a canonical base change map

$$Lg^*Rf_*R\mathcal{H}om(K, L) \longrightarrow R(f')_*R\mathcal{H}om(Lh^*K, Lh^*L)$$

in $D(\mathcal{O}_{\mathcal{D}'})$. Namely, we take the map adjoint to the composition

$$\begin{aligned} L(f')^*Lg^*Rf_*R\mathcal{H}om(K, L) &= Lh^*Lf^*Rf_*R\mathcal{H}om(K, L) \\ &\rightarrow Lh^*R\mathcal{H}om(K, L) \\ &\rightarrow R\mathcal{H}om(Lh^*K, Lh^*L) \end{aligned}$$

where the first arrow uses the adjunction mapping $Lf^*Rf_* \rightarrow \text{id}$ and the second arrow is the canonical map constructed in Remark 21.26.9.

21.27. Derived lower shriek

In this section we study some situations where besides Lf^* and Rf_* there also a derived functor $Lf_!$.

Lemma 21.27.1. *Let $u : \mathcal{C} \rightarrow \mathcal{D}$ be a continuous and cocontinuous functor of sites which induces a morphism of topoi $g : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$. Let $\mathcal{O}_{\mathcal{D}}$ be a sheaf of rings and set $\mathcal{O}_{\mathcal{C}} = g^{-1}\mathcal{O}_{\mathcal{D}}$. The functor $g_! : Mod(\mathcal{O}_{\mathcal{C}}) \rightarrow Mod(\mathcal{O}_{\mathcal{D}})$ (see Modules on Sites, Lemma 18.40.1) has a left derived functor*

$$Lg_! : D(\mathcal{O}_{\mathcal{C}}) \longrightarrow D(\mathcal{O}_{\mathcal{D}})$$

which is left adjoint to g^* . Moreover, for $U \in \text{Ob}(\mathcal{C})$ we have

$$Lg_!(j_{U!}\mathcal{O}_U) = g_!j_{U!}\mathcal{O}_U = j_{u(U)!}\mathcal{O}_{u(U)}.$$

where $j_{U!}$ and $j_{u(U)!}$ are extension by zero associated to the localization morphism $j_U : \mathcal{C}/U \rightarrow \mathcal{C}$ and $j_{u(U)} : \mathcal{D}/u(U) \rightarrow \mathcal{D}$.

Proof. We are going to use Derived Categories, Proposition 13.28.2 to construct $Lg_!$. To do this we have to verify assumptions (1), (2), (3), (4), and (5) of that proposition. First, since $g_!$ is a left adjoint we see that it is right exact and commutes with all colimits, so (5) holds. Conditions (3) and (4) hold because the category of modules on a ringed site is a Grothendieck abelian category. Let $\mathcal{P} \subset \text{Ob}(Mod(\mathcal{O}_{\mathcal{C}}))$ be the collection of $\mathcal{O}_{\mathcal{C}}$ -modules which are direct sums of modules of the form $j_{U!}\mathcal{O}_U$. Note that $g_!j_{U!}\mathcal{O}_U = j_{u(U)!}\mathcal{O}_{u(U)}$, see proof of Modules on Sites, Lemma 18.40.1. Every $\mathcal{O}_{\mathcal{C}}$ -module is a quotient of an object of \mathcal{P} , see Modules on Sites, Lemma 18.28.6. Thus (1) holds. Finally, we have to prove (2). Let \mathcal{K}^\bullet be a bounded above

acyclic complex of $\mathcal{O}_{\mathcal{C}}$ -modules with $\mathcal{K}^n \in \mathcal{P}$ for all n . We have to show that $g_! \mathcal{K}^\bullet$ is exact. To do this it suffices to show, for every injective $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{I} that

$$\mathrm{Hom}_{D(\mathcal{O}_{\mathcal{D}})}(g_! \mathcal{K}^\bullet, \mathcal{I}[n]) = 0$$

for all $n \in \mathbf{Z}$. Since \mathcal{I} is injective we have

$$\begin{aligned} \mathrm{Hom}_{D(\mathcal{O}_{\mathcal{D}})}(g_! \mathcal{K}^\bullet, \mathcal{I}[n]) &= \mathrm{Hom}_{K(\mathcal{O}_{\mathcal{D}})}(g_! \mathcal{K}^\bullet, \mathcal{I}[n]) \\ &= H^n(\mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(g_! \mathcal{K}^\bullet, \mathcal{I})) \\ &= H^n(\mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(\mathcal{K}^\bullet, g^{-1} \mathcal{I})) \end{aligned}$$

the last equality by the adjointness of $g_!$ and g^{-1} .

The vanishing of this group would be clear if $g^{-1} \mathcal{I}$ were an injective $\mathcal{O}_{\mathcal{C}}$ -module. But $g^{-1} \mathcal{I}$ isn't necessarily an injective $\mathcal{O}_{\mathcal{C}}$ -module as $g_!$ isn't exact in general. We do know that

$$\mathrm{Ext}_{\mathcal{O}_{\mathcal{C}}}^p(j_{U!} \mathcal{O}_U, g^{-1} \mathcal{I}) = H^p(U, g^{-1} \mathcal{I}) = 0 \text{ for } p \geq 1$$

Namely, the first equality follows from $\mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(j_{U!} \mathcal{O}_U, \mathcal{H}) = \mathcal{H}(U)$ and taking derived functors. The vanishing of $H^p(U, g^{-1} \mathcal{I})$ for all $U \in \mathrm{Ob}(\mathcal{C})$ comes from the vanishing of all higher Čech cohomology groups $\check{H}^p(\mathcal{U}, g^{-1} \mathcal{I})$ via Lemma 21.11.9. Namely, for a covering $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ in \mathcal{C} we have $\check{H}^p(\mathcal{U}, g^{-1} \mathcal{I}) = \check{H}^p(u(\mathcal{U}), \mathcal{I})$. Since \mathcal{I} is an injective \mathcal{O} -module these Čech cohomology groups vanish, see Lemma 21.12.3. Since each \mathcal{K}^{-q} is a direct sum of modules of the form $j_{U!} \mathcal{O}_U$ we see that

$$\mathrm{Ext}_{\mathcal{O}_{\mathcal{C}}}^p(\mathcal{K}^{-q}, g^{-1} \mathcal{I}) = 0 \text{ for } p \geq 1 \text{ and all } q$$

Let us use the spectral sequence (see Example 21.24.1)

$$E_1^{p,q} = \mathrm{Ext}_{\mathcal{O}_{\mathcal{C}}}^p(\mathcal{K}^{-q}, g^{-1} \mathcal{I}) \Rightarrow \mathrm{Ext}_{\mathcal{O}_{\mathcal{C}}}^{p+q}(\mathcal{K}^\bullet, g^{-1} \mathcal{I}) = 0.$$

Note that the spectral sequence abuts to zero as \mathcal{K}^\bullet is acyclic (hence vanishes in the derived category, hence produces vanishing ext groups). By the vanishing of higher exts proved above the only nonzero terms on the E_1 page are the terms $E_1^{0,q} = \mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(\mathcal{K}^{-q}, g^{-1} \mathcal{I})$. We conclude that the complex $\mathrm{Hom}_{\mathcal{O}_{\mathcal{C}}}(\mathcal{K}^\bullet, g^{-1} \mathcal{I})$ is acyclic as desired.

Thus the left derived functor $Lg_!$ exists. We still have to show that it is left adjoint to $g^{-1} = g^* = Rg^* = Lg^*$, i.e., that we have

$$(21.27.1.1) \quad \mathrm{Hom}_{D(\mathcal{O}_{\mathcal{C}})}(\mathcal{H}^\bullet, g^{-1} \mathcal{E}^\bullet) = \mathrm{Hom}_{D(\mathcal{O}_{\mathcal{D}})}(Lg_! \mathcal{H}^\bullet, \mathcal{E}^\bullet)$$

This is actually a formal consequence of the discussion above. Choose a quasi-isomorphism $\mathcal{K}^\bullet \rightarrow \mathcal{H}^\bullet$ such that \mathcal{K}^\bullet computes $Lg_!$. Moreover, choose a quasi-isomorphism $\mathcal{E}^\bullet \rightarrow \mathcal{I}^\bullet$ into a K-injective complex of $\mathcal{O}_{\mathcal{D}}$ -modules \mathcal{I}^\bullet . Then the RHS of (21.27.1.1) is

$$\mathrm{Hom}_{K(\mathcal{O}_{\mathcal{D}})}(g_! \mathcal{K}^\bullet, \mathcal{I}^\bullet)$$

On the other hand, by the definition of morphisms in the derived category the LHS of (21.27.1.1) is

$$\begin{aligned} \mathrm{Hom}_{D(\mathcal{O}_{\mathcal{C}})}(\mathcal{K}^\bullet, g^{-1} \mathcal{I}^\bullet) &= \mathrm{colim}_{s: \mathcal{L}^\bullet \rightarrow \mathcal{K}^\bullet} \mathrm{Hom}_{K(\mathcal{O}_{\mathcal{C}})}(\mathcal{L}^\bullet, g^{-1} \mathcal{I}^\bullet) \\ &= \mathrm{colim}_{s: \mathcal{L}^\bullet \rightarrow \mathcal{K}^\bullet} \mathrm{Hom}_{K(\mathcal{O}_{\mathcal{D}})}(g_! \mathcal{L}^\bullet, \mathcal{I}^\bullet) \end{aligned}$$

by the adjointness of $g_!$ and g^* on the level of sheaves of modules. The colimit is over all quasi-isomorphisms with target \mathcal{K}^\bullet . Since for every complex \mathcal{L}^\bullet there exists a quasi-isomorphism $(\mathcal{K}')^\bullet \rightarrow \mathcal{L}^\bullet$ such that $(\mathcal{K}')^\bullet$ computes $Lg_!$ we see that we may

as well take the colimit over quasi-isomorphisms of the form $s : (\mathcal{K}')^\bullet \rightarrow \mathcal{K}^\bullet$ where $(\mathcal{K}')^\bullet$ computes $Lg_!$. In this case

$$\mathrm{Hom}_{K(\mathcal{O}_{\mathcal{D}})}(g_!\mathcal{K}^\bullet, \mathcal{I}^\bullet) \longrightarrow \mathrm{Hom}_{K(\mathcal{O}_{\mathcal{D}})}(g_!(\mathcal{K}')^\bullet, \mathcal{I}^\bullet)$$

is an isomorphism as $g_!(\mathcal{K}')^\bullet \rightarrow g_!\mathcal{K}^\bullet$ is a quasi-isomorphism and \mathcal{I}^\bullet is K-injective. This finishes the proof. \square

Remark 21.27.2. Warning! Let $u : \mathcal{C} \rightarrow \mathcal{D}$, g , $\mathcal{O}_{\mathcal{D}}$, and $\mathcal{O}_{\mathcal{C}}$ be as in Lemma 21.27.1. In general it is **not** the case that the diagram

$$\begin{array}{ccc} D(\mathcal{O}_{\mathcal{C}}) & \xrightarrow{Lg_!} & D(\mathcal{O}_{\mathcal{D}}) \\ \text{forget} \downarrow & & \downarrow \text{forget} \\ D(\mathcal{C}) & \xrightarrow{Lg_!^{Ab}} & D(\mathcal{D}) \end{array}$$

commutes where the functor $Lg_!^{Ab}$ is the one constructed in Lemma 21.27.1 but using the constant sheaf \mathbf{Z} as the structure sheaf on both \mathcal{C} and \mathcal{D} . In general it isn't even the case that $g_! = g_!^{Ab}$ (see Modules on Sites, Remark 18.40.2), but this phenomenon **can occur even if** $g_! = g_!^{Ab}$! Namely, the construction of $Lg_!$ in the proof of Lemma 21.27.1 shows that $Lg_!$ agrees with $Lg_!^{Ab}$ if and only if the canonical maps

$$Lg_!^{Ab} j_{U!} \mathcal{O}_U \longrightarrow j_{u(U)!} \mathcal{O}_{u(U)}$$

are isomorphisms in $D(\mathcal{D})$ for all objects U in \mathcal{C} . In general all we can say is that there exists a natural transformation

$$Lg_!^{Ab} \circ \text{forget} \longrightarrow \text{forget} \circ Lg_!$$

21.28. Derived lower shriek for fibred categories

In this section we work out some special cases of the situation discussed in Section 21.27. We make sure that we have equality between lower shriek on modules and sheaves of abelian groups. We encourage the reader to skip this section on a first reading.

Situation 21.28.1. Here $(\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a ringed site and $p : \mathcal{C} \rightarrow \mathcal{D}$ is a fibred category. We endow \mathcal{C} with the topology inherited from \mathcal{D} (Stacks, Section 8.10). We denote $\pi : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$ the morphism of topoi associated to p (Stacks, Lemma 8.10.3). We set $\mathcal{O}_{\mathcal{C}} = \pi^{-1} \mathcal{O}_{\mathcal{D}}$ so that we obtain a morphism of ringed topoi

$$\pi : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \longrightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$$

Lemma 21.28.2. *Assumptions and notation as in Situation 21.28.1. For $U \in \mathrm{Ob}(\mathcal{C})$ consider the induced morphism of topoi*

$$\pi_U : Sh(\mathcal{C}/U) \longrightarrow Sh(\mathcal{D}/p(U))$$

Then there exists a morphism of topoi

$$\sigma : Sh(\mathcal{D}/p(U)) \rightarrow Sh(\mathcal{C}/U)$$

such that $\pi_U \circ \sigma = \mathrm{id}$ and $\sigma^{-1} = \pi_{U,}$.*

Proof. Observe that π_U is the restriction of π to the localizations, see Sites, Lemma 7.27.4. For an object $V \rightarrow p(U)$ of $\mathcal{D}/p(U)$ denote $V \times_{p(U)} U \rightarrow U$ the strongly cartesian morphism of \mathcal{C} over \mathcal{D} which exists as p is a fibred category. The functor

$$v : \mathcal{D}/p(U) \rightarrow \mathcal{C}/U, \quad V/p(U) \mapsto V \times_{p(U)} U/U$$

is continuous by the definition of the topology on \mathcal{C} . Moreover, it is a right adjoint to p by the definition of strongly cartesian morphisms. Hence we are in the situation discussed in Sites, Section 7.21 and we see that the sheaf $\pi_{U,*}\mathcal{F}$ is equal to $V \mapsto \mathcal{F}(V \times_{p(U)} U)$ (see especially Sites, Lemma 7.21.2).

But here we have more. Namely, the functor v is also cocontinuous (as all morphisms in coverings of \mathcal{C} are strongly cartesian). Hence v defines a morphism σ as indicated in the lemma. The equality $\sigma^{-1} = \pi_{U,*}$ is immediate from the definition. Since $\pi_U^{-1}\mathcal{G}$ is given by the rule $U'/U \mapsto \mathcal{G}(p(U')/p(U))$ it follows that $\sigma^{-1} \circ \pi_U^{-1} = \text{id}$ which proves the equality $\pi_U \circ \sigma = \text{id}$. \square

Situation 21.28.3. Let $(\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a ringed site. Let $u : \mathcal{C}' \rightarrow \mathcal{C}$ be a 1-morphism of fibred categories over \mathcal{D} (Categories, Definition 4.31.9). Endow \mathcal{C} and \mathcal{C}' with their inherited topologies (Stacks, Definition 8.10.2) and let $\pi : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{D})$, $\pi' : Sh(\mathcal{C}') \rightarrow Sh(\mathcal{D})$, and $g : Sh(\mathcal{C}') \rightarrow Sh(\mathcal{C})$ be the corresponding morphisms of topoi (Stacks, Lemma 8.10.3). Set $\mathcal{O}_{\mathcal{C}} = \pi^{-1}\mathcal{O}_{\mathcal{D}}$ and $\mathcal{O}_{\mathcal{C}'} = (\pi')^{-1}\mathcal{O}_{\mathcal{D}}$. Observe that $g^{-1}\mathcal{O}_{\mathcal{C}} = \mathcal{O}_{\mathcal{C}'}$ so that

$$\begin{array}{ccc} (Sh(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g} & (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ & \searrow \pi' & \swarrow \pi \\ & (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) & \end{array}$$

is a commutative diagram of morphisms of ringed topoi.

Lemma 21.28.4. *Assumptions and notation as in Situation 21.28.3. For $U' \in \text{Ob}(\mathcal{C}')$ set $U = u(U')$ and $V = p'(U')$ and consider the induced morphisms of ringed topoi*

$$\begin{array}{ccc} (Sh(\mathcal{C}'/U'), \mathcal{O}_{U'}) & \xrightarrow{g'} & (Sh(\mathcal{C}), \mathcal{O}_U) \\ & \searrow \pi'_{U'} & \swarrow \pi_U \\ & (Sh(\mathcal{D}/V), \mathcal{O}_V) & \end{array}$$

Then there exists a morphism of topoi

$$\sigma' : Sh(\mathcal{D}/V) \rightarrow Sh(\mathcal{C}'/U'),$$

such that setting $\sigma = g' \circ \sigma'$ we have $\pi'_{U'} \circ \sigma' = \text{id}$, $\pi_U \circ \sigma = \text{id}$, $(\sigma')^{-1} = \pi'_{U',*}$, and $\sigma^{-1} = \pi_{U,*}$.

Proof. Let $v' : \mathcal{D}/V \rightarrow \mathcal{C}'/U'$ be the functor constructed in the proof of Lemma 21.28.2 starting with $p' : \mathcal{C}' \rightarrow \mathcal{D}$ and the object U' . Since u is a 1-morphism of fibred categories over \mathcal{D} it transforms strongly cartesian morphisms into strongly cartesian morphisms, hence the functor $v = u \circ v'$ is the functor of the proof of Lemma 21.28.2 relative to $p : \mathcal{C} \rightarrow \mathcal{D}$ and U . Thus our lemma follows from that lemma. \square

Lemma 21.28.5. *Assumption and notation as in Situation 21.28.3.*

- (1) There are left adjoints $g_! : \text{Mod}(\mathcal{O}_{\mathcal{C}'}) \rightarrow \text{Mod}(\mathcal{O}_{\mathcal{C}})$ and $g_!^{Ab} : \text{Ab}(\mathcal{C}') \rightarrow \text{Ab}(\mathcal{C})$ to $g^* = g^{-1}$ on modules and on abelian sheaves.
 (2) The diagram

$$\begin{array}{ccc} \text{Mod}(\mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g_!} & \text{Mod}(\mathcal{O}_{\mathcal{C}}) \\ \downarrow & & \downarrow \\ \text{Ab}(\mathcal{C}') & \xrightarrow{g_!^{Ab}} & \text{Ab}(\mathcal{C}) \end{array}$$

commutes.

- (3) There are left adjoints $Lg_! : D(\mathcal{O}_{\mathcal{C}'}) \rightarrow D(\mathcal{O}_{\mathcal{C}})$ and $Lg_!^{Ab} : D(\mathcal{C}') \rightarrow D(\mathcal{C})$ to $g^* = g^{-1}$ on derived categories of modules and abelian sheaves.
 (4) The diagram

$$\begin{array}{ccc} D(\mathcal{O}_{\mathcal{C}'}) & \xrightarrow{Lg_!} & D(\mathcal{O}_{\mathcal{C}}) \\ \downarrow & & \downarrow \\ D(\mathcal{C}') & \xrightarrow{Lg_!^{Ab}} & D(\mathcal{C}) \end{array}$$

commutes.

Proof. The functor u is continuous and cocontinuous Stacks, Lemma 8.10.3. Hence the existence of the functors $g_!$, $g_!^{Ab}$, $Lg_!$, and $Lg_!^{Ab}$ can be found in Modules on Sites, Sections 18.16 and 18.40 and Section 21.27.

To prove (2) it suffices to show that the canonical map

$$g_!^{Ab} j_{U'}! \mathcal{O}_{U'} \rightarrow j_{u(U')!} \mathcal{O}_{u(U')}$$

is an isomorphism for all objects U' of \mathcal{C}' , see Modules on Sites, Remark 18.40.2. Similarly, to prove (4) it suffices to show that the canonical map

$$Lg_!^{Ab} j_{U'}! \mathcal{O}_{U'} \rightarrow j_{u(U')!} \mathcal{O}_{u(U')}$$

is an isomorphism in $D(\mathcal{C})$ for all objects U' of \mathcal{C}' , see Remark 21.27.2. This will also imply the previous formula hence this is what we will show.

We will use that for a localization morphism j the functors $j_!$ and $j_!^{Ab}$ agree (see Modules on Sites, Remark 18.19.5) and that $j_!$ is exact (Modules on Sites, Lemma 18.19.3). Let us adopt the notation of Lemma 21.28.4. Since $Lg_!^{Ab} \circ j_{U'}! = j_{U'}! \circ L(g')_!^{Ab}$ (by commutativity of Sites, Lemma 7.27.4 and uniqueness of adjoint functors) it suffices to prove that $L(g')_!^{Ab} \mathcal{O}_{U'} = \mathcal{O}_U$. Using the results of Lemma 21.28.4 we have for any object E of $D(\mathcal{C}/u(U'))$ the following sequence of equalities

$$\begin{aligned} \text{Hom}_{D(\mathcal{C}/U)}(L(g')_!^{Ab} \mathcal{O}_{U'}, E) &= \text{Hom}_{D(\mathcal{C}'/U')}(\mathcal{O}_{U'}, (g')^{-1} E) \\ &= \text{Hom}_{D(\mathcal{C}'/U')}((\pi'_{U'})^{-1} \mathcal{O}_V, (g')^{-1} E) \\ &= \text{Hom}_{D(\mathcal{D}/V)}(\mathcal{O}_V, R\pi'_{U',*} (g')^{-1} E) \\ &= \text{Hom}_{D(\mathcal{D}/V)}(\mathcal{O}_V, (\sigma')^{-1} (g')^{-1} E) \\ &= \text{Hom}_{D(\mathcal{D}/V)}(\mathcal{O}_V, \sigma^{-1} E) \\ &= \text{Hom}_{D(\mathcal{D}/V)}(\mathcal{O}_V, \pi_{U,*} E) \\ &= \text{Hom}_{D(\mathcal{C}/U)}(\pi_U^{-1} \mathcal{O}_V, E) \\ &= \text{Hom}_{D(\mathcal{C}/U)}(\mathcal{O}_U, E) \end{aligned}$$

By Yoneda's lemma we conclude. \square

Remark 21.28.6. Assumptions and notation as in Situation 21.28.1. Note that setting $\mathcal{C}' = \mathcal{D}$ and u equal to the structure functor of \mathcal{C} gives a situation as in Situation 21.28.3. Hence Lemma 21.28.5 tells us we have functors $\pi_!$, $\pi_!^{Ab}$, $L\pi_!$, and $L\pi_!^{Ab}$ such that $forget \circ \pi_! = \pi_!^{Ab} \circ forget$ and $forget \circ L\pi_! = L\pi_!^{Ab} \circ forget$.

Remark 21.28.7. Assumptions and notation as in Situation 21.28.3. Let \mathcal{F} be an abelian sheaf on \mathcal{C} , let \mathcal{F}' be an abelian sheaf on \mathcal{C}' , and let $t : \mathcal{F}' \rightarrow g^{-1}\mathcal{F}$ be a map. Then we obtain a canonical map

$$L\pi_!(\mathcal{F}') \longrightarrow L\pi_!(\mathcal{F})$$

by using the adjoint $g_!\mathcal{F}' \rightarrow \mathcal{F}$ of t , the map $Lg_!(\mathcal{F}') \rightarrow g_!\mathcal{F}'$, and the equality $L\pi_! = L\pi_! \circ Lg_!$.

Lemma 21.28.8. *Assumptions and notation as in Situation 21.28.1. For \mathcal{F} in $Ab(\mathcal{C})$ the sheaf $\pi_!\mathcal{F}$ is the sheaf associated to the presheaf*

$$V \longmapsto \operatorname{colim}_{\mathcal{C}^{opp}} \mathcal{F}|_{\mathcal{C}_V}$$

with restriction maps as indicated in the proof.

Proof. Denote \mathcal{H} be the rule of the lemma. For a morphism $h : V' \rightarrow V$ of \mathcal{D} there is a pullback functor $h^* : \mathcal{C}_V \rightarrow \mathcal{C}_{V'}$ of fibre categories (Categories, Definition 4.31.6). Moreover for $U \in \operatorname{Ob}(\mathcal{C}_V)$ there is a strongly cartesian morphism $h^*U \rightarrow U$ covering h . Restriction along these strongly cartesian morphisms defines a transformation of functors

$$\mathcal{F}|_{\mathcal{C}_V} \longrightarrow \mathcal{F}|_{\mathcal{C}_{V'}} \circ h^*.$$

Hence a map $\mathcal{H}(V) \rightarrow \mathcal{H}(V')$ between colimits, see Categories, Lemma 4.14.7.

To prove the lemma we show that

$$\operatorname{Mor}_{PSh(\mathcal{D})}(\mathcal{H}, \mathcal{G}) = \operatorname{Mor}_{Sh(\mathcal{C})}(\mathcal{F}, \pi^{-1}\mathcal{G})$$

for every sheaf \mathcal{G} on \mathcal{C} . An element of the left hand side is a compatible system of maps $\mathcal{F}(U) \rightarrow \mathcal{G}(p(U))$ for all U in \mathcal{C} . Since $\pi^{-1}\mathcal{G}(U) = \mathcal{G}(p(U))$ by our choice of topology on \mathcal{C} we see the same thing is true for the right hand side and we win. \square

21.29. Homology on a category

In the case of a category over a point we will baptize the left derived lower shriek functors the homology functors.

Example 21.29.1 (Category over point). Let \mathcal{C} be a category. Endow \mathcal{C} with the chaotic topology (Sites, Example 7.6.6). Thus presheaves and sheaves agree on \mathcal{C} . The functor $p : \mathcal{C} \rightarrow *$ where $*$ is the category with a single object and a single morphism is cocontinuous and continuous. Let $\pi : Sh(\mathcal{C}) \rightarrow Sh(*)$ be the corresponding morphism of topoi. Let B be a ring. We endow $*$ with the sheaf of rings B and \mathcal{C} with $\mathcal{O}_{\mathcal{C}} = \pi^{-1}B$ which we will denote \underline{B} . In this way

$$\pi : (Sh(\mathcal{C}), \underline{B}) \rightarrow (*, B)$$

is an example of Situation 21.28.1. By Remark 21.28.6 we do not need to distinguish between $\pi_!$ on modules or abelian sheaves. By Lemma 21.28.8 we see that $\pi_!\mathcal{F} = \operatorname{colim}_{\mathcal{C}^{opp}} \mathcal{F}$. Thus $L_n\pi_!$ is the n th left derived functor of taking colimits. In the following, we write

$$H_n(\mathcal{C}, \mathcal{F}) = L_n\pi_!(\mathcal{F})$$

and we will name this the n th homology group of \mathcal{F} on \mathcal{C} .

Example 21.29.2 (Computing homology). In Example 21.29.1 we can compute the functors $H_n(\mathcal{C}, -)$ as follows. Let $\mathcal{F} \in \text{Ob}(Ab(\mathcal{C}))$. Consider the chain complex

$$K_\bullet(\mathcal{F}) : \dots \rightarrow \bigoplus_{U_2 \rightarrow U_1 \rightarrow U_0} \mathcal{F}(U_0) \rightarrow \bigoplus_{U_1 \rightarrow U_0} \mathcal{F}(U_0) \rightarrow \bigoplus_{U_0} \mathcal{F}(U_0)$$

where the transition maps are given by

$$(U_2 \rightarrow U_1 \rightarrow U_0, s) \mapsto (U_1 \rightarrow U_0, s) - (U_2 \rightarrow U_0, s) + (U_2 \rightarrow U_1, s|_{U_1})$$

and similarly in other degrees. By construction

$$H_0(\mathcal{C}, \mathcal{F}) = \text{colim}_{\mathcal{C}^{opp}} \mathcal{F} = H_0(K_\bullet(\mathcal{F})),$$

see Categories, Lemma 4.14.11. The construction of $K_\bullet(\mathcal{F})$ is functorial in \mathcal{F} and transforms short exact sequences of $Ab(\mathcal{C})$ into short exact sequences of complexes. Thus the sequence of functors $\mathcal{F} \mapsto H_n(K_\bullet(\mathcal{F}))$ forms a δ -functor, see Homology, Definition 12.11.1 and Lemma 12.12.12. For $\mathcal{F} = j_{U!}\mathbf{Z}_U$ the complex $K_\bullet(\mathcal{F})$ is the complex associated to the free \mathbf{Z} -module on the simplicial set X_\bullet with terms

$$X_n = \coprod_{U_n \rightarrow \dots \rightarrow U_1 \rightarrow U_0} \text{Mor}_{\mathcal{C}}(U_0, U)$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$. Namely, the map $X_\bullet \rightarrow \{*\}$ is obvious, the map $\{*\} \rightarrow X_n$ is given by mapping $*$ to $(U \rightarrow \dots \rightarrow U, \text{id}_U)$, and the maps

$$h_{n,i} : X_n \longrightarrow X_n$$

(Simplicial, Lemma 14.25.2) defining the homotopy between the two maps $X_\bullet \rightarrow X_\bullet$ are given by the rule

$$h_{n,i} : (U_n \rightarrow \dots \rightarrow U_0, f) \mapsto (U_n \rightarrow \dots \rightarrow U_i \rightarrow U \rightarrow \dots \rightarrow U, \text{id})$$

for $i > 0$ and $h_{n,0} = \text{id}$. Verifications omitted. This implies that $K_\bullet(j_{U!}\mathbf{Z}_U)$ has trivial cohomology in negative degrees (by the functoriality of Simplicial, Remark 14.25.4 and the result of Simplicial, Lemma 14.26.1). Thus $K_\bullet(\mathcal{F})$ computes the left derived functors $H_n(\mathcal{C}, -)$ of $H_0(\mathcal{C}, -)$ for example by (the duals of) Homology, Lemma 12.11.4 and Derived Categories, Lemma 13.17.6.

Example 21.29.3. Let $u : \mathcal{C}' \rightarrow \mathcal{C}$ be a functor. Endow \mathcal{C}' and \mathcal{C} with the chaotic topology as in Example 21.29.1. The functors $u, \mathcal{C}' \rightarrow *$, and $\mathcal{C} \rightarrow *$ where $*$ is the category with a single object and a single morphism are cocontinuous and continuous. Let $g : Sh(\mathcal{C}') \rightarrow Sh(\mathcal{C}), \pi' : Sh(\mathcal{C}') \rightarrow Sh(*),$ and $\pi : Sh(\mathcal{C}) \rightarrow Sh(*),$ be the corresponding morphisms of topoi. Let B be a ring. We endow $*$ with the sheaf of rings B and $\mathcal{C}', \mathcal{C}$ with the constant sheaf \underline{B} . In this way

$$\begin{array}{ccc} (Sh(\mathcal{C}'), \underline{B}) & \xrightarrow{g} & (Sh(\mathcal{C}), \underline{B}) \\ & \searrow \pi' & \swarrow \pi \\ & (Sh(*), B) & \end{array}$$

is an example of Situation 21.28.3. Thus Lemma 21.28.5 applies to g so we do not need to distinguish between $g_!$ on modules or abelian sheaves. In particular Remark 21.28.7 produces canonical maps

$$H_n(\mathcal{C}', \mathcal{F}') \longrightarrow H_n(\mathcal{C}, \mathcal{F})$$

whenever we have \mathcal{F} in $Ab(\mathcal{C})$, \mathcal{F}' in $Ab(\mathcal{C}')$, and a map $t : \mathcal{F}' \rightarrow g^{-1}\mathcal{F}$. In terms of the computation of homology given in Example 21.29.2 we see that these maps come from a map of complexes

$$K_{\bullet}(\mathcal{F}') \longrightarrow K_{\bullet}(\mathcal{F})$$

given by the rule

$$(U'_n \rightarrow \dots \rightarrow U'_0, s') \longmapsto (u(U'_n) \rightarrow \dots \rightarrow u(U'_0), t(s'))$$

with obvious notation.

Remark 21.29.4. Notation and assumptions as in Example 21.29.1. Let \mathcal{F}^{\bullet} be a bounded complex of abelian sheaves on \mathcal{C} . For any object U of \mathcal{C} there is a canonical map

$$\mathcal{F}^{\bullet}(U) \longrightarrow L\pi_!(\mathcal{F}^{\bullet})$$

in $D(Ab)$. If \mathcal{F}^{\bullet} is a complex of \underline{B} -modules then this map is in $D(B)$. To prove this, note that we compute $L\pi_!(\mathcal{F}^{\bullet})$ by taking a quasi-isomorphism $\mathcal{P}^{\bullet} \rightarrow \mathcal{F}^{\bullet}$ where \mathcal{P}^{\bullet} is a complex of projectives. However, since the topology is chaotic this means that $\mathcal{P}^{\bullet}(U) \rightarrow \mathcal{F}^{\bullet}(U)$ is a quasi-isomorphism hence can be inverted in $D(Ab)$, resp. $D(B)$. Composing with the canonical map $\mathcal{P}^{\bullet}(U) \rightarrow \pi_!(\mathcal{P}^{\bullet})$ coming from the computation of $\pi_!$ as a colimit we obtain the desired arrow.

Lemma 21.29.5. *Notation and assumptions as in Example 21.29.1. If \mathcal{C} has either an initial or a final object, then $L\pi_! \circ \pi^{-1} = id$ on $D(Ab)$, resp. $D(B)$.*

Proof. If \mathcal{C} has an initial object, then $\pi_!$ is computed by evaluating on this object and the statement is clear. If \mathcal{C} has a final object, then $R\pi_*$ is computed by evaluating on this object, hence $R\pi_* \circ \pi^{-1} \cong id$ on $D(Ab)$, resp. $D(B)$. This implies that $\pi^{-1} : D(Ab) \rightarrow D(\mathcal{C})$, resp. $\pi^{-1} : D(B) \rightarrow D(\underline{B})$ is fully faithful, see Categories, Lemma 4.24.3. Then the same lemma implies that $L\pi_! \circ \pi^{-1} = id$ as desired. \square

Lemma 21.29.6. *Notation and assumptions as in Example 21.29.1. Let $B \rightarrow B'$ be a ring map. Consider the commutative diagram of ringed topoi*

$$\begin{array}{ccc} (Sh(\mathcal{C}), \underline{B}) & \xleftarrow{h} & (Sh(\mathcal{C}), \underline{B}') \\ \pi \downarrow & & \downarrow \pi' \\ (*, B) & \xleftarrow{f} & (*, B') \end{array}$$

Then $L\pi_! \circ Lh^* = Lf^* \circ L\pi'_!$.

Proof. Both functors are right adjoint to the obvious functor $D(B') \rightarrow D(\underline{B})$. \square

Lemma 21.29.7. *Notation and assumptions as in Example 21.29.1. Let U_{\bullet} be a cosimplicial object in \mathcal{C} such that for every $U \in Ob(\mathcal{C})$ the simplicial set $Mor_{\mathcal{C}}(U_{\bullet}, U)$ is homotopy equivalent to the constant simplicial set on a singleton. Then*

$$L\pi_!(\mathcal{F}) = \mathcal{F}(U_{\bullet})$$

in $D(Ab)$, resp. $D(B)$ functorially in \mathcal{F} in $Ab(\mathcal{C})$, resp. $Mod(\underline{B})$.

Proof. As $L\pi_!$ agrees for modules and abelian sheaves by Lemma 21.28.5 it suffices to prove this when \mathcal{F} is an abelian sheaf. For $U \in \text{Ob}(\mathcal{C})$ the abelian sheaf $j_{U!}\mathbf{Z}_U$ is a projective object of $Ab(\mathcal{C})$ since $\text{Hom}(j_{U!}\mathbf{Z}_U, \mathcal{F}) = \mathcal{F}(U)$ and taking sections is an exact functor as the topology is chaotic. Every abelian sheaf is a quotient of a direct sum of $j_{U!}\mathbf{Z}_U$ by Modules on Sites, Lemma 18.28.6. Thus we can compute $L\pi_!(\mathcal{F})$ by choosing a resolution

$$\dots \rightarrow \mathcal{G}^{-1} \rightarrow \mathcal{G}^0 \rightarrow \mathcal{F} \rightarrow 0$$

whose terms are direct sums of sheaves of the form above and taking $L\pi_!(\mathcal{F}) = \pi_!(\mathcal{G}^\bullet)$. Consider the double complex $A^{\bullet, \bullet} = \mathcal{G}^\bullet(U_\bullet)$. The map $\mathcal{G}^0 \rightarrow \mathcal{F}$ gives a map of complexes $A^{0, \bullet} \rightarrow \mathcal{F}(U_\bullet)$. Since $\pi_!$ is computed by taking the colimit over \mathcal{C}^{opp} (Lemma 21.28.8) we see that the two compositions $\mathcal{G}^m(U_1) \rightarrow \mathcal{G}^m(U_0) \rightarrow \pi_!\mathcal{G}^m$ are equal. Thus we obtain a canonical map of complexes

$$\text{Tot}(A^{\bullet, \bullet}) \longrightarrow \pi_!(\mathcal{G}^\bullet) = L\pi_!(\mathcal{F})$$

To prove the lemma it suffices to show that the complexes

$$\dots \rightarrow \mathcal{G}^m(U_1) \rightarrow \mathcal{G}^m(U_0) \rightarrow \pi_!\mathcal{G}^m \rightarrow 0$$

are exact, see Homology, Lemma 12.22.7. Since the sheaves \mathcal{G}^m are direct sums of the sheaves $j_{U!}\mathbf{Z}_U$ we reduce to $\mathcal{G} = j_{U!}\mathbf{Z}_U$. The complex $j_{U!}\mathbf{Z}_U(U_\bullet)$ is the complex of abelian groups associated to the free \mathbf{Z} -module on the simplicial set $\text{Mor}_{\mathcal{C}}(U_\bullet, U)$ which we assumed to be homotopy equivalent to a singleton. We conclude that

$$j_{U!}\mathbf{Z}_U(U_\bullet) \rightarrow \mathbf{Z}$$

is a homotopy equivalence of abelian groups hence a quasi-isomorphism (Simplicial, Remark 14.25.4 and Lemma 14.26.1). This finishes the proof since $\pi_!j_{U!}\mathbf{Z}_U = \mathbf{Z}$ as was shown in the proof of Lemma 21.28.5. \square

Lemma 21.29.8. *Notation and assumptions as in Example 21.29.3. If there exists a cosimplicial object U'_\bullet of \mathcal{C}' such that Lemma 21.29.7 applies to both U'_\bullet in \mathcal{C}' and $u(U'_\bullet)$ in \mathcal{C} , then we have $L\pi'_! \circ g^{-1} = L\pi_!$ as functors $D(\mathcal{C}) \rightarrow D(Ab)$, resp. $D(\mathcal{C}, \underline{B}) \rightarrow D(B)$.*

Proof. Follows immediately from Lemma 21.29.7 and the fact that g^{-1} is given by precomposing with u . \square

Lemma 21.29.9. *Let \mathcal{C}_i , $i = 1, 2$ be categories. Let $u_i : \mathcal{C}_1 \times \mathcal{C}_2 \rightarrow \mathcal{C}_i$ be the projection functors. Let B be a ring. Let $g_i : (Sh(\mathcal{C}_1 \times \mathcal{C}_2), \underline{B}) \rightarrow (Sh(\mathcal{C}_i), \underline{B})$ be the corresponding morphisms of ringed topoi, see Example 21.29.3. For $K_i \in D(\mathcal{C}_i, B)$ we have*

$$L(\pi_1 \times \pi_2)_!(g_1^{-1}K_1 \otimes_{\underline{B}}^{\mathbf{L}} g_2^{-1}K_2) = L\pi_{1,!}(K_1) \otimes_{\underline{B}}^{\mathbf{L}} L\pi_{2,!}(K_2)$$

in $D(B)$ with obvious notation.

Proof. As both sides commute with colimits, it suffices to prove this for $K_1 = j_{U!}\underline{B}_U$ and $K_2 = j_{V!}\underline{B}_V$ for $U \in \text{Ob}(\mathcal{C}_1)$ and $V \in \text{Ob}(\mathcal{C}_2)$. See construction of $L\pi_!$ in Lemma 21.27.1. In this case

$$g_1^{-1}K_1 \otimes_{\underline{B}}^{\mathbf{L}} g_2^{-1}K_2 = g_1^{-1}K_1 \otimes_{\underline{B}} g_2^{-1}K_2 = j_{(U,V)!}\underline{B}_{(U,V)}$$

Verification omitted. Hence the result follows as both the left and the right hand side of the formula of the lemma evaluate to B , see construction of $L\pi_!$ in Lemma 21.27.1. \square

Lemma 21.29.10. *Notation and assumptions as in Example 21.29.1. If there exists a cosimplicial object U_\bullet of \mathcal{C} such that Lemma 21.29.7 applies, then*

$$L\pi_!(K_1 \otimes_{\underline{B}}^{\mathbf{L}} K_2) = L\pi_!(K_1) \otimes_{\underline{B}}^{\mathbf{L}} L\pi_!(K_2)$$

for all $K_i \in D(\underline{B})$.

Proof. Consider the diagram of categories and functors

where u is the diagonal functor and u_i are the projection functors. This gives morphisms of ringed topoi g, g_1, g_2 . For any object (U_1, U_2) of \mathcal{C} we have

$$\text{Mor}_{\mathcal{C} \times \mathcal{C}}(u(U_\bullet), (U_1, U_2)) = \text{Mor}_{\mathcal{C}}(U_\bullet, U_1) \times \text{Mor}_{\mathcal{C}}(U_\bullet, U_2)$$

which is homotopy equivalent to a point by *Simplicial*, Lemma 14.25.10. Thus Lemma 21.29.8 gives $L\pi_!(g^{-1}K) = L(\pi \times \pi)_!(K)$ for any K in $D(\mathcal{C} \times \mathcal{C}, B)$. Take $K = g_1^{-1}K_1 \otimes_{\underline{B}}^{\mathbf{L}} g_2^{-1}K_2$. Then $g^{-1}K = K_1 \otimes_{\underline{B}}^{\mathbf{L}} K_2$ because $g^{-1} = g^* = Lg^*$ commutes with derived tensor product (Lemma 21.18.4 – a site with chaotic topology has enough points). To finish we apply Lemma 21.29.9. \square

Remark 21.29.11 (Simplicial modules). Let $\mathcal{C} = \Delta$ and let B be any ring. This is a special case of Example 21.29.1 where the assumptions of Lemma 21.29.7 hold. Namely, let U_\bullet be the cosimplicial object of Δ given by the identity functor. To verify the condition we have to show that for $[m] \in \text{Ob}(\Delta)$ the simplicial set $\Delta[m] : n \mapsto \text{Mor}_\Delta([n], [m])$ is homotopy equivalent to a point. This is explained in *Simplicial*, Example 14.25.7.

In this situation the category $\text{Mod}(B)$ is just the category of simplicial B -modules and the functor $L\pi_!$ sends a simplicial B -module M_\bullet to its associated complex $s(M_\bullet)$ of B -modules. Thus the results above can be reinterpreted in terms of results on simplicial modules. For example a special case of Lemma 21.29.10 is: if M_\bullet, M'_\bullet are flat simplicial B -modules, then the complex $s(M_\bullet \otimes_B M'_\bullet)$ is quasi-isomorphic to the total complex associated to the double complex $s(M_\bullet) \otimes_B s(M'_\bullet)$. (Hint: use flatness to convert from derived tensor products to usual tensor products.) This is a special case of the Eilenberg-Zilber theorem which can be found in [EZ53].

Lemma 21.29.12. *Let \mathcal{C} be a category (endowed with chaotic topology). Let $\mathcal{O} \rightarrow \mathcal{O}'$ be a map of sheaves of rings on \mathcal{C} . Assume*

- (1) *there exists a cosimplicial object U_\bullet in \mathcal{C} as in Lemma 21.29.7, and*
- (2) *$L\pi_!\mathcal{O} \rightarrow L\pi_!\mathcal{O}'$ is an isomorphism.*

For K in $D(\mathcal{O})$ we have

$$L\pi_!(K) = L\pi_!(K \otimes_{\underline{\mathcal{O}}}^{\mathbf{L}} \mathcal{O}')$$

in $D(\text{Ab})$.

Proof. Note: in this proof $L\pi_!$ denotes the left derived functor of $\pi_!$ on abelian sheaves. Since $L\pi_!$ commutes with colimits, it suffices to prove this for bounded above complexes of \mathcal{O} -modules (compare with argument of Derived Categories, Proposition 13.28.2 or just stick to bounded above complexes). Every such complex is quasi-isomorphic to a bounded above complex whose terms are direct sums of $j_{U!}\mathcal{O}_U$ with $U \in \text{Ob}(\mathcal{C})$, see Modules on Sites, Lemma 18.28.6. Thus it suffices to prove the lemma for $j_{U!}\mathcal{O}_U$. By assumption

$$S_\bullet = \text{Mor}_{\mathcal{C}}(U_\bullet, U)$$

is a simplicial set homotopy equivalent to the constant simplicial set on a singleton. Set $P_n = \mathcal{O}(U_n)$ and $P'_n = \mathcal{O}'(U_n)$. Observe that the complex associated to the simplicial abelian group

$$X_\bullet : n \mapsto \bigoplus_{s \in S_n} P_n$$

computes $L\pi_!(j_{U!}\mathcal{O}_U)$ by Lemma 21.29.7. Since $j_{U!}\mathcal{O}_U$ is a flat \mathcal{O} -module we have $j_{U!}\mathcal{O}_U \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}' = j_{U!}\mathcal{O}'_U$ and $L\pi_!$ of this is computed by the complex associated to the simplicial abelian group

$$X'_\bullet : n \mapsto \bigoplus_{s \in S_n} P'_n$$

As the rule which to a simplicial set T_\bullet associated the simplicial abelian group with terms $\bigoplus_{t \in T_n} P_n$ is a functor, we see that $X_\bullet \rightarrow P_\bullet$ is a homotopy equivalence of simplicial abelian groups. Similarly, the rule which to a simplicial set T_\bullet associates the simplicial abelian group with terms $\bigoplus_{t \in T_n} P'_n$ is a functor. Hence $X'_\bullet \rightarrow P'_\bullet$ is a homotopy equivalence of simplicial abelian groups. By assumption $P_\bullet \rightarrow P'_\bullet$ is a quasi-isomorphism (since P_\bullet , resp. P'_\bullet computes $L\pi_!\mathcal{O}$, resp. $L\pi_!\mathcal{O}'$ by Lemma 21.29.7). We conclude that X_\bullet and X'_\bullet are quasi-isomorphic as desired. \square

Remark 21.29.13. Let \mathcal{C} and B be as in Example 21.29.1. Assume there exists a cosimplicial object as in Lemma 21.29.7. Let $\mathcal{O} \rightarrow \underline{B}$ be a map sheaf of rings on \mathcal{C} which induces an isomorphism $L\pi_!\mathcal{O} \rightarrow L\pi_!\underline{B}$. In this case we obtain an exact functor of triangulated categories

$$L\pi_! : D(\mathcal{O}) \longrightarrow D(B)$$

Namely, for any object K of $D(\mathcal{O})$ we have $L\pi_!^{Ab}(K) = L\pi_!^{Ab}(K \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B})$ by Lemma 21.29.12. Thus we can define the displayed functor as the composition of $- \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B}$ with the functor $L\pi_! : D(\underline{B}) \rightarrow D(B)$. In other words, we obtain a B -module structure on $L\pi_!(K)$ coming from the (canonical, functorial) identification of $L\pi_!(K)$ with $L\pi_!(K \otimes_{\mathcal{O}}^{\mathbf{L}} \underline{B})$ of the lemma.

21.30. Calculating derived lower shriek

In this section we apply the results from Section 21.29 to compute $L\pi_!$ in Situation 21.28.1 and $Lg_!$ in Situation 21.28.3.

Lemma 21.30.1. *Assumptions and notation as in Situation 21.28.1. For \mathcal{F} in $\text{PAb}(\mathcal{C})$ and $n \geq 0$ consider the abelian sheaf $L_n(\mathcal{F})$ on \mathcal{D} which is the sheaf associated to the presheaf*

$$V \mapsto H_n(\mathcal{C}_V, \mathcal{F}|_{\mathcal{C}_V})$$

with restriction maps as indicated in the proof. Then $L_n(\mathcal{F}) = L_n(\mathcal{F}^\#)$.

Proof. For a morphism $h : V' \rightarrow V$ of \mathcal{D} there is a pullback functor $h^* : \mathcal{C}_V \rightarrow \mathcal{C}_{V'}$ of fibre categories (Categories, Definition 4.31.6). Moreover for $U \in \text{Ob}(\mathcal{C}_V)$ there is a strongly cartesian morphism $h^*U \rightarrow U$ covering h . Restriction along these strongly cartesian morphisms defines a transformation of functors

$$\mathcal{F}|_{\mathcal{C}_V} \longrightarrow \mathcal{F}|_{\mathcal{C}_{V'}} \circ h^*.$$

By Example 21.29.3 we obtain the desired restriction map

$$H_n(\mathcal{C}_V, \mathcal{F}|_{\mathcal{C}_V}) \longrightarrow H_n(\mathcal{C}_{V'}, \mathcal{F}|_{\mathcal{C}_{V'}})$$

Let us denote $L_{n,p}(\mathcal{F})$ this presheaf, so that $L_n(\mathcal{F}) = L_{n,p}(\mathcal{F})^\#$. The canonical map $\gamma : \mathcal{F} \rightarrow \mathcal{F}^+$ (Sites, Theorem 7.10.10) defines a canonical map $L_{n,p}(\mathcal{F}) \rightarrow L_{n,p}(\mathcal{F}^+)$. We have to prove this map becomes an isomorphism after sheafification.

Let us use the computation of homology given in Example 21.29.2. Denote $K_\bullet(\mathcal{F}|_{\mathcal{C}_V})$ the complex associated to the restriction of \mathcal{F} to the fibre category \mathcal{C}_V . By the remarks above we obtain a presheaf $K_\bullet(\mathcal{F})$ of complexes

$$V \mapsto K_\bullet(\mathcal{F}|_{\mathcal{C}_V})$$

whose cohomology presheaves are the presheaves $L_{n,p}(\mathcal{F})$. Thus it suffices to show that

$$K_\bullet(\mathcal{F}) \longrightarrow K_\bullet(\mathcal{F}^+)$$

becomes an isomorphism on sheafification.

Injectivity. Let V be an object of \mathcal{D} and let $\xi \in K_n(\mathcal{F})(V)$ be an element which maps to zero in $K_n(\mathcal{F}^+)(V)$. We have to show there exists a covering $\{V_j \rightarrow V\}$ such that $\xi|_{V_j}$ is zero in $K_n(\mathcal{F})(V_j)$. We write

$$\xi = \sum (U_{i,n+1} \rightarrow \dots \rightarrow U_{i,0}, \sigma_i)$$

with $\sigma_i \in \mathcal{F}(U_{i,0})$. We arrange it so that each sequence of morphisms $U_n \rightarrow \dots \rightarrow U_0$ of \mathcal{C}_V occurs are most once. Since the sums in the definition of the complex K_\bullet are direct sums, the only way this can map to zero in $K_\bullet(\mathcal{F}^+)(V)$ is if all σ_i map to zero in $\mathcal{F}^+(U_{i,0})$. By construction of \mathcal{F}^+ there exist coverings $\{U_{i,0,j} \rightarrow U_{i,0}\}$ such that $\sigma_i|_{U_{i,0,j}}$ is zero. By our construction of the topology on \mathcal{C} we can write $U_{i,0,j} \rightarrow U_{i,0}$ as the pullback (Categories, Definition 4.31.6) of some morphisms $V_{i,j} \rightarrow V$ and moreover each $\{V_{i,j} \rightarrow V\}$ is a covering. Choose a covering $\{V_j \rightarrow V\}$ dominating each of the coverings $\{V_{i,j} \rightarrow V\}$. Then it is clear that $\xi|_{V_j} = 0$.

Surjectivity. Proof omitted. Hint: Argue as in the proof of injectivity. □

Lemma 21.30.2. *Assumptions and notation as in Situation 21.28.1. For \mathcal{F} in $Ab(\mathcal{C})$ and $n \geq 0$ the sheaf $L_n\pi_!(\mathcal{F})$ is equal to the sheaf $L_n(\mathcal{F})$ constructed in Lemma 21.30.1.*

Proof. Consider the sequence of functors $\mathcal{F} \mapsto L_n(\mathcal{F})$ from $PAb(\mathcal{C}) \rightarrow Ab(\mathcal{C})$. Since for each $V \in \text{Ob}(\mathcal{D})$ the sequence of functors $H_n(\mathcal{C}_V, -)$ forms a δ -functor so do the functors $\mathcal{F} \mapsto L_n(\mathcal{F})$. Our goal is to show these form a universal δ -functor. In order to do this we construct some abelian presheaves on which these functors vanish.

For $U' \in \text{Ob}(\mathcal{C})$ consider the abelian presheaf $\mathcal{F}_{U'} = j_{U'}^{PAb} \mathbf{Z}_{U'}$ (Modules on Sites, Remark 18.19.6). Recall that

$$\mathcal{F}_{U'}(U) = \bigoplus_{\text{Mor}_{\mathcal{C}}(U, U')} \mathbf{Z}$$

If U lies over $V = p(U)$ in \mathcal{D} and U' lies over $V' = p(U')$ then any morphism $a : U \rightarrow U'$ factors uniquely as $U \rightarrow h^*U' \rightarrow U'$ where $h = p(a) : V \rightarrow V'$ (see Categories, Definition 4.31.6). Hence we see that

$$\mathcal{F}_{U'}|_{\mathcal{C}_V} = \bigoplus_{h \in \text{Mor}_{\mathcal{D}}(V, V')} j_{h^*U'} \mathbf{Z}_{h^*U'}$$

where $j_{h^*U'} : Sh(\mathcal{C}_V/h^*U') \rightarrow Sh(\mathcal{C}_V)$ is the localization morphism. The sheaves $j_{h^*U'} \mathbf{Z}_{h^*U'}$ have vanishing higher homology groups (see Example 21.29.2). We conclude that $L_n(\mathcal{F}_{U'}) = 0$ for all $n > 0$ and all U' . It follows that any abelian presheaf \mathcal{F} is a quotient of an abelian presheaf \mathcal{G} with $L_n(\mathcal{G}) = 0$ for all $n > 0$ (Modules on Sites, Lemma 18.28.6). Since $L_n(\mathcal{F}) = L_n(\mathcal{F}^\#)$ we see that the same thing is true for abelian sheaves. Thus the sequence of functors $L_n(-)$ is a universal delta functor on $Ab(\mathcal{C})$ (Homology, Lemma 12.11.4). Since we have agreement with $H^{-n}(L\pi_!(-))$ for $n = 0$ by Lemma 21.28.8 we conclude by uniqueness of universal δ -functors (Homology, Lemma 12.11.5) and Derived Categories, Lemma 13.17.6. \square

Lemma 21.30.3. *Assumptions and notation as in Situation 21.28.3. For an abelian sheaf \mathcal{F}' on \mathcal{C}' the sheaf $L_{ng_!}(\mathcal{F}')$ is the sheaf associated to the presheaf*

$$U \mapsto H_n(\mathcal{I}_U, \mathcal{F}'_U)$$

For notation and restriction maps see proof.

Proof. Say $p(U) = V$. The category \mathcal{I}_U is the category of pairs (U', φ) where $\varphi : U \rightarrow u(U')$ is a morphism of \mathcal{C} with $p(\varphi) = \text{id}_V$, i.e., φ is a morphism of the fibre category \mathcal{C}_V . Morphisms $(U'_1, \varphi_1) \rightarrow (U'_2, \varphi_2)$ are given by morphisms $a : U'_1 \rightarrow U'_2$ of the fibre category \mathcal{C}'_V such that $\varphi_2 = u(a) \circ \varphi_1$. The presheaf \mathcal{F}'_U sends (U', φ) to $\mathcal{F}'(U')$. We will construct the restriction mappings below.

Choose a factorization

$$\mathcal{C}' \begin{array}{c} \xrightarrow{u'} \\ \xleftarrow{w} \end{array} \mathcal{C}'' \xrightarrow{u''} \mathcal{C}$$

of u as in Categories, Lemma 4.31.14. Then $g_! = g''_! \circ g'_!$ and similarly for derived functors. On the other hand, the functor $g'_!$ is exact, see Modules on Sites, Lemma 18.16.6. Thus we get $L_{g_!}(\mathcal{F}') = L_{g''_!}(\mathcal{F}'')$ where $\mathcal{F}'' = g'_! \mathcal{F}'$. Note that $\mathcal{F}'' = h^{-1} \mathcal{F}'$ where $h : Sh(\mathcal{C}'') \rightarrow Sh(\mathcal{C}')$ is the morphism of topoi associated to w , see Sites, Lemma 7.22.1. The functor u'' turns \mathcal{C}'' into a fibred category over \mathcal{C} , hence Lemma 21.30.2 applies to the computation of $L_{ng''_!}$. The result follows as the construction of \mathcal{C}'' in the proof of Categories, Lemma 4.31.14 shows that the fibre category \mathcal{C}''_U is equal to \mathcal{I}_U . Moreover, $h^{-1} \mathcal{F}'|_{\mathcal{C}''_U}$ is given by the rule described above (as w is continuous and cocontinuous by Stacks, Lemma 8.10.3 so we may apply Sites, Lemma 7.20.5). \square

21.31. Simplicial modules

Let A_\bullet be a simplicial ring. Recall that we may think of A_\bullet as a sheaf on Δ (endowed with the chaotic topology), see Simplicial, Section 14.4. Then a simplicial module M_\bullet over A_\bullet is just a sheaf of A_\bullet -modules on Δ . In other words, for every $n \geq 0$ we have an A_n -module M_n and for every map $\varphi : [n] \rightarrow [m]$ we have a corresponding map

$$M_\bullet(\varphi) : M_m \longrightarrow M_n$$

which is $A_\bullet(\varphi)$ -linear such that these maps compose in the usual manner.

Let \mathcal{C} be a site. A *simplicial sheaf of rings* \mathcal{A}_\bullet on \mathcal{C} is a simplicial object in the category of sheaves of rings on \mathcal{C} . In this case the assignment $U \mapsto \mathcal{A}_\bullet(U)$ is a sheaf of simplicial rings and in fact the two notions are equivalent. A similar discussion holds for simplicial abelian sheaves, simplicial sheaves of Lie algebras, and so on.

However, as in the case of simplicial rings above, there is another way to think about simplicial sheaves. Namely, consider the projection

$$p : \Delta \times \mathcal{C} \longrightarrow \mathcal{C}$$

This defines a fibred category with strongly cartesian morphisms exactly the morphisms of the form $([n], U) \rightarrow ([n], V)$. We endow the category $\Delta \times \mathcal{C}$ with the topology inherited from \mathcal{C} (see Stacks, Section 8.10). The simple description of the coverings in $\Delta \times \mathcal{C}$ (Stacks, Lemma 8.10.1) immediately implies that a simplicial sheaf of rings on \mathcal{C} is the same thing as a sheaf of rings on $\Delta \times \mathcal{C}$.

By analogy with the case of simplicial modules over a simplicial ring, we define simplicial modules over simplicial sheaves of rings as follows.

Definition 21.31.1. Let \mathcal{C} be a site. Let \mathcal{A}_\bullet be a simplicial sheaf of rings on \mathcal{C} . A *simplicial \mathcal{A}_\bullet -module* \mathcal{F}_\bullet (sometimes called a *simplicial sheaf of \mathcal{A}_\bullet -modules*) is a sheaf of modules over the sheaf of rings on $\Delta \times \mathcal{C}$ associated to \mathcal{A}_\bullet .

We obtain a category $\text{Mod}(\mathcal{A}_\bullet)$ of simplicial modules and a corresponding derived category $D(\mathcal{A}_\bullet)$. Given a map $\mathcal{A}_\bullet \rightarrow \mathcal{B}_\bullet$ of simplicial sheaves of rings we obtain a functor

$$- \otimes_{\mathcal{A}_\bullet}^{\mathbf{L}} \mathcal{B}_\bullet : D(\mathcal{A}_\bullet) \longrightarrow D(\mathcal{B}_\bullet)$$

Moreover, the material of the preceding sections determines a functor

$$L\pi_! : D(\mathcal{A}_\bullet) \longrightarrow D(\mathcal{C})$$

Given a simplicial module \mathcal{F}_\bullet the object $L\pi_!(\mathcal{F}_\bullet)$ is represented by the associated chain complex $s(\mathcal{F}_\bullet)$ (Simplicial, Section 14.22). This follows from Lemmas 21.30.2 and 21.29.7.

Lemma 21.31.2. *Let \mathcal{C} be a site. Let $\mathcal{A}_\bullet \rightarrow \mathcal{B}_\bullet$ be a homomorphism of simplicial sheaves of rings on \mathcal{C} . If $L\pi_!\mathcal{A}_\bullet \rightarrow L\pi_!\mathcal{B}_\bullet$ is an isomorphism in $D(\mathcal{C})$, then we have*

$$L\pi_!(K) = L\pi_!(K \otimes_{\mathcal{A}_\bullet}^{\mathbf{L}} \mathcal{B}_\bullet)$$

for all K in $D(\mathcal{A}_\bullet)$.

Proof. Let $([n], U)$ be an object of $\Delta \times \mathcal{C}$. Since $L\pi_!$ commutes with colimits, it suffices to prove this for bounded above complexes of \mathcal{O} -modules (compare with argument of Derived Categories, Proposition 13.28.2 or just stick to bounded above complexes). Every such complex is quasi-isomorphic to a bounded above complex whose terms are flat modules, see Modules on Sites, Lemma 18.28.6. Thus it suffices to prove the lemma for a flat \mathcal{A}_\bullet -module \mathcal{F} . In this case the derived tensor product is the usual tensor product and is a sheaf also. Hence by Lemma 21.30.2 we can compute the cohomology sheaves of both sides of the equation by the procedure of Lemma 21.30.1. Thus it suffices to prove the result for the restriction of \mathcal{F} to the fibre categories (i.e., to $\Delta \times U$). In this case the result follows from Lemma 21.29.12. \square

Remark 21.31.3. Let \mathcal{C} be a site. Let $\epsilon : \mathcal{A}_\bullet \rightarrow \mathcal{O}$ be an augmentation (Simplicial, Definition 14.19.1) in the category of sheaves of rings. Assume ϵ induces a quasi-isomorphism $s(\mathcal{A}_\bullet) \rightarrow \mathcal{O}$. In this case we obtain an exact functor of triangulated categories

$$L\pi_! : D(\mathcal{A}_\bullet) \longrightarrow D(\mathcal{O})$$

Namely, for any object K of $D(\mathcal{A}_\bullet)$ we have $L\pi_!(K) = L\pi_!(K \otimes_{\mathcal{A}_\bullet}^L \mathcal{O})$ by Lemma 21.31.2. Thus we can define the displayed functor as the composition of $-\otimes_{\mathcal{A}_\bullet}^L \mathcal{O}$ with the functor $L\pi_! : D(\Delta \times \mathcal{C}, \pi^{-1}\mathcal{O}) \rightarrow D(\mathcal{O})$ of Remark 21.28.6. In other words, we obtain a \mathcal{O} -module structure on $L\pi_!(K)$ coming from the (canonical, functorial) identification of $L\pi_!(K)$ with $L\pi_!(K \otimes_{\mathcal{A}_\bullet}^L \mathcal{O})$ of the lemma.

21.32. Cohomology on a category

In the situation of Example 21.29.1 in addition to the derived functor $L\pi_!$, we also have the functor $R\pi_*$. For an abelian sheaf \mathcal{F} on \mathcal{C} we have $H_n(\mathcal{C}, \mathcal{F}) = H^{-n}(L\pi_!\mathcal{F})$ and $H^n(\mathcal{C}, \mathcal{F}) = H^n(R\pi_*\mathcal{F})$.

Example 21.32.1 (Computing cohomology). In Example 21.29.1 we can compute the functors $H^n(\mathcal{C}, -)$ as follows. Let $\mathcal{F} \in \text{Ob}(Ab(\mathcal{C}))$. Consider the cochain complex

$$K^\bullet(\mathcal{F}) : \prod_{U_0} \mathcal{F}(U_0) \rightarrow \prod_{U_0 \rightarrow U_1} \mathcal{F}(U_0) \rightarrow \prod_{U_0 \rightarrow U_1 \rightarrow U_2} \mathcal{F}(U_0) \rightarrow \dots$$

where the transition maps are given by

$$(s_{U_0 \rightarrow U_1}) \longmapsto ((U_0 \rightarrow U_1 \rightarrow U_2) \mapsto s_{U_0 \rightarrow U_1} - s_{U_0 \rightarrow U_2} + s_{U_1 \rightarrow U_2}|_{U_0})$$

and similarly in other degrees. By construction

$$H^0(\mathcal{C}, \mathcal{F}) = \lim_{\mathcal{C} \text{ opp}} \mathcal{F} = H^0(K^\bullet(\mathcal{F})),$$

see Categories, Lemma 4.14.10. The construction of $K^\bullet(\mathcal{F})$ is functorial in \mathcal{F} and transforms short exact sequences of $Ab(\mathcal{C})$ into short exact sequences of complexes. Thus the sequence of functors $\mathcal{F} \mapsto H^n(K^\bullet(\mathcal{F}))$ forms a δ -functor, see Homology, Definition 12.11.1 and Lemma 12.12.12. For an object U of \mathcal{C} denote $p_U : Sh(*) \rightarrow Sh(\mathcal{C})$ the corresponding point with p_U^{-1} equal to evaluation at U , see Sites, Example 7.32.7. Let A be an abelian group and set $\mathcal{F} = p_{U,*}A$. In this case the complex $K^\bullet(\mathcal{F})$ is the complex with terms $\text{Map}(X_n, A)$ where

$$X_n = \coprod_{U_0 \rightarrow \dots \rightarrow U_{n-1} \rightarrow U_n} \text{Mor}_{\mathcal{C}}(U, U_0)$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$. Namely, the map $X_\bullet \rightarrow \{*\}$ is obvious, the map $\{*\} \rightarrow X_n$ is given by mapping $*$ to $(U \rightarrow \dots \rightarrow U, \text{id}_U)$, and the maps

$$h_{n,i} : X_n \longrightarrow X_n$$

(Simplicial, Lemma 14.25.2) defining the homotopy between the two maps $X_\bullet \rightarrow X_\bullet$ are given by the rule

$$h_{n,i} : (U_0 \rightarrow \dots \rightarrow U_n, f) \longmapsto (U \rightarrow \dots \rightarrow U \rightarrow U_i \rightarrow \dots \rightarrow U_n, \text{id})$$

for $i > 0$ and $h_{n,0} = \text{id}$. Verifications omitted. Since $\text{Map}(-, A)$ is a contravariant functor, implies that $K^\bullet(p_{U,*}A)$ has trivial cohomology in positive degrees (by the functoriality of Simplicial, Remark 14.25.4 and the result of Simplicial, Lemma 14.27.5). This implies that $K^\bullet(\mathcal{F})$ is acyclic in positive degrees also if \mathcal{F} is a product

of sheaves of the form $p_{U,*}A$. As every abelian sheaf on \mathcal{C} embeds into such a product we conclude that $K^\bullet(\mathcal{F})$ computes the left derived functors $H^n(\mathcal{C}, -)$ of $H^0(\mathcal{C}, -)$ for example by Homology, Lemma 12.11.4 and Derived Categories, Lemma 13.17.6.

Example 21.32.2 (Computing Exts). In Example 21.29.1 assume we are moreover given a sheaf of rings \mathcal{O} on \mathcal{C} . Let \mathcal{F}, \mathcal{G} be \mathcal{O} -modules. Consider the complex $K^\bullet(\mathcal{G}, \mathcal{F})$ with degree n term

$$\prod_{U_0 \rightarrow U_1 \rightarrow \dots \rightarrow U_n} \text{Hom}_{\mathcal{O}(U_n)}(\mathcal{G}(U_n), \mathcal{F}(U_0))$$

and transition map given by

$$(\varphi_{U_0 \rightarrow U_1}) \mapsto ((U_0 \rightarrow U_1 \rightarrow U_2) \mapsto \varphi_{U_0 \rightarrow U_1} \circ \rho_{U_1}^{U_2} - \varphi_{U_0 \rightarrow U_2} + \rho_{U_0}^{U_1} \circ \varphi_{U_1 \rightarrow U_2}$$

and similarly in other degrees. Here the ρ 's indicate restriction maps. By construction

$$\text{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{F}) = H^0(K^\bullet(\mathcal{G}, \mathcal{F}))$$

for all pairs of \mathcal{O} -modules \mathcal{F}, \mathcal{G} . The assignment $(\mathcal{G}, \mathcal{F}) \mapsto K^\bullet(\mathcal{G}, \mathcal{F})$ is a bifunctor which transforms direct sums in the first variable into products and commutes with products in the second variable. We claim that

$$\text{Ext}_{\mathcal{O}}^i(\mathcal{G}, \mathcal{F}) = H^i(K^\bullet(\mathcal{G}, \mathcal{F}))$$

for $i \geq 0$ provided either

- (1) $\mathcal{G}(U)$ is a projective $\mathcal{O}(U)$ -module for all $U \in \text{Ob}(\mathcal{C})$, or
- (2) $\mathcal{F}(U)$ is an injective $\mathcal{O}(U)$ -module for all $U \in \text{Ob}(\mathcal{C})$.

Namely, case (1) the functor $K^\bullet(\mathcal{G}, -)$ is an exact functor from the category of \mathcal{O} -modules to the category of cochain complexes of abelian groups. Thus, arguing as in Example 21.32.1, it suffices to show that $K^\bullet(\mathcal{G}, \mathcal{F})$ is acyclic in positive degrees when \mathcal{F} is $p_{U,*}A$ for an $\mathcal{O}(U)$ -module A . Choose a short exact sequence

$$(21.32.2.1) \quad 0 \rightarrow \mathcal{G}' \rightarrow \bigoplus j_{U_i!} \mathcal{O}_{U_i} \rightarrow \mathcal{G} \rightarrow 0$$

see Modules on Sites, Lemma 18.28.6. Since (1) holds for the middle and right sheaves, it also holds for \mathcal{G}' and evaluating (21.32.2.1) on an object of \mathcal{C} gives a split exact sequence of modules. We obtain a short exact sequence of complexes

$$0 \rightarrow K^\bullet(\mathcal{G}, \mathcal{F}) \rightarrow \prod K^\bullet(j_{U_i!} \mathcal{O}_{U_i}, \mathcal{F}) \rightarrow K^\bullet(\mathcal{G}', \mathcal{F}) \rightarrow 0$$

for any \mathcal{F} , in particular $\mathcal{F} = p_{U,*}A$. On H^0 we obtain

$$0 \rightarrow \text{Hom}(\mathcal{G}, p_{U,*}A) \rightarrow \text{Hom}\left(\prod j_{U_i!} \mathcal{O}_{U_i}, p_{U,*}A\right) \rightarrow \text{Hom}(\mathcal{G}', p_{U,*}A) \rightarrow 0$$

which is exact as $\text{Hom}(\mathcal{H}, p_{U,*}A) = \text{Hom}_{\mathcal{O}(U)}(\mathcal{H}(U), A)$ and the sequence of sections of (21.32.2.1) over U is split exact. Thus we can use dimension shifting to see that it suffices to prove $K^\bullet(j_{U'!} \mathcal{O}_{U'}, p_{U,*}A)$ is acyclic in positive degrees for all $U, U' \in \text{Ob}(\mathcal{C})$. In this case $K^n(j_{U'!} \mathcal{O}_{U'}, p_{U,*}A)$ is equal to

$$\prod_{U \rightarrow U_0 \rightarrow U_1 \rightarrow \dots \rightarrow U_n \rightarrow U'} A$$

In other words, $K^\bullet(j_{U'!} \mathcal{O}_{U'}, p_{U,*}A)$ is the complex with terms $\text{Map}(X_\bullet, A)$ where

$$X_n = \prod_{U_0 \rightarrow \dots \rightarrow U_{n-1} \rightarrow U_n} \text{Mor}_{\mathcal{C}}(U, U_0) \times \text{Mor}_{\mathcal{C}}(U_n, U')$$

This simplicial set is homotopy equivalent to the constant simplicial set on a singleton $\{*\}$ as can be proved in exactly the same way as the corresponding statement in Example 21.32.1. This finishes the proof of the claim.

The argument in case (2) is similar (but dual).

21.33. Strictly perfect complexes

This section is the analogue of Cohomology, Section 20.35.

Definition 21.33.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{E}^\bullet be a complex of \mathcal{O} -modules. We say \mathcal{E}^\bullet is *strictly perfect* if \mathcal{E}^i is zero for all but finitely many i and \mathcal{E}^i is a direct summand of a finite free \mathcal{O} -module for all i .

Let U be an object of \mathcal{C} . We will often say “Let \mathcal{E}^\bullet be a strictly perfect complex of \mathcal{O}_U -modules” to mean \mathcal{E}^\bullet is a strictly perfect complex of modules on the ringed site $(\mathcal{C}/U, \mathcal{O}_U)$, see Modules on Sites, Definition 18.19.1.

Lemma 21.33.2. *The cone on a morphism of strictly perfect complexes is strictly perfect.*

Proof. This is immediate from the definitions. □

Lemma 21.33.3. *The total complex associated to the tensor product of two strictly perfect complexes is strictly perfect.*

Proof. Omitted. □

Lemma 21.33.4. *Let $(f, f^\sharp) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed sites. If \mathcal{F}^\bullet is a strictly perfect complex of $\mathcal{O}_{\mathcal{D}}$ -modules, then $f^*\mathcal{F}^\bullet$ is a strictly perfect complex of $\mathcal{O}_{\mathcal{C}}$ -modules.*

Proof. We have seen in Modules on Sites, Lemma 18.17.2 that the pullback of a finite free module is finite free. The functor f^* is additive functor hence preserves direct summands. The lemma follows. □

Lemma 21.33.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . Given a solid diagram of \mathcal{O}_U -modules*

$$\begin{array}{ccc}
 \mathcal{E} & \longrightarrow & \mathcal{F} \\
 & \searrow \text{dotted} & \uparrow p \\
 & & \mathcal{G}
 \end{array}$$

with \mathcal{E} a direct summand of a finite free \mathcal{O}_U -module and p surjective, then there exists a covering $\{U_i \rightarrow U\}$ such that a dotted arrow making the diagram commute exists over each U_i .

Proof. We may assume $\mathcal{E} = \mathcal{O}_U^{\oplus n}$ for some n . In this case finding the dotted arrow is equivalent to lifting the images of the basis elements in $\Gamma(U, \mathcal{F})$. This is locally possible by the characterization of surjective maps of sheaves (Sites, Section 7.12). □

Lemma 21.33.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} .*

- (1) *Let $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ be a morphism of complexes of \mathcal{O}_U -modules with \mathcal{E}^\bullet strictly perfect and \mathcal{F}^\bullet acyclic. Then there exists a covering $\{U_i \rightarrow U\}$ such that each $\alpha|_{U_i}$ is homotopic to zero.*

- (2) Let $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ be a morphism of complexes of \mathcal{O}_U -modules with \mathcal{E}^\bullet strictly perfect, $\mathcal{E}^i = 0$ for $i < a$, and $H^i(\mathcal{F}^\bullet) = 0$ for $i \geq a$. Then there exists a covering $\{U_i \rightarrow U\}$ such that each $\alpha|_{U_i}$ is homotopic to zero.

Proof. The first statement follows from the second, hence we only prove (2). We will prove this by induction on the length of the complex \mathcal{E}^\bullet . If $\mathcal{E}^\bullet \cong \mathcal{E}[-n]$ for some direct summand \mathcal{E} of a finite free \mathcal{O} -module and integer $n \geq a$, then the result follows from Lemma 21.33.5 and the fact that $\mathcal{F}^{n-1} \rightarrow \text{Ker}(\mathcal{F}^n \rightarrow \mathcal{F}^{n+1})$ is surjective by the assumed vanishing of $H^n(\mathcal{F}^\bullet)$. If \mathcal{E}^i is zero except for $i \in [a, b]$, then we have a split exact sequence of complexes

$$0 \rightarrow \mathcal{E}^b[-b] \rightarrow \mathcal{E}^\bullet \rightarrow \sigma_{\leq b-1}\mathcal{E}^\bullet \rightarrow 0$$

which determines a distinguished triangle in $K(\mathcal{O}_U)$. Hence an exact sequence

$$\text{Hom}_{K(\mathcal{O}_U)}(\sigma_{\leq b-1}\mathcal{E}^\bullet, \mathcal{F}^\bullet) \rightarrow \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \rightarrow \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{E}^b[-b], \mathcal{F}^\bullet)$$

by the axioms of triangulated categories. The composition $\mathcal{E}^b[-b] \rightarrow \mathcal{F}^\bullet$ is homotopic to zero on the members of a covering of U by the above, whence we may assume our map comes from an element in the left hand side of the displayed exact sequence above. This element is zero on the members of a covering of U by induction hypothesis. \square

Lemma 21.33.7. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . Given a solid diagram of complexes of \mathcal{O}_U -modules

$$\begin{array}{ccc} \mathcal{E}^\bullet & \xrightarrow{\alpha} & \mathcal{F}^\bullet \\ & \searrow \text{dotted} & \uparrow f \\ & & \mathcal{G}^\bullet \end{array}$$

with \mathcal{E}^\bullet strictly perfect, $\mathcal{E}^j = 0$ for $j < a$ and $H^j(f)$ an isomorphism for $j > a$ and surjective for $j = a$, then there exists a covering $\{U_i \rightarrow U\}$ and for each i a dotted arrow over U_i making the diagram commute up to homotopy.

Proof. Our assumptions on f imply the cone $C(f)^\bullet$ has vanishing cohomology sheaves in degrees $\geq a$. Hence Lemma 21.33.6 guarantees there is a covering $\{U_i \rightarrow U\}$ such that the composition $\mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet \rightarrow C(f)^\bullet$ is homotopic to zero over U_i . Since

$$\mathcal{G}^\bullet \rightarrow \mathcal{F}^\bullet \rightarrow C(f)^\bullet \rightarrow \mathcal{G}^\bullet[1]$$

restricts to a distinguished triangle in $K(\mathcal{O}_{U_i})$ we see that we can lift $\alpha|_{U_i}$ up to homotopy to a map $\alpha_i : \mathcal{E}^\bullet|_{U_i} \rightarrow \mathcal{G}^\bullet|_{U_i}$ as desired. \square

Lemma 21.33.8. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O}_U -modules with \mathcal{E}^\bullet strictly perfect.

- (1) For any element $\alpha \in \text{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ there exists a covering $\{U_i \rightarrow U\}$ such that $\alpha|_{U_i}$ is given by a morphism of complexes $\alpha_i : \mathcal{E}^\bullet|_{U_i} \rightarrow \mathcal{F}^\bullet|_{U_i}$.
- (2) Given a morphism of complexes $\alpha : \mathcal{E}^\bullet \rightarrow \mathcal{F}^\bullet$ whose image in the group $\text{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is zero, there exists a covering $\{U_i \rightarrow U\}$ such that $\alpha|_{U_i}$ is homotopic to zero.

Proof. Proof of (1). By the construction of the derived category we can find a quasi-isomorphism $f : \mathcal{F}^\bullet \rightarrow \mathcal{G}^\bullet$ and a map of complexes $\beta : \mathcal{E}^\bullet \rightarrow \mathcal{G}^\bullet$ such that

$\alpha = f^{-1}\beta$. Thus the result follows from Lemma 21.33.7. We omit the proof of (2). \square

Lemma 21.33.9. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O} -modules with \mathcal{E}^\bullet strictly perfect. Then the internal hom $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex \mathcal{H}^\bullet with terms*

$$\mathcal{H}^n = \bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

and differential as described in Section 21.26.

Proof. Choose a quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ into a K-injective complex. Let $(\mathcal{H}')^\bullet$ be the complex with terms

$$(\mathcal{H}')^n = \prod_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{L}^{-q}, \mathcal{I}^p)$$

which represents $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ by the construction in Section 21.26. It suffices to show that the map

$$\mathcal{H}^\bullet \longrightarrow (\mathcal{H}')^\bullet$$

is a quasi-isomorphism. Given an object U of \mathcal{C} we have by inspection

$$H^0(\mathcal{H}^\bullet(U)) = \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{E}^\bullet|_U, \mathcal{K}^\bullet|_U) \rightarrow H^0((\mathcal{H}')^\bullet(U)) = \text{Hom}_{D(\mathcal{O}_U)}(\mathcal{E}^\bullet|_U, \mathcal{K}^\bullet|_U)$$

By Lemma 21.33.8 the sheafification of $U \mapsto H^0(\mathcal{H}^\bullet(U))$ is equal to the sheafification of $U \mapsto H^0((\mathcal{H}')^\bullet(U))$. A similar argument can be given for the other cohomology sheaves. Thus \mathcal{H}^\bullet is quasi-isomorphic to $(\mathcal{H}')^\bullet$ which proves the lemma. \square

Lemma 21.33.10. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet$ be complexes of \mathcal{O} -modules with*

- (1) $\mathcal{F}^n = 0$ for $n \ll 0$,
- (2) $\mathcal{E}^n = 0$ for $n \gg 0$, and
- (3) \mathcal{E}^n isomorphic to a direct summand of a finite free \mathcal{O} -module.

Then the internal hom $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex \mathcal{H}^\bullet with terms

$$\mathcal{H}^n = \bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

and differential as described in Section 21.26.

Proof. Choose a quasi-isomorphism $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ where \mathcal{I}^\bullet is a bounded below complex of injectives. Note that \mathcal{I}^\bullet is K-injective (Derived Categories, Lemma 13.29.4). Hence the construction in Section 21.26 shows that $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$ is represented by the complex $(\mathcal{H}')^\bullet$ with terms

$$(\mathcal{H}')^n = \prod_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{I}^p) = \bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{I}^p)$$

(equality because there are only finitely many nonzero terms). Note that \mathcal{H}^\bullet is the total complex associated to the double complex with terms $\mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{F}^p)$ and similarly for $(\mathcal{H}')^\bullet$. The natural map $(\mathcal{H}')^\bullet \rightarrow \mathcal{H}^\bullet$ comes from a map of double complexes. Thus to show this map is a quasi-isomorphism, we may use the spectral sequence of a double complex (Homology, Lemma 12.22.6)

$${}'E_1^{p,q} = H^p(\mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{F}^\bullet))$$

converging to $H^{p+q}(\mathcal{H}^\bullet)$ and similarly for $(\mathcal{H}')^\bullet$. To finish the proof of the lemma it suffices to show that $\mathcal{F}^\bullet \rightarrow \mathcal{I}^\bullet$ induces an isomorphism

$$H^p(\mathcal{H}om_{\mathcal{O}}(\mathcal{E}, \mathcal{F}^\bullet)) \longrightarrow H^p(\mathcal{H}om_{\mathcal{O}}(\mathcal{E}, \mathcal{I}^\bullet))$$

on cohomology sheaves whenever \mathcal{E} is a direct summand of a finite free \mathcal{O} -module. Since this is clear when \mathcal{E} is finite free the result follows. \square

21.34. Pseudo-coherent modules

In this section we discuss pseudo-coherent complexes.

Definition 21.34.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{E}^\bullet be a complex of \mathcal{O} -modules. Let $m \in \mathbf{Z}$.

- (1) We say \mathcal{E}^\bullet is *m-pseudo-coherent* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ and for each i a morphism of complexes $\alpha_i : \mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{U_i}$ where \mathcal{E}_i is a strictly perfect complex of \mathcal{O}_{U_i} -modules and $H^j(\alpha_i)$ is an isomorphism for $j > m$ and $H^m(\alpha_i)$ is surjective.
- (2) We say \mathcal{E}^\bullet is *pseudo-coherent* if it is *m-pseudo-coherent* for all m .
- (3) We say an object E of $D(\mathcal{O})$ is *m-pseudo-coherent* (resp. *pseudo-coherent*) if and only if it can be represented by a *m-pseudo-coherent* (resp. *pseudo-coherent*) complex of \mathcal{O} -modules.

If \mathcal{C} has a final object X which is quasi-compact (i.e., every covering of X can be refined by a finite covering), then an *m-pseudo-coherent* object of $D(\mathcal{O})$ is in $D^-(\mathcal{O})$. But this need not be the case in general.

Lemma 21.34.2. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$.

- (1) If \mathcal{C} has a final object X and if there exist a covering $\{U_i \rightarrow X\}$, strictly perfect complexes \mathcal{E}_i^\bullet of \mathcal{O}_{U_i} -modules, and maps $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with $H^j(\alpha_i)$ an isomorphism for $j > m$ and $H^m(\alpha_i)$ surjective, then E is *m-pseudo-coherent*.
- (2) If E is *m-pseudo-coherent*, then any complex of \mathcal{O} -modules representing E is *m-pseudo-coherent*.
- (3) If for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ such that $E|_{U_i}$ is *m-pseudo-coherent*, then E is *m-pseudo-coherent*.

Proof. Let \mathcal{F}^\bullet be any complex representing E and let X , $\{U_i \rightarrow X\}$, and $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ be as in (1). We will show that \mathcal{F}^\bullet is *m-pseudo-coherent* as a complex, which will prove (1) and (2) in case \mathcal{C} has a final object. By Lemma 21.33.8 we can after refining the covering $\{U_i \rightarrow X\}$ represent the maps α_i by maps of complexes $\alpha_i : \mathcal{E}_i^\bullet \rightarrow \mathcal{F}^\bullet|_{U_i}$. By assumption $H^j(\alpha_i)$ are isomorphisms for $j > m$, and $H^m(\alpha_i)$ is surjective whence \mathcal{F}^\bullet is *m-pseudo-coherent*.

Proof of (2). By the above we see that $\mathcal{F}^\bullet|_U$ is *m-pseudo-coherent* as a complex of \mathcal{O}_U -modules for all objects U of \mathcal{C} . It is a formal consequence of the definitions that \mathcal{F}^\bullet is *m-pseudo-coherent*.

Proof of (3). Follows from the definitions and Sites, Definition 7.6.2 part (2). \square

Lemma 21.34.3. Let $(f, f^\#) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed sites. Let E be an object of $D(\mathcal{O}_{\mathcal{C}})$. If E is *m-pseudo-coherent*, then Lf^*E is *m-pseudo-coherent*.

Proof. Say f is given by the functor $u : \mathcal{D} \rightarrow \mathcal{C}$. Let U be an object of \mathcal{C} . By Sites, Lemma 7.15.9 we can find a covering $\{U_i \rightarrow U\}$ and for each i a morphism $U_i \rightarrow u(V_i)$ for some object V_i of \mathcal{D} . By Lemma 21.34.2 it suffices to show that $Lf^*E|_{U_i}$ is *m-pseudo-coherent*. To do this it is enough to show that $Lf^*E|_{u(V_i)}$

is m -pseudo-coherent, since $Lf^*E|_{U_i}$ is the restriction of $Lf^*E|_{u(V_i)}$ to \mathcal{C}/U_i (via Modules on Sites, Lemma 18.19.4). By the commutative diagram of Modules on Sites, Lemma 18.20.1 it suffices to prove the lemma for the morphism of ringed sites $(\mathcal{C}/u(V_i), \mathcal{O}_{u(V_i)}) \rightarrow (\mathcal{D}/V_i, \mathcal{O}_{V_i})$. Thus we may assume \mathcal{D} has a final object Y such that $X = u(Y)$ is a final object of \mathcal{C} .

Let $\{V_i \rightarrow Y\}$ be a covering such that for each i there exists a strictly perfect complex \mathcal{F}_i^\bullet of \mathcal{O}_{V_i} -modules and a morphism $\alpha_i : \mathcal{F}_i^\bullet \rightarrow E|_{V_i}$ of $D(\mathcal{O}_{V_i})$ such that $H^j(\alpha_i)$ is an isomorphism for $j > m$ and $H^m(\alpha_i)$ is surjective. Arguing as above it suffices to prove the result for $(\mathcal{C}/u(V_i), \mathcal{O}_{u(V_i)}) \rightarrow (\mathcal{D}/V_i, \mathcal{O}_{V_i})$. Hence we may assume that there exists a strictly perfect complex \mathcal{F}^\bullet of $\mathcal{O}_{\mathcal{D}}$ -modules and a morphism $\alpha : \mathcal{F}^\bullet \rightarrow E$ of $D(\mathcal{O}_{\mathcal{D}})$ such that $H^j(\alpha)$ is an isomorphism for $j > m$ and $H^m(\alpha)$ is surjective. In this case, choose a distinguished triangle

$$\mathcal{F}^\bullet \rightarrow E \rightarrow C \rightarrow \mathcal{F}^\bullet[1]$$

The assumption on α means exactly that the cohomology sheaves $H^j(C)$ are zero for all $j \geq m$. Applying Lf^* we obtain the distinguished triangle

$$Lf^*\mathcal{F}^\bullet \rightarrow Lf^*E \rightarrow Lf^*C \rightarrow Lf^*\mathcal{F}^\bullet[1]$$

By the construction of Lf^* as a left derived functor we see that $H^j(Lf^*C) = 0$ for $j \geq m$ (by the dual of Derived Categories, Lemma 13.17.1). Hence $H^j(Lf^*\alpha)$ is an isomorphism for $j > m$ and $H^m(Lf^*\alpha)$ is surjective. On the other hand, since \mathcal{F}^\bullet is a bounded above complex of flat $\mathcal{O}_{\mathcal{D}}$ -modules we see that $Lf^*\mathcal{F}^\bullet = f^*\mathcal{F}^\bullet$. Applying Lemma 21.33.4 we conclude. \square

Lemma 21.34.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site and $m \in \mathbf{Z}$. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O})$.*

- (1) *If K is $(m + 1)$ -pseudo-coherent and L is m -pseudo-coherent then M is m -pseudo-coherent.*
- (2) *If K and M are m -pseudo-coherent, then L is m -pseudo-coherent.*
- (3) *If L is $(m + 1)$ -pseudo-coherent and M is m -pseudo-coherent, then K is $(m + 1)$ -pseudo-coherent.*

Proof. Proof of (1). Let U be an object of \mathcal{C} . Choose a covering $\{U_i \rightarrow U\}$ and maps $\alpha_i : \mathcal{K}_i^\bullet \rightarrow K|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with \mathcal{K}_i^\bullet strictly perfect and $H^j(\alpha_i)$ isomorphisms for $j > m + 1$ and surjective for $j = m + 1$. We may replace \mathcal{K}_i^\bullet by $\sigma_{\geq m+1}\mathcal{K}_i^\bullet$ and hence we may assume that $\mathcal{K}_i^j = 0$ for $j < m + 1$. After refining the covering we may choose maps $\beta_i : \mathcal{L}_i^\bullet \rightarrow L|_{U_i}$ in $D(\mathcal{O}_{U_i})$ with \mathcal{L}_i^\bullet strictly perfect such that $H^j(\beta)$ is an isomorphism for $j > m$ and surjective for $j = m$. By Lemma 21.33.7 we can, after refining the covering, find maps of complexes $\gamma_i : \mathcal{K}^\bullet \rightarrow \mathcal{L}^\bullet$ such that the diagrams

$$\begin{array}{ccc} K|_{U_i} & \longrightarrow & L|_{U_i} \\ \alpha_i \uparrow & & \uparrow \beta_i \\ \mathcal{K}_i^\bullet & \xrightarrow{\gamma_i} & \mathcal{L}_i^\bullet \end{array}$$

are commutative in $D(\mathcal{O}_{U_i})$ (this requires representing the maps α_i, β_i and $K|_{U_i} \rightarrow L|_{U_i}$ by actual maps of complexes; some details omitted). The cone $C(\gamma_i)^\bullet$ is strictly perfect (Lemma 21.33.2). The commutativity of the diagram implies that there

exists a morphism of distinguished triangles

$$(\mathcal{K}_i^\bullet, \mathcal{L}_i^\bullet, C(\gamma_i)^\bullet) \longrightarrow (K|_{U_i}, L|_{U_i}, M|_{U_i}).$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5.19 and 12.5.20 that $C(\gamma_i)^\bullet \rightarrow M|_{U_i}$ induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . Hence M is m -pseudo-coherent by Lemma 21.34.2.

Assertions (2) and (3) follow from (1) by rotating the distinguished triangle. \square

Lemma 21.34.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L be objects of $D(\mathcal{O})$.*

- (1) *If K is n -pseudo-coherent and $H^i(K) = 0$ for $i > a$ and L is m -pseudo-coherent and $H^j(L) = 0$ for $j > b$, then $K \otimes_{\mathcal{O}}^L L$ is t -pseudo-coherent with $t = \max(m + a, n + b)$.*
- (2) *If K and L are pseudo-coherent, then $K \otimes_{\mathcal{O}}^L L$ is pseudo-coherent.*

Proof. Proof of (1). Let U be an object of \mathcal{C} . By replacing U by the members of a covering and replacing \mathcal{C} by the localization \mathcal{C}/U we may assume there exist strictly perfect complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet and maps $\alpha : \mathcal{K}^\bullet \rightarrow K$ and $\beta : \mathcal{L}^\bullet \rightarrow L$ with $H^i(\alpha)$ and isomorphism for $i > n$ and surjective for $i = n$ and with $H^i(\beta)$ and isomorphism for $i > m$ and surjective for $i = m$. Then the map

$$\alpha \otimes^L \beta : \text{Tot}(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \mathcal{L}^\bullet) \rightarrow K \otimes_{\mathcal{O}}^L L$$

induces isomorphisms on cohomology sheaves in degree i for $i > t$ and a surjection for $i = t$. This follows from the spectral sequence of tors (details omitted).

Proof of (2). Let U be an object of \mathcal{C} . We may first replace U by the members of a covering and \mathcal{C} by the localization \mathcal{C}/U to reduce to the case that K and L are bounded above. Then the statement follows immediately from case (1). \square

Lemma 21.34.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $m \in \mathbf{Z}$. If $K \oplus L$ is m -pseudo-coherent (resp. pseudo-coherent) in $D(\mathcal{O})$ so are K and L .*

Proof. Assume that $K \oplus L$ is m -pseudo-coherent. Let U be an object of \mathcal{C} . After replacing U by the members of a covering we may assume $K \oplus L \in D^-(\mathcal{O}_U)$, hence $L \in D^-(\mathcal{O}_U)$. Note that there is a distinguished triangle

$$(K \oplus L, K \oplus L, L \oplus L[1]) = (K, K, 0) \oplus (L, L, L \oplus L[1])$$

see Derived Categories, Lemma 13.4.9. By Lemma 21.34.4 we see that $L \oplus L[1]$ is m -pseudo-coherent. Hence also $L[1] \oplus L[2]$ is m -pseudo-coherent. By induction $L[n] \oplus L[n + 1]$ is m -pseudo-coherent. Since L is bounded above we see that $L[n]$ is m -pseudo-coherent for large n . Hence working backwards, using the distinguished triangles

$$(L[n], L[n] \oplus L[n - 1], L[n - 1])$$

we conclude that $L[n - 1], L[n - 2], \dots, L$ are m -pseudo-coherent as desired. \square

Lemma 21.34.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K be an object of $D(\mathcal{O})$. Let $m \in \mathbf{Z}$.*

- (1) *If K is m -pseudo-coherent and $H^i(K) = 0$ for $i > m$, then $H^m(K)$ is a finite type \mathcal{O} -module.*
- (2) *If K is m -pseudo-coherent and $H^i(K) = 0$ for $i > m + 1$, then $H^{m+1}(K)$ is a finitely presented \mathcal{O} -module.*

Proof. Proof of (1). Let U be an object of \mathcal{C} . We have to show that $H^m(K)$ is can be generated by finitely many sections over the members of a covering of U (see Modules on Sites, Definition 18.23.1). Thus during the proof we may (finitely often) choose a covering $\{U_i \rightarrow U\}$ and replace \mathcal{C} by \mathcal{C}/U_i and U by U_i . In particular, by our definitions we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow K$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . It suffices to prove the result for \mathcal{E}^\bullet . Let n be the largest integer such that $\mathcal{E}^n \neq 0$. If $n = m$, then $H^m(\mathcal{E}^\bullet)$ is a quotient of \mathcal{E}^n and the result is clear. If $n > m$, then $\mathcal{E}^{n-1} \rightarrow \mathcal{E}^n$ is surjective as $H^n(\mathcal{E}^\bullet) = 0$. By Lemma 21.33.5 we can (after replacing U by the members of a covering) find a section of this surjection and write $\mathcal{E}^{n-1} = \mathcal{E}' \oplus \mathcal{E}^n$. Hence it suffices to prove the result for the complex $(\mathcal{E}')^\bullet$ which is the same as \mathcal{E}^\bullet except has \mathcal{E}' in degree $n - 1$ and 0 in degree n . We win by induction on n .

Proof of (2). Pick an object U of \mathcal{C} . As in the proof of (1) we may work locally on U . Hence we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow K$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . As in the proof of (1) we can reduce to the case that $\mathcal{E}^i = 0$ for $i > m + 1$. Then we see that $H^{m+1}(K) \cong H^{m+1}(\mathcal{E}^\bullet) = \text{Coker}(\mathcal{E}^m \rightarrow \mathcal{E}^{m+1})$ which is of finite presentation. \square

21.35. Tor dimension

In this section we take a closer look at resolutions by flat modules.

Definition 21.35.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$ with $a \leq b$.

- (1) We say E has *tor-amplitude in $[a, b]$* if $H^i(E \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}) = 0$ for all \mathcal{O} -modules \mathcal{F} and all $i \notin [a, b]$.
- (2) We say E has *finite tor dimension* if it has tor-amplitude in $[a, b]$ for some a, b .
- (3) We say E *locally has finite tor dimension* if for any object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ such that $E|_{U_i}$ has finite tor dimension for all i .

Note that if E has finite tor dimension, then E is an object of $D^b(\mathcal{O})$ as can be seen by taking $\mathcal{F} = \mathcal{O}$ in the definition above.

Lemma 21.35.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{E}^\bullet be a bounded above complex of flat \mathcal{O} -modules with tor-amplitude in $[a, b]$. Then $\text{Coker}(d_{\mathcal{E}^\bullet}^{a-1})$ is a flat \mathcal{O} -module.*

Proof. As \mathcal{E}^\bullet is a bounded above complex of flat modules we see that $\mathcal{E}^\bullet \otimes_{\mathcal{O}} \mathcal{F} = \mathcal{E}^\bullet \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ for any \mathcal{O} -module \mathcal{F} . Hence for every \mathcal{O} -module \mathcal{F} the sequence

$$\mathcal{E}^{a-2} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^a \otimes_{\mathcal{O}} \mathcal{F}$$

is exact in the middle. Since $\mathcal{E}^{a-2} \rightarrow \mathcal{E}^{a-1} \rightarrow \mathcal{E}^a \rightarrow \text{Coker}(d^{a-1}) \rightarrow 0$ is a flat resolution this implies that $\text{Tor}_1^{\mathcal{O}}(\text{Coker}(d^{a-1}), \mathcal{F}) = 0$ for all \mathcal{O} -modules \mathcal{F} . This means that $\text{Coker}(d^{a-1})$ is flat, see Lemma 21.17.13. \square

Lemma 21.35.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$ with $a \leq b$. The following are equivalent*

- (1) E has *tor-amplitude in $[a, b]$* .

- (2) E is represented by a complex \mathcal{E}^\bullet of flat \mathcal{O} -modules with $\mathcal{E}^i = 0$ for $i \notin [a, b]$.

Proof. If (2) holds, then we may compute $E \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F} = \mathcal{E}^\bullet \otimes_{\mathcal{O}} \mathcal{F}$ and it is clear that (1) holds.

Assume that (1) holds. We may represent E by a bounded above complex of flat \mathcal{O} -modules \mathcal{K}^\bullet , see Section 21.17. Let n be the largest integer such that $\mathcal{K}^n \neq 0$. If $n > b$, then $\mathcal{K}^{n-1} \rightarrow \mathcal{K}^n$ is surjective as $H^n(\mathcal{K}^\bullet) = 0$. As \mathcal{K}^n is flat we see that $\text{Ker}(\mathcal{K}^{n-1} \rightarrow \mathcal{K}^n)$ is flat (Modules on Sites, Lemma 18.28.8). Hence we may replace \mathcal{K}^\bullet by $\tau_{\leq n-1} \mathcal{K}^\bullet$. Thus, by induction on n , we reduce to the case that \mathcal{K}^\bullet is a complex of flat \mathcal{O} -modules with $\mathcal{K}^i = 0$ for $i > b$.

Set $\mathcal{E}^\bullet = \tau_{\geq a} \mathcal{K}^\bullet$. Everything is clear except that \mathcal{E}^a is flat which follows immediately from Lemma 21.35.2 and the definitions. \square

Lemma 21.35.4. *Let $(f, f^\sharp) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed sites. Assume \mathcal{C} has enough points. Let E be an object of $D(\mathcal{O}_{\mathcal{D}})$. If E has tor amplitude in $[a, b]$, then Lf^*E has tor amplitude in $[a, b]$.*

Proof. Assume E has tor amplitude in $[a, b]$. By Lemma 21.35.3 we can represent E by a complex of \mathcal{E}^\bullet of flat \mathcal{O} -modules with $\mathcal{E}^i = 0$ for $i \notin [a, b]$. Then Lf^*E is represented by $f^*\mathcal{E}^\bullet$. By Modules on Sites, Lemma 18.38.3 the module $f^*\mathcal{E}^i$ are flat (this is where we need the assumption on the existence of points). Thus by Lemma 21.35.3 we conclude that Lf^*E has tor amplitude in $[a, b]$. \square

Lemma 21.35.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O})$. Let $a, b \in \mathbf{Z}$.*

- (1) *If K has tor-amplitude in $[a + 1, b + 1]$ and L has tor-amplitude in $[a, b]$ then M has tor-amplitude in $[a, b]$.*
- (2) *If K and M have tor-amplitude in $[a, b]$, then L has tor-amplitude in $[a, b]$.*
- (3) *If L has tor-amplitude in $[a + 1, b + 1]$ and M has tor-amplitude in $[a, b]$, then K has tor-amplitude in $[a + 1, b + 1]$.*

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation. \square

Lemma 21.35.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K, L be objects of $D(\mathcal{O})$. If K has tor-amplitude in $[a, b]$ and L has tor-amplitude in $[c, d]$ then $K \otimes_{\mathcal{O}}^{\mathbf{L}} L$ has tor amplitude in $[a + c, b + d]$.*

Proof. Omitted. Hint: use the spectral sequence for tors. \square

Lemma 21.35.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $a, b \in \mathbf{Z}$. For K, L objects of $D(\mathcal{O})$ if $K \oplus L$ has tor amplitude in $[a, b]$ so do K and L .*

Proof. Clear from the fact that the Tor functors are additive. \square

Lemma 21.35.8. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. Let K be an object of $D(\mathcal{O})$.*

- (1) *If $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}$ is bounded above, then $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n$ is uniformly bounded above for all n .*

- (2) If $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}$ as an object of $D(\mathcal{O}/\mathcal{I})$ has tor amplitude in $[a, b]$, then $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n$ as an object of $D(\mathcal{O}/\mathcal{I}^n)$ has tor amplitude in $[a, b]$ for all n .

Proof. Proof of (1). Assume that $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}$ is bounded above, say $H^i(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}) = 0$ for $i > b$. Note that we have distinguished triangles

$$K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^n/\mathcal{I}^{n+1} \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^{n+1} \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n \rightarrow K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^n/\mathcal{I}^{n+1}[1]$$

and that

$$K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{I}^n/\mathcal{I}^{n+1} = (K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}) \otimes_{\mathcal{O}/\mathcal{I}}^{\mathbf{L}} \mathcal{I}^n/\mathcal{I}^{n+1}$$

By induction we conclude that $H^i(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n) = 0$ for $i > b$ for all n .

Proof of (2). Assume $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}$ as an object of $D(\mathcal{O}/\mathcal{I})$ has tor amplitude in $[a, b]$. Let \mathcal{F} be a sheaf of $\mathcal{O}/\mathcal{I}^n$ -modules. Then we have a finite filtration

$$0 \subset \mathcal{I}^{n-1}\mathcal{F} \subset \dots \subset \mathcal{I}\mathcal{F} \subset \mathcal{F}$$

whose successive quotients are sheaves of \mathcal{O}/\mathcal{I} -modules. Thus to prove that $K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n$ has tor amplitude in $[a, b]$ it suffices to show $H^i(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n \otimes_{\mathcal{O}/\mathcal{I}^n}^{\mathbf{L}} \mathcal{G})$ is zero for $i \notin [a, b]$ for all \mathcal{O}/\mathcal{I} -modules \mathcal{G} . Since

$$(K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}^n) \otimes_{\mathcal{O}/\mathcal{I}^n}^{\mathbf{L}} \mathcal{G} = (K \otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{O}/\mathcal{I}) \otimes_{\mathcal{O}/\mathcal{I}}^{\mathbf{L}} \mathcal{G}$$

for every sheaf of \mathcal{O}/\mathcal{I} -modules \mathcal{G} the result follows. □

21.36. Perfect complexes

In this section we discuss properties of perfect complexes on ringed sites.

Definition 21.36.1. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let \mathcal{E}^\bullet be a complex of \mathcal{O} -modules. We say \mathcal{E}^\bullet is *perfect* if for every object U of \mathcal{C} there exists a covering $\{U_i \rightarrow U\}$ such that for each i there exists a morphism of complexes $\mathcal{E}_i^\bullet \rightarrow \mathcal{E}^\bullet|_{U_i}$ which is a quasi-isomorphism with \mathcal{E}_i^\bullet strictly perfect. An object E of $D(\mathcal{O})$ is *perfect* if it can be represented by a perfect complex of \mathcal{O} -modules.

Lemma 21.36.2. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$.*

- (1) *If \mathcal{C} has a final object X and there exist a covering $\{U_i \rightarrow X\}$, strictly perfect complexes \mathcal{E}_i^\bullet of \mathcal{O}_{U_i} -modules, and isomorphisms $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ in $D(\mathcal{O}_{U_i})$, then E is perfect.*
- (2) *If E is perfect, then any complex representing E is perfect.*

Proof. Identical to the proof of Lemma 21.34.2. □

Lemma 21.36.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$. Let $a \leq b$ be integers. If E has tor amplitude in $[a, b]$ and is $(a - 1)$ -pseudo-coherent, then E is perfect.*

Proof. Let U be an object of \mathcal{C} . After replacing U by the members of a covering and \mathcal{C} by the localization \mathcal{C}/U we may assume there exists a strictly perfect complex \mathcal{E}^\bullet and a map $\alpha : \mathcal{E}^\bullet \rightarrow E$ such that $H^i(\alpha)$ is an isomorphism for $i \geq a$. We may and do replace \mathcal{E}^\bullet by $\sigma_{\geq a-1}\mathcal{E}^\bullet$. Choose a distinguished triangle

$$\mathcal{E}^\bullet \rightarrow E \rightarrow C \rightarrow \mathcal{E}^\bullet[1]$$

From the vanishing of cohomology sheaves of E and \mathcal{E}^\bullet and the assumption on α we obtain $C \cong \mathcal{K}[a - 2]$ with $\mathcal{K} = \text{Ker}(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^a)$. Let \mathcal{F} be an \mathcal{O} -module. Applying $-\otimes_{\mathcal{O}}^{\mathbf{L}} \mathcal{F}$ the assumption that E has tor amplitude in $[a, b]$ implies $\mathcal{K} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow$

$\mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F}$ has image $\text{Ker}(\mathcal{E}^{a-1} \otimes_{\mathcal{O}} \mathcal{F} \rightarrow \mathcal{E}^a \otimes_{\mathcal{O}} \mathcal{F})$. It follows that $\text{Tor}_1^{\mathcal{O}}(\mathcal{E}', \mathcal{F}) = 0$ where $\mathcal{E}' = \text{Coker}(\mathcal{E}^{a-1} \rightarrow \mathcal{E}^a)$. Hence \mathcal{E}' is flat (Lemma 21.17.13). Thus there exists a covering $\{U_i \rightarrow U\}$ such that $\mathcal{E}'|_{U_i}$ is a direct summand of a finite free module by Modules on Sites, Lemma 18.28.12. Thus the complex

$$\mathcal{E}'|_{U_i} \rightarrow \mathcal{E}^{a-1}|_{U_i} \rightarrow \dots \rightarrow \mathcal{E}^b|_{U_i}$$

is quasi-isomorphic to $E|_{U_i}$ and E is perfect. □

Lemma 21.36.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let E be an object of $D(\mathcal{O})$. The following are equivalent*

- (1) E is perfect, and
- (2) E is pseudo-coherent and locally has finite tor dimension.

Proof. Assume (1). Let U be an object of \mathcal{C} . By definition there exists a covering $\{U_i \rightarrow U\}$ such that $E|_{U_i}$ is represented by a strictly perfect complex. Thus E is pseudo-coherent (i.e., m -pseudo-coherent for all m) by Lemma 21.34.2. Moreover, a direct summand of a finite free module is flat, hence $E|_{U_i}$ has finite Tor dimension by Lemma 21.35.3. Thus (2) holds.

Assume (2). Let U be an object of \mathcal{C} . After replacing U by the members of a covering we may assume there exist integers $a \leq b$ such that $E|_U$ has tor amplitude in $[a, b]$. Since $E|_U$ is m -pseudo-coherent for all m we conclude using Lemma 21.36.3. □

Lemma 21.36.5. *Let $(f, f^\#) : (\mathcal{C}, \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{D}, \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed sites. Assume \mathcal{C} has enough points. Let E be an object of $D(\mathcal{O}_{\mathcal{D}})$. If E is perfect in $D(\mathcal{O}_{\mathcal{D}})$, then Lf^*E is perfect in $D(\mathcal{O}_{\mathcal{C}})$.*

Proof. This follows from Lemma 21.36.4, 21.35.4, and 21.34.3. (An alternative proof is to copy the proof of Lemma 21.34.3. This gives a proof of the result without assuming the site \mathcal{C} has enough points.) □

Lemma 21.36.6. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (K, L, M, f, g, h) be a distinguished triangle in $D(\mathcal{O})$. If two out of three of K, L, M are perfect then the third is also perfect.*

Proof. First proof: Combine Lemmas 21.36.4, 21.34.4, and 21.35.5. Second proof (sketch): Say K and L are perfect. Let U be an object of \mathcal{C} . After replacing U by the members of a covering we may assume that $K|_U$ and $L|_U$ are represented by strictly perfect complexes \mathcal{K}^\bullet and \mathcal{L}^\bullet . After replacing U by the members of a covering we may assume the map $K|_U \rightarrow L|_U$ is given by a map of complexes $\alpha : \mathcal{K}^\bullet \rightarrow \mathcal{L}^\bullet$, see Lemma 21.33.8. Then $M|_U$ is isomorphic to the cone of α which is strictly perfect by Lemma 21.33.2. □

Lemma 21.36.7. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If K, L are perfect objects of $D(\mathcal{O})$, then so is $K \otimes_{\mathcal{O}}^L L$.*

Proof. Follows from Lemmas 21.36.4, 21.34.5, and 21.35.6. □

Lemma 21.36.8. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. If $K \oplus L$ is a perfect object of $D(\mathcal{O})$, then so are K and L .*

Proof. Follows from Lemmas 21.36.4, 21.34.6, and 21.35.7. □

Lemma 21.36.9. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K be a perfect object of $D(\mathcal{O})$. Then $K^\wedge = R\mathcal{H}om(K, \mathcal{O})$ is a perfect object too and $(K^\wedge)^\wedge = K$. There are functorial isomorphisms*

$$K^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M = R\mathcal{H}om_{\mathcal{O}}(K, M)$$

and

$$H^0(\mathcal{C}, K^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M) = \text{Hom}_{D(\mathcal{O})}(K, M)$$

for M in $D(\mathcal{O})$.

Proof. We will use without further mention that formation of internal hom commutes with restriction (Lemma 21.26.3). In particular we may check the first two statements locally, i.e., given any object U of \mathcal{C} it suffices to prove there is a covering $\{U_i \rightarrow U\}$ such that the statement is true after restricting to \mathcal{C}/U_i for each i . By Lemma 21.26.8 to see the final statement it suffices to check that the map (21.26.8.1)

$$K^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M \longrightarrow R\mathcal{H}om(K, M)$$

is an isomorphism. This is a local question as well. Hence it suffices to prove the lemma when K is represented by a strictly perfect complex.

Assume K is represented by the strictly perfect complex \mathcal{E}^\bullet . Then it follows from Lemma 21.33.9 that K^\wedge is represented by the complex whose terms are $(\mathcal{E}^n)^\wedge = \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^n, \mathcal{O})$ in degree $-n$. Since \mathcal{E}^n is a direct summand of a finite free \mathcal{O} -module, so is $(\mathcal{E}^n)^\wedge$. Hence K^\wedge is represented by a strictly perfect complex too. It is also clear that $(K^\wedge)^\wedge = K$ as we have $((\mathcal{E}^n)^\wedge)^\wedge = \mathcal{E}^n$. To see that (21.26.8.1) is an isomorphism, represent M by a K -flat complex \mathcal{F}^\bullet . By Lemma 21.33.9 the complex $R\mathcal{H}om(K, M)$ is represented by the complex with terms

$$\bigoplus_{n=p+q} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}^{-q}, \mathcal{F}^p)$$

On the other hand, the object $K^\wedge \otimes_{\mathcal{O}}^{\mathbf{L}} M$ is represented by the complex with terms

$$\bigoplus_{n=p+q} \mathcal{F}^p \otimes_{\mathcal{O}} (\mathcal{E}^{-q})^\wedge$$

Thus the assertion that (21.26.8.1) is an isomorphism reduces to the assertion that the canonical map

$$\mathcal{F} \otimes_{\mathcal{O}} \mathcal{H}om_{\mathcal{O}}(\mathcal{E}, \mathcal{O}) \longrightarrow \mathcal{H}om_{\mathcal{O}}(\mathcal{E}, \mathcal{F})$$

is an isomorphism when \mathcal{E} is a direct summand of a finite free \mathcal{O} -module and \mathcal{F} is any \mathcal{O} -module. This follows immediately from the corresponding statement when \mathcal{E} is finite free. \square

Lemma 21.36.10. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(K_n)_{n \in \mathbf{N}}$ be a system of perfect objects of $D(\mathcal{O})$. Let $K = \text{hocolim} K_n$ be the derived colimit (Derived Categories, Definition 13.31.1). Then for any object E of $D(\mathcal{O})$ we have*

$$R\mathcal{H}om(K, E) = R\lim E \otimes_{\mathcal{O}}^{\mathbf{L}} K_n^\wedge$$

where (K_n^\wedge) is the inverse system of dual perfect complexes.

Proof. By Lemma 21.36.9 we have $R\lim E \otimes_{\mathcal{O}}^{\mathbf{L}} K_n^\wedge = R\lim R\mathcal{H}om(K_n, E)$ which fits into the distinguished triangle

$$R\lim R\mathcal{H}om(K_n, E) \rightarrow \prod R\mathcal{H}om(K_n, E) \rightarrow \prod R\mathcal{H}om(K_n, E)$$

Because K similarly fits into the distinguished triangle $\bigoplus K_n \rightarrow \bigoplus K_n \rightarrow K$ it suffices to show that $\prod R\mathcal{H}om(K_n, E) = R\mathcal{H}om(\bigoplus K_n, E)$. This is a formal consequence of (21.26.0.1) and the fact that derived tensor product commutes with direct sums. \square

21.37. Projection formula

A general version of the projection formula is the following.

Lemma 21.37.1. *Let $f : (\mathcal{S}h(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathcal{S}h(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let $E \in D(\mathcal{O}_{\mathcal{C}})$ and $K \in D(\mathcal{O}_{\mathcal{D}})$. If K is perfect, then*

$$Rf_*E \otimes_{\mathcal{O}_{\mathcal{D}}}^{\mathbf{L}} K = Rf_*(E \otimes_{\mathcal{O}_{\mathcal{C}}}^{\mathbf{L}} Lf^*K)$$

in $D(\mathcal{O}_{\mathcal{D}})$.

Proof. Without any assumptions there is a map $Rf_*(E) \otimes^{\mathbf{L}} K \rightarrow Rf_*(E \otimes^{\mathbf{L}} Lf^*K)$. Namely, it is the adjoint to the canonical map

$$Lf^*(Rf_*(E) \otimes^{\mathbf{L}} K) = Lf^*(Rf_*(E)) \otimes^{\mathbf{L}} Lf^*K \longrightarrow E \otimes^{\mathbf{L}} Lf^*K$$

coming from the map $Lf^*Rf_*E \rightarrow E$. See Lemmas 21.18.4 and 21.19.1. To check it is an isomorphism we may work locally on \mathcal{D} , i.e., for any object V of \mathcal{D} we have to find a covering $\{V_j \rightarrow V\}$ such that the map restricts to an isomorphism on V_j . By definition of perfect objects, this means we may assume K is represented by a strictly perfect complex of $\mathcal{O}_{\mathcal{D}}$ -modules. Note that, completely generally, the statement is true for $K = K_1 \oplus K_2$, if and only if the statement is true for K_1 and K_2 . Hence we may assume K is a finite complex of finite free $\mathcal{O}_{\mathcal{D}}$ -modules. In this case a simple argument involving stupid truncations reduces the statement to the case where K is represented by a finite free $\mathcal{O}_{\mathcal{D}}$ -module. Since the statement is invariant under finite direct summands in the K variable, we conclude it suffices to prove it for $K = \mathcal{O}_{\mathcal{D}}[n]$ in which case it is trivial. \square

21.38. Weakly contractible objects

An object U of a site is *weakly contractible* if every surjection $\mathcal{F} \rightarrow \mathcal{G}$ of sheaves of sets gives rise to a surjection $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$, see Sites, Definition 7.39.2.

Lemma 21.38.1. *Let \mathcal{C} be a site. Let U be a weakly contractible object of \mathcal{C} . Then*

- (1) *the functor $\mathcal{F} \mapsto \mathcal{F}(U)$ is an exact functor $Ab(\mathcal{C}) \rightarrow Ab$,*
- (2) *$H^p(U, \mathcal{F}) = 0$ for every abelian sheaf \mathcal{F} and all $p \geq 1$, and*
- (3) *for any sheaf of groups \mathcal{G} any \mathcal{G} -torsor has a section over U .*

Proof. The first statement follows immediately from the definition (see also Homology, Section 12.7). The higher derived functors vanish by Derived Categories, Lemma 13.17.8. Let \mathcal{F} be a \mathcal{G} -torsor. Then $\mathcal{F} \rightarrow *$ is a surjective map of sheaves. Hence (3) follows from the definition as well. \square

It is convenient to list some consequences of having enough weakly contractible objects here.

Proposition 21.38.2. *Let \mathcal{C} be a site. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ such that every $U \in \mathcal{B}$ is weakly contractible and every object of \mathcal{C} has a covering by elements of \mathcal{B} . Let \mathcal{O} be a sheaf of rings on \mathcal{C} . Then*

- (1) *A complex $\mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3$ of \mathcal{O} -modules is exact, if and only if $\mathcal{F}_1(U) \rightarrow \mathcal{F}_2(U) \rightarrow \mathcal{F}_3(U)$ is exact for all $U \in \mathcal{B}$.*

- (2) Every object K of $D(\mathcal{O})$ is a derived limit of its canonical truncations:
 $K = R\lim \tau_{\geq -n}K$.
- (3) Given an inverse system $\dots \rightarrow \mathcal{F}_3 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_1$ with surjective transition maps, the projection $\lim \mathcal{F}_n \rightarrow \mathcal{F}_1$ is surjective.
- (4) Products are exact on $\text{Mod}(\mathcal{O})$.
- (5) Products on $D(\mathcal{O})$ can be computed by taking products of any representative complexes.
- (6) If (\mathcal{F}_n) is an inverse system of \mathcal{O} -modules, then $R^p\lim \mathcal{F}_n = 0$ for all $p > 1$ and

$$R^1\lim \mathcal{F}_n = \text{Coker}(\prod \mathcal{F}_n \rightarrow \prod \mathcal{F}_n)$$

where the map is $(x_n) \mapsto (x_n - f(x_{n+1}))$.

- (7) If (K_n) is an inverse system of objects of $D(\mathcal{O})$, then there are short exact sequences

$$0 \rightarrow R^1\lim H^{p-1}(K_n) \rightarrow H^p(R\lim K_n) \rightarrow \lim H^p(K_n) \rightarrow 0$$

Proof. Proof of (1). If the sequence is exact, then evaluating at any weakly contractible element of \mathcal{C} gives an exact sequence by Lemma 21.38.1. Conversely, assume that $\mathcal{F}_1(U) \rightarrow \mathcal{F}_2(U) \rightarrow \mathcal{F}_3(U)$ is exact for all $U \in \mathcal{B}$. Let V be an object of \mathcal{C} and let $s \in \mathcal{F}_2(V)$ be an element of the kernel of $\mathcal{F}_2 \rightarrow \mathcal{F}_3$. By assumption there exists a covering $\{U_i \rightarrow V\}$ with $U_i \in \mathcal{B}$. Then $s|_{U_i}$ lifts to a section $s_i \in \mathcal{F}_1(U_i)$. Thus s is a section of the image sheaf $\text{Im}(\mathcal{F}_1 \rightarrow \mathcal{F}_2)$. In other words, the sequence $\mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3$ is exact.

Proof of (2). Lemma 21.22.3 applies to every complex of sheaves on \mathcal{C} . Thus (1) holds by Lemma 21.22.4.

Proof of (3). Let (\mathcal{F}_n) be a system as in (2) and set $\mathcal{F} = \lim \mathcal{F}_n$. If $U \in \mathcal{B}$, then $\mathcal{F}(U) = \lim \mathcal{F}_n(U)$ surjects onto $\mathcal{F}_1(U)$ as all the transition maps $\mathcal{F}_{n+1}(U) \rightarrow \mathcal{F}_n(U)$ are surjective. Thus $\mathcal{F} \rightarrow \mathcal{F}_1$ is surjective by Sites, Definition 7.12.1 and the assumption that every object has a covering by elements of \mathcal{B} .

Proof of (4). Let $\mathcal{F}_{i,1} \rightarrow \mathcal{F}_{i,2} \rightarrow \mathcal{F}_{i,3}$ be a family of exact sequences of \mathcal{O} -modules. We want to show that $\prod \mathcal{F}_{i,1} \rightarrow \prod \mathcal{F}_{i,2} \rightarrow \prod \mathcal{F}_{i,3}$ is exact. We use the criterion of (1). Let $U \in \mathcal{B}$. Then

$$(\prod \mathcal{F}_{i,1})(U) \rightarrow (\prod \mathcal{F}_{i,2})(U) \rightarrow (\prod \mathcal{F}_{i,3})(U)$$

is the same as

$$\prod \mathcal{F}_{i,1}(U) \rightarrow \prod \mathcal{F}_{i,2}(U) \rightarrow \prod \mathcal{F}_{i,3}(U)$$

Each of the sequences $\mathcal{F}_{i,1}(U) \rightarrow \mathcal{F}_{i,2}(U) \rightarrow \mathcal{F}_{i,3}(U)$ are exact by (1). Thus the displayed sequences are exact by Homology, Lemma 12.28.1. We conclude by (1) again.

Proof of (5). Follows from (4) and (slightly generalized) Derived Categories, Lemma 13.32.2.

Proof of (6) and (7). We refer to Section 21.21 for a discussion of derived and homotopy limits and their relationship. By Derived Categories, Definition 13.32.1 we have a distinguished triangle

$$R\lim K_n \rightarrow \prod K_n \rightarrow \prod K_n \rightarrow R\lim K_n[1]$$

Taking the long exact sequence of cohomology sheaves we obtain

$$H^{p-1}(\prod K_n) \rightarrow H^{p-1}(\prod K_n) \rightarrow H^p(R\lim K_n) \rightarrow H^p(\prod K_n) \rightarrow H^p(\prod K_n)$$

Since products are exact by (4) this becomes

$$\prod H^{p-1}(K_n) \rightarrow \prod H^{p-1}(K_n) \rightarrow H^p(R\lim K_n) \rightarrow \prod H^p(K_n) \rightarrow \prod H^p(K_n)$$

Now we first apply this to the case $K_n = \mathcal{F}_n[0]$ where (\mathcal{F}_n) is as in (6). We conclude that (6) holds. Next we apply it to (K_n) as in (7) and we conclude (7) holds. \square

21.39. Compact objects

In this section we study compact objects in the derived category of modules on a ringed site. We recall that compact objects are defined in Derived Categories, Definition 13.34.1.

Lemma 21.39.1. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Assume \mathcal{C} has the following properties*

- (1) \mathcal{C} has a quasi-compact final object X ,
- (2) every object of \mathcal{C} can be covered by quasi-compact objects,
- (3) for a finite covering $\{U_i \rightarrow U\}_{i \in I}$ with U , U_i quasi-compact the fibre products $U_i \times_U U_j$ are quasi-compact.

Then any perfect object of $D(\mathcal{O})$ is compact.

Proof. Let K be a perfect object and let K^\wedge be its dual, see Lemma 21.36.9. Then we have

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(K, M) = H^0(X, K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} M)$$

functorially in M in $D(\mathcal{O}_X)$. Since $K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} -$ commutes with direct sums (by construction) and H^0 does by Lemma 21.16.1 and the construction of direct sums in Injectives, Lemma 19.13.4 we obtain the result of the lemma. \square

Lemma 21.39.2. *Let \mathcal{A} be a Grothendieck abelian category. Let $S \subset \mathrm{Ob}(\mathcal{A})$ be a set of objects such that*

- (1) any object of \mathcal{A} is a quotient of a direct sum of elements of S , and
- (2) for any $E \in S$ the functor $\mathrm{Hom}_{\mathcal{A}}(E, -)$ commutes with direct sums.

Then every compact object of $D(\mathcal{A})$ is a direct summand in $D(\mathcal{A})$ of a finite complex of finite direct sums of elements of S .

Proof. Assume $K \in D(\mathcal{A})$ is a compact object. Represent K by a complex K^\bullet and consider the map

$$K^\bullet \longrightarrow \bigoplus_{n \geq 0} \tau_{\geq n} K^\bullet$$

where we have used the canonical truncations, see Homology, Section 12.13. This makes sense as in each degree the direct sum on the right is finite. By assumption this map factors through a finite direct sum. We conclude that $K \rightarrow \tau_{\geq n} K$ is zero for at least one n , i.e., K is in $D^-(R)$.

We may represent K by a bounded above complex K^\bullet each of whose terms is a direct sum of objects from S , see Derived Categories, Lemma 13.16.5. Note that we have

$$K^\bullet = \bigcup_{n \leq 0} \sigma_{\geq n} K^\bullet$$

where we have used the stupid truncations, see Homology, Section 12.13. Hence by Derived Categories, Lemmas 13.31.4 and 13.31.5 we see that $1 : K^\bullet \rightarrow K^\bullet$ factors through $\sigma_{\geq n} K^\bullet \rightarrow K^\bullet$ in $D(R)$. Thus we see that $1 : K^\bullet \rightarrow K^\bullet$ factors as

$$K^\bullet \xrightarrow{\varphi} L^\bullet \xrightarrow{\psi} K^\bullet$$

in $D(\mathcal{A})$ for some complex L^\bullet which is bounded and whose terms are direct sums of elements of S . Say L^i is zero for $i \notin [a, b]$. Let c be the largest integer $\leq b + 1$ such that L^i a finite direct sum of elements of S for $i < c$. Claim: if $c < b + 1$, then we can modify L^\bullet to increase c . By induction this claim will show we have a factorization of 1_K as

$$K \xrightarrow{\varphi} L \xrightarrow{\psi} K$$

in $D(\mathcal{A})$ where L can be represented by a finite complex of finite direct sums of elements of S . Note that $e = \varphi \circ \psi \in \text{End}_{D(\mathcal{A})}(L)$ is an idempotent. By Derived Categories, Lemma 13.4.12 we see that $L = \text{Ker}(e) \oplus \text{Ker}(1-e)$. The map $\varphi : K \rightarrow L$ induces an isomorphism with $\text{Ker}(1 - e)$ in $D(R)$ and we conclude.

Proof of the claim. Write $L^c = \bigoplus_{\lambda \in \Lambda} E_\lambda$. Since L^{c-1} is a finite direct sum of elements of S we can by assumption (2) find a finite subset $\Lambda' \subset \Lambda$ such that $L^{c-1} \rightarrow L^c$ factors through $\bigoplus_{\lambda \in \Lambda'} E_\lambda \subset L^c$. Consider the map of complexes

$$\pi : L^\bullet \longrightarrow \left(\bigoplus_{\lambda \in \Lambda \setminus \Lambda'} E_\lambda \right)[-i]$$

given by the projection onto the factors corresponding to $\Lambda \setminus \Lambda'$ in degree i . By our assumption on K we see that, after possibly replacing Λ' by a larger finite subset, we may assume that $\pi \circ \varphi = 0$ in $D(\mathcal{A})$. Let $(L')^\bullet \subset L^\bullet$ be the kernel of π . Since π is surjective we get a short exact sequence of complexes, which gives a distinguished triangle in $D(\mathcal{A})$ (see Derived Categories, Lemma 13.12.1). Since $\text{Hom}_{D(\mathcal{A})}(K, -)$ is homological (see Derived Categories, Lemma 13.4.2) and $\pi \circ \varphi = 0$, we can find a morphism $\varphi' : K^\bullet \rightarrow (L')^\bullet$ in $D(\mathcal{A})$ whose composition with $(L')^\bullet \rightarrow L^\bullet$ gives φ . Setting ψ' equal to the composition of ψ with $(L')^\bullet \rightarrow L^\bullet$ we obtain a new factorization. Since $(L')^\bullet$ agrees with L^\bullet except in degree c and since $(L')^c = \bigoplus_{\lambda \in \Lambda'} E_\lambda$ the claim is proved. \square

Lemma 21.39.3. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Assume every object of \mathcal{C} has a covering by quasi-compact objects. Then every compact object of $D(\mathcal{O})$ is a direct summand in $D(\mathcal{O})$ of a finite complex whose terms are finite direct sums of \mathcal{O} -modules of the form $j_! \mathcal{O}_U$ where U is a quasi-compact object of \mathcal{C} .*

Proof. Apply Lemma 21.39.2 where $S \subset \text{Ob}(\text{Mod}(\mathcal{O}))$ is the set of modules of the form $j_! \mathcal{O}_U$ with $U \in \text{Ob}(\mathcal{C})$ quasi-compact. Assumption (1) holds by Modules on Sites, Lemma 18.28.6 and the assumption that every U can be covered by quasi-compact objects. Assumption (2) follows as

$$\text{Hom}_{\mathcal{O}}(j_! \mathcal{O}_U, \mathcal{F}) = \mathcal{F}(U)$$

which commutes with direct sums by Sites, Lemma 7.11.2. \square

In the situation of the lemma above it is not always true that the modules $j_! \mathcal{O}_U$ are compact objects of $D(\mathcal{O})$ (even if U is a quasi-compact object of \mathcal{C}). Here is a criterion.

Lemma 21.39.4. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} . The \mathcal{O} -module $j_! \mathcal{O}_U$ is a compact object of $D(\mathcal{O})$ if there exists an integer d such that*

- (1) $H^p(U, \mathcal{F}) = 0$ for all $p > d$, and
- (2) the functors $\mathcal{F} \mapsto H^p(U, \mathcal{F})$ commute with direct sums.

Proof. Assume (1) and (2). The first means that the functor $F = H^0(U, -)$ has finite cohomological dimension. Moreover, any direct sum of injective modules is acyclic for F by (2). Since we may compute RF by applying F to any complex of acyclics (Derived Categories, Lemma 13.30.2). Thus, if K_i be a family of objects of $D(\mathcal{O})$, then we can choose K-injective representatives I_i^\bullet and we see that $\bigoplus K_i$ is represented by $\bigoplus I_i^\bullet$. Thus $H^0(U, -)$ commutes with direct sums. \square

Lemma 21.39.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let U be an object of \mathcal{C} which is quasi-compact and weakly contractible. Then $j_! \mathcal{O}_U$ is a compact object of $D(\mathcal{O})$.*

Proof. Combine Lemmas 21.39.4 and 21.38.1 with Modules on Sites, Lemma 18.29.2. \square

21.40. Complexes with locally constant cohomology sheaves

Locally constant sheaves are introduced in Modules on Sites, Section 18.42. Let \mathcal{C} be a site. Let Λ be a ring. We denote $D(\mathcal{C}, \Lambda)$ the derived category of the abelian category of $\underline{\Lambda}$ -modules on \mathcal{C} .

Lemma 21.40.1. *Let \mathcal{C} be a site with final object X . Let Λ be a Noetherian ring. Let $K \in D^b(\mathcal{C}, \Lambda)$ with $H^i(K)$ locally constant sheaves of Λ -modules of finite type. Then there exists a covering $\{U_i \rightarrow X\}$ such that each $K|_{U_i}$ is represented by a complex of locally constant sheaves of Λ -modules of finite type.*

Proof. Let $a \leq b$ be such that $H^i(K) = 0$ for $i \notin [a, b]$. By induction on $b - a$ we will prove there exists a covering $\{U_i \rightarrow X\}$ such that $K|_{U_i}$ can be represented by a complex $\underline{M}^\bullet_{U_i}$ with M^p a finite type Λ -module and $M^p = 0$ for $p \notin [a, b]$. If $b = a$, then this is clear. In general, we may replace X by the members of a covering and assume that $H^b(K)$ is constant, say $H^b(K) = \underline{M}$. By Modules on Sites, Lemma 18.41.5 the module M is a finite Λ -module. Choose a surjection $\Lambda^{\oplus r} \rightarrow M$ given by generators x_1, \dots, x_r of M .

By a slight generalization of Lemma 21.8.3 (details omitted) there exists a covering $\{U_i \rightarrow X\}$ such that $x_i \in H^0(X, H^b(K))$ lifts to an element of $H^b(U_i, K)$. Thus, after replacing X by the U_i we reach the situation where there is a map $\underline{\Lambda}^{\oplus r}[-b] \rightarrow K$ inducing a surjection on cohomology sheaves in degree b . Choose a distinguished triangle

$$\underline{\Lambda}^{\oplus r}[-b] \rightarrow K \rightarrow L \rightarrow \underline{\Lambda}^{\oplus r}[-b+1]$$

Now the cohomology sheaves of L are nonzero only in the interval $[a, b - 1]$, agree with the cohomology sheaves of K in the interval $[a, b - 2]$ and there is a short exact sequence

$$0 \rightarrow H^{b-1}(K) \rightarrow H^{b-1}(L) \rightarrow \underline{\text{Ker}}(\underline{\Lambda}^{\oplus r} \rightarrow M) \rightarrow 0$$

in degree $b - 1$. By Modules on Sites, Lemma 18.42.5 we see that $H^{b-1}(L)$ is locally constant of finite type. By induction hypothesis we obtain an isomorphism $\underline{M}^\bullet \rightarrow L$ in $D(\mathcal{C}, \underline{\Lambda})$ with M^p a finite Λ -module and $M^p = 0$ for $p \notin [a, b - 1]$. The map $L \rightarrow \underline{\Lambda}^{\oplus r}[-b+1]$ gives a map $\underline{M}^{b-1} \rightarrow \underline{\Lambda}^{\oplus r}$ which locally is constant (Modules on Sites, Lemma 18.42.3). Thus we may assume it is given by a map $M^{b-1} \rightarrow \Lambda^{\oplus r}$.

The distinguished triangle shows that the composition $M^{b-2} \rightarrow M^{b-1} \rightarrow \Lambda^{\oplus r}$ is zero and the axioms of triangulated categories produce an isomorphism

$$\underline{M^a} \rightarrow \dots \rightarrow \underline{M^{b-1}} \rightarrow \underline{\Lambda^{\oplus r}} \rightarrow K$$

in $D(\mathcal{C}, \Lambda)$. □

Let \mathcal{C} be a site. Let Λ be a ring. Using the morphism $Sh(\mathcal{C}) \rightarrow Sh(pt)$ we see that there is a functor $D(\Lambda) \rightarrow D(\mathcal{C}, \Lambda)$, $K \mapsto \underline{K}$.

Lemma 21.40.2. *Let \mathcal{C} be a site with final object X . Let Λ be a ring. Let*

- (1) K a perfect object of $D(\Lambda)$,
- (2) a finite complex K^\bullet of finite projective Λ -modules representing K ,
- (3) \mathcal{L}^\bullet a complex of sheaves of Λ -modules, and
- (4) $\varphi : \underline{K} \rightarrow \mathcal{L}^\bullet$ a map in $D(\mathcal{C}, \Lambda)$.

Then there exists a covering $\{U_i \rightarrow X\}$ and maps of complexes $\alpha_i : \underline{K}^\bullet|_{U_i} \rightarrow \mathcal{L}^\bullet|_{U_i}$ representing $\varphi|_{U_i}$.

Proof. Follows immediately from Lemma 21.33.8. □

Lemma 21.40.3. *Let \mathcal{C} be a site with final object X . Let Λ be a ring. Let K, L be objects of $D(\Lambda)$ with K perfect. Let $\varphi : \underline{K} \rightarrow \underline{L}$ be map in $D(\mathcal{C}, \Lambda)$. There exists a covering $\{U_i \rightarrow X\}$ such that $\varphi|_{U_i}$ is equal to $\underline{\alpha}_i$ for some map $\alpha_i : K \rightarrow L$ in $D(\Lambda)$.*

Proof. Follows from Lemma 21.40.2 and Modules on Sites, Lemma 18.42.3. □

Lemma 21.40.4. *Let \mathcal{C} be a site. Let Λ be a Noetherian ring. Let $K, L \in D^-(\mathcal{C}, \Lambda)$. If the cohomology sheaves of K and L are locally constant sheaves of Λ -modules of finite type, then the cohomology sheaves of $K \otimes_{\Lambda}^L L$ are locally constant sheaves of Λ -modules of finite type.*

Proof. We'll prove this as an application of Lemma 21.40.1. Note that $H^i(K \otimes_{\Lambda}^L L)$ is the same as $H^i(\tau_{\geq i-1} K \otimes_{\Lambda}^L \tau_{\geq i-1} L)$. Thus we may assume K and L are bounded. By Lemma 21.40.1 we may assume that K and L are represented by complexes of locally constant sheaves of Λ -modules of finite type. Then we can replace these complexes by bounded above complexes of finite free Λ -modules. In this case the result is clear. □

Lemma 21.40.5. *Let \mathcal{C} be a site. Let Λ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Let $K \in D^-(\mathcal{C}, \Lambda)$. If the cohomology sheaves of $K \otimes_{\Lambda}^L \underline{\Lambda/I}$ are locally constant sheaves of Λ/I -modules of finite type, then the cohomology sheaves of $K \otimes_{\Lambda}^L \underline{\Lambda/I^n}$ are locally constant sheaves of Λ/I^n -modules of finite type for all $n \geq 1$.*

Proof. Recall that the locally constant sheaves of Λ -modules of finite type form a weak Serre subcategory of all $\underline{\Lambda}$ -modules, see Modules on Sites, Lemma 18.42.5. Thus the subcategory of $D(\mathcal{C}, \Lambda)$ consisting of complexes whose cohomology sheaves are locally constant sheaves of Λ -modules of finite type forms a strictly full, saturated triangulated subcategory of $D(\mathcal{C}, \Lambda)$, see Derived Categories, Lemma 13.13.1. Next, consider the distinguished triangles

$$K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}} \rightarrow K \otimes_{\Lambda}^L \underline{\Lambda/I^{n+1}} \rightarrow K \otimes_{\Lambda}^L \underline{\Lambda/I^n} \rightarrow K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}}[1]$$

and the isomorphisms

$$K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}} = \left(K \otimes_{\Lambda}^L \underline{\Lambda/I} \right) \otimes_{\Lambda/I}^L \underline{I^n/I^{n+1}}$$

Combined with Lemma 21.40.4 we obtain the result. \square

Differential Graded Algebra

22.1. Introduction

In this chapter we talk about differential graded algebras, modules, categories, etc. A basic reference is [Kel94]. A survey paper is [Kel06].

Since we do not worry about length of exposition in the Stacks project we first develop the material in the setting of categories of differential graded modules. After that we redo the constructions in the setting of differential graded modules over differential graded categories.

22.2. Conventions

In this chapter we hold on to the convention that *ring* means commutative ring with 1. If R is a ring, then an R -algebra A will be an R -module A endowed with an R -bilinear map $A \times A \rightarrow A$ (multiplication) such that multiplication is associative and has a unit. In other words, these are unital associative R -algebras such that the structure map $R \rightarrow A$ maps into the center of A .

22.3. Differential graded algebras

Just the definitions.

Definition 22.3.1. Let R be a commutative ring. A *differential graded algebra over R* is either

- (1) a chain complex A_\bullet of R -modules endowed with R -bilinear maps $A_n \times A_m \rightarrow A_{n+m}$, $(a, b) \mapsto ab$ such that

$$d_{n+m}(ab) = d_n(a)b + (-1)^n ad_m(b)$$

and such that $\bigoplus A_n$ becomes an associative and unital R -algebra, or

- (2) a cochain complex A^\bullet of R -modules endowed with R -bilinear maps $A^n \times A^m \rightarrow A^{n+m}$, $(a, b) \mapsto ab$ such that

$$d^{n+m}(ab) = d^n(a)b + (-1)^n ad^m(b)$$

and such that $\bigoplus A^n$ becomes an associative and unital R -algebra.

We often just write $A = \bigoplus A_n$ or $A = \bigoplus A^n$ and think of this as an associative unital R -algebra endowed with a \mathbf{Z} -grading and an R -linear operator d whose square is zero and which satisfies the Leibniz rule as explained above. In this case we often say “Let (A, d) be a differential graded algebra”.

Definition 22.3.2. A *homomorphism of differential graded algebras* $f : (A, d) \rightarrow (B, d)$ is an algebra map $f : A \rightarrow B$ compatible with the gradings and d .

Definition 22.3.3. Let R be a ring. Let (A, d) be a differential graded algebra over R . The *opposite differential graded algebra* is the differential graded algebra (A^{opp}, d) over R where $A^{opp} = A$ as an R -module, $d = d$, and multiplication is given by

$$a \cdot_{opp} b = (-1)^{\deg(a) \deg(b)} ba$$

for homogeneous elements $a, b \in A$.

This makes sense because

$$\begin{aligned} d(a \cdot_{opp} b) &= (-1)^{\deg(a) \deg(b)} d(ba) \\ &= (-1)^{\deg(a) \deg(b)} d(b)a + (-1)^{\deg(a) \deg(b) + \deg(b)} b d(a) \\ &= (-1)^{\deg(a)} a \cdot_{opp} d(b) + d(a) \cdot_{opp} b \end{aligned}$$

as desired.

Definition 22.3.4. A differential graded algebra (A, d) is *commutative* if $ab = (-1)^{nm}ba$ for a in degree n and b in degree m . We say A is *strictly commutative* if in addition $a^2 = 0$ for $\deg(a)$ odd.

The following definition makes sense in general but is perhaps “correct” only when tensoring commutative differential graded algebras.

Definition 22.3.5. Let R be a ring. Let $(A, d), (B, d)$ be differential graded algebras over R . The *tensor product differential graded algebra* of A and B is the algebra $A \otimes_R B$ with multiplication defined by

$$(a \otimes b)(a' \otimes b') = (-1)^{\deg(a') \deg(b)} aa' \otimes bb'$$

endowed with differential d defined by the rule $d(a \otimes b) = d(a) \otimes b + (-1)^m a \otimes d(b)$ where $m = \deg(b)$.

Lemma 22.3.6. Let R be a ring. Let $(A, d), (B, d)$ be differential graded algebras over R . Denote A^\bullet, B^\bullet the underlying cochain complexes. As cochain complexes of R -modules we have

$$(A \otimes_R B)^\bullet = \text{Tot}(A^\bullet \otimes_R B^\bullet).$$

Proof. Recall that the differential of the total complex is given by $d_1^{p,q} + (-1)^p d_2^{p,q}$ on $A^p \otimes_R B^q$. And this is exactly the same as the rule for the differential on $A \otimes_R B$ in Definition 22.3.5. \square

22.4. Differential graded modules

Just the definitions.

Definition 22.4.1. Let R be a ring. Let (A, d) be a differential graded algebra over R . A (right) *differential graded module* M over A is a right A -module M which has a grading $M = \bigoplus M^n$ and a differential d such that $M^n A^m \subset M^{n+m}$, such that $d(M^n) \subset M^{n+1}$, and such that

$$d(ma) = d(m)a + (-1)^n md(a)$$

for $a \in A$ and $m \in M^n$. A *homomorphism of differential graded modules* $f : M \rightarrow N$ is an A -module map compatible with gradings and differentials. The category of (right) differential graded A -modules is denoted $\text{Mod}_{(A,d)}$.

Note that we can think of M as a cochain complex M^\bullet of (right) R -modules. Namely, for $r \in R$ we have $d(r) = 0$ and r maps to a degree 0 element of A , hence $d(mr) = d(m)r$.

We can define *left differential graded A -modules* in exactly the same manner. If M is a left A -module, then we can think of M as a right A^{opp} -module with multiplication \cdot_{opp} defined by the rule

$$m \cdot_{opp} a = (-1)^{\deg(a)\deg(m)} am$$

for a and m homogeneous. The category of left differential graded A -modules is equivalent to the category of right differential graded A^{opp} -modules. We prefer to work with right modules (essentially because of what happens in Example 22.19.8), but the reader is free to switch to left modules if (s)he so desires.

Lemma 22.4.2. *Let (A, d) be a differential graded algebra. The category $\text{Mod}_{(A,d)}$ is abelian and has arbitrary limits and colimits.*

Proof. Kernels and cokernels commute with taking underlying A -modules. Similarly for direct sums and colimits. In other words, these operations in $\text{Mod}_{(A,d)}$ commute with the forgetful functor to the category of A -modules. This is not the case for products and limits. Namely, if $N_i, i \in I$ is a family of differential graded A -modules, then the product $\prod N_i$ in $\text{Mod}_{(A,d)}$ is given by setting $(\prod N_i)^n = \prod N_i^n$ and $\prod N_i = \bigoplus_n (\prod N_i)^n$. Thus we see that the product does commute with the forgetful functor to the category of graded A -modules. A category with products and equalizers has limits, see Categories, Lemma 4.14.10. \square

Thus, if (A, d) is a differential graded algebra over R , then there is an exact functor

$$\text{Mod}_{(A,d)} \longrightarrow \text{Comp}(R)$$

of abelian categories. For a differential graded module M the cohomology groups $H^n(M)$ are defined as the cohomology of the corresponding complex of R -modules. Therefore, a short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ of differential graded modules gives rise to a long exact sequence

$$(22.4.2.1) \quad H^n(K) \rightarrow H^n(L) \rightarrow H^n(M) \rightarrow H^{n+1}(K)$$

of cohomology modules, see Homology, Lemma 12.12.12.

Moreover, from now on we borrow all the terminology used for complexes of modules. For example, we say that a differential graded A -module M is *acyclic* if $H^k(M) = 0$ for all $k \in \mathbf{Z}$. We say that a homomorphism $M \rightarrow N$ of differential graded A -modules is a *quasi-isomorphism* if it induces isomorphisms $H^k(M) \rightarrow H^k(N)$ for all $k \in \mathbf{Z}$. And so on and so forth.

Definition 22.4.3. Let (A, d) be a differential graded algebra. Let M be a differential graded module. For any $k \in \mathbf{Z}$ we define the *k -shifted module* $M[k]$ as follows

- (1) as A -module $M[k] = M$,
- (2) $M[k]^n = M^{n+k}$,
- (3) $d_{M[k]} = (-1)^k d_M$.

For a morphism $f : M \rightarrow N$ of differential graded A -modules we let $f[k] : M[k] \rightarrow N[k]$ be the map equal to f on underlying A -modules. This defines a functor $[k] : \text{Mod}_{(A,d)} \rightarrow \text{Mod}_{(A,d)}$.

The remarks in Homology, Section 12.14 apply. In particular, we will identify the cohomology groups of all shifts $M[k]$ without the intervention of signs.

At this point we have enough structure to talk about *triangles*, see Derived Categories, Definition 13.3.1. In fact, our next goal is to develop enough theory to be able to state and prove that the homotopy category of differential graded modules is a triangulated category. First we define the homotopy category.

22.5. The homotopy category

Our homotopies take into account the A -module structure and the grading, but not the differential (of course).

Definition 22.5.1. Let (A, d) be a differential graded algebra. Let $f, g : M \rightarrow N$ be homomorphisms of differential graded A -modules. A *homotopy between f and g* is an A -module map $h : M \rightarrow N$ such that

- (1) $h(M^n) \subset N^{n-1}$ for all n , and
- (2) $f(x) - g(x) = d_N(h(x)) + h(d_M(x))$ for all $x \in M$.

If a homotopy exists, then we say f and g are *homotopic*.

Thus h is compatible with the A -module structure and the grading but not with the differential. If $f = g$ and h is a homotopy as in the definition, then h defines a morphism $h : M \rightarrow N[-1]$ in $\text{Mod}_{(A,d)}$.

Lemma 22.5.2. Let (A, d) be a differential graded algebra. Let $f, g : L \rightarrow M$ be homomorphisms of differential graded A -modules. Suppose given further homomorphisms $a : K \rightarrow L$, and $c : M \rightarrow N$. If $h : L \rightarrow M$ is an A -module map which defines a homotopy between f and g , then $c \circ h \circ a$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.

Proof. Immediate from Homology, Lemma 12.12.7. □

This lemma allows us to define the homotopy category as follows.

Definition 22.5.3. Let (A, d) be a differential graded algebra. The *homotopy category*, denoted $K(\text{Mod}_{(A,d)})$, is the category whose objects are the objects of $\text{Mod}_{(A,d)}$ and whose morphisms are homotopy classes of homomorphisms of differential graded A -modules.

The notation $K(\text{Mod}_{(A,d)})$ is not standard but at least is consistent with the use of $K(-)$ in other places of the Stacks project.

Lemma 22.5.4. Let (A, d) be a differential graded algebra. The homotopy category $K(\text{Mod}_{(A,d)})$ has direct sums and products.

Proof. Omitted. Hint: Just use the direct sums and products as in Lemma 22.4.2. This works because we saw that these functors commute with the forgetful functor to the category of graded A -modules and because \coprod is an exact functor on the category of families of abelian groups. □

22.6. Cones

We introduce cones for the category of differential graded modules.

Definition 22.6.1. Let (A, d) be a differential graded algebra. Let $f : K \rightarrow L$ be a homomorphism of differential graded A -modules. The *cone* of f is the differential graded A -module $C(f)$ given by $C(f) = L \oplus K$ with grading $C(f)^n = L^n \oplus K^{n+1}$ and differential

$$d_{C(f)} = \begin{pmatrix} d_L & f \\ 0 & -d_K \end{pmatrix}$$

It comes equipped with canonical morphisms of complexes $i : L \rightarrow C(f)$ and $p : C(f) \rightarrow K[1]$ induced by the obvious maps $L \rightarrow C(f)$ and $C(f) \rightarrow K$.

The formation of the cone triangle is functorial in the following sense.

Lemma 22.6.2. *Let (A, d) be a differential graded algebra. Suppose that*

$$\begin{array}{ccc} K_1 & \xrightarrow{f_1} & L_1 \\ a \downarrow & & \downarrow b \\ K_2 & \xrightarrow{f_2} & L_2 \end{array}$$

is a diagram of homomorphisms of differential graded A -modules which is commutative up to homotopy. Then there exists a morphism $c : C(f_1) \rightarrow C(f_2)$ which gives rise to a morphism of triangles

$$(a, b, c) : (K_1, L_1, C(f_1), f_1, i_1, p_1) \rightarrow (K_2, L_2, C(f_2), f_2, i_2, p_2)$$

in $K(\text{Mod}_{(A,d)})$.

Proof. Let $h : K_1 \rightarrow L_2$ be a homotopy between $f_2 \circ a$ and $b \circ f_1$. Define c by the matrix

$$c = \begin{pmatrix} b & h \\ 0 & a \end{pmatrix} : L_1 \oplus K_1 \rightarrow L_2 \oplus K_2$$

A matrix computation show that c is a morphism of differential graded modules. It is trivial that $c \circ i_1 = i_2 \circ b$, and it is trivial also to check that $p_2 \circ c = a \circ p_1$. \square

22.7. Admissible short exact sequences

An admissible short exact sequence is the analogue of termwise split exact sequences in the setting of differential graded modules.

Definition 22.7.1. Let (A, d) be a differential graded algebra.

- (1) A homomorphism $K \rightarrow L$ of differential graded A -modules is an *admissible monomorphism* if there exists a graded A -module map $L \rightarrow K$ which is left inverse to $K \rightarrow L$.
- (2) A homomorphism $L \rightarrow M$ of differential graded A -modules is an *admissible epimorphism* if there exists a graded A -module map $M \rightarrow L$ which is right inverse to $L \rightarrow M$.
- (3) A short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ of differential graded A -modules is an *admissible short exact sequence* if it is split as a sequence of graded A -modules.

Thus the splittings are compatible with all the data except for the differentials. Given an admissible short exact sequence we obtain a triangle; this is the reason that we require our splittings to be compatible with the A -module structure.

Lemma 22.7.2. *Let (A, d) be a differential graded algebra. Let $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ be an admissible short exact sequence of differential graded A -modules. Let $s : M \rightarrow L$ and $\pi : L \rightarrow K$ be splittings such that $\text{Ker}(\pi) = \text{Im}(s)$. Then we obtain a morphism*

$$\delta = \pi \circ d_L \circ s : M \rightarrow K[1]$$

of $\text{Mod}_{(A,d)}$ which induces the boundary maps in the long exact sequence of cohomology (22.4.2.1).

Proof. The map $\pi \circ d_L \circ s$ is compatible with the A -module structure and the gradings by construction. It is compatible with differentials by Homology, Lemmas 12.14.10. Let R be the ring that A is a differential graded algebra over. The equality of maps is a statement about R -modules. Hence this follows from Homology, Lemmas 12.14.10 and 12.14.11. \square

Lemma 22.7.3. *Let (A, d) be a differential graded algebra. Let*

$$\begin{array}{ccc} K & \xrightarrow{\quad} & L \\ a \downarrow & & \downarrow b \\ M & \xrightarrow{\quad} & N \end{array}$$

be a diagram of homomorphisms of differential graded A -modules commuting up to homotopy.

- (1) *If f is an admissible monomorphism, then b is homotopic to a homomorphism which makes the diagram commute.*
- (2) *If g is an admissible epimorphism, then a is homotopic to a morphism which makes the diagram commute.*

Proof. Let $h : K \rightarrow N$ be a homotopy between bf and ga , i.e., $bf - ga = dh + hd$. Suppose that $\pi : L \rightarrow K$ is a graded A -module map left inverse to f . Take $b' = b - dh\pi - h\pi d$. Suppose $s : N \rightarrow M$ is a graded A -module map right inverse to g . Take $a' = a + dsh + shd$. Computations omitted. \square

Lemma 22.7.4. *Let (A, d) be a differential graded algebra. Let $\alpha : K \rightarrow L$ be a homomorphism of differential graded A -modules. There exists a factorization*

$$\begin{array}{ccccc} K & \xrightarrow{\tilde{\alpha}} & \tilde{L} & \xrightarrow{\pi} & L \\ & & \searrow & \nearrow & \\ & & & \alpha & \end{array}$$

in $\text{Mod}_{(A,d)}$ such that

- (1) *$\tilde{\alpha}$ is an admissible monomorphism (see Definition 22.7.1),*
- (2) *there is a morphism $s : L \rightarrow \tilde{L}$ such that $\pi \circ s = id_L$ and such that $s \circ \pi$ is homotopic to $id_{\tilde{L}}$.*

Proof. The proof is identical to the proof of Derived Categories, Lemma 13.9.6. Namely, we set $\tilde{L} = L \oplus C(1_K)$ and we use elementary properties of the cone construction. \square

Lemma 22.7.5. *Let (A, d) be a differential graded algebra. Let $L_1 \rightarrow L_2 \rightarrow \dots \rightarrow L_n$ be a sequence of composable homomorphisms of differential graded A -modules.*

There exists a commutative diagram

$$\begin{array}{ccccccc}
 L_1 & \longrightarrow & L_2 & \longrightarrow & \dots & \longrightarrow & L_n \\
 \uparrow & & \uparrow & & & & \uparrow \\
 M_1 & \longrightarrow & M_2 & \longrightarrow & \dots & \longrightarrow & M_n
 \end{array}$$

in $\text{Mod}_{(A,d)}$ such that each $M_i \rightarrow M_{i+1}$ is an admissible monomorphism and each $M_i \rightarrow L_i$ is a homotopy equivalence.

Proof. The case $n = 1$ is without content. Lemma 22.7.4 is the case $n = 2$. Suppose we have constructed the diagram except for M_n . Apply Lemma 22.7.4 to the composition $M_{n-1} \rightarrow L_{n-1} \rightarrow L_n$. The result is a factorization $M_{n-1} \rightarrow M_n \rightarrow L_n$ as desired. \square

Lemma 22.7.6. Let (A, d) be a differential graded algebra. Let $0 \rightarrow K_i \rightarrow L_i \rightarrow M_i \rightarrow 0$, $i = 1, 2, 3$ be admissible short exact sequence of differential graded A -modules. Let $b : L_1 \rightarrow L_2$ and $b' : L_2 \rightarrow L_3$ be homomorphisms of differential graded modules such that

$$\begin{array}{ccccc}
 K_1 & \longrightarrow & L_1 & \longrightarrow & M_1 \\
 \downarrow 0 & & \downarrow b & & \downarrow 0 \\
 K_2 & \longrightarrow & L_2 & \longrightarrow & M_2
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccccc}
 K_2 & \longrightarrow & L_2 & \longrightarrow & M_2 \\
 \downarrow 0 & & \downarrow b' & & \downarrow 0 \\
 K_3 & \longrightarrow & L_3 & \longrightarrow & M_3
 \end{array}$$

commute up to homotopy. Then $b' \circ b$ is homotopic to 0.

Proof. By Lemma 22.7.3 we can replace b and b' by homotopic maps such that the right square of the left diagram commutes and the left square of the right diagram commutes. In other words, we have $\text{Im}(b) \subset \text{Im}(K_2 \rightarrow L_2)$ and $\text{Ker}((b')^n) \supset \text{Im}(K_2 \rightarrow L_2)$. Then $b \circ b' = 0$ as a map of modules. \square

22.8. Distinguished triangles

The following lemma produces our distinguished triangles.

Lemma 22.8.1. Let (A, d) be a differential graded algebra. Let $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ be an admissible short exact sequence of differential graded A -modules. The triangle

$$(22.8.1.1) \quad K \rightarrow L \rightarrow M \xrightarrow{\delta} K[1]$$

with δ as in Lemma 22.7.2 is, up to canonical isomorphism in $K(\text{Mod}_{(A,d)})$, independent of the choices made in Lemma 22.7.2.

Proof. Namely, let (s', π') be a second choice of splittings as in Lemma 22.7.2. Then we claim that δ and δ' are homotopic. Namely, write $s' = s + \alpha \circ h$ and $\pi' = \pi + g \circ \beta$ for some unique homomorphisms of A -modules $h : M \rightarrow K$ and $g : M \rightarrow K$ of degree -1 . Then $g = -h$ and g is a homotopy between δ and δ' . The computations are done in the proof of Homology, Lemma 12.14.12. \square

Definition 22.8.2. Let (A, d) be a differential graded algebra.

- (1) If $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded A -modules, then the triangle associated to $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is the triangle (22.8.1.1) of $K(\text{Mod}_{(A,d)})$.

- (2) A triangle of $K(\text{Mod}_{(A,d)})$ is called a *distinguished triangle* if it is isomorphic to a triangle associated to an admissible short exact sequence of differential graded A -modules.

22.9. Cones and distinguished triangles

Let (A, d) be a differential graded algebra. Let $f : K \rightarrow L$ be a homomorphism of differential graded A -modules. Then $(K, L, C(f), f, i, p)$ forms a triangle:

$$K \rightarrow L \rightarrow C(f) \rightarrow K[1]$$

in $\text{Mod}_{(A,d)}$ and hence in $K(\text{Mod}_{(A,d)})$. Cones are **not** distinguished triangles in general, but the difference is a sign or a rotation (your choice). Here are two precise statements.

Lemma 22.9.1. *Let (A, d) be a differential graded algebra. Let $f : K \rightarrow L$ be a homomorphism of differential graded modules. The triangle $(L, C(f), K[1], i, p, f[1])$ is the triangle associated to the admissible short exact sequence*

$$0 \rightarrow L \rightarrow C(f) \rightarrow K[1] \rightarrow 0$$

coming from the definition of the cone of f .

Proof. Immediate from the definitions. □

Lemma 22.9.2. *Let (A, d) be a differential graded algebra. Let $\alpha : K \rightarrow L$ and $\beta : L \rightarrow M$ define an admissible short exact sequence*

$$0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$$

of differential graded A -modules. Let $(K, L, M, \alpha, \beta, \delta)$ be the associated triangle. Then the triangles

$$(M[-1], K, L, \delta[-1], \alpha, \beta) \quad \text{and} \quad (M[-1], K, C(\delta[-1]), \delta[-1], i, p)$$

are isomorphic.

Proof. Using a choice of splittings we write $L = K \oplus M$ and we identify α and β with the natural inclusion and projection maps. By construction of δ we have

$$d_B = \begin{pmatrix} d_K & \delta \\ 0 & d_M \end{pmatrix}$$

On the other hand the cone of $\delta[-1] : M[-1] \rightarrow K$ is given as $C(\delta[-1]) = K \oplus M$ with differential identical with the matrix above! Whence the lemma. □

Lemma 22.9.3. *Let (A, d) be a differential graded algebra. Let $f_1 : K_1 \rightarrow L_1$ and $f_2 : K_2 \rightarrow L_2$ be homomorphisms of differential graded A -modules. Let*

$$(a, b, c) : (K_1, L_1, C(f_1), f_1, i_1, p_1) \longrightarrow (K_2, L_2, C(f_2), f_2, i_2, p_2)$$

be any morphism of triangles of $K(\text{Mod}_{(A,d)})$. If a and b are homotopy equivalences then so is c .

Proof. Let $a^{-1} : K_2 \rightarrow K_1$ be a homomorphism of differential graded A -modules which is inverse to a in $K(\text{Mod}_{(A,d)})$. Let $b^{-1} : L_2 \rightarrow L_1$ be a homomorphism of differential graded A -modules which is inverse to b in $K(\text{Mod}_{(A,d)})$. Let $c' : C(f_2) \rightarrow C(f_1)$ be the morphism from Lemma 22.6.2 applied to $f_1 \circ a^{-1} = b^{-1} \circ f_2$. If we can show that $c \circ c'$ and $c' \circ c$ are isomorphisms in $K(\text{Mod}_{(A,d)})$ then we win. Hence it suffices to prove the following: Given a morphism of triangles

$(1, 1, c) : (K, L, C(f), f, i, p)$ in $K(\text{Mod}_{(A,d)})$ the morphism c is an isomorphism in $K(\text{Mod}_{(A,d)})$. By assumption the two squares in the diagram

$$\begin{array}{ccccc} L & \longrightarrow & C(f) & \longrightarrow & K[1] \\ \downarrow 1 & & \downarrow c & & \downarrow 1 \\ L & \longrightarrow & C(f) & \longrightarrow & K[1] \end{array}$$

commute up to homotopy. By construction of $C(f)$ the rows form admissible short exact sequences. Thus we see that $(c - 1)^2 = 0$ in $K(\text{Mod}_{(A,d)})$ by Lemma 22.7.6. Hence c is an isomorphism in $K(\text{Mod}_{(A,d)})$ with inverse $2 - c$. \square

The following lemma shows that the collection of triangles of the homotopy category given by cones and the distinguished triangles are the same up to isomorphisms, at least up to sign!

Lemma 22.9.4. *Let (A, d) be a differential graded algebra.*

- (1) *Given an admissible short exact sequence $0 \rightarrow K \xrightarrow{\alpha} L \rightarrow M \rightarrow 0$ of differential graded A -modules there exists a homotopy equivalence $C(\alpha) \rightarrow M$ such that the diagram*

$$\begin{array}{ccccccc} K & \longrightarrow & L & \longrightarrow & C(\alpha) & \xrightarrow{-p} & K[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ K & \xrightarrow{\alpha} & L & \xrightarrow{\beta} & M & \xrightarrow{\delta} & K[1] \end{array}$$

defines an isomorphism of triangles in $K(\text{Mod}_{(A,d)})$.

- (2) *Given a morphism of complexes $f : K \rightarrow L$ there exists an isomorphism of triangles*

$$\begin{array}{ccccccc} K & \longrightarrow & \tilde{L} & \longrightarrow & M & \xrightarrow{\delta} & K[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ K & \longrightarrow & L & \longrightarrow & C(f) & \xrightarrow{-p} & K[1] \end{array}$$

where the upper triangle is the triangle associated to a admissible short exact sequence $K \rightarrow \tilde{L} \rightarrow M$.

Proof. Proof of (1). We have $C(\alpha) = L \oplus K$ and we simply define $C(\alpha) \rightarrow M$ via the projection onto L followed by β . This defines a morphism of differential graded modules because the compositions $K^{n+1} \rightarrow L^{n+1} \rightarrow M^{n+1}$ are zero. Choose splittings $s : M \rightarrow L$ and $\pi : L \rightarrow K$ with $\text{Ker}(\pi) = \text{Im}(s)$ and set $\delta = \pi \circ d_L \circ s$ as usual. To get a homotopy inverse we take $M \rightarrow C(\alpha)$ given by $(s, -\delta)$. This is compatible with differentials because δ^n can be characterized as the unique map $M^n \rightarrow K^{n+1}$ such that $d \circ s^n - s^{n+1} \circ d = \alpha \circ \delta^n$, see proof of Homology, Lemma 12.14.10. The composition $M \rightarrow C(f) \rightarrow M$ is the identity. The composition $C(f) \rightarrow M \rightarrow C(f)$ is equal to the morphism

$$\begin{pmatrix} s \circ \beta & 0 \\ -\delta \circ \beta & 0 \end{pmatrix}$$

To see that this is homotopic to the identity map use the homotopy $h : C(\alpha) \rightarrow C(\alpha)$ given by the matrix

$$\begin{pmatrix} 0 & 0 \\ \pi & 0 \end{pmatrix} : C(\alpha) = L \oplus K \rightarrow L \oplus K = C(\alpha)$$

It is trivial to verify that

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} - \begin{pmatrix} s & \\ -\delta & \end{pmatrix} (\beta \quad 0) = \begin{pmatrix} d & \alpha \\ 0 & -d \end{pmatrix} \begin{pmatrix} 0 & 0 \\ \pi & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ \pi & 0 \end{pmatrix} \begin{pmatrix} d & \alpha \\ 0 & -d \end{pmatrix}$$

To finish the proof of (1) we have to show that the morphisms $-p : C(\alpha) \rightarrow K[1]$ (see Definition 22.6.1) and $C(\alpha) \rightarrow M \rightarrow K[1]$ agree up to homotopy. This is clear from the above. Namely, we can use the homotopy inverse $(s, -\delta) : M \rightarrow C(\alpha)$ and check instead that the two maps $M \rightarrow K[1]$ agree. And note that $p \circ (s, -\delta) = -\delta$ as desired.

Proof of (2). We let $\tilde{f} : K \rightarrow \tilde{L}$, $s : L \rightarrow \tilde{L}$ and $\pi : L \rightarrow L$ be as in Lemma 22.7.4. By Lemmas 22.6.2 and 22.9.3 the triangles $(K, L, C(f), i, p)$ and $(K, \tilde{L}, C(\tilde{f}), \tilde{i}, \tilde{p})$ are isomorphic. Note that we can compose isomorphisms of triangles. Thus we may replace L by \tilde{L} and f by \tilde{f} . In other words we may assume that f is an admissible monomorphism. In this case the result follows from part (1). \square

22.10. The homotopy category is triangulated

We first prove that it is pre-triangulated.

Lemma 22.10.1. *Let (A, d) be a differential graded algebra. The homotopy category $K(\text{Mod}_{(A,d)})$ with its natural translation functors and distinguished triangles is a pre-triangulated category.*

Proof. Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Also, any triangle $(K, K, 0, 1, 0, 0)$ is distinguished since $0 \rightarrow K \rightarrow K \rightarrow 0 \rightarrow 0$ is an admissible short exact sequence. Finally, given any homomorphism $f : K \rightarrow L$ of differential graded A -modules the triangle $(K, L, C(f), f, i, -p)$ is distinguished by Lemma 22.9.4.

Proof of TR2. Let (X, Y, Z, f, g, h) be a triangle. Assume $(Y, Z, X[1], g, h, -f[1])$ is distinguished. Then there exists an admissible short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ such that the associated triangle $(K, L, M, \alpha, \beta, \delta)$ is isomorphic to $(Y, Z, X[1], g, h, -f[1])$. Rotating back we see that (X, Y, Z, f, g, h) is isomorphic to $(M[-1], K, L, -\delta[-1], \alpha, \beta)$. It follows from Lemma 22.9.2 that the triangle $(M[-1], K, L, \delta[-1], \alpha, \beta)$ is isomorphic to $(M[-1], K, C(\delta[-1]), \delta[-1], i, p)$. Pre-composing the previous isomorphism of triangles with -1 on Y it follows that (X, Y, Z, f, g, h) is isomorphic to $(M[-1], K, C(\delta[-1]), \delta[-1], i, -p)$. Hence it is distinguished by Lemma 22.9.4. On the other hand, suppose that (X, Y, Z, f, g, h) is distinguished. By Lemma 22.9.4 this means that it is isomorphic to a triangle of the form $(K, L, C(f), f, i, -p)$ for some morphism f of $\text{Mod}_{(A,d)}$. Then the rotated triangle $(Y, Z, X[1], g, h, -f[1])$ is isomorphic to $(L, C(f), K[1], i, -p, -f[1])$ which is isomorphic to the triangle $(L, C(f), K[1], i, p, f[1])$. By Lemma 22.9.1 this triangle is distinguished. Hence $(Y, Z, X[1], g, h, -f[1])$ is distinguished as desired.

Proof of TR3. Let (X, Y, Z, f, g, h) and (X', Y', Z', f', g', h') be distinguished triangles of $K(\mathcal{A})$ and let $a : X \rightarrow X'$ and $b : Y \rightarrow Y'$ be morphisms such that $f' \circ a = b \circ f$. By Lemma 22.9.4 we may assume that $(X, Y, Z, f, g, h) = (X, Y, C(f), f, i, -p)$

and $(X', Y', Z', f', g', h') = (X', Y', C(f'), f', i', -p')$. At this point we simply apply Lemma 22.6.2 to the commutative diagram given by f, f', a, b . \square

Before we prove TR4 in general we prove it in a special case.

Lemma 22.10.2. *Let (A, d) be a differential graded algebra. Suppose that $\alpha : K \rightarrow L$ and $\beta : L \rightarrow M$ are admissible monomorphisms of differential graded A -modules. Then there exist distinguished triangles $(K, L, Q_1, \alpha, p_1, d_1)$, $(K, M, Q_2, \beta \circ \alpha, p_2, d_2)$ and $(L, M, Q_3, \beta, p_3, d_3)$ for which TR4 holds.*

Proof. Say $\pi_1 : L \rightarrow K$ and $\pi_3 : M \rightarrow L$ are homomorphisms of graded A -modules which are left inverse to α and β . Then also $K \rightarrow M$ is an admissible monomorphism with left inverse $\pi_2 = \pi_1 \circ \pi_3$. Let us write Q_1, Q_2 and Q_3 for the cokernels of $K \rightarrow L, K \rightarrow M$, and $L \rightarrow M$. Then we obtain identifications (as graded A -modules) $Q_1 = \text{Ker}(\pi_1)$, $Q_3 = \text{Ker}(\pi_3)$ and $Q_2 = \text{Ker}(\pi_2)$. Then $L = K \oplus Q_1$ and $M = L \oplus Q_3$ as graded A -modules. This implies $M = K \oplus Q_1 \oplus Q_3$. Note that $\pi_2 = \pi_1 \circ \pi_3$ is zero on both Q_1 and Q_3 . Hence $Q_2 = Q_1 \oplus Q_3$. Consider the commutative diagram

$$\begin{array}{ccccccccc} 0 & \rightarrow & K & \rightarrow & L & \rightarrow & Q_1 & \rightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \rightarrow & K & \rightarrow & M & \rightarrow & Q_2 & \rightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \rightarrow & L & \rightarrow & M & \rightarrow & Q_3 & \rightarrow & 0 \end{array}$$

The rows of this diagram are admissible short exact sequences, and hence determine distinguished triangles by definition. Moreover downward arrows in the diagram above are compatible with the chosen splittings and hence define morphisms of triangles

$$(K \rightarrow L \rightarrow Q_1 \rightarrow K[1]) \longrightarrow (K \rightarrow M \rightarrow Q_2 \rightarrow K[1])$$

and

$$(K \rightarrow M \rightarrow Q_2 \rightarrow K[1]) \longrightarrow (L \rightarrow M \rightarrow Q_3 \rightarrow L[1]).$$

Note that the splittings $Q_3 \rightarrow M$ of the bottom sequence in the diagram provides a splitting for the split sequence $0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3 \rightarrow 0$ upon composing with $M \rightarrow Q_2$. It follows easily from this that the morphism $\delta : Q_3 \rightarrow Q_1[1]$ in the corresponding distinguished triangle

$$(Q_1 \rightarrow Q_2 \rightarrow Q_3 \rightarrow Q_1[1])$$

is equal to the composition $Q_3 \rightarrow L[1] \rightarrow Q_1[1]$. Hence we get a structure as in the conclusion of axiom TR4. \square

Here is the final result.

Proposition 22.10.3. *Let (A, d) be a differential graded algebra. The homotopy category $K(\text{Mod}_{(A,d)})$ of differential graded A -modules with its natural translation functors and distinguished triangles is a triangulated category.*

Proof. We know that $K(\text{Mod}_{(A,d)})$ is a pre-triangulated category. Hence it suffices to prove TR4 and to prove it we can use Derived Categories, Lemma 13.4.13. Let $K \rightarrow L$ and $L \rightarrow M$ be composable morphisms of $K(\text{Mod}_{(A,d)})$. By Lemma 22.7.5 we may assume that $K \rightarrow L$ and $L \rightarrow M$ are admissible monomorphisms. In this case the result follows from Lemma 22.10.2. \square

22.11. Projective modules over algebras

In this section we discuss projective modules over algebras and over graded algebras. Thus it is the analogue of Algebra, Section 10.74 in the setting of this chapter.

Algebras and modules. Let R be a ring and let A be an R -algebra, see Section 22.2 for our conventions. It is clear that A is a projective right A -module since $\text{Hom}_A(A, M) = M$ for any right A -module M (and thus $\text{Hom}_A(A, -)$ is exact). Conversely, let P be a projective right A -module. Then we can choose a surjection $\bigoplus_{i \in I} A \rightarrow P$ by choosing a set $\{m_i\}_{i \in I}$ of generators of P over A . Since P is projective there is a left inverse to the surjection, and we find that P is isomorphic to a direct summand of a free module, exactly as in the commutative case (Algebra, Lemma 10.74.2).

Graded algebras and modules. Let R be a ring. Let A be a graded algebra over R . Let Mod_A denote the category of graded right A -modules. For an integer k let $A[k]$ denote the shift of A . For an graded right A -module we have

$$\text{Hom}_{\text{Mod}_A}(A[k], M) = M^{-k}$$

As the functor $M \mapsto M^{-k}$ is exact on Mod_A we conclude that $A[k]$ is a projective object of Mod_A . Conversely, suppose that P is a projective object of Mod_A . By choosing a set of homogeneous generators of P as an A -module, we can find a surjection

$$\bigoplus_{i \in I} A[k_i] \longrightarrow P$$

Thus we conclude that a projective object of Mod_A is a direct summand of a direct sum of the shifts $A[k]$.

If (A, d) is a differential graded algebra and P is an object of $\text{Mod}_{(A, d)}$ then we say P is *projective as a graded A -module* or sometimes *P is graded projective* to mean that P is a projective object of the abelian category Mod_A of graded A -modules.

Lemma 22.11.1. *Let (A, d) be a differential graded algebra. Let $M \rightarrow P$ be a surjective homomorphism of differential graded A -modules. If P is projective as a graded A -module, then $M \rightarrow P$ is an admissible epimorphism.*

Proof. This is immediate from the definitions. □

Lemma 22.11.2. *Let (A, d) be a differential graded algebra. Then we have*

$$\text{Hom}_{\text{Mod}_{(A, d)}}(A[k], M) = \text{Ker}(d: M^{-k} \rightarrow M^{-k+1})$$

and

$$\text{Hom}_{K(\text{Mod}_{(A, d)})}(A[k], M) = H^{-k}(M)$$

for any differential graded A -module M .

Proof. This is clear from the discussion above. □

22.12. Injective modules over algebras

In this section we discuss injective modules over algebras and over graded algebras. Thus it is the analogue of More on Algebra, Section 15.42 in the setting of this chapter.

Algebras and modules. Let R be a ring and let A be an R -algebra, see Section 22.2 for our conventions. For a right A -module M we set

$$M^\vee = \text{Hom}_{\mathbf{Z}}(M, \mathbf{Q}/\mathbf{Z})$$

which we think of as a left A -module by the multiplication $(af)(x) = f(xa)$. Namely, $((ab)f)(x) = f(xab) = (bf)(xa) = (a(bf))(x)$. Conversely, if M is a left A -module, then M^\vee is a right A -module. Since \mathbf{Q}/\mathbf{Z} is an injective abelian group (More on Algebra, Lemma 15.41.1), the functor $M \mapsto M^\vee$ is exact (More on Algebra, Lemma 15.42.2). Moreover, the evaluation map $M \rightarrow (M^\vee)^\vee$ is injective for all modules M (More on Algebra, Lemma 15.42.3).

We claim that A^\vee is an injective right A -module. Namely, given a right A -module N we have

$$\text{Hom}_A(N, A^\vee) = \text{Hom}_A(N, \text{Hom}_{\mathbf{Z}}(A, \mathbf{Q}/\mathbf{Z})) = N^\vee$$

and we conclude because the functor $N \mapsto N^\vee$ is exact. The second equality holds because

$$\text{Hom}_{\mathbf{Z}}(N, \text{Hom}_{\mathbf{Z}}(A, \mathbf{Q}/\mathbf{Z})) = \text{Hom}_{\mathbf{Z}}(N \otimes_{\mathbf{Z}} A, \mathbf{Q}/\mathbf{Z})$$

by Algebra, Lemma 10.11.8. Inside this module A -linearity exactly picks out the bilinear maps $\varphi : N \times A \rightarrow \mathbf{Q}/\mathbf{Z}$ which have the same value on $x \otimes a$ and $xa \otimes 1$, i.e., come from elements of N^\vee .

Finally, for every right A -module M we can choose a surjection $\bigoplus_{i \in I} A \rightarrow M^\vee$ to get an injection $M \rightarrow (M^\vee)^\vee \rightarrow \prod_{i \in I} A^\vee$.

We conclude

- (1) the category of A -modules has enough injectives,
- (2) A^\vee is an injective A -module, and
- (3) every A -module injects into a product of copies of A^\vee .

Graded algebras and modules. Let R be a ring. Let A be a graded algebra over R . If M is a graded A -module we set

$$M^\vee = \bigoplus_{n \in \mathbf{Z}} \text{Hom}_{\mathbf{Z}}(M^{-n}, \mathbf{Q}/\mathbf{Z}) = \bigoplus_{n \in \mathbf{Z}} (M^{-n})^\vee$$

as a graded R -module with the A -module structure defined as above (for homogeneous elements). This again switches left and right modules. On the category of graded A -modules the functor $M \mapsto M^\vee$ is exact (check on graded pieces). Moreover, the evaluation map $M \rightarrow (M^\vee)^\vee$ is injective as before (because we can check this on the graded pieces).

We claim that A^\vee is an injective object of the category Mod_A of graded right A -modules. Namely, given a graded right A -module N we have

$$\text{Hom}_{\text{Mod}_A}(N, A^\vee) = \text{Hom}_{\text{Mod}_A}(N, \bigoplus \text{Hom}_{\mathbf{Z}}(A^{-n}, \mathbf{Q}/\mathbf{Z})) = (N^0)^\vee$$

and we conclude because the functor $N \mapsto (N^0)^\vee = (N^\vee)^0$ is exact. To see that the second equality holds we use the equalities

$$\text{Hom}_{\mathbf{Z}}(N^n, \text{Hom}_{\mathbf{Z}}(A^{-n}, \mathbf{Q}/\mathbf{Z})) = \text{Hom}_{\mathbf{Z}}(N^n \otimes_{\mathbf{Z}} A^{-n}, \mathbf{Q}/\mathbf{Z})$$

of Algebra, Lemma 10.11.8. Thus an element of $\text{Hom}_{\text{Mod}_A}(N, A^\vee)$ corresponds to a family of \mathbf{Z} -bilinear maps $\psi_n : N^n \times A^{-n} \rightarrow \mathbf{Q}/\mathbf{Z}$ such that $\psi_n(x, a) = \psi_0(xa, 1)$ for all $x \in N^n$ and $a \in A^{-n}$. Moreover, $\psi_0(x, a) = \psi_0(xa, 1)$ for all $x \in N^0$, $a \in A^0$.

It follows that the maps ψ_n are determined by ψ_0 and that $\psi_0(x, a) = \varphi(xa)$ for a unique element $\varphi \in (N^0)^\vee$.

Finally, for every graded right A -module M we can choose a surjection (of graded left A -modules)

$$\bigoplus_{i \in I} A[k_i] \rightarrow M^\vee$$

where $A[k_i]$ denotes the shift of A by $k_i \in \mathbf{Z}$. (We do this by choosing homogeneous generators for M^\vee .) In this way we get an injection

$$M \rightarrow (M^\vee)^\vee \rightarrow \prod A[k_i]^\vee = \prod A^\vee[-k_i]$$

Observe that the products in the formula above are products in the category of graded modules (in other words, take products in each degree and then take the direct sum of the pieces).

We conclude that

- (1) the category of graded A -modules has enough injectives,
- (2) for every $k \in \mathbf{Z}$ the module $A^\vee[k]$ is injective, and
- (3) every A -module injects into a product in the category of graded modules of copies of shifts $A^\vee[k]$.

If (A, d) is a differential graded algebra and I is an object of $\text{Mod}_{(A, d)}$ then we say I is *injective as a graded A -module* to mean that I is a injective object of the abelian category Mod_A of graded A -modules.

Lemma 22.12.1. *Let (A, d) be a differential graded algebra. Let $I \rightarrow M$ be an injective homomorphism of differential graded A -modules. If I is an injective object of the category of graded A -modules, then $I \rightarrow M$ is an admissible monomorphism.*

Proof. This is immediate from the definitions. \square

Let (A, d) be a differential graded algebra. If M is a **left** differential graded A -module, then we will endow M^\vee (with its graded module structure as above) with a right differential graded module structure by setting

$$d_{M^\vee}(f) = -(-1)^n f \circ d_M^{-n-1} \quad \text{in } (M^\vee)^{n+1}$$

for $f \in (M^\vee)^n = \text{Hom}_{\mathbf{Z}}(M^{-n}, \mathbf{Q}/\mathbf{Z})$ and $d_M^{-n-1} : M^{-n-1} \rightarrow M^{-n}$ the differential of M^1 . We will show by a computation that this works. Namely, if $a \in A^m$, $x \in M^{-n-m-1}$ and $f \in (M^\vee)^n$, then we have

$$\begin{aligned} d_{M^\vee}(fa)(x) &= -(-1)^{n+m}(fa)(d_M(x)) \\ &= -(-1)^{n+m}f(ad_M(x)) \\ &= -(-1)^n f(d_M(ax) - d(a)x) \\ &= -(-1)^n [-(-1)^n d_{M^\vee}(f)(ax) - (fd(a))(x)] \\ &= (d_{M^\vee}(f)a)(x) + (-1)^n (fd(a))(x) \end{aligned}$$

the third equality because $d_M(ax) = d(a)x + (-1)^m ad_M(x)$. In other words we have $d_{M^\vee}(fa) = d_{M^\vee}(f)a + (-1)^n fd(a)$ as desired.

If M is a **right** differential graded module, then the sign rule above does not work. The problem seems to be that in defining the left A -module structure on M^\vee our

¹The sign rule is analogous to the one in Example 22.19.8, although there we are working with right modules and the same sign rule taken there does not work for left modules. Sigh!

conventions for graded modules above defines af to be the element of $(M^\vee)^{n+m}$ such that $(af)(x) = f(xa)$ for $f \in (M^\vee)^n$, $a \in A^m$ and $x \in M^{-n-m}$ which in some sense is the “wrong” thing to do if m is odd. Anyway, instead of changing the sign rule for the module structure, we fix the problem by using

$$d_{M^\vee}(f) = (-1)^n f \circ d_M^{-n-1}$$

when M is a right differential graded A -module. The computation for $a \in A^m$, $x \in M^{-n-m-1}$ and $f \in (M^\vee)^n$ then becomes

$$\begin{aligned} d_{M^\vee}(af)(x) &= (-1)^{n+m}(fa)(d_M(x)) \\ &= (-1)^{n+m}f(d_M(x)a) \\ &= (-1)^{n+m}f(d_M(ax) - (-1)^{m+n+1}xd(a)) \\ &= (-1)^m d_{M^\vee}(f)(ax) + f(xd(a)) \\ &= (-1)^m(ad_{M^\vee}(f))(x) + (d(a)f)(x) \end{aligned}$$

the third equality because $d_M(xa) = d_M(x)a + (-1)^{n+m+1}xd(a)$. In other words, we have $d_{M^\vee}(af) = d(a)f + (-1)^m ad_{M^\vee}(f)$ as desired.

We leave it to the reader to show that with the conventions above there is a natural evaluation map $M \rightarrow (M^\vee)^\vee$ in the category of differential graded modules if M is either a differential graded left module or a differential graded right module. This works because the sign choices above cancel out and the differentials of $((M^\vee)^\vee)$ are the natural maps $((M^n)^\vee)^\vee \rightarrow ((M^{n+1})^\vee)^\vee$.

Lemma 22.12.2. *Let (A, d) be a differential graded algebra. If M is a left differential graded A -module and N is a right differential graded A -module, then*

$$\text{Hom}_{\text{Mod}_{(A,d)}}(N, M^\vee)$$

is isomorphic to the set of sequences (ψ_n) of \mathbf{Z} -bilinear pairings

$$\psi_n : N^n \times M^{-n} \longrightarrow \mathbf{Q}/\mathbf{Z}$$

such that $\psi_{n+m}(y, ax) = \psi_{n+m}(ya, x)$ for all $y \in N^n$, $x \in M^{-m}$, and $a \in A^{m-n}$ and such that $\psi_{n+1}(d(y), x) + (-1)^n \psi_n(y, d(x)) = 0$ for all $y \in N^n$ and $x \in M^{-n-1}$.

Proof. If $f \in \text{Hom}_{\text{Mod}_{(A,d)}}(N, M^\vee)$, then we map this to the sequence of pairings defined by $\psi_n(y, x) = f(y)(x)$. It is a computation (omitted) to see that these pairings satisfy the conditions as in the lemma. For the converse, use Algebra, Lemma 10.11.8 to turn a sequence of pairings into a map $f : N \rightarrow M^\vee$. \square

Lemma 22.12.3. *Let (A, d) be a differential graded algebra. Then we have*

$$\text{Hom}_{\text{Mod}_{(A,d)}}(M, A^\vee[k]) = \text{Ker}(d : (M^\vee)^k \rightarrow (M^\vee)^{k+1})$$

and

$$\text{Hom}_{K(\text{Mod}_{(A,d)})}(M, A^\vee[k]) = H^k(M^\vee)$$

for any differential graded A -module M .

Proof. This is clear from the discussion above. \square

22.13. P-resolutions

This section is the analogue of Derived Categories, Section 13.28.

Let (A, d) be a differential graded algebra. Let P be a differential graded A -module. We say P has property (P) if there exists a filtration

$$0 = F_{-1}P \subset F_0P \subset F_1P \subset \dots \subset P$$

by differential graded submodules such that

- (1) $P = \bigcup F_p P$,
- (2) the inclusions $F_i P \rightarrow F_{i+1} P$ are admissible monomorphisms,
- (3) the quotients $F_{i+1} P / F_i P$ are isomorphic as differential graded A -modules to a direct sum of $A[k]$.

In fact, condition (2) is a consequence of condition (3), see Lemma 22.11.1. Moreover, the reader can verify that as a graded A -module P will be isomorphic to a direct sum of shifts of A .

Lemma 22.13.1. *Let (A, d) be a differential graded algebra. Let P be a differential graded A -module. If F_\bullet is a filtration as in property (P), then we obtain an admissible short exact sequence*

$$0 \rightarrow \bigoplus F_i P \rightarrow \bigoplus F_i P \rightarrow P \rightarrow 0$$

of differential graded A -modules.

Proof. The second map is the direct sum of the inclusion maps. The first map on the summand $F_i P$ of the source is the sum of the identity $F_i P \rightarrow F_i P$ and the negative of the inclusion map $F_i P \rightarrow F_{i+1} P$. Choose homomorphisms $s_i : F_{i+1} P \rightarrow F_i P$ of graded A -modules which are left inverse to the inclusion maps. Composing gives maps $s_{j,i} : F_j P \rightarrow F_i P$ for all $j > i$. Then a left inverse of the first arrow maps $x \in F_j P$ to $(s_{j,0}(x), s_{j,1}(x), \dots, s_{j,j-1}(x), 0, \dots)$ in $\bigoplus F_i P$. \square

The following lemma shows that differential graded modules with property (P) are the dual notion to K-injective modules (i.e., they are K-projective in some sense). See Derived Categories, Definition 13.29.1.

Lemma 22.13.2. *Let (A, d) be a differential graded algebra. Let P be a differential graded A -module with property (P). Then*

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(P, N) = 0$$

for all acyclic differential graded A -modules N .

Proof. We will use that $K(\mathrm{Mod}_{(A,d)})$ is a triangulated category (Proposition 22.10.3). Let F_\bullet be a filtration on P as in property (P). The short exact sequence of Lemma 22.13.1 produces a distinguished triangle. Hence by Derived Categories, Lemma 13.4.2 it suffices to show that

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(F_i P, N) = 0$$

for all acyclic differential graded A -modules N and all i . Each of the differential graded modules $F_i P$ has a finite filtration by admissible monomorphisms, whose graded pieces are direct sums of shifts $A[k]$. Thus it suffices to prove that

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(A[k], N) = 0$$

for all acyclic differential graded A -modules N and all k . This follows from Lemma 22.11.2. \square

Lemma 22.13.3. *Let (A, d) be a differential graded algebra. Let M be a differential graded A -module. There exists a homomorphism $P \rightarrow M$ of differential graded A -modules with the following properties*

- (1) $P \rightarrow M$ is surjective,
- (2) $\text{Ker}(d_P) \rightarrow \text{Ker}(d_M)$ is surjective, and
- (3) P sits in an admissible short exact sequence $0 \rightarrow P' \rightarrow P \rightarrow P'' \rightarrow 0$ where P', P'' are direct sums of shifts of A .

Proof. Let P_k be the free A -module with generators x, y in degrees k and $k + 1$. Define the structure of a differential graded A -module on P_k by setting $d(x) = y$ and $d(y) = 0$. For every element $m \in M^k$ there is a homomorphism $P_k \rightarrow M$ sending x to m and y to $d(m)$. Thus we see that there is a surjection from a direct sum of copies of P_k to M . This clearly produces $P \rightarrow M$ having properties (1) and (3). To obtain property (2) note that if $m \in \text{Ker}(d_M)$ has degree k , then there is a map $A[k] \rightarrow M$ mapping 1 to m . Hence we can achieve (2) by adding a direct sum of copies of shifts of A . \square

Lemma 22.13.4. *Let (A, d) be a differential graded algebra. Let M be a differential graded A -module. There exists a homomorphism $P \rightarrow M$ of differential graded A -modules such that*

- (1) $P \rightarrow M$ is a quasi-isomorphism, and
- (2) P has property (P).

Proof. Set $M = M_0$. We inductively choose short exact sequences

$$0 \rightarrow M_{i+1} \rightarrow P_i \rightarrow M_i \rightarrow 0$$

where the maps $P_i \rightarrow M_i$ are chosen as in Lemma 22.13.3. This gives a “resolution”

$$\dots \rightarrow P_2 \xrightarrow{f_2} P_1 \xrightarrow{f_1} P_0 \rightarrow M \rightarrow 0$$

Then we set

$$P = \bigoplus_{i \geq 0} P_i$$

as an A -module with grading given by $P^n = \bigoplus_{a+b=n} P_{-a}^b$ and differential (as in the construction of the total complex associated to a double complex) by

$$d_P(x) = f_{-a}(x) + (-1)^a d_{P_{-a}}(x)$$

for $x \in P_{-a}^b$. With these conventions P is indeed a differential graded A -module. Recalling that each P_i has a two step filtration $0 \rightarrow P'_i \rightarrow P_i \rightarrow P''_i \rightarrow 0$ we set

$$F_{2i}P = \bigoplus_{i \geq j \geq 0} P_j \subset \bigoplus_{i \geq 0} P_i = P$$

and we add P'_{i+1} to $F_{2i}P$ to get F_{2i+1} . These are differential graded submodules and the successive quotients are direct sums of shifts of A . By Lemma 22.11.1 we see that the inclusions $F_iP \rightarrow F_{i+1}P$ are admissible monomorphisms. Finally, we have to show that the map $P \rightarrow M$ (given by the augmentation $P_0 \rightarrow M$) is a quasi-isomorphism. This follows from Homology, Lemma 12.22.10. \square

22.14. I-resolutions

This section is the dual of the section on P-resolutions.

Let (A, d) be a differential graded algebra. Let I be a differential graded A -module. We say I has *property (I)* if there exists a filtration

$$I = F_0I \supset F_1I \supset F_2I \supset \dots \supset 0$$

by differential graded submodules such that

- (1) $I = \lim I/F_pI$,
- (2) the maps $I/F_{i+1}I \rightarrow I/F_iI$ are admissible epimorphisms,
- (3) the quotients $F_iI/F_{i+1}I$ are isomorphic as differential graded A -modules to products of $A^\vee[k]$.

In fact, condition (2) is a consequence of condition (3), see Lemma 22.12.1. The reader can verify that as a graded module I will be isomorphic to a product of $A^\vee[k]$.

Lemma 22.14.1. *Let (A, d) be a differential graded algebra. Let I be a differential graded A -module. If F_\bullet is a filtration as in property (I), then we obtain an admissible short exact sequence*

$$0 \rightarrow I \rightarrow \prod I/F_iI \rightarrow \prod I/F_iI \rightarrow 0$$

of differential graded A -modules.

Proof. Omitted. Hint: This is dual to Lemma 22.13.1. □

The following lemma shows that differential graded modules with property (I) are the analogue of K-injective modules. See Derived Categories, Definition 13.29.1.

Lemma 22.14.2. *Let (A, d) be a differential graded algebra. Let I be a differential graded A -module with property (I). Then*

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(N, I) = 0$$

for all acyclic differential graded A -modules N .

Proof. We will use that $K(\mathrm{Mod}_{(A,d)})$ is a triangulated category (Proposition 22.10.3). Let F_\bullet be a filtration on I as in property (I). The short exact sequence of Lemma 22.14.1 produces a distinguished triangle. Hence by Derived Categories, Lemma 13.4.2 it suffices to show that

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(N, I/F_iI) = 0$$

for all acyclic differential graded A -modules N and all i . Each of the differential graded modules I/F_iI has a finite filtration by admissible monomorphisms, whose graded pieces are products of $A^\vee[k]$. Thus it suffices to prove that

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(N, A^\vee[k]) = 0$$

for all acyclic differential graded A -modules N and all k . This follows from Lemma 22.12.3 and the fact that $(-)^\vee$ is an exact functor. □

Lemma 22.14.3. *Let (A, d) be a differential graded algebra. Let M be a differential graded A -module. There exists a homomorphism $M \rightarrow I$ of differential graded A -modules with the following properties*

- (1) $M \rightarrow I$ is injective,

- (2) $\text{Coker}(d_M) \rightarrow \text{Coker}(d_I)$ is injective, and
 (3) I sits in an admissible short exact sequence $0 \rightarrow I' \rightarrow I \rightarrow I'' \rightarrow 0$ where I', I'' are products of shifts of A^\vee .

Proof. For every $k \in \mathbf{Z}$ let Q_k be the free left A -module with generators x, y in degrees k and $k + 1$. Define the structure of a left differential graded A -module on Q_k by setting $d(x) = y$ and $d(y) = 0$. Let $I_k = Q_{-k}^\vee$ be the “dual” right differential graded A -module, see Section 22.12. The next paragraph shows that we can embed M into a product of copies of I_k (for varying k). The dual statement (that any differential graded module is a quotient of a direct sum of P_k 's) is easy to prove (see proof of Lemma 22.13.3) and using double duals there should be a noncomputational way to deduce what we want. Thus we suggest skipping the next paragraph.

Given a \mathbf{Z} -linear map $\lambda : M^k \rightarrow \mathbf{Q}/\mathbf{Z}$ we construct pairings

$$\psi_n : M^n \times Q_k^{-n} \longrightarrow \mathbf{Q}/\mathbf{Z}$$

by setting

$$\psi_n(m, ax + by) = \lambda(ma + (-1)^{k+1}d(mb))$$

for $m \in M^n$, $a \in A^{-n-k}$, and $b \in A^{-n-k-1}$. We compute

$$\begin{aligned} \psi_{n+1}(d(m), ax + by) &= \lambda(d(m)a + (-1)^{k+1}d(d(m)b)) \\ &= \lambda(d(m)a + (-1)^{k+n}d(m)d(b)) \end{aligned}$$

and because $d(ax + by) = d(a)x + (-1)^{-n-k}ay + d(b)y$ we have

$$\begin{aligned} \psi_n(m, d(ax + by)) &= \lambda(md(a) + (-1)^{k+1}d(m((-1)^{-n-k}a + d(b)))) \\ &= \lambda(md(a) + (-1)^{-n+1}d(ma) + (-1)^{k+1}d(m)d(b))) \end{aligned}$$

and we see that

$$\psi_{n+1}(d(m), ax + by) + (-1)^n \psi_n(m, d(ax + by)) = 0$$

Thus these pairings define a homomorphism $f_\lambda : M \rightarrow I_k$ by Lemma 22.12.2 such that the composition

$$M^k \xrightarrow{f_\lambda^k} I_k^k = (Q_k^k)^\vee \xrightarrow{\text{evaluation at } x} \mathbf{Q}/\mathbf{Z}$$

is the given map λ . It is clear that we can find an embedding into a product of copies of I_k 's by using a map of the form $\prod f_\lambda$ for a suitable choice of the maps λ .

The result of the previous paragraph produces $M \rightarrow I$ having properties (1) and (3). To obtain property (2), suppose $\bar{m} \in \text{Coker}(d_M)$ is a nonzero element of degree k . Pick a map $\lambda : M^k \rightarrow \mathbf{Q}/\mathbf{Z}$ which vanishes on $\text{Im}(M^{k-1} \rightarrow M^k)$ but not on m . By Lemma 22.12.3 this corresponds to a homomorphism $M \rightarrow A^\vee[k]$ of differential graded A -modules which does not vanish on m . Hence we can achieve (2) by adding a product of copies of shifts of A^\vee . \square

Lemma 22.14.4. *Let (A, d) be a differential graded algebra. Let M be a differential graded A -module. There exists a homomorphism $M \rightarrow I$ of differential graded A -modules such that*

- (1) $M \rightarrow I$ is a quasi-isomorphism, and
 (2) I has property (I).

Proof. Set $M = M_0$. We inductively choose short exact sequences

$$0 \rightarrow M_i \rightarrow I_i \rightarrow M_{i+1} \rightarrow 0$$

where the maps $M_i \rightarrow I_i$ are chosen as in Lemma 22.14.3. This gives a “resolution”

$$0 \rightarrow M \rightarrow I_0 \xrightarrow{f_0} I_1 \xrightarrow{f_1} I_1 \rightarrow \dots$$

Then we set

$$I = \prod_{i \geq 0} I_i$$

where we take the product in the category of graded A -modules and differential defined by

$$d_I(x) = f_a(x) + (-1)^a d_{I_a}(x)$$

for $x \in I_a^b$. With these conventions I is indeed a differential graded A -module. Recalling that each I_i has a two step filtration $0 \rightarrow I'_i \rightarrow I_i \rightarrow I''_i \rightarrow 0$ we set

$$F_{2i}P = \prod_{j \geq i} I_j \subset \prod_{i \geq 0} I_i = I$$

and we add a factor I'_{i+1} to $F_{2i}I$ to get $F_{2i+1}I$. These are differential graded submodules and the successive quotients are products of shifts of A^\vee . By Lemma 22.12.1 we see that the inclusions $F_{i+1}I \rightarrow F_iI$ are admissible monomorphisms. Finally, we have to show that the map $M \rightarrow I$ (given by the augmentation $M \rightarrow I_0$) is a quasi-isomorphism. This follows from Homology, Lemma 12.22.11. \square

22.15. The derived category

Recall that the notions of acyclic differential graded modules and quasi-isomorphism of differential graded modules make sense (see Section 22.4).

Lemma 22.15.1. *Let (A, d) be a differential graded algebra. The full subcategory Ac of $K(\text{Mod}_{(A,d)})$ consisting of acyclic modules is a strictly full saturated triangulated subcategory of $K(\text{Mod}_{(A,d)})$. The corresponding saturated multiplicative system (see *Derived Categories*, Lemma 13.6.10) of $K(\text{Mod}_{(A,d)})$ is the class Qis of quasi-isomorphisms. In particular, the kernel of the localization functor*

$$Q : K(\text{Mod}_{(A,d)}) \rightarrow Qis^{-1}K(\text{Mod}_{(A,d)})$$

is Ac . Moreover, the functor H^0 factors through Q .

Proof. We know that H^0 is a homological functor by the long exact sequence of homology (22.4.2.1). The kernel of H^0 is the subcategory of acyclic objects and the arrows which induce isomorphisms on all H^i are the quasi-isomorphisms. Thus this lemma is a special case of *Derived Categories*, Lemma 13.6.11.

Set theoretical remark. The construction of the localization in *Derived Categories*, Proposition 13.5.5 assumes the given triangulated category is “small”, i.e., that the underlying collection of objects forms a set. Let V_α be a partial universe (as in *Sets*, Section 3.5) containing (A, d) and where the cofinality of α is bigger than \aleph_0 (see *Sets*, Proposition 3.7.2). Then we can consider the category $\text{Mod}_{(A,d),\alpha}$ of differential graded A -modules contained in V_α . A straightforward check shows that all the constructions used in the proof of Proposition 22.10.3 work inside of $\text{Mod}_{(A,d),\alpha}$ (because at worst we take finite direct sums of differential graded

modules). Thus we obtain a triangulated category $\text{Qis}_\alpha^{-1}K(\text{Mod}_{(A,d),\alpha})$. We will see below that if $\beta > \alpha$, then the transition functors

$$\text{Qis}_\alpha^{-1}K(\text{Mod}_{(A,d),\alpha}) \longrightarrow \text{Qis}_\beta^{-1}K(\text{Mod}_{(A,d),\beta})$$

are fully faithful as the morphism sets in the quotient categories are computed by maps in the homotopy categories from P-resolutions (the construction of a P-resolution in the proof of Lemma 22.13.4 takes countable direct sums as well as direct sums indexed over subsets of the given module). The reader should therefore think of the category of the lemma as the union of these subcategories. \square

Taking into account the set theoretical remark at the end of the proof of the preceding lemma we define the derived category as follows.

Definition 22.15.2. Let (A, d) be a differential graded algebra. Let Ac and Qis be as in Lemma 22.15.1. The *derived category of (A, d)* is the triangulated category

$$D(A, d) = K(\text{Mod}_{(A,d)})/\text{Ac} = \text{Qis}^{-1}K(\text{Mod}_{(A,d)}).$$

We denote $H^0 : D(A, d) \rightarrow \text{Mod}_R$ the unique functor whose composition with the quotient functor gives back the functor H^0 defined above.

Here is the promised lemma computing morphism sets in the derived category.

Lemma 22.15.3. *Let (A, d) be a differential graded algebra. Let M and N be differential graded A -modules.*

- (1) *Let $P \rightarrow M$ be a P-resolution as in Lemma 22.13.4. Then*

$$\text{Hom}_{D(A,d)}(M, N) = \text{Hom}_{K(\text{Mod}_{(A,d)})}(P, N)$$

- (2) *Let $N \rightarrow I$ be an I-resolution as in Lemma 22.14.4. Then*

$$\text{Hom}_{D(A,d)}(M, N) = \text{Hom}_{K(\text{Mod}_{(A,d)})}(M, I)$$

Proof. Let $P \rightarrow M$ be as in (1). Since $P \rightarrow M$ is a quasi-isomorphism we see that

$$\text{Hom}_{D(A,d)}(P, N) = \text{Hom}_{D(A,d)}(M, N)$$

by definition of the derived category. A morphism $f : P \rightarrow N$ in $D(A, d)$ is equal to $s^{-1}f'$ where $f' : P \rightarrow N'$ is a morphism and $s : N \rightarrow N'$ is a quasi-isomorphism. Choose a distinguished triangle

$$N \rightarrow N' \rightarrow Q \rightarrow N[1]$$

As s is a quasi-isomorphism, we see that Q is acyclic. Thus $\text{Hom}_{K(\text{Mod}_{(A,d)})}(P, Q[k]) = 0$ for all k by Lemma 22.13.2. Since $\text{Hom}_{K(\text{Mod}_{(A,d)})}(P, -)$ is cohomological, we conclude that we can lift $f' : P \rightarrow N'$ uniquely to a morphism $f : P \rightarrow N$. This finishes the proof.

The proof of (2) is dual to that of (1) using Lemma 22.14.2 in stead of Lemma 22.13.2. \square

Lemma 22.15.4. *Let (A, d) be a differential graded algebra. Then*

- (1) *$D(A, d)$ has both direct sums and products,*
- (2) *direct sums are obtained by taking direct sums of differential graded modules,*
- (3) *products are obtained by taking products of differential graded modules.*

Proof. We will use that $\text{Mod}_{(A,d)}$ is an abelian category with arbitrary direct sums and products, and that these give rise to direct sums and products in $K(\text{Mod}_{(A,d)})$. See Lemmas 22.4.2 and 22.5.4.

Let M_j be a family of differential graded A -modules. Consider the graded direct sum $M = \bigoplus M_j$ which is a differential graded A -module with the obvious. For a differential graded A -module N choose a quasi-isomorphism $N \rightarrow I$ where I is a differential graded A -module with property (I). See Lemma 22.14.4. Using Lemma 22.15.3 we have

$$\begin{aligned} \text{Hom}_{D(A,d)}(M, N) &= \text{Hom}_{K(A,d)}(M, I) \\ &= \prod \text{Hom}_{K(A,d)}(M_j, I) \\ &= \prod \text{Hom}_{D(A,d)}(M_j, N) \end{aligned}$$

whence the existence of direct sums in $D(A, d)$ as given in part (2) of the lemma.

Let M_j be a family of differential graded A -modules. Consider the product $M = \prod M_j$ of differential graded A -modules. For a differential graded A -module N choose a quasi-isomorphism $P \rightarrow N$ where P is a differential graded A -module with property (P). See Lemma 22.13.4. Using Lemma 22.15.3 we have

$$\begin{aligned} \text{Hom}_{D(A,d)}(N, M) &= \text{Hom}_{K(A,d)}(P, M) \\ &= \prod \text{Hom}_{K(A,d)}(P, M_j) \\ &= \prod \text{Hom}_{D(A,d)}(N, M_j) \end{aligned}$$

whence the existence of direct sums in $D(A, d)$ as given in part (3) of the lemma. \square

22.16. The canonical delta-functor

Let (A, d) be a differential graded algebra. Consider the functor $\text{Mod}(A) \rightarrow K(\text{Mod}_{(A,d)})$. This functor is **not** a δ -functor in general. However, it turns out that the functor $\text{Mod}_{(A,d)} \rightarrow D(A, d)$ is a δ -functor. In order to see this we have to define the morphisms δ associated to a short exact sequence

$$0 \rightarrow K \xrightarrow{a} L \xrightarrow{b} M \rightarrow 0$$

in the abelian category $\text{Mod}_{(A,d)}$. Consider the cone $C(a)$ of the morphism a . We have $C(a) = L \oplus K$ and we define $q : C(a) \rightarrow M$ via the projection to L followed by b . Hence a homomorphism of differential graded A -modules

$$q : C(a) \longrightarrow M.$$

It is clear that $q \circ i = b$ where i is as in Definition 22.6.1. Note that, as a is injective, the kernel of q is identified with the cone of id_K which is acyclic. Hence we see that q is a quasi-isomorphism. According to Lemma 22.9.4 the triangle

$$(K, L, C(a), a, i, -p)$$

is a distinguished triangle in $K(\text{Mod}_{(A,d)})$. As the localization functor $K(\text{Mod}_{(A,d)}) \rightarrow D(A, d)$ is exact we see that $(K, L, C(a), a, i, -p)$ is a distinguished triangle in $D(A, d)$. Since q is a quasi-isomorphism we see that q is an isomorphism in $D(A, d)$. Hence we deduce that

$$(K, L, M, a, b, -p \circ q^{-1})$$

is a distinguished triangle of $D(A, d)$. This suggests the following lemma.

Lemma 22.16.1. *Let (A, d) be a differential graded algebra. The functor $\text{Mod}_{(A,d)} \rightarrow D(A, d)$ defined has the natural structure of a δ -functor, with*

$$\delta_{K \rightarrow L \rightarrow M} = -p \circ q^{-1}$$

with p and q as explained above.

Proof. We have already seen that this choice leads to a distinguished triangle whenever given a short exact sequence of complexes. We have to show functoriality of this construction, see Derived Categories, Definition 13.3.6. This follows from Lemma 22.6.2 with a bit of work. Compare with Derived Categories, Lemma 13.12.1. \square

22.17. Linear categories

Just the definitions.

Definition 22.17.1. Let R be a ring. An R -linear category \mathcal{A} is a category where every morphism set is given the structure of an R -module and where for $x, y, z \in \text{Ob}(\mathcal{A})$ composition law

$$\text{Hom}_{\mathcal{A}}(y, z) \times \text{Hom}_{\mathcal{A}}(x, y) \longrightarrow \text{Hom}_{\mathcal{A}}(x, z)$$

is R -bilinear.

Thus composition determines an R -linear map

$$\text{Hom}_{\mathcal{A}}(y, z) \otimes_R \text{Hom}_{\mathcal{A}}(x, y) \longrightarrow \text{Hom}_{\mathcal{A}}(x, z)$$

of R -modules. Note that we do not assume R -linear categories to be additive.

Definition 22.17.2. Let R be a ring. A functor of R -linear categories, or an R -linear is a functor $F : \mathcal{A} \rightarrow \mathcal{B}$ where for all objects x, y of \mathcal{A} the map $F : \text{Hom}_{\mathcal{A}}(x, y) \rightarrow \text{Hom}_{\mathcal{B}}(F(x), F(y))$ is a homomorphism of R -modules.

22.18. Graded categories

Just some definitions.

Definition 22.18.1. Let R be a ring. A graded category \mathcal{A} over R is a category where every morphism set is given the structure of a graded R -module and where for $x, y, z \in \text{Ob}(\mathcal{A})$ composition is R -bilinear and induces a homomorphism

$$\text{Hom}_{\mathcal{A}}(y, z) \otimes_R \text{Hom}_{\mathcal{A}}(x, y) \longrightarrow \text{Hom}_{\mathcal{A}}(x, z)$$

of graded R -modules (i.e., preserving degrees).

In this situation we denote $\text{Hom}_{\mathcal{A}}^i(x, y)$ the degree i part of the graded object $\text{Hom}_{\mathcal{A}}(x, y)$, so that

$$\text{Hom}_{\mathcal{A}}(x, y) = \bigoplus_{i \in \mathbf{Z}} \text{Hom}_{\mathcal{A}}^i(x, y)$$

is the direct sum decomposition into graded parts.

Definition 22.18.2. Let R be a ring. A functor of graded categories over R , or a graded functor is a functor $F : \mathcal{A} \rightarrow \mathcal{B}$ where for all objects x, y of \mathcal{A} the map $F : \text{Hom}_{\mathcal{A}}(x, y) \rightarrow \text{Hom}_{\mathcal{B}}(F(x), F(y))$ is a homomorphism of graded R -modules.

Given a graded category we are often interested in the corresponding “usual” category of maps of degree 0. Here is a formal definition.

Definition 22.18.3. Let R be a ring. Let \mathcal{A} be a differential graded category over R . We let \mathcal{A}^0 be the category with the same objects as \mathcal{A} and with

$$\mathrm{Hom}_{\mathcal{A}^0}(x, y) = \mathrm{Hom}_{\mathcal{A}}^0(x, y)$$

the degree 0 graded piece of the graded module of morphisms of \mathcal{A} .

Definition 22.18.4. Let R be a ring. Let \mathcal{A} be a graded category over R . A direct sum (x, y, z, i, j, p, q) in \mathcal{A} (notation as in Homology, Remark 12.3.6) is a *graded direct sum* if i, j, p, q are homogeneous of degree 0.

Example 22.18.5 (Graded category of graded objects). Let \mathcal{B} be an additive category. Recall that we have defined the category $\mathrm{Gr}(\mathcal{B})$ of graded objects of \mathcal{B} in Homology, Definition 12.15.1. In this example, we will construct a graded category $\mathrm{Gr}^{gr}(\mathcal{B})$ over $R = \mathbf{Z}$ whose associated category $\mathrm{Gr}^{gr}(\mathcal{B})^0$ recovers $\mathrm{Gr}(\mathcal{B})$. As objects of $\mathrm{Comp}^{gr}(\mathcal{B})$ we take graded objects of \mathcal{B} . Then, given graded objects $A = (A^i)$ and $B = (B^i)$ of \mathcal{B} we set

$$\mathrm{Hom}_{\mathrm{Gr}^{gr}(\mathcal{B})}(A, B) = \bigoplus_{n \in \mathbf{Z}} \mathrm{Hom}^n(A, B)$$

where the graded piece of degree n is the abelian group of homogeneous maps of degree n from A to B defined by the rule

$$\mathrm{Hom}^n(A, B) = \mathrm{Hom}_{\mathrm{Gr}(\mathcal{A})}(A, B[n]) = \mathrm{Hom}_{\mathrm{Gr}(\mathcal{A})}(A[-n], B)$$

see Homology, Equation (12.15.4.1). Explicitly we have

$$\mathrm{Hom}^n(A, B) = \prod_{p+q=n} \mathrm{Hom}_{\mathcal{B}}(A^{-q}, B^p)$$

(observe reversal of indices and observe that we have a product here and not a direct sum). In other words, a degree n morphism f from A to B can be seen as a system $f = (f_{p,q})$ where $p, q \in \mathbf{Z}$, $p + q = n$ with $f_{p,q} : A^{-q} \rightarrow B^p$ a morphism of \mathcal{B} . Given graded objects A, B, C of \mathcal{B} composition of morphisms in $\mathrm{Gr}^{gr}(\mathcal{B})$ is defined via the maps

$$\mathrm{Hom}^m(B, C) \times \mathrm{Hom}^n(A, B) \longrightarrow \mathrm{Hom}^{n+m}(A, C)$$

by simple composition $(g, f) \mapsto g \circ f$ of homogeneous maps of graded objects. In terms of components we have

$$(g \circ f)_{p,r} = g_{p,q} \circ f_{-q,r}$$

where q is such that $p + q = m$ and $-q + r = n$.

Example 22.18.6 (Graded category of graded modules). Let A be a \mathbf{Z} -graded algebra over a ring R . We will construct a graded category Mod_A^{gr} over R whose associated category $(\mathrm{Mod}_A^{gr})^0$ is the category of graded A -modules. As objects of Mod_A^{gr} we take right graded A -modules (see Section 22.11). Given graded A -modules L and M we set

$$\mathrm{Hom}_{\mathrm{Mod}_A^{gr}}(L, M) = \bigoplus_{n \in \mathbf{Z}} \mathrm{Hom}^n(L, M)$$

where $\mathrm{Hom}^n(L, M)$ is the set of right A -module maps $L \rightarrow M$ which are homogeneous of degree n , i.e., $f(L^i) \subset M^{i+n}$ for all $i \in \mathbf{Z}$. In terms of components, we have that

$$\mathrm{Hom}^n(L, M) \subset \prod_{p+q=n} \mathrm{Hom}_R(L^{-q}, M^p)$$

(observe reversal of indices) is the subset consisting of those $f = (f_{p,q})$ such that

$$f_{p,q}(ma) = f_{p-i,q+i}(m)a$$

for $a \in A^i$ and $m \in L^{-q-i}$. For graded A -modules K, L, M we define composition in Mod_A^{gr} via the maps

$$\text{Hom}^m(L, M) \times \text{Hom}^n(K, L) \longrightarrow \text{Hom}^{n+m}(K, M)$$

by simple composition of right A -module maps: $(g, f) \mapsto g \circ f$.

Remark 22.18.7. Let R be a ring. Let \mathcal{D} be an R -linear category endowed with a collection of R -linear functors $[n] : \mathcal{D} \rightarrow \mathcal{D}$, $x \mapsto x[n]$ indexed by $n \in \mathbf{Z}$ such that $[n] \circ [m] = [n+m]$ and $[0] = \text{id}_{\mathcal{D}}$ (equality as functors). This allows us to construct a graded category \mathcal{D}^{gr} over R with the same objects of \mathcal{D} setting

$$\text{Hom}_{\mathcal{D}^{gr}}(x, y) = \bigoplus_{n \in \mathbf{Z}} \text{Hom}_{\mathcal{D}}(x, y[n])$$

for x, y in \mathcal{D} . Observe that $(\mathcal{D}^{gr})^0 = \mathcal{D}$ (see Definition 22.18.3). Moreover, the graded category \mathcal{D}^{gr} inherits R -linear graded functors $[n]$ satisfying $[n] \circ [m] = [n+m]$ and $[0] = \text{id}_{\mathcal{D}^{gr}}$ with the property that

$$\text{Hom}_{\mathcal{D}^{gr}}(x, y[n]) = \text{Hom}_{\mathcal{D}^{gr}}(x, y)[n]$$

as graded R -modules compatible with composition of morphisms.

Conversely, suppose given a graded category \mathcal{A} over R endowed with a collection of R -linear graded functors $[n]$ satisfying $[n] \circ [m] = [n+m]$ and $[0] = \text{id}_{\mathcal{A}}$ which are moreover equipped with isomorphisms

$$\text{Hom}_{\mathcal{A}}(x, y[n]) = \text{Hom}_{\mathcal{A}}(x, y)[n]$$

as graded R -modules compatible with composition of morphisms. Then the reader easily shows that $\mathcal{A} = (\mathcal{A}^0)^{gr}$.

Here are two examples of the relationship $\mathcal{D} \leftrightarrow \mathcal{A}$ we established above:

- (1) Let \mathcal{B} be an additive category. If $\mathcal{D} = \text{Gr}(\mathcal{B})$, then $\mathcal{A} = \text{Gr}^{gr}(\mathcal{B})$ as in Example 22.18.5.
- (2) If A is a graded ring and $\mathcal{D} = \text{Mod}_A$ is the category of graded right A -modules, then $\mathcal{A} = \text{Mod}_A^{gr}$, see Example 22.18.6.

22.19. Differential graded categories

Note that if R is a ring, then R is a differential graded algebra over itself (with $R = R^0$ of course). In this case a differential graded R -module is the same thing as a complex of R -modules. In particular, given two differential graded R -modules M and N we denote $M \otimes_R N$ the differential graded R -module corresponding to the total complex associated to the double complex obtained by the tensor product of the complexes of R -modules associated to M and N .

Definition 22.19.1. Let R be a ring. A *differential graded category* \mathcal{A} over R is a category where every morphism set is given the structure of a differential graded R -module and where for $x, y, z \in \text{Ob}(\mathcal{A})$ composition is R -bilinear and induces a homomorphism

$$\text{Hom}_{\mathcal{A}}(y, z) \otimes_R \text{Hom}_{\mathcal{A}}(x, y) \longrightarrow \text{Hom}_{\mathcal{A}}(x, z)$$

of differential graded R -modules.

The final condition of the definition signifies the following: if $f \in \text{Hom}_{\mathcal{A}}^n(x, y)$ and $g \in \text{Hom}_{\mathcal{A}}^m(y, z)$ are homogeneous of degrees n and m , then

$$d(g \circ f) = d(g) \circ f + (-1)^m g \circ d(f)$$

in $\text{Hom}_{\mathcal{A}}^{n+m+1}(x, z)$. This follows from the sign rule for the differential on the total complex of a double complex, see Homology, Definition 12.22.3.

Definition 22.19.2. Let R be a ring. A *functor of differential graded categories over R* is a functor $F : \mathcal{A} \rightarrow \mathcal{B}$ where for all objects x, y of \mathcal{A} the map $F : \text{Hom}_{\mathcal{A}}(x, y) \rightarrow \text{Hom}_{\mathcal{A}}(F(x), F(y))$ is a homomorphism of differential graded R -modules.

Given a differential graded category we are often interested in the corresponding categories of complexes and homotopy category. Here is a formal definition.

Definition 22.19.3. Let R be a ring. Let \mathcal{A} be a differential graded category over R . Then we let

- (1) the *category of complexes of \mathcal{A}* ² be the category $\text{Comp}(\mathcal{A})$ whose objects are the same as the objects of \mathcal{A} and with

$$\text{Hom}_{\text{Comp}(\mathcal{A})}(x, y) = \text{Ker}(d : \text{Hom}_{\mathcal{A}}^0(x, y) \rightarrow \text{Hom}_{\mathcal{A}}^0(x, y))$$

- (2) the *homotopy category of \mathcal{A}* be the category $K(\mathcal{A})$ whose objects are the same as the objects of \mathcal{A} and with

$$\text{Hom}_{K(\mathcal{A})}(x, y) = H^0(\text{Hom}_{\mathcal{A}}(x, y))$$

Our use of the symbol $K(\mathcal{A})$ is nonstandard, but at least is compatible with the use of $K(-)$ in other chapters of the Stacks project.

Definition 22.19.4. Let R be a ring. Let \mathcal{A} be a differential graded category over R . A direct sum (x, y, z, i, j, p, q) in \mathcal{A} (notation as in Homology, Remark 12.3.6) is a *differential graded direct sum* if i, j, p, q are homogeneous of degree 0 and closed, i.e., $d(i) = 0$, etc.

Lemma 22.19.5. *Let R be a ring. A functor $F : \mathcal{A} \rightarrow \mathcal{B}$ of differential graded categories over R induces functors $\text{Comp}(\mathcal{A}) \rightarrow \text{Comp}(\mathcal{B})$ and $K(\mathcal{A}) \rightarrow K(\mathcal{B})$.*

Proof. Omitted. □

Example 22.19.6 (Differential graded category of complexes). Let \mathcal{B} be an additive category. We will construct a differential graded category $\text{Comp}^{dg}(\mathcal{B})$ over $R = \mathbf{Z}$ whose associated category of complexes is $\text{Comp}(\mathcal{B})$ and whose associated homotopy category is $K(\mathcal{B})$. As objects of $\text{Comp}^{dg}(\mathcal{B})$ we take complexes of \mathcal{B} . Given complexes A^\bullet and B^\bullet of \mathcal{B} , we sometimes also denote A^\bullet and B^\bullet the corresponding graded objects of \mathcal{B} (i.e., forget about the differential). Using this abuse of notation, we set

$$\text{Hom}_{\text{Comp}^{dg}(\mathcal{B})}(A^\bullet, B^\bullet) = \text{Hom}_{\text{Gr}^{gr}(\mathcal{B})}(A^\bullet, B^\bullet)$$

as a graded \mathbf{Z} -module where the right hand side is defined in Example 22.18.5. In other words, the n th graded piece is the abelian group of homogeneous morphism of degree n of graded objects

$$\text{Hom}^n(A^\bullet, B^\bullet) = \text{Hom}_{\text{Gr}(\mathcal{B})}(A^\bullet, B^\bullet[n]) = \prod_{p+q=n} \text{Hom}_{\mathcal{B}}(A^{-q}, B^p)$$

²This may be nonstandard terminology.

(observe reversal of indices and observe we have a direct product and not a direct sum). For an element $f \in \text{Hom}^n(A^\bullet, B^\bullet)$ of degree n we set

$$d(f) = d_B \circ f - (-1)^n f \circ d_A$$

To make sense of this we think of d_B and d_A as maps of graded objects of \mathcal{B} homogeneous of degree 1 and we use composition in the category $\text{Gr}^{gr}(\mathcal{B})$ on the right hand side. In terms of components, if $f = (f_{p,q})$ with $f_{p,q} : A^{-q} \rightarrow B^p$ we have

$$(22.19.6.1) \quad d(f_{p,q}) = d_B \circ f_{p,q} + (-1)^{p+q+1} f_{p,q} \circ d_A$$

Note that the first term of this expression is in $\text{Hom}_{\mathcal{B}}(A^{-q}, B^{p+1})$ and the second term is in $\text{Hom}_{\mathcal{B}}(A^{-q-1}, B^p)$. In other words, given $p+q = n+1$ we have

$$d(f)_{p,q} = d_B \circ f_{p-1,q} - (-1)^n f_{p,q-1} \circ d_A$$

with obvious notation. The reader checks³ that

- (1) d has square zero,
- (2) an element f in $\text{Hom}^n(A^\bullet, B^\bullet)$ has $d(f) = 0$ if and only if the morphism $f : A^\bullet \rightarrow B^\bullet[n]$ of graded objects of \mathcal{B} is actually a map of complexes,
- (3) in particular, the category of complexes of $\text{Comp}^{dg}(\mathcal{B})$ is equal to $\text{Comp}(\mathcal{B})$,
- (4) the morphism of complexes defined by f as in (2) is homotopy equivalent to zero if and only if $f = d(g)$ for some $g \in \text{Hom}^{n-1}(A^\bullet, B^\bullet)$.
- (5) in particular, we obtain a canonical isomorphism

$$\text{Hom}_{K(\mathcal{B})}(A^\bullet, B^\bullet) \longrightarrow H^0(\text{Hom}_{\text{Comp}^{dg}(\mathcal{B})}(A^\bullet, B^\bullet))$$

and the homotopy category of $\text{Comp}^{dg}(\mathcal{B})$ is equal to $K(\mathcal{B})$.

Given complexes $A^\bullet, B^\bullet, C^\bullet$ we define composition

$$\text{Hom}^m(B^\bullet, C^\bullet) \times \text{Hom}^n(A^\bullet, B^\bullet) \longrightarrow \text{Hom}^{n+m}(A^\bullet, C^\bullet)$$

by composition $(g, f) \mapsto g \circ f$ in the graded category $\text{Gr}^{gr}(\mathcal{B})$, see Example 22.18.5. This defines a map of differential graded modules as in Definition 22.19.1 because

$$\begin{aligned} d(g \circ f) &= d_C \circ g \circ f - (-1)^{n+m} g \circ f \circ d_A \\ &= (d_C \circ g - (-1)^m g \circ d_B) \circ f + (-1)^m g \circ (d_B \circ f - (-1)^n f \circ d_A) \\ &= d(g) \circ f + (-1)^m g \circ d(f) \end{aligned}$$

as desired.

Lemma 22.19.7. *Let $F : \mathcal{B} \rightarrow \mathcal{B}'$ be an additive functor between additive categories. Then F induces a functor of differential graded categories*

$$F : \text{Comp}^{dg}(\mathcal{B}) \rightarrow \text{Comp}^{dg}(\mathcal{B}')$$

of Example 22.19.6 inducing the usual functors on the category of complexes and the homotopy categories.

Proof. Omitted. □

³What may be useful here is to think of the double complex $H^{\bullet,\bullet}$ with terms $H^{p,q} = \text{Hom}_{\mathcal{B}}(A^{-q}, B^p)$ and differentials d_1 of degree $(1,0)$ given by d_B and d_2 of degree $(0,1)$ given by the contragredient of d_A . Up to sign and up to replacing the direct sum by a direct product, the differential graded \mathbf{Z} -module $\text{Hom}_{\text{Comp}^{dg}(\mathcal{B})}(A^\bullet, B^\bullet)$ is the total complex associated to $H^{\bullet,\bullet}$, see Homology, Definition 12.22.3. To get the sign correct, change $d_2^{p,q} : H^{p,q} \rightarrow H^{p,q+1}$ by $(-1)^{q+1}$ (after this change we still have a double complex).

Example 22.19.8 (Differential graded category of differential graded modules). Let (A, d) be a differential graded algebra over a ring R . We will construct a differential graded category $\text{Mod}_{(A,d)}^{dg}$ over R whose category of complexes is $\text{Mod}_{(A,d)}$ and whose homotopy category is $K(\text{Mod}_{(A,d)})$. As objects of $\text{Mod}_{(A,d)}^{dg}$ we take the differential graded A -modules. Given differential graded A -modules L and M we set

$$\text{Hom}_{\text{Mod}_{(A,d)}^{dg}}(L, M) = \text{Hom}_{\text{Mod}_A^{gr}}(L, M) = \bigoplus \text{Hom}^n(L, M)$$

as a graded R -module where the right hand side is defined as in Example 22.18.6. In other words, the n th graded piece $\text{Hom}^n(L, M)$ is the R -module of right A -module maps homogeneous of degree n . For an element $f \in \text{Hom}^n(L, M)$ we set

$$d(f) = d_M \circ f - (-1)^n f \circ d_L$$

To make sense of this we think of d_M and d_L as graded R -module maps and we use composition of graded R -module maps. It is clear that $d(f)$ is homogeneous of degree $n + 1$ as a graded R -module map, and it is linear because

$$\begin{aligned} d(f)(xa) &= d_M(f(x)a) - (-1)^n f(d_L(xa)) \\ &= d_M(f(x)a) + (-1)^{\deg(x)+n} f(x)d(a) - (-1)^n f(d_L(x))a - (-1)^{n+\deg(x)} f(x)d(a) \\ &= d(f)(x)a \end{aligned}$$

as desired (observe that this calculation would not work without the sign in the definition of our differential on Hom). Similar formulae to those of Example 22.19.6 hold for the differential of f in terms of components. The reader checks (in the same way as in Example 22.19.6) that

- (1) d has square zero,
- (2) an element f in $\text{Hom}^n(L, M)$ has $d(f) = 0$ if and only if $f : L \rightarrow M[n]$ is a homomorphism of differential graded A -modules,
- (3) in particular, the category of complexes of $\text{Mod}_{(A,d)}^{dg}$ is $\text{Mod}_{(A,d)}$,
- (4) the homomorphism defined by f as in (2) is homotopy equivalent to zero if and only if $f = d(g)$ for some $g \in \text{Hom}^{n-1}(L, M)$.
- (5) in particular, we obtain a canonical isomorphism

$$\text{Hom}_{K(\text{Mod}_{(A,d)})}(L, M) \longrightarrow H^0(\text{Hom}_{\text{Mod}_{(A,d)}^{dg}}(L, M))$$

and the homotopy category of $\text{Mod}_{(A,d)}^{dg}$ is $K(\text{Mod}_{(A,d)})$.

Given differential graded A -modules K, L, M we define composition

$$\text{Hom}^m(L, M) \times \text{Hom}^n(K, L) \longrightarrow \text{Hom}^{n+m}(K, M)$$

by composition of homogeneous right A -module maps $(g, f) \mapsto g \circ f$. This defines a map of differential graded modules as in Definition 22.19.1 because

$$\begin{aligned} d(g \circ f) &= d_M \circ g \circ f - (-1)^{n+m} g \circ f \circ d_K \\ &= (d_M \circ g - (-1)^m g \circ d_L) \circ f + (-1)^m g \circ (d_L \circ f - (-1)^n f \circ d_K) \\ &= d(g) \circ f + (-1)^m g \circ d(f) \end{aligned}$$

as desired.

Lemma 22.19.9. *Let $\varphi : (A, d) \rightarrow (E, d)$ be a homomorphism of differential graded algebras. Then φ induces a functor of differential graded categories*

$$F : \text{Mod}_{(E,d)}^{\text{dg}} \longrightarrow \text{Mod}_{(A,d)}^{\text{dg}}$$

of Example 22.19.8 inducing obvious restriction functors on the categories of differential graded modules and homotopy categories.

Proof. Omitted. □

Lemma 22.19.10. *Let R be a ring. Let \mathcal{A} be a differential graded category over R . Let x be an object of \mathcal{A} . Let*

$$(E, d) = \text{Hom}_{\mathcal{A}}(x, x)$$

be the differential graded R -algebra of endomorphisms of x . We obtain a functor

$$\mathcal{A} \longrightarrow \text{Mod}_{(E,d)}^{\text{dg}}, \quad y \longmapsto \text{Hom}_{\mathcal{A}}(x, y)$$

of differential graded categories by letting E act on $\text{Hom}_{\mathcal{A}}(x, y)$ via composition in \mathcal{A} . This functor induces functors

$$\text{Comp}(\mathcal{A}) \rightarrow \text{Mod}_{(A,d)} \quad \text{and} \quad K(\mathcal{A}) \rightarrow K(\text{Mod}_{(A,d)})$$

by an application of Lemma 22.19.5.

Proof. This lemma proves itself. □

22.20. Obtaining triangulated categories

In this section we discuss the most general setup to which the arguments proving Derived Categories, Proposition 22.10.3 and Proposition 22.10.3 apply.

Let R be a ring. Let \mathcal{A} be a differential graded category over R . To make our argument work, we impose some axioms on \mathcal{A} :

- (A) \mathcal{A} has a zero object and differential graded direct sums of two objects (as in Definition 22.19.4).
- (B) there are functors $[n] : \mathcal{A} \rightarrow \mathcal{A}$ of differential graded categories such that $[0] = \text{id}_{\mathcal{A}}$ and $[n + m] = [n] \circ [m]$ and given isomorphisms

$$\text{Hom}_{\mathcal{A}}(x, y[n]) = \text{Hom}_{\mathcal{A}}(x, y)[n]$$

of differential graded R -modules compatible with composition.

Given our differential graded category \mathcal{A} we say

- (1) a sequence $x \rightarrow y \rightarrow z$ of morphisms of $\text{Comp}(\mathcal{A})$ is an *admissible short exact sequence* if there exists an isomorphism $y \cong x \oplus z$ in the underlying graded category such that $x \rightarrow z$ and $y \rightarrow z$ are (co)projections.
- (2) a morphism $x \rightarrow y$ of $\text{Comp}(\mathcal{A})$ is an *admissible monomorphism* if it extends to an admissible short exact sequence $x \rightarrow y \rightarrow z$.
- (3) a morphism $y \rightarrow z$ of $\text{Comp}(\mathcal{A})$ is an *admissible epimorphism* if it extends to an admissible short exact sequence $x \rightarrow y \rightarrow z$.

The next lemma tells us an admissible short exact sequence gives a triangle, provided we have axioms (A) and (B).

Lemma 22.20.1. *Let \mathcal{A} be a differential graded category satisfying axioms (A) and (B). Given an admissible short exact sequence $x \rightarrow y \rightarrow z$ we obtain (see proof) a triangle*

$$x \rightarrow y \rightarrow z \rightarrow x[1]$$

in $\text{Comp}(\mathcal{A})$ with the property that any two compositions in $z[-1] \rightarrow x \rightarrow y \rightarrow z \rightarrow x[1]$ are zero in $K(\mathcal{A})$.

Proof. Choose a diagram

giving the isomorphism of graded objects $y \cong x \oplus z$ as in the definition of an admissible short exact sequence. Here are some equations that hold in this situation

- (1) $1 = \pi a$ and hence $d(\pi)a = 0$,
- (2) $1 = bs$ and hence $bd(s) = 0$,
- (3) $1 = a\pi + sb$ and hence $ad(\pi) + d(s)b = 0$,
- (4) $\pi s = 0$ and hence $d(\pi)s + \pi d(s) = 0$,
- (5) $d(s) = a\pi d(s)$ because $d(s) = (a\pi + sb)d(s)$ and $bd(s) = 0$,
- (6) $d(\pi) = d(\pi)sb$ because $d(\pi) = d(\pi)(a\pi + sb)$ and $d(\pi)a = 0$,
- (7) $d(\pi d(s)) = 0$ because if we postcompose it with the monomorphism a we get $d(a\pi d(s)) = d(d(s)) = 0$, and
- (8) $d(d(\pi)s) = 0$ as by (4) it is the negative of $d(\pi d(s))$ which is 0 by (7).

We've used repeatedly that $d(a) = 0$, $d(b) = 0$, and that $d(1) = 0$. By (7) we see that

$$\delta = \pi d(s) = -d(\pi)s : z \rightarrow x[1]$$

is a morphism in $\text{Comp}(\mathcal{A})$. By (5) we see that the composition $a\delta = a\pi d(s) = d(s)$ is homotopic to zero. By (6) we see that the composition $\delta b = -d(\pi)sb = d(-\pi)$ is homotopic to zero. \square

Besides axioms (A) and (B) we need an axiom concerning the existence of cones. We formalize everything as follows.

Situation 22.20.2. Here R is a ring and \mathcal{A} is a differential graded category over R having axioms (A), (B), and

- (C) given an arrow $f : x \rightarrow y$ of degree 0 with $d(f) = 0$ there exists an admissible short exact sequence $y \rightarrow c(f) \rightarrow x[1]$ in $\text{Comp}(\mathcal{A})$ such that the map $x[1] \rightarrow y[1]$ of Lemma 22.20.1 is equal to $f[1]$.

We will call $c(f)$ a *cone* of the morphism f . If (A), (B), and (C) hold, then cones are functorial in a weak sense.

Lemma 22.20.3. *In Situation 22.20.2 suppose that*

is a diagram of $\text{Comp}(\mathcal{A})$ commutative up to homotopy. Then there exists a morphism $c : c(f_1) \rightarrow c(f_2)$ which gives rise to a morphism of triangles

$$(a, b, c) : (x_1, y_1, c(f_1)) \rightarrow (x_1, y_1, c(f_2))$$

in $K(\mathcal{A})$.

Proof. The assumption means there exists a morphism $h : x_1 \rightarrow y_2$ of degree -1 such that $d(h) = bf_1 - f_2a$. Choose isomorphisms $c(f_i) = y_i \oplus x_i[1]$ of graded objects compatible with the morphisms $y_i \rightarrow c(f_i) \rightarrow x_i[1]$. Let's denote $a_i : y_i \rightarrow c(f_i)$, $b_i : c(f_i) \rightarrow x_i[1]$, $s_i : x_i[1] \rightarrow c(f_i)$, and $\pi_i : c(f_i) \rightarrow y_i$ the given morphisms. Recall that $x_i[1] \rightarrow y_i[1]$ is given by $\pi_i d(s_i)$. By axiom (C) this means that

$$f_i = \pi_i d(s_i) = -d(\pi_i)s_i$$

(we identify $\text{Hom}(x_i, y_i)$ with $\text{Hom}(x_i[1], y_i[1])$ using the shift functor $[1]$). Set $c = a_2 b \pi_1 + s_2 a b_1 + a_2 h b$. Then, using the equalities found in the proof of Lemma 22.20.1 we obtain

$$\begin{aligned} d(c) &= a_2 b d(\pi_1) + d(s_2) a b_1 + a_2 d(h) b_1 \\ &= -a_2 b f_1 b_1 + a_2 f_2 a b_1 + a_2 (b f_1 - f_2 a) b_1 \\ &= 0 \end{aligned}$$

(where we have used in particular that $d(\pi_1) = d(\pi_1)s_1 b_1 = f_1 b_1$ and $d(s_2) = a_2 \pi_2 d(s_2) = a_2 f_2$). Thus c is a degree 0 morphism $c : c(f_1) \rightarrow c(f_2)$ of \mathcal{A} compatible with the given morphisms $y_i \rightarrow c(f_i) \rightarrow x_i[1]$. \square

In Situation 22.20.2 we say that a triangle (x, y, z, f, g, h) in $K(\mathcal{A})$ is a *distinguished triangle* if there exists an admissible short exact sequence $x' \rightarrow y' \rightarrow z'$ such that (x, y, z, f, g, h) is isomorphic as a triangle in $K(\mathcal{A})$ to the triangle $(x', y', z', x' \rightarrow y', y' \rightarrow z', \delta)$ constructed in Lemma 22.20.1. We will show below that

$$\boxed{K(\mathcal{A}) \text{ is a triangulated category}}$$

This result, although not as general as one might think, applies to a number of natural generalizations of the cases covered so far in the Stacks project. Here are some examples:

- (1) Let (X, \mathcal{O}_X) be a ringed space. Let (A, d) be a sheaf of differential graded \mathcal{O}_X -algebras. Let \mathcal{A} be the differential graded category of differential graded A -modules. Then $K(\mathcal{A})$ is a triangulated category.
- (2) Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let (A, d) be a sheaf of differential graded \mathcal{O} -algebras. Let \mathcal{A} be the differential graded category of differential graded A -modules. Then $K(\mathcal{A})$ is a triangulated category.
- (3) Two examples with a different flavor may be found in Examples, Section 82.59.

The following simple lemma is a key to the construction.

Lemma 22.20.4. *In Situation 22.20.2 given any object x of \mathcal{A} , and the cone $C(1_x)$ of the identity morphism $1_x : x \rightarrow x$, the identity morphism on $C(1_x)$ is homotopic to zero.*

Proof. Consider the admissible short exact sequence given by axiom (C).

$$x \begin{array}{c} \xrightarrow{a} \\ \xleftarrow{\pi} \end{array} C(1_x) \begin{array}{c} \xrightarrow{b} \\ \xleftarrow{s} \end{array} x[1]$$

Then by Lemma 22.20.1, identifying hom-sets under shifting, we have $1_x = \pi d(s) = -d(\pi)s$ where s is regarded as a morphism in $\text{Hom}_{\mathcal{A}}^{-1}(x, C(1_x))$. Therefore $a = a\pi d(s) = d(s)$ using formula (5) of Lemma 22.20.1, and $b = -d(\pi)s b = -d(\pi)$ by formula (6) of Lemma 22.20.1. Hence

$$1_{C(1_x)} = a\pi + sb = d(s)\pi - sd(\pi) = d(s\pi)$$

since s is of degree -1 . □

A more general version of the above lemma will appear in Lemma 22.20.13. The following lemma is the analogue of Lemma 22.7.3.

Lemma 22.20.5. *In Situation 22.20.2 given a diagram*

$$\begin{array}{ccc} x & \xrightarrow{f} & y \\ a \downarrow & & \downarrow b \\ z & \xrightarrow{g} & w \end{array}$$

in $\text{Comp}(\mathcal{A})$ commuting up to homotopy. Then

- (1) *If f is an admissible monomorphism, then b is homotopic to a morphism b' which makes the diagram commute.*
- (2) *If g is an admissible epimorphism, then a is homotopic to a morphism a' which makes the diagram commute.*

Proof. To prove (1), observe that the hypothesis implies that there is some $h \in \text{Hom}_{\mathcal{A}}(x, w)$ of degree -1 such that $bf - ga = d(h)$. Since f is an admissible monomorphism, there is a morphism $\pi : y \rightarrow x$ in the category \mathcal{A} of degree 0. Let $b' = b - d(h\pi)$. Then

$$\begin{aligned} b'f &= bf - d(h\pi)f = bf - d(h\pi f) \quad (\text{since } d(f) = 0) \\ &= bf - d(h) \\ &= ga \end{aligned}$$

as desired. The proof for (2) is omitted. □

The following lemma is the analogue of Lemma 22.7.4.

Lemma 22.20.6. *In Situation 22.20.2 let $\alpha : x \rightarrow y$ be a morphism in $\text{Comp}(\mathcal{A})$. Then there exists a factorization in $\text{Comp}(\mathcal{A})$:*

$$x \xrightarrow{\tilde{\alpha}} \tilde{y} \begin{array}{c} \xrightarrow{\pi} \\ \xleftarrow{s} \end{array} y$$

such that

- (1) *$\tilde{\alpha}$ is an admissible monomorphism, and $\pi\tilde{\alpha} = \alpha$.*
- (2) *There exists a morphism $s : y \rightarrow \tilde{y}$ in $\text{Comp}(\mathcal{A})$ such that $\pi s = 1_y$ and $s\pi$ is homotopic to $1_{\tilde{y}}$.*

Proof. By axiom (B), we may let \tilde{y} be the differential graded direct sum of y and $C(1_x)$, i.e., there exists a diagram

$$y \begin{array}{c} \xrightarrow{s} \\ \xleftarrow{\pi} \end{array} y \oplus C(1_x) \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{t} \end{array} C(1_x)$$

where all morphisms are of degree zero, and in $\text{Comp}(\mathcal{A})$. Let $\tilde{y} = y \oplus C(1_x)$. Then $1_{\tilde{y}} = s\pi + tp$. Consider now the diagram

$$x \xrightarrow{\tilde{\alpha}} \tilde{y} \begin{matrix} \xrightarrow{\pi} \\ \xleftarrow{s} \end{matrix} y$$

where $\tilde{\alpha}$ is induced by the morphism $x \xrightarrow{\alpha} y$ and the natural morphism $x \rightarrow C(1_x)$ fitting in the admissible short exact sequence

$$x \rightleftarrows C(1_x) \rightleftarrows x[1]$$

So the morphism $C(1_x) \rightarrow x$ of degree 0 in this diagram, together with the zero morphism $y \rightarrow x$, induces a degree-0 morphism $\beta : \tilde{y} \rightarrow x$. Then $\tilde{\alpha}$ is an admissible monomorphism since it fits into the admissible short exact sequence

$$x \xrightarrow{\tilde{\alpha}} \tilde{y} \longrightarrow x[1]$$

Furthermore, $\pi\tilde{\alpha} = \alpha$ by the construction of $\tilde{\alpha}$, and $\pi s = 1_y$ by the first diagram. It remains to show that $s\pi$ is homotopic to $1_{\tilde{y}}$. Write 1_x as $d(h)$ for some degree -1 map. Then, our last statement follows from

$$\begin{aligned} 1_{\tilde{y}} - s\pi &= tp \\ &= t(dh)p \quad (\text{by Lemma 22.20.4}) \\ &= d(thp) \end{aligned}$$

since $dt = dp = 0$, and t is of degree zero. □

The following lemma is the analogue of Lemma 22.7.5.

Lemma 22.20.7. *In Situation 22.20.2 let $x_1 \rightarrow x_2 \rightarrow \dots \rightarrow x_n$ be a sequence of composable morphisms in $\text{Comp}(\mathcal{A})$. Then there exists a commutative diagram in $\text{Comp}(\mathcal{A})$:*

$$\begin{array}{ccccccc} x_1 & \longrightarrow & x_2 & \longrightarrow & \dots & \longrightarrow & x_n \\ \uparrow & & \uparrow & & & & \uparrow \\ y_1 & \longrightarrow & y_2 & \longrightarrow & \dots & \longrightarrow & y_n \end{array}$$

such that each $y_i \rightarrow y_{i+1}$ is an admissible monomorphism and each $y_i \rightarrow x_i$ is a homotopy equivalence.

Proof. The case for $n = 1$ is trivial: one simply takes $y_1 = x_1$ and the identity morphism on x_1 is in particular a homotopy equivalence. The case $n = 2$ is given by Lemma 22.20.6. Suppose we have constructed the diagram up to x_{n-1} . We apply Lemma 22.20.6 to the composition $y_{n-1} \rightarrow x_{n-1} \rightarrow x_n$ to obtain y_n . Then $y_{n-1} \rightarrow y_n$ will be an admissible monomorphism, and $y_n \rightarrow x_n$ a homotopy equivalence. □

The following lemma is the analogue of Lemma 22.7.6.

Lemma 22.20.8. *In Situation 22.20.2 let $x_i \rightarrow y_i \rightarrow z_i$ be morphisms in \mathcal{A} ($i = 1, 2, 3$) such that $x_2 \rightarrow y_2 \rightarrow z_2$ is an admissible short exact sequence. Let $b : y_1 \rightarrow y_2$ and $b' : y_2 \rightarrow y_3$ be morphisms in $\text{Comp}(\mathcal{A})$ such that*

$$\begin{array}{ccccc} x_1 & \longrightarrow & y_1 & \longrightarrow & z_1 \\ 0 \downarrow & & b \downarrow & & 0 \downarrow \\ x_2 & \longrightarrow & y_2 & \longrightarrow & z_2 \end{array} \quad \text{and} \quad \begin{array}{ccccc} x_2 & \longrightarrow & y_2 & \longrightarrow & z_2 \\ 0 \downarrow & & b' \downarrow & & 0 \downarrow \\ x_3 & \longrightarrow & y_3 & \longrightarrow & z_3 \end{array}$$

commute up to homotopy. Then $b' \circ b$ is homotopic to 0.

Proof. By Lemma 22.20.5, we can replace b and b' by homotopic maps \tilde{b} and \tilde{b}' , such that the right square of the left diagram commutes and the left square of the right diagram commutes. Say $b = \tilde{b} + d(h)$ and $b' = \tilde{b}' + d(h')$ for degree -1 morphisms h and h' in \mathcal{A} . Hence

$$b'b = \tilde{b}'\tilde{b} + d(\tilde{b}'h + h'\tilde{b} + h'd(h))$$

since $d(\tilde{b}) = d(\tilde{b}') = 0$, i.e. $b'b$ is homotopic to $\tilde{b}'\tilde{b}$. We now want to show that $\tilde{b}'\tilde{b} = 0$. Because $x_2 \xrightarrow{f} y_2 \xrightarrow{g} z_2$ is an admissible short exact sequence, there exist degree 0 morphisms $\pi : y_2 \rightarrow x_2$ and $s : z_2 \rightarrow y_2$ such that $\text{id}_{y_2} = f\pi + sg$. Therefore

$$\tilde{b}'\tilde{b} = \tilde{b}'(f\pi + sg)\tilde{b} = 0$$

since $g\tilde{b} = 0$ and $\tilde{b}'f = 0$ as consequences of the two commuting squares. \square

The following lemma is the analogue of Lemma 22.8.1.

Lemma 22.20.9. *In Situation 22.20.2 let $0 \rightarrow x \rightarrow y \rightarrow z \rightarrow 0$ be an admissible short exact sequence in $\text{Comp}(\mathcal{A})$. The triangle*

$$x \longrightarrow y \longrightarrow z \xrightarrow{\delta} x[1]$$

with $\delta : z \rightarrow x[1]$ as defined in Lemma 22.20.1 is up to canonical isomorphism in $K(\mathcal{A})$, independent of the choices made in Lemma 22.20.1.

Proof. Suppose δ is defined by the splitting

$$x \begin{array}{c} \xrightarrow{a} \\ \xleftarrow{\pi} \end{array} y \begin{array}{c} \xrightarrow{b} \\ \xleftarrow{s} \end{array} z$$

and δ' is defined by the splitting with π', s' in place of π, s . Then

$$s' - s = (a\pi + sb)(s' - s) = a\pi s'$$

since $bs' = bs = 1_z$ and $\pi s = 0$. Similarly,

$$\pi' - \pi = (\pi' - \pi)(a\pi + sb) = \pi' sb$$

Since $\delta = \pi d(s)$ and $\delta' = \pi' d(s')$ as constructed in Lemma 22.20.1, we may compute

$$\delta' = \pi' d(s') = (\pi + \pi' sb)d(s + a\pi s') = \delta + d(\pi s')$$

using $\pi a = 1_x$, $ba = 0$, and $\pi' s b d(s') = \pi' s b a \pi d(s') = 0$ by formula (5) in Lemma 22.20.1. \square

The following lemma is the analogue of Lemma 22.9.1.

Lemma 22.20.10. *In Situation 22.20.2 let $f : x \rightarrow y$ be a morphism in $\text{Comp}(\mathcal{A})$. The triangle $(y, c(f), x[1], i, p, f[1])$ is the triangle associated to the admissible short exact sequence*

$$y \longrightarrow c(f) \longrightarrow x[1]$$

where the cone $c(f)$ is defined as in Lemma 22.20.1.

Proof. This follows from axiom (C). \square

The following lemma is the analogue of Lemma 22.9.2.

Lemma 22.20.11. *In Situation 22.20.2 let $\alpha : x \rightarrow y$ and $\beta : y \rightarrow z$ define an admissible short exact sequence*

$$x \longrightarrow y \longrightarrow z$$

in $\text{Comp}(\mathcal{A})$. Let $(x, y, z, \alpha, \beta, \delta)$ be the associated triangle in $K(\mathcal{A})$. Then, the triangles

$$(z[-1], x, y, \delta[-1], \alpha, \beta) \quad \text{and} \quad (z[-1], x, c(\delta[-1]), \delta[-1], i, p)$$

are isomorphic.

Proof. We have a diagram of the form

$$\begin{array}{ccccccc} z[-1] & \xrightarrow{\delta[-1]} & x & \xrightleftharpoons[\tilde{\alpha}]{\alpha} & y & \xrightleftharpoons[\tilde{\beta}]{\beta} & z \\ \downarrow 1 & & \downarrow 1 & & \downarrow \text{---} & & \downarrow 1 \\ z[-1] & \xrightarrow{\delta[-1]} & x & \xrightleftharpoons[\tilde{i}]{i} & c(\delta[-1]) & \xrightleftharpoons[\tilde{p}]{p} & z \end{array}$$

with splittings to α, β, i , and p given by $\tilde{\alpha}, \tilde{\beta}, \tilde{i}$, and \tilde{p} respectively. Define a morphism $y \rightarrow c(\delta[-1])$ by $i\tilde{\alpha} + \tilde{p}\beta$ and a morphism $c(\delta[-1]) \rightarrow y$ by $\alpha\tilde{i} + \tilde{\beta}p$. Let us first check that these define morphisms in $\text{Comp}(\mathcal{A})$. We remark that by identities from Lemma 22.20.1, we have the relation $\delta[-1] = \tilde{\alpha}d(\tilde{\beta}) = -d(\tilde{\alpha})\tilde{\beta}$ and the relation $\delta[-1] = \tilde{i}d(\tilde{p})$. Then

$$\begin{aligned} d(\tilde{\alpha}) &= d(\tilde{\alpha})\tilde{\beta}\beta \\ &= -\delta[-1]\beta \end{aligned}$$

where we have used equation (6) of Lemma 22.20.1 for the first equality and the preceding remark for the second. Similarly, we obtain $d(\tilde{p}) = i\delta[-1]$. Hence

$$\begin{aligned} d(i\tilde{\alpha} + \tilde{p}\beta) &= d(i)\tilde{\alpha} + id(\tilde{\alpha}) + d(\tilde{p})\beta + \tilde{p}d(\beta) \\ &= id(\tilde{\alpha}) + d(\tilde{p})\beta \\ &= -i\delta[-1]\beta + i\delta[-1]\beta \\ &= 0 \end{aligned}$$

so $i\tilde{\alpha} + \tilde{p}\beta$ is indeed a morphism of $\text{Comp}(\mathcal{A})$. By a similar calculation, $\alpha\tilde{i} + \tilde{\beta}p$ is also a morphism of $\text{Comp}(\mathcal{A})$. It is immediate that these morphisms fit in the commutative diagram. We compute:

$$\begin{aligned} (i\tilde{\alpha} + \tilde{p}\beta)(\alpha\tilde{i} + \tilde{\beta}p) &= i\tilde{\alpha}\alpha\tilde{i} + i\tilde{\alpha}\tilde{\beta}p + \tilde{p}\beta\alpha\tilde{i} + \tilde{p}\beta\tilde{\beta}p \\ &= i\tilde{i} + \tilde{p}p \\ &= 1_{c(\delta[-1])} \end{aligned}$$

where we have freely used the identities of Lemma 22.20.1. Similarly, we compute $(\alpha\tilde{i} + \tilde{\beta}p)(i\tilde{\alpha} + \tilde{p}\beta) = 1_y$, so we conclude $y \cong c(\delta[-1])$. Hence, the two triangles in question are isomorphic. \square

The following lemma is the analogue of Lemma 22.9.3.

Lemma 22.20.12. *In Situation 22.20.2 let $f_1 : x_1 \rightarrow y_1$ and $f_2 : x_2 \rightarrow y_2$ be morphisms in $\text{Comp}(\mathcal{A})$. Let*

$$(a, b, c) : (x_1, y_1, c(f_1), f_1, i_1, p_1) \rightarrow (x_2, y_2, c(f_2), f_2, i_1, p_1)$$

be any morphism of triangles in $K(\mathcal{A})$. If a and b are homotopy equivalences, then so is c .

Proof. Since a and b are homotopy equivalences, they are invertible in $K(\mathcal{A})$ so let a^{-1} and b^{-1} denote their inverses in $K(\mathcal{A})$, giving us a commutative diagram

$$\begin{array}{ccccc} x_2 & \xrightarrow{f_2} & y_2 & \xrightarrow{i_2} & c(f_2) \\ \downarrow a^{-1} & & \downarrow b^{-1} & & \downarrow c' \\ x_1 & \xrightarrow{f_1} & y_1 & \xrightarrow{i_1} & c(f_1) \end{array}$$

where the map c' is defined via Lemma 22.20.3 applied to the left commutative box of the above diagram. Since the diagram commutes in $K(\mathcal{A})$, it suffices by Lemma 22.20.8 to prove the following: given a morphism of triangle $(1, 1, c) : (x, y, c(f), f, i, p) \rightarrow (x, y, c(f), f, i, p)$ in $K(\mathcal{A})$, the map c is an isomorphism in $K(\mathcal{A})$. We have the commutative diagrams in $K(\mathcal{A})$:

$$\begin{array}{ccccc} y & \longrightarrow & c(f) & \longrightarrow & x[1] \\ \downarrow 1 & & \downarrow c & & \downarrow 1 \\ y & \longrightarrow & c(f) & \longrightarrow & x[1] \end{array} \Rightarrow \begin{array}{ccccc} y & \longrightarrow & c(f) & \longrightarrow & x[1] \\ \downarrow 0 & & \downarrow c^{-1} & & \downarrow 0 \\ y & \longrightarrow & c(f) & \longrightarrow & x[1] \end{array}$$

Since the rows are admissible short exact sequences, we obtain the identity $(c-1)^2 = 0$ by Lemma 22.20.8, from which we conclude that $2 - c$ is inverse to c in $K(\mathcal{A})$ so that c is an isomorphism. \square

The following lemma is the analogue of Lemma 22.9.4.

Lemma 22.20.13. *In Situation 22.20.2.*

- (1) *Given an admissible short exact sequence $x \xrightarrow{\alpha} y \xrightarrow{\beta} z$. Then there exists a homotopy equivalence $e : C(\alpha) \rightarrow z$ such that the diagram*

$$(22.20.13.1) \quad \begin{array}{ccccccc} x & \xrightarrow{\alpha} & y & \xrightarrow{\beta} & C(\alpha) & \xrightarrow{-c} & x[1] \\ \downarrow & & \downarrow & & \downarrow e & & \downarrow \\ x & \xrightarrow{\alpha} & y & \xrightarrow{\beta} & z & \xrightarrow{\delta} & x[1] \end{array}$$

defines an isomorphism of triangles in $K(\mathcal{A})$. Here $y \xrightarrow{\beta} C(\alpha) \xrightarrow{-c} x[1]$ is the admissible short exact sequence given as in axiom (C).

- (2) *Given a morphism $\alpha : x \rightarrow y$ in $\text{Comp}(\mathcal{A})$, let $x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow y$ be the factorization given as in Lemma 22.20.6, where the admissible monomorphism $x \xrightarrow{\tilde{\alpha}} y$ extends to the admissible short exact sequence*

$$x \xrightarrow{\tilde{\alpha}} \tilde{y} \longrightarrow z$$

Then there exists an isomorphism of triangles

$$\begin{array}{ccccccc} x & \xrightarrow{\tilde{\alpha}} & \tilde{y} & \longrightarrow & z & \xrightarrow{\delta} & x[1] \\ \downarrow & & \downarrow & & \downarrow e & & \downarrow \\ x & \xrightarrow{\alpha} & y & \longrightarrow & C(\alpha) & \xrightarrow{-c} & x[1] \end{array}$$

where the upper triangle is the triangle associated to the sequence $x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow z$.

Proof. For (1), we consider the more complete diagram, *without* the sign change on c :

$$\begin{array}{ccccccc}
 x & \xrightleftharpoons[\pi]{\alpha} & y & \xrightleftharpoons[p]{b} & C(\alpha) & \xrightleftharpoons[\sigma]{c} & x[1] & \xrightleftharpoons[\pi]{\alpha} & y[1] \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 x & \xrightleftharpoons[\pi]{\alpha} & y & \xrightleftharpoons[s]{\beta} & z & \xrightarrow{\delta} & x[1] & & \\
 & & & & \uparrow & & & & \\
 & & & & f & & e & &
 \end{array}$$

where the admissible short exact sequence $x \xrightarrow{\alpha} y \xrightarrow{\beta} z$ is given the splitting π, s , and the admissible short exact sequence $y \xrightarrow{b} C(\alpha) \xrightarrow{c} x[1]$ is given the splitting p, σ . Note that (identifying hom-sets under shifting)

$$\alpha = pd(\sigma) = -d(p)\sigma, \quad \delta = \pi d(s) = -d(\pi)s$$

by the construction in Lemma 22.20.1.

We define $e = \beta p$ and $f = bs - \sigma\delta$. We first check that they are morphisms in $\text{Comp}(\mathcal{A})$. To show that $d(e) = \beta d(p)$ vanishes, it suffices to show that $\beta d(p)b$ and $\beta d(p)\sigma$ both vanish, whereas

$$\beta d(p)b = \beta d(pb) = \beta d(1_y) = 0, \quad \beta d(p)\sigma = -\beta\alpha = 0$$

Similarly, to check that $d(f) = bd(s) - d(\sigma)\delta$ vanishes, it suffices to check the post-compositions by p and c both vanish, whereas

$$\begin{aligned}
 pbd(s) - pd(\sigma)\delta &= d(s) - \alpha\delta = d(s) - \alpha\pi d(s) = 0 \\
 cbd(s) - cd(\sigma)\delta &= -cd(\sigma)\delta = -d(c\sigma)\delta = 0
 \end{aligned}$$

The commutativity of left two squares of the diagram 22.20.13.1 follows directly from definition. Before we prove the commutativity of the right square (up to homotopy), we first check that e is a homotopy equivalence. Clearly,

$$ef = \beta p(bs - \sigma\delta) = \beta s = 1_z$$

To check that fe is homotopic to $1_{C(\alpha)}$, we first observe

$$b\alpha = bpd(\alpha) = d(\sigma), \quad \alpha c = -d(p)\sigma c = -d(p), \quad d(\pi)p = d(\pi)s\beta p = -\delta\beta p$$

Using these identities, we compute

$$\begin{aligned}
 1_{C(\alpha)} &= bp + \sigma c \quad (\text{from } y \xrightarrow{b} C(\alpha) \xrightarrow{c} x[1]) \\
 &= b(\alpha\pi + s\beta)p + \sigma(\pi\alpha)c \quad (\text{from } x \xrightarrow{\alpha} y \xrightarrow{\beta} z) \\
 &= d(\sigma)\pi p + bs\beta p - \sigma\pi d(p) \quad (\text{by the first two identities above}) \\
 &= d(\sigma)\pi p + bs\beta p - \sigma\delta\beta p + \sigma\delta\beta p - \sigma\pi d(p) \\
 &= (bs - \sigma\delta)\beta p + d(\sigma)\pi p - \sigma d(\pi)p - \sigma\pi d(p) \quad (\text{by the third identity above}) \\
 &= fe + d(\sigma\pi p)
 \end{aligned}$$

since $\sigma \in \text{Hom}^{-1}(x, C(\alpha))$ (cf. proof of Lemma 22.20.4). Hence e and f are homotopy inverses. Finally, to check that the right square of diagram 22.20.13.1 commutes up to homotopy, it suffices to check that $-cf = \delta$. This follows from

$$-cf = -c(bs - \sigma\delta) = c\sigma\delta = \delta$$

since $cb = 0$.

For (2), consider the factorization $x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow y$ given as in Lemma 22.20.6, so the second morphism is a homotopy equivalence. By Lemmas 22.20.3 and 22.20.12, there exists an isomorphism of triangles between

$$x \xrightarrow{\alpha} y \rightarrow C(\alpha) \rightarrow x[1] \quad \text{and} \quad x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow C(\tilde{\alpha}) \rightarrow x[1]$$

Since we can compose isomorphisms of triangles, by replacing α by $\tilde{\alpha}$, y by \tilde{y} , and $C(\alpha)$ by $C(\tilde{\alpha})$, we may assume α is an admissible monomorphism. In this case, the result follows from (1). \square

The following lemma is the analogue of Lemma 22.10.1.

Lemma 22.20.14. *In Situation 22.20.2 the homotopy category $K(\mathcal{A})$ with its natural translation functors and distinguished triangles is a pre-triangulated category.*

Proof. We will verify each of TR1, TR2, and TR3.

Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Since

$$x \xrightarrow{1_x} x \longrightarrow 0$$

is an admissible short exact sequence, $(x, x, 0, 1_x, 0, 0)$ is a distinguished triangle. Moreover, given a morphism $\alpha : x \rightarrow y$ in $\text{Comp}(\mathcal{A})$, the triangle given by $(x, y, c(\alpha), \alpha, i, -p)$ is distinguished by Lemma 22.20.13.

Proof of TR2. Let $(x, y, z, \alpha, \beta, \gamma)$ be a triangle and suppose $(y, z, x[1], \beta, \gamma, -\alpha[1])$ is distinguished. Then there exists an admissible short exact sequence $0 \rightarrow x' \rightarrow y' \rightarrow z' \rightarrow 0$ such that the associated triangle $(x', y', z', \alpha', \beta', \gamma')$ is isomorphic to $(y, z, x[1], \beta, \gamma, -\alpha[1])$. After rotating, we conclude that $(x, y, z, \alpha, \beta, \gamma)$ is isomorphic to $(z'[-1], x', y', \gamma'[-1], \alpha', \beta')$. By Lemma 22.20.11, we deduce that $(z'[-1], x', y', \gamma'[-1], \alpha', \beta')$ is isomorphic to $(z'[-1], x', c(\gamma'[-1]), \gamma'[-1], i, p)$. Composing the two isomorphisms with sign changes as indicated in the following diagram:

$$\begin{array}{ccccccc}
 x & \xrightarrow{\alpha} & y & \xrightarrow{\beta} & z & \xrightarrow{\gamma} & x[1] \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 z'[-1] & \xrightarrow{-\gamma'[-1]} & x & \xrightarrow{\alpha'} & y' & \xrightarrow{\beta'} & z' \\
 \downarrow -1_{z'[-1]} & & \parallel & & \downarrow & & \downarrow -1_{z'} \\
 z'[-1] & \xrightarrow{\gamma'[-1]} & x & \xrightarrow{\alpha'} & c(\gamma'[-1]) & \xrightarrow{-p} & z'
 \end{array}$$

We conclude that $(x, y, z, \alpha, \beta, \gamma)$ is distinguished by Lemma 22.20.13 (2). Conversely, suppose that $(x, y, z, \alpha, \beta, \gamma)$ is distinguished, so that by Lemma 22.20.13 (1), it is isomorphic to a triangle of the form $(x', y', c(\alpha'), \alpha', i, -p)$ for some morphism $\alpha' : x' \rightarrow y'$ in $\text{Comp}(\mathcal{A})$. The rotated triangle $(y, z, x[1], \beta, \gamma, -\alpha[1])$ is isomorphic to the triangle $(y', c(\alpha'), x'[1], i, -p, -\alpha[1])$ which is isomorphic to $(y', c(\alpha'), x'[1], i, p, \alpha[1])$. By Lemma 22.20.10, this triangle is distinguished, from which it follows that $(y, z, x[1], \beta, \gamma, -\alpha[1])$ is distinguished.

Proof of TR3: Suppose $(x, y, z, \alpha, \beta, \gamma)$ and $(x', y', z', \alpha', \beta', \gamma')$ are distinguished triangles of $\text{Comp}(\mathcal{A})$ and let $f : x \rightarrow x'$ and $g : y \rightarrow y'$ be morphisms such that $\alpha' \circ f = g \circ \alpha$. By Lemma 22.20.13, we may assume that $(x, y, z, \alpha, \beta, \gamma) =$

$(x, y, c(\alpha), \alpha, i, -p)$ and $(x', y', z', \alpha', \beta', \gamma') = (x', y', c(\alpha'), \alpha', i', -p')$. Now apply Lemma 22.20.3 and we are done. \square

The following lemma is the analogue of Lemma 22.10.2.

Lemma 22.20.15. *In Situation 22.20.2 given admissible monomorphisms $x \xrightarrow{\alpha} y$, $y \xrightarrow{\beta} z$ in \mathcal{A} , there exist distinguished triangles $(x, y, q_1, \alpha, p_1, \delta_1)$, $(x, z, q_2, \beta\alpha, p_2, \delta_2)$ and $(y, z, q_3, \beta, p_3, \delta_3)$ for which TR_4 holds.*

Proof. Given admissible monomorphisms $x \xrightarrow{\alpha} y$ and $y \xrightarrow{\beta} z$, we can find distinguished triangles, via their extensions to admissible short exact sequences,

$$\begin{array}{c} x \begin{array}{c} \xrightarrow{\alpha} \\ \xleftarrow{\pi_1} \end{array} y \begin{array}{c} \xrightarrow{p_1} \\ \xleftarrow{s_1} \end{array} q_1 \xrightarrow{\delta_1} x[1] \\ \\ x \begin{array}{c} \xrightarrow{\beta\alpha} \\ \xleftarrow{\pi_1\pi_3} \end{array} z \begin{array}{c} \xrightarrow{p_2} \\ \xleftarrow{s_2} \end{array} q_2 \xrightarrow{\delta_2} x[1] \\ \\ y \begin{array}{c} \xrightarrow{\beta} \\ \xleftarrow{\pi_3} \end{array} z \begin{array}{c} \xrightarrow{p_3} \\ \xleftarrow{s_3} \end{array} q_3 \xrightarrow{\delta_3} x[1] \end{array}$$

In these diagrams, the maps δ_i are defined as $\delta_i = \pi_i d(s_i)$ analagous to the maps defined in Lemma 22.20.1. They fit in the following solid commutative diagram

where we have defined the dashed arrows as indicated. Clearly, their composition $p_3 s_2 p_2 \beta s_1 = 0$ since $s_2 p_2 = 0$. We claim that they both are morphisms of $\text{Comp}(\mathcal{A})$. We can check this using equations in Lemma 22.20.1:

$$d(p_2 \beta s_1) = p_2 \beta d(s_1) = p_2 \beta \alpha \pi_1 d(s_1) = 0$$

since $p_2 \beta \alpha = 0$, and

$$d(p_3 s_2) = p_3 d(s_2) = p_3 \beta \alpha \pi_1 \pi_3 d(s_2) = 0$$

since $p_3 \beta = 0$. To check that $q_1 \rightarrow q_2 \rightarrow q_3$ is an admissible short exact sequence, it remains to show that in the underlying graded category, $q_2 = q_1 \oplus q_3$ with the above two morphisms as coprojection and projection. To do this, observe that in the underlying graded category \mathcal{C} , there hold

$$y = x \oplus q_1, \quad z = y \oplus q_3 = x \oplus q_1 \oplus q_3$$

where $\pi_1\pi_3$ gives the projection morphism onto the first factor: $x \oplus q_1 \oplus q_3 \rightarrow z$. By axiom (A) on \mathcal{A} , \mathcal{C} is an additive category, hence we may apply Homology, Lemma 12.3.10 and conclude that

$$\text{Ker}(\pi_1\pi_3) = q_1 \oplus q_3$$

in \mathcal{C} . Another application of Homology, Lemma 12.3.10 to $z = x \oplus q_2$ gives $\text{Ker}(\pi_1\pi_3) = q_2$. Hence $q_2 \cong q_1 \oplus q_3$ in \mathcal{C} . It is clear that the dashed morphisms defined above give coprojection and projection.

Finally, we have to check that the morphism $\delta : q_3 \rightarrow q_1[1]$ induced by the admissible short exact sequence $q_1 \rightarrow q_2 \rightarrow q_3$ agrees with $p_1\delta_3$. By the construction in Lemma 22.20.1, the morphism δ is given by

$$\begin{aligned} p_1\pi_3s_2d(p_2s_3) &= p_1\pi_3s_2p_2d(s_3) \\ &= p_1\pi_3(1 - \beta\alpha\pi_1\pi_3)d(s_3) \\ &= p_1\pi_3d(s_3) \quad (\text{since } \pi_3\beta = 0) \\ &= p_1\delta_3 \end{aligned}$$

as desired. The proof is complete. \square

Putting everything together we finally obtain the analogue of Proposition 22.10.3.

Proposition 22.20.16. *In Situation 22.20.2 the homotopy category $K(\mathcal{A})$ with its natural translation functors and distinguished triangles is a triangulated category.*

Proof. By Lemma 22.20.14 we know that $K(\mathcal{A})$ is pre-triangulated. Combining Lemmas 22.20.7 and 22.20.15 with Derived Categories, Lemma 13.4.13, we conclude that $K(\mathcal{A})$ is a triangulated category. \square

22.21. Derived Hom

Let R be a ring. Let (B, d) be a differential graded algebra over R . Denote $\mathcal{B} = \text{Mod}_{(B, d)}^{dg}$ the differential graded category of differential graded B -modules, see Example 22.19.8. Let N be a differential graded B -module. Then the endomorphisms of N in \mathcal{B}

$$\text{Hom}_{\mathcal{B}}(N, N)$$

is differential graded algebra over R . Now let N' be a second differential graded B -module. Then

$$\text{Hom}_{\mathcal{B}}(N, N')$$

becomes a right differential graded $\text{Hom}_{\mathcal{B}}(N, N)$ -module by the composition

$$\text{Hom}_{\mathcal{B}}(N, N') \times \text{Hom}_{\mathcal{B}}(N, N) \longrightarrow \text{Hom}_{\mathcal{B}}(N, N')$$

We need one more piece of data, in order to be able to formulate the results in the correct generality. Namely, let (A, d) be a differential graded R -algebra and let $A \rightarrow \text{Hom}_{\mathcal{B}}(N, N)$ be a homomorphism of differential graded R -algebras⁴. Using this homomorphism we obtain a functor

$$(22.21.0.1) \quad \text{Mod}_{(B, d)} \longrightarrow \text{Mod}_{(A, d)}, \quad N' \longmapsto \text{Hom}_{\mathcal{B}}(N, N')$$

where A acts on $\text{Hom}_{\mathcal{B}}(N, N')$ via the given homomorphism and the action of $\text{Hom}_{\mathcal{B}}(N, N)$ given above.

⁴A very interesting case is when $A = \text{Hom}_{\mathcal{B}}(N, N)$.

Lemma 22.21.1. *The functor (22.21.0.1) defines an exact functor of triangulated categories $K(\text{Mod}_{(B,d)}) \rightarrow K(\text{Mod}_{(A,d)})$.*

Proof. Combining Lemmas 22.19.9, 22.19.10, and 22.19.5 we obtain the functor of the statement. We have to show that (22.21.0.1) transforms distinguished triangles into distinguished triangles. To see this suppose that $0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3 \rightarrow 0$ is an admissible short exact sequence of differential graded B -modules. Let $s : N_3 \rightarrow N_2$ be a graded B -module homomorphism which is left inverse to $N_2 \rightarrow N_3$. Then s defines a graded A -module homomorphism $\text{Hom}_{\mathcal{B}}(N, N_3) \rightarrow \text{Hom}_{\mathcal{B}}(N, N_2)$ which is left inverse to $\text{Hom}_{\mathcal{B}}(N, N_2) \rightarrow \text{Hom}_{\mathcal{B}}(N, N_3)$. This finishes the proof. \square

At this point we can consider the diagram

$$\begin{array}{ccc} K(\text{Mod}_{(B,d)}) & \xrightarrow{\text{Hom}_{\mathcal{B}}(N,-)} & K(\text{Mod}_{(A,d)}) \\ \downarrow & \searrow F & \downarrow \\ D(B, d) & \cdots\cdots\cdots & D(A, d) \end{array}$$

We would like to construct a dotted arrow as the *right derived functor* of the composition F . (*Warning:* the diagram will not commute.) Namely, in the general setting of Derived Categories, Section 13.15 we want to compute the right derived functor of F with respect to the multiplicative system of quasi-isomorphisms in $K(\text{Mod}_{(A,d)})$.

Lemma 22.21.2. *In the situation above, the right derived functor of F exists. We denote it $R\text{Hom}(N, -) : D(B, d) \rightarrow D(A, d)$.*

Proof. We will use Derived Categories, Lemma 13.15.15 to prove this. As our collection \mathcal{I} of objects we will use the objects with property (I). Property (1) was shown in Lemma 22.14.4. Property (2) holds because if $s : I \rightarrow I'$ is a quasi-isomorphism of modules with property (I), then s is a homotopy equivalence by Lemma 22.15.3. \square

22.22. Variant of derived Hom

Let \mathcal{A} be an abelian category. Consider the differential graded category $\text{Comp}^{dg}(\mathcal{A})$ of complexes of \mathcal{A} , see Example 22.19.6. Let K^\bullet be a complex of \mathcal{A} . Set

$$(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{A})}(K^\bullet, K^\bullet)$$

and consider the functor of differential graded categories

$$\text{Comp}^{dg}(\mathcal{A}) \longrightarrow \text{Mod}_{(E,d)}^{dg}, \quad X^\bullet \longmapsto \text{Hom}_{\text{Comp}^{dg}(\mathcal{A})}(K^\bullet, X^\bullet)$$

of Lemma 22.19.10.

Lemma 22.22.1. *In the situation above. If the right derived functor $R\text{Hom}(K^\bullet, -)$ of $\text{Hom}(K^\bullet, -) : K(\mathcal{A}) \rightarrow D(\text{Ab})$ is everywhere defined on $D(\mathcal{A})$, then we obtain a canonical exact functor*

$$R\text{Hom}(K^\bullet, -) : D(\mathcal{A}) \longrightarrow D(E, d)$$

of triangulated categories which reduces to the usual one on taking associated complexes of abelian groups.

Proof. Note that we have an associated functor $K(\mathcal{A}) \rightarrow K(\text{Mod}_{(E,d)})$ by Lemma 22.19.10. We claim this functor is an exact functor of triangulated categories. Namely, let $f : A^\bullet \rightarrow B^\bullet$ be a map of complexes of \mathcal{A} . Then a computation shows that

$$\text{Hom}_{\text{Comp}^{dg}(\mathcal{A})}(K^\bullet, C(f)^\bullet) = C(\text{Hom}_{\text{Comp}^{dg}(\mathcal{A})}(K^\bullet, A^\bullet) \rightarrow \text{Hom}_{\text{Comp}^{dg}(\mathcal{A})}(K^\bullet, B^\bullet))$$

where the right hand side is the cone in $\text{Mod}_{(E,d)}$ defined earlier in this chapter. This shows that our functor is compatible with cones, hence with distinguished triangles. Let X^\bullet be an object of $K(\mathcal{A})$. Consider the category of quasi-isomorphisms $s : X^\bullet \rightarrow Y^\bullet$. We are given that the functor $(s : X^\bullet \rightarrow Y^\bullet) \mapsto \text{Hom}_{\mathcal{A}}(K^\bullet, Y^\bullet)$ is essentially constant when viewed in $D(\text{Ab})$. But since the forgetful functor $D(E, d) \rightarrow D(\text{Ab})$ is compatible with taking cohomology, the same thing is true in $D(E, d)$. This proves the lemma. \square

Warning: Although the lemma holds as stated and may be useful as stated, the differential algebra E isn't the "correct" one unless $H^n(E) = \text{Ext}_{D(\mathcal{A})}^n(K^\bullet, K^\bullet)$ for all $n \in \mathbf{Z}$.

22.23. Tensor product

This section should be moved somewhere else. Let R be a ring. Let A be an R -algebra (see Section 22.2). Given a right A -module M and a left A -module N there is a *tensor product*

$$M \otimes_A N$$

This tensor product is a module over R . In fact, it is the receptacle of the universal A -bilinear map $M \times N \rightarrow M \otimes_A N$, $(m, n) \mapsto m \otimes n$.

We list some properties of the tensor product

- (1) In each variable the tensor product is right exact, in fact commutes with direct sums and arbitrary colimits.
- (2) If A , M , N are graded and the module structures are compatible with gradings then $M \otimes_A N$ is graded as well. Then n th graded piece $(M \otimes_A N)^n$ of $M \otimes_A N$ is the quotient of $\bigoplus_{p+q=n} M^p \otimes_{A^0} N^q$ by the submodule generated by $m \otimes an - ma \otimes n$ where $m \in M^p$, $n \in N^q$, and $a \in A^{n-p-q}$.
- (3) If (A, d) is a differential graded algebra, and M and N are (left and right) differential graded A -modules, then $M \otimes_A N$ is a differential graded R -module with differential

$$d(m \otimes n) = d(m) \otimes n + (-1)^i m \otimes d(n)$$

for $m \in M^i$ and $n \in N$.

- (4) If N is a (A, B) -bimodule then $M \otimes_A N$ is a right B -module.
- (5) If A and B are graded algebras, M is a graded A -module, and N is an (A, B) -bimodule which comes with a grading such that it is both a left graded A -module and a right graded B -module, then $M \otimes_A N$ is a graded B -module.
- (6) If (A, d) and (B, d) are differential graded algebras, M is a differential graded A -module, and N is an (A, B) -bimodule which comes with a grading and a differential such that it is both a left differential graded A -module and a right differential graded B -module, then $M \otimes_A N$ is a differential graded B -module.

In the last item, the condition may be more succinctly stated by saying that N is a differential graded module over $A^{opp} \otimes_R B$. We state the following as a lemma.

Lemma 22.23.1. *Let (A, d) and (B, d) be differential graded algebras, and let N be an (A, B) -bimodule which comes with a grading and a differential such that it is both a left differential graded A -module and a right differential graded B -module. Then $M \mapsto M \otimes_A N$ defines a functor*

$$- \otimes_A N : \text{Mod}_{(A,d)}^{dg} \longrightarrow \text{Mod}_{(B,d)}^{dg}$$

of differential graded categories. This functor induces functors

$$\text{Mod}_{(A,d)} \rightarrow \text{Mod}_{(B,d)} \quad \text{and} \quad K(\text{Mod}_{(A,d)}) \rightarrow K(\text{Mod}_{(B,d)})$$

by an application of Lemma 22.19.5.

Proof. This follows from the discussion above. \square

If A is an algebra and M, M' are right A -modules, then we define

$$\text{Hom}_A(M, M') = \{f : M \rightarrow M' \mid f \text{ is } A\text{-linear}\}$$

as usual. If A is graded and M and M' are graded A -modules, then we recall (Example 22.18.6) that

$$\text{Hom}_{\text{Mod}_A^{gr}}(M, M') = \bigoplus_{n \in \mathbf{Z}} \text{Hom}^n(M, M')$$

where $\text{Hom}^n(M, M')$ is the collection of all A -module maps $M \rightarrow M'$ which are homogeneous of degree n .

Lemma 22.23.2. *Let A and B be algebras. Let M be a right A -module, N an (A, B) -bimodule, and N' a right B -module. Then we have*

$$\text{Hom}_B(M \otimes_A N, N') = \text{Hom}_A(M, \text{Hom}_B(N, N'))$$

If A, B, M, N, N' are compatibly graded, then we have

$$\text{Hom}_{\text{Mod}_B^{gr}}(M \otimes_A N, N') = \text{Hom}_{\text{Mod}_A^{gr}}(M, \text{Hom}_{\text{Mod}_B^{gr}}(N, N'))$$

for the graded versions.

Proof. This follows by interpreting both sides as A -bilinear maps $\psi : M \times N \rightarrow N'$ which are B -linear on the right. \square

22.24. Derived tensor product

This section is analogous to More on Algebra, Section 15.46.

Let R be a ring. Let (A, d) and (B, d) be differential graded algebras over R . Let N be a (A, B) -bimodule equipped with a grading and differential such that N is a left differential graded A -module and a right differential graded B -module. In other words, N is a differential graded $A^{opp} \otimes_R B$ -module. Consider the functor

$$(22.24.0.1) \quad \text{Mod}_{(A,d)} \longrightarrow \text{Mod}_{(B,d)}, \quad M \longmapsto M \otimes_A N$$

defined in Section 22.23.

Lemma 22.24.1. *The functor (22.24.0.1) defines an exact functor of triangulated categories $K(\text{Mod}_{(A,d)}) \rightarrow K(\text{Mod}_{(B,d)})$.*

Proof. The functor was constructed in Lemma 22.23.1. We have to show that $-\otimes_A N$ transforms distinguished triangles into distinguished triangles. Suppose that $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded A -modules. Let $s : M \rightarrow L$ be a graded A -module homomorphism which is left inverse to $L \rightarrow M$. Then s defines a graded B -module homomorphism $M \otimes_A N \rightarrow L \otimes_A N$ which is left inverse to $L \otimes_A N \rightarrow M \otimes_A N$. \square

At this point we can consider the diagram

$$\begin{array}{ccc}
 K(\text{Mod}_{(A,d)}) & \xrightarrow{-\otimes_A N} & K(\text{Mod}_{(B,d)}) \\
 \downarrow & \searrow F & \downarrow \\
 D(A, d) & \cdots\cdots\cdots & D(B, d)
 \end{array}$$

The dotted arrow that we will construct below will be the *left derived functor* of the composition F . (*Warning:* the diagram will not commute.) Namely, in the general setting of Derived Categories, Section 13.15 we want to compute the left derived functor of F with respect to the multiplicative system of quasi-isomorphisms in $K(\text{Mod}_{(A,d)})$.

Lemma 22.24.2. *In the situation above, the left derived functor of F exists. We denote it $-\otimes_A^L N : D(A, d) \rightarrow D(B, d)$.*

Proof. We will use Derived Categories, Lemma 13.15.15 to prove this. As our collection \mathcal{P} of objects we will use the objects with property (P). Property (1) was shown in Lemma 22.13.4. Property (2) holds because if $s : P \rightarrow P'$ is a quasi-isomorphism of modules with property (P), then s is a homotopy equivalence by Lemma 22.15.3. \square

Remark 22.24.3. Let (A, d) and (B, d) be differential graded algebras. Let $f : N \rightarrow N'$ be a homomorphism of differential graded $A^{opp} \otimes_R B$ -modules. Then f induces a morphism of functors

$$1 \otimes f : -\otimes_A^L N \longrightarrow -\otimes_A^L N'$$

If f is a quasi-isomorphism, then $1 \otimes f$ is an isomorphism of functors.

Lemma 22.24.4. *Let (A, d) and (B, d) be differential graded algebras. Let N be an (A, B) -bimodule which comes with a grading and a differential such that it is a differential graded module for both A and B . Then the functors*

$$-\otimes_A^L N : D(A, d) \longrightarrow D(B, d)$$

of Lemma 22.24.2 and

$$R\text{Hom}(N, -) : D(B, d) \longrightarrow D(A, d)$$

of Lemma 22.21.2 are adjoint.

Proof. The statement means that we have

$$\text{Hom}_{D(A,d)}(M, R\text{Hom}(N, N')) = \text{Hom}_{D(B,d)}(M \otimes_A^L N, N')$$

bifunctorially in M and N' . To see this we may assume that M is a differential graded A -module with property (P) and that N' is a differential graded B -module

with property (I). The computation of the derived functors given in the lemmas referenced in the statement combined with Lemma 22.15.3 translates the above into

$$\mathrm{Hom}_{K(\mathrm{Mod}_{(A,d)})}(M, \mathrm{Hom}_{\mathcal{B}}(N, N')) = \mathrm{Hom}_{K(\mathrm{Mod}_{(B,d)})}(M \otimes_A N, N')$$

where $\mathcal{B} = \mathrm{Mod}_{(B,d)}^{dg}$. Thus it is certainly sufficient to show that

$$\mathrm{Hom}_{\mathcal{A}}(M, \mathrm{Hom}_{\mathcal{B}}(N, N')) = \mathrm{Hom}_{\mathcal{B}}(M \otimes_A N, N')$$

as differential graded \mathbf{Z} -modules where $\mathcal{A} = \mathrm{Mod}_{(A,d)}^{dg}$. This follows from the fact that the isomorphism (Lemma 22.23.2)

$$\mathrm{Hom}_{\mathcal{A}}(M, \mathrm{Hom}_{\mathcal{B}}(N, N')) = \mathrm{Hom}_{\mathcal{B}}(M \otimes_A N, N')$$

of internal homs of graded modules respects the differentials. \square

Lemma 22.24.5. *Let R be a ring. Let (A, d) , (B, d) , and (C, d) be differential graded algebras over R . Let N be a differential graded $A^{opp} \otimes_R B$ -module. Let N' be a differential graded $B^{opp} \otimes_R C$ -module. If C is K -flat as a complex of R -modules, then the composition*

$$D(A, d) \xrightarrow{-\otimes_A^{\mathbf{L}} N} D(B, d) \xrightarrow{-\otimes_B^{\mathbf{L}} N'} D(C, d)$$

is isomorphic to $-\otimes_A^{\mathbf{L}} N''$ for some differential graded $A^{opp} \otimes_R C$ -module N'' .

Proof. We will use the construction of the functor $-\otimes^{\mathbf{L}}-$ of the proof of Lemma 22.24.2 without further mention. By Remark 22.24.3 we may replace N' by a quasi-isomorphic bimodule. Thus we assume that N' has property (P) as a differential graded $B^{opp} \otimes_R C$ -module, see Lemma 22.13.4. Let F_{\bullet} be the corresponding filtration on N' . We claim that $N'' = N \otimes_B N'$ works.

Let M be an object of $D(A, d)$. Using the lemma we may and do assume that M has property (P) as a differential graded A -module. Then $M \otimes_A^{\mathbf{L}} N = M \otimes_A N$. Next, we choose a quasi-isomorphism $P \rightarrow M \otimes_A N$ where P is a differential graded B -module with property (P). Then

$$(M \otimes_A^{\mathbf{L}} N) \otimes_B^{\mathbf{L}} N' = P \otimes_B N'$$

The map $P \rightarrow M \otimes_A N$ induces a map

$$P \otimes_B N' \rightarrow (M \otimes_A N) \otimes_B N' = M \otimes_A N''$$

This construction is functorial in M (details omitted) and hence it suffices to prove this map is a quasi-isomorphism.

Since $N' = \mathrm{colim} F_i N'$ it suffices to prove

$$P \otimes_B F_i N' \rightarrow M \otimes_A N \otimes_B F_i N'$$

is a quasi-isomorphism for all i . Using the short exact sequences $0 \rightarrow F_{i-1} N' \rightarrow F_i N' \rightarrow F_i N' / F_{i-1} N' \rightarrow 0$ which are graded split, we see that it suffices to prove that the maps

$$P \otimes_B F_i N' / F_{i-1} N' \rightarrow M \otimes_A N \otimes_B F_i N' / F_{i-1} N'$$

are quasi-isomorphisms for all i . Since $F_i N' / F_{i-1} N'$ is a direct sum of shifts of $B^{opp} \otimes_R C$ we finally reduce to showing that the map

$$P \otimes_B (B^{opp} \otimes_R C) \rightarrow M \otimes_A N \otimes_B (B^{opp} \otimes_R C)$$

is a quasi-isomorphism. In other words, we have to show that

$$P \otimes_R C \rightarrow M \otimes_A N \otimes_R C$$

is a quasi-isomorphism. Since $P \rightarrow M \otimes_A N$ is a quasi-isomorphism we conclude using More on Algebra, Lemma 15.45.4. \square

Lemma 22.24.6. *With notation and assumptions as in Lemma 22.24.4. Assume*

- (1) *N defines a compact object of $D(B, d)$, and*
- (2) *the map $H^k(A) \rightarrow \text{Hom}_{D(B,d)}(N, N[k])$ is an isomorphism for all $k \in \mathbf{Z}$.*

Then the functor $- \otimes_A^{\mathbf{L}} N$ is fully faithful.

Proof. Because our functor has a left adjoint given by $R\text{Hom}(N, -)$ by Lemma 22.24.4 it suffices to show that for a differential graded A -module M the map

$$H^0(M) \longrightarrow \text{Hom}_{D(B,d)}(N, M \otimes_A^{\mathbf{L}} N)$$

is an isomorphism. We may assume that $M = P$ is a differential graded A -module which has property (P). Since N defines a compact object, we reduce using Lemma 22.13.1 to the case where P has a finite filtration whose graded pieces are direct sums of $A[k]$. Again using compactness we reduce to the case $P = A[k]$. Assumption (2) on N is that the result holds for these. \square

22.25. Variant of derived tensor product

Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Then we have the functors

$$\text{Comp}(\mathcal{O}) \rightarrow K(\mathcal{O}) \rightarrow D(\mathcal{O})$$

and as we've seen above we have differential graded enhancement $\text{Comp}^{dg}(\mathcal{O})$. Namely, this is the differential graded category of Example 22.19.6 associated to the abelian category $\text{Mod}(\mathcal{O})$. Let K^\bullet be a complex of \mathcal{O} -modules in other words, an object of $\text{Comp}^{dg}(\mathcal{O})$. Set

$$(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O})}(K^\bullet, K^\bullet)$$

This is a differential graded \mathbf{Z} -algebra. We claim there is an analogue of the derived base change in this situation.

Lemma 22.25.1. *In the situation above there is a functor*

$$- \otimes_E K^\bullet : \text{Mod}_{(E,d)}^{dg} \longrightarrow \text{Comp}^{dg}(\mathcal{O})$$

of differential graded categories. This functor sends E to K^\bullet and commutes with direct sums.

Proof. Let M be a differential graded E -module. For every object U of \mathcal{C} the complex $K^\bullet(U)$ is a left differential graded E -module as well as a right $\mathcal{O}(U)$ -module. The actions commute, so we have a bimodule. Thus, by the constructions in Section 22.23 we can form the tensor product

$$M \otimes_E K^\bullet(U)$$

which is a differential graded $\mathcal{O}(U)$ -module, i.e., a complex of $\mathcal{O}(U)$ -modules. This construction is functorial with respect to U , hence we can sheafify to get a complex of \mathcal{O} -modules which we denote

$$M \otimes_E K^\bullet$$

Moreover, for each U the construction determines a functor $\text{Mod}_{(E,d)}^{dg} \rightarrow \text{Comp}^{dg}(\mathcal{O}(U))$ of differential graded categories by Lemma 22.23.1. It is therefore clear that we obtain a functor as stated in the lemma. \square

Lemma 22.25.2. *The functor of Lemma 22.25.1 defines an exact functor of triangulated categories $K(\text{Mod}_{(E,d)}) \rightarrow K(\mathcal{O})$.*

Proof. The functor induces a functor between homotopy categories by Lemma 22.19.5. We have to show that $- \otimes_E K^\bullet$ transforms distinguished triangles into distinguished triangles. Suppose that $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded E -modules. Let $s : M \rightarrow L$ be a graded E -module homomorphism which is left inverse to $L \rightarrow M$. Then s defines a map $M \otimes_E K^\bullet \rightarrow L \otimes_E K^\bullet$ of graded \mathcal{O} -modules (i.e., respecting \mathcal{O} -module structure and grading, but not differentials) which is left inverse to $L \otimes_E K^\bullet \rightarrow M \otimes_E K^\bullet$. Thus we see that

$$0 \rightarrow K \otimes_E K^\bullet \rightarrow L \otimes_E K^\bullet \rightarrow M \otimes_E K^\bullet \rightarrow 0$$

is a termwise split short exact sequences of complexes, i.e., a defines a distinguished triangle in $K(\mathcal{O})$. \square

Lemma 22.25.3. *The functor $K(\text{Mod}_{(E,d)}) \rightarrow K(\mathcal{O})$ of Lemma 22.25.2 has a left derived version defined on all of $D(E, d)$. We denote it $-\otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \rightarrow D(\mathcal{O})$.*

Proof. We will use Derived Categories, Lemma 13.15.15 to prove this. As our collection \mathcal{P} of objects we will use the objects with property (P). Property (1) was shown in Lemma 22.13.4. Property (2) holds because if $s : P \rightarrow P'$ is a quasi-isomorphism of modules with property (P), then s is a homotopy equivalence by Lemma 22.15.3. \square

Lemma 22.25.4. *Let (C, \mathcal{O}) be a ringed site. Let K^\bullet be a complex of \mathcal{O} -modules. Then the functors*

$$-\otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O})$$

of Lemma 22.25.3 and

$$R\text{Hom}(K^\bullet, -) : D(\mathcal{O}) \longrightarrow D(E, d)$$

of Lemma 22.22.1 are adjoint.

Proof. The statement means that we have

$$\text{Hom}_{D(E,d)}(M, R\text{Hom}(K^\bullet, L^\bullet)) = \text{Hom}_{D(\mathcal{O})}(M \otimes_E^{\mathbf{L}} K^\bullet, L^\bullet)$$

bifunctorially in M and L^\bullet . To see this we may replace M by a differential graded E -module P with property (P). We also may replace L^\bullet by a K-injective complex of \mathcal{O} -modules I^\bullet . The computation of the derived functors given in the lemmas referenced in the statement combined with Lemma 22.15.3 translates the above into

$$\text{Hom}_{K(\text{Mod}_{(E,d)})}(P, \text{Hom}_{\mathcal{B}}(K^\bullet, I^\bullet)) = \text{Hom}_{K(\mathcal{O})}(P \otimes_E K^\bullet, I^\bullet)$$

where $\mathcal{B} = \text{Comp}^{dg}(\mathcal{O})$. There is an evaluation map from right to left functorial in P and I^\bullet (details omitted). Choose a filtration F_\bullet on P as in the definition of property (P). By Lemma 22.13.1 and the fact that both sides of the equation are homological functors in P on $K(\text{Mod}_{(E,d)})$ we reduce to the case where P is replaced by the differential graded E -module $\bigoplus F_i P$. Since both sides turn direct sums in the variable P into direct products we reduce to the case where P is one

of the differential graded E -modules $F_i P$. Since each $F_i P$ has a finite filtration (given by admissible monomorphisms) whose graded pieces are graded projective E -modules we reduce to the case where P is a graded projective E -module. In this case we clearly have

$$\mathrm{Hom}_{\mathrm{Mod}_{(E,d)}^{dg}}(P, \mathrm{Hom}_{\mathcal{B}}(K^\bullet, I^\bullet)) = \mathrm{Hom}_{\mathrm{Comp}^{dg}(\mathcal{O})}(P \otimes_E K^\bullet, I^\bullet)$$

as graded \mathbf{Z} -modules (because this statement reduces to the case $P = E[k]$ where it is obvious). As the isomorphism is compatible with differentials we conclude. \square

Lemma 22.25.5. *Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let K^\bullet be a complex of \mathcal{O} -modules. Assume*

- (1) K^\bullet represents a compact object of $D(\mathcal{O})$, and
- (2) $E = \mathrm{Hom}_{\mathrm{Comp}^{dg}(\mathcal{O})}(K^\bullet, K^\bullet)$ computes the ext groups of K^\bullet in $D(\mathcal{O})$.

Then the functor

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O})$$

of Lemma 22.25.3 is fully faithful.

Proof. Because our functor has a left adjoint given by $R\mathrm{Hom}(K^\bullet, -)$ by Lemma 22.25.4 it suffices to show for a differential graded E -module M that the map

$$H^0(M) \longrightarrow \mathrm{Hom}_{D(\mathcal{O})}(K^\bullet, M \otimes_E^{\mathbf{L}} K^\bullet)$$

is an isomorphism. We may assume that $M = P$ is a differential graded E -module which has property (P). Since K^\bullet defines a compact object, we reduce using Lemma 22.13.1 to the case where P has a finite filtration whose graded pieces are direct sums of $E[k]$. Again using compactness we reduce to the case $P = E[k]$. The assumption on K^\bullet is that the result holds for these. \square

22.26. Characterizing compact objects

Compact objects of additive categories are defined in Derived Categories, Definition 13.34.1. In this section we characterize compact objects of the derived category of a differential graded algebra.

Lemma 22.26.1. *Let (A, d) be a differential graded algebra. Let P, M be differential graded A -modules. Assume P is projective as a graded A -module.*

- (1) *If M is acyclic, then $\mathrm{Hom}_{K(A,d)}(P, M) = 0$.*
- (2) *In general $\mathrm{Hom}_{K(A,d)}(P, M) = \mathrm{Hom}_{D(A,d)}(P, M)$.*

Proof. Consider the functor

$$N \longmapsto \mathrm{Hom}_{\mathrm{Mod}_{(A,d)}^{dg}}(P, N)$$

that to a differential graded A -module N associates the differential graded R -module whose degree n summand is the degree n homogeneous A -module maps from P to N , see Example 22.19.8. Since P is graded projective, this functor transforms any short exact sequence of differential graded A -modules into a short exact sequence of complexes of R -modules. In particular, if $Z \subset M$ is the kernel of d_M , then we get the short exact sequence $0 \rightarrow Z \rightarrow M \rightarrow Z[1] \rightarrow 0$ because M is acyclic. This in turn produces the short exact sequence

$$0 \rightarrow \mathrm{Hom}_{\mathrm{Mod}_{(A,d)}^{dg}}(P, Z) \rightarrow \mathrm{Hom}_{\mathrm{Mod}_{(A,d)}^{dg}}(P, M) \rightarrow \mathrm{Hom}_{\mathrm{Mod}_{(A,d)}^{dg}}(P, Z[1]) \rightarrow 0$$

The associated long exact sequence of cohomology modules is

$$\begin{array}{ccccccc} & & \mathrm{Hom}_{K(A,d)}(P, Z) & \rightarrow & \mathrm{Hom}_{K(A,d)}(P, Z) & \rightarrow & \\ & & \mathrm{Hom}_{K(A,d)}(P, M) & \rightarrow & \mathrm{Hom}_{K(A,d)}(P, Z[1]) & \rightarrow & \mathrm{Hom}_{K(A,d)}(P, Z[1]) \end{array}$$

A computation, which we omit, shows that the first and the last arrows are identity maps, thereby proving part (1).

Choose a quasi-isomorphism $M \rightarrow I$ where I has property (I) which is possible by Lemma 22.14.4. Choose a distinguished triangle

$$M \rightarrow I \rightarrow Q \rightarrow M[1]$$

in $K(A, d)$. Since $M \rightarrow I$ is a quasi-isomorphism, we see that Q is acyclic. By part (1) we have $\mathrm{Hom}_{K(A,d)}(P, Q[n]) = 0$ for all n . As $\mathrm{Hom}_{K(A,d)}(P, -)$ is homological (Derived Categories, Lemma 13.4.2) we see that $\mathrm{Hom}_{K(A,d)}(P, M) = \mathrm{Hom}_{K(A,d)}(P, I)$. We finish by applying Lemma 22.15.3. \square

Let us say a differential graded A -module M is *finite* if M is generated, as a right A -module, by finitely many elements.

Lemma 22.26.2. *Let (A, d) be a differential graded algebra. If P is a differential graded A -module which is finite graded projective, then P is a compact object of $D(A, d)$.*

Proof. Suppose that P is finite and projective as a graded module. Choose a quasi-isomorphism $P' \rightarrow P$ where P' has property (P). Let $K = \mathrm{Ker}(P' \rightarrow P)$. Then K is an acyclic differential graded A -module, whence the boundary $\delta : P \rightarrow K[1]$ (see Lemmas 22.11.1 and 22.7.2) is zero by Lemma 22.26.1. Thus we see that $P' \rightarrow P$ is a homotopy equivalence (by general properties of triangulated categories). It follows that $\mathrm{Hom}_{K(A,d)}(P', -) = \mathrm{Hom}_{K(A,d)}(P, -)$ as functors, whence we see that

$$\mathrm{Hom}_{D(A,d)}(P, M) = \mathrm{Hom}_{K(A,d)}(P, M)$$

for any differential graded A -module M as this is true for P' by Lemma 22.15.3. Now, if $M = \bigoplus M_i$, then because P is a finite A -module, we see that

$$\mathrm{Hom}_{K(A,d)}(P, M) = \bigoplus \mathrm{Hom}_{K(A,d)}(P, M_i)$$

(look at the image of the generators of P for any map or homotopy). Moreover, the direct sum is the direct sum in the derived category, see Lemma 22.15.4. Thus P represents a compact object of $D(A, d)$. \square

Lemma 22.26.3. *Let (A, d) be a differential graded algebra. Let E be a compact object of $D(A, d)$. Let P be a differential graded A -module which has a finite filtration*

$$0 = F_{-1}P \subset F_0P \subset F_1P \subset \dots \subset F_nP = P$$

by differential graded submodules such that

$$F_{i+1}P/F_iP \cong \bigoplus_{j \in J_i} A[k_{i,j}]$$

as differential graded A -modules for some sets J_i and integers $k_{i,j}$. Let $E \rightarrow P$ be a morphism of $D(A, d)$. Then there exists a differential graded submodule $P' \subset P$ such that $F_{i+1}P \cap P'/(F_iP \cap P')$ is equal to $\bigoplus_{j \in J'_i} A[k_{i,j}]$ for some finite subsets $J'_i \subset J_i$ and such that $E \rightarrow P$ factors through P' .

Proof. We will prove by induction on $-1 \leq m \leq n$ that there exists a differential graded submodule $P' \subset P$ such that

- (1) $F_m P \subset P'$,
- (2) for $i \geq m$ the quotient $F_{i+1} P \cap P' / (F_i P \cap P')$ is isomorphic to $\bigoplus_{j \in J'_i} A[k_{i,j}]$ for some finite subsets $J'_i \subset J_i$, and
- (3) $E \rightarrow P$ factors through P' .

The base case is $m = n$ where we can take $P' = P$.

Induction step. Assume P' works for m . For $i \geq m$ and $j \in J'_i$ let $x_{i,j} \in F_{i+1} P \cap P'$ be a homogeneous element of degree $k_{i,j}$ whose image in $F_{i+1} P \cap P' / (F_i P \cap P')$ is the generator in the summand corresponding to $j \in J_i$. The $x_{i,j}$ generate $P' / F_m P$ as an A -module. Write

$$d(x_{i,j}) = \sum x_{i',j'} a_{i,j}^{i',j'} + y_{i,j}$$

with $y_{i,j} \in F_m P$ and $a_{i,j}^{i',j'} \in A$. There exists a finite subset $J'_{m-1} \subset J_{m-1}$ such that each $y_{i,j}$ maps to an element of the submodule $\bigoplus_{j \in J'_{m-1}} A[k_{m-1,j}]$ of $F_m P / F_{m-1} P$. Let $P'' \subset F_m P$ be the inverse image of $\bigoplus_{j \in J'_{m-1}} A[k_{m-1,j}]$ under the map $F_m P \rightarrow F_m P / F_{m-1} P$. Then we see that the A -submodule

$$P'' + \sum x_{i,j} A$$

is a differential graded submodule of the type we are looking for. Moreover

$$P' / (P'' + \sum x_{i,j} A) = \bigoplus_{j \in J_{m-1} \setminus J'_{m-1}} A[k_{m-1,j}]$$

Since E is compact, the composition of the given map $E \rightarrow P'$ with the quotient map, factors through a finite direct subsum of the module displayed above. Hence after enlarging J'_{m-1} we may assume $E \rightarrow P'$ factors through $P'' + \sum x_{i,j} A$ as desired. \square

It is not true that every compact object of $D(A, d)$ comes from a finite graded projective differential graded A -module, see Examples, Section 82.58.

Proposition 22.26.4. *Let (A, d) be a differential graded algebra. Let E be an object of $D(A, d)$. Then the following are equivalent*

- (1) E is a compact object,
- (2) E is a direct summand of an object of $D(A, d)$ which is represented by a finite graded projective differential graded A -module, and
- (3) E is a direct summand of an object of $D(A, d)$ which is represented by a differential graded module P which has a finite filtration F_\bullet by differential graded submodules such that $F_i P / F_{i-1} P$ are finite direct sums of shifts of A .

Proof. Assume E is compact. By Lemma 22.13.4 we may assume that E is represented by a differential graded A -module P with property (P). Consider the distinguished triangle

$$\bigoplus F_i P \rightarrow \bigoplus F_i P \rightarrow P \xrightarrow{\delta} \bigoplus F_i P[1]$$

coming from the admissible short exact sequence of Lemma 22.13.1. Since E is compact we have $\delta = \sum_{i=1, \dots, n} \delta_i$ for some $\delta_i : P \rightarrow F_i P[1]$. Since the composition of δ with the map $\bigoplus F_i P[1] \rightarrow \bigoplus F_i P[1]$ is zero (Derived Categories, Lemma

13.4.1) it follows that $\delta = 0$ (follows as $\bigoplus F_i P \rightarrow \bigoplus F_i P$ maps the summand $F_i P$ via the difference of id and the inclusion map into $F_{i-1} P$). Thus we see that the identity on E factors through $\bigoplus F_i P$ in $D(A, d)$ (by Derived Categories, Lemma 13.4.10). Next, we use that P is compact again to see that the map $E \rightarrow \bigoplus F_i P$ factors through $\bigoplus_{i=1, \dots, n} F_i P$ for some n . In other words, the identity on E factors through $\bigoplus_{i=1, \dots, n} F_i P$. By Lemma 22.26.3 we see that the identity of E factors as $E \rightarrow P \rightarrow E$ where P is as in part (3) of the statement of the lemma. In other words, we have proven that (1) implies (3).

It is clear that (3) implies (2). Finally, (2) implies (1) by Lemma 22.26.2 and Derived Categories, Lemma 13.34.2. \square

Lemma 22.26.5. *Let (A, d) be a differential graded algebra. For every compact object E of $D(A, d)$ there exist integers $a \leq b$ such that $\text{Hom}_{D(A, d)}(E, M) = 0$ if $H^i(M) = 0$ for $i \in [a, b]$.*

Proof. Observe that the collection of objects of $D(A, d)$ for which such a pair of integers exists is a saturated, strictly full triangulated subcategory of $D(A, d)$. Thus by Proposition 22.26.4 it suffices to prove this when E is represented by a differential graded module P which has a finite filtration F_\bullet by differential graded submodules such that $F_i P / F_{i-1} P$ are finite direct sums of shifts of A . Using the compatibility with triangles, we see that it suffices to prove it for $P = A$. In this case $\text{Hom}_{D(A, d)}(A, M) = H^0(M)$ and the result holds with $a = b = 0$. \square

If (A, d) is just a graded algebra or more generally lives in only a finite number of degrees, then we do obtain the more precise description of compact objects.

Lemma 22.26.6. *Let (A, d) be a differential graded algebra. Assume that $A^n = 0$ for $|n| \gg 0$. Then an object of $D(A, d)$ is compact if and only if it can be represented by a finite graded projective differential graded A -module.*

Proof. One implication is Lemma 22.26.2. For the converse, let E be a compact object of $D(A, d)$. Fix $a \leq b$ as in Lemma 22.26.5. After decreasing a and increasing b if necessary, we may also assume that $H^i(E) = 0$ for $i \notin [a, b]$ (this follows from Proposition 22.26.4 and our assumption on A). Moreover, fix an integer $c > 0$ such that $A^n = 0$ if $|n| \geq c$.

By Proposition 22.26.4 we see that E is a direct summand, in $D(A, d)$, of a differential graded A -module P which has a finite filtration F_\bullet by differential graded submodules such that $F_i P / F_{i-1} P$ are finite direct sums of shifts of A . Note that P is a finite graded free A -module. We will use without further mention that for such a differential graded A -module we have $\text{Hom}_{D(A, d)}(P, P) = \text{Hom}_{K(A, d)}(P, P)$ by Lemma 22.26.1.

Choose $n > 0$ such that $b + 4c - n < a$. Represent the projector onto E by an endomorphism $\varphi : P \rightarrow P$ of differential graded A -modules. Consider the distinguished triangle

$$P \xrightarrow{1-\varphi} P \rightarrow C \rightarrow P[1]$$

in $K(A, d)$ where C is the cone of the first arrow. Then $C \cong E \oplus E[1]$ in $D(A, d)$ and C is a finite graded free A -module. Next, consider a distinguished triangle

$$C[1] \rightarrow C \rightarrow C' \rightarrow C[2]$$

in $K(A, d)$ where C' is the cone on a morphism $C[1] \rightarrow C$ representing the composition

$$C[1] \cong E[1] \oplus E[2] \rightarrow E[1] \rightarrow E \oplus E[1] \cong C$$

in $D(A, d)$. Then we see that C' represents $E \oplus E[2]$. Continuing in this manner we see that we can find a differential graded A -module P which is a finite graded free A -module representing $E \oplus E[n]$.

Choose a basis $x_i, i \in I$ of homogeneous element for P as an A -module. Let $d_i = \text{deg}(x_i)$. Let P_1 be the A -submodule of P generated by x_i and $d(x_i)$ for $d_i \leq a - c - 1$. Let P_2 be the A -submodule of P generated by x_i and $d(x_i)$ for $d_i \geq b - n + c$. We observe

- (1) P_1 and P_2 are differential graded submodules of P ,
- (2) $P_1^t = 0$ for $t \geq a$,
- (3) $P_1^t = P^t$ for $t \leq a - 2c$,
- (4) $P_2^t = 0$ for $t \leq b - n$,
- (5) $P_2^t = P^t$ for $t \geq b - n + 2c$.

As $b - n + 2c \geq a - 2c$ by our choice of n we obtain a short exact sequence of differential graded A -modules

$$0 \rightarrow P_1 \cap P_2 \rightarrow P_1 \oplus P_2 \xrightarrow{\pi} P \rightarrow 0$$

Since P is projective as a graded A -module this is an admissible short exact sequence (Lemma 22.11.1). Hence we obtain a boundary map $\delta : P \rightarrow (P_1 \cap P_2)[1]$ in $K(A, d)$, see Lemma 22.7.2. Since $P = E \oplus E[n]$ and since $P_1 \cap P_2$ lives in degrees $(b - n, a)$ we find that $\text{Hom}_{D(A, d)}(E \oplus E[n], (P_1 \cap P_2)[1])$ is zero. Therefore $\delta = 0$ as a morphism in $K(A, d)$. By Derived Categories, Lemma 13.4.10 we can find a map $s : P \rightarrow P_1 \oplus P_2$ such that $\pi \circ s = \text{id}_P + dh + hd$ for some $h : P \rightarrow P$ of degree -1 . Since $P_1 \oplus P_2 \rightarrow P$ is surjective and since P is projective as a graded A -module we can choose a homogeneous lift $\tilde{h} : P \rightarrow P_1 \oplus P_2$ of h . Then we change s into $s + d\tilde{h} + \tilde{h}d$ to get $\pi \circ s = \text{id}_P$. This means we obtain a direct sum decomposition $P = s^{-1}(P_1) \oplus s^{-1}(P_2)$. Since $s^{-1}(P_2)$ is equal to P in degrees $\geq b - n + 2c$ we see that $s^{-1}(P_2) \rightarrow P \rightarrow E$ is a quasi-isomorphism, i.e., an isomorphism in $D(A, d)$. This finishes the proof. \square

22.27. Equivalences of derived categories

Let R be a ring. Let (A, d) and (B, d) be differential graded R -algebras. A natural question that arises in nature is what it means that $D(A, d)$ is equivalent to $D(B, d)$ as an R -linear triangulated category. This is a rather subtle question and it will turn out it isn't always the correct question to ask. Nonetheless, in this section we collection some conditions that guarantee this is the case.

We strongly urge the reader to take a look at the groundbreaking paper [Ric89b] on this topic.

Lemma 22.27.1. *Let R be a ring. Let $(A, d) \rightarrow (B, d)$ be a homomorphism of differential graded algebras over R , which induces an isomorphism on cohomology algebras. Then*

$$- \otimes_A^L B : D(A, d) \rightarrow D(B, d)$$

gives an R -linear equivalence of triangulated categories with quasi-inverse the restriction functor $N \mapsto N_A$.

Proof. By Lemma 22.24.6 the functor $M \mapsto M \otimes_A^{\mathbf{L}} B$ is fully faithful. By Lemma 22.24.4 the functor $N \mapsto R\mathrm{Hom}(B, N) = N_A$ is a right adjoint. It is clear that the kernel of $R\mathrm{Hom}(B, -)$ is zero. Hence the result follows from Derived Categories, Lemma 13.7.2. \square

When we analyze the proof above we see that we obtain the following generalization for free.

Lemma 22.27.2. *Let R be a ring. Let (A, d) and (B, d) be differential graded algebras over R . Let N be an (A, B) -bimodule which comes with a grading and a differential such that it is a differential graded module for both A and B . Assume that*

- (1) N defines a compact object of $D(B, d)$,
- (2) if $N' \in D(B, d)$ and $\mathrm{Hom}_{D(B, d)}(N, N'[n]) = 0$ for $n \in \mathbf{Z}$, then $N' = 0$, and
- (3) the map $H^k(A) \rightarrow \mathrm{Hom}_{D(B, d)}(N, N[k])$ is an isomorphism for all $k \in \mathbf{Z}$.

Then

$$- \otimes_A^{\mathbf{L}} N : D(A, d) \rightarrow D(B, d)$$

gives an R -linear equivalence of triangulated categories.

Proof. By Lemma 22.24.6 the functor $M \mapsto M \otimes_A^{\mathbf{L}} N$ is fully faithful. By Lemma 22.24.4 the functor $N' \mapsto R\mathrm{Hom}(N, N')$ is a right adjoint. By assumption (3) the kernel of $R\mathrm{Hom}(N, -)$ is zero. Hence the result follows from Derived Categories, Lemma 13.7.2. \square

Remark 22.27.3. In Lemma 22.27.2 we can replace condition (2) by the condition that N is a classical generator for $D_{compact}(B, d)$, see Derived Categories, Proposition 13.34.6. Moreover, if we knew that $R\mathrm{Hom}(N, B)$ is a compact object of $D(A, d)$, then it suffices to check that N is a weak generator for $D_{compact}(B, d)$. We omit the proof; we will add it here if we ever need it in the Stacks project.

Sometimes the B -module P in the lemma below is called an “ (A, B) -tilting complex”.

Lemma 22.27.4. *Let R be a ring. Let (A, d) and (B, d) be differential graded R -algebras. Assume that $A = H^0(A)$. The following are equivalent*

- (1) $D(A, d)$ and $D(B, d)$ are equivalent as R -linear triangulated categories, and
- (2) there exists an object P of $D(B, d)$ such that
 - (a) P is a compact object of $D(B, d)$,
 - (b) if $N \in D(B, d)$ with $\mathrm{Hom}_{D(B, d)}(P, N[i]) = 0$ for $i \in \mathbf{Z}$, then $N = 0$,
 - (c) $\mathrm{Hom}_{D(B, d)}(P, P[i]) = 0$ for $i \neq 0$ and equal to A for $i = 0$.

Proof. Let $F : D(A, d) \rightarrow D(B, d)$ be an equivalence. Then F maps compact objects to compact objects. Hence $P = F(A)$ is compact, i.e., (2)(a) holds. Conditions (2)(b) and (2)(c) are immediate from the fact that F is an equivalence.

Let P be an object as in (2). Represent P by a differential graded module with property (P). Set

$$(E, d) = \mathrm{Hom}_{\mathrm{Mod}_B^{dg}}(P, P)$$

Then $H^0(E) = A$ and $H^k(E) = 0$ for $k \neq 0$ by Lemma 22.15.3 and assumption (2)(c). Viewing P as a (E, B) -bimodule and using Lemma 22.27.2 and assumption (2)(b) we obtain an equivalence

$$D(E, d) \rightarrow D(B, d)$$

Let $E' \subset E$ be the differential graded R -subalgebra with

$$(E')^i = \begin{cases} E^i & \text{if } i < 0 \\ \text{Ker}(E^0 \rightarrow E^1) & \text{if } i = 0 \\ 0 & \text{if } i > 0 \end{cases}$$

Then there are quasi-isomorphisms of differential graded algebras $(A, d) \leftarrow (E', d) \rightarrow (E, d)$ Thus we obtain equivalences

$$D(A, d) \leftarrow D(E', d) \rightarrow D(E, d) \rightarrow D(B, d)$$

by Lemma 22.27.1. □

Remark 22.27.5. Let R be a ring. Let (A, d) and (B, d) be differential graded R -algebras. Suppose given an R -linear equivalence

$$F : D(A, d) \longrightarrow D(B, d)$$

of triangulated categories. Set $N = F(A)$. Then N is a differential graded B -module. Since F is an equivalence and A is a compact object of $D(A, d)$, we conclude that N is a compact object of $D(B, d)$. Moreover, since $H^k(A) = \text{Hom}_{D(A, d)}(A, A[k])$ and F an equivalence we see that F induces an isomorphism $H^k(A) = \text{Hom}_{D(B, d)}(N, N[k])$ for all k . In order to conclude that there is an equivalence $D(A, d) \longrightarrow D(B, d)$ which arises from the construction in Lemma 22.27.2 all we need is a right A -module structure on N or on any differential graded B -module quasi-isomorphic to B . This module structure can be constructed in certain cases. For example, if we assume that F can be lifted to a differential graded functor

$$F^{dg} : \text{Mod}_{(A, d)}^{dg} \longrightarrow \text{Mod}_{(B, d)}^{dg}$$

(for notation see Example 22.19.8) between the associated differential graded categories, then this holds. Another case is discussed in the proposition below.

Proposition 22.27.6. *Let R be a ring. Let (A, d) and (B, d) be differential graded R -algebras. Let $F : D(A, d) \rightarrow D(B, d)$ be an R -linear equivalence of triangulated categories. Assume that*

- (1) $A = H^0(A)$, and
- (2) B is K -flat as a complex of R -modules.

Then there exists an (A, B) -bimodule N as in Lemma 22.27.2.

Proof. As in Remark 22.27.5 above, we set $N = F(A)$ in $D(B, d)$. We may assume that N is a differential graded B -module with property (P). Set

$$(E, d) = \text{Hom}_{\text{Mod}_{(B, d)}^{dg}}(N, N)$$

Then $H^0(E) = A$ and $H^k(E) = 0$ for $k \neq 0$ by Lemma 22.15.3. Moreover, by the discussion preceding the proposition and Lemma 22.27.2 we see that N as a

(E, B) -bimodule induces an equivalence $-\otimes_E^{\mathbf{L}} N : D(E, d) \rightarrow D(B, d)$. Let $E' \subset E$ be the differential graded R -subalgebra with

$$(E')^i = \begin{cases} E^i & \text{if } i < 0 \\ \text{Ker}(E^0 \rightarrow E^1) & \text{if } i = 0 \\ 0 & \text{if } i > 0 \end{cases}$$

Then there are quasi-isomorphisms of differential graded algebras $(A, d) \leftarrow (E', d) \rightarrow (E, d)$. Thus we obtain equivalences

$$D(A, d) \leftarrow D(E', d) \rightarrow D(E, d) \rightarrow D(B, d)$$

by Lemma 22.27.1. Note that the quasi-inverse $D(A, d) \rightarrow D(E', d)$ of the left vertical arrow is given by $M \mapsto M \otimes_A^{\mathbf{L}} A$ where A is viewed as a $A^{opp} \otimes_R E'$ -module. On the other hand the functor $D(E', d) \rightarrow D(B, d)$ is given by $M \mapsto M \otimes_{E'}^{\mathbf{L}} N$ where N is as above. We conclude by Lemma 22.24.5. \square

Remark 22.27.7. Let A, B, F, N be as in Proposition 22.27.6. It is not clear that F and the functor $G(-) = - \otimes_A^{\mathbf{L}} N$ are isomorphic. By construction there is an isomorphism $N = G(A) \rightarrow F(A)$ in $D(B, d)$. It is straightforward to extend this to a functorial isomorphism $G(M) \rightarrow F(M)$ for M is a differential graded A -module which is graded projective (e.g., a sum of shifts of A). Then one can conclude that $G(M) \cong F(M)$ when M is a cone of a map between such modules. We don't know whether more is true in general.

Lemma 22.27.8. *Let R be a ring. Let A and B be R -algebras. The following are equivalent*

- (1) *there is an R -linear equivalence $D(A) \rightarrow D(B)$ of triangulated categories,*
- (2) *there exists an object P of $D(B)$ such that*
 - (a) *P can be represented by a finite complex of finite projective B -modules,*
 - (b) *if $K \in D(B)$ with $\text{Ext}_B^i(P, K) = 0$ for $i \in \mathbf{Z}$, then $K = 0$, and*
 - (c) *$\text{Ext}_B^i(P, P) = 0$ for $i \neq 0$ and equal to A for $i = 0$.*

Moreover, if B is flat as an R -module, then this is also equivalent to

- (3) *there exists an (A, B) -bimodule N such that $-\otimes_A^{\mathbf{L}} N : D(A) \rightarrow D(B)$ is an equivalence.*

Proof. The equivalence of (1) and (2) is a special case of Lemma 22.27.4 combined with the result of Lemma 22.26.6 characterizing compact objects of $D(B)$. The equivalence with (3) if B is R -flat follows from Proposition 22.27.6. \square

Remark 22.27.9. Let R be a ring. Let A and B be R -algebras. If $D(A)$ and $D(B)$ are equivalent as R -linear triangulated categories, then the centers of A and B are isomorphic as R -algebras. In particular, if A and B are commutative, then $A \cong B$. The rather tricky proof can be found in [Ric89b, Proposition 9.2] or [KZ98, Proposition 6.3.2]. Another approach might be to use Hochschild cohomology (see remark below).

Remark 22.27.10. Let R be a ring. Let (A, d) and (B, d) be differential graded R -algebras which are derived equivalent, i.e., such that there exists an R -linear equivalence $D(A, d) \rightarrow D(B, d)$ of triangulated categories. We would like to show that certain invariants of (A, d) and (B, d) coincide. In many situations one has

more control of the situation. For example, it may happen that there is an equivalence of the form

$$- \otimes_A \Omega : D(A, d) \longrightarrow D(B, d)$$

for some differential graded $A^{opp} \otimes_R B$ -module Ω (this happens in the situation of Proposition 22.27.6 and is often true if the equivalence comes from a geometric construction). If also the quasi-inverse of our functor is given as

$$- \otimes_A^{\mathbf{L}} \Omega' : D(B, d) \longrightarrow D(A, d)$$

for a differential graded $B^{opp} \otimes_R A$ -module Ω' (and as before such a module Ω' often exists in practice) then we can consider the functor

$$D(A^{opp} \otimes_R A, d) \longrightarrow D(B^{opp} \otimes_R B, d), \quad M \longmapsto \Omega' \otimes_A^{\mathbf{L}} M \otimes_A^{\mathbf{L}} \Omega$$

Observe that this functor sends the (A, A) -bimodule A to the (B, B) -bimodule B . Under suitable conditions (e.g., flatness of A , B , Ω , etc) this functor will be an equivalence as well. If this is the case, then it follows that we have isomorphisms of Hochschild cohomology groups

$$HH^i(A, d) = \text{Hom}_{D(A^{opp} \otimes_R A, d)}(A, A[i]) \longrightarrow \text{Hom}_{D(B^{opp} \otimes_R B, d)}(B, B[i]) = HH^i(B, d).$$

For example, if $A = H^0(A)$, then $HH^0(A, d)$ is equal to the center of A , and this gives a conceptual proof of the result mentioned in Remark 22.27.9. If we ever need this remark we will provide a precise statement with a detailed proof here.

Divided Power Algebra

23.1. Introduction

In this chapter we talk about divided power algebras and what you can do with them. A reference is the book [Ber74].

23.2. Divided powers

In this section we collect some results on divided power rings. We will use the convention $0! = 1$ (as empty products should give 1).

Definition 23.2.1. Let A be a ring. Let I be an ideal of A . A collection of maps $\gamma_n : I \rightarrow I$, $n > 0$ is called a *divided power structure* on I if for all $n \geq 0$, $m > 0$, $x, y \in I$, and $a \in A$ we have

- (1) $\gamma_1(x) = x$, we also set $\gamma_0(x) = 1$,
- (2) $\gamma_n(x)\gamma_m(x) = \frac{(n+m)!}{n!m!}\gamma_{n+m}(x)$,
- (3) $\gamma_n(ax) = a^n\gamma_n(x)$,
- (4) $\gamma_n(x+y) = \sum_{i=0, \dots, n} \gamma_i(x)\gamma_{n-i}(y)$,
- (5) $\gamma_n(\gamma_m(x)) = \frac{(nm)!}{n!(m!)^n}\gamma_{nm}(x)$.

Note that the rational numbers $\frac{(n+m)!}{n!m!}$ and $\frac{(nm)!}{n!(m!)^n}$ occurring in the definition are in fact integers; the first is the number of ways to choose n out of $n+m$ and the second counts the number of ways to divide a group of nm objects into n groups of m . We make some remarks about the definition which show that $\gamma_n(x)$ is a replacement for $x^n/n!$ in I .

Lemma 23.2.2. *Let A be a ring. Let I be an ideal of A .*

- (1) *If γ is a divided power structure on I , then $n!\gamma_n(x) = x^n$ for $n \geq 1$, $x \in I$.*

Assume A is torsion free as a \mathbf{Z} -module.

- (2) *A divided power structure on I , if it exists, is unique.*
- (3) *If $\gamma_n : I \rightarrow I$ are maps then*

$$\gamma \text{ is a divided power structure} \Leftrightarrow n!\gamma_n(x) = x^n \quad \forall x \in I, n \geq 1.$$

- (4) *The ideal I has a divided power structure if and only if there exists a set of generators x_i of I as an ideal such that for all $n \geq 1$ we have $x_i^n \in (n!)I$.*

Proof. Proof of (1). If γ is a divided power structure, then condition (2) implies that $n\gamma_n(x) = \gamma_1(x)\gamma_{n-1}(x)$. Hence by induction and condition (1) we get $n!\gamma_n(x) = x^n$.

Assume A is torsion free as a \mathbf{Z} -module. Proof of (2). This is clear from (1).

Proof of (3). Assume that $n!\gamma_n(x) = x^n$ for all $x \in I$ and $n \geq 1$. Since $A \subset A \otimes_{\mathbf{Z}} \mathbf{Q}$ it suffices to prove (1) – (5) in case A is a \mathbf{Q} -algebra. In this case $\gamma_n(x) = x^n/n!$

and it is straightforward to verify (1) – (5), for example (4) corresponds to the binomial formula

$$(x + y)^n = \sum \frac{n!}{i!(n-i)!} x^i y^{n-i}$$

We encourage the reader to do the verifications to make sure that we have the coefficients correct.

Proof of (4). Assume we have generators x_i of I as an ideal such that $x_i^n \in (n!)I$ for all $n \geq 1$. We claim that for all $x \in I$ we have $x^n \in (n!)I$. If the claim holds then we can set $\gamma_n(x) = x^n/n!$ which is a divided power structure by (3). To prove the claim we note that it holds for $x = ax_i$. Hence we see that the claim holds for a set of generators of I as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove the claim for $x + y$ if it holds for x and y . This follows immediately from the binomial theorem. \square

Example 23.2.3. Let p be a prime number. Let A be a ring such that every integer n not divisible by p is invertible, i.e., A is a $\mathbf{Z}_{(p)}$ -algebra. Then $I = pA$ has a canonical divided power structure. Namely, given $x = pa \in A$ we set

$$\gamma_n(x) = \frac{p^n}{n!} a^n$$

The reader verifies immediately that $p^n/n! \in \mathbf{Z}_{(p)}$ so that the definition makes sense. It is a straightforward exercise to verify that conditions (1) – (5) of Definition 23.2.1 are satisfied. Alternatively, it is clear that the definition works for $A_0 = \mathbf{Z}_{(p)}$ and then the result follows from Lemma 23.4.2.

Lemma 23.2.4. *Let A be a ring. Let I be an ideal of A . Let $\gamma_n : I \rightarrow I$, $n \geq 1$ be a sequence of maps. Assume*

- (a) (1), (3), and (4) of Definition 23.2.1 hold for all $x, y \in I$, and
- (b) properties (2) and (5) hold for x in set of generators of I as an ideal.

Then γ is a divided power structure on I .

Proof. The numbers (1), (2), (3), (4), (5) in this proof refer to the conditions listed in Definition 23.2.1. Applying (3) we see that if (2) and (5) hold for x then (2) and (5) hold for ax for all $a \in A$. Hence we see (b) implies (2) and (5) hold for a set of generators of I as an abelian group. Hence, by induction of the length of an expression in terms of these it suffices to prove that, given $x, y \in I$ such that (2) and (5) hold for x and y , then (2) and (5) hold for $x + y$.

Proof of (2) for $x + y$. By (4) we have

$$\gamma_n(x + y)\gamma_m(x + y) = \sum_{i+j=n, k+l=m} \gamma_i(x)\gamma_k(x)\gamma_j(y)\gamma_l(y)$$

Using (2) for x and y this equals

$$\sum \frac{(i+k)!(j+l)!}{i!k!j!l!} \gamma_{i+k}(x)\gamma_{j+l}(y)$$

Comparing this with the expansion

$$\gamma_{n+m}(x + y) = \sum \gamma_a(x)\gamma_b(y)$$

we see that we have to prove that given $a + b = n + m$ we have

$$\sum_{i+k=a, j+l=b, i+j=n, k+l=m} \frac{(i+k)!(j+l)!}{i!k!j!l!} = \frac{(n+m)!}{n!m!}.$$

Instead of arguing this directly, we note that the result is true for the ideal $I = (x, y)$ in the polynomial ring $\mathbf{Q}[x, y]$ because $\gamma_n(f) = f^n/n!$, $f \in I$ defines a divided power structure on I . Hence the equality of rational numbers above is true.

Proof of (5) for $x + y$ given that (1) – (4) hold and that (5) holds for x and y . We will again reduce the proof to an equality of rational numbers. Namely, using (4) we can write $\gamma_n(\gamma_m(x + y)) = \gamma_n(\sum \gamma_i(x)\gamma_j(y))$. Using (4) we can write $\gamma_n(\gamma_m(x + y))$ as a sum of terms which are products of factors of the form $\gamma_k(\gamma_i(x)\gamma_j(y))$. If $i > 0$ then

$$\begin{aligned} \gamma_k(\gamma_i(x)\gamma_j(y)) &= \gamma_j(y)^k \gamma_k(\gamma_i(x)) \\ &= \frac{(ki)!}{k!(i!)^k} \gamma_j(y)^k \gamma_{ki}(x) \\ &= \frac{(ki)!}{k!(i!)^k} \frac{(kj)!}{k!(j!)^k} \gamma_{ik}(x) \gamma_{kj}(y) \end{aligned}$$

using (3) in the first equality, (5) for x in the second, and (2) exactly k times in the third. Using (5) for y we see the same equality holds when $i = 0$. Continuing like this using all axioms but (5) we see that we can write

$$\gamma_n(\gamma_m(x + y)) = \sum_{i+j=nm} c_{ij} \gamma_i(x)\gamma_j(y)$$

for certain universal constants $c_{ij} \in \mathbf{Z}$. Again the fact that the equality is valid in the polynomial ring $\mathbf{Q}[x, y]$ implies that the coefficients c_{ij} are all equal to $(nm)!/n!(m!)^n$ as desired. \square

Lemma 23.2.5. *Let A be a ring with two ideals $I, J \subset A$. Let γ be a divided power structure on I and let δ be a divided power structure on J . Then*

- (1) γ and δ agree on IJ ,
- (2) if γ and δ agree on $I \cap J$ then they are the restriction of a unique divided power structure ϵ on $I + J$.

Proof. Let $x \in I$ and $y \in J$. Then

$$\gamma_n(xy) = y^n \gamma_n(x) = n! \delta_n(y) \gamma_n(x) = \delta_n(y) x^n = \delta_n(xy).$$

Hence γ and δ agree on a set of (additive) generators of IJ . By property (4) of Definition 23.2.1 it follows that they agree on all of IJ .

Let $z \in I + J$. Write $z = x + y$ with $x \in I$ and $y \in J$. Then we set

$$\epsilon_n(z) = \sum \gamma_i(x) \delta_{n-i}(y)$$

To see that this is well defined, suppose that $z = x' + y'$ is another representation with $x' \in I$ and $y' \in J$. Then $w = x - x' = y' - y \in I \cap J$. Hence

$$\begin{aligned} \sum_{i+j=n} \gamma_i(x) \delta_j(y) &= \sum_{i+j=n} \gamma_i(x' + w) \delta_j(y) \\ &= \sum_{i'+l+j=n} \gamma_{i'}(x') \gamma_l(w) \delta_j(y) \\ &= \sum_{i'+l+j=n} \gamma_{i'}(x') \delta_l(w) \delta_j(y) \\ &= \sum_{i'+j'=n} \gamma_{i'}(x') \delta_{j'}(y + w) \\ &= \sum_{i'+j'=n} \gamma_{i'}(x') \delta_{j'}(y') \end{aligned}$$

as desired. Next, we prove conditions (1) – (5) of Definition 23.2.1. Properties (1) and (3) are clear. To see (4), suppose that $z = x + y$ and $z' = x' + y'$ with $x, x' \in I$ and $y, y' \in J$ and compute

$$\begin{aligned} \epsilon_n(z + z') &= \sum_{a+b=n} \gamma_i(x + x')\delta_j(y + y') \\ &= \sum_{i+i'+j+j'=n} \gamma_i(x)\gamma_{i'}(x')\delta_j(y)\delta_{j'}(y') \\ &= \sum_{k=0, \dots, n} \sum_{i+j=k} \gamma_i(x)\delta_j(y) \sum_{i'+j'=n-k} \gamma_{i'}(x')\delta_{j'}(y') \\ &= \sum_{k=0, \dots, n} \epsilon_k(z)\epsilon_{n-k}(z') \end{aligned}$$

as desired. Now we see that it suffices to prove (2) and (5) for elements of I or J , see Lemma 23.2.4. This is clear because γ and δ are divided power structures. \square

Lemma 23.2.6. *Let p be a prime number. Let A be a ring, let $I \subset A$ be an ideal, and let γ be a divided power structure on I . Assume p is nilpotent in A/I . Then I is locally nilpotent if and only if p is nilpotent in A .*

Proof. If $p^N = 0$ in A , then for $x \in I$ we have $x^{p^N} = (pN)!\gamma_N(x) = 0$ because $(pN)!$ is divisible by p^N . Conversely, assume I is locally nilpotent. We've also assumed that p is nilpotent in A/I , hence $p^r \in I$ for some r , hence p^r nilpotent, hence p nilpotent. \square

23.3. Divided power rings

There is a category of divided power rings. Here is the definition.

Definition 23.3.1. A *divided power ring* is a triple (A, I, γ) where A is a ring, $I \subset A$ is an ideal, and $\gamma = (\gamma_n)_{n \geq 1}$ is a divided power structure on I . A *homomorphism of divided power rings* $\varphi : (A, I, \gamma) \rightarrow (B, J, \delta)$ is a ring homomorphism $\varphi : A \rightarrow B$ such that $\varphi(I) \subset J$ and such that $\delta_n(\varphi(x)) = \varphi(\gamma_n(x))$ for all $x \in I$.

We sometimes say “let (B, J, δ) be a divided power algebra over (A, I, γ) ” to indicate that (B, J, δ) is a divided power ring which comes equipped with a homomorphism of divided power rings $(A, I, \gamma) \rightarrow (B, J, \delta)$.

Lemma 23.3.2. *The category of divided power rings has all limits and they agree with limits in the category of rings.*

Proof. The empty limit is the zero ring (that's weird but we need it). The product of a collection of divided power rings (A_t, I_t, γ_t) , $t \in T$ is given by $(\prod A_t, \prod I_t, \gamma)$ where $\gamma_n((x_t)) = (\gamma_{t,n}(x_t))$. The equalizer of $\alpha, \beta : (A, I, \gamma) \rightarrow (B, J, \delta)$ is just $C = \{a \in A \mid \alpha(a) = \beta(a)\}$ with ideal $C \cap I$ and induced divided powers. It follows that all limits exist, see Categories, Lemma 4.14.10. \square

The following lemma illustrates a very general category theoretic phenomenon in the case of divided power algebras.

Lemma 23.3.3. *Let \mathcal{C} be the category of divided power rings. Let $F : \mathcal{C} \rightarrow \text{Sets}$ be a functor. Assume that*

- (1) *there exists a cardinal κ such that for every $f \in F(A, I, \gamma)$ there exists a morphism $(A', I', \gamma') \rightarrow (A, I, \gamma)$ of \mathcal{C} such that f is the image of $f' \in F(A', I', \gamma')$ and $|A'| \leq \kappa$, and*
- (2) *F commutes with limits.*

Then F is representable, i.e., there exists an object (B, J, δ) of \mathcal{C} such that

$$F(A, I, \gamma) = \text{Hom}_{\mathcal{C}}((B, J, \delta), (A, I, \gamma))$$

functorially in (A, I, γ) .

Proof. This is a special case of Categories, Lemma 4.40.1. □

Lemma 23.3.4. *The category of divided power rings has all colimits.*

Proof. The empty colimit is \mathbf{Z} with divided power ideal (0) . Let's discuss general colimits. Let \mathcal{C} be a category and let $c \mapsto (A_c, I_c, \gamma_c)$ be a diagram. Consider the functor

$$F(B, J, \delta) = \lim_{c \in \mathcal{C}} \text{Hom}((A_c, I_c, \gamma_c), (B, J, \delta))$$

Note that any $f = (f_c)_{c \in \mathcal{C}} \in F(B, J, \delta)$ has the property that all the images $f_c(A_c)$ generate a subring B' of B of bounded cardinality κ and that all the images $f_c(I_c)$ generate a divided power sub ideal J' of B' . And we get a factorization of f as a f' in $F(B')$ followed by the inclusion $B' \rightarrow B$. Also, F commutes with limits. Hence we may apply Lemma 23.3.3 to see that F is representable and we win. □

Remark 23.3.5. The forgetful functor $(A, I, \gamma) \mapsto A$ does not commute with colimits. For example, let

$$\begin{array}{ccc} (B, J, \delta) & \longrightarrow & (B'', J'', \delta'') \\ \uparrow & & \uparrow \\ (A, I, \gamma) & \longrightarrow & (B', J', \delta') \end{array}$$

be a pushout in the category of divided power rings. Then in general the map $B \otimes_A B' \rightarrow B''$ isn't an isomorphism. (It is always surjective.) An explicit example is given by $(A, I, \gamma) = (\mathbf{Z}, (0), \emptyset)$, $(B, J, \delta) = (\mathbf{Z}/4\mathbf{Z}, 2\mathbf{Z}/4\mathbf{Z}, \delta)$, and $(B', J', \delta') = (\mathbf{Z}/4\mathbf{Z}, 2\mathbf{Z}/4\mathbf{Z}, \delta')$ where $\delta_2(2) = 2$ and $\delta'_2(2) = 0$ and all higher divided powers equal to zero. Then $(B'', J'', \delta'') = (\mathbf{F}_2, (0), \emptyset)$ which doesn't agree with the tensor product. However, note that it is always true that

$$B''/J'' = B/J \otimes_{A/I} B'/J'$$

as can be seen from the universal property of the pushout by considering maps into divided power algebras of the form $(C, (0), \emptyset)$.

23.4. Extending divided powers

Here is the definition.

Definition 23.4.1. Given a divided power ring (A, I, γ) and a ring map $A \rightarrow B$ we say γ extends to B if there exists a divided power structure $\bar{\gamma}$ on IB such that $(A, I, \gamma) \rightarrow (B, IB, \bar{\gamma})$ is a homomorphism of divided power rings.

Lemma 23.4.2. *Let (A, I, γ) be a divided power ring. Let $A \rightarrow B$ be a ring map. If γ extends to B then it extends uniquely. Assume (at least) one of the following conditions holds*

- (1) $IB = 0$,
- (2) I is principal, or
- (3) $A \rightarrow B$ is flat.

Then γ extends to B .

Proof. Any element of IB can be written as a finite sum $\sum b_i x_i$ with $b_i \in B$ and $x_i \in I$. If γ extends to $\bar{\gamma}$ on IB then $\bar{\gamma}_n(x_i) = \gamma_n(x_i)$. Thus conditions (3) and (4) imply that

$$\bar{\gamma}_n(\sum b_i x_i) = \sum_{n_1+\dots+n_t=n} \prod_{i=1}^t b_i^{n_i} \gamma_{n_i}(x_i)$$

Thus we see that $\bar{\gamma}$ is unique if it exists.

If $IB = 0$ then setting $\bar{\gamma}_n(0) = 0$ works. If $I = (x)$ then we define $\bar{\gamma}_n(bx) = b^n \gamma_n(x)$. This is well defined: if $b'x = bx$, i.e., $(b - b')x = 0$ then

$$\begin{aligned} b^n \gamma_n(x) - (b')^n \gamma_n(x) &= (b^n - (b')^n) \gamma_n(x) \\ &= (b^{n-1} + \dots + (b')^{n-1})(b - b') \gamma_n(x) = 0 \end{aligned}$$

because $\gamma_n(x)$ is divisible by x and hence annihilated by $b - b'$. Next, we prove conditions (1) – (5) of Definition 23.2.1. Parts (1), (2), (3), (5) are obvious from the construction. For (4) suppose that $y, z \in IB$, say $y = bx$ and $z = cx$. Then $y + z = (b + c)x$ hence

$$\begin{aligned} \bar{\gamma}_n(y + z) &= (b + c)^n \gamma_n(x) \\ &= \sum \frac{n!}{i!(n-i)!} b^i c^{n-i} \gamma_n(x) \\ &= \sum b^i c^{n-i} \gamma_i(x) \gamma_{n-i}(x) \\ &= \sum \bar{\gamma}_i(y) \bar{\gamma}_{n-i}(z) \end{aligned}$$

as desired.

Assume $A \rightarrow B$ is flat. Suppose that $b_1, \dots, b_r \in B$ and $x_1, \dots, x_r \in I$. Then

$$\bar{\gamma}_n(\sum b_i x_i) = \sum b_1^{e_1} \dots b_r^{e_r} \gamma_{e_1}(x_1) \dots \gamma_{e_r}(x_r)$$

where the sum is over $e_1 + \dots + e_r = n$ if $\bar{\gamma}_n$ exists. Next suppose that we have $c_1, \dots, c_s \in B$ and $a_{ij} \in A$ such that $b_i = \sum a_{ij} c_j$. Setting $y_j = \sum a_{ij} x_i$ we claim that

$$\sum b_1^{e_1} \dots b_r^{e_r} \gamma_{e_1}(x_1) \dots \gamma_{e_r}(x_r) = \sum c_1^{d_1} \dots c_s^{d_s} \gamma_{d_1}(y_1) \dots \gamma_{d_s}(y_s)$$

in B where on the right hand side we are summing over $d_1 + \dots + d_s = n$. Namely, using the axioms of a divided power structure we can expand both sides into a sum with coefficients in $\mathbf{Z}[a_{ij}]$ of terms of the form $c_1^{d_1} \dots c_s^{d_s} \gamma_{e_1}(x_1) \dots \gamma_{e_r}(x_r)$. To see that the coefficients agree we note that the result is true in $\mathbf{Q}[x_1, \dots, x_r, c_1, \dots, c_s, a_{ij}]$ with γ the unique divided power structure on (x_1, \dots, x_r) . By Lazard’s theorem (Algebra, Theorem 10.78.4) we can write B as a directed colimit of finite free A -modules. In particular, if $z \in IB$ is written as $z = \sum x_i b_i$ and $z = \sum x'_i b'_i$, then we can find $c_1, \dots, c_s \in B$ and $a_{ij}, a'_{i'j} \in A$ such that $b_i = \sum a_{ij} c_j$ and $b'_{i'} = \sum a'_{i'j} c_j$ such that $y_j = \sum x_i a_{ij} = \sum x'_{i'} a'_{i'j}$. Hence the procedure above gives a well defined map $\bar{\gamma}_n$ on IB . By construction $\bar{\gamma}$ satisfies conditions (1), (3), and (4). Moreover, for $x \in I$ we have $\bar{\gamma}_n(x) = \gamma_n(x)$. Hence it follows from Lemma 23.2.4 that $\bar{\gamma}$ is a divided power structure on IB . \square

Lemma 23.4.3. *Let (A, I, γ) be a divided power ring.*

- (1) *If $\varphi : (A, I, \gamma) \rightarrow (B, J, \delta)$ is a homomorphism of divided power rings, then $\text{Ker}(\varphi) \cap I$ is preserved by γ_n for all $n \geq 1$.*
- (2) *Let $\mathfrak{a} \subset A$ be an ideal and set $I' = I \cap \mathfrak{a}$. The following are equivalent*

- (a) I' is preserved by γ_n for all $n > 0$,
- (b) γ extends to A/\mathfrak{a} , and
- (c) there exist a set of generators x_i of I' as an ideal such that $\gamma_n(x_i) \in I'$ for all $n > 0$.

Proof. Proof of (1). This is clear. Assume (2)(a). Define $\bar{\gamma}_n(x \bmod I') = \gamma_n(x) \bmod I'$ for $x \in I$. This is well defined since $\gamma_n(x + y) = \gamma_n(x) \bmod I'$ for $y \in I'$ by Definition 23.2.1 (4) and the fact that $\gamma_j(y) \in I'$ by assumption. It is clear that $\bar{\gamma}$ is a divided power structure as γ is one. Hence (2)(b) holds. Also, (2)(b) implies (2)(a) by part (1). It is clear that (2)(a) implies (2)(c). Assume (2)(c). Note that $\gamma_n(x) = a^n \gamma_n(x_i) \in I'$ for $x = ax_i$. Hence we see that $\gamma_n(x) \in I'$ for a set of generators of I' as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove $\forall n : \gamma_n(x + y) \in I'$ if $\forall n : \gamma_n(x), \gamma_n(y) \in I'$. This follows immediately from the fourth axiom of a divided power structure. \square

Lemma 23.4.4. *Let (A, I, γ) be a divided power ring. Let $E \subset I$ be a subset. Then the smallest ideal $J \subset I$ preserved by γ and containing all $f \in E$ is the ideal J generated by $\gamma_n(f)$, $n \geq 1$, $f \in E$.*

Proof. Follows immediately from Lemma 23.4.3. \square

Lemma 23.4.5. *Let (A, I, γ) be a divided power ring. Let p be a prime. If p is nilpotent in A/I , then*

- (1) the p -adic completion $A^\wedge = \lim_e A/p^e A$ surjects onto A/I ,
- (2) the kernel of this map is the p -adic completion I^\wedge of I , and
- (3) each γ_n is continuous for the p -adic topology and extends to $\gamma_n^\wedge : I^\wedge \rightarrow I^\wedge$ defining a divided power structure on I^\wedge .

If moreover A is a $\mathbf{Z}_{(p)}$ -algebra, then

- (4) for e large enough the ideal $p^e A \subset I$ is preserved by the divided power structure γ and

$$(A^\wedge, I^\wedge, \gamma^\wedge) = \lim_e (A/p^e A, I/p^e A, \bar{\gamma})$$

in the category of divided power rings.

Proof. Let $t \geq 1$ be an integer such that $p^t A/I = 0$, i.e., $p^t A \subset I$. The map $A^\wedge \rightarrow A/I$ is the composition $A^\wedge \rightarrow A/p^t A \rightarrow A/I$ which is surjective (for example by Algebra, Lemma 10.93.1). As $p^e I \subset p^e A \cap I \subset p^{e-t} I$ for $e \geq t$ we see that the kernel of the composition $A^\wedge \rightarrow A/I$ is the p -adic completion of I . The map γ_n is continuous because

$$\gamma_n(x + p^e y) = \sum_{i+j=n} p^{j e} \gamma_i(x) \gamma_j(y) = \gamma_n(x) \bmod p^e I$$

by the axioms of a divided power structure. It is clear that the axioms for divided power structures are inherited by the maps γ_n^\wedge from the maps γ_n . Finally, to see the last statement say $e > t$. Then $p^e A \subset I$ and $\gamma_1(p^e A) \subset p^e A$ and for $n > 1$ we have

$$\gamma_n(p^e a) = p^n \gamma_n(p^{e-1} a) = \frac{p^n}{n!} p^{n(e-1)} a^n \in p^e A$$

as $p^n/n! \in \mathbf{Z}_{(p)}$ and as $n \geq 2$ and $e \geq 2$ so $n(e-1) \geq e$. This proves that γ extends to $A/p^e A$, see Lemma 23.4.3. The statement on limits is clear from the construction of limits in the proof of Lemma 23.3.2. \square

23.5. Divided power polynomial algebras

A very useful example is the *divided power polynomial algebra*. Let A be a ring. Let $t \geq 1$. We will denote $A\langle x_1, \dots, x_t \rangle$ the following A -algebra: As an A -module we set

$$A\langle x_1, \dots, x_t \rangle = \bigoplus_{n_1, \dots, n_t \geq 0} Ax_1^{[n_1]} \dots x_t^{[n_t]}$$

with multiplication given by

$$x_i^{[n]} x_i^{[m]} = \frac{(n+m)!}{n!m!} x_i^{[n+m]}.$$

We also set $x_i = x_i^{[1]}$. Note that $1 = x_1^{[0]} \dots x_t^{[0]}$. There is a similar construction which gives the divided power polynomial algebra in infinitely many variables. There is an canonical A -algebra map $A\langle x_1, \dots, x_t \rangle \rightarrow A$ sending $x_i^{[n]}$ to zero for $n > 0$. The kernel of this map is denoted $A\langle x_1, \dots, x_t \rangle_+$.

Lemma 23.5.1. *Let (A, I, γ) be a divided power ring. There exists a unique divided power structure δ on*

$$J = IA\langle x_1, \dots, x_t \rangle + A\langle x_1, \dots, x_t \rangle_+$$

such that

- (1) $\delta_n(x_i) = x_i^{[n]}$, and
- (2) $(A, I, \gamma) \rightarrow (A\langle x_1, \dots, x_t \rangle, J, \delta)$ is a homomorphism of divided power rings.

Moreover, $(A\langle x_1, \dots, x_t \rangle, J, \delta)$ has the following universal property: A homomorphism of divided power rings $\varphi : (A\langle x \rangle, J, \delta) \rightarrow (C, K, \epsilon)$ is the same thing as a homomorphism of divided power rings $A \rightarrow C$ and elements $k_1, \dots, k_t \in K$.

Proof. We will prove the lemma in case of a divided power polynomial algebra in one variable. The result for the general case can be argued in exactly the same way, or by noting that $A\langle x_1, \dots, x_t \rangle$ is isomorphic to the ring obtained by adjoining the divided power variables x_1, \dots, x_t one by one.

Let $A\langle x \rangle_+$ be the ideal generated by $x, x^{[2]}, x^{[3]}, \dots$. Note that $J = IA\langle x \rangle + A\langle x \rangle_+$ and that

$$IA\langle x \rangle \cap A\langle x \rangle_+ = IA\langle x \rangle \cdot A\langle x \rangle_+$$

Hence by Lemma 23.2.5 it suffices to show that there exist divided power structures on the ideals $IA\langle x \rangle$ and $A\langle x \rangle_+$. The existence of the first follows from Lemma 23.4.2 as $A \rightarrow A\langle x \rangle$ is flat. For the second, note that if A is torsion free, then we can apply Lemma 23.2.2 (4) to see that δ exists. Namely, choosing as generators the elements $x^{[m]}$ we see that $(x^{[m]})^n = \frac{(nm)!}{(m!)^n} x^{[nm]}$ and $n!$ divides the integer $\frac{(nm)!}{(m!)^n}$. In general write $A = R/\mathfrak{a}$ for some torsion free ring R (e.g., a polynomial ring over \mathbf{Z}). The kernel of $R\langle x \rangle \rightarrow A\langle x \rangle$ is $\bigoplus \mathfrak{a}x^{[m]}$. Applying criterion (2)(c) of Lemma 23.4.3 we see that the divided power structure on $R\langle x \rangle_+$ extends to $A\langle x \rangle$ as desired.

Proof of the universal property. Given a homomorphism $\varphi : A \rightarrow C$ of divided power rings and $k_1, \dots, k_t \in K$ we consider

$$A\langle x_1, \dots, x_t \rangle \rightarrow C, \quad x_1^{[n_1]} \dots x_t^{[n_t]} \mapsto \epsilon_{n_1}(k_1) \dots \epsilon_{n_t}(k_t)$$

using φ on coefficients. The only thing to check is that this is an A -algebra homomorphism (details omitted). The inverse construction is clear. \square

Remark 23.5.2. Let (A, I, γ) be a divided power ring. There is a variant of Lemma 23.5.1 for infinitely many variables. First note that if $s < t$ then there is a canonical map

$$A\langle x_1, \dots, x_s \rangle \rightarrow A\langle x_1, \dots, x_t \rangle$$

Hence if W is any set, then we set

$$A\langle x_w, w \in W \rangle = \operatorname{colim}_{E \subset W} A\langle x_e, e \in E \rangle$$

(colimit over E finite subset of W) with transition maps as above. By the definition of a colimit we see that the universal mapping property of $A\langle x_w, w \in W \rangle$ is completely analogous to the mapping property stated in Lemma 23.5.1.

The following lemma can be found in [BO83].

Lemma 23.5.3. *Let p be a prime number. Let A be a ring such that every integer n not divisible by p is invertible, i.e., A is a $\mathbf{Z}_{(p)}$ -algebra. Let $I \subset A$ be an ideal. Two divided power structures γ, γ' on I are equal if and only if $\gamma_p = \gamma'_p$. Moreover, given a map $\delta : I \rightarrow I$ such that*

- (1) $p! \delta(x) = x^p$ for all $x \in I$,
- (2) $\delta(ax) = a^p \delta(x)$ for all $a \in A, x \in I$, and
- (3) $\delta(x + y) = \delta(x) + \sum_{i+j=p, i, j \geq 1} \frac{1}{i!j!} x^i y^j + \delta(y)$ for all $x, y \in I$,

then there exists a unique divided power structure γ on I such that $\gamma_p = \delta$.

Proof. If n is not divisible by p , then $\gamma_n(x) = cx\gamma_{n-1}(x)$ where c is a unit in $\mathbf{Z}_{(p)}$. Moreover,

$$\gamma_{pm}(x) = c\gamma_m(\gamma_p(x))$$

where c is a unit in $\mathbf{Z}_{(p)}$. Thus the first assertion is clear. For the second assertion, we can, working backwards, use these equalities to define all γ_n . More precisely, if $n = a_0 + a_1p + \dots + a_ep^e$ with $a_i \in \{0, \dots, p - 1\}$ then we set

$$\gamma_n(x) = c_n x^{a_0} \delta(x)^{a_1} \dots \delta^e(x)^{a_e}$$

for $c_n \in \mathbf{Z}_{(p)}$ defined by

$$c_n = (p!)^{a_1 + a_2(1+p) + \dots + a_e(1 + \dots + p^{e-1})} / n!.$$

Now we have to show the axioms (1) – (5) of a divided power structure, see Definition 23.2.1. We observe that (1) and (3) are immediate. Verification of (2) and (5) is by a direct calculation which we omit. Let $x, y \in I$. We claim there is a ring map

$$\varphi : \mathbf{Z}_{(p)}\langle u, v \rangle \longrightarrow A$$

which maps $u^{[n]}$ to $\gamma_n(x)$ and $v^{[n]}$ to $\gamma_n(y)$. By construction of $\mathbf{Z}_{(p)}\langle u, v \rangle$ this means we have to check that

$$\gamma_n(x)\gamma_m(x) = \frac{(n+m)!}{n!m!} \gamma_{n+m}(x)$$

in A and similarly for y . This is true because (2) holds for γ . Let ϵ denote the divided power structure on the ideal $\mathbf{Z}_{(p)}\langle u, v \rangle_+$ of $\mathbf{Z}_{(p)}\langle u, v \rangle$. Next, we claim that $\varphi(\epsilon_n(f)) = \gamma_n(\varphi(f))$ for $f \in \mathbf{Z}_{(p)}\langle u, v \rangle_+$ and all n . This is clear for $n = 0, 1, \dots, p - 1$. For $n = p$ it suffices to prove it for a set of generators of the ideal $\mathbf{Z}_{(p)}\langle u, v \rangle_+$ because both ϵ_p and $\gamma_p = \delta$ satisfy properties (1) and (3) of the lemma. Hence it suffices to prove that $\gamma_p(\gamma_n(x)) = \frac{(pn)!}{p!(n!)^p} \gamma_{pn}(x)$ and similarly for y , which

follows as (5) holds for γ . Now, if $n = a_0 + a_1p + \dots + a_ep^e$ is an arbitrary integer written in p -adic expansion as above, then

$$\epsilon_n(f) = c_n f^{a_0} \gamma_p(f)^{a_1} \dots \gamma_p^e(f)^{a_e}$$

because ϵ is a divided power structure. Hence we see that $\varphi(\epsilon_n(f)) = \gamma_n(\varphi(f))$ holds for all n . Applying this for $f = u + v$ we see that axiom (4) for γ follows from the fact that ϵ is a divided power structure. \square

23.6. Tate resolutions

In this section we briefly discuss the resolutions constructed in [Tat57] which combine divided power structures with differential graded algebras. In this section we will use *homological notation* for differential graded algebras. Our differential graded algebras will sit in nonnegative homological degrees. Thus our differential graded algebras (A, d) will be given as chain complexes

$$\dots \rightarrow A_2 \rightarrow A_1 \rightarrow A_0 \rightarrow 0 \rightarrow \dots$$

endowed with a multiplication.

Let R be a ring. In this section we will often consider graded R -algebras $A = \bigoplus_{d \geq 0} A_d$ whose components are zero in negative degrees. We will set $A_+ = \bigoplus_{d > 0} A_d$. We will write $A_{\text{even}} = \bigoplus_{d \geq 0} A_{2d}$ and $A_{\text{odd}} = \bigoplus_{d \geq 0} A_{2d+1}$. Recall that A is graded commutative if $xy = (-1)^{\deg(x)\deg(y)}yx$ for homogeneous elements x, y . Recall that A is strictly graded commutative if in addition $x^2 = 0$ for homogeneous elements x of odd degree. Finally, to understand the following definition, keep in mind that $\gamma_n(x) = x^n/n!$ if A is a \mathbf{Q} -algebra.

Definition 23.6.1. Let R be a ring. Let $A = \bigoplus_{d \geq 0} A_d$ be a graded R -algebra which is strictly graded commutative. A collection of maps $\gamma_n : A_{\text{even},+} \rightarrow A_{\text{even},+}$ defined for all $n > 0$ is called a *divided power structure* on A if we have

- (1) $\gamma_n(x) \in A_{2nd}$ if $x \in A_{2d}$,
- (2) $\gamma_1(x) = x$ for any x , we also set $\gamma_0(x) = 1$,
- (3) $\gamma_n(x)\gamma_m(x) = \frac{(n+m)!}{n!m!} \gamma_{n+m}(x)$,
- (4) $\gamma_n(xy) = x^n \gamma_n(y)$ for all $x \in A_{\text{even}}$ and $y \in A_{\text{even},+}$,
- (5) $\gamma_n(xy) = 0$ if $x, y \in A_{\text{odd}}$ homogeneous and $n > 1$
- (6) if $x, y \in A_{\text{even},+}$ then $\gamma_n(x+y) = \sum_{i=0, \dots, n} \gamma_i(x)\gamma_{n-i}(y)$,
- (7) $\gamma_n(\gamma_m(x)) = \frac{(nm)!}{n!(m!)^n} \gamma_{nm}(x)$ for $x \in A_{\text{even},+}$.

Observe that conditions (2), (3), (4), (6), and (7) imply that γ is a “usual” divided power structure on the ideal $A_{\text{even},+}$ of the (commutative) ring A_{even} , see Sections 23.2, 23.3, 23.4, and 23.5. In particular, we have $\gamma_n(x) = n!x^n$ for all $x \in A_{\text{even},+}$. Condition (1) states that γ is compatible with grading and condition (5) tells us γ_n for $n > 1$ vanishes on products of homogeneous elements of odd degree. But note that it may happen that

$$\gamma_2(z_1z_2 + z_3z_4) = z_1z_2z_3z_4$$

is nonzero if z_1, z_2, z_3, z_4 are homogeneous elements of odd degree.

Example 23.6.2 (Adjoining odd variable). Let R be a ring. Let (A, γ) be a strictly graded commutative graded R -algebra endowed with a divided power structure as

in the definition above. Let $d > 0$ be an odd integer. In this setting we can adjoin a variable T of degree d to A . Namely, set

$$A\langle T \rangle = A \oplus AT$$

with grading given by $A\langle T \rangle_m = A_m \oplus A_{m-d}T$. We claim there is a unique divided power structure on $A\langle T \rangle$ compatible with the given divided power structure on A . Namely, we set

$$\gamma_n(x + yT) = \gamma_n(x) + \gamma_{n-1}(x)yT$$

for $x \in A_{\text{even},+}$ and $y \in A_{\text{odd}}$.

Example 23.6.3 (Adjoining even variable). Let R be a ring. Let (A, γ) be a strictly graded commutative graded R -algebra endowed with a divided power structure as in the definition above. Let $d > 0$ be an even integer. In this setting we can adjoin a variable T of degree d to A . Namely, set

$$A\langle T \rangle = A \oplus AT \oplus AT^{(2)} \oplus AT^{(3)} \oplus \dots$$

with multiplication given by

$$T^{(n)}T^{(m)} = \frac{(n+m)!}{n!m!}T^{(n+m)}$$

and with grading given by

$$A\langle T \rangle_m = A_m \oplus A_{m-d}T \oplus A_{m-2d}T^{(2)} \oplus \dots$$

We claim there is a unique divided power structure on $A\langle T \rangle$ compatible with the given divided power structure on A such that $\gamma_n(T^{(i)}) = T^{(ni)}$. To define the divided power structure we first set

$$\gamma_n \left(\sum_{i>0} x_i T^{(i)} \right) = \sum \prod_{n=\sum e_i} x_i^{e_i} T^{(ie_i)}$$

if x_i is in A_{even} . If $x_0 \in A_{\text{even},+}$ then we take

$$\gamma_n \left(\sum_{i \geq 0} x_i T^{(i)} \right) = \sum_{a+b=n} \gamma_a(x_0) \gamma_b \left(\sum_{i>0} x_i T^{(i)} \right)$$

where γ_b is as defined above.

At this point we tie in the definition of divided power structures with differentials. To understand the definition note that $d(x^n/n!) = d(x)x^{n-1}/(n-1)!$ if A is a \mathbf{Q} -algebra and $x \in A_{\text{even},+}$.

Definition 23.6.4. Let R be a ring. Let $A = \bigoplus_{d \geq 0} A_d$ be a differential graded R -algebra which is strictly graded commutative. A divided power structure γ on A is compatible with the differential graded structure if $d(\gamma_n(x)) = d(x)\gamma_{n-1}(x)$ for all $x \in A_{\text{even},+}$.

Warning: Let (A, d, γ) be as in Definition 23.6.4. It may not be true that $\gamma_n(x)$ is a boundary, if x is a boundary. Thus γ in general does not induce a divided power structure on the homology algebra $H(A)$. In some papers the authors put an additional compatibility condition in order to insure this is the case, but we elect not to do so.

Lemma 23.6.5. Let (A, d, γ) and (B, d, γ) be as in Definition 23.6.4. Let $f : A \rightarrow B$ be a map of differential graded algebras compatible with divided power structures. Assume

- (1) $H_k(A) = 0$ for $k > 0$, and

(2) f is surjective.

Then γ induces a divided power structure on the graded R -algebra $H(B)$.

Proof. Suppose that x and x' are homogeneous of the same degree $2d$ and define the same cohomology class in $H(B)$. Say $x' - x = d(w)$. Choose a lift $y \in A_{2d}$ of x and a lift $z \in A_{2d+1}$ of w . Then $y' = y + d(z)$ is a lift of x' . Hence

$$\gamma_n(y') = \sum \gamma_i(y)\gamma_{n-i}(d(z)) = \gamma_n(y) + \sum_{i < n} \gamma_i(y)\gamma_{n-i}(d(z))$$

Since A is acyclic in positive degrees and since $d(\gamma_j(d(z))) = 0$ for all j we can write this as

$$\gamma_n(y') = \gamma_n(y) + \sum_{i < n} \gamma_i(y)d(z_i)$$

for some z_i in A . Moreover, for $0 < i < n$ we have

$$d(\gamma_i(y)z_i) = d(\gamma_i(y))z_i + \gamma_i(y)d(z_i) = d(y)\gamma_{i-1}(y)z_i + \gamma_i(y)d(z_i)$$

and the first term maps to zero in B as $d(y)$ maps to zero in B . Hence $\gamma_n(x')$ and $\gamma_n(x)$ map to the same element of $H(B)$. Thus we obtain a well defined map $\gamma_n : H_{2d}(B) \rightarrow H_{2nd}(B)$ for all $d > 0$ and $n > 0$. We omit the verification that this defines a divided power structure on $H(B)$. \square

Lemma 23.6.6. *Let (A, d, γ) is as in Definition 23.6.4. Let $R \rightarrow R'$ be a ring map. Then d and γ induce similar structures on $A' = A \otimes_R R'$ such that (A, d, γ) is as in Definition 23.6.4.*

Proof. Observe that $A'_{even} = A_{even} \otimes_R R'$ and $A'_{even,+} = A_{even,+} \otimes_R R'$. Hence we are trying to show that the divided powers γ extend to A'_{even} (terminology as in Definition 23.4.1). Once we have shown γ extends it follows easily that this extension has all the desired properties.

Choose a polynomial R -algebra P and a surjection of R -algebras $P \rightarrow R'$. The ring map $A_{even} \rightarrow A_{even} \otimes_R P$ is flat, hence the divided powers γ extend to $A_{even} \otimes_R P$ uniquely by Lemma 23.4.2. Let $J = \text{Ker}(P \rightarrow R')$. To show that γ extends to $A \otimes_R R'$ it suffices to show that $I' = \text{Ker}(A_{even,+} \otimes_R P \rightarrow A_{even,+} \otimes_R R')$ is generated by elements z such that $\gamma_n(z) \in I'$ for all $n > 0$. This is clear as I' is generated by elements of the form $x \otimes f$ with $x \in A_{even,+}$ and $f \in \text{Ker}(P \rightarrow R')$. \square

Lemma 23.6.7. *Let (A, d, γ) be as in Definition 23.6.4. Let $d \geq 1$ be an integer. Let $A\langle T \rangle$ be the graded divided power polynomial algebra on T with $\text{deg}(T) = d$ constructed in Example 23.6.2 or 23.6.3. Let $f \in A_{d-1}$ be an element with $d(f) = 0$. There exists a unique differential d on $A\langle T \rangle$ such that $d(T) = f$ and such that d is compatible with the divided power structure on $A\langle T \rangle$.*

Proof. This is proved by a direct computation which is omitted. \square

Here is the construction of Tate.

Lemma 23.6.8. *Assume that R is a Noetherian ring and $R \rightarrow S$ a ring map of finite type. There exists a factorization*

$$R \rightarrow A \rightarrow S$$

with the following properties

- (1) (A, d, γ) is as in Definition 23.6.4,
- (2) $A \rightarrow S$ is a quasi-isomorphism (if we endow S with the zero differential),

- (3) A is a graded divided power polynomial algebra over R with finitely many variables in each degree.

The last condition means that A is constructed out of R by successively adjoining variables T as in Examples 23.6.2 and 23.6.3.

Proof. Start of the construction. Let $A(0) = R[x_1, \dots, x_n]$ be a (usual) polynomial ring and let $A(0) \rightarrow S$ be a surjection. As grading we take $A(0)_0 = A(0)$ and $A(0)_d = 0$ for $d \neq 0$. Thus $d = 0$ and $\gamma_n, n > 0$ is zero as well.

Choose generators $f_1, \dots, f_m \in R[x_1, \dots, x_m]$ for the kernel of the given map $A(0) = R[x_1, \dots, x_m] \rightarrow S$. We apply Examples 23.6.2 m times to get

$$A(1) = A(0)\langle T_1, \dots, T_m \rangle$$

with $\deg(T_i) = 1$ as a graded divided power polynomial algebra. We set $d(T_i) = f_i$. Since $A(1)$ is a divided power polynomial algebra over $A(0)$ and since $d(f_i) = 0$ this extends uniquely to a differential on $A(1)$ by Lemma 23.6.7.

Induction hypothesis: Assume we are given factorizations

$$R \rightarrow A(0) \rightarrow A(1) \rightarrow \dots \rightarrow A(m) \rightarrow S$$

where $A(0)$ and $A(1)$ are as above and each $R \rightarrow A(m') \rightarrow S$ for $2 \leq m' \leq m$ satisfies properties (1) and (3) of the statement of the lemma and (2) replaced by the condition that $H_i(A(m')) \rightarrow H_i(S)$ is an isomorphism for $m' > i \geq 0$. The base case is $m = 1$.

Induction step. Assume we have $R \rightarrow A(m) \rightarrow S$ as in the induction hypothesis. Consider the group $H_m(A(m))$. This is a module over $H_0(A(m)) = S$. In fact, it is a subquotient of $A(m)_m$ which is a finite type module over $A(m)_0 = R[x_1, \dots, x_n]$. Thus we can pick finitely many elements

$$e_1, \dots, e_t \in \text{Ker}(d : A(m)_m \rightarrow A(m)_{m-1})$$

which map to generators of this module. Applying Example 23.6.3 or 23.6.2 t times we get

$$A(m+1) = A(m)\langle T_1, \dots, T_t \rangle$$

with $\deg(T_i) = m + 1$ as a graded divided power algebra. We set $d(T_i) = e_i$. Since $A(1)$ is a divided power polynomial algebra over $A(0)$ and since $d(e_i) = 0$ this extends uniquely to a differential on $A(m+1)$ compatible with the divided power structure. Since we've added only material in degree $m + 1$ and higher we see that $H_i(A(m+1)) = H_i(A(m))$ for $i < m$. Moreover, it is clear that $H_m(A(m+1)) = 0$ by construction.

To finish the proof we observe that we have shown there exists a sequence of maps

$$R \rightarrow A(0) \rightarrow A(1) \rightarrow \dots \rightarrow A(m) \rightarrow A(m+1) \rightarrow \dots \rightarrow S$$

and to finish the proof we set $A = \text{colim } A(m)$. □

Lemma 23.6.9. Let R be a ring. Suppose that (A, d, γ) and (B, d, γ) are as in Definition 23.6.4. Let $\bar{\varphi} : H_0(A) \rightarrow H_0(B)$ be an R -algebra map. Assume

- (1) A is a graded divided power polynomial algebra over R with finitely many variables in each degree,
- (2) $H_k(B) = 0$ for $k > 0$.

Then there exists a map $\varphi : A \rightarrow B$ of differential graded R -algebras compatible with divided powers lifting $\bar{\varphi}$.

Proof. Since A is obtained from R by adjoining divided power variables, we obtain filtrations $R \subset A(0) \subset A(1) \subset \dots$ such that $A(m+1)$ is obtained from $A(m)$ by adjoining finitely many divided power variables of degree $m+1$. Then $A(0) \rightarrow S$ is a surjection from a (usual) polynomial algebra over R onto S . Thus we can lift $\bar{\varphi}$ to an R -algebra map $\varphi(0) : A(0) \rightarrow B(0)$.

Write $A(1) = A(0)\langle T_1, \dots, T_m \rangle$ for some divided power variables T_j of degree 1. Let $f_j \in B_0$ be $f_j = \varphi(0)(d(T_j))$. Observe that f_j maps to zero in $H_0(B)$ as dT_j maps to zero in $H_0(A)$. Thus we can find $b_j \in B_1$ with $d(b_j) = f_j$. By the universal property of divided power polynomial algebras we find a lift $\varphi(1) : A(1) \rightarrow B$ of $\varphi(0)$ mapping T_j to f_j .

Having constructed $\varphi(m)$ for some $m \geq 1$ we can construct $\varphi(m+1) : A(m+1) \rightarrow B$ in exactly the same manner. We omit the details. \square

Lemma 23.6.10. *Let R be a Noetherian ring. Let $R \rightarrow S$ and $R \rightarrow T$ be finite type ring maps. There exists a canonical structure of a divided power graded R -algebra on*

$$\mathrm{Tor}_*^R(S, T)$$

Proof. Choose a factorization $R \rightarrow A \rightarrow S$ as above. Since $A \rightarrow S$ is a quasi-isomorphism and since A_d is a free R -module, we see that the differential graded algebra $B = A \otimes_R T$ computes the tor groups displayed in the lemma. Choose a surjection $R[y_1, \dots, y_k] \rightarrow T$. Then we see that B is a quotient of the differential graded algebra $A[y_1, \dots, y_k]$ whose homology sits in degree 0 (it is equal to $S[y_1, \dots, y_k]$). By Lemma 23.6.6 the differential graded algebras B and $A[y_1, \dots, y_k]$ have divided power structures compatible with the differentials. Hence we obtain our divided power structure on $H(B)$ by Lemma 23.6.5.

The divided power algebra structure constructed in this way is independent of the choice of A . Namely, if A' is a second choice, then Lemma 23.6.9 implies there is a map $A \rightarrow A'$ preserving all structure and the augmentations towards S . Then the induced map $B = A \otimes_R T \rightarrow A' \otimes_R T' = B'$ is likewise and is a quasi-isomorphism. The induced isomorphism of Tor algebras is therefore compatible with all multiplication and divided powers. \square

23.7. Application to complete intersections

Let R be a ring. Let (A, d, γ) be as in Definition 23.6.4. A *derivation* of degree 2 is an R -linear map $\theta : A \rightarrow A$ with the following properties

- (1) $\theta(A_d) \subset A_{d-2}$,
- (2) $\theta(xy) = \theta(x)y + x\theta(y)$,
- (3) θ commutes with d ,
- (4) $\theta(\gamma_n(x)) = \theta(x)\gamma_{n-1}(x)$ for all $x \in A_{2d}$ all d .

In the following lemma we construct a derivation.

Lemma 23.7.1. *Let R be a ring. Let (A, d, γ) be as in Definition 23.6.4. Let $R' \rightarrow R$ be a surjection of rings whose kernel has square zero and is generated by one element f . If A is a graded divided power polynomial algebra over R with finitely many variables in each degree, then we obtain a derivation $\theta : A/IA \rightarrow A/IA$ where I is the annihilator of f in R .*

Proof. Since A is a divided power polynomial algebra, we can find a divided power polynomial algebra A' over R' such that $A = A' \otimes_R R'$. Moreover, we can lift d to an R -linear operator d on A' such that

- (1) $d(xy) = d(x)y + (-1)^{\deg(x)}xd(y)$ for $x, y \in A'$ homogeneous, and
- (2) $d(\gamma_n(x)) = d(x)\gamma_{n-1}(x)$ for $x \in A'_{\text{even},+}$.

We omit the details (hint: proceed one variable at the time). However, it may not be the case that d^2 is zero on A' . It is clear that d^2 maps A' into $fA' \cong A/IA$. Hence d^2 annihilates fA' and factors as a map $A \rightarrow A/IA$. Since d^2 is R -linear we obtain our map $\theta : A/IA \rightarrow A/IA$. The verification of the properties of a derivation is immediate. \square

Lemma 23.7.2. *Assumption and notation as in Lemma 23.7.1. Suppose $S = H_0(A)$ is isomorphic to $R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ for some n, m , and $f_j \in R[x_1, \dots, x_n]$. Moreover, suppose given a relation*

$$\sum r_j f_j = 0$$

with $r_j \in R[x_1, \dots, x_n]$. Choose $r'_j, f'_j \in R'[x_1, \dots, x_n]$ lifting r_j, f_j . Write $\sum r'_j f'_j = gf$ for some $g \in R/I[x_1, \dots, x_n]$. If $H_1(A) = 0$ and all the coefficients of each r_j are in I , then there exists an element $\xi \in H_2(A/IA)$ such that $\theta(\xi) = g$ in S/IS .

Proof. Let $A(0) \subset A(1) \subset A(2) \subset \dots$ be the filtration of A such that $A(m)$ is gotten from $A(m-1)$ by adjoining divided power variables of degree m . Then $A(0)$ is a polynomial algebra over R equipped with an R -algebra surjection $A(0) \rightarrow S$. Thus we can choose a map

$$\varphi : R[x_1, \dots, x_n] \rightarrow A(0)$$

lifting the augmentations to S . Next, $A(1) = A(0)\langle T_1, \dots, T_t \rangle$ for some divided power variables T_i of degree 1. Since $H_0(A) = S$ we can pick $\xi_j \in \sum A(0)T_i$ with $d(\xi_j) = \varphi(f_j)$. Then

$$d\left(\sum \varphi(r_j)\xi_j\right) = \sum \varphi(r_j)\varphi(f_j) = \sum \varphi(r_j f_j) = 0$$

Since $H_1(A) = 0$ we can pick $\xi \in A_2$ with $d(\xi) = \sum \varphi(r_j)\xi_j$. If the coefficients of r_j are in I , then the same is true for $\varphi(r_j)$. In this case $d(\xi)$ dies in A_1/IA_1 and hence ξ defines a class in $H_2(A/IA)$.

The construction of θ in the proof of Lemma 23.7.1 proceeds by successively lifting $A(i)$ to $A'(i)$ and lifting the differential d . We lift φ to $\varphi' : R'[x_1, \dots, x_n] \rightarrow A'(0)$. Next, we have $A'(1) = A'(0)\langle T_1, \dots, T_t \rangle$. Moreover, we can lift ξ_j to $\xi'_j \in \sum A'(0)T_i$. Then $d(\xi'_j) = \varphi'(f'_j) + fa_j$ for some $a_j \in A'(0)$. Consider a lift $\xi' \in A'_2$ of ξ . Then we know that

$$d(\xi') = \sum \varphi'(r'_j)\xi'_j + \sum fb_i T_i$$

for some $b_i \in A(0)$. Applying d again we find

$$\theta(\xi) = \sum \varphi'(r'_j)\varphi'(f'_j) + \sum f\varphi'(r'_j)a_j + \sum fb_i d(T_i)$$

The first term gives us what we want. The second term is zero because the coefficients of r_j are in I and hence are annihilated by f . The third term maps to zero in H_0 because $d(T_i)$ maps to zero. \square

The method of proof of the following lemma is apparently due to Gulliksen.

Lemma 23.7.3. *Let $R' \rightarrow R$ be a surjection of Noetherian rings whose kernel has square zero and is generated by one element f . Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Let $\sum r_j f_j = 0$ be a relation in $R[x_1, \dots, x_m]$. Assume that*

- (1) *each r_j has coefficients in the annihilator I of f in R ,*
- (2) *for some lifts $r'_j, f'_j \in R'[x_1, \dots, x_n]$ we have $\sum r'_j f'_j = gf$ where g is not nilpotent in S .*

Then S does not have finite tor dimension over R (i.e., S is not a perfect R -algebra).

Proof. Choose a Tate resolution $R \rightarrow A \rightarrow S$ as in Lemma 23.6.8. Let $\xi \in H_2(A/IA)$ and $\theta : A/IA \rightarrow A/IA$ be the element and derivation found in Lemmas 23.7.1 and 23.7.2. Observe that

$$\theta^n(\gamma_n(\xi)) = g^n$$

Hence if g is not nilpotent, then ξ^n is nonzero in $H_{2n}(A/IA)$ for all $n > 0$. Since $H_{2n}(A/IA) = \text{Tor}_{2n}^R(S, R/I)$ we conclude. \square

The following result can be found in [Rod88].

Lemma 23.7.4. *Let (A, \mathfrak{m}) be a Noetherian local ring. Let $I \subset J \subset A$ be proper ideals. If A/J has finite tor dimension over A/I , then $I/\mathfrak{m}I \rightarrow J/\mathfrak{m}J$ is injective.*

Proof. Let $f \in I$ be an element mapping to a nonzero element of $I/\mathfrak{m}I$ which is mapped to zero in $J/\mathfrak{m}J$. We can choose an ideal I' with $\mathfrak{m}I \subset I' \subset I$ such that I/I' is generated by the image of f . Set $R = A/I$ and $R' = A/I'$. Let $J = (a_1, \dots, a_m)$ for some $a_j \in A$. Then $f = \sum b_j a_j$ for some $b_j \in \mathfrak{m}$. Let $r_j, f_j \in R$ resp. $r'_j, f'_j \in R'$ be the image of b_j, a_j . Then we see we are in the situation of Lemma 23.7.3 (with the ideal I of that lemma equal to \mathfrak{m}_R) and the lemma is proved. \square

Lemma 23.7.5. *Let (A, \mathfrak{m}) be a Noetherian local ring. Let $I \subset J \subset A$ be proper ideals. Assume*

- (1) *A/J has finite tor dimension over A/I , and*
- (2) *J is generated by a regular sequence.*

Then I is generated by a regular sequence and J/I is generated by a regular sequence.

Proof. By Lemma 23.7.4 we see that $I/\mathfrak{m}I \rightarrow J/\mathfrak{m}J$ is injective. Thus we can find $s \leq r$ and a minimal system of generators f_1, \dots, f_r of J such that f_1, \dots, f_s are in I and form a minimal system of generators of I . The lemma follows as any minimal system of generators of J is a regular sequence by More on Algebra, Lemmas 15.21.14 and 15.21.6. \square

Lemma 23.7.6. *Let $R \rightarrow S$ be a local ring map of Noetherian local rings. Let $I \subset R$ and $J \subset S$ be ideals with $IS \subset J$. If $R \rightarrow S$ is flat and $S/\mathfrak{m}_R S$ is regular, then the following are equivalent*

- (1) *J is generated by a regular sequence and S/J has finite tor dimension as a module over R/I ,*
- (2) *J is generated by a regular sequence and $\text{Tor}_p^{R/I}(S/J, R/\mathfrak{m}_R)$ is nonzero for only finitely many p ,*
- (3) *I is generated by a regular sequence and J/IS is generated by a regular sequence in S/IS .*

Proof. If (3) holds, then J is generated by a regular sequence, see for example More on Algebra, Lemmas 15.21.12 and 15.21.6. Moreover, if (3) holds, then $S/J = (S/I)/(J/I)$ has finite projective dimension over S/IS because the Koszul complex will be a finite free resolution of S/J over S/IS . Since $R/I \rightarrow S/IS$ is flat, it then follows that S/J has finite tor dimension over R/I by More on Algebra, Lemma 15.51.9. Thus (3) implies (1).

The implication (1) \Rightarrow (2) is trivial. Assume (2). By More on Algebra, Lemma 15.56.20 we find that S/J has finite tor dimension over S/IS . Thus we can apply Lemma 23.7.5 to conclude that IS and J/IS are generated by regular sequences. Let $f_1, \dots, f_r \in I$ be a minimal system of generators of I . Since $R \rightarrow S$ is flat, we see that f_1, \dots, f_r form a minimal system of generators for IS in S . Thus $f_1, \dots, f_r \in R$ is a sequence of elements whose images in S form a regular sequence by More on Algebra, Lemmas 15.21.14 and 15.21.6. Thus f_1, \dots, f_r is a regular sequence in R by Algebra, Lemma 10.67.7. \square

23.8. Local complete intersection rings

Let (A, \mathfrak{m}) be a Noetherian complete local ring. By the Cohen structure theorem (see Algebra, Theorem 10.149.8) we can write A as the quotient of a regular Noetherian complete local ring R . Let us say that A is a *complete intersection* if there exists some surjection $R \rightarrow A$ with R a regular local ring such that the kernel is generated by a regular sequence. The following lemma shows this notion is independent of the choice of the surjection.

Lemma 23.8.1. *Let (A, \mathfrak{m}) be a Noetherian complete local ring. The following are equivalent*

- (1) *for every surjection of local rings $R \rightarrow A$ with R a regular local ring, the kernel of $R \rightarrow A$ is generated by a regular sequence, and*
- (2) *for some surjection of local rings $R \rightarrow A$ with R a regular local ring, the kernel of $R \rightarrow A$ is generated by a regular sequence.*

Proof. Let k be the residue field of A . If the characteristic of k is $p > 0$, then we denote Λ a Cohen ring (Algebra, Definition 10.149.5) with residue field k (Algebra, Lemma 10.149.6). If the characteristic of k is 0 we set $\Lambda = k$. Recall that $\Lambda[[x_1, \dots, x_n]]$ for any n is formally smooth over \mathbf{Z} , resp. \mathbf{Q} in the \mathfrak{m} -adic topology, see More on Algebra, Lemma 15.28.1. Fix a surjection $\Lambda[[x_1, \dots, x_n]] \rightarrow A$ as in the Cohen structure theorem (Algebra, Theorem 10.149.8).

Let $R \rightarrow A$ be a surjection from a regular local ring R . Let f_1, \dots, f_r be a minimal sequence of generators of $\text{Ker}(R \rightarrow A)$. We will use without further mention that an ideal in a Noetherian local ring is generated by a regular sequence if and only if any minimal set of generators is a regular sequence. Observe that f_1, \dots, f_r is a regular sequence in R if and only if f_1, \dots, f_r is a regular sequence in the completion R^\wedge by Algebra, Lemmas 10.67.7 and 10.93.3. Moreover, we have

$$R^\wedge / (f_1, \dots, f_r)R^\wedge = (R / (f_1, \dots, f_r))^\wedge = A^\wedge = A$$

because A is \mathfrak{m}_A -adically complete (first equality by Algebra, Lemma 10.93.2). Finally, the ring R^\wedge is regular since R is regular (More on Algebra, Lemma 15.32.4). Hence we may assume R is complete.

If R is complete we can choose a map $\Lambda[[x_1, \dots, x_n]] \rightarrow R$ lifting the given map $\Lambda[[x_1, \dots, x_n]] \rightarrow A$, see More on Algebra, Lemma 15.27.5. By adding some more variables y_1, \dots, y_m mapping to generators of the kernel of $R \rightarrow A$ we may assume that $\Lambda[[x_1, \dots, x_n, y_1, \dots, y_m]] \rightarrow R$ is surjective (some details omitted). Then we can consider the commutative diagram

$$\begin{array}{ccc} \Lambda[[x_1, \dots, x_n, y_1, \dots, y_m]] & \longrightarrow & R \\ \downarrow & & \downarrow \\ \Lambda[[x_1, \dots, x_n]] & \longrightarrow & A \end{array}$$

By Algebra, Lemma 10.130.6 we see that the condition for $R \rightarrow A$ is equivalent to the condition for the fixed chosen map $\Lambda[[x_1, \dots, x_n]] \rightarrow A$. This finishes the proof of the lemma. \square

The following two lemmas are sanity checks on the definition given above.

Lemma 23.8.2. *Let R be a regular ring. Let $\mathfrak{p} \subset R$ be a prime. Let $f_1, \dots, f_r \in \mathfrak{p}$ be a regular sequence. Then the completion of*

$$A = (R/(f_1, \dots, f_r))_{\mathfrak{p}} = R_{\mathfrak{p}}/(f_1, \dots, f_r)R_{\mathfrak{p}}$$

is a complete intersection in the sense defined above.

Proof. The completion of A is equal to $A^{\wedge} = R_{\mathfrak{p}}^{\wedge}/(f_1, \dots, f_r)R_{\mathfrak{p}}^{\wedge}$ because completion for finite modules over the Noetherian ring $R_{\mathfrak{p}}$ is exact (Algebra, Lemma 10.93.2). The image of the sequence f_1, \dots, f_r in $R_{\mathfrak{p}}$ is a regular sequence by Algebra, Lemmas 10.93.3 and 10.67.7. Moreover, $R_{\mathfrak{p}}^{\wedge}$ is a regular local ring by More on Algebra, Lemma 15.32.4. Hence the result holds by our definition of complete intersection for complete local rings. \square

The following lemma is the analogue of Algebra, Lemma 10.130.4.

Lemma 23.8.3. *Let R be a regular ring. Let $\mathfrak{p} \subset R$ be a prime. Let $I \subset \mathfrak{p}$ be an ideal. Set $A = (R/I)_{\mathfrak{p}} = R_{\mathfrak{p}}/I_{\mathfrak{p}}$. The following are equivalent*

- (1) *the completion of A is a complete intersection in the sense above,*
- (2) *$I_{\mathfrak{p}} \subset R_{\mathfrak{p}}$ is generated by a regular sequence,*
- (3) *the module $(I/I^2)_{\mathfrak{p}}$ can be generated by $\dim(R_{\mathfrak{p}}) - \dim(A)$ elements,*
- (4) *add more here.*

Proof. We may and do replace R by its localization at \mathfrak{p} . Then $\mathfrak{p} = \mathfrak{m}$ is the maximal ideal of R and $A = R/I$. Let $f_1, \dots, f_r \in I$ be a minimal sequence of generators. The completion of A is equal to $A^{\wedge} = R^{\wedge}/(f_1, \dots, f_r)R^{\wedge}$ because completion for finite modules over the Noetherian ring $R_{\mathfrak{p}}$ is exact (Algebra, Lemma 10.93.2).

If (1) holds, then the image of the sequence f_1, \dots, f_r in R^{\wedge} is a regular sequence by assumption. Hence it is a regular sequence in R by Algebra, Lemmas 10.93.3 and 10.67.7. Thus (1) implies (2).

Assume (3) holds. Set $c = \dim(R) - \dim(A)$ and let $f_1, \dots, f_c \in I$ map to generators of $(I/I^2)_{\mathfrak{p}}$. by Nakayama's lemma (Algebra, Lemma 10.19.1) we see that $I = (f_1, \dots, f_c)$. Since R is regular and hence Cohen-Macaulay (Algebra, Proposition 10.99.5) we see that f_1, \dots, f_c is a regular sequence by Algebra, Proposition 10.99.5. Thus (3) implies (2). Finally, (2) implies (1) by Lemma 23.8.2. \square

The following result is due to Avramov, see [Avr75].

Proposition 23.8.4. *Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. Then the following are equivalent*

- (1) B^\wedge is a complete intersection,
- (2) A^\wedge and $(B/\mathfrak{m}_A B)^\wedge$ are complete intersections.

Proof. Consider the diagram

$$\begin{array}{ccc} B & \longrightarrow & B^\wedge \\ \uparrow & & \uparrow \\ A & \longrightarrow & A^\wedge \end{array}$$

Since the horizontal maps are faithfully flat (Algebra, Lemma 10.93.4) we conclude that the right vertical arrow is flat (for example by Algebra, Lemma 10.95.15). Moreover, we have $(B/\mathfrak{m}_A B)^\wedge = B^\wedge/\mathfrak{m}_{A^\wedge} B^\wedge$ by Algebra, Lemma 10.93.2. Thus we may assume A and B are complete local Noetherian rings.

Assume A and B are complete local Noetherian rings. Choose a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in More on Algebra, Lemma 15.28.3. Let $I = \text{Ker}(R \rightarrow A)$ and $J = \text{Ker}(S \rightarrow B)$. Note that since $R/I = A \rightarrow B = S/J$ is flat the map $J/I \otimes_R R/\mathfrak{m}_R \rightarrow J/J \cap \mathfrak{m}_R S$ is an isomorphism. Hence a minimal system of generators of J/I maps to a minimal system of generators of $\text{Ker}(S/\mathfrak{m}_R S \rightarrow B/\mathfrak{m}_A B)$. Finally, $S/\mathfrak{m}_R S$ is a regular local ring.

Assume (1) holds, i.e., J is generated by a regular sequence. Since $A = R/I \rightarrow B = S/J$ is flat we see Lemma 23.7.6 applies and we deduce that I and J/I are generated by regular sequences. We have $\dim(B) = \dim(A) + \dim(B/\mathfrak{m}_A B)$ and $\dim(S/IS) = \dim(A) + \dim(S/\mathfrak{m}_R S)$ (Algebra, Lemma 10.108.7). Thus J/I is generated by

$$\dim(S/J) - \dim(S/IS) = \dim(S/\mathfrak{m}_R S) - \dim(B/\mathfrak{m}_A B)$$

elements (Algebra, Lemma 10.59.11). It follows that $\text{Ker}(S/\mathfrak{m}_R S \rightarrow B/\mathfrak{m}_A B)$ is generated by the same number of elements (see above). Hence $\text{Ker}(S/\mathfrak{m}_R S \rightarrow B/\mathfrak{m}_A B)$ is generated by a regular sequence, see for example Lemma 23.8.3. In this way we see that (2) holds.

If (2) holds, then I and $J/J \cap \mathfrak{m}_R S$ are generated by regular sequences. Lifting these generators (see above), using flatness of $R/I \rightarrow S/IS$, and using Grothendieck's lemma (Algebra, Lemma 10.95.3) we find that J/I is generated by a regular sequence in S/IS . Thus Lemma 23.7.6 tells us that J is generated by a regular sequence, whence (1) holds. \square

Definition 23.8.5. Let A be a Noetherian ring.

- (1) If A is local, then we say A is a *complete intersection* if its completion is a complete intersection in the sense above.
- (2) In general we say A is a *local complete intersection* if all of its local rings are complete intersections.

We will check below that this does not conflict with the terminology introduced in Algebra, Definitions 10.130.1 and 10.130.5. But first, we show this “makes sense” by showing that if A is a Noetherian local complete intersection, then A is a local complete intersection, i.e., all of its local rings are complete intersections.

Lemma 23.8.6. *Let (A, \mathfrak{m}) be a Noetherian local ring. Let $\mathfrak{p} \subset A$ be a prime ideal. If A is a complete intersection, then $A_{\mathfrak{p}}$ is a complete intersection too.*

Proof. Choose a prime \mathfrak{q} of A^\wedge lying over \mathfrak{p} (this is possible as $A \rightarrow A^\wedge$ is faithfully flat by Algebra, Lemma 10.93.4). Then $A_{\mathfrak{p}} \rightarrow (A^\wedge)_{\mathfrak{q}}$ is a flat local ring homomorphism. Thus by Proposition 23.8.4 we see that $A_{\mathfrak{p}}$ is a complete intersection if and only if $(A^\wedge)_{\mathfrak{q}}$ is a complete intersection. Thus it suffices to prove the lemma in case A is complete (this is the key step of the proof).

Assume A is complete. By definition we may write $A = R/(f_1, \dots, f_r)$ for some regular sequence f_1, \dots, f_r in a regular local ring R . Let $\mathfrak{q} \subset R$ be the prime corresponding to \mathfrak{p} . Observe that $f_1, \dots, f_r \in \mathfrak{q}$ and that $A_{\mathfrak{p}} = R_{\mathfrak{q}}/(f_1, \dots, f_r)R_{\mathfrak{q}}$. Hence $A_{\mathfrak{p}}$ is a complete intersection by Lemma 23.8.2. \square

Lemma 23.8.7. *Let A be a Noetherian ring. Then A is a local complete intersection if and only if $A_{\mathfrak{m}}$ is a complete intersection for every maximal ideal \mathfrak{m} of A .*

Proof. This follows immediately from Lemma 23.8.6 and the definitions. \square

Lemma 23.8.8. *Let S be a finite type algebra over a field k .*

- (1) *for a prime $\mathfrak{q} \subset S$ the local ring $S_{\mathfrak{q}}$ is a complete intersection in the sense of Algebra, Definition 10.130.5 if and only if $S_{\mathfrak{q}}$ is a complete intersection in the sense of Definition 23.8.5, and*
- (2) *S is a local complete intersection in the sense of Algebra, Definition 10.130.1 if and only if S is a local complete intersection in the sense of Definition 23.8.5.*

Proof. Proof of (1). Let $k[x_1, \dots, x_n] \rightarrow S$ be a surjection. Let $\mathfrak{p} \subset k[x_1, \dots, x_n]$ be the prime ideal corresponding to \mathfrak{q} . Let $I \subset k[x_1, \dots, x_n]$ be the kernel of our surjection. Note that $k[x_1, \dots, x_n]_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is surjective with kernel $I_{\mathfrak{p}}$. Observe that $k[x_1, \dots, x_n]$ is a regular ring by Algebra, Proposition 10.110.2. Hence the equivalence of the two notions in (1) follows by combining Lemma 23.8.3 with Algebra, Lemma 10.130.7.

Having proved (1) the equivalence in (2) follows from the definition and Algebra, Lemma 10.130.9. \square

Lemma 23.8.9. *Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. Then the following are equivalent*

- (1) *B is a complete intersection,*
- (2) *A and $B/\mathfrak{m}_A B$ are complete intersections.*

Proof. Now that the definition makes sense this is a trivial reformulation of the (nontrivial) Proposition 23.8.4. \square

23.9. Local complete intersection maps

Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. A consequence of the Cohen structure theorem is that we can find a commutative diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ & \searrow & \uparrow \\ & & A \end{array}$$

of Noetherian complete local rings with $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S/\mathfrak{m}_A S$ a regular local ring. This follows from More on Algebra, Lemma 15.28.3. Let us (temporarily) say $A \rightarrow S \rightarrow B$ is a *good factorization* of $A \rightarrow B$ if S is a Noetherian local ring, $A \rightarrow S \rightarrow B$ are local ring maps, $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S/\mathfrak{m}_A S$ regular. Let us say that $A \rightarrow B$ is a *complete intersection homomorphism* if there exists some good factorization $A \rightarrow S \rightarrow B$ such that the kernel of $S \rightarrow B$ is generated by a regular sequence. The following lemma shows this notion is independent of the choice of the diagram.

Lemma 23.9.1. *Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. The following are equivalent*

- (1) *for some good factorization $A \rightarrow S \rightarrow B$ the kernel of $S \rightarrow B$ is generated by a regular sequence, and*
- (2) *for every good factorization $A \rightarrow S \rightarrow B$ the kernel of $S \rightarrow B$ is generated by a regular sequence.*

Proof. Let $A \rightarrow S \rightarrow B$ be a good factorization. As B is complete we obtain a factorization $A \rightarrow S^\wedge \rightarrow B$ where S^\wedge is the completion of S . Note that this is also a good factorization: The ring map $S \rightarrow S^\wedge$ is flat (Algebra, Lemma 10.93.3), hence $A \rightarrow S^\wedge$ is flat. The ring $S^\wedge/\mathfrak{m}_A S^\wedge = (S/\mathfrak{m}_A S)^\wedge$ is regular since $S/\mathfrak{m}_A S$ is regular (More on Algebra, Lemma 15.32.4). Let f_1, \dots, f_r be a minimal sequence of generators of $\text{Ker}(S \rightarrow B)$. We will use without further mention that an ideal in a Noetherian local ring is generated by a regular sequence if and only if any minimal set of generators is a regular sequence. Observe that f_1, \dots, f_r is a regular sequence in S if and only if f_1, \dots, f_r is a regular sequence in the completion S^\wedge by Algebra, Lemma 10.67.7. Moreover, we have

$$S^\wedge/(f_1, \dots, f_r)R^\wedge = (S/(f_1, \dots, f_n))^\wedge = B^\wedge = B$$

because B is \mathfrak{m}_B -adically complete (first equality by Algebra, Lemma 10.93.2). Thus the kernel of $S \rightarrow B$ is generated by a regular sequence if and only if the kernel of $S^\wedge \rightarrow B$ is generated by a regular sequence. Hence it suffices to consider good factorizations where S is complete.

Assume we have two factorizations $A \rightarrow S \rightarrow B$ and $A \rightarrow S' \rightarrow B$ with S and S' complete. By More on Algebra, Lemma 15.28.4 the ring $S \times_B S'$ is a Noetherian complete local ring. Hence, using More on Algebra, Lemma 15.28.3 we can choose a good factorization $A \rightarrow S'' \rightarrow S \times_B S'$ with S'' complete. Thus it suffices to show: If $A \rightarrow S' \rightarrow S \rightarrow B$ are comparable good factorizations, then $\text{Ker}(S \rightarrow B)$ is generated by a regular sequence if and only if $\text{Ker}(S' \rightarrow B)$ is generated by a regular sequence.

Let $A \rightarrow S' \rightarrow S \rightarrow B$ be comparable good factorizations. First, since $S'/\mathfrak{m}_R S' \rightarrow S/\mathfrak{m}_R S$ is a surjection of regular local rings, the kernel is generated by a regular sequence $\bar{x}_1, \dots, \bar{x}_c \in \mathfrak{m}_{S'}/\mathfrak{m}_R S'$ which can be extended to a regular system of parameters for the regular local ring $S'/\mathfrak{m}_R S'$, see (Algebra, Lemma 10.102.4). Set $I = \text{Ker}(S' \rightarrow S)$. By flatness of S over R we have

$$I/\mathfrak{m}_R I = \text{Ker}(S'/\mathfrak{m}_R S' \rightarrow S/\mathfrak{m}_R S) = (\bar{x}_1, \dots, \bar{x}_c).$$

Choose lifts $x_1, \dots, x_c \in I$. These lifts form a regular sequence generating I as S' is flat over R , see Algebra, Lemma 10.95.3.

We conclude that if also $\text{Ker}(S \rightarrow B)$ is generated by a regular sequence, then so is $\text{Ker}(S' \rightarrow B)$, see More on Algebra, Lemmas 15.21.12 and 15.21.6.

Conversely, assume that $J = \text{Ker}(S' \rightarrow B)$ is generated by a regular sequence. Because the generators x_1, \dots, x_c of I map to linearly independent elements of $\mathfrak{m}_{S'}/\mathfrak{m}_R^2 S'$, we see that $I/\mathfrak{m}_{S'} I \rightarrow J/\mathfrak{m}_{S'} J$ is injective. Hence there exists a minimal system of generators $x_1, \dots, x_c, y_1, \dots, y_d$ for J . Then $x_1, \dots, x_c, y_1, \dots, y_d$ is a regular sequence and it follows that the images of y_1, \dots, y_d in S form a regular sequence generating $\text{Ker}(S \rightarrow B)$. This finishes the proof of the lemma. \square

In the following proposition observe that the condition on vanishing of Tor's applies in particular if B has finite tor dimension over A and thus in particular if B is flat over A .

Proposition 23.9.2. *Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Then the following are equivalent*

- (1) *B is a complete intersection and $\text{Tor}_p^A(B, A/\mathfrak{m}_A)$ is nonzero for only finitely many p ,*
- (2) *A is a complete intersection and $A^\wedge \rightarrow B^\wedge$ is a complete intersection homomorphism in the sense defined above.*

Proof. Let $F_\bullet \rightarrow A/\mathfrak{m}_A$ be a resolution by finite free A -modules. Observe that $\text{Tor}_p^A(B, A/\mathfrak{m}_A)$ is the p th homology of the complex $F_\bullet \otimes_A B$. Let $F_\bullet^\wedge = F_\bullet \otimes_A A^\wedge$ be the completion. Then F_\bullet^\wedge is a resolution of $A^\wedge/\mathfrak{m}_{A^\wedge}$ by finite free A^\wedge -modules (as $A \rightarrow A^\wedge$ is flat and completion on finite modules is exact, see Algebra, Lemmas 10.93.2 and 10.93.3). It follows that

$$F_\bullet^\wedge \otimes_{A^\wedge} B^\wedge = F_\bullet \otimes_A B \otimes_B B^\wedge$$

By flatness of $B \rightarrow B^\wedge$ we conclude that

$$\text{Tor}_p^{A^\wedge}(B^\wedge, A^\wedge/\mathfrak{m}_{A^\wedge}) = \text{Tor}_p^A(B, A/\mathfrak{m}_A) \otimes_B B^\wedge$$

In this way we see that the condition in (1) on the local ring map $A \rightarrow B$ is equivalent to the same condition for the local ring map $A^\wedge \rightarrow B^\wedge$. Thus we may assume A and B are complete local Noetherian rings (since the other conditions are formulated in terms of the completions in any case).

Assume A and B are complete local Noetherian rings. Choose a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in More on Algebra, Lemma 15.28.3. Let $I = \text{Ker}(R \rightarrow A)$ and $J = \text{Ker}(S \rightarrow B)$. The proposition now follows from Lemma 23.7.6. \square

Remark 23.9.3. It appears difficult to define an good notion of “local complete intersection homomorphisms” for maps between general Noetherian rings. The reason is that, for a local Noetherian ring A , the fibres of $A \rightarrow A^\wedge$ are not local complete intersection rings. Thus, if $A \rightarrow B$ is a local homomorphism of local Noetherian rings, and the map of completions $A^\wedge \rightarrow B^\wedge$ is a complete intersection homomorphism in the sense defined above, then $(A_{\mathfrak{p}})^\wedge \rightarrow (B_{\mathfrak{q}})^\wedge$ is in general **not** a complete intersection homomorphism in the sense defined above. A solution can be had by working exclusively with excellent Noetherian rings. More generally, one could work with those Noetherian rings whose formal fibres are complete intersections, see [Rod87]. We will develop this theory here if we ever need it.

To finish of this section we compare the notion defined above with the notion introduced in More on Algebra, Section 23.8.

Lemma 23.9.4. *Consider a commutative diagram*

$$\begin{array}{ccc} S & \longrightarrow & B \\ & \searrow & \uparrow \\ & & A \end{array}$$

of Noetherian local rings with $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S/\mathfrak{m}_A S$ a regular local ring. The following are equivalent

- (1) *$\text{Ker}(S \rightarrow B)$ is generated by a regular sequence, and*
- (2) *$A^\wedge \rightarrow B^\wedge$ is a complete intersection homomorphism as defined above.*

Proof. Omitted. Hint: the proof is identical to the argument given in the first paragraph of the proof of Lemma 23.9.1. \square

Lemma 23.9.5. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. The following are equivalent*

- (1) *$A \rightarrow B$ is a local complete intersection in the sense of More on Algebra, Definition 15.23.2,*
- (2) *for every prime $\mathfrak{q} \subset B$ and with $\mathfrak{p} = A \cap \mathfrak{q}$ the ring map $(A_{\mathfrak{p}})^\wedge \rightarrow (B_{\mathfrak{q}})^\wedge$ is a complete intersection homomorphism in the sense defined above.*

Proof. Choose a surjection $R = A[x_1, \dots, x_n] \rightarrow B$. Observe that $A \rightarrow R$ is flat with regular fibres. Let I be the kernel of $R \rightarrow B$. Assume (2). Then we see that I is locally generated by a regular sequence by Lemma 23.9.4 and Algebra, Lemma 10.67.8. In other words, (1) holds. Conversely, assume (1). Then after localizing on R and B we can assume that I is generated by a Koszul regular sequence. By More on Algebra, Lemma 15.21.6 we find that I is locally generated by a regular sequence. Hence (2) hold by Lemma 23.9.4. Some details omitted. \square

Lemma 23.9.6. *Let A be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map such that the image of $\text{Spec}(B) \rightarrow \text{Spec}(A)$ contains all closed points of $\text{Spec}(A)$. Then the following are equivalent*

- (1) *B is a complete intersection and $A \rightarrow B$ has finite tor dimension,*
- (2) *A is a complete intersection and $A \rightarrow B$ is a complete intersection in the sense of More on Algebra, Definition 15.23.2.*

Proof. This is a reformulation of Proposition 23.9.2 via Lemma 23.9.5. We omit the details. \square

Hycoverings

24.1. Introduction

Let \mathcal{C} be a site, see Sites, Definition 7.6.2. Let X be an object of \mathcal{C} . Given an abelian sheaf \mathcal{F} on \mathcal{C} we would like to compute its cohomology groups

$$H^i(X, \mathcal{F}).$$

According to our general definitions (Cohomology on Sites, Section 21.3) this cohomology group is computed by choosing an injective resolution $0 \rightarrow \mathcal{F} \rightarrow \mathcal{I}^0 \rightarrow \mathcal{I}^1 \rightarrow \dots$ and setting

$$H^i(X, \mathcal{F}) = H^i(\Gamma(X, \mathcal{I}^0) \rightarrow \Gamma(X, \mathcal{I}^1) \rightarrow \Gamma(X, \mathcal{I}^2) \rightarrow \dots)$$

The goal of this chapter is to show that we may also compute these cohomology groups without choosing an injective resolution (in the case that \mathcal{C} has fibre products). To do this we will use hypercoverings.

A hypercovering in a site is a generalization of a covering, see [AGV71, Exposé V, Sec. 7]. Given a hypercovering K of an object X , there is a Čech to cohomology spectral sequence expressing the cohomology of an abelian sheaf \mathcal{F} over X in terms of the cohomology of the sheaf over the components K_n of K . It turns out that there are always enough hypercoverings, so that taking the colimit over all hypercoverings, the spectral sequence degenerates and the cohomology of \mathcal{F} over X is computed by the colimit of the Čech cohomology groups.

A more general gadget one can consider is a simplicial augmentation where one has cohomological descent, see [AGV71, Exposé Vbis]. A nice manuscript on cohomological descent is the text by Brian Conrad, see <http://math.stanford.edu/~conrad/papers/hypercover.pdf>. We will come back to these issue in the chapter on simplicial spaces where we will show, for example, that proper hypercoverings of “locally compact” topological spaces are of cohomological descent (Simplicial Spaces, Section 64.6). Our method of attack will be to reduce this statement to the Čech to cohomology spectral sequence constructed in this chapter.

24.2. Hypercoverings

In order to start we make the following definition. The letters “SR” stand for Semi-Representable.

Definition 24.2.1. Let \mathcal{C} be a site. We denote $\text{SR}(\mathcal{C})$ the category of *semi-representable objects* defined as follows

- (1) objects are families of objects $\{U_i\}_{i \in I}$, and
- (2) morphisms $\{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ are given by a map $\alpha : I \rightarrow J$ and for each $i \in I$ a morphism $f_i : U_i \rightarrow V_{\alpha(i)}$ of \mathcal{C} .

Let $X \in \text{Ob}(\mathcal{C})$ be an object of \mathcal{C} . The category of *semi-representable objects over X* is the category $\text{SR}(\mathcal{C}, X) = \text{SR}(\mathcal{C}/X)$.

This definition differs from the one in [AGV71, Exposé V, Sec. 7], but it seems flexible enough to do all the required arguments. Note that this is a “big” category. We will later “bound” the size of the index sets I that we need for hypercoverings of X . We can then redefine $\text{SR}(\mathcal{C}, X)$ to become a category. Let’s spell out the objects and morphisms $\text{SR}(\mathcal{C}, X)$:

- (1) objects are families of morphisms $\{U_i \rightarrow X\}_{i \in I}$, and
- (2) morphisms $\{U_i \rightarrow X\}_{i \in I} \rightarrow \{V_j \rightarrow X\}_{j \in J}$ are given by a map $\alpha : I \rightarrow J$ and for each $i \in I$ a morphism $f_i : U_i \rightarrow V_{\alpha(i)}$ over X .

There is a forgetful functor $\text{SR}(\mathcal{C}, X) \rightarrow \text{SR}(\mathcal{C})$.

Definition 24.2.2. Let \mathcal{C} be a site with fibre products. We denote F the functor which associates a presheaf to a semi-representable object. In a formula

$$F : \text{SR}(\mathcal{C}) \longrightarrow \text{PSh}(\mathcal{C})$$

$$\{U_i\}_{i \in I} \longmapsto \coprod_{i \in I} h_{U_i}$$

where h_U denotes the representable presheaf associated to the object U .

Given a morphism $U \rightarrow X$ we obtain a morphism $h_U \rightarrow h_X$ of representable presheaves. Thus we often think of F on $\text{SR}(\mathcal{C}, X)$ as a functor into the category of presheaves of sets over h_X , namely $\text{PSh}(\mathcal{C})/h_X$. Here is a picture:

$$\begin{array}{ccc} \text{SR}(\mathcal{C}, X) & \xrightarrow{F} & \text{PSh}(\mathcal{C})/h_X \\ \downarrow & & \downarrow \\ \text{SR}(\mathcal{C}) & \xrightarrow{F} & \text{PSh}(\mathcal{C}) \end{array}$$

Next we discuss the existence of limits in the category of semi-representable objects.

Lemma 24.2.3. *Let \mathcal{C} be a site.*

- (1) *the category $\text{SR}(\mathcal{C})$ has coproducts and F commutes with them,*
- (2) *the functor $F : \text{SR}(\mathcal{C}) \rightarrow \text{PSh}(\mathcal{C})$ commutes with limits,*
- (3) *if \mathcal{C} has fibre products, then $\text{SR}(\mathcal{C})$ has fibre products,*
- (4) *if \mathcal{C} has products of pairs, then $\text{SR}(\mathcal{C})$ has products of pairs,*
- (5) *if \mathcal{C} has equalizers, so does $\text{SR}(\mathcal{C})$, and*
- (6) *if \mathcal{C} has a final object, so does $\text{SR}(\mathcal{C})$.*

Let $X \in \text{Ob}(\mathcal{C})$.

- (1) *the category $\text{SR}(\mathcal{C}, X)$ has coproducts and F commutes with them,*
- (2) *if \mathcal{C} has fibre products, then $\text{SR}(\mathcal{C}, X)$ has finite limits and $F : \text{SR}(\mathcal{C}, X) \rightarrow \text{PSh}(\mathcal{C})/h_X$ commutes with them.*

Proof. Proof of the results on $\text{SR}(\mathcal{C})$. Proof of (1). The coproduct of $\{U_i\}_{i \in I}$ and $\{V_j\}_{j \in J}$ is $\{U_i\}_{i \in I} \amalg \{V_j\}_{j \in J}$, in other words, the family of objects whose index set is $I \amalg J$ and for an element $k \in I \amalg J$ gives U_i if $k = i \in I$ and gives V_j if $k = j \in J$. Similarly for coproducts of families of objects. It is clear that F commutes with these.

Proof of (2). For U in $\text{Ob}(\mathcal{C})$ consider the object $\{U\}$ of $\text{SR}(\mathcal{C})$. It is clear that $\text{Mor}_{\text{SR}(\mathcal{C})}(\{U\}, K) = F(K)(U)$ for $K \in \text{Ob}(\text{SR}(\mathcal{C}))$. Since limits of presheaves are

computed at the level of sections (Sites, Section 7.4) we conclude that F commutes with limits.

Proof of (3). Suppose given a morphism $(\alpha, f_i) : \{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ and a morphism $(\beta, g_k) : \{W_k\}_{k \in K} \rightarrow \{V_j\}_{j \in J}$. The fibred product of these morphisms is given by

$$\{U_i \times_{f_i, V_j, g_k} W_k\}_{(i,j,k) \in I \times J \times K \text{ such that } j = \alpha(i) = \beta(k)}$$

The fibre products exist if \mathcal{C} has fibre products.

Proof of (4). The product of $\{U_i\}_{i \in I}$ and $\{V_j\}_{j \in J}$ is $\{U_i \times V_j\}_{i \in I, j \in J}$. The products exist if \mathcal{C} has products.

Proof of (5). The equalizer of two maps $(\alpha, f_i), (\alpha', f'_i) : \{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ is

$$\{\text{Eq}(f_i, f'_i : U_i \rightarrow V_{\alpha(i)})\}_{i \in I, \alpha(i) = \alpha'(i)}$$

The equalizers exist if \mathcal{C} has equalizers.

Proof of (6). If X is a final object of \mathcal{C} , then $\{X\}$ is a final object of $\text{SR}(\mathcal{C})$.

Proof of the statements about $\text{SR}(\mathcal{C}, X)$. These follow from the results above applied to the category \mathcal{C}/X using that $\text{SR}(\mathcal{C}/X) = \text{SR}(\mathcal{C}, X)$ and that $\text{PSh}(\mathcal{C}/X) = \text{PSh}(\mathcal{C})/h_X$ (Sites, Lemma 7.24.4 applied to \mathcal{C} endowed with the chaotic topology). However we also argue directly as follows. It is clear that the coproduct of $\{U_i \rightarrow X\}_{i \in I}$ and $\{V_j \rightarrow X\}_{j \in J}$ is $\{U_i \rightarrow X\}_{i \in I} \amalg \{V_j \rightarrow X\}_{j \in J}$ and similarly for coproducts of families of families of morphisms with target X . The object $\{X \rightarrow X\}$ is a final object of $\text{SR}(\mathcal{C}, X)$. Suppose given a morphism $(\alpha, f_i) : \{U_i \rightarrow X\}_{i \in I} \rightarrow \{V_j \rightarrow X\}_{j \in J}$ and a morphism $(\beta, g_k) : \{W_k \rightarrow X\}_{k \in K} \rightarrow \{V_j \rightarrow X\}_{j \in J}$. The fibred product of these morphisms is given by

$$\{U_i \times_{f_i, V_j, g_k} W_k \rightarrow X\}_{(i,j,k) \in I \times J \times K \text{ such that } j = \alpha(i) = \beta(k)}$$

The fibre products exist by the assumption that \mathcal{C} has fibre products. Thus $\text{SR}(\mathcal{C}, X)$ has finite limits, see Categories, Lemma 4.18.4. We omit verifying the statements on the functor F in this case. \square

Definition 24.2.4. Let \mathcal{C} be a site. Let $f = (\alpha, f_i) : \{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ be a morphism in the category $\text{SR}(\mathcal{C})$. We say that f is a *covering* if for every $j \in J$ the family of morphisms $\{U_i \rightarrow V_j\}_{i \in I, \alpha(i) = j}$ is a covering for the site \mathcal{C} . Let X be an object of \mathcal{C} . A morphism $K \rightarrow L$ in $\text{SR}(\mathcal{C}, X)$ is a *covering* if its image in $\text{SR}(\mathcal{C})$ is a covering.

Lemma 24.2.5. *Let \mathcal{C} be a site.*

- (1) *A composition of coverings in $\text{SR}(\mathcal{C})$ is a covering.*
- (2) *If $K \rightarrow L$ is a covering in $\text{SR}(\mathcal{C})$ and $L' \rightarrow L$ is a morphism, then $L' \times_L K$ exists and $L' \times_L K \rightarrow L'$ is a covering.*
- (3) *If \mathcal{C} has products of pairs, and $A \rightarrow B$ and $K \rightarrow L$ are coverings in $\text{SR}(\mathcal{C})$, then $A \times K \rightarrow B \times L$ is a covering.*

Let $X \in \text{Ob}(\mathcal{C})$. Then (1) and (2) holds for $\text{SR}(\mathcal{C}, X)$ and (3) holds if \mathcal{C} has fibre products.

Proof. Part (1) is immediate from the axioms of a site. Part (2) follows by the construction of fibre products in $\text{SR}(\mathcal{C})$ in the proof of Lemma 24.2.3 and the requirement that the morphisms in a covering of \mathcal{C} are representable. Part (3) follows by thinking of $A \times K \rightarrow B \times L$ as the composition $A \times K \rightarrow B \times K \rightarrow B \times L$

and hence a composition of basechanges of coverings. The final statement follows because $\text{SR}(\mathcal{C}, X) = \text{SR}(\mathcal{C}/X)$. \square

By Lemma 24.2.3 and Simplicial, Lemma 14.18.2 the coskeleton of a truncated simplicial object of $\text{SR}(\mathcal{C}, X)$ exists if \mathcal{C} has fibre products. Hence the following definition makes sense.

Definition 24.2.6. Let \mathcal{C} be a site. Assume \mathcal{C} has fibre products. Let $X \in \text{Ob}(\mathcal{C})$ be an object of \mathcal{C} . A *hypercovering of X* is a simplicial object K of $\text{SR}(\mathcal{C}, X)$ such that

- (1) The object K_0 is a covering of X for the site \mathcal{C} .
- (2) For every $n \geq 0$ the canonical morphism

$$K_{n+1} \longrightarrow (\text{cosk}_n \text{sk}_n K)_{n+1}$$

is a covering in the sense defined above.

Condition (1) makes sense since each object of $\text{SR}(\mathcal{C}, X)$ is after all a family of morphisms with target X . It could also be formulated as saying that the morphism of K_0 to the final object of $\text{SR}(\mathcal{C}, X)$ is a covering.

Example 24.2.7. Let $\{U_i \rightarrow X\}_{i \in I}$ be a covering of the site \mathcal{C} . Set $K_0 = \{U_i \rightarrow X\}_{i \in I}$. Then K_0 is a 0-truncated simplicial object of $\text{SR}(\mathcal{C}, X)$. Hence we may form

$$K = \text{cosk}_0 K_0.$$

Clearly K passes condition (1) of Definition 24.2.6. Since all the morphisms $K_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n K)_{n+1}$ are isomorphisms by Simplicial, Lemma 14.18.10 it also passes condition (2). Note that the terms K_n are the usual

$$K_n = \{U_{i_0} \times_X U_{i_1} \times_X \dots \times_X U_{i_n} \rightarrow X\}_{(i_0, i_1, \dots, i_n) \in I^{n+1}}$$

Lemma 24.2.8. *Let \mathcal{C} be a site with fibre products. Let $X \in \text{Ob}(\mathcal{C})$ be an object of \mathcal{C} . The collection of all hypercoverings of X forms a set.*

Proof. Since \mathcal{C} is a site, the set of all coverings of X forms a set. Thus we see that the collection of possible K_0 forms a set. Suppose we have shown that the collection of all possible K_0, \dots, K_n form a set. Then it is enough to show that given K_0, \dots, K_n the collection of all possible K_{n+1} forms a set. And this is clearly true since we have to choose K_{n+1} among all possible coverings of $(\text{cosk}_n \text{sk}_n K)_{n+1}$. \square

Remark 24.2.9. The lemma does not just say that there is a cofinal system of choices of hypercoverings that is a set, but that really the hypercoverings form a set.

The category of presheaves on \mathcal{C} has finite (co)limits. Hence the functors cosk_n exists for presheaves of sets.

Lemma 24.2.10. *Let \mathcal{C} be a site with fibre products. Let $X \in \text{Ob}(\mathcal{C})$ be an object of \mathcal{C} . Let K be a hypercovering of X . Consider the simplicial object $F(K)$ of $\text{PSh}(\mathcal{C})$, endowed with its augmentation to the constant simplicial presheaf h_X .*

- (1) *The morphism of presheaves $F(K)_0 \rightarrow h_X$ becomes a surjection after sheafification.*

(2) *The morphism*

$$(d_0^1, d_1^1) : F(K)_1 \longrightarrow F(K)_0 \times_{h_X} F(K)_0$$

becomes a surjection after sheafification.

(3) *For every $n \geq 1$ the morphism*

$$F(K)_{n+1} \longrightarrow (\text{cosk}_n \text{sk}_n F(K))_{n+1}$$

turns into a surjection after sheafification.

Proof. We will use the fact that if $\{U_i \rightarrow U\}_{i \in I}$ is a covering of the site \mathcal{C} , then the morphism

$$\coprod_{i \in I} h_{U_i} \rightarrow h_U$$

becomes surjective after sheafification, see Sites, Lemma 7.13.4. Thus the first assertion follows immediately.

For the second assertion, note that according to Simplicial, Example 14.18.1 the simplicial object $\text{cosk}_0 \text{sk}_0 K$ has terms $K_0 \times \dots \times K_0$. Thus according to the definition of a hypercovering we see that $(d_0^1, d_1^1) : K_1 \rightarrow K_0 \times K_0$ is a covering. Hence (2) follows from the claim above and the fact that F transforms products into fibred products over h_X .

For the third, we claim that $\text{cosk}_n \text{sk}_n F(K) = F(\text{cosk}_n \text{sk}_n K)$ for $n \geq 1$. To prove this, denote temporarily F' the functor $\text{SR}(\mathcal{C}, X) \rightarrow \text{PSh}(\mathcal{C})/h_X$. By Lemma 24.2.3 the functor F' commutes with finite limits. By our description of the cosk_n functor in Simplicial, Section 14.12 we see that $\text{cosk}_n \text{sk}_n F'(K) = F'(\text{cosk}_n \text{sk}_n K)$. Recall that the category used in the description of $(\text{cosk}_n U)_m$ in Simplicial, Lemma 14.18.2 is the category $(\Delta/[m])_{\leq n}^{\text{opp}}$. It is an amusing exercise to show that $(\Delta/[m])_{\leq n}$ is a connected category (see Categories, Definition 4.16.1) as soon as $n \geq 1$. Hence, Categories, Lemma 4.16.2 shows that $\text{cosk}_n \text{sk}_n F'(K) = \text{cosk}_n \text{sk}_n F(K)$. Whence the claim. Property (2) follows from this, because now we see that the morphism in (2) is the result of applying the functor F to a covering as in Definition 24.2.4, and the result follows from the first fact mentioned in this proof. \square

24.3. Acyclicity

Let \mathcal{C} be a site. For a presheaf of sets \mathcal{F} we denote $\mathbf{Z}_{\mathcal{F}}$ the presheaf of abelian groups defined by the rule

$$\mathbf{Z}_{\mathcal{F}}(U) = \text{free abelian group on } \mathcal{F}(U).$$

We will sometimes call this the *free abelian presheaf on \mathcal{F}* . Of course the construction $\mathcal{F} \mapsto \mathbf{Z}_{\mathcal{F}}$ is a functor and it is left adjoint to the forgetful functor $\text{PAb}(\mathcal{C}) \rightarrow \text{PSh}(\mathcal{C})$. Of course the sheafification $\mathbf{Z}_{\mathcal{F}}^{\#}$ is a sheaf of abelian groups, and the functor $\mathcal{F} \mapsto \mathbf{Z}_{\mathcal{F}}^{\#}$ is a left adjoint as well. We sometimes call $\mathbf{Z}_{\mathcal{F}}^{\#}$ the *free abelian sheaf on \mathcal{F}* .

For an object X of the site \mathcal{C} we denote \mathbf{Z}_X the free abelian presheaf on h_X , and we denote $\mathbf{Z}_X^{\#}$ its sheafification.

Definition 24.3.1. Let \mathcal{C} be a site. Let K be a simplicial object of $\text{PSh}(\mathcal{C})$. By the above we get a simplicial object $\mathbf{Z}_K^{\#}$ of $\text{Ab}(\mathcal{C})$. We can take its associated complex of abelian presheaves $s(\mathbf{Z}_K^{\#})$, see Simplicial, Section 14.22. The *homology of K* is the homology of the complex of abelian sheaves $s(\mathbf{Z}_K^{\#})$.

In other words, the i th homology $H_i(K)$ of K is the sheaf of abelian groups $H_i(K) = H_i(s(\mathbf{Z}_K^\#))$. In this section we worry about the homology in case K is a hypercovering of an object X of \mathcal{C} .

Lemma 24.3.2. *Let \mathcal{C} be a site. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a morphism of presheaves of sets. Denote K the simplicial object of $PSh(\mathcal{C})$ whose n th term is the $(n + 1)$ st fibre product of \mathcal{F} over \mathcal{G} , see *Simplicial, Example 14.3.5*. Then, if $\mathcal{F} \rightarrow \mathcal{G}$ is surjective after sheafification, we have*

$$H_i(K) = \begin{cases} 0 & \text{if } i > 0 \\ \mathbf{Z}_\mathcal{G}^\# & \text{if } i = 0 \end{cases}$$

The isomorphism in degree 0 is given by the morphism $H_0(K) \rightarrow \mathbf{Z}_\mathcal{G}^\#$ coming from the map $(\mathbf{Z}_K^\#)_0 = \mathbf{Z}_\mathcal{F}^\# \rightarrow \mathbf{Z}_\mathcal{G}^\#$.

Proof. Let $\mathcal{G}' \subset \mathcal{G}$ be the image of the morphism $\mathcal{F} \rightarrow \mathcal{G}$. Let $U \in \text{Ob}(\mathcal{C})$. Set $A = \mathcal{F}(U)$ and $B = \mathcal{G}'(U)$. Then the simplicial set $K(U)$ is equal to the simplicial set with n -simplices given by

$$A \times_B A \times_B \dots \times_B A \text{ (} n + 1 \text{ factors)}.$$

By *Simplicial, Lemma 14.31.3* the morphism $K(U) \rightarrow B$ is a trivial Kan fibration. Thus it is a homotopy equivalence (*Simplicial, Lemma 14.31.3*). Hence applying the functor “free abelian group on” to this we deduce that

$$\mathbf{Z}_K(U) \longrightarrow \mathbf{Z}_B$$

is a homotopy equivalence. Note that $s(\mathbf{Z}_B)$ is the complex

$$\dots \rightarrow \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{0} \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{1} \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{0} \bigoplus_{b \in B} \mathbf{Z} \rightarrow 0$$

see *Simplicial, Lemma 14.22.3*. Thus we see that $H_i(s(\mathbf{Z}_K(U))) = 0$ for $i > 0$, and $H_0(s(\mathbf{Z}_K(U))) = \bigoplus_{b \in B} \mathbf{Z} = \bigoplus_{s \in \mathcal{G}'(U)} \mathbf{Z}$. These identifications are compatible with restriction maps.

We conclude that $H_i(s(\mathbf{Z}_K)) = 0$ for $i > 0$ and $H_0(s(\mathbf{Z}_K)) = \mathbf{Z}_{\mathcal{G}'}$, where here we compute homology groups in $PAb(\mathcal{C})$. Since sheafification is an exact functor we deduce the result of the lemma. Namely, the exactness implies that $H_0(s(\mathbf{Z}_K))^\# = H_0(s(\mathbf{Z}_K^\#))$, and similarly for other indices. \square

Lemma 24.3.3. *Let \mathcal{C} be a site. Let $f : L \rightarrow K$ be a morphism of simplicial objects of $PSh(\mathcal{C})$. Let $n \geq 0$ be an integer. Assume that*

- (1) *For $i < n$ the morphism $L_i \rightarrow K_i$ is an isomorphism.*
- (2) *The morphism $L_n \rightarrow K_n$ is surjective after sheafification.*
- (3) *The canonical map $L \rightarrow \text{cosk}_n sk_n L$ is an isomorphism.*
- (4) *The canonical map $K \rightarrow \text{cosk}_n sk_n K$ is an isomorphism.*

Then $H_i(f) : H_i(L) \rightarrow H_i(K)$ is an isomorphism.

Proof. This proof is exactly the same as the proof of Lemma 24.3.2 above. Namely, we first let $K'_n \subset K_n$ be the sub presheaf which is the image of the map $L_n \rightarrow K_n$. Assumption (2) means that the sheafification of K'_n is equal to the sheafification of K_n . Moreover, since $L_i = K_i$ for all $i < n$ we see that get an n -truncated simplicial presheaf U by taking $U_0 = L_0 = K_0, \dots, U_{n-1} = L_{n-1} = K_{n-1}, U_n = K'_n$. Denote $K' = \text{cosk}_n U$, a simplicial presheaf. Because we can construct K'_m as a finite limit, and since sheafification is exact, we see that $(K'_m)^\# = K_m$. In other

words, $(K')^\# = K^\#$. We conclude, by exactness of sheafification once more, that $H_i(K) = H_i(K')$. Thus it suffices to prove the lemma for the morphism $L \rightarrow K'$, in other words, we may assume that $L_n \rightarrow K_n$ is a surjective morphism of *presheaves*!

In this case, for any object U of \mathcal{C} we see that the morphism of simplicial sets

$$L(U) \longrightarrow K(U)$$

satisfies all the assumptions of Simplicial, Lemma 14.31.1. Hence it is a trivial Kan fibration. In particular it is a homotopy equivalence (Simplicial, Lemma 14.29.8). Thus

$$\mathbf{Z}_L(U) \longrightarrow \mathbf{Z}_K(U)$$

is a homotopy equivalence too. This for all U . The result follows. \square

Lemma 24.3.4. *Let \mathcal{C} be a site. Let K be a simplicial presheaf. Let \mathcal{G} be a presheaf. Let $K \rightarrow \mathcal{G}$ be an augmentation of K towards \mathcal{G} . Assume that*

- (1) *The morphism of presheaves $K_0 \rightarrow \mathcal{G}$ becomes a surjection after sheafification.*
- (2) *The morphism*

$$(d_0^1, d_1^1) : K_1 \longrightarrow K_0 \times_{\mathcal{G}} K_0$$

becomes a surjection after sheafification.

- (3) *For every $n \geq 1$ the morphism*

$$K_{n+1} \longrightarrow (\text{cosk}_n \text{sk}_n K)_{n+1}$$

turns into a surjection after sheafification.

Then $H_i(K) = 0$ for $i > 0$ and $H_0(K) = \mathbf{Z}_{\mathcal{G}}^\#$.

Proof. Denote $K^n = \text{cosk}_n \text{sk}_n K$ for $n \geq 1$. Define K^0 as the simplicial object with terms $(K^0)_n$ equal to the $(n + 1)$ -fold fibred product $K_0 \times_{\mathcal{G}} \dots \times_{\mathcal{G}} K_0$, see Simplicial, Example 14.3.5. We have morphisms

$$K \longrightarrow \dots \rightarrow K^n \rightarrow K^{n-1} \rightarrow \dots \rightarrow K^1 \rightarrow K^0.$$

The morphisms $K \rightarrow K^i$, $K^j \rightarrow K^i$ for $j \geq i \geq 1$ come from the universal properties of the cosk_n functors. The morphism $K^1 \rightarrow K^0$ is the canonical morphism from Simplicial, Remark 14.19.4. We also recall that $K^0 \rightarrow \text{cosk}_1 \text{sk}_1 K^0$ is an isomorphism, see Simplicial, Lemma 14.19.3.

By Lemma 24.3.2 we see that $H_i(K^0) = 0$ for $i > 0$ and $H_0(K^0) = \mathbf{Z}_{\mathcal{G}}^\#$.

Pick $n \geq 1$. Consider the morphism $K^n \rightarrow K^{n-1}$. It is an isomorphism on terms of degree $< n$. Note that $K^n \rightarrow \text{cosk}_n \text{sk}_n K^n$ and $K^{n-1} \rightarrow \text{cosk}_n \text{sk}_n K^{n-1}$ are isomorphisms. Note that $(K^n)_n = K_n$ and that $(K^{n-1})_n = (\text{cosk}_{n-1} \text{sk}_{n-1} K)_n$. Hence by assumption, we have that $(K^n)_n \rightarrow (K^{n-1})_n$ is a morphism of presheaves which becomes surjective after sheafification. By Lemma 24.3.3 we conclude that $H_i(K^n) = H_i(K^{n-1})$. Combined with the above this proves the lemma. \square

Lemma 24.3.5. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . The homology of the simplicial presheaf $F(K)$ is 0 in degrees > 0 and equal to $\mathbf{Z}_X^\#$ in degree 0.*

Proof. Combine Lemmas 24.3.4 and 24.2.10. \square

24.4. Čech cohomology and hypercoverings

Let \mathcal{C} be a site. Consider a presheaf of abelian groups \mathcal{F} on the site \mathcal{C} . It defines a functor

$$\begin{aligned} \mathcal{F} : \text{SR}(\mathcal{C})^{opp} &\longrightarrow \text{Ab} \\ \{U_i\}_{i \in I} &\longmapsto \prod_{i \in I} \mathcal{F}(U_i) \end{aligned}$$

Thus a simplicial object K of $\text{SR}(\mathcal{C})$ is turned into a cosimplicial object $\mathcal{F}(K)$ of Ab . The cochain complex $s(\mathcal{F}(K))$ associated to $\mathcal{F}(K)$ (Simplicial, Section 14.24) is called the Čech complex of \mathcal{F} with respect to the simplicial object K . We set

$$\check{H}^i(K, \mathcal{F}) = H^i(s(\mathcal{F}(K))).$$

and we call it the i th Čech cohomology group of \mathcal{F} with respect to K . In this section we prove analogues of some of the results for Čech cohomology of open coverings proved in Cohomology, Sections 20.10, 20.11 and 20.12.

Lemma 24.4.1. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . Then $\check{H}^0(K, \mathcal{F}) = \mathcal{F}(X)$.*

Proof. We have

$$\check{H}^0(K, \mathcal{F}) = \text{Ker}(\mathcal{F}(K_0) \longrightarrow \mathcal{F}(K_1))$$

Write $K_0 = \{U_i \rightarrow X\}$. It is a covering in the site \mathcal{C} . As well, we have that $K_1 \rightarrow K_0 \times K_0$ is a covering in $\text{SR}(\mathcal{C}, X)$. Hence we may write $K_1 = \coprod_{i_0, i_1 \in I} \{V_{i_0 i_1 j} \rightarrow X\}$ so that the morphism $K_1 \rightarrow K_0 \times K_0$ is given by coverings $\{V_{i_0 i_1 j} \rightarrow U_{i_0} \times_X U_{i_1}\}$ of the site \mathcal{C} . Thus we can further identify

$$\check{H}^0(K, \mathcal{F}) = \text{Ker}(\prod_i \mathcal{F}(U_i) \longrightarrow \prod_{i_0 i_1 j} \mathcal{F}(V_{i_0 i_1 j}))$$

with obvious map. The sheaf property of \mathcal{F} implies that $\check{H}^0(K, \mathcal{F}) = H^0(X, \mathcal{F})$. \square

In fact this property characterizes the abelian sheaves among all abelian presheaves on \mathcal{C} of course. The analogue of Cohomology, Lemma 24.4.2 in this case is the following.

Lemma 24.4.2. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let \mathcal{I} be an injective sheaf of abelian groups on \mathcal{C} . Then*

$$\check{H}^p(K, \mathcal{I}) = \begin{cases} \mathcal{I}(X) & \text{if } p = 0 \\ 0 & \text{if } p > 0 \end{cases}$$

Proof. Observe that for any object $Z = \{U_i \rightarrow X\}$ of $\text{SR}(\mathcal{C}, X)$ and any abelian sheaf \mathcal{F} on \mathcal{C} we have

$$\begin{aligned} \mathcal{F}(Z) &= \prod \mathcal{F}(U_i) \\ &= \prod \text{Mor}_{\text{PSh}(\mathcal{C})}(h_{U_i}, \mathcal{F}) \\ &= \text{Mor}_{\text{PSh}(\mathcal{C})}(F(Z), \mathcal{F}) \\ &= \text{Mor}_{\text{PAb}(\mathcal{C})}(\mathbf{Z}_{F(Z)}, \mathcal{F}) \\ &= \text{Mor}_{\text{Ab}(\mathcal{C})}(\mathbf{Z}_{F(Z)}^\#, \mathcal{F}) \end{aligned}$$

Thus we see, for any simplicial object K of $\text{SR}(\mathcal{C}, X)$ that we have

$$(24.4.2.1) \quad s(\mathcal{F}(K)) = \text{Hom}_{\text{Ab}(\mathcal{C})}(s(\mathbf{Z}_{F(K)}^\#), \mathcal{F})$$

see Definition 24.3.1 for notation. The complex of sheaves $s(\mathbf{Z}_{F(K)}^\#)$ is quasi-isomorphic to $\mathbf{Z}_X^\#$ if K is a hypercovering, see Lemma 24.3.5. We conclude that if \mathcal{I} is an injective abelian sheaf, and K a hypercovering, then the complex $s(\mathcal{I}(K))$ is acyclic except possibly in degree 0. In other words, we have

$$\check{H}^i(K, \mathcal{I}) = 0$$

for $i > 0$. Combined with Lemma 24.4.1 the lemma is proved. □

Next we come to the analogue of Cohomology on Sites, Lemma 21.11.6. Let \mathcal{C} be a site. Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . Recall that $\underline{H}^i(\mathcal{F})$ indicates the presheaf of abelian groups on \mathcal{C} which is defined by the rule $\underline{H}^i(\mathcal{F}) : U \mapsto H^i(U, \mathcal{F})$. We extend this to $\text{SR}(\mathcal{C})$ as in the introduction to this section.

Lemma 24.4.3. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . There is a map*

$$s(\mathcal{F}(K)) \longrightarrow R\Gamma(X, \mathcal{F})$$

in $D^+(\text{Ab})$ functorial in \mathcal{F} , which induces natural transformations

$$\check{H}^i(K, -) \longrightarrow H^i(X, -)$$

as functors $\text{Ab}(\mathcal{C}) \rightarrow \text{Ab}$. Moreover, there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with

$$E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(X, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} and in the hypercovering K .

Proof. We could prove this by the same method as employed in the corresponding lemma in the chapter on cohomology. Instead let us prove this by a double complex argument.

Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in the category of abelian sheaves on \mathcal{C} . Consider the double complex $A^{\bullet, \bullet}$ with terms

$$A^{p,q} = \mathcal{I}^q(K_p)$$

where the differential $d_1^{p,q} : A^{p,q} \rightarrow A^{p+1,q}$ is the one coming from the differential $\mathcal{I}^p \rightarrow \mathcal{I}^{p+1}$ and the differential $d_2^{p,q} : A^{p,q} \rightarrow A^{p,q+1}$ is the one coming from the differential on the complex $s(\mathcal{I}^p(K))$ associated to the cosimplicial abelian group $\mathcal{I}^p(K)$ as explained above. As usual we denote sA^\bullet the simple complex associated to the double complex $A^{\bullet, \bullet}$. We will use the two spectral sequences $({}'E_r, {}'d_r)$ and $({}''E_r, {}''d_r)$ associated to this double complex, see Homology, Section 12.22.

By Lemma 24.4.2 the complexes $s(\mathcal{I}^p(K))$ are acyclic in positive degrees and have H^0 equal to $\mathcal{I}^p(X)$. Hence by Homology, Lemma 12.22.7 and its proof the spectral sequence $({}'E_r, {}'d_r)$ degenerates, and the natural map

$$\mathcal{I}^\bullet(X) \longrightarrow sA^\bullet$$

is a quasi-isomorphism of complexes of abelian groups. In particular we conclude that $H^n(sA^\bullet) = H^n(X, \mathcal{F})$.

The map $s(\mathcal{F}(K)) \longrightarrow R\Gamma(X, \mathcal{F})$ of the lemma is the composition of the natural map $s(\mathcal{F}(K)) \rightarrow sA^\bullet$ followed by the inverse of the displayed quasi-isomorphism above. This works because $\mathcal{I}^\bullet(X)$ is a representative of $R\Gamma(X, \mathcal{F})$.

Consider the spectral sequence $({}''E_r, {}''d_r)_{r \geq 0}$. By Homology, Lemma 12.22.4 we see that

$${}''E_2^{p,q} = H_{II}^p(H_1^q(A^{\bullet,\bullet}))$$

In other words, we first take cohomology with respect to d_1 which gives the groups ${}''E_1^{p,q} = \underline{H}^p(\mathcal{F})(K_q)$. Hence it is indeed the case (by the description of the differential ${}''d_1$) that ${}''E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$. And by the other spectral sequence above we see that this one converges to $H^n(X, \mathcal{F})$ as desired.

We omit the proof of the statements regarding the functoriality of the above constructions in the abelian sheaf \mathcal{F} and the hypercovering K . \square

24.5. Hypercoverings a la Verdier

The astute reader will have noticed that all we need in order to get the Čech to cohomology spectral sequence for a hypercovering of an object X , is the conclusion of Lemma 24.2.10. Therefore the following definition makes sense.

Definition 24.5.1. Let \mathcal{C} be a site. Assume \mathcal{C} has equalizers and fibre products. Let \mathcal{G} be a presheaf of sets. A *hypercovering* of \mathcal{G} is a simplicial object K of $\text{SR}(\mathcal{C})$ endowed with an augmentation $F(K) \rightarrow \mathcal{G}$ such that

- (1) $F(K_0) \rightarrow \mathcal{G}$ becomes surjective after sheafification,
- (2) $F(K_1) \rightarrow F(K_0) \times_{\mathcal{G}} F(K_0)$ becomes surjective after sheafification, and
- (3) $F(K_{n+1}) \rightarrow F((\text{cosk}_n \text{sk}_n K)_{n+1})$ for $n \geq 1$ becomes surjective after sheafification.

We say that a simplicial object K of $\text{SR}(\mathcal{C})$ is a *hypercovering* if K is a hypercovering of the final object $*$ of $\text{PSh}(\mathcal{C})$.

The assumption that \mathcal{C} has fibre products and equalizers guarantees that $\text{SR}(\mathcal{C})$ has fibre products and equalizers and F commutes with these (Lemma 24.2.3) which suffices to define the coskeleton functors used (see Simplicial, Remark 14.18.11 and Categories, Lemma 4.18.2). If \mathcal{C} is general, we can replace the condition (3) by the condition that $F(K_{n+1}) \rightarrow ((\text{cosk}_n \text{sk}_n F(K))_{n+1})$ for $n \geq 1$ becomes surjective after sheafification and the results of this section remain valid.

Let \mathcal{F} be an abelian sheaf on \mathcal{C} . In the previous section, we defined the Čech complex of \mathcal{F} with respect to a simplicial object K of $\text{SR}(\mathcal{C})$. Next, given a presheaf \mathcal{G} we set

$$H^0(\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{PSh}(\mathcal{C})}(\mathcal{G}, \mathcal{F}) = \text{Mor}_{\text{Sh}(\mathcal{C})}(\mathcal{G}^\#, \mathcal{F}) = H^0(\mathcal{G}^\#, \mathcal{F})$$

with notation as in Cohomology on Sites, Section 21.13). This is a left exact functor and its higher derived functors (briefly studied in Cohomology on Sites, Section 21.13) will be denoted $H^i(\mathcal{G}, \mathcal{F})$. We will show that given a hypercovering K of \mathcal{G} , there is a Čech to cohomology spectral sequence converging to the cohomology $H^i(\mathcal{G}, \mathcal{F})$. Note that if $\mathcal{G} = *$, then $H^i(*, \mathcal{F}) = H^i(\mathcal{F})$ recovers the global cohomology of \mathcal{F} .

Lemma 24.5.2. *Let \mathcal{C} be a site with equalizers and fibre products. Let \mathcal{G} be a presheaf on \mathcal{C} . Let K be a hypercovering of \mathcal{G} . Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . Then $\check{H}^0(K, \mathcal{F}) = H^0(\mathcal{G}, \mathcal{F})$.*

Proof. This follows from the definition of $H^0(\mathcal{G}, \mathcal{F})$ and the fact that

$$F(K_1) \rightrightarrows F(K_0) \longrightarrow \mathcal{G}$$

becomes an coequalizer diagram after sheafification. □

Lemma 24.5.3. *Let \mathcal{C} be a site with equalizers and fibre products. Let \mathcal{G} be a presheaf on \mathcal{C} . Let K be a hypercovering of \mathcal{G} . Let \mathcal{I} be an injective sheaf of abelian groups on \mathcal{C} . Then*

$$\check{H}^p(K, \mathcal{I}) = \begin{cases} H^0(\mathcal{G}, \mathcal{I}) & \text{if } p = 0 \\ 0 & \text{if } p > 0 \end{cases}$$

Proof. By (24.4.2.1) we have

$$s(\mathcal{F}(K)) = \text{Hom}_{\text{Ab}(\mathcal{C})}(s(\mathbf{Z}_{\mathcal{F}(K)}^\#), \mathcal{F})$$

The complex $s(\mathbf{Z}_{\mathcal{F}(K)}^\#)$ is quasi-isomorphic to $\mathbf{Z}_{\mathcal{G}}^\#$, see Lemma 24.3.4. We conclude that if \mathcal{I} is an injective abelian sheaf, then the complex $s(\mathcal{I}(K))$ is acyclic except possibly in degree 0. In other words, we have $\check{H}^i(K, \mathcal{I}) = 0$ for $i > 0$. Combined with Lemma 24.5.2 the lemma is proved. □

Lemma 24.5.4. *Let \mathcal{C} be a site with equalizers and fibre products. Let \mathcal{G} be a presheaf on \mathcal{C} . Let K be a hypercovering of \mathcal{G} . Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . There is a map*

$$s(\mathcal{F}(K)) \longrightarrow R\Gamma(\mathcal{G}, \mathcal{F})$$

in $D^+(\text{Ab})$ functorial in \mathcal{F} , which induces a natural transformation

$$\check{H}^i(K, -) \longrightarrow H^i(\mathcal{G}, -)$$

of functors $\text{Ab}(\mathcal{C}) \rightarrow \text{Ab}$. Moreover, there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with

$$E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(\mathcal{G}, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} and in the hypercovering K .

Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in the category of abelian sheaves on \mathcal{C} . Consider the double complex $A^{\bullet, \bullet}$ with terms

$$A^{p,q} = \mathcal{I}^q(K_p)$$

where the differential $d_1^{p,q} : A^{p,q} \rightarrow A^{p+1,q}$ is the one coming from the differential $\mathcal{I}^p \rightarrow \mathcal{I}^{p+1}$ and the differential $d_2^{p,q} : A^{p,q} \rightarrow A^{p,q+1}$ is the one coming from the differential on the complex $s(\mathcal{I}^p(K))$ associated to the cosimplicial abelian group $\mathcal{I}^p(K)$ as explained above. We will use the two spectral sequences $({}'E_r, {}'d_r)$ and $({}''E_r, {}''d_r)$ associated to this double complex, see Homology, Section 12.22.

By Lemma 24.5.3 the complexes $s(\mathcal{I}^p(K))$ are acyclic in positive degrees and have H^0 equal to $H^0(\mathcal{G}, \mathcal{I}^p)$. Hence by Homology, Lemma 12.22.7 and its proof the spectral sequence $({}'E_r, {}'d_r)$ degenerates, and the natural map

$$H^0(\mathcal{G}, \mathcal{I}^\bullet) \longrightarrow \text{Tot}(A^{\bullet, \bullet})$$

is a quasi-isomorphism of complexes of abelian groups. The map $s(\mathcal{F}(K)) \longrightarrow R\Gamma(\mathcal{G}, \mathcal{F})$ of the lemma is the composition of the natural map $s(\mathcal{F}(K)) \rightarrow \text{Tot}(A^{\bullet, \bullet})$ followed by the inverse of the displayed quasi-isomorphism above. This works because $H^0(\mathcal{G}, \mathcal{I}^\bullet)$ is a representative of $R\Gamma(\mathcal{G}, \mathcal{F})$.

Consider the spectral sequence $({}''E_r, {}''d_r)_{r \geq 0}$. By Homology, Lemma 12.22.4 we see that

$${}''E_2^{p,q} = H_{II}^p(H_I^q(A^{\bullet, \bullet}))$$

In other words, we first take cohomology with respect to d_1 which gives the groups ${}''E_1^{p,q} = \underline{H}^p(\mathcal{F})(K_q)$. Hence it is indeed the case (by the description of the differential ${}''d_1$) that ${}''E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$. Since this spectral sequence converges to the cohomology of $\text{Tot}(A^{\bullet,\bullet})$ the proof is finished. \square

Lemma 24.5.5. *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. Let \mathcal{F} be an abelian sheaf. There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$$

converging to the global cohomology groups $H^{p+q}(\mathcal{F})$.

Proof. This is a special case of Lemma 24.5.4. \square

24.6. Covering hypercoverings

Here are some ways to construct hypercoverings. We note that since the category $\text{SR}(\mathcal{C}, X)$ has fibre products the category of simplicial objects of $\text{SR}(\mathcal{C}, X)$ has fibre products as well, see *Simplicial*, Lemma 14.7.2.

Lemma 24.6.1. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K, L, M be simplicial objects of $\text{SR}(\mathcal{C}, X)$. Let $a : K \rightarrow L, b : M \rightarrow L$ be morphisms. Assume*

- (1) K is a hypercovering of X ,
- (2) the morphism $M_0 \rightarrow L_0$ is a covering, and
- (3) for all $n \geq 0$ in the diagram

$$\begin{array}{ccc}
 M_{n+1} & \xrightarrow{\quad} & (\text{cosk}_n \text{sk}_n M)_{n+1} \\
 \downarrow & \searrow \gamma & \downarrow \\
 & L_{n+1} \times_{(\text{cosk}_n \text{sk}_n L)_{n+1}} (\text{cosk}_n \text{sk}_n M)_{n+1} & \\
 \downarrow & \swarrow & \downarrow \\
 L_{n+1} & \xrightarrow{\quad} & (\text{cosk}_n \text{sk}_n L)_{n+1}
 \end{array}$$

the arrow γ is a covering.

Then the fibre product $K \times_L M$ is a hypercovering of X .

Proof. The morphism $(K \times_L M)_0 = K_0 \times_{L_0} M_0 \rightarrow K_0$ is a base change of a covering by (2), hence a covering, see Lemma 24.2.5. And $K_0 \rightarrow \{X \rightarrow X\}$ is a covering by (1). Thus $(K \times_L M)_0 \rightarrow \{X \rightarrow X\}$ is a covering by Lemma 24.2.5. Hence $K \times_L M$ satisfies the first condition of Definition 24.2.6.

We still have to check that

$$K_{n+1} \times_{L_{n+1}} M_{n+1} = (K \times_L M)_{n+1} \longrightarrow (\text{cosk}_n \text{sk}_n (K \times_L M))_{n+1}$$

is a covering for all $n \geq 0$. We abbreviate as follows: $A = (\text{cosk}_n \text{sk}_n K)_{n+1}$, $B = (\text{cosk}_n \text{sk}_n L)_{n+1}$, and $C = (\text{cosk}_n \text{sk}_n M)_{n+1}$. The functor $\text{cosk}_n \text{sk}_n$ commutes with fibre products, see *Simplicial*, Lemma 14.18.13. Thus the right hand side

above is equal to $A \times_B C$. Consider the following commutative diagram

$$\begin{array}{ccccc}
 K_{n+1} \times_{L_{n+1}} M_{n+1} & \longrightarrow & M_{n+1} & & \\
 \downarrow & & \downarrow & \searrow \gamma & \\
 K_{n+1} & \longrightarrow & L_{n+1} & \longleftarrow & L_{n+1} \times_B C \longrightarrow C \\
 & \searrow & & \searrow & \downarrow \\
 & & A & \longrightarrow & B
 \end{array}$$

This diagram shows that

$$K_{n+1} \times_{L_{n+1}} M_{n+1} = (K_{n+1} \times_B C) \times_{(L_{n+1} \times_B C), \gamma} M_{n+1}$$

Now, $K_{n+1} \times_B C \rightarrow A \times_B C$ is a base change of the covering $K_{n+1} \rightarrow A$ via the morphism $A \times_B C \rightarrow A$, hence is a covering. By assumption (3) the morphism γ is a covering. Hence the morphism

$$(K_{n+1} \times_B C) \times_{(L_{n+1} \times_B C), \gamma} M_{n+1} \longrightarrow K_{n+1} \times_B C$$

is a covering as a base change of a covering. The lemma follows as a composition of coverings is a covering. \square

Lemma 24.6.2. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . If K, L are hypercoverings of X , then $K \times L$ is a hypercovering of X .*

Proof. You can either verify this directly, or use Lemma 24.6.1 above and check that $L \rightarrow \{X \rightarrow X\}$ has property (3). \square

Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Since the category $\text{SR}(\mathcal{C}, X)$ has coproducts and finite limits, it is permissible to speak about the objects $U \times K$ and $\text{Hom}(U, K)$ for certain simplicial sets U (for example those with finitely many nondegenerate simplices) and any simplicial object K of $\text{SR}(\mathcal{C}, X)$. See Simplicial, Sections 14.13 and 14.16.

Lemma 24.6.3. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let $k \geq 0$ be an integer. Let $u : Z \rightarrow K_k$ be a covering in $\text{SR}(\mathcal{C}, X)$. Then there exists a morphism of hypercoverings $f : L \rightarrow K$ such that $L_k \rightarrow K_k$ factors through u .*

Proof. Denote $Y = K_k$. There is a canonical morphism $K \rightarrow \text{Hom}(\Delta[k], Y)$ corresponding to id_Y via Simplicial, Lemma 14.16.5. We will use the description of $\text{Hom}(\Delta[k], Y)$ and $\text{Hom}(\Delta[k], Z)$ given in that lemma. In particular there is a morphism $\text{Hom}(\Delta[k], Y) \rightarrow \text{Hom}(\Delta[k], Z)$ which on degree n terms is the morphism

$$\prod_{\alpha: [k] \rightarrow [n]} Y \longrightarrow \prod_{\alpha: [k] \rightarrow [n]} Z.$$

Set

$$L = K \times_{\text{Hom}(\Delta[n], Y)} \text{Hom}(\Delta[n], Z).$$

The morphism $L_k \rightarrow K_k$ sits in to a commutative diagram

$$\begin{array}{ccccc}
 L_k & \longrightarrow & \prod_{\alpha: [k] \rightarrow [n]} Y & \xrightarrow{\text{pr}_{\text{id}_{[k]}}} & Y \\
 \downarrow & & \downarrow & & \downarrow \\
 K_k & \longrightarrow & \prod_{\alpha: [k] \rightarrow [n]} Z & \xrightarrow{\text{pr}_{\text{id}_{[k]}}} & Z
 \end{array}$$

Since the composition of the two bottom arrows is the identity we conclude that we have the desired factorization.

We still have to show that L is a hypercovering of X . To see this we will use Lemma 24.6.1. Condition (1) is satisfied by assumption. For (2), the morphism

$$\text{Hom}(\Delta[k], Y)_0 \rightarrow \text{Hom}(\Delta[k], Z)_0$$

is a covering because it is a product of coverings, see Lemma 24.2.5. For (3) suppose first that $n \geq 1$. In this case by Simplicial, Lemma 14.20.12 we have $\text{Hom}(\Delta[k], Y) = \text{cosk}_n \text{sk}_n \text{Hom}(\Delta[k], Y)$ and similarly for Z . Thus condition (3) for $n > 0$ is clear. For $n = 0$, the diagram of condition (3) of Lemma 24.6.1 is, according to Simplicial, Lemma 14.20.13, the diagram

$$\begin{array}{ccc} \prod_{\alpha: [k] \rightarrow [1]} Z & \longrightarrow & Z \times Z \\ \downarrow & & \downarrow \\ \prod_{\alpha: [k] \rightarrow [1]} Y & \longrightarrow & Y \times Y \end{array}$$

with obvious horizontal arrows. Thus the morphism γ is the morphism

$$\prod_{\alpha: [k] \rightarrow [1]} Z \longrightarrow \prod_{\alpha: [k] \rightarrow [1] \text{ not onto}} Z \times \prod_{\alpha: [k] \rightarrow [1] \text{ onto}} Y$$

which is a product of coverings and hence a covering according to Lemma 24.6.1 once again. \square

Lemma 24.6.4. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let $n \geq 0$ be an integer. Let $u : \mathcal{F} \rightarrow F(K_n)$ be a morphism of presheaves which becomes surjective on sheafification. Then there exists a morphism of hypercoverings $f : L \rightarrow K$ such that $F(f_n) : F(L_n) \rightarrow F(K_n)$ factors through u .*

Proof. Write $K_n = \{U_i \rightarrow X\}_{i \in I}$. Thus the map u is a morphism of presheaves of sets $u : \mathcal{F} \rightarrow \coprod h_{u_i}$. The assumption on u means that for every $i \in I$ there exists a covering $\{U_{ij} \rightarrow U_i\}_{j \in I_i}$ of the site \mathcal{C} and a morphism of presheaves $t_{ij} : h_{U_{ij}} \rightarrow \mathcal{F}$ such that $u \circ t_{ij}$ is the map $h_{U_{ij}} \rightarrow h_{U_i}$ coming from the morphism $U_{ij} \rightarrow U_i$. Set $J = \coprod_{i \in I} I_i$, and let $\alpha : J \rightarrow I$ be the obvious map. For $j \in J$ denote $V_j = U_{\alpha(j)j}$. Set $Z = \{V_j \rightarrow X\}_{j \in J}$. Finally, consider the morphism $u' : Z \rightarrow K_n$ given by $\alpha : J \rightarrow I$ and the morphisms $V_j = U_{\alpha(j)j} \rightarrow U_{\alpha(j)}$ above. Clearly, this is a covering in the category $\text{SR}(\mathcal{C}, X)$, and by construction $F(u') : F(Z) \rightarrow F(K_n)$ factors through u . Thus the result follows from Lemma 24.6.3 above. \square

24.7. Adding simplices

In this section we prove some technical lemmas which we will need later. Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . As we pointed out in Section 24.6 above, the objects $U \times K$ and $\text{Hom}(U, K)$ for certain simplicial sets U and any simplicial object K of $\text{SR}(\mathcal{C}, X)$ are defined. See Simplicial, Sections 14.13 and 14.16.

Lemma 24.7.1. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let $U \subset V$ be simplicial sets, with U_n, V_n finite nonempty for all n . Assume that U has finitely many nondegenerate simplices. Suppose $n \geq 0$ and $x \in V_n, x \notin U_n$ are such that*

- (1) $V_i = U_i$ for $i < n$,
- (2) $V_n = U_n \cup \{x\}$,
- (3) any $z \in V_j$, $z \notin U_j$ for $j > n$ is degenerate.

Then the morphism

$$\text{Hom}(V, K)_0 \longrightarrow \text{Hom}(U, K)_0$$

of $\text{SR}(\mathcal{C}, X)$ is a covering.

Proof. If $n = 0$, then it follows easily that $V = U \amalg \Delta[0]$ (see below). In this case $\text{Hom}(V, K)_0 = \text{Hom}(U, K)_0 \times K_0$. The result, in this case, then follows from Lemma 24.2.5.

Let $a : \Delta[n] \rightarrow V$ be the morphism associated to x as in *Simplicial*, Lemma 14.11.3. Let us write $\partial\Delta[n] = i_{(n-1), \text{sk}_{n-1}}\Delta[n]$ for the $(n - 1)$ -skeleton of $\Delta[n]$. Let $b : \partial\Delta[n] \rightarrow U$ be the restriction of a to the $(n - 1)$ skeleton of $\Delta[n]$. By *Simplicial*, Lemma 14.20.7 we have $V = U \amalg_{\partial\Delta[n]} \Delta[n]$. By *Simplicial*, Lemma 14.16.6 we get that

$$\begin{array}{ccc} \text{Hom}(V, K)_0 & \longrightarrow & \text{Hom}(U, K)_0 \\ \downarrow & & \downarrow \\ \text{Hom}(\Delta[n], K)_0 & \longrightarrow & \text{Hom}(\partial\Delta[n], K)_0 \end{array}$$

is a fibre product square. Thus it suffices to show that the bottom horizontal arrow is a covering. By *Simplicial*, Lemma 14.20.11 this arrow is identified with

$$K_n \rightarrow (\text{cosk}_{n-1}\text{sk}_{n-1}K)_n$$

and hence is a covering by definition of a hypercovering. □

Lemma 24.7.2. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K be a hypercovering of X . Let $U \subset V$ be simplicial sets, with U_n, V_n finite nonempty for all n . Assume that U and V have finitely many nondegenerate simplices. Then the morphism*

$$\text{Hom}(V, K)_0 \longrightarrow \text{Hom}(U, K)_0$$

of $\text{SR}(\mathcal{C}, X)$ is a covering.

Proof. By Lemma 24.7.1 above, it suffices to prove a simple lemma about inclusions of simplicial sets $U \subset V$ as in the lemma. And this is exactly the result of *Simplicial*, Lemma 14.20.8. □

24.8. Homotopies

Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let L be a simplicial object of $\text{SR}(\mathcal{C}, X)$. According to *Simplicial*, Lemma 14.16.4 there exists an object $\text{Hom}(\Delta[1], L)$ in the category $\text{Simp}(\text{SR}(\mathcal{C}, X))$ which represents the functor

$$T \longmapsto \text{Mor}_{\text{Simp}(\text{SR}(\mathcal{C}, X))}(\Delta[1] \times T, L)$$

There is a canonical morphism

$$\text{Hom}(\Delta[1], L) \rightarrow L \times L$$

coming from $e_i : \Delta[0] \rightarrow \Delta[1]$ and the identification $\text{Hom}(\Delta[0], L) = L$.

Lemma 24.8.1. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let L be a simplicial object of $SR(\mathcal{C}, X)$. Let $n \geq 0$. Consider the commutative diagram*

$$(24.8.1.1) \quad \begin{array}{ccc} \text{Hom}(\Delta[1], L)_{n+1} & \longrightarrow & (\text{cosk}_n \text{sk}_n \text{Hom}(\Delta[1], L))_{n+1} \\ \downarrow & & \downarrow \\ (L \times L)_{n+1} & \longrightarrow & (\text{cosk}_n \text{sk}_n(L \times L))_{n+1} \end{array}$$

coming from the morphism defined above. We can identify the terms in this diagram as follows, where $\partial\Delta[n+1] = i_{n!} \text{sk}_n \Delta[n+1]$ is the n -skeleton of the $(n+1)$ -simplex:

$$\begin{aligned} \text{Hom}(\Delta[1], L)_{n+1} &= \text{Hom}(\Delta[1] \times \Delta[n+1], L)_0 \\ (\text{cosk}_n \text{sk}_n \text{Hom}(\Delta[1], L))_{n+1} &= \text{Hom}(\Delta[1] \times \partial\Delta[n+1], L)_0 \\ (L \times L)_{n+1} &= \text{Hom}(\Delta[n+1] \amalg \Delta[n+1], L)_0 \\ (\text{cosk}_n \text{sk}_n(L \times L))_{n+1} &= \text{Hom}(\partial\Delta[n+1] \amalg \partial\Delta[n+1], L)_0 \end{aligned}$$

and the morphism between these objects of $SR(\mathcal{C}, X)$ come from the commutative diagram of simplicial sets

$$(24.8.1.2) \quad \begin{array}{ccc} \Delta[1] \times \Delta[n+1] & \longleftarrow & \Delta[1] \times \partial\Delta[n+1] \\ \uparrow & & \uparrow \\ \Delta[n+1] \amalg \Delta[n+1] & \longleftarrow & \partial\Delta[n+1] \amalg \partial\Delta[n+1] \end{array}$$

Moreover the fibre product of the bottom arrow and the right arrow in (24.8.1.1) is equal to

$$\text{Hom}(U, L)_0$$

where $U \subset \Delta[1] \times \Delta[n+1]$ is the smallest simplicial subset such that both $\Delta[n+1] \amalg \Delta[n+1]$ and $\Delta[1] \times \partial\Delta[n+1]$ map into it.

Proof. The first and third equalities are Simplicial, Lemma 14.16.4. The second and fourth follow from the cited lemma combined with Simplicial, Lemma 14.20.11. The last assertion follows from the fact that U is the push-out of the bottom and right arrow of the diagram (24.8.1.2), via Simplicial, Lemma 14.16.6. To see that U is equal to this push-out it suffices to see that the intersection of $\Delta[n+1] \amalg \Delta[n+1]$ and $\Delta[1] \times \partial\Delta[n+1]$ in $\Delta[1] \times \Delta[n+1]$ is equal to $\partial\Delta[n+1] \amalg \partial\Delta[n+1]$. This we leave to the reader. \square

Lemma 24.8.2. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let K, L be hypercoverings of X . Let $a, b : K \rightarrow L$ be morphisms of hypercoverings. There exists a morphism of hypercoverings $c : K' \rightarrow K$ such that $a \circ c$ is homotopic to $b \circ c$.*

Proof. Consider the following commutative diagram

$$\begin{array}{ccc} K' \xrightarrow{\text{def}} K \times_{(L \times L)} \text{Hom}(\Delta[1], L) & \longrightarrow & \text{Hom}(\Delta[1], L) \\ & \searrow c & \downarrow \\ & & K \xrightarrow{(a,b)} L \times L \end{array}$$

By the functorial property of $\text{Hom}(\Delta[1], L)$ the composition of the horizontal morphisms corresponds to a morphism $K' \Delta[1] \rightarrow L$ which defines a homotopy between

$c \circ a$ and $c \circ b$. Thus if we can show that K' is a hypercovering of X , then we obtain the lemma. To see this we will apply Lemma 24.6.1 to the pair of morphisms $K \rightarrow L \times L$ and $\text{Hom}(\Delta[1], L) \rightarrow L \times L$. Condition (1) of Lemma 24.6.1 is satisfied. Condition (2) of Lemma 24.6.1 is true because $\text{Hom}(\Delta[1], L)_0 = L_1$, and the morphism $(d_0^1, d_1^1) : L_1 \rightarrow L_0 \times L_0$ is a covering of $\text{SR}(\mathcal{C}, X)$ by our assumption that L is a hypercovering. To prove condition (3) of Lemma 24.6.1 we use Lemma 24.8.1 above. According to this lemma the morphism γ of condition (3) of Lemma 24.6.1 is the morphism

$$\text{Hom}(\Delta[1] \times \Delta[n + 1], L)_0 \longrightarrow \text{Hom}(U, L)_0$$

where $U \subset \Delta[1] \times \Delta[n + 1]$. According to Lemma 24.7.2 this is a covering and hence the claim has been proven. \square

Remark 24.8.3. Note that the crux of the proof is to use Lemma 24.7.2. This lemma is completely general and does not care about the exact shape of the simplicial sets (as long as they have only finitely many nondegenerate simplices). It seems altogether reasonable to expect a result of the following kind: Given any morphism $a : K \times \partial\Delta[k] \rightarrow L$, with K and L hypercoverings, there exists a morphism of hypercoverings $c : K' \rightarrow K$ and a morphism $g : K' \times \Delta[k] \rightarrow L$ such that $g|_{K' \times \partial\Delta[k]} = a \circ (c \times \text{id}_{\partial\Delta[k]})$. In other words, the category of hypercoverings is in a suitable sense contractible.

24.9. Cohomology and hypercoverings

Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let \mathcal{F} be a sheaf of abelian groups on \mathcal{C} . Let K, L be hypercoverings of X . If $a, b : K \rightarrow L$ are homotopic maps, then $\mathcal{F}(a), \mathcal{F}(b) : \mathcal{F}(K) \rightarrow \mathcal{F}(L)$ are homotopic maps, see Simplicial, Lemma 14.27.3. Hence have the same effect on cohomology groups of the associated cochain complexes, see Simplicial, Lemma 14.27.5. We are going to use this to define the colimit over all hypercoverings.

Let us temporarily denote $\text{HC}(\mathcal{C}, X)$ the category of hypercoverings of X . We have seen that this is a category and not a “big” category, see Lemma 24.2.8. This will be the index category for our diagram, see Categories, Section 4.14 for notation. Consider the diagram

$$\check{H}^i(-, \mathcal{F}) : \text{HC}(\mathcal{C}, X) \longrightarrow \text{Ab}.$$

By Lemma 24.6.2 and Lemma 24.8.2, and the remark on homotopies above, this diagram is directed, see Categories, Definition 4.19.1. Thus the colimit

$$\check{H}_{\text{HC}}^i(X, \mathcal{F}) = \text{colim}_{K \in \text{HC}(\mathcal{C}, X)} \check{H}^i(K, \mathcal{F})$$

has a particularly simple description (see location cited).

Theorem 24.9.1. *Let \mathcal{C} be a site with fibre products. Let X be an object of \mathcal{C} . Let $i \geq 0$. The functors*

$$\begin{aligned} \text{Ab}(\mathcal{C}) &\longrightarrow \text{Ab} \\ \mathcal{F} &\longmapsto H^i(X, \mathcal{F}) \\ \mathcal{F} &\longmapsto \check{H}_{\text{HC}}^i(X, \mathcal{F}) \end{aligned}$$

are canonically isomorphic.

Proof using spectral sequences. Suppose that $\xi \in H^p(X, \mathcal{F})$ for some $p \geq 0$. Let us show that ξ is in the image of the map $\check{H}^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F})$ of Lemma 24.4.3 for some hypercovering K of X .

This is true if $p = 0$ by Lemma 24.4.1. If $p = 1$, choose a Čech hypercovering K of X as in Example 24.2.7 starting with a covering $K_0 = \{U_i \rightarrow X\}$ in the site \mathcal{C} such that $\xi|_{U_i} = 0$, see Cohomology on Sites, Lemma 21.8.3. It follows immediately from the spectral sequence in Lemma 24.4.3 that ξ comes from an element of $\check{H}^1(K, \mathcal{F})$ in this case. In general, choose any hypercovering K of X such that ξ maps to zero in $\underline{H}^p(\mathcal{F})(K_0)$ (using Example 24.2.7 and Cohomology on Sites, Lemma 21.8.3 again). By the spectral sequence of Lemma 24.4.3 the obstruction for ξ to come from an element of $\check{H}^p(K, \mathcal{F})$ is a sequence of elements ξ_1, \dots, ξ_{p-1} with $\xi_q \in \check{H}^{p-q}(K, \underline{H}^q(\mathcal{F}))$ (more precisely the images of the ξ_q in certain subquotients of these groups).

We can inductively replace the hypercovering K by refinements such that the obstructions ξ_1, \dots, ξ_{p-1} restrict to zero (and not just the images in the subquotients – so no subtlety here). Indeed, suppose we have already managed to reach the situation where $\xi_{q+1}, \dots, \xi_{p-1}$ are zero. Note that $\xi_q \in \check{H}^{p-q}(K, \underline{H}^q(\mathcal{F}))$ is the class of some element

$$\tilde{\xi}_q \in \underline{H}^q(\mathcal{F})(K_{p-q}) = \prod H^q(U_i, \mathcal{F})$$

if $K_{p-q} = \{U_i \rightarrow X\}_{i \in I}$. Let $\xi_{q,i}$ be the component of $\tilde{\xi}_q$ in $H^q(U_i, \mathcal{F})$. As $q \geq 1$ we can use Cohomology on Sites, Lemma 21.8.3 yet again to choose coverings $\{U_{i,j} \rightarrow U_i\}$ of the site such that each restriction $\xi_{q,i}|_{U_{i,j}} = 0$. Consider the object $Z = \{U_{i,j} \rightarrow X\}$ of the category $\text{SR}(\mathcal{C}, X)$ and its obvious morphism $u : Z \rightarrow K_{p-q}$. It is clear that u is a covering, see Definition 24.2.4. By Lemma 24.6.3 there exists a morphism $L \rightarrow K$ of hypercoverings of X such that $L_{p-q} \rightarrow K_{p-q}$ factors through u . Then clearly the image of ξ_q in $\underline{H}^q(\mathcal{F})(L_{p-q})$ is zero. Since the spectral sequence of Lemma 24.4.3 is functorial this means that after replacing K by L we reach the situation where ξ_q, \dots, ξ_{p-1} are all zero. Continuing like this we end up with a hypercovering where they are all zero and hence ξ is in the image of the map $\check{H}^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F})$.

Suppose that K is a hypercovering of X , that $\xi \in \check{H}^p(K, \mathcal{F})$ and that the image of ξ under the map $\check{H}^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F})$ of Lemma 24.4.3 is zero. To finish the proof of the theorem we have to show that there exists a morphism of hypercoverings $L \rightarrow K$ such that ξ restricts to zero in $\check{H}^p(L, \mathcal{F})$. By the spectral sequence of Lemma 24.4.3 the vanishing of the image of ξ in $H^p(X, \mathcal{F})$ means that there exist elements ξ_1, \dots, ξ_{p-2} with $\xi_q \in \check{H}^{p-1-q}(K, \underline{H}^q(\mathcal{F}))$ (more precisely the images of these in certain subquotients) such that the images $d_{q+1}^{p-1-q, q} \xi_q$ (in the spectral sequence) add up to ξ . Hence by exactly the same mechanism as above we can find a morphism of hypercoverings $L \rightarrow K$ such that the restrictions of the elements ξ_q , $q = 1, \dots, p-2$ in $\check{H}^{p-1-q}(L, \underline{H}^q(\mathcal{F}))$ are zero. Then it follows that ξ is zero since the morphism $L \rightarrow K$ induces a morphism of spectral sequences according to Lemma 24.4.3. \square

Proof without using spectral sequences. We have seen the result for $i = 0$, see Lemma 24.4.1. We know that the functors $H^i(X, -)$ form a universal δ -functor, see Derived Categories, Lemma 13.20.4. In order to prove the theorem it suffices to show that the sequence of functors $\check{H}_{HC}^i(X, -)$ forms a δ -functor. Namely we

know that Čech cohomology is zero on injective sheaves (Lemma 24.4.2) and then we can apply Homology, Lemma 12.11.4.

Let

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$$

be a short exact sequence of abelian sheaves on \mathcal{C} . Let $\xi \in \check{H}_{HC}^p(X, \mathcal{H})$. Choose a hypercovering K of X and an element $\sigma \in \mathcal{H}(K_p)$ representing ξ in cohomology. There is a corresponding exact sequence of complexes

$$0 \rightarrow s(\mathcal{F}(K)) \rightarrow s(\mathcal{G}(K)) \rightarrow s(\mathcal{H}(K))$$

but we are not assured that there is a zero on the right also and this is the only thing that prevents us from defining $\delta(\xi)$ by a simple application of the snake lemma. Recall that

$$\mathcal{H}(K_p) = \prod \mathcal{H}(U_i)$$

if $K_p = \{U_i \rightarrow X\}$. Let $\sigma = \prod \sigma_i$ with $\sigma_i \in \mathcal{H}(U_i)$. Since $\mathcal{G} \rightarrow \mathcal{H}$ is a surjection of sheaves we see that there exist coverings $\{U_{i,j} \rightarrow U_i\}$ such that $\sigma_i|_{U_{i,j}}$ is the image of some element $\tau_{i,j} \in \mathcal{G}(U_{i,j})$. Consider the object $Z = \{U_{i,j} \rightarrow X\}$ of the category $\text{SR}(\mathcal{C}, X)$ and its obvious morphism $u : Z \rightarrow K_p$. It is clear that u is a covering, see Definition 24.2.4. By Lemma 24.6.3 there exists a morphism $L \rightarrow K$ of hypercoverings of X such that $L_p \rightarrow K_p$ factors through u . After replacing K by L we may therefore assume that σ is the image of an element $\tau \in \mathcal{G}(K_p)$. Note that $d(\sigma) = 0$, but not necessarily $d(\tau) = 0$. Thus $d(\tau) \in \mathcal{F}(K_{p+1})$ is a cocycle. In this situation we define $\delta(\xi)$ as the class of the cocycle $d(\tau)$ in $\check{H}_{HC}^{p+1}(X, \mathcal{F})$.

At this point there are several things to verify: (a) $\delta(\xi)$ does not depend on the choice of τ , (b) $\delta(\xi)$ does not depend on the choice of the hypercovering $L \rightarrow K$ such that σ lifts, and (c) $\delta(\xi)$ does not depend on the initial hypercovering and σ chosen to represent ξ . We omit the verification of (a), (b), and (c); the independence of the choices of the hypercoverings really comes down to Lemmas 24.6.2 and 24.8.2. We also omit the verification that δ is functorial with respect to morphisms of short exact sequences of abelian sheaves on \mathcal{C} .

Finally, we have to verify that with this definition of δ our short exact sequence of abelian sheaves above leads to a long exact sequence of Čech cohomology groups. First we show that if $\delta(\xi) = 0$ (with ξ as above) then ξ is the image of some element $\xi' \in \check{H}_{HC}^p(X, \mathcal{G})$. Namely, if $\delta(\xi) = 0$, then, with notation as above, we see that the class of $d(\tau)$ is zero in $\check{H}_{HC}^{p+1}(X, \mathcal{F})$. Hence there exists a morphism of hypercoverings $L \rightarrow K$ such that the restriction of $d(\tau)$ to an element of $\mathcal{F}(L_{p+1})$ is equal to $d(v)$ for some $v \in \mathcal{F}(L_p)$. This implies that $\tau|_{L_p} + v$ form a cocycle, and determine a class $\xi' \in \check{H}^p(L, \mathcal{G})$ which maps to ξ as desired.

We omit the proof that if $\xi' \in \check{H}_{HC}^{p+1}(X, \mathcal{F})$ maps to zero in $\check{H}_{HC}^{p+1}(X, \mathcal{G})$, then it is equal to $\delta(\xi)$ for some $\xi \in \check{H}_{HC}^p(X, \mathcal{H})$. \square

Next, we deduce Verdier's case of Theorem 24.9.1 by a sleight of hand.

Proposition 24.9.2. *Let \mathcal{C} be a site with fibre products and products of pairs. Let \mathcal{F} be an abelian sheaf on \mathcal{C} . Let $i \geq 0$. Then*

- (1) *for every $\xi \in H^i(\mathcal{F})$ there exists a hypercovering K such that ξ is in the image of the canonical map $\check{H}^i(K, \mathcal{F}) \rightarrow H^i(\mathcal{F})$, and*

- (2) if K, L are hypercoverings and $\xi_K \in \check{H}^i(K, \mathcal{F})$, $\xi_L \in \check{H}^i(L, \mathcal{F})$ are elements mapping to the same element of $H^i(\mathcal{F})$, then there exists a hypercovering M and morphisms $M \rightarrow K$ and $M \rightarrow L$ such that ξ_K and ξ_L map to the same element of $\check{H}^i(M, \mathcal{F})$.

In other words, modulo set theoretical issues, the cohomology groups of \mathcal{F} on \mathcal{C} are the colimit of the Čech cohomology groups of \mathcal{F} over all hypercoverings.

Proof. This result is a trivial consequence of Theorem 24.9.1. Namely, we can artificially replace \mathcal{C} with a slightly bigger site \mathcal{C}' such that (I) \mathcal{C}' has a final object X and (II) hypercoverings in \mathcal{C} are more or less the same thing as hypercoverings of X in \mathcal{C}' . But due to the nature of things, there is quite a bit of bookkeeping to do.

Let us call a family of morphisms $\{U_i \rightarrow U\}$ in \mathcal{C} with fixed target a *weak covering* if the sheafification of the map $\prod_{i \in I} h_{U_i} \rightarrow h_U$ becomes surjective. We construct a new site \mathcal{C}' as follows

- (1) as a category set $\text{Ob}(\mathcal{C}') = \text{Ob}(\mathcal{C}) \amalg \{X\}$ and add a unique morphism to X from every object of \mathcal{C}' ,
- (2) \mathcal{C}' has fibre products as fibre products and products of pairs exist in \mathcal{C} ,
- (3) coverings of \mathcal{C}' are weak coverings of \mathcal{C} together with those $\{U_i \rightarrow X\}_{i \in I}$ such that either $U_i = X$ for some i , or $U_i \neq X$ for all i and the map $\prod h_{U_i} \rightarrow *$ of presheaves on \mathcal{C} becomes surjective after sheafification on \mathcal{C} ,
- (4) we apply Sets, Lemma 3.11.1 to restrict the coverings to obtain our site \mathcal{C}' .

Then $Sh(\mathcal{C}') = Sh(\mathcal{C})$ because the inclusion functor $\mathcal{C} \rightarrow \mathcal{C}'$ is a special cocontinuous functor (see Sites, Definition 7.28.2). We omit the straightforward verifications.

Choose a covering $\{U_i \rightarrow X\}$ of \mathcal{C}' such that U_i is an object of \mathcal{C} for all i (possible because $\mathcal{C} \rightarrow \mathcal{C}'$ is special cocontinuous). Then $K_0 = \{U_i \rightarrow X\}$ is a covering in the site \mathcal{C}' constructed above. We view K_0 as an object of $\text{SR}(\mathcal{C}', X)$ and we set $K_{init} = \text{cosk}_0(K_0)$. Then K_{init} is a hypercovering of X , see Example 24.2.7. Note that every $K_{init, n}$ has the shape $\{W_j \rightarrow X\}$ with $W_j \in \text{Ob}(\mathcal{C})$.

Proof of (1). Choose $\xi \in H^i(\mathcal{F}) = H^i(X, \mathcal{F}')$ where \mathcal{F}' is the abelian sheaf on \mathcal{C}' corresponding to \mathcal{F} on \mathcal{C} . By Theorem 24.9.1 there exists a morphism of hypercoverings $K' \rightarrow K_{init}$ of X in \mathcal{C}' such that ξ comes from an element of $\check{H}^i(K', \mathcal{F})$. Write $K'_n = \{U_{n, j} \rightarrow X\}$. Now since K'_n maps to $K_{init, n}$ we see that $U_{n, j}$ is an object of \mathcal{C} . Hence we can define a simplicial object K of $\text{SR}(\mathcal{C})$ by setting $K_n = \{U_{n, j}\}$. Since coverings in \mathcal{C}' consisting of families of morphisms of \mathcal{C} are weak coverings, we see that K is a hypercovering in the sense of Definition 24.5.1. Finally, since \mathcal{F}' is the unique sheaf on \mathcal{C}' whose restriction to \mathcal{C} is equal to \mathcal{F} we see that the Čech complexes $s(\mathcal{F}(K))$ and $s(\mathcal{F}'(K'))$ are identical and (1) follows. (Compatibility with map into cohomology groups omitted.)

Proof of (2). Let K and L be hypercoverings in \mathcal{C} . Let K' and L' be the simplicial objects of $\text{SR}(\mathcal{C}', X)$ gotten from K and L by the functor $\text{SR}(\mathcal{C}) \rightarrow \text{SR}(\mathcal{C}', X)$, $\{U_i\} \mapsto \{U_i \rightarrow X\}$. As before we have equality of Čech complexes and hence we obtain $\xi_{K'}$ and $\xi_{L'}$ mapping to the same cohomology class of \mathcal{F}' over \mathcal{C}' . After possibly enlarging our choice of coverings in \mathcal{C}' (due to a set theoretical issue) we may assume that K' and L' are hypercoverings of X in \mathcal{C}' ; this is true by our

definition of hypercoverings in Definition 24.5.1 and the fact that weak coverings in \mathcal{C} give coverings in \mathcal{C}' . By Theorem 24.9.1 there exists a hypercovering M' of X in \mathcal{C}' and morphisms $M' \rightarrow K'$, $M' \rightarrow L'$, and $M' \rightarrow K_{init}$ such that $\xi_{K'}$ and $\xi_{L'}$ restrict to the same element of $\check{H}^i(M', \mathcal{F})$. Unwinding this statement as above we find that (2) is true. \square

24.10. Hypercoverings of spaces

The theory above is mildly interesting even in the case of topological spaces. In this case we can work out what a hypercovering is and see what the result actually says.

Let X be a topological space. Consider the site X_{Zar} of Sites, Example 7.6.4. Recall that an object of X_{Zar} is simply an open of X and that morphisms of X_{Zar} correspond simply to inclusions. So what is a hypercovering of X for the site X_{Zar} ?

Let us first unwind Definition 24.2.1. An object of $SR(X_{Zar}, X)$ is simply given by a set I and for each $i \in I$ an open $U_i \subset X$. Let us denote this by $\{U_i\}_{i \in I}$ since there can be no confusion about the morphism $U_i \rightarrow X$. A morphism $\{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ between two such objects is given by a map of sets $\alpha : I \rightarrow J$ such that $U_i \subset V_{\alpha(i)}$ for all $i \in I$. When is such a morphism a covering? This is the case if and only if for every $j \in J$ we have $V_j = \bigcup_{i \in I, \alpha(i)=j} U_i$ (and is a covering in the site X_{Zar}).

Using the above we get the following description of a hypercovering in the site X_{Zar} . A hypercovering of X in X_{Zar} is given by the following data

- (1) a simplicial set I (see Simplicial, Section 14.11), and
- (2) for each $n \geq 0$ and every $i \in I_n$ an open set $U_i \subset X$.

We will denote such a collection of data by the notation $(I, \{U_i\})$. In order for this to be a hypercovering of X we require the following properties

- for $i \in I_n$ and $0 \leq a \leq n$ we have $U_i \subset U_{d_a^n(i)}$,
- for $i \in I_n$ and $0 \leq a \leq n$ we have $U_i = U_{s_a^n(i)}$,
- we have

$$(24.10.0.1) \quad X = \bigcup_{i \in I_0} U_i,$$

- for every $i_0, i_1 \in I_0$, we have

$$(24.10.0.2) \quad U_{i_0} \cap U_{i_1} = \bigcup_{i \in I_1, d_0^1(i)=i_0, d_1^1(i)=i_1} U_i,$$

- for every $n \geq 1$ and every $(i_0, \dots, i_{n+1}) \in (I_n)^{n+2}$ such that $d_{b-1}^n(i_a) = d_a^n(i_b)$ for all $0 \leq a < b \leq n+1$ we have

$$(24.10.0.3) \quad U_{i_0} \cap \dots \cap U_{i_{n+1}} = \bigcup_{i \in I_{n+1}, d_a^{n+1}(i)=i_a, a=0, \dots, n+1} U_i,$$

- each of the open coverings (24.10.0.1), (24.10.0.2), and (24.10.0.3) is an element of $\text{Cov}(X_{Zar})$ (this is a set theoretic condition, bounding the size of the index sets of the coverings).

Conditions (24.10.0.1) and (24.10.0.2) should be familiar from the chapter on sheaves on spaces for example, and condition (24.10.0.3) is the natural generalization.

Remark 24.10.1. One feature of this description is that if one of the multiple intersections $U_{i_0} \cap \dots \cap U_{i_{n+1}}$ is empty then the covering on the right hand side may be the empty covering. Thus it is not automatically the case that the maps

$I_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n I)_{n+1}$ are surjective. This means that the geometric realization of I may be an interesting (non-contractible) space.

In fact, let $I'_n \subset I_n$ be the subset consisting of those simplices $i \in I_n$ such that $U_i \neq \emptyset$. It is easy to see that $I' \subset I$ is a subsimplicial set, and that $(I', \{U_i\})$ is a hypercovering. Hence we can always refine a hypercovering to a hypercovering where none of the opens U_i is empty.

Remark 24.10.2. Let us repackage this information in yet another way. Namely, suppose that $(I, \{U_i\})$ is a hypercovering of the topological space X . Given this data we can construct a simplicial topological space U_\bullet by setting

$$U_n = \coprod_{i \in I_n} U_i,$$

and where for given $\varphi : [n] \rightarrow [m]$ we let morphisms $U(\varphi) : U_n \rightarrow U_m$ be the morphism coming from the inclusions $U_i \subset U_{\varphi(i)}$ for $i \in I_n$. This simplicial topological space comes with an augmentation $\epsilon : U_\bullet \rightarrow X$. With this morphism the simplicial space U_\bullet becomes a hypercovering of X along which one has cohomological descent in the sense of [AGV71, Exposé Vbis]. In other words, $H^n(U_\bullet, \epsilon^* \mathcal{F}) = H^n(X, \mathcal{F})$. (Insert future reference here to cohomology over simplicial spaces and cohomological descent formulated in those terms.) Suppose that \mathcal{F} is an abelian sheaf on X . In this case the spectral sequence of Lemma 24.4.3 becomes the spectral sequence with E_1 -term

$$E_1^{p,q} = H^q(U_p, \epsilon_q^* \mathcal{F}) \Rightarrow H^{p+q}(U_\bullet, \epsilon^* \mathcal{F}) = H^{p+q}(X, \mathcal{F})$$

comparing the total cohomology of $\epsilon^* \mathcal{F}$ to the cohomology groups of \mathcal{F} over the pieces of U_\bullet . (Insert future reference to this spectral sequence here.)

In topology we often want to find hypercoverings of X which have the property that all the U_i come from a given basis for the topology of X and that all the coverings (24.10.0.2) and (24.10.0.3) are from a given cofinal collection of coverings. Here are two example lemmas.

Lemma 24.10.3. *Let X be a topological space. Let \mathcal{B} be a basis for the topology of X . There exists a hypercovering $(I, \{U_i\})$ of X such that each U_i is an element of \mathcal{B} .*

Proof. Let $n \geq 0$. Let us say that an n -truncated hypercovering of X is given by an n -truncated simplicial set I and for each $i \in I_a$, $0 \leq a \leq n$ an open U_i of X such that the conditions defining a hypercovering hold whenever they make sense. In other words we require the inclusion relations and covering conditions only when all simplices that occur in them are a -simplices with $a \leq n$. The lemma follows if we can prove that given a n -truncated hypercovering $(I, \{U_i\})$ with all $U_i \in \mathcal{B}$ we can extend it to an $(n+1)$ -truncated hypercovering without adding any a -simplices for $a \leq n$. This we do as follows. First we consider the $(n+1)$ -truncated simplicial set I' defined by $I' = \text{sk}_{n+1}(\text{cosk}_n I)$. Recall that

$$I'_{n+1} = \left\{ (i_0, \dots, i_{n+1}) \in (I_n)^{n+2} \text{ such that } \left. \begin{array}{l} d_{b-1}^n(i_a) = d_a^n(i_b) \text{ for all } 0 \leq a < b \leq n+1 \end{array} \right\}$$

If $i' \in I'_{n+1}$ is degenerate, say $i' = s_a^n(i)$ then we set $U_{i'} = U_i$ (this is forced on us anyway by the second condition). We also set $J_{i'} = \{i'\}$ in this case. If $i' \in I'_{n+1}$

is nondegenerate, say $i' = (i_0, \dots, i_{n+1})$, then we choose a set $J_{i'}$ and an open covering

$$(24.10.3.1) \quad U_{i_0} \cap \dots \cap U_{i_{n+1}} = \bigcup_{i \in J_{i'}} U_i,$$

with $U_i \in \mathcal{B}$ for $i \in J_{i'}$. Set

$$I_{n+1} = \coprod_{i' \in I'_{n+1}} J_{i'}$$

There is a canonical map $\pi : I_{n+1} \rightarrow I'_{n+1}$ which is a bijection over the set of degenerate simplices in I'_{n+1} by construction. For $i \in I_{n+1}$ we define $d_a^{n+1}(i) = d_a^{n+1}(\pi(i))$. For $i \in I_n$ we define $s_a^n(i) \in I_{n+1}$ as the unique simplex lying over the degenerate simplex $s_a^n(i) \in I'_{n+1}$. We omit the verification that this defines an $(n + 1)$ -truncated hypercovering of X . \square

Lemma 24.10.4. *Let X be a topological space. Let \mathcal{B} be a basis for the topology of X . Assume that*

- (1) X is quasi-compact,
- (2) each $U \in \mathcal{B}$ is quasi-compact open, and
- (3) the intersection of any two quasi-compact opens in X is quasi-compact.

Then there exists a hypercovering $(I, \{U_i\})$ of X with the following properties

- (1) each U_i is an element of the basis \mathcal{B} ,
- (2) each of the I_n is a finite set, and in particular
- (3) each of the coverings (24.10.0.1), (24.10.0.2), and (24.10.0.3) is finite.

Proof. This follows directly from the construction in the proof of Lemma 24.10.3 if we choose finite coverings by elements of \mathcal{B} in (24.10.3.1). Details omitted. \square

24.11. Hypercoverings and weakly contractible objects

In this section we construct hypercoverings in the presence of enough weakly contractible objects (Sites, Definition 7.39.2). With our conventions this is particularly straightforward if every object has a covering by a single weakly contractible object.

Lemma 24.11.1. *Let \mathcal{C} be a site. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Assume*

- (1) \mathcal{C} has fibre products,
- (2) for all $X \in \text{Ob}(\mathcal{C})$ there exists a covering $\{U \rightarrow X\}$ with $U \in \mathcal{B}$,
- (3) every element of \mathcal{B} is weakly contractible,
- (4) the topology is subcanonical.

Then for every X there exists a hypercovering K of X such that each $K_n = \{U_n \rightarrow X\}$ with $U_n \in \mathcal{B}$.

Proof. We will construct K by induction. As a first approximation choose a covering $\{U_0 \rightarrow X\}$ with $U_0 \in \mathcal{B}$ and set $K_0 = \{U_0 \rightarrow X\}$ and $K = \text{cosk}_0 K_0$, see Example 24.2.7. (This object will be denoted K^0 in the final paragraph of the proof.)

Suppose for some $n \geq 0$ we have constructed a hypercovering K such that K_k consists of a single object of \mathcal{B} mapping to X for $0 \leq k \leq n$ and such that $K = \text{cosk}_n \text{sk}_n K$. In particular $K_{n+1} = (\text{cosk}_n \text{sk}_n K)_{n+1}$ is a finite limit of K_k for $k \leq n$, see *Simplicial*, Section 14.12 (especially Lemmas 14.18.2 and 14.18.5). By the description of finite limits in $\text{SR}(\mathcal{C}, X)$ (see proof of Lemma 24.2.3) we see that $K_{n+1} = \{X_{n+1} \rightarrow X\}$ for some object X_{n+1} of \mathcal{C} . Choose a covering

$\{U_{n+1} \rightarrow X_{n+1}\}$ with $U_{n+1} \in \mathcal{B}$. Since U_n is weakly contractible, the topology is subcanonical, and $\{U_{n+1} \rightarrow X_{n+1}\}$ is a covering, the morphisms $s_i : U_n \rightarrow X_{n+1}$ lift to morphisms $s'_i : U_n \rightarrow U_{n+1}$. Set $d'_j : U_{n+1} \rightarrow U_n$ equal to the composition of $U_{n+1} \rightarrow X_{n+1}$ and $d_j : X_{n+1} \rightarrow U_n$. We obtain a truncated simplicial object K' of $\text{SR}(\mathcal{C}, X)$ by setting $K'_k = K_k$ for $k \leq n$ and $K'_{n+1} = U_{n+1}$ and morphisms $d'_i = d_i$ and $s'_i = s_i$ in degrees $k \leq n-1$ and using the morphisms d'_j and s'_i in degree n . Extend this to a full simplicial object K' of $\text{SR}(\mathcal{C}, X)$ using cosk_{n+1} . By functoriality of the coskeleton functors there is a morphism $K' \rightarrow K$ of simplicial objects extending the given morphism of $(n+1)$ -truncated simplicial objects.

It is immediately clear from the construction that the simplicial object K' so constructed is a hypercovering of X . Moreover, note that $K' \rightarrow K$ is the identity morphism in degrees $\leq n$.

To finish the proof we take the inverse limit $K = \lim K^n$ of the sequence of simplicial objects

$$\dots \rightarrow K^2 \rightarrow K^1 \rightarrow K^0$$

constructed above. Since we have stabilization in each degree it is clear that K agrees with K^n in degrees $\leq n$ and therefore is a hypercovering of X . \square

CHAPTER 25

Schemes

25.1. Introduction

In this document we define schemes. A basic reference is [DG67].

25.2. Locally ringed spaces

Recall that we defined ringed spaces in Sheaves, Section 6.25. Briefly, a ringed space is a pair (X, \mathcal{O}_X) consisting of a topological space X and a sheaf of rings \mathcal{O}_X . A morphism of ringed spaces $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ is given by a continuous map $f : X \rightarrow Y$ and an f -map of sheaves of rings $f^\# : \mathcal{O}_Y \rightarrow \mathcal{O}_X$. You can think of $f^\#$ as a map $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$, see Sheaves, Definition 6.21.7 and Lemma 6.21.8.

A good geometric example of this to keep in mind is \mathcal{C}^∞ -manifolds and morphisms of \mathcal{C}^∞ -manifolds. Namely, if M is a \mathcal{C}^∞ -manifold, then the sheaf \mathcal{C}_M^∞ of smooth functions is a sheaf of rings on M . And any map $f : M \rightarrow N$ of manifolds is smooth if and only if for every local section h of \mathcal{C}_N^∞ the composition $h \circ f$ is a local section of \mathcal{C}_M^∞ . Thus a smooth map f gives rise in a natural way to a morphism of ringed spaces

$$f : (M, \mathcal{C}_M^\infty) \longrightarrow (N, \mathcal{C}_N^\infty)$$

see Sheaves, Example 6.25.2. It is instructive to consider what happens to stalks. Namely, let $m \in M$ with image $f(m) = n \in N$. Recall that the stalk $\mathcal{C}_{M,m}^\infty$ is the ring of germs of smooth functions at m , see Sheaves, Example 6.11.4. The algebra of germs of functions on (M, m) is a local ring with maximal ideal the functions which vanish at m . Similarly for $\mathcal{C}_{N,n}^\infty$. The map on stalks $f^\# : \mathcal{C}_{N,n}^\infty \rightarrow \mathcal{C}_{M,m}^\infty$ maps the maximal ideal into the maximal ideal, simply because $f(m) = n$.

In algebraic geometry we study schemes. On a scheme the sheaf of rings is not determined by an intrinsic property of the space. The spectrum of a ring R (see Algebra, Section 10.16) endowed with a sheaf of rings constructed out of R (see below), will be our basic building block. It will turn out that the stalks of \mathcal{O} on $\text{Spec}(R)$ are the local rings of R at its primes. There are two reasons to introduce locally ringed spaces in this setting: (1) There is in general no mechanism that assigns to a continuous map of spectra a map of the corresponding rings. This is why we add as an extra datum the map $f^\#$. (2) If we consider morphisms of these spectra in the category of ringed spaces, then the maps on stalks may not be local homomorphisms. Since our geometric intuition says it should we introduce locally ringed spaces as follows.

Definition 25.2.1. Locally ringed spaces.

- (1) A *locally ringed space* (X, \mathcal{O}_X) is a pair consisting of a topological space X and a sheaf of rings \mathcal{O}_X all of whose stalks are local rings.

- (2) Given a locally ringed space (X, \mathcal{O}_X) we say that $\mathcal{O}_{X,x}$ is the *local ring of X at x* . We denote $\mathfrak{m}_{X,x}$ or simply \mathfrak{m}_x the maximal ideal of $\mathcal{O}_{X,x}$. Moreover, the *residue field of X at x* is the residue field $\kappa(x) = \mathcal{O}_{X,x}/\mathfrak{m}_x$.
- (3) A *morphism of locally ringed spaces* $(f, f^\#) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ is a morphism of ringed spaces such that for all $x \in X$ the induced ring map $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$ is a local ring map.

We will usually suppress the sheaf of rings \mathcal{O}_X in the notation when discussing locally ringed spaces. We will simply refer to “the locally ringed space X ”. We will by abuse of notation think of X also as the underlying topological space. Finally we will denote the corresponding sheaf of rings \mathcal{O}_X as the *structure sheaf of X* . In addition, it is customary to denote the maximal ideal of the local ring $\mathcal{O}_{X,x}$ by $\mathfrak{m}_{X,x}$ or simply \mathfrak{m}_x . We will say “let $f : X \rightarrow Y$ be a morphism of locally ringed spaces” thereby suppressing the structure sheaves even further. In this case, we will by abuse of notation think of $f : X \rightarrow Y$ also as the underlying continuous map of topological spaces. The f -map corresponding to f will customarily be denoted $f^\#$. The condition that f is a morphism of locally ringed spaces can then be expressed by saying that for every $x \in X$ the map on stalks

$$f_x^\# : \mathcal{O}_{Y,f(x)} \longrightarrow \mathcal{O}_{X,x}$$

maps the maximal ideal $\mathfrak{m}_{Y,f(x)}$ into $\mathfrak{m}_{X,x}$.

Let us use these notational conventions to show that the collection of locally ringed spaces and morphisms of locally ringed spaces forms a category. In order to see this we have to show that the composition of morphisms of locally ringed spaces is a morphism of locally ringed spaces. OK, so let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphism of locally ringed spaces. The composition of f and g is defined in Sheaves, Definition 6.25.3. Let $x \in X$. By Sheaves, Lemma 6.21.10 the composition

$$\mathcal{O}_{Z,g(f(x))} \xrightarrow{g^\#} \mathcal{O}_{Y,f(x)} \xrightarrow{f^\#} \mathcal{O}_{X,x}$$

is the associated map on stalks for the morphism $g \circ f$. The result follows since a composition of local ring homomorphisms is a local ring homomorphism.

A pleasing feature of the definition is the fact that the functor

$$\text{Locally ringed spaces} \longrightarrow \text{Ringed spaces}$$

reflects isomorphisms (plus more). Here is a less abstract statement.

Lemma 25.2.2. *Let X, Y be locally ringed spaces. If $f : X \rightarrow Y$ is an isomorphism of ringed spaces, then f is an isomorphism of locally ringed spaces.*

Proof. This follows trivially from the corresponding fact in algebra: Suppose A, B are local rings. Any isomorphism of rings $A \rightarrow B$ is a local ring homomorphism. \square

25.3. Open immersions of locally ringed spaces

Definition 25.3.1. Let $f : X \rightarrow Y$ be a morphism of locally ringed spaces. We say that f is an *open immersion* if f is a homeomorphism of X onto an open subset of Y , and the map $f^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X$ is an isomorphism.

The following construction is parallel to Sheaves, Definition 6.31.2 (3).

Example 25.3.2. Let X be a locally ringed space. Let $U \subset X$ be an open subset. Let $\mathcal{O}_U = \mathcal{O}_X|_U$ be the restriction of \mathcal{O}_X to U . For $u \in U$ the stalk $\mathcal{O}_{U,u}$ is equal to the stalk $\mathcal{O}_{X,u}$, and hence is a local ring. Thus (U, \mathcal{O}_U) is a locally ringed space and the morphism $j : (U, \mathcal{O}_U) \rightarrow (X, \mathcal{O}_X)$ is an open immersion.

Definition 25.3.3. Let X be a locally ringed space. Let $U \subset X$ be an open subset. The locally ringed space (U, \mathcal{O}_U) of Example 25.3.2 above is the *open subspace of X associated to U* .

Lemma 25.3.4. Let $f : X \rightarrow Y$ be an open immersion of locally ringed spaces. Let $j : V = f(X) \rightarrow Y$ be the open subspace of Y associated to the image of f . There is a unique isomorphism $f' : X \cong V$ of locally ringed spaces such that $f = j \circ f'$.

Proof. Let f' be the homeomorphism between X and V induced by f . Then $f = j \circ f'$ as maps of topological spaces. Since there is an isomorphism of sheaves $f^\# : f^{-1}(\mathcal{O}_Y) \rightarrow \mathcal{O}_X$, there is an isomorphism of rings $f^\# : \Gamma(U, f^{-1}(\mathcal{O}_Y)) \rightarrow \Gamma(U, \mathcal{O}_X)$ for each open subset $U \subset X$. Since $\mathcal{O}_V = j^{-1}\mathcal{O}_Y$ and $f^{-1} = f'^{-1}j^{-1}$ (Sheaves, Lemma 6.21.6) we see that $f^{-1}\mathcal{O}_Y = f'^{-1}\mathcal{O}_V$, hence $\Gamma(U, f'^{-1}(\mathcal{O}_V)) \rightarrow \Gamma(U, f^{-1}(\mathcal{O}_Y))$ for every $U \subset X$ open. By composing these we get an isomorphism of rings

$$\Gamma(U, f'^{-1}(\mathcal{O}_V)) \rightarrow \Gamma(U, \mathcal{O}_X)$$

for each open subset $U \subset X$, and therefore an isomorphism of sheaves $f'^{-1}(\mathcal{O}_V) \rightarrow \mathcal{O}_X$. In other words, we have an isomorphism $f'^\# : f'^{-1}(\mathcal{O}_V) \rightarrow \mathcal{O}_X$ and therefore an isomorphism of locally ringed spaces $(f', f'^\#) : (X, \mathcal{O}_X) \rightarrow (V, \mathcal{O}_V)$ (use Lemma 25.2.2). Note that $f = j \circ f'$ as morphisms of locally ringed spaces by construction.

Suppose we have another morphism $f'' : (X, \mathcal{O}_X) \rightarrow (V, \mathcal{O}_V)$ such that $f = j \circ f''$. At any point $x \in X$, we have $j(f'(x)) = j(f''(x))$ from which it follows that $f'(x) = f''(x)$ since j is the inclusion map; therefore f' and f'' are the same as morphisms of topological spaces. On structure sheaves, for each open subset $U \subset X$ we have a commutative diagram

$$\begin{array}{ccc} \Gamma(U, f^{-1}(\mathcal{O}_Y)) & \xrightarrow{\cong} & \Gamma(U, \mathcal{O}_X) \\ \downarrow \cong & \nearrow f'^\# & \nearrow \\ \Gamma(U, f'^{-1}(\mathcal{O}_V)) & & \end{array}$$

(Note: The diagram above is a simplified representation of the commutative diagram in the image. The image shows a square with $\Gamma(U, f^{-1}(\mathcal{O}_Y))$ at the top-left, $\Gamma(U, \mathcal{O}_X)$ at the top-right, $\Gamma(U, f'^{-1}(\mathcal{O}_V))$ at the bottom-left, and an unlabeled node at the bottom-right. Arrows: $\Gamma(U, f^{-1}(\mathcal{O}_Y)) \xrightarrow{\cong} \Gamma(U, \mathcal{O}_X)$ (top), $\Gamma(U, f'^{-1}(\mathcal{O}_V)) \xrightarrow{\cong} \Gamma(U, f^{-1}(\mathcal{O}_Y))$ (left), $\Gamma(U, f'^{-1}(\mathcal{O}_V)) \xrightarrow{f''^\#} \Gamma(U, \mathcal{O}_X)$ (diagonal down-right), and $\Gamma(U, f'^{-1}(\mathcal{O}_V)) \xrightarrow{f'^\#} \Gamma(U, \mathcal{O}_X)$ (diagonal up-right).

from which we see that $f'^\#$ and $f''^\#$ define the same morphism of sheaves. □

From now on we do not distinguish between open subsets and their associated subspaces.

Lemma 25.3.5. Let $f : X \rightarrow Y$ be a morphism of locally ringed spaces. Let $U \subset X$, and $V \subset Y$ be open subsets. Suppose that $f(U) \subset V$. There exists a unique morphism of locally ringed spaces $f|_U : U \rightarrow V$ such that the following diagram is a commutative square of locally ringed spaces

$$\begin{array}{ccc} U & \longrightarrow & X \\ f|_U \downarrow & & \downarrow f \\ V & \longrightarrow & Y \end{array}$$

Proof. Omitted. □

In the following we will use without further mention the following fact which follows from the lemma above. Given any morphism $f : Y \rightarrow X$ of locally ringed spaces, and any open subset $U \subset X$ such that $f(Y) \subset U$, then there exists a unique morphism of locally ringed spaces $Y \rightarrow U$ such that the composition $Y \rightarrow U \rightarrow X$ is equal to f . In fact, we will even by abuse of notation write $f : Y \rightarrow U$ since this rarely gives rise to confusion.

25.4. Closed immersions of locally ringed spaces

We follow our conventions introduced in Modules, Definition 17.13.1.

Definition 25.4.1. Let $i : Z \rightarrow X$ be a morphism of locally ringed spaces. We say that i is an *closed immersion* if:

- (1) The map i is a homeomorphism of Z onto a closed subset of X .
- (2) The map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective; let \mathcal{I} denote the kernel.
- (3) The \mathcal{O}_X -module \mathcal{I} is locally generated by sections.

Lemma 25.4.2. *Let $f : Z \rightarrow X$ be a morphism of locally ringed spaces. In order for f to be a closed immersion it suffices if there exists an open covering $X = \bigcup U_i$ such that each $f : f^{-1}U_i \rightarrow U_i$ is a closed immersion.*

Proof. Omitted. □

Example 25.4.3. Let X be a locally ringed space. Let $\mathcal{I} \subset \mathcal{O}_X$ be a sheaf of ideals which is locally generated by sections as a sheaf of \mathcal{O}_X -modules. Let Z be the support of the sheaf of rings $\mathcal{O}_X/\mathcal{I}$. This is a closed subset of X , by Modules, Lemma 17.5.3. Denote $i : Z \rightarrow X$ the inclusion map. By Modules, Lemma 17.6.1 there is a unique sheaf of rings \mathcal{O}_Z on Z with $i_*\mathcal{O}_Z = \mathcal{O}_X/\mathcal{I}$. For any $z \in Z$ the local ring $\mathcal{O}_{Z,z}$ is equal to the quotient ring $\mathcal{O}_{X,i(z)}/\mathcal{I}_{i(z)}$ and nonzero, hence a local ring. Thus $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$ is a closed immersion of locally ringed spaces.

Definition 25.4.4. Let X be a locally ringed space. Let \mathcal{I} be a sheaf of ideals on X which is locally generated by sections. The locally ringed space (Z, \mathcal{O}_Z) of Example 25.4.3 above is the *closed subspace of X associated to the sheaf of ideals \mathcal{I}* .

Lemma 25.4.5. *Let $f : X \rightarrow Y$ be a closed immersion of locally ringed spaces. Let \mathcal{I} be the kernel of the map $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$. Let $i : Z \rightarrow Y$ be the closed subspace of Y associated to \mathcal{I} . There is a unique isomorphism $f' : X \cong Z$ of locally ringed spaces such that $f = i \circ f'$.*

Proof. Omitted. □

Lemma 25.4.6. *Let X, Y be a locally ringed spaces. Let $\mathcal{I} \subset \mathcal{O}_X$ be a sheaf of ideals locally generated by sections. Let $i : Z \rightarrow X$ be the associated closed subspace. A morphism $f : Y \rightarrow X$ factors through Z if and only if the map $f^*\mathcal{I} \rightarrow f^*\mathcal{O}_X = \mathcal{O}_Y$ is zero. If this is the case the morphism $g : Y \rightarrow Z$ such that $f = i \circ g$ is unique.*

Proof. Clearly if f factors as $Y \rightarrow Z \rightarrow X$ then the map $f^*\mathcal{I} \rightarrow \mathcal{O}_Y$ is zero. Conversely suppose that $f^*\mathcal{I} \rightarrow \mathcal{O}_Y$ is zero. Pick any $y \in Y$, and consider the ring map $f_y^\sharp : \mathcal{O}_{X,f(y)} \rightarrow \mathcal{O}_{Y,y}$. Since the composition $\mathcal{I}_{f(y)} \rightarrow \mathcal{O}_{X,f(y)} \rightarrow \mathcal{O}_{Y,y}$ is zero

by assumption and since $f_y^\sharp(1) = 1$ we see that $1 \notin \mathcal{I}_{f(y)}$, i.e., $\mathcal{I}_{f(y)} \neq \mathcal{O}_{X,f(y)}$. We conclude that $f(Y) \subset Z = \text{Supp}(\mathcal{O}_X/\mathcal{I})$. Hence $f = i \circ g$ where $g : Y \rightarrow Z$ is continuous. Consider the map $f^\sharp : \mathcal{O}_X \rightarrow f_*\mathcal{O}_Y$. The assumption $f^*\mathcal{I} \rightarrow \mathcal{O}_Y$ is zero implies that the composition $\mathcal{I} \rightarrow \mathcal{O}_X \rightarrow f_*\mathcal{O}_Y$ is zero by adjointness of f_* and f^* . In other words, we obtain a morphism of sheaves of rings $f^\sharp : \mathcal{O}_X/\mathcal{I} \rightarrow f_*\mathcal{O}_Y$. Note that $f_*\mathcal{O}_Y = i_*g_*\mathcal{O}_Y$ and that $\mathcal{O}_X/\mathcal{I} = i_*\mathcal{O}_Z$. By Sheaves, Lemma 6.32.4 we obtain a unique morphism of sheaves of rings $g^\sharp : \mathcal{O}_Z \rightarrow g_*\mathcal{O}_Y$ whose pushforward under i is f^\sharp . We omit the verification that (g, g^\sharp) defines a morphism of locally ringed spaces and that $f = i \circ g$ as a morphism of locally ringed spaces. The uniqueness of (g, g^\sharp) was pointed out above. \square

Lemma 25.4.7. *Let $f : X \rightarrow Y$ be a morphism of locally ringed spaces. Let $\mathcal{I} \subset \mathcal{O}_Y$ be a sheaf of ideals which is locally generated by sections. Let $i : Z \rightarrow Y$ be the closed subspace associated to the sheaf of ideals \mathcal{I} . Let \mathcal{J} be the image of the map $f^*\mathcal{I} \rightarrow f^*\mathcal{O}_Y = \mathcal{O}_X$. Then this ideal is locally generated by sections. Moreover, let $i' : Z' \rightarrow X$ be the associated closed subspace of X . There exists a unique morphism of locally ringed spaces $f' : Z' \rightarrow Z$ such that the following diagram is a commutative square of locally ringed spaces*

$$\begin{array}{ccc} Z' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ Z & \xrightarrow{\quad i \quad} & Y \end{array}$$

Moreover, this diagram is a fibre square in the category of locally ringed spaces.

Proof. The ideal \mathcal{J} is locally generated by sections by Modules, Lemma 17.8.2. The rest of the lemma follows from the characterization, in Lemma 25.4.6 above, of what it means for a morphism to factor through a closed subspace. \square

25.5. Affine schemes

Let R be a ring. Consider the topological space $\text{Spec}(R)$ associated to R , see Algebra, Section 10.16. We will endow this space with a sheaf of rings $\mathcal{O}_{\text{Spec}(R)}$ and the resulting pair $(\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ will be an affine scheme.

Recall that $\text{Spec}(R)$ has a basis of open sets $D(f)$, $f \in R$ which we call standard opens, see Algebra, Definition 10.16.3. In addition, the intersection of two standard opens is another: $D(f) \cap D(g) = D(fg)$, $f, g \in R$.

Lemma 25.5.1. *Let R be a ring. Let $f \in R$.*

- (1) *If $g \in R$ and $D(g) \subset D(f)$, then*
 - (a) *f is invertible in R_g ,*
 - (b) *$g^e = af$ for some $e \geq 1$ and $a \in R$,*
 - (c) *there is a canonical ring map $R_f \rightarrow R_g$, and*
 - (d) *there is a canonical R_f -module map $M_f \rightarrow M_g$ for any R -module M .*
- (2) *Any open covering of $D(f)$ can be refined to a finite open covering of the form $D(f) = \bigcup_{i=1}^n D(g_i)$.*
- (3) *If $g_1, \dots, g_n \in R$, then $D(f) \subset \bigcup D(g_i)$ if and only if g_1, \dots, g_n generate the unit ideal in R_f .*

Proof. Recall that $D(g) = \text{Spec}(R_g)$ (see Algebra, Lemma 10.16.6). Thus (a) holds because f maps to an element of R_g which is not contained in any prime ideal, and hence invertible, see Algebra, Lemma 10.16.2. Write the inverse of f in R_g as a/g^d . This means $g^d - af$ is annihilated by a power of g , whence (b). For (c), the map $R_f \rightarrow R_g$ exists by (a) from the universal property of localization, or we can define it by mapping b/f^n to $a^n b/g^{ne}$. The equality $M_f = M \otimes_R R_f$ can be used to obtain the map on modules, or we can define $M_f \rightarrow M_g$ by mapping x/f^n to $a^n x/g^{ne}$.

Recall that $D(f)$ is quasi-compact, see Algebra, Lemma 10.28.1. Hence the second statement follows directly from the fact that the standard opens form a basis for the topology.

The third statement follows directly from Algebra, Lemma 10.16.2. \square

In Sheaves, Section 6.30 we defined the notion of a sheaf on a basis, and we showed that it is essentially equivalent to the notion of a sheaf on the space, see Sheaves, Lemmas 6.30.6 and 6.30.9. Moreover, we showed in Sheaves, Lemma 6.30.4 that it is sufficient to check the sheaf condition on a cofinal system of open coverings for each standard open. By the lemma above it suffices to check on the finite coverings by standard opens.

Definition 25.5.2. Let R be a ring.

- (1) A *standard open covering* of $\text{Spec}(R)$ is a covering $\text{Spec}(R) = \bigcup_{i=1}^n D(f_i)$, where $f_1, \dots, f_n \in R$.
- (2) Suppose that $D(f) \subset \text{Spec}(R)$ is a standard open. A *standard open covering* of $D(f)$ is a covering $D(f) = \bigcup_{i=1}^n D(g_i)$, where $g_1, \dots, g_n \in R$.

Let R be a ring. Let M be an R -module. We will define a presheaf \widetilde{M} on the basis of standard opens. Suppose that $U \subset \text{Spec}(R)$ is a standard open. If $f, g \in R$ are such that $D(f) = D(g)$, then by Lemma 25.5.1 above there are canonical maps $M_f \rightarrow M_g$ and $M_g \rightarrow M_f$ which are mutually inverse. Hence we may choose any f such that $U = D(f)$ and define

$$\widetilde{M}(U) = M_f.$$

Note that if $D(g) \subset D(f)$, then by Lemma 25.5.1 above we have a canonical map

$$\widetilde{M}(D(f)) = M_f \longrightarrow M_g = \widetilde{M}(D(g)).$$

Clearly, this defines a presheaf of abelian groups on the basis of standard opens. If $M = R$, then \widetilde{R} is a presheaf of rings on the basis of standard opens.

Let us compute the stalk of \widetilde{M} at a point $x \in \text{Spec}(R)$. Suppose that x corresponds to the prime $\mathfrak{p} \subset R$. By definition of the stalk we see that

$$\widetilde{M}_x = \text{colim}_{f \in R, f \notin \mathfrak{p}} M_f$$

Here the set $\{f \in R, f \notin \mathfrak{p}\}$ is partially ordered by the rule $f \geq f' \Leftrightarrow D(f) \subset D(f')$. If $f_1, f_2 \in R \setminus \mathfrak{p}$, then we have $f_1 f_2 \geq f_1$ in this ordering. Hence by Algebra, Lemma 10.9.9 we conclude that

$$\widetilde{M}_x = M_{\mathfrak{p}}.$$

Next, we check the sheaf condition for the standard open coverings. If $D(f) = \bigcup_{i=1}^n D(g_i)$, then the sheaf condition for this covering is equivalent with the exactness of the sequence

$$0 \rightarrow M_f \rightarrow \bigoplus M_{g_i} \rightarrow \bigoplus M_{g_i g_j}.$$

Note that $D(g_i) = D(f g_i)$, and hence we can rewrite this sequence as the sequence

$$0 \rightarrow M_f \rightarrow \bigoplus M_{f g_i} \rightarrow \bigoplus M_{f g_i g_j}.$$

In addition, by Lemma 25.5.1 above we see that g_1, \dots, g_n generate the unit ideal in R_f . Thus we may apply Algebra, Lemma 10.22.2 to the module M_f over R_f and the elements g_1, \dots, g_n . We conclude that the sequence is exact. By the remarks made above, we see that \widetilde{M} is a sheaf on the basis of standard opens.

Thus we conclude from the material in Sheaves, Section 6.30 that there exists a unique sheaf of rings $\mathcal{O}_{\text{Spec}(R)}$ which agrees with \widetilde{R} on the standard opens. Note that by our computation of stalks above, the stalks of this sheaf of rings are all local rings.

Similarly, for any R -module M there exists a unique sheaf of $\mathcal{O}_{\text{Spec}(R)}$ -modules \mathcal{F} which agrees with \widetilde{M} on the standard opens, see Sheaves, Lemma 6.30.12.

Definition 25.5.3. Let R be a ring.

- (1) The *structure sheaf* $\mathcal{O}_{\text{Spec}(R)}$ of the spectrum of R is the unique sheaf of rings $\mathcal{O}_{\text{Spec}(R)}$ which agrees with \widetilde{R} on the basis of standard opens.
- (2) The locally ringed space $(\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ is called the *spectrum* of R and denoted $\text{Spec}(R)$.
- (3) The sheaf of $\mathcal{O}_{\text{Spec}(R)}$ -modules extending \widetilde{M} to all opens of $\text{Spec}(R)$ is called the sheaf of $\mathcal{O}_{\text{Spec}(R)}$ -modules associated to M . This sheaf is denoted \widetilde{M} as well.

We summarize the results obtained so far.

Lemma 25.5.4. Let R be a ring. Let M be an R -module. Let \widetilde{M} be the sheaf of $\mathcal{O}_{\text{Spec}(R)}$ -modules associated to M .

- (1) We have $\Gamma(\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)}) = R$.
- (2) We have $\Gamma(\text{Spec}(R), \widetilde{M}) = M$ as an R -module.
- (3) For every $f \in R$ we have $\Gamma(D(f), \mathcal{O}_{\text{Spec}(R)}) = R_f$.
- (4) For every $f \in R$ we have $\Gamma(D(f), \widetilde{M}) = M_f$ as an R_f -module.
- (5) Whenever $D(g) \subset D(f)$ the restriction mappings on $\mathcal{O}_{\text{Spec}(R)}$ and \widetilde{M} are the maps $R_f \rightarrow R_g$ and $M_f \rightarrow M_g$ from Lemma 25.5.1.
- (6) Let \mathfrak{p} be a prime of R , and let $x \in \text{Spec}(R)$ be the corresponding point. We have $\mathcal{O}_{\text{Spec}(R), x} = R_{\mathfrak{p}}$.
- (7) Let \mathfrak{p} be a prime of R , and let $x \in \text{Spec}(R)$ be the corresponding point. We have $\mathcal{F}_x = M_{\mathfrak{p}}$ as an $R_{\mathfrak{p}}$ -module.

Moreover, all these identifications are functorial in the R module M . In particular, the functor $M \mapsto \widetilde{M}$ is an exact functor from the category of R -modules to the category of $\mathcal{O}_{\text{Spec}(R)}$ -modules.

Proof. Assertions (1) - (7) are clear from the discussion above. The exactness of the functor $M \mapsto \widetilde{M}$ follows from the fact that the functor $M \mapsto M_{\mathfrak{p}}$ is exact and the fact that exactness of short exact sequences may be checked on stalks, see Modules, Lemma 17.3.1. \square

Definition 25.5.5. An *affine scheme* is a locally ringed space isomorphic as a locally ringed space to $\text{Spec}(R)$ for some ring R . A *morphism of affine schemes* is a morphism in the category of locally ringed spaces.

It turns out that affine schemes play a special role among all locally ringed spaces, which is what the next section is about.

25.6. The category of affine schemes

Note that if Y is an affine scheme, then its points are in canonical 1 – 1 bijection with prime ideals in $\Gamma(Y, \mathcal{O}_Y)$.

Lemma 25.6.1. *Let X be a locally ringed space. Let Y be an affine scheme. Let $f \in \text{Mor}(X, Y)$ be a morphism of locally ringed spaces. Given a point $x \in X$ consider the ring maps*

$$\Gamma(Y, \mathcal{O}_Y) \xrightarrow{f^\sharp} \Gamma(X, \mathcal{O}_X) \rightarrow \mathcal{O}_{X,x}$$

Let $\mathfrak{p} \subset \Gamma(Y, \mathcal{O}_Y)$ denote the inverse image of \mathfrak{m}_x . Let $y \in Y$ be the corresponding point. Then $f(x) = y$.

Proof. Consider the commutative diagram

$$\begin{array}{ccc} \Gamma(X, \mathcal{O}_X) & \longrightarrow & \mathcal{O}_{X,x} \\ \uparrow & & \uparrow \\ \Gamma(Y, \mathcal{O}_Y) & \longrightarrow & \mathcal{O}_{Y,f(x)} \end{array}$$

(see the discussion of f -maps below Sheaves, Definition 6.21.7). Since the right vertical arrow is local we see that $\mathfrak{m}_{f(x)}$ is the inverse image of \mathfrak{m}_x . The result follows. \square

Lemma 25.6.2. *Let X be a locally ringed space. Let $f \in \Gamma(X, \mathcal{O}_X)$. The set*

$$D(f) = \{x \in X \mid \text{image } f \notin \mathfrak{m}_x\}$$

is open. Moreover $f|_{D(f)}$ has an inverse.

Proof. This is a special case of Modules, Lemma 17.21.7, but we also give a direct proof. Suppose that $U \subset X$ and $V \subset X$ are two open subsets such that $f|_U$ has an inverse g and $f|_V$ has an inverse h . Then clearly $g|_{U \cap V} = h|_{U \cap V}$. Thus it suffices to show that f is invertible in an open neighbourhood of any $x \in D(f)$. This is clear because $f \notin \mathfrak{m}_x$ implies that $f \in \mathcal{O}_{X,x}$ has an inverse $g \in \mathcal{O}_{X,x}$ which means there is some open neighbourhood $x \in U \subset X$ so that $g \in \mathcal{O}_X(U)$ and $g \cdot f|_U = 1$. \square

Lemma 25.6.3. *In Lemma 25.6.2 above, if X is an affine scheme, then the open $D(f)$ agrees with the standard open $D(f)$ defined previously (in Algebra, Definition 10.16.1).*

Proof. Omitted. \square

Lemma 25.6.4. *Let X be a locally ringed space. Let Y be an affine scheme. The map*

$$\text{Mor}(X, Y) \longrightarrow \text{Hom}(\Gamma(Y, \mathcal{O}_Y), \Gamma(X, \mathcal{O}_X))$$

which maps f to $f^\#$ (on global sections) is bijective.

Proof. Since Y is affine we have $(Y, \mathcal{O}_Y) \cong (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ for some ring R . During the proof we will use facts about Y and its structure sheaf which are direct consequences of things we know about the spectrum of a ring, see e.g. Lemma 25.5.4.

Motivated by the lemmas above we construct the inverse map. Let $\psi_Y : \Gamma(Y, \mathcal{O}_Y) \rightarrow \Gamma(X, \mathcal{O}_X)$ be a ring map. First, we define the corresponding map of spaces

$$\Psi : X \longrightarrow Y$$

by the rule of Lemma 25.6.1. In other words, given $x \in X$ we define $\Psi(x)$ to be the point of Y corresponding to the prime in $\Gamma(Y, \mathcal{O}_Y)$ which is the inverse image of \mathfrak{m}_x under the composition $\Gamma(Y, \mathcal{O}_Y) \xrightarrow{\psi_Y} \Gamma(X, \mathcal{O}_X) \rightarrow \mathcal{O}_{X,x}$.

We claim that the map $\Psi : X \rightarrow Y$ is continuous. The standard opens $D(g)$, for $g \in \Gamma(Y, \mathcal{O}_Y)$ are a basis for the topology of Y . Thus it suffices to prove that $\Psi^{-1}(D(g))$ is open. By construction of Ψ the inverse image $\Psi^{-1}(D(g))$ is exactly the set $D(\psi_Y(g)) \subset X$ which is open by Lemma 25.6.2. Hence Ψ is continuous.

Next we construct a Ψ -map of sheaves from \mathcal{O}_Y to \mathcal{O}_X . By Sheaves, Lemma 6.30.14 it suffices to define ring maps $\psi_{D(g)} : \Gamma(D(g), \mathcal{O}_Y) \rightarrow \Gamma(\Psi^{-1}(D(g)), \mathcal{O}_X)$ compatible with restriction maps. We have a canonical isomorphism $\Gamma(D(g), \mathcal{O}_Y) = \Gamma(Y, \mathcal{O}_Y)_g$, because Y is an affine scheme. Because $\psi_Y(g)$ is invertible on $D(\psi_Y(g))$ we see that there is a canonical map

$$\Gamma(Y, \mathcal{O}_Y)_g \longrightarrow \Gamma(\Psi^{-1}(D(g)), \mathcal{O}_X) = \Gamma(D(\psi_Y(g)), \mathcal{O}_X)$$

extending the map ψ_Y by the universal property of localization. Note that there is no choice but to take the canonical map here! And we take this, combined with the canonical identification $\Gamma(D(g), \mathcal{O}_Y) = \Gamma(Y, \mathcal{O}_Y)_g$, to be $\psi_{D(g)}$. This is compatible with localization since the restriction mapping on the affine schemes are defined in terms of the universal properties of localization also, see Lemmas 25.5.4 and 25.5.1.

Thus we have defined a morphism of ringed spaces $(\Psi, \psi) : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ recovering ψ_Y on global sections. To see that it is a morphism of locally ringed spaces we have to show that the induced maps on local rings

$$\psi_x : \mathcal{O}_{Y, \Psi(x)} \longrightarrow \mathcal{O}_{X, x}$$

are local. This follows immediately from the commutative diagram of the proof of Lemma 25.6.1 and the definition of Ψ .

Finally, we have to show that the constructions $(\Psi, \psi) \mapsto \psi_Y$ and the construction $\psi_Y \mapsto (\Psi, \psi)$ are inverse to each other. Clearly, $\psi_Y \mapsto (\Psi, \psi) \mapsto \psi_Y$. Hence the only thing to prove is that given ψ_Y there is at most one pair (Ψ, ψ) giving rise to it. The uniqueness of Ψ was shown in Lemma 25.6.1 and given the uniqueness of Ψ the uniqueness of the map ψ was pointed out during the course of the proof above. \square

Lemma 25.6.5. *The category of affine schemes is equivalent to the opposite of the category of rings. The equivalence is given by the functor that associates to an affine scheme the global sections of its structure sheaf.*

Proof. This is now clear from Definition 25.5.5 and Lemma 25.6.4. \square

Lemma 25.6.6. *Let Y be an affine scheme. Let $f \in \Gamma(Y, \mathcal{O}_Y)$. The open subspace $D(f)$ is an affine scheme.*

Proof. We may assume that $Y = \text{Spec}(R)$ and $f \in R$. Consider the morphism of affine schemes $\phi : U = \text{Spec}(R_f) \rightarrow \text{Spec}(R) = Y$ induced by the ring map $R \rightarrow R_f$. By Algebra, Lemma 10.16.6 we know that it is a homeomorphism onto $D(f)$. On the other hand, the map $\phi^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_U$ is an isomorphism on stalks, hence an isomorphism. Thus we see that ϕ is an open immersion. We conclude that $D(f)$ is isomorphic to U by Lemma 25.3.4. \square

Lemma 25.6.7. *The category of affine schemes has finite products, and fibre products. In other words, it has finite limits. Moreover, the products and fibre products in the category of affine schemes are the same as in the category of locally ringed spaces. In a formula, we have (in the category of locally ringed spaces)*

$$\text{Spec}(R) \times \text{Spec}(S) = \text{Spec}(R \otimes_{\mathbf{Z}} S)$$

and given ring maps $R \rightarrow A$, $R \rightarrow B$ we have

$$\text{Spec}(A) \times_{\text{Spec}(R)} \text{Spec}(B) = \text{Spec}(A \otimes_R B).$$

Proof. This is just an application of Lemma 25.6.4. First of all, by that lemma, the affine scheme $\text{Spec}(\mathbf{Z})$ is the final object in the category of locally ringed spaces. Thus the first displayed formula follows from the second. To prove the second note that for any locally ringed space X we have

$$\begin{aligned} \text{Mor}(X, \text{Spec}(A \otimes_R B)) &= \text{Hom}(A \otimes_R B, \mathcal{O}_X(X)) \\ &= \text{Hom}(A, \mathcal{O}_X(X)) \times_{\text{Hom}(R, \mathcal{O}_X(X))} \text{Hom}(B, \mathcal{O}_X(X)) \\ &= \text{Mor}(X, \text{Spec}(A)) \times_{\text{Mor}(X, \text{Spec}(R))} \text{Mor}(X, \text{Spec}(B)) \end{aligned}$$

which proves the formula. See Categories, Section 4.6 for the relevant definitions. \square

Lemma 25.6.8. *Let X be a locally ringed space. Assume $X = U \amalg V$ with U and V open and such that U, V are affine schemes. Then X is an affine scheme.*

Proof. Set $R = \Gamma(X, \mathcal{O}_X)$. Note that $R = \mathcal{O}_X(U) \times \mathcal{O}_X(V)$ by the sheaf property. By Lemma 25.6.4 there is a canonical morphism of locally ringed spaces $X \rightarrow \text{Spec}(R)$. By Algebra, Lemma 10.20.2 we see that as a topological space $\text{Spec}(\mathcal{O}_X(U)) \amalg \text{Spec}(\mathcal{O}_X(V)) = \text{Spec}(R)$ with the maps coming from the ring homomorphisms $R \rightarrow \mathcal{O}_X(U)$ and $R \rightarrow \mathcal{O}_X(V)$. This of course means that $\text{Spec}(R)$ is the coproduct in the category of locally ringed spaces as well. By assumption the morphism $X \rightarrow \text{Spec}(R)$ induces an isomorphism of $\text{Spec}(\mathcal{O}_X(U))$ with U and similarly for V . Hence $X \rightarrow \text{Spec}(R)$ is an isomorphism. \square

25.7. Quasi-coherent sheaves on affines

Recall that we have defined the abstract notion of a quasi-coherent sheaf in Modules, Definition 17.10.1. In this section we show that any quasi-coherent sheaf on an affine scheme $\text{Spec}(R)$ corresponds to the sheaf \widetilde{M} associated to an R -module M .

Lemma 25.7.1. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. Let M be an R -module. There exists a canonical isomorphism between the sheaf \widetilde{M} associated to the R -module M (Definition 25.5.3) and the sheaf \mathcal{F}_M associated to the R -module M (Modules, Definition 17.10.6). This isomorphism is functorial in M . In particular, the sheaves \widetilde{M} are quasi-coherent. Moreover, they are characterized by the following mapping property*

$$\text{Hom}_{\mathcal{O}_X}(\widetilde{M}, \mathcal{F}) = \text{Hom}_R(M, \Gamma(X, \mathcal{F}))$$

for any sheaf of \mathcal{O}_X -modules \mathcal{F} . Here a map $\alpha : \widetilde{M} \rightarrow \mathcal{F}$ corresponds to its effect on global sections.

Proof. By Modules, Lemma 17.10.5 we have a morphism $\mathcal{F}_M \rightarrow \widetilde{M}$ corresponding to the map $M \rightarrow \Gamma(X, \widetilde{M}) = M$. Let $x \in X$ correspond to the prime $\mathfrak{p} \subset R$. The induced map on stalks are the maps $\mathcal{O}_{X,x} \otimes_R M \rightarrow M_{\mathfrak{p}}$ which are isomorphisms because $R_{\mathfrak{p}} \otimes_R M = M_{\mathfrak{p}}$. Hence the map $\mathcal{F}_M \rightarrow \widetilde{M}$ is an isomorphism. The mapping property follows from the mapping property of the sheaves \mathcal{F}_M . \square

Lemma 25.7.2. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. There are canonical isomorphisms*

- (1) $\widetilde{M \otimes_R N} \cong \widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N}$, see Modules, Section 17.15.
- (2) $\widetilde{T^n(M)} \cong T^n(\widetilde{M})$, $\widetilde{\text{Sym}^n(M)} \cong \text{Sym}^n(\widetilde{M})$, and $\widetilde{\wedge^n(M)} \cong \wedge^n(\widetilde{M})$, see Modules, Section 17.18.
- (3) if M is a finitely presented R -module, then $\mathcal{H}om_{\mathcal{O}_X}(\widetilde{M}, \widetilde{N}) \cong \widetilde{\text{Hom}_R(M, N)}$, see Modules, Section 17.19.

Proof. To give a map $\widetilde{M \otimes_R N}$ into $\widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N}$ we have to give a map on global sections $M \otimes_R N \rightarrow \Gamma(X, \widetilde{M \otimes_R N})$ which exists by definition of the tensor product of sheaves of modules. To see that this map is an isomorphism it suffices to check that it is an isomorphism on stalks. And this follows from the description of the stalks of \widetilde{M} (as a functor) and Modules, Lemma 17.15.1.

The proof of (2) is similar, using Modules, Lemma 17.18.2.

For (3) note that if M is finitely presented as an R -module then \widetilde{M} has a global finite presentation as an \mathcal{O}_X -module. Hence Modules, Lemma 17.19.3 applies. \square

Lemma 25.7.3. *Let $(X, \mathcal{O}_X) = (\text{Spec}(S), \mathcal{O}_{\text{Spec}(S)})$, $(Y, \mathcal{O}_Y) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be affine schemes. Let $\psi : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of affine schemes, corresponding to the ring map $\psi^\sharp : R \rightarrow S$ (see Lemma 25.6.5).*

- (1) We have $\psi^* \widetilde{M} = \widetilde{S \otimes_R M}$ functorially in the R -module M .
- (2) We have $\psi_* \widetilde{N} = \widetilde{N_R}$ functorially in the S -module N .

Proof. The first assertion follows from the identification in Lemma 25.7.1 and the result of Modules, Lemma 17.10.7. The second assertion follows from the fact that $\psi^{-1}(D(f)) = D(\psi^\sharp(f))$ and hence

$$\psi_*\widetilde{N}(D(f)) = \widetilde{N}(D(\psi^\sharp(f))) = N_{\psi^\sharp(f)} = (N_R)_f = \widetilde{N}_R(D(f))$$

as desired. □

Lemma 25.7.3 above says in particular that if you restrict the sheaf \widetilde{M} to a standard affine open subspace $D(f)$, then you get \widetilde{M}_f . We will use this from now on without further mention.

Lemma 25.7.4. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then \mathcal{F} is isomorphic to the sheaf associated to the R -module $\Gamma(X, \mathcal{F})$.*

Proof. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Since every standard open $D(f)$ is quasi-compact we see that X is a locally quasi-compact, i.e., every point has a fundamental system of quasi-compact neighbourhoods, see Topology, Definition 5.12.1. Hence by Modules, Lemma 17.10.8 for every prime $\mathfrak{p} \subset R$ corresponding to $x \in X$ there exists an open neighbourhood $x \in U \subset X$ such that $\mathcal{F}|_U$ is isomorphic to the quasi-coherent sheaf associated to some $\mathcal{O}_X(U)$ -module M . In other words, we get an open covering by U 's with this property. By Lemma 25.5.1 for example we can refine this covering to a standard open covering. Thus we get a covering $\text{Spec}(R) = \bigcup D(f_i)$ and R_{f_i} -modules M_i and isomorphisms $\varphi_i : \mathcal{F}|_{D(f_i)} \rightarrow \mathcal{F}_{M_i}$ for some R_{f_i} -module M_i . On the overlaps we get isomorphisms

$$\mathcal{F}_{M_i}|_{D(f_i f_j)} \xrightarrow{\varphi_i^{-1}|_{D(f_i f_j)}} \mathcal{F}|_{D(f_i f_j)} \xrightarrow{\varphi_j|_{D(f_i f_j)}} \mathcal{F}_{M_j}|_{D(f_i f_j)}.$$

Let us denote these ψ_{ij} . It is clear that we have the cocycle condition

$$\psi_{jk}|_{D(f_i f_j f_k)} \circ \psi_{ij}|_{D(f_i f_j f_k)} = \psi_{ik}|_{D(f_i f_j f_k)}$$

on triple overlaps.

Recall that each of the open subspaces $D(f_i)$, $D(f_i f_j)$, $D(f_i f_j f_k)$ is an affine scheme. Hence the sheaves \mathcal{F}_{M_i} are isomorphic to the sheaves \widetilde{M}_i by Lemma 25.7.1 above. In particular we see that $\mathcal{F}_{M_i}(D(f_i f_j)) = (M_i)_{f_j}$, etc. Also by Lemma 25.7.1 above we see that ψ_{ij} corresponds to a unique $R_{f_i f_j}$ -module isomorphism

$$\psi_{ij} : (M_i)_{f_j} \longrightarrow (M_j)_{f_i}$$

namely, the effect of ψ_{ij} on sections over $D(f_i f_j)$. Moreover these then satisfy the cocycle condition that

$$\begin{array}{ccc} (M_i)_{f_j f_k} & \xrightarrow{\psi_{ik}} & (M_k)_{f_i f_j} \\ & \searrow \psi_{ij} & \nearrow \psi_{jk} \\ & (M_j)_{f_i f_k} & \end{array}$$

commutes (for any triple i, j, k).

Now Algebra, Lemma 10.23.4 shows that there exist an R -module M such that $M_i = M_{f_i}$ compatible with the morphisms ψ_{ij} . Consider $\mathcal{F}_M = \widetilde{M}$. At this point it is a formality to show that \widetilde{M} is isomorphic to the quasi-coherent sheaf \mathcal{F} we

started out with. Namely, the sheaves \mathcal{F} and \widetilde{M} give rise to isomorphic sets of glueing data of sheaves of \mathcal{O}_X -modules with respect to the covering $X = \bigcup D(f_i)$, see Sheaves, Section 6.33 and in particular Lemma 6.33.4. Explicitly, in the current situation, this boils down to the following argument: Let us construct an R -module map

$$M \longrightarrow \Gamma(X, \mathcal{F}).$$

Namely, given $m \in M$ we get $m_i = m/1 \in M_{f_i} = M_i$ by construction of M . By construction of M_i this corresponds to a section $s_i \in \mathcal{F}(U_i)$. (Namely, $\varphi_i^{-1}(m_i)$.) We claim that $s_i|_{D(f_i f_j)} = s_j|_{D(f_i f_j)}$. This is true because, by construction of M , we have $\psi_{ij}(m_i) = m_j$, and by the construction of the ψ_{ij} . By the sheaf condition of \mathcal{F} this collection of sections gives rise to a unique section s of \mathcal{F} over X . We leave it to the reader to show that $m \mapsto s$ is a R -module map. By Lemma 25.7.1 we obtain an associated \mathcal{O}_X -module map

$$\widetilde{M} \longrightarrow \mathcal{F}.$$

By construction this map reduces to the isomorphisms φ_i^{-1} on each $D(f_i)$ and hence is an isomorphism. \square

Lemma 25.7.5. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. The functors $M \mapsto \widetilde{M}$ and $\mathcal{F} \mapsto \Gamma(X, \mathcal{F})$ define quasi-inverse equivalences of categories*

$$\text{QCoh}(\mathcal{O}_X) \xrightleftharpoons{\sim} \text{Mod-}R$$

between the category of quasi-coherent \mathcal{O}_X -modules and the category of R -modules.

Proof. See Lemmas 25.7.1 and 25.7.4 above. \square

From now on we will not distinguish between quasi-coherent sheaves on affine schemes and sheaves of the form \widetilde{M} .

Lemma 25.7.6. *Let $X = \text{Spec}(R)$ be an affine scheme. Kernels and cokernels of maps of quasi-coherent \mathcal{O}_X -modules are quasi-coherent.*

Proof. This follows from the exactness of the functor \sim since by Lemma 25.7.1 we know that any map $\psi : \widetilde{M} \rightarrow \widetilde{N}$ comes from an R -module map $\varphi : M \rightarrow N$. (So we have $\text{Ker}(\psi) = \widetilde{\text{Ker}(\varphi)}$ and $\text{Coker}(\psi) = \widetilde{\text{Coker}(\varphi)}$.) \square

Lemma 25.7.7. *Let $X = \text{Spec}(R)$ be an affine scheme. The direct sum of an arbitrary collection of quasi-coherent sheaves on X is quasi-coherent. The same holds for colimits.*

Proof. Suppose $\mathcal{F}_i, i \in I$ is a collection of quasi-coherent sheaves on X . By Lemma 25.7.5 above we can write $\mathcal{F}_i = \widetilde{M}_i$ for some R -module M_i . Set $M = \bigoplus M_i$. Consider the sheaf \widetilde{M} . For each standard open $D(f)$ we have

$$\widetilde{M}(D(f)) = M_f = \left(\bigoplus M_i \right)_f = \bigoplus M_{i,f}.$$

Hence we see that the quasi-coherent \mathcal{O}_X -module \widetilde{M} is the direct sum of the sheaves \mathcal{F}_i . A similar argument works for general colimits. \square

Lemma 25.7.8. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. Suppose that*

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

is a short exact sequence of sheaves \mathcal{O}_X -modules. If two out of three are quasi-coherent then so is the third.

Proof. This is clear in case both \mathcal{F}_1 and \mathcal{F}_2 are quasi-coherent because the functor $M \mapsto \widetilde{M}$ is exact, see Lemma 25.5.4. Similarly in case both \mathcal{F}_2 and \mathcal{F}_3 are quasi-coherent. Now, suppose that $\mathcal{F}_1 = \widetilde{M}_1$ and $\mathcal{F}_3 = \widetilde{M}_3$ are quasi-coherent. Set $M_2 = \Gamma(X, \mathcal{F}_2)$. We claim it suffices to show that the sequence

$$0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

is exact. Namely, if this is the case, then (by using the mapping property of Lemma 25.7.1) we get a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \widetilde{M}_1 & \longrightarrow & \widetilde{M}_2 & \longrightarrow & \widetilde{M}_3 \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{F}_1 & \longrightarrow & \mathcal{F}_2 & \longrightarrow & \mathcal{F}_3 \longrightarrow 0 \end{array}$$

and we win by the snake lemma.

The “correct” argument here would be to show first that $H^1(X, \mathcal{F}) = 0$ for any quasi-coherent sheaf \mathcal{F} . This is actually not all that hard, but it is perhaps better to postpone this till later. Instead we use a small trick.

Pick $m \in M_3 = \Gamma(X, \mathcal{F}_3)$. Consider the following set

$$I = \{f \in R \mid \text{the element } fm \text{ comes from } M_2\}.$$

Clearly this is an ideal. It suffices to show $1 \in I$. Hence it suffices to show that for any prime \mathfrak{p} there exists an $f \in I, f \notin \mathfrak{p}$. Let $x \in X$ be the point corresponding to \mathfrak{p} . Because surjectivity can be checked on stalks there exists an open neighbourhood U of x such that $m|_U$ comes from a local section $s \in \mathcal{F}_2(U)$. In fact we may assume that $U = D(f)$ is a standard open, i.e., $f \in R, f \notin \mathfrak{p}$. We will show that for some $N \gg 0$ we have $f^N \in I$, which will finish the proof.

Take any point $z \in V(f)$, say corresponding to the prime $\mathfrak{q} \subset R$. We can also find a $g \in R, g \notin \mathfrak{q}$ such that $m|_{D(g)}$ lifts to some $s' \in \mathcal{F}_2(D(g))$. Consider the difference $s|_{D(fg)} - s'|_{D(fg)}$. This is an element m' of $\mathcal{F}_1(D(fg)) = (M_1)_{fg}$. For some integer $n = n(z)$ the element $f^n m'$ comes from some $m'_1 \in (M_1)_g$. We see that $f^n s$ extends to a section σ of \mathcal{F}_2 on $D(f) \cup D(g)$ because it agrees with the restriction of $f^n s' + m'_1$ on $D(f) \cap D(g) = D(fg)$. Moreover, σ maps to the restriction of $f^n m$ to $D(f) \cup D(g)$.

Since $V(f)$ is quasi-compact, there exists a finite list of elements $g_1, \dots, g_m \in R$ such that $V(f) \subset \bigcup D(g_j)$, an integer $n > 0$ and sections $\sigma_j \in \mathcal{F}_2(D(f) \cup D(g_j))$ such that $\sigma_j|_{D(f)} = f^n s$ and σ_j maps to the section $f^n m|_{D(f) \cup D(g_j)}$ of \mathcal{F}_3 . Consider the differences

$$\sigma_j|_{D(f) \cup D(g_j g_k)} - \sigma_k|_{D(f) \cup D(g_j g_k)}.$$

These correspond to sections of \mathcal{F}_1 over $D(f) \cup D(g_j g_k)$ which are zero on $D(f)$. In particular their images in $\mathcal{F}_1(D(g_j g_k)) = (M_1)_{g_j g_k}$ are zero in $(M_1)_{g_j g_k f}$. Thus some high power of f kills each and every one of these. In other words, the elements

$f^N \sigma_j$, for some $N \gg 0$ satisfy the glueing condition of the sheaf property and give rise to a section σ of \mathcal{F}_2 over $\bigcup(D(f) \cup D(g_j)) = X$ as desired. \square

25.8. Closed subspaces of affine schemes

Example 25.8.1. Let R be a ring. Let $I \subset R$ be an ideal. Consider the morphism of affine schemes $i : Z = \text{Spec}(R/I) \rightarrow \text{Spec}(R) = X$. By Algebra, Lemma 10.16.7 this is a homeomorphism of Z onto a closed subset of X . Moreover, if $I \subset \mathfrak{p} \subset R$ is a prime corresponding to a point $x = i(z)$, $x \in X$, $z \in Z$, then on stalks we get the map

$$\mathcal{O}_{X,x} = R_{\mathfrak{p}} \longrightarrow R_{\mathfrak{p}}/IR_{\mathfrak{p}} = \mathcal{O}_{Z,z}$$

Thus we see that i is a closed immersion of locally ringed spaces, see Definition 25.4.1. Clearly, this is (isomorphic) to the closed subspace associated to the quasi-coherent sheaf of ideals \tilde{I} , as in Example 25.4.3.

Lemma 25.8.2. *Let $(X, \mathcal{O}_X) = (\text{Spec}(R), \mathcal{O}_{\text{Spec}(R)})$ be an affine scheme. Let $i : Z \rightarrow X$ be any closed immersion of locally ringed spaces. Then there exists a unique ideal $I \subset R$ such that the morphism $i : Z \rightarrow X$ can be identified with the closed immersion $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$ constructed in Example 25.8.1 above.*

Proof. This is kind of silly! Namely, by Lemma 25.4.5 we can identify $Z \rightarrow X$ with the closed subspace associated to a sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ as in Definition 25.4.4 and Example 25.4.3. By our conventions this sheaf of ideals is locally generated by sections as a sheaf of \mathcal{O}_X -modules. Hence the quotient sheaf $\mathcal{O}_X/\mathcal{I}$ is locally on X the cokernel of a map $\bigoplus_{j \in J} \mathcal{O}_U \rightarrow \mathcal{O}_U$. Thus by definition, $\mathcal{O}_X/\mathcal{I}$ is quasi-coherent. By our results in Section 25.7 it is of the form \tilde{S} for some R -module S . Moreover, since $\mathcal{O}_X = \tilde{R} \rightarrow \tilde{S}$ is surjective we see by Lemma 25.7.8 that also \mathcal{I} is quasi-coherent, say $\mathcal{I} = \tilde{I}$. Of course $I \subset R$ and $S = R/I$ and everything is clear. \square

25.9. Schemes

Definition 25.9.1. A *scheme* is a locally ringed space with the property that every point has an open neighbourhood which is an affine scheme. A *morphism of schemes* is a morphism of locally ringed spaces. The category of schemes will be denoted Sch .

Let X be a scheme. We will use the following (very slight) abuse of language. We will say $U \subset X$ is an *affine open*, or an *open affine* if the open subspace U is an affine scheme. We will often write $U = \text{Spec}(R)$ to indicate that U is isomorphic to $\text{Spec}(R)$ and moreover that we will identify (temporarily) U and $\text{Spec}(R)$.

Lemma 25.9.2. *Let X be a scheme. Let $j : U \rightarrow X$ be an open immersion of locally ringed spaces. Then U is a scheme. In particular, any open subspace of X is a scheme.*

Proof. Let $U \subset X$. Let $u \in U$. Pick an affine open neighbourhood $u \in V \subset X$. Because standard opens of V form a basis of the topology on V we see that there exists a $f \in \mathcal{O}_V(V)$ such that $u \in D(f) \subset U$. And $D(f)$ is an affine scheme by Lemma 25.6.6. This proves that every point of U has an open neighbourhood which is affine. \square

Clearly the lemma (or its proof) shows that any scheme X has a basis (see Topology, Section 5.4) for the topology consisting of affine opens.

Example 25.9.3. Let k be a field. An example of a scheme which is not affine is given by the open subspace $U = \text{Spec}(k[x, y]) \setminus \{(x, y)\}$ of the affine scheme $X = \text{Spec}(k[x, y])$. It is covered by two affines, namely $D(x) = \text{Spec}(k[x, y, 1/x])$ and $D(y) = \text{Spec}(k[x, y, 1/y])$ whose intersection is $D(xy) = \text{Spec}(k[x, y, 1/xy])$. By the sheaf property for \mathcal{O}_U there is an exact sequence

$$0 \rightarrow \Gamma(U, \mathcal{O}_U) \rightarrow k[x, y, 1/x] \times k[x, y, 1/y] \rightarrow k[x, y, 1/xy]$$

We conclude that the map $k[x, y] \rightarrow \Gamma(U, \mathcal{O}_U)$ (coming from the morphism $U \rightarrow X$) is an isomorphism. Therefore U cannot be affine since if it was then by Lemma 25.6.5 we would have $U \cong X$.

25.10. Immersions of schemes

In Lemma 25.9.2 we saw that any open subspace of a scheme is a scheme. Below we will prove that the same holds for a closed subspace of a scheme.

Note that the notion of a quasi-coherent sheaf of \mathcal{O}_X -modules is defined for any ringed space X in particular when X is a scheme. By our efforts in Section 25.7 we know that such a sheaf is on any affine open $U \subset X$ of the form \tilde{M} for some $\mathcal{O}_X(U)$ -module M .

Lemma 25.10.1. *Let X be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of locally ringed spaces.*

- (1) *The locally ringed space Z is a scheme,*
- (2) *the kernel \mathcal{I} of the map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is a quasi-coherent sheaf of ideals,*
- (3) *for any affine open $U = \text{Spec}(R)$ of X the morphism $i^{-1}(U) \rightarrow U$ can be identified with $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$ for some ideal $I \subset R$, and*
- (4) *we have $\mathcal{I}|_U = \tilde{I}$.*

In particular, any sheaf of ideals locally generated by sections is a quasi-coherent sheaf of ideals (and vice versa), and any closed subspace of X is a scheme.

Proof. Let $i : Z \rightarrow X$ be a closed immersion. Let $z \in Z$ be a point. Choose any affine open neighbourhood $i(z) \in U \subset X$. Say $U = \text{Spec}(R)$. By Lemma 25.8.2 we know that $i^{-1}(U) \rightarrow U$ can be identified with the morphism of affine schemes $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$. First of all this implies that $z \in i^{-1}(U) \subset Z$ is an affine neighbourhood of z . Thus Z is a scheme. Second this implies that $\mathcal{I}|_U$ is \tilde{I} . In other words for every point $x \in i(Z)$ there exists an open neighbourhood such that \mathcal{I} is quasi-coherent in that neighbourhood. Note that $\mathcal{I}|_{X \setminus i(Z)} \cong \mathcal{O}_{X \setminus i(Z)}$. Thus the restriction of the sheaf of ideals is quasi-coherent on $X \setminus i(Z)$ also. We conclude that \mathcal{I} is quasi-coherent. \square

Definition 25.10.2. Let X be a scheme.

- (1) A morphism of schemes is called an *open immersion* if it is an open immersion of locally ringed spaces (see Definition 25.3.1).
- (2) An *open subscheme* of X is an open subspace of X which is a scheme by Lemma 25.9.2 above.
- (3) A morphism of schemes is called a *closed immersion* if it is a closed immersion of locally ringed spaces (see Definition 25.4.1).

- (4) A *closed subscheme* of X is a closed subspace of X which is a scheme by Lemma 25.10.1 above.
- (5) A morphism of schemes $f : X \rightarrow Y$ is called an *immersion*, or a *locally closed immersion* if it can be factored as $j \circ i$ where i is a closed immersion and j is an open immersion.

It follows from the lemmas in Sections 25.3 and 25.4 that any open (resp. closed) immersion of schemes is isomorphic to the inclusion of an open (resp. closed) subscheme of the target. We will define locally closed subschemes below.

Remark 25.10.3. If $f : X \rightarrow Y$ is an immersion of schemes, then it is in general not possible to factor f as an open immersion followed by a closed immersion. See Morphisms, Example 28.3.4.

Lemma 25.10.4. *Let $f : Y \rightarrow X$ be an immersion of schemes. Then f is a closed immersion if and only if $f(Y) \subset X$ is a closed subset.*

Proof. If f is a closed immersion then $f(Y)$ is closed by definition. Conversely, suppose that $f(Y)$ is closed. By definition there exists an open subscheme $U \subset X$ such that f is the composition of a closed immersion $i : Y \rightarrow U$ and the open immersion $j : U \rightarrow X$. Let $\mathcal{I} \subset \mathcal{O}_U$ be the quasi-coherent sheaf of ideals associated to the closed immersion i . Note that $\mathcal{I}|_{U \setminus i(Y)} = \mathcal{O}_{U \setminus i(Y)} = \mathcal{O}_{X \setminus i(Y)}|_{U \setminus i(Y)}$. Thus we may glue (see Sheaves, Section 6.33) \mathcal{I} and $\mathcal{O}_{X \setminus i(Y)}$ to a sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$. Since every point of X has a neighbourhood where \mathcal{J} is quasi-coherent, we see that \mathcal{J} is quasi-coherent (in particular locally generated by sections). By construction $\mathcal{O}_X/\mathcal{J}$ is supported on U and equal to $\mathcal{O}_U/\mathcal{I}$. Thus we see that the closed subspaces associated to \mathcal{I} and \mathcal{J} are canonically isomorphic, see Example 25.4.3. In particular the closed subspace of U associated to \mathcal{I} is isomorphic to a closed subspace of X . Since $Y \rightarrow U$ is identified with the closed subspace associated to \mathcal{I} , see Lemma 25.4.5, we conclude that $Y \rightarrow U \rightarrow X$ is a closed immersion. \square

Let $f : Y \rightarrow X$ be an immersion. Let $Z = \overline{f(Y)} \setminus f(Y)$ which is a closed subset of X . Let $U = X \setminus Z$. The lemma implies that U is the biggest open subspace of X such that $f : Y \rightarrow X$ factors through a closed immersion into U . If we define a *locally closed subscheme of X* as a pair (Z, U) consisting of a closed subscheme Z of an open subscheme U of X such that in addition $\overline{Z} \cup U = X$. We usually just say “let Z be a locally closed subscheme of X ” since we may recover U from the morphism $Z \rightarrow X$. The above then shows that any immersion $f : Y \rightarrow X$ factors uniquely as $Y \rightarrow Z \rightarrow X$ where Z is a locally closed subspace of X and $Y \rightarrow Z$ is an isomorphism.

The interest of this is that the collection of locally closed subschemes of X forms a set. We may define a partial ordering on this set, which we call inclusion for obvious reasons. To be explicit, if $Z \rightarrow X$ and $Z' \rightarrow X$ are two locally closed subschemes of X , then we say that Z is *contained in* Z' simply if the morphism $Z \rightarrow X$ factors through Z' . If it does, then of course Z is identified with a unique locally closed subscheme of Z' , and so on.

25.11. Zariski topology of schemes

See Topology, Section 5.1 for some basic material in topology adapted to the Zariski topology of schemes.

Lemma 25.11.1. *Let X be a scheme. Any irreducible closed subset of X has a unique generic point. In other words, X is a sober topological space, see Topology, Definition 5.7.4.*

Proof. Let $Z \subset X$ be an irreducible closed subset. For every affine open $U \subset X$, $U = \text{Spec}(R)$ we know that $Z \cap U = V(I)$ for a unique radical ideal $I \subset R$. Note that $Z \cap U$ is either empty or irreducible. In the second case (which occurs for at least one U) we see that $I = \mathfrak{p}$ is a prime ideal, which is a generic point ξ of $Z \cap U$. It follows that $Z = \overline{\{\xi\}}$, in other words ξ is a generic point of Z . If ξ' was a second generic point, then $\xi' \in Z \cap U$ and it follows immediately that $\xi' = \xi$. \square

Lemma 25.11.2. *Let X be a scheme. The collection of affine opens of X forms a basis for the topology on X .*

Proof. This follows from the discussion on open subschemes in Section 25.9. \square

Remark 25.11.3. In general the intersection of two affine opens in X is not affine open. See Example 25.14.3.

Lemma 25.11.4. *The underlying topological space of any scheme is locally quasi-compact, see Topology, Definition 5.12.1.*

Proof. This follows from Lemma 25.11.2 above and the fact that the spectrum of R is quasi-compact, see Algebra, Lemma 10.16.10. \square

Lemma 25.11.5. *Let X be a scheme. Let U, V be affine opens of X , and let $x \in U \cap V$. There exists an affine open neighbourhood W of x such that W is a standard open of both U and V .*

Proof. Write $U = \text{Spec}(A)$ and $V = \text{Spec}(B)$. Say x corresponds to the prime $\mathfrak{p} \subset A$ and the prime $\mathfrak{q} \subset B$. We may choose a $f \in A$, $f \notin \mathfrak{p}$ such that $D(f) \subset U \cap V$. Note that any standard open of $D(f)$ is a standard open of $\text{Spec}(A) = U$. Hence we may assume that $U \subset V$. In other words, now we may think of U as an affine open of V . Next we choose a $g \in B$, $g \notin \mathfrak{q}$ such that $D(g) \subset U$. In this case we see that $D(g) = D(g_A)$ where $g_A \in A$ denotes the image of $g \in B$. Thus the lemma is proved. \square

Lemma 25.11.6. *Let X be a scheme. Let $X = \bigcup_i U_i$ be an affine open covering. Let $V \subset X$ be an affine open. There exists a standard open covering $V = \bigcup_{j=1, \dots, m} V_j$ (see Definition 25.5.2) such that each V_j is a standard open in one of the U_i .*

Proof. Pick $v \in V$. Then $v \in U_i$ for some i . By Lemma 25.11.5 above there exists an open $v \in W_v \subset V \cap U_i$ such that W_v is a standard open in both V and U_i . Since V is quasi-compact the lemma follows. \square

Lemma 25.11.7. *Let X be a scheme whose underlying topological space is a finite discrete set. Then X is affine.*

Proof. Say $X = \{x_1, \dots, x_n\}$. Then $U_i = \{x_i\}$ is an open neighbourhood of x_i . By Lemma 25.11.2 it is affine. Hence X is a finite disjoint union of affine schemes, and hence is affine by Lemma 25.6.8. \square

Example 25.11.8. There exists a scheme without closed points. Namely, let R be a local domain whose spectrum looks like $(0) = \mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \mathfrak{p}_2 \subset \dots \subset \mathfrak{m}$. Then the open subscheme $\text{Spec}(R) \setminus \{\mathfrak{m}\}$ does not have a closed point. To see that such a ring R exists, we use that given any totally ordered group (Γ, \geq) there exists a valuation ring A with valuation group (Γ, \geq) , see [Kru32]. See Algebra, Section 10.48 for notation. We take $\Gamma = \mathbf{Z}x_1 \oplus \mathbf{Z}x_2 \oplus \mathbf{Z}x_3 \oplus \dots$ and we define $\sum_i a_i x_i \geq 0$ if and only if the first nonzero a_i is > 0 , or all $a_i = 0$. So $x_1 \geq x_2 \geq x_3 \geq \dots \geq 0$. The subsets $x_i + \Gamma_{\geq 0}$ are prime ideals of (Γ, \geq) , see Algebra, notation above Lemma 10.48.17. These together with \emptyset and $\Gamma_{\geq 0}$ are the only prime ideals. Hence A is an example of a ring with the given structure of its spectrum, by Algebra, Lemma 10.48.17.

25.12. Reduced schemes

Definition 25.12.1. Let X be a scheme. We say X is *reduced* if every local ring $\mathcal{O}_{X,x}$ is reduced.

Lemma 25.12.2. *A scheme X is reduced if and only if $\mathcal{O}_X(U)$ is a reduced ring for all $U \subset X$ open.*

Proof. Assume that X is reduced. Let $f \in \mathcal{O}_X(U)$ be a section such that $f^n = 0$. Then the image of f in $\mathcal{O}_{U,u}$ is zero for all $u \in U$. Hence f is zero, see Sheaves, Lemma 6.11.1. Conversely, assume that $\mathcal{O}_X(U)$ is reduced for all opens U . Pick any nonzero element $f \in \mathcal{O}_{X,x}$. Any representative $(U, f \in \mathcal{O}(U))$ of f is nonzero and hence not nilpotent. Hence f is not nilpotent in $\mathcal{O}_{X,x}$. \square

Lemma 25.12.3. *An affine scheme $\text{Spec}(R)$ is reduced if and only if R is reduced.*

Proof. The direct implication follows immediately from Lemma 25.12.2 above. In the other direction it follows since any localization of a reduced ring is reduced, and in particular the local rings of a reduced ring are reduced. \square

Lemma 25.12.4. *Let X be a scheme. Let $T \subset X$ be a closed subset. There exists a unique closed subscheme $Z \subset X$ with the following properties: (a) the underlying topological space of Z is equal to T , and (b) Z is reduced.*

Proof. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sub presheaf defined by the rule

$$\mathcal{I}(U) = \{f \in \mathcal{O}_X(U) \mid f(t) = 0 \text{ for all } t \in T \cap U\}$$

Here we use $f(t)$ to indicate the image of f in the residue field $\kappa(t)$ of X at t . Because of the local nature of the condition it is clear that \mathcal{I} is a sheaf of ideals. Moreover, let $U = \text{Spec}(R)$ be an affine open. We may write $T \cap U = V(I)$ for a unique radical ideal $I \subset R$. Given a prime $\mathfrak{p} \in V(I)$ corresponding to $t \in T \cap U$ and an element $f \in R$ we have $f(t) = 0 \Leftrightarrow f \in \mathfrak{p}$. Hence $\mathcal{I}(U) = \bigcap_{\mathfrak{p} \in V(I)} \mathfrak{p} = I$ by Algebra, Lemma 10.16.2. Moreover, for any standard open $D(g) \subset \text{Spec}(R) = U$ we have $\mathcal{I}(D(g)) = I_g$ by the same reasoning. Thus \tilde{I} and $\mathcal{I}|_U$ agree (as ideals) on a basis of opens and hence are equal. Therefore \mathcal{I} is a quasi-coherent sheaf of ideals.

At this point we may define Z as the closed subspace associated to the sheaf of ideals \mathcal{I} . For every affine open $U = \text{Spec}(R)$ of X we see that $Z \cap U = \text{Spec}(R/I)$ where I is a radical ideal and hence Z is reduced (by Lemma 25.12.3 above). By

construction the underlying closed subset of Z is T . Hence we have found a closed subscheme with properties (a) and (b).

Let $Z' \subset X$ be a second closed subscheme with properties (a) and (b). For every affine open $U = \text{Spec}(R)$ of X we see that $Z' \cap U = \text{Spec}(R/I')$ for some ideal $I' \subset R$. By Lemma 25.12.3 the ring R/I' is reduced and hence I' is radical. Since $V(I') = T \cap U = V(I)$ we deduced that $I = I'$ by Algebra, Lemma 10.16.2. Hence Z' and Z are defined by the same sheaf of ideals and hence are equal. \square

Definition 25.12.5. Let X be a scheme. Let $i : Z \rightarrow X$ be the inclusion of a closed subset. A *scheme structure on Z* is given by a closed subscheme Z' of X whose underlying closed is equal to Z . We often say “let (Z, \mathcal{O}_Z) be a scheme structure on Z ” to indicate this. The *reduced induced scheme structure on Z* is the one constructed in Lemma 25.12.4. The *reduction X_{red} of X* is the reduced induced scheme structure on X itself.

Often when we say “let $Z \subset X$ be an irreducible component of X ” we think of Z as a reduced closed subscheme of X using the reduced induced scheme structure.

Lemma 25.12.6. *Let X be a scheme. Let $Z \subset X$ be a closed subscheme. Let Y be a reduced scheme. A morphism $f : Y \rightarrow X$ factors through Z if and only if $f(Y) \subset Z$ (set theoretically). In particular, any morphism $Y \rightarrow X$ factors as $Y \rightarrow X_{red} \rightarrow X$.*

Proof. Assume $f(Y) \subset Z$ (set theoretically). Let $I \subset \mathcal{O}_X$ be the ideal sheaf of Z . For any affine opens $U \subset X$, $\text{Spec}(B) = V \subset Y$ with $f(V) \subset U$ and any $g \in \mathcal{I}(U)$ the pullback $b = f^\#(g) \in \Gamma(V, \mathcal{O}_Y) = B$ maps to zero in the residue field of any $y \in V$. In other words $b \in \bigcap_{\mathfrak{p} \subset B} \mathfrak{p}$. This implies $b = 0$ as B is reduced (Lemma 25.12.2, and Algebra, Lemma 10.16.2). Hence f factors through Z by Lemma 25.4.6. \square

25.13. Points of schemes

Given a scheme X we can define a functor

$$h_X : \text{Sch}^{opp} \longrightarrow \text{Sets}, \quad T \longmapsto \text{Mor}(T, X).$$

See Categories, Example 4.3.4. This is called the *functor of points of X* . A fun part of scheme theory is to find descriptions of the internal geometry of X in terms of this functor h_X . In this section we find a simple way to describe points of X .

Let X be a scheme. Let R be a local ring with maximal ideal $\mathfrak{m} \subset R$. Suppose that $f : \text{Spec}(R) \rightarrow X$ is a morphism of schemes. Let $x \in X$ be the image of the closed point $\mathfrak{m} \in \text{Spec}(R)$. Then we obtain a local homomorphism of local rings

$$f^\# : \mathcal{O}_{X,x} \longrightarrow \mathcal{O}_{\text{Spec}(R),\mathfrak{m}} = R.$$

Lemma 25.13.1. *Let X be a scheme. Let R be a local ring. The construction above gives a bijective correspondence between morphisms $\text{Spec}(R) \rightarrow X$ and pairs (x, φ) consisting of a point $x \in X$ and a local homomorphism of local rings $\varphi : \mathcal{O}_{X,x} \rightarrow R$.*

Proof. Let A be a ring. For any ring homomorphism $\psi : A \rightarrow R$ there exists a unique prime ideal $\mathfrak{p} \subset A$ and a factorization $A \rightarrow A_{\mathfrak{p}} \rightarrow R$ where the last map is a local homomorphism of local rings. Namely, $\mathfrak{p} = \psi^{-1}(\mathfrak{m})$. Via Lemma 25.6.4 this proves that the lemma holds if X is an affine scheme.

Let X be a general scheme. Any $x \in X$ is contained in an open affine $U \subset X$. By the affine case we conclude that every pair (x, φ) occurs as the end product of the construction above the lemma.

To finish the proof it suffices to show that any morphism $f : \text{Spec}(R) \rightarrow X$ has image contained in any affine open containing the image x of the closed point of $\text{Spec}(R)$. In fact, let $x \in V \subset X$ be any open neighbourhood containing x . Then $f^{-1}(V) \subset \text{Spec}(R)$ is an open containing the unique closed point and hence equal to $\text{Spec}(R)$. \square

As a special case of the lemma above we obtain for every point x of a scheme X a canonical morphism

$$(25.13.1.1) \quad \text{Spec}(\mathcal{O}_{X,x}) \longrightarrow X$$

corresponding to the identity map on the local ring of X at x . We may reformulate the lemma above as saying that for any morphism $f : \text{Spec}(R) \rightarrow X$ there exists a unique point $x \in X$ such that f factors as $\text{Spec}(R) \rightarrow \text{Spec}(\mathcal{O}_{X,x}) \rightarrow X$ where the first map comes from a local homomorphism $\mathcal{O}_{X,x} \rightarrow R$.

In case we have a morphism of schemes $f : X \rightarrow S$, and a point x mapping to a point $s \in S$ we obtain a commutative diagram

$$\begin{array}{ccc} \text{Spec}(\mathcal{O}_{X,x}) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(\mathcal{O}_{S,s}) & \longrightarrow & S \end{array}$$

where the left vertical map corresponds to the local ring map $f_x^\# : \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{S,s}$.

Lemma 25.13.2. *Let X be a scheme. Let $x, x' \in X$ be points of X . Then $x' \in X$ is a generalization of x if and only if x' is in the image of the canonical morphism $\text{Spec}(\mathcal{O}_{X,x}) \rightarrow X$.*

Proof. A continuous map preserves the relation of specialization/generalization. Since every point of $\text{Spec}(\mathcal{O}_{X,x})$ is a generalization of the closed point we see every point in the image of $\text{Spec}(\mathcal{O}_{X,x}) \rightarrow X$ is a generalization of x . Conversely, suppose that x' is a generalization of x . Choose an affine open neighbourhood $U = \text{Spec}(R)$ of x . Then $x' \in U$. Say $\mathfrak{p} \subset R$ and $\mathfrak{p}' \subset R$ are the primes corresponding to x and x' . Since x' is a generalization of x we see that $\mathfrak{p}' \subset \mathfrak{p}$. This means that \mathfrak{p}' is in the image of the morphism $\text{Spec}(\mathcal{O}_{X,x}) = \text{Spec}(R_{\mathfrak{p}}) \rightarrow \text{Spec}(R) = U \subset X$ as desired. \square

Now, let us discuss morphisms from spectra of fields. Let $(R, \mathfrak{m}, \kappa)$ be a local ring with maximal ideal \mathfrak{m} and residue field κ . Let K be a field. A local homomorphism $R \rightarrow K$ by definition factors as $R \rightarrow \kappa \rightarrow K$, i.e., is the same thing as a morphism $\kappa \rightarrow K$. Thus we see that morphisms

$$\text{Spec}(K) \longrightarrow X$$

correspond to pairs $(x, \kappa(x) \rightarrow K)$. We may define a partial ordering on morphisms of spectra of fields to X by saying that $\text{Spec}(K) \rightarrow X$ dominates $\text{Spec}(L) \rightarrow X$ if $\text{Spec}(K) \rightarrow X$ factors through $\text{Spec}(L) \rightarrow X$. This suggests the following notion:

Let us temporarily say that two morphisms $p : \text{Spec}(K) \rightarrow X$ and $q : \text{Spec}(L) \rightarrow X$ are *equivalent* if there exists a third field Ω and a commutative diagram

$$\begin{array}{ccc} \text{Spec}(\Omega) & \longrightarrow & \text{Spec}(L) \\ \downarrow & & \downarrow q \\ \text{Spec}(K) & \xrightarrow{p} & X \end{array}$$

Of course this immediately implies that the unique points of all three of the schemes $\text{Spec}(K)$, $\text{Spec}(L)$, and $\text{Spec}(\Omega)$ map to the same $x \in X$. Thus a diagram (by the remarks above) corresponds to a point $x \in X$ and a commutative diagram

$$\begin{array}{ccc} \Omega & \longleftarrow & L \\ \uparrow & & \uparrow \\ K & \longleftarrow & \kappa(x) \end{array}$$

of fields. This defines an equivalence relation, because given any set of extensions $\kappa \subset K_i$ there exists some field extension $\kappa \subset \Omega$ such that all the field extensions K_i are contained in the extension Ω .

Lemma 25.13.3. *Let X be a scheme. Points of X correspond bijectively to equivalence classes of morphisms from spectra of fields into X . Moreover, each equivalence class contains a (unique up to unique isomorphism) smallest element $\text{Spec}(\kappa(x)) \rightarrow X$.*

Proof. Follows from the discussion above. \square

Of course the morphisms $\text{Spec}(\kappa(x)) \rightarrow X$ factor through the canonical morphisms $\text{Spec}(\mathcal{O}_{X,x}) \rightarrow X$. And the content of Lemma 25.13.2 is in this setting that the morphism $\text{Spec}(\kappa(x')) \rightarrow X$ factors as $\text{Spec}(\kappa(x')) \rightarrow \text{Spec}(\mathcal{O}_{X,x}) \rightarrow X$ whenever x' is a generalization of x . In case we have a morphism of schemes $f : X \rightarrow S$, and a point x mapping to a point $s \in S$ we obtain a commutative diagram

$$\begin{array}{ccccc} \text{Spec}(\kappa(x)) & \longrightarrow & \text{Spec}(\mathcal{O}_{X,x}) & \longrightarrow & X \\ \downarrow & & \downarrow & & \downarrow \\ \text{Spec}(\kappa(s)) & \longrightarrow & \text{Spec}(\mathcal{O}_{S,s}) & \longrightarrow & S. \end{array}$$

25.14. Glueing schemes

Let I be a set. For each $i \in I$ let (X_i, \mathcal{O}_i) be a locally ringed space. (Actually the construction that follows works equally well for ringed spaces.) For each pair $i, j \in I$ let $U_{ij} \subset X_i$ be an open subspace. For each pair $i, j \in I$, let

$$\varphi_{ij} : U_{ij} \rightarrow U_{ji}$$

be an isomorphism of locally ringed spaces. For convenience we assume that $U_{ii} = X_i$ and $\varphi_{ii} = \text{id}_{X_i}$. For each triple $i, j, k \in I$ assume that

- (1) we have $\varphi_{ij}^{-1}(U_{ji} \cap U_{jk}) = U_{ij} \cap U_{ik}$, and

(2) the diagram

$$\begin{array}{ccc}
 U_{ij} \cap U_{ik} & \xrightarrow{\varphi_{ik}} & U_{ki} \cap U_{kj} \\
 & \searrow \varphi_{ij} & \nearrow \varphi_{jk} \\
 & U_{ji} \cap U_{jk} &
 \end{array}$$

is commutative.

Let us call a collection $(I, (X_i)_{i \in I}, (U_{ij})_{i,j \in I}, (\varphi_{ij})_{i,j \in I})$ satisfying the conditions above a glueing data.

Lemma 25.14.1. *Given any glueing data of locally ringed spaces there exists a locally ringed space X and open subspaces $U_i \subset X$ together with isomorphisms $\varphi_i : X_i \rightarrow U_i$ of locally ringed spaces such that*

- (1) $\varphi_i(U_{ij}) = U_i \cap U_j$, and
- (2) $\varphi_{ij} = \varphi_j^{-1}|_{U_i \cap U_j} \circ \varphi_i|_{U_{ij}}$.

The locally ringed space X is characterized by the following mapping properties: Given a locally ringed space Y we have

$$\begin{aligned}
 \text{Mor}(X, Y) &= \{(f_i)_{i \in I} \mid f_i : X_i \rightarrow Y, f_j \circ \varphi_{ij} = f_i|_{U_{ij}}\} \\
 f &\mapsto (f|_{U_i} \circ \varphi_i)_{i \in I} \\
 \text{Mor}(Y, X) &= \left\{ \begin{array}{l} \text{open covering } Y = \bigcup_{i \in I} V_i \text{ and } (g_i : V_i \rightarrow X_i)_{i \in I} \text{ such that} \\ g_i^{-1}(U_{ij}) = V_i \cap V_j \text{ and } g_j|_{V_i \cap V_j} = \varphi_{ij} \circ g_i|_{V_i \cap V_j} \end{array} \right\} \\
 g &\mapsto V_i = g^{-1}(U_i), g_i = g|_{V_i}
 \end{aligned}$$

Proof. We construct X in stages. As a set we take

$$X = \left(\coprod X_i \right) / \sim .$$

Here given $x \in X_i$ and $x' \in X_j$ we say $x \sim x'$ if and only if $x \in U_{ij}$, $x' \in U_{ji}$ and $\varphi_{ij}(x) = x'$. This is an equivalence relation since if $x \in X_i$, $x' \in X_j$, $x'' \in X_k$, and $x \sim x'$ and $x' \sim x''$, then $x' \in U_{ji} \cap U_{jk}$, hence by condition (1) of a glueing data also $x \in U_{ij} \cap U_{ik}$ and $x'' \in U_{ki} \cap U_{kj}$ and by condition (2) we see that $\varphi_{ik}(x) = x''$. (Reflexivity and symmetry follows from our assumptions that $U_{ii} = X_i$ and $\varphi_{ii} = \text{id}_{X_i}$.) Denote $\varphi_i : X_i \rightarrow X$ the natural maps. Denote $U_i = \varphi_i(X_i) \subset X$. Note that $\varphi_i : X_i \rightarrow U_i$ is a bijection.

The topology on X is defined by the rule that $U \subset X$ is open if and only if $\varphi_i^{-1}(U)$ is open for all i . We leave it to the reader to verify that this does indeed define a topology. Note that in particular U_i is open since $\varphi_j^{-1}(U_i) = U_{ji}$ which is open in X_j for all j . Moreover, for any open set $W \subset X_i$ the image $\varphi_i(W) \subset U_i$ is open because $\varphi_j^{-1}(\varphi_i(W)) = \varphi_j^{-1}(W \cap U_{ij})$. Therefore $\varphi_i : X_i \rightarrow U_i$ is a homeomorphism.

To obtain a locally ringed space we have to construct the sheaf of rings \mathcal{O}_X . We do this by glueing the sheaves of rings $\mathcal{O}_{U_i} := \varphi_{i,*}\mathcal{O}_{X_i}$. Namely, in the commutative diagram

$$\begin{array}{ccc}
 U_{ij} & \xrightarrow{\varphi_{ij}} & U_{ji} \\
 & \searrow \varphi_i|_{U_{ij}} & \swarrow \varphi_j|_{U_{ji}} \\
 & U_i \cap U_j &
 \end{array}$$

the arrow on top is an isomorphism of ringed spaces, and hence we get unique isomorphisms of sheaves of rings

$$\mathcal{O}_{U_i}|_{U_i \cap U_j} \longrightarrow \mathcal{O}_{U_j}|_{U_i \cap U_j}.$$

These satisfy a cocycle condition as in Sheaves, Section 6.33. By the results of that section we obtain a sheaf of rings \mathcal{O}_X on X such that $\mathcal{O}_X|_{U_i}$ is isomorphic to \mathcal{O}_{U_i} compatibly with the glueing maps displayed above. In particular (X, \mathcal{O}_X) is a locally ringed space since the stalks of \mathcal{O}_X are equal to the stalks of \mathcal{O}_{X_i} at corresponding points.

The proof of the mapping properties is omitted. \square

Lemma 25.14.2. *In Lemma 25.14.1 above, assume that all X_i are schemes. Then the resulting locally ringed space X is a scheme.*

Proof. This is clear since each of the U_i is a scheme and hence every $x \in X$ has an affine neighbourhood. \square

It is customary to think of X_i as an open subspace of X via the isomorphisms φ_i . We will do this in the next two examples.

Example 25.14.3 (Affine space with zero doubled). Let k be a field. Let $n \geq 1$. Let $X_1 = \text{Spec}(k[x_1, \dots, x_n])$, let $X_2 = \text{Spec}(k[y_1, \dots, y_n])$. Let $0_1 \in X_1$ be the point corresponding to the maximal ideal $(x_1, \dots, x_n) \subset k[x_1, \dots, x_n]$. Let $0_2 \in X_2$ be the point corresponding to the maximal ideal $(y_1, \dots, y_n) \subset k[y_1, \dots, y_n]$. Let $U_{12} = X_1 \setminus \{0_1\}$ and let $U_{21} = X_2 \setminus \{0_2\}$. Let $\varphi_{12} : U_{12} \rightarrow U_{21}$ be the isomorphism coming from the isomorphism of k -algebras $k[y_1, \dots, y_n] \rightarrow k[x_1, \dots, x_n]$ mapping y_i to x_i (which induces $X_1 \cong X_2$ mapping 0_1 to 0_2). Let X be the scheme obtained from the glueing data $(X_1, X_2, U_{12}, U_{21}, \varphi_{12}, \varphi_{21} = \varphi_{12}^{-1})$. Via the slight abuse of notation introduced above the example we think of $X_i \subset X$ as open subschemes. There is a morphism $f : X \rightarrow \text{Spec}(k[t_1, \dots, t_n])$ which on X_i corresponds to k algebra map $k[t_1, \dots, t_n] \rightarrow k[x_1, \dots, x_n]$ (resp. $k[t_1, \dots, t_n] \rightarrow k[y_1, \dots, y_n]$) mapping t_i to x_i (resp. t_i to y_i). It is easy to see that this morphism identifies $k[t_1, \dots, t_n]$ with $\Gamma(X, \mathcal{O}_X)$. Since $f(0_1) = f(0_2)$ we see that X is not affine.

Note that X_1 and X_2 are affine opens of X . But, if $n = 2$, then $X_1 \cap X_2$ is the scheme described in Example 25.9.3 and hence not affine. Thus in general the intersection of affine opens of a scheme is not affine. (This fact holds more generally for any $n > 1$.)

Another curious feature of this example is the following. If $n > 1$ there are many irreducible closed subsets $T \subset X$ (take the closure of any non closed point in X_1 for example). But unless $T = \{0_1\}$, or $T = \{0_2\}$ we have $0_1 \in T \Leftrightarrow 0_2 \in T$. Proof omitted.

Example 25.14.4 (Projective line). Let k be a field. Let $X_1 = \text{Spec}(k[x])$, let $X_2 = \text{Spec}(k[y])$. Let $0 \in X_1$ be the point corresponding to the maximal ideal $(x) \subset k[x]$. Let $\infty \in X_2$ be the point corresponding to the maximal ideal $(y) \subset k[y]$. Let $U_{12} = X_1 \setminus \{0\} = D(x) = \text{Spec}(k[x, 1/x])$ and let $U_{21} = X_2 \setminus \{\infty\} = D(y) = \text{Spec}(k[y, 1/y])$. Let $\varphi_{12} : U_{12} \rightarrow U_{21}$ be the isomorphism coming from the isomorphism of k -algebras $k[y, 1/y] \rightarrow k[x, 1/x]$ mapping y to $1/x$. Let \mathbf{P}_k^1 be the scheme obtained from the glueing data $(X_1, X_2, U_{12}, U_{21}, \varphi_{12}, \varphi_{21} = \varphi_{12}^{-1})$. Via the slight abuse of notation introduced above the example we think of $X_i \subset \mathbf{P}_k^1$ as open

subschemes. In this case we see that $\Gamma(\mathbf{P}_k^1, \mathcal{O}) = k$ because the only polynomials $g(x)$ in x such that $g(1/y)$ is also a polynomial in y are constant polynomials. Since \mathbf{P}_k^1 is infinite we see that \mathbf{P}_k^1 is not affine.

We claim that there exists an affine open $U \subset \mathbf{P}_k^1$ which contains both 0 and ∞ . Namely, let $U = \mathbf{P}_k^1 \setminus \{1\}$, where 1 is the point of X_1 corresponding to the maximal ideal $(x - 1)$ and also the point of X_2 corresponding to the maximal ideal $(y - 1)$. Then it is easy to see that $s = 1/(x - 1) = y/(1 - y) \in \Gamma(U, \mathcal{O}_U)$. In fact you can show that $\Gamma(U, \mathcal{O}_U)$ is equal to the polynomial ring $k[s]$ and that the corresponding morphism $U \rightarrow \text{Spec}(k[s])$ is an isomorphism of schemes. Details omitted.

25.15. A representability criterion

In this section we reformulate the glueing lemma of Section 25.14 in terms of functors. We recall some of the material from Categories, Section 4.3. Recall that given a scheme X we can define a functor

$$h_X : \text{Sch}^{opp} \longrightarrow \text{Sets}, \quad T \longmapsto \text{Mor}(T, X).$$

This is called the *functor of points of X* .

Let F be a contravariant functor from the category of schemes to the category of sets. In a formula

$$F : \text{Sch}^{opp} \longrightarrow \text{Sets}.$$

We will use the same terminology as in Sites, Section 7.2. Namely, given a scheme T , an element $\xi \in F(T)$, and a morphism $f : T' \rightarrow T$ we will denote $f^*\xi$ the element $F(f)(\xi)$, and sometimes we will even use the notation $\xi|_{T'}$.

Definition 25.15.1. (See Categories, Definition 4.3.6.) Let F be a contravariant functor from the category of schemes to the category of sets (as above). We say that F is *representable by a scheme* or *representable* if there exists a scheme X such that $h_X \cong F$.

Suppose that F is representable by the scheme X and that $s : h_X \rightarrow F$ is an isomorphism. By Categories, Yoneda Lemma 4.3.5 the pair $(X, s : h_X \rightarrow F)$ is unique up to unique isomorphism if it exists. Moreover, the Yoneda lemma says that given any contravariant functor F as above and any scheme Y , we have a bijection

$$\text{Mor}_{\text{Fun}(\text{Sch}^{opp}, \text{Sets})}(h_Y, F) \longrightarrow F(Y), \quad s \longmapsto s(\text{id}_Y).$$

Here is the reverse construction. Given any $\xi \in F(Y)$ the transformation of functors $s_\xi : h_Y \rightarrow F$ associates to any morphism $f : T \rightarrow Y$ the element $f^*\xi \in F(T)$.

In particular, in the case that F is representable, there exists a scheme X and an element $\xi \in F(X)$ such that the corresponding morphism $h_X \rightarrow F$ is an isomorphism. In this case we also say *the pair (X, ξ) represents F* . The element $\xi \in F(X)$ is often called the *“universal family”* for reasons that will become more clear when we talk about algebraic stacks (insert future reference here). For the moment we simply observe that the fact that if the pair (X, ξ) represents F , then every element $\xi' \in F(T)$ for any T is of the form $\xi' = f^*\xi$ for a unique morphism $f : T \rightarrow X$.

Example 25.15.2. Consider the rule which associates to every scheme T the set $F(T) = \Gamma(T, \mathcal{O}_T)$. We can turn this into a contravariant functor by using for a morphism $f : T' \rightarrow T$ the pullback map $f^\sharp : \Gamma(T, \mathcal{O}_T) \rightarrow \Gamma(T', \mathcal{O}_{T'})$. Given a ring

R and an element $t \in R$ there exists a unique ring homomorphism $\mathbf{Z}[x] \rightarrow R$ which maps x to t . Thus, using Lemma 25.6.4, we see that

$$\text{Mor}(T, \text{Spec}(\mathbf{Z}[x])) = \text{Hom}(\mathbf{Z}[x], \Gamma(T, \mathcal{O}_T)) = \Gamma(T, \mathcal{O}_T).$$

This does indeed give an isomorphism $h_{\text{Spec}(\mathbf{Z}[x])} \rightarrow F$. What is the “universal family” ξ ? To get it we have to apply the identifications above to $\text{id}_{\text{Spec}(\mathbf{Z}[x])}$. Clearly under the identifications above this gives that $\xi = x \in \Gamma(\text{Spec}(\mathbf{Z}[x]), \mathcal{O}_{\text{Spec}(\mathbf{Z}[x])}) = \mathbf{Z}[x]$ as expected.

Definition 25.15.3. Let F be a contravariant functor on the category of schemes with values in sets.

- (1) We say that F satisfies the sheaf property for the Zariski topology if for every scheme T and every open covering $T = \bigcup_{i \in I} U_i$, and for any collection of elements $\xi_i \in F(U_i)$ such that $\xi_i|_{U_i \cap U_j} = \xi_j|_{U_i \cap U_j}$ there exists a unique element $\xi \in F(T)$ such that $\xi_i = \xi|_{U_i}$ in $F(U_i)$.
- (2) A subfunctor $H \subset F$ is a rule that associates to every scheme T a subset $H(T) \subset F(T)$ such that the maps $F(f) : F(T) \rightarrow F(T')$ maps $H(T)$ into $H(T')$ for all morphisms of schemes $f : T' \rightarrow T$.
- (3) Let $H \subset F$ be a subfunctor. We say that $H \subset F$ is representable by open immersions if for all pairs (T, ξ) , where T is a scheme and $\xi \in F(T)$ there exists an open subscheme $U_\xi \subset T$ with the following property:
 - (*) A morphism $f : T' \rightarrow T$ factors through U_ξ if and only if $f^*\xi \in H(T')$.
- (4) Let I be a set. For each $i \in I$ let $H_i \subset F$ be a subfunctor. We say that the collection $(H_i)_{i \in I}$ covers F if and only if for every $\xi \in F(T)$ there exists an open covering $T = \bigcup U_i$ such that $\xi|_{U_i} \in H_i(U_i)$.

Lemma 25.15.4. Let F be a contravariant functor on the category of schemes with values in the category of sets. Suppose that

- (1) F satisfies the sheaf property for the Zariski topology,
- (2) there exists a set I and a collection of subfunctors $F_i \subset F$ such that
 - (a) each F_i is representable,
 - (b) each $F_i \subset F$ is representable by open immersions, and
 - (c) the collection $(F_i)_{i \in I}$ covers F .

Then F is representable.

Proof. Let X_i be a scheme representing F_i and let $\xi_i \in F_i(X_i) \subset F(X_i)$ be the “universal family”. Because $F_j \subset F$ is representable by open immersions, there exists an open $U_{ij} \subset X_i$ such that $T \rightarrow X_i$ factors through U_{ij} if and only if $\xi_i|_T \in F_j(T)$. In particular $\xi_i|_{U_{ij}} \in F_j(U_{ij})$ and therefore we obtain a canonical morphism $\varphi_{ij} : U_{ij} \rightarrow X_j$ such that $\varphi_{ij}^*\xi_j = \xi_i|_{U_{ij}}$. By definition of U_{ij} this implies that φ_{ij} factors through U_{ji} . Since $(\varphi_{ij} \circ \varphi_{ji})^*\xi_j = \varphi_{ji}^*(\varphi_{ij}^*\xi_j) = \varphi_{ji}^*\xi_i = \xi_j$ we conclude that $\varphi_{ij} \circ \varphi_{ji} = \text{id}_{U_{ji}}$ because the pair (X_j, ξ_j) represents F_j . In particular the maps $\varphi_{ij} : U_{ij} \rightarrow U_{ji}$ are isomorphisms of schemes. Next we have to show that $\varphi_{ij}^{-1}(U_{ji} \cap U_{jk}) = U_{ij} \cap U_{ik}$. This is true because (a) $U_{ji} \cap U_{jk}$ is the largest open of U_{ji} such that ξ_j restricts to an element of F_k , (b) $U_{ij} \cap U_{ik}$ is the largest open of U_{ij} such that ξ_i restricts to an element of F_k , and (c) $\varphi_{ij}^*\xi_j = \xi_i$. Moreover, the cocycle condition in Section 25.14 follows because both $\varphi_{jk}|_{U_{ji} \cap U_{jk}} \circ \varphi_{ij}|_{U_{ij} \cap U_{ik}}$ and $\varphi_{ik}|_{U_{ij} \cap U_{ik}}$ pullback ξ_k to the element ξ_i . Thus we may apply Lemma 25.14.2 to obtain a scheme X with an open covering $X = \bigcup U_i$ and isomorphisms $\varphi_i : X_i \rightarrow U_i$

with properties as in Lemma 25.14.1. Let $\xi'_i = (\varphi_i^{-1})^*\xi_i$. The conditions of Lemma 25.14.1 imply that $\xi'_i|_{U_i \cap U_j} = \xi'_j|_{U_i \cap U_j}$. Therefore, by the condition that F satisfies the sheaf condition in the Zariski topology we see that there exists an element $\xi' \in F(X)$ such that $\xi_i = \varphi_i^*\xi'|_{U_i}$ for all i . Since φ_i is an isomorphism we also get that $(U_i, \xi'|_{U_i})$ represents the functor F_i .

We claim that the pair (X, ξ') represents the functor F . To show this, let T be a scheme and let $\xi \in F(T)$. We will construct a unique morphism $g : T \rightarrow X$ such that $g^*\xi' = \xi$. Namely, by the condition that the subfunctors F_i cover T there exists an open covering $T = \bigcup V_i$ such that for each i the restriction $\xi|_{V_i} \in F_i(V_i)$. Moreover, since each of the inclusions $F_i \subset F$ are representable by open immersions we may assume that each $V_i \subset T$ is maximal open with this property. Because, (U_i, ξ'_{U_i}) represents the functor F_i we get a unique morphism $g_i : V_i \rightarrow U_i$ such that $g_i^*\xi'|_{U_i} = \xi|_{V_i}$. On the overlaps $V_i \cap V_j$ the morphisms g_i and g_j agree, for example because they both pull back $\xi'|_{U_i \cap U_j} \in F_i(U_i \cap U_j)$ to the same element. Thus the morphisms g_i glue to a unique morphism from $T \rightarrow X$ as desired. \square

Remark 25.15.5. Suppose the functor F is defined on all locally ringed spaces, and if conditions of Lemma 25.15.4 are replaced by the following:

- (1) F satisfies the sheaf property on the category of locally ringed spaces,
- (2) there exists a set I and a collection of subfunctors $F_i \subset F$ such that
 - (a) each F_i is representable by a scheme,
 - (b) each $F_i \subset F$ is representable by open immersions on the category of locally ringed spaces, and
 - (c) the collection $(F_i)_{i \in I}$ covers F as a functor on the category of locally ringed spaces.

We leave it to the reader to spell this out further. Then the end result is that the functor F is representable in the category of locally ringed spaces and that the representing object is a scheme.

25.16. Existence of fibre products of schemes

A very basic question is whether or not products and fibre products exist on the category of schemes. We first prove abstractly that products and fibre products exist, and in the next section we show how we may think in a reasonable way about fibre products of schemes.

Lemma 25.16.1. *The category of schemes has a final object, products and fibre products. In other words, the category of schemes has finite limits, see Categories, Lemma 4.18.4.*

Proof. Please skip this proof. It is more important to learn how to work with the fibre product which is explained in the next section.

By Lemma 25.6.4 the scheme $\text{Spec}(\mathbf{Z})$ is a final object in the category of locally ringed spaces. Thus it suffices to prove that fibred products exist.

Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes. We have to show that the functor

$$\begin{aligned} F : \text{Sch}^{opp} &\longrightarrow \text{Sets} \\ T &\longmapsto \text{Mor}(T, X) \times_{\text{Mor}(T, S)} \text{Mor}(T, Y) \end{aligned}$$

is representable. We claim that Lemma 25.15.4 applies to the functor F . If we prove this then the lemma is proved.

First we show that F satisfies the sheaf property in the Zariski topology. Namely, suppose that T is a scheme, $T = \bigcup_{i \in I} U_i$ is an open covering, and $\xi_i \in F(U_i)$ such that $\xi_i|_{U_i \cap U_j} = \xi_j|_{U_i \cap U_j}$ for all pairs i, j . By definition ξ_i corresponds to a pair (a_i, b_i) where $a_i : U_i \rightarrow X$ and $b_i : U_i \rightarrow Y$ are morphisms of schemes such that $f \circ a_i = g \circ b_i$. The glueing condition says that $a_i|_{U_i \cap U_j} = a_j|_{U_i \cap U_j}$ and $b_i|_{U_i \cap U_j} = b_j|_{U_i \cap U_j}$. Thus by glueing the morphisms a_i we obtain a morphism of locally ringed spaces (i.e., a morphism of schemes) $a : T \rightarrow X$ and similarly $b : T \rightarrow Y$ (see for example the mapping property of Lemma 25.14.1). Moreover, on the members of an open covering the compositions $f \circ a$ and $g \circ b$ agree. Therefore $f \circ a = g \circ b$ and the pair (a, b) defines an element of $F(T)$ which restricts to the pairs (a_i, b_i) on each U_i . The sheaf condition is verified.

Next, we construct the family of subfunctors. Choose an open covering by open affines $S = \bigcup_{i \in I} U_i$. For every $i \in I$ choose open coverings by open affines $f^{-1}(U_i) = \bigcup_{j \in J_i} V_j$ and $g^{-1}(U_i) = \bigcup_{k \in K_i} W_k$. Note that $X = \bigcup_{i \in I} \bigcup_{j \in J_i} V_j$ is an open covering and similarly for Y . For any $i \in I$ and each pair $(j, k) \in J_i \times K_i$ we have a commutative diagram

where all the skew arrows are open immersions. For such a triple we get a functor

$$\begin{aligned}
 F_{i,j,k} : Sch^{opp} &\longrightarrow Sets \\
 T &\longmapsto \text{Mor}(T, V_j) \times_{\text{Mor}(T, U_i)} \text{Mor}(T, W_k).
 \end{aligned}$$

There is an obvious transformation of functors $F_{i,j,k} \rightarrow F$ (coming from the huge commutative diagram above) which is injective, so we may think of $F_{i,j,k}$ as a subfunctor of F .

We check condition (2)(a) of Lemma 25.15.4. This follows directly from Lemma 25.6.7. (Note that we use here that the fibre products in the category of affine schemes are also fibre products in the whole category of locally ringed spaces.)

We check condition (2)(b) of Lemma 25.15.4. Let T be a scheme and let $\xi \in F(T)$. In other words, $\xi = (a, b)$ where $a : T \rightarrow X$ and $b : T \rightarrow Y$ are morphisms of schemes such that $f \circ a = g \circ b$. Set $V_{i,j,k} = a^{-1}(V_j) \cap b^{-1}(W_k)$. For any further morphism $h : T' \rightarrow T$ we have $h^*\xi = (a \circ h, b \circ h)$. Hence we see that $h^*\xi \in F_{i,j,k}(T')$ if and only if $a(h(T')) \subset V_j$ and $b(h(T')) \subset W_k$. In other words, if and only if $h(T') \subset V_{i,j,k}$. This proves condition (2)(b).

We check condition (2)(c) of Lemma 25.15.4. Let T be a scheme and let $\xi = (a, b) \in F(T)$ as above. Set $V_{i,j,k} = a^{-1}(V_j) \cap b^{-1}(W_k)$ as above. Condition (2)(c) just means that $T = \bigcup V_{i,j,k}$ which is evident. Thus the lemma is proved and fibre products exist. \square

Remark 25.16.2. Using Remark 25.15.5 you can show that the fibre product of morphisms of schemes exists in the category of locally ringed spaces and is a scheme.

25.17. Fibre products of schemes

Here is a review of the general definition, even though we have already shown that fibre products of schemes exist.

Definition 25.17.1. Given morphisms of schemes $f : X \rightarrow S$ and $g : Y \rightarrow S$ the *fibre product* is a scheme $X \times_S Y$ together with projection morphisms $p : X \times_S Y \rightarrow X$ and $q : X \times_S Y \rightarrow Y$ sitting into the following commutative diagram

$$\begin{array}{ccc} X \times_S Y & \xrightarrow{q} & Y \\ p \downarrow & & \downarrow g \\ X & \xrightarrow{f} & S \end{array}$$

which is universal among all diagrams of this sort, see Categories, Definition 4.6.1.

In other words, given any solid commutative diagram of morphisms of schemes

$$\begin{array}{ccccc} T & & & & \\ & \searrow & & & \\ & & X \times_S Y & \longrightarrow & Y \\ & & \downarrow & & \downarrow \\ & & X & \longrightarrow & S \end{array}$$

there exists a unique dotted arrow making the diagram commute. We will prove some lemmas which will tell us how to think about fibre products.

Lemma 25.17.2. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target. If X, Y, S are all affine then $X \times_S Y$ is affine.*

Proof. Suppose that $X = \text{Spec}(A)$, $Y = \text{Spec}(B)$ and $S = \text{Spec}(R)$. By Lemma 25.6.7 the affine scheme $\text{Spec}(A \otimes_R B)$ is the fibre product $X \times_S Y$ in the category of locally ringed spaces. Hence it is a fortiori the fibre product in the category of schemes. \square

Lemma 25.17.3. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target. Let $X \times_S Y$, p , q be the fibre product. Suppose that $U \subset S$, $V \subset X$, $W \subset Y$ are open subschemes such that $f(V) \subset U$ and $g(W) \subset U$. Then the canonical morphism $V \times_U W \rightarrow X \times_S Y$ is an open immersion which identifies $V \times_U W$ with $p^{-1}(V) \cap q^{-1}(W)$.*

Proof. Let T be a scheme. Suppose $a : T \rightarrow V$ and $b : T \rightarrow W$ are morphisms such that $f \circ a = g \circ b$ as morphisms into U . Then they agree as morphisms into S . By the universal property of the fibre product we get a unique morphism $T \rightarrow X \times_S Y$. Of course this morphism has image contained in the open $p^{-1}(V) \cap q^{-1}(W)$. Thus $p^{-1}(V) \cap q^{-1}(W)$ is a fibre product of V and W over U . The result follows from the uniqueness of fibre products, see Categories, Section 4.6. \square

In particular this shows that $V \times_U W = V \times_S W$ in the situation of the lemma. Moreover, if U, V, W are all affine, then we know that $V \times_U W$ is affine. And of course we may cover $X \times_S Y$ by such affine opens $V \times_U W$. We formulate this as a lemma.

Lemma 25.17.4. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target. Let $S = \bigcup U_i$ be any affine open covering of S . For each $i \in I$, let $f^{-1}(U_i) = \bigcup_{j \in J_i} V_j$ be an affine open covering of $f^{-1}(U_i)$ and let $g^{-1}(U_i) = \bigcup_{k \in K_i} W_k$ be an affine open covering of $g^{-1}(U_i)$. Then*

$$X \times_S Y = \bigcup_{i \in I} \bigcup_{j \in J_i, k \in K_i} V_j \times_{U_i} W_k$$

is an affine open covering of $X \times_S Y$.

Proof. See discussion above the lemma. □

In other words, we might have used the previous lemma as a way of construction the fibre product directly by glueing the affine schemes. (Which is of course exactly what we did in the proof of Lemma 25.16.1 anyway.) Here is a way to describe the set of points of a fibre product of schemes.

Lemma 25.17.5. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target. Points z of $X \times_S Y$ are in bijective correspondence to quadruples*

$$(x, y, s, \mathfrak{p})$$

where $x \in X, y \in Y, s \in S$ are points with $f(x) = s, g(y) = s$ and \mathfrak{p} is a prime ideal of the ring $\kappa(x) \otimes_{\kappa(s)} \kappa(y)$. The residue field of z corresponds to the residue field of the prime \mathfrak{p} .

Proof. Let z be a point of $X \times_S Y$ and let us construct a triple as above. Recall that we may think of z as a morphism $\text{Spec}(\kappa(z)) \rightarrow X \times_S Y$, see Lemma 25.13.3. This morphism corresponds to morphisms $a : \text{Spec}(\kappa(z)) \rightarrow X$ and $b : \text{Spec}(\kappa(z)) \rightarrow Y$ such that $f \circ a = g \circ b$. By the same lemma again we get points $x \in X, y \in Y$ lying over the same point $s \in S$ as well as field maps $\kappa(x) \rightarrow \kappa(z), \kappa(y) \rightarrow \kappa(z)$ such that the compositions $\kappa(s) \rightarrow \kappa(x) \rightarrow \kappa(z)$ and $\kappa(s) \rightarrow \kappa(y) \rightarrow \kappa(z)$ are the same. In other words we get a ring map $\kappa(x) \otimes_{\kappa(s)} \kappa(y) \rightarrow \kappa(z)$. We let \mathfrak{p} be the kernel of this map.

Conversely, given a quadruple (x, y, s, \mathfrak{p}) we get a commutative solid diagram

see the discussion in Section 25.13. Thus we get the dotted arrow. The corresponding point z of $X \times_S Y$ is the image of the generic point of $\text{Spec}(\kappa(x) \otimes_{\kappa(s)} \kappa(y)/\mathfrak{p})$. We omit the verification that the two constructions are inverse to each other. □

Lemma 25.17.6. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target.*

- (1) *If $f : X \rightarrow S$ is a closed immersion, then $X \times_S Y \rightarrow Y$ is a closed immersion. Moreover, if $X \rightarrow S$ corresponds to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_S$, then $X \times_S Y \rightarrow Y$ corresponds to the sheaf of ideals $\text{Im}(g^*\mathcal{I} \rightarrow \mathcal{O}_Y)$.*
- (2) *If $f : X \rightarrow S$ is an open immersion, then $X \times_S Y \rightarrow Y$ is an open immersion.*
- (3) *If $f : X \rightarrow S$ is an immersion, then $X \times_S Y \rightarrow Y$ is an immersion.*

Proof. Assume that $X \rightarrow S$ is a closed immersion corresponding to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_S$. By Lemma 25.4.7 the closed subspace $Z \subset Y$ defined by the sheaf of ideals $\text{Im}(g^*\mathcal{I} \rightarrow \mathcal{O}_Y)$ is the fibre product in the category of locally ringed spaces. By Lemma 25.10.1 Z is a scheme. Hence $Z = X \times_S Y$ and the first statement follows. The second follows from Lemma 25.17.3 for example. The third is a combination of the first two. \square

Definition 25.17.7. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $Z \subset Y$ be a closed subscheme of Y . The *inverse image* $f^{-1}(Z)$ of the closed subscheme Z is the closed subscheme $Z \times_Y X$ of X . See Lemma 25.17.6 above.

We may occasionally also use this terminology with locally closed and open subschemes.

25.18. Base change in algebraic geometry

One motivation for the introduction of the language of schemes is that it gives a very precise notion of what it means to define a variety over a particular field. For example a variety X over \mathbf{Q} is synonymous (insert future reference here) with $X \rightarrow \text{Spec}(\mathbf{Q})$ which is of finite type, separated, irreducible and reduced¹. In any case, the idea is more generally to work with schemes over a given *base scheme*, often denoted S . We use the language: “let X be a scheme over S ” to mean simply that X comes equipped with a morphism $X \rightarrow S$. In diagrams we will try to picture the *structure morphism* $X \rightarrow S$ as a downward arrow from X to S . We are often more interested in the properties of X relative to S rather than the internal geometry of X . For example, we would like to know things about the fibres of $X \rightarrow S$, what happens to X after base change, and so on.

We introduce some of the language that is customarily used. Of course this language is just a special case of thinking about the category of objects over a given object in a category, see Categories, Example 4.2.13.

Definition 25.18.1. Let S be a scheme.

- (1) We say X is a *scheme over S* to mean that X comes equipped with a morphism of schemes $X \rightarrow S$. The morphism $X \rightarrow S$ is sometimes called the *structure morphism*.
- (2) If R is a ring we say X is a *scheme over R* instead of X is a scheme over $\text{Spec}(R)$.

¹Of course algebraic geometers still quibble over whether one should require X to be geometrically irreducible over \mathbf{Q} .

- (3) A *morphism* $f : X \rightarrow Y$ of schemes over S is a morphism of schemes such that the composition $X \rightarrow Y \rightarrow S$ of f with the structure morphism of Y is equal to the structure morphism of X .
- (4) We denote $\text{Mor}_S(X, Y)$ the set of all morphisms from X to Y over S .
- (5) Let X be a scheme over S . Let $S' \rightarrow S$ be a morphism of schemes. The *base change* of X is the scheme $X_{S'} = S' \times_S X$ over S' .
- (6) Let $f : X \rightarrow Y$ be a morphism of schemes over S . Let $S' \rightarrow S$ be a morphism of schemes. The *base change* of f is the induced morphism $f' : X_{S'} \rightarrow Y_{S'}$ (namely the morphism $\text{id}_{S'} \times_{\text{id}_S} f$).
- (7) Let R be a ring. Let X be a scheme over R . Let $R \rightarrow R'$ be a ring map. The *base change* $X_{R'}$ is the scheme $\text{Spec}(R') \times_{\text{Spec}(R)} X$ over R' .

Here is a typical result.

Lemma 25.18.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an immersion (resp. closed immersion, resp. open immersion) of schemes over S . Then any base change of f is an immersion (resp. closed immersion, resp. open immersion).*

Proof. We can think of the base change of f via the morphism $S' \rightarrow S$ as the top left vertical arrow in the following commutative diagram:

$$\begin{array}{ccc}
 X_{S'} & \longrightarrow & X \\
 \downarrow & & \downarrow \\
 Y_{S'} & \longrightarrow & Y \\
 \downarrow & & \downarrow \\
 S' & \longrightarrow & S
 \end{array}$$

The diagram implies $X_{S'} \cong Y_{S'} \times_Y X$, and the lemma follows from Lemma 25.17.6. \square

In fact this type of result is so typical that there is a piece of language to express it. Here it is.

Definition 25.18.3. Properties and base change.

- (1) Let \mathcal{P} be a property of schemes over a base. We say that \mathcal{P} is *preserved under arbitrary base change*, or simply that *preserved under base change* if whenever X/S has \mathcal{P} , any base change $X_{S'}/S'$ has \mathcal{P} .
- (2) Let \mathcal{P} be a property of morphisms of schemes over a base. We say that \mathcal{P} is *preserved under arbitrary base change*, or simply that *preserved under base change* if whenever $f : X \rightarrow Y$ over S has \mathcal{P} , any base change $f' : X_{S'} \rightarrow Y_{S'}$ over S' has \mathcal{P} .

At this point we can say that “being a closed immersion” is preserved under arbitrary base change.

Definition 25.18.4. Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. The *scheme theoretic fibre* X_s of f over s , or simply the *fibre* of f over s is

the scheme fitting in the following fibre product diagram

$$\begin{array}{ccc} X_s = \text{Spec}(\kappa(s)) \times_S X & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(\kappa(s)) & \longrightarrow & S \end{array}$$

We think of the fibre X_s always as a scheme over $\kappa(s)$.

Lemma 25.18.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Consider the diagrams*

$$\begin{array}{ccc} X_s & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(\kappa(s)) & \longrightarrow & S \end{array} \quad \begin{array}{ccc} \text{Spec}(\mathcal{O}_{S,s}) \times_S X & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(\mathcal{O}_{S,s}) & \longrightarrow & S \end{array}$$

In both cases the top horizontal arrow is a homeomorphism onto its image.

Proof. Choose an open affine $U \subset S$ that contains s . The bottom horizontal morphisms factor through U , see Lemma 25.13.1 for example. Thus we may assume that S is affine. If X is also affine, then the result follows from Algebra, Remark 10.16.8. In the general case the result follows by covering X by open affines. \square

25.19. Quasi-compact morphisms

A scheme is *quasi-compact* if its underlying topological space is quasi-compact. There is a relative notion which is defined as follows.

Definition 25.19.1. A morphism of schemes is called *quasi-compact* if the underlying map of topological spaces is quasi-compact, see Topology, Definition 5.11.1.

Lemma 25.19.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) $f : X \rightarrow S$ is quasi-compact,
- (2) the inverse image of every affine open is quasi-compact, and
- (3) there exists some affine open covering $S = \bigcup_{i \in I} U_i$ such that $f^{-1}(U_i)$ is quasi-compact for all i .

Proof. Suppose we are given a covering $X = \bigcup_{i \in I} U_i$ as in (3). First, let $U \subset S$ be any affine open. For any $u \in U$ we can find an index $i(u) \in I$ such that $u \in U_{i(u)}$. As standard opens form a basis for the topology on $U_{i(u)}$ we can find $W_u \subset U \cap U_{i(u)}$ which is standard open in $U_{i(u)}$. By compactness we can find finitely many points $u_1, \dots, u_n \in U$ such that $U = \bigcup_{j=1}^n W_{u_j}$. For each j write $f^{-1}U_{i(u_j)} = \bigcup_{k \in K_j} V_{jk}$ as a finite union of affine opens. Since $W_{u_j} \subset U_{i(u_j)}$ is a standard open we see that $f^{-1}(W_{u_j}) \cap V_{jk}$ is a standard open of V_{jk} , see Algebra, Lemma 10.16.4. Hence $f^{-1}(W_{u_j}) \cap V_{jk}$ is affine, and so $f^{-1}(W_{u_j})$ is a finite union of affines. This proves that the inverse image of any affine open is a finite union of affine opens.

Next, assume that the inverse image of every affine open is a finite union of affine opens. Let $K \subset X$ be any quasi-compact open. Since X has a basis of the topology consisting of affine opens we see that K is a finite union of affine opens. Hence the inverse image of K is a finite union of affine opens. Hence f is quasi-compact.

Finally, assume that f is quasi-compact. In this case the argument of the previous paragraph shows that the inverse image of any affine is a finite union of affine opens. \square

Lemma 25.19.3. *Being quasi-compact is a property of morphisms of schemes over a base which is preserved under arbitrary base change.*

Proof. Omitted. \square

Lemma 25.19.4. *The composition of quasi-compact morphisms is quasi-compact.*

Proof. This follows from the definitions and Topology, Lemma 5.11.2. \square

Lemma 25.19.5. *A closed immersion is quasi-compact.*

Proof. Follows from the definitions and Topology, Lemma 5.11.3. \square

Example 25.19.6. An open immersion is in general not quasi-compact. The standard example of this is the open subspace $U \subset X$, where $X = \text{Spec}(k[x_1, x_2, x_3, \dots])$, where U is $X \setminus \{0\}$, and where 0 is the point of X corresponding to the maximal ideal (x_1, x_2, x_3, \dots) .

Lemma 25.19.7. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. The following are equivalent*

- (1) $f(X) \subset S$ is closed, and
- (2) $f(X) \subset S$ is stable under specialization.

Proof. We have (1) \Rightarrow (2) by Topology, Lemma 5.18.2. Assume (2). Let $U \subset S$ be an affine open. It suffices to prove that $f(X) \cap U$ is closed. Since $U \cap f(X)$ is stable under specializations, we have reduced to the case where S is affine. Because f is quasi-compact we deduce that $X = f^{-1}(S)$ is quasi-compact as S is affine. Thus we may write $X = \bigcup_{i=1}^n U_i$ with $U_i \subset X$ open affine. Say $S = \text{Spec}(R)$ and $U_i = \text{Spec}(A_i)$ for some R -algebra A_i . Then $f(X) = \text{Im}(\text{Spec}(A_1 \times \dots \times A_n) \rightarrow \text{Spec}(R))$. Thus the lemma follows from Algebra, Lemma 10.40.5. \square

Lemma 25.19.8. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. Then f is closed if and only if specializations lift along f , see Topology, Definition 5.18.3.*

Proof. According to Topology, Lemma 5.18.6 if f is closed then specializations lift along f . Conversely, suppose that specializations lift along f . Let $Z \subset X$ be a closed subset. We may think of Z as a scheme with the reduced induced scheme structure, see Definition 25.12.5. Since $Z \subset X$ is closed the restriction of f to Z is still quasi-compact. Moreover specializations lift along $Z \rightarrow S$ as well, see Topology, Lemma 5.18.4. Hence it suffices to prove $f(X)$ is closed if specializations lift along f . In particular $f(X)$ is stable under specializations, see Topology, Lemma 5.18.5. Thus $f(X)$ is closed by Lemma 25.19.7. \square

25.20. Valuative criterion for universal closedness

In Topology, Section 5.16 there is a discussion of proper maps as closed maps of topological spaces all of whose fibres are quasi-compact, or as maps such that all base changes are closed maps. Here is the corresponding notion in algebraic geometry.

Definition 25.20.1. A morphism of schemes $f : X \rightarrow S$ is said to be *universally closed* if every base change $f' : X_{S'} \rightarrow S'$ is closed.

In fact the adjective “universally” is often used in this way. In other words, given a property \mathcal{P} of morphisms we say that “ $X \rightarrow S$ is universally \mathcal{P} ” if and only if every base change $X_{S'} \rightarrow S'$ has \mathcal{P} .

Please take a look at Morphisms, Section 28.42 for a more detailed discussion of the properties of universally closed morphisms. In this section we restrict the discussion to the relationship between universal closed morphisms and morphisms satisfying the existence part of the valuative criterion.

Lemma 25.20.2. *Let $f : X \rightarrow S$ be a morphism of schemes.*

- (1) *If f is universally closed then specializations lift along any base change of f , see Topology, Definition 5.18.3.*
- (2) *If f is quasi-compact and specializations lift along any base change of f , then f is universally closed.*

Proof. Part (1) is a direct consequence of Topology, Lemma 5.18.6. Part (2) follows from Lemmas 25.19.8 and 25.19.3. \square

Definition 25.20.3. Let $f : X \rightarrow S$ be a morphism of schemes. We say f *satisfies the existence part of the valuative criterion* if given any commutative solid diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & S \end{array}$$

where A is a valuation ring with field of fractions K , the dotted arrow exists. We say f *satisfies the uniqueness part of the valuative criterion* if there is at most one dotted arrow given any diagram as above (without requiring existence of course).

A *valuation ring* is a local domain maximal among the relation of domination in its fraction field, see Algebra, Definition 10.48.1. Hence the spectrum of a valuation ring has a unique generic point η and a unique closed point 0 , and of course we have the specialization $\eta \rightsquigarrow 0$. The significance of valuation rings is that any specialization of points in any scheme is the image of $\eta \rightsquigarrow 0$ under some morphism from the spectrum of some valuation ring. Here is the precise result.

Lemma 25.20.4. *Let S be a scheme. Let $s' \rightsquigarrow s$ be a specialization of points of S . Then*

- (1) *there exists a valuation ring A and a morphism $\mathrm{Spec}(A) \rightarrow S$ such that the generic point η of $\mathrm{Spec}(A)$ maps to s' and the special point maps to s , and*
- (2) *given a field extension $\kappa(s') \subset K$ we may arrange it so that the extension $\kappa(s') \subset \kappa(\eta)$ induced by f is isomorphic to the given extension.*

Proof. Let $s' \rightsquigarrow s$ be a specialization in S , and let $\kappa(s') \subset K$ be an extension of fields. By Lemma 25.13.2 and the discussion following Lemma 25.13.3 this leads to ring maps $\mathcal{O}_{S,s} \rightarrow \kappa(s') \rightarrow K$. Let $A \subset K$ be any valuation ring whose field of fractions is K and which dominates the image of $\mathcal{O}_{S,s} \rightarrow K$, see Algebra, Lemma 10.48.2. The ring map $\mathcal{O}_{S,s} \rightarrow A$ induces the morphism $f : \mathrm{Spec}(A) \rightarrow S$, see Lemma 25.13.1. This morphism has all the desired properties by construction. \square

Lemma 25.20.5. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *Specializations lift along any base change of f*
- (2) *The morphism f satisfies the existence part of the valuative criterion.*

Proof. Assume (1) holds. Let a solid diagram as in Definition 25.20.3 be given. In order to find the dotted arrow we may replace $X \rightarrow S$ by $X_{\text{Spec}(A)} \rightarrow \text{Spec}(A)$ since after all the assumption is stable under base change. Thus we may assume $S = \text{Spec}(A)$. Let $x' \in X$ be the image of $\text{Spec}(K) \rightarrow X$, so that we have $\kappa(x') \subset K$, see Lemma 25.13.3. By assumption there exists a specialization $x' \rightsquigarrow x$ in X such that x maps to the closed point of $S = \text{Spec}(A)$. We get a local ring map $A \rightarrow \mathcal{O}_{X,x}$ and a ring map $\mathcal{O}_{X,x} \rightarrow \kappa(x')$, see Lemma 25.13.2 and the discussion following Lemma 25.13.3. The composition $A \rightarrow \mathcal{O}_{X,x} \rightarrow \kappa(x') \rightarrow K$ is the given injection $A \rightarrow K$. Since $A \rightarrow \mathcal{O}_{X,x}$ is local, the image of $\mathcal{O}_{X,x} \rightarrow K$ dominates A and hence is equal to A , by Algebra, Definition 10.48.1. Thus we obtain a ring map $\mathcal{O}_{X,x} \rightarrow A$ and hence a morphism $\text{Spec}(A) \rightarrow X$ (see Lemma 25.13.1 and discussion following it). This proves (2).

Conversely, assume (2) holds. It is immediate that the existence part of the valuative criterion holds for any base change $X_{S'} \rightarrow S'$ of f by considering the following commutative diagram

$$\begin{array}{ccccc}
 \text{Spec}(K) & \longrightarrow & X_{S'} & \longrightarrow & X \\
 \downarrow & \nearrow \text{dotted} & \downarrow & \nearrow \text{dotted} & \downarrow \\
 \text{Spec}(A) & \longrightarrow & S' & \longrightarrow & S
 \end{array}$$

Namely, the more horizontal dotted arrow will lead to the other one by definition of the fibre product. OK, so it clearly suffices to show that specializations lift along f . Let $s' \rightsquigarrow s$ be a specialization in S , and let $x' \in X$ be a point lying over s' . Apply Lemma 25.20.4 to $s' \rightsquigarrow s$ and the extension of fields $\kappa(s') \subset \kappa(x') = K$. We get a commutative diagram

$$\begin{array}{ccccc}
 \text{Spec}(K) & \longrightarrow & X & & \\
 \downarrow & \nearrow \text{dotted} & \downarrow & & \\
 \text{Spec}(A) & \longrightarrow & \text{Spec}(\mathcal{O}_{S,s}) & \longrightarrow & S
 \end{array}$$

and by condition (2) we get the dotted arrow. The image x of the closed point of $\text{Spec}(A)$ in X will be a solution to our problem, i.e., x is a specialization of x' and maps to s . □

Proposition 25.20.6 (Valuative criterion of universal closedness). *Let f be a quasi-compact morphism of schemes. Then f is universally closed if and only if f satisfies the existence part of the valuative criterion.*

Proof. This is a formal consequence of Lemmas 25.20.2 and 25.20.5 above. □

Example 25.20.7. Let k be a field. Consider the structure morphism $p : \mathbf{P}_k^1 \rightarrow \text{Spec}(k)$ of the projective line over k , see Example 25.14.4. Let us use the valuative criterion above to prove that p is universally closed. By construction \mathbf{P}_k^1 is covered

by two affine opens and hence p is quasi-compact. Let a commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \xrightarrow{\xi} & \mathbf{P}_k^1 \\ \downarrow & & \downarrow \\ \mathrm{Spec}(A) & \xrightarrow{\varphi} & \mathrm{Spec}(k) \end{array}$$

be given, where A is a valuation ring and K is its field of fractions. Recall that \mathbf{P}_k^1 is gotten by glueing $\mathrm{Spec}(k[x])$ to $\mathrm{Spec}(k[y])$ by glueing $D(x)$ to $D(y)$ via $x = y^{-1}$ (or more symmetrically $xy = 1$). To show there is a morphism $\mathrm{Spec}(A) \rightarrow \mathbf{P}_k^1$ fitting diagonally into the diagram above we may assume that ξ maps into the open $\mathrm{Spec}(k[x])$ (by symmetry). This gives the following commutative diagram of rings

$$\begin{array}{ccc} K & \xleftarrow{\xi^\#} & k[x] \\ \uparrow & & \uparrow \\ A & \xleftarrow{\varphi^\#} & k \end{array}$$

By Algebra, Lemma 10.48.3 we see that either $\xi^\#(x) \in A$ or $\xi^\#(x)^{-1} \in A$. In the first case we get a ring map

$$k[x] \rightarrow A, \lambda \mapsto \varphi^\#(\lambda), x \mapsto \xi^\#(x)$$

fitting into the diagram of rings above, and we win. In the second case we see that we get a ring map

$$k[y] \rightarrow A, \lambda \mapsto \varphi^\#(\lambda), y \mapsto \xi^\#(x)^{-1}.$$

This gives a morphism $\mathrm{Spec}(A) \rightarrow \mathrm{Spec}(k[y]) \rightarrow \mathbf{P}_k^1$ which fits diagonally into the initial commutative diagram of this example (check omitted).

25.21. Separation axioms

A topological space X is Hausdorff if and only if the diagonal $\Delta \subset X \times X$ is a closed subset. The analogue in algebraic geometry is, given a scheme X over a base scheme S , to consider the diagonal morphism

$$\Delta_{X/S} : X \longrightarrow X \times_S X.$$

This is the unique morphism of schemes such that $\mathrm{pr}_1 \circ \Delta_{X/S} = \mathrm{id}_X$ and $\mathrm{pr}_2 \circ \Delta_{X/S} = \mathrm{id}_X$ (it exists in any category with fibre products).

Lemma 25.21.1. *The diagonal morphism of a morphism between affines is closed.*

Proof. The diagonal morphism associated to the morphism $\mathrm{Spec}(S) \rightarrow \mathrm{Spec}(R)$ is the morphism on spectra corresponding to the ring map $S \otimes_R S \rightarrow S, a \otimes b \mapsto ab$. This map is clearly surjective, so $S \cong S \otimes_R S/J$ for some ideal $J \subset S \otimes_R S$. Hence Δ is a closed immersion according to Example 25.8.1 \square

Lemma 25.21.2. *Let X be a scheme over S . The diagonal morphism $\Delta_{X/S}$ is an immersion.*

Proof. Recall that if $V \subset X$ is affine open and maps into $U \subset S$ affine open, then $V \times_U V$ is affine open in $X \times_S X$, see Lemmas 25.17.2 and 25.17.3. Consider the open subscheme W of $X \times_S X$ which is the union of these affine opens $V \times_U V$. By Lemma 25.4.2 it is enough to show that each morphism $\Delta_{X/S}^{-1}(V \times_U V) \rightarrow V \times_U V$

is a closed immersion. Since $V = \Delta_{X/S}^{-1}(V \times_U V)$ we are just checking that $\Delta_{V/U}$ is a closed immersion, which is Lemma 25.21.1. \square

Definition 25.21.3. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say f is *separated* if the diagonal morphism $\Delta_{X/S}$ is a closed immersion.
- (2) We say f is *quasi-separated* if the diagonal morphism $\Delta_{X/S}$ is a quasi-compact morphism.
- (3) We say a scheme Y is *separated* if the morphism $Y \rightarrow \text{Spec}(\mathbf{Z})$ is separated.
- (4) We say a scheme Y is *quasi-separated* if the morphism $Y \rightarrow \text{Spec}(\mathbf{Z})$ is quasi-separated.

By Lemmas 25.21.2 and 25.10.4 we see that $\Delta_{X/S}$ is a closed immersion if and only if $\Delta_{X/S}(X) \subset X \times_S X$ is a closed subset. Moreover, by Lemma 25.19.5 we see that a separated morphism is quasi-separated. The reason for introducing quasi-separated morphisms is that non-separated morphisms come up naturally in studying algebraic varieties (especially when doing moduli, algebraic stacks, etc). But most often they are still quasi-separated.

Example 25.21.4. Here is an example of a non-quasi-separated morphism. Suppose $X = X_1 \cup X_2 \rightarrow S = \text{Spec}(k)$ with $X_1 = X_2 = \text{Spec}(k[t_1, t_2, t_3, \dots])$ glued along the complement of $\{0\} = \{(t_1, t_2, t_3, \dots)\}$ (glued as in Example 25.14.3). In this case the inverse image of the affine scheme $X_1 \times_S X_2$ under $\Delta_{X/S}$ is the scheme $\text{Spec}(k[t_1, t_2, t_3, \dots]) \setminus \{0\}$ which is not quasi-compact.

Lemma 25.21.5. Let X, Y be schemes over S . Let $a, b : X \rightarrow Y$ be morphisms of schemes over S . There exists a largest locally closed subscheme $Z \subset X$ such that $a|_Z = b|_Z$. In fact Z is the equalizer of (a, b) . Moreover, if Y is separated over S , then Z is a closed subscheme.

Proof. The equalizer of (a, b) is for categorical reasons the fibre product Z in the following diagram

$$\begin{array}{ccc} Z = Y \times_{(Y \times_S Y)} X & \longrightarrow & X \\ \downarrow & & \downarrow (a,b) \\ Y & \xrightarrow{\Delta_{Y/S}} & Y \times_S Y \end{array}$$

Thus the lemma follows from Lemmas 25.18.2, 25.21.2 and Definition 25.21.3. \square

Lemma 25.21.6. An affine scheme is separated. A morphism of affine schemes is separated.

Proof. See Lemma 25.21.1. \square

Lemma 25.21.7. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:

- (1) The morphism f is quasi-separated.
- (2) For every pair of affine opens $U, V \subset X$ which map into a common affine open of S the intersection $U \cap V$ is a finite union of affine opens of X .
- (3) There exists an affine open covering $S = \bigcup_{i \in I} U_i$ and for each i an affine open covering $f^{-1}U_i = \bigcup_{j \in I_i} V_j$ such that for each i and each pair $j, j' \in I_i$ the intersection $V_j \cap V_{j'}$ is a finite union of affine opens of X .

Proof. Let us prove that (3) implies (1). By Lemma 25.17.4 the covering $X \times_S X = \bigcup_i \bigcup_{j,j'} V_j \times_{U_i} V_{j'}$ is an affine open covering of $X \times_S X$. Moreover, $\Delta_{X/S}^{-1}(V_j \times_{U_i} V_{j'}) = V_j \cap V_{j'}$. Hence the implication follows from Lemma 25.19.2.

The implication (1) \Rightarrow (2) follows from the fact that under the hypotheses of (2) the fibre product $U \times_S V$ is an affine open of $X \times_S X$. The implication (2) \Rightarrow (3) is trivial. \square

Lemma 25.21.8. *Let $f : X \rightarrow S$ be a morphism of schemes.*

- (1) *If f is separated then for every pair of affine opens (U, V) of X which map into a common affine open of S we have*
 - (a) *the intersection $U \cap V$ is affine.*
 - (b) *the ring map $\mathcal{O}_X(U) \otimes_{\mathbf{Z}} \mathcal{O}_X(V) \rightarrow \mathcal{O}_X(U \cap V)$ is surjective.*
- (2) *If any pair of points $x_1, x_2 \in X$ lying over a common point $s \in S$ are contained in affine opens $x_1 \in U, x_2 \in V$ which map into a common affine open of S such that (a), (b) hold, then f is separated.*

Proof. Assume f separated. Suppose (U, V) is a pair as in (1). Let $W = \text{Spec}(R)$ be an affine open of S containing both $f(U)$ and $f(V)$. Write $U = \text{Spec}(A)$ and $V = \text{Spec}(B)$ for R -algebras A and B . By Lemma 25.17.3 we see that $U \times_S V = U \times_W V = \text{Spec}(A \otimes_R B)$ is an affine open of $X \times_S X$. Hence, by Lemma 25.10.1 we see that $\Delta^{-1}(U \times_S V) \rightarrow U \times_S V$ can be identified with $\text{Spec}(A \otimes_R B/J)$ for some ideal $J \subset A \otimes_R B$. Thus $U \cap V = \Delta^{-1}(U \times_S V)$ is affine. Assertion (1)(b) holds because $A \otimes_{\mathbf{Z}} B \rightarrow (A \otimes_R B)/J$ is surjective.

Assume the hypothesis formulated in (2) holds. Clearly the collection of affine opens $U \times_S V$ for pairs (U, V) as in (2) form an affine open covering of $X \times_S X$ (see e.g. Lemma 25.17.4). Hence it suffices to show that each morphism $U \cap V = \Delta_{X/S}^{-1}(U \times_S V) \rightarrow U \times_S V$ is a closed immersion, see Lemma 25.4.2. By assumption (a) we have $U \cap V = \text{Spec}(C)$ for some ring C . After choosing an affine open $W = \text{Spec}(R)$ of S into which both U and V map and writing $U = \text{Spec}(A)$, $V = \text{Spec}(B)$ we see that the assumption (b) means that the composition

$$A \otimes_{\mathbf{Z}} B \rightarrow A \otimes_R B \rightarrow C$$

is surjective. Hence $A \otimes_R B \rightarrow C$ is surjective and we conclude that $\text{Spec}(C) \rightarrow \text{Spec}(A \otimes_R B)$ is a closed immersion. \square

Example 25.21.9. Let k be a field. Consider the structure morphism $p : \mathbf{P}_k^1 \rightarrow \text{Spec}(k)$ of the projective line over k , see Example 25.14.4. Let us use the lemma above to prove that p is separated. By construction \mathbf{P}_k^1 is covered by two affine opens $U = \text{Spec}(k[x])$ and $V = \text{Spec}(k[y])$ with intersection $U \cap V = \text{Spec}(k[x, y]/(xy - 1))$ (using obvious notation). Thus it suffices to check that conditions (2)(a) and (2)(b) of Lemma 25.21.8 hold for the pairs of affine opens (U, U) , (U, V) , (V, U) and (V, V) . For the pairs (U, U) and (V, V) this is trivial. For the pair (U, V) this amounts to proving that $U \cap V$ is affine, which is true, and that the ring map

$$k[x] \otimes_{\mathbf{Z}} k[y] \longrightarrow k[x, y]/(xy - 1)$$

is surjective. This is clear because any element in the right hand side can be written as a sum of a polynomial in x and a polynomial in y .

Lemma 25.21.10. *Let $f : X \rightarrow T$ and $g : Y \rightarrow T$ be morphisms of schemes with the same target. Let $h : T \rightarrow S$ be a morphism of schemes. Then the induced morphism $i : X \times_T Y \rightarrow X \times_S Y$ is an immersion. If $T \rightarrow S$ is separated, then i is a closed immersion. If $T \rightarrow S$ is quasi-separated, then i is a quasi-compact morphism.*

Proof. By general category theory the following diagram

$$\begin{array}{ccc} X \times_T Y & \longrightarrow & X \times_S Y \\ \downarrow & & \downarrow \\ T & \xrightarrow{\Delta_{T/S}} & T \times_S T \end{array}$$

is a fibre product diagram. The lemma follows from Lemmas 25.21.2, 25.17.6 and 25.19.3. \square

Lemma 25.21.11. *Let $g : X \rightarrow Y$ be a morphism of schemes over S . The morphism $i : X \rightarrow X \times_S Y$ is an immersion. If Y is separated over S it is a closed immersion. If Y is quasi-separated over S it is quasi-compact.*

Proof. This is a special case of Lemma 25.21.10 applied to the morphism $X = X \times_Y Y \rightarrow X \times_S Y$. \square

Lemma 25.21.12. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s : S \rightarrow X$ be a section of f (in a formula $f \circ s = id_S$). Then s is an immersion. If f is separated then s is a closed immersion. If f is quasi-separated, then s is quasi-compact.*

Proof. This is a special case of Lemma 25.21.11 applied to $g = s$ so the morphism $i = s : S \rightarrow S \times_S X$. \square

Lemma 25.21.13. *Permanence properties.*

- (1) *A composition of separated morphisms is separated.*
- (2) *A composition of quasi-separated morphisms is quasi-separated.*
- (3) *The base change of a separated morphism is separated.*
- (4) *The base change of a quasi-separated morphism is quasi-separated.*
- (5) *A (fibre) product of separated morphisms is separated.*
- (6) *A (fibre) product of quasi-separated morphisms is quasi-separated.*

Proof. Let $X \rightarrow Y \rightarrow Z$ be morphisms. Assume that $X \rightarrow Y$ and $Y \rightarrow Z$ are separated. The composition

$$X \rightarrow X \times_Y X \rightarrow X \times_Z X$$

is closed because the first one is by assumption and the second one by Lemma 25.21.10. The same argument works for “quasi-separated” (with the same references).

Let $f : X \rightarrow Y$ be a morphism of schemes over a base S . Let $S' \rightarrow S$ be a morphism of schemes. Let $f' : X_{S'} \rightarrow Y_{S'}$ be the base change of f . Then the diagonal morphism of f' is a morphism

$$\Delta_{f'} : X_{S'} = S' \times_S X \longrightarrow X_{S'} \times_{Y_{S'}} X_{S'} = S' \times_S (X \times_Y X)$$

which is easily seen to be the base change of Δ_f . Thus (3) and (4) follow from the fact that closed immersions and quasi-compact morphisms are preserved under arbitrary base change (Lemmas 25.17.6 and 25.19.3).

If $f : X \rightarrow Y$ and $g : U \rightarrow V$ are morphisms of schemes over a base S , then $f \times g$ is the composition of $X \times_S U \rightarrow X \times_S V$ (a base change of g) and $X \times_S V \rightarrow Y \times_S V$ (a base change of f). Hence (5) and (6) follow from (1) – (4). \square

Lemma 25.21.14. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of schemes. If $g \circ f$ is separated then so is f . If $g \circ f$ is quasi-separated then so is f .*

Proof. Assume that $g \circ f$ is separated. Consider the factorization $X \rightarrow X \times_Y X \rightarrow X \times_Z X$ of the diagonal morphism of $g \circ f$. By Lemma 25.21.10 the last morphism is an immersion. By assumption the image of X in $X \times_Z X$ is closed. Hence it is also closed in $X \times_Y X$. Thus we see that $X \rightarrow X \times_Y X$ is a closed immersion by Lemma 25.10.4.

Assume that $g \circ f$ is quasi-separated. Let $V \subset Y$ be an affine open which maps into an affine open of Z . Let $U_1, U_2 \subset X$ be affine opens which map into V . Then $U_1 \cap U_2$ is a finite union of affine opens because U_1, U_2 map into a common affine open of Z . Since we may cover Y by affine opens like V we deduce the lemma from Lemma 25.21.7. \square

Lemma 25.21.15. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of schemes. If $g \circ f$ is quasi-compact and g is quasi-separated then f is quasi-compact.*

Proof. This is true because f equals the composition $(1, f) : X \rightarrow X \times_Z Y \rightarrow Y$. The first map is quasi-compact by Lemma 25.21.12 because it is a section of the quasi-separated morphism $X \times_Z Y \rightarrow X$ (a base change of g , see Lemma 25.21.13). The second map is quasi-compact as it is the base change of f , see Lemma 25.19.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 25.19.4. \square

You may have been wondering whether the condition of only considering pairs of affine opens whose image is contained in an affine open is really necessary to be able to conclude that their intersection is affine. Often it isn't!

Lemma 25.21.16. *Let $f : X \rightarrow S$ be a morphism. Assume f is separated and S is a separated scheme. Suppose $U \subset X$ and $V \subset X$ are affine. Then $U \cap V$ is affine (and a closed subscheme of $U \times V$).*

Proof. In this case X is separated by Lemma 25.21.13. Hence $U \cap V$ is affine by applying Lemma 25.21.8 to the morphism $X \rightarrow \text{Spec}(\mathbf{Z})$. \square

On the other hand, the following example shows that we cannot expect the image of an affine to be contained in an affine.

Example 25.21.17. Consider the nonaffine scheme $U = \text{Spec}(k[x, y]) \setminus \{(x, y)\}$ of Example 25.9.3. On the other hand, consider the scheme

$$\mathbf{GL}_{2,k} = \text{Spec}(k[a, b, c, d, 1/ad - bc]).$$

There is a morphism $\mathbf{GL}_{2,k} \rightarrow U$ corresponding to the ring map $x \mapsto a, y \mapsto b$. It is easy to see that this is a surjective morphism, and hence the image is not contained in any affine open of U . In fact, the affine scheme $\mathbf{GL}_{2,k}$ also surjects onto \mathbf{P}_k^1 , and \mathbf{P}_k^1 does not even have an immersion into *any* affine scheme.

Remark 25.21.18. The category of quasi-compact and quasi-separated schemes \mathcal{C} has the following properties. If $X, Y \in \text{Ob}(\mathcal{C})$, then any morphism of schemes $f : X \rightarrow Y$ is quasi-compact and quasi-separated by Lemmas 25.21.15 and 25.21.14 with $Z = \text{Spec}(\mathbf{Z})$. Moreover, if $X \rightarrow Y$ and $Z \rightarrow Y$ are morphisms \mathcal{C} , then $X \times_Y Z$ is an object of \mathcal{C} too. Namely, the projection $X \times_Y Z \rightarrow Z$ is quasi-compact and quasi-separated as a base change of the morphism $Z \rightarrow Y$, see Lemmas 25.21.13 and 25.19.3. Hence the composition $X \times_Y Z \rightarrow Z \rightarrow \text{Spec}(\mathbf{Z})$ is quasi-compact and quasi-separated, see Lemmas 25.21.13 and 25.19.4.

25.22. Valuative criterion of separatedness

Lemma 25.22.1. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is separated, then f satisfies the uniqueness part of the valuative criterion.*

Proof. Let a diagram as in Definition 25.20.3 be given. Suppose there are two morphisms $a, b : \text{Spec}(A) \rightarrow X$ fitting into the diagram. Let $Z \subset \text{Spec}(A)$ be the equalizer of a and b . By Lemma 25.21.5 this is a closed subscheme of $\text{Spec}(A)$. By assumption it contains the generic point of $\text{Spec}(A)$. Since A is a domain this implies $Z = \text{Spec}(A)$. Hence $a = b$ as desired. \square

Lemma 25.22.2 (Valuative criterion separatedness). *Let $f : X \rightarrow S$ be a morphism. Assume*

- (1) *the morphism f is quasi-separated, and*
- (2) *the morphism f satisfies the uniqueness part of the valuative criterion.*

Then f is separated.

Proof. By assumption (1) and Proposition 25.20.6 we see that it suffices to prove the morphism $\Delta_{X/S} : X \rightarrow X \times_S X$ satisfies the existence part of the valuative criterion. Let a solid commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \text{Spec}(A) & \longrightarrow & X \times_S X \end{array}$$

be given. The lower right arrow corresponds to a pair of morphisms $a, b : \text{Spec}(A) \rightarrow X$ over S . By (2) we see that $a = b$. Hence using a as the dotted arrow works. \square

25.23. Monomorphisms

Definition 25.23.1. A morphism of schemes is called a *monomorphism* if it is a monomorphism in the category of schemes, see Categories, Definition 4.13.1.

Lemma 25.23.2. *Let $j : X \rightarrow Y$ be a morphism of schemes. Then j is a monomorphism if and only if the diagonal morphism $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is an isomorphism.*

Proof. This is true in any category with fibre products. \square

Lemma 25.23.3. *A monomorphism of schemes is separated.*

Proof. This is true because an isomorphism is a closed immersion, and Lemma 25.23.2 above. \square

Lemma 25.23.4. *A composition of monomorphisms is a monomorphism.*

Proof. True in any category. \square

Lemma 25.23.5. *The base change of a monomorphism is a monomorphism.*

Proof. True in any category with fibre products. \square

Lemma 25.23.6. *Let $j : X \rightarrow Y$ be a morphism of schemes. If*

- (1) *j is injective on points, and*
- (2) *for any $x \in X$ the ring map $j_x^\# : \mathcal{O}_{Y,j(x)} \rightarrow \mathcal{O}_{X,x}$ is surjective,*

then j is a monomorphism.

Proof. Let $a, b : Z \rightarrow X$ be two morphisms of schemes such that $j \circ a = j \circ b$. Then (1) implies $a = b$ as underlying maps of topological spaces. For any $z \in Z$ we have $a_z^\# \circ j_{a(z)}^\# = b_z^\# \circ j_{b(z)}^\#$ as maps $\mathcal{O}_{Y,j(a(z))} \rightarrow \mathcal{O}_{Z,z}$. The surjectivity of the maps $j_x^\#$ forces $a_z^\# = b_z^\#, \forall z \in Z$. This implies that $a^\# = b^\#$. Hence we conclude $a = b$ as morphisms of schemes as desired. \square

Lemma 25.23.7. *An immersion of schemes is a monomorphism. In particular, any immersion is separated.*

Proof. We can see this by checking that the criterion of Lemma 25.23.6 applies. More elegantly perhaps, we can use that Lemmas 25.3.5 and 25.4.6 imply that open and closed immersions are monomorphisms and hence any immersion (which is a composition of such) is a monomorphism. \square

Lemma 25.23.8. *Let $f : X \rightarrow S$ be a separated morphism. Any locally closed subscheme $Z \subset X$ is separated over S .*

Proof. Follows from Lemma 25.23.7 and the fact that a composition of separated morphisms is separated (Lemma 25.21.13). \square

Example 25.23.9. The morphism $\text{Spec}(\mathbf{Q}) \rightarrow \text{Spec}(\mathbf{Z})$ is a monomorphism. This is true because $\mathbf{Q} \otimes_{\mathbf{Z}} \mathbf{Q} = \mathbf{Q}$. More generally, for any scheme S and any point $s \in S$ the canonical morphism

$$\text{Spec}(\mathcal{O}_{S,s}) \longrightarrow S$$

is a monomorphism.

Lemma 25.23.10. *Let k_1, \dots, k_n be fields. For any monomorphism of schemes $X \rightarrow \text{Spec}(k_1 \times \dots \times k_n)$ there exists a subset $I \subset \{1, \dots, n\}$ such that $X \cong \text{Spec}(\prod_{i \in I} k_i)$ as schemes over $\text{Spec}(k_1 \times \dots \times k_n)$. More generally, if $X = \coprod_{i \in I} \text{Spec}(k_i)$ is a disjoint union of spectra of fields and $Y \rightarrow X$ is a monomorphism, then there exists a subset $J \subset I$ such that $Y = \coprod_{i \in J} \text{Spec}(k_i)$.*

Proof. First reduce to the case $n = 1$ (or $\#I = 1$) by taking the inverse images of the open and closed subschemes $\text{Spec}(k_i)$. In this case X has only one point hence is affine. The corresponding algebra problem is this: If $k \rightarrow R$ is an algebra map with $R \otimes_k R \cong R$, then $R \cong k$. This holds for dimension reasons. See also Algebra, Lemma 10.103.8 \square

25.24. Functoriality for quasi-coherent modules

Let X be a scheme. We denote $QCoh(\mathcal{O}_X)$ the category of quasi-coherent \mathcal{O}_X -modules as defined in Modules, Definition 17.10.1. We have seen in Section 25.7 that the category $QCoh(\mathcal{O}_X)$ has a lot of good properties when X is affine. Since the property of being quasi-coherent is local on X , these properties are inherited by the category of quasi-coherent sheaves on any scheme X . We enumerate them here.

- (1) A sheaf of \mathcal{O}_X -modules \mathcal{F} is quasi-coherent if and only if the restriction of \mathcal{F} to each affine open $U = \text{Spec}(R)$ is of the form \widetilde{M} for some R -module M .
- (2) A sheaf of \mathcal{O}_X -modules \mathcal{F} is quasi-coherent if and only if the restriction of \mathcal{F} to each of the members of an affine open covering is quasi-coherent.
- (3) Any direct sum of quasi-coherent sheaves is quasi-coherent.
- (4) Any colimit of quasi-coherent sheaves is quasi-coherent.
- (5) The kernel and cokernel of a morphism of quasi-coherent sheaves is quasi-coherent.
- (6) Given a short exact sequence of \mathcal{O}_X -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ if two out of three are quasi-coherent so is the third.
- (7) Given a morphism of schemes $f : Y \rightarrow X$ the pullback of a quasi-coherent \mathcal{O}_X -module is a quasi-coherent \mathcal{O}_Y -module. See Modules, Lemma 17.10.4.
- (8) Given two quasi-coherent \mathcal{O}_X -modules the tensor product is quasi-coherent, see Modules, Lemma 17.15.5.
- (9) Given a quasi-coherent \mathcal{O}_X -module \mathcal{F} the tensor, symmetric and exterior algebras on \mathcal{F} are quasi-coherent, see Modules, Lemma 17.18.6.
- (10) Given two quasi-coherent \mathcal{O}_X -modules \mathcal{F}, \mathcal{G} such that \mathcal{F} is of finite presentation, then the internal hom $\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is quasi-coherent, see Modules, Lemma 17.19.4 and (5) above.

On the other hand, it is in general not the case that the pushforward of a quasi-coherent module is quasi-coherent. Here is a case where it this does hold.

Lemma 25.24.1. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is quasi-compact and quasi-separated then f_* transforms quasi-coherent \mathcal{O}_X -modules into quasi-coherent \mathcal{O}_S -modules.*

Proof. The question is local on S and hence we may assume that S is affine. Because X is quasi-compact we may write $X = \bigcup_{i=1}^n U_i$ with each U_i open affine. Because f is quasi-separated we may write $U_i \cap U_j = \bigcup_{k=1}^{n_{ij}} U_{ijk}$ for some affine open U_{ijk} , see Lemma 25.21.7. Denote $f_i : U_i \rightarrow S$ and $f_{ijk} : U_{ijk} \rightarrow S$ the restrictions of f . For any open V of S and any sheaf \mathcal{F} on X we have

$$\begin{aligned} f_*\mathcal{F}(V) &= \mathcal{F}(f^{-1}V) \\ &= \text{Ker} \left(\bigoplus_i \mathcal{F}(f^{-1}V \cap U_i) \rightarrow \bigoplus_{i,j,k} \mathcal{F}(f^{-1}V \cap U_{ijk}) \right) \\ &= \text{Ker} \left(\bigoplus_i f_{i,*}(\mathcal{F}|_{U_i})(V) \rightarrow \bigoplus_{i,j,k} f_{ijk,*}(\mathcal{F}|_{U_{ijk}}) \right) (V) \\ &= \text{Ker} \left(\bigoplus_i f_{i,*}(\mathcal{F}|_{U_i}) \rightarrow \bigoplus_{i,j,k} f_{ijk,*}(\mathcal{F}|_{U_{ijk}}) \right) (V) \end{aligned}$$

In other words there is a short exact sequence of sheaves

$$0 \rightarrow f_*\mathcal{F} \rightarrow \bigoplus_i f_{i,*}\mathcal{F}_i \rightarrow \bigoplus_{i,j,k} f_{ijk,*}\mathcal{F}_{ijk}$$

where $\mathcal{F}_i, \mathcal{F}_{ijk}$ denotes the restriction of \mathcal{F} to the corresponding open. If \mathcal{F} is a quasi-coherent \mathcal{O}_X -modules then $\mathcal{F}_i, \mathcal{F}_{ijk}$ is a quasi-coherent $\mathcal{O}_{U_i}, \mathcal{O}_{U_{ijk}}$ -module. Hence by Lemma 25.7.3 we see that the second and third term of the exact sequence are quasi-coherent \mathcal{O}_S -modules. Thus we conclude that $f_*\mathcal{F}$ is a quasi-coherent \mathcal{O}_S -module. \square

Using this we can characterize (closed) immersions of schemes as follows.

Lemma 25.24.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Suppose that*

- (1) *f induces a homeomorphism of X with a closed subset of Y , and*
- (2) *$f^\# : \mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$ is surjective.*

Then f is a closed immersion of schemes.

Proof. Assume (1) and (2). By (1) the morphism f is quasi-compact (see Topology, Lemma 5.11.3). Conditions (1) and (2) imply conditions (1) and (2) of Lemma 25.23.6. Hence $f : X \rightarrow Y$ is a monomorphism. In particular, f is separated, see Lemma 25.23.3. Hence Lemma 25.24.1 above applies and we conclude that $f_*\mathcal{O}_X$ is a quasi-coherent \mathcal{O}_Y -module. Therefore the kernel of $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$ is quasi-coherent by Lemma 25.7.8. Since a quasi-coherent sheaf is locally generated by sections (see Modules, Definition 17.10.1) this implies that f is a closed immersion, see Definition 25.4.1. \square

We can use this lemma to prove the following lemma.

Lemma 25.24.3. *A composition of immersions of schemes is an immersion, a composition of closed immersions of schemes is a closed immersion, and a composition of open immersions of schemes is an open immersion.*

Proof. This is clear for the case of open immersions since an open subspace of an open subspace is also an open subspace.

Suppose $a : Z \rightarrow Y$ and $b : Y \rightarrow X$ are closed immersions of schemes. We will verify that $c = b \circ a$ is also a closed immersion. The assumption implies that a and b are homeomorphisms onto closed subsets, and hence also $c = b \circ a$ is a homeomorphism onto a closed subset. Moreover, the map $\mathcal{O}_X \rightarrow c_*\mathcal{O}_Z$ is surjective since it factors as the composition of the surjective maps $\mathcal{O}_X \rightarrow b_*\mathcal{O}_Y$ and $b_*\mathcal{O}_Y \rightarrow b_*a_*\mathcal{O}_Z$ (surjective as b_* is exact, see Modules, Lemma 17.6.1). Hence by Lemma 25.24.2 above c is a closed immersion.

Finally, we come to the case of immersions. Suppose $a : Z \rightarrow Y$ and $b : Y \rightarrow X$ are immersions of schemes. This means there exist open subschemes $V \subset Y$ and $U \subset X$ such that $a(Z) \subset V$, $b(Y) \subset U$ and $a : Z \rightarrow V$ and $b : Y \rightarrow U$ are closed immersions. Since the topology on Y is induced from the topology on U we can find an open $U' \subset U$ such that $V = b^{-1}(U')$. Then we see that $Z \rightarrow V = b^{-1}(U') \rightarrow U'$ is a composition of closed immersions and hence a closed immersion. This proves that $Z \rightarrow X$ is an immersion and we win. \square

Constructions of Schemes

26.1. Introduction

In this chapter we introduce ways of constructing schemes out of others. A basic reference is [DG67].

26.2. Relative glueing

The following lemma is relevant in case we are trying to construct a scheme X over S , and we already know how to construct the restriction of X to the affine opens of S . The actual result is completely general and works in the setting of (locally) ringed spaces, although our proof is written in the language of schemes.

Lemma 26.2.1. *Let S be a scheme. Let \mathcal{B} be a basis for the topology of S . Suppose given the following data:*

- (1) *For every $U \in \mathcal{B}$ a scheme $f_U : X_U \rightarrow U$ over U .*
- (2) *For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\rho_V^U : X_V \rightarrow X_U$.*

Assume that

- (a) *each ρ_V^U induces an isomorphism $X_V \rightarrow f_U^{-1}(V)$ of schemes over V ,*
- (b) *whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\rho_W^U = \rho_V^U \circ \rho_W^V$.*

Then there exists a unique scheme $f : X \rightarrow S$ over S and isomorphisms $i_U : f^{-1}(U) \rightarrow X_U$ over U such that for $V \subset U \subset S$ affine open the composition

$$X_V \xrightarrow{i_V^{-1}} f^{-1}(V) \xrightarrow{\text{inclusion}} f^{-1}(U) \xrightarrow{i_U} X_U$$

is the morphism ρ_V^U .

Proof. To prove this we will use Schemes, Lemma 25.15.4. First we define a contravariant functor F from the category of schemes to the category of sets. Namely, for a scheme T we set

$$F(T) = \left\{ (g, \{h_U\}_{U \in \mathcal{B}}), g : T \rightarrow S, h_U : g^{-1}(U) \rightarrow X_U, \right. \\ \left. f_U \circ h_U = g|_{g^{-1}(U)}, h_U|_{g^{-1}(V)} = \rho_V^U \circ h_V \ \forall V, U \in \mathcal{B}, V \subset U \right\}.$$

The restriction mapping $F(T) \rightarrow F(T')$ given a morphism $T' \rightarrow T$ is just gotten by composition. For any $W \in \mathcal{B}$ we consider the subfunctor $F_W \subset F$ consisting of those systems $(g, \{h_U\})$ such that $g(T) \subset W$.

First we show F satisfies the sheaf property for the Zariski topology. Suppose that T is a scheme, $T = \bigcup V_i$ is an open covering, and $\xi_i \in F(V_i)$ is an element such that $\xi_i|_{V_i \cap V_j} = \xi_j|_{V_i \cap V_j}$. Say $\xi_i = (g_i, \{h_{i,U}\})$. Then we immediately see that the morphisms g_i glue to a unique global morphism $g : T \rightarrow S$. Moreover, it is clear that $g^{-1}(U) = \bigcup g_i^{-1}(U)$. Hence the morphisms $h_{i,U} : g_i^{-1}(U) \rightarrow X_U$ glue to a

unique morphism $h_U : U \rightarrow X_U$. It is easy to verify that the system $(g, \{f_U\})$ is an element of $F(T)$. Hence F satisfies the sheaf property for the Zariski topology.

Next we verify that each F_W , $W \in \mathcal{B}$ is representable. Namely, we claim that the transformation of functors

$$F_W \longrightarrow \text{Mor}(-, X_W), (g, \{h_U\}) \longmapsto h_W$$

is an isomorphism. To see this suppose that T is a scheme and $\alpha : T \rightarrow X_W$ is a morphism. Set $g = f_W \circ \alpha$. For any $U \in \mathcal{B}$ such that $U \subset W$ we can define $h_U : g^{-1}(U) \rightarrow X_U$ be the composition $(\rho_U^W)^{-1} \circ \alpha|_{g^{-1}(U)}$. This works because the image $\alpha(g^{-1}(U))$ is contained in $f_W^{-1}(U)$ and condition (a) of the lemma. It is clear that $f_U \circ h_U = g|_{g^{-1}(U)}$ for such a U . Moreover, if also $V \in \mathcal{B}$ and $V \subset U \subset W$, then $\rho_V^U \circ h_V = h_U|_{g^{-1}(V)}$ by property (b) of the lemma. We still have to define h_U for an arbitrary element $U \in \mathcal{B}$. Since \mathcal{B} is a basis for the topology on S we can find an open covering $U \cap W = \bigcup U_i$ with $U_i \in \mathcal{B}$. Since g maps into W we have $g^{-1}(U) = g^{-1}(U \cap W) = \bigcup g^{-1}(U_i)$. Consider the morphisms $h_i = \rho_{U_i}^U \circ h_{U_i} : g^{-1}(U_i) \rightarrow X_{U_i}$. It is a simple matter to use condition (b) of the lemma to prove that $h_i|_{g^{-1}(U_i) \cap g^{-1}(U_j)} = h_j|_{g^{-1}(U_i) \cap g^{-1}(U_j)}$. Hence these morphisms glue to give the desired morphism $h_U : g^{-1}(U) \rightarrow X_U$. We omit the (easy) verification that the system $(g, \{h_U\})$ is an element of $F_W(T)$ which maps to α under the displayed arrow above.

Next, we verify each $F_W \subset F$ is representable by open immersions. This is clear from the definitions.

Finally we have to verify the collection $(F_W)_{W \in \mathcal{B}}$ covers F . This is clear by construction and the fact that \mathcal{B} is a basis for the topology of S .

Let X be a scheme representing the functor F . Let $(f, \{i_U\}) \in F(X)$ be a ‘‘universal family’’. Since each F_W is representable by X_W (via the morphism of functors displayed above) we see that $i_W : f^{-1}(W) \rightarrow X_W$ is an isomorphism as desired. The lemma is proved. \square

Lemma 26.2.2. *Let S be a scheme. Let \mathcal{B} be a basis for the topology of S . Suppose given the following data:*

- (1) *For every $U \in \mathcal{B}$ a scheme $f_U : X_U \rightarrow U$ over U .*
- (2) *For every $U \in \mathcal{B}$ a quasi-coherent sheaf \mathcal{F}_U over X_U .*
- (3) *For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\rho_V^U : X_V \rightarrow X_U$.*
- (4) *For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\theta_V^U : (\rho_V^U)^* \mathcal{F}_U \rightarrow \mathcal{F}_V$.*

Assume that

- (a) *each ρ_V^U induces an isomorphism $X_V \rightarrow f_U^{-1}(V)$ of schemes over V ,*
- (b) *each θ_V^U is an isomorphism,*
- (c) *whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\rho_W^U = \rho_V^U \circ \rho_W^V$,*
- (d) *whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\theta_W^U = \theta_V^U \circ (\rho_W^V)^* \theta_V^U$.*

Then there exists a unique scheme $f : X \rightarrow S$ over S together with a unique quasi-coherent sheaf \mathcal{F} on X and isomorphisms $i_U : f^{-1}(U) \rightarrow X_U$ and $\theta_U : i_U^ \mathcal{F}_U \rightarrow \mathcal{F}|_{f^{-1}(U)}$ over U such that for $V \subset U \subset S$ affine open the composition*

$$X_V \xrightarrow{i_V^{-1}} f^{-1}(V) \xrightarrow{\text{inclusion}} f^{-1}(U) \xrightarrow{i_U} X_U$$

is the morphism ρ_V^U , and the composition

$$(26.2.2.1) \quad (\rho_V^U)^* \mathcal{F}_U = (i_V^{-1})^*((i_U^* \mathcal{F}_U)|_{f^{-1}(V)}) \xrightarrow{\theta_U|_{f^{-1}(V)}} (i_V^{-1})^*(\mathcal{F}|_{f^{-1}(V)}) \xrightarrow{\theta_V^{-1}} \mathcal{F}_V$$

is equal to θ_V^U .

Proof. By Lemma 26.2.1 we get the scheme X over S and the isomorphisms i_U . Set $\mathcal{F}'_U = i_U^* \mathcal{F}_U$ for $U \in \mathcal{B}$. This is a quasi-coherent $\mathcal{O}_{f^{-1}(U)}$ -module. The maps

$$\mathcal{F}'_U|_{f^{-1}(V)} = i_U^* \mathcal{F}_U|_{f^{-1}(V)} = i_V^*(\rho_V^U)^* \mathcal{F}_U \xrightarrow{i_V^* \theta_V^U} i_V^* \mathcal{F}_V = \mathcal{F}'_V$$

define isomorphisms $(\theta')^U_V : \mathcal{F}'_U|_{f^{-1}(V)} \rightarrow \mathcal{F}'_V$ whenever $V \subset U$ are elements of \mathcal{B} . Condition (d) says exactly that this is compatible in case we have a triple of elements $W \subset V \subset U$ of \mathcal{B} . This allows us to get well defined isomorphisms

$$\varphi_{12} : \mathcal{F}'_{U_1}|_{f^{-1}(U_1 \cap U_2)} \longrightarrow \mathcal{F}'_{U_2}|_{f^{-1}(U_1 \cap U_2)}$$

whenever $U_1, U_2 \in \mathcal{B}$ by covering the intersection $U_1 \cap U_2 = \bigcup V_j$ by elements V_j of \mathcal{B} and taking

$$\varphi_{12}|_{V_j} = \left((\theta')^{U_2}_{V_j} \right)^{-1} \circ (\theta')^{U_1}_{V_j}.$$

We omit the verification that these maps do indeed glue to a φ_{12} and we omit the verification of the cocycle condition of a glueing datum for sheaves (as in Sheaves, Section 6.33). By Sheaves, Lemma 6.33.2 we get our \mathcal{F} on X . We omit the verification of (26.2.2.1). \square

Remark 26.2.3. There is a functoriality property for the constructions explained in Lemmas 26.2.1 and 26.2.2. Namely, suppose given two collections of data $(f_U : X_U \rightarrow U, \rho_V^U)$ and $(g_U : Y_U \rightarrow U, \sigma_V^U)$ as in Lemma 26.2.1. Suppose for every $U \in \mathcal{B}$ given a morphism $h_U : X_U \rightarrow Y_U$ over U compatible with the restrictions ρ_V^U and σ_V^U . Functoriality means that this gives rise to a morphism of schemes $h : X \rightarrow Y$ over S restricting back to the morphisms h_U , where $f : X \rightarrow S$ is obtained from the datum $(f_U : X_U \rightarrow U, \rho_V^U)$ and $g : Y \rightarrow S$ is obtained from the datum $(g_U : Y_U \rightarrow U, \sigma_V^U)$.

Similarly, suppose given two collections of data $(f_U : X_U \rightarrow U, \mathcal{F}_U, \rho_V^U, \theta_V^U)$ and $(g_U : Y_U \rightarrow U, \mathcal{G}_U, \sigma_V^U, \eta_V^U)$ as in Lemma 26.2.2. Suppose for every $U \in \mathcal{B}$ given a morphism $h_U : X_U \rightarrow Y_U$ over U compatible with the restrictions ρ_V^U and σ_V^U , and a morphism $\tau_U : h_U^* \mathcal{G}_U \rightarrow \mathcal{F}_U$ compatible with the maps θ_V^U and η_V^U . Functoriality means that these give rise to a morphism of schemes $h : X \rightarrow Y$ over S restricting back to the morphisms h_U , and a morphism $h^* \mathcal{G} \rightarrow \mathcal{F}$ restricting back to the maps h_U where $(f : X \rightarrow S, \mathcal{F})$ is obtained from the datum $(f_U : X_U \rightarrow U, \mathcal{F}_U, \rho_V^U, \theta_V^U)$ and where $(g : Y \rightarrow S, \mathcal{G})$ is obtained from the datum $(g_U : Y_U \rightarrow U, \mathcal{G}_U, \sigma_V^U, \eta_V^U)$.

We omit the verifications and we omit a suitable formulation of “equivalence of categories” between relative glueing data and relative objects.

26.3. Relative spectrum via glueing

Situation 26.3.1. Here S is a scheme, and \mathcal{A} is a quasi-coherent \mathcal{O}_S -algebra.

In this section we outline how to construct a morphism of schemes

$$\underline{\text{Spec}}_S(\mathcal{A}) \longrightarrow S$$

by glueing the spectra $\text{Spec}(\Gamma(U, \mathcal{A}))$ where U ranges over the affine opens of S . We first show that the spectra of the values of \mathcal{A} over affines form a suitable collection of schemes, as in Lemma 26.2.1.

Lemma 26.3.2. *In Situation 26.3.1. Suppose $U \subset U' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$ and $A' = \mathcal{A}(U')$. The map of rings $A' \rightarrow A$ induces a morphism $\text{Spec}(A) \rightarrow \text{Spec}(A')$, and the diagram*

$$\begin{array}{ccc} \text{Spec}(A) & \longrightarrow & \text{Spec}(A') \\ \downarrow & & \downarrow \\ U & \longrightarrow & U' \end{array}$$

is cartesian.

Proof. Let $R = \mathcal{O}_S(U)$ and $R' = \mathcal{O}_S(U')$. Note that the map $R \otimes_{R'} A' \rightarrow A$ is an isomorphism as \mathcal{A} is quasi-coherent (see Schemes, Lemma 25.7.3 for example). The result follows from the description of the fibre product of affine schemes in Schemes, Lemma 25.6.7. \square

In particular the morphism $\text{Spec}(A) \rightarrow \text{Spec}(A')$ of the lemma is an open immersion.

Lemma 26.3.3. *In Situation 26.3.1. Suppose $U \subset U' \subset U'' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$, $A' = \mathcal{A}(U')$ and $A'' = \mathcal{A}(U'')$. The composition of the morphisms $\text{Spec}(A) \rightarrow \text{Spec}(A')$, and $\text{Spec}(A') \rightarrow \text{Spec}(A'')$ of Lemma 26.3.2 gives the morphism $\text{Spec}(A) \rightarrow \text{Spec}(A'')$ of Lemma 26.3.2.*

Proof. This follows as the map $A'' \rightarrow A$ is the composition of $A'' \rightarrow A'$ and $A' \rightarrow A$ (because \mathcal{A} is a sheaf). \square

Lemma 26.3.4. *In Situation 26.3.1. There exists a morphism of schemes*

$$\pi : \underline{\text{Spec}}_S(\mathcal{A}) \longrightarrow S$$

with the following properties:

- (1) for every affine open $U \subset S$ there exists an isomorphism $i_U : \pi^{-1}(U) \rightarrow \text{Spec}(\mathcal{A}(U))$, and
- (2) for $U \subset U' \subset S$ affine open the composition

$$\text{Spec}(\mathcal{A}(U)) \xrightarrow{i_U^{-1}} \pi^{-1}(U) \xrightarrow{\text{inclusion}} \pi^{-1}(U') \xrightarrow{i_{U'}} \text{Spec}(\mathcal{A}(U'))$$

is the open immersion of Lemma 26.3.2 above.

Proof. Follows immediately from Lemmas 26.2.1, 26.3.2, and 26.3.3. \square

26.4. Relative spectrum as a functor

We place ourselves in Situation 26.3.1. So S is a scheme and \mathcal{A} is a quasi-coherent sheaf of \mathcal{O}_S -algebras. (This means that \mathcal{A} is a sheaf of \mathcal{O}_S -algebras which is quasi-coherent as an \mathcal{O}_S -module.)

For any $f : T \rightarrow S$ the pullback $f^*\mathcal{A}$ is a quasi-coherent sheaf of \mathcal{O}_T -algebras. We are going to consider pairs $(f : T \rightarrow S, \varphi)$ where f is a morphism of schemes and $\varphi : f^*\mathcal{A} \rightarrow \mathcal{O}_T$ is a morphism of \mathcal{O}_T -algebras. Note that this is the same as giving a $f^{-1}\mathcal{O}_S$ -algebra homomorphism $\varphi : f^{-1}\mathcal{A} \rightarrow \mathcal{O}_T$, see Sheaves, Lemma 6.20.2. This

is also the same as giving a \mathcal{O}_S -algebra map $\varphi : \mathcal{A} \rightarrow f_*\mathcal{O}_T$, see Sheaves, Lemma 6.24.7. We will use all three ways of thinking about φ , without further mention.

Given such a pair $(f : T \rightarrow S, \varphi)$ and a morphism $a : T' \rightarrow T$ we get a second pair $(f' = f \circ a, \varphi' = a^*\varphi)$ which we call the pullback of (f, φ) . One way to describe $\varphi' = a^*\varphi$ is as the composition $\mathcal{A} \rightarrow f_*\mathcal{O}_T \rightarrow f'_*\mathcal{O}_{T'}$ where the second map is f_*a^\sharp with $a^\sharp : \mathcal{O}_T \rightarrow a_*\mathcal{O}_{T'}$. In this way we have defined a functor

$$(26.4.0.1) \quad \begin{aligned} F : Sch^{opp} &\longrightarrow Sets \\ T &\longmapsto F(T) = \{\text{pairs } (f, \varphi) \text{ as above}\} \end{aligned}$$

Lemma 26.4.1. *In Situation 26.3.1. Let F be the functor associated to (S, \mathcal{A}) above. Let $g : S' \rightarrow S$ be a morphism of schemes. Set $\mathcal{A}' = g^*\mathcal{A}$. Let F' be the functor associated to (S', \mathcal{A}') above. Then there is a canonical isomorphism*

$$F' \cong h_{S'} \times_{h_S} F$$

of functors.

Proof. A pair $(f' : T \rightarrow S', \varphi' : (f')^*\mathcal{A}' \rightarrow \mathcal{O}_T)$ is the same as a pair $(f, \varphi : f^*\mathcal{A} \rightarrow \mathcal{O}_T)$ together with a factorization of f as $f = g \circ f'$. Namely with this notation we have $(f')^*\mathcal{A}' = (f')^*g^*\mathcal{A} = f^*\mathcal{A}$. Hence the lemma. \square

Lemma 26.4.2. *In Situation 26.3.1. Let F be the functor associated to (S, \mathcal{A}) above. If S is affine, then F is representable by the affine scheme $\text{Spec}(\Gamma(S, \mathcal{A}))$.*

Proof. Write $S = \text{Spec}(R)$ and $A = \Gamma(S, \mathcal{A})$. Then A is an R -algebra and $\mathcal{A} = \widetilde{A}$. The ring map $R \rightarrow A$ gives rise to a canonical map

$$f_{univ} : \text{Spec}(A) \longrightarrow S = \text{Spec}(R).$$

We have $f_{univ}^*\mathcal{A} = \widetilde{A \otimes_R A}$ by Schemes, Lemma 25.7.3. Hence there is a canonical map

$$\varphi_{univ} : f_{univ}^*\mathcal{A} = \widetilde{A \otimes_R A} \longrightarrow \widetilde{A} = \mathcal{O}_{\text{Spec}(A)}$$

coming from the A -module map $A \otimes_R A \rightarrow A, a \otimes a' \mapsto aa'$. We claim that the pair $(f_{univ}, \varphi_{univ})$ represents F in this case. In other words we claim that for any scheme T the map

$$\text{Mor}(T, \text{Spec}(A)) \longrightarrow \{\text{pairs } (f, \varphi)\}, \quad a \longmapsto (a^*f_{univ}, a^*\varphi)$$

is bijective.

Let us construct the inverse map. For any pair $(f : T \rightarrow S, \varphi)$ we get the induced ring map

$$A = \Gamma(S, \mathcal{A}) \xrightarrow{f^*} \Gamma(T, f^*\mathcal{A}) \xrightarrow{\varphi} \Gamma(T, \mathcal{O}_T)$$

This induces a morphism of schemes $T \rightarrow \text{Spec}(A)$ by Schemes, Lemma 25.6.4.

The verification that this map is inverse to the map displayed above is omitted. \square

Lemma 26.4.3. *In Situation 26.3.1. The functor F is representable by a scheme.*

Proof. We are going to use Schemes, Lemma 25.15.4.

First we check that F satisfies the sheaf property for the Zariski topology. Namely, suppose that T is a scheme, that $T = \bigcup_{i \in I} U_i$ is an open covering, and that $(f_i, \varphi_i) \in F(U_i)$ such that $(f_i, \varphi_i)|_{U_i \cap U_j} = (f_j, \varphi_j)|_{U_i \cap U_j}$. This implies that the morphisms $f_i : U_i \rightarrow S$ glue to a morphism of schemes $f : T \rightarrow S$ such that $f|_{U_i} = f_i$, see

Schemes, Section 25.14. Thus $f_i^* \mathcal{A} = f^* \mathcal{A}|_{U_i}$ and by assumption the morphisms φ_i agree on $U_i \cap U_j$. Hence by Sheaves, Section 6.33 these glue to a morphism of \mathcal{O}_T -algebras $f^* \mathcal{A} \rightarrow \mathcal{O}_T$. This proves that F satisfies the sheaf condition with respect to the Zariski topology.

Let $S = \bigcup_{i \in I} U_i$ be an affine open covering. Let $F_i \subset F$ be the subfunctor consisting of those pairs $(f : T \rightarrow S, \varphi)$ such that $f(T) \subset U_i$.

We have to show each F_i is representable. This is the case because F_i is identified with the functor associated to U_i equipped with the quasi-coherent \mathcal{O}_{U_i} -algebra $\mathcal{A}|_{U_i}$, by Lemma 26.4.1. Thus the result follows from Lemma 26.4.2.

Next we show that $F_i \subset F$ is representable by open immersions. Let $(f : T \rightarrow S, \varphi) \in F(T)$. Consider $V_i = f^{-1}(U_i)$. It follows from the definition of F_i that given $a : T' \rightarrow T$ we gave $a^*(f, \varphi) \in F_i(T')$ if and only if $a(T') \subset V_i$. This is what we were required to show.

Finally, we have to show that the collection $(F_i)_{i \in I}$ covers F . Let $(f : T \rightarrow S, \varphi) \in F(T)$. Consider $V_i = f^{-1}(U_i)$. Since $S = \bigcup_{i \in I} U_i$ is an open covering of S we see that $T = \bigcup_{i \in I} V_i$ is an open covering of T . Moreover $(f, \varphi)|_{V_i} \in F_i(V_i)$. This finishes the proof of the lemma. \square

Lemma 26.4.4. *In Situation 26.3.1. The scheme $\pi : \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow S$ constructed in Lemma 26.3.4 and the scheme representing the functor F are canonically isomorphic as schemes over S .*

Proof. Let $X \rightarrow S$ be the scheme representing the functor F . Consider the sheaf of \mathcal{O}_S -algebras $\mathcal{R} = \pi_* \mathcal{O}_{\underline{\text{Spec}}_S(\mathcal{A})}$. By construction of $\underline{\text{Spec}}_S(\mathcal{A})$ we have isomorphisms $\mathcal{A}(U) \rightarrow \mathcal{R}(U)$ for every affine open $U \subset S$; this follows from Lemma 26.3.4 part (1). For $U \subset U' \subset S$ open these isomorphisms are compatible with the restriction mappings; this follows from Lemma 26.3.4 part (2). Hence by Sheaves, Lemma 6.30.13 these isomorphisms result from an isomorphism of \mathcal{O}_S -algebras $\mathcal{A} \rightarrow \mathcal{R}$. Hence this gives an element $(\underline{\text{Spec}}_S(\mathcal{A}), \varphi) \in F(\underline{\text{Spec}}_S(\mathcal{A}))$. Since X represents the functor F we get a corresponding morphism of schemes $\text{can} : \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow X$ over S .

Let $U \subset S$ be any affine open. Let $F_U \subset F$ be the subfunctor of F corresponding to pairs (f, φ) over schemes T with $f(T) \subset U$. Clearly the base change X_U represents F_U . Moreover, F_U is represented by $\text{Spec}(\mathcal{A}(U)) = \pi^{-1}(U)$ according to Lemma 26.4.2. In other words $X_U \cong \pi^{-1}(U)$. We omit the verification that this identification is brought about by the base change of the morphism can to U . \square

Definition 26.4.5. Let S be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_S -algebras. The *relative spectrum of \mathcal{A} over S* , or simply the *spectrum of \mathcal{A} over S* is the scheme constructed in Lemma 26.3.4 which represents the functor F (26.4.0.1), see Lemma 26.4.4. We denote it $\pi : \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow S$. The “universal family” is a morphism of \mathcal{O}_S -algebras

$$\mathcal{A} \longrightarrow \pi_* \mathcal{O}_{\underline{\text{Spec}}_S(\mathcal{A})}$$

The following lemma says among other things that forming the relative spectrum commutes with base change.

Lemma 26.4.6. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_S -algebras. Let $\pi : \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow S$ be the relative spectrum of \mathcal{A} over S .*

- (1) For every affine open $U \subset S$ the inverse image $\pi^{-1}(U)$ is affine.
- (2) For every morphism $g : S' \rightarrow S$ we have $S' \times_S \underline{\text{Spec}}_S(\mathcal{A}) = \underline{\text{Spec}}_{S'}(g^*\mathcal{A})$.
- (3) The universal map

$$\mathcal{A} \longrightarrow \pi_* \mathcal{O}_{\underline{\text{Spec}}_S(\mathcal{A})}$$

is an isomorphism of \mathcal{O}_S -algebras.

Proof. Part (1) comes from the description of the relative spectrum by glueing, see Lemma 26.3.4. Part (2) follows immediately from Lemma 26.4.1. Part (3) follows because it is local on S and it is clear in case S is affine by Lemma 26.4.2 for example. \square

Lemma 26.4.7. Let $f : X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. By Schemes, Lemma 25.24.1 the sheaf $f_*\mathcal{O}_X$ is a quasi-coherent sheaf of \mathcal{O}_S -algebras. There is a canonical morphism

$$\text{can} : X \longrightarrow \underline{\text{Spec}}_S(f_*\mathcal{O}_X)$$

of schemes over S . For any affine open $U \subset S$ the restriction $\text{can}|_{f^{-1}(U)}$ is identified with the canonical morphism

$$f^{-1}(U) \longrightarrow \text{Spec}(\Gamma(f^{-1}(U), \mathcal{O}_X))$$

coming from Schemes, Lemma 25.6.4.

Proof. The morphism comes, via the definition of $\underline{\text{Spec}}$ as the scheme representing the functor F , from the canonical map $\varphi : f^*f_*\mathcal{O}_X \rightarrow \mathcal{O}_X$ (which by adjointness of push and pull corresponds to $\text{id} : f_*\mathcal{O}_X \rightarrow f_*\mathcal{O}_X$). The statement on the restriction to $f^{-1}(U)$ follows from the description of the relative spectrum over affines, see Lemma 26.4.2. \square

26.5. Affine n-space

As an application of the relative spectrum we define affine n -space over a base scheme S as follows. For any integer $n \geq 0$ we can consider the quasi-coherent sheaf of \mathcal{O}_S -algebras $\mathcal{O}_S[T_1, \dots, T_n]$. It is quasi-coherent because as a sheaf of \mathcal{O}_S -modules it is just the direct sum of copies of \mathcal{O}_S indexed by multi-indices.

Definition 26.5.1. Let S be a scheme and $n \geq 0$. The scheme

$$\mathbf{A}_S^n = \underline{\text{Spec}}_S(\mathcal{O}_S[T_1, \dots, T_n])$$

over S is called *affine n -space over S* . If $S = \text{Spec}(R)$ is affine then we also call this *affine n -space over R* and we denote it \mathbf{A}_R^n .

Note that $\mathbf{A}_R^n = \text{Spec}(R[T_1, \dots, T_n])$. For any morphism $g : S' \rightarrow S$ of schemes we have $g^*\mathcal{O}_S[T_1, \dots, T_n] = \mathcal{O}_{S'}[T_1, \dots, T_n]$ and hence $\mathbf{A}_{S'}^n = S' \times_S \mathbf{A}_S^n$ is the base change. Therefore an alternative definition of affine n -space is the formula

$$\mathbf{A}_S^n = S \times_{\text{Spec}(\mathbf{Z})} \mathbf{A}_{\mathbf{Z}}^n.$$

Also, a morphism from an S -scheme $f : X \rightarrow S$ to \mathbf{A}_S^n is given by a homomorphism of \mathcal{O}_S -algebras $\mathcal{O}_S[T_1, \dots, T_n] \rightarrow f_*\mathcal{O}_X$. This is clearly the same thing as giving the images of the T_i . In other words, a morphism from X to \mathbf{A}_S^n over S is the same as giving n elements $h_1, \dots, h_n \in \Gamma(X, \mathcal{O}_X)$.

26.6. Vector bundles

Let S be a scheme. Let \mathcal{E} be a quasi-coherent sheaf of \mathcal{O}_S -modules. By Modules, Lemma 17.18.6 the symmetric algebra $\mathrm{Sym}(\mathcal{E})$ of \mathcal{E} over \mathcal{O}_S is a quasi-coherent sheaf of \mathcal{O}_S -algebras. Hence it makes sense to apply the construction of the previous section to it.

Definition 26.6.1. Let S be a scheme. Let \mathcal{E} be a quasi-coherent \mathcal{O}_S -module¹. The *vector bundle associated to \mathcal{E}* is

$$\mathbf{V}(\mathcal{E}) = \underline{\mathrm{Spec}}_S(\mathrm{Sym}(\mathcal{E})).$$

The vector bundle associated to \mathcal{E} comes with a bit of extra structure. Namely, we have a grading

$$\pi_*\mathcal{O}_{\mathbf{V}(\mathcal{E})} = \bigoplus_{n \geq 0} \mathrm{Sym}^n(\mathcal{E}).$$

which turns $\pi_*\mathcal{O}_{\mathbf{V}(\mathcal{E})}$ into a graded \mathcal{O}_S -algebra. Conversely, we can recover \mathcal{E} from the degree 1 part of this. Thus we define an abstract vector bundle as follows.

Definition 26.6.2. Let S be a scheme. A *vector bundle $\pi : V \rightarrow S$ over S* is an affine morphism of schemes such that $\pi_*\mathcal{O}_V$ is endowed with the structure of a graded \mathcal{O}_S -algebra $\pi_*\mathcal{O}_V = \bigoplus_{n \geq 0} \mathcal{E}_n$ such that $\mathcal{E}_0 = \mathcal{O}_S$ and such that the maps

$$\mathrm{Sym}^n(\mathcal{E}_1) \longrightarrow \mathcal{E}_n$$

are isomorphisms for all $n \geq 0$. A *morphism of vector bundles over S* is a morphism $f : V \rightarrow V'$ such that the induced map

$$f^* : \pi'_*\mathcal{O}_{V'} \longrightarrow \pi_*\mathcal{O}_V$$

is compatible with the given gradings.

An example of a vector bundle over S is affine n -space \mathbf{A}_S^n over S , see Definition 26.5.1. This is true because $\mathcal{O}_S[T_1, \dots, T_n] = \mathrm{Sym}(\mathcal{O}_S^{\oplus n})$.

Lemma 26.6.3. *The category of vector bundles over a scheme S is anti-equivalent to the category of quasi-coherent \mathcal{O}_S -modules.*

Proof. Omitted. Hint: In one direction one uses the functor $\underline{\mathrm{Spec}}_S(-)$ and in the other the functor $(\pi : V \rightarrow S) \rightsquigarrow (\pi_*\mathcal{O}_V)_1$ (degree 1 part). \square

26.7. Cones

In algebraic geometry cones correspond to graded algebras. By our conventions a graded ring or algebra A comes with a grading $A = \bigoplus_{d \geq 0} A_d$ by the nonnegative integers, see Algebra, Section 10.54.

Definition 26.7.1. Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Assume that $\mathcal{O}_S \rightarrow \mathcal{A}_0$ is an isomorphism². The *cone associated to \mathcal{A}* or the *affine cone associated to \mathcal{A}* is

$$C(\mathcal{A}) = \underline{\mathrm{Spec}}_S(\mathcal{A}).$$

¹The reader may expect here the condition that \mathcal{E} is finite locally free. We do not do so in order to be consistent with [DG67, II, Definition 1.7.8].

²Often one imposes the assumption that \mathcal{A} is generated by \mathcal{A}_1 over \mathcal{O}_S . We do not assume this in order to be consistent with [DG67, II, (8.3.1)].

The cone associated to a graded sheaf of \mathcal{O}_S -algebras comes with a bit of extra structure. Namely, we obtain a grading

$$\pi_*\mathcal{O}_{C(\mathcal{A})} = \bigoplus_{n \geq 0} \mathcal{A}_n$$

Thus we can define an abstract cone as follows.

Definition 26.7.2. Let S be a scheme. A *cone* $\pi : C \rightarrow S$ over S is an affine morphism of schemes such that $\pi_*\mathcal{O}_C$ is endowed with the structure of a graded \mathcal{O}_S -algebra $\pi_*\mathcal{O}_C = \bigoplus_{n \geq 0} \mathcal{A}_n$ such that $\mathcal{A}_0 = \mathcal{O}_S$. A *morphism of cones* from $\pi : C \rightarrow S$ to $\pi' : C' \rightarrow S$ is a morphism $f : C \rightarrow C'$ such that the induced map

$$f^* : \pi'_*\mathcal{O}_{C'} \rightarrow \pi_*\mathcal{O}_C$$

is compatible with the given gradings.

Any vector bundle is an example of a cone. In fact the category of vector bundles over S is a full subcategory of the category of cones over S .

26.8. Proj of a graded ring

Let S be a graded ring. Consider the topological space $\text{Proj}(S)$ associated to S , see Algebra, Section 10.55. We will endow this space with a sheaf of rings $\mathcal{O}_{\text{Proj}(S)}$ such that the resulting pair $(\text{Proj}(S), \mathcal{O}_{\text{Proj}(S)})$ will be a scheme.

Recall that $\text{Proj}(S)$ has a basis of open sets $D_+(f)$, $f \in S_d$, $d \geq 1$ which we call *standard opens*, see Algebra, Section 10.55. This terminology will always imply that f is homogeneous of positive degree even if we forget to mention it. In addition, the intersection of two standard opens is another: $D_+(f) \cap D_+(g) = D_+(fg)$, for $f, g \in S$ homogeneous of positive degree.

Lemma 26.8.1. *Let S be a graded ring. Let $f \in S$ homogeneous of positive degree.*

- (1) *If $g \in S$ homogeneous of positive degree and $D_+(g) \subset D_+(f)$, then*
 - (a) *f is invertible in S_g , and $f^{\deg(g)}/g^{\deg(f)}$ is invertible in $S_{(g)}$,*
 - (b) *$g^e = af$ for some $e \geq 1$ and $a \in S$ homogeneous,*
 - (c) *there is a canonical S -algebra map $S_f \rightarrow S_g$,*
 - (d) *there is a canonical S_0 -algebra map $S_{(f)} \rightarrow S_{(g)}$ compatible with the map $S_f \rightarrow S_g$,*
 - (e) *the map $S_{(f)} \rightarrow S_{(g)}$ induces an isomorphism*

$$(S_{(f)})_{g^{\deg(f)}/f^{\deg(g)}} \cong S_{(g)},$$

- (f) *these maps induce a commutative diagram of topological spaces*

$$\begin{array}{ccccc} D_+(g) & \longleftarrow & \{\mathbf{Z}\text{-graded primes of } S_g\} & \longrightarrow & \text{Spec}(S_{(g)}) \\ \downarrow & & \downarrow & & \downarrow \\ D_+(f) & \longleftarrow & \{\mathbf{Z}\text{-graded primes of } S_f\} & \longrightarrow & \text{Spec}(S_{(f)}) \end{array}$$

where the horizontal maps are homeomorphisms and the vertical maps are open immersions,

- (g) *there are compatible canonical S_f and $S_{(f)}$ -module maps $M_f \rightarrow M_g$ and $M_{(f)} \rightarrow M_{(g)}$ for any graded S -module M , and*
- (h) *the map $M_{(f)} \rightarrow M_{(g)}$ induces an isomorphism*

$$(M_{(f)})_{g^{\deg(f)}/f^{\deg(g)}} \cong M_{(g)}.$$

- (2) Any open covering of $D_+(f)$ can be refined to a finite open covering of the form $D_+(f) = \bigcup_{i=1}^n D_+(g_i)$.
- (3) Let $g_1, \dots, g_n \in S$ be homogeneous of positive degree. Then $D_+(f) \subset \bigcup D_+(g_i)$ if and only if $g_1^{\deg(f)}/f^{\deg(g_1)}, \dots, g_n^{\deg(f)}/f^{\deg(g_n)}$ generate the unit ideal in $S_{(f)}$.

Proof. Recall that $D_+(g) = \text{Spec}(S_{(g)})$ with identification given by the ring maps $S \rightarrow S_g \leftarrow S_{(g)}$, see Algebra, Lemma 10.55.3. Thus $f^{\deg(g)}/g^{\deg(f)}$ is an element of $S_{(g)}$ which is not contained in any prime ideal, and hence invertible, see Algebra, Lemma 10.16.2. We conclude that (a) holds. Write the inverse of f in S_g as a/g^d . We may replace a by its homogeneous part of degree $d \deg(g) - \deg(f)$. This means $g^d - af$ is annihilated by a power of g , whence $g^e = af$ for some $a \in S$ homogeneous of degree $e \deg(g) - \deg(f)$. This proves (b). For (c), the map $S_f \rightarrow S_g$ exists by (a) from the universal property of localization, or we can define it by mapping b/f^n to $a^n b/g^{ne}$. This clearly induces a map of the subrings $S_{(f)} \rightarrow S_{(g)}$ of degree zero elements as well. We can similarly define $M_f \rightarrow M_g$ and $M_{(f)} \rightarrow M_{(g)}$ by mapping x/f^n to $a^n x/g^{ne}$. The statements writing $S_{(g)}$ resp. $M_{(g)}$ as principal localizations of $S_{(f)}$ resp. $M_{(f)}$ are clear from the formulas above. The maps in the commutative diagram of topological spaces correspond to the ring maps given above. The horizontal arrows are homeomorphisms by Algebra, Lemma 10.55.3. The vertical arrows are open immersions since the left one is the inclusion of an open subset.

The open $D_+(f)$ is quasi-compact because it is homeomorphic to $\text{Spec}(S_{(f)})$, see Algebra, Lemma 10.16.10. Hence the second statement follows directly from the fact that the standard opens form a basis for the topology.

The third statement follows directly from Algebra, Lemma 10.16.2. □

In Sheaves, Section 6.30 we defined the notion of a sheaf on a basis, and we showed that it is essentially equivalent to the notion of a sheaf on the space, see Sheaves, Lemmas 6.30.6 and 6.30.9. Moreover, we showed in Sheaves, Lemma 6.30.4 that it is sufficient to check the sheaf condition on a cofinal system of open coverings for each standard open. By the lemma above it suffices to check on the finite coverings by standard opens.

Definition 26.8.2. Let S be a graded ring. Suppose that $D_+(f) \subset \text{Proj}(S)$ is a standard open. A *standard open covering* of $D_+(f)$ is a covering $D_+(f) = \bigcup_{i=1}^n D_+(g_i)$, where $g_1, \dots, g_n \in S$ are homogeneous of positive degree.

Let S be a graded ring. Let M be a graded S -module. We will define a presheaf \widetilde{M} on the basis of standard opens. Suppose that $U \subset \text{Proj}(S)$ is a standard open. If $f, g \in S$ are homogeneous of positive degree such that $D_+(f) = D_+(g)$, then by Lemma 26.8.1 above there are canonical maps $M_{(f)} \rightarrow M_{(g)}$ and $M_{(g)} \rightarrow M_{(f)}$ which are mutually inverse. Hence we may choose any f such that $U = D_+(f)$ and define

$$\widetilde{M}(U) = M_{(f)}.$$

Note that if $D_+(g) \subset D_+(f)$, then by Lemma 26.8.1 above we have a canonical map

$$\widetilde{M}(D_+(f)) = M_{(f)} \longrightarrow M_{(g)} = \widetilde{M}(D_+(g)).$$

Clearly, this defines a presheaf of abelian groups on the basis of standard opens. If $M = S$, then \widetilde{S} is a presheaf of rings on the basis of standard opens. And for general M we see that \widetilde{M} is a presheaf of \widetilde{S} -modules on the basis of standard opens.

Let us compute the stalk of \widetilde{M} at a point $x \in \text{Proj}(S)$. Suppose that x corresponds to the homogeneous prime ideal $\mathfrak{p} \subset S$. By definition of the stalk we see that

$$\widetilde{M}_x = \text{colim}_{f \in S_d, d > 0, f \notin \mathfrak{p}} M_{(f)}$$

Here the set $\{f \in S_d, d > 0, f \notin \mathfrak{p}\}$ is partially ordered by the rule $f \geq f' \Leftrightarrow D_+(f) \subset D_+(f')$. If $f_1, f_2 \in S \setminus \mathfrak{p}$ are homogeneous of positive degree, then we have $f_1 f_2 \geq f_1$ in this ordering. In Algebra, Section 10.55 we defined $M_{(\mathfrak{p})}$ as the ring whose elements are fractions x/f with x, f homogeneous, $\deg(x) = \deg(f)$, $f \notin \mathfrak{p}$. Since $\mathfrak{p} \in \text{Proj}(S)$ there exists at least one $f_0 \in S$ homogeneous of positive degree with $f_0 \notin \mathfrak{p}$. Hence $x/f = f_0 x / f f_0$ and we see that we may always assume the denominator of an element in $M_{(\mathfrak{p})}$ has positive degree. From these remarks it follows easily that

$$\widetilde{M}_x = M_{(\mathfrak{p})}.$$

Next, we check the sheaf condition for the standard open coverings. If $D_+(f) = \bigcup_{i=1}^n D_+(g_i)$, then the sheaf condition for this covering is equivalent with the exactness of the sequence

$$0 \rightarrow M_{(f)} \rightarrow \bigoplus M_{(g_i)} \rightarrow \bigoplus M_{(g_i g_j)}.$$

Note that $D_+(g_i) = D_+(f g_i)$, and hence we can rewrite this sequence as the sequence

$$0 \rightarrow M_{(f)} \rightarrow \bigoplus M_{(f g_i)} \rightarrow \bigoplus M_{(f g_i g_j)}.$$

By Lemma 26.8.1 we see that $g_1^{\deg(f)} / f^{\deg(g_1)}, \dots, g_n^{\deg(f)} / f^{\deg(g_n)}$ generate the unit ideal in $S_{(f)}$, and that the modules $M_{(f g_i)}, M_{(f g_i g_j)}$ are the principal localizations of the $S_{(f)}$ -module $M_{(f)}$ at these elements and their products. Thus we may apply Algebra, Lemma 10.22.2 to the module $M_{(f)}$ over $S_{(f)}$ and the elements $g_1^{\deg(f)} / f^{\deg(g_1)}, \dots, g_n^{\deg(f)} / f^{\deg(g_n)}$. We conclude that the sequence is exact. By the remarks made above, we see that \widetilde{M} is a sheaf on the basis of standard opens.

Thus we conclude from the material in Sheaves, Section 6.30 that there exists a unique sheaf of rings $\mathcal{O}_{\text{Proj}(S)}$ which agrees with \widetilde{S} on the standard opens. Note that by our computation of stalks above and Algebra, Lemma 10.55.5 the stalks of this sheaf of rings are all local rings.

Similarly, for any graded S -module M there exists a unique sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules \mathcal{F} which agrees with \widetilde{M} on the standard opens, see Sheaves, Lemma 6.30.12.

Definition 26.8.3. Let S be a graded ring.

- (1) The *structure sheaf* $\mathcal{O}_{\text{Proj}(S)}$ of the homogeneous spectrum of S is the unique sheaf of rings $\mathcal{O}_{\text{Proj}(S)}$ which agrees with \widetilde{S} on the basis of standard opens.
- (2) The locally ringed space $(\text{Proj}(S), \mathcal{O}_{\text{Proj}(S)})$ is called the *homogeneous spectrum* of S and denoted $\text{Proj}(S)$.

- (3) The sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules extending \widetilde{M} to all opens of $\text{Proj}(S)$ is called the sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules associated to M . This sheaf is denoted \widetilde{M} as well.

We summarize the results obtained so far.

Lemma 26.8.4. *Let S be a graded ring. Let M be a graded S -module. Let \widetilde{M} be the sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules associated to M .*

- (1) *For every $f \in S$ homogeneous of positive degree we have*

$$\Gamma(D_+(f), \mathcal{O}_{\text{Proj}(S)}) = S_{(f)}.$$

- (2) *For every $f \in S$ homogeneous of positive degree we have $\Gamma(D_+(f), \widetilde{M}) = M_{(f)}$ as an $S_{(f)}$ -module.*

- (3) *Whenever $D_+(g) \subset D_+(f)$ the restriction mappings on $\mathcal{O}_{\text{Proj}(S)}$ and \widetilde{M} are the maps $S_{(f)} \rightarrow S_{(g)}$ and $M_{(f)} \rightarrow M_{(g)}$ from Lemma 26.8.1.*

- (4) *Let \mathfrak{p} be a homogeneous prime of S not containing S_+ , and let $x \in \text{Proj}(S)$ be the corresponding point. We have $\mathcal{O}_{\text{Proj}(S), x} = S_{(\mathfrak{p})}$.*

- (5) *Let \mathfrak{p} be a homogeneous prime of S not containing S_+ , and let $x \in \text{Proj}(S)$ be the corresponding point. We have $\mathcal{F}_x = M_{(\mathfrak{p})}$ as an $S_{(\mathfrak{p})}$ -module.*

- (6) *There is a canonical ring map $S_0 \rightarrow \Gamma(\text{Proj}(S), \widetilde{S})$ and a canonical S_0 -module map $M_0 \rightarrow \Gamma(\text{Proj}(S), \widetilde{M})$ compatible with the descriptions of sections over standard opens and stalks above.*

Moreover, all these identifications are functorial in the graded S -module M . In particular, the functor $M \mapsto \widetilde{M}$ is an exact functor from the category of graded S -modules to the category of $\mathcal{O}_{\text{Proj}(S)}$ -modules.

Proof. Assertions (1) - (5) are clear from the discussion above. We see (6) since there are canonical maps $M_0 \rightarrow M_{(f)}$, $x \mapsto x/1$ compatible with the restriction maps described in (3). The exactness of the functor $M \mapsto \widetilde{M}$ follows from the fact that the functor $M \mapsto M_{(\mathfrak{p})}$ is exact (see Algebra, Lemma 10.55.5) and the fact that exactness of short exact sequences may be checked on stalks, see Modules, Lemma 17.3.1. \square

Remark 26.8.5. The map from M_0 to the global sections of \widetilde{M} is generally far from being an isomorphism. A trivial example is to take $S = k[x, y, z]$ with $1 = \deg(x) = \deg(y) = \deg(z)$ (or any number of variables) and to take $M = S/(x^{100}, y^{100}, z^{100})$. It is easy to see that $\widetilde{M} = 0$, but $M_0 = k$.

Lemma 26.8.6. *Let S be a graded ring. Let $f \in S$ be homogeneous of positive degree. Suppose that $D(g) \subset \text{Spec}(S_{(f)})$ is a standard open. Then there exists a $h \in S$ homogeneous of positive degree such that $D(g)$ corresponds to $D_+(h) \subset D_+(f)$ via the homeomorphism of Algebra, Lemma 10.55.3. In fact we can take h such that $g = h/f^n$ for some n .*

Proof. Write $g = h/f^n$ for some h homogeneous of positive degree and some $n \geq 1$. If $D_+(h)$ is not contained in $D_+(f)$ then we replace h by hf and n by $n+1$. Then h has the required shape and $D_+(h) \subset D_+(f)$ corresponds to $D(g) \subset \text{Spec}(S_{(f)})$. \square

Lemma 26.8.7. *Let S be a graded ring. The locally ringed space $\text{Proj}(S)$ is a scheme. The standard opens $D_+(f)$ are affine opens. For any graded S -module M the sheaf \widetilde{M} is a quasi-coherent sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules.*

Proof. Consider a standard open $D_+(f) \subset \text{Proj}(S)$. By Lemmas 26.8.1 and 26.8.4 we have $\Gamma(D_+(f), \mathcal{O}_{\text{Proj}(S)}) = S_{(f)}$, and we have a homeomorphism $\varphi : D_+(f) \rightarrow \text{Spec}(S_{(f)})$. For any standard open $D(g) \subset \text{Spec}(S_{(f)})$ we may pick a $h \in S_+$ as in Lemma 26.8.6. Then $\varphi^{-1}(D(g)) = D_+(h)$, and by Lemmas 26.8.4 and 26.8.1 we see

$$\Gamma(D_+(h), \mathcal{O}_{\text{Proj}(S)}) = S_{(h)} = (S_{(f)})_{h^{\deg(f)}/f^{\deg(h)}} = (S_{(f)})_g = \Gamma(D(g), \mathcal{O}_{\text{Spec}(S_{(f)})}).$$

Thus the restriction of $\mathcal{O}_{\text{Proj}(S)}$ to $D_+(f)$ corresponds via the homeomorphism φ exactly to the sheaf $\mathcal{O}_{\text{Spec}(S_{(f)})}$ as defined in Schemes, Section 25.5. We conclude that $D_+(f)$ is an affine scheme isomorphic to $\text{Spec}(S_{(f)})$ via φ and hence that $\text{Proj}(S)$ is a scheme.

In exactly the same way we show that \widetilde{M} is a quasi-coherent sheaf of $\mathcal{O}_{\text{Proj}(S)}$ -modules. Namely, the argument above will show that

$$\widetilde{M}|_{D_+(f)} \cong \varphi^* \left(\widetilde{M}_{(f)} \right)$$

which shows that \widetilde{M} is quasi-coherent. □

Lemma 26.8.8. *Let S be a graded ring. The scheme $\text{Proj}(S)$ is separated.*

Proof. We have to show that the canonical morphism $\text{Proj}(S) \rightarrow \text{Spec}(\mathbf{Z})$ is separated. We will use Schemes, Lemma 25.21.8. Thus it suffices to show given any pair of standard opens $D_+(f)$ and $D_+(g)$ that $D_+(f) \cap D_+(g) = D_+(fg)$ is affine (clear) and that the ring map

$$S_{(f)} \otimes_{\mathbf{Z}} S_{(g)} \longrightarrow S_{(fg)}$$

is surjective. Any element s in $S_{(fg)}$ is of the form $s = h/(f^n g^m)$ with $h \in S$ homogeneous of degree $n \deg(f) + m \deg(g)$. We may multiply h by a suitable monomial $f^i g^j$ and assume that $n = n' \deg(g)$, and $m = m' \deg(f)$. Then we can rewrite s as $s = h/f^{(n'+m') \deg(g)} \cdot f^{m' \deg(g)} / g^{m' \deg(f)}$. So s is indeed in the image of the displayed arrow. □

Lemma 26.8.9. *Let S be a graded ring. The scheme $\text{Proj}(S)$ is quasi-compact if and only if there exist finitely many homogeneous elements $f_1, \dots, f_n \in S_+$ such that $S_+ \subset \sqrt{(f_1, \dots, f_n)}$. In this case $\text{Proj}(S) = D_+(f_1) \cup \dots \cup D_+(f_n)$.*

Proof. Given such a collection of elements the standard affine opens $D_+(f_i)$ cover $\text{Proj}(S)$ by Algebra, Lemma 10.55.3. Conversely, if $\text{Proj}(S)$ is quasi-compact, then we may cover it by finitely many standard opens $D_+(f_i)$, $i = 1, \dots, n$ and we see that $S_+ \subset \sqrt{(f_1, \dots, f_n)}$ by the lemma referenced above. □

Lemma 26.8.10. *Let S be a graded ring. The scheme $\text{Proj}(S)$ has a canonical morphism towards the affine scheme $\text{Spec}(S_0)$, agreeing with the map on topological spaces coming from Algebra, Definition 10.55.1.*

Proof. We saw above that our construction of \widetilde{S} , resp. \widetilde{M} gives a sheaf of S_0 -algebras, resp. S_0 -modules. Hence we get a morphism by Schemes, Lemma 25.6.4. This morphism, when restricted to $D_+(f)$ comes from the canonical ring map $S_0 \rightarrow S_{(f)}$. The maps $S \rightarrow S_f$, $S_{(f)} \rightarrow S_f$ are S_0 -algebra maps, see Lemma 26.8.1. Hence if the homogeneous prime $\mathfrak{p} \subset S$ corresponds to the \mathbf{Z} -graded prime $\mathfrak{p}' \subset S_f$ and the (usual) prime $\mathfrak{p}'' \subset S_{(f)}$, then each of these has the same inverse image in S_0 . □

Lemma 26.8.11. *Let S be a graded ring. If S is finitely generated as an algebra over S_0 , then the morphism $\text{Proj}(S) \rightarrow \text{Spec}(S_0)$ satisfies the existence and uniqueness parts of the valuative criterion, see Schemes, Definition 25.20.3.*

Proof. The uniqueness part follows from the fact that $\text{Proj}(S)$ is separated (Lemma 26.8.8 and Schemes, Lemma 25.22.1). Choose $x_i \in S_+$ homogeneous, $i = 1, \dots, n$ which generate S over S_0 . Let $d_i = \deg(x_i)$ and set $d = \text{lcm}\{d_i\}$. Suppose we are given a diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & \text{Proj}(S) \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & \text{Spec}(S_0) \end{array}$$

as in Schemes, Definition 25.20.3. Denote $v : K^* \rightarrow \Gamma$ the valuation of A , see Algebra, Definition 10.48.13. We may choose an $f \in S_+$ homogeneous such that $\text{Spec}(K)$ maps into $D_+(f)$. Then we get a commutative diagram of ring maps

$$\begin{array}{ccc} K & \xleftarrow{\varphi} & S_{(f)} \\ \uparrow & & \uparrow \\ A & \xleftarrow{\quad} & S_0 \end{array}$$

Let $i_0 \in \{1, \dots, n\}$ be an index minimizing the valuation $(d/d_{i_0})v(\varphi(x_i^{\deg(f)}/f^{d_i}))$ where we temporarily use the convention that the valuation of zero is bigger than any element of the value group. For convenience set $x_0 = x_{i_0}$ and $d_0 = d_{i_0}$. Since the open sets $D_+(x_i)$ cover $\text{Proj}(S)$ we see that $\varphi(x_0) \neq 0$. This means that the ring map φ factors through a map $\varphi' : S_{(fx_0)} \rightarrow K$. We see that

$$\deg(f)v(\varphi'(x_i^{d_0}/x_0^{d_i})) = d_0v(\varphi(x_i^{\deg(f)}/f^{d_i})) - d_iv(\varphi(x_0^{\deg(f)}/f^{d_0})) \geq 0$$

by our choice of i_0 . This implies that the S_0 -algebra $S_{(x_0)}$, which is generated by the elements $x_i^{d_0}/x_0^{d_i}$ over S_0 , maps into A via φ' . The corresponding morphism of schemes $\text{Spec}(A) \rightarrow \text{Spec}(S_{(x_0)}) = D_+(x_0) \subset \text{Proj}(S)$ provides the morphism fitting into the first commutative diagram of this proof. \square

We saw in the proof of Lemma 26.8.11 that, under the hypotheses of that lemma, the morphism $\text{Proj}(S) \rightarrow \text{Spec}(S_0)$ is quasi-compact as well. Hence (by Schemes, Proposition 25.20.6) we see that $\text{Proj}(S) \rightarrow \text{Spec}(S_0)$ is universally closed in the situation of the lemma. We give two examples showing these results do not hold without some assumption on the graded ring S .

Example 26.8.12. Let $\mathbf{C}[X_1, X_2, X_3, \dots]$ be the graded \mathbf{C} -algebra with each X_i in degree 0. Consider the ring map

$$\mathbf{C}[X_1, X_2, X_3, \dots] \longrightarrow \mathbf{C}[t^\alpha; \alpha \in \mathbf{Q}_{\geq 0}]$$

which maps X_i to $t^{1/i}$. The right hand side becomes a valuation ring A upon localization at the ideal $\mathfrak{m} = (t^\alpha; \alpha > 0)$. This gives a morphism from $\text{Spec}(f.f.(A))$ to $\text{Proj}(\mathbf{C}[X_1, X_2, X_3, \dots])$ which does not extend to a morphism defined on all of $\text{Spec}(A)$. The reason is that the image of $\text{Spec}(A)$ would be contained in one of the $D_+(X_i)$ but then X_{i+1}/X_i would map to an element of A which it doesn't since it maps to $t^{1/(i+1)-1/i}$.

Example 26.8.13. Let $R = \mathbf{C}[t]$ and

$$S = R[X_1, X_2, X_3, \dots]/(X_i^2 - tX_{i+1}).$$

The grading is such that $R = S_0$ and $\deg(X_i) = 2^{i-1}$. Note that if $\mathfrak{p} \in \text{Proj}(S)$ then $t \notin \mathfrak{p}$ (otherwise \mathfrak{p} has to contain all of the X_i which is not allowed for an element of the homogeneous spectrum). Thus we see that $D_+(X_i) = D_+(X_{i+1})$ for all i . Hence $\text{Proj}(S)$ is quasi-compact; in fact it is affine since it is equal to $D_+(X_1)$. It is easy to see that the image of $\text{Proj}(S) \rightarrow \text{Spec}(R)$ is $D(t)$. Hence the morphism $\text{Proj}(S) \rightarrow \text{Spec}(R)$ is not closed. Thus the valuative criterion cannot apply because it would imply that the morphism is closed (see Schemes, Proposition 25.20.6).

Example 26.8.14. Let A be a ring. Let $S = A[T]$ as a graded A algebra with T in degree 1. Then the canonical morphism $\text{Proj}(S) \rightarrow \text{Spec}(A)$ (see Lemma 26.8.10) is an isomorphism.

26.9. Quasi-coherent sheaves on Proj

Let S be a graded ring. Let M be a graded S -module. We saw in Lemma 26.8.4 how to construct a quasi-coherent sheaf of modules \widetilde{M} on $\text{Proj}(S)$ and a map

$$(26.9.0.1) \quad M_0 \longrightarrow \Gamma(\text{Proj}(S), \widetilde{M})$$

of the degree 0 part of M to the global sections of \widetilde{M} . The degree 0 part of the n th twist $M(n)$ of the graded module M (see Algebra, Section 10.54) is equal to M_n . Hence we can get maps

$$(26.9.0.2) \quad M_n \longrightarrow \Gamma(\text{Proj}(S), \widetilde{M(n)}).$$

We would like to be able to perform this operation for any quasi-coherent sheaf \mathcal{F} on $\text{Proj}(S)$. We will do this by tensoring with the n th twist of the structure sheaf, see Definition 26.10.1. In order to relate the two notions we will use the following lemma.

Lemma 26.9.1. *Let S be a graded ring. Let $(X, \mathcal{O}_X) = (\text{Proj}(S), \mathcal{O}_{\text{Proj}(S)})$ be the scheme of Lemma 26.8.7. Let $f \in S_+$ be homogeneous. Let $x \in X$ be a point corresponding to the homogeneous prime $\mathfrak{p} \subset S$. Let M, N be graded S -modules. There is a canonical map of $\mathcal{O}_{\text{Proj}(S)}$ -modules*

$$\widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N} \longrightarrow \widetilde{M \otimes_S N}$$

which induces the canonical map $M_{(f)} \otimes_{S_{(f)}} N_{(f)} \rightarrow (M \otimes_S N)_{(f)}$ on sections over $D_+(f)$ and the canonical map $M_{(\mathfrak{p})} \otimes_{S_{(\mathfrak{p})}} N_{(\mathfrak{p})} \rightarrow (M \otimes_S N)_{(\mathfrak{p})}$ on stalks at x . Moreover, the following diagram

$$\begin{array}{ccc} M_0 \otimes_{S_0} N_0 & \longrightarrow & (M \otimes_S N)_0 \\ \downarrow & & \downarrow \\ \Gamma(X, \widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N}) & \longrightarrow & \Gamma(X, \widetilde{M \otimes_S N}) \end{array}$$

is commutative where the vertical maps are given by (26.9.0.1).

Proof. To construct a morphism as displayed is the same as constructing a \mathcal{O}_X -bilinear map

$$\widetilde{M} \times \widetilde{N} \longrightarrow \widetilde{M \otimes_R N}$$

see Modules, Section 17.15. It suffices to define this on sections over the opens $D_+(f)$ compatible with restriction mappings. On $D_+(f)$ we use the $S_{(f)}$ -bilinear map $M_{(f)} \times N_{(f)} \rightarrow (M \otimes_S N)_{(f)}$, $(x/f^n, y/f^m) \mapsto (x \otimes y)/f^{n+m}$. Details omitted. \square

Remark 26.9.2. In general the map constructed in Lemma 26.9.1 above is not an isomorphism. Here is an example. Let k be a field. Let $S = k[x, y, z]$ with k in degree 0 and $\deg(x) = 1$, $\deg(y) = 2$, $\deg(z) = 3$. Let $M = S(1)$ and $N = S(2)$, see Algebra, Section 10.54 for notation. Then $M \otimes_S N = S(3)$. Note that

$$\begin{aligned} S_z &= k[x, y, z, 1/z] \\ S_{(z)} &= k[x^3/z, xy/z, y^3/z^2] \cong k[u, v, w]/(uw - v^3) \\ M_{(z)} &= S_{(z)} \cdot x + S_{(z)} \cdot y^2/z \subset S_z \\ N_{(z)} &= S_{(z)} \cdot y + S_{(z)} \cdot x^2 \subset S_z \\ S(3)_{(z)} &= S_{(z)} \cdot z \subset S_z \end{aligned}$$

Consider the maximal ideal $\mathfrak{m} = (u, v, w) \subset S_{(z)}$. It is not hard to see that both $M_{(z)}/\mathfrak{m}M_{(z)}$ and $N_{(z)}/\mathfrak{m}N_{(z)}$ have dimension 2 over $\kappa(\mathfrak{m})$. But $S(3)_{(z)}/\mathfrak{m}S(3)_{(z)}$ has dimension 1. Thus the map $M_{(z)} \otimes N_{(z)} \rightarrow S(3)_{(z)}$ is not an isomorphism.

26.10. Invertible sheaves on Proj

Recall from Algebra, Section 10.54 the construction of the twisted module $M(n)$ associated to a graded module over a graded ring.

Definition 26.10.1. Let S be a graded ring. Let $X = \text{Proj}(S)$.

- (1) We define $\mathcal{O}_X(n) = \widetilde{S(n)}$. This is called the *n*th twist of the structure sheaf of $\text{Proj}(S)$.
- (2) For any sheaf of \mathcal{O}_X -modules \mathcal{F} we set $\mathcal{F}(n) = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n)$.

We are going to use Lemma 26.9.1 to construct some canonical maps. Since $S(n) \otimes_S S(m) = S(n+m)$ we see that there are canonical maps

$$(26.10.1.1) \quad \mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{O}_X(m) \longrightarrow \mathcal{O}_X(n+m).$$

These maps are not isomorphisms in general, see the example in Remark 26.9.2. The same example shows that $\mathcal{O}_X(n)$ is *not* an invertible sheaf on X in general. Tensoring with an arbitrary \mathcal{O}_X -module \mathcal{F} we get maps

$$(26.10.1.2) \quad \mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{F}(m) \longrightarrow \mathcal{F}(n+m).$$

The maps (26.10.1.1) on global sections give a map of graded rings

$$(26.10.1.3) \quad S \longrightarrow \bigoplus_{n \geq 0} \Gamma(X, \mathcal{O}_X(n)).$$

And for an arbitrary \mathcal{O}_X -module \mathcal{F} the maps (26.10.1.2) give a graded module structure

$$(26.10.1.4) \quad \bigoplus_{n \geq 0} \Gamma(X, \mathcal{O}_X(n)) \times \bigoplus_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m)) \longrightarrow \bigoplus_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m))$$

and via (26.10.1.3) also a S -module structure. More generally, given any graded S -module M we have $M(n) = M \otimes_S S(n)$. Hence we get maps

$$(26.10.1.5) \quad \widetilde{M}(n) = \widetilde{M} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n) \longrightarrow \widetilde{M(n)}.$$

On global sections we get a map of graded S -modules

$$(26.10.1.6) \quad M \longrightarrow \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \widetilde{M(n)}).$$

Here is an important fact which follows basically immediately from the definitions.

Lemma 26.10.2. *Let S be a graded ring. Set $X = \text{Proj}(S)$. Let $f \in S$ be homogeneous of degree $d > 0$. The sheaves $\mathcal{O}_X(nd)|_{D_+(f)}$ are invertible, and in fact trivial for all $n \in \mathbf{Z}$ (see Modules, Definition 17.21.1). The maps (26.10.1.1) restricted to $D_+(f)$*

$$\mathcal{O}_X(nd)|_{D_+(f)} \otimes_{\mathcal{O}_{D_+(f)}} \mathcal{O}_X(m)|_{D_+(f)} \longrightarrow \mathcal{O}_X(nd+m)|_{D_+(f)},$$

the maps (26.10.1.2) restricted to $D_+(f)$

$$\mathcal{O}_X(nd)|_{D_+(f)} \otimes_{\mathcal{O}_{D_+(f)}} \mathcal{F}(m)|_{D_+(f)} \longrightarrow \mathcal{F}(nd+m)|_{D_+(f)},$$

and the maps (26.10.1.5) restricted to $D_+(f)$

$$\widetilde{M}(nd)|_{D_+(f)} = \widetilde{M}|_{D_+(f)} \otimes_{\mathcal{O}_{D_+(f)}} \mathcal{O}_X(nd)|_{D_+(f)} \longrightarrow \widetilde{M(nd)}|_{D_+(f)}$$

are isomorphisms for all $n, m \in \mathbf{Z}$.

Proof. The (not graded) S -module maps $S \rightarrow S(n)$, and $M \rightarrow M(n)$, given by $x \mapsto f^{n/d}x$ become isomorphisms after inverting f . The first shows that $S_{(f)} \cong S(n)_{(f)}$ which gives an isomorphism $\mathcal{O}_{D_+(f)} \cong \mathcal{O}_X(n)|_{D_+(f)}$. The second shows that the map $S(n)_{(f)} \otimes_{S_{(f)}} M_{(f)} \rightarrow M(n)_{(f)}$ is an isomorphism. The case of the map (26.10.1.2) is a consequence of the case of the map (26.10.1.1). \square

Lemma 26.10.3. *Let S be a graded ring. Let M be a graded S -module. Set $X = \text{Proj}(S)$. If S is generated by S_1 over S_0 , then the sheaves $\mathcal{O}_X(n)$ are invertible and the maps (26.10.1.1), (26.10.1.2), and (26.10.1.5) are isomorphisms. In particular, these maps induce isomorphisms*

$$\mathcal{O}_X(1)^{\otimes n} \cong \mathcal{O}_X(n) \quad \text{and} \quad \widetilde{M} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n) = \widetilde{M(n)} \cong \widetilde{M}(n)$$

Thus (26.9.0.2) becomes a map

$$(26.10.3.1) \quad M_n \longrightarrow \Gamma(X, \widetilde{M(n)})$$

and (26.10.1.6) becomes a map

$$(26.10.3.2) \quad M \longrightarrow \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \widetilde{M(n)}).$$

In fact these results hold more generally if X is covered by the standard opens $D_+(f)$ with $f \in S_1$.

Proof. Under the assumptions of the lemma X is covered by the open subsets $D_+(f)$ with $f \in S_1$ and the lemma is a consequence of Lemma 26.10.2 above. \square

Lemma 26.10.4. *Let S be a graded ring. Set $X = \text{Proj}(S)$. Fix $d \geq 1$ an integer. The following open subsets of X are equal:*

- (1) The largest open subset $W = W_d \subset X$ such that each $\mathcal{O}_X(dn)|_W$ is invertible and all the multiplication maps $\mathcal{O}_X(nd)|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(md)|_W \rightarrow \mathcal{O}_X(nd+md)|_W$ (see 26.10.1.1) are isomorphisms.
- (2) The union of the open subsets $D_+(fg)$ with $f, g \in S$ homogeneous and $\deg(f) = \deg(g) + d$.

Moreover, all the maps $\widetilde{M}(nd)|_W = \widetilde{M}|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(nd)|_W \rightarrow \widetilde{M}(nd)|_W$ (see 26.10.1.5) are isomorphisms.

Proof. If $x \in D_+(fg)$ with $\deg(f) = \deg(g) + d$ then on $D_+(fg)$ the sheaves $\mathcal{O}_X(dn)$ are generated by the element $(f/g)^n = f^{2n}/(fg)^n$. This implies x is in the open subset W defined in (1) by arguing as in the proof of Lemma 26.10.2.

Conversely, suppose that $\mathcal{O}_X(d)$ is free of rank 1 in an open neighbourhood V of $x \in X$ and all the multiplication maps $\mathcal{O}_X(nd)|_V \otimes_{\mathcal{O}_V} \mathcal{O}_X(md)|_V \rightarrow \mathcal{O}_X(nd+md)|_V$ are isomorphisms. We may choose $h \in S_+$ homogeneous such that $D_+(h) \subset V$. By the definition of the twists of the structure sheaf we conclude there exists an element s of $(S_h)_d$ such that s^n is a basis of $(S_h)_{nd}$ as a module over $S_{(h)}$ for all $n \in \mathbf{Z}$. We may write $s = f/h^m$ for some $m \geq 1$ and $f \in S_{d+m \deg(h)}$. Set $g = h^m$ so $s = f/g$. Note that $x \in D(g)$ by construction. Note that $g^d \in (S_h)_{-d \deg(g)}$. By assumption we can write this as a multiple of $s^{\deg(g)} = f^{\deg(g)}/g^{\deg(g)}$, say $g^d = a/g^e \cdot f^{\deg(g)}/g^{\deg(g)}$. Then we conclude that $g^{d+e+\deg(g)} = a f^{\deg(g)}$ and hence also $x \in D_+(f)$. So x is an element of the set defined in (2).

The existence of the generating section $s = f/g$ over the affine open $D_+(fg)$ whose powers freely generate the sheaves of modules $\mathcal{O}_X(nd)$ easily implies that the multiplication maps $\widetilde{M}(nd)|_W = \widetilde{M}|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(nd)|_W \rightarrow \widetilde{M}(nd)|_W$ (see 26.10.1.5) are isomorphisms. Compare with the proof of Lemma 26.10.2. \square

Recall from Modules, Lemma 17.21.7 that given an invertible sheaf \mathcal{L} on a locally ringed space X , and given a global section s of \mathcal{L} the set $X_s = \{x \in X \mid s \notin \mathfrak{m}_x \mathcal{L}_x\}$ is open.

Lemma 26.10.5. *Let S be a graded ring. Set $X = \text{Proj}(S)$. Fix $d \geq 1$ an integer. Let $W = W_d \subset X$ be the open subscheme defined in Lemma 26.10.4. Let $n \geq 1$ and $f \in S_{nd}$. Denote $s \in \Gamma(W, \mathcal{O}_W(nd))$ the section which is the image of f via (26.10.1.3) restricted to W . Then*

$$W_s = D_+(f) \cap W.$$

Proof. Let $D_+(ab) \subset W$ be a standard affine open with $a, b \in S$ homogeneous and $\deg(a) = \deg(b) + d$. Note that $D_+(ab) \cap D_+(f) = D_+(abf)$. On the other hand the restriction of s to $D_+(ab)$ corresponds to the element $f/1 = b^n f/a^n (a/b)^n \in (S_{ab})_{nd}$. We have seen in the proof of Lemma 26.10.4 that $(a/b)^n$ is a generator for $\mathcal{O}_W(nd)$ over $D_+(ab)$. We conclude that $W_s \cap D_+(ab)$ is the principal open associated to $b^n f/a^n \in \mathcal{O}_X(D_+(ab))$. Thus the result of the lemma is clear. \square

The following lemma states the properties that we will later use to characterize schemes with an ample invertible sheaf.

Lemma 26.10.6. *Let S be a graded ring. Let $X = \text{Proj}(S)$. Let $Y \subset X$ be a quasi-compact open subscheme. Denote $\mathcal{O}_Y(n)$ the restriction of $\mathcal{O}_X(n)$ to Y . There exists an integer $d \geq 1$ such that*

- (1) the subscheme Y is contained in the open W_d defined in Lemma 26.10.4,
- (2) the sheaf $\mathcal{O}_Y(dn)$ is invertible for all $n \in \mathbf{Z}$,
- (3) all the maps $\mathcal{O}_Y(nd) \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(m) \rightarrow \mathcal{O}_Y(nd+m)$ of Equation (26.10.1.1) are isomorphisms,
- (4) all the maps $\widetilde{M}(nd)|_Y = \widetilde{M}|_Y \otimes_{\mathcal{O}_Y} \mathcal{O}_X(nd)|_Y \rightarrow \widetilde{M}(nd)|_Y$ (see 26.10.1.5) are isomorphisms,
- (5) given $f \in S_{nd}$ denote $s \in \Gamma(Y, \mathcal{O}_Y(nd))$ the image of f via (26.10.1.3) restricted to Y , then $D_+(f) \cap Y = Y_s$,
- (6) a basis for the topology on Y is given by the collection of opens Y_s , where $s \in \Gamma(Y, \mathcal{O}_Y(nd))$, $n \geq 1$, and
- (7) a basis for the topology of Y is given by those opens $Y_s \subset Y$, for $s \in \Gamma(Y, \mathcal{O}_Y(nd))$, $n \geq 1$ which are affine.

Proof. Since Y is quasi-compact there exist finitely many homogeneous $f_i \in S_+$, $i = 1, \dots, n$ such that the standard opens $D_+(f_i)$ give an open covering of Y . Let $d_i = \deg(f_i)$ and set $d = d_1 \dots d_n$. Note that $D_+(f_i) = D_+(f_i^{d/d_i})$ and hence we see immediately that $Y \subset W_d$, by characterization (2) in Lemma 26.10.4 or by (1) using Lemma 26.10.2. Note that (1) implies (2), (3) and (4) by Lemma 26.10.4. (Note that (3) is a special case of (4).) Assertion (5) follows from Lemma 26.10.5. Assertions (6) and (7) follow because the open subsets $D_+(f)$ form a basis for the topology of X and are affine. \square

26.11. Functoriality of Proj

A graded ring map $\psi : A \rightarrow B$ does not always give rise to a morphism of associated projective homogeneous spectra. The reason is that the inverse image $\psi^{-1}(\mathfrak{q})$ of a homogeneous prime $\mathfrak{q} \subset B$ may contain the irrelevant prime A_+ even if \mathfrak{q} does not contain B_+ . The correct result is stated as follows.

Lemma 26.11.1. *Let A, B be two graded rings. Set $X = \text{Proj}(A)$ and $Y = \text{Proj}(B)$. Let $\psi : A \rightarrow B$ be a graded ring map. Set*

$$U(\psi) = \bigcup_{f \in A_+ \text{ homogeneous}} D_+(\psi(f)) \subset Y.$$

Then there is a canonical morphism of schemes

$$r_\psi : U(\psi) \rightarrow X$$

and a map of \mathbf{Z} -graded $\mathcal{O}_{U(\psi)}$ -algebras

$$\theta = \theta_\psi : r_\psi^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_X(d) \right) \rightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d).$$

The triple $(U(\psi), r_\psi, \theta)$ is characterized by the following properties:

- (1) For every $d \geq 0$ the diagram

$$\begin{array}{ccc} A_d & \xrightarrow{\quad \psi \quad} & B_d \\ \downarrow & & \downarrow \\ \Gamma(X, \mathcal{O}_X(d)) & \xrightarrow{\quad \theta \quad} & \Gamma(U(\psi), \mathcal{O}_Y(d)) \longleftarrow \Gamma(Y, \mathcal{O}_Y(d)) \end{array}$$

is commutative.

- (2) For any $f \in A_+$ homogeneous we have $r_\psi^{-1}(D_+(f)) = D_+(\psi(f))$ and the restriction of r_ψ to $D_+(\psi(f))$ corresponds to the ring map $A_{(f)} \rightarrow B_{(\psi(f))}$ induced by ψ .

Proof. Clearly condition (2) uniquely determines the morphism of schemes and the open subset $U(\psi)$. Pick $f \in A_d$ with $d \geq 1$. Note that $\mathcal{O}_X(n)|_{D_+(f)}$ corresponds to the $A_{(f)}$ -module $(A_f)_n$ and that $\mathcal{O}_Y(n)|_{D_+(\psi(f))}$ corresponds to the $B_{(\psi(f))}$ -module $(B_{\psi(f)})_n$. In other words θ when restricted to $D_+(\psi(f))$ corresponds to a map of \mathbf{Z} -graded $B_{(\psi(f))}$ -algebras

$$A_f \otimes_{A_{(f)}} B_{(\psi(f))} \longrightarrow B_{\psi(f)}$$

Condition (1) determines the images of all elements of A . Since f is an invertible element which is mapped to $\psi(f)$ we see that $1/f^m$ is mapped to $1/\psi(f)^m$. It easily follows from this that θ is uniquely determined, namely it is given by the rule

$$a/f^m \otimes b/\psi(f)^e \longmapsto \psi(a)b/\psi(f)^{m+e}.$$

To show existence we remark that the proof of uniqueness above gave a well defined prescription for the morphism r and the map θ when restricted to every standard open of the form $D_+(\psi(f)) \subset U(\psi)$ into $D_+(f)$. Call these r_f and θ_f . Hence we only need to verify that if $D_+(f) \subset D_+(g)$ for some $f, g \in A_+$ homogeneous, then the restriction of r_g to $D_+(\psi(f))$ matches r_f . This is clear from the formulas given for r and θ above. □

Lemma 26.11.2. *Let A, B , and C be graded rings. Set $X = \text{Proj}(A), Y = \text{Proj}(B)$ and $Z = \text{Proj}(C)$. Let $\varphi : A \rightarrow B, \psi : B \rightarrow C$ be graded ring maps. Then we have*

$$U(\psi \circ \varphi) = r_\varphi^{-1}(U(\psi)) \quad \text{and} \quad r_{\psi \circ \varphi} = r_\varphi \circ r_\psi|_{U(\psi \circ \varphi)}.$$

In addition we have

$$\theta_\psi \circ r_\psi^* \theta_\varphi = \theta_{\psi \circ \varphi}$$

with obvious notation.

Proof. Omitted. □

Lemma 26.11.3. *With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_d \rightarrow B_d$ is surjective for all $d \gg 0$. Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are surjective but not isomorphisms in general (even if $A \rightarrow B$ is surjective).

Proof. Part (1) follows from the definition of $U(\psi)$ and the fact that $D_+(f) = D_+(f^n)$ for any $n > 0$. For $f \in A_+$ homogeneous we see that $A_{(f)} \rightarrow B_{(\psi(f))}$ is surjective because any element of $B_{(\psi(f))}$ can be represented by a fraction $b/\psi(f)^n$ with n arbitrarily large (which forces the degree of $b \in B$ to be large). This proves (2). The same argument shows the map

$$A_f \rightarrow B_{\psi(f)}$$

is surjective which proves the surjectivity of θ . For an example where this map is not an isomorphism consider the graded ring $A = k[x, y]$ where k is a field and $\deg(x) = 1, \deg(y) = 2$. Set $I = (x)$, so that $B = k[y]$. Note that $\mathcal{O}_Y(1) = 0$ in this case. But it is easy to see that $r_\psi^* \mathcal{O}_Y(1)$ is not zero. (There are less silly examples.) □

Lemma 26.11.4. *With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_d \rightarrow B_d$ is an isomorphism for all $d \gg 0$. Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is an isomorphism, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are isomorphisms.

Proof. We have (1) by Lemma 26.11.3. Let $f \in A_+$ be homogeneous. The assumption on ψ implies that $A_f \rightarrow B_f$ is an isomorphism (details omitted). Thus it is clear that r_ψ and θ restrict to isomorphisms over $D_+(f)$. The lemma follows. \square

Lemma 26.11.5. *With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_d \rightarrow B_d$ is surjective for $d \gg 0$ and that A is generated by A_1 over A_0 . Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are isomorphisms.

Proof. By Lemmas 26.11.4 and 26.11.2 we may replace B by the image of $A \rightarrow B$ without changing X or the sheaves $\mathcal{O}_X(n)$. Thus we may assume that $A \rightarrow B$ is surjective. By Lemma 26.11.3 we get (1) and (2) and surjectivity in (3). By Lemma 26.10.3 we see that both $\mathcal{O}_X(n)$ and $\mathcal{O}_Y(n)$ are invertible. Hence θ is an isomorphism. \square

Lemma 26.11.6. *With hypotheses and notation as in Lemma 26.11.1 above. Assume there exists a ring map $R \rightarrow A_0$ and a ring map $R \rightarrow R'$ such that $B = R' \otimes_R A$. Then*

- (1) $U(\psi) = Y$,
- (2) the diagram

$$\begin{array}{ccc}
 Y = \text{Proj}(B) & \xrightarrow{r_\psi} & \text{Proj}(A) = X \\
 \downarrow & & \downarrow \\
 \text{Spec}(R') & \longrightarrow & \text{Spec}(R)
 \end{array}$$

- is a fibre product square, and*
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are isomorphisms.

Proof. This follows immediately by looking at what happens over the standard opens $D_+(f)$ for $f \in A_+$. \square

Lemma 26.11.7. *With hypotheses and notation as in Lemma 26.11.1 above. Assume there exists a $g \in A_0$ such that ψ induces an isomorphism $A_g \rightarrow B$. Then $U(\psi) = Y$, $r_\psi : Y \rightarrow X$ is an open immersion which induces an isomorphism of Y with the inverse image of $D(g) \subset \text{Spec}(A_0)$. Moreover the map θ is an isomorphism.*

Proof. This is a special case of Lemma 26.11.6 above. \square

26.12. Morphisms into Proj

Let S be a graded ring. Let $X = \text{Proj}(S)$ be the homogeneous spectrum of S . Let $d \geq 1$ be an integer. Consider the open subscheme

$$(26.12.0.1) \quad U_d = \bigcup_{f \in S_d} D_+(f) \subset X = \text{Proj}(S)$$

Note that $d|d' \Rightarrow U_d \subset U_{d'}$ and $X = \bigcup_d U_d$. Neither X nor U_d need be quasi-compact, see Algebra, Lemma 10.55.3. Let us write $\mathcal{O}_{U_d}(n) = \mathcal{O}_X(n)|_{U_d}$. By Lemma 26.10.2 we know that $\mathcal{O}_{U_d}(nd)$, $n \in \mathbf{Z}$ is an invertible \mathcal{O}_{U_d} -module and that all the multiplication maps $\mathcal{O}_{U_d}(nd) \otimes_{\mathcal{O}_{U_d}} \mathcal{O}_X(m) \rightarrow \mathcal{O}_{U_d}(nd+m)$ of (26.10.1.1) are isomorphisms. In particular we have $\mathcal{O}_{U_d}(nd) \cong \mathcal{O}_{U_d}(d)^{\otimes n}$. The graded ring map (26.10.1.3) on global sections combined with restriction to U_d give a homomorphism of graded rings

$$(26.12.0.2) \quad \psi^d : S^{(d)} \longrightarrow \Gamma_*(U_d, \mathcal{O}_{U_d}(d)).$$

For the notation $S^{(d)}$, see Algebra, Section 10.54. For the notation Γ_* see Modules, Definition 17.21.4. Moreover, since U_d is covered by the opens $D_+(f)$, $f \in S_d$ we see that $\mathcal{O}_{U_d}(d)$ is globally generated by the sections in the image of $\psi_1^d : S_1^{(d)} = S_d \rightarrow \Gamma(U_d, \mathcal{O}_{U_d}(d))$, see Modules, Definition 17.4.1.

Let Y be a scheme, and let $\varphi : Y \rightarrow X$ be a morphism of schemes. Assume the image $\varphi(Y)$ is contained in the open subscheme U_d of X . By the discussion following Modules, Definition 17.21.4 we obtain a homomorphism of graded rings

$$\Gamma_*(U_d, \mathcal{O}_{U_d}(d)) \longrightarrow \Gamma_*(Y, \varphi^* \mathcal{O}_X(d)).$$

The composition of this and ψ^d gives a graded ring homomorphism

$$(26.12.0.3) \quad \psi_\varphi^d : S^{(d)} \longrightarrow \Gamma_*(Y, \varphi^* \mathcal{O}_X(d))$$

which has the property that the invertible sheaf $\varphi^* \mathcal{O}_X(d)$ is globally generated by the sections in the image of $(S^{(d)})_1 = S_d \rightarrow \Gamma(Y, \varphi^* \mathcal{O}_X(d))$.

Lemma 26.12.1. *Let S be a graded ring, and $X = \text{Proj}(S)$. Let $d \geq 1$ and $U_d \subset X$ as above. Let Y be a scheme. Let \mathcal{L} be an invertible sheaf on Y . Let $\psi : S^{(d)} \rightarrow \Gamma_*(Y, \mathcal{L})$ be a graded ring homomorphism such that \mathcal{L} is generated by the sections in the image of $\psi|_{S_d} : S_d \rightarrow \Gamma(Y, \mathcal{L})$. Then there exists a morphism $\varphi : Y \rightarrow X$ such that $\varphi(Y) \subset U_d$ and an isomorphism $\alpha : \varphi^* \mathcal{O}_{U_d}(d) \rightarrow \mathcal{L}$ such that ψ_φ^d agrees with ψ via α :*

$$\begin{array}{ccccc} \Gamma_*(Y, \mathcal{L}) & \xleftarrow{\alpha} & \Gamma_*(Y, \varphi^* \mathcal{O}_{U_d}(d)) & \xleftarrow{\varphi^*} & \Gamma_*(U_d, \mathcal{O}_{U_d}(d)) \\ \psi \uparrow & & \swarrow \psi_\varphi^d & & \uparrow \psi^d \\ S^{(d)} & \xleftarrow{id} & & & S^{(d)} \end{array}$$

commutes. Moreover, the pair (φ, α) is unique.

Proof. Pick $f \in S_d$. Denote $s = \psi(f) \in \Gamma(Y, \mathcal{L})$. On the open set Y_s where s does not vanish multiplication by s induces an isomorphism $\mathcal{O}_{Y_s} \rightarrow \mathcal{L}|_{Y_s}$, see Modules, Lemma 17.21.7. We will denote the inverse of this map $x \mapsto x/s$, and similarly for powers of \mathcal{L} . Using this we define a ring map $\psi_{(f)} : S_{(f)} \rightarrow \Gamma(Y_s, \mathcal{O})$ by mapping the fraction a/f^n to $\psi(a)/s^n$. By Schemes, Lemma 25.6.4 this corresponds to a morphism $\varphi_f : Y_s \rightarrow \text{Spec}(S_{(f)}) = D_+(f)$. We also introduce the isomorphism $\alpha_f : \varphi_f^* \mathcal{O}_{D_+(f)}(d) \rightarrow \mathcal{L}|_{Y_s}$ which maps the pullback of the trivializing section f over $D_+(f)$ to the trivializing section s over Y_s . With this choice the commutativity of the diagram in the lemma holds with Y replace by Y_s , φ replaced by φ_f , and α replaced by α_f ; verification omitted.

Suppose that $f' \in S_d$ is a second element, and denote $s' = \psi(f') \in \Gamma(Y, \mathcal{L})$. Then $Y_s \cap Y_{s'} = Y_{s s'}$ and similarly $D_+(f) \cap D_+(f') = D_+(ff')$. In Lemma 26.10.6 we saw

that $D_+(f') \cap D_+(f)$ is the same as the set of points of $D_+(f)$ where the section of $\mathcal{O}_X(d)$ defined by f' does not vanish. Hence $\varphi_f^{-1}(D_+(f') \cap D_+(f)) = Y_s \cap Y_{s'} = \varphi_{f'}^{-1}(D_+(f') \cap D_+(f))$. On $D_+(f) \cap D_+(f')$ the fraction f/f' is an invertible section of the structure sheaf with inverse f'/f . Note that $\psi_{(f')}(f/f') = \psi(f)/s' = s/s'$ and $\psi_{(f)}(f'/f) = \psi(f')/s = s'/s$. We claim there is a unique ring map $S_{(ff')} \rightarrow \Gamma(Y_{ss'}, \mathcal{O})$ making the following diagram commute

$$\begin{array}{ccccc} \Gamma(Y_s, \mathcal{O}) & \longrightarrow & \Gamma(Y_{ss'}, \mathcal{O}) & \longleftarrow & \Gamma(Y_{s'}, \mathcal{O}) \\ \psi_{(f)} \uparrow & & \uparrow & & \uparrow \psi_{(f')} \\ S_{(f)} & \longrightarrow & S_{(ff')} & \longleftarrow & S_{(f')} \end{array}$$

It exists because we may use the rule $x/(ff')^n \mapsto \psi(x)/(ss')^n$, which “works” by the formulas above. Uniqueness follows as $\text{Proj}(S)$ is separated, see Lemma 26.8.8 and its proof. This shows that the morphisms φ_f and $\varphi_{f'}$ agree over $Y_s \cap Y_{s'}$. The restrictions of α_f and $\alpha_{f'}$ agree over $Y_s \cap Y_{s'}$, because the regular functions s/s' and $\psi_{(f')}(f)$ agree. This proves that the morphisms ψ_f glue to a global morphism from Y into $U_d \subset X$, and that the maps α_f glue to an isomorphism satisfying the conditions of the lemma.

We still have to show the pair (φ, α) is unique. Suppose (φ', α') is a second such pair. Let $f \in S_d$. By the commutativity of the diagrams in the lemma we have that the inverse images of $D_+(f)$ under both φ and φ' are equal to $Y_{\psi(f)}$. Since the opens $D_+(f)$ are a basis for the topology on X , and since X is a sober topological space (see Schemes, Lemma 25.11.1) this means the maps φ and φ' are the same on underlying topological spaces. Let us use $s = \psi(f)$ to trivialize the invertible sheaf \mathcal{L} over $Y_{\psi(f)}$. By the commutativity of the diagrams we have that $\alpha^{\otimes n}(\psi_\varphi^d(x)) = \psi(x) = (\alpha')^{\otimes n}(\psi_{\varphi'}^d(x))$ for all $x \in S_{nd}$. By construction of ψ_φ^d and $\psi_{\varphi'}^d$, we have $\psi_\varphi^d(x) = \varphi^\sharp(x/f^n)\psi_\varphi^d(f^n)$ over $Y_{\psi(f)}$, and similarly for $\psi_{\varphi'}^d$. By the commutativity of the diagrams of the lemma we deduce that $\varphi^\sharp(x/f^n) = (\varphi')^\sharp(x/f^n)$. This proves that φ and φ' induce the same morphism from $Y_{\psi(f)}$ into the affine scheme $D_+(f) = \text{Spec}(S_{(f)})$. Hence φ and φ' are the same as morphisms. Finally, it remains to show that the commutativity of the diagram of the lemma singles out, given φ , a unique α . We omit the verification. \square

We continue the discussion from above the lemma. Let S be a graded ring. Let Y be a scheme. We will consider *triples* (d, \mathcal{L}, ψ) where

- (1) $d \geq 1$ is an integer,
- (2) \mathcal{L} is an invertible \mathcal{O}_Y -module, and
- (3) $\psi : S^{(d)} \rightarrow \Gamma_*(Y, \mathcal{L})$ is a graded ring homomorphism such that \mathcal{L} is generated by the global sections $\psi(f)$, with $f \in S_d$.

Given a morphism $h : Y' \rightarrow Y$ and a triple (d, \mathcal{L}, ψ) over Y we can pull it back to the triple $(d, h^*\mathcal{L}, h^* \circ \psi)$. Given two triples (d, \mathcal{L}, ψ) and (d, \mathcal{L}', ψ') with the same integer d we say they are *strictly equivalent* if there exists an isomorphism $\beta : \mathcal{L} \rightarrow \mathcal{L}'$ such that $\beta \circ \psi = \psi'$ as graded ring maps $S^{(d)} \rightarrow \Gamma_*(Y, \mathcal{L}')$.

For each integer $d \geq 1$ we define

$$\begin{aligned} F_d : \text{Sch}^{opp} &\longrightarrow \text{Sets}, \\ Y &\longmapsto \{\text{strict equivalence classes of triples } (d, \mathcal{L}, \psi) \text{ as above}\} \end{aligned}$$

with pullbacks as defined above.

Lemma 26.12.2. *Let S be a graded ring. Let $X = \text{Proj}(S)$. The open subscheme $U_d \subset X$ (26.12.0.1) represents the functor F_d and the triple $(d, \mathcal{O}_{U_d}(d), \psi^d)$ defined above is the universal family (see Schemes, Section 25.15).*

Proof. This is a reformulation of Lemma 26.12.1 □

Lemma 26.12.3. *Let S be a graded ring generated as an S_0 -algebra by the elements of S_1 . In this case the scheme $X = \text{Proj}(S)$ represents the functor which associates to a scheme Y the set of pairs (\mathcal{L}, ψ) , where*

- (1) \mathcal{L} is an invertible \mathcal{O}_Y -module, and
- (2) $\psi : S \rightarrow \Gamma_*(Y, \mathcal{L})$ is a graded ring homomorphism such that \mathcal{L} is generated by the global sections $\psi(f)$, with $f \in S_1$

up to strict equivalence as above.

Proof. Under the assumptions of the lemma we have $X = U_1$ and the lemma is a reformulation of Lemma 26.12.2 above. □

We end this section with a discussion of a functor corresponding to $\text{Proj}(S)$ for a general graded ring S . We advise the reader to skip the rest of this section.

Fix an arbitrary graded ring S . Let T be a scheme. We will say two triples (d, \mathcal{L}, ψ) and $(d', \mathcal{L}', \psi')$ over T with possibly different integers d, d' are *equivalent* if there exists an isomorphism $\beta : \mathcal{L}^{\otimes d'} \rightarrow (\mathcal{L}')^{\otimes d}$ of invertible sheaves over T such that $\beta \circ \psi|_{S^{(dd')}}$ and $\psi'|_{S^{(dd')}}$ agree as graded ring maps $S^{(dd')} \rightarrow \Gamma_*(Y, (\mathcal{L}')^{\otimes dd'})$.

Lemma 26.12.4. *Let S be a graded ring. Set $X = \text{Proj}(S)$. Let T be a scheme. Let (d, \mathcal{L}, ψ) and $(d', \mathcal{L}', \psi')$ be two triples over T . The following are equivalent:*

- (1) *Let $n = \text{lcm}(d, d')$. Write $n = ad = a'd'$. There exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{S^{(n)}}$ and $\psi'|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \rightarrow \Gamma_*(Y, (\mathcal{L}')^{\otimes n})$.*
- (2) *The triples (d, \mathcal{L}, ψ) and $(d', \mathcal{L}', \psi')$ are equivalent.*
- (3) *For some positive integer $n = ad = a'd'$ there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{S^{(n)}}$ and $\psi'|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \rightarrow \Gamma_*(Y, (\mathcal{L}')^{\otimes n})$.*
- (4) *The morphisms $\varphi : T \rightarrow X$ and $\varphi' : T \rightarrow X$ associated to (d, \mathcal{L}, ψ) and $(d', \mathcal{L}', \psi')$ are equal.*

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Also (3) implies (4) by the uniqueness statement in Lemma 26.12.1. Thus we have to prove that (4) implies (1). Assume (4), in other words $\varphi = \varphi'$. Note that this implies that we may write $\mathcal{L} = \varphi^* \mathcal{O}_X(d)$ and $\mathcal{L}' = \varphi^* \mathcal{O}_X(d')$. Moreover, via these identifications we have that the graded ring maps ψ and ψ' correspond to the restriction of the canonical graded ring map

$$S \longrightarrow \bigoplus_{n \geq 0} \Gamma(X, \mathcal{O}_X(n))$$

to $S^{(d)}$ and $S^{(d')}$ composed with pullback by φ (by Lemma 26.12.1 again). Hence taking β to be the isomorphism

$$(\varphi^* \mathcal{O}_X(d))^{\otimes a} = \varphi^* \mathcal{O}_X(n) = (\varphi^* \mathcal{O}_X(d'))^{\otimes a'}$$

works. □

Let S be a graded ring. Let $X = \text{Proj}(S)$. Over the open subscheme $U_d \subset X = \text{Proj}(S)$ (26.12.0.1) we have the triple $(d, \mathcal{O}_{U_d}(d), \psi^d)$. Clearly, if $d|d'$ the triples $(d, \mathcal{O}_{U_d}(d), \psi^d)$ and $(d', \mathcal{O}_{U_{d'}}(d'), \psi^{d'})$ are equivalent when restricted to the open U_d (which is a subset of $U_{d'}$). This, combined with Lemma 26.12.1 shows that morphisms $Y \rightarrow X$ correspond roughly to equivalence classes of triples over Y . This is not quite true since if Y is not quasi-compact, then there may not be a single triple which works. Thus we have to be slightly careful in defining the corresponding functor.

Here is one possible way to do this. Suppose $d' = ad$. Consider the transformation of functors $F_d \rightarrow F_{d'}$ which assigns to the triple (d, \mathcal{L}, ψ) over T the triple $(d', \mathcal{L}^{\otimes a}, \psi|_{S(d')})$. One of the implications of Lemma 26.12.4 is that the transformation $F_d \rightarrow F_{d'}$ is injective! For a quasi-compact scheme T we define

$$F(T) = \bigcup_{d \in \mathbf{N}} F_d(T)$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general scheme T we define

$$F(T) = \lim_{V \subset T \text{ quasi-compact open}} F(V).$$

In other words, an element ξ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where V ranges over the quasi-compact opens of T . We omit the definition of the pullback map $F(T) \rightarrow F(T')$ for a morphism $T' \rightarrow T$ of schemes. Thus we have defined our functor

$$F : \text{Sch}^{opp} \longrightarrow \text{Sets}$$

Lemma 26.12.5. *Let S be a graded ring. Let $X = \text{Proj}(S)$. The functor F defined above is representable by the scheme X .*

Proof. We have seen above that the functor F_d corresponds to the open subscheme $U_d \subset X$. Moreover the transformation of functors $F_d \rightarrow F_{d'}$ (if $d|d'$) defined above corresponds to the inclusion morphism $U_d \rightarrow U_{d'}$ (see discussion above). Hence to show that F is represented by X it suffices to show that $T \rightarrow X$ for a quasi-compact scheme T ends up in some U_d , and that for a general scheme T we have

$$\text{Mor}(T, X) = \lim_{V \subset T \text{ quasi-compact open}} \text{Mor}(V, X).$$

These verifications are omitted. □

26.13. Projective space

Projective space is one of the fundamental objects studied in algebraic geometry. In this section we just give its construction as Proj of a polynomial ring. Later we will discover many of its beautiful properties.

Lemma 26.13.1. *Let $S = \mathbf{Z}[T_0, \dots, T_n]$ with $\deg(T_i) = 1$. The scheme*

$$\mathbf{P}_{\mathbf{Z}}^n = \text{Proj}(S)$$

represents the functor which associates to a scheme Y the pairs $(\mathcal{L}, (s_0, \dots, s_n))$ where

- (1) \mathcal{L} is an invertible \mathcal{O}_Y -module, and
- (2) s_0, \dots, s_n are global sections of \mathcal{L} which generate \mathcal{L}

up to the following equivalence: $(\mathcal{L}, (s_0, \dots, s_n)) \sim (\mathcal{N}, (t_0, \dots, t_n)) \Leftrightarrow$ there exists an isomorphism $\beta : \mathcal{L} \rightarrow \mathcal{N}$ with $\beta(s_i) = t_i$ for $i = 0, \dots, n$.

Proof. This is a special case of Lemma 26.12.3 above. Namely, for any graded ring A we have

$$\begin{aligned} \text{Mor}_{\text{graded rings}}(\mathbf{Z}[T_0, \dots, T_n], A) &= A_1 \times \dots \times A_1 \\ \psi &\mapsto (\psi(T_0), \dots, \psi(T_n)) \end{aligned}$$

and the degree 1 part of $\Gamma_*(Y, \mathcal{L})$ is just $\Gamma(Y, \mathcal{L})$. □

Definition 26.13.2. The scheme $\mathbf{P}_{\mathbf{Z}}^n = \text{Proj}(\mathbf{Z}[T_0, \dots, T_n])$ is called *projective n -space over \mathbf{Z}* . Its base change \mathbf{P}_S^n to a scheme S is called *projective n -space over S* . If R is a ring the base change to $\text{Spec}(R)$ is denoted \mathbf{P}_R^n and called *projective n -space over R* .

Given a scheme Y over S and a pair $(\mathcal{L}, (s_0, \dots, s_n))$ as in Lemma 26.13.1 the induced morphism to \mathbf{P}_S^n is denoted

$$\varphi_{(\mathcal{L}, (s_0, \dots, s_n))} : Y \rightarrow \mathbf{P}_S^n$$

This makes sense since the pair defines a morphism into $\mathbf{P}_{\mathbf{Z}}^n$ and we already have the structure morphism into S so combined we get a morphism into $\mathbf{P}_S^n = \mathbf{P}_{\mathbf{Z}}^n \times S$. Note that this is the S -morphism characterized by

$$\mathcal{L} = \varphi_{(\mathcal{L}, (s_0, \dots, s_n))}^* \mathcal{O}_{\mathbf{P}_R^n}(1) \quad \text{and} \quad s_i = \varphi_{(\mathcal{L}, (s_0, \dots, s_n))}^* T_i$$

where we think of T_i as a global section of $\mathcal{O}_{\mathbf{P}_{\mathbf{Z}}^n}(1)$ via (26.10.1.3).

Lemma 26.13.3. *Projective n -space over \mathbf{Z} is covered by $n + 1$ standard opens*

$$\mathbf{P}_{\mathbf{Z}}^n = \bigcup_{i=0, \dots, n} D_+(T_i)$$

where each $D_+(T_i)$ is isomorphic to $\mathbf{A}_{\mathbf{Z}}^n$ affine n -space over \mathbf{Z} .

Proof. This is true because $\mathbf{Z}[T_0, \dots, T_n]_+ = (T_0, \dots, T_n)$ and since

$$\text{Spec} \left(\mathbf{Z} \left[\frac{T_0}{T_i}, \dots, \frac{T_n}{T_i} \right] \right) \cong \mathbf{A}_{\mathbf{Z}}^n$$

in an obvious way. □

Lemma 26.13.4. *Let S be a scheme. The structure morphism $\mathbf{P}_S^n \rightarrow S$ is*

- (1) *separated,*
- (2) *quasi-compact,*
- (3) *satisfies the existence and uniqueness parts of the valuative criterion, and*
- (4) *universally closed.*

Proof. All these properties are stable under base change (this is clear for the last two and for the other two see Schemes, Lemmas 25.21.13 and 25.19.3). Hence it suffices to prove them for the morphism $\mathbf{P}_{\mathbf{Z}}^n \rightarrow \text{Spec}(\mathbf{Z})$. Separatedness is Lemma 26.8.8. Quasi-compactness follows from Lemma 26.13.3. Existence and uniqueness of the valuative criterion follow from Lemma 26.8.11. Universally closed follows from the above and Schemes, Proposition 25.20.6. □

Remark 26.13.5. What’s missing in the list of properties above? Well to be sure the property of being of finite type. The reason we do not list this here is that we have not yet defined the notion of finite type at this point. (Another property which is missing is “smoothness”. And I’m sure there are many more you can think of.)

We finish this section with two simple lemmas. These lemmas are special cases of more general results later, but perhaps it makes sense to prove these directly here now.

Lemma 26.13.6. *Let R be a ring. Let $Z \subset \mathbf{P}_R^n$ be a closed subscheme. Let*

$$I_d = \text{Ker} (R[T_0, \dots, T_n]_d \longrightarrow \Gamma(Z, \mathcal{O}_{\mathbf{P}_R^n}(d)|_Z))$$

Then $I = \bigoplus I_d \subset R[T_0, \dots, T_n]$ is a graded ideal and $Z = \text{Proj}(R[T_0, \dots, T_n]/I)$.

Proof. It is clear that I is a graded ideal. Set $Z' = \text{Proj}(R[T_0, \dots, T_n]/I)$. By Lemma 26.11.5 we see that Z' is a closed subscheme of \mathbf{P}_R^n . To see the equality $Z = Z'$ it suffices to check on an standard affine open $D_+(T_i)$. By renumbering the homogeneous coordinates we may assume $i = 0$. Say $Z \cap D_+(T_0)$, resp. $Z' \cap D_+(T_0)$ is cut out by the ideal J , resp. J' of $R[T_1/T_0, \dots, T_n/T_0]$. Then J' is the ideal generated by the elements $F/T_0^{\deg(F)}$ where $F \in I$ is homogeneous. Suppose the degree of $F \in I$ is d . Since F vanishes as a section of $\mathcal{O}_{\mathbf{P}_R^n}(d)$ restricted to Z we see that F/T_0^d is an element of J . Thus $J' \subset J$.

Conversely, suppose that $f \in J$. If f has total degree d in $T_1/T_0, \dots, T_n/T_0$, then we can write $f = F/T_0^d$ for some $F \in R[T_0, \dots, T_n]_d$. Pick $i \in \{1, \dots, n\}$. Then $Z \cap D_+(T_i)$ is cut out by some ideal $J_i \subset R[T_0/T_i, \dots, T_n/T_i]$. Moreover,

$$J \cdot R \left[\frac{T_1}{T_0}, \dots, \frac{T_n}{T_0}, \frac{T_0}{T_i}, \dots, \frac{T_n}{T_i} \right] = J_i \cdot R \left[\frac{T_1}{T_0}, \dots, \frac{T_n}{T_0}, \frac{T_0}{T_i}, \dots, \frac{T_n}{T_i} \right]$$

The left hand side is the localization of J with respect to the element T_i/T_0 and the right hand side is the localization of J_i with respect to the element T_0/T_i . It follows that $T_0^{d_i} F/T_i^{d+d_i}$ is an element of J_i for some d_i sufficiently large. This proves that $T_0^{\max(d_i)} F$ is an element of I , because its restriction to each standard affine open $D_+(T_i)$ vanishes on the closed subscheme $Z \cap D_+(T_i)$. Hence $f \in J'$ and we conclude $J \subset J'$ as desired. \square

The following lemma is a special case of the more general Properties, Lemma 27.26.3.

Lemma 26.13.7. *Let R be a ring. Let \mathcal{F} be a quasi-coherent sheaf on \mathbf{P}_R^n . For $d \geq 0$ set*

$$M_d = \Gamma(\mathbf{P}_R^n, \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}_R^n}} \mathcal{O}_{\mathbf{P}_R^n}(d)) = \Gamma(\mathbf{P}_R^n, \mathcal{F}(d))$$

Then $M = \bigoplus_{d \geq 0} M_d$ is a graded $R[T_0, \dots, T_n]$ -module and there is a canonical isomorphism $\mathcal{F} = \widetilde{M}$.

Proof. The multiplication maps

$$R[T_0, \dots, T_n]_e \times M_d \longrightarrow M_{d+e}$$

come from the natural isomorphisms

$$\mathcal{O}_{\mathbf{P}_R^n}(e) \otimes_{\mathcal{O}_{\mathbf{P}_R^n}} \mathcal{F}(d) \longrightarrow \mathcal{F}(e+d)$$

see Equation (26.10.1.4). Let us construct the map $c : \widetilde{M} \rightarrow \mathcal{F}$. On each of the standard affines $U_i = D_+(T_i)$ we see that $\Gamma(U_i, \widetilde{M}) = (M[1/T_i])_0$ where the subscript $_0$ means degree 0 part. An element of this can be written as m/T_i^d with $m \in M_d$. Since T_i is a generator of $\mathcal{O}(1)$ over U_i we can always write $m|_{U_i} = m_i \otimes T_i^d$ where $m_i \in \Gamma(U_i, \mathcal{F})$ is a unique section. Thus a natural guess is $c(m/T_i^d) = m_i$. A small argument, which is omitted here, shows that this gives a well defined map $c : \widetilde{M} \rightarrow \mathcal{F}$ if we can show that

$$(T_i/T_j)^d m_i|_{U_i \cap U_j} = m_j|_{U_i \cap U_j}$$

in $M[1/T_i T_j]$. But this is clear since on the overlap the generators T_i and T_j of $\mathcal{O}(1)$ differ by the invertible function T_i/T_j .

Injectivity of c . We may check for injectivity over the affine opens U_i . Let $i \in \{0, \dots, n\}$ and let s be an element $s = m/T_i^d \in \Gamma(U_i, \widetilde{M})$ such that $c(m/T_i^d) = 0$. By the description of c above this means that $m_i = 0$, hence $m|_{U_i} = 0$. Hence $T_i^e m = 0$ in M for some e . Hence $s = m/T_i^d = T_i^e/T_i^{e+d} = 0$ as desired.

Surjectivity of c . We may check for surjectivity over the affine opens U_i . By renumbering it suffices to check it over U_0 . Let $s \in \mathcal{F}(U_0)$. Let us write $\mathcal{F}|_{U_i} = \widetilde{N}_i$ for some $R[T_0/T_i, \dots, T_0/T_i]$ -module N_i , which is possible because \mathcal{F} is quasi-coherent. So s corresponds to an element $x \in N_0$. Then we have that

$$(N_i)_{T_j/T_i} \cong (N_j)_{T_i/T_j}$$

(where the subscripts mean “principal localization at”) as modules over the ring

$$R \left[\frac{T_0}{T_i}, \dots, \frac{T_n}{T_i}, \frac{T_0}{T_j}, \dots, \frac{T_n}{T_j} \right].$$

This means that for some large integer d there exist elements $s_i \in N_i, i = 1, \dots, n$ such that

$$s = (T_i/T_0)^d s_i$$

on $U_0 \cap U_i$. Next, we look at the difference

$$t_{ij} = s_i - (T_j/T_i)^d s_j$$

on $U_i \cap U_j, 0 < i < j$. By our choice of s_i we know that $t_{ij}|_{U_0 \cap U_i \cap U_j} = 0$. Hence there exists a large integer e such that $(T_0/T_i)^e t_{ij} = 0$. Set $s'_i = (T_0/T_i)^e s_i$, and $s'_0 = s$. Then we will have

$$s'_a = (T_b/T_a)^{e+d} s'_b$$

on $U_a \cap U_b$ for all a, b . This is exactly the condition that the elements s'_a glue to a global section $m \in \Gamma(\mathbf{P}^n_R, \mathcal{F}(e+d))$. And moreover $c(m/T_0^{e+d}) = s$ by construction. Hence c is surjective and we win. □

26.14. Invertible sheaves and morphisms into Proj

Let T be a scheme and let \mathcal{L} be an invertible sheaf on T . For a section $s \in \Gamma(T, \mathcal{L})$ we denote T_s the open subset of points where s does not vanish. See Modules, Lemma 17.21.7. We can view the following lemma as a slight generalization of Lemma 26.12.3. It also is a generalization of Lemma 26.11.1.

Lemma 26.14.1. *Let A be a graded ring. Set $X = \text{Proj}(A)$. Let T be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_T -module. Let $\psi : A \rightarrow \Gamma_*(T, \mathcal{L})$ be a homomorphism of graded rings. Set*

$$U(\psi) = \bigcup_{f \in A_+ \text{ homogeneous}} T_{\psi(f)}$$

The morphism ψ induces a canonical morphism of schemes

$$r_{\mathcal{L}, \psi} : U(\psi) \longrightarrow X$$

together with a map of \mathbf{Z} -graded \mathcal{O}_T -algebras

$$\theta : r_{\mathcal{L}, \psi}^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_X(d) \right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{L}^{\otimes d}|_{U(\psi)}.$$

The triple $(U(\psi), r_{\mathcal{L}, \psi}, \theta)$ is characterized by the following properties:

- (1) *For $f \in A_+$ homogeneous we have $r_{\mathcal{L}, \psi}^{-1}(D_+(f)) = T_{\psi(f)}$.*
- (2) *For every $d \geq 0$ the diagram*

$$\begin{array}{ccc} A_d & \xrightarrow{\psi} & \Gamma(T, \mathcal{L}^{\otimes d}) \\ \downarrow (26.10.1.3) & & \downarrow \text{restrict} \\ \Gamma(X, \mathcal{O}_X(d)) & \xrightarrow{\theta} & \Gamma(U(\psi), \mathcal{L}^{\otimes d}) \end{array}$$

is commutative.

Moreover, for any $d \geq 1$ and any open subscheme $V \subset T$ such that the sections in $\psi(A_d)$ generate $\mathcal{L}^{\otimes d}|_V$ the morphism $r_{\mathcal{L}, \psi}|_V$ agrees with the morphism $\varphi : V \rightarrow \text{Proj}(A)$ and the map $\theta|_V$ agrees with the map $\alpha : \varphi^ \mathcal{O}_X(d) \rightarrow \mathcal{L}^{\otimes d}|_V$ where (φ, α) is the pair of Lemma 26.12.1 associated to $\psi|_{A^{(d)}} : A^{(d)} \rightarrow \Gamma_*(V, \mathcal{L}^{\otimes d})$.*

Proof. Suppose that we have two triples $(U, r : U \rightarrow X, \theta)$ and $(U', r' : U' \rightarrow X, \theta')$ satisfying (1) and (2). Property (1) implies that $U = U' = U(\psi)$ and that $r = r'$ as maps of underlying topological spaces, since the opens $D_+(f)$ form a basis for the topology on X , and since X is a sober topological space (see Algebra, Section 10.55 and Schemes, Lemma 25.11.1). Let $f \in A_+$ be homogeneous. Note that $\Gamma(D_+(f), \bigoplus_{n \in \mathbf{Z}} \mathcal{O}_X(n)) = A_f$ as a \mathbf{Z} -graded algebra. Consider the two \mathbf{Z} -graded ring maps

$$\theta, \theta' : A_f \longrightarrow \Gamma(T_{\psi(f)}, \bigoplus \mathcal{L}^{\otimes n}).$$

We know that multiplication by f (resp. $\psi(f)$) is an isomorphism on the left (resp. right) hand side. We also know that $\theta(x/1) = \theta'(x/1) = \psi(x)|_{T_{\psi(f)}}$ by (2) for all $x \in A$. Hence we deduce easily that $\theta = \theta'$ as desired. Considering the degree 0 parts we deduce that $r^\# = (r')^\#$, i.e., that $r = r'$ as morphisms of schemes. This proves the uniqueness.

Now we come to existence. By the uniqueness just proved, it is enough to construct the pair (r, θ) locally on T . Hence we may assume that $T = \text{Spec}(R)$ is affine, that $\mathcal{L} = \mathcal{O}_T$ and that for some $f \in A_+$ homogeneous we have $\psi(f)$ generates $\mathcal{O}_T = \mathcal{O}_T^{\otimes \deg(f)}$. In other words, $\psi(f) = u \in R^*$ is a unit. In this case the map ψ is a graded ring map

$$A \longrightarrow R[x] = \Gamma_*(T, \mathcal{O}_T)$$

which maps f to $ux^{\deg(f)}$. Clearly this extends (uniquely) to a \mathbf{Z} -graded ring map $\theta : A_f \rightarrow R[x, x^{-1}]$ by mapping $1/f$ to $u^{-1}x^{-\deg(f)}$. This map in degree zero gives

the ring map $A_{(f)} \rightarrow R$ which gives the morphism $r : T = \text{Spec}(R) \rightarrow \text{Spec}(A_{(f)}) = D_+(f) \subset X$. Hence we have constructed (r, θ) in this special case.

Let us show the last statement of the lemma. According to Lemma 26.12.1 the morphism constructed there is the unique one such that the displayed diagram in its statement commutes. The commutativity of the diagram in the lemma implies the commutativity when restricted to V and $A^{(d)}$. Whence the result. \square

Remark 26.14.2. Assumptions as in Lemma 26.14.1 above. The image of the morphism $r_{\mathcal{L}, \psi}$ need not be contained in the locus where the sheaf $\mathcal{O}_X(1)$ is invertible. Here is an example. Let k be a field. Let $S = k[A, B, C]$ graded by $\deg(A) = 1, \deg(B) = 2, \deg(C) = 3$. Set $X = \text{Proj}(S)$. Let $T = \mathbf{P}_k^2 = \text{Proj}(k[X_0, X_1, X_2])$. Recall that $\mathcal{L} = \mathcal{O}_T(1)$ is invertible and that $\mathcal{O}_T(n) = \mathcal{L}^{\otimes n}$. Consider the composition ψ of the maps

$$S \rightarrow k[X_0, X_1, X_2] \rightarrow \Gamma_*(T, \mathcal{L}).$$

Here the first map is $A \mapsto X_0^6, B \mapsto X_1^3, C \mapsto X_2^3$ and the second map is (26.10.1.3). By the lemma this corresponds to a morphism $r_{\mathcal{L}, \psi} : T \rightarrow X = \text{Proj}(S)$ which is easily seen to be surjective. On the other hand, in Remark 26.9.2 we showed that the sheaf $\mathcal{O}_X(1)$ is not invertible at all points of X .

26.15. Relative Proj via glueing

Situation 26.15.1. Here S is a scheme, and \mathcal{A} is a quasi-coherent graded \mathcal{O}_S -algebra.

In this section we outline how to construct a morphism of schemes

$$\underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow S$$

by glueing the homogeneous spectra $\text{Proj}(\Gamma(U, \mathcal{A}))$ where U ranges over the affine opens of S . We first show that the homogeneous spectra of the values of \mathcal{A} over affines form a suitable collection of schemes, as in Lemma 26.2.1.

Lemma 26.15.2. *In Situation 26.15.1. Suppose $U \subset U' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$ and $A' = \mathcal{A}(U')$. The map of graded rings $A' \rightarrow A$ induces a morphism $r : \text{Proj}(A) \rightarrow \text{Proj}(A')$, and the diagram*

$$\begin{array}{ccc} \text{Proj}(A) & \longrightarrow & \text{Proj}(A') \\ \downarrow & & \downarrow \\ U & \longrightarrow & U' \end{array}$$

is cartesian. Moreover there are canonical isomorphisms $\theta : r^ \mathcal{O}_{\text{Proj}(A')}(n) \rightarrow \mathcal{O}_{\text{Proj}(A)}(n)$ compatible with multiplication maps.*

Proof. Let $R = \mathcal{O}_S(U)$ and $R' = \mathcal{O}_S(U')$. Note that the map $R \otimes_{R'} A' \rightarrow A$ is an isomorphism as \mathcal{A} is quasi-coherent (see Schemes, Lemma 25.7.3 for example). Hence the lemma follows from Lemma 26.11.6. \square

In particular the morphism $\text{Proj}(A) \rightarrow \text{Proj}(A')$ of the lemma is an open immersion.

Lemma 26.15.3. *In Situation 26.15.1. Suppose $U \subset U' \subset U'' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$, $A' = \mathcal{A}(U')$ and $A'' = \mathcal{A}(U'')$. The composition of the morphisms $r : \text{Proj}(A) \rightarrow \text{Proj}(A')$, and $r' : \text{Proj}(A') \rightarrow \text{Proj}(A'')$ of Lemma*

26.15.2 gives the morphism $r'' : \text{Proj}(A) \rightarrow \text{Proj}(A'')$ of Lemma 26.15.2. A similar statement holds for the isomorphisms θ .

Proof. This follows from Lemma 26.11.2 since the map $A'' \rightarrow A$ is the composition of $A'' \rightarrow A'$ and $A' \rightarrow A$. \square

Lemma 26.15.4. *In Situation 26.15.1. There exists a morphism of schemes*

$$\pi : \underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow S$$

with the following properties:

- (1) for every affine open $U \subset S$ there exists an isomorphism $i_U : \pi^{-1}(U) \rightarrow \text{Proj}(A)$ with $A = \mathcal{A}(U)$, and
- (2) for $U \subset U' \subset S$ affine open the composition

$$\text{Proj}(A) \xrightarrow{i_U^{-1}} \pi^{-1}(U) \xrightarrow{\text{inclusion}} \pi^{-1}(U') \xrightarrow{i_{U'}} \text{Proj}(A')$$

with $A = \mathcal{A}(U)$, $A' = \mathcal{A}(U')$ is the open immersion of Lemma 26.15.2 above.

Proof. Follows immediately from Lemmas 26.2.1, 26.15.2, and 26.15.3. \square

Lemma 26.15.5. *In Situation 26.15.1. The morphism $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ of Lemma 26.15.4 comes with the following additional structure. There exists a quasi-coherent \mathbf{Z} -graded sheaf of $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}$ -algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$, and a morphism of graded \mathcal{O}_S -algebras*

$$\psi : \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \pi_* \left(\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n) \right)$$

uniquely determined by the following property: For every affine open $U \subset S$ with $A = \mathcal{A}(U)$ there is an isomorphism

$$\theta_U : i_U^* \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\text{Proj}(A)}(n) \right) \longrightarrow \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n) \right) |_{\pi^{-1}(U)}$$

of \mathbf{Z} -graded $\mathcal{O}_{\pi^{-1}(U)}$ -algebras such that

$$\begin{array}{ccc} A_n & \xrightarrow{\psi} & \Gamma(\pi^{-1}(U), \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)) \\ & \searrow (26.10.1.3) & \nearrow \theta_U \\ & & \Gamma(\text{Proj}(A), \mathcal{O}_{\text{Proj}(A)}(n)) \end{array}$$

is commutative.

Proof. We are going to use Lemma 26.2.2 to glue the sheaves of \mathbf{Z} -graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\text{Proj}(A)}(n)$ for $A = \mathcal{A}(U)$, $U \subset S$ affine open over the scheme $\underline{\text{Proj}}_S(\mathcal{A})$. We have constructed the data necessary for this in Lemma 26.15.2 and we have checked condition (d) of Lemma 26.2.2 in Lemma 26.15.3. Hence we get the sheaf of \mathbf{Z} -graded $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}$ -algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$ together with the isomorphisms θ_U for all $U \subset S$ affine open and all $n \in \mathbf{Z}$. For every affine open $U \subset S$ with $A = \mathcal{A}(U)$ we have a map $A \rightarrow \Gamma(\text{Proj}(A), \bigoplus_{n \geq 0} \mathcal{O}_{\text{Proj}(A)}(n))$. Hence the map ψ exists by functoriality of relative glueing, see Remark 26.2.3. The diagram of the lemma commutes by construction. This characterizes the sheaf of \mathbf{Z} -graded $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}$ -algebras $\bigoplus \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$ because the proof of Lemma 26.11.1 shows that

having these diagrams commute uniquely determines the maps θ_U . Some details omitted. \square

26.16. Relative Proj as a functor

We place ourselves in Situation 26.15.1. So S is a scheme and $\mathcal{A} = \bigoplus_{d \geq 0} \mathcal{A}_d$ is a quasi-coherent graded \mathcal{O}_S -algebra. In this section we relativize the construction of Proj by constructing a functor which the relative homogeneous spectrum will represent. As a result we will construct a morphism of schemes

$$\underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow S$$

which above affine opens of S will look like the homogeneous spectrum of a graded ring. The discussion will be modeled after our discussion of the relative spectrum in Section 26.4. The easier method using glueing schemes of the form $\text{Proj}(A)$, $A = \Gamma(U, \mathcal{A})$, $U \subset S$ affine open, is explained in Section 26.15, and the result in this section will be shown to be isomorphic to that one.

Fix for the moment an integer $d \geq 1$. We denote $\mathcal{A}^{(d)} = \bigoplus_{n \geq 0} \mathcal{A}_{nd}$ similarly to the notation in Algebra, Section 10.54. Let T be a scheme. Let us consider *quadruples* $(d, f : T \rightarrow S, \mathcal{L}, \psi)$ over T where

- (1) d is the integer we fixed above,
- (2) $f : T \rightarrow S$ is a morphism of schemes,
- (3) \mathcal{L} is an invertible \mathcal{O}_T -module, and
- (4) $\psi : f^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a homomorphism of graded \mathcal{O}_T -algebras such that $f^* \mathcal{A}_d \rightarrow \mathcal{L}$ is surjective.

Given a morphism $h : T' \rightarrow T$ and a quadruple $(d, f, \mathcal{L}, \psi)$ over T we can pull it back to the quadruple $(d, f \circ h, h^* \mathcal{L}, h^* \psi)$ over T' . Given two quadruples $(d, f, \mathcal{L}, \psi)$ and $(d, f', \mathcal{L}', \psi')$ over T with the same integer d we say they are *strictly equivalent* if $f = f'$ and there exists an isomorphism $\beta : \mathcal{L} \rightarrow \mathcal{L}'$ such that $\beta \circ \psi = \psi'$ as graded \mathcal{O}_T -algebra maps $f^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes n}$.

For each integer $d \geq 1$ we define

$$\begin{aligned} F_d : \text{Sch}^{opp} &\longrightarrow \text{Sets}, \\ T &\longmapsto \{\text{strict equivalence classes of } (d, f : T \rightarrow S, \mathcal{L}, \psi) \text{ as above}\} \end{aligned}$$

with pullbacks as defined above.

Lemma 26.16.1. *In Situation 26.15.1. Let $d \geq 1$. Let F_d be the functor associated to (S, \mathcal{A}) above. Let $g : S' \rightarrow S$ be a morphism of schemes. Set $\mathcal{A}' = g^* \mathcal{A}$. Let F'_d be the functor associated to (S', \mathcal{A}') above. Then there is a canonical isomorphism*

$$F'_d \cong h_{S'} \times_{h_S} F_d$$

of functors.

Proof. A quadruple $(d, f' : T \rightarrow S', \mathcal{L}', \psi' : (f')^*(\mathcal{A}')^{(d)} \rightarrow \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes n})$ is the same as a quadruple $(d, f, \mathcal{L}, \psi : f^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n})$ together with a factorization of f as $f = g \circ f'$. Namely, the correspondence is $f = g \circ f'$, $\mathcal{L} = \mathcal{L}'$ and $\psi = \psi'$ via the identifications $(f')^*(\mathcal{A}')^{(d)} = (f')^* g^*(\mathcal{A}^{(d)}) = f^* \mathcal{A}^{(d)}$. Hence the lemma. \square

Lemma 26.16.2. *In Situation 26.15.1. Let F_d be the functor associated to (d, S, \mathcal{A}) above. If S is affine, then F_d is representable by the open subscheme U_d (26.12.0.1) of the scheme $\text{Proj}(\Gamma(S, \mathcal{A}))$.*

Proof. Write $S = \text{Spec}(R)$ and $A = \Gamma(S, \mathcal{A})$. Then A is a graded R -algebra and $\mathcal{A} = \widetilde{A}$. To prove the lemma we have to identify the functor F_d with the functor F_d^{triples} of triples defined in Section 26.12.

Let $(d, f : T \rightarrow S, \mathcal{L}, \psi)$ be a quadruple. We may think of ψ as a \mathcal{O}_S -module map $\mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} f_* \mathcal{L}^{\otimes n}$. Since $\mathcal{A}^{(d)}$ is quasi-coherent this is the same thing as an R -linear homomorphism of graded rings $A^{(d)} \rightarrow \Gamma(S, \bigoplus_{n \geq 0} f_* \mathcal{L}^{\otimes n})$. Clearly, $\Gamma(S, \bigoplus_{n \geq 0} f_* \mathcal{L}^{\otimes n}) = \Gamma_*(T, \mathcal{L})$. Thus we may associate to the quadruple the triple (d, \mathcal{L}, ψ) .

Conversely, let (d, \mathcal{L}, ψ) be a triple. The composition $R \rightarrow A_0 \rightarrow \Gamma(T, \mathcal{O}_T)$ determines a morphism $f : T \rightarrow S = \text{Spec}(R)$, see Schemes, Lemma 25.6.4. With this choice of f the map $A^{(d)} \rightarrow \Gamma(S, \bigoplus_{n \geq 0} f_* \mathcal{L}^{\otimes n})$ is R -linear, and hence corresponds to a ψ which we can use for a quadruple $(d, f : T \rightarrow S, \mathcal{L}, \psi)$. We omit the verification that this establishes an isomorphism of functors $F_d = F_d^{\text{triples}}$. \square

Lemma 26.16.3. *In Situation 26.15.1. The functor F_d is representable by a scheme.*

Proof. We are going to use Schemes, Lemma 25.15.4.

First we check that F_d satisfies the sheaf property for the Zariski topology. Namely, suppose that T is a scheme, that $T = \bigcup_{i \in I} U_i$ is an open covering, and that $(d, f_i, \mathcal{L}_i, \psi_i) \in F_d(U_i)$ such that $(d, f_i, \mathcal{L}_i, \psi_i)|_{U_i \cap U_j}$ and $(d, f_j, \mathcal{L}_j, \psi_j)|_{U_i \cap U_j}$ are strictly equivalent. This implies that the morphisms $f_i : U_i \rightarrow S$ glue to a morphism of schemes $f : T \rightarrow S$ such that $f|_{U_i} = f_i$, see Schemes, Section 25.14. Thus $f_i^* \mathcal{A}^{(d)} = f^* \mathcal{A}^{(d)}|_{U_i}$. It also implies there exist isomorphisms $\beta_{ij} : \mathcal{L}_i|_{U_i \cap U_j} \rightarrow \mathcal{L}_j|_{U_i \cap U_j}$ such that $\beta_{ij} \circ \psi_i = \psi_j$ on $U_i \cap U_j$. Note that the isomorphisms β_{ij} are uniquely determined by this requirement because the maps $f_i^* \mathcal{A}_d \rightarrow \mathcal{L}_i$ are surjective. In particular we see that $\beta_{jk} \circ \beta_{ij} = \beta_{ik}$ on $U_i \cap U_j \cap U_k$. Hence by Sheaves, Section 6.33 the invertible sheaves \mathcal{L}_i glue to an invertible \mathcal{O}_T -module \mathcal{L} and the morphisms ψ_i glue to morphism of \mathcal{O}_T -algebras $\psi : f^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$. This proves that F_d satisfies the sheaf condition with respect to the Zariski topology.

Let $S = \bigcup_{i \in I} U_i$ be an affine open covering. Let $F_{d,i} \subset F_d$ be the subfunctor consisting of those pairs $(f : T \rightarrow S, \varphi)$ such that $f(T) \subset U_i$.

We have to show each $F_{d,i}$ is representable. This is the case because $F_{d,i}$ is identified with the functor associated to U_i equipped with the quasi-coherent graded \mathcal{O}_{U_i} -algebra $\mathcal{A}|_{U_i}$ by Lemma 26.16.1. Thus the result follows from Lemma 26.16.2.

Next we show that $F_{d,i} \subset F_d$ is representable by open immersions. Let $(f : T \rightarrow S, \varphi) \in F_d(T)$. Consider $V_i = f^{-1}(U_i)$. It follows from the definition of $F_{d,i}$ that given $a : T' \rightarrow T$ we gave $a^*(f, \varphi) \in F_{d,i}(T')$ if and only if $a(T') \subset V_i$. This is what we were required to show.

Finally, we have to show that the collection $(F_{d,i})_{i \in I}$ covers F_d . Let $(f : T \rightarrow S, \varphi) \in F_d(T)$. Consider $V_i = f^{-1}(U_i)$. Since $S = \bigcup_{i \in I} U_i$ is an open covering of S we see that $T = \bigcup_{i \in I} V_i$ is an open covering of T . Moreover $(f, \varphi)|_{V_i} \in F_{d,i}(V_i)$. This finishes the proof of the lemma. \square

At this point we can redo the material at the end of Section 26.12 in the current relative setting and define a functor which is representable by $\text{Proj}_S(\mathcal{A})$. To do this we introduce the notion of equivalence between two quadruples $(d, f : T \rightarrow S, \mathcal{L}, \psi)$

and $(d', f' : T \rightarrow S, \mathcal{L}', \psi')$ with possibly different values of the integers d, d' . Namely, we say these are *equivalent* if $f = f'$, and there exists an isomorphism $\beta : \mathcal{L}^{\otimes d'} \rightarrow (\mathcal{L}')^{\otimes d}$ such that $\beta \circ \psi|_{f^* \mathcal{A}(dd')} = \psi'|_{f^* \mathcal{A}(dd')}$. The following lemma implies that this defines an equivalence relation. (This is not a complete triviality.)

Lemma 26.16.4. *In Situation 26.15.1. Let T be a scheme. Let $(d, f, \mathcal{L}, \psi)$, $(d', f', \mathcal{L}', \psi')$ be two quadruples over T . The following are equivalent:*

- (1) *Let $m = \text{lcm}(d, d')$. Write $m = ad = a'd'$. We have $f = f'$ and there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{f^* \mathcal{A}^{(m)}}$ and $\psi'|_{f^* \mathcal{A}^{(m)}}$ agree as graded ring maps $f^* \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes mn}$.*
- (2) *The quadruples $(d, f, \mathcal{L}, \psi)$ and $(d', f', \mathcal{L}', \psi')$ are equivalent.*
- (3) *We have $f = f'$ and for some positive integer $m = ad = a'd'$ there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{f^* \mathcal{A}^{(m)}}$ and $\psi'|_{f^* \mathcal{A}^{(m)}}$ agree as graded ring maps $f^* \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes mn}$.*

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Assume (3) for some integer $m = ad = a'd'$. Let $m_0 = \text{lcm}(d, d')$ and write it as $m_0 = a_0 d = a'_0 d'$. We are given an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property described in (3). We want to find an isomorphism $\beta_0 : \mathcal{L}^{\otimes a_0} \rightarrow (\mathcal{L}')^{\otimes a'_0}$ having that property as well. Since by assumption the maps $\psi : f^* \mathcal{A}_d \rightarrow \mathcal{L}$ and $\psi' : (f')^* \mathcal{A}_{d'} \rightarrow \mathcal{L}'$ are surjective the same is true for the maps $\psi : f^* \mathcal{A}_{m_0} \rightarrow \mathcal{L}^{\otimes a_0}$ and $\psi' : (f')^* \mathcal{A}_{m_0} \rightarrow (\mathcal{L}')^{\otimes a'_0}$. Hence if β_0 exists it is uniquely determined by the condition that $\beta_0 \circ \psi = \psi'$. This means that we may work locally on T . Hence we may assume that $f = f' : T \rightarrow S$ maps into an affine open, in other words we may assume that S is affine. In this case the result follows from the corresponding result for triples (see Lemma 26.12.4) and the fact that triples and quadruples correspond in the affine base case (see proof of Lemma 26.16.2). □

Suppose $d' = ad$. Consider the transformation of functors $F_d \rightarrow F_{d'}$ which assigns to the quadruple $(d, f, \mathcal{L}, \psi)$ over T the quadruple $(d', f, \mathcal{L}^{\otimes a}, \psi|_{f^* \mathcal{A}(ad)})$. One of the implications of Lemma 26.16.4 is that the transformation $F_d \rightarrow F_{d'}$ is injective! For a quasi-compact scheme T we define

$$F(T) = \bigcup_{d \in \mathbf{N}} F_d(T)$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general scheme T we define

$$F(T) = \lim_{V \subset T \text{ quasi-compact open}} F(V).$$

In other words, an element ξ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where V ranges over the quasi-compact opens of T . We omit the definition of the pullback map $F(T) \rightarrow F(T')$ for a morphism $T' \rightarrow T$ of schemes. Thus we have defined our functor

$$(26.16.4.1) \quad F : \text{Sch}^{opp} \longrightarrow \text{Sets}$$

Lemma 26.16.5. *In Situation 26.15.1. The functor F above is representable by a scheme.*

Proof. Let $U_d \rightarrow S$ be the scheme representing the functor F_d defined above. Let $\mathcal{L}_d, \psi^d : \pi_d^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}_d^{\otimes n}$ be the universal object. If $d|d'$, then we may consider the quadruple $(d', \pi_d, \mathcal{L}_d^{\otimes d'/d}, \psi^d|_{\mathcal{A}^{(d')}})$ which determines a canonical morphism $U_d \rightarrow U_{d'}$ over S . By construction this morphism corresponds to the transformation of functors $F_d \rightarrow F_{d'}$ defined above.

For every affine open $\text{Spec}(R) = V \subset S$ setting $A = \Gamma(V, \mathcal{A})$ we have a canonical identification of the base change $U_{d,V}$ with the corresponding open subscheme of $\text{Proj}(A)$, see Lemma 26.16.2. Moreover, the morphisms $U_{d,V} \rightarrow U_{d',V}$ constructed above correspond to the inclusions of opens in $\text{Proj}(A)$. Thus we conclude that $U_d \rightarrow U_{d'}$ is an open immersion.

This allows us to construct X by glueing the schemes U_d along the open immersions $U_d \rightarrow U_{d'}$. Technically, it is convenient to choose a sequence $d_1|d_2|d_3|\dots$ such that every positive integer divides one of the d_i and to simply take $X = \bigcup U_{d_i}$ using the open immersions above. It is then a simple matter to prove that X represents the functor F . \square

Lemma 26.16.6. *In Situation 26.15.1. The scheme $\pi : \text{Proj}_S(\mathcal{A}) \rightarrow S$ constructed in Lemma 26.15.4 and the scheme representing the functor F are canonically isomorphic as schemes over S .*

Proof. Let X be the scheme representing the functor F . Note that X is a scheme over S since the functor F comes equipped with a natural transformation $F \rightarrow h_S$. Write $Y = \text{Proj}_S(\mathcal{A})$. We have to show that $X \cong Y$ as S -schemes. We give two arguments.

The first argument uses the construction of X as the union of the schemes U_d representing F_d in the proof of Lemma 26.16.5. Over each affine open of S we can identify X with the homogeneous spectrum of the sections of \mathcal{A} over that open, since this was true for the opens U_d . Moreover, these identifications are compatible with further restrictions to smaller affine opens. On the other hand, Y was constructed by glueing these homogeneous spectra. Hence we can glue these isomorphisms to an isomorphism between X and $\text{Proj}_S(\mathcal{A})$ as desired. Details omitted.

Here is the second argument. Lemma 26.15.5 shows that there exists a morphism of graded algebras

$$\psi : \pi^* \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_Y(n)$$

over Y which on sections over affine opens of S agrees with (26.10.1.3). Hence for every $y \in Y$ there exists an open neighbourhood $V \subset Y$ of y and an integer $d \geq 1$ such that for $d|n$ the sheaf $\mathcal{O}_Y(n)|_V$ is invertible and the multiplication maps $\mathcal{O}_Y(n)|_V \otimes_{\mathcal{O}_V} \mathcal{O}_Y(m)|_V \rightarrow \mathcal{O}_Y(n+m)|_V$ are isomorphisms. Thus ψ restricted to the sheaf $\pi^* \mathcal{A}^{(d)}|_V$ gives an element of $F_d(V)$. Since the opens V cover Y we see “ ψ ” gives rise to an element of $F(Y)$. Hence a canonical morphism $Y \rightarrow X$ over S . Because this construction is completely canonical to see that it is an isomorphism we may work locally on S . Hence we reduce to the case S affine where the result is clear. \square

Definition 26.16.7. Let S be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_S -algebras. The *relative homogeneous spectrum of \mathcal{A} over S* , or the *homogeneous spectrum of \mathcal{A} over S* , or the *relative Proj of \mathcal{A} over S* is the scheme constructed

in Lemma 26.15.4 which represents the functor F (26.16.4.1), see Lemma 26.16.6. We denote it $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$.

The relative Proj comes equipped with a quasi-coherent sheaf of \mathbf{Z} -graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$ (the twists of the structure sheaf) and a “universal” homomorphism of graded algebras

$$\psi_{univ} : \mathcal{A} \longrightarrow \pi_* \left(\bigoplus_{n \geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n) \right)$$

see Lemma 26.15.5. We may also think of this as a homomorphism

$$\psi_{univ} : \pi^* \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$$

if we like. The following lemma is a formulation of the universality of this object.

Lemma 26.16.8. *In Situation 26.15.1. Let $(f : T \rightarrow S, d, \mathcal{L}, \psi)$ be a quadruple. Let $r_{d, \mathcal{L}, \psi} : T \rightarrow \underline{\text{Proj}}_S(\mathcal{A})$ be the associated S -morphism. There exists an isomorphism of \mathbf{Z} -graded \mathcal{O}_T -algebras*

$$\theta : r_{d, \mathcal{L}, \psi}^* \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(nd) \right) \longrightarrow \bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}$$

such that the following diagram commutes

$$\begin{array}{ccc} \mathcal{A}^{(d)} & \xrightarrow{\psi} & f_* \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) \\ & \searrow \psi_{univ} & \nearrow \theta \\ & \pi_* \left(\bigoplus_{n \geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(nd) \right) & \end{array}$$

The commutativity of this diagram uniquely determines θ .

Proof. Note that the quadruple $(f : T \rightarrow S, d, \mathcal{L}, \psi)$ defines an element of $F_d(T)$. Let $U_d \subset \underline{\text{Proj}}_S(\mathcal{A})$ be the locus where the sheaf $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d)$ is invertible and generated by the image of $\psi_{univ} : \pi^* \mathcal{A} \rightarrow \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d)$. Recall that U_d represents the functor F_d , see the proof of Lemma 26.16.5. Hence the result will follow if we can show the quadruple $(U_d \rightarrow S, d, \mathcal{O}_{U_d}(d), \psi_{univ}|_{\mathcal{A}^{(d)}})$ is the universal family, i.e., the representing object in $F_d(U_d)$. We may do this after restricting to an affine open of S because (a) the formation of the functors F_d commutes with base change (see Lemma 26.16.1), and (b) the pair $(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n), \psi_{univ})$ is constructed by glueing over affine opens in S (see Lemma 26.15.5). Hence we may assume that S is affine. In this case the functor of quadruples F_d and the functor of triples F_d agree (see proof of Lemma 26.16.2) and moreover Lemma 26.12.2 shows that $(d, \mathcal{O}_{U_d}(d), \psi^d)$ is the universal triple over U_d . Going backwards through the identifications in the proof of Lemma 26.16.2 shows that $(U_d \rightarrow S, d, \mathcal{O}_{U_d}(d), \psi_{univ}|_{\mathcal{A}^{(d)}})$ is the universal quadruple as desired. \square

Lemma 26.16.9. *Let S be a scheme and \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_S -algebras. The morphism $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ is separated.*

Proof. To prove a morphism is separated we may work locally on the base, see Schemes, Section 25.21. By construction $\underline{\text{Proj}}_S(\mathcal{A})$ is over any affine $U \subset S$ isomorphic to $\text{Proj}(A)$ with $A = \mathcal{A}(U)$. By Lemma 26.8.8 we see that $\text{Proj}(A)$ is separated. Hence $\text{Proj}(A) \rightarrow U$ is separated (see Schemes, Lemma 25.21.14) as desired. \square

Lemma 26.16.10. *Let S be a scheme and \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_S -algebras. Let $g : S' \rightarrow S$ be any morphism of schemes. Then there is a canonical isomorphism*

$$r : \underline{\text{Proj}}_{S'}(g^*\mathcal{A}) \longrightarrow S' \times_S \underline{\text{Proj}}_S(\mathcal{A})$$

as well as a corresponding isomorphism

$$\theta : r^*pr_2^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d) \right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_{S'}(g^*\mathcal{A})}(d)$$

of \mathbf{Z} -graded $\mathcal{O}_{\underline{\text{Proj}}_{S'}(g^*\mathcal{A})}$ -algebras.

Proof. This follows from Lemma 26.16.1 and the construction of $\underline{\text{Proj}}_S(\mathcal{A})$ in Lemma 26.16.5 as the union of the schemes U_d representing the functors F_d . In terms of the construction of relative Proj via glueing this isomorphism is given by the isomorphisms constructed in Lemma 26.11.6 which provides us with the isomorphism θ . Some details omitted. \square

Lemma 26.16.11. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_S -modules generated as an \mathcal{A}_0 -algebra by \mathcal{A}_1 . In this case the scheme $X = \underline{\text{Proj}}_S(\mathcal{A})$ represents the functor F_1 which associates to a scheme $f : T \rightarrow S$ over S the set of pairs (\mathcal{L}, ψ) , where*

- (1) \mathcal{L} is an invertible \mathcal{O}_T -module, and
- (2) $\psi : f^*\mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a graded \mathcal{O}_T -algebra homomorphism such that $f^*\mathcal{A}_1 \rightarrow \mathcal{L}$ is surjective

up to strict equivalence as above. Moreover, in this case all the quasi-coherent sheaves $\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(n)$ are invertible $\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}$ -modules and the multiplication maps induce isomorphisms $\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(n) \otimes_{\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}} \mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(m) = \mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(n + m)$.

Proof. Under the assumptions of the lemma the sheaves $\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(n)$ are invertible and the multiplication maps isomorphisms by Lemma 26.16.5 and Lemma 26.12.3 over affine opens of S . Thus X actually represents the functor F_1 , see proof of Lemma 26.16.5. \square

26.17. Quasi-coherent sheaves on relative Proj

We briefly discuss how to deal with graded modules in the relative setting.

We place ourselves in Situation 26.15.1. So S is a scheme, and \mathcal{A} is a quasi-coherent graded \mathcal{O}_S -algebra. Let $\mathcal{M} = \bigoplus_{n \in \mathbf{Z}} \mathcal{M}_n$ be a graded \mathcal{A} -module, quasi-coherent as an \mathcal{O}_S -module. We are going to describe the associated quasi-coherent sheaf of modules on $\underline{\text{Proj}}_S(\mathcal{A})$. We first describe the value of this sheaf schemes T mapping into the relative Proj.

Let T be a scheme. Let $(d, f : T \rightarrow S, \mathcal{L}, \psi)$ be a quadruple over T , as in Section 26.16. We define a quasi-coherent sheaf $\widetilde{\mathcal{M}}_T$ of \mathcal{O}_T -modules as follows

$$(26.17.0.1) \quad \widetilde{\mathcal{M}}_T = \left(f^*\mathcal{M}^{(d)} \otimes_{f^*\mathcal{A}^{(d)}} \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) \right)_0$$

So $\widetilde{\mathcal{M}}_T$ is the degree 0 part of the tensor product of the graded $f^*\mathcal{A}^{(d)}$ -modules $\mathcal{M}^{(d)}$ and $\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}$. Note that the sheaf $\widetilde{\mathcal{M}}_T$ depends on the quadruple even though we suppressed this in the notation. This construction has the pleasing property that given any morphism $g : T' \rightarrow T$ we have $\widetilde{\mathcal{M}}_{T'} = g^*\widetilde{\mathcal{M}}_T$ where $\widetilde{\mathcal{M}}_{T'}$ denotes the quasi-coherent sheaf associated to the pullback quadruple $(d, f \circ g, g^*\mathcal{L}, g^*\psi)$.

Since all sheaves in (26.17.0.1) are quasi-coherent we can spell out the construction over an affine open $\text{Spec}(C) = V \subset T$ which maps into an affine open $\text{Spec}(R) = U \subset S$. Namely, suppose that $\mathcal{A}|_U$ corresponds to the graded R -algebra A , that $\mathcal{M}|_U$ corresponds to the graded A -module M , and that $\mathcal{L}|_V$ corresponds to the invertible C -module L . The map ψ gives rise to a graded R -algebra map $\gamma : A^{(d)} \rightarrow \bigoplus_{n \geq 0} L^{\otimes n}$. (Tensor powers of L over C .) Then $(\widetilde{\mathcal{M}}_T)|_V$ is the quasi-coherent sheaf associated to the C -module

$$N_{R,C,A,M,\gamma} = \left(M^{(d)} \otimes_{A^{(d),\gamma}} \left(\bigoplus_{n \in \mathbf{Z}} L^{\otimes n} \right) \right)_0$$

By assumption we may even cover T by affine opens V such that there exists some $a \in A_d$ such that $\gamma(a) \in L$ is a C -basis for the module L . In that case any element of $N_{R,C,A,M,\gamma}$ is a sum of pure tensors $\sum m_i \otimes \gamma(a)^{-n_i}$ with $m \in M_{n_i d}$. In fact we may multiply each m_i with a suitable positive power of a and collect terms to see that each element of $N_{R,C,A,M,\gamma}$ can be written as $m \otimes \gamma(a)^{-n}$ with $m \in M_{nd}$ and $n \gg 0$. In other words we see that in this case

$$N_{R,C,A,M,\gamma} = M_{(a)} \otimes_{A_{(a)}} C$$

where the map $A_{(a)} \rightarrow C$ is the map $x/a^n \mapsto \gamma(x)/\gamma(a)^n$. In other words, this is the value of $\widetilde{\mathcal{M}}$ on $D_+(a) \subset \text{Proj}(A)$ pulled back to $\text{Spec}(C)$ via the morphism $\text{Spec}(C) \rightarrow D_+(a)$ coming from γ .

Lemma 26.17.1. *In Situation 26.15.1. For any quasi-coherent sheaf of graded A -modules \mathcal{M} on S , there exists a canonical associated sheaf of $\mathcal{O}_{\text{Proj}_S(A)}$ -modules $\widetilde{\mathcal{M}}$ with the following properties:*

- (1) *Given a scheme T and a quadruple $(T \rightarrow S, d, \mathcal{L}, \psi)$ over T corresponding to a morphism $h : T \rightarrow \text{Proj}_S(A)$ there is a canonical isomorphism $\widetilde{\mathcal{M}}_T = h^* \widetilde{\mathcal{M}}$ where $\widetilde{\mathcal{M}}_T$ is defined by (26.17.0.1).*
- (2) *The isomorphisms of (1) are compatible with pullbacks.*
- (3) *There is a canonical map*

$$\pi^* \mathcal{M}_0 \longrightarrow \widetilde{\mathcal{M}}.$$

- (4) *The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is functorial in \mathcal{M} .*
- (5) *The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is exact.*
- (6) *There are canonical maps*

$$\widetilde{\mathcal{M}} \otimes_{\mathcal{O}_{\text{Proj}_S(A)}} \widetilde{\mathcal{N}} \longrightarrow \widetilde{\mathcal{M} \otimes_A \mathcal{N}}$$

as in Lemma 26.9.1.

- (7) *There exist canonical maps*

$$\pi^* \mathcal{M} \longrightarrow \bigoplus_{n \in \mathbf{Z}} \widetilde{\mathcal{M}}(n)$$

generalizing (26.10.1.6).

- (8) *The formation of $\widetilde{\mathcal{M}}$ commutes with base change.*

Proof. Omitted. We should split this lemma into parts and prove the parts separately. □

26.18. Functoriality of relative Proj

This section is the analogue of Section 26.11 for the relative Proj. Let S be a scheme. A graded \mathcal{O}_S -algebra map $\psi : \mathcal{A} \rightarrow \mathcal{B}$ does not always give rise to a morphism of associated relative Proj. The correct result is stated as follows.

Lemma 26.18.1. *Let S be a scheme. Let \mathcal{A}, \mathcal{B} be two graded quasi-coherent \mathcal{O}_S -algebras. Set $p : X = \text{Proj}_S(\mathcal{A}) \rightarrow S$ and $q : Y = \text{Proj}_S(\mathcal{B}) \rightarrow S$. Let $\psi : \mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of graded \mathcal{O}_S -algebras. There is a canonical open $U(\psi) \subset Y$ and a canonical morphism of schemes*

$$r_\psi : U(\psi) \longrightarrow X$$

over S and a map of \mathbf{Z} -graded $\mathcal{O}_{U(\psi)}$ -algebras

$$\theta = \theta_\psi : r_\psi^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_X(d) \right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d).$$

The triple $(U(\psi), r_\psi, \theta)$ is characterized by the property that for any affine open $W \subset S$ the triple

$$(U(\psi) \cap p^{-1}W, \quad r_\psi|_{U(\psi) \cap p^{-1}W} : U(\psi) \cap p^{-1}W \rightarrow q^{-1}W, \quad \theta|_{U(\psi) \cap p^{-1}W})$$

is equal to the triple associated to $\psi : \mathcal{A}(W) \rightarrow \mathcal{B}(W)$ in Lemma 26.11.1 via the identifications $p^{-1}W = \text{Proj}(\mathcal{A}(W))$ and $q^{-1}W = \text{Proj}(\mathcal{B}(W))$ of Section 26.15.

Proof. This lemma proves itself by glueing the local triples. □

Lemma 26.18.2. *Let S be a scheme. Let \mathcal{A}, \mathcal{B} , and \mathcal{C} be quasi-coherent graded \mathcal{O}_S -algebras. Set $X = \text{Proj}_S(\mathcal{A})$, $Y = \text{Proj}_S(\mathcal{B})$ and $Z = \text{Proj}_S(\mathcal{C})$. Let $\varphi : \mathcal{A} \rightarrow \mathcal{B}$, $\psi : \mathcal{B} \rightarrow \mathcal{C}$ be graded \mathcal{O}_S -algebra maps. Then we have*

$$U(\psi \circ \varphi) = r_\varphi^{-1}(U(\psi)) \quad \text{and} \quad r_{\psi \circ \varphi} = r_\varphi \circ r_\psi|_{U(\psi \circ \varphi)}.$$

In addition we have

$$\theta_\psi \circ r_\psi^* \theta_\varphi = \theta_{\psi \circ \varphi}$$

with obvious notation.

Proof. Omitted. □

Lemma 26.18.3. *With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is surjective for $d \gg 0$. Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are surjective but not isomorphisms in general (even if $\mathcal{A} \rightarrow \mathcal{B}$ is surjective).

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.3. □

Lemma 26.18.4. *With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is an isomorphism for all $d \gg 0$. Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is an isomorphism, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are isomorphisms.

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.4. □

Lemma 26.18.5. *With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is surjective for $d \gg 0$ and that \mathcal{A} is generated by \mathcal{A}_1 over \mathcal{A}_0 . Then*

- (1) $U(\psi) = Y$,
- (2) $r_\psi : Y \rightarrow X$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_X(n) \rightarrow \mathcal{O}_Y(n)$ are isomorphisms.

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.5. □

26.19. Invertible sheaves and morphisms into relative Proj

It seems that we may need the following lemma somewhere. The situation is the following:

- (1) Let S be a scheme.
- (2) Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra.
- (3) Denote $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ the relative homogeneous spectrum over S .
- (4) Let $f : X \rightarrow S$ be a morphism of schemes.
- (5) Let \mathcal{L} be an invertible \mathcal{O}_X -module.
- (6) Let $\psi : f^* \mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ be a homomorphism of graded \mathcal{O}_X -algebras.

Given this data set

$$U(\psi) = \bigcup_{(U,V,a)} U_{\psi(a)}$$

where (U, V, a) satisfies:

- (1) $V \subset S$ affine open,
- (2) $U = f^{-1}(V)$, and
- (3) $a \in \mathcal{A}(V)_+$ is homogeneous.

Namely, then $\psi(a) \in \Gamma(U, \mathcal{L}^{\otimes \deg(a)})$ and $U_{\psi(a)}$ is the corresponding open (see Modules, Lemma 17.21.7).

Lemma 26.19.1. *With assumptions and notation as above. The morphism ψ induces a canonical morphism of schemes over S*

$$r_{\mathcal{L},\psi} : U(\psi) \rightarrow \underline{\text{Proj}}_S(\mathcal{A})$$

together with a map of graded $\mathcal{O}_{U(\psi)}$ -algebras

$$\theta : r_{\mathcal{L},\psi}^* \left(\bigoplus_{d \geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d) \right) \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}|_{U(\psi)}$$

characterized by the following properties:

- (1) For every open $V \subset S$ and every $d \geq 0$ the diagram

$$\begin{CD} \mathcal{A}_d(V) @>\psi>> \Gamma(f^{-1}(V), \mathcal{L}^{\otimes d}) \\ @V\psi VV @VV\text{restrict}V \\ \Gamma(\pi^{-1}(V), \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d)) @>\theta>> \Gamma(f^{-1}(V) \cap U(\psi), \mathcal{L}^{\otimes d}) \end{CD}$$

is commutative.

- (2) For any $d \geq 1$ and any open subscheme $W \subset X$ such that $\psi|_W : f^* \mathcal{A}_d|_W \rightarrow \mathcal{L}^{\otimes d}|_W$ is surjective the restriction of the morphism $r_{\mathcal{L},\psi}$ agrees with the morphism $W \rightarrow \underline{\text{Proj}}_S(\mathcal{A})$ which exists by the construction of the relative homogeneous spectrum, see Definition 26.16.7.

(3) For any affine open $V \subset S$, the restriction

$$(U(\psi) \cap f^{-1}(V), r_{\mathcal{L}, \psi}|_{U(\psi) \cap f^{-1}(V)}, \theta|_{U(\psi) \cap f^{-1}(V)})$$

agrees via i_V (see Lemma 26.15.4) with the triple $(U(\psi'), r_{\mathcal{L}, \psi'}, \theta')$ of Lemma 26.14.1 associated to the map $\psi' : A = \mathcal{A}(V) \rightarrow \Gamma_*(f^{-1}(V), \mathcal{L}|_{f^{-1}(V)})$ induced by ψ .

Proof. Use characterization (3) to construct the morphism $r_{\mathcal{L}, \psi}$ and θ locally over S . Use the uniqueness of Lemma 26.14.1 to show that the construction glues. Details omitted. \square

26.20. Twisting by invertible sheaves and relative Proj

Let S be a scheme. Let $\mathcal{A} = \bigoplus_{d \geq 0} \mathcal{A}_d$ be a quasi-coherent graded \mathcal{O}_S -algebra. Let \mathcal{L} be an invertible sheaf on S . In this situation we obtain another quasi-coherent graded \mathcal{O}_S -algebra, namely

$$\mathcal{B} = \bigoplus_{d \geq 0} \mathcal{A}_d \otimes_{\mathcal{O}_S} \mathcal{L}^{\otimes d}$$

It turns out that \mathcal{A} and \mathcal{B} have isomorphic relative homogeneous spectra.

Lemma 26.20.1. *With notation $S, \mathcal{A}, \mathcal{L}$ and \mathcal{B} as above. There is a canonical isomorphism*

$$\begin{array}{ccc} P = \text{Proj}_S(\mathcal{A}) & \xrightarrow{g} & \text{Proj}_S(\mathcal{B}) = P' \\ & \searrow \pi & \swarrow \pi' \\ & S & \end{array}$$

with the following properties

(1) There are isomorphisms $\theta_n : g^* \mathcal{O}_{P'}(n) \rightarrow \mathcal{O}_P(n) \otimes \pi^* \mathcal{L}^{\otimes n}$ which fit together to give an isomorphism of \mathbf{Z} -graded algebras

$$\theta : g^* \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{P'}(n) \right) \rightarrow \bigoplus_{n \in \mathbf{Z}} \mathcal{O}_P(n) \otimes \pi^* \mathcal{L}^{\otimes n}$$

(2) For every open $V \subset S$ the diagrams

$$\begin{array}{ccc} \mathcal{A}_n(V) \otimes \mathcal{L}^{\otimes n}(V) & \xrightarrow{\text{multiply}} & \mathcal{B}_n(V) \\ \downarrow \psi \otimes \pi^* & & \downarrow \psi \\ \Gamma(\pi^{-1}V, \mathcal{O}_P(n)) \otimes \Gamma(\pi^{-1}V, \pi^* \mathcal{L}^{\otimes n}) & & \Gamma(\pi'^{-1}V, \mathcal{O}_{P'}(n)) \\ \downarrow \text{multiply} & \xleftarrow{\theta_n} & \\ \Gamma(\pi^{-1}V, \mathcal{O}_P(n) \otimes \pi^* \mathcal{L}^{\otimes n}) & & \end{array}$$

are commutative.

(3) Add more here as necessary.

Proof. This is the identity map when $\mathcal{L} \cong \mathcal{O}_S$. In general choose an open covering of S such that \mathcal{L} is trivialized over the pieces and glue the corresponding maps. Details omitted. \square

26.21. Projective bundles

Let S be a scheme. Let \mathcal{E} be a quasi-coherent sheaf of \mathcal{O}_S -modules. By Modules, Lemma 17.18.6 the symmetric algebra $\mathrm{Sym}(\mathcal{E})$ of \mathcal{E} over \mathcal{O}_S is a quasi-coherent sheaf of \mathcal{O}_S -algebras. Note that it is generated in degree 1 over \mathcal{O}_S . Hence it makes sense to apply the construction of the previous section to it, specifically Lemmas 26.16.5 and 26.16.11.

Definition 26.21.1. Let S be a scheme. Let \mathcal{E} be a quasi-coherent \mathcal{O}_S -module³. We denote

$$\pi : \mathbf{P}(\mathcal{E}) = \underline{\mathrm{Proj}}_S(\mathrm{Sym}(\mathcal{E})) \longrightarrow S$$

and we call it the *projective bundle associated to \mathcal{E}* . The symbol $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n)$ indicates the invertible $\mathcal{O}_{\mathbf{P}(\mathcal{E})}$ -modules introduced in Lemma 26.16.5 and is called the *n th twist of the structure sheaf*.

Note that according to Lemma 26.16.5 there are canonical \mathcal{O}_S -module homomorphisms

$$\mathrm{Sym}^n(\mathcal{E}) \longrightarrow \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n))$$

for all $n \geq 0$. This, combined with the fact that $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is the canonical relatively ample invertible sheaf on $\mathbf{P}(\mathcal{E})$, is a good way to remember how we have normalized our construction of $\mathbf{P}(\mathcal{E})$. Namely, in some references the space $\mathbf{P}(\mathcal{E})$ is only defined for \mathcal{E} finite locally free on S , and sometimes $\mathbf{P}(\mathcal{E})$ is actually defined as our $\mathbf{P}(\mathcal{E}^\wedge)$ where \mathcal{E}^\wedge is the dual of the sheaf \mathcal{E} .

Example 26.21.2. The map $\mathrm{Sym}^n(\mathcal{E}) \rightarrow \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n))$ is an isomorphism if \mathcal{E} is locally free, but in general need not be an isomorphism. In fact we will give an example where this map is not injective for $n = 1$. Set $S = \mathrm{Spec}(A)$ with

$$A = k[u, v, s_1, s_2, t_1, t_2]/I$$

where k is a field and

$$I = (-us_1 + vt_1 + ut_2, vs_1 + us_2 - vt_2, vs_2, ut_1).$$

Denote \bar{u} the class of u in A and similarly for the other variables. Let $M = (Ax \oplus Ay)/A(\bar{u}x + \bar{v}y)$ so that

$$\mathrm{Sym}(M) = A[x, y]/(\bar{u}x + \bar{v}y) = k[x, y, u, v, s_1, s_2, t_1, t_2]/J$$

where

$$J = (-us_1 + vt_1 + ut_2, vs_1 + us_2 - vt_2, vs_2, ut_1, ux + vy).$$

In this case the projective bundle associated to the quasi-coherent sheaf $\mathcal{E} = \widetilde{M}$ on $S = \mathrm{Spec}(A)$ is the scheme

$$P = \mathrm{Proj}(\mathrm{Sym}(M)).$$

Note that this scheme as an affine open covering $P = D_+(x) \cup D_+(y)$. Consider the element $m \in M$ which is the image of the element $us_1x + vt_2y$. Note that

$$x(us_1x + vt_2y) = (s_1x + s_2y)(ux + vy) \bmod I$$

and

$$y(us_1x + vt_2y) = (t_1x + t_2y)(ux + vy) \bmod I.$$

³The reader may expect here the condition that \mathcal{E} is finite locally free. We do not do so in order to be consistent with [DG67, II, Definition 4.1.1].

The first equation implies that m maps to zero as a section of $\mathcal{O}_P(1)$ on $D_+(x)$ and the second that it maps to zero as a section of $\mathcal{O}_P(1)$ on $D_+(y)$. This shows that m maps to zero in $\Gamma(P, \mathcal{O}_P(1))$. On the other hand we claim that $m \neq 0$, so that m gives an example of a nonzero global section of \mathcal{E} mapping to zero in $\Gamma(P, \mathcal{O}_P(1))$. Assume $m = 0$ to get a contradiction. In this case there exists an element $f \in k[u, v, s_1, s_2, t_1, t_2]$ such that

$$us_1x + vt_2y = f(ux + vy) \text{ mod } I$$

Since I is generated by homogeneous polynomials of degree 2 we may decompose f into its homogeneous components and take the degree 1 component. In other words we may assume that

$$f = au + bv + \alpha_1s_1 + \alpha_2s_2 + \beta_1t_1 + \beta_2t_2$$

for some $a, b, \alpha_1, \alpha_2, \beta_1, \beta_2 \in k$. The resulting conditions are that

$$\begin{aligned} us_1 - u(au + bv + \alpha_1s_1 + \alpha_2s_2 + \beta_1t_1 + \beta_2t_2) &\in I \\ vt_2 - v(au + bv + \alpha_1s_1 + \alpha_2s_2 + \beta_1t_1 + \beta_2t_2) &\in I \end{aligned}$$

There are no terms u^2, uv, v^2 in the generators of I and hence we see $a = b = 0$. Thus we get the relations

$$\begin{aligned} us_1 - u(\alpha_1s_1 + \alpha_2s_2 + \beta_1t_1 + \beta_2t_2) &\in I \\ vt_2 - v(\alpha_1s_1 + \alpha_2s_2 + \beta_1t_1 + \beta_2t_2) &\in I \end{aligned}$$

We may use the first generator of I to replace any occurrence of us_1 by $vt_1 + ut_2$, the second generator of I to replace any occurrence of vs_1 by $-us_2 + vt_2$, the third generator to remove occurrences of vs_2 and the third to remove occurrences of ut_1 . Then we get the relations

$$\begin{aligned} (1 - \alpha_1)vt_1 + (1 - \alpha_1)ut_2 - \alpha_2us_2 - \beta_2ut_2 &= 0 \\ (1 - \alpha_1)vt_2 + \alpha_1us_2 - \beta_1vt_1 - \beta_2vt_2 &= 0 \end{aligned}$$

This implies that α_1 should be both 0 and 1 which is a contradiction as desired.

Lemma 26.21.3. *Let S be a scheme. The structure morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$ of a projective bundle over S is separated.*

Proof. Immediate from Lemma 26.16.9. □

Lemma 26.21.4. *Let S be a scheme. Let $n \geq 0$. Then \mathbf{P}_S^n is a projective bundle over S .*

Proof. Note that

$$\mathbf{P}_{\mathbf{Z}}^n = \text{Proj}(\mathbf{Z}[T_0, \dots, T_n]) = \underline{\text{Proj}}_{\text{Spec}(\mathbf{Z})}(\widetilde{\mathbf{Z}[T_0, \dots, T_n]})$$

where the grading on the ring $\mathbf{Z}[T_0, \dots, T_n]$ is given by $\deg(T_i) = 1$ and the elements of \mathbf{Z} are in degree 0. Recall that \mathbf{P}_S^n is defined as $\mathbf{P}_{\mathbf{Z}}^n \times_{\text{Spec}(\mathbf{Z})} S$. Moreover, forming the relative homogeneous spectrum commutes with base change, see Lemma 26.16.10. For any scheme $g : S \rightarrow \text{Spec}(\mathbf{Z})$ we have $g^*\mathcal{O}_{\text{Spec}(\mathbf{Z})}[T_0, \dots, T_n] = \mathcal{O}_S[T_0, \dots, T_n]$. Combining the above we see that

$$\mathbf{P}_S^n = \underline{\text{Proj}}_S(\mathcal{O}_S[T_0, \dots, T_n]).$$

Finally, note that $\mathcal{O}_S[T_0, \dots, T_n] = \text{Sym}(\mathcal{O}_S^{\oplus n+1})$. Hence we see that \mathbf{P}_S^n is a projective bundle over S . □

26.22. Grassmannians

In this section we introduce the standard Grassmannian functors and we show that they are represented by schemes. Pick integers k, n with $0 < k < n$. We will construct a functor

$$(26.22.0.1) \quad G(k, n) : \text{Sch} \longrightarrow \text{Sets}$$

which will loosely speaking parametrize k -dimensional subspaces of n -space. However, for technical reasons it is more convenient to parametrize $(n - k)$ -dimensional quotients and this is what we will do.

More precisely, $G(k, n)$ associates to a scheme S the set $G(k, n)(S)$ of isomorphism classes of surjections

$$q : \mathcal{O}_S^{\oplus n} \longrightarrow \mathcal{Q}$$

where \mathcal{Q} is a finite locally free \mathcal{O}_S -module of rank $n - k$. Note that this is indeed a set, for example by Modules, Lemma 17.9.8 or by the observation that the isomorphism class of the surjection q is determined by the kernel of q (and given a sheaf there is a set of subsheaves). Given a morphism of schemes $f : T \rightarrow S$ we let $G(k, n)(f) : G(k, n)(S) \rightarrow G(k, n)(T)$ which sends the isomorphism class of $q : \mathcal{O}_S^{\oplus n} \rightarrow \mathcal{Q}$ to the isomorphism class of $f^*q : \mathcal{O}_T^{\oplus n} \rightarrow f^*\mathcal{Q}$. This makes sense since (1) $f^*\mathcal{O}_S = \mathcal{O}_T$, (2) f^* is additive, (3) f^* preserves locally free modules (Modules, Lemma 17.14.3), and (4) f^* is right exact (Modules, Lemma 17.3.3).

Lemma 26.22.1. *Let $0 < k < n$. The functor $G(k, n)$ of (26.22.0.1) is representable by a scheme.*

Proof. Set $F = G(k, n)$. To prove the lemma we will use the criterion of Schemes, Lemma 25.15.4. The reason F satisfies the sheaf property for the Zariski topology is that we can glue sheaves, see Sheaves, Section 6.33 (some details omitted).

The family of subfunctors F_i . Let I be the set of subsets of $\{1, \dots, n\}$ of cardinality $n - k$. Given a scheme S and $j \in \{1, \dots, n\}$ we denote e_j the global section

$$e_j = (0, \dots, 0, 1, 0, \dots, 0) \quad (1 \text{ in } j\text{th spot})$$

of $\mathcal{O}_S^{\oplus n}$. Of course these sections freely generate $\mathcal{O}_S^{\oplus n}$. Similarly, for $j \in \{1, \dots, k\}$ we denote f_j the global section of $\mathcal{O}_S^{\oplus k}$ which is zero in all summands except the j th where we put a 1. For $i \in I$ we let

$$s_i : \mathcal{O}_S^{\oplus n-k} \longrightarrow \mathcal{O}_S^{\oplus n}$$

which is the direct sum of the coprojections $\mathcal{O}_S \rightarrow \mathcal{O}_S^{\oplus n}$ corresponding to elements of i . More precisely, if $i = \{i_1, \dots, i_{n-k}\}$ with $i_1 < i_2 < \dots < i_{n-k}$ then s_i maps f_j to e_{i_j} for $j \in \{1, \dots, n - k\}$. With this notation we can set

$$F_i(S) = \{q : \mathcal{O}_S^{\oplus n} \rightarrow \mathcal{Q} \in F(S) \mid q \circ s_i \text{ is surjective}\} \subset F(S)$$

Given a morphism $f : T \rightarrow S$ of schemes the pullback f^*s_i is the corresponding map over T . Since f^* is right exact (Modules, Lemma 17.3.3) we conclude that F_i is a subfunctor of F .

Representability of F_i . To prove this we may assume (after renumbering) that $i = \{1, \dots, n - k\}$. This means s_i is the inclusion of the first $n - k$ summands. Observe that if $q \circ s_i$ is surjective, then $q \circ s_i$ is an isomorphism as a surjective map between finite locally free modules of the same rank (Modules, Lemma 17.14.5).

Thus if $q : \mathcal{O}_S^{\oplus n} \rightarrow \mathcal{Q}$ is an element of $F_i(S)$, then we can use $q \circ s_i$ to identify \mathcal{Q} with $\mathcal{O}_S^{\oplus n-k}$. After doing so we obtain

$$q : \mathcal{O}_S^{\oplus n} \longrightarrow \mathcal{O}_S^{\oplus n-k}$$

mapping e_j to f_j (notation as above) for $j = 1, \dots, n-k$. To determine q completely we have to fix the images $q(e_{n-k+1}), \dots, q(e_n)$ in $\Gamma(S, \mathcal{O}_S^{\oplus n-k})$. It follows that F_i is isomorphic to the functor

$$S \longmapsto \prod_{j=n-k+1, \dots, n} \Gamma(S, \mathcal{O}_S^{\oplus n-k})$$

This functor is isomorphic to the $k(n-k)$ -fold self product of the functor $S \mapsto \Gamma(S, \mathcal{O}_S)$. By Schemes, Example 25.15.2 the latter is representable by $\mathbf{A}_{\mathbf{Z}}^1$. It follows F_i is representable by $\mathbf{A}_{\mathbf{Z}}^{k(n-k)}$ since fibred product over $\text{Spec}(\mathbf{Z})$ is the product in the category of schemes.

The inclusion $F_i \subset F$ is representable by open immersions. Let S be a scheme and let $q : \mathcal{O}_S^{\oplus n} \rightarrow \mathcal{Q}$ be an element of $F(S)$. By Modules, Lemma 17.9.4. the set $U_i = \{s \in S \mid (q \circ s_i)_s \text{ surjective}\}$ is open in S . Since $\mathcal{O}_{S,s}$ is a local ring and \mathcal{Q}_s a finite $\mathcal{O}_{S,s}$ -module by Nakayama's lemma (Algebra, Lemma 10.19.1) we have

$$s \in U_i \Leftrightarrow (\text{the map } \kappa(s)^{\oplus n-k} \rightarrow \mathcal{Q}_s/\mathfrak{m}_s \mathcal{Q}_s \text{ induced by } (q \circ s_i)_s \text{ is surjective})$$

Let $f : T \rightarrow S$ be a morphism of schemes and let $t \in T$ be a point mapping to $s \in S$. We have $(f^* \mathcal{Q})_t = \mathcal{Q}_s \otimes_{\mathcal{O}_{S,s}} \mathcal{O}_{T,t}$ (Sheaves, Lemma 6.26.4) and so on. Thus the map

$$\kappa(t)^{\oplus n-k} \rightarrow (f^* \mathcal{Q})_t/\mathfrak{m}_t(f^* \mathcal{Q})_t$$

induced by $(f^* q \circ f^* s_i)_t$ is the base change of the map $\kappa(s)^{\oplus n-k} \rightarrow \mathcal{Q}_s/\mathfrak{m}_s \mathcal{Q}_s$ above by the field extension $\kappa(s) \subset \kappa(t)$. It follows that $s \in U_i$ if and only if t is in the corresponding open for $f^* q$. In particular $T \rightarrow S$ factors through U_i if and only if $f^* q \in F_i(T)$ as desired.

The collection $F_i, i \in I$ covers F . Let $q : \mathcal{O}_S^{\oplus n} \rightarrow \mathcal{Q}$ be an element of $F(S)$. We have to show that for every point s of S there exists an $i \in I$ such that s_i is surjective in a neighbourhood of s . Thus we have to show that one of the compositions

$$\kappa(s)^{\oplus n-k} \xrightarrow{s_i} \kappa(s)^{\oplus n} \rightarrow \mathcal{Q}_s/\mathfrak{m}_s \mathcal{Q}_s$$

is surjective (see previous paragraph). As $\mathcal{Q}_s/\mathfrak{m}_s \mathcal{Q}_s$ is a vector space of dimension $n-k$ this follows from the theory of vector spaces. □

Definition 26.22.2. Let $0 < k < n$. The scheme $\mathbf{G}(k, n)$ representing the functor $G(k, n)$ is called *Grassmannian over \mathbf{Z}* . Its base change $\mathbf{G}(k, n)_S$ to a scheme S is called *Grassmannian over S* . If R is a ring the base change to $\text{Spec}(R)$ is denoted $\mathbf{G}(k, n)_R$ and called *Grassmannian over R* .

The definition makes sense as we've shown in Lemma 26.22.1 that these functors are indeed representable.

Lemma 26.22.3. *Let $n \geq 1$. There is a canonical isomorphism $\mathbf{G}(n, n+1) = \mathbf{P}_{\mathbf{Z}}^n$.*

Proof. According to Lemma 26.13.1 the scheme $\mathbf{P}_{\mathbf{Z}}^n$ represents the functor which assigns to a scheme S the set of isomorphism classes of pairs $(\mathcal{L}, (s_0, \dots, s_n))$ consisting of an invertible module \mathcal{L} and an $(n+1)$ -tuple of global sections generating \mathcal{L} . Given such a pair we obtain a quotient

$$\mathcal{O}_S^{\oplus n+1} \longrightarrow \mathcal{L}, \quad (h_0, \dots, h_n) \longmapsto \sum h_i s_i.$$

Conversely, given an element $q : \mathcal{O}_S^{\oplus n+1} \rightarrow \mathcal{Q}$ of $G(n, n+1)(S)$ we obtain such a pair, namely $(\mathcal{Q}, (q(e_1), \dots, q(e_{n+1})))$. Here e_i , $i = 1, \dots, n+1$ are the standard generating sections of the free module $\mathcal{O}_S^{\oplus n+1}$. We omit the verification that these constructions define mutually inverse transformations of functors. \square

Properties of Schemes

27.1. Introduction

In this chapter we introduce some absolute properties of schemes. A foundational reference is [DG67].

27.2. Constructible sets

Constructible and locally constructible sets are introduced in Topology, Section 5.14. We may characterize locally constructible subsets of schemes as follows.

Lemma 27.2.1. *Let X be a scheme. A subset E of X is locally constructible in X if and only if $E \cap U$ is constructible in U for every affine open U of X .*

Proof. Assume E is locally constructible. Then there exists an open covering $X = \bigcup U_i$ such that $E \cap U_i$ is constructible in U_i for each i . Let $V \subset X$ be any affine open. We can find a finite open affine covering $V = V_1 \cup \dots \cup V_m$ such that for each j we have $V_j \subset U_i$ for some $i = i(j)$. By Topology, Lemma 5.14.4 we see that each $E \cap V_j$ is constructible in V_j . Since the inclusions $V_j \rightarrow V$ are quasi-compact (see Schemes, Lemma 25.19.2) we conclude that $E \cap V$ is constructible in V by Topology, Lemma 5.14.6. The converse implication is immediate. \square

Lemma 27.2.2. *Let X be a scheme and let $E \subset X$ be a constructible subset. Let $\xi \in X$ be a generic point of an irreducible component of X .*

- (1) *If $\xi \in E$, then an open neighbourhood of ξ is contained in E .*
- (2) *If $\xi \notin E$, then an open neighbourhood of ξ is disjoint from E .*

Proof. As the complement of a locally constructible subset is locally constructible it suffices to show (2). We may assume X is affine and hence E constructible (Lemma 27.2.1). In this case X is a spectral space (Algebra, Lemma 10.25.2). Then $\xi \notin E$ implies $\xi \notin \bar{E}$ by Topology, Lemma 5.22.5 and the fact that there are no points of X different from ξ which specialize to ξ . \square

Lemma 27.2.3. *Let X be a quasi-separated scheme. The intersection of any two quasi-compact opens of X is a quasi-compact open of X . Every quasi-compact open of X is retrocompact in X .*

Proof. If U and V are quasi-compact open then $U \cap V = \Delta^{-1}(U \times V)$, where $\Delta : X \rightarrow X \times X$ is the diagonal. As X is quasi-separated we see that Δ is quasi-compact. Hence we see that $U \cap V$ is quasi-compact as $U \times V$ is quasi-compact (details omitted; use Schemes, Lemma 25.17.4 to see $U \times V$ is a finite union of affines). The other assertions follow from the first and Topology, Lemma 5.26.1. \square

Lemma 27.2.4. *Let X be a quasi-compact and quasi-separated scheme. Then the underlying topological space of X is a spectral space.*

Proof. By Topology, Definition 5.22.1 we have to check that X is sober, quasi-compact, has a basis of quasi-compact opens, and the intersection of any two quasi-compact opens is quasi-compact. This follows from Schemes, Lemma 25.11.1 and 25.11.2 and Lemma 27.2.3 above. \square

Lemma 27.2.5. *Let X be a quasi-compact and quasi-separated scheme. Any locally constructible subset of X is constructible.*

Proof. As X is quasi-compact we can choose a finite affine open covering $X = V_1 \cup \dots \cup V_m$. As X is quasi-separated each V_i is retrocompact in X by Lemma 27.2.3. Hence by Topology, Lemma 5.14.6 we see that $E \subset X$ is constructible in X if and only if $E \cap V_j$ is constructible in V_j . Thus we win by Lemma 27.2.1. \square

Lemma 27.2.6. *Let X be a scheme. A subset Z of X is retrocompact in X if and only if $E \cap U$ is quasi-compact for every affine open U of X .*

Proof. Immediate from the fact that every quasi-compact open of X is a finite union of affine opens. \square

27.3. Integral, irreducible, and reduced schemes

Definition 27.3.1. Let X be a scheme. We say X is *integral* if it is nonempty and for every nonempty affine open $\text{Spec}(R) = U \subset X$ the ring R is an integral domain.

Lemma 27.3.2. *Let X be a scheme. The following are equivalent.*

- (1) *The scheme X is reduced, see Schemes, Definition 25.12.1.*
- (2) *There exists an affine open covering $X = \bigcup U_i$ such that each $\Gamma(U_i, \mathcal{O}_X)$ is reduced.*
- (3) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is reduced.*
- (4) *For every open $U \subset X$ the ring $\mathcal{O}_X(U)$ is reduced.*

Proof. See Schemes, Lemmas 25.12.2 and 25.12.3. \square

Lemma 27.3.3. *Let X be a scheme. The following are equivalent.*

- (1) *The scheme X is irreducible.*
- (2) *There exists an affine open covering $X = \bigcup_{i \in I} U_i$ such that I is not empty, U_i is irreducible for all $i \in I$, and $U_i \cap U_j \neq \emptyset$ for all $i, j \in I$.*
- (3) *The scheme X is nonempty and every nonempty affine open $U \subset X$ is irreducible.*

Proof. Assume (1). By Schemes, Lemma 25.11.1 we see that X has a unique generic point η . Then $X = \overline{\{\eta\}}$. Hence η is an element of every nonempty affine open $U \subset X$. This implies that $U = \overline{\{\eta\}}$ and that any two nonempty affines meet. Thus (1) implies both (2) and (3).

Assume (2). Suppose $X = Z_1 \cup Z_2$ is a union of two closed subsets. For every i we see that either $U_i \subset Z_1$ or $U_i \subset Z_2$. Pick some $i \in I$ and assume $U_i \subset Z_1$ (possibly after renumbering Z_1, Z_2). For any $j \in I$ the open subset $U_i \cap U_j$ is dense in U_j and contained in the closed subset $Z_1 \cap U_j$. We conclude that also $U_j \subset Z_1$. Thus $X = Z_1$ as desired.

Assume (3). Choose an affine open covering $X = \bigcup_{i \in I} U_i$. We may assume that each U_i is nonempty. Since X is nonempty we see that I is not empty. By assumption each U_i is irreducible. Suppose $U_i \cap U_j = \emptyset$ for some pair $i, j \in I$. Then the

open $U_i \coprod U_j = U_i \cup U_j$ is affine, see Schemes, Lemma 25.6.8. Hence it is irreducible by assumption which is absurd. We conclude that (3) implies (2). The lemma is proved. \square

Lemma 27.3.4. *A scheme X is integral if and only if it is reduced and irreducible.*

Proof. If X is irreducible, then every affine open $\text{Spec}(R) = U \subset X$ is irreducible. If X is reduced, then R is reduced, by Lemma 27.3.2 above. Hence R is reduced and (0) is a prime ideal, i.e., R is an integral domain.

If X is integral, then for every nonempty affine open $\text{Spec}(R) = U \subset X$ the ring R is reduced and hence X is reduced by Lemma 27.3.2. Moreover, every nonempty affine open is irreducible. Hence X is irreducible, see Lemma 27.3.3. \square

In Examples, Section 82.5 we construct a connected affine scheme all of whose local rings are domains, but which is not integral.

27.4. Types of schemes defined by properties of rings

In this section we study what properties of rings allow one to define local properties of schemes.

Definition 27.4.1. Let P be a property of rings. We say that P is *local* if the following hold:

- (1) For any ring R , and any $f \in R$ we have $P(R) \Rightarrow P(R_f)$.
- (2) For any ring R , and $f_i \in R$ such that $(f_1, \dots, f_n) = R$ then $\forall i, P(R_{f_i}) \Rightarrow P(R)$.

Definition 27.4.2. Let P be a property of rings. Let X be a scheme. We say X is *locally P* if for any $x \in X$ there exists an affine open neighbourhood U of x in X such that $\mathcal{O}_X(U)$ has property P .

This is only a good notion if the property is local. Even if P is a local property we will not automatically use this definition to say that a scheme is “locally P ” unless we also explicitly state the definition elsewhere.

Lemma 27.4.3. *Let X be a scheme. Let P be a local property of rings. The following are equivalent:*

- (1) *The scheme X is locally P .*
- (2) *For every affine open $U \subset X$ the property $P(\mathcal{O}_X(U))$ holds.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ satisfies P .*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is locally P .*

Moreover, if X is locally P then every open subscheme is locally P .

Proof. Of course (1) \Leftrightarrow (3) and (2) \Rightarrow (1). If (3) \Rightarrow (2), then the final statement of the lemma holds and it follows easily that (4) is also equivalent to (1). Thus we show (3) \Rightarrow (2).

Let $X = \bigcup U_i$ be an affine open covering, say $U_i = \text{Spec}(R_i)$. Assume $P(R_i)$. Let $\text{Spec}(R) = U \subset X$ be an arbitrary affine open. By Schemes, Lemma 25.11.6 there exists a standard covering of $U = \text{Spec}(R)$ by standard opens $D(f_j)$ such that each ring R_{f_j} is a principal localization of one of the rings R_i . By Definition 27.4.1 (1) we get $P(R_{f_j})$. Whereupon $P(R)$ by Definition 27.4.1 (2). \square

Here is a sample application.

Lemma 27.4.4. *Let X be a scheme. Then X is reduced if and only if X is “locally reduced” in the sense of Definition 27.4.2.*

Proof. This is clear from Lemma 27.3.2. □

Lemma 27.4.5. *The following properties of a ring R are local.*

- (1) (Cohen-Macaulay.) *The ring R is Noetherian and CM, see Algebra, Definition 10.100.6.*
- (2) (Regular.) *The ring R is Noetherian and regular, see Algebra, Definition 10.106.7.*
- (3) (Absolutely Noetherian.) *The ring R is of finite type over Z .*
- (4) *Add more here as needed.*¹

Proof. Omitted. □

27.5. Noetherian schemes

Recall that a ring R is *Noetherian* if it satisfies the ascending chain condition of ideals. Equivalently every ideal of R is finitely generated.

Definition 27.5.1. Let X be a scheme.

- (1) We say X is *locally Noetherian* if every $x \in X$ has an affine open neighbourhood $\text{Spec}(R) = U \subset X$ such that the ring R is Noetherian.
- (2) We say X is *Noetherian* if X is locally Noetherian and quasi-compact.

Here is the standard result characterizing locally Noetherian schemes.

Lemma 27.5.2. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is locally Noetherian.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is locally Noetherian.*

Moreover, if X is locally Noetherian then every open subscheme is locally Noetherian.

Proof. To show this it suffices to show that being Noetherian is a local property of rings, see Lemma 27.4.3. Any localization of a Noetherian ring is Noetherian, see Algebra, Lemma 10.30.1. By Algebra, Lemma 10.23.2 we see the second property to Definition 27.4.1. □

Lemma 27.5.3. *Any immersion $Z \rightarrow X$ with X locally Noetherian is quasi-compact.*

Proof. A closed immersion is clearly quasi-compact. A composition of quasi-compact morphisms is quasi-compact, see Topology, Lemma 5.11.2. Hence it suffices to show that an open immersion into a locally Noetherian scheme is quasi-compact. Using Schemes, Lemma 25.19.2 we reduce to the case where X is affine.

¹But we only list those properties here which we have not already dealt with separately somewhere else.

Any open subset of the spectrum of a Noetherian ring is quasi-compact (for example combine Algebra, Lemma 10.30.5 and Topology, Lemmas 5.8.2 and 5.11.13). \square

Lemma 27.5.4. *A locally Noetherian scheme is quasi-separated.*

Proof. By Schemes, Lemma 25.21.7 we have to show that the intersection $U \cap V$ of two affine opens of X is quasi-compact. This follows from Lemma 27.5.3 above on considering the open immersion $U \cap V \rightarrow U$ for example. (But really it is just because any open of the spectrum of a Noetherian ring is quasi-compact.) \square

Lemma 27.5.5. *A (locally) Noetherian scheme has a (locally) Noetherian underlying topological space, see Topology, Definition 5.8.1.*

Proof. This is because a Noetherian scheme is a finite union of spectra of Noetherian rings and Algebra, Lemma 10.30.5 and Topology, Lemma 5.8.4. \square

Lemma 27.5.6. *Any morphism of schemes $f : X \rightarrow Y$ with X Noetherian is quasi-compact.*

Proof. Use Lemma 27.5.5 and use that any subset of a Noetherian topological space is quasi-compact (see Topology, Lemmas Lemmas 5.8.2 and 5.11.13). \square

Lemma 27.5.7. *Any locally closed subscheme of a (locally) Noetherian scheme is (locally) Noetherian.*

Proof. Omitted. Hint: Any quotient, and any localization of a Noetherian ring is Noetherian. For the Noetherian case use again that any subset of a Noetherian space is a Noetherian space (with induced topology). \square

Here is a fun lemma. It says that every locally Noetherian scheme has plenty of closed points (at least one in every closed subset).

Lemma 27.5.8. *Any nonempty locally Noetherian scheme has a closed point. Any nonempty closed subset of a locally Noetherian scheme has a closed point. Equivalently, any point of a locally Noetherian scheme specializes to a closed point.*

Proof. The second assertion follows from the first (using Schemes, Lemma 25.12.4 and Lemma 27.5.7). Consider any nonempty affine open $U \subset X$. Let $x \in U$ be a closed point. If x is a closed point of X then we are done. If not, let $X_0 \subset X$ be the reduced induced closed subscheme structure on $\overline{\{x\}}$. Then $U_0 = U \cap X_0$ is an affine open of X_0 by Schemes, Lemma 25.10.1 and $U_0 = \{x\}$. Let $y \in X_0$, $y \neq x$ be a specialization of x . Consider the local ring $R = \mathcal{O}_{X_0, y}$. This is a Noetherian local ring as X_0 is Noetherian by Lemma 27.5.7. Denote $V \subset \text{Spec}(R)$ the inverse image of U_0 in $\text{Spec}(R)$ by the canonical morphism $\text{Spec}(R) \rightarrow X_0$ (see Schemes, Section 25.13.) By construction V is a singleton with unique point corresponding to x (use Schemes, Lemma 25.13.2). By Algebra, Lemma 10.60.1 we see that $\dim(R) = 1$. In other words, we see that y is an immediate specialization of x (see Topology, Definition 5.19.1). In other words, any point $y \neq x$ such that $x \rightsquigarrow y$ is an immediate specialization of x . Clearly each of these points is a closed point as desired. \square

Lemma 27.5.9. *Let X be a locally Noetherian scheme. Let $x' \rightsquigarrow x$ be a specialization of points of X . Then*

- (1) *there exists a discrete valuation ring R and a morphism $f : \text{Spec}(R) \rightarrow X$ such that the generic point η of $\text{Spec}(R)$ maps to x' and the special point maps to x , and*

- (2) given a finitely generated field extension $\kappa(x') \subset K$ we may arrange it so that the extension $\kappa(x') \subset \kappa(\eta)$ induced by f is isomorphic to the given one.

Proof. Let $x' \rightsquigarrow x$ be a specialization in X , and let $\kappa(x') \subset K$ be a finitely generated extension of fields. By Schemes, Lemma 25.13.2 and the discussion following Schemes, Lemma 25.13.3 this leads to ring maps $\mathcal{O}_{X,x} \rightarrow \kappa(x') \rightarrow K$. Let $R \subset K$ be any discrete valuation ring whose field of fractions is K and which dominates the image of $\mathcal{O}_{X,x} \rightarrow K$, see Algebra, Lemma 10.115.12. The ring map $\mathcal{O}_{X,x} \rightarrow R$ induces the morphism $f : \text{Spec}(R) \rightarrow X$, see Schemes, Lemma 25.13.1. This morphism has all the desired properties by construction. \square

27.6. Jacobson schemes

Recall that a space is said to be *Jacobson* if the closed points are dense in every closed subset, see Topology, Section 5.17.

Definition 27.6.1. A scheme S is said to be *Jacobson* if its underlying topological space is Jacobson.

Recall that a ring R is Jacobson if every radical ideal of R is the intersection of maximal ideals, see Algebra, Definition 10.34.1.

Lemma 27.6.2. *An affine scheme $\text{Spec}(R)$ is Jacobson if and only if the ring R is Jacobson.*

Proof. This is Algebra, Lemma 10.34.4. \square

Here is the standard result characterizing Jacobson schemes. Intuitively it claims that Jacobson \Leftrightarrow locally Jacobson.

Lemma 27.6.3. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is Jacobson.*
- (2) *The scheme X is “locally Jacobson” in the sense of Definition 27.4.2.*
- (3) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Jacobson.*
- (4) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Jacobson.*
- (5) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Jacobson.*

Moreover, if X is Jacobson then every open subscheme is Jacobson.

Proof. The final assertion of the lemma holds by Topology, Lemma 5.17.5. The equivalence of (5) and (1) is Topology, Lemma 5.17.4. Hence, using Lemma 27.6.2, we see that (1) \Leftrightarrow (2). To finish proving the lemma it suffices to show that “Jacobson” is a local property of rings, see Lemma 27.4.3. Any localization of a Jacobson ring at an element is Jacobson, see Algebra, Lemma 10.34.14. Suppose R is a ring, $f_1, \dots, f_n \in R$ generate the unit ideal and each R_{f_i} is Jacobson. Then we see that $\text{Spec}(R) = \bigcup D(f_i)$ is a union of open subsets which are all Jacobson, and hence $\text{Spec}(R)$ is Jacobson by Topology, Lemma 5.17.4 again. This proves the second property of Definition 27.4.1. \square

Many schemes used commonly in algebraic geometry are Jacobson, see Morphisms, Lemma 28.17.10. We mention here the following interesting case.

Lemma 27.6.4. *Let R be a Noetherian local ring with maximal ideal \mathfrak{m} . In this case the scheme $S = \text{Spec}(R) \setminus \{\mathfrak{m}\}$ is Jacobson.*

Proof. Since $\text{Spec}(R)$ is a Noetherian scheme, hence S is a Noetherian scheme (Lemma 27.5.7). Hence S is a sober, Noetherian topological space (use Schemes, Lemma 25.11.1). Assume S is not Jacobson to get a contradiction. By Topology, Lemma 5.17.3 there exists some non-closed point $\xi \in S$ such that $\{\xi\}$ is locally closed. This corresponds to a prime $\mathfrak{p} \subset R$ such that (1) there exists a prime \mathfrak{q} , $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$ with both inclusions strict, and (2) $\{\mathfrak{p}\}$ is open in $\text{Spec}(R/\mathfrak{p})$. This is impossible by Algebra, Lemma 10.60.1. \square

27.7. Normal schemes

Recall that a ring R is said to be normal if all its local rings are normal domains, see Algebra, Definition 10.36.10. A normal domain is a domain which is integrally closed in its field of fractions, see Algebra, Definition 10.36.1. Thus it makes sense to define a normal scheme as follows.

Definition 27.7.1. A scheme X is *normal* if and only if for all $x \in X$ the local ring $\mathcal{O}_{X,x}$ is a normal domain.

This seems to be the definition used in EGA, see [DG67, 0, 4.1.4]. Suppose $X = \text{Spec}(A)$, and A is reduced. Then saying that X is normal is not equivalent to saying that A is integrally closed in its total ring of fractions. However, if A is Noetherian then this is the case (see Algebra, Lemma 10.36.14).

Lemma 27.7.2. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is normal.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is normal.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is normal.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is normal.*

Moreover, if X is normal then every open subscheme is normal.

Proof. This is clear from the definitions. \square

Lemma 27.7.3. *A normal scheme is reduced.*

Proof. Immediate from the definitions. \square

Lemma 27.7.4. *Let X be an integral scheme. Then X is normal if and only if for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is a normal domain.*

Proof. This follows from Algebra, Lemma 10.36.9. \square

Lemma 27.7.5. *Let X be a scheme with a finite number of irreducible components. The following are equivalent:*

- (1) *X is normal, and*
- (2) *X is a finite disjoint union of normal integral schemes.*

Proof. It is immediate from the definitions that (2) implies (1). Let X be a normal scheme with a finite number of irreducible components. If X is affine then X satisfies (2) by Algebra, Lemma 10.36.14. For a general X , let $X = \bigcup X_i$ be an

affine open covering. Note that also each X_i has but a finite number of irreducible components, and the lemma holds for each X_i . Let $T \subset X$ be an irreducible component. By the affine case each intersection $T \cap X_i$ is open in X_i and an integral normal scheme. Hence $T \subset X$ is open, and an integral normal scheme. This proves that X is the disjoint union of its irreducible components, which are integral normal schemes. There are only finitely many by assumption. \square

Lemma 27.7.6. *Let X be a Noetherian scheme. The following are equivalent:*

- (1) X is normal, and
- (2) X is a finite disjoint union of normal integral schemes.

Proof. This is a special case of Lemma 27.7.5 because a Noetherian scheme has a Noetherian underlying topological space (Lemma 27.5.5 and Topology, Lemma 5.8.2). \square

Lemma 27.7.7. *Let X be a locally Noetherian scheme. The following are equivalent:*

- (1) X is normal, and
- (2) X is a disjoint union of integral normal schemes.

Proof. Omitted. Hint: This is purely topological from Lemma 27.7.6. \square

Remark 27.7.8. Let X be a normal scheme. If X is locally Noetherian then we see that X is integral if and only if X is connected, see Lemma 27.7.7. But there exists a connected affine scheme X such that $\mathcal{O}_{X,x}$ is a domain for all $x \in X$, but X is not irreducible, see Examples, Section 82.5. This example is even a normal scheme (proof omitted), so beware!

Lemma 27.7.9. *Let X be an integral normal scheme. Then $\Gamma(X, \mathcal{O}_X)$ is a normal domain.*

Proof. Set $R = \Gamma(X, \mathcal{O}_X)$. It is clear that R is a domain. Suppose $f = a/b$ is an element of its fraction field which is integral over R . Say we have $f^d + \sum_{i=1, \dots, d} a_i f^i = 0$ with $a_i \in R$. Let $U \subset X$ be affine open. Since $b \in R$ is not zero and since X is integral we see that also $b|_U \in \mathcal{O}_X(U)$ is not zero. Hence a/b is an element of the fraction field of $\mathcal{O}_X(U)$ which is integral over $\mathcal{O}_X(U)$ (because we can use the same polynomial $f^d + \sum_{i=1, \dots, d} a_i|_U f^i = 0$ on U). Since $\mathcal{O}_X(U)$ is a normal domain (Lemma 27.7.2), we see that $f_U = (a|_U)/(b|_U) \in \mathcal{O}_X(U)$. It is easy to see that $f_U|_V = f_V$ whenever $V \subset U \subset X$ are affine open. Hence the local sections f_U glue to a global section f as desired. \square

27.8. Cohen-Macaulay schemes

Recall, see Algebra, Definition 10.100.1, that a local Noetherian ring (R, \mathfrak{m}) is said to be Cohen-Macaulay if $\text{depth}_{\mathfrak{m}}(R) = \dim(R)$. Recall that a Noetherian ring R is said to be Cohen-Macaulay if every local ring $R_{\mathfrak{p}}$ of R is Cohen-Macaulay, see Algebra, Definition 10.100.6.

Definition 27.8.1. Let X be a scheme. We say X is *Cohen-Macaulay* if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of x such that the ring $\mathcal{O}_X(U)$ is Noetherian and Cohen-Macaulay.

Lemma 27.8.2. *Let X be a scheme. The following are equivalent:*

- (1) X is Cohen-Macaulay,
- (2) X is locally Noetherian and all of its local rings are Cohen-Macaulay, and
- (3) X is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X,x}$ is Cohen-Macaulay.

Proof. Algebra, Lemma 10.100.5 says that the localization of a Cohen-Macaulay local ring is Cohen-Macaulay. The lemma follows by combining this with Lemma 27.5.2, with the existence of closed points on locally Noetherian schemes (Lemma 27.5.8), and the definitions. \square

Lemma 27.8.3. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is Cohen-Macaulay.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian and Cohen-Macaulay.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian and Cohen-Macaulay.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Cohen-Macaulay.*

Moreover, if X is Cohen-Macaulay then every open subscheme is Cohen-Macaulay.

Proof. Combine Lemmas 27.5.2 and 27.8.2. \square

More information on Cohen-Macaulay schemes and depth can be found in Cohomology of Schemes, Section 29.11.

27.9. Regular schemes

Recall, see Algebra, Definition 10.59.9, that a local Noetherian ring (R, \mathfrak{m}) is said to be *regular* if \mathfrak{m} can be generated by $\dim(R)$ elements. Recall that a Noetherian ring R is said to be *regular* if every local ring $R_{\mathfrak{p}}$ of R is regular, see Algebra, Definition 10.106.7.

Definition 27.9.1. Let X be a scheme. We say X is *regular*, or *nonsingular* if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of x such that the ring $\mathcal{O}_X(U)$ is Noetherian and regular.

Lemma 27.9.2. *Let X be a scheme. The following are equivalent:*

- (1) X is regular,
- (2) X is locally Noetherian and all of its local rings are regular, and
- (3) X is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X,x}$ is regular.

Proof. By the discussion in Algebra preceding Algebra, Definition 10.106.7 we know that the localization of a regular local ring is regular. The lemma follows by combining this with Lemma 27.5.2, with the existence of closed points on locally Noetherian schemes (Lemma 27.5.8), and the definitions. \square

Lemma 27.9.3. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is regular.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian and regular.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian and regular.*

- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is regular.*

Moreover, if X is regular then every open subscheme is regular.

Proof. Combine Lemmas 27.5.2 and 27.9.2. □

Lemma 27.9.4. *A regular scheme is normal.*

Proof. See Algebra, Lemma 10.146.5. □

27.10. Dimension

The dimension of a scheme is just the dimension of its underlying topological space.

Definition 27.10.1. Let X be a scheme.

- (1) The *dimension* of X is just the dimension of X as a topological spaces, see Topology, Definition 5.9.1.
- (2) For $x \in X$ we denote $\dim_x(X)$ the dimension of the underlying topological space of X at x as in Topology, Definition 5.9.1. We say $\dim_x(X)$ is the *dimension of X at x* .

As a scheme has a sober underlying topological space (Schemes, Lemma 25.11.1) we may compute the dimension of X as the supremum of the lengths n of chains

$$T_0 \subset T_1 \subset \dots \subset T_n$$

of irreducible closed subsets of X , or as the supremum of the lengths n of chains of specializations

$$\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$$

of points of X .

Lemma 27.10.2. *Let X be a scheme. The following are equal*

- (1) *The dimension of X .*
- (2) *The supremum of the dimensions of the local rings of X .*
- (3) *The supremum of $\dim_x(X)$ for $x \in X$.*

Proof. Note that given a chain of specializations

$$\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$$

of points of X all of the points ξ_i correspond to prime ideals of the local ring of X at ξ_0 by Schemes, Lemma 25.13.2. Hence we see that the dimension of X is the supremum of the dimensions of its local rings. In particular $\dim_x(X) \geq \dim(\mathcal{O}_{X,x})$ as $\dim_x(X)$ is the minimum of the dimensions of open neighbourhoods of x . Thus $\sup_{x \in X} \dim_x(X) \geq \dim(X)$. On the other hand, it is clear that $\sup_{x \in X} \dim_x(X) \leq \dim(X)$ as $\dim(U) \leq \dim(X)$ for any open subset of X . □

Lemma 27.10.3. *A locally Noetherian scheme of dimension 0 is a disjoint union of spectra of Artinian local rings.*

Proof. A Noetherian ring of dimension 0 is a finite product of Artinian local rings, see Algebra, Proposition 10.59.6. Hence an affine open of a locally Noetherian scheme X of dimension 0 has discrete underlying topological space. This implies that the topology on X is discrete. The lemma follows easily from these remarks. □

27.11. Catenary schemes

Recall that a topological space X is called *catenary* if for every pair of irreducible closed subsets $T \subset T'$ there exist a maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \dots \subset T_e = T'$$

and every such chain has the same length. See Topology, Definition 5.10.4.

Definition 27.11.1. Let S be a scheme. We say S is *catenary* if the underlying topological space of S is catenary.

Recall that a ring A is called *catenary* if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$ there exists a maximal chain of primes

$$\mathfrak{p} = \mathfrak{p}_0 \subset \dots \subset \mathfrak{p}_e = \mathfrak{q}$$

and all of these have the same length. See Algebra, Definition 10.101.1.

Lemma 27.11.2. *Let S be a scheme. The following are equivalent*

- (1) S is catenary,
- (2) there exists an open covering of S all of whose members are catenary schemes,
- (3) for every affine open $\text{Spec}(R) = U \subset S$ the ring R is catenary, and
- (4) there exists an affine open covering $S = \bigcup U_i$ such that each U_i is the spectrum of a catenary ring.

Moreover, in this case any locally closed subscheme of S is catenary as well.

Proof. Combine Topology, Lemma 5.10.5, and Algebra, Lemma 10.101.2. \square

Lemma 27.11.3. *Let S be a locally Noetherian scheme. The following are equivalent:*

- (1) S is catenary, and
- (2) locally in the Zariski topology there exists a dimension function on S (see Topology, Definition 5.19.1).

Proof. This follows from Topology, Lemmas 5.10.5, 5.19.2, and 5.19.4, Schemes, Lemma 25.11.1 and finally Lemma 27.5.5. \square

Lemma 27.11.4. *Let X be a scheme. Let $Y \subset X$ be an irreducible closed subset. Let $\xi \in Y$ be the generic point. Then*

$$\text{codim}(Y, X) = \dim(\mathcal{O}_{X, \xi})$$

where the codimension is as defined in Topology, Definition 5.10.1.

Proof. By Topology, Lemma 5.10.2 we may replace X by an affine open neighbourhood of ξ . In this case the result follows easily from Algebra, Lemma 10.25.3. \square

In particular the dimension of a scheme is the supremum of the dimensions of all of its local rings. It turns out that we can use this lemma to characterize a catenary scheme as a scheme all of whose local rings are catenary.

Lemma 27.11.5. *Let X be a scheme. The following are equivalent*

- (1) X is catenary, and
- (2) for any $x \in X$ the local ring $\mathcal{O}_{X, x}$ is catenary.

Proof. Assume X is catenary. Let $x \in X$. By Lemma 27.11.2 we may replace X by an affine open neighbourhood of x , and then $\Gamma(X, \mathcal{O}_X)$ is a catenary ring. By Algebra, Lemma 10.101.3 any localization of a catenary ring is catenary. Whence $\mathcal{O}_{X,x}$ is catenary.

Conversely assume all local rings of X are catenary. Let $Y \subset Y'$ be an inclusion of irreducible closed subsets of X . Let $\xi \in Y$ be the generic point. Let $\mathfrak{p} \subset \mathcal{O}_{X,\xi}$ be the prime corresponding to the generic point of Y' , see Schemes, Lemma 25.13.2. By that same lemma the irreducible closed subsets of X in between Y and Y' correspond to primes $\mathfrak{q} \subset \mathcal{O}_{X,\xi}$ with $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}_\xi$. Hence we see all maximal chains of these are finite and have the same length as $\mathcal{O}_{X,\xi}$ is a catenary ring. \square

27.12. Serre's conditions

Here are two technical notions that are often useful. See also Cohomology of Schemes, Section 29.11.

Definition 27.12.1. Let X be a locally Noetherian scheme. Let $k \geq 0$.

- (1) We say X is *regular in codimension k* , or we say X has property (R_k) if for every $x \in X$ we have

$$\dim(\mathcal{O}_{X,x}) \leq k \Rightarrow \mathcal{O}_{X,x} \text{ is regular}$$

- (2) We say X has property (S_k) if for every $x \in X$ we have $\text{depth}(\mathcal{O}_{X,x}) \geq \min(k, \dim(\mathcal{O}_{X,x}))$.

The phrase “regular in codimension k ” makes sense since we have seen in Section 27.11 that if $Y \subset X$ is irreducible closed with generic point x , then $\dim(\mathcal{O}_{X,x}) = \text{codim}(Y, X)$. For example condition (R_0) means that for every generic point $\eta \in X$ of an irreducible component of X the local ring $\mathcal{O}_{X,\eta}$ is a field. But for general Noetherian schemes it can happen that the regular locus of X is badly behaved, so care has to be taken.

Lemma 27.12.2. *Let X be a locally Noetherian scheme. Then X is Cohen-Macaulay if and only if X has (S_k) for all $k \geq 0$.*

Proof. By Lemma 27.8.2 we reduce to looking at local rings. Hence the lemma is true because a Noetherian local ring is Cohen-Macaulay if and only if it has depth equal to its dimension. \square

Lemma 27.12.3. *Let X be a locally Noetherian scheme. Then X is reduced if and only if X has properties (S_1) and (R_0) .*

Proof. This is Algebra, Lemma 10.146.3. \square

Lemma 27.12.4. *Let X be a locally Noetherian scheme. Then X is normal if and only if X has properties (S_2) and (R_1) .*

Proof. This is Algebra, Lemma 10.146.4. \square

27.13. Japanese and Nagata schemes

The notions considered in this section are not prominently defined in EGA. A “universally Japanese scheme” is mentioned and defined in [DG67, IV Corollary 5.11.4]. A “Japanese scheme” is mentioned in [DG67, IV Remark 10.4.14 (ii)] but no definition is given. A Nagata scheme (as given below) occurs in a few places in the literature (see for example [Liu02, Definition 8.2.30] and [Gre76, Page 142]).

We briefly recall that a domain R is called *Japanese* if the integral closure of R in any finite extension of its fraction field is finite over R . A ring R is called *universally Japanese* if for any finite type ring map $R \rightarrow S$ with S a domain S is Japanese. A ring R is called *Nagata* if it is Noetherian and R/\mathfrak{p} is Japanese for every prime \mathfrak{p} of R .

Definition 27.13.1. Let X be a scheme.

- (1) Assume X integral. We say X is *Japanese* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is Japanese (see Algebra, Definition 10.150.1).
- (2) We say X is *universally Japanese* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is universally Japanese (see Algebra, Definition 10.150.15).
- (3) We say X is *Nagata* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is Nagata (see Algebra, Definition 10.150.15).

Being Nagata is the same thing as being locally Noetherian and universally Japanese, see Lemma 27.13.8.

Remark 27.13.2. In [Hoo72] a (locally Noetherian) scheme X is called Japanese if for every $x \in X$ and every associated prime \mathfrak{p} of $\mathcal{O}_{X,x}$ the ring $\mathcal{O}_{X,x}/\mathfrak{p}$ is Japanese. We do not use this definition since it is not clear that this gives the same notion as above for Noetherian integral schemes. In other words, we do not know whether a Noetherian domain all of whose local rings are Japanese is Japanese. If you do please email stacks.project@gmail.com. On the other hand, we could circumvent this problem by calling a scheme X Japanese if for every affine open $\text{Spec}(A) \subset X$ the ring A/\mathfrak{p} is Japanese for every associated prime \mathfrak{p} of A .

Lemma 27.13.3. *A Nagata scheme is locally Noetherian.*

Proof. This is true because a Nagata ring is Noetherian by definition. □

Lemma 27.13.4. *Let X be an integral scheme. The following are equivalent:*

- (1) *The scheme X is Japanese.*
- (2) *For every affine open $U \subset X$ the domain $\mathcal{O}_X(U)$ is Japanese.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Japanese.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Japanese.*

Moreover, if X is Japanese then every open subscheme is Japanese.

Proof. This follows from Lemma 27.4.3 and Algebra, Lemmas 10.150.3 and 10.150.4. □

Lemma 27.13.5. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is universally Japanese.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is universally Japanese.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is universally Japanese.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is universally Japanese.*

Moreover, if X is universally Japanese then every open subscheme is universally Japanese.

Proof. This follows from Lemma 27.4.3 and Algebra, Lemmas 10.150.18 and 10.150.21. \square

Lemma 27.13.6. *Let X be a scheme. The following are equivalent:*

- (1) *The scheme X is Nagata.*
- (2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Nagata.*
- (3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Nagata.*
- (4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Nagata.*

Moreover, if X is Nagata then every open subscheme is Nagata.

Proof. This follows from Lemma 27.4.3 and Algebra, Lemmas 10.150.20 and 10.150.21. \square

Lemma 27.13.7. *Let X be a locally Noetherian scheme. Then X is Nagata if and only if every integral closed subscheme $Z \subset X$ is Japanese.*

Proof. Assume X is Nagata. Let $Z \subset X$ be an integral closed subscheme. Let $z \in Z$. Let $\text{Spec}(A) = U \subset X$ be an affine open containing z such that A is Nagata. Then $Z \cap U \cong \text{Spec}(A/\mathfrak{p})$ for some prime \mathfrak{p} , see Schemes, Lemma 25.10.1 (and Definition 27.3.1). By Algebra, Definition 10.150.15 we see that A/\mathfrak{p} is Japanese. Hence Z is Japanese by definition.

Assume every integral closed subscheme of X is Japanese. Let $\text{Spec}(A) = U \subset X$ be any affine open. As X is locally Noetherian we see that A is Noetherian (Lemma 27.5.2). Let $\mathfrak{p} \subset A$ be a prime ideal. We have to show that A/\mathfrak{p} is Japanese. Let $T \subset U$ be the closed subset $V(\mathfrak{p}) \subset \text{Spec}(A)$. Let $\overline{T} \subset X$ be the closure. Then \overline{T} is irreducible as the closure of an irreducible subset. Hence the reduced closed subscheme defined by \overline{T} is an integral closed subscheme (called \overline{T} again), see Schemes, Lemma 25.12.4. In other words, $\text{Spec}(A/\mathfrak{p})$ is an affine open of an integral closed subscheme of X . This subscheme is Japanese by assumption and by Lemma 27.13.4 we see that A/\mathfrak{p} is Japanese. \square

Lemma 27.13.8. *Let X be a scheme. The following are equivalent:*

- (1) *X is Nagata, and*
- (2) *X is locally Noetherian and universally Japanese.*

Proof. This is Algebra, Proposition 10.150.30. \square

This discussion will be continued in Morphisms, Section 28.19.

27.14. The singular locus

Here is the definition.

Definition 27.14.1. Let X be a locally Noetherian scheme. The *regular locus* $\text{Reg}(X)$ of X is the set of $x \in X$ such that $\mathcal{O}_{X,x}$ is a regular local ring. The *singular locus* $\text{Sing}(X)$ is the complement $X \setminus \text{Reg}(X)$, i.e., the set of points $x \in X$ such that $\mathcal{O}_{X,x}$ is not a regular local ring.

The regular locus of a locally Noetherian scheme is stable under generalizations, see the discussion preceding Algebra, Definition 10.106.7. However, for general locally Noetherian schemes the regular locus need not be open. In More on Algebra, Section 15.36 the reader can find some criteria for when this is the case. We will discuss this further in Morphisms, Section 28.20.

27.15. Quasi-affine schemes

Definition 27.15.1. A scheme X is called *quasi-affine* if it is quasi-compact and isomorphic to an open subscheme of an affine scheme.

Lemma 27.15.2. *Let X be a scheme. Let $f \in \Gamma(X, \mathcal{O}_X)$. Denote X_f the maximal open subscheme of X where f is invertible, see Schemes, Lemma 25.6.2 or Modules, Lemma 17.21.7. If X is quasi-compact and quasi-separated, the canonical map*

$$\Gamma(X, \mathcal{O}_X)_f \longrightarrow \Gamma(X_f, \mathcal{O}_X)$$

is an isomorphism. Moreover, if \mathcal{F} is a quasi-coherent sheaf of \mathcal{O}_X -modules the map

$$\Gamma(X, \mathcal{F})_f \longrightarrow \Gamma(X_f, \mathcal{F})$$

is an isomorphism.

Proof. Write $R = \Gamma(X, \mathcal{O}_X)$. Consider the canonical morphism

$$\varphi : X \longrightarrow \text{Spec}(R)$$

of schemes, see Schemes, Lemma 25.6.4. Then the inverse image of the standard open $D(f)$ on the right hand side is X_f on the left hand side. Moreover, since X is assumed quasi-compact and quasi-separated the morphism φ is quasi-compact and quasi-separated, see Schemes, Lemma 25.19.2 and 25.21.14. Hence by Schemes, Lemma 25.24.1 we see that $\varphi_*\mathcal{F}$ is quasi-coherent. Hence we see that $\varphi_*\mathcal{F} = \widetilde{M}$ with $M = \Gamma(X, \mathcal{F})$ as an R -module. Thus we see that

$$\Gamma(X_f, \mathcal{F}) = \Gamma(D(f), \varphi_*\mathcal{F}) = \Gamma(D(f), \widetilde{M}) = M_f$$

which is exactly the content of the lemma. The case of $\mathcal{F} = \mathcal{O}_X$ will give the first displayed isomorphism of the lemma. \square

Lemma 27.15.3. *Let X be a scheme. Let $f \in \Gamma(X, \mathcal{O}_X)$. Assume X is quasi-compact and quasi-separated and assume that X_f is affine. Then the canonical morphism*

$$j : X \longrightarrow \text{Spec}(\Gamma(X, \mathcal{O}_X))$$

from Schemes, Lemma 25.6.4 induces an isomorphism of $X_f = j^{-1}(D(f))$ onto the standard affine open $D(f) \subset \text{Spec}(\Gamma(X, \mathcal{O}_X))$.

Proof. This is clear as j induces an isomorphism of rings $\Gamma(X, \mathcal{O}_X)_f \rightarrow \mathcal{O}_X(X_f)$ by Lemma 27.15.2 above. \square

Lemma 27.15.4. *Let X be a scheme. Then X is quasi-affine if and only if the canonical morphism*

$$X \longrightarrow \operatorname{Spec}(\Gamma(X, \mathcal{O}_X))$$

from Schemes, Lemma 25.6.4 is a quasi-compact open immersion.

Proof. If the displayed morphism is a quasi-compact open immersion then X is isomorphic to a quasi-compact open subscheme of $\operatorname{Spec}(\Gamma(X, \mathcal{O}_X))$ and clearly X is quasi-affine.

Assume X is quasi-affine, say $X \subset \operatorname{Spec}(R)$ is quasi-compact open. This in particular implies that X is separated, see Schemes, Lemma 25.23.8. Let $A = \Gamma(X, \mathcal{O}_X)$. Consider the ring map $R \rightarrow A$ coming from $R = \Gamma(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)})$ and the restriction mapping of the sheaf $\mathcal{O}_{\operatorname{Spec}(R)}$. By Schemes, Lemma 25.6.4 we obtain a factorization:

$$X \longrightarrow \operatorname{Spec}(A) \longrightarrow \operatorname{Spec}(R)$$

of the inclusion morphism. Let $x \in X$. Choose $r \in R$ such that $x \in D(r)$ and $D(r) \subset X$. Denote $f \in A$ the image of r in A . The open X_f of Lemma 27.15.2 above is equal to $D(r) \subset X$ and hence $A_f \cong R_r$ by the conclusion of that lemma. Hence $D(r) \rightarrow \operatorname{Spec}(A)$ is an isomorphism onto the standard affine open $D(f)$ of $\operatorname{Spec}(A)$. Since X can be covered by such affine opens $D(f)$ we win. \square

Lemma 27.15.5. *Let $U \rightarrow V$ be an open immersion of quasi-affine schemes. Then*

$$\begin{array}{ccc} U & \xrightarrow{j} & \operatorname{Spec}(\Gamma(U, \mathcal{O}_U)) \\ \downarrow & & \downarrow \\ U & \xrightarrow{j'} & \operatorname{Spec}(\Gamma(V, \mathcal{O}_V)) \end{array}$$

is cartesian.

Proof. The diagram is commutative by Schemes, Lemma 25.6.4. Write $A = \Gamma(U, \mathcal{O}_U)$ and $B = \Gamma(V, \mathcal{O}_V)$. Let $g \in B$ be such that V_g is affine and contained in U . This means that if f is the image of g in A , then $U_f = V_g$. By Lemma 27.15.3 we see that j' induces an isomorphism of V_g with the standard open $D(g)$ of $\operatorname{Spec}(B)$. Thus $V_g \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(A)$ is an isomorphism onto $D(f) \subset \operatorname{Spec}(A)$. By Lemma 27.15.3 again j maps U_f isomorphically to $D(f)$. Thus we see that $U_f = U_f \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A)$. Since by Lemma 27.15.4 we can cover U by $V_g = U_f$ as above, we see that $U \rightarrow U \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A)$ is an isomorphism. \square

27.16. Characterizing modules of finite type and finite presentation

Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The following lemma implies that \mathcal{F} is of finite type (see Modules, Definition 17.9.1) if and only if \mathcal{F} is on each open affine $\operatorname{Spec}(A) = U \subset X$ of the form \widetilde{M} for some finite type A -module M . Similarly, \mathcal{F} is of finite presentation (see Modules, Definition 17.11.1) if and only if \mathcal{F} is on each open affine $\operatorname{Spec}(A) = U \subset X$ of the form \widetilde{M} for some finitely presented A -module M .

Lemma 27.16.1. *Let $X = \operatorname{Spec}(R)$ be an affine scheme. The quasi-coherent sheaf of \mathcal{O}_X -modules \widetilde{M} is a finite type \mathcal{O}_X -module if and only if M is a finite R -module.*

Proof. Assume \widetilde{M} is a finite type \mathcal{O}_X -module. This means there exists an open covering of X such that \widetilde{M} restricted to the members of this covering is globally generated by finitely many sections. Thus there also exists a standard open covering $X = \bigcup_{i=1, \dots, n} D(f_i)$ such that $\widetilde{M}|_{D(f_i)}$ is generated by finitely many sections. Thus M_{f_i} is finitely generated for each i . Hence we conclude by Algebra, Lemma 10.23.2. \square

Lemma 27.16.2. *Let $X = \text{Spec}(R)$ be an affine scheme. The quasi-coherent sheaf of \mathcal{O}_X -modules \widetilde{M} is an \mathcal{O}_X -module of finite presentation if and only if M is an R -module of finite presentation.*

Proof. Assume \widetilde{M} is an \mathcal{O}_X -module of finite presentation. By Lemma 27.16.1 we see that M is a finite R -module. Choose a surjection $R^n \rightarrow M$ with kernel K . By Schemes, Lemma 25.5.4 there is a short exact sequence

$$0 \rightarrow \widetilde{K} \rightarrow \bigoplus \mathcal{O}_X^{\oplus n} \rightarrow \widetilde{M} \rightarrow 0$$

By Modules, Lemma 17.11.3 we see that \widetilde{K} is a finite type \mathcal{O}_X -module. Hence by Lemma 27.16.1 again we see that K is a finite R -module. Hence M is an R -module of finite presentation. \square

27.17. Flat modules

On any ringed space (X, \mathcal{O}_X) we know what it means for an \mathcal{O}_X -module to be flat (at a point), see Modules, Definition 17.16.1 (Definition 17.16.3). On an affine scheme this matches the notion defined in the algebra chapter.

Lemma 27.17.1. *Let $X = \text{Spec}(R)$ be an affine scheme. Let $\mathcal{F} = \widetilde{M}$ for some R -module M . The quasi-coherent sheaf \mathcal{F} is a flat \mathcal{O}_X -module if and only if M is a flat R -module.*

Proof. Flatness of \mathcal{F} may be checked on the stalks, see Modules, Lemma 17.16.2. The same is true in the case of modules over a ring, see Algebra, Lemma 10.38.19. And since $\mathcal{F}_x = M_{\mathfrak{p}}$ if x corresponds to \mathfrak{p} the lemma is true. \square

27.18. Locally free modules

On any ringed space we know what it means for an \mathcal{O}_X -module to be (finite) locally free. On an affine scheme this matches the notion defined in the algebra chapter.

Lemma 27.18.1. *Let $X = \text{Spec}(R)$ be an affine scheme. Let $\mathcal{F} = \widetilde{M}$ for some R -module M . The quasi-coherent sheaf \mathcal{F} is a (finite) locally free \mathcal{O}_X -module if and only if M is a (finite) locally free R -module.*

Proof. Follows from the definitions, see Modules, Definition 17.14.1 and Algebra, Definition 10.75.1. \square

We can characterize finite locally free modules in many different ways.

Lemma 27.18.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The following are equivalent:*

- (1) \mathcal{F} is a flat \mathcal{O}_X -module of finite presentation,
- (2) \mathcal{F} is \mathcal{O}_X -module of finite presentation and for all $x \in X$ the stalk \mathcal{F}_x is a free $\mathcal{O}_{X,x}$ -module,

- (3) \mathcal{F} is a locally free, finite type \mathcal{O}_X -module,
- (4) \mathcal{F} is a finite locally free \mathcal{O}_X -module, and
- (5) \mathcal{F} is an \mathcal{O}_X -module of finite type, for every $x \in X$ the stalk \mathcal{F}_x is a free $\mathcal{O}_{X,x}$ -module, and the function

$$\rho_{\mathcal{F}} : X \rightarrow \mathbf{Z}, \quad x \mapsto \dim_{\kappa(x)} \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is locally constant in the Zariski topology on X .

Proof. This lemma immediately reduces to the affine case. In this case the lemma is a reformulation of Algebra, Lemma 10.75.2. The translation uses Lemmas 27.16.1, 27.16.2, 27.17.1, and 27.18.1. \square

27.19. Locally projective modules

A consequence of the work done in the algebra chapter is that it makes sense to define a locally projective module as follows.

Definition 27.19.1. Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. We say \mathcal{F} is *locally projective* if for every affine open $U \subset X$ the $\mathcal{O}_X(U)$ -module $\mathcal{F}(U)$ is projective.

Lemma 27.19.2. Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The following are equivalent

- (1) \mathcal{F} is locally projective, and
- (2) there exists an affine open covering $X = \bigcup U_i$ such that the $\mathcal{O}_X(U_i)$ -module $\mathcal{F}(U_i)$ is projective for every i .

In particular, if $X = \text{Spec}(A)$ and $\mathcal{F} = \widetilde{M}$ then \mathcal{F} is locally projective if and only if M is a projective A -module.

Proof. First, note that if M is a projective A -module and $A \rightarrow B$ is a ring map, then $M \otimes_A B$ is a projective B -module, see Algebra, Lemma 10.91.1. Hence if U is an affine open such that $\mathcal{F}(U)$ is a projective $\mathcal{O}_X(U)$ -module, then the standard open $D(f)$ is an affine open such that $\mathcal{F}(D(f))$ is a projective $\mathcal{O}_X(D(f))$ -module for all $f \in \mathcal{O}_X(U)$. Assume (2) holds. Let $U \subset X$ be an arbitrary affine open. We can find an open covering $U = \bigcup_{j=1, \dots, m} D(f_j)$ by finitely many standard opens $D(f_j)$ such that for each j the open $D(f_j)$ is a standard open of some U_i , see Schemes, Lemma 25.11.5. Hence, if we set $A = \mathcal{O}_X(U)$ and if M is an A -module such that $\mathcal{F}|_U$ corresponds to M , then we see that M_{f_j} is a projective A_{f_j} -module. It follows that $A \rightarrow B = \prod A_{f_j}$ is a faithfully flat ring map such that $M \times_A B$ is a projective B -module. Hence M is projective by Algebra, Theorem 10.92.5. \square

Lemma 27.19.3. Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{G} be a quasi-coherent \mathcal{O}_Y -module. If \mathcal{G} is locally projective on Y , then $f^*\mathcal{G}$ is locally projective on X .

Proof. See Algebra, Lemma 10.91.1. \square

27.20. Extending quasi-coherent sheaves

It is sometimes useful to be able to show that a given quasi-coherent sheaf on an open subscheme extends to the whole scheme.

Lemma 27.20.1. Let $j : U \rightarrow X$ be a quasi-compact open immersion of schemes.

- (1) Any quasi-coherent sheaf on U extends to a quasi-coherent sheaf on X .
- (2) Let \mathcal{F} be a quasi-coherent sheaf on X . Let $\mathcal{G} \subset \mathcal{F}|_U$ be a quasi-coherent subsheaf. There exists a quasi-coherent subsheaf \mathcal{H} of \mathcal{F} such that $\mathcal{H}|_U = \mathcal{G}$ as subsheaves of $\mathcal{F}|_U$.
- (3) Let \mathcal{F} be a quasi-coherent sheaf on X . Let \mathcal{G} be a quasi-coherent sheaf on U . Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}|_U$ be a morphism of \mathcal{O}_U -modules. There exists a quasi-coherent sheaf \mathcal{H} of \mathcal{O}_X -modules and a map $\psi : \mathcal{H} \rightarrow \mathcal{F}$ such that $\mathcal{H}|_U = \mathcal{G}$ and that $\psi|_U = \varphi$.

Proof. An immersion is separated (see Schemes, Lemma 25.23.7) and j is quasi-compact by assumption. Hence for any quasi-coherent sheaf \mathcal{G} on U the sheaf $j_*\mathcal{G}$ is an extension to X . See Schemes, Lemma 25.24.1 and Sheaves, Section 6.31.

Assume \mathcal{F}, \mathcal{G} are as in (2). Then $j_*\mathcal{G}$ is a quasi-coherent sheaf on X (see above). It is a subsheaf of $j_*j^*\mathcal{F}$. Hence the kernel

$$\mathcal{H} = \text{Ker}(\mathcal{F} \oplus j_*\mathcal{G} \longrightarrow j_*j^*\mathcal{F})$$

is quasi-coherent as well, see Schemes, Section 25.24. It is formal to check that $\mathcal{H} \subset \mathcal{F}$ and that $\mathcal{H}|_U = \mathcal{G}$ (using the material in Sheaves, Section 6.31 again).

The same proof as above works. Just take $\mathcal{H} = \text{Ker}(\mathcal{F} \oplus j_*\mathcal{G} \rightarrow j_*j^*\mathcal{F})$ with its obvious map to \mathcal{F} and its obvious identification with \mathcal{G} over U . \square

Lemma 27.20.2. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{G} \subset \mathcal{F}|_U$ be a quasi-coherent \mathcal{O}_U -submodule which is of finite type. Then there exists a quasi-coherent submodule $\mathcal{G}' \subset \mathcal{F}$ which is of finite type such that $\mathcal{G}'|_U = \mathcal{G}$.*

Proof. Let n be the minimal number of affine opens $U_i \subset X$, $i = 1, \dots, n$ such that $X = U \cup \bigcup U_i$. (Here we use that X is quasi-compact.) Suppose we can prove the lemma for the case $n = 1$. Then we can successively extend \mathcal{G} to a \mathcal{G}_1 over $U \cup U_1$ to a \mathcal{G}_2 over $U \cup U_1 \cup U_2$ to a \mathcal{G}_3 over $U \cup U_1 \cup U_2 \cup U_3$, and so on. Thus we reduce to the case $n = 1$.

Thus we may assume that $X = U \cup V$ with V affine. Since X is quasi-separated and U, V are quasi-compact open, we see that $U \cap V$ is a quasi-compact open. It suffices to prove the lemma for the system $(V, U \cap V, \mathcal{F}|_V, \mathcal{G}|_{U \cap V})$ since we can glue the resulting sheaf \mathcal{G}' over V to the given sheaf \mathcal{G} over U along the common value over $U \cap V$. Thus we reduce to the case where X is affine.

Assume $X = \text{Spec}(R)$. Write $\mathcal{F} = \widetilde{M}$ for some R -module M . By Lemma 27.20.1 above we may find a quasi-coherent subsheaf $\mathcal{H} \subset \mathcal{F}$ which restricts to \mathcal{G} over U . Write $\mathcal{H} = \widetilde{N}$ for some R -module N . For every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that N_f is finitely generated, see Lemma 27.16.1. Since U is quasi-compact we can cover it by finitely many $D(f_i)$ such that N_{f_i} is generated by finitely many elements, say $x_{i,1}/f_i^N, \dots, x_{i,r_i}/f_i^N$. Let $N' \subset N$ be the submodule generated by the elements $x_{i,j}$. Then the subsheaf $\mathcal{G}' := \widetilde{N'} \subset \mathcal{H} \subset \mathcal{F}$ works. \square

Lemma 27.20.3. *Let X be a quasi-compact and quasi-separated scheme. Any quasi-coherent sheaf of \mathcal{O}_X -modules is the directed colimit of its quasi-coherent \mathcal{O}_X -submodules which are of finite type.*

Proof. The colimit is direct because if $\mathcal{G}_1, \mathcal{G}_2$ are quasi-coherent subsheaves of finite type, then $\mathcal{G}_1 + \mathcal{G}_2 \subset \mathcal{F}$ is a quasi-coherent subsheaf of finite type. Let $U \subset X$ be any affine open, and let $s \in \Gamma(U, \mathcal{F})$ be any section. Let $\mathcal{G} \subset \mathcal{F}|_U$ be the subsheaf generated by s . Then clearly \mathcal{G} is quasi-coherent and has finite type as an \mathcal{O}_U -module. By Lemma 27.20.2 we see that \mathcal{G} is the restriction of a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{F}$ which has finite type. Since X has a basis for the topology consisting of affine opens we conclude that every local section of \mathcal{F} is locally contained in a quasi-coherent submodule of finite type. Thus we win. \square

Lemma 27.20.4. (Variant of Lemma 27.20.2 dealing with modules of finite presentation.) Let X be a quasi-compact and quasi-separated scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $U \subset X$ be a quasi-compact open. Let \mathcal{G} be an \mathcal{O}_U -module which of finite presentation. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}|_U$ be a morphism of \mathcal{O}_U -modules. Then there exists an \mathcal{O}_X -module \mathcal{G}' of finite presentation, and a morphism of \mathcal{O}_X -modules $\varphi' : \mathcal{G}' \rightarrow \mathcal{F}$ such that $\mathcal{G}'|_U = \mathcal{G}$ and such that $\varphi'|_U = \varphi$.

Proof. The beginning of the proof is a repeat of the beginning of the proof of Lemma 27.20.2. We write it out carefully anyway.

Let n be the minimal number of affine opens $U_i \subset X$, $i = 1, \dots, n$ such that $X = U \cup \bigcup U_i$. (Here we use that X is quasi-compact.) Suppose we can prove the lemma for the case $n = 1$. Then we can successively extend the pair (\mathcal{G}, φ) to a pair $(\mathcal{G}_1, \varphi_1)$ over $U \cup U_1$ to a pair $(\mathcal{G}_2, \varphi_2)$ over $U \cup U_1 \cup U_2$ to a pair $(\mathcal{G}_3, \varphi_3)$ over $U \cup U_1 \cup U_2 \cup U_3$, and so on. Thus we reduce to the case $n = 1$.

Thus we may assume that $X = U \cup V$ with V affine. Since X is quasi-separated and U quasi-compact, we see that $U \cap V \subset V$ is quasi-compact. Suppose we prove the lemma for the system $(V, U \cap V, \mathcal{F}|_V, \mathcal{G}|_{U \cap V}, \varphi|_{U \cap V})$ thereby producing (\mathcal{G}', φ') over V . Then we can glue \mathcal{G}' over V to the given sheaf \mathcal{G} over U along the common value over $U \cap V$, and similarly we can glue the map φ' to the map φ along the common value over $U \cap V$. Thus we reduce to the case where X is affine.

Assume $X = \text{Spec}(R)$. By Lemma 27.20.1 above we may find a quasi-coherent sheaf \mathcal{H} with a map $\psi : \mathcal{H} \rightarrow \mathcal{F}$ over X which restricts to \mathcal{G} and φ over U . By Lemma 27.20.2 we can find a finite type quasi-coherent \mathcal{O}_X -submodule $\mathcal{H}' \subset \mathcal{H}$ such that $\mathcal{H}'|_U = \mathcal{G}$. Thus after replacing \mathcal{H} by \mathcal{H}' and ψ by the restriction of ψ to \mathcal{H}' we may assume that \mathcal{H} is of finite type. By Lemma 27.16.2 we conclude that $\mathcal{H} = \tilde{N}$ with N a finitely generated R -module. Hence there exists a surjection as in the following short exact sequence of quasi-coherent \mathcal{O}_X -modules

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}_X^{\oplus n} \rightarrow \mathcal{H} \rightarrow 0$$

where \mathcal{K} is defined as the kernel. Since \mathcal{G} is of finite presentation and $\mathcal{H}|_U = \mathcal{G}$ by Modules, Lemma 17.11.3 the restriction $\mathcal{K}|_U$ is an \mathcal{O}_U -module of finite type. Hence by Lemma 27.20.2 again we see that there exists a finite type quasi-coherent \mathcal{O}_X -submodule $\mathcal{K}' \subset \mathcal{K}$ such that $\mathcal{K}'|_U = \mathcal{K}|_U$. The solution to the problem posed in the lemma is to set

$$\mathcal{G}' = \mathcal{O}_X^{\oplus n} / \mathcal{K}'$$

which is clearly of finite presentation and restricts to give \mathcal{G} on U with φ' equal to the composition

$$\mathcal{G}' = \mathcal{O}_X^{\oplus n} / \mathcal{K}' \rightarrow \mathcal{O}_X^{\oplus n} / \mathcal{K} = \mathcal{H} \xrightarrow{\psi} \mathcal{F}.$$

This finishes the proof of the lemma. \square

The following lemma says that every quasi-coherent sheaf on a quasi-compact and quasi-separated scheme is a filtered colimit of \mathcal{O} -modules of finite presentation. Actually, we reformulate this in (perhaps more familiar) terms of directed colimits over posets in the next lemma.

Lemma 27.20.5. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. There exist*

- (1) *a filtered index category \mathcal{I} (see Categories, Definition 4.19.1),*
- (2) *a diagram $\mathcal{I} \rightarrow \text{Mod}(\mathcal{O}_X)$ (see Categories, Section 4.14), $i \mapsto \mathcal{F}_i$,*
- (3) *morphisms of \mathcal{O}_X -modules $\varphi_i : \mathcal{F}_i \rightarrow \mathcal{F}$*

such that each \mathcal{F}_i is of finite presentation and such that the morphisms φ_i induce an isomorphism

$$\text{colim}_i \mathcal{F}_i = \mathcal{F}.$$

Proof. Choose a set I and for each $i \in I$ an \mathcal{O}_X -module of finite presentation and a homomorphism of \mathcal{O}_X -modules $\varphi_i : \mathcal{F}_i \rightarrow \mathcal{F}$ with the following property: For any $\psi : \mathcal{G} \rightarrow \mathcal{F}$ with \mathcal{G} of finite presentation there is an $i \in I$ such that there exists an isomorphism $\alpha : \mathcal{F}_i \rightarrow \mathcal{G}$ with $\varphi_i = \psi \circ \alpha$. It is clear from Modules, Lemma 17.9.8 that such a set exists (see also its proof). We denote \mathcal{I} the category with $\text{Ob}(\mathcal{I}) = I$ and given $i, i' \in I$ we set

$$\text{Mor}_{\mathcal{I}}(i, i') = \{\alpha : \mathcal{F}_i \rightarrow \mathcal{F}_{i'} \mid \alpha \circ \varphi_i = \varphi_{i'}\}.$$

We claim that \mathcal{I} is a filtered category and that $\mathcal{F} = \text{colim}_i \mathcal{F}_i$.

Let $i, i' \in I$. Then we can consider the morphism

$$\mathcal{F}_i \oplus \mathcal{F}_{i'} \longrightarrow \mathcal{F}$$

which is the direct sum of φ_i and $\varphi_{i'}$. Since a direct sum of finitely presented \mathcal{O}_X -modules is finitely presented we see that there exists some $i'' \in I$ such that $\varphi_{i''} : \mathcal{F}_{i''} \rightarrow \mathcal{F}$ is isomorphic to the displayed arrow towards \mathcal{F} above. Since there are commutative diagrams

$$\begin{array}{ccc} \mathcal{F}_i & \longrightarrow & \mathcal{F} \\ \downarrow & & \parallel \\ \mathcal{F}_i \oplus \mathcal{F}_{i'} & \longrightarrow & \mathcal{F} \end{array} \quad \text{and} \quad \begin{array}{ccc} \mathcal{F}_{i'} & \longrightarrow & \mathcal{F} \\ \downarrow & & \parallel \\ \mathcal{F}_i \oplus \mathcal{F}_{i'} & \longrightarrow & \mathcal{F} \end{array}$$

we see that there are morphisms $i \rightarrow i''$ and $i' \rightarrow i''$ in \mathcal{I} . Next, suppose that we have $i, i' \in I$ and morphisms $\alpha, \beta : i \rightarrow i'$ (corresponding to \mathcal{O}_X -module maps $\alpha, \beta : \mathcal{F}_i \rightarrow \mathcal{F}_{i'}$). In this case consider the coequalizer

$$\mathcal{G} = \text{Coker}(\mathcal{F}_i \xrightarrow{\alpha - \beta} \mathcal{F}_{i'})$$

Note that \mathcal{G} is an \mathcal{O}_X -module of finite presentation. Since by definition of morphisms in the category \mathcal{I} we have $\varphi_{i'} \circ \alpha = \varphi_{i'} \circ \beta$ we see that we get an induced map $\psi : \mathcal{G} \rightarrow \mathcal{F}$. Hence again the pair (\mathcal{G}, ψ) is isomorphic to the pair $(\mathcal{F}_{i''}, \varphi_{i''})$ for some i'' . Hence we see that there exists a morphism $i' \rightarrow i''$ in \mathcal{I} which equalizes α and β . Thus we have shown that the category \mathcal{I} is filtered.

We still have to show that the colimit of the diagram is \mathcal{F} . By definition of the colimit, and by our definition of the category \mathcal{I} there is a canonical map

$$\varphi : \text{colim}_i \mathcal{F}_i \longrightarrow \mathcal{F}.$$

Pick $x \in X$. Let us show that φ_x is an isomorphism. Recall that

$$(\operatorname{colim}_i \mathcal{F}_i)_x = \operatorname{colim}_i \mathcal{F}_{i,x},$$

see Sheaves, Section 6.29. First we show that the map φ_x is injective. Suppose that $s \in \mathcal{F}_{i,x}$ is an element such that s maps to zero in \mathcal{F}_x . Then there exists a quasi-compact open U such that s comes from $s \in \mathcal{F}_i(U)$ and such that $\varphi_i(s) = 0$ in $\mathcal{F}(U)$. By Lemma 27.20.2 we can find a finite type quasi-coherent subsheaf $\mathcal{K} \subset \operatorname{Ker}(\varphi_i)$ which restricts to the quasi-coherent \mathcal{O}_U -submodule of \mathcal{F}_i generated by s : $\mathcal{K}|_U = \mathcal{O}_U \cdot s \subset \mathcal{F}_i|_U$. Clearly, $\mathcal{F}_i/\mathcal{K}$ is of finite presentation and the map φ_i factors through the quotient map $\mathcal{F}_i \rightarrow \mathcal{F}_i/\mathcal{K}$. Hence we can find an $i' \in I$ and a morphism $\alpha : \mathcal{F}_i \rightarrow \mathcal{F}_{i'}$ in \mathcal{I} which can be identified with the quotient map $\mathcal{F}_i \rightarrow \mathcal{F}_i/\mathcal{K}$. Then it follows that the section s maps to zero in $\mathcal{F}_{i'}(U)$ and in particular in $(\operatorname{colim}_i \mathcal{F}_i)_x = \operatorname{colim}_i \mathcal{F}_{i,x}$. The injectivity follows. Finally, we show that the map φ_x is surjective. Pick $s \in \mathcal{F}_x$. Choose a quasi-compact open neighbourhood $U \subset X$ of x such that s corresponds to a section $s \in \mathcal{F}(U)$. Consider the map $s : \mathcal{O}_U \rightarrow \mathcal{F}$ (multiplication by s). By Lemma 27.20.4 there exists an \mathcal{O}_X -module \mathcal{G} of finite presentation and an \mathcal{O}_X -module map $\mathcal{G} \rightarrow \mathcal{F}$ such that $\mathcal{G}|_U \rightarrow \mathcal{F}|_U$ is identified with $s : \mathcal{O}_U \rightarrow \mathcal{F}$. Again by definition of \mathcal{I} there exists an $i \in I$ such that $\mathcal{G} \rightarrow \mathcal{F}$ is isomorphic to $\varphi_i : \mathcal{F}_i \rightarrow \mathcal{F}$. Clearly there exists a section $s' \in \mathcal{F}_i(U)$ mapping to $s \in \mathcal{F}(U)$. This proves surjectivity and the proof of the lemma is complete. \square

Lemma 27.20.6. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. There exist*

- (1) *a directed partially ordered set I (see Categories, Definition 4.21.2),*
- (2) *a system $(\mathcal{F}_i, \varphi_{ii'})$ over I in $\operatorname{Mod}(\mathcal{O}_X)$ (see Categories, Definition 4.21.1)*
- (3) *morphisms of \mathcal{O}_X -modules $\varphi_i : \mathcal{F}_i \rightarrow \mathcal{F}$*

such that each \mathcal{F}_i is of finite presentation and such that the morphisms φ_i induce an isomorphism

$$\operatorname{colim}_i \mathcal{F}_i = \mathcal{F}.$$

Proof. This is a direct consequence of Lemma 27.20.5 and Categories, Lemma 4.21.3 (combined with the fact that colimits exist in the category of sheaves of \mathcal{O}_X -modules, see Sheaves, Section 6.29). \square

Lemma 27.20.7. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then \mathcal{F} is the directed colimit of its finite type quasi-coherent submodules.*

Proof. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are finite type quasi-coherent \mathcal{O}_X -submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another finite type quasi-coherent \mathcal{O}_X -submodule which contains both of them. In this way we see that the system is directed. To show that \mathcal{F} is the colimit of this system, write $\mathcal{F} = \operatorname{colim}_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 27.20.6. Then the images $\mathcal{G}_i = \operatorname{Im}(\mathcal{F}_i \rightarrow \mathcal{F})$ are finite type quasi-coherent subsheaves of \mathcal{F} . Since \mathcal{F} is the colimit of these the result follows. \square

Lemma 27.20.8. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Then we can write $\mathcal{F} = \lim \mathcal{F}_i$ with \mathcal{F}_i of finite presentation and all transition maps $\mathcal{F}_i \rightarrow \mathcal{F}_{i'}$ surjective.*

Proof. Write $\mathcal{F} = \operatorname{colim} \mathcal{G}_i$ as a filtered colimit of finitely presented \mathcal{O}_X -modules (Lemma 27.20.6). We claim that $\mathcal{G}_i \rightarrow \mathcal{F}$ is surjective for some i . Namely, choose a finite affine open covering $X = U_1 \cup \dots \cup U_m$. Choose sections $s_{jl} \in \mathcal{F}(U_j)$ generating $\mathcal{F}|_{U_j}$, see Lemma 27.16.1. By Sheaves, Lemma 6.29.1 we see that s_{jl} is in the image of $\mathcal{G}_i \rightarrow \mathcal{F}$ for i large enough. Hence $\mathcal{G}_i \rightarrow \mathcal{F}$ is surjective for i large enough. Choose such an i and let $\mathcal{K} \subset \mathcal{G}_i$ be the kernel of the map $\mathcal{G}_i \rightarrow \mathcal{F}$. Write $\mathcal{K} = \operatorname{colim} \mathcal{K}_a$ as the filtered colimit of its finite type quasi-coherent submodules (Lemma 27.20.7). Then $\mathcal{F} = \operatorname{colim} \mathcal{G}_i/\mathcal{K}_a$ is a solution to the problem posed by the lemma. \square

Lemma 27.20.9. *Let X be a quasi-compact and quasi-separated scheme. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Let $U \subset X$ be a quasi-compact open such that $\mathcal{F}|_U$ is of finite presentation. Then there exists a map of \mathcal{O}_X -modules $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ with (a) \mathcal{G} of finite presentation, (b) φ is surjective, and (c) $\varphi|_U$ is an isomorphism.*

Proof. Write $\mathcal{F} = \operatorname{colim} \mathcal{F}_i$ as a directed colimit with each \mathcal{F}_i of finite presentation, see Lemma 27.20.6. Choose a finite affine open covering $X = \bigcup V_j$ and choose finitely many sections $s_{jl} \in \mathcal{F}(V_j)$ generating $\mathcal{F}|_{V_j}$, see Lemma 27.16.1. By Sheaves, Lemma 6.29.1 we see that s_{jl} is in the image of $\mathcal{F}_i \rightarrow \mathcal{F}$ for i large enough. Hence $\mathcal{F}_i \rightarrow \mathcal{F}$ is surjective for i large enough. Choose such an i and let $\mathcal{K} \subset \mathcal{F}_i$ be the kernel of the map $\mathcal{F}_i \rightarrow \mathcal{F}$. Since $\mathcal{F}|_U$ is of finite presentation, we see that $\mathcal{K}|_U$ is of finite type, see Modules, Lemma 17.11.3. Hence we can find a finite type quasi-coherent submodule $\mathcal{K}' \subset \mathcal{K}$ with $\mathcal{K}'|_U = \mathcal{K}|_U$, see Lemma 27.20.2. Then $\mathcal{G} = \mathcal{F}_i/\mathcal{K}'$ with the given map $\mathcal{G} \rightarrow \mathcal{F}$ is a solution. \square

Let X be a scheme. In the following lemma we use the notion of a *quasi-coherent \mathcal{O}_X -algebra \mathcal{A} of finite presentation*. This means that for every affine open $\operatorname{Spec}(R) \subset X$ we have $\mathcal{A} = \tilde{A}$ where A is a (commutative) R -algebra which is of finite presentation as an R -algebra.

Lemma 27.20.10. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{A} be a quasi-coherent \mathcal{O}_X -algebra. There exist*

- (1) *a directed partially ordered set I (see Categories, Definition 4.21.2),*
- (2) *a system $(\mathcal{A}_i, \varphi_{ii'})$ over I in the category of \mathcal{O}_X -algebras,*
- (3) *morphisms of \mathcal{O}_X -algebras $\varphi_i : \mathcal{A}_i \rightarrow \mathcal{A}$*

such that each \mathcal{A}_i is a quasi-coherent \mathcal{O}_X -algebra of finite presentation and such that the morphisms φ_i induce an isomorphism

$$\operatorname{colim}_i \mathcal{A}_i = \mathcal{A}.$$

Proof. First we write $\mathcal{A} = \operatorname{colim}_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 27.20.6. For each i let $\mathcal{B}_i = \operatorname{Sym}(\mathcal{F}_i)$ be the symmetric algebra on \mathcal{F}_i over \mathcal{O}_X . Write $\mathcal{I}_i = \operatorname{Ker}(\mathcal{B}_i \rightarrow \mathcal{A})$. Write $\mathcal{I}_i = \operatorname{colim}_j \mathcal{F}_{i,j}$ where $\mathcal{F}_{i,j}$ is a finite type quasi-coherent submodule of \mathcal{I}_i , see Lemma 27.20.7. Set $\mathcal{I}_{i,j} \subset \mathcal{I}_i$ equal to the \mathcal{B}_i -ideal generated by $\mathcal{F}_{i,j}$. Set $\mathcal{A}_{i,j} = \mathcal{B}_i/\mathcal{I}_{i,j}$. Then $\mathcal{A}_{i,j}$ is a quasi-coherent finitely presented \mathcal{O}_X -algebra. Define $(i, j) \leq (i', j')$ if $i \leq i'$ and the map $\mathcal{B}_i \rightarrow \mathcal{B}_{i'}$ maps the ideal $\mathcal{I}_{i,j}$ into the ideal $\mathcal{I}_{i',j'}$. Then it is clear that $\mathcal{A} = \operatorname{colim}_{i,j} \mathcal{A}_{i,j}$. \square

Let X be a scheme. In the following lemma we use the notion of a *quasi-coherent \mathcal{O}_X -algebra \mathcal{A} of finite type*. This means that for every affine open $\operatorname{Spec}(R) \subset X$

we have $\mathcal{A} = \widetilde{A}$ where A is a (commutative) R -algebra which is of finite type as an R -algebra.

Lemma 27.20.11. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{A} be a quasi-coherent \mathcal{O}_X -algebra. Then \mathcal{A} is the directed colimit of its finite type quasi-coherent \mathcal{O}_X -subalgebras.*

Proof. Omitted. Hint: Compare with the proof of Lemma 27.20.7. \square

Let X be a scheme. In the following lemma we use the notion of a *finite (resp. integral) quasi-coherent \mathcal{O}_X -algebra* \mathcal{A} . This means that for every affine open $\text{Spec}(R) \subset X$ we have $\mathcal{A} = \widetilde{A}$ where A is a (commutative) R -algebra which is finite (resp. integral) as an R -algebra.

Lemma 27.20.12. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{A} be a finite quasi-coherent \mathcal{O}_X -algebra. Then $\mathcal{A} = \text{colim } \mathcal{A}_i$ is a directed colimit of finite and finitely presented quasi-coherent \mathcal{O}_X -algebras such that all transition maps $\mathcal{A}_{i'} \rightarrow \mathcal{A}_i$ are surjective.*

Proof. By Lemma 27.20.8 there exists a finitely presented \mathcal{O}_X -module \mathcal{F} and a surjection $\mathcal{F} \rightarrow \mathcal{A}$. Using the algebra structure we obtain a surjection

$$\text{Sym}_{\mathcal{O}_X}^*(\mathcal{F}) \longrightarrow \mathcal{A}$$

Denote \mathcal{J} the kernel. Write $\mathcal{J} = \text{colim } \mathcal{E}_i$ as a filtered colimit of finite type \mathcal{O}_X -submodules \mathcal{E}_i (Lemma 27.20.7). Set

$$\mathcal{A}_i = \text{Sym}_{\mathcal{O}_X}^*(\mathcal{F})/(\mathcal{E}_i)$$

where (\mathcal{E}_i) indicates the ideal sheaf generated by the image of $\mathcal{E}_i \rightarrow \text{Sym}_{\mathcal{O}_X}^*(\mathcal{F})$. Then each \mathcal{A}_i is a finitely presented \mathcal{O}_X -algebra, the transition maps are surjections, and $\mathcal{A} = \text{colim } \mathcal{A}_i$. To finish the proof we still have to show that \mathcal{A}_i is a finite \mathcal{O}_X -algebra for i sufficiently large. To do this we choose an affine open covering $X = U_1 \cup \dots \cup U_m$. Take generators $f_{j,1}, \dots, f_{j,N_j} \in \Gamma(U_j, \mathcal{F})$. As $\mathcal{A}(U_j)$ is a finite $\mathcal{O}_X(U_j)$ -algebra we see that for each k there exists a monic polynomial $P_{j,k} \in \mathcal{O}(U_j)[T]$ such that $P_{j,k}(f_{j,k})$ is zero in $\mathcal{A}(U_j)$. Since $\mathcal{A} = \text{colim } \mathcal{A}_i$ by construction, we have $P_{j,k}(f_{j,k}) = 0$ in $\mathcal{A}_i(U_j)$ for all sufficiently large i . For such i the algebras \mathcal{A}_i are finite. \square

Lemma 27.20.13. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let \mathcal{A} be an integral quasi-coherent \mathcal{O}_X -algebra. Then*

- (1) \mathcal{A} is the directed colimit of its finite quasi-coherent \mathcal{O}_X -subalgebras, and
- (2) \mathcal{A} is a direct colimit of finite and finitely presented quasi-coherent \mathcal{O}_X -algebras.

Proof. By Lemma 27.20.11 we have $\mathcal{A} = \text{colim } \mathcal{A}_i$ where $\mathcal{A}_i \subset \mathcal{A}$ runs through the quasi-coherent \mathcal{O}_X -algebras of finite type. Any finite type quasi-coherent \mathcal{O}_X -subalgebra of \mathcal{A} is finite (apply Algebra, Lemma 10.35.5 to $\mathcal{A}_i(U) \subset \mathcal{A}(U)$ for affine opens U in X). This proves (1).

To prove (2), write $\mathcal{A} = \text{colim } \mathcal{F}_i$ as a colimit of finitely presented \mathcal{O}_X -modules using Lemma 27.20.6. For each i , let \mathcal{J}_i be the kernel of the map

$$\text{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i) \longrightarrow \mathcal{A}$$

For $i' \geq i$ there is an induced map $\mathcal{J}_i \rightarrow \mathcal{J}_{i'}$ and we have $\mathcal{A} = \text{colim } \text{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/\mathcal{J}_i$. Moreover, the quasi-coherent \mathcal{O}_X -algebras $\text{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/\mathcal{J}_i$ are finite (see above).

Write $\mathcal{J}_i = \operatorname{colim} \mathcal{E}_{ik}$ as a colimit of finitely presented \mathcal{O}_X -modules. Given $i' \geq i$ and k there exists a k' such that we have a map $\mathcal{E}_{ik} \rightarrow \mathcal{E}_{i'k'}$ making

$$\begin{array}{ccc} \mathcal{J}_i & \longrightarrow & \mathcal{J}_{i'} \\ \uparrow & & \uparrow \\ \mathcal{E}_{ik} & \longrightarrow & \mathcal{E}_{i'k'} \end{array}$$

commute. This follows from Modules, Lemma 17.11.6. This induces a map

$$\mathcal{A}_{ik} = \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/(\mathcal{E}_{ik}) \longrightarrow \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_{i'})/(\mathcal{E}_{i'k'}) = \mathcal{A}_{i'k'}$$

where (\mathcal{E}_{ik}) denotes the ideal generated by \mathcal{E}_{ik} . The quasi-coherent \mathcal{O}_X -algebras \mathcal{A}_{ki} are of finite presentation and finite for k large enough (see proof of Lemma 27.20.12). Finally, we have

$$\operatorname{colim} \mathcal{A}_{ik} = \operatorname{colim} \mathcal{A}_i = \mathcal{A}$$

Namely, the first equality was shown in the proof of Lemma 27.20.12 and the second equality because \mathcal{A} is the colimit of the modules \mathcal{F}_i . \square

27.21. Gabber's result

In this section we prove a result of Gabber which guarantees that on every scheme there exists a cardinal κ such that every quasi-coherent module \mathcal{F} is the union of its quasi-coherent κ -generated subsheaves. It follows that the category of quasi-coherent sheaves on a scheme is a Grothendieck abelian category having limits and enough injectives².

Definition 27.21.1. Let (X, \mathcal{O}_X) be a ringed space. Let κ be an infinite cardinal. We say a sheaf of \mathcal{O}_X -modules \mathcal{F} is κ -generated if there exists an open covering $X = \bigcup U_i$ such that $\mathcal{F}|_{U_i}$ is generated by a subset $R_i \subset \mathcal{F}(U_i)$ whose cardinality is at most κ .

Note that a direct sum of at most κ κ -generated modules is again κ -generated because $\kappa \otimes \kappa = \kappa$, see Sets, Section 3.6. In particular this holds for the direct sum of two κ -generated modules. Moreover, a quotient of a κ -generated sheaf is κ -generated. (But the same needn't be true for submodules.)

Lemma 27.21.2. Let (X, \mathcal{O}_X) be a ringed space. Let κ be a cardinal. There exists a set T and a family $(\mathcal{F}_t)_{t \in T}$ of κ -generated \mathcal{O}_X -modules such that every κ -generated \mathcal{O}_X -module is isomorphic to one of the \mathcal{F}_t .

Proof. There is a set of coverings of X (provided we disallow repeats). Suppose $X = \bigcup U_i$ is a covering and suppose \mathcal{F}_i is an \mathcal{O}_{U_i} -module. Then there is a set of isomorphism classes of \mathcal{O}_X -modules \mathcal{F} with the property that $\mathcal{F}|_{U_i} \cong \mathcal{F}_i$ since there is a set of glueing maps. This reduces us to proving there is a set of (isomorphism classes of) quotients $\bigoplus_{k \in \kappa} \mathcal{O}_X \rightarrow \mathcal{F}$ for any ringed space X . This is clear. \square

Here is the result the title of this section refers to.

Lemma 27.21.3. Let X be a scheme. There exists a cardinal κ such that every quasi-coherent module \mathcal{F} is the directed colimit of its quasi-coherent κ -generated quasi-coherent subsheaves.

²Nicely explained in a blog post by Akhil Mathew.

Proof. Choose an affine open covering $X = \bigcup_{i \in I} U_i$. For each pair i, j choose an affine open covering $U_i \cap U_j = \bigcup_{k \in I_{ij}} U_{ijk}$. Write $U_i = \text{Spec}(A_i)$ and $U_{ijk} = \text{Spec}(A_{ijk})$. Let κ be any infinite cardinal \geq than the cardinality of any of the sets I, I_{ij} .

Let \mathcal{F} be a quasi-coherent sheaf. Set $M_i = \mathcal{F}(U_i)$ and $M_{ijk} = \mathcal{F}(U_{ijk})$. Note that

$$M_i \otimes_{A_i} A_{ijk} = M_{ijk} = M_j \otimes_{A_j} A_{ijk}.$$

see Schemes, Lemma 25.7.3. Using the axiom of choice we choose a map

$$(i, j, k, m) \mapsto S(i, j, k, m)$$

which associates to every $i, j \in I, k \in I_{ij}$ and $m \in M_i$ a finite subset $S(i, j, k, m) \subset M_j$ such that we have

$$m \otimes 1 = \sum_{m' \in S(i, j, k, m)} m' \otimes a_{m'}$$

in M_{ijk} for some $a_{m'} \in A_{ijk}$. Moreover, let's agree that $S(i, i, k, m) = \{m\}$ for all $i, j = i, k, m$ as above. Fix such a map.

Given a family $\mathcal{S} = (S_i)_{i \in I}$ of subsets $S_i \subset M_i$ of cardinality at most κ we set $\mathcal{S}' = (S'_i)$ where

$$S'_j = \bigcup_{(i, j, k, m) \text{ such that } m \in S_i} S(i, j, k, m)$$

Note that $S_i \subset S'_i$. Note that S'_i has cardinality at most κ because it is a union over a set of cardinality at most κ of finite sets. Set $\mathcal{S}^{(0)} = \mathcal{S}, \mathcal{S}^{(1)} = \mathcal{S}'$ and by induction $\mathcal{S}^{(n+1)} = (\mathcal{S}^{(n)})'$. Then set $\mathcal{S}^{(\infty)} = \bigcup_{n \geq 0} \mathcal{S}^{(n)}$. Writing $\mathcal{S}^{(\infty)} = (S_i^{(\infty)})$ we see that for any element $m \in S_i^{(\infty)}$ the image of m in M_{ijk} can be written as a finite sum $\sum m' \otimes a_{m'}$ with $m' \in S'_j$. In this way we see that setting

$$N_i = A_i\text{-submodule of } M_i \text{ generated by } S_i^{(\infty)}$$

we have

$$N_i \otimes_{A_i} A_{ijk} = N_j \otimes_{A_j} A_{ijk}.$$

as submodules of M_{ijk} . Thus there exists a quasi-coherent subsheaf $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{G}(U_i) = N_i$. Moreover, by construction the sheaf \mathcal{G} is κ -generated.

Let $\{\mathcal{G}_t\}_{t \in T}$ be the set of κ -generated quasi-coherent subsheaves. If $t, t' \in T$ then $\mathcal{G}_t + \mathcal{G}_{t'}$ is also a κ -generated quasi-coherent subsheaf as it is the image of the map $\mathcal{G}_t \oplus \mathcal{G}_{t'} \rightarrow \mathcal{F}$. Hence the system (ordered by inclusion) is directed. The arguments above show that every section of \mathcal{F} over U_i is in one of the \mathcal{G}_t (because we can start with S such that the given section is an element of S_i). Hence $\text{colim}_t \mathcal{G}_t \rightarrow \mathcal{F}$ is both injective and surjective as desired. \square

Proposition 27.21.4. *Let X be a scheme.*

- (1) *The category $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category. Consequently, $QCoh(\mathcal{O}_X)$ has enough injectives and all limits.*
- (2) *The inclusion functor $QCoh(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_X)$ has a right adjoint³*

$$Q : \text{Mod}(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

such that for every quasi-coherent sheaf \mathcal{F} the adjunction mapping $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism.

³This functor is sometimes called the *coherator*.

Proof. Part (1) means $QCoh(\mathcal{O}_X)$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Schemes, Section 25.24 colimits in $QCoh(\mathcal{O}_X)$ exist and agree with colimits in $Mod(\mathcal{O}_X)$. By Modules, Lemma 17.3.2 filtered colimits are exact. Hence (a) and (b) hold. To construct a generator U , pick a cardinal κ as in Lemma 27.21.3. Pick a collection $(\mathcal{F}_t)_{t \in T}$ of κ -generated quasi-coherent sheaves as in Lemma 27.21.2. Set $U = \bigoplus_{t \in T} \mathcal{F}_t$. Since every object of $QCoh(\mathcal{O}_X)$ is a filtered colimit of κ -generated quasi-coherent modules, i.e., of objects isomorphic to \mathcal{F}_t , it is clear that U is a generator. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11.6 and Lemma 19.13.2.

Proof of (2). To construct Q we use the following general procedure. Given an object \mathcal{F} of $Mod(\mathcal{O}_X)$ we consider the functor

$$QCoh(\mathcal{O}_X)^{opp} \longrightarrow Sets, \quad \mathcal{G} \longmapsto \text{Hom}_X(\mathcal{G}, \mathcal{F})$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\text{Hom}_X(\mathcal{G}, \mathcal{F}) = \text{Hom}_X(\mathcal{G}, Q(\mathcal{F}))$ for \mathcal{G} in $QCoh(\mathcal{O}_X)$. By the Yoneda lemma (Categories, Lemma 4.3.5) the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in \mathcal{F} . By construction Q is a right adjoint to the inclusion functor. The fact that $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when \mathcal{F} is quasi-coherent is a formal consequence of the fact that the inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$ is fully faithful. \square

27.22. Sections with support in a closed subset

Given any topological space X , a closed subset $Z \subset X$, and an abelian sheaf \mathcal{F} you can take the subsheaf of sections whose support is contained in Z . If X is a scheme, Z a closed subscheme, and \mathcal{F} a quasi-coherent module there is a variant where you take sections which are scheme theoretically supported on Z . However, in the scheme setting you have to be careful because the resulting \mathcal{O}_X -module may not be quasi-coherent.

Lemma 27.22.1. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be an open subscheme. The following are equivalent:*

- (1) U is retrocompact in X ,
- (2) U is quasi-compact,
- (3) U is a finite union of affine opens, and
- (4) there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ such that $X \setminus U = V(\mathcal{I})$ (set theoretically).

Proof. The equivalence of (1), (2), and (3) follows from Lemma 27.2.3. Assume (1), (2), (3). Let $T = X \setminus U$. By Schemes, Lemma 25.12.4 there exists a unique quasi-coherent sheaf of ideals \mathcal{J} cutting out the reduced induced closed subscheme structure on T . Note that $\mathcal{J}|_U = \mathcal{O}_U$ which is an \mathcal{O}_U -modules of finite type. By Lemma 27.20.2 there exists a quasi-coherent subsheaf $\mathcal{I} \subset \mathcal{J}$ which is of finite type and has the property that $\mathcal{I}|_U = \mathcal{J}|_U$. Then $X \setminus U = V(\mathcal{I})$ and we obtain (4). Conversely, if \mathcal{I} is as in (4) and $W = \text{Spec}(R) \subset X$ is an affine open, then $\mathcal{I}|_W = \tilde{I}$ for some finitely generated ideal $I \subset R$, see Lemma 27.16.1. It follows that $U \cap W = \text{Spec}(R) \setminus V(I)$ is quasi-compact, see Algebra, Lemma 10.28.1. Hence $U \subset X$ is retrocompact by Lemma 27.2.6. \square

Lemma 27.22.2. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Consider the sheaf of \mathcal{O}_X -modules \mathcal{F}' which associates to every open $U \subset X$*

$$\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}s = 0\}$$

Assume \mathcal{I} is of finite type. Then

- (1) \mathcal{F}' is a quasi-coherent sheaf of \mathcal{O}_X -modules,
- (2) on any affine open $U \subset X$ we have $\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}(U)s = 0\}$,
and
- (3) $\mathcal{F}'_x = \{s \in \mathcal{F}_x \mid \mathcal{I}_x s = 0\}$.

Proof. It is clear that the rule defining \mathcal{F}' gives a subsheaf of \mathcal{F} (the sheaf condition is easy to verify). Hence we may work locally on X to verify the other statements. In other words we may assume that $X = \text{Spec}(A)$, $\mathcal{F} = \widetilde{M}$ and $\mathcal{I} = \widetilde{I}$. It is clear that in this case $\mathcal{F}'(U) = \{x \in M \mid Ix = 0\} =: M'$ because \widetilde{I} is generated by its global sections I which proves (2). To show \mathcal{F}' is quasi-coherent it suffices to show that for every $f \in A$ we have $\{x \in M_f \mid I_f x = 0\} = (M')_f$. Write $I = (g_1, \dots, g_t)$, which is possible because \mathcal{I} is of finite type, see Lemma 27.16.1. If $x = y/f^n$ and $I_f x = 0$, then that means that for every i there exists an $m \geq 0$ such that $f^m g_i x = 0$. We may choose one m which works for all i (and this is where we use that I is finitely generated). Then we see that $f^m x \in M'$ and $x/f^n = f^m x / f^{n+m}$ in $(M')_f$ as desired. The proof of (3) is similar and omitted. \square

Definition 27.22.3. Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The subsheaf $\mathcal{F}' \subset \mathcal{F}$ defined in Lemma 27.22.2 above is called the *subsheaf of sections annihilated by \mathcal{I}* .

Lemma 27.22.4. *Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{I} \subset \mathcal{O}_Y$ be a quasi-coherent sheaf of ideals of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of sections annihilated by $f^{-1}\mathcal{I}\mathcal{O}_X$. Then $f_*\mathcal{F}' \subset f_*\mathcal{F}$ is the subsheaf of sections annihilated by \mathcal{I} .*

Proof. Omitted. (Hint: The assumption that f is quasi-compact and quasi-separated implies that $f_*\mathcal{F}$ is quasi-coherent so that Lemma 27.22.2 applies to \mathcal{I} and $f_*\mathcal{F}$.) \square

For an abelian sheaf on a topological space we have discussed the subsheaf of sections with support in a closed subset in Modules, Lemma 17.6.2. For quasi-coherent modules this submodule isn't always a quasi-coherent module, but if the closed subset has a retrocompact complement, then it is.

Lemma 27.22.5. *Let X be a scheme. Let $Z \subset X$ be a closed subset. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Consider the sheaf of \mathcal{O}_X -modules \mathcal{F}' which associates to every open $U \subset X$*

$$\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \text{the support of } s \text{ is contained in } Z \cap U\}$$

If $X \setminus Z$ is a retrocompact open in X , then

- (1) for an affine open $U \subset X$ there exist a finitely generated ideal $I \subset \mathcal{O}_X(U)$ such that $Z \cap U = V(I)$,
- (2) for U and I as in (1) we have $\mathcal{F}'(U) = \{x \in \mathcal{F}(U) \mid I^n x = 0 \text{ for some } n\}$,
- (3) \mathcal{F}' is a quasi-coherent sheaf of \mathcal{O}_X -modules.

Proof. Part (1) is Algebra, Lemma 10.28.1. Let $U = \text{Spec}(A)$ and I be as in (1). Then $\mathcal{F}|_U$ is the quasi-coherent sheaf associated to some A -module M . We have

$$\mathcal{F}'(U) = \{x \in M \mid x = 0 \text{ in } M_{\mathfrak{p}} \text{ for all } \mathfrak{p} \notin Z\}.$$

by Modules, Definition 17.5.1. Thus $x \in \mathcal{F}'(U)$ if and only if $V(\text{Ann}(x)) \subset V(I)$, see Algebra, Lemma 10.39.6. Since I is finitely generated this is equivalent to $I^n x = 0$ for some n . This proves (2).

The rule for \mathcal{F}' indeed defines a submodule of \mathcal{F} . Hence we may work locally on X to verify (3). Let U, I and M be as above. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals corresponding to I . Part (2) implies sections of \mathcal{F}' over any affine open of U are the sections of \mathcal{F} which are annihilated by some power of \mathcal{I} . Hence we see that $\mathcal{F}'|_U = \text{colim } \mathcal{F}_n$, where $\mathcal{F}_n \subset \mathcal{F}|_U$ is the subsheaf of sections annihilated by \mathcal{I}^n , see Definition 27.22.3. Thus (3) follows from Lemma 27.22.2 and that colimits of quasi-coherent modules are quasi-coherent, see Schemes, Section 25.24. \square

Definition 27.22.6. Let X be a scheme. Let $T \subset X$ be a closed subset whose complement is retrocompact in X . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The quasi-coherent subsheaf $\mathcal{F}' \subset \mathcal{F}$ defined in Lemma 27.22.5 is called the *subsheaf of sections supported on T* .

Lemma 27.22.7. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. Let $Z \subset Y$ be a closed subset such that $Y \setminus Z$ is retrocompact in Y . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of sections supported in $f^{-1}Z$. Then $f_*\mathcal{F}' \subset f_*\mathcal{F}$ is the subsheaf of sections supported in Z .

Proof. Omitted. (Hint: First show that $X \setminus f^{-1}Z$ is retrocompact in X as $Y \setminus Z$ is retrocompact in Y . Hence Lemma 27.22.5 applies to $f^{-1}Z$ and \mathcal{F} . As f is quasi-compact and quasi-separated we see that $f_*\mathcal{F}$ is quasi-coherent. Hence Lemma 27.22.5 applies to Z and $f_*\mathcal{F}$. Finally, match the sheaves directly.) \square

27.23. Sections of quasi-coherent sheaves

Here is a computation of sections of a quasi-coherent sheaf on a quasi-compact open of an affine spectrum.

Lemma 27.23.1. Let A be a ring. Let $I \subset A$ be a finitely generated ideal. Let M be an A -module. Then there is a canonical map

$$\text{colim}_n \text{Hom}_A(I^n, M) \longrightarrow \Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M}).$$

This map is always injective. If for all $x \in M$ we have $Ix = 0 \Rightarrow x = 0$ then this map is an isomorphism. In general, set $M_n = \{x \in M \mid I^n x = 0\}$, then there is an isomorphism

$$\text{colim}_n \text{Hom}_A(I^n, M/M_n) \longrightarrow \Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M}).$$

Proof. Since $I^n \subset I^{n+1}$ and $M_n \subset M_{n+1}$ we can use composition via these maps to get canonical maps of A -modules

$$\text{Hom}_A(I^n, M) \longrightarrow \text{Hom}_A(I^{n+1}, M)$$

and

$$\text{Hom}_A(I^n, M/M_n) \longrightarrow \text{Hom}_A(I^{n+1}, M/M_{n+1})$$

which we will use as the transition maps in the systems. Given an A -module map $\varphi : I^n \rightarrow M$, then we get a map of sheaves $\widetilde{\varphi} : \widetilde{I^n} \rightarrow \widetilde{M}$ which we can restrict to

the open $\text{Spec}(A) \setminus V(I)$. Since \widetilde{I}^n restricted to this open gives the structure sheaf we get an element of $\Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M})$. We omit the verification that this is compatible with the transition maps in the system $\text{Hom}_A(\widetilde{I}^n, \widetilde{M})$. This gives the first arrow. To get the second arrow we note that \widetilde{M} and M/M_n agree over the open $\text{Spec}(A) \setminus V(I)$ since the sheaf \widetilde{M}_n is clearly supported on $V(I)$. Hence we can use the same mechanism as before.

Next, we work out how to define this arrow in terms of algebra. Say $I = (f_1, \dots, f_t)$. Then $\text{Spec}(A) \setminus V(I) = \bigcup_{i=1, \dots, t} D(f_i)$. Hence

$$0 \rightarrow \Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M}) \rightarrow \bigoplus_i M_{f_i} \rightarrow \bigoplus_{i,j} M_{f_i f_j}$$

is exact. Suppose that $\varphi : I^n \rightarrow M$ is an A -module map. Consider the vector of elements $\varphi(f_i^n)/f_i^n \in M_{f_i}$. It is easy to see that this vector maps to zero in the second direct sum of the exact sequence above. Whence an element of $\Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M})$. We omit the verification that this description agrees with the one given above.

Let us show that the first arrow is injective using this description. Namely, if φ maps to zero, then for each i the element $\varphi(f_i^n)/f_i^n$ is zero in M_{f_i} . In other words we see that for each i we have $f_i^m \varphi(f_i^n) = 0$ for some $m \geq 0$. We may choose a single m which works for all i . Then we see that $\varphi(f_i^{n+m}) = 0$ for all i . It is easy to see that this means that $\varphi|_{I^{t(n+m-1)+1}} = 0$ in other words that φ maps to zero in the $t(n+m-1)+1$ st term of the colimit. Hence injectivity follows.

Note that each $M_n = 0$ in case we have $Ix = 0 \Rightarrow x = 0$ for $x \in M$. Thus to finish the proof of the lemma it suffices to show that the second arrow is an isomorphism.

Let us attempt to construct an inverse of the second map of the lemma. Let $s \in \Gamma(\text{Spec}(A) \setminus V(I), \widetilde{M})$. This corresponds to a vector x_i/f_i^n with $x_i \in M$ of the first direct sum of the exact sequence above. Hence for each i, j there exists $m \geq 0$ such that $f_i^m f_j^m (f_j^n x_i - f_i^n x_j) = 0$ in M . We may choose a single m which works for all pairs i, j . After replacing x_i by $f_i^m x_i$ and n by $n+m$ we see that we get $f_j^n x_i = f_i^n x_j$ in M for all i, j . Let us introduce

$$K_n = \{x \in M \mid f_1^n x = \dots = f_t^n x = 0\}$$

We claim there is an A -module map

$$\varphi : I^{t(n-1)+1} \longrightarrow M/K_n$$

which maps the monomial $f_1^{e_1} \dots f_t^{e_t}$ with $\sum e_i = t(n-1)+1$ to the class modulo K_n of the expression $f_1^{e_1} \dots f_i^{e_i-n} \dots f_t^{e_t} x_i$ where i is chosen such that $e_i \geq n$ (note that there is at least one such i). To see that this is indeed the case suppose that

$$\sum_{E=(e_1, \dots, e_t), |E|=t(n-1)+1} a_E f_1^{e_1} \dots f_t^{e_t} = 0$$

is a relation between the monomials with coefficients a_E in A . Then we would map this to

$$z = \sum_{E=(e_1, \dots, e_t), |E|=t(n-1)+1} a_E f_1^{e_1} \dots f_{i(E)}^{e_{i(E)}-n} \dots f_t^{e_t} x_{i(E)}$$

where for each multiindex E we have chosen a particular $i(E)$ such that $e_{i(E)} \geq n$. Note that if we multiply this by f_j^n for any j , then we get zero, since by the relations

$f_j^n x_i = f_i^n x_j$ above we get

$$\begin{aligned} f_j^n z &= \sum_{E=(e_1, \dots, e_t), |E|=t(n-1)+1} a_E f_1^{e_1} \dots f_j^{e_j+n} \dots f_{i(E)}^{e_{i(E)}-n} \dots f_t^{e_t} x_{i(E)} \\ &= \sum_{E=(e_1, \dots, e_t), |E|=t(n-1)+1} a_E f_1^{e_1} \dots f_t^{e_t} x_j = 0. \end{aligned}$$

Hence $z \in K_n$ and we see that every relation gets mapped to zero in M/K_n . This proves the claim.

Note that $K_n \subset M_{t(n-1)+1}$. Hence the map φ in particular gives rise to a A -module map $I^{t(n-1)+1} \rightarrow M/M_{t(n-1)+1}$. This proves the second arrow of the lemma is surjective. We omit the proof of injectivity. \square

Example 27.23.2. We will give two examples showing that the first displayed map of Lemma 27.23.1 is not an isomorphism.

Let k be a field. Consider the ring

$$A = k[x, y, z_1, z_2, \dots]/(x^n z_n).$$

Set $I = (x)$ and let $M = A$. Then the element y/x defines a section of the structure sheaf of $\text{Spec}(A)$ over $D(x) = \text{Spec}(A) \setminus V(I)$. We claim that y/x is not in the image of the canonical map $\text{colim Hom}_A(I^n, A) \rightarrow A_x = \mathcal{O}(D(x))$. Namely, if so it would come from a homomorphism $\varphi : I^n \rightarrow A$ for some n . Set $a = \varphi(x^n)$. Then we would have $x^m(xa - x^n y) = 0$ for some $m > 0$. This would mean that $x^{m+1}a = x^{m+n}y$. This would mean that $\varphi(x^{n+m+1}) = x^{m+n}y$. This leads to a contradiction because it would imply that

$$0 = \varphi(0) = \varphi(z_{n+m+1}x^{n+m+1}) = x^{m+n}y z_{n+m+1}$$

which is not true in the ring A .

Let k be a field. Consider the ring

$$A = k[f, g, x, y, \{a_n, b_n\}_{n \geq 1}]/(fy - gx, \{a_n f^n + b_n g^n\}_{n \geq 1}).$$

Set $I = (f, g)$ and let $M = A$. Then $x/f \in A_f$ and $y/g \in A_g$ map to the same element of A_{fg} . Hence these define a section s of the structure sheaf of $\text{Spec}(A)$ over $D(f) \cup D(g) = \text{Spec}(A) \setminus V(I)$. However, there is no $n \geq 0$ such that s comes from an A -module map $\varphi : I^n \rightarrow A$ as in the source of the first displayed arrow of Lemma 27.23.1. Namely, given such a module map set $x_n = \varphi(f^n)$ and $y_n = \varphi(g^n)$. Then $f^m x_n = f^{n+m-1}x$ and $g^m y_n = g^{n+m-1}y$ for some $m \geq 0$ (see proof of the lemma). But then we would have $0 = \varphi(0) = \varphi(a_{n+m}f^{n+m} + b_{n+m}g^{n+m}) = a_{n+m}f^{n+m-1}x + b_{n+m}g^{n+m-1}y$ which is not the case in the ring A .

We will improve on the following lemma in the Noetherian case, see Cohomology of Schemes, Lemma 29.10.4.

Lemma 27.23.3. *Let X be a quasi-compact scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals of finite type. Let $Z \subset X$ be the closed subscheme defined by \mathcal{I} and set $U = X \setminus Z$. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The canonical map*

$$\text{colim}_n \text{Hom}_{\mathcal{O}_X}(I^n, \mathcal{F}) \longrightarrow \Gamma(U, \mathcal{F})$$

is injective. Assume further that X is quasi-separated. Let $\mathcal{F}_n \subset \mathcal{F}$ be subsheaf of sections annihilated by I^n . The canonical map

$$\text{colim}_n \text{Hom}_{\mathcal{O}_X}(I^n, \mathcal{F}/\mathcal{F}_n) \longrightarrow \Gamma(U, \mathcal{F})$$

is an isomorphism.

Proof. Let $\text{Spec}(A) = W \subset X$ be an affine open. Write $\mathcal{F}|_W = \widetilde{M}$ for some A -module M and $\mathcal{I}|_W = \widetilde{I}$ for some finite type ideal $I \subset A$. Restricting the first displayed map of the lemma to W we obtain the first displayed map of Lemma 27.23.1. Since we can cover X by a finite number of affine opens this proves the first displayed map of the lemma is injective.

We have $\mathcal{F}_n|_W = \widetilde{M_n}$ where $M_n \subset M$ is defined as in Lemma 27.23.1 (details omitted). The lemma guarantees that we have a bijection

$$\text{colim}_n \text{Hom}_{\mathcal{O}_W}(\mathcal{I}^n|_W, (\mathcal{F}/\mathcal{F}_n)|_W) \longrightarrow \Gamma(U \cap W, \mathcal{F})$$

for any such affine open W .

To see the second displayed arrow of the lemma is bijective, we choose a finite affine open covering $X = \bigcup_{j=1, \dots, m} W_j$. The injectivity follows immediately from the above and the finiteness of the covering. If X is quasi-separated, then for each pair j, j' we choose a finite affine open covering

$$W_j \cap W_{j'} = \bigcup_{k=1, \dots, m_{jj'}} W_{jj'k}.$$

Let $s \in \Gamma(U, \mathcal{F})$. As seen above for each j there exists an n_j and a map $\varphi_j : \mathcal{I}^{n_j}|_{W_j} \rightarrow (\mathcal{F}/\mathcal{F}_{n_j})|_{W_j}$ which corresponds to $s|_{W_j}$. By the same token for each triple (j, j', k) there exists an integer $n_{jj'k}$ such that the restriction of φ_j and $\varphi_{j'}$ as maps $\mathcal{I}^{n_{jj'k}} \rightarrow \mathcal{F}/\mathcal{F}_{n_{jj'k}}$ agree over $W_{jj'k}$. Let $n = \max\{n_j, n_{jj'k}\}$ and we see that the φ_j glue as maps $\mathcal{I}^n \rightarrow \mathcal{F}/\mathcal{F}_n$ over X . This proves surjectivity of the map. \square

27.24. Ample invertible sheaves

Recall from Modules, Lemma 17.21.7 that given an invertible sheaf \mathcal{L} on a locally ringed space X , and given a global section s of \mathcal{L} the set $X_s = \{x \in X \mid s \notin \mathfrak{m}_x \mathcal{L}_x\}$ is open. A general remark is that $X_s \cap X_{s'} = X_{ss'}$, where ss' denote the section $s \otimes s' \in \Gamma(X, \mathcal{L} \otimes \mathcal{L}')$.

Definition 27.24.1. Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. We say \mathcal{L} is *ample* if

- (1) X is quasi-compact, and
- (2) for every $x \in X$ there exists an $n \geq 1$ and $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $x \in X_s$ and X_s is affine.

Lemma 27.24.2. Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $n \geq 1$. Then \mathcal{L} is ample if and only if $\mathcal{L}^{\otimes n}$ is ample.

Proof. This follows from the fact that $X_{s^n} = X_s$. \square

Lemma 27.24.3. Let X be a scheme. Let \mathcal{L} be an ample invertible \mathcal{O}_X -module. For any closed subscheme $Z \subset X$ the restriction of \mathcal{L} to Z is ample.

Proof. This is clear since a closed subset of a quasi-compact space is quasi-compact and a closed subscheme of an affine scheme is affine (see Schemes, Lemma 25.8.2). \square

Lemma 27.24.4. Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$. For any affine $U \subset X$ the intersection $U \cap X_s$ is affine.

Proof. This translates into the following algebra problem. Let R be a ring. Let N be an invertible R -module (i.e., locally free of rank 1). Let $s \in N$ be an element. Then $U = \{\mathfrak{p} \mid s \notin \mathfrak{p}N\}$ is an affine open subset of $\text{Spec}(R)$. This you can see as follows. Think of s as an R -module map $R \rightarrow N$. This gives rise to R -module maps $N^{\otimes k} \rightarrow N^{\otimes k+1}$. Consider

$$R' = \text{colim}_n N^{\otimes n}$$

with transition maps as above. Define an R -algebra structure on R' by the rule $x \cdot y = x \otimes y \in N^{\otimes n+m}$ if $x \in N^{\otimes n}$ and $y \in N^{\otimes m}$. We claim that $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is an open immersion with image U .

To prove this is a local question on $\text{Spec}(R)$. Let $\mathfrak{p} \in \text{Spec}(R)$. Pick $f \in R$, $f \notin \mathfrak{p}$ such that $N_f \cong R_f$ as a module. Replacing R by R_f , N by N_f and R' by $R'_f = \text{colim}_n N_f^{\otimes n}$ we may assume that $N \cong R$. Say $N = R$. In this case s is an element of R and it is easy to see that $R' \cong R_s$. Thus the lemma follows. \square

Lemma 27.24.5. *Let X be a scheme. Let \mathcal{L} and \mathcal{M} be invertible \mathcal{O}_X -modules. If*

- (1) \mathcal{L} is ample, and
- (2) the open sets X_t where $t \in \Gamma(X, \mathcal{M}^{\otimes m})$ for $m > 0$ cover X ,

then $\mathcal{L} \otimes \mathcal{M}$ is ample.

Proof. We check the conditions of Definition 27.24.1. As \mathcal{L} is ample we see that X is quasi-compact. Let $x \in X$. Choose $n \geq 1$, $m \geq 1$, $s \in \Gamma(X, \mathcal{L}^{\otimes n})$, and $t \in \Gamma(X, \mathcal{M}^{\otimes m})$ such that $x \in X_s$, $x \in X_t$ and X_s is affine. Then $s^m t^n \in \Gamma(X, (\mathcal{L} \otimes \mathcal{M})^{\otimes nm})$, $x \in X_{s^m t^n}$, and $X_{s^m t^n}$ is affine by Lemma 27.24.4. \square

Recall that given a scheme X and an invertible sheaf \mathcal{L} on X we get a graded ring $\Gamma_*(X, \mathcal{L}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{L}^{\otimes n})$, see Modules, Definition 17.21.4. Also, given a sheaf of \mathcal{O}_X -modules we have the graded $\Gamma_*(X, \mathcal{L})$ -module $\Gamma_*(X, \mathcal{F}) = \Gamma_*(X, \mathcal{L}, \mathcal{F})$.

Lemma 27.24.6. *Let X be a scheme. Let \mathcal{L} be an invertible sheaf on X . Let $s \in \Gamma(X, \mathcal{L})$. If X is quasi-compact and quasi-separated, the canonical map*

$$\Gamma_*(X, \mathcal{L})_{(s)} \longrightarrow \Gamma(X_s, \mathcal{O})$$

which maps a/s^n to $a \otimes s^{-n}$ is an isomorphism. Moreover, if \mathcal{F} is a quasi-coherent \mathcal{O}_X -module then the map

$$\Gamma_*(X, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow \Gamma(X_s, \mathcal{F})$$

is an isomorphism.

Proof. Consider the scheme

$$\pi : L^* = \text{Spec}_X \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) \longrightarrow X$$

see Constructions, Section 26.4. Since the inverse image $\pi^{-1}(U)$ of every affine open $U \subset X$ is affine (see Constructions, Lemma 26.4.6), it follows that L^* quasi-compact and separated, since X is assumed quasi-compact and separated (use Schemes, Lemma 25.21.7). Note that s gives rise to an element $f \in \Gamma(L^*, \mathcal{O})$, via $\pi_* \mathcal{O}_{L^*} = \bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}$. Note that $(L^*)_f = \pi^{-1}(X_s)$. Hence we have

$$\begin{aligned} \left(\bigoplus_{n \in \mathbf{Z}} \Gamma(X, \mathcal{L}^{\otimes n}) \right)_s &= \Gamma(L^*, \mathcal{O}_{L^*})_f \\ &= \Gamma((L^*)_f, \mathcal{O}_{L^*}) \\ &= \bigoplus_{n \in \mathbf{Z}} \Gamma(X_s, \mathcal{L}^{\otimes n}) \end{aligned}$$

where the middle “=” is Lemma 27.15.2. The first statement of the lemma follows from this equality by looking at degree zero terms. The second statement also follows from Lemma 27.15.2 applied to the quasi-coherent sheaf of \mathcal{O}_{L^*} -modules $\pi^*\mathcal{F}$ using that

$$\pi_*\pi^*\mathcal{F} = \mathcal{F} \otimes_{\mathcal{O}_X} \left(\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) = \bigoplus_{n \in \mathbf{Z}} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$$

which is proved by computing both sides on affine opens of X . \square

Lemma 27.24.7. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Assume the open sets X_s , where $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ and $n \geq 1$, form a basis for the topology on X . Then among those opens, the open sets X_s which are affine form a basis for the topology on X .*

Proof. Let $x \in X$. Choose an affine open neighbourhood $\text{Spec}(R) = U \subset X$ of x . By assumption, there exists a $n \geq 1$ and a $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $X_s \subset U$. By Lemma 27.24.4 above the intersection $X_s = U \cap X_s$ is affine. Since U can be chosen arbitrarily small we win. \square

Lemma 27.24.8. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Assume for every point x of X there exists $n \geq 1$ and $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $x \in X_s$ and X_s is affine. Then X is separated.*

Proof. By assumption we can find a covering of X by affine opens of the form X_s . To show that X is quasi-separated, by Schemes, Lemma 25.21.7 it suffices to show that $X_s \cap X_{s'}$ is quasi-compact whenever X_s is affine. This is true by Lemma 27.24.4. Finally, to show that X is separated, we can use the valuative criterion, see Schemes, Lemma 25.22.2.

Thus, let A be a valuation ring with fraction field K and consider two morphisms $f, g : \text{Spec}(A) \rightarrow X$ such that the two compositions $\text{Spec}(K) \rightarrow \text{Spec}(A) \rightarrow X$ agree. Then $f^*\mathcal{L}$ corresponds to an A -module M and $g^*\mathcal{L}$ corresponds to an A -module N by our classification of quasi-coherent modules over affine schemes (Schemes, Lemma 25.7.4). The A -modules M and N are locally free of rank 1 (Lemma 27.18.1) and as A is local they are free of rank 1. We are given an isomorphism $N \otimes_A K \cong M \otimes_A K$ because $f|_{\text{Spec}(K)} = g|_{\text{Spec}(K)}$. We fix an isomorphism $M \otimes_A K \cong K \cong N \otimes_A K$ compatible with the given isomorphism above, so that we may think of M and N as A -submodules of K (free of rank 1 over A). Next, choose $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $\text{Im}(f) \subset X_s$ and such that X_s is affine. This is possible by assumption and the fact that A is local, so it suffices to look at the image of the closed point of $\text{Spec}(A)$. Then s corresponds to an element $x \in M^{\otimes n}$ and $y \in N^{\otimes n}$ mapping to the same element of $K^{\otimes n}$ and moreover $x \notin \mathfrak{m}_A M^{\otimes n}$ because $f(\text{Spec}(A)) \subset X_s$. We conclude that $N^{\otimes n} = Ax = Ay \subset M^{\otimes n}$ inside of $K^{\otimes n}$. Thus $N \subset M$. By symmetry we get $M = N$. This in turn implies that $g(\text{Spec}(A)) \subset X_s$. Then $f = g$ because X_s is affine and hence separated, thereby finishing the proof. \square

Lemma 27.24.9. *Let X be a scheme. If there exists an ample invertible sheaf on X then X is separated.*

Proof. Follows immediately from Lemma 27.24.8 and Definition 27.24.1. \square

Lemma 27.24.10. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Set $S = \Gamma_*(X, \mathcal{L})$ as a graded ring. If every point of X is contained in one of the open subschemes X_s , for some $s \in S_+$ homogeneous, then there is a canonical morphism of schemes*

$$f : X \longrightarrow Y = \text{Proj}(S),$$

to the homogeneous spectrum of S (see Constructions, Section 26.8). This morphism has the following properties

- (1) $f^{-1}(D_+(s)) = X_s$ for any $s \in S_+$ homogeneous,
- (2) there are \mathcal{O}_Y -module maps $f^*\mathcal{O}_Y(n) \rightarrow \mathcal{L}^{\otimes n}$ compatible with multiplication maps, see Constructions, Equation (26.10.1.1),
- (3) the compositions $S_n \rightarrow \Gamma(Y, \mathcal{O}_Y(n)) \rightarrow \Gamma(X, \mathcal{L}^{\otimes n})$ are equal to the identity maps, and
- (4) for every $x \in X$ there is an integer $d \geq 1$ and an open neighbourhood $U \subset X$ of x such that $f^*\mathcal{O}_Y(dn)|_U \rightarrow \mathcal{L}^{\otimes dn}|_U$ is an isomorphism for all $n \in \mathbf{Z}$.

Proof. Denote $\psi : S \rightarrow \Gamma_*(X, \mathcal{L})$ the identity map. We are going to use the triple $(U(\psi), r_{\mathcal{L}, \psi}, \theta)$ of Constructions, Lemma 26.14.1. By assumption the open subscheme $U(\psi)$ equals X . Hence $r_{\mathcal{L}, \psi} : U(\psi) \rightarrow Y$ is defined on all of X . We set $f = r_{\mathcal{L}, \psi}$. The maps in part (2) are the components of θ . Part (3) follows from condition (2) in the lemma cited above. Part (1) follows from (3) combined with condition (1) in the lemma cited above. Part (4) follows from the last statement in Constructions, Lemma 26.14.1 since the map α mentioned there is an isomorphism. \square

Lemma 27.24.11. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Set $S = \Gamma_*(X, \mathcal{L})$. Assume (a) every point of X is contained in one of the open subschemes X_s , for some $s \in S_+$ homogeneous, and (b) X is quasi-compact. Then the canonical morphism of schemes $f : X \rightarrow \text{Proj}(S)$ of Lemma 27.24.10 above is quasi-compact.*

Proof. It suffices to show that $f^{-1}(D_+(s))$ is quasi-compact for any $s \in S_+$ homogeneous. Write $X = \bigcup_{i=1, \dots, n} X_i$ as a finite union of affine opens. By Lemma 27.24.4 each intersection $X_s \cap X_i$ is affine. Hence $X_s = \bigcup_{i=1, \dots, n} X_s \cap X_i$ is quasi-compact. \square

Lemma 27.24.12. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Set $S = \Gamma_*(X, \mathcal{L})$. Assume \mathcal{L} is ample. Then the canonical morphism of schemes $f : X \rightarrow \text{Proj}(S)$ of Lemma 27.24.10 is an open immersion.*

Proof. By Lemma 27.24.8 we see that X is quasi-separated. Choose finitely many $s_1, \dots, s_n \in S_+$ homogeneous such that X_{s_i} are affine, and $X = \bigcup X_{s_i}$. Say s_i has degree d_i . The inverse image of $D_+(s_i)$ under f is X_{s_i} , see Lemma 27.24.10. By Lemma 27.24.6 the ring map

$$(S^{(d_i)})_{(s_i)} = \Gamma(D_+(s_i), \mathcal{O}_{\text{Proj}(S)}) \longrightarrow \Gamma(X_{s_i}, \mathcal{O}_X)$$

is an isomorphism. Hence f induces an isomorphism $X_{s_i} \rightarrow D_+(s_i)$. Thus f is an isomorphism of X onto the open subscheme $\bigcup_{i=1, \dots, n} D_+(s_i)$ of $\text{Proj}(S)$. \square

Lemma 27.24.13. *Let X be a scheme. Let S be a graded ring. Assume X is quasi-compact, and assume there exists an open immersion*

$$j : X \longrightarrow Y = \text{Proj}(S).$$

Then $j^\mathcal{O}_Y(d)$ is an invertible ample sheaf for some $d > 0$.*

Proof. This is Constructions, Lemma 26.10.6. \square

Proposition 27.24.14. *Let X be a quasi-compact scheme. Let \mathcal{L} be an invertible sheaf on X . Set $S = \Gamma_*(X, \mathcal{L})$. The following are equivalent:*

- (1) \mathcal{L} is ample,
- (2) the open sets X_s , with $s \in S_+$ homogeneous, cover X and the associated morphism $X \rightarrow \text{Proj}(S)$ is an open immersion,
- (3) the open sets X_s , with $s \in S_+$ homogeneous, form a basis for the topology of X ,
- (4) the open sets X_s , with $s \in S_+$ homogeneous, which are affine form a basis for the topology of X ,
- (5) for every quasi-coherent sheaf \mathcal{F} on X the sum of the images of the canonical maps

$$\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

with $n \geq 1$ equals \mathcal{F} ,

- (6) same property as (5) with \mathcal{F} ranging over all quasi-coherent sheaves of ideals,
- (7) X is quasi-separated and for every quasi-coherent sheaf \mathcal{F} of finite type on X there exists an integer n_0 such that $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$,
- (8) X is quasi-separated and for every quasi-coherent sheaf \mathcal{F} of finite type on X there exist integers $n > 0$, $k \geq 0$ such that \mathcal{F} is a quotient of a direct sum of k copies of $\mathcal{L}^{\otimes -n}$, and
- (9) same as in (8) with \mathcal{F} ranging over all sheaves of ideals of finite type on X .

Proof. Lemma 27.24.12 is (1) \Rightarrow (2). Lemmas 27.24.2 and 27.24.13 provide the implication (1) \Leftarrow (2). The implications (2) \Rightarrow (4) \Rightarrow (3) are clear from Constructions, Section 26.8. Lemma 27.24.7 is (3) \Rightarrow (1). Thus we see that the first 4 conditions are all equivalent.

Assume the equivalent conditions (1) – (4). Note that in particular X is separated (as an open subscheme of the separated scheme $\text{Proj}(S)$). Let \mathcal{F} be a quasi-coherent sheaf on X . Choose $s \in S_+$ homogeneous such that X_s is affine. We claim that any section $m \in \Gamma(X_s, \mathcal{F})$ is in the image of one of the maps displayed in (5) above. This will imply (5) since these affines X_s cover X . Namely, by Lemma 27.24.6 we may write m as the image of $m' \otimes s^{-n}$ for some $n \geq 1$, some $m' \in \Gamma(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$. This proves the claim.

Clearly (5) \Rightarrow (6). Let us assume (6) and prove \mathcal{L} is ample. Pick $x \in X$. Let $U \subset X$ be an affine open which contains x . Set $Z = X \setminus U$. We may think of Z as a reduced closed subscheme, see Schemes, Section 25.12. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals corresponding to the closed subscheme Z . By assumption (6), there exists an $n \geq 1$ and a section $s \in \Gamma(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n})$ such that s does not vanish at x (more precisely such that $s \notin \mathfrak{m}_x \mathcal{I}_x \otimes \mathcal{L}_x^{\otimes n}$). We may think of s as a section of

$\mathcal{L}^{\otimes n}$. Since it clearly vanishes along Z we see that $X_s \subset U$. Hence X_s is affine, see Lemma 27.24.4. This proves that \mathcal{L} is ample. At this point we have proved that (1) – (6) are equivalent.

Assume the equivalent conditions (1) – (6). In the following we will use the fact that the tensor product of two sheaves of modules which are globally generated is globally generated without further mention (see Modules, Lemma 17.4.3). By (1) we can find elements $s_i \in S_{d_i}$ with $d_i \geq 1$ such that $X = \bigcup_{i=1, \dots, n} X_{s_i}$. Set $d = d_1 \dots d_n$. It follows that $\mathcal{L}^{\otimes d}$ is globally generated by

$$s_1^{d/d_1}, \dots, s_n^{d/d_n}.$$

This means that if $\mathcal{L}^{\otimes j}$ is globally generated then so is $\mathcal{L}^{\otimes j+dn}$ for all $n \geq 0$. Fix a $j \in \{0, \dots, d-1\}$. For any point $x \in X$ there exists an $n \geq 1$ and a global section s of \mathcal{L}^{j+dn} which does not vanish at x , as follows from (5) applied to $\mathcal{F} = \mathcal{L}^{\otimes j}$ and ample invertible sheaf $\mathcal{L}^{\otimes d}$. Since X is quasi-compact there we may find a finite list of integers n_i and global sections s_i of $\mathcal{L}^{\otimes j+dn_i}$ which do not vanish at any point of X . Since $\mathcal{L}^{\otimes d}$ is globally generated this means that $\mathcal{L}^{\otimes j+dn}$ is globally generated where $n = \max\{n_i\}$. Since we proved this for every congruence class mod d we conclude that there exists an $n_0 = n_0(\mathcal{L})$ such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$. At this point we see that if \mathcal{F} is globally generated then so is $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ for all $n \geq n_0$.

We continue to assume the equivalent conditions (1) – (6). Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules of finite type. Denote $\mathcal{F}_n \subset \mathcal{F}$ the image of the canonical map of (5). By construction $\mathcal{F}_n \otimes \mathcal{L}^{\otimes n}$ is globally generated. By (5) we see \mathcal{F} is the sum of the subsheaves \mathcal{F}_n , $n \geq 1$. By Modules, Lemma 17.9.7 we see that $\mathcal{F} = \sum_{n=1, \dots, N} \mathcal{F}_n$ for some $N \geq 1$. It follows that $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ is globally generated whenever $n \geq N + n_0(\mathcal{L})$ with $n_0(\mathcal{L})$ as above. We conclude that (1) – (6) implies (7).

Assume (7). Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules of finite type. By (7) there exists an integer $n \geq 1$ such that the canonical map

$$\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

is surjective. Let I be the set of finite subsets of $\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$ partially ordered by inclusion. Then I is a directed partially ordered set. For $i = \{s_1, \dots, s_{r(i)}\}$ let $\mathcal{F}_i \subset \mathcal{F}$ be the image of the map

$$\bigoplus_{j=1, \dots, r(i)} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

which is multiplication by s_j on the j th factor. The surjectivity above implies that $\mathcal{F} = \text{colim}_{i \in I} \mathcal{F}_i$. Hence Modules, Lemma 17.9.7 applies and we conclude that $\mathcal{F} = \mathcal{F}_i$ for some i . Hence we have proved (8). In other words, (7) \Rightarrow (8).

The implication (8) \Rightarrow (9) is trivial.

Finally, assume (9). Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. By Lemma 27.20.3 (this is where we use the condition that X be quasi-separated) we see that $\mathcal{I} = \text{colim}_{\alpha} I_{\alpha}$ with each I_{α} quasi-coherent of finite type. Since by assumption each of the I_{α} is a quotient of negative tensor powers of \mathcal{L} we conclude the same for \mathcal{I} (but of course without the finiteness or boundedness of the powers). Hence we conclude that (9) implies (6). This ends the proof of the proposition. \square

27.25. Affine and quasi-affine schemes

Lemma 27.25.1. *Let X be a scheme. Then X is quasi-affine if and only if \mathcal{O}_X is ample.*

Proof. Suppose that X is quasi-affine. Consider the open immersion

$$j : X \longrightarrow \operatorname{Spec}(\Gamma(X, \mathcal{O}_X))$$

from Lemma 27.15.4. Note that $\operatorname{Spec}(A) = \operatorname{Proj}(A[T])$, see Constructions, Example 26.8.14. Hence we can apply Lemma 27.24.13 to deduce that \mathcal{O}_X is ample.

Suppose that \mathcal{O}_X is ample. Note that $\Gamma_*(X, \mathcal{O}_X) \cong \Gamma(X, \mathcal{O}_X)[T]$ as graded rings. Hence the result follows from Lemmas 27.24.12 and 27.15.4 taking into account that $\operatorname{Spec}(A) = \operatorname{Proj}(A[T])$ for any ring A as seen above. \square

Lemma 27.25.2. *Let X be a scheme. Suppose that there exist finitely many elements $f_1, \dots, f_n \in \Gamma(X, \mathcal{O}_X)$ such that*

- (1) *each X_{f_i} is an affine open of X , and*
- (2) *the ideal generated by f_1, \dots, f_n in $\Gamma(X, \mathcal{O}_X)$ is equal to the unit ideal.*

Then X is affine.

Proof. Assume we have f_1, \dots, f_n as in the lemma. We may write $1 = \sum g_i f_i$ for some $g_j \in \Gamma(X, \mathcal{O}_X)$ and hence it is clear that $X = \bigcup X_{f_i}$. (The f_i 's cannot all vanish at a point.) Since each X_{f_i} is quasi-compact (being affine) it follows that X is quasi-compact. Hence we see that X is quasi-affine by Lemma 27.25.1 above. Consider the open immersion

$$j : X \rightarrow \operatorname{Spec}(\Gamma(X, \mathcal{O}_X)),$$

see Lemma 27.15.4. The inverse image of the standard open $D(f_i)$ on the right hand side is equal to X_{f_i} on the left hand side and the morphism j induces an isomorphism $X_{f_i} \cong D(f_i)$, see Lemma 27.15.3. Since the f_i generate the unit ideal we see that $\operatorname{Spec}(\Gamma(X, \mathcal{O}_X)) = \bigcup_{i=1, \dots, n} D(f_i)$. Thus j is an isomorphism. \square

27.26. Quasi-coherent sheaves and ample invertible sheaves

Theme of this section: in the presence of an ample invertible sheaf every quasi-coherent sheaf comes from a graded module.

Situation 27.26.1. Let X be a scheme. Let \mathcal{L} be an ample invertible sheaf on X . Set $S = \Gamma_*(X, \mathcal{L})$ as a graded ring. Set $Y = \operatorname{Proj}(S)$. Let $f : X \rightarrow Y$ be the canonical morphism of Lemma 27.24.10. It comes equipped with a \mathbf{Z} -graded \mathcal{O}_X -algebra map $\bigoplus f^* \mathcal{O}_Y(n) \rightarrow \bigoplus \mathcal{L}^{\otimes n}$.

The following lemma is really a special case of the next lemma but it seems like a good idea to point out its validity first.

Lemma 27.26.2. *In Situation 27.26.1. The canonical morphism $f : X \rightarrow Y$ maps X into the open subscheme $W = W_1 \subset Y$ where $\mathcal{O}_Y(1)$ is invertible and where all multiplication maps $\mathcal{O}_Y(n) \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(m) \rightarrow \mathcal{O}_Y(n+m)$ are isomorphisms (see Constructions, Lemma 26.10.4). Moreover, the maps $f^* \mathcal{O}_Y(n) \rightarrow \mathcal{L}^{\otimes n}$ are all isomorphisms.*

Proof. By Proposition 27.24.14 there exists an integer n_0 such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$. Let $x \in X$ be a point. By the above we can find $a \in S_{n_0}$ and $b \in S_{n_0+1}$ such that a and b do not vanish at x . Hence $f(x) \in D_+(a) \cap D_+(b) = D_+(ab)$. By Constructions, Lemma 26.10.4 we see that $f(x) \in W_1$ as desired. By Constructions, Lemma 26.14.1 which was used in the construction of the map f the maps $f^*\mathcal{O}_Y(n_0) \rightarrow \mathcal{L}^{\otimes n_0}$ and $f^*\mathcal{O}_Y(n_0 + 1) \rightarrow \mathcal{L}^{\otimes n_0+1}$ are isomorphisms in a neighbourhood of x . By compatibility with the algebra structure and the fact that f maps into W we conclude all the maps $f^*\mathcal{O}_Y(n) \rightarrow \mathcal{L}^{\otimes n}$ are isomorphisms in a neighbourhood of x . Hence we win. \square

Recall from Modules, Definition 17.21.4 that given a locally ringed space X , an invertible sheaf \mathcal{L} , and a \mathcal{O}_X -module \mathcal{F} we have the graded $\Gamma_*(X, \mathcal{L})$ -module

$$\Gamma(X, \mathcal{L}, \mathcal{F}) = \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}).$$

The following lemma says that, in Situation 27.26.1, we can recover a quasi-coherent \mathcal{O}_X -module \mathcal{F} from this graded module. Take a look also at Constructions, Lemma 26.13.7 where we prove this lemma in the special case $X = \mathbf{P}_R^n$.

Lemma 27.26.3. *In Situation 27.26.1. Let \mathcal{F} be a quasi-coherent sheaf on X . Set $M = \Gamma_*(X, \mathcal{L}, \mathcal{F})$ as a graded S -module. There are isomorphisms*

$$f^*\widetilde{M} \longrightarrow \mathcal{F}$$

functorial in \mathcal{F} such that $M_0 \rightarrow \Gamma(\text{Proj}(S), \widetilde{M}) \rightarrow \Gamma(X, \mathcal{F})$ is the identity map.

Proof. Let $s \in S_+$ be homogeneous such that X_s is affine open in X . Recall that $\widetilde{M}|_{D_+(s)}$ corresponds to the $S_{(s)}$ -module $M_{(s)}$, see Constructions, Lemma 26.8.4. Recall that $f^{-1}(D_+(s)) = X_s$. As X carries an ample invertible sheaf it is quasi-compact and quasi-separated, see Section 27.24. By Lemma 27.24.6 there is a canonical isomorphism $M_{(s)} = \Gamma_*(X, \mathcal{L}, \mathcal{F})_{(s)} \rightarrow \Gamma(X_s, \mathcal{F})$. Since \mathcal{F} is quasi-coherent this leads to a canonical isomorphism

$$f^*\widetilde{M}|_{X_s} \rightarrow \mathcal{F}|_{X_s}$$

Since \mathcal{L} is ample on X we know that X is covered by the affine opens of the form X_s . Hence it suffices to prove that the displayed maps glue on overlaps. Proof of this is omitted. \square

Remark 27.26.4. With assumptions and notation of Lemma 27.26.3. Denote the displayed map of the lemma by $\theta_{\mathcal{F}}$. Note that the isomorphism $f^*\mathcal{O}_Y(n) \rightarrow \mathcal{L}^{\otimes n}$ of Lemma 27.26.2 is just $\theta_{\mathcal{L}^{\otimes n}}$. Consider the multiplication maps

$$\widetilde{M} \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(n) \longrightarrow \widetilde{M}(n)$$

see Constructions, Equation (26.10.1.5). Pull this back to X and consider

$$\begin{array}{ccc} f^*\widetilde{M} \otimes_{\mathcal{O}_X} f^*\mathcal{O}_Y(n) & \longrightarrow & f^*\widetilde{M}(n) \\ \theta_{\mathcal{F}} \otimes \theta_{\mathcal{L}^{\otimes n}} \downarrow & & \downarrow \theta_{\mathcal{F} \otimes \mathcal{L}^{\otimes n}} \\ \mathcal{F} \otimes \mathcal{L}^{\otimes n} & \xrightarrow{\text{id}} & \mathcal{F} \otimes \mathcal{L}^{\otimes n} \end{array}$$

Here we have used the obvious identification $M(n) = \Gamma_*(X, \mathcal{L}, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$. This diagram commutes. Proof omitted.

It should be possible to deduce the following lemma from Lemma 27.26.3 (or conversely) but it seems simpler to just repeat the proof.

Lemma 27.26.5. *Let S be a graded ring such that $X = \text{Proj}(S)$ is quasi-compact and can be covered by opens of the form $D_+(f)$ where f is homogeneous of degree 1. Let \mathcal{F} be a quasi-coherent sheaf on X . Set $M = \Gamma_*(X, \mathcal{O}_X(1), \mathcal{F})$. Think of M as a graded S -module, see Constructions, Section 26.10. There is a canonical isomorphism*

$$\widetilde{M} \longrightarrow \mathcal{F}$$

functorial in \mathcal{F} such that the induced maps $M_n \rightarrow \Gamma(X, \mathcal{F}(n))$ are the identity maps.

Proof. We will use without further mention the results of Constructions, Lemma 26.10.3 (which applies). Let $S' = \Gamma_*(X, \mathcal{O}_X(1))$. There is a graded ring map $S \rightarrow S'$ and M has a graded S' -module structure such that the S -module structure is the restriction of the S' -module structure. Pick $f \in S$ homogeneous of degree 1 with image $s \in S'$. Observe that $M_f \cong M_s$ and $M_{(f)} \cong M_{(s)}$. Also $D_+(f) = X_s$, see Constructions, Lemma 26.10.5. Recall that $\widetilde{M}|_{D_+(f)}$ corresponds to the $S_{(f)}$ -module $M_{(f)}$, see Constructions, Lemma 26.8.4. The scheme X is quasi-compact by assumption and separated by Constructions, Lemma 26.8.8. By Lemma 27.24.6 there is a canonical isomorphism

$$M_{(f)} = M_{(s)} = \Gamma_*(X, \mathcal{O}_X(1), \mathcal{F})_{(s)} \rightarrow \Gamma(X_s, \mathcal{F}).$$

Since \mathcal{F} is quasi-coherent this leads to a canonical isomorphism

$$\widetilde{M}|_{X_s} \rightarrow \mathcal{F}|_{X_s}$$

By assumption the opens $D_+(f) = X_s$ cover the scheme X . Hence it suffices to prove that the displayed maps glue on overlaps. Proof of this is omitted. We also omit the proof of the final statement. \square

27.27. Finding suitable affine opens

In this section we collect some results on the existence of affine opens in more and less general situations.

Lemma 27.27.1. *Let X be a quasi-separated scheme. Let Z_1, \dots, Z_n be pairwise distinct irreducible components of X , see Topology, Section 5.7. Let $\eta_i \in Z_i$ be their generic points, see Schemes, Lemma 25.11.1. There exist affine open neighbourhoods $U_i \in U_i$ such that $U_i \cap U_j = \emptyset$ for all $i \neq j$. In particular, $U = U_1 \cup \dots \cup U_n$ is an affine open containing all of the points η_1, \dots, η_n .*
