Proof. Let V_i be any affine open containing η_i and disjoint from the closed set $Z_1 \cup \dots \cup \widehat{Z}_i \cup \dots \cup Z_n$. Since X is quasi-separated for each i the union $W_i = \bigcup_{j, j \neq i} V_i \cap V_j$ is a quasi-compact open of V_i not containing η_i . We can find open neighbourhoods $U_i \subset V_i$ containing η_i and disjoint from W_i by Algebra, Lemma 10.25.4. Finally, U is affine since it is the spectrum of the ring $R_1 \times \dots \times R_n$ where $R_i = \mathcal{O}_X(U_i)$, see Schemes, Lemma 25.6.8. \square

Remark 27.27.2. Lemma 27.27.1 above is false if X is not quasi-separated. Here is an example. Take $R = \mathbf{Q}[x, y_1, y_2, \dots]/((x - i)y_i)$. Consider the minimal prime ideal $\mathfrak{p} = (y_1, y_2, \dots)$ of R . Glue two copies of $\text{Spec}(R)$ along the (not quasi-compact) open $\text{Spec}(R) \setminus V(\mathfrak{p})$ to get a scheme X (glueing as in Schemes, Example

25.14.3). Then the two maximal points of X corresponding to \mathfrak{p} are not contained in a common affine open. The reason is that any open of $\text{Spec}(R)$ containing \mathfrak{p} contains infinitely many of the “lines” $x = i, y_j = 0, j \neq i$ with parameter y_i . Details omitted.

Notwithstanding the example above, for “most” finite sets of irreducible closed subsets one can apply Lemma 27.27.1 above, at least if X is quasi-compact. This is true because X contains a dense open which is separated.

Lemma 27.27.3. *Let X be a quasi-compact scheme. There exists a dense open $V \subset X$ which is separated.*

Proof. Say $X = \bigcup_{i=1, \dots, n} U_i$ is a union of n affine open subschemes. We will prove the lemma by induction on n . It is trivial for $n = 1$. Let $V' \subset \bigcup_{i=1, \dots, n-1} U_i$ be a separated dense open subscheme, which exists by induction hypothesis. Consider

$$V = V' \prod (U_n \setminus \overline{V'}).$$

It is clear that V is separated and a dense open subscheme of X . □

It turns out that, even if X is quasi-separated as well as quasi-compact, there does not exist a separated, quasi-compact dense open, see Examples, Lemma 82.20.2. Here is a slight refinement of Lemma 27.27.1 above.

Lemma 27.27.4. *Let X be a quasi-separated scheme. Let Z_1, \dots, Z_n be pairwise distinct irreducible components of X . Let $\eta_i \in Z_i$ be their generic points. Let $x \in X$ be arbitrary. There exists an affine open $U \subset X$ containing x and all the η_i .*

Proof. Suppose that $x \in Z_1 \cap \dots \cap Z_r$ and $x \notin Z_{r+1}, \dots, Z_n$. Then we may choose an affine open $W \subset X$ such that $x \in W$ and $W \cap Z_i = \emptyset$ for $i = r+1, \dots, n$. Note that clearly $\eta_i \in W$ for $i = 1, \dots, r$. By Lemma 27.27.1 we may choose affine opens $U_i \subset X$ which are pairwise disjoint such that $\eta_i \in U_i$ for $i = r+1, \dots, n$. Since X is quasi-separated the opens $W \cap U_i$ are quasi-compact and do not contain η_i for $i = r+1, \dots, n$. Hence by Algebra, Lemma 10.25.4 we may shrink U_i such that $W \cap U_i = \emptyset$ for $i = r+1, \dots, n$. Then the union $U = W \cup \bigcup_{i=r+1, \dots, n} U_i$ is disjoint and hence (by Schemes, Lemma 25.6.8) a suitable affine open. □

Lemma 27.27.5. *Let X be a scheme. Assume either*

- (1) *The scheme X is quasi-affine.*
- (2) *The scheme X is isomorphic to a locally closed subscheme of an affine scheme.*
- (3) *There exists an ample invertible sheaf on X .*
- (4) *The scheme X is isomorphic to a locally closed subscheme of $\text{Proj}(S)$ for some graded ring S .*

Then for any finite subset $E \subset X$ there exists an affine open $U \subset X$ with $E \subset U$.

Proof. By Properties, Definition 27.15.1 a quasi-affine scheme is a quasi-compact open subscheme of an affine scheme. Any affine scheme $\text{Spec}(R)$ is isomorphic to $\text{Proj}(R[X])$ where $R[X]$ is graded by setting $\deg(X) = 1$. By Proposition 27.24.14 if X has an ample invertible sheaf then X is isomorphic to an open subscheme of $\text{Proj}(S)$ for some graded ring S . Hence, it suffices to prove the lemma in case (4). (We urge the reader to prove case (2) directly for themselves.)

Thus assume $X \subset \text{Proj}(S)$ is a locally closed subscheme where S is some graded ring. Let $T = \overline{X} \setminus X$. Recall that the standard opens $D_+(f)$ form a basis of the topology on $\text{Proj}(S)$. Since E is finite we may choose finitely many homogeneous elements $f_i \in S_+$ such that

$$E \subset D_+(f_1) \cup \dots \cup D_+(f_n) \subset \text{Proj}(S) \setminus T$$

Suppose that $E = \{\mathfrak{p}_1, \dots, \mathfrak{p}_m\}$ as a subset of $\text{Proj}(S)$. Consider the ideal $I = (f_1, \dots, f_n) \subset S$. Since $I \not\subset \mathfrak{p}_j$ for all $j = 1, \dots, m$ we see from Algebra, Lemma 10.55.6 that there exists a homogeneous element $f \in I$, $f \notin \mathfrak{p}_j$ for all $j = 1, \dots, m$. Then $E \subset D_+(f) \subset D_+(f_1) \cup \dots \cup D_+(f_n)$. Since $D_+(f)$ does not meet T we see that $X \cap D_+(f)$ is a closed subscheme of the affine scheme $D_+(f)$, hence is an affine open of X as desired. \square

Lemma 27.27.6. *Let X be a scheme. Let \mathcal{L} be an ample invertible sheaf on X . Let $E \subset X$ be a finite subset. Then there exists an $n > 0$ and a section $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that X_s is affine and $E \subset X_s$.*

Proof. The reader can modify the proof of Lemma 27.27.5 to prove this lemma; we will instead deduce the lemma from it. By Lemma 27.27.5 we can choose an affine open $U \subset X$ such that $E \subset U$. Consider the graded ring $S = \Gamma_*(X, \mathcal{L}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{L}^{\otimes n})$. For each $x \in E$ let $\mathfrak{p}_x \subset S$ be the graded ideal of sections vanishing at x . It is clear that \mathfrak{p}_x is a prime ideal and since some power of \mathcal{L} is globally generated, it is clear that $S_+ \not\subset \mathfrak{p}_x$. Let $I \subset S$ be the graded ideal of sections vanishing on all points of $X \setminus U$. Since the sets X_s form a basis for the topology we see that $I \not\subset \mathfrak{p}_x$ for all $x \in E$. By (graded) prime avoidance (Algebra, Lemma 10.55.6) we can find $s \in I$ homogeneous with $s \notin \mathfrak{p}_x$ for all $x \in E$. Then $E \subset X_s \subset U$ and X_s is affine by Lemma 27.24.4. \square

Morphisms of Schemes

28.1. Introduction

In this chapter we introduce some types of morphisms of schemes. A basic reference is [DG67].

28.2. Closed immersions

In this section we elucidate some of the results obtained previously on closed immersions of schemes. Recall that a morphism of schemes $i : Z \rightarrow X$ is defined to be a closed immersion if (a) i induces a homeomorphism onto a closed subset of X , (b) $i^\sharp : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective, and (c) the kernel of i^\sharp is locally generated by sections, see Schemes, Definitions 25.10.2 and 25.4.1. It turns out that, given that Z and X are schemes, there are many different ways of characterizing a closed immersion.

Lemma 28.2.1. *Let $i : Z \rightarrow X$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism i is a closed immersion.*
- (2) *For every affine open $\text{Spec}(R) = U \subset X$, there exists an ideal $I \subset R$ such that $i^{-1}(U) = \text{Spec}(R/I)$ as schemes over $U = \text{Spec}(R)$.*
- (3) *There exists an affine open covering $X = \bigcup_{j \in J} U_j$, $U_j = \text{Spec}(R_j)$ and for every $j \in J$ there exists an ideal $I_j \subset R_j$ such that $i^{-1}(U_j) = \text{Spec}(R_j/I_j)$ as schemes over $U_j = \text{Spec}(R_j)$.*
- (4) *The morphism i induces a homeomorphism of Z with a closed subset of X and $i^\sharp : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective.*
- (5) *The morphism i induces a homeomorphism of Z with a closed subset of X , the map $i^\sharp : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective, and the kernel $\text{Ker}(i^\sharp) \subset \mathcal{O}_X$ is a quasi-coherent sheaf of ideals.*
- (6) *The morphism i induces a homeomorphism of Z with a closed subset of X , the map $i^\sharp : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective, and the kernel $\text{Ker}(i^\sharp) \subset \mathcal{O}_X$ is a sheaf of ideals which is locally generated by sections.*

Proof. Condition (6) is our definition of a closed immersion, see Schemes, Definitions 25.4.1 and 25.10.2. So (6) \Leftrightarrow (1). We have (1) \Rightarrow (2) by Schemes, Lemma 25.10.1. Trivially (2) \Rightarrow (3).

Assume (3). Each of the morphisms $\text{Spec}(R_j/I_j) \rightarrow \text{Spec}(R_j)$ is a closed immersion, see Schemes, Example 25.8.1. Hence $i^{-1}(U_j) \rightarrow U_j$ is a homeomorphism onto its image and $i^\sharp|_{U_j}$ is surjective. Hence i is a homeomorphism onto its image and i^\sharp is surjective since this may be checked locally. We conclude that (3) \Rightarrow (4).

The implication (4) \Rightarrow (1) is Schemes, Lemma 25.24.2. The implication (5) \Rightarrow (6) is trivial. And the implication (6) \Rightarrow (5) follows from Schemes, Lemma 25.10.1. \square

Lemma 28.2.2. *Let X be a scheme. Suppose $i : Z \rightarrow X$ and $i' : Z' \rightarrow X$ are closed immersions corresponding to the quasi-coherent ideal sheaves $\mathcal{I} = \text{Ker}(i^\#)$ and $\mathcal{I}' = \text{Ker}((i')^\#)$ of \mathcal{O}_X .*

- (1) *The morphism $i : Z \rightarrow X$ factors as $Z \rightarrow Z' \rightarrow X$ for some $a : Z \rightarrow Z'$ if and only if $\mathcal{I}' \subset \mathcal{I}$. If this happens, then a is a closed immersion.*
- (2) *We have $Z \cong Z'$ as schemes over X if and only if $\mathcal{I} = \mathcal{I}'$.*

Proof. This follows from our discussion of closed subspaces in Schemes, Section 25.4 especially Schemes, Lemma 25.4.6. It also follows in a straightforward way from characterization (3) in Lemma 28.2.1 above. \square

Lemma 28.2.3. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a sheaf of ideals. The following are equivalent:*

- (1) *The sheaf of ideals \mathcal{I} is locally generated by sections as a sheaf of \mathcal{O}_X modules.*
- (2) *The sheaf of ideals \mathcal{I} is quasi-coherent as a sheaf of \mathcal{O}_X -modules.*
- (3) *There exists a closed immersion $i : Z \rightarrow X$ whose corresponding sheaf of ideals $\text{Ker}(i^\#)$ is equal to \mathcal{I} .*

Proof. In Schemes, Section 25.4 we constructed the closed subspace associated to a sheaf of ideals locally generated by sections. This closed subspace is a scheme by Schemes, Lemma 25.10.1. Hence we see that (1) \Rightarrow (3) by our definition of a closed immersion of schemes. By Lemma 28.2.1 above we see that (3) \Rightarrow (2). And of course (2) \Rightarrow (1). \square

Lemma 28.2.4. *The base change of a closed immersion is a closed immersion.*

Proof. See Schemes, Lemma 25.18.2. \square

Lemma 28.2.5. *A composition of closed immersions is a closed immersion.*

Proof. We have seen this in Schemes, Lemma 25.24.3, but here is another proof. Namely, it follows from the characterization (3) of closed immersions in Lemma 28.2.1. Since if $I \subset R$ is an ideal, and $\bar{J} \subset R/I$ is an ideal, then $\bar{J} = J/I$ for some ideal $J \subset R$ which contains I and $(R/I)/\bar{J} = R/J$. \square

Lemma 28.2.6. *A closed immersion is quasi-compact.*

Proof. This lemma is a duplicate of Schemes, Lemma 25.19.5. \square

Lemma 28.2.7. *A closed immersion is separated.*

Proof. This lemma is a special case of Schemes, Lemma 25.23.7. \square

28.3. Immersions

In this section we collect some facts on immersions.

Lemma 28.3.1. *Let $Z \rightarrow Y \rightarrow X$ be morphisms of schemes.*

- (1) *If $Z \rightarrow X$ is an immersion, then $Z \rightarrow Y$ is an immersion.*
- (2) *If $Z \rightarrow X$ is a quasi-compact immersion and $Z \rightarrow Y$ is quasi-separated, then $Z \rightarrow Y$ is a quasi-compact immersion.*
- (3) *If $Z \rightarrow X$ is a closed immersion and $Y \rightarrow X$ is separated, then $Z \rightarrow Y$ is a closed immersion.*

Proof. In each case the proof is to contemplate the commutative diagram

$$\begin{array}{ccccc} Z & \longrightarrow & Y \times_X Z & \longrightarrow & Z \\ & \searrow & \downarrow & & \downarrow \\ & & Y & \longrightarrow & X \end{array}$$

where the composition of the top horizontal arrows is the identity. Let us prove (1). The first horizontal arrow is a section of $Y \times_X Z \rightarrow Z$, whence an immersion by Schemes, Lemma 25.21.12. The arrow $Y \times_X Z \rightarrow Y$ is a base change of $Z \rightarrow X$ hence an immersion (Schemes, Lemma 25.18.2). Finally, a composition of immersions is an immersion (Schemes, Lemma 25.24.3). This proves (1). The other two results are proved in exactly the same manner. \square

Lemma 28.3.2. *Let $h : Z \rightarrow X$ be an immersion. If h is quasi-compact, then we can factor $h = i \circ j$ with $j : Z \rightarrow \bar{Z}$ an open immersion and $i : \bar{Z} \rightarrow X$ a closed immersion.*

Proof. Note that h is quasi-compact and quasi-separated (see Schemes, Lemma 25.23.7). Hence $h_*\mathcal{O}_Z$ is a quasi-coherent sheaf of \mathcal{O}_X -modules by Schemes, Lemma 25.24.1. This implies that $\mathcal{I} = \text{Ker}(\mathcal{O}_X \rightarrow h_*\mathcal{O}_Z)$ is a quasi-coherent sheaf of ideals, see Schemes, Section 25.24. Let $\bar{Z} \subset X$ be the closed subscheme corresponding to \mathcal{I} , see Lemma 28.2.3. By Schemes, Lemma 25.4.6 the morphism h factors as $h = i \circ j$ where $i : \bar{Z} \rightarrow X$ is the inclusion morphism. To see that j is an open immersion, choose an open subscheme $U \subset X$ such that h induces a closed immersion of Z into U . Then it is clear that $\mathcal{I}|_U$ is the sheaf of ideals corresponding to the closed immersion $Z \rightarrow U$. Hence we see that $Z = \bar{Z} \cap U$. \square

Lemma 28.3.3. *Let $h : Z \rightarrow X$ be an immersion. If Z is reduced, then we can factor $h = i \circ j$ with $j : Z \rightarrow \bar{Z}$ an open immersion and $i : \bar{Z} \rightarrow X$ a closed immersion.*

Proof. Let $\bar{Z} \subset X$ be the closure of $h(Z)$ with the reduced induced closed subscheme structure, see Schemes, Definition 25.12.5. By Schemes, Lemma 25.12.6 the morphism h factors as $h = i \circ j$ with $i : \bar{Z} \rightarrow X$ the inclusion morphism and $j : Z \rightarrow \bar{Z}$. From the definition of an immersion we see there exists an open subscheme $U \subset X$ such that h factors through a closed immersion into U . Hence $\bar{Z} \cap U$ and $h(Z)$ are reduced closed subschemes of U with the same underlying closed set. Hence by the uniqueness in Schemes, Lemma 25.12.4 we see that $h(Z) \cong \bar{Z} \cap U$. So j induces an isomorphism of Z with $\bar{Z} \cap U$. In other words j is an open immersion. \square

Example 28.3.4. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let k be a field. Let $X = \text{Spec}(k[x_1, x_2, x_3, \dots])$. Let $U = \bigcup_{n=1}^{\infty} D(x_n)$. Then $U \rightarrow X$ is an open immersion. Consider the ideals

$$I_n = (x_1^n, x_2^n, \dots, x_{n-1}^n, x_n - 1, x_{n+1}, x_{n+2}, \dots) \subset k[x_1, x_2, x_3, \dots][1/x_n].$$

Note that $I_n k[x_1, x_2, x_3, \dots][1/x_n x_m] = (1)$ for any $m \neq n$. Hence the quasi-coherent ideals \tilde{I}_n on $D(x_n)$ agree on $D(x_n x_m)$, namely $\tilde{I}_n|_{D(x_n x_m)} = \mathcal{O}_{D(x_n x_m)}$ if $n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_U$. Let $Z \subset U$ be the closed subscheme corresponding to \mathcal{I} . Thus $Z \rightarrow X$ is an immersion.

We claim that we cannot factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z} \rightarrow X$, where $\bar{Z} \rightarrow X$ is closed and $Z \rightarrow \bar{Z}$ is open. Namely, \bar{Z} would have to be defined by an ideal $I \subset k[x_1, x_2, x_3, \dots]$ such that $I_n = Ik[x_1, x_2, x_3, \dots][1/x_n]$. But the only element $f \in k[x_1, x_2, x_3, \dots]$ which ends up in all I_n is 0! Hence I does not exist.

28.4. Closed immersions and quasi-coherent sheaves

The following lemma finally does for quasi-coherent sheaves on schemes what Modules, Lemma 17.6.1 does for abelian sheaves. See also the discussion in Modules, Section 17.13.

Lemma 28.4.1. *Let $i : Z \rightarrow X$ be a closed immersion of schemes. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z . The functor*

$$i_* : QCoh(\mathcal{O}_Z) \longrightarrow QCoh(\mathcal{O}_X)$$

is exact, fully faithful, with essential image those quasi-coherent \mathcal{O}_X -modules \mathcal{G} such that $\mathcal{I}\mathcal{G} = 0$.

Proof. A closed immersion is quasi-compact and separated, see Lemmas 28.2.6 and 28.2.7. Hence Schemes, Lemma 25.24.1 applies and the pushforward of a quasi-coherent sheaf on Z is indeed a quasi-coherent sheaf on X .

By Modules, Lemma 17.13.4 the functor i_* is fully faithful.

Now we turn to the description of the essential image of the functor i_* . It is clear that $\mathcal{I}(i_*\mathcal{F}) = 0$ for any quasi-coherent \mathcal{O}_Z -module, for example by our local description above. Next, suppose that \mathcal{G} is any quasi-coherent \mathcal{O}_X -module such that $\mathcal{I}\mathcal{G} = 0$. It suffices to show that the canonical map

$$\mathcal{G} \longrightarrow i_*i^*\mathcal{G}$$

is an isomorphism. By exactly the same arguments as above we see that it suffices to prove the following algebraic statement: Given a ring R , an ideal I and an R -module N such that $IN = 0$ the canonical map

$$N \longrightarrow N \otimes_R R/I, \quad n \longmapsto n \otimes 1$$

is an isomorphism of R -modules. Proof of this easy algebra fact is omitted. \square

Let $i : Z \rightarrow X$ be a closed immersion. Because of the lemma above we often, by abuse of notation, denote \mathcal{F} the sheaf $i_*\mathcal{F}$ on X .

Lemma 28.4.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{G} \subset \mathcal{F}$ be a \mathcal{O}_X -submodule. There exists a unique quasi-coherent \mathcal{O}_X -submodule $\mathcal{G}' \subset \mathcal{G}$ with the following property: For every quasi-coherent \mathcal{O}_X -module \mathcal{H} the map*

$$\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G}') \longrightarrow \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G})$$

is bijective. In particular \mathcal{G}' is the largest quasi-coherent \mathcal{O}_X -submodule of \mathcal{F} contained in \mathcal{G} .

Proof. Let \mathcal{G}_a , $a \in A$ be the set of quasi-coherent \mathcal{O}_X -submodules contained in \mathcal{G} . Then the image \mathcal{G}' of

$$\bigoplus_{a \in A} \mathcal{G}_a \longrightarrow \mathcal{F}$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on X is quasi-coherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see

Schemes, Section 25.24. The module \mathcal{G}' is contained in \mathcal{G} . Hence this is the largest quasi-coherent \mathcal{O}_X -module contained in \mathcal{G} .

To prove the formula, let \mathcal{H} be a quasi-coherent \mathcal{O}_X -module and let $\alpha : \mathcal{H} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -module map. The image of the composition $\mathcal{H} \rightarrow \mathcal{G} \rightarrow \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in \mathcal{G}' . Hence α factors through \mathcal{G}' as desired. \square

Lemma 28.4.3. *Let $i : Z \rightarrow X$ be a closed immersion of schemes. There is a functor¹ $i^! : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Z)$ which is a right adjoint to i_* . (Compare Modules, Lemma 17.6.3.)*

Proof. Given quasi-coherent \mathcal{O}_X -module \mathcal{G} we consider the subsheaf $\mathcal{H}_Z(\mathcal{G})$ of \mathcal{G} of local sections annihilated by \mathcal{I} . By Lemma 28.4.2 there is a canonical largest quasi-coherent \mathcal{O}_X -submodule $\mathcal{H}_Z(\mathcal{G})'$. By construction we have

$$\mathrm{Hom}_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{H}_Z(\mathcal{G})') = \mathrm{Hom}_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{G})$$

for any quasi-coherent \mathcal{O}_Z -module \mathcal{F} . Hence we can set $i^!\mathcal{G} = i^*(\mathcal{H}_Z(\mathcal{G})')$. Details omitted. \square

28.5. Supports of modules

In this section we collect some elementary results on supports of quasi-coherent modules on schemes. Recall that the support of a sheaf of modules has been defined in Modules, Section 17.5. On the other hand, the support of a module was defined in Algebra, Section 10.61. These match.

Lemma 28.5.1. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X . Let $\mathrm{Spec}(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent*

- (1) \mathfrak{p} is in the support of M , and
- (2) x is in the support of \mathcal{F} .

Proof. This follows from the equality $\mathcal{F}_x = M_{\mathfrak{p}}$, see Schemes, Lemma 25.5.4 and the definitions. \square

Lemma 28.5.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X . The support of \mathcal{F} is closed under specialization.*

Proof. If $x' \rightsquigarrow x$ is a specialization and $\mathcal{F}_x = 0$ then $\mathcal{F}_{x'}$ is zero, as $\mathcal{F}_{x'}$ is a localization of the module \mathcal{F}_x . Hence the complement of $\mathrm{Supp}(\mathcal{F})$ is closed under generalization. \square

For finite type quasi-coherent modules the support is closed, can be checked on fibres, and commutes with base change.

Lemma 28.5.3. *Let \mathcal{F} be a finite type quasi-coherent module on a scheme X . Then*

- (1) *The support of \mathcal{F} is closed.*
- (2) *For $x \in X$ we have*

$$x \in \mathrm{Supp}(\mathcal{F}) \Leftrightarrow \mathcal{F}_x \neq 0 \Leftrightarrow \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \kappa(x) \neq 0.$$

¹This is likely nonstandard notation.

- (3) For any morphism of schemes $f : Y \rightarrow X$ the pullback $f^*\mathcal{F}$ is of finite type as well and we have $\text{Supp}(f^*\mathcal{F}) = f^{-1}(\text{Supp}(\mathcal{F}))$.

Proof. Part (1) is a reformulation of Modules, Lemma 17.9.6. You can also combine Lemma 28.5.1, Properties, Lemma 27.16.1, and Algebra, Lemma 10.39.5 to see this. The first equivalence in (2) is the definition of support, and the second equivalence follows from Nakayama's lemma, see Algebra, Lemma 10.19.1. Let $f : Y \rightarrow X$ be a morphism of schemes. Note that $f^*\mathcal{F}$ is of finite type by Modules, Lemma 17.9.2. For the final assertion, let $y \in Y$ with image $x \in X$. Recall that

$$(f^*\mathcal{F})_y = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{Y,y},$$

see Sheaves, Lemma 6.26.4. Hence $(f^*\mathcal{F})_y \otimes \kappa(y)$ is nonzero if and only if $\mathcal{F}_x \otimes \kappa(x)$ is nonzero. By (2) this implies $x \in \text{Supp}(\mathcal{F})$ if and only if $y \in \text{Supp}(f^*\mathcal{F})$, which is the content of assertion (3). \square

Lemma 28.5.4. *Let \mathcal{F} be a finite type quasi-coherent module on a scheme X . There exists a smallest closed subscheme $i : Z \rightarrow X$ such that there exists a quasi-coherent \mathcal{O}_Z -module \mathcal{G} with $i_*\mathcal{G} \cong \mathcal{F}$. Moreover:*

- (1) *If $\text{Spec}(A) \subset X$ is any affine open, and $\mathcal{F}|_{\text{Spec}(A)} = \widetilde{M}$ then $Z \cap \text{Spec}(A) = \text{Spec}(A/I)$ where $I = \text{Ann}_A(M)$.*
- (2) *The quasi-coherent sheaf \mathcal{G} is unique up to unique isomorphism.*
- (3) *The quasi-coherent sheaf \mathcal{G} is of finite type.*
- (4) *The support of \mathcal{G} and of \mathcal{F} is Z .*

Proof. Suppose that $i' : Z' \rightarrow X$ is a closed subscheme which satisfies the description on open affines from the lemma. Then by Lemma 28.4.1 we see that $\mathcal{F} \cong i'_*\mathcal{G}'$ for some unique quasi-coherent sheaf \mathcal{G}' on Z' . Furthermore, it is clear that Z' is the smallest closed subscheme with this property (by the same lemma). Finally, using Properties, Lemma 27.16.1 and Algebra, Lemma 10.5.5 it follows that \mathcal{G}' is of finite type. We have $\text{Supp}(\mathcal{G}') = Z$ by Algebra, Lemma 10.39.5. Hence, in order to prove the lemma it suffices to show that the characterization in (1) actually does define a closed subscheme. And, in order to do this it suffices to prove that the given rule produces a quasi-coherent sheaf of ideals, see Lemma 28.2.3. This comes down to the following algebra fact: If A is a ring, $f \in A$, and M is a finite A -module, then $\text{Ann}_A(M)_f = \text{Ann}_{A_f}(M_f)$. We omit the proof. \square

Definition 28.5.5. Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. The *scheme theoretic support* of \mathcal{F} is the closed subscheme $Z \subset X$ constructed in Lemma 28.5.4.

In this situation we often think of \mathcal{F} as a quasi-coherent sheaf of finite type on Z (via the equivalence of categories of Lemma 28.4.1).

28.6. Scheme theoretic image

Caution: Some of the material in this section is ultra-general and behaves differently from what you might expect.

Lemma 28.6.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. There exists a closed subscheme $Z \subset Y$ such that f factors through Z and such that for any other closed subscheme $Z' \subset Y$ such that f factors through Z' we have $Z \subset Z'$.*

Proof. Let $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$. If \mathcal{I} is quasi-coherent then we just take Z to be the closed subscheme determined by \mathcal{I} , see Lemma 28.2.3. This works by Schemes, Lemma 25.4.6. In general the same lemma requires us to show that there exists a largest quasi-coherent sheaf of ideals \mathcal{I}' contained in \mathcal{I} . This follows from Lemma 28.4.2. \square

Definition 28.6.2. Let $f : X \rightarrow Y$ be a morphism of schemes. The *scheme theoretic image* of f is the smallest closed subscheme $Z \subset Y$ through which f factors, see Lemma 28.6.1 above.

We often just denote $f : X \rightarrow Z$ the factorization of f . If the morphism f is not quasi-compact, then (in general) the construction of the scheme theoretic image does not commute with restriction to open subschemes to Y . Namely, if f is the immersion $Z \rightarrow X$ of Example 28.3.4 above then the scheme theoretic image of $Z \rightarrow X$ is X . But clearly the scheme theoretic image of $Z = Z \cap U \rightarrow U$ is just Z .

Lemma 28.6.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $Z \subset Y$ be the scheme theoretic image of f . If f is quasi-compact then*

- (1) *the sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$ is quasi-coherent,*
- (2) *the scheme theoretic image Z is the closed subscheme determined by \mathcal{I} ,*
- (3) *for any open $U \subset Y$ the scheme theoretic image of $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$ is equal to $Z \cap U$, and*
- (4) *the image $f(X) \subset Z$ is a dense subset of Z , in other words the morphism $X \rightarrow Z$ is dominant (see Definition 28.8.1).*

Proof. Part (4) follows from part (3). To show (3) it suffices to prove (1) since the formation of \mathcal{I} commutes with restriction to open subschemes of Y . And if (1) holds then in the proof of Lemma 28.6.1 we showed (2). Thus it suffices to prove that \mathcal{I} is quasi-coherent. Since the property of being quasi-coherent is local we may assume Y is affine. As f is quasi-compact, we can find a finite affine open covering $X = \bigcup_{i=1, \dots, n} U_i$. Denote f' the composition

$$X' = \coprod U_i \longrightarrow X \longrightarrow Y.$$

Then $f_*\mathcal{O}_X$ is a subsheaf of $f'_*\mathcal{O}_{X'}$, and hence $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow \mathcal{O}_{X'})$. By Schemes, Lemma 25.24.1 the sheaf $f'_*\mathcal{O}_{X'}$ is quasi-coherent on Y . Hence we win. \square

Example 28.6.4. If $A \rightarrow B$ is a ring map with kernel I , then the scheme theoretic image of $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is the closed subscheme $\text{Spec}(A/I)$ of $\text{Spec}(A)$. This follows from Lemma 28.6.3.

If the morphism is quasi-compact, then the scheme theoretic image only adds points which are specializations of points in the image.

Lemma 28.6.5. *Let $f : X \rightarrow Y$ be a quasi-compact morphism. Let Z be the scheme theoretic image of f . Let $z \in Z$. There exists a valuation ring A with fraction field K and a commutative diagram*

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \swarrow \downarrow \\ \text{Spec}(A) & \longrightarrow & Z \longrightarrow Y \end{array}$$

such that the closed point of $\text{Spec}(A)$ maps to z . In particular any point of Z is the specialization of a point of $f(X)$.

Proof. Let $z \in \text{Spec}(R) = V \subset Y$ be an affine open neighbourhood of z . By Lemma 28.6.3 we have $Z \cap V$ is the scheme theoretic closure of $f^{-1}(V) \rightarrow V$, and hence we may replace Y by V and assume $Y = \text{Spec}(R)$ is affine. In this case X is quasi-compact as f is quasi-compact. Say $X = U_1 \cup \dots \cup U_n$ is a finite affine open covering. Write $U_i = \text{Spec}(A_i)$. Let $I = \text{Ker}(R \rightarrow A_1 \times \dots \times A_n)$. By Lemma 28.6.3 again we see that Z corresponds to the closed subscheme $\text{Spec}(R/I)$ of Y . If $\mathfrak{p} \subset R$ is the prime corresponding to z , then we see that $I_{\mathfrak{p}} \subset R_{\mathfrak{p}}$ is not an equality. Hence (as localization is exact, see Algebra, Proposition 10.9.12) we see that $R_{\mathfrak{p}} \rightarrow (A_1)_{\mathfrak{p}} \times \dots \times (A_n)_{\mathfrak{p}}$ is not zero. Hence one of the rings $(A_i)_{\mathfrak{p}}$ is not zero. Hence there exists an i and a prime $\mathfrak{q}_i \subset A_i$ lying over a prime $\mathfrak{p}_i \subset \mathfrak{p}$. By Algebra, Lemma 10.48.2 we can choose a valuation ring $A \subset K = f.f.(A_i/\mathfrak{q}_i)$ dominating the local ring $R_{\mathfrak{p}}/\mathfrak{p}_1 R_{\mathfrak{p}} \subset f.f.(A_i/\mathfrak{q}_i)$. This gives the desired diagram. Some details omitted. \square

Lemma 28.6.6. Let $f_1 : X \rightarrow Y_1$ and $Y_1 \rightarrow Y_2$ be morphisms of schemes. Let $f_2 : X \rightarrow Y_2$ be the composition. Let $Z_i \subset Y_i, i = 1, 2$ be the scheme theoretic image of f_i . Then the morphism $Y_1 \rightarrow Y_2$ induces a morphism $Z_1 \rightarrow Z_2$ and a commutative diagram

$$\begin{array}{ccccc} X & \longrightarrow & Z_1 & \longrightarrow & Y_1 \\ & \searrow & \downarrow & & \downarrow \\ & & Z_2 & \longrightarrow & Y_2 \end{array}$$

Proof. See Schemes, Lemma 25.4.6. \square

Lemma 28.6.7. Let $f : X \rightarrow Y$ be a morphism of schemes. If X is reduced, then the scheme theoretic image of f is the reduced induced scheme structure on $\overline{f(X)}$.

Proof. This is true because the reduced induced scheme structure on $\overline{f(X)}$ is clearly the smallest closed subscheme of Y through which f factors, see Schemes, Lemma 25.12.6. \square

28.7. Scheme theoretic closure and density

We take the following definition from [DG67, IV, Definition 11.10.2].

Definition 28.7.1. Let X be a scheme. Let $U \subset X$ be an open subscheme.

- (1) The scheme theoretic image of the morphism $U \rightarrow X$ is called the *scheme theoretic closure of U in X* .
- (2) We say U is *scheme theoretically dense in X* if for every open $V \subset X$ the scheme theoretic closure of $U \cap V$ in V is equal to V .

With this definition it is **not** the case that U is scheme theoretically dense in X if and only if the scheme theoretic closure of U is X , see Example 28.7.2. This is somewhat inelegant; but see Lemmas 28.7.3 and 28.7.8 below. On the other hand, with this definition U is scheme theoretically dense in X if and only if for every $V \subset X$ open the ring map $\mathcal{O}_X(V) \rightarrow \mathcal{O}_X(U \cap V)$ is injective, see Lemma 28.7.5 below. In particular we see that scheme theoretically dense implies dense which is pleasing.

Example 28.7.2. Here is an example where scheme theoretic closure being X does not imply dense for the underlying topological spaces. Let k be a field. Set $A = k[x, z_1, z_2, \dots]/(x^n z_n)$. Set $I = (z_1, z_2, \dots) \subset A$. Consider the affine scheme $X = \text{Spec}(A)$ and the open subscheme $U = X \setminus V(I)$. Since $A \rightarrow \prod_n A_{z_n}$ is injective we see that the scheme theoretic closure of U is X . Consider the morphism $X \rightarrow \text{Spec}(k[x])$. This morphism is surjective (set all $z_n = 0$ to see this). But the restriction of this morphism to U is not surjective because it maps to the point $x = 0$. Hence U cannot be topologically dense in X .

Lemma 28.7.3. *Let X be a scheme. Let $U \subset X$ be an open subscheme. If the inclusion morphism $U \rightarrow X$ is quasi-compact, then U is scheme theoretically dense in X if and only if the scheme theoretic closure of U in X is X .*

Proof. Follows from Lemma 28.6.3 part (3). □

Example 28.7.4. Let A be a ring and $X = \text{Spec}(A)$. Let $f_1, \dots, f_n \in A$ and let $U = D(f_1) \cup \dots \cup D(f_n)$. Let $I = \text{Ker}(A \rightarrow \prod A_{f_i})$. Then the scheme theoretic closure of U in X is the closed subscheme $\text{Spec}(A/I)$ of X . Note that $U \rightarrow X$ is quasi-compact. Hence by Lemma 28.7.3 we see U is scheme theoretically dense in X if and only if $I = 0$.

Lemma 28.7.5. *Let $j : U \rightarrow X$ be an open immersion of schemes. Then U is scheme theoretically dense in X if and only if $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is injective.*

Proof. If $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is injective, then the same is true when restricted to any open V of X . Hence the scheme theoretic closure of $U \cap V$ in V is equal to V , see proof of Lemma 28.6.1. Conversely, suppose that the scheme theoretic closure of $U \cap V$ is equal to V for all opens V . Suppose that $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is not injective. Then we can find an affine open, say $\text{Spec}(A) = V \subset X$ and a nonzero element $f \in A$ such that f maps to zero in $\Gamma(V \cap U, \mathcal{O}_X)$. In this case the scheme theoretic closure of $V \cap U$ in V is clearly contained in $\text{Spec}(A/(f))$ a contradiction. □

Lemma 28.7.6. *Let X be a scheme. If U, V are scheme theoretically dense open subschemes of X , then so is $U \cap V$.*

Proof. Let $W \subset X$ be any open. Consider the map $\mathcal{O}_X(W) \rightarrow \mathcal{O}_X(W \cap V) \rightarrow \mathcal{O}_X(W \cap V \cap U)$. By Lemma 28.7.5 both maps are injective. Hence the composite is injective. Hence by Lemma 28.7.5 $U \cap V$ is scheme theoretically dense in X . □

Lemma 28.7.7. *Let $h : Z \rightarrow X$ be an immersion. Assume either h is quasi-compact or Z is reduced. Let $\bar{Z} \subset X$ be the scheme theoretic image of h . Then the morphism $Z \rightarrow \bar{Z}$ is an open immersion which identifies Z with a scheme theoretically dense open subscheme of \bar{Z} . Moreover, Z is topologically dense in \bar{Z} .*

Proof. By Lemma 28.3.2 or Lemma 28.3.3 we can factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z}_1 \rightarrow X$ with $Z \rightarrow \bar{Z}_1$ open and $\bar{Z}_1 \rightarrow X$ closed. On the other hand, let $\bar{Z} \subset X$ be the scheme theoretic closure of $Z \rightarrow X$. We conclude that $\bar{Z} \subset \bar{Z}_1$. Since Z is an open subscheme of \bar{Z}_1 it follows that Z is an open subscheme of \bar{Z} as well. In the case that Z is reduced we know that $Z \subset \bar{Z}_1$ is topologically dense by the construction of \bar{Z}_1 in the proof of Lemma 28.3.3. Hence \bar{Z}_1 and \bar{Z} have the same underlying topological spaces. Thus $\bar{Z} \subset \bar{Z}_1$ is a closed immersion into a reduced scheme which induces a bijection on underlying topological spaces, and hence it is an isomorphism. In the case that $Z \rightarrow X$ is quasi-compact we argue as follows:

The assertion that Z is scheme theoretically dense in \overline{Z} follows from Lemma 28.6.3 part (3). The last assertion follows from Lemma 28.6.3 part (4). \square

Lemma 28.7.8. *Let X be a reduced scheme and let $U \subset X$ be an open subscheme. Then the following are equivalent*

- (1) U is topologically dense in X ,
- (2) the scheme theoretic closure of U in X is X , and
- (3) U is scheme theoretically dense in X .

Proof. This follows from Lemma 28.7.7 and the fact that a closed subscheme Z of X whose underlying topological space equals X must be equal to X as a scheme. \square

Lemma 28.7.9. *Let X be a scheme and let $U \subset X$ be a reduced open subscheme. Then the following are equivalent*

- (1) the scheme theoretic closure of U in X is X , and
- (2) U is scheme theoretically dense in X .

If this holds then X is a reduced scheme.

Proof. This follows from Lemma 28.7.7 and the fact that the scheme theoretic closure of U in X is reduced by Lemma 28.6.7. \square

Lemma 28.7.10. *Let S be a scheme. Let X, Y be schemes over S . Let $f, g : X \rightarrow Y$ be morphisms of schemes over S . Let $U \subset X$ be an open subscheme such that $f|_U = g|_U$. If the scheme theoretic closure of U in X is X and $Y \rightarrow S$ is separated, then $f = g$.*

Proof. Follows from the definitions and Schemes, Lemma 25.21.5. \square

28.8. Dominant morphisms

The definition of a morphism of schemes being dominant is a little different from what you might expect if you are used to the notion of a dominant morphism of varieties.

Definition 28.8.1. A morphism $f : X \rightarrow S$ of schemes is called *dominant* if the image of f is a dense subset of S .

So for example, if k is an infinite field and $\lambda_1, \lambda_2, \dots$ is a countable collection of elements of k , then the morphism

$$\coprod_{i=1,2,\dots} \text{Spec}(k) \longrightarrow \text{Spec}(k[x])$$

with i th factor mapping to the point $x = \lambda_i$ is dominant.

Lemma 28.8.2. *Let $f : X \rightarrow S$ be a morphism of schemes. If every generic point of every irreducible component of S is in the image of f , then f is dominant.*

Proof. This is a topological fact which follows directly from the fact that the topological space underlying a scheme is sober, see Schemes, Lemma 25.11.1, and that every point of S is contained in an irreducible component of S , see Topology, Lemma 5.7.3. \square

The expectation that morphisms are dominant only if generic points of the target are in the image does hold if the morphism is quasi-compact.

Lemma 28.8.3. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. Then f is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of Z is in the image of f .*

Proof. Let $V \subset S$ be an affine open. Because f is quasi-compact we may choose finitely many affine opens $U_i \subset f^{-1}(V)$, $i = 1, \dots, n$ covering $f^{-1}(V)$. Consider the morphism of affines

$$f' : \coprod_{i=1, \dots, n} U_i \longrightarrow V.$$

A disjoint union of affines is affine, see Schemes, Lemma 25.6.8. Generic points of irreducible components of V are exactly the generic points of the irreducible components of S that meet V . Also, f is dominant if and only if f' is dominant no matter what choices of V, n, U_i we make above. Thus we have reduced the lemma to the case of a morphism of affine schemes. The affine case is Algebra, Lemma 10.29.6. \square

Here is a slightly more useful variant of the lemma above.

Lemma 28.8.4. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. Let $\eta \in S$ be a generic point of an irreducible component of S . If $\eta \notin f(X)$ then there exists an open neighbourhood $V \subset S$ of η such that $f^{-1}(V) = \emptyset$.*

Proof. Let $Z \subset S$ be the scheme theoretic image of f . We have to show that $\eta \notin Z$. This follows from Lemma 28.6.5 but can also be seen as follows. By Lemma 28.6.3 the morphism $X \rightarrow Z$ is dominant, which by Lemma 28.8.3 means all the generic points of all irreducible components of Z are in the image of $X \rightarrow Z$. By assumption we see that $\eta \notin Z$ since η would be the generic point of some irreducible component of Z if it were in Z . \square

There is another case where dominant is the same as having all generic points of irreducible components in the image.

Lemma 28.8.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Suppose that X has finitely many irreducible components. Then f is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of Z is in the image of f . If so, then S has finitely many irreducible components as well.*

Proof. Assume f is dominant. Say $X = Z_1 \cup Z_2 \cup \dots \cup Z_n$ is the decomposition of X into irreducible components. Let $\xi_i \in Z_i$ be its generic point, so $Z_i = \overline{\{\xi_i\}}$. Note that $f(Z_i)$ is an irreducible subset of S . Hence

$$S = \overline{f(X)} = \bigcup \overline{f(Z_i)} = \bigcup \overline{\{f(\xi_i)\}}$$

is a finite union of irreducible subsets whose generic points are in the image of f . The lemma follows. \square

28.9. Birational morphisms

You may be used to the notion of a birational map of varieties having the property that it is an isomorphism over an open subset of the target. However, in general a birational morphism may not be an isomorphism over any nonempty open, see Example 28.9.3. Here is the formal definition.

Definition 28.9.1. Let X, Y be schemes. Assume X and Y have finitely many irreducible components. We say a morphism $f : X \rightarrow Y$ is *birational* if

- (1) f induces a bijection between the set of generic points of irreducible components of X and the set of generic points of the irreducible components of Y , and
- (2) for every generic point $\eta \in X$ of an irreducible component of X the local ring map $\mathcal{O}_{Y, f(\eta)} \rightarrow \mathcal{O}_{X, \eta}$ is an isomorphism.

Lemma 28.9.2. *Let $f : X \rightarrow Y$ be a morphism of schemes having finitely many irreducible components. If f is birational then f is dominant.*

Proof. Follows immediately from the definitions. \square

Example 28.9.3. Here is an example of a birational morphism which is not an isomorphism over any open of the target. Let k be an infinite field. Let $A = k[x]$. Let $B = k[x, \{y_\alpha\}_{\alpha \in k}] / ((x - \alpha)y_\alpha, y_\alpha y_\beta)$. There is an inclusion $A \subset B$ and a retraction $B \rightarrow A$ setting all y_α equal to zero. Both the morphism $\text{Spec}(A) \rightarrow \text{Spec}(B)$ and the morphism $\text{Spec}(B) \rightarrow \text{Spec}(A)$ are birational but not an isomorphism over any open.

28.10. Rational maps

Let X be a scheme. Note that if U, V are dense open in X , then so is $U \cap V$.

Definition 28.10.1. Let X, Y be schemes.

- (1) Let $f : U \rightarrow Y, g : V \rightarrow Y$ be morphisms of schemes defined on dense open subsets U, V of X . We say that f is *equivalent* to g if $f|_W = g|_W$ for some $W \subset U \cap V$ dense open in X .
- (2) A *rational map from X to Y* is an equivalence class for the equivalence relation defined in (1).
- (3) If X, Y are schemes over a base scheme S we say that a rational map from X to Y is an *S -rational map from X to Y* if there exists a representative $f : U \rightarrow Y$ of the equivalence class which is an S -morphism.

We say that two morphisms f, g as in (1) of the definition define the same rational map instead of saying that they are equivalent.

Definition 28.10.2. Let X be a scheme. A *rational function on X* is a rational map from X to $\mathbf{A}_{\mathbf{Z}}^1$.

See Constructions, Definition 26.5.1 for the definition of the affine line \mathbf{A}^1 . Let X be a scheme over S . For any open $U \subset X$ a morphism $U \rightarrow \mathbf{A}_{\mathbf{Z}}^1$ is the same as a morphism $U \rightarrow \mathbf{A}_S^1$ over S . Hence a rational function is also the same as a S -rational map from X into \mathbf{A}_S^1 .

Recall that we have the canonical identification $\text{Mor}(T, \mathbf{A}_{\mathbf{Z}}^1) = \Gamma(T, \mathcal{O}_T)$ for any scheme T , see Schemes, Example 25.15.2. Hence $\mathbf{A}_{\mathbf{Z}}^1$ is a ring-object in the category of schemes. More precisely, the morphisms

$$\begin{aligned} + : \mathbf{A}_{\mathbf{Z}}^1 \times \mathbf{A}_{\mathbf{Z}}^1 &\longrightarrow \mathbf{A}_{\mathbf{Z}}^1 \\ (f, g) &\longmapsto f + g \\ * : \mathbf{A}_{\mathbf{Z}}^1 \times \mathbf{A}_{\mathbf{Z}}^1 &\longrightarrow \mathbf{A}_{\mathbf{Z}}^1 \\ (f, g) &\longmapsto fg \end{aligned}$$

satisfy all the axioms of the addition and multiplication in a ring (commutative with 1 as always). Hence also the set of rational maps into $\mathbf{A}_{\mathbf{Z}}^1$ has a natural ring structure.

Definition 28.10.3. Let X be a scheme. The *ring of rational functions on X* is the ring $R(X)$ whose elements are rational functions with addition and multiplication as just described.

Lemma 28.10.4. *Let X be an irreducible scheme. Let $\eta \in X$ be the generic point of X . There is a canonical identification $R(X) \cong \mathcal{O}_{X,\eta}$. If X is integral then $R(X) = \kappa(\eta) = \mathcal{O}_{X,\eta}$ is a field.*

Proof. Omitted. □

Definition 28.10.5. Let X be an integral scheme. The *function field*, or the *field of rational functions* of X is the field $R(X)$.

We may occasionally indicate this field $k(X)$ instead of $R(X)$. We can use the notion of the function field to elucidate the separation condition on an integral scheme. Note that by Lemma 28.10.4 on an integral scheme every local ring $\mathcal{O}_{X,x}$ may be viewed as a local subring of $R(X)$.

Lemma 28.10.6. *Let X be an integral separated scheme. Let Z_1, Z_2 be distinct irreducible closed subsets of X . Let η_i be the generic point of Z_i . If $Z_1 \not\subset Z_2$, then $\mathcal{O}_{X,\eta_1} \not\subset \mathcal{O}_{X,\eta_2}$ as subrings of $R(X)$. In particular, if $Z_1 = \{x\}$ consists of one closed point x , there exists a function regular in a neighborhood of x which is not in \mathcal{O}_{X,η_2} .*

Proof. First observe that under the assumption of X being separated, there is a unique map of schemes $\text{Spec}(\mathcal{O}_{X,\eta_2}) \rightarrow X$ over X such that the composition

$$\text{Spec}(R(X)) \longrightarrow \text{Spec}(\mathcal{O}_{X,\eta_2}) \longrightarrow X$$

is the canonical map $\text{Spec}(R(X)) \rightarrow X$. Namely, there is the canonical map $can : \text{Spec}(\mathcal{O}_{X,\eta_2}) \rightarrow X$, see Schemes, Equation (25.13.1.1). Given a second morphism a to X , we have that a agrees with can on the generic point of $\text{Spec}(\mathcal{O}_{X,\eta_2})$ by assumption. Now being X being separated guarantees that the subset in $\text{Spec}(\mathcal{O}_{X,\eta_2})$ where these two maps agree is closed, see Schemes, Lemma 25.21.5. Hence $a = can$ on all of $\text{Spec}(\mathcal{O}_{X,\eta_2})$.

Assume $Z_1 \not\subset Z_2$ and assume on the contrary that $\mathcal{O}_{X,\eta_1} \subset \mathcal{O}_{X,\eta_2}$ as subrings of $R(X)$. Then we would obtain a second morphism

$$\text{Spec}(\mathcal{O}_{X,\eta_2}) \longrightarrow \text{Spec}(\mathcal{O}_{X,\eta_1}) \longrightarrow X.$$

By the above this composition would have to be equal to can . This implies that η_2 specializes to η_1 (see Schemes, Lemma 25.13.2). But this contradicts our assumption $Z_1 \not\subset Z_2$. □

Definition 28.10.7. Let φ be a rational map between two schemes X and Y . We say φ is *defined in a point $x \in X$* if there exists a representative (U, f) of φ with $x \in U$. The *domain of definition* of φ is the set of all points where φ is defined.

With this definition it isn't true in general that φ has a representative which is defined on all of the domain of definition.

Lemma 28.10.8. *Let X and Y be schemes. Assume X reduced and Y separated. Let φ be a rational map from X to Y with domain of definition $U \subset X$. Then there exists a unique morphism $f : U \rightarrow Y$ representing φ . If X and Y are schemes over a separated scheme S and if φ is an S -rational map, then f is a morphism over S .*

Proof. Let (V, g) and (V', g') be representatives of φ . Then g, g' agree on a dense open subscheme $W \subset V \cap V'$. On the other hand, the equalizer E of $g|_{V \cap V'}$ and $g'|_{V \cap V'}$ is a closed subscheme of $V \cap V'$ (Schemes, Lemma 25.21.5). Now $W \subset E$ implies that $E = V \cap V'$ set theoretically. As $V \cap V'$ is reduced we conclude $E = V \cap V'$ scheme theoretically, i.e., $g|_{V \cap V'} = g'|_{V \cap V'}$. It follows that we can glue the representatives $g : V \rightarrow Y$ of φ to a morphism $f : U \rightarrow Y$, see Schemes, Lemma 25.14.1. We omit the proof of the final statement. \square

In general it does not make sense to compose rational maps. The reason is that the image of a representative of the first rational map may have empty intersection with the domain of definition of the second. However, if we assume that our schemes are irreducible and we look at dominant rational maps, then we can compose rational maps.

Definition 28.10.9. Let X and Y be irreducible schemes. A rational map from X to Y is called *dominant* if any representative $f : U \rightarrow Y$ is a dominant morphism of schemes.

By Lemma 28.8.5 it is equivalent to require that the generic point $\eta \in X$ maps to the generic point ξ of Y , i.e., $f(\eta) = \xi$ for any representative $f : U \rightarrow Y$. We can compose a dominant rational map φ between irreducible schemes X and Y with an arbitrary rational map ψ from Y to Z . Namely, choose representatives $f : U \rightarrow Y$ with $U \subset X$ open dense and $g : V \rightarrow Z$ with $V \subset Y$ open dense. Then $W = f^{-1}(V) \subset X$ is open nonempty (because it contains the generic point of X) and we let $\psi \circ \varphi$ be the equivalence class of $g \circ f|_W : W \rightarrow Z$. We omit the verification that this is well defined.

In this way we obtain a category whose objects are irreducible schemes and whose morphisms are dominant rational maps. Given a base scheme S we can similarly define a category whose objects are irreducible schemes over S and whose morphisms are dominant S -rational maps.

Definition 28.10.10. Let X and Y be irreducible schemes.

- (1) We say X and Y are *birational* if X and Y are isomorphic in the category of irreducible schemes and dominant rational maps.
- (2) Assume X and Y are schemes over a base scheme S . We say X and Y are *S -birational* if X and Y are isomorphic in the category of irreducible schemes over S and dominant S -rational maps.

If X and Y are birational irreducible schemes, then the set of rational maps from X to Z is bijective with the set of rational map from Y to Z for all schemes Z (functorially in Z). For “general” irreducible schemes this is just one possible definition. Another would be to require X and Y have isomorphic nonempty opens, or we could ask that X and Y have isomorphic rings of rational functions. For varieties all three conditions are equivalent (see insert future reference here).

Remark 28.10.11. There is a variant of Definition 28.10.1 where we consider only those morphism $U \rightarrow Y$ defined on scheme theoretically dense open subschemes $U \subset X$. We use Lemma 28.7.6 to see that we obtain an equivalence relation. An equivalence class of these is called a *pseudo-morphism from X to Y* . If X is reduced the two notions coincide.

28.11. Surjective morphisms

Definition 28.11.1. A morphism of schemes is said to be *surjective* if it is surjective on underlying topological spaces.

Lemma 28.11.2. *The composition of surjective morphisms is surjective.*

Proof. Omitted. □

Lemma 28.11.3. *Let X and Y be schemes over a base scheme S . Given points $x \in X$ and $y \in Y$, there is a point of $X \times_S Y$ mapping to x and y under the projections if and only if x and y lie above the same point of S .*

Proof. The condition is obviously necessary, and the converse follows from the proof of Schemes, Lemma 25.17.5. □

Lemma 28.11.4. *The base change of a surjective morphism is surjective.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes over a base scheme S . If $S' \rightarrow S$ is a morphism of schemes, let $p : X_{S'} \rightarrow X$ and $q : Y_{S'} \rightarrow Y$ be the canonical projections. The commutative square

$$\begin{array}{ccc} X_{S'} & \xrightarrow{p} & X \\ f_{S'} \downarrow & & \downarrow f \\ Y_{S'} & \xrightarrow{q} & Y. \end{array}$$

identifies $X_{S'}$ as a fibre product of $X \rightarrow Y$ and $Y_{S'} \rightarrow Y$. Let Z be a subset of the underlying topological space of X . Then $q^{-1}(f(Z)) = f_{S'}(p^{-1}(Z))$, because $y' \in q^{-1}(f(Z))$ if and only if $q(y') = f(x)$ for some $x \in Z$, if and only if, by Lemma 28.11.3, there exists $x' \in X_{S'}$ such that $f_{S'}(x') = y'$ and $p(x') = x$. In particular taking $Z = X$ we see that if f is surjective so is the base change $f_{S'} : X_{S'} \rightarrow Y_{S'}$. □

Example 28.11.5. Bijectivity is not stable under base change, and so neither is injectivity. For example consider the bijection $\text{Spec}(\mathbf{C}) \rightarrow \text{Spec}(\mathbf{R})$. The base change $\text{Spec}(\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C}) \rightarrow \text{Spec}(\mathbf{C})$ is not injective, since there is an isomorphism $\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C} \cong \mathbf{C} \times \mathbf{C}$ (the decomposition comes from the idempotent $\frac{1 \otimes 1 + i \otimes i}{2}$) and hence $\text{Spec}(\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C})$ has two points.

Lemma 28.11.6. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

be a commutative diagram of morphisms of schemes. If f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Let $W \subset Z$ be a quasi-compact open. By assumption $p^{-1}(W)$ is quasi-compact. Hence by Topology, Lemma 5.11.7 the inverse image $q^{-1}(W) = f(p^{-1}(W))$ is quasi-compact too. This proves the lemma. □

28.12. Radicial and universally injective morphisms

In this section we define what it means for a morphism of schemes to be *radicial* and what it means for a morphism of schemes to be *universally injective*. We then show that these notions agree. The reason for introducing both is that in the case of algebraic spaces there are corresponding notions which may not always agree.

Definition 28.12.1. Let $f : X \rightarrow S$ be a morphism.

- (1) We say that f is *universally injective* if and only if for any morphism of schemes $S' \rightarrow S$ the base change $f' : X_{S'} \rightarrow S'$ is injective (on underlying topological spaces).
- (2) We say f is *radicial* if f is injective as a map of topological spaces, and for every $x \in X$ the field extension $\kappa(x) \supset \kappa(f(x))$ is purely inseparable.

Lemma 28.12.2. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:

- (1) For every field K the induced map $\text{Mor}(\text{Spec}(K), X) \rightarrow \text{Mor}(\text{Spec}(K), S)$ is injective.
- (2) The morphism f is universally injective.
- (3) The morphism f is radicial.
- (4) The diagonal morphism $\Delta_{X/S} : X \rightarrow X \times_S X$ is surjective.

Proof. Let K be a field, and let $s : \text{Spec}(K) \rightarrow S$ be a morphism. Giving a morphism $x : \text{Spec}(K) \rightarrow X$ such that $f \circ x = s$ is the same as giving a section of the projection $X_K = \text{Spec}(K) \times_S X \rightarrow \text{Spec}(K)$, which in turn is the same as giving a point $x \in X_K$ whose residue field is K . Hence we see that (2) implies (1).

Conversely, suppose that (1) holds. Assume that $x, x' \in X_{S'}$ map to the same point $s' \in S'$. Choose a commutative diagram

$$\begin{array}{ccc} K & \longleftarrow & \kappa(x) \\ \uparrow & & \uparrow \\ \kappa(x') & \longleftarrow & \kappa(s') \end{array}$$

of fields. By Schemes, Lemma 25.13.3 we get two morphisms $a, a' : \text{Spec}(K) \rightarrow X_{S'}$. One corresponding to the point x and the embedding $\kappa(x) \subset K$ and the other corresponding to the point x' and the embedding $\kappa(x') \subset K$. Also we have $f' \circ a = f' \circ a'$. Condition (1) now implies that the compositions of a and a' with $X_{S'} \rightarrow X$ are equal. Since $X_{S'}$ is the fibre product of S' and X over S we see that $a = a'$. Hence $x = x'$. Thus (1) implies (2).

If there are two different points $x, x' \in X$ mapping to the same point of s then (2) is violated. If for some $s = f(x)$, $x \in X$ the field extension $\kappa(s) \subset \kappa(x)$ is not purely inseparable, then we may find a field extension $\kappa(s) \subset K$ such that $\kappa(x)$ has two $\kappa(s)$ -homomorphisms into K . By Schemes, Lemma 25.13.3 this implies that the map $\text{Mor}(\text{Spec}(K), X) \rightarrow \text{Mor}(\text{Spec}(K), S)$ is not injective, and hence (1) is violated. Thus we see that the equivalent conditions (1) and (2) imply f is radicial, i.e., they imply (3).

Assume (3). By Schemes, Lemma 25.13.3 a morphism $\text{Spec}(K) \rightarrow X$ is given by a pair $(x, \kappa(x) \rightarrow K)$. Property (3) says exactly that associating to the pair

$(x, \kappa(x) \rightarrow K)$ the pair $(s, \kappa(s) \rightarrow \kappa(x) \rightarrow K)$ is injective. In other words (1) holds. At this point we know that (1), (2) and (3) are all equivalent.

Finally, we prove the equivalence of (4) with (1), (2) and (3). A point of $X \times_S X$ is given by a quadruple $(x_1, x_2, s, \mathfrak{p})$, where $x_1, x_2 \in X$, $f(x_1) = f(x_2) = s$ and $\mathfrak{p} \subset \kappa(x_1) \otimes_{\kappa(s)} \kappa(x_2)$ is a prime ideal, see Schemes, Lemma 25.17.5. If f is universally injective, then by taking $S' = X$ in the definition of universally injective, $\Delta_{X/S}$ must be surjective since it is a section of the injective morphism $X \times_S X \rightarrow X$. Conversely, if $\Delta_{X/S}$ is surjective, then always $x_1 = x_2 = x$ and there is exactly one such prime ideal \mathfrak{p} , which means that $\kappa(s) \subset \kappa(x)$ is purely inseparable. Hence f is radicial. Alternatively, if $\Delta_{X/S}$ is surjective, then for any $S' \rightarrow S$ the base change $\Delta_{X_{S'}/S'}$ is surjective which implies that f is universally injective. This finishes the proof of the lemma. \square

Lemma 28.12.3. *A universally injective morphism is separated.*

Proof. Combine Lemma 28.12.2 with the remark that $X \rightarrow S$ is separated if and only if the image of $\Delta_{X/S}$ is closed in $X \times_S X$, see Schemes, Definition 25.21.3 and the discussion following it. \square

Lemma 28.12.4. *A base change of a universally injective morphism is universally injective.*

Proof. This is formal. \square

Lemma 28.12.5. *A composition of radicial morphisms is radicial, and so the same holds for the equivalent condition of being universally injective.*

Proof. Omitted. \square

28.13. Affine morphisms

Definition 28.13.1. A morphism of schemes $f : X \rightarrow S$ is called *affine* if the inverse image of every affine open of S is an affine open of X .

Lemma 28.13.2. *An affine morphism is separated and quasi-compact.*

Proof. Let $f : X \rightarrow S$ be affine. Quasi-compactness is immediate from Schemes, Lemma 25.19.2. We will show f is separated using Schemes, Lemma 25.21.8. Let $x_1, x_2 \in X$ be points of X which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing s . By assumption $f^{-1}(W)$ is affine. Apply the lemma cited with $U = V = f^{-1}(W)$. \square

Lemma 28.13.3. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is affine.*
- (2) *There exists an affine open covering $S = \bigcup W_j$ such that each $f^{-1}(W_j)$ is affine.*
- (3) *There exists a quasi-coherent sheaf of \mathcal{O}_S -algebras \mathcal{A} and an isomorphism $X \cong \underline{\text{Spec}}_S(\mathcal{A})$ of schemes over S . See Constructions, Section 26.4 for notation.*

Moreover, in this case $X = \underline{\text{Spec}}_S(f_*\mathcal{O}_X)$.

Proof. It is obvious that (1) implies (2).

Assume $S = \bigcup_{j \in J} W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is affine. By Schemes, Lemma 25.19.2 we see that f is quasi-compact. By Schemes, Lemma 25.21.7 we see the morphism f is quasi-separated. Hence by Schemes, Lemma 25.24.1 the sheaf $\mathcal{A} = f_*\mathcal{O}_X$ is a quasi-coherent sheaf of \mathcal{O}_X -algebras. Thus we have the scheme $g : Y = \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow S$ over S . The identity map $\text{id} : \mathcal{A} = f_*\mathcal{O}_X \rightarrow f_*\mathcal{O}_X$ provides, via the definition of the relative spectrum, a morphism $\text{can} : X \rightarrow Y$ over S , see Constructions, Lemma 26.4.7. By assumption and the lemma just cited the restriction $\text{can}|_{f^{-1}(W_j)} : f^{-1}(W_j) \rightarrow g^{-1}(W_j)$ is an isomorphism. Thus can is an isomorphism. We have shown that (2) implies (3).

Assume (3). By Constructions, Lemma 26.4.6 we see that the inverse image of every affine open is affine, and hence the morphism is affine by definition. \square

Remark 28.13.4. We can also argue directly that (2) implies (1) in Lemma 28.13.3 above as follows. Assume $S = \bigcup W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is affine. First argue that $\mathcal{A} = f_*\mathcal{O}_X$ is quasi-coherent as in the proof above. Let $\text{Spec}(R) = V \subset S$ be affine open. We have to show that $f^{-1}(V)$ is affine. Set $A = \mathcal{A}(V) = f_*\mathcal{O}_X(V) = \mathcal{O}_X(f^{-1}(V))$. By Schemes, Lemma 25.6.4 there is a canonical morphism $\psi : f^{-1}(V) \rightarrow \text{Spec}(A)$ over $\text{Spec}(R) = V$. By Schemes, Lemma 25.11.6 there exists an integer $n \geq 0$, a standard open covering $V = \bigcup_{i=1, \dots, n} D(h_i)$, $h_i \in R$, and a map $a : \{1, \dots, n\} \rightarrow J$ such that each $D(h_i)$ is also a standard open of the affine scheme $W_{a(i)}$. The inverse image of a standard open under a morphism of affine schemes is standard open, see Algebra, Lemma 10.16.4. Hence we see that $f^{-1}(D(h_i))$ is a standard open of $f^{-1}(W_{a(i)})$, in particular that $f^{-1}(D(h_i))$ is affine. Because \mathcal{A} is quasi-coherent we have $A_{h_i} = \mathcal{A}(D(h_i)) = \mathcal{O}_X(f^{-1}(D(h_i)))$, so $f^{-1}(D(h_i))$ is the spectrum of A_{h_i} . It follows that the morphism ψ induces an isomorphism of the open $f^{-1}(D(h_i))$ with the open $\text{Spec}(A_{h_i})$ of $\text{Spec}(A)$. Since $f^{-1}(V) = \bigcup f^{-1}(D(h_i))$ and $\text{Spec}(A) = \bigcup \text{Spec}(A_{h_i})$ we win.

Lemma 28.13.5. *Let S be a scheme. There is an anti-equivalence of categories*

$$\begin{array}{ccc} \text{Schemes affine} & \longleftrightarrow & \text{quasi-coherent sheaves} \\ \text{over } S & & \text{of } \mathcal{O}_S\text{-algebras} \end{array}$$

which associates to $f : X \rightarrow S$ the sheaf $f_\mathcal{O}_X$. Moreover, this equivalence is compatible with arbitrary base change.*

Proof. The functor from right to left is given by $\underline{\text{Spec}}_S$. The two functors are mutually inverse by Lemma 28.13.3 and Constructions, Lemma 26.4.6 part (3). The final statement is Constructions, Lemma 26.4.6 part (2). \square

Lemma 28.13.6. *Let $f : X \rightarrow S$ be an affine morphism of schemes. Let $\mathcal{A} = f_*\mathcal{O}_X$. The functor $\mathcal{F} \mapsto f_*\mathcal{F}$ induces an equivalence of categories*

$$\left\{ \begin{array}{c} \text{category of quasi-coherent} \\ \mathcal{O}_X\text{-modules} \end{array} \right\} \longrightarrow \left\{ \begin{array}{c} \text{category of quasi-coherent} \\ \mathcal{A}\text{-modules} \end{array} \right\}$$

Moreover, an \mathcal{A} -module is quasi-coherent as an \mathcal{O}_S -module if and only if it is quasi-coherent as an \mathcal{A} -module.

Proof. Omitted. \square

Lemma 28.13.7. *The composition of affine morphisms is affine.*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is affine by assumption on g . Whereupon $f^{-1}(g^{-1}(U))$ is affine by assumption on f . Hence $(g \circ f)^{-1}(U)$ is affine. \square

Lemma 28.13.8. *The base change of an affine morphism is affine.*

Proof. Let $f : X \rightarrow S$ be an affine morphism. Let $S' \rightarrow S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \rightarrow S'$ the base change of f . For every $s' \in S'$ there exists an open affine neighbourhood $s' \in V \subset S'$ which maps into some open affine $U \subset S$. By assumption $f^{-1}(U)$ is affine. By the material in Schemes, Section 25.17 we see that $f^{-1}(U)_V = V \times_U f^{-1}(U)$ is affine and equal to $(f')^{-1}(V)$. This proves that S' has an open covering by affines whose inverse image under f' is affine. We conclude by Lemma 28.13.3 above. \square

Lemma 28.13.9. *A closed immersion is affine.*

Proof. The first indication of this is Schemes, Lemma 25.8.2. See Schemes, Lemma 25.10.1 for a complete statement. \square

Lemma 28.13.10. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$. The inclusion morphism $j : X_s \rightarrow X$ is affine.*

Proof. This follows from Properties, Lemma 27.24.4 and the definition. \square

Lemma 28.13.11. *Suppose $g : X \rightarrow Y$ is a morphism of schemes over S .*

- (1) *If X is affine over S and $\Delta : Y \rightarrow Y \times_S Y$ is affine, then g is affine.*
- (2) *If X is affine over S and Y is separated over S , then g is affine.*
- (3) *A morphism from an affine scheme to a scheme with affine diagonal is affine.*
- (4) *A morphism from an affine scheme to a separated scheme is affine.*

Proof. Proof of (1). The base change $X \times_S Y \rightarrow Y$ is affine by Lemma 28.13.8. The morphism $(1, g) : X \rightarrow X \times_S Y$ is the base change of $Y \rightarrow Y \times_S Y$ by the morphism $X \times_S Y \rightarrow Y \times_S Y$. Hence it is affine by Lemma 28.13.8. The composition of affine morphisms is affine (see Lemma 28.13.7) and (1) follows. Part (2) follows from (1) as a closed immersion is affine (see Lemma 28.13.9) and Y/S separated means Δ is a closed immersion. Parts (3) and (4) are special cases of (1) and (2). \square

Lemma 28.13.12. *A morphism between affine schemes is affine.*

Proof. Immediate from Lemma 28.13.11 with $S = \text{Spec}(\mathbf{Z})$. It also follows directly from the equivalence of (1) and (2) in Lemma 28.13.3. \square

Lemma 28.13.13. *Let S be a scheme. Let A be an Artinian ring. Any morphism $\text{Spec}(A) \rightarrow S$ is affine.*

Proof. Omitted. \square

28.14. Quasi-affine morphisms

Recall that a scheme X is called *quasi-affine* if it is quasi-compact and isomorphic to an open subscheme of an affine scheme, see Properties, Definition 27.15.1.

Definition 28.14.1. A morphism of schemes $f : X \rightarrow S$ is called *quasi-affine* if the inverse image of every affine open of S is a quasi-affine scheme.

Lemma 28.14.2. *A quasi-affine morphism is separated and quasi-compact.*

Proof. Let $f : X \rightarrow S$ be quasi-affine. Quasi-compactness is immediate from Schemes, Lemma 25.19.2. We will show f is separated using Schemes, Lemma 25.21.8. Let $x_1, x_2 \in X$ be points of X which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing s . By assumption $f^{-1}(W)$ is isomorphic to an open subscheme of an affine scheme, say $f^{-1}(W) \rightarrow Y$ is such an open immersion. Choose affine open neighbourhoods $x_1 \in U \subset f^{-1}(W)$ and $x_2 \in V \subset f^{-1}(W)$. We may think of U and V as open subschemes of Y and hence we see that $U \cap V$ is affine and that $\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$ is surjective (by the lemma cited above applied to U, V in Y). Hence by the lemma cited we conclude that f is separated. \square

Lemma 28.14.3. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is quasi-affine.*
- (2) *There exists an affine open covering $S = \bigcup W_j$ such that each $f^{-1}(W_j)$ is quasi-affine.*
- (3) *There exists a quasi-coherent sheaf of \mathcal{O}_S -algebras \mathcal{A} and a quasi-compact open immersion*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & \underline{\text{Spec}}_S(\mathcal{A}) \\ & \searrow & \swarrow \\ & S & \end{array}$$

over S .

- (4) *Same as in (3) but with $\mathcal{A} = f_*\mathcal{O}_X$ and the horizontal arrow the canonical morphism of Constructions, Lemma 26.4.7.*

Proof. It is obvious that (1) implies (2) and that (4) implies (3).

Assume $S = \bigcup_{j \in J} W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is quasi-affine. By Schemes, Lemma 25.19.2 we see that f is quasi-compact. By Schemes, Lemma 25.21.7 we see the morphism f is quasi-separated. Hence by Schemes, Lemma 25.24.1 the sheaf $\mathcal{A} = f_*\mathcal{O}_X$ is a quasi-coherent sheaf of \mathcal{O}_S -algebras. Thus we have the scheme $g : Y = \underline{\text{Spec}}_S(\mathcal{A}) \rightarrow S$ over S . The identity map $\text{id} : \mathcal{A} = f_*\mathcal{O}_X \rightarrow f_*\mathcal{O}_X$ provides, via the definition of the relative spectrum, a morphism $\text{can} : X \rightarrow Y$ over S , see Constructions, Lemma 26.4.7. By assumption, the lemma just cited, and Properties, Lemma 27.15.4 the restriction $\text{can}|_{f^{-1}(W_j)} : f^{-1}(W_j) \rightarrow g^{-1}(W_j)$ is a quasi-compact open immersion. Thus can is a quasi-compact open immersion. We have shown that (2) implies (4).

Assume (3). Choose any affine open $U \subset S$. By Constructions, Lemma 26.4.6 we see that the inverse image of U in the relative spectrum is affine. Hence we conclude

that $f^{-1}(U)$ is quasi-affine (note that quasi-compactness is encoded in (3) as well). Thus (3) implies (1). \square

Lemma 28.14.4. *The composition of quasi-affine morphisms is quasi-affine.*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be quasi-affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is quasi-affine by assumption on g . Let $j : g^{-1}(U) \rightarrow V$ be a quasi-compact open immersion into an affine scheme V . By Lemma 28.14.3 above we see that $f^{-1}(g^{-1}(U))$ is a quasi-compact open subscheme of the relative spectrum $\underline{\text{Spec}}_{g^{-1}(U)}(\mathcal{A})$ for some quasi-coherent sheaf of $\mathcal{O}_{g^{-1}(U)}$ -algebras \mathcal{A} . By Schemes, Lemma 25.24.1 the sheaf $\mathcal{A}' = j_*\mathcal{A}$ is a quasi-coherent sheaf of \mathcal{O}_V -algebras with the property that $j^*\mathcal{A}' = \mathcal{A}$. Hence we get a commutative diagram

$$\begin{array}{ccccc} f^{-1}(g^{-1}(U)) & \longrightarrow & \underline{\text{Spec}}_{g^{-1}(U)}(\mathcal{A}) & \longrightarrow & \underline{\text{Spec}}_V(\mathcal{A}') \\ & & \downarrow & & \downarrow \\ & & g^{-1}(U) & \xrightarrow{j} & V \end{array}$$

with the square being a fibre square, see Constructions, Lemma 26.4.6. Note that the upper right corner is an affine scheme. Hence $(g \circ f)^{-1}(U)$ is quasi-affine. \square

Lemma 28.14.5. *The base change of a quasi-affine morphism is quasi-affine.*

Proof. Let $f : X \rightarrow S$ be a quasi-affine morphism. By Lemma 28.14.3 above we can find a quasi-coherent sheaf of \mathcal{O}_S -algebras \mathcal{A} and a quasi-compact open immersion $X \rightarrow \underline{\text{Spec}}_S(\mathcal{A})$ over S . Let $g : S' \rightarrow S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \rightarrow S'$ the base change of f . Since the base change of a quasi-compact open immersion is a quasi-compact open immersion we see that $X_{S'} \rightarrow \underline{\text{Spec}}_{S'}(g^*\mathcal{A})$ is a quasi-compact open immersion (we have used Schemes, Lemmas 25.19.3 and 25.18.2 and Constructions, Lemma 26.4.6). By Lemma 28.14.3 again we conclude that $X_{S'} \rightarrow S'$ is quasi-affine. \square

Lemma 28.14.6. *A quasi-compact immersion is quasi-affine.*

Proof. Let $X \rightarrow S$ be a quasi-compact immersion. We have to show the inverse image of every affine open is quasi-affine. Hence, assuming S is an affine scheme, we have to show X is quasi-affine. By Lemma 28.7.7 the morphism $X \rightarrow S$ factors as $X \rightarrow Z \rightarrow S$ where Z is a closed subscheme of S and $X \subset Z$ is a quasi-compact open. Since S is affine Lemma 28.2.1 implies Z is affine. Hence we win. \square

Lemma 28.14.7. *Let S be a scheme. Let X be an affine scheme. A morphism $f : X \rightarrow S$ is quasi-affine if and only if it is quasi-compact. In particular any morphism from an affine scheme to a quasi-separated scheme is quasi-affine.*

Proof. Let $V \subset S$ be an affine open. Then $f^{-1}(V)$ is an open subscheme of the affine scheme X , hence quasi-affine if and only if it is quasi-compact. This proves the first assertion. The quasi-compactness of any $f : X \rightarrow S$ where X is affine and S quasi-separated follows from Schemes, Lemma 25.21.15 applied to $X \rightarrow S \rightarrow \text{Spec}(\mathbf{Z})$. \square

Lemma 28.14.8. *Suppose $g : X \rightarrow Y$ is a morphism of schemes over S . If X is quasi-affine over S and Y is quasi-separated over S , then g is quasi-affine. In particular, any morphism from a quasi-affine scheme to a quasi-separated scheme is quasi-affine.*

Proof. The base change $X \times_S Y \rightarrow Y$ is quasi-affine by Lemma 28.14.5. The morphism $X \rightarrow X \times_S Y$ is a quasi-compact immersion as $Y \rightarrow S$ is quasi-separated, see Schemes, Lemma 25.21.12. A quasi-compact immersion is quasi-affine by Lemma 28.14.6 and the composition of quasi-affine morphisms is quasi-affine (see Lemma 28.14.4). Thus we win. \square

28.15. Types of morphisms defined by properties of ring maps

In this section we study what properties of ring maps allow one to define local properties of morphisms of schemes.

Definition 28.15.1. Let P be a property of ring maps.

- (1) We say that P is *local* if the following hold:
 - (a) For any ring map $R \rightarrow A$, and any $f \in R$ we have $P(R \rightarrow A) \Rightarrow P(R_f \rightarrow A_f)$.
 - (b) For any rings R, A , any $f \in R, a \in A$, and any ring map $R_f \rightarrow A$ we have $P(R_f \rightarrow A) \Rightarrow P(R \rightarrow A_a)$.
 - (c) For any ring map $R \rightarrow A$, and $a_i \in A$ such that $(a_1, \dots, a_n) = A$ then $\forall i, P(R \rightarrow A_{a_i}) \Rightarrow P(R \rightarrow A)$.
- (2) We say that P is *stable under base change* if for any ring maps $R \rightarrow A, R \rightarrow R'$ we have $P(R \rightarrow A) \Rightarrow P(R' \rightarrow R' \otimes_R A)$.
- (3) We say that P is *stable under composition* if for any ring maps $A \rightarrow B, B \rightarrow C$ we have $P(A \rightarrow B) \wedge P(B \rightarrow C) \Rightarrow P(A \rightarrow C)$.

Definition 28.15.2. Let P be a property of ring maps. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *locally of type P* if for any $x \in X$ there exists an affine open neighbourhood U of x in X which maps into an affine open $V \subset S$ such that the induced ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ has property P .

This is not a “good” definition unless the property P is a local property. Even if P is a local property we will not automatically use this definition to say that a morphism is “locally of type P ” unless we also explicitly state the definition elsewhere.

Lemma 28.15.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let P be a property of ring maps. Let U be an affine open of X , and V an affine open of S such that $f(U) \subset V$. If f is locally of type P and P is local, then $P(\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U))$ holds.*

Proof. As f is locally of type P for every $u \in U$ there exists an affine open $U_u \subset X$ mapping into an affine open $V_u \subset S$ such that $P(\mathcal{O}_S(V_u) \rightarrow \mathcal{O}_X(U_u))$ holds. Choose an open neighbourhood $U'_u \subset U \cap U_u$ of u which is standard affine open in both U and U_u , see Schemes, Lemma 25.11.5. By Definition 28.15.1 (1)(b) we see that $P(\mathcal{O}_S(V_u) \rightarrow \mathcal{O}_X(U'_u))$ holds. Hence we may assume that $U_u \subset U$ is a standard affine open. Choose an open neighbourhood $V'_u \subset V \cap V_u$ of $f(u)$ which is standard affine open in both V and V_u , see Schemes, Lemma 25.11.5. Then $U'_u = f^{-1}(V'_u) \cap U_u$ is a standard affine open of U_u (hence of U) and we have $P(\mathcal{O}_S(V'_u) \rightarrow \mathcal{O}_X(U'_u))$ by Definition 28.15.1 (1)(a). Hence we may assume both $U_u \subset U$ and $V_u \subset V$ are standard affine open. Applying Definition 28.15.1 (1)(b) one more time we conclude that $P(\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U_u))$ holds. Because U is quasi-compact we may choose a finite number of points $u_1, \dots, u_n \in U$ such that

$$U = U_{u_1} \cup \dots \cup U_{u_n}.$$

By Definition 28.15.1 (1)(c) we conclude that $P(\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U))$ holds. \square

Lemma 28.15.4. *Let P be a local property of ring maps. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is locally of type P .*
- (2) *For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ we have $P(\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U))$.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j, j \in J, i \in I_j$ is locally of type P .*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that $P(\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i))$ holds, for all $j \in J, i \in I_j$.*

Moreover, if f is locally of type P then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is locally of type P .

Proof. This follows from Lemma 28.15.3 above. □

Lemma 28.15.5. *Let P be a property of ring maps. Assume P is local and stable under composition. The composition of morphisms locally of type P is locally of type P .*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms locally of type P . Let $x \in X$. Choose an affine open neighbourhood $W \subset Z$ of $g(f(x))$. Choose an affine open neighbourhood $V \subset g^{-1}(W)$ of $f(x)$. Choose an affine open neighbourhood $U \subset f^{-1}(V)$ of x . By Lemma 28.15.4 the ring maps $\mathcal{O}_Z(W) \rightarrow \mathcal{O}_Y(V)$ and $\mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(U)$ satisfy P . Hence $\mathcal{O}_Z(W) \rightarrow \mathcal{O}_X(U)$ satisfies P as P is assumed stable under composition. □

Lemma 28.15.6. *Let P be a property of ring maps. Assume P is local and stable under base change. The base change of a morphism locally of type P is locally of type P .*

Proof. Let $f : X \rightarrow S$ be a morphism locally of type P . Let $S' \rightarrow S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \rightarrow S'$ the base change of f . For every $s' \in S'$ there exists an open affine neighbourhood $s' \in V' \subset S'$ which maps into some open affine $V \subset S$. By Lemma 28.15.4 the open $f^{-1}(V)$ is a union of affines U_i such that the ring maps $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U_i)$ all satisfy P . By the material in Schemes, Section 25.17 we see that $f^{-1}(U)_{V'} = V' \times_V f^{-1}(V)$ is the union of the affine opens $V' \times_V U_i$. Since $\mathcal{O}_{X_{S'}}(V' \times_V U_i) = \mathcal{O}_{S'}(V') \otimes_{\mathcal{O}_S(V)} \mathcal{O}_X(U_i)$ we see that the ring maps $\mathcal{O}_{S'}(V') \rightarrow \mathcal{O}_{X_{S'}}(V' \times_V U_i)$ satisfy P as P is assumed stable under base change. □

Lemma 28.15.7. *The following properties of a ring map $R \rightarrow A$ are local.*

- (1) *(Isomorphism on local rings.) For every prime \mathfrak{q} of A lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.*
- (2) *(Open immersion.) For every prime \mathfrak{q} of A there exists an $f \in R, \varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi : R \rightarrow A$ induces an isomorphism $R_f \rightarrow A_f$.*
- (3) *(Reduced fibres.) For every prime \mathfrak{p} of R the fibre ring $A \otimes_R \kappa(\mathfrak{p})$ is reduced.*
- (4) *(Fibres of dimension at most n .) For every prime \mathfrak{p} of R the fibre ring $A \otimes_R \kappa(\mathfrak{p})$ has Krull dimension at most n .*

- (5) (*Locally Noetherian on the target.*) The ring map $R \rightarrow A$ has the property that A is Noetherian.
- (6) Add more here as needed².

Proof. Omitted. □

Lemma 28.15.8. *The following properties of ring maps are stable under base change.*

- (1) (*Isomorphism on local rings.*) For every prime \mathfrak{q} of A lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.
- (2) (*Open immersion.*) For every prime \mathfrak{q} of A there exists an $f \in R$, $\varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi : R \rightarrow A$ induces an isomorphism $R_f \rightarrow A_f$.
- (3) (*Reduced fibres.*) For every prime \mathfrak{p} of R the fibre ring $A \otimes_R \kappa(\mathfrak{p})$ is reduced.
- (4) (*Fibres of dimension at most n .*) For every prime \mathfrak{p} of R the fibre ring $A \otimes_R \kappa(\mathfrak{p})$ has Krull dimension at most n .
- (5) Add more here as needed³.

Proof. Omitted. □

Lemma 28.15.9. *The following properties of ring maps are stable under composition.*

- (1) (*Isomorphism on local rings.*) For every prime \mathfrak{q} of A lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.
- (2) (*Open immersion.*) For every prime \mathfrak{q} of A there exists an $f \in R$, $\varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi : R \rightarrow A$ induces an isomorphism $R_f \rightarrow A_f$.
- (3) (*Locally Noetherian on the target.*) The ring map $R \rightarrow A$ has the property that A is Noetherian.
- (4) Add more here as needed⁴.

Proof. Omitted. □

28.16. Morphisms of finite type

Recall that a ring map $R \rightarrow A$ is said to be of finite type if A is isomorphic to a quotient of $R[x_1, \dots, x_n]$ as an R -algebra, see Algebra, Definition 10.6.1.

Definition 28.16.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is of *finite type at $x \in X$* if there exists an affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and an affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is of finite type.
- (2) We say that f is *locally of finite type* if it is of finite type at every point of X .
- (3) We say that f is of *finite type* if it is locally of finite type and quasi-compact.

Lemma 28.16.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is locally of finite type.*

²But only those properties that are not already dealt with separately elsewhere.

³But only those properties that are not already dealt with separately elsewhere.

⁴But only those properties that are not already dealt with separately elsewhere.

- (2) For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is of finite type.
- (3) There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is locally of finite type.
- (4) There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is of finite type, for all $j \in J, i \in I_j$.

Moreover, if f is locally of finite type then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is locally of finite type.

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is of finite type” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. By Algebra, Lemma 10.13.2 being of finite type is stable under base change and hence we conclude (a) holds. By the same lemma being of finite type is stable under composition and trivially for any ring R the ring map $R \rightarrow R_f$ is of finite type. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.23.3. \square

Lemma 28.16.3. *The composition of two morphisms which are locally of finite type is locally of finite type. The same is true for morphisms of finite type.*

Proof. In the proof of Lemma 28.16.2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being of finite type is a property of ring maps that is stable under composition, see Algebra, Lemma 10.6.2. By the above and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 25.19.4 we see that the composition of morphisms of finite type is of finite type. \square

Lemma 28.16.4. *The base change of a morphism which is locally of finite type is locally of finite type. The same is true for morphisms of finite type.*

Proof. In the proof of Lemma 28.16.2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being of finite type is a property of ring maps that is stable under base change, see Algebra, Lemma 10.13.2. By the above and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19.3 we see that the base change of a morphism of finite type is a morphism of finite type. \square

Lemma 28.16.5. *A closed immersion is of finite type. An immersion is locally of finite type.*

Proof. This is true because an open immersion is a local isomorphism, and a closed immersion is obviously of finite type. \square

Lemma 28.16.6. *Let $f : X \rightarrow S$ be a morphism. If S is (locally) Noetherian and f (locally) of finite type then X is (locally) Noetherian.*

Proof. This follows immediately from the fact that a ring of finite type over a Noetherian ring is Noetherian, see Algebra, Lemma 10.30.1. (Also: use the fact

that the source of a quasi-compact morphism with quasi-compact target is quasi-compact.) \square

Lemma 28.16.7. *Let $f : X \rightarrow S$ be locally of finite type with S locally Noetherian. Then f is quasi-separated.*

Proof. In fact, it is true that X is quasi-separated, see Properties, Lemma 27.5.4 and Lemma 28.16.6 above. Then apply Schemes, Lemma 25.21.14 to conclude that f is quasi-separated. \square

Lemma 28.16.8. *Let $X \rightarrow Y$ be a morphism of schemes over a base scheme S . If X is locally of finite type over S , then $X \rightarrow Y$ is locally of finite type.*

Proof. Via Lemma 28.16.2 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is of finite type, then $B \rightarrow C$ is of finite type. (See Algebra, Lemma 10.6.2). \square

28.17. Points of finite type and Jacobson schemes

Let S be a scheme. A finite type point s of S is a point such that the morphism $\text{Spec}(\kappa(s)) \rightarrow S$ is of finite type. The reason for studying this is that finite type points can replace closed points in a certain sense and in certain situations. There are always enough of them for example. Moreover, a scheme is Jacobson if and only if all finite type points are closed points.

Lemma 28.17.1. *Let S be a scheme. Let k be a field. Let $f : \text{Spec}(k) \rightarrow S$ be a morphism. The following are equivalent:*

- (1) *The morphism f is of finite type.*
- (2) *The morphism f is locally of finite type.*
- (3) *There exists an affine open $U = \text{Spec}(R)$ of S such that f corresponds to a finite ring map $R \rightarrow k$.*
- (4) *There exists an affine open $U = \text{Spec}(R)$ of S such that the image of f consists of a closed point u in U and the field extension $\kappa(u) \subset k$ is finite.*

Proof. The equivalence of (1) and (2) is obvious as $\text{Spec}(k)$ is a singleton and hence any morphism from it is quasi-compact.

Suppose f is locally of finite type. Choose any affine open $\text{Spec}(R) = U \subset S$ such that the image of f is contained in U , and the ring map $R \rightarrow k$ is of finite type. Let $\mathfrak{p} \subset R$ be the kernel. Then $R/\mathfrak{p} \subset k$ is of finite type. By Algebra, Lemma 10.33.2 there exist a $\bar{f} \in R/\mathfrak{p}$ such that $(R/\mathfrak{p})_{\bar{f}}$ is a field and $(R/\mathfrak{p})_{\bar{f}} \rightarrow k$ is a finite field extension. If $f \in R$ is a lift of \bar{f} , then we see that k is a finite R_f -module. Thus (2) \Rightarrow (3).

Suppose that $\text{Spec}(R) = U \subset S$ is an affine open such that f corresponds to a finite ring map $R \rightarrow k$. Then f is locally of finite type by Lemma 28.16.2. Thus (3) \Rightarrow (2).

Suppose $R \rightarrow k$ is finite. The image of $R \rightarrow k$ is a field over which k is finite by Algebra, Lemma 10.35.16. Hence the kernel of $R \rightarrow k$ is a maximal ideal. Thus (3) \Rightarrow (4).

The implication (4) \Rightarrow (3) is immediate. \square

Lemma 28.17.2. *Let S be a scheme. Let A be an Artinian local ring with residue field κ . Let $f : \text{Spec}(A) \rightarrow S$ be a morphism of schemes. Then f is of finite type if and only if the composition $\text{Spec}(\kappa) \rightarrow \text{Spec}(A) \rightarrow S$ is of finite type.*

Proof. Since the morphism $\text{Spec}(\kappa) \rightarrow \text{Spec}(A)$ is of finite type it is clear that if f is of finite type so is the composition $\text{Spec}(\kappa) \rightarrow S$ (see Lemma 28.16.3). For the converse, note that $\text{Spec}(A) \rightarrow S$ maps into some affine open $U = \text{Spec}(B)$ of S as $\text{Spec}(A)$ has only one point. To finish apply Algebra, Lemma 10.52.3 to $B \rightarrow A$. \square

Recall that given a point s of a scheme S there is a canonical morphism $\text{Spec}(\kappa(s)) \rightarrow S$, see Schemes, Section 25.13.

Definition 28.17.3. Let S be a scheme. Let us say that a point s of S is a *finite type point* if the canonical morphism $\text{Spec}(\kappa(s)) \rightarrow S$ is of finite type. We denote $S_{\text{ft-pts}}$ the set of finite type points of S .

We can describe the set of finite type points as follows.

Lemma 28.17.4. *Let S be a scheme. We have*

$$S_{\text{ft-pts}} = \bigcup_{U \subset S \text{ open}} U_0$$

where U_0 is the set of closed points of U . Here we may let U range over all opens or over all affine opens of S .

Proof. Immediate from Lemma 28.17.1. \square

Lemma 28.17.5. *Let $f : T \rightarrow S$ be a morphism of schemes. If f is locally of finite type, then $f(T_{\text{ft-pts}}) \subset S_{\text{ft-pts}}$.*

Proof. If T is the spectrum of a field this is Lemma 28.17.1. In general it follows since the composition of morphisms locally of finite type is locally of finite type (Lemma 28.16.3). \square

Lemma 28.17.6. *Let $f : T \rightarrow S$ be a morphism of schemes. If f is locally of finite type and surjective, then $f(T_{\text{ft-pts}}) = S_{\text{ft-pts}}$.*

Proof. We have $f(T_{\text{ft-pts}}) \subset S_{\text{ft-pts}}$ by Lemma 28.17.5. Let $s \in S$ be a finite type point. As f is surjective the scheme $T_s = \text{Spec}(\kappa(s)) \times_S T$ is nonempty, therefore has a finite type point $t \in T_s$ by Lemma 28.17.4. Now $T_s \rightarrow T$ is a morphism of finite type as a base change of $s \rightarrow S$ (Lemma 28.16.4). Hence the image of t in T is a finite type point by Lemma 28.17.5 which maps to s by construction. \square

Lemma 28.17.7. *Let S be a scheme. For any locally closed subset $T \subset S$ we have*

$$T \neq \emptyset \Rightarrow T \cap S_{\text{ft-pts}} \neq \emptyset.$$

In particular, for any closed subset $T \subset S$ we see that $T \cap S_{\text{ft-pts}}$ is dense in T .

Proof. Note that T carries a scheme structure (see Schemes, Lemma 25.12.4) such that $T \rightarrow S$ is a locally closed immersion. Any locally closed immersion is locally of finite type, see Lemma 28.16.5. Hence by Lemma 28.17.5 we see $T_{\text{ft-pts}} \subset S_{\text{ft-pts}}$. Finally, any nonempty affine open of T has at least one closed point which is a finite type point of T by Lemma 28.17.4. \square

It follows that most of the material from Topology, Section 5.17 goes through with the set of closed points replaced by the set of points of finite type. In fact, if S is Jacobson then we recover the closed points as the finite type points.

Lemma 28.17.8. *Let S be a scheme. The following are equivalent:*

- (1) *For every finite type morphism $f : \text{Spec}(k) \rightarrow S$ with k a field the image consists of a closed point of S . In the terminology introduced above: finite type points of S are closed points of S .*
- (2) *For every locally finite type morphism $T \rightarrow S$ closed points map to closed points.*
- (3) *For every locally finite type morphism $f : T \rightarrow S$ any closed point $t \in T$ maps to a closed point $s \in S$ and $\kappa(s) \subset \kappa(t)$ is finite.*
- (4) *The scheme S is Jacobson.*

Proof. We have trivially (3) \Rightarrow (2) \Rightarrow (1). The discussion above shows that (1) implies (4). Hence it suffices to show that (4) implies (3). Suppose that $T \rightarrow S$ is locally of finite type. Choose $t \in T$ with $s = f(t)$ as in (3). Choose affine open neighbourhoods $\text{Spec}(R) = U \subset S$ of s and $\text{Spec}(A) = V \subset T$ of t with $f(V) \subset U$. The induced ring map $R \rightarrow A$ is of finite type (see Lemma 28.16.2) and R is Jacobson by Properties, Lemma 27.6.3. Thus the result follows from Algebra, Proposition 10.34.18. \square

Lemma 28.17.9. *Let S be a Jacobson scheme. Any scheme locally of finite type over S is Jacobson.*

Proof. This is clear from Algebra, Proposition 10.34.18 (and Properties, Lemma 27.6.3 and Lemma 28.16.2). \square

Lemma 28.17.10. *The following types of schemes are Jacobson.*

- (1) *Any scheme locally of finite type over a field.*
- (2) *Any scheme locally of finite type over \mathbf{Z} .*
- (3) *Any scheme locally of finite type over a 1-dimensional Noetherian domain with infinitely many primes.*
- (4) *A scheme of the form $\text{Spec}(R) \setminus \{\mathfrak{m}\}$ where (R, \mathfrak{m}) is a Noetherian local ring. Also any scheme locally of finite type over it.*

Proof. We will use Lemma 28.17.9 without mention. The spectrum of a field is clearly Jacobson. The spectrum of \mathbf{Z} is Jacobson, see Algebra, Lemma 10.34.6. For (3) see Algebra, Lemma 10.60.4. For (4) see Properties, Lemma 27.6.4. \square

28.18. Universally catenary schemes

Recall that a topological space X is called *catenary* if for every pair of irreducible closed subsets $T \subset T'$ there exist a maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \dots \subset T_e = T'$$

and every such chain has the same length. See Topology, Definition 5.10.4. Recall that a scheme is catenary if its underlying topological space is catenary. See Properties, Definition 27.11.1.

Definition 28.18.1. Let S be a scheme. Assume S is locally Noetherian. We say S is *universally catenary* if for every morphism $X \rightarrow S$ locally of finite type the scheme X is catenary.

This is a “better” notion than catenary as there exist Noetherian schemes which are catenary but not universally catenary. See Examples, Section 82.16. Many schemes are universally catenary, see Lemma 28.18.4 below.

Recall that a ring A is called *catenary* if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$ there exists a maximal chain of primes

$$\mathfrak{p} = \mathfrak{p}_0 \subset \dots \subset \mathfrak{p}_e = \mathfrak{q}$$

and all of these have the same length. See Algebra, Definition 10.101.1. We have seen the relationship between catenary schemes and catenary rings in Properties, Section 27.11. Recall that a ring A is called *universally catenary* if A is Noetherian and for every finite type ring map $A \rightarrow B$ the ring B is catenary. See Algebra, Definition 10.101.5. Many interesting rings which come up in algebraic geometry satisfy this property.

Lemma 28.18.2. *Let S be a locally Noetherian scheme. The following are equivalent*

- (1) S is universally catenary,
- (2) there exists an open covering of S all of whose members are universally catenary schemes,
- (3) for every affine open $\text{Spec}(R) = U \subset S$ the ring R is universally catenary, and
- (4) there exists an affine open covering $S = \bigcup U_i$ such that each U_i is the spectrum of a universally catenary ring.

Moreover, in this case any scheme locally of finite type over S is universally catenary as well.

Proof. By Lemma 28.16.5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 28.16.3). Thus it is clear that if S is universally catenary then any open and any scheme locally of finite type over S is universally catenary as well. This proves the final statement of the lemma and that (1) implies (2).

If $\text{Spec}(R)$ is a universally catenary scheme, then every scheme $\text{Spec}(A)$ with A a finite type R -algebra is catenary. Hence all these rings A are catenary by Algebra, Lemma 10.101.2. Thus R is universally catenary. Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course (3) implies (4) trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $X \rightarrow S$ be a morphism locally of finite type. We can find an affine open covering $X = \bigcup V_j$ such that each $V_j \rightarrow S$ maps into one of the U_i . By Lemma 28.16.2 the induced ring map $\mathcal{O}(U_i) \rightarrow \mathcal{O}(V_j)$ is of finite type. Hence $\mathcal{O}(V_j)$ is catenary. Hence X is catenary by Properties, Lemma 27.11.2. \square

Lemma 28.18.3. *Let S be a locally Noetherian scheme. The following are equivalent:*

- (1) S is universally catenary, and
- (2) all local rings $\mathcal{O}_{S,s}$ of S are universally catenary.

Proof. Assume that all local rings of S are universally catenary. Let $f : X \rightarrow S$ be locally of finite type. We know that X is catenary if and only if $\mathcal{O}_{X,x}$ is catenary

for all $x \in X$. If $f(x) = s$, then $\mathcal{O}_{X,x}$ is essentially of finite type over $\mathcal{O}_{S,s}$. Hence $\mathcal{O}_{X,x}$ is catenary by the assumption that $\mathcal{O}_{S,s}$ is universally catenary.

Conversely, assume that S is universally catenary. Let $s \in S$. We may replace S by an affine open neighbourhood of s by Lemma 28.18.2. Say $S = \text{Spec}(R)$ and s corresponds to the prime ideal \mathfrak{p} . Any finite type $R_{\mathfrak{p}}$ -algebra A' is of the form $A_{\mathfrak{p}}$ for some finite type R -algebra A . By assumption (and Lemma 28.18.2 if you like) the ring A is catenary, and hence A' (a localization of A) is catenary. Thus $R_{\mathfrak{p}}$ is universally catenary. \square

Lemma 28.18.4. *The following types of schemes are universally catenary.*

- (1) *Any scheme locally of finite type over a field.*
- (2) *Any scheme locally of finite type over a Cohen-Macaulay scheme.*
- (3) *Any scheme locally of finite type over \mathbf{Z} .*
- (4) *Any scheme locally of finite type over a 1-dimensional Noetherian domain.*
- (5) *And so on.*

Proof. All of these follow from the fact that a Cohen-Macaulay ring is universally catenary, see Algebra, Lemma 10.101.6. Also, use the last assertion of Lemma 28.18.2. Some details omitted. \square

28.19. Nagata schemes, reprise

See Properties, Section 27.13 for the definitions and basic properties of Nagata and universally Japanese schemes.

Lemma 28.19.1. *Let $f : X \rightarrow S$ be a morphism. If S is Nagata and f locally of finite type then X is Nagata. If S is universally Japanese and f locally of finite type then X is universally Japanese.*

Proof. For “universally Japanese” this follows from Algebra, Lemma 10.150.18. For “Nagata” this follows from Algebra, Proposition 10.150.30. \square

Lemma 28.19.2. *The following types of schemes are Nagata.*

- (1) *Any scheme locally of finite type over a field.*
- (2) *Any scheme locally of finite type over a Noetherian complete local ring.*
- (3) *Any scheme locally of finite type over \mathbf{Z} .*
- (4) *Any scheme locally of finite type over a Dedekind ring of characteristic zero.*
- (5) *And so on.*

Proof. By Lemma 28.19.1 we only need to show that the rings mentioned above are Nagata rings. For this see Algebra, Proposition 10.150.31. \square

28.20. The singular locus, reprise

We look for a criterion that implies openness of the regular locus for any scheme locally of finite type over the base. Here is the definition.

Definition 28.20.1. Let X be a locally Noetherian scheme. We say X is *J-2* if for every morphism $Y \rightarrow X$ which is locally of finite type the regular locus $\text{Reg}(Y)$ is open in Y .

This is the analogue of the corresponding notion for Noetherian rings, see More on Algebra, Definition 15.36.1.

Lemma 28.20.2. *Let X be a locally Noetherian scheme. The following are equivalent*

- (1) X is J-2,
- (2) there exists an open covering of X all of whose members are J-2 schemes,
- (3) for every affine open $\text{Spec}(R) = U \subset X$ the ring R is J-2, and
- (4) there exists an affine open covering $S = \bigcup U_i$ such that each $\mathcal{O}(U_i)$ is J-2 for all i .

Moreover, in this case any scheme locally of finite type over X is J-2 as well.

Proof. By Lemma 28.16.5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 28.16.3). Thus it is clear that if X is J-2 then any open and any scheme locally of finite type over X is J-2 as well. This proves the final statement of the lemma.

If $\text{Spec}(R)$ is J-2, then for every finite type R -algebra A the regular locus of the scheme $\text{Spec}(A)$ is open. Hence R is J-2, by definition (see More on Algebra, Definition 15.36.1). Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course (1) \Rightarrow (2) and (3) \Rightarrow (4) trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $Y \rightarrow X$ be a morphism locally of finite type. We can find an affine open covering $Y = \bigcup V_j$ such that each $V_j \rightarrow X$ maps into one of the U_i . By Lemma 28.16.2 the induced ring map $\mathcal{O}(U_i) \rightarrow \mathcal{O}(V_j)$ is of finite type. Hence the regular locus of $V_j = \text{Spec}(\mathcal{O}(V_j))$ is open. Since $\text{Reg}(Y) \cap V_j = \text{Reg}(V_j)$ we conclude that $\text{Reg}(Y)$ is open as desired. \square

Lemma 28.20.3. *The following types of schemes are J-2.*

- (1) Any scheme locally of finite type over a field.
- (2) Any scheme locally of finite type over a Noetherian complete local ring.
- (3) Any scheme locally of finite type over \mathbf{Z} .
- (4) Any scheme locally of finite type over a Dedekind ring of characteristic zero.
- (5) And so on.

Proof. By Lemma 28.20.2 we only need to show that the rings mentioned above are J-2. For this see More on Algebra, Proposition 15.37.6. \square

28.21. Quasi-finite morphisms

A solid treatment of quasi-finite morphisms is the basis of many developments further down the road. It will lead to various versions of Zariski's Main Theorem, behaviour of dimensions of fibres, descent for étale morphisms, etc, etc. Before reading this section it may be a good idea to take a look at the algebra results in Algebra, Section 10.118.

Recall that a finite type ring map $R \rightarrow A$ is quasi-finite at a prime \mathfrak{q} if \mathfrak{q} defines an isolated point of its fibre, see Algebra, Definition 10.118.3.

Definition 28.21.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *quasi-finite at a point* $x \in X$ if there exist an affine neighbourhood $\text{Spec}(A) = U \subset X$ of x and an affine open $\text{Spec}(R) = V \subset S$ such that $f(U) \subset V$, the ring map $R \rightarrow A$ is of finite type, and $R \rightarrow A$ is quasi-finite at the prime of A corresponding to x (see above).
- (2) We say f is *locally quasi-finite* if f is quasi-finite at every point x of X .

- (3) We say that f is *quasi-finite* if f is of finite type and every point x is an isolated point of its fibre.

Trivially, a locally quasi-finite morphism is locally of finite type. We will see below that a morphism f which is locally of finite type is quasi-finite at x if and only if x is isolated in its fibre. Moreover, the set of points at which a morphism is quasi-finite is open; we will see this in Section 28.49 on Zariski's Main Theorem.

Lemma 28.21.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. If $\kappa(s) \supset \kappa(x)$ is an algebraic field extension, then*

- (1) x is a closed point of its fibre, and
- (2) if in addition s is a closed point of S , then x is a closed point of X .

Proof. The second statement follows from the first by elementary topology. According to Schemes, Lemma 25.18.5 to prove the first statement we may replace X by X_s and S by $\text{Spec}(\kappa(s))$. Thus we may assume that $S = \text{Spec}(k)$ is the spectrum of a field. In this case, let $\text{Spec}(A) = U \subset X$ be any affine open containing x . The point x corresponds to a prime ideal $\mathfrak{q} \subset A$ such that $k \subset \kappa(\mathfrak{q})$ is an algebraic field extension. By Algebra, Lemma 10.34.9 we see that \mathfrak{q} is a maximal ideal, i.e., $x \in U$ is a closed point. Since the affine opens form a basis of the topology of X we conclude that $\{x\}$ is closed. \square

The following lemma is a version of the Hilbert Nullstellensatz.

Lemma 28.21.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. Assume f is locally of finite type. Then x is a closed point of its fibre if and only if $\kappa(s) \subset \kappa(x)$ is a finite field extension.*

Proof. If the extension is finite, then x is a closed point of the fibre by Lemma 28.21.2 above. For the converse, assume that x is a closed point of its fibre. Choose affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset S$ such that $f(U) \subset V$. By Lemma 28.16.2 the ring map $R \rightarrow A$ is of finite type. Let $\mathfrak{q} \subset A$, resp. $\mathfrak{p} \subset R$ be the prime ideal corresponding to x , resp. s . Consider the fibre ring $\bar{A} = A \otimes_R \kappa(\mathfrak{p})$. Let $\bar{\mathfrak{q}}$ be the prime of \bar{A} corresponding to \mathfrak{q} . The assumption that x is a closed point of its fibre implies that $\bar{\mathfrak{q}}$ is a maximal ideal of \bar{A} . Since \bar{A} is an algebra of finite type over the field $\kappa(\mathfrak{p})$ we see by the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1, that $\kappa(\bar{\mathfrak{q}})$ is a finite extension of $\kappa(\mathfrak{p})$. Since $\kappa(s) = \kappa(\mathfrak{p})$ and $\kappa(x) = \kappa(\mathfrak{q}) = \kappa(\bar{\mathfrak{q}})$ we win. \square

Lemma 28.21.4. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $g : S' \rightarrow S$ be any morphism. Denote $f' : X' \rightarrow S'$ the base change. If $x' \in X'$ maps to a point $x \in X$ which is closed in $X_{f(x)}$ then x' is closed in $X'_{f'(x')}$.*

Proof. The residue field $\kappa(x')$ is a quotient of $\kappa(f'(x')) \otimes_{\kappa(f(x))} \kappa(x)$, see Schemes, Lemma 25.17.5. Hence it is a finite extension of $\kappa(f'(x'))$ as $\kappa(x)$ is a finite extension of $\kappa(f(x))$ by Lemma 28.21.3. Thus we see that x' is closed in its fibre by applying that lemma one more time. \square

Lemma 28.21.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. If f is quasi-finite at x , then the residue field extension $\kappa(s) \subset \kappa(x)$ is finite.*

Proof. This is clear from Algebra, Definition 10.118.3. \square

Lemma 28.21.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. Let X_s be the fibre of f at s . Assume f is locally of finite type. The following are equivalent:*

- (1) *The morphism f is quasi-finite at x .*
- (2) *The point x is isolated in X_s .*
- (3) *The point x is closed in X_s and there is no point $x' \in X_s$, $x' \neq x$ which specializes to x .*
- (4) *For any pair of affine opens $\text{Spec}(A) = U \subset X$, $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ and $x \in U$ corresponding to $\mathfrak{q} \subset A$ the ring map $R \rightarrow A$ is quasi-finite at \mathfrak{q} .*

Proof. Assume f is quasi-finite at x . By assumption there exist opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$, $x \in U$ and x an isolated point of U_s . Hence $\{x\} \subset U_s$ is an open subset. Since $U_s = U \cap X_s \subset X_s$ is also open we conclude that $\{x\} \subset X_s$ is an open subset also. Thus we conclude that x is an isolated point of X_s .

Note that X_s is a Jacobson scheme by Lemma 28.17.10 (and Lemma 28.16.4). If x is isolated in X_s , i.e., $\{x\} \subset X_s$ is open, then $\{x\}$ contains a closed point (by the Jacobson property), hence x is closed in X_s . It is clear that there is no point $x' \in X_s$, distinct from x , specializing to x .

Assume that x is closed in X_s and that there is no point $x' \in X_s$, distinct from x , specializing to x . Consider a pair of affine opens $\text{Spec}(A) = U \subset X$, $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ and $x \in U$. Let $\mathfrak{q} \subset A$ correspond to x and $\mathfrak{p} \subset R$ correspond to s . By Lemma 28.16.2 the ring map $R \rightarrow A$ is of finite type. Consider the fibre ring $\bar{A} = A \otimes_R \kappa(\mathfrak{p})$. Let $\bar{\mathfrak{q}}$ be the prime of \bar{A} corresponding to \mathfrak{q} . Since $\text{Spec}(\bar{A})$ is an open subscheme of the fibre X_s we see that $\bar{\mathfrak{q}}$ is a maximal ideal of \bar{A} and that there is no point of $\text{Spec}(\bar{A})$ specializing to $\bar{\mathfrak{q}}$. This implies that $\dim(\bar{A}_{\bar{\mathfrak{q}}}) = 0$. Hence by Algebra, Definition 10.118.3 we see that $R \rightarrow A$ is quasi-finite at \mathfrak{q} , i.e., $X \rightarrow S$ is quasi-finite at x by definition.

At this point we have shown conditions (1) – (3) are all equivalent. It is clear that (4) implies (1). And it is also clear that (2) implies (4) since if x is an isolated point of X_s then it is also an isolated point of U_s for any open U which contains it. \square

Lemma 28.21.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that*

- (1) *f is locally of finite type, and*
- (2) *$f^{-1}(\{s\})$ is a finite set.*

Then X_s is a finite discrete topological space, and f is quasi-finite at each point of X lying over s .

Proof. Suppose T is a scheme which (a) is locally of finite type over a field k , and (b) has finitely many points. Then Lemma 28.17.10 shows T is a Jacobson scheme. A finite Jacobson space is discrete, see Topology, Lemma 5.17.6. Apply this remark to the fibre X_s which is locally of finite type over $\text{Spec}(\kappa(s))$ to see the first statement. Finally, apply Lemma 28.21.6 to see the second. \square

Lemma 28.21.8. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is locally of finite type. Then the following are equivalent*

- (1) f is locally quasi-finite,
- (2) for every $s \in S$ the fibre X_s is a discrete topological space, and
- (3) for every morphism $\text{Spec}(k) \rightarrow S$ where k is a field the base change X_k has an underlying discrete topological space.

Proof. It is immediate that (3) implies (2). Lemma 28.21.6 shows that (2) is equivalent to (1). Assume (2) and let $\text{Spec}(k) \rightarrow S$ be as in (3). Denote $s \in S$ the image of $\text{Spec}(k) \rightarrow S$. Then X_k is the base change of X_s via $\text{Spec}(k) \rightarrow \text{Spec}(\kappa(s))$. Hence every point of X_k is closed by Lemma 28.21.4. As $X_k \rightarrow \text{Spec}(k)$ is locally of finite type (by Lemma 28.16.4), we may apply Lemma 28.21.6 to conclude that every point of X_k is isolated, i.e., X_k has a discrete underlying topological space. \square

Lemma 28.21.9. *Let $f : X \rightarrow S$ be a morphism of schemes. Then f is quasi-finite if and only if f is locally quasi-finite and quasi-compact.*

Proof. Assume f is quasi-finite. It is quasi-compact by Definition 28.16.1. Let $x \in X$. We see that f is quasi-finite at x by Lemma 28.21.6. Hence f is quasi-compact and locally quasi-finite.

Assume f is quasi-compact and locally quasi-finite. Then f is of finite type. Let $x \in X$ be a point. By Lemma 28.21.6 we see that x is an isolated point of its fibre. The lemma is proved. \square

Lemma 28.21.10. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) f is quasi-finite, and
- (2) f is locally of finite type, quasi-compact, and has finite fibres.

Proof. Assume f is quasi-finite. In particular f is locally of finite type and quasi-compact (since it is of finite type). Let $s \in S$. Since every $x \in X_s$ is isolated in X_s we see that $X_s = \bigcup_{x \in X_s} \{x\}$ is an open covering. As f is quasi-compact, the fibre X_s is quasi-compact. Hence we see that X_s is finite.

Conversely, assume f is locally of finite type, quasi-compact and has finite fibres. Then it is locally quasi-finite by Lemma 28.21.7. Hence it is quasi-finite by Lemma 28.21.9. \square

Recall that a ring map $R \rightarrow A$ is quasi-finite if it is of finite type and quasi-finite at all primes of A , see Algebra, Definition 10.118.3.

Lemma 28.21.11. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) The morphism f is locally quasi-finite.
- (2) For every pair of affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is quasi-finite.
- (3) There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is locally quasi-finite.
- (4) There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is quasi-finite, for all $j \in J, i \in I_j$.

Moreover, if f is locally quasi-finite then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is locally quasi-finite.

Proof. For a ring map $R \rightarrow A$ let us define $P(R \rightarrow A)$ to mean “ $R \rightarrow A$ is quasi-finite” (see remark above lemma). We claim that P is a local property of ring maps. We check conditions (a), (b) and (c) of Definition 28.15.1. In the proof of Lemma 28.16.2 we have seen that (a), (b) and (c) hold for the property of being “of finite type”. Note that, for a finite type ring map $R \rightarrow A$, the property $R \rightarrow A$ is quasi-finite at \mathfrak{q} depends only on the local ring $A_{\mathfrak{q}}$ as an algebra over $R_{\mathfrak{p}}$ where $\mathfrak{p} = R \cap \mathfrak{q}$ (usual abuse of notation). Using these remarks (a), (b) and (c) of Definition 28.15.1 follow immediately. For example, suppose $R \rightarrow A$ is a ring map such that all of the ring maps $R \rightarrow A_{a_i}$ are quasi-finite for $a_1, \dots, a_n \in A$ generating the unit ideal. We conclude that $R \rightarrow A$ is of finite type. Also, for any prime $\mathfrak{q} \subset A$ the local ring $A_{\mathfrak{q}}$ is isomorphic as an R -algebra to the local ring $(A_{a_i})_{\mathfrak{q}_i}$ for some i and some $\mathfrak{q}_i \subset A_{a_i}$. Hence we conclude that $R \rightarrow A$ is quasi-finite at \mathfrak{q} .

We conclude that Lemma 28.15.3 applies with P as in the previous paragraph. Hence it suffices to prove that f is locally quasi-finite is equivalent to f is locally of type P . Since $P(R \rightarrow A)$ is “ $R \rightarrow A$ is quasi-finite” which means $R \rightarrow A$ is quasi-finite at every prime of A , this follows from Lemma 28.21.6. \square

Lemma 28.21.12. *The composition of two morphisms which are locally quasi-finite is locally quasi-finite. The same is true for quasi-finite morphisms.*

Proof. In the proof of Lemma 28.21.11 we saw that $P =$ “quasi-finite” is a local property of ring maps, and that a morphism of schemes is locally quasi-finite if and only if it is locally of type P as in Definition 28.15.2. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being quasi-finite is a property of ring maps that is stable under composition, see Algebra, Lemma 10.118.7. By the above, Lemma 28.21.9 and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 25.19.4 we see that the composition of quasi-finite morphisms is quasi-finite. \square

We will see later (Lemma 28.49.2) that the set U of the following lemma is open.

Lemma 28.21.13. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $g : S' \rightarrow S$ be a morphism of schemes. Denote $f' : X_{S'} \rightarrow S'$ the base change of f by g and denote $g' : X_{S'} \rightarrow X$ the projection. Assume X is locally of finite type over S .*

- (1) *Let $U \subset X$ (resp. $U' \subset X'$) be the set of points where f (resp. f') is quasi-finite. Then $U' = U_{S'} = (g')^{-1}(U)$.*
- (2) *The base change of a locally quasi-finite morphism is locally quasi-finite.*
- (3) *The base change of a quasi-finite morphism is quasi-finite.*

Proof. The first and second assertion follow from the corresponding algebra result, see Algebra, Lemma 10.118.8 (combined with the fact that f' is also locally of finite type by Lemma 28.16.4). By the above, Lemma 28.21.9 and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19.3 we see that the base change of a quasi-finite morphism is quasi-finite. \square

Lemma 28.21.14. *Let $f : X \rightarrow S$ be a morphism of schemes of finite type. Let $s \in S$. There are at most finitely many points of X lying over s at which f is quasi-finite.*

Proof. The fibre X_s is a scheme of finite type over a field, hence Noetherian (Lemma 28.16.6). Hence the topology on X_s is Noetherian (Properties, Lemma

27.5.5) and can have at most a finite number of isolated points (by elementary topology). Thus our lemma follows from Lemma 28.21.6. \square

Lemma 28.21.15. *Any immersion is locally quasi-finite.*

Proof. This is true because an open immersion is a local isomorphism and a closed immersion is clearly quasi-finite. \square

Lemma 28.21.16. *Let $X \rightarrow Y$ be a morphism of schemes over a base scheme S . Let $x \in X$. If $X \rightarrow S$ is quasi-finite at x , then $X \rightarrow Y$ is quasi-finite at x . If X is locally quasi-finite over S , then $X \rightarrow Y$ is locally quasi-finite.*

Proof. Via Lemma 28.21.11 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is quasi-finite, then $B \rightarrow C$ is quasi-finite. This follows from Algebra, Lemma 10.118.6 with $R = A$, $S = S' = C$ and $R' = B$. \square

28.22. Morphisms of finite presentation

Recall that a ring map $R \rightarrow A$ is of finite presentation if A is isomorphic to $R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ as an R -algebra for some n, m and some polynomials f_j , see Algebra, Definition 10.6.1.

Definition 28.22.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is of *finite presentation at $x \in X$* if there exists a affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is of finite presentation.
- (2) We say that f is *locally of finite presentation* if it is of finite presentation at every point of X .
- (3) We say that f is of *finite presentation* if it is locally of finite presentation, quasi-compact and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation. Later we will characterize morphisms which are locally of finite presentation as those morphisms such that

$$\text{colim Mor}_S(T_i, X) = \text{Mor}_S(\lim T_i, X)$$

for any directed system of affine schemes T_i over S . See Limits, Proposition 31.5.1. In Limits, Section 31.9 we show that, if $S = \lim_i S_i$ is a limit of affine schemes, any scheme X of finite presentation over S descends to a scheme X_i over S_i for some i .

Lemma 28.22.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is locally of finite presentation.*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is of finite presentation.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is locally of finite presentation.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is of finite presentation, for all $j \in J, i \in I_j$.*

Moreover, if f is locally of finite presentation then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is locally of finite presentation.

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is of finite presentation” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. By Algebra, Lemma 10.13.2 being of finite presentation is stable under base change and hence we conclude (a) holds. By the same lemma being of finite presentation is stable under composition and trivially for any ring R the ring map $R \rightarrow R_f$ is of finite presentation. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.23.3. \square

Lemma 28.22.3. *The composition of two morphisms which locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.*

Proof. In the proof of Lemma 28.22.2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being of finite presentation is a property of ring maps that is stable under composition, see Algebra, Lemma 10.6.2. By the above and the fact that compositions of quasi-compact, quasi-separated morphisms are quasi-compact and quasi-separated, see Schemes, Lemmas 25.19.4 and 25.21.13 we see that the composition of morphisms of finite presentation is of finite presentation. \square

Lemma 28.22.4. *The base change of a morphism which is locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.*

Proof. In the proof of Lemma 28.22.2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being of finite presentation is a property of ring maps that is stable under base change, see Algebra, Lemma 10.13.2. By the above and the fact that a base change of a quasi-compact, quasi-separated morphism is quasi-compact and quasi-separated, see Schemes, Lemmas 25.19.3 and 25.21.13 we see that the base change of a morphism of finite presentation is a morphism of finite presentation. \square

Lemma 28.22.5. *Any open immersion is locally of finite presentation.*

Proof. This is true because an open immersion is a local isomorphism. \square

Lemma 28.22.6. *Any open immersion is of finite presentation if and only if it is quasi-compact.*

Proof. We have seen (Lemma 28.22.5) that an open immersion is locally of finite presentation. We have seen (Schemes, Lemma 25.23.7) that an immersion is separated and hence quasi-separated. From this and Definition 28.22.1 the lemma follows. \square

Lemma 28.22.7. *A closed immersion $i : Z \rightarrow X$ is of finite presentation if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z)$ is of finite type (as an \mathcal{O}_X -module).*

Proof. On any affine open $\text{Spec}(R) \subset X$ we have $i^{-1}(\text{Spec}(R)) = \text{Spec}(R/I)$ and $\mathcal{I} = \tilde{I}$. Moreover, \mathcal{I} is of finite type if and only if I is a finite R -module for every such affine open (see Properties, Lemma 27.16.1). And R/I is of finite presentation over R if and only if I is a finite R -module. Hence we win. \square

Lemma 28.22.8. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Omitted. \square

Lemma 28.22.9. *Let $f : X \rightarrow S$ be a morphism.*

- (1) *If S is locally Noetherian and f locally of finite type then f is locally of finite presentation.*
- (2) *If S is locally Noetherian and f of finite type then f is of finite presentation.*

Proof. The first statement follows from the fact that a ring of finite type over a Noetherian ring is of finite presentation, see Algebra, Lemma 10.30.4. Suppose that f is of finite type and S is locally Noetherian. Then f is quasi-compact and locally of finite presentation by (1). Hence it suffices to prove that f is quasi-separated. This follows from Lemma 28.16.7 (and Lemma 28.22.8). \square

Lemma 28.22.10. *Let S be a scheme which is quasi-compact and quasi-separated. If X is of finite presentation over S , then X is quasi-compact and quasi-separated.*

Proof. Omitted. \square

Lemma 28.22.11. *Let $f : X \rightarrow Y$ be a morphism of schemes over S .*

- (1) *If X is locally of finite presentation over S and Y is locally of finite type over S , then f is locally of finite presentation.*
- (2) *If X is of finite presentation over S and Y is quasi-separated and locally of finite type over S , then f is of finite presentation.*

Proof. Proof of (1). Via Lemma 28.22.2 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is of finite presentation and $A \rightarrow B$ is of finite type, then $B \rightarrow C$ is of finite type. See Algebra, Lemma 10.6.2.

Part (2) follows from (1) and Schemes, Lemmas 25.21.14 and 25.21.15. \square

Lemma 28.22.12. *Let $f : X \rightarrow Y$ be a morphism of schemes with diagonal $\Delta : X \rightarrow X \times_Y X$. If f is locally of finite type then Δ is locally of finite presentation. If f is quasi-separated and locally of finite type, then Δ is of finite presentation.*

Proof. Note that Δ is a morphism of schemes over X (via the second projection $X \times_Y X \rightarrow X$). Assume f is locally of finite type. Note that X is of finite presentation over X and $X \times_Y X$ is locally of finite type over X (by Lemma 28.16.4). Thus the first statement holds by Lemma 28.22.11. The second statement follows from the first, the definitions, and the fact that a diagonal morphism is a monomorphism, hence separated (Schemes, Lemma 25.23.3). \square

28.23. Constructible sets

Constructible and locally constructible sets of schemes have been discussed in Properties, Section 27.2. In this section we prove some results concerning images and inverse images of (locally) constructible sets. The main result is Chevalley's theorem which states that the image of a locally constructible set under a morphism of finite presentation is locally constructible.

Lemma 28.23.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $E \subset Y$ be a subset. If E is (locally) constructible in Y , then $f^{-1}(E)$ is (locally) constructible in X .*

Proof. To show that the inverse image of every constructible subset is constructible it suffices to show that the inverse image of every retrocompact open V of Y is retrocompact in X , see Topology, Lemma 5.14.3. The significance of V being retrocompact in Y is just that the open immersion $V \rightarrow Y$ is quasi-compact. Hence the base change $f^{-1}(V) = X \times_Y V \rightarrow X$ is quasi-compact too, see Schemes, Lemma 25.19.3. Hence we see $f^{-1}(V)$ is retrocompact in X . Suppose E is locally constructible in Y . Choose $x \in X$. Choose an affine neighbourhood V of $f(x)$ and an affine neighbourhood $U \subset X$ of x such that $f(U) \subset V$. Thus we think of $f|_U : U \rightarrow V$ as a morphism into V . By Properties, Lemma 27.2.1 we see that $E \cap V$ is constructible in V . By the constructible case we see that $(f|_U)^{-1}(E \cap V)$ is constructible in U . Since $(f|_U)^{-1}(E \cap V) = f^{-1}(E) \cap U$ we win. \square

Lemma 28.23.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume*

- (1) *f is quasi-compact and locally of finite presentation, and*
- (2) *Y is quasi-compact and quasi-separated.*

Then the image of every constructible subset of X is constructible in Y .

Proof. By Properties, Lemma 27.2.5 it suffices to prove this lemma in case Y is affine. In this case X is quasi-compact. Hence we can write $X = U_1 \cup \dots \cup U_n$ with each U_i affine open in X . If $E \subset X$ is constructible, then each $E \cap U_i$ is constructible too, see Topology, Lemma 5.14.4. Hence, since $f(E) = \bigcup f(E \cap U_i)$ and since finite unions of constructible sets are constructible, this reduces us to the case where X is affine. In this case the result is Algebra, Theorem 10.28.9. \square

Theorem 28.23.3 (Chevalley's Theorem). *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume f is quasi-compact and locally of finite presentation. Then the image of every locally constructible subset is locally constructible.*

Proof. Let $E \subset X$ be locally constructible. We have to show that $f(E)$ is locally constructible too. We will show that $f(E) \cap V$ is constructible for any affine open $V \subset Y$. Thus we reduce to the case where Y is affine. In this case X is quasi-compact. Hence we can write $X = U_1 \cup \dots \cup U_n$ with each U_i affine open in X . If $E \subset X$ is locally constructible, then each $E \cap U_i$ is constructible, see Properties, Lemma 27.2.1. Hence, since $f(E) = \bigcup f(E \cap U_i)$ and since finite unions of constructible sets are constructible, this reduces us to the case where X is affine. In this case the result is Algebra, Theorem 10.28.9. \square

Lemma 28.23.4. *Let X be a scheme. Let $x \in X$. Let $E \subset X$ be a locally constructible subset. If $\{x' \mid x' \rightsquigarrow x\} \subset E$, then E contains an open neighbourhood of x .*

Proof. Assume $\{x' \mid x' \rightsquigarrow x\} \subset E$. We may assume X is affine. In this case E is constructible, see Properties, Lemma 27.2.1. In particular, also the complement E^c is constructible. By Algebra, Lemma 10.28.3 we can find a morphism of affine schemes $f : Y \rightarrow X$ such that $E^c = f(Y)$. Let $Z \subset X$ be the scheme theoretic image of f . By Lemma 28.6.5 and the assumption $\{x' \mid x' \rightsquigarrow x\} \subset E$ we see that $x \notin Z$. Hence $X \setminus Z \subset E$ is an open neighbourhood of x contained in E . \square

28.24. Open morphisms

Definition 28.24.1. Let $f : X \rightarrow S$ be a morphism.

- (1) We say f is *open* if the map on underlying topological spaces is open.
- (2) We say f is *universally open* if for any morphism of schemes $S' \rightarrow S$ the base change $f' : X_{S'} \rightarrow S'$ is open.

According to Topology, Lemma 5.18.6 generalizations lift along certain types of open maps of topological spaces. In fact generalizations lift along any open morphism of schemes (see Lemma 28.24.5). Also, we will see that generalizations lift along flat morphisms of schemes (Lemma 28.26.8). This sometimes in turn implies that the morphism is open.

Lemma 28.24.2. *Let $f : X \rightarrow S$ be a morphism.*

- (1) *If f is locally of finite presentation and generalizations lift along f , then f is open.*
- (2) *If f is locally of finite presentation and generalizations lift along every base change of f , then f is universally open.*

Proof. It suffices to prove the first assertion. This reduces to the case where both X and S are affine. In this case the result follows from Algebra, Lemma 10.40.3 and Proposition 10.40.8. \square

See also Lemma 28.26.9 for the case of a morphism flat of finite presentation.

Lemma 28.24.3. *A composition of (universally) open morphisms is (universally) open.*

Proof. Omitted. \square

Lemma 28.24.4. *Let k be a field. Let X be a scheme over k . The structure morphism $X \rightarrow \text{Spec}(k)$ is universally open.*

Proof. Let $S \rightarrow \text{Spec}(k)$ be a morphism. We have to show that the base change $X_S \rightarrow S$ is open. The question is local on S and X , hence we may assume that S and X are affine. In this case the result is Algebra, Lemma 10.40.10. \square

Lemma 28.24.5. *Let $\varphi : X \rightarrow Y$ be a morphism of schemes. If φ is open, then φ is generizing (i.e., generalizations lift along φ). If φ is universally open, then φ is universally generizing.*

Proof. Assume φ is open. Let $y' \rightsquigarrow y$ be a specialization of points of Y . Let $x \in X$ with $\varphi(x) = y$. Choose affine opens $U \subset X$ and $V \subset Y$ such that $\varphi(U) \subset V$ and $x \in U$. Then also $y' \in V$. Hence we may replace X by U and Y by V and assume X, Y affine. The affine case is Algebra, Lemma 10.40.2 (combined with Algebra, Lemma 10.40.3). \square

Lemma 28.24.6. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $g : Y' \rightarrow Y$ be open and surjective such that the base change $f' : X' \rightarrow Y'$ is quasi-compact. Then f is quasi-compact.*

Proof. Let $V \subset Y$ be a quasi-compact open. As g is open and surjective we can find a quasi-compact open $W' \subset W$ such that $g(W') = V$. By assumption $(f')^{-1}(W')$ is quasi-compact. The image of $(f')^{-1}(W')$ in X is equal to $f^{-1}(V)$, see Lemma 28.11.3. Hence $f^{-1}(V)$ is quasi-compact as the image of a quasi-compact space, see Topology, Lemma 5.11.7. Thus f is quasi-compact. \square

28.25. Submersive morphisms

Definition 28.25.1. Let $f : X \rightarrow Y$ be a morphism of schemes.

- (1) We say f is *submersive*⁵ if the continuous map of underlying topological spaces is submersive, see Topology, Definition 5.5.3.
- (2) We say f is *universally submersive* if for every morphism of schemes $Y' \rightarrow Y$ the base change $Y' \times_Y X \rightarrow Y'$ is submersive.

We note that a submersive morphism is in particular surjective.

28.26. Flat morphisms

Flatness is one of the most important technical tools in algebraic geometry. In this section we introduce this notion. We intentionally limit the discussion to straightforward observations, apart from Lemma 28.26.9. A very important class of results, namely criteria for flatness will be discussed (insert future reference here).

Recall that a module M over a ring R is *flat* if the functor $-\otimes_R M : \text{Mod}_R \rightarrow \text{Mod}_R$ is exact. A ring map $R \rightarrow A$ is said to be *flat* if A is flat as an R -module. See Algebra, Definition 10.38.1.

Definition 28.26.1. Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules.

- (1) We say f is *flat at a point* $x \in X$ if the local ring $\mathcal{O}_{X,x}$ is flat over the local ring $\mathcal{O}_{S,f(x)}$.
- (2) We say that \mathcal{F} is *flat over S at a point* $x \in X$ if the stalk \mathcal{F}_x is a flat $\mathcal{O}_{S,f(x)}$ -module.
- (3) We say f is *flat* if f is flat at every point of X .
- (4) We say that \mathcal{F} is *flat over S* if \mathcal{F} is flat over S at every point x of X .

Thus we see that f is flat if and only if the structure sheaf \mathcal{O}_X is flat over S .

Lemma 28.26.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. The following are equivalent*

- (1) *The sheaf \mathcal{F} is flat over S .*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the $\mathcal{O}_S(V)$ -module $\mathcal{F}(U)$ is flat.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the modules $\mathcal{F}|_{U_i}$ is flat over V_j , for all $j \in J, i \in I_j$.*

⁵This is very different from the notion of a submersion of differential manifolds.

- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that $\mathcal{F}(U_i)$ is a flat $\mathcal{O}_S(V_j)$ -module, for all $j \in J, i \in I_j$.*

Moreover, if \mathcal{F} is flat over S then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\mathcal{F}|_U$ is flat over V .

Proof. Let $R \rightarrow A$ be a ring map. Let M be an A -module. If M is R -flat, then for all primes \mathfrak{q} the module $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ with \mathfrak{p} the prime of R lying under \mathfrak{q} . Conversely, if $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ for all primes \mathfrak{q} of A , then M is flat over R . See Algebra, Lemma 10.38.19. This equivalence easily implies the statements of the lemma. \square

Lemma 28.26.3. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is flat.*
- (2) *For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is flat.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j, j \in J, i \in I_j$ is flat.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is flat, for all $j \in J, i \in I_j$.*

Moreover, if f is flat then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is flat.

Proof. This is a special case of Lemma 28.26.2 above. \square

Lemma 28.26.4. *Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If \mathcal{F} is flat over Y , and Y is flat over Z , then \mathcal{F} is flat over Z .*

Proof. See Algebra, Lemma 10.38.3. \square

Lemma 28.26.5. *The composition of flat morphisms is flat.*

Proof. This is a special case of Lemma 28.26.4. \square

Lemma 28.26.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Let $g : S' \rightarrow S$ be a morphism of schemes. Denote $g' : X' = X_{S'} \rightarrow X$ the projection. Let $x' \in X'$ be a point with image $x = g(x') \in X$. If \mathcal{F} is flat over S at x , then $(g')^*\mathcal{F}$ is flat over S' at x' . In particular, if \mathcal{F} is flat over S , then $(g')^*\mathcal{F}$ is flat over S' .*

Proof. See Algebra, Lemma 10.38.6. \square

Lemma 28.26.7. *The base change of a flat morphism is flat.*

Proof. This is a special case of Lemma 28.26.6. \square

Lemma 28.26.8. *Let $f : X \rightarrow S$ be a flat morphism of schemes. Then generalizations lift along f , see Topology, Definition 5.18.3.*

Proof. See Algebra, Section 10.40. \square

Lemma 28.26.9. *A flat morphism locally of finite presentation is universally open.*

Proof. This follows from Lemmas 28.26.8 and Lemma 28.24.2 above. We can also argue directly as follows.

Let $f : X \rightarrow S$ be flat locally of finite presentation. To show f is open it suffices to show that we may cover X by open affines $X = \bigcup U_i$ such that $U_i \rightarrow S$ is open. By definition we may cover X by affine opens $U_i \subset X$ such that each U_i maps into an affine open $V_i \subset S$ and such that the induced ring map $\mathcal{O}_S(V_i) \rightarrow \mathcal{O}_X(U_i)$ is of finite presentation. Thus $U_i \rightarrow V_i$ is open by Algebra, Proposition 10.40.8. The lemma follows. \square

Lemma 28.26.10. *Let $f : X \rightarrow Y$ be a quasi-compact, surjective, flat morphism. A subset $T \subset Y$ is open (resp. closed) if and only if $f^{-1}(T)$ is open (resp. closed). In other words, f is a submersive morphism.*

Proof. The question is local on Y , hence we may assume that Y is affine. In this case X is quasi-compact as f is quasi-compact. Write $X = X_1 \cup \dots \cup X_n$ as a finite union of affine opens. Then $f' : X' = X_1 \amalg \dots \amalg X_n \rightarrow Y$ is a surjective flat morphism of affine schemes. Note that for $T \subset Y$ we have $(f')^{-1}(T) = f^{-1}(T) \cap X_1 \amalg \dots \amalg f^{-1}(T) \cap X_n$. Hence, $f^{-1}(T)$ is open if and only if $(f')^{-1}(T)$ is open. Thus we may assume both X and Y are affine.

Let $f : \text{Spec}(B) \rightarrow \text{Spec}(A)$ be a surjective morphism of affine schemes corresponding to a flat ring map $A \rightarrow B$. Suppose that $f^{-1}(T)$ is closed, say $f^{-1}(T) = V(I)$ for $I \subset A$ an ideal. Then $T = f(f^{-1}(T)) = f(V(I))$ is the image of $\text{Spec}(A/I) \rightarrow \text{Spec}(B)$ (here we use that f is surjective). On the other hand, generalizations lift along f (Lemma 28.26.8). Hence by Topology, Lemma 5.18.5 we see that $Y \setminus T = f(X \setminus f^{-1}(T))$ is stable under generalization. Hence T is stable under specialization (Topology, Lemma 5.18.2). Thus T is closed by Algebra, Lemma 10.40.5. \square

Lemma 28.26.11. *Let $h : X \rightarrow Y$ be a morphism of schemes over S . Let \mathcal{G} be a quasi-coherent sheaf on Y . Let $x \in X$ with $y = h(x) \in Y$. If h is flat at x , then*

$$\mathcal{G} \text{ flat over } S \text{ at } y \Leftrightarrow h^*\mathcal{G} \text{ flat over } S \text{ at } x.$$

In particular: If h is surjective and flat, then \mathcal{G} is flat over S , if and only if $h^\mathcal{G}$ is flat over S . If h is surjective and flat, and X is flat over S , then Y is flat over S .*

Proof. You can prove this by applying Algebra, Lemma 10.38.8. Here is a direct proof. Let $s \in S$ be the image of y . Consider the local ring maps $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$. By assumption the ring map $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ is faithfully flat, see Algebra, Lemma 10.38.16. Let $N = \mathcal{G}_y$. Note that $h^*\mathcal{G}_x = N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x}$, see Sheaves, Lemma 6.26.4. Let $M' \rightarrow M$ be an injection of $\mathcal{O}_{S,s}$ -modules. By the faithful flatness mentioned above we have

$$\begin{aligned} & \text{Ker}(M' \otimes_{\mathcal{O}_{S,s}} N \rightarrow M \otimes_{\mathcal{O}_{S,s}} N) \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \\ &= \text{Ker}(M' \otimes_{\mathcal{O}_{S,s}} N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \rightarrow M \otimes_{\mathcal{O}_{S,s}} N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x}) \end{aligned}$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Algebra, Lemma 10.38.4. \square

Lemma 28.26.12. *Let $f : Y \rightarrow X$ be a morphism of schemes. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module with scheme theoretic support $Z \subset X$. If f is flat, then $f^{-1}(Z)$ is the scheme theoretic support of $f^*\mathcal{F}$.*

Proof. Using the characterization of scheme theoretic support on affines as given in Lemma 28.5.4 we reduce to Algebra, Lemma 10.39.4. \square

Lemma 28.26.13. *Let $f : X \rightarrow Y$ be a flat morphism of schemes. Let $V \subset Y$ be a retrocompact open which is scheme theoretically dense. Then $f^{-1}V$ is scheme theoretically dense in X .*

Proof. We will use the characterization of Lemma 28.7.5. We have to show that for any open $U \subset X$ the map $\mathcal{O}_X(U) \rightarrow \mathcal{O}_X(U \cap f^{-1}V)$ is injective. It suffices to prove this when U is an affine open which maps into an affine open $W \subset Y$. Say $W = \text{Spec}(A)$ and $U = \text{Spec}(B)$. Then $V \cap W = D(f_1) \cup \dots \cup D(f_n)$ for some $f_i \in A$, see Algebra, Lemma 10.28.1. Thus we have to show that $B \rightarrow B_{f_1} \times \dots \times B_{f_n}$ is injective. We are given that $A \rightarrow A_{f_1} \times \dots \times A_{f_n}$ is injective and that $A \rightarrow B$ is flat. Since $B_{f_i} = A_{f_i} \otimes_A B$ we win. \square

Lemma 28.26.14. *Let $f : X \rightarrow Y$ be a flat morphism of schemes. Let $g : V \rightarrow Y$ be a quasi-compact morphism of schemes. Let $Z \subset Y$ be the scheme theoretic image of g and let $Z' \subset X$ be the scheme theoretic image of the base change $V \times_Y X \rightarrow X$. Then $Z' = f^{-1}Z$.*

Proof. Recall that Z is cut out by $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow g_*\mathcal{O}_V)$ and Z' is cut out by $\mathcal{I}' = \text{Ker}(\mathcal{O}_X \rightarrow (V \times_Y X \rightarrow X)_*\mathcal{O}_{V \times_Y X})$, see Lemma 28.6.3. Hence the question is local on X and Y and we may assume X and Y affine. Note that we may replace V by $\coprod V_i$ where $V = V_1 \cup \dots \cup V_n$ is a finite affine open covering. Hence we may assume g is affine. In this case $(V \times_Y X \rightarrow X)_*\mathcal{O}_{V \times_Y X}$ is the pullback of $g_*\mathcal{O}_V$ by f . Since f is flat we conclude that $f^*\mathcal{I} = \mathcal{I}'$ and the lemma holds. \square

28.27. Flat closed immersions

Connected components of schemes are not always open. But they do always have a canonical scheme structure. We explain this in this section.

Lemma 28.27.1. *Let X be a scheme. The rule which associates to a closed subscheme of X its underlying closed subset defines a bijection*

$$\left\{ \begin{array}{l} \text{closed subschemes } Z \subset X \\ \text{such that } Z \rightarrow X \text{ is flat} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{closed subsets } Z \subset X \\ \text{closed under generalizations} \end{array} \right\}$$

Proof. The affine case is Algebra, Lemma 10.104.4. In general the lemma follows by covering X by affines and glueing. Details omitted. \square

Lemma 28.27.2. *A flat closed immersion of finite presentation is the open immersion of an open and closed subscheme.*

Proof. The affine case is Algebra, Lemma 10.104.5. In general the lemma follows by covering X by affines. Details omitted. \square

Note that a connected component T of a scheme X is a closed subset stable under generalization. Hence the following definition makes sense.

Definition 28.27.3. Let X be a scheme. Let $T \subset X$ be a connected component. The *canonical scheme structure on T* is the unique scheme structure on T such that the closed immersion $T \rightarrow X$ is flat, see Lemma 28.27.1.

It turns out that we can determine when every finite flat \mathcal{O}_X -module is finite locally free using the previous lemma.

Lemma 28.27.4. *Let X be a scheme. The following are equivalent*

- (1) *every finite flat quasi-coherent \mathcal{O}_X -module is finite locally free, and*
- (2) *every closed subset $Z \subset X$ which is closed under generalizations is open.*

Proof. In the affine case this is Algebra, Lemma 10.104.6. The scheme case does not follow directly from the affine case, so we simply repeat the arguments.

Assume (1). Consider a closed immersion $i : Z \rightarrow X$ such that i is flat. Then $i_*\mathcal{O}_Z$ is quasi-coherent and flat, hence finite locally free by (1). Thus $Z = \text{Supp}(i_*\mathcal{O}_Z)$ is also open and we see that (2) holds. Hence the implication (1) \Rightarrow (2) follows from the characterization of flat closed immersions in Lemma 28.27.1.

For the converse assume that X satisfies (2). Let \mathcal{F} be a finite flat quasi-coherent \mathcal{O}_X -module. The support $Z = \text{Supp}(\mathcal{F})$ of \mathcal{F} is closed, see Modules, Lemma 17.9.6. On the other hand, if $x \rightsquigarrow x'$ is a specialization, then by Algebra, Lemma 10.75.4 the module $\mathcal{F}_{x'}$ is free over $\mathcal{O}_{X,x'}$, and

$$\mathcal{F}_x = \mathcal{F}_{x'} \otimes_{\mathcal{O}_{X,x'}} \mathcal{O}_{X,x}.$$

Hence $x' \in \text{Supp}(\mathcal{F}) \Rightarrow x \in \text{Supp}(\mathcal{F})$, in other words, the support is closed under generalization. As X satisfies (2) we see that the support of \mathcal{F} is open and closed. The modules $\wedge^i(\mathcal{F})$, $i = 1, 2, 3, \dots$ are finite flat quasi-coherent \mathcal{O}_X -modules also, see Modules, Section 17.18. Note that $\text{Supp}(\wedge^{i+1}(\mathcal{F})) \subset \text{Supp}(\wedge^i(\mathcal{F}))$. Thus we see that there exists a decomposition

$$X = U_0 \coprod U_1 \coprod U_2 \coprod \dots$$

by open and closed subsets such that the support of $\wedge^i(\mathcal{F})$ is $U_i \cup U_{i+1} \cup \dots$ for all i . Let x be a point of X , and say $x \in U_r$. Note that $\wedge^i(\mathcal{F})_x \otimes \kappa(x) = \wedge^i(\mathcal{F}_x \otimes \kappa(x))$. Hence, $x \in U_r$ implies that $\mathcal{F}_x \otimes \kappa(x)$ is a vector space of dimension r . By Nakayama's lemma, see Algebra, Lemma 10.19.1 we can choose an affine open neighbourhood $U \subset U_r \subset X$ of x and sections $s_1, \dots, s_r \in \mathcal{F}(U)$ such that the induced map

$$\mathcal{O}_U^{\oplus r} \rightarrow \mathcal{F}|_U, \quad (f_1, \dots, f_r) \mapsto \sum f_i s_i$$

is surjective. This means that $\wedge^r(\mathcal{F}|_U)$ is a finite flat quasi-coherent \mathcal{O}_U -module whose support is all of U . By the above it is generated by a single element, namely $s_1 \wedge \dots \wedge s_r$. Hence $\wedge^r(\mathcal{F}|_U) \cong \mathcal{O}_U/\mathcal{I}$ for some quasi-coherent sheaf of ideals \mathcal{I} such that $\mathcal{O}_U/\mathcal{I}$ is flat over \mathcal{O}_U and such that $V(\mathcal{I}) = U$. It follows that $\mathcal{I} = 0$ by applying Lemma 28.27.1. Thus $s_1 \wedge \dots \wedge s_r$ is a basis for $\wedge^r(\mathcal{F}|_U)$ and it follows that the displayed map is injective as well as surjective. This proves that \mathcal{F} is finite locally free as desired. \square

28.28. Generic flatness

A scheme of finite type over an integral base is flat over a dense open of the base. In Algebra, Section 10.114 we proved a Noetherian version, a version for morphisms of finite presentation, and a general version. We only state and prove the general version here. However, it turns out that this will be superseded by Proposition 28.28.2 which shows the result holds if we only assume the base is reduced.

Proposition 28.28.1 (Generic flatness). *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Assume*

- (1) *S is integral,*

- (2) f is of finite type, and
- (3) \mathcal{F} is a finite type \mathcal{O}_X -module.

Then there exists an open dense subscheme $U \subset S$ such that $X_U \rightarrow U$ is flat and of finite presentation and such that $\mathcal{F}|_{X_U}$ is flat over U and of finite presentation over \mathcal{O}_{X_U} .

Proof. As S is integral it is irreducible (see Properties, Lemma 27.3.4) and any nonempty open is dense. Hence we may replace S by an affine open of S and assume that $S = \text{Spec}(A)$ is affine. As S is integral we see that A is a domain. As f is of finite type, it is quasi-compact, so X is quasi-compact. Hence we can find a finite affine open cover $X = \bigcup_{i=1, \dots, n} X_i$. Write $X_i = \text{Spec}(B_i)$. Then B_i is a finite type A -algebra, see Lemma 28.16.2. Moreover there are finite type B_i -modules M_i such that $\mathcal{F}|_{X_i}$ is the quasi-coherent sheaf associated to the B_i -module M_i , see Properties, Lemma 27.16.1. Next, for each pair of indices i, j choose an ideal $I_{ij} \subset B_i$ such that $X_i \setminus X_i \cap X_j = V(I_{ij})$ inside $X_i = \text{Spec}(B_i)$. Set $M_{ij} = B_i/I_{ij}$ and think of it as a B_i -module. Then $V(I_{ij}) = \text{Supp}(M_{ij})$ and M_{ij} is a finite B_i -module.

At this point we apply Algebra, Lemma 10.114.3 the pairs $(A \rightarrow B_i, M_{ij})$ and to the pairs $(A \rightarrow B_i, M_i)$. Thus we obtain nonzero $f_{ij}, f_i \in A$ such that (a) $A_{f_{ij}} \rightarrow B_{i, f_{ij}}$ is flat and of finite presentation and $M_{ij, f_{ij}}$ is flat over $A_{f_{ij}}$ and of finite presentation over $B_{i, f_{ij}}$, and (b) B_{i, f_i} is flat and of finite presentation over A_f and M_{i, f_i} is flat and of finite presentation over B_{i, f_i} . Set $f = (\prod f_i)(\prod f_{ij})$. We claim that taking $U = D(f)$ works.

To prove our claim we may replace A by A_f , i.e., perform the base change by $U = \text{Spec}(A_f) \rightarrow S$. After this base change we see that each of $A \rightarrow B_i$ is flat and of finite presentation and that M_i, M_{ij} are flat over A and of finite presentation over B_i . This already proves that $X \rightarrow S$ is quasi-compact, locally of finite presentation, flat, and that \mathcal{F} is flat over S and of finite presentation over \mathcal{O}_X , see Lemma 28.22.2 and Properties, Lemma 27.16.2. Since M_{ij} is of finite presentation over B_i we see that $X_i \cap X_j = X_i \setminus \text{Supp}(M_{ij})$ is a quasi-compact open of X_i , see Algebra, Lemma 10.39.7. Hence we see that $X \rightarrow S$ is quasi-separated by Schemes, Lemma 25.21.7. This proves the proposition. \square

It actually turns out that there is also a version of generic flatness over an arbitrary reduced base. Here it is.

Proposition 28.28.2 (Generic flatness, reduced case). *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Assume*

- (1) S is reduced,
- (2) f is of finite type, and
- (3) \mathcal{F} is a finite type \mathcal{O}_X -module.

Then there exists an open dense subscheme $U \subset S$ such that $X_U \rightarrow U$ is flat and of finite presentation and such that $\mathcal{F}|_{X_U}$ is flat over U and of finite presentation over \mathcal{O}_{X_U} .

Proof. For the impatient reader: This proof is a repeat of the proof of Proposition 28.28.1 using Algebra, Lemma 10.114.7 instead of Algebra, Lemma 10.114.3.

Since being flat and being of finite presentation is local on the base, see Lemmas 28.26.2 and 28.22.2, we may work affine locally on S . Thus we may assume that

$S = \text{Spec}(A)$, where A is a reduced ring (see Properties, Lemma 27.3.2). As f is of finite type, it is quasi-compact, so X is quasi-compact. Hence we can find a finite affine open cover $X = \bigcup_{i=1, \dots, n} X_i$. Write $X_i = \text{Spec}(B_i)$. Then B_i is a finite type A -algebra, see Lemma 28.16.2. Moreover there are finite type B_i -modules M_i such that $\mathcal{F}|_{X_i}$ is the quasi-coherent sheaf associated to the B_i -module M_i , see Properties, Lemma 27.16.1. Next, for each pair of indices i, j choose an ideal $I_{ij} \subset B_i$ such that $X_i \setminus X_i \cap X_j = V(I_{ij})$ inside $X_i = \text{Spec}(B_i)$. Set $M_{ij} = B_i/I_{ij}$ and think of it as a B_i -module. Then $V(I_{ij}) = \text{Supp}(M_{ij})$ and M_{ij} is a finite B_i -module.

At this point we apply Algebra, Lemma 10.114.7 the pairs $(A \rightarrow B_i, M_{ij})$ and to the pairs $(A \rightarrow B_i, M_i)$. Thus we obtain dense opens $U(A \rightarrow B_i, M_{ij}) \subset S$ and dense opens $U(A \rightarrow B_i, M_i) \subset S$ with notation as in Algebra, Equation (10.114.3.2). Since a finite intersection of dense opens is dense open, we see that

$$U = \bigcap_{i,j} U(A \rightarrow B_i, M_{ij}) \cap \bigcap_i U(A \rightarrow B_i, M_i)$$

is open and dense in S . We claim that U is the desired open.

Pick $u \in U$. By definition of the loci $U(A \rightarrow B_i, M_{ij})$ and $U(A \rightarrow B_i, M_i)$ there exist $f_{ij}, f_i \in A$ such that (a) $u \in D(f_i)$ and $u \in D(f_{ij})$, (b) $A_{f_{ij}} \rightarrow B_{i,f_{ij}}$ is flat and of finite presentation and $M_{ij,f_{ij}}$ is flat over $A_{f_{ij}}$ and of finite presentation over $B_{i,f_{ij}}$, and (c) B_{i,f_i} is flat and of finite presentation over A_f and M_{i,f_i} is flat and of finite presentation over B_{i,f_i} . Set $f = (\prod f_i)(\prod f_{ij})$. Now it suffices to prove that $X \rightarrow S$ is flat and of finite presentation over $D(f)$ and that \mathcal{F} restricted to $X_{D(f)}$ is flat over $D(f)$ and of finite presentation over the structure sheaf of $X_{D(f)}$.

Hence we may replace A by A_f , i.e., perform the base change by $\text{Spec}(A_f) \rightarrow S$. After this base change we see that each of $A \rightarrow B_i$ is flat and of finite presentation and that M_i, M_{ij} are flat over A and of finite presentation over B_i . This already proves that $X \rightarrow S$ is quasi-compact, locally of finite presentation, flat, and that \mathcal{F} is flat over S and of finite presentation over \mathcal{O}_X , see Lemma 28.22.2 and Properties, Lemma 27.16.2. Since M_{ij} is of finite presentation over B_i we see that $X_i \cap X_j = X_i \setminus \text{Supp}(M_{ij})$ is a quasi-compact open of X_i , see Algebra, Lemma 10.39.7. Hence we see that $X \rightarrow S$ is quasi-separated by Schemes, Lemma 25.21.7. This proves the proposition. \square

Remark 28.28.3. The results above are a first step towards more refined flattening techniques for morphisms of schemes. The article [GR71] by Raynaud and Gruson contains many wonderful results in this direction.

28.29. Morphisms and dimensions of fibres

Let X be a topological space, and $x \in X$. Recall that we have defined $\dim_x(X)$ as the minimum of the dimensions of the open neighbourhoods of x in X . See Topology, Definition 5.9.1.

Lemma 28.29.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ and set $s = f(x)$. Assume f is locally of finite type. Then*

$$\dim_x(X_s) = \dim(\mathcal{O}_{X_s, x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)).$$

Proof. This immediately reduces to the case $S = s$, and X affine. In this case the result follows from Algebra, Lemma 10.112.3. \square

Lemma 28.29.2. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow S$ be morphisms of schemes. Let $x \in X$ and set $y = f(x)$, $s = g(y)$. Assume f and g locally of finite type. Then*

$$\dim_x(X_s) \leq \dim_x(X_y) + \dim_y(Y_s).$$

Moreover, equality holds if $\mathcal{O}_{X_s, x}$ is flat over $\mathcal{O}_{Y_s, y}$, which holds for example if $\mathcal{O}_{X, x}$ is flat over $\mathcal{O}_{Y, y}$.

Proof. Note that $\text{trdeg}_{\kappa(s)}(\kappa(x)) = \text{trdeg}_{\kappa(y)}(\kappa(x)) + \text{trdeg}_{\kappa(s)}(\kappa(y))$. Thus by Lemma 28.29.1 the statement is equivalent to

$$\dim(\mathcal{O}_{X_s, x}) \leq \dim(\mathcal{O}_{X_y, x}) + \dim(\mathcal{O}_{Y_s, y}).$$

For this see Algebra, Lemma 10.108.6. For the flat case see Algebra, Lemma 10.108.7. \square

Lemma 28.29.3. *Let*

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

be a fibre product diagram of schemes. Assume f locally of finite type. Suppose that $x' \in X'$, $x = g'(x')$, $s' = f'(x')$ and $s = g(s') = f(x)$. Then $\dim_x(X_s) = \dim_{x'}(X'_{s'})$.

Proof. Follows immediately from Algebra, Lemma 10.112.6. \square

The following lemma follows from a nontrivial algebraic result. Namely, the algebraic version of Zariski's main theorem.

Lemma 28.29.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $n \geq 0$. Assume f is locally of finite type. The set*

$$U_n = \{x \in X \mid \dim_x X_{f(x)} \leq n\}$$

is open in X .

Proof. This is immediate from Algebra, Lemma 10.121.6 \square

Lemma 28.29.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $n \geq 0$. Assume f is locally of finite presentation. The open*

$$U_n = \{x \in X \mid \dim_x X_{f(x)} \leq n\}$$

of Lemma 28.29.4 is retrocompact in X . (See Topology, Definition 5.11.1.)

Proof. The topological space X has a basis for its topology consisting of affine opens $U \subset X$ such that the induced morphism $f|_U : U \rightarrow S$ factors through an affine open $V \subset S$. Hence it is enough to show that $U \cap U_n$ is quasi-compact for such a U . Note that $U_n \cap U$ is the same as the open $\{x \in U \mid \dim_x U_{f(x)} \leq n\}$. This reduces us to the case where X and S are affine. In this case the lemma follows from Algebra, Lemma 10.121.8 (and Lemma 28.22.2). \square

Lemma 28.29.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \rightsquigarrow x'$ be a nontrivial specialization of points in X lying over the same point $s \in S$. Assume f is locally of finite type. Then*

- (1) $\dim_x(X_s) \leq \dim_{x'}(X_s)$,
- (2) $\text{trdeg}_{\kappa(s)}(\kappa(x)) > \text{trdeg}_{\kappa(s)}(\kappa(x'))$, and

$$(3) \dim(\mathcal{O}_{X_s, x}) < \dim(\mathcal{O}_{X_s, x'}).$$

Proof. The first inequality follows from Lemma 28.29.4. The third inequality follows since $\mathcal{O}_{X_s, x}$ is a localization of $\mathcal{O}_{X_s, x'}$ at a prime ideal, hence any chain of prime ideals in $\mathcal{O}_{X_s, x}$ is part of a strictly longer chain of primes in $\mathcal{O}_{X_s, x'}$. The second inequality follows from Algebra, Lemma 10.112.2. \square

28.30. Morphisms of given relative dimension

In order to be able to speak comfortably about morphisms of a given relative dimension we introduce the following notion.

Definition 28.30.1. Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is locally of finite type.

- (1) We say f is of *relative dimension* $\leq d$ at x if $\dim_x(X_{f(x)}) \leq d$.
- (2) We say f is of *relative dimension* $\leq d$ if $\dim_x(X_{f(x)}) \leq d$ for all $x \in X$.
- (3) We say f is of *relative dimension* d if all nonempty fibres X_s are equidimensional of dimension d .

This is not a particularly well behaved notion, but it works well in a number of situations.

Lemma 28.30.2. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. If f has relative dimension d , then so does any base change of f . Same for relative dimension $\leq d$.

Proof. This is immediate from Lemma 28.29.3. \square

Lemma 28.30.3. Let $f : X \rightarrow Y$, $g : Y \rightarrow Z$ be locally of finite type. If f has relative dimension $\leq d$ and g has relative dimension $\leq e$ then $g \circ f$ has relative dimension $\leq d + e$. If

- (1) f has relative dimension d ,
- (2) g has relative dimension e , and
- (3) f is flat,

then $g \circ f$ has relative dimension $d + e$.

Proof. This is immediate from Lemma 28.29.2. \square

In general it is not possible to decompose a morphism into its pieces where the relative dimension is a given one. However, it is possible if the morphism has Cohen-Macaulay fibres and is flat of finite presentation.

Lemma 28.30.4. Let $f : X \rightarrow S$ be a morphism of schemes. Assume that

- (1) f is flat,
- (2) f is locally of finite presentation, and
- (3) for all $s \in S$ the fibre X_s is Cohen-Macaulay (Properties, Definition 27.8.1)

Then there exist open and closed subschemes $X_d \subset X$ such that $X = \coprod_{d \geq 0} X_d$ and $f|_{X_d} : X_d \rightarrow S$ has relative dimension d .

Proof. This is immediate from Algebra, Lemma 10.126.8. \square

Lemma 28.30.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is locally of finite type. Let $x \in X$ with $s = f(x)$. Then f is quasi-finite at x if and only if $\dim_x(X_s) = 0$. In particular, f is locally quasi-finite if and only if f has relative dimension 0.*

Proof. If f is quasi-finite at x then $\kappa(x)$ is a finite extension of $\kappa(s)$ (by Lemma 28.21.5) and x is isolated in X_s (by Lemma 28.21.6), hence $\dim_x(X_s) = 0$ by Lemma 28.29.1. Conversely, if $\dim_x(X_s) = 0$ then by Lemma 28.29.1 we see $\kappa(s) \subset \kappa(x)$ is algebraic and there are no other points of X_s specializing to x . Hence x is closed in its fibre by Lemma 28.21.2 and by Lemma 28.21.6 (3) we conclude that f is quasi-finite at x . \square

Lemma 28.30.6. *Let $f : X \rightarrow Y$ be a morphism of locally Noetherian schemes which is flat, locally of finite type and of relative dimension d . For every point x in X with image y in Y we have $\dim_x(X) = \dim_y(Y) + d$.*

Proof. After shrinking X and Y to open neighborhoods of x and y , we can assume that $\dim(X) = \dim_x(X)$ and $\dim(Y) = \dim_y(Y)$, by definition of the dimension of a scheme at a point (Properties, Definition 27.10.1). The morphism f is open by Lemmas 28.22.9 and 28.26.9. Hence we can shrink Y to arrange that f is surjective. It remains to show that $\dim(X) = \dim(Y) + d$.

Let a be a point in X with image b in Y . By Algebra, Lemma 10.108.7,

$$\dim(\mathcal{O}_{X,a}) = \dim(\mathcal{O}_{Y,b}) + \dim(\mathcal{O}_{X_b,a}).$$

Taking the supremum over all points a in X , it follows that $\dim(X) = \dim(Y) + d$, as we want, see Properties, Lemma 27.10.2. \square

28.31. The dimension formula

For morphisms between Noetherian schemes we can say a little more about dimensions of local rings. Here is an important (and not so hard to prove) result. Recall that $R(X)$ denotes the function field of an integral scheme X .

Lemma 28.31.1. *Let S be a scheme. Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$, and set $s = f(x)$. Assume*

- (1) S is locally Noetherian,
- (2) f is locally of finite type,
- (3) X and S integral, and
- (4) f dominant.

We have

$$(28.31.1.1) \quad \dim(\mathcal{O}_{X,x}) \leq \dim(\mathcal{O}_{S,s}) + \operatorname{trdeg}_{R(S)} R(X) - \operatorname{trdeg}_{\kappa(s)} \kappa(x).$$

Moreover, equality holds if S is universally catenary.

Proof. The corresponding algebra statement is Algebra, Lemma 10.109.1. \square

An application is the construction of a dimension function on any scheme of finite type over a universally catenary scheme endowed with a dimension function. For the definition of dimension functions, see Topology, Definition 5.19.1.

Lemma 28.31.2. *Let S be a universally catenary scheme. Let $\delta : S \rightarrow \mathbf{Z}$ be a dimension function. Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite type. Then the map*

$$\begin{aligned} \delta &= \delta_{X/S} : X \longrightarrow \mathbf{Z} \\ x &\longmapsto \delta(f(x)) + \operatorname{trdeg}_{\kappa(f(x))} \kappa(x) \end{aligned}$$

is a dimension function on X .

Proof. Let $f : X \rightarrow S$ be locally of finite type. Let $x \rightsquigarrow y$, $x \neq y$ be a specialization in X . We have to show that $\delta_{X/S}(x) > \delta_{X/S}(y)$ and that $\delta_{X/S}(x) = \delta_{X/S}(y) + 1$ if y is an immediate specialization of x .

Choose an affine open $V \subset S$ containing the image of y and choose an affine open $U \subset X$ mapping into V and containing y . We may clearly replace X by U and S by V . Thus we may assume that $X = \operatorname{Spec}(A)$ and $S = \operatorname{Spec}(R)$ and that f is given by a ring map $R \rightarrow A$. The ring R is universally catenary (Lemma 28.18.2) and the map $R \rightarrow A$ is of finite type (Lemma 28.16.2).

Let $\mathfrak{q} \subset A$ be the prime ideal corresponding to the point x and let $\mathfrak{p} \subset R$ be the prime ideal corresponding to $f(x)$. The restriction δ' of δ to $S' = \operatorname{Spec}(R/\mathfrak{p}) \subset S$ is a dimension function. The ring R/\mathfrak{p} is universally catenary. The restriction of $\delta_{X/S}$ to $X' = \operatorname{Spec}(A/\mathfrak{q})$ is clearly equal to the function $\delta_{X'/S'}$ constructed using the dimension function δ' . Hence we may assume in addition to the above that $R \subset A$ are domains, in other words that X and S are integral schemes.

Note that $\mathcal{O}_{X,x}$ is a localization of $\mathcal{O}_{X,y}$ at a non-maximal prime (Schemes, Lemma 25.13.2). Hence $\dim(\mathcal{O}_{X,x}) < \dim(\mathcal{O}_{X,y})$ and $\dim(\mathcal{O}_{X,x}) = \dim(\mathcal{O}_{X,y}) - 1$ if y is an immediate specialization of x .

Write $s = f(x) \neq f(y) = s'$. We see, using equality in (28.31.1.1), that

$$\begin{aligned} \delta_{X/S}(x) - \delta_{X/S}(y) &= \delta(s) - \delta(s') \\ &\quad + \dim(\mathcal{O}_{S,s}) - \dim(\mathcal{O}_{S,s'}) \\ &\quad - \dim(\mathcal{O}_{X,x}) + \dim(\mathcal{O}_{X,y}). \end{aligned}$$

Since δ is a dimension function on the scheme S the difference $\delta(s) - \delta(s')$ is equal to $\operatorname{codim}(\overline{\{s'\}}, \overline{\{s\}})$ by Topology, Lemma 5.19.2. As S is integral, catenary this is equal to $\operatorname{codim}(\overline{\{s'\}}, S) - \operatorname{codim}(\overline{\{s\}}, S)$ (Topology, Lemma 5.10.6). And this in turn is equal to $\dim(\mathcal{O}_{S,s'}) - \dim(\mathcal{O}_{S,s})$ by Properties, Lemma 27.11.4. Hence we conclude that

$$\delta_{X/S}(x) - \delta_{X/S}(y) = -\dim(\mathcal{O}_{X,x}) + \dim(\mathcal{O}_{X,y})$$

and hence the lemma follows from our remarks about the dimensions of these local rings above. \square

Another application of the dimension formula is that the dimension does not change under “alterations” (to be defined later).

Lemma 28.31.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that*

- (1) *Y is locally Noetherian,*
- (2) *X and Y are integral schemes,*
- (3) *f is dominant, and*
- (4) *f is locally of finite type.*

Then we have

$$\dim(X) \leq \dim(Y) + \operatorname{trdeg}_{R(Y)} R(X).$$

If f is closed⁶ then equality holds.

Proof. Let $f : X \rightarrow Y$ be as in the lemma. Let $\xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \dots \rightsquigarrow \xi_e$ be a sequence of specializations in X . We may assume that $x = \xi_e$ is a closed point of X , see Properties, Lemma 27.5.8. In particular, setting $y = f(x)$, we see x is a closed point of its fibre X_y . By the Hilbert Nullstellensatz we see that $\kappa(x)$ is a finite extension of $\kappa(y)$, see Lemma 28.21.3. By the dimension formula, Lemma 28.31.1, we see that

$$\dim(\mathcal{O}_{X,x}) \leq \dim(\mathcal{O}_{Y,y}) + \operatorname{trdeg}_{R(Y)} R(X)$$

Hence we conclude that $e \leq \dim(Y) + \operatorname{trdeg}_{R(Y)} R(X)$ as desired.

Next, assume f is also closed. Say $\bar{\xi}_0 \rightsquigarrow \bar{\xi}_1 \rightsquigarrow \dots \rightsquigarrow \bar{\xi}_d$ is a sequence of specializations in Y . We want to show that $\dim(X) \geq d + r$. We may assume that $\bar{\xi}_0 = \eta$ is the generic point of Y . The generic fibre X_η is a scheme locally of finite type over $\kappa(\eta) = R(Y)$. It is nonempty as f is dominant. Hence by Lemma 28.17.10 it is a Jacobson scheme. Thus by Lemma 28.17.8 we can find a closed point $\xi_0 \in X_\eta$ and the extension $\kappa(\eta) \subset \kappa(\xi_0)$ is a finite extension. Note that $\mathcal{O}_{X,\xi_0} = \mathcal{O}_{X_\eta,\xi_0}$ because η is the generic point of Y . Hence we see that $\dim(\mathcal{O}_{X,\xi_0}) = r$ by Lemma 28.31.1 applied to the scheme X_η over the universally catenary scheme $\operatorname{Spec}(\kappa(\eta))$ (see Lemma 28.18.4) and the point ξ_0 . This means that we can find $\xi_{-r} \rightsquigarrow \dots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_0$ in X . On the other hand, as f is closed specializations lift along f , see Topology, Lemma 5.18.6. Thus, as ξ_0 lies over $\eta = \bar{\xi}_0$ we can find specializations $\xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \dots \rightsquigarrow \xi_d$ lying over $\bar{\xi}_0 \rightsquigarrow \bar{\xi}_1 \rightsquigarrow \dots \rightsquigarrow \bar{\xi}_d$. In other words we have

$$\xi_{-r} \rightsquigarrow \dots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \dots \rightsquigarrow \xi_d$$

which means that $\dim(X) \geq d + r$ as desired. \square

28.32. Syntomic morphisms

An algebra A over a field k is called a *global complete intersection over k* if $A \cong k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ and $\dim(A) = n - c$. An algebra A over a field k is called a *local complete intersection* if $\operatorname{Spec}(A)$ can be covered by standard opens each of which are global complete intersections over k . See Algebra, Section 10.130. Recall that a ring map $R \rightarrow A$ is *syntomic* if it is of finite presentation, flat with local complete intersection rings as fibres, see Algebra, Definition 10.131.1.

Definition 28.32.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *syntomic at $x \in X$* if there exists an affine open neighbourhood $\operatorname{Spec}(A) = U \subset X$ of x and affine open $\operatorname{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is syntomic.
- (2) We say that f is *syntomic* if it is syntomic at every point of X .
- (3) If $S = \operatorname{Spec}(k)$ and f is syntomic, then we say that X is a *local complete intersection over k* .

⁶For example if f is proper, see Definition 28.42.1.

- (4) A morphism of affine schemes $f : X \rightarrow S$ is called *standard syntomic* if there exists a global relative complete intersection $R \rightarrow R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ (see Algebra, Definition 10.131.5) such that $X \rightarrow S$ is isomorphic to

$$\mathrm{Spec}(R[x_1, \dots, x_n]/(f_1, \dots, f_c)) \rightarrow \mathrm{Spec}(R).$$

In the literature a syntomic morphism is sometimes referred to as a *flat local complete intersection morphism*. It turns out this is a convenient class of morphisms. For example one can define a syntomic topology using these, which is finer than the smooth and étale topologies, but has many of the same formal properties.

A global relative complete intersection (which we used to define standard syntomic ring maps) is in particular flat. In More on Morphisms, Section 36.42 we will consider morphisms $X \rightarrow S$ which locally are of the form

$$\mathrm{Spec}(R[x_1, \dots, x_n]/(f_1, \dots, f_c)) \rightarrow \mathrm{Spec}(R).$$

for some Koszul-regular sequence f_1, \dots, f_r in $R[x_1, \dots, x_n]$. Such a morphism will be called a *local complete intersection morphism*. One we have this definition in place it will be the case that a morphism is syntomic if and only if it is a flat, local complete intersection morphism.

Note that there is no separation or quasi-compactness hypotheses in the definition of a syntomic morphism. Hence the question of being syntomic is local in nature on the source. Here is the precise result.

Lemma 28.32.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is syntomic.*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is syntomic.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is syntomic.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is syntomic, for all $j \in J, i \in I_j$.*

Moreover, if f is syntomic then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is syntomic.

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is syntomic” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. By Algebra, Lemma 10.131.3 being syntomic is stable under base change and hence we conclude (a) holds. By Algebra, Lemma 10.131.17 being syntomic is stable under composition and trivially for any ring R the ring map $R \rightarrow R_f$ is syntomic. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.131.4. \square

Lemma 28.32.3. *The composition of two morphisms which are syntomic is syntomic.*

Proof. In the proof of Lemma 28.32.2 we saw that being syntomic is a local property of ring maps. Hence the first statement of the lemma follows from Lemma

28.15.5 combined with the fact that being syntomic is a property of ring maps that is stable under composition, see Algebra, Lemma 10.131.17. \square

Lemma 28.32.4. *The base change of a morphism which is syntomic is syntomic.*

Proof. In the proof of Lemma 28.32.2 we saw that being syntomic is a local property of ring maps. Hence the lemma follows from Lemma 28.15.5 combined with the fact that being syntomic is a property of ring maps that is stable under base change, see Algebra, Lemma 10.131.3. \square

Lemma 28.32.5. *Any open immersion is syntomic.*

Proof. This is true because an open immersion is a local isomorphism. \square

Lemma 28.32.6. *A syntomic morphism is locally of finite presentation.*

Proof. True because a syntomic ring map is of finite presentation by definition. \square

Lemma 28.32.7. *A syntomic morphism is flat.*

Proof. True because a syntomic ring map is flat by definition. \square

Lemma 28.32.8. *A syntomic morphism is universally open.*

Proof. Combine Lemmas 28.32.6, 28.32.7, and 28.26.9. \square

Let k be a field. Let A be a local k -algebra essentially of finite type over k . Recall that A is called a *complete intersection over k* if we can write $A \cong R/(f_1, \dots, f_c)$ where R is a regular local ring essentially of finite type over k , and f_1, \dots, f_c is a regular sequence in R , see Algebra, Definition 10.130.5.

Lemma 28.32.9. *Let k be a field. Let X be a scheme locally of finite type over k . The following are equivalent:*

- (1) X is a local complete intersection over k ,
- (2) for every $x \in X$ there exists an affine open $U = \text{Spec}(R) \subset X$ neighbourhood of x such that $R \cong k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a global complete intersection over k , and
- (3) for every $x \in X$ the local ring $\mathcal{O}_{X,x}$ is a complete intersection over k .

Proof. The corresponding algebra results can be found in Algebra, Lemmas 10.130.8 and 10.130.9. \square

The following lemma says locally any syntomic morphism is standard syntomic. Hence we can use standard syntomic morphisms as a *local model* for a syntomic morphism. Moreover, it says that a flat morphism of finite presentation is syntomic if and only if the fibres are local complete intersection schemes.

Lemma 28.32.10. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite presentation. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

- (1) The morphism f is syntomic at x .
- (2) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard syntomic.
- (3) The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat and $\mathcal{O}_{X,x}/\mathfrak{m}_s \mathcal{O}_{X,x}$ is a complete intersection over $\kappa(s)$ (see Algebra, Definition 10.130.5).

Proof. Follows from the definitions and Algebra, Lemma 10.131.15. \square

Lemma 28.32.11. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is flat, locally of finite presentation, and all fibres X_s are local complete intersections, then f is syntomic.*

Proof. Clear from Lemmas 28.32.9 and 28.32.10 and the isomorphisms of local rings $\mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x} \cong \mathcal{O}_{X_s,x}$. \square

Lemma 28.32.12. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid \mathcal{O}_{X_{f(x)},x} \text{ is a complete intersection over } \kappa(f(x))\}$$

commutes with arbitrary base change: For any morphism $g : S' \rightarrow S$, consider the base change $f' : X' \rightarrow S'$ of f and the projection $g' : X' \rightarrow X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed flat, and locally of finite presentation then the same holds for the open set of points where f is syntomic.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = \text{Spec}(\kappa(s')) \times_{\text{Spec}(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. Hence the first part is equivalent to Algebra, Lemma 10.130.10. The second part follows from the first because in that case T is the set of points where f is syntomic according to Lemma 28.32.10. \square

Lemma 28.32.13. *Let R be a ring. Let $R \rightarrow A = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ be a relative global complete intersection. Set $S = \text{Spec}(R)$ and $X = \text{Spec}(A)$. Consider the morphism $f : X \rightarrow S$ associated to the ring map $R \rightarrow A$. The function $x \mapsto \dim_x(X_{f(x)})$ is constant with value $n - c$.*

Proof. By Algebra, Definition 10.131.5 $R \rightarrow A$ being a relative global complete intersection means all nonzero fibre rings have dimension $n - c$. Thus for a prime \mathfrak{p} of R the fibre ring $\kappa(\mathfrak{p})[x_1, \dots, x_n]/(\bar{f}_1, \dots, \bar{f}_c)$ is either zero or a global complete intersection ring of dimension $n - c$. By the discussion following Algebra, Definition 10.130.1 this implies it is equidimensional of dimension $n - c$. Whence the lemma. \square

Lemma 28.32.14. *Let $f : X \rightarrow S$ be a syntomic morphism. The function $x \mapsto \dim_x(X_{f(x)})$ is locally constant on X .*

Proof. By Lemma 28.32.10 the morphism f locally looks like a standard syntomic morphism of affines. Hence the result follows from Lemma 28.32.13. \square

Lemma 28.32.14 says that the following definition makes sense.

Definition 28.32.15. Let $d \geq 0$ be an integer. We say a morphism of schemes $f : X \rightarrow S$ is *syntomic of relative dimension d* if f is syntomic and the function $\dim_x(X_{f(x)}) = d$ for all $x \in X$.

In other words, f is syntomic and the nonempty fibres are equidimensional of dimension d .

Lemma 28.32.16. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) *f is surjective and syntomic,*
- (2) *p is syntomic, and*
- (3) *q is locally of finite presentation⁷.*

Then q is syntomic.

Proof. By Lemma 28.26.11 we see that q is flat. Hence it suffices to show that the fibres of $Y \rightarrow S$ are local complete intersections, see Lemma 28.32.11. Let $s \in S$. Consider the morphism $X_s \rightarrow Y_s$. This is a base change of the morphism $X \rightarrow Y$ and hence surjective, and syntomic (Lemma 28.32.4). For the same reason X_s is syntomic over $\kappa(s)$. Moreover, Y_s is locally of finite type over $\kappa(s)$ (Lemma 28.16.4). In this way we reduce to the case where S is the spectrum of a field.

Assume $S = \text{Spec}(k)$. Let $y \in Y$. Choose an affine open $\text{Spec}(A) \subset Y$ neighbourhood of y . Let $\text{Spec}(B) \subset X$ be an affine open such that $f(\text{Spec}(B)) \subset \text{Spec}(A)$, containing a point $x \in X$ such that $f(x) = y$. Choose a surjection $k[x_1, \dots, x_n] \rightarrow A$ with kernel I . Choose a surjection $A[y_1, \dots, y_m] \rightarrow B$, which gives rise in turn to a surjection $k[x_i, y_j] \rightarrow B$ with kernel J . Let $\mathfrak{q} \subset k[x_i, y_j]$ be the prime corresponding to $y \in \text{Spec}(B)$ and let $\mathfrak{p} \subset k[x_i]$ the prime corresponding to $x \in \text{Spec}(A)$. Since x maps to y we have $\mathfrak{p} = \mathfrak{q} \cap k[x_i]$. Consider the following commutative diagram of local rings:

$$\begin{array}{ccccc} \mathcal{O}_{X,x} & \xlongequal{\quad} & B_{\mathfrak{q}} & \longleftarrow & k[x_1, \dots, x_n, y_1, \dots, y_m]_{\mathfrak{q}} \\ \uparrow & & \uparrow & & \uparrow \\ \mathcal{O}_{Y,y} & \xlongequal{\quad} & A_{\mathfrak{p}} & \longleftarrow & k[x_1, \dots, x_n]_{\mathfrak{p}} \end{array}$$

We claim that the hypotheses of Algebra, Lemma 10.130.12 are satisfied. Conditions (1) and (2) are trivial. Condition (4) follows as $X \rightarrow Y$ is flat. Condition (3) follows as the rings $\mathcal{O}_{Y,y}$ and $\mathcal{O}_{X,y,x} = \mathcal{O}_{X,x}/\mathfrak{m}_y \mathcal{O}_{X,x}$ are complete intersection rings by our assumptions that f and p are syntomic, see Lemma 28.32.10. The output of Algebra, Lemma 10.130.12 is exactly that $\mathcal{O}_{Y,y}$ is a complete intersection ring! Hence by Lemma 28.32.10 again we see that Y is syntomic over k at y as desired. \square

28.33. Conormal sheaf of an immersion

Let $i : Z \rightarrow X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Consider the short exact sequence

$$0 \rightarrow \mathcal{I}^2 \rightarrow \mathcal{I} \rightarrow \mathcal{I}/\mathcal{I}^2 \rightarrow 0$$

of quasi-coherent sheaves on X . Since the sheaf $\mathcal{I}/\mathcal{I}^2$ is annihilated by \mathcal{I} it corresponds to a sheaf on Z by Lemma 28.4.1. This quasi-coherent \mathcal{O}_Z -module is called

⁷In fact, if f is surjective, flat, and of finite presentation and p is syntomic, then both q and f are syntomic, see Descent, Lemma 34.10.7.

the *conormal sheaf of Z in X* and is often simply denoted $\mathcal{I}/\mathcal{I}^2$ by the abuse of notation mentioned in Section 28.4.

In case $i : Z \rightarrow X$ is a (locally closed) immersion we define the conormal sheaf of i as the conormal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$, where $\partial Z = \overline{Z} \setminus Z$. It is often denoted $\mathcal{I}/\mathcal{I}^2$ where \mathcal{I} is the ideal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$.

Definition 28.33.1. Let $i : Z \rightarrow X$ be an immersion. The *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X* or the *conormal sheaf of i* is the quasi-coherent \mathcal{O}_Z -module $\mathcal{I}/\mathcal{I}^2$ described above.

In [DG67, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z/X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z/X}$ for the *normal sheaf of the immersion*. It is defined as

$$\mathcal{N}_{Z/X} = \text{Hom}_{\mathcal{O}_Z}(\mathcal{C}_{Z/X}, \mathcal{O}_Z) = \text{Hom}_{\mathcal{O}_Z}(\mathcal{I}/\mathcal{I}^2, \mathcal{O}_Z)$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

Lemma 28.33.2. Let $i : Z \rightarrow X$ be an immersion. The conormal sheaf of i has the following properties:

- (1) Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of U . Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then

$$\mathcal{C}_{Z/X} = i^*\mathcal{I} = i^{-1}(\mathcal{I}/\mathcal{I}^2)$$

- (2) For any affine open $\text{Spec}(R) = U \subset X$ such that $Z \cap U = \text{Spec}(R/I)$ there is a canonical isomorphism $\Gamma(Z \cap U, \mathcal{C}_{Z/X}) = I/I^2$.

Proof. Mostly clear from the definitions. Note that given a ring R and an ideal I of R we have $I/I^2 = I \otimes_R R/I$. Details omitted. \square

Lemma 28.33.3. Let

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ f \downarrow & & \downarrow g \\ Z' & \xrightarrow{\quad} & X' \end{array}$$

be a commutative diagram in the category of schemes. Assume i, i' immersions. There is a canonical map of \mathcal{O}_Z -modules

$$f^*\mathcal{C}_{Z'/X'} \longrightarrow \mathcal{C}_{Z/X}$$

characterized by the following property: For every pair of affine opens $(\text{Spec}(R) = U \subset X, \text{Spec}(R') = U' \subset X')$ with $f(U) \subset U'$ such that $Z \cap U = \text{Spec}(R/I)$ and $Z' \cap U' = \text{Spec}(R'/I')$ the induced map

$$\Gamma(Z' \cap U', \mathcal{C}_{Z'/X'}) = I'/I'^2 \longrightarrow I/I^2 = \Gamma(Z \cap U, \mathcal{C}_{Z/X})$$

is the one induced by the ring map $f^\sharp : R' \rightarrow R$ which has the property $f^\sharp(I') \subset I$.

Proof. Let $\partial Z' = \overline{Z'} \setminus Z'$ and $\partial Z = \overline{Z} \setminus Z$. These are closed subsets of X' and of X . Replacing X' by $X' \setminus \partial Z'$ and X by $X \setminus (g^{-1}(\partial Z') \cup \partial Z)$ we see that we may assume that i and i' are closed immersions.

The fact that $g \circ i$ factors through i' implies that $g^*\mathcal{I}'$ maps into \mathcal{I} under the canonical map $g^*\mathcal{I}' \rightarrow \mathcal{O}_X$, see Schemes, Lemmas 25.4.6 and 25.4.7. Hence we get an induced map of quasi-coherent sheaves $g^*(\mathcal{I}'/(\mathcal{I}')^2) \rightarrow \mathcal{I}/\mathcal{I}^2$. Pulling back by i gives $i^*g^*(\mathcal{I}'/(\mathcal{I}')^2) \rightarrow i^*(\mathcal{I}/\mathcal{I}^2)$. Note that $i^*(\mathcal{I}/\mathcal{I}^2) = \mathcal{C}_{Z/X}$. On the other hand, $i^*g^*(\mathcal{I}'/(\mathcal{I}')^2) = f^*(i')^*(\mathcal{I}'/(\mathcal{I}')^2) = f^*\mathcal{C}_{Z'/X'}$. This gives the desired map.

Checking that the map is locally described as the given map $I'/(I')^2 \rightarrow I/I^2$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods U, U' with $f(U) \subset U'$ and $Z \cap U$ as well as $U' \cap Z'$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it). □

Lemma 28.33.4. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ f \downarrow & & \downarrow g \\ Z' & \xrightarrow{i'} & X' \end{array}$$

be a fibre product diagram in the category of schemes with i, i' immersions. Then the canonical map $f^\mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$ of Lemma 28.33.3 is surjective. If g is flat, then it is an isomorphism.*

Proof. Let $R' \rightarrow R$ be a ring map, and $I' \subset R'$ an ideal. Set $I = I'R$. Then $I'/(I')^2 \otimes_{R'} R \rightarrow I/I^2$ is surjective. If $R' \rightarrow R$ is flat, then $I = I' \otimes_{R'} R$ and $I^2 = (I')^2 \otimes_{R'} R$ and we see the map is an isomorphism. □

Lemma 28.33.5. *Let $Z \rightarrow Y \rightarrow X$ be immersions of schemes. Then there is a canonical exact sequence*

$$i^*\mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

where the maps come from Lemma 28.33.3 and $i : Z \rightarrow Y$ is the first morphism.

Proof. Via Lemma 28.33.3 this translates into the following algebra fact. Suppose that $C \rightarrow B \rightarrow A$ are surjective ring maps. Let $I = \text{Ker}(B \rightarrow A)$, $J = \text{Ker}(C \rightarrow A)$ and $K = \text{Ker}(C \rightarrow B)$. Then there is an exact sequence

$$K/K^2 \otimes_B A \rightarrow J/J^2 \rightarrow I/I^2 \rightarrow 0.$$

This follows immediately from the observation that $I = J/K$. □

28.34. Sheaf of differentials of a morphism

We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.127) and the corresponding section in the chapter on sheaves of modules (Modules, Section 17.23).

Definition 28.34.1. Let $f : X \rightarrow S$ be a morphism of schemes. The *sheaf of differentials* $\Omega_{X/S}$ of X over S is the sheaf of differentials of f viewed as a morphism of ringed spaces (Modules, Definition 17.23.10) equipped with its *universal S -derivation*

$$d_{X/S} : \mathcal{O}_X \longrightarrow \Omega_{X/S}.$$

It turns out that $\Omega_{X/S}$ is a quasi-coherent \mathcal{O}_X -module for example as it is isomorphic to the conormal sheaf of the diagonal morphism $\Delta : X \rightarrow X \times_S X$ (Lemma 28.34.5). We have defined the module of differentials of X over S using a universal property, namely as the receptacle of the universal derivation. If you have any other construction of the sheaf of relative differentials which satisfies this universal property then, by the Yoneda lemma, it will be canonically isomorphic to the one defined above. For convenience we restate the universal property here.

Lemma 28.34.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The map*

$$\mathrm{Hom}_{\mathcal{O}_X}(\Omega_{X/S}, \mathcal{F}) \longrightarrow \mathrm{Der}_S(\mathcal{O}_X, \mathcal{F}), \quad \alpha \longmapsto \alpha \circ d_{X/S}$$

is an isomorphism of functors $\mathrm{Mod}(\mathcal{O}_X) \rightarrow \mathrm{Sets}$.

Proof. This is just a restatement of the definition. \square

Lemma 28.34.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $U \subset X$, $V \subset S$ be open subschemes such that $f(U) \subset V$. Then there is a unique isomorphism $\Omega_{X/S}|_U = \Omega_{U/V}$ of \mathcal{O}_U -modules such that $d_{X/S}|_U = d_{U/V}$.*

Proof. This is a special case of Modules, Lemma 17.23.5 if we use the canonical identification $f^{-1}\mathcal{O}_S|_U = (f|_U)^{-1}\mathcal{O}_V$. \square

From now on we will use these canonical identifications and simply write $\Omega_{U/S}$ or $\Omega_{U/V}$ for the restriction of $\Omega_{X/S}$ to U .

Lemma 28.34.4. *Let $R \rightarrow A$ be a ring map. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules on $X = \mathrm{Spec}(A)$. Set $S = \mathrm{Spec}(R)$. The rule which associates to an S -derivation on \mathcal{F} its action on global sections defines a bijection between the set of S -derivations of \mathcal{F} and the set of R -derivations on $M = \Gamma(X, \mathcal{F})$.*

Proof. Let $D : A \rightarrow M$ be an R -derivation. We have to show there exists a unique S -derivation on \mathcal{F} which gives rise to D on global sections. Let $U = D(f) \subset X$ be a standard affine open. Any element of $\Gamma(U, \mathcal{O}_X)$ is of the form a/f^n for some $a \in A$ and $n \geq 0$. By the Leibniz rule we have

$$D(a)|_U = a/f^n D(f^n)|_U + f^n D(a/f^n)$$

in $\Gamma(U, \mathcal{F})$. Since f acts invertibly on $\Gamma(U, \mathcal{F})$ this completely determines the value of $D(a/f^n) \in \Gamma(U, \mathcal{F})$. This proves uniqueness. Existence follows by simply defining

$$D(a/f^n) := (1/f^n)D(a)|_U - a/f^{2n}D(f^n)|_U$$

and proving this has all the desired properties (on the basis of standard opens of X). Details omitted. \square

Lemma 28.34.5. *Let $f : X \rightarrow S$ be a morphism of schemes. For any pair of affine opens $\mathrm{Spec}(A) = U \subset X$, $\mathrm{Spec}(R) = V \subset S$ with $f(U) \subset V$ there is a unique isomorphism*

$$\Gamma(U, \Omega_{X/S}) = \Omega_{A/R}.$$

compatible with $d_{X/S}$ and $d : A \rightarrow \Omega_{A/R}$.

Proof. We claim that the A -module $M = \Gamma(U, \Omega_{X/S}) = \Gamma(U, \Omega_{U/V})$ together with $d_{X/S} = d_{U/V} : A \rightarrow M$ is a universal R -derivation of A . This follows by combining Lemmas 28.34.4 and 28.34.2 above. The universal property of $d : A \rightarrow \Omega_{A/R}$ (see Algebra, Lemma 10.127.3) and the Yoneda lemma (Categories, Lemma 4.3.5)

imply there is a unique isomorphism of A -modules $M \cong \Omega_{A/R}$ compatible with derivations. \square

Remark 28.34.6. The lemma above gives a second way of constructing the module of differentials. Namely, let $f : X \rightarrow S$ be a morphism of schemes. Consider the collection of all affine opens $U \subset X$ which map into an affine open of S . These form a basis for the topology on X . Thus it suffices to define $\Gamma(U, \Omega_{X/S})$ for such U . We simply set $\Gamma(U, \Omega_{X/S}) = \Omega_{A/R}$ if A, R are as in Lemma 28.34.5 above. This works, but it takes somewhat more algebraic preliminaries to construct the restriction mappings and to verify the sheaf condition with this ansatz.

The following lemma gives yet another way to define the sheaf of differentials and it in particular shows that $\Omega_{X/S}$ is quasi-coherent if X and S are schemes.

Lemma 28.34.7. *Let $f : X \rightarrow S$ be a morphism of schemes. There is a canonical isomorphism between $\Omega_{X/S}$ and the conormal sheaf of the diagonal morphism $\Delta_{X/S} : X \rightarrow X \times_S X$.*

Proof. We first establish the existence of a couple of “global” sheaves and global maps of sheaves, and further down we describe the constructions over some affine opens.

Recall that $\Delta = \Delta_{X/S} : X \rightarrow X \times_S X$ is an immersion, see Schemes, Lemma 25.21.2. Let \mathcal{J} be the ideal sheaf of the immersion which lives over some open open subscheme W of $X \times_S X$ such that $\Delta(X) \subset W$ is closed. Let us take the one that was found in the proof of Schemes, Lemma 25.21.2. Note that the sheaf of rings $\mathcal{O}_W/\mathcal{J}^2$ is supported on $\Delta(X)$. Moreover it sits in a short exact sequence of sheaves

$$0 \rightarrow \mathcal{J}/\mathcal{J}^2 \rightarrow \mathcal{O}_W/\mathcal{J}^2 \rightarrow \Delta_*\mathcal{O}_X \rightarrow 0.$$

Using Δ^{-1} we can think of this as a surjection of sheaves of $f^{-1}\mathcal{O}_S$ -algebras with kernel the conormal sheaf of Δ (see Definition 28.33.1 and Lemma 28.33.2).

$$0 \rightarrow \mathcal{C}_{X/X \times_S X} \rightarrow \Delta^{-1}(\mathcal{O}_W/\mathcal{J}^2) \rightarrow \mathcal{O}_X \rightarrow 0$$

This places us in the situation of Modules, Lemma 17.23.11. The projection morphisms $p_i : X \times_S X \rightarrow X$, $i = 1, 2$ induce maps of sheaves of rings $(p_i)^\# : (p_i)^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_{X \times_S X}$. We may restrict to W and quotient by \mathcal{J}^2 to get $(p_i)^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_W/\mathcal{J}^2$. Since $\Delta^{-1}p_i^{-1}\mathcal{O}_X = \mathcal{O}_X$ we get maps

$$s_i : \mathcal{O}_X \rightarrow \Delta^{-1}(\mathcal{O}_W/\mathcal{J}^2).$$

Both s_1 and s_2 are sections to the map $\Delta^{-1}(\mathcal{O}_W/\mathcal{J}^2) \rightarrow \mathcal{O}_X$, as in Modules, Lemma 17.23.11. Thus we get an S -derivation $d = s_2 - s_1 : \mathcal{O}_X \rightarrow \mathcal{C}_{X/X \times_S X}$. By the universal property of the module of differentials we find a unique \mathcal{O}_X -linear map

$$\Omega_{X/S} \rightarrow \mathcal{C}_{X/X \times_S X}, \quad fdg \mapsto fs_2(g) - fs_1(g)$$

To see the map is an isomorphism, let us work this out over suitable affine opens. We can cover X by affine opens $\text{Spec}(A) = U \subset X$ whose image is contained in an affine open $\text{Spec}(R) = V \subset S$. According to the proof of Schemes, Lemma 25.21.2 $U \times_V U \subset X \times_S X$ is an affine open contained in the open W mentioned above. Also $U \times_V U = \text{Spec}(A \otimes_R A)$. The sheaf \mathcal{J} corresponds to the ideal $J = \text{Ker}(A \otimes_R A \rightarrow A)$. The short exact sequence to the short exact sequence of $A \otimes_R A$ -modules

$$0 \rightarrow J/J^2 \rightarrow (A \otimes_R A)/J^2 \rightarrow A \rightarrow 0$$

The sections s_i correspond to the ring maps

$$A \longrightarrow (A \otimes_R A)/J^2, \quad s_1 : a \mapsto a \otimes 1, \quad s_2 : a \mapsto 1 \otimes a.$$

By Lemma 28.33.2 we have $\Gamma(U, \mathcal{C}_{X/X \times_S X}) = J/J^2$ and by Lemma 28.34.5 we have $\Gamma(U, \Omega_{X/S}) = \Omega_{A/R}$. The map above is the map $adb \mapsto a \otimes b - ab \otimes 1$ which is shown to be an isomorphism in Algebra, Lemma 10.127.13. \square

Lemma 28.34.8. *Let*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & \searrow f & \downarrow \\ S' & \xrightarrow{\quad} & S \end{array}$$

be a commutative diagram of schemes. The canonical map $\mathcal{O}_X \rightarrow f_\mathcal{O}_{X'}$ composed with the map $f_*d_{X'/S'} : f_*\mathcal{O}_{X'} \rightarrow f_*\Omega_{X'/S'}$ is a S -derivation. Hence we obtain a canonical map of \mathcal{O}_X -modules $\Omega_{X/S} \rightarrow f_*\Omega_{X'/S'}$, and by adjointness of f_* and f^* a canonical $\mathcal{O}_{X'}$ -module homomorphism*

$$c_f : f^*\Omega_{X/S} \longrightarrow \Omega_{X'/S'}.$$

*It is uniquely characterized by the property that $f^*d_{X/S}(h)$ maps to $d_{X'/S'}(f^*h)$ for any local section h of \mathcal{O}_X .*

Proof. This is a special case of Modules, Lemma 17.23.12. In the case of schemes we can also use the functoriality of the conormal sheaves (see Lemma 28.33.3) and Lemma 28.34.7 to define c_f . Or we can use the characterization in the last line of the lemma to glue maps defined on affine patches (see Algebra, Equation (10.127.5.1)). \square

Lemma 28.34.9. *Let $f : X \rightarrow Y$, $g : Y \rightarrow S$ be morphisms of schemes. Then there is a canonical exact sequence*

$$f^*\Omega_{Y/S} \rightarrow \Omega_{X/S} \rightarrow \Omega_{X/Y} \rightarrow 0$$

where the maps come from applications of Lemma 28.34.8.

Proof. This is the sheafified version of Algebra, Lemma 10.127.7. \square

Lemma 28.34.10. *Let $X \rightarrow S$ be a morphism of schemes. Let $g : S' \rightarrow S$ be a morphism of schemes. Let $X' = X_{S'}$ be the base change of X . Denote $g' : X' \rightarrow X$ the projection. Then the map*

$$(g')^*\Omega_{X/S} \rightarrow \Omega_{X'/S'}$$

of Lemma 28.34.8 is an isomorphism.

Proof. This is the sheafified version of Algebra, Lemma 10.127.12. \square

Lemma 28.34.11. *Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes with the same target. Let $p : X \times_S Y \rightarrow X$ and $q : X \times_S Y \rightarrow Y$ be the projection morphisms. The maps from Lemma 28.34.8*

$$p^*\Omega_{X/S} \oplus q^*\Omega_{Y/S} \longrightarrow \Omega_{X \times_S Y/S}$$

give an isomorphism.

Proof. By Lemma 28.34.10 the composition $p^*\Omega_{X/S} \rightarrow \Omega_{X \times_S Y/S} \rightarrow \Omega_{X \times_S Y/Y}$ is an isomorphism, and similarly for q . Moreover, the cokernel of $p^*\Omega_{X/S} \rightarrow \Omega_{X \times_S Y/S}$ is $\Omega_{X \times_S Y/X}$ by Lemma 28.34.9. The result follows. \square

Lemma 28.34.12. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is locally of finite type, then $\Omega_{X/S}$ is a finite type \mathcal{O}_X -module.*

Proof. Immediate from Algebra, Lemma 10.127.16, Lemma 28.34.5, Lemma 28.16.2, and Properties, Lemma 27.16.1. \square

Lemma 28.34.13. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is locally of finite type, then $\Omega_{X/S}$ is an \mathcal{O}_X -module of finite presentation.*

Proof. Immediate from Algebra, Lemma 10.127.15, Lemma 28.34.5, Lemma 28.22.2, and Properties, Lemma 27.16.2. \square

Lemma 28.34.14. *If $X \rightarrow S$ is an immersion, or more generally a monomorphism, then $\Omega_{X/S}$ is zero.*

Proof. This is true because $\Delta_{X/S}$ is an isomorphism in this case and hence has trivial conormal sheaf. Hence $\Omega_{X/S} = 0$ by Lemma 28.34.7. The algebraic version is Algebra, Lemma 10.127.5. \square

Lemma 28.34.15. *Let $i : Z \rightarrow X$ be an immersion of schemes over S . There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0$$

where the first arrow is induced by $d_{X/S}$ and the second arrow comes from Lemma 28.34.8.

Proof. This is the sheafified version of Algebra, Lemma 10.127.9. However we should make sure we can define the first arrow globally. Hence we explain the meaning of “induced by $d_{X/S}$ ” here. Namely, we may assume that i is a closed immersion by shrinking X . Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals corresponding to $Z \subset X$. Then $d_{X/S} : \mathcal{I} \rightarrow \Omega_{X/S}$ maps the subsheaf $\mathcal{I}^2 \subset \mathcal{I}$ to $\mathcal{I}\Omega_{X/S}$. Hence it induces a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{X/S}/\mathcal{I}\Omega_{X/S}$ which is $\mathcal{O}_X/\mathcal{I}$ -linear. By Lemma 28.4.1 this corresponds to a map $\mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/S}$ as desired. \square

Lemma 28.34.16. *Let $i : Z \rightarrow X$ be an immersion of schemes over S , and assume i (locally) has a left inverse. Then the canonical sequence*

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0$$

of Lemma 28.34.15 is (locally) split exact. In particular, if $s : S \rightarrow X$ is a section of the structure morphism $X \rightarrow S$ then the map $\mathcal{C}_{S/X} \rightarrow s^*\Omega_{X/S}$ induced by $d_{X/S}$ is an isomorphism.

Proof. Follows from Algebra, Lemma 10.127.10. Clarification: if $g : X \rightarrow Z$ is a left inverse of i , then i^*c_g is a right inverse of the map $i^*\Omega_{X/S} \rightarrow \Omega_{Z/S}$. Also, if s is a section, then it is an immersion $s : Z = S \rightarrow X$ over S (see Schemes, Lemma 25.21.12) and in that case $\Omega_{Z/S} = 0$. \square

Remark 28.34.17. Let $X \rightarrow S$ be a morphism of schemes. According to Lemma 28.34.11 we have

$$\Omega_{X \times_S X/S} = \text{pr}_1^*\Omega_{X/S} \oplus \text{pr}_2^*\Omega_{X/S}$$

On the other hand, the diagonal morphism $\Delta : X \rightarrow X \times_S X$ is an immersion, which locally has a left inverse. Hence by Lemma 28.34.16 we obtain a canonical short exact sequence

$$0 \rightarrow \mathcal{C}_{X/X \times_S X} \rightarrow \Omega_{X/S} \oplus \Omega_{X/S} \rightarrow \Omega_{X/S} \rightarrow 0$$

Note that the right arrow is $(1, 1)$ which is indeed a split surjection. On the other hand, by Lemma 28.34.7 we have an identification $\Omega_{X/S} = \mathcal{C}_{X/X \times_S X}$. Because we chose $d_{X/S}(f) = s_2(f) - s_1(f)$ in this identification it turns out that the left arrow is the map $(-1, 1)$ ⁸.

Lemma 28.34.18. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad i \quad} & X \\ & \searrow j & \downarrow \\ & & Y \end{array}$$

be a commutative diagram of schemes where i and j are immersions. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

where the first arrow comes from Lemma 28.33.3 and the second from Lemma 28.34.15.

Proof. The algebraic version of this is Algebra, Lemma 10.129.7. □

28.35. Smooth morphisms

Let $f : X \rightarrow Y$ be a map of topological spaces. Consider the following condition:

- (*) For every $x \in X$ there exist open neighbourhoods $x \in U \subset X$ and $f(x) \in V \subset Y$, and an integer d such that $f(U) = V$ and such that there is an isomorphism

$$\begin{array}{ccccc} V \times B_d(0, 1) & \xrightarrow{\cong} & U & \longrightarrow & X \\ \downarrow & & \downarrow & & \downarrow \\ V & \xlongequal{\quad} & V & \longrightarrow & Y \end{array}$$

where $B_d(0, 1) \subset \mathbf{R}^d$ is a ball of radius 1 around 0.

Smooth morphisms are the analogue of such morphisms in the category of schemes. See Lemma 28.35.11 and Lemma 28.37.20.

Contrary to expectations (perhaps) the notion of a smooth ring map is not defined solely in terms of the module of differentials. Namely, recall that $R \rightarrow A$ is a *smooth ring map* if A is of finite presentation over R and if the naive cotangent complex of A over R is quasi-isomorphic to a projective module placed in degree 0, see Algebra, Definition 10.132.1.

Definition 28.35.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *smooth at* $x \in X$ if there exists a affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is smooth.
- (2) We say that f is *smooth* if it is smooth at every point of X .

⁸Namely, the local section $d_{X/S}(f) = 1 \otimes f - f \otimes 1$ of the ideal sheaf of Δ maps via $d_{X \times_S X/X}$ to the local section $1 \otimes 1 \otimes 1 \otimes f - 1 \otimes f \otimes 1 \otimes 1 - 1 \otimes 1 \otimes f \otimes 1 + f \otimes 1 \otimes 1 \otimes 1 = \text{pr}_2^* d_{X/S}(f) - \text{pr}_1^* d_{X/S}(f)$.

- (3) A morphism of affine schemes $f : X \rightarrow S$ is called *standard smooth* if there exists a standard smooth ring map $R \rightarrow R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ (see Algebra, Definition 10.132.6) such that $X \rightarrow S$ is isomorphic to

$$\mathrm{Spec}(R[x_1, \dots, x_n]/(f_1, \dots, f_c)) \rightarrow \mathrm{Spec}(R).$$

A pleasing feature of this definition is that the set of points where a morphism is smooth is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being smooth is local in nature on the source. Here is the precise result.

Lemma 28.35.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is smooth.*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is smooth.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is smooth.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is smooth, for all $j \in J, i \in I_j$.*

Moreover, if f is smooth then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is smooth.

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is smooth” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. By Algebra, Lemma 10.132.4 being smooth is stable under base change and hence we conclude (a) holds. By Algebra, Lemma 10.132.14 being smooth is stable under composition and for any ring R the ring map $R \rightarrow R_f$ is (standard) smooth. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.132.13. \square

The following lemma characterizes a smooth morphism as a flat, finitely presented morphism with smooth fibres. Note that schemes smooth over a field are discussed in more detail in Varieties, Section 32.15.

Lemma 28.35.3. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is flat, locally of finite presentation, and all fibres X_s are smooth, then f is smooth.*

Proof. Follows from Algebra, Lemma 10.132.16. \square

Lemma 28.35.4. *The composition of two morphisms which are smooth is smooth.*

Proof. In the proof of Lemma 28.35.2 we saw that being smooth is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being smooth is a property of ring maps that is stable under composition, see Algebra, Lemma 10.132.14. \square

Lemma 28.35.5. *The base change of a morphism which is smooth is smooth.*

Proof. In the proof of Lemma 28.35.2 we saw that being smooth is a local property of ring maps. Hence the lemma follows from Lemma 28.15.5 combined with the fact that being smooth is a property of ring maps that is stable under base change, see Algebra, Lemma 10.132.4. \square

Lemma 28.35.6. *Any open immersion is smooth.*

Proof. This is true because an open immersion is a local isomorphism. \square

Lemma 28.35.7. *A smooth morphism is syntomic.*

Proof. See Algebra, Lemma 10.132.10. \square

Lemma 28.35.8. *A smooth morphism is locally of finite presentation.*

Proof. True because a smooth ring map is of finite presentation by definition. \square

Lemma 28.35.9. *A smooth morphism is flat.*

Proof. Combine Lemmas 28.32.7 and 28.35.7. \square

Lemma 28.35.10. *A smooth morphism is universally open.*

Proof. Combine Lemmas 28.35.9, 28.35.8, and 28.26.9. Or alternatively, combine Lemmas 28.35.7, 28.32.8. \square

The following lemma says locally any smooth morphism is standard smooth. Hence we can use standard smooth morphisms as a *local model* for a smooth morphism.

Lemma 28.35.11. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

- (1) *The morphism f is smooth at x .*
- (2) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard smooth.*

Proof. Follows from the definitions and Algebra, Lemmas 10.132.7 and 10.132.10. \square

Lemma 28.35.12. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is smooth. Then the module of differentials $\Omega_{X/S}$ of X over S is finite locally free and*

$$\text{rank}_x(\Omega_{X/S}) = \dim_x(X_{f(x)})$$

for every $x \in X$.

Proof. The statement is local on X and S . By Lemma 28.35.11 above we may assume that f is a standard smooth morphism of affines. In this case the result follows from Algebra, Lemma 10.132.7 (and the definition of a relative global complete intersection, see Algebra, Definition 10.131.5). \square

Lemma 28.35.12 says that the following definition makes sense.

Definition 28.35.13. Let $d \geq 0$ be an integer. We say a morphism of schemes $f : X \rightarrow S$ is *smooth of relative dimension d* if f is smooth and $\Omega_{X/S}$ is finite locally free of constant rank d .

In other words, f is smooth and the nonempty fibres are equidimensional of dimension d . By Lemma 28.35.14 below this is also the same as requiring: (a) f is locally of finite presentation, (b) f is flat, (c) all nonempty fibres equidimensional of dimension d , and (d) $\Omega_{X/S}$ finite locally free of rank d . It is not enough to simply assume that f is flat, of finite presentation, and $\Omega_{X/S}$ is finite locally free of rank d . A counter example is given by $\text{Spec}(\mathbf{F}_p[t]) \rightarrow \text{Spec}(\mathbf{F}_p[t^p])$.

Here is a differential criterion of smoothness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.

Lemma 28.35.14. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite presentation. The following are equivalent:*

- (1) *The morphism f is smooth at x .*
- (2) *The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat and the $\mathcal{O}_{X,x}$ -module $\Omega_{X/S,x}$ can be generated by at most $\dim_x(X_{f(x)})$ elements.*
- (3) *The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat and the $\kappa(x)$ -vector space*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

can be generated by at most $\dim_x(X_{f(x)})$ elements.

- (4) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard smooth.*
- (5) *There exist affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*

$$A = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

with

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \dots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \dots & \partial f_c/\partial x_2 \\ \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \dots & \partial f_c/\partial x_c \end{pmatrix}$$

mapping to an element of A not in \mathfrak{q} .

Proof. Note that if f is smooth at x , then we see from Lemma 28.35.11 that (4) holds, and (5) is a slightly weakened version of (4). Moreover, this implies that the ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat (see Lemma 28.35.9) and that $\Omega_{X/S}$ is finite locally free of rank equal to $\dim_x(X_s)$ (see Lemma 28.35.12). This implies (2) and (3).

By Lemma 28.34.10 the module of differentials $\Omega_{X_s/s}$ of the fibre X_s over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X/S}$ of X over S . Hence the displayed equality in part (3) of the lemma. By Lemma 28.34.12 these modules are of finite type. Hence the minimal number of generators of the modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ is the same and equal to the dimension of this $\kappa(x)$ -vector space by Nakayama's Lemma (Algebra, Lemma 10.19.1). This in particular shows that (2) and (3) are equivalent.

Combining Algebra, Lemmas 10.132.16 and 10.135.3 shows that (2) and (3) imply (1). Finally, (5) implies (4) see for example Algebra, Example 10.132.8. \square

Lemma 28.35.15. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid X_{f(x)} \text{ is smooth over } \kappa(f(x)) \text{ at } x\}$$

commutes with arbitrary base change: For any morphism $g : S' \rightarrow S$, consider the base change $f' : X' \rightarrow S'$ of f and the projection $g' : X' \rightarrow X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed flat, and locally of finite presentation then the same holds for the open set of points where f is smooth.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = \text{Spec}(\kappa(s')) \times_{\text{Spec}(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. Hence the first part is equivalent to Algebra, Lemma 10.132.18. The second part follows from the first because in that case T is the (open) set of points where f is smooth according to Lemma 28.35.3. \square

Here is a lemma that actually uses the vanishing of H^{-1} of the naive cotangent complex for a smooth ring map.

Lemma 28.35.16. *Let $f : X \rightarrow Y$, $g : Y \rightarrow S$ be morphisms of schemes. Assume f is smooth. Then*

$$0 \rightarrow f^* \Omega_{Y/S} \rightarrow \Omega_{X/S} \rightarrow \Omega_{X/Y} \rightarrow 0$$

(see Lemma 28.34.9) is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ smooth, then the sequence

$$0 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of Algebra, Lemma 10.127.7 is exact. This is Algebra, Lemma 10.134.1. \square

Lemma 28.35.17. *Let $i : Z \rightarrow X$ be an immersion of schemes over S . Assume that Z is smooth over S . Then the canonical exact sequence*

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0$$

of Lemma 28.34.15 is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $A \rightarrow C$ smooth and $B \rightarrow C$ surjective with kernel J , then the sequence

$$0 \rightarrow J/J^2 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow 0$$

of Algebra, Lemma 10.127.9 is exact. This is Algebra, Lemma 10.134.2. \square

Lemma 28.35.18. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{i} & X \\ & \searrow j & \downarrow \\ & & Y \end{array}$$

be a commutative diagram of schemes where i and j are immersions and $X \rightarrow Y$ is smooth. Then the canonical exact sequence

$$0 \rightarrow \mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

of Lemma 28.34.18 is exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $A \rightarrow C$ surjective and $A \rightarrow B$ smooth, then the sequence

$$0 \rightarrow I/I^2 \rightarrow J/J^2 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow 0$$

of Algebra, Lemma 10.129.7 is exact. This is Algebra, Lemma 10.134.3. \square

Lemma 28.35.19. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & S \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) f is surjective, and smooth,
- (2) p is smooth, and
- (3) q is locally of finite presentation⁹.

Then q is smooth.

Proof. By Lemma 28.26.11 we see that q is flat. Pick a point $y \in Y$. Pick a point $x \in X$ mapping to y . Suppose f has relative dimension a at x and p has relative dimension b at x . By Lemma 28.35.12 this means that $\Omega_{X/S,x}$ is free of rank b and $\Omega_{X/Y,x}$ is free of rank a . By the short exact sequence of Lemma 28.35.16 this means that $(f^*\Omega_{Y/S})_x$ is free of rank $b - a$. By Nakayama's Lemma this implies that $\Omega_{Y/S,y}$ can be generated by $b - a$ elements. Also, by Lemma 28.29.2 we see that $\dim_y(Y_s) = b - a$. Hence we conclude that $Y \rightarrow S$ is smooth at y by Lemma 28.35.14 part (2). \square

In the situation of the following lemma the image of σ is locally on X cut out by a regular sequence, see Divisors, Lemma 30.14.7.

Lemma 28.35.20. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $\sigma : S \rightarrow X$ be a section of f . Let $s \in S$ be a point such that f is smooth at $x = \sigma(s)$. Then there exist affine open neighbourhoods $\text{Spec}(A) = U \subset S$ of s and $\text{Spec}(B) = V \subset X$ of x such that*

- (1) $f(V) \subset U$ and $\sigma(U) \subset V$,
- (2) with $I = \text{Ker}(\sigma^\# : B \rightarrow A)$ the module I/I^2 is a free A -module, and
- (3) $B^\wedge \cong A[[x_1, \dots, x_d]]$ as A -algebras where B^\wedge denotes the completion of B with respect to I .

Proof. Pick an affine open $U \subset S$ containing s . Pick an affine open $V \subset f^{-1}(U)$ containing x . Pick an affine open $U' \subset \sigma^{-1}(U)$ containing s . Note that $V' = f^{-1}(U') \cap V$ is affine as it is equal to the fibre product $V' = U' \times_U V$. Then U' and V' satisfy (1). Write $U' = \text{Spec}(A')$ and $V' = \text{Spec}(B')$. By Algebra, Lemma 10.134.4 the module $I'/(I')^2$ is finite locally free as a A' -module. Hence after replacing U' by a smaller affine open $U'' \subset U'$ and V' by $V'' = V' \cap f^{-1}(U'')$ we obtain the situation where $I''/(I'')^2$ is free, i.e., (2) holds. In this case (3) holds also by Algebra, Lemma 10.134.4. \square

⁹In fact this is implied by (1) and (2), see Descent, Lemma 34.10.3. Moreover, it suffices to assume f is surjective, flat and locally of finite presentation, see Descent, Lemma 34.10.5.

The dimension of a scheme X at a point x (Properties, Definition 27.10.1) is just the dimension of X at x as a topological space, see Topology, Definition 5.9.1. This is not the dimension of the local ring $\mathcal{O}_{X,x}$, in general.

Lemma 28.35.21. *Let $f : X \rightarrow Y$ be a smooth morphism of locally Noetherian schemes. For every point x in X with image y in Y ,*

$$\dim_x(X) = \dim_y(Y) + \dim_x(X_y),$$

where X_y denotes the fiber over y .

Proof. After replacing X by an open neighborhood of x , there is a natural number d such that all fibers of $X \rightarrow Y$ have dimension d at every point, see Lemma 28.35.12. Then f is flat (Lemma 28.35.9), locally of finite type (Lemma 28.35.8), and of relative dimension d . Hence the result follows from Lemma 28.30.6. \square

28.36. Unramified morphisms

We briefly discuss unramified morphisms before the (perhaps) more interesting class of étale morphisms. Recall that a ring map $R \rightarrow A$ is *unramified* if it is of finite type and $\Omega_{A/R} = 0$ (this is the definition of [Ray70]). A ring map $R \rightarrow A$ is called *G-unramified* if it is of finite presentation and $\Omega_{A/R} = 0$ (this is the definition of [DG67]). See Algebra, Definition 10.144.1.

Definition 28.36.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *unramified at $x \in X$* if there exists a affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is unramified.
- (2) We say that f is *G-unramified at $x \in X$* if there exists a affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is G-unramified.
- (3) We say that f is *unramified* if it is unramified at every point of X .
- (4) We say that f is *G-unramified* if it is G-unramified at every point of X .

Note that a G-unramified morphism is unramified. Hence any result for unramified morphisms implies the corresponding result for G-unramified morphisms. Moreover, if S is locally Noetherian then there is no difference between G-unramified and unramified morphisms, see Lemma 28.36.6. A pleasing feature of this definition is that the set of points where a morphism is unramified (resp. G-unramified) is automatically open.

Lemma 28.36.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Then*

- (1) *f is unramified if and only if f is locally of finite type and $\Omega_{X/S} = 0$, and*
- (2) *f is G-unramified if and only if f is locally of finite presentation and $\Omega_{X/S} = 0$.*

Proof. By definition a ring map $R \rightarrow A$ is unramified (resp. G-unramified) if and only if it is of finite type (resp. finite presentation) and $\Omega_{A/R} = 0$. Hence the lemma follows directly from the definitions and Lemma 28.34.5. \square

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being unramified is local in nature on the source. Here is the precise result.

Lemma 28.36.3. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is unramified (resp. G -unramified).*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is unramified (resp. G -unramified).*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is unramified (resp. G -unramified).*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is unramified (resp. G -unramified), for all $j \in J, i \in I_j$.*

Moreover, if f is unramified (resp. G -unramified) then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is unramified (resp. G -unramified).

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is unramified” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. These properties are proved in Algebra, Lemma 10.144.3. \square

Lemma 28.36.4. *The composition of two morphisms which are unramified is unramified. The same holds for G -unramified morphisms.*

Proof. The proof of Lemma 28.36.3 shows that being unramified (resp. G -unramified) is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being unramified (resp. G -unramified) is a property of ring maps that is stable under composition, see Algebra, Lemma 10.144.3. \square

Lemma 28.36.5. *The base change of a morphism which is unramified is unramified. The same holds for G -unramified morphisms.*

Proof. The proof of Lemma 28.36.3 shows that being unramified (resp. G -unramified) is a local property of ring maps. Hence the lemma follows from Lemma 28.15.5 combined with the fact that being unramified (resp. G -unramified) is a property of ring maps that is stable under base change, see Algebra, Lemma 10.144.3. \square

Lemma 28.36.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume S is locally Noetherian. Then f is unramified if and only if f is G -unramified.*

Proof. Follows from the definitions and Lemma 28.22.9. \square

Lemma 28.36.7. *Any open immersion is G -unramified.*

Proof. This is true because an open immersion is a local isomorphism. \square

Lemma 28.36.8. *A closed immersion $i : Z \rightarrow X$ is unramified. It is G -unramified if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z)$ is of finite type (as an \mathcal{O}_X -module).*

Proof. Follows from Lemma 28.22.7 and Algebra, Lemma 10.144.3. \square

Lemma 28.36.9. *An unramified morphism is locally of finite type. A G -unramified morphism is locally of finite presentation.*

Proof. An unramified ring map is of finite type by definition. A G -unramified ring map is of finite presentation by definition. \square

Lemma 28.36.10. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is unramified at x then f is quasi-finite at x . In particular, an unramified morphism is locally quasi-finite.*

Proof. See Algebra, Lemma 10.144.6. \square

Lemma 28.36.11. *Fibres of unramified morphisms.*

- (1) *Let X be a scheme over a field k . The structure morphism $X \rightarrow \text{Spec}(k)$ is unramified if and only if X is a disjoint union of spectra of finite separable field extensions of k .*
- (2) *If $f : X \rightarrow S$ is an unramified morphism then for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.*

Proof. Part (2) follows from part (1) and Lemma 28.36.5. Let us prove part (1). We first use Algebra, Lemma 10.144.7. This lemma implies that if X is a disjoint union of spectra of finite separable field extensions of k then $X \rightarrow \text{Spec}(k)$ is unramified. Conversely, suppose that $X \rightarrow \text{Spec}(k)$ is unramified. By Algebra, Lemma 10.144.5 for every $x \in X$ the residue field extension $k \subset \kappa(x)$ is finite separable. Hence all points of X are closed points (see Lemma 28.21.2 for example). Thus X is a discrete space, in particular the disjoint union of the spectra of its local rings. By Algebra, Lemma 10.144.5 again these local rings are fields, and we win. \square

The following lemma characterizes an unramified morphisms as morphisms locally of finite type with unramified fibres.

Lemma 28.36.12. *Let $f : X \rightarrow S$ be a morphism of schemes.*

- (1) *If f is unramified then for any $x \in X$ the field extension $\kappa(f(x)) \subset \kappa(x)$ is finite separable.*
- (2) *If f is locally of finite type, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then f is unramified.*
- (3) *If f is locally of finite presentation, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then f is G -unramified.*

Proof. Follows from Algebra, Lemmas 10.144.5 and 10.144.7. \square

Here is a characterization of unramified morphisms in terms of the diagonal morphism.

Lemma 28.36.13. *Let $f : X \rightarrow S$ be a morphism.*

- (1) *If f is unramified, then the diagonal morphism $\Delta : X \rightarrow X \times_S X$ is an open immersion.*
- (2) *If f is locally of finite type and Δ is an open immersion, then f is unramified.*
- (3) *If f is locally of finite presentation and Δ is an open immersion, then f is G -unramified.*

Proof. The first statement follows from Algebra, Lemma 10.144.4. The second statement from the fact that $\Omega_{X/S}$ is the conormal sheaf of the diagonal morphism (Lemma 28.34.7) and hence clearly zero if Δ is an open immersion. \square

Lemma 28.36.14. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite type (resp. locally of finite presentation). The following are equivalent:*

- (1) *The morphism f is unramified (resp. G -unramified) at x .*
- (2) *The fibre X_s is unramified over $\kappa(s)$ at x .*
- (3) *The $\mathcal{O}_{X,x}$ -module $\Omega_{X/S,x}$ is zero.*
- (4) *The $\mathcal{O}_{X_s,x}$ -module $\Omega_{X_s/s,x}$ is zero.*
- (5) *The $\kappa(x)$ -vector space*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is zero.

- (6) *We have $\mathfrak{m}_s \mathcal{O}_{X,x} = \mathfrak{m}_x$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.*

Proof. Note that if f is unramified at x , then we see that $\Omega_{X/S} = 0$ in a neighbourhood of x by the definitions and the results on modules of differentials in Section 28.34. Hence (1) implies (3) and the vanishing of the right hand vector space in (5). It also implies (2) because by Lemma 28.34.10 the module of differentials $\Omega_{X_s/s}$ of the fibre X_s over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X/S}$ of X over S . This fact on modules of differentials also implies the displayed equality of vector spaces in part (4). By Lemma 28.34.12 the modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ are of finite type. Hence the modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ are zero if and only if the corresponding $\kappa(x)$ -vector space in (4) is zero by Nakayama's Lemma (Algebra, Lemma 10.19.1). This in particular shows that (3), (4) and (5) are equivalent. The support of $\Omega_{X/S}$ is closed in X , see Modules, Lemma 17.9.6. Assumption (3) implies that x is not in the support. Hence $\Omega_{X/S}$ is zero in a neighbourhood of x , which implies (1). The equivalence of (1) and (3) applied to $X_s \rightarrow s$ implies the equivalence of (2) and (4). At this point we have seen that (1) – (5) are equivalent.

Alternatively you can use Algebra, Lemma 10.144.3 to see the equivalence of (1) – (5) more directly.

The equivalence of (1) and (6) follows from Lemma 28.36.12. It also follows more directly from Algebra, Lemmas 10.144.5 and 10.144.7. \square

Lemma 28.36.15. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite type. Formation of the open set*

$$\begin{aligned} T &= \{x \in X \mid X_{f(x)} \text{ is unramified over } \kappa(f(x)) \text{ at } x\} \\ &= \{x \in X \mid X \text{ is unramified over } S \text{ at } x\} \end{aligned}$$

commutes with arbitrary base change: For any morphism $g : S' \rightarrow S$, consider the base change $f' : X' \rightarrow S'$ of f and the projection $g' : X' \rightarrow X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. If f is assumed locally of finite presentation then the same holds for the open set of points where f is G -unramified.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = \text{Spec}(\kappa(s')) \times_{\text{Spec}(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. In particular

$$\Omega_{X_s/s, x} \otimes_{\mathcal{O}_{X_s, x}} \kappa(x') = \Omega_{X'_{s'}/s', x'} \otimes_{\mathcal{O}_{X'_{s'}, x'}} \kappa(x')$$

see Lemma 28.34.10. Whence $x' \in T'$ if and only if $x \in T$ by Lemma 28.36.14. The second part follows from the first because in that case T is the (open) set of points where f is G -unramified according to Lemma 28.36.14. \square

Lemma 28.36.16. *Let $f : X \rightarrow Y$ be a morphism of schemes over S .*

- (1) *If X is unramified over S , then f is unramified.*
- (2) *If X is G -unramified over S and Y of finite type over S , then f is G -unramified.*

Proof. Assume that X is unramified over S . By Lemma 28.16.8 we see that f is locally of finite type. By assumption we have $\Omega_{X/S} = 0$. Hence $\Omega_{X/Y} = 0$ by Lemma 28.34.9. Thus f is unramified. If X is G -unramified over S and Y of finite type over S , then by Lemma 28.22.11 we see that f is locally of finite presentation and we conclude that f is G -unramified. \square

Lemma 28.36.17. *Let S be a scheme. Let X, Y be schemes over S . Let $f, g : X \rightarrow Y$ be morphisms over S . Let $x \in X$. Assume that*

- (1) *the structure morphism $Y \rightarrow S$ is unramified,*
- (2) *$f(x) = g(x)$ in Y , say $y = f(x) = g(x)$, and*
- (3) *the induced maps $f^\#, g^\# : \kappa(y) \rightarrow \kappa(x)$ are equal.*

Then there exists an open neighbourhood of x in X on which f and g are equal.

Proof. Consider the morphism $(f, g) : X \rightarrow Y \times_S Y$. By assumption (1) and Lemma 28.36.13 the inverse image of $\Delta_{Y/S}(Y)$ is open in X . And assumptions (2) and (3) imply that x is in this open subset. \square

28.37. Étale morphisms

The Zariski topology of a scheme is a very coarse topology. This is particularly clear when looking at varieties over \mathbf{C} . It turns out that declaring an étale morphism to be the analogue of a local isomorphism in topology introduces a much finer topology. On varieties over \mathbf{C} this topology gives rise to the “correct” Betti numbers when computing cohomology with finite coefficients. Another observable is that if $f : X \rightarrow Y$ is an étale morphism of varieties over \mathbf{C} , and if x is a closed point of X , then f induces an isomorphism $\mathcal{O}_{Y, f(x)}^\wedge \rightarrow \mathcal{O}_{X, x}^\wedge$ of complete local rings.

In this section we start our study of these matters. In fact we deliberately restrict our discussion to a minimum since we will discuss more interesting results elsewhere. Recall that a ring map $R \rightarrow A$ is said to be *étale* if it is smooth and $\Omega_{A/R} = 0$, see Algebra, Definition 10.138.1.

Definition 28.37.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *étale at $x \in X$* if there exists an affine open neighbourhood $\text{Spec}(A) = U \subset X$ of x and affine open $\text{Spec}(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is étale.

- (2) We say that f is *étale* if it is étale at every point of X .
 (3) A morphism of affine schemes $f : X \rightarrow S$ is called *standard étale* if $X \rightarrow S$ is isomorphic to

$$\mathrm{Spec}(R[x]_g/(f)) \rightarrow \mathrm{Spec}(R)$$

where $R \rightarrow R[x]_g/(f)$ is a standard étale ring map, see Algebra, Definition 10.138.14, i.e., f is monic and f' invertible in $R[x]_g/(f)$.

A morphism is étale if and only if it is smooth of relative dimension 0 (see Definition 28.35.13). A pleasing feature of the definition is that the set of points where a morphism is étale is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being étale is local in nature on the source. Here is the precise result.

Lemma 28.37.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is étale.*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is étale.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is étale.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is étale, for all $j \in J, i \in I_j$.*

Moreover, if f is étale then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is étale.

Proof. This follows from Lemma 28.15.3 if we show that the property “ $R \rightarrow A$ is étale” is local. We check conditions (a), (b) and (c) of Definition 28.15.1. These all follow from Algebra, Lemma 10.138.3. \square

Lemma 28.37.3. *The composition of two morphisms which are étale is étale.*

Proof. In the proof of Lemma 28.37.2 we saw that being étale is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.15.5 combined with the fact that being étale is a property of ring maps that is stable under composition, see Algebra, Lemma 10.138.3. \square

Lemma 28.37.4. *The base change of a morphism which is étale is étale.*

Proof. In the proof of Lemma 28.37.2 we saw that being étale is a local property of ring maps. Hence the lemma follows from Lemma 28.15.5 combined with the fact that being étale is a property of ring maps that is stable under base change, see Algebra, Lemma 10.138.3. \square

Lemma 28.37.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Then f is étale at x if and only if f is smooth and unramified at x .*

Proof. This follows immediately from the definitions. \square

Lemma 28.37.6. *An étale morphism is locally quasi-finite.*

Proof. By Lemma 28.37.5 an étale morphism is unramified. By Lemma 28.36.10 an unramified morphism is locally quasi-finite. \square

Lemma 28.37.7. *Fibres of étale morphisms.*

- (1) *Let X be a scheme over a field k . The structure morphism $X \rightarrow \text{Spec}(k)$ is étale if and only if X is a disjoint union of spectra of finite separable field extensions of k .*
- (2) *If $f : X \rightarrow S$ is an étale morphism, then for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.*

Proof. You can deduce this from Lemma 28.36.11 via Lemma 28.37.5 above. Here is a direct proof.

We will use Algebra, Lemma 10.138.4. Hence it is clear that if X is a disjoint union of spectra of finite separable field extensions of k then $X \rightarrow \text{Spec}(k)$ is étale. Conversely, suppose that $X \rightarrow \text{Spec}(k)$ is étale. Then for any affine open $U \subset X$ we see that U is a finite disjoint union of spectra of finite separable field extensions of k . Hence all points of X are closed points (see Lemma 28.21.2 for example). Thus X is a discrete space and we win. \square

The following lemma characterizes an étale morphism as a flat, finitely presented morphism with “étale fibres”.

Lemma 28.37.8. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is flat, locally of finite presentation, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$, then f is étale.*

Proof. You can deduce this from Algebra, Lemma 10.138.7. Here is another proof.

By Lemma 28.37.7 a fibre X_s is étale and hence smooth over s . By Lemma 28.35.3 we see that $X \rightarrow S$ is smooth. By Lemma 28.36.12 we see that f is unramified. We conclude by Lemma 28.37.5. \square

Lemma 28.37.9. *Any open immersion is étale.*

Proof. This is true because an open immersion is a local isomorphism. \square

Lemma 28.37.10. *An étale morphism is syntomic.*

Proof. See Algebra, Lemma 10.132.10 and use that an étale morphism is the same as a smooth morphism of relative dimension 0. \square

Lemma 28.37.11. *An étale morphism is locally of finite presentation.*

Proof. True because an étale ring map is of finite presentation by definition. \square

Lemma 28.37.12. *An étale morphism is flat.*

Proof. Combine Lemmas 28.32.7 and 28.37.10. \square

Lemma 28.37.13. *An étale morphism is open.*

Proof. Combine Lemmas 28.37.12, 28.37.11, and 28.26.9. \square

The following lemma says locally any étale morphism is standard étale. This is actually kind of a tricky result to prove in complete generality. The tricky parts are hidden in the chapter on commutative algebra. Hence a standard étale morphism is a *local model* for a general étale morphism.

Lemma 28.37.14. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

- (1) *The morphism f is étale at x .*
- (2) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard étale (see Definition 28.37.1).*

Proof. Follows from the definitions and Algebra, Proposition 10.138.17. \square

Here is a differential criterion of étaleness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.

Lemma 28.37.15. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite presentation. The following are equivalent:*

- (1) *The morphism f is étale at x .*
- (2) *The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat and the $\mathcal{O}_{X,x}$ -module $\Omega_{X/S,x}$ is zero.*
- (3) *The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat and the $\kappa(x)$ -vector space*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is zero.

- (4) *The local ring map $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x}$ is flat, we have $\mathfrak{m}_s \mathcal{O}_{X,x} = \mathfrak{m}_x$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.*
- (5) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard smooth of relative dimension 0.*
- (6) *There exist affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*

$$A = R[x_1, \dots, x_n]/(f_1, \dots, f_n)$$

with

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \dots & \partial f_n/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \dots & \partial f_n/\partial x_2 \\ \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_n & \partial f_2/\partial x_n & \dots & \partial f_n/\partial x_n \end{pmatrix}$$

mapping to an element of A not in \mathfrak{q} .

- (7) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \rightarrow V$ is standard étale.*
- (8) *There exist affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*

$$A = R[x]_Q/(P) = R[x, 1/Q]/(P)$$

with $P, Q \in R[x]$, P monic and $P' = dP/dx$ mapping to an element of A not in \mathfrak{q} .

Proof. Use Lemma 28.37.14 and the definitions to see that (1) implies all of the other conditions. For each of the conditions (2) – (7) combine Lemmas 28.35.14

and 28.36.14 to see that (1) holds by showing f is both smooth and unramified at x and applying Lemma 28.37.5. Some details omitted. \square

Lemma 28.37.16. *A morphism is étale at a point if and only if it is flat and G -unramified at that point. A morphism is étale if and only if it is flat and G -unramified.*

Proof. This is clear from Lemmas 28.37.15 and 28.36.14. \square

Lemma 28.37.17. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid X_{f(x)} \text{ is étale over } \kappa(f(x)) \text{ at } x\}$$

commutes with arbitrary base change: For any morphism $g : S' \rightarrow S$, consider the base change $f' : X' \rightarrow S'$ of f and the projection $g' : X' \rightarrow X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed locally of finite presentation and flat then the same holds for the open set of points where f is étale.

Proof. Combine Lemmas 28.37.16 and 28.36.15. \square

Our proof of the following lemma is somewhat complicated. It uses the “Critère de platitude par fibres” to see that a morphism $X \rightarrow Y$ over S between schemes étale over S is automatically flat. The details are in the chapter on commutative algebra.

Lemma 28.37.18. *Let $f : X \rightarrow Y$ be a morphism of schemes over S . If X and Y are étale over S , then f is étale.*

Proof. See Algebra, Lemma 10.138.9. \square

Lemma 28.37.19. *Let*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & S \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) f is surjective, and étale,
- (2) p is étale, and
- (3) q is locally of finite presentation¹⁰.

Then q is étale.

Proof. By Lemma 28.35.19 we see that q is smooth. Thus we only need to see that q has relative dimension 0. This follows from Lemma 28.29.2 and the fact that f and p have relative dimension 0. \square

A final characterization of smooth morphisms is that a smooth morphism $f : X \rightarrow S$ is locally the composition of an étale morphism by a projection $\mathbf{A}_S^d \rightarrow S$.

¹⁰In fact this is implied by (1) and (2), see Descent, Lemma 34.10.3. Moreover, it suffices to assume that f is surjective, flat and locally of finite presentation, see Descent, Lemma 34.10.5.

Lemma 28.37.20. *Let $\varphi : X \rightarrow Y$ be a morphism of schemes. Let $x \in X$. If φ is smooth at x , then there exist an integer $d \geq 0$ and affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that there exists a commutative diagram*

$$\begin{array}{ccc} X & \longleftarrow & U \xrightarrow{\pi} \mathbf{A}_V^d \\ \downarrow & & \downarrow \swarrow \\ Y & \longleftarrow & V \end{array}$$

where π is étale.

Proof. By Lemma 28.35.11 we can find affine opens U and V as in the lemma such that $\varphi|_U : U \rightarrow V$ is standard smooth. Write $U = \text{Spec}(A)$ and $V = \text{Spec}(R)$ so that we can write

$$A = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

with

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \dots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \dots & \partial f_c/\partial x_2 \\ \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \dots & \partial f_c/\partial x_c \end{pmatrix}$$

mapping to an invertible element of A . Then it is clear that $R[x_{c+1}, \dots, x_n] \rightarrow A$ is standard smooth of relative dimension 0. Hence it is smooth of relative dimension 0. In other words the ring map $R[x_{c+1}, \dots, x_n] \rightarrow A$ is étale. As $\mathbf{A}_V^{n-c} = \text{Spec}(R[x_{c+1}, \dots, x_n])$ the lemma with $d = n - c$. \square

28.38. Relatively ample sheaves

Let X be a scheme and \mathcal{L} an invertible sheaf on X . Then \mathcal{L} is ample on X if X is quasi-compact and every point of X is contained in an affine open of the form X_s , where $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ and $n \geq 1$, see Properties, Definition 27.24.1. We turn this into a relative notion as follows.

Definition 28.38.1. Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. We say \mathcal{L} is *relatively ample*, or *f-relatively ample*, or *ample on X/S* , or *f-ample* if $f : X \rightarrow S$ is quasi-compact, and if for every affine open $V \subset S$ the restriction of \mathcal{L} to the open subscheme $f^{-1}(V)$ of X is ample.

We note that the existence of a relatively ample sheaf on X does not force the morphism $X \rightarrow S$ to be of finite type.

Lemma 28.38.2. *Let $X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $n \geq 1$. Then \mathcal{L} is f-ample if and only if $\mathcal{L}^{\otimes n}$ is f-ample.*

Proof. This follows from Properties, Lemma 27.24.2. \square

Lemma 28.38.3. *Let $f : X \rightarrow S$ be a morphism of schemes. If there exists an f-ample invertible sheaf, then f is separated.*

Proof. Being separated is local on the base (see Schemes, Lemma 25.21.8 for example; it also follows easily from the definition). Hence we may assume S is affine and X has an ample invertible sheaf. In this case the result follows from Properties, Lemma 27.24.9. \square

There are many ways to characterize relatively ample invertible sheaves, analogous to the equivalent conditions in Properties, Proposition 27.24.14. We will add these here as needed.

Lemma 28.38.4. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . The following are equivalent:*

- (1) *The invertible sheaf \mathcal{L} is f -ample.*
- (2) *There exists an open covering $S = \bigcup V_i$ such that each $\mathcal{L}|_{f^{-1}(V_i)}$ is ample relative to $f^{-1}(V_i) \rightarrow V_i$.*
- (3) *There exists an affine open covering $S = \bigcup V_i$ such that each $\mathcal{L}|_{f^{-1}(V_i)}$ is ample.*
- (4) *There exists a quasi-coherent graded \mathcal{O}_S -algebra \mathcal{A} and a map of graded \mathcal{O}_X -algebras $\psi : f^*\mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ such that $U(\psi) = X$ and*

$$r_{\mathcal{L},\psi} : X \longrightarrow \underline{\text{Proj}}_S(\mathcal{A})$$
is an open immersion (see Constructions, Lemma 26.19.1 for notation).
- (5) *The morphism f is quasi-separated and part (4) above holds with $\mathcal{A} = f_*(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d})$ and ψ the adjunction mapping.*
- (6) *Same as (4) but just requiring $r_{\mathcal{L},\psi}$ to be an immersion.*

Proof. It is immediate from the definition that (1) implies (2) and (2) implies (3). It is clear that (5) implies (4).

Assume (3) holds for the affine open covering $S = \bigcup V_i$. We are going to show (5) holds. Since each $f^{-1}(V_i)$ has an ample invertible sheaf we see that $f^{-1}(V_i)$ is separated (see Properties, Lemma 27.24.12 and Constructions, Lemma 26.8.8). Hence f is separated. By Schemes, Lemma 25.24.1 we see that $\mathcal{A} = f_*(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d})$ is a quasi-coherent graded \mathcal{O}_S -algebra. Denote $\psi : f^*\mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ the adjunction mapping. The description of the open $U(\psi)$ in Constructions, Section 26.19 and the definition of ampleness of $\mathcal{L}|_{f^{-1}(V_i)}$ show that $U(\psi) = X$. Moreover, Constructions, Lemma 26.19.1 part (3) shows that the restriction of $r_{\mathcal{L},\psi}$ to $f^{-1}(V_i)$ is the same as the morphism from Properties, Lemma 27.24.10 which is an open immersion according to Properties, Lemma 27.24.12. Hence (5) holds.

Let us show that (4) implies (1). Assume (4). Denote $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ the structure morphism. Choose $V \subset S$ affine open. By Constructions, Definition 26.16.7 we see that $\pi^{-1}(V) \subset \underline{\text{Proj}}_S(\mathcal{A})$ is equal to $\text{Proj}(A)$ where $A = \mathcal{A}(V)$ as a graded ring. Hence $r_{\mathcal{L},\psi}$ maps $f^{-1}(V)$ isomorphically onto a quasi-compact open of $\text{Proj}(A)$. Moreover, $\mathcal{L}^{\otimes d}$ is isomorphic to the pullback of $\mathcal{O}_{\text{Proj}(A)}(d)$ for some $d \geq 1$. (See part (3) of Constructions, Lemma 26.19.1 and the final statement of Constructions, Lemma 26.14.1.) This implies that $\mathcal{L}|_{f^{-1}(V)}$ is ample by Properties, Lemmas 27.24.13 and 27.24.2.

Assume (6). By the equivalence of (1) - (5) above we see that the property of being relatively ample on X/S is local on S . Hence we may assume that S is affine, and we have to show that \mathcal{L} is ample on X . In this case the morphism $r_{\mathcal{L},\psi}$ is identified with the morphism, also denoted $r_{\mathcal{L},\psi} : X \rightarrow \text{Proj}(A)$ associated to the map $\psi : A = \mathcal{A}(V) \rightarrow \Gamma_*(X, \mathcal{L})$. (See references above.) As above we also see that $\mathcal{L}^{\otimes d}$ is the pullback of the sheaf $\mathcal{O}_{\text{Proj}(A)}(d)$ for some $d \geq 1$. Moreover, since X is quasi-compact we see that X gets identified with a closed subscheme of a quasi-compact open subscheme $Y \subset \text{Proj}(A)$. By Constructions, Lemma 26.10.6 (see

also Properties, Lemma 27.24.13) we see that $\mathcal{O}_Y(d')$ is an ample invertible sheaf on Y for some $d' \geq 1$. Since the restriction of an ample sheaf to a closed subscheme is ample, see Properties, Lemma 27.24.3 we conclude that the pullback of $\mathcal{O}_Y^{d'}$ is ample. Combining these results with Properties, Lemma 27.24.2 we conclude that \mathcal{L} is ample as desired. \square

Lemma 28.38.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Assume S affine. Then \mathcal{L} is f -relatively ample if and only if \mathcal{L} is ample on X .*

Proof. Immediate from Lemma 28.38.4 and the definitions. \square

Lemma 28.38.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Then f is quasi-affine if and only if \mathcal{O}_X is f -relatively ample.*

Proof. Follows from Properties, Lemma 27.25.1 and the definitions. \square

Lemma 28.38.7. *Let $f : X \rightarrow Y$ be a morphism of schemes, \mathcal{M} an invertible \mathcal{O}_Y -module, and \mathcal{L} an invertible \mathcal{O}_X -module.*

- (1) *If \mathcal{L} is f -ample and \mathcal{M} is ample, then $\mathcal{L} \otimes f^*\mathcal{M}^{\otimes a}$ is ample for $a \gg 0$.*
- (2) *If \mathcal{M} is ample and f quasi-affine, then $f^*\mathcal{M}$ is ample.*

Proof. Assume \mathcal{L} is f -ample and \mathcal{M} ample. By assumption Y and f are quasi-compact (see Definition 28.38.1 and Properties, Definition 27.24.1). Hence X is quasi-compact. Pick $x \in X$. We can choose $m \geq 1$ and $t \in \Gamma(Y, \mathcal{M}^{\otimes m})$ such that Y_t is affine and $f(x) \in Y_t$. Since \mathcal{L} restricts to an ample invertible sheaf on $f^{-1}(Y_t) = X_{f^*t}$ we can choose $n \geq 1$ and $s \in \Gamma(X_{f^*t}, \mathcal{L}^{\otimes n})$ with $x \in (X_{f^*t})_s$ with $(X_{f^*t})_s$ affine. By Properties, Lemma 27.24.6 there exists an integer $e \geq 1$ and a section $s' \in \Gamma(X, \mathcal{L}^{\otimes n} \otimes f^*\mathcal{M}^{\otimes em})$ which restricts to $s(f^*t)^e$ on X_{f^*t} . For any $b > 0$ consider the section $s'' = s'(f^*t)^b$ of $\mathcal{L}^{\otimes n} \otimes f^*\mathcal{M}^{\otimes (e+b)m}$. Then $X_{s''} = (X_{f^*t})_s$ is an affine open of X containing x . Picking b such that n divides $e + b$ we see $\mathcal{L}^{\otimes n} \otimes f^*\mathcal{M}^{\otimes (e+b)m}$ is the n th power of $\mathcal{L} \otimes f^*\mathcal{M}^{\otimes a}$ for some a and we can get any a divisible by m and big enough. Since X is quasi-compact a finite number of these affine opens cover X . We conclude that for some a sufficiently divisible and large enough the invertible sheaf $\mathcal{L} \otimes f^*\mathcal{M}^{\otimes a}$ is ample on X . On the other hand, we know that $\mathcal{M}^{\otimes c}$ (and hence its pullback to X) is globally generated for all $c \gg 0$ by Properties, Proposition 27.24.14. Thus $\mathcal{L} \otimes f^*\mathcal{M}^{\otimes a+c}$ is ample (Properties, Lemma 27.24.5) for $c \gg 0$ and (1) is proved.

Part (2) follows from Lemma 28.38.6, Properties, Lemma 27.24.2, and part (1). \square

Lemma 28.38.8. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $S' \rightarrow S$ be a morphism of schemes. Let $f' : X' \rightarrow S'$ be the base change of f and denote \mathcal{L}' the pullback of \mathcal{L} to X' . If \mathcal{L} is f -ample, then \mathcal{L}' is f' -ample.*

Proof. By Lemma 28.38.4 it suffices to find an affine open covering $S' = \bigcup U'_i$ such that \mathcal{L}' restricts to an ample invertible sheaf on $(f')^{-1}(U'_i)$ for all i . We may choose U'_i mapping into an affine open $U_i \subset S$. In this case the morphism $(f')^{-1}(U'_i) \rightarrow f^{-1}(U_i)$ is affine as a base change of the affine morphism $U'_i \rightarrow U_i$ (Lemma 28.13.8). Thus $\mathcal{L}'|_{(f')^{-1}(U'_i)}$ is ample by Lemma 28.38.7. \square

28.39. Very ample sheaves

Recall that given a quasi-coherent sheaf \mathcal{E} on a scheme S the *projective bundle* associated to \mathcal{E} is the morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$, where $\mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\text{Sym}(\mathcal{E}))$, see Constructions, Definition 26.21.1.

Definition 28.39.1. Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. We say \mathcal{L} is *relatively very ample* or more precisely *f-relatively very ample*, or *very ample on X/S* , or *f-very ample* if there exist a quasi-coherent \mathcal{O}_S -module \mathcal{E} and an immersion $i : X \rightarrow \mathbf{P}(\mathcal{E})$ over S such that $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$.

Since there is no assumption of quasi-compactness in this definition it is not true in general that a relatively very ample invertible sheaf is a relatively ample invertible sheaf.

Lemma 28.39.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. If f is quasi-compact and \mathcal{L} is a relatively very ample invertible sheaf, then \mathcal{L} is a relatively ample invertible sheaf.*

Proof. By definition there exists quasi-coherent \mathcal{O}_S -module \mathcal{E} and an immersion $i : X \rightarrow \mathbf{P}(\mathcal{E})$ over S such that $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Set $\mathcal{A} = \text{Sym}(\mathcal{E})$, so $\mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\mathcal{A})$ by definition. The graded \mathcal{O}_S -algebra \mathcal{A} comes equipped with a map

$$\psi : \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \pi_* \mathcal{O}_{\mathbf{P}(\mathcal{E})}(n) \rightarrow \bigoplus_{n \geq 0} f_* \mathcal{L}^{\otimes n}$$

where the second arrow uses the identification $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. By adjointness of f_* and f^* we get a morphism $\psi : f^*\mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$. We omit the verification that the morphism $r_{\mathcal{L}, \psi}$ associated to this map is exactly the immersion i . Hence the result follows from part (6) of Lemma 28.38.4. \square

To arrive at the correct converse of this lemma we ask whether given a relatively ample invertible sheaf \mathcal{L} there exists an integer $n \geq 1$ such that $\mathcal{L}^{\otimes n}$ is relatively very ample? In general this is false. There are several things that prevent this from being true:

- (1) Even if S is affine, it can happen that no finite integer n works because $X \rightarrow S$ is not of finite type, see Example 28.39.4.
- (2) The base not being quasi-compact means the result can be prevented from being true even with f finite type. Namely, given a field k there exists a scheme X_d of finite type over k with an ample invertible sheaf $\mathcal{O}_{X_d}(1)$ so that the smallest tensor power of $\mathcal{O}_{X_d}(1)$ which is very ample is the d th power. See Example 28.39.5. Taking f to be the disjoint union of the schemes X_d mapping to the disjoint union of copies of $\text{Spec}(k)$ gives an example.

To see our version of the converse take a look at Lemma 28.40.5 below. We will do some preliminary work before proving it.

Example 28.39.3. Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra generated by \mathcal{A}_1 over \mathcal{A}_0 . Set $X = \underline{\text{Proj}}_S(\mathcal{A})$. In this case $\mathcal{O}_X(1)$ is a very ample invertible sheaf on X . Namely, the morphism associated to the graded \mathcal{O}_S -algebra map

$$\text{Sym}_{\mathcal{O}_X}^*(\mathcal{A}_1) \longrightarrow \mathcal{A}$$

is a closed immersion $X \rightarrow \mathbf{P}(\mathcal{A}_1)$ which pulls back $\mathcal{O}_{\mathbf{P}(\mathcal{A}_1)}(1)$ to $\mathcal{O}_X(1)$, see Constructions, Lemma 26.18.5.

Example 28.39.4. Let k be a field. Consider the graded k -algebra

$$A = k[U, V, Z_1, Z_2, Z_3, \dots]/I \quad \text{with} \quad I = (U^2 - Z_1^2, U^4 - Z_2^2, U^6 - Z_3^2, \dots)$$

with grading given by $\deg(U) = \deg(V) = \deg(Z_1) = 1$ and $\deg(Z_d) = d$. Note that $X = \text{Proj}(A)$ is covered by $D_+(U)$ and $D_+(V)$. Hence the sheaves $\mathcal{O}_X(n)$ are all invertible and isomorphic to $\mathcal{O}_X(1)^{\otimes n}$. In particular $\mathcal{O}_X(1)$ is ample and f -ample for the morphism $f : X \rightarrow \text{Spec}(k)$. We claim that no power of $\mathcal{O}_X(1)$ is f -relatively very ample. Namely, it is easy to see that $\Gamma(X, \mathcal{O}_X(n))$ is the degree n summand of the algebra A . Hence if $\mathcal{O}_X(n)$ were very ample, then X would be a closed subscheme of a projective space over k and hence of finite type over k . On the other hand $D_+(V)$ is the spectrum of $k[t, t_1, t_2, \dots]/(t^2 - t_1^2, t^4 - t_2^2, t^6 - t_3^2, \dots)$ which is not of finite type over k .

Example 28.39.5. Let k be an infinite field. Let $\lambda_1, \lambda_2, \lambda_3, \dots$ be pairwise distinct elements of k^* . (This is not strictly necessary, and in fact the example works perfectly well even if all λ_i are equal to 1.) Consider the graded k -algebra

$$A_d = k[U, V, Z]/I_d \quad \text{with} \quad I_d = (Z^2 - \prod_{i=1}^{2d} (U - \lambda_i V)).$$

with grading given by $\deg(U) = \deg(V) = 1$ and $\deg(Z) = d$. Then $X_d = \text{Proj}(A_d)$ has ample invertible sheaf $\mathcal{O}_{X_d}(1)$. We claim that if $\mathcal{O}_{X_d}(n)$ is very ample, then $n \geq d$. The reason for this is that Z has degree d , and hence $\Gamma(X_d, \mathcal{O}_{X_d}(n)) = k[U, V]_n$ for $n < d$. Details omitted.

Lemma 28.39.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . If \mathcal{L} is relatively very ample on X/S then f is separated.*

Proof. Being separated is local on the base (see Schemes, Section 25.21). An immersion is separated (see Schemes, Lemma 25.23.7). Hence the lemma follows since locally X has an immersion into the homogeneous spectrum of a graded ring which is separated, see Constructions, Lemma 26.8.8. \square

Lemma 28.39.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . Assume f is quasi-compact. The following are equivalent*

- (1) \mathcal{L} is relatively very ample on X/S ,
- (2) there exists an open covering $S = \bigcup V_j$ such that $\mathcal{L}|_{f^{-1}(V_j)}$ is relatively very ample on $f^{-1}(V_j)/V_j$ for all j ,
- (3) there exists a quasi-coherent sheaf of graded \mathcal{O}_S -algebras \mathcal{A} generated in degree 1 over \mathcal{O}_S and a map of graded \mathcal{O}_X -algebras $\psi : f^* \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ such that $f^* \mathcal{A}_1 \rightarrow \mathcal{L}$ is surjective and the associated morphism $r_{\mathcal{L}, \psi} : X \rightarrow \overline{\text{Proj}}_S(\mathcal{A})$ is an immersion, and
- (4) f is quasi-separated, the canonical map $\psi : f^* f_* \mathcal{L} \rightarrow \mathcal{L}$ is surjective, and the associated map $r_{\mathcal{L}, \psi} : X \rightarrow \mathbf{P}(f_* \mathcal{L})$ is an immersion.

Proof. It is clear that (1) implies (2). It is also clear that (4) implies (1); the hypothesis of quasi-separation in (4) is used to guarantee that $f_* \mathcal{L}$ is quasi-coherent via Schemes, Lemma 25.24.1.

Assume (2). We will prove (4). Let $S = \bigcup V_j$ be an open covering as in (2). Set $X_j = f^{-1}(V_j)$ and $f_j : X_j \rightarrow V_j$ the restriction of f . We see that f is

separated by Lemma 28.39.6 (as being separated is local on the base). Consider the map $\psi : f^*f_*\mathcal{L} \rightarrow \mathcal{L}$. On each V_j there exists a quasi-coherent sheaf \mathcal{E}_j and an embedding $i : X_j \rightarrow \mathbf{P}(\mathcal{E}_j)$ with $\mathcal{L}_{X_j} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E}_j)}(1)$. In other words there is a map $\mathcal{E}_j \rightarrow (f_*\mathcal{L})|_{X_j}$ such that the composition

$$f_j^*\mathcal{E}_j \rightarrow (f^*f_*\mathcal{L})|_{X_j} \rightarrow \mathcal{L}|_{X_j}$$

is surjective. Hence we conclude that ψ is surjective. Let $r_{\mathcal{L},\psi} : X \rightarrow \mathbf{P}(f_*\mathcal{L})$ be the associated morphism. Using the maps $\mathcal{E}_j \rightarrow (f_*\mathcal{L})|_{X_j}$ we see that there is a factorization

$$X_j \xrightarrow{r_{\mathcal{L},\psi}} \mathbf{P}(f_*\mathcal{L})|_{V_j} \longrightarrow \mathbf{P}(\mathcal{E}_j)$$

which shows that $r_{\mathcal{L},\psi}$ is an immersion.

At this point we see that (1), (2) and (4) are equivalent. Clearly (4) implies (3). Assume (3). We will prove (1). Let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_S -algebras generated in degree 1 over \mathcal{O}_S . Consider the map of graded \mathcal{O}_S -algebras $\mathrm{Sym}(\mathcal{A}_1) \rightarrow \mathcal{A}$. This is surjective by hypothesis and hence induces a closed immersion

$$\underline{\mathrm{Proj}}_S(\mathcal{A}) \longrightarrow \mathbf{P}(\mathcal{A}_1)$$

which pulls back $\mathcal{O}(1)$ to $\mathcal{O}(1)$, see Constructions, Lemma 26.18.5. Hence it is clear that (3) implies (1). \square

28.40. Ample and very ample sheaves relative to finite type morphisms

In fact most of the material in this section is about the notion of a (quasi-)projective morphism which we have not defined yet.

Lemma 28.40.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . Assume that*

- (1) *the invertible sheaf \mathcal{L} is very ample on X/S ,*
- (2) *the morphism $X \rightarrow S$ is of finite type, and*
- (3) *S is affine.*

Then there exists an $n \geq 0$ and an immersion $i : X \rightarrow \mathbf{P}_S^n$ over S such that $\mathcal{L} \cong i^\mathcal{O}_{\mathbf{P}_S^n}(1)$.*

Proof. Assume (1), (2) and (3). Condition (3) means $S = \mathrm{Spec}(R)$ for some ring R . Condition (1) means by definition there exists a quasi-coherent \mathcal{O}_S -module \mathcal{E} and an immersion $\alpha : X \rightarrow \mathbf{P}(\mathcal{E})$ such that $\mathcal{L} = \alpha^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Write $\mathcal{E} = \widetilde{M}$ for some R -module M . Thus we have

$$\mathbf{P}(\mathcal{E}) = \mathrm{Proj}(\mathrm{Sym}_R(M)).$$

Since α is an immersion, and since the topology of $\mathrm{Proj}(\mathrm{Sym}_R(M))$ is generated by the standard opens $D_+(f)$, $f \in \mathrm{Sym}_R^d(M)$, $d \geq 1$, we can find for each $x \in X$ an $f \in \mathrm{Sym}_R^d(M)$, $d \geq 1$, with $\alpha(x) \in D_+(f)$ such that

$$\alpha|_{\alpha^{-1}(D_+(f))} : \alpha^{-1}(D_+(f)) \rightarrow D_+(f)$$

is a closed immersion. Condition (2) implies X is quasi-compact. Hence we can find a finite collection of elements $f_j \in \mathrm{Sym}_R^{d_j}(M)$, $d_j \geq 1$ such that for each $f = f_j$ the displayed map above is a closed immersion and such that $\alpha(X) \subset \bigcup D_+(f_j)$. Write $U_j = \alpha^{-1}(D_+(f_j))$. Note that U_j is affine as a closed subscheme of the affine scheme $D_+(f_j)$. Write $U_j = \mathrm{Spec}(A_j)$. Condition (2) also implies that A_j

is of finite type over R , see Lemma 28.16.2. Choose finitely many $x_{j,k} \in A_j$ which generate A_j as a R -algebra. Since $\alpha|_{U_j}$ is a closed immersion we see that $x_{j,k}$ is the image of an element

$$f_{j,k}/f_j^{e_{j,k}} \in \text{Sym}_R(M)_{(f_j)} = \Gamma(D_+(f_j), \mathcal{O}_{\text{Proj}(\text{Sym}_R(M))}).$$

Finally, choose $n \geq 1$ and elements $y_0, \dots, y_n \in M$ such that each of the polynomials $f_j, f_{j,k} \in \text{Sym}_R(M)$ is a polynomial in the elements y_t with coefficients in R . Consider the graded ring map

$$\psi : R[Y_0, \dots, Y_n] \longrightarrow \text{Sym}_R(M), \quad Y_i \longmapsto y_i.$$

Denote $F_j, F_{j,k}$ the elements of $R[Y_0, \dots, Y_n]$ such that $\psi(F_j) = f_j$ and $\psi(F_{j,k}) = f_{j,k}$. By Constructions, Lemma 26.11.1 we obtain an open subscheme

$$U(\psi) \subset \text{Proj}(\text{Sym}_R(M))$$

and a morphism $r_\psi : U(\psi) \rightarrow \mathbf{P}_R^n$. This morphism satisfies $r_\psi^{-1}(D_+(F_j)) = D_+(f_j)$, and hence we see that $\alpha(X) \subset U(\psi)$. Moreover, it is clear that

$$i = r_\psi \circ \alpha : X \longrightarrow \mathbf{P}_R^n$$

is still an immersion since $i^\sharp(F_{j,k}/F_j^{e_{j,k}}) = x_{j,k} \in A_j = \Gamma(U_j, \mathcal{O}_X)$ by construction. Moreover, the morphism r_ψ comes equipped with a map $\theta : r_\psi^* \mathcal{O}_{\mathbf{P}_R^n}(1) \rightarrow \mathcal{O}_{\text{Proj}(\text{Sym}_R(M))}(1)|_{U(\psi)}$ which is an isomorphism in this case (for construction θ see lemma cited above; some details omitted). Since the original map α was assumed to have the property that $\mathcal{L} = \alpha^* \mathcal{O}_{\text{Proj}(\text{Sym}_R(M))}(1)$ we win. \square

Lemma 28.40.2. *Let $\pi : X \rightarrow S$ be a morphism of schemes. Assume that X is quasi-affine and that π is locally of finite type. Then there exist $n \geq 0$ and an immersion $i : X \rightarrow \mathbf{A}_S^n$ over S .*

Proof. Let $A = \Gamma(X, \mathcal{O}_X)$. By assumption X is quasi-compact and is identified with an open subscheme of $\text{Spec}(A)$, see Properties, Lemma 27.15.4. Moreover, the set of opens X_f , for those $f \in A$ such that X_f is affine, forms a basis for the topology of X , see the proof of Properties, Lemma 27.15.4. Hence we can find a finite number of $f_j \in A$, $j = 1, \dots, m$ such that $X = \bigcup X_{f_j}$, and such that $\pi(X_{f_j}) \subset V_j$ for some affine open $V_j \subset S$. By Lemma 28.16.2 the ring maps $\mathcal{O}(V_j) \rightarrow \mathcal{O}(X_{f_j}) = A_{f_j}$ are of finite type. Thus we may choose $a_1, \dots, a_N \in A$ such that the elements $a_1, \dots, a_N, f_1, \dots, f_m, 1/f_j$ generate A_{f_j} over $\mathcal{O}(V_j)$ for each j . Take $n = N + m$ and let

$$i : X \longrightarrow \mathbf{A}_S^n$$

be the morphism given by the global sections $a_1, \dots, a_n, f_1, \dots, f_n$ of the structure sheaf of X . Let $D(x_j) \subset \mathbf{A}_S^n$ be the open subscheme where the j th coordinate function is nonzero. Then it is clear that $i^{-1}(D(x_j))$ is X_{f_j} and that the induced morphism $X_{f_j} \rightarrow D(x_j)$ factors through the affine open $\text{Spec}(\mathcal{O}(V_j)[x_1, \dots, x_n, 1/x_j])$ of $D(x_j)$. Since the ring map $\mathcal{O}(V_j)[x_1, \dots, x_n, 1/x_j] \rightarrow A_{f_j}$ is surjective by construction we conclude that the restriction of i to X_{f_j} is an immersion as desired. \square

Lemma 28.40.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . Assume that*

- (1) *the invertible sheaf \mathcal{L} is ample on X , and*
- (2) *the morphism $X \rightarrow S$ is locally of finite type.*

Then there exists a $d_0 \geq 1$ such that for every $d \geq d_0$ there exists an $n \geq 0$ and an immersion $i : X \rightarrow \mathbf{P}_S^n$ over S such that $\mathcal{L}^{\otimes d} \cong i^* \mathcal{O}_{\mathbf{P}_S^n}(1)$.

Proof. Let $A = \Gamma_*(X, \mathcal{L}) = \bigoplus_{d \geq 0} \Gamma(X, \mathcal{L}^{\otimes d})$. By Properties, Proposition 27.24.14 the set of affine opens X_a with $a \in A_+$ homogeneous forms a basis for the topology of X . Hence we can find finitely many such elements $a_0, \dots, a_n \in A_+$ such that

- (1) we have $X = \bigcup_{i=0, \dots, n} X_{a_i}$,
- (2) each X_{a_i} is affine, and
- (3) each X_{a_i} maps into an affine open $V_i \subset S$.

By Lemma 28.16.2 we see that the ring maps $\mathcal{O}_S(V_i) \rightarrow \mathcal{O}_X(X_{a_i})$ are of finite type. Hence we can find finitely many elements $f_{ij} \in \mathcal{O}_X(X_{a_i})$, $j = 1, \dots, n_i$ which generate $\mathcal{O}_X(X_{a_i})$ as an $\mathcal{O}_S(V_i)$ -algebra. By Properties, Lemma 27.24.6 we may write each f_{ij} as $a_{ij}/a_i^{e_{ij}}$ for some $a_{ij} \in A_+$ homogeneous. Let N be a positive integer which is a common multiple of all the degrees of the elements a_i, a_{ij} . Consider the elements

$$a_i^{N/\deg(a_i)}, a_{ij} a_i^{(N/\deg(a_i)) - e_{ij}} \in A_N.$$

By construction these generate the invertible sheaf $\mathcal{L}^{\otimes N}$ over X . Hence they give rise to a morphism

$$j : X \longrightarrow \mathbf{P}_S^m \quad \text{with } m = n + \sum n_i$$

over S , see Constructions, Lemma 26.13.1 and Definition 26.13.2. Moreover, $j^* \mathcal{O}_{\mathbf{P}_S^m}(1) = \mathcal{L}^{\otimes N}$. We name the homogeneous coordinates T_0, \dots, T_n, T_{ij} instead of T_0, \dots, T_m . For $i = 0, \dots, n$ we have $i^{-1}(D_+(T_i)) = X_{a_i}$. Moreover, pulling back the element T_{ij}/T_i via j^\sharp we get the element $f_{ij} \in \mathcal{O}_X(X_{a_i})$. Hence the morphism j restricted to X_{a_i} gives a closed immersion of X_{a_i} into the affine open $D_+(T_i) \cap \mathbf{P}_{V_i}^m$ of \mathbf{P}_S^m . Hence we conclude that the morphism j is an immersion. This implies the lemma holds for some d and n which is enough in virtually all applications.

This proves that for one $d_2 \geq 1$ (namely $d_2 = N$ above), some $m \geq 0$ there exists some immersion $j : X \rightarrow \mathbf{P}_S^m$ given by global sections $s'_0, \dots, s'_m \in \Gamma(X, \mathcal{L}^{\otimes d_2})$. By Properties, Proposition 27.24.14 we know there exists an integer d_1 such that $\mathcal{L}^{\otimes d}$ is globally generated for all $d \geq d_1$. Set $d_0 = d_1 + d_2$. We claim that the lemma holds with this value of d_0 . Namely, given an integer $d \geq d_0$ we may choose $s''_1, \dots, s''_t \in \Gamma(X, \mathcal{L}^{\otimes d-d_2})$ which generate $\mathcal{L}^{\otimes d-d_2}$ over X . Set $n = (m+1)t$ and denote s_0, \dots, s_n the collection of sections $s'_\alpha s''_\beta$, $\alpha = 0, \dots, m$, $\beta = 1, \dots, t$. These generate $\mathcal{L}^{\otimes d}$ over X and therefore define a morphism

$$i : X \longrightarrow \mathbf{P}_S^n$$

such that $i^* \mathcal{O}_{\mathbf{P}_S^n}(1) \cong \mathcal{L}^{\otimes d}$. We omit the verification that since j was an immersion also the morphism i so obtained is an immersion also. (Hint: Segre embedding.) \square

Lemma 28.40.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Assume S affine and f of finite type. The following are equivalent*

- (1) \mathcal{L} is ample on X ,
- (2) \mathcal{L} is f -ample,
- (3) $\mathcal{L}^{\otimes d}$ is f -very ample for some $d \geq 1$,
- (4) $\mathcal{L}^{\otimes d}$ is f -very ample for all $d \gg 1$,
- (5) for some $d \geq 1$ there exist $n \geq 1$ and an immersion $i : X \rightarrow \mathbf{P}_S^n$ such that $\mathcal{L}^{\otimes d} \cong i^* \mathcal{O}_{\mathbf{P}_S^n}(1)$, and

- (6) for all $d \gg 1$ there exist $n \geq 1$ and an immersion $i : X \rightarrow \mathbf{P}_S^n$ such that $\mathcal{L}^{\otimes d} \cong i^* \mathcal{O}_{\mathbf{P}_S^n}(1)$.

Proof. The equivalence of (1) and (2) is Lemma 28.38.5. The implication (2) \Rightarrow (6) is Lemma 28.40.3. Trivially (6) implies (5). As \mathbf{P}_S^n is a projective bundle over S (see Constructions, Lemma 26.21.4) we see that (5) implies (3) and (6) implies (4) from the definition of a relatively very ample sheaf. Trivially (4) implies (3). To finish we have to show that (3) implies (2) which follows from Lemma 28.39.2 and Lemma 28.38.2. \square

Lemma 28.40.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Assume S quasi-compact and f of finite type. The following are equivalent*

- (1) \mathcal{L} is f -ample,
- (2) $\mathcal{L}^{\otimes d}$ is f -very ample for some $d \geq 1$,
- (3) $\mathcal{L}^{\otimes d}$ is f -very ample for all $d \gg 1$.

Proof. Trivially (3) implies (2). Lemma 28.39.2 guarantees that (2) implies (1) since a morphism of finite type is quasi-compact by definition. Assume that \mathcal{L} is f -ample. Choose a finite affine open covering $S = V_1 \cup \dots \cup V_m$. Write $X_i = f^{-1}(V_i)$. By Lemma 28.40.4 above we see there exists a d_0 such that $\mathcal{L}^{\otimes d}$ is relatively very ample on X_i/V_i for all $d \geq d_0$. Hence we conclude (1) implies (3) by Lemma 28.39.7. \square

The following two lemmas provide the most used and most useful characterizations of relatively very ample and relatively ample invertible sheaves when the morphism is of finite type.

Lemma 28.40.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . Assume f is of finite type. The following are equivalent:*

- (1) \mathcal{L} is f -relatively very ample, and
- (2) there exist an open covering $S = \bigcup V_j$, for each j an integer n_j , and immersions

$$i_j : X_j = f^{-1}(V_j) = V_j \times_S X \longrightarrow \mathbf{P}_{V_j}^{n_j}$$

over V_j such that $\mathcal{L}|_{X_j} \cong i_j^* \mathcal{O}_{\mathbf{P}_{V_j}^{n_j}}(1)$.

Proof. We see that (1) implies (2) by taking an affine open covering of S and applying Lemma 28.40.1 to each of the restrictions of f and \mathcal{L} . We see that (2) implies (1) by Lemma 28.39.7. \square

Lemma 28.40.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{L} be an invertible sheaf on X . Assume f is of finite type. The following are equivalent:*

- (1) \mathcal{L} is f -relatively ample, and
- (2) there exist an open covering $S = \bigcup V_j$, for each j an integers $d_j \geq 1$, $n_j \geq 0$, and immersions

$$i_j : X_j = f^{-1}(V_j) = V_j \times_S X \longrightarrow \mathbf{P}_{V_j}^{n_j}$$

over V_j such that $\mathcal{L}^{\otimes d_j}|_{X_j} \cong i_j^* \mathcal{O}_{\mathbf{P}_{V_j}^{n_j}}(1)$.

Proof. We see that (1) implies (2) by taking an affine open covering of S and applying Lemma 28.40.4 to each of the restrictions of f and \mathcal{L} . We see that (2) implies (1) by Lemma 28.38.4. \square

28.41. Quasi-projective morphisms

The discussion in the previous section suggests the following definitions. We take our definition of quasi-projective from [DG67]. The version with the letter “H” is the definition in [Har77].

Definition 28.41.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say f is *quasi-projective* if f is of finite type and there exists an f -relatively ample invertible \mathcal{O}_X -module.
- (2) We say f is *H-quasi-projective* if there exists a quasi-compact immersion $X \rightarrow \mathbf{P}_S^n$ over S for some n .¹¹
- (3) We say f is *locally quasi-projective* if there exists an open covering $S = \bigcup V_j$ such that each $f^{-1}(V_j) \rightarrow V_j$ is quasi-projective.

As this definition suggests the property of being quasi-projective is not local on S .

Lemma 28.41.2. *Let $f : X \rightarrow S$ be a morphism of schemes. If f is quasi-projective, or H-quasi-projective or locally quasi-projective, then f is separated of finite type.*

Proof. Omitted. \square

Lemma 28.41.3. *A H-quasi-projective morphism is quasi-projective.*

Proof. Omitted. \square

Lemma 28.41.4. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is locally quasi-projective.*
- (2) *There exists an open covering $S = \bigcup V_j$ such that each $f^{-1}(V_j) \rightarrow V_j$ is H-quasi-projective.*

Proof. By Lemma 28.41.3 we see that (2) implies (1). Assume (1). The question is local on S and hence we may assume S is affine, X of finite type over S and \mathcal{L} is a relatively ample invertible sheaf on X/S . By Lemma 28.40.4 we may assume \mathcal{L} is ample on X . By Lemma 28.40.3 we see that there exists an immersion of X into a projective space over S , i.e., X is H-quasi-projective over S as desired. \square

28.42. Proper morphisms

The notion of a proper morphism plays an important role in algebraic geometry. An important example of a proper morphism will be the structure morphism $\mathbf{P}_S^n \rightarrow S$ of projective n -space, and this is in fact the motivating example leading to the definition.

Definition 28.42.1. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *proper* if f is separated, finite type, and universally closed.

¹¹This is not exactly the same as the definition in Hartshorne. Namely, the definition in Hartshorne (8th corrected printing, 1997) is that f should be the composition of an open immersion followed by a H-projective morphism (see Definition 28.43.1), which does not imply f is quasi-compact. See Lemma 28.43.11 for the implication in the other direction.

The morphism from the affine line with zero doubled to the affine line is of finite type and universally closed, so the separation condition is necessary in the definition above. In the rest of this section we prove some of the basic properties of proper morphisms and of universally closed morphisms.

Lemma 28.42.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is universally closed.*
- (2) *There exists an open covering $S = \bigcup V_j$ such that $f^{-1}(V_j) \rightarrow V_j$ is universally closed for all indices j .*

Proof. This is clear from the definition. □

Lemma 28.42.3. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is proper.*
- (2) *There exists an open covering $S = \bigcup V_j$ such that $f^{-1}(V_j) \rightarrow V_j$ is proper for all indices j .*

Proof. Omitted. □

Lemma 28.42.4. *The composition of proper morphisms is proper. The same is true for universally closed morphisms.*

Proof. A composition of closed morphisms is closed. If $X \rightarrow Y \rightarrow Z$ are universally closed morphisms and $Z' \rightarrow Z$ is any morphism, then we see that $Z' \times_Z X = (Z' \times_Z Y) \times_Y X \rightarrow Z' \times_Z Y$ is closed and $Z' \times_Z Y \rightarrow Z'$ is closed. Hence the result for universally closed morphisms. We have seen that “separated” and “finite type” are preserved under compositions (Schemes, Lemma 25.21.13 and Lemma 28.16.3). Hence the result for proper morphisms. □

Lemma 28.42.5. *The base change of a proper morphism is proper. The same is true for universally closed morphisms.*

Proof. This is true by definition for universally closed morphisms. It is true for separated morphisms (Schemes, Lemma 25.21.13). It is true for morphisms of finite type (Lemma 28.16.4). Hence it is true for proper morphisms. □

Lemma 28.42.6. *A closed immersion is proper, hence a fortiori universally closed.*

Proof. The base change of a closed immersion is a closed immersion (Schemes, Lemma 25.18.2). Hence it is universally closed. A closed immersion is separated (Schemes, Lemma 25.23.7). A closed immersion is of finite type (Lemma 28.16.5). Hence a closed immersion is proper. □

Lemma 28.42.7. *Suppose given a commutative diagram of schemes*

$$\begin{array}{ccc} X & \longrightarrow & Y \\ & \searrow & \swarrow \\ & S & \end{array}$$

with Y separated over S .

- (1) *If $X \rightarrow S$ is universally closed, then the morphism $X \rightarrow Y$ is universally closed.*

(2) If X proper over S , then the morphism $X \rightarrow Y$ is proper.
 In particular, in both cases the image of X in Y is closed.

Proof. Assume that $X \rightarrow S$ is universally closed (resp. proper). We factor the morphism as $X \rightarrow X \times_S Y \rightarrow Y$. The first morphism is a closed immersion, see Schemes, Lemma 25.21.11. Hence the first morphism is proper (Lemma 28.42.6). The projection $X \times_S Y \rightarrow Y$ is the base change of a universally closed (resp. proper) morphism and hence universally closed (resp. proper), see Lemma 28.42.5. Thus $X \rightarrow Y$ is universally closed (resp. proper) as the composition of universally closed (resp. proper) morphisms (Lemma 28.42.4). \square

The following lemma says that the image of a proper scheme (in a separated scheme of finite type over the base) is proper.

Lemma 28.42.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . If X is universally closed over S and f is surjective then Y is universally closed over S . In particular, if also Y is separated and of finite type over S , then Y is proper over S .*

Proof. Assume X is universally closed and f surjective. Denote $p : X \rightarrow S$, $q : Y \rightarrow S$ the structure morphisms. Let $S' \rightarrow S$ be a morphism of schemes. The base change $f' : X_{S'} \rightarrow Y_{S'}$ is surjective (Lemma 28.11.4), and the base change $p' : X_{S'} \rightarrow S'$ is closed. If $T \subset Y_{S'}$ is closed, then $(f')^{-1}(T) \subset X_{S'}$ is closed, hence $p'((f')^{-1}(T)) = q'(T)$ is closed. So q' is closed. \square

Lemma 28.42.9. *Suppose given a commutative diagram of schemes*

$$\begin{array}{ccc} X & \xrightarrow{\quad h \quad} & Y \\ & \searrow f & \swarrow g \\ & & S \end{array}$$

Assume

- (1) $X \rightarrow S$ is a proper morphism, and
- (2) $Y \rightarrow S$ is separated and locally of finite type.

Then the scheme theoretic image $Z \subset Y$ of h is proper over S and $X \rightarrow Z$ is surjective.

Proof. The scheme theoretic image of h is constructed in Section 28.6. Observe that h is quasi-compact (Schemes, Lemma 25.21.15) hence $h(X) \subset Z$ is dense (Lemma 28.6.3). On the other hand $h(X)$ is closed in Y (Lemma 28.42.7) hence $X \rightarrow Z$ is surjective. Thus $Z \rightarrow S$ is a proper (Lemma 28.42.8). \square

The proof of the following lemma is due to Bjorn Poonen, see this location.

Lemma 28.42.10. *A universally closed morphism of schemes is quasi-compact.*

Proof. Let $f : X \rightarrow S$ be a morphism. Assume that f is not quasi-compact. Our goal is to show that f is not universally closed. By Schemes, Lemma 25.19.2 there exists an affine open $V \subset S$ such that $f^{-1}(V)$ is not quasi-compact. To achieve our goal it suffices to show that $f^{-1}(V) \rightarrow V$ is not universally closed, hence we may assume that $S = \text{Spec}(A)$ for some ring A .

Write $X = \bigcup_{i \in I} X_i$ where the X_i are affine open subschemes of X . Let $T = \text{Spec}(A[y_i; i \in I])$. Let $T_i = D(y_i) \subset T$. Let Z be the closed set $(X \times_S T) -$

$\bigcup_{i \in I} (X_i \times_S T_i)$. It suffices to prove that the image $f_T(Z)$ of Z under $f_T : X \times_S T \rightarrow T$ is not closed.

There exists a point $s \in S$ such that there is no neighborhood U of s in S such that X_U is quasi-compact. Otherwise we could cover S with finitely many such U and Schemes, Lemma 25.19.2 would imply f quasi-compact. Fix such an $s \in S$.

First we check that $f_T(Z_s) \neq T_s$. Let $t \in T$ be the point lying over s with $\kappa(t) = \kappa(s)$ such that $y_i = 1$ in $\kappa(t)$ for all i . Then $t \in T_i$ for all i , and the fiber of $Z_s \rightarrow T_s$ above t is isomorphic to $(X - \bigcup_{i \in I} X_i)_s$, which is empty. Thus $t \in T_s - f_T(Z_s)$.

Assume $f_T(Z)$ is closed in T . Then there exists an element $g \in A[y_i; i \in I]$ with $f_T(Z) \subset V(g)$ but $t \notin V(g)$. Hence the image of g in $\kappa(t)$ is nonzero. In particular some coefficient of g has nonzero image in $\kappa(s)$. Hence this coefficient is invertible on some neighborhood U of s . Let J be the finite set of $j \in I$ such that y_j appears in g . Since X_U is not quasi-compact, we may choose a point $x \in X - \bigcup_{j \in J} X_j$ lying above some $u \in U$. Since g has a coefficient that is invertible on U , we can find a point $t' \in T$ lying above u such that $t' \notin V(g)$ and $t' \in V(y_i)$ for all $i \notin J$. This is true because $V(y_i; i \in I, i \notin J) = \text{Spec}(A[t_j; j \in J])$ and the set of points of this scheme lying over u is bijective with $\text{Spec}(\kappa(u)[t_j; j \in J])$. In other words $t' \notin T_i$ for each $i \notin J$. By Schemes, Lemma 25.17.5 we can find a point z of $X \times_S T$ mapping to $x \in X$ and to $t' \in T$. Since $x \notin X_j$ for $j \in J$ and $t' \notin T_i$ for $i \in I \setminus J$ we see that $z \in Z$. On the other hand $f_T(z) = t' \notin V(g)$ which contradicts $f_T(Z) \subset V(g)$. Thus the assumption “ $f_T(Z)$ closed” is wrong and we conclude indeed that f_T is not closed, as desired. \square

The target of a separated scheme under a surjective universally closed morphism is separated.

Lemma 28.42.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a surjective universally closed morphism of schemes over S .*

- (1) *If X is quasi-separated, then Y is quasi-separated.*
- (2) *If X is separated, then Y is separated.*
- (3) *If X is quasi-separated over S , then Y is quasi-separated over S .*
- (4) *If X is separated over S , then Y is separated over S .*

Proof. Parts (1) and (2) are a consequence of (3) and (4) for $S = \text{Spec}(\mathbf{Z})$ (see Schemes, Definition 25.21.3). Consider the commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\quad} & X \times_S X \\ \downarrow & \Delta_{X/S} & \downarrow \\ Y & \xrightarrow{\quad} & Y \times_S Y \end{array}$$

The left vertical arrow is surjective (i.e., universally surjective). The right vertical arrow is universally closed as a composition of the universally closed morphisms $X \times_S X \rightarrow X \times_S Y \rightarrow Y \times_S Y$. Hence it is also quasi-compact, see Lemma 28.42.10.

Assume X is quasi-separated over S , i.e., $\Delta_{X/S}$ is quasi-compact. If $V \subset Y \times_S Y$ is a quasi-compact open, then $V \times_{Y \times_S Y} X \rightarrow \Delta_{Y/S}^{-1}(V)$ is surjective and $V \times_{Y \times_S Y} X$ is quasi-compact by our remarks above. We conclude that $\Delta_{Y/S}$ is quasi-compact, i.e., Y is quasi-separated over S .

Assume X is separated over S , i.e., $\Delta_{X/S}$ is a closed immersion. Then $X \rightarrow Y \times_S Y$ is closed as a composition of closed morphisms. Since $X \rightarrow Y$ is surjective, it follows that $\Delta_{Y/S}(Y)$ is closed in $Y \times_S Y$. Hence Y is separated over S by the discussion following Schemes, Definition 25.21.3. \square

Lemma 28.42.12. *Let $f : X \rightarrow S$ and $h : U \rightarrow X$ be morphisms of schemes. Assume that f and h are quasi-compact and that $h(U)$ is dense in X . If given any commutative solid diagram*

$$\begin{array}{ccccc} \text{Spec}(K) & \longrightarrow & U & \longrightarrow & X \\ \downarrow & & \nearrow \text{dotted} & & \downarrow \\ \text{Spec}(A) & \longrightarrow & & \longrightarrow & S \end{array}$$

where A is a valuation ring with field of fractions K , there exists a unique dotted arrow making the diagram commute, then f is universally closed.

Proof. We will verify the existence part of the valuative criterion for f which will imply f is universally closed by Schemes, Proposition 25.20.6. To do this, consider a commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & S \end{array}$$

where A is a valuation ring and K is the fraction field of A . Note that since valuation rings and fields are reduced, we may replace U , X , and S by their respective reductions by Schemes, Lemma 25.12.6. In this case the assumption that $h(U)$ is dense means that the scheme theoretic image of $h : U \rightarrow X$ is X , see Lemma 28.6.7. We may also replace S by an affine open through which the morphism $\text{Spec}(A) \rightarrow S$ factors. Thus we may assume that $S = \text{Spec}(R)$.

Let $\text{Spec}(B) \subset X$ be an affine open through which the morphism $\text{Spec}(K) \rightarrow X$ factors. Choose a polynomial algebra P over B and a B -algebra surjection $P \rightarrow K$. Then $\text{Spec}(P) \rightarrow X$ is flat. Hence the scheme theoretic image of the morphism $U \times_X \text{Spec}(P) \rightarrow \text{Spec}(P)$ is $\text{Spec}(P)$ by Lemma 28.26.14. By Lemma 28.6.5 we can find a commutative diagram

$$\begin{array}{ccc} \text{Spec}(K') & \longrightarrow & U \times_X \text{Spec}(P) \\ \downarrow & & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(P) \end{array}$$

where A' is a valuation ring and K' is the fraction field of A' such that the closed point of $\text{Spec}(A')$ maps to $\text{Spec}(K) \subset \text{Spec}(P)$. In other words, there is a B -algebra map $\varphi : K \rightarrow A'/\mathfrak{m}_{A'}$. Choose a valuation ring $A'' \subset A'/\mathfrak{m}_{A'}$ dominating $\varphi(A)$ with field of fractions $K'' = A''/\mathfrak{m}_{A''}$ (Algebra, Lemma 10.48.2). We set

$$C = \{\lambda \in A' \mid \lambda \bmod \mathfrak{m}_{A'} \in A''\}.$$

which is a valuation ring by Algebra, Lemma 10.48.9. As C is an R -algebra with fraction field K' , we obtain a commutative diagram

$$\begin{array}{ccccc} \mathrm{Spec}(K') & \longrightarrow & U & \longrightarrow & X \\ \downarrow & & \nearrow \text{dotted} & & \downarrow \\ \mathrm{Spec}(C) & \longrightarrow & & & S \end{array}$$

as in the statement of the lemma. Thus a dotted arrow fitting into the diagram as indicated. By the uniqueness assumption of the lemma the composition $\mathrm{Spec}(A') \rightarrow \mathrm{Spec}(C) \rightarrow X$ agrees with the given morphism $\mathrm{Spec}(A') \rightarrow \mathrm{Spec}(P) \rightarrow \mathrm{Spec}(B) \subset X$. Hence the restriction of the morphism to the spectrum of $C/\mathfrak{m}_{A'} = A''$ induces the given morphism $\mathrm{Spec}(K'') = \mathrm{Spec}(A'/\mathfrak{m}_{A'}) \rightarrow \mathrm{Spec}(K) \rightarrow X$. Let $x \in X$ be the image of the closed point of $\mathrm{Spec}(A'') \rightarrow X$. The image of the induced ring map $\mathcal{O}_{X,x} \rightarrow A''$ is a local subring which is contained in $K \subset K''$. Since A is maximal for the relation of domination in K and since $A \subset A''$, we have $A = K \cap A''$. We conclude that $\mathcal{O}_{X,x} \rightarrow A''$ factors through $A \subset A''$. In this way we obtain our desired arrow $\mathrm{Spec}(A) \rightarrow X$. \square

Remark 28.42.13. The assumption on uniqueness of the dotted arrows in Lemma 28.42.12 is necessary (details omitted). The uniqueness is guaranteed if f is separated (Schemes, Lemma 25.22.1). Conversely, if h and f satisfy the assumptions of the lemma and f is quasi-separated, then f is separated as well as universally closed (details omitted; apply the lemma to the diagonal morphism as in the proof of Schemes, Lemma 25.22.2).

28.43. Projective morphisms

We will use the definition of a projective morphism from [DG67]. The version of the definition with the “H” is the one from [Har77]. The resulting definitions are different. Both are useful.

Definition 28.43.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say f is *projective* if X is isomorphic as an S -scheme to a closed subscheme of a projective bundle $\mathbf{P}(\mathcal{E})$ for some quasi-coherent, finite type \mathcal{O}_S -module \mathcal{E} .
- (2) We say f is *H-projective* if there exists an integer n and a closed immersion $X \rightarrow \mathbf{P}_S^n$ over S .
- (3) We say f is *locally projective* if there exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \rightarrow U_i$ is projective.

As expected, a projective morphism is quasi-projective, see Lemma 28.43.10. Conversely, quasi-projective morphisms are often compositions of open immersions and projective morphisms, see Lemma 28.43.12.

Example 28.43.2. Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra generated by \mathcal{A}_1 over \mathcal{A}_0 . Assume furthermore that \mathcal{A}_1 is of finite type over \mathcal{O}_S . Set $X = \underline{\mathrm{Proj}}_S(\mathcal{A})$. In this case $X \rightarrow S$ is projective. Namely, the morphism associated to the graded \mathcal{O}_S -algebra map

$$\mathrm{Sym}_{\mathcal{O}_X}^*(\mathcal{A}_1) \longrightarrow \mathcal{A}$$

is a closed immersion $X \rightarrow \mathbf{P}(\mathcal{A}_1)$ which pulls back $\mathcal{O}_{\mathbf{P}(\mathcal{A}_1)}(1)$ to $\mathcal{O}_X(1)$, see Constructions, Lemma 26.18.5.

Lemma 28.43.3. *An H -projective morphism is H -quasi-projective. An H -projective morphism is projective.*

Proof. The first statement is immediate from the definitions. The second holds as \mathbf{P}_S^n is a projective bundle over S , see Constructions, Lemma 26.21.4. \square

Lemma 28.43.4. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is locally projective.*
- (2) *There exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \rightarrow U_i$ is H -projective.*

Proof. By Lemma 28.43.3 we see that (2) implies (1). Assume (1). For every point $s \in S$ we can find $\text{Spec}(R) = U \subset S$ an affine open neighbourhood of s such that X_U is isomorphic to a closed subscheme of $\mathbf{P}(\mathcal{E})$ for some finite type, quasi-coherent sheaf of \mathcal{O}_U -modules \mathcal{E} . Write $\mathcal{E} = \widetilde{M}$ for some finite type R -module M (see Properties, Lemma 27.16.1). Choose generators $x_0, \dots, x_n \in M$ of M as an R -module. Consider the surjective graded R -algebra map

$$R[X_0, \dots, X_n] \longrightarrow \text{Sym}_R(M).$$

According to Constructions, Lemma 26.11.3 the corresponding morphism

$$\mathbf{P}(\mathcal{E}) \rightarrow \mathbf{P}_R^n$$

is a closed immersion. Hence we conclude that $f^{-1}(U)$ is isomorphic to a closed subscheme of \mathbf{P}_U^n (as a scheme over U). In other words: (2) holds. \square

Lemma 28.43.5. *A locally projective morphism is proper.*

Proof. Let $f : X \rightarrow S$ be locally projective. In order to show that f is proper we may work locally on the base, see Lemma 28.42.3. Hence, by Lemma 28.43.4 above we may assume there exists a closed immersion $X \rightarrow \mathbf{P}_S^n$. By Lemmas 28.42.4 and 28.42.6 it suffices to prove that $\mathbf{P}_S^n \rightarrow S$ is proper. Since $\mathbf{P}_S^n \rightarrow S$ is the base change of $\mathbf{P}_{\mathbf{Z}}^n \rightarrow \text{Spec}(\mathbf{Z})$ it suffices to show that $\mathbf{P}_{\mathbf{Z}}^n \rightarrow \text{Spec}(\mathbf{Z})$ is proper, see Lemma 28.42.5. By Constructions, Lemma 26.8.8 the scheme $\mathbf{P}_{\mathbf{Z}}^n$ is separated. By Constructions, Lemma 26.8.9 the scheme $\mathbf{P}_{\mathbf{Z}}^n$ is quasi-compact. It is clear that $\mathbf{P}_{\mathbf{Z}}^n \rightarrow \text{Spec}(\mathbf{Z})$ is locally of finite type since $\mathbf{P}_{\mathbf{Z}}^n$ is covered by the affine opens $D_+(X_i)$ each of which is the spectrum of the finite type \mathbf{Z} -algebra

$$\mathbf{Z}[X_0/X_i, \dots, X_n/X_i].$$

Finally, we have to show that $\mathbf{P}_{\mathbf{Z}}^n \rightarrow \text{Spec}(\mathbf{Z})$ is universally closed. This follows from Constructions, Lemma 26.8.11 and the valuative criterion (see Schemes, Proposition 25.20.6). \square

Lemma 28.43.6. *Let S be a scheme. There exists a closed immersion*

$$\mathbf{P}_S^n \times_S \mathbf{P}_S^m \longrightarrow \mathbf{P}_S^{nm+n+m}$$

called the Segre embedding.

Proof. It suffices to prove this when $S = \text{Spec}(\mathbf{Z})$. Hence we will drop the index S and work in the absolute setting. Write $\mathbf{P}^n = \text{Proj}(\mathbf{Z}[X_0, \dots, X_n])$, $\mathbf{P}^m = \text{Proj}(\mathbf{Z}[Y_0, \dots, Y_m])$, and $\mathbf{P}^{nm+n+m} = \text{Proj}(\mathbf{Z}[Z_0, \dots, Z_{nm+n+m}])$. In order to map into \mathbf{P}^{nm+n+m} we have to write down an invertible sheaf \mathcal{L} on the left hand side and $(n+1)(m+1)$ sections s_i which generate it. See Constructions, Lemma 26.13.1. The invertible sheaf we take is

$$\mathcal{L} = \text{pr}_1^* \mathcal{O}_{\mathbf{P}^n}(1) \otimes \text{pr}_2^* \mathcal{O}_{\mathbf{P}^m}(1)$$

The sections we take are

$$s_0 = X_0 Y_0, s_1 = X_1 Y_0, \dots, s_n = X_n Y_0, s_{n+1} = X_0 Y_1, \dots, s_{nm+n+m} = X_n Y_m.$$

These generate \mathcal{L} since the sections X_i generate $\mathcal{O}_{\mathbf{P}^n}(1)$ and the sections Y_j generate $\mathcal{O}_{\mathbf{P}^m}(1)$. The induced morphism φ has the property that

$$\varphi^{-1}(D_+(Z_{i+(n+1)j})) = D_+(X_i) \times D_+(Y_j).$$

Hence it is an affine morphism. The corresponding ring map in case $(i, j) = (0, 0)$ is the map

$$\mathbf{Z}[Z_1/Z_0, \dots, Z_{nm+n+m}/Z_0] \longrightarrow \mathbf{Z}[X_1/X_0, \dots, X_n/X_0, Y_1/Y_0, \dots, Y_n/Y_0]$$

which maps Z_i/Z_0 to the element X_i/X_0 for $i \leq n$ and the element $Z_{(n+1)j}/Z_0$ to the element Y_j/Y_0 . Hence it is surjective. A similar argument works for the other affine open subsets. Hence the morphism φ is a closed immersion. \square

Lemma 28.43.7. *A composition of H-projective morphisms is H-projective.*

Proof. Suppose $X \rightarrow Y$ and $Y \rightarrow Z$ are H-projective. Then there exist closed immersions $X \rightarrow \mathbf{P}_Y^n$ over Y , and $Y \rightarrow \mathbf{P}_Z^m$ over Z . Consider the following diagram

Here the rightmost top horizontal arrow is the Segre embedding, see Lemma 28.43.6. The diagram identifies X as a closed subscheme of \mathbf{P}_Z^{nm+n+m} as desired. \square

Lemma 28.43.8. *A base change of a H-projective morphism is H-projective.*

Proof. This is true because the base change of projective space over a scheme is projective space, and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 25.18.2. \square

Lemma 28.43.9. *A base change of a (locally) projective morphism is (locally) projective.*

Proof. This is true because the base change of a projective bundle over a scheme is a projective bundle, the pullback of a finite type \mathcal{O} -module is of finite type (Modules, Lemma 17.9.2) and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 25.18.2. Some details omitted. \square

Lemma 28.43.10. *A projective morphism is quasi-projective.*

Proof. Let $f : X \rightarrow S$ be a projective morphism. Choose a closed immersion $i : X \rightarrow \mathbf{P}(\mathcal{E})$ where \mathcal{E} is a quasi-coherent, finite type \mathcal{O}_S -module. Then $\mathcal{L} = i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is f -very ample. Since f is proper (Lemma 28.43.5) it is quasi-compact. Hence Lemma 28.39.2 implies that \mathcal{L} is f -ample. Since f is proper it is of finite type. Thus we've checked all the defining properties of quasi-projective holds and we win. \square

Lemma 28.43.11. *Let $f : X \rightarrow S$ be a H -quasi-projective morphism. Then f factors as $X \rightarrow X' \rightarrow S$ where $X \rightarrow X'$ is an open immersion and $X' \rightarrow S$ is H -projective.*

Proof. By definition we can factor f as a quasi-compact immersion $i : X \rightarrow \mathbf{P}_S^n$ followed by the projection $\mathbf{P}_S^n \rightarrow S$. By Lemma 28.7.7 there exists a closed subscheme $X' \subset \mathbf{P}_S^n$ such that i factors through an open immersion $X \rightarrow X'$. The lemma follows. \square

Lemma 28.43.12. *Let $f : X \rightarrow S$ be a quasi-projective morphism with S quasi-compact and quasi-separated. Then f factors as $X \rightarrow X' \rightarrow S$ where $X \rightarrow X'$ is an open immersion and $X' \rightarrow S$ is projective.*

Proof. Let \mathcal{L} be f -ample. Since f is of finite type and S is quasi-compact $\mathcal{L}^{\otimes n}$ is f -very ample for some $n > 0$, see Lemma 28.40.5. Replace \mathcal{L} by $\mathcal{L}^{\otimes n}$. Write $\mathcal{F} = f_*\mathcal{L}$. This is a quasi-coherent \mathcal{O}_S -module by Schemes, Lemma 25.24.1 (quasi-projective morphisms are quasi-compact and separated, see Lemma 28.41.2). By Properties, Lemma 27.20.6 we can find a directed partially ordered set I and a system of finite type quasi-coherent \mathcal{O}_S -modules \mathcal{E}_i over I such that $\mathcal{F} = \text{colim } \mathcal{E}_i$. Consider the compositions $\psi_i : f^*\mathcal{E}_i \rightarrow f^*\mathcal{F} \rightarrow \mathcal{L}$. Choose a finite affine open covering $S = \bigcup_{j=1, \dots, m} V_j$. For each j we can choose sections

$$s_{j,0}, \dots, s_{j,n_j} \in \Gamma(f^{-1}(V_j), \mathcal{L}) = f_*\mathcal{L}(V_j) = \mathcal{F}(V_j)$$

which generate \mathcal{L} over $f^{-1}V_j$ and define an immersion

$$f^{-1}V_j \longrightarrow \mathbf{P}_{V_j}^{n_j},$$

see Lemma 28.40.1. Choose i such that there exist sections $e_{j,t} \in \mathcal{E}_i(V_j)$ mapping to $s_{j,t}$ in \mathcal{F} for all $j = 1, \dots, m$ and $t = 1, \dots, n_j$. Then the map ψ_i is surjective as the sections $f^*e_{j,t}$ have the same image as the sections $s_{j,t}$ which generate $\mathcal{L}|_{f^{-1}V_j}$. Whence we obtain a morphism

$$r_{\mathcal{L}, \psi_i} : X \longrightarrow \mathbf{P}(\mathcal{E}_i)$$

over S such that over V_j we have a factorization

$$f^{-1}V_j \rightarrow \mathbf{P}(\mathcal{E}_i)|_{V_j} \rightarrow \mathbf{P}_{V_j}^{n_j}$$

of the immersion given above. It follows that $r_{\mathcal{L}, \psi_i}|_{V_j}$ is an immersion, see Lemma 28.3.1. Since $S = \bigcup V_j$ we conclude that $r_{\mathcal{L}, \psi_i}$ is an immersion. Note that $r_{\mathcal{L}, \psi_i}$ is quasi-compact as $X \rightarrow S$ is quasi-compact and $\mathbf{P}(\mathcal{E}_i) \rightarrow S$ is separated (see Schemes, Lemma 25.21.15). By Lemma 28.7.7 there exists a closed subscheme $X' \subset \mathbf{P}(\mathcal{E}_i)$ such that i factors through an open immersion $X \rightarrow X'$. Then $X' \rightarrow S$ is projective by definition and we win. \square

Lemma 28.43.13. *Let S be a scheme which admits an ample invertible sheaf. Then*

- (1) any projective morphism $X \rightarrow S$ is H -projective, and
- (2) any quasi-projective morphism $X \rightarrow S$ is H -quasi-projective.

Proof. The assumptions on S imply that S is quasi-compact and separated, see Properties, Definition 27.24.1 and Lemma 27.24.12 and Constructions, Lemma 26.8.8. Hence Lemma 28.43.12 applies and we see that (1) implies (2). Let \mathcal{E} be a finite type quasi-coherent \mathcal{O}_S -module. By our definition of projective morphisms it suffices to show that $\mathbf{P}(\mathcal{E}) \rightarrow S$ is H -projective. If \mathcal{E} is generated by finitely many global sections, then the corresponding surjection $\mathcal{O}_S^{\oplus n} \rightarrow \mathcal{E}$ induces a closed immersion

$$\mathbf{P}(\mathcal{E}) \longrightarrow \mathbf{P}(\mathcal{O}_S^{\oplus n}) = \mathbf{P}_S^n$$

as desired. In general, let \mathcal{L} be an invertible sheaf on S . By Properties, Proposition 27.24.14 there exists an integer n such that $\mathcal{E} \otimes_{\mathcal{O}_S} \mathcal{L}^{\otimes n}$ is globally generated by finitely many sections. Since $\mathbf{P}(\mathcal{E}) = \mathbf{P}(\mathcal{E} \otimes_{\mathcal{O}_S} \mathcal{L}^{\otimes n})$ by Constructions, Lemma 26.20.1 this finishes the proof. \square

28.44. Integral and finite morphisms

Recall that a ring map $R \rightarrow A$ is said to be *integral* if every element of A satisfies a monic equation with coefficients in R . Recall that a ring map $R \rightarrow A$ is said to be *finite* if A is *finite* as an R -module. See Algebra, Definition 10.35.1.

Definition 28.44.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) We say that f is *integral* if f is affine and if for every affine open $\text{Spec}(R) = V \subset S$ with inverse image $\text{Spec}(A) = f^{-1}(V) \subset X$ the associated ring map $R \rightarrow A$ is integral.
- (2) We say that f is *finite* if f is affine and if for every affine open $\text{Spec}(R) = V \subset S$ with inverse image $\text{Spec}(A) = f^{-1}(V) \subset X$ the associated ring map $R \rightarrow A$ is finite.

It is clear that integral/finite morphisms are separated and quasi-compact. It is also clear that a finite morphism is a morphism of finite type. Most of the lemmas in this section are completely standard. But note the fun Lemma 28.44.7 at the end of the section.

Lemma 28.44.2. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:

- (1) The morphism f is integral.
- (2) There exists an affine open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i)$ is affine and $\mathcal{O}_S(U_i) \rightarrow \mathcal{O}_X(f^{-1}(U_i))$ is integral.
- (3) There exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \rightarrow U_i$ is integral.

Moreover, if f is integral then for every open subscheme $U \subset S$ the morphism $f : f^{-1}(U) \rightarrow U$ is integral.

Proof. See Algebra, Lemma 10.35.12. Some details omitted. \square

Lemma 28.44.3. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:

- (1) The morphism f is finite.
- (2) There exists an affine open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i)$ is affine and $\mathcal{O}_S(U_i) \rightarrow \mathcal{O}_X(f^{-1}(U_i))$ is finite.

- (3) *There exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \rightarrow U_i$ is finite.*

Moreover, if f is finite then for every open subscheme $U \subset S$ the morphism $f : f^{-1}(U) \rightarrow U$ is finite.

Proof. See Algebra, Lemma 10.35.12. Some details omitted. □

Lemma 28.44.4. *A finite morphism is integral. An integral morphism which is locally of finite type is finite.*

Proof. See Algebra, Lemma 10.35.3 and Lemma 10.35.5. □

Lemma 28.44.5. *A composition of finite morphisms is finite. Same is true for integral morphisms.*

Proof. See Algebra, Lemmas 10.7.3 and 10.35.6. □

Lemma 28.44.6. *A base change of a finite morphism is finite. Same is true for integral morphisms.*

Proof. See Algebra, Lemma 10.35.11. □

Lemma 28.44.7. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *f is integral, and*
- (2) *f is affine and universally closed.*

Proof. Assume (1). An integral morphism is affine by definition. A base change of an integral morphism is integral so in order to prove (2) it suffices to show that an integral morphism is closed. This follows from Algebra, Lemmas 10.35.20 and 10.40.6.

Assume (2). We may assume f is the morphism $f : \text{Spec}(A) \rightarrow \text{Spec}(R)$ coming from a ring map $R \rightarrow A$. Let a be an element of A . We have to show that a is integral over R , i.e. that in the kernel I of the map $R[x] \rightarrow A$ sending x to a there is a monic polynomial. Consider the ring $B = A[x]/(ax - 1)$ and let J be the kernel of the composition $R[x] \rightarrow A[x] \rightarrow B$. If $f \in J$ there exists $q \in A[x]$ such that $f = (ax - 1)q$ in $A[x]$ so if $f = \sum_i f_i x^i$ and $q = \sum_i q_i x^i$, for all $i \geq 0$ we have $f_i = aq_{i-1} - q_i$. For $n \geq \deg q + 1$ the polynomial

$$\sum_{i \geq 0} f_i x^{n-i} = \sum_{i \geq 0} (aq_{i-1} - q_i) x^{n-i} = (a - x) \sum_{i \geq 0} q_i x^{n-i-1}$$

is clearly in I ; if $f_0 = 1$ this polynomial is also monic, so we are reduced to prove that J contains a polynomial with constant term 1. We do it by proving $\text{Spec}(R[x]/(J + (x)))$ is empty.

Since f is universally closed the base change $\text{Spec}(A[x]) \rightarrow \text{Spec}(R[x])$ is closed. Hence the image of the closed subset $\text{Spec}(B) \subset \text{Spec}(A[x])$ is the closed subset $\text{Spec}(R[x]/J) \subset \text{Spec}(R[x])$, see Example 28.6.4 and Lemma 28.6.3. In particular $\text{Spec}(B) \rightarrow \text{Spec}(R[x]/J)$ is surjective. Consider the following diagram where every

square is a pullback:

$$\begin{array}{ccccc}
 \mathrm{Spec}(B) & \xrightarrow{g} & \mathrm{Spec}(R[x]/J) & \longrightarrow & \mathrm{Spec}(R[x]) \\
 \uparrow & & \uparrow & & \uparrow \\
 \emptyset & \longrightarrow & \mathrm{Spec}(R[x]/(J+(x))) & \longrightarrow & \mathrm{Spec}(R)
 \end{array}$$

The bottom left corner is empty because it is the spectrum of $R \otimes_{R[x]} B$ where the map $R[x] \rightarrow B$ sends x to an invertible element and $R[x] \rightarrow R$ sends x to 0. Since g is surjective this implies $\mathrm{Spec}(R[x]/(J+(x)))$ is empty, as we wanted to show. \square

Lemma 28.44.8. *Let $f : X \rightarrow S$ be an integral morphism. Then every point of X is closed in its fibre.*

Proof. See Algebra, Lemma 10.35.18. \square

Lemma 28.44.9. *A finite morphism is quasi-finite.*

Proof. This is implied by Algebra, Lemma 10.118.4 and Lemma 28.21.9. Alternatively, all points in fibres are closed points by Lemma 28.44.8 (and the fact that a finite morphism is integral) and use Lemma 28.21.6 (3) to see that f is quasi-finite at x for all $x \in X$. \square

Lemma 28.44.10. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) f is finite, and
- (2) f is affine and proper.

Proof. This follows formally from Lemma 28.44.7, the fact that a finite morphism is integral and separated, the fact that a proper morphism is the same thing as a finite type, separated, universally closed morphism, and the fact that an integral morphism of finite type is finite (Lemma 28.44.4). \square

Lemma 28.44.11. *A closed immersion is finite (and a fortiori integral).*

Proof. True because a closed immersion is affine (Lemma 28.13.9) and a surjective ring map is finite and integral. \square

Lemma 28.44.12. *Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms.*

- (1) *If $g \circ f$ is finite and g separated then f is finite.*
- (2) *If $g \circ f$ is integral and g separated then f is integral.*

Proof. Assume $g \circ f$ is finite (resp. integral) and g separated. The base change $X \times_Z Y \rightarrow Y$ is finite (resp. integral) by Lemma 28.44.6. The morphism $X \rightarrow X \times_Z Y$ is a closed immersion as $Y \rightarrow Z$ is separated, see Schemes, Lemma 25.21.12. A closed immersion is finite (resp. integral), see Lemma 28.44.11. The composition of finite (resp. integral) morphisms is finite (resp. integral), see Lemma 28.44.5. Thus we win. \square

Lemma 28.44.13. *Let $f : X \rightarrow Y$ be a morphism of schemes. If f is finite and a monomorphism, then f is a closed immersion.*

Proof. This reduces to Algebra, Lemma 10.103.6. \square

28.45. Universal homeomorphisms

The following definition is really superfluous since a universal homeomorphism is really just an integral, universally injective and surjective morphism, see Lemma 28.45.3.

Definition 28.45.1. A morphism $f : X \rightarrow Y$ of schemes is called a *universal homeomorphism* if the base change $f' : Y' \times_Y X \rightarrow Y'$ is a homeomorphism for every morphism $Y' \rightarrow Y$.

Lemma 28.45.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. If f is a homeomorphism onto a closed subset of Y then f is affine.*

Proof. Let $y \in Y$ be a point. If $y \notin f(X)$, then there exists an affine neighbourhood of y which is disjoint from $f(X)$. If $y \in f(X)$, let $x \in X$ be the unique point of X mapping to y . Let $V \subset Y$ be an affine open neighbourhood of y . Let $U \subset X$ be an affine open neighbourhood of x which maps into V . Since $f(U) \subset V \cap f(X)$ is open in the induced topology by our assumption on f we may choose a $h \in \Gamma(V, \mathcal{O}_Y)$ such that $y \in D(h)$ and $D(h) \cap f(X) \subset f(U)$. Denote $h' \in \Gamma(U, \mathcal{O}_X)$ the restriction of $f^\#(h)$ to U . Then we see that $D(h') \subset U$ is equal to $f^{-1}(D(h))$. In other words, every point of Y has an open neighbourhood whose inverse image is affine. Thus f is affine, see Lemma 28.13.3. \square

Lemma 28.45.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. The following are equivalent:*

- (1) f is a universal homeomorphism, and
- (2) f is integral, universally injective and surjective.

Proof. Assume f is a universal homeomorphism. By Lemma 28.45.2 we see that f is affine. Since f is clearly universally closed we see that f is integral by Lemma 28.44.7. It is also clear that f is universally injective and surjective.

Assume f is integral, universally injective and surjective. By Lemma 28.44.7 f is universally closed. Since it is also universally bijective (see Lemma 28.11.4) we see that it is a universal homeomorphism. \square

Lemma 28.45.4. *Let X be a scheme. The canonical closed immersion $X_{red} \rightarrow X$ (see Schemes, Definition 25.12.5) is a universal homeomorphism.*

Proof. Omitted. \square

Lemma 28.45.5. *Let $f : X \rightarrow S$ and $S' \rightarrow S$ be morphisms of schemes. Assume*

- (1) $S' \rightarrow S$ is a closed immersion,
- (2) $S' \rightarrow S$ is bijective on points,
- (3) $X \times_S S' \rightarrow S'$ is a closed immersion, and
- (4) $X \rightarrow S$ is of finite type or $S' \rightarrow S$ is of finite presentation.

Then $f : X \rightarrow S$ is a closed immersion.

Proof. Assumptions (1) and (2) imply that $S' \rightarrow S$ is a universal homeomorphism (for example because $S_{red} = S'_{red}$ and using Lemma 28.45.4). Hence (3) implies that $X \rightarrow S$ is homeomorphism onto a closed subset of S . Then $X \rightarrow S$ is affine by Lemma 28.45.2. Let $U \subset S$ be an affine open, say $U = \text{Spec}(A)$. Then $S' = \text{Spec}(A/I)$ by (1) for a locally nilpotent ideal I by (2). As f is affine we see that $f^{-1}(U) = \text{Spec}(B)$. Assumption (4) tells us B is a finite type A -algebra (Lemma

28.16.2) or that I is finitely generated (Lemma 28.22.7). Assumption (3) is that $A/I \rightarrow B/IB$ is surjective. From Algebra, Lemma 10.122.8 if $A \rightarrow B$ is of finite type or Algebra, Lemma 10.19.1 if I is finitely generated and hence nilpotent we deduce that $A \rightarrow B$ is surjective. This means that f is a closed immersion, see Lemma 28.2.1. \square

28.46. Finite locally free morphisms

In many papers the authors use finite flat morphisms when they really mean finite locally free morphisms. The reason is that if the base is locally Noetherian then this is the same thing. But in general it is not, see Exercises, Exercise 83.4.3.

Definition 28.46.1. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *finite locally free* if f is affine and $f_*\mathcal{O}_X$ is a finite locally free \mathcal{O}_S -module. In this case we say f has *rank* or *degree* d if the sheaf $f_*\mathcal{O}_X$ is finite locally free of degree d .

Note that if $f : X \rightarrow S$ is finite locally free then S is the disjoint union of open and closed subschemes S_d such that $f^{-1}(S_d) \rightarrow S_d$ is finite locally free of degree d .

Lemma 28.46.2. Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:

- (1) f is finite locally free,
- (2) f is finite, flat, and locally of finite presentation.

If S is locally Noetherian these are also equivalent to

- (3) f is finite and flat.

Proof. See Algebra, Lemma 10.75.2. The Noetherian case follows as a finite module over a Noetherian ring is a finitely presented module, see Algebra, Lemma 10.30.4. \square

Lemma 28.46.3. A composition of finite locally free morphisms is finite locally free.

Proof. Omitted. \square

Lemma 28.46.4. A base change of a finite locally free morphism is finite locally free.

Proof. Omitted. \square

Lemma 28.46.5. Let $f : X \rightarrow S$ be a finite locally free morphism of schemes. There exists a disjoint union decomposition $S = \coprod_{d \geq 0} S_d$ by open and closed subschemes such that setting $X_d = f^{-1}(S_d)$ the restrictions $f|_{X_d}$ are finite locally free morphisms $X_d \rightarrow S_d$ of degree d .

Proof. This is true because a finite locally free sheaf locally has a well defined rank. Details omitted. \square

Lemma 28.46.6. Let $f : Y \rightarrow X$ be a finite morphism with X affine. There exists a diagram

$$\begin{array}{ccccc} Z' & \longleftarrow & Y' & \longrightarrow & Y \\ & \searrow & \downarrow & & \downarrow \\ & & X' & \longrightarrow & X \end{array}$$

where

- (1) $Y' \rightarrow Y$ and $X' \rightarrow X$ are surjective finite locally free,
- (2) $Y' = X' \times_X Y$,
- (3) $i : Y' \rightarrow Z'$ is a closed immersion,
- (4) $Z' \rightarrow X'$ is finite locally free, and
- (5) $Z' = \bigcup_{j=1, \dots, m} Z'_j$ is a (set theoretic) finite union of closed subschemes, each of which maps isomorphically to X' .

Proof. Write $X = \text{Spec}(A)$ and $Y = \text{Spec}(B)$. See also More on Algebra, Section 15.14. Let $x_1, \dots, x_n \in B$ be generators of B over A . For each i we can choose a monic polynomial $P_i(T) \in A[T]$ such that $P(x_i) = 0$ in B . By Algebra, Lemma 10.131.9 (applied n times) there exists a finite locally free ring extension $A \subset A'$ such that each P_i splits completely:

$$P_i(T) = \prod_{k=1, \dots, d_i} (T - \alpha_{ik})$$

for certain $\alpha_{ik} \in A'$. Set

$$C = A'[T_1, \dots, T_n]/(P_1(T_1), \dots, P_n(T_n))$$

and $B' = A' \otimes_A B$. The map $C \rightarrow B'$, $T_i \mapsto 1 \otimes x_i$ is an A' -algebra surjection. Setting $X' = \text{Spec}(A')$, $Y' = \text{Spec}(B')$ and $Z' = \text{Spec}(C)$ we see that (1) – (4) hold. Part (5) holds because set theoretically $\text{Spec}(C)$ is the union of the closed subschemes cut out by the ideals

$$(T_1 - \alpha_{1k_1}, T_2 - \alpha_{2k_2}, \dots, T_n - \alpha_{nk_n})$$

for any $1 \leq k_i \leq d_i$. □

The following lemma is stated in the correct generality in Lemma 28.49.4 below.

Lemma 28.46.7. *Let $f : Y \rightarrow X$ be a finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of Y . Then $f(T) \subset X$ is a closed nowhere dense subset of X .*

Proof. By Lemma 28.44.10 we know that $f(T) \subset X$ is closed. Let $X = \bigcup X_i$ be an affine covering. Since T is nowhere dense in Y , we see that also $T \cap f^{-1}(X_i)$ is nowhere dense in $f^{-1}(X_i)$. Hence if we can prove the theorem in the affine case, then we see that $f(T) \cap X_i$ is nowhere dense. This then implies that T is nowhere dense in X by Topology, Lemma 5.20.4.

Assume X is affine. Choose a diagram

$$\begin{array}{ccccc} Z' & \longleftarrow & Y' & \xrightarrow{a} & Y \\ & \searrow & \downarrow f' & & \downarrow f \\ & & X' & \xrightarrow{b} & X \end{array}$$

as in Lemma 28.46.6. The morphisms a, b are open since they are finite locally free (Lemmas 28.46.2 and 28.26.9). Hence $T' = a^{-1}(T)$ is nowhere dense, see Topology, Lemma 5.20.6. The morphism b is surjective and open. Hence, if we can prove $f'(T') = b^{-1}(f(T))$ is nowhere dense, then $f(T)$ is nowhere dense, see Topology, Lemma 5.20.6. As i is a closed immersion, by Topology, Lemma 5.20.5 we see that $i(T') \subset Z'$ is closed and nowhere dense. Thus we have reduced the problem to the case discussed in the following paragraph.

Assume that $Y = \bigcup_{i=1, \dots, n} Y_i$ is a finite union of closed subsets, each mapping isomorphically to X . Consider $T_i = Y_i \cap T$. If each of the T_i is nowhere dense in Y_i , then each $f(T_i)$ is nowhere dense in X as $Y_i \rightarrow X$ is an isomorphism. Hence $f(T) = f(T_i)$ is a finite union of nowhere dense closed subsets of X and we win, see Topology, Lemma 5.20.2. Suppose not, say T_1 contains a nonempty open $V \subset Y_1$. We are going to show this leads to a contradiction. Consider $Y_2 \cap V \subset V$. This is either a proper closed subset, or equal to V . In the first case we replace V by $V \setminus V \cap Y_2$, so $V \subset T_1$ is open in Y_1 and does not meet Y_2 . In the second case we have $V \subset Y_1 \cap Y_2$ is open in both Y_1 and Y_2 . Repeat sequentially with $i = 3, \dots, n$. The result is a disjoint union decomposition

$$\{1, \dots, n\} = I_1 \amalg I_2, \quad 1 \in I_1$$

and an open V of Y_1 contained in T_1 such that $V \subset Y_i$ for $i \in I_1$ and $V \cap Y_i = \emptyset$ for $i \in I_2$. Set $U = f(V)$. This is an open of X since $f|_{Y_1} : Y_1 \rightarrow X$ is an isomorphism. Then

$$f^{-1}(U) = V \amalg \bigcup_{i \in I_2} (Y_i \cap f^{-1}(U))$$

As $\bigcup_{i \in I_2} Y_i$ is closed, this implies that $V \subset f^{-1}(U)$ is open, hence $V \subset Y$ is open. This contradicts the assumption that T is nowhere dense in Y , as desired. \square

28.47. Generically finite morphisms

In this section we characterize maps between schemes which are locally of finite type and which are “generically finite” in some sense.

Lemma 28.47.1. *Let X, Y be schemes. Let $f : X \rightarrow Y$ be locally of finite type. Let $\eta \in Y$ be a generic point of an irreducible component of Y . The following are equivalent:*

- (1) *the set $f^{-1}(\{\eta\})$ is finite,*
- (2) *there exist affine opens $U_i \subset X$, $i = 1, \dots, n$ and $V \subset Y$ with $f(U_i) \subset V$, $\eta \in V$ and $f^{-1}(\{\eta\}) \subset \bigcup U_i$ such that each $f|_{U_i} : U_i \rightarrow V$ is finite.*

If f is quasi-separated, then these are also equivalent to

- (3) *there exist affine opens $V \subset Y$, and $U \subset X$ with $f(U) \subset V$, $\eta \in V$ and $f^{-1}(\{\eta\}) \subset U$ such that $f|_U : U \rightarrow V$ is finite.*

If f is quasi-compact and quasi-separated, then these are also equivalent to

- (4) *there exists an affine open $V \subset Y$, $\eta \in V$ such that $f^{-1}(V) \rightarrow V$ is finite.*

Proof. The question is local on the base. Hence we may replace Y by an affine neighbourhood of η , and we may and do assume throughout the proof below that Y is affine, say $Y = \text{Spec}(R)$.

It is clear that (2) implies (1). Assume that $f^{-1}(\{\eta\}) = \{\xi_1, \dots, \xi_n\}$ is finite. Choose affine opens $U_i \subset X$ with $\xi_i \in U_i$. By Algebra, Lemma 10.118.9 we see that after replacing Y by a standard open in Y each of the morphisms $U_i \rightarrow Y$ is finite. In other words (2) holds.

It is clear that (3) implies (1). Assume $f^{-1}(\{\eta\}) = \{\xi_1, \dots, \xi_n\}$ and assume that f is quasi-separated. Since Y is affine this implies that X is quasi-separated. Since each ξ_i maps to a generic point of an irreducible component of Y , we see that each ξ_i is a generic point of an irreducible component of X . By Properties, Lemma 27.27.1 we can find an affine open $U \subset X$ containing each ξ_i . By Algebra, Lemma

10.118.9 we see that after replacing Y by a standard open in Y the morphisms $U \rightarrow Y$ is finite. In other words (3) holds.

It is clear that (4) implies all of (1) – (3) with no further assumptions on f . Suppose that f is quasi-compact and quasi-separated. We have to show that the equivalent conditions (1) – (3) imply (4). Let U, V be as in (3). Replace Y by V . Since f is quasi-compact and Y is quasi-compact (being affine) we see that X is quasi-compact. Hence $Z = X \setminus U$ is quasi-compact, hence the morphism $f|_Z : Z \rightarrow Y$ is quasi-compact. By construction of Z we see that $\eta \notin f(Z)$. Hence by Lemma 28.8.4 we see that there exists an affine open neighbourhood V' of η in Y such that $f^{-1}(V') \cap Z = \emptyset$. Then we have $f^{-1}(V') \subset U$ and this means that $f^{-1}(V') \rightarrow V'$ is finite. \square

Example 28.47.2. Let $A = \prod_{n \in \mathbf{N}} \mathbf{F}_2$. Every element of A is an idempotent. Hence every prime ideal is maximal with residue field \mathbf{F}_2 . Thus the topology on $X = \text{Spec}(A)$ is totally disconnected and quasi-compact. The projection maps $A \rightarrow \mathbf{F}_2$ define open points of $\text{Spec}(A)$. It cannot be the case that all the points of X are open since X is quasi-compact. Let $x \in X$ be a closed point which is not open. Then we can form a scheme Y which is two copies of X glued along $X \setminus \{x\}$. In other words, this is X with x doubled, compare Schemes, Example 25.14.3. The morphism $f : Y \rightarrow X$ is quasi-compact, finite type and has finite fibres but is not quasi-separated. The point $x \in X$ is a generic point of an irreducible component of X (since X is totally disconnected). But properties (3) and (4) of Lemma 28.47.1 do not hold. The reason is that for any open neighbourhood $x \in U \subset X$ the inverse image $f^{-1}(U)$ is not affine because functions on $f^{-1}(U)$ cannot separated the two points lying over x (proof omitted; this is a nice exercise). Hence the condition that f is quasi-separated is necessary in parts (3) and (4) of the lemma.

Remark 28.47.3. An alternative to Lemma 28.47.1 is the statement that a quasi-finite morphism is finite over a dense open of the target. This will be shown in More on Morphisms, Section 36.31.

Lemma 28.47.4. *Let X, Y be integral schemes. Let $f : X \rightarrow Y$ be locally of finite type. Assume f is dominant. The following are equivalent:*

- (1) *the extension $R(Y) \subset R(X)$ has transcendence degree 0,*
- (2) *the extension $R(Y) \subset R(X)$ is finite,*
- (3) *there exist nonempty affine opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $f|_U : U \rightarrow V$ is finite, and*
- (4) *the generic point of X is the only point of X mapping to the generic point of Y .*

If f is separated, or if f is quasi-compact, then these are also equivalent to

- (5) *there exists a nonempty affine open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.*

Proof. Choose any affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset Y$ such that $f(U) \subset V$. Then R and A are domains by definition. The ring map $R \rightarrow A$ is of finite type (Lemma 28.16.2). By Lemma 28.8.5 the generic point of X maps to the generic point of Y hence $R \rightarrow A$ is injective. Let $K = f.f.(R) = R(Y)$ and $L = f.f.(A) = R(X)$. Then $K \subset L$ is a finitely generated field extension. Hence we see that (1) is equivalent to (2).

Suppose (2) holds. Let $x_1, \dots, x_n \in A$ be generators of A over R . By assumption there exist nonzero polynomials $P_i(X) \in R[X]$ such that $P_i(x_i) = 0$. Let $f_i \in R$ be the leading coefficient of P_i . Then we conclude that $R_{f_1 \dots f_n} \rightarrow A_{f_1 \dots f_n}$ is finite, i.e., (3) holds. Note that (3) implies (2). So now we see that (1), (2) and (3) are all equivalent.

Let η be the generic point of X , and let $\eta' \in Y$ be the generic point of Y . Assume (4). Then $\dim_{\eta}(X_{\eta'}) = 0$ and we see that $R(X) = \kappa(\eta)$ has transcendence degree 0 over $R(Y) = \kappa(\eta')$ by Lemma 28.29.1. In other words (1) holds. Assume the equivalent conditions (1), (2) and (3). Suppose that $x \in X$ is a point mapping to η' . As x is a specialization of η , this gives inclusions $R(Y) \subset \mathcal{O}_{X,x} \subset R(X)$, which implies $\mathcal{O}_{X,x}$ is a field, see Algebra, Lemma 10.35.17. Hence $x = \eta$. Thus we see that (1) – (4) are all equivalent.

It is clear that (5) implies (3) with no additional assumptions on f . What remains is to prove that if f is either separated or quasi-compact, then the equivalent conditions (1) – (4) imply (5).

Assume U, V as in (3) and assume f is separated. Then $U \rightarrow f^{-1}(V)$ is a morphism from a scheme proper over V (Lemma 28.44.10) into a scheme separated over V . Hence $U \subset f^{-1}(V)$ is closed Lemma 28.42.7. Since X is irreducible we conclude $U = f^{-1}(V)$. This proves (5).

Assume f is quasi-compact. Let U, V be as in (3). Then $f^{-1}(V)$ is quasi-compact. Consider the closed subset $Z = f^{-1}(V) \setminus U$. Since Z does not contain the generic point of X we see that the quasi-compact morphism $f : Z \rightarrow V$ is not dominant by Lemma 28.8.3. Hence after shrinking V we may assume that $f^{-1}(V) = U$ which implies that (5) holds. \square

Definition 28.47.5. Let X and Y be integral schemes. Let $f : X \rightarrow Y$ be locally of finite type and dominant. Assume $[R(X) : R(Y)] < \infty$, or any other of the equivalent conditions (1) – (4) of Lemma 28.47.4. Then the positive integer

$$\deg(X/Y) = [R(X) : R(Y)]$$

is called the *degree of X over Y* .

It is possible to extend this notion to a morphism $f : X \rightarrow Y$ if (a) Y is integral with generic point η , (b) f is locally of finite type, and (c) $f^{-1}(\{\eta\})$ is finite. In this case we can define

$$\deg(X/Y) = \sum_{\xi \in X, f(\xi) = \eta} \dim_{R(Y)}(\mathcal{O}_{X,\xi}).$$

Namely, given that $R(Y) = \kappa(\eta) = \mathcal{O}_{Y,\eta}$ (Lemma 28.10.4) the dimensions above are finite by Lemma 28.47.1 above. However, for most applications the definition given above is the right one.

Lemma 28.47.6. *Let X, Y, Z be integral schemes. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be dominant morphisms locally of finite type. Assume that $[R(X) : R(Y)] < \infty$ and $[R(Y) : R(Z)] < \infty$. Then*

$$\deg(X/Z) = \deg(X/Y) \deg(Y/Z).$$

Proof. This comes from the multiplicativity of degrees in towers of finite extensions of fields, see Fields, Lemma 9.7.6. \square

Remark 28.47.7. Let $f : X \rightarrow Y$ be a morphism of schemes which is locally of finite type. There are (at least) two properties that we could use to define *generically finite* morphisms. These correspond to whether you want the property to be local on the source or local on the target:

- (1) (Local on the target; suggested by Ravi Vakil.) Assume every quasi-compact open of Y has finitely many irreducible components (for example if Y is locally Noetherian). The requirement is that the inverse image of each generic point is finite, see Lemma 28.47.1.
- (2) (Local on the source.) The requirement is that there exists a dense open $U \subset X$ such that $U \rightarrow Y$ is locally quasi-finite.

In case (1) the requirement can be formulated without the auxiliary condition on Y , but probably doesn't give the right notion for general schemes. Property (2) as formulated doesn't imply that the fibres over generic points are finite; however, if f is quasi-compact and Y is as in (1) then it does.

Definition 28.47.8. Let X be an integral scheme. A *modification* of X is a birational proper morphism $f : X' \rightarrow X$ with X' integral.

Let $f : X' \rightarrow X$ be a modification as in the definition. By Lemma 28.47.4 there exists a nonempty $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite. By generic flatness (Proposition 28.28.1) we may assume $f^{-1}(U) \rightarrow U$ is flat and of finite presentation. So $f^{-1}(U) \rightarrow U$ is finite locally free (Lemma 28.46.2). Since f is birational, the degree of X' over X is 1. Hence $f^{-1}(U) \rightarrow U$ is finite locally free of degree 1, in other words it is an isomorphism. Thus we can *redefine* a modification to be a proper morphism $f : X' \rightarrow X$ of integral schemes such that $f^{-1}(U) \rightarrow U$ is an isomorphism for some nonempty open $U \subset X$.

Definition 28.47.9. Let X be an integral scheme. An *alteration* of X is a proper dominant morphism $f : Y \rightarrow X$ with Y integral such that $f^{-1}(U) \rightarrow U$ is finite for some nonempty open $U \subset X$.

This is the definition as given in [dJ96], except that here we do not require X and Y to be Noetherian. Arguing as above we see that an alteration is a proper dominant morphism $f : Y \rightarrow X$ of integral schemes which induces a finite extension of function fields, i.e., such that the equivalent conditions of Lemma 28.47.4 hold.

28.48. Normalization

In this section we construct the *normalization*, and the *normalization of one scheme in another*.

Lemma 28.48.1. Let X be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The subsheaf $\mathcal{A}' \subset \mathcal{A}$ defined by the rule

$$U \mapsto \{f \in \mathcal{A}(U) \mid f_x \in \mathcal{A}_x \text{ integral over } \mathcal{O}_{X,x} \text{ for all } x \in U\}$$

is a quasi-coherent \mathcal{O}_X -algebra, and for any affine open $U \subset X$ the ring $\mathcal{A}'(U) \subset \mathcal{A}(U)$ is the integral closure of $\mathcal{O}_X(U)$ in $\mathcal{A}(U)$.

Proof. This is a subsheaf by the local nature of the conditions. It is an \mathcal{O}_X -algebra by Algebra, Lemma 10.35.7. Let $U \subset X$ be an affine open. Say $U = \text{Spec}(R)$ and say \mathcal{A} is the quasi-coherent sheaf associated to the R -algebra A . Then according to Algebra, Lemma 10.35.10 the value of \mathcal{A}' over U is given by the integral closure

A' of R in A . This proves the last assertion of the lemma. To prove that \mathcal{A}' is quasi-coherent, it suffices to show that $\mathcal{A}'(D(f)) = A'_f$. This follows from the fact that integral closure and localization commute, see Algebra, Lemma 10.35.9. \square

Definition 28.48.2. Let X be a scheme. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The *integral closure of \mathcal{O}_X in \mathcal{A}* is the quasi-coherent \mathcal{O}_X -subalgebra $\mathcal{A}' \subset \mathcal{A}$ constructed in Lemma 28.48.1 above.

In the setting of the definition above we can consider the morphism of relative spectra

$$\begin{array}{ccc} Y = \underline{\text{Spec}}_X(\mathcal{A}) & \longrightarrow & X' = \underline{\text{Spec}}_X(\mathcal{A}') \\ & \searrow & \swarrow \\ & X & \end{array}$$

see Lemma 28.13.5. The scheme $X' \rightarrow X$ will be the normalization of X in the scheme Y . Here is a slightly more general setting. Suppose we have a quasi-compact and quasi-separated morphism $f : Y \rightarrow X$ of schemes. In this case the sheaf of \mathcal{O}_X -algebras $f_*\mathcal{O}_Y$ is quasi-coherent, see Schemes, Lemma 25.24.1. Taking the integral closure $\mathcal{O}' \subset f_*\mathcal{O}_Y$ we obtain a quasi-coherent sheaf of \mathcal{O}_X -algebras whose relative spectrum is the normalization of X in Y . Here is the formal definition.

Definition 28.48.3. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let \mathcal{O}' be the integral closure of \mathcal{O}_X in $f_*\mathcal{O}_Y$. The *normalization of X in Y* is the scheme¹²

$$\nu : X' = \underline{\text{Spec}}_X(\mathcal{O}') \rightarrow X$$

over X . It comes equipped with a natural factorization

$$Y \xrightarrow{f'} X' \xrightarrow{\nu} X$$

of the initial morphism f .

The factorization is the composition of the canonical morphism $Y \rightarrow \underline{\text{Spec}}(f_*\mathcal{O}_Y)$ (see Constructions, Lemma 26.4.7) and the morphism of relative spectra coming from the inclusion map $\mathcal{O}' \rightarrow f_*\mathcal{O}_Y$. We can characterize the normalization as follows.

Lemma 28.48.4. *Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. The factorization $f = \nu \circ f'$, where $\nu : X' \rightarrow X$ is the normalization of X in Y is characterized by the following two properties:*

- (1) *the morphism ν is integral, and*
- (2) *for any factorization $f = \pi \circ g$, with $\pi : Z \rightarrow X$ integral, there exists a commutative diagram*

$$\begin{array}{ccc} Y & \xrightarrow{g} & Z \\ f' \downarrow & \nearrow h & \downarrow \pi \\ X' & \xrightarrow{\nu} & X \end{array}$$

for some unique morphism $h : X' \rightarrow Z$.

Moreover, in (2) the morphism $h : X' \rightarrow Z$ is the normalization of Z in Y .

¹²The scheme X' need not be normal, for example if $Y = X$ and $f = \text{id}_X$, then $X' = X$.

Proof. Let $\mathcal{O}' \subset f_*\mathcal{O}_Y$ be the integral closure of \mathcal{O}_X as in Definition 28.48.3. The morphism ν is integral by construction, which proves (1). Assume given a factorization $f = \pi \circ g$ with $\pi : Z \rightarrow X$ integral as in (2). By Definition 28.44.1 π is affine, and hence Z is the relative spectrum of a quasi-coherent sheaf of \mathcal{O}_X -algebras \mathcal{B} . The morphism $g : X \rightarrow Z$ corresponds to a map of \mathcal{O}_X -algebras $\chi : \mathcal{B} \rightarrow f_*\mathcal{O}_Y$. Since $\mathcal{B}(U)$ is integral over $\mathcal{O}_X(U)$ for every affine open $U \subset X$ (by Definition 28.44.1) we see from Lemma 28.48.1 that $\chi(\mathcal{B}) \subset \mathcal{O}'$. By the functoriality of the relative spectrum Lemma 28.13.5 this provides us with a unique morphism $h : X' \rightarrow Z$. We omit the verification that the diagram commutes.

It is clear that (1) and (2) characterize the factorization $f = \nu \circ f'$ since it characterizes it as an initial object in a category. The morphism h in (2) is integral by Lemma 28.44.12. Given a factorization $g = \pi' \circ g'$ with $\pi' : Z' \rightarrow Z$ integral, we get a factorization $f = (\pi \circ \pi') \circ g'$ and we get a morphism $h' : X' \rightarrow Z'$. Uniqueness implies that $\pi' \circ h' = h$. Hence the characterization (1), (2) applies to the morphism $h : X' \rightarrow Z$ which gives the last statement of the lemma. \square

Lemma 28.48.5. *Let*

$$\begin{array}{ccc} Y_2 & \longrightarrow & Y_1 \\ f_2 \downarrow & & \downarrow f_1 \\ X_2 & \longrightarrow & X_1 \end{array}$$

be a commutative diagram of morphisms of schemes. Assume f_1, f_2 quasi-compact and quasi-separated. Let $f_i = \nu_i \circ f'_i, i = 1, 2$ be the canonical factorizations, where $\nu_i : X'_i \rightarrow X_i$ is the normalization of X_i in Y_i . Then there exists a canonical commutative diagram

$$\begin{array}{ccc} Y_2 & \longrightarrow & Y_1 \\ f'_2 \downarrow & & \downarrow f'_1 \\ X'_2 & \longrightarrow & X'_1 \\ \nu_2 \downarrow & & \downarrow \nu_1 \\ X_2 & \longrightarrow & X_1 \end{array}$$

Proof. By Lemmas 28.48.4 (1) and 28.44.6 the base change $X_2 \times_{X_1} X'_1 \rightarrow X_2$ is integral. Note that f_2 factors through this morphism. Hence we get a canonical morphism $X'_2 \rightarrow X_2 \times_{X_1} X'_1$ from Lemma 28.48.4 (2). This gives the middle horizontal arrow in the last diagram. \square

Lemma 28.48.6. *Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $U \subset X$ be an open subscheme and set $V = f^{-1}(U)$. Then the normalization of U in V is the inverse image of U in the normalization of X in Y .*

Proof. Clear from the construction. \square

Lemma 28.48.7. *Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Suppose that $Y = Y_1 \amalg Y_2$ is a disjoint union of two schemes. Write $f_i = f|_{Y_i}$. Let X'_i be the normalization of X in Y_i . Then $X'_1 \amalg X'_2$ is the normalization of X in Y .*

Proof. In terms of integral closures this corresponds to the following fact: Let $A \rightarrow B$ be a ring map. Suppose that $B = B_1 \times B_2$. Let A'_i be the integral closure of A in B_i . Then $A'_1 \times A'_2$ is the integral closure of A in B . The reason this works is that the elements $(1, 0)$ and $(0, 1)$ of B are idempotents and hence integral over A . Thus the integral closure A' of A in B is a product and it is not hard to see that the factors are the integral closures A'_i as described above (some details omitted). \square

Lemma 28.48.8. *Let $f : Y \rightarrow X$ be an integral morphism. Then the integral closure of X in Y is equal to Y .*

Proof. Omitted. \square

The following lemma is a generalization of the preceding one.

Lemma 28.48.9. *Let $f : X \rightarrow S$ be a quasi-compact, quasi-separated and universally closed morphisms of schemes. Then $f_*\mathcal{O}_X$ is integral over \mathcal{O}_S . In other words, the normalization of S in X is equal to the factorization*

$$X \longrightarrow \underline{\text{Spec}}_S(f_*\mathcal{O}_X) \longrightarrow S$$

of Constructions, Lemma 26.4.7.

Proof. The question is local on S , hence we may assume $S = \text{Spec}(R)$ is affine. Let $h \in \Gamma(X, \mathcal{O}_X)$. We have to show that h satisfies a monic equation over R . Think of h as a morphism as in the following commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{h} & \mathbf{A}_S^1 \\ & \searrow f & \swarrow \\ & & S \end{array}$$

Let $Z \subset \mathbf{A}_S^1$ be the scheme theoretic image of h , see Definition 28.6.2. The morphism h is quasi-compact as f is quasi-compact and $\mathbf{A}_S^1 \rightarrow S$ is separated, see Schemes, Lemma 25.21.15. By Lemma 28.6.3 the morphism $X \rightarrow Z$ is dominant. By Lemma 28.42.7 the morphism $X \rightarrow Z$ is closed. Hence $h(X) = Z$ (set theoretically). Thus we can use Lemma 28.42.8 to conclude that $Z \rightarrow S$ is universally closed (and even proper). Since $Z \subset \mathbf{A}_S^1$, we see that $Z \rightarrow S$ is affine and proper, hence integral by Lemma 28.44.7. Writing $\mathbf{A}_S^1 = \text{Spec}(R[T])$ we conclude that the ideal $I \subset R[T]$ of Z contains a monic polynomial $P(T) \in R[T]$. Hence $P(h) = 0$ and we win. \square

Lemma 28.48.10. *Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Assume*

- (1) Y is a normal scheme,
- (2) any quasi-compact open $V \subset Y$ has a finite number of irreducible components.

Then the normalization X' of X in Y is a normal scheme. Moreover, the morphism $Y \rightarrow X'$ is dominant and induces a bijection of irreducible components.

Proof. We first prove that X' is normal. Let $U \subset X$ be an affine open. It suffices to prove that the inverse image of U in X' is normal (see Properties, Lemma 27.7.2). By Lemma 28.48.6 we may replace X by U , and hence we may assume $X = \text{Spec}(A)$ affine. In this case Y is quasi-compact, and hence has a finite number of irreducible components by assumption. Hence $Y = \coprod_{i=1, \dots, n} Y_i$ is a finite disjoint

union of normal integral schemes by Properties, Lemma 27.7.5. By Lemma 28.48.7 we see that $X' = \coprod_{i=1, \dots, n} X'_i$, where X'_i is the normalization of X in Y_i . By Properties, Lemma 27.7.9 we see that $B_i = \Gamma(Y_i, \mathcal{O}_{Y_i})$ is a normal domain. Note that $X'_i = \text{Spec}(A'_i)$, where $A'_i \subset B_i$ is the integral closure of A in B_i , see Lemma 28.48.1. By Algebra, Lemma 10.36.2 we see that $A'_i \subset B_i$ is a normal domain. Hence $X' = \coprod X'_i$ is a finite union of normal schemes and hence is normal.

It is clear from the description of X' above that $Y \rightarrow X'$ is dominant and induces a bijection on irreducible components if X is affine. The result in general follows from this by a topological argument (omitted). \square

Lemma 28.48.11. *Let $f : X \rightarrow S$ be a morphism. Assume that*

- (1) *S is a Nagata scheme,*
- (2) *f is of finite type¹³, and*
- (3) *X is reduced.*

Then the normalization $\nu : S' \rightarrow S$ of S in X is finite.

Proof. There is an immediate reduction to the case $S = \text{Spec}(R)$ where R is a Nagata ring. In this case we have to show that the integral closure A of R in $\Gamma(X, \mathcal{O}_X)$ is finite over R . Since f is of finite type we can write $X = \bigcup_{i=1, \dots, n} U_i$ with each U_i affine. Say $U_i = \text{Spec}(B_i)$. Each B_i is a reduced ring of finite type over R (Lemma 28.16.2). Moreover, $\Gamma(X, \mathcal{O}_X) \subset B = B_1 \times \dots \times B_n$. So A is contained in the integral closure A' of R in B . Note that B is a reduced finite type R -algebra. Since R is Noetherian it suffices to prove that A' is finite over R . This is Algebra, Lemma 10.150.16. \square

Next, we come to the normalization of a scheme X . We only define/construct it when X has locally finitely many irreducible components. Let X be a scheme such that every quasi-compact open has finitely many irreducible components. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of X . Let

$$(28.48.11.1) \quad f : Y = \coprod_{\eta \in X^{(0)}} \text{Spec}(\kappa(\eta)) \longrightarrow X$$

be the inclusion of the generic points into X using the canonical maps of Schemes, Section 25.13. Note that this morphism is quasi-compact by assumption and quasi-separated as Y is separated (see Schemes, Section 25.21).

Definition 28.48.12. Let X be a scheme such that every quasi-compact open has finitely many irreducible components. We define the *normalization* of X as the morphism

$$\nu : X^\nu \longrightarrow X$$

which is the normalization of X in the morphism $f : Y \rightarrow X$ (28.48.11.1) constructed above.

Any locally Noetherian scheme has a locally finite set of irreducible components and the definition applies to it. Usually the normalization is defined only for reduced schemes. With the definition above the normalization of X is the same as the normalization of the reduction X_{red} of X .

¹³The proof shows that the lemma holds if f is quasi-compact and “essentially of finite type”.

Lemma 28.48.13. *Let X be a scheme such that every quasi-compact open has finitely many irreducible components. The normalization morphism ν factors through the reduction X_{red} and $X^\nu \rightarrow X_{red}$ is the normalization of X_{red} .*

Proof. Let $f : Y \rightarrow X$ be the morphism (28.48.11.1). We get a factorization $Y \rightarrow X_{red} \rightarrow X$ of f from Schemes, Lemma 25.12.6. By Lemma 28.48.4 we obtain a canonical morphism $X^\nu \rightarrow X_{red}$ and that X^ν is the normalization of X_{red} in Y . The lemma follows as $Y \rightarrow X_{red}$ is identical to the morphism (28.48.11.1) constructed for X_{red} . \square

If X is reduced, then the normalization of X is the same as the relative spectrum of the integral closure of \mathcal{O}_X in the sheaf of meromorphic functions \mathcal{K}_X (see Divisors, Section 30.15). Namely, $\mathcal{K}_X = f_*\mathcal{O}_Y$ in this case, see Divisors, Lemma 30.15.8 and its proof. We describe this here explicitly.

Lemma 28.48.14. *Let X be a reduced scheme such that every quasi-compact open has finitely many irreducible components. Let $\text{Spec}(A) = U \subset X$ be an affine open. Then*

- (1) *A has finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$,*
- (2) *the total ring of fractions $Q(A)$ of A is $Q(A/\mathfrak{q}_1) \times \dots \times Q(A/\mathfrak{q}_t)$,*
- (3) *the integral closure A' of A in $Q(A)$ is the product of the integral closures of the domains A/\mathfrak{q}_i in the fields $Q(A/\mathfrak{q}_i)$, and*
- (4) *$\nu^{-1}(U)$ is identified with the spectrum of A' .*

Proof. Minimal primes correspond to irreducible components (Algebra, Lemma 10.25.1), hence we have (1) by assumption. Then $(0) = \mathfrak{q}_1 \cap \dots \cap \mathfrak{q}_t$ because A is reduced (Algebra, Lemma 10.16.2). Then we have $Q(A) = \prod A_{\mathfrak{q}_i} = \prod \kappa(\mathfrak{q}_i)$ by Algebra, Lemmas 10.24.4 and 10.24.1. This proves (2). Part (3) follows from Algebra, Lemma 10.36.14, or Lemma 28.48.7. Part (4) holds because it is clear that $f^{-1}(U) \rightarrow U$ is the morphism

$$\text{Spec}\left(\prod \kappa(\mathfrak{q}_i)\right) \longrightarrow \text{Spec}(A)$$

where $f : Y \rightarrow X$ is the morphism (28.48.11.1). \square

Lemma 28.48.15. *Let X be a scheme such that every quasi-compact open has finitely many irreducible components.*

- (1) *The normalization X^ν is a normal scheme.*
- (2) *The morphism $\nu : X^\nu \rightarrow X$ is integral, surjective, and induces a bijection on irreducible components.*
- (3) *For any integral, birational¹⁴ morphism $X' \rightarrow X$ there exists a factorization $X^\nu \rightarrow X' \rightarrow X$ and $X^\nu \rightarrow X'$ is the normalization of X' .*
- (4) *For any morphism $Z \rightarrow X$ with Z a normal scheme such that each irreducible component of Z dominates an irreducible component of X there exists a unique factorization $Z \rightarrow X^\nu \rightarrow X$.*

Proof. Let $f : Y \rightarrow X$ be as in (28.48.11.1). Part (1) follows from Lemma 28.48.10 and the fact that Y is normal. It also follows from the description of the affine opens in Lemma 28.48.14.

¹⁴It suffices if $X'_{red} \rightarrow X_{red}$ is birational.

The morphism ν is integral by Lemma 28.48.4. By Lemma 28.48.10 the morphism $Y \rightarrow X^\nu$ induces a bijection on irreducible components, and by construction of Y this implies that $X^\nu \rightarrow X$ induces a bijection on irreducible components. By construction $f : Y \rightarrow X$ is dominant, hence also ν is dominant. Since an integral morphism is closed (Lemma 28.44.7) this implies that ν is surjective. This proves (2).

Suppose that $\alpha : X' \rightarrow X$ is integral and birational. Any quasi-compact open U' of X' maps to a quasi-compact open of X , hence we see that U' has only finitely many irreducible components. Let $f' : Y' \rightarrow X'$ be the morphism (28.48.11.1) constructed starting with X' . As α is birational it is clear that $Y' = Y$ and $f = \alpha \circ f'$. Hence the factorization $X^\nu \rightarrow X' \rightarrow X$ exists and $X^\nu \rightarrow X'$ is the normalization of X' by Lemma 28.48.4. This proves (3).

Let $g : Z \rightarrow X$ be a morphism whose domain is a normal scheme and such that every irreducible component dominates an irreducible component of X . By Lemma 28.48.13 we have $X^\nu = X_{red}^\nu$ and by Schemes, Lemma 25.12.6 $Z \rightarrow X$ factors through X_{red} . Hence we may replace X by X_{red} and assume X is reduced. Moreover, as the factorization is unique it suffices to construct it locally on Z . Let $W \subset Z$ and $U \subset X$ be affine opens such that $g(W) \subset U$. Write $U = \text{Spec}(A)$ and $W = \text{Spec}(B)$, with $g|_W$ given by $\varphi : A \rightarrow B$. We will use the results of Lemma 28.48.14 freely. Let $\mathfrak{p}_1, \dots, \mathfrak{p}_t$ be the minimal primes of A . As Z is normal, we see that B is a normal ring, in particular reduced. Moreover, by assumption any minimal prime $\mathfrak{q} \subset B$ we have that $\varphi^{-1}(\mathfrak{q})$ is a minimal prime of A . Hence if $x \in A$ is a nonzerodivisor, i.e., $x \notin \bigcup \mathfrak{p}_i$, then $\varphi(x)$ is a nonzerodivisor in B . Thus we obtain a canonical ring map $Q(A) \rightarrow Q(B)$. As B is normal it is equal to its integral closure in $Q(B)$ (see Algebra, Lemma 10.36.11). Hence we see that the integral closure $A' \subset Q(A)$ of A maps into B via the canonical map $Q(A) \rightarrow Q(B)$. Since $\nu^{-1}(U) = \text{Spec}(A')$ this gives the canonical factorization $W \rightarrow \nu^{-1}(U) \rightarrow U$ of $\nu|_W$. We omit the verification that it is unique. \square

Lemma 28.48.16. *A finite (or even integral) birational morphism of normal integral schemes is an isomorphism.*

Proof. Let $f : X \rightarrow Y$ be such a morphism. Let $V \subset Y$ be an affine open with inverse image $U \subset X$ which is an affine open too. Since f is a birational morphism of integral schemes, the homomorphism $\mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(U)$ is an injective map of domains which induces an isomorphism of fraction fields. As Y is normal, the ring $\mathcal{O}_Y(V)$ is integrally closed in the fraction field. Since f is finite (or integral) every element of $\mathcal{O}_X(U)$ is integral over $\mathcal{O}_Y(V)$. We conclude that $\mathcal{O}_Y(V) = \mathcal{O}_X(U)$. This proves that f is an isomorphism as desired. \square

Lemma 28.48.17. *Let X be an integral, Japanese scheme. The normalization $\nu : X^\nu \rightarrow X$ is a finite morphism.*

Proof. Follows from the definitions and Lemma 28.48.14. Namely, in this case the lemma says that $\nu^{-1}(\text{Spec}(A))$ is the spectrum of the integral closure of A in its field of fractions. \square

Lemma 28.48.18. *Let X be a Nagata scheme. The normalization $\nu : X^\nu \rightarrow X$ is a finite morphism.*

Proof. Note that a Nagata scheme is locally Noetherian, thus Definition 28.48.12 does apply. Write $X^\nu \rightarrow X$ as the composition $X^\nu \rightarrow X_{red} \rightarrow X$. As $X_{red} \rightarrow X$ is a closed immersion it is finite. Hence it suffices to prove the lemma for a reduced Nagata scheme (by Lemma 28.44.5). Let $\text{Spec}(A) = U \subset X$ be an affine open. By Lemma 28.48.14 we have $\nu^{-1}(U) = \text{Spec}(\prod A'_i)$ where A'_i is the integral closure of A/\mathfrak{q}_i in its fraction field. As A is a Nagata ring (see Properties, Lemma 27.13.6) each of the ring extensions $A/\mathfrak{q}_i \subset A'_i$ are finite. Hence $A \rightarrow \prod A'_i$ is a finite ring map and we win. \square

28.49. Zariski's Main Theorem (algebraic version)

This is the version you can prove using purely algebraic methods. Before we can prove more powerful versions (for non-affine morphisms) we need to develop more tools. See Cohomology of Schemes, Section 29.19 and More on Morphisms, Section 36.31.

Theorem 28.49.1 (Algebraic version of Zariski's Main Theorem). *Let $f : Y \rightarrow X$ be an affine morphism of schemes. Assume f is of finite type. Let X' be the normalization of X in Y . Picture:*

$$\begin{array}{ccc} Y & \xrightarrow{\quad f' \quad} & X' \\ & \searrow f & \swarrow \nu \\ & & X \end{array}$$

Then there exists an open subscheme $U' \subset X'$ such that

- (1) $(f')^{-1}(U') \rightarrow U'$ is an isomorphism, and
- (2) $(f')^{-1}(U') \subset Y$ is the set of points at which f is quasi-finite.

Proof. There is an immediate reduction to the case where X and hence Y are affine. Say $X = \text{Spec}(R)$ and $Y = \text{Spec}(A)$. Then $X' = \text{Spec}(A')$, where A' is the integral closure of R in A , see Definitions 28.48.2 and 28.48.3. By Algebra, Theorem 10.119.13 for every $y \in Y$ at which f is quasi-finite, there exists an open $U'_y \subset X'$ such that $(f')^{-1}(U'_y) \rightarrow U'_y$ is an isomorphism. Set $U' = \bigcup U'_y$ where $y \in Y$ ranges over all points where f is quasi-finite. It remains to show that f is quasi-finite at all points of $(f')^{-1}(U')$. If $y \in (f')^{-1}(U')$ with image $x \in X$, then we see that $Y_x \rightarrow X'_x$ is an isomorphism in a neighbourhood of y . Hence there is no point of Y_x which specializes to y , since this is true for $f'(y)$ in X'_x , see Lemma 28.44.8. By Lemma 28.21.6 part (3) this implies f is quasi-finite at y . \square

We can use the algebraic version of Zariski's Main Theorem to show that the set of points where a morphism is quasi-finite is open.

Lemma 28.49.2. *Let $f : X \rightarrow S$ be a morphism of schemes. The set of points of X where f is quasi-finite is an open $U \subset X$. The induced morphism $U \rightarrow S$ is locally quasi-finite.*

Proof. Suppose f is quasi-finite at x . Let $x \in U = \text{Spec}(R) \subset X$, $V = \text{Spec}(A) \subset S$ be affine opens as in Definition 28.21.1. By either Theorem 28.49.1 above or Algebra, Lemma 10.119.14, the set of primes \mathfrak{q} at which $R \rightarrow A$ is quasi-finite is open in $\text{Spec}(A)$. Since these all correspond to points of X where f is quasi-finite we get the first statement. The second statement is obvious. \square

We will improve the following lemma to general quasi-finite separated morphisms later, see More on Morphisms, Lemma 36.31.3.

Lemma 28.49.3. *Let $f : Y \rightarrow X$ be a morphism of schemes. Assume*

- (1) *X and Y are affine, and*
- (2) *f is quasi-finite.*

Then there exists a diagram

with Z affine, π finite and j an open immersion.

Proof. This is Algebra, Lemma 10.119.15 reformulated in the language of schemes. □

Lemma 28.49.4. *Let $f : Y \rightarrow X$ be a quasi-finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of Y . Then $f(T) \subset X$ is a nowhere dense subset of X .*

Proof. As in the proof of Lemma 28.46.7 this reduces immediately to the case where the base X is affine. In this case $Y = \bigcup_{i=1, \dots, n} Y_i$ is a finite union of affine opens (as f is quasi-compact). Since each $T \cap Y_i$ is nowhere dense, and since a finite union of nowhere dense sets is nowhere dense (see Topology, Lemma 5.20.2), it suffices to prove that the image $f(T \cap Y_i)$ is nowhere dense in X . This reduces us to the case where both X and Y are affine. At this point we apply Lemma 28.49.3 above to get a diagram

with Z affine, π finite and j an open immersion. Set $\bar{T} = \overline{j(T)} \subset Z$. By Topology, Lemma 5.20.3 we see \bar{T} is nowhere dense in Z . Since $f(T) \subset \pi(\bar{T})$ the lemma follows from the corresponding result in the finite case, see Lemma 28.46.7. □

28.50. Universally bounded fibres

Let X be a scheme over a field k . If X is finite over k , then $X = \text{Spec}(A)$ where A is a finite k -algebra. Another way to say this is that X is finite locally free over $\text{Spec}(k)$, see Definition 28.46.1. Hence $X \rightarrow \text{Spec}(k)$ has a *degree* which is an integer $d \geq 0$, namely $d = \dim_k(A)$. We sometime call this the *degree* of the (finite) scheme X over k .

Definition 28.50.1. Let $f : X \rightarrow Y$ be a morphism of schemes.

- (1) We say the integer n *bounds the degrees of the fibres of f* if for all $y \in Y$ the fibre X_y is a finite scheme over $\kappa(y)$ whose degree over $\kappa(y)$ is $\leq n$.
- (2) We say the *fibres of f are universally bounded*¹⁵ if there exists an integer n which bounds the degrees of the fibres of f .

¹⁵This is probably nonstandard notation.

Note that in particular the number of points in a fibre is bounded by n as well. (The converse does not hold, even if all fibres are finite reduced schemes.)

Lemma 28.50.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n \geq 0$. The following are equivalent:*

- (1) *the integer n bounds the degrees of the fibres of f , and*
- (2) *for every morphism $\text{Spec}(k) \rightarrow Y$, where k is a field, the fibre product $X_k = \text{Spec}(k) \times_Y X$ is finite over k of degree $\leq n$.*

In this case f is universally bounded and the schemes X_k have at most n points.

Proof. The implication (2) \Rightarrow (1) is trivial. The other implication holds because if the image of $\text{Spec}(k) \rightarrow Y$ is y , then $X_k = \text{Spec}(k) \times_{\text{Spec}(\kappa(y))} X_y$. \square

Lemma 28.50.3. *A composition of morphisms with universally bounded fibres is a morphism with universally bounded fibres. More precisely, assume that n bounds the degrees of the fibres of $f : X \rightarrow Y$ and m bounds the degrees of $g : Y \rightarrow Z$. Then nm bounds the degrees of the fibres of $g \circ f : X \rightarrow Z$.*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ have universally bounded fibres. Say that $\deg(X_y/\kappa(y)) \leq n$ for all $y \in Y$, and that $\deg(Y_z/\kappa(z)) \leq m$ for all $z \in Z$. Let $z \in Z$ be a point. By assumption the scheme Y_z is finite over $\text{Spec}(\kappa(z))$. In particular, the underlying topological space of Y_z is a finite discrete set. The fibres of the morphism $f_z : X_z \rightarrow Y_z$ are the fibres of f at the corresponding points of Y , which are finite discrete sets by the reasoning above. Hence we conclude that the underlying topological space of X_z is a finite discrete set as well. Thus X_z is an affine scheme (this is a nice exercise; it also follows for example from Properties, Lemma 27.27.1 applied to the set of all points of X_z). Write $X_z = \text{Spec}(A)$, $Y_z = \text{Spec}(B)$, and $k = \kappa(z)$. Then $k \rightarrow B \rightarrow A$ and we know that (a) $\dim_k(B) \leq m$, and (b) for every maximal ideal $\mathfrak{m} \subset B$ we have $\dim_{\kappa(\mathfrak{m})}(A/\mathfrak{m}A) \leq n$. We claim this implies that $\dim_k(A) \leq nm$. Note that B is the product of its localizations $B_{\mathfrak{m}}$, for example because Y_z is a disjoint union of 1-point schemes, or by Algebra, Lemmas 10.51.2 and 10.51.6. So we see that $\dim_k(B) = \sum_{\mathfrak{m}} \dim_k(B_{\mathfrak{m}})$ and $\dim_k(A) = \sum_{\mathfrak{m}} \dim_k(A_{\mathfrak{m}})$ where in both cases \mathfrak{m} runs over the maximal ideals of B (not of A). By the above, and Nakayama's Lemma (Algebra, Lemma 10.19.1) we see that each $A_{\mathfrak{m}}$ is a quotient of $B_{\mathfrak{m}}^{\oplus n}$ as a $B_{\mathfrak{m}}$ -module. Hence $\dim_k(A_{\mathfrak{m}}) \leq n \dim_k(B_{\mathfrak{m}})$. Putting everything together we see that

$$\dim_k(A) = \sum_{\mathfrak{m}} \dim_k(A_{\mathfrak{m}}) \leq \sum_{\mathfrak{m}} n \dim_k(B_{\mathfrak{m}}) = n \dim_k(B) \leq nm$$

as desired. \square

Lemma 28.50.4. *A base change of a morphism with universally bounded fibres is a morphism with universally bounded fibres. More precisely, if n bounds the degrees of the fibres of $f : X \rightarrow Y$ and $Y' \rightarrow Y$ is any morphism, then the degrees of the fibres of the base change $f' : Y' \times_Y X \rightarrow Y' \rightarrow Y'$ is also bounded by n .*

Proof. This is clear from the result of Lemma 28.50.2. \square

Lemma 28.50.5. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $Y' \rightarrow Y$ be a morphism of schemes, and let $f' : X' = X_{Y'} \rightarrow Y'$ be the base change of f . If $Y' \rightarrow Y$ is surjective and f' has universally bounded fibres, then f has universally bounded fibres. More precisely, if n bounds the degree of the fibres of f' , then also n bounds the degrees of the fibres of f .*

Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibres of f' . We claim that n works for f also. Namely, if $y \in Y$ is a point, then choose a point $y' \in Y'$ lying over y and observe that

$$X'_{y'} = \text{Spec}(\kappa(y')) \times_{\text{Spec}(\kappa(y))} X_y.$$

Since $X'_{y'}$ is assumed finite of degree $\leq n$ over $\kappa(y')$ it follows that also X_y is finite of degree $\leq n$ over $\kappa(y)$. (Some details omitted.) \square

Lemma 28.50.6. *An immersion has universally bounded fibres.*

Proof. The integer $n = 1$ works in the definition. \square

Lemma 28.50.7. *Let $f : X \rightarrow Y$ be an étale morphism of schemes. Let $n \geq 0$. The following are equivalent*

- (1) *the integer n bounds the degrees of the fibres,*
- (2) *for every field k and morphism $\text{Spec}(k) \rightarrow Y$ the base change $X_k = \text{Spec}(k) \times_Y X$ has at most n points, and*
- (3) *for every $y \in Y$ and every separable algebraic closure $\kappa(y) \subset \kappa(y)^{sep}$ the scheme $X_{\kappa(y)^{sep}}$ has at most n points.*

Proof. This follows from Lemma 28.50.2 and the fact that the fibres X_y are disjoint unions of spectra of finite separable field extensions of $\kappa(y)$, see Lemma 28.37.7. \square

Having universally bounded fibres is an absolute notion and not a relative notion. This is why the condition in the following lemma is that X is quasi-compact, and not that f is quasi-compact.

Lemma 28.50.8. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that*

- (1) *f is locally quasi-finite, and*
- (2) *X is quasi-compact.*

Then f has universally bounded fibres.

Proof. Since X is quasi-compact, there exists a finite affine open covering $X = \bigcup_{i=1, \dots, n} U_i$ and affine opens $V_i \subset Y$, $i = 1, \dots, n$ such that $f(U_i) \subset V_i$. Because of the local nature of “local quasi-finiteness” (see Lemma 28.21.6 part (4)) we see that the morphisms $f|_{U_i} : U_i \rightarrow V_i$ are locally quasi-finite morphisms of affines, hence quasi-finite, see Lemma 28.21.9. For $y \in Y$ it is clear that $X_y = \bigcup_{y \in V_i} (U_i)_y$ is an open covering. Hence it suffices to prove the lemma for a quasi-finite morphism of affines (namely, if n_i works for the morphism $f|_{U_i} : U_i \rightarrow V_i$, then $\sum n_i$ works for f).

Assume $f : X \rightarrow Y$ is a quasi-finite morphism of affines. By Lemma 28.49.3 we can find a diagram

$$\begin{array}{ccc} X & \xrightarrow{j} & Z \\ & \searrow f & \swarrow \pi \\ & & Y \end{array}$$

with Z affine, π finite and j an open immersion. Since j has universally bounded fibres (Lemma 28.50.6) this reduces us to showing that π has universally bounded fibres (Lemma 28.50.3).

This reduces us to a morphism of the form $\text{Spec}(B) \rightarrow \text{Spec}(A)$ where $A \rightarrow B$ is finite. Say B is generated by x_1, \dots, x_n over A and say $P_i(T) \in A[T]$ is a monic

polynomial of degree d_i such that $P_i(x_i) = 0$ in B (a finite ring extension is integral, see Algebra, Lemma 10.35.3). With these notations it is clear that

$$\bigoplus_{0 \leq e_i < d_i, i=1, \dots, n} A \longrightarrow B, \quad (a_{(e_1, \dots, e_n)}) \longmapsto \sum a_{(e_1, \dots, e_n)} x_1^{e_1} \dots x_n^{e_n}$$

is a surjective A -module map. Thus for any prime $\mathfrak{p} \subset A$ this induces a surjective map $\kappa(\mathfrak{p})$ -vector spaces

$$\kappa(\mathfrak{p})^{\oplus d_1 \dots d_n} \longrightarrow B \otimes_A \kappa(\mathfrak{p})$$

In other words, the integer $d_1 \dots d_n$ works in the definition of a morphism with universally bounded fibres. □

Lemma 28.50.9. *Consider a commutative diagram of morphisms of schemes*

If g has universally bounded fibres, and f is surjective and flat, then also h has universally bounded fibres. More precisely, if n bounds the degree of the fibres of g , then also n bounds the degree of the fibres of h .

Proof. Assume g has universally bounded fibres, and f is surjective and flat. Say the degree of the fibres of g is bounded by $n \in \mathbf{N}$. We claim n also works for h . Let $z \in Z$. Consider the morphism of schemes $X_z \rightarrow Y_z$. It is flat and surjective. By assumption X_z is a finite scheme over $\kappa(z)$, in particular it is the spectrum of an Artinian ring (by Algebra, Lemma 10.51.2). By Lemma 28.13.13 the morphism $X_z \rightarrow Y_z$ is affine in particular quasi-compact. It follows from Lemma 28.26.10 that Y_z is a finite discrete as this holds for X_z . Hence Y_z is an affine scheme (this is a nice exercise; it also follows for example from Properties, Lemma 27.27.1 applied to the set of all points of Y_z). Write $Y_z = \text{Spec}(B)$ and $X_z = \text{Spec}(A)$. Then A is faithfully flat over B , so $B \subset A$. Hence $\dim_k(B) \leq \dim_k(A) \leq n$ as desired. □

Cohomology of Schemes

29.1. Introduction

In this chapter we first prove a number of results on the cohomology of quasi-coherent sheaves. A fundamental reference is [DG67]. Having done this we will elaborate on cohomology of coherent sheaves in the Noetherian setting. See [Ser55b].

29.2. Čech cohomology of quasi-coherent sheaves

Let X be a scheme. Let $U \subset X$ be an affine open. Recall that a *standard open covering* of U is a covering of the form $\mathcal{U} : U = \bigcup_{i=1}^n D(f_i)$ where $f_1, \dots, f_n \in \Gamma(U, \mathcal{O}_X)$ generate the unit ideal, see Schemes, Definition 25.5.2.

Lemma 29.2.1. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{U} : U = \bigcup_{i=1}^n D(f_i)$ be a standard open covering of an affine open of X . Then $\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$ for all $p > 0$.*

Proof. Write $U = \text{Spec}(A)$ for some ring A . In other words, f_1, \dots, f_n are elements of A which generate the unit ideal of A . Write $\mathcal{F}|_U = \widetilde{M}$ for some A -module M . Clearly the Čech complex $\check{C}^\bullet(\mathcal{U}, \mathcal{F})$ is identified with the complex

$$\prod_{i_0} M_{f_{i_0}} \rightarrow \prod_{i_0 i_1} M_{f_{i_0} f_{i_1}} \rightarrow \prod_{i_0 i_1 i_2} M_{f_{i_0} f_{i_1} f_{i_2}} \rightarrow \dots$$

We are asked to show that the extended complex

$$(29.2.1.1) \quad 0 \rightarrow M \rightarrow \prod_{i_0} M_{f_{i_0}} \rightarrow \prod_{i_0 i_1} M_{f_{i_0} f_{i_1}} \rightarrow \prod_{i_0 i_1 i_2} M_{f_{i_0} f_{i_1} f_{i_2}} \rightarrow \dots$$

(whose truncation we have studied in Algebra, Lemma 10.22.2) is exact. It suffices to show that (29.2.1.1) is exact after localizing at a prime \mathfrak{p} , see Algebra, Lemma 10.23.1. In fact we will show that the extended complex localized at \mathfrak{p} is homotopic to zero.

There exists an index i such that $f_i \notin \mathfrak{p}$. Choose and fix such an element i_{fix} . Note that $M_{f_{i_{\text{fix}}}, \mathfrak{p}} = M_{\mathfrak{p}}$. Similarly for a localization at a product $f_{i_0} \dots f_{i_p}$ and \mathfrak{p} we can drop any f_{i_j} for which $i_j = i_{\text{fix}}$. Let us define a homotopy

$$h : \prod_{i_0 \dots i_{p+1}} M_{f_{i_0} \dots f_{i_{p+1}}, \mathfrak{p}} \longrightarrow \prod_{i_0 \dots i_p} M_{f_{i_0} \dots f_{i_p}, \mathfrak{p}}$$

by the rule

$$h(s)_{i_0 \dots i_p} = s_{i_{\text{fix}} i_0 \dots i_p}$$

(This is “dual” to the homotopy in the proof of Cohomology, Lemma 20.11.4.) In other words, $h : \prod_{i_0} M_{f_{i_0}, \mathfrak{p}} \rightarrow M$ is projection onto the factor $M_{f_{i_{\text{fix}}}, \mathfrak{p}} = M_{\mathfrak{p}}$

and in general the map h equal projection onto the factors $M_{f_{\text{fix}} f_{i_1} \dots f_{i_{p+1}}, \mathfrak{p}} = M_{f_{i_1} \dots f_{i_{p+1}}, \mathfrak{p}}$. We compute

$$\begin{aligned} (dh + hd)(s)_{i_0 \dots i_p} &= \sum_{j=0}^p (-1)^j h(s)_{i_0 \dots \hat{i}_j \dots i_p} + d(s)_{i_{\text{fix}} i_0 \dots i_p} \\ &= \sum_{j=0}^p (-1)^j s_{i_{\text{fix}} i_0 \dots \hat{i}_j \dots i_p} + s_{i_0 \dots i_p} + \sum_{j=0}^p (-1)^{j+1} s_{i_{\text{fix}} i_0 \dots \hat{i}_j \dots i_p} \\ &= s_{i_0 \dots i_p} \end{aligned}$$

This proves the identity map is homotopic to zero as desired. □

The following lemma says in particular that for any affine scheme X and any quasi-coherent sheaf \mathcal{F} on X we have

$$H^p(X, \mathcal{F}) = 0$$

for all $p > 0$.

Lemma 29.2.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. For any affine open $U \subset X$ we have $H^p(U, \mathcal{F}) = 0$ for all $p > 0$.*

Proof. We are going to apply Cohomology, Lemma 20.12.8. As our basis \mathcal{B} for the topology of X we are going to use the affine opens of X . As our set Cov of open coverings we are going to use the standard open coverings of affine opens of X . Next we check that conditions (1), (2) and (3) of Cohomology, Lemma 20.12.8 hold. Note that the intersection of standard opens in an affine is another standard open. Hence property (1) holds. The coverings form a cofinal system of open coverings of any element of \mathcal{B} , see Schemes, Lemma 25.5.1. Hence (2) holds. Finally, condition (3) of the lemma follows from Lemma 29.2.1. □

Here is a relative version of the vanishing of cohomology of quasi-coherent sheaves on affines.

Lemma 29.2.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If f is affine then $R^i f_* \mathcal{F} = 0$ for all $i > 0$.*

Proof. According to Cohomology, Lemma 20.7.3 the sheaf $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf $V \mapsto H^i(f^{-1}(V), \mathcal{F}|_{f^{-1}(V)})$. By assumption, whenever V is affine we have that $f^{-1}(V)$ is affine, see Morphisms, Definition 28.13.1. By Lemma 29.2.2 we conclude that $H^i(f^{-1}(V), \mathcal{F}|_{f^{-1}(V)}) = 0$ whenever V is affine. Since S has a basis consisting of affine opens we win. □

Lemma 29.2.4. *Let $f : X \rightarrow S$ be an affine morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then $H^i(X, \mathcal{F}) = H^i(S, f_* \mathcal{F})$ for all $i \geq 0$.*

Proof. Follows from Lemma 29.2.3 and the Leray spectral sequence. See Cohomology, Lemma 20.14.6. □

Lemma 29.2.5. *Let X be a scheme. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering such that $U_{i_0 \dots i_p}$ is affine open for all $p \geq 0$ and all $i_0, \dots, i_p \in I$. In this case for any quasi-coherent sheaf \mathcal{F} we have*

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(X, \mathcal{F})$$

as $\Gamma(X, \mathcal{O}_X)$ -modules for all p .

Proof. In view of Lemma 29.2.2 this is a special case of Cohomology, Lemma 20.12.5. □

29.3. Vanishing of cohomology

We have seen that on an affine scheme the higher cohomology groups of any quasi-coherent sheaf vanish (Lemma 29.2.2). It turns out that this also characterizes affine schemes. We give two versions.

Lemma 29.3.1. *Let X be a scheme. Assume that*

- (1) *X is quasi-compact,*
- (2) *for every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ we have $H^1(X, \mathcal{I}) = 0$.*

Then X is affine.

Proof. Let $x \in X$ be a closed point. Let $U \subset X$ be an affine open neighbourhood of x . Write $U = \text{Spec}(A)$ and let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to x . Set $Z = X \setminus U$ and $Z' = Z \cup \{x\}$. By Schemes, Lemma 25.12.4 there are quasi-coherent sheaves of ideals \mathcal{I} , resp. \mathcal{I}' cutting out the reduced closed subschemes Z , resp. Z' . Consider the short exact sequence

$$0 \rightarrow \mathcal{I}' \rightarrow \mathcal{I} \rightarrow \mathcal{I}/\mathcal{I}' \rightarrow 0.$$

Since x is a closed point of X and $x \notin Z$ we see that \mathcal{I}/\mathcal{I}' is supported at x . In fact, the restriction of \mathcal{I}/\mathcal{I}' to U corresponds to the A -module A/\mathfrak{m} . Hence we see that $\Gamma(X, \mathcal{I}/\mathcal{I}') = A/\mathfrak{m}$. Since by assumption $H^1(X, \mathcal{I}') = 0$ we see there exists a global section $f \in \Gamma(X, \mathcal{I})$ which maps to the element $1 \in A/\mathfrak{m}$ as a section of \mathcal{I}/\mathcal{I}' . Clearly we have $x \in X_f \subset U$. This implies that $X_f = D(f_A)$ where f_A is the image of f in $A = \Gamma(U, \mathcal{O}_X)$. In particular X_f is affine.

Consider the union $W = \bigcup X_f$ over all $f \in \Gamma(X, \mathcal{O}_X)$ such that X_f is affine. Obviously W is open in X . By the arguments above every closed point of X is contained in W . The closed subset $X \setminus W$ of X is also quasi-compact (see Topology, Lemma 5.11.3). Hence it has a closed point if it is nonempty (see Topology, Lemma 5.11.8). This would contradict the fact that all closed points are in W . Hence we conclude $X = W$.

Choose finitely many $f_1, \dots, f_n \in \Gamma(X, \mathcal{O}_X)$ such that $X = X_{f_1} \cup \dots \cup X_{f_n}$ and such that each X_{f_i} is affine. This is possible as we've seen above. By Properties, Lemma 27.25.2 to finish the proof it suffices to show that f_1, \dots, f_n generate the unit ideal in $\Gamma(X, \mathcal{O}_X)$. Consider the short exact sequence

$$0 \longrightarrow \mathcal{F} \longrightarrow \mathcal{O}_X^{\oplus n} \xrightarrow{f_1, \dots, f_n} \mathcal{O}_X \longrightarrow 0$$

The arrow defined by f_1, \dots, f_n is surjective since the opens X_{f_i} cover X . We let \mathcal{F} be the kernel of this surjective map. Observe that \mathcal{F} has a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_n = \mathcal{F}$$

so that each subquotient $\mathcal{F}_i/\mathcal{F}_{i-1}$ is isomorphic to a quasi-coherent sheaf of ideals. Namely we can take \mathcal{F}_i to be the intersection of \mathcal{F} with the first i direct summands of $\mathcal{O}_X^{\oplus n}$. The assumption of the lemma implies that $H^1(X, \mathcal{F}_i/\mathcal{F}_{i-1}) = 0$ for all i . This implies that $H^1(X, \mathcal{F}_2) = 0$ because it is sandwiched between $H^1(X, \mathcal{F}_1)$ and $H^1(X, \mathcal{F}_2/\mathcal{F}_1)$. Continuing like this we deduce that $H^1(X, \mathcal{F}) = 0$. Therefore we conclude that the map

$$\bigoplus_{i=1, \dots, n} \Gamma(X, \mathcal{O}_X) \xrightarrow{f_1, \dots, f_n} \Gamma(X, \mathcal{O}_X)$$

is surjective as desired. □

Note that if X is a Noetherian scheme then every quasi-coherent sheaf of ideals is automatically a coherent sheaf of ideals and a finite type quasi-coherent sheaf of ideals. Hence the preceding lemma and the next lemma both apply in this case.

Lemma 29.3.2. *Let X be a scheme. Assume that*

- (1) X is quasi-compact,
- (2) X is quasi-separated, and
- (3) $H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals \mathcal{I} of finite type.

Then X is affine.

Proof. By Properties, Lemma 27.20.3 every quasi-coherent sheaf of ideals is a directed colimit of quasi-coherent sheaves of ideals of finite type. By Cohomology, Lemma 20.20.1 taking cohomology on X commutes with directed colimits. Hence we see that $H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals on X . In other words we see that Lemma 29.3.1 applies. \square

29.4. Quasi-coherence of higher direct images

We have seen that the higher cohomology groups of a quasi-coherent module on an affine is zero. For (quasi-)separated quasi-compact schemes X this implies vanishing of cohomology groups of quasi-coherent sheaves beyond a certain degree. However, it may not be the case that X has finite cohomological dimension, because that is defined in terms of vanishing of cohomology of *all* \mathcal{O}_X -modules.

Lemma 29.4.1. *Let X be a quasi-compact and quasi-separated scheme. Let P be a property of the quasi-compact opens of X . Assume that*

- (1) P holds for every affine open of X ,
- (2) if U is quasi-compact open, V affine open, P holds for U , V , and $U \cap V$, then P holds for $U \cup V$.

Then P holds for every quasi-compact open of X and in particular for X .

Proof. First we argue by induction that P holds for *separated* quasi-compact opens $W \subset X$. Namely, such an open can be written as $W = U_1 \cup \dots \cup U_n$ and we can do induction on n using property (2) with $U = U_1 \cup \dots \cup U_{n-1}$ and $V = U_n$. This is allowed because $U \cap V = (U_1 \cap U_n) \cup \dots \cup (U_{n-1} \cap U_n)$ is also a union of $n - 1$ affine open subschemes by Schemes, Lemma 25.21.8 applied to the affine opens U_i and U_n of W . Having said this, for any quasi-compact open $W \subset X$ we can do induction on the number of affine opens needed to cover W using the same trick as before and using that the quasi-compact open $U_i \cap U_n$ is separated as an open subscheme of the affine scheme U_n . \square

Lemma 29.4.2. *Let X be a quasi-compact separated scheme. Let $t = t(X)$ be the minimal number of affine opens needed to cover X . Then $H^n(X, \mathcal{F}) = 0$ for all $n \geq t$ and all quasi-coherent sheaves \mathcal{F} .*

Proof. First proof. By induction on t . If $t = 1$ the result follows from Lemma 29.2.2. If $t > 1$ write $X = U \cup V$ with V affine open and $U = U_1 \cup \dots \cup U_{t-1}$ a union of $t - 1$ open affines. Note that in this case $U \cap V = (U_1 \cap V) \cup \dots \cup (U_{t-1} \cap V)$ is also a union of $t - 1$ affine open subschemes, see Schemes, Lemma 25.21.8. We apply the Mayer-Vietoris long exact sequence

$$0 \rightarrow H^0(X, \mathcal{F}) \rightarrow H^0(U, \mathcal{F}) \oplus H^0(V, \mathcal{F}) \rightarrow H^0(U \cap V, \mathcal{F}) \rightarrow H^1(X, \mathcal{F}) \rightarrow \dots$$

see Cohomology, Lemma 20.9.2. By induction we see that the groups $H^i(U, \mathcal{F})$, $H^i(V, \mathcal{F})$, $H^i(U \cap V, \mathcal{F})$ are zero for $i \geq t - 1$. It follows immediately that $H^i(X, \mathcal{F})$ is zero for $i \geq t$.

Second proof. Let $\mathcal{U} : X = \bigcup_{i=1}^t U_i$ be a finite affine open covering. Since X is separated the multiple intersections $U_{i_0 \dots i_p}$ are all affine, see Schemes, Lemma 25.21.8. By Lemma 29.2.5 the Čech cohomology groups $\check{H}^p(\mathcal{U}, \mathcal{F})$ agree with the cohomology groups. By Cohomology, Lemma 20.24.6 the Čech cohomology groups may be computed using the alternating Čech complex $\check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$. As the covering consists of t elements we see immediately that $\check{C}_{alt}^p(\mathcal{U}, \mathcal{F}) = 0$ for all $p \geq t$. Hence the result follows. \square

Lemma 29.4.3. *Let X be a quasi-compact quasi-separated scheme. Let $X = U_1 \cup \dots \cup U_t$ be an affine open covering. Set*

$$d = \max_{I \subset \{1, \dots, t\}} |I| + t \left(\bigcap_{i \in I} U_i \right)$$

where $t(U)$ is the minimal number of affines needed to cover the scheme U . Then $H^n(X, \mathcal{F}) = 0$ for all $n \geq d$ and all quasi-coherent sheaves \mathcal{F} .

Proof. Note that since X is quasi-separated the numbers $t(\bigcap_{i \in I} U_i)$ are finite. Let $\mathcal{U} : X = \bigcup_{i=1}^t U_i$. By Cohomology, Lemma 20.12.4 there is a spectral sequence

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(U, \mathcal{F})$. By Cohomology, Lemma 20.24.6 we have

$$E_2^{p,q} = H^p(\check{C}_{alt}^\bullet(\mathcal{U}, \underline{H}^q(\mathcal{F})))$$

The alternating Čech complex with values in the presheaf $\underline{H}^q(\mathcal{F})$ vanishes in high degrees by Lemma 29.4.2, more precisely $E_2^{p,q} = 0$ for $p + q \geq d$. Hence the result follows. \square

Lemma 29.4.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that f is quasi-separated and quasi-compact.*

- (1) *For any quasi-coherent \mathcal{O}_X -module \mathcal{F} the higher direct images $R^p f_* \mathcal{F}$ are quasi-coherent on S .*
- (2) *If S is quasi-compact, there exists an integer $n = n(X, S, f)$ such that $R^p f_* \mathcal{F} = 0$ for all $p \geq n$ and any quasi-coherent sheaf \mathcal{F} on X .*
- (3) *In fact, if S is quasi-compact we can find $n = n(X, S, f)$ such that for every morphism of schemes $S' \rightarrow S$ we have $R^p (f')_* \mathcal{F}' = 0$ for $p \geq n$ and any quasi-coherent sheaf \mathcal{F}' on X' . Here $f' : X' = S' \times_S X \rightarrow S'$ is the base change of f .*

Proof. We first prove (1). Note that under the hypotheses of the lemma the sheaf $R^0 f_* \mathcal{F} = f_* \mathcal{F}$ is quasi-coherent by Schemes, Lemma 25.24.1. Using Cohomology, Lemma 20.7.4 we see that forming higher direct images commutes with restriction to open subschemes. Since being quasi-coherent is local on S we may assume S is affine.

Assume S is affine and f quasi-compact and separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover X . We will prove this case of (1) by induction on t . If $t = 1$ then the morphism f is affine by Morphisms, Lemma 28.13.12 and (1) follows from Lemma 29.2.3. If $t > 1$ write $X = U \cup V$ with V affine open and $U = U_1 \cup \dots \cup U_{t-1}$ a union of $t - 1$ open affines. Note that in this case

$U \cap V = (U_1 \cap V) \cup \dots \cup (U_{t-1} \cap V)$ is also a union of $t - 1$ affine open subschemes, see Schemes, Lemma 25.21.8. We will apply the relative Mayer-Vietoris sequence

$$0 \rightarrow f_*\mathcal{F} \rightarrow a_*(\mathcal{F}|_U) \oplus b_*(\mathcal{F}|_V) \rightarrow c_*(\mathcal{F}|_{U \cap V}) \rightarrow R^1 f_*\mathcal{F} \rightarrow \dots$$

see Cohomology, Lemma 20.9.3. By induction we see that $R^p a_*\mathcal{F}$, $R^p b_*\mathcal{F}$ and $R^p c_*\mathcal{F}$ are all quasi-coherent. This implies that each of the sheaves $R^p f_*\mathcal{F}$ is quasi-coherent since it sits in the middle of a short exact sequence with a cokernel of a map between quasi-coherent sheaves on the left and a kernel of a map between quasi-coherent sheaves on the right. Using the results on quasi-coherent sheaves in Schemes, Section 25.24 we see conclude $R^p f_*\mathcal{F}$ is quasi-coherent.

Assume S is affine and f quasi-compact and quasi-separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover X . We will prove (1) by induction on t . In case $t = 1$ the morphism f is separated and we are back in the previous case (see previous paragraph). If $t > 1$ write $X = U \cup V$ with V affine open and U a union of $t - 1$ open affines. Note that in this case $U \cap V$ is an open subscheme of an affine scheme and hence separated (see Schemes, Lemma 25.21.6). We will apply the relative Mayer-Vietoris sequence

$$0 \rightarrow f_*\mathcal{F} \rightarrow a_*(\mathcal{F}|_U) \oplus b_*(\mathcal{F}|_V) \rightarrow c_*(\mathcal{F}|_{U \cap V}) \rightarrow R^1 f_*\mathcal{F} \rightarrow \dots$$

see Cohomology, Lemma 20.9.3. By induction and the result of the previous paragraph we see that $R^p a_*\mathcal{F}$, $R^p b_*\mathcal{F}$ and $R^p c_*\mathcal{F}$ are quasi-coherent. As in the previous paragraph this implies each of sheaves $R^p f_*\mathcal{F}$ is quasi-coherent.

Next, we prove (3) and a fortiori (2). Choose a finite affine open covering $S = \bigcup_{j=1, \dots, m} S_j$. For each i choose a finite affine open covering $f^{-1}(S_j) = \bigcup_{i=1, \dots, t_j} U_{ji}$. Let

$$d_j = \max_{I \subset \{1, \dots, t_j\}} |I| + t \left(\bigcap_{i \in I} U_{ji} \right)$$

be the integer found in Lemma 29.4.3. We claim that $n(X, S, f) = \max d_j$ works.

Namely, let $S' \rightarrow S$ be a morphism of schemes and let \mathcal{F}' be a quasi-coherent sheaf on $X' = S' \times_S X$. We want to show that $R^p f'_*\mathcal{F}' = 0$ for $p \geq n(X, S, f)$. Since this question is local on S' we may assume that S' is affine and maps into S_j for some j . Then $X' = S' \times_{S_j} f^{-1}(S_j)$ is covered by the open affines $S' \times_{S_j} U_{ji}$, $i = 1, \dots, t_j$ and the intersections

$$\bigcap_{i \in I} S' \times_{S_j} U_{ji} = S' \times_{S_j} \bigcap_{i \in I} U_{ji}$$

are covered by the same number of affines as before the base change. Applying Lemma 29.4.3 we get $H^p(X', \mathcal{F}') = 0$. By the first part of the proof we already know that each $R^q f'_*\mathcal{F}'$ is quasi-coherent hence has vanishing higher cohomology groups on our affine scheme S' , thus we see that $H^0(S', R^p f'_*\mathcal{F}') = H^p(X', \mathcal{F}') = 0$ by Cohomology, Lemma 20.14.6. Since $R^p f'_*\mathcal{F}'$ is quasi-coherent we conclude that $R^p f'_*\mathcal{F}' = 0$. \square

Lemma 29.4.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that f is quasi-separated and quasi-compact. Assume S is affine. For any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have*

$$H^q(X, \mathcal{F}) = H^0(S, R^q f_*\mathcal{F})$$

for all $q \in \mathbf{Z}$.

Proof. Consider the Leray spectral sequence $E_2^{p,q} = H^p(S, R^q f_* \mathcal{F})$ converging to $H^{p+q}(X, \mathcal{F})$, see Cohomology, Lemma 20.14.4. By Lemma 29.4.4 we see that the sheaves $R^q f_* \mathcal{F}$ are quasi-coherent. By Lemma 29.2.2 we see that $E_2^{p,q} = 0$ when $p > 0$. Hence the spectral sequence degenerates at E_2 and we win. See also Cohomology, Lemma 20.14.6 (2) for the general principle. \square

29.5. Cohomology and base change, I

Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on X . Suppose further that $g : S' \rightarrow S$ is any morphism of schemes. Denote $X' = X_{S'} = S' \times_S X$ the base change of X and denote $f' : X' \rightarrow S'$ the base change of f . Also write $g' : X' \rightarrow X$ the projection, and set $\mathcal{F}' = (g')^* \mathcal{F}$. Here is a diagram representing the situation:

$$(29.5.0.1) \quad \begin{array}{ccccc} \mathcal{F}' = (g')^* \mathcal{F} & & X' & \xrightarrow{g'} & X & & \mathcal{F} \\ & & \downarrow f' & & \downarrow f & & \\ Rf'_* \mathcal{F}' & & S' & \xrightarrow{g} & S & & Rf_* \mathcal{F} \end{array}$$

Here is the simplest case of the base change property we have in mind.

Lemma 29.5.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is affine. In this case $f_* \mathcal{F} \cong Rf_* \mathcal{F}$ is a quasi-coherent sheaf, and for every base change diagram (29.5.0.1) we have*

$$g^* f_* \mathcal{F} = f'_* (g')^* \mathcal{F}.$$

Proof. The vanishing of higher direct images is Lemma 29.2.3. The statement is local on S and S' . Hence we may assume $X = \text{Spec}(A)$, $S = \text{Spec}(R)$, $S' = \text{Spec}(R')$ and $\mathcal{F} = \widetilde{M}$ for some A -module M . We use Schemes, Lemma 25.7.3 to describe pullbacks and pushforwards of \mathcal{F} . Namely, $X' = \text{Spec}(R' \otimes_R A)$ and \mathcal{F}' is the quasi-coherent sheaf associated to $(R' \otimes_R A) \otimes_A M$. Thus we see that the lemma boils down to the equality

$$(R' \otimes_R A) \otimes_A M = R' \otimes_R M$$

as R' -modules. \square

In many situations it is sufficient to know about the following special case of cohomology and base change. It follows immediately from the stronger results in Section 29.7, but since it is so important it deserves its own proof.

Lemma 29.5.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on X . Let $g : S' \rightarrow S$ be a morphism of schemes. Assume that g is flat and that f is quasi-compact and quasi-separated. Then for any $i \geq 0$ we have*

$$R^i f'_* \mathcal{F}' = g^* R^i f_* \mathcal{F}$$

with notation as in (29.5.0.1). Moreover, the induced isomorphism is the map given by the base change map of Cohomology, Lemma 20.18.1.

Proof. The statement is local on S' and hence we may assume S and S' are affine. Say $S = \text{Spec}(A)$ and $S' = \text{Spec}(B)$. In this case we are really trying to show that the map

$$H^i(X, \mathcal{F}) \otimes_A B \longrightarrow H^i(X_B, \mathcal{F}_B)$$

(given by the reference in the statement of the lemma) is an isomorphism where $X_B = \text{Spec}(B) \times_{\text{Spec}(A)} X$ and \mathcal{F}_B is the pullback of \mathcal{F} to X_B .

In case X is separated, choose an affine open covering $\mathcal{U} : X = U_1 \cup \dots \cup U_t$ and recall that

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(X, \mathcal{F}),$$

see Lemma 29.2.5. If $\mathcal{U}_B : X_B = (U_1)_B \cup \dots \cup (U_t)_B$ we obtain by base change, then it is still the case that each $(U_i)_B$ is affine and that X_B is separated. Thus we obtain

$$\check{H}^p(\mathcal{U}_B, \mathcal{F}_B) = H^p(X_B, \mathcal{F}_B).$$

We have the following relation between the Čech complexes

$$\check{C}^\bullet(\mathcal{U}_B, \mathcal{F}_B) = \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \otimes_A B$$

as follows from Lemma 29.5.1. Since $A \rightarrow B$ is flat, the same thing remains true on taking cohomology.

In case X is quasi-separated, choose an affine open covering $\mathcal{U} : X = U_1 \cup \dots \cup U_t$. We will use the Čech-to-cohomology spectral sequence Cohomology, Lemma 20.12.4. The reader who wishes to avoid this spectral sequence can use Majer-Vietoris and induction on t as in the proof of Lemma 29.4.4. The spectral sequence has E_2 -page $E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$ and converges to $H^{p+q}(X, \mathcal{F})$. Similarly, we have a spectral sequence with E_2 -page $E_2^{p,q} = \check{H}^p(\mathcal{U}_B, \underline{H}^q(\mathcal{F}_B))$ which converges to $H^{p+q}(X_B, \mathcal{F}_B)$. Since the intersections $U_{i_0 \dots i_p}$ are quasi-compact and separated, the result of the second paragraph of the proof gives $\check{H}^p(\mathcal{U}_B, \underline{H}^q(\mathcal{F}_B)) = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F})) \otimes_A B$. Using that $A \rightarrow B$ is flat we conclude that $H^i(X, \mathcal{F}) \otimes_A B \rightarrow H^i(X_B, \mathcal{F}_B)$ is an isomorphism for all i and we win. \square

29.6. Colimits and higher direct images

General results of this nature can be found in Cohomology, Section 20.20, Sheaves, Lemma 6.29.1, and Modules, Lemma 17.11.6.

Lemma 29.6.1. *Let $f : X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{F} = \text{colim } \mathcal{F}_i$ be a filtered colimit of quasi-coherent sheaves on X . Then for any $p \geq 0$ we have*

$$R^p f_* \mathcal{F} = \text{colim } R^p f_* \mathcal{F}_i.$$

Proof. Recall that $R^p f_* \mathcal{F}$ is the sheaf associated to $U \mapsto H^p(f^{-1}U, \mathcal{F})$, see Cohomology, Lemma 20.7.3. Recall that the colimit is the sheaf associated to the presheaf colimit (taking colimits over opens). Hence we can apply Cohomology, Lemma 20.20.1 to $H^p(f^{-1}U, -)$ where U is affine to conclude. (Because the basis of affine opens in $f^{-1}U$ satisfies the assumptions of that lemma.) \square

29.7. Cohomology and base change, II

Let $f : X \rightarrow S$ be a morphism of schemes and let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If f is quasi-compact and quasi-separated we would like to represent $Rf_* \mathcal{F}$ by a complex of quasi-coherent sheaves on S . This follows from the fact that the sheaves $R^i f_* \mathcal{F}$ are quasi-coherent if S is quasi-compact and has affine diagonal, using that $D_{Qcoh}(S)$ is equivalent to $D(Qcoh(\mathcal{O}_S))$, see Derived Categories of Schemes, Proposition 35.6.5.

In this section we will use a different approach which produces an explicit complex having a good base change property. The construction is particularly easy if f and S are separated, or more generally have affine diagonal. Since this is the case which by far the most often used we treat it separately.

Lemma 29.7.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume X is quasi-compact and X and S have affine diagonal (e.g., if X and S are separated). In this case we can compute $Rf_*\mathcal{F}$ as follows:*

- (1) Choose a finite affine open covering $\mathcal{U} : X = \bigcup_{i=1, \dots, n} U_i$.
- (2) For $i_0, \dots, i_p \in \{1, \dots, n\}$ denote $f_{i_0 \dots i_p} : U_{i_0 \dots i_p} \rightarrow S$ the restriction of f to the intersection $U_{i_0 \dots i_p} = U_{i_0} \cap \dots \cap U_{i_p}$.
- (3) Set $\mathcal{F}_{i_0 \dots i_p}$ equal to the restriction of \mathcal{F} to $U_{i_0 \dots i_p}$.
- (4) Set

$$\check{\mathcal{C}}^p(\mathcal{U}, f, \mathcal{F}) = \bigoplus_{i_0 \dots i_p} f_{i_0 \dots i_p}^* \mathcal{F}_{i_0 \dots i_p}$$

and define differentials $d : \check{\mathcal{C}}^p(\mathcal{U}, f, \mathcal{F}) \rightarrow \check{\mathcal{C}}^{p+1}(\mathcal{U}, f, \mathcal{F})$ as in Cohomology, Equation (20.10.0.1).

Then the complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$ is a complex of quasi-coherent sheaves on S which comes equipped with an isomorphism

$$\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) \longrightarrow Rf_*\mathcal{F}$$

in $D^+(S)$. This isomorphism is functorial in the quasi-coherent sheaf \mathcal{F} .

Proof. Consider the resolution $\mathcal{F} \rightarrow \mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ of Cohomology, Lemma 20.25.1. We have an equality of complexes $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = f_*\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ of quasi-coherent \mathcal{O}_S -modules. The morphisms $j_{i_0 \dots i_p} : U_{i_0 \dots i_p} \rightarrow X$ and the morphisms $f_{i_0 \dots i_p} : U_{i_0 \dots i_p} \rightarrow S$ are affine by Morphisms, Lemma 28.13.11. Hence $R^q j_{i_0 \dots i_p}^* \mathcal{F}_{i_0 \dots i_p}$ as well as $R^q f_{i_0 \dots i_p}^* \mathcal{F}_{i_0 \dots i_p}$ are zero for $q > 0$ (Lemma 29.2.3). Using $f \circ j_{i_0 \dots i_p} = f_{i_0 \dots i_p}$ and the spectral sequence of Cohomology, Lemma 20.14.8 we conclude that $R^q f_*(j_{i_0 \dots i_p}^* \mathcal{F}_{i_0 \dots i_p}) = 0$ for $q > 0$. Since the terms of the complex $\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ are finite direct sums of the sheaves $j_{i_0 \dots i_p}^* \mathcal{F}_{i_0 \dots i_p}$ we conclude using Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) that

$$Rf_*\mathcal{F} = f_*\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$$

as desired. □

Next, we are going to consider what happens if we do a base change.

Lemma 29.7.2. *With notation as in diagram (29.5.0.1). Assume $f : X \rightarrow S$ and \mathcal{F} satisfy the hypotheses of Lemma 29.7.1. Choose a finite affine open covering $\mathcal{U} : X = \bigcup U_i$ of X . There is a canonical isomorphism*

$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) \longrightarrow Rf'_*\mathcal{F}'$$

in $D^+(S')$. Moreover, if $S' \rightarrow S$ is affine, then in fact

$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$$

with $\mathcal{U}' : X' = \bigcup U'_i$ where $U'_i = (g')^{-1}(U_i) = U_{i, S'}$ is also affine.

Proof. In fact we may define $U'_i = (g')^{-1}(U_i) = U_{i, S'}$ no matter whether S' is affine over S or not. Let $\mathcal{U}' : X' = \bigcup U'_i$ be the induced covering of X' . In this case we claim that

$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$$

with $\check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$ defined in exactly the same manner as in Lemma 29.7.1. This is clear from the case of affine morphisms (Lemma 29.5.1) by working locally on S' . Moreover, exactly as in the proof of Lemma 29.7.1 one sees that there is an isomorphism

$$\check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}') \longrightarrow Rf'_*\mathcal{F}'$$

in $D^+(S')$ since the morphisms $U'_i \rightarrow X'$ and $U'_i \rightarrow S'$ are still affine (being base changes of affine morphisms). Details omitted. \square

The lemma above says that the complex

$$\mathcal{K}^\bullet = \check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$$

is a bounded below complex of quasi-coherent sheaves on S which *universally* computes the higher direct images of $f : X \rightarrow S$. This is something about this particular complex and it is not preserved by replacing $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$ by a quasi-isomorphic complex in general! In other words, this is not a statement that makes sense in the derived category. The reason is that the pullback $g^*\mathcal{K}^\bullet$ is *not* equal to the derived pullback $Lg^*\mathcal{K}^\bullet$ of \mathcal{K}^\bullet in general!

Here is a more general case where we can prove this statement. We remark that the condition of S being separated is harmless in most applications, since this is usually used to prove some local property of the total derived image. The proof is significantly more involved and uses hypercoverings; it is a nice example of how you can use them sometimes.

Lemma 29.7.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on X . Assume that f is quasi-compact and quasi-separated and that S is quasi-compact and separated. There exists a bounded below complex \mathcal{K}^\bullet of quasi-coherent \mathcal{O}_S -modules with the following property: For every morphism $g : S' \rightarrow S$ the complex $g^*\mathcal{K}^\bullet$ is a representative for $Rf'_*\mathcal{F}'$ with notation as in diagram (29.5.0.1).*

Proof. (If f is separated as well, please see Lemma 29.7.2.) The assumptions imply in particular that X is quasi-compact and quasi-separated as a scheme. Let \mathcal{B} be the set of affine opens of X . By Hypercoverings, Lemma 24.10.4 we can find a hypercovering $K = (I, \{U_i\})$ such that each I_n is finite and each U_i is an affine open of X . By Hypercoverings, Lemma 24.4.3 there is a spectral sequence with E_2 -page

$$E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(X, \mathcal{F})$. Note that $\check{H}^p(K, \underline{H}^q(\mathcal{F}))$ is the p th cohomology group of the complex

$$\prod_{i \in I_0} H^q(U_i, \mathcal{F}) \rightarrow \prod_{i \in I_1} H^q(U_i, \mathcal{F}) \rightarrow \prod_{i \in I_2} H^q(U_i, \mathcal{F}) \rightarrow \dots$$

Since each U_i is affine we see that this is zero unless $q = 0$ in which case we obtain

$$\prod_{i \in I_0} \mathcal{F}(U_i) \rightarrow \prod_{i \in I_1} \mathcal{F}(U_i) \rightarrow \prod_{i \in I_2} \mathcal{F}(U_i) \rightarrow \dots$$

Thus we conclude that $R\Gamma(X, \mathcal{F})$ is computed by this complex.

For any n and $i \in I_n$ denote $f_i : U_i \rightarrow S$ the restriction of f to U_i . As S is separated and U_i is affine this morphism is affine. Consider the complex of quasi-coherent sheaves

$$\mathcal{K}^\bullet = (\prod_{i \in I_0} f_{i,*}\mathcal{F}|_{U_i} \rightarrow \prod_{i \in I_1} f_{i,*}\mathcal{F}|_{U_i} \rightarrow \prod_{i \in I_2} f_{i,*}\mathcal{F}|_{U_i} \rightarrow \dots)$$

on S . As in Hypercoverings, Lemma 24.4.3 we obtain a map $\mathcal{K}^\bullet \rightarrow Rf_*\mathcal{F}$ in $D(\mathcal{O}_S)$ by choosing an injective resolution of \mathcal{F} (details omitted). Consider any affine scheme V and a morphism $g : V \rightarrow S$. Then the base change X_V has a hypercovering $K_V = (I, \{U_{i,V}\})$ obtained by base change. Moreover, $g^*f_{i,*}\mathcal{F} = f_{i,V,*}(g')^*\mathcal{F}|_{U_{i,V}}$. Thus the arguments above prove that $\Gamma(V, g^*\mathcal{K}^\bullet)$ computes $R\Gamma(X_V, (g')^*\mathcal{F})$. This finishes the proof of the lemma as it suffices to prove the equality of complexes Zariski locally on S' . \square

29.8. Cohomology of projective space

In this section we compute the cohomology of the twists of the structure sheaf on \mathbf{P}_S^n over a scheme S . Recall that \mathbf{P}_S^n was defined as the fibre product $\mathbf{P}_S^n = S \times_{\text{Spec}(\mathbf{Z})} \mathbf{P}_{\mathbf{Z}}^n$ in Constructions, Definition 26.13.2. It was shown to be equal to

$$\mathbf{P}_S^n = \underline{\text{Proj}}_S(\mathcal{O}_S[T_0, \dots, T_n])$$

in Constructions, Lemma 26.21.4. In particular, projective space is a particular case of a projective bundle. If $S = \text{Spec}(R)$ is affine then we have

$$\mathbf{P}_S^n = \mathbf{P}_R^n = \text{Proj}(R[T_0, \dots, T_n]).$$

All these identifications are compatible and compatible with the constructions of the twisted structure sheaves $\mathcal{O}_{\mathbf{P}_S^n}(d)$.

Before we state the result we need some notation. Let R be a ring. Recall that $R[T_0, \dots, T_n]$ is a graded R -algebra where each T_i is homogeneous of degree 1. Denote $(R[T_0, \dots, T_n])_d$ the degree d summand. It is a finite free R -module of rank $\binom{n+d}{d}$ when $d \geq 0$ and zero else. It has a basis consisting of monomials $T_0^{e_0} \dots T_n^{e_n}$ with $\sum e_i = d$. We will also use the following notation: $R[\frac{1}{T_0}, \dots, \frac{1}{T_n}]$ denotes the \mathbf{Z} -graded ring with $\frac{1}{T_i}$ in degree -1 . In particular the \mathbf{Z} -graded $R[\frac{1}{T_0}, \dots, \frac{1}{T_n}]$ module

$$\frac{1}{T_0 \dots T_n} R[\frac{1}{T_0}, \dots, \frac{1}{T_n}]$$

which shows up in the statement below is zero in degrees $\geq -n$, is free on the generator $\frac{1}{T_0 \dots T_n}$ in degree $-n-1$ and is free of rank $(-1)^n \binom{n+d}{d}$ for $d \leq -n-1$.

Lemma 29.8.1. *Let R be a ring. Let $n \geq 0$ be an integer. We have*

$$H^q(\mathbf{P}_R^n, \mathcal{O}_{\mathbf{P}_R^n}(d)) = \begin{cases} (R[T_0, \dots, T_n])_d & \text{if } q = 0 \\ 0 & \text{if } q \neq 0, n \\ \left(\frac{1}{T_0 \dots T_n} R[\frac{1}{T_0}, \dots, \frac{1}{T_n}]\right)_d & \text{if } q = n \end{cases}$$

as R -modules.

Proof. We will use the standard affine open covering

$$\mathcal{U} : \mathbf{P}_R^n = \bigcup_{i=0}^n D_+(T_i)$$

to compute the cohomology using the Cech complex. This is permissible by Lemma 29.2.5 since any intersection of finitely many affine $D_+(T_i)$ is also a standard affine open (see Constructions, Section 26.8). In fact, we can use the alternating or ordered Cech complex according to Cohomology, Lemmas 20.24.3 and 20.24.6.

The ordering we will use on $\{0, \dots, n\}$ is the usual one. Hence the complex we are looking at has terms

$$\check{C}_{ord}^p(\mathcal{U}, \mathcal{O}_{\mathbf{P}^R}(d)) = \bigoplus_{i_0 < \dots < i_p} (R[T_0, \dots, T_n, \frac{1}{T_{i_0} \dots T_{i_p}}])_d$$

Moreover, the maps are given by the usual formula

$$d(s)_{i_0 \dots i_{p+1}} = \sum_{j=0}^{p+1} (-1)^j s_{i_0 \dots \hat{i}_j \dots i_{p+1}}$$

see Cohomology, Section 20.24. Note that each term of this complex has a natural \mathbf{Z}^{n+1} -grading. Namely, we get this by declaring a monomial $T_0^{e_0} \dots T_n^{e_n}$ to be homogeneous with weight $(e_0, \dots, e_n) \in \mathbf{Z}^{n+1}$. It is clear that the differential given above respects the grading. In a formula we have

$$\check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}^R}(d)) = \bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}} \check{C}^\bullet(\vec{e})$$

where not all summand on the right hand side occur (see below). Hence in order to compute the cohomology modules of the complex it suffices to compute the cohomology of the graded pieces and take the direct sum at the end.

Fix $\vec{e} = (e_0, \dots, e_n) \in \mathbf{Z}^{n+1}$. In order for this weight to occur in the complex above we need to assume $e_0 + \dots + e_n = d$ (if not then it occurs for a different twist of the structure sheaf of course). Assuming this set

$$NEG(\vec{e}) = \{i \in \{0, \dots, n\} \mid e_i < 0\}.$$

With this notation the weight \vec{e} summand $\check{C}^\bullet(\vec{e})$ of the Cech complex above has the following terms

$$\check{C}^p(\vec{e}) = \bigoplus_{i_0 < \dots < i_p, NEG(\vec{e}) \subset \{i_0, \dots, i_p\}} R \cdot T_0^{e_0} \dots T_n^{e_n}$$

In other words, the terms corresponding to $i_0 < \dots < i_p$ such that $NEG(\vec{e})$ is not contained in $\{i_0 \dots i_p\}$ are zero. The differential of the complex $\check{C}^\bullet(\vec{e})$ is still given by the exact same formula as above.

Suppose that $NEG(\vec{e}) = \{0, \dots, n\}$, i.e., that all exponents e_i are negative. In this case the complex $\check{C}^\bullet(\vec{e})$ has only one term, namely $\check{C}^n(\vec{e}) = R \cdot \frac{1}{T^{-e_0} \dots T^{-e_n}}$. Hence in this case

$$H^q(\check{C}^\bullet(\vec{e})) = \begin{cases} R \cdot \frac{1}{T^{-e_0} \dots T^{-e_n}} & \text{if } q = n \\ 0 & \text{if else} \end{cases}$$

The direct sum of all of these terms clearly gives the value

$$\left(\frac{1}{T_0 \dots T_n} R[\frac{1}{T_0}, \dots, \frac{1}{T_n}] \right)_d$$

in degree n as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).

Assume $NEG(\vec{e}) = \emptyset$. In this case the complex $\check{C}^\bullet(\vec{e})$ has a summand R corresponding to all $i_0 < \dots < i_p$. Let us compare the complex $\check{C}^\bullet(\vec{e})$ to another complex. Namely, consider the affine open open covering

$$\mathcal{V} : \text{Spec}(R) = \bigcup_{i \in \{0, \dots, n\}} V_i$$

where $V_i = \text{Spec}(R)$ for all i . Consider the alternating Cech complex

$$\check{C}_{ord}^\bullet(\mathcal{V}, \mathcal{O}_{\text{Spec}(R)})$$

By the same reasoning as above this computes the cohomology of the structure sheaf on $\text{Spec}(R)$. Hence we see that $H^p(\check{\mathcal{C}}_{ord}^\bullet(\mathcal{V}, \mathcal{O}_{\text{Spec}(R)})) = R$ if $p = 0$ and is 0 whenever $p > 0$. For these facts, see Lemma 29.2.1 and its proof. Note that also $\check{\mathcal{C}}_{ord}^\bullet(\mathcal{V}, \mathcal{O}_{\text{Spec}(R)})$ has a summand R for every $i_0 < \dots < i_p$ and has exactly the same differential as $\check{\mathcal{C}}^\bullet(\vec{e})$. In other words these complexes are isomorphic complexes and hence have the same cohomology. We conclude that

$$H^q(\check{\mathcal{C}}^\bullet(\vec{e})) = \begin{cases} R \cdot T^{e_0} \dots T^{e_n} & \text{if } q = 0 \\ 0 & \text{if else} \end{cases}$$

in the case that $NEG(\vec{e}) = \emptyset$. The direct sum of all of these terms clearly gives the value

$$(R[T_0, \dots, T_n])_d$$

in degree 0 as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).

To finish the proof of the lemma we have to show that the complexes $\check{\mathcal{C}}^\bullet(\vec{e})$ are acyclic when $NEG(\vec{e})$ is neither empty nor equal to $\{0, \dots, n\}$. Pick an index $i_{\text{fix}} \notin NEG(\vec{e})$ (such an index exists). Consider the map

$$h : \check{\mathcal{C}}^{p+1}(\vec{e}) \rightarrow \check{\mathcal{C}}^p(\vec{e})$$

given by the rule

$$h(s)_{i_0 \dots i_p} = s_{i_{\text{fix}} i_0 \dots i_p}$$

(compare with the proof of Lemma 29.2.1). It is clear that this is well defined since

$$NEG(\vec{e}) \subset \{i_0, \dots, i_p\} \Leftrightarrow NEG(\vec{e}) \subset \{i_{\text{fix}}, i_0, \dots, i_p\}$$

Also $\check{\mathcal{C}}^0(\vec{e}) = 0$ so that this formula does work for all p including $p = -1$. The exact same (combinatorial) computation as in the proof of Lemma 29.2.1 shows that

$$(hd + dh)(s)_{i_0 \dots i_p} = s_{i_0 \dots i_p}$$

Hence we see that the identity map of the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ is homotopic to zero which implies that it is acyclic. \square

In the following lemma we are going to use the pairing of free R -modules

$$R[T_0, \dots, T_n] \times \frac{1}{T_0 \dots T_n} R\left[\frac{1}{T_0}, \dots, \frac{1}{T_n}\right] \longrightarrow R$$

which is defined by the rule

$$(f, g) \longmapsto \text{coefficient of } \frac{1}{T_0 \dots T_n} \text{ in } fg.$$

In other words, the basis element $T_0^{e_0} \dots T_n^{e_n}$ pairs with the basis element $T_0^{d_0} \dots T_n^{d_n}$ to give 1 if and only if $e_i + d_i = -1$ for all i , and pairs to zero in all other cases. Using this pairing we get an identification

$$\left(\frac{1}{T_0 \dots T_n} R\left[\frac{1}{T_0}, \dots, \frac{1}{T_n}\right] \right)_d = \text{Hom}_R((R[T_0, \dots, T_n])_{-n-1-d}, R)$$

Thus we can reformulate the result of Lemma 29.8.1 as saying that

$$(29.8.1.1) \quad H^q(\mathbf{P}^n, \mathcal{O}_{\mathbf{P}^n}(d)) = \begin{cases} (R[T_0, \dots, T_n])_d & \text{if } q = 0 \\ 0 & \text{if } q \neq 0, n \\ \text{Hom}_R((R[T_0, \dots, T_n])_{-n-1-d}, R) & \text{if } q = n \end{cases}$$

Lemma 29.8.2. *The identifications of Equation (29.8.1.1) are compatible with base change w.r.t. ring maps $R \rightarrow R'$. Moreover, for any $f \in R[T_0, \dots, T_n]$ homogeneous of degree m the map multiplication by f*

$$\mathcal{O}_{\mathbf{P}_R^n}(d) \longrightarrow \mathcal{O}_{\mathbf{P}_R^n}(d+m)$$

induces the map on the cohomology group via the identifications of Equation (29.8.1.1) which is multiplication by f for H^0 and the contragredient of multiplication by f

$$(R[T_0, \dots, T_n])_{-n-1-(d+m)} \longrightarrow (R[T_0, \dots, T_n])_{-n-1-d}$$

on H^n .

Proof. Suppose that $R \rightarrow R'$ is a ring map. Let \mathcal{U} be the standard affine open covering of \mathbf{P}_R^n , and let \mathcal{U}' be the standard affine open covering of $\mathbf{P}_{R'}^n$. Note that \mathcal{U}' is the pullback of the covering \mathcal{U} under the canonical morphism $\mathbf{P}_{R'}^n \rightarrow \mathbf{P}_R^n$. Hence there is a map of Čech complexes

$$\gamma : \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) \longrightarrow \check{C}_{ord}^\bullet(\mathcal{U}', \mathcal{O}_{\mathbf{P}_{R'}}(d))$$

which is compatible with the map on cohomology by Cohomology, Lemma 20.16.1. It is clear from the computations in the proof of Lemma 29.8.1 that this map of Čech complexes is compatible with the identifications of the cohomology groups in question. (Namely the basis elements for the Čech complex over R simply map to the corresponding basis elements for the Čech complex over R' .) Whence the first statement of the lemma.

Now fix the ring R and consider two homogeneous polynomials $f, g \in R[T_0, \dots, T_n]$ both of the same degree m . Since cohomology is an additive functor, it is clear that the map induced by multiplication by $f + g$ is the same as the sum of the maps induced by multiplication by f and the map induced by multiplication by g . Moreover, since cohomology is a functor a similar result holds for multiplication by a product fg where f, g are both homogeneous (but not necessarily of the same degree). Hence to verify the second statement of the lemma it suffices to prove this when $f = x \in R$ or when $f = T_i$. In the case of multiplication by an element $x \in R$ the result follows since every cohomology groups or complex in sight has the structure of an R -module or complex of R -modules. Finally, we consider the case of multiplication by T_i as a $\mathcal{O}_{\mathbf{P}_R^n}$ -linear map

$$\mathcal{O}_{\mathbf{P}_R^n}(d) \longrightarrow \mathcal{O}_{\mathbf{P}_R^n}(d+1)$$

The statement on H^0 is clear. For the statement on H^n consider multiplication by T_i as a map on Čech complexes

$$\check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) \longrightarrow \check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d+1))$$

We are going to use the notation introduced in the proof of Lemma 29.8.1. We consider the effect of multiplication by T_i in terms of the decompositions

$$\check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) = \bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}, \sum e_i = d} \check{C}^\bullet(\vec{e})$$

and

$$\check{C}_{ord}^\bullet(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d+1)) = \bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}, \sum e_i = d+1} \check{C}^\bullet(\vec{e})$$

It is clear that it maps the subcomplex $\check{C}^\bullet(\vec{e})$ to the subcomplex $\check{C}^\bullet(\vec{e} + \vec{b}_i)$ where $\vec{b}_i = (0, \dots, 0, 1, 0, \dots, 0)$ the i th basis vector. In other words, it maps the summand of H^n corresponding to \vec{e} with $e_i < 0$ and $\sum e_i = d$ to the summand of H^n

corresponding to $\vec{e} + \vec{b}_i$ (which is zero if $e_i + b_i \geq 0$). It is easy to see that this corresponds exactly to the action of the contragredient of multiplication by T_i as a map

$$(R[T_0, \dots, T_n])_{-n-1-(d+1)} \longrightarrow (R[T_0, \dots, T_n])_{-n-1-d}$$

This proves the lemma. □

Before we state the relative version we need some notation. Namely, recall that $\mathcal{O}_S[T_0, \dots, T_n]$ is a graded \mathcal{O}_S -module where each T_i is homogeneous of degree 1. Denote $(\mathcal{O}_S[T_0, \dots, T_n])_d$ the degree d summand. It is a finite locally free sheaf of rank $\binom{n+d}{d}$ on S .

Lemma 29.8.3. *Let S be a scheme. Let $n \geq 0$ be an integer. Consider the structure morphism*

$$f : \mathbf{P}_S^n \longrightarrow S.$$

We have

$$R^q f_*(\mathcal{O}_{\mathbf{P}_S^n}(d)) = \begin{cases} (\mathcal{O}_S[T_0, \dots, T_n])_d & \text{if } q = 0 \\ 0 & \text{if } q \neq 0, n \\ \mathcal{H}om_{\mathcal{O}_S}((\mathcal{O}_S[T_0, \dots, T_n])_{-n-1-d}, \mathcal{O}_S) & \text{if } q = n \end{cases}$$

Proof. Omitted. Hint: This follows since the identifications in (29.8.1.1) are compatible with affine base change by Lemma 29.8.2. □

Next we state the version for projective bundles associated to finite locally free sheaves. Let S be a scheme. Let \mathcal{E} be a finite locally free \mathcal{O}_S -module of constant rank $n + 1$, see Modules, Section 17.14. In this case we think of $\text{Sym}(\mathcal{E})$ as a graded \mathcal{O}_S -module where \mathcal{E} is the graded part of degree 1. And $\text{Sym}^d(\mathcal{E})$ is the degree d summand. It is a finite locally free sheaf of rank $\binom{n+d}{d}$ on S . Recall that our normalization is that

$$\pi : \mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\text{Sym}(\mathcal{E})) \longrightarrow S$$

and that there are natural maps $\text{Sym}^d(\mathcal{E}) \rightarrow \pi_* \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$.

Lemma 29.8.4. *Let S be a scheme. Let $n \geq 1$. Let \mathcal{E} be a finite locally free \mathcal{O}_S -module of constant rank $n + 1$. Consider the structure morphism*

$$\pi : \mathbf{P}(\mathcal{E}) \longrightarrow S.$$

We have

$$R^q \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)) = \begin{cases} \text{Sym}^d(\mathcal{E}) & \text{if } q = 0 \\ 0 & \text{if } q \neq 0, n \\ \mathcal{H}om_{\mathcal{O}_S}(\text{Sym}^{-n-1-d}(\mathcal{E}) \otimes_{\mathcal{O}_S} \wedge^{n+1} \mathcal{E}, \mathcal{O}_S) & \text{if } q = n \end{cases}$$

These identifications are compatible with base change and isomorphism between locally free sheaves.

Proof. Consider the canonical map

$$\pi^* \mathcal{E} \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$$

and twist down by 1 to get

$$\pi^*(\mathcal{E})(-1) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}$$

This is a surjective map from a locally free rank $n + 1$ sheaf onto the structure sheaf. Hence the corresponding Koszul complex is exact (insert future reference here). In other words there is an exact complex

$$0 \rightarrow \pi^*(\wedge^{n+1}\mathcal{E})(-n - 1) \rightarrow \dots \rightarrow \pi^*(\wedge^i\mathcal{E})(-i) \rightarrow \dots \rightarrow \pi^*\mathcal{E}(-1) \rightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})} \rightarrow 0$$

We will think of the term $\pi^*(\wedge^i\mathcal{E})(-i)$ as being in degree $-i$. We are going to compute the higher direct images of this acyclic complex using the first spectral sequence of Derived Categories, Lemma 13.21.3. Namely, we see that there is a spectral sequence with terms

$$E_2^{p,q} = H^p(L^{\bullet,q}) \quad \text{with} \quad L^{-i,q} = R^q\pi_* (\pi^*(\wedge^i\mathcal{E})(-i))$$

converging to zero! By the projection formula (Cohomology, Lemma 20.8.2) we have

$$L^{-i,q} = \wedge^i\mathcal{E} \otimes_{\mathcal{O}_S} R^q\pi_* (\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-i)).$$

Note that locally on S the sheaf \mathcal{E} is trivial, i.e., isomorphic to $\mathcal{O}_S^{\oplus n+1}$, hence locally on S the morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$ can be identified with $\mathbf{P}_S^n \rightarrow S$. Hence locally on S we can use the result of Lemmas 29.8.1, 29.8.2, or 29.8.3. It follows that $L^{-i,q} = 0$ unless $i = q = 0$ or $i = n + 1$ and $q = n$. This in turn implies that $E_2^{p,q} = 0$ unless $(p, q) = (0, 0)$ or $(p, q) = (-n - 1, n)$, and

$$\begin{aligned} E_2^{0,0} &= \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})} = \mathcal{O}_S \\ E_2^{-n-1,n} &= \wedge^{n+1}\mathcal{E} \otimes_{\mathcal{O}_S} R^n\pi_* (\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n - 1)). \end{aligned}$$

Hence there can only be one nonzero differential in the spectral sequence namely the map d_{n+1} inducing a map

$$d_{n+1}^{0,0} : \mathcal{O}_S \longrightarrow \wedge^{n+1}\mathcal{E} \otimes_{\mathcal{O}_S} R^n\pi_* (\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n - 1))$$

which has to be an isomorphism (because the spectral sequence converges to the 0 sheaf). Since $\wedge^{n+1}\mathcal{E}$ is an invertible sheaf, this implies that $R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n - 1)$ is invertible as well and canonically isomorphic to the inverse of $\wedge^{n+1}\mathcal{E}$. In other words we have proved the case $d = -n - 1$ of the lemma.

Working locally on S we see immediately from the computation of cohomology in Lemmas 29.8.1, 29.8.2, or 29.8.3 the statements on vanishing of the lemma. Moreover the result on $R^0\pi_*$ is clear as well, since there are canonical maps $\text{Sym}^d(\mathcal{E}) \rightarrow \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ for all d . It remains to show that the description of $R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ is correct for $d < -n - 1$. In order to do this we consider the map

$$\pi^*(\text{Sym}^{-d-n-1}(\mathcal{E})) \otimes_{\mathcal{O}_{\mathbf{P}(\mathcal{E})}} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n - 1)$$

Applying $R^n\pi_*$ and the projection formula (see above) we get a map

$$\text{Sym}^{-d-n-1}(\mathcal{E}) \otimes_{\mathcal{O}_S} R^n\pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)) \longrightarrow R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n - 1) = (\wedge^{n+1}\mathcal{E})^{\otimes -1}$$

(the last equality we have shown above). Again by the local calculations of Lemmas 29.8.1, 29.8.2, or 29.8.3 it follows that this map induces a perfect pairing between $R^n\pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d))$ and $\text{Sym}^{-d-n-1}(\mathcal{E}) \otimes \wedge^{n+1}(\mathcal{E})$ as desired. \square

29.9. Coherent sheaves on locally Noetherian schemes

We have defined the notion of a coherent module on any ringed space in Modules, Section 17.12. Although it is possible to consider coherent sheaves on non-Noetherian schemes we will always assume the base scheme is locally Noetherian when we consider coherent sheaves. Here is a characterization of coherent sheaves on locally Noetherian schemes.

Lemma 29.9.1. *Let X be a locally Noetherian scheme. Let \mathcal{F} be an \mathcal{O}_X -module. The following are equivalent*

- (1) \mathcal{F} is coherent,
- (2) \mathcal{F} is a quasi-coherent, finite type \mathcal{O}_X -module,
- (3) \mathcal{F} is a finitely presented \mathcal{O}_X -module,
- (4) for any affine open $\text{Spec}(A) = U \subset X$ we have $\mathcal{F}|_U = \widetilde{M}$ with M a finite A -module, and
- (5) there exists an affine open covering $X = \bigcup U_i$, $U_i = \text{Spec}(A_i)$ such that each $\mathcal{F}|_{U_i} = \widetilde{M}_i$ with M_i a finite A_i -module.

In particular \mathcal{O}_X is coherent, any invertible \mathcal{O}_X -module is coherent, and more generally any finite locally free \mathcal{O}_X -module is coherent.

Proof. The implications (1) \Rightarrow (2) and (1) \Rightarrow (3) hold in general, see Modules, Lemma 17.12.2. If \mathcal{F} is finitely presented then \mathcal{F} is quasi-coherent, see Modules, Lemma 17.11.2. Hence also (3) \Rightarrow (2).

Assume \mathcal{F} is a quasi-coherent, finite type \mathcal{O}_X -module. By Properties, Lemma 27.16.1 we see that on any affine open $\text{Spec}(A) = U \subset X$ we have $\mathcal{F}|_U = \widetilde{M}$ with M a finite A -module. Since A is Noetherian we see that M has a finite resolution

$$A^{\oplus m} \rightarrow A^{\oplus n} \rightarrow M \rightarrow 0.$$

Hence \mathcal{F} is of finite presentation by Properties, Lemma 27.16.2. In other words (2) \Rightarrow (3).

By Modules, Lemma 17.12.5 it suffices to show that \mathcal{O}_X is coherent in order to show that (3) implies (1). Thus we have to show: given any open $U \subset X$ and any finite collection of sections $f_i \in \mathcal{O}_X(U)$, $i = 1, \dots, n$ the kernel of the map $\bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{O}_U$ is of finite type. Since being of finite type is a local property it suffices to check this in a neighbourhood of any $x \in U$. Thus we may assume $U = \text{Spec}(A)$ is affine. In this case $f_1, \dots, f_n \in A$ are elements of A . Since A is Noetherian, see Properties, Lemma 27.5.2 the kernel K of the map $\bigoplus_{i=1, \dots, n} A \rightarrow A$ is a finite A -module. See for example Algebra, Lemma 10.49.1. As the functor $\widetilde{}$ is exact, see Schemes, Lemma 25.5.4 we get an exact sequence

$$\widetilde{K} \rightarrow \bigoplus_{i=1, \dots, n} \mathcal{O}_U \rightarrow \mathcal{O}_U$$

and by Properties, Lemma 27.16.1 again we see that \widetilde{K} is of finite type. We conclude that (1), (2) and (3) are all equivalent.

It follows from Properties, Lemma 27.16.1 that (2) implies (4). It is trivial that (4) implies (5). The discussion in Schemes, Section 25.24 show that (5) implies that \mathcal{F} is quasi-coherent and it is clear that (5) implies that \mathcal{F} is of finite type. Hence (5) implies (2) and we win. \square

Lemma 29.9.2. *Let X be a locally Noetherian scheme. The category of coherent \mathcal{O}_X -modules is abelian. More precisely, the kernel and cokernel of a map of coherent \mathcal{O}_X -modules are coherent. Any extension of coherent sheaves is coherent.*

Proof. This is a restatement of Modules, Lemma 17.12.4 in a particular case. \square

The following lemma does not always hold for the category of coherent \mathcal{O}_X -modules on a general ringed space X .

Lemma 29.9.3. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Any quasi-coherent submodule of \mathcal{F} is coherent. Any quasi-coherent quotient module of \mathcal{F} is coherent.*

Proof. We may assume that X is affine, say $X = \text{Spec}(A)$. Properties, Lemma 27.5.2 implies that A is Noetherian. Lemma 29.9.1 turns this into algebra. The algebraic counter part of the lemma is that a quotient, or a submodule of a finite A -module is a finite A -module, see for example Algebra, Lemma 10.49.1. \square

Lemma 29.9.4. *Let X be a locally Noetherian scheme. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. The \mathcal{O}_X -modules $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ and $\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ are coherent.*

Proof. It is shown in Modules, Lemma 17.19.4 that $\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is coherent. The result for tensor products is Modules, Lemma 17.15.5 \square

Lemma 29.9.5. *Let X be a locally Noetherian scheme. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of \mathcal{O}_X -modules. Let $x \in X$.*

- (1) *If $\mathcal{F}_x = 0$ then there exists an open neighbourhood $U \subset X$ of x such that $\mathcal{F}|_U = 0$.*
- (2) *If $\varphi_x : \mathcal{G}_x \rightarrow \mathcal{F}_x$ is injective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is injective.*
- (3) *If $\varphi_x : \mathcal{G}_x \rightarrow \mathcal{F}_x$ is surjective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is surjective.*
- (4) *If $\varphi_x : \mathcal{G}_x \rightarrow \mathcal{F}_x$ is bijective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is an isomorphism.*

Proof. See Modules, Lemmas 17.9.4, 17.9.5, and 17.12.6. \square

Lemma 29.9.6. *Let X be a locally Noetherian scheme. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Let $x \in X$. Suppose $\psi : \mathcal{G}_x \rightarrow \mathcal{F}_x$ is a map of $\mathcal{O}_{X,x}$ -modules. Then there exists an open neighbourhood $U \subset X$ of x and a map $\varphi : \mathcal{G}|_U \rightarrow \mathcal{F}|_U$ such that $\varphi_x = \psi$.*

Proof. In view of Lemma 29.9.1 this is a reformulation of Modules, Lemma 17.19.3. \square

Lemma 29.9.7. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $\text{Supp}(\mathcal{F})$ is closed, and \mathcal{F} comes from a coherent sheaf on the scheme theoretic support of \mathcal{F} , see Morphisms, Definition 28.5.5.*

Proof. Let $i : Z \rightarrow X$ be the scheme theoretic support of \mathcal{F} and let \mathcal{G} be the finite type quasi-coherent sheaf on Z such that $i_*\mathcal{G} \cong \mathcal{F}$. Since $Z = \text{Supp}(\mathcal{F})$ we see that the support is closed. The scheme Z is locally Noetherian by Morphisms, Lemmas 28.16.5 and 28.16.6. Finally, \mathcal{G} is a coherent \mathcal{O}_Z -module by Lemma 29.9.1 \square

Lemma 29.9.8. *Let $i : Z \rightarrow X$ be a closed immersion of locally Noetherian schemes. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z . The functor i_* induces an equivalence between the category of coherent \mathcal{O}_X -modules annihilated by \mathcal{I} and the category of coherent \mathcal{O}_Z -modules.*

Proof. The functor is fully faithful by Morphisms, Lemma 28.4.1. Let \mathcal{F} be a coherent \mathcal{O}_X -module annihilated by \mathcal{I} . By Morphisms, Lemma 28.4.1 we can write $\mathcal{F} = i_*\mathcal{G}$ for some quasi-coherent sheaf \mathcal{G} on Z . By Modules, Lemma 17.13.3 we see that \mathcal{G} is of finite type. Hence \mathcal{G} is coherent by Lemma 29.9.1. Thus the functor is also essentially surjective as desired. \square

Lemma 29.9.9. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is finite and Y locally Noetherian. Then $R^p f_*\mathcal{F} = 0$ for $p > 0$ and $f_*\mathcal{F}$ is coherent if \mathcal{F} is coherent.*

Proof. The higher direct images vanish by Lemma 29.2.3 and because a finite morphism is affine (by definition). Note that the assumptions imply that also X is locally Noetherian (see Morphisms, Lemma 28.16.6) and hence the statement makes sense. Let $\text{Spec}(A) = V \subset Y$ be an affine open subset. By Morphisms, Definition 28.44.1 we see that $f^{-1}(V) = \text{Spec}(B)$ with $A \rightarrow B$ finite. Lemma 29.9.1 turns the statement of the lemma into the following algebra fact: If M is a finite B -module, then M is also finite viewed as a A -module, see Algebra, Lemma 10.7.2. \square

In the situation of the lemma also the higher direct images are coherent since they vanish. We will show that this is always the case for a proper morphism between locally Noetherian schemes (insert future reference here).

29.10. Coherent sheaves on Noetherian schemes

In this section we mention some properties of coherent sheaves on Noetherian schemes.

Lemma 29.10.1. *Let X be a Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. The ascending chain condition holds for quasi-coherent submodules of \mathcal{F} . In other words, given any sequence*

$$\mathcal{F}_1 \subset \mathcal{F}_2 \subset \dots \subset \mathcal{F}$$

of quasi-coherent submodules, then $\mathcal{F}_n = \mathcal{F}_{n+1} = \dots$ for some $n \geq 0$.

Proof. Choose a finite affine open covering. On each member of the covering we get stabilization by Algebra, Lemma 10.49.1. Hence the lemma follows. \square

Lemma 29.10.2. *Let X be a Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals corresponding to a closed subscheme $Z \subset X$. Then there is some $n \geq 0$ such that $\mathcal{I}^n \mathcal{F} = 0$ if and only if $\text{Supp}(\mathcal{F}) \subset Z$ (set theoretically).*

Proof. This follows immediately from Algebra, Lemma 10.61.4 because X has a finite covering by spectra of Noetherian rings. \square

Lemma 29.10.3 (Artin-Rees). *Let X be a Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . Let $\mathcal{G} \subset \mathcal{F}$ be a quasi-coherent subsheaf. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Then there exists a $c \geq 0$ such that for all $n \geq c$ we have*

$$\mathcal{I}^{n-c}(\mathcal{I}^c \mathcal{F} \cap \mathcal{G}) = \mathcal{I}^n \mathcal{F} \cap \mathcal{G}$$

Proof. This follows immediately from Algebra, Lemma 10.49.2 because X has a finite covering by spectra of Noetherian rings. \square

Lemma 29.10.4. *Let X be a Noetherian scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let \mathcal{G} be coherent \mathcal{O}_X -module. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Denote $Z \subset X$ the corresponding closed subscheme and set $U = X \setminus Z$. There is a canonical isomorphism*

$$\operatorname{colim}_n \operatorname{Hom}_{\mathcal{O}_X}(\mathcal{I}^n \mathcal{G}, \mathcal{F}) \longrightarrow \operatorname{Hom}_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U).$$

In particular we have an isomorphism

$$\operatorname{colim}_n \operatorname{Hom}_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \longrightarrow \Gamma(U, \mathcal{F}).$$

Proof. We first prove the second map is an isomorphism. It is injective by Properties, Lemma 27.23.3. Since \mathcal{F} is the union of its coherent submodules, see Properties, Lemma 27.20.3 (and Lemma 29.9.1) we may and do assume that \mathcal{F} is coherent to prove surjectivity. Let \mathcal{F}_n denote the quasi-coherent subsheaf of \mathcal{F} consisting of sections annihilated by \mathcal{I}^n , see Properties, Lemma 27.23.3. Since $\mathcal{F}_1 \subset \mathcal{F}_2 \subset \dots$ we see that $\mathcal{F}_n = \mathcal{F}_{n+1} = \dots$ for some $n \geq 0$ by Lemma 29.10.1. Set $\mathcal{H} = \mathcal{F}_n$ for this n . By Artin-Rees (Lemma 29.10.3) there exists an $c \geq 0$ such that $\mathcal{I}^m \mathcal{F} \cap \mathcal{H} \subset \mathcal{I}^{m-c} \mathcal{H}$. Picking $m = n + c$ we get $\mathcal{I}^m \mathcal{F} \cap \mathcal{H} \subset \mathcal{I}^n \mathcal{H} = 0$. Thus if we set $\mathcal{F}' = \mathcal{I}^m \mathcal{F}$ then we see that $\mathcal{F}' \cap \mathcal{F}_n = 0$ and $\mathcal{F}'|_U = \mathcal{F}|_U$. Note in particular that the subsheaf $(\mathcal{F}')_N$ of sections annihilated by \mathcal{I}^N is zero for all $N \geq 0$. Hence by Properties, Lemma 27.23.3 we deduce that the top horizontal arrow in the following commutative diagram is a bijection:

$$\begin{array}{ccc} \operatorname{colim}_n \operatorname{Hom}_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}') & \longrightarrow & \Gamma(U, \mathcal{F}') \\ \downarrow & & \downarrow \\ \operatorname{colim}_n \operatorname{Hom}_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) & \longrightarrow & \Gamma(U, \mathcal{F}) \end{array}$$

Since also the right vertical arrow is a bijection we conclude that the bottom horizontal arrow is surjective as desired.

Next, we prove the first arrow of the lemma is a bijection. By Lemma 29.9.1 the sheaf \mathcal{G} is of finite presentation and hence the sheaf $\mathcal{H} = \operatorname{Hom}_{\mathcal{O}_X}(\mathcal{G}, \mathcal{F})$ is quasi-coherent, see Schemes, Section 25.24. By definition we have

$$\mathcal{H}(U) = \operatorname{Hom}_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U)$$

Pick a ψ in the right hand side of the first arrow of the lemma, i.e., $\psi \in \mathcal{H}(U)$. The result just proved applies to \mathcal{H} and hence there exists an $n \geq 0$ and an $\varphi : \mathcal{I}^n \rightarrow \mathcal{H}$ which recovers ψ on restriction to U . By Modules, Lemma 17.19.1 φ corresponds to a map

$$\varphi : \mathcal{I}^{\otimes n} \otimes_{\mathcal{O}_X} \mathcal{G} \longrightarrow \mathcal{F}.$$

This is almost what we want except that the source of the arrow is the tensor product of \mathcal{I}^n and \mathcal{G} and not the product. We will show that, at the cost of increasing n , the difference is irrelevant. Consider the short exact sequence

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G} \rightarrow \mathcal{I}^n \mathcal{G} \rightarrow 0$$

where \mathcal{K} is defined as the kernel. Note that $\mathcal{I}^n \mathcal{K} = 0$ (proof omitted). By Artin-Rees again we see that

$$\mathcal{K} \cap \mathcal{I}^m (\mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G}) = 0$$

for some m large enough. In other words we see that

$$\mathcal{I}^m(\mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G}) \longrightarrow \mathcal{I}^{n+m}\mathcal{G}$$

is an isomorphism. Let φ' be the restriction of φ to this submodule thought of as a map $\mathcal{I}^{m+n}\mathcal{G} \rightarrow \mathcal{F}$. Then φ' gives an element of the left hand side of the first arrow of the lemma which maps to ψ via the arrow. In other words we have proved surjectivity of the arrow. We omit the proof of injectivity. \square

29.11. Depth

In this section we talk a little bit about depth and property (S_k) for coherent modules on locally Noetherian schemes. Note that we have already discussed this notion for locally Noetherian schemes in Properties, Section 27.12.

Definition 29.11.1. Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Let $k \geq 0$ be an integer.

- (1) We say \mathcal{F} has *depth k at a point x* of X if $\text{depth}_{\mathcal{O}_{X,x}}(\mathcal{F}_x) = k$.
- (2) We say X has *depth k at a point x* of X if $\text{depth}(\mathcal{O}_{X,x}) = k$.
- (3) We say \mathcal{F} has *property (S_k)* if

$$\text{depth}_{\mathcal{O}_{X,x}}(\mathcal{F}_x) \geq \min(k, \dim(\text{Supp}(\mathcal{F}_x)))$$

for all $x \in X$.

- (4) We say X has *property (S_k)* if \mathcal{O}_X has property (S_k) .

Any coherent sheaf satisfies condition (S_0) . Condition (S_1) is equivalent to having no embedded associated points, see Divisors, Lemma 30.4.3.

We have seen in Properties, Lemma 27.12.2 that a locally Noetherian scheme is Cohen-Macaulay if and only if (S_k) holds for all k . Thus it makes sense to introduce the following definition, which is equivalent to the condition that all stalks are Cohen-Macaulay modules.

Definition 29.11.2. Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. We say \mathcal{F} is *Cohen-Macaulay* if and only if (S_k) holds for all $k \geq 0$.

29.12. Devissage of coherent sheaves

Let X be a Noetherian scheme. Consider an integral closed subscheme $i : Z \rightarrow X$. It is often convenient to consider coherent sheaves of the form $i_*\mathcal{G}$ where \mathcal{G} is a coherent sheaf on Z . In particular we are interested in these sheaves when \mathcal{G} is a torsion free rank 1 sheaf. For example \mathcal{G} could be a nonzero sheaf of ideals on Z , or even more specifically $\mathcal{G} = \mathcal{O}_Z$.

Throughout this section we will use that a coherent sheaf is the same thing as a finite type quasi-coherent sheaf and that a quasi-coherent subquotient of a coherent sheaf is coherent, see Section 29.9. The support of a coherent sheaf is closed, see Modules, Lemma 17.9.6.

Lemma 29.12.1. *Let X be a Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . Suppose that $\text{Supp}(\mathcal{F}) = Z \cup Z'$ with Z, Z' closed. Then there exists a short exact sequence of coherent sheaves*

$$0 \rightarrow \mathcal{G}' \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow 0$$

with $\text{Supp}(\mathcal{G}') \subset Z'$ and $\text{Supp}(\mathcal{G}) \subset Z$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals defining the reduced induced closed subscheme structure on Z , see Schemes, Lemma 25.12.4. Consider the subsheaves $\mathcal{G}'_n = \mathcal{I}^n \mathcal{F}$ and the quotients $\mathcal{G}_n = \mathcal{F}/\mathcal{I}^n \mathcal{F}$. For each n we have a short exact sequence

$$0 \rightarrow \mathcal{G}'_n \rightarrow \mathcal{F} \rightarrow \mathcal{G}_n \rightarrow 0$$

For every point x of $Z' \setminus Z$ we have $\mathcal{I}_x = \mathcal{O}_{X,x}$ and hence $\mathcal{G}_{n,x} = 0$. Thus we see that $\text{Supp}(\mathcal{G}_n) \subset Z$. Note that $X \setminus Z'$ is a Noetherian scheme. Hence by Lemma 29.10.2 there exists an n such that $\mathcal{G}'_n|_{X \setminus Z'} = \mathcal{I}^n \mathcal{F}|_{X \setminus Z'} = 0$. For such an n we see that $\text{Supp}(\mathcal{G}'_n) \subset Z'$. Thus setting $\mathcal{G}' = \mathcal{G}'_n$ and $\mathcal{G} = \mathcal{G}_n$ works. \square

Lemma 29.12.2. *Let X be a Noetherian scheme. Let $i : Z \rightarrow X$ be an integral closed subscheme. Let $\xi \in Z$ be the generic point. Let \mathcal{F} be a coherent sheaf on X . Assume that \mathcal{F}_ξ is annihilated by \mathfrak{m}_ξ . Then there exists an integer $r \geq 0$ and a sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ and an injective map of coherent sheaves*

$$i_* (\mathcal{I}^{\oplus r}) \rightarrow \mathcal{F}$$

which is an isomorphism in a neighbourhood of ξ .

Proof. Let $\mathcal{J} \subset \mathcal{O}_X$ be the ideal sheaf of Z . Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of local sections of \mathcal{F} which are annihilated by \mathcal{J} . It is a quasi-coherent sheaf by Properties, Lemma 27.22.2. Moreover, $\mathcal{F}'_\xi = \mathcal{F}_\xi$ because $\mathcal{J}_\xi = \mathfrak{m}_\xi$ and part (3) of Properties, Lemma 27.22.2. By Lemma 29.9.5 we see that $\mathcal{F}' \rightarrow \mathcal{F}$ induces an isomorphism in a neighbourhood of ξ . Hence we may replace \mathcal{F} by \mathcal{F}' and assume that \mathcal{F} is annihilated by \mathcal{J} .

Assume $\mathcal{J}\mathcal{F} = 0$. By Lemma 29.9.8 we can write $\mathcal{F} = i_* \mathcal{G}$ for some coherent sheaf \mathcal{G} on Z . Suppose we can find a morphism $\mathcal{I}^{\oplus r} \rightarrow \mathcal{G}$ which is an isomorphism in a neighbourhood of the generic point ξ of Z . Then applying i_* (which is left exact) we get the result of the lemma. Hence we have reduced to the case $X = Z$.

Suppose $Z = X$ is an integral Noetherian scheme with generic point ξ . Note that $\mathcal{O}_{X,\xi} = \kappa(\xi)$ is the function field of X in this case. Since \mathcal{F}_ξ is a finite \mathcal{O}_ξ -module we see that $r = \dim_{\kappa(\xi)} \mathcal{F}_\xi$ is finite. Hence the sheaves $\mathcal{O}_X^{\oplus r}$ and \mathcal{F} have isomorphic stalks at ξ . By Lemma 29.9.6 there exists a nonempty open $U \subset X$ and a morphism $\psi : \mathcal{O}_X^{\oplus r}|_U \rightarrow \mathcal{F}|_U$ which is an isomorphism at ξ , and hence an isomorphism in a neighbourhood of ξ by Lemma 29.9.5. By Schemes, Lemma 25.12.4 there exists a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ whose associated closed subscheme $Z \subset X$ is the complement of U . By Lemma 29.10.4 there exists an $n \geq 0$ and a morphism $\mathcal{I}^n(\mathcal{O}_X^{\oplus r}) \rightarrow \mathcal{F}$ which recovers our ψ over U . Since $\mathcal{I}^n(\mathcal{O}_X^{\oplus r}) = (\mathcal{I}^n)^{\oplus r}$ we get a map as in the lemma. It is injective because X is integral and it is injective at the generic point of X (easy proof omitted). \square

Lemma 29.12.3. *Let X be a Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . There exists a filtration*

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that for each $j = 1, \dots, m$ there exists an integral closed subscheme $Z_j \subset X$ and a sheaf of ideals $\mathcal{I}_j \subset \mathcal{O}_{Z_j}$ such that

$$\mathcal{F}_j/\mathcal{F}_{j-1} \cong (Z_j \rightarrow X)_* \mathcal{I}_j$$

Proof. Consider the collection

$$\mathcal{T} = \left\{ \begin{array}{l} Z \subset X \text{ closed such that there exists a coherent sheaf } \mathcal{F} \\ \text{with } \text{Supp}(\mathcal{F}) = Z \text{ for which the lemma is wrong} \end{array} \right\}$$

We are trying to show that \mathcal{T} is empty. If not, then because X is Noetherian we can choose a minimal element $Z \in \mathcal{T}$. This means that there exists a coherent sheaf \mathcal{F} on X whose support is Z and for which the lemma does not hold. Clearly $Z \neq \emptyset$ since the only sheaf whose support is empty is the zero sheaf for which the lemma does hold (with $m = 0$).

If Z is not irreducible, then we can write $Z = Z_1 \cup Z_2$ with Z_1, Z_2 closed and strictly smaller than Z . Then we can apply Lemma 29.12.1 to get a short exact sequence of coherent sheaves

$$0 \rightarrow \mathcal{G}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{G}_2 \rightarrow 0$$

with $\text{Supp}(\mathcal{G}_i) \subset Z_i$. By minimality of Z each of \mathcal{G}_i has a filtration as in the statement of the lemma. By considering the induced filtration on \mathcal{F} we arrive at a contradiction. Hence we conclude that Z is irreducible.

Suppose Z is irreducible. Let \mathcal{J} be the sheaf of ideals cutting out the reduced induced closed subscheme structure of Z , see Schemes, Lemma 25.12.4. By Lemma 29.10.2 we see there exists an $n \geq 0$ such that $\mathcal{J}^n \mathcal{F} = 0$. Hence we obtain a filtration

$$0 = \mathcal{J}^n \mathcal{F} \subset \mathcal{J}^{n-1} \mathcal{F} \subset \dots \subset \mathcal{J} \mathcal{F} \subset \mathcal{F}$$

each of whose successive subquotients is annihilated by \mathcal{J} . Hence if each of these subquotients has a filtration as in the statement of the lemma then also \mathcal{F} does. In other words we may assume that \mathcal{J} does annihilate \mathcal{F} .

In the case where Z is irreducible and $\mathcal{J} \mathcal{F} = 0$ we can apply Lemma 29.12.2. This gives a short exact sequence

$$0 \rightarrow i_*(\mathcal{I}^{\oplus r}) \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0$$

where \mathcal{Q} is defined as the quotient. Since \mathcal{Q} is zero in a neighbourhood of ξ by the lemma just cited we see that the support of \mathcal{Q} is strictly smaller than Z . Hence we see that \mathcal{Q} has a filtration of the desired type by minimality of Z . But then clearly \mathcal{F} does too, which is our final contradiction. \square

Lemma 29.12.4. *Let X be a Noetherian scheme. Let \mathcal{P} be a property of coherent sheaves on X . Assume*

- (1) *For any short exact sequence of coherent sheaves*

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$$

if \mathcal{F}_i , $i = 1, 2$ have property \mathcal{P} then so does \mathcal{F} .

- (2) *For every integral closed subscheme $Z \subset X$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $i_* \mathcal{I}$.*

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. First note that if \mathcal{F} is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property \mathcal{P} , then so does \mathcal{F} . This follows from the property (1) for \mathcal{P} . On the other hand, by Lemma 29.12.3 we can filter any \mathcal{F} with successive subquotients as in (2). Hence the lemma follows. \square

Lemma 29.12.5. *Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ . Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) *For any short exact sequence of coherent sheaves if two out of three of them have property \mathcal{P} then so does the third.*
- (2) *For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $(Z \rightarrow X)_*\mathcal{I}$.*
- (3) *There exists some coherent sheaf \mathcal{G} on X such that*
 - (a) *$\text{Supp}(\mathcal{G}) = Z_0$,*
 - (b) *\mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ ,*
 - (c) *$\dim_{\kappa(\xi)} \mathcal{G}_\xi = 1$, and*
 - (d) *property \mathcal{P} holds for \mathcal{G} .*

Then property \mathcal{P} holds for every coherent sheaf \mathcal{F} on X whose support is contained in Z_0 .

Proof. First note that if \mathcal{F} is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property \mathcal{P} , then so does \mathcal{F} . Or, if \mathcal{F} has property \mathcal{P} and all but one of the $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property \mathcal{P} then so does the last one. This follows from assumption (1).

As a first application we conclude that any coherent sheaf whose support is strictly contained in Z_0 has property \mathcal{P} . Namely, such a sheaf has a filtration (see Lemma 29.12.3) whose subquotients have property \mathcal{P} according to (2).

Let \mathcal{G} be as in (3). By Lemma 29.12.2 there exist a sheaf of ideals \mathcal{I} on Z_0 , an integer $r \geq 1$, and a short exact sequence

$$0 \rightarrow ((Z_0 \rightarrow X)_*\mathcal{I})^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0$$

where the support of \mathcal{Q} is strictly contained in Z_0 . By (3)(c) we see that $r = 1$. Since \mathcal{Q} has property \mathcal{P} too we conclude that $(Z_0 \rightarrow X)_*\mathcal{I}$ has property \mathcal{P} .

Next, suppose that $\mathcal{I}' \neq 0$ is another quasi-coherent sheaf of ideals on Z_0 . Then we can consider the intersection $\mathcal{I}'' = \mathcal{I}' \cap \mathcal{I}$ and we get two short exact sequences

$$0 \rightarrow (Z_0 \rightarrow X)_*\mathcal{I}'' \rightarrow (Z_0 \rightarrow X)_*\mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0$$

and

$$0 \rightarrow (Z_0 \rightarrow X)_*\mathcal{I}'' \rightarrow (Z_0 \rightarrow X)_*\mathcal{I}' \rightarrow \mathcal{Q}' \rightarrow 0.$$

Note that the support of the coherent sheaves \mathcal{Q} and \mathcal{Q}' are strictly contained in Z_0 . Hence \mathcal{Q} and \mathcal{Q}' have property \mathcal{P} (see above). Hence we conclude using (1) that $(Z_0 \rightarrow X)_*\mathcal{I}''$ and $(Z_0 \rightarrow X)_*\mathcal{I}'$ both have \mathcal{P} as well.

The final step of the proof is to note that any coherent sheaf \mathcal{F} on X whose support is contained in Z_0 has a filtration (see Lemma 29.12.3 again) whose subquotients all have property \mathcal{P} by what we just said. \square

Lemma 29.12.6. *Let X be a Noetherian scheme. Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) *For any short exact sequence of coherent sheaves if two out of three of them have property \mathcal{P} then so does the third.*

- (2) For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf \mathcal{G} such that
- (a) $\text{Supp}(\mathcal{G}) = Z$,
 - (b) \mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ ,
 - (c) $\dim_{\kappa(\xi)} \mathcal{G}_\xi = 1$, and
 - (d) property \mathcal{P} holds for \mathcal{G} .

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. According to Lemma 29.12.4 it suffices to show that given any integral closed subscheme $Z \subset X$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $(Z \rightarrow X)_*\mathcal{I}$. If this fails, then since X is Noetherian there is a minimal integral closed subscheme $Z_0 \subset X$ such that \mathcal{P} fails for $(Z_0 \rightarrow X)_*\mathcal{I}$ for some quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z_0}$. In other words, the result does hold for any integral closed subscheme of Z . According to Lemma 29.12.5 this cannot happen. \square

Lemma 29.12.7. *Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ . Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) For any short exact sequence of coherent sheaves

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$$

if \mathcal{F}_i , $i = 1, 2$ have property \mathcal{P} then so does \mathcal{F} .

- (2) If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.
 (3) For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $(Z \rightarrow X)_*\mathcal{I}$.
 (4) There exists some coherent sheaf \mathcal{G} such that
- (a) $\text{Supp}(\mathcal{G}) = Z_0$,
 - (b) \mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ , and
 - (c) for every quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ such that $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$ there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{J}\mathcal{G}$ with $\mathcal{G}'_\xi = \mathcal{G}_\xi$ and such that \mathcal{P} holds for \mathcal{G}' .

Then property \mathcal{P} holds for every coherent sheaf \mathcal{F} on X whose support is contained in Z_0 .

Proof. Note that if \mathcal{F} is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property \mathcal{P} , then so does \mathcal{F} . This follows from assumption (1).

As a first application we conclude that any coherent sheaf whose support is strictly contained in Z_0 has property \mathcal{P} . Namely, such a sheaf has a filtration (see Lemma 29.12.3) whose subquotients have property \mathcal{P} according to (3).

Let us denote $i : Z_0 \rightarrow X$ the closed immersion. Consider a coherent sheaf \mathcal{G} as in (4). By Lemma 29.12.2 there exists a sheaf of ideals \mathcal{I} on Z_0 and a short exact sequence

$$0 \rightarrow i_*\mathcal{I}^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0$$

where the support of \mathcal{Q} is strictly contained in Z_0 . In particular $r > 0$ and \mathcal{I} is nonzero because the support of \mathcal{G} is equal to Z_0 . Let $\mathcal{I}' \subset \mathcal{I}$ be any nonzero

quasi-coherent sheaf of ideals on Z_0 contained in \mathcal{I} . Then we also get a short exact sequence

$$0 \rightarrow i_*(\mathcal{I}')^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q}' \rightarrow 0$$

where \mathcal{Q}' has support properly contained in Z_0 . Let $\mathcal{J} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals cutting out the support of \mathcal{Q}' (for example the ideal corresponding to the reduced induced closed subscheme structure on the support of \mathcal{Q}'). Then $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$. By Lemma 29.10.2 we see that $\mathcal{J}^n \mathcal{Q}' = 0$ for some n . Hence $\mathcal{J}^n \mathcal{G} \subset i_*(\mathcal{I}')^{\oplus r}$. By assumption (4)(c) of the lemma we see there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{J}^n \mathcal{G}$ with $\mathcal{G}'_\xi = \mathcal{G}_\xi$ for which property \mathcal{P} holds. Hence we get a short exact sequence

$$0 \rightarrow \mathcal{G}' \rightarrow i_*(\mathcal{I}')^{\oplus r} \rightarrow \mathcal{Q}'' \rightarrow 0$$

where \mathcal{Q}'' has support properly contained in Z_0 . Thus by our initial remarks and property (1) of the lemma we conclude that $i_*(\mathcal{I}')^{\oplus r}$ satisfies \mathcal{P} . Hence we see that $i_*\mathcal{I}'$ satisfies \mathcal{P} by (2). Finally, for an arbitrary quasi-coherent sheaf of ideals $\mathcal{I}'' \subset \mathcal{O}_{Z_0}$ we can set $\mathcal{I}' = \mathcal{I}'' \cap \mathcal{I}$ and we get a short exact sequence

$$0 \rightarrow i_*(\mathcal{I}') \rightarrow i_*(\mathcal{I}'') \rightarrow \mathcal{Q}''' \rightarrow 0$$

where \mathcal{Q}''' has support properly contained in Z_0 . Hence we conclude that property \mathcal{P} holds for $i_*\mathcal{I}''$ as well.

The final step of the proof is to note that any coherent sheaf \mathcal{F} on X whose support is contained in Z_0 has a filtration (see Lemma 29.12.3 again) whose subquotients all have property \mathcal{P} by what we just said. \square

Lemma 29.12.8. *Let X be a Noetherian scheme. Let \mathcal{P} be a property of coherent sheaves on X such that*

- (1) *For any short exact sequence of coherent sheaves*

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$$

if \mathcal{F}_i , $i = 1, 2$ have property \mathcal{P} then so does \mathcal{F} .

- (2) *If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.*
 (3) *For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf \mathcal{G} such that*
 (a) *$\text{Supp}(\mathcal{G}) = Z$,*
 (b) *\mathcal{G}_ξ is annihilated by \mathfrak{m}_ξ , and*
 (c) *for every quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ such that $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$ there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{J}\mathcal{G}$ with $\mathcal{G}'_\xi = \mathcal{G}_\xi$ and such that \mathcal{P} holds for \mathcal{G}' .*

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. Follows from Lemma 29.12.7 in exactly the same way that Lemma 29.12.6 follows from Lemma 29.12.5. \square

29.13. Finite morphisms and affines

In this section we use the results of the preceding sections to show that the image of a Noetherian affine scheme under a finite morphism is affine. We will see later that this result holds more generally (see Limits, Lemma 31.10.1).

Lemma 29.13.1. *Let $f : Y \rightarrow X$ be a morphism of schemes. Assume f is finite, surjective and X locally Noetherian. Let $Z \subset X$ be an integral closed subscheme with generic point ξ . Then there exists a coherent sheaf \mathcal{F} on Y such that the support of $f_*\mathcal{F}$ is equal to Z and $(f_*\mathcal{F})_\xi$ is annihilated by \mathfrak{m}_ξ .*

Proof. Note that Y is locally Noetherian by Morphisms, Lemma 28.16.6. Because f is surjective the fibre Y_ξ is not empty. Pick $\xi' \in Y$ mapping to ξ . Let $Z' = \overline{\{\xi'\}}$. We may think of $Z' \subset Y$ as a reduced closed subscheme, see Schemes, Lemma 25.12.4. Hence the sheaf $\mathcal{F} = (Z' \rightarrow Y)_*\mathcal{O}_{Z'}$ is a coherent sheaf on Y (see Lemma 29.9.9). Look at the commutative diagram

$$\begin{array}{ccc} Z' & \xrightarrow{\quad} & Y \\ f' \downarrow & \searrow^{i'} & \downarrow f \\ Z & \xrightarrow{\quad} & X \end{array}$$

We see that $f_*\mathcal{F} = i_*f'_*\mathcal{O}_{Z'}$. Hence the stalk of $f_*\mathcal{F}$ at ξ is the stalk of $f'_*\mathcal{O}_{Z'}$ at ξ . Note that since Z' is integral with generic point ξ' we have that ξ' is the only point of Z' lying over ξ , see Algebra, Lemmas 10.35.3 and 10.35.18. Hence the stalk of $f'_*\mathcal{O}_{Z'}$ at ξ equal $\mathcal{O}_{Z',\xi'} = \kappa(\xi')$. In particular the stalk of $f_*\mathcal{F}$ at ξ is not zero. This combined with the fact that $f_*\mathcal{F}$ is of the form $i_*f'_*(\text{something})$ implies the lemma. \square

Lemma 29.13.2. *Let $f : Y \rightarrow X$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on Y . Let \mathcal{I} be a quasi-coherent sheaf of ideals on X . If the morphism f is affine then $\mathcal{I}f_*\mathcal{F} = f_*(f^{-1}\mathcal{I}\mathcal{F})$.*

Proof. The notation means the following. Since f^{-1} is an exact functor we see that $f^{-1}\mathcal{I}$ is a sheaf of ideals of $f^{-1}\mathcal{O}_X$. Via the map $f^\# : f^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_Y$ this acts on \mathcal{F} . Then $f^{-1}\mathcal{I}\mathcal{F}$ is the subsheaf generated by sums of local sections of the form as where a is a local section of $f^{-1}\mathcal{I}$ and s is a local section of \mathcal{F} . It is a quasi-coherent \mathcal{O}_Y -submodule of \mathcal{F} because it is also the image of a natural map $f^*\mathcal{I} \otimes_{\mathcal{O}_Y} \mathcal{F} \rightarrow \mathcal{F}$.

Having said this the proof is straightforward. Namely, the question is local and hence we may assume X is affine. Since f is affine we see that Y is affine too. Thus we may write $Y = \text{Spec}(B)$, $X = \text{Spec}(A)$, $\mathcal{F} = \widetilde{M}$, and $\mathcal{I} = \widetilde{I}$. The assertion of the lemma in this case boils down to the statement that

$$I(M_A) = ((IB)M)_A$$

where M_A indicates the A -module associated to the B -module M . \square

Lemma 29.13.3. *Let $f : Y \rightarrow X$ be a morphism of schemes. Assume*

- (1) f finite,
- (2) f surjective,
- (3) Y affine, and
- (4) X Noetherian.

Then X is affine.

Proof. We will prove that under the assumptions of the lemma for any coherent \mathcal{O}_X -module \mathcal{F} we have $H^1(X, \mathcal{F}) = 0$. This will in particular imply that $H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals of \mathcal{O}_X . Then it follows that X is affine from either Lemma 29.3.1 or Lemma 29.3.2.

Let \mathcal{P} be the property of coherent sheaves \mathcal{F} on X defined by the rule

$$\mathcal{P}(\mathcal{F}) \Leftrightarrow H^1(X, \mathcal{F}) = 0.$$

We are going to apply Lemma 29.12.8. Thus we have to verify (1), (2) and (3) of that lemma for \mathcal{P} . Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves. Property (2) follows since $H^1(X, -)$ is an additive functor. To see (3) let $Z \subset X$ be an integral closed subscheme with generic point ξ . Let \mathcal{F} be a coherent sheaf on Y such that the support of $f_*\mathcal{F}$ is equal to Z and $(f_*\mathcal{F})_\xi$ is annihilated by \mathfrak{m}_ξ , see Lemma 29.13.1. We claim that taking $\mathcal{G} = f_*\mathcal{F}$ works. We only have to verify part (3)(c) of Lemma 29.12.8. Hence assume that $\mathcal{J} \subset \mathcal{O}_X$ is a quasi-coherent sheaf of ideals such that $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$. A finite morphism is affine hence by Lemma 29.13.2 we see that $\mathcal{J}\mathcal{G} = f_*(f^{-1}\mathcal{J}\mathcal{F})$. Also, as pointed out in the proof of Lemma 29.13.2 the sheaf $f^{-1}\mathcal{J}\mathcal{F}$ is a quasi-coherent \mathcal{O}_Y -module. Since Y is affine we see that $H^1(Y, f^{-1}\mathcal{J}\mathcal{F}) = 0$, see Lemma 29.2.2. Since f is finite, hence affine, we see that

$$H^1(X, \mathcal{J}\mathcal{G}) = H^1(X, f_*(f^{-1}\mathcal{J}\mathcal{F})) = H^1(Y, f^{-1}\mathcal{J}\mathcal{F}) = 0$$

by Lemma 29.2.4. Hence the quasi-coherent subsheaf $\mathcal{G}' = \mathcal{J}\mathcal{G}$ satisfies \mathcal{P} . This verifies property (3)(c) of Lemma 29.12.8 as desired. \square

29.14. Ample invertible sheaves and cohomology

Given a ringed space X , an invertible \mathcal{O}_X -module \mathcal{L} , a section $s \in \Gamma(X, \mathcal{L})$ and an \mathcal{O}_X -module \mathcal{F} we get a map $\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$, $t \mapsto t \otimes s$ which we call multiplication by s . We usually denote it $t \mapsto st$.

Lemma 29.14.1. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}' \subset \mathcal{F}$ be quasi-coherent \mathcal{O}_X -modules. Assume that*

- (1) X is quasi-compact,
- (2) \mathcal{F} is of finite type, and
- (3) $\mathcal{F}'|_{X_s} = \mathcal{F}|_{X_s}$.

Then there exists an $n \geq 0$ such that multiplication by s^n on \mathcal{F} factors through \mathcal{F}' .

Proof. In other words we claim that $s^n\mathcal{F} \subset \mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ for some $n \geq 0$. If this is true for n_0 then it is true for all $n \geq n_0$. Hence it suffices to show there is a finite open covering such that the result holds for each of the members of this open covering. Since X is quasi-compact we may therefore assume that X is affine and that $\mathcal{L} \cong \mathcal{O}_X$. Thus the lemma translates into the following algebra problem (use Properties, Lemma 27.16.1): Let A be a ring. Let $f \in A$. Let $M' \subset M$ be A -modules. Assume M is a finite A -module, and assume that $(M')_f = M_f$. Then there exists an $n \geq 0$ such that $f^n M \subset M'$. The proof of this is omitted. \square

Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Assume X quasi-compact and quasi-separated. The following lemma says roughly that the category of finitely presented \mathcal{O}_{X_s} -modules is the category of finitely presented \mathcal{O}_X -modules where the map multiplication by s has been inverted.

Lemma 29.14.2. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}, \mathcal{F}'$ be quasi-coherent \mathcal{O}_X -modules. Let $\psi : \mathcal{F}|_{X_s} \rightarrow \mathcal{F}'|_{X_s}$ be a map of \mathcal{O}_{X_s} -modules. Assume that*

- (1) X is quasi-compact and quasi-separated, and

(2) \mathcal{F} is of finitely presented.

Then there exists an $n \geq 0$ and a morphism $\alpha : \mathcal{F} \rightarrow \mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ whose restriction to X_s equals ψ via the identification $\mathcal{L}^{\otimes n}|_{X_s} = \mathcal{O}_{X_s}$ coming from s . Moreover, given a pair of solutions (n, α) and (n', α') there exists an $m \geq \max(n, n')$ such that $s^{m-n}\alpha = s^{m-n'}\alpha'$.

Proof. If the lemma holds for n_0 with map α_0 then it holds for all $n \geq n_0$ simply by taking $\alpha = s^{n-n_0}\alpha_0$. Choose a finite affine open covering $X = \bigcup U_i$ such that $\mathcal{L}|_{U_i}$ is trivial. Choose finite affine open coverings $U_i \cap U_{i'} = \bigcup U_{ii'j}$. Suppose we can prove the lemma when X is affine and \mathcal{L} is trivial. Then we can find $n_i \geq 0$ $\alpha_i : \mathcal{F}|_{U_i} \rightarrow \mathcal{F}'|_{U_i} \otimes_{\mathcal{O}_{U_i}} \mathcal{L}^{\otimes n_i}|_{U_i}$ satisfying the relation over U_i . By the uniqueness assertion of the lemma, and the finiteness of the number of affines $U_{ii'j}$ we can find a single large integer m such that the maps $s^{m-n_i}\alpha_i$ and $s^{m-n_{i'}}\alpha_{i'}$ agree over $U_{ii'j}$ and hence over $U_i \cap U_{i'}$. Thus the morphisms $s^{m-n_i}\alpha_i$ glue to give our global map α . Proof of the uniqueness statement is omitted.

Assume X affine and that $\mathcal{L} \cong \mathcal{O}_X$. Then the lemma translates into the following algebra problem (use Properties, Lemma 27.16.2): Let A be a ring. Let $f \in A$. Let $\psi : M_f \rightarrow (M')_f$ be a map of A_f -modules. Assume M is a finitely presented A -module. Then there exists an $n \geq 0$ and an A -module map $\alpha : M \rightarrow M'$ such that $\alpha \otimes 1_{A_f} = f^n\psi$. Moreover, given any second solution (n', α') there exists an $m \geq \max(n, n')$ such that $f^{m-n}\alpha = f^{m-n'}\alpha'$. The proof of this algebraic fact is omitted. \square

Cohomology is functorial. In particular, given a ringed space X , an invertible \mathcal{O}_X -module \mathcal{L} , a section $s \in \Gamma(X, \mathcal{L})$ we get maps

$$H^p(X, \mathcal{F}) \longrightarrow H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}), \quad \xi \longmapsto s\xi$$

induced by the map $\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$ which is multiplication by s . We set $\Gamma_*(X, \mathcal{L}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{L}^{\otimes n})$ as a graded ring, see Modules, Definition 17.21.4. Given a sheaf of \mathcal{O}_X -modules \mathcal{F} and an integer $p \geq 0$ we set

$$H_*^p(X, \mathcal{L}, \mathcal{F}) = \bigoplus_{n \in \mathbf{Z}} H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$$

This is a graded $\Gamma_*(X, \mathcal{L})$ -module by the multiplication defined above. Warning: the notation $H_*^p(X, \mathcal{L}, \mathcal{F})$ is nonstandard.

Lemma 29.14.3. *Let X be a scheme. Let \mathcal{L} be an invertible sheaf on X . Let $s \in \Gamma(X, \mathcal{L})$. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If X is quasi-compact and quasi-separated, the canonical map*

$$H_*^p(X, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow H^p(X_s, \mathcal{F})$$

which maps ξ/s^n to $s^{-n}\xi$ is an isomorphism.

Proof. Note that for $p = 0$ this is Properties, Lemma 27.24.6. We will prove the statement using the induction principle (Lemma 29.4.1) where for $U \subset X$ quasi-compact open we let $P(U)$ be the property: for all $p \geq 0$ the map

$$H_*^p(U, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow H^p(U_s, \mathcal{F})$$

is an isomorphism.

If U is affine, then both sides of the arrow displayed above are zero for $p > 0$ by Lemma 29.2.2 and Properties, Lemma 27.24.4 and the statement is true. If P is true

for U, V , and $U \cap V$, then we can use the Mayer-Vietoris sequences (Cohomology, Lemma 20.9.2) to obtain a map of long exact sequences

$$\begin{array}{ccccc}
 H_*^{p-1}(U \cap V, \mathcal{L}, \mathcal{F})_{(s)} & \longrightarrow & H_*^p(U \cup V, \mathcal{L}, \mathcal{F})_{(s)} & \longrightarrow & H_*^p(U, \mathcal{L}, \mathcal{F})_{(s)} \oplus H_*^p(V, \mathcal{L}, \mathcal{F})_{(s)} \\
 \downarrow & & \downarrow & & \downarrow \\
 H^{p-1}(U_s \cap V_s, \mathcal{F}) & \longrightarrow & H^p(U_s \cup V_s, \mathcal{F}) & \longrightarrow & H^p(U_s, \mathcal{F}) \oplus H^p(V_s, \mathcal{F})
 \end{array}$$

(only a snippet shown). Observe that $U_s \cap V_s = (U \cap V)_s$ and that $U_s \cup V_s = (U \cup V)_s$. Thus the left and right vertical maps are isomorphisms (as well as one more to the right and one more to the left which are not shown in the diagram). We conclude that $P(U \cup V)$ holds by the 5-lemma (Homology, Lemma 12.5.20). This finishes the proof. \square

Lemma 29.14.4. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Assume that*

- (1) X is quasi-compact and quasi-separated, and
- (2) X_s is affine.

Then for every quasi-coherent \mathcal{O}_X -module \mathcal{F} and every $p > 0$ and all $\xi \in H^p(X, \mathcal{F})$ there exists an $n \geq 0$ such that $s^n \xi = 0$ in $H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$.

Proof. Recall that $H^p(X_s, \mathcal{G})$ is zero for every quasi-coherent module \mathcal{G} by Lemma 29.2.2. Hence the lemma follows from Lemma 29.14.3. \square

For a more general version of the following lemma see Limits, Lemma 31.10.4.

Lemma 29.14.5. *Let $i : Z \rightarrow X$ be a closed immersion of Noetherian schemes inducing a homeomorphism of underlying topological spaces. Let \mathcal{L} be an invertible sheaf on X . If $i^* \mathcal{L}$ is ample on Z , then \mathcal{L} is ample on X .*

Proof. Let $\mathcal{I} \subset \mathcal{O}_X$ be the coherent sheaf of ideals cutting out the closed subscheme Z . Since $i(Z) = X$ set theoretically we see that $\mathcal{I}^n = 0$ for some n by Lemma 29.10.2. Consider the sequence

$$X = Z_n \supset Z_{n-1} \supset Z_{n-2} \supset \dots \supset Z_1 = Z$$

of closed subschemes cut out by $0 = \mathcal{I}^n \subset \mathcal{I}^{n-1} \subset \dots \subset \mathcal{I}$. Then each of the closed immersions $Z_i \rightarrow Z_{i-1}$ is defined by a coherent sheaf of ideals of square zero. In this way we reduce to the case that $\mathcal{I}^2 = 0$.

Consider the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_X \rightarrow i_* \mathcal{O}_Z \rightarrow 0$$

of quasi-coherent \mathcal{O}_X -modules. Tensoring with $\mathcal{L}^{\otimes n}$ we obtain short exact sequences

$$0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n} \rightarrow \mathcal{L}^{\otimes n} \rightarrow i_* i^* \mathcal{L}^{\otimes n} \rightarrow 0$$

As $\mathcal{I}^2 = 0$, we can use Morphisms, Lemma 28.4.1 to think of \mathcal{I} as a quasi-coherent \mathcal{O}_Z -module and then $\mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n} = \mathcal{I} \otimes_{\mathcal{O}_Z} i^* \mathcal{L}^{\otimes n}$ with obvious abuse of notation. Moreover, the cohomology of this sheaf over Z is canonically the same as the cohomology of this sheaf over X (as i is a homeomorphism).

Let $x \in X$ be a point and denote $z \in Z$ the corresponding point. Because $i^*\mathcal{L}$ is ample there exists an n and a section $s \in \Gamma(Z, i^*\mathcal{L}^{\otimes n})$ with $z \in Z_s$ and with Z_s affine. The obstruction to lifting s to a section of $\mathcal{L}^{\otimes n}$ over X is an element ξ of

$$H^1(X, \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = H^1(Z, \mathcal{I} \otimes_{\mathcal{O}_Z} i^*\mathcal{L}^{\otimes n})$$

If we replace s by s^{e+1} then ξ is replaced by $s^e\xi$ in $H^1(Z, \mathcal{I} \otimes_{\mathcal{O}_Z} i^*\mathcal{L}^{\otimes(e+1)n})$. Computation omitted. By Lemma 29.14.4 we see that $s^e\xi$ is zero for e large enough. Hence, after replacing s by a power, we can assume s is the image of a section $s' \in \Gamma(X, \mathcal{L}^{\otimes n})$. Then X_s is an open subscheme and $Z_s \rightarrow X_s$ is a surjective closed immersion of Noetherian schemes with Z_s affine. Hence X_s is affine by Lemma 29.13.3 and we conclude that \mathcal{L} is ample. \square

29.15. Coherent sheaves and projective morphisms

It seems illuminating to formulate an all-in-one result for projective space over a Noetherian ring.

Lemma 29.15.1. *Let R be a Noetherian ring. Let $n \geq 0$ be an integer. For every coherent sheaf \mathcal{F} on \mathbf{P}_R^n we have the following:*

- (1) *There exists an $r \geq 0$ and $d_1, \dots, d_r \in \mathbf{Z}$ and a surjection*

$$\bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j) \longrightarrow \mathcal{F}.$$

- (2) *We have $H^i(\mathbf{P}_R^n, \mathcal{F}) = 0$ unless $0 \leq i \leq n$.*
 (3) *For any i the cohomology group $H^i(\mathbf{P}_R^n, \mathcal{F})$ is a finite R -module.*
 (4) *If $i > 0$, then $H^i(\mathbf{P}_R^n, \mathcal{F}(d)) = 0$ for all d large enough.*
 (5) *For any $k \in \mathbf{Z}$ the graded $R[T_0, \dots, T_n]$ -module*

$$\bigoplus_{d \geq k} H^0(\mathbf{P}_R^n, \mathcal{F}(d))$$

is a finite $R[T_0, \dots, T_n]$ -module.

Proof. We will use that $\mathcal{O}_{\mathbf{P}_R^n}(1)$ is an ample invertible sheaf on the scheme \mathbf{P}_R^n . This follows directly from the definition since \mathbf{P}_R^n covered by the standard affine opens $D_+(T_i)$. Hence by Properties, Proposition 27.24.14 every finite type quasi-coherent $\mathcal{O}_{\mathbf{P}_R^n}$ -module is a quotient of a finite direct sum of tensor powers of $\mathcal{O}_{\mathbf{P}_R^n}(1)$. On the other hand a coherent sheaves and finite type quasi-coherent sheaves are the same thing on projective space over R by Lemma 29.9.1. Thus we see (1).

Projective n -space \mathbf{P}_R^n is covered by $n + 1$ affines, namely the standard opens $D_+(T_i)$, $i = 0, \dots, n$, see Constructions, Lemma 26.13.3. Hence we see that for any quasi-coherent sheaf \mathcal{F} on \mathbf{P}_R^n we have $H^i(\mathbf{P}_R^n, \mathcal{F}) = 0$ for $i \geq n + 1$, see Lemma 29.4.2. Hence (2) holds.

Let us prove (3) and (4) simultaneously for all coherent sheaves on \mathbf{P}_R^n by descending induction on i . Clearly the result holds for $i \geq n + 1$ by (2). Suppose we know the result for $i + 1$ and we want to show the result for i . (If $i = 0$, then part (4) is vacuous.) Let \mathcal{F} be a coherent sheaf on \mathbf{P}_R^n . Choose a surjection as in (1) and denote \mathcal{G} the kernel so that we have a short exact sequence

$$0 \rightarrow \mathcal{G} \rightarrow \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j) \rightarrow \mathcal{F} \rightarrow 0$$

By Lemma 29.9.2 we see that \mathcal{G} is coherent. The long exact cohomology sequence gives an exact sequence

$$H^i(\mathbf{P}_R^n, \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j)) \rightarrow H^i(\mathbf{P}_R^n, \mathcal{F}) \rightarrow H^{i+1}(\mathbf{P}_R^n, \mathcal{G}).$$

By induction assumption the right R -module is finite and by Lemma 29.8.1 the left R -module is finite. Since R is Noetherian it follows immediately that $H^i(\mathbf{P}_R^n, \mathcal{F})$ is a finite R -module. This proves the induction step for assertion (3). Since $\mathcal{O}_{\mathbf{P}_R^n}(d)$ is invertible we see that twisting on \mathbf{P}_R^n is an exact functor (since you get it by tensoring with an invertible sheaf, see Constructions, Definition 26.10.1). This means that for all $d \in \mathbf{Z}$ the sequence

$$0 \rightarrow \mathcal{G}(d) \rightarrow \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j + d) \rightarrow \mathcal{F}(d) \rightarrow 0$$

is short exact. The resulting cohomology sequence is

$$H^i(\mathbf{P}_R^n, \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j + d)) \rightarrow H^i(\mathbf{P}_R^n, \mathcal{F}(d)) \rightarrow H^{i+1}(\mathbf{P}_R^n, \mathcal{G}(d)).$$

By induction assumption we see the module on the right is zero for $d \gg 0$ and by the computation in Lemma 29.8.1 the module on the left is zero as soon as $d \geq -\min\{d_j\}$ and $i \geq 1$. Hence the induction step for assertion (4). This concludes the proof of (3) and (4).

In order to prove (5) note that for all sufficiently large d the map

$$H^0(\mathbf{P}_R^n, \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j + d)) \rightarrow H^0(\mathbf{P}_R^n, \mathcal{F}(d))$$

is surjective by the vanishing of $H^1(\mathbf{P}_R^n, \mathcal{G}(d))$ we just proved. In other words, the module

$$M_k = \bigoplus_{d \geq k} H^0(\mathbf{P}_R^n, \mathcal{F}(d))$$

is for k large enough a quotient of the corresponding module

$$N_k = \bigoplus_{d \geq k} H^0(\mathbf{P}_R^n, \bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_R^n}(d_j + d))$$

When k is sufficiently small (e.g. $k < -d_j$ for all j) then

$$N_k = \bigoplus_{j=1, \dots, r} R[T_0, \dots, T_n](d_j)$$

by our computations in Section 29.8. In particular it is finitely generated. Suppose $k \in \mathbf{Z}$ is arbitrary. Choose $k_- \ll k \ll k_+$. Consider the diagram

$$\begin{array}{ccc} N_{k_-} & \longleftarrow & N_{k_+} \\ & & \downarrow \\ M_k & \longleftarrow & M_{k_+} \end{array}$$

where the vertical arrow is the surjective map above and the horizontal arrows are the obvious inclusion maps. By what was said above we see that N_{k_-} is a finitely generated $R[T_0, \dots, T_n]$ -module. Hence N_{k_+} is a finitely generated $R[T_0, \dots, T_n]$ -module because it is a submodule of a finitely generated module and the ring $R[T_0, \dots, T_n]$ is Noetherian. Since the vertical arrow is surjective we conclude that M_{k_+} is a finitely generated $R[T_0, \dots, T_n]$ -module. The quotient M_k/M_{k_+} is finite as an R -module since it is a finite direct sum of the finite R -modules $H^0(\mathbf{P}_R^n, \mathcal{F}(d))$ for $k \leq d < k_+$. Note that we use part (3) for $i = 0$ here. Hence M_k/M_{k_+} is

a fortiori a finite $R[T_0, \dots, T_n]$ -module. In other words, we have sandwiched M_k between two finite $R[T_0, \dots, T_n]$ -modules and we win. \square

Lemma 29.15.2. *Let A be a graded ring such that A_0 is Noetherian and A is generated by finitely many elements of A_1 over A_0 . Set $X = \text{Proj}(A)$. Then X is a Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module.*

- (1) *There exists an $r \geq 0$ and $d_1, \dots, d_r \in \mathbf{Z}$ and a surjection*

$$\bigoplus_{j=1, \dots, r} \mathcal{O}_X(d_j) \longrightarrow \mathcal{F}.$$

- (2) *For any i the cohomology group $H^i(X, \mathcal{F})$ is a finite A_0 -module.*
 (3) *If $i > 0$, then $H^i(X, \mathcal{F}(d)) = 0$ for all d large enough.*
 (4) *For any $k \in \mathbf{Z}$ the graded A -module*

$$\bigoplus_{d \geq k} H^0(X, \mathcal{F}(d))$$

is a finite A -module.

Proof. By assumption there exists a surjection of graded A_0 -algebras

$$A_0[T_0, \dots, T_n] \longrightarrow A$$

where $\deg(T_j) = 1$ for $j = 0, \dots, n$. By Constructions, Lemma 26.11.5 this defines a closed immersion $r : X \rightarrow \mathbf{P}_{A_0}^n$ such that $r^* \mathcal{O}_{\mathbf{P}_{A_0}^n}(1) = \mathcal{O}_X(1)$. In particular, X is Noetherian as a closed subscheme of the Noetherian scheme $\mathbf{P}_{A_0}^n$. We claim that the results of the lemma for \mathcal{F} follow from the corresponding results of Lemma 29.15.1 for the coherent sheaf $r_* \mathcal{F}$ (Lemma 29.9.8) on $\mathbf{P}_{A_0}^n$. For example, by this lemma there exists a surjection

$$\bigoplus_{j=1, \dots, r} \mathcal{O}_{\mathbf{P}_{A_0}^n}(d_j) \longrightarrow r_* \mathcal{F}.$$

Pulling back and using that $r^* r_* \mathcal{F} = \mathcal{F}$ (see lemma cited above) we obtain a corresponding surjection over X . The statements on cohomology follow from the fact that $H^i(X, \mathcal{F}(d)) = H^i(\mathbf{P}_{A_0}^n, r_* \mathcal{F}(d))$ for example by Lemma 29.2.4. Some details omitted. \square

Lemma 29.15.3. *Let A be a graded ring. Let M be a graded A -module. Assume*

- (1) *A_0 is Noetherian,*
 (2) *A is generated by finitely many elements of A_1 over A_0 , and*
 (3) *M is a finitely generated A -module.*

Set $X = \text{Proj}(A)$ and let \widetilde{M} be the quasi-coherent \mathcal{O}_X -module on X associated to M . The maps

$$M_n \longrightarrow \Gamma(X, \widetilde{M}(n))$$

from Constructions, Lemma 26.10.3 are isomorphisms for all sufficiently large n .

Proof. Because M is a finite A -module we see that \widetilde{M} is a finite type \mathcal{O}_X -module, i.e., a coherent \mathcal{O}_X -module. Set $N = \bigoplus_{n \geq 0} \Gamma(X, \widetilde{M}(n))$. We have to show that the map $M \rightarrow N$ of graded A -modules is an isomorphism in all sufficiently large degrees. By Properties, Lemma 27.26.5 we have a canonical isomorphism $\widetilde{N} \rightarrow \widetilde{M}$ such that $M_n \rightarrow N_n = \Gamma(X, \widetilde{M}(n))$ is the canonical map. Let $K = \text{Ker}(M \rightarrow N)$ and $Q = \text{Coker}(M \rightarrow N)$. Recall that the functor $M \mapsto \widetilde{M}$ is exact, see Constructions, Lemma 26.8.4. Hence we see that $\widetilde{K} = 0$ and $\widetilde{Q} = 0$. On the other hand, A is a Noetherian ring and M and N are finitely generated A -modules (for N this follows

from the last part of Lemma 29.15.2). Hence K and Q are finite A -modules. Thus it suffices to show that a finite A -module K with $\tilde{K} = 0$ has only finitely many nonzero homogeneous parts K_d . To do this, let $x_1, \dots, x_r \in K$ be homogeneous generators say sitting in degrees d_1, \dots, d_r . Let $f_1, \dots, f_n \in A_1$ be elements generating A over A_0 . For each i and j there exists an $n_{ij} \geq 0$ such that $f_i^{n_{ij}} x_j = 0$ in $K_{d_j+n_{ij}}$: if not then $K_{(f_i)}$ would not be zero, i.e., \tilde{K} would not be zero. Then we see that K_d is zero for $d > \max_j(d_j + \sum_i n_{ij})$ as every element of K_d is a sum of terms where each term is a monomials in the f_i times one of the x_j of total degree d . \square

Lemma 29.15.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let \mathcal{L} be an invertible sheaf on X . Assume that*

- (1) S is Noetherian,
- (2) f is proper,
- (3) \mathcal{F} is coherent, and
- (4) \mathcal{L} is relatively ample on X/S .

Then there exists an n_0 such that for all $n \geq n_0$ we have

$$R^p f_* (\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = 0$$

for all $p > 0$.

Proof. A proper morphism is of finite type by definition. By Morphisms, Lemma 28.40.7 there exists an open covering $S = \bigcup V_j$ and immersions $i_j : X_j \rightarrow \mathbf{P}_{V_j}^{n_j}$, where $X_j = f^{-1}(V_j)$ such that $i_j^* \mathcal{O}(1)$ is a power of \mathcal{L} . Since S is quasi-compact we may assume the covering is finite. Clearly, if we solve the question for each of the finitely many systems $(X_j \rightarrow V_j, \mathcal{L}|_{X_j}, \mathcal{F}|_{V_j})$ then the result follows. Hence we may assume there exists an immersion $i : X \rightarrow \mathbf{P}_S^n$ such that $\mathcal{L}^{\otimes d} = i^* \mathcal{O}(1)$ for some $d \geq 1$.

Repeating the argument above with a finite affine open covering of S we see that we may also assume that S is affine. In this case the vanishing of $R^p f_* (\mathcal{F} \otimes \mathcal{L}^{\otimes n})$ is equivalent to the vanishing of $H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$, see Lemma 29.4.5.

Since f is proper we see that i is a closed immersion (Morphisms, Lemma 28.42.7). Hence we see that $R^p i_* (\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = 0$ for all $p \geq 1$ (see Lemma 29.9.9 for example). This implies that

$$H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}) = H^p(\mathbf{P}_S^n, i_* (\mathcal{F} \otimes \mathcal{L}^{\otimes n}))$$

by the Leray spectral sequence (Cohomology, Lemma 20.14.4). Moreover, by the projection formula (Cohomology, Lemma 20.8.2) we have

$$i_* (\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = i_* (\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes \langle n \rangle_d}) \otimes_{\mathcal{O}_{\mathbf{P}_S^n}} \mathcal{O}(\lfloor n/d \rfloor)$$

for all $n \in \mathbf{Z}$ where $\langle n \rangle_d \in \{0, 1, \dots, d-1\}$ is the unique element congruent to n modulo d . The sheaves $\mathcal{F}_j = i_* (\mathcal{F} \otimes \mathcal{L}^{\otimes j})$, $j \in \{0, 1, \dots, d-1\}$ are coherent by Lemma 29.9.9. Thus we see that for all n large enough the cohomology groups $H^p(\mathbf{P}_S^n, \mathcal{F}_j(n))$ vanish by Lemma 29.15.1. Putting everything together this implies the lemma. \square

29.16. Chow's Lemma

In this section we prove Chow's lemma in the Noetherian case (Lemma 29.16.1). In Limits, Section 31.11 we prove some variants for the non-Noetherian case.

Lemma 29.16.1. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram*

$$\begin{array}{ccccc} X & \longleftarrow & X' & \longrightarrow & \mathbf{P}_S^n \\ & \searrow & \downarrow & \swarrow & \\ & & S & & \end{array}$$

where $X' \rightarrow \mathbf{P}_S^n$ is an immersion, and $\pi : X' \rightarrow X$ is proper and surjective. Moreover, we may arrange it such that there exists a dense open subscheme $U \subset X$ such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism.

Proof. All of the schemes we will encounter during the rest of the proof are going to be of finite type over the Noetherian scheme S and hence Noetherian (see Morphisms, Lemma 28.16.6). All morphisms between them will automatically be quasi-compact, locally of finite type and quasi-separated, see Morphisms, Lemma 28.16.8 and Properties, Lemmas 27.5.4 and 27.5.6.

The underlying topological space of X is Noetherian (see Properties, Lemma 27.5.5) and we conclude that X has only finitely many irreducible components (see Topology, Lemma 5.8.2). Say $X = X_1 \cup \dots \cup X_r$ is the decomposition of X into irreducible components. Let $\eta_i \in X_i$ be the generic point. For every point $x \in X$ there exists an affine open $U_x \subset X$ which contains x and each of the generic points η_i . See Properties, Lemma 27.27.4. Since X is quasi-compact, we can find a finite affine open covering $X = U_1 \cup \dots \cup U_m$ such that each U_i contains η_1, \dots, η_r . In particular we conclude that the open $U = U_1 \cap \dots \cap U_m \subset X$ is a dense open. This and the fact that the U_i are affine opens covering X is all that we will use below.

Let $X^* \subset X$ be the scheme theoretic closure of $U \rightarrow X$, see Morphisms, Definition 28.6.2. Let $U_i^* = X^* \cap U_i$. Note that U_i^* is a closed subscheme of U_i . Hence U_i^* is affine. Since U is dense in X the morphism $X^* \rightarrow X$ is a surjective closed immersion. It is an isomorphism over U . Hence we may replace X by X^* and U_i by U_i^* and assume that U is scheme theoretically dense in X , see Morphisms, Definition 28.7.1.

By Morphisms, Lemma 28.40.3 we can find an immersion $j_i : U_i \rightarrow \mathbf{P}_S^{n_i}$ for each i . By Morphisms, Lemma 28.7.7 we can find closed subschemes $Z_i \subset \mathbf{P}_S^{n_i}$ such that $j_i : U_i \rightarrow Z_i$ is a scheme theoretically dense open immersion. Note that $Z_i \rightarrow S$ is proper, see Morphisms, Lemma 28.43.5. Consider the morphism

$$j = (j_1|_U, \dots, j_n|_U) : U \longrightarrow \mathbf{P}_S^{n_1} \times_S \dots \times_S \mathbf{P}_S^{n_n}.$$

By the lemma cited above we can find a closed subscheme Z of $\mathbf{P}_S^{n_1} \times_S \dots \times_S \mathbf{P}_S^{n_n}$ such that $j : U \rightarrow Z$ is an open immersion and such that U is scheme theoretically dense in Z . The morphism $Z \rightarrow S$ is proper. Consider the i th projection

$$\text{pr}_i|_Z : Z \longrightarrow \mathbf{P}_S^{n_i}.$$

This morphism factors through Z_i (see Morphisms, Lemma 28.6.6). Denote $p_i : Z \rightarrow Z_i$ the induced morphism. This is a proper morphism, see Morphisms, Lemma

28.42.7 for example. At this point we have that $U \subset U_i \subset Z_i$ are scheme theoretically dense open immersions. Moreover, we can think of Z as the scheme theoretic image of the “diagonal” morphism $U \rightarrow Z_1 \times_S \dots \times_S Z_n$.

Set $V_i = p_i^{-1}(U_i)$. Note that $p_i|_{V_i} : V_i \rightarrow U_i$ is proper. Set $X' = V_1 \cup \dots \cup V_n$. By construction X' has an immersion into the scheme $\mathbf{P}_S^{n_1} \times_S \dots \times_S \mathbf{P}_S^{n_n}$. Thus by the Segre embedding (see Morphisms, Lemma 28.43.6) we see that X' has an immersion into a projective space over S .

We claim that the morphisms $p_i|_{V_i} : V_i \rightarrow U_i$ glue to a morphism $X' \rightarrow X$. Namely, it is clear that $p_i|_U$ is the identity map from U to U . Since $U \subset X'$ is scheme theoretically dense by construction, it is also scheme theoretically dense in the open subscheme $V_i \cap V_j$. Thus we see that $p_i|_{V_i \cap V_j} = p_j|_{V_i \cap V_j}$ as morphisms into the separated S -scheme X , see Morphisms, Lemma 28.7.10. We denote the resulting morphism $\pi : X' \rightarrow X$.

We claim that $\pi^{-1}(U_i) = V_i$. Since $\pi|_{V_i} = p_i|_{V_i}$ it follows that $V_i \subset \pi^{-1}(U_i)$. Consider the diagram

$$\begin{array}{ccc} V_i & \longrightarrow & \pi^{-1}(U_i) \\ & \searrow p_i|_{V_i} & \downarrow \\ & & U_i \end{array}$$

Since $V_i \rightarrow U_i$ is proper we see that the image of the horizontal arrow is closed, see Morphisms, Lemma 28.42.7. Since $V_i \subset \pi^{-1}(U_i)$ is scheme theoretically dense (as it contains U) we conclude that $V_i = \pi^{-1}(U_i)$ as claimed.

This shows that $\pi^{-1}(U_i) \rightarrow U_i$ is identified with the proper morphism $p_i|_{V_i} : V_i \rightarrow U_i$. Hence we see that X has a finite affine covering $X = \bigcup U_i$ such that the restriction of π is proper on each member of the covering. Thus by Morphisms, Lemma 28.42.3 we see that π is proper.

Finally we have to show that $\pi^{-1}(U) = U$. To see this we argue in the same way as above using the diagram

$$\begin{array}{ccc} U & \longrightarrow & \pi^{-1}(U) \\ & \searrow & \downarrow \\ & & U \end{array}$$

and using that $\text{id}_U : U \rightarrow U$ is proper and that U is scheme theoretically dense in $\pi^{-1}(U)$. \square

Remark 29.16.2. In the situation of Chow’s Lemma 29.16.1:

- (1) The morphism π is actually H-projective (hence projective, see Morphisms, Lemma 28.43.3) since the morphism $X' \rightarrow \mathbf{P}_S^n \times_S X = \mathbf{P}_X^n$ is a closed immersion (use the fact that π is proper, see Morphisms, Lemma 28.42.7).
- (2) We may assume that $\pi^{-1}(U)$ is scheme theoretically dense in X' . Namely, we can simply replace X' by the scheme theoretic closure of $\pi^{-1}(U)$. In this case we can think of U as a scheme theoretically dense open subscheme of X' . See Morphisms, Section 28.6.
- (3) If X is reduced then we may choose X' reduced. This is clear from (2).

29.17. Higher direct images of coherent sheaves

In this section we prove the fundamental fact that the higher direct images of a coherent sheaf under a proper morphism are coherent.

Lemma 29.17.1. *Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a locally projective morphism. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $R^i f_* \mathcal{F}$ is a coherent \mathcal{O}_S -module for all $i \geq 0$.*

Proof. We first remark that a locally projective morphism is proper (Morphisms, Lemma 28.43.5) and hence of finite type. In particular X is locally Noetherian (Morphisms, Lemma 28.16.6) and hence the statement makes sense. Moreover, by Lemma 29.4.4 the sheaves $R^p f_* \mathcal{F}$ are quasi-coherent.

Having said this the statement is local on S (for example by Cohomology, Lemma 20.7.4). Hence we may assume $S = \text{Spec}(R)$ is the spectrum of a Noetherian ring, and X is a closed subscheme of \mathbf{P}_R^n for some n , see Morphisms, Lemma 28.43.4. In this case, the sheaves $R^p f_* \mathcal{F}$ are the quasi-coherent sheaves associated to the R -modules $H^p(X, \mathcal{F})$, see Lemma 29.4.5. Hence it suffices to show that R -modules $H^p(X, \mathcal{F})$ are finite R -modules (Lemma 29.9.1). Denote $i : X \rightarrow \mathbf{P}_R^n$ the closed immersion. Note that $R^p i_* \mathcal{F} = 0$ by Lemma 29.9.9. Hence the Leray spectral sequence (Cohomology, Lemma 20.14.4) for $i : X \rightarrow \mathbf{P}_R^n$ degenerates, and we see that $H^p(X, \mathcal{F}) = H^p(\mathbf{P}_R^n, i_* \mathcal{F})$. Since the sheaf $i_* \mathcal{F}$ is coherent by Lemma 29.9.9 we see that the lemma follows from Lemma 29.15.1. \square

Here is the general statement.

Proposition 29.17.2. *Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a proper morphism. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $R^i f_* \mathcal{F}$ is a coherent \mathcal{O}_S -module for all $i \geq 0$.*

Proof. Since the problem is local on S we may assume that S is a Noetherian scheme. Since a proper morphism is of finite type we see that in this case X is a Noetherian scheme also. Consider the property \mathcal{P} of coherent sheaves on X defined by the rule

$$\mathcal{P}(\mathcal{F}) \Leftrightarrow R^p f_* \mathcal{F} \text{ is coherent for all } p \geq 0$$

We are going to use the result of Lemma 29.12.6 to prove that \mathcal{P} holds for every coherent sheaf on X .

Let

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

be a short exact sequence of coherent sheaves on X . Consider the long exact sequence of higher direct images

$$R^{p-1} f_* \mathcal{F}_3 \rightarrow R^p f_* \mathcal{F}_1 \rightarrow R^p f_* \mathcal{F}_2 \rightarrow R^p f_* \mathcal{F}_3 \rightarrow R^{p+1} f_* \mathcal{F}_1$$

Then it is clear that if 2-out-of-3 of the sheaves \mathcal{F}_i have property \mathcal{P} , then the higher direct images of the third are sandwiched in this exact complex between two coherent sheaves. Hence these higher direct images are also coherent by Lemma 29.9.2 and 29.9.3. Hence property \mathcal{P} holds for the third as well.

Let $Z \subset X$ be an integral closed subscheme. We have to find a coherent sheaf \mathcal{F} on X whose support is contained in Z , whose stalk at the generic point ξ of Z is a 1-dimensional vector space over $\kappa(\xi)$ such that \mathcal{P} holds for \mathcal{F} . Denote

$g = f|_Z : Z \rightarrow S$ the restriction of f . Suppose we can find a coherent sheaf \mathcal{G} on Z such that (a) \mathcal{G}_ξ is a 1-dimensional vector space over $\kappa(\xi)$, (b) $R^p g_* \mathcal{G} = 0$ for $p > 0$, and (c) $g_* \mathcal{G}$ is coherent. Then we can consider $\mathcal{F} = (Z \rightarrow X)_* \mathcal{G}$. As $Z \rightarrow X$ is a closed immersion we see that $(Z \rightarrow X)_* \mathcal{G}$ is coherent on X and $R^p(Z \rightarrow X)_* \mathcal{G} = 0$ for $p > 0$ (Lemma 29.9.9). Hence by the relative Leray spectral sequence (Cohomology, Lemma 20.14.8) we will have $R^p f_* \mathcal{F} = R^p g_* \mathcal{G} = 0$ for $p > 0$ and $f_* \mathcal{F} = g_* \mathcal{G}$ is coherent. Finally $\mathcal{F}_\xi = ((Z \rightarrow X)_* \mathcal{G})_\xi = \mathcal{G}_\xi$ which verifies the condition on the stalk at ξ . Hence everything depends on finding a coherent sheaf \mathcal{G} on Z which has properties (a), (b), and (c).

We can apply Chow's Lemma 29.16.1 to the morphism $Z \rightarrow S$. Thus we get a diagram

$$\begin{array}{ccccc} Z & \xleftarrow{\pi} & Z' & \xrightarrow{i} & \mathbf{P}_S^n \\ & \searrow g & \downarrow g' & \swarrow & \\ & & S & & \end{array}$$

as in the statement of Chow's lemma. Also, let $U \subset Z$ be the dense open subscheme such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism. By the discussion in Remark 29.16.2 we see that $i' = (i, \pi) : Z' \rightarrow \mathbf{P}_Z^n$ is a closed immersion. Hence

$$\mathcal{L} = i'^* \mathcal{O}_{\mathbf{P}_S^n}(1) \cong (i')^* \mathcal{O}_{\mathbf{P}_Z^n}(1)$$

is g' -relatively ample and π -relatively ample (for example by Morphisms, Lemma 28.40.7). Hence by Lemma 29.15.4 there exists an $n \geq 0$ such that both $R^p \pi_* \mathcal{L}^{\otimes n} = 0$ for all $p > 0$ and $R^p (g')_* \mathcal{L}^{\otimes n} = 0$ for all $p > 0$. Set $\mathcal{G} = \pi_* \mathcal{L}^{\otimes n}$. Property (a) holds because $\pi_* \mathcal{L}^{\otimes n}|_U$ is an invertible sheaf (as $\pi^{-1}(U) \rightarrow U$ is an isomorphism). Properties (b) and (c) hold because by the relative Leray spectral sequence (Cohomology, Lemma 20.14.8) we have

$$E_2^{p,q} = R^p g_* R^q \pi_* \mathcal{L}^{\otimes n} \Rightarrow R^{p+q} (g')_* \mathcal{L}^{\otimes n}$$

and by choice of n the only nonzero terms in $E_2^{p,q}$ are those with $q = 0$ and the only nonzero terms of $R^{p+q} (g')_* \mathcal{L}^{\otimes n}$ are those with $p = q = 0$. This implies that $R^p g_* \mathcal{G} = 0$ for $p > 0$ and that $g_* \mathcal{G} = (g')_* \mathcal{L}^{\otimes n}$. Finally, applying the previous Lemma 29.17.1 we see that $g_* \mathcal{G} = (g')_* \mathcal{L}^{\otimes n}$ is coherent as desired. \square

Remark 29.17.3. Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Then X is locally Noetherian (Morphisms, Lemma 28.16.6). Let \mathcal{F} be a coherent \mathcal{O}_X -module. Assume the scheme theoretic support Z of \mathcal{F} is proper over S . we claim $R^p f_* \mathcal{F}$ is a coherent \mathcal{O}_S -module for all $p \geq 0$. Namely, Let $i : Z \rightarrow X$ be the closed immersion and write $\mathcal{F} = i_* \mathcal{G}$ for some coherent module \mathcal{G} on Z (Lemma 29.9.7). Denoting $g : Z \rightarrow S$ the composition $f \circ i$ we see that $R^p g_* \mathcal{G}$ is coherent on S by Proposition 29.17.2. On the other hand, $R^q i_* \mathcal{G} = 0$ for $q > 0$ (Lemma 29.9.9). By Cohomology, Lemma 20.14.8 we get $R^p f_* \mathcal{F} = R^p g_* \mathcal{G}$ and the claim.

Lemma 29.17.4. Let $S = \text{Spec}(A)$ with A a Noetherian ring. Let $f : X \rightarrow S$ be a proper morphism. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $H^i(X, \mathcal{F})$ is finite A -module for all $i \geq 0$.

Proof. This is just the affine case of Proposition 29.17.2. Namely, by Lemmas 29.4.4 and 29.4.5 we know that $R^i f_* \mathcal{F}$ is the quasi-coherent sheaf associated to the

A -module $H^i(X, \mathcal{F})$ and by Lemma 29.9.1 this is a coherent sheaf if and only if $H^i(X, \mathcal{F})$ is an A -module of finite type. \square

Lemma 29.17.5. *Let A be a Noetherian ring. Let B be a finitely generated graded A -algebra. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Set $\mathcal{B} = f^*\tilde{B}$. Let \mathcal{F} be a quasi-coherent graded \mathcal{B} -module of finite type.*

- (1) *For every $p \geq 0$ the graded B -module $H^p(X, \mathcal{F})$ is a finite B -module.*
- (2) *If \mathcal{L} is an ample invertible \mathcal{O}_X -module, then there exists an integer d_0 such that $H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes d}) = 0$ for all $p > 0$ and $d \geq d_0$.*

Proof. To prove this we consider the fibre product diagram

$$\begin{array}{ccc} X' = \text{Spec}(B) \times_{\text{Spec}(A)} X & \xrightarrow{\pi} & X \\ f' \downarrow & & \downarrow f \\ \text{Spec}(B) & \longrightarrow & \text{Spec}(A) \end{array}$$

Note that f' is a proper morphism, see Morphisms, Lemma 28.42.5. Also, B is a finitely generated A -algebra, and hence Noetherian (Algebra, Lemma 10.30.1). This implies that X' is a Noetherian scheme (Morphisms, Lemma 28.16.6). Note that X' is the relative spectrum of the quasi-coherent \mathcal{O}_X -algebra \mathcal{B} by Constructions, Lemma 26.4.6. Since \mathcal{F} is a quasi-coherent \mathcal{B} -module we see that there is a unique quasi-coherent $\mathcal{O}_{X'}$ -module \mathcal{F}' such that $\pi_*\mathcal{F}' = \mathcal{F}$, see Morphisms, Lemma 28.13.6. Since \mathcal{F} is finite type as a \mathcal{B} -module we conclude that \mathcal{F}' is a finite type $\mathcal{O}_{X'}$ -module (details omitted). In other words, \mathcal{F}' is a coherent $\mathcal{O}_{X'}$ -module (Lemma 29.9.1). Since the morphism $\pi : X' \rightarrow X$ is affine we have

$$H^p(X, \mathcal{F}) = H^p(X', \mathcal{F}')$$

by Lemma 29.2.4. Thus (1) follows from Lemma 29.17.4. Given \mathcal{L} as in (2) we set $\mathcal{L}' = \pi^*\mathcal{L}$. Note that \mathcal{L}' is ample on X' by Morphisms, Lemma 28.38.7. By the projection formula (Cohomology, Lemma 20.8.2) we have $\pi_*(\mathcal{F}' \otimes \mathcal{L}') = \mathcal{F} \otimes \mathcal{L}$. Thus part (2) follows by the same reasoning as above from Lemma 29.15.4. \square

29.18. The theorem on formal functions

In this section we study the behaviour of cohomology of sequences of sheaves either of the form $\{\mathcal{I}^n\mathcal{F}\}_{n \geq 0}$ or of the form $\{\mathcal{F}/\mathcal{I}^n\mathcal{F}\}_{n \geq 0}$ as n varies.

Here and below we use the following notation. Given a morphism of schemes $f : X \rightarrow Y$, a quasi-coherent sheaf \mathcal{F} on X , and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Y$ we denote $\mathcal{I}^n\mathcal{F}$ the quasi-coherent subsheaf generated by products of local sections of $f^{-1}(\mathcal{I}^n)$ and \mathcal{F} . In a formula

$$\mathcal{I}^n\mathcal{F} = \text{Im}(f^*(\mathcal{I}^n) \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{F}).$$

Note that there are natural maps

$$f^{-1}(\mathcal{I}^n) \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{I}^m\mathcal{F} \rightarrow f^*(\mathcal{I}^n) \otimes_{\mathcal{O}_X} \mathcal{I}^m\mathcal{F} \rightarrow \mathcal{I}^{n+m}\mathcal{F}$$

Hence a section of \mathcal{I}^n will give rise to a map $R^p f_*(\mathcal{I}^m\mathcal{F}) \rightarrow R^p f_*(\mathcal{I}^{n+m}\mathcal{F})$ by functoriality of higher direct images. Localizing and then sheafifying we see that there are \mathcal{O}_Y -module maps

$$\mathcal{I}^n \otimes_{\mathcal{O}_Y} R^p f_*(\mathcal{I}^m\mathcal{F}) \rightarrow R^p f_*(\mathcal{I}^{n+m}\mathcal{F}).$$

In other words we see that $\bigoplus_{n \geq 0} R^p f_*(\mathcal{I}^n \mathcal{F})$ is a graded $\bigoplus_{n \geq 0} \mathcal{I}^n$ -module.

If $Y = \text{Spec}(A)$ and $\mathcal{I} = \tilde{I}$ we denote $\mathcal{I}^n \mathcal{F}$ simply $I^n \mathcal{F}$. The maps introduced above give $M = \bigoplus H^p(X, I^n \mathcal{F})$ the structure of a graded $S = \bigoplus I^n$ -module. If f is proper, A is Noetherian and \mathcal{F} is coherent, then this turns out to be a module of finite type.

Lemma 29.18.1. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Set $B = \bigoplus_{n \geq 0} I^n$. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let \mathcal{F} be a coherent sheaf on \tilde{X} . Then for every $p \geq 0$ the graded B -module $\bigoplus_{n \geq 0} H^p(X, I^n \mathcal{F})$ is a finite B -module.*

Proof. Let $\mathcal{B} = \bigoplus I^n \mathcal{O}_X = f^* \tilde{B}$. Then $\bigoplus I^n \mathcal{F}$ is a finite type graded \mathcal{B} -module. Hence the result follows from Lemma 29.17.5 part (1). \square

Lemma 29.18.2. *Given a morphism of schemes $f : X \rightarrow Y$, a quasi-coherent sheaf \mathcal{F} on X , and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Y$. Assume Y locally Noetherian, f proper, and \mathcal{F} coherent. Then*

$$\mathcal{M} = \bigoplus_{n \geq 0} R^p f_*(\mathcal{I}^n \mathcal{F})$$

is a graded $\mathcal{A} = \bigoplus_{n \geq 0} \mathcal{I}^n$ -module which is quasi-coherent and of finite type.

Proof. The statement is local on Y , hence this reduces to the case where Y is affine. In the affine case the result follows from Lemma 29.18.1. Details omitted. \square

Lemma 29.18.3. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let \mathcal{F} be a coherent sheaf on X . Then for every $p \geq 0$ there exists an integer $c \geq 0$ such that*

- (1) *the multiplication map $I^{n-c} \otimes H^p(X, I^c \mathcal{F}) \rightarrow H^p(X, I^n \mathcal{F})$ is surjective for all $n \geq c$, and*
- (2) *the image of $H^p(X, I^{n+m} \mathcal{F}) \rightarrow H^p(X, I^n \mathcal{F})$ is contained in the submodule $I^{m-c} H^p(X, I^n \mathcal{F})$ for all $n \geq 0$, $m \geq c$.*

Proof. By Lemma 29.18.1 we can find $d_1, \dots, d_t \geq 0$, and $x_i \in H^p(X, I^{d_i} \mathcal{F})$ such that $\bigoplus_{n \geq 0} H^p(X, I^n \mathcal{F})$ is generated by x_1, \dots, x_t over $S = \bigoplus_{n \geq 0} I^n$. Take $c = \max\{d_i\}$. It is clear that (1) holds. For (2) let $b = \max(0, n - c)$. Consider the commutative diagram of A -modules

$$\begin{array}{ccccc} I^{n+m-c-b} \otimes I^b \otimes H^p(X, I^c \mathcal{F}) & \longrightarrow & I^{n+m-c} \otimes H^p(X, I^c \mathcal{F}) & \longrightarrow & H^p(X, I^{n+m} \mathcal{F}) \\ \downarrow & & & & \downarrow \\ I^{n+m-c-b} \otimes H^p(X, I^n \mathcal{F}) & \longrightarrow & & \longrightarrow & H^p(X, I^n \mathcal{F}) \end{array}$$

By part (1) of the lemma the composition of the horizontal arrows is surjective if $n + m \geq c$. On the other hand, it is clear that $n + m - c - b \geq m - c$. Hence part (2). \square

In the situation of Lemmas 29.18.1 and 29.18.3 consider the inverse system

$$\mathcal{F}/I\mathcal{F} \leftarrow \mathcal{F}/I^2\mathcal{F} \leftarrow \mathcal{F}/I^3\mathcal{F} \leftarrow \dots$$

We would like to know what happens to the cohomology groups. Here is a first result.

Lemma 29.18.4. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let \mathcal{F} be a coherent sheaf on X . Fix $p \geq 0$.*

(1) *There exists a $c_1 \geq 0$ such that for all $n \geq c_1$ we have*

$$\text{Ker}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) \subset I^{n-c_1} H^p(X, \mathcal{F}).$$

(2) *The inverse system*

$$(H^p(X, \mathcal{F}/I^n \mathcal{F}))_{n \in \mathbf{N}}$$

satisfies the Mittag-Leffler condition (see Homology, Definition 12.27.2).

(3) *In fact for any p and n there exists a $c_2(n) \geq n$ such that*

$$\begin{aligned} \text{Im}(H^p(X, \mathcal{F}/I^k \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) &= \text{Im}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) \\ &\text{for all } k \geq c_2(n). \end{aligned}$$

Proof. Let $c_1 = \max\{c_p, c_{p+1}\}$, where c_p, c_{p+1} are the integers found in Lemma 29.18.3 for H^p and H^{p+1} . We will use this constant in the proofs of (1), (2) and (3).

Let us prove part (1). Consider the short exact sequence

$$0 \rightarrow I^n \mathcal{F} \rightarrow \mathcal{F} \rightarrow \mathcal{F}/I^n \mathcal{F} \rightarrow 0$$

From the long exact cohomology sequence we see that

$$\text{Ker}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) = \text{Im}(H^p(X, I^n \mathcal{F}) \rightarrow H^p(X, \mathcal{F}))$$

Hence by our choice of c_1 we see that this is contained in $I^{n-c_1} H^p(X, \mathcal{F})$ for $n \geq c_1$.

Note that part (3) implies part (2) by definition of the Mittag-Leffler condition.

Let us prove part (3). Fix an n throughout the rest of the proof. Consider the commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & I^n \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{F}/I^n \mathcal{F} & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I^{n+m} \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{F}/I^{n+m} \mathcal{F} & \longrightarrow & 0 \end{array}$$

This gives rise to the following commutative diagram

$$\begin{array}{ccccccc} H^p(X, I^n \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}/I^n \mathcal{F}) & \xrightarrow{\delta} & H^{p+1}(X, I^n \mathcal{F}) \\ \uparrow & & \uparrow & & \uparrow & & \uparrow \\ H^p(X, I^{n+m} \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}/I^{n+m} \mathcal{F}) & \longrightarrow & H^{p+1}(X, I^{n+m} \mathcal{F}) \end{array}$$

If $m \geq c_1$ we see that the image of a is contained in $I^{m-c_1} H^{p+1}(X, I^n \mathcal{F})$. By the Artin-Rees lemma (see Algebra, Lemma 10.49.3) there exists an integer $c_3(n)$ such that

$$I^N H^{p+1}(X, I^n \mathcal{F}) \cap \text{Im}(\delta) \subset \delta \left(I^{N-c_3(n)} H^p(X, \mathcal{F}/I^n \mathcal{F}) \right)$$

for all $N \geq c_3(n)$. As $H^p(X, \mathcal{F}/I^n \mathcal{F})$ is annihilated by I^n , we see that if $m \geq c_3(n) + c_1 + n$, then

$$\text{Im}(H^p(X, \mathcal{F}/I^{n+m} \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) = \text{Im}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F}))$$

In other words, part (3) holds with $c_2(n) = c_3(n) + c_1 + n$. □

Theorem 29.18.5 (Theorem on formal functions). *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let \mathcal{F} be a coherent sheaf on X . Fix $p \geq 0$. The system of maps*

$$H^p(X, \mathcal{F})/I^n H^p(X, \mathcal{F}) \longrightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})$$

define an isomorphism of limits

$$H^p(X, \mathcal{F})^\wedge \longrightarrow \lim_n H^p(X, \mathcal{F}/I^n \mathcal{F})$$

where the left hand side is the completion of the A -module $H^p(X, \mathcal{F})$ with respect to the ideal I , see Algebra, Section 10.93. Moreover, this is in fact a homeomorphism for the limit topologies.

Proof. In fact, this follows immediately from Lemma 29.18.4. We spell out the details. Set $M = H^p(X, \mathcal{F})$ and $M_n = H^p(X, \mathcal{F}/I^n \mathcal{F})$. Denote $N_n = \text{Im}(M \rightarrow M_n)$. By the description of the limit in Homology, Section 12.27 we have

$$\lim_n M_n = \{(x_n) \in \prod M_n \mid \varphi_i(x_n) = x_{n-1}, n = 2, 3, \dots\}$$

Pick an element $x = (x_n) \in \lim_n M_n$. By Lemma 29.18.4 part (3) we have $x_n \in N_n$ for all n since by definition x_n is the image of some $x_{n+m} \in M_{n+m}$ for all m . By Lemma 29.18.4 part (1) we see that there exists a factorization

$$M \rightarrow N_n \rightarrow M/I^{n-c_1} M$$

of the reduction map. Denote $y_n \in M/I^{n-c_1} M$ the image of x_n for $n \geq c_1$. Since for $n' \geq n$ the composition $M \rightarrow M_{n'} \rightarrow M_n$ is the given map $M \rightarrow M_n$ we see that $y_{n'}$ maps to y_n under the canonical map $M/I^{n'-c_1} M \rightarrow M/I^{n-c_1} M$. Hence $y = (y_{n+c_1})$ defines an element of $\lim_n M/I^n M$. We omit the verification that y maps to x under the map

$$M^\wedge = \lim_n M/I^n M \longrightarrow \lim_n M_n$$

of the lemma. We also omit the verification on topologies. \square

Lemma 29.18.6. *Let A be a ring. Let $I \subset A$ be an ideal. Assume A is Noetherian and complete with respect to I . Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let \mathcal{F} be a coherent sheaf on X . Then*

$$H^p(X, \mathcal{F}) = \lim_n H^p(X, \mathcal{F}/I^n \mathcal{F})$$

for all $p \geq 0$.

Proof. This is a reformulation of the theorem on formal functions (Theorem 29.18.5) in the case of a complete Noetherian base ring. Namely, in this case the A -module $H^p(X, \mathcal{F})$ is finite (Lemma 29.17.4) hence I -adically complete (Algebra, Lemma 10.93.2) and we see that completion on the left hand side is not necessary. \square

Lemma 29.18.7. *Given a morphism of schemes $f : X \rightarrow Y$ and a quasi-coherent sheaf \mathcal{F} on X . Assume*

- (1) Y locally Noetherian,
- (2) f proper, and
- (3) \mathcal{F} coherent.

Let $y \in Y$ be a point. Consider the infinitesimal neighbourhoods

$$\begin{array}{ccc} X_n = \operatorname{Spec}(\mathcal{O}_{Y,y}/\mathfrak{m}_y^n) \times_Y X & \xrightarrow{i_n} & X \\ f_n \downarrow & & \downarrow f \\ \operatorname{Spec}(\mathcal{O}_{Y,y}/\mathfrak{m}_y^n) & \xrightarrow{c_n} & Y \end{array}$$

of the fibre $X_1 = X_y$ and set $\mathcal{F}_n = i_n^* \mathcal{F}$. Then we have

$$(R^p f_* \mathcal{F})_y^\wedge \cong \lim_n H^p(X_n, \mathcal{F}_n)$$

as $\mathcal{O}_{Y,y}^\wedge$ -modules.

Proof. This is just a reformulation of a special case of the theorem on formal functions, Theorem 29.18.5. Let us spell it out. Note that $\mathcal{O}_{Y,y}$ is a Noetherian local ring. Consider the canonical morphism $c : \operatorname{Spec}(\mathcal{O}_{Y,y}) \rightarrow Y$, see Schemes, Equation (25.13.1.1). This is a flat morphism as it identifies local rings. Denote momentarily $f' : X' \rightarrow \operatorname{Spec}(\mathcal{O}_{Y,y})$ the base change of f to this local ring. We see that $c^* R^p f_* \mathcal{F} = R^p f'_* \mathcal{F}'$ by Lemma 29.5.2. Moreover, the infinitesimal neighbourhoods of the fibre X_y and X'_y are identified (verification omitted; hint: the morphisms c_n factor through c).

Hence we may assume that $Y = \operatorname{Spec}(A)$ is the spectrum of a Noetherian local ring A with maximal ideal \mathfrak{m} and that $y \in Y$ corresponds to the closed point (i.e., to \mathfrak{m}). In particular it follows that

$$(R^p f_* \mathcal{F})_y = \Gamma(Y, R^p f_* \mathcal{F}) = H^p(X, \mathcal{F}).$$

In this case also, the morphisms c_n are each closed immersions. Hence their base changes i_n are closed immersions as well. Note that $i_{n,*} \mathcal{F}_n = i_{n,*} i_n^* \mathcal{F} = \mathcal{F}/\mathfrak{m}^n \mathcal{F}$. By the Leray spectral sequence for i_n , and Lemma 29.9.9 we see that

$$H^p(X_n, \mathcal{F}_n) = H^p(X, i_{n,*} \mathcal{F}) = H^p(X, \mathcal{F}/\mathfrak{m}^n \mathcal{F})$$

Hence we may indeed apply the theorem on formal functions to compute the limit in the statement of the lemma and we win. \square

Here is a lemma which we will generalize later to fibres of dimension > 0 , namely the next lemma.

Lemma 29.18.8. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $y \in Y$. Assume*

- (1) Y locally Noetherian,
- (2) f is proper, and
- (3) $f^{-1}(\{y\})$ is finite.

Then for any coherent sheaf \mathcal{F} on X we have $(R^p f_ \mathcal{F})_y = 0$ for all $p > 0$.*

Proof. The fibre X_y is finite, and by Morphisms, Lemma 28.21.7 it is a finite discrete space. Moreover, the underlying topological space of each infinitesimal neighbourhood X_n is the same. Hence each of the schemes X_n is affine according to Schemes, Lemma 25.11.7. Hence it follows that $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > 0$. Hence we see that $(R^p f_* \mathcal{F})_y^\wedge = 0$ by Lemma 29.18.7. Note that $R^p f_* \mathcal{F}$ is coherent by Proposition 29.17.2 and hence $R^p f_* \mathcal{F}_y$ is a finite $\mathcal{O}_{Y,y}$ -module. By Algebra, Lemma 10.93.2 this implies that $(R^p f_* \mathcal{F})_y = 0$. \square

Lemma 29.18.9. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $y \in Y$. Assume*

- (1) Y locally Noetherian,
- (2) f is proper, and
- (3) $\dim(X_y) = d$.

Then for any coherent sheaf \mathcal{F} on X we have $(R^p f_* \mathcal{F})_y = 0$ for all $p > d$.

Proof. The fibre X_y is of finite type over $\text{Spec}(\kappa(y))$. Hence X_y is a Noetherian scheme by Morphisms, Lemma 28.16.6. Hence the underlying topological space of X_y is Noetherian, see Properties, Lemma 27.5.5. Moreover, the underlying topological space of each infinitesimal neighbourhood X_n is the same as that of X_y . Hence $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > d$ by Cohomology, Proposition 20.21.6. Hence we see that $(R^p f_* \mathcal{F})_y^\wedge = 0$ by Lemma 29.18.7 for $p > d$. Note that $R^p f_* \mathcal{F}$ is coherent by Proposition 29.17.2 and hence $R^p f_* \mathcal{F}_y$ is a finite $\mathcal{O}_{Y,y}$ -module. By Algebra, Lemma 10.93.2 this implies that $(R^p f_* \mathcal{F})_y = 0$. \square

29.19. Applications of the theorem on formal functions

We will add more here as needed. For the moment we need the following characterization of finite morphisms (in the Noetherian case – for a more general version see the chapter More on Morphisms, Section 36.31).

Lemma 29.19.1. *(For a more general version see More on Morphisms, Lemma 36.31.5). Let $f : X \rightarrow S$ be a morphism of schemes. Assume S is locally Noetherian. The following are equivalent*

- (1) f is finite, and
- (2) f is proper with finite fibres.

Proof. A finite morphism is proper according to Morphisms, Lemma 28.44.10. A finite morphism is quasi-finite according to Morphisms, Lemma 28.44.9. A quasi-finite morphism has finite fibres, see Morphisms, Lemma 28.21.10. Hence a finite morphism is proper and has finite fibres.

Assume f is proper with finite fibres. We want to show f is finite. In fact it suffices to prove f is affine. Namely, if f is affine, then it follows that f is integral by Morphisms, Lemma 28.44.7 whereupon it follows from Morphisms, Lemma 28.44.4 that f is finite.

To show that f is affine we may assume that S is affine, and our goal is to show that X is affine too. Since f is proper we see that X is separated and quasi-compact. Hence we may use the criterion of Lemma 29.3.2 to prove that X is affine. To see this let $\mathcal{I} \subset \mathcal{O}_X$ be a finite type ideal sheaf. In particular \mathcal{I} is a coherent sheaf on X . By Lemma 29.18.8 we conclude that $R^1 f_* \mathcal{I}_s = 0$ for all $s \in S$. In other words, $R^1 f_* \mathcal{I} = 0$. Hence we see from the Leray Spectral Sequence for f that $H^1(X, \mathcal{I}) = H^1(S, f_* \mathcal{I})$. Since S is affine, and $f_* \mathcal{I}$ is quasi-coherent (Schemes, Lemma 25.24.1) we conclude $H^1(S, f_* \mathcal{I}) = 0$ from Lemma 29.2.2 as desired. Hence $H^1(X, \mathcal{I}) = 0$ as desired. \square

As a consequence we have the following useful result.

Lemma 29.19.2. *(For a more general version see More on Morphisms, Lemma 36.31.6). Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume*

- (1) S is locally Noetherian,
- (2) f is proper, and
- (3) $f^{-1}(\{s\})$ is a finite set.

Then there exists an open neighbourhood $V \subset S$ of s such that $f|_{f^{-1}(V)} : f^{-1}(V) \rightarrow V$ is finite.

Proof. The morphism f is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 28.21.7. By Morphisms, Lemma 28.49.2 the set of points at which f is quasi-finite is an open $U \subset X$. Let $Z = X \setminus U$. Then $s \notin f(Z)$. Since f is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of s with $Z \cap V = \emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 28.21.9), hence has finite fibres (Morphisms, Lemma 28.21.10), hence is finite by Lemma 29.19.1. \square

29.20. Cohomology and base change, III

In this section we prove the simplest case of a very general phenomenon that will be discussed in Derived Categories of Schemes, Section 35.16. Please see Remark 29.20.2 for a translation of the following lemma into algebra.

Lemma 29.20.1. *Let A be a Noetherian ring and set $S = \text{Spec}(A)$. Let $f : X \rightarrow S$ be a proper morphism of schemes. Let \mathcal{F} be a coherent \mathcal{O}_X -module flat over S . Then*

- (1) $R\Gamma(X, \mathcal{F})$ is a perfect object of $D(A)$, and
- (2) for any ring map $A \rightarrow A'$ the base change map

$$R\Gamma(X, \mathcal{F}) \otimes_A^{\mathbf{L}} A' \longrightarrow R\Gamma(X_{A'}, \mathcal{F}_{A'})$$

is an isomorphism.

Proof. Choose a finite affine open covering $X = \bigcup_{i=1, \dots, n} U_i$. By Lemmas 29.7.1 and 29.7.2 the Čech complex $K^\bullet = \check{C}^\bullet(\mathcal{U}, \mathcal{F})$ satisfies

$$K^\bullet \otimes_A A' = R\Gamma(X_{A'}, \mathcal{F}_{A'})$$

for all ring maps $A \rightarrow A'$. Let $K_{alt}^\bullet = \check{C}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$ be the alternating Čech complex. By Cohomology, Lemma 20.24.6 there is a homotopy equivalence $K_{alt}^\bullet \rightarrow K^\bullet$ of A -modules. In particular, we have

$$K_{alt}^\bullet \otimes_A A' = R\Gamma(X_{A'}, \mathcal{F}_{A'})$$

as well. Since \mathcal{F} is flat over A we see that each K_{alt}^n is flat over A (see Morphisms, Lemma 28.26.2). Since moreover K_{alt}^\bullet is bounded above (this is why we switched to the alternating Čech complex) $K_{alt}^\bullet \otimes_A A' = K_{alt}^\bullet \otimes_A^{\mathbf{L}} A'$ by the definition of derived tensor products (see More on Algebra, Section 15.45). By Lemma 29.17.4 the cohomology groups $H^i(K_{alt}^\bullet)$ are finite A -modules. As K_{alt}^\bullet is bounded, we conclude that K_{alt}^\bullet is pseudo-coherent, see More on Algebra, Lemma 15.50.16. Given any A -module M set $A' = A \oplus M$ where M is a square zero ideal, i.e., $(a, m) \cdot (a', m') = (aa', am' + a'm)$. By the above we see that $K_{alt}^\bullet \otimes_A^{\mathbf{L}} A'$ has cohomology in degrees $0, \dots, n$. Hence $K_{alt}^\bullet \otimes_A^{\mathbf{L}} M$ has cohomology in degrees $0, \dots, n$. Hence K_{alt}^\bullet has finite Tor dimension, see More on Algebra, Definition 15.51.1. We win by More on Algebra, Lemma 15.56.2. \square

Remark 29.20.2. A consequence of Lemma 29.20.1 is that there exists a finite complex of finite projective A -modules M^\bullet such that we have

$$H^i(X_{A'}, \mathcal{F}_{A'}) = H^i(M^\bullet \otimes_A A')$$

functorially in A' . The condition that \mathcal{F} is flat over A is essential, see [Har98].

29.21. Grothendieck's existence theorem, I

In this section we discuss Grothendieck's existence theorem for the projective case. As we do not yet have the theory of formal schemes to our disposal, we temporarily develop a bit of language that replaces the notion of a "coherent module on a Noetherian adic formal scheme". The reader who is familiar with formal schemes is encouraged to read the statement and proof of the theorem in [DG67].

Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Below we will consider inverse systems (\mathcal{F}_n) of coherent \mathcal{O}_X -modules such that

- (1) \mathcal{F}_n is annihilated by \mathcal{I}^n , and
- (2) the transition maps induce isomorphisms $\mathcal{F}_{n+1}/\mathcal{I}^n\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$.

A morphism of such inverse systems is defined as usual. Let us denote the category of these inverse systems with $\text{Coh}(X, \mathcal{I})$. We are going to proceed by proving a bunch of lemmas about objects in this category. In fact, most of the lemmas that follow are straightforward consequences of the following description of the category in the affine case.

Lemma 29.21.1. *If $X = \text{Spec}(A)$ is the spectrum of a Noetherian ring and \mathcal{I} is the quasi-coherent sheaf of ideals associated to the ideal $I \subset A$, then $\text{Coh}(X, \mathcal{I})$ is equivalent to the category of finite A^\wedge -modules where A^\wedge is the completion of A with respect to I .*

Proof. Let $\text{Mod}_{A, I}^{fg}$ be the category of inverse systems (M_n) of finite A -modules satisfying: (1) M_n is annihilated by I^n and (2) $M_{n+1}/I^n M_{n+1} = M_n$. By the correspondence between coherent sheaves on X and finite A -modules (Lemma 29.9.1) it suffices to show $\text{Mod}_{A, I}^{fg}$ is equivalent to the category of finite A^\wedge -modules. To see this it suffices to prove that given an object (M_n) of $\text{Mod}_{A, I}^{fg}$ the module

$$M = \lim M_n$$

is a finite A^\wedge -module and that $M/I^n M = M_n$. As the transition maps are surjective, we see that $M \rightarrow M_1$ is surjective. Pick $x_1, \dots, x_t \in M$ which map to generators of M_1 . This induces a map of systems $(A/I^n)^{\oplus t} \rightarrow M_n$. By Nakayama's lemma (Algebra, Lemma 10.19.1) these maps are surjective. Let $K_n \subset (A/I^n)^{\oplus t}$ be the kernel. Property (2) implies that $K_{n+1} \rightarrow K_n$ is surjective, in particular the system (K_n) satisfies the Mittag-Leffler condition. By Homology, Lemma 12.27.3 we obtain an exact sequence $0 \rightarrow K \rightarrow (A^\wedge)^{\oplus t} \rightarrow M \rightarrow 0$ with $K = \lim K_n$. Hence M is a finite A^\wedge -module. As $K \rightarrow K_n$ is surjective it follows that

$$M/I^n M = \text{Coker}(K \rightarrow (A/I^n)^{\oplus t}) = (A/I^n)^{\oplus t}/K_n = M_n$$

as desired. □

Lemma 29.21.2. *Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals.*

- (1) *The category $\text{Coh}(X, \mathcal{I})$ is abelian.*
- (2) *For $U \subset X$ open the restriction functor $\text{Coh}(X, \mathcal{I}) \rightarrow \text{Coh}(U, \mathcal{I}|_U)$ is exact.*
- (3) *Exactness in $\text{Coh}(X, \mathcal{I})$ may be checked by restricting to the members of an open covering of X .*

Proof. Let $\alpha = (\alpha_n) : (\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ be a morphism of $\text{Coh}(X, \mathcal{I})$. The cokernel of α is the inverse system $(\text{Coker}(\alpha_n))$ (details omitted). To describe the kernel let

$$\mathcal{K}'_{l,m} = \text{Im}(\text{Ker}(\alpha_l) \rightarrow \mathcal{F}_m)$$

for $l \geq m$. We claim:

- (a) the inverse system $(\mathcal{K}'_{l,m})_{l \geq m}$ is eventually constant, say with value \mathcal{K}'_m ,
- (b) the system $(\mathcal{K}'_m/\mathcal{I}^n \mathcal{K}'_m)_{m \geq n}$ is eventually constant, say with value \mathcal{K}_n ,
- (c) the system (\mathcal{K}_n) forms an object of $\text{Coh}(X, \mathcal{I})$, and
- (d) this object is the kernel of α .

To see (a), (b), and (c) we may work affine locally, say $X = \text{Spec}(A)$ and \mathcal{I} corresponds to the ideal $I \subset A$. By Lemma 29.21.1 α corresponds to a map $f : M \rightarrow N$ of finite A^\wedge -modules. Denote $K = \text{Ker}(f)$. Note that A^\wedge is a Noetherian ring (Algebra, Lemma 10.93.10). Choose an integer $c \geq 0$ such that $K \cap I^n M \subset I^{n-c} K$ for $n \geq c$ (Algebra, Lemma 10.49.2) and which satisfies Algebra, Lemma 10.49.3 for the map f and the ideal $I^\wedge = IA^\wedge$. Then $\mathcal{K}'_{l,m}$ corresponds to the A -module

$$\mathcal{K}'_{l,m} = \frac{a^{-1}(I^l N) + I^m M}{I^m M} = \frac{K + I^{l-c} f^{-1}(I^c N) + I^m M}{I^m M} = \frac{K + I^m M}{I^m M}$$

where the last equality holds if $l \geq m + c$. So \mathcal{K}'_m corresponds to the A -module $K/K \cap I^m M$ and $\mathcal{K}'_m/\mathcal{I}^n \mathcal{K}'_m$ corresponds to

$$\frac{K}{K \cap I^m M + I^n K} = \frac{K}{I^n K}$$

for $m \geq n + c$ by our choice of c above. Hence \mathcal{K}_n corresponds to $K/I^n K$.

We prove (d). It is clear from the description on affines above that the composition $(\mathcal{K}_n) \rightarrow (\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ is zero. Let $\beta : (\mathcal{H}_n) \rightarrow (\mathcal{F}_n)$ be a morphism such that $\alpha \circ \beta = 0$. Then $\mathcal{H}_l \rightarrow \mathcal{F}_l$ maps into $\text{Ker}(\alpha_l)$. Since $\mathcal{H}_m = \mathcal{H}_l/\mathcal{I}^m \mathcal{H}_l$ for $l \geq m$ we obtain a system of maps $\mathcal{H}_m \rightarrow \mathcal{K}'_{l,m}$. Thus a map $\mathcal{H}_m \rightarrow \mathcal{K}'_m$. Since $\mathcal{H}_n = \mathcal{H}_m/\mathcal{I}^n \mathcal{H}_m$ we obtain a system of maps $\mathcal{H}_n \rightarrow \mathcal{K}'_m/\mathcal{I}^n \mathcal{K}'_m$ and hence a map $\mathcal{H}_n \rightarrow \mathcal{K}_n$ as desired.

To finish the proof of (1) we still have to show that $\text{Coim} = \text{Im}$ in $\text{Coh}(X, \mathcal{I})$. We have seen above that taking kernels and cokernels commutes, over affines, with the description of $\text{Coh}(X, \mathcal{I})$ as a category of modules. Since $\text{Im} = \text{Coim}$ holds in the category of modules this gives $\text{Coim} = \text{Im}$ in $\text{Coh}(X, \mathcal{I})$. Parts (2) and (3) of the lemma are immediate from our construction of kernels and cokernels. \square

Lemma 29.21.3. *Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. A map $(\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ is surjective in $\text{Coh}(X, \mathcal{I})$ if and only if $\mathcal{F}_1 \rightarrow \mathcal{G}_1$ is surjective.*

Proof. Omitted. Hint: Look on affine opens, use Lemma 29.21.1, and use Algebra, Lemma 10.19.1. \square

Lemma 29.21.4. *Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If (\mathcal{F}_n) is an object of $\text{Coh}(X, \mathcal{I})$ then $\bigoplus \text{Ker}(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n)$ is a finite type, graded, quasi-coherent $\bigoplus \mathcal{I}^n/\mathcal{I}^{n+1}$ -module.*

Proof. The question is local on X hence we may assume X is affine, i.e., we have a situation as in Lemma 29.21.1. In this case, if (\mathcal{F}_n) corresponds to the finite A^\wedge module M , then $\bigoplus \text{Ker}(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n)$ corresponds to $\bigoplus I^n M/I^{n+1} M$ which is clearly a finite module over $\bigoplus I^n/I^{n+1}$. \square

Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. There is a functor

$$(29.21.4.1) \quad \text{Coh}(\mathcal{O}_X) \longrightarrow \text{Coh}(X, \mathcal{I}), \quad \mathcal{F} \longmapsto \mathcal{F}^\wedge$$

which associates to the coherent \mathcal{O}_X -module \mathcal{F} the object $\mathcal{F}^\wedge = (\mathcal{F}/\mathcal{I}^n \mathcal{F})$ of $\text{Coh}(X, \mathcal{I})$.

Lemma 29.21.5. *The functor (29.21.4.1) is exact.*

Proof. It suffices to check this locally on X . Hence we may assume X is affine, i.e., we have a situation as in Lemma 29.21.1. The functor is the functor $\text{Mod}_A^{fg} \rightarrow \text{Mod}_{A^\wedge}^{fg}$ which associates to a finite A -module M the completion M^\wedge . Thus the result follows from Algebra, Lemma 10.93.3. \square

Lemma 29.21.6. *Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Set $\mathcal{H} = \text{Hom}_{\mathcal{O}_X}(\mathcal{G}, \mathcal{F})$. Then*

$$\lim H^0(X, \mathcal{H}/\mathcal{I}^n \mathcal{H}) = \text{Mor}_{\text{Coh}(X, \mathcal{I})}(\mathcal{G}^\wedge, \mathcal{F}^\wedge).$$

Proof. To prove this we may work affine locally on X . Hence we may assume $X = \text{Spec}(A)$ and \mathcal{F}, \mathcal{G} given by finite A -module M and N . Then \mathcal{H} corresponds to the finite A -module $H = \text{Hom}_A(M, N)$. The statement of the lemma becomes the statement

$$H^\wedge = \text{Hom}_{A^\wedge}(M^\wedge, N^\wedge)$$

via the equivalence of Lemma 29.21.1. By Algebra, Lemma 10.93.3 (used 3 times) we have

$$H^\wedge = \text{Hom}_A(M, N) \otimes_A A^\wedge = \text{Hom}_{A^\wedge}(M \otimes_A A^\wedge, N \otimes_A A^\wedge) = \text{Hom}_{A^\wedge}(M^\wedge, N^\wedge)$$

where the second equality uses that A^\wedge is flat over A (see More on Algebra, Remark 15.50.18). The lemma follows. \square

Lemma 29.21.7. *Let A be Noetherian ring complete with respect to an ideal I . Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism. Let $\mathcal{I} = I\mathcal{O}_X$. Then the functor (29.21.4.1) is fully faithful.*

Proof. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Then $\mathcal{H} = \text{Hom}_{\mathcal{O}_X}(\mathcal{G}, \mathcal{F})$ is a coherent \mathcal{O}_X -module, see Modules, Lemma 17.19.4. By Lemma 29.21.6 the map

$$\lim_n H^0(X, \mathcal{H}/\mathcal{I}^n \mathcal{H}) \rightarrow \text{Mor}_{\text{Coh}(X, \mathcal{I})}(\mathcal{G}^\wedge, \mathcal{F}^\wedge)$$

is bijective. Hence fully faithfulness of (29.21.4.1) follows from the theorem on formal functions (Lemma 29.18.6) for the coherent sheaf \mathcal{H} . \square

Lemma 29.21.8. *Let A be Noetherian ring and $I \subset A$ and ideal. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism and let \mathcal{L} be an f -ample invertible sheaf. Let $\mathcal{I} = I\mathcal{O}_X$. Let (\mathcal{F}_n) be an object of $\text{Coh}(X, \mathcal{I})$. Then there exists an integer d_0 such that*

$$H^1(X, \text{Ker}(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n) \otimes \mathcal{L}^{\otimes d}) = 0$$

for all $n \geq 0$ and all $d \geq d_0$.

Proof. Set $B = \bigoplus I^n/I^{n+1}$ and $\mathcal{B} = \bigoplus \mathcal{I}^n/\mathcal{I}^{n+1} = f^* \tilde{B}$. By Lemma 29.21.4 the graded quasi-coherent \mathcal{B} -module $\mathcal{G} = \bigoplus \text{Ker}(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n)$ is of finite type. Hence the lemma follows from Lemma 29.17.5 part (2). \square

Lemma 29.21.9. *Let A be Noetherian ring complete with respect to an ideal I . Let $f : X \rightarrow \text{Spec}(A)$ be a projective morphism. Let $\mathcal{I} = I\mathcal{O}_X$. Then the functor (29.21.4.1) is an equivalence.*

Proof. We have already seen that (29.21.4.1) is fully faithful in Lemma 29.21.7. Thus it suffices to show that the functor is essentially surjective.

We first show that every object (\mathcal{F}_n) of $\text{Coh}(X, \mathcal{I})$ is the quotient of an object in the image of (29.21.4.1). Let \mathcal{L} be an f -ample invertible sheaf on X . Choose d_0 as in Lemma 29.21.8. Choose a $d \geq d_0$ such that $\mathcal{F}_1 \otimes \mathcal{L}^{\otimes d}$ is globally generated by some sections $s_{1,1}, \dots, s_{t,1}$. Since the transition maps of the system

$$H^0(X, \mathcal{F}_{n+1} \otimes \mathcal{L}^{\otimes d}) \longrightarrow H^0(X, \mathcal{F}_n \otimes \mathcal{L}^{\otimes d})$$

are surjective by the vanishing of H^1 we can lift $s_{1,1}, \dots, s_{t,1}$ to a compatible system of global sections $s_{1,n}, \dots, s_{t,n}$ of $\mathcal{F}_n \otimes \mathcal{L}^{\otimes d}$. These determine a compatible system of maps

$$(s_{1,n}, \dots, s_{t,n}) : (\mathcal{L}^{\otimes -d})^{\oplus t} \longrightarrow \mathcal{F}_n$$

Using Lemma 29.21.3 we deduce that we have a surjective map

$$((\mathcal{L}^{\otimes -d})^{\oplus t})^\wedge \longrightarrow (\mathcal{F}_n)$$

as desired.

The result of the previous paragraph and the fact that $\text{Coh}(X, \mathcal{I})$ is abelian (Lemma 29.21.2) implies that every object of $\text{Coh}(X, \mathcal{I})$ is a cokernel of a map between objects coming from $\text{Coh}(\mathcal{O}_X)$. As (29.21.4.1) is fully faithful and exact by Lemmas 29.21.7 and 29.21.5 we conclude. \square

29.22. Grothendieck's existence theorem, II

In this section we discuss Grothendieck's existence theorem. Before we give the statement and proof, we need to develop a bit more theory regarding the categories $\text{Coh}(X, \mathcal{I})$ introduced in Section 29.21.

Lemma 29.22.1. *Let $f : X \rightarrow Y$ be a morphism of Noetherian schemes. Let $\mathcal{J} \subset \mathcal{O}_Y$ be a quasi-coherent sheaf of ideals and set $\mathcal{I} = f^{-1}\mathcal{J}\mathcal{O}_X$. Then there is a right exact functor*

$$f^* : \text{Coh}(Y, \mathcal{J}) \longrightarrow \text{Coh}(X, \mathcal{I})$$

which sends (\mathcal{G}_n) to $(f^\mathcal{G}_n)$. If f is flat, then f^* is an exact functor.*

Proof. Since $f^* : \text{Coh}(\mathcal{O}_Y) \rightarrow \text{Coh}(\mathcal{O}_X)$ is right exact we have

$$f^*\mathcal{G}_n = f^*(\mathcal{G}_{n+1}/\mathcal{I}^n\mathcal{G}_{n+1}) = f^*\mathcal{G}_{n+1}/f^{-1}\mathcal{I}^n f^*\mathcal{G}_{n+1} = f^*\mathcal{G}_{n+1}/\mathcal{J}^n f^*\mathcal{G}_{n+1}$$

hence the pullback of a system is a system. The construction of cokernels in the proof of Lemma 29.21.2 shows that $f^* : \text{Coh}(Y, \mathcal{J}) \rightarrow \text{Coh}(X, \mathcal{I})$ is always right exact. If f is flat, then $f^* : \text{Coh}(\mathcal{O}_Y) \rightarrow \text{Coh}(\mathcal{O}_X)$ is an exact functor. It follows from the construction of kernels in the proof of Lemma 29.21.2 that in this case $f^* : \text{Coh}(Y, \mathcal{J}) \rightarrow \text{Coh}(X, \mathcal{I})$ also transforms kernels into kernels. \square

Remark 29.22.2. Let X be a Noetherian scheme and let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_X$ be quasi-coherent sheaves of ideals. Let $\alpha : (\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ be a morphism of $\text{Coh}(X, \mathcal{I})$. Given an affine open $\text{Spec}(A) = U \subset X$ with $\mathcal{I}|_U, \mathcal{K}|_U$ corresponding to ideals $I, K \subset A$ denote $\alpha_U : M \rightarrow N$ of finite A^\wedge -modules which corresponds to $\alpha|_U$ via Lemma 29.21.1. We claim the following are equivalent

- (1) there exists an integer $t \geq 1$ such that $\text{Ker}(\alpha_n)$ and $\text{Coker}(\alpha_n)$ are annihilated by \mathcal{K}^t for all $n \geq 1$,
- (2) for any affine open $\text{Spec}(A) = U \subset X$ as above the modules $\text{Ker}(\alpha_U)$ and $\text{Coker}(\alpha_U)$ are annihilated by K^t for some integer $t \geq 1$, and
- (3) there exists a finite affine open covering $X = \bigcup U_i$ such that the conclusion of (2) holds for α_{U_i} .

If these equivalent conditions hold we will say that α is a *map whose kernel and cokernel are annihilated by a power of \mathcal{K}* . To see the equivalence we use the following commutative algebra fact: suppose given an exact sequence

$$0 \rightarrow T \rightarrow M \rightarrow N \rightarrow Q \rightarrow 0$$

of A -modules with T and Q annihilated by K^t for some ideal $K \subset A$. Then for every $f, g \in K^t$ there exists a canonical map " fg " : $N \rightarrow M$ such that $M \rightarrow N \rightarrow M$ is equal to multiplication by fg . Namely, for $y \in N$ we can pick $x \in M$ mapping to fy in N and then we can set " fg "(y) = gx . Thus it is clear that $\text{Ker}(M/JM \rightarrow N/JN)$ and $\text{Coker}(M/JM \rightarrow N/JN)$ are annihilated by K^{2t} for any ideal $J \subset A$.

Applying the commutative algebra fact to α_{U_i} and $J = I^n$ we see that (3) implies (1). Conversely, suppose (1) holds and $M \rightarrow N$ is equal to α_U . Then there is a $t \geq 1$ such that $\text{Ker}(M/I^n M \rightarrow N/I^n N)$ and $\text{Coker}(M/I^n M \rightarrow N/I^n N)$ are annihilated by K^t for all n . We obtain maps " fg " : $N/I^n N \rightarrow M/I^n M$ which in the limit induce a map $N \rightarrow M$ as N and M are I -adically complete. Since the composition with $N \rightarrow M \rightarrow N$ is multiplication by fg we conclude that fg annihilates T and Q . In other words T and Q are annihilated by K^{2t} as desired.

Lemma 29.22.3. *Let X be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{G} be a coherent \mathcal{O}_X -module, (\mathcal{F}_n) an object of $\text{Coh}(X, \mathcal{I})$, and $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{G}^\wedge$ a map whose kernel and cokernel are annihilated by a power of \mathcal{I} . Then there exists a unique (up to unique isomorphism) triple (\mathcal{F}, a, β) where*

- (1) \mathcal{F} is a coherent \mathcal{O}_X -module,
- (2) $a : \mathcal{F} \rightarrow \mathcal{G}$ is an \mathcal{O}_X -module map whose kernel and cokernel are annihilated by a power of \mathcal{I} ,
- (3) $\beta : (\mathcal{F}_n) \rightarrow \mathcal{F}^\wedge$ is an isomorphism, and
- (4) $\alpha = a^\wedge \circ \beta$.

Proof. The uniqueness implies it suffices to construct (\mathcal{F}, a, β) Zariski locally on X . Thus we may assume $X = \text{Spec}(A)$ and \mathcal{I} corresponds to the ideal $I \subset A$. In this situation Lemma 29.21.1 applies. Let M' be the finite A^\wedge -module corresponding to (\mathcal{F}_n) . Let N be the finite A -module corresponding to \mathcal{G} . Then α corresponds to a map

$$\varphi : M' \longrightarrow N^\wedge$$

whose kernel and cokernel are annihilated by I^t for some t . Recall that $N^\wedge = N \otimes_A A^\wedge$ (Algebra, Lemma 10.93.2). By More on Algebra, Lemma 15.63.16 there is an A -module map $\psi : M \rightarrow N$ whose kernel and cokernel are I -power torsion and an isomorphism $M \otimes_A A^\wedge = M'$ compatible with φ . As N and M' are finite modules, we conclude that M is a finite A -module, see More on Algebra, Remark 15.63.19. Hence $M \otimes_A A^\wedge = M^\wedge$. We omit the verification that the triple $(M, N \rightarrow M, M^\wedge \rightarrow M')$ so obtained is unique up to unique isomorphism. \square

Lemma 29.22.4. *Let X be a Noetherian scheme. Let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_X$ be quasi-coherent sheaves of ideals. Let $X_e \subset X$ be the closed subscheme cut out by \mathcal{K}^e . Let $\mathcal{I}_e = \mathcal{I}\mathcal{O}_{X_e}$. Let (\mathcal{F}_n) be an object of $\text{Coh}(X, \mathcal{I})$. Assume*

- (1) *the functor $\text{Coh}(\mathcal{O}_{X_e}) \rightarrow \text{Coh}(X_e, \mathcal{I}_e)$ is an equivalence for all $e \geq 1$, and*
- (2) *there exists a coherent sheaf \mathcal{H} on X and a map $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{H}^\wedge$ whose kernel and cokernel are annihilated by a power of \mathcal{K} .*

Then (\mathcal{F}_n) is in the essential image of (29.21.4.1).

Proof. During this proof we will use without further mention that for a closed immersion $i : Z \rightarrow X$ the functor i_* gives an equivalence between the category of coherent modules on Z and coherent modules on X annihilated by the ideal sheaf of Z , see Lemma 29.9.8. In particular we may identify $\text{Coh}(\mathcal{O}_{X_e})$ with the category of coherent \mathcal{O}_X -modules annihilated by \mathcal{K}^e and $\text{Coh}(X_e, \mathcal{I}_e)$ as the full subcategory of $\text{Coh}(X, \mathcal{I})$ of objects annihilated by \mathcal{K}^e . Moreover (1) tells us these two categories are equivalent under the completion functor (29.21.4.1).

Applying this equivalence we get a coherent \mathcal{O}_X -module \mathcal{G}_e annihilated by \mathcal{K}^e corresponding to the system $(\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n)$ of $\text{Coh}(X, \mathcal{I})$. The maps $\mathcal{F}_n/\mathcal{K}^{e+1}\mathcal{F}_n \rightarrow \mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n$ correspond to canonical maps $\mathcal{G}_{e+1} \rightarrow \mathcal{G}_e$ which induce isomorphisms $\mathcal{G}_{e+1}/\mathcal{K}^e\mathcal{G}_{e+1} \rightarrow \mathcal{G}_e$. Hence (\mathcal{G}_e) is an object of $\text{Coh}(X, \mathcal{K})$. The map α induces a system of maps

$$\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n \longrightarrow \mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H}$$

whence maps $\mathcal{G}_e \rightarrow \mathcal{H}/\mathcal{K}^e\mathcal{H}$ (by the equivalence of categories again). Let $t \geq 1$ be an integer, which exists by assumption (2), such that \mathcal{K}^t annihilates the kernel and cokernel of all the maps $\mathcal{F}_n \rightarrow \mathcal{H}/\mathcal{I}^n\mathcal{H}$. Then \mathcal{K}^{2t} annihilates the kernel and cokernel of the maps $\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n \rightarrow \mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H}$, see Remark 29.22.2. Whereupon we conclude that \mathcal{K}^{4t} annihilates the kernel and the cokernel of the maps

$$\mathcal{G}_e \longrightarrow \mathcal{H}/\mathcal{K}^e\mathcal{H},$$

see Remark 29.22.2. We apply Lemma 29.22.3 to obtain a coherent \mathcal{O}_X -module \mathcal{F} , a map $a : \mathcal{F} \rightarrow \mathcal{H}$ and an isomorphism $\beta : (\mathcal{G}_e) \rightarrow (\mathcal{F}/\mathcal{K}^e\mathcal{F})$ in $\text{Coh}(X, \mathcal{K})$. Working backwards, for a given n the triple $(\mathcal{F}/\mathcal{I}^n\mathcal{F}, a \bmod \mathcal{I}^n, \beta \bmod \mathcal{I}^n)$ is a triple as in the lemma for the morphism $\alpha_n \bmod \mathcal{K}^e : (\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n) \rightarrow (\mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H})$ of $\text{Coh}(X, \mathcal{K})$. Thus the uniqueness in Lemma 29.22.3 gives a canonical isomorphism $\mathcal{F}/\mathcal{I}^n\mathcal{F} \rightarrow \mathcal{F}_n$ compatible with all the morphisms in sight. This finishes the proof of the lemma. \square

Lemma 29.22.5. *Let Y be a Noetherian scheme. Let $\mathcal{J}, \mathcal{K} \subset \mathcal{O}_Y$ be quasi-coherent sheaves of ideals. Let $f : X \rightarrow Y$ be a proper morphism which is an isomorphism over $V = Y \setminus V(\mathcal{K})$. Set $\mathcal{I} = f^{-1}\mathcal{J}\mathcal{O}_X$. Let (\mathcal{G}_n) be an object of $\text{Coh}(Y, \mathcal{J})$, let \mathcal{F} be a coherent \mathcal{O}_X -module, and let $\beta : (f^*\mathcal{G}_n) \rightarrow \mathcal{F}^\wedge$ be an isomorphism in $\text{Coh}(X, \mathcal{I})$. Then there exists a map*

$$\alpha : (\mathcal{G}_n) \longrightarrow (f_*\mathcal{F})^\wedge$$

in $\text{Coh}(Y, \mathcal{J})$ whose kernel and cokernel are annihilated by a power of \mathcal{K} .

Proof. Since f is a proper morphism we see that $f_*\mathcal{F}$ is a coherent \mathcal{O}_Y -module (Proposition 29.17.2). Thus the statement of the lemma makes sense. Consider the compositions

$$\gamma_n : \mathcal{G}_n \rightarrow f_*f^*\mathcal{G}_n \rightarrow f_*(\mathcal{F}/\mathcal{I}^n\mathcal{F}).$$

Here the first map is the adjunction map and the second is $f_*\beta_n$. We claim that there exists a unique α as in the lemma such that the compositions

$$\mathcal{G}_n \xrightarrow{\alpha_n} f_*\mathcal{F}/\mathcal{I}^n f_*\mathcal{F} \rightarrow f_*(\mathcal{F}/\mathcal{I}^n \mathcal{F})$$

equal γ_n for all n . Because of the uniqueness we may assume that $Y = \text{Spec}(B)$ is affine. Let $J \subset B$ corresponds to the ideal \mathcal{J} . Set

$$M_n = H^0(X, \mathcal{F}/\mathcal{I}^n \mathcal{F}) \quad \text{and} \quad M = H^0(X, \mathcal{F})$$

By Lemma 29.18.4 and Theorem 29.18.5 the inverse limit of the modules M_n equals the completion $M^\wedge = \lim M/J^n M$. Set $N_n = H^0(Y, \mathcal{G}_n)$ and $N = \lim N_n$. Via the equivalence of categories of Lemma 29.21.1 the finite B^\wedge modules N and M^\wedge correspond to (\mathcal{G}_n) and $f_*\mathcal{F}^\wedge$. It follows from this that α has to be the morphism of $\text{Coh}(Y, \mathcal{J})$ corresponding to the homomorphism

$$\lim \gamma_n : N = \lim_n N_n \longrightarrow \lim M_n = M^\wedge$$

of finite B^\wedge -modules.

We still have to show that the kernel and cokernel of α are annihilated by a power of \mathcal{K} . Set $Y' = \text{Spec}(B^\wedge)$ and $X' = Y' \times_Y X$. Let \mathcal{K}' , \mathcal{J}' , \mathcal{G}'_n and \mathcal{I}' , \mathcal{F}' be the pullback of \mathcal{K} , \mathcal{J} , \mathcal{G}_n and \mathcal{I} , \mathcal{F} , to Y' and X' . The projection morphism $f' : X' \rightarrow Y'$ is the base change of f by $Y' \rightarrow Y$. Note that $Y' \rightarrow Y$ is a flat morphism of schemes as $B \rightarrow B^\wedge$ is flat by Algebra, Lemma 10.93.3. Hence $f'_*\mathcal{F}'$, resp. $f'_*(f')^*\mathcal{G}'_n$ is the pullback of $f_*\mathcal{F}$, resp. $f_*f^*\mathcal{G}_n$ to Y' by Lemma 29.5.2. The uniqueness of our construction shows the pullback of α to Y' is the corresponding map α' constructed for the situation on Y' . Moreover, to check that the kernel and cokernel of α are annihilated by \mathcal{K}^t it suffices to check that the kernel and cokernel of α' are annihilated by $(\mathcal{K}')^t$. Namely, to see this we need to check this for kernels and cokernels of the maps α_n and α'_n (see Remark 29.22.2) and the ring map $B \rightarrow B^\wedge$ induces an equivalence of categories between modules annihilated by J^n and $(J')^n$, see More on Algebra, Lemma 15.63.3. Thus we may assume B is complete with respect to J .

Assume $Y = \text{Spec}(B)$ is affine, \mathcal{J} corresponds to the ideal $J \subset B$, and B is complete with respect to J . In this case (\mathcal{G}_n) is in the essential image of the functor $\text{Coh}(\mathcal{O}_Y) \rightarrow \text{Coh}(Y, \mathcal{J})$. Say \mathcal{G} is a coherent \mathcal{O}_Y -module such that $(\mathcal{G}_n) = \mathcal{G}^\wedge$. Note that $f^*(\mathcal{G}^\wedge) = (f^*\mathcal{G})^\wedge$. Hence Lemma 29.21.7 tells us that β comes from an isomorphism $b : f^*\mathcal{G} \rightarrow \mathcal{F}$ and α is the completion functor applied to

$$\mathcal{G} \rightarrow f_*f^*\mathcal{G} \cong f_*\mathcal{F}$$

Hence we are trying to verify that the kernel and cokernel of the adjunction map $c : \mathcal{G} \rightarrow f_*f^*\mathcal{G}$ are annihilated by a power of \mathcal{K} . However, since the restriction $f|_{f^{-1}(V)} : f^{-1}(V) \rightarrow V$ is an isomorphism we see that $c|_V$ is an isomorphism. Thus the coherent sheaves $\text{Ker}(c)$ and $\text{Coker}(c)$ are supported on $V(\mathcal{K})$ hence are annihilated by a power of \mathcal{K} (Lemma 29.10.2) as desired. \square

The following proposition is the form of Grothendieck's existence theorem which is most often used in practice.

Proposition 29.22.6. *Let A be a Noetherian ring complete with respect to an ideal I . Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism of schemes. Set $\mathcal{I} = I\mathcal{O}_X$. Then the functor (29.21.4.1) is an equivalence.*

Proof. We have already seen that (29.21.4.1) is fully faithful in Lemma 29.21.7. Thus it suffices to show that the functor is essentially surjective.

Consider the collection Ξ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_X$ such that every object (\mathcal{F}_n) annihilated by \mathcal{K} is in the essential image. We want to show (0) is in Ξ . If not, then since X is Noetherian there exists a maximal quasi-coherent sheaf of ideals \mathcal{K} not in Ξ , see Lemma 29.10.1. After replacing X by the closed subscheme of X corresponding to \mathcal{K} we may assume that every nonzero \mathcal{K} is in Ξ . (This uses the correspondence by coherent modules annihilated by \mathcal{K} and coherent modules on the closed subscheme corresponding to \mathcal{K} , see Lemma 29.9.8.) Let (\mathcal{F}_n) be an object of $\text{Coh}(X, \mathcal{I})$. We will show that this object is in the essential image of the functor (29.21.4.1), thereby completion the proof of the proposition.

Apply Chow's lemma (Lemma 29.16.1) to find a proper surjective morphism $f : X' \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that X' is projective over A . Let \mathcal{K} be the quasi-coherent sheaf of ideals cutting out the reduced complement $X' \setminus U$. By the projective case of Grothendieck's existence theorem (Lemma 29.21.9) there exists a coherent module \mathcal{F}' on X' such that $(\mathcal{F}')^\wedge \cong (f^* \mathcal{F}_n)$. By Proposition 29.17.2 the $\mathcal{O}_{X'}$ -module $\mathcal{H} = f_* \mathcal{F}'$ is coherent and by Lemma 29.22.5 there exists a morphism $(\mathcal{F}_n) \rightarrow \mathcal{H}^\wedge$ of $\text{Coh}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of \mathcal{K} . The powers \mathcal{K}^e are all in Ξ so that (29.21.4.1) is an equivalence for the closed subschemes $X_e = V(\mathcal{K}^e)$. We conclude by Lemma 29.22.4. \square

To state the general version of Grothendieck's existence theorem we introduce a bit more notation. Let A be a Noetherian ring complete with respect to an ideal I . Let $f : X \rightarrow \text{Spec}(A)$ be a separated finite type morphism of schemes. Set $\mathcal{I} = I\mathcal{O}_X$. In this situation we let

$$\text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$$

be the full subcategory of $\text{Coh}(\mathcal{O}_X)$ consisting of those coherent \mathcal{O}_X -modules whose scheme theoretic support is proper over $\text{Spec}(A)$. Similarly, we let

$$\text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$$

be the full subcategory of $\text{Coh}(X, \mathcal{I})$ consisting of those objects (\mathcal{F}_n) such that the scheme theoretic support of \mathcal{F}_1 is proper over $\text{Spec}(A)$. Since the support of a quotient module is contained in the support of the module, it follows that (29.21.4.1) induces a functor

$$(29.22.6.1) \quad \text{Coh}_{\text{support proper over } A}(\mathcal{O}_X) \longrightarrow \text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$$

We are now ready to state the main theorem of this section.

Theorem 29.22.7 (Grothendieck's existence theorem). *In the situation described above the functor (29.22.6.1) is an equivalence.*

Proof. We will use the equivalence of categories of Lemma 29.9.8 without further mention in the proof of the theorem. Let $Z \subset X$ be a closed subscheme proper over A . By Proposition 29.22.6 we know that the result is true for the functor between coherent modules and systems of coherent modules supported on Z . Hence it suffices to show that every object of $\text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$ and every object of $\text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$ is supported on such a closed subscheme $Z \subset X$ proper over A . This holds by definition for objects of $\text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$.

We will prove this statement for objects of $\mathit{Coh}_{\text{support proper over } A}(X, \mathcal{I})$ using the method of proof of Proposition 29.22.6. We urge the reader to read that proof first.

Consider the collection Ξ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_X$ such that the statement holds for every object (\mathcal{F}_n) of $\mathit{Coh}_{\text{support proper over } A}(X, \mathcal{I})$ annihilated by \mathcal{K} . We want to show (0) is in Ξ . If not, then since X is Noetherian there exists a maximal quasi-coherent sheaf of ideals \mathcal{K} not in Ξ , see Lemma 29.10.1. After replacing X by the closed subscheme of X corresponding to \mathcal{K} we may assume that every nonzero \mathcal{K} is in Ξ . Let (\mathcal{F}_n) be an object of $\mathit{Coh}_{\text{support proper over } A}(X, \mathcal{I})$. We will show that this object is supported on a closed subscheme $Z \subset X$ proper over A , thereby completing the proof of the theorem.

Apply Chow's lemma (Lemma 29.16.1) to find a proper surjective morphism $f : Y \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that Y is H-quasi-projective over A . Choose an open immersion $j : Y \rightarrow Y'$ with Y' projective over A , see Morphisms, Lemma 28.43.11. Let T_n be the scheme theoretic support of \mathcal{F}_n . Note that $T_n = T_1$ set-theoretically, hence T_n is proper over A for all n (Morphisms, Lemma 28.42.8). Then $f^*\mathcal{F}_n$ is supported on the closed subscheme $f^{-1}T_n$ which is proper over A (by Morphisms, Lemma 28.42.4 and properness of f). In particular, the composition $f^{-1}T_n \rightarrow Y \rightarrow Y'$ is closed (Morphisms, Lemma 28.42.7). Let $T'_n \subset Y'$ be the corresponding closed subscheme; it is contained in the open subscheme Y and equal to $f^{-1}T_n$ as a closed subscheme of Y . Let \mathcal{F}'_n be the coherent $\mathcal{O}_{Y'}$ -module corresponding to $f^*\mathcal{F}_n$ viewed as a coherent module on Y' via the closed immersion $f^{-1}T_n = T'_n \subset Y'$. Then (\mathcal{F}'_n) is an object of $\mathit{Coh}(Y', \mathcal{I}\mathcal{O}_{Y'})$. By the projective case of Grothendieck's existence theorem (Lemma 29.21.9) there exists a coherent $\mathcal{O}_{Y'}$ -module \mathcal{F}' and an isomorphism $(\mathcal{F}')^\wedge \cong (\mathcal{F}'_n)$ in $\mathit{Coh}(Y', \mathcal{I}\mathcal{O}_{Y'})$. Let $Z' \subset Y'$ be the scheme theoretic support of \mathcal{F}' . Since $\mathcal{F}'/\mathcal{I}\mathcal{F}' = \mathcal{F}'_1$ we see that $Z' \cap V(\mathcal{I}\mathcal{O}_{Y'}) = T'_1$ set-theoretically. The structure morphism $p' : Y' \rightarrow \text{Spec}(A)$ is proper, hence $p'(Z' \cap (Y' \setminus Y))$ is closed in $\text{Spec}(A)$. If nonempty, then it would contain a point of $V(\mathcal{I})$ as \mathcal{I} is contained in the radical of A (Algebra, Lemma 10.93.11). But we've seen above that $Z' \cap (p')^{-1}V(\mathcal{I}) = T'_1 \subset Y$ hence we conclude that $Z' \subset Y$. Thus $\mathcal{F}'|_Y$ is supported on a closed subscheme of Y proper over A .

Let \mathcal{K} be the quasi-coherent sheaf of ideals cutting out the reduced complement $X \setminus U$. By Proposition 29.17.2 the \mathcal{O}_X -module $\mathcal{H} = f_*\mathcal{F}'$ is coherent and by Lemma 29.22.5 there exists a morphism $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{H}^\wedge$ of $\mathit{Coh}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of \mathcal{K} . Let $Z_0 \subset X$ be the scheme theoretic support of \mathcal{H} . It is clear that $Z_0 \subset f(Z')$ set-theoretically. Hence $Z_0 \rightarrow \text{Spec}(A)$ is proper (Morphisms, Lemma 28.42.7). The kernel of α is an object of $\mathit{Coh}_{\text{support proper over } A}(X, \mathcal{I})$ annihilated by a power of \mathcal{K}^t which is in Ξ . Hence the kernel of α are supported on closed subschemes $Z_1 \subset X$ proper over A . Let $\mathcal{K}_i \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z_i for $i = 0, 1$. Set $\mathcal{K} = \mathcal{K}_0\mathcal{K}_1$ and let $Z = V(\mathcal{K}) \subset X$. Then (\mathcal{F}_n) is supported on Z (details omitted). Finally, $Z_0 \amalg Z_1 \rightarrow Z$ is surjective, whence Z is proper over A by Morphisms, Lemma 28.42.7. This finishes the proof of the theorem. \square

Remark 29.22.8 (Unwinding Grothendieck's existence theorem). Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$

we set $X_n = X \times_S S_n$. Picture:

$$\begin{array}{ccccccc}
 X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots & & X \\
 \downarrow & & \downarrow & & \downarrow & & & & \downarrow \\
 S_1 & \longrightarrow & S_2 & \longrightarrow & S_3 & \longrightarrow & \dots & & S
 \end{array}$$

In this situation we consider systems $(\mathcal{F}_n, \varphi_n)$ where

- (1) \mathcal{F}_n is a coherent \mathcal{O}_{X_n} -module,
- (2) $\varphi_n : i_n^* \mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$ is an isomorphism, and
- (3) $\text{Supp}(\mathcal{F}_1)$ is proper over S_1 .

Theorem 29.22.7 says that the completion functor

$$\begin{array}{ccc}
 \text{coherent } \mathcal{O}_X\text{-modules } \mathcal{F} & \longrightarrow & \text{systems } (\mathcal{F}_n) \\
 \text{with support proper over } A & & \text{as above}
 \end{array}$$

is an equivalence of categories. In the special case that X is proper over A we can omit the conditions on the supports.

29.23. Grothendieck's algebraization theorem

Our first result is a translation of Grothendieck's existence theorem in terms of closed subschemes and finite morphisms.

Lemma 29.23.1. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$ we set $X_n = X \times_S S_n$. Suppose given a commutative diagram*

$$\begin{array}{ccccccc}
 Z_1 & \longrightarrow & Z_2 & \longrightarrow & Z_3 & \longrightarrow & \dots \\
 \downarrow & & \downarrow & & \downarrow & & \\
 X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots
 \end{array}$$

of schemes with cartesian squares. Assume that

- (1) $Z_1 \rightarrow X_1$ is a closed immersion, and
- (2) $Z_1 \rightarrow S_1$ is proper.

Then there exists a closed immersion of schemes $Z \rightarrow X$ such that $Z_n = Z \times_S S_n$. Moreover, Z is proper over S .

Proof. Let's write $j_n : Z_n \rightarrow X_n$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of j_n to X_1 is j_1 . Thus Morphisms, Lemma 28.45.5 shows that j_n is a closed immersion. Set $\mathcal{F}_n = j_{n,*} \mathcal{O}_{Z_n}$, so that $j_n^\#$ is a surjection $\mathcal{O}_{X_n} \rightarrow \mathcal{F}_n$. Again using that the squares are cartesian we see that the pullback of \mathcal{F}_{n+1} to X_n is \mathcal{F}_n . Hence Grothendieck's existence theorem, as reformulated in Remark 29.22.8, tells us there exists a map $\mathcal{O}_X \rightarrow \mathcal{F}$ of coherent \mathcal{O}_X -modules whose restriction to X_n recovers $\mathcal{O}_{X_n} \rightarrow \mathcal{F}_n$. Moreover, the support of \mathcal{F} is proper over S . As the completion functor is exact (Lemma 29.21.5) we see that $\mathcal{O}_X \rightarrow \mathcal{F}$ is surjective. Thus $\mathcal{F} = \mathcal{O}_X/\mathcal{J}$ for some quasi-coherent sheaf of ideals \mathcal{J} . Setting $Z = V(\mathcal{J})$ finishes the proof. \square

In the following lemma it is actually enough to assume that $Y_1 \rightarrow X_1$ is finite as it will imply that $Y_n \rightarrow X_n$ is finite too (see More on Morphisms, Lemma 36.2.6).

Lemma 29.23.2. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$ we set $X_n = X \times_S S_n$. Suppose given a commutative diagram*

$$\begin{array}{ccccccc} Y_1 & \longrightarrow & Y_2 & \longrightarrow & Y_3 & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \downarrow & & \\ X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots \end{array}$$

of schemes with cartesian squares. Assume that

- (1) $Y_n \rightarrow X_n$ is a finite morphism, and
- (2) $Y_1 \rightarrow S_1$ is proper.

Then there exists a finite morphism of schemes $Y \rightarrow X$ such that $Y_n = Y \times_S S_n$. Moreover, Y is proper over S .

Proof. Let's write $f_n : Y_n \rightarrow X_n$ for the vertical morphisms. Set $\mathcal{F}_n = f_{n,*} \mathcal{O}_{Y_n}$. This is a coherent \mathcal{O}_{X_n} -module as f_n is finite (Lemma 29.9.9). Using that the squares are cartesian we see that the pullback of \mathcal{F}_{n+1} to X_n is \mathcal{F}_n . Hence Grothendieck's existence theorem, as reformulated in Remark 29.22.8, tells us there exists a coherent \mathcal{O}_X -module \mathcal{F} whose restriction to X_n recovers \mathcal{F}_n . Moreover, the support of \mathcal{F} is proper over S . As the completion functor is fully faithful (Theorem 29.22.7) we see that the multiplication maps $\mathcal{F}_n \otimes_{\mathcal{O}_{X_n}} \mathcal{F}_n \rightarrow \mathcal{F}_n$ fit together to give an algebra structure on \mathcal{F} . Setting $Y = \text{Spec}_X(\mathcal{F})$ finishes the proof. \square

Lemma 29.23.3. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let X, Y be schemes over S . For $n \geq 1$ we set $X_n = X \times_S S_n$ and $Y_n = Y \times_S S_n$. Suppose given a compatible system of commutative diagrams*

$$\begin{array}{ccccc} & & X_{n+1} & \xrightarrow{g_{n+1}} & Y_{n+1} \\ & \nearrow & \searrow & \nearrow & \searrow \\ X_n & \xrightarrow{g_n} & Y_n & & S_{n+1} \\ & \searrow & \nearrow & \nearrow & \\ & & S_n & & \end{array}$$

Assume that

- (1) $X \rightarrow S$ is proper, and
- (2) $Y \rightarrow S$ is separated of finite type.

Then there exists a unique morphism of schemes $g : X \rightarrow Y$ over S such that g_n is the base change of g to S_n .

Proof. The morphisms $(1, g_n) : X_n \rightarrow X_n \times_S Y_n$ are closed immersions because $Y_n \rightarrow S_n$ is separated (Schemes, Lemma 25.21.12). Thus by Lemma 29.23.1 there exists a closed subscheme $Z \subset X \times_S Y$ proper over S whose base change to S_n recovers $X_n \subset X_n \times_S Y_n$. The first projection $p : Z \rightarrow X$ is a proper morphism (as Z is proper over S , see Morphisms, Lemma 28.42.7) whose base change to S_n is an isomorphism for all n . In particular, $p : Z \rightarrow X$ is finite over an open neighbourhood of X_0 by Lemma 29.19.2. As X is proper over S this open neighbourhood is all of X and we conclude $p : Z \rightarrow X$ is finite. Applying the equivalence of Proposition

29.22.6 we see that $p_*\mathcal{O}_Z = \mathcal{O}_X$ as this is true modulo I^n for all n . Hence p is an isomorphism and we obtain the morphism g as the composition $X \cong Z \rightarrow Y$. We omit the proof of uniqueness. \square

In order to prove an “abstract” algebraization theorem we need to assume we have an ample invertible sheaf, as the result is false without such an assumption.

Theorem 29.23.4 (Grothendieck’s algebraization theorem). *Let A be a Noetherian ring complete with respect to an ideal I . Set $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Consider a commutative diagram*

$$\begin{array}{ccccccc} X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \downarrow & & \\ S_1 & \longrightarrow & S_2 & \longrightarrow & S_3 & \longrightarrow & \dots \end{array}$$

of schemes with cartesian squares. Suppose given $(\mathcal{L}_n, \varphi_n)$ where each \mathcal{L}_n is an invertible sheaf on X_n and $\varphi_n : i_n^*\mathcal{L}_{n+1} \rightarrow \mathcal{L}_n$ is an isomorphism. If

- (1) $X_1 \rightarrow S_1$ is proper, and
- (2) \mathcal{L}_1 is ample on X_1

then there exists a proper morphism of schemes $X \rightarrow S$ and an ample invertible \mathcal{O}_X -module \mathcal{L} and isomorphisms $X_n \cong X \times_S S_n$ and $\mathcal{L}_n \cong \mathcal{L}|_{X_n}$ compatible with the morphisms i_n and φ_n .

Proof. Since the squares in the diagram are cartesian and since the morphisms $S_n \rightarrow S_{n+1}$ are closed immersions, we see that the morphisms i_n are closed immersions too. In particular we may think of X_m as a closed subscheme of X_n for $m < n$. In fact X_m is the closed subscheme cut out by the quasi-coherent sheaf of ideals $I^m\mathcal{O}_{X_n}$. Moreover, the underlying topological spaces of the schemes X_1, X_2, X_3, \dots are all identified, hence we may (and do) think of sheaves \mathcal{O}_{X_n} as living on the same underlying topological space; similarly for coherent \mathcal{O}_{X_n} -modules. Set

$$\mathcal{F}_n = \text{Ker}(\mathcal{O}_{X_{n+1}} \rightarrow \mathcal{O}_{X_n})$$

so that we obtain short exact sequences

$$0 \rightarrow \mathcal{F}_n \rightarrow \mathcal{O}_{X_{n+1}} \rightarrow \mathcal{O}_{X_n} \rightarrow 0$$

By the above we have $\mathcal{F}_n = I^n\mathcal{O}_{X_{n+1}}$. It follows \mathcal{F}_n is a coherent sheaf on X_{n+1} annihilated by I , hence we may (and do) think of it as a coherent module \mathcal{O}_{X_1} -module. Observe that for $m > n$ the sheaf

$$I^n\mathcal{O}_{X_m}/I^{n+1}\mathcal{O}_{X_m}$$

maps isomorphically to \mathcal{F}_n under the map $\mathcal{O}_{X_m} \rightarrow \mathcal{O}_{X_{n+1}}$. Hence given $n_1, n_2 \geq 0$ we can pick an $m > n_1 + n_2$ and consider the multiplication map

$$I^{n_1}\mathcal{O}_{X_m} \times I^{n_2}\mathcal{O}_{X_m} \longrightarrow I^{n_1+n_2}\mathcal{O}_{X_m} \rightarrow \mathcal{F}_{n_1+n_2}$$

This induces an \mathcal{O}_{X_1} -bilinear map

$$\mathcal{F}_{n_1} \times \mathcal{F}_{n_2} \longrightarrow \mathcal{F}_{n_1+n_2}$$

which in turn defines the structure of a graded \mathcal{O}_{X_1} -algebra on $\mathcal{F} = \bigoplus_{n \geq 0} \mathcal{F}_n$.

Set $B = \bigoplus I^n/I^{n+1}$; this is a finitely generated graded A/I -algebra. Set $\mathcal{B} = (X_1 \rightarrow S_1)^* \tilde{B}$. The discussion above provides us with a canonical surjection

$$\mathcal{B} \longrightarrow \mathcal{F}$$

of graded \mathcal{O}_{X_1} -algebras. In particular we see that \mathcal{F} is a finite type quasi-coherent graded \mathcal{B} -module. By Lemma 29.17.5 we can find an integer d_0 such that $H^1(X_1, \mathcal{F} \otimes \mathcal{L}^{\otimes d}) = 0$ for all $d \geq d_0$. Pick a $d \geq d_0$ such that there exist sections $s_{0,1}, \dots, s_{N,1} \in \Gamma(X_1, \mathcal{L}_1^{\otimes d})$ which induce an immersion

$$\psi_1 : X_1 \rightarrow \mathbf{P}_{S_1}^N$$

over S_1 , see Morphisms, Lemma 28.40.4. As X_1 is proper over S_1 we see that ψ_1 is a closed immersion, see Morphisms, Lemma 28.42.7 and Schemes, Lemma 25.10.4. We are going to “lift” ψ_1 to a compatible system of closed immersions of X_n into \mathbf{P}^N .

Upon tensoring the short exact sequences of the first paragraph of the proof by $\mathcal{L}_{n+1}^{\otimes d}$ we obtain short exact sequences

$$0 \rightarrow \mathcal{F}_n \otimes \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow 0$$

Using the isomorphisms φ_n we obtain isomorphisms $\mathcal{L}_{n+1} \otimes \mathcal{O}_{X_l} = \mathcal{L}_l$ for $l \leq n$. Whence the sequence above becomes

$$0 \rightarrow \mathcal{F}_n \otimes \mathcal{L}_1^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_n^{\otimes d} \rightarrow 0$$

The vanishing of $H^1(X, \mathcal{F}_n \otimes \mathcal{L}_1^{\otimes d})$ implies we can inductively lift $s_{0,1}, \dots, s_{N,1} \in \Gamma(X_1, \mathcal{L}_1^{\otimes d})$ to sections $s_{0,n}, \dots, s_{N,n} \in \Gamma(X_n, \mathcal{L}_n^{\otimes d})$. Thus we obtain a commutative diagram

$$\begin{array}{ccccccc} X_1 & \xrightarrow{\quad} & X_2 & \xrightarrow{\quad} & X_3 & \longrightarrow & \dots \\ \psi_1 \downarrow & & \psi_2 \downarrow & & \psi_3 \downarrow & & \\ \mathbf{P}_{S_1}^N & \longrightarrow & \mathbf{P}_{S_2}^N & \longrightarrow & \mathbf{P}_{S_3}^N & \longrightarrow & \dots \end{array}$$

where $\psi_n = \varphi_{(\mathcal{L}_n, (s_{0,n}, \dots, s_{N,n}))}$ in the notation of Constructions, Section 26.13. As the squares in the statement of the theorem are cartesian we see that the squares in the above diagram are cartesian. We win by applying Lemma 29.23.1. \square

CHAPTER 30

Divisors

30.1. Introduction

In this chapter we study some very basic questions related to defining divisors, etc. A basic reference is [DG67].

30.2. Associated points

Let R be a ring and let M be an R -module. Recall that a prime $\mathfrak{p} \subset R$ is *associated* to M if there exists an element of M whose annihilator is \mathfrak{p} . See Algebra, Definition 10.62.1. Here is the definition of associated points for quasi-coherent sheaves on schemes as given in [DG67, IV Definition 3.1.1].

Definition 30.2.1. Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X .

- (1) We say $x \in X$ is *associated* to \mathcal{F} if the maximal ideal \mathfrak{m}_x is associated to the $\mathcal{O}_{X,x}$ -module \mathcal{F}_x .
- (2) We denote $\text{Ass}(\mathcal{F})$ or $\text{Ass}_X(\mathcal{F})$ the set of associated points of \mathcal{F} .
- (3) The *associated points of X* are the associated points of \mathcal{O}_X .

These definitions are most useful when X is locally Noetherian and \mathcal{F} of finite type. For example it may happen that a generic point of an irreducible component of X is not associated to X , see Example 30.2.7. In the non-Noetherian case it may be more convenient to use weakly associated points, see Section 30.5. Let us link the scheme theoretic notion with the algebraic notion on affine opens; note that this correspondence works perfectly only for locally Noetherian schemes.

Lemma 30.2.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X . Let $\text{Spec}(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime.*

- (1) *If \mathfrak{p} is associated to M , then x is associated to \mathcal{F} .*
- (2) *If \mathfrak{p} is finitely generated, then the converse holds as well.*

In particular, if X is locally Noetherian, then the equivalence

$$\mathfrak{p} \in \text{Ass}(M) \Leftrightarrow x \in \text{Ass}(\mathcal{F})$$

holds for all pairs (\mathfrak{p}, x) as above.

Proof. This follows from Algebra, Lemma 10.62.14. But we can also argue directly as follows. Suppose \mathfrak{p} is associated to M . Then there exists an $m \in M$ whose annihilator is \mathfrak{p} . Since localization is exact we see that $\mathfrak{p}A_{\mathfrak{p}}$ is the annihilator of $m/1 \in M_{\mathfrak{p}}$. Since $M_{\mathfrak{p}} = \mathcal{F}_x$ (Schemes, Lemma 25.5.4) we conclude that x is associated to \mathcal{F} .

Conversely, assume that x is associated to \mathcal{F} , and \mathfrak{p} is finitely generated. As x is associated to \mathcal{F} there exists an element $m' \in M_{\mathfrak{p}}$ whose annihilator is $\mathfrak{p}A_{\mathfrak{p}}$. Write

$m' = m/f$ for some $f \in A$, $f \notin \mathfrak{p}$. The annihilator I of m is an ideal of A such that $IA_{\mathfrak{p}} = \mathfrak{p}A_{\mathfrak{p}}$. Hence $I \subset \mathfrak{p}$, and $(\mathfrak{p}/I)_{\mathfrak{p}} = 0$. Since \mathfrak{p} is finitely generated, there exists a $g \in A$, $g \notin \mathfrak{p}$ such that $g(\mathfrak{p}/I) = 0$. Hence the annihilator of gm is \mathfrak{p} and we win.

If X is locally Noetherian, then A is Noetherian (Properties, Lemma 27.5.2) and \mathfrak{p} is always finitely generated. \square

Lemma 30.2.3. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then $\text{Ass}(\mathcal{F}) \subset \text{Supp}(\mathcal{F})$.*

Proof. This is immediate from the definitions. \square

Lemma 30.2.4. *Let X be a scheme. Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of quasi-coherent sheaves on X . Then $\text{Ass}(\mathcal{F}_2) \subset \text{Ass}(\mathcal{F}_1) \cup \text{Ass}(\mathcal{F}_3)$ and $\text{Ass}(\mathcal{F}_1) \subset \text{Ass}(\mathcal{F}_2)$.*

Proof. For every point $x \in X$ the sequence of stalks $0 \rightarrow \mathcal{F}_{1,x} \rightarrow \mathcal{F}_{2,x} \rightarrow \mathcal{F}_{3,x} \rightarrow 0$ is a short exact sequence of $\mathcal{O}_{X,x}$ -modules. Hence the lemma follows from Algebra, Lemma 10.62.3. \square

Lemma 30.2.5. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $\text{Ass}(\mathcal{F}) \cap U$ is finite for every quasi-compact open $U \subset X$.*

Proof. This is true because the set of associated primes of a finite module over a Noetherian ring is finite, see Algebra, Lemma 10.62.5. To translate from schemes to algebra use that U is a finite union of affine opens, each of these opens is the spectrum of a Noetherian ring (Properties, Lemma 27.5.2), \mathcal{F} corresponds to a finite module over this ring (Cohomology of Schemes, Lemma 29.9.1), and finally use Lemma 30.2.2. \square

Lemma 30.2.6. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then*

$$\mathcal{F} = 0 \Leftrightarrow \text{Ass}(\mathcal{F}) = \emptyset.$$

Proof. If $\mathcal{F} = 0$, then $\text{Ass}(\mathcal{F}) = \emptyset$ by definition. Conversely, if $\text{Ass}(\mathcal{F}) = \emptyset$, then $\mathcal{F} = 0$ by Algebra, Lemma 10.62.7. To translate from schemes to algebra, restrict to any affine and use Lemma 30.2.2. \square

Example 30.2.7. Let k be a field. The ring $R = R[x_1, x_2, x_3, \dots]/(x_i^2)$ is local with locally nilpotent maximal ideal \mathfrak{m} . There exists no element of R which has annihilator \mathfrak{m} . Hence $\text{Ass}(R) = \emptyset$, and $X = \text{Spec}(R)$ is an example of a scheme which has no associated points.

Lemma 30.2.8. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in \text{Supp}(\mathcal{F})$ be a point in the support of \mathcal{F} which is not a specialization of another point of $\text{Supp}(\mathcal{F})$. Then $x \in \text{Ass}(\mathcal{F})$. In particular, any generic point of an irreducible component of X is an associated point of X .*

Proof. Since $x \in \text{Supp}(\mathcal{F})$ the module \mathcal{F}_x is not zero. Hence $\text{Ass}(\mathcal{F}_x) \subset \text{Spec}(\mathcal{O}_{X,x})$ is nonempty by Algebra, Lemma 10.62.7. On the other hand, by assumption $\text{Supp}(\mathcal{F}_x) = \{\mathfrak{m}_x\}$. Since $\text{Ass}(\mathcal{F}_x) \subset \text{Supp}(\mathcal{F}_x)$ (Algebra, Lemma 10.62.2) we see that \mathfrak{m}_x is associated to \mathcal{F}_x and we win. \square

30.3. Morphisms and associated points

Lemma 30.3.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on X which is flat over S . Let \mathcal{G} be a quasi-coherent sheaf on S . Then we have*

$$\text{Ass}_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) \supset \bigcup_{s \in \text{Ass}_S(\mathcal{G})} \text{Ass}_{X_s}(\mathcal{F}_s)$$

and equality holds if S is locally Noetherian.

Proof. Let $x \in X$ and let $s = f(x) \in S$. Set $B = \mathcal{O}_{X,x}$, $A = \mathcal{O}_{S,s}$, $N = \mathcal{F}_x$, and $M = \mathcal{G}_s$. Note that the stalk of $\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}$ at x is equal to the B -module $M \otimes_A N$. Hence $x \in \text{Ass}_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G})$ if and only if \mathfrak{m}_B is in $\text{Ass}_B(M \otimes_A N)$. Similarly $s \in \text{Ass}_S(\mathcal{G})$ and $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$ if and only if $\mathfrak{m}_A \in \text{Ass}_A(M)$ and $\mathfrak{m}_B/\mathfrak{m}_A B \in \text{Ass}_{B \otimes_{\kappa(\mathfrak{m}_A)}(N \otimes_{\kappa(\mathfrak{m}_A)})}$. Thus the lemma follows from Algebra, Lemma 10.64.5. \square

30.4. Embedded points

Let R be a ring and let M be an R -module. Recall that a prime $\mathfrak{p} \subset R$ is an *embedded associated* to M if it is an associated prime of M which is not minimal among the associated primes of M . See Algebra, Definition 10.66.1. Here is the definition of embedded associated points for quasi-coherent sheaves on schemes as given in [DG67, IV Definition 3.1.1].

Definition 30.4.1. Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X .

- (1) An *embedded associated point* of \mathcal{F} is an associated point which is not maximal among the associated points of \mathcal{F} , i.e., it is the specialization of another associated point of \mathcal{F} .
- (2) A point x of X is called an *embedded point* if x is an embedded associated point of \mathcal{O}_X .
- (3) An *embedded component* of X is an irreducible closed subset $Z = \overline{\{x\}}$ where x is an embedded point of X .

In the Noetherian case when \mathcal{F} is coherent we have the following.

Lemma 30.4.2. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then*

- (1) *the generic points of irreducible components of $\text{Supp}(\mathcal{F})$ are associated points of \mathcal{F} , and*
- (2) *an associated point of \mathcal{F} is embedded if and only if it is not a generic point of an irreducible component of $\text{Supp}(\mathcal{F})$.*

In particular an embedded point of X is an associated point of X which is not a generic point of an irreducible component of X .

Proof. Recall that in this case $Z = \text{Supp}(\mathcal{F})$ is closed, see Morphisms, Lemma 28.5.3 and that the generic points of irreducible components of Z are associated points of \mathcal{F} , see Lemma 30.2.8. Finally, we have $\text{Ass}(\mathcal{F}) \subset Z$, by Lemma 30.2.3. These results, combined with the fact that Z is a sober topological space and hence every point of Z is a specialization of a generic point of Z , imply (1) and (2). \square

Lemma 30.4.3. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . Then the following are equivalent:*

- (1) *\mathcal{F} has no embedded associated points, and*

(2) \mathcal{F} has property (S_1) .

Proof. This is Algebra, Lemma 10.146.2, combined with Lemma 30.2.2 above. \square

Lemma 30.4.4. *Let X be a locally Noetherian scheme. Let $U \subset X$ be an open subscheme. The following are equivalent*

- (1) U is scheme theoretically dense in X (Morphisms, Definition 28.7.1),
- (2) U is dense in X and U contains all embedded points of X .

Proof. The question is local on X , hence we may assume that $X = \text{Spec}(A)$ where A is a Noetherian ring. Then U is quasi-compact (Properties, Lemma 27.5.3) hence $U = D(f_1) \cup \dots \cup D(f_n)$ (Algebra, Lemma 10.28.1). In this situation U is scheme theoretically dense in X if and only if $A \rightarrow A_{f_1} \times \dots \times A_{f_n}$ is injective, see Morphisms, Example 28.7.4. Condition (2) translated into algebra means that for every associated prime \mathfrak{p} of A there exists an i with $f_i \notin \mathfrak{p}$.

Assume (1), i.e., $A \rightarrow A_{f_1} \times \dots \times A_{f_n}$ is injective. If $x \in A$ has annihilator a prime \mathfrak{p} , then x maps to a nonzero element of A_{f_i} for some i and hence $f_i \notin \mathfrak{p}$. Thus (2) holds. Assume (2), i.e., every associated prime \mathfrak{p} of A corresponds to a prime of A_{f_i} for some i . Then $A \rightarrow A_{f_1} \times \dots \times A_{f_n}$ is injective because $A \rightarrow \prod_{\mathfrak{p} \in \text{Ass}(A)} A_{\mathfrak{p}}$ is injective by Algebra, Lemma 10.62.18. \square

Lemma 30.4.5. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent sheaf on X . The set of coherent subsheaves*

$$\{\mathcal{K} \subset \mathcal{F} \mid \text{Supp}(\mathcal{K}) \text{ is nowhere dense in } \text{Supp}(\mathcal{F})\}$$

has a maximal element \mathcal{K} . Setting $\mathcal{F}' = \mathcal{F}/\mathcal{K}$ we have the following

- (1) $\text{Supp}(\mathcal{F}') = \text{Supp}(\mathcal{F})$,
- (2) \mathcal{F}' has no embedded associated points, and
- (3) there exists a dense open $U \subset X$ such that $U \cap \text{Supp}(\mathcal{F})$ is dense in $\text{Supp}(\mathcal{F})$ and $\mathcal{F}'|_U \cong \mathcal{F}|_U$.

Proof. This follows from Algebra, Lemmas 10.66.2 and 10.66.3. Note that U can be taken as the complement of the closure of the set of embedded associated points of \mathcal{F} . \square

Lemma 30.4.6. *Let X be a locally Noetherian scheme. Let \mathcal{F} be a coherent \mathcal{O}_X -module without embedded associated points. Set*

$$\mathcal{I} = \text{Ker}(\mathcal{O}_X \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{F})).$$

This is a coherent sheaf of ideals which defines a closed subscheme $Z \subset X$ without embedded points. Moreover there exists a coherent sheaf \mathcal{G} on Z such that (a) $\mathcal{F} = (Z \rightarrow X)_\mathcal{G}$, (b) \mathcal{G} has no associated embedded points, and (c) $\text{Supp}(\mathcal{G}) = Z$ (as sets).*

Proof. Some of the statements we have seen in the proof of Cohomology of Schemes, Lemma 29.9.7. The others follow from Algebra, Lemma 10.66.4. \square

30.5. Weakly associated points

Let R be a ring and let M be an R -module. Recall that a prime $\mathfrak{p} \subset R$ is *weakly associated* to M if there exists an element m of M such that \mathfrak{p} is minimal among the primes containing the annihilator of m . See Algebra, Definition 10.65.1. If R is a local ring with maximal ideal \mathfrak{m} , then \mathfrak{m} is associated to M if and only if there exists an element $m \in M$ whose annihilator has radical \mathfrak{m} , see Algebra, Lemma 10.65.2.

Definition 30.5.1. Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X .

- (1) We say $x \in X$ is *weakly associated* to \mathcal{F} if the maximal ideal \mathfrak{m}_x is weakly associated to the $\mathcal{O}_{X,x}$ -module \mathcal{F}_x .
- (2) We denote $\text{WeakAss}(\mathcal{F})$ the set of weakly associated points of \mathcal{F} .
- (3) The *weakly associated points* of X are the weakly associated points of \mathcal{O}_X .

In this case, on any affine open, this corresponds exactly to the weakly associated primes as defined above. Here is the precise statement.

Lemma 30.5.2. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on X . Let $\text{Spec}(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent*

- (1) \mathfrak{p} is weakly associated to M , and
- (2) x is weakly associated to \mathcal{F} .

Proof. This follows from Algebra, Lemma 10.65.2. □

Lemma 30.5.3. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then*

$$\text{Ass}(\mathcal{F}) \subset \text{WeakAss}(\mathcal{F}) \subset \text{Supp}(\mathcal{F}).$$

Proof. This is immediate from the definitions. □

Lemma 30.5.4. *Let X be a scheme. Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of quasi-coherent sheaves on X . Then $\text{WeakAss}(\mathcal{F}_2) \subset \text{WeakAss}(\mathcal{F}_1) \cup \text{WeakAss}(\mathcal{F}_3)$ and $\text{WeakAss}(\mathcal{F}_1) \subset \text{WeakAss}(\mathcal{F}_2)$.*

Proof. For every point $x \in X$ the sequence of stalks $0 \rightarrow \mathcal{F}_{1,x} \rightarrow \mathcal{F}_{2,x} \rightarrow \mathcal{F}_{3,x} \rightarrow 0$ is a short exact sequence of $\mathcal{O}_{X,x}$ -modules. Hence the lemma follows from Algebra, Lemma 10.65.3. □

Lemma 30.5.5. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then*

$$\mathcal{F} = (0) \Leftrightarrow \text{WeakAss}(\mathcal{F}) = \emptyset$$

Proof. Follows from Lemma 30.5.2 and Algebra, Lemma 10.65.4 □

Lemma 30.5.6. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in \text{Supp}(\mathcal{F})$ be a point in the support of \mathcal{F} which is not a specialization of another point of $\text{Supp}(\mathcal{F})$. Then $x \in \text{WeakAss}(\mathcal{F})$. In particular, any generic point of an irreducible component of X is weakly associated to \mathcal{O}_X .*

Proof. Since $x \in \text{Supp}(\mathcal{F})$ the module \mathcal{F}_x is not zero. Hence $\text{WeakAss}(\mathcal{F}_x) \subset \text{Spec}(\mathcal{O}_{X,x})$ is nonempty by Algebra, Lemma 10.65.4. On the other hand, by assumption $\text{Supp}(\mathcal{F}_x) = \{\mathfrak{m}_x\}$. Since $\text{WeakAss}(\mathcal{F}_x) \subset \text{Supp}(\mathcal{F}_x)$ (Algebra, Lemma 10.65.5) we see that \mathfrak{m}_x is weakly associated to \mathcal{F}_x and we win. □

Lemma 30.5.7. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If \mathfrak{m}_x is a finitely generated ideal of $\mathcal{O}_{X,x}$, then*

$$x \in \text{Ass}(\mathcal{F}) \Leftrightarrow x \in \text{WeakAss}(\mathcal{F}).$$

In particular, if X is locally Noetherian, then $\text{Ass}(\mathcal{F}) = \text{WeakAss}(\mathcal{F})$.

Proof. See Algebra, Lemma 10.65.8. □

30.6. Morphisms and weakly associated points

Lemma 30.6.1. *Let $f : X \rightarrow S$ be an affine morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then we have*

$$\text{WeakAss}_S(f_*\mathcal{F}) \subset f(\text{WeakAss}_X(\mathcal{F}))$$

Proof. We may assume X and S affine, so $X \rightarrow S$ comes from a ring map $A \rightarrow B$. Then $\mathcal{F} = \widetilde{M}$ for some B -module M . By Lemma 30.5.2 the weakly associated points of \mathcal{F} correspond exactly to the weakly associated primes of M . Similarly, the weakly associated points of $f_*\mathcal{F}$ correspond exactly to the weakly associated primes of M as an A -module. Hence the lemma follows from Algebra, Lemma 10.65.10. □

Lemma 30.6.2. *Let $f : X \rightarrow S$ be an affine morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If X is locally Noetherian, then we have*

$$f(\text{Ass}_X(\mathcal{F})) = \text{Ass}_S(f_*\mathcal{F}) = \text{WeakAss}_S(f_*\mathcal{F}) = f(\text{WeakAss}_X(\mathcal{F}))$$

Proof. We may assume X and S affine, so $X \rightarrow S$ comes from a ring map $A \rightarrow B$. As X is locally Noetherian the ring B is Noetherian, see Properties, Lemma 27.5.2. Write $\mathcal{F} = \widetilde{M}$ for some B -module M . By Lemma 30.2.2 the associated points of \mathcal{F} correspond exactly to the associated primes of M , and any associated prime of M as an A -module is an associated points of $f_*\mathcal{F}$. Hence the inclusion

$$f(\text{Ass}_X(\mathcal{F})) \subset \text{Ass}_S(f_*\mathcal{F})$$

follows from Algebra, Lemma 10.62.12. We have the inclusion

$$\text{Ass}_S(f_*\mathcal{F}) \subset \text{WeakAss}_S(f_*\mathcal{F})$$

by Lemma 30.5.3. We have the inclusion

$$\text{WeakAss}_S(f_*\mathcal{F}) \subset f(\text{WeakAss}_X(\mathcal{F}))$$

by Lemma 30.6.1. The outer sets are equal by Lemma 30.5.7 hence we have equality everywhere. □

Lemma 30.6.3. *Let $f : X \rightarrow S$ be a finite morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then $\text{WeakAss}(f_*\mathcal{F}) = f(\text{WeakAss}(\mathcal{F}))$.*

Proof. We may assume X and S affine, so $X \rightarrow S$ comes from a finite ring map $A \rightarrow B$. Write $\mathcal{F} = \widetilde{M}$ for some B -module M . By Lemma 30.5.2 the weakly associated points of \mathcal{F} correspond exactly to the weakly associated primes of M . Similarly, the weakly associated points of $f_*\mathcal{F}$ correspond exactly to the weakly associated primes of M as an A -module. Hence the lemma follows from Algebra, Lemma 10.65.12. □

Lemma 30.6.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{G} be a quasi-coherent \mathcal{O}_S -module. Let $x \in X$ with $s = f(x)$. If f is flat at x , the point x is a generic point of the fibre X_s , and $s \in \text{WeakAss}_S(\mathcal{G})$, then $x \in \text{WeakAss}(f^*\mathcal{G})$.*

Proof. Let $A = \mathcal{O}_{S,s}$, $B = \mathcal{O}_{X,x}$, and $M = \mathcal{G}_s$. Let $m \in M$ be an element whose annihilator $I = \{a \in A \mid am = 0\}$ has radical \mathfrak{m}_A . Then $m \otimes 1$ has annihilator IB as $A \rightarrow B$ is faithfully flat. Thus it suffices to see that $\sqrt{IB} = \mathfrak{m}_B$. This follows from the fact that the maximal ideal of $B/\mathfrak{m}_A B$ is locally nilpotent (see Algebra, Lemma 10.24.1) and the assumption that $\sqrt{I} = \mathfrak{m}_A$. Some details omitted. \square

30.7. Relative assassin

Definition 30.7.1. Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The *relative assassin of \mathcal{F} in X over S* is the set

$$\text{Ass}_{X/S}(\mathcal{F}) = \bigcup_{s \in S} \text{Ass}_{X_s}(\mathcal{F}_s)$$

where $\mathcal{F}_s = (X_s \rightarrow X)^*\mathcal{F}$ is the restriction of \mathcal{F} to the fibre of f at s .

Again there is a caveat that this is best used when the fibres of f are locally Noetherian and \mathcal{F} is of finite type. In the general case we should probably use the relative weak assassin (defined in the next section).

Lemma 30.7.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $g : S' \rightarrow S$ be a morphism of schemes. Consider the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & \searrow^{g'} & \downarrow \\ S' & \xrightarrow{\quad g \quad} & S \end{array}$$

and set $\mathcal{F}' = (g')^*\mathcal{F}$. Let $x' \in X'$ be a point with images $x \in X$, $s' \in S'$ and $s \in S$. Assume f locally of finite type. Then $x' \in \text{Ass}_{X'/S'}(\mathcal{F}')$ if and only if $x \in \text{Ass}_{X/S}(\mathcal{F})$ and x' corresponds to a generic point of an irreducible component of $\text{Spec}(\kappa(s') \otimes_{\kappa(s)} \kappa(x))$.

Proof. Consider the morphism $X'_{s'} \rightarrow X_s$ of fibres. As $X_{s'} = X_s \times_{\text{Spec}(\kappa(s))} \text{Spec}(\kappa(s'))$ this is a flat morphism. Moreover $\mathcal{F}'_{s'}$ is the pullback of \mathcal{F}_s via this morphism. As X_s is locally of finite type over the Noetherian scheme $\text{Spec}(\kappa(s))$ we have that X_s is locally Noetherian, see Morphisms, Lemma 28.16.6. Thus we may apply Lemma 30.3.1 and we see that

$$\text{Ass}_{X'_{s'}}(\mathcal{F}'_{s'}) = \bigcup_{x \in \text{Ass}(\mathcal{F}_s)} \text{Ass}((X'_{s'})_x).$$

Thus to prove the lemma it suffices to show that the associated points of the fibre $(X'_{s'})_x$ of the morphism $X'_{s'} \rightarrow X_s$ over x are its generic points. Note that $(X'_{s'})_x = \text{Spec}(\kappa(s') \otimes_{\kappa(s)} \kappa(x))$ as schemes. By Algebra, Lemma 10.155.1 the ring $\kappa(s') \otimes_{\kappa(s)} \kappa(x)$ is a Noetherian Cohen-Macaulay ring. Hence its associated primes are its minimal primes, see Algebra, Proposition 10.62.6 (minimal primes are associated) and Algebra, Lemma 10.146.2 (no embedded primes). \square

Remark 30.7.3. With notation and assumptions as in Lemma 30.7.2 we see that it is always the case that $(g')^{-1}(\text{Ass}_{X/S}(\mathcal{F})) \supset \text{Ass}_{X'/S'}(\mathcal{F}')$. If the morphism $S' \rightarrow S$ is locally quasi-finite, then we actually have

$$(g')^{-1}(\text{Ass}_{X/S}(\mathcal{F})) = \text{Ass}_{X'/S'}(\mathcal{F}')$$

because in this case the field extensions $\kappa(s) \subset \kappa(s')$ are always finite. In fact, this holds more generally for any morphism $g : S' \rightarrow S$ such that all the field extensions $\kappa(s) \subset \kappa(s')$ are algebraic, because in this case all prime ideals of $\kappa(s') \otimes_{\kappa(s)} \kappa(x)$ are maximal (and minimal) primes, see Algebra, Lemma 10.35.17.

30.8. Relative weak assassin

Definition 30.8.1. Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The *relative weak assassin of \mathcal{F} in X over S* is the set

$$\text{WeakAss}_{X/S}(\mathcal{F}) = \bigcup_{s \in S} \text{WeakAss}(\mathcal{F}_s)$$

where $\mathcal{F}_s = (X_s \rightarrow X)^* \mathcal{F}$ is the restriction of \mathcal{F} to the fibre of f at s .

Lemma 30.8.2. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then $\text{WeakAss}_{X/S}(\mathcal{F}) = \text{Ass}_{X/S}(\mathcal{F})$.*

Proof. This is true because the fibres of f are locally Noetherian schemes, and associated and weakly associated points agree on locally Noetherian schemes, see Lemma 30.5.7. \square

30.9. Effective Cartier divisors

For some reason it seem convenient to define the notion of an effective Cartier divisor before anything else.

Definition 30.9.1. Let S be a scheme.

- (1) A *locally principal closed subscheme* of S is a closed subscheme whose sheaf of ideals is locally generated by a single element.
- (2) An *effective Cartier divisor* on S is a closed subscheme $D \subset S$ such that the ideal sheaf $\mathcal{I}_D \subset \mathcal{O}_X$ is an invertible \mathcal{O}_X -module.

Thus an effective Cartier divisor is a locally principal closed subscheme, but the converse is not always true. Effective Cartier divisors are closed subschemes of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zerodivisor. In particular they are nowhere dense.

Lemma 30.9.2. *Let S be a scheme. Let $D \subset S$ be a closed subscheme. The following are equivalent:*

- (1) *The subscheme D is an effective Cartier divisor on S .*
- (2) *For every $x \in D$ there exists an affine open neighbourhood $\text{Spec}(A) = U \subset S$ of x such that $U \cap D = \text{Spec}(A/(f))$ with $f \in A$ not a zerodivisor.*

Proof. Assume (1). For every $x \in D$ there exists an affine open neighbourhood $\text{Spec}(A) = U \subset S$ of x such that $\mathcal{I}_D|_U \cong \mathcal{O}_U$. In other words, there exists a section $f \in \Gamma(U, \mathcal{I}_D)$ which freely generates the restriction $\mathcal{I}_D|_U$. Hence $f \in A$, and the multiplication map $f : A \rightarrow A$ is injective. Also, since \mathcal{I}_D is quasi-coherent we see that $D \cap U = \text{Spec}(A/(f))$.

Assume (2). Let $x \in D$. By assumption there exists an affine open neighbourhood $\text{Spec}(A) = U \subset S$ of x such that $U \cap D = \text{Spec}(A/(f))$ with $f \in A$ not a zerodivisor. Then $\mathcal{I}_D|_U \cong \mathcal{O}_U$ since it is equal to $(f) \cong \tilde{A} \cong \mathcal{O}_U$. Of course \mathcal{I}_D restricted to the open subscheme $S \setminus D$ is isomorphic to $\mathcal{O}_{S \setminus D}$. Hence \mathcal{I}_D is an invertible \mathcal{O}_S -module. \square

Lemma 30.9.3. *Let S be a scheme. Let $Z \subset S$ be a locally principal closed subscheme. Let $U = S \setminus Z$. Then $U \rightarrow S$ is an affine morphism.*

Proof. The question is local on S , see Morphisms, Lemmas 28.13.3. Thus we may assume $S = \text{Spec}(A)$ and $Z = V(f)$ for some $f \in A$. In this case $U = D(f) = \text{Spec}(A_f)$ is affine hence $U \rightarrow S$ is affine. \square

Lemma 30.9.4. *Let S be a scheme. Let $D \subset S$ be an effective Cartier divisor. Let $U = S \setminus D$. Then $U \rightarrow S$ is an affine morphism and U is scheme theoretically dense in S .*

Proof. Affineness is Lemma 30.9.3. The density question is local on S , see Morphisms, Lemma 28.7.5. Thus we may assume $S = \text{Spec}(A)$ and D corresponding to the nonzerodivisor $f \in A$, see Lemma 30.9.2. Thus $A \subset A_f$ which implies that $U \subset S$ is scheme theoretically dense, see Morphisms, Example 28.7.4. \square

Lemma 30.9.5. *Let S be a scheme. Let $D \subset S$ be an effective Cartier divisor. Let $s \in D$. If $\dim_s(S) < \infty$, then $\dim_s(D) < \dim_s(S)$.*

Proof. Assume $\dim_s(S) < \infty$. Let $U = \text{Spec}(A) \subset S$ be an affine open neighbourhood of s such that $\dim(U) = \dim_s(S)$ and such that $D = V(f)$ for some nonzerodivisor $f \in A$ (see Lemma 30.9.2). Recall that $\dim(U)$ is the Krull dimension of the ring A and that $\dim(U \cap D)$ is the Krull dimension of the ring $A/(f)$. Then f is not contained in any minimal prime of A . Hence any maximal chain of primes in $A/(f)$, viewed as a chain of primes in A , can be extended by adding a minimal prime. \square

Definition 30.9.6. Let S be a scheme. Given effective Cartier divisors D_1, D_2 on S we set $D = D_1 + D_2$ equal to the closed subscheme of S corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_1}\mathcal{I}_{D_2} \subset \mathcal{O}_S$. We call this the *sum of the effective Cartier divisors D_1 and D_2* .

It is clear that we may define the sum $\sum n_i D_i$ given finitely many effective Cartier divisors D_i on X and nonnegative integers n_i .

Lemma 30.9.7. *The sum of two effective Cartier divisors is an effective Cartier divisor.*

Proof. Omitted. Locally $f_1, f_2 \in A$ are nonzerodivisors, then also $f_1 f_2 \in A$ is a nonzerodivisor. \square

Lemma 30.9.8. *Let X be a scheme. Let D, D' be two effective Cartier divisors on X . If $D \subset D'$ (as closed subschemes of X), then there exists an effective Cartier divisor D'' such that $D' = D + D''$.*

Proof. Omitted. \square

Lemma 30.9.9. *Let X be a scheme. Let Z, Y be two closed subschemes of X with ideal sheaves \mathcal{I} and \mathcal{J} . If $\mathcal{I}\mathcal{J}$ defines an effective Cartier divisor $D \subset X$, then Z and Y are effective Cartier divisors and $D = Z + Y$.*

Proof. Applying Lemma 30.9.2 we obtain the following algebra situation: A is a ring, $I, J \subset A$ ideals and $f \in A$ a nonzerodivisor such that $IJ = (f)$. Thus the result follows from Algebra, Lemma 10.116.12. \square

Recall that we have defined the inverse image of a closed subscheme under any morphism of schemes in Schemes, Definition 25.17.7.

Lemma 30.9.10. *Let $f : S' \rightarrow S$ be a morphism of schemes. Let $Z \subset S$ be a locally principal closed subscheme. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subscheme of S' .*

Proof. Omitted. \square

Definition 30.9.11. Let $f : S' \rightarrow S$ be a morphism of schemes. Let $D \subset S$ be an effective Cartier divisor. We say the *pullback of D by f is defined* if the closed subscheme $f^{-1}(D) \subset S'$ is an effective Cartier divisor. In this case we denote it either f^*D or $f^{-1}(D)$ and we call it the *pullback of the effective Cartier divisor*.

The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice. Here is an example lemma.

Lemma 30.9.12. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $D \subset Y$ be an effective Cartier divisor. The pullback of D by f is defined in each of the following cases:*

- (1) X, Y integral and f dominant,
- (2) X reduced, and for any generic point ξ of any irreducible component of X we have $f(\xi) \notin D$,
- (3) X is locally Noetherian and for any associated point x of X we have $f(x) \notin D$,
- (4) X is locally Noetherian, has no embedded points, and for any generic point ξ of any irreducible component of X we have $f(\xi) \notin D$,
- (5) f is flat, and
- (6) add more here as needed.

Proof. The question is local on X , and hence we reduce to the case where $X = \text{Spec}(A)$, $Y = \text{Spec}(R)$, f is given by $\varphi : R \rightarrow A$ and $D = \text{Spec}(R/(t))$ where $t \in R$ is not a zerodivisor. The goal in each case is to show that $\varphi(t) \in A$ is not a zerodivisor.

In case (2) this follows as the intersection of all minimal primes of a ring is the nilradical of the ring, see Algebra, Lemma 10.16.2.

Let us prove (3). By Lemma 30.2.2 the associated points of X correspond to the primes $\mathfrak{p} \in \text{Ass}(A)$. By Algebra, Lemma 10.62.9 we have $\bigcup_{\mathfrak{p} \in \text{Ass}(A)} \mathfrak{p}$ is the set of zerodivisors of A . The hypothesis of (3) is that $\varphi(t) \notin \mathfrak{p}$ for all $\mathfrak{p} \in \text{Ass}(A)$. Hence $\varphi(t)$ is a nonzerodivisor as desired.

Part (4) follows from (3) and the definitions. \square

Lemma 30.9.13. *Let $f : S' \rightarrow S$ be a morphism of schemes. Let D_1, D_2 be effective Cartier divisors on S . If the pullbacks of D_1 and D_2 are defined then the pullback of $D = D_1 + D_2$ is defined and $f^*D = f^*D_1 + f^*D_2$.*

Proof. Omitted. \square

Definition 30.9.14. Let S be a scheme and let D be an effective Cartier divisor. The *invertible sheaf* $\mathcal{O}_S(D)$ associated to D is given by

$$\mathcal{O}_S(D) := \mathcal{H}om_{\mathcal{O}_S}(\mathcal{I}_D, \mathcal{O}_S) = \mathcal{I}_D^{\otimes -1}.$$

The canonical section, usually denoted 1 or 1_D , is the global section of $\mathcal{O}_S(D)$ corresponding to the inclusion mapping $\mathcal{I}_D \rightarrow \mathcal{O}_S$.

Lemma 30.9.15. Let S be a scheme. Let D_1, D_2 be effective Cartier divisors on S . Let $D = D_1 + D_2$. Then there is a unique isomorphism

$$\mathcal{O}_S(D_1) \otimes_{\mathcal{O}_S} \mathcal{O}_S(D_2) \longrightarrow \mathcal{O}_S(D)$$

which maps $1_{D_1} \otimes 1_{D_2}$ to 1_D .

Proof. Omitted. □

Definition 30.9.16. Let (X, \mathcal{O}_X) be a locally ringed space. Let \mathcal{L} be an invertible sheaf on X . A global section $s \in \Gamma(X, \mathcal{L})$ is called a *regular section* if the map $\mathcal{O}_X \rightarrow \mathcal{L}, f \mapsto fs$ is injective.

Lemma 30.9.17. Let X be a locally ringed space. Let $f \in \Gamma(X, \mathcal{O}_X)$. The following are equivalent:

- (1) f is a regular section, and
- (2) for any $x \in X$ the image $f \in \mathcal{O}_{X,x}$ is not a zerodivisor.

If X is a scheme these are also equivalent to

- (3) for any affine open $\text{Spec}(A) = U \subset X$ the image $f \in A$ is not a zerodivisor, and
- (4) there exists an affine open covering $X = \bigcup \text{Spec}(A_i)$ such that the image of f in A_i is not a zerodivisor for all i .

Proof. Omitted. □

Note that a global section s of an invertible \mathcal{O}_X -module \mathcal{L} may be seen as an \mathcal{O}_X -module map $s : \mathcal{O}_X \rightarrow \mathcal{L}$. Its dual is therefore a map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$. (See Modules, Definition 17.21.3 for the definition of the dual invertible sheaf.)

Definition 30.9.18. Let X be a scheme. Let \mathcal{L} be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$. The *zero scheme* of s is the closed subscheme $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ which is the image of the map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$.

Lemma 30.9.19. Let X be a scheme. Let \mathcal{L} be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$.

- (1) Consider closed immersions $i : Z \rightarrow X$ such that $i^*s \in \Gamma(Z, i^*\mathcal{L})$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the maximal element of this ordered set.
- (2) For any morphism of schemes $f : Y \rightarrow X$ we have $f^*s = 0$ in $\Gamma(Y, f^*\mathcal{L})$ if and only if f factors through $Z(s)$.
- (3) The zero scheme $Z(s)$ is a locally principal closed subscheme.
- (4) The zero scheme $Z(s)$ is an effective Cartier divisor if and only if s is a regular section of \mathcal{L} .

Proof. Omitted. □

Lemma 30.9.20. Let X be a scheme.

- (1) If $D \subset X$ is an effective Cartier divisor, then the canonical section 1_D of $\mathcal{O}_X(D)$ is regular.
- (2) Conversely, if s is a regular section of the invertible sheaf \mathcal{L} , then there exists a unique effective Cartier divisor $D = Z(s) \subset X$ and a unique isomorphism $\mathcal{O}_X(D) \rightarrow \mathcal{L}$ which maps 1_D to s .

The constructions $D \mapsto (\mathcal{O}_X(D), 1_D)$ and $(\mathcal{L}, s) \mapsto Z(s)$ give mutually inverse maps

$$\{\text{effective Cartier divisors on } X\} \leftrightarrow \left\{ \begin{array}{l} \text{pairs } (\mathcal{L}, s) \text{ consisting of an invertible} \\ \mathcal{O}_X\text{-module and a regular global section} \end{array} \right\}$$

Proof. Omitted. □

Lemma 30.9.21. *Let X be a Noetherian scheme. Let $D \subset X$ be a closed subscheme corresponding to the quasi-coherent ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$.*

- (1) *If for every $x \in D$ the ideal $\mathcal{I}_x \subset \mathcal{O}_{X,x}$ can be generated by one element, then D is locally principal.*
- (2) *If for every $x \in D$ the ideal $\mathcal{I}_x \subset \mathcal{O}_{X,x}$ can be generated by a single nonzerodivisor, then D is an effective Cartier divisor.*

Proof. Let $\text{Spec}(A)$ be an affine neighbourhood of a point $x \in D$. Let $\mathfrak{p} \subset A$ be the prime corresponding to x . Let $I \subset A$ be the ideal defining the trace of D on $\text{Spec}(A)$. Since A is Noetherian (as X is Noetherian) the ideal I is generated by finitely many elements, say $I = (f_1, \dots, f_r)$. Under the assumption of (1) we have $I_{\mathfrak{p}} = (f)$ for some $f \in A_{\mathfrak{p}}$. Then $f_i = g_i f$ for some $g_i \in A_{\mathfrak{p}}$. Write $g_i = a_i/h_i$ and $f = f'/h$ for some $h_i, h \in A$, $h_i, h \notin \mathfrak{p}$. Then $I_{h_1 \dots h_r h} \subset A_{h_1 \dots h_r h}$ is principal, because it is generated by f' . This proves (1). For (2) we may assume $I = (f)$. The assumption implies that the image of f in $A_{\mathfrak{p}}$ is a nonzerodivisor. Then f is a nonzero divisor on a neighbourhood of x by Algebra, Lemma 10.67.8. This proves (2). □

Lemma 30.9.22. *Let X be a Noetherian scheme. Let $D \subset X$ be an integral closed subscheme which is also an effective Cartier divisor. Then the local ring of X at the generic point of D is a discrete valuation ring.*

Proof. By Lemma 30.9.2 we may assume $X = \text{Spec}(A)$ and $D = \text{Spec}(A/(f))$ where A is a Noetherian ring and $f \in A$ is a nonzerodivisor. The assumption that D is integral signifies that (f) is prime. Hence the local ring of X at the generic point is $A_{(f)}$ which is a Noetherian local ring whose maximal ideal is generated by a nonzerodivisor. Thus it is a discrete valuation ring by Algebra, Lemma 10.115.6. □

Lemma 30.9.23. *Let X be a Noetherian scheme. Let $D \subset X$ be an integral closed subscheme. Assume that*

- (1) *D has codimension 1 in X , and*
- (2) *$\mathcal{O}_{X,x}$ is a UFD for all $x \in D$.*

Then D is an effective Cartier divisor.

Proof. Let $x \in D$ and set $A = \mathcal{O}_{X,x}$. Let $\mathfrak{p} \subset A$ correspond to the generic point of D . Then $A_{\mathfrak{p}}$ has dimension 1 by assumption (1). Thus \mathfrak{p} is a prime ideal of height 1. Since A is a UFD this implies that $\mathfrak{p} = (f)$ for some $f \in A$. Of course f is a nonzerodivisor and we conclude by Lemma 30.9.21. □

Lemma 30.9.24. *Let X be a Noetherian scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Assume at least one of the following conditions holds*

- (1) *There exist reduced and irreducible effective Cartier divisors $D_i \subset X$, $i = 1, \dots, n$ and a closed subset $Z \subset X$ of codimension ≥ 2 , such that $\mathcal{O}_X/\mathcal{I}$ is supported on $Z \cup \bigcup D_i$.*
- (2) *The local ring $\mathcal{O}_{X,x}$ is a UFD for every point x of the support of $\mathcal{O}_X/\mathcal{I}$.*
- (3) *The scheme X is regular.*

Then there exists an invertible ideal sheaf $\mathcal{I} \subset \mathcal{J} \subset \mathcal{O}_X$ such that the support of \mathcal{J}/\mathcal{I} has codimension ≥ 2 . Moreover, in case (1) we have $\mathcal{J}^{\otimes -1} = \mathcal{O}_X(\sum a_i D_i)$ for some $a_i \geq 0$.

Proof. Case (1). Let $\xi_i \in D_i$ be the generic point and let $\mathcal{O}_i = \mathcal{O}_{X,\xi_i}$ be the local ring which is a discrete valuation ring by Lemma 30.9.22. Let $a_i \geq 0$ be the minimal valuation of an element of $\mathcal{I}_{x_i} \subset \mathcal{O}_i$. We claim that the ideal sheaf \mathcal{J} of the effective Cartier divisor $D = \sum a_i D_i$ works.

Namely, suppose that $x \in D$. Let $A = \mathcal{O}_{X,x}$. Let $f_i \in A$ be a local equation for D_i ; we only consider those i such that $x \in D_i$. Then f_i is a nonzerodivisor and $A/(f_i)$ is a domain and $\mathcal{O}_i = A_{(f_i)}$. Let $I = \mathcal{I}_x \subset A$. We chose a_i such that $IA_{(f_i)} = f_i^{a_i} A_{(f_i)}$. It follows that $I \subset (\prod f_i^{a_i})$ because $(\prod f_i^{a_i})$ is the kernel of $A \rightarrow \prod A_{(f_i)}/f_i^{a_i} A_{(f_i)}$. This proves that $\mathcal{I} \subset \mathcal{J}$. Moreover, we also see that $\mathcal{I}_{x_i} = \mathcal{J}_{x_i}$ which proves that x_i is not in the support of \mathcal{J}/\mathcal{I} . Hence the support of \mathcal{I}/\mathcal{J} has codimension at least 2. This finishes the proof in case (1).

Observe that (3) is a special case of (2) because a regular local ring is a UFD (More on Algebra, Lemma 15.70.4). In case (2) let D_i be the irreducible components of the support of $\mathcal{O}_X/\mathcal{I}$ which have codimension 1. By Lemma 30.9.23 each D_i is an effective Cartier divisor. In this way we reduce to case (1). \square

30.10. Relative effective Cartier divisors

The following lemma shows that an effective Cartier divisor which is flat over the base is really a “family of effective Cartier divisors” over the base. For example the restriction to any fibre is an effective Cartier divisor.

Lemma 30.10.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a closed subscheme. Assume*

- (1) *D is an effective Cartier divisor, and*
- (2) *$D \rightarrow S$ is a flat morphism.*

Then for every morphism of schemes $g : S' \rightarrow S$ the pullback $(g')^{-1}D$ is an effective Cartier divisor on $X' = S' \times_S X$.

Proof. Using Lemma 30.9.2 we translate this as follows into algebra. Let $A \rightarrow B$ be a ring map and $h \in B$. Assume h is a nonzerodivisor and that B/hB is flat over A . Then

$$0 \rightarrow B \xrightarrow{h} B \rightarrow B/hB \rightarrow 0$$

is a short exact sequence of A -modules with B/hB flat over A . By Algebra, Lemma 10.38.11 this sequence remains exact on tensoring over A with any module, in particular with any A -algebra A' . \square

This lemma is the motivation for the following definition.

Definition 30.10.2. Let $f : X \rightarrow S$ be a morphism of schemes. A *relative effective Cartier divisor* on X/S is an effective Cartier divisor $D \subset X$ such that $D \rightarrow S$ is a flat morphism of schemes.

We warn the reader that this may be nonstandard notation. In particular, in [DG67, IV, Section 21.15] the notion of a relative divisor is discussed only when $X \rightarrow S$ is flat and locally of finite presentation. Our definition is a bit more general. However, it turns out that if $x \in D$ then $X \rightarrow S$ is flat at x in many cases (but not always).

Lemma 30.10.3. Let $f : X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor on X/S . If $x \in D$ and $\mathcal{O}_{X,x}$ is Noetherian, then f is flat at x .

Proof. Set $A = \mathcal{O}_{S,f(x)}$ and $B = \mathcal{O}_{X,x}$. Let $h \in B$ be an element which generates the ideal of D . Then h is a nonzerodivisor in B such that B/hB is a flat local A -algebra. Let $I \subset A$ be a finitely generated ideal. Consider the commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & B & \xrightarrow{h} & B & \longrightarrow & B/hB \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 0 & \longrightarrow & B \otimes_A I & \xrightarrow{h} & B \otimes_A I & \longrightarrow & B/hB \otimes_A I \longrightarrow 0
 \end{array}$$

The lower sequence is short exact as B/hB is flat over A , see Algebra, Lemma 10.38.11. The right vertical arrow is injective as B/hB is flat over A , see Algebra, Lemma 10.38.4. Hence multiplication by h is surjective on the kernel K of the middle vertical arrow. By Nakayama’s lemma, see Algebra, Lemma 10.19.1 we conclude that $K = 0$. Hence B is flat over A , see Algebra, Lemma 10.38.4. \square

The following lemma relies on the algebraic version of openness of the flat locus. The scheme theoretic version can be found in More on Morphisms, Section 36.12.

Lemma 30.10.4. Let $f : X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor. If f is locally of finite presentation, then there exists an open subscheme $U \subset X$ such that $D \subset U$ and such that $f|_U : U \rightarrow S$ is flat.

Proof. Pick $x \in D$. It suffices to find an open neighbourhood $U \subset X$ of x such that $f|_U$ is flat. Hence the lemma reduces to the case that $X = \text{Spec}(B)$ and $S = \text{Spec}(A)$ are affine and that D is given by a nonzerodivisor $h \in B$. By assumption B is a finitely presented A -algebra and B/hB is a flat A -algebra. We are going to use absolute Noetherian approximation.

Write $B = A[x_1, \dots, x_n]/(g_1, \dots, g_m)$. Assume h is the image of $h' \in A[x_1, \dots, x_n]$. Choose a finite type \mathbf{Z} -subalgebra $A_0 \subset A$ such that all the coefficients of the polynomials h', g_1, \dots, g_m are in A_0 . Then we can set $B_0 = A_0[x_1, \dots, x_n]/(g_1, \dots, g_m)$ and h_0 the image of h' in B_0 . Then $B = B_0 \otimes_{A_0} A$ and $B/hB = B_0/h_0B_0 \otimes_{A_0} A$. By Algebra, Lemma 10.156.1 we may, after enlarging A_0 , assume that B_0/h_0B_0 is flat over A_0 . Let $K_0 = \text{Ker}(h_0 : B_0 \rightarrow B_0)$. As B_0 is of finite type over \mathbf{Z} we see that K_0 is a finitely generated ideal. Let $A_1 \subset A$ be a finite type \mathbf{Z} -subalgebra containing A_0 and denote B_1, h_1, K_1 the corresponding objects over A_1 . By More on Algebra, Lemma 15.21.15 the map $K_0 \otimes_{A_0} A_1 \rightarrow K_1$ is surjective. On the other

hand, the kernel of $h : B \rightarrow B$ is zero by assumption. Hence every element of K_0 maps to zero in K_1 for sufficiently large subrings $A_1 \subset A$. Since K_0 is finitely generated, we conclude that $K_1 = 0$ for a suitable choice of A_1 .

Set $f_1 : X_1 \rightarrow S_1$ equal to Spec of the ring map $A_1 \rightarrow B_1$. Set $D_1 = \text{Spec}(B_1/h_1B_1)$. Since $B = B_1 \otimes_{A_1} A$, i.e., $X = X_1 \times_{S_1} S$, it now suffices to prove the lemma for $X_1 \rightarrow S_1$ and the relative effective Cartier divisor D_1 , see Morphisms, Lemma 28.26.6. Hence we have reduced to the case where A is a Noetherian ring. In this case we know that the ring map $A \rightarrow B$ is flat at every prime \mathfrak{q} of $V(h)$ by Lemma 30.10.3. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 10.125.4 we win. \square

There is also the following lemma (whose idea is apparently due to Michael Artin, see [Nob77]) which needs no finiteness assumptions at all.

Lemma 30.10.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor on X/S . If f is flat at all points of $X \setminus D$, then f is flat.*

Proof. This translates into the following algebra fact: Let $A \rightarrow B$ be a ring map and $h \in B$. Assume h is a nonzerodivisor, that B/hB is flat over A , and that the localization B_h is flat over A . Then B is flat over A . The reason is that we have a short exact sequence

$$0 \rightarrow B \rightarrow B_h \rightarrow \text{colim}_n (1/h^n)B/B \rightarrow 0$$

and that the second and third terms are flat over A , which implies that B is flat over A (see Algebra, Lemma 10.38.12). Note that a filtered colimit of flat modules is flat (see Algebra, Lemma 10.38.2) and that by induction on n each $(1/h^n)B/B \cong B/h^nB$ is flat over A since it fits into the short exact sequence

$$0 \rightarrow B/h^{n-1}B \xrightarrow{h} B/h^nB \rightarrow B/hB \rightarrow 0$$

Some details omitted. \square

Example 30.10.6. Here is an example of a relative effective Cartier divisor D where the ambient scheme is not flat in a neighbourhood of D . Namely, let $A = k[t]$ and

$$B = k[t, x, y, x^{-1}y, x^{-2}y, \dots] / (ty, tx^{-1}y, tx^{-2}y, \dots)$$

Then B is not flat over A but $B/xB \cong A$ is flat over A . Moreover x is a nonzerodivisor and hence defines a relative effective Cartier divisor in $\text{Spec}(B)$ over $\text{Spec}(A)$.

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative effective Cartier divisor in terms of its fibres. See also More on Morphisms, Lemma 36.18.1 for a slightly different take on this lemma.

Lemma 30.10.7. *Let $\varphi : X \rightarrow S$ be a flat morphism which is locally of finite presentation. Let $Z \subset X$ be a closed subscheme. Let $x \in Z$ with image $s \in S$.*

- (1) *If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x , then there exists an open $U \subset X$ and a relative effective Cartier divisor $D \subset U$ such that $Z \cap U \subset D$.*
- (2) *If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x , the morphism $Z \rightarrow X$ is of finite presentation, and $Z \rightarrow S$ is flat at x , then we can choose U and D such that $Z \cap U = D$.*

- (3) If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x and Z is a locally principal closed subscheme of X in a neighbourhood of x , then we can choose U and D such that $Z \cap U = D$.

In particular, if $Z \rightarrow S$ is locally of finite presentation and flat and all fibres $Z_s \subset X_s$ are effective Cartier divisors, then Z is a relative effective Cartier divisor. Similarly, if Z is a locally principal closed subscheme of X such that all fibres $Z_s \subset X_s$ are effective Cartier divisors, then Z is a relative effective Cartier divisor.

Proof. Choose affine open neighbourhoods $\text{Spec}(A)$ of s and $\text{Spec}(B)$ of x such that $\varphi(\text{Spec}(B)) \subset \text{Spec}(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s . Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x . Let $I \subset B$ be the ideal corresponding to Z . By the initial assumption of the lemma we know that $A \rightarrow B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $\text{Spec}(B)$, we may assume $I(B \otimes_A \kappa(\mathfrak{p}))$ is generated by a single element which is a nonzerodivisor in $B \otimes_A \kappa(\mathfrak{p})$. Say $f \in I$ maps to this generator. We claim that after inverting an element $g \in B$, $g \notin \mathfrak{q}$ the closed subscheme $D = V(f) \subset \text{Spec}(B_g)$ is a relative effective Cartier divisor.

By Algebra, Lemma 10.156.1 we can find a flat finite type ring map $A_0 \rightarrow B_0$ of Noetherian rings, an element $f_0 \in B_0$, a ring map $A_0 \rightarrow A$ and an isomorphism $A \otimes_{A_0} B_0 \cong B$. If $\mathfrak{p}_0 = A_0 \cap \mathfrak{p}$ then we see that

$$B \otimes_A \kappa(\mathfrak{p}) = (B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)) \otimes_{\kappa(\mathfrak{p}_0)} \kappa(\mathfrak{p})$$

hence f_0 is a nonzerodivisor in $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)$. By Algebra, Lemma 10.95.2 we see that f_0 is a nonzerodivisor in $(B_0)_{\mathfrak{q}_0}$ where $\mathfrak{q}_0 = B_0 \cap \mathfrak{q}$ and that $(B_0/f_0 B_0)_{\mathfrak{q}_0}$ is flat over A_0 . Hence by Algebra, Lemma 10.67.8 and Algebra, Theorem 10.125.4 there exists a $g_0 \in B_0$, $g_0 \notin \mathfrak{q}_0$ such that f_0 is a nonzerodivisor in $(B_0)_{g_0}$ and such that $(B_0/f_0 B_0)_{g_0}$ is flat over A_0 . Hence we see that $D_0 = V(f_0) \subset \text{Spec}((B_0)_{g_0})$ is a relative effective Cartier divisor. Since we know that this property is preserved under base change, see Lemma 30.10.1, we obtain the claim mentioned above with g equal to the image of g_0 in B .

At this point we have proved (1). To see (2) consider the closed immersion $Z \rightarrow D$. The surjective ring map $u : \mathcal{O}_{D,x} \rightarrow \mathcal{O}_{Z,x}$ is a map of flat local $\mathcal{O}_{S,s}$ -algebras which are essentially of finite presentation, and which becomes an isomorphism after dividing by \mathfrak{m}_s . Hence it is an isomorphism, see Algebra, Lemma 10.124.4. It follows that $Z \rightarrow D$ is an isomorphism in a neighbourhood of x , see Algebra, Lemma 10.122.6. To see (3), after possibly shrinking U we may assume that the ideal of D is generated by a single nonzerodivisor f and the ideal of Z is generated by an element g . Then $f = gh$. But $g|_{U_s}$ and $f|_{U_s}$ cut out the same effective Cartier divisor in a neighbourhood of x . Hence $h|_{X_s}$ is a unit in $\mathcal{O}_{X_s,x}$, hence h is a unit in $\mathcal{O}_{X,x}$ hence h is a unit in an open neighbourhood of x . I.e., $Z \cap U = D$ after shrinking U .

The final statements of the lemma follow immediately from parts (2) and (3), combined with the fact that $Z \rightarrow S$ is locally of finite presentation if and only if $Z \rightarrow X$ is of finite presentation, see Morphisms, Lemmas 28.22.3 and 28.22.11. \square

30.11. The normal cone of an immersion

Let $i : Z \rightarrow X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Consider the quasi-coherent sheaf of graded \mathcal{O}_X -algebras

$\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$. Since the sheaves $\mathcal{I}^n / \mathcal{I}^{n+1}$ are each annihilated by \mathcal{I} this graded algebra corresponds to a quasi-coherent sheaf of graded \mathcal{O}_Z -algebras by Morphisms, Lemma 28.4.1. This quasi-coherent graded \mathcal{O}_Z -algebra is called the *conormal algebra of Z in X* and is often simply denoted $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ by the abuse of notation mentioned in Morphisms, Section 28.4.

Let $f : Z \rightarrow X$ be an immersion. We define the conormal algebra of f as the conormal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$, where $\partial Z = \bar{Z} \setminus Z$. It is often denoted $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ where \mathcal{I} is the ideal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$.

Definition 30.11.1. Let $f : Z \rightarrow X$ be an immersion. The *conormal algebra $\mathcal{C}_{Z/X,*}$ of Z in X* or the *conormal algebra of f* is the quasi-coherent sheaf of graded \mathcal{O}_Z -algebras $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ described above.

Thus $\mathcal{C}_{Z/X,1} = \mathcal{C}_{Z/X}$ is the conormal sheaf of the immersion. Also $\mathcal{C}_{Z/X,0} = \mathcal{O}_Z$ and $\mathcal{C}_{Z/X,n}$ is a quasi-coherent \mathcal{O}_Z -module characterized by the property

$$(30.11.1.1) \quad i_* \mathcal{C}_{Z/X,n} = \mathcal{I}^n / \mathcal{I}^{n+1}$$

where $i : Z \rightarrow X \setminus \partial Z$ and \mathcal{I} is the ideal sheaf of i as above. Finally, note that there is a canonical surjective map

$$(30.11.1.2) \quad \text{Sym}^*(\mathcal{C}_{Z/X}) \longrightarrow \mathcal{C}_{Z/X,*}$$

of quasi-coherent graded \mathcal{O}_Z -algebras which is an isomorphism in degrees 0 and 1.

Lemma 30.11.2. *Let $i : Z \rightarrow X$ be an immersion. The conormal algebra of i has the following properties:*

- (1) *Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of U . Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then*

$$\mathcal{C}_{Z/X,*} = i^* \left(\bigoplus_{n \geq 0} \mathcal{I}^n \right) = i^{-1} \left(\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1} \right)$$

- (2) *For any affine open $\text{Spec}(R) = U \subset X$ such that $Z \cap U = \text{Spec}(R/I)$ there is a canonical isomorphism $\Gamma(Z \cap U, \mathcal{C}_{Z/X,*}) = \bigoplus_{n \geq 0} I^n / I^{n+1}$.*

Proof. Mostly clear from the definitions. Note that given a ring R and an ideal I of R we have $I^n / I^{n+1} = I^n \otimes_R R/I$. Details omitted. \square

Lemma 30.11.3. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{i} & X \\ f \downarrow & & \downarrow g \\ Z' & \xrightarrow{i'} & X' \end{array}$$

be a commutative diagram in the category of schemes. Assume i, i' immersions. There is a canonical map of graded \mathcal{O}_Z -algebras

$$f^* \mathcal{C}_{Z'/X',*} \longrightarrow \mathcal{C}_{Z/X,*}$$

characterized by the following property: For every pair of affine opens ($\text{Spec}(R) = U \subset X, \text{Spec}(R') = U' \subset X'$) with $f(U) \subset U'$ such that $Z \cap U = \text{Spec}(R/I)$ and $Z' \cap U' = \text{Spec}(R'/I')$ the induced map

$$\Gamma(Z' \cap U', \mathcal{C}_{Z'/X',*}) = \bigoplus (I')^n / (I')^{n+1} \longrightarrow \bigoplus_{n \geq 0} I^n / I^{n+1} = \Gamma(Z \cap U, \mathcal{C}_{Z/X,*})$$

is the one induced by the ring map $f^\sharp : R' \rightarrow R$ which has the property $f^\sharp(I') \subset I$.

Proof. Let $\partial Z' = \overline{Z'} \setminus Z'$ and $\partial Z = \overline{Z} \setminus Z$. These are closed subsets of X' and of X . Replacing X' by $X' \setminus \partial Z'$ and X by $X \setminus (g^{-1}(\partial Z') \cup \partial Z)$ we see that we may assume that i and i' are closed immersions.

The fact that $g \circ i$ factors through i' implies that $g^* \mathcal{I}'$ maps into \mathcal{I} under the canonical map $g^* \mathcal{I}' \rightarrow \mathcal{O}_X$, see Schemes, Lemmas 25.4.6 and 25.4.7. Hence we get an induced map of quasi-coherent sheaves $g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \rightarrow \mathcal{I}^n/\mathcal{I}^{n+1}$. Pulling back by i gives $i^*g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \rightarrow i^*(\mathcal{I}^n/\mathcal{I}^{n+1})$. Note that $i^*(\mathcal{I}^n/\mathcal{I}^{n+1}) = \mathcal{C}_{Z/X,n}$. On the other hand, $i^*g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) = f^*(i')^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) = f^*\mathcal{C}_{Z'/X',n}$. This gives the desired map.

Checking that the map is locally described as the given map $(I')^n/(I')^{n+1} \rightarrow I^n/I^{n+1}$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods U, U' with $f(U) \subset U'$ and $Z \cap U$ as well as $U' \cap Z'$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it). \square

Lemma 30.11.4. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ f \downarrow & \begin{array}{c} i \\ \searrow \end{array} & \downarrow g \\ Z' & \xrightarrow{\quad} & X' \end{array}$$

be a fibre product diagram in the category of schemes with i, i' immersions. Then the canonical map $f^*\mathcal{C}_{Z'/X',*} \rightarrow \mathcal{C}_{Z/X,*}$ of Lemma 30.11.3 is surjective. If g is flat, then it is an isomorphism.

Proof. Let $R' \rightarrow R$ be a ring map, and $I' \subset R'$ an ideal. Set $I = I'R$. Then $(I')^n/(I')^{n+1} \otimes_{R'} R \rightarrow I^n/I^{n+1}$ is surjective. If $R' \rightarrow R$ is flat, then $I^n = (I')^n \otimes_{R'} R$ and we see the map is an isomorphism. \square

Definition 30.11.5. Let $i : Z \rightarrow X$ be an immersion of schemes. The *normal cone* $C_Z X$ of Z in X is

$$C_Z X = \underline{\text{Spec}}_Z(\mathcal{C}_{Z/X,*})$$

see Constructions, Definitions 26.7.1 and 26.7.2. The *normal bundle* of Z in X is the vector bundle

$$N_Z X = \underline{\text{Spec}}_Z(\text{Sym}(\mathcal{C}_{Z/X}))$$

see Constructions, Definitions 26.6.1 and 26.6.2.

Thus $C_Z X \rightarrow Z$ is a cone over Z and $N_Z X \rightarrow Z$ is a vector bundle over Z (recall that in our terminology this does not imply that the conormal sheaf is a finite locally free sheaf). Moreover, the canonical surjection (30.11.1.2) of graded algebras defines a canonical closed immersion

$$(30.11.5.1) \quad C_Z X \longrightarrow N_Z X$$

of cones over Z .

30.12. Regular ideal sheaves

In this section we generalize the notion of an effective Cartier divisor to higher codimension. Recall that a sequence of elements f_1, \dots, f_r of a ring R is a *regular sequence* if for each $i = 1, \dots, r$ the element f_i is a nonzerodivisor on $R/(f_1, \dots, f_{i-1})$ and $R/(f_1, \dots, f_r) \neq 0$, see Algebra, Definition 10.67.1. There are three closely related weaker conditions that we can impose. The first is to assume that f_1, \dots, f_r is a *Koszul-regular sequence*, i.e., that $H_i(K_\bullet(f_1, \dots, f_r)) = 0$ for $i > 0$, see More on Algebra, Definition 15.21.1. The sequence is called an *H_1 -regular sequence* if $H_1(K_\bullet(f_1, \dots, f_r)) = 0$. Another condition we can impose is that with $J = (f_1, \dots, f_r)$, the map

$$R/J[T_1, \dots, T_r] \longrightarrow \bigoplus_{n \geq 0} J^n/J^{n+1}$$

which maps T_i to $f_i \bmod J^2$ is an isomorphism. In this case we say that f_1, \dots, f_r is a *quasi-regular sequence*, see Algebra, Definition 10.68.1. Given an R -module M there is also a notion of M -regular and M -quasi-regular sequence.

We can generalize this to the case of ringed spaces as follows. Let X be a ringed space and let $f_1, \dots, f_r \in \Gamma(X, \mathcal{O}_X)$. We say that f_1, \dots, f_r is a *regular sequence* if for each $i = 1, \dots, r$ the map

$$(30.12.0.2) \quad f_i : \mathcal{O}_X/(f_1, \dots, f_{i-1}) \longrightarrow \mathcal{O}_X/(f_1, \dots, f_{i-1})$$

is an injective map of sheaves. We say that f_1, \dots, f_r is a *Koszul-regular sequence* if the Koszul complex

$$(30.12.0.3) \quad K_\bullet(\mathcal{O}_X, f_\bullet),$$

see Modules, Definition 17.20.2, is acyclic in degrees > 0 . We say that f_1, \dots, f_r is a *H_1 -regular sequence* if the Koszul complex $K_\bullet(\mathcal{O}_X, f_\bullet)$ is exact in degree 1. Finally, we say that f_1, \dots, f_r is a *quasi-regular sequence* if the map

$$(30.12.0.4) \quad \mathcal{O}_X/\mathcal{J}[T_1, \dots, T_r] \longrightarrow \bigoplus_{d \geq 0} \mathcal{J}^d/\mathcal{J}^{d+1}$$

is an isomorphism of sheaves where $\mathcal{J} \subset \mathcal{O}_X$ is the sheaf of ideals generated by f_1, \dots, f_r . (There is also a notion of \mathcal{F} -regular and \mathcal{F} -quasi-regular sequence for a given \mathcal{O}_X -module \mathcal{F} which we will introduce here if we ever need it.)

Lemma 30.12.1. *Let X be a ringed space. Let $f_1, \dots, f_r \in \Gamma(X, \mathcal{O}_X)$. We have the following implications f_1, \dots, f_r is a regular sequence $\Rightarrow f_1, \dots, f_r$ is a Koszul-regular sequence $\Rightarrow f_1, \dots, f_r$ is an H_1 -regular sequence $\Rightarrow f_1, \dots, f_r$ is a quasi-regular sequence.*

Proof. Since we may check exactness at stalks, a sequence f_1, \dots, f_r is a regular sequence if and only if the maps

$$f_i : \mathcal{O}_{X,x}/(f_1, \dots, f_{i-1}) \longrightarrow \mathcal{O}_{X,x}/(f_1, \dots, f_{i-1})$$

are injective for all $x \in X$. In other words, the image of the sequence f_1, \dots, f_r in the ring $\mathcal{O}_{X,x}$ is a regular sequence for all $x \in X$. The other types of regularity can be checked stalkwise as well (details omitted). Hence the implications follow from More on Algebra, Lemmas 15.21.2 and 15.21.5. \square

Definition 30.12.2. Let X be a ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals.

- (1) We say \mathcal{J} is *regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a regular sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by f_1, \dots, f_r .
- (2) We say \mathcal{J} is *Koszul-regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a Koszul-regular sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by f_1, \dots, f_r .
- (3) We say \mathcal{J} is *H_1 -regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a H_1 -regular sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by f_1, \dots, f_r .
- (4) We say \mathcal{J} is *quasi-regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a quasi-regular sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by f_1, \dots, f_r .

Many properties of this notion immediately follow from the corresponding notions for regular and quasi-regular sequences in rings.

Lemma 30.12.3. *Let X be a ringed space. Let \mathcal{J} be a sheaf of ideals. We have the following implications: \mathcal{J} is regular $\Rightarrow \mathcal{J}$ is Koszul-regular $\Rightarrow \mathcal{J}$ is H_1 -regular $\Rightarrow \mathcal{J}$ is quasi-regular.*

Proof. The lemma immediately reduces to Lemma 30.12.1. □

Lemma 30.12.4. *Let X be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals. Then \mathcal{J} is quasi-regular if and only if the following conditions are satisfied:*

- (1) \mathcal{J} is an \mathcal{O}_X -module of finite type,
- (2) $\mathcal{J}/\mathcal{J}^2$ is a finite locally free $\mathcal{O}_X/\mathcal{J}$ -module, and
- (3) the canonical maps

$$\text{Sym}_{\mathcal{O}_X/\mathcal{J}}^n(\mathcal{J}/\mathcal{J}^2) \longrightarrow \mathcal{J}^n/\mathcal{J}^{n+1}$$

are isomorphisms for all $n \geq 0$.

Proof. It is clear that if $U \subset X$ is an open such that $\mathcal{J}|_U$ is generated by a quasi-regular sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$ then $\mathcal{J}|_U$ is of finite type, $\mathcal{J}|_U/\mathcal{J}^2|_U$ is free with basis f_1, \dots, f_r , and the maps in (3) are isomorphisms because they are coordinate free formulation of the degree n part of (30.12.0.4). Hence it is clear that being quasi-regular implies conditions (1), (2), and (3).

Conversely, suppose that (1), (2), and (3) hold. Pick a point $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$. Then there exists a neighbourhood $U \subset X$ of x such that $\mathcal{J}|_U/\mathcal{J}^2|_U$ is free of rank r over $\mathcal{O}_U/\mathcal{J}|_U$. After possibly shrinking U we may assume there exist $f_1, \dots, f_r \in \mathcal{J}(U)$ which map to a basis of $\mathcal{J}|_U/\mathcal{J}^2|_U$ as an $\mathcal{O}_U/\mathcal{J}|_U$ -module. In particular we see that the images of f_1, \dots, f_r in $\mathcal{J}_x/\mathcal{J}_x^2$ generate. Hence by Nakayama's lemma (Algebra, Lemma 10.19.1) we see that f_1, \dots, f_r generate the stalk \mathcal{J}_x . Hence, since \mathcal{J} is of finite type, by Modules, Lemma 17.9.4 after shrinking U we may assume that f_1, \dots, f_r generate \mathcal{J} . Finally, from (3) and the isomorphism $\mathcal{J}|_U/\mathcal{J}^2|_U = \bigoplus \mathcal{O}_U/\mathcal{J}|_U f_i$ it is clear that $f_1, \dots, f_r \in \mathcal{O}_X(U)$ is a quasi-regular sequence. □

Lemma 30.12.5. *Let (X, \mathcal{O}_X) be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals. Let $x \in X$ and $f_1, \dots, f_r \in \mathcal{J}_x$ whose images give a basis for the $\kappa(x)$ -vector space $\mathcal{J}_x/\mathfrak{m}_x \mathcal{J}_x$.*

- (1) If \mathcal{J} is quasi-regular, then there exists an open neighbourhood such that $f_1, \dots, f_r \in \mathcal{O}_X(U)$ form a quasi-regular sequence generating $\mathcal{J}|_U$.
- (2) If \mathcal{J} is H_1 -regular, then there exists an open neighbourhood such that $f_1, \dots, f_r \in \mathcal{O}_X(U)$ form an H_1 -regular sequence generating $\mathcal{J}|_U$.
- (3) If \mathcal{J} is Koszul-regular, then there exists an open neighbourhood such that $f_1, \dots, f_r \in \mathcal{O}_X(U)$ form an Koszul-regular sequence generating $\mathcal{J}|_U$.

Proof. First assume that \mathcal{J} is quasi-regular. We may choose an open neighbourhood $U \subset X$ of x and a quasi-regular sequence $g_1, \dots, g_s \in \mathcal{O}_X(U)$ which generates $\mathcal{J}|_U$. Note that this implies that $\mathcal{J}/\mathcal{J}^2$ is free of rank s over $\mathcal{O}_U/\mathcal{J}|_U$ (see Lemma 30.12.4 and its proof) and hence $r = s$. We may shrink U and assume $f_1, \dots, f_r \in \mathcal{J}(U)$. Thus we may write

$$f_i = \sum a_{ij} g_j$$

for some $a_{ij} \in \mathcal{O}_X(U)$. By assumption the matrix $A = (a_{ij})$ maps to an invertible matrix over $\kappa(x)$. Hence, after shrinking U once more, we may assume that (a_{ij}) is invertible. Thus we see that f_1, \dots, f_r give a basis for $(\mathcal{J}/\mathcal{J}^2)|_U$ which proves that f_1, \dots, f_r is a quasi-regular sequence over U .

Note that in order to prove (2) and (3) we may, because the assumptions of (2) and (3) are stronger than the assumption in (1), already assume that $f_1, \dots, f_r \in \mathcal{J}(U)$ and $f_i = \sum a_{ij} g_j$ with (a_{ij}) invertible as above, where now g_1, \dots, g_r is a H_1 -regular or Koszul-regular sequence. Since the Koszul complex on f_1, \dots, f_r is isomorphic to the Koszul complex on g_1, \dots, g_r via the matrix (a_{ij}) (see More on Algebra, Lemma 15.20.4) we conclude that f_1, \dots, f_r is H_1 -regular or Koszul-regular as desired. \square

Lemma 30.12.6. *Any regular, Koszul-regular, H_1 -regular, or quasi-regular sheaf of ideals on a scheme is a finite type quasi-coherent sheaf of ideals.*

Proof. This follows as such a sheaf of ideals is locally generated by finitely many sections. And any sheaf of ideals locally generated by sections on a scheme is quasi-coherent, see Schemes, Lemma 25.10.1. \square

Lemma 30.12.7. *Let X be a scheme. Let \mathcal{J} be a sheaf of ideals. Then \mathcal{J} is regular (resp. Koszul-regular, H_1 -regular, quasi-regular) if and only if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an affine open neighbourhood $x \in U \subset X$, $U = \text{Spec}(A)$ such that $\mathcal{J}|_U = \tilde{I}$ and such that I is generated by a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) sequence $f_1, \dots, f_r \in A$.*

Proof. By assumption we can find an open neighbourhood U of x over which \mathcal{J} is generated by a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) sequence $f_1, \dots, f_r \in \mathcal{O}_X(U)$. After shrinking U we may assume that U is affine, say $U = \text{Spec}(A)$. Since \mathcal{J} is quasi-coherent by Lemma 30.12.6 we see that $\mathcal{J}|_U = \tilde{I}$ for some ideal $I \subset A$. Now we can use the fact that

$$\sim: \text{Mod}_A \longrightarrow \text{QCoh}(\mathcal{O}_U)$$

is an equivalence of categories which preserves exactness. For example the fact that the functions f_i generate \mathcal{J} means that the f_i , seen as elements of A generate I . The fact that (30.12.0.2) is injective (resp. (30.12.0.3) is exact, (30.12.0.3) is exact in degree 1, (30.12.0.4) is an isomorphism) implies the corresponding property of the map $A/(f_1, \dots, f_{i-1}) \rightarrow A/(f_1, \dots, f_{i-1})$ (resp. the complex $K_\bullet(A, f_1, \dots, f_r)$,

the map $A/I[T_1, \dots, T_r] \rightarrow \bigoplus I^n/I^{n+1}$. Thus $f_1, \dots, f_r \in A$ is a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) sequence of the ring A . \square

Lemma 30.12.8. *Let X be a locally Noetherian scheme. Let $\mathcal{J} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let x be a point of the support of $\mathcal{O}_X/\mathcal{J}$. The following are equivalent*

- (1) \mathcal{J}_x is generated by a regular sequence in $\mathcal{O}_{X,x}$,
- (2) \mathcal{J}_x is generated by a Koszul-regular sequence in $\mathcal{O}_{X,x}$,
- (3) \mathcal{J}_x is generated by an H_1 -regular sequence in $\mathcal{O}_{X,x}$,
- (4) \mathcal{J}_x is generated by a quasi-regular sequence in $\mathcal{O}_{X,x}$,
- (5) there exists an affine neighbourhood $U = \text{Spec}(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a regular sequence in A , and
- (6) there exists an affine neighbourhood $U = \text{Spec}(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a Koszul-regular sequence in A , and
- (7) there exists an affine neighbourhood $U = \text{Spec}(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by an H_1 -regular sequence in A , and
- (8) there exists an affine neighbourhood $U = \text{Spec}(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a quasi-regular sequence in A ,
- (9) there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is regular, and
- (10) there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is Koszul-regular, and
- (11) there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is H_1 -regular, and
- (12) there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is quasi-regular.

In particular, on a locally Noetherian scheme the notions of regular, Koszul-regular, H_1 -regular, or quasi-regular ideal sheaf all agree.

Proof. It follows from Lemma 30.12.7 that (5) \Leftrightarrow (9), (6) \Leftrightarrow (10), (7) \Leftrightarrow (11), and (8) \Leftrightarrow (12). It is clear that (5) \Rightarrow (1), (6) \Rightarrow (2), (7) \Rightarrow (3), and (8) \Rightarrow (4). We have (1) \Rightarrow (5) by Algebra, Lemma 10.67.8. We have (9) \Rightarrow (10) \Rightarrow (11) \Rightarrow (12) by Lemma 30.12.3. Finally, (4) \Rightarrow (1) by Algebra, Lemma 10.68.6. Now all 12 statements are equivalent. \square

30.13. Regular immersions

Let $i : Z \rightarrow X$ be an immersion of schemes. By definition this means there exists an open subscheme $U \subset X$ such that Z is identified with a closed subscheme of U . Let $\mathcal{I} \subset \mathcal{O}_U$ be the corresponding quasi-coherent sheaf of ideals. Suppose $U' \subset X$ is a second such open subscheme, and denote $\mathcal{I}' \subset \mathcal{O}_{U'}$ the corresponding quasi-coherent sheaf of ideals. Then $\mathcal{I}|_{U \cap U'} = \mathcal{I}'|_{U \cap U'}$. Moreover, the support of $\mathcal{O}_U/\mathcal{I}$ is Z which is contained in $U \cap U'$ and is also the support of $\mathcal{O}_{U'}/\mathcal{I}'$. Hence it follows from Definition 30.12.2 that \mathcal{I} is a regular ideal if and only if \mathcal{I}' is a regular ideal. Similarly for being Koszul-regular, H_1 -regular, or quasi-regular.

Definition 30.13.1. Let $i : Z \rightarrow X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme of U and denote $\mathcal{I} \subset \mathcal{O}_U$ the corresponding quasi-coherent sheaf of ideals.

- (1) We say i is a *regular immersion* if \mathcal{I} is regular.
- (2) We say i is a *Koszul-regular immersion* if \mathcal{I} is Koszul-regular.
- (3) We say i is a *H_1 -regular immersion* if \mathcal{I} is H_1 -regular.
- (4) We say i is a *quasi-regular immersion* if \mathcal{I} is quasi-regular.

The discussion above shows that this is independent of the choice of U . The conditions are listed in decreasing order of strength, see Lemma 30.13.2. A Koszul-regular closed immersion is smooth locally a regular immersion, see Lemma 30.13.11. In the locally Noetherian case all four notions agree, see Lemma 30.12.8.

Lemma 30.13.2. *Let $i : Z \rightarrow X$ be an immersion of schemes. We have the following implications: i is regular $\Rightarrow i$ is Koszul-regular $\Rightarrow i$ is H_1 -regular $\Rightarrow i$ is quasi-regular.*

Proof. The lemma immediately reduces to Lemma 30.12.3. \square

Lemma 30.13.3. *Let $i : Z \rightarrow X$ be an immersion of schemes. Assume X is locally Noetherian. Then i is regular $\Leftrightarrow i$ is Koszul-regular $\Leftrightarrow i$ is H_1 -regular $\Leftrightarrow i$ is quasi-regular.*

Proof. Follows immediately from Lemma 30.13.2 and Lemma 30.12.8. \square

Lemma 30.13.4. *Let $i : Z \rightarrow X$ be a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) immersion. Let $X' \rightarrow X$ be a flat morphism. Then the base change $i' : Z \times_X X' \rightarrow X'$ is a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) immersion.*

Proof. Via Lemma 30.12.7 this translates into the algebraic statements in Algebra, Lemmas 10.67.7 and 10.68.3 and More on Algebra, Lemma 15.21.4. \square

Lemma 30.13.5. *Let $i : Z \rightarrow X$ be an immersion of schemes. Then i is a quasi-regular immersion if and only if the following conditions are satisfied*

- (1) i is locally of finite presentation,
- (2) the conormal sheaf $\mathcal{C}_{Z/X}$ is finite locally free, and
- (3) the map (30.11.1.2) is an isomorphism.

Proof. An open immersion is locally of finite presentation. Hence we may replace X by an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme of U , i.e., we may assume that i is a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Recall, see Morphisms, Lemma 28.22.7 that \mathcal{I} is of finite type if and only if i is locally of finite presentation. Hence the equivalence follows from Lemma 30.12.4 and unwinding the definitions. \square

Lemma 30.13.6. *Let $Z \rightarrow Y \rightarrow X$ be immersions of schemes. Assume that $Z \rightarrow Y$ is H_1 -regular. Then the canonical sequence of Morphisms, Lemma 28.33.5*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

is exact and locally split.

Proof. Since $\mathcal{C}_{Z/Y}$ is finite locally free (see Lemma 30.13.5 and Lemma 30.12.3) it suffices to prove that the sequence is exact. By what was proven in Morphisms, Lemma 28.33.5 it suffices to show that the first map is injective. Working affine locally this reduces to the following question: Suppose that we have a ring A and ideals $I \subset J \subset A$. Assume that $J/I \subset A/I$ is generated by an H_1 -regular sequence. Does this imply that $I/I^2 \otimes_A A/J \rightarrow J/J^2$ is injective? Note that $I/I^2 \otimes_A A/J = I/IJ$. Hence we are trying to prove that $I \cap J^2 = IJ$. This is the result of More on Algebra, Lemma 15.21.8. \square

A composition of quasi-regular immersions may not be quasi-regular, see Algebra, Remark 10.68.8. The other types of regular immersions are preserved under composition.

Lemma 30.13.7. *Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of schemes.*

- (1) *If i and j are regular immersions, so is $j \circ i$.*
- (2) *If i and j are Koszul-regular immersions, so is $j \circ i$.*
- (3) *If i and j are H_1 -regular immersions, so is $j \circ i$.*
- (4) *If i is an H_1 -regular immersion and j is a quasi-regular immersion, then $j \circ i$ is a quasi-regular immersion.*

Proof. The algebraic version of (1) is Algebra, Lemma 10.67.9. The algebraic version of (2) is More on Algebra, Lemma 15.21.12. The algebraic version of (3) is More on Algebra, Lemma 15.21.10. The algebraic version of (4) is More on Algebra, Lemma 15.21.9. \square

Lemma 30.13.8. *Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of schemes. Assume that the sequence*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

of Morphisms, Lemma 28.33.5 is exact and locally split.

- (1) *If $j \circ i$ is a quasi-regular immersion, so is i .*
- (2) *If $j \circ i$ is a H_1 -regular immersion, so is i .*
- (3) *If both j and $j \circ i$ are Koszul-regular immersions, so is i .*

Proof. After shrinking Y and X we may assume that i and j are closed immersions. Denote $\mathcal{I} \subset \mathcal{O}_X$ the ideal sheaf of Y and $\mathcal{J} \subset \mathcal{O}_X$ the ideal sheaf of Z . The conormal sequence is $0 \rightarrow \mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{J}/\mathcal{J}^2 \rightarrow \mathcal{J}/(\mathcal{I} + \mathcal{J}^2) \rightarrow 0$. Let $z \in Z$ and set $y = i(z)$, $x = j(y) = j(i(z))$. Choose $f_1, \dots, f_n \in \mathcal{I}_x$ which map to a basis of $\mathcal{I}_x/\mathfrak{m}_z \mathcal{I}_x$. Extend this to $f_1, \dots, f_n, g_1, \dots, g_m \in \mathcal{J}_x$ which map to a basis of $\mathcal{J}_x/\mathfrak{m}_z \mathcal{J}_x$. This is possible as we have assumed that the sequence of conormal sheaves is split in a neighbourhood of z , hence $\mathcal{I}_x/\mathfrak{m}_z \mathcal{I}_x \rightarrow \mathcal{J}_x/\mathfrak{m}_z \mathcal{J}_x$ is injective.

Proof of (1). By Lemma 30.12.5 we can find an affine open neighbourhood U of x such that $f_1, \dots, f_n, g_1, \dots, g_m$ forms a quasi-regular sequence generating \mathcal{J} . Hence by Algebra, Lemma 10.68.5 we see that g_1, \dots, g_m induces a quasi-regular sequence on $Y \cap U$ cutting out Z .

Proof of (2). Exactly the same as the proof of (1) except using More on Algebra, Lemma 15.21.11.

Proof of (3). By Lemma 30.12.5 (applied twice) we can find an affine open neighbourhood U of x such that f_1, \dots, f_n forms a Koszul-regular sequence generating \mathcal{I} and $f_1, \dots, f_n, g_1, \dots, g_m$ forms a Koszul-regular sequence generating \mathcal{J} . Hence by More on Algebra, Lemma 15.21.13 we see that g_1, \dots, g_m induces a Koszul-regular sequence on $Y \cap U$ cutting out Z . \square

Lemma 30.13.9. *Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of schemes. Pick $z \in Z$ and denote $y \in Y$, $x \in X$ the corresponding points. Assume X is locally Noetherian. The following are equivalent*

- (1) *i is a regular immersion in a neighbourhood of z and j is a regular immersion in a neighbourhood of y ,*
- (2) *i and $j \circ i$ are regular immersions in a neighbourhood of z ,*

(3) $j \circ i$ is a regular immersion in a neighbourhood of z and the conormal sequence

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

is split exact in a neighbourhood of z .

Proof. Since X (and hence Y) is locally Noetherian all 4 types of regular immersions agree, and moreover we may check whether a morphism is a regular immersion on the level of local rings, see Lemma 30.12.8. The implication (1) \Rightarrow (2) is Lemma 30.13.7. The implication (2) \Rightarrow (3) is Lemma 30.13.6. Thus it suffices to prove that (3) implies (1).

Assume (3). Set $A = \mathcal{O}_{X,x}$. Denote $I \subset A$ the kernel of the surjective map $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{Y,y}$ and denote $J \subset A$ the kernel of the surjective map $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{Z,z}$. Note that any minimal sequence of elements generating J in A is a quasi-regular hence regular sequence, see Lemma 30.12.5. By assumption the conormal sequence

$$0 \rightarrow I/IJ \rightarrow J/J^2 \rightarrow J/(I + J^2) \rightarrow 0$$

is split exact as a sequence of A/J -modules. Hence we can pick a minimal system of generators $f_1, \dots, f_n, g_1, \dots, g_m$ of J with $f_1, \dots, f_n \in I$ a minimal system of generators of I . As pointed out above $f_1, \dots, f_n, g_1, \dots, g_m$ is a regular sequence in A . It follows directly from the definition of a regular sequence that f_1, \dots, f_n is a regular sequence in A and $\bar{g}_1, \dots, \bar{g}_m$ is a regular sequence in A/I . Thus j is a regular immersion at y and i is a regular immersion at z . \square

Remark 30.13.10. In the situation of Lemma 30.13.9 parts (1), (2), (3) are **not** equivalent to “ $j \circ i$ and j are regular immersions at z and y ”. An example is $X = \mathbf{A}_k^1 = \text{Spec}(k[x])$, $Y = \text{Spec}(k[x]/(x^2))$ and $Z = \text{Spec}(k[x]/(x))$.

Lemma 30.13.11. *Let $i : Z \rightarrow X$ be a Koszul regular closed immersion. Then there exists a surjective smooth morphism $X' \rightarrow X$ such that the base change $i' : Z \times_X X' \rightarrow X'$ of i is a regular immersion.*

Proof. We may assume that X is affine and the ideal of Z generated by a Koszul-regular sequence by replacing X by the members of a suitable affine open covering (affine opens as in Lemma 30.12.7). The affine case is More on Algebra, Lemma 15.21.17. \square

30.14. Relative regular immersions

In this section we consider the base change property for regular immersions. The following lemma does not hold for regular immersions or for Koszul immersions, see Examples, Lemma 82.13.2.

Lemma 30.14.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $i : Z \subset X$ be an immersion. Assume*

- (1) i is an H_1 -regular (resp. quasi-regular) immersion, and
- (2) $Z \rightarrow S$ is a flat morphism.

Then for every morphism of schemes $g : S' \rightarrow S$ the base change $Z' = S' \times_S Z \rightarrow X' = S' \times_S X$ is an H_1 -regular (resp. quasi-regular) immersion.

Proof. Unwinding the definitions and using Lemma 30.12.7 we translate this into algebra as follows. Let $A \rightarrow B$ be a ring map and $f_1, \dots, f_r \in B$. Assume $B/(f_1, \dots, f_r)B$ is flat over A . Consider a ring map $A \rightarrow A'$. Set $B' = B \otimes_A A'$ and $J' = JB'$.

Case I: f_1, \dots, f_r is quasi-regular. Set $J = (f_1, \dots, f_r)$. By assumption J^n/J^{n+1} is isomorphic to a direct sum of copies of B/J hence flat over A . By induction and Algebra, Lemma 10.38.12 we conclude that B/J^n is flat over A . The ideal $(J')^n$ is equal to $J^n \otimes_A A'$, see Algebra, Lemma 10.38.11. Hence $(J')^n/(J')^{n+1} = J^n/J^{n+1} \otimes_A A'$ which clearly implies that f_1, \dots, f_r is a quasi-regular sequence in B' .

Case II: f_1, \dots, f_r is H_1 -regular. By More on Algebra, Lemma 15.21.15 the vanishing of the Koszul homology group $H_1(K_\bullet(B, f_1, \dots, f_r))$ implies the vanishing of $H_1(K_\bullet(B', f'_1, \dots, f'_r))$ and we win. \square

This lemma is the motivation for the following definition.

Definition 30.14.2. Let $f : X \rightarrow S$ be a morphism of schemes. Let $i : Z \rightarrow X$ be an immersion.

- (1) We say i is a *relative quasi-regular immersion* if $Z \rightarrow S$ is flat and i is a quasi-regular immersion.
- (2) We say i is a *relative H_1 -regular immersion* if $Z \rightarrow S$ is flat and i is an H_1 -regular immersion.

We warn the reader that this may be nonstandard notation. Lemma 30.14.1 guarantees that relative quasi-regular (resp. H_1 -regular) immersions are preserved under any base change. A relative H_1 -regular immersion is a relative quasi-regular immersion, see Lemma 30.13.2. Please take a look at Lemma 30.14.5 (or Lemma 30.14.4) which shows that if $Z \rightarrow X$ is a relative H_1 -regular (or quasi-regular) immersion and the ambient scheme is (flat and) locally of finite presentation over S , then $Z \rightarrow X$ is actually a regular immersion and the same remains true after any base change.

Lemma 30.14.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be a relative quasi-regular immersion. If $x \in Z$ and $\mathcal{O}_{X,x}$ is Noetherian, then f is flat at x .*

Proof. Let $f_1, \dots, f_r \in \mathcal{O}_{X,x}$ be a quasi-regular sequence cutting out the ideal of Z at x . By Algebra, Lemma 10.68.6 we know that f_1, \dots, f_r is a regular sequence. Hence f_r is a nonzerodivisor on $\mathcal{O}_{X,x}/(f_1, \dots, f_{r-1})$ such that the quotient is a flat $\mathcal{O}_{S,f(x)}$ -module. By Lemma 30.10.3 we conclude that $\mathcal{O}_{X,x}/(f_1, \dots, f_{r-1})$ is a flat $\mathcal{O}_{S,f(x)}$ -module. Continuing by induction we find that $\mathcal{O}_{X,x}$ is a flat $\mathcal{O}_{S,s}$ -module. \square

Lemma 30.14.4. *Let $X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be an immersion. Assume*

- (1) $X \rightarrow S$ is flat and locally of finite presentation,
- (2) $Z \rightarrow X$ is a relative quasi-regular immersion.

Then $Z \rightarrow X$ is a regular immersion and the same remains true after any base change.

Proof. Pick $x \in Z$ with image $s \in S$. To prove this it suffices to find an affine neighbourhood of x contained in U such that the result holds on that affine open. Hence we may assume that X is affine and there exist a quasi-regular sequence $f_1, \dots, f_r \in \Gamma(X, \mathcal{O}_X)$ such that $Z = V(f_1, \dots, f_r)$. By Lemma 30.14.1 and its proof the sequence $f_1|_{X_s}, \dots, f_r|_{X_s}$ is a quasi-regular sequence in $\Gamma(X_s, \mathcal{O}_{X_s})$. Since X_s is Noetherian, this implies, possibly after shrinking X a bit, that $f_1|_{X_s}, \dots, f_r|_{X_s}$ is a regular sequence, see Algebra, Lemmas 10.68.6 and 10.67.8. By Lemma 30.10.7 it follows that $Z_1 = V(f_1) \subset X$ is a relative effective Cartier divisor, again after possibly shrinking X a bit. Applying the same lemma again, but now to $Z_2 = V(f_1, f_2) \subset Z_1$ we see that $Z_2 \subset Z_1$ is a relative effective Cartier divisor. And so on until one reaches $Z = Z_n = V(f_1, \dots, f_n)$. Since being a relative effective Cartier divisor is preserved under arbitrary base change, see Lemma 30.10.1, we also see that the final statement of the lemma holds. \square

Lemma 30.14.5. *Let $X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be a relative H_1 -regular immersion. Assume $X \rightarrow S$ is locally of finite presentation. Then*

- (1) *there exists an open subscheme $U \subset X$ such that $Z \subset U$ and such that $U \rightarrow S$ is flat, and*
- (2) *$Z \rightarrow X$ is a regular immersion and the same remains true after any base change.*

Proof. Pick $x \in Z$. To prove (1) suffices to find an open neighbourhood $U \subset X$ of x such that $U \rightarrow S$ is flat. Hence the lemma reduces to the case that $X = \text{Spec}(B)$ and $S = \text{Spec}(A)$ are affine and that Z is given by an H_1 -regular sequence $f_1, \dots, f_r \in B$. By assumption B is a finitely presented A -algebra and $B/(f_1, \dots, f_r)B$ is a flat A -algebra. We are going to use absolute Noetherian approximation.

Write $B = A[x_1, \dots, x_n]/(g_1, \dots, g_m)$. Assume f_i is the image of $f'_i \in A[x_1, \dots, x_n]$. Choose a finite type \mathbf{Z} -subalgebra $A_0 \subset A$ such that all the coefficients of the polynomials $f'_1, \dots, f'_r, g_1, \dots, g_m$ are in A_0 . We set $B_0 = A_0[x_1, \dots, x_n]/(g_1, \dots, g_m)$ and we denote $f_{i,0}$ the image of f'_i in B_0 . Then $B = B_0 \otimes_{A_0} A$ and

$$B/(f_1, \dots, f_r) = B_0/(f_{0,1}, \dots, f_{0,r}) \otimes_{A_0} A.$$

By Algebra, Lemma 10.156.1 we may, after enlarging A_0 , assume that $B_0/(f_{0,1}, \dots, f_{0,r})$ is flat over A_0 . It may not be the case at this point that the Koszul cohomology group $H_1(K_\bullet(B_0, f_{0,1}, \dots, f_{0,r}))$ is zero. On the other hand, as B_0 is Noetherian, it is a finitely generated B_0 -module. Let $\xi_1, \dots, \xi_n \in H_1(K_\bullet(B_0, f_{0,1}, \dots, f_{0,r}))$ be generators. Let $A_0 \subset A_1 \subset A$ be a larger finite type \mathbf{Z} -subalgebra of A . Denote $f_{1,i}$ the image of $f_{0,i}$ in $B_1 = B_0 \otimes_{A_0} A_1$. By More on Algebra, Lemma 15.21.15 the map

$$H_1(K_\bullet(B_0, f_{0,1}, \dots, f_{0,r})) \otimes_{A_0} A_1 \longrightarrow H_1(K_\bullet(B_1, f_{1,1}, \dots, f_{1,r}))$$

is surjective. Furthermore, it is clear that the colimit (over all choices of A_1 as above) of the complexes $K_\bullet(B_1, f_{1,1}, \dots, f_{1,r})$ is the complex $K_\bullet(B, f_1, \dots, f_r)$ which is acyclic in degree 1. Hence

$$\text{colim}_{A_0 \subset A_1 \subset A} H_1(K_\bullet(B_1, f_{1,1}, \dots, f_{1,r})) = 0$$

by Algebra, Lemma 10.8.9. Thus we can find a choice of A_1 such that ξ_1, \dots, ξ_n all map to zero in $H_1(K_\bullet(B_1, f_{1,1}, \dots, f_{1,r}))$. In other words, the Koszul cohomology group $H_1(K_\bullet(B_1, f_{1,1}, \dots, f_{1,r}))$ is zero.

Consider the morphism of affine schemes $X_1 \rightarrow S_1$ equal to Spec of the ring map $A_1 \rightarrow B_1$ and $Z_1 = \text{Spec}(B_1/(f_{1,1}, \dots, f_{1,r}))$. Since $B = B_1 \otimes_{A_1} A$, i.e., $X = X_1 \times_{S_1} S$, and similarly $Z = Z_1 \times_S S_1$, it now suffices to prove (1) for $X_1 \rightarrow S_1$ and the relative H_1 -regular immersion $Z_1 \rightarrow X_1$, see Morphisms, Lemma 28.26.6. Hence we have reduced to the case where $X \rightarrow S$ is a finite type morphism of Noetherian schemes. In this case we know that $X \rightarrow S$ is flat at every point of Z by Lemma 30.14.3. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 10.125.4 we see that (1) holds. Part (2) then follows from an application of Lemma 30.14.4. \square

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative quasi-regular immersion in terms of its fibres.

Lemma 30.14.6. *Let $\varphi : X \rightarrow S$ be a flat morphism which is locally of finite presentation. Let $T \subset X$ be a closed subscheme. Let $x \in T$ with image $s \in S$.*

- (1) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x , then there exists an open $U \subset X$ and a relative quasi-regular immersion $Z \subset U$ such that $Z_s = T_s \cap U_s$ and $T \cap U \subset Z$.*
- (2) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x , the morphism $T \rightarrow X$ is of finite presentation, and $T \rightarrow S$ is flat at x , then we can choose U and Z as in (1) such that $T \cap U = Z$.*
- (3) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x , and T is cut out by c equations in a neighbourhood of x , where $c = \dim_x(X_s) - \dim_x(T_s)$, then we can choose U and Z as in (1) such that $T \cap U = Z$.*

In each case $Z \rightarrow U$ is a regular immersion by Lemma 30.14.4. In particular, if $T \rightarrow S$ is locally of finite presentation and flat and all fibres $T_s \subset X_s$ are quasi-regular immersions, then $T \rightarrow X$ is a relative quasi-regular immersion.

Proof. Choose affine open neighbourhoods $\text{Spec}(A)$ of s and $\text{Spec}(B)$ of x such that $\varphi(\text{Spec}(B)) \subset \text{Spec}(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s . Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x . Let $I \subset B$ be the ideal corresponding to T . By the initial assumption of the lemma we know that $A \rightarrow B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $\text{Spec}(B)$, we may assume $I(B \otimes_A \kappa(\mathfrak{p}))$ is generated by a quasi-regular sequence of elements. After possibly localizing B at some $g \in B$, $g \notin \mathfrak{q}$ we may assume there exist $f_1, \dots, f_r \in I$ which map to a quasi-regular sequence in $B \otimes_A \kappa(\mathfrak{p})$ which generates $I(B \otimes_A \kappa(\mathfrak{p}))$. By Algebra, Lemmas 10.68.6 and 10.67.8 we may assume after another localization that $f_1, \dots, f_r \in I$ form a regular sequence in $B \otimes_A \kappa(\mathfrak{p})$. By Lemma 30.10.7 it follows that $Z_1 = V(f_1) \subset \text{Spec}(B)$ is a relative effective Cartier divisor, again after possibly localizing B . Applying the same lemma again, but now to $Z_2 = V(f_1, f_2) \subset Z_1$ we see that $Z_2 \subset Z_1$ is a relative effective Cartier divisor. And so on until one reaches $Z = Z_n = V(f_1, \dots, f_n)$. Then $Z \rightarrow \text{Spec}(B)$ is a regular immersion and Z is flat over S , in particular $Z \rightarrow \text{Spec}(B)$ is a relative quasi-regular immersion over $\text{Spec}(A)$. This proves (1).

To see (2) consider the closed immersion $Z \rightarrow D$. The surjective ring map $u : \mathcal{O}_{D,x} \rightarrow \mathcal{O}_{Z,x}$ is a map of flat local $\mathcal{O}_{S,s}$ -algebras which are essentially of finite presentation, and which becomes an isomorphism after dividing by \mathfrak{m}_s . Hence it is an isomorphism, see Algebra, Lemma 10.124.4. It follows that $Z \rightarrow D$ is an isomorphism in a neighbourhood of x , see Algebra, Lemma 10.122.6.

To see (3), after possibly shrinking U we may assume that the ideal of Z is generated by a regular sequence f_1, \dots, f_r (see our construction of Z above) and the ideal of T is generated by g_1, \dots, g_c . We claim that $c = r$. Namely,

$$\begin{aligned} \dim_x(X_s) &= \dim(\mathcal{O}_{X_s, x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim_x(T_s) &= \dim(\mathcal{O}_{T_s, x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim(\mathcal{O}_{X_s, x}) &= \dim(\mathcal{O}_{T_s, x}) + r \end{aligned}$$

the first two equalities by Algebra, Lemma 10.112.3 and the second by r times applying Algebra, Lemma 10.59.11. As $T \subset Z$ we see that $f_i = \sum b_{ij}g_j$. But the ideals of Z and T cut out the same quasi-regular closed subscheme of X_s in a neighbourhood of x . Hence the matrix $(b_{ij}) \bmod \mathfrak{m}_x$ is invertible (some details omitted). Hence (b_{ij}) is invertible in an open neighbourhood of x . In other words, $T \cap U = Z$ after shrinking U .

The final statements of the lemma follow immediately from part (2), combined with the fact that $Z \rightarrow S$ is locally of finite presentation if and only if $Z \rightarrow X$ is of finite presentation, see Morphisms, Lemmas 28.22.3 and 28.22.11. \square

The following lemma is an enhancement of Morphisms, Lemma 28.35.20.

Lemma 30.14.7. *Let $f : X \rightarrow S$ be a smooth morphism of schemes. Let $\sigma : S \rightarrow X$ be a section of f . Then σ is a regular immersion.*

Proof. By Schemes, Lemma 25.21.11 the morphism σ is an immersion. After replacing X by an open neighbourhood of $\sigma(S)$ we may assume that σ is a closed immersion. Let $T = \sigma(S)$ be the corresponding closed subscheme of X . Since $T \rightarrow S$ is an isomorphism it is flat and of finite presentation. Also a smooth morphism is flat and locally of finite presentation, see Morphisms, Lemmas 28.35.9 and 28.35.8. Thus, according to Lemma 30.14.6, it suffices to show that $T_s \subset X_s$ is a quasi-regular closed subscheme. This follows immediately from Morphisms, Lemma 28.35.20 but we can also see it directly as follows. Let k be a field and let A be a smooth k -algebra. Let $\mathfrak{m} \subset A$ be a maximal ideal whose residue field is k . Then \mathfrak{m} is generated by a quasi-regular sequence, possibly after replacing A by A_g for some $g \in A, g \notin \mathfrak{m}$. In Algebra, Lemma 10.135.3 we proved that $A_{\mathfrak{m}}$ is a regular local ring, hence $\mathfrak{m}A_{\mathfrak{m}}$ is generated by a regular sequence. This does indeed imply that \mathfrak{m} is generated by a regular sequence (after replacing A by A_g for some $g \in A, g \notin \mathfrak{m}$), see Algebra, Lemma 10.67.8. \square

The following lemma has a kind of converse, see Lemma 30.14.11.

Lemma 30.14.8. *Let*

be a commutative diagram of morphisms of schemes. Assume $X \rightarrow S$ smooth, and i, j immersions. If j is a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) immersion, then so is i .

Proof. We can write i as the composition

$$Y \rightarrow Y \times_S X \rightarrow X$$

By Lemma 30.14.7 the first arrow is a regular immersion. The second arrow is a flat base change of $Y \rightarrow S$, hence is a regular (resp. Koszul-regular, H_1 -regular, quasi-regular) immersion, see Lemma 30.13.4. We conclude by an application of Lemma 30.13.7. \square

Lemma 30.14.9. *Let*

$$\begin{array}{ccc} Y & \xrightarrow{\quad i \quad} & X \\ & \searrow & \swarrow \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that $Y \rightarrow S$ is syntomic, $X \rightarrow S$ smooth, and i an immersion. Then i is a regular immersion.

Proof. After replacing X by an open neighbourhood of $i(Y)$ we may assume that i is a closed immersion. Let $T = i(Y)$ be the corresponding closed subscheme of X . Since $T \cong Y$ the morphism $T \rightarrow S$ is flat and of finite presentation (Morphisms, Lemmas 28.32.6 and 28.32.7). Also a smooth morphism is flat and locally of finite presentation (Morphisms, Lemmas 28.35.9 and 28.35.8). Thus, according to Lemma 30.14.6, it suffices to show that $T_s \subset X_s$ is a quasi-regular closed subscheme. As X_s is locally of finite type over a field, it is Noetherian (Morphisms, Lemma 28.16.6). Thus we can check that $T_s \subset X_s$ is a quasi-regular immersion at points, see Lemma 30.12.8. Take $t \in T_s$. By Morphisms, Lemma 28.32.9 the local ring $\mathcal{O}_{T_s,t}$ is a local complete intersection over $\kappa(s)$. The local ring $\mathcal{O}_{X_s,t}$ is regular, see Algebra, Lemma 10.135.3. By Algebra, Lemma 10.130.7 we see that the kernel of the surjection $\mathcal{O}_{X_s,t} \rightarrow \mathcal{O}_{T_s,t}$ is generated by a regular sequence, which is what we had to show. \square

Lemma 30.14.10. *Let*

$$\begin{array}{ccc} Y & \xrightarrow{\quad i \quad} & X \\ & \searrow & \swarrow \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that $Y \rightarrow S$ is smooth, $X \rightarrow S$ smooth, and i an immersion. Then i is a regular immersion.

Proof. This is a special case of Lemma 30.14.9 because a smooth morphism is syntomic, see Morphisms, Lemma 28.35.7. \square

Lemma 30.14.11. *Let*

$$\begin{array}{ccc} Y & \xrightarrow{\quad i \quad} & X \\ & \searrow j & \swarrow \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume $X \rightarrow S$ smooth, and i, j immersions. If i is a Koszul-regular (resp. H_1 -regular, quasi-regular) immersion, then so is j .

Proof. Let $y \in Y$ be any point. Set $x = i(y)$ and set $s = j(y)$. It suffices to prove the result after replacing X, S by open neighbourhoods U, V of x, s and Y by an open neighbourhood of y in $i^{-1}(U) \cap j^{-1}(V)$. Hence we may assume that Y, X and S are affine. In this case we can choose a closed immersion $h : X \rightarrow \mathbf{A}_S^n$ over S for some n . Note that h is a regular immersion by Lemma 30.14.10. Hence $h \circ i$ is

a Koszul-regular (resp. H_1 -regular, quasi-regular) immersion, see Lemmas 30.13.7 and 30.13.2. In this way we reduce to the case $X = \mathbf{A}_S^n$ and S affine.

After replacing S by an affine open V and replacing Y by $j^{-1}(V)$ we may assume that i is a closed immersion and S affine. Write $S = \text{Spec}(A)$. Then $j : Y \rightarrow S$ defines an isomorphism of Y to the closed subscheme $\text{Spec}(A/I)$ for some ideal $I \subset A$. The map $i : Y = \text{Spec}(A/I) \rightarrow \mathbf{A}_S^n = \text{Spec}(A[x_1, \dots, x_n])$ corresponds to an A -algebra homomorphism $i^\# : A[x_1, \dots, x_n] \rightarrow A/I$. Choose $a_i \in A$ which map to $i^\#(x_i)$ in A/I . Observe that the ideal of the closed immersion i is

$$J = (x_1 - a_1, \dots, x_n - a_n) + IA[x_1, \dots, x_n].$$

Set $K = (x_1 - a_1, \dots, x_n - a_n)$. We claim the sequence

$$0 \rightarrow K/KJ \rightarrow J/J^2 \rightarrow J/(K + J^2) \rightarrow 0$$

is split exact. To see this note that K/K^2 is free with basis $x_i - a_i$ over the ring $A[x_1, \dots, x_n]/K \cong A$. Hence K/KJ is free with the same basis over the ring $A[x_1, \dots, x_n]/J \cong A/I$. On the other hand, taking derivatives gives a map

$$d_{A[x_1, \dots, x_n]/A} : J/J^2 \longrightarrow \Omega_{A[x_1, \dots, x_n]/A} \otimes_{A[x_1, \dots, x_n]} A[x_1, \dots, x_n]/J$$

which maps the generators $x_i - a_i$ to the basis elements dx_i of the free module on the right. The claim follows. Moreover, note that $x_1 - a_1, \dots, x_n - a_n$ is a regular sequence in $A[x_1, \dots, x_n]$ with quotient ring $A[x_1, \dots, x_n]/(x_1 - a_1, \dots, x_n - a_n) \cong A$. Thus we have a factorization

$$Y \rightarrow V(x_1 - a_1, \dots, x_n - a_n) \rightarrow \mathbf{A}_S^n$$

of our closed immersion i where the composition is Koszul-regular (resp. H_1 -regular, quasi-regular), the second arrow is a regular immersion, and the associated conormal sequence is split. Now the result follows from Lemma 30.13.8. \square

30.15. Meromorphic functions and sections

See [Kle79] for some possible pitfalls¹.

Let (X, \mathcal{O}_X) be a locally ringed space. For any open $U \subset X$ we have defined the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ of regular sections of \mathcal{O}_X over U , see Definition 30.9.16. The restriction of a regular section to a smaller open is regular. Hence $\mathcal{S} : U \mapsto \mathcal{S}(U)$ is a subsheaf (of sets) of \mathcal{O}_X . We sometimes denote $\mathcal{S} = \mathcal{S}_X$ if we want to indicate the dependence on X . Moreover, $\mathcal{S}(U)$ is a multiplicative subset of the ring $\mathcal{O}_X(U)$ for each U . Hence we may consider the presheaf of rings

$$U \mapsto \mathcal{S}(U)^{-1}\mathcal{O}_X(U),$$

see Modules, Lemma 17.22.1.

Definition 30.15.1. Let (X, \mathcal{O}_X) be a locally ringed space. The *sheaf of meromorphic functions on X* is the sheaf \mathcal{K}_X associated to the presheaf displayed above. A *meromorphic function* on X is a global section of \mathcal{K}_X .

Since each element of each $\mathcal{S}(U)$ is a nonzerodivisor on $\mathcal{O}_X(U)$ we see that the natural map of sheaves of rings $\mathcal{O}_X \rightarrow \mathcal{K}_X$ is injective.

¹Danger, Will Robinson!

Example 30.15.2. Let $A = \mathbf{C}[x, \{y_\alpha\}_{\alpha \in \mathbf{C}}] / ((x - \alpha)y_\alpha, y_\alpha y_\beta)$. Any element of A can be written uniquely as $f(x) + \sum \lambda_\alpha y_\alpha$ with $f(x) \in \mathbf{C}[x]$ and $\lambda_\alpha \in \mathbf{C}$. Let $X = \text{Spec}(A)$. In this case $\mathcal{O}_X = \mathcal{K}_X$, since on any affine open $D(f)$ the ring A_f any nonzerodivisor is a unit (proof omitted).

Definition 30.15.3. Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of locally ringed spaces. We say that *pullbacks of meromorphic functions are defined for f* if for every pair of open $U \subset X, V \subset Y$ such that $f(U) \subset V$, and any section $s \in \Gamma(V, \mathcal{S}_Y)$ the pullback $f^\sharp(s) \in \Gamma(U, \mathcal{O}_X)$ is an element of $\Gamma(U, \mathcal{S}_X)$.

In this case there is an induced map $f^\sharp : f^{-1}\mathcal{K}_Y \rightarrow \mathcal{K}_X$, in other words we obtain a commutative diagram of morphisms of ringed spaces

$$\begin{array}{ccc} (X, \mathcal{K}_X) & \longrightarrow & (X, \mathcal{O}_X) \\ \downarrow f & & \downarrow f \\ (Y, \mathcal{K}_Y) & \longrightarrow & (Y, \mathcal{O}_Y) \end{array}$$

We sometimes denote $f^*(s) = f^\sharp(s)$ for a section $s \in \Gamma(Y, \mathcal{K}_Y)$.

Lemma 30.15.4. *Let $f : X \rightarrow Y$ be a morphism of schemes. In each of the following cases pullbacks of meromorphic sections are defined.*

- (1) X, Y are integral and f is dominant,
- (2) X is integral and the generic point of X maps to a generic point of an irreducible component of Y ,
- (3) X is reduced and every generic point of every irreducible component of X maps to the generic point of an irreducible component of Y ,
- (4) X is locally Noetherian, and any associated point of X maps to a generic point of an irreducible component of Y , and
- (5) X is locally Noetherian, has no embedded points and any generic point of an irreducible component of X maps to the generic point of an irreducible component of Y .

Proof. Omitted. Hint: Similar to the proof of Lemma 30.9.12, using the following fact (on Y): if an element $x \in R$ maps to a nonzerodivisor in $R_{\mathfrak{p}}$ for a minimal prime \mathfrak{p} of R , then $x \notin \mathfrak{p}$. See Algebra, Lemma 10.24.1. □

Let (X, \mathcal{O}_X) be a locally ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. Consider the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{F}(U)$. Its sheafification is the sheaf $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$, see Modules, Lemma 17.22.2.

Definition 30.15.5. Let X be a locally ringed space. Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules.

- (1) We denote $\mathcal{K}_X(\mathcal{F})$ the sheaf of \mathcal{K}_X -modules which is the sheafification of the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{F}(U)$. Equivalently $\mathcal{K}_X(\mathcal{F}) = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$ (see above).
- (2) A *meromorphic section of \mathcal{F}* is a global section of $\mathcal{K}_X(\mathcal{F})$.

In particular we have

$$\mathcal{K}_X(\mathcal{F})_x = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{K}_{X,x} = \mathcal{S}_x^{-1}\mathcal{F}_x$$

for any point $x \in X$. However, one has to be careful since it may not be the case that \mathcal{S}_x is the set of nonzerodivisors in the local ring $\mathcal{O}_{X,x}$. Namely, there is always an injective map

$$\mathcal{K}_{X,x} \longrightarrow Q(\mathcal{O}_{X,x})$$

to the total quotient ring. It is also surjective if and only if \mathcal{S}_x is the set of nonzerodivisors in $\mathcal{O}_{X,x}$. The sheaves of meromorphic sections aren't quasi-coherent modules in general, but they do have some properties in common with quasi-coherent modules.

Lemma 30.15.6. *Let X be a quasi-compact scheme. Let $h \in \Gamma(X, \mathcal{O}_X)$ and $f \in \Gamma(X, \mathcal{K}_X)$ such that f restricts to zero on X_h . Then $h^n f = 0$ for some $n \gg 0$.*

Proof. We can find a covering of X by affine opens U such that $f|_U = s^{-1}a$ with $a \in \mathcal{O}_X(U)$ and $s \in \mathcal{S}(U)$. Since X is quasi-compact we can cover it by finitely many affine opens of this form. Thus it suffices to prove the lemma when $X = \text{Spec}(A)$ and $f = s^{-1}a$. Note that $s \in A$ is a nonzerodivisor hence it suffices to prove the result when $f = a$. The condition $f|_{X_h} = 0$ implies that a maps to zero in $A_h = \mathcal{O}_X(X_h)$ as $\mathcal{O}_X \subset \mathcal{K}_X$. Thus $h^n a = 0$ for some $n > 0$ as desired. \square

Lemma 30.15.7. *Let X be a locally Noetherian scheme.*

- (1) *For any $x \in X$ we have $\mathcal{S}_x \subset \mathcal{O}_{X,x}$ is the set of nonzerodivisors, and hence $\mathcal{K}_{X,x}$ is the total quotient ring of $\mathcal{O}_{X,x}$.*
- (2) *For any affine open $U \subset X$ the ring $\mathcal{K}_X(U)$ equals the total quotient ring of $\mathcal{O}_X(U)$.*

Proof. To prove this lemma we may assume X is the spectrum of a Noetherian ring A . Say $x \in X$ corresponds to $\mathfrak{p} \subset A$.

Proof of (1). It is clear that \mathcal{S}_x is contained in the set of nonzero divisors of $\mathcal{O}_{X,x} = A_{\mathfrak{p}}$. For the converse, let $f, g \in A$, $g \notin \mathfrak{p}$ and assume f/g is a nonzerodivisor in $A_{\mathfrak{p}}$. Let $I = \{a \in A \mid af = 0\}$. Then we see that $I_{\mathfrak{p}} = 0$ by exactness of localization. Since A is Noetherian we see that I is finitely generated and hence that $g'I = 0$ for some $g' \in A$, $g' \notin \mathfrak{p}$. Hence f is a nonzerodivisor in $A_{g'}$, i.e., in a Zariski open neighbourhood of \mathfrak{p} . Thus f/g is an element of \mathcal{S}_x .

Proof of (2). Let $f \in \Gamma(X, \mathcal{K}_X)$ be a meromorphic function. Set $I = \{a \in A \mid af \in A\}$. Fix a prime $\mathfrak{p} \subset A$ corresponding to the point $x \in X$. By (1) we can write the image of f in the stalk at \mathfrak{p} as a/b , $a, b \in A_{\mathfrak{p}}$ with $b \in A_{\mathfrak{p}}$ not a zerodivisor. Write $b = c/d$ with $c, d \in A$, $d \notin \mathfrak{p}$. Then $ad - cf$ is a section of \mathcal{K}_X which vanishes in an open neighbourhood of x . Say it vanishes on $D(e)$ with $e \in A$, $e \notin \mathfrak{p}$. Then $e^n(ad - cf) = 0$ for some $n \gg 0$ by Lemma 30.15.6. Thus $e^n c \in I$ and $e^n c$ maps to a nonzerodivisor in $A_{\mathfrak{p}}$. Let $\text{Ass}(A) = \{\mathfrak{q}_1, \dots, \mathfrak{q}_t\}$ be the associated primes of A . By looking at $IA_{\mathfrak{q}_i}$ and using Algebra, Lemma 10.62.14 the above says that $I \not\subset \mathfrak{q}_i$ for each i . By Algebra, Lemma 10.14.2 there exists an element $x \in I$, $x \notin \bigcup \mathfrak{q}_i$. By Algebra, Lemma 10.62.9 we see that x is not a zerodivisor on A . Hence $f = (xf)/x$ is an element of the total ring of fractions of A . This proves (2). \square

Lemma 30.15.8. *Let X be a scheme. Assume X is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components.*

- (1) *The sheaf \mathcal{K}_X is a quasi-coherent sheaf of \mathcal{O}_X -algebras.*
- (2) *For any $x \in X$ we have $\mathcal{S}_x \subset \mathcal{O}_{X,x}$ is the set of nonzerodivisors. In particular $\mathcal{K}_{X,x}$ is the total quotient ring of $\mathcal{O}_{X,x}$.*

- (3) For any affine open $\text{Spec}(A) = U \subset X$ we have that $\mathcal{K}_X(U)$ equals the total quotient ring of A .

Proof. Let X be as in the lemma. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of X . Let

$$f : Y = \coprod_{\eta \in X^{(0)}} \text{Spec}(\kappa(\eta)) \longrightarrow X$$

be the inclusion of the generic points into X using the canonical maps of Schemes, Section 25.13. (This morphism was used in Morphisms, Definition 28.48.12 to define the normalization of X .) We claim that $\mathcal{K}_X = f_*\mathcal{O}_Y$. First note that $\mathcal{K}_Y = \mathcal{O}_Y$ as Y is a disjoint union of spectra of field. Next, note that pullbacks of meromorphic functions are defined for f , by Lemma 30.15.4. This gives a map

$$\mathcal{K}_X \longrightarrow f_*\mathcal{O}_Y.$$

Let $\text{Spec}(A) = U \subset X$ be an affine open. Then A is a reduced ring with finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$. Then we have $Q(A) = \prod A_{\mathfrak{q}_i} = \prod \kappa(\mathfrak{q}_i)$ by Algebra, Lemmas 10.24.4 and 10.24.1. In other words, already the value of the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{O}_X(U)$ agrees with $f_*\mathcal{O}_Y(U)$ on our affine open U . Hence the displayed map is an isomorphism.

Now we are ready to prove (1), (2) and (3). The morphism f is quasi-compact by our assumption that the set of irreducible components of X is locally finite. Hence f is quasi-compact and quasi-separated (as Y is separated). By Schemes, Lemma 25.24.1 $f_*\mathcal{O}_Y$ is quasi-coherent. This proves (1). Let $x \in X$. Then

$$(f_*\mathcal{O}_Y)_x = \prod_{\eta \in X^{(0)}, x \in \overline{\{\eta\}}} \kappa(\eta)$$

On the other hand, $\mathcal{O}_{X,x}$ is reduced and has finitely minimal primes \mathfrak{q}_i corresponding exactly to those $\eta \in X^{(0)}$ such that $x \in \overline{\{\eta\}}$. Hence by Algebra, Lemmas 10.24.4 and 10.24.1 again we see that $Q(\mathcal{O}_{X,x}) = \prod \kappa(\mathfrak{q}_i)$ is the same as $(f_*\mathcal{O}_Y)_x$. This proves (2). Part (3) we saw during the course of the proof that $\mathcal{K}_X = f_*\mathcal{O}_Y$. □

Lemma 30.15.9. *Let X be a scheme. Assume X is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components. Then the normalization morphism $\nu : X^\nu \rightarrow X$ is the morphism*

$$\text{Spec}_X(\mathcal{O}') \longrightarrow X$$

where $\mathcal{O}' \subset \mathcal{K}_X$ is the integral closure of \mathcal{O}_X in the sheaf of meromorphic functions.

Proof. Compare the definition of the normalization morphism $\nu : X^\nu \rightarrow X$ (see Morphisms, Definition 28.48.12) with the result $\mathcal{K}_X = f_*\mathcal{O}_Y$ obtained in the proof of Lemma 30.15.8 above. □

Lemma 30.15.10. *Let X be an integral scheme with generic point η . We have*

- (1) *the sheaf of meromorphic functions is isomorphic to the constant sheaf with value the function field (see Morphisms, Definition 28.10.5) of X .*
- (2) *for any quasi-coherent sheaf \mathcal{F} on X the sheaf $\mathcal{K}_X(\mathcal{F})$ is isomorphic to the constant sheaf with value \mathcal{F}_η .*

Proof. Omitted. □

Definition 30.15.11. Let X be a locally ringed space. Let \mathcal{L} be an invertible \mathcal{O}_X -module. A meromorphic section s of \mathcal{L} is said to be *regular* if the induced map $\mathcal{K}_X \rightarrow \mathcal{K}_X(\mathcal{L})$ is injective. (In other words, this means that s is a regular section of the invertible \mathcal{K}_X -module $\mathcal{K}_X(\mathcal{L})$. See Definition 30.9.16.)

First we spell out when (regular) meromorphic sections can be pulled back. After that we discuss the existence of regular meromorphic sections and consequences.

Lemma 30.15.12. *Let $f : X \rightarrow Y$ be a morphism of locally ringed spaces. Assume that pullbacks of meromorphic functions are defined for f (see Definition 30.15.3).*

- (1) *Let \mathcal{F} be a sheaf of \mathcal{O}_Y -modules. There is a canonical pullback map $f^* : \Gamma(Y, \mathcal{K}_Y(\mathcal{F})) \rightarrow \Gamma(X, \mathcal{K}_X(f^*\mathcal{F}))$ for meromorphic sections of \mathcal{F} .*
- (2) *Let \mathcal{L} be an invertible \mathcal{O}_X -module. A regular meromorphic section s of \mathcal{L} pulls back to a regular meromorphic section f^*s of $f^*\mathcal{L}$.*

Proof. Omitted. □

In some cases we can show regular meromorphic sections exist.

Lemma 30.15.13. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. In each of the following cases \mathcal{L} has a regular meromorphic section:*

- (1) *X is integral,*
- (2) *X is reduced and any quasi-compact open has a finite number of irreducible components, and*
- (3) *X is locally Noetherian and has no embedded points.*

Proof. In case (1) we have seen in Lemma 30.15.10 that $\mathcal{K}_X(\mathcal{L})$ is a constant sheaf with value \mathcal{L}_η , and hence the result is clear.

Suppose X is a scheme. Let $G \subset X$ be the set of generic points of irreducible components of X . For each $\eta \in G$ denote $j_\eta : \eta \rightarrow X$ the canonical morphism of $\eta = \text{Spec}(\kappa(\eta))$ into X (see Schemes, Lemma 25.13.3). Consider the sheaf

$$\mathcal{G}_X(\mathcal{L}) = \prod_{\eta \in G} j_{\eta,*}(\mathcal{L}_\eta).$$

There is a canonical map

$$\varphi : \mathcal{K}_X(\mathcal{L}) \longrightarrow \mathcal{G}_X(\mathcal{L})$$

coming from the maps $\mathcal{K}_X(\mathcal{L})_\eta \rightarrow \mathcal{L}_\eta$ and adjunction (see Sheaves, Lemma 6.27.3).

We claim that in cases (2) and (3) the map φ is an isomorphism for any invertible sheaf \mathcal{L} . Before proving this let us show that cases (2) and (3) follow from this. Namely, we can choose $s_\eta \in \mathcal{L}_\eta$ which generate \mathcal{L}_η , i.e., such that $\mathcal{L}_\eta = \mathcal{O}_{X,\eta}s_\eta$. Since the claim applied to \mathcal{O}_X gives $\mathcal{K}_X = \mathcal{G}_X(\mathcal{O}_X)$ it is clear that the global section $s = \prod_{\eta \in G} s_\eta$ is regular as desired.

To prove that φ is an isomorphism we may work locally on X . For example it suffices to show that sections of $\mathcal{K}_X(\mathcal{L})$ and $\mathcal{G}_X(\mathcal{L})$ agree over small affine opens U . Say $U = \text{Spec}(A)$ and $\mathcal{L}|_U \cong \mathcal{O}_U$. By Lemmas 30.15.7 and 30.15.8 we see that $\Gamma(U, \mathcal{K}_X) = Q(A)$ is the total ring of fractions of A . On the other hand, $\Gamma(U, \mathcal{G}_X(\mathcal{O}_X)) = \prod_{\mathfrak{q} \subset A \text{ minimal}} A_{\mathfrak{q}}$. In both cases we see that the set of minimal primes of A is finite, say $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, and that the set of zerodivisors of A is equal to $\mathfrak{q}_1 \cup \dots \cup \mathfrak{q}_t$ (see Algebra, Lemma 10.62.9). Hence the result follows from Algebra, Lemma 10.24.4. □

Lemma 30.15.14. *Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let s be a regular meromorphic section of \mathcal{L} . Let us denote $\mathcal{I} \subset \mathcal{O}_X$ the sheaf of ideals defined by the rule*

$$\mathcal{I}(V) = \{f \in \mathcal{O}_Z(V) \mid fs \in \mathcal{L}(V)\}.$$

The formula makes sense since $\mathcal{L}(V) \subset \mathcal{K}_X(\mathcal{L})(V)$. Then \mathcal{I} is a quasi-coherent sheaf of ideals and we have injective maps

$$1 : \mathcal{I} \longrightarrow \mathcal{O}_X, \quad s : \mathcal{I} \longrightarrow \mathcal{L}$$

whose cokernels are supported on closed nowhere dense subsets of X .

Proof. The question is local on X . Hence we may assume that $X = \text{Spec}(A)$, and $\mathcal{L} = \mathcal{O}_X$. After shrinking further we may assume that $s = x/y$ with $a, b \in A$ both nonzerodivisors in A . Set $I = \{x \in A \mid x(a/b) \in A\}$.

To show that \mathcal{I} is quasi-coherent we have to show that $I_f = \{x \in A_f \mid x(a/b) \in A_f\}$ for every $f \in A$. If $c/f^n \in A_f$, $(c/f^n)(a/b) \in A_f$, then we see that $f^m c(a/b) \in A$ for some m , hence $c/f^n \in I_f$. Conversely it is easy to see that I_f is contained in $\{x \in A_f \mid x(a/b) \in A_f\}$. This proves quasi-coherence.

Let us prove the final statement. It is clear that $(b) \subset I$. Hence $V(I) \subset V(b)$ is a nowhere dense subset as b is a nonzerodivisor. Thus the cokernel of 1 is supported in a nowhere dense closed set. The same argument works for the cokernel of s since $s(b) = (a) \subset sI \subset A$. \square

Definition 30.15.15. Let X be a scheme. Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let s be a regular meromorphic section of \mathcal{L} . The sheaf of ideals \mathcal{I} constructed in Lemma 30.15.14 is called the *ideal sheaf of denominators of s* .

Here is a lemma which will be used later.

Lemma 30.15.16. *Suppose given*

- (1) X a locally Noetherian scheme,
- (2) \mathcal{L} an invertible \mathcal{O}_X -module,
- (3) s a regular meromorphic section of \mathcal{L} , and
- (4) \mathcal{F} coherent on X without embedded associated points and $\text{Supp}(\mathcal{F}) = X$.

Let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal of denominators of s . Let $T \subset X$ be the union of the supports of $\mathcal{O}_X/\mathcal{I}$ and $\mathcal{L}/s(\mathcal{I})$ which is a nowhere dense closed subset $T \subset X$ according to Lemma 30.15.14. Then there are canonical injective maps

$$1 : \mathcal{I}\mathcal{F} \rightarrow \mathcal{F}, \quad s : \mathcal{I}\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$$

whose cokernels are supported on T .

Proof. Reduce to the affine case with $\mathcal{L} \cong \mathcal{O}_X$, and $s = a/b$ with $a, b \in A$ both nonzerodivisors. Proof of reduction step omitted. Write $\mathcal{F} = \widetilde{M}$. Let $I = \{x \in A \mid x(a/b) \in A\}$ so that $\mathcal{I} = \widetilde{I}$ (see proof of Lemma 30.15.14). Note that $T = V(I) \cup V((a/b)I)$. For any A -module M consider the map $1 : IM \rightarrow M$; this is the map that gives rise to the map 1 of the lemma. Consider on the other hand the map $\sigma : IM \rightarrow M_b, x \mapsto ax/b$. Since b is not a zerodivisor in A , and since M has support $\text{Spec}(A)$ and no embedded primes we see that b is a nonzerodivisor on M also. Hence $M \subset M_b$. By definition of I we have $\sigma(IM) \subset M$ as submodules of M_b . Hence we get an A -module map $s : IM \rightarrow M$ (namely the unique map such that $s(z)/1 = \sigma(z)$ in M_b for all $z \in IM$). It is injective because a is a

nonzerodivisor also (on both A and M). It is clear that M/IM is annihilated by I and that $M/s(IM)$ is annihilated by $(a/b)I$. Thus the lemma follows. \square

30.16. Relative Proj

Some results on relative Proj. First some very basic results. Recall that a relative Proj is always separated over the base, see Constructions, Lemma 26.16.9.

Lemma 30.16.1. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . If one of the following holds*

- (1) \mathcal{A} is of finite type as a sheaf of \mathcal{A}_0 -algebras,
- (2) \mathcal{A} is generated by \mathcal{A}_1 as an \mathcal{A}_0 -algebra and \mathcal{A}_1 is a finite type \mathcal{A}_0 -module,
- (3) there exists a finite type quasi-coherent \mathcal{A}_0 -submodule $\mathcal{F} \subset \mathcal{A}_+$ such that $\mathcal{A}_+/\mathcal{F}\mathcal{A}$ is a locally nilpotent sheaf of ideals of $\mathcal{A}/\mathcal{F}\mathcal{A}$,

then p is quasi-compact.

Proof. The question is local on the base, see Schemes, Lemma 25.19.2. Thus we may assume S is affine. Say $S = \text{Spec}(R)$ and \mathcal{A} corresponds to the graded R -algebra A . Then $X = \text{Proj}(A)$, see Constructions, Section 26.15. In case (1) we may after possibly localizing more assume that A is generated by homogeneous elements $f_1, \dots, f_n \in A_+$ over A_0 . Then $A_+ = (f_1, \dots, f_n)$ by Algebra, Lemma 10.57.1. In case (3) we see that $\mathcal{F} = \bar{M}$ for some finite type \mathcal{A}_0 -module $M \subset A_+$. Say $M = \sum A_0 f_i$. Say $f_i = \sum f_{i,j}$ is the decomposition into homogeneous pieces. The condition in (2) signifies that $A_+ \subset \sqrt{(f_{i,j})}$. Thus in both cases we conclude that $\text{Proj}(A)$ is quasi-compact by Constructions, Lemma 26.8.9. Finally, (2) follows from (1). \square

Lemma 30.16.2. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . If \mathcal{A} is of finite type as a sheaf of \mathcal{O}_S -algebras, then p is of finite type.*

Proof. The assumption implies that p is quasi-compact, see Lemma 30.16.1. Hence it suffices to show that p is locally of finite type. Thus the question is local on the base and target, see Morphisms, Lemma 28.16.2. Say $S = \text{Spec}(R)$ and \mathcal{A} corresponds to the graded R -algebra A . After further localizing on S we may assume that A is a finite type R -algebra. The scheme X is constructed out of glueing the spectra of the rings $A_{(f)}$ for $f \in A_+$ homogeneous. Each of these is of finite type over R by Algebra, Lemma 10.55.9. Thus $\text{Proj}(A)$ is of finite type over R . \square

Lemma 30.16.3. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . If $\mathcal{O}_S \rightarrow \mathcal{A}_0$ is an integral algebra map² and \mathcal{A} is of finite type as an \mathcal{A}_0 -algebra, then p is universally closed.*

Proof. The question is local on the base. Thus we may assume that $X = \text{Spec}(R)$ is affine. Let \mathcal{A} be the quasi-coherent \mathcal{O}_X -algebra associated to the graded R -algebra A . The assumption is that $R \rightarrow A_0$ is integral and A is of finite type over A_0 . Write $X \rightarrow \text{Spec}(R)$ as the composition $X \rightarrow \text{Spec}(A_0) \rightarrow \text{Spec}(R)$. Since $R \rightarrow A_0$ is an integral ring map, we see that $\text{Spec}(A_0) \rightarrow \text{Spec}(R)$ is universally

²In other words, the integral closure of \mathcal{O}_S in \mathcal{A}_0 , see Morphisms, Definition 28.48.2, equals \mathcal{A}_0 .

closed, see Morphisms, Lemma 28.44.7. The quasi-compact (see Constructions, Lemma 26.8.9) morphism

$$\mathrm{Proj}(A) \rightarrow \mathrm{Proj}(A_0)$$

satisfies the existence part of the valuative criterion by Constructions, Lemma 26.8.11 and hence it is universally closed by Schemes, Proposition 25.20.6. Thus $X \rightarrow \mathrm{Spec}(R)$ is universally closed as a composition of universally closed morphisms. \square

Lemma 30.16.4. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\mathrm{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . The following conditions are equivalent*

- (1) \mathcal{A}_0 is a finite type \mathcal{O}_S -module and \mathcal{A} is of finite type as an \mathcal{A}_0 -algebra,
- (2) \mathcal{A}_0 is a finite type \mathcal{O}_S -module and \mathcal{A} is of finite type as an \mathcal{O}_S -algebra

If these conditions hold, then p is locally projective and in particular proper.

Proof. Assume that \mathcal{A}_0 is a finite type \mathcal{O}_S -module. Choose an affine open $U = \mathrm{Spec}(R) \subset X$ such that \mathcal{A} corresponds to a graded R -algebra A with A_0 a finite R -module. Condition (1) means that (after possibly localizing further on S) that A is a finite type A_0 -algebra and condition (2) means that (after possibly localizing further on S) that A is a finite type R -algebra. Thus these conditions imply each other by Algebra, Lemma 10.6.2.

A locally projective morphism is proper, see Morphisms, Lemma 28.43.5. Thus we may now assume that $S = \mathrm{Spec}(R)$ and $X = \mathrm{Proj}(A)$ and that A_0 is finite over R and A of finite type over R . We will show that $X = \mathrm{Proj}(A) \rightarrow \mathrm{Spec}(R)$ is projective. We urge the reader to prove this for themselves, by directly constructing a closed immersion of X into a projective space over R , instead of reading the argument we give below.

By Lemma 30.16.2 we see that X is of finite type over $\mathrm{Spec}(R)$. Constructions, Lemma 26.10.6 tells us that $\mathcal{O}_X(d)$ is ample on X for some $d \geq 1$ (see Properties, Section 27.24). Hence $X \rightarrow \mathrm{Spec}(R)$ is quasi-projective (by Morphisms, Definition 28.41.1). By Morphisms, Lemma 28.43.12 we conclude that X is isomorphic to an open subscheme of a scheme projective over $\mathrm{Spec}(R)$. Therefore, to finish the proof, it suffices to show that $X \rightarrow \mathrm{Spec}(R)$ is universally closed (use Morphisms, Lemma 28.42.7). This follows from Lemma 30.16.3. \square

30.17. Closed subschemes of relative proj

Some auxiliary lemmas about closed subschemes of relative proj.

Lemma 30.17.1. *Let S be a scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\mathrm{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow X$ be a closed subscheme. Denote $\mathcal{I} \subset \mathcal{A}$ the kernel of the canonical map*

$$\mathcal{A} \longrightarrow \bigoplus_{d \geq 0} p_*((i_*\mathcal{O}_Z)(d))$$

If p is quasi-compact, then there is an isomorphism $Z = \underline{\mathrm{Proj}}_S(\mathcal{A}/\mathcal{I})$.

Proof. The morphism p is separated by Constructions, Lemma 26.16.9. As p is quasi-compact, p_* transforms quasi-coherent modules into quasi-coherent modules, see Schemes, Lemma 25.24.1. Hence \mathcal{I} is a quasi-coherent \mathcal{O}_S -module. In particular, $\mathcal{B} = \mathcal{A}/\mathcal{I}$ is a quasi-coherent graded \mathcal{O}_S -algebra. The functoriality morphism

$Z' = \text{Proj}_S(\mathcal{B}) \rightarrow \text{Proj}_S(\mathcal{A})$ is everywhere defined and a closed immersion, see Constructions, Lemma 26.18.3. Hence it suffices to prove $Z = Z'$ as closed subschemes of X .

Having said this, the question is local on the base and we may assume that $S = \text{Spec}(R)$ and that $X = \text{Proj}(A)$ for some graded R -algebra A . Assume $\mathcal{I} = \tilde{I}$ for $I \subset A$ a graded ideal. By Constructions, Lemma 26.8.9 there exist $f_0, \dots, f_n \in A_+$ such that $A_+ \subset \sqrt{(f_0, \dots, f_n)}$ in other words $X = \bigcup D_+(f_i)$. Therefore, it suffices to check that $Z \cap D_+(f_i) = Z' \cap D_+(f_i)$ for each i . By renumbering we may assume $i = 0$. Say $Z \cap D_+(f_0)$, resp. $Z' \cap D_+(f_0)$ is cut out by the ideal J , resp. J' of $A_{(f_0)}$.

The inclusion $J' \subset J$. Let d be the least common multiple of $\deg(f_0), \dots, \deg(f_n)$. Note that each of the twists $\mathcal{O}_X(nd)$ is invertible, trivialized by $f_i^{nd/\deg(f_i)}$ over $D_+(f_i)$, and that for any quasi-coherent module \mathcal{F} on X the multiplication maps $\mathcal{O}_X(nd) \otimes_{\mathcal{O}_X} \mathcal{F}(m) \rightarrow \mathcal{F}(nd + m)$ are isomorphisms, see Constructions, Lemma 26.10.2. Observe that J' is the ideal generated by the elements g/f_0^e where $g \in I$ is homogeneous of degree $e \deg(f_0)$ (see proof of Constructions, Lemma 26.11.3). Of course, by replacing g by $f_0^l g$ for suitable l we may always assume that $d|e$. Then, since g vanishes as a section of $\mathcal{O}_X(e \deg(f_0))$ restricted to Z we see that g/f_0^d is an element of J . Thus $J' \subset J$.

Conversely, suppose that $g/f_0^e \in J$. Again we may assume $d|e$. Pick $i \in \{1, \dots, n\}$. Then $Z \cap D_+(f_i)$ is cut out by some ideal $J_i \subset A_{(f_i)}$. Moreover,

$$J \cdot A_{(f_0 f_i)} = J_i \cdot A_{(f_0 f_i)}$$

The right hand side is the localization of J_i with respect to $f_0^{\deg(f_i)}/f_i^{\deg(f_0)}$. It follows that

$$f_0^{e_i} g / f_i^{(e_i+e) \deg(f_0) / \deg(f_i)} \in J_i$$

for some $e_i \gg 0$ sufficiently divisible. This proves that $f_0^{\max(e_i)} g$ is an element of I , because its restriction to each affine open $D_+(f_i)$ vanishes on the closed subscheme $Z \cap D_+(f_i)$. Hence $g \in J'$ and we conclude $J \subset J'$ as desired. \square

In case the closed subscheme is locally cut out by finitely many equations we can define it by a finite type ideal sheaf of \mathcal{A} .

Lemma 30.17.2. *Let S be a quasi-compact and quasi-separated scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \text{Proj}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow X$ be a closed subscheme. If p is quasi-compact and i of finite presentation, then there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_S -submodule $\mathcal{F} \subset \mathcal{A}_d$ such that $Z = \text{Proj}_S(\mathcal{A}/\mathcal{F}\mathcal{A})$.*

Proof. By Lemma 30.17.1 we know there exists a quasi-coherent graded sheaf of ideals $\mathcal{I} \subset \mathcal{A}$ such that $Z = \text{Proj}(\mathcal{A}/\mathcal{I})$. Since S is quasi-compact we can choose a finite affine open covering $S = U_1 \cup \dots \cup U_n$. Say $U_i = \text{Spec}(R_i)$. Let $\mathcal{A}|_{U_i}$ correspond to the graded R_i -algebra A_i and $\mathcal{I}|_{U_i}$ to the graded ideal $I_i \subset A_i$. Note that $p^{-1}(U_i) = \text{Proj}(A_i)$ as schemes over R_i . Since p is quasi-compact we can choose finitely many homogeneous elements $f_{i,j} \in A_{i,+}$ such that $p^{-1}(U_i) = D_+(f_{i,j})$. The condition on $Z \rightarrow X$ means that the ideal sheaf of Z in \mathcal{O}_X is of finite type, see Morphisms, Lemma 28.22.7. Hence we can find finitely many homogeneous elements $h_{i,j,k} \in I_i \cap A_{i,+}$ such that the ideal of $Z \cap D_+(f_{i,j})$ is generated by the elements $h_{i,j,k}/f_{i,j}^{e_{i,j,k}}$. Choose $d > 0$ to be a common multiple of all the integers $\deg(f_{i,j})$

and $\deg(h_{i,j,k})$. By Properties, Lemma 27.20.7 there exists a finite type $\mathcal{F} \subset \mathcal{I}_d$ such that all the local sections

$$h_{i,j,k} f_{i,j}^{(d-\deg(h_{i,j,k}))/\deg(f_{i,j})}$$

are sections of \mathcal{F} . By construction \mathcal{F} is a solution. □

The following version of Lemma 30.17.2 will be used in the proof of Lemma 30.20.2.

Lemma 30.17.3. *Let S be a quasi-compact and quasi-separated scheme. Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_S -algebra. Let $p : X = \underline{\text{Proj}}_S(\mathcal{A}) \rightarrow S$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow X$ be a closed subscheme. Let $U \subset X$ be an open. Assume that*

- (1) p is quasi-compact,
- (2) i of finite presentation,
- (3) $U \cap p(i(Z)) = \emptyset$,
- (4) U is quasi-compact,
- (5) \mathcal{A}_n is a finite type \mathcal{O}_S -module for all n .

Then there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_S -submodule $\mathcal{F} \subset \mathcal{A}_d$ with (a) $Z = \underline{\text{Proj}}_S(\mathcal{A}/\mathcal{F}\mathcal{A})$ and (b) the support of $\mathcal{A}_d/\mathcal{F}$ is disjoint from U .

Proof. Let $\mathcal{I} \subset \mathcal{A}$ be the sheaf of quasi-coherent graded ideals constructed in Lemma 30.17.1. Let $U_i, R_i, A_i, I_i, f_{i,j}, h_{i,j,k}$, and d be as constructed in the proof of Lemma 30.17.2. Since $U \cap p(i(Z)) = \emptyset$ we see that $\mathcal{I}_d|_U = \mathcal{A}_d|_U$ (by our construction of \mathcal{I} as a kernel). Since U is quasi-compact we can choose a finite affine open covering $U = W_1 \cup \dots \cup W_m$. Since \mathcal{A}_d is of finite type we can find finitely many sections $g_{t,s} \in \mathcal{A}_d(W_t)$ which generate $\mathcal{A}_d|_{W_t} = \mathcal{I}_d|_{W_t}$ as an \mathcal{O}_{W_t} -module. To finish the proof, note that by Properties, Lemma 27.20.7 there exists a finite type $\mathcal{F} \subset \mathcal{I}_d$ such that all the local sections

$$h_{i,j,k} f_{i,j}^{(d-\deg(h_{i,j,k}))/\deg(f_{i,j})} \quad \text{and} \quad g_{t,s}$$

are sections of \mathcal{F} . By construction \mathcal{F} is a solution. □

30.18. Blowing up

Blowing up is an important tool in algebraic geometry.

Definition 30.18.1. Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subscheme corresponding to \mathcal{I} , see Schemes, Definition 25.10.2. The *blowing up of X along Z* , or the *blowing up of X in the ideal sheaf \mathcal{I}* is the morphism

$$b : \underline{\text{Proj}}_X \left(\bigoplus_{n \geq 0} \mathcal{I}^n \right) \longrightarrow X$$

The *exceptional divisor* of the blow up is the inverse image $b^{-1}(Z)$. Sometimes Z is called the *center* of the blowup.

We will see later that the exceptional divisor is an effective Cartier divisor. Moreover, the blowing up is characterized as the “smallest” scheme over X such that the inverse image of Z is an effective Cartier divisor.

If $b : X' \rightarrow X$ is the blow up of X in Z , then we often denote $\mathcal{O}_{X'}(n)$ the twists of the structure sheaf. Note that these are invertible $\mathcal{O}_{X'}$ -modules and that $\mathcal{O}_{X'}(n) = \mathcal{O}_{X'}(1)^{\otimes n}$ because X' is the relative Proj of a quasi-coherent graded \mathcal{O}_X -algebra which is generated in degree 1, see Constructions, Lemma 26.16.11. Note that

$\mathcal{O}_{X'}(1)$ is b -relatively very ample, even though b need not be of finite type or even quasi-compact, because X' comes equipped with a closed immersion into $\mathbf{P}(\mathcal{I})$, see Morphisms, Example 28.39.3.

Lemma 30.18.2. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $U = \text{Spec}(A)$ be an affine open subscheme of X and let $I \subset A$ be the ideal corresponding to $\mathcal{I}|_U$. If $b : X' \rightarrow X$ is the blow up of X in \mathcal{I} , then there is a canonical isomorphism*

$$b^{-1}(U) = \text{Proj}\left(\bigoplus_{d \geq 0} I^d\right)$$

of $b^{-1}(U)$ with the homogeneous spectrum of the Rees algebra of I in A . Moreover, $b^{-1}(U)$ has an affine open covering by spectra of the affine blowup algebras $A[\frac{I}{a}]$.

Proof. The first statement is clear from the construction of the relative Proj via glueing, see Constructions, Section 26.15. For $a \in I$ denote $a^{(1)}$ the element a seen as an element of degree 1 in the Rees algebra $\bigoplus_{n \geq 0} I^n$. Since these elements generate the Rees algebra over A we see that $\text{Proj}(\bigoplus_{d \geq 0} I^d)$ is covered by the affine opens $D_+(a^{(1)})$. The affine scheme $D_+(a^{(1)})$ is the spectrum of the affine blowup algebra $A' = A[\frac{I}{a}]$, see Algebra, Definition 10.56.1. This finishes the proof. \square

Lemma 30.18.3. *Let $X_1 \rightarrow X_2$ be a flat morphism of schemes. Let $Z_2 \subset X_2$ be a closed subscheme. Let Z_1 be the inverse image of Z_2 in X_1 . Let X'_i be the blow up of Z_i in X_i . Then there exists a cartesian diagram*

$$\begin{array}{ccc} X'_1 & \longrightarrow & X'_2 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X_2 \end{array}$$

of schemes.

Proof. Let \mathcal{I}_2 be the ideal sheaf of Z_2 in X_2 . Denote $g : X_1 \rightarrow X_2$ the given morphism. Then the ideal sheaf \mathcal{I}_1 of Z_1 is the image of $g^*\mathcal{I}_2 \rightarrow \mathcal{O}_{X_1}$ (by definition of the inverse image, see Schemes, Definition 25.17.7). By Constructions, Lemma 26.16.10 we see that $X_1 \times_{X_2} X'_2$ is the relative Proj of $\bigoplus_{n \geq 0} g^*\mathcal{I}_2^n$. Because g is flat the map $g^*\mathcal{I}_2^n \rightarrow \mathcal{O}_{X_1}$ is injective with image \mathcal{I}_1^n . Thus we see that $X_1 \times_{X_2} X'_2 = X'_1$. \square

Lemma 30.18.4. *Let X be a scheme. Let $Z \subset X$ be a closed subscheme. The blowing up $b : X' \rightarrow X$ of Z in X has the following properties:*

- (1) $b|_{b^{-1}(X \setminus Z)} : b^{-1}(X \setminus Z) \rightarrow X \setminus Z$ is an isomorphism,
- (2) the exceptional divisor $E = b^{-1}(Z)$ is an effective Cartier divisor on X' ,
- (3) there is a canonical isomorphism $\mathcal{O}_{X'}(-1) = \mathcal{O}_{X'}(E)$

Proof. As blowing up commutes with restrictions to open subschemes (Lemma 30.18.3) the first statement just means that $X' = X$ if $Z = \emptyset$. In this case we are blowing up in the ideal sheaf $\mathcal{I} = \mathcal{O}_X$ and the result follows from Constructions, Example 26.8.14.

The second statement is local on X , hence we may assume X affine. Say $X = \text{Spec}(A)$ and $Z = \text{Spec}(A/I)$. By Lemma 30.18.2 we see that X' is covered by the spectra of the affine blowup algebras $A' = A[\frac{I}{a}]$. Then $IA' = aA'$ and a maps to a

nonzerodivisor in A' according to Algebra, Lemma 10.56.2. This proves the lemma as the inverse image of Z in $\text{Spec}(A')$ corresponds to $\text{Spec}(A'/IA') \subset \text{Spec}(A')$.

Consider the canonical map $\psi_{\text{univ},1} : b^*\mathcal{I} \rightarrow \mathcal{O}_{X'}(1)$, see discussion following Constructions, Definition 26.16.7. We claim that this factors through an isomorphism $\mathcal{I}_E \rightarrow \mathcal{O}_{X'}(1)$ (which proves the final assertion). Namely, on the affine open corresponding to the blowup algebra $A' = A[\frac{I}{a}]$ mentioned above $\psi_{\text{univ},1}$ corresponds to the A' -module map

$$I \otimes_A A' \longrightarrow \left(\left(\bigoplus_{d \geq 0} I^d \right)_{a^{(1)}} \right)_1$$

where $a^{(1)}$ is as in Algebra, Definition 10.56.1. We omit the verification that this is the map $I \otimes_A A' \rightarrow IA' = aA'$. \square

Lemma 30.18.5 (Universal property blowing up). *Let X be a scheme. Let $Z \subset X$ be a closed subscheme. Let \mathcal{C} be the full subcategory of (Sch/X) consisting of $Y \rightarrow X$ such that the inverse image of Z is an effective Cartier divisor on Y . Then the blowing up $b : X' \rightarrow X$ of Z in X is a final object of \mathcal{C} .*

Proof. We see that $b : X' \rightarrow X$ is an object of \mathcal{C} according to Lemma 30.18.4. Let $f : Y \rightarrow X$ be an object of \mathcal{C} . We have to show there exists a unique morphism $Y \rightarrow X'$ over X . Let $D = f^{-1}(Z)$. Let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal sheaf of Z and let \mathcal{I}_D be the ideal sheaf of D . Then $f^*\mathcal{I} \rightarrow \mathcal{I}_D$ is a surjection to an invertible \mathcal{O}_Y -module. This extends to a map $\psi : \bigoplus f^*\mathcal{I}^d \rightarrow \bigoplus \mathcal{I}_D^d$ of graded \mathcal{O}_Y -algebras. (We observe that $\mathcal{I}_D^d = \mathcal{I}_D^{\otimes d}$ as D is an effective Cartier divisor.) By the material in Constructions, Section 26.16 the triple $(1, f : Y \rightarrow X, \psi)$ defines a morphism $Y \rightarrow X'$ over X . The restriction

$$Y \setminus D \longrightarrow X' \setminus b^{-1}(Z) = X \setminus Z$$

is unique. The open $Y \setminus D$ is scheme theoretically dense in Y according to Lemma 30.9.4. Thus the morphism $Y \rightarrow X'$ is unique by Morphisms, Lemma 28.7.10 (also b is separated by Constructions, Lemma 26.16.9). \square

Lemma 30.18.6. *Let X be a scheme. Let $Z \subset X$ be an effective Cartier divisor. The blowing up of X in Z is the identity morphism of X .*

Proof. Immediate from the universal property of blowups (Lemma 30.18.5). \square

Lemma 30.18.7. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If X is integral, then the blow up X' of X in \mathcal{I} is integral.*

Proof. Combine Lemma 30.18.2 with Algebra, Lemma 10.56.4. \square

Lemma 30.18.8. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If X is reduced, then the blow up X' of X in \mathcal{I} is reduced.*

Proof. Combine Lemma 30.18.2 with Algebra, Lemma 10.56.5. \square

Lemma 30.18.9. *Let X be a scheme. Let $b : X' \rightarrow X$ be a blow up of X in a closed subscheme. For any effective Cartier divisor D on X the pullback $b^{-1}D$ is defined (see Definition 30.9.11).*

Proof. By Lemmas 30.18.2 and 30.9.2 this reduces to the following algebra fact: Let A be a ring, $I \subset A$ an ideal, $a \in I$, and $x \in A$ a nonzerodivisor. Then the image of x in $A[\frac{I}{a}]$ is a nonzerodivisor. Namely, suppose that $x(y/a^n) = 0$ in $A[\frac{I}{a}]$.

Then $a^mxy = 0$ in A for some m . Hence $a^my = 0$ as x is a nonzerodivisor. Whence y/a^n is zero in $A[\frac{I}{a}]$ as desired. \square

Lemma 30.18.10. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ and \mathcal{J} be quasi-coherent sheaves of ideals. Let $b : X' \rightarrow X$ be the blowing up of X in \mathcal{I} . Let $b' : X'' \rightarrow X'$ be the blowing up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$. Then $X'' \rightarrow X$ is canonically isomorphic to the blowing up of X in $\mathcal{I}\mathcal{J}$.*

Proof. Let $E \subset X'$ be the exceptional divisor of b which is an effective Cartier divisor by Lemma 30.18.4. Then $(b')^{-1}E$ is an effective Cartier divisor on X'' by Lemma 30.18.9. Let $E' \subset X''$ be the exceptional divisor of b' (also an effective Cartier divisor). Consider the effective Cartier divisor $E'' = E' + (b')^{-1}E$. By construction the ideal of E'' is $(b \circ b')^{-1}\mathcal{I}(b \circ b')^{-1}\mathcal{J}\mathcal{O}_{X''}$. Hence according to Lemma 30.18.5 there is a canonical morphism from X'' to the blowup $c : Y \rightarrow X$ of X in $\mathcal{I}\mathcal{J}$. Conversely, as $\mathcal{I}\mathcal{J}$ pulls back to an invertible ideal we see that $c^{-1}\mathcal{I}\mathcal{O}_Y$ defines an effective Cartier divisor, see Lemma 30.9.9. Thus a morphism $c' : Y \rightarrow X'$ over X by Lemma 30.18.5. Then $(c')^{-1}b^{-1}\mathcal{J}\mathcal{O}_Y = c^{-1}\mathcal{J}\mathcal{O}_Y$ which also defines an effective Cartier divisor. Thus a morphism $c'' : Y \rightarrow X''$ over X' . We omit the verification that this morphism is inverse to the morphism $X'' \rightarrow Y$ constructed earlier. \square

Lemma 30.18.11. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $b : X' \rightarrow X$ be the blowing up of X in the ideal sheaf \mathcal{I} . If \mathcal{I} is of finite type, then*

- (1) $b : X' \rightarrow X$ is a projective morphism, and
- (2) $\mathcal{O}_{X'}(1)$ is a b -relatively ample invertible sheaf.

Proof. The surjection of graded \mathcal{O}_X -algebras

$$\text{Sym}_{\mathcal{O}_X}^*(\mathcal{I}) \longrightarrow \bigoplus_{d \geq 0} \mathcal{I}^d$$

defines via Constructions, Lemma 26.18.5 a closed immersion

$$X' = \underline{\text{Proj}}_X(\bigoplus_{d \geq 0} \mathcal{I}^d) \longrightarrow \mathbf{P}(\mathcal{I}).$$

Hence b is projective, see Morphisms, Definition 28.43.1. The second statement follows for example from the characterization of relatively ample invertible sheaves in Morphisms, Lemma 28.38.4. Some details omitted. \square

Lemma 30.18.12. *Let X be a quasi-compact and quasi-separated scheme. Let $Z \subset X$ be a closed subscheme of finite presentation. Let $b : X' \rightarrow X$ be the blowing up with center Z . Let $Z' \subset X'$ be a closed subscheme of finite presentation. Let $X'' \rightarrow X'$ be the blowing up with center Z' . There exists a closed subscheme $Y \subset X$ of finite presentation, such that*

- (1) $Y = Z \cup b(Z')$ set theoretically, and
- (2) the composition $X'' \rightarrow X$ is isomorphic to the blowing up of X in Y .

Proof. The condition that $Z \rightarrow X$ is of finite presentation means that Z is cut out by a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$, see Morphisms, Lemma 28.22.7. Write $\mathcal{A} = \bigoplus_{n \geq 0} \mathcal{I}^n$ so that $X' = \underline{\text{Proj}}(\mathcal{A})$. Note that $X \setminus Z$ is a quasi-compact open of X by Properties, Lemma 27.22.1. Since $b^{-1}(X \setminus Z) \rightarrow X \setminus Z$ is an isomorphism (Lemma 30.18.4) the same result shows that $b^{-1}(X \setminus Z) \setminus Z'$ is quasi-compact open in X' . Hence $U = X \setminus (Z \cup b(Z'))$ is quasi-compact open in

X . By Lemma 30.17.3 there exist a $d > 0$ and a finite type \mathcal{O}_X -submodule $\mathcal{F} \subset \mathcal{I}^d$ such that $Z' = \underline{\text{Proj}}(\mathcal{A}/\mathcal{F}\mathcal{A})$ and such that the support of $\mathcal{I}^d/\mathcal{F}$ is contained in $X \setminus U$.

Since $\mathcal{F} \subset \mathcal{I}^d$ is an \mathcal{O}_X -submodule we may think of $\mathcal{F} \subset \mathcal{I}^d \subset \mathcal{O}_X$ as a finite type quasi-coherent sheaf of ideals on X . Let's denote this $\mathcal{J} \subset \mathcal{O}_X$ to prevent confusion. Since $\mathcal{I}^d/\mathcal{J}$ and $\mathcal{O}/\mathcal{I}^d$ are supported on $X \setminus U$ we see that $V(\mathcal{J})$ is contained in $X \setminus U$. Conversely, as $\mathcal{J} \subset \mathcal{I}^d$ we see that $Z \subset V(\mathcal{J})$. Over $X \setminus Z \cong X' \setminus b^{-1}(Z)$ the sheaf of ideals \mathcal{J} cuts out Z' (see displayed formula below). Hence $V(\mathcal{J})$ equals $Z \cup b(Z')$. It follows that also $V(\mathcal{I}\mathcal{J}) = Z \cup b(Z')$ set theoretically. Moreover, $\mathcal{I}\mathcal{J}$ is an ideal of finite type as a product of two such. We claim that $X'' \rightarrow X$ is isomorphic to the blowing up of X in $\mathcal{I}\mathcal{J}$ which finishes the proof of the lemma by setting $Y = V(\mathcal{I}\mathcal{J})$.

First, recall that the blow up of X in $\mathcal{I}\mathcal{J}$ is the same as the blow up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$, see Lemma 30.18.10. Hence it suffices to show that the blow up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$ agrees with the blow up of X' in Z' . We will show that

$$b^{-1}\mathcal{J}\mathcal{O}_{X'} = \mathcal{I}_E^d \mathcal{I}_{Z'}$$

as ideal sheaves on X'' . This will prove what we want as \mathcal{I}_E^d cuts out the effective Cartier divisor dE and we can use Lemmas 30.18.6 and 30.18.10.

To see the displayed equality of the ideals we may work locally. With notation $A, I, a \in I$ as in Lemma 30.18.2 we see that \mathcal{F} corresponds to an R -submodule $M \subset I^d$ mapping isomorphically to an ideal $J \subset R$. The condition $Z' = \underline{\text{Proj}}(\mathcal{A}/\mathcal{F}\mathcal{A})$ means that $Z' \cap \text{Spec}(A[\frac{I}{a}])$ is cut out by the ideal generated by the elements $m/a^d, m \in M$. Say the element $m \in M$ corresponds to the function $f \in J$. Then in the affine blowup algebra $A' = A[\frac{I}{a}]$ we see that $f = (a^d m)/a^d = a^d(m/a^d)$. Thus the equality holds. \square

30.19. Strict transform

In this section we briefly discuss strict transform under blowing up. Let S be a scheme and let $Z \subset S$ be a closed subscheme. Let $b : S' \rightarrow S$ be the blowing up of S in Z and denote $E \subset S'$ the exceptional divisor $E = b^{-1}Z$. In the following we will often consider a scheme X over S and form the cartesian diagram

$$\begin{array}{ccccc} \text{pr}_{S'}^{-1}E & \longrightarrow & X \times_S S' & \xrightarrow{\text{pr}_X} & X \\ \downarrow & & \downarrow \text{pr}_{S'} & & \downarrow f \\ E & \longrightarrow & S' & \longrightarrow & S \end{array}$$

Since E is an effective Cartier divisor (Lemma 30.18.4) we see that $\text{pr}_{S'}^{-1}E \subset X \times_S S'$ is locally principal (Lemma 30.9.10). Thus the complement of $\text{pr}_{S'}^{-1}E$ in $X \times_S S'$ is retrocompact (Lemma 30.9.3). Consequently, for a quasi-coherent $\mathcal{O}_{X \times_S S'}$ -module \mathcal{G} the subsheaf of sections supported on $\text{pr}_{S'}^{-1}E$ is a quasi-coherent submodule, see Properties, Lemma 27.22.5. If \mathcal{G} is a quasi-coherent sheaf of algebras, e.g., $\mathcal{G} = \mathcal{O}_{X \times_S S'}$, then this subsheaf is an ideal of \mathcal{G} .

Definition 30.19.1. With $Z \subset S$ and $f : X \rightarrow S$ as above.

- (1) Given a quasi-coherent \mathcal{O}_X -module \mathcal{F} the *strict transform* of \mathcal{F} with respect to the blowup of S in Z is the quotient \mathcal{F}' of $\text{pr}_X^* \mathcal{F}$ by the submodule of sections supported on $\text{pr}_{S'}^{-1} E$.
- (2) The *strict transform* of X is the closed subscheme $X' \subset X \times_S S'$ cut out by the quasi-coherent ideal of sections of $\mathcal{O}_{X \times_S S'}$ supported on $\text{pr}_{S'}^{-1} E$.

Note that taking the strict transform along a blowup depends on the closed subscheme used for the blowup (and not just on the morphism $S' \rightarrow S$). This notion is often used for closed subschemes of S . It turns out that the strict transform of X is a blowup of X .

Lemma 30.19.2. *In the situation of Definition 30.19.1.*

- (1) *The strict transform X' of X is the blowup of X in the closed subscheme $f^{-1}Z$ of X .*
- (2) *For a quasi-coherent \mathcal{O}_X -module \mathcal{F} the strict transform \mathcal{F}' is canonically isomorphic to the pushforward along $X' \rightarrow X \times_S S'$ of the strict transform of \mathcal{F} relative to the blowing up $X' \rightarrow X$.*

Proof. Let $X'' \rightarrow X$ be the blowup of X in $f^{-1}Z$. By the universal property of blowing up (Lemma 30.18.5) there exists a commutative diagram

$$\begin{array}{ccc} X'' & \longrightarrow & X \\ \downarrow & & \downarrow \\ S' & \longrightarrow & S \end{array}$$

whence a morphism $X'' \rightarrow X \times_S S'$. Thus the first assertion is that this morphism is a closed immersion with image X' . The question is local on X . Thus we may assume X and S are affine. Say that $S = \text{Spec}(A)$, $X = \text{Spec}(B)$, and Z is cut out by the ideal $I \subset A$. Set $J = IB$. The map $B \otimes_A \bigoplus_{n \geq 0} I^n \rightarrow \bigoplus_{n \geq 0} J^n$ defines a closed immersion $X'' \rightarrow X \times_S S'$, see Constructions, Lemmas 26.11.6 and 26.11.5. We omit the verification that this morphism is the same as the one constructed above from the universal property. Pick $a \in I$ corresponding to the affine open $\text{Spec}(A[\frac{I}{a}]) \subset S'$, see Lemma 30.18.2. The inverse image of $\text{Spec}(A[\frac{I}{a}])$ in the strict transform X' of X is the spectrum of

$$B' = (B \otimes_A A[\frac{I}{a}]) / a\text{-power-torsion}$$

On the other hand, letting $b \in J$ be the image of a we see that $\text{Spec}(B[\frac{J}{b}])$ is the inverse image of $\text{Spec}(A[\frac{I}{a}])$ in X'' . The ring map

$$B \otimes_A A[\frac{I}{a}] \longrightarrow B[\frac{J}{b}]$$

see Properties, Lemma 27.22.5. is surjective and annihilates a -power torsion as b is a nonzerodivisor in $B[\frac{J}{b}]$. Hence we obtain a surjective map $B' \rightarrow B[\frac{J}{b}]$. To see that the kernel is trivial, we construct an inverse map. Namely, let $z = y/b^n$ be an element of $B[\frac{J}{b}]$, i.e., $y \in J^n$. Write $y = \sum x_i b_i$ with $x_i \in I^n$ and $b_i \in B$. We map z to the class of $\sum b_i \otimes x_i / a^n$ in B' . This is well defined because an element of the kernel of the map $B \otimes_A I^n \rightarrow J^n$ is annihilated by a^n , hence maps to zero in B' . This shows that the open $\text{Spec}(B[\frac{J}{b}])$ maps isomorphically to the open subscheme $\text{pr}_{S'}^{-1}(\text{Spec}(A[\frac{I}{a}]))$ of X' . Thus $X'' \rightarrow X'$ is an isomorphism.

In the notation above, let \mathcal{F} correspond to the B -module N . The strict transform of \mathcal{F} corresponds to the $B \otimes_A A[\frac{I}{a}]$ -module

$$N' = (N \otimes_A A[\frac{I}{a}])/a\text{-power-torsion}$$

see Properties, Lemma 27.22.5. The strict transform of \mathcal{F} relative to the blowup of X in $f^{-1}Z$ corresponds to the $B[\frac{J}{b}]$ -module $N \otimes_B B[\frac{J}{b}]/b$ -power-torsion. In exactly the same way as above one proves that these two modules are isomorphic. Details omitted. \square

Lemma 30.19.3. *In the situation of Definition 30.19.1.*

- (1) *If X is flat over S at all points lying over Z , then the strict transform of X is equal to the base change $X \times_S S'$.*
- (2) *Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If \mathcal{F} is flat over S at all points lying over Z , then the strict transform \mathcal{F}' of \mathcal{F} is equal to the pullback $pr_X^* \mathcal{F}$.*

Proof. We will prove part (2) as it implies part (1) by the definition of the strict transform of a scheme over S . The question is local on X . Thus we may assume that $S = \text{Spec}(A)$, $X = \text{Spec}(B)$, and that \mathcal{F} corresponds to the B -module N . Then \mathcal{F}' over the open $\text{Spec}(B \otimes_A A[\frac{I}{a}])$ of $X \times_S S'$ corresponds to the module

$$N' = (N \otimes_A A[\frac{I}{a}])/a\text{-power-torsion}$$

see Properties, Lemma 27.22.5. Thus we have to show that the a -power-torsion of $N \otimes_A A[\frac{I}{a}]$ is zero. Let $y \in N \otimes_A A[\frac{I}{a}]$ with $a^n y = 0$. If $\mathfrak{q} \subset B$ is a prime and $a \notin \mathfrak{q}$, then y maps to zero in $(N \otimes_A A[\frac{I}{a}])_{\mathfrak{q}}$. On the other hand, if $a \in \mathfrak{q}$, then $N_{\mathfrak{q}}$ is a flat A -module and we see that $N_{\mathfrak{q}} \otimes_A A[\frac{I}{a}] = (N \otimes_A A[\frac{I}{a}])_{\mathfrak{q}}$ has no a -power torsion (as $A[\frac{I}{a}]$ doesn't). Hence y maps to zero in this localization as well. We conclude that y is zero by Algebra, Lemma 10.23.1. \square

Lemma 30.19.4. *Let S be a scheme. Let $Z \subset S$ be a closed subscheme. Let $b : S' \rightarrow S$ be the blowing up of Z in S . Let $g : X \rightarrow Y$ be an affine morphism of schemes over S . Let \mathcal{F} be a quasi-coherent sheaf on X . Let $g' : X \times_S S' \rightarrow Y \times_S S'$ be the base change of g . Let \mathcal{F}' be the strict transform of \mathcal{F} relative to b . Then $g'_* \mathcal{F}'$ is the strict transform of $g_* \mathcal{F}$.*

Proof. Observe that $g'_* pr_X^* \mathcal{F} = pr_Y^* g_* \mathcal{F}$ by Cohomology of Schemes, Lemma 29.5.1. Let $\mathcal{K} \subset pr_X^* \mathcal{F}$ be the subsheaf of sections supported in the inverse image of Z in $X \times_S S'$. By Properties, Lemma 27.22.7 the pushforward $g'_* \mathcal{K}$ is the subsheaf of sections of $pr_Y^* g_* \mathcal{F}$ supported in the inverse image of Z in $Y \times_S S'$. As g' is affine (Morphisms, Lemma 28.13.8) we see that g'_* is exact, hence we conclude. \square

Lemma 30.19.5. *Let S be a scheme. Let $Z \subset S$ be a closed subscheme. Let $D \subset S$ be an effective Cartier divisor. Let $Z' \subset S$ be the closed subscheme cut out by the product of the ideal sheaves of Z and D . Let $S' \rightarrow S$ be the blowup of S in Z .*

- (1) *The blowup of S in Z' is isomorphic to $S' \rightarrow S$.*
- (2) *Let $f : X \rightarrow S$ be a morphism of schemes and let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If \mathcal{F} has no nonzero local sections supported in $f^{-1}D$, then the strict transform of \mathcal{F} relative to the blowing up in Z agrees with the strict transform of \mathcal{F} relative to the blowing up of S in Z' .*

Proof. The first statement follows on combining Lemmas 30.18.10 and 30.18.6. Using Lemma 30.18.2 the second statement translates into the following algebra problem. Let A be a ring, $I \subset A$ an ideal, $x \in A$ a nonzerodivisor, and $a \in I$. Let M be an A -module whose x -torsion is zero. To show: the a -power torsion in $M \otimes_A A[\frac{I}{a}]$ is equal to the xa -power torsion. The reason for this is that the kernel and cokernel of the map $A \rightarrow A[\frac{I}{a}]$ is a -power torsion, so this map becomes an isomorphism after inverting a . Hence the kernel and cokernel of $M \rightarrow M \otimes_A A[\frac{I}{a}]$ are a -power torsion too. This implies the result. \square

Lemma 30.19.6. *Let S be a scheme. Let $Z \subset S$ be a closed subscheme. Let $b : S' \rightarrow S$ be the blowing up with center Z . Let $Z' \subset S'$ be a closed subscheme. Let $S'' \rightarrow S'$ be the blowing up with center Z' . Let $Y \subset S$ be a closed subscheme such that $Y = Z \cup b(Z')$ set theoretically and the composition $S'' \rightarrow S$ is isomorphic to the blowing up of S in Y . In this situation, given any scheme X over S and $\mathcal{F} \in QCoh(\mathcal{O}_X)$ we have*

- (1) *the strict transform of \mathcal{F} with respect to the blowing up of S in Y is equal to the strict transform with respect to the blowup $S'' \rightarrow S'$ in Z' of the strict transform of \mathcal{F} with respect to the blowup $S' \rightarrow S$ of S in Z , and*
- (2) *the strict transform of X with respect to the blowing up of S in Y is equal to the strict transform with respect to the blowup $S'' \rightarrow S'$ in Z' of the strict transform of X with respect to the blowup $S' \rightarrow S$ of S in Z .*

Proof. Let \mathcal{F}' be the strict transform of \mathcal{F} with respect to the blowup $S' \rightarrow S$ of S in Z . Let \mathcal{F}'' be the strict transform of \mathcal{F}' with respect to the blowup $S'' \rightarrow S'$ of S' in Z' . Let \mathcal{G} be the strict transform of \mathcal{F} with respect to the blowup $S'' \rightarrow S$ of S in Y . We also label the morphisms

$$\begin{array}{ccccc}
 X \times_S S'' & \xrightarrow{q} & X \times_S S' & \xrightarrow{p} & X \\
 \downarrow f'' & & \downarrow f' & & \downarrow f \\
 S'' & \longrightarrow & S' & \longrightarrow & S
 \end{array}$$

By definition there is a surjection $p^*\mathcal{F}' \rightarrow \mathcal{F}'$ and a surjection $q^*\mathcal{F}' \rightarrow \mathcal{F}''$ which combine by right exactness of q^* to a surjection $(p \circ q)^*\mathcal{F}' \rightarrow \mathcal{F}''$. Also we have the surjection $(p \circ q)^*\mathcal{F}' \rightarrow \mathcal{G}$. Thus it suffices to prove that these two surjections have the same kernel.

The kernel of the surjection $p^*\mathcal{F}' \rightarrow \mathcal{F}'$ is supported on $(f \circ p)^{-1}Z$, so this map is an isomorphism at points in the complement. Hence the kernel of $q^*p^*\mathcal{F}' \rightarrow q^*\mathcal{F}'$ is supported on $(f \circ p \circ q)^{-1}Z$. The kernel of $q^*\mathcal{F}' \rightarrow \mathcal{F}''$ is supported on $(f' \circ q)^{-1}Z'$. Combined we see that the kernel of $(p \circ q)^*\mathcal{F}' \rightarrow \mathcal{F}''$ is supported on $(f \circ p \circ q)^{-1}Z \cup (f' \circ q)^{-1}Z' = (f \circ p \circ q)^{-1}Y$. By construction of \mathcal{G} we see that we obtain a factorization $(p \circ q)^*\mathcal{F}' \rightarrow \mathcal{F}'' \rightarrow \mathcal{G}$. To finish the proof it suffices to show that \mathcal{F}'' has no nonzero (local) sections supported on $(f \circ p \circ q)^{-1}(Y) = (f \circ p \circ q)^{-1}Z \cup (f' \circ q)^{-1}Z'$. This follows from Lemma 30.19.5 applied to \mathcal{F}' on $X \times_S S'$ over S' , the closed subscheme Z' and the effective Cartier divisor $b^{-1}Z$. \square

Lemma 30.19.7. *In the situation of Definition 30.19.1. Suppose that*

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

is an exact sequence of quasi-coherent sheaves on X which remains exact after any base change $T \rightarrow S$. Then the strict transforms of \mathcal{F}_i' relative to any blowup $S' \rightarrow S$ form a short exact sequence $0 \rightarrow \mathcal{F}_1' \rightarrow \mathcal{F}_2' \rightarrow \mathcal{F}_3' \rightarrow 0$ too.

Proof. We may localize on S and X and assume both are affine. Then we may push \mathcal{F}_i to S , see Lemma 30.19.4. We may assume that our blowup is the morphism $1 : S \rightarrow S$ associated to an effective Cartier divisor $D \subset S$. Then the translation into algebra is the following: Suppose that A is a ring and $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is a universally exact sequence of A -modules. Let $a \in A$. Then the sequence

$$0 \rightarrow M_1/a\text{-power torsion} \rightarrow M_2/a\text{-power torsion} \rightarrow M_3/a\text{-power torsion} \rightarrow 0$$

is exact too. Namely, surjectivity of the last map and injectivity of the first map are immediate. The problem is exactness in the middle. Suppose that $x \in M_2$ maps to zero in M_3/a -power torsion. Then $y = a^n x \in M_1$ for some n . Then y maps to zero in $M_2/a^n M_2$. Since $M_1 \rightarrow M_2$ is universally injective we see that y maps to zero in $M_1/a^n M_1$. Thus $y = a^n z$ for some $z \in M_1$. Thus $a^n(x - y) = 0$. Hence y maps to the class of x in M_2/a -power torsion as desired. \square

30.20. Admissible blowups

To have a bit more control over our blowups we introduce the following standard terminology.

Definition 30.20.1. Let X be a scheme. Let $U \subset X$ be an open subscheme. A morphism $X' \rightarrow X$ is called a *U -admissible blowup* if there exists a closed immersion $Z \rightarrow X$ of finite presentation with Z disjoint from U such that X' is isomorphic to the blow up of X in Z .

We recall that $Z \rightarrow X$ is of finite presentation if and only if the ideal sheaf $\mathcal{I}_Z \subset \mathcal{O}_X$ is of finite type, see Morphisms, Lemma 28.22.7. In particular, a U -admissible blowup is a projective morphism, see Lemma 30.18.11. Note that there can be multiple centers which give rise to the same morphism. Hence the requirement is just the existence of some center disjoint from U which produces X' . Finally, as the morphism $b : X' \rightarrow X$ is an isomorphism over U (see Lemma 30.18.4) we will often abuse notation and think of U as an open subscheme of X' as well.

Lemma 30.20.2. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open subscheme. Let $b : X' \rightarrow X$ be a U -admissible blowup. Let $X'' \rightarrow X'$ be a U -admissible blowup. Then the composition $X'' \rightarrow X$ is a U -admissible blowup.*

Proof. Immediate from the more precise Lemma 30.18.12. \square

Lemma 30.20.3. *Let X be a quasi-compact and quasi-separated scheme. Let $U, V \subset X$ be quasi-compact open subschemes. Let $b : V' \rightarrow V$ be a $U \cap V$ -admissible blowup. Then there exists a U -admissible blowup $X' \rightarrow X$ whose restriction to V is V' .*

Proof. Let $\mathcal{I} \subset \mathcal{O}_V$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I})$ is disjoint from $U \cap V$ and such that V' is isomorphic to the blow up of V in \mathcal{I} . Let $\mathcal{I}' \subset \mathcal{O}_{U \cup V}$ be the quasi-coherent sheaf of ideals whose restriction to U is \mathcal{O}_U and whose restriction to V is \mathcal{I} (see Sheaves, Section 6.33). By Properties, Lemma 27.20.2 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ whose restriction to $U \cup V$ is \mathcal{I}' . The lemma follows. \square

Lemma 30.20.4. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open subscheme. Let $b_i : X_i \rightarrow X$, $i = 1, \dots, n$ be U -admissible blowups. There exists a U -admissible blowup $b : X' \rightarrow X$ such that (a) b factors as $X' \rightarrow X_i \rightarrow X$ for $i = 1, \dots, n$ and (b) each of the morphisms $X' \rightarrow X_i$ is a U -admissible blowup.*

Proof. Let $\mathcal{I}_i \subset \mathcal{O}_X$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}_i)$ is disjoint from U and such that X_i is isomorphic to the blow up of X in \mathcal{I}_i . Set $\mathcal{I} = \mathcal{I}_1 \cdot \dots \cdot \mathcal{I}_n$ and let X' be the blowup of X in \mathcal{I} . Then $X' \rightarrow X$ factors through b_i by Lemma 30.18.10. \square

Lemma 30.20.5. *Let X be a quasi-compact and quasi-separated scheme. Let U, V be quasi-compact disjoint open subschemes of X . Then there exist a $U \cup V$ -admissible blowup $b : X' \rightarrow X$ such that X' is a disjoint union of open subschemes $X' = X'_1 \amalg X'_2$ with $b^{-1}(U) \subset X'_1$ and $b^{-1}(V) \subset X'_2$.*

Proof. Choose a finite type quasi-coherent sheaf of ideals \mathcal{I} , resp. \mathcal{J} such that $X \setminus U = V(\mathcal{I})$, resp. $X \setminus V = V(\mathcal{J})$, see Properties, Lemma 27.22.1. Then $V(\mathcal{I}\mathcal{J}) = X$ set theoretically, hence $\mathcal{I}\mathcal{J}$ is a locally nilpotent sheaf of ideals. Since \mathcal{I} and \mathcal{J} are of finite type and X is quasi-compact there exists an $n > 0$ such that $\mathcal{I}^n \mathcal{J}^n = 0$. We may and do replace \mathcal{I} by \mathcal{I}^n and \mathcal{J} by \mathcal{J}^n . Whence $\mathcal{I}\mathcal{J} = 0$. Let $b : X' \rightarrow X$ be the blowing up in $\mathcal{I} + \mathcal{J}$. This is $U \cup V$ -admissible as $V(\mathcal{I} + \mathcal{J}) = X \setminus U \cup V$. We will show that X' is a disjoint union of open subschemes $X' = X'_1 \amalg X'_2$ such that $b^{-1}\mathcal{I}|_{X'_2} = 0$ and $b^{-1}\mathcal{J}|_{X'_1} = 0$ which will prove the lemma.

We will use the description of the blowing up in Lemma 30.18.2. Suppose that $U = \text{Spec}(A) \subset X$ is an affine open such that $\mathcal{I}|_U$, resp. $\mathcal{J}|_U$ corresponds to the finitely generated ideal $I \subset A$, resp. $J \subset A$. Then

$$b^{-1}(U) = \text{Proj}(A \oplus (I + J) \oplus (I + J)^2 \oplus \dots)$$

This is covered by the affine open subsets $A[\frac{I+J}{x}]$ and $A[\frac{I+J}{y}]$ with $x \in I$ and $y \in J$. Since $x \in I$ is a nonzerodivisor in $A[\frac{I+J}{x}]$ and $IJ = 0$ we see that $JA[\frac{I+J}{x}] = 0$. Since $y \in J$ is a nonzerodivisor in $A[\frac{I+J}{y}]$ and $IJ = 0$ we see that $IA[\frac{I+J}{y}] = 0$. Moreover,

$$\text{Spec}(A[\frac{I+J}{x}]) \cap \text{Spec}(A[\frac{I+J}{y}]) = \text{Spec}(A[\frac{I+J}{xy}]) = \emptyset$$

because xy is both a nonzerodivisor and zero. Thus $b^{-1}(U)$ is the disjoint union of the open subscheme U_1 defined as the union of the standard opens $\text{Spec}(A[\frac{I+J}{x}])$ for $x \in I$ and the open subscheme U_2 which is the union of the affine opens $\text{Spec}(A[\frac{I+J}{y}])$ for $y \in J$. We have seen that $b^{-1}\mathcal{I}\mathcal{O}_{X'}$ restricts to zero on U_2 and $b^{-1}\mathcal{J}\mathcal{O}_{X'}$ restricts to zero on U_1 . We omit the verification that these open subschemes glue to global open subschemes X'_1 and X'_2 . \square

Limits of Schemes

31.1. Introduction

In this chapter we put material related to limits of schemes. We mostly study limits of inverse systems over directed partially ordered sets with affine transition maps. We discuss absolute Noetherian approximation. We characterize schemes locally of finite presentation over a base as those whose associated functor of points is limit preserving. As an application of absolute Noetherian approximation we prove that the image of an affine under an integral morphism is affine. Moreover, we prove some very general variants of Chow's lemma. A basic reference is [DG67].

31.2. Directed limits of schemes with affine transition maps

In this section we construct the limit.

Lemma 31.2.1. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I . If all the schemes S_i are affine, then the limit $S = \lim_i S_i$ exists in the category of schemes. In fact S is affine and $S = \text{Spec}(\text{colim}_i R_i)$ with $R_i = \Gamma(S_i, \mathcal{O})$.*

Proof. Just define $S = \text{Spec}(\text{colim}_i R_i)$. It follows from Schemes, Lemma 25.6.4 that S is the limit even in the category of locally ringed spaces. \square

Lemma 31.2.2. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I . If all the morphisms $f_{ii'} : S_i \rightarrow S_{i'}$ are affine, then the limit $S = \lim_i S_i$ exists in the category of schemes. Moreover,*

- (1) *each of the morphisms $f_i : S \rightarrow S_i$ is affine,*
- (2) *for an element $0 \in I$ and any open subscheme $U_0 \subset S_0$ we have*

$$f_0^{-1}(U_0) = \lim_{i \geq 0} f_{i0}^{-1}(U_0)$$

in the category of schemes.

Proof. Choose an element $0 \in I$. Note that I is nonempty as the limit is directed. For every $i \geq 0$ consider the quasi-coherent sheaf of \mathcal{O}_{S_0} -algebras $\mathcal{A}_i = f_{i0,*}\mathcal{O}_{S_i}$. Recall that $S_i = \text{Spec}_{S_0}(\mathcal{A}_i)$, see Morphisms, Lemma 28.13.3. Set $\mathcal{A} = \text{colim}_{i \geq 0} \mathcal{A}_i$. This is a quasi-coherent sheaf of \mathcal{O}_{S_0} -algebras, see Schemes, Section 25.24. Set $S = \text{Spec}_{S_0}(\mathcal{A})$. By Morphisms, Lemma 28.13.5 we get for $i \geq 0$ morphisms $f_i : S \rightarrow S_i$ compatible with the transition morphisms. Note that the morphisms f_i are affine by Morphisms, Lemma 28.13.11 for example. By Lemma 31.2.1 above we see that for any affine open $U_0 \subset S_0$ the inverse image $U = f_0^{-1}(U_0) \subset S$ is the limit of the system of opens $U_i = f_{i0}^{-1}(U_0)$, $i \geq 0$ in the category of schemes.

Let T be a scheme. Let $g_i : T \rightarrow S_i$ be a compatible system of morphisms. To show that $S = \lim_i S_i$ we have to prove there is a unique morphism $g : T \rightarrow S$

with $g_i = f_i \circ g$ for all $i \in I$. For every $t \in T$ there exists an affine open $U_0 \subset S_0$ containing $g_0(t)$. Let $V \subset g_0^{-1}(U_0)$ be an affine open neighbourhood containing t . By the remarks above we obtain a unique morphism $g_V : V \rightarrow U = f_0^{-1}(U_0)$ such that $f_i \circ g_V = g_i|_{U_i}$ for all i . The open sets $V \subset T$ so constructed form a basis for the topology of T . The morphisms g_V glue to a morphism $g : T \rightarrow S$ because of the uniqueness property. This gives the desired morphism $g : T \rightarrow S$.

The final statement is clear from the construction of the limit above. □

Lemma 31.2.3. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I . Assume all the morphisms $f_{ii'} : S_i \rightarrow S_{i'}$ are affine, Let $S = \lim_i S_i$. Let $0 \in I$. Suppose that T is a scheme over S_0 . Then*

$$T \times_{S_0} S = \lim_{i \geq 0} T \times_{S_0} S_i$$

Proof. The right hand side is a scheme by Lemma 31.2.2. The equality is formal, see Categories, Lemma 4.14.9. □

31.3. Descending properties

In this section we work in the following situation.

Situation 31.3.1. Let $S = \lim_{i \in I} S_i$ be the limit of a directed system of schemes with affine transition morphisms $f_{i'i} : S_{i'} \rightarrow S_i$ (Lemma 31.2.2). We assume that S_i is quasi-compact and quasi-separated for all $i \in I$. We denote $f_i : S \rightarrow S_i$ the projection. We also choose an element $0 \in I$.

The type of result we are looking for is the following: If we have an object over S , then for some i there is a similar object over S_i .

Lemma 31.3.2. *In Situation 31.3.1.*

- (1) *We have $S_{set} = \lim_i S_{i,set}$ where S_{set} indicates the underlying set of the scheme S .*
- (2) *We have $S_{top} = \lim_i S_{i,top}$ where S_{top} indicates the underlying topological space of the scheme S .*
- (3) *If $s, s' \in S$ and s' is not a specialization of s then for some $i \in I$ the image $s'_i \in S_i$ of s' is not a specialization of the image $s_i \in S_i$ of s .*
- (4) *Add more easy facts on topology of S here. (Requirement: whatever is added should be easy in the affine case.)*

Proof. Proof of (1). Pick $i \in I$. Take $U_i \subset S_i$ an affine open. Denote $U_{i'} = f_{i'i}^{-1}(U_i)$ and $U = f_i^{-1}(U_i)$. Suppose we can show that $U_{set} = \lim_{i' \geq i} U_{i',set}$. Then assertion (1) follows by a simple argument using an affine covering of S_i . Hence we may assume all S_i and S affine. This reduces us to the following algebra question: Suppose given a system of rings $(A_i, \varphi_{ii'})$ over I . Set $A = \text{colim}_i A_i$ with canonical maps $\varphi_i : A_i \rightarrow A$. Then

$$\text{Spec}(A) = \lim_i \text{Spec}(A_i)$$

Namely, suppose that we are given primes $\mathfrak{p}_i \subset A_i$ such that $\mathfrak{p}_i = \varphi_{ii'}^{-1}(\mathfrak{p}_{i'})$ for all $i' \geq i$. Then we simply set

$$\mathfrak{p} = \{x \in A \mid \exists i, x_i \in \mathfrak{p}_i \text{ with } \varphi_i(x_i) = x\}$$

It is clear that this is an ideal and has the property that $\varphi_i^{-1}(\mathfrak{p}) = \mathfrak{p}_i$. Then it follows easily that it is a prime ideal as well. This proves (1).

Proof of (2). Choose an i and a finite affine open covering $S_i = U_{1,i} \cup \dots \cup U_{n,i}$. If we can show the topology on $f_i^{-1}(U_{k,i}) = \lim_{i' \geq i} f_{i'}^{-1}(U_{k,i})$ is the limit topology, then the same is true for S . Hence we may assume that S and S_i are affine. Say $S_i = \text{Spec}(A_i)$ and $S = \text{Spec}(A)$ with $A = \text{colim } A_i$. A basis for the topology of $\text{Spec}(A)$ is given by the standard opens $D(g)$, $g \in A$. Since each $g \in A$ is the image of some $g_i \in A_i$ for some i we see that $D(g)$ is the inverse image of $D(g_i)$ by f_i . The desired result now follows from the criterion of Topology, Lemma 5.13.3.

Proof of (3). Pick $i \in I$. Pick an affine open $U_i \subset S_i$ containing $f_i(s')$. If $f_i(s) \notin S_i$ then we are done. Hence reduce to the affine case by considering the inverse images of U_i as above. This reduces us to the following algebra question: Suppose given a system of rings $(A_i, \varphi_{ii'})$ over I . Set $A = \text{colim}_i A_i$ with canonical maps $\varphi_i : A_i \rightarrow A$. Suppose given primes $\mathfrak{p}, \mathfrak{p}'$ of A . Suppose that $\mathfrak{p} \not\subset \mathfrak{p}'$. Then for some i we have $\varphi_i^{-1}(\mathfrak{p}) \not\subset \varphi_i^{-1}(\mathfrak{p}')$. This is clear. \square

Lemma 31.3.3. *In Situation 31.3.1. Suppose that \mathcal{F}_0 is a quasi-coherent sheaf on S_0 . Set $\mathcal{F}_i = f_{i0}^* \mathcal{F}_0$ for $i \geq 0$ and set $\mathcal{F} = f_0^* \mathcal{F}_0$. Then*

$$\Gamma(S, \mathcal{F}) = \text{colim}_{i \geq 0} \Gamma(S_i, \mathcal{F}_i)$$

Proof. Write $\mathcal{A}_j = f_{j0,*} \mathcal{O}_{S_j}$. This is a quasi-coherent sheaf of \mathcal{O}_{S_0} -algebras (see Morphisms, Lemma 28.13.5) and S_i is the relative spectrum of \mathcal{A}_i over S_0 . In the proof of Lemma 31.2.2 we constructed S as the relative spectrum of $\mathcal{A} = \text{colim}_{i \geq 0} \mathcal{A}_i$ over S_0 . Set

$$\mathcal{M}_i = \mathcal{F}_0 \otimes_{\mathcal{O}_{S_0}} \mathcal{A}_i$$

and

$$\mathcal{M} = \mathcal{F}_0 \otimes_{\mathcal{O}_{S_0}} \mathcal{A}.$$

Then we have $f_{i0,*} \mathcal{F}_i = \mathcal{M}_i$ and $f_{0,*} \mathcal{F} = \mathcal{M}$. Since \mathcal{A} is the colimit of the sheaves \mathcal{A}_i and since tensor product commutes with directed colimits, we conclude that $\mathcal{M} = \text{colim}_{i \geq 0} \mathcal{M}_i$. Since S_0 is quasi-compact and quasi-separated we see that

$$\begin{aligned} \Gamma(S, \mathcal{F}) &= \Gamma(S_0, \mathcal{M}) \\ &= \Gamma(S_0, \text{colim}_{i \geq 0} \mathcal{M}_i) \\ &= \text{colim}_{i \geq 0} \Gamma(S_0, \mathcal{M}_i) \\ &= \text{colim}_{i \geq 0} \Gamma(S_i, \mathcal{F}_i) \end{aligned}$$

see Sheaves, Lemma 6.29.1 and Topology, Lemma 5.26.1 for the middle equality. \square

Lemma 31.3.4. *In Situation 31.3.1. If all the schemes S_i are nonempty, then the limit $S = \lim_i S_i$ is nonempty.*

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience write $S_0 = S_{i_0}$ and $i_0 = 0$. Choose an affine open covering $S_0 = \bigcup_{j=1, \dots, m} U_j$. Since I is directed there exists a $j \in \{1, \dots, m\}$ such that $f_{i_0}^{-1}(U_j) \neq \emptyset$ for all $i \geq 0$. Hence $\lim_{i \geq 0} f_{i_0}^{-1}(U_j)$ is not empty since a directed colimit of nonzero rings is nonzero (because $1 \neq 0$). As $\lim_{i \geq 0} f_{i_0}^{-1}(U_j)$ is an open subscheme of the limit we win. \square

Lemma 31.3.5. *In Situation 31.3.1. Suppose for each i we are given a nonempty closed subset $Z_i \subset S_i$ with $f_{ii'}(Z_i) \subset Z_{i'}$. Then there exists a point $s \in S$ with $f_i(s) \in Z_i$ for all i .*

Proof. Let $Z_i \subset S_i$ also denote the reduced closed subscheme associated to Z_i , see Schemes, Definition 25.12.5. A closed immersion is affine, and a composition of affine morphisms is affine (see Morphisms, Lemmas 28.13.9 and 28.13.7), and hence $Z_i \rightarrow S_{i'}$ is affine when $i \geq i'$. We conclude that the morphism $f_{ii'} : Z_i \rightarrow Z_{i'}$ is affine by Morphisms, Lemma 28.13.11. Each of the schemes Z_i is quasi-compact as a closed subscheme of a quasi-compact scheme. Hence we may apply Lemma 31.3.4 to see that $Z = \lim_i Z_i$ is nonempty. Since there is a canonical morphism $Z \rightarrow S$ we win. \square

Lemma 31.3.6. *In Situation 31.3.1. Suppose we are given an i and a morphism $T \rightarrow S_i$ such that*

- (1) $T \times_{S_i} S = \emptyset$, and
- (2) T is quasi-compact.

Then $T \times_{S_i} S_{i'} = \emptyset$ for all sufficiently large i' .

Proof. By Lemma 31.2.3 we see that $T \times_{S_i} S = \lim_{i' \geq i} T \times_{S_i} S_{i'}$. Hence the result follows from Lemma 31.3.4. \square

Lemma 31.3.7. *In Situation 31.3.1. Suppose we are given an i and a locally constructible subset $E \subset S_i$ such that $f_i(S) \subset E$. Then $f_{ii'}(S_{i'}) \subset E$ for all sufficiently large i' .*

Proof. Writing S_i as a finite union of open affine subschemes reduces the question to the case that S_i is affine and E is constructible, see Lemma 31.2.2 and Properties, Lemma 27.2.1. In this case the complement $S_i \setminus E$ is constructible too. Hence there exists an affine scheme T and a morphism $T \rightarrow S_i$ whose image is $S_i \setminus E$, see Algebra, Lemma 10.28.3. By Lemma 31.3.6 we see that $T \times_{S_i} S_{i'}$ is empty for all sufficiently large i' , and hence $f_{ii'}(S_{i'}) \subset E$ for all sufficiently large i' . \square

Lemma 31.3.8. *In Situation 31.3.1 we have the following:*

- (1) *Given any quasi-compact open $V \subset S = \lim_i S_i$ there exists an $i \in I$ and a quasi-compact open $V_i \subset S_i$ such that $f_i^{-1}(V_i) = V$.*
- (2) *Given $V_i \subset S_i$ and $V_{i'} \subset S_{i'}$ quasi-compact opens such that $f_i^{-1}(V_i) = f_{i'}^{-1}(V_{i'})$ there exists an index $i'' \geq i, i'$ such that $f_{i''i}^{-1}(V_i) = f_{i''i'}^{-1}(V_{i'})$.*
- (3) *If $V_{1,i}, \dots, V_{n,i} \subset S_i$ are quasi-compact opens and $S = f_i^{-1}(V_{1,i}) \cup \dots \cup f_i^{-1}(V_{n,i})$ then $S_{i'} = f_{i'i}^{-1}(V_{1,i}) \cup \dots \cup f_{i'i}^{-1}(V_{n,i})$ for some $i' \geq i$.*

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience we write $S_0 = S_{i_0}$ and $i_0 = 0$. Choose an affine open covering $S_0 = U_{1,0} \cup \dots \cup U_{m,0}$. Denote $U_{j,i} \subset S_i$ the inverse image of $U_{j,0}$ under the transition morphism for $i \geq 0$. Denote U_j the inverse image of $U_{j,0}$ in S . Note that $U_j = \lim_i U_{j,i}$ is a limit of affine schemes.

We first prove the uniqueness statement: Let $V_i \subset S_i$ and $V_{i'} \subset S_{i'}$ quasi-compact opens such that $f_i^{-1}(V_i) = f_{i'}^{-1}(V_{i'})$. It suffices to show that $f_{i''i}^{-1}(V_i \cap U_{j,i''})$ and $f_{i''i'}^{-1}(V_{i'} \cap U_{j,i''})$ become equal for i'' large enough. Hence we reduce to the case of a limit of affine schemes. In this case write $S = \text{Spec}(R)$ and $S_i = \text{Spec}(R_i)$ for all $i \in I$. We may write $V_i = S_i \setminus V(h_1, \dots, h_m)$ and $V_{i'} = S_{i'} \setminus V(g_1, \dots, g_n)$. The assumption means that the ideals $\sum g_j R$ and $\sum h_j R$ have the same radical in R . This means that $g_j^N = \sum a_{jj'} h_{j'}$ and $h_j^N = \sum b_{jj'} g_{j'}$ for some $N \gg 0$ and $a_{jj'}$ and $b_{jj'}$ in R . Since $R = \text{colim}_i R_i$ we can choose an index $i'' \geq i$ such that the

equations $g_j^N = \sum a_{jj'} h_{j'}$ and $h_j^N = \sum b_{jj'} g_{j'}$ hold in $R_{i''}$ for some $a_{jj'}$ and $b_{jj'}$ in $R_{i''}$. This implies that the ideals $\sum g_j R_{i''}$ and $\sum h_j R_{i''}$ have the same radical in $R_{i''}$ as desired.

We prove existence. We may apply the uniqueness statement to the limit of schemes $U_{j_1} \cap U_{j_2} = \lim_i U_{j_1,i} \cap U_{j_2,i}$ since these are still quasi-compact due to the fact that the S_i were assumed quasi-separated. Hence it is enough to prove existence in the affine case. In this case write $S = \text{Spec}(R)$ and $S_i = \text{Spec}(R_i)$ for all $i \in I$. Then $V = S \setminus V(g_1, \dots, g_n)$ for some $g_1, \dots, g_n \in R$. Choose any i large enough so that each of the g_j comes from an element $g_{j,i} \in R_i$ and take $V_i = S_i \setminus V(g_{1,i}, \dots, g_{n,i})$.

The statement on coverings follows from the uniqueness statement for the opens $V_{1,i} \cup \dots \cup V_{n,i}$ and S_i of S_i . □

Lemma 31.3.9. *In Situation 31.3.1 if S is quasi-affine, then for some $i_0 \in I$ the schemes S_i for $i \geq i_0$ are quasi-affine.*

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience we write $S_0 = S_{i_0}$ and $i_0 = 0$. Let $s \in S$. We may choose an affine open $U_0 \subset S_0$ containing $f_0(s)$. Since S is quasi-affine we may choose an element $a \in \Gamma(S, \mathcal{O}_S)$ such that $s \in D(a) \subset f_0^{-1}(U_0)$, and such that $D(a)$ is affine. By Lemma 31.3.3 there exists an $i \geq 0$ such that a comes from an element $a_i \in \Gamma(S_i, \mathcal{O}_{S_i})$. For any index $j \geq i$ we denote a_j the image of a_i in the global sections of the structure sheaf of S_j . Consider the opens $D(a_j) \subset S_j$ and $U_j = f_j^{-1}(U_0)$. Note that U_j is affine and $D(a_j)$ is a quasi-compact open of S_j , see Properties, Lemma 27.24.4 for example. Hence we may apply Lemma 31.3.8 to the opens U_j and $U_j \cup D(a_j)$ to conclude that $D(a_j) \subset U_j$ for some $j \geq i$. For such an index j we see that $D(a_j) \subset S_j$ is an affine open (because $D(a_j)$ is a standard affine open of the affine open U_j) containing the image $f_j(s)$.

We conclude that for every $s \in S$ there exist an index $i \in I$, and a global section $a \in \Gamma(S_i, \mathcal{O}_{S_i})$ such that $D(a) \subset S_i$ is an affine open containing $f_i(s)$. Because S is quasi-compact we may choose a single index $i \in I$ and global sections $a_1, \dots, a_m \in \Gamma(S_i, \mathcal{O}_{S_i})$ such that each $D(a_j) \subset S_i$ is affine open and such that $f_i : S \rightarrow S_i$ has image contained in the union $W_i = \bigcup_{j=1, \dots, m} D(a_j)$. For $i' \geq i$ set $W_{i'} = f_{i'}^{-1}(W_i)$. Since $f_i^{-1}(W_i)$ is all of S we see (by Lemma 31.3.8 again) that for a suitable $i' \geq i$ we have $S_{i'} = W_{i'}$. Thus we may replace i by i' and assume that $S_i = \bigcup_{j=1, \dots, m} D(a_j)$. This implies that \mathcal{O}_{S_i} is an ample invertible sheaf on S_i (see Properties, Definition 27.24.1) and hence that S_i is quasi-affine, see Properties, Lemma 27.25.1. Hence we win. □

Lemma 31.3.10. *In Situation 31.3.1 if S is affine, then for some $i_0 \in I$ the schemes S_i for $i \geq i_0$ are affine.*

Proof. By Lemma 31.3.9 we may assume that S_0 is quasi-affine for some $0 \in I$. Set $R_0 = \Gamma(S_0, \mathcal{O}_{S_0})$. Then S_0 is a quasi-compact open of $T_0 = \text{Spec}(R_0)$. Denote $j_0 : S_0 \rightarrow T_0$ the corresponding quasi-compact open immersion. For $i \geq 0$ set $\mathcal{A}_i = f_{0i,*} \mathcal{O}_{S_i}$. Since f_{0i} is affine we see that $S_i = \text{Spec}_{S_0}(\mathcal{A}_i)$. Set $T_i = \text{Spec}_{T_0}(j_{0,*} \mathcal{A}_i)$. Then $T_i \rightarrow T_0$ is affine, hence T_i is affine. Thus T_i is the spectrum of

$$R_i = \Gamma(T_0, j_{0,*} \mathcal{A}_i) = \Gamma(S_0, \mathcal{A}_i) = \Gamma(S_i, \mathcal{O}_{S_i}).$$

Write $S = \text{Spec}(R)$. We have $R = \text{colim}_i R_i$ by Lemma 31.3.3. Hence also $S = \text{lim}_i T_i$. As formation of the relative spectrum commutes with base change, the inverse image of the open $S_0 \subset T_0$ in T_i is S_i . Let $Z_0 = T_0 \setminus S_0$ and let $Z_i \subset T_i$ be the inverse image of Z_0 . As $S_i = T_i \setminus Z_i$, it suffices to show that Z_i is empty for some i . Assume Z_i is nonempty for all i to get a contradiction. By Lemma 31.3.5 there exists a point s of $S = \text{lim}_i T_i$ which maps to a point of Z_i for every i . But $S = \text{lim}_i S_i$, and hence we arrive at a contradiction by Lemma 31.3.2. \square

Lemma 31.3.11. *In Situation 31.3.1 if S is separated, then for some $i_0 \in I$ the schemes S_i for $i \geq i_0$ are separated.*

Proof. Choose a finite affine open covering $S_0 = U_{0,1} \cup \dots \cup U_{0,m}$. Set $U_{i,j} \subset S_i$ and $U_j \subset S$ equal to the inverse image of $U_{0,j}$. Note that $U_{i,j}$ and U_j are affine. As S is separated the intersections $U_{j_1} \cap U_{j_2}$ are affine. Since $U_{j_1} \cap U_{j_2} = \text{lim}_{i \geq 0} U_{i,j_1} \cap U_{i,j_2}$ we see that $U_{i,j_1} \cap U_{i,j_2}$ is affine for large i by Lemma 31.3.10. To show that S_i is separated for large i it now suffices to show that

$$\mathcal{O}_{S_i}(V_{i,j_1}) \otimes_{\mathcal{O}_S(S)} \mathcal{O}_{S_i}(V_{i,j_2}) \longrightarrow \mathcal{O}_{S_i}(V_{i,j_1} \cap V_{i,j_2})$$

is surjective for large i (Schemes, Lemma 25.21.8).

To get rid of the annoying indices, assume we have affine opens $U, V \subset S_0$ such that $U \cap V$ is affine too. Let $U_i, V_i \subset S_i$, resp. $U, V \subset S$ be the inverse images. We have to show that $\mathcal{O}(U_i) \otimes \mathcal{O}(V_i) \rightarrow \mathcal{O}(U_i \cap V_i)$ is surjective for i large enough and we know that $\mathcal{O}(U) \otimes \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$ is surjective. Note that $\mathcal{O}(U_0) \otimes \mathcal{O}(V_0) \rightarrow \mathcal{O}(U_0 \cap V_0)$ is of finite type, as the diagonal morphism $S_i \rightarrow S_i \times S_i$ is an immersion (Schemes, Lemma 25.21.2) hence locally of finite type (Morphisms, Lemmas 28.16.2 and 28.16.5). Thus we can choose elements $f_{0,1}, \dots, f_{0,n} \in \mathcal{O}(U_0 \cap V_0)$ which generate $\mathcal{O}(U_0 \cap V_0)$ over $\mathcal{O}(U_0) \otimes \mathcal{O}(V_0)$. Observe that for $i \geq 0$ the diagram of schemes

$$\begin{array}{ccc} U_i \cap V_i & \longrightarrow & U_i \\ \downarrow & & \downarrow \\ U_0 \cap V_0 & \longrightarrow & U_0 \end{array}$$

is cartesian. Thus we see that the images $f_{i,1}, \dots, f_{i,n} \in \mathcal{O}(U_i \cap V_i)$ generate $\mathcal{O}(U_i \cap V_i)$ over $\mathcal{O}(U_i) \otimes \mathcal{O}(V_0)$ and a fortiori over $\mathcal{O}(U_i) \otimes \mathcal{O}(V_i)$. By assumption the images $f_1, \dots, f_n \in \mathcal{O}(U \cap V)$ are in the image of the map $\mathcal{O}(U) \otimes \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$. Since $\mathcal{O}(U) \otimes \mathcal{O}(V) = \text{colim } \mathcal{O}(U_i) \otimes \mathcal{O}(V_i)$ we see that they are in the image of the map at some finite level and the lemma is proved. \square

Lemma 31.3.12. *In Situation 31.3.1 let \mathcal{L}_0 be an invertible sheaf of modules on S_0 . If the pullback \mathcal{L} to S is ample, then for some $i \in I$ the pullback \mathcal{L}_i to S_i is ample.*

Proof. The assumption means there are finitely many sections $s_1, \dots, s_m \in \Gamma(S, \mathcal{L})$ such that S_{s_j} is affine and such that $S = \bigcup S_{s_j}$, see Properties, Definition 27.24.1. By Lemma 31.3.3 we can find an $i \in I$ and sections $s_{i,j} \in \Gamma(S_i, \mathcal{L}_i)$ mapping to s_j . By Lemma 31.3.10 we may, after increasing i , assume that $(S_i)_{s_{i,j}}$ is affine for $j = 1, \dots, m$. By Lemma 31.3.8 we may, after increasing i a last time, assume that $S_i = \bigcup (S_i)_{s_{i,j}}$. Then \mathcal{L}_i is ample by definition. \square

Lemma 31.3.13. *Let S be a scheme. Let $X = \lim X_i$ be a directed limit of schemes over S with affine transition morphisms. Let $Y \rightarrow X$ be a morphism of schemes over S .*

- (1) *If $Y \rightarrow X$ is a closed immersion, X_i quasi-compact, and Y locally of finite type over S , then $Y \rightarrow X_i$ is a closed immersion for i large enough.*
- (2) *If $Y \rightarrow X$ is an immersion, X_i quasi-separated, $Y \rightarrow S$ locally of finite type, and Y quasi-compact, then $Y \rightarrow X_i$ is an immersion for i large enough.*

Proof. Proof of (1). Choose $0 \in I$ and a finite affine open covering $X_0 = U_{0,1} \cup \dots \cup U_{0,m}$ with the property that $U_{0,j}$ maps into an affine open $W_j \subset S$. Let $V_j \subset Y$, resp. $U_{i,j} \subset X_i$, $i \geq 0$, resp. $U_j \subset X$ be the inverse image of $U_{0,j}$. It suffices to prove that $V_j \rightarrow U_{i,j}$ is a closed immersion for i sufficiently large and we know that $V_j \rightarrow U_j$ is a closed immersion. Thus we reduce to the following algebra fact: If $A = \text{colim } A_i$ is a directed colimit of R -algebras, $A \rightarrow B$ is a surjection of R -algebras, and B is a finitely generated R -algebra, then $A_i \rightarrow B$ is surjective for i sufficiently large.

Proof of (2). Choose $0 \in I$. Choose a quasi-compact open $X'_0 \subset X_0$ such that $Y \rightarrow X_0$ factors through X'_0 . After replacing X_i by the inverse image of X'_0 for $i \geq 0$ we may assume all X_i are quasi-compact and quasi-separated. Let $U \subset X$ be a quasi-compact open such that $Y \rightarrow X$ factors through a closed immersion $Y \rightarrow U$ (U exists as Y is quasi-compact). By Lemma 31.3.8 we may assume that $U = \lim U_i$ with $U_i \subset X_i$ quasi-compact open. By part (1) we see that $Y \rightarrow U_i$ is a closed immersion for some i . Thus (2) holds. \square

Lemma 31.3.14. *Let S be a scheme. Let $X = \lim X_i$ be a directed limit of schemes over S with affine transition morphisms. Assume*

- (1) *S quasi-separated,*
- (2) *X_i quasi-compact and quasi-separated,*
- (3) *$X \rightarrow S$ separated.*

Then $X_i \rightarrow S$ is separated for all i large enough.

Proof. Let $0 \in I$. Note that I is nonempty as the limit is directed. As X_0 is quasi-compact we can find finitely many affine opens $U_1, \dots, U_n \subset S$ such that $X_0 \rightarrow S$ maps into $U_1 \cup \dots \cup U_n$. Denote $h_i : X_i \rightarrow S$ the structure morphism. It suffices to check that for some $i \geq 0$ the morphisms $h_i^{-1}(U_j) \rightarrow U_j$ are separated for $j = 1, \dots, n$. Since S is quasi-separated the morphisms $U_j \rightarrow S$ are quasi-compact. Hence $h_i^{-1}(U_j)$ is quasi-compact and quasi-separated. In this way we reduce to the case S affine. In this case we have to show that X_i is separated and we know that X is separated. Thus the lemma follows from Lemma 31.3.11. \square

Lemma 31.3.15. *Let S be a scheme. Let $X = \lim X_i$ be a directed limit of schemes over S with affine transition morphisms. Assume*

- (1) *S quasi-compact and quasi-separated,*
- (2) *X_i quasi-compact and quasi-separated,*
- (3) *$X \rightarrow S$ affine.*

Then $X_i \rightarrow S$ is affine for i large enough.

Proof. Choose a finite affine open covering $S = \bigcup_{j=1, \dots, n} V_j$. Denote $f : X \rightarrow S$ and $f_i : X_i \rightarrow S$ the structure morphisms. For each j the scheme $f^{-1}(V_j) =$

$\lim_i f_i^{-1}(V_j)$ is affine (as a finite morphism is affine by definition). Hence by Lemma 31.3.10 there exists an $i \in I$ such that each $f_i^{-1}(V_j)$ is affine. In other words, $f_i : X_i \rightarrow S$ is affine for i large enough, see Morphisms, Lemma 28.13.3. \square

Lemma 31.3.16. *Let S be a scheme. Let $X = \lim X_i$ be a directed limit of schemes over S with affine transition morphisms. Assume*

- (1) S quasi-compact and quasi-separated,
- (2) X_i quasi-compact and quasi-separated,
- (3) the transition morphisms $X_{i'} \rightarrow X_i$ are finite,
- (4) $X_i \rightarrow S$ locally of finite type
- (5) $X \rightarrow S$ integral.

Then $X_i \rightarrow S$ is finite for i large enough.

Proof. By Lemma 31.3.15 we may assume $X_i \rightarrow S$ is affine for all i . Choose a finite affine open covering $S = \bigcup_{j=1, \dots, n} V_j$. Denote $f : X \rightarrow S$ and $f_i : X_i \rightarrow S$ the structure morphisms. It suffices to show that there exists an i such that $f_i^{-1}(V_j)$ is finite over V_j for $j = 1, \dots, m$ (Morphisms, Lemma 28.44.3). Namely, for $i' \geq i$ the composition $X_{i'} \rightarrow X_i \rightarrow S$ will be finite as a composition of finite morphisms (Morphisms, Lemma 28.44.5). This reduces us to the affine case: Let R be a ring and $A = \operatorname{colim} A_i$ with $R \rightarrow A$ integral and $A_i \rightarrow A_{i'}$ finite for all $i \leq i'$. Moreover $R \rightarrow A_i$ is of finite type for all i . Goal: Show that A_i is finite over R for some i . To prove this choose an $i \in I$ and pick generators $x_1, \dots, x_m \in A_i$ of A_i as an R -algebra. Since A is integral over R we can find monic polynomials $P_j \in R[T]$ such that $P_j(x_j) = 0$ in A . Thus there exists an $i' \geq i$ such that $P_j(x_j) = 0$ in $A_{i'}$ for $j = 1, \dots, m$. Then the image A'_i of A_i in $A_{i'}$ is finite over R by Algebra, Lemma 10.35.5. Since $A'_i \subset A_{i'}$ is finite too we conclude that $A_{i'}$ is finite over R by Algebra, Lemma 10.7.3. \square

Lemma 31.3.17. *Let S be a scheme. Let $X = \lim X_i$ be a directed limit of schemes over S with affine transition morphisms. Assume*

- (1) S quasi-compact and quasi-separated,
- (2) X_i quasi-compact and quasi-separated,
- (3) the transition morphisms $X_{i'} \rightarrow X_i$ are closed immersions,
- (4) $X_i \rightarrow S$ locally of finite type
- (5) $X \rightarrow S$ a closed immersion.

Then $X_i \rightarrow S$ is a closed immersion for i large enough.

Proof. By Lemma 31.3.15 we may assume $X_i \rightarrow S$ is affine for all i . Choose a finite affine open covering $S = \bigcup_{j=1, \dots, n} V_j$. Denote $f : X \rightarrow S$ and $f_i : X_i \rightarrow S$ the structure morphisms. It suffices to show that there exists an i such that $f_i^{-1}(V_j)$ is a closed subscheme of V_j for $j = 1, \dots, m$ (Morphisms, Lemma 28.2.1). This reduces us to the affine case: Let R be a ring and $A = \operatorname{colim} A_i$ with $R \rightarrow A$ surjective and $A_i \rightarrow A_{i'}$ surjective for all $i \leq i'$. Moreover $R \rightarrow A_i$ is of finite type for all i . Goal: Show that $R \rightarrow A_i$ is surjective for some i . To prove this choose an $i \in I$ and pick generators $x_1, \dots, x_m \in A_i$ of A_i as an R -algebra. Since $R \rightarrow A$ is surjective we can find $r_j \in R$ such that r_j maps to x_j in A . Thus there exists an $i' \geq i$ such that r_j maps to the image of x_j in $A_{i'}$ for $j = 1, \dots, m$. Since $A_i \rightarrow A_{i'}$ is surjective this implies that $R \rightarrow A_{i'}$ is surjective. \square

31.4. Absolute Noetherian Approximation

A nice reference for this section is Appendix C of the article by Thomason and Trobaugh [TT90]. See Categories, Section 4.21 for our conventions regarding directed systems. We will use the existence result and properties of the limit from Section 31.2 without further mention.

Lemma 31.4.1. *Let W be a quasi-affine scheme of finite type over \mathbf{Z} . Suppose $W \rightarrow \text{Spec}(R)$ is an open immersion into an affine scheme. There exists a finite type \mathbf{Z} -algebra $A \subset R$ which induces an open immersion $W \rightarrow \text{Spec}(A)$. Moreover, R is the directed colimit of such subalgebras.*

Proof. Choose an affine open covering $W = \bigcup_{i=1, \dots, n} W_i$ such that each W_i is a standard affine open in $\text{Spec}(R)$. In other words, if we write $W_i = \text{Spec}(R_i)$ then $R_i = R_{f_i}$ for some $f_i \in R$. Choose finitely many $x_{ij} \in R_i$ which generate R_i over \mathbf{Z} . Pick an $N \gg 0$ such that each $f_i^N x_{ij}$ comes from an element of R , say $y_{ij} \in R$. Set A equal to the \mathbf{Z} -algebra generated by the f_i and the y_{ij} and (optionally) finitely many additional elements of R . Then A works. Details omitted. \square

Lemma 31.4.2. *Suppose given a cartesian diagram of rings*

$$\begin{array}{ccc} B & \xrightarrow{s} & R \\ \uparrow & & \uparrow t \\ B' & \longrightarrow & R' \end{array}$$

Let $W' \subset \text{Spec}(R')$ be an open of the form $W' = D(f_1) \cup \dots \cup D(f_n)$ such that $t(f_i) = s(g_i)$ for some $g_i \in B$ and $B_{g_i} \cong R_{s(g_i)}$. Then $B' \rightarrow R'$ induces an open immersion of W' into $\text{Spec}(B')$.

Proof. Set $h_i = (g_i, f_i) \in B'$. More on Algebra, Lemma 15.4.3 shows that $(B')_{h_i} \cong (R')_{f_i}$ as desired. \square

The following lemma is a precise statement of Noetherian approximation.

Lemma 31.4.3. *Let S be a quasi-compact and quasi-separated scheme. Let $V \subset S$ be a quasi-compact open. Let I be a directed partially ordered set and let $(V_i, f_{ii'})$ be an inverse system of schemes over I with affine transition maps, with each V_i of finite type over \mathbf{Z} , and with $V = \lim V_i$. Then there exist*

- (1) *a directed partially ordered set J ,*
- (2) *an inverse system of schemes $(S_j, g_{jj'})$ over J ,*
- (3) *an order preserving map $\alpha : J \rightarrow I$,*
- (4) *open subschemes $V'_j \subset S_j$, and*
- (5) *isomorphisms $V'_j \rightarrow V_{\alpha(j)}$*

such that

- (1) *the transition morphisms $g_{jj'} : S_j \rightarrow S_{j'}$ are affine,*
- (2) *each S_j is of finite type over \mathbf{Z} ,*
- (3) *$g_{jj'}^{-1}(V_{j'}) = V_j$,*
- (4) *$S = \lim S_j$ and $V = \lim V_j$, and*

(5) the diagrams

$$\begin{array}{ccc}
 V & & \\
 \downarrow & \searrow & \\
 V'_j & \longrightarrow & V_{\alpha(j)}
 \end{array}
 \quad \text{and} \quad
 \begin{array}{ccc}
 V_j & \longrightarrow & V_{\alpha(j)} \\
 \downarrow & & \downarrow \\
 V'_j & \longrightarrow & V_{\alpha(j')}
 \end{array}$$

are commutative.

Proof. Set $Z = S \setminus V$. Choose affine opens $U_1, \dots, U_m \subset S$ such that $Z \subset \bigcup_{l=1, \dots, m} U_l$. Consider the opens

$$V \subset V \cup U_1 \subset V \cup U_1 \cup U_2 \subset \dots \subset V \cup \bigcup_{l=1, \dots, m} U_l = S$$

If we can prove the lemma successively for each of the cases

$$V \cup U_1 \cup \dots \cup U_l \subset V \cup U_1 \cup \dots \cup U_{l+1}$$

then the lemma will follow for $V \subset S$. In each case we are adding one affine open. Thus we may assume

- (1) $S = U \cup V$,
- (2) U affine open in S ,
- (3) V quasi-compact open in S , and
- (4) $V = \lim_i V_i$ with $(V_i, f_{ii'})$ an inverse system over a directed set I , each $f_{ii'}$ affine and each V_i of finite type over \mathbf{Z} .

Set $W = U \cap V$. As S is quasi-separated, this is a quasi-compact open of V . By Lemma 31.3.8 (and after shrinking I) we may assume that there exist opens $W_i \subset V_i$ such that $f_{ij}^{-1}(W_j) = W_i$ and such that $f_i^{-1}(W_i) = W$. Since W is a quasi-compact open of U it is quasi-affine. Hence we may assume (after shrinking I again) that W_i is quasi-affine for all i , see Lemma 31.3.9.

Write $U = \text{Spec}(B)$. Set $R = \Gamma(W, \mathcal{O}_W)$, and $R_i = \Gamma(W_i, \mathcal{O}_{W_i})$. By Lemma 31.3.3 we have $R = \text{colim}_i R_i$. Now we have the maps of rings

$$\begin{array}{ccc}
 B & \xrightarrow{s} & R \\
 & & \uparrow t_i \\
 & & R_i
 \end{array}$$

We set $B_i = \{(b, r) \in B \times R_i \mid s(b) = t_i(r)\}$ so that we have a cartesian diagram

$$\begin{array}{ccc}
 B & \xrightarrow{s} & R \\
 \uparrow & & \uparrow t_i \\
 B_i & \longrightarrow & R_i
 \end{array}$$

for each i . The transition maps $R_i \rightarrow R_{i'}$ induce maps $B_i \rightarrow B_{i'}$. It is clear that $B = \text{colim}_i B_i$. In the next paragraph we show that for all sufficiently large i the composition $W_i \rightarrow \text{Spec}(R_i) \rightarrow \text{Spec}(B_i)$ is an open immersion.

As W is a quasi-compact open of $U = \text{Spec}(B)$ we can find a finitely many elements $g_l \in B$, $l = 1, \dots, m$ such that $D(g_l) \subset W$ and such that $W = \bigcup_{l=1, \dots, m} D(g_l)$.

Note that this implies $D(g_i) = W_{s(g_i)}$ as open subsets of U , where $W_{s(g_i)}$ denotes the largest open subset of W on which $s(g_i)$ is invertible. Hence

$$B_{g_i} = \Gamma(D(g_i), \mathcal{O}_U) = \Gamma(W_{s(g_i)}, \mathcal{O}_W) = R_{s(g_i)},$$

where the last equality is Properties, Lemma 27.15.2. Since $W_{s(g_i)}$ is affine this also implies that $D(s(g_i)) = W_{s(g_i)}$ as open subsets of $\text{Spec}(R)$. Since $R = \text{colim}_i R_i$ we can (after shrinking I) assume there exist $g_{i,i} \in R_i$ for all $i \in I$ such that $s(g_i) = t_i(g_{i,i})$. Of course we choose the $g_{i,i}$ such that $g_{i,i}$ maps to $g_{i,i'}$ under the transition maps $R_i \rightarrow R_{i'}$. Then, by Lemma 31.3.8 we can (after shrinking I again) assume the corresponding opens $D(g_{i,i}) \subset \text{Spec}(R_i)$ are contained in W_i , $j = 1, \dots, m$ and cover W_i . We conclude that the morphism $W_i \rightarrow \text{Spec}(R_i) \rightarrow \text{Spec}(B_i)$ is an open immersion, see Lemma 31.4.2

By Lemma 31.4.1 we can write B_i as a directed colimit of subalgebras $A_{i,p} \subset B_i$, $p \in P_i$ each of finite type over \mathbf{Z} and such that W_i is identified with an open subscheme of $\text{Spec}(A_{i,p})$. Let $S_{i,p}$ be the scheme obtained by glueing V_i and $\text{Spec}(A_{i,p})$ along the open W_i , see Schemes, Section 25.14. Here is the resulting commutative diagram of schemes:

The morphism $S \rightarrow S_{i,p}$ arises because the upper right square is a pushout in the category of schemes. Note that $S_{i,p}$ is of finite type over \mathbf{Z} since it has a finite affine open covering whose members are spectra of finite type \mathbf{Z} -algebras. We define a partial ordering on $J = \coprod_{i \in I} P_i$ by the rule $(i', p') \geq (i, p)$ if and only if $i' \geq i$ and the map $B_i \rightarrow B_{i'}$ maps $A_{i,p}$ into $A_{i',p'}$. This is exactly the condition needed to define a morphism $S_{i',p'} \rightarrow S_{i,p}$: namely make a commutative diagram as above using the transition morphisms $V_{i'} \rightarrow V_i$ and $W_{i'} \rightarrow W_i$ and the morphism $\text{Spec}(A_{i',p'}) \rightarrow \text{Spec}(A_{i,p})$ induced by the ring map $A_{i,p} \rightarrow A_{i',p'}$. The relevant commutativities have been built into the constructions. We claim that S is the directed limit of the schemes $S_{i,p}$. Since by construction the schemes V_i have limit V this boils down to the fact that B is the limit of the rings $A_{i,p}$ which is true by construction. The map $\alpha : J \rightarrow I$ is given by the rule $j = (i, p) \mapsto i$. The open subscheme V_j is just the image of $V_i \rightarrow S_{i,p}$ above. The commutativity of the diagrams in (5) is clear from the construction. This finishes the proof of the lemma. \square

Proposition 31.4.4. *Let S be a quasi-compact and quasi-separated scheme. There exist a directed partially ordered set I and an inverse system of schemes $(S_i, f_{ii'})$ over I such that*

- (1) *the transition morphisms $f_{ii'}$ are affine*
- (2) *each S_i is of finite type over \mathbf{Z} , and*
- (3) *$S = \lim_i S_i$.*

Proof. This is a special case of Lemma 31.4.3 with $V = \emptyset$. \square

31.5. Limits and morphisms of finite presentation

The following is a generalization of Algebra, Lemma 10.123.2.

Proposition 31.5.1. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is locally of finite presentation.*
- (2) *For any directed partially ordered set I , and any inverse system $(T_i, f_{ii'})$ of S -schemes over I with each T_i affine, we have*

$$\mathrm{Mor}_S(\lim_i T_i, X) = \mathrm{colim}_i \mathrm{Mor}_S(T_i, X)$$

- (3) *For any directed partially ordered set I , and any inverse system $(T_i, f_{ii'})$ of S -schemes over I with each $f_{ii'}$ affine and every T_i quasi-compact and quasi-separated as a scheme, we have*

$$\mathrm{Mor}_S(\lim_i T_i, X) = \mathrm{colim}_i \mathrm{Mor}_S(T_i, X)$$

Proof. It is clear that (3) implies (2).

Let us prove that (2) implies (1). Assume (2). Choose any affine opens $U \subset X$ and $V \subset S$ such that $f(U) \subset V$. We have to show that $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is of finite presentation. Let $(A_i, \varphi_{ii'})$ be a directed system of $\mathcal{O}_S(V)$ -algebras. Set $A = \mathrm{colim}_i A_i$. According to Algebra, Lemma 10.123.2 we have to show that

$$\mathrm{Hom}_{\mathcal{O}_S(V)}(\mathcal{O}_X(U), A) = \mathrm{colim}_i \mathrm{Hom}_{\mathcal{O}_S(V)}(\mathcal{O}_X(U), A_i)$$

Consider the schemes $T_i = \mathrm{Spec}(A_i)$. They form an inverse system of V -schemes over I with transition morphisms $f_{ii'} : T_i \rightarrow T_{i'}$ induced by the $\mathcal{O}_S(V)$ -algebra maps $\varphi_{ii'}$. Set $T := \mathrm{Spec}(A) = \lim_i T_i$. The formula above becomes in terms of morphism sets of schemes

$$\mathrm{Mor}_V(\lim_i T_i, U) = \mathrm{colim}_i \mathrm{Mor}_V(T_i, U).$$

We first observe that $\mathrm{Mor}_V(T_i, U) = \mathrm{Mor}_S(T_i, U)$ and $\mathrm{Mor}_V(T, U) = \mathrm{Mor}_S(T, U)$. Hence we have to show that

$$\mathrm{Mor}_S(\lim_i T_i, U) = \mathrm{colim}_i \mathrm{Mor}_S(T_i, U)$$

and we are given that

$$\mathrm{Mor}_S(\lim_i T_i, X) = \mathrm{colim}_i \mathrm{Mor}_S(T_i, X).$$

Hence it suffices to prove that given a morphism $g_i : T_i \rightarrow X$ over S such that the composition $T \rightarrow T_i \rightarrow X$ ends up in U there exists some $i' \geq i$ such that the composition $g_{i'} : T_{i'} \rightarrow T_i \rightarrow X$ ends up in U . Denote $Z_{i'} = g_{i'}^{-1}(X \setminus U)$. Assume each $Z_{i'}$ is nonempty to get a contradiction. By Lemma 31.3.5 there exists a point t of T which is mapped into $Z_{i'}$ for all $i' \geq i$. Such a point is not mapped into U . A contradiction.

Finally, let us prove that (1) implies (3). Assume (1). Let an inverse directed system $(T_i, f_{ii'})$ of S -schemes be given. Assume the morphisms $f_{ii'}$ are affine and each T_i is quasi-compact and quasi-separated as a scheme. Let $T = \lim_i T_i$. Denote $f_i : T \rightarrow T_i$ the projection morphisms. We have to show:

- (a) Given morphisms $g_i, g'_i : T_i \rightarrow X$ over S such that $g_i \circ f_i = g'_i \circ f_i$, then there exists an $i' \geq i$ such that $g_i \circ f_{ii'} = g'_i \circ f_{ii'}$.
- (b) Given any morphism $g : T \rightarrow X$ over S there exists an $i \in I$ and a morphism $g_i : T_i \rightarrow X$ such that $g = f_i \circ g_i$.

First let us prove the uniqueness part (a). Let $g_i, g'_i : T_i \rightarrow X$ be morphisms such that $g_i \circ f_i = g'_i \circ f_i$. For any $i' \geq i$ we set $g_{i'} = g_i \circ f_{i'i}$ and $g'_{i'} = g'_i \circ f_{i'i}$. We also set $g = g_i \circ f_i = g'_i \circ f_i$. Consider the morphism $(g_i, g'_i) : T_i \rightarrow X \times_S X$. Set

$$W = \bigcup_{U \subset X \text{ affine open}, V \subset S \text{ affine open}, f(U) \subset V} U \times_V U.$$

This is an open in $X \times_S X$, with the property that the morphism $\Delta_{X/S}$ factors through a closed immersion into W , see the proof of Schemes, Lemma 25.21.2. Note that the composition $(g_i, g'_i) \circ f_i : T_i \rightarrow X \times_S X$ is a morphism into W because it factors through the diagonal by assumption. Set $Z_{i'} = (g_{i'}, g'_{i'})^{-1}(X \times_S X \setminus W)$. If each $Z_{i'}$ is nonempty, then by Lemma 31.3.5 there exists a point $t \in T$ which maps to $Z_{i'}$ for all $i' \geq i$. This is a contradiction with the fact that T maps into W . Hence we may increase i and assume that $(g_i, g'_i) : T_i \rightarrow X \times_S X$ is a morphism into W . By construction of W , and since T_i is quasi-compact we can find a finite affine open covering $T_i = T_{1,i} \cup \dots \cup T_{n,i}$ such that $(g_i, g'_i)|_{T_{j,i}}$ is a morphism into $U \times_V U$ for some pair (U, V) as in the definition of W above. Since it suffices to prove that $g_{i'}$ and $g'_{i'}$ agree on each of the $f_{i'i}^{-1}(T_{j,i})$ this reduces us to the affine case. The affine case follows from Algebra, Lemma 10.123.2 and the fact that the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is of finite presentation (see Morphisms, Lemma 28.22.2).

Finally, we prove the existence part (b). Let $g : T \rightarrow X$ be a morphism of schemes over S . We can find a finite affine open covering $T = W_1 \cup \dots \cup W_n$ such that for each $j \in \{1, \dots, n\}$ there exist affine opens $U_j \subset X$ and $V_j \subset S$ with $f(U_j) \subset V_j$ and $g(W_j) \subset U_j$. By Lemmas 31.3.8 and 31.3.10 (after possibly shrinking I) we may assume that there exist affine open coverings $T_i = W_{1,i} \cup \dots \cup W_{n,i}$ compatible with transition maps such that $W_j = \lim_i W_{j,i}$. We apply Algebra, Lemma 10.123.2 to the rings corresponding to the affine schemes $U_j, V_j, W_{j,i}$ and W_j using that $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_j)$ is of finite presentation (see Morphisms, Lemma 28.22.2). Thus we can find for each j an index $i_j \in I$ and a morphism $g_{j,i_j} : W_{j,i_j} \rightarrow X$ such that $g_{j,i_j} \circ f_i|_{W_j} : W_j \rightarrow W_{j,i} \rightarrow X$ equals $g|_{W_j}$. By part (a) proved above, using the quasi-compactness of $W_{j_1,i} \cap W_{j_2,i}$ which follows as T_i is quasi-separated, we can find an index $i' \in I$ larger than all i_j such that

$$g_{j_1,i_{j_1}} \circ f_{i'i_{j_1}}|_{W_{j_1,i'} \cap W_{j_2,i'}} = g_{j_2,i_{j_2}} \circ f_{i'i_{j_2}}|_{W_{j_1,i'} \cap W_{j_2,i'}}$$

for all $j_1, j_2 \in \{1, \dots, n\}$. Hence the morphisms $g_{j,i_j} \circ f_{i'i_j}|_{W_{j,i'}}$ glue to given the desired morphism $T_{i'} \rightarrow X$. \square

Remark 31.5.2. Let S be a scheme. Let us say that a functor $F : (\text{Sch}/S)^{\text{opp}} \rightarrow \text{Sets}$ is *limit preserving* if for every directed inverse system $\{T_i\}_{i \in I}$ of affine schemes with limit T we have $F(T) = \text{colim}_i F(T_i)$. Let X be a scheme over S , and let $h_X : (\text{Sch}/S)^{\text{opp}} \rightarrow \text{Sets}$ be its functor of points, see Schemes, Section 25.15. In this terminology Proposition 31.5.1 says that a scheme X is locally of finite presentation over S if and only if h_X is limit preserving.

31.6. Relative approximation

The title of this section refers to results of the following type.

Lemma 31.6.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that*

- (1) *X is quasi-compact and quasi-separated, and*
- (2) *S is quasi-separated.*

Then $X = \lim X_i$ is a limit of a directed system of schemes X_i of finite presentation over S with affine transition morphisms over S .

Proof. Since $f(X)$ is quasi-compact we may replace S by a quasi-compact open containing $f(X)$. Hence we may assume S is quasi-compact as well. Write $X = \lim X_a$ and $S = \lim S_b$ as in Proposition 31.4.4, i.e., with X_a and S_b of finite type over \mathbf{Z} and with affine transition morphisms. By Proposition 31.5.1 we find that for each b there exists an a and a morphism $f_{a,b} : X_a \rightarrow S_b$ making the diagram

$$\begin{array}{ccc} X & \longrightarrow & S \\ \downarrow & & \downarrow \\ X_a & \longrightarrow & S_b \end{array}$$

commute. Moreover the same proposition implies that, given a second triple $(a', b', f_{a',b'})$, there exists an $a'' \geq a'$ such that the compositions $X_{a''} \rightarrow X_a \rightarrow X_b$ and $X_{a''} \rightarrow X_{a'} \rightarrow X_{b'} \rightarrow X_b$ are equal. Consider the set of triples $(a, b, f_{a,b})$ endowed with the partial ordering

$$(a, b, f_{a,b}) \geq (a', b', f_{a',b'}) \Leftrightarrow a \geq a', b' \geq b, \text{ and } f_{a',b'} \circ h_{a,a'} = g_{b',b} \circ f_{a,b}$$

where $h_{a,a'} : X_a \rightarrow X_{a'}$ and $g_{b',b} : S_{b'} \rightarrow S_b$ are the transition morphisms. The remarks above show that this system is directed. It follows formally from the equalities $X = \lim X_a$ and $S = \lim S_b$ that

$$X = \lim_{(a,b,f_{a,b})} X_a \times_{f_{a,b}, S_b} S.$$

where the limit is over our directed system above. The transition morphisms $X_a \times_{S_b} S \rightarrow X_{a'} \times_{S_{b'}} S$ are affine as the composition

$$X_a \times_{S_b} S \rightarrow X_a \times_{S_{b'}} S \rightarrow X_{a'} \times_{S_{b'}} S$$

where the first morphism is a closed immersion (by Schemes, Lemma 25.21.10) and the second is a base change of an affine morphism (Morphisms, Lemma 28.13.8) and the composition of affine morphisms is affine (Morphisms, Lemma 28.13.7). The morphisms $f_{a,b}$ are of finite presentation (Morphisms, Lemmas 28.22.9 and 28.22.11) and hence the base changes $X_a \times_{f_{a,b}, S_b} S \rightarrow S$ are of finite presentation (Morphisms, Lemma 28.22.4). \square

Lemma 31.6.2. *Let $X \rightarrow S$ be an integral morphism with S quasi-compact and quasi-separated. Then $X = \lim X_i$ with $X_i \rightarrow S$ finite and of finite presentation.*

Proof. Consider the sheaf $\mathcal{A} = f_* \mathcal{O}_X$. This is a quasi-coherent sheaf of \mathcal{O}_S -algebras, see Schemes, Lemma 25.24.1. Combining Properties, Lemma 27.20.13 we can write $\mathcal{A} = \text{colim}_i \mathcal{A}_i$ as a filtered colimit of finite and finitely presented \mathcal{O}_S -algebras. Then

$$X_i = \underline{\text{Spec}}_S(\mathcal{A}_i) \longrightarrow S$$

is a finite and finitely presented morphism of schemes. By construction $X = \lim_i X_i$ which proves the lemma. \square

31.7. Descending properties of morphisms

This section is the analogue of Section 31.3 for properties of morphisms over S . We will work in the following situation.

Situation 31.7.1. Let $S = \lim S_i$ be a limit of a directed system of schemes with affine transition morphisms (Lemma 31.2.2). Let $0 \in I$ and let $f_0 : X_0 \rightarrow Y_0$ be a morphism of schemes over S_0 . Assume S_0, X_0, Y_0 are quasi-compact and quasi-separated. Let $f_i : X_i \rightarrow Y_i$ be the base change of f_0 to S_i and let $f : X \rightarrow Y$ be the base change of f_0 to S .

Lemma 31.7.2. *Notation and assumptions as in Situation 31.7.1. If f is affine, then there exists an index $i \geq 0$ such that f_i is affine.*

Proof. Let $Y_0 = \bigcup_{j=1, \dots, m} V_{j,0}$ be a finite affine open covering. Set $U_{j,0} = f_0^{-1}(V_{j,0})$. For $i \geq 0$ we denote $V_{j,i}$ the inverse image of $V_{j,0}$ in Y_i and $U_{j,i} = f_i^{-1}(V_{j,i})$. Similarly we have $U_j = f^{-1}(V_j)$. Then $U_j = \lim_{i \geq 0} U_{j,i}$ (see Lemma 31.2.2). Since U_j is affine by assumption we see that each $U_{j,i}$ is affine for i large enough, see Lemma 31.3.10. As there are finitely many j we can pick an i which works for all j . Thus f_i is affine for i large enough, see Morphisms, Lemma 28.13.3. \square

Lemma 31.7.3. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is a finite morphism, and
- (2) f_0 is locally of finite type,

then there exists an $i \geq 0$ such that f_i is finite.

Proof. A finite morphism is affine, see Morphisms, Definition 28.44.1. Hence by Lemma 31.7.2 above after increasing 0 we may assume that f_0 is affine. By writing Y_0 as a finite union of affines we reduce to proving the result when X_0 and Y_0 are affine and map into a common affine $W \subset S_0$. The corresponding algebra statement follows from Algebra, Lemma 10.156.3. \square

Lemma 31.7.4. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is a closed immersion, and
- (2) f_0 is locally of finite type,

then there exists an $i \geq 0$ such that f_i is a closed immersion.

Proof. A closed immersion is affine, see Morphisms, Lemma 28.13.9. Hence by Lemma 31.7.2 above after increasing 0 we may assume that f_0 is affine. By writing Y_0 as a finite union of affines we reduce to proving the result when X_0 and Y_0 are affine and map into a common affine $W \subset S_0$. The corresponding algebra statement is a consequence of Algebra, Lemma 10.156.4. \square

Lemma 31.7.5. *Notation and assumptions as in Situation 31.7.1. If f is separated, then f_i is separated for some $i \geq 0$.*

Proof. Apply Lemma 31.7.4 to the diagonal morphism $\Delta_{X_0/S_0} : X_0 \rightarrow X_0 \times_{S_0} X_0$. (This is permissible as diagonal morphisms are locally of finite type and the fibre product $X_0 \times_{S_0} X_0$ is quasi-compact and quasi-separated, see Schemes, Lemma 25.21.2, Morphisms, Lemma 28.16.5, and Schemes, Remark 25.21.18. \square)

Lemma 31.7.6. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is flat,
- (2) f_0 is locally of finite presentation,

then f_i is flat for some $i \geq 0$.

Proof. Choose a finite affine open covering $Y_0 = \bigcup_{j=1, \dots, m} Y_{j,0}$ such that each $Y_{j,0}$ maps into an affine open $S_{j,0} \subset S_0$. For each j let $f_0^{-1}Y_{j,0} = \bigcup_{k=1, \dots, n_j} X_{k,0}$ be a finite affine open covering. Since the property of being flat is local we see that it suffices to prove the lemma for the morphisms of affines $X_{k,i} \rightarrow Y_{j,i} \rightarrow S_{j,i}$ which are the base changes of $X_{k,0} \rightarrow Y_{j,0} \rightarrow S_{j,0}$ to S_i . Thus we reduce to the case that X_0, Y_0, S_0 are affine

In the affine case we reduce to the following algebra result. Suppose that $R = \text{colim}_{i \in I} R_i$. For some $0 \in I$ suppose given an R_0 -algebra map $A_i \rightarrow B_i$ of finite presentation. If $R \otimes_{R_0} A_0 \rightarrow R \otimes_{R_0} B_0$ is flat, then for some $i \geq 0$ the map $R_i \otimes_{R_0} A_0 \rightarrow R_i \otimes_{R_0} B_0$ is flat. This follows from Algebra, Lemma 10.156.1 part (3). \square

Lemma 31.7.7. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is finite locally free (of degree d),
- (2) f_0 is locally of finite presentation,

then f_i is finite locally free (of degree d) for some $i \geq 0$.

Proof. By Lemmas 31.7.6 and 31.7.3 we find an i such that f_i is flat and finite. On the other hand, f_i is locally of finite presentation. Hence f_i is finite locally free by Morphisms, Lemma 28.46.2. If moreover f is finite locally free of degree d , then the image of $Y \rightarrow Y_i$ is contained in the open and closed locus $W_d \subset Y_i$ over which f_i has degree d . By Lemma 31.3.7 we see that for some $i' \geq i$ the image of $Y_{i'} \rightarrow Y_i$ is contained in W_d . Then $f_{i'}$ will be finite locally free of degree d . \square

Lemma 31.7.8. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is étale,
- (2) f_0 is locally of finite presentation,

then f_i is étale for some $i \geq 0$.

Proof. Being étale is local on the source and the target (Morphisms, Lemma 28.37.2) hence we may assume S_0, X_0, Y_0 affine (details omitted). The corresponding algebra fact is Algebra, Lemma 10.156.5. \square

Lemma 31.7.9. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is an isomorphism, and
- (2) f_0 is locally of finite presentation,

then f_i is an isomorphism for some $i \geq 0$.

Proof. By Lemmas 31.7.8 and 31.7.4 we can find an i such that f_i is flat and a closed immersion. Then f_i identifies X_i with an open and closed subscheme of Y_i , see Morphisms, Lemma 28.27.2. By assumption the image of $Y \rightarrow Y_i$ maps into $f_i(X_i)$. Thus by Lemma 31.3.7 we find that $Y_{i'}$ maps into $f_i(X_i)$ for some $i' \geq i$. It follows that $X_{i'} \rightarrow Y_{i'}$ is surjective and we win. \square

Lemma 31.7.10. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is a monomorphism, and
- (2) f_0 is locally of finite type,

then f_i is a monomorphism for some $i \geq 0$.

Proof. Recall that a morphism of schemes $V \rightarrow W$ is a monomorphism if and only if the diagonal $V \rightarrow V \times_W V$ is an isomorphism (Schemes, Lemma 25.23.2). The morphism $X_0 \rightarrow X_0 \times_{Y_0} X_0$ is locally of finite presentation by Morphisms, Lemma 28.22.12. Since $X_0 \times_{Y_0} X_0$ is quasi-compact and quasi-separated (Schemes, Remark 25.21.18) we conclude from Lemma 31.7.9 that $\Delta_i : X_i \rightarrow X_i \times_{Y_i} X_i$ is an isomorphism for some $i \geq 0$. For this i the morphism f_i is a monomorphism. \square

Lemma 31.7.11. *Notation and assumptions as in Situation 31.7.1. If*

- (1) f is surjective, and
- (2) f_0 is locally of finite presentation,

then there exists an $i \geq 0$ such that f_i is surjective.

Proof. The morphism f_0 is of finite presentation. Hence $E = f_0(X_0)$ is a constructible subset of Y_0 , see Morphisms, Lemma 28.23.2. Since f_i is the base change of f_0 by $Y_i \rightarrow Y_0$ we see that the image of f_i is the inverse image of E in Y_i . Moreover, we know that $Y \rightarrow Y_0$ maps into E . Hence we win by Lemma 31.3.7. \square

31.8. Finite type closed in finite presentation

A result of this type is [Kie72, Satz 2.10]. Another reference is [Con07].

Lemma 31.8.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume:*

- (1) *The morphism f is locally of finite type.*
- (2) *The scheme X is quasi-compact and quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \rightarrow S$ and an immersion $X \rightarrow X'$ of schemes over S .

Proof. By Proposition 31.4.4 we can write $X = \lim_i X_i$ with each X_i of finite type over \mathbf{Z} and with transition morphisms $f_{ii'} : X_i \rightarrow X_{i'}$ affine. Consider the commutative diagram

$$\begin{array}{ccccc}
 X & \longrightarrow & X_{i,S} & \longrightarrow & X_i \\
 & \searrow & \downarrow & & \downarrow \\
 & & S & \longrightarrow & \text{Spec}(\mathbf{Z})
 \end{array}$$

Note that X_i is of finite presentation over $\text{Spec}(\mathbf{Z})$, see Morphisms, Lemma 28.22.9. Hence the base change $X_{i,S} \rightarrow S$ is of finite presentation by Morphisms, Lemma 28.22.4. Thus it suffices to show that the arrow $X \rightarrow X_{i,S}$ is an immersion for i sufficiently large.

To do this we choose a finite affine open covering $X = V_1 \cup \dots \cup V_n$ such that f maps each V_j into an affine open $U_j \subset S$. Let $h_{j,a} \in \mathcal{O}_X(V_j)$ be a finite set of elements which generate $\mathcal{O}_X(V_j)$ as an $\mathcal{O}_S(U_j)$ -algebra, see Morphisms, Lemma 28.16.2. By Lemmas 31.3.8 and 31.3.10 (after possibly shrinking I) we may assume that there exist affine open coverings $X_i = V_{1,i} \cup \dots \cup V_{n,i}$ compatible with transition maps such that $V_j = \lim_i V_{j,i}$. By Lemma 31.3.3 we can choose i so large that each $h_{j,a}$ comes from an element $h_{j,a,i} \in \mathcal{O}_{X_i}(V_{j,i})$. Thus the arrow in

$$V_j \longrightarrow U_j \times_{\text{Spec}(\mathbf{Z})} V_{j,i} = (V_{j,i})_{U_j} \subset (V_{j,i})_S \subset X_{i,S}$$

is a closed immersion. Since $\bigcup (V_{j,i})_{U_j}$ forms an open of $X_{i,S}$ and since the inverse image of $(V_{j,i})_{U_j}$ in X is V_j it follows that $X \rightarrow X_{i,S}$ is an immersion. \square

Remark 31.8.2. We cannot do better than this if we do not assume more on S and the morphism $f : X \rightarrow S$. For example, in general it will not be possible to find a *closed* immersion $X \rightarrow X'$ as in the lemma. The reason is that this would imply that f is quasi-compact which may not be the case. An example is to take S to be infinite dimensional affine space with 0 doubled and X to be one of the two infinite dimensional affine spaces.

Lemma 31.8.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume:*

- (1) *The morphism f is of locally of finite type.*
- (2) *The scheme X is quasi-compact and quasi-separated, and*
- (3) *The scheme S is quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \rightarrow S$ and a closed immersion $X \rightarrow X'$ of schemes over S .

Proof. By Lemma 31.8.1 above there exists a morphism $Y \rightarrow S$ of finite presentation and an immersion $i : X \rightarrow Y$ of schemes over S . For every point $x \in X$, there exists an affine open $V_x \subset Y$ such that $i^{-1}(V_x) \rightarrow V_x$ is a closed immersion. Since X is quasi-compact we can find finitely many affine opens $V_1, \dots, V_n \subset Y$ such that $i(X) \subset V_1 \cup \dots \cup V_n$ and $i^{-1}(V_j) \rightarrow V_j$ is a closed immersion. In other words such that $i : X \rightarrow X' = V_1 \cup \dots \cup V_n$ is a closed immersion of schemes over S . Since S is quasi-separated and Y is quasi-separated over S we deduce that Y is quasi-separated, see Schemes, Lemma 25.21.13. Hence the open immersion $X' = V_1 \cup \dots \cup V_n \rightarrow Y$ is quasi-compact. This implies that $X' \rightarrow Y$ is of finite presentation, see Morphisms, Lemma 28.22.6. We conclude since then $X' \rightarrow Y \rightarrow S$ is a composition of morphisms of finite presentation, and hence of finite presentation (see Morphisms, Lemma 28.22.3). \square

Lemma 31.8.4. *Let $X \rightarrow Y$ be a closed immersion of schemes. Assume Y quasi-compact and quasi-separated. Then X can be written as a directed limit $X = \lim X_i$ of schemes over Y where $X_i \rightarrow Y$ is a closed immersion of finite presentation.*

Proof. Let $\mathcal{I} \subset \mathcal{O}_Y$ be the quasi-coherent sheaf of ideals defining X as a closed subscheme of Y . By Properties, Lemma 27.20.3 we can write \mathcal{I} as a directed colimit $\mathcal{I} = \operatorname{colim}_{i \in I} \mathcal{I}_i$ of its quasi-coherent sheaves of ideals of finite type. Let $X_i \subset Y$ be the closed subscheme defined by \mathcal{I}_i . These form an inverse system of schemes indexed by I . The transition morphisms $X_i \rightarrow X_{i'}$ are affine because they are closed immersions. Each X_i is quasi-compact and quasi-separated since it is a closed subscheme of Y and Y is quasi-compact and quasi-separated by our assumptions. We have $X = \lim_i X_i$ as follows directly from the fact that $\mathcal{I} = \operatorname{colim}_{i \in I} \mathcal{I}_i$. Each of the morphisms $X_i \rightarrow Y$ is of finite presentation, see Morphisms, Lemma 28.22.7. \square

Lemma 31.8.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume*

- (1) *The morphism f is of locally of finite type.*
- (2) *The scheme X is quasi-compact and quasi-separated, and*
- (3) *The scheme S is quasi-separated.*

Then $X = \lim X_i$ where the $X_i \rightarrow S$ are of finite presentation, the X_i are quasi-compact and quasi-separated, and the transition morphisms $X_{i'} \rightarrow X_i$ are closed immersions (which implies that $X \rightarrow X_i$ are closed immersions for all i).

Proof. By Lemma 31.8.3 there is a closed immersion $X \rightarrow Y$ with $Y \rightarrow S$ of finite presentation. Then Y is quasi-separated by Schemes, Lemma 25.21.13. Since X is quasi-compact, we may assume Y is quasi-compact by replacing Y with a quasi-compact open containing X . We see that $X = \lim X_i$ with $X_i \rightarrow Y$ a closed immersion of finite presentation by Lemma 31.8.4. The morphisms $X_i \rightarrow S$ are of finite presentation by Morphisms, Lemma 28.22.3. \square

Proposition 31.8.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume*

- (1) *f is of finite type and separated, and*
- (2) *S is quasi-compact and quasi-separated.*

Then there exists a separated morphism of finite presentation $f' : X' \rightarrow S$ and a closed immersion $X \rightarrow X'$ of schemes over S .

Proof. Apply Lemma 31.8.5 and note that $X_i \rightarrow S$ is separated for large i by Lemma 31.3.14 as we have assumed that $X \rightarrow S$ is separated. \square

Lemma 31.8.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume*

- (1) *f is finite, and*
- (2) *S is quasi-compact and quasi-separated.*

Then there exists a morphism which is finite and of finite presentation $f' : X' \rightarrow S$ and a closed immersion $X \rightarrow X'$ of schemes over S .

Proof. We may write $X = \lim X_i$ as in Lemma 31.8.5. Applying Lemma 31.3.16 we see that $X_i \rightarrow S$ is finite for large enough i . \square

Lemma 31.8.8. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume*

- (1) *f is finite, and*
- (2) *S quasi-compact and quasi-separated.*

Then X is a directed limit $X = \lim X_i$ where the transition maps are closed immersions and the objects X_i are finite and of finite presentation over S .

Proof. We may write $X = \lim X_i$ as in Lemma 31.8.5. Applying Lemma 31.3.16 we see that $X_i \rightarrow S$ is finite for large enough i . \square

31.9. Descending relative objects

The following lemma is typical of the type of results in this section. We write out the “standard” proof completely. It may be faster to convince yourself that the result is true than to read this proof.

Lemma 31.9.1. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I . Assume*

- (1) *the morphisms $f_{ii'} : S_i \rightarrow S_{i'}$ are affine,*
- (2) *the schemes S_i are quasi-compact and quasi-separated.*

Let $S = \lim_i S_i$. Then we have the following:

- (1) *For any morphism of finite presentation $X \rightarrow S$ there exists an index $i \in I$ and a morphism of finite presentation $X_i \rightarrow S_i$ such that $X \cong X_{i,S}$ as schemes over S .*
- (2) *Given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i , and a morphism $\varphi : X_{i,S} \rightarrow Y_{i,S}$ over S , there exists an index $i' \geq i$ and a morphism $\varphi_{i'} : X_{i,S_{i'}} \rightarrow Y_{i,S_{i'}}$ whose base change to S is φ .*

- (3) Given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a pair of morphisms $\varphi_i, \psi_i : X_i \rightarrow Y_i$ whose base changes $\varphi_{i,S} = \psi_{i,S}$ are equal, there exists an index $i' \geq i$ such that $\varphi_{i,S_{i'}} = \psi_{i,S_{i'}}$.

In other words, the category of schemes of finite presentation over S is the colimit over I of the categories of schemes of finite presentation over S_i .

Proof. In case each of the schemes S_i is affine, and we consider only affine schemes of finite presentation over S_i , resp. S this lemma is equivalent to Algebra, Lemma 10.123.6. We claim that the affine case implies the lemma in general.

Let us prove (3). Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a pair of morphisms $\varphi_i, \psi_i : X_i \rightarrow Y_i$. Assume that the base changes are equal: $\varphi_{i,S} = \psi_{i,S}$. We will use the notation $X_{i'} = X_{i,S_{i'}}$ and $Y_{i'} = Y_{i,S_{i'}}$ for $i' \geq i$. We also set $X = X_{i,S}$ and $Y = Y_{i,S}$. Note that according to Lemma 31.2.3 we have $X = \lim_{i' \geq i} X_{i'}$ and similarly for Y . Additionally we denote $\varphi_{i'}$ and $\psi_{i'}$ (resp. φ and ψ) the base change of φ_i and ψ_i to $S_{i'}$ (resp. S). So our assumption means that $\varphi = \psi$. Since Y_i and X_i are of finite presentation over S_i , and since S_i is quasi-compact and quasi-separated, also X_i and Y_i are quasi-compact and quasi-separated (see Morphisms, Lemma 28.22.10). Hence we may choose a finite affine open covering $Y_i = \bigcup V_{j,i}$ such that each $V_{j,i}$ maps into an affine open of S . As above, denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and V_j the inverse image in Y . The immersions $V_{j,i'} \rightarrow Y_{i'}$ are quasi-compact, and the inverse images $U_{j,i'} = \varphi_i^{-1}(V_{j,i'})$ and $U'_{j,i'} = \psi_i^{-1}(V_{j,i'})$ are quasi-compact opens of $X_{i'}$. By assumption the inverse images of V_j under φ and ψ in X are equal. Hence by Lemma 31.3.8 there exists an index $i' \geq i$ such that of $U_{j,i'} = U'_{j,i'}$ in $X_{i'}$. Choose an finite affine open covering $U_{j,i'} = U'_{j,i'} = \bigcup W_{j,k,i'}$ which induce coverings $U_{j,i''} = U'_{j,i''} = \bigcup W_{j,k,i''}$ for all $i'' \geq i'$. By the affine case there exists an index i'' such that $\varphi_{i''}|_{W_{j,k,i''}} = \psi_{i''}|_{W_{j,k,i''}}$ for all j, k . Then i'' is an index such that $\varphi_{i''} = \psi_{i''}$ and (3) is proved.

Let us prove (2). Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a morphism $\varphi : X_{i,S} \rightarrow Y_{i,S}$. We will use the notation $X_{i'} = X_{i,S_{i'}}$ and $Y_{i'} = Y_{i,S_{i'}}$ for $i' \geq i$. We also set $X = X_{i,S}$ and $Y = Y_{i,S}$. Note that according to Lemma 31.2.3 we have $X = \lim_{i' \geq i} X_{i'}$ and similarly for Y . Since Y_i and X_i are of finite presentation over S_i , and since S_i is quasi-compact and quasi-separated, also X_i and Y_i are quasi-compact and quasi-separated (see Morphisms, Lemma 28.22.10). Hence we may choose a finite affine open covering $Y_i = \bigcup V_{j,i}$ such that each $V_{j,i}$ maps into an affine open of S . As above, denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and V_j the inverse image in Y . The immersions $V_j \rightarrow Y$ are quasi-compact, and the inverse images $U_j = \varphi^{-1}(V_j)$ are quasi-compact opens of X . Hence by Lemma 31.3.8 there exists an index $i' \geq i$ and quasi-compact opens $U_{j,i'}$ of $X_{i'}$ whose inverse image in X is U_j . Choose an finite affine open covering $U_{j,i'} = \bigcup W_{j,k,i'}$ which induce affine open coverings $U_{j,i''} = \bigcup W_{j,k,i''}$ for all $i'' \geq i'$ and an affine open covering $U_j = \bigcup W_{j,k}$. By the affine case there exists an index i'' and morphisms $\varphi_{j,k,i''} : W_{j,k,i''} \rightarrow V_{j,i''}$ such that $\varphi|_{W_{j,k}} = \varphi_{j,k,i''}|_{W_{j,k,i''}}$ for all j, k . By part (3) proved above, there is a further index $i''' \geq i''$ such that

$$\varphi_{j_1,k_1,i''}|_{W_{j_1,k_1,i''} \cap W_{j_2,k_2,i''}} = \varphi_{j_2,k_2,i''}|_{W_{j_1,k_1,i''} \cap W_{j_2,k_2,i''}}$$

for all j_1, j_2, k_1, k_2 . Then i''' is an index such that there exists a morphism $\varphi_{i'''} : X_{i'''} \rightarrow Y_{i'''}$ whose base change to S gives φ . Hence (2) holds.

Let us prove (1). Suppose given a scheme X of finite presentation over S . Since X is of finite presentation over S , and since S is quasi-compact and quasi-separated, also X is quasi-compact and quasi-separated (see Morphisms, Lemma 28.22.10). Choose a finite affine open covering $X = \bigcup U_j$ such that each U_j maps into an affine open $V_j \subset S$. Denote $U_{j_1 j_2} = U_{j_1} \cap U_{j_2}$ and $U_{j_1 j_2 j_3} = U_{j_1} \cap U_{j_2} \cap U_{j_3}$. By Lemmas 31.3.8 and 31.3.10 we can find an index i_1 and affine opens $V_{j, i_1} \subset S_{i_1}$ such that each V_j is the inverse of this in S . Let $V_{j, i}$ be the inverse image of V_{j, i_1} in S_i for $i \geq i_1$. By the affine case we may find an index $i_2 \geq i_1$ and affine schemes $U_{j, i_2} \rightarrow V_{j, i_2}$ such that $U_j = S \times_{S_{i_2}} U_{j, i_2}$ is the base change. Denote $U_{j, i} = S_i \times_{S_{i_2}} U_{j, i_2}$ for $i \geq i_2$. By Lemma 31.3.8 there exists an index $i_3 \geq i_2$ and open subschemes $W_{j_1, j_2, i_3} \subset U_{j_1, i_3}$ whose base change to S is equal to $U_{j_1 j_2}$. Denote $W_{j_1, j_2, i} = S_i \times_{S_{i_3}} W_{j_1, j_2, i_3}$ for $i \geq i_3$. By part (2) shown above there exists an index $i_4 \geq i_3$ and morphisms $\varphi_{j_1, j_2, i_4} : W_{j_1, j_2, i_4} \rightarrow W_{j_2, j_1, i_4}$ whose base change to S gives the identity morphism $U_{j_1 j_2} = U_{j_2 j_1}$ for all j_1, j_2 . For all $i \geq i_4$ denote $\varphi_{j_1, j_2, i} = \text{id}_S \times \varphi_{j_1, j_2, i_4}$ the base change. We claim that for some $i_5 \geq i_4$ the system $((U_{j, i_5})_j, (W_{j_1, j_2, i_5})_{j_1, j_2}, (\varphi_{j_1, j_2, i_5})_{j_1, j_2})$ forms a glueing datum as in Schemes, Section 25.14. In order to see this we have to verify that for i large enough we have

$$\varphi_{j_1, j_2, i}^{-1}(W_{j_1, j_2, i} \cap W_{j_1, j_3, i}) = W_{j_1, j_2, i} \cap W_{j_1, j_3, i}$$

and that for large enough i the cocycle condition holds. The first condition follows from Lemma 31.3.8 and the fact that $U_{j_2 j_1 j_3} = U_{j_1 j_2 j_3}$. The second from part (1) of the lemma proved above and the fact that the cocycle condition holds for the maps $\text{id} : U_{j_1 j_2} \rightarrow U_{j_2 j_1}$. Ok, so now we can use Schemes, Lemma 25.14.2 to glue the system $((U_{j, i_5})_j, (W_{j_1, j_2, i_5})_{j_1, j_2}, (\varphi_{j_1, j_2, i_5})_{j_1, j_2})$ to get a scheme $X_{i_5} \rightarrow S_{i_5}$. By construction the base change of X_{i_5} to S is formed by glueing the open affines U_j along the opens $U_{j_1} \leftarrow U_{j_1 j_2} \rightarrow U_{j_2}$. Hence $S \times_{S_{i_5}} X_{i_5} \cong X$ as desired. \square

Lemma 31.9.2. *Let I be a directed partially ordered set. Let $(S_i, f_{i i'})$ be an inverse system of schemes over I . Assume*

- (1) *all the morphisms $f_{i i'} : S_i \rightarrow S_{i'}$ are affine,*
- (2) *all the schemes S_i are quasi-compact and quasi-separated.*

Let $S = \lim_i S_i$. Then we have the following:

- (1) *For any sheaf of \mathcal{O}_S -modules \mathcal{F} of finite presentation there exists an index $i \in I$ and a sheaf of \mathcal{O}_{S_i} -modules of finite presentation \mathcal{F}_i such that $\mathcal{F} \cong f_i^* \mathcal{F}_i$.*
- (2) *Suppose given an index $i \in I$, sheaves of \mathcal{O}_{S_i} -modules $\mathcal{F}_i, \mathcal{G}_i$ of finite presentation and a morphism $\varphi : f_i^* \mathcal{F}_i \rightarrow f_i^* \mathcal{G}_i$ over S . Then there exists an index $i' \geq i$ and a morphism $\varphi_{i'} : f_{i'}^* \mathcal{F}_i \rightarrow f_{i'}^* \mathcal{G}_i$ whose base change to S is φ .*
- (3) *Suppose given an index $i \in I$, sheaves of \mathcal{O}_{S_i} -modules $\mathcal{F}_i, \mathcal{G}_i$ of finite presentation and a pair of morphisms $\varphi_i, \psi_i : \mathcal{F}_i \rightarrow \mathcal{G}_i$. Assume that the base changes are equal: $f_i^* \varphi_i = f_i^* \psi_i$. Then there exists an index $i' \geq i$ such that $f_{i'}^* \varphi_i = f_{i'}^* \psi_i$.*

In other words, the category of modules of finite presentation over S is the colimit over I of the categories modules of finite presentation over S_i .

Proof. Omitted. Since we have written out completely the proof of Lemma 31.9.1 above it seems wise to use this here and not completely write this proof out also. For example we can use:

- (1) there is an equivalence of categories between quasi-coherent \mathcal{O}_S -modules and vector bundles over S , see Constructions, Section 26.6.
- (2) a vector bundle $\mathbf{V}(\mathcal{F}) \rightarrow S$ is of finite presentation over S if and only if \mathcal{F} is an \mathcal{O}_S -module of finite presentation.

Then you can descend morphisms in terms of morphisms of the associated vector-bundles. Similarly for objects. \square

Lemma 31.9.3. *With notation and assumptions as in Lemma 31.9.1. Let $i \in I$. Suppose that $\varphi_i : X_i \rightarrow Y_i$ is a morphism of schemes of finite presentation over S_i and that \mathcal{F}_i is a quasi-coherent \mathcal{O}_{X_i} -module of finite presentation. If the pullback of \mathcal{F}_i to $X_i \times_{S_i} S$ is flat over $Y_i \times_{S_i} S$, then there exists an index $i' \geq i$ such that the pullback of \mathcal{F}_i to $X_i \times_{S_i} S_{i'}$ is flat over $Y_i \times_{S_i} S_{i'}$.*

Proof. (This lemma is the analogue of Lemma 31.7.6 for modules.) For $i' \geq i$ denote $X_{i'} = S_{i'} \times_{S_i} X_i$, $\mathcal{F}_{i'} = (X_{i'} \rightarrow X_i)^* \mathcal{F}_i$ and similarly for $Y_{i'}$. Denote $\varphi_{i'}$ the base change of φ_i to $S_{i'}$. Also set $X = S \times_{S_i} X_i$, $Y = S \times_{S_i} Y_i$, $\mathcal{F} = (X \rightarrow X_i)^* \mathcal{F}_i$ and φ the base change of φ_i to S . Let $Y_i = \bigcup_{j=1, \dots, m} V_{j,i}$ be a finite affine open covering such that each $V_{j,i}$ maps into some affine open of S_i . For each $j = 1, \dots, m$ let $\varphi_i^{-1}(V_{j,i}) = \bigcup_{k=1, \dots, m(j)} U_{k,j,i}$ be a finite affine open covering. For $i' \geq i$ we denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and $U_{k,j,i'}$ the inverse image of $U_{k,j,i}$ in $X_{i'}$. Similarly we have $U_{k,j} \subset X$ and $V_j \subset Y$. Then $U_{k,j} = \lim_{i' \geq i} U_{k,j,i'}$ and $V_j = \lim_{i' \geq i} V_{j,i}$ (see Lemma 31.2.2). Since $X_{i'} = \bigcup_{k,j} U_{k,j,i'}$ is a finite open covering it suffices to prove the lemma for each of the morphisms $U_{k,j,i} \rightarrow V_{j,i}$ and the sheaf $\mathcal{F}_i|_{U_{k,j,i}}$. Hence we see that the lemma reduces to the case that X_i and Y_i are affine and map into an affine open of S_i , i.e., we may also assume that S is affine.

In the affine case we reduce to the following algebra result. Suppose that $R = \text{colim}_{i \in I} R_i$. For some $i \in I$ suppose given a map $A_i \rightarrow B_i$ of finitely presented R_i -algebras. Let N_i be a finitely presented B_i -module. Then, if $R \otimes_{R_i} N_i$ is flat over $R \otimes_{R_i} A_i$, then for some $i' \geq i$ the module $R_{i'} \otimes_{R_i} N_i$ is flat over $R_{i'} \otimes_{R_i} A_i$. This is exactly the result proved in Algebra, Lemma 10.156.1 part (3). \square

31.10. Characterizing affine schemes

If $f : X \rightarrow S$ is a surjective integral morphism of schemes such that X is an affine scheme then S is affine too. See [Con07, A.2]. Our proof relies on the Noetherian case which we stated and proved in Cohomology of Schemes, Lemma 29.13.3. See also [DG67, II 6.7.1].

Lemma 31.10.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that f is surjective and finite, and assume that X is affine. Then S is affine.*

Proof. Since f is surjective and X is quasi-compact we see that S is quasi-compact. Since X is separated and f is surjective and universally closed (Morphisms, Lemma 28.44.7), we see that S is separated (Morphisms, Lemma 28.42.11).

By Lemma 31.8.8 we can write $X = \lim_a X_a$ with $X_a \rightarrow S$ finite and of finite presentation. By Lemma 31.3.10 we see that X_a is affine for some $a \in A$. Replacing X by X_a we may assume that $X \rightarrow S$ is surjective, finite, of finite presentation and that X is affine.

By Proposition 31.4.4 we may write $S = \lim_{i \in I} S_i$ as a directed limits as schemes of finite type over \mathbf{Z} . By Lemma 31.9.1 we can after shrinking I assume there exist

schemes $X_i \rightarrow S_i$ of finite presentation such that $X_{i'} = X_i \times_S S_{i'}$ for $i' \geq i$ and such that $X = \lim_i X_i$. By Lemma 31.7.3 we may assume that $X_i \rightarrow S_i$ is finite for all $i \in I$ as well. By Lemma 31.3.10 once again we may assume that X_i is affine for all $i \in I$. Hence the result follows from the Noetherian case, see Cohomology of Schemes, Lemma 29.13.3. \square

Proposition 31.10.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that f is surjective and integral, and assume that X is affine. Then S is affine.*

Proof. Since f is surjective and X is quasi-compact we see that S is quasi-compact. Since X is separated and f is surjective and universally closed (Morphisms, Lemma 28.44.7), we see that S is separated (Morphisms, Lemma 28.42.11).

By Lemma 31.6.2 we can write $X = \lim_i X_i$ with $X_i \rightarrow S$ finite. By Lemma 31.3.10 we see that for i sufficiently large the scheme X_i is affine. Moreover, since $X \rightarrow S$ factors through each X_i we see that $X_i \rightarrow S$ is surjective. Hence we conclude that S is affine by Lemma 31.10.1. \square

Lemma 31.10.3. *Let X be a scheme which is set theoretically the union of finitely many affine closed subschemes. Then X is affine.*

Proof. Let $Z_i \subset X$, $i = 1, \dots, n$ be affine closed subschemes such that $X = \bigcup Z_i$ set theoretically. Then $\coprod Z_i \rightarrow X$ is surjective and integral with affine source. Hence X is affine by Proposition 31.10.2. \square

Lemma 31.10.4. *Let $i : Z \rightarrow X$ be a closed immersion of schemes inducing a homeomorphism of underlying topological spaces. Let \mathcal{L} be an invertible sheaf on X . If $i^*\mathcal{L}$ is ample on Z , then \mathcal{L} is ample on X .*

Proof. Since $i^*\mathcal{L}$ is ample we see that Z is quasi-compact (Properties, Definition 27.24.1) and separated (Properties, Lemma 27.24.9). Since i is surjective, we see that X is quasi-compact. Since i is universally closed and surjective, we see that X is separated (Morphisms, Lemma 28.42.11).

By Proposition 31.4.4 we can write $X = \lim X_i$ as a directed limit of finite type schemes over \mathbf{Z} with affine transition morphisms. We can find an i and an invertible sheaf \mathcal{L}_i on X_i whose pullback to X is isomorphic to \mathcal{L} , see Lemma 31.9.2.

For each i let $Z_i \subset X_i$ be the scheme theoretic image of the morphism $Z \rightarrow X$. If $\text{Spec}(A_i) \subset X_i$ is an affine open subscheme with inverse image of $\text{Spec}(A)$ in X and if $Z \cap \text{Spec}(A)$ is defined by the ideal $I \subset A$, then $Z_i \cap \text{Spec}(A_i)$ is defined by the ideal $I_i \subset A_i$ which is the inverse image of I in A_i under the ring map $A_i \rightarrow A$, see Morphisms, Example 28.6.4. Since $\text{colim } A_i/I_i = A/I$ it follows that $\lim Z_i = Z$. By Lemma 31.3.12 we see that $\mathcal{L}_i|_{Z_i}$ is ample for some i . Since Z and hence X maps into Z_i set theoretically, we see that $X_{i'} \rightarrow X_i$ maps into Z_i set theoretically for some $i' \geq i$, see Lemma 31.3.7. (Observe that since X_i is Noetherian, every closed subset of X_i is constructible.) Let $T \subset X_{i'}$ be the scheme theoretic inverse image of Z_i in $X_{i'}$. Observe that $\mathcal{L}_{i'}|_T$ is the pullback of $\mathcal{L}_i|_{Z_i}$ and hence ample by Morphisms, Lemma 28.38.7 and the fact that $T \rightarrow Z_i$ is an affine morphism. Thus we see that $\mathcal{L}_{i'}$ is ample on $X_{i'}$ by Cohomology of Schemes, Lemma 29.14.5. Pulling back to X (using the same lemma as above) we find that \mathcal{L} is ample. \square

31.11. Variants of Chow's Lemma

In this section we prove a number of variants of Chow's lemma. The most interesting version is probably just the Noetherian case, which we stated and proved in Cohomology of Schemes, Section 29.16.

Lemma 31.11.1. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \rightarrow S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram*

$$\begin{array}{ccccc} X & \xleftarrow{\pi} & X' & \longrightarrow & \mathbf{P}_S^n \\ & \searrow & \downarrow & \swarrow & \\ & & S & & \end{array}$$

where $X' \rightarrow \mathbf{P}_S^n$ is an immersion, and $\pi : X' \rightarrow X$ is proper and surjective.

Proof. By Proposition 31.8.6 we can find a closed immersion $X \rightarrow Y$ where Y is separated and of finite presentation over S . Clearly, if we prove the assertion for Y , then the result follows for X . Hence we may assume that X is of finite presentation over S .

Write $S = \lim_i S_i$ as a directed limit of Noetherian schemes, see Proposition 31.4.4. By Lemma 31.9.1 we can find an index $i \in I$ and a scheme $X_i \rightarrow S_i$ of finite presentation so that $X = S \times_{S_i} X_i$. By Lemma 31.7.5 we may assume that $X_i \rightarrow S_i$ is separated. Clearly, if we prove the assertion for X_i over S_i , then the assertion holds for X . The case $X_i \rightarrow S_i$ is treated by Cohomology of Schemes, Lemma 29.16.1. \square

Here is a variant of Chow's lemma where we assume the scheme on top has finitely many irreducible components.

Lemma 31.11.2. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \rightarrow S$ be a separated morphism of finite type. Assume that X has finitely many irreducible components. Then there exists an $n \geq 0$ and a diagram*

$$\begin{array}{ccccc} X & \xleftarrow{\pi} & X' & \longrightarrow & \mathbf{P}_S^n \\ & \searrow & \downarrow & \swarrow & \\ & & S & & \end{array}$$

where $X' \rightarrow \mathbf{P}_S^n$ is an immersion, and $\pi : X' \rightarrow X$ is proper and surjective. Moreover, there exists an open dense subscheme $U \subset X$ such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism of schemes.

Proof. Let $X = Z_1 \cup \dots \cup Z_n$ be the decomposition of X into irreducible components. Let $\eta_j \in Z_j$ be the generic point.

There are (at least) two ways to proceed with the proof. The first is to redo the proof of Cohomology of Schemes, Lemma 29.16.1 using the general Properties, Lemma 27.27.4 to find suitable affine opens in X . (This is the "standard" proof.) The second is to use absolute Noetherian approximation as in the proof of Lemma 31.11.1 above. This is what we will do here.

By Proposition 31.8.6 we can find a closed immersion $X \rightarrow Y$ where Y is separated and of finite presentation over S . Write $S = \lim_i S_i$ as a directed limit of Noetherian

schemes, see Proposition 31.4.4. By Lemma 31.9.1 we can find an index $i \in I$ and a scheme $Y_i \rightarrow S_i$ of finite presentation so that $Y = S \times_{S_i} Y_i$. By Lemma 31.7.5 we may assume that $Y_i \rightarrow S_i$ is separated. We have the following diagram

$$\begin{array}{ccccccc} \eta_j \in Z_j & \longrightarrow & X & \longrightarrow & Y & \longrightarrow & Y_i \\ & & & \searrow & \downarrow & & \downarrow \\ & & & & S & \longrightarrow & S_i \end{array}$$

Denote $h : X \rightarrow Y_i$ the composition.

For $i' \geq i$ write $Y_{i'} = S_{i'} \times_{S_i} Y_i$. Then $Y = \lim_{i' \geq i} Y_{i'}$, see Lemma 31.2.3. Choose $j, j' \in \{1, \dots, n\}$, $j \neq j'$. Note that η_j is not a specialization of $\eta_{j'}$. By Lemma 31.3.2 we can replace i by a bigger index and assume that $h(\eta_j)$ is not a specialization of $h(\eta_{j'})$ for all pairs (j, j') as above. For such an index, let $Y' \subset Y_i$ be the scheme theoretic image of $h : X \rightarrow Y_i$, see Morphisms, Definition 28.6.2. The morphism h is quasi-compact as the composition of the quasi-compact morphisms $X \rightarrow Y$ and $Y \rightarrow Y_i$ (which is affine). Hence by Morphisms, Lemma 28.6.3 the morphism $X \rightarrow Y'$ is dominant. Thus the generic points of Y' are all contained in the set $\{h(\eta_1), \dots, h(\eta_n)\}$, see Morphisms, Lemma 28.8.3. Since none of the $h(\eta_j)$ is the specialization of another we see that the points $h(\eta_1), \dots, h(\eta_n)$ are pairwise distinct and are each a generic point of Y' .

We apply Cohomology of Schemes, Lemma 29.16.1 above to the morphism $Y' \rightarrow S_i$. This gives a diagram

$$\begin{array}{ccc} Y' & \xleftarrow{\pi} & Y^* & \longrightarrow & \mathbf{P}_{S_i}^n \\ & \searrow & \downarrow & \swarrow & \\ & & S_i & & \end{array}$$

such that π is proper and surjective and an isomorphism over a dense open subscheme $V \subset Y'$. By our choice of i above we know that $h(\eta_1), \dots, h(\eta_n) \in V$. Consider the commutative diagram

$$\begin{array}{ccccccc} X' & \xlongequal{\quad} & X \times_{Y'} Y^* & \longrightarrow & Y^* & \longrightarrow & \mathbf{P}_{S_i}^n \\ & & \downarrow & & \downarrow & & \swarrow \\ & & X & \longrightarrow & Y' & & \\ & & \downarrow & & \downarrow & & \\ & & S & \longrightarrow & S_i & & \end{array}$$

Note that $X' \rightarrow X$ is an isomorphism over the open subscheme $U = h^{-1}(V)$ which contains each of the η_j and hence is dense in X . We conclude $X \leftarrow X' \rightarrow \mathbf{P}_S^n$ is a solution to the problem posed in the lemma. \square

31.12. Applications of Chow's lemma

We can use Chow's lemma to investigate the notions of proper and separated morphisms. As a first application we have the following.

Lemma 31.12.1. *Let S be a scheme. Let $f : X \rightarrow S$ be a separated morphism of finite type. The following are equivalent:*

- (1) *The morphism f is proper.*
- (2) *For any morphism $S' \rightarrow S$ which is locally of finite type the base change $X_{S'} \rightarrow S'$ is closed.*
- (3) *For every $n \geq 0$ the morphism $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is closed.*

Proof. Clearly (1) implies (2), and (2) implies (3), so we just need to show (3) implies (1). First we reduce to the case when S is affine. Assume that (3) implies (1) when the base is affine. Now let $f : X \rightarrow S$ be a separated morphism of finite type. Being proper is local on the base (see Morphisms, Lemma 28.42.3), so if $S = \bigcup_{\alpha} S_{\alpha}$ is an open affine cover, and if we denote $X_{\alpha} := f^{-1}(S_{\alpha})$, then it is enough to show that $f|_{X_{\alpha}} : X_{\alpha} \rightarrow S_{\alpha}$ is proper for all α . Since S_{α} is affine, if the map $f|_{X_{\alpha}}$ satisfies (3), then it will satisfy (1) by assumption, and will be proper. To finish the reduction to the case S is affine, we must show that if $f : X \rightarrow S$ is separated of finite type satisfying (3), then $f|_{X_{\alpha}} : X_{\alpha} \rightarrow S_{\alpha}$ is separated of finite type satisfying (3). Separatedness and finite type are clear. To see (3), notice that $\mathbf{A}^n \times X_{\alpha}$ is the open preimage of $\mathbf{A}^n \times S_{\alpha}$ under the map $1 \times f$. Fix a closed set $Z \subset \mathbf{A}^n \times X_{\alpha}$. Let \bar{Z} denote the closure of Z in $\mathbf{A}^n \times X$. Then for topological reasons,

$$1 \times f(\bar{Z}) \cap \mathbf{A}^n \times S_{\alpha} = 1 \times f(Z).$$

Hence $1 \times f(Z)$ is closed, and we have reduced the proof of (3) \Rightarrow (1) to the affine case.

Assume S affine, and $f : X \rightarrow S$ separated of finite type. We can apply Chow's Lemma 31.11.1 to get $\pi : X' \rightarrow X$ proper surjective and $X' \rightarrow \mathbf{P}_S^n$ an immersion. If X is proper over S , then $X' \rightarrow S$ is proper (Morphisms, Lemma 28.42.4). Since $\mathbf{P}_S^n \rightarrow S$ is separated, we conclude that $X' \rightarrow \mathbf{P}_S^n$ is proper (Morphisms, Lemma 28.42.7) and hence a closed immersion (Schemes, Lemma 25.10.4). Conversely, assume $X' \rightarrow \mathbf{P}_S^n$ is a closed immersion. Consider the diagram:

$$(31.12.1.1) \quad \begin{array}{ccc} X' & \longrightarrow & \mathbf{P}_S^n \\ \pi \downarrow & & \downarrow \\ X & \xrightarrow{f} & S \end{array}$$

All maps are a priori proper except for $X \rightarrow S$. Hence we conclude that $X \rightarrow S$ is proper by Morphisms, Lemma 28.42.8. Therefore, we have shown that $X \rightarrow S$ is proper if and only if $X' \rightarrow \mathbf{P}_S^n$ is a closed immersion.

Assume S is affine and (3) holds, and let n, X', π be as above. Since being a closed morphism is local on the base, the map $X \times \mathbf{P}^n \rightarrow S \times \mathbf{P}^n$ is closed since by (3) $X \times \mathbf{A}^n \rightarrow S \times \mathbf{A}^n$ is closed and since projective space is covered by copies of affine n -space, see Constructions, Lemma 26.13.3. By Morphisms, Lemma 28.42.5 the morphism

$$X' \times_S \mathbf{P}_S^n \rightarrow X \times_S \mathbf{P}_S^n = X \times \mathbf{P}^n$$

is proper. Since \mathbf{P}^n is separated, the projection

$$X' \times_S \mathbf{P}_S^n = \mathbf{P}_{X'}^n \rightarrow X'$$

will be separated as it is just a base change of a separated morphism. Therefore, the map $X' \rightarrow X' \times_S \mathbf{P}_S^n$ is proper, since it is a section to a separated map (see Schemes, Lemma 25.21.12). Composing all these proper morphisms

$$X' \rightarrow X' \times_S \mathbf{P}_S^n \rightarrow X \times_S \mathbf{P}_S^n = X \times \mathbf{P}^n \rightarrow S \times \mathbf{P}^n = \mathbf{P}_S^n$$

we see that the map $X' \rightarrow \mathbf{P}_S^n$ is proper, and hence a closed immersion. \square

If the base is Noetherian we can show that the valuative criterion holds using only discrete valuation rings. First we state the result concerning separation. We will often use solid commutative diagrams of morphisms of schemes having the following shape

$$(31.12.1.2) \quad \begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & S \end{array}$$

with A a valuation ring and K its field of fractions.

Lemma 31.12.2. *Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is locally of finite type. The following are equivalent:*

- (1) *The morphism f is separated.*
- (2) *For any diagram (31.12.1.2) there is at most one dotted arrow.*
- (3) *For all diagrams (31.12.1.2) with A a discrete valuation ring there is at most one dotted arrow.*
- (4) *For any irreducible component X_0 of X with generic point $\eta \in X_0$, for any discrete valuation ring $A \subset K = \kappa(\eta)$ with fraction field K and any diagram (31.12.1.2) such that the morphism $\mathrm{Spec}(K) \rightarrow X$ is the canonical one (see Schemes, Section 25.13) there is at most one dotted arrow.*

Proof. Clearly (1) implies (2), (2) implies (3), and (3) implies (4). It remains to show (4) implies (1). Assume (4). We begin by reducing to S affine. Being separated is a local on the base (see Schemes, Lemma 25.21.8). Hence, as in the proof of Lemma 31.12.1, if we can show that whenever $X \rightarrow S$ has (4) that the restriction $X_\alpha \rightarrow S_\alpha$ has (4) where $S_\alpha \subset S$ is an (affine) open subset and $X_\alpha := f^{-1}(S_\alpha)$, then we will be done. The generic points of the irreducible components of X_α will be the generic points of irreducible components of X , since X_α is open in X . Therefore, any two distinct dotted arrows in the diagram

$$(31.12.2.1) \quad \begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X_\alpha \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & S_\alpha \end{array}$$

would then give two distinct arrows in diagram (31.12.1.2) via the maps $X_\alpha \rightarrow X$ and $S_\alpha \rightarrow S$, which is a contradiction. Thus we have reduced to the case S is affine. We remark that in the course of this reduction, we prove that if $X \rightarrow S$ has (4) then the restriction $U \rightarrow V$ has (4) for opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$.

We next wish to reduce to the case $X \rightarrow S$ is finite type. Assume that we know (4) implies (1) when X is finite type. Since S is Noetherian and X is locally of finite type over S we see X is locally Noetherian as well (see Morphisms, Lemma 28.16.6). Thus, $X \rightarrow S$ is quasi-separated (see Properties, Lemma 27.5.4), and therefore we may apply the valuative criterion to check whether X is separated (see Schemes, Lemma 25.22.2). Let $X = \bigcup_\alpha X_\alpha$ be an affine open cover of X . Given any two dotted arrows, in a diagram (31.12.1.2), the image of the closed points of $\mathrm{Spec} A$

will fall in two sets X_α and X_β . Since $X_\alpha \cup X_\beta$ is open, for topological reasons it must contain the image of $\text{Spec}(A)$ under both maps. Therefore, the two dotted arrows factor through $X_\alpha \cup X_\beta \rightarrow X$, which is a scheme of finite type over S . Since $X_\alpha \cup X_\beta$ is an open subset of X , by our previous remark, $X_\alpha \cup X_\beta$ satisfies (4), so by assumption, is separated. This implies the two given dotted arrows are the same. Therefore, we have reduced to $X \rightarrow S$ is finite type.

Assume $X \rightarrow S$ of finite type and assume (4). Since $X \rightarrow S$ is finite type, and S is an affine Noetherian scheme, X is also Noetherian (see Morphisms, Lemma 28.16.6). Therefore, $X \rightarrow X \times_S X$ will be a quasi-compact immersion of Noetherian schemes. We proceed by contradiction. Assume that $X \rightarrow X \times_S X$ is not closed. Then, there is some $y \in X \times_S X$ in the closure of the image that is not in the image. As X is Noetherian it has finitely many irreducible components. Therefore, y is in the closure of the image of one of the irreducible components $X_0 \subset X$. Give X_0 the reduced induced structure. The composition $X_0 \rightarrow X \rightarrow X \times_S X$ factors through the closed subscheme $X_0 \times_S X_0 \subset X \times_S X$. Denote the closure of $\Delta(X_0)$ in $X_0 \times_S X_0$ by \bar{X}_0 (again as a reduced closed subscheme). Thus $y \in \bar{X}_0$. Since $X_0 \rightarrow X_0 \times_S X_0$ is an immersion, the image of X_0 will be open in \bar{X}_0 . Hence X_0 and \bar{X}_0 are birational. Since \bar{X}_0 is a closed subscheme of a Noetherian scheme, it is Noetherian. Thus, the local ring $\mathcal{O}_{\bar{X}_0, y}$ is a local Noetherian domain with fraction field K equal to the function field of X_0 . By the Krull-Akizuki theorem (see Algebra, Lemma 10.115.12), there exists a discrete valuation ring A dominating $\mathcal{O}_{\bar{X}_0, y}$ with fraction field K . This allows to to construct a diagram:

$$(31.12.2.2) \quad \begin{array}{ccc} \text{Spec } K & \longrightarrow & X_0 \\ \downarrow & \nearrow & \downarrow \Delta \\ A & \longrightarrow & X_0 \times_S X_0 \end{array}$$

which sends $\text{Spec } K$ to the generic point of $\Delta(X_0)$ and the closed point of A to $y \in X_0 \times_S X_0$ (use the material in Schemes, Section 25.13 to construct the arrows). There cannot even exist a set theoretic dotted arrow, since y is not in the image of Δ by our choice of y . By categorical means, the existence of the dotted arrow in the above diagram is equivalent to the uniqueness of the dotted arrow in the following diagram:

$$(31.12.2.3) \quad \begin{array}{ccc} \text{Spec } K & \longrightarrow & X_0 \\ \downarrow & \nearrow & \downarrow \\ A & \longrightarrow & S \end{array}$$

Therefore, we have non-uniqueness in this latter diagram by the nonexistence in the first. Therefore, X_0 does not satisfy uniqueness for discrete valuation rings, and since X_0 is an irreducible component of X , we have that $X \rightarrow S$ does not satisfy (4). Therefore, we have shown (4) implies (1). \square

Lemma 31.12.3. *Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of finite type. The following are equivalent:*

- (1) *The morphism f is proper.*
- (2) *For any diagram (31.12.1.2) there exists exactly one dotted arrow.*

- (3) For all diagrams (31.12.1.2) with A a discrete valuation ring there exists exactly one dotted arrow.
- (4) For any irreducible component X_0 of X with generic point $\eta \in X_0$, for any discrete valuation ring $A \subset K = \kappa(\eta)$ with fraction field K and any diagram (31.12.1.2) such that the morphism $\text{Spec}(K) \rightarrow X$ is the canonical one (see Schemes, Section 25.13) there exists exactly one dotted arrow.

Proof. (1) implies (2) implies (3) implies (4). We will now show (4) implies (1). As in the proof of Lemma 31.12.2, we can reduce to the case S is affine, since properness is local on the base, and if $X \rightarrow S$ satisfies (4), then $X_\alpha \rightarrow S_\alpha$ does as well for open $S_\alpha \subset S$ and $X_\alpha = f^{-1}(S_\alpha)$.

Now S is a Noetherian scheme, and so X is as well, since $X \rightarrow S$ is of finite type. Now we may use Chow's lemma (Cohomology of Schemes, Lemma 29.16.1) to get a surjective, proper, birational $X' \rightarrow X$ and an immersion $X' \rightarrow \mathbf{P}_S^n$. We wish to show $X \rightarrow S$ is universally closed. As in the proof of Lemma 31.12.1, it is enough to check that $X' \rightarrow \mathbf{P}_S^n$ is a closed immersion. For the sake of contradiction, assume that $X' \rightarrow \mathbf{P}_S^n$ is not a closed immersion. Then there is some $y \in \mathbf{P}_S^n$ that is in the closure of the image of X' , but is not in the image. So y is in the closure of the image of an irreducible component X'_0 of X' , but not in the image. Let $\bar{X}'_0 \subset \mathbf{P}_S^n$ be the closure of the image of X'_0 . As $X' \rightarrow \mathbf{P}_S^n$ is an immersion of Noetherian schemes, the morphism $X'_0 \rightarrow \bar{X}'_0$ is open and dense. By Algebra, Lemma 10.115.12 or Properties, Lemma 27.5.9 we can find a discrete valuation ring A dominating $\mathcal{O}_{\bar{X}'_0, y}$ and with identical field of fractions K . It is clear that K is the residue field at the generic point of X'_0 . Thus the solid commutative diagram

$$(31.12.3.1) \quad \begin{array}{ccccc} \text{Spec } K & \longrightarrow & X' & \longrightarrow & \mathbf{P}_S^n \\ \downarrow & \nearrow \text{dotted} & \downarrow & \nearrow & \downarrow \\ \text{Spec } A & \dashrightarrow & X & \longrightarrow & S \end{array}$$

Note that the closed point of A maps to $y \in \mathbf{P}_S^n$. By construction, there does not exist a set theoretic lift to X' . As $X' \rightarrow X$ is birational, the image of X'_0 in X is an irreducible component X_0 of X and K is also identified with the function field of X_0 . Hence, as $X \rightarrow S$ is assumed to satisfy (4), the dotted arrow $\text{Spec}(A) \rightarrow X$ exists. Since $X' \rightarrow X$ is proper, the dotted arrow lifts to the dotted arrow $\text{Spec}(A) \rightarrow X'$ (use Schemes, Proposition 25.20.6). We can compose this with the immersion $X' \rightarrow \mathbf{P}_S^n$ to obtain another morphism (not depicted in the diagram) from $\text{Spec}(A) \rightarrow \mathbf{P}_S^n$. Since \mathbf{P}_S^n is proper over S , it satisfies (2), and so these two morphisms agree. This is a contradiction, for we have constructed the forbidden lift of our original map $\text{Spec}(A) \rightarrow \mathbf{P}_S^n$ to X' . \square

Here is an application of Chow's lemma which goes in a slightly different direction.

Lemma 31.12.4. *Assumptions and notation as in Situation 31.7.1. If*

- (1) f is proper, and
- (2) f_0 is locally of finite type,

then there exists an i such that f_i is proper.

Proof. By Lemma 31.7.5 we see that f_i is separated for some $i \geq 0$. Replacing 0 by i we may assume that f_0 is separated. Observe that f_0 is quasi-compact, see Schemes, Lemma 25.21.15. By Lemma 31.11.1 we can choose a diagram

$$\begin{array}{ccc} X_0 & \xleftarrow{\pi} X'_0 & \longrightarrow \mathbf{P}_{Y_0}^n \\ & \searrow & \downarrow \\ & & Y_0 \end{array}$$

where $X'_0 \rightarrow \mathbf{P}_{Y_0}^n$ is an immersion, and $\pi : X'_0 \rightarrow X_0$ is proper and surjective. Introduce $X' = X'_0 \times_{Y_0} Y$ and $X'_i = X'_0 \times_{Y_0} Y_i$. By Morphisms, Lemmas 28.42.4 and 28.42.5 we see that $X' \rightarrow Y$ is proper. Hence $X' \rightarrow \mathbf{P}_Y^n$ is a closed immersion (Morphisms, Lemma 28.42.7). By Morphisms, Lemma 28.42.8 it suffices to prove that $X'_i \rightarrow Y_i$ is proper for some i . By Lemma 31.7.4 we find that $X'_i \rightarrow \mathbf{P}_{Y_i}^n$ is a closed immersion for i large enough. Then $X'_i \rightarrow Y_i$ is proper and we win. \square

Lemma 31.12.5. *Let $f : X \rightarrow S$ be a proper morphism with S quasi-compact and quasi-separated. Then $X = \lim X_i$ with $X_i \rightarrow S$ proper and of finite presentation.*

Proof. By Proposition 31.8.6 we can find a closed immersion $X \rightarrow Y$ with Y separated and of finite presentation over S . By Lemma 31.11.1 we can find a diagram

$$\begin{array}{ccc} Y & \xleftarrow{\pi} Y' & \longrightarrow \mathbf{P}_S^n \\ & \searrow & \downarrow \\ & & S \end{array}$$

where $Y' \rightarrow \mathbf{P}_S^n$ is an immersion, and $\pi : Y' \rightarrow Y$ is proper and surjective. By Lemma 31.8.4 we can write $X = \lim X_i$ with $X_i \rightarrow Y$ a closed immersion of finite presentation. Denote $X'_i \subset Y'$, resp. $X' \subset Y'$ the scheme theoretic inverse image of $X_i \subset Y$, resp. $X \subset Y$. Then $\lim X'_i = X'$. Since $X' \rightarrow S$ is proper (Morphisms, Lemmas 28.42.4), we see that $X' \rightarrow \mathbf{P}_S^n$ is a closed immersion (Morphisms, Lemma 28.42.7). Hence for i large enough we find that $X'_i \rightarrow \mathbf{P}_S^n$ is a closed immersion by Lemma 31.3.17. Thus X'_i is proper over S . For such i the morphism $X_i \rightarrow S$ is proper by Morphisms, Lemma 28.42.8. \square

Lemma 31.12.6. *Let $f : X \rightarrow S$ be a proper morphism with S quasi-compact and quasi-separated. Then $(X \rightarrow S) = \lim (X_i \rightarrow S_i)$ with S_i of finite type over \mathbf{Z} and $X_i \rightarrow S_i$ proper and of finite presentation.*

Proof. By Lemma 31.12.5 we can write $X = \lim_{k \in K} X_k$ with $X_k \rightarrow S$ proper and of finite presentation. Next, by absolute Noetherian approximation (Proposition 31.4.4) we can write $S = \lim_{j \in J} S_j$ with S_j of finite type over \mathbf{Z} . For each k there exists a j and a morphism $X_{k,j} \rightarrow S_j$ of finite presentation with $X_k \cong S \times_{S_j} X_{k,j}$ as schemes over S , see Lemma 31.9.1. After increasing j we may assume $X_{k,j} \rightarrow S_j$ is proper, see Lemma 31.12.4. The set I will consist of these pairs (k, j) and the corresponding morphism is $X_{k,j} \rightarrow S_j$. For every $k' \geq k$ we can find a $j' \geq j$ and a morphism $X_{j',k'} \rightarrow X_{j,k}$ over $S_{j'} \rightarrow S_j$ whose base change to S gives the morphism $X_{k'} \rightarrow X_k$ (follows again from Lemma 31.9.1). These morphisms form the transition morphisms of the system. Some details omitted. \square

Recall the scheme theoretic support of a finite type quasi-coherent module, see Morphisms, Definition 28.5.5.

Lemma 31.12.7. *Assumptions and notation as in Situation 31.7.1. Let \mathcal{F}_0 be a quasi-coherent \mathcal{O}_{X_0} -module. Denote \mathcal{F} and \mathcal{F}_i the pullbacks of \mathcal{F}_0 to X and X_i . Assume*

- (1) f_0 is locally of finite type,
- (2) \mathcal{F}_0 is of finite type,
- (3) the scheme theoretic support of \mathcal{F} is proper over Y .

Then the scheme theoretic support of \mathcal{F}_i is proper over Y_i for some i .

Proof. We may replace X_0 by the scheme theoretic support of \mathcal{F}_0 . By Morphisms, Lemma 28.5.3 this guarantees that X_i is the support of \mathcal{F}_i and X is the support of \mathcal{F} . Then, if $Z \subset X$ denotes the scheme theoretic support of \mathcal{F} , we see that $Z \rightarrow X$ is a universal homeomorphism. We conclude that $X \rightarrow Y$ is proper as this is true for $Z \rightarrow Y$ by assumption, see Morphisms, Lemma 28.42.8. By Lemma 31.12.4 we see that $X_i \rightarrow Y$ is proper for some i . Then it follows that the scheme theoretic support Z_i of \mathcal{F}_i is proper over Y by Morphisms, Lemmas 28.42.6 and 28.42.4. \square

31.13. Universally closed morphisms

In this section we discuss when a quasi-compact but not necessarily separated morphism is universally closed. We first prove a lemma which will allow us to check universal closedness after a base change which is locally of finite presentation.

Lemma 31.13.1. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. Let $g : T \rightarrow S$ be a morphism of schemes. Let $t \in T$ be a point and $Z \subset X_T$ be a closed subscheme such that $Z \cap X_t = \emptyset$. Then there exists an open neighbourhood $V \subset T$ of t , a commutative diagram*

$$\begin{array}{ccc} V & \xrightarrow{a} & T' \\ \downarrow & & \downarrow b \\ T & \xrightarrow{g} & S, \end{array}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

- (1) the morphism $b : T' \rightarrow S$ is locally of finite presentation,
- (2) with $t' = a(t)$ we have $Z' \cap X_{t'} = \emptyset$, and
- (3) $Z \cap X_V$ maps into Z' via the morphism $X_V \rightarrow X_{T'}$.

Proof. Let $s = g(t)$. During the proof we may always replace T by an open neighbourhood of t . Hence we may also replace S by an open neighbourhood of s . Thus we may and do assume that T and S are affine. Say $S = \text{Spec}(A)$, $T = \text{Spec}(B)$, g is given by the ring map $A \rightarrow B$, and t correspond to the prime ideal $\mathfrak{q} \subset B$.

As $X \rightarrow S$ is quasi-compact and S is affine we may write $X = \bigcup_{i=1, \dots, n} U_i$ as a finite union of affine opens. Write $U_i = \text{Spec}(C_i)$. In particular we have $X_T = \bigcup_{i=1, \dots, n} U_{i,T} = \bigcup_{i=1, \dots, n} \text{Spec}(C_i \otimes_A B)$. Let $I_i \subset C_i \otimes_A B$ be the ideal corresponding to the closed subscheme $Z \cap U_{i,T}$. The condition that $Z \cap X_t = \emptyset$ signifies that I_i generates the unit ideal in the ring

$$C_i \otimes_A \kappa(\mathfrak{q}) = (B \setminus \mathfrak{q})^{-1} (C_i \otimes_A B / \mathfrak{q} C_i \otimes_A B)$$

Since $I_i(B \setminus \mathfrak{q})^{-1}(C_i \otimes_A B) = (B \setminus \mathfrak{q})^{-1}I_i$ this means that $1 = x_i/g_i$ for some $x_i \in I_i$ and $g_i \in B, g_i \notin \mathfrak{q}$. Thus, clearing denominators we can find a relation of the form

$$x_i + \sum_j f_{i,j}c_{i,j} = g_i$$

with $x_i \in I_i, f_{i,j} \in \mathfrak{q}, c_{i,j} \in C_i \otimes_A B$, and $g_i \in B, g_i \notin \mathfrak{q}$. After replacing B by $B_{g_1 \dots g_n}$, i.e., after replacing T by a smaller affine neighbourhood of t , we may assume the equations read

$$x_i + \sum_j f_{i,j}c_{i,j} = 1$$

with $x_i \in I_i, f_{i,j} \in \mathfrak{q}, c_{i,j} \in C_i \otimes_A B$.

To finish the argument write B as a colimit of finitely presented A -algebras B_λ over a directed partially ordered set Λ . For each λ set $\mathfrak{q}_\lambda = (B_\lambda \rightarrow B)^{-1}(\mathfrak{q})$. For sufficiently large $\lambda \in \Lambda$ we can find

- (1) an element $x_{i,\lambda} \in C_i \otimes_A B_\lambda$ which maps to x_i ,
- (2) elements $f_{i,j,\lambda} \in \mathfrak{q}_{i,\lambda}$ mapping to $f_{i,j}$, and
- (3) elements $c_{i,j,\lambda} \in C_i \otimes_A B_\lambda$ mapping to $c_{i,j}$.

After increasing λ a bit more the equation

$$x_{i,\lambda} + \sum_j f_{i,j,\lambda}c_{i,j,\lambda} = 1$$

will hold. Fix such a λ and set $T' = \text{Spec}(B_\lambda)$. Then $t' \in T'$ is the point corresponding to the prime \mathfrak{q}_λ . Finally, let $Z' \subset X_{T'}$ be the scheme theoretic closure of $Z \rightarrow X_T \rightarrow X_{T'}$. As $X_T \rightarrow X_{T'}$ is affine, we can compute Z' on the affine open pieces $U_{i,T'}$ as the closed subscheme associated to $\text{Ker}(C_i \otimes_A B_\lambda \rightarrow C_i \otimes_A B/I_i)$, see Morphisms, Example 28.6.4. Hence $x_{i,\lambda}$ is in the ideal defining Z' . Thus the last displayed equation shows that $Z' \cap X_{t'}$ is empty. \square

Lemma 31.13.2. *Let $f : X \rightarrow S$ be a quasi-compact morphism of schemes. The following are equivalent*

- (1) f is universally closed,
- (2) for every morphism $S' \rightarrow S$ which is locally of finite presentation the base change $X_{S'} \rightarrow S'$ is closed, and
- (3) for every n the morphism $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is closed.

Proof. It is clear that (1) implies (2). Let us prove that (2) implies (1). Suppose that the base change $X_T \rightarrow T$ is not closed for some scheme T over S . By Schemes, Lemma 25.19.8 this means that there exists some specialization $t_1 \rightsquigarrow t$ in T and a point $\xi \in X_T$ mapping to t_1 such that ξ does not specialize to a point in the fibre over t . Set $Z = \overline{\{\xi\}} \subset X_T$. Then $Z \cap X_t = \emptyset$. Apply Lemma 31.13.1. We find an open neighbourhood $V \subset T$ of t , a commutative diagram

$$\begin{array}{ccc} V & \xrightarrow{a} & T' \\ \downarrow & & \downarrow b \\ T & \xrightarrow{g} & S, \end{array}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

- (1) the morphism $b : T' \rightarrow S$ is locally of finite presentation,
- (2) with $t' = a(t)$ we have $Z' \cap X_{t'} = \emptyset$, and
- (3) $Z \cap X_V$ maps into Z' via the morphism $X_V \rightarrow X_{T'}$.

Clearly this means that $X_{T'} \rightarrow T'$ maps the closed subset Z' to a subset of T' which contains $a(t_1)$ but not $t' = a(t)$. Since $a(t_1) \rightsquigarrow a(t) = t'$ we conclude that $X_{T'} \rightarrow T'$ is not closed. Hence we have shown that $X \rightarrow S$ not universally closed implies that $X_{T'} \rightarrow T'$ is not closed for some $T' \rightarrow S$ which is locally of finite presentation. In other words (2) implies (1).

Assume that $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is closed for every integer n . We want to prove that $X_T \rightarrow T$ is closed for every scheme T which is locally of finite presentation over S . We may of course assume that T is affine and maps into an affine open V of S (since $X_T \rightarrow T$ being a closed is local on T). In this case there exists a closed immersion $T \rightarrow \mathbf{A}^n \times V$ because $\mathcal{O}_T(T)$ is a finitely presented $\mathcal{O}_S(V)$ -algebra, see Morphisms, Lemma 28.22.2. Then $T \rightarrow \mathbf{A}^n \times S$ is a locally closed immersion. Hence we get a cartesian diagram

$$\begin{array}{ccc} X_T & \longrightarrow & \mathbf{A}^n \times X \\ f_T \downarrow & & \downarrow f_n \\ T & \longrightarrow & \mathbf{A}^n \times S \end{array}$$

of schemes where the horizontal arrows are locally closed immersions. Hence any closed subset $Z \subset X_T$ can be written as $X_T \cap Z'$ for some closed subset $Z' \subset \mathbf{A}^n \times X$. Then $f_T(Z) = T \cap f_n(Z')$ and we see that if f_n is closed, then also f_T is closed. \square

Lemma 31.13.3. *Let $f : X \rightarrow S$ be a finite type morphism of schemes. Assume S is locally Noetherian. Then the following are equivalent*

- (1) f is universally closed,
- (2) for every n the morphism $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is closed,
- (3) for any diagram (31.12.1.2) there exists some dotted arrow,
- (4) for all diagrams (31.12.1.2) with A a discrete valuation ring there exists some dotted arrow.

Proof. The equivalence of (1) and (2) is a special case of Lemma 31.13.2. The equivalence of (1) and (3) is a special case of Schemes, Proposition 25.20.6. Trivially (3) implies (4). Thus all we have to do is prove that (4) implies (2). We will prove that $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is closed by the criterion of Schemes, Lemma 25.19.8. Pick n and a specialization $z \rightsquigarrow z'$ of points in $\mathbf{A}^n \times S$ and a point $y \in \mathbf{A}^n \times X$ lying over z . Note that $\kappa(y)$ is a finitely generated field extension of $\kappa(z)$ as $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ is of finite type. Hence by Properties, Lemma 27.5.9 or Algebra, Lemma 10.115.12 implies that there exists a discrete valuation ring $A \subset \kappa(y)$ with fraction field $\kappa(z)$ dominating the image of $\mathcal{O}_{\mathbf{A}^n \times S, z'}$ in $\kappa(z)$. This gives a commutative diagram

$$\begin{array}{ccccc} \mathrm{Spec}(\kappa(y)) & \longrightarrow & \mathbf{A}^n \times X & \longrightarrow & X \\ \downarrow & & \downarrow & & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & \mathbf{A}^n \times S & \longrightarrow & S \end{array}$$

Now property (4) implies that there exists a morphism $\mathrm{Spec}(A) \rightarrow X$ which fits into this diagram. Since we already have the morphism $\mathrm{Spec}(A) \rightarrow \mathbf{A}^n$ from the left lower horizontal arrow we also get a morphism $\mathrm{Spec}(A) \rightarrow \mathbf{A}^n \times X$ fitting into the left square. Thus the image $y' \in \mathbf{A}^n \times X$ of the closed point is a specialization of y lying over z' . This proves that specializations lift along $\mathbf{A}^n \times X \rightarrow \mathbf{A}^n \times S$ and we win. \square

31.14. Limits and dimensions of fibres

The following lemma is most often used in the situation of Lemma 31.9.1 to assure that if the fibres of the limit have dimension $\leq d$, then the fibres at some finite stage have dimension $\leq d$.

Lemma 31.14.1. *Let I be a directed partially ordered set. Let $(f_i : X_i \rightarrow S_i)$ be an inverse system of morphisms of schemes over I . Assume*

- (1) *all the morphisms $S_{i'} \rightarrow S_i$ are affine,*
- (2) *all the schemes S_i are quasi-compact and quasi-separated,*
- (3) *the morphisms f_i are of finite type, and*
- (4) *the morphisms $X_{i'} \rightarrow X_i \times_{S_i} S_{i'}$ are closed immersions.*

Let $f : X = \lim_i X_i \rightarrow S = \lim_i S_i$ be the limit. Let $d \geq 0$. If every fibre of f has dimension $\leq d$, then for some i every fibre of f_i has dimension $\leq d$.

Proof. For each i let $U_i = \{x \in X_i \mid \dim_x((X_i)_{f_i(x)}) \leq d\}$. This is an open subset of X_i , see Morphisms, Lemma 28.29.4. Set $Z_i = X_i \setminus U_i$ (with reduced induced scheme structure). We have to show that $Z_i = \emptyset$ for some i . If not, then $Z = \lim Z_i \neq \emptyset$, see Lemma 31.3.4. Say $z \in Z$ is a point. Note that $Z \subset X$ is a closed subscheme. Set $s = f(z)$. For each i let $s_i \in S_i$ be the image of s . We remark that Z_s is the limit of the schemes $(Z_i)_{s_i}$ and Z_s is also the limit of the schemes $(Z_i)_{s_i}$ base changed to $\kappa(s)$. Moreover, all the morphisms

$$Z_s \longrightarrow (Z_{i'})_{s_{i'}} \times_{\mathrm{Spec}(\kappa(s_{i'}))} \mathrm{Spec}(\kappa(s)) \longrightarrow (Z_i)_{s_i} \times_{\mathrm{Spec}(\kappa(s_i))} \mathrm{Spec}(\kappa(s)) \longrightarrow X_s$$

are closed immersions by assumption (4). Hence Z_s is the scheme theoretic intersection of the closed subschemes $(Z_i)_{s_i} \times_{\mathrm{Spec}(\kappa(s_i))} \mathrm{Spec}(\kappa(s))$ in X_s . Since all the irreducible components of the schemes $(Z_i)_{s_i} \times_{\mathrm{Spec}(\kappa(s_i))} \mathrm{Spec}(\kappa(s))$ have dimension $> d$ and contain z we conclude that Z_s contains an irreducible component of dimension $> d$ passing through z which contradicts the fact that $Z_s \subset X_s$ and $\dim(X_s) \leq d$. \square

Lemma 31.14.2. *Notation and assumptions as in Situation 31.7.1. If*

- (1) *f is a quasi-finite morphism, and*
- (2) *f_0 is locally of finite type,*

then there exists an $i \geq 0$ such that f_i is quasi-finite.

Proof. Follows immediately from Lemma 31.14.1. \square

Lemma 31.14.3. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \rightarrow S$ be a morphism of finite presentation. Let $d \geq 0$ be an integer. If $Z \subset X$ be a closed subscheme such that $\dim(Z_s) \leq d$ for all $s \in S$, then there exists a closed subscheme $Z' \subset X$ such that*

- (1) $Z \subset Z'$,
- (2) $Z' \rightarrow X$ is of finite presentation, and
- (3) $\dim(Z'_s) \leq d$ for all $s \in S$.

Proof. By Proposition 31.4.4 we can write $S = \lim S_i$ as the limit of a directed inverse system of Noetherian schemes with affine transition maps. By Lemma 31.9.1 we may assume that there exist a system of morphisms $f_i : X_i \rightarrow S_i$ of finite presentation such that $X_{i'} = X_i \times_{S_i} S_{i'}$ for all $i' \geq i$ and such that $X = X_i \times_{S_i} S$. Let $Z_i \subset X_i$ be the scheme theoretic image of $Z \rightarrow X \rightarrow X_i$. Then for $i' \geq i$ the

morphism $X_{i'} \rightarrow X_i$ maps $Z_{i'}$ into Z_i and the induced morphism $Z_{i'} \rightarrow Z_i \times_{S_i} S_{i'}$ is a closed immersion. By Lemma 31.14.1 we see that the dimension of the fibres of $Z_i \rightarrow S_i$ all have dimension $\leq d$ for a suitable $i \in I$. Fix such an i and set $Z' = Z_i \times_{S_i} S \subset X$. Since S_i is Noetherian, we see that X_i is Noetherian, and hence the morphism $Z_i \rightarrow X_i$ is of finite presentation. Therefore also the base change $Z' \rightarrow X$ is of finite presentation. Moreover, the fibres of $Z' \rightarrow S$ are base changes of the fibres of $Z_i \rightarrow S_i$ and hence have dimension $\leq d$. \square

CHAPTER 32

Varieties

32.1. Introduction

In this chapter we start studying varieties and more generally schemes over a field. A fundamental reference is [DG67].

32.2. Notation

Throughout this chapter we use the letter k to denote the ground field.

32.3. Varieties

In the stacks project we will use the following as our definition of a variety.

Definition 32.3.1. Let k be a field. A *variety* is a scheme X over k such that X is integral and the structure morphism $X \rightarrow \mathrm{Spec}(k)$ is separated and of finite type.

This definition has the following drawback. Suppose that $k \subset k'$ is an extension of fields. Suppose that X is a variety over k . Then the base change $X_{k'} = X \times_{\mathrm{Spec}(k)} \mathrm{Spec}(k')$ is not necessarily a variety over k' . This phenomenon (in greater generality) will be discussed in detail in the following sections. The product of two varieties need not be a variety (this is really the same phenomenon). Here is an example.

Example 32.3.2. Let $k = \mathbf{Q}$. Let $X = \mathrm{Spec}(\mathbf{Q}(i))$ and $Y = \mathrm{Spec}(\mathbf{Q}(i))$. Then the product $X \times_{\mathrm{Spec}(k)} Y$ of the varieties X and Y is not a variety, since it is reducible. (It is isomorphic to the disjoint union of two copies of X .)

If the ground field is algebraically closed however, then the product of varieties is a variety. This follows from the results in the algebra chapter, but there we treat much more general situations. There is also a simple direct proof of it which we present here.

Lemma 32.3.3. *Let k be an algebraically closed field. Let X, Y be varieties over k . Then $X \times_{\mathrm{Spec}(k)} Y$ is a variety over k .*

Proof. The morphism $X \times_{\mathrm{Spec}(k)} Y \rightarrow \mathrm{Spec}(k)$ is of finite type and separated because it is the composition of the morphisms $X \times_{\mathrm{Spec}(k)} Y \rightarrow Y \rightarrow \mathrm{Spec}(k)$ which are separated and of finite type, see Morphisms, Lemmas 28.16.4 and 28.16.3 and Schemes, Lemma 25.21.13. To finish the proof it suffices to show that $X \times_{\mathrm{Spec}(k)} Y$ is integral. Let $X = \bigcup_{i=1, \dots, n} U_i$, $Y = \bigcup_{j=1, \dots, m} V_j$ be finite affine open coverings. If we can show that each $U_i \times_{\mathrm{Spec}(k)} V_j$ is integral, then we are done by Properties, Lemmas 27.3.2, 27.3.3, and 27.3.4. This reduces us to the affine case.

The affine case translates into the following algebra statement: Suppose that A, B are integral domains and finitely generated k -algebras. Then $A \otimes_k B$ is an integral domain. To get a contradiction suppose that

$$\left(\sum_{i=1, \dots, n} a_i \otimes b_i\right) \left(\sum_{j=1, \dots, m} c_j \otimes d_j\right) = 0$$

in $A \otimes_k B$ with both factors nonzero in $A \otimes_k B$. We may assume that b_1, \dots, b_n are k -linearly independent in B , and that d_1, \dots, d_m are k -linearly independent in B . Of course we may also assume that a_1 and c_1 are nonzero in A . Hence $D(a_1 c_1) \subset \text{Spec}(A)$ is nonempty. By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) we can find a maximal ideal $\mathfrak{m} \subset A$ contained in $D(a_1 c_1)$ and $A/\mathfrak{m} = k$ as k is algebraically closed. Denote \bar{a}_i, \bar{c}_j the residue classes of a_i, c_j in $A/\mathfrak{m} = k$. Then equation above becomes

$$\left(\sum_{i=1, \dots, n} \bar{a}_i b_i\right) \left(\sum_{j=1, \dots, m} \bar{c}_j d_j\right) = 0$$

which is a contradiction with $\mathfrak{m} \in D(a_1 c_1)$, the linear independence of b_1, \dots, b_n and d_1, \dots, d_m , and the fact that B is a domain. \square

32.4. Geometrically reduced schemes

If X is a reduced scheme over a field, then it can happen that X becomes nonreduced after extending the ground field. This does not happen for geometrically reduced schemes.

Definition 32.4.1. Let k be a field. Let X be a scheme over k . Let $x \in X$ be a point.

- (1) Let $x \in X$ be a point. We say X is *geometrically reduced at x* if for any field extension $k \subset k'$ and any point $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is reduced.
- (2) We say X is *geometrically reduced over k* if X is geometrically reduced at every point of X .

This may seem a little mysterious at first, but it is really the same thing as the notion discussed in the algebra chapter. Here are some basic results explaining the connection.

Lemma 32.4.2. Let k be a field. Let X be a scheme over k . Let $x \in X$. The following are equivalent

- (1) X is geometrically reduced at x , and
- (2) the ring $\mathcal{O}_{X, x}$ is geometrically reduced over k (see Algebra, Definition 10.42.1).

Proof. Assume (1). This in particular implies that $\mathcal{O}_{X, x}$ is reduced. Let $k \subset k'$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X, x} \otimes_k k'$. By Algebra, Lemma 10.45.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'}, x'} \cong \mathcal{O}_{X, x} \otimes_k k'$. By assumption this is a reduced ring. Hence we deduce (2) by Algebra, Lemma 10.43.3.

Assume (2). Let $k \subset k'$ be a field extension. Since $\text{Spec}(k') \rightarrow \text{Spec}(k)$ is surjective, also $X_{k'} \rightarrow X$ is surjective (Morphisms, Lemma 28.11.4). Let $x' \in X_{k'}$ be any point lying over x . The local ring $\mathcal{O}_{X_{k'}, x'}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_k k'$. Hence it is reduced by assumption and (1) is proved. \square

The notion isn't interesting in characteristic zero.

Lemma 32.4.3. *Let X be a scheme over a perfect field k (e.g. k has characteristic zero). Let $x \in X$. If $\mathcal{O}_{X,x}$ is reduced, then X is geometrically reduced at x . If X is reduced, then X is geometrically reduced over k .*

Proof. The first statement follows from Lemma 32.4.2 and Algebra, Lemma 10.42.6 and the definition of a perfect field (Algebra, Definition 10.44.1). The second statement follows from the first. \square

Lemma 32.4.4. *Let k be a field of characteristic $p > 0$. Let X be a scheme over k . The following are equivalent*

- (1) X is geometrically reduced,
- (2) $X_{k'}$ is reduced for every field extension $k \subset k'$,
- (3) $X_{k'}$ is reduced for every finite purely inseparable field extension $k \subset k'$,
- (4) $X_{k^{1/p}}$ is reduced,
- (5) $X_{k^{perf}}$ is reduced,
- (6) $X_{\bar{k}}$ is reduced,
- (7) for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically reduced (see Algebra, Definition 10.42.1).

Proof. Assume (1). Then for every field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is reduced. In other words $X_{k'}$ is reduced. Hence (2).

Assume (2). Let $U \subset X$ be an affine open. Then for every field extension $k \subset k'$ the scheme $X_{k'}$ is reduced, hence $U_{k'} = \text{Spec}(\mathcal{O}(U) \otimes_k k')$ is reduced, hence $\mathcal{O}(U) \otimes_k k'$ is reduced (see Properties, Section 27.3). In other words $\mathcal{O}(U)$ is geometrically reduced, so (7) holds.

Assume (7). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U) \otimes_k k'$ where U is affine open in X (see Schemes, Section 25.17). Hence $X_{k'}$ is reduced. So (1) holds.

This proves that (1), (2), and (7) are equivalent. These are equivalent to (3), (4), (5), and (6) because we can apply Algebra, Lemma 10.43.3 to $\mathcal{O}_X(U)$ for $U \subset X$ affine open. \square

Lemma 32.4.5. *Let k be a field of characteristic $p > 0$. Let X be a scheme over k . Let $x \in X$. The following are equivalent*

- (1) X is geometrically reduced at x ,
- (2) $\mathcal{O}_{X_{k'},x'}$ is reduced for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ the unique point lying over x ,
- (3) $\mathcal{O}_{X_{k^{1/p}},x'}$ is reduced for $x' \in X_{k^{1/p}}$ the unique point lying over x , and
- (4) $\mathcal{O}_{X_{k^{perf}},x'}$ is reduced for $x' \in X_{k^{perf}}$ the unique point lying over x .

Proof. Note that if $k \subset k'$ is purely inseparable, then $X_{k'} \rightarrow X$ induces a homeomorphism on underlying topological spaces, see Algebra, Lemma 10.45.2. Whence the uniqueness of x' lying over x mentioned in the statement. Moreover, in this case $\mathcal{O}_{X_{k'},x'} = \mathcal{O}_{X,x} \otimes_k k'$. Hence the lemma follows from Lemma 32.4.2 above and Algebra, Lemma 10.43.3. \square

Lemma 32.4.6. *Let k be a field. Let X be a scheme over k . Let k'/k be a field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x . The following are equivalent*

- (1) X is geometrically reduced at x ,
- (2) $X_{k'}$ is geometrically reduced at x' .

In particular, X is geometrically reduced over k if and only if $X_{k'}$ is geometrically reduced over k' .

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x'' . Consider the map of local rings

$$\mathcal{O}_{X_{k''}, x''} \longrightarrow \mathcal{O}_{X_{k'''}, x'''}$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is reduced. Thus by Algebra, Lemma 10.152.2 we conclude that $\mathcal{O}_{X_{k''}, x''}$ is reduced. Thus by Lemma 32.4.5 we conclude that X is geometrically reduced at x . \square

Lemma 32.4.7. *Let k be a field. Let X, Y be schemes over k .*

- (1) *If X is geometrically reduced at x , and Y reduced, then $X \times_k Y$ is reduced at every point lying over x .*
- (2) *If X geometrically reduced over k and Y reduced. Then $X \times_k Y$ is reduced.*

Proof. Combine, Lemmas 32.4.2 and 32.4.4 and Algebra, Lemma 10.42.5. \square

Lemma 32.4.8. *Let k be a field. Let X be a scheme over k .*

- (1) *If $x' \rightsquigarrow x$ is a specialization and X is geometrically reduced at x , then X is geometrically reduced at x' .*
- (2) *If $x \in X$ such that (a) $\mathcal{O}_{X, x}$ is reduced, and (b) for each specialization $x' \rightsquigarrow x$ where x' is a generic point of an irreducible component of X the scheme X is geometrically reduced at x' , then X is geometrically reduced at x .*
- (3) *If X is reduced and geometrically reduced at all generic points of irreducible components of X , then X is geometrically reduced.*

Proof. Part (1) follows from Lemma 32.4.2 and the fact that if A is a geometrically reduced k -algebra, then $S^{-1}A$ is a geometrically reduced k -algebra for any multiplicative subset S of A , see Algebra, Lemma 10.42.3.

Let $A = \mathcal{O}_{X, x}$. The assumptions (a) and (b) of (2) imply that A is reduced, and that $A_{\mathfrak{q}}$ is geometrically reduced over k for every minimal prime \mathfrak{q} of A . Hence A is geometrically reduced over k , see Algebra, Lemma 10.42.7. Thus X is geometrically reduced at x , see Lemma 32.4.2.

Part (3) follows trivially from part (2). \square

Lemma 32.4.9. *Let k be a field. Let X be a scheme over k . Let $x \in X$. Assume X locally Noetherian and geometrically reduced at x . Then there exists an open neighbourhood $U \subset X$ of x which is geometrically reduced over k .*

Proof. Let R be a Noetherian k -algebra. Let $\mathfrak{p} \subset R$ be a prime. Let $I = \text{Ker}(R \rightarrow R_{\mathfrak{p}})$. Since $IR_{\mathfrak{p}} = 0$ and I is finitely generated there exists an $f \in R$, $f \notin \mathfrak{p}$ such that $fI = 0$. Hence $R_f \subset R_{\mathfrak{p}}$.

Assume X locally Noetherian and geometrically reduced at x . If we apply the above to $R = \mathcal{O}_X(U)$ for some affine open neighbourhood of x , and $\mathfrak{p} \subset R$ the prime corresponding to x , then we see that after shrinking U we may assume $R \subset R_{\mathfrak{p}}$. By Lemma 32.4.2 the assumption means that $R_{\mathfrak{p}}$ is geometrically reduced over k . By Algebra, Lemma 10.42.2 this implies that R is geometrically reduced over k , which in turn implies that U is geometrically reduced. \square

Example 32.4.10. Let $k = \mathbf{F}_p(s, t)$, i.e., a purely transcendental extension of the prime field. Consider the variety $X = \text{Spec}(k[x, y]/(1 + sx^p + ty^p))$. Let $k \subset k'$ be any extension such that both s and t have a p th root in k' . Then the base change $X_{k'}$ is not reduced. Namely, the ring $k'[x, y]/(1 + sx^p + ty^p)$ contains the element $1 + s^{1/p}x + t^{1/p}y$ whose p th power is zero but which is not zero (since the ideal $(1 + sx^p + ty^p)$ certainly does not contain any nonzero element of degree $< p$).

Lemma 32.4.11. *Let k be a field. Let $X \rightarrow \text{Spec}(k)$ be locally of finite type. Assume X has finitely many irreducible components. Then there exists a finite purely inseparable extension $k \subset k'$ such that $(X_{k'})_{red}$ is geometrically reduced over k' .*

Proof. To prove this lemma we may replace X by its reduction X_{red} . Hence we may assume that X is reduced and locally of finite type over k . Let $x_1, \dots, x_n \in X$ be the generic points of the irreducible components of X . Note that for every purely inseparable algebraic extension $k \subset k'$ the morphism $(X_{k'})_{red} \rightarrow X$ is a homeomorphism, see Algebra, Lemma 10.45.2. Hence the points x'_1, \dots, x'_n lying over x_1, \dots, x_n are the generic points of the irreducible components of $(X_{k'})_{red}$. As X is reduced the local rings $K_i = \mathcal{O}_{X, x_i}$ are fields, see Algebra, Lemma 10.24.1. As X is locally of finite type over k the field extensions $k \subset K_i$ are finitely generated field extensions. Finally, the local rings $\mathcal{O}_{(X_{k'})_{red}, x'_i}$ are the fields $(K_i \otimes_k k')_{red}$. By Algebra, Lemma 10.44.3 we can find a finite purely inseparable extension $k \subset k'$ such that $(K_i \otimes_k k')_{red}$ are separable field extensions of k' . In particular each $(K_i \otimes_k k')_{red}$ is geometrically reduced over k' by Algebra, Lemma 10.43.1. At this point Lemma 32.4.8 part (3) implies that $(X_{k'})_{red}$ is geometrically reduced. \square

32.5. Geometrically connected schemes

If X is a connected scheme over a field, then it can happen that X becomes disconnected after extending the ground field. This does not happen for geometrically connected schemes.

Definition 32.5.1. Let X be a scheme over the field k . We say X is *geometrically connected* over k if the scheme $X_{k'}$ is connected for every field extension k' of k .

By convention a connected topological space is nonempty; hence a fortiori geometrically connected schemes are nonempty. Here is an example of a variety which is not geometrically connected.

Example 32.5.2. Let $k = \mathbf{Q}$. The scheme $X = \text{Spec}(\mathbf{Q}(i))$ is a variety over $\text{Spec}(\mathbf{Q})$. But the base change $X_{\mathbf{C}}$ is the spectrum of $\mathbf{C} \otimes_{\mathbf{Q}} \mathbf{Q}(i) \cong \mathbf{C} \times \mathbf{C}$ which is the disjoint union of two copies of $\text{Spec}(\mathbf{C})$. So in fact, this is an example of a non-geometrically connected variety.

Lemma 32.5.3. *Let X be a scheme over the field k . Let $k \subset k'$ be a field extension. Then X is geometrically connected over k if and only if $X_{k'}$ is geometrically connected over k' .*

Proof. If X is geometrically connected over k , then it is clear that $X_{k'}$ is geometrically connected over k' . For the converse, note that for any field extension $k \subset k''$ there exists a common field extension $k' \subset k'''$ and $k'' \subset k'''$. As the morphism $X_{k'''} \rightarrow X_{k''}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the connectedness of $X_{k'''}$ implies the connectedness of $X_{k''}$. Thus if $X_{k'}$ is geometrically connected over k' then X is geometrically connected over k . \square

Lemma 32.5.4. *Let k be a field. Let X, Y be schemes over k . Assume X is geometrically connected over k . Then the projection morphism*

$$p : X \times_k Y \longrightarrow Y$$

induces a bijection between connected components.

Proof. The scheme theoretic fibres of p are connected, since they are base changes of the geometrically connected scheme X by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 25.18.5. By Morphisms, Lemma 28.24.4 the map p is open. Thus we may apply Topology, Lemma 5.6.5 to conclude. \square

Lemma 32.5.5. *Let k be a field. Let A be a k -algebra. Then $X = \text{Spec}(A)$ is geometrically connected over k if and only if A is geometrically connected over k (see Algebra, Definition 10.46.3).*

Proof. Immediate from the definitions. \square

Lemma 32.5.6. *Let $k \subset k'$ be an extension of fields. Let X be a scheme over k . Assume k separably algebraically closed. Then the morphism $X_{k'} \rightarrow X$ induces a bijection of connected components. In particular, X is geometrically connected over k if and only if X is connected.*

Proof. Since k is separably algebraically closed we see that k' is geometrically connected over k , see Algebra, Lemma 10.46.4. Hence $Z = \text{Spec}(k')$ is geometrically connected over k by Lemma 32.5.5 above. Since $X_{k'} = Z \times_k X$ the result is a special case of Lemma 32.5.4. \square

Lemma 32.5.7. *Let k be a field. Let X be a scheme over k . Let \bar{k} be a separable algebraic closure of k . Then X is geometrically connected if and only if the base change $X_{\bar{k}}$ is connected.*

Proof. Assume $X_{\bar{k}}$ is connected. Let $k \subset k'$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}'$ such that k' embeds into \bar{k}' as an extension of k . By Lemma 32.5.6 we see that $X_{\bar{k}'}$ is connected. Since $X_{\bar{k}'} \rightarrow X_{k'}$ is surjective we conclude that $X_{k'}$ is connected as desired. \square

Lemma 32.5.8. *Let k be a field. Let X be a scheme over k . Let A be a k -algebra. Let $V \subset X_A$ be a quasi-compact open. Then there exists a finitely generated k -subalgebra $A' \subset A$ and a quasi-compact open $V' \subset X_{A'}$ such that $V = V'_A$.*

Proof. We remark that if X is also quasi-separated this follows from Limits, Lemma 31.3.8. Let U_1, \dots, U_n be finitely many affine opens of X such that $V \subset \bigcup U_{i,A}$. Say $U_i = \text{Spec}(R_i)$. Since V is quasi-compact we can find finitely many $f_{ij} \in R_i \otimes_k A$, $j = 1, \dots, n_i$ such that $V = \bigcup_i \bigcup_{j=1, \dots, n_i} D(f_{ij})$ where $D(f_{ij}) \subset U_{i,A}$ is the corresponding standard open. (We do not claim that $V \cap U_{i,A}$ is the union

of the $D(f_{ij})$, $j = 1, \dots, n_i$.) It is clear that we can find a finitely generated k -subalgebra $A' \subset A$ such that f_{ij} is the image of some $f'_{ij} \in R_i \otimes_k A'$. Set $V' = \bigcup D(f'_{ij})$ which is a quasi-compact open of $X_{A'}$. Denote $\pi : X_A \rightarrow X_{A'}$ the canonical morphism. We have $\pi(V) \subset V'$ as $\pi(D(f_{ij})) \subset D(f'_{ij})$. If $x \in X_A$ with $\pi(x) \in V'$, then $\pi(x) \in D(f'_{ij})$ for some i, j and we see that $x \in D(f_{ij})$ as f'_{ij} maps to f_{ij} . Thus we see that $V = \pi^{-1}(V')$ as desired. \square

Let k be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. For example \bar{k} could be the separable algebraic closure of k . For any $\sigma \in \text{Gal}(\bar{k}/k)$ we get a corresponding automorphism $\text{Spec}(\sigma) : \text{Spec}(\bar{k}) \rightarrow \text{Spec}(\bar{k})$. Note that $\text{Spec}(\sigma) \circ \text{Spec}(\tau) = \text{Spec}(\tau \circ \sigma)$. Hence we get an action

$$\text{Gal}(\bar{k}/k)^{\text{opp}} \times \text{Spec}(\bar{k}) \longrightarrow \text{Spec}(\bar{k})$$

of the opposite group on the scheme $\text{Spec}(\bar{k})$. Let X be a scheme over k . Since $X_{\bar{k}} = \text{Spec}(\bar{k}) \times_{\text{Spec}(k)} X$ by definition we see that the action above induces a canonical action

$$(32.5.8.1) \quad \text{Gal}(\bar{k}/k)^{\text{opp}} \times X_{\bar{k}} \longrightarrow X_{\bar{k}}.$$

Lemma 32.5.9. *Let k be a field. Let X be a scheme over k . Let \bar{k} be a (possibly infinite) Galois extension of k . Let $V \subset X_{\bar{k}}$ be a quasi-compact open. Then*

- (1) *there exists a finite subextension $k \subset k' \subset \bar{k}$ and a quasi-compact open $V' \subset X_{k'}$ such that $V = (V')_{\bar{k}}$,*
- (2) *there exists an open subgroup $H \subset \text{Gal}(\bar{k}/k)$ such that $\sigma(V) = V$ for all $\sigma \in H$.*

Proof. By Lemma 32.5.8 there exists a finite subextension $k \subset k' \subset \bar{k}$ and an open $V' \subset X_{k'}$ which pulls back to V . This proves (1). Since $\text{Gal}(\bar{k}/k')$ is open in $\text{Gal}(\bar{k}/k)$ part (2) is clear as well. \square

Lemma 32.5.10. *Let k be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let X be a scheme over k . Let $\bar{T} \subset X_{\bar{k}}$ have the following properties*

- (1) *\bar{T} is a closed subset of $X_{\bar{k}}$,*
- (2) *for every $\sigma \in \text{Gal}(\bar{k}/k)$ we have $\sigma(\bar{T}) = \bar{T}$.*

Then there exists a closed subset $T \subset X$ whose inverse image in $X_{k'}$ is \bar{T} .

Proof. This lemma immediately reduces to the case where $X = \text{Spec}(A)$ is affine. In this case, let $\bar{I} \subset A \otimes_k \bar{k}$ be the radical ideal corresponding to \bar{T} . Assumption (2) implies that $\sigma(\bar{I}) = \bar{I}$ for all $\sigma \in \text{Gal}(\bar{k}/k)$. Pick $x \in \bar{I}$. There exists a finite Galois extension $k \subset k'$ contained in \bar{k} such that $x \in A \otimes_k k'$. Set $G = \text{Gal}(k'/k)$. Set

$$P(T) = \prod_{\sigma \in G} (T - \sigma(x)) \in (A \otimes_k k')[T]$$

It is clear that $P(T)$ is monic and is actually an element of $(A \otimes_k k')^G[T] = A[T]$ (by basic Galois theory). Moreover, if we write $P(T) = T^d + a_1 T^{d-1} + \dots + a_0$ then we see that $a_i \in I := A \cap \bar{I}$. By Algebra, Lemma 10.37.5 we see that x is contained in the radical of $I(A \otimes_k \bar{k})$. Hence \bar{I} is the radical of $I(A \otimes_k \bar{k})$ and setting $T = V(I)$ is a solution. \square

Lemma 32.5.11. *Let k be a field. Let X be a scheme over k . The following are equivalent*

- (1) X is geometrically connected,
- (2) for every finite separable field extension $k \subset k'$ the scheme $X_{k'}$ is connected.

Proof. It follows immediately from the definition that (1) implies (2). Assume that X is not geometrically connected. Let $k \subset \bar{k}$ be a separable algebraic closure of k . By Lemma 32.5.7 it follows that $X_{\bar{k}}$ is disconnected. Say $X_{\bar{k}} = \bar{U} \amalg \bar{V}$ with \bar{U} and \bar{V} open, closed, and nonempty.

Suppose that $W \subset X$ is any quasi-compact open. Then $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are open and closed in $W_{\bar{k}}$. In particular $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are quasi-compact, and by Lemma 32.5.9 both $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are defined over a finite subextension and invariant under an open subgroup of $\text{Gal}(\bar{k}/k)$. We will use this without further mention in the following.

Pick $W_0 \subset X$ quasi-compact open such that both $W_{0,\bar{k}} \cap \bar{U}$ and $W_{0,\bar{k}} \cap \bar{V}$ are nonempty. Choose a finite subextension $k \subset k' \subset \bar{k}$ and a decomposition $W_{0,k'} = U'_0 \amalg V'_0$ into open and closed subsets such that $W_{0,\bar{k}} \cap \bar{U} = (U'_0)_{\bar{k}}$ and $W_{0,\bar{k}} \cap \bar{V} = (V'_0)_{\bar{k}}$. Let $H = \text{Gal}(\bar{k}/k') \subset \text{Gal}(\bar{k}/k)$. In particular $\sigma(W_{0,\bar{k}} \cap \bar{U}) = W_{0,\bar{k}} \cap \bar{U}$ and similarly for \bar{V} .

Having chosen W_0, k' as above, for every quasi-compact open $W \subset X$ we set

$$U_W = \bigcap_{\sigma \in H} \sigma(W_{\bar{k}} \cap \bar{U}), \quad V_W = \bigcup_{\sigma \in H} \sigma(W_{\bar{k}} \cap \bar{V}).$$

Now, since $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are fixed by an open subgroup of $\text{Gal}(\bar{k}/k)$ we see that the union and intersection above are finite. Hence U_W and V_W are both open and closed. Also, by construction $W_{\bar{k}} = U_W \amalg V_W$.

We claim that if $W \subset W' \subset X$ are quasi-compact open, then $W_{\bar{k}} \cap U_{W'} = U_W$ and $W_{\bar{k}} \cap V_{W'} = V_W$. Verification omitted. Hence we see that upon defining $U = \bigcup_{W \subset X} U_W$ and $V = \bigcup_{W \subset X} V_W$ we obtain $X_{\bar{k}} = U \amalg V$ is a disjoint union of open and closed subsets. It is clear that V is nonempty as it is constructed by taking unions (locally). On the other hand, U is nonempty since it contains $W_0 \cap \bar{U}$ by construction. Finally, $U, V \subset X_{\bar{k}}$ are closed and H -invariant by construction. Hence by Lemma 32.5.10 we have $U = (U')_{\bar{k}}$, and $V = (V')_{\bar{k}}$ for some closed $U', V' \subset X_{k'}$. Clearly $X_{k'} = U' \amalg V'$ and we see that $X_{k'}$ is disconnected as desired. \square

Lemma 32.5.12. *Let k be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let $f : T \rightarrow X$ be a morphism of schemes over k . Assume $T_{\bar{k}}$ connected and $X_{\bar{k}}$ disconnected. Then X is disconnected.*

Proof. Write $X_{\bar{k}} = \bar{U} \amalg \bar{V}$ with \bar{U} and \bar{V} open and closed. Denote $\bar{f} : T_{\bar{k}} \rightarrow X_{\bar{k}}$ the base change of f . Since $T_{\bar{k}}$ is connected we see that $T_{\bar{k}}$ is contained in either $\bar{f}^{-1}(\bar{U})$ or $\bar{f}^{-1}(\bar{V})$. Say $T_{\bar{k}} \subset \bar{f}^{-1}(\bar{U})$.

Fix a quasi-compact open $W \subset X$. There exists a finite Galois subextension $k \subset k' \subset \bar{k}$ such that $\bar{U} \cap W_{\bar{k}}$ and $\bar{V} \cap W_{\bar{k}}$ come from quasi-compact opens $U', V' \subset W_{k'}$. Then also $W_{k'} = U' \amalg V'$. Consider

$$U'' = \bigcap_{\sigma \in \text{Gal}(k'/k)} \sigma(U'), \quad V'' = \bigcup_{\sigma \in \text{Gal}(k'/k)} \sigma(V').$$

These are Galois invariant, open and closed, and $W_{k'} = U'' \coprod V''$. By Lemma 32.5.10 we get open and closed subsets $U_W, V_W \subset W$ such that $U'' = (U_W)_{k'}$, $V'' = (V_W)_{k'}$ and $W = U_W \coprod V_W$.

We claim that if $W \subset W' \subset X$ are quasi-compact open, then $W \cap U_{W'} = U_W$ and $W \cap V_{W'} = V_W$. Verification omitted. Hence we see that upon defining $U = \bigcup_{W \subset X} U_W$ and $V = \bigcup_{W \subset X} V_W$ we obtain $X = U \coprod V$. It is clear that V is nonempty as it is constructed by taking unions (locally). On the other hand, U is nonempty since it contains $f(T)$ by construction. \square

Lemma 32.5.13. *Let k be a field. Let $T \rightarrow X$ be a morphism of schemes over k . Assume T is geometrically connected and X connected. Then X is geometrically connected.*

Proof. This is a reformulation of Lemma 32.5.12. \square

Lemma 32.5.14. *Let k be a field. Let X be a scheme over k . Assume X is connected and has a point x such that k is algebraically closed in $\kappa(x)$. Then X is geometrically connected. In particular, if X has a k -rational point and X is connected, then X is geometrically connected.*

Proof. Set $T = \text{Spec}(\kappa(x))$. Let $k \subset \bar{k}$ be a separable algebraic closure of k . The assumption on $k \subset \kappa(x)$ implies that $T_{\bar{k}}$ is irreducible, see Algebra, Lemma 10.45.10. Hence by Lemma 32.5.13 we see that $X_{\bar{k}}$ is connected. By Lemma 32.5.7 we conclude that X is geometrically connected. \square

Lemma 32.5.15. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k . For every connected component T of X the inverse image $T_K \subset X_K$ is a union of connected components of X_K .*

Proof. This is a purely topological statement. Denote $p : X_K \rightarrow X$ the projection morphism. Let $T \subset X$ be a connected component of X . Let $t \in T_K = p^{-1}(T)$. Let $C \subset X_K$ be a connected component containing t . Then $p(C)$ is a connected subset of X which meets T , hence $p(C) \subset T$. Hence $C \subset T_K$. \square

Lemma 32.5.16. *Let $k \subset K$ be a finite extension of fields and let X be a scheme over k . Denote by $p : X_K \rightarrow X$ the projection morphism. For every connected component T of X_K the image $p(T)$ is a connected component of X .*

Proof. The image $p(T)$ is contained in some connected component X' of X . Consider X' as a closed subscheme of X in any way. Then T is also a connected component of $X'_K = p^{-1}(X')$ and we may therefore assume that X is connected. The morphism p is open (Morphisms, Lemma 28.24.4), closed (Morphisms, Lemma 28.44.7) and the fibers of p are finite sets (Morphisms, Lemma 28.44.9). Thus we may apply Topology, Lemma 5.6.6 to conclude. \square

Remark 32.5.17. Let $k \subset K$ be an extension of fields. Let X be a scheme over k . Denote $p : X_K \rightarrow X$ the projection morphism. Let $\bar{T} \subset X_K$ be a connected component. Is it true that $p(\bar{T})$ is a connected component of X ? When $k \subset K$ is finite Lemma 32.5.16 tells us the answer is “yes”. In general we do not know the answer. If you do, or if you have a reference, please email stacks.project@gmail.com.

Let X be a scheme. We denote $\pi_0(X)$ the set of connected components of X .

Lemma 32.5.18. *Let k be a field, with separable algebraic closure \bar{k} . Let X be a scheme over k . There is an action*

$$\text{Gal}(\bar{k}/k)^{\text{opp}} \times \pi_0(X_{\bar{k}}) \longrightarrow \pi_0(X_{\bar{k}})$$

with the following properties:

- (1) *An element $\bar{T} \in \pi_0(X_{\bar{k}})$ is fixed by the action if and only if there exists a connected component $T \subset X$, which is geometrically connected over k , such that $T_{\bar{k}} = \bar{T}$.*
- (2) *For any field extension $k \subset k'$ with separable algebraic closure \bar{k}' the diagram*

$$\begin{array}{ccc} \text{Gal}(\bar{k}'/k') \times \pi_0(X_{\bar{k}'}) & \longrightarrow & \pi_0(X_{\bar{k}'}) \\ \downarrow & & \downarrow \\ \text{Gal}(\bar{k}/k) \times \pi_0(X_{\bar{k}}) & \longrightarrow & \pi_0(X_{\bar{k}}) \end{array}$$

is commutative (where the right vertical arrow is a bijection according to Lemma 32.5.6).

Proof. The action (32.5.8.1) of $\text{Gal}(\bar{k}/k)$ on $X_{\bar{k}}$ induces an action on its connected components. Connected components are always closed (Topology, Lemma 5.6.3). Hence if \bar{T} is as in (1), then by Lemma 32.5.10 there exists a closed subset $T \subset X$ such that $\bar{T} = T_{\bar{k}}$. Note that T is geometrically connected over k , see Lemma 32.5.7. To see that T is a connected component of X , suppose that $T \subset T'$, $T \neq T'$ where T' is a connected component of X . In this case $T'_{\bar{k}}$ strictly contains \bar{T} and hence is disconnected. By Lemma 32.5.12 this means that T' is disconnected! Contradiction.

We omit the proof of the functoriality in (2). □

Lemma 32.5.19. *Let k be a field, with separable algebraic closure \bar{k} . Let X be a scheme over k . Assume*

- (1) *X is quasi-compact, and*
- (2) *the connected components of $X_{\bar{k}}$ are open.*

Then

- (a) *$\pi_0(X_{\bar{k}})$ is finite, and*
- (b) *the action of $\text{Gal}(\bar{k}/k)$ on $\pi_0(X_{\bar{k}})$ is continuous.*

Moreover, assumptions (1) and (2) are satisfied when X is of finite type over k .

Proof. Since the connected components are open, cover $X_{\bar{k}}$ (Topology, Lemma 5.6.3) and $X_{\bar{k}}$ is quasi-compact, we conclude that there are only finitely many of them. Thus (a) holds. By Lemma 32.5.8 these connected components are each defined over a finite subextension of $k \subset \bar{k}$ and we get (b). If X is of finite type over k , then $X_{\bar{k}}$ is of finite type over \bar{k} (Morphisms, Lemma 28.16.4). Hence $X_{\bar{k}}$ is a Noetherian scheme (Morphisms, Lemma 28.16.6) and has an underlying Noetherian topological space (Properties, Lemma 27.5.5). Thus $X_{\bar{k}}$ has finitely many irreducible components (Topology, Lemma 5.8.2) and a fortiori finitely many connected components (which are therefore open). □

32.6. Geometrically irreducible schemes

If X is an irreducible scheme over a field, then it can happen that X becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

Definition 32.6.1. Let X be a scheme over the field k . We say X is *geometrically irreducible* over k if the scheme $X_{k'}$ is irreducible¹ for any field extension k' of k .

Lemma 32.6.2. Let X be a scheme over the field k . Let $k \subset k'$ be a field extension. Then X is geometrically irreducible over k if and only if $X_{k'}$ is geometrically irreducible over k' .

Proof. If X is geometrically irreducible over k , then it is clear that $X_{k'}$ is geometrically irreducible over k' . For the converse, note that for any field extension $k \subset k''$ there exists a common field extension $k' \subset k'''$ and $k'' \subset k'''$. As the morphism $X_{k''} \rightarrow X_{k'}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the irreducibility of $X_{k''}$ implies the irreducibility of $X_{k'}$. Thus if $X_{k'}$ is geometrically irreducible over k' then X is geometrically irreducible over k . \square

Lemma 32.6.3. Let X be a scheme over a separably closed field k . If X is irreducible, then X_K is irreducible for any field extension $k \subset K$. I.e., X is geometrically irreducible over k .

Proof. Use Properties, Lemma 27.3.3 and Algebra, Lemma 10.45.4. \square

Lemma 32.6.4. Let k be a field. Let X, Y be schemes over k . Assume X is geometrically irreducible over k . Then the projection morphism

$$p : X \times_k Y \longrightarrow Y$$

induces a bijection between irreducible components.

Proof. First, note that the scheme theoretic fibres of p are irreducible, since they are base changes of the geometrically irreducible scheme X by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 25.18.5. By Morphisms, Lemma 28.24.4 the map p is open. Thus we may apply Topology, Lemma 5.7.8 to conclude. \square

Lemma 32.6.5. Let k be a field. Let X be a scheme over k . The following are equivalent

- (1) X is geometrically irreducible over k ,
- (2) for every nonempty affine open U the k -algebra $\mathcal{O}_X(U)$ is geometrically irreducible over k (see Algebra, Definition 10.45.6),
- (3) X is irreducible and there exists an affine open covering $X = \bigcup U_i$ such that each k -algebra $\mathcal{O}_X(U_i)$ is geometrically irreducible, and
- (4) there exists an open covering $X = \bigcup_{i \in I} X_i$ with $I \neq \emptyset$ such that X_i is geometrically irreducible for each i and such that $X_i \cap X_j \neq \emptyset$ for all $i, j \in I$.

Moreover, if X is geometrically irreducible so is every nonempty open subscheme of X .

¹An irreducible space is nonempty.

Proof. An affine scheme $\text{Spec}(A)$ over k is geometrically irreducible if and only if A is geometrically irreducible over k ; this is immediate from the definitions. Recall that if a scheme is irreducible so is every nonempty open subscheme of X , any two nonempty open subsets have a nonempty intersection. Also, if every affine open is irreducible then the scheme is irreducible, see Properties, Lemma 27.3.3. Hence the final statement of the lemma is clear, as well as the implications (1) \Rightarrow (2), (2) \Rightarrow (3), and (3) \Rightarrow (4). If (4) holds, then for any field extension k'/k the scheme $X_{k'}$ has a covering by irreducible opens which pairwise intersect. Hence $X_{k'}$ is irreducible. Hence (4) implies (1). \square

Lemma 32.6.6. *Let X be a geometrically irreducible scheme over the field k . Let $\xi \in X$ be its generic point. Then $\kappa(\xi)$ is a geometrically irreducible over k .*

Proof. Combining Lemma 32.6.5 and Algebra, Lemma 10.45.8 we see that $\mathcal{O}_{X,\xi}$ is geometrically irreducible over k . Since $\mathcal{O}_{X,\xi} \rightarrow \kappa(\xi)$ is a surjection with locally nilpotent kernel (see Algebra, Lemma 10.24.1) it follows that $\kappa(\xi)$ is geometrically irreducible, see Algebra, Lemma 10.45.2. \square

Lemma 32.6.7. *Let $k \subset k'$ be an extension of fields. Let X be a scheme over k . Set $X' = X_{k'}$. Assume k separably algebraically closed. Then the morphism $X' \rightarrow X$ induces a bijection of irreducible components.*

Proof. Since k is separably algebraically closed we see that k' is geometrically irreducible over k , see Algebra, Lemma 10.45.7. Hence $Z = \text{Spec}(k')$ is geometrically irreducible over k . by Lemma 32.6.5 above. Since $X' = Z \times_k X$ the result is a special case of Lemma 32.6.4. \square

Lemma 32.6.8. *Let k be a field. Let X be a scheme over k . The following are equivalent:*

- (1) X is geometrically irreducible over k ,
- (2) for every finite separable field extension $k \subset k'$ the scheme $X_{k'}$ is irreducible, and
- (3) $X_{\bar{k}}$ is irreducible, where $k \subset \bar{k}$ is a separable algebraic closure of k .

Proof. Assume $X_{\bar{k}}$ is irreducible, i.e., assume (3). Let $k \subset k'$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}'$ such that k' embeds into \bar{k}' as an extension of k . By Lemma 32.6.7 we see that $X_{\bar{k}'}$ is irreducible. Since $X_{\bar{k}'} \rightarrow X_{k'}$ is surjective we conclude that $X_{k'}$ is irreducible. Hence (1) holds.

Let $k \subset \bar{k}$ be a separable algebraic closure of k . Assume not (3), i.e., assume $X_{\bar{k}}$ is reducible. Our goal is to show that also $X_{k'}$ is reducible for some finite subextension $k \subset k' \subset \bar{k}$. Let $X = \bigcup_{i \in I} U_i$ be an affine open covering with U_i not empty. If for some i the scheme U_i is reducible, or if for some pair $i \neq j$ the intersection $U_i \cap U_j$ is empty, then X is reducible (Properties, Lemma 27.3.3) and we are done. In particular we may assume that $U_{i,\bar{k}} \cap U_{j,\bar{k}}$ for all $i, j \in I$ is nonempty and we conclude that $U_{i,\bar{k}}$ has to be reducible for some i . According to Algebra, Lemma 10.45.5 this means that $U_{i,k'}$ is reducible for some finite separable field extension $k \subset k'$. Hence also $X_{k'}$ is reducible. Thus we see that (2) implies (3).

The implication (1) \Rightarrow (2) is immediate. This proves the lemma. \square

Lemma 32.6.9. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k . For every irreducible component T of X the inverse image $T_K \subset X_K$ is a union of irreducible components of X_K .*

Proof. Let $T \subset X$ be an irreducible component of X . The morphism $T_K \rightarrow T$ is flat, so generalizations lift along $T_K \rightarrow T$. Hence every $\xi \in T_K$ which is a generic point of an irreducible component of T_K maps to the generic point η of T . If $\xi' \rightsquigarrow \xi$ is a specialization in X_K then ξ' maps to η since there are no points specializing to η in X . Hence $\xi' \in T_K$ and we conclude that $\xi = \xi'$. In other words ξ is the generic point of an irreducible component of X_K . This means that the irreducible components of T_K are all irreducible components of X_K . \square

For a scheme X we denote $\text{IrredComp}(X)$ the set of irreducible components of X .

Lemma 32.6.10. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k . For every irreducible component $\bar{T} \subset X_K$ the image of \bar{T} in X is an irreducible component in X . This defines a canonical map*

$$\text{IrredComp}(X_K) \longrightarrow \text{IrredComp}(X)$$

which is surjective.

Proof. Consider the diagram

$$\begin{array}{ccc} X_K & \longleftarrow & X_{\bar{K}} \\ \downarrow & & \downarrow \\ X & \longleftarrow & X_{\bar{k}} \end{array}$$

where \bar{K} is the separable algebraic closure of K , and where \bar{k} is the separable algebraic closure of k . By Lemma 32.6.7 the morphism $X_{\bar{K}} \rightarrow X_{\bar{k}}$ induces a bijection between irreducible components. Hence it suffices to show the lemma for the morphisms $X_{\bar{k}} \rightarrow X$ and $X_{\bar{K}} \rightarrow X_K$. In other words we may assume that $K = \bar{k}$.

The morphism $p : X_{\bar{k}} \rightarrow X$ is integral, flat and surjective. Flatness implies that generalizations lift along p , see Morphisms, Lemma 28.26.8. Hence generic points of irreducible components of $X_{\bar{k}}$ map to generic points of irreducible components of X . Integrality implies that p is universally closed, see Morphisms, Lemma 28.44.7. Hence we conclude that the image $p(\bar{T})$ of an irreducible component is a closed irreducible subset which contains a generic point of an irreducible component of X , hence $p(\bar{T})$ is an irreducible component of X . This proves the first assertion. If $T \subset X$ is an irreducible component, then $p^{-1}(T) = T_K$ is a nonempty union of irreducible components, see Lemma 32.6.9. Each of these necessarily maps onto T by the first part. Hence the map is surjective. \square

Lemma 32.6.11. *Let k be a field, with separable algebraic closure \bar{k} . Let X be a scheme over k . There is an action*

$$\text{Gal}(\bar{k}/k)^{\text{opp}} \times \text{IrredComp}(X_{\bar{k}}) \longrightarrow \text{IrredComp}(X_{\bar{k}})$$

with the following properties:

- (1) *An element $\bar{T} \in \text{IrredComp}(X_{\bar{k}})$ is fixed by the action if and only if there exists an irreducible component $T \subset X$, which is geometrically irreducible over k , such that $T_{\bar{k}} = \bar{T}$.*

- (2) For any field extension $k \subset k'$ with separable algebraic closure \bar{k}' the diagram

$$\begin{array}{ccc} \text{Gal}(\bar{k}'/k') \times \text{IrredComp}(X_{\bar{k}'}) & \longrightarrow & \text{IrredComp}(X_{\bar{k}'}) \\ \downarrow & & \downarrow \\ \text{Gal}(\bar{k}/k) \times \text{IrredComp}(X_{\bar{k}}) & \longrightarrow & \text{IrredComp}(X_{\bar{k}}) \end{array}$$

is commutative (where the right vertical arrow is a bijection according to Lemma 32.6.7).

Proof. The action (32.5.8.1) of $\text{Gal}(\bar{k}/k)$ on $X_{\bar{k}}$ induces an action on its irreducible components. Irreducible components are always closed (Topology, Lemma 5.6.3). Hence if \bar{T} is as in (1), then by Lemma 32.5.10 there exists a closed subset $T \subset X$ such that $\bar{T} = T_{\bar{k}}$. Note that T is geometrically irreducible over k , see Lemma 32.6.8. To see that T is an irreducible component of X , suppose that $T \subset T'$, $T \neq T'$ where T' is an irreducible component of X . Let $\bar{\eta}$ be the generic point of \bar{T} . It maps to the generic point η of T . Then the generic point $\xi \in T'$ specializes to η . As $X_{\bar{k}} \rightarrow X$ is flat there exists a point $\bar{\xi} \in X_{\bar{k}}$ which maps to ξ and specializes to $\bar{\eta}$. It follows that the closure of the singleton $\{\bar{\xi}\}$ is an irreducible closed subset of $X_{\bar{k}}$ which strictly contains \bar{T} . This is the desired contradiction.

We omit the proof of the functoriality in (2). □

Lemma 32.6.12. Let k be a field, with separable algebraic closure \bar{k} . Let X be a scheme over k . The fibres of the map

$$\text{IrredComp}(X_{\bar{k}}) \longrightarrow \text{IrredComp}(X)$$

of Lemma 32.6.10 are exactly the orbits of $\text{Gal}(\bar{k}/k)$ under the action of Lemma 32.6.11.

Proof. Let $T \subset X$ be an irreducible component of X . Let $\eta \in T$ be its generic point. By Lemmas 32.6.9 and 32.6.10 the generic points of irreducible components of \bar{T} which map into T map to η . By Algebra, Lemma 10.45.12 the Galois group acts transitively on all of the points of $X_{\bar{k}}$ mapping to η . Hence the lemma follows. □

Lemma 32.6.13. Let k be a field. Assume $X \rightarrow \text{Spec}(k)$ locally of finite type. In this case

- (1) the action

$$\text{Gal}(\bar{k}/k)^{\text{opp}} \times \text{IrredComp}(X_{\bar{k}}) \longrightarrow \text{IrredComp}(X_{\bar{k}})$$

is continuous if we give $\text{IrredComp}(X_{\bar{k}})$ the discrete topology,

- (2) every irreducible component of $X_{\bar{k}}$ can be defined over a finite extension of k , and
 (3) given any irreducible component $T \subset X$ the scheme $T_{\bar{k}}$ is a finite union of irreducible components of $X_{\bar{k}}$ which are all in the same $\text{Gal}(\bar{k}/k)$ -orbit.

Proof. Let \bar{T} be an irreducible component of $X_{\bar{k}}$. We may choose an affine open $U \subset X$ such that $\bar{T} \cap U_{\bar{k}}$ is not empty. Write $U = \text{Spec}(A)$, so A is a finite type k -algebra, see Morphisms, Lemma 28.16.2. Hence $A_{\bar{k}}$ is a finite type \bar{k} -algebra, and in particular Noetherian. Let $\mathfrak{p} = (f_1, \dots, f_n)$ be the prime ideal corresponding to

$\bar{T} \cap U_{\bar{k}}$. Since $A_{\bar{k}} = A \otimes_k \bar{k}$ we see that there exists a finite subextension $k \subset k' \subset \bar{k}$ such that each $f_i \in A_{k'}$. It is clear that $\text{Gal}(\bar{k}/k')$ fixes \bar{T} , which proves (1).

Part (2) follows by applying Lemma 32.6.11 (1) to the situation over k' which implies the irreducible component \bar{T} is of the form T'_k for some irreducible $T' \subset X_{k'}$.

To prove (3), let $T \subset X$ be an irreducible component. Choose an irreducible component $\bar{T} \subset X_{\bar{k}}$ which maps to T , see Lemma 32.6.10. By the above the orbit of \bar{T} is finite, say it is $\bar{T}_1, \dots, \bar{T}_n$. Then $\bar{T}_1 \cup \dots \cup \bar{T}_n$ is a $\text{Gal}(\bar{k}/k)$ -invariant closed subset of $X_{\bar{k}}$ hence of the form $W_{\bar{k}}$ for some $W \subset X$ closed by Lemma 32.5.10. Clearly $W = T$ and we win. \square

Lemma 32.6.14. *Let k be a field. Let $X \rightarrow \text{Spec}(k)$ be locally of finite type. Assume X has finitely many irreducible components. Then there exists a finite separable extension $k \subset k'$ such that every irreducible component of $X_{k'}$ is geometrically irreducible over k' .*

Proof. Let \bar{k} be a separable algebraic closure of k . The assumption that X has finitely many irreducible components combined with Lemma 32.6.13 (3) shows that $X_{\bar{k}}$ has finitely many irreducible components $\bar{T}_1, \dots, \bar{T}_n$. By Lemma 32.6.13 (2) there exists a finite extension $k \subset k' \subset \bar{k}$ and irreducible components $T_i \subset X_{k'}$ such that $\bar{T}_i = T_{i, \bar{k}}$ and we win. \square

Lemma 32.6.15. *Let X be a scheme over the field k . Assume X has finitely many irreducible components which are all geometrically irreducible. Then X has finitely many connected components each of which is geometrically connected.*

Proof. This is clear because a connected component is a union of irreducible components. Details omitted. \square

32.7. Geometrically integral schemes

If X is an irreducible scheme over a field, then it can happen that X becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

Definition 32.7.1. Let X be a scheme over the field k .

- (1) Let $x \in X$. We say X is *geometrically pointwise integral at x* if for every field extension $k \subset k'$ and every $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is integral.
- (2) We say X is *geometrically pointwise integral* if X is geometrically pointwise integral at every point.
- (3) We say X is *geometrically integral over k* if the scheme $X_{k'}$ is integral for every field extension k' of k .

The distinction between notions (2) and (3) is necessary. For example if $k = \mathbf{R}$ and $X = \text{Spec}(\mathbf{C}[x])$, then X is geometrically pointwise integral over \mathbf{R} but of course not geometrically integral.

Lemma 32.7.2. *Let k be a field. Let X be a scheme over k . Then X is geometrically integral over k if and only if X is both geometrically reduced and geometrically irreducible over k .*

Proof. See Properties, Lemma 27.3.4. \square

32.8. Geometrically normal schemes

In Properties, Definition 27.7.1 we have defined the notion of a normal scheme. This notion is defined even for non-Noetherian schemes. Hence, contrary to our discussion of “geometrically regular” schemes we consider all field extensions of the ground field.

Definition 32.8.1. Let X be a scheme over the field k .

- (1) Let $x \in X$. We say X is *geometrically normal at x* if for every field extension $k \subset k'$ and every $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is normal.
- (2) We say X is *geometrically normal over k* if X is geometrically normal at every $x \in X$.

Lemma 32.8.2. Let k be a field. Let X be a scheme over k . Let $x \in X$. The following are equivalent

- (1) X is geometrically normal at x ,
- (2) for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is normal, and
- (3) the ring $\mathcal{O}_{X, x}$ is geometrically normal over k (see Algebra, Definition 10.153.2).

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k'$ be a finite purely inseparable field extension (for example $k = k'$). Consider the ring $\mathcal{O}_{X, x} \otimes_k k'$. By Algebra, Lemma 10.45.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'}, x'} \cong \mathcal{O}_{X, x} \otimes_k k'$. By assumption this is a normal ring. Hence we deduce (3) by Algebra, Lemma 10.153.1.

Assume (3). Let $k \subset k'$ be a field extension. Since $\text{Spec}(k') \rightarrow \text{Spec}(k)$ is surjective, also $X_{k'} \rightarrow X$ is surjective (Morphisms, Lemma 28.11.4). Let $x' \in X_{k'}$ be any point lying over x . The local ring $\mathcal{O}_{X_{k'}, x'}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_k k'$. Hence it is normal by assumption and (1) is proved. \square

Lemma 32.8.3. Let k be a field. Let X be a scheme over k . The following are equivalent

- (1) X is geometrically normal,
- (2) $X_{k'}$ is a normal scheme for every field extension $k \subset k'$,
- (3) $X_{k'}$ is a normal scheme for every finitely generated field extension $k \subset k'$,
- (4) $X_{k'}$ is a normal scheme for every finite purely inseparable field extension $k \subset k'$, and
- (5) for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically normal (see Algebra, Definition 10.153.2).

Proof. Assume (1). Then for every field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is normal. By definition this means that $X_{k'}$ is normal. Hence (2).

It is clear that (2) implies (3) implies (4).

Assume (4) and let $U \subset X$ be an affine open subscheme. Then $U_{k'}$ is a normal scheme for any finite purely inseparable extension $k \subset k'$ (including $k = k'$). This

means that $k' \otimes_k \mathcal{O}(U)$ is a normal ring for all finite purely inseparable extensions $k \subset k'$. Hence $\mathcal{O}(U)$ is a geometrically normal k -algebra by definition.

Assume (5). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U) \otimes_k k'$ where U is affine open in X (see Schemes, Section 25.17). Hence $X_{k'}$ is normal. So (1) holds. \square

Lemma 32.8.4. *Let k be a field. Let X be a scheme over k . Let k'/k be a field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x . The following are equivalent*

- (1) X is geometrically normal at x ,
- (2) $X_{k'}$ is geometrically normal at x' .

In particular, X is geometrically normal over k if and only if $X_{k'}$ is geometrically normal over k' .

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x'' . Consider the map of local rings

$$\mathcal{O}_{X_{k''}, x''} \longrightarrow \mathcal{O}_{X_{k'''}, x'''}$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is normal. Thus by Algebra, Lemma 10.152.3 we conclude that $\mathcal{O}_{X_{k''}, x''}$ is normal. By Lemma 32.8.2 we see that X is geometrically normal at x . \square

Lemma 32.8.5. *Let k be a field. Let X be a geometrically normal scheme over k and let Y be a normal scheme over k . Then $X \times_k Y$ is a normal scheme.*

Proof. This reduces to Algebra, Lemma 10.153.4 by Lemma 32.8.3. \square

32.9. Change of fields and locally Noetherian schemes

Let X a locally Noetherian scheme over a field k . It is not always the case that $X_{k'}$ is locally Noetherian too. For example if $X = \text{Spec}(\overline{\mathbf{Q}})$ and $k = \mathbf{Q}$, then $X_{\overline{\mathbf{Q}}}$ is the spectrum of $\overline{\mathbf{Q}} \otimes_{\mathbf{Q}} \overline{\mathbf{Q}}$ which is not Noetherian. (Hint: It has too many idempotents). But if we only base change using finitely generated field extensions then the Noetherian property is preserved. (Or if X is locally of finite type over k , since this property is preserved under base change.)

Lemma 32.9.1. *Let k be a field. Let X be a scheme over k . Let $k \subset k'$ be a finitely generated field extension. Then X is locally Noetherian if and only if $X_{k'}$ is locally Noetherian.*

Proof. Using Properties, Lemma 27.5.2 we reduce to the case where X is affine, say $X = \text{Spec}(A)$. In this case we have to prove that A is Noetherian if and only if $A_{k'}$ is Noetherian. Since $A \rightarrow A_{k'} = k' \otimes_k A$ is faithfully flat, we see that if $A_{k'}$ is Noetherian, then so is A , by Algebra, Lemma 10.152.1. Conversely, if A is Noetherian then $A_{k'}$ is Noetherian by Algebra, Lemma 10.30.7. \square

32.10. Geometrically regular schemes

A geometrically regular scheme over a field k is a locally Noetherian scheme over k which remains regular upon suitable changes of base field. A finite type scheme over k is geometrically regular if and only if it is smooth over k (see Lemma 32.10.6). The notion of geometric regularity is most interesting in situations where smoothness cannot be used such as formal fibres (insert future reference here).

In the following definition we restrict ourselves to locally Noetherian schemes, since the property of being a regular local ring is only defined for Noetherian local rings. By Lemma 32.8.3 above, if we restrict ourselves to finitely generated field extensions then this property is preserved under change of base field. This comment will be used without further reference in this section. In particular the following definition makes sense.

Definition 32.10.1. Let k be a field. Let X be a locally Noetherian scheme over k .

- (1) Let $x \in X$. We say X is *geometrically regular at x* over k if for every finitely generated field extension $k \subset k'$ and any $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is regular.
- (2) We say X is *geometrically regular over k* if X is geometrically regular at all of its points.

A similar definition works to define geometrically Cohen-Macaulay, (R_k) , and (S_k) schemes over a field. We will add a section for these separately as needed.

Lemma 32.10.2. Let k be a field. Let X be a locally Noetherian scheme over k . Let $x \in X$. The following are equivalent

- (1) X is geometrically regular at x ,
- (2) for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'}, x'}$ is regular, and
- (3) the ring $\mathcal{O}_{X, x}$ is geometrically regular over k (see Algebra, Definition 10.154.2).

Proof. It is clear that (1) implies (2). Assume (2). This in particular implies that $\mathcal{O}_{X, x}$ is a regular local ring. Let $k \subset k'$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X, x} \otimes_k k'$. By Algebra, Lemma 10.45.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'}, x'} \cong \mathcal{O}_{X, x} \otimes_k k'$. By assumption this is a regular ring. Hence we deduce (3) from the definition of a geometrically regular ring.

Assume (3). Let $k \subset k'$ be a field extension. Since $\text{Spec}(k') \rightarrow \text{Spec}(k)$ is surjective, also $X_{k'} \rightarrow X$ is surjective (Morphisms, Lemma 28.11.4). Let $x' \in X_{k'}$ be any point lying over x . The local ring $\mathcal{O}_{X_{k'}, x'}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_k k'$. Hence it is regular by assumption and (1) is proved. \square

Lemma 32.10.3. Let k be a field. Let X be a locally Noetherian scheme over k . The following are equivalent

- (1) X is geometrically regular,
- (2) $X_{k'}$ is a regular scheme for every finitely generated field extension $k \subset k'$,
- (3) $X_{k'}$ is a regular scheme for every finite purely inseparable field extension $k \subset k'$,

- (4) for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically regular (see Algebra, Definition 10.154.2), and
- (5) there exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is geometrically regular over k .

Proof. Assume (1). Then for every finitely generated field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is regular. By Properties, Lemma 27.9.2 this means that $X_{k'}$ is regular. Hence (2).

It is clear that (2) implies (3).

Assume (3) and let $U \subset X$ be an affine open subscheme. Then $U_{k'}$ is a regular scheme for any finite purely inseparable extension $k \subset k'$ (including $k = k'$). This means that $k' \otimes_k \mathcal{O}(U)$ is a regular ring for all finite purely inseparable extensions $k \subset k'$. Hence $\mathcal{O}(U)$ is a geometrically regular k -algebra and we see that (4) holds.

It is clear that (4) implies (5). Let $X = \bigcup U_i$ be an affine open covering as in (5). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U_i) \otimes_k k'$ (see Schemes, Section 25.17). Hence $X_{k'}$ is regular. So (1) holds. \square

Lemma 32.10.4. *Let k be a field. Let X be a scheme over k . Let k'/k be a finitely generated field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x . The following are equivalent*

- (1) X is geometrically regular at x ,
- (2) $X_{k'}$ is geometrically regular at x' .

In particular, X is geometrically regular over k if and only if $X_{k'}$ is geometrically regular over k' .

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common, finitely generated, field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x'' . Consider the map of local rings

$$\mathcal{O}_{X_{k''}, x''} \longrightarrow \mathcal{O}_{X_{k'''}, x'''}$$

This is a flat local ring homomorphism of Noetherian local rings and hence faithfully flat. By (2) we see that the local ring on the right is regular. Thus by Algebra, Lemma 10.106.9 we conclude that $\mathcal{O}_{X_{k''}, x''}$ is regular. By Lemma 32.10.2 we see that X is geometrically regular at x . \square

The following lemma is a geometric variant of Algebra, Lemma 10.154.3.

Lemma 32.10.5. *Let k be a field. Let $f : X \rightarrow Y$ be a morphism of locally Noetherian schemes over k . Let $x \in X$ be a point and set $y = f(x)$. If X is geometrically regular at x and f is flat at x then Y is geometrically regular at y . In particular, if X is geometrically regular over k and f is flat and surjective, then Y is geometrically regular over k .*

Proof. Let k' be finite purely inseparable extension of k . Let $f' : X_{k'} \rightarrow Y_{k'}$ be the base change of f . Let $x' \in X_{k'}$ be the unique point lying over x . If we show that $Y_{k'}$ is regular at $y' = f'(x')$, then Y is geometrically regular over k at y' , see

Lemma 32.10.3. By Morphisms, Lemma 28.26.6 the morphism $X_{k'} \rightarrow Y_{k'}$ is flat at x' . Hence the ring map

$$\mathcal{O}_{Y_{k'}, y'} \longrightarrow \mathcal{O}_{X_{k'}, x'}$$

is a flat local homomorphism of local Noetherian rings with right hand side regular by assumption. Hence the left hand side is a regular local ring by Algebra, Lemma 10.106.9. \square

Lemma 32.10.6. *Let k be a field. Let X be a scheme of finite type over k . Let $x \in X$. Then X is geometrically regular at x if and only if $X \rightarrow \text{Spec}(k)$ is smooth at x (Morphisms, Definition 28.35.1).*

Proof. The question is local around x , hence we may assume that $X = \text{Spec}(A)$ for some finite type k -algebra. Let x correspond to the prime \mathfrak{p} .

If A is smooth over k at \mathfrak{p} , then we may localize A and assume that A is smooth over k . In this case $k' \otimes_k A$ is smooth over k' for all extension fields k'/k , and each of these Noetherian rings is regular by Algebra, Lemma 10.135.3.

Assume X is geometrically regular at x . Consider the residue field $K := \kappa(x) = \kappa(\mathfrak{p})$ of x . It is a finitely generated extension of k . By Algebra, Lemma 10.44.3 there exists a finite purely inseparable extension $k \subset k'$ such that the compositum $k'K$ is a separable field extension of k' . Let $\mathfrak{p}' \subset A' = k' \otimes_k A$ be a prime ideal lying over \mathfrak{p} . It is the unique prime lying over \mathfrak{p} , see Algebra, Lemma 10.45.2. Hence the residue field $K' := \kappa(\mathfrak{p}')$ is the compositum $k'K$. By assumption the local ring $(A')_{\mathfrak{p}'}$ is regular. Hence by Algebra, Lemma 10.135.5 we see that $k' \rightarrow A'$ is smooth at \mathfrak{p}' . This in turn implies that $k \rightarrow A$ is smooth at \mathfrak{p} by Algebra, Lemma 10.132.18. The lemma is proved. \square

Example 32.10.7. Let $k = \mathbf{F}_p(t)$. It is quite easy to give an example of a regular variety V over k which is not geometrically reduced. For example we can take $\text{Spec}(k[x]/(x^p - t))$. In fact, there exists an example of a regular variety V which is geometrically reduced, but not even geometrically normal. Namely, take for $p > 2$ the scheme $V = \text{Spec}(k[x, y]/(y^2 - x^p + t))$. This is a variety as the polynomial $y^2 - x^p + t \in k[x, y]$ is irreducible. The morphism $V \rightarrow \text{Spec}(k)$ is smooth at all points except at the point $v_0 \in V$ corresponding to the maximal ideal $(y, x^p - t)$ (because $2y$ is invertible). In particular we see that V is (geometrically) regular at all points, except possibly v_0 . The local ring

$$\mathcal{O}_{V, v_0} = (k[x, y]/(y^2 - x^p + t))_{(y, x^p - t)}$$

is a domain of dimension 1. Its maximal ideal is generated by 1 element, namely y . Hence it is a discrete valuation ring and regular. Let $k' = k[t^{1/p}]$. Denote $t' = t^{1/p} \in k'$, $V' = V_{k'}$, $v'_0 \in V'$ the unique point lying over v_0 . Over k' we can write $x^p - t = (x - t')^p$, but the polynomial $y^2 - (x - t')^p$ is still irreducible and V' is still a variety. But the element

$$\frac{y}{x - t'} \in f.f.(\mathcal{O}_{V', v'_0})$$

is integral over \mathcal{O}_{V', v'_0} (just compute its square) and not contained in it, so V' is not normal at v'_0 . This concludes the example.

32.11. Change of fields and the Cohen-Macaulay property

The following lemma says that it does not make sense to define geometrically Cohen-Macaulay schemes, since these would be the same as Cohen-Macaulay schemes.

Lemma 32.11.1. *Let X be a locally Noetherian scheme over the field k . Let $k \subset k'$ be a finitely generated field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x . Then we have*

$$\mathcal{O}_{X,x} \text{ is Cohen-Macaulay} \Leftrightarrow \mathcal{O}_{X_{k'},x'} \text{ is Cohen-Macaulay}$$

If X is locally of finite type over k , the same holds for any field extension $k \subset k'$.

Proof. The first case of the lemma follows from Algebra, Lemma 10.155.2. The second case of the lemma is equivalent to Algebra, Lemma 10.126.6. \square

32.12. Change of fields and the Jacobson property

A scheme locally of finite type over a field has plenty of closed points, namely it is Jacobson. Moreover, the residue fields are finite extensions of the ground field.

Lemma 32.12.1. *Let X be a scheme which is locally of finite type over k . Then*

- (1) *for any closed point $x \in X$ the extension $k \subset \kappa(x)$ is algebraic, and*
- (2) *X is a Jacobson scheme (Properties, Definition 27.6.1).*

Proof. A scheme is Jacobson if and only if it has an affine open covering by Jacobson schemes, see Properties, Lemma 27.6.3. The property on residue fields at closed points is also local on X . Hence we may assume that X is affine. In this case the result is a consequence of the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1. It also follows from a combination of Morphisms, Lemmas 28.17.8, 28.17.9, and 28.17.10. \square

It turns out that if X is not locally of finite type, then we can achieve the same result after making a suitably large base field extension.

Lemma 32.12.2. *Let X be a scheme over a field k . For any field extension $k \subset K$ whose cardinality is large enough we have*

- (1) *for any closed point $x \in X_K$ the extension $K \subset \kappa(x)$ is algebraic, and*
- (2) *X_K is a Jacobson scheme (Properties, Definition 27.6.1).*

Proof. Choose an affine open covering $X = \bigcup U_i$. By Algebra, Lemma 10.34.12 and Properties, Lemma 27.6.2 there exist cardinals κ_i such that $U_{i,K}$ has the desired properties over K if $\#(K) \geq \kappa_i$. Set $\kappa = \max\{\kappa_i\}$. Then if the cardinality of K is larger than κ we see that each $U_{i,K}$ satisfies the conclusions of the lemma. Hence X_K is Jacobson by Properties, Lemma 27.6.3. The statement on residue fields at closed points of X_K follows from the corresponding statements for residue fields of closed points of the $U_{i,K}$. \square

32.13. Algebraic schemes

The following definition is taken from [DG67, I Definition 6.4.1].

Definition 32.13.1. Let k be a field. An *algebraic k -scheme* is a scheme X over k such that the structure morphism $X \rightarrow \text{Spec}(k)$ is of finite type. A *locally algebraic k -scheme* is a scheme X over k such that the structure morphism $X \rightarrow \text{Spec}(k)$ is locally of finite type.

Note that every (locally) algebraic k -scheme is (locally) Noetherian, see Morphisms, Lemma 28.16.6. The category of algebraic k -schemes has all products and fibre products (unlike the category of varieties over k). Similarly for the category of locally algebraic k -schemes.

Lemma 32.13.2. *Let k be a field. Let X be a locally algebraic k -scheme of dimension 0. Then X is a disjoint union of spectra of local Artinian k -algebras A with $\dim_k(A) < \infty$. If X is an algebraic k -scheme of dimension 0, then in addition X is affine and the morphism $X \rightarrow \text{Spec}(k)$ is finite.*

Proof. Let X be a locally algebraic k -scheme of dimension 0. Let $U = \text{Spec}(A) \subset X$ be an affine open subscheme. Since $\dim(X) = 0$ we see that $\dim(A) = 0$. By Noether normalization, see Algebra, Lemma 10.111.4 we see that there exists a finite injection $k \rightarrow A$, i.e., $\dim_k(A) < \infty$. Hence A is Artinian, see Algebra, Lemma 10.51.2. This implies that $A = A_1 \times \dots \times A_r$ is a product of finitely many Artinian local rings, see Algebra, Lemma 10.51.6. Of course $\dim_k(A_i) < \infty$ for each i as the sum of these dimensions equals $\dim_k(A)$.

The arguments above show that X has an open covering whose members are finite discrete topological spaces. Hence X is a discrete topological space. It follows that X is isomorphic to the disjoint union of its connected components each of which is a singleton. Since a singleton scheme is affine we conclude (by the results of the paragraph above) that each of these singletons is the spectrum of a local Artinian k -algebra A with $\dim_k(A) < \infty$.

Finally, if X is an algebraic k -scheme of dimension 0, then X is quasi-compact hence is a finite disjoint union $X = \text{Spec}(A_1) \amalg \dots \amalg \text{Spec}(A_r)$ hence affine (see Schemes, Lemma 25.6.8) and we have seen the finiteness of $X \rightarrow \text{Spec}(k)$ in the first paragraph of the proof. \square

Lemma 32.13.3. *Let k be a field. Let X be a locally algebraic k -scheme.*

- (1) *The dimension of k is the supremum of the numbers $\text{trdeg}_k(\kappa(\eta))$ where η runs over the generic points of the irreducible components of X .*
- (2) *If X is irreducible, then all maximal chains of irreducible closed subsets have length equal to the dimension of X .*

Proof. It is clear that the dimension of X is the supremum of the dimensions of all affine opens. Similarly, any maximal chain in X gives rise to a maximal chain in an affine open. Hence it suffices to prove the lemma for an affine open. Part (2) follows from Algebra, Lemma 10.110.4. Part (1) follows from Algebra, Lemma 10.112.3. \square

32.14. Closures of products

Some results on the relation between closure and products.

Lemma 32.14.1. *Let k be a field. Let X, Y be schemes over k , and let $A \subset X, B \subset Y$ be subsets. Set*

$$AB = \{z \in X \times_k Y \mid \text{pr}_X(\gamma) \in A, \text{pr}_Y(\gamma) \in B\} \subset X \times_k Y$$

Then set theoretically we have

$$\overline{A} \times_k \overline{B} = \overline{AB}$$

Proof. The inclusion $\overline{AB} \subset \overline{A} \times_k \overline{B}$ is immediate. We may replace X and Y by the reduced closed subschemes \overline{A} and \overline{B} . Let $W \subset X \times_k Y$ be a nonempty open subset. By Morphisms, Lemma 28.24.4 the subset $U = \text{pr}_X(W)$ is nonempty open in X . Hence $A \cap U$ is nonempty. Pick $a \in A \cap U$. Denote $Y_{\kappa(a)} = \{a\} \times_k Y$ the fibre of $\text{pr}_X : X \times_k Y \rightarrow X$ over a . By Morphisms, Lemma 28.24.4 again the morphism $Y_a \rightarrow Y$ is open as $\text{Spec}(\kappa(a)) \rightarrow \text{Spec}(k)$ is universally open. Hence the nonempty open subset $W_a = W \times_{X \times_k Y} Y_a$ maps to a nonempty open subset of Y . We conclude there exists a $b \in B$ in the image. Hence $AB \cap W \neq \emptyset$ as desired. \square

Lemma 32.14.2. *Let k be a field. Let $f : A \rightarrow X$, $g : B \rightarrow Y$ be morphisms of schemes over k . Then set theoretically we have*

$$\overline{f(A)} \times_k \overline{g(B)} = \overline{(f \times g)(A \times_k B)}$$

Proof. This follows from Lemma 32.14.1 as the image of $f \times g$ is $f(A)g(B)$ in the notation of that lemma. \square

Lemma 32.14.3. *Let k be a field. Let $f : A \rightarrow X$, $g : B \rightarrow Y$ be quasi-compact morphisms of schemes over k . Let $Z \subset X$ be the scheme theoretic image of f , see Morphisms, Definition 28.6.2. Similarly, let $Z' \subset Y$ be the scheme theoretic image of g . Then $Z \times_k Z'$ is the scheme theoretic image of $f \times g$.*

Proof. Recall that Z is the smallest closed subscheme of X through which f factors. Similarly for Z' . Let $W \subset X \times_k Y$ be the scheme theoretic image of $f \times g$. As $f \times g$ factors through $Z \times_k Z'$ we see that $W \subset Z \times_k Z'$.

To prove the other inclusion let $U \subset X$ and $V \subset Y$ be affine opens. By Morphisms, Lemma 28.6.3 the scheme $Z \cap U$ is the scheme theoretic image of $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$, and similarly for $Z' \cap V$ and $W \cap U \times_k V$. Hence we may assume X and Y affine. As f and g are quasi-compact this implies that $A = \bigcup U_i$ is a finite union of affines and $B = \bigcup V_j$ is a finite union of affines. Then we may replace A by $\coprod U_i$ and B by $\coprod V_j$, i.e., we may assume that A and B are affine as well. In this case Z is cut out by $\text{Ker}(\Gamma(X, \mathcal{O}_X) \rightarrow \Gamma(A, \mathcal{O}_A))$ and similarly for Z' and W . Hence the result follows from the equality

$$\Gamma(A \times_k B, \mathcal{O}_{A \times_k B}) = \Gamma(A, \mathcal{O}_A) \otimes_k \Gamma(B, \mathcal{O}_B)$$

which holds as A and B are affine. Details omitted. \square

32.15. Schemes smooth over fields

Here are two lemmas characterizing smooth schemes over fields.

Lemma 32.15.1. *Let k be a field. Let X be a scheme over k . Assume*

- (1) X is locally of finite type over k ,
- (2) $\Omega_{X/k}$ is locally free, and
- (3) k has characteristic zero.

Then the structure morphism $X \rightarrow \text{Spec}(k)$ is smooth.

Proof. This follows from Algebra, Lemma 10.135.7. \square

In positive characteristic there exist nonreduced schemes of finite type whose sheaf of differentials is free, for example $\text{Spec}(\mathbf{F}_p[t]/(t^p))$ over $\text{Spec}(\mathbf{F}_p)$. If the ground field k is nonperfect of characteristic p , there exist reduced schemes X/k with free

$\Omega_{X/k}$ which are nonsmooth, for example $\text{Spec}(k[t]/(t^p - a))$ where $a \in k$ is not a p th power.

Lemma 32.15.2. *Let k be a field. Let X be a scheme over k . Assume*

- (1) X is locally of finite type over k ,
- (2) $\Omega_{X/k}$ is locally free,
- (3) X is reduced, and
- (4) k is perfect.

Then the structure morphism $X \rightarrow \text{Spec}(k)$ is smooth.

Proof. Let $x \in X$ be a point. As X is locally Noetherian (see Morphisms, Lemma 28.16.6) there are finitely many irreducible components X_1, \dots, X_n passing through x (see Properties, Lemma 27.5.5 and Topology, Lemma 5.8.2). Let $\eta_i \in X_i$ be the generic point. As X is reduced we have $\mathcal{O}_{X, \eta_i} = \kappa(\eta_i)$, see Algebra, Lemma 10.24.1. Moreover, $\kappa(\eta_i)$ is a finitely generated field extension of the perfect field k hence separably generated over k (see Algebra, Section 10.41). It follows that $\Omega_{X/k, \eta_i} = \Omega_{\kappa(\eta_i)/k}$ is free of rank the transcendence degree of $\kappa(\eta_i)$ over k . By Morphisms, Lemma 28.29.1 we conclude that $\dim_{\eta_i}(X_i) = \text{rank}_{\eta_i}(\Omega_{X/k})$. Since $x \in X_1 \cap \dots \cap X_n$ we see that

$$\text{rank}_x(\Omega_{X/k}) = \text{rank}_{\eta_i}(\Omega_{X/k}) = \dim(X_i).$$

Therefore $\dim_x(X) = \text{rank}_x(\Omega_{X/k})$, see Algebra, Lemma 10.110.5. It follows that $X \rightarrow \text{Spec}(k)$ is smooth at x for example by Algebra, Lemma 10.135.3. \square

Lemma 32.15.3. *Let $X \rightarrow \text{Spec}(k)$ be a smooth morphism where k is a field. Then X is a regular scheme.*

Proof. (See also Lemma 32.10.6.) By Algebra, Lemma 10.135.3 every local ring $\mathcal{O}_{X, x}$ is regular. And because X is locally of finite type over k it is locally Noetherian. Hence X is regular by Properties, Lemma 27.9.2. \square

Lemma 32.15.4. *Let $X \rightarrow \text{Spec}(k)$ be a smooth morphism where k is a field. Then X is geometrically regular, geometrically normal, and geometrically reduced over k .*

Proof. (See also Lemma 32.10.6.) Let k' be a finite purely inseparable extension of k . It suffices to prove that $X_{k'}$ is regular, normal, reduced, see Lemmas 32.10.3, 32.8.3, and 32.4.5. By Morphisms, Lemma 28.35.5 the morphism $X_{k'} \rightarrow \text{Spec}(k')$ is smooth too. Hence it suffices to show that a scheme X smooth over a field is regular, normal, and reduced. We see that X is regular by Lemma 32.15.3. Hence Properties, Lemma 27.9.4 guarantees that X is normal. \square

Lemma 32.15.5. *Let k be a field. Let $d \geq 0$. Let $W \subset \mathbf{A}_k^d$ be nonempty open. Then there exists a closed point $w \in W$ such that $k \subset \kappa(w)$ is finite separable.*

Proof. After possible shrinking W we may assume that $W = \mathbf{A}_k^d \setminus V(f)$ for some $f \in k[x_1, \dots, x_n]$. If the lemma is wrong then $f(a_1, \dots, a_n) = 0$ for all $(a_1, \dots, a_n) \in (k^{sep})^n$. This is absurd as k^{sep} is an infinite field. \square

Lemma 32.15.6. *Let k be a field. If X is smooth over $\text{Spec}(k)$ then the set*

$$\{x \in X \text{ closed such that } k \subset \kappa(x) \text{ is finite separable}\}$$

is dense in X .

Proof. It suffices to show that given a nonempty smooth X over k there exists at least one closed point whose residue field is finite separable over k . To see this, choose a diagram

$$X \longleftarrow U \xrightarrow{\pi} \mathbf{A}_k^d$$

with π étale, see Morphisms, Lemma 28.37.20. The morphism $\pi : U \rightarrow \mathbf{A}_k^d$ is open, see Morphisms, Lemma 28.37.13. By Lemma 32.15.5 we may choose a closed point $w \in \pi(U)$ whose residue field is finite separable over k . Pick any $x \in U$ with $\pi(x) = w$. By Morphisms, Lemma 28.37.7 the field extension $\kappa(w) \subset \kappa(x)$ is finite separable. Hence $k \subset \kappa(x)$ is finite separable. The point x is a closed point of X by Morphisms, Lemma 28.21.2. \square

Lemma 32.15.7. *Let X be a scheme over a field k . If X is locally of finite type and geometrically reduced over k then X contains a dense open which is smooth over k .*

Proof. The problem is local on X , hence we may assume X is quasi-compact. Let $X = X_1 \cup \dots \cup X_n$ be the irreducible components of X . Then $Z = \bigcup_{i \neq j} X_i \cap X_j$ is nowhere dense in X . Hence we may replace X by $X \setminus Z$. As $X \setminus Z$ is a disjoint union of irreducible schemes, this reduces us to the case where X is irreducible. As X is irreducible and reduced, it is integral, see Properties, Lemma 27.3.4. Let $\eta \in X$ be its generic point. Then the function field $K = k(X) = \kappa(\eta)$ is geometrically reduced over k , hence separable over k , see Algebra, Lemma 10.43.1. Let $U = \text{Spec}(A) \subset X$ be any nonempty affine open so that $K = f.f.(A) = A_{(0)}$. Apply Algebra, Lemma 10.135.5 to conclude that A is smooth at (0) over k . By definition this means that some principal localization of A is smooth over k and we win. \square

Lemma 32.15.8. *Let k be a field. Let $f : X \rightarrow Y$ be a morphism of schemes locally of finite type over k . Let $x \in X$ be a point and set $y = f(x)$. If $X \rightarrow \text{Spec}(k)$ is smooth at x and f is flat at x then $Y \rightarrow \text{Spec}(k)$ is smooth at y . In particular, if X is smooth over k and f is flat and surjective, then Y is smooth over k .*

Proof. It suffices to show that Y is geometrically regular at y , see Lemma 32.10.6. This follows from Lemma 32.10.5 (and Lemma 32.10.6 applied to (X, x)). \square

32.16. Types of varieties

Short section discussion some elementary global properties of varieties.

Definition 32.16.1. Let k be a field. Let X be a variety over k .

- (1) We say X is an *affine variety* if X is an affine scheme. This is equivalent to requiring X to be isomorphic to a closed subscheme of \mathbf{A}_k^n for some n .
- (2) We say X is a *projective variety* if the structure morphism $X \rightarrow \text{Spec}(k)$ is projective. By Morphisms, Lemma 28.43.4 this is true if and only if X is isomorphic to a closed subscheme of \mathbf{P}_k^n for some n .
- (3) We say X is a *quasi-projective variety* if the structure morphism $X \rightarrow \text{Spec}(k)$ is quasi-projective. By Morphisms, Lemma 28.41.4 this is true if and only if X is isomorphic to a locally closed subscheme of \mathbf{P}_k^n for some n .
- (4) A *proper variety* is a variety such that the morphism $X \rightarrow \text{Spec}(k)$ is proper.

Note that a projective variety is a proper variety, see Morphisms, Lemma 28.43.5. Also, an affine variety is quasi-projective as \mathbf{A}_k^n is isomorphic to an open subscheme of \mathbf{P}_k^n , see Constructions, Lemma 26.13.3.

Lemma 32.16.2. *Let X be a proper variety over k . Then $\Gamma(X, \mathcal{O}_X)$ is a field which is a finite extension of the field k .*

Proof. By Cohomology of Schemes, Proposition 29.17.2 we see that $\Gamma(X, \mathcal{O}_X)$ is a finite dimensional k -vector space. It is also a k -algebra without zero-divisors. Hence it is a field, see Algebra, Lemma 10.35.17. \square

32.17. Groups of invertible functions

It is often (but not always) the case that $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group if X is a variety over k . We show this by a series of lemmas. Everything rests on the following special case.

Lemma 32.17.1. *Let k be an algebraically closed field. Let \overline{X} be a proper variety over k . Let $X \subset \overline{X}$ be an open subscheme. Assume X is normal. Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. We will use without further mention that for any affine open U of \overline{X} the ring $\mathcal{O}(U)$ is a finitely generated k -algebra, which is Noetherian, a domain and normal, see Algebra, Lemma 10.30.1, Properties, Definition 27.3.1, Properties, Lemmas 27.5.2 and 27.7.2, Morphisms, Lemma 28.16.2.

Let ξ_1, \dots, ξ_r be the generic points of the complement of X in \overline{X} . There are finitely many since \overline{X} has a Noetherian underlying topological space (see Morphisms, Lemma 28.16.6, Properties, Lemma 27.5.5, and Topology, Lemma 5.8.2). For each i the local ring $\mathcal{O}_i = \mathcal{O}_{X, \xi_i}$ is a normal Noetherian local domain (as a localization of a Noetherian normal domain). Let $J \subset \{1, \dots, r\}$ be the set of indices i such that $\dim(\mathcal{O}_i) = 1$. For $j \in J$ the local ring \mathcal{O}_j is a discrete valuation ring, see Algebra, Lemma 10.115.6. Hence we obtain a valuation

$$v_j : k(\overline{X})^* \longrightarrow \mathbf{Z}$$

with the property that $v_j(f) \geq 0 \Leftrightarrow f \in \mathcal{O}_j$.

Think of $\mathcal{O}(X)$ as a sub k -algebra of $k(X) = k(\overline{X})$. We claim that the kernel of the map

$$\mathcal{O}(X)^* \longrightarrow \prod_{j \in J} \mathbf{Z}, \quad f \longmapsto \prod v_j(f)$$

is k^* . It is clear that this claim proves the lemma. Namely, suppose that $f \in \mathcal{O}(X)$ is an element of the kernel. Let $U = \text{Spec}(B) \subset \overline{X}$ be any affine open. Then B is a Noetherian normal domain. For every height one prime $\mathfrak{q} \subset B$ with corresponding point $\xi \in X$ we see that either $\xi = \xi_j$ for some $j \in J$ or that $\xi \in X$. The reason is that $\text{codim}(\overline{\{\xi\}}, \overline{X}) = 1$ by Properties, Lemma 27.11.4 and hence if $\xi \in \overline{X} \setminus X$ it must be a generic point of $\overline{X} \setminus X$, hence equal to some ξ_j , $j \in J$. We conclude that $f \in \mathcal{O}_{X, \xi} = B_{\mathfrak{q}}$ in either case as f is in the kernel of the map. Thus $f \in \bigcap_{\text{ht}(\mathfrak{q})=1} B_{\mathfrak{q}} = B$, see Algebra, Lemma 10.146.6. In other words, we see that $f \in \Gamma(\overline{X}, \mathcal{O}_{\overline{X}})$. But since k is algebraically closed we conclude that $f \in k$ by Lemma 32.16.2. \square

Next, we generalize the case above by some elementary arguments, still keeping the field algebraically closed.

Lemma 32.17.2. *Let k be an algebraically closed field. Let X be an integral scheme locally of finite type over k . Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. As X is integral the restriction mapping $\mathcal{O}(X) \rightarrow \mathcal{O}(U)$ is injective for any nonempty open subscheme $U \subset X$. Hence we may assume that X is affine. Choose a closed immersion $X \rightarrow \mathbf{A}_k^n$ and denote \overline{X} the closure of X in \mathbf{P}_k^n via the usual immersion $\mathbf{A}_k^n \rightarrow \mathbf{P}_k^n$. Thus we may assume that X is an affine open of a projective variety \overline{X} .

Let $\nu : \overline{X}^\nu \rightarrow \overline{X}$ be the normalization morphism, see Morphisms, Definition 28.48.12. We know that ν is finite, dominant, and that \overline{X}^ν is a normal irreducible scheme, see Morphisms, Lemmas 28.48.15, 28.48.17, and 28.19.2. It follows that \overline{X}^ν is a proper variety, because $\overline{X} \rightarrow \text{Spec}(k)$ is proper as a composition of a finite and a proper morphism (see results in Morphisms, Sections 28.42 and 28.44). It also follows that ν is a surjective morphism, because the image of ν is closed and contains the generic point of \overline{X} . Hence setting $X^\nu = \nu^{-1}(X)$ we see that it suffices to prove the result for X^ν . In other words, we may assume that X is a nonempty open of a normal proper variety \overline{X} . This case is handled by Lemma 32.17.1. \square

The preceding lemma implies the following slight generalization.

Lemma 32.17.3. *Let k be an algebraically closed field. Let X be a connected reduced scheme which is locally of finite type over k with finitely many irreducible components. Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. Let $X = \bigcup X_i$ be the irreducible components. By Lemma 32.17.2 we see that $\mathcal{O}(X_i)^*/k^*$ is a finitely generated abelian group. Let $f \in \mathcal{O}(X)^*$ be in the kernel of the map

$$\mathcal{O}(X)^* \longrightarrow \prod \mathcal{O}(X_i)^*/k^*.$$

Then for each i there exists an element $\lambda_i \in k$ such that $f|_{X_i} = \lambda_i$. By restricting to $X_i \cap X_j$ we conclude that $\lambda_i = \lambda_j$ if $X_i \cap X_j \neq \emptyset$. Since X is connected we conclude that all λ_i agree and hence that $f \in k^*$. This proves that

$$\mathcal{O}(X)^*/k^* \subset \prod \mathcal{O}(X_i)^*/k^*$$

and the lemma follows as on the right we have a product of finitely many finitely generated abelian groups. \square

Lemma 32.17.4. *Let k be a field. Let X be a scheme over k which is connected and reduced. Then the integral closure of k in $\Gamma(X, \mathcal{O}_X)$ is a field.*

Proof. Let $k' \subset \Gamma(X, \mathcal{O}_X)$ be the integral closure of k . Then $X \rightarrow \text{Spec}(k)$ factors through $\text{Spec}(k')$, see Schemes, Lemma 25.6.4. As X is reduced we see that k' has no nonzero nilpotent elements. As $k \rightarrow k'$ is integral we see that every prime ideal of k' is both a maximal ideal and a minimal prime, and $\text{Spec}(k')$ is totally disconnected, see Algebra, Lemmas 10.35.18 and 10.25.5. As X is connected the morphism $X \rightarrow \text{Spec}(k')$ is constant, say with image the point corresponding to $\mathfrak{p} \subset k'$. Then any $f \in k'$, $f \notin \mathfrak{p}$ maps to an invertible element of \mathcal{O}_X . By definition of k' this then forces f to be a unit of k' . Hence we see that k' is local with maximal ideal \mathfrak{p} , see Algebra, Lemma 10.17.2. Since we've already seen that k' is reduced this implies that k' is a field, see Algebra, Lemma 10.24.1. \square

Proposition 32.17.5. *Let k be a field. Let X be a scheme over k . Assume that X is locally of finite type over k , connected, reduced, and has finitely many irreducible components. Then $\mathcal{O}(X)^*/k^*$ is a finitely generated abelian group if in addition to the conditions above at least one of the following conditions is satisfied:*

- (1) *the integral closure of k in $\Gamma(X, \mathcal{O}_X)$ is k ,*
- (2) *X has a k -rational point, or*
- (3) *X is geometrically integral.*

Proof. Let \bar{k} be an algebraic closure of k . Let Y be a connected component of $(X_{\bar{k}})_{red}$. Note that the canonical morphism $p : Y \rightarrow X$ is open (by Morphisms, Lemma 28.24.4) and closed (by Morphisms, Lemma 28.44.7). Hence $p(Y) = X$ as X was assumed connected. In particular, as X is reduced this implies $\mathcal{O}(X) \subset \mathcal{O}(Y)$. By Lemma 32.6.13 we see that Y has finitely many irreducible components. Thus Lemma 32.17.3 applies to Y . This implies that if $\mathcal{O}(X)^*/k^*$ is not a finitely generated abelian group, then there exist elements $f \in \mathcal{O}(X)$, $f \notin k$ which map to an element of \bar{k} via the map $\mathcal{O}(X) \rightarrow \mathcal{O}(Y)$. In this case f is algebraic over k , hence integral over k . Thus, if condition (1) holds, then this cannot happen. To finish the proof we show that conditions (2) and (3) imply (1).

Let $k \subset k' \subset \Gamma(X, \mathcal{O}_X)$ be the integral closure of k in $\Gamma(X, \mathcal{O}_X)$. By Lemma 32.17.4 we see that k' is a field. If $e : \text{Spec}(k) \rightarrow X$ is a k -rational point, then $e^\sharp : \Gamma(X, \mathcal{O}_X) \rightarrow k$ is a section to the inclusion map $k \rightarrow \Gamma(X, \mathcal{O}_X)$. In particular the restriction of e^\sharp to k' is a field map $k' \rightarrow k$ over k , which clearly shows that (2) implies (1).

If the integral closure k' of k in $\Gamma(X, \mathcal{O}_X)$ is not trivial, then we see that X is either not geometrically connected (if $k \subset k'$ is not purely inseparable) or that X is not geometrically reduced (if $k \subset k'$ is nontrivial purely inseparable). Details omitted. Hence (3) implies (1). \square

Lemma 32.17.6. *Let k be a field. Let X be a variety over k . The group $\mathcal{O}(X)^*/k^*$ is a finitely generated abelian group provided at least one of the following conditions holds:*

- (1) *k is integrally closed in $\Gamma(X, \mathcal{O}_X)$,*
- (2) *k is algebraically closed in $k(X)$,*
- (3) *X is geometrically integral over k , or*
- (4) *k is the “intersection” of the field extensions $k \subset \kappa(x)$ where x runs over the closed points of X .*

Proof. We see that (1) is enough by Proposition 32.17.5. We omit the verification that each of (2), (3), (4) implies (1). \square

32.18. Uniqueness of base field

The phrase “let X be a scheme over k ” means that X is a scheme which comes equipped with a morphism $X \rightarrow \text{Spec}(k)$. Now we can ask whether the field k is uniquely determined by the scheme X . Of course this is not the case, since for example $\mathbf{A}_{\mathbf{C}}^1$ which we ordinarily consider as a scheme over the field \mathbf{C} of complex numbers, could also be considered as a scheme over \mathbf{Q} . But what if we ask that the morphism $X \rightarrow \text{Spec}(k)$ does not factor as $X \rightarrow \text{Spec}(k') \rightarrow \text{Spec}(k)$ for any nontrivial field extension $k \subset k'$? In other words we ask that k is somehow maximal such that X lives over k .

An example to show that this still does not guarantee uniqueness of k is the scheme

$$X = \operatorname{Spec} \left(\mathbf{Q}(x)[y] \left[\frac{1}{P(y)}, P \in \mathbf{Q}[y], P \neq 0 \right] \right)$$

At first sight this seems to be a scheme over $\mathbf{Q}(x)$, but on a second look it is clear that it is also a scheme over $\mathbf{Q}(y)$. Moreover, the fields $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are subfields of $R = \Gamma(X, \mathcal{O}_X)$ which are maximal among the subfields of R (details omitted). In particular, both $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are maximal in the sense above. Note that both morphisms $X \rightarrow \operatorname{Spec}(\mathbf{Q}(x))$ and $X \rightarrow \operatorname{Spec}(\mathbf{Q}(y))$ are “essentially of finite type” (i.e., the corresponding ring map is essentially of finite type). Hence X is a Noetherian scheme of finite dimension, i.e., it is not completely pathological.

Another issue that can prevent uniqueness is that the scheme X may be nonreduced. In that case there can be many different morphisms from X to the spectrum of a given field. As an explicit example consider the dual numbers $D = \mathbf{C}[y]/(y^2) = \mathbf{C} \oplus \epsilon\mathbf{C}$. Given any derivation $\theta : \mathbf{C} \rightarrow \mathbf{C}$ over \mathbf{Q} we get a ring map

$$\mathbf{C} \longrightarrow D, \quad c \longmapsto c + \epsilon\theta(c).$$

The subfield of \mathbf{C} on which all of these maps are the same is the algebraic closure of \mathbf{Q} . This means that taking the intersection of all the fields that X can live over may end up being a very small field if X is nonreduced.

One observation in this regard is the following: given a field k and two subfields k_1, k_2 of k such that k is finite over k_1 and over k_2 , then in general it is *not* the case that k is finite over $k_1 \cap k_2$. An example is the field $k = \mathbf{Q}(t)$ and its subfields $k_1 = \mathbf{Q}(t^2)$ and $\mathbf{Q}((t+1)^2)$. Namely we have $k_1 \cap k_2 = \mathbf{Q}$ in this case. So in the following we have to be careful when taking intersections of fields.

Having said all of this we now show that if X is locally of finite type over a field, then some uniqueness holds. Here is the precise result.

Proposition 32.18.1. *Let X be a scheme. Let $a : X \rightarrow \operatorname{Spec}(k_1)$ and $b : X \rightarrow \operatorname{Spec}(k_2)$ be morphisms from X to spectra of fields. Assume a, b are locally of finite type, and X is reduced, and connected. Then we have $k'_1 = k'_2$, where $k'_i \subset \Gamma(X, \mathcal{O}_X)$ is the integral closure of k_i in $\Gamma(X, \mathcal{O}_X)$.*

Proof. First, assume the lemma holds in case X is quasi-compact (we will do the quasi-compact case below). As X is locally of finite type over a field, it is locally Noetherian, see Morphisms, Lemma 28.16.6. In particular this means that it is locally connected, connected components of open subsets are open, and intersections of quasi-compact opens are quasi-compact, see Properties, Lemma 27.5.5, Topology, Lemma 5.6.10, Topology, Section 5.8, and Topology, Lemma 5.15.1. Pick an open covering $X = \bigcup_{i \in I} U_i$ such that each U_i is quasi-compact and connected. For each i let $K_i \subset \mathcal{O}_X(U_i)$ be the integral closure of k_1 and of k_2 . For each pair $i, j \in I$ we decompose

$$U_i \cap U_j = \coprod U_{i,j,l}$$

into its finitely many connected components. Write $K_{i,j,l} \subset \mathcal{O}(U_{i,j,l})$ for the integral closure of k_1 and of k_2 . By Lemma 32.17.4 the rings K_i and $K_{i,j,l}$ are fields. Now we claim that k'_1 and k'_2 both equal the kernel of the map

$$\prod K_i \longrightarrow \prod K_{i,j,l}, \quad (x_i)_i \longmapsto x_i|_{U_{i,j,l}} - x_j|_{U_{i,j,l}}$$

which proves what we want. Namely, it is clear that k'_1 is contained in this kernel. On the other hand, suppose that $(x_i)_i$ is in the kernel. By the sheaf condition $(x_i)_i$ corresponds to $f \in \mathcal{O}(X)$. Pick some $i_0 \in I$ and let $P(T) \in k_1[T]$ be a monic polynomial with $P(x_{i_0}) = 0$. Then we claim that $P(f) = 0$ which proves that $f \in k_1$. To prove this we have to show that $P(x_i) = 0$ for all i . Pick $i \in I$. As X is connected there exists a sequence $i_0, i_1, \dots, i_n = i \in I$ such that $U_{i_t} \cap U_{i_{t+1}} \neq \emptyset$. Now this means that for each t there exists an l_t such that x_{i_t} and $x_{i_{t+1}}$ map to the same element of the field $K_{i_t, j, l}$. Hence if $P(x_{i_t}) = 0$, then $P(x_{i_{t+1}}) = 0$. By induction, starting with $P(x_{i_0}) = 0$ we deduce that $P(x_i) = 0$ as desired.

To finish the proof of the lemma we prove the lemma under the additional hypothesis that X is quasi-compact. By Lemma 32.17.4 after replacing k_i by k'_i we may assume that k_i is integrally closed in $\Gamma(X, \mathcal{O}_X)$. This implies that $\mathcal{O}(X)^*/k_i^*$ is a finitely generated abelian group, see Proposition 32.17.5. Let $k_{12} = k_1 \cap k_2$ as a subring of $\mathcal{O}(X)$. Note that k_{12} is a field. Since

$$k_1^*/k_{12}^* \longrightarrow \mathcal{O}(X)^*/k_2^*$$

we see that k_1^*/k_{12}^* is a finitely generated abelian group as well. Hence there exist $\alpha_1, \dots, \alpha_n \in k_1^*$ such that every element $\lambda \in k_1$ has the form

$$\lambda = c\alpha_1^{e_1} \dots \alpha_n^{e_n}$$

for some $e_i \in \mathbf{Z}$ and $c \in k_{12}$. In particular, the ring map

$$k_{12}[x_1, \dots, x_n, \frac{1}{x_1 \dots x_n}] \longrightarrow k_1, \quad x_i \longmapsto \alpha_i$$

is surjective. By the Hilbert Nullstellensatz, Algebra, Theorem 10.33.1 we conclude that k_1 is a finite extension of k_{12} . In the same way we conclude that k_2 is a finite extension of k_{12} . In particular both k_1 and k_2 are contained in the integral closure k'_{12} of k_{12} in $\Gamma(X, \mathcal{O}_X)$. But since k'_{12} is a field by Lemma 32.17.4 and since we chose k_i to be integrally closed in $\Gamma(X, \mathcal{O}_X)$ we conclude that $k_1 = k_{12} = k_2$ as desired. \square

32.19. Coherent sheaves on projective space

In this section we prove some results on the cohomology of coherent sheaves on \mathbf{P}^n over a field which can be found in [Mum66]. These will be useful later when discussing Quot and Hilbert schemes.

32.19.1. Preliminaries. Let k be a field, $n \geq 1$, $d \geq 1$, and let $s \in \Gamma(\mathbf{P}_k^n, \mathcal{O}(d))$ be a nonzero section. In this section we will write $\mathcal{O}(d)$ for the d th twist of the structure sheaf on projective space (Constructions, Definitions 26.10.1 and 26.13.2). Since \mathbf{P}_k^n is a variety this section is regular, hence s is a regular section of $\mathcal{O}(d)$ and defines an effective Cartier divisor $H = Z(s) \subset \mathbf{P}_k^n$, see Divisors, Section 30.9. Such a divisor H is called a *hypersurface* and if $d = 1$ it is called a *hyperplane*.

Lemma 32.19.2. *Let k be a field. Let $n \geq 1$. Let $i : H \rightarrow \mathbf{P}_k^n$ be a hyperplane. Then there exists an isomorphism*

$$\varphi : \mathbf{P}_k^{n-1} \longrightarrow H$$

such that $i^\mathcal{O}(1)$ pulls back to $\mathcal{O}(1)$.*

Proof. We have $\mathbf{P}_k^n = \text{Proj}(k[T_0, \dots, T_n])$. The section s corresponds to a homogeneous form in T_0, \dots, T_n of degree 1, see Cohomology of Schemes, Section 29.8. Say $s = \sum a_i T_i$. Constructions, Lemma 26.13.6 gives that $H = \text{Proj}(k[T_0, \dots, T_n]/I)$ for the graded ideal I defined by setting I_d equal to the kernel of the map $\Gamma(\mathbf{P}_k^n, \mathcal{O}(d)) \rightarrow \Gamma(H, i^* \mathcal{O}(d))$. By our construction of $Z(s)$ in Divisors, Definition 30.9.18 we see that on $D_+(T_j)$ the ideal of H is generated by $\sum a_i T_i/T_j$ in the polynomial ring $k[T_0/T_j, \dots, T_n/T_j]$. Thus it is clear that I is the ideal generated by $\sum a_i T_i$. Note that

$$k[T_0, \dots, T_n]/I = k[T_0, \dots, T_n]/(\sum a_i T_i) \cong k[S_0, \dots, S_{n-1}]$$

as graded rings. For example, if $a_n \neq 0$, then mapping S_i equal to the class of T_i works. We obtain the desired isomorphism by functoriality of Proj . Equality of twists of structure sheaves follows for example from Constructions, Lemma 26.11.5. \square

Lemma 32.19.3. *Let k be an infinite field. Let $n \geq 1$. Let \mathcal{F} be a coherent module on \mathbf{P}_k^n . Then there exist a nonzero section $s \in \Gamma(\mathbf{P}_k^n, \mathcal{O}(1))$ and a short exact sequence*

$$0 \rightarrow \mathcal{F}(-1) \rightarrow \mathcal{F} \rightarrow i_* \mathcal{G} \rightarrow 0$$

where $i : H \rightarrow \mathbf{P}_k^n$ is the hyperplane H associated to s and $\mathcal{G} = i^* \mathcal{F}$.

Proof. The map $\mathcal{F}(-1) \rightarrow \mathcal{F}$ comes from Constructions, Equation (26.10.1.2) with $n = 1$, $m = -1$ and the section s of $\mathcal{O}(1)$. Let's work out what this map looks like if we restrict it to $D_+(T_0)$. Write $D_+(T_0) = \text{Spec}(k[x_1, \dots, x_n])$ with $x_i = T_i/T_0$. Identify $\mathcal{O}(1)|_{D_+(T_0)}$ with \mathcal{O} using the section T_0 . Hence if $s = \sum a_i T_i$ then $s|_{D_+(T_0)} = a_0 + \sum a_i x_i$ with the identification chosen above. Furthermore, suppose $\mathcal{F}|_{D_+(T_0)}$ corresponds to the finite $k[x_1, \dots, x_n]$ -module M . Via the identification $\mathcal{F}(-1) = \mathcal{F} \otimes \mathcal{O}(-1)$ and our chosen trivialization of $\mathcal{O}(1)$ we see that $\mathcal{F}(-1)$ corresponds to M as well. Thus restricting $\mathcal{F}(-1) \rightarrow \mathcal{F}$ to $D_+(T_0)$ gives the map

$$M \xrightarrow{a_0 + \sum a_i x_i} M$$

To see that the arrow is injective, it suffices to pick $a_0 + \sum a_i x_i$ outside any of the associated primes of M , see Algebra, Lemma 10.62.9. By Algebra, Lemma 10.62.5 the set $\text{Ass}(M)$ of associated primes of M is finite. Note that for $\mathfrak{p} \in \text{Ass}(M)$ the intersection $\mathfrak{p} \cap \{a_0 + \sum a_i x_i\}$ is a proper k -subvector space. We conclude that there is a finite family of proper sub vector spaces $V_1, \dots, V_m \subset \Gamma(\mathbf{P}_k^n, \mathcal{O}(1))$ such that if we take s outside of $\bigcup V_i$, then multiplication by s is injective over $D_+(T_0)$. Similarly for the restriction to $D_+(T_j)$ for $j = 1, \dots, n$. Since k is infinite, a finite union of proper sub vector spaces is never equal to the whole space, hence we may choose s such that the map is injective. The cokernel of $\mathcal{F}(-1) \rightarrow \mathcal{F}$ is annihilated by $\text{Im}(s : \mathcal{O}(-1) \rightarrow \mathcal{O})$ which is the ideal sheaf of H by Divisors, Definition 30.9.18. Hence we obtain \mathcal{G} on H using Cohomology of Schemes, Lemma 29.9.8. \square

Remark 32.19.4. Let k be an infinite field. Let $n \geq 1$. Given a finite number of coherent modules \mathcal{F}_i on \mathbf{P}_k^n we can choose a single $s \in \Gamma(\mathbf{P}_k^n, \mathcal{O}(1))$ such that the statement of Lemma 32.19.3 works for each of them. To prove this, just apply the lemma to $\bigoplus \mathcal{F}_i$.

32.19.5. Regularity.

Definition 32.19.6. Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . We say \mathcal{F} is m -regular if

$$H^i(\mathbf{P}_k^n, \mathcal{F}(m-i)) = 0$$

for $i = 1, \dots, n$.

Note that $\mathcal{F} = \mathcal{O}(d)$ is m -regular if and only if $d \geq m$. This follows from the computation of cohomology groups in Cohomology of Schemes, Equation (29.8.1.1). Namely, we see that $H^n(\mathbf{P}_k^n, \mathcal{O}(d)) = 0$ if and only if $d \geq -n$.

Lemma 32.19.7. Let $k \subset k'$ be an extension of fields. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . Let \mathcal{F}' be the pullback of \mathcal{F} to $\mathbf{P}_{k'}^n$. Then \mathcal{F} is m -regular if and only if \mathcal{F}' is m -regular.

Proof. This is true because

$$H^i(\mathbf{P}_{k'}^n, \mathcal{F}') = H^i(\mathbf{P}_k^n, \mathcal{F}) \otimes_k k'$$

by flat base change, see Cohomology of Schemes, Lemma 29.5.2. \square

Lemma 32.19.8. In the situation of Lemma 32.19.3, if \mathcal{F} is m -regular, then \mathcal{G} is m -regular on $H \cong \mathbf{P}_k^{n-1}$.

Proof. Recall that $H^i(\mathbf{P}_k^n, i_*\mathcal{G}) = H^i(H, \mathcal{G})$ by Cohomology of Schemes, Lemma 29.2.4. Hence we see that for $i \geq 1$ we get

$$H^i(\mathbf{P}_k^n, \mathcal{F}(m-i)) \rightarrow H^i(H, \mathcal{G}(m-i)) \rightarrow H^{i+1}(\mathbf{P}_k^n, \mathcal{F}(m-1-i))$$

as part of the long exact sequence associated to the short exact sequence $0 \rightarrow \mathcal{F}(m-1-i) \rightarrow \mathcal{F}(m-i) \rightarrow i_*\mathcal{G}(m-i) \rightarrow 0$ we obtain from the exact sequence of Lemma 32.19.3 by tensoring with the invertible sheaf $\mathcal{O}(m-i)$. The lemma follows. \square

Lemma 32.19.9. Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . If \mathcal{F} is m -regular, then \mathcal{F} is $(m+1)$ -regular.

Proof. We prove this by induction on n . If $n = 0$ every sheaf is m -regular for all m and there is nothing to prove. By Lemma 32.19.7 we may replace k by an infinite overfield and assume k is infinite. Thus we may apply Lemma 32.19.3. By Lemma 32.19.8 we know that \mathcal{G} is m -regular. By induction on n we see that \mathcal{G} is $(m+1)$ -regular. Considering the long exact cohomology sequence associated to the sequence

$$0 \rightarrow \mathcal{F}(m-i) \rightarrow \mathcal{F}(m+1-i) \rightarrow i_*\mathcal{G}(m+1-i) \rightarrow 0$$

the reader easily deduces for $i \geq 1$ the vanishing of $H^i(\mathbf{P}_k^n, \mathcal{F}(m+1-i))$ from the (known) vanishing of $H^i(\mathbf{P}_k^n, \mathcal{F}(m-i))$ and $H^i(\mathbf{P}_k^n, \mathcal{G}(m+1-i))$. \square

Lemma 32.19.10. Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . If \mathcal{F} is m -regular, then the multiplication map

$$H^0(\mathbf{P}_k^n, \mathcal{F}(m)) \otimes_k H^0(\mathbf{P}_k^n, \mathcal{O}(1)) \longrightarrow H^0(\mathbf{P}_k^n, \mathcal{F}(m+1))$$

is surjective.

Proof. Let $k \subset k'$ be an extension of fields. Let \mathcal{F}' be as in Lemma 32.19.7. By Cohomology of Schemes, Lemma 29.5.2 the base change of the linear map of the lemma to k' is the same linear map for the sheaf \mathcal{F}' . Since $k \rightarrow k'$ is faithfully flat it suffices to prove the lemma over k' , i.e., we may assume k is infinite.

Assume k is infinite. We prove the lemma by induction on n . The case $n = 0$ is trivial as $\mathcal{O}(1) \cong \mathcal{O}$ is generated by T_0 . For $n > 0$ apply Lemma 32.19.3 and tensor the sequence by $\mathcal{O}(m+1)$ to get

$$0 \rightarrow \mathcal{F}(m) \xrightarrow{s} \mathcal{F}(m+1) \rightarrow i_*\mathcal{G}(m+1) \rightarrow 0$$

Let $t \in H^0(\mathbf{P}_k^n, \mathcal{F}(m+1))$. By induction the image $\bar{t} \in H^0(H, \mathcal{G}(m+1))$ is the image of $\sum g_i \otimes \bar{s}_i$ with $\bar{s}_i \in \Gamma(H, \mathcal{O}(1))$ and $g_i \in H^0(H, \mathcal{G}(m))$. Since \mathcal{F} is m -regular we have $H^1(\mathbf{P}_k^n, \mathcal{F}(m-1)) = 0$, hence long exact cohomology sequence associated to the short exact sequence

$$0 \rightarrow \mathcal{F}(m-1) \xrightarrow{s} \mathcal{F}(m) \rightarrow i_*\mathcal{G}(m) \rightarrow 0$$

shows we can lift g_i to $f_i \in H^0(\mathbf{P}_k^n, \mathcal{F}(m))$. We can also lift \bar{s}_i to $s_i \in H^0(\mathbf{P}_k^n, \mathcal{O}(1))$ (see proof of Lemma 32.19.2 for example). After subtracting the image of $\sum f_i \otimes s_i$ from t we see that we may assume $\bar{t} = 0$. But this exactly means that t is the image of $f \otimes s$ for some $f \in H^0(\mathbf{P}_k^n, \mathcal{F}(m))$ as desired. \square

Lemma 32.19.11. *Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . If \mathcal{F} is m -regular, then $\mathcal{F}(m)$ is globally generated.*

Proof. For all $d \gg 0$ the sheaf $\mathcal{F}(d)$ is globally generated. This follows for example from the first part of Cohomology of Schemes, Lemma 29.15.1. Pick $d \geq m$ such that $\mathcal{F}(d)$ is globally generated. Choose a basis $f_1, \dots, f_r \in H^0(\mathbf{P}_k^n, \mathcal{F})$. By Lemma 32.19.10 every element $f \in H^0(\mathbf{P}_k^n, \mathcal{F}(d))$ can be written as $f = \sum P_i f_i$ for some $P_i \in k[T_0, \dots, T_n]$ homogeneous of degree $d-m$. Since the sections f generate $\mathcal{F}(d)$ it follows that the sections f_i generate $\mathcal{F}(m)$. \square

32.19.12. Hilbert polynomials. Let k be a field. Let X be a proper scheme over k . Let \mathcal{F} be a coherent \mathcal{O}_X -module. In this situation the *Euler characteristic* of \mathcal{F} is the integer

$$\chi(X, \mathcal{F}) = \sum (-1)^i \dim_k H^i(X, \mathcal{F}).$$

Note that only a finite number of the vector spaces $H^i(X, \mathcal{F})$ are nonzero (Cohomology of Schemes, Lemma 29.4.4) and that each of these spaces is finite dimensional (Cohomology of Schemes, Lemma 29.17.4). Thus $\chi(X, \mathcal{F}) \in \mathbf{Z}$ is well defined. Observe that this definition depends on the field k and not just on the pair (X, \mathcal{F}) .

Lemma 32.19.13. *Let k be a field. Let X be a proper scheme over k . Let $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ be a short exact sequence of coherent modules on X . Then*

$$\chi(X, \mathcal{F}_2) = \chi(X, \mathcal{F}_1) + \chi(X, \mathcal{F}_3)$$

Proof. Consider the long exact sequence of cohomology

$$0 \rightarrow H^0(X, \mathcal{F}_1) \rightarrow H^0(X, \mathcal{F}_2) \rightarrow H^0(X, \mathcal{F}_3) \rightarrow H^1(X, \mathcal{F}_1) \rightarrow \dots$$

associated to the short exact sequence of the lemma. The rank-nullity theorem in linear algebra shows that

$$0 = \dim H^0(X, \mathcal{F}_1) - \dim H^0(X, \mathcal{F}_2) + \dim H^0(X, \mathcal{F}_3) - \dim H^1(X, \mathcal{F}_1) + \dots$$

This immediately implies the lemma. \square

Lemma 32.19.14. *Let $k \subset k'$ be an extension of fields. Let X be a proper scheme over k . Let \mathcal{F} be a coherent sheaf on X . Let \mathcal{F}' be the pullback of \mathcal{F} to $X_{k'}$. Then $\chi(X, \mathcal{F}) = \chi(X', \mathcal{F}')$.*

Proof. This is true because

$$H^i(X_{k'}, \mathcal{F}') = H^i(X, \mathcal{F}) \otimes_k k'$$

by flat base change, see Cohomology of Schemes, Lemma 29.5.2. \square

Lemma 32.19.15. *Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . The function*

$$d \mapsto \chi(\mathbf{P}_k^n, \mathcal{F}(d))$$

is a polynomial.

Proof. We prove this by induction on n . If $n = 0$, then $\mathbf{P}_k^n = \text{Spec}(k)$ and $\mathcal{F}(d) = \mathcal{F}$. Hence in this case the function is constant, i.e., a polynomial of degree 0. Assume $n > 0$. By Lemma 32.19.14 we may assume k is infinite. Apply Lemma 32.19.3. Applying Lemma 32.19.13 to the twisted sequences $0 \rightarrow \mathcal{F}(d-1) \rightarrow \mathcal{F}(d) \rightarrow i_*\mathcal{G}(d) \rightarrow 0$ we obtain

$$\chi(\mathbf{P}_k^n, \mathcal{F}(d)) - \chi(\mathbf{P}_k^n, \mathcal{F}(d-1)) = \chi(H, \mathcal{G}(d))$$

(this also uses the identification of the cohomology of $i_*\mathcal{G}$ with the cohomology of \mathcal{G} , see Cohomology of Schemes, Lemma 29.2.4). Since $H \cong \mathbf{P}_k^{n-1}$ (Lemma 32.19.2) by induction the right hand side is a polynomial. The lemma is finished by noting that any function $f : \mathbf{Z} \rightarrow \mathbf{Z}$ with the property that the map $d \mapsto f(d) - f(d-1)$ is a polynomial, is itself a polynomial. We omit the proof of this fact (hint: compare with Algebra, Lemma 10.57.5). \square

Definition 32.19.16. Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n . The function $d \mapsto \chi(\mathbf{P}_k^n, \mathcal{F}(d))$ is called the *Hilbert polynomial* of \mathcal{F} .

The Hilbert polynomial has coefficients in \mathbf{Q} and not in general in \mathbf{Z} . For example the Hilbert polynomial of $\mathcal{O}_{\mathbf{P}_k^n}$ is

$$d \mapsto \binom{d+n}{n} = \frac{d^n}{n!} + \dots$$

This follows from the following lemma and the fact that

$$H^0(\mathbf{P}_k^n, \mathcal{O}_{\mathbf{P}_k^n}) = k[T_0, \dots, T_n]_d$$

(degree d part) whose dimension over k is $\binom{d+n}{n}$.

Lemma 32.19.17. *Let k be a field. Let $n \geq 0$. Let \mathcal{F} be a coherent sheaf on \mathbf{P}_k^n with Hilbert polynomial $P \in \mathbf{Q}[t]$. Then*

$$P(d) = \dim_k H^0(\mathbf{P}_k^n, \mathcal{F}(d))$$

for all $d \gg 0$.

Proof. This follows from the vanishing of cohomology of high enough twists of \mathcal{F} . See Cohomology of Schemes, Lemma 29.15.1. \square

32.19.18. Boundedness of quotients. In this subsection we bound the regularity of quotients of a given coherent sheaf on \mathbf{P}^n in terms of the Hilbert polynomial.

Lemma 32.19.19. *Let k be a field. Let $n \geq 0$. Let $r \geq 1$. Let $P \in \mathbf{Q}[t]$. There exists an integer m depending on $n, r,$ and P with the following property: if*

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}^{\oplus r} \rightarrow \mathcal{F} \rightarrow 0$$

is a short exact sequence of coherent sheaves on \mathbf{P}_k^n and \mathcal{F} has Hilbert polynomial P , then \mathcal{K} is m -regular.

Proof. We prove this by induction on n . If $n = 0$, then $\mathbf{P}_k^n = \text{Spec}(k)$ and any coherent module is 0-regular and any surjective map is surjective on global sections. Assume $n > 0$. Consider an exact sequence as in the lemma. Let $P' \in \mathbf{Q}[t]$ be the polynomial $P'(t) = P(t) - P(t - 1)$. Let m' be the integer which works for $n - 1, r,$ and P' . By Lemmas 32.19.7 and 32.19.14 we may replace k by a field extension, hence we may assume k is infinite. Apply Lemma 32.19.3 to the coherent sheaf \mathcal{F} . The Hilbert polynomial of $\mathcal{F}' = i^*\mathcal{F}$ is P' (see proof of Lemma 32.19.15). Since i^* is right exact we see that \mathcal{F}' is a quotient of $\mathcal{O}_H^{\oplus r} = i^*\mathcal{O}^{\oplus r}$. Thus the induction hypothesis applies to \mathcal{F}' on $H \cong \mathbf{P}_k^{n-1}$ (Lemma 32.19.2). Note that the map $\mathcal{K}(-1) \rightarrow \mathcal{K}$ is injective as $\mathcal{K} \subset \mathcal{O}^{\oplus r}$ and has cokernel $i_*\mathcal{H}$ where $\mathcal{H} = i^*\mathcal{K}$. By the snake lemma (Homology, Lemma 12.5.17) we obtain a commutative diagram with exact columns and rows

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \mathcal{K}(-1) & \longrightarrow & \mathcal{O}^{\oplus r}(-1) & \longrightarrow & \mathcal{F}(-1) \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \mathcal{K} & \longrightarrow & \mathcal{O}^{\oplus r} & \longrightarrow & \mathcal{F} \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & i_*\mathcal{H} & \longrightarrow & i_*\mathcal{O}_H^{\oplus r} & \longrightarrow & i_*\mathcal{F}' \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 & & 0 & & 0 & & 0
 \end{array}$$

Thus the induction hypothesis applies to the exact sequence $0 \rightarrow \mathcal{H} \rightarrow \mathcal{O}_H^{\oplus r} \rightarrow \mathcal{F}' \rightarrow 0$ on $H \cong \mathbf{P}_k^{n-1}$ (Lemma 32.19.2) and \mathcal{H} is m' -regular. Recall that this implies that \mathcal{H} is d -regular for all $d \geq m'$ (Lemma 32.19.9).

Let $i \geq 2$ and $d \geq m'$. It follows from the long exact cohomology sequence associated to the left column of the diagram above and the vanishing of $H^{i-1}(H, \mathcal{H}(d))$ that the map

$$H^i(\mathbf{P}_k^n, \mathcal{K}(d - 1)) \longrightarrow H^i(\mathbf{P}_k^n, \mathcal{K}(d))$$

is injective. As these groups are zero for $d \gg 0$ (Cohomology of Schemes, Lemma 29.15.1) we conclude $H^i(\mathbf{P}_k^n, \mathcal{K}(d))$ are zero for all $d \geq m'$ and $i \geq 2$.

We still have to control H^1 . First we observe that all the maps

$$H^1(\mathbf{P}_k^n, \mathcal{K}(m' - 1)) \rightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(m')) \rightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(m' + 1)) \rightarrow \dots$$

are surjective by the vanishing of $H^1(H, \mathcal{H}(d))$ for $d \geq m'$. Suppose $d > m'$ is such that

$$H^1(\mathbf{P}_k^n, \mathcal{K}(d-1)) \longrightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(d))$$

is injective. Then $H^0(\mathbf{P}_k^n, \mathcal{K}(d)) \rightarrow H^0(H, \mathcal{H}(d))$ is surjective. Consider the commutative diagram

$$\begin{CD} H^0(\mathbf{P}_k^n, \mathcal{K}(d)) \otimes_k H^0(\mathbf{P}_k^n, \mathcal{O}(1)) @>>> H^0(\mathbf{P}_k^n, \mathcal{K}(d+1)) \\ @VVV @VVV \\ H^0(H, \mathcal{H}(d)) \otimes_k H^0(H, \mathcal{O}_H(1)) @>>> H^0(H, \mathcal{H}(d+1)) \end{CD}$$

By Lemma 32.19.10 we see that the bottom horizontal arrow is surjective. Hence the right vertical arrow is surjective. We conclude that

$$H^1(\mathbf{P}_k^n, \mathcal{K}(d)) \longrightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(d+1))$$

is injective. By induction we see that

$$H^1(\mathbf{P}_k^n, \mathcal{K}(d-1)) \rightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(d)) \rightarrow H^1(\mathbf{P}_k^n, \mathcal{K}(d+1)) \rightarrow \dots$$

are all injective and we conclude that $H^1(\mathbf{P}_k^n, \mathcal{K}(d-1)) = 0$ because of the eventual vanishing of these groups. Thus the dimensions of the groups $H^1(\mathbf{P}_k^n, \mathcal{K}(d))$ for $d \geq m'$ are strictly decreasing until they become zero. It follows that the regularity of \mathcal{K} is bounded by $m' + \dim_k H^1(\mathbf{P}_k^n, \mathcal{K}(m'))$. On the other hand, by the vanishing of the higher cohomology groups we have

$$\dim_k H^1(\mathbf{P}_k^n, \mathcal{K}(m')) = -\chi(\mathbf{P}_k^n, \mathcal{K}(m')) + \dim_k H^0(\mathbf{P}_k^n, \mathcal{K}(m'))$$

Note that the H^0 has dimension bounded by the dimension of $H^0(\mathbf{P}_k^n, \mathcal{O}^{\oplus r}(m'))$ which is at most $r \binom{n+m'}{n}$ if $m' > 0$ and zero if not. Finally, the term $\chi(\mathbf{P}_k^n, \mathcal{K}(m'))$ is equal to $r \binom{n+m'}{n} - P(m')$. This gives a bound of the desired type finishing the proof of the lemma. \square

32.20. Glueing dimension one rings

This section contains some algebraic preliminaries to proving that a finite set of codimension 1 points of a separated scheme is contained in an affine open.

Situation 32.20.1. Here we are given a commutative diagram of rings

$$\begin{CD} A @>>> K \\ @VVV @VVV \\ R @>>> B \end{CD}$$

where K is a field and A, B are subrings of K with fraction field K . Finally, $R = A \times_K B = A \cap B$.

Lemma 32.20.2. *In Situation 32.20.1 assume that B is a valuation ring. Then for every unit u of A either $u \in R$ or $u^{-1} \in R$.*

Proof. Namely, if the image c of u in K is in B , then $u \in R$. Otherwise, $c^{-1} \in B$ (Algebra, Lemma 10.48.3) and $u^{-1} \in R$. \square

The following lemma explains the meaning of the condition “ $A \otimes B \rightarrow K$ is surjective” which comes up quite a bit in the following.

Lemma 32.20.3. *In Situation 32.20.1 assume A is a Noetherian ring of dimension 1. The following are equivalent*

- (1) $A \otimes B \rightarrow K$ is not surjective,
- (2) there exists a discrete valuation ring $\mathcal{O} \subset K$ containing both A and B .

Proof. It is clear that (2) implies (1). On the other hand, if $A \otimes B \rightarrow K$ is not surjective, then the image $C \subset K$ is not a field hence C has a nonzero maximal ideal \mathfrak{m} . Choose a valuation ring $\mathcal{O} \subset K$ dominating $C_{\mathfrak{m}}$. By Algebra, Lemma 10.115.11 applied to $A \subset \mathcal{O}$ the ring \mathcal{O} is Noetherian. Hence \mathcal{O} is a valuation ring by Algebra, Lemma 10.48.18. \square

Lemma 32.20.4. *In Situation 32.20.1 assume*

- (1) A is a Noetherian semi-local domain of dimension 1,
- (2) B is a discrete valuation ring,

Then we have the following two possibilities

- (a) If A^* is not contained in R , then $\text{Spec}(A) \rightarrow \text{Spec}(R)$ and $\text{Spec}(B) \rightarrow \text{Spec}(R)$ are open immersions and $K = A \otimes_R B$.
- (b) If A^* is contained in R , then B dominates one of the local rings of A at a maximal ideal and $A \otimes B \rightarrow K$ is not surjective.

Proof. Assumption (a) implies there is a unit of A whose image in K lies in the maximal ideal of B . Then u is a nonzerodivisor of R and for every $a \in A$ there exists an n such that $u^n a \in R$. It follows that $A = R_u$.

Let \mathfrak{m}_A be the radical of A . Let $x \in \mathfrak{m}_A$ be a nonzero element. Since $\dim(A) = 1$ we see that $K = A_x$. After replacing x by $x^n u^m$ for some $n \geq 1$ and $m \in \mathbf{Z}$ we may assume x maps to a unit of B . We see that for every $b \in B$ we have that $x^n b$ in the image of R for some n . Thus $B = R_x$.

Let $z \in R$. If $z \notin \mathfrak{m}_A$ and z does not map to an element of \mathfrak{m}_B , then z is invertible. Thus $x + u$ is invertible in R . Hence $\text{Spec}(R) = D(x) \cup D(u)$. We have seen above that $D(u) = \text{Spec}(A)$ and $D(x) = \text{Spec}(B)$.

Case (b). If $x \in \mathfrak{m}_A$, then $1 + x$ is a unit and hence $1 + x \in R$, i.e., $x \in R$. Thus we see that $\mathfrak{m}_A \subset R \subset A$. In fact, in this case A is integral over R . Namely, write $A/\mathfrak{m}_A = \kappa_1 \times \dots \times \kappa_n$ as a product of fields. Say $x = (c_1, \dots, c_r, 0, \dots, 0)$ is an element with $c_i \neq 0$. Then

$$x^2 - x(c_1, \dots, c_r, 1, \dots, 1) = 0$$

Since R contains all units we see that A/\mathfrak{m}_A is integral over the image of R in it, and hence A is integral over R . It follows that $R \subset A \subset B$ as B is integrally closed. Moreover, if $x \in \mathfrak{m}_A$ is nonzero, then $K = A_x = \bigcup x^{-n} A = \bigcup x^{-n} R$. Hence $x^{-1} \notin B$, i.e., $x \in \mathfrak{m}_B$. We conclude $\mathfrak{m}_A \subset \mathfrak{m}_B$. Thus $A \cap \mathfrak{m}_B$ is a maximal ideal of A thereby finishing the proof. \square

Lemma 32.20.5. *Let B be a semi-local Noetherian domain of dimension 1. Let B' be the integral closure of B in its fraction field. Then B' is a semi-local Dedekind domain. Let x be a nonzero element of the radical of B' . Then for every $y \in B'$ there exists an n such that $x^n y \in B$.*

Proof. Let \mathfrak{m}_B be the radical of B . The structure of B' results from Algebra, Lemma 10.116.14. Given $x, y \in B'$ as in the statement of the lemma consider the subring $B \subset A \subset B'$ generated by x and y . Then A is finite over B (Algebra,

Lemma 10.35.5). Since the fraction fields of B and A are the same we see that the finite module A/B is supported on the set of closed points of B . Thus $\mathfrak{m}_B^n A \subset B$ for a suitable n . Moreover, $\text{Spec}(B') \rightarrow \text{Spec}(A)$ is surjective (Algebra, Lemma 10.35.15), hence A is semi-local as well. It also follows that x is in the radical \mathfrak{m}_A of A . Note that $\mathfrak{m}_A = \sqrt{\mathfrak{m}_B A}$. Thus $x^m y \in \mathfrak{m}_B A$ for some m . Then $x^{nm} y \in B$. \square

Lemma 32.20.6. *In Situation 32.20.1 assume*

- (1) A is a Noetherian semi-local domain of dimension 1,
- (2) B is a Noetherian semi-local domain of dimension 1,
- (3) $A \otimes B \rightarrow K$ is surjective.

Then $\text{Spec}(A) \rightarrow \text{Spec}(R)$ and $\text{Spec}(B) \rightarrow \text{Spec}(R)$ are open immersions and $K = A \otimes_R B$.

Proof. Special case: B is integrally closed in K . This means that B is a Dedekind domain (Algebra, Lemma 10.116.13) whence all of its localizations at maximal ideals are discrete valuation rings. Let $\mathfrak{m}_1, \dots, \mathfrak{m}_r$ be the maximal ideals of B . We set

$$R_1 = A \times_K B_{\mathfrak{m}_1}$$

Observing that $A \otimes_{R_1} B_{\mathfrak{m}_1} \rightarrow K$ is surjective we conclude from Lemma 32.20.4 that A and $B_{\mathfrak{m}_1}$ define open subschemes covering $\text{Spec}(R_1)$ and that $K = A \otimes_{R_1} B_{\mathfrak{m}_1}$. In particular R_1 is a semi-local Noetherian ring of dimension 1. By induction we define

$$R_{i+1} = R_i \times_K B_{\mathfrak{m}_{i+1}}$$

for $i = 1, \dots, r-1$. Observe that $R = R_n$ because $B = B_{\mathfrak{m}_1} \cap \dots \cap B_{\mathfrak{m}_r}$ (see Algebra, Lemma 10.146.6). It follows from the inductive procedure that $R \rightarrow A$ defines an open immersion $\text{Spec}(A) \rightarrow \text{Spec}(R)$. On the other hand, the maximal ideals \mathfrak{n}_i of R not in this open correspond to the maximal ideals \mathfrak{m}_i of B and in fact the ring map $R \rightarrow B$ defines an isomorphism $R_{\mathfrak{n}_i} \rightarrow B_{\mathfrak{m}_i}$ (details omitted; hint: in each step we added exactly one maximal ideal to $\text{Spec}(R_i)$). It follows that $\text{Spec}(B) \rightarrow \text{Spec}(R)$ is an open immersion as desired.

General case. Let $B' \subset K$ be the integral closure of B . See Lemma 32.20.5. Then the special case applies to $R' = A \times_K B'$. Pick $x \in R'$ which is not contained in the maximal ideals of A and is contained in the maximal ideals of B' (see Algebra, Lemma 10.14.3). By Lemma 32.20.5 there exists an integer n such that $x^n \in R = A \times_K B$. Replace x by x^n so $x \in R$. For every $y \in R'$ there exists an integer n such that $x^n y \in R$. On the other hand, it is clear that $R'_x = A$. Thus $R_x = A$. Exchanging the roles of A and B we also find an $y \in R$ such that $B = R_y$. Note that inverting both x and y leaves no primes except (0) . Thus $K = R_{xy} = R_x \otimes_R R_y$. This finishes the proof. \square

Lemma 32.20.7. *Let K be a field. Let $A_1, \dots, A_r \subset K$ be Noetherian semi-local rings of dimension 1 with fraction field K . If $A_i \otimes A_j \rightarrow K$ is surjective for all $i \neq j$, then there exists a Noetherian semi-local domain $A \subset K$ of dimension 1 containing A_1, \dots, A_r such that*

- (1) $A \rightarrow A_i$ induces an open immersion $j_i : \text{Spec}(A_i) \rightarrow \text{Spec}(A)$,
- (2) $\text{Spec}(A)$ is the union of the opens $j_i(\text{Spec}(A_i))$,
- (3) each closed point of $\text{Spec}(A)$ lies in exactly one of these opens.

Proof. Namely, we can take $A = A_1 \cap \dots \cap A_r$. First we note that (3), once (1) and (2) have been proven, follows from the assumption that $A_i \otimes A_j \rightarrow K$ is surjective since if $\mathfrak{m} \in j_i(\text{Spec}(A_i)) \cap j_j(\text{Spec}(A_j))$, then $A_i \otimes A_j \rightarrow K$ ends up in $A_{\mathfrak{m}}$. To prove (1) and (2) we argue by induction on r . If $r > 1$ by induction we have the results (1) and (2) for $B = A_2 \cap \dots \cap A_r$. Then we apply Lemma 32.20.6 to see they hold for $A = A_1 \cap B$. \square

Lemma 32.20.8. *Let A be a domain with fraction field K . Let $B_1, \dots, B_r \subset K$ be Noetherian 1-dimensional semi-local rings whose fraction fields are K . If $A \otimes B_i \rightarrow K$ are surjective for $i = 1, \dots, r$, then there exists an $x \in A$ such that x^{-1} is in the radical of B_i for $i = 1, \dots, r$.*

Proof. Let B'_i be the integral closure of B_i in K . Suppose we find a nonzero $x \in A$ such that x^{-1} is in the radical of B'_i for $i = 1, \dots, r$. Then by Lemma 32.20.5, after replacing x by a power we get $x^{-1} \in B_i$. Since $\text{Spec}(B'_i) \rightarrow \text{Spec}(B_i)$ is surjective we see that x^{-1} is then also in the radical of B_i . Thus we may assume that each B_i is a semi-local Dedekind domain.

If B_i is not local, then remove B_i from the list and add back the finite collection of local rings $(B_i)_{\mathfrak{m}}$. Thus we may assume that B_i is a discrete valuation ring for $i = 1, \dots, r$.

Let $v_i : K \rightarrow \mathbf{Z}$, $i = 1, \dots, r$ be the corresponding discrete valuations (see Algebra, Lemma 10.116.13). We are looking for a nonzero $x \in A$ with $v_i(x) < 0$ for $i = 1, \dots, r$. We will prove this by induction on r .

If $r = 1$ and the result is wrong, then $A \subset B$ and the map $A \otimes B \rightarrow K$ is not surjective, contradiction.

If $r > 1$, then by induction we can find a nonzero $x \in A$ such that $v_i(x) < 0$ for $i = 1, \dots, r - 1$. If $v_r(x) < 0$ then we are done, so we may assume $v_r(x) \geq 0$. By the base case we can find $y \in A$ nonzero such that $v_r(y) < 0$. After replacing x by a power we may assume that $v_i(x) < v_i(y)$ for $i = 1, \dots, r - 1$. Then $x + y$ is the element we are looking for. \square

Lemma 32.20.9. *Let A be a Noetherian local ring of dimension 1. Let $L = \prod A_{\mathfrak{p}}$ where the product is over the minimal primes of A . Let $a_1, a_2 \in \mathfrak{m}_A$ map to the same element of L . Then $a_1^n = a_2^n$ for some $n > 0$.*

Proof. Write $a_1 = a_2 + x$. Then x maps to zero in L . Hence x is a nilpotent element of A because $\bigcap \mathfrak{p}$ is the radical of (0) and the annihilator I of x contains a power of the maximal ideal because $\mathfrak{p} \notin V(I)$ for all minimal primes. Say $x^k = 0$ and $\mathfrak{m}^n \subset I$. Then

$$a_1^{k+n} = a_2^{k+n} + \binom{n+k}{1} a_2^{n+k-1} x + \binom{n+k}{2} a_2^{n+k-2} x^2 + \dots + \binom{n+k}{k-1} a_2^{n+1} x^{k-1} = a_2^{n+k}$$

because $a_2 \in \mathfrak{m}_A$. \square

Lemma 32.20.10. *Let A be a Noetherian local ring of dimension 1. Let $L = \prod A_{\mathfrak{p}}$ and $I = \bigcap \mathfrak{p}$ where the product and intersection are over the minimal primes of A . Let $f \in L$ be an element of the form $f = i + a$ where $a \in \mathfrak{m}_A$ and $i \in IL$. Then some power of f is in the image of $A \rightarrow L$.*

Proof. Since A is Noetherian we have $I^t = 0$ for some $t > 0$. Suppose that we know that $f = a + i$ with $i \in I^k L$. Then $f^n = a^n + na^{n-1}i \pmod{I^{k+1}L}$. Hence it suffices to show that $na^{n-1}i$ is in the image of $I^k \rightarrow I^k L$ for some $n \gg 0$. To see this, pick a $g \in A$ such that $\mathfrak{m}_A = \sqrt{(g)}$ (Algebra, Lemma 10.59.7). Then $L = A_g$ for example by Algebra, Proposition 10.59.6. On the other hand, there is an n such that $a^n \in (g)$. Hence we can clear denominators for elements of L by multiplying by a high power of a . \square

Lemma 32.20.11. *Let A be a Noetherian local ring of dimension 1. Let $L = \prod A_{\mathfrak{p}}$ where the product is over the minimal primes of A . Let $K \rightarrow L$ be an integral ring map. Then there exist $a \in \mathfrak{m}_A$ and $x \in K$ which map to the same element of L such that $\mathfrak{m}_A = \sqrt{(a)}$.*

Proof. By Lemma 32.20.10 we may replace A by $A/(\bigcap \mathfrak{p})$ and assume that A is a reduced ring (some details omitted). We may also replace K by the image of $K \rightarrow L$. Then K is a reduced ring. The map $\text{Spec}(L) \rightarrow \text{Spec}(K)$ is surjective and closed (details omitted). Hence $\text{Spec}(K)$ is a finite discrete space. It follows that K is a finite product of fields.

Let \mathfrak{p}_j , $j = 1, \dots, m$ be the minimal primes of A . Set $L_j = f.f.(A_j)$ so that $L = \prod_{j=1, \dots, m} L_j$. Let A_j be the normalization of A/\mathfrak{p}_j . Then A_j is a semi-local Dedekind domain with at least one maximal ideal, see Algebra, Lemma 10.116.14. Let n be the sum of the numbers of maximal ideals in A_1, \dots, A_m . For such a maximal ideal $\mathfrak{m} \subset A_j$ we consider the function

$$v_{\mathfrak{m}} : L \rightarrow L_j \rightarrow \mathbf{Z} \cup \{\infty\}$$

where the second arrow is the discrete valuation corresponding to the discrete valuation ring $(A_j)_{\mathfrak{m}}$ extended by mapping 0 to ∞ . In this way we obtain n functions $v_1, \dots, v_n : L \rightarrow \mathbf{Z} \cup \{\infty\}$. We will find an element $x \in K$ such that $v_i(x) < 0$ for all $i = 1, \dots, n$.

First we claim that for each i there exists an element $x \in K$ with $v_i(x) < 0$. Namely, suppose that v_i corresponds to $\mathfrak{m} \subset A_j$. If $v_i(x) \geq 0$ for all $x \in K$, then K maps into $(A_j)_{\mathfrak{m}}$ inside of $L_j = f.f.(A_j)$. The image of K in L_j is a field over L_j is algebraic by Algebra, Lemma 10.35.16. Combined we get a contradiction with Algebra, Lemma 10.48.7.

Suppose we have found an element $x \in K$ such that $v_1(x) < 0, \dots, v_r(x) < 0$ for some $r < n$. If $v_{r+1}(x) < 0$, then x works for $r + 1$. If not, then choose some $y \in K$ with $v_{r+1}(y) < 0$ as is possible by the result of the previous paragraph. After replacing x by x^n for some $n > 0$, we may assume $v_i(x) < v_i(y)$ for $i = 1, \dots, r$. Then $v_j(x+y) = v_j(x) < 0$ for $j = 1, \dots, r$ by properties of valuations and similarly $v_{r+1}(x+y) = v_{r+1}(y) < 0$. Arguing by induction, we find $x \in K$ with $v_i(x) < 0$ for $i = 1, \dots, n$.

In particular, the element $x \in K$ has nonzero projection in each factor of K (recall that K is a finite product of fields and if some component of x was zero, then one of the values $v_i(x)$ would be ∞). Hence x is invertible and $x^{-1} \in K$ is an element with $\infty > v_i(x^{-1}) > 0$ for all i . It follows from Lemma 32.20.5 that for some $e < 0$ the element $x^e \in K$ maps to an element of $\mathfrak{m}_A/\mathfrak{p}_j \subset A/\mathfrak{p}_j$ for all $j = 1, \dots, m$. Observe that the cokernel of the map $\mathfrak{m}_A \rightarrow \prod \mathfrak{m}_A/\mathfrak{p}_j$ is annihilated by a power of \mathfrak{m}_A . Hence after replacing e by a more negative e , we find an element $a \in \mathfrak{m}_A$

whose image in $\mathfrak{m}_A/\mathfrak{p}_j$ is equal to the image of x^e . The pair (a, x^e) satisfies the conclusions of the lemma. \square

Lemma 32.20.12. *Let A be a ring. Let $\mathfrak{p}_1, \dots, \mathfrak{p}_r$ be a finite set of a primes of A . Let $S = A \setminus \bigcup \mathfrak{p}_i$. Then S is a multiplicative system and $S^{-1}A$ is a semi-local ring whose maximal ideals correspond to the maximal elements of the set $\{\mathfrak{p}_i\}$.*

Proof. If $a, b \in A$ and $a, b \in S$, then $a, b \notin \mathfrak{p}_i$ hence $ab \notin \mathfrak{p}_i$, hence $ab \in S$. Also $1 \in S$. Thus S is a multiplicative subset of A . By the description of $\text{Spec}(S^{-1}A)$ in Algebra, Lemma 10.16.5 and by Algebra, Lemma 10.14.2 we see that the primes of $S^{-1}A$ correspond to the primes of A contained in one of the \mathfrak{p}_i . Hence the maximal ideals of $S^{-1}A$ correspond one-to-one with the maximal (w.r.t. inclusion) elements of the set $\{\mathfrak{p}_1, \dots, \mathfrak{p}_r\}$. \square

32.21. One dimensional Noetherian schemes

Some material leading up to a discussion of algebraic curves.

Lemma 32.21.1. *Let X be a scheme all of whose local rings are Noetherian of dimension ≤ 1 . Let $U \subset X$ be a retrocompact open. Denote $j : U \rightarrow X$ the inclusion morphism. Then $R^p j_* \mathcal{F} = 0$, $p > 0$ for every quasi-coherent \mathcal{O}_U -module \mathcal{F} .*

Proof. We may check the vanishing of $R^p j_* \mathcal{F}$ at stalks. Formation of $R^q j_*$ commutes with flat base change, see Cohomology of Schemes, Lemma 29.5.2. Thus we may assume that X is the spectrum of a Noetherian local ring of dimension ≤ 1 . In this case X has a closed points x and finitely many other points x_1, \dots, x_n which specialize to x but not each other (see Algebra, Lemma 10.30.6). If $x \in U$, then $U = X$ and the result is clear. If not, then $U = \{x_1, \dots, x_r\}$ for some r after possibly renumbering the points. Then U is affine (Schemes, Lemma 25.11.7). Thus the result by Cohomology of Schemes, Lemma 29.2.3. \square

Lemma 32.21.2. *Let X be an affine scheme all of whose local rings are Noetherian of dimension ≤ 1 . Then any quasi-compact open $U \subset X$ is affine.*

Proof. Denote $j : U \rightarrow X$ the inclusion morphism. Let \mathcal{F} be a quasi-coherent \mathcal{O}_U -module. By Lemma 32.21.1 the higher direct images $R^p j_* \mathcal{F}$ are zero. The \mathcal{O}_X -module $j_* \mathcal{F}$ is quasi-coherent (Schemes, Lemma 25.24.1). Hence it has vanishing higher cohomology groups by Cohomology of Schemes, Lemma 29.2.2. By the Leray spectral sequence Cohomology, Lemma 20.14.6 we have $H^p(U, \mathcal{F}) = 0$ for all $p > 0$. Thus U is affine, for example by Cohomology of Schemes, Lemma 29.3.1. \square

Lemma 32.21.3. *Let X be a scheme. Let $U \subset X$ be an open. Assume*

- (1) U is a retrocompact open of X ,
- (2) $X \setminus U$ is discrete, and
- (3) for $x \in X \setminus U$ the local ring $\mathcal{O}_{X,x}$ is Noetherian of dimension ≤ 1 .

Then (1) there exists an invertible \mathcal{O}_X -module \mathcal{L} and a section s such that $U = X_s$ and (2) the map $\text{Pic}(X) \rightarrow \text{Pic}(U)$ is surjective.

Proof. Let $X \setminus U = \{x_i; i \in I\}$. Choose affine opens $U_i \subset X$ with $x_i \in X$ and $x_j \notin U_i$ for $j \neq i$. This is possible by condition (2). Say $U_i = \text{Spec}(A_i)$. Let $\mathfrak{m}_i \subset A_i$ be the maximal ideal corresponding to x_i . By our assumption on the local rings there are only a finite number of prime ideals $\mathfrak{q} \subset \mathfrak{m}_i$, $\mathfrak{q} \neq \mathfrak{m}_i$ (see

Algebra, Lemma 10.30.6). Thus by prime avoidance (Algebra, Lemma 10.14.2) we can find $f_i \in \mathfrak{m}_i$ not contained in any of those primes. Then $V(f_i) = \{\mathfrak{m}_i\} \amalg Z_i$ for some closed subset $Z_i \subset U_i$ because Z_i is a retrocompact open subset of $V(f_i)$ closed under specialization, see Algebra, Lemma 10.40.7. After shrinking U_i we may assume $V(f_i) = \{x_i\}$. Then

$$\mathcal{U} : X = U \cup \bigcup U_i$$

is an open covering of X . Consider the 2-cocycle with values in \mathcal{O}_X^* given by f_i on $U \cap U_i$ and by f_i/f_j on $U_i \cap U_j$. This defines a line bundle \mathcal{L} such that the section s defined by 1 on U and f_i on U_i is as in the statement of the lemma.

Let \mathcal{N} be an invertible \mathcal{O}_U -module. Let N_i be the invertible $(A_i)_{f_i}$ module such that $\mathcal{N}|_{U \cap U_i}$ is equal to \tilde{N}_i . Observe that $(A_{\mathfrak{m}_i})_{f_i}$ is an Artinian ring (as a dimension zero Noetherian ring, see Algebra, Lemma 10.59.4). Thus it is a product of local rings (Algebra, Lemma 10.51.6) and hence has trivial Picard group. Thus, after shrinking U_i (i.e., after replacing A_i by $(A_i)_g$ for some $g \in A_i$, $g \notin \mathfrak{m}_i$) we can assume that $N_i = (A_i)_{f_i}$, i.e., that $\mathcal{N}|_{U \cap U_i}$ is trivial. In this case it is clear how to extend \mathcal{N} to an invertible sheaf over X (by extending it by a trivial invertible module over each U_i). \square

Lemma 32.21.4. *Let X be an integral separated scheme. Let $U \subset X$ be a nonempty affine open such that $X \setminus U$ is a finite set of points x_1, \dots, x_r with \mathcal{O}_{X, x_i} Noetherian of dimension 1. Then there exists a globally generated invertible \mathcal{O}_X -module \mathcal{L} and a section s such that $U = X_s$.*

Proof. Say $U = \text{Spec}(A)$ and let K be the fraction field of X . Write $B_i = \mathcal{O}_{X, x_i}$ and $\mathfrak{m}_i = \mathfrak{m}_{x_i}$. Since $x_i \notin U$ we see that the open $U \times_X \text{Spec}(B_i)$ of $\text{Spec}(B_i)$ has only one point, i.e., $U \times_X \text{Spec}(B_i) = \text{Spec}(K)$. Since X is separated, we find that $\text{Spec}(K)$ is a closed subscheme of $U \times \text{Spec}(B_i)$, i.e., the map $A \otimes B_i \rightarrow K$ is a surjection. By Lemma 32.20.8 we can find a nonzero $f \in A$ such that $f^{-1} \in \mathfrak{m}_i$ for $i = 1, \dots, r$. Pick opens $U_i \subset X$ such that $f^{-1} \in \mathcal{O}(U_i)$. Then

$$\mathcal{U} : X = U \cup \bigcup U_i$$

is an open covering of X . Consider the 2-cocycle with values in \mathcal{O}_X^* given by f on $U \cap U_i$ and by 1 on $U_i \cap U_j$. This defines a line bundle \mathcal{L} with two sections:

- (1) a section s defined by 1 on U and f^{-1} on U_i is as in the statement of the lemma, and
- (2) a section t defined by f on U and 1 on U_i .

Note that $X_t \supset U_1 \cup \dots \cup U_r$. Hence s, t generate \mathcal{L} and the lemma is proved. \square

Lemma 32.21.5. *Let X be a quasi-compact scheme. If for every $x \in X$ there exists a pair (\mathcal{L}, s) consisting of a globally generated invertible sheaf \mathcal{L} and a global section s such that $x \in X_s$ and X_s is affine, then X has an ample invertible sheaf.*

Proof. Since X is quasi-compact we can find a finite collection (\mathcal{L}_i, s_i) , $i = 1, \dots, n$ of pairs such that X_{s_i} is affine and $X = \bigcup X_{s_i}$. Again because X is quasi-compact we can find, for each i , a finite collection of sections $t_{i,j}$, $j = 1, \dots, m_i$ such that $X = \bigcup X_{t_{i,j}}$. Set $t_{i,0} = s_i$. Consider the invertible sheaf

$$\mathcal{L} = \mathcal{L}_1 \otimes_{\mathcal{O}_X} \dots \otimes_{\mathcal{O}_X} \mathcal{L}_n$$

and the global sections

$$\tau_J = t_{1,j_1} \otimes \dots \otimes t_{n,j_n}$$

By Properties, Lemma 27.24.4 the open X_{τ_J} is affine as soon as $j_i = 0$ for some i . It is a simple matter to see that these opens cover X . Hence \mathcal{L} is ample by definition. \square

Lemma 32.21.6. *Let X be a Noetherian integral separated scheme of dimension 1. Then X has an ample invertible sheaf.*

Proof. Choose an affine open covering $X = U_1 \cup \dots \cup U_n$. Since X is Noetherian, each of the sets $X \setminus U_i$ is finite. Thus by Lemma 32.21.4 we can find a pair (\mathcal{L}_i, s_i) consisting of a globally generated invertible sheaf \mathcal{L}_i and a global section s_i such that $U_i = X_{s_i}$. We conclude that X has an ample invertible sheaf by Lemma 32.21.5. \square

Lemma 32.21.7. *Let X be a scheme. Let $Z_1, \dots, Z_n \subset X$ be closed subschemes. Let \mathcal{L}_i be an invertible sheaf on Z_i . Assume that*

- (1) X is reduced,
- (2) $X = \bigcup Z_i$ set theoretically, and
- (3) $Z_i \cap Z_j$ is a discrete topological space for $i \neq j$.

Then there exists an invertible sheaf \mathcal{L} on X whose restriction to Z_i is \mathcal{L}_i . Moreover, if we are given sections $s_i \in \Gamma(Z_i, \mathcal{L}_i)$ which are nonvanishing at the points of $Z_i \cap Z_j$, then we can choose \mathcal{L} such that there exists a $s \in \Gamma(X, \mathcal{L})$ with $s|_{Z_i} = s_i$ for all i .

Proof. Set $T = \bigcup_{i \neq j} Z_i \cap Z_j$. As X is reduced we have

$$X \setminus T = \bigcup (Z_i \setminus T)$$

as schemes. Assumption (3) implies T is a discrete subset of X . Thus for each $t \in T$ we can find an open $U_t \subset X$ with $t \in U_t$ but $t' \notin U_t$ for $t' \in T$, $t' \neq t$. By shrinking U_t if necessary, we may assume that there exist isomorphisms $\varphi_{t,i} : \mathcal{L}_i|_{U_t \cap Z_i} \rightarrow \mathcal{O}_{U_t \cap Z_i}$. Furthermore, for each i choose an open covering

$$Z_i \setminus T = \bigcup_j U_{ij}$$

such that there exist isomorphisms $\varphi_{i,j} : \mathcal{L}_i|_{U_{ij}} \cong \mathcal{O}_{U_{ij}}$. Observe that

$$\mathcal{U} : X = \bigcup U_t \cup \bigcup U_{ij}$$

is an open covering of X . We claim that we can use the isomorphisms $\varphi_{t,i}$ and $\varphi_{i,j}$ to define a 2-cocycle with values in \mathcal{O}_X^* for this covering that defines \mathcal{L} as in the statement of the lemma.

Namely, if $i \neq i'$, then $U_{i,j} \cap U_{i',j'} = \emptyset$ and there is nothing to do. For $U_{i,j} \cap U_{i,j'}$ we have $\mathcal{O}_X(U_{i,j} \cap U_{i,j'}) = \mathcal{O}_{Z_i}(U_{i,j} \cap U_{i,j'})$ by the first remark of the proof. Thus the transition function for \mathcal{L}_i (more precisely $\varphi_{i,j} \circ \varphi_{i,j'}^{-1}$) defines the value of our cocycle on this intersection. For $U_t \cap U_{i,j}$ we can do the same thing as before. Finally, for $t \neq t'$ we have

$$U_t \cap U_{t'} = \coprod (U_t \cap U_{t'}) \cap Z_i$$

and moreover the intersections $U_t \cap U_{t'} \cap Z_i$ is contained in $Z_t \setminus T$. Hence by the same reasoning as before we see that

$$\mathcal{O}_X(U_t \cap U_{t'}) = \prod \mathcal{O}_{Z_i}(U_t \cap U_{t'} \cap Z_i)$$

and we can use the transition functions for \mathcal{L}_i (more precisely $\varphi_{t,i} \circ \varphi_{t',i}^{-1}$) to define the value of our cocycle on $U_t \cap U_{t'}$. This finishes the proof of existence of \mathcal{L} .

Given sections s_i as in the last assertion of the lemma, in the argument above, we choose U_t such that $s_i|_{U_t \cap Z_i}$ is nonvanishing and we choose $\varphi_{t,i}$ such that $\varphi_{t,i}(s_i|_{U_t \cap Z_i}) = 1$. Then using 1 over U_t and $\varphi_{i,j}(s_i|_{U_{i,j}})$ over $U_{i,j}$ will define a section of \mathcal{L} which restricts to s_i over Z_i . \square

Remark 32.21.8. Let A be a reduced ring. Let I, J be ideals of A such that $V(I) \cup V(J) = \text{Spec}(A)$. Set $B = A/J$. Then $I \rightarrow IB$ is an isomorphism of A -modules. Namely, we have $IB = I + J/J = I/(I \cap J)$ and $I \cap J$ is zero because A is reduced and $\text{Spec}(A) = V(I) \cup V(J) = V(I \cap J)$. Thus for any projective A -module P we also have $IP = I(P/J)$.

Lemma 32.21.9. *Let X be a Noetherian reduced separated scheme of dimension 1. Then X has an ample invertible sheaf.*

Proof. Let $Z_i, i = 1, \dots, n$ be the irreducible components of X . We view these as reduced closed subschemes of X . By Lemma 32.21.6 there exist ample invertible sheaves \mathcal{L}_i on Z_i . Set $T = \bigcup_{i \neq j} Z_i \cap Z_j$. As X is Noetherian of dimension 1, the set T is finite and consists of closed points of X . For each i we may, possibly after replacing \mathcal{L}_i by a power, choose $s_i \in \Gamma(Z_i, \mathcal{L}_i)$ such that $(Z_i)_{s_i}$ is affine and contains $T \cap Z_i$, see Properties, Lemma 27.27.6.

By Lemma 32.21.7 we can find an invertible sheaf \mathcal{L} on X and $s \in \Gamma(X, \mathcal{L})$ such that $(\mathcal{L}, s)|_{Z_i} = (\mathcal{L}_i, s_i)$. Observe that X_s contains T and is set theoretically equal to the affine closed subschemes $(Z_i)_{s_i}$. Thus it is affine by Limits, Lemma 31.10.3. To finish the proof, it suffices to find for every $x \in X, x \notin T$ an integer $m > 0$ and a section $t \in \Gamma(X, \mathcal{L}^{\otimes m})$ such that X_t is affine and $x \in X_t$. Since $x \notin T$ we see that $x \in Z_i$ for some unique i , say $i = 1$. Let $Z \subset X$ be the reduced closed subscheme whose underlying topological space is $Z_2 \cup \dots \cup Z_n$. Let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal sheaf of Z . Denote that $\mathcal{I}_1 \subset \mathcal{O}_{Z_1}$ the inverse image of this ideal sheaf under the inclusion morphism $Z_1 \rightarrow X$. Observe that

$$\Gamma(X, \mathcal{I}\mathcal{L}^{\otimes m}) = \Gamma(Z_1, \mathcal{I}_1\mathcal{L}_1^{\otimes m})$$

see Remark 32.21.8. Thus it suffices to find $m > 0$ and $t \in \Gamma(Z_1, \mathcal{I}_1\mathcal{L}_1^{\otimes m})$ with $x \in (Z_1)_t$ affine. Since \mathcal{L}_1 is ample and since x is not in $Z_1 \cap T = V(\mathcal{I}_1)$ we can find a section $t_1 \in \Gamma(Z_1, \mathcal{I}_1\mathcal{L}_1^{\otimes m_1})$ with $x \in (Z_1)_{t_1}$, see Properties, Proposition 27.24.14. Since \mathcal{L}_1 is ample we can find a section $t_2 \in \Gamma(Z_1, \mathcal{L}_1^{\otimes m_2})$ with $x \in (Z_1)_{t_2}$ and $(Z_1)_{t_2}$ affine, see Properties, Definition 27.24.1. Set $m = m_1 + m_2$ and $t = t_1 t_2$. Then $t \in \Gamma(Z_1, \mathcal{I}_1\mathcal{L}_1^{\otimes m})$ with $x \in (Z_1)_t$ by construction and $(Z_1)_t$ is affine by Properties, Lemma 27.24.4. \square

Lemma 32.21.10. *Let $i : Z \rightarrow X$ be a closed immersion of schemes inducing a homeomorphism on underlying topological spaces. If the underlying topological space of X is Noetherian and $\dim(X) \leq 1$, then $\text{Pic}(X) \rightarrow \text{Pic}(Z)$ is surjective.*

Proof. Consider the short exact sequence

$$0 \rightarrow (1 + \mathcal{I})^* \rightarrow \mathcal{O}_X^* \rightarrow \mathcal{O}_Z^* \rightarrow 0$$

of sheaves of abelian groups on X . Since $\dim(X) \leq 1$ we see that $H^2(X, \mathcal{F}) = 0$ for any abelian sheaf \mathcal{F} , see Cohomology, Proposition 20.21.6. Hence the map $H^1(X, \mathcal{O}_X^*) \rightarrow H^1(Z, \mathcal{O}_Z^*)$ is surjective. This proves the lemma by Cohomology, Lemma 20.6.1. \square

Proposition 32.21.11. *Let X be a Noetherian separated scheme of dimension 1. Then X has an ample invertible sheaf.*

Proof. Let $Z \subset X$ be the reduction of X . By Lemma 32.21.9 the scheme Z has an ample invertible sheaf. Thus by Lemma 32.21.10 there exists an invertible \mathcal{O}_X -module \mathcal{L} on X whose restriction to Z is ample. Then \mathcal{L} is ample by an application of Cohomology of Schemes, Lemma 29.14.5. \square

Remark 32.21.12. In fact, if X is a scheme whose reduction is a Noetherian separated scheme of dimension 1, then X has an ample invertible sheaf. The argument to prove this is the same as the proof of Proposition 32.21.11 except one uses Limits, Lemma 31.10.4 instead of Cohomology of Schemes, Lemma 29.14.5.

32.22. Finding affine opens

We continue the discussion started in Properties, Section 27.27. It turns out that we can find affines containing a finite given set of codimension 1 points on a separated scheme. See Proposition 32.22.7.

We will improve on the following lemma in Descent, Lemma 34.21.4.

Lemma 32.22.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let X^0 denote the set of generic points of irreducible components of X . If*

- (1) *f is separated,*
- (2) *there is an open covering $X = \bigcup U_i$ such that $f|_{U_i} : U_i \rightarrow X$ is an open immersion, and*
- (3) *if $\xi, \xi' \in X^0$, $\xi \neq \xi'$, then $f(\xi) \neq f(\xi')$,*

then f is an open immersion.

Proof. Suppose that $y = f(x) = f(x')$. Pick a specialization $y_0 \rightsquigarrow y$ where y_0 is a generic point of an irreducible component of Y . Since f is locally on the source an isomorphism we can pick specializations $x_0 \rightsquigarrow x$ and $x'_0 \rightsquigarrow x'$ mapping to $y_0 \rightsquigarrow y$. Note that $x_0, x'_0 \in X^0$. Hence $x_0 = x'_0$ by assumption (3). As f is separated we conclude that $x = x'$. Thus f is an open immersion. \square

Lemma 32.22.2. *Let $X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. If*

- (1) $\mathcal{O}_{X,x} = \mathcal{O}_{S,s}$,
- (2) X is reduced,
- (3) $X \rightarrow S$ is of finite type, and
- (4) S has finitely many irreducible components,

then there exists an open neighbourhood U of x such that $f|_U$ is an open immersion.

Proof. We may remove the (finitely many) irreducible components of S which do not contain s . We may replace S by an affine open neighbourhood of s . We may replace X by an affine open neighbourhood of x . Say $S = \text{Spec}(A)$ and $X = \text{Spec}(B)$. Let $\mathfrak{q} \subset B$, resp. $\mathfrak{p} \subset A$ be the prime ideal corresponding to x , resp. s . As A is a reduced and all of the minimal primes of A are contained in \mathfrak{p} we see that $A \subset A_{\mathfrak{p}}$. As $X \rightarrow S$ is of finite type, B is of finite type over A . Let $b_1, \dots, b_n \in B$ be elements which generate B over A . Since $A_{\mathfrak{p}} = B_{\mathfrak{q}}$ we can find $f \in A$, $f \notin \mathfrak{p}$ and $a_i \in A$ such that b_i and a_i/f have the same image in $B_{\mathfrak{q}}$. Thus we can find $g \in B$, $g \notin \mathfrak{q}$ such that $g(fb_i - a_i) = 0$ in B . It follows that the image of $A_f \rightarrow B_{fg}$ contains the images of b_1, \dots, b_n , in particular also the image of g . Choose $n \geq 0$ and $f' \in A$ such that f'/f^n maps to the image of g in B_{fg} . Since $A_{\mathfrak{p}} = B_{\mathfrak{q}}$ we see that $f' \notin \mathfrak{p}$. We conclude that $A_{ff'} \rightarrow B_{fg}$ is surjective. Finally, as $A_{ff'} \subset A_{\mathfrak{p}} = B_{\mathfrak{q}}$ (see above) the map $A_{ff'} \rightarrow B_{fg}$ is injective, hence an isomorphism. \square

Lemma 32.22.3. *Let $f : T \rightarrow X$ be a morphism of schemes. Let X^0 , resp. T^0 denote the sets of generic points of irreducible components. Let $t_1, \dots, t_m \in T$ be a finite set of points with images $x_j = f(t_j)$. If*

- (1) T is affine,
- (2) X is quasi-separated,
- (3) X^0 is finite
- (4) $f(T^0) \subset X^0$ and $f : T^0 \rightarrow X^0$ is injective, and
- (5) $\mathcal{O}_{X, x_j} = \mathcal{O}_{T, t_j}$,

then there exists an affine open of X containing x_1, \dots, x_r .

Proof. Using Limits, Proposition 31.10.2 there is an immediate reduction to the case where X and T are reduced. Details omitted.

Assume X and T are reduced. We may write $T = \lim_{i \in I} T_i$ as a directed limit of schemes of finite presentation over X with affine transition morphisms, see Limits, Lemma 31.6.1. Pick $i \in I$ such that T_i is affine, see Limits, Lemma 31.3.10. Say $T_i = \text{Spec}(R_i)$ and $T = \text{Spec}(R)$. Let $R' \subset R$ be the image of $R_i \rightarrow R$. Then $T' = \text{Spec}(R')$ is affine, reduced, of finite type over X , and $T \rightarrow T'$ dominant. For $j = 1, \dots, r$ let $t'_j \in T'$ be the image of t_j . Consider the local ring maps

$$\mathcal{O}_{X, x_j} \rightarrow \mathcal{O}_{T', t'_j} \rightarrow \mathcal{O}_{T, t_j}$$

Denote $(T')^0$ the set of generic points of irreducible components of T' . Let $\xi \rightsquigarrow t'_j$ be a specialization with $\xi \in (T')^0$. As $T \rightarrow T'$ is dominant we can choose $\eta \in T^0$ mapping to ξ (warning: a priori we do not know that η specializes to t_j). Assumption (3) applied to η tells us that the image θ of ξ in X corresponds to a minimal prime of \mathcal{O}_{X, x_j} . Lifting ξ via the isomorphism of (5) we obtain a specialization $\eta' \rightsquigarrow t_j$ with $\eta' \in X^0$ mapping to $\theta \rightsquigarrow x_j$. The injectivity of (4) shows that $\eta = \eta'$. Thus every minimal prime of \mathcal{O}_{T', t'_j} lies below a minimal prime of \mathcal{O}_{T, t_j} . We conclude that $\mathcal{O}_{T', t'_j} \rightarrow \mathcal{O}_{T, t_j}$ is injective, hence both maps above are isomorphisms.

By Lemma 32.22.2 there exists an open $U \subset T'$ containing all the points t'_j such that $U \rightarrow X$ is a local isomorphism as in Lemma 32.22.1. By that lemma we see that $U \rightarrow X$ is an open immersion. Finally, by Properties, Lemma 27.27.5 we can

find an open $W \subset U \subset T'$ containing all the t'_j . The image of W in X is the desired affine open. \square

Lemma 32.22.4. *Let X be an integral separated scheme. Let $x_1, \dots, x_r \in X$ be a finite set of points such that \mathcal{O}_{X, x_i} is Noetherian of dimension ≤ 1 . Then there exists an affine open subscheme of X containing all of x_1, \dots, x_r .*

Proof. Let K be the field of rational functions of X . Set $A_i = \mathcal{O}_{X, x_i}$. Then $A_i \subset K$ and K is the fraction field of A_i . Since X is separated, and $x_i \neq x_j$ there cannot be a valuation ring $\mathcal{O} \subset K$ dominating both A_i and A_j . Namely, considering the diagram

$$\begin{array}{ccc} \mathrm{Spec}(\mathcal{O}) & \longrightarrow & \mathrm{Spec}(A_1) \\ \downarrow & & \downarrow \\ \mathrm{Spec}(A_2) & \longrightarrow & X \end{array}$$

and applying the valuative criterion of separatedness (Schemes, Lemma 25.22.1) we would get $x_i = x_j$. Thus we see by Lemma 32.20.3 that $A_i \otimes A_j \rightarrow K$ is surjective for all $i \neq j$. By Lemma 32.20.7 we see that $A = A_1 \cap \dots \cap A_r$ is a Noetherian semi-local rings with exactly r maximal ideals $\mathfrak{m}_1, \dots, \mathfrak{m}_r$ such that $A_i = A_{\mathfrak{m}_i}$. Moreover,

$$\mathrm{Spec}(A) = \mathrm{Spec}(A_1) \cup \dots \cup \mathrm{Spec}(A_r)$$

is an open covering and the intersection of any two pieces of this covering is $\mathrm{Spec}(K)$. Thus the given morphisms $\mathrm{Spec}(A_i) \rightarrow X$ glue to a morphism of schemes

$$\mathrm{Spec}(A) \longrightarrow X$$

mapping \mathfrak{m}_i to x_i and inducing isomorphisms of local rings. Thus the result follows from Lemma 32.22.3. \square

Lemma 32.22.5. *Let A be a ring, $I \subset A$ an ideal, $\mathfrak{p}_1, \dots, \mathfrak{p}_r$ primes of A , and $\bar{f} \in A/I$ an element. If $I \not\subset \mathfrak{p}_i$ for all i , then there exists an $f \in A$, $f \notin \mathfrak{p}_i$ which maps to \bar{f} in A/I .*

Proof. We may assume there are no inclusion relations among the \mathfrak{p}_i (by removing the smaller primes). First pick any $f \in A$ lifting \bar{f} . Let S be the set $s \in \{1, \dots, r\}$ such that $f \in \mathfrak{p}_s$. If S is empty we are done. If not, consider the ideal $J = I \prod_{i \notin S} \mathfrak{p}_i$. Note that J is not contained in \mathfrak{p}_s for $s \in S$ because there are no inclusions among the \mathfrak{p}_i and because I is not contained in any \mathfrak{p}_i . Hence we can choose $g \in J$, $g \notin \mathfrak{p}_s$ for $s \in S$ by Algebra, Lemma 10.14.2. Then $f + g$ is a solution to the problem posed by the lemma. \square

Lemma 32.22.6. *Let X be a scheme. Let $T \subset X$ be finite set of points. Assume*

- (1) X has finitely many irreducible components Z_1, \dots, Z_t , and
- (2) $Z_i \cap T$ is contained in an affine open of the reduced induced subscheme corresponding to Z_i .

Then there exists an affine open subscheme of X containing T .

Proof. Using Limits, Proposition 31.10.2 there is an immediate reduction to the case where X is reduced. Details omitted. In the rest of the proof we endow every closed subset of X with the induced reduced closed subscheme structure.

We argue by induction that we can find an affine open $U \subset Z_1 \cup \dots \cup Z_r$ containing $T \cap (Z_1 \cup \dots \cup Z_r)$. For $r = 1$ this holds by assumption. Say $r > 1$ and let $U \subset Z_1 \cup \dots \cup Z_{r-1}$ be an affine open containing $T \cap (Z_1 \cup \dots \cup Z_{r-1})$. Let $V \subset X_r$ be an affine open containing $T \cap Z_r$ (exists by assumption). Then $U \cap V$ contains $T \cap (Z_1 \cup \dots \cup Z_{r-1}) \cap Z_r$. Hence

$$\Delta = (U \cap Z_r) \setminus (U \cap V)$$

does not contain any element of T . Note that Δ is a closed subset of U . By prime avoidance (Algebra, Lemma 10.14.2), we can find a standard open U' of U containing $T \cap U$ and avoiding Δ , i.e., $U' \cap Z_r \subset U \cap V$. After replacing U by U' we may assume that $U \cap V$ is closed in U .

Using that by the same arguments as above also the set $\Delta' = (U \cap (Z_1 \cup \dots \cup Z_{r-1})) \setminus (U \cap V)$ does not contain any element of T we find a $h \in \mathcal{O}(V)$ such that $D(h) \subset V$ contains $T \cap V$ and such that $U \cap D(h) \subset U \cap V$. Using that $U \cap V$ is closed in U we can use Lemma 32.22.5 to find an element $g \in \mathcal{O}(U)$ whose restriction to $U \cap V$ equals the restriction of h to $U \cap V$ and such that $T \cap U \subset D(g)$. Then we can replace U by $D(g)$ and V by $D(h)$ to reach the situation where $U \cap V$ is closed in both U and V . In this case the scheme $U \cup V$ is affine by Limits, Lemma 31.10.3. This proves the induction step and thereby the lemma. \square

Here is a conclusion we can draw from the material above.

Proposition 32.22.7. *Let X be a separated scheme such that every quasi-compact open has a finite number of irreducible components. Let $x_1, \dots, x_r \in X$ be points such that \mathcal{O}_{X, x_i} is Noetherian of dimension ≤ 1 . Then there exists an affine open subscheme of X containing all of x_1, \dots, x_r .*

Proof. We can replace X by a quasi-compact open containing x_1, \dots, x_r hence we may assume that X has finitely many irreducible components. By Lemma 32.22.6 we reduce to the case where X is integral. This case is Lemma 32.22.4. \square

32.23. Curves

In the stacks project we will use the following as our definition of a curve.

Definition 32.23.1. Let k be a field. A *curve* is a variety of dimension 1 over k .

Two standard examples of curves over k are the affine line \mathbf{A}_k^1 and the projective line \mathbf{P}_k^1 . The scheme $X = \text{Spec}(k[x, y]/(f))$ is a curve if and only if $f \in k[x, y]$ is irreducible.

Our definition of a curve has the same problems as our definition of a variety, see the discussion following Definition 32.3.1. Moreover, it means that every curve comes with a specified field of definition. For example $X = \text{Spec}(\mathbf{C}[x])$ is a curve over \mathbf{C} but we can also view it as a curve over \mathbf{R} . The scheme $\text{Spec}(\mathbf{Z})$ isn't a curve, even though the schemes $\text{Spec}(\mathbf{Z})$ and $\mathbf{A}_{\mathbf{F}_p}^1$ behave similarly in many respects.

Lemma 32.23.2. *Let X be an irreducible scheme of dimension > 0 over a field k . Let $x \in X$ be a closed point. The open subscheme $X \setminus \{x\}$ is not proper over k .*

Proof. Namely, choose a specialization $x' \rightsquigarrow x$ with $x' \neq x$ (for example take x' to be the generic point). By Schemes, Lemma 25.20.4 there exists a morphism $\text{Spec}(A) \rightarrow X$ where A is a valuation ring such that the generic point of A maps to x'

and the closed point of $\text{Spec}(A)$ maps to x . Clearly the morphism $\text{Spec}(f.f.(A)) \rightarrow X \setminus \{x\}$ does not extend to a morphism $\text{Spec}(A) \rightarrow X \setminus \{x\}$. Hence the valuative criterion (Schemes, Proposition 25.20.6) shows that $X \rightarrow \text{Spec}(k)$ is not universally closed, hence not proper. \square

Lemma 32.23.3. *Let X be a separated finite type scheme over a field k . If $\dim(X) \leq 1$ then X is H -quasi-projective over k .*

Proof. By Proposition 32.21.11 the scheme X has an ample invertible sheaf \mathcal{L} . By Morphisms, Lemma 28.40.3 we see that X is isomorphic to a locally closed subscheme of \mathbf{P}_k^n over $\text{Spec}(k)$. This is the definition of being H -quasi-projective over k , see Morphisms, Definition 28.41.1. \square

Lemma 32.23.4. *Let X be a proper scheme over a field k . If $\dim(X) \leq 1$ then X is H -projective over k .*

Proof. By Lemma 32.23.3 we see that X is a locally closed subscheme of \mathbf{P}_k^n for some field k . Since X is proper over k it follows that X is a closed subscheme of \mathbf{P}_k^n (Morphisms, Lemma 28.42.7). \square

Observe that if an affine scheme X over k is proper over k then X is finite over k (Morphisms, Lemma 28.44.7) and hence has dimension 0 (Algebra, Lemma 10.51.2 and Proposition 10.59.6). Hence a scheme of dimension > 0 over k cannot be both affine and proper over k . Thus the possibilities in the following lemma are mutually exclusive.

Lemma 32.23.5. *Let X be a curve over k . Then either X is an affine scheme or X is H -projective over k .*

Proof. By Lemma 32.23.3 we may assume X is a locally closed subscheme of \mathbf{P}_k^n for some n . Let $\bar{X} \subset \mathbf{P}_k^n$ be the scheme theoretic image of $X \rightarrow \mathbf{P}_k^n$, see Morphisms, Definition 28.6.2 and the description in Morphisms, Lemma 28.7.7. Since X is irreducible, we see that \bar{X} is irreducible. Then $\dim(X) = 1 \Rightarrow \dim(\bar{X}) = 1$ for example by looking at the generic point, see Lemma 32.13.3. As \bar{X} is Noetherian, it then follows that $\bar{X} \setminus X = \{x_1, \dots, x_n\}$ is a finite set of closed points. By Lemma 32.21.4 we can find a globally generated invertible sheaf \mathcal{L} on \bar{X} and a section $s \in \Gamma(\bar{X}, \mathcal{L})$ such that $X = \bar{X}_s$.

Choose a basis $s = s_0, s_1, \dots, s_m$ of the finite dimensional k -vector space $\Gamma(\bar{X}, \mathcal{L})$ (Cohomology of Schemes, Lemma 29.17.4). We obtain a corresponding morphism

$$f : \bar{X} \rightarrow \mathbf{P}_k^m$$

such that the inverse image of $D_+(T_0)$ is X , see Constructions, Lemma 26.13.1. In particular, f is non-constant, i.e., $\text{Im}(f)$ has more than one point. A topological argument shows that f maps the generic point η of \bar{X} to a nonclosed point of \mathbf{P}_k^m . Hence if $y \in \mathbf{P}_k^m$ is a closed point, then $f^{-1}(\{y\})$ is a closed set of \bar{X} not containing η , hence finite. By Cohomology of Schemes, Lemma 29.19.2² we conclude that f is finite. Hence $X = f^{-1}(D_+(T_0))$ is affine. \square

²One can avoid using this lemma which relies on the theorem of formal functions. Namely, \bar{X} is projective hence it suffices to show a proper morphism $f : X \rightarrow Y$ with finite fibres between quasi-projective schemes over k is finite. To do this, one chooses an affine open of X containing the fibre of f over a point y using that any finite set of points of a quasi-projective scheme over k is contained in an affine. Shrinking Y to a small affine neighbourhood of y one reduces to the case of a proper morphism between affines. Such a morphism is finite by Morphisms, Lemma 28.44.7.

The following lemma combined with Lemma 32.23.2 tells us that given a separated scheme of finite type over k , then $X \setminus Z$ is affine, whenever the closed subset Z meets every irreducible component of X .

Lemma 32.23.6. *Let X be a separated scheme of finite type over k . If $\dim(X) \leq 1$ and no irreducible component of X is proper of dimension 1, then X is affine.*

Proof. Let $X = \bigcup X_i$ be the decomposition of X into irreducible components. We think of X_i as an integral scheme (using the reduced induced scheme structure, see Schemes, Definition 25.12.5). In particular X_i is a singleton (hence affine) or a curve hence affine by Lemma 32.23.5. Then $\coprod X_i \rightarrow X$ is finite surjective and $\coprod X_i$ is affine. Thus we see that X is affine by Cohomology of Schemes, Lemma 29.13.3. \square

32.24. Generically finite morphisms

In this section we revisit the notion of a generically finite morphism of schemes as studied in Morphisms, Section 28.47.

Lemma 32.24.1. *Let $f : X \rightarrow Y$ be locally of finite type. Let $y \in Y$ be a point such that $\mathcal{O}_{Y,y}$ is Noetherian of dimension ≤ 1 . Assume in addition one of the following conditions is satisfied*

- (1) *for every generic point η of an irreducible component of X the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),*
- (2) *for every generic point η of an irreducible component of X such that $f(\eta) \rightsquigarrow y$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),*
- (3) *f is quasi-finite at every generic point of an irreducible component of X ,*
- (4) *Y is locally Noetherian and f is quasi-finite at a dense set of points of X ,*
- (5) *add more here.*

Then f is quasi-finite at every point of X lying over y .

Proof. Condition (4) implies X is locally Noetherian (Morphisms, Lemma 28.16.6). The set of points at which morphism is quasi-finite is open (Morphisms, Lemma 28.49.2). A dense open of a locally Noetherian scheme contains all generic point of irreducible components, hence (4) implies (3). Condition (3) implies condition (1) by Morphisms, Lemma 28.21.5. Condition (1) implies condition (2). Thus it suffices to prove the lemma in case (2) holds.

Assume (2) holds. Recall that $\text{Spec}(\mathcal{O}_{Y,y})$ is the set of points of Y specializing to y , see Schemes, Lemma 25.13.2. Combined with Morphisms, Lemma 28.21.13 this shows we may replace Y by $\text{Spec}(\mathcal{O}_{Y,y})$. Thus we may assume $Y = \text{Spec}(B)$ where B is a Noetherian local ring of dimension ≤ 1 and y is the closed point.

Let $X = \bigcup X_i$ be the irreducible components of X viewed as reduced closed subschemes. If we can show each fibre $X_{i,y}$ is a discrete space, then $X_y = \bigcup X_{i,y}$ is discrete as well and we conclude that $X \rightarrow Y$ is quasi-finite at all points of X_y by Morphisms, Lemma 28.21.6. Thus we may assume X is an integral scheme.

If $X \rightarrow Y$ maps the generic point η of X to y , then X is the spectrum of a finite extension of $\kappa(y)$ and the result is true. Assume that X maps η to a point corresponding to a minimal prime \mathfrak{p} of B different from \mathfrak{m}_B . We obtain a factorization

$X \rightarrow \text{Spec}(B/\mathfrak{q}) \rightarrow \text{Spec}(B)$. Let $x \in X$ be a point lying over y . By the dimension formula (Morphisms, Lemma 28.31.1) we have

$$\dim(\mathcal{O}_{X,x}) \leq \dim(B/\mathfrak{q}) + \text{trdeg}_{\kappa(\mathfrak{q})}(R(X)) - \text{trdeg}_{\kappa(y)}\kappa(x)$$

We know that $\dim(B/\mathfrak{q}) = 1$, that the generic point of X is not equal to x and specializes to x and that $R(X)$ is algebraic over $\kappa(\mathfrak{q})$. Thus we get

$$1 \leq 1 - \text{trdeg}_{\kappa(y)}\kappa(x)$$

Hence every point x of X_y is closed in X_y by Morphisms, Lemma 28.21.2 and hence $X \rightarrow Y$ is quasi-finite at every point x of X_y by Morphisms, Lemma 28.21.6 (which also implies that X_y is a discrete topological space). \square

Lemma 32.24.2. *Let $f : X \rightarrow Y$ be a proper morphism. Let $y \in Y$ be a point such that $\mathcal{O}_{Y,y}$ is Noetherian of dimension ≤ 1 . Assume in addition one of the following conditions is satisfied*

- (1) *for every generic point η of an irreducible component of X the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),*
- (2) *for every generic point η of an irreducible component of X such that $f(\eta) \rightsquigarrow y$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),*
- (3) *f is quasi-finite at every generic point of X ,*
- (4) *Y is locally Noetherian and f is quasi-finite at a dense set of points of X ,*
- (5) *add more here.*

Then there exists an open neighbourhood $V \subset Y$ of y such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. By Lemma 32.24.1 the morphism f is quasi-finite at every point of the fibre X_y . Hence X_y is a discrete topological space (Morphisms, Lemma 28.21.6). As f is proper the fibre X_y is quasi-compact, i.e., finite. Thus we can apply Cohomology of Schemes, Lemma 29.19.2 to conclude. \square

Topologies on Schemes

33.1. Introduction

In this document we explain what the different topologies on the category of schemes are. Some references are [Gro71] and [BLR90]. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 7.6.2) which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

33.2. The general procedure

In this section we explain a general procedure for producing the sites we will be working with. Suppose we want to study sheaves over schemes with respect to some topology τ . In order to get a site, as in Sites, Definition 7.6.2, of schemes with that topology we have to do some work. Namely, we cannot simply say “consider all schemes with the Zariski topology” since that would give a “big” category. Instead, in each section of this chapter we will proceed as follows:

- (1) We define a class Cov_τ of coverings of schemes satisfying the axioms of Sites, Definition 7.6.2. It will always be the case that a Zariski open covering of a scheme is a covering for τ .
- (2) We single out a notion of standard τ -covering within the category of affine schemes.
- (3) We define what is an “absolute” big τ -site Sch_τ . These are the sites one gets by appropriately choosing a set of schemes and a set of coverings.
- (4) For any object S of Sch_τ we define the big τ -site $(Sch/S)_\tau$ and for suitable τ the small¹ τ -site S_τ .
- (5) In addition there is a site $(Aff/S)_\tau$ using the notion of standard τ -covering of affines whose category of sheaves is equivalent to the category of sheaves on $(Sch/S)_\tau$.

The above is a little clumsy in that we do not end up with a canonical choice for the big τ -site of a scheme, or even the small τ -site of a scheme. If you are willing to ignore set theoretic difficulties, then you can work with classes and end up with canonical big and small sites...

¹The words big and small here do not relate to bigness/smallness of the corresponding categories.

33.3. The Zariski topology

Definition 33.3.1. Let T be a scheme. A *Zariski covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is an open immersion and such that $T = \bigcup f_i(T_i)$.

This defines a (proper) class of coverings. Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.

Lemma 33.3.2. *Let T be a scheme.*

- (1) *If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is a Zariski covering of T .*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering and for each i we have a Zariski covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a Zariski covering.*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is a Zariski covering.*

Proof. Omitted. □

Lemma 33.3.3. *Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be a Zariski covering of T . Then there exists a Zariski covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is a standard open of T , see Schemes, Definition 25.5.2. Moreover, we may choose each U_j to be an open of one of the T_i .*

Proof. Follows as T is quasi-compact and standard opens form a basis for its topology. This is also proved in Schemes, Lemma 25.5.1. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 33.3.4. Compare Schemes, Definition 25.5.2. Let T be an affine scheme. A *standard Zariski covering* of T is a Zariski covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ with each $U_j \rightarrow T$ inducing an isomorphism with a standard affine open of T .

Definition 33.3.5. A *big Zariski site* is any site Sch_{Zar} as in Sites, Definition 7.6.2 constructed as follows:

- (1) Choose any set of schemes S_0 , and any set of Zariski coverings Cov_0 among these schemes.
- (2) As underlying category of Sch_{Zar} take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0 .
- (3) As coverings of Sch_{Zar} choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of Zariski coverings, and the set Cov_0 chosen above.

It is shown in Sites, Lemma 7.8.6 that, after having chosen the category Sch_α , the category of sheaves on Sch_α does not depend on the choice of coverings chosen in (3) above. In other words, the topos $Sh(Sch_{Zar})$ only depends on the choice of the category Sch_α . It is shown in Sets, Lemma 3.9.9 that these categories are closed under many constructions of algebraic geometry, e.g., fibre products and taking open and closed subschemes. We can also show that the exact choice of Sch_α does not matter too much, see Section 33.10.

Another approach would be to assume the existence of a strongly inaccessible cardinal and to define Sch_{Zar} to be the category of schemes contained in a chosen universe with set of coverings the Zariski coverings contained in that same universe.

Before we continue with the introduction of the big Zariski site of a scheme S , let us point out that the topology on a big Zariski site Sch_{Zar} is in some sense induced from the Zariski topology on the category of all schemes.

Lemma 33.3.6. *Let Sch_{Zar} be a big Zariski site as in Definition 33.3.5. Let $T \in \text{Ob}(Sch_{Zar})$. Let $\{T_i \rightarrow T\}_{i \in I}$ be an arbitrary Zariski covering of T . There exists a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} which is tautologically equivalent (see Sites, Definition 7.8.2) to $\{T_i \rightarrow T\}_{i \in I}$.*

Proof. Since each $T_i \rightarrow T$ is an open immersion, we see by Sets, Lemma 3.9.9 that each T_i is isomorphic to an object V_i of Sch_{Zar} . The covering $\{V_i \rightarrow T\}_{i \in I}$ is tautologically equivalent to $\{T_i \rightarrow T\}_{i \in I}$ (using the identity map on I both ways). Moreover, $\{V_i \rightarrow T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.11.1. \square

Definition 33.3.7. Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S .

- (1) The *big Zariski site of S* , denoted $(Sch/S)_{Zar}$, is the site Sch_{Zar}/S introduced in Sites, Section 7.24.
- (2) The *small Zariski site of S* , which we denote S_{Zar} , is the full subcategory of $(Sch/S)_{Zar}$ whose objects are those U/S such that $U \rightarrow S$ is an open immersion. A covering of S_{Zar} is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{Zar}$ with $U \in \text{Ob}(S_{Zar})$.
- (3) The *big affine Zariski site of S* , denoted $(Aff/S)_{Zar}$, is the full subcategory of $(Sch/S)_{Zar}$ whose objects are affine U/S . A covering of $(Aff/S)_{Zar}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{Zar}$ which is a standard Zariski covering.

It is not completely clear that the small Zariski site and the big affine Zariski site are sites. We check this now.

Lemma 33.3.8. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S . Both S_{Zar} and $(Aff/S)_{Zar}$ are sites.*

Proof. Let us show that S_{Zar} is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 7.6.2. Since $(Sch/S)_{Zar}$ is a site, it suffices to prove that given any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{Zar}$ with $U \in \text{Ob}(S_{Zar})$ we also have $U_i \in \text{Ob}(S_{Zar})$. This follows from the definitions as the composition of open immersions is an open immersion.

Let us show that $(Aff/S)_{Zar}$ is a site. Reasoning as above, it suffices to show that the collection of standard Zariski coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. Let R be a ring. Let $f_1, \dots, f_n \in R$ generate the unit ideal. For each $i \in \{1, \dots, n\}$ let $g_{i1}, \dots, g_{in_i} \in R_{f_i}$ be elements generating the unit ideal of R_{f_i} . Write $g_{ij} = f_{ij}/f_i^{e_{ij}}$ which is possible. After replacing f_{ij} by $f_i f_{ij}$ if necessary, we have that $D(f_{ij}) \subset D(f_i) \cong \text{Spec}(R_{f_i})$ is equal to $D(g_{ij}) \subset \text{Spec}(R_{f_i})$. Hence we see that the family of morphisms $\{D(g_{ij}) \rightarrow \text{Spec}(R)\}$ is a standard Zariski covering. From these considerations it follows that (2) holds for standard Zariski coverings. We omit the verification of (1) and (3). \square

Lemma 33.3.9. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S . The underlying categories of the sites Sch_{Zar} , $(Sch/S)_{Zar}$, S_{Zar} , and $(Aff/S)_{Zar}$ have fibre products. In each case the obvious functor into the category Sch of all*

schemes commutes with taking fibre products. The categories $(Sch/S)_{Zar}$, and S_{Zar} both have a final object, namely S/S .

Proof. For Sch_{Zar} it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S$, $V \rightarrow U$, $W \rightarrow U$ morphisms of schemes with $U, V, W \in \text{Ob}(Sch_{Zar})$. The fibre product $V \times_U W$ in Sch_{Zar} is a fibre product in Sch and is the fibre product of V/S with W/S over U/S in the category of all schemes over S , and hence also a fibre product in $(Sch/S)_{Zar}$. This proves the result for $(Sch/S)_{Zar}$. If $U \rightarrow S$, $V \rightarrow U$ and $W \rightarrow U$ are open immersions then so is $V \times_U W \rightarrow S$ and hence we get the result for S_{Zar} . If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{Zar}$. \square

Next, we check that the big affine site defines the same topos as the big site.

Lemma 33.3.10. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S . The functor $(Aff/S)_{Zar} \rightarrow (Sch/S)_{Zar}$ is a special cocontinuous functor. Hence it induces an equivalence of topoi from $Sh((Aff/S)_{Zar})$ to $Sh((Sch/S)_{Zar})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) – (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u : (Aff/S)_{Zar} \rightarrow (Sch/S)_{Zar}$. Being cocontinuous just means that any Zariski covering of T/S , T affine, can be refined by a standard Zariski covering of T . This is the content of Lemma 33.3.3. Hence (1) holds. We see u is continuous simply because a standard Zariski covering is a Zariski covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. \square

Let us check that the notion of a sheaf on the small Zariski site corresponds to notion of a sheaf on S .

Lemma 33.3.11. *The category of sheaves on S_{Zar} is equivalent to the category of sheaves on the underlying topological space of S .*

Proof. We will use repeatedly that for any object U/S of S_{Zar} the morphism $U \rightarrow S$ is an isomorphism onto an open subscheme. Let \mathcal{F} be a sheaf on S . Then we define a sheaf on S_{Zar} by the rule $\mathcal{F}'(U/S) = \mathcal{F}(\text{Im}(U \rightarrow S))$. For the converse, we choose for every open subscheme $U \subset S$ an object $U'/S \in \text{Ob}(S_{Zar})$ with $\text{Im}(U' \rightarrow S) = U$ (here you have to use Sets, Lemma 3.9.9). Given a sheaf \mathcal{G} on S_{Zar} we define a sheaf on S by setting $\mathcal{G}(U) = \mathcal{G}(U'/S)$. To see that \mathcal{G}' is a sheaf we use that for any open covering $U = \bigcup_{i \in I} U_i$ the covering $\{U_i \rightarrow U\}_{i \in I}$ is combinatorially equivalent to a covering $\{U'_j \rightarrow U'\}_{j \in J}$ in S_{Zar} by Sets, Lemma 3.11.1, and we use Sites, Lemma 7.8.4. Details omitted. \square

From now on we will not make any distinction between a sheaf on S_{Zar} or a sheaf on S . We will always use the procedures of the proof of the lemma to go between the two notions. Next, we establish some relationships between the topoi associated to these sites.

Lemma 33.3.12. *Let Sch_{Zar} be a big Zariski site. Let $f : T \rightarrow S$ be a morphism in Sch_{Zar} . The functor $T_{Zar} \rightarrow (Sch/S)_{Zar}$ is cocontinuous and induces a morphism of topoi*

$$i_f : Sh(T_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

For a sheaf \mathcal{G} on $(Sch/S)_{Zar}$ we have the formula $(i_f^{-1}\mathcal{G})(U/T) = \mathcal{G}(U/S)$. The functor i_f^{-1} also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u : T_{Zar} \rightarrow (Sch/S)_{Zar}$. In other words, given an open immersion $j : U \rightarrow T$ corresponding to an object of T_{Zar} we set $u(U \rightarrow T) = (f \circ j : U \rightarrow S)$. This functor commutes with fibre products, see Lemma 33.3.9. Moreover, T_{Zar} has equalizers (as any two morphisms with the same source and target are the same) and u commutes with them. It is clearly cocontinuous. It is also continuous as u transforms coverings to coverings and commutes with fibre products. Hence the lemma follows from Sites, Lemmas 7.20.5 and 7.20.6. \square

Lemma 33.3.13. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S . The inclusion functor $S_{Zar} \rightarrow (Sch/S)_{Zar}$ satisfies the hypotheses of Sites, Lemma 7.20.8 and hence induces a morphism of sites*

$$\pi_S : (Sch/S)_{Zar} \longrightarrow S_{Zar}$$

and a morphism of topoi

$$i_S : Sh(S_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

such that $\pi_S \circ i_S = id$. Moreover, $i_S = i_{id_S}$ with i_{id_S} as in Lemma 33.3.12. In particular the functor $i_S^{-1} = \pi_{S,*}$ is described by the rule $i_S^{-1}(\mathcal{G})(U/S) = \mathcal{G}(U/S)$.

Proof. In this case the functor $u : S_{Zar} \rightarrow (Sch/S)_{Zar}$, in addition to the properties seen in the proof of Lemma 33.3.12 above, also is fully faithful and transforms the final object into the final object. The lemma follows. \square

Definition 33.3.14. In the situation of Lemma 33.3.13 the functor $i_S^{-1} = \pi_{S,*}$ is often called the *restriction to the small Zariski site*, and for a sheaf \mathcal{F} on the big Zariski site we denote $\mathcal{F}|_{S_{Zar}}$ this restriction.

With this notation in place we have for a sheaf \mathcal{F} on the big site and a sheaf \mathcal{G} on the small site that

$$\begin{aligned} \text{Mor}_{Sh(S_{Zar})}(\mathcal{F}|_{S_{Zar}}, \mathcal{G}) &= \text{Mor}_{Sh((Sch/S)_{Zar})}(\mathcal{F}, i_{S,*}\mathcal{G}) \\ \text{Mor}_{Sh(S_{Zar})}(\mathcal{G}, \mathcal{F}|_{S_{Zar}}) &= \text{Mor}_{Sh((Sch/S)_{Zar})}(\pi_S^{-1}\mathcal{G}, \mathcal{F}) \end{aligned}$$

Moreover, we have $(i_{S,*}\mathcal{G})|_{S_{Zar}} = \mathcal{G}$ and we have $(\pi_S^{-1}\mathcal{G})|_{S_{Zar}} = \mathcal{G}$.

Lemma 33.3.15. *Let Sch_{Zar} be a big Zariski site. Let $f : T \rightarrow S$ be a morphism in Sch_{Zar} . The functor*

$$u : (Sch/T)_{Zar} \longrightarrow (Sch/S)_{Zar}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{Zar} \longrightarrow (Sch/T)_{Zar}, \quad (U \rightarrow S) \longmapsto (U \times_S T \rightarrow T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big,!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers (details omitted; compare with proof of Lemma 33.3.12). Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big}!$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $\text{Mor}_S(u(U), V) = \text{Mor}_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 7.21.1 and 7.21.2 to get the formula for $f_{big,*}$. \square

Lemma 33.3.16. *Let Sch_{Zar} be a big Zariski site. Let $f : T \rightarrow S$ be a morphism in Sch_{Zar} .*

- (1) *We have $i_f = f_{big} \circ i_T$ with i_f as in Lemma 33.3.12 and i_T as in Lemma 33.3.13.*
- (2) *The functor $S_{Zar} \rightarrow T_{Zar}, (U \rightarrow S) \mapsto (U \times_S T \rightarrow T)$ is continuous and induces a morphism of topoi*

$$f_{small} : Sh(T_{Zar}) \longrightarrow Sh(S_{Zar}).$$

The functors f_{small}^{-1} and $f_{small,}$ agree with the usual notions f^{-1} and f_* if we identify sheaves on T_{Zar} , resp. S_{Zar} with sheaves on T , resp. S via Lemma 33.3.11.*

- (3) *We have a commutative diagram of morphisms of sites*

$$\begin{array}{ccc} T_{Zar} & \xleftarrow{\pi_T} & (Sch/T)_{Zar} \\ f_{small} \downarrow & & \downarrow f_{big} \\ S_{Zar} & \xleftarrow{\pi_S} & (Sch/S)_{Zar} \end{array}$$

so that $f_{small} \circ \pi_T = \pi_S \circ f_{big}$ as morphisms of topoi.

- (4) *We have $f_{small} = \pi_S \circ f_{big} \circ i_T = \pi_S \circ i_f$.*

Proof. The equality $i_f = f_{big} \circ i_T$ follows from the equality $i_f^{-1} = i_T^{-1} \circ f_{big}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

Statement (2): See Sites, Example 7.15.2.

Part (3) follows because π_S and π_T are given by the inclusion functors and f_{small} and f_{big} by the base change functor $U \mapsto U \times_S T$.

Statement (4) follows from (3) by precomposing with i_T . \square

In the situation of the lemma, using the terminology of Definition 33.3.14 we have: for \mathcal{F} a sheaf on the big Zariski site of T

$$(f_{big,*}\mathcal{F})|_{S_{Zar}} = f_{small,*}(\mathcal{F}|_{T_{Zar}}),$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small Zariski site of T , resp. S is given by $\pi_{T,*}$, resp. $\pi_{S,*}$. A similar formula involving pullbacks and restrictions is false.

Lemma 33.3.17. *Given schemes X, Y, Z in $(Sch/S)_{Zar}$ and morphisms $f : X \rightarrow Y, g : Y \rightarrow Z$ we have $g_{big} \circ f_{big} = (g \circ f)_{big}$ and $g_{small} \circ f_{small} = (g \circ f)_{small}$.*

Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.3.15. For the functors on the small sites this is Sheaves, Lemma 6.21.2 via the identification of Lemma 33.3.11. \square

We can think about a sheaf on the big Zariski site of S as a collection of “usual” sheaves on all schemes over S .

Lemma 33.3.18. *Let S be a scheme contained in a big Zariski site Sch_{Zar} . A sheaf \mathcal{F} on the big Zariski site $(Sch/S)_{Zar}$ is given by the following data:*

- (1) for every $T/S \in \text{Ob}((Sch/S)_{Zar})$ a sheaf \mathcal{F}_T on T ,
- (2) for every $f : T' \rightarrow T$ in $(Sch/S)_{Zar}$ a map $c_f : f^{-1}\mathcal{F}_T \rightarrow \mathcal{F}_{T'}$.

These data are subject to the following conditions:

- (i) given any $f : T' \rightarrow T$ and $g : T'' \rightarrow T'$ in $(Sch/S)_{Zar}$ the composition $g^{-1}c_f \circ c_g$ is equal to $c_{f \circ g}$, and
- (ii) if $f : T' \rightarrow T$ in $(Sch/S)_{Zar}$ is an open immersion then c_f is an isomorphism.

Proof. Given a sheaf \mathcal{F} on $Sh((Sch/S)_{Zar})$ we set $\mathcal{F}_T = i_p^{-1}\mathcal{F}$ where $p : T \rightarrow S$ is the structure morphism. Note that $\mathcal{F}_T(U) = \mathcal{F}(U'/S)$ for any open $U \subset T$, and $U' \rightarrow T$ an open immersion in $(Sch/T)_{Zar}$ with image U , see Lemmas 33.3.11 and 33.3.12. Hence given $f : T' \rightarrow T$ over S and $U, U' \rightarrow T$ we get a canonical map $\mathcal{F}_T(U) = \mathcal{F}(U'/S) \rightarrow \mathcal{F}(U' \times_T T'/S) = \mathcal{F}_{T'}(f^{-1}(U))$ where the middle is the restriction map of \mathcal{F} with respect to the morphism $U' \times_T T' \rightarrow U'$ over S . The collection of these maps are compatible with restrictions, and hence define an f -map c_f from \mathcal{F}_T to $\mathcal{F}_{T'}$, see Sheaves, Definition 6.21.7 and the discussion surrounding it. It is clear that $c_{f \circ g}$ is the composition of c_f and c_g , since composition of restriction maps of \mathcal{F} gives restriction maps.

Conversely, given a system (\mathcal{F}_T, c_f) as in the lemma we may define a presheaf \mathcal{F} on $Sh((Sch/S)_{Zar})$ by simply setting $\mathcal{F}(T/S) = \mathcal{F}_T(T)$. As restriction mapping, given $f : T' \rightarrow T$ we set for $s \in \mathcal{F}(T)$ the pullback $f^*(s)$ equal to $c_f(s)$ (where we think of c_f as an f -map again). The condition on the c_f guarantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse. \square

33.4. The étale topology

Let S be a scheme. We would like to define the étale-topology on the category of schemes over S . According to our general principle we first introduce the notion of an étale covering.

Definition 33.4.1. Let T be a scheme. An *étale covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is étale and such that $T = \bigcup f_i(T_i)$.

Lemma 33.4.2. *Any Zariski covering is an étale covering.*

Proof. This is clear from the definitions and the fact that an open immersion is an étale morphism, see Morphisms, Lemma 28.37.9. \square

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.

Lemma 33.4.3. *Let T be a scheme.*

- (1) *If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is an étale covering of T .*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is an étale covering and for each i we have an étale covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an étale covering.*

- (3) If $\{T_i \rightarrow T\}_{i \in I}$ is an étale covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is an étale covering.

Proof. Omitted. \square

Lemma 33.4.4. Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be an étale covering of T . Then there exists an étale covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i .

Proof. Omitted. \square

Thus we define the corresponding standard coverings of affines as follows.

Definition 33.4.5. Let T be an affine scheme. A *standard étale covering* of T is a family $\{f_j : U_j \rightarrow T\}_{j=1, \dots, m}$ with each U_j is affine and étale over T and $T = \bigcup f_j(U_j)$.

In the definition above we do **not** assume the morphisms f_j are standard étale. The reason is that if we did then the standard étale coverings would not define a site on Aff/S , for example because of Algebra, Lemma 10.138.15 part (4). On the other hand, an étale morphism of affines is automatically standard smooth, see Algebra, Lemma 10.138.2. Hence a standard étale covering is a standard smooth covering and a standard syntomic covering.

Definition 33.4.6. A *big étale site* is any site $Sch_{\text{étale}}$ as in Sites, Definition 7.6.2 constructed as follows:

- (1) Choose any set of schemes S_0 , and any set of étale coverings Cov_0 among these schemes.
- (2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0 .
- (3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of étale coverings, and the set Cov_0 chosen above.

See the remarks following Definition 33.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big étale site of a scheme S , let us point out that the topology on a big étale site $Sch_{\text{étale}}$ is in some sense induced from the étale topology on the category of all schemes.

Lemma 33.4.7. Let $Sch_{\text{étale}}$ be a big étale site as in Definition 33.4.6. Let $T \in \text{Ob}(Sch_{\text{étale}})$. Let $\{T_i \rightarrow T\}_{i \in I}$ be an arbitrary étale covering of T .

- (1) There exists a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site $Sch_{\text{étale}}$ which refines $\{T_i \rightarrow T\}_{i \in I}$.
- (2) If $\{T_i \rightarrow T\}_{i \in I}$ is a standard étale covering, then it is tautologically equivalent to a covering in $Sch_{\text{étale}}$.
- (3) If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in $Sch_{\text{étale}}$.

Proof. For each i choose an affine open covering $T_i = \bigcup_{j \in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T . By Lemma 33.4.3 the refinement $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an étale covering of T as well. Hence we may assume each

T_i is affine, and maps into an affine open W_i of T . Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar} . But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \rightarrow T\}_{i \in I}$ refines $\{T_i \rightarrow T\}_{i \in I}$ (because they are isomorphic). Moreover, $\{V_i \rightarrow T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \rightarrow T\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of $Sch_{\acute{e}tale}$ by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. \square

Definition 33.4.8. Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big étale site containing S .

- (1) The *big étale site of S* , denoted $(Sch/S)_{\acute{e}tale}$, is the site $Sch_{\acute{e}tale}/S$ introduced in Sites, Section 7.24.
- (2) The *small étale site of S* , which we denote $S_{\acute{e}tale}$, is the full subcategory of $(Sch/S)_{\acute{e}tale}$ whose objects are those U/S such that $U \rightarrow S$ is étale. A covering of $S_{\acute{e}tale}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{\acute{e}tale}$ with $U \in \text{Ob}(S_{\acute{e}tale})$.
- (3) The *big affine étale site of S* , denoted $(Aff/S)_{\acute{e}tale}$, is the full subcategory of $(Sch/S)_{\acute{e}tale}$ whose objects are affine U/S . A covering of $(Aff/S)_{\acute{e}tale}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{\acute{e}tale}$ which is a standard étale covering.

It is not completely clear that the big affine étale site or the small étale site are sites. We check this now.

Lemma 33.4.9. Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big étale site containing S . Both $S_{\acute{e}tale}$ and $(Aff/S)_{\acute{e}tale}$ are sites.

Proof. Let us show that $S_{\acute{e}tale}$ is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 7.6.2. Since $(Sch/S)_{\acute{e}tale}$ is a site, it suffices to prove that given any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{\acute{e}tale}$ with $U \in \text{Ob}(S_{\acute{e}tale})$ we also have $U_i \in \text{Ob}(S_{\acute{e}tale})$. This follows from the definitions as the composition of étale morphisms is an étale morphism.

Let us show that $(Aff/S)_{\acute{e}tale}$ is a site. Reasoning as above, it suffices to show that the collection of standard étale coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. This is clear since for example, given a standard étale covering $\{T_i \rightarrow T\}_{i \in I}$ and for each i we have a standard étale covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a standard étale covering because $\bigcup_{i \in I} J_i$ is finite and each T_{ij} is affine. \square

Lemma 33.4.10. Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big étale site containing S . The underlying categories of the sites $Sch_{\acute{e}tale}$, $(Sch/S)_{\acute{e}tale}$, $S_{\acute{e}tale}$, and $(Aff/S)_{\acute{e}tale}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The categories $(Sch/S)_{\acute{e}tale}$, and $S_{\acute{e}tale}$ both have a final object, namely S/S .

Proof. For $Sch_{\acute{e}tale}$ it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S$, $V \rightarrow U$, $W \rightarrow U$ morphisms of schemes with $U, V, W \in \text{Ob}(Sch_{\acute{e}tale})$. The fibre product $V \times_U W$ in $Sch_{\acute{e}tale}$ is a fibre product in Sch and is the fibre product of V/S with W/S over U/S in the category of all schemes over S , and

hence also a fibre product in $(Sch/S)_{\acute{e}tale}$. This proves the result for $(Sch/S)_{\acute{e}tale}$. If $U \rightarrow S, V \rightarrow U$ and $W \rightarrow U$ are étale then so is $V \times_U W \rightarrow S$ and hence we get the result for $S_{\acute{e}tale}$. If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{\acute{e}tale}$. \square

Next, we check that the big affine site defines the same topos as the big site.

Lemma 33.4.11. *Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big étale site containing S . The functor $(Aff/S)_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{\acute{e}tale})$ to $Sh((Sch/S)_{\acute{e}tale})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) – (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u : (Aff/S)_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$. Being cocontinuous just means that any étale covering of $T/S, T$ affine, can be refined by a standard étale covering of T . This is the content of Lemma 33.4.4. Hence (1) holds. We see u is continuous simply because a standard étale covering is a étale covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. \square

Next, we establish some relationships between the topoi associated to these sites.

Lemma 33.4.12. *Let $Sch_{\acute{e}tale}$ be a big étale site. Let $f : T \rightarrow S$ be a morphism in $Sch_{\acute{e}tale}$. The functor $T_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$ is cocontinuous and induces a morphism of topoi*

$$i_f : Sh(T_{\acute{e}tale}) \longrightarrow Sh((Sch/S)_{\acute{e}tale})$$

For a sheaf \mathcal{G} on $(Sch/S)_{\acute{e}tale}$ we have the formula $(i_f^{-1}\mathcal{G})(U/T) = \mathcal{G}(U/S)$. The functor i_f^{-1} also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u : T_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$. In other words, given an étale morphism $j : U \rightarrow T$ corresponding to an object of $T_{\acute{e}tale}$ we set $u(U \rightarrow T) = (f \circ j : U \rightarrow S)$. This functor commutes with fibre products, see Lemma 33.4.10. Let $a, b : U \rightarrow V$ be two morphisms in $T_{\acute{e}tale}$. In this case the equalizer of a and b (in the category of schemes) is

$$V \times_{\Delta_{V/T}, V \times_T V, (a,b)} U \times_T U$$

which is a fibre product of schemes étale over T , hence étale over T . Thus $T_{\acute{e}tale}$ has equalizers and u commutes with them. It is clearly cocontinuous. It is also continuous as u transforms coverings to coverings and commutes with fibre products. Hence the Lemma follows from Sites, Lemmas 7.20.5 and 7.20.6. \square

Lemma 33.4.13. *Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big étale site containing S . The inclusion functor $S_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$ satisfies the hypotheses of Sites, Lemma 7.20.8 and hence induces a morphism of sites*

$$\pi_S : (Sch/S)_{\acute{e}tale} \longrightarrow S_{\acute{e}tale}$$

and a morphism of topoi

$$i_S : Sh(S_{\acute{e}tale}) \longrightarrow Sh((Sch/S)_{\acute{e}tale})$$

such that $\pi_S \circ i_S = id$. Moreover, $i_S = i_{id_S}$ with i_{id_S} as in Lemma 33.4.12. In particular the functor $i_S^{-1} = \pi_{S,*}$ is described by the rule $i_S^{-1}(\mathcal{G})(U/S) = \mathcal{G}(U/S)$.

Proof. In this case the functor $u : S_{\acute{e}tale} \rightarrow (Sch/S)_{\acute{e}tale}$, in addition to the properties seen in the proof of Lemma 33.4.12 above, also is fully faithful and transforms the final object into the final object. The lemma follows from Sites, Lemma 7.20.8. \square

Definition 33.4.14. In the situation of Lemma 33.4.13 the functor $i_S^{-1} = \pi_{S,*}$ is often called the *restriction to the small étale site*, and for a sheaf \mathcal{F} on the big étale site we denote $\mathcal{F}|_{S_{\acute{e}tale}}$ this restriction.

With this notation in place we have for a sheaf \mathcal{F} on the big site and a sheaf \mathcal{G} on the big site that

$$\begin{aligned} \text{Mor}_{Sh(S_{\acute{e}tale})}(\mathcal{F}|_{S_{\acute{e}tale}}, \mathcal{G}) &= \text{Mor}_{Sh((Sch/S)_{\acute{e}tale})}(\mathcal{F}, i_{S,*}\mathcal{G}) \\ \text{Mor}_{Sh(S_{\acute{e}tale})}(\mathcal{G}, \mathcal{F}|_{S_{\acute{e}tale}}) &= \text{Mor}_{Sh((Sch/S)_{\acute{e}tale})}(\pi_S^{-1}\mathcal{G}, \mathcal{F}) \end{aligned}$$

Moreover, we have $(i_{S,*}\mathcal{G})|_{S_{\acute{e}tale}} = \mathcal{G}$ and we have $(\pi_S^{-1}\mathcal{G})|_{S_{\acute{e}tale}} = \mathcal{G}$.

Lemma 33.4.15. *Let $Sch_{\acute{e}tale}$ be a big étale site. Let $f : T \rightarrow S$ be a morphism in $Sch_{\acute{e}tale}$. The functor*

$$u : (Sch/T)_{\acute{e}tale} \longrightarrow (Sch/S)_{\acute{e}tale}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{\acute{e}tale} \longrightarrow (Sch/T)_{\acute{e}tale}, \quad (U \rightarrow S) \longmapsto (U \times_S T \rightarrow T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{\acute{e}tale}) \longrightarrow Sh((Sch/S)_{\acute{e}tale})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big}!$ which commutes with fibre products and equalizers.*

Proof. The functor u is cocontinuous, continuous and commutes with fibre products and equalizers (details omitted; compare with the proof of Lemma 33.4.12). Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big}!$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $\text{Mor}_S(u(U), V) = \text{Mor}_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 7.21.1 and 7.21.2 to get the formula for $f_{big,*}$. \square

Lemma 33.4.16. *Let $Sch_{\acute{e}tale}$ be a big étale site. Let $f : T \rightarrow S$ be a morphism in $Sch_{\acute{e}tale}$.*

- (1) *We have $i_f = f_{big} \circ i_T$ with i_f as in Lemma 33.4.12 and i_T as in Lemma 33.4.13.*
- (2) *The functor $S_{\acute{e}tale} \rightarrow T_{\acute{e}tale}$, $(U \rightarrow S) \mapsto (U \times_S T \rightarrow T)$ is continuous and induces a morphism of topoi*

$$f_{small} : Sh(T_{\acute{e}tale}) \longrightarrow Sh(S_{\acute{e}tale}).$$

We have $f_{small,}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$.*

- (3) *We have a commutative diagram of morphisms of sites*

$$\begin{array}{ccc} T_{\acute{e}tale} & \xleftarrow{\pi_T} & (Sch/T)_{\acute{e}tale} \\ f_{small} \downarrow & & \downarrow f_{big} \\ S_{\acute{e}tale} & \xleftarrow{\pi_S} & (Sch/S)_{\acute{e}tale} \end{array}$$

so that $f_{small} \circ \pi_T = \pi_S \circ f_{big}$ as morphisms of topoi.

(4) We have $f_{small} = \pi_S \circ f_{big} \circ i_T = \pi_S \circ i_f$.

Proof. The equality $i_f = f_{big} \circ i_T$ follows from the equality $i_f^{-1} = i_T^{-1} \circ f_{big}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

The functor $u : S_{\acute{e}tale} \rightarrow T_{\acute{e}tale}$, $u(U \rightarrow S) = (U \times_S T \rightarrow T)$ transforms coverings into coverings and commutes with fibre products, see Lemma 33.4.3 (3) and 33.4.10. Moreover, both $S_{\acute{e}tale}$, $T_{\acute{e}tale}$ have final objects, namely S/S and T/T and $u(S/S) = T/T$. Hence by Sites, Proposition 7.15.6 the functor u corresponds to a morphism of sites $T_{\acute{e}tale} \rightarrow S_{\acute{e}tale}$. This in turn gives rise to the morphism of topoi, see Sites, Lemma 7.16.2. The description of the pushforward is clear from these references.

Part (3) follows because π_S and π_T are given by the inclusion functors and f_{small} and f_{big} by the base change functors $U \mapsto U \times_S T$.

Statement (4) follows from (3) by precomposing with i_T . \square

In the situation of the lemma, using the terminology of Definition 33.4.14 we have: for \mathcal{F} a sheaf on the big étale site of T

$$(f_{big,*}\mathcal{F})|_{S_{\acute{e}tale}} = f_{small,*}(\mathcal{F}|_{T_{\acute{e}tale}}),$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small étale site of T , resp. S is given by $\pi_{T,*}$, resp. $\pi_{S,*}$. A similar formula involving pullbacks and restrictions is false.

Lemma 33.4.17. *Given schemes X, Y, Z in $Sch_{\acute{e}tale}$ and morphisms $f : X \rightarrow Y$, $g : Y \rightarrow Z$ we have $g_{big} \circ f_{big} = (g \circ f)_{big}$ and $g_{small} \circ f_{small} = (g \circ f)_{small}$.*

Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.4.15. For the functors on the small sites this follows from the description of the pushforward functors in Lemma 33.4.16. \square

We can think about a sheaf on the big étale site of S as a collection of “usual” sheaves on all schemes over S .

Lemma 33.4.18. *Let S be a scheme contained in a big étale site $Sch_{\acute{e}tale}$. A sheaf \mathcal{F} on the big étale site $(Sch/S)_{\acute{e}tale}$ is given by the following data:*

- (1) for every $T/S \in \text{Ob}((Sch/S)_{\acute{e}tale})$ a sheaf \mathcal{F}_T on $T_{\acute{e}tale}$,
- (2) for every $f : T' \rightarrow T$ in $(Sch/S)_{\acute{e}tale}$ a map $c_f : f_{small}^{-1}\mathcal{F}_T \rightarrow \mathcal{F}_{T'}$.

These data are subject to the following conditions:

- (i) given any $f : T' \rightarrow T$ and $g : T'' \rightarrow T'$ in $(Sch/S)_{\acute{e}tale}$ the composition $g_{small}^{-1}c_f \circ c_g$ is equal to $c_{f \circ g}$, and
- (ii) if $f : T' \rightarrow T$ in $(Sch/S)_{\acute{e}tale}$ is étale then c_f is an isomorphism.

Proof. Given a sheaf \mathcal{F} on $Sh((Sch/S)_{\acute{e}tale})$ we set $\mathcal{F}_T = i_p^{-1}\mathcal{F}$ where $p : T \rightarrow S$ is the structure morphism. Note that $\mathcal{F}_T(U) = \mathcal{F}(U/S)$ for any $U \rightarrow T$ in $T_{\acute{e}tale}$ see Lemma 33.4.12. Hence given $f : T' \rightarrow T$ over S and $U \rightarrow T$ we get a canonical map $\mathcal{F}_T(U) = \mathcal{F}(U/S) \rightarrow \mathcal{F}(U \times_T T'/S) = \mathcal{F}_{T'}(U \times_T T')$ where the middle is the restriction map of \mathcal{F} with respect to the morphism $U \times_T T' \rightarrow U$ over S . The collection of these maps are compatible with restrictions, and hence define a map $c'_f : \mathcal{F}_T \rightarrow f_{small,*}\mathcal{F}_{T'}$ where $u : T_{\acute{e}tale} \rightarrow T'_{\acute{e}tale}$ is the base change functor associated to f . By adjunction of $f_{small,*}$ (see Sites, Section 7.14) with f_{small}^{-1} this

is the same as a map $c_f : f_{small}^{-1}\mathcal{F}_T \rightarrow \mathcal{F}_{T'}$. It is clear that $c'_{f \circ g}$ is the composition of c'_f and $f_{small,*}c'_g$, since composition of restriction maps of \mathcal{F} gives restriction maps, and this gives the desired relationship among c_f , c_g and $c_{f \circ g}$.

Conversely, given a system (\mathcal{F}_T, c_f) as in the lemma we may define a presheaf \mathcal{F} on $Sh((Sch/S)_{\acute{e}tale})$ by simply setting $\mathcal{F}(T/S) = \mathcal{F}_T(T)$. As restriction mapping, given $f : T' \rightarrow T$ we set for $s \in \mathcal{F}(T)$ the pullback $f^*(s)$ equal to $c_f(s)$ where we think of c_f as a map $\mathcal{F}_T \rightarrow f_{small,*}\mathcal{F}_{T'}$ again. The condition on the c_f guarantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse. \square

33.5. The smooth topology

In this section we define the smooth topology. This is a bit pointless as it will turn out later (see More on Morphisms, Section 36.28) that this topology defines the same topos as the étale topology. But still it makes sense and it is used occasionally.

Definition 33.5.1. Let T be a scheme. An *smooth covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is smooth and such that $T = \bigcup f_i(T_i)$.

Lemma 33.5.2. Any étale covering is a smooth covering, and a fortiori, any Zariski covering is a smooth covering.

Proof. This is clear from the definitions, the fact that an étale morphism is smooth see Morphisms, Definition 28.37.1 and Lemma 33.4.2. \square

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.

Lemma 33.5.3. Let T be a scheme.

- (1) If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is a smooth covering of T .
- (2) If $\{T_i \rightarrow T\}_{i \in I}$ is a smooth covering and for each i we have a smooth covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a smooth covering.
- (3) If $\{T_i \rightarrow T\}_{i \in I}$ is a smooth covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is a smooth covering.

Proof. Omitted. \square

Lemma 33.5.4. Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be a smooth covering of T . Then there exists a smooth covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is an affine scheme, and such that each morphism $U_j \rightarrow T$ is standard smooth, see Morphisms, Definition 28.35.1. Moreover, we may choose each U_j to be open affine in one of the T_i .

Proof. Omitted, but see Algebra, Lemma 10.132.10. \square

Thus we define the corresponding standard coverings of affines as follows.

Definition 33.5.5. Let T be an affine scheme. A *standard smooth covering* of T is a family $\{f_j : U_j \rightarrow T\}_{j=1, \dots, m}$ with each U_j is affine, $U_j \rightarrow T$ standard smooth and $T = \bigcup f_j(U_j)$.

Definition 33.5.6. A *big smooth site* is any site Sch_{smooth} as in Sites, Definition 7.6.2 constructed as follows:

- (1) Choose any set of schemes S_0 , and any set of smooth coverings Cov_0 among these schemes.
- (2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0 .
- (3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of smooth coverings, and the set Cov_0 chosen above.

See the remarks following Definition 33.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big smooth site of a scheme S , let us point out that the topology on a big smooth site Sch_{smooth} is in some sense induced from the smooth topology on the category of all schemes.

Lemma 33.5.7. *Let Sch_{smooth} be a big smooth site as in Definition 33.5.6. Let $T \in \text{Ob}(Sch_{smooth})$. Let $\{T_i \rightarrow T\}_{i \in I}$ be an arbitrary smooth covering of T .*

- (1) *There exists a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{smooth} which refines $\{T_i \rightarrow T\}_{i \in I}$.*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is a standard smooth covering, then it is tautologically equivalent to a covering of Sch_{smooth} .*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch_{smooth} .*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j \in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T . By Lemma 33.5.3 the refinement $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a smooth covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T . Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar} . But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \rightarrow T\}_{i \in I}$ refines $\{T_i \rightarrow T\}_{i \in I}$ (because they are isomorphic). Moreover, $\{V_i \rightarrow T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \rightarrow T\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{smooth} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. \square

Definition 33.5.8. Let S be a scheme. Let Sch_{smooth} be a big smooth site containing S .

- (1) The *big smooth site of S* , denoted $(Sch/S)_{smooth}$, is the site Sch_{smooth}/S introduced in Sites, Section 7.24.
- (2) The *big affine smooth site of S* , denoted $(Aff/S)_{smooth}$, is the full subcategory of $(Sch/S)_{smooth}$ whose objects are affine U/S . A covering of $(Aff/S)_{smooth}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{smooth}$ which is a standard smooth covering.

Next, we check that the big affine site defines the same topos as the big site.

Lemma 33.5.9. *Let S be a scheme. Let $Sch_{\acute{e}tale}$ be a big smooth site containing S . The functor $(Aff/S)_{smooth} \rightarrow (Sch/S)_{smooth}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{smooth})$ to $Sh((Sch/S)_{smooth})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) – (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u : (Aff/S)_{smooth} \rightarrow (Sch/S)_{smooth}$. Being cocontinuous just means that any smooth covering of T/S , T affine, can be refined by a standard smooth covering of T . This is the content of Lemma 33.5.4. Hence (1) holds. We see u is continuous simply because a standard smooth covering is a smooth covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. \square

To be continued...

Lemma 33.5.10. *Let Sch_{smooth} be a big smooth site. Let $f : T \rightarrow S$ be a morphism in Sch_{smooth} . The functor*

$$u : (Sch/T)_{smooth} \longrightarrow (Sch/S)_{smooth}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{smooth} \longrightarrow (Sch/T)_{smooth}, \quad (U \rightarrow S) \longmapsto (U \times_S T \rightarrow T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{smooth}) \longrightarrow Sh((Sch/S)_{smooth})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big}!$ which commutes with fibre products and equalizers.*

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big}!$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $\text{Mor}_S(u(U), V) = \text{Mor}_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 7.21.1 and 7.21.2 to get the formula for $f_{big,*}$. \square

33.6. The syntomic topology

In this section we define the syntomic topology. This topology is quite interesting in that it often has the same cohomology groups as the fppf topology but is technically easier to deal with.

Definition 33.6.1. Let T be a scheme. An *syntomic covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is syntomic and such that $T = \bigcup f_i(T_i)$.

Lemma 33.6.2. *Any smooth covering is a syntomic covering, and a fortiori, any étale or Zariski covering is a syntomic covering.*

Proof. This is clear from the definitions and the fact that a smooth morphism is syntomic, see Morphisms, Lemma 28.35.7 and Lemma 33.5.2. \square

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.

Lemma 33.6.3. *Let T be a scheme.*

- (1) *If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is an syntomic covering of T .*

- (2) If $\{T_i \rightarrow T\}_{i \in I}$ is a syntomic covering and for each i we have a syntomic covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a syntomic covering.
- (3) If $\{T_i \rightarrow T\}_{i \in I}$ is a syntomic covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is a syntomic covering.

Proof. Omitted. □

Lemma 33.6.4. *Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be a syntomic covering of T . Then there exists a syntomic covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is an affine scheme, and such that each morphism $U_j \rightarrow T$ is standard syntomic, see Morphisms, Definition 28.32.1. Moreover, we may choose each U_j to be open affine in one of the T_i .*

Proof. Omitted, but see Algebra, Lemma 10.131.15. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 33.6.5. Let T be an affine scheme. A *standard syntomic covering* of T is a family $\{f_j : U_j \rightarrow T\}_{j=1, \dots, m}$ with each U_j is affine, $U_j \rightarrow T$ standard syntomic and $T = \bigcup f_j(U_j)$.

Definition 33.6.6. A *big syntomic site* is any site Sch_{syntomic} as in Sites, Definition 7.6.2 constructed as follows:

- (1) Choose any set of schemes S_0 , and any set of syntomic coverings Cov_0 among these schemes.
- (2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0 .
- (3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of syntomic coverings, and the set Cov_0 chosen above.

See the remarks following Definition 33.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big syntomic site of a scheme S , let us point out that the topology on a big syntomic site Sch_{syntomic} is in some sense induced from the syntomic topology on the category of all schemes.

Lemma 33.6.7. *Let Sch_{syntomic} be a big syntomic site as in Definition 33.6.6. Let $T \in \text{Ob}(Sch_{\text{syntomic}})$. Let $\{T_i \rightarrow T\}_{i \in I}$ be an arbitrary syntomic covering of T .*

- (1) *There exists a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{syntomic} which refines $\{T_i \rightarrow T\}_{i \in I}$.*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is a standard syntomic covering, then it is tautologically equivalent to a covering in Sch_{syntomic} .*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in Sch_{syntomic} .*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j \in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T . By Lemma 33.6.3 the refinement $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an syntomic covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T . Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar} . But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application

of Sets, Lemma 3.9.9. The covering $\{V_i \rightarrow T\}_{i \in I}$ refines $\{T_i \rightarrow T\}_{i \in I}$ (because they are isomorphic). Moreover, $\{V_i \rightarrow T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \rightarrow T\}_{j \in J}$ is a covering as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{Zar} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. \square

Definition 33.6.8. Let S be a scheme. Let $Sch_{syntomic}$ be a big syntomic site containing S .

- (1) The *big syntomic site of S* , denoted $(Sch/S)_{syntomic}$, is the site $Sch_{syntomic}/S$ introduced in Sites, Section 7.24.
- (2) The *big affine syntomic site of S* , denoted $(Aff/S)_{syntomic}$, is the full subcategory of $(Sch/S)_{syntomic}$ whose objects are affine U/S . A covering of $(Aff/S)_{syntomic}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{syntomic}$ which is a standard syntomic covering.

Next, we check that the big affine site defines the same topos as the big site.

Lemma 33.6.9. *Let S be a scheme. Let $Sch_{syntomic}$ be a big syntomic site containing S . The functor $(Aff/S)_{syntomic} \rightarrow (Sch/S)_{syntomic}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{syntomic})$ to $Sh((Sch/S)_{syntomic})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) – (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u : (Aff/S)_{syntomic} \rightarrow (Sch/S)_{syntomic}$. Being cocontinuous just means that any syntomic covering of T/S , T affine, can be refined by a standard syntomic covering of T . This is the content of Lemma 33.6.4. Hence (1) holds. We see u is continuous simply because a standard syntomic covering is a syntomic covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. \square

To be continued...

Lemma 33.6.10. *Let $Sch_{syntomic}$ be a big syntomic site. Let $f : T \rightarrow S$ be a morphism in $Sch_{syntomic}$. The functor*

$$u : (Sch/T)_{syntomic} \longrightarrow (Sch/S)_{syntomic}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{syntomic} \longrightarrow (Sch/T)_{syntomic}, \quad (U \rightarrow S) \longmapsto (U \times_S T \rightarrow T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{syntomic}) \longrightarrow Sh((Sch/S)_{syntomic})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big}!$ which commutes with fibre products and equalizers.*

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big}!$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 7.21.1 and 7.21.2 to get the formula for $f_{big,*}$. \square

33.7. The fppf topology

Let S be a scheme. We would like to define the fppf-topology² on the category of schemes over S . According to our general principle we first introduce the notion of an fppf-covering.

Definition 33.7.1. Let T be a scheme. An *fppf covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is flat, locally of finite presentation and such that $T = \bigcup f_i(T_i)$.

Lemma 33.7.2. *Any syntomic covering is an fppf covering, and a fortiori, any smooth, étale, or Zariski covering is an fppf covering.*

Proof. This is clear from the definitions, the fact that a syntomic morphism is flat and locally of finite presentation, see Morphisms, Lemmas 28.32.6 and 28.32.7, and Lemma 33.6.2. \square

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.

Lemma 33.7.3. *Let T be a scheme.*

- (1) *If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is an fppf covering of T .*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is an fppf covering and for each i we have an fppf covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an fppf covering.*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is an fppf covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is an fppf covering.*

Proof. The first assertion is clear. The second follows as the composition of flat morphisms is flat (see Morphisms, Lemma 28.26.5) and the composition of morphisms of finite presentation is of finite presentation (see Morphisms, Lemma 28.22.3). The third follows as the base change of a flat morphism is flat (see Morphisms, Lemma 28.26.7) and the base change of a morphism of finite presentation is of finite presentation (see Morphisms, Lemma 28.22.4). Moreover, the base change of a surjective family of morphisms is surjective (proof omitted). \square

Lemma 33.7.4. *Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be an fppf covering of T . Then there exists an fppf covering $\{U_j \rightarrow T\}_{j=1, \dots, m}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i .*

Proof. This follows directly from the definitions using that a morphism which is flat and locally of finite presentation is open, see Morphisms, Lemma 28.26.9. \square

Thus we define the corresponding standard coverings of affines as follows.

Definition 33.7.5. Let T be an affine scheme. A *standard fppf covering* of T is a family $\{f_j : U_j \rightarrow T\}_{j=1, \dots, m}$ with each U_j is affine, flat and of finite presentation over T and $T = \bigcup f_j(U_j)$.

Definition 33.7.6. A *big fppf site* is any site Sch_{fppf} as in Sites, Definition 7.6.2 constructed as follows:

- (1) Choose any set of schemes S_0 , and any set of fppf coverings Cov_0 among these schemes.

² The letters fppf stand for “fidèlement plat de présentation finie”.

- (2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0 .
- (3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings, and the set Cov_0 chosen above.

See the remarks following Definition 33.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big fppf site of a scheme S , let us point out that the topology on a big fppf site Sch_{fppf} is in some sense induced from the fppf topology on the category of all schemes.

Lemma 33.7.7. *Let Sch_{fppf} be a big fppf site as in Definition 33.7.6. Let $T \in \text{Ob}(Sch_{fppf})$. Let $\{T_i \rightarrow T\}_{i \in I}$ be an arbitrary fppf covering of T .*

- (1) *There exists a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{fppf} which refines $\{T_i \rightarrow T\}_{i \in I}$.*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is a standard fppf covering, then it is tautologically equivalent to a covering of Sch_{fppf} .*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch_{fppf} .*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j \in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T . By Lemma 33.7.3 the refinement $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an fppf covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T . Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar} . But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \rightarrow T\}_{i \in I}$ refines $\{T_i \rightarrow T\}_{i \in I}$ (because they are isomorphic). Moreover, $\{V_i \rightarrow T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \rightarrow T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \rightarrow T\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{fppf} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. \square

Definition 33.7.8. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S .

- (1) The *big fppf site of S* , denoted $(Sch/S)_{fppf}$, is the site Sch_{fppf}/S introduced in Sites, Section 7.24.
- (2) The *big affine fppf site of S* , denoted $(Aff/S)_{fppf}$, is the full subcategory of $(Sch/S)_{fppf}$ whose objects are affine U/S . A covering of $(Aff/S)_{fppf}$ is any covering $\{U_i \rightarrow U\}$ of $(Sch/S)_{fppf}$ which is a standard fppf covering.

It is not completely clear that the big affine fppf site is a site. We check this now.

Lemma 33.7.9. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S . Then $(Aff/S)_{fppf}$ is a site.*

Proof. Let us show that $(Aff/S)_{fppf}$ is a site. Reasoning as in the proof of Lemma 33.4.9 it suffices to show that the collection of standard fppf coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. This is clear since for example, given a standard fppf covering $\{T_i \rightarrow T\}_{i \in I}$ and for each i we have a

standard fppf covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a standard fppf covering because $\bigcup_{i \in I} J_i$ is finite and each T_{ij} is affine. \square

Lemma 33.7.10. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S . The underlying categories of the sites Sch_{fppf} , $(Sch/S)_{fppf}$, and $(Aff/S)_{fppf}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The category $(Sch/S)_{fppf}$ has a final object, namely S/S .*

Proof. For Sch_{fppf} it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S$, $V \rightarrow U$, $W \rightarrow U$ morphisms of schemes with $U, V, W \in \text{Ob}(Sch_{fppf})$. The fibre product $V \times_U W$ in Sch_{fppf} is a fibre product in Sch and is the fibre product of V/S with W/S over U/S in the category of all schemes over S , and hence also a fibre product in $(Sch/S)_{fppf}$. This proves the result for $(Sch/S)_{fppf}$. If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{fppf}$. \square

Next, we check that the big affine site defines the same topos as the big site.

Lemma 33.7.11. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S . The functor $(Aff/S)_{fppf} \rightarrow (Sch/S)_{fppf}$ is cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{fppf})$ to $Sh((Sch/S)_{fppf})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) – (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u : (Aff/S)_{fppf} \rightarrow (Sch/S)_{fppf}$. Being cocontinuous just means that any fppf covering of T/S , T affine, can be refined by a standard fppf covering of T . This is the content of Lemma 33.7.4. Hence (1) holds. We see u is continuous simply because a standard fppf covering is a fppf covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. \square

Next, we establish some relationships between the topoi associated to these sites.

Lemma 33.7.12. *Let Sch_{fppf} be a big fppf site. Let $f : T \rightarrow S$ be a morphism in Sch_{fppf} . The functor*

$$u : (Sch/T)_{fppf} \longrightarrow (Sch/S)_{fppf}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{fppf} \longrightarrow (Sch/T)_{fppf}, \quad (U \rightarrow S) \longmapsto (U \times_S T \rightarrow T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{fppf}) \longrightarrow Sh((Sch/S)_{fppf})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big}!$ which commutes with fibre products and equalizers.*

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big}!$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $\text{Mor}_S(u(U), V) = \text{Mor}_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 7.21.1 and 7.21.2 to get the formula for $f_{big,*}$. \square

Lemma 33.7.13. *Given schemes X, Y, Z in $(Sch/S)_{fppf}$ and morphisms $f : X \rightarrow Y, g : Y \rightarrow Z$ we have $g_{big} \circ f_{big} = (g \circ f)_{big}$.*

Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.7.12. \square

33.8. The fpqc topology

Definition 33.8.1. Let T be a scheme. An *fpqc covering* of T is a family of morphisms $\{f_i : T_i \rightarrow T\}_{i \in I}$ of schemes such that each f_i is flat and such that for every affine open $U \subset T$ there exists $n \geq 0$, a map $a : \{1, \dots, n\} \rightarrow I$ and affine opens $V_j \subset T_{a(j)}, j = 1, \dots, n$ with $\bigcup_{j=1}^n f_{a(j)}(V_j) = U$.

To be sure this condition implies that $T = \bigcup f_i(T_i)$. It is slightly harder to recognize an fpqc covering, hence we provide some lemmas to do so.

Lemma 33.8.2. *Let T be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with target T . The following are equivalent*

- (1) $\{f_i : T_i \rightarrow T\}_{i \in I}$ is an fpqc covering,
- (2) each f_i is flat and for every affine open $U \subset T$ there exist quasi-compact opens $U_i \subset T_i$ which are almost all empty, such that $U = \bigcup f_i(U_i)$,
- (3) each f_i is flat and there exists an affine open covering $T = \bigcup_{\alpha \in A} U_\alpha$ and for each $\alpha \in A$ there exist $i_{\alpha,1}, \dots, i_{\alpha,n(\alpha)} \in I$ and quasi-compact opens $U_{\alpha,j} \subset T_{i_{\alpha,j}}$ such that $U_\alpha = \bigcup_{j=1, \dots, n(\alpha)} f_{i_{\alpha,j}}(U_{\alpha,j})$.

If T is quasi-separated, these are also equivalent to

- (4) each f_i is flat, and for every $t \in T$ there exist $i_1, \dots, i_n \in I$ and quasi-compact opens $U_j \subset T_{i_j}$ such that $\bigcup_{j=1, \dots, n} f_{i_j}(U_j)$ is a (not necessarily open) neighbourhood of t in T .

Proof. We omit the proof of the equivalence of (1), (2), and (3). From now on assume T is quasi-separated. We prove (4) implies (2). Let $U \subset T$ be an affine open. To prove (2) it suffices to show that for every $t \in U$ there exist finitely many quasi-compact opens $U_j \subset T_{i_j}$ such that $f_{i_j}(U_j) \subset U$ and such that $\bigcup f_{i_j}(U_j)$ is a neighbourhood of t in U . By assumption there do exist finitely many quasi-compact opens $U'_j \subset T_{i_j}$ such that $\bigcup f_{i_j}(U'_j)$ is a neighbourhood of t in T . Since T is quasi-separated we see that $U_j = U'_j \cap f_j^{-1}(U)$ is quasi-compact open as desired. Since it is clear that (2) implies (4) the proof is finished. \square

Lemma 33.8.3. *Let T be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with target T . The following are equivalent*

- (1) $\{f_i : T_i \rightarrow T\}_{i \in I}$ is an fpqc covering, and
- (2) setting $T' = \prod_{i \in I} T_i$, and $f = \prod_{i \in I} f_i$ the family $\{f : T' \rightarrow T\}$ is an fpqc covering.

Proof. Suppose that $U \subset T$ is an affine open. If (1) holds, then we find $i_1, \dots, i_n \in I$ and affine opens $U_j \subset T_{i_j}$ such that $U = \bigcup_{j=1, \dots, n} f_{i_j}(U_j)$. Then $U_1 \amalg \dots \amalg U_n \subset T'$ is a quasi-compact open surjecting onto U . Thus $\{f : T' \rightarrow T\}$ is an fpqc covering by Lemma 33.8.2. Conversely, if (2) holds then there exists a quasi-compact open $U' \subset T'$ with $U = f(U')$. Then $U_j = U' \cap T_j$ is quasi-compact open in T_j and empty for almost all j . By Lemma 33.8.2 we see that (1) holds. \square

Lemma 33.8.4. *Let T be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with target T . Assume that*

- (1) *each f_i is flat, and*
- (2) *the family $\{f_i : T_i \rightarrow T\}_{i \in I}$ can be refined by a fpqc covering of T .*

Then $\{f_i : T_i \rightarrow T\}_{i \in I}$ is a fpqc covering of T .

Proof. Let $\{g_j : X_j \rightarrow T\}_{j \in J}$ be an fpqc covering refining $\{f_i : T_i \rightarrow T\}$. Suppose that $U \subset T$ is affine open. Choose $j_1, \dots, j_m \in J$ and $V_k \subset X_{j_k}$ affine open such that $U = \bigcup g_{j_k}(V_k)$. For each j pick $i_j \in I$ and a morphism $h_j : X_j \rightarrow T_{i_j}$ such that $g_j = f_{i_j} \circ h_j$. Since $h_{j_k}(V_k)$ is quasi-compact we can find a quasi-compact open $h_{j_k}(V_k) \subset U_k \subset f_{i_{j_k}}^{-1}(U)$. Then $U = \bigcup f_{i_{j_k}}(U_k)$. We conclude that $\{f_i : T_i \rightarrow T\}_{i \in I}$ is an fpqc covering by Lemma 33.8.2. \square

Lemma 33.8.5. *Let T be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with target T . Assume that*

- (1) *each f_i is flat, and*
- (2) *there exists an fpqc covering $\{g_j : S_j \rightarrow T\}_{j \in J}$ such that each $\{S_j \times_T T_i \rightarrow S_j\}_{i \in I}$ is an fpqc covering.*

Then $\{f_i : T_i \rightarrow T\}_{i \in I}$ is a fpqc covering of T .

Proof. We will use Lemma 33.8.2 without further mention. Let $U \subset T$ be an affine open. By (2) we can find quasi-compact opens $V_j \subset S_j$ for $j \in J$, almost all empty, such that $U = \bigcup g_j(V_j)$. Then for each j we can choose quasi-compact opens $W_{ij} \subset S_j \times_T T_i$ for $i \in I$, almost all empty, with $V_j = \bigcup_i \text{pr}_1(W_{ij})$. Thus $\{S_j \times_T T_i \rightarrow T\}$ is an fpqc covering. Since this covering refines $\{f_i : T_i \rightarrow T\}$ we conclude by Lemma 33.8.4. \square

Lemma 33.8.6. *Any fppf covering is an fpqc covering, and a fortiori, any syntomic, smooth, étale or Zariski covering is an fpqc covering.*

Proof. We will show that an fppf covering is an fpqc covering, and then the rest follows from Lemma 33.7.2. Let $\{f_i : U_i \rightarrow U\}_{i \in I}$ be an fppf covering. By definition this means that the f_i are flat which checks the first condition of Definition 33.8.1. To check the second, let $V \subset U$ be an affine open subset. Write $f_i^{-1}(V) = \bigcup_{j \in J_i} V_{ij}$ for some affine opens $V_{ij} \subset U_i$. Since each f_i is open (Morphisms, Lemma 28.26.9), we see that $V = \bigcup_{i \in I} \bigcup_{j \in J_i} f_i(V_{ij})$ is an open covering of V . Since V is quasi-compact, this covering has a finite refinement. This finishes the proof. \square

The fpqc³ topology cannot be treated in the same way as the fppf topology⁴. Namely, suppose that R is a nonzero ring. For any faithfully flat ring map $R \rightarrow R'$ the morphism $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is an fpqc-covering. We claim that there does not exist a set A of fpqc-coverings of $\text{Spec}(R)$ such that every fpqc-covering can be refined by an element of A . For example, if $R = k$ is a field, then for any set I we can consider the purely transcendental field extension $k \subset k(\{t_i\}_{i \in I})$. We leave it to the reader to show that there does not exist a set of morphisms of schemes $\{S_j \rightarrow \text{Spec}(k)\}_{j \in J}$ such that every morphism $\text{Spec}(k(\{t_i\}_{i \in I}))$ is dominated by one of the schemes S_j .

³The letters fpqc stand for “fidèlement plat quasi-compacte”.

⁴A more precise statement would be that the analogue of Lemma 33.7.7 for the fpqc topology does not hold.

A mildly interesting option is to consider only those faithfully flat ring extensions $R \rightarrow R'$ where the cardinality of R' is suitably bounded. (And if you consider all schemes in a fixed universe as in SGA4 then you are bounding the cardinality by a strongly inaccessible cardinal.) However, it is not so clear what happens if you change the cardinal to a bigger one.

For these reasons we do not introduce fpqc sites and we will not consider cohomology with respect to the fpqc-topology.

On the other hand, given a contravariant functor $F : Sch^{opp} \rightarrow Sets$ it does make sense to ask whether F satisfies the sheaf property for the fpqc topology, see below. Moreover, we can wonder about descent of object in the fpqc topology, etc. Simply put, for certain results the correct generality is to work with fpqc coverings.

Lemma 33.8.7. *Let T be a scheme.*

- (1) *If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is an fpqc covering of T .*
- (2) *If $\{T_i \rightarrow T\}_{i \in I}$ is an fpqc covering and for each i we have an fpqc covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is an fpqc covering.*
- (3) *If $\{T_i \rightarrow T\}_{i \in I}$ is an fpqc covering and $T' \rightarrow T$ is a morphism of schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is an fpqc covering.*

Proof. Part (1) is immediate. Recall that the composition of flat morphisms is flat and that the base change of a flat morphism is flat (Morphisms, Lemmas 28.26.7 and 28.26.5). Thus we can apply Lemma 33.8.2 in each case to check that our families of morphisms are fpqc coverings.

Proof of (2). Assume $\{T_i \rightarrow T\}_{i \in I}$ is an fpqc covering and for each i we have an fpqc covering $\{f_{ij} : T_{ij} \rightarrow T_i\}_{j \in J_i}$. Let $U \subset T$ be an affine open. We can find quasi-compact opens $U_i \subset T_i$ for $i \in I$, almost all empty, such that $U = \bigcup f_i(U_i)$. Then for each i we can choose quasi-compact opens $W_{ij} \subset T_{ij}$ for $j \in J_i$, almost all empty, with $U_i = \bigcup_j f_{ij}(W_{ij})$. Thus $\{T_{ij} \rightarrow T\}$ is an fpqc covering.

Proof of (3). Assume $\{T_i \rightarrow T\}_{i \in I}$ is an fpqc covering and $T' \rightarrow T$ is a morphism of schemes. Let $U' \subset T'$ be an affine open which maps into the affine open $U \subset T$. Choose quasi-compact opens $U_i \subset T_i$, almost all empty, such that $U = \bigcup f_i(U_i)$. Then $U' \times_U U_i$ is a quasi-compact open of $T' \times_T T_i$ and $U' = \bigcup \text{pr}_1(U' \times_U U_i)$. Since T' can be covered by such affine opens $U' \subset T'$ we see that $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is an fpqc covering by Lemma 33.8.2 \square

Lemma 33.8.8. *Let T be an affine scheme. Let $\{T_i \rightarrow T\}_{i \in I}$ be an fpqc covering of T . Then there exists an fpqc covering $\{U_j \rightarrow T\}_{j=1, \dots, n}$ which is a refinement of $\{T_i \rightarrow T\}_{i \in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i .*

Proof. This follows directly from the definition. \square

Definition 33.8.9. Let T be an affine scheme. A *standard fpqc covering* of T is a family $\{f_j : U_j \rightarrow T\}_{j=1, \dots, n}$ with each U_j is affine, flat over T and $T = \bigcup f_j(U_j)$.

Since we do not introduce the affine site we have to show directly that the collection of all standard fpqc coverings satisfies the axioms.

Lemma 33.8.10. *Let T be an affine scheme.*

- (1) If $T' \rightarrow T$ is an isomorphism then $\{T' \rightarrow T\}$ is a standard fpqc covering of T .
- (2) If $\{T_i \rightarrow T\}_{i \in I}$ is a standard fpqc covering and for each i we have a standard fpqc covering $\{T_{ij} \rightarrow T_i\}_{j \in J_i}$, then $\{T_{ij} \rightarrow T\}_{i \in I, j \in J_i}$ is a standard fpqc covering.
- (3) If $\{T_i \rightarrow T\}_{i \in I}$ is a standard fpqc covering and $T' \rightarrow T$ is a morphism of affine schemes then $\{T' \times_T T_i \rightarrow T'\}_{i \in I}$ is a standard fpqc covering.

Proof. This follows formally from the fact that compositions and base changes of flat morphisms are flat (Morphisms, Lemmas 28.26.7 and 28.26.5) and that fibre products of affine schemes are affine (Schemes, Lemma 25.17.2). \square

Lemma 33.8.11. *Let T be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with target T . Assume that*

- (1) *each f_i is flat, and*
- (2) *every affine scheme Z and morphism $h : Z \rightarrow T$ there exists a standard fpqc covering $\{Z_j \rightarrow Z\}_{j=1, \dots, n}$ which refines the family $\{T_i \times_T Z \rightarrow Z\}_{i \in I}$.*

Then $\{f_i : T_i \rightarrow T\}_{i \in I}$ is a fpqc covering of T .

Proof. Let $T = \bigcup U_\alpha$ be an affine open covering. For each α the pullback family $\{T_i \times_T U_\alpha \rightarrow U_\alpha\}$ can be refined by a standard fpqc covering, hence is an fpqc covering by Lemma 33.8.4. As $\{U_\alpha \rightarrow T\}$ is an fpqc covering we conclude that $\{T_i \rightarrow T\}$ is an fpqc covering by Lemma 33.8.5. \square

Definition 33.8.12. Let F be a contravariant functor on the category of schemes with values in sets.

- (1) Let $\{U_i \rightarrow T\}_{i \in I}$ be a family of morphisms of schemes with fixed target. We say that F satisfies the sheaf property for the given family if for any collection of elements $\xi_i \in F(U_i)$ such that $\xi_i|_{U_i \times_T U_j} = \xi_j|_{U_i \times_T U_j}$ there exists a unique element $\xi \in F(T)$ such that $\xi_i = \xi|_{U_i}$ in $F(U_i)$.
- (2) We say that F satisfies the sheaf property for the fpqc topology if it satisfies the sheaf property for any fpqc covering.

We try to avoid using the terminology “ F is a sheaf” in this situation since we are not defining a category of fpqc sheaves as we explained above.

Lemma 33.8.13. *Let F be a contravariant functor on the category of schemes with values in sets. Then F satisfies the sheaf property for the fpqc topology if and only if it satisfies*

- (1) *the sheaf property for every Zariski covering, and*
- (2) *the sheaf property for any standard fpqc covering.*

Moreover, in the presence of (1) property (2) is equivalent to property

- (2') *the sheaf property for $\{V \rightarrow U\}$ with V, U affine and $V \rightarrow U$ faithfully flat.*

Proof. Assume (1) and (2) hold. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be an fpqc covering. Let $s_i \in F(T_i)$ be a family of elements such that s_i and s_j map to the same element of $F(T_i \times_T T_j)$. Let $W \subset T$ be the maximal open subset such that there exists a unique $s \in F(W)$ with $s|_{f_i^{-1}(W)} = s_i|_{f_i^{-1}(W)}$ for all i . Such a maximal open exists because F satisfies the sheaf property for Zariski coverings; in fact W is the union of all opens with this property. Let $t \in T$. We will show $t \in W$. To do this we

pick an affine open $t \in U \subset T$ and we will show there is a unique $s \in F(U)$ with $s|_{f_i^{-1}(U)} = s_i|_{f_i^{-1}(U)}$ for all i .

By Lemma 33.8.8 we can find a standard fpqc covering $\{U_j \rightarrow U\}_{j=1,\dots,n}$ refining $\{U \times_T T_i \rightarrow U\}$, say by morphisms $h_j : U_j \rightarrow T_{i_j}$. By (2) we obtain a unique element $s \in F(U)$ such that $s|_{U_j} = F(h_j)(s_{i_j})$. Note that for any scheme $V \rightarrow U$ over U there is a unique section $s_V \in F(V)$ which restricts to $F(h_j \circ \text{pr}_2)(s_{i_j})$ on $V \times_U U_j$ for $j = 1, \dots, n$. Namely, this is true if V is affine by (2) as $\{V \times_U U_j \rightarrow V\}$ is a standard fpqc covering and in general this follows from (1) and the affine case by choosing an affine open covering of V . In particular, $s_V = s|_V$. Now, taking $V = U \times_T T_i$ and using that $s_{i_j}|_{T_{i_j} \times_T T_i} = s_i|_{T_{i_j} \times_T T_i}$ we conclude that $s|_{U \times_T T_i} = s_V = s_i|_{U \times_T T_i}$ which is what we had to show.

Proof of the equivalence of (2) and (2') in the presence of (1). Suppose $\{T_i \rightarrow T\}$ is a standard fpqc covering, then $\coprod T_i \rightarrow T$ is a faithfully flat morphism of affine schemes. In the presence of (1) we have $F(\coprod T_i) = \prod F(T_i)$ and similarly $F((\coprod T_i) \times_T (\coprod T_i)) = \prod F(T_i \times_T T_i)$. Thus the sheaf condition for $\{T_i \rightarrow T\}$ and $\{\coprod T_i \rightarrow T\}$ is the same. \square

33.9. Change of topologies

Let $f : X \rightarrow Y$ be a morphism of schemes over a base scheme S . In this case we have the following morphisms of sites (with suitable choices of sites as in Remark 33.9.1 below):

- (1) $(Sch/X)_{fppf} \rightarrow (Sch/Y)_{fppf}$,
- (2) $(Sch/X)_{fppf} \rightarrow (Sch/Y)_{syntomic}$,
- (3) $(Sch/X)_{fppf} \rightarrow (Sch/Y)_{smooth}$,
- (4) $(Sch/X)_{fppf} \rightarrow (Sch/Y)_{\acute{e}tale}$,
- (5) $(Sch/X)_{fppf} \rightarrow (Sch/Y)_{Zar}$,
- (6) $(Sch/X)_{syntomic} \rightarrow (Sch/Y)_{syntomic}$,
- (7) $(Sch/X)_{syntomic} \rightarrow (Sch/Y)_{smooth}$,
- (8) $(Sch/X)_{syntomic} \rightarrow (Sch/Y)_{\acute{e}tale}$,
- (9) $(Sch/X)_{syntomic} \rightarrow (Sch/Y)_{Zar}$,
- (10) $(Sch/X)_{smooth} \rightarrow (Sch/Y)_{smooth}$,
- (11) $(Sch/X)_{smooth} \rightarrow (Sch/Y)_{\acute{e}tale}$,
- (12) $(Sch/X)_{smooth} \rightarrow (Sch/Y)_{Zar}$,
- (13) $(Sch/X)_{\acute{e}tale} \rightarrow (Sch/Y)_{\acute{e}tale}$,
- (14) $(Sch/X)_{\acute{e}tale} \rightarrow (Sch/Y)_{Zar}$,
- (15) $(Sch/X)_{Zar} \rightarrow (Sch/Y)_{Zar}$,
- (16) $(Sch/X)_{fppf} \rightarrow Y_{\acute{e}tale}$,
- (17) $(Sch/X)_{syntomic} \rightarrow Y_{\acute{e}tale}$,
- (18) $(Sch/X)_{smooth} \rightarrow Y_{\acute{e}tale}$,
- (19) $(Sch/X)_{\acute{e}tale} \rightarrow Y_{\acute{e}tale}$,
- (20) $(Sch/X)_{fppf} \rightarrow Y_{Zar}$,
- (21) $(Sch/X)_{syntomic} \rightarrow Y_{Zar}$,
- (22) $(Sch/X)_{smooth} \rightarrow Y_{Zar}$,
- (23) $(Sch/X)_{\acute{e}tale} \rightarrow Y_{Zar}$,
- (24) $(Sch/X)_{Zar} \rightarrow Y_{Zar}$,
- (25) $X_{\acute{e}tale} \rightarrow Y_{\acute{e}tale}$,
- (26) $X_{\acute{e}tale} \rightarrow Y_{Zar}$,

$$(27) \quad X_{Zar} \longrightarrow Y_{Zar},$$

In each case the underlying continuous functor $Sch/Y \rightarrow Sch/X$, or $Y_\tau \rightarrow Sch/X$ is the functor $Y'/Y \mapsto X \times_Y Y'/X$. Namely, in the sections above we have seen the morphisms $f_{big} : (Sch/X)_\tau \rightarrow (Sch/Y)_\tau$ and $f_{small} : X_\tau \rightarrow Y_\tau$ for τ as above. We also have seen the morphisms of sites $\pi_Y : (Sch/Y)_\tau \rightarrow Y_\tau$ for $\tau \in \{\acute{e}tale, Zariski\}$. On the other hand, it is clear that the identity functor $(Sch/X)_\tau \rightarrow (Sch/X)_{\tau'}$ defines a morphism of sites when τ is a stronger topology than τ' . Hence composing these gives the list of possible morphisms above.

Because of the simple description of the underlying functor it is clear that given morphisms of schemes $X \rightarrow Y \rightarrow Z$ the composition of two of the morphisms of sites above, e.g.,

$$(Sch/X)_{\tau_0} \longrightarrow (Sch/Y)_{\tau_1} \longrightarrow (Sch/Z)_{\tau_2}$$

is the corresponding morphism of sites associated to the morphism of schemes $X \rightarrow Z$.

Remark 33.9.1. Take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set of schemes $\{X, Y, S\}$. Choose any set of coverings Cov_{fppf} on Sch_α as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings. Let Sch_{fppf} denote the big fppf site so obtained. Next, for $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic\}$ let Sch_τ have the same underlying category as Sch_{fppf} with coverings $Cov_\tau \subset Cov_{fppf}$ simply the subset of τ -coverings. It is straightforward to check that this gives rise to a big site Sch_τ .

33.10. Change of big sites

In this section we explain what happens on changing the big Zariski/fppf/étale sites.

Let $\tau, \tau' \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$. Given two big sites Sch_τ and $Sch'_{\tau'}$, we say that Sch_τ is contained in $Sch'_{\tau'}$ if $Ob(Sch_\tau) \subset Ob(Sch'_{\tau'})$ and $Cov(Sch_\tau) \subset Cov(Sch'_{\tau'})$. In this case τ is stronger than τ' , for example, no fppf site can be contained in an étale site.

Lemma 33.10.1. *Any set of big Zariski sites is contained in a common big Zariski site. The same is true, mutatis mutandis, for big fppf and big étale sites.*

Proof. This is true because the union of a set of sets is a set, and the constructions in Sets, Lemmas 3.9.2 and 3.11.1 allow one to start with any initially given set of schemes and coverings. \square

Lemma 33.10.2. *Let $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$. Suppose given big sites Sch_τ and $Sch'_{\tau'}$. Assume that Sch_τ is contained in $Sch'_{\tau'}$. The inclusion functor $Sch_\tau \rightarrow Sch'_{\tau'}$ satisfies the assumptions of Sites, Lemma 7.20.8. There are morphisms of topoi*

$$\begin{aligned} g : Sh(Sch_\tau) &\longrightarrow Sh(Sch'_{\tau'}) \\ f : Sh(Sch'_{\tau'}) &\longrightarrow Sh(Sch_\tau) \end{aligned}$$

such that $f \circ g \cong id$. For any object S of Sch_τ the inclusion functor $(Sch/S)_\tau \rightarrow (Sch'/S)_{\tau'}$ satisfies the assumptions of Sites, Lemma 7.20.8 also. Hence similarly

we obtain morphisms

$$\begin{aligned} g : Sh((Sch/S)_\tau) &\longrightarrow Sh((Sch'/S)_\tau) \\ f : Sh((Sch'/S)_\tau) &\longrightarrow Sh((Sch/S)_\tau) \end{aligned}$$

with $f \circ g \cong id$.

Proof. Assumptions (b), (c), and (e) of Sites, Lemma 7.20.8 are immediate for the functors $Sch_\tau \rightarrow Sch'_\tau$ and $(Sch/S)_\tau \rightarrow (Sch'/S)_\tau$. Property (a) holds by Lemma 33.3.6, 33.4.7, 33.5.7, 33.6.7, or 33.7.7. Property (d) holds because fibre products in the categories Sch_τ , Sch'_τ exist and are compatible with fibre products in the category of schemes. \square

Discussion: The functor $g^{-1} = f_*$ is simply the restriction functor which associates to a sheaf \mathcal{G} on Sch'_τ the restriction $\mathcal{G}|_{Sch_\tau}$. Hence this lemma simply says that given any sheaf of sets \mathcal{F} on Sch_τ there exists a canonical sheaf \mathcal{F}' on Sch'_τ such that $\mathcal{F}|_{Sch'_\tau} = \mathcal{F}'$. In fact the sheaf \mathcal{F}' has the following description: it is the sheafification of the presheaf

$$Sch'_\tau \longrightarrow Sets, \quad V \longmapsto \text{colim}_{U \rightarrow V} \mathcal{F}(U)$$

where U is an object of Sch_τ . This is true because $\mathcal{F}' = f^{-1}\mathcal{F} = (u_p\mathcal{F})^\#$ according to Sites, Lemmas 7.20.5 and 7.20.8.

Descent

34.1. Introduction

In the chapter on topologies on schemes (see Topologies, Section 33.1) we introduced Zariski, étale, fppf, smooth, syntomic and fpqc coverings of schemes. In this chapter we discuss what kind of structures over schemes can be descended through such coverings. See for example [Gro95a], [Gro95b], [Gro95e], [Gro95f], [Gro95c], and [Gro95d]. This is also meant to introduce the notions of descent, descent data, effective descent data, in the less formal setting of descent questions for quasi-coherent sheaves, schemes, etc. The formal notion, that of a stack over a site, is discussed in the chapter on stacks (see Stacks, Section 8.1).

34.2. Descent data for quasi-coherent sheaves

In this chapter we will use the convention where the projection maps $\text{pr}_i : X \times \dots \times X \rightarrow X$ are labeled starting with $i = 0$. Hence we have $\text{pr}_0, \text{pr}_1 : X \times X \rightarrow X$, $\text{pr}_0, \text{pr}_1, \text{pr}_2 : X \times X \times X \rightarrow X$, etc.

Definition 34.2.1. Let S be a scheme. Let $\{f_i : S_i \rightarrow S\}_{i \in I}$ be a family of morphisms with target S .

- (1) A *descent datum* $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given family is given by a quasi-coherent sheaf \mathcal{F}_i on S_i for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{S_i \times_S S_j}$ -modules $\varphi_{ij} : \text{pr}_0^* \mathcal{F}_i \rightarrow \text{pr}_1^* \mathcal{F}_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{array}{ccc} \text{pr}_0^* \mathcal{F}_i & \xrightarrow{\quad} & \text{pr}_2^* \mathcal{F}_k \\ & \searrow \text{pr}_{01}^* \varphi_{ij} & \nearrow \text{pr}_{12}^* \varphi_{jk} \\ & \text{pr}_1^* \mathcal{F}_j & \end{array}$$

of $\mathcal{O}_{S_i \times_S S_j \times_S S_k}$ -modules commutes. This is called the *cocycle condition*.

- (2) A *morphism* $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms of \mathcal{O}_{S_i} -modules $\psi_i : \mathcal{F}_i \rightarrow \mathcal{F}'_i$ such that all the diagrams

$$\begin{array}{ccc} \text{pr}_0^* \mathcal{F}_i & \xrightarrow{\quad \varphi_{ij} \quad} & \text{pr}_1^* \mathcal{F}_j \\ \text{pr}_0^* \psi_i \downarrow & & \downarrow \text{pr}_1^* \psi_j \\ \text{pr}_0^* \mathcal{F}'_i & \xrightarrow{\quad \varphi'_{ij} \quad} & \text{pr}_1^* \mathcal{F}'_j \end{array}$$

commute.

A good example to keep in mind is the following. Suppose that $S = \bigcup S_i$ is an open covering. In that case we have seen descent data for sheaves of sets in Sheaves,

Section 6.33 where we called them “glueing data for sheaves of sets with respect to the given covering”. Moreover, we proved that the category of glueing data is equivalent to the category of sheaves on S . We will show the analogue in the setting above when $\{S_i \rightarrow S\}_{i \in I}$ is an fpqc covering.

In the extreme case where the covering $\{S \rightarrow S\}$ is given by id_S a descent datum is necessarily of the form $(\mathcal{F}, \text{id}_{\mathcal{F}})$. The cocycle condition guarantees that the identity on \mathcal{F} is the only permitted map in this case. The following lemma shows in particular that to every quasi-coherent sheaf of \mathcal{O}_S -modules there is associated a unique descent datum with respect to any given family.

Lemma 34.2.2. *Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ and $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be families of morphisms of schemes with fixed target. Let $(g, \alpha : I \rightarrow J, (g_i)) : \mathcal{U} \rightarrow \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Let $(\mathcal{F}_j, \varphi_{jj'})$ be a descent datum for quasi-coherent sheaves with respect to the family $\{V_j \rightarrow V\}_{j \in J}$. Then*

(1) *The system*

$$(g_i^* \mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$

is a descent datum with respect to the family $\{U_i \rightarrow U\}_{i \in I}$.

(2) *This construction is functorial in the descent datum $(\mathcal{F}_j, \varphi_{jj'})$.*

(3) *Given a second morphism $(g', \alpha' : I \rightarrow J, (g'_i))$ of families of maps with fixed target with $g = g'$ there exists a functorial isomorphism of descent data*

$$(g_i^* \mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')}) \cong ((g'_i)^* \mathcal{F}_{\alpha'(i)}, (g'_i \times g'_{i'})^* \varphi_{\alpha'(i)\alpha'(i')}).$$

Proof. Omitted. Hint: The maps $g_i^* \mathcal{F}_{\alpha(i)} \rightarrow (g'_i)^* \mathcal{F}_{\alpha'(i)}$ which give the isomorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i)\alpha'(i)}$ by the morphisms $(g_i, g'_i) : U_i \rightarrow V_{\alpha(i)} \times_V V_{\alpha'(i)}$. \square

Any family $\mathcal{U} = \{S_i \rightarrow S\}_{i \in I}$ is a refinement of the trivial covering $\{S \rightarrow S\}$ in a unique way. For a quasi-coherent sheaf \mathcal{F} on S we denote simply $(\mathcal{F}|_{S_i}, \text{can})$ the descent datum with respect to \mathcal{U} obtained by the procedure above.

Definition 34.2.3. Let S be a scheme. Let $\{S_i \rightarrow S\}_{i \in I}$ be a family of morphisms with target S .

- (1) Let \mathcal{F} be a quasi-coherent \mathcal{O}_S -module. We call the unique descent on \mathcal{F} datum with respect to the covering $\{S \rightarrow S\}$ the *trivial descent datum*.
- (2) The pullback of the trivial descent datum to $\{S_i \rightarrow S\}$ is called the *canonical descent datum*. Notation: $(\mathcal{F}|_{S_i}, \text{can})$.
- (3) A descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given covering is said to be *effective* if there exists a quasi-coherent sheaf \mathcal{F} on S such that $(\mathcal{F}_i, \varphi_{ij})$ is isomorphic to $(\mathcal{F}|_{S_i}, \text{can})$.

Lemma 34.2.4. *Let S be a scheme. Let $S = \bigcup U_i$ be an open covering. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U} = \{U_i \rightarrow S\}$ is effective. Moreover, the functor from the category of quasi-coherent \mathcal{O}_S -modules to the category of descent data with respect to \mathcal{U} is fully faithful.*

Proof. This follows immediately from Sheaves, Section 6.33 and the fact that being quasi-coherent is a local property, see Modules, Definition 17.10.1. \square

To prove more we first need to study the case of modules over rings.

34.3. Descent for modules

Let $R \rightarrow A$ be a ring map. By Simplicial, Example 14.5.5 this gives rise to a cosimplicial R -algebra

$$A \begin{array}{c} \rightrightarrows \\ \leftarrow \\ \rightleftarrows \\ \rightarrow \\ \rightrightarrows \end{array} A \otimes_R A \begin{array}{c} \rightrightarrows \\ \leftarrow \\ \rightleftarrows \\ \rightarrow \\ \rightrightarrows \end{array} A \otimes_R A \otimes_R A$$

Let us denote this $(A/R)_\bullet$ so that $(A/R)_n$ is the $(n + 1)$ -fold tensor product of A over R . Given a map $\varphi : [n] \rightarrow [m]$ the R -algebra map $(A/R)_\bullet(\varphi)$ is the map

$$a_0 \otimes \dots \otimes a_n \mapsto \prod_{\varphi(i)=0} a_i \otimes \prod_{\varphi(i)=1} a_i \otimes \dots \otimes \prod_{\varphi(i)=m} a_i$$

where we use the convention that the empty product is 1. Thus the first few maps, notation as in Simplicial, Section 14.5, are

$$\begin{array}{llll} \delta_0^1 & : & a_0 & \mapsto & 1 \otimes a_0 \\ \delta_1^1 & : & a_0 & \mapsto & a_0 \otimes 1 \\ \sigma_0^0 & : & a_0 \otimes a_1 & \mapsto & a_0 a_1 \\ \delta_0^2 & : & a_0 \otimes a_1 & \mapsto & 1 \otimes a_0 \otimes a_1 \\ \delta_1^2 & : & a_0 \otimes a_1 & \mapsto & a_0 \otimes 1 \otimes a_1 \\ \delta_2^2 & : & a_0 \otimes a_1 & \mapsto & a_0 \otimes a_1 \otimes 1 \\ \sigma_0^1 & : & a_0 \otimes a_1 \otimes a_2 & \mapsto & a_0 a_1 \otimes a_2 \\ \sigma_1^1 & : & a_0 \otimes a_1 \otimes a_2 & \mapsto & a_0 \otimes a_1 a_2 \end{array}$$

and so on.

An R -module M gives rise to a cosimplicial $(A/R)_\bullet$ -module $(A/R)_\bullet \otimes_R M$. In other words $M_n = (A/R)_n \otimes_R M$ and using the R -algebra maps $(A/R)_n \rightarrow (A/R)_m$ to define the corresponding maps on $M \otimes_R (A/R)_\bullet$.

The analogue to a descent datum for quasi-coherent sheaves in the setting of modules is the following.

Definition 34.3.1. Let $R \rightarrow A$ be a ring map.

- (1) A *descent datum* (N, φ) for modules with respect to $R \rightarrow A$ is given by an A -module N and a isomorphism of $A \otimes_R A$ -modules

$$\varphi : N \otimes_R A \rightarrow A \otimes_R N$$

such that the *cocycle condition* holds: the diagram of $A \otimes_R A \otimes_R A$ -module maps

$$\begin{array}{ccc} N \otimes_R A \otimes_R A & \xrightarrow{\varphi_{02}} & A \otimes_R A \otimes_R N \\ & \searrow \varphi_{01} & \nearrow \varphi_{12} \\ & A \otimes_R N \otimes_R A & \end{array}$$

commutes (see below for notation).

- (2) A *morphism* $(N, \varphi) \rightarrow (N', \varphi')$ of descent data is a morphism of A -modules $\psi : N \rightarrow N'$ such that the diagram

$$\begin{array}{ccc} N \otimes_R A & \xrightarrow{\varphi} & A \otimes_R N \\ \psi \otimes \text{id}_A \downarrow & & \downarrow \text{id}_A \otimes \psi \\ N' \otimes_R A & \xrightarrow{\varphi'} & A \otimes_R N' \end{array}$$

is commutative.

In the definition we use the notation that $\varphi_{01} = \varphi \otimes \text{id}_A$, $\varphi_{12} = \text{id}_A \otimes \varphi$, and $\varphi_{02}(n \otimes 1 \otimes 1) = \sum a_i \otimes 1 \otimes n_i$ if $\varphi(n) = \sum a_i \otimes n_i$. All three are $A \otimes_R A \otimes_R A$ -module homomorphisms. Equivalently we have

$$\varphi_{ij} = \varphi \otimes_{(A/R)_1, (A/R)_\bullet(\tau_{ij}^2)} (A/R)_2$$

where $\tau_{ij}^2 : [1] \rightarrow [2]$ is the map $0 \mapsto i, 1 \mapsto j$. Namely, $(A/R)_\bullet(\tau_{02}^2)(a_0 \otimes a_1) = a_0 \otimes 1 \otimes a_1$, and similarly for the others¹.

We need some more notation to be able to state the next lemma. Let (N, φ) be a descent datum with respect to a ring map $R \rightarrow A$. For $n \geq 0$ and $i \in [n]$ we set

$$N_{n,i} = A \otimes_R \dots \otimes_R A \otimes_R N \otimes_R A \otimes_R \dots \otimes_R A$$

with the factor N in the i th spot. It is an $(A/R)_n$ -module. If we introduce the maps $\tau_i^n : [0] \rightarrow [n], 0 \mapsto i$ then we see that

$$N_{n,i} = N \otimes_{(A/R)_0, (A/R)_\bullet(\tau_i^n)} (A/R)_n$$

For $0 \leq i \leq j \leq n$ we let $\tau_{ij}^n : [1] \rightarrow [n]$ be the map such that 0 maps to i and 1 to j . Similarly to the above the homomorphism φ induces isomorphisms

$$\varphi_{ij}^n = \varphi \otimes_{(A/R)_1, (A/R)_\bullet(\tau_{ij}^n)} (A/R)_n : N_{n,i} \longrightarrow N_{n,j}$$

of $(A/R)_n$ -modules when $i < j$. If $i = j$ we set $\varphi_{ij}^n = \text{id}$. Since these are all isomorphisms they allow us to move the factor N to any spot we like. And the cocycle condition exactly means that it does not matter how we do this (e.g., as a composition of two of these or at once). Finally, for any $\beta : [n] \rightarrow [m]$ we define the morphism

$$N_{\beta,i} : N_{n,i} \rightarrow N_{m,\beta(i)}$$

as the unique $(A/R)_\bullet(\beta)$ -semi linear map such that

$$N_{\beta,i}(1 \otimes \dots \otimes n \otimes \dots \otimes 1) = 1 \otimes \dots \otimes n \otimes \dots \otimes 1$$

for all $n \in N$. This hints at the following lemma.

Lemma 34.3.2. *Let $R \rightarrow A$ be a ring map. Given a descent datum (N, φ) we can associate to it a cosimplicial $(A/R)_\bullet$ -module N_\bullet ² by the rules $N_n = N_{n,n}$ and given $\beta : [n] \rightarrow [m]$ setting we define*

$$N_\bullet(\beta) = (\varphi_{\beta(n)m}^m) \circ N_{\beta,n} : N_{n,n} \longrightarrow N_{m,m}.$$

This procedure is functorial in the descent datum.

Proof. Here are the first few maps where $\varphi(n \otimes 1) = \sum \alpha_i \otimes x_i$

$$\begin{array}{llllll} \delta_0^1 & : & N & \rightarrow & A \otimes N & n & \mapsto & 1 \otimes n \\ \delta_1^1 & : & N & \rightarrow & A \otimes N & n & \mapsto & \sum \alpha_i \otimes x_i \\ \sigma_0^0 & : & A \otimes N & \rightarrow & N & a_0 \otimes n & \mapsto & a_0 n \\ \delta_0^2 & : & A \otimes N & \rightarrow & A \otimes A \otimes N & a_0 \otimes n & \mapsto & 1 \otimes a_0 \otimes n \\ \delta_1^2 & : & A \otimes N & \rightarrow & A \otimes A \otimes N & a_0 \otimes n & \mapsto & a_0 \otimes 1 \otimes n \\ \delta_2^2 & : & A \otimes N & \rightarrow & A \otimes A \otimes N & a_0 \otimes n & \mapsto & \sum a_0 \otimes \alpha_i \otimes x_i \\ \sigma_0^1 & : & A \otimes A \otimes N & \rightarrow & A \otimes N & a_0 \otimes a_1 \otimes n & \mapsto & a_0 a_1 \otimes n \\ \sigma_1^1 & : & A \otimes A \otimes N & \rightarrow & A \otimes N & a_0 \otimes a_1 \otimes n & \mapsto & a_0 \otimes a_1 n \end{array}$$

¹Note that $\tau_{ij}^2 = \delta_k^2$, if $\{i, j, k\} = [2] = \{0, 1, 2\}$, see Simplicial, Definition 14.2.1.

²We should really write $(N, \varphi)_\bullet$.

with notation as in Simplicial, Section 14.5. We first verify the two properties $\sigma_0^0 \circ \delta_0^1 = \text{id}$ and $\sigma_0^0 \circ \delta_1^1 = \text{id}$. The first one, $\sigma_0^0 \circ \delta_0^1 = \text{id}$, is clear from the explicit description of the morphisms above. To prove the second relation we have to use the cocycle condition (because it does not hold for an arbitrary isomorphism $\varphi : N \otimes_R A \rightarrow A \otimes_R N$). Write $p = \sigma_0^0 \circ \delta_1^1 : N \rightarrow N$. By the description of the maps above we deduce that p is also equal to

$$p = \varphi \otimes \text{id} : N = (N \otimes_R A) \otimes_{(A \otimes_R A)} A \longrightarrow (A \otimes_R N) \otimes_{(A \otimes_R A)} A = N$$

Since φ is an isomorphism we see that p is an isomorphism. Write $\varphi(n \otimes 1) = \sum \alpha_i \otimes x_i$ for certain $\alpha_i \in A$ and $x_i \in N$. Then $p(n) = \sum \alpha_i x_i$. Next, write $\varphi(x_i \otimes 1) = \sum \alpha_{ij} \otimes y_j$ for certain $\alpha_{ij} \in A$ and $y_j \in N$. Then the cocycle condition says that

$$\sum \alpha_i \otimes \alpha_{ij} \otimes y_j = \sum \alpha_i \otimes 1 \otimes x_i.$$

This means that $p(n) = \sum \alpha_i x_i = \sum \alpha_i \alpha_{ij} y_j = \sum \alpha_i p(x_i) = p(p(n))$. Thus p is a projector, and since it is an isomorphism it is the identity.

To prove fully that N_\bullet is a cosimplicial module we have to check all 5 types of relations of Simplicial, Remark 14.5.3. The relations on composing σ 's are obvious. The relations on composing δ 's come down to the cocycle condition for φ . In exactly the same way as above one checks the relations $\sigma_j \circ \delta_j = \sigma_j \circ \delta_{j+1} = \text{id}$. Finally, the other relations on compositions of δ 's and σ 's hold for any φ whatsoever. \square

Note that to an R -module M we can associate a canonical descent datum, namely $(M \otimes_R A, \text{can})$ where $\text{can} : (M \otimes_R A) \otimes_R A \rightarrow A \otimes_R (M \otimes_R A)$ is the obvious map: $(m \otimes a) \otimes a' \mapsto a \otimes (m \otimes a')$.

Lemma 34.3.3. *Let $R \rightarrow A$ be a ring map. Let M be an R -module. The cosimplicial $(A/R)_\bullet$ -module associated to the canonical descent datum is isomorphic to the cosimplicial module $(A/R)_\bullet \otimes_R M$.*

Proof. Omitted. \square

Definition 34.3.4. Let $R \rightarrow A$ be a ring map. We say a descent datum (N, φ) is *effective* if there exists an R -module M and an isomorphism of descent data from $(M \otimes_R A, \text{can})$ to (N, φ) .

Let $R \rightarrow A$ be a ring map. Let (N, φ) be a descent datum. We may take the cochain complex $s(N_\bullet)$ associated with N_\bullet (see Simplicial, Section 14.24). It has the following shape:

$$N \rightarrow A \otimes_R N \rightarrow A \otimes_R A \otimes_R N \rightarrow \dots$$

We can describe the maps. The first map is the map

$$n \mapsto 1 \otimes n - \varphi(n \otimes 1).$$

The second map on pure tensors has the values

$$a \otimes n \mapsto 1 \otimes a \otimes n - a \otimes 1 \otimes n + a \otimes \varphi(n \otimes 1).$$

It is clear how the pattern continues.

In the special case where $N = A \otimes_R M$ we see that for any $m \in M$ the element $1 \otimes m$ is in the kernel of the first map of the cochain complex associated to the cosimplicial module $(A/R)_\bullet \otimes_R M$. Hence we get an extended cochain complex

$$(34.3.4.1) \quad 0 \rightarrow M \rightarrow A \otimes_R M \rightarrow A \otimes_R A \otimes_R M \rightarrow \dots$$

Here we think of the 0 as being in degree -2 , the module M in degree -1 , the module $A \otimes_R M$ in degree 0, etc. Note that this complex has the shape

$$0 \rightarrow R \rightarrow A \rightarrow A \otimes_R A \rightarrow A \otimes_R A \otimes_R A \rightarrow \dots$$

when $M = R$.

Lemma 34.3.5. *Suppose that $R \rightarrow A$ has a section. Then for any R -module M the extended cochain complex (34.3.4.1) is exact.*

Proof. By Simplicial, Lemma 14.27.4 the map $R \rightarrow (A/R)_\bullet$ is a homotopy equivalence of cosimplicial R -algebras (here R denotes the constant cosimplicial R -algebra). Hence $M \rightarrow (A/R)_\bullet \otimes_R M$ is a homotopy equivalence in the category of cosimplicial R -modules, because $\otimes_R M$ is a functor from the category of R -algebras to the category of R -modules, see Simplicial, Lemma 14.27.3. This implies that the induced map of associated complexes is a homotopy equivalence, see Simplicial, Lemma 14.27.5. Since the complex associated to the constant cosimplicial R -module M is the complex

$$M \xrightarrow{0} M \xrightarrow{1} M \xrightarrow{0} M \xrightarrow{1} M \dots$$

we win (since the extended version simply puts an extra M at the beginning). \square

Lemma 34.3.6. *Suppose that $R \rightarrow A$ is faithfully flat, see Algebra, Definition 10.38.1. Then for any R -module M the extended cochain complex (34.3.4.1) is exact.*

Proof. Suppose we can show there exists a faithfully flat ring map $R \rightarrow R'$ such that the result holds for the ring map $R' \rightarrow A' = R' \otimes_R A$. Then the result follows for $R \rightarrow A$. Namely, for any R -module M the cosimplicial module $(M \otimes_R R') \otimes_{R'} (A'/R')_\bullet$ is just the cosimplicial module $R' \otimes_R (M \otimes_R (A/R)_\bullet)$. Hence the vanishing of cohomology of the complex associated to $(M \otimes_R R') \otimes_{R'} (A'/R')_\bullet$ implies the vanishing of the cohomology of the complex associated to $M \otimes_R (A/R)_\bullet$ by faithful flatness of $R \rightarrow R'$. Similarly for the vanishing of cohomology groups in degrees -1 and 0 of the extended complex (proof omitted).

But we have such a faithful flat extension. Namely $R' = A$ works because the ring map $R' = A \rightarrow A' = A \otimes_A A$ has a section $a \otimes a' \mapsto aa'$ and Lemma 34.3.5 applies. \square

Here is how the complex relates to the question of effectivity.

Lemma 34.3.7. *Let $R \rightarrow A$ be a faithfully flat ring map. Let (N, φ) be a descent datum. Then (N, φ) is effective if and only if the canonical map*

$$A \otimes_R H^0(s(N_\bullet)) \longrightarrow N$$

is an isomorphism.

Proof. If (N, φ) is effective, then we may write $N = A \otimes_R M$ with $\varphi = \text{can}$. It follows that $H^0(s(N_\bullet)) = M$ by Lemmas 34.3.3 and 34.3.6. Conversely, suppose the map of the lemma is an isomorphism. In this case set $M = H^0(s(N_\bullet))$. This is an R -submodule of N , namely $M = \{n \in N \mid 1 \otimes n = \varphi(n \otimes 1)\}$. The only thing to check is that via the isomorphism $A \otimes_R M \rightarrow N$ the canonical descent data agrees with φ . We omit the verification. \square

Lemma 34.3.8. *Let $R \rightarrow A$ be a ring map, and let $R \rightarrow R'$ be faithfully flat. Set $A' = R' \otimes_R A$. If all descent data for $R' \rightarrow A'$ are effective, then so are all descent data for $R \rightarrow A$.*

Proof. Let (N, φ) be a descent datum for $R \rightarrow A$. Set $N' = R' \otimes_R N = A' \otimes_A N$, and denote $\varphi' = \text{id}_{R'} \otimes \varphi$ the base change of the descent datum φ . Then (N', φ') is a descent datum for $R' \rightarrow A'$ and $H^0(s(N'_\bullet)) = R' \otimes_R H^0(s(N_\bullet))$. Moreover, the map $A' \otimes_{R'} H^0(s(N'_\bullet)) \rightarrow N'$ is identified with the base change of the A -module map $A \otimes_R H^0(s(N)) \rightarrow N$ via the faithfully flat map $A \rightarrow A'$. Hence we conclude by Lemma 34.3.7. \square

Here is the main result of this section. Its proof may seem a little clumsy; for a more highbrow approach see Remark 34.3.11 below.

Proposition 34.3.9. *Let $R \rightarrow A$ be a faithfully flat ring map. Then*

- (1) *any descent datum on modules with respect to $R \rightarrow A$ is effective,*
- (2) *the functor $M \mapsto (A \otimes_R M, \text{can})$ from R -modules to the category of descent data is an equivalence, and*
- (3) *the inverse functor is given by $(N, \varphi) \mapsto H^0(s(N_\bullet))$.*

Proof. We only prove (1) and omit the proofs of (2) and (3). As $R \rightarrow A$ is faithfully flat, there exists a faithfully flat base change $R \rightarrow R'$ such that $R' \rightarrow A' = R' \otimes_R A$ has a section (namely take $R' = A$ as in the proof of Lemma 34.3.6). Hence, using Lemma 34.3.8 we may assume that $R \rightarrow A$ as a section, say $\sigma : A \rightarrow R$. Let (N, φ) be a descent datum relative to $R \rightarrow A$. Set

$$M = H^0(s(N_\bullet)) = \{n \in N \mid 1 \otimes n = \varphi(n \otimes 1)\} \subset N$$

By Lemma 34.3.7 it suffices to show that $A \otimes_R M \rightarrow N$ is an isomorphism.

Take an element $n \in N$. Write $\varphi(n \otimes 1) = \sum a_i \otimes x_i$ for certain $a_i \in A$ and $x_i \in N$. By Lemma 34.3.2 we have $n = \sum a_i x_i$ in N (because $\sigma_0^0 \circ \delta_0^1 = \text{id}$ in any cosimplicial object). Next, write $\varphi(x_i \otimes 1) = \sum a_{ij} \otimes y_j$ for certain $a_{ij} \in A$ and $y_j \in N$. The cocycle condition means that

$$\sum a_i \otimes a_{ij} \otimes y_j = \sum a_i \otimes 1 \otimes x_i$$

in $A \otimes_R A \otimes_R N$. We conclude two things from this. First, by applying σ to the first A we conclude that $\sum \sigma(a_i) \varphi(x_i \otimes 1) = \sum \sigma(a_i) \otimes x_i$ which means that $\sum \sigma(a_i) x_i \in M$. Next, by applying σ to the middle A and multiplying out we conclude that $\sum_i a_i (\sum_j \sigma(a_{ij}) y_j) = \sum a_i x_i = n$. Hence by the first conclusion we see that $A \otimes_R M \rightarrow N$ is surjective. Finally, suppose that $m_i \in M$ and $\sum a_i m_i = 0$. Then we see by applying φ to $\sum a_i m_i \otimes 1$ that $\sum a_i \otimes m_i = 0$. In other words $A \otimes_R M \rightarrow N$ is injective and we win. \square

Remark 34.3.10. Let R be a ring. Let $f_1, \dots, f_n \in R$ generate the unit ideal. The ring $A = \prod_i R_{f_i}$ is a faithfully flat R -algebra. We remark that the cosimplicial ring $(A/R)_\bullet$ has the following ring in degree n :

$$\prod_{i_0, \dots, i_n} R_{f_{i_0} \dots f_{i_n}}$$

Hence the results above recover Algebra, Lemmas 10.22.1, 10.22.2 and 10.23.4. But the results above actually say more because of exactness in higher degrees. Namely, it implies that Čech cohomology of quasi-coherent sheaves on affines is trivial, see (insert future reference here).

Remark 34.3.11. Let R be a ring. Let A_\bullet be a cosimplicial R -algebra. In this setting a descent datum corresponds to an cosimplicial A_\bullet -module M_\bullet with the property that for every $n, m \geq 0$ and every $\varphi : [n] \rightarrow [m]$ the map $M(\varphi) : M_n \rightarrow M_m$ induces an isomorphism

$$M_n \otimes_{A_n, A(\varphi)} A_m \longrightarrow M_m.$$

Let us call such a cosimplicial module a *cartesian module*. In this setting, the proof of Proposition 34.3.9 can be split in the following steps

- (1) If $R \rightarrow R'$ is faithfully flat, $R \rightarrow A$ any ring map, then descent data for A/R are effective if descent data for $(R' \otimes_R A)/R'$ are effective.
- (2) Let A be an R -algebra. Descent data for A/R correspond to cartesian $(A/R)_\bullet$ -modules.
- (3) If $R \rightarrow A$ has a section then $(A/R)_\bullet$ is homotopy equivalent to R , the constant cosimplicial R -algebra with value R .
- (4) If $A_\bullet \rightarrow B_\bullet$ is a homotopy equivalence of cosimplicial R -algebras then the functor $M_\bullet \mapsto M_\bullet \otimes_{A_\bullet} B_\bullet$ induces an equivalence of categories between cartesian A_\bullet -modules and cartesian B_\bullet -modules.

For (1) see Lemma 34.3.8. Part (2) uses Lemma 34.3.2. Part (3) we have seen in the proof of Lemma 34.3.5 (it relies on Simplicial, Lemma 14.27.4). Moreover, part (4) is a triviality if you think about it right!

34.4. Descent for universally injective morphisms

Numerous constructions in algebraic geometry are made using techniques of *descent*, such as constructing objects over a given space by first working over a somewhat larger space which projects down to the given space, or verifying a property of a space or a morphism by pulling back along a covering map. The utility of such techniques is of course dependent on identification of a wide class of *effective descent morphisms*. Early in the Grothendieckian development of modern algebraic geometry, the class of morphisms which are *quasi-compact* and *faithfully flat* was shown to be effective for descending objects, morphisms, and many properties thereof.

As usual, this statement comes down to a property of rings and modules. For a homomorphism $f : R \rightarrow S$ to be an effective descent morphism for modules, Grothendieck showed that it is sufficient for f to be faithfully flat. However, this excludes many natural examples: for instance, any split ring homomorphism is an effective descent morphism. One natural example of this even arises in the proof of faithfully flat descent: for $f : R \rightarrow S$ any ring homomorphism, $1_S \otimes f : S \rightarrow S \otimes_R S$ is split by the multiplication map whether or not it is flat.

One may then ask whether one there is a natural ring-theoretic condition implying effective descent for modules which includes both the case of a faithfully flat morphism and that of a split ring homomorphism. It may surprise the reader (at least it surprised this author) to learn that a complete answer to this question has been known since around 1970! Namely, it is not hard to check that a necessary condition for $f : R \rightarrow S$ to be an effective descent morphism for modules is that f must be *universally injective* in the category of R -modules, that is, for any R -module M , the map $1_M \otimes f : M \rightarrow M \otimes_R S$ must be injective. This then turns out to be a sufficient condition as well. For example, if f is split in the category

of R -modules (but not necessarily in the category of rings), then f is an effective descent morphism for modules.

The history of this result is a bit involved: it was originally asserted by Olivier [Oli70], who called universally injective morphisms *pure*, but without a clear indication of proof. One can extract the result from the work of Joyal and Tierney [JT84], but to the best of our knowledge, the first free-standing proof to appear in the literature is that of Mesablishvili [Mes00]. The first purpose of this section is to expose Mesablishvili’s proof; this requires little modification of his original presentation aside from correcting typos, with the one exception that we make explicit the relationship between the customary definition of a descent datum in algebraic geometry and the one used in [Mes00]. The proof turns to be entirely category-theoretic, and consequently can be put in the language of monads (and thus applied in other contexts); see [JT04].

The second purpose of this section is to collect some information about which properties of modules, algebras, and morphisms can be descended along universally injective ring homomorphisms. The cases of finite modules and flat modules were treated by Mesablishvili [Mes02].

34.4.1. Category-theoretic preliminaries. We start by recalling a few basic notions from category theory which will simplify the exposition. In this subsection, fix an ambient category.

For two morphisms $g_1, g_2 : B \rightarrow C$, recall that an *equalizer* of g_1 and g_2 is a morphism $f : A \rightarrow B$ which satisfies $g_1 \circ f = g_2 \circ f$ and is universal for this property. This second statement means that any commutative diagram

without the dashed arrow can be uniquely completed. We also say in this situation that the diagram

$$(34.4.1.1) \quad A \xrightarrow{f} B \begin{array}{c} \xrightarrow{g_1} \\ \xrightarrow{g_2} \end{array} C$$

is an equalizer. Reversing arrows gives the definition of a *coequalizer*. See Categories, Sections 4.10 and 4.11.

Since it involves a universal property, the property of being an equalizer is typically not stable under applying a covariant functor. Just as for monomorphisms and epimorphisms, one can get around this in some cases by exhibiting splittings.

Definition 34.4.2. A *split equalizer* is a diagram (34.4.1.1) with $g_1 \circ f = g_2 \circ f$ for which there exist auxiliary morphisms $h : B \rightarrow A$ and $i : C \rightarrow B$ such that

$$(34.4.2.1) \quad h \circ f = 1_A, \quad f \circ h = i \circ g_1, \quad i \circ g_2 = 1_B.$$

The point is that the equalities among arrows force (34.4.1.1) to be an equalizer: the map e factors uniquely through f by writing $e = f \circ (h \circ e)$. Consequently, applying a covariant functor to a split equalizer gives a split equalizer; applying a contravariant functor gives a *split coequalizer*, whose definition is apparent.

34.4.3. Universally injective morphisms. Recall that *Rings* denotes the category of commutative rings with 1. For an object R of *Rings* we denote Mod_R the category of R -modules.

Remark 34.4.4. Any functor $F : \mathcal{A} \rightarrow \mathcal{B}$ of abelian categories which is exact and takes nonzero objects to nonzero objects reflects injections and surjections. Namely, exactness implies that F preserves kernels and cokernels (compare with Homology, Section 12.7). For example, if $f : R \rightarrow S$ is a faithfully flat ring homomorphism, then $\bullet \otimes_R S : \text{Mod}_R \rightarrow \text{Mod}_S$ has these properties.

Let R be a ring. Recall that a morphism $f : M \rightarrow N$ in Mod_R is *universally injective* if for all $P \in \text{Mod}_R$, the morphism $f \otimes 1_P : M \otimes_R P \rightarrow N \otimes_R P$ is injective. See Algebra, Definition 10.79.1.

Definition 34.4.5. A ring map $f : R \rightarrow S$ is *universally injective* if it is universally injective as a morphism in Mod_R .

Example 34.4.6. Any split injection in Mod_R is universally injective. In particular, any split injection in *Rings* is universally injective.

Example 34.4.7. For a ring R and $f_1, \dots, f_n \in R$ generating the unit ideal, the morphism $R \rightarrow R_{f_1} \oplus \dots \oplus R_{f_n}$ is universally injective. Although this is immediate from Lemma 34.4.8, it is instructive to check it directly: we immediately reduce to the case where R is local, in which case some f_i must be a unit and so the map $R \rightarrow R_{f_i}$ is an isomorphism.

Lemma 34.4.8. *Any faithfully flat ring map is universally injective.*

Proof. This is a reformulation of Algebra, Lemma 10.79.11. \square

The key observation from [Mes00] is that universal injectivity can be usefully reformulated in terms of a splitting, using the usual construction of an injective cogenerator in Mod_R .

Definition 34.4.9. Let R be a ring. Define the contravariant functor $C : \text{Mod}_R \rightarrow \text{Mod}_R$ by setting

$$C(M) = \text{Hom}_{\text{Ab}}(M, \mathbf{Q}/\mathbf{Z}),$$

with the R -action on $C(M)$ given by $rf(s) = f(rs)$.

This functor was denoted $M \mapsto M^\vee$ in More on Algebra, Section 15.42.

Lemma 34.4.10. *For a ring R , the functor $C : \text{Mod}_R \rightarrow \text{Mod}_R$ is exact and reflects injections and surjections.*

Proof. Exactness is More on Algebra, Lemma 15.42.2 and the other properties follow from this, see Remark 34.4.4. \square

Remark 34.4.11. We will use frequently the standard adjunction between Hom and tensor product, in the form of the natural isomorphism of contravariant functors

$$(34.4.11.1) \quad C(\bullet_1 \otimes_R \bullet_2) \cong \text{Hom}_R(\bullet_1, C(\bullet_2)) : \text{Mod}_R \times \text{Mod}_R \rightarrow \text{Mod}_R$$

taking $f : M_1 \otimes_R M_2 \rightarrow \mathbf{Q}/\mathbf{Z}$ to the map $m_1 \mapsto (m_2 \mapsto f(m_1 \otimes m_2))$. See Algebra, Lemma 10.13.5. A corollary of this observation is that if

$$C(M) \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{\quad} \end{array} C(N) \xrightarrow{\quad} C(P)$$

is a split coequalizer diagram in Mod_R , then so is

$$C(M \otimes_R Q) \begin{array}{c} \xrightarrow{\quad\quad\quad} \\ \xrightarrow{\quad\quad\quad} \end{array} C(N \otimes_R Q) \xrightarrow{\quad\quad\quad} C(P \otimes_R Q)$$

for any $Q \in \text{Mod}_R$.

Lemma 34.4.12. *Let R be a ring. A morphism $f : M \rightarrow N$ in Mod_R is universally injective if and only if $C(f) : C(N) \rightarrow C(M)$ is a split surjection.*

Proof. By (34.4.11.1), for any $P \in \text{Mod}_R$ we have a commutative diagram

$$\begin{array}{ccc} \text{Hom}_R(P, C(N)) & \xrightarrow{\text{Hom}_R(P, C(f))} & \text{Hom}_R(P, C(M)) \\ \downarrow \cong & & \downarrow \cong \\ C(P \otimes_R N) & \xrightarrow{C(1_P \otimes f)} & C(P \otimes_R M). \end{array}$$

If f is universally injective, then $1_{C(M)} \otimes f : C(M) \otimes_R M \rightarrow C(M) \otimes_R N$ is injective, so both rows in the above diagram are surjective for $P = C(M)$. We may thus lift $1_{C(M)} \in \text{Hom}_R(C(M), C(M))$ to some $g \in \text{Hom}_R(C(N), C(M))$ splitting $C(f)$. Conversely, if $C(f)$ is a split surjection, then both rows in the above diagram are surjective, so by Lemma 34.4.10, $1_P \otimes f$ is injective. \square

Remark 34.4.13. Let $f : M \rightarrow N$ be a universally injective morphism in Mod_R . By choosing a splitting g of $C(f)$, we may construct a functorial splitting of $C(1_P \otimes f)$ for each $P \in \text{Mod}_R$. Namely, by (34.4.11.1) this amounts to splitting $\text{Hom}_R(P, C(f))$ functorially in P , and this is achieved by the map $g \circ \bullet$.

34.4.14. Descent for modules and their morphisms. Throughout this subsection, fix a ring map $f : R \rightarrow S$. As seen in Section 34.3 we can use the language of cosimplicial algebras to talk about descent data for modules, but in this subsection we prefer a more down to earth terminology.

For $i = 1, 2, 3$, let S_i be the i -fold tensor product of S over R . Define the ring homomorphisms $\delta_0^1, \delta_1^1 : S_1 \rightarrow S_2$, $\delta_{01}^1, \delta_{02}^1, \delta_{12}^1 : S_1 \rightarrow S_3$, and $\delta_0^2, \delta_1^2, \delta_2^2 : S_2 \rightarrow S_3$ by the formulas

$$\begin{aligned} \delta_0^1(a_0) &= 1 \otimes a_0 \\ \delta_1^1(a_0) &= a_0 \otimes 1 \\ \delta_0^2(a_0 \otimes a_1) &= 1 \otimes a_0 \otimes a_1 \\ \delta_1^2(a_0 \otimes a_1) &= a_0 \otimes 1 \otimes a_1 \\ \delta_2^2(a_0 \otimes a_1) &= a_0 \otimes a_1 \otimes 1 \\ \delta_{01}^1(a_0) &= 1 \otimes 1 \otimes a_0 \\ \delta_{02}^1(a_0) &= 1 \otimes a_0 \otimes 1 \\ \delta_{12}^1(a_0) &= a_0 \otimes 1 \otimes 1. \end{aligned}$$

In other words, the upper index indicates the source ring, while the lower index indicates where to insert factors of 1. (This notation is compatible with the notation introduced in Section 34.3.)

Recall³ from Definition 34.3.1 that for $M \in \text{Mod}_S$, a *descent datum* on M relative to f is an isomorphism

$$\theta : M \otimes_{S, \delta_0^1} S_2 \longrightarrow M \otimes_{S, \delta_1^1} S_2$$

of S_2 -modules satisfying the *cocycle condition*

$$(34.4.14.1) \quad (\theta \otimes \delta_2^2) \circ (\theta \otimes \delta_2^0) = (\theta \otimes \delta_2^1) : M \otimes_{S, \delta_{01}^1} S_3 \rightarrow M \otimes_{S, \delta_{12}^1} S_3.$$

Let $DD_{S/R}$ be the category of S -modules equipped with descent data relative to f .

For example, for $M_0 \in \text{Mod}_R$ and a choice of isomorphism $M \cong M_0 \otimes_R S$ gives rise to a descent datum by identifying $M \otimes_{S, \delta_0^1} S_2$ and $M \otimes_{S, \delta_1^1} S_2$ naturally with $M_0 \otimes_R S_2$. This construction in particular defines a functor $f^* : \text{Mod}_R \rightarrow DD_{S/R}$.

Definition 34.4.15. The functor $f^* : \text{Mod}_R \rightarrow DD_{S/R}$ is called *base extension along f* . We say that f is a *descent morphism for modules* if f^* is fully faithful. We say that f is an *effective descent morphism for modules* if f^* is an equivalence of categories.

Our goal is to show that for f universally injective, we can use θ to locate M_0 within M . This process makes crucial use of some equalizer diagrams.

Lemma 34.4.16. *For $(M, \theta) \in DD_{S/R}$, the diagram*

(34.4.16.1)

$$M \xrightarrow{\theta \circ (1_M \otimes \delta_0^1)} M \otimes_{S, \delta_1^1} S_2 \begin{array}{c} \xrightarrow{(\theta \otimes \delta_2^2) \circ (1_M \otimes \delta_0^2)} \\ \xrightarrow{1_M \otimes_{S_2} \delta_1^2} \end{array} M \otimes_{S, \delta_{12}^1} S_3$$

is a split equalizer.

Proof. Define the ring homomorphisms $\sigma_0^0 : S_2 \rightarrow S_1$ and $\sigma_0^1, \sigma_1^1 : S_3 \rightarrow S_2$ by the formulas

$$\begin{aligned} \sigma_0^0(a_0 \otimes a_1) &= a_0 a_1 \\ \sigma_0^1(a_0 \otimes a_1 \otimes a_2) &= a_0 a_1 \otimes a_2 \\ \sigma_1^1(a_0 \otimes a_1 \otimes a_2) &= a_0 \otimes a_1 a_2. \end{aligned}$$

We then take the auxiliary morphisms to be $1_M \otimes \sigma_0^0 : M \otimes_{S, \delta_1^1} S_2 \rightarrow M$ and $1_M \otimes \sigma_0^1 : M \otimes_{S, \delta_{12}^1} S_3 \rightarrow M \otimes_{S, \delta_1^1} S_2$. Of the compatibilities required in (34.4.2.1), the first follows from tensoring the cocycle condition (34.4.14.1) with σ_1^1 and the others are immediate. \square

Lemma 34.4.17. *For $(M, \theta) \in DD_{S/R}$, the diagram*

(34.4.17.1)

$$C(M \otimes_{S, \delta_{12}^1} S_3) \begin{array}{c} \xrightarrow{C((\theta \otimes \delta_2^2) \circ (1_M \otimes \delta_0^2))} \\ \xrightarrow{C(1_M \otimes_{S_2} \delta_1^2)} \end{array} C(M \otimes_{S, \delta_1^1} S_2) \xrightarrow{C(\theta \circ (1_M \otimes \delta_0^1))} C(M).$$

obtained by applying C to (34.4.16.1) is a split coequalizer.

Proof. Omitted. \square

³To be precise, our θ here is the inverse of φ from Definition 34.3.1.

Lemma 34.4.18. *The diagram*

$$(34.4.18.1) \quad S_1 \xrightarrow{\delta_1^1} S_2 \begin{array}{c} \xrightarrow{\delta_2^2} \\ \xrightarrow{\delta_1^2} \end{array} S_3$$

is a split equalizer.

Proof. In Lemma 34.4.16, take $(M, \theta) = f^*(S)$. □

This suggests a definition of a potential quasi-inverse functor for f^* .

Definition 34.4.19. Define the functor $f_* : DD_{S/R} \rightarrow \text{Mod}_R$ by taking $f_*(M, \theta)$ to be the R -submodule of M for which the diagram

(34.4.19.1)

$$f_*(M, \theta) \longrightarrow M \begin{array}{c} \xrightarrow{\theta \circ (1_M \otimes \delta_0^1)} \\ \xrightarrow{1_M \otimes \delta_1^1} \end{array} M \otimes_{S, \delta_1^1} S_2$$

is an equalizer.

Using Lemma 34.4.16 and the fact that the restriction functor $\text{Mod}_S \rightarrow \text{Mod}_R$ is right adjoint to the base extension functor $\bullet \otimes_R S : \text{Mod}_R \rightarrow \text{Mod}_S$, we deduce that f_* is right adjoint to f^* .

We are ready for the key lemma. In the faithfully flat case this is a triviality (see Remark 34.4.21), but in the general case some argument is needed.

Lemma 34.4.20. *If f is universally injective, then the diagram*

(34.4.20.1)

$$f_*(M, \theta) \otimes_R S \xrightarrow{\theta \circ (1_M \otimes \delta_0^1)} M \otimes_{S, \delta_1^1} S_2 \begin{array}{c} \xrightarrow{(\theta \otimes \delta_2^2) \circ (1_M \otimes \delta_0^2)} \\ \xrightarrow{1_M \otimes \delta_2^2 \otimes \delta_1^2} \end{array} M \otimes_{S, \delta_{12}^2} S_3$$

obtained by tensoring (34.4.19.1) over R with S is an equalizer.

Proof. By Lemma 34.4.12 and Remark 34.4.13, the map $C(1_N \otimes f) : C(N \otimes_R S) \rightarrow C(N)$ can be split functorially in N . This gives the upper vertical arrows in the commutative diagram

$$\begin{array}{ccccc} C(M \otimes_{S, \delta_1^1} S_2) & \begin{array}{c} \xrightarrow{C(\theta \circ (1_M \otimes \delta_0^1))} \\ \xrightarrow{C(1_M \otimes \delta_1^1)} \end{array} & C(M) & \xrightarrow{\quad} & C(f_*(M, \theta)) \\ \downarrow & & \downarrow & & \downarrow \\ C(M \otimes_{S, \delta_{12}^2} S_3) & \begin{array}{c} \xrightarrow{C((\theta \otimes \delta_2^2) \circ (1_M \otimes \delta_0^2))} \\ \xrightarrow{C(1_M \otimes \delta_2^2 \otimes \delta_1^2)} \end{array} & C(M \otimes_{S, \delta_1^1} S_2) & \xrightarrow{C(\theta \circ (1_M \otimes \delta_0^1))} & C(M) \\ \downarrow & & \downarrow & \nearrow & \downarrow \\ C(M \otimes_{S, \delta_1^1} S_2) & \begin{array}{c} \xrightarrow{C(\theta \circ (1_M \otimes \delta_0^1))} \\ \xrightarrow{C(1_M \otimes \delta_1^1)} \end{array} & C(M) & \xrightarrow{\quad} & C(f_*(M, \theta)) \end{array}$$

in which the compositions along the columns are identity morphisms. The second row is the coequalizer diagram (34.4.17.1); this produces the dashed arrow. From the top right square, we obtain auxiliary morphisms $C(f_*(M, \theta)) \rightarrow C(M)$ and $C(M) \rightarrow C(M \otimes_{S, \delta_1^1} S_2)$ which imply that the first row is a split coequalizer diagram.

By Remark 34.4.11, we may tensor with S inside C to obtain the split coequalizer diagram

$$C(M \otimes_{S, \delta_2^2 \circ \delta_1^1} S_3) \begin{array}{c} \xrightarrow{C((\theta \otimes \delta_2^2) \circ (1_M \otimes \delta_0^2))} \\ \xrightarrow{C(1_M \otimes_{S_2} \otimes \delta_1^2)} \end{array} C(M \otimes_{S, \delta_1^1} S_2) \xrightarrow{C(\theta \circ (1_M \otimes \delta_0^1))} C(f_*(M, \theta) \otimes_R S).$$

By Lemma 34.4.10, we conclude (34.4.20.1) must also be an equalizer. □

Remark 34.4.21. If f is a split injection in Mod_R , one can simplify the argument by splitting f directly, without using C . Things are even simpler if f is faithfully flat; in this case, the conclusion of Lemma 34.4.20 is immediate because tensoring over R with S preserves all equalizers.

Theorem 34.4.22. *The following conditions are equivalent.*

- (a) *The morphism f is a descent morphism for modules.*
- (b) *The morphism f is an effective descent morphism for modules.*
- (c) *The morphism f is universally injective.*

Proof. It is clear that (b) implies (a). We now check that (a) implies (c). If f is not universally injective, we can find $M \in \text{Mod}_R$ such that the map $1_M \otimes f : M \rightarrow M \otimes_R S$ has nontrivial kernel N . The natural projection $M \rightarrow M/N$ is not an isomorphism, but its image in $DD_{S/R}$ is an isomorphism. Hence f^* is not fully faithful.

We finally check that (c) implies (b). By Lemma 34.4.20, for $(M, \theta) \in DD_{S/R}$, the natural map $f^* f_*(M, \theta) \rightarrow M$ is an isomorphism of S -modules. On the other hand, for $M_0 \in \text{Mod}_R$, we may tensor (34.4.18.1) with M_0 over R to obtain an equalizer sequence, so $M_0 \rightarrow f_* f^* M$ is an isomorphism. Consequently, f_* and f^* are quasi-inverse functors, proving the claim. □

34.4.23. Descent for properties of modules. Throughout this subsection, fix a universally injective ring map $f : R \rightarrow S$, an object $M \in \text{Mod}_R$, and a ring map $R \rightarrow A$. We now investigate the question of which properties of M or A can be checked after base extension along f . We start with some results from [Mes02].

Lemma 34.4.24. *If $M \in \text{Mod}_R$ is flat, then $C(M)$ is an injective R -module.*

Proof. Let $0 \rightarrow N \rightarrow P \rightarrow Q \rightarrow 0$ be an exact sequence in Mod_R . Since M is flat,

$$0 \rightarrow N \otimes_R M \rightarrow P \otimes_R M \rightarrow Q \otimes_R M \rightarrow 0$$

is exact. By Lemma 34.4.10,

$$0 \rightarrow C(Q \otimes_R M) \rightarrow C(P \otimes_R M) \rightarrow C(N \otimes_R M) \rightarrow 0$$

is exact. By (34.4.11.1), this last sequence can be rewritten as

$$0 \rightarrow \text{Hom}_R(Q, C(M)) \rightarrow \text{Hom}_R(P, C(M)) \rightarrow \text{Hom}_R(N, C(M)) \rightarrow 0.$$

Hence $C(M)$ is an injective object of Mod_R . □

Theorem 34.4.25. *If $M \otimes_R S$ has one of the following properties as an S -module*

- (a) *finitely generated;*
- (b) *finitely presented;*
- (c) *flat;*
- (d) *faithfully flat;*

(e) *finite projective*;

then so does M as an R -module (and conversely).

Proof. To prove (a), choose a finite set $\{n_i\}$ of generators of $M \otimes_R S$ in Mod_S . Write each n_i as $\sum_j m_{ij} \otimes s_{ij}$ with $m_{ij} \in M$ and $s_{ij} \in S$. Let F be the finite free R -module with basis e_{ij} and let $F \rightarrow M$ be the R -module map sending e_{ij} to m_{ij} . Then $F \otimes_R S \rightarrow M \otimes_R S$ is surjective, so $\text{Coker}(F \rightarrow M) \otimes_R S$ is zero and hence $\text{Coker}(F \rightarrow M)$ is zero. This proves (a).

To see (b) assume $M \otimes_R S$ is finitely presented. Then M is finitely generated by (a). Choose a surjection $R^{\oplus n} \rightarrow M$ with kernel K . Then $K \otimes_R S \rightarrow S^{\oplus n} \rightarrow M \otimes_R S \rightarrow 0$ is exact. By Algebra, Lemma 10.5.3 the kernel of $S^{\oplus n} \rightarrow M \otimes_R S$ is a finite S -module. Thus we can find finitely many elements $k_1, \dots, k_t \in K$ such that the images of $k_i \otimes 1$ in $S^{\oplus n}$ generate the kernel of $S^{\oplus n} \rightarrow M \otimes_R S$. Let $K' \subset K$ be the submodule generated by k_1, \dots, k_t . Then $M' = R^{\oplus n}/K'$ is a finitely presented R -module with a morphism $M' \rightarrow M$ such that $M' \otimes_R S \rightarrow M \otimes_R S$ is an isomorphism. Thus $M' \cong M$ as desired.

To prove (c), let $0 \rightarrow M' \rightarrow M'' \rightarrow M \rightarrow 0$ be a short exact sequence in Mod_R . Since $\bullet \otimes_R S$ is a right exact functor, $M'' \otimes_R S \rightarrow M \otimes_R S$ is surjective. So by Lemma 34.4.10 the map $C(M \otimes_R S) \rightarrow C(M'' \otimes_R S)$ is injective. If $M \otimes_R S$ is flat, then Lemma 34.4.24 shows $C(M \otimes_R S)$ is an injective object of Mod_S , so the injection $C(M \otimes_R S) \rightarrow C(M'' \otimes_R S)$ is split in Mod_S and hence also in Mod_R . Since $C(M \otimes_R S) \rightarrow C(M)$ is a split surjection by Lemma 34.4.12, it follows that $C(M) \rightarrow C(M'')$ is a split injection in Mod_R . That is, the sequence

$$0 \rightarrow C(M) \rightarrow C(M'') \rightarrow C(M') \rightarrow 0$$

is split exact. For $N \in \text{Mod}_R$, by (34.4.11.1) we see that

$$0 \rightarrow C(M \otimes_R N) \rightarrow C(M'' \otimes_R N) \rightarrow C(M' \otimes_R N) \rightarrow 0$$

is split exact. By Lemma 34.4.10,

$$0 \rightarrow M' \otimes_R N \rightarrow M'' \otimes_R N \rightarrow M \otimes_R N \rightarrow 0$$

is exact. This implies M is flat over R . Namely, taking M' a free module surjecting onto M we conclude that $\text{Tor}_1^R(M, N) = 0$ for all modules N and we can use Algebra, Lemma 10.72.7. This proves (c).

To deduce (d) from (c), note that if $N \in \text{Mod}_R$ and $M \otimes_R N$ is zero, then $M \otimes_R S \otimes_S (N \otimes_R S) \cong (M \otimes_R N) \otimes_R S$ is zero, so $N \otimes_R S$ is zero and hence N is zero.

To deduce (e) at this point, it suffices to recall that M is finitely generated and projective if and only if it is finitely presented and flat. See Algebra, Lemma 10.75.2. \square

There is a variant for R -algebras.

Theorem 34.4.26. *If $A \otimes_R S$ has one of the following properties as an S -algebra*

- (a) *of finite type*;
- (b) *of finite presentation*;
- (c) *formally unramified*;
- (d) *unramified*;
- (e) *étale*;

then so does A as an R -algebra (and of course conversely).

Proof. To prove (a), choose a finite set $\{x_i\}$ of generators of $A \otimes_R S$ over S . Write each x_i as $\sum_j y_{ij} \otimes s_{ij}$ with $y_{ij} \in A$ and $s_{ij} \in S$. Let F be the polynomial R -algebra on variables e_{ij} and let $F \rightarrow M$ be the R -algebra map sending e_{ij} to y_{ij} . Then $F \otimes_R S \rightarrow A \otimes_R S$ is surjective, so $\text{Coker}(F \rightarrow A) \otimes_R S$ is zero and hence $\text{Coker}(F \rightarrow A)$ is zero. This proves (a).

To see (b) assume $A \otimes_R S$ is a finitely presented S -algebra. Then A is finite type over R by (a). Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$ with kernel I . Then $I \otimes_R S \rightarrow S[x_1, \dots, x_n] \rightarrow A \otimes_R S \rightarrow 0$ is exact. By Algebra, Lemma 10.6.3 the kernel of $S[x_1, \dots, x_n] \rightarrow A \otimes_R S$ is a finitely generated ideal. Thus we can find finitely many elements $y_1, \dots, y_t \in I$ such that the images of $y_i \otimes 1$ in $S[x_1, \dots, x_n]$ generate the kernel of $S[x_1, \dots, x_n] \rightarrow A \otimes_R S$. Let $I' \subset I$ be the ideal generated by y_1, \dots, y_t . Then $A' = R[x_1, \dots, x_n]/I'$ is a finitely presented R -algebra with a morphism $A' \rightarrow A$ such that $A' \otimes_R S \rightarrow A \otimes_R S$ is an isomorphism. Thus $A' \cong A$ as desired.

To prove (c), recall that A is formally unramified over R if and only if the module of relative differentials $\Omega_{A/R}$ vanishes, see Algebra, Lemma 10.141.2 or [GD67, Proposition 17.2.1]. Since $\Omega_{(A \otimes_R S)/S} = \Omega_{A/R} \otimes_R S$, the vanishing descends by Theorem 34.4.22.

To deduce (d) from the previous cases, recall that A is unramified over R if and only if A is formally unramified and of finite type over R , see Algebra, Lemma 10.144.2.

To prove (e), recall that by Algebra, Lemma 10.138.8 or [GD67, Théorème 17.6.1] the algebra A is étale over R if and only if A is flat, unramified, and of finite presentation over R . \square

Remark 34.4.27. It would make things easier to have a faithfully flat ring homomorphism $g : R \rightarrow T$ for which $T \rightarrow S \otimes_R T$ has some extra structure. For instance, if one could ensure that $T \rightarrow S \otimes_R T$ is split in *Rings*, then it would follow that every property of a module or algebra which is stable under base extension and which descends along faithfully flat morphisms also descends along universally injective morphisms. An obvious guess would be to find g for which T is not only faithfully flat but also injective in Mod_R , but even for $R = \mathbf{Z}$ no such homomorphism can exist.

34.5. Fpqc descent of quasi-coherent sheaves

The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.

Lemma 34.5.1. *Let S be an affine scheme. Let $\mathcal{U} = \{f_i : U_i \rightarrow S\}_{i=1, \dots, n}$ be a standard fpqc covering of S , see Topologies, Definition 33.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U} = \{U_i \rightarrow S\}$ is effective. Moreover, the functor from the category of quasi-coherent \mathcal{O}_S -modules to the category of descent data with respect to \mathcal{U} is fully faithful.*

Proof. This is a restatement of Proposition 34.3.9 in terms of schemes. First, note that a descent datum ξ for quasi-coherent sheaves with respect to \mathcal{U} is exactly the same as a descent datum ξ' for quasi-coherent sheaves with respect to the covering $\mathcal{U}' = \{\coprod_{i=1, \dots, n} U_i \rightarrow S\}$. Moreover, effectivity for ξ is the same as effectivity for

ξ' . Hence we may assume $n = 1$, i.e., $\mathcal{U} = \{U \rightarrow S\}$ where U and S are affine. In this case descent data correspond to descent data on modules with respect to the ring map

$$\Gamma(S, \mathcal{O}) \longrightarrow \Gamma(U, \mathcal{O}).$$

Since $U \rightarrow S$ is surjective and flat, we see that this ring map is faithfully flat. In other words, Proposition 34.3.9 applies and we win. \square

Proposition 34.5.2. *Let S be a scheme. Let $\mathcal{U} = \{\varphi_i : U_i \rightarrow S\}$ be an fpqc covering, see Topologies, Definition 33.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U} = \{U_i \rightarrow S\}$ is effective. Moreover, the functor from the category of quasi-coherent \mathcal{O}_S -modules to the category of descent data with respect to \mathcal{U} is fully faithful.*

Proof. Let $S = \bigcup_{j \in J} V_j$ be an affine open covering. For $j, j' \in J$ we denote $V_{jj'} = V_j \cap V_{j'}$, the intersection (which need not be affine). For $V \subset S$ open we denote $\mathcal{U}_V = \{V \times_S U_i \rightarrow V\}_{i \in I}$ which is a fpqc-covering (Topologies, Lemma 33.8.7). By definition of an fpqc covering, we can find for each $j \in J$ a finite set K_j , a map $\dot{i} : K_j \rightarrow I$, affine opens $U_{\dot{i}(k), k} \subset U_{\dot{i}(k)}$, $k \in K_j$ such that $\mathcal{V}_j = \{U_{\dot{i}(k), k} \rightarrow V_j\}_{k \in K_j}$ is a standard fpqc covering of V_j . And of course, \mathcal{V}_j is a refinement of \mathcal{U}_{V_j} . Picture

$$\begin{array}{ccccc} \mathcal{V}_j & \longrightarrow & \mathcal{U}_{V_j} & \longrightarrow & \mathcal{U} \\ \downarrow & & \downarrow & & \downarrow \\ V_j & \xlongequal{\quad} & V_j & \longrightarrow & S \end{array}$$

where the top horizontal arrows are morphisms of families of morphisms with fixed target (see Sites, Definition 7.8.1).

To prove the proposition you show successively the faithfulness, fullness, and essential surjectivity of the functor from quasi-coherent sheaves to descent data.

Faithfulness. Let \mathcal{F}, \mathcal{G} be quasi-coherent sheaves on S and let $a, b : \mathcal{F} \rightarrow \mathcal{G}$ be homomorphisms of \mathcal{O}_S -modules. Suppose $\varphi_i^*(a) = \varphi_i^*(b)$ for all i . Pick $s \in S$. Then $s = \varphi_i(u)$ for some $i \in I$ and $u \in U_i$. Since $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{U_i, u}$ is flat, hence faithfully flat (Algebra, Lemma 10.38.16) we see that $a_s = b_s : \mathcal{F}_s \rightarrow \mathcal{G}_s$. Hence $a = b$.

Fully faithfulness. Let \mathcal{F}, \mathcal{G} be quasi-coherent sheaves on S and let $a_i : \varphi_i^* \mathcal{F} \rightarrow \varphi_i^* \mathcal{G}$ be homomorphisms of \mathcal{O}_{U_i} -modules such that $\text{pr}_0^* a_i = \text{pr}_1^* a_j$ on $U_i \times_U U_j$. We can pull back these morphisms to get morphisms

$$a_k : \mathcal{F}|_{U_{\dot{i}(k), k}} \longrightarrow \mathcal{G}|_{U_{\dot{i}(k), k}}$$

$k \in K_j$ with notation as above. Moreover, Lemma 34.2.2 assures us that these define a morphism between (canonical) descent data on \mathcal{V}_j . Hence, by Lemma 34.5.1, we get correspondingly unique morphisms $a_j : \mathcal{F}|_{V_j} \rightarrow \mathcal{G}|_{V_j}$. To see that $a_j|_{V_{jj'}} = a_{j'}|_{V_{jj'}}$, we use that both a_j and $a_{j'}$ agree with the pullback of the morphism $(a_i)_{i \in I}$ of (canonical) descent data to any covering refining both $\mathcal{V}_{j, V_{jj'}}$ and $\mathcal{V}_{j', V_{jj'}}$, and using the faithfulness already shown. For example the covering $\mathcal{V}_{jj'} = \{V_k \times_S V_{k'} \rightarrow V_{jj'}\}_{k \in K_j, k' \in K_{j'}}$ will do.

Essential surjectivity. Let $\xi = (\mathcal{F}_i, \varphi_{ii'})$ be a descent datum for quasi-coherent sheaves relative to the covering \mathcal{U} . Pull back this descent datum to get descent

data ξ_j for quasi-coherent sheaves relative to the coverings \mathcal{V}_j of V_j . By Lemma 34.5.1 once again there exist quasi-coherent sheaves \mathcal{F}_j on V_j whose associated canonical descent datum is isomorphic to ξ_j . By fully faithfulness (proved above) we see there are isomorphisms

$$\phi_{jj'} : \mathcal{F}_j|_{V_{jj'}} \longrightarrow \mathcal{F}_{j'}|_{V_{jj'}}$$

corresponding to the isomorphism of descent data between the pullback of ξ_j and $\xi_{j'}$ to $\mathcal{V}_{jj'}$. To see that these maps $\phi_{jj'}$ satisfy the cocycle condition we use faithfulness (proved above) over the triple intersections $V_{jj'j''}$. Hence, by Lemma 34.2.4 we see that the sheaves \mathcal{F}_j glue to a quasi-coherent sheaf \mathcal{F} as desired. We still have to verify that the canonical descent datum relative to \mathcal{U} associated to \mathcal{F} is isomorphic to the descent datum we started out with. This verification is omitted. \square

34.6. Descent of finiteness properties of modules

In this section we prove that one can check quasi-coherent module has a certain finiteness conditions by checking on the members of a covering.

Lemma 34.6.1. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a finite type \mathcal{O}_{X_i} -module. Then \mathcal{F} is a finite type \mathcal{O}_X -module.*

Proof. Omitted. For the affine case, see Algebra, Lemma 10.80.2. \square

Lemma 34.6.2. *Let $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ be a morphism of locally ringed spaces. Let \mathcal{F} be a sheaf of \mathcal{O}_Y -modules. If*

- (1) *f is open as a map of topological spaces,*
- (2) *f is surjective and flat, and*
- (3) *$f^*\mathcal{F}$ is of finite type,*

then \mathcal{F} is of finite type.

Proof. Let $y \in Y$ be a point. Choose a point $x \in X$ mapping to y . Choose an open $x \in U \subset X$ and elements s_1, \dots, s_n of $f^*\mathcal{F}(U)$ which generate $f^*\mathcal{F}$ over U . Since $f^*\mathcal{F} = f^{-1}\mathcal{F} \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{O}_X$ we can after shrinking U assume $s_i = \sum t_{ij} \otimes a_{ij}$ with $t_{ij} \in f^{-1}\mathcal{F}(U)$ and $a_{ij} \in \mathcal{O}_X(U)$. After shrinking U further we may assume that t_{ij} comes from a section $s_{ij} \in \mathcal{F}(V)$ for some $V \subset Y$ open with $f(U) \subset V$. Let N be the number of sections s_{ij} and consider the map

$$\sigma = (s_{ij}) : \mathcal{O}_V^{\oplus N} \rightarrow \mathcal{F}|_V$$

By our choice of the sections we see that $f^*\sigma|_U$ is surjective. Hence for every $u \in U$ the map

$$\sigma_{f(u)} \otimes_{\mathcal{O}_{Y,f(u)}} \mathcal{O}_{X,u} : \mathcal{O}_{X,u}^{\oplus N} \longrightarrow \mathcal{F}_{f(u)} \otimes_{\mathcal{O}_{Y,f(u)}} \mathcal{O}_{X,u}$$

is surjective. As f is flat, the local ring map $\mathcal{O}_{Y,f(u)} \rightarrow \mathcal{O}_{X,u}$ is flat, hence faithfully flat (Algebra, Lemma 10.38.16). Hence $\sigma_{f(u)}$ is surjective. Since f is open, $f(U)$ is an open neighbourhood of y and the proof is done. \square

Lemma 34.6.3. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is an \mathcal{O}_{X_i} -module of finite presentation. Then \mathcal{F} is an \mathcal{O}_X -module of finite presentation.*

Proof. Omitted. For the affine case, see Algebra, Lemma 10.80.2. \square

Lemma 34.6.4. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is locally generated by r sections as an \mathcal{O}_{X_i} -module. Then \mathcal{F} is locally generated by r sections as an \mathcal{O}_X -module.*

Proof. By Lemma 34.6.1 we see that \mathcal{F} is of finite type. Hence Nakayama's lemma (Algebra, Lemma 10.19.1) implies that \mathcal{F} is generated by r sections in the neighbourhood of a point $x \in X$ if and only if $\dim_{\kappa(x)} \mathcal{F}_x \otimes \kappa(x) \leq r$. Choose an i and a point $x_i \in X_i$ mapping to x . Then $\dim_{\kappa(x)} \mathcal{F}_x \otimes \kappa(x) = \dim_{\kappa(x_i)} (f_i^* \mathcal{F})_{x_i} \otimes \kappa(x_i)$ which is $\leq r$ as $f_i^* \mathcal{F}$ is locally generated by r sections. \square

Lemma 34.6.5. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a flat \mathcal{O}_{X_i} -module. Then \mathcal{F} is a flat \mathcal{O}_X -module.*

Proof. Omitted. For the affine case, see Algebra, Lemma 10.80.2. \square

Lemma 34.6.6. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a finite locally free \mathcal{O}_{X_i} -module. Then \mathcal{F} is a finite locally free \mathcal{O}_X -module.*

Proof. This follows from the fact that a quasi-coherent sheaf is finite locally free if and only if it is of finite presentation and flat, see Algebra, Lemma 10.75.2. Namely, if each $f_i^* \mathcal{F}$ is flat and of finite presentation, then so is \mathcal{F} by Lemmas 34.6.5 and 34.6.3. \square

The definition of a locally projective quasi-coherent sheaf can be found in Properties, Section 27.19.

Lemma 34.6.7. *Let X be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a locally projective \mathcal{O}_{X_i} -module. Then \mathcal{F} is a locally projective \mathcal{O}_X -module.*

Proof. Omitted. For Zariski coverings this is Properties, Lemma 27.19.2. For the affine case this is Algebra, Theorem 10.92.5. \square

Remark 34.6.8. Being locally free is a property of quasi-coherent modules which does not descend in the fpqc topology. Namely, suppose that R is a ring and that M is a projective R -module which is a countable direct sum $M = \bigoplus L_n$ of rank 1 locally free modules, but not locally free, see Examples, Lemma 82.26.5. Then M becomes free on making the faithfully flat base change

$$R \longrightarrow \bigoplus_{m \geq 1} \bigoplus_{(i_1, \dots, i_m) \in \mathbb{Z}^{\oplus m}} L_1^{\otimes i_1} \otimes_R \dots \otimes_R L_m^{\otimes i_m}$$

But we don't know what happens for fppf coverings. In other words, we don't know the answer to the following question: Suppose $A \rightarrow B$ is a faithfully flat ring map of finite presentation. Let M be an A -module such that $M \otimes_A B$ is free. Is M a locally free A -module? It turns out that if A is Noetherian, then the answer is yes. This follows from the results of [Bas63]. But in general we don't know the answer. If you know the answer, or have a reference, please email stacks.project@gmail.com.

We also add here two results which are related to the results above, but are of a slightly different nature.

Lemma 34.6.9. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is a finite morphism. Then \mathcal{F} is an \mathcal{O}_X -module of finite type if and only if $f_*\mathcal{F}$ is an \mathcal{O}_Y -module of finite type.*

Proof. As f is finite it is affine. This reduces us to the case where f is the morphism $\text{Spec}(B) \rightarrow \text{Spec}(A)$ given by a finite ring map $A \rightarrow B$. Moreover, then $\mathcal{F} = \widetilde{M}$ is the sheaf of modules associated to the B -module M . Note that M is finite as a B -module if and only if M is finite as an A -module, see Algebra, Lemma 10.7.2. Combined with Properties, Lemma 27.16.1 this proves the lemma. \square

Lemma 34.6.10. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is finite and of finite presentation. Then \mathcal{F} is an \mathcal{O}_X -module of finite presentation if and only if $f_*\mathcal{F}$ is an \mathcal{O}_Y -module of finite presentation.*

Proof. As f is finite it is affine. This reduces us to the case where f is the morphism $\text{Spec}(B) \rightarrow \text{Spec}(A)$ given by a finite and finitely presented ring map $A \rightarrow B$. Moreover, then $\mathcal{F} = \widetilde{M}$ is the sheaf of modules associated to the B -module M . Note that M is finitely presented as a B -module if and only if M is finitely presented as an A -module, see Algebra, Lemma 10.7.4. Combined with Properties, Lemma 27.16.2 this proves the lemma. \square

34.7. Quasi-coherent sheaves and topologies

Let S be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_S -module. Consider the functor

$$(34.7.0.1) \quad (Sch/S)^{opp} \longrightarrow Ab, \quad (f : T \rightarrow S) \longmapsto \Gamma(T, f^*\mathcal{F}).$$

Lemma 34.7.1. *Let S be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_S -module. Let $\tau \in \{\text{Zariski}, \text{fpqc}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. The functor defined in (34.7.0.1) satisfies the sheaf condition with respect to any τ -covering $\{T_i \rightarrow T\}_{i \in I}$ of any scheme T over S .*

Proof. For $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$ a τ -covering is also a fpqc-covering, see the results in Topologies, Lemmas 33.4.2, 33.5.2, 33.6.2, 33.7.2, and 33.8.6. Hence it suffices to prove the theorem for a fpqc covering. Assume that $\{f_i : T_i \rightarrow T\}_{i \in I}$ is an fpqc covering where $f : T \rightarrow S$ is given. Suppose that we have a family of sections $s_i \in \Gamma(T_i, f_i^*f^*\mathcal{F})$ such that $s_i|_{T_i \times_T T_j} = s_j|_{T_i \times_T T_j}$. We have to find the correspond section $s \in \Gamma(T, f^*\mathcal{F})$. We can reinterpret the s_i as a family of maps $\varphi_i : f_i^*\mathcal{O}_T = \mathcal{O}_{T_i} \rightarrow f_i^*f^*\mathcal{F}$ compatible with the canonical descent data associated to the quasi-coherent sheaves \mathcal{O}_T and $f^*\mathcal{F}$ on T . Hence by Proposition 34.5.2 we see that we may (uniquely) descend these to a map $\mathcal{O}_T \rightarrow f^*\mathcal{F}$ which gives us our section s . \square

We may in particular make the following definition.

Definition 34.7.2. Let $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Let S be a scheme. Let Sch_τ be a big site containing S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_S -module.

- (1) The *structure sheaf of the big site* $(Sch/S)_\tau$ is the sheaf of rings $T/S \mapsto \Gamma(T, \mathcal{O}_T)$ which is denoted \mathcal{O} or \mathcal{O}_S .
- (2) If $\tau = \text{étale}$ the *structure sheaf of the small site* $S_{\text{étale}}$ is the sheaf of rings $T/S \mapsto \Gamma(T, \mathcal{O}_T)$ which is denoted \mathcal{O} or \mathcal{O}_S .

- (3) The *sheaf of \mathcal{O} -modules associated to \mathcal{F}* on the big site $(Sch/S)_\tau$ is the sheaf of \mathcal{O} -modules $(f : T \rightarrow S) \mapsto \Gamma(T, f^*\mathcal{F})$ which is denoted \mathcal{F}^a (and often simply \mathcal{F}).
- (4) Let $\tau = \text{étale}$ (resp. $\tau = \text{Zariski}$). The *sheaf of \mathcal{O} -modules associated to \mathcal{F}* on the small site $S_{\text{étale}}$ (resp. S_{Zar}) is the sheaf of \mathcal{O} -modules $(f : T \rightarrow S) \mapsto \Gamma(T, f^*\mathcal{F})$ which is denoted \mathcal{F}^a (and often simply \mathcal{F}).

Note how we use the same notation \mathcal{F}^a in each case. No confusion can really arise from this as by definition the rule that defines the sheaf \mathcal{F}^a is independent of the site we choose to look at.

Remark 34.7.3. In Topologies, Lemma 33.3.11 we have seen that the small Zariski site of a scheme S is equivalent to S as a topological space in the sense that the category of sheaves are naturally equivalent. Now that S_{Zar} is also endowed with a structure sheaf \mathcal{O} we see that sheaves of modules on the ringed site $(S_{\text{Zar}}, \mathcal{O})$ agree with sheaves of modules on the ringed space (S, \mathcal{O}_S) .

Remark 34.7.4. Let $f : T \rightarrow S$ be a morphism of schemes. Each of the morphisms of sites f_{sites} listed in Topologies, Section 33.9 becomes a morphism of ringed sites. Namely, each of these morphisms of sites $f_{\text{sites}} : (Sch/T)_\tau \rightarrow (Sch/S)_{\tau'}$, or $f_{\text{sites}} : (Sch/S)_\tau \rightarrow S_{\tau'}$ is given by the continuous functor $S'/S \mapsto T \times_S S'/S$. Hence, given S'/S we let

$$f_{\text{sites}}^\# : \mathcal{O}(S'/S) \longrightarrow f_{\text{sites},*}\mathcal{O}(S'/S) = \mathcal{O}(S \times_S S'/T)$$

be the usual map $\text{pr}_{S'}^\# : \mathcal{O}(S') \rightarrow \mathcal{O}(T \times_S S')$. Similarly, the morphism $i_f : Sh(T_\tau) \rightarrow Sh((Sch/S)_\tau)$ for $\tau \in \{\text{Zar}, \text{étale}\}$, see Topologies, Lemmas 33.3.12 and 33.4.12, becomes a morphism of ringed topoi because $i_f^{-1}\mathcal{O} = \mathcal{O}$. Here are some special cases:

- (1) The morphism of big sites $f_{\text{big}} : (Sch/X)_{\text{fppf}} \rightarrow (Sch/Y)_{\text{fppf}}$, becomes a morphism of ringed sites

$$(f_{\text{big}}, f_{\text{big}}^\#) : ((Sch/X)_{\text{fppf}}, \mathcal{O}_X) \longrightarrow ((Sch/Y)_{\text{fppf}}, \mathcal{O}_Y)$$

as in Modules on Sites, Definition 18.6.1. Similarly for the big syntomic, smooth, étale and Zariski sites.

- (2) The morphism of small sites $f_{\text{small}} : X_{\text{étale}} \rightarrow Y_{\text{étale}}$ becomes a morphism of ringed sites

$$(f_{\text{small}}, f_{\text{small}}^\#) : (X_{\text{étale}}, \mathcal{O}_X) \longrightarrow (Y_{\text{étale}}, \mathcal{O}_Y)$$

as in Modules on Sites, Definition 18.6.1. Similarly for the small Zariski site.

Let S be a scheme. It is clear that given an \mathcal{O} -module on (say) $(Sch/S)_{\text{Zar}}$ the pullback to (say) $(Sch/S)_{\text{fppf}}$ is just the fppf-sheafification. To see what happens when comparing big and small sites we have the following.

Lemma 34.7.5. *Let S be a scheme. Denote*

$$\begin{aligned} id_{\tau, \text{Zar}} & : (Sch/S)_\tau \rightarrow S_{\text{Zar}}, & \tau \in \{\text{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\} \\ id_{\tau, \text{étale}} & : (Sch/S)_\tau \rightarrow S_{\text{étale}}, & \tau \in \{\text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\} \\ id_{\text{small}, \text{étale}, \text{Zar}} & : S_{\text{étale}} \rightarrow S_{\text{Zar}}, \end{aligned}$$

the morphisms of ringed sites of Remark 34.7.4. Let \mathcal{F} be a sheaf of \mathcal{O}_S -modules which we view a sheaf of \mathcal{O} -modules on S_{Zar} . Then

- (1)
- $(id_{\tau, Zar})^* \mathcal{F}$
- is the
- τ
- sheafification of the Zariski sheaf

$$(f : T \rightarrow S) \mapsto \Gamma(T, f^* \mathcal{F})$$

on $(Sch/S)_{\tau}$, and

- (2)
- $(id_{small, \acute{e}tale, Zar})^* \mathcal{F}$
- is the étale sheafification of the Zariski sheaf

$$(f : T \rightarrow S) \mapsto \Gamma(T, f^* \mathcal{F})$$

on $S_{\acute{e}tale}$.

Let \mathcal{G} be a sheaf of \mathcal{O} -modules on $S_{\acute{e}tale}$. Then

- (3)
- $(id_{\tau, \acute{e}tale})^* \mathcal{G}$
- is the
- τ
- sheafification of the étale sheaf

$$(f : T \rightarrow S) \mapsto \Gamma(T, f_{small}^* \mathcal{G})$$

where $f_{small} : T_{\acute{e}tale} \rightarrow S_{\acute{e}tale}$ is the morphism of ringed small étale sites of Remark 34.7.4.

Proof. Proof of (1). We first note that the result is true when $\tau = Zar$ because in that case we have the morphism of topoi $i_f : Sh(T_{Zar}) \rightarrow Sh(Sch/S)_{Zar}$ such that $id_{\tau, Zar} \circ i_f = f_{small}$ as morphisms $T_{Zar} \rightarrow S_{Zar}$, see Topologies, Lemmas 33.3.12 and 33.3.16. Since pullback is transitive (see Modules on Sites, Lemma 18.13.3) we see that $i_f^*(id_{\tau, Zar})^* \mathcal{F} = f_{small}^* \mathcal{F}$ as desired. Hence, by the remark preceding this lemma we see that $(id_{\tau, Zar})^* \mathcal{F}$ is the τ -sheafification of the presheaf $T \mapsto \Gamma(T, f^* \mathcal{F})$.

The proof of (3) is exactly the same as the proof of (1), except that it uses Topologies, Lemmas 33.4.12 and 33.4.16. We omit the proof of (2). \square

Remark 34.7.6. Remark 34.7.4 and Lemma 34.7.5 have the following applications:

- (1) Let S be a scheme. The construction $\mathcal{F} \mapsto \mathcal{F}^a$ is the pullback under the morphism of ringed sites $id_{\tau, Zar} : ((Sch/S)_{\tau}, \mathcal{O}) \rightarrow (S_{Zar}, \mathcal{O})$ or the morphism $id_{small, \acute{e}tale, Zar} : (S_{\acute{e}tale}, \mathcal{O}) \rightarrow (S_{Zar}, \mathcal{O})$.
- (2) Let $f : X \rightarrow Y$ be a morphism of schemes. For any of the morphisms f_{sites} of ringed sites of Remark 34.7.4 we have

$$(f^* \mathcal{F})^a = f_{sites}^* \mathcal{F}^a.$$

This follows from (1) and the fact that pullbacks are compatible with compositions of morphisms of ringed sites, see Modules on Sites, Lemma 18.13.3.

Lemma 34.7.7. Let S be a scheme. Let \mathcal{F} be a quasi-coherent \mathcal{O}_S -module. Let $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$.

- (1) The sheaf \mathcal{F}^a is a quasi-coherent \mathcal{O} -module on $(Sch/S)_{\tau}$, as defined in Modules on Sites, Definition 18.23.1.
- (2) If $\tau = \acute{e}tale$ (resp. $\tau = Zariski$), then the sheaf \mathcal{F}^a is a quasi-coherent \mathcal{O} -module on $S_{\acute{e}tale}$ (resp. S_{Zar}) as defined in Modules on Sites, Definition 18.23.1.

Proof. Let $\{S_i \rightarrow S\}$ be a Zariski covering such that we have exact sequences

$$\bigoplus_{k \in K_i} \mathcal{O}_{S_i} \longrightarrow \bigoplus_{j \in J_i} \mathcal{O}_{S_i} \longrightarrow \mathcal{F} \longrightarrow 0$$

for some index sets K_i and J_i . This is possible by the definition of a quasi-coherent sheaf on a ringed space (See Modules, Definition 17.10.1).

Proof of (1). Let $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. It is clear that $\mathcal{F}^a|_{(Sch/S_i)_\tau}$ also sits in an exact sequence

$$\bigoplus_{k \in K_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \bigoplus_{j \in J_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{F}^a|_{(Sch/S_i)_\tau} \longrightarrow 0$$

Hence \mathcal{F}^a is quasi-coherent by Modules on Sites, Lemma 18.23.3.

Proof of (2). Let $\tau = \text{étale}$. It is clear that $\mathcal{F}^a|_{(S_i)_{\text{étale}}}$ also sits in an exact sequence

$$\bigoplus_{k \in K_i} \mathcal{O}|_{(S_i)_{\text{étale}}} \longrightarrow \bigoplus_{j \in J_i} \mathcal{O}|_{(S_i)_{\text{étale}}} \longrightarrow \mathcal{F}^a|_{(S_i)_{\text{étale}}} \longrightarrow 0$$

Hence \mathcal{F}^a is quasi-coherent by Modules on Sites, Lemma 18.23.3. The case $\tau = \text{Zariski}$ is similar (actually, it is really tautological since the corresponding ringed topoi agree). \square

Lemma 34.7.8. *Let S be a scheme. Let*

- (a) $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$ and $\mathcal{C} = (Sch/S)_\tau$, or
- (b) let $\tau = \text{étale}$ and $\mathcal{C} = S_{\text{étale}}$, or
- (c) let $\tau = \text{Zariski}$ and $\mathcal{C} = S_{\text{Zar}}$.

Let \mathcal{F} be an abelian sheaf on \mathcal{C} . Let $U \in \text{Ob}(\mathcal{C})$ be affine. Let $\{U_i \rightarrow U\}_{i=1, \dots, n}$ be a standard affine τ -covering in \mathcal{C} . Then

- (1) $\mathcal{V} = \{\coprod_{i=1, \dots, n} U_i \rightarrow U\}$ is a τ -covering of U ,
- (2) \mathcal{U} is a refinement of \mathcal{V} , and
- (3) the induced map on Čech complexes (Cohomology on Sites, Equation (21.9.2.1))

$$\check{C}^\bullet(\mathcal{V}, \mathcal{F}) \longrightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

is an isomorphism of complexes.

Proof. This follows because

$$\left(\coprod_{i_0=1, \dots, n} U_{i_0}\right) \times_U \dots \times_U \left(\coprod_{i_p=1, \dots, n} U_{i_p}\right) = \coprod_{i_0, \dots, i_p \in \{1, \dots, n\}} U_{i_0} \times_U \dots \times_U U_{i_p}$$

and the fact that $\mathcal{F}(\coprod_a V_a) = \prod_a \mathcal{F}(V_a)$ since disjoint unions are τ -coverings. \square

Lemma 34.7.9. *Let S be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on S . Let $\tau, \mathcal{C}, U, \mathcal{U}$ be as in Lemma 34.7.8. Then there is an isomorphism of complexes*

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}^a) \cong s((A/R)_\bullet \otimes_R M)$$

(see Section 34.3) where $R = \Gamma(U, \mathcal{O}_U)$, $M = \Gamma(U, \mathcal{F}^a)$ and $R \rightarrow A$ is a faithfully flat ring map. In particular

$$\check{H}^p(\mathcal{U}, \mathcal{F}^a) = 0$$

for all $p \geq 1$.

Proof. By Lemma 34.7.8 we see that $\check{C}^\bullet(\mathcal{U}, \mathcal{F}^a)$ is isomorphic to $\check{C}^\bullet(\mathcal{V}, \mathcal{F}^a)$ where $\mathcal{V} = \{V \rightarrow U\}$ with $V = \coprod_{i=1, \dots, n} U_i$ affine also. Set $A = \Gamma(V, \mathcal{O}_V)$. Since $\{V \rightarrow U\}$ is a τ -covering we see that $R \rightarrow A$ is faithfully flat. On the other hand, by definition of \mathcal{F}^a we have that the degree p term $\check{C}^p(\mathcal{V}, \mathcal{F}^a)$ is

$$\Gamma(V \times_U \dots \times_U V, \mathcal{F}^a) = \Gamma(\text{Spec}(A \otimes_R \dots \otimes_R A), \mathcal{F}^a) = A \otimes_R \dots \otimes_R A \otimes_R M$$

We omit the verification that the maps of the check complex agree with the maps in the complex $s((A/R)_\bullet \otimes_R M)$. The vanishing of cohomology is Lemma 34.3.6. \square

Proposition 34.7.10. *Let S be a scheme. Let \mathcal{F} be a quasi-coherent sheaf on S . Let $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$.*

(1) *There is a canonical isomorphism*

$$H^q(S, \mathcal{F}) = H^q((Sch/S)_\tau, \mathcal{F}^a).$$

(2) *There are canonical isomorphisms*

$$H^q(S, \mathcal{F}) = H^q(S_{Zar}, \mathcal{F}^a) = H^q(S_{\acute{e}tale}, \mathcal{F}^a).$$

Proof. The result for $q = 0$ is clear from the definition of \mathcal{F}^a . Let $\mathcal{C} = (Sch/S)_\tau$, or $\mathcal{C} = S_{\acute{e}tale}$, or $\mathcal{C} = S_{Zar}$.

We are going to apply Cohomology on Sites, Lemma 21.11.9 with $\mathcal{F} = \mathcal{F}^a$, $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ the set of affine schemes in \mathcal{C} , and $\text{Cov} \subset \text{Cov}_{\mathcal{C}}$ the set of standard affine τ -coverings. Assumption (3) of the lemma is satisfied by Lemma 34.7.9. Hence we conclude that $H^p(U, \mathcal{F}^a) = 0$ for every affine object U of \mathcal{C} .

Next, let $U \in \text{Ob}(\mathcal{C})$ be any separated object. Denote $f : U \rightarrow S$ the structure morphism. Let $U = \bigcup U_i$ be an affine open covering. We may also think of this as a τ -covering $\mathcal{U} = \{U_i \rightarrow U\}$ of U in \mathcal{C} . Note that $U_{i_0} \times_U \dots \times_U U_{i_p} = U_{i_0} \cap \dots \cap U_{i_p}$ is affine as we assumed U separated. By Cohomology on Sites, Lemma 21.11.7 and the result above we see that

$$H^p(U, \mathcal{F}^a) = \check{H}^p(\mathcal{U}, \mathcal{F}^a) = H^p(U, f^* \mathcal{F})$$

the last equality by Cohomology of Schemes, Lemma 29.2.5. In particular, if S is separated we can take $U = S$ and $f = \text{id}_S$ and the proposition is proved. We suggest the reader skip the rest of the proof (or rewrite it to give a clearer exposition).

Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ on S . Choose an injective resolution $\mathcal{F}^a \rightarrow \mathcal{J}^\bullet$ on \mathcal{C} . Denote $\mathcal{J}^n|_S$ the restriction of \mathcal{J}^n to opens of S ; this is a sheaf on the topological space S as open coverings are τ -coverings. We get a complex

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{J}^0|_S \rightarrow \mathcal{J}^1|_S \rightarrow \dots$$

which is exact since its sections over any affine open $U \subset S$ is exact (by the vanishing of $H^p(U, \mathcal{F}^a)$, $p > 0$ seen above). Hence by Derived Categories, Lemma 13.18.6 there exists map of complexes $\mathcal{J}^\bullet|_S \rightarrow \mathcal{I}^\bullet$ which in particular induces a map

$$R\Gamma(\mathcal{C}, \mathcal{F}^a) = \Gamma(S, \mathcal{J}^\bullet) \longrightarrow \Gamma(S, \mathcal{I}^\bullet) = R\Gamma(S, \mathcal{F}).$$

Taking cohomology gives the map $H^n(\mathcal{C}, \mathcal{F}^a) \rightarrow H^n(S, \mathcal{F})$ which we have to prove is an isomorphism. Let $\mathcal{U} : S = \bigcup U_i$ be an affine open covering which we may think of as a τ -covering also. By the above we get a map of double complexes

$$\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{J}) = \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{J}|_S) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{I}).$$

This map induces a map of spectral sequences

$${}^\tau E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}^a)) \longrightarrow E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

The first spectral sequence converges to $H^{p+q}(\mathcal{C}, \mathcal{F})$ and the second to $H^{p+q}(S, \mathcal{F})$. On the other hand, we have seen that the induced maps ${}^\tau E_2^{p,q} \rightarrow E_2^{p,q}$ are bijections (as all the intersections are separated being opens in affines). Whence also the maps $H^n(\mathcal{C}, \mathcal{F}^a) \rightarrow H^n(S, \mathcal{F})$ are isomorphisms, and we win. \square

Proposition 34.7.11. *Let S be a scheme. Let $\tau \in \{\text{Zariski}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$.*

- (1) The functor $\mathcal{F} \mapsto \mathcal{F}^a$ defines an equivalence of categories

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh((Sch/S)_\tau, \mathcal{O})$$

between the category of quasi-coherent sheaves on S and the category of quasi-coherent \mathcal{O} -modules on the big τ site of S .

- (2) Let $\tau = \text{étale}$, or $\tau = \text{Zariski}$. The functor $\mathcal{F} \mapsto \mathcal{F}^a$ defines an equivalence of categories

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh(S_\tau, \mathcal{O})$$

between the category of quasi-coherent sheaves on S and the category of quasi-coherent \mathcal{O} -modules on the small τ site of S .

Proof. We have seen in Lemma 34.7.7 that the functor is well defined. It is straightforward to show that the functor is fully faithful (we omit the verification). To finish the proof we will show that a quasi-coherent \mathcal{O} -module on $(Sch/S)_\tau$ gives rise to a descent datum for quasi-coherent sheaves relative to a τ -covering of S . Having produced this descent datum we will appeal to Proposition 34.5.2 to get the corresponding quasi-coherent sheaf on S .

Let \mathcal{G} be a quasi-coherent \mathcal{O} -modules on the big τ site of S . By Modules on Sites, Definition 18.23.1 there exists a τ -covering $\{S_i \rightarrow S\}_{i \in I}$ of S such that each of the restrictions $\mathcal{G}|_{(Sch/S_i)_\tau}$ has a global presentation

$$\bigoplus_{k \in K_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \bigoplus_{j \in J_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{G}|_{(Sch/S_i)_\tau} \longrightarrow 0$$

for some index sets J_i and K_i . We claim that this implies that $\mathcal{G}|_{(Sch/S_i)_\tau}$ is \mathcal{F}_i^a for some quasi-coherent sheaf \mathcal{F}_i on S_i . Namely, this is clear for the direct sums $\bigoplus_{k \in K_i} \mathcal{O}|_{(Sch/S_i)_\tau}$ and $\bigoplus_{j \in J_i} \mathcal{O}|_{(Sch/S_i)_\tau}$. Hence we see that $\mathcal{G}|_{(Sch/S_i)_\tau}$ is a cokernel of a map $\varphi : \mathcal{K}_i^a \rightarrow \mathcal{L}_i^a$ for some quasi-coherent sheaves $\mathcal{K}_i, \mathcal{L}_i$ on S_i . By the fully faithfulness of $(\)^a$ we see that $\varphi = \phi^a$ for some map of quasi-coherent sheaves $\phi : \mathcal{K}_i \rightarrow \mathcal{L}_i$ on S_i . Then it is clear that $\mathcal{G}|_{(Sch/S_i)_\tau} \cong \text{Coker}(\phi)^a$ as claimed.

Since \mathcal{G} lives on all of the category $(Sch/S_i)_\tau$ we see that

$$(\text{pr}_0^* \mathcal{F}_i)^a \cong \mathcal{G}|_{(Sch/(S_i \times_S S_j))_\tau} \cong (\text{pr}_1^* \mathcal{F}_j)^a$$

as \mathcal{O} -modules on $(Sch/(S_i \times_S S_j))_\tau$. Hence, using fully faithfulness again we get canonical isomorphisms

$$\phi_{ij} : \text{pr}_0^* \mathcal{F}_i \longrightarrow \text{pr}_1^* \mathcal{F}_j$$

of quasi-coherent modules over $S_i \times_S S_j$. We omit the verification that these satisfy the cocycle condition. Since they do we see by effectivity of descent for quasi-coherent sheaves and the covering $\{S_i \rightarrow S\}$ (Proposition 34.5.2) that there exists a quasi-coherent sheaf \mathcal{F} on S with $\mathcal{F}|_{S_i} \cong \mathcal{F}_i$ compatible with the given descent data. In other words we are given \mathcal{O} -module isomorphisms

$$\phi_i : \mathcal{F}^a|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{G}|_{(Sch/S_i)_\tau}$$

which agree over $S_i \times_S S_j$. Hence, since $\text{Hom}_{\mathcal{O}}(\mathcal{F}^a, \mathcal{G})$ is a sheaf (Modules on Sites, Lemma 18.27.1), we conclude that there is a morphism of \mathcal{O} -modules $\mathcal{F}^a \rightarrow \mathcal{G}$ recovering the isomorphisms ϕ_i above. Hence this is an isomorphism and we win.

The case of the sites $S_{\text{étale}}$ and S_{Zar} is proved in the exact same manner. \square

Lemma 34.7.12. *Let S be a scheme. Let $\tau \in \{\text{Zariski, fppf, étale, smooth, syntomic}\}$. Let \mathcal{P} be one of the properties of modules⁴ defined in Modules on Sites, Definitions 18.17.1, 18.23.1, and 18.28.1. The equivalences of categories*

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh((Sch/S)_\tau, \mathcal{O}) \quad \text{and} \quad QCoh(\mathcal{O}_S) \longrightarrow QCoh(S_\tau, \mathcal{O})$$

defined by the rule $\mathcal{F} \mapsto \mathcal{F}^a$ seen in Proposition 34.7.11 have the property

$$\mathcal{F} \text{ has } \mathcal{P} \Leftrightarrow \mathcal{F}^a \text{ has } \mathcal{P} \text{ as an } \mathcal{O}\text{-module}$$

except (possibly) when \mathcal{P} is “locally free” or “coherent”. If $\mathcal{P} = \text{“coherent”}$ the equivalence holds for $QCoh(\mathcal{O}_S) \rightarrow QCoh(S_\tau, \mathcal{O})$ when S is locally Noetherian and τ is Zariski or étale.

Proof. This is immediate for the global properties, i.e., those defined in Modules on Sites, Definition 18.17.1. For the local properties we can use Modules on Sites, Lemma 18.23.3 to translate “ \mathcal{F}^a has \mathcal{P} ” into a property on the members of a covering of X . Hence the result follows from Lemmas 34.6.1, 34.6.3, 34.6.4, 34.6.5, and 34.6.6. Being coherent for a quasi-coherent module is the same as being of finite type over a locally Noetherian scheme (see Cohomology of Schemes, Lemma 29.9.1) hence this reduces to the case of finite type modules (details omitted). \square

Lemma 34.7.13. *Let S be a scheme. Let $\tau \in \{\text{Zariski, fppf, étale, smooth, syntomic}\}$. The functors*

$$QCoh(\mathcal{O}_S) \longrightarrow Mod((Sch/S)_\tau, \mathcal{O}) \quad \text{and} \quad QCoh(\mathcal{O}_S) \longrightarrow Mod(S_\tau, \mathcal{O})$$

defined by the rule $\mathcal{F} \mapsto \mathcal{F}^a$ seen in Proposition 34.7.11 are

- (1) *fully faithful,*
- (2) *compatible with direct sums,*
- (3) *compatible with colimits,*
- (4) *right exact,*
- (5) *exact as a functor $QCoh(\mathcal{O}_S) \rightarrow Mod(S_\tau, \mathcal{O})$,*
- (6) **not** *exact as a functor $QCoh(\mathcal{O}_S) \rightarrow Mod((Sch/S)_\tau, \mathcal{O})$ in general,*
- (7) *given two quasi-coherent \mathcal{O}_S -modules \mathcal{F}, \mathcal{G} we have $(\mathcal{F} \otimes_{\mathcal{O}_S} \mathcal{G})^a = \mathcal{F}^a \otimes_{\mathcal{O}} \mathcal{G}^a$,*
- (8) *given two quasi-coherent \mathcal{O}_S -modules \mathcal{F}, \mathcal{G} such that \mathcal{F} is of finite presentation we have $(\mathcal{H}om_{\mathcal{O}_S}(\mathcal{F}, \mathcal{G}))^a = \mathcal{H}om_{\mathcal{O}}(\mathcal{F}^a, \mathcal{G}^a)$, and*
- (9) *given a short exact sequence $0 \rightarrow \mathcal{F}_1^a \rightarrow \mathcal{E} \rightarrow \mathcal{F}_2^a \rightarrow 0$ of \mathcal{O} -modules then \mathcal{E} is quasi-coherent⁵, i.e., \mathcal{E} is in the essential image of the functor.*

Proof. Part (1) we saw in Proposition 34.7.11.

We have seen in Schemes, Section 25.24 that a colimit of quasi-coherent sheaves on a scheme is a quasi-coherent sheaf. Moreover, in Remark 34.7.6 we saw that $\mathcal{F} \mapsto \mathcal{F}^a$ is the pullback functor for a morphism of ringed sites, hence commutes with all colimits, see Modules on Sites, Lemma 18.14.3. Thus (3) and its special case (3) hold.

⁴The list is: free, finite free, generated by global sections, generated by r global sections, generated by finitely many global sections, having a global presentation, having a global finite presentation, locally free, finite locally free, locally generated by sections, locally generated by r sections, finite type, of finite presentation, coherent, or flat.

⁵Warning: This is misleading. See part (6).

This also shows that the functor is right exact (i.e., commutes with finite colimits), hence (4).

The functor $QCoh(\mathcal{O}_S) \rightarrow QCoh(S_{\acute{e}tale}, \mathcal{O})$, $\mathcal{F} \mapsto \mathcal{F}^a$ is left exact because an étale morphism is flat, see Morphisms, Lemma 28.37.12. This proves (5).

To see (6), suppose that $S = \text{Spec}(\mathbf{Z})$. Then $2 : \mathcal{O}_S \rightarrow \mathcal{O}_S$ is injective but the associated map of \mathcal{O} -modules on $(Sch/S)_\tau$ isn't injective because $2 : \mathbf{F}_2 \rightarrow \mathbf{F}_2$ isn't injective and $\text{Spec}(\mathbf{F}_2)$ is an object of $(Sch/S)_\tau$.

We omit the proofs of (7) and (8).

Let $0 \rightarrow \mathcal{F}_1^a \rightarrow \mathcal{E} \rightarrow \mathcal{F}_2^a \rightarrow 0$ be a short exact sequence of \mathcal{O} -modules with \mathcal{F}_1 and \mathcal{F}_2 quasi-coherent on S . Consider the restriction

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{E}|_{S_{Zar}} \rightarrow \mathcal{F}_2$$

to S_{Zar} . By Proposition 34.7.10 we see that on any affine $U \subset S$ we have $H^1(U, \mathcal{F}_1^a) = H^1(U, \mathcal{F}_1) = 0$. Hence the sequence above is also exact on the right. By Schemes, Section 25.24 we conclude that $\mathcal{F} = \mathcal{E}|_{S_{Zar}}$ is quasi-coherent. Thus we obtain a commutative diagram

$$\begin{array}{ccccccc} & & \mathcal{F}_1^a & \longrightarrow & \mathcal{F}^a & \longrightarrow & \mathcal{F}_2^a \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{F}_1^a & \longrightarrow & \mathcal{E} & \longrightarrow & \mathcal{F}_2^a \longrightarrow 0 \end{array}$$

To finish the proof it suffices to show that the top row is also right exact. To do this, denote once more $U = \text{Spec}(A) \subset S$ an affine open of S . We have seen above that $0 \rightarrow \mathcal{F}_1(U) \rightarrow \mathcal{E}(U) \rightarrow \mathcal{F}_2(U) \rightarrow 0$ is exact. For any affine scheme V/U , $V = \text{Spec}(B)$ the map $\mathcal{F}_1^a(V) \rightarrow \mathcal{E}(V)$ is injective. We have $\mathcal{F}_1^a(V) = \mathcal{F}_1(U) \otimes_A B$ by definition. The injection $\mathcal{F}_1^a(V) \rightarrow \mathcal{E}(V)$ factors as

$$\mathcal{F}_1(U) \otimes_A B \rightarrow \mathcal{E}(U) \otimes_A B \rightarrow \mathcal{E}(V)$$

Considering A -algebras B of the form $B = A \oplus M$ we see that $\mathcal{F}_1(U) \rightarrow \mathcal{E}(U)$ is universally injective (see Algebra, Definition 10.79.1). Since $\mathcal{E}(U) = \mathcal{F}(U)$ we conclude that $\mathcal{F}_1 \rightarrow \mathcal{F}$ remains injective after any base change, or equivalently that $\mathcal{F}_1^a \rightarrow \mathcal{F}^a$ is injective. \square

Proposition 34.7.14. *Let $f : T \rightarrow S$ be a morphism of schemes.*

- (1) *The equivalences of categories of Proposition 34.7.11 are compatible with pullback. More precisely, we have $f^*(\mathcal{G}^a) = (f^*\mathcal{G})^a$ for any quasi-coherent sheaf \mathcal{G} on S .*
- (2) *The equivalences of categories of Proposition 34.7.11 part (1) are **not** compatible with pushforward in general.*
- (3) *If f is quasi-compact and quasi-separated, and $\tau \in \{\text{Zariski}, \acute{e}tale\}$ then f_* and $f_{small,*}$ preserve quasi-coherent sheaves and the diagram*

$$\begin{array}{ccc} QCoh(\mathcal{O}_T) & \xrightarrow{f_*} & QCoh(\mathcal{O}_S) \\ \mathcal{F} \mapsto \mathcal{F}^a \downarrow & & \downarrow \mathcal{G} \mapsto \mathcal{G}^a \\ QCoh(T_\tau, \mathcal{O}) & \xrightarrow{f_{small,*}} & QCoh(S_\tau, \mathcal{O}) \end{array}$$

is commutative, i.e., $f_{small,}(\mathcal{F}^a) = (f_*\mathcal{F})^a$.*

Proof. Part (1) follows from the discussion in Remark 34.7.6. Part (2) is just a warning, and can be explained in the following way: First the statement cannot be made precise since f_* does not transform quasi-coherent sheaves into quasi-coherent sheaves in general. Even if this is the case for f (and any base change of f), then the compatibility over the big sites would mean that formation of $f_*\mathcal{F}$ commutes with any base change, which does not hold in general. An explicit example is the quasi-compact open immersion $j : X = \mathbf{A}_k^2 \setminus \{0\} \rightarrow \mathbf{A}_k^2 = Y$ where k is a field. We have $j_*\mathcal{O}_X = \mathcal{O}_Y$ but after base change to $\text{Spec}(k)$ by the 0 map we see that the pushforward is zero.

Let us prove (3) in case $\tau = \text{étale}$. Note that f , and any base change of f , transforms quasi-coherent sheaves into quasi-coherent sheaves, see Schemes, Lemma 25.24.1. The equality $f_{small,*}(\mathcal{F}^a) = (f_*\mathcal{F})^a$ means that for any étale morphism $g : U \rightarrow S$ we have $\Gamma(U, g^*f_*\mathcal{F}) = \Gamma(U \times_S T, (g')^*\mathcal{F})$ where $g' : U \times_S T \rightarrow T$ is the projection. This is true by Cohomology of Schemes, Lemma 29.5.2. \square

Lemma 34.7.15. *Let $f : T \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let \mathcal{F} be a quasi-coherent sheaf on T . For either the étale or Zariski topology, there are canonical isomorphisms $R^i f_{small,*}(\mathcal{F}^a) = (R^i f_*\mathcal{F})^a$.*

Proof. We prove this for the étale topology; we omit the proof in the case of the Zariski topology. By Cohomology of Schemes, Lemma 29.4.4 the sheaves $R^i f_*\mathcal{F}$ are quasi-coherent so that the assertion makes sense. The sheaf $R^i f_{small,*}\mathcal{F}^a$ is the sheaf associated to the presheaf

$$U \mapsto H^i(U \times_S T, \mathcal{F}^a)$$

where $g : U \rightarrow S$ is an object of $S_{\text{étale}}$, see Cohomology on Sites, Lemma 21.8.4. By our conventions the right hand side is the étale cohomology of the restriction of \mathcal{F}^a to the localization $T_{\text{étale}}/U \times_S T$ which equals $(U \times_S T)_{\text{étale}}$. By Proposition 34.7.10 this is presheaf the same as the presheaf

$$U \mapsto H^i(U \times_S T, (g')^*\mathcal{F}),$$

where $g' : U \times_S T \rightarrow T$ is the projection. If U is affine then this is the same as $H^0(U, R^i f'_*(g')^*\mathcal{F})$, see Cohomology of Schemes, Lemma 29.4.5. By Cohomology of Schemes, Lemma 29.5.2 this is equal to $H^0(U, g^*R^i f_*\mathcal{F})$ which is the value of $(R^i f_*\mathcal{F})^a$ on U . Thus the values of the sheaves of modules $R^i f_{small,*}(\mathcal{F}^a)$ and $(R^i f_*\mathcal{F})^a$ on every affine object of $S_{\text{étale}}$ are canonically isomorphic which implies they are canonically isomorphic. \square

The results in this section say there is virtually no difference between quasi-coherent sheaves on S and quasi-coherent sheaves on any of the sites associated to S in the chapter on topologies. Hence one often sees statements on quasi-coherent sheaves formulated in either language, without restatements in the other.

34.8. Parasitic modules

Parasitic modules are those which are zero when restricted to schemes flat over the base scheme. Here is the formal definition.

Definition 34.8.1. Let S be a scheme. Let $\tau \in \{\text{Zar}, \text{étale}, \text{smooth}, \text{syntomic}, \text{fppf}\}$. Let \mathcal{F} be a presheaf of \mathcal{O} -modules on $(\text{Sch}/S)_\tau$.

- (1) \mathcal{F} is called *parasitic*⁶ if for every flat morphism $U \rightarrow S$ we have $\mathcal{F}(U) = 0$.
- (2) \mathcal{F} is called *parasitic for the τ -topology* if for every τ -covering $\{U_i \rightarrow S\}_{i \in I}$ we have $\mathcal{F}(U_i) = 0$ for all i .

If $\tau = fppf$ this means that $\mathcal{F}|_{U_{Zar}} = 0$ whenever $U \rightarrow S$ is flat and locally of finite presentation; similar for the other cases.

Lemma 34.8.2. *Let S be a scheme. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let \mathcal{G} be a presheaf of \mathcal{O} -modules on $(Sch/S)_\tau$.*

- (1) *If \mathcal{G} is parasitic for the τ -topology, then $H_\tau^p(U, \mathcal{G}) = 0$ for every U open in S , resp. $\acute{e}tale$ over S , resp. smooth over S , resp. syntomic over S , resp. flat and locally of finite presentation over S .*
- (2) *If \mathcal{G} is parasitic then $H_\tau^p(U, \mathcal{G}) = 0$ for every U flat over S .*

Proof. Proof in case $\tau = fppf$; the other cases are proved in the exact same way. The assumption means that $\mathcal{G}(U) = 0$ for any $U \rightarrow S$ flat and locally of finite presentation. Apply Cohomology on Sites, Lemma 21.11.9 to the subset $\mathcal{B} \subset \text{Ob}((Sch/S)_{fppf})$ consisting of $U \rightarrow S$ flat and locally of finite presentation and the collection Cov of all fppf coverings of elements of \mathcal{B} . \square

Lemma 34.8.3. *Let $f : T \rightarrow S$ be a morphism of schemes. For any parasitic \mathcal{O} -module on $(Sch/T)_\tau$ the pushforward $f_*\mathcal{F}$ and the higher direct images $R^i f_*\mathcal{F}$ are parasitic \mathcal{O} -modules on $(Sch/S)_\tau$.*

Proof. Recall that $R^i f_*\mathcal{F}$ is the sheaf associated to the presheaf

$$U \mapsto H^i((Sch/U \times_S T)_\tau, \mathcal{F})$$

see Cohomology on Sites, Lemma 21.8.4. If $U \rightarrow S$ is flat, then $U \times_S T \rightarrow T$ is flat as a base change. Hence the displayed group is zero by Lemma 34.8.2. If $\{U_i \rightarrow U\}$ is a τ -covering then $U_i \times_S T \rightarrow T$ is also flat. Hence it is clear that the sheafification of the displayed presheaf is zero on schemes U flat over S . \square

Lemma 34.8.4. *Let S be a scheme. Let $\tau \in \{Zar, \acute{e}tale\}$. Let \mathcal{G} be a sheaf of \mathcal{O} -modules on $(Sch/S)_{fppf}$ such that*

- (1) $\mathcal{G}|_{S_\tau}$ is quasi-coherent, and
- (2) for every flat, locally finitely presented morphism $g : U \rightarrow S$ the canonical map $g_{\tau, small}^*(\mathcal{G}|_{S_\tau}) \rightarrow \mathcal{G}|_{U_\tau}$ is an isomorphism.

Then $H^p(U, \mathcal{G}) = H^p(U, \mathcal{G}|_{U_\tau})$ for every U flat and locally of finite presentation over S .

Proof. Let \mathcal{F} be the pullback of $\mathcal{G}|_{S_\tau}$ to the big fppf site $(Sch/S)_{fppf}$. Note that \mathcal{F} is quasi-coherent. There is a canonical comparison map $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ which by assumptions (1) and (2) induces an isomorphism $\mathcal{F}|_{U_\tau} \rightarrow \mathcal{G}|_{U_\tau}$ for all $g : U \rightarrow S$ flat and locally of finite presentation. Hence in the short exact sequences

$$0 \rightarrow \text{Ker}(\varphi) \rightarrow \mathcal{F} \rightarrow \text{Im}(\varphi) \rightarrow 0$$

and

$$0 \rightarrow \text{Im}(\varphi) \rightarrow \mathcal{G} \rightarrow \text{Coker}(\varphi) \rightarrow 0$$

the sheaves $\text{Ker}(\varphi)$ and $\text{Coker}(\varphi)$ are parasitic for the fppf topology. By Lemma 34.8.2 we conclude that $H^p(U, \mathcal{F}) \rightarrow H^p(U, \mathcal{G})$ is an isomorphism for $g : U \rightarrow S$

⁶This may be nonstandard notation.

flat and locally of finite presentation. Since the result holds for \mathcal{F} by Proposition 34.7.10 we win. \square

34.9. Fpqc coverings are universal effective epimorphisms

We apply the material above to prove an interesting result, namely Lemma 34.9.3. By Sites, Section 7.13 this lemma implies that the representable presheaves on any of the sites $(Sch/S)_\tau$ are sheaves for $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$. First we prove a helper lemma.

Lemma 34.9.1. *For a scheme X denote $|X|$ the underlying set. Let $f : X \rightarrow S$ be a morphism of schemes. Then*

$$|X \times_S X| \rightarrow |X| \times_{|S|} |X|$$

is surjective.

Proof. Follows immediately from the description of points on the fibre product in Schemes, Lemma 25.17.5. \square

Lemma 34.9.2. *Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be a fpqc covering. Suppose that for each i we have an open subset $W_i \subset T_i$ such that for all $i, j \in I$ we have $pr_0^{-1}(W_i) = pr_1^{-1}(W_j)$ as open subsets of $T_i \times_T T_j$. Then there exists a unique open subset $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i .*

Proof. Apply Lemma 34.9.1 to the map $\coprod_{i \in I} T_i \rightarrow T$. It implies there exists a subset $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i , namely $W = \bigcup f_i(W_i)$. To see that W is open we may work Zariski locally on T . Hence we may assume that T is affine. Using the definition of a fpqc covering, this reduces us to the case where $\{f_i : T_i \rightarrow T\}$ is a standard fpqc covering. In this case we may apply Morphisms, Lemma 28.26.10 to the morphism $\coprod T_i \rightarrow T$ to conclude that W is open. \square

Lemma 34.9.3. *Let $\{T_i \rightarrow T\}$ be an fpqc covering, see Topologies, Definition 33.8.1. Then $\{T_i \rightarrow T\}$ is a universal effective epimorphism in the category of schemes, see Sites, Definition 7.13.1. In other words, every representable functor on the category of schemes satisfies the sheaf condition for the fpqc topology, see Topologies, Definition 33.8.12.*

Proof. Let S be a scheme. We have to show the following: Given morphisms $\varphi_i : T_i \rightarrow S$ such that $\varphi_i|_{T_i \times_T T_j} = \varphi_j|_{T_i \times_T T_j}$ there exists a unique morphism $T \rightarrow S$ which restricts to φ_i on each T_i . In other words, we have to show that the functor $h_S = \text{Mor}_{Sch}(-, S)$ satisfies the sheaf property for the fpqc topology.

Thus Topologies, Lemma 33.8.13 reduces us to the case of a Zariski covering and a covering $\{\text{Spec}(A) \rightarrow \text{Spec}(R)\}$ with $R \rightarrow A$ faithfully flat. The case of a Zariski covering follows from Schemes, Lemma 25.14.1.

Suppose that $R \rightarrow A$ is a faithfully flat ring map. Denote $\pi : \text{Spec}(A) \rightarrow \text{Spec}(R)$ the corresponding morphism of schemes. It is surjective and flat. Let $f : \text{Spec}(A) \rightarrow S$ be a morphism such that $f \circ pr_1 = f \circ pr_2$ as maps $\text{Spec}(A \otimes_R A) \rightarrow S$. By Lemma 34.9.1 we see that as a map on the underlying sets f is of the form $f = g \circ \pi$ for some (set theoretic) map $g : \text{Spec}(R) \rightarrow S$. By Morphisms, Lemma 28.26.10 and the fact that f is continuous we see that g is continuous.

Pick $x \in \text{Spec}(R)$. Choose $U \subset S$ affine open containing $g(x)$. Say $U = \text{Spec}(B)$. By the above we may choose an $r \in R$ such that $x \in D(r) \subset g^{-1}(U)$. The

restriction of f to $\pi^{-1}(D(r))$ into U corresponds to a ring map $B \rightarrow A_r$. The two induced ring maps $B \rightarrow A_r \otimes_{R_r} A_r = (A \otimes_R A)_r$ are equal by assumption on f . Note that $R_r \rightarrow A_r$ is faithfully flat. By Lemma 34.3.6 the equalizer of the two arrows $A_r \rightarrow A_r \otimes_{R_r} A_r$ is R_r . We conclude that $B \rightarrow A_r$ factors uniquely through a map $B \rightarrow R_r$. This map in turn gives a morphism of schemes $D(r) \rightarrow U \rightarrow S$, see Schemes, Lemma 25.6.4.

What have we proved so far? We have shown that for any prime $\mathfrak{p} \subset R$, there exists a standard affine open $D(r) \subset \text{Spec}(R)$ such that the morphism $f|_{\pi^{-1}(D(r))} : \pi^{-1}(D(r)) \rightarrow S$ factors uniquely through some morphism of schemes $D(r) \rightarrow S$. We omit the verification that these morphisms glue to the desired morphism $\text{Spec}(R) \rightarrow S$. \square

34.10. Descent of finiteness properties of morphisms

Another application of flat descent for modules is the following amusing and useful result. There is an algebraic version and a scheme theoretic version. (The “Noetherian” reader should consult Lemma 34.10.2 instead of the next lemma.)

Lemma 34.10.1. *Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $R \rightarrow B$ is of finite presentation and $A \rightarrow B$ faithfully flat and of finite presentation. Then $R \rightarrow A$ is of finite presentation.*

Proof. Consider the algebra $C = B \otimes_A B$ together with the pair of maps $p, q : B \rightarrow C$ given by $p(b) = b \otimes 1$ and $q(b) = 1 \otimes b$. Of course the two compositions $A \rightarrow B \rightarrow C$ are the same. Note that as $p : B \rightarrow C$ is flat and of finite presentation (base change of $A \rightarrow B$), the ring map $R \rightarrow C$ is of finite presentation (as the composite of $R \rightarrow B \rightarrow C$).

We are going to use the criterion Algebra, Lemma 10.123.2 to show that $R \rightarrow A$ is of finite presentation. Let S be any R -algebra, and suppose that $S = \text{colim}_{\lambda \in \Lambda} S_\lambda$ is written as a directed colimit of R -algebras. Let $A \rightarrow S$ be an R -algebra homomorphism. We have to show that $A \rightarrow S$ factors through one of the S_λ . Consider the rings $B' = S \otimes_A B$ and $C' = S \otimes_A C = B' \otimes_S B'$. As B is faithfully flat of finite presentation over A , also B' is faithfully flat of finite presentation over S . By Algebra, Lemma 10.156.1 part (2) applied to the pair $(S \rightarrow B', B')$ and the system (S_λ) there exists a $\lambda_0 \in \Lambda$ and a flat, finitely presented S_{λ_0} -algebra B_{λ_0} such that $B' = S \otimes_{S_{\lambda_0}} B_{\lambda_0}$. For $\lambda \geq \lambda_0$ set $B_\lambda = S_\lambda \otimes_{S_{\lambda_0}} B_{\lambda_0}$ and $C_\lambda = B_\lambda \otimes_{S_\lambda} B_\lambda$.

We interrupt the flow of the argument to show that $S_\lambda \rightarrow B_\lambda$ is faithfully flat for λ large enough. (This should really be a separate lemma somewhere else, maybe in the chapter on limits.) Since $\text{Spec}(B_{\lambda_0}) \rightarrow \text{Spec}(S_{\lambda_0})$ is flat and of finite presentation it is open (see Morphisms, Lemma 28.26.9). Let $I \subset S_{\lambda_0}$ be an ideal such that $V(I) \subset \text{Spec}(S_{\lambda_0})$ is the complement of the image. Note that formation of the image commutes with base change. Hence, since $\text{Spec}(B') \rightarrow \text{Spec}(S)$ is surjective, and $B' = B_{\lambda_0} \otimes_{S_{\lambda_0}} S$ we see that $IS = S$. Thus for some $\lambda \geq \lambda_0$ we have $IS_\lambda = S_\lambda$. For this and all greater λ the morphism $\text{Spec}(B_\lambda) \rightarrow \text{Spec}(S_\lambda)$ is surjective.

By analogy with the notation in the first paragraph of the proof denote $p_\lambda, q_\lambda : B_\lambda \rightarrow C_\lambda$ the two canonical maps. Then $B' = \text{colim}_{\lambda \geq \lambda_0} B_\lambda$ and $C' = \text{colim}_{\lambda \geq \lambda_0} C_\lambda$. Since B and C are finitely presented over R there exist (by Algebra, Lemma 10.123.2

applied several times) a $\lambda \geq \lambda_0$ and an R -algebra maps $B \rightarrow B_\lambda$, $C \rightarrow C_\lambda$ such that the diagram

$$\begin{array}{ccc} C & \longrightarrow & C_\lambda \\ p \uparrow & & \uparrow p_\lambda \\ B & \longrightarrow & B_\lambda \\ q \uparrow & & \uparrow q_\lambda \end{array}$$

is commutative. OK, and this means that $A \rightarrow B \rightarrow B_\lambda$ maps into the equalizer of p_λ and q_λ . By Lemma 34.3.6 we see that S_λ is the equalizer of p_λ and q_λ . Thus we get the desired ring map $A \rightarrow S_\lambda$ and we win. \square

Here is an easier version of this dealing with the property of being of finite type.

Lemma 34.10.2. *Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $R \rightarrow B$ is of finite type and $A \rightarrow B$ faithfully flat and of finite presentation. Then $R \rightarrow A$ is of finite type.*

Proof. By Algebra, Lemma 10.156.2 there exists a commutative diagram

$$\begin{array}{ccccc} R & \longrightarrow & A_0 & \longrightarrow & B_0 \\ \parallel & & \downarrow & & \downarrow \\ R & \longrightarrow & A & \longrightarrow & B \end{array}$$

with $R \rightarrow A_0$ of finite presentation, $A_0 \rightarrow B_0$ faithfully flat of finite presentation and $B = A \otimes_{A_0} B_0$. Since $R \rightarrow B$ is of finite type by assumption, we may add some elements to A_0 and assume that the map $B_0 \rightarrow B$ is surjective! In this case, since $A_0 \rightarrow B_0$ is faithfully flat, we see that as

$$(A_0 \rightarrow A) \otimes_{A_0} B_0 \cong (B_0 \rightarrow B)$$

is surjective, also $A_0 \rightarrow A$ is surjective. Hence we win. \square

Lemma 34.10.3. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & S \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that f is surjective, flat and locally of finite presentation and assume that p is locally of finite presentation (resp. locally of finite type). Then q is locally of finite presentation (resp. locally of finite type).

Proof. The problem is local on S and Y . Hence we may assume that S and Y are affine. Since f is flat and locally of finite presentation, we see that f is open (Morphisms, Lemma 28.26.9). Hence, since Y is quasi-compact, there exist finitely many affine opens $X_i \subset X$ such that $Y = \bigcup f(X_i)$. Clearly we may replace X by $\coprod X_i$, and hence we may assume X is affine as well. In this case the lemma is equivalent to Lemma 34.10.1 (resp. Lemma 34.10.2) above. \square

We use this to improve some of the results on morphisms obtained earlier.

Lemma 34.10.4. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) *f is surjective, and syntomic (resp. smooth, resp. étale),*
- (2) *p is syntomic (resp. smooth, resp. étale).*

Then q is syntomic (resp. smooth, resp. étale).

Proof. Combine Morphisms, Lemmas 28.32.16, 28.35.19, and 28.37.19 with Lemma 34.10.3 above. \square

Actually we can strengthen this result as follows.

Lemma 34.10.5. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) *f is surjective, flat, and locally of finite presentation,*
- (2) *p is smooth (resp. étale).*

Then q is smooth (resp. étale).

Proof. Assume (1) and that p is smooth. By Lemma 34.10.3 we see that q is locally of finite presentation. By Morphisms, Lemma 28.26.11 we see that q is flat. Hence now it suffices to show that the fibres of q are smooth, see Morphisms, Lemma 28.35.3. Apply Varieties, Lemma 32.15.8 to the flat surjective morphisms $X_s \rightarrow Y_s$ for $s \in S$ to conclude. We omit the proof of the étale case. \square

Remark 34.10.6. With the assumptions (1) and p smooth in Lemma 34.10.5 it is not automatically the case that $X \rightarrow Y$ is smooth. A counter example is $S = \text{Spec}(k)$, $X = \text{Spec}(k[s])$, $Y = \text{Spec}(k[t])$ and f given by $t \mapsto s^2$. But see also Lemma 34.10.7 for some information on the structure of f .

Lemma 34.10.7. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume that

- (1) *f is surjective, flat, and locally of finite presentation,*
- (2) *p is syntomic.*

Then both q and f are syntomic.

Proof. By Lemma 34.10.3 we see that q is of finite presentation. By Morphisms, Lemma 28.26.11 we see that q is flat. By Morphisms, Lemma 28.32.10 it now suffices to show that the local rings of the fibres of $Y \rightarrow S$ and the fibres of $X \rightarrow Y$ are local complete intersection rings. To do this we may take the fibre of $X \rightarrow Y \rightarrow S$

at a point $s \in S$, i.e., we may assume S is the spectrum of a field. Pick a point $x \in X$ with image $y \in Y$ and consider the ring map

$$\mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,x}$$

This is a flat local homomorphism of local Noetherian rings. The local ring $\mathcal{O}_{X,x}$ is a complete intersection. Thus may use Avramov's result, see Divided Power Algebra, Lemma 23.8.9, to conclude that both $\mathcal{O}_{Y,y}$ and $\mathcal{O}_{X,x}/\mathfrak{m}_y \mathcal{O}_{X,x}$ are complete intersection rings. \square

The following type of lemma is occasionally useful.

Lemma 34.10.8. *Let $X \rightarrow Y \rightarrow Z$ be morphism of schemes. Let P be one of the following properties of morphisms of schemes: flat, locally finite type, locally finite presentation. Assume that $X \rightarrow Z$ has P and that $\{X \rightarrow Y\}$ can be refined by an fppf covering of Y . Then $Y \rightarrow Z$ is P .*

Proof. Let $\text{Spec}(C) \subset Z$ be an affine open and let $\text{Spec}(B) \subset Y$ be an affine open which maps into $\text{Spec}(C)$. The assumption on $X \rightarrow Y$ implies we can find a standard affine fppf covering $\{\text{Spec}(B_j) \rightarrow \text{Spec}(B)\}$ and lifts $x_j : \text{Spec}(B_j) \rightarrow X$. Since $\text{Spec}(B_j)$ is quasi-compact we can find finitely many affine opens $\text{Spec}(A_i) \subset X$ lying over $\text{Spec}(B)$ such that the image of each x_j is contained in the union $\bigcup \text{Spec}(A_i)$. Hence after replacing each $\text{Spec}(B_j)$ by a standard affine Zariski coverings of itself we may assume we have a standard affine fppf covering $\{\text{Spec}(B_i) \rightarrow \text{Spec}(B)\}$ such that each $\text{Spec}(B_i) \rightarrow Y$ factors through an affine open $\text{Spec}(A_i) \subset X$ lying over $\text{Spec}(B)$. In other words, we have ring maps $C \rightarrow B \rightarrow A_i \rightarrow B_i$ for each i . Note that we can also consider

$$C \rightarrow B \rightarrow A = \prod A_i \rightarrow B' = \prod B_i$$

and that the ring map $B \rightarrow \prod B_i$ is faithfully flat and of finite presentation.

The case $P = \textit{flat}$. In this case we know that $C \rightarrow A$ is flat and we have to prove that $C \rightarrow B$ is flat. Suppose that $N \rightarrow N' \rightarrow N''$ is an exact sequence of C -modules. We want to show that $N \otimes_C B \rightarrow N' \otimes_C B \rightarrow N'' \otimes_C B$ is exact. Let H be its cohomology and let H' be the cohomology of $N \otimes_C B' \rightarrow N' \otimes_C B' \rightarrow N'' \otimes_C B'$. As $B \rightarrow B'$ is flat we know that $H' = H \otimes_B B'$. On the other hand $N \otimes_C A \rightarrow N' \otimes_C A \rightarrow N'' \otimes_C A$ is exact hence has zero cohomology. Hence the map $H \rightarrow H'$ is zero (as it factors through the zero module). Thus $H' = 0$. As $B \rightarrow B'$ is faithfully flat we conclude that $H = 0$ as desired.

The case $P = \textit{locally finite type}$. In this case we know that $C \rightarrow A$ is of finite type and we have to prove that $C \rightarrow B$ is of finite type. Because $B \rightarrow B'$ is of finite presentation (hence of finite type) we see that $A \rightarrow B'$ is of finite type, see Algebra, Lemma 10.6.2. Therefore $C \rightarrow B'$ is of finite type and we conclude by Lemma 34.10.2.

The case $P = \textit{locally finite presentation}$. In this case we know that $C \rightarrow A$ is of finite presentation and we have to prove that $C \rightarrow B$ is of finite presentation. Because $B \rightarrow B'$ is of finite presentation and $B \rightarrow A$ of finite type we see that $A \rightarrow B'$ is of finite presentation, see Algebra, Lemma 10.6.2. Therefore $C \rightarrow B'$ is of finite presentation and we conclude by Lemma 34.10.1. \square

34.11. Local properties of schemes

It often happens one can prove the members of a covering of a scheme have a certain property. In many cases this implies the scheme has the property too. For example, if S is a scheme, and $f : S' \rightarrow S$ is a surjective flat morphism such that S' is a reduced scheme, then S is reduced. You can prove this by looking at local rings and using Algebra, Lemma 10.152.2. We say that the property of being reduced *descends through flat surjective morphisms*. Some results of this type are collected in Algebra, Section 10.152.

On the other hand, there are examples of surjective flat morphisms $f : S' \rightarrow S$ with S reduced and S' not, for example the morphism $\text{Spec}(k[x]/(x^2)) \rightarrow \text{Spec}(k)$. Hence the property of being reduced does not *ascend along flat morphisms*. Having infinite residue fields is a property which does ascend along flat morphisms (but does not descend along surjective flat morphisms of course). Some results of this type are collected in Algebra, Section 10.151.

Finally, we say that a property is *local for the flat topology* if it ascends along flat morphisms and descends along flat surjective morphisms. A somewhat silly example is the property of having residue fields of a given characteristic. To be more precise, and to tie this in with the various topologies on schemes, we make the following formal definition.

Definition 34.11.1. Let \mathcal{P} be a property of schemes. Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale, Zariski\}$. We say \mathcal{P} is *local in the τ -topology* if for any τ -covering $\{S_i \rightarrow S\}_{i \in I}$ (see Topologies, Section 33.2) we have

$$S \text{ has } \mathcal{P} \Leftrightarrow \text{each } S_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property \mathcal{P} holds for S if and only if it holds for any scheme S' isomorphic to S . In fact, if $\tau = fpqc, fppf, syntomic, smooth, \acute{e}tale$, or *Zariski*, then if S has \mathcal{P} and $S' \rightarrow S$ is flat, flat and locally of finite presentation, syntomic, smooth, *étale*, or an open immersion, then S' has \mathcal{P} . This is true because we can always extend $\{S' \rightarrow S\}$ to a τ -covering.

We have the following implications: \mathcal{P} is local in the fpqc topology $\Rightarrow \mathcal{P}$ is local in the fppf topology $\Rightarrow \mathcal{P}$ is local in the syntomic topology $\Rightarrow \mathcal{P}$ is local in the smooth topology $\Rightarrow \mathcal{P}$ is local in the *étale* topology $\Rightarrow \mathcal{P}$ is local in the Zariski topology. This follows from Topologies, Lemmas 33.4.2, 33.5.2, 33.6.2, 33.7.2, and 33.8.6.

Lemma 34.11.2. *Let \mathcal{P} be a property of schemes. Let $\tau \in \{fpqc, fppf, \acute{e}tale, smooth, syntomic\}$. Assume that*

- (1) *the property is local in the Zariski topology,*
- (2) *for any morphism of affine schemes $S' \rightarrow S$ which is flat, flat of finite presentation, *étale*, smooth or syntomic depending on whether τ is fpqc, fppf, *étale*, smooth, or syntomic, property \mathcal{P} holds for S' if property \mathcal{P} holds for S , and*
- (3) *for any surjective morphism of affine schemes $S' \rightarrow S$ which is flat, flat of finite presentation, *étale*, smooth or syntomic depending on whether τ is fpqc, fppf, *étale*, smooth, or syntomic, property \mathcal{P} holds for S if property \mathcal{P} holds for S' .*

Then \mathcal{P} is τ local on the base.

Proof. This follows almost immediately from the definition of a τ -covering, see Topologies, Definition 33.8.1 33.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4, or 33.6.4. Details omitted. \square

Remark 34.11.3. In Lemma 34.11.2 above if $\tau = \textit{smooth}$ then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = \textit{syntomic}$ or $\tau = \textit{étale}$.

34.12. Properties of schemes local in the fppf topology

In this section we find some properties of schemes which are local on the base in the fppf topology.

Lemma 34.12.1. *The property $\mathcal{P}(S) = “S \text{ is locally Noetherian}”$ is local in the fppf topology.*

Proof. We will use Lemma 34.11.2. First we note that “being locally Noetherian” is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.5.1. Next, we show that if $S' \rightarrow S$ is a flat, finitely presented morphism of affines and S is locally Noetherian, then S' is locally Noetherian. This is Morphisms, Lemma 28.16.6. Finally, we have to show that if $S' \rightarrow S$ is a surjective flat, finitely presented morphism of affines and S' is locally Noetherian, then S is locally Noetherian. This follows from Algebra, Lemma 10.152.1. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

Lemma 34.12.2. *The property $\mathcal{P}(S) = “S \text{ is Jacobson}”$ is local in the fppf topology.*

Proof. We will use Lemma 34.11.2. First we note that “being Jacobson” is local in the Zariski topology. This is Properties, Lemma 27.6.3. Next, we show that if $S' \rightarrow S$ is a flat, finitely presented morphism of affines and S is Jacobson, then S' is Jacobson. This is Morphisms, Lemma 28.17.9. Finally, we have to show that if $f : S' \rightarrow S$ is a surjective flat, finitely presented morphism of affines and S' is Jacobson, then S is Jacobson. Say $S = \text{Spec}(A)$ and $S' = \text{Spec}(B)$ and $S' \rightarrow S$ given by $A \rightarrow B$. Then $A \rightarrow B$ is finitely presented and faithfully flat. Moreover, the ring B is Jacobson, see Properties, Lemma 27.6.3.

By Algebra, Lemma 10.156.6 there exists a diagram

$$\begin{array}{ccc} B & \longrightarrow & B' \\ & \swarrow & \searrow \\ & A & \end{array}$$

with $A \rightarrow B'$ finitely presented, faithfully flat and quasi-finite. In particular, $B \rightarrow B'$ is finite type, and we see from Algebra, Proposition 10.34.18 that B' is Jacobson. Hence we may assume that $A \rightarrow B$ is quasi-finite as well as faithfully flat and of finite presentation.

Assume A is not Jacobson to get a contradiction. According to Algebra, Lemma 10.34.5 there exists a nonmaximal prime $\mathfrak{p} \subset A$ and an element $f \in A$, $f \notin \mathfrak{p}$ such that $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$.

This leads to a contradiction as follows. First let $\mathfrak{p} \subset \mathfrak{m}$ be a maximal ideal of A . Pick a prime $\mathfrak{m}' \subset B$ lying over \mathfrak{m} (exists because $A \rightarrow B$ is faithfully flat, see Algebra, Lemma 10.38.15). As $A \rightarrow B$ is flat, by going down see Algebra, Lemma

10.38.17, we can find a prime $\mathfrak{q} \subset \mathfrak{m}'$ lying over \mathfrak{p} . In particular we see that \mathfrak{q} is not maximal. Hence according to Algebra, Lemma 10.34.5 again the set $V(\mathfrak{q}) \cap D(f)$ is infinite (here we finally use that B is Jacobson). All points of $V(\mathfrak{q}) \cap D(f)$ map to $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$. Hence the fibre over \mathfrak{p} is infinite. This contradicts the fact that $A \rightarrow B$ is quasi-finite (see Algebra, Lemma 10.118.4 or more explicitly Morphisms, Lemma 28.21.10). Thus the lemma is proved. \square

34.13. Properties of schemes local in the syntomic topology

In this section we find some properties of schemes which are local on the base in the syntomic topology.

Lemma 34.13.1. *The property $\mathcal{P}(S) = "S \text{ is locally Noetherian and } (S_k)"$ is local in the syntomic topology.*

Proof. We will check (1), (2) and (3) of Lemma 34.11.2. As a syntomic morphism is flat of finite presentation (Morphisms, Lemmas 28.32.7 and 28.32.6) we have already checked this for “being locally Noetherian” in the proof of Lemma 34.12.1. We will use this without further mention in the proof. First we note that \mathcal{P} is local in the Zariski topology. This is clear from the definition, see Cohomology of Schemes, Definition 29.11.1. Next, we show that if $S' \rightarrow S$ is a syntomic morphism of affines and S has \mathcal{P} , then S' has \mathcal{P} . This is Algebra, Lemma 10.151.4 (use Morphisms, Lemma 28.32.2 and Algebra, Definition 10.131.1 and Lemma 10.130.3). Finally, we show that if $S' \rightarrow S$ is a surjective syntomic morphism of affines and S' has \mathcal{P} , then S has \mathcal{P} . This is Algebra, Lemma 10.152.5. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

Lemma 34.13.2. *The property $\mathcal{P}(S) = "S \text{ is Cohen-Macaulay}"$ is local in the syntomic topology.*

Proof. This is clear from Lemma 34.13.1 above since a scheme is Cohen-Macaulay if and only if it is locally Noetherian and (S_k) for all $k \geq 0$, see Properties, Lemma 27.12.2. \square

34.14. Properties of schemes local in the smooth topology

In this section we find some properties of schemes which are local on the base in the smooth topology.

Lemma 34.14.1. *The property $\mathcal{P}(S) = "S \text{ is reduced}"$ is local in the smooth topology.*

Proof. We will use Lemma 34.11.2. First we note that “being reduced” is local in the Zariski topology. This is clear from the definition, see Schemes, Definition 25.12.1. Next, we show that if $S' \rightarrow S$ is a smooth morphism of affines and S is reduced, then S' is reduced. This is Algebra, Lemma 10.151.6. Finally, we show that if $S' \rightarrow S$ is a surjective smooth morphism of affines and S' is reduced, then S is reduced. This is Algebra, Lemma 10.152.2. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

Lemma 34.14.2. *The property $\mathcal{P}(S) = "S \text{ is normal}"$ is local in the smooth topology.*

Proof. We will use Lemma 34.11.2. First we show “being normal” is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.7.1. Next, we show that if $S' \rightarrow S$ is a smooth morphism of affines and S is normal, then S' is normal. This is Algebra, Lemma 10.151.7. Finally, we show that if $S' \rightarrow S$ is a surjective smooth morphism of affines and S' is normal, then S is normal. This is Algebra, Lemma 10.152.3. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

Lemma 34.14.3. *The property $\mathcal{P}(S) = “S$ is locally Noetherian and $(R_k)”$ is local in the smooth topology.*

Proof. We will check (1), (2) and (3) of Lemma 34.11.2. As a smooth morphism is flat of finite presentation (Morphisms, Lemmas 28.35.9 and 28.35.8) we have already checked this for “being locally Noetherian” in the proof of Lemma 34.12.1. We will use this without further mention in the proof. First we note that \mathcal{P} is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.12.1. Next, we show that if $S' \rightarrow S$ is a smooth morphism of affines and S has \mathcal{P} , then S' has \mathcal{P} . This is Algebra, Lemmas 10.151.5 (use Morphisms, Lemma 28.35.2, Algebra, Lemmas 10.132.4 and 10.135.3). Finally, we show that if $S' \rightarrow S$ is a surjective smooth morphism of affines and S' has \mathcal{P} , then S has \mathcal{P} . This is Algebra, Lemma 10.152.5. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

Lemma 34.14.4. *The property $\mathcal{P}(S) = “S$ is regular” is local in the smooth topology.*

Proof. This is clear from Lemma 34.14.3 above since a locally Noetherian scheme is regular if and only if it is locally Noetherian and (R_k) for all $k \geq 0$. \square

Lemma 34.14.5. *The property $\mathcal{P}(S) = “S$ is Nagata” is local in the smooth topology.*

Proof. We will check (1), (2) and (3) of Lemma 34.11.2. First we note that being Nagata is local in the Zariski topology. This is Properties, Lemma 27.13.6. Next, we show that if $S' \rightarrow S$ is a smooth morphism of affines and S is Nagata, then S' is Nagata. This is Morphisms, Lemma 28.19.1. Finally, we show that if $S' \rightarrow S$ is a surjective smooth morphism of affines and S' is Nagata, then S is Nagata. This is Algebra, Lemma 10.152.7. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win. \square

34.15. Variants on descending properties

Sometimes one can descend properties, which are not local. We put results of this kind in this section.

Lemma 34.15.1. *If $f : X \rightarrow Y$ is a flat and surjective morphism of schemes and X is reduced, then Y is reduced.*

Proof. The result follows by looking at local rings (Schemes, Definition 25.12.1) and Algebra, Lemma 10.152.2. \square

Lemma 34.15.2. *Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is regular, then Y is regular.*

Proof. This lemma reduces to the following algebra statement: If $A \rightarrow B$ is a faithfully flat, finitely presented ring homomorphism with B Noetherian and regular, then A is Noetherian and regular. We see that A is Noetherian by Algebra, Lemma 10.152.1 and regular by Algebra, Lemma 10.106.9. \square

34.16. Germs of schemes

Definition 34.16.1. Germs of schemes.

- (1) A pair (X, x) consisting of a scheme X and a point $x \in X$ is called the *germ of X at x* .
- (2) A *morphism of germs* $f : (X, x) \rightarrow (S, s)$ is an equivalence class of morphisms of schemes $f : U \rightarrow S$ with $f(x) = s$ where $U \subset X$ is an open neighbourhood of x . Two such f, f' are said to be equivalent if and only if f and f' agree in some open neighbourhood of x .
- (3) We define the *composition of morphisms of germs* by composing representatives (this is well defined).

Before we continue we need one more definition.

Definition 34.16.2. Let $f : (X, x) \rightarrow (S, s)$ be a morphism of germs. We say f is *étale* (resp. *smooth*) if there exists a representative $f : U \rightarrow S$ of f which is an étale morphism (resp. a smooth morphism) of schemes.

34.17. Local properties of germs

Definition 34.17.1. Let \mathcal{P} be a property of germs of schemes. We say that \mathcal{P} is *étale local* (resp. *smooth local*) if for any étale (resp. smooth) morphism of germs $(U', u') \rightarrow (U, u)$ we have $\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}(U', u')$.

Let (X, x) be a germ of a scheme. The dimension of X at x is the minimum of the dimensions of open neighbourhoods of x in X , and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\dim_x(X)$. The following lemma tells us that the assertion $\dim_x(X) = d$ is an étale local property of germs.

Lemma 34.17.2. *Let $f : U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v = f(u)$. Then $\dim_u(U) = \dim_v(V)$.*

Proof. In the statement $\dim_u(U)$ is the dimension of U at u as defined in Topology, Definition 5.9.1 as the minimum of the Krull dimensions of open neighbourhoods of u in U . Similarly for $\dim_v(V)$.

Let us show that $\dim_v(V) \geq \dim_u(U)$. Let V' be an open neighbourhood of v in V . Then there exists an open neighbourhood U' of u in U contained in $f^{-1}(V')$ such that $\dim_u(U) = \dim(U')$. Suppose that $Z_0 \subset Z_1 \subset \dots \subset Z_n$ is a chain of irreducible closed subschemes of U' . If $\xi_i \in Z_i$ is the generic point then we have specializations $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$. This gives specializations $f(\xi_n) \rightsquigarrow f(\xi_{n-1}) \rightsquigarrow \dots \rightsquigarrow f(\xi_0)$ in V' . Note that $f(\xi_j) \neq f(\xi_i)$ if $i \neq j$ as the fibres of f are discrete (see Morphisms, Lemma 28.37.7). Hence we see that $\dim(V') \geq n$. The inequality $\dim_v(V) \geq \dim_u(U)$ follows formally.

Let us show that $\dim_u(U) \geq \dim_v(V)$. Let U' be an open neighbourhood of u in U . Note that $V' = f(U')$ is an open neighbourhood of v by Morphisms, Lemma 28.26.9. Hence $\dim(V') \geq \dim_v(V)$. Pick a chain $Z_0 \subset Z_1 \subset \dots \subset Z_n$ of irreducible closed

subschemes of V' . Let $\xi_i \in Z_i$ be the generic point, so we have specializations $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$. Since $\xi_0 \in f(U')$ we can find a point $\eta_0 \in U'$ with $f(\eta_0) = \xi_0$. Consider the map of local rings

$$\mathcal{O}_{V', \xi_0} \longrightarrow \mathcal{O}_{U', \eta_0}$$

which is a flat local ring map by Morphisms, Lemma 28.37.12. Note that the points ξ_i correspond to primes of the ring on the left by Schemes, Lemma 25.13.2. Hence by going down (see Algebra, Section 10.40) for the displayed ring map we can find a sequence of specializations $\eta_n \rightsquigarrow \eta_{n-1} \rightsquigarrow \dots \rightsquigarrow \eta_0$ in U' mapping to the sequence $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \dots \rightsquigarrow \xi_0$ under f . This implies that $\dim_u(U) \geq \dim_v(V)$. \square

Let (X, x) be a germ of a scheme. The isomorphism class of the local ring $\mathcal{O}_{X, x}$ is an invariant of the germ. The following lemma says that the property $\dim(\mathcal{O}_{X, x}) = d$ is an étale local property of germs.

Lemma 34.17.3. *Let $f : U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v = f(u)$. Then $\dim(\mathcal{O}_{U, u}) = \dim(\mathcal{O}_{V, v})$.*

Proof. The algebraic statement we are asked to prove is the following: If $A \rightarrow B$ is an étale ring map and \mathfrak{q} is a prime of B lying over $\mathfrak{p} \subset A$, then $\dim(A_{\mathfrak{p}}) = \dim(B_{\mathfrak{q}})$. This is More on Algebra, Lemma 15.33.2. \square

Let (X, x) be a germ of a scheme. The isomorphism class of the local ring $\mathcal{O}_{X, x}$ is an invariant of the germ. The following lemma says that the property “ $\mathcal{O}_{X, x}$ is regular” is an étale local property of germs.

Lemma 34.17.4. *Let $f : U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v = f(u)$. Then $\mathcal{O}_{U, u}$ is a regular local ring if and only if $\mathcal{O}_{V, v}$ is a regular local ring.*

Proof. The algebraic statement we are asked to prove is the following: If $A \rightarrow B$ is an étale ring map and \mathfrak{q} is a prime of B lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is regular if and only if $B_{\mathfrak{q}}$ is regular. This is More on Algebra, Lemma 15.33.3. \square

34.18. Properties of morphisms local on the target

Suppose that $f : X \rightarrow Y$ is a morphism of schemes. Let $g : Y' \rightarrow Y$ be a morphism of schemes. Let $f' : X' \rightarrow Y'$ be the base change of f by g :

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

Let \mathcal{P} be a property of morphisms of schemes. Then we can wonder if (a) $\mathcal{P}(f) \Rightarrow \mathcal{P}(f')$, and also whether the converse (b) $\mathcal{P}(f') \Rightarrow \mathcal{P}(f)$ is true. If (a) holds whenever g is flat, then we say \mathcal{P} is preserved under flat base change. If (b) holds whenever g is surjective and flat, then we say \mathcal{P} descends through flat surjective base changes. If \mathcal{P} is preserved under flat base changes and descends through flat surjective base changes, then we say \mathcal{P} is flat local on the target. Compare with the discussion in Section 34.11. This turns out to be a very important notion which we formalize in the following definition.

Definition 34.18.1. Let \mathcal{P} be a property of morphisms of schemes over a base. Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale, Zariski\}$. We say \mathcal{P} is τ local on the base, or τ local on the target, or local on the base for the τ -topology if for any τ -covering $\{Y_i \rightarrow Y\}_{i \in I}$ (see Topologies, Section 33.2) and any morphism of schemes $f : X \rightarrow Y$ over S we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } Y_i \times_Y X \rightarrow Y_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property \mathcal{P} holds for $X \rightarrow Y$ if and only if it holds for any arrow $X' \rightarrow Y'$ isomorphic to $X \rightarrow Y$. If a property is τ -local on the target then it is preserved by base changes by morphisms which occur in τ -coverings. Here is a formal statement.

Lemma 34.18.2. *Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale, Zariski\}$. Let \mathcal{P} be a property of morphisms which is τ local on the target. Let $f : X \rightarrow Y$ have property \mathcal{P} . For any morphism $Y' \rightarrow Y$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. $\acute{e}tale$, resp. an open immersion, the base change $f' : Y' \times_Y X \rightarrow Y'$ of f has property \mathcal{P} .*

Proof. This is true because we can fit $Y' \rightarrow Y$ into a family of morphisms which forms a τ -covering. \square

A simple often used consequence of the above is that if $f : X \rightarrow Y$ has property \mathcal{P} which is τ -local on the target and $f(X) \subset V$ for some open subscheme $V \subset Y$, then also the induced morphism $X \rightarrow V$ has \mathcal{P} . Proof: The base change f by $V \rightarrow Y$ gives $X \rightarrow V$.

Lemma 34.18.3. *Let $\tau \in \{fppf, syntomic, smooth, \acute{e}tale\}$. Let \mathcal{P} be a property of morphisms which is τ local on the target. For any morphism of schemes $f : X \rightarrow Y$ there exists a largest open $W(f) \subset Y$ such that the restriction $X_{W(f)} \rightarrow W(f)$ has \mathcal{P} . Moreover,*

- (1) *if $g : Y' \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$ and the base change $f' : X_{Y'} \rightarrow Y'$ has \mathcal{P} , then $g(Y') \subset W(f)$,*
- (2) *if $g : Y' \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$, then $W(f') = g^{-1}(W(f))$, and*
- (3) *if $\{g_i : Y_i \rightarrow Y\}$ is a τ -covering, then $g_i^{-1}(W(f)) = W(f_i)$, where f_i is the base change of f by $Y_i \rightarrow Y$.*

Proof. Consider the union W of the images $g(Y') \subset Y$ of morphisms $g : Y' \rightarrow Y$ with the properties:

- (1) g is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$, and
- (2) the base change $Y' \times_{g,Y} X \rightarrow Y'$ has property \mathcal{P} .

Since such a morphism g is open (see Morphisms, Lemma 28.26.9) we see that $W \subset Y$ is an open subset of Y . Since \mathcal{P} is local in the τ topology the restriction $X_W \rightarrow W$ has property \mathcal{P} because we are given a covering $\{Y' \rightarrow W\}$ of W such that the pullbacks have \mathcal{P} . This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W(f') \supset g^{-1}(W(f))$ because \mathcal{P} is stable under base change by flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$ morphisms, see Lemma 34.18.2. On the other hand, if $Y'' \subset Y'$ is an open such that $X_{Y''} \rightarrow Y''$ has property \mathcal{P} , then $Y'' \rightarrow Y$ factors through W by construction, i.e., $Y'' \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each

morphism $Y_i \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a τ -covering. \square

Lemma 34.18.4. *Let \mathcal{P} be a property of morphisms of schemes over a base. Let $\tau \in \{\text{fpqc}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Assume that*

- (1) *the property is preserved under flat, flat and locally of finite presentation, étale, smooth, or syntomic base change depending on whether τ is fpqc, fppf, étale, smooth, or syntomic (compare with Schemes, Definition 25.18.3),*
- (2) *the property is Zariski local on the base.*
- (3) *for any surjective morphism of affine schemes $S' \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, and any morphism of schemes $f : X \rightarrow S$ property \mathcal{P} holds for f if property \mathcal{P} holds for the base change $f' : X' = S' \times_S X \rightarrow S'$.*

Then \mathcal{P} is τ local on the base.

Proof. This follows almost immediately from the definition of a τ -covering, see Topologies, Definition 33.8.1 33.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4, or 33.6.4. Details omitted. \square

Remark 34.18.5. (This is a repeat of Remark 34.11.3 above.) In Lemma 34.18.4 above if $\tau = \text{smooth}$ then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = \text{syntomic}$ or $\tau = \text{étale}$.

34.19. Properties of morphisms local in the fpqc topology on the target

In this section we find a large number of properties of morphisms of schemes which are local on the base in the fpqc topology. By contrast, in Examples, Section 82.55 we will show that the properties “projective” and “quasi-projective” are not local on the base even in the Zariski topology.

Lemma 34.19.1. *The property $\mathcal{P}(f) = “f \text{ is quasi-compact}”$ is fpqc local on the base.*

Proof. A base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19.3. Being quasi-compact is Zariski local on the base, see Schemes, Lemma 25.19.2. Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is quasi-compact. Then X' is quasi-compact, and $X' \rightarrow X$ is surjective. Hence X is quasi-compact. This implies that f is quasi-compact. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.2. *The property $\mathcal{P}(f) = “f \text{ is quasi-separated}”$ is fpqc local on the base.*

Proof. Any base change of a quasi-separated morphism is quasi-separated, see Schemes, Lemma 25.21.13. Being quasi-separated is Zariski local on the base (from the definition or by Schemes, Lemma 25.21.7). Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is quasi-separated. This means that $\Delta' : X' \rightarrow X' \times_{S'} X'$

is quasi-compact. Note that Δ' is the base change of $\Delta : X \rightarrow X \times_S X$ via $S' \rightarrow S$. By Lemma 34.19.1 this implies Δ is quasi-compact, and hence f is quasi-separated. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.3. *The property $\mathcal{P}(f) = “f \text{ is universally closed}”$ is fpqc local on the base.*

Proof. A base change of a universally closed morphism is universally closed by definition. Being universally closed is Zariski local on the base (from the definition or by Morphisms, Lemma 28.42.2). Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is universally closed. Let $T \rightarrow S$ be any morphism. Consider the diagram

$$\begin{array}{ccccc} X' & \longleftarrow & S' \times_S T \times_S X & \longrightarrow & T \times_S X \\ \downarrow & & \downarrow & & \downarrow \\ S' & \longleftarrow & S' \times_S T & \longrightarrow & T \end{array}$$

in which both squares are cartesian. Thus the assumption implies that the middle vertical arrow is closed. The right horizontal arrows are flat, quasi-compact and surjective (as base changes of $S' \rightarrow S$). Hence a subset of T is closed if and only if its inverse image in $S' \times_S T$ is closed, see Morphisms, Lemma 28.26.10. An easy diagram chase shows that the right vertical arrow is closed too, and we conclude $X \rightarrow S$ is universally closed. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.4. *The property $\mathcal{P}(f) = “f \text{ is universally open}”$ is fpqc local on the base.*

Proof. The proof is the same as the proof of Lemma 34.19.3. \square

Lemma 34.19.5. *The property $\mathcal{P}(f) = “f \text{ is separated}”$ is fpqc local on the base.*

Proof. A base change of a separated morphism is separated, see Schemes, Lemma 25.21.13. Being separated is Zariski local on the base (from the definition or by Schemes, Lemma 25.21.8). Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is separated. This means that $\Delta' : X' \rightarrow X' \times_{S'} X'$ is a closed immersion, hence universally closed. Note that Δ' is the base change of $\Delta : X \rightarrow X \times_S X$ via $S' \rightarrow S$. By Lemma 34.19.3 this implies Δ is universally closed. Since it is an immersion (Schemes, Lemma 25.21.2) we conclude Δ is a closed immersion. Hence f is separated. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.6. *The property $\mathcal{P}(f) = “f \text{ is surjective}”$ is fpqc local on the base.*

Proof. This is clear. \square

Lemma 34.19.7. *The property $\mathcal{P}(f) = “f \text{ is universally injective}”$ is fpqc local on the base.*

Proof. A base change of a universally injective morphism is universally injective (this is formal). Being universally injective is Zariski local on the base; this is clear from the definition. Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is universally injective. Let K be a field, and let $a, b : \text{Spec}(K) \rightarrow X$

be two morphisms such that $f \circ a = f \circ b$. As $S' \rightarrow S$ is surjective and by the discussion in Schemes, Section 25.13 there exists a field extension $K \subset K'$ and a morphism $\text{Spec}(K') \rightarrow S'$ such that the following solid diagram commutes

$$\begin{array}{ccccc}
 \text{Spec}(K') & & & & \\
 \downarrow & \searrow & & \searrow & \\
 & a', b' & & & \\
 & & X' & \longrightarrow & S' \\
 & & \downarrow & & \downarrow \\
 \text{Spec}(K) & \xrightarrow{a, b} & X & \longrightarrow & S
 \end{array}$$

As the square is cartesian we get the two dotted arrows a', b' making the diagram commute. Since $X' \rightarrow S'$ is universally injective we get $a' = b'$, by Morphisms, Lemma 28.12.2. Clearly this forces $a = b$ (by the discussion in Schemes, Section 25.13). Therefore Lemma 34.18.4 applies and we win.

An alternative proof would be to use the characterization of a universally injective morphism as one whose diagonal is surjective, see Morphisms, Lemma 28.12.2. The lemma then follows from the fact that the property of being surjective is fpqc local on the base, see Lemma 34.19.6. (Hint: use that the base change of the diagonal is the diagonal of the base change.) \square

Lemma 34.19.8. *The property $\mathcal{P}(f) = "f \text{ is locally of finite type}"$ is fpqc local on the base.*

Proof. Being locally of finite type is preserved under base change, see Morphisms, Lemma 28.16.4. Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 28.16.2. Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is locally of finite type. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine and of finite type over S' . Write $S = \text{Spec}(R)$, $S' = \text{Spec}(R')$, $U = \text{Spec}(A)$, and $U' = \text{Spec}(A')$. We know that $R \rightarrow R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \rightarrow A'$ is of finite type. We have to show that $R \rightarrow A$ is of finite type. This is the result of Algebra, Lemma 10.122.1. It follows that f is locally of finite type. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.9. *The property $\mathcal{P}(f) = "f \text{ is locally of finite presentation}"$ is fpqc local on the base.*

Proof. Being locally of finite presentation is preserved under base change, see Morphisms, Lemma 28.22.4. Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 28.22.2. Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is locally of finite presentation. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine and of finite type over S' . Write $S = \text{Spec}(R)$, $S' = \text{Spec}(R')$, $U = \text{Spec}(A)$, and $U' = \text{Spec}(A')$. We know that $R \rightarrow R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \rightarrow A'$ is of finite presentation. We have to show that $R \rightarrow A$ is of finite presentation. This is the result of Algebra, Lemma 10.122.2. It follows that f is locally of finite presentation. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.10. *The property $\mathcal{P}(f) = “f \text{ is of finite type}”$ is fpqc local on the base.*

Proof. Combine Lemmas 34.19.1 and 34.19.8. □

Lemma 34.19.11. *The property $\mathcal{P}(f) = “f \text{ is of finite presentation}”$ is fpqc local on the base.*

Proof. Combine Lemmas 34.19.1, 34.19.2 and 34.19.9. □

Lemma 34.19.12. *The property $\mathcal{P}(f) = “f \text{ is proper}”$ is fpqc local on the base.*

Proof. The lemma follows by combining Lemmas 34.19.3, 34.19.5 and 34.19.10. □

Lemma 34.19.13. *The property $\mathcal{P}(f) = “f \text{ is flat}”$ is fpqc local on the base.*

Proof. Being flat is preserved under arbitrary base change, see Morphisms, Lemma 28.26.7. Being flat is Zariski local on the base by definition. Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is flat. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine. Write $S = \text{Spec}(R)$, $S' = \text{Spec}(R')$, $U = \text{Spec}(A)$, and $U' = \text{Spec}(A')$. We know that $R \rightarrow R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \rightarrow A'$ is flat. Goal: Show that $R \rightarrow A$ is flat. This follows immediately from Algebra, Lemma 10.38.7. Hence f is flat. Therefore Lemma 34.18.4 applies and we win. □

Lemma 34.19.14. *The property $\mathcal{P}(f) = “f \text{ is an open immersion}”$ is fpqc local on the base.*

Proof. The property of being an open immersion is stable under base change, see Schemes, Lemma 25.18.2. The property of being an open immersion is Zariski local on the base (this is obvious). Finally, let $S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is an open immersion. Then f' is universally open, and universally injective. Hence we conclude that f is universally open by Lemma 34.19.4, and universally injective by Lemma 34.19.7. In particular $f(X) \subset S$ is open, and we may replace S by $f(S)$ and assume that f is surjective. This implies that f' is an isomorphism and we have to show that f is an isomorphism also. Since f is universally injective we see that f is bijective. Hence f is a homeomorphism. Let $x \in X$ and choose $U \subset X$ an affine open neighbourhood of x . Since $f(U) \subset S$ is open, and S is affine we may choose a standard open $D(g) \subset f(U)$ containing $f(x)$ where $g \in \Gamma(S, \mathcal{O}_S)$. It is clear that $U \cap f^{-1}(D(g))$ is still affine and still an open neighbourhood of x . Replace U by $U \cap f^{-1}(D(g))$ and write $V = D(g) \subset S$ and V' the inverse image of V in S' . Note that V' is a standard open of S' as well and in particular that V' is affine. Since f' is an isomorphism we have $V' \times_{V'} U \rightarrow V'$ is an isomorphism. In terms of rings this means that

$$\mathcal{O}(V') \longrightarrow \mathcal{O}(V') \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$$

is an isomorphism. Since $\mathcal{O}(V) \rightarrow \mathcal{O}(V')$ is faithfully flat this implies that $\mathcal{O}(V) \rightarrow \mathcal{O}(U)$ is an isomorphism. Hence $U \cong V$ and we see that f is an isomorphism. Therefore Lemma 34.18.4 applies and we win. □

Lemma 34.19.15. *The property $\mathcal{P}(f) = “f \text{ is an isomorphism}”$ is fpqc local on the base.*

Proof. Combine Lemmas 34.19.6 and 34.19.14. \square

Lemma 34.19.16. *The property $\mathcal{P}(f) = “f \text{ is affine}”$ is fpqc local on the base.*

Proof. A base change of an affine morphism is affine, see Morphisms, Lemma 28.13.8. Being affine is Zariski local on the base, see Morphisms, Lemma 28.13.3. Finally, let $g : S' \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is affine. In other words, X' is affine, say $X' = \text{Spec}(A')$. Also write $S = \text{Spec}(R)$ and $S' = \text{Spec}(R')$. We have to show that X is affine.

By Lemmas 34.19.1 and 34.19.5 we see that $X \rightarrow S$ is separated and quasi-compact. Thus $f_*\mathcal{O}_X$ is a quasi-coherent sheaf of \mathcal{O}_S -algebras, see Schemes, Lemma 25.24.1. Hence $f_*\mathcal{O}_X = \widetilde{A}$ for some R -algebra A . In fact $A = \Gamma(X, \mathcal{O}_X)$ of course. Also, by flat base change (see for example Cohomology of Schemes, Lemma 29.5.2) we have $g^*f_*\mathcal{O}_X = f'_*\mathcal{O}_{X'}$. In other words, we have $A' = R' \otimes_R A$. Consider the canonical morphism

$$X \longrightarrow \text{Spec}(A)$$

over S from Schemes, Lemma 25.6.4. By the above the base change of this morphism to S' is an isomorphism. Hence it is an isomorphism by Lemma 34.19.15. Therefore Lemma 34.18.4 applies and we win. \square

Lemma 34.19.17. *The property $\mathcal{P}(f) = “f \text{ is a closed immersion}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{Y_i \rightarrow Y\}$ be an fpqc covering. Assume that each $f_i : Y_i \times_Y X \rightarrow Y_i$ is a closed immersion. This implies that each f_i is affine, see Morphisms, Lemma 28.13.9. By Lemma 34.19.16 we conclude that f is affine. It remains to show that $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$ is surjective. For every $y \in Y$ there exists an i and a point $y_i \in Y_i$ mapping to y . By Cohomology of Schemes, Lemma 29.5.2 the sheaf $f_{i,*}(\mathcal{O}_{Y_i \times_Y X})$ is the pullback of $f_*\mathcal{O}_X$. By assumption it is a quotient of \mathcal{O}_{Y_i} . Hence we see that

$$\left(\mathcal{O}_{Y,y} \longrightarrow (f_*\mathcal{O}_X)_y \right) \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{Y_i,y_i}$$

is surjective. Since \mathcal{O}_{Y_i,y_i} is faithfully flat over $\mathcal{O}_{Y,y}$ this implies the surjectivity of $\mathcal{O}_{Y,y} \rightarrow (f_*\mathcal{O}_X)_y$ as desired. \square

Lemma 34.19.18. *The property $\mathcal{P}(f) = “f \text{ is quasi-affine}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{g_i : Y_i \rightarrow Y\}$ be an fpqc covering. Assume that each $f_i : Y_i \times_Y X \rightarrow Y_i$ is quasi-affine. This implies that each f_i is quasi-compact and separated. By Lemmas 34.19.1 and 34.19.5 this implies that f is quasi-compact and separated. Consider the sheaf of \mathcal{O}_Y -algebras $\mathcal{A} = f_*\mathcal{O}_X$. By Schemes, Lemma 25.24.1 it is a quasi-coherent \mathcal{O}_Y -algebra. Consider the canonical morphism

$$j : X \longrightarrow \underline{\text{Spec}}_Y(\mathcal{A})$$

see Constructions, Lemma 26.4.7. By flat base change (see for example Cohomology of Schemes, Lemma 29.5.2) we have $g_i^*f_*\mathcal{O}_X = f_{i,*}\mathcal{O}_{X'}$ where $g_i : Y_i \rightarrow Y$ are the given flat maps. Hence the base change j_i of j by g_i is the canonical morphism of Constructions, Lemma 26.4.7 for the morphism f_i . By assumption and

Morphisms, Lemma 28.14.3 all of these morphisms j_i are quasi-compact open immersions. Hence, by Lemmas 34.19.1 and 34.19.14 we see that j is a quasi-compact open immersion. Hence by Morphisms, Lemma 28.14.3 again we conclude that f is quasi-affine. \square

Lemma 34.19.19. *The property $\mathcal{P}(f) = “f \text{ is a quasi-compact immersion}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{Y_i \rightarrow Y\}$ be an fpqc covering. Write $X_i = Y_i \times_Y X$ and $f_i : X_i \rightarrow Y_i$ the base change of f . Also denote $q_i : Y_i \rightarrow Y$ the given flat morphisms. Assume each f_i is a quasi-compact immersion. By Schemes, Lemma 25.23.7 each f_i is separated. By Lemmas 34.19.1 and 34.19.5 this implies that f is quasi-compact and separated. Let $X \rightarrow Z \rightarrow Y$ be the factorization of f through its scheme theoretic image. By Morphisms, Lemma 28.6.3 the closed subscheme $Z \subset Y$ is cut out by the quasi-coherent sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$ as f is quasi-compact. By flat base change (see for example Cohomology of Schemes, Lemma 29.5.2; here we use f is separated) we see $f_{i,*}\mathcal{O}_{X_i}$ is the pullback $q_i^*f_*\mathcal{O}_X$. Hence $Y_i \times_Y Z$ is cut out by the quasi-coherent sheaf of ideals $q_i^*\mathcal{I} = \text{Ker}(\mathcal{O}_{Y_i} \rightarrow f_{i,*}\mathcal{O}_{X_i})$. By Morphisms, Lemma 28.7.7 the morphisms $X_i \rightarrow Y_i \times_Y Z$ are open immersions. Hence by Lemma 34.19.14 we see that $X \rightarrow Z$ is an open immersion and hence f is a immersion as desired (we already saw it was quasi-compact). \square

Lemma 34.19.20. *The property $\mathcal{P}(f) = “f \text{ is integral}”$ is fpqc local on the base.*

Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms, Lemma 28.44.7. Hence the lemma follows on combining Lemmas 34.19.3 and 34.19.16. \square

Lemma 34.19.21. *The property $\mathcal{P}(f) = “f \text{ is finite}”$ is fpqc local on the base.*

Proof. An finite morphism is the same thing as an integral morphism which is locally of finite type. See Morphisms, Lemma 28.44.4. Hence the lemma follows on combining Lemmas 34.19.8 and 34.19.20. \square

Lemma 34.19.22. *The properties $\mathcal{P}(f) = “f \text{ is locally quasi-finite}”$ and $\mathcal{P}(f) = “f \text{ is quasi-finite}”$ are fpqc local on the base.*

Proof. Let $f : X \rightarrow S$ be a morphism of schemes, and let $\{S_i \rightarrow S\}$ be an fpqc covering such that each base change $f_i : X_i \rightarrow S_i$ is locally quasi-finite. We have already seen (Lemma 34.19.8) that “locally of finite type” is fpqc local on the base, and hence we see that f is locally of finite type. Then it follows from Morphisms, Lemma 28.21.13 that f is locally quasi-finite. The quasi-finite case follows as we have already seen that “quasi-compact” is fpqc local on the base (Lemma 34.19.1). \square

Lemma 34.19.23. *The property $\mathcal{P}(f) = “f \text{ is locally of finite type of relative dimension } d”$ is fpqc local on the base.*

Proof. This follows immediately from the fact that being locally of finite type is fpqc local on the base and Morphisms, Lemma 28.29.3. \square

Lemma 34.19.24. *The property $\mathcal{P}(f) = “f \text{ is syntomic}”$ is fpqc local on the base.*

Proof. A morphism is syntomic if and only if it is locally of finite presentation, flat, and has locally complete intersections as fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 34.19.13, and 34.19.9). Hence the result follows for syntomic from Morphisms, Lemma 28.32.12. \square

Lemma 34.19.25. *The property $\mathcal{P}(f) = “f \text{ is smooth}”$ is fpqc local on the base.*

Proof. A morphism is smooth if and only if it is locally of finite presentation, flat, and has smooth fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 34.19.13, and 34.19.9). Hence the result follows for smooth from Morphisms, Lemma 28.35.15. \square

Lemma 34.19.26. *The property $\mathcal{P}(f) = “f \text{ is unramified}”$ is fpqc local on the base. The property $\mathcal{P}(f) = “f \text{ is } G\text{-unramified}”$ is fpqc local on the base.*

Proof. A morphism is unramified (resp. G -unramified) if and only if it is locally of finite type (resp. finite presentation) and its diagonal morphism is an open immersion (see Morphisms, Lemma 28.36.13). We have seen already that being locally of finite type (resp. locally of finite presentation) and an open immersion is fpqc local on the base (Lemmas 34.19.9, 34.19.8, and 34.19.14). Hence the result follows formally. \square

Lemma 34.19.27. *The property $\mathcal{P}(f) = “f \text{ is étale}”$ is fpqc local on the base.*

Proof. A morphism is étale if and only if it flat and G -unramified. See Morphisms, Lemma 28.37.16. We have seen already that being flat and G -unramified are fpqc local on the base (Lemmas 34.19.13, and 34.19.26). Hence the result follows. \square

Lemma 34.19.28. *The property $\mathcal{P}(f) = “f \text{ is finite locally free}”$ is fpqc local on the base. Let $d \geq 0$. The property $\mathcal{P}(f) = “f \text{ is finite locally free of degree } d”$ is fpqc local on the base.*

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms, Lemma 28.46.2). Hence this follows from Lemmas 34.19.21, 34.19.13, and 34.19.9. If $f : Z \rightarrow U$ is finite locally free, and $\{U_i \rightarrow U\}$ is a surjective family of morphisms such that each pullback $Z \times_U U_i \rightarrow U_i$ has degree d , then $Z \rightarrow U$ has degree d , for example because we can read off the degree in a point $u \in U$ from the fibre $(f_*\mathcal{O}_Z)_u \otimes_{\mathcal{O}_{U,u}} \kappa(u)$. \square

Lemma 34.19.29. *The property $\mathcal{P}(f) = “f \text{ is a monomorphism}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow S$ be a morphism of schemes. Let $\{S_i \rightarrow S\}$ be an fpqc covering, and assume each of the base changes $f_i : X_i \rightarrow S_i$ of f is a monomorphism. Let $a, b : T \rightarrow X$ be two morphisms such that $f \circ a = f \circ b$. We have to show that $a = b$. Since f_i is a monomorphism we see that $a_i = b_i$, where $a_i, b_i : S_i \times_S T \rightarrow X_i$ are the base changes. In particular the compositions $S_i \times_S T \rightarrow T \rightarrow X$ are equal. Since $\coprod S_i \times_S T \rightarrow T$ is an epimorphism (see e.g. Lemma 34.9.3) we conclude $a = b$. \square

Lemma 34.19.30. *The properties*

$\mathcal{P}(f) = “f \text{ is a Koszul-regular immersion}”$,
 $\mathcal{P}(f) = “f \text{ is an } H_1\text{-regular immersion}”$, and

$\mathcal{P}(f) = "f \text{ is a quasi-regular immersion}"$

are fpqc local on the base.

Proof. We will use the criterion of Lemma 34.18.4 to prove this. By Divisors, Definition 30.13.1 being a Koszul-regular (resp. H_1 -regular, quasi-regular) immersion is Zariski local on the base. By Divisors, Lemma 30.13.4 being a Koszul-regular (resp. H_1 -regular, quasi-regular) immersion is preserved under flat base change. The final hypothesis (3) of Lemma 34.18.4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $I \subset A$ be an ideal. If IB is locally on $\text{Spec}(B)$ generated by a Koszul-regular (resp. H_1 -regular, quasi-regular) sequence in B , then $I \subset A$ is locally on $\text{Spec}(A)$ generated by a Koszul-regular (resp. H_1 -regular, quasi-regular) sequence in A . This is More on Algebra, Lemma 15.22.4. \square

34.20. Properties of morphisms local in the fppf topology on the target

In this section we find some properties of morphisms of schemes for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

Lemma 34.20.1. *The property $\mathcal{P}(f) = "f \text{ is an immersion}"$ is fppf local on the base.*

Proof. The property of being an immersion is stable under base change, see Schemes, Lemma 25.18.2. The property of being an immersion is Zariski local on the base. Finally, let $\pi : S' \rightarrow S$ be a surjective morphism of affine schemes, which is flat and locally of finite presentation. Note that $\pi : S' \rightarrow S$ is open by Morphisms, Lemma 28.26.9. Let $f : X \rightarrow S$ be a morphism. Assume that the base change $f' : X' \rightarrow S'$ is an immersion. In particular we see that $f'(X') = \pi^{-1}(f(X))$ is locally closed. Hence by Topology, Lemma 5.5.4 we see that $f(X) \subset S$ is locally closed. Let $Z \subset S$ be the closed subset $Z = \overline{f(X)} \setminus f(X)$. By Topology, Lemma 5.5.4 again we see that $f'(X')$ is closed in $S' \setminus Z'$. Hence we may apply Lemma 34.19.17 to the fpqc covering $\{S' \setminus Z' \rightarrow S \setminus Z\}$ and conclude that $f : X \rightarrow S \setminus Z$ is a closed immersion. In other words, f is an immersion. Therefore Lemma 34.18.4 applies and we win. \square

34.21. Application of fpqc descent of properties of morphisms

The following lemma may seem a bit frivolous but turns out is a useful tool in studying étale and unramified morphisms.

Lemma 34.21.1. *Let $f : X \rightarrow Y$ be a flat, quasi-compact, surjective monomorphism. Then f is an isomorphism.*

Proof. As f is a flat, quasi-compact, surjective morphism we see $\{X \rightarrow Y\}$ is an fpqc covering of Y . The diagonal $\Delta : X \rightarrow X \times_Y X$ is an isomorphism. This implies that the base change of f by f is an isomorphism. Hence we see f is an isomorphism by Lemma 34.19.15. \square

We can use this lemma to show the following important result. We will discuss this and related results in more detail in Étale Morphisms, Section 40.14.

Lemma 34.21.2. *A universally injective étale morphism is an open immersion.*

Proof. Let $f : X \rightarrow Y$ be an étale morphism which is universally injective. Then f is open (Morphisms, Lemma 28.37.13) hence we can replace Y by $f(X)$ and we may assume that f is surjective. Then f is bijective and open hence a homeomorphism. Hence f is quasi-compact. Thus by Lemma 34.21.1 it suffices to show that f is a monomorphism. As $X \rightarrow Y$ is étale the morphism $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is an open immersion by Morphisms, Lemma 28.36.13 (and Morphisms, Lemma 28.37.16). As f is universally injective $\Delta_{X/Y}$ is also surjective, see Morphisms, Lemma 28.12.2. Hence $\Delta_{X/Y}$ is an isomorphism, i.e., $X \rightarrow Y$ is a monomorphism. \square

We can reformulate the hypotheses in the lemma above a bit by using the following characterization of flat universally injective morphisms.

Lemma 34.21.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let X^0 denote the set of generic points of irreducible components of X . If*

- (1) *f is flat and separated,*
- (2) *for $\xi \in X^0$ we have $\kappa(f(\xi)) = \kappa(\xi)$, and*
- (3) *if $\xi, \xi' \in X^0$, $\xi \neq \xi'$, then $f(\xi) \neq f(\xi')$,*

then f is universally injective.

Proof. We have to show that $\Delta : X \rightarrow X \times_Y X$ is surjective, see Morphisms, Lemma 28.12.2. As $X \rightarrow Y$ is separated, the image of Δ is closed. Thus if Δ is not surjective, we can find a generic point $\eta \in X \times_S X$ of an irreducible component of $X \times_S X$ which is not in the image of Δ . The projection $\text{pr}_1 : X \times_Y X \rightarrow X$ is flat as a base change of the flat morphism $X \rightarrow Y$, see Morphisms, Lemma 28.26.7. Hence generalizations lift along pr_1 , see Morphisms, Lemma 28.26.8. We conclude that $\xi = \text{pr}_1(\eta) \in X^0$. However, assumptions (2) and (3) guarantee that the scheme $(X \times_Y X)_{f(\xi)}$ has at most one point for every $\xi \in X^0$. In other words, we have $\Delta(\xi) = \eta$ a contradiction. \square

Thus we can reformulate Lemma 34.21.2 as follows.

Lemma 34.21.4. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let X^0 denote the set of generic points of irreducible components of X . If*

- (1) *f is étale and separated,*
- (2) *for $\xi \in X^0$ we have $\kappa(f(\xi)) = \kappa(\xi)$, and*
- (3) *if $\xi, \xi' \in X^0$, $\xi \neq \xi'$, then $f(\xi) \neq f(\xi')$,*

then f is an open immersion.

Proof. Immediate from Lemmas 34.21.3 and 34.21.2. \square

34.22. Properties of morphisms local on the source

It often happens one can prove a morphism has a certain property after precomposing with some other morphism. In many cases this implies the morphism has the property too. We formalize this in the following definition.

Definition 34.22.1. Let \mathcal{P} be a property of morphisms of schemes. Let $\tau \in \{\text{Zariski, fpqc, fppf, étale, smooth, syntomic}\}$. We say \mathcal{P} is τ local on the source, or local on the source for the τ -topology if for any morphism of schemes $f : X \rightarrow Y$ over S , and any τ -covering $\{X_i \rightarrow X\}_{i \in I}$ we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } X_i \rightarrow Y \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property \mathcal{P} holds for $X \rightarrow Y$ if and only if it holds for any arrow $X' \rightarrow Y'$ isomorphic to $X \rightarrow Y$. If a property is τ -local on the source then it is preserved by precomposing with morphisms which occur in τ -coverings. Here is a formal statement.

Lemma 34.22.2. *Let $\tau \in \{\text{fpqc}, \text{fppf}, \text{syntomic}, \text{smooth}, \text{étale}, \text{Zariski}\}$. Let \mathcal{P} be a property of morphisms which is τ local on the source. Let $f : X \rightarrow Y$ have property \mathcal{P} . For any morphism $a : X' \rightarrow X$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, resp. an open immersion, the composition $f \circ a : X' \rightarrow Y$ has property \mathcal{P} .*

Proof. This is true because we can fit $X' \rightarrow X$ into a family of morphisms which forms a τ -covering. \square

Lemma 34.22.3. *Let \mathcal{P} be a property of morphisms of schemes. Let $\tau \in \{\text{fpqc}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Assume that*

- (1) *the property is preserved under precomposing with flat, flat locally of finite presentation, étale, smooth or syntomic morphisms depending on whether τ is fpqc, fppf, étale, smooth, or syntomic,*
- (2) *the property is Zariski local on the source,*
- (3) *the property is Zariski local on the target,*
- (4) *for any morphism of affine schemes $X \rightarrow Y$, and any surjective morphism of affine schemes $X' \rightarrow X$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, property \mathcal{P} holds for f if property \mathcal{P} holds for the composition $f' : X' \rightarrow Y$.*

Then \mathcal{P} is τ local on the source.

Proof. This follows almost immediately from the definition of a τ -covering, see Topologies, Definition 33.8.1 33.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4, or 33.6.4. Details omitted. (Hint: Use locality on the source and target to reduce the verification of property \mathcal{P} to the case of a morphism between affines. Then apply (1) and (4).) \square

Remark 34.22.4. (This is a repeat of Remarks 34.11.3 and 34.18.5 above.) In Lemma 34.22.3 above if $\tau = \text{smooth}$ then in condition (4) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = \text{syntomic}$ or $\tau = \text{étale}$.

34.23. Properties of morphisms local in the fpqc topology on the source

Here are some properties of morphisms that are fpqc local on the source.

Lemma 34.23.1. *The property $\mathcal{P}(f) = \text{“}f \text{ is flat”}$ is fpqc local on the source.*

Proof. Since flatness is defined in terms of the maps of local rings (Morphisms, Definition 28.26.1) what has to be shown is the following algebraic fact: Suppose $A \rightarrow B \rightarrow C$ are local homomorphisms of local rings, and assume $B \rightarrow C$ are flat. Then $A \rightarrow B$ is flat if and only if $A \rightarrow C$ is flat. If $A \rightarrow B$ is flat, then $A \rightarrow C$ is flat by Algebra, Lemma 10.38.3. Conversely, assume $A \rightarrow C$ is flat. Note that $B \rightarrow C$ is faithfully flat, see Algebra, Lemma 10.38.16. Hence $A \rightarrow B$ is flat by Algebra, Lemma 10.38.9. (Also see Morphisms, Lemma 28.26.11 for a direct proof.) \square

Lemma 34.23.2. *Then property $\mathcal{P}(f : X \rightarrow Y) = \text{“for every } x \in X \text{ the map of local rings } \mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x} \text{ is injective”}$ is fppc local on the source.*

Proof. Omitted. This is just a (probably misguided) attempt to be playful. \square

34.24. Properties of morphisms local in the fppf topology on the source

Here are some properties of morphisms that are fppf local on the source.

Lemma 34.24.1. *The property $\mathcal{P}(f) = \text{“}f \text{ is locally of finite presentation”}$ is fppf local on the source.*

Proof. Being locally of finite presentation is Zariski local on the source and the target, see Morphisms, Lemma 28.22.2. It is a property which is preserved under composition, see Morphisms, Lemma 28.22.3. This proves (1), (2) and (3) of Lemma 34.22.3. The final condition (4) is Lemma 34.10.1. Hence we win. \square

Lemma 34.24.2. *The property $\mathcal{P}(f) = \text{“}f \text{ is locally of finite type”}$ is fppf local on the source.*

Proof. Being locally of finite type is Zariski local on the source and the target, see Morphisms, Lemma 28.16.2. It is a property which is preserved under composition, see Morphisms, Lemma 28.16.3, and a flat morphism locally of finite presentation is locally of finite type, see Morphisms, Lemma 28.22.8. This proves (1), (2) and (3) of Lemma 34.22.3. The final condition (4) is Lemma 34.10.2. Hence we win. \square

Lemma 34.24.3. *The property $\mathcal{P}(f) = \text{“}f \text{ is open”}$ is fppf local on the source.*

Proof. Being an open morphism is clearly Zariski local on the source and the target. It is a property which is preserved under composition, see Morphisms, Lemma 28.24.3, and a flat morphism of finite presentation is open, see Morphisms, Lemma 28.26.9. This proves (1), (2) and (3) of Lemma 34.22.3. The final condition (4) follows from Morphisms, Lemma 28.26.10. Hence we win. \square

Lemma 34.24.4. *The property $\mathcal{P}(f) = \text{“}f \text{ is universally open”}$ is fppf local on the source.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{X_i \rightarrow X\}_{i \in I}$ be an fppf covering. Denote $f_i : X_i \rightarrow X$ the compositions. We have to show that f is universally open if and only if each f_i is universally open. If f is universally open, then also each f_i is universally open since the maps $X_i \rightarrow X$ are universally open and compositions of universally open morphisms are universally open (Morphisms, Lemmas 28.26.9 and 28.24.3). Conversely, assume each f_i is universally open. Let $Y' \rightarrow Y$ be a morphism of schemes. Denote $X' = Y' \times_Y X$ and $X'_i = Y' \times_Y X_i$. Note that $\{X'_i \rightarrow X'\}_{i \in I}$ is an fppf covering also. The morphisms $f'_i : X'_i \rightarrow Y'$ are open by assumption. Hence by the Lemma 34.24.3 above we conclude that $f' : X' \rightarrow Y'$ is open as desired. \square

34.25. Properties of morphisms local in the syntomic topology on the source

Here are some properties of morphisms that are syntomic local on the source.

Lemma 34.25.1. *The property $\mathcal{P}(f) = \text{“}f \text{ is syntomic”}$ is syntomic local on the source.*

Proof. Combine Lemma 34.22.3 with Morphisms, Lemma 28.32.2 (local for Zariski on source and target), Morphisms, Lemma 28.32.3 (pre-composing), and Lemma 34.10.4 (part (4)). \square

34.26. Properties of morphisms local in the smooth topology on the source

Here are some properties of morphisms that are smooth local on the source.

Lemma 34.26.1. *The property $\mathcal{P}(f) = “f \text{ is smooth}”$ is smooth local on the source.*

Proof. Combine Lemma 34.22.3 with Morphisms, Lemma 28.35.2 (local for Zariski on source and target), Morphisms, Lemma 28.35.4 (pre-composing), and Lemma 34.10.4 (part (4)). \square

34.27. Properties of morphisms local in the étale topology on the source

Here are some properties of morphisms that are étale local on the source.

Lemma 34.27.1. *The property $\mathcal{P}(f) = “f \text{ is étale}”$ is étale local on the source.*

Proof. Combine Lemma 34.22.3 with Morphisms, Lemma 28.37.2 (local for Zariski on source and target), Morphisms, Lemma 28.37.3 (pre-composing), and Lemma 34.10.4 (part (4)). \square

Lemma 34.27.2. *The property $\mathcal{P}(f) = “f \text{ is locally quasi-finite}”$ is étale local on the source.*

Proof. We are going to use Lemma 34.22.3. By Morphisms, Lemma 28.21.11 the property of being locally quasi-finite is local for Zariski on source and target. By Morphisms, Lemmas 28.21.12 and 28.37.6 we see the precomposition of a locally quasi-finite morphism by an étale morphism is locally quasi-finite. Finally, suppose that $X \rightarrow Y$ is a morphism of affine schemes and that $X' \rightarrow X$ is a surjective étale morphism of affine schemes such that $X' \rightarrow Y$ is locally quasi-finite. Then $X' \rightarrow Y$ is of finite type, and by Lemma 34.10.2 we see that $X \rightarrow Y$ is of finite type also. Moreover, by assumption $X' \rightarrow Y$ has finite fibres, and hence $X \rightarrow Y$ has finite fibres also. We conclude that $X \rightarrow Y$ is quasi-finite by Morphisms, Lemma 28.21.10. This proves the last assumption of Lemma 34.22.3 and finishes the proof. \square

Lemma 34.27.3. *The property $\mathcal{P}(f) = “f \text{ is unramified}”$ is étale local on the source. The property $\mathcal{P}(f) = “f \text{ is } G\text{-unramified}”$ is étale local on the source.*

Proof. We are going to use Lemma 34.22.3. By Morphisms, Lemma 28.36.3 the property of being unramified (resp. G -unramified) is local for Zariski on source and target. By Morphisms, Lemmas 28.36.4 and 28.37.5 we see the precomposition of an unramified (resp. G -unramified) morphism by an étale morphism is unramified (resp. G -unramified). Finally, suppose that $X \rightarrow Y$ is a morphism of affine schemes and that $f : X' \rightarrow X$ is a surjective étale morphism of affine schemes such that $X' \rightarrow Y$ is unramified (resp. G -unramified). Then $X' \rightarrow Y$ is of finite type (resp. finite presentation), and by Lemma 34.10.2 (resp. Lemma 34.10.1) we see that

$X \rightarrow Y$ is of finite type (resp. finite presentation) also. By Morphisms, Lemma 28.35.16 we have a short exact sequence

$$0 \rightarrow f^*\Omega_{X/Y} \rightarrow \Omega_{X'/Y} \rightarrow \Omega_{X'/X} \rightarrow 0.$$

As $X' \rightarrow Y$ is unramified we see that the middle term is zero. Hence, as f is faithfully flat we see that $\Omega_{X/Y} = 0$. Hence $X \rightarrow Y$ is unramified (resp. G-unramified), see Morphisms, Lemma 28.36.2. This proves the last assumption of Lemma 34.22.3 and finishes the proof. \square

34.28. Properties of morphisms étale local on source-and-target

Let \mathcal{P} be a property of morphisms of schemes. There is an intuitive meaning to the phrase “ \mathcal{P} is étale local on the source and target”. However, it turns out that this notion is not the same as asking \mathcal{P} to be both étale local on the source and étale local on the target. Before we discuss this further we give two silly examples.

Example 34.28.1. Consider the property \mathcal{P} of morphisms of schemes defined by the rule $\mathcal{P}(X \rightarrow Y) = “Y$ is locally Noetherian”. The reader can verify that this is étale local on the source and étale local on the target (omitted, see Lemma 34.12.1). But it is **not** true that if $f : X \rightarrow Y$ has \mathcal{P} and $g : Y \rightarrow Z$ is étale, then $g \circ f$ has \mathcal{P} . Namely, f could be the identity on Y and g could be an open immersion of a locally Noetherian scheme Y into a non locally Noetherian scheme Z .

The following example is in some sense worse.

Example 34.28.2. Consider the property \mathcal{P} of morphisms of schemes defined by the rule $\mathcal{P}(f : X \rightarrow Y) = “\text{for every } y \in Y \text{ which is a specialization of some } f(x), x \in X \text{ the local ring } \mathcal{O}_{Y,y} \text{ is Noetherian}”$. Let us verify that this is étale local on the source and étale local on the target. We will freely use Schemes, Lemma 25.13.2.

Local on the target: Let $\{g_i : Y_i \rightarrow Y\}$ be an étale covering. Let $f_i : X_i \rightarrow Y_i$ be the base change of f , and denote $h_i : X_i \rightarrow X$ the projection. Assume $\mathcal{P}(f)$. Let $f(x_i) \rightsquigarrow y_i$ be a specialization. Then $f(h_i(x_i)) \rightsquigarrow g_i(y_i)$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y,g_i(y_i)}$ is Noetherian. Also $\mathcal{O}_{Y,g_i(y_i)} \rightarrow \mathcal{O}_{Y_i,y_i}$ is a localization of an étale ring map. Hence \mathcal{O}_{Y_i,y_i} is Noetherian by Algebra, Lemma 10.30.1. Conversely, assume $\mathcal{P}(f_i)$ for all i . Let $f(x) \rightsquigarrow y$ be a specialization. Choose an i and $y_i \in Y_i$ mapping to y . Since x can be viewed as a point of $\text{Spec}(\mathcal{O}_{Y,y}) \times_Y X$ and $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{Y_i,y_i}$ is faithfully flat, there exists a point $x_i \in \text{Spec}(\mathcal{O}_{Y_i,y_i}) \times_Y X$ mapping to x . Then $x_i \in X_i$, and $f_i(x_i)$ specializes to y_i . Thus we see that \mathcal{O}_{Y_i,y_i} is Noetherian by $\mathcal{P}(f_i)$ which implies that $\mathcal{O}_{Y,y}$ is Noetherian by Algebra, Lemma 10.152.1.

Local on the source: Let $\{h_i : X_i \rightarrow X\}$ be an étale covering. Let $f_i : X_i \rightarrow Y$ be the composition $f \circ h_i$. Assume $\mathcal{P}(f)$. Let $f(x_i) \rightsquigarrow y$ be a specialization. Then $f(h_i(x_i)) \rightsquigarrow y$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y,y}$ is Noetherian. Thus $\mathcal{P}(f_i)$ holds. Conversely, assume $\mathcal{P}(f_i)$ for all i . Let $f(x) \rightsquigarrow y$ be a specialization. Choose an i and $x_i \in X_i$ mapping to x . Then y is a specialization of $f_i(x_i) = f(x)$. Hence $\mathcal{P}(f_i)$ implies $\mathcal{O}_{Y,y}$ is Noetherian as desired.

We claim that there exists a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \quad \quad & \downarrow b \\ X & \xrightarrow{\quad} & Y \end{array}$$

with surjective étale vertical arrows, such that h has \mathcal{P} and f does not have \mathcal{P} . Namely, let

$$Y = \text{Spec} \left(\mathbf{C}[x_n; n \in \mathbf{Z}] / (x_n x_m; n \neq m) \right)$$

and let $X \subset Y$ be the open subscheme which is the complement of the point all of whose coordinates $x_n = 0$. Let $U = X$, let $V = X \amalg Y$, let a, b the obvious map, and let $h : U \rightarrow V$ be the inclusion of $U = X$ into the first summand of V . The claim above holds because U is locally Noetherian, but Y is not.

What should be the correct notion of a property which is étale local on the source-and-target? We think that, by analogy with Morphisms, Definition 28.15.1 it should be the following.

Definition 34.28.3. Let \mathcal{P} be a property of morphisms of schemes. We say \mathcal{P} is *étale local on source-and-target* if

- (1) (stable under precomposing with étale maps) if $f : X \rightarrow Y$ is étale and $g : Y \rightarrow Z$ has \mathcal{P} , then $g \circ f$ has \mathcal{P} ,
- (2) (stable under étale base change) if $f : X \rightarrow Y$ has \mathcal{P} and $Y' \rightarrow Y$ is étale, then the base change $f' : Y' \times_Y X \rightarrow Y'$ has \mathcal{P} , and
- (3) (locality) given a morphism $f : X \rightarrow Y$ the following are equivalent
 - (a) f has \mathcal{P} ,
 - (b) for every $x \in X$ there exists a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \searrow h & \downarrow b \\ X & \xrightarrow{\quad f \quad} & Y \end{array}$$

with étale vertical arrows and $u \in U$ with $a(u) = x$ such that h has \mathcal{P} .

It turns out this definition excludes the behavior seen in Examples 34.28.1 and 34.28.2. We will compare this to the definition in the paper [DM69] by Deligne and Mumford in Remark 34.28.8. Moreover, a property which is étale local on the source-and-target is étale local on the source and étale local on the target. Finally, the converse is almost true as we will see in Lemma 34.28.6.

Lemma 34.28.4. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on source-and-target. Then*

- (1) \mathcal{P} is étale local on the source,
- (2) \mathcal{P} is étale local on the target,
- (3) \mathcal{P} is stable under postcomposing with étale morphisms: if $f : X \rightarrow Y$ has \mathcal{P} and $g : Y \rightarrow Z$ is étale, then $g \circ f$ has \mathcal{P} , and
- (4) \mathcal{P} has a permanence property: given $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ étale such that $g \circ f$ has \mathcal{P} , then f has \mathcal{P} .

Proof. We write everything out completely.

Proof of (1). Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{X_i \rightarrow X\}_{i \in I}$ be an étale covering of X . If each composition $h_i : X_i \rightarrow Y$ has \mathcal{P} , then for each $x \in X$ we can find an $i \in I$ and a point $x_i \in X_i$ mapping to x . Then $(X_i, x_i) \rightarrow (X, x)$ is an étale morphism of germs, and $\text{id}_Y : Y \rightarrow Y$ is an étale morphism, and h_i is as

in part (3) of Definition 34.28.3. Thus we see that f has \mathcal{P} . Conversely, if f has \mathcal{P} then each $X_i \rightarrow Y$ has \mathcal{P} by Definition 34.28.3 part (1).

Proof of (2). Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an étale covering of Y . Write $X_i = Y_i \times_Y X$ and $h_i : X_i \rightarrow Y_i$ for the base change of f . If each $h_i : X_i \rightarrow Y_i$ has \mathcal{P} , then for each $x \in X$ we pick an $i \in I$ and a point $x_i \in X_i$ mapping to x . Then $(X_i, x_i) \rightarrow (X, x)$ is an étale morphism of germs, $Y_i \rightarrow Y$ is étale, and h_i is as in part (3) of Definition 34.28.3. Thus we see that f has \mathcal{P} . Conversely, if f has \mathcal{P} , then each $X_i \rightarrow Y_i$ has \mathcal{P} by Definition 34.28.3 part (2).

Proof of (3). Assume $f : X \rightarrow Y$ has \mathcal{P} and $g : Y \rightarrow Z$ is étale. For every $x \in X$ we can think of $(X, x) \rightarrow (X, x)$ as an étale morphism of germs, $Y \rightarrow Z$ is an étale morphism, and $h = f$ is as in part (3) of Definition 34.28.3. Thus we see that $g \circ f$ has \mathcal{P} .

Proof of (4). Let $f : X \rightarrow Y$ be a morphism and $g : Y \rightarrow Z$ étale such that $g \circ f$ has \mathcal{P} . Then by Definition 34.28.3 part (2) we see that $\text{pr}_Y : Y \times_Z X \rightarrow Y$ has \mathcal{P} . But the morphism $(f, 1) : X \rightarrow Y \times_Z X$ is étale as a section to the étale projection $\text{pr}_X : Y \times_Z X \rightarrow X$, see Morphisms, Lemma 28.37.18. Hence $f = \text{pr}_Y \circ (f, 1)$ has \mathcal{P} by Definition 34.28.3 part (1). \square

The following lemma is the analogue of Morphisms, Lemma 28.15.4.

Lemma 34.28.5. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on source-and-target. Let $f : X \rightarrow Y$ be a morphism of schemes. The following are equivalent:*

- (a) f has property \mathcal{P} ,
- (b) for every $x \in X$ there exists an étale morphism of germs $a : (U, u) \rightarrow (X, x)$, an étale morphism $b : V \rightarrow Y$, and a morphism $h : U \rightarrow V$ such that $f \circ a = b \circ h$ and h has \mathcal{P} ,
- (c) for any commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \quad h \quad & \downarrow b \\ X & \xrightarrow{\quad f \quad} & Y \end{array}$$

with a, b étale the morphism h has \mathcal{P} ,

- (d) for some diagram as in (c) with $a : U \rightarrow X$ surjective h has \mathcal{P} ,
- (e) there exists an étale covering $\{Y_i \rightarrow Y\}_{i \in I}$ such that each base change $Y_i \times_Y X \rightarrow Y_i$ has \mathcal{P} ,
- (f) there exists an étale covering $\{X_i \rightarrow X\}_{i \in I}$ such that each composition $X_i \rightarrow Y$ has \mathcal{P} ,
- (g) there exists an étale covering $\{Y_i \rightarrow Y\}_{i \in I}$ and for each $i \in I$ an étale covering $\{X_{ij} \rightarrow Y_i \times_Y X\}_{j \in J_i}$ such that each morphism $X_{ij} \rightarrow Y_i$ has \mathcal{P} .

Proof. The equivalence of (a) and (b) is part of Definition 34.28.3. The equivalence of (a) and (e) is Lemma 34.28.4 part (2). The equivalence of (a) and (f) is Lemma 34.28.4 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).

It is clear that (c) implies (a). If (a) holds, then for any diagram as in (c) the morphism $f \circ a$ has \mathcal{P} by Definition 34.28.3 part (1), whereupon h has \mathcal{P} by Lemma

34.28.4 part (4). Thus (a) and (c) are equivalent. It is clear that (c) implies (d). To see that (d) implies (a) assume we have a diagram as in (c) with $a : U \rightarrow X$ surjective and h having \mathcal{P} . Then $b \circ h$ has \mathcal{P} by Lemma 34.28.4 part (3). Since $\{a : U \rightarrow X\}$ is an étale covering we conclude that f has \mathcal{P} by Lemma 34.28.4 part (1). \square

It seems that the result of the following lemma is not a formality, i.e., it actually uses something about the geometry of étale morphisms.

Lemma 34.28.6. *Let \mathcal{P} be a property of morphisms of schemes. Assume*

- (1) \mathcal{P} is étale local on the source,
- (2) \mathcal{P} is étale local on the target, and
- (3) \mathcal{P} is stable under postcomposing with open immersions: if $f : X \rightarrow Y$ has \mathcal{P} and $Y \subset Z$ is an open subscheme then $X \rightarrow Z$ has \mathcal{P} .

Then \mathcal{P} is étale local on the source-and-target.

Proof. Let \mathcal{P} be a property of morphisms of schemes which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 34.22.2 we see that \mathcal{P} is stable under precomposing with étale morphisms. By Lemma 34.18.2 we see that \mathcal{P} is stable under étale base change. Hence it suffices to prove part (3) of Definition 34.28.3 holds.

More precisely, suppose that $f : X \rightarrow Y$ is a morphism of schemes which satisfies Definition 34.28.3 part (3)(b). In other words, for every $x \in X$ there exists an étale morphism $a_x : U_x \rightarrow X$, a point $u_x \in U_x$ mapping to x , an étale morphism $b_x : V_x \rightarrow Y$, and a morphism $h_x : U_x \rightarrow V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has \mathcal{P} . The proof of the lemma is complete once we show that f has \mathcal{P} . Set $U = \coprod U_x$, $a = \coprod a_x$, $V = \coprod V_x$, $b = \coprod b_x$, and $h = \coprod h_x$. We obtain a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

with a, b étale, a surjective. Note that h has \mathcal{P} as each h_x does and \mathcal{P} is étale local on the target. Because a is surjective and \mathcal{P} is étale local on the source, it suffices to prove that $b \circ h$ has \mathcal{P} . This reduces the lemma to proving that \mathcal{P} is stable under postcomposing with an étale morphism.

During the rest of the proof we let $f : X \rightarrow Y$ be a morphism with property \mathcal{P} and $g : Y \rightarrow Z$ is an étale morphism. Consider the following statements:

- (\emptyset) With no additional assumptions $g \circ f$ has property \mathcal{P} .
- (A) Whenever Z is affine $g \circ f$ has property \mathcal{P} .
- (AA) Whenever X and Z are affine $g \circ f$ has property \mathcal{P} .
- (AAA) Whenever X, Y , and Z are affine $g \circ f$ has property \mathcal{P} .

Once we have proved (\emptyset) the proof of the lemma will be complete.

Claim 1: (AAA) \Rightarrow (AA). Namely, let $f : X \rightarrow Y, g : Y \rightarrow Z$ be as above with X, Z affine. As X is affine hence quasi-compact we can find finitely many affine open $Y_i \subset Y, i = 1, \dots, n$ such that $X = \bigcup_{i=1, \dots, n} f^{-1}(Y_i)$. Set $X_i = f^{-1}(Y_i)$. By Lemma 34.18.2 each of the morphisms $X_i \rightarrow Y_i$ has \mathcal{P} . Hence $\coprod_{i=1, \dots, n} X_i \rightarrow \coprod_{i=1, \dots, n} Y_i$ has \mathcal{P} as \mathcal{P} is étale local on the target. By (AAA) applied to $\coprod_{i=1, \dots, n} X_i \rightarrow$

$\coprod_{i=1,\dots,n} Y_i$ and the étale morphism $\coprod_{i=1,\dots,n} Y_i \rightarrow Z$ we see that $\coprod_{i=1,\dots,n} X_i \rightarrow Z$ has \mathcal{P} . Now $\{\coprod_{i=1,\dots,n} X_i \rightarrow X\}$ is an étale covering, hence as \mathcal{P} is étale local on the source we conclude that $X \rightarrow Z$ has \mathcal{P} as desired.

Claim 2: (AAA) \Rightarrow (A). Namely, let $f : X \rightarrow Y, g : Y \rightarrow Z$ be as above with Z affine. Choose an affine open covering $X = \bigcup X_i$. As \mathcal{P} is étale local on the source we see that each $f|_{X_i} : X_i \rightarrow Y$ has \mathcal{P} . By (AA), which follows from (AAA) according to Claim 1, we see that $X_i \rightarrow Z$ has \mathcal{P} for each i . Since $\{X_i \rightarrow X\}$ is an étale covering and \mathcal{P} is étale local on the source we conclude that $X \rightarrow Z$ has \mathcal{P} .

Claim 3: (AAA) \Rightarrow (\emptyset). Namely, let $f : X \rightarrow Y, g : Y \rightarrow Z$ be as above. Choose an affine open covering $Z = \bigcup Z_i$. Set $Y_i = g^{-1}(Z_i)$ and $X_i = f^{-1}(Y_i)$. By Lemma 34.18.2 each of the morphisms $X_i \rightarrow Y_i$ has \mathcal{P} . By (A), which follows from (AAA) according to Claim 2, we see that $X_i \rightarrow Z_i$ has \mathcal{P} for each i . Since \mathcal{P} is local on the target and $X_i = (g \circ f)^{-1}(Z_i)$ we conclude that $X \rightarrow Z$ has \mathcal{P} .

Thus to prove the lemma it suffices to prove (AAA). Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be as above X, Y, Z affine. Note that an étale morphism of affines has universally bounded fibres, see Morphisms, Lemma 28.37.6 and Lemma 28.50.8. Hence we can do induction on the integer n bounding the degree of the fibres of $Y \rightarrow Z$. See Morphisms, Lemma 28.50.7 for a description of this integer in the case of an étale morphism. If $n = 1$, then $Y \rightarrow Z$ is an open immersion, see Lemma 34.21.2, and the result follows from assumption (3) of the lemma. Assume $n > 1$.

Consider the following commutative diagram

$$\begin{array}{ccccc} X \times_Z Y & \xrightarrow{f_Y} & Y \times_Z Y & \xrightarrow{\text{pr}} & Y \\ \downarrow & & \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y & \xrightarrow{g} & Z \end{array}$$

Note that we have a decomposition into open and closed subschemes $Y \times_Z Y = \Delta_{Y/Z}(Y) \amalg Y'$, see Morphisms, Lemma 28.36.13. As a base change the degrees of the fibres of the second projection $\text{pr} : Y \times_Z Y \rightarrow Y$ are bounded by n , see Morphisms, Lemma 28.50.4. On the other hand, $\text{pr}|_{\Delta(Y)} : \Delta(Y) \rightarrow Y$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 28.50.7 we conclude the degrees of the fibres of the restriction $\text{pr}|_{Y'} : Y' \rightarrow Y$ are bounded by $n - 1$. Set $X' = f_Y^{-1}(Y')$. Picture

$$\begin{array}{ccccc} X \amalg X' & \xrightarrow{f \amalg f'} & \Delta(Y) \amalg Y' & \longrightarrow & Y \\ \parallel & & \parallel & & \parallel \\ X \times_Z Y & \xrightarrow{f_Y} & Y \times_Z Y & \xrightarrow{\text{pr}} & Y \end{array}$$

As \mathcal{P} is étale local on the target and hence stable under étale base change (see Lemma 34.18.2) we see that f_Y has \mathcal{P} . Hence, as \mathcal{P} is étale local on the source, $f' = f_Y|_{X'}$ has \mathcal{P} . By induction hypothesis we see that $X' \rightarrow Y$ has \mathcal{P} . As \mathcal{P} is local on the source, and $\{X \rightarrow X \times_Z Y, X' \rightarrow X \times_Z Y\}$ is an étale covering, we conclude that $\text{pr} \circ f_Y$ has \mathcal{P} . Note that $g \circ f$ can be viewed as a morphism $g \circ f : X \rightarrow g(Y)$. As $\text{pr} \circ f_Y$ is the pullback of $g \circ f : X \rightarrow g(Y)$ via the étale covering $\{Y \rightarrow g(Y)\}$, and as \mathcal{P} is étale local on the target, we conclude that $g \circ f : X \rightarrow g(Y)$ has property \mathcal{P} . Finally, applying assumption (3) of the lemma once more we conclude that $g \circ f : X \rightarrow Z$ has property \mathcal{P} . \square

Remark 34.28.7. Using Lemma 34.28.6 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are étale local on the source-and-target. In each case we list the lemma which implies the property is étale local on the source and the lemma which implies the property is étale local on the target. In each case the third assumption of Lemma 34.28.6 is trivial to check, and we omit it. Here is the list:

- (1) flat, see Lemmas 34.23.1 and 34.19.13,
- (2) locally of finite presentation, see Lemmas 34.24.1 and 34.19.9,
- (3) locally finite type, see Lemmas 34.24.2 and 34.19.8,
- (4) universally open, see Lemmas 34.24.4 and 34.19.4,
- (5) syntomic, see Lemmas 34.25.1 and 34.19.24,
- (6) smooth, see Lemmas 34.26.1 and 34.19.25,
- (7) étale, see Lemmas 34.27.1 and 34.19.27,
- (8) locally quasi-finite, see Lemmas 34.27.2 and 34.19.22,
- (9) unramified, see Lemmas 34.27.3 and 34.19.26,
- (10) G-unramified, see Lemmas 34.27.3 and 34.19.26, and
- (11) add more here as needed.

Remark 34.28.8. At this point we have three possible definitions of what it means for a property \mathcal{P} of morphisms to be “étale local on the source and target”:

- (ST) \mathcal{P} is étale local on the source and \mathcal{P} is étale local on the target,
- (DM) (the definition in the paper [DM69, Page 100] by Deligne and Mumford) for every diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

with surjective étale vertical arrows we have $\mathcal{P}(h) \Leftrightarrow \mathcal{P}(f)$, and

- (SP) \mathcal{P} is étale local on the source-and-target.

In this section we have seen that (SP) \Rightarrow (DM) \Rightarrow (ST). The Examples 34.28.1 and 34.28.2 show that neither implication can be reversed. Finally, Lemma 34.28.6 shows that the difference disappears when looking at properties of morphisms which are stable under postcomposing with open immersions, which in practice will always be the case.

34.29. Properties of morphisms of germs local on source-and-target

In this section we discuss the analogue of the material in Section 34.28 for morphisms of germs of schemes.

Definition 34.29.1. Let \mathcal{Q} be a property of morphisms of germs of schemes. We say \mathcal{Q} is *étale local on the source-and-target* if for any commutative diagram

$$\begin{array}{ccc} (U', u') & \xrightarrow{h'} & (V', v') \\ a \downarrow & & \downarrow b \\ (U, u) & \xrightarrow{h} & (V, v) \end{array}$$

with étale vertical arrows we have $\mathcal{Q}(h) \Leftrightarrow \mathcal{Q}(h')$.

Lemma 34.29.2. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property \mathcal{Q} of morphisms of germs defined by the rule*

$$\mathcal{Q}((X, x) \rightarrow (S, s)) \Leftrightarrow \text{there exists a representative } U \rightarrow S \text{ which has } \mathcal{P}$$

Then \mathcal{Q} is étale local on the source-and-target as in Definition 34.29.1.

Proof. We first remark that as \mathcal{P} is étale local on the source, see Lemma 34.28.4, if $(X, x) \rightarrow (S, s)$ has \mathcal{P} , then there are arbitrarily small neighbourhoods U of x in X such that a representative $U \rightarrow S$ of $(X, x) \rightarrow (S, s)$ has \mathcal{P} . We will use this without further mention. Let

$$\begin{array}{ccc} (U', u') & \xrightarrow{h'} & (V', v') \\ a \downarrow & & \downarrow b \\ (U, u) & \xrightarrow{h} & (V, v) \end{array}$$

be as in Definition 34.29.1. We will use a rather pedantic notation in order to distinguish between morphisms of germs and their representatives in this proof.

If $\mathcal{P}(h)$ holds, then \mathcal{P} holds for a representative $h_1 : U_1 \rightarrow V$ of h . Let $a_1 : U'_1 \rightarrow U$ be a representative of a which is étale with $a_1(U'_1) \subset U_1$. As \mathcal{P} is stable under precomposing with étale morphisms we see that $h_1 \circ a_1 : U'_1 \rightarrow V$ has \mathcal{P} . Moreover, $h_1 \circ a_1 : U'_1 \rightarrow V$ is a representative of $b \circ h'$ by the commutativity of the diagram. Choose a representative $b_1 : V'_1 \rightarrow V$ of b . Choose a representative $h'_1 : U'_2 \rightarrow V'$ with $h'_1(U'_1) \subset V'_1$, $U'_2 \subset U'_1$, and $(h_1 \circ a_1)|_{U'_2} = b_1 \circ h'_1$. Then we see that $b_1 \circ h'_1$ has \mathcal{P} . Hence h' has \mathcal{P} by Lemma 34.28.4 part (4).

Conversely, suppose $\mathcal{P}(h')$ holds. Choose a representative $b_1 : V'_1 \rightarrow V$ of b . Choose a representative $h'_1 : U'_1 \rightarrow V'$ with \mathcal{P} and with $h'_1(U'_1) \subset V'_1$. Then $b_1 \circ h'_1$ has \mathcal{P} by Lemma 34.28.4 part (3). Moreover, $b_1 \circ h'_1 : U'_1 \rightarrow V$ is a representative of $h \circ a$ by the commutativity of the diagram. Choose a representative $h_1 : U_1 \rightarrow V$ of h . Choose a representative $a_1 : U'_2 \rightarrow U$ with $a_1(U'_2) \subset U_1$, $U'_2 \subset U'_1$, and $h_1 \circ a_1 = (b_1 \circ h'_1)|_{U'_2}$. Then we see that $h_1 \circ a_1$ has \mathcal{P} . As \mathcal{P} is étale local on the source we conclude that $h_1|_{a_1(U'_2)}$ has \mathcal{P} and we win. \square

Lemma 34.29.3. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on source-and-target. Let \mathcal{Q} be the associated property of morphisms of germs, see Lemma 34.29.2. Let $f : X \rightarrow Y$ be a morphism of schemes. The following are equivalent:*

- (1) f has property \mathcal{P} , and
- (2) for every $x \in X$ the morphism of germs $(X, x) \rightarrow (Y, f(x))$ has property \mathcal{Q} .

Proof. The implication (1) \Rightarrow (2) is direct from the definitions. The implication (2) \Rightarrow (1) also follows from part (3) of Definition 34.28.3. \square

A morphism of germs $(X, x) \rightarrow (S, s)$ determines a well defined map of local rings. Hence the following lemma makes sense.

Lemma 34.29.4. *The property of morphisms of germs*

$$\mathcal{P}((X, x) \rightarrow (S, s)) = \mathcal{O}_{S,s} \rightarrow \mathcal{O}_{X,x} \text{ is flat}$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 34.29.1 we obtain the following diagram of local homomorphisms of local rings

$$\begin{array}{ccc} \mathcal{O}_{U',u'} & \longleftarrow & \mathcal{O}_{V',v'} \\ \uparrow & & \uparrow \\ \mathcal{O}_{U,u} & \longleftarrow & \mathcal{O}_{V,v} \end{array}$$

Note that the vertical arrows are localizations of étale ring maps, in particular they are essentially of finite presentation, flat, and unramified (see Algebra, Section 10.138). In particular the vertical maps are faithfully flat, see Algebra, Lemma 10.38.16. Now, if the upper horizontal arrow is flat, then the lower horizontal arrow is flat by an application of Algebra, Lemma 10.38.9 with $R = \mathcal{O}_{V,v}$, $S = \mathcal{O}_{U,u}$ and $M = \mathcal{O}_{U',u'}$. If the lower horizontal arrow is flat, then the ring map

$$\mathcal{O}_{V',v'} \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{U,u} \longleftarrow \mathcal{O}_{V',v'}$$

is flat by Algebra, Lemma 10.38.6. And the ring map

$$\mathcal{O}_{U',u'} \longleftarrow \mathcal{O}_{V',v'} \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{U,u}$$

is a localization of a map between étale ring extensions of $\mathcal{O}_{U,u}$, hence flat by Algebra, Lemma 10.138.9. \square

Lemma 34.29.5. *Consider a commutative diagram of morphisms of schemes*

$$\begin{array}{ccc} U' & \longrightarrow & V' \\ \downarrow & & \downarrow \\ U & \longrightarrow & V \end{array}$$

with étale vertical arrows and a point $v' \in U'$ mapping to $v \in U$. Then the morphism of fibres $U'_{v'} \rightarrow U_v$ is étale.

Proof. Note that $U'_v \rightarrow U_v$ is étale as a base change of the étale morphism $U' \rightarrow U$. The scheme U'_v is a scheme over V'_v . By Morphisms, Lemma 28.37.7 the scheme V'_v is a disjoint union of spectra of finite separable field extensions of $\kappa(v)$. One of these is $v' = \text{Spec}(\kappa(v'))$. Hence $U'_{v'}$ is an open and closed subscheme of U'_v and it follows that $U'_{v'} \rightarrow U'_v \rightarrow U_v$ is étale (as a composition of an open immersion and an étale morphism, see Morphisms, Section 28.37). \square

Given a morphism of germs of schemes $(X, x) \rightarrow (S, s)$ we can define the *fibre* as the isomorphism class of germs (U_s, x) where $U \rightarrow S$ is any representative. We will often abuse notation and just write (X_s, x) .

Lemma 34.29.6. *Let $d \in \{0, 1, 2, \dots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_d((X, x) \rightarrow (S, s)) = \text{the local ring } \mathcal{O}_{X_s, x} \text{ of the fibre has dimension } d$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 34.29.1 we obtain an étale morphism of fibres $U'_{v'} \rightarrow U_v$ mapping u' to u , see Lemma 34.29.5. Hence the result follows from Lemma 34.17.3. \square

Lemma 34.29.7. *Let $r \in \{0, 1, 2, \dots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_r((X, x) \rightarrow (S, s)) \Leftrightarrow \text{trdeg}_{\kappa(s)} \kappa(x) = r$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 34.29.1 we obtain the following diagram of local homomorphisms of local rings

$$\begin{array}{ccc} \mathcal{O}_{U',u'} & \longleftarrow & \mathcal{O}_{V',v'} \\ \uparrow & & \uparrow \\ \mathcal{O}_{U,u} & \longleftarrow & \mathcal{O}_{V,v} \end{array}$$

Note that the vertical arrows are localizations of étale ring maps, in particular they are unramified (see Algebra, Section 10.138). Hence $\kappa(u) \subset \kappa(u')$ and $\kappa(v) \subset \kappa(v')$ are finite separable field extensions. Thus we have $\text{trdeg}_{\kappa(v)} \kappa(u) = \text{trdeg}_{\kappa(v')} \kappa(u)$ which proves the lemma. \square

Let (X, x) be a germ of a scheme. The dimension of X at x is the minimum of the dimensions of open neighbourhoods of x in X , and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\dim_x(X)$.

Lemma 34.29.8. *Let $d \in \{0, 1, 2, \dots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_d((X, x) \rightarrow (S, s)) \Leftrightarrow \dim_x(X_s) = d$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 34.29.1 we obtain an étale morphism of fibres $U'_{v'} \rightarrow U_v$ mapping u' to u , see Lemma 34.29.5. Hence now the equality $\dim_u(U_v) = \dim_{u'}(U'_{v'})$ follows from Lemma 34.17.2. \square

34.30. Descent data for schemes over schemes

Most of the arguments in this section are formal relying only on the definition of a descent datum. In Simplicial Spaces, Section 64.8 we will examine the relationship with simplicial schemes which will somewhat clarify the situation.

Definition 34.30.1. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) Let $V \rightarrow X$ be a scheme over X . A *descent datum* for $V/X/S$ is an isomorphism $\varphi : V \times_S X \rightarrow X \times_S V$ of schemes over $X \times_S X$ satisfying the *cocycle condition* that the diagram

$$\begin{array}{ccc} V \times_S X \times_S X & \xrightarrow{\varphi_{02}} & X \times_S X \times_S V \\ & \searrow \varphi_{01} & \nearrow \varphi_{12} \\ & X \times_S V \times_S X & \end{array}$$

commutes (with obvious notation).

- (2) We also say that the pair $(V/X, \varphi)$ is a *descent datum relative to $X \rightarrow S$* .

- (3) A morphism $f : (V/X, \varphi) \rightarrow (V'/X, \varphi')$ of descent data relative to $X \rightarrow S$ is a morphism $f : V \rightarrow V'$ of schemes over X such that the diagram

$$\begin{array}{ccc} V \times_S X & \xrightarrow{\varphi} & X \times_S V \\ f \times \text{id}_X \downarrow & & \downarrow \text{id}_X \times f \\ V' \times_S X & \xrightarrow{\varphi'} & X \times_S V' \end{array}$$

commutes.

There are all kinds of “miraculous” identities which arise out of the definition above. For example the pullback of φ via the diagonal morphism $\Delta : X \rightarrow X \times_S X$ can be seen as a morphism $\Delta^*\varphi : V \rightarrow V$. This because $X \times_{\Delta, X \times_S X} (V \times_S X) = V$ and also $X \times_{\Delta, X \times_S X} (X \times_S V) = V$. In fact, $\Delta^*\varphi$ is equal to the identity. This is a good exercise if you are unfamiliar with this material.

Remark 34.30.2. Let $X \rightarrow S$ be a morphism of schemes. Let $(V/X, \varphi)$ be a descent datum relative to $X \rightarrow S$. We may think of the isomorphism φ as an isomorphism

$$(X \times_S X) \times_{\text{pr}_0, X} V \longrightarrow (X \times_S X) \times_{\text{pr}_1, X} V$$

of schemes over $X \times_S X$. So loosely speaking one may think of φ as a map $\varphi : \text{pr}_0^*V \rightarrow \text{pr}_1^*V$ ⁷. The cocycle condition then says that $\text{pr}_{02}^*\varphi = \text{pr}_{12}^*\varphi \circ \text{pr}_{01}^*\varphi$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

Here is the definition in case you have a family of morphisms with fixed target.

Definition 34.30.3. Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be a family of morphisms with target S .

- (1) A descent datum (V_i, φ_{ij}) relative to the family $\{X_i \rightarrow S\}$ is given by a scheme V_i over X_i for each $i \in I$, an isomorphism $\varphi_{ij} : V_i \times_S X_j \rightarrow X_i \times_S V_j$ of schemes over $X_i \times_S X_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{array}{ccc} V_i \times_S X_j \times_S X_k & \xrightarrow{\quad \quad \quad} & X_i \times_S X_j \times_S V_k \\ \text{pr}_{01}^* \varphi_{ij} \searrow & \text{pr}_{02}^* \varphi_{ik} \quad \quad \quad \nearrow & \text{pr}_{12}^* \varphi_{jk} \\ & X_i \times_S V_j \times_S X_k & \end{array}$$

of schemes over $X_i \times_S X_j \times_S X_k$ commutes (with obvious notation).

- (2) A morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms of X_i -schemes $\psi_i : V_i \rightarrow V'_i$ such that all the diagrams

$$\begin{array}{ccc} V_i \times_S X_j & \xrightarrow{\varphi_{ij}} & X_i \times_S V_j \\ \psi_i \times \text{id} \downarrow & & \downarrow \text{id} \times \psi_j \\ V'_i \times_S X_j & \xrightarrow{\varphi'_{ij}} & X_i \times_S V'_j \end{array}$$

commute.

⁷Unfortunately, we have chosen the “wrong” direction for our arrow here. In Definitions 34.30.1 and 34.30.3 we should have the opposite direction to what was done in Definition 34.2.1 by the general principle that “functions” and “spaces” are dual.

This is the notion that comes up naturally for example when the question arises whether the fibred category of relative curves is a stack in the fpqc topology (it isn't – at least not if you stick to schemes).

Remark 34.30.4. Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be a family of morphisms with target S . Let (V_i, φ_{ij}) be a descent datum relative to $\{X_i \rightarrow S\}$. We may think of the isomorphisms φ_{ij} as isomorphisms

$$(X_i \times_S X_j) \times_{\text{pr}_0, X_i} V_i \longrightarrow (X_i \times_S X_j) \times_{\text{pr}_1, X_j} V_j$$

of schemes over $X_i \times_S X_j$. So loosely speaking one may think of φ_{ij} as an isomorphism $\text{pr}_0^* V_i \rightarrow \text{pr}_1^* V_j$ over $X_i \times_S X_j$. The cocycle condition then says that $\text{pr}_{02}^* \varphi_{ik} = \text{pr}_{12}^* \varphi_{jk} \circ \text{pr}_{01}^* \varphi_{ij}$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

The reason we will usually work with the version of a family consisting of a single morphism is the following lemma.

Lemma 34.30.5. *Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be a family of morphisms with target S . Set $X = \coprod_{i \in I} X_i$, and consider it as an S -scheme. There is a canonical equivalence of categories*

$$\begin{array}{ccc} \text{category of descent data} & & \text{category of descent data} \\ \text{relative to the family } \{X_i \rightarrow S\}_{i \in I} & \xrightarrow{\quad} & \text{relative to } X/S \end{array}$$

which maps (V_i, φ_{ij}) to (V, φ) with $V = \coprod_{i \in I} V_i$ and $\varphi = \coprod \varphi_{ij}$.

Proof. Observe that $X \times_S X = \coprod_{i,j} X_i \times_S X_j$ and similarly for higher fibre products. Giving a morphism $V \rightarrow X$ is exactly the same as giving a family $V_i \rightarrow X_i$. And giving a descent datum φ is exactly the same as giving a family φ_{ij} . \square

Lemma 34.30.6. *Pullback of descent data for schemes over schemes.*

(1) *Let*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ a' \downarrow & & \downarrow a \\ S' & \xrightarrow{\quad h \quad} & S \end{array}$$

be a commutative diagram of morphisms of schemes. The construction

$$(V \rightarrow X, \varphi) \longmapsto f^*(V \rightarrow X, \varphi) = (V' \rightarrow X', \varphi')$$

where $V' = X' \times_X V$ and where φ' is defined as the composition

$$\begin{array}{ccc} V' \times_{S'} X' \longlongequal{\quad} (X' \times_X V) \times_{S'} X' \longlongequal{\quad} (X' \times_{S'} X') \times_{X \times_S X} (V \times_S X) & & \\ & & \downarrow \text{id} \times \varphi \\ X' \times_{S'} V' \longlongequal{\quad} X' \times_{S'} (X' \times_X V) \longlongequal{\quad} (X' \times_S X') \times_{X \times_S X} (X \times_S V) & & \end{array}$$

defines a functor from the category of descent data relative to $X \rightarrow S$ to the category of descent data relative to $X' \rightarrow S'$.

(2) *Given two morphisms $f_i : X' \rightarrow X$, $i = 0, 1$ making the diagram commute the functors f_0^* and f_1^* are canonically isomorphic.*

Proof. We omit the proof of (1), but we remark that the morphism φ' is the morphism $(f \times f)^*\varphi$ in the notation introduced in Remark 34.30.2. For (2) we indicate which morphism $f_0^*V \rightarrow f_1^*V$ gives the functorial isomorphism. Namely, since f_0 and f_1 both fit into the commutative diagram we see there is a unique morphism $r : X' \rightarrow X \times_S X$ with $f_i = \text{pr}_i \circ r$. Then we take

$$\begin{aligned} f_0^*V &= X' \times_{f_0, X} V \\ &= X' \times_{\text{pr}_0 \circ r, X} V \\ &= X' \times_{r, X \times_S X} (X \times_S X) \times_{\text{pr}_0, X} V \\ &\xrightarrow{\varphi} X' \times_{r, X \times_S X} (X \times_S X) \times_{\text{pr}_1, X} V \\ &= X' \times_{\text{pr}_1 \circ r, X} V \\ &= X' \times_{f_1, X} V \\ &= f_1^*V \end{aligned}$$

We omit the verification that this works. □

Definition 34.30.7. With $S, S', X, X', f, a, a', h$ as in Lemma 34.30.6 the functor

$$(V, \varphi) \mapsto f^*(V, \varphi)$$

constructed in that lemma is called the *pullback functor* on descent data.

Lemma 34.30.8 (Pullback of descent data for schemes over families). *Let $\mathcal{U} = \{U_i \rightarrow S'\}_{i \in I}$ and $\mathcal{V} = \{V_j \rightarrow S\}_{j \in J}$ be families of morphisms with fixed target. Let $\alpha : I \rightarrow J$, $h : S' \rightarrow S$ and $g_i : U_i \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.*

- (1) *Let $(Y_j, \varphi_{jj'})$ be a descent datum relative to the family $\{V_j \rightarrow S'\}$. The system*

$$(g_i^*Y_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')})$$

(with notation as in Remark 34.30.4) is a descent datum relative to \mathcal{V} .

- (2) *This construction defines a functor between descent data relative to \mathcal{U} and descent data relative to \mathcal{V} .*
- (3) *Given a second $\alpha' : I \rightarrow J$, $h' : S' \rightarrow S$ and $g'_i : U_i \rightarrow V_{\alpha'(i)}$ morphism of families of maps with fixed target, then if $h = h'$ the two resulting functors between descent data are canonically isomorphic.*
- (4) *These functors agree, via Lemma 34.30.5, with the pullback functors constructed in Lemma 34.30.6.*

Proof. This follows from Lemma 34.30.6 via the correspondence of Lemma 34.30.5. □

Definition 34.30.9. With $\mathcal{U} = \{U_i \rightarrow S'\}_{i \in I}$, $\mathcal{V} = \{V_j \rightarrow S\}_{j \in J}$, $\alpha : I \rightarrow J$, $h : S' \rightarrow S$, and $g_i : U_i \rightarrow V_{\alpha(i)}$ as in Lemma 34.30.8 the functor

$$(Y_j, \varphi_{jj'}) \mapsto (g_i^*Y_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')})$$

constructed in that lemma is called the *pullback functor* on descent data.

If \mathcal{U} and \mathcal{V} have the same target S , and if \mathcal{U} refines \mathcal{V} (see Sites, Definition 7.8.1) but no explicit pair (α, g_i) is given, then we can still talk about the pullback functor since we have seen in Lemma 34.30.8 that the choice of the pair does not matter (up to a canonical isomorphism).

Definition 34.30.10. Let S be a scheme. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) Given a scheme U over S we have the *trivial descent datum* of U relative to $\text{id} : S \rightarrow S$, namely the identity morphism on U .
- (2) By Lemma 34.30.6 we get a *canonical descent datum* on $X \times_S U$ relative to $X \rightarrow S$ by pulling back the trivial descent datum via f . We often denote $(X \times_S U, \text{can})$ this descent datum.
- (3) A descent datum (V, φ) relative to X/S is called *effective* if (V, φ) is isomorphic to the canonical descent datum $(X \times_S U, \text{can})$ for some scheme U over S .

Thus being effective means there exists a scheme U over S and an isomorphism $\psi : V \rightarrow X \times_S U$ of X -schemes such that φ is equal to the composition

$$V \times_S X \xrightarrow{\psi \times \text{id}_X} X \times_S U \times_S X = X \times_S X \times_S U \xrightarrow{\text{id}_X \times \psi^{-1}} X \times_S U$$

Definition 34.30.11. Let S be a scheme. Let $\{X_i \rightarrow S\}$ be a family of morphisms with target S .

- (1) Given a scheme U over S we have a *canonical descent datum* on the family of schemes $X_i \times_S U$ by pulling back the trivial descent datum for U relative to $\{\text{id} : S \rightarrow S\}$. We denote this descent datum $(X_i \times_S U, \text{can})$.
- (2) A descent datum (V_i, φ_{ij}) relative to $\{X_i \rightarrow S\}$ is called *effective* if there exists a scheme U over S such that (V_i, φ_{ij}) is isomorphic to $(X_i \times_S U, \text{can})$.

34.31. Fully faithfulness of the pullback functors

It turns out that the pullback functor between descent data for fpqc-coverings is fully faithful. In other words, morphisms of schemes satisfy fpqc descent. The goal of this section is to prove this. The reader is encouraged instead to prove this him/herself. The key is to use Lemma 34.9.3.

Lemma 34.31.1. *A surjective and flat morphism is an epimorphism in the category of schemes.*

Proof. Suppose we have $h : X' \rightarrow X$ surjective and flat and $a, b : X \rightarrow Y$ morphisms such that $a \circ h = b \circ h$. As h is surjective we see that a and b agree on underlying topological spaces. Pick $x' \in X'$ and set $x = h(x')$ and $y = a(x) = b(x)$. Consider the local ring maps

$$a_x^\#, b_x^\# : \mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$$

These become equal when composed with the flat local homomorphism $h_{x'}^\# : \mathcal{O}_{X',x'} \rightarrow \mathcal{O}_{X,x}$. Since a flat local homomorphism is faithfully flat (Algebra, Lemma 10.38.16) we conclude that $h_{x'}^\#$ is injective. Hence $a_x^\# = b_x^\#$ which implies $a = b$ as desired. \square

Lemma 34.31.2. *Let $h : S' \rightarrow S$ be a surjective, flat morphism of schemes. The base change functor*

$$\text{Sch}/S \longrightarrow \text{Sch}/S', \quad X \longmapsto S' \times_S X$$

is faithful.

Proof. Let X_1, X_2 be schemes over S . Let $\alpha, \beta : X_2 \rightarrow X_1$ be morphisms over S . If α, β base change to the same morphism then we get a commutative diagram as follows

$$\begin{array}{ccccc} X_2 & \longleftarrow & S' \times_S X_2 & \longrightarrow & X_2 \\ \downarrow \alpha & & \downarrow & & \downarrow \beta \\ X_1 & \longleftarrow & S' \times_S X_1 & \longrightarrow & X_1 \end{array}$$

Hence it suffices to show that $S' \times_S X_2 \rightarrow X_2$ is an epimorphism. As the base change of a surjective and flat morphism it is surjective and flat (see Morphisms, Lemmas 28.11.4 and 28.26.7). Hence the lemma follows from Lemma 34.31.1. \square

Lemma 34.31.3. *In the situation of Lemma 34.30.6 assume that $f : X' \rightarrow X$ is surjective and flat. Then the pullback functor is faithful.*

Proof. Let $(V_i, \varphi_i), i = 1, 2$ be descent data for $X \rightarrow S$. Let $\alpha, \beta : V_1 \rightarrow V_2$ be morphisms of descent data. Suppose that $f^*\alpha = f^*\beta$. Our task is to show that $\alpha = \beta$. Note that α, β are morphisms of schemes over X , and that $f^*\alpha, f^*\beta$ are simply the base changes of α, β to morphisms over X' . Hence the lemma follows from Lemma 34.31.2. \square

Here is the key lemma of this section.

Lemma 34.31.4. *In the situation of Lemma 34.30.6 assume*

- (1) $\{f : X' \rightarrow X\}$ is an fpqc covering (for example if f is surjective, flat, and quasi-compact), and
- (2) $f \times f : X' \times_{S'} X' \rightarrow X \times_S X$ is surjective and flat⁸.

Then the pullback functor is fully faithful.

Proof. Assumption (1) implies that f is surjective and flat. Hence the pullback functor is faithful by Lemma 34.31.3. Let (V, φ) and (W, ψ) be two descent data relative to $X \rightarrow S$. Set $(V', \varphi') = f^*(V, \varphi)$ and $(W', \psi') = f^*(W, \psi)$. Let $\alpha' : V' \rightarrow W'$ be a morphism of descent data for X' over S' . We have to show there exists a morphism $\alpha : V \rightarrow W$ of descent data for X over S whose pullback is α' .

Recall that V' is the base change of V by f and that φ' is the base change of φ by $f \times f$ (see Remark 34.30.2). By assumption the diagram

$$\begin{array}{ccc} V' \times_{S'} X' & \xrightarrow{\varphi'} & X' \times_{S'} V' \\ \alpha' \times \text{id} \downarrow & & \downarrow \text{id} \times \alpha' \\ W' \times_{S'} X' & \xrightarrow{\psi'} & X' \times_{S'} W' \end{array}$$

commutes. We claim the two compositions

$$V' \times_V V' \xrightarrow{\text{pr}_i} V' \xrightarrow{\alpha'} W' \longrightarrow W, \quad i = 0, 1$$

are the same. The reader is advised to prove this themselves rather than read the rest of this paragraph. (Please email if you find a nice clean argument.) Let v_0, v_1 be points of V' which map to the same point $v \in V$. Let $x_i \in X'$ be the image of v_i , and let x be the point of X which is the image of v in X . In other words, $v_i = (x_i, v)$ in $V' = X' \times_X V$. Write $\varphi(v, x) = (x, v')$ for some point v' of V . This is possible

⁸This follows from (1) if $S = S'$.

because φ is a morphism over $X \times_S X$. Denote $v'_i = (x_i, v')$ which is a point of V' . Then a calculation (using the definition of φ') shows that $\varphi'(v_i, x_j) = (x_i, v'_j)$. Denote $w_i = \alpha'(v_i)$ and $w'_i = \alpha'(v'_i)$. Now we may write $w_i = (x_i, u_i)$ for some point u_i of W , and $w'_i = (x_i, u'_i)$ for some point u'_i of W . The claim is equivalent to the assertion: $u_0 = u_1$. A formal calculation using the definition of ψ' (see Lemma 34.30.6) shows that the commutativity of the diagram displayed above says that

$$((x_i, x_j), \psi(u_i, x)) = ((x_i, x_j), (x, u'_j))$$

as points of $(X' \times_{S'} X') \times_{X \times_S X} (X \times_S W)$ for all $i, j \in \{0, 1\}$. This shows that $\psi(u_0, x) = \psi(u_1, x)$ and hence $u_0 = u_1$ by taking ψ^{-1} . This proves the claim because the argument above was formal and we can take scheme points (in other words, we may take $(v_0, v_1) = \text{id}_{V' \times_V V'}$).

At this point we can use Lemma 34.9.3. Namely, $\{V' \rightarrow V\}$ is a fpqc covering as the base change of the morphism $f : X' \rightarrow X$. Hence, by Lemma 34.9.3 the morphism $\alpha' : V' \rightarrow W' \rightarrow W$ factors through a unique morphism $\alpha : V \rightarrow W$ whose base change is necessarily α' . Finally, we see the diagram

$$\begin{array}{ccc} V \times_S X & \xrightarrow{\varphi} & X \times_S V \\ \alpha \times \text{id} \downarrow & & \downarrow \text{id} \times \alpha \\ W \times_S X & \xrightarrow{\psi} & X \times_S W \end{array}$$

commutes because its base change to $X' \times_{S'} X'$ commutes and the morphism $X' \times_{S'} X' \rightarrow X \times_S X$ is surjective and flat (use Lemma 34.31.2). Hence α is a morphism of descent data $(V, \varphi) \rightarrow (W, \psi)$ as desired. \square

The following two lemmas have been obsoleted by the improved exposition of the previous material. But they are still true!

Lemma 34.31.5. *Let $X \rightarrow S$ be a morphism of schemes. Let $f : X \rightarrow X$ be a selfmap of X over S . In this case pullback by f is isomorphic to the identity functor on the category of descent data relative to $X \rightarrow S$.*

Proof. This is clear from Lemma 34.30.6 since it tells us that $f^* \cong \text{id}^*$. \square

Lemma 34.31.6. *Let $f : X' \rightarrow X$ be a morphism of schemes over a base scheme S . Assume there exists a morphism $g : X \rightarrow X'$ over S , for example if f has a section. Then the pullback functor of Lemma 34.30.6 defines an equivalence of categories between the category of descent data relative to X/S and X'/S .*

Proof. Let $g : X \rightarrow X'$ be a morphism over S . Lemma 34.31.5 above shows that the functors $f^* \circ g^* = (g \circ f)^*$ and $g^* \circ f^* = (f \circ g)^*$ are isomorphic to the respective identity functors as desired. \square

Lemma 34.31.7. *Let $f : X \rightarrow X'$ be a morphism of schemes over a base scheme S . Assume $X \rightarrow S$ is surjective and flat. Then the pullback functor of Lemma 34.30.6 is a faithful functor from the category of descent data relative to X'/S to the category of descent data relative to X/S .*

Proof. We may factor $X \rightarrow X'$ as $X \rightarrow X \times_S X' \rightarrow X'$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 34.31.6. The second morphism is surjective and flat, hence induces a faithful functor by Lemma 34.31.3. \square

Lemma 34.31.8. *Let $f : X \rightarrow X'$ be a morphism of schemes over a base scheme S . Assume $\{X \rightarrow S\}$ is an fpqc covering (for example if f is surjective, flat and quasi-compact). Then the pullback functor of Lemma 34.30.6 is a fully faithful functor from the category of descent data relative to X'/S to the category of descent data relative to X/S .*

Proof. We may factor $X \rightarrow X'$ as $X \rightarrow X \times_S X' \rightarrow X'$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 34.31.6. The second morphism is an fpqc covering hence induces a fully faithful functor by Lemma 34.31.4. \square

Lemma 34.31.9. *Let S be a scheme. Let $\mathcal{U} = \{U_i \rightarrow S\}_{i \in I}$, and $\mathcal{V} = \{V_j \rightarrow S\}_{j \in J}$, be families of morphisms with target S . Let $\alpha : I \rightarrow J$, $id : S \rightarrow S$ and $g_i : U_i \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Assume that for each $j \in J$ the family $\{g_i : U_i \rightarrow V_j\}_{\alpha(i)=j}$ is an fpqc covering of V_j . Then the pullback functor*

$$\text{descent data relative to } \mathcal{V} \longrightarrow \text{descent data relative to } \mathcal{U}$$

of Lemma 34.30.8 is fully faithful.

Proof. Consider the morphism of schemes

$$g : X = \coprod_{i \in I} U_i \longrightarrow Y = \coprod_{j \in J} V_j$$

over S which on the i th component maps into the $\alpha(i)$ th component via the morphism $g_{\alpha(i)}$. We claim that $\{g : X \rightarrow Y\}$ is an fpqc covering of schemes. Namely, by Topologies, Lemma 33.8.3 for each j the morphism $\{\coprod_{\alpha(i)=j} U_i \rightarrow V_j\}$ is an fpqc covering. Thus for every affine open $V \subset V_j$ (which we may think of as an affine open of Y) we can find finitely many affine opens $W_1, \dots, W_n \subset \coprod_{\alpha(i)=j} U_i$ (which we may think of as affine opens of X) such that $V = \bigcup_{i=1, \dots, n} g(W_i)$. This provides enough affine opens of Y which can be covered by finitely many affine opens of X so that Topologies, Lemma 33.8.2 part (3) applies, and the claim follows. Let us write $DD(X/S)$, resp. $DD(\mathcal{U})$ for the category of descent data with respect to X/S , resp. \mathcal{U} , and similarly for Y/S and \mathcal{V} . Consider the diagram

$$\begin{array}{ccc} DD(Y/S) & \longrightarrow & DD(X/S) \\ \uparrow \text{Lemma 34.30.5} & & \uparrow \text{Lemma 34.30.5} \\ DD(\mathcal{V}) & \longrightarrow & DD(\mathcal{U}) \end{array}$$

This diagram is commutative, see the proof of Lemma 34.30.8. The vertical arrows are equivalences. Hence the lemma follows from Lemma 34.31.4 which shows the top horizontal arrow of the diagram is fully faithful. \square

The next lemma shows that, in order to check effectiveness, we may always Zariski refine the given family of morphisms with target S .

Lemma 34.31.10. *Let S be a scheme. Let $\mathcal{U} = \{U_i \rightarrow S\}_{i \in I}$, and $\mathcal{V} = \{V_j \rightarrow S\}_{j \in J}$, be families of morphisms with target S . Let $\alpha : I \rightarrow J$, $id : S \rightarrow S$ and $g_i : U_i \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Assume that for each $j \in J$ the family $\{g_i : U_i \rightarrow V_j\}_{\alpha(i)=j}$ is a Zariski covering (see Topologies, Definition 33.3.1) of V_j . Then the pullback functor*

$$\text{descent data relative to } \mathcal{V} \longrightarrow \text{descent data relative to } \mathcal{U}$$

of Lemma 34.30.8 is an equivalence of categories. In particular, the category of schemes over S is equivalent to the category of descent data relative to any Zariski covering of S .

Proof. The functor is faithful and fully faithful by Lemma 34.31.9. Let us indicate how to prove that it is essentially surjective. Let $(X_i, \varphi_{ii'})$ be a descent datum relative to \mathcal{U} . Fix $j \in J$ and set $I_j = \{i \in I \mid \alpha(i) = j\}$. For $i, i' \in I_j$ note that there is a canonical morphism

$$c_{ii'} : U_i \times_{g_i, V_j, g_{i'}} U_{i'} \rightarrow U_i \times_S U_{i'}.$$

Hence we can pullback $\varphi_{ii'}$ by this morphism and set $\psi_{ii'} = c_{ii'}^* \varphi_{ii'}$ for $i, i' \in I_j$. In this way we obtain a descent datum $(X_i, \psi_{ii'})$ relative to the Zariski covering $\{g_i : U_i \rightarrow V_j\}_{i \in I_j}$. Note that $\psi_{ii'}$ is an isomorphism from the open $X_{i, U_i \times_{V_j} U_{i'}}$ of X_i to the corresponding open of $X_{i'}$. It follows from Schemes, Section 25.14 that we may glue $(X_i, \psi_{ii'})$ into a scheme Y_j over V_j . Moreover, the morphisms $\varphi_{ii'}$ for $i \in I_j$ and $i' \in I_{j'}$ glue to a morphism $\varphi_{jj'} : Y_j \times_S V_{j'} \rightarrow V_j \times_S Y_{j'}$ satisfying the cocycle condition (details omitted). Hence we obtain the desired descent datum $(Y_j, \varphi_{jj'})$ relative to \mathcal{V} . \square

Lemma 34.31.11. *Let S be a scheme. Let $\mathcal{U} = \{U_i \rightarrow S\}_{i \in I}$, and $\mathcal{V} = \{V_j \rightarrow S\}_{j \in J}$, be fpqc-coverings of S . If \mathcal{U} is a refinement of \mathcal{V} , then the pullback functor*

$$\text{descent data relative to } \mathcal{V} \longrightarrow \text{descent data relative to } \mathcal{U}$$

is fully faithful. In particular, the category of schemes over S is identified with a full subcategory of the category of descent data relative to any fpqc-covering of S .

Proof. Consider the fpqc-covering $\mathcal{W} = \{U_i \times_S V_j \rightarrow S\}_{(i,j) \in I \times J}$ of S . It is a refinement of both \mathcal{U} and \mathcal{V} . Hence we have a 2-commutative diagram of functors and categories

$$\begin{array}{ccc} DD(\mathcal{V}) & \xrightarrow{\quad\quad\quad} & DD(\mathcal{U}) \\ & \searrow & \swarrow \\ & DD(\mathcal{W}) & \end{array}$$

Notation as in the proof of Lemma 34.31.9 and commutativity by Lemma 34.30.8 part (3). Hence clearly it suffices to prove the functors $DD(\mathcal{V}) \rightarrow DD(\mathcal{W})$ and $DD(\mathcal{U}) \rightarrow DD(\mathcal{W})$ are fully faithful. This follows from Lemma 34.31.9 as desired. \square

Remark 34.31.12. Lemma 34.31.11 says that morphisms of schemes satisfy fpqc descent. In other words, given a scheme S and schemes X, Y over S the functor

$$(Sch/S)^{opp} \longrightarrow Sets, \quad T \longmapsto \text{Mor}_T(X_T, Y_T)$$

satisfies the sheaf condition for the fpqc topology. The simplest case of this is the following. Suppose that $T \rightarrow S$ is a surjective flat morphism of affines. Let $\psi_0 : X_T \rightarrow Y_T$ be a morphism of schemes over T which is compatible with the canonical descent data. Then there exists a unique morphism $\psi : X \rightarrow Y$ whose base change to T is ψ_0 . In fact this special case follows in a straightforward manner from Lemma 34.31.4. And, in turn, that lemma is a formal consequence of the following two facts: (a) the base change functor by a faithfully flat morphism is faithful, see Lemma 34.31.2 and (b) a scheme satisfies the sheaf condition for the fpqc topology, see Lemma 34.9.3.

Lemma 34.31.13. *Let $X \rightarrow S$ be a surjective, quasi-compact, flat morphism of schemes. Let (V, φ) be a descent datum relative to X/S . Suppose that for all $v \in V$ there exists an open subscheme $v \in W \subset V$ such that $\varphi(W \times_S X) \subset X \times_S W$ and such that the descent datum $(W, \varphi|_{W \times_S X})$ is effective. Then (V, φ) is effective.*

Proof. Let $V = \bigcup W_i$ be an open covering with $\varphi(W_i \times_S X) \subset X \times_S W_i$ and such that the descent datum $(W_i, \varphi|_{W_i \times_S X})$ is effective. Let $U_i \rightarrow S$ be a scheme and let $\alpha_i : (X \times_S U_i, \text{can}) \rightarrow (W_i, \varphi|_{W_i \times_S X})$ be an isomorphism of descent data. For each pair of indices (i, j) consider the open $\alpha_i^{-1}(W_i \cap W_j) \subset X \times_S U_i$. Because everything is compatible with descent data and since $\{X \rightarrow S\}$ is an fpqc covering, we may apply Lemma 34.9.2 to find an open $V_{ij} \subset V_j$ such that $\alpha_i^{-1}(W_i \cap W_j) = X \times_S V_{ij}$. Now the identity morphism on $W_i \cap W_j$ is compatible with descent data, hence comes from a unique morphism $\varphi_{ij} : U_{ij} \rightarrow U_{ji}$ over S (see Remark 34.31.12). Then $(U_i, U_{ij}, \varphi_{ij})$ is a glueing data as in Schemes, Section 25.14 (proof omitted). Thus we may assume there is a scheme U over S such that $U_i \subset U$ is open, $U_{ij} = U_i \cap U_j$ and $\varphi_{ij} = \text{id}_{U_i \cap U_j}$, see Schemes, Lemma 25.14.1. Pulling back to X we can use the α_i to get the desired isomorphism $\alpha : X \times_S U \rightarrow V$. \square

34.32. Descending types of morphisms

In the following we study the question as to whether descent data for schemes relative to a fpqc-covering are effective. The first remark to make is that this is not always the case. We will see this in Algebraic Spaces, Example 47.14.2. Even projective morphisms do not always satisfy descent for fpqc-coverings, by Examples, Lemma 82.56.1.

On the other hand, if the schemes we are trying to descend are particularly simple, then it is sometime the case that for whole classes of schemes descent data are effective. We will introduce terminology here that describes this phenomenon abstractly, even though it may lead to confusion if not used correctly later on.

Definition 34.32.1. Let \mathcal{P} be a property of morphisms of schemes over a base. Let $\tau \in \{\text{Zariski}, \text{fpqc}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. We say *morphisms of type \mathcal{P} satisfy descent for τ -coverings* if for any τ -covering $\mathcal{U} : \{U_i \rightarrow S\}_{i \in I}$ (see Topologies, Section 33.2), any descent datum (X_i, φ_{ij}) relative to \mathcal{U} such that each morphism $X_i \rightarrow U_i$ has property \mathcal{P} is effective.

Note that in each of the cases we have already seen that the functor from schemes over S to descent data over \mathcal{U} is fully faithful (Lemma 34.31.11 combined with the results in Topologies that any τ -covering is also a fpqc-covering). We have also seen that descent data are always effective with respect to Zariski coverings (Lemma 34.31.10). It may be prudent to only study the notion just introduced when \mathcal{P} is either stable under any base change or at least local on the base in the τ -topology (see Definition 34.18.1) in order to avoid erroneous arguments (relying on \mathcal{P} when descending halfway).

Here is the obligatory lemma reducing this question to the case of a covering given by a single morphism of affines.

Lemma 34.32.2. *Let \mathcal{P} be a property of morphisms of schemes over a base. Let $\tau \in \{\text{fpqc}, \text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Suppose that*

- (1) \mathcal{P} is stable under any base change (see Schemes, Definition 25.18.3), and

- (2) for any surjective morphism of affines $X \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, any descent datum (V, φ) relative to X over S such that \mathcal{P} holds for $V \rightarrow X$ is effective.

Then morphisms of type \mathcal{P} satisfy descent for τ -coverings.

Proof. Let S be a scheme. Let $\mathcal{U} = \{\varphi_i : U_i \rightarrow S\}_{i \in I}$ be a τ -covering of S . Let $(X_i, \varphi_{ii'})$ be a descent datum relative to \mathcal{U} and assume that each morphism $X_i \rightarrow U_i$ has property \mathcal{P} . We have to show there exists a scheme $X \rightarrow S$ such that $(X_i, \varphi_{ii'}) \cong (U_i \times_S X, \text{can})$.

Before we start the proof proper we remark that for any family of morphisms $\mathcal{V} : \{V_j \rightarrow S\}$ and any morphism of families $\mathcal{V} \rightarrow \mathcal{U}$, if we pullback the descent datum $(X_i, \varphi_{ii'})$ to a descent datum $(Y_j, \varphi_{jj'})$ over \mathcal{V} , then each of the morphisms $Y_j \rightarrow V_j$ has property \mathcal{P} also. This is true because we assumed that \mathcal{P} is stable under any base change and the definition of pullback (see Definition 34.30.9). We will use this without further mention.

First, let us prove the lemma when S is affine. By Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4, or 33.6.4 there exists a standard τ -covering $\mathcal{V} : \{V_j \rightarrow S\}_{j=1, \dots, m}$ which refines \mathcal{U} . The pullback functor $DD(\mathcal{U}) \rightarrow DD(\mathcal{V})$ between categories of descent data is fully faithful by Lemma 34.31.11. Hence it suffices to prove that the descent datum over the standard τ -covering \mathcal{V} is effective. By Lemma 34.30.5 this reduces to the covering $\{\coprod_{j=1, \dots, m} V_j \rightarrow S\}$ for which we have assumed the result in property (2) of the lemma. Hence the lemma holds when S is affine.

Assume S is general. Let $V \subset S$ be an affine open. By the properties of site the family $\mathcal{U}_V = \{V \times_S U_i \rightarrow V\}_{i \in I}$ is a τ -covering of V . Denote $(X_i, \varphi_{ii'})_V$ the restriction (or pullback) of the given descent datum to \mathcal{U}_V . Hence by what we just saw we obtain a scheme X_V over V whose canonical descent datum with respect to \mathcal{U}_V is isomorphic to $(X_i, \varphi_{ii'})_V$. Suppose that $V' \subset V$ is an affine open of V . Then both $X_{V'}$ and $V' \times_V X_V$ have canonical descent data isomorphic to $(X_i, \varphi_{ii'})_{V'}$. Hence, by Lemma 34.31.11 again we obtain a canonical morphism $\rho_{V'}^V : X_{V'} \rightarrow X_V$ over S which identifies $X_{V'}$ with the inverse image of V' in X_V . We omit the verification that given affine opens $V'' \subset V' \subset V$ of S we have $\rho_{V''}^V = \rho_{V'}^V \circ \rho_{V''}^{V'}$.

By Constructions, Lemma 26.2.1 the data $(X_V, \rho_{V'}^V)$ glue to a scheme $X \rightarrow S$. Moreover, we are given isomorphisms $V \times_S X \rightarrow X_V$ which recover the maps $\rho_{V'}^V$. Unwinding the construction of the schemes X_V we obtain isomorphisms

$$V \times_S U_i \times_S X \longrightarrow V \times_S X_i$$

compatible with the maps $\varphi_{ii'}$ and compatible with restricting to smaller affine opens in X . This implies that the canonical descent datum on $U_i \times_S X$ is isomorphic to the given descent datum and we win. \square

34.33. Descending affine morphisms

In this section we show that “affine morphisms satisfy descent for fpqc-coverings”. Here is the formal statement.

Lemma 34.33.1. *Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \rightarrow S\}$. If each morphism $V_i \rightarrow X_i$ is affine, then the descent datum is effective.*

Proof. Being affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 28.13.8. Hence Lemma 34.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of affines. Say $X = \text{Spec}(A)$ and $S = \text{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $V \rightarrow X$ is affine. Then $V \rightarrow X$ being affine implies that $V = \text{Spec}(B)$ for some A -algebra B (see Morphisms, Definition 28.13.1). The isomorphism φ corresponds to an isomorphism of rings

$$\varphi^\# : B \otimes_R A \xleftarrow{\cong} A \otimes_R B$$

as $A \otimes_R A$ -algebras. The cocycle condition on φ says that

$$\begin{array}{ccc} B \otimes_R A \otimes_R A & \xleftarrow{\cong} & A \otimes_R A \otimes_R B \\ & \searrow & \swarrow \\ & A \otimes_R B \otimes_R A & \end{array}$$

is commutative. Inverting these arrows we see that we have a descent datum for modules with respect to $R \rightarrow A$ as in Definition 34.3.1. Hence we may apply Proposition 34.3.9 to obtain an R -module $C = \text{Ker}(B \rightarrow A \otimes_R B)$ and an isomorphism $A \otimes_R C \cong B$ respecting descent data. Given any pair $c, c' \in C$ the product cc' in B lies in C since the map φ is an algebra homomorphism. Hence C is an R -algebra whose base change to A is isomorphic to B compatibly with descent data. Applying Spec we obtain a scheme U over S such that $(V, \varphi) \cong (X \times_S U, \text{can})$ as desired. \square

Lemma 34.33.2. *Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \rightarrow S\}$. If each morphism $V_i \rightarrow X_i$ is a closed immersion, then the descent datum is effective.*

Proof. This is true because a closed immersion is an affine morphism (Morphisms, Lemma 28.13.9), and hence Lemma 34.33.1 applies. \square

34.34. Descending quasi-affine morphisms

In this section we show that “quasi-affine morphisms satisfy descent for fpqc-coverings”. Here is the formal statement.

Lemma 34.34.1. *Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \rightarrow S\}$. If each morphism $V_i \rightarrow X_i$ is quasi-affine, then the descent datum is effective.*

Proof. Being quasi-affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 28.14.5. Hence Lemma 34.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of affines. Say $X = \text{Spec}(A)$ and $S = \text{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $\pi : V \rightarrow X$ is quasi-affine.

According to Morphisms, Lemma 28.14.3 this means that

$$V \longrightarrow \underline{\text{Spec}}_X(\pi_* \mathcal{O}_V) = W$$

is a quasi-compact open immersion of schemes over X . The projections $\text{pr}_i : X \times_S X \rightarrow X$ are flat and hence we have

$$\text{pr}_0^* \pi_* \mathcal{O}_V = (\pi \times \text{id}_X)_* \mathcal{O}_{V \times_S X}, \quad \text{pr}_1^* \pi_* \mathcal{O}_V = (\text{id}_X \times \pi)_* \mathcal{O}_{X \times_S V}$$

by flat base change (Cohomology of Schemes, Lemma 29.5.2). Thus the isomorphism $\varphi : V \times_S X \rightarrow X \times_S V$ (which is an isomorphism over $X \times_S X$) induces an isomorphism of quasi-coherent sheaves of algebras

$$\varphi^\sharp : \text{pr}_0^* \pi_* \mathcal{O}_V \longrightarrow \text{pr}_1^* \pi_* \mathcal{O}_V$$

on $X \times_S X$. The cocycle condition for φ implies the cocycle condition for φ^\sharp . Another way to say this is that it produces a descent datum φ' on the affine scheme W relative to X over S , which moreover has the property that the morphism $V \rightarrow W$ is a morphism of descent data. Hence by Lemma 34.33.1 (or by effectivity of descent for quasi-coherent algebras) we obtain a scheme $U' \rightarrow S$ with an isomorphism $(W, \varphi') \cong (X \times_S U', \text{can})$ of descent data. We note in passing that U' is affine by Lemma 34.19.16.

And now we can think of V as a (quasi-compact) open $V \subset X \times_S U'$ with the property that it is stable under the descent datum

$$\text{can} : X \times_S U' \times_S X \rightarrow X \times_S X \times_S U', (x_0, u', x_1) \mapsto (x_0, x_1, u').$$

In other words $(x_0, u') \in V \Rightarrow (x_1, u') \in V$ for any x_0, x_1, u' mapping to the same point of S . Because $X \rightarrow S$ is surjective we immediately find that V is the inverse image of a subset $U \subset U'$ under the morphism $X \times_S U' \rightarrow U'$. Because $X \rightarrow S$ is quasi-compact, flat and surjective also $X \times_S U' \rightarrow U'$ is quasi-compact flat and surjective. Hence by Morphisms, Lemma 28.26.10 this subset $U \subset U'$ is open and we win. □

34.35. Descent data in terms of sheaves

Here is another way to think about descent data in case of a covering on a site.

Lemma 34.35.1. *Let $\tau \in \{\text{Zariski, fppf, étale, smooth, syntomic}\}^9$. Let Sch_τ be a big τ -site. Let $S \in \text{Ob}(\text{Sch}_\tau)$. Let $\{S_i \rightarrow S\}_{i \in I}$ be a covering in the site $(\text{Sch}/S)_\tau$. There is an equivalence of categories*

$$\left\{ \begin{array}{l} \text{descent data } (X_i, \varphi_{ii'}) \text{ such that} \\ \text{each } X_i \in \text{Ob}((\text{Sch}/S)_\tau) \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{sheaves } F \text{ on } (\text{Sch}/S)_\tau \text{ such that} \\ \text{each } h_{S_i} \times F \text{ is representable} \end{array} \right\}.$$

Moreover,

- (1) *the objects representing $h_{S_i} \times F$ on the right hand side correspond to the schemes X_i on the left hand side, and*
- (2) *the sheaf F is representable if and only if the corresponding descent datum $(X_i, \varphi_{ii'})$ is effective.*

Proof. We have seen in Section 34.9 that representable presheaves are sheaves on the site $(\text{Sch}/S)_\tau$. Moreover, the Yoneda lemma (Categories, Lemma 4.3.5) guarantees that maps between representable sheaves correspond one to one with maps between the representing objects. We will use these remarks without further mention during the proof.

⁹The fact that fpqc is missing is not a typo. See discussion in Topologies, Section 33.8.

Let us construct the functor from right to left. Let F be a sheaf on $(Sch/S)_\tau$ such that each $h_{S_i} \times F$ is representable. In this case let X_i be a representing object in $(Sch/S)_\tau$. It comes equipped with a morphism $X_i \rightarrow S_i$. Then both $X_i \times_S S_{i'}$ and $S_i \times_S X_{i'}$ represent the sheaf $h_{S_i} \times F \times h_{S_{i'}}$ and hence we obtain an isomorphism

$$\varphi_{ii'} : X_i \times_S S_{i'} \rightarrow S_i \times_S X_{i'}$$

It is straightforward to see that the maps $\varphi_{ii'}$ are morphisms over $S_i \times_S S_{i'}$ and satisfy the cocycle condition. The functor from right to left is given by this construction $F \mapsto (X_i, \varphi_{ii'})$.

Let us construct a functor from left to right. For each i denote F_i the sheaf h_{X_i} . The isomorphisms $\varphi_{ii'}$ give isomorphisms

$$\varphi_{ii'} : F_i \times h_{S_{i'}} \rightarrow h_{S_i} \times F_{i'}$$

over $h_{S_i} \times h_{S_{i'}}$. Set F equal to the coequalizer in the following diagram

$$\coprod_{i,i'} F_i \times h_{S_{i'}} \begin{array}{c} \xrightarrow{\text{pr}_0} \\ \xrightarrow{\text{pr}_1 \circ \varphi_{ii'}} \end{array} \coprod_i F_i \longrightarrow F$$

The cocycle condition guarantees that $h_{S_i} \times F$ is isomorphic to F_i and hence representable. The functor from left to right is given by this construction $(X_i, \varphi_{ii'}) \mapsto F$.

We omit the verification that these constructions are mutually quasi-inverse functors. The final statements (1) and (2) follow from the constructions. \square

Remark 34.35.2. In the statement of Lemma 34.35.1 the condition that $h_{S_i} \times F$ is representable is equivalent to the condition that the restriction of F to $(Sch/S_i)_\tau$ is representable.

Derived Categories of Schemes

35.1. Introduction

In this chapter we discuss derived categories of modules on schemes. Most of the material discussed here can be found in [TT90], [BN93], [BV03], and [LN07]. Of course there are many other references.

35.2. Conventions

If \mathcal{A} is an abelian category and M is an object of \mathcal{A} then we also denote M the object of $K(\mathcal{A})$ and/or $D(\mathcal{A})$ corresponding to the complex which has M in degree 0 and is zero in all other degrees.

If we have a ring A , then $K(A)$ denotes the homotopy category of complexes of A -modules and $D(A)$ the associated derived category. Similarly, if we have a ringed space (X, \mathcal{O}_X) the symbol $K(\mathcal{O}_X)$ denotes the homotopy category of complexes of \mathcal{O}_X -modules and $D(\mathcal{O}_X)$ the associated derived category.

35.3. Derived category of quasi-coherent modules

In this section we discuss the relationship between quasi-coherent modules and all modules on a scheme X . A reference is [TT90, Appendix B]. By the discussion in Schemes, Section 25.24 the embedding $QCoh(\mathcal{O}_X) \subset Mod(\mathcal{O}_X)$ exhibits $QCoh(\mathcal{O}_X)$ as a weak Serre subcategory of the category of \mathcal{O}_X -modules. Denote

$$D_{QCoh}(\mathcal{O}_X) \subset D(\mathcal{O}_X)$$

the subcategory of complexes whose cohomology sheaves are quasi-coherent, see Derived Categories, Section 13.13. Thus we obtain a canonical functor

$$(35.3.0.1) \quad D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

see Derived Categories, Equation (13.13.1.1).

Lemma 35.3.1. *Let X be a scheme. Then $D_{QCoh}(\mathcal{O}_X)$ has direct sums.*

Proof. By Injectives, Lemma 19.13.4 the derived category $D(\mathcal{O}_X)$ has direct sums and they are computed by taking termwise direct sums of any representatives. Thus it is clear that the cohomology sheaf of a direct sum is the direct sum of the cohomology sheaves as taking direct sums is an exact functor (in any grothendieck abelian category). The lemma follows as the direct sum of quasi-coherent sheaves is quasi-coherent, see Schemes, Section 25.24. \square

The following lemma will help us to “compute” a right derived functor on an object of $D_{QCoh}(\mathcal{O}_X)$.

Lemma 35.3.2. *Let X be a scheme. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Then there exists an inverse system \mathcal{I}_n^\bullet of complexes of \mathcal{O}_X -modules such that*

- (1) $\mathcal{I}^\bullet = \lim_n \mathcal{I}_n^\bullet$ represents E ,
- (2) \mathcal{I}_n^\bullet is a bounded below complex of injectives,
- (3) $\mathcal{I}^\bullet \rightarrow \mathcal{I}_n^\bullet$ induces an identification $\tau_{\geq -n} E \rightarrow \mathcal{I}_n^\bullet$ in $D(\mathcal{O}_X)$,
- (4) the transition maps $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections, and
- (5) \mathcal{I}^\bullet is a K -injective complex of \mathcal{O}_X -modules.

Moreover, E is the derived limit of the inverse system of its canonical truncations $\tau_{\geq -n} E$.

Proof. Denote $\mathcal{H}^i = H^i(E)$ the i th cohomology sheaf of E . Let \mathcal{B} be the set of affine open subsets of X . Then $H^p(U, \mathcal{H}^i) = 0$ for all $p > 0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Cohomology of Schemes, Lemma 29.2.2. Thus the lemma follows from Cohomology, Lemmas 20.31.2 and 20.31.3. \square

Lemma 35.3.3. *Let X be a scheme. Let $F : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Ab}$ be an additive functor and $N \geq 0$ an integer. Assume that*

- (1) F commutes with countable direct products,
- (2) $R^p F(\mathcal{F}) = 0$ for all $p \geq N$ and \mathcal{F} quasi-coherent.

Then for $E \in D_{QCoh}(\mathcal{O}_X)$ the maps $R^p F(E) \rightarrow R^p F(\tau_{\geq p-N+1} E)$ are isomorphisms.

Proof. By shifting the complex we see it suffices to prove the assertion for $p = 0$. Write $E_n = \tau_{\geq -n} E$. We have $E = R \lim E_n$, see Lemma 35.3.2. Thus $RF(E) = R \lim RF(E_n)$ in $D(\text{Ab})$ by Injectives, Lemma 19.13.6. Thus we have a short exact sequence

$$0 \rightarrow R^1 \lim R^{-1} F(E_n) \rightarrow R^0 F(E) \rightarrow \lim R^0 F(E_n) \rightarrow 0$$

see More on Algebra, Remark 15.61.16. To finish the proof we will show that the term on the left is zero and that the term on the right equals $R^0 F(E_{N-1})$.

We have a distinguished triangle

$$H^{-n}(E)[n] \rightarrow E_n \rightarrow E_{n-1} \rightarrow H^{-n}(E)[n+1]$$

(Derived Categories, Remark 13.12.4) in $D(\mathcal{O}_X)$. Since $H^{-n}(E)$ is quasi-coherent we have

$$R^p F(H^{-n}(E)[n]) = R^{p+n} F(H^{-n}(E)) = 0$$

for $p+n \geq N$ and

$$R^p F(H^{-n}(E)[n+1]) = R^{p+n+1} F(H^{-n}(E)) = 0$$

for $p+n+1 \geq N$. We conclude that

$$R^p F(E_n) \rightarrow R^p F(E_{n-1})$$

is an isomorphism for all $n \gg p$ and an isomorphism for $n \geq N$ for $p = 0$. Thus the systems $R^p F(E_n)$ all satisfy the ML condition and $R^1 \lim$ gives zero (see discussion in More on Algebra, Section 15.61). Moreover, the system $R^0 F(\tau_{\geq -n} E)$ is constant starting with $n = N - 1$ as desired. \square

The following lemma is the key ingredient to many of the results in this chapter.

Lemma 35.3.4. *Let $X = \text{Spec}(A)$ be an affine scheme. All the functors in the diagram*

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \xrightarrow{(35.3.0.1)} & D_{QCoh}(\mathcal{O}_X) \\ & \searrow \sim & \swarrow R\Gamma(X, -) \\ & & D(A) \end{array}$$

are equivalences of triangulated categories. Moreover, for E in $D_{QCoh}(\mathcal{O}_X)$ we have $H^0(X, E) = H^0(X, H^0(E))$.

Proof. The functor $R\Gamma(X, -)$ gives a functor $D(\mathcal{O}_X) \rightarrow D(A)$ and hence by restriction a functor

$$(35.3.4.1) \quad R\Gamma(X, -) : D_{QCoh}(\mathcal{O}_X) \longrightarrow D(A).$$

We will show this functor is quasi-inverse to (35.3.0.1) via the equivalence between quasi-coherent modules on X and the category of A -modules.

Elucidation. Denote (Y, \mathcal{O}_Y) the one point space with sheaf of rings given by A . Denote $\pi : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$ the obvious morphism of ringed spaces. Then $R\Gamma(X, -)$ can be identified with $R\pi_*$ and the functor (35.3.0.1) via the equivalence $Mod(\mathcal{O}_Y) = Mod_A = QCoh(\mathcal{O}_X)$ can be identified with $L\pi^* = \pi^* = \sim$ (see Modules, Lemma 17.10.5 and Schemes, Lemmas 25.7.1 and 25.7.5). Thus the functors

$$D(A) \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} D_{QCoh}(\mathcal{O}_X)$$

are adjoint (by Cohomology, Lemma 20.29.1). In particular we obtain canonical adjunction mappings

$$a : R\Gamma(X, \widetilde{E}) \longrightarrow E$$

for E in $D(\mathcal{O}_X)$ and

$$b : M^\bullet \longrightarrow R\Gamma(X, \widetilde{M^\bullet})$$

for M^\bullet a complex of A -modules.

Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. We may apply Lemma 35.3.3 to the functor $F(-) = \Gamma(X, -)$ with $N = 1$ by Cohomology of Schemes, Lemma 29.2.2. Hence

$$R^0\Gamma(X, E) = R^0\Gamma(X, \tau_{\geq 0}E) = \Gamma(X, H^0(E))$$

(the last equality by definition of the canonical truncation). Using this we will show that the adjunction mappings a and b induce isomorphisms $H^0(a)$ and $H^0(b)$. Thus a and b are quasi-isomorphisms (as the statement is invariant under shifts) and the lemma is proved.

In both cases we use that \sim is an exact functor (Schemes, Lemma 25.5.4). Namely, this implies that

$$H^0\left(R\Gamma(X, \widetilde{E})\right) = R^0\Gamma(X, \widetilde{E}) = \Gamma(X, \widetilde{H^0(E)})$$

which is equal to $H^0(E)$ because $H^0(E)$ is quasi-coherent. Thus $H^0(a)$ is an isomorphism. For the other direction we have

$$H^0(R\Gamma(X, \widetilde{M^\bullet})) = R^0\Gamma(X, \widetilde{M^\bullet}) = \Gamma(X, H^0(\widetilde{M^\bullet})) = \Gamma(X, \widetilde{H^0(M^\bullet)}) = H^0(M^\bullet)$$

which proves that $H^0(b)$ is an isomorphism. \square

Lemma 35.3.5. *Let $X = \text{Spec}(A)$ be an affine scheme. If K^\bullet is a K -flat complex of A -modules, then \widetilde{K}^\bullet is a K -flat complex of \mathcal{O}_X -modules.*

Proof. By More on Algebra, Lemma 15.45.5 we see that $K^\bullet \otimes_A A_{\mathfrak{p}}$ is a K -flat complex of $A_{\mathfrak{p}}$ -modules for every $\mathfrak{p} \in \text{Spec}(A)$. Hence we conclude from Cohomology, Lemma 20.27.4 (and Schemes, Lemma 25.5.4) that \widetilde{K}^\bullet is K -flat. \square

Lemma 35.3.6. *Let $f : Y \rightarrow X$ be a morphism of schemes.*

- (1) *The functor Lf^* sends $D_{QCoh}(\mathcal{O}_X)$ into $D_{QCoh}(\mathcal{O}_Y)$.*
- (2) *If X and Y are affine and f is given by the ring map $A \rightarrow B$, then the diagram*

$$\begin{array}{ccc} D(B) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \\ \uparrow -\otimes_A^L B & & \uparrow Lf^* \\ D(A) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \end{array}$$

commutes.

Proof. We first prove the diagram

$$\begin{array}{ccc} D(B) & \longrightarrow & D(\mathcal{O}_Y) \\ \uparrow -\otimes_A^L B & & \uparrow Lf^* \\ D(A) & \longrightarrow & D(\mathcal{O}_X) \end{array}$$

commutes. This is clear from Lemma 35.3.5 and the constructions of the functors in question. To see (1) let E be an object of $D_{QCoh}(\mathcal{O}_X)$. To see that Lf^*E has quasi-coherent cohomology sheaves we may work locally on X . Note that Lf^* is compatible with restricting to open subschemes. Hence we can assume that f is a morphism of affine schemes as in (2). Then we can apply Lemma 35.3.4 to see that E comes from a complex of A -modules. By the commutativity of the first diagram of the proof the same holds for Lf^*E and we conclude (1) is true. \square

Lemma 35.3.7. *Let X be a scheme.*

- (1) *For objects K, L of $D_{QCoh}(\mathcal{O}_X)$ the derived tensor product $K \otimes_{\mathcal{O}_X}^L L$ is in $D_{QCoh}(\mathcal{O}_X)$.*
- (2) *If $X = \text{Spec}(A)$ is affine then*

$$\widetilde{M}^\bullet \otimes_{\mathcal{O}_X}^L \widetilde{K}^\bullet = \widetilde{M^\bullet \otimes_A^L K^\bullet}$$

for any pair of complexes of A -modules K^\bullet, M^\bullet .

Proof. The equality of (2) follows immediately from Lemma 35.3.5 and the construction of the derived tensor product. To see (1) let K, L be objects of $D_{QCoh}(\mathcal{O}_X)$. To check that $K \otimes^L L$ is in $D_{QCoh}(\mathcal{O}_X)$ we may work locally on X , hence we may assume $X = \text{Spec}(A)$ is affine. By Lemma 35.3.4 we may represent K and L by complexes of A -modules. Then part (2) implies the result. \square

35.4. Total direct image

The following lemma is the analogue of Cohomology of Schemes, Lemma 29.4.4.

Lemma 35.4.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that f is quasi-separated and quasi-compact.*

- (1) *The functor Rf_* sends $D_{QCoh}(\mathcal{O}_X)$ into $D_{QCoh}(\mathcal{O}_S)$.*
- (2) *If S is quasi-compact, there exists an integer $N = N(X, S, f)$ such that for an object E of $D_{QCoh}(\mathcal{O}_X)$ with $H^m(E) = 0$ for $m > 0$ we have $H^m(Rf_*E) = 0$ for $m > N$.*
- (3) *In fact, if S is quasi-compact we can find $N = N(X, S, f)$ such that for every morphism of schemes $S' \rightarrow S$ the same conclusion holds for the functor $R(f')_*$ where $f' : X' \rightarrow S'$ is the base change of f .*

Proof. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. To prove (1) we have to show that Rf_*E has quasi-coherent cohomology sheaves. This question is local on S , hence we may assume S is quasi-compact. Pick $N = N(X, S, f)$ as in Cohomology of Schemes, Lemma 29.4.4. Thus $R^p f_*\mathcal{F} = 0$ for all quasi-coherent \mathcal{O}_X -modules \mathcal{F} and all $p \geq N$. In particular, for any affine open $U \subset S$ we have $H^p(f^{-1}(U), \mathcal{F}) = 0$ for $p \geq N$, see Cohomology of Schemes, Lemma 29.4.5.

Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Choose $\mathcal{I}^\bullet = \lim \mathcal{I}_n^\bullet$ as in Lemma 35.3.2. As \mathcal{I}^\bullet is K -injective Rf_*E is represented by $f_*\mathcal{I}^\bullet = \lim f_*\mathcal{I}_n^\bullet$. Let $U \subset S$ be any affine open. The cohomology $H^m(f_*\mathcal{I}_n^\bullet(U))$ of

$$f_*\mathcal{I}_n^{m-1}(U) \rightarrow f_*\mathcal{I}_n^m(U) \rightarrow f_*\mathcal{I}_n^{m+1}(U)$$

is equal to $H^m(f^{-1}(U), \tau_{\geq -n}E)$ because \mathcal{I}_n^\bullet is a bounded below complex of injectives representing $\tau_{\geq -n}E$. We have a distinguished triangle

$$H^{-n}(E)[n] \rightarrow \tau_{\geq -n}E \rightarrow \tau_{\geq -n+1}E \rightarrow H^{-n}(E)[n+1]$$

(Derived Categories, Remark 13.12.4) in $D(\mathcal{O}_X)$. Since $H^{-n}(E)$ is quasi-coherent we have $H^m(f^{-1}(U), H^{-n}(E)[n]) = 0$ for $n+m \geq N$ by our choice of N . Similarly, $H^m(f^{-1}(U), H^{-n}(E)[n+1]) = 0$ for $n+m+1 \geq N$. We conclude that

$$H^m(f_*\mathcal{I}_n^\bullet(U)) \rightarrow H^m(f_*\mathcal{I}_{n-1}^\bullet(U))$$

is an isomorphism for all $n \geq N - m$. Thus Cohomology, Lemma 20.31.1 applies to show that the m th cohomology sheaf of $\lim f_*\mathcal{I}_n^\bullet$ agrees with the m th cohomology sheaf of $f_*\mathcal{I}_n^\bullet$ for $n \geq N - m$. Since these cohomology sheaves are quasi-coherent by Cohomology of Schemes, Lemma 29.4.4 we get (1).

Finally, we show that (2) and (3) hold with our choice of N . Namely, the stabilization proven above gives that $H^m(Rf_*E)$ is equal to $H^m(Rf_*(\tau_{\geq -n}E))$ for all n large enough which means we can work with objects in $D^+(\mathcal{O}_X)$ in order to prove (2) and (3). In this case we can for example use the spectral sequence

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E$$

(Derived Categories, Lemma 13.21.3) and the vanishing of $R^p f_* H^q(E)$ for $p \geq N$ to conclude. Some details omitted. \square

Lemma 35.4.2. *Let $f : X \rightarrow S$ be a quasi-separated and quasi-compact morphism of schemes. Then $Rf_* : D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_S)$ commutes with direct sums.*

Proof. Let E_i be a family of objects of $D_{QCoh}(\mathcal{O}_X)$ and set $E = \bigoplus E_i$. We want to show that the map

$$\bigoplus Rf_*E_i \longrightarrow Rf_*E$$

is an isomorphism. We will show it induces an isomorphism on cohomology sheaves in degree 0 which will imply the lemma. Choose an integer N as in Lemma 35.4.1. Then $R^0f_*E = R^0f_*\tau_{\geq -N}E$ and $R^0f_*E_i = R^0f_*\tau_{\geq -N}E_i$ by the lemma cited. Observe that $\tau_{\geq -N}E = \bigoplus \tau_{\geq -N}E_i$. Thus we may assume all of the E_i have vanishing cohomology sheaves in degrees $< -N$. Next we use the spectral sequences

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E \quad \text{and} \quad R^p f_* H^q(E_i) \Rightarrow R^{p+q} f_* E_i$$

(Derived Categories, Lemma 13.21.3) to reduce to the case of a direct sum of quasi-coherent sheaves. This case is handled by Cohomology of Schemes, Lemma 29.6.1. \square

Lemma 35.4.3. *Let $f : X \rightarrow S$ be an affine morphism of schemes. Then $Rf_* : D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_S)$ reflects isomorphisms.*

Proof. The statement means that a morphism $\alpha : E \rightarrow F$ of $D_{QCoh}(\mathcal{O}_X)$ is an isomorphism if $Rf_*\alpha$ is an isomorphism. We may check this on cohomology sheaves. In particular, the question is local on S . Hence we may assume S and therefore X is affine. In this case the statement is clear from the description of the derived categories $D_{QCoh}(\mathcal{O}_X)$ and $D_{QCoh}(\mathcal{O}_S)$ given in Lemma 35.3.4. Some details omitted. \square

Lemma 35.4.4. *Let $f : X \rightarrow S$ be an affine morphism of schemes. For E in $D_{QCoh}(\mathcal{O}_S)$ we have $Rf_*Lf^*E = E \otimes_{\mathcal{O}_S}^L f_*\mathcal{O}_X$.*

Proof. Since f is affine the map $f_*\mathcal{O}_X \rightarrow Rf_*\mathcal{O}_X$ is an isomorphism (Cohomology of Schemes, Lemma 29.2.3). There is a canonical map $E \otimes_{\mathcal{O}_S}^L f_*\mathcal{O}_X = E \otimes_{\mathcal{O}_S}^L Rf_*\mathcal{O}_X \rightarrow Rf_*Lf^*E$ adjoint to the map

$$Lf^*(E \otimes_{\mathcal{O}_S}^L Rf_*\mathcal{O}_X) = Lf^*E \otimes_{\mathcal{O}_X}^L Lf^*Rf_*\mathcal{O}_X \longrightarrow Lf^*E \otimes_{\mathcal{O}_X}^L \mathcal{O}_X = Lf^*E$$

coming from $1 : Lf^*E \rightarrow Lf^*E$ and the canonical map $Lf^*Rf_*\mathcal{O}_X \rightarrow \mathcal{O}_X$. To check the map so constructed is an isomorphism we may work locally on S . Hence we may assume S and therefore X is affine. In this case the statement is clear from the description of the derived categories $D_{QCoh}(\mathcal{O}_X)$ and $D_{QCoh}(\mathcal{O}_S)$ and the functor Lf^* given in Lemmas 35.3.4 and 35.3.6. Some details omitted. \square

35.5. Derived category of coherent modules

Let X be a locally Noetherian scheme. In this case the category $Coh(\mathcal{O}_X) \subset Mod(\mathcal{O}_X)$ of coherent \mathcal{O}_X -modules is a weak Serre subcategory, see Homology, Section 12.9 and Cohomology of Schemes, Lemma 29.9.2. Denote

$$D_{Coh}(\mathcal{O}_X) \subset D(\mathcal{O}_X)$$

the subcategory of complexes whose cohomology sheaves are coherent, see Derived Categories, Section 13.13. Thus we obtain a canonical functor

$$(35.5.0.1) \quad D(Coh(\mathcal{O}_X)) \longrightarrow D_{Coh}(\mathcal{O}_X)$$

see Derived Categories, Equation (13.13.1.1).

Lemma 35.5.1. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let E be an object of $D_{Coh}^b(\mathcal{O}_X)$ such that the scheme theoretic support of $H^i(E)$ is proper over S for all i . Then Rf_*E is an object of $D_{Coh}^b(\mathcal{O}_S)$.*

Proof. Consider the spectral sequence

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E$$

see Derived Categories, Lemma 13.21.3. By assumption and Cohomology of Schemes, Remark 29.17.3 the sheaves $R^p f_* H^q(E)$ are coherent. Hence $R^{p+q} f_* E$ is coherent, i.e., $E \in D_{Coh}(\mathcal{O}_S)$. Boundedness from below is trivial. Boundedness from above follows from Cohomology of Schemes, Lemma 29.4.4 or from Lemma 35.4.1. \square

35.6. The coherator

Let X be a scheme. The *coherator* is a functor

$$Q_X : Mod(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

which is right adjoint to the inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$. It exists for any scheme X and moreover the adjunction mapping $Q_X(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism for every quasi-coherent module \mathcal{F} , see Properties, Proposition 27.21.4. Since Q_X is left exact (as a right adjoint) we can consider its right derived extension

$$RQ_X : D(\mathcal{O}_X) \longrightarrow D(QCoh(\mathcal{O}_X)).$$

As this functor is constructed by applying Q_X to a K-injective replacement we see that RQ_X is a right adjoint to the canonical functor $D(QCoh(\mathcal{O}_X)) \rightarrow D(\mathcal{O}_X)$.

Lemma 35.6.1. *Let $f : X \rightarrow Y$ be an affine morphism of schemes. Then f_* defines a derived functor $f_* : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$. This functor has the property that*

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \\ f_* \downarrow & & \downarrow Rf_* \\ D(QCoh(\mathcal{O}_Y)) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

commutes.

Proof. The functor $f_* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Y)$ is exact, see Cohomology of Schemes, Lemma 29.2.3. Hence f_* defines a derived functor $f_* : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ by simply applying f_* to any representative complex, see Derived Categories, Lemma 13.17.8. For any complex of \mathcal{O}_X -modules \mathcal{F}^\bullet there is a canonical map $f_* \mathcal{F}^\bullet \rightarrow Rf_* \mathcal{F}^\bullet$. To finish the proof we show this is a quasi-isomorphism when \mathcal{F}^\bullet is a complex with each \mathcal{F}^n quasi-coherent. As the statement is invariant under shifts it suffices to show that $H^0(f_*(\mathcal{F}^\bullet)) \rightarrow R^0 f_* \mathcal{F}^\bullet$ is an isomorphism. The statement is local on Y hence we may assume Y affine. By Lemma 35.4.1 we have $R^0 f_* \mathcal{F}^\bullet = R^0 f_* \tau_{\geq -n} \mathcal{F}^\bullet$ for all sufficiently large n . Thus we may assume \mathcal{F}^\bullet bounded below. As each \mathcal{F}^n is f_* -acyclic by Cohomology of Schemes, Lemma 29.2.3 we see that $f_* \mathcal{F}^\bullet \rightarrow Rf_* \mathcal{F}^\bullet$ is a quasi-isomorphism by Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7). \square

Lemma 35.6.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that*

- (1) *f is quasi-compact, quasi-separated, and flat, and*

(2) denoting

$$\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$$

the right derived functor of $f_* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Y)$ the diagram

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \\ \Phi \downarrow & & \downarrow Rf_* \\ D(QCoh(\mathcal{O}_Y)) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

commutes.

Then $RQ_Y \circ Rf_* = \Phi \circ RQ_X$.

Proof. Since f is quasi-compact and quasi-separated, we see that f_* preserve quasi-coherence, see Schemes, Lemma 25.24.1. Recall that $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category (Properties, Proposition 27.21.4). Hence any K in $D(QCoh(\mathcal{O}_X))$ can be represented by a K-injective complex \mathcal{I}^\bullet of $QCoh(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. Then we can define $\Phi(K) = f_*\mathcal{I}^\bullet$.

Since f is flat, the functor f^* is exact. Hence f^* defines $f^* : D(\mathcal{O}_Y) \rightarrow D(\mathcal{O}_X)$ and also $f^* : D(QCoh(\mathcal{O}_Y)) \rightarrow D(QCoh(\mathcal{O}_X))$. The functor $f^* = Lf^* : D(\mathcal{O}_Y) \rightarrow D(\mathcal{O}_X)$ is left adjoint to $Rf_* : D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_Y)$, see Cohomology, Lemma 20.29.1. Similarly, the functor $f^* : D(QCoh(\mathcal{O}_Y)) \rightarrow D(QCoh(\mathcal{O}_X))$ is left adjoint to $\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ by Derived Categories, Lemma 13.28.4.

Let A be an object of $D(QCoh(\mathcal{O}_Y))$ and E an object of $D(\mathcal{O}_X)$. Then

$$\begin{aligned} \text{Hom}_{D(QCoh(\mathcal{O}_Y))}(A, RQ_Y(Rf_*E)) &= \text{Hom}_{D(\mathcal{O}_Y)}(A, Rf_*E) \\ &= \text{Hom}_{D(\mathcal{O}_X)}(f^*A, E) \\ &= \text{Hom}_{D(QCoh(\mathcal{O}_X))}(f^*A, RQ_X(E)) \\ &= \text{Hom}_{D(QCoh(\mathcal{O}_Y))}(A, \Phi(RQ_X(E))) \end{aligned}$$

This implies what we want. □

Lemma 35.6.3. *Let $X = \text{Spec}(A)$ be an affine scheme. Then*

- (1) $Q_X : \text{Mod}(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_X)$ is the functor which sends \mathcal{F} to the quasi-coherent \mathcal{O}_X -module associated to the A -module $\Gamma(X, \mathcal{F})$,
- (2) $RQ_X : D(\mathcal{O}_X) \rightarrow D(QCoh(\mathcal{O}_X))$ is the functor which sends E to the complex of quasi-coherent \mathcal{O}_X -modules associated to the object $R\Gamma(X, E)$ of $D(A)$,
- (3) restricted to $D_{QCoh}(\mathcal{O}_X)$ the functor RQ_X defines a quasi-inverse to (35.3.0.1).

Proof. The functor Q_X is the functor

$$\mathcal{F} \mapsto \widetilde{\Gamma(X, \mathcal{F})}$$

by Schemes, Lemma 25.7.1. This immediately implies (1) and (2). The third assertion follows from (the proof of) Lemma 35.3.4. □

Definition 35.6.4. Let X be a scheme. Let E be an object of $D(\mathcal{O}_X)$. Let $T \subset X$ be a closed subset. We say E is supported on T if the cohomology sheaves $H^i(E)$ are supported on T .

Proposition 35.6.5. *Let X be a quasi-compact scheme with affine diagonal. Then the functor (35.3.0.1)*

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

Proof. In this proof we will denote $i_X : D(QCoh(\mathcal{O}_X)) \rightarrow D_{QCoh}(\mathcal{O}_X)$ the functor of the lemma. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$ and let A be an object of $D(QCoh(\mathcal{O}_X))$. We have to show that the adjunction maps

$$RQ_X(i_X(A)) \rightarrow A \quad \text{and} \quad E \rightarrow i_X(RQ_X(E))$$

are isomorphisms. We will prove this by induction on n : the smallest integer $n \geq 0$ such that E and $i_X(A)$ are supported on a closed subset of X which is contained in the union of n affine opens of X .

Base case: $n = 0$. In this case $E = 0$, hence the map $E \rightarrow i_X(RQ_X(E))$ is an isomorphism. Similarly $i_X(A) = 0$. Thus the cohomology sheaves of $i_X(A)$ are zero. Since the inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$ is fully faithful and exact, we conclude that the cohomology objects of A are zero, i.e., $A = 0$ and $RQ_X(i_X(A)) \rightarrow A$ is an isomorphism as well.

Induction step. Suppose that E and $i_X(A)$ are supported on a closed subset T of X contained in $U_1 \cup \dots \cup U_n$ with $U_i \subset X$ affine open. Set $U = U_n$. The inclusion morphism $j : U \rightarrow X$ is flat and affine (Morphisms, Lemma 28.13.11). Consider the distinguished triangles

$$A \rightarrow j_*(A|_U) \rightarrow A' \rightarrow A[1] \quad \text{and} \quad E \rightarrow Rj_*(E|_U) \rightarrow E' \rightarrow E[1]$$

where j_* is as in Lemma 35.6.1. Note that $E \rightarrow Rj_*(E|_U)$ is a quasi-isomorphism over $U = U_n$. Since $i_X \circ j_* = Rj_* \circ i_U$ by Lemma 35.6.1 and since $i_X(A)|_U = i_U(A|_U)$ we see that $i_X(A) \rightarrow i_X(j_*(A|_U))$ is a quasi-isomorphism over U . Hence $i_X(A')$ and E' are supported on the closed subset $T \setminus U$ of X which is contained in $U_1 \cup \dots \cup U_{n-1}$. By induction hypothesis the statement is true for A' and E' . By Derived Categories, Lemma 13.4.3 it suffices to prove the maps

$$RQ_X(i_X(j_*(A|_U))) \rightarrow j_*(A|_U) \quad \text{and} \quad Rj_*(E|_U) \rightarrow i_X(RQ_X(Rj_*E|_U))$$

are isomorphisms. By Lemmas 35.6.1 and 35.6.2 we have

$$RQ_X(i_X(j_*(A|_U))) = RQ_X(Rj_*(i_U(A|_U))) = j_*RQ_U(i_U(A|_U))$$

and

$$i_X(RQ_X(Rj_*(E|_U))) = i_X(j_*RQ_U(E|_U)) = Rj_*(i_U(RQ_U(E|_U)))$$

Finally, the maps

$$RQ_U(i_U(A|_U)) \rightarrow A|_U \quad \text{and} \quad E|_U \rightarrow i_U(RQ_U(E|_U))$$

are isomorphisms by Lemma 35.6.3. The result follows. □

Remark 35.6.6. Analyzing the proof of Proposition 35.6.5 we see that we have shown the following. Let X be a quasi-compact and quasi-separated scheme. Suppose that for every affine open $U \subset X$ the right derived functor

$$\Phi : D(QCoh(\mathcal{O}_U)) \rightarrow D(QCoh(\mathcal{O}_X))$$

of the left exact functor $j_* : QCoh(\mathcal{O}_U) \rightarrow QCoh(\mathcal{O}_X)$ fits into a commutative diagram

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_U)) & \xrightarrow{i_U} & D_{QCoh}(\mathcal{O}_U) \\ \Phi \downarrow & & \downarrow Rj_* \\ D(QCoh(\mathcal{O}_X)) & \xrightarrow{i_X} & D_{QCoh}(\mathcal{O}_X) \end{array}$$

Then the functor (35.3.0.1)

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

35.7. The coherator for Noetherian schemes

In the case of Noetherian schemes we can use the following lemma.

Lemma 35.7.1. *Let X be a Noetherian scheme. Let \mathcal{J} be an injective object of $QCoh(\mathcal{O}_X)$. Then \mathcal{J} is a flasque sheaf of \mathcal{O}_X -modules.*

Proof. Let $U \subset X$ be an open subset and let $s \in \mathcal{J}(U)$ be a section. Let $\mathcal{I} \subset X$ be the quasi-coherent sheaf of ideals defining the reduced induced scheme structure on $X \setminus U$ (see Schemes, Definition 25.12.5). By Cohomology of Schemes, Lemma 29.10.4 the section s corresponds to a map $\sigma : \mathcal{I}^n \rightarrow \mathcal{J}$ for some n . As \mathcal{J} is an injective object of $QCoh(\mathcal{O}_X)$ we can extend σ to a map $\tilde{s} : \mathcal{O}_X \rightarrow \mathcal{J}$. Then \tilde{s} corresponds to a global section of \mathcal{J} restricting to s . \square

Lemma 35.7.2. *Let $f : X \rightarrow Y$ be a morphism of Noetherian schemes. Then f_* on quasi-coherent sheaves has a right derived extension $\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ such that the diagram*

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \\ \Phi \downarrow & & \downarrow Rf_* \\ D(QCoh(\mathcal{O}_Y)) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

commutes.

Proof. Since X and Y are Noetherian schemes the morphism is quasi-compact and quasi-separated (see Properties, Lemma 27.5.4 and Schemes, Remark 25.21.18). Thus f_* preserve quasi-coherence, see Schemes, Lemma 25.24.1. Next, Let K be an object of $D(QCoh(\mathcal{O}_X))$. Since $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category (Properties, Proposition 27.21.4), we can represent K by a K-injective complex \mathcal{I}^\bullet such that each \mathcal{I}^n is an injective object of $QCoh(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. Thus we see that the functor Φ is defined by setting

$$\Phi(K) = f_*\mathcal{I}^\bullet$$

where the right hand side is viewed as an object of $D(QCoh(\mathcal{O}_Y))$. To finish the proof of the lemma it suffices to show that the canonical map

$$f_*\mathcal{I}^\bullet \longrightarrow Rf_*\mathcal{I}^\bullet$$

is an isomorphism in $D(\mathcal{O}_Y)$. To see this it suffices to prove the map induces an isomorphism on cohomology sheaves. Pick any $m \in \mathbf{Z}$. Let $N = N(X, Y, f)$ be as in Lemma 35.4.1. Consider the short exact sequence

$$0 \rightarrow \sigma_{\geq m-N-1} \mathcal{I}^\bullet \rightarrow \mathcal{I}^\bullet \rightarrow \sigma_{\leq m-N-2} \mathcal{I}^\bullet \rightarrow 0$$

of complexes of quasi-coherent sheaves on X . By Lemma 35.4.1 we see that the cohomology sheaves of $Rf_* \sigma_{\leq m-N-2} \mathcal{I}^\bullet$ are zero in degrees $\geq m-1$. Thus we see that $R^m f_* \mathcal{I}^\bullet$ is isomorphic to $R^m f_* \sigma_{\geq m-N-1} \mathcal{I}^\bullet$. In other words, we may assume that \mathcal{I}^\bullet is a bounded below complex of injective objects of $QCoh(\mathcal{O}_X)$. This follows from Leray’s acyclicity lemma (Derived Categories, Lemma 13.17.7) via Cohomology, Lemma 20.13.5 and Lemma 35.7.1. \square

Proposition 35.7.3. *Let X be a Noetherian scheme. Then the functor (35.3.0.1)*

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

Proof. This follows using the exact same argument as in the proof of Proposition 35.6.5 using Lemma 35.7.2. See discussion in Remark 35.6.6. \square

35.8. Koszul complexes

Let A be a ring and let f_1, \dots, f_r be a sequence of elements of A . We have defined the Koszul complex $K_\bullet(f_1, \dots, f_r)$ in More on Algebra, Definition 15.20.2. It is a chain complex sitting in degrees $r, \dots, 0$. We turn this into a cochain complex $K^\bullet(f_1, \dots, f_r)$ by setting $K^{-n}(f_1, \dots, f_r) = K_n(f_1, \dots, f_r)$ and using the same differentials. In the rest of this section all the complexes will be cochain complexes.

We define a complex $I^\bullet(f_1, \dots, f_r)$ such that we have a distinguished triangle

$$I^\bullet(f_1, \dots, f_r) \rightarrow A \rightarrow K^\bullet(f_1, \dots, f_r) \rightarrow I^\bullet(f_1, \dots, f_r)[1]$$

in $K(A)$. In other words, we set

$$I^i(f_1, \dots, f_r) = \begin{cases} K^{i-1}(f_1, \dots, f_r) & \text{if } i \leq 0 \\ 0 & \text{else} \end{cases}$$

and we use the negative of the differential on $K^\bullet(f_1, \dots, f_r)$. The maps in the distinguished triangle are the obvious ones. Note that $I^0(f_1, \dots, f_r) = A^{\oplus r} \rightarrow A$ is given by multiplication by f_i on the i th factor. Hence $I^\bullet(f_1, \dots, f_r) \rightarrow A$ factors as

$$I^\bullet(f_1, \dots, f_r) \rightarrow I \rightarrow A$$

where $I = (f_1, \dots, f_r)$. In fact, there is a short exact sequence

$$0 \rightarrow H^{-1}(K^\bullet(f_1, \dots, f_r)) \rightarrow H^0(I^\bullet(f_1, \dots, f_r)) \rightarrow I \rightarrow 0$$

and for every $i < 0$ we have $H^i(I^\bullet(f_1, \dots, f_r)) = H^{i-1}(K^\bullet(f_1, \dots, f_r))$. Observe that given a second sequence g_1, \dots, g_r of elements of A there are canonical maps

$$I^\bullet(f_1 g_1, \dots, f_r g_r) \rightarrow I^\bullet(f_1, \dots, f_r) \quad \text{and} \quad K^\bullet(f_1 g_1, \dots, f_r g_r) \rightarrow K^\bullet(f_1, \dots, f_r)$$

compatible with the maps described above. The first of these maps is given by multiplication by g_i on the i th summand of $I^0(f_1 g_1, \dots, f_r g_r) = A^{\oplus r}$. In particular, given f_1, \dots, f_r we obtain an inverse system of complexes

$$(35.8.0.1) \quad I^\bullet(f_1, \dots, f_r) \leftarrow I^\bullet(f_1^2, \dots, f_r^2) \leftarrow I^\bullet(f_1^3, \dots, f_r^3) \leftarrow \dots$$

which will play an important role in that which is to follow. To easily formulate the following lemmas we fix some notation.

Situation 35.8.1. Here A is a ring and f_1, \dots, f_r is a sequence of elements of A . We set $X = \text{Spec}(A)$ and $U = D(f_1) \cup \dots \cup D(f_r) \subset X$. We denote $\mathcal{U} : U = \bigcup_{i=1, \dots, r} D(f_i)$ the given open covering of U .

Our first lemma is that the complexes above can be used to compute the cohomology of quasi-coherent sheaves on U . Suppose given a complex I^\bullet of A -modules and an A -module M . Then we define $\text{Hom}_A(I^\bullet, M)$ to be the complex with n th term $\text{Hom}_A(I^{-n}, M)$ and differentials given as the contragredients of the differentials on I^\bullet .

Lemma 35.8.2. *In Situation 35.8.1. Let M be an A -module and denote \mathcal{F} the associated \mathcal{O}_X -module. Then there is a canonical isomorphism of complexes*

$$\text{colim}_e \text{Hom}_A(I^\bullet(f_1^e, \dots, f_r^e), M) \longrightarrow \check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$$

functorial in M .

Proof. Recall that the alternating Čech complex is the subcomplex of the usual Čech complex given by alternating cochains, see Cohomology, Section 20.24. As usual we view a p -cochain in $\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \mathcal{F})$ as an alternating function s on $\{1, \dots, r\}^{p+1}$ whose value $s_{i_0 \dots i_p}$ at (i_0, \dots, i_p) lies in $M_{f_{i_0} \dots f_{i_p}} = \mathcal{F}(U_{i_0 \dots i_p})$. On the other hand, a p -cochain t in $\text{Hom}_A(I^\bullet(f_1^e, \dots, f_r^e), M)$ is given by a map $t : \wedge^{p+1}(A^{\oplus r}) \rightarrow M$. Write $[i] \in A^{\oplus r}$ for the i th basis element and write

$$[i_0, \dots, i_p] = [i_0] \wedge \dots \wedge [i_p] \in \wedge^{p+1}(A^{\oplus r})$$

Then we send t as above to s with

$$s_{i_0 \dots i_p} = \frac{t([i_0, \dots, i_p])}{f_{i_0}^e \dots f_{i_p}^e}$$

It is clear that s so defined is an alternating cochain. The construction of this map is compatible with the transition maps of the system as the transition map

$$I^\bullet(f_1^e, \dots, f_r^e) \leftarrow I^\bullet(f_1^{e+1}, \dots, f_r^{e+1}),$$

of the (35.8.0.1) sends $[i_0, \dots, i_p]$ to $f_{i_0} \dots f_{i_p} [i_0, \dots, i_p]$. It is clear from the description of the localizations $M_{f_{i_0} \dots f_{i_p}}$ in Algebra, Lemma 10.9.9 that these maps define an isomorphism of cochain modules in degree p in the limit. To finish the proof we have to show that the map is compatible with differentials. To see this recall that

$$\begin{aligned} d(s)_{i_0 \dots i_{p+1}} &= \sum_{j=0}^{p+1} (-1)^j s_{i_0 \dots \hat{i}_j \dots i_{p+1}} \\ &= \sum_{j=0}^{p+1} (-1)^j \frac{t([i_0, \dots, \hat{i}_j, \dots, i_{p+1}])}{f_{i_0}^e \dots \hat{f}_{i_j}^e \dots f_{i_{p+1}}^e} \end{aligned}$$

On the other hand, we have

$$\begin{aligned} \frac{d(t)([i_0, \dots, i_{p+1}])}{f_{i_0}^e \dots f_{i_{p+1}}^e} &= \frac{t(d[i_0, \dots, i_{p+1}])}{f_{i_0}^e \dots f_{i_{p+1}}^e} \\ &= \frac{\sum_j (-1)^j f_{i_j}^e t([i_0, \dots, \hat{i}_j, \dots, i_{p+1}])}{f_{i_0}^e \dots f_{i_{p+1}}^e} \end{aligned}$$

The two formulas agree by inspection. □

Suppose given a finite complex I^\bullet of A -modules and a complex of A -modules M^\bullet . We obtain a double complex $H^{\bullet,\bullet} = \text{Hom}_A(I^\bullet, M^\bullet)$ where $H^{p,q} = \text{Hom}_A(I^p, M^q)$. The first differential comes from the differential on $\text{Hom}_A(I^\bullet, M^q)$ and the second from the differential on M^\bullet . Associated to this double complex is the total complex with degree n term given by

$$\bigoplus_{p+q=n} \text{Hom}_A(I^p, M^q)$$

and differential as in Homology, Definition 12.22.3. As our complex I^\bullet has only finitely many nonzero terms, the direct sum displayed above is finite. The conventions for taking the total complex associated to a Čech complex of a complex are as in Cohomology, Section 20.26.

Lemma 35.8.3. *In Situation 35.8.1. Let M^\bullet be a complex of A -modules and denote \mathcal{F}^\bullet the associated complex of \mathcal{O}_X -modules. Then there is a canonical isomorphism of complexes*

$$\text{colim}_e \text{Tot}(\text{Hom}_A(I^\bullet(f_1^e, \dots, f_r^e), M^\bullet)) \longrightarrow \text{Tot}(\check{C}_{\text{alt}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet))$$

functorial in M^\bullet .

Proof. Immediate from Lemma 35.8.2 and our conventions for taking associated total complexes. \square

Lemma 35.8.4. *In Situation 35.8.1. Let \mathcal{F}^\bullet be a complex of quasi-coherent \mathcal{O}_X -modules. Then there is a canonical isomorphism*

$$\text{Tot}(\check{C}_{\text{alt}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow R\Gamma(U, \mathcal{F}^\bullet)$$

in $D(A)$ functorial in \mathcal{F}^\bullet .

Proof. Let \mathcal{B} be the set of affine opens of U . Since the higher cohomology groups of a quasi-coherent module on an affine scheme are zero (Cohomology of Schemes, Lemma 29.2.2) this is a special case of Cohomology, Lemma 20.32.2. \square

In Situation 35.8.1 denote I_e the object of $D(\mathcal{O}_X)$ corresponding to the complex of A -modules $I^\bullet(f_1^e, \dots, f_r^e)$ via the equivalence of Lemma 35.3.4. The maps (35.8.0.1) give a system

$$I_1 \leftarrow I_2 \leftarrow I_3 \leftarrow \dots$$

Moreover, there is a compatible system of maps $I_e \rightarrow \mathcal{O}_X$ which become isomorphisms when restricted to U . Thus we see that for every object E of $D(\mathcal{O}_X)$ there is a canonical map

$$(35.8.4.1) \quad \text{colim}_e \text{Hom}_{D(\mathcal{O}_X)}(I_e, E) \longrightarrow H^0(U, E)$$

constructed by sending a map $I_e \rightarrow E$ to its restriction to U and using that $\text{Hom}_{D(\mathcal{O}_U)}(\mathcal{O}_U, E|_U) = H^0(U, E)$.

Proposition 35.8.5. *In Situation 35.8.1. For every object E of $D_{\text{Qcoh}}(\mathcal{O}_X)$ the map (35.8.4.1) is an isomorphism.*

Proof. By Lemma 35.3.4 we may assume that E is given by a complex of quasi-coherent sheaves \mathcal{F}^\bullet . Let $M^\bullet = \Gamma(X, \mathcal{F}^\bullet)$ be the corresponding complex of A -modules. By Lemmas 35.8.3 and 35.8.4 we have quasi-isomorphisms

$$\text{colim}_e \text{Tot}(\text{Hom}_A(I^\bullet(f_1^e, \dots, f_r^e), M^\bullet)) \longrightarrow \text{Tot}(\check{C}_{\text{alt}}^\bullet(\mathcal{U}, \mathcal{F}^\bullet)) \longrightarrow R\Gamma(U, \mathcal{F}^\bullet)$$

Taking H^0 on both sides we obtain

$$\operatorname{colim}_e \operatorname{Hom}_{D(A)}(I^\bullet(f_1^e, \dots, f_r^e), M^\bullet) = H^0(U, E)$$

Since $\operatorname{Hom}_{D(A)}(I^\bullet(f_1^e, \dots, f_r^e), M^\bullet) = \operatorname{Hom}_{D(\mathcal{O}_X)}(I_e, E)$ by Lemma 35.3.4 the lemma follows. \square

In Situation 35.8.1 denote K_e the object of $D(\mathcal{O}_X)$ corresponding to the complex of A -modules $K^\bullet(f_1^e, \dots, f_r^e)$ via the equivalence of Lemma 35.3.4. Thus we have distinguished triangles

$$I_e \rightarrow \mathcal{O}_X \rightarrow K_e \rightarrow I_e[1]$$

and a system

$$K_1 \leftarrow K_2 \leftarrow K_3 \leftarrow \dots$$

compatible with the system (I_e) . Moreover, there is a compatible system of maps

$$K_e \rightarrow H^0(K_e) = \mathcal{O}_X / (f_1^e, \dots, f_r^e)$$

Lemma 35.8.6. *In Situation 35.8.1. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Assume that $H^i(E)|_U = 0$ for $i = -r + 1, \dots, 0$. Then given $s \in H^0(X, E)$ there exists an $e \geq 0$ and a morphism $K_e \rightarrow E$ such that s is in the image of $H^0(X, K_e) \rightarrow H^0(X, E)$.*

Proof. Since U is covered by r affine opens we have $H^j(U, \mathcal{F}) = 0$ for $j \geq r$ and any quasi-coherent module (Cohomology of Schemes, Lemma 29.4.2). By Lemma 35.3.3 we see that $H^0(U, E)$ is equal to $H^0(U, \tau_{\geq -r+1}E)$. There is a spectral sequence

$$H^j(U, H^i(\tau_{\geq -r+1}E)) \Rightarrow H^{i+j}(U, \tau_{\geq -N}E)$$

see Derived Categories, Lemma 13.21.3. Hence $H^0(U, E) = 0$ by our assumed vanishing of cohomology sheaves of E . We conclude that $s|_U = 0$. Think of s as a morphism $\mathcal{O}_X \rightarrow E$ in $D(\mathcal{O}_X)$. By Proposition 35.8.5 the composition $I_e \rightarrow \mathcal{O}_X \rightarrow E$ is zero for some e . By the distinguished triangle $I_e \rightarrow \mathcal{O}_X \rightarrow K_e \rightarrow I_e[1]$ we obtain a morphism $K_e \rightarrow E$ such that s is the composition $\mathcal{O}_X \rightarrow K_e \rightarrow E$. \square

35.9. Pseudo-coherent and perfect complexes

In this section we make the connection between the general notions defined in Cohomology, Sections 20.35, 20.36, 20.37, and 20.38 and the corresponding notions for complexes of modules in More on Algebra, Sections 15.50, 15.51, and 15.56.

Lemma 35.9.1. *Let X be a scheme. If E is an m -pseudo-coherent object of $D(\mathcal{O}_X)$, then $H^i(E)$ is a quasi-coherent \mathcal{O}_X -module for $i > m$. If E is pseudo-coherent, then E is an object of $D_{QCoh}(\mathcal{O}_X)$.*

Proof. Locally $H^i(E)$ is isomorphic to $H^i(\mathcal{E}^\bullet)$ with \mathcal{E}^\bullet strictly perfect. The sheaves \mathcal{E}^i are direct summands of finite free modules, hence quasi-coherent. The lemma follows. \square

Lemma 35.9.2. *Let X be a locally ringed space. A direct summand of a free \mathcal{O}_X -module is finite locally free.*

Proof. Omitted. \square

Lemma 35.9.3. *Let $X = \operatorname{Spec}(A)$ be an affine scheme. Let M^\bullet be a complex of A -modules and let E be the corresponding object of $D(\mathcal{O}_X)$. Then E is an m -pseudo-coherent (resp. pseudo-coherent) as an object of $D(\mathcal{O}_X)$ if and only if M^\bullet is m -pseudo-coherent (resp. pseudo-coherent) as a complex of A -modules.*

Proof. It is immediate from the definitions that if M^\bullet is m -pseudo-coherent, so is E . To prove the converse, assume E is m -pseudo-coherent. As $X = \text{Spec}(A)$ is quasi-compact with a basis for the topology given by standard opens, we can find a standard open covering $X = D(f_1) \cup \dots \cup D(f_n)$ and strictly perfect complexes \mathcal{E}_i^\bullet on $D(f_i)$ and maps $\alpha_i : \mathcal{E}_i^\bullet \rightarrow E|_{U_i}$ inducing isomorphisms on H^j for $j > m$ and surjections on H^m . By Cohomology, Lemma 20.35.8 after refining the open covering we may assume α_i is given by a map of complexes $\mathcal{E}_i^\bullet \rightarrow \widetilde{M^\bullet}|_{U_i}$ for each i . By Lemma 35.9.2 the terms \mathcal{E}_i^n are finite locally free modules. Hence after refining the open covering we may assume each \mathcal{E}_i^n is a finite free \mathcal{O}_{U_i} -module. From the definition it follows that $M_{f_i}^\bullet$ is an m -pseudo-coherent complex of A_{f_i} -modules. We conclude by applying More on Algebra, Lemma 15.50.14.

The case “pseudo-coherent” follows from the fact that E is pseudo-coherent if and only if E is m -pseudo-coherent for all m (by definition) and the same is true for M^\bullet by More on Algebra, Lemma 15.50.5. \square

Lemma 35.9.4. *Let X be a Noetherian scheme. Let E be an object of $D_{Q\text{Coh}}(\mathcal{O}_X)$. For $m \in \mathbf{Z}$ the following are equivalent*

- (1) $H^i(E)$ is coherent for $i \geq m$ and zero for $i \gg 0$, and
- (2) E is m -pseudo-coherent.

In particular, E is pseudo-coherent if and only if E is an object of $D_{\text{Coh}}^-(\mathcal{O}_X)$.

Proof. As X is quasi-compact we see that in both (1) and (2) the object E is bounded above. Thus the question is local on X and we may assume X is affine. Say $X = \text{Spec}(A)$ for some Noetherian ring A . In this case E corresponds to a complex of A -modules M^\bullet by Lemma 35.3.4. By Lemma 35.9.3 we see that E is m -pseudo-coherent if and only if M^\bullet is m -pseudo-coherent. On the other hand, $H^i(E)$ is coherent if and only if $H^i(M^\bullet)$ is a finite A -module (Properties, Lemma 27.16.1). Thus the result follows from More on Algebra, Lemma 15.50.16. \square

Lemma 35.9.5. *Let $X = \text{Spec}(A)$ be an affine scheme. Let M^\bullet be a complex of A -modules and let E be the corresponding object of $D(\mathcal{O}_X)$. Then*

- (1) E has tor amplitude in $[a, b]$ if and only if M^\bullet has tor amplitude in $[a, b]$.
- (2) E has finite tor dimension if and only if M^\bullet has finite tor dimension.

Proof. Part (2) follows trivially from part (1). In the proof of (1) we will use the equivalence $D(A) = D_{Q\text{Coh}}(X)$ of Lemma 35.3.4 without further mention. Assume M^\bullet has tor amplitude in $[a, b]$. Then K^\bullet is isomorphic in $D(A)$ to a complex K^\bullet of flat A -modules with $K^i = 0$ for $i \notin [a, b]$, see More on Algebra, Lemma 15.51.3. Then E is isomorphic to $\widetilde{K^\bullet}$. Since each $\widetilde{K^i}$ is a flat \mathcal{O}_X -module, we see that E has tor amplitude in $[a, b]$ by Cohomology, Lemma 20.37.3.

Assume that E has tor amplitude in $[a, b]$. Then E is bounded whence M^\bullet is in $K^-(A)$. Thus we may replace M^\bullet by a bounded above complex of A -modules. We may even choose a projective resolution and assume that M^\bullet is a bounded above complex of free A -modules. Then for any A -module N we have

$$E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \widetilde{N} \cong \widetilde{M^\bullet} \otimes_{\mathcal{O}_X}^{\mathbf{L}} \widetilde{N} \cong M^\bullet \widetilde{\otimes}_A N$$

in $D(\mathcal{O}_X)$. Thus the vanishing of cohomology sheaves of the left hand side implies M^\bullet has tor amplitude in $[a, b]$. \square

Lemma 35.9.6. *Let X be a quasi-separated scheme. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Let $a \leq b$. The following are equivalent*

- (1) E has tor amplitude in $[a, b]$, and
- (2) for all \mathcal{F} in $QCoh(\mathcal{O}_X)$ we have $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}) = 0$ for $i \notin [a, b]$.

Proof. It is clear that (1) implies (2). Assume (2). Let $U \subset X$ be an affine open. As X is quasi-separated the morphism $j : U \rightarrow X$ is quasi-compact and separated, hence j_* transforms quasi-coherent modules into quasi-coherent modules (Schemes, Lemma 25.24.1). Thus the functor $QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_U)$ is essentially surjective. It follows that condition (2) implies the vanishing of $H^i(E|_U \otimes_{\mathcal{O}_U}^{\mathbf{L}} \mathcal{G})$ for $i \notin [a, b]$ for all quasi-coherent \mathcal{O}_U -modules \mathcal{G} . Write $U = \text{Spec}(A)$ and let M^\bullet be the complex of A -modules corresponding to $E|_U$ by Lemma 35.3.4. We have just shown that $M^\bullet \otimes_A^{\mathbf{L}} N$ has vanishing cohomology groups outside the range $[a, b]$, in other words M^\bullet has tor amplitude in $[a, b]$. By Lemma 35.9.5 we conclude that $E|_U$ has tor amplitude in $[a, b]$. This proves the lemma. \square

Lemma 35.9.7. *Let $X = \text{Spec}(A)$ be an affine scheme. Let M^\bullet be a complex of A -modules and let E be the corresponding object of $D(\mathcal{O}_X)$. Then E is a perfect object of $D(\mathcal{O}_X)$ if and only if M^\bullet is perfect as an object of $D(A)$.*

Proof. This is a logical consequence of Lemmas 35.9.3 and 35.9.5, Cohomology, Lemma 20.38.4, and More on Algebra, Lemma 15.56.2. \square

As a consequence of our description of pseudo-coherent complexes on schemes we can prove certain internal homs are quasi-coherent.

Lemma 35.9.8. *Let X be a scheme.*

- (1) *If L is in $D_{QCoh}^+(\mathcal{O}_X)$ and K in $D(\mathcal{O}_X)$ is pseudo-coherent, then $R\mathcal{H}om(K, L)$ is in $D_{QCoh}(\mathcal{O}_X)$.*
- (2) *If L is in $D_{QCoh}(\mathcal{O}_X)$ and K in $D(\mathcal{O}_X)$ is perfect, then $R\mathcal{H}om(K, L)$ is in $D_{QCoh}(\mathcal{O}_X)$.*
- (3) *If $X = \text{Spec}(A)$ is affine and $K, L \in D(A)$ then*

$$R\mathcal{H}om(\tilde{K}, \tilde{L}) = R\widetilde{\text{Hom}}(K, L)$$

in the following two cases

- (a) K is pseudo-coherent and L is bounded below,
 - (b) K is perfect and L arbitrary.
- (4) *If $X = \text{Spec}(A)$ and K, L are in $D(A)$, then the n th cohomology sheaf of $R\mathcal{H}om(\tilde{K}, \tilde{L})$ is the sheaf associated to the presheaf*

$$X \supset D(f) \mapsto \text{Ext}_{A_f}^n(K \otimes_A A_f, L \otimes_A A_f)$$

for $f \in A$.

Proof. The construction of the internal hom in the derived category of \mathcal{O}_X commutes with localization (see Cohomology, Section 20.34). Hence to prove (1) and (2) we may replace X by an affine open. By Lemmas 35.3.4, 35.9.3, and 35.9.7 in order to prove (1) and (2) it suffices to prove (3).

Part (3) follows from the computation of the internal hom of Cohomology, Lemma 20.35.10 by representing K by a bounded above (resp. finite) complex of finite projective A -modules and L by a bounded above (resp. arbitrary) complex of A -modules.

To prove (4) recall that on any ringed space the n th cohomology sheaf of $R\mathcal{H}om(A, B)$ is the sheaf associated to the presheaf

$$U \mapsto \mathrm{Hom}_{D(U)}(A|_U, B|_U[n]) = \mathrm{Ext}_{D(\mathcal{O}_U)}^n(A|_U, B|_U)$$

See Cohomology, Section 20.34. On the other hand, the restriction of \tilde{K} to a principal open $D(f)$ is the image of $K \otimes_A A_f$ and similarly for L . Hence (4) follows from the equivalence of categories of Lemma 35.3.4. \square

35.10. Descent finiteness properties of complexes

This section is the analogue of Descent, Section 34.6 for objects of the derived category of a scheme. The easiest such result is probably the following.

Lemma 35.10.1. *Let $f : X \rightarrow Y$ be a surjective flat morphism of schemes (or more generally locally ringed spaces). Let $E \in D(\mathcal{O}_Y)$. Let $a, b \in \mathbf{Z}$. Then E has tor-amplitude in $[a, b]$ if and only if Lf^*E has tor-amplitude in $[a, b]$.*

Proof. Pullback always preserves tor-amplitude, see Cohomology, Lemma 20.37.4. We may check tor-amplitude in $[a, b]$ on stalks, see Cohomology, Lemma 20.37.5. A flat local ring homomorphism is faithfully flat by Algebra, Lemma 10.38.16. Thus the result follows from More on Algebra, Lemma 15.51.14. \square

Lemma 35.10.2. *Let $\{f_i : X_i \rightarrow X\}$ be an fpqc covering of schemes. Let $E \in D_{Q\mathrm{Coh}}(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$. Then E is m -pseudo-coherent if and only if each Lf_i^*E is m -pseudo-coherent.*

Proof. Pullback always preserves m -pseudo-coherence, see Cohomology, Lemma 20.36.3. Conversely, assume that Lf_i^*E is m -pseudo-coherent for all i . Let $U \subset X$ be an affine open. It suffices to prove that $E|_U$ is m -pseudo-coherent. Since $\{f_i : X_i \rightarrow X\}$ is an fpqc covering, we can find finitely many affine open $V_j \subset X_{a(j)}$ such that $f_{a(j)}(V_j) \subset U$ and $U = \bigcup f_{a(j)}(V_j)$. Set $V = \coprod V_i$. Thus we may replace X by U and $\{f_i : X_i \rightarrow X\}$ by $\{V \rightarrow U\}$ and assume that X is affine and our covering is given by a single surjective flat morphism $\{f : Y \rightarrow X\}$ of affine schemes. In this case the result follows from More on Algebra, Lemma 15.50.15 via Lemmas 35.3.4 and 35.9.3. \square

Lemma 35.10.3. *Let $\{f_i : X_i \rightarrow X\}$ be an fppf covering of schemes. Let $E \in D(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$. Then E is m -pseudo-coherent if and only if each Lf_i^*E is m -pseudo-coherent.*

Proof. Pullback always preserves m -pseudo-coherence, see Cohomology, Lemma 20.36.3. Conversely, assume that Lf_i^*E is m -pseudo-coherent for all i . Let $U \subset X$ be an affine open. It suffices to prove that $E|_U$ is m -pseudo-coherent. Since $\{f_i : X_i \rightarrow X\}$ is an fppf covering, we can find finitely many affine open $V_j \subset X_{a(j)}$ such that $f_{a(j)}(V_j) \subset U$ and $U = \bigcup f_{a(j)}(V_j)$. Set $V = \coprod V_i$. Thus we may replace X by U and $\{f_i : X_i \rightarrow X\}$ by $\{V \rightarrow U\}$ and assume that X is affine and our covering is given by a single surjective flat morphism $\{f : Y \rightarrow X\}$ of finite presentation.

Since f is flat the derived functor Lf^* is just given by f^* and f^* is exact. Hence $H^i(Lf^*E) = f^*H^i(E)$. Since Lf^*E is m -pseudo-coherent, we see that $Lf^*E \in D^-(\mathcal{O}_Y)$. Since f is surjective and flat, we see that $E \in D^-(\mathcal{O}_X)$. Let $i \in \mathbf{Z}$ be the largest integer such that $H^i(E)$ is nonzero. If $i < m$, then we are done. Otherwise, $f^*H^i(E)$ is a finite type \mathcal{O}_Y -module by Cohomology, Lemma 20.36.9.

Then by Descent, Lemma 34.6.2 the \mathcal{O}_X -module $H^i(E)$ is of finite type. Thus, after replacing X by the members of a finite affine open covering, we may assume there exists a map

$$\alpha : \mathcal{O}_X^{\oplus n}[-i] \longrightarrow E$$

such that $H^i(\alpha)$ is a surjection. Let C be the cone of α in $D(\mathcal{O}_X)$. Pulling back to Y and using Cohomology, Lemma 20.36.4 we find that Lf^*C is m -pseudo-coherent. Moreover $H^j(C) = 0$ for $j \geq i$. Thus by induction on i we see that C is m -pseudo-coherent. Using Cohomology, Lemma 20.36.4 again we conclude. \square

Lemma 35.10.4. *Let $\{f_i : X_i \rightarrow X\}$ be an fpqc covering of schemes. Let $E \in D(\mathcal{O}_X)$. Then E is perfect if and only if each Lf_i^*E is perfect.*

Proof. Pullback always preserves perfect complexes, see Cohomology, Lemma 20.38.5. Conversely, assume that Lf_i^*E is perfect for all i . Then the cohomology sheaves of each Lf_i^*E are quasi-coherent, see Lemma 35.9.1 and Cohomology, Lemma 20.38.4. Since the morphisms f_i is flat we see that $H^p(Lf_i^*E) = f_i^*H^p(E)$. Thus the cohomology sheaves of E are quasi-coherent by Descent, Proposition 34.5.2. Having said this the lemma follows formally from Cohomology, Lemma 20.38.4 and Lemmas 35.10.1 and 35.10.2. \square

Lemma 35.10.5. *Let $i : Z \rightarrow X$ be a morphism of ringed spaces such that i is a closed immersion of underlying topological spaces and such that $i_*\mathcal{O}_Z$ is pseudo-coherent as an \mathcal{O}_X -module. Let $E \in D(\mathcal{O}_X)$. Then E is m -pseudo-coherent if and only if Ri_*E is m -pseudo-coherent.*

Proof. Throughout this proof we will use that i_* is an exact functor, and hence that $Ri_* = i_*$, see Modules, Lemma 17.6.1.

Assume E is m -pseudo-coherent. Let $x \in X$. We will find a neighbourhood of x such that i_*E is m -pseudo-coherent on it. If $x \notin Z$ then this is clear. Thus we may assume $x \in Z$. We will use that $U \cap Z$ for $x \in U \subset X$ open form a fundamental system of neighbourhoods of x in Z . After shrinking X we may assume E is bounded above. We will argue by induction on the largest integer p such that $H^p(E)$ is nonzero. If $p < m$, then there is nothing to prove. If $p \geq m$, then $H^p(E)$ is an \mathcal{O}_Z -module of finite type, see Cohomology, Lemma 20.36.9. Thus we may choose, after shrinking X , a map $\mathcal{O}_Z^{\oplus n}[-p] \rightarrow E$ which induces a surjection $\mathcal{O}_Z^{\oplus n} \rightarrow H^p(E)$. Choose a distinguished triangle

$$\mathcal{O}_Z^{\oplus n}[-p] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_Z^{\oplus n}[-p+1]$$

We see that $H^j(C) = 0$ for $j \geq p$ and that C is m -pseudo-coherent by Cohomology, Lemma 20.36.4. By induction we see that i_*C is m -pseudo-coherent on X . Since $i_*\mathcal{O}_Z$ is m -pseudo-coherent on X as well, we conclude from the distinguished triangle

$$i_*\mathcal{O}_Z^{\oplus n}[-p] \rightarrow i_*E \rightarrow i_*C \rightarrow i_*\mathcal{O}_Z^{\oplus n}[-p+1]$$

and Cohomology, Lemma 20.36.4 that i_*E is m -pseudo-coherent.

Assume that i_*E is m -pseudo-coherent. Let $z \in Z$. We will find a neighbourhood of z such that E is m -pseudo-coherent on it. We will use that $U \cap Z$ for $z \in U \subset X$ open form a fundamental system of neighbourhoods of z in Z . After shrinking X we may assume i_*E and hence E is bounded above. We will argue by induction on the largest integer p such that $H^p(E)$ is nonzero. If $p < m$, then there is nothing to prove. If $p \geq m$, then $H^p(i_*E) = i_*H^p(E)$ is an \mathcal{O}_X -module of finite type, see

Cohomology, Lemma 20.36.9. Choose a complex \mathcal{E}^\bullet of \mathcal{O}_Z -modules representing E . We may choose, after shrinking X , a map $\alpha : \mathcal{O}_X^{\oplus n}[-p] \rightarrow i_*\mathcal{E}^\bullet$ which induces a surjection $\mathcal{O}_X^{\oplus n} \rightarrow i_*H^p(\mathcal{E}^\bullet)$. By adjunction we find a map $\alpha : \mathcal{O}_Z^{\oplus n}[-p] \rightarrow \mathcal{E}^\bullet$ which induces a surjection $\mathcal{O}_Z^{\oplus n} \rightarrow H^p(\mathcal{E}^\bullet)$. Choose a distinguished triangle

$$\mathcal{O}_Z^{\oplus n}[-p] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_Z^{\oplus n}[-p+1]$$

We see that $H^j(C) = 0$ for $j \geq p$. From the distinguished triangle

$$i_*\mathcal{O}_Z^{\oplus n}[-p] \rightarrow i_*E \rightarrow i_*C \rightarrow i_*\mathcal{O}_Z^{\oplus n}[-p+1]$$

the fact that $i_*\mathcal{O}_Z$ is pseudo-coherent and Cohomology, Lemma 20.36.4 we conclude that i_*C is m -pseudo-coherent. By induction we conclude that C is m -pseudo-coherent. By Cohomology, Lemma 20.36.4 again we conclude that E is m -pseudo-coherent. \square

Lemma 35.10.6. *Let $f : X \rightarrow Y$ be a finite morphism of schemes such that $f_*\mathcal{O}_X$ is pseudo-coherent as an \mathcal{O}_Y -module¹. Let $E \in D_{QCoh}(\mathcal{O}_X)$. Then E is m -pseudo-coherent if and only if Rf_*E is m -pseudo-coherent.*

Proof. This is a translation of More on Algebra, Lemma 15.50.11 into the language of schemes. To do the translation, use Lemmas 35.3.4 and 35.9.3. \square

35.11. Lifting complexes

Let $U \subset X$ be an open subspace of a ringed space and denote $j : U \rightarrow X$ the inclusion morphism. The functor $D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_U)$ is essentially surjective as Rj_* is a right inverse to restriction. In this section we extend this to complexes with quasi-coherent cohomology sheaves, etc.

Lemma 35.11.1. *Let X be a scheme and let $j : U \rightarrow X$ be a quasi-compact open immersion. The functors*

$$D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_U) \quad \text{and} \quad D_{QCoh}^+(\mathcal{O}_X) \rightarrow D_{QCoh}^+(\mathcal{O}_U)$$

are essentially surjective. If X is quasi-compact, then the functors

$$D_{QCoh}^-(\mathcal{O}_X) \rightarrow D_{QCoh}^-(\mathcal{O}_U) \quad \text{and} \quad D_{QCoh}^b(\mathcal{O}_X) \rightarrow D_{QCoh}^b(\mathcal{O}_U)$$

are essentially surjective.

Proof. The argument preceding the lemma applies for the first case because Rj_* maps $D_{QCoh}(\mathcal{O}_U)$ into $D_{QCoh}(\mathcal{O}_X)$ by Lemma 35.4.1. It is clear that Rj_* maps $D_{QCoh}^+(\mathcal{O}_U)$ into $D_{QCoh}^+(\mathcal{O}_X)$ which implies the statement on bounded below complexes. Finally, Lemma 35.4.1 guarantees that Rj_* maps $D_{QCoh}^-(\mathcal{O}_U)$ into $D_{QCoh}^-(\mathcal{O}_X)$ if X is quasi-compact. Combining these two we obtain the last statement. \square

Lemma 35.11.2. *Let X be an affine scheme and let $U \subset X$ be a quasi-compact open subscheme. For any pseudo-coherent object E of $D(\mathcal{O}_U)$ there exists a bounded above complex of finite free \mathcal{O}_X -modules whose restriction to U is isomorphic to E .*

Proof. By Lemma 35.9.1 we see that E is an object of $D_{QCoh}(\mathcal{O}_U)$. By Lemma 35.11.1 we may assume $E = E'|U$ for some object E' of $D_{QCoh}(\mathcal{O}_X)$. Write $X = \text{Spec}(A)$. By Lemma 35.3.4 we can find a complex M^\bullet of A -modules whose associated complex of \mathcal{O}_X -modules is a representative of E' .

¹This means that f is pseudo-coherent, see More on Morphisms, Definition 36.40.2.

Choose $f_1, \dots, f_r \in A$ such that $U = D(f_1) \cup \dots \cup D(f_r)$. By Lemma 35.9.3 the complexes $M_{f_j}^\bullet$ are pseudo-coherent complexes of A_{f_j} -modules. Let n be an integer. Assume we have a map of complexes $\alpha : F^\bullet \rightarrow M^\bullet$ where F^\bullet is bounded above, $F^i = 0$ for $i < n$, each F^i is a finite free R -module, such that

$$H^i(\alpha_{f_j}) : H^i(F_{f_j}^\bullet) \rightarrow H^i(M_{f_j}^\bullet)$$

is an isomorphism for $i > n$ and surjective for $i = n$. Picture

$$\begin{array}{ccccccc} F^n & \longrightarrow & F^{n+1} & \longrightarrow & \dots & & \\ & & \downarrow \alpha & & \downarrow \alpha & & \\ M^{n-1} & \longrightarrow & M^n & \longrightarrow & M^{n+1} & \longrightarrow & \dots \end{array}$$

Since each $M_{f_j}^\bullet$ has vanishing cohomology in large degrees we can find such a map for $n \gg 0$. By induction on n we are going to extend this to a map of complexes $F^\bullet \rightarrow M^\bullet$ such that $H^i(\alpha_{f_j})$ is an isomorphism for all i . The lemma will follow by taking \widetilde{F}^\bullet .

The induction step will be to extend the diagram above by adding F^{n-1} . Let C^\bullet be the cone on α (Derived Categories, Definition 13.9.1). The long exact sequence of cohomology shows that $H^i(C_{f_j}^\bullet) = 0$ for $i \geq n$. By More on Algebra, Lemma 15.50.2 we see that $C_{f_j}^\bullet$ is $(n - 1)$ -pseudo-coherent. By More on Algebra, Lemma 15.50.3 we see that $H^{-1}(C_{f_j}^\bullet)$ is a finite A_{f_j} -module. Choose a finite free A -module F^{n-1} and an A -module $\beta : F^{n-1} \rightarrow C^{-1}$ such that the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^n$ is zero and such that $F_{f_j}^{n-1}$ surjects onto $H^{n-1}(C_{f_j}^\bullet)$. (Some details omitted; hint: clear denominators.) Since $C^{n-1} = M^{n-1} \oplus F^n$ we can write $\beta = (\alpha^{n-1}, -d^{n-1})$. The vanishing of the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^n$ implies these maps fit into a morphism of complexes

$$\begin{array}{ccccccc} F^{n-1} & \xrightarrow{\quad} & F^n & \longrightarrow & F^{n+1} & \longrightarrow & \dots \\ & & \downarrow \alpha^{n-1} & & \downarrow \alpha & & \downarrow \alpha \\ \dots & \longrightarrow & M^{n-1} & \longrightarrow & M^n & \longrightarrow & M^{n+1} \longrightarrow \dots \end{array}$$

Moreover, these maps define a morphism of distinguished triangles

$$\begin{array}{ccccccc} (F^n \rightarrow \dots) & \longrightarrow & (F^{n-1} \rightarrow \dots) & \longrightarrow & F^{n-1} & \longrightarrow & (F^n \rightarrow \dots)[1] \\ \downarrow & & \downarrow & & \downarrow \beta & & \downarrow \\ (F^n \rightarrow \dots) & \longrightarrow & M^\bullet & \longrightarrow & C^\bullet & \longrightarrow & (F^n \rightarrow \dots)[1] \end{array}$$

Hence our choice of β implies that the map of complexes $(F^{-1} \rightarrow \dots) \rightarrow M^\bullet$ induces an isomorphism on cohomology localized at f_j in degrees $\geq n$ and a surjection in degree -1 . This finishes the proof of the lemma. \square

Lemma 35.11.3. *Let X be a quasi-compact and quasi-separated scheme. Let $E \in D_{QCoh}^b(\mathcal{O}_X)$. There exists an integer $n_0 > 0$ such that $Ext_{D(\mathcal{O}_X)}^n(\mathcal{E}, E) = 0$ for every finite locally free \mathcal{O}_X -module \mathcal{E} and every $n \geq n_0$.*

Proof. Recall that $Ext_{D(\mathcal{O}_X)}^n(\mathcal{E}, E) = \text{Hom}_{D(\mathcal{O}_X)}(\mathcal{E}, E[n])$. We have Mayer-Vietoris for morphisms in the derived category, see Cohomology, Lemma 20.30.6. Thus if $X = U \cup V$ and the result of the lemma holds for $E|_U$, $E|_V$, and $E|_{U \cap V}$ for some

bound n_0 , then the result holds for E with bound $n_0 + 1$. Thus it suffices to prove the lemma when X is affine, see Cohomology of Schemes, Lemma 29.4.1.

Assume $X = \text{Spec}(A)$ is affine. Choose a complex of A -modules M^\bullet whose associated complex of quasi-coherent modules represents E , see Lemma 35.3.4. Write $\mathcal{E} = \tilde{P}$ for some A -module P . Since \mathcal{E} is finite locally free, we see that P is a finite projective A -module. We have

$$\begin{aligned} \text{Hom}_{D(\mathcal{O}_X)}(\mathcal{E}, E[n]) &= \text{Hom}_{D(A)}(P, M^\bullet[n]) \\ &= \text{Hom}_{K(A)}(P, M^\bullet[n]) \\ &= \text{Hom}_A(P, H^n(M^\bullet)) \end{aligned}$$

The first equality by Lemma 35.3.4, the second equality by Derived Categories, Lemma 13.19.8, and the final equality because $\text{Hom}_A(P, -)$ is an exact functor. As E and hence M^\bullet is bounded we get zero for all sufficiently large n . \square

Lemma 35.11.4. *Let X be an affine scheme. Let $U \subset X$ be a quasi-compact open. For every perfect object E of $D(\mathcal{O}_U)$ there exists an integer r and a finite locally free sheaf \mathcal{F} on U such that $\mathcal{F}[-r] \oplus E$ is the restriction of a perfect object of $D(\mathcal{O}_X)$.*

Proof. Say $X = \text{Spec}(A)$. Recall that a perfect complex is pseudo-coherent, see Cohomology, Lemma 20.38.4. By Lemma 35.11.2 we can find a bounded above complex \mathcal{F}^\bullet of finite free A -modules such that E is isomorphic to $\mathcal{F}^\bullet|_U$ in $D(\mathcal{O}_U)$. By Cohomology, Lemma 20.38.4 and since U is quasi-compact, we see that E has finite tor dimension, say E has tor amplitude in $[a, b]$. Pick $r < a$ and set

$$\mathcal{F} = \text{Ker}(\mathcal{F}^r \rightarrow \mathcal{F}^{r+1}) = \text{Im}(\mathcal{F}^{r-1} \rightarrow \mathcal{F}^r).$$

Since E has tor amplitude in $[a, b]$ we see that $\mathcal{F}|_U$ is flat (Cohomology, Lemma 20.37.2). Hence $\mathcal{F}|_U$ is flat and of finite presentation, thus finite locally free (Properties, Lemma 27.18.2). It follows that

$$(\mathcal{F} \rightarrow \mathcal{F}^r \rightarrow \mathcal{F}^{r+1} \rightarrow \dots)|_U$$

is a strictly perfect complex on U representing E . We obtain a distinguished triangle

$$\mathcal{F}|_U[-r-1] \rightarrow E \rightarrow (\mathcal{F}^r \rightarrow \mathcal{F}^{r+1} \rightarrow \dots)|_U \rightarrow \mathcal{F}|_U[-r]$$

Note that $(\mathcal{F}^r \rightarrow \mathcal{F}^{r+1} \rightarrow \dots)$ is a perfect complex on X . To finish the proof it suffices to pick r such that the map $\mathcal{F}|_U[-r-1] \rightarrow E$ is zero in $D(\mathcal{O}_U)$, see Derived Categories, Lemma 13.4.10. By Lemma 35.11.3 this holds if $r \ll 0$. \square

Lemma 35.11.5. *Let X be an affine scheme. Let $U \subset X$ be a quasi-compact open. Let E, E' be objects of $D_{QCoh}(\mathcal{O}_X)$ with E perfect. For every map $\alpha : E|_U \rightarrow E'|_U$ there exist maps*

$$E \xleftarrow{\beta} E_1 \xrightarrow{\gamma} E'$$

of perfect complexes on X such that $\beta : E_1 \rightarrow E$ restricts to an isomorphism on U and such that $\alpha = \gamma|_U \circ \beta|_U^{-1}$. Moreover we can assume $E_1 = E \otimes_{\mathcal{O}_X}^L I$ for some perfect complex I on X .

Proof. Write $X = \text{Spec}(A)$. Write $U = D(f_1) \cup \dots \cup D(f_r)$. Choose finite complex of finite projective A -modules M^\bullet representing E (Lemma 35.9.7). Choose a complex of A -modules $(M')^\bullet$ representing E' (Lemma 35.3.4). In this case the complex $H^\bullet = \text{Hom}_A(M^\bullet, (M')^\bullet)$ is a complex of A -modules whose associated complex of quasi-coherent \mathcal{O}_X -modules represents $R\mathcal{H}om(E, E')$, see Cohomology, Lemma

20.35.9. Then α determines an element s of $H^0(U, R\mathcal{H}om(E, E'))$, see Cohomology, Lemma 20.34.1. There exists an e and a map

$$\xi : I^\bullet(f_1^e, \dots, f_r^e) \rightarrow \text{Hom}_A(M^\bullet, (M')^\bullet)$$

corresponding to s , see Proposition 35.8.5. Letting E_1 be the object corresponding to complex of quasi-coherent \mathcal{O}_X -modules associated to

$$\text{Tot}(I^\bullet(f_1^e, \dots, f_r^e) \otimes_A M^\bullet)$$

we obtain $E_1 \rightarrow E$ using the canonical map $I^\bullet(f_1^e, \dots, f_r^e) \rightarrow A$ and $E_1 \rightarrow E'$ using ξ and Cohomology, Lemma 20.34.1. \square

Lemma 35.11.6. *Let X be an affine scheme. Let $U \subset X$ be a quasi-compact open. For every perfect object F of $D(\mathcal{O}_U)$ the object $F \oplus F[1]$ is the restriction of a perfect object of $D(\mathcal{O}_X)$.*

Proof. By Lemma 35.11.4 we can find a perfect object E of $D(\mathcal{O}_X)$ such that $E|_U = \mathcal{F}[r] \oplus F$ for some finite locally free \mathcal{O}_U -module \mathcal{F} . By Lemma 35.11.5 we can find a morphism of perfect complexes $\alpha : E_1 \rightarrow E$ such that $(E_1)|_U \cong E|_U$ and such that $\alpha|_U$ is the map

$$\begin{pmatrix} \text{id}_{\mathcal{F}[r]} & 0 \\ 0 & 0 \end{pmatrix} : \mathcal{F}[r] \oplus F \rightarrow \mathcal{F}[r] \oplus F$$

Then the cone on α is a solution. \square

Lemma 35.11.7. *Let X be a quasi-compact and quasi-separated scheme. Let $f \in \Gamma(X, \mathcal{O}_X)$. For any morphism $\alpha : E \rightarrow E'$ in $D_{Qcoh}(\mathcal{O}_X)$ such that*

- (1) E is perfect, and
- (2) E' is supported on $T = V(f)$

there exists an $n \geq 0$ such that $f^n \alpha = 0$.

Proof. We have Mayer-Vietoris for morphisms in the derived category, see Cohomology, Lemma 20.30.6. Thus if $X = U \cup V$ and the result of the lemma holds for $f|_U, f|_V$, and $f|_{U \cap V}$, then the result holds for f . Thus it suffices to prove the lemma when X is affine, see Cohomology of Schemes, Lemma 29.4.1.

Let $X = \text{Spec}(A)$. Then $f \in A$. We will use the equivalence $D(A) = D_{Qcoh}(X)$ of Lemma 35.3.4 without further mention. Represent E by a finite complex of finite projective A -modules P^\bullet . This is possible by Lemma 35.9.7. Let t be the largest integer such that P^t is nonzero. The distinguished triangle

$$P^t[-t] \rightarrow P^\bullet \rightarrow \sigma_{\leq t-1} P^\bullet \rightarrow P^t[-t+1]$$

shows that by induction on the length of the complex P^\bullet we can reduce to the case where P^\bullet has a single nonzero term. This and the shift functor reduces us to the case where P^\bullet consists of a single finite projective A -module P in degree 0. Represent E' by a complex M^\bullet of A -modules. Then α corresponds to a map $P \rightarrow H^0(M^\bullet)$. Since the module $H^0(M^\bullet)$ is supported on $V(f)$ by assumption (2) we see that every element of $H^0(M^\bullet)$ is annihilated by a power of f . Since P is a finite A -module the map $f^n \alpha : P \rightarrow H^0(M^\bullet)$ is zero for some n as desired. \square

Lemma 35.11.8. *Let X be an affine scheme. Let $T \subset X$ be a closed subset such that $X \setminus T$ is quasi-compact. Let $U \subset X$ be a quasi-compact open. For every perfect object F of $D(\mathcal{O}_U)$ supported on $T \cap U$ the object $F \oplus F[1]$ is the restriction of a perfect object E of $D(\mathcal{O}_X)$ supported in T .*

Proof. Say $T = V(g_1, \dots, g_s)$. After replacing g_j by a power we may assume multiplication by g_j is zero on F , see Lemma 35.11.7. Choose E as in Lemma 35.11.6. Note that $g_j : E \rightarrow E$ restricts to zero on U . Choose a distinguished triangle

$$E \xrightarrow{g_1} E \rightarrow C_1 \rightarrow E[1]$$

By Derived Categories, Lemma 13.4.10 the object C_1 restricts to $F \oplus F[1] \oplus F[1] \oplus F[2]$ on U . Moreover, $g_1 : C_1 \rightarrow C_1$ has square zero by Derived Categories, Lemma 13.4.5. Namely, the diagram

$$\begin{array}{ccccc} E & \longrightarrow & C_1 & \longrightarrow & E[1] \\ \downarrow 0 & & \downarrow g_1 & & \downarrow 0 \\ E & \longrightarrow & C_1 & \longrightarrow & E[1] \end{array}$$

is commutative since the compositions $E \xrightarrow{g_1} E \rightarrow C_1$ and $C_1 \rightarrow E[1] \xrightarrow{g_1} E[1]$ are zero. Continuing, setting C_{i+1} equal to the cone of the map $g_i : C_i \rightarrow C_i$ we obtain a perfect complex C_s on X supported on T whose restriction to U gives

$$F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus \binom{s}{2}} \oplus \dots \oplus F[s]$$

Choose a morphisms of perfect complexes $\beta : C' \rightarrow C_s$ and $\gamma : C' \rightarrow C_s$ as in Lemma 35.11.5 such that $\beta|_U$ is an isomorphism and such that $\gamma|_U \circ \beta|_U^{-1}$ is the morphism

$$F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus \binom{s}{2}} \oplus \dots \oplus F[s] \rightarrow F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus \binom{s}{2}} \oplus \dots \oplus F[s]$$

which is the identity on all summands except for F where it is zero. By Lemma 35.11.5 we also have $C' = C_s \otimes^{\mathbf{L}} I$ for some perfect complex I on X . Hence the nullity of $g_j^2 \text{id}_{C_s}$ implies the same thing for C' . Thus C' is supported on T as well. Then $\text{Cone}(\gamma)$ is a solution. \square

A special case of the following lemma can be found in [Nee96].

Lemma 35.11.9. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open. Let $T \subset X$ be a closed subset with $X \setminus T$ retro-compact in X . Let E be an object of $D_{\text{QCoh}}(\mathcal{O}_X)$. Let $\alpha : P \rightarrow E|_U$ be a map where P is a perfect object of $D(\mathcal{O}_U)$ supported on $T \cap U$. Then there exists a map $\beta : R \rightarrow E$ where R is a perfect object of $D(\mathcal{O}_X)$ supported on T such that P is a direct summand of $R|_U$ in $D(\mathcal{O}_U)$ compatible α and $\beta|_U$.*

Proof. Since X is quasi-compact there exists an integer m such that $X = U \cup V_1 \cup \dots \cup V_m$ for some affine opens V_j of X . Arguing by induction on m we see that we may assume $m = 1$. In other words, we may assume that $X = U \cup V$ with V affine. By Lemma 35.11.8 we can choose a perfect object Q in $D(\mathcal{O}_V)$ supported on $T \cap V$ and an isomorphism $Q|_{U \cap V} \rightarrow (P \oplus P[1])|_{U \cap V}$. By Lemma 35.11.5 we can replace Q by $Q \otimes^{\mathbf{L}} I$ (still supported on $T \cap V$) and assume that the map

$$Q|_{U \cap V} \rightarrow (P \oplus P[1])|_{U \cap V} \rightarrow P|_{U \cap V} \rightarrow E|_{U \cap V}$$

lifts to $Q \rightarrow E|_V$. By Cohomology, Lemma 20.30.10 we find an morphism $a : R \rightarrow E$ of $D(\mathcal{O}_X)$ such that $a|_U$ is isomorphic to $P \oplus P[1] \rightarrow E|_U$ and $a|_V$ isomorphic to $Q \rightarrow E|_V$. Thus R is perfect and supported on T as desired. \square

Remark 35.11.10. The proof of Lemma 35.11.9 shows that

$$R|_U = P \oplus P^{\oplus n_1}[1] \oplus \dots \oplus P^{\oplus n_m}[m]$$

for some $m \geq 0$ and $n_j \geq 0$. Thus the highest degree cohomology sheaf of $R|_U$ equals that of P . By repeating the construction for the map $P^{\oplus n_1}[1] \oplus \dots \oplus P^{\oplus n_m}[m] \rightarrow R|_U$, taking cones, and using induction we can achieve equality of cohomology sheaves of $R|_U$ and P above any given degree.

35.12. Approximation by perfect complexes

In this section we discuss the observation, due to Neeman and Lipman, that a pseudo-coherent complex can be “approximated” by perfect complexes.

Definition 35.12.1. Let X be a scheme. Consider triples (T, E, m) where

- (1) $T \subset X$ is a closed subset,
- (2) E is an object of $D_{QCoh}(\mathcal{O}_X)$, and
- (3) $m \in \mathbf{Z}$.

We say *approximation holds for the triple* (T, E, m) if there exists a perfect object P of $D(\mathcal{O}_X)$ supported on T and a map $\alpha : P \rightarrow E$ which induces isomorphisms $H^i(P) \rightarrow H^i(E)$ for $i > m$ and a surjection $H^m(P) \rightarrow H^m(E)$.

Approximation cannot hold for every triple. Namely, it is clear that if approximation holds for the triple (T, E, m) , then

- (1) E is m -pseudo-coherent, see Cohomology, Definition 20.36.1, and
- (2) the cohomology sheaves $H^i(E)$ are supported on T for $i \geq m$.

Moreover, the “support” of a perfect complex is a closed subscheme whose complement is retrocompact in X (details omitted). Hence we cannot expect approximation to hold without this assumption on T . This partly explains the conditions in the following definition.

Definition 35.12.2. Let X be a scheme. We say *approximation by perfect complexes holds* on X if for any closed subset $T \subset X$ with $X \setminus T$ retro-compact in X there exists an integer r such that for every triple (T, E, m) as in Definition 35.12.1 with

- (1) E is $(m - r)$ -pseudo-coherent, and
- (2) $H^i(E)$ is supported on T for $i \geq m - r$

approximation holds.

We will prove that approximation by perfect complexes holds for quasi-compact and quasi-separated schemes. It seems that the second condition is necessary for our method of proof. It is possible that the first condition may be weakened to “ E is m -pseudo-coherent” by carefully analyzing the arguments below.

Lemma 35.12.3. *Let X be a scheme. Let $U \subset X$ be an open subscheme. Let (T, E, m) be a triple as in Definition 35.12.1. If*

- (1) $T \subset U$,
- (2) *approximation holds for* $(T, E|_U, m)$, *and*
- (3) *the sheaves* $H^i(E)$ *for* $i \geq m$ *are supported on* T ,

then approximation holds for (T, E, m) .

Proof. Let $j : U \rightarrow X$ be the inclusion morphism. If $P \rightarrow E|_U$ is an approximation of the triple $(T, E|_U, m)$ over U , then $j_!P = Rj_*P \rightarrow j_!(E|_U) \rightarrow E$ is an approximation of (T, E, m) over X . See Cohomology, Lemmas 20.30.9 and 20.38.9. \square

Lemma 35.12.4. *Let X be an affine scheme. Then approximation holds for every triple (T, E, m) as in Definition 35.12.1 such that there exists an integer $r \geq 0$ with*

- (1) E is m -pseudo-coherent,
- (2) $H^i(E)$ is supported on T for $i \geq m - r + 1$,
- (3) $X \setminus T$ is the union of r affine opens.

In particular, approximation by perfect complexes holds for affine schemes.

Proof. Say $X = \text{Spec}(A)$. Write $T = V(f_1, \dots, f_r)$. (The case $r = 0$, i.e., $T = X$ follows immediately from Lemma 35.9.3 and the definitions.) Let (T, E, m) be a triple as in the lemma. Let t be the largest integer such that $H^t(E)$ is nonzero. We will proceed by induction on t . The base case is $t < m$; in this case the result is trivial. Now suppose that $t \geq m$. By Cohomology, Lemma 20.36.9 the sheaf $H^t(E)$ is of finite type. Since it is quasi-coherent it is generated by finitely many sections (Properties, Lemma 27.16.1). For every $s \in \Gamma(X, H^t(E)) = H^t(X, E)$ (see proof of Lemma 35.3.4) we can find an $e > 0$ and a morphism $K_e[-t] \rightarrow E$ such that s is in the image of $H^0(K_e) = H^t(K_e[-t]) \rightarrow H^t(E)$, see Lemma 35.8.6. Taking a finite direct sum of these maps we obtain a map $P \rightarrow E$ where P is a perfect complex supported on T , where $H^i(P) = 0$ for $i > t$, and where $H^t(P) \rightarrow E$ is surjective. Choose a distinguished triangle

$$P \rightarrow E \rightarrow E' \rightarrow P[1]$$

Then E' is m -pseudo-coherent (Cohomology, Lemma 20.36.4), $H^i(E') = 0$ for $i \geq t$, and $H^i(E')$ is supported on T for $i \geq m - r + 1$. By induction we find an approximation $P' \rightarrow E'$ of (T, E', m) . Fit the composition $P' \rightarrow E' \rightarrow P[1]$ into a distinguished triangle $P \rightarrow P'' \rightarrow P' \rightarrow P[1]$ and extend the morphisms $P' \rightarrow E'$ and $P[1] \rightarrow P[1]$ into a morphism of distinguished triangles

$$\begin{array}{ccccccc} P & \longrightarrow & P'' & \longrightarrow & P' & \longrightarrow & P[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ P & \longrightarrow & E & \longrightarrow & E' & \longrightarrow & P[1] \end{array}$$

using TR3. Then P'' is a perfect complex (Cohomology, Lemma 20.38.6) supported on T . An easy diagram chase shows that $P'' \rightarrow E$ is the desired approximation. \square

Lemma 35.12.5. *Let X be a scheme. Let $X = U \cup V$ be an open covering with U quasi-compact, V affine, and $U \cap V$ quasi-compact. If approximation by perfect complexes holds on U , then approximation holds on X .*

Proof. Let $T \subset X$ be a closed subset with $X \setminus T$ retro-compact in X . Let r_U be the integer of Definition 35.12.2 adapted to the pair $(U, T \cap U)$. Set $T' = T \setminus U$. Note that $T' \subset V$ and that $V \setminus T' = (X \setminus T) \cap U \cap V$ is quasi-compact by our assumption on T . Let r' be the number of affines needed to cover $V \setminus T'$. We claim that $r = \max(r_U, r')$ works for the pair (X, T) .

To see this choose a triple (T, E, m) such that E is $(m - r)$ -pseudo-coherent and $H^i(E)$ is supported on T for $i \geq m - r$. Let t be the largest integer such that $H^t(E)|_U$ is nonzero. (Such an integer exists as U is quasi-compact and $E|_U$ is

$(m - r)$ -pseudo-coherent.) We will prove that E can be approximated by induction on t .

Base case: $t \leq m - r'$. This means that $H^i(E)$ is supported on T' for $i \geq m - r'$. Hence Lemma 35.12.4 guarantees the existence of an approximation $P \rightarrow E|_V$ of $(T', E|_V, m)$ on V . Applying Lemma 35.12.3 we see that (T', E, m) can be approximated. Such an approximation is also an approximation of (T, E, m) .

Induction step. Choose an approximation $P \rightarrow E|_U$ of $(T \cap U, E|_U, m)$. This in particular gives a surjection $H^t(P) \rightarrow H^t(E|_U)$. By Lemma 35.11.8 we can choose a perfect object Q in $D(\mathcal{O}_V)$ supported on $T \cap V$ and an isomorphism $Q|_{U \cap V} \rightarrow (P \oplus P[1])|_{U \cap V}$. By Lemma 35.11.5 we can replace Q by $Q \otimes^{\mathbf{L}} I$ and assume that the map

$$Q|_{U \cap V} \rightarrow (P \oplus P[1])|_{U \cap V} \rightarrow P|_{U \cap V} \rightarrow E|_{U \cap V}$$

lifts to $Q \rightarrow E|_V$. By Cohomology, Lemma 20.30.10 we find an morphism $a : R \rightarrow E$ of $D(\mathcal{O}_X)$ such that $a|_U$ is isomorphic to $P \oplus P[1] \rightarrow E|_U$ and $a|_V$ isomorphic to $Q \rightarrow E|_V$. Thus R is perfect and supported on T and the map $H^t(R) \rightarrow H^t(E)$ is surjective on restriction to U . Choose a distinguished triangle

$$R \rightarrow E \rightarrow E' \rightarrow R[1]$$

Then E' is $(m - r)$ -pseudo-coherent (Cohomology, Lemma 20.36.4), $H^i(E')|_U = 0$ for $i \geq t$, and $H^i(E')$ is supported on T for $i \geq m - r$. By induction we find an approximation $R' \rightarrow E'$ of (T, E', m) . Fit the composition $R' \rightarrow E' \rightarrow R[1]$ into a distinguished triangle $R \rightarrow R'' \rightarrow R' \rightarrow R[1]$ and extend the morphisms $R' \rightarrow E'$ and $R[1] \rightarrow R[1]$ into a morphism of distinguished triangles

$$\begin{array}{ccccccc} R & \longrightarrow & R'' & \longrightarrow & R' & \longrightarrow & R[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ R & \longrightarrow & E & \longrightarrow & E' & \longrightarrow & R[1] \end{array}$$

using TR3. Then R'' is a perfect complex (Cohomology, Lemma 20.38.6) supported on T . An easy diagram chase shows that $R'' \rightarrow E$ is the desired approximation. \square

Theorem 35.12.6. *Let X be a quasi-compact and quasi-separated scheme. Then approximation by perfect complexes holds on X .*

Proof. This follows from the induction principle of Cohomology of Schemes, Lemma 29.4.1 and Lemmas 35.12.5 and 35.12.4. \square

35.13. Generating derived categories

In this section we prove that the derived category $D_{QCoh}(\mathcal{O}_X)$ of a quasi-compact and quasi-separated scheme can be generated by a single perfect object. We urge the reader to read the proof of this result in the wonderful paper by Bondal and van den Bergh, see [BV03].

Lemma 35.13.1. *Let X be a quasi-compact and quasi-separated scheme. Let U be a quasi-compact open subscheme. Let P be a perfect object of $D(\mathcal{O}_U)$. Then P is a direct summand of the restriction of a perfect object of $D(\mathcal{O}_X)$.*

Proof. Special case of Lemma 35.11.9. \square

Lemma 35.13.2. *In Situation 35.8.1 denote $j : U \rightarrow X$ the open immersion and let K be the perfect object of $D(\mathcal{O}_X)$ corresponding to the Koszul complex on f_1, \dots, f_r over A . For $E \in D_{Qcoh}(\mathcal{O}_X)$ the following are equivalent*

- (1) $E = Rj_*(E|_U)$, and
- (2) $\text{Hom}_{D(\mathcal{O}_X)}(K[n], E) = 0$ for all $n \in \mathbf{Z}$.

Proof. Choose a distinguished triangle $E \rightarrow Rj_*(E|_U) \rightarrow N \rightarrow E[1]$. Observe that

$$\text{Hom}_{D(\mathcal{O}_X)}(K[n], Rj_*(E|_U)) = \text{Hom}_{D(\mathcal{O}_U)}(K|_U[n], E) = 0$$

for all n as $K|_U = 0$. Thus it suffices to prove the result for N . In other words, we may assume that E restricts to zero on U . Observe that there are distinguished triangles

$$K^\bullet(f_1^{e_1}, \dots, f_i^{e'_i}, \dots, f_r^{e_r}) \rightarrow K^\bullet(f_1^{e_1}, \dots, f_i^{e'_i + e''_i}, \dots, f_r^{e_r}) \rightarrow K^\bullet(f_1^{e_1}, \dots, f_i^{e''_i}, \dots, f_r^{e_r}) \rightarrow \dots$$

of Koszul complexes, see More on Algebra, Lemma 15.20.11. Hence if $\text{Hom}_{D(\mathcal{O}_X)}(K[n], E) = 0$ for all $n \in \mathbf{Z}$ then the same thing is true for the K replaced by K_e as in Lemma 35.8.6. Thus our lemma follows immediately from that one and the fact that E is determined by the complex of A -modules $R\Gamma(X, E)$, see Lemma 35.3.4. \square

Theorem 35.13.3. *Let X be a quasi-compact and quasi-separated scheme. The category $D_{Qcoh}(\mathcal{O}_X)$ can be generated by a single perfect object. More precisely, there exists a perfect object P of $D(\mathcal{O}_X)$ such that for $E \in D_{Qcoh}(\mathcal{O}_X)$ the following are equivalent*

- (1) $E = 0$, and
- (2) $\text{Hom}_{D(\mathcal{O}_X)}(P[n], E) = 0$ for all $n \in \mathbf{Z}$.

Proof. We will prove this using the induction principle of Cohomology of Schemes, Lemma 29.4.1

If X is affine, then \mathcal{O}_X is a perfect generator. This follows from Lemma 35.3.4.

Assume that $X = U \cup V$ is an open covering with U quasi-compact such that the theorem holds for U and V is an affine open. Let P be a perfect object of $D(\mathcal{O}_U)$ which is a generator for $D_{Qcoh}(\mathcal{O}_U)$. Using Lemma 35.13.1 we may choose a perfect object Q of $D(\mathcal{O}_X)$ whose restriction to U is a direct sum one of whose summands is P . Say $V = \text{Spec}(A)$. Let $Z = X \setminus U$. This is a closed subset of V with $V \setminus Z$ quasi-compact. Choose $f_1, \dots, f_r \in A$ such that $Z = V(f_1, \dots, f_r)$. Let $K \in D(\mathcal{O}_V)$ be the perfect object corresponding to the Koszul complex on f_1, \dots, f_r over A . Note that since K is supported on $Z \subset V$ closed, the pushforward $K' = R(V \rightarrow X)_*K$ is a perfect object of $D(\mathcal{O}_X)$ whose restriction to V is K (see Cohomology, Lemma 20.38.9). We claim that $Q \oplus K'$ is a generator for $D_{Qcoh}(\mathcal{O}_X)$.

Let E be an object of $D_{Qcoh}(\mathcal{O}_X)$ such that there are no nontrivial maps from any shift of $Q \oplus K'$ into E . By Cohomology, Lemma 20.30.9 we have $K' = R(V \rightarrow X)_!K$ and hence

$$\text{Hom}_{D(\mathcal{O}_X)}(K'[n], E) = \text{Hom}_{D(\mathcal{O}_V)}(K[n], E|_V)$$

Thus by Lemma 35.13.2 the vanishing of these groups implies that $E|_V$ is isomorphic to $R(U \cap V \rightarrow V)_*E|_{U \cap V}$. This implies that $E = R(U \rightarrow X)_*E|_U$ (small detail omitted). If this is the case then

$$\text{Hom}_{D(\mathcal{O}_X)}(Q[n], E) = \text{Hom}_{D(\mathcal{O}_U)}(Q|_U[n], E|_U)$$

which contains $\mathrm{Hom}_{D(\mathcal{O}_U)}(P[n], E|_U)$ as a direct summand. Thus by our choice of P the vanishing of these groups implies that $E|_U$ is zero. Whence E is zero. \square

Here is an example.

Lemma 35.13.4. *Let A be a ring. Let $X = \mathbf{P}_A^1$. Then*

$$E = \mathcal{O}_X \oplus \mathcal{O}_X(-1)$$

is a generator (Derived Categories, Definition 13.33.1) of $D_{Q\mathrm{Coh}}(X)$.

Proof. Write $X = \mathrm{Proj}(A[X_0, X_1])$. Let $U = D_+(X_0) = \mathrm{Spec}(A[x])$ where $x = X_0/X_1$. Let $j : V = D_+(X_1) \rightarrow \mathbf{P}^1$ be the inclusion morphism. Consider the complex

$$K = (\mathcal{O}_X(-1) \xrightarrow{X_1} \mathcal{O}_X)$$

The restriction of K to $U = \mathrm{Spec}(A[x])$ is isomorphic to the Koszul complex $A[x] \xrightarrow{x} A[x]$ and the restriction to V is zero.

Let L be an object of $D_{Q\mathrm{Coh}}(X)$ with $\mathrm{Hom}_{D(\mathcal{O}_X)}(K, L[n]) = 0$ for all $n \in \mathbf{Z}$. By Derived Categories of Schemes, Lemma 35.13.2 this implies that $L|_U$ is the pushforward of a complex living on $U \cap V$. This implies $L = Rj_*(L|_V)$ (small argument omitted). Then

$$\begin{aligned} \mathrm{Hom}_{D(\mathcal{O}_X)}(\mathcal{O}_X, L) &= \mathrm{Hom}_{D(\mathcal{O}_X)}(\mathcal{O}_X, Rj_*(L|_V)) \\ &= \mathrm{Hom}_{D(\mathcal{O}_V)}(\mathcal{O}_V, L|_V) \\ &= H^n(V, L|_V) \end{aligned}$$

Thus if in addition $\mathrm{Hom}_{D(\mathcal{O}_X)}(\mathcal{O}_X, L[n]) = 0$ for all n , then we find $H^n(V, L|_V) = 0$ for all n and since V is affine this means $L|_V = 0$ which in turn implies $L = 0$. The lemma follows as K and \mathcal{O}_X are in $\langle E \rangle$, see Derived Categories, Lemma 13.33.2. \square

The following result is an strengthening of Theorem 35.13.3 proved using exactly the same methods. Let $T \subset X$ be a closed subset of a scheme X . Let's denote $D_T(\mathcal{O}_X)$ the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on T .

Lemma 35.13.5. *Let X be a quasi-compact and quasi-separated scheme. Let $T \subset X$ be a closed subset such that $X \setminus T$ is quasi-compact. With notation as above, the category $D_{Q\mathrm{Coh}, T}(\mathcal{O}_X)$ is generated by a single perfect object.*

Proof. We will prove this using the induction principle of Cohomology of Schemes, Lemma 29.4.1.

Assume $X = \mathrm{Spec}(A)$ is affine. In this case there exist $f_1, \dots, f_r \in A$ such that $T = V(f_1, \dots, f_r)$. Let K be the Koszul complex on f_1, \dots, f_r as in Lemma 35.13.2. Then K is a perfect object with cohomology supported on T and hence a perfect object of $D_{Q\mathrm{Coh}, T}(\mathcal{O}_X)$. On the other hand, if $E \in D_{Q\mathrm{Coh}, T}(\mathcal{O}_X)$ and $\mathrm{Hom}(K, E[n]) = 0$ for all n , then Lemma 35.13.2 tells us that $E = Rj_*(E|_{X \setminus T}) = 0$. Hence K generates $D_{Q\mathrm{Coh}, T}(\mathcal{O}_X)$, (by our definition of generators of triangulated categories in Derived Categories, Definition 13.33.1).

Assume that $X = U \cup V$ is an open covering with U quasi-compact such that the lemma holds for U and V is an affine open. Let P be a perfect object of $D(\mathcal{O}_U)$ supported on $T \cap U$ which is a generator for $D_{Q\mathrm{Coh}, T \cap U}(\mathcal{O}_U)$. Using Lemma 35.11.9 we may choose a perfect object Q of $D(\mathcal{O}_X)$ supported on T whose restriction to U

is a direct sum one of whose summands is P . Write $V = \text{Spec}(B)$. Let $Z = X \setminus U$. Then Z is a closed subset of V such that $V \setminus Z$ is quasi-compact. As X is quasi-separated, it follows that $Z \cap T$ is a closed subset of V such that $W = V \setminus (Z \cap T)$ is quasi-compact. Thus we can choose $g_1, \dots, g_s \in B$ such that $Z \cap T = V(g_1, \dots, g_r)$. Let $K \in D(\mathcal{O}_V)$ be the perfect object corresponding to the Koszul complex on g_1, \dots, g_s over B . Note that since K is supported on $(Z \cap T) \subset V$ closed, the pushforward $K' = R(V \rightarrow X)_*K$ is a perfect object of $D(\mathcal{O}_X)$ whose restriction to V is K (see Cohomology, Lemma 20.38.9). We claim that $Q \oplus K'$ is a generator for $D_{QCoh,T}(\mathcal{O}_X)$.

Let E be an object of $D_{QCoh,T}(\mathcal{O}_X)$ such that there are no nontrivial maps from any shift of $Q \oplus K'$ into E . By Cohomology, Lemma 20.30.9 we have $K' = R(V \rightarrow X)_!K$ and hence

$$\text{Hom}_{D(\mathcal{O}_X)}(K'[n], E) = \text{Hom}_{D(\mathcal{O}_V)}(K[n], E|_V)$$

Thus by Lemma 35.13.2 we have $E|_V = Rj_*E|_W$ where $j : W \rightarrow V$ is the inclusion. Picture

Since E is supported on T we see that $E|_W$ is supported on $T \cap W = T \cap U \cap V$ which is closed in W . We conclude that

$$E|_V = Rj_*(E|_W) = Rj_*(Rj'_*(E|_{U \cap V})) = Rj''_*(E|_{U \cap V})$$

where the second equality is part (1) of Cohomology, Lemma 20.30.9. This implies that $E = R(U \rightarrow X)_*E|_U$ (small detail omitted). If this is the case then

$$\text{Hom}_{D(\mathcal{O}_X)}(Q[n], E) = \text{Hom}_{D(\mathcal{O}_U)}(Q|_U[n], E|_U)$$

which contains $\text{Hom}_{D(\mathcal{O}_U)}(P[n], E|_U)$ as a direct summand. Thus by our choice of P the vanishing of these groups implies that $E|_U$ is zero. Whence E is zero. \square

35.14. Compact and perfect objects

Let X be a Noetherian scheme of finite dimension. By Cohomology, Proposition 20.21.6 and Cohomology on Sites, Lemma 21.39.4 the sheaves of modules $j_!\mathcal{O}_U$ are compact objects of $D(\mathcal{O}_X)$ for all opens $U \subset X$. These sheaves are typically not quasi-coherent, hence these do not give perfect object of the derived category $D(\mathcal{O}_X)$. However, if we restrict ourselves to complexes with quasi-coherent cohomology sheaves, then this does not happen. Here is the precise statement.

Proposition 35.14.1. *Let X be a quasi-compact and quasi-separated scheme. An object of $D_{QCoh}(\mathcal{O}_X)$ is compact if and only if it is perfect.*

Proof. By Cohomology, Lemma 20.39.1 the perfect objects define compact objects of $D(\mathcal{O}_X)$. Conversely, let K be a compact object of $D_{QCoh}(\mathcal{O}_X)$. To show that K is perfect, it suffices to show that $K|_U$ is perfect for every affine open $U \subset X$, see Cohomology, Lemma 20.38.2. Observe that $j : U \rightarrow X$ is a quasi-compact and separated morphism. Hence $Rj_* : D_{QCoh}(\mathcal{O}_U) \rightarrow D_{QCoh}(\mathcal{O}_X)$ commutes with direct sums, see Lemma 35.4.2. Thus the adjointness of restriction to U and Rj_* implies that $K|_U$ is a compact object of $D_{QCoh}(\mathcal{O}_U)$. Hence we reduce to the case that X is affine.

Assume $X = \text{Spec}(A)$ is affine. By Lemma 35.3.4 the problem is translated into the same problem for $D(A)$. For $D(A)$ the result is More on Algebra, Proposition 15.57.2. \square

The following result is a strengthening of Proposition 35.14.1. Let $T \subset X$ be a closed subset of a scheme X . As before $D_T(\mathcal{O}_X)$ denotes the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on T . Since taking direct sums commutes with taking cohomology sheaves, it follows that $D_T(\mathcal{O}_X)$ has direct sums and that they are equal to direct sums in $D(\mathcal{O}_X)$.

Lemma 35.14.2. *Let X be a quasi-compact and quasi-separated scheme. Let $T \subset X$ be a closed subset such that $X \setminus T$ is quasi-compact. An object of $D_{Q\text{Coh},T}(\mathcal{O}_X)$ is compact if and only if it is perfect as an object of $D(\mathcal{O}_X)$.*

Proof. We observe that $D_{Q\text{Coh},T}(\mathcal{O}_X)$ is a triangulated category with direct sums by the remark preceding the lemma. By Cohomology, Lemma 20.39.1 the perfect objects define compact objects of $D(\mathcal{O}_X)$ hence a fortiori of any subcategory preserved under taking direct sums. For the converse we will use there exists a generator $E \in D_{Q\text{Coh},T}(\mathcal{O}_X)$ which is a perfect complex of \mathcal{O}_X -modules, see Lemma 35.13.5. Hence by the above, E is compact. Then it follows from Derived Categories, Proposition 13.34.6 that E is a classical generator of the full subcategory of compact objects of $D_{Q\text{Coh},T}(\mathcal{O}_X)$. Thus any compact object can be constructed out of E by a finite sequence of operations consisting of (a) taking shifts, (b) taking finite direct sums, (c) taking cones, and (d) taking direct summands. Each of these operations preserves the property of being perfect and the result follows. \square

The following lemma is an application of the ideas that go into the proof of the preceding lemma.

Lemma 35.14.3. *Let X be a quasi-compact and quasi-separated scheme. Let $T \subset X$ be a closed subset such that $U = X \setminus T$ is quasi-compact. Let $\alpha : P \rightarrow E$ be a morphism of $D_{Q\text{Coh}}(\mathcal{O}_X)$ with either*

- (1) P is perfect and E supported on T , or
- (2) P pseudo-coherent, E supported on T , and E bounded below.

Then there exists a perfect complex of \mathcal{O}_X -modules I and a map $I \rightarrow \mathcal{O}_X[0]$ such that $I \otimes^{\mathbf{L}} P \rightarrow E$ is zero and such that $I|_U \rightarrow \mathcal{O}_U[0]$ is an isomorphism.

Proof. Set $\mathcal{D} = D_{Q\text{Coh},T}(\mathcal{O}_X)$. In both cases the complex $K = R\mathcal{H}om(P, E)$ is an object of \mathcal{D} . See Lemma 35.9.8 for quasi-coherence. It is clear that K is supported on T as formation of $R\mathcal{H}om$ commutes with restriction to opens. The map α defines an element of $H^0(K) = \text{Hom}_{D(\mathcal{O}_X)}(\mathcal{O}_X[0], K)$. Then it suffices to prove the result for the map $\alpha : \mathcal{O}_X[0] \rightarrow K$.

Let $E \in \mathcal{D}$ be a perfect generator, see Lemma 35.13.5. Write

$$K = \text{hocolim} K_n$$

as in Derived Categories, Lemma 13.34.3 using the generator E . Since the functor $\mathcal{D} \rightarrow D(\mathcal{O}_X)$ commutes with direct sums, we see that $K = \text{hocolim} K_n$ also in $D(\mathcal{O}_X)$. Since \mathcal{O}_X is a compact object of $D(\mathcal{O}_X)$ we find an n and a morphism $\alpha_n : \mathcal{O}_X \rightarrow K_n$ which gives rise to α . By Derived Categories, Lemma 13.34.4 applied to the morphism $\mathcal{O}_X[0] \rightarrow K_n$ in the ambient category $D(\mathcal{O}_X)$ we see that

α_n factors as $\mathcal{O}_X[0] \rightarrow Q \rightarrow K_n$ where Q is an object of $\langle E \rangle$. We conclude that Q is a perfect complex supported on T .

Choose a distinguished triangle

$$I \rightarrow \mathcal{O}_X[0] \rightarrow Q \rightarrow I[1]$$

By construction I is perfect, the map $I \rightarrow \mathcal{O}_X[0]$ restricts to an isomorphism over U , and the composition $I \rightarrow K$ is zero as α factors through Q . This proves the lemma. \square

35.15. Derived categories as module categories

In this section we draw some conclusions of what has gone before. Before we do so we need a couple more lemmas.

Lemma 35.15.1. *Let X be a scheme. Let K^\bullet be a complex of \mathcal{O}_X -modules whose cohomology sheaves are quasi-coherent. Let $(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, K^\bullet)$ be the endomorphism differential graded algebra. Then the functor*

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O}_X)$$

of Differential Graded Algebra, Lemma 22.25.3 has image contained in $D_{QCoh}(\mathcal{O}_X)$.

Proof. Let P be a differential graded E -module with property (P) and let F_\bullet be a filtration on P as in Differential Graded Algebra, Section 22.13. Then we have

$$P \otimes_E K^\bullet = \text{hocolim } F_i P \otimes_E K^\bullet$$

Each of the $F_i P$ has a finite filtration whose graded pieces are direct sums of $E[k]$. The result follows easily. \square

The following lemma can be strengthened (there is a uniformity in the vanishing over all L with nonzero cohomology sheaves only in a fixed range).

Lemma 35.15.2. *Let X be a quasi-compact and quasi-separated scheme. Let K, L be objects of $D(\mathcal{O}_X)$ with K perfect and L in $D_{QCoh}^b(\mathcal{O}_X)$. Then $\text{Ext}_{D(\mathcal{O}_X)}^n(K, L)$ is nonzero for only a finite number of n .*

Proof. Since K is perfect we have

$$\text{Ext}_{D(\mathcal{O}_X)}^i(K, L) = H^i(X, K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L)$$

where K^\wedge is the “dual” perfect complex to K , see Cohomology, Lemma 20.38.10. Note that $P = K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$ is in $D_{QCoh}(X)$ by Lemmas 35.3.7 and 35.9.1 (to see that a perfect complex has quasi-coherent cohomology sheaves). On the other hand, the spectral sequence

$$E_1^{p,q} = H^p(K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} H^q(L)) \Rightarrow H^{p+q}(K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L) = H^{p+q}(P),$$

the boundedness of L , and the finite tor amplitude of K^\wedge show that P has only finitely many nonzero cohomology sheaves. It follows that $H^n(X, P) = 0$ for $n \ll 0$. But also $H^n(X, P) = 0$ for $n \gg 0$ by Cohomology of Schemes, Lemma 29.4.3 and the spectral sequence expressing $H^n(X, P^\bullet)$ in terms of $H^p(X, H^q(P^\bullet))$ using that the cohomology sheaves of P are quasi-coherent. \square

The following result is taken from [BV03].

Theorem 35.15.3. *Let X be a quasi-compact and quasi-separated scheme. Then there exist a differential graded algebra (E, d) with only a finite number of nonzero cohomology groups $H^i(E)$ such that $D_{QCoh}(\mathcal{O}_X)$ is equivalent to $D(E, d)$.*

Proof. Let K^\bullet be a K-injective complex of \mathcal{O} -modules which is perfect and generates $D_{QCoh}(\mathcal{O}_X)$. Such a thing exists by Theorem 35.13.3 and the existence of K-injective resolutions. We will show the theorem holds with

$$(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, K^\bullet)$$

where $\text{Comp}^{dg}(\mathcal{O}_X)$ is the differential graded category of complexes of \mathcal{O} -modules. Please see Differential Graded Algebra, Section 22.25. Since K^\bullet is K-injective we have

$$(35.15.3.1) \quad H^n(E) = \text{Ext}_{D(\mathcal{O}_X)}^n(K^\bullet, K^\bullet)$$

for all $n \in \mathbf{Z}$. Only a finite number of these Exts are nonzero by Lemma 35.15.2. Consider the functor

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O}_X)$$

of Differential Graded Algebra, Lemma 22.25.3. Since K^\bullet is perfect, it defines a compact object of $D(\mathcal{O}_X)$, see Proposition 35.14.1. Combined with (35.15.3.1) the functor above is fully faithful as follows from Differential Graded Algebra, Lemmas 22.25.5. It has a right adjoint

$$R\text{Hom}(K^\bullet, -) : D(\mathcal{O}_X) \longrightarrow D(E, d)$$

by Differential Graded Algebra, Lemmas 22.25.4 which is a left quasi-inverse functor by generalities on adjoint functors. On the other hand, it follows from Lemma 35.15.1 that we obtain

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

and by our choice of K^\bullet as a generator of $D_{QCoh}(\mathcal{O}_X)$ the kernel of the adjoint restricted to $D_{QCoh}(\mathcal{O}_X)$ is zero. A formal argument shows that we obtain the desired equivalence, see Derived Categories, Lemma 13.7.2. \square

Remark 35.15.4. Let X be a quasi-compact and quasi-separated scheme over a ring R . By the construction of the proof of Theorem 35.15.3 there exists a differential graded algebra (A, d) over R such that $D_{QCoh}(X)$ is R -linearly equivalent to $D(A, d)$ as a triangulated category. One may ask: how unique is (A, d) ? The answer is (only) slightly better than just saying that (A, d) is well defined up to derived equivalence. Namely, suppose that (B, d) is a second such pair. Then we have

$$(A, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, K^\bullet)$$

and

$$(B, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(L^\bullet, L^\bullet)$$

for some K-injective complexes K^\bullet and L^\bullet of \mathcal{O}_X -modules corresponding to perfect generators of $D_{QCoh}(\mathcal{O}_X)$. Set

$$\Omega = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, L^\bullet) \quad \Omega' = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(L^\bullet, K^\bullet)$$

Then Ω is a differential graded $B^{opp} \otimes_R A$ -module and Ω' is a differential graded $A^{opp} \otimes_R B$ -module. Moreover, the equivalence

$$D(A, d) \rightarrow D_{QCoh}(\mathcal{O}_X) \rightarrow D(B, d)$$

is given by the functor $-\otimes_A^{\mathbf{L}} \mathcal{O}'$ and similarly for the quasi-inverse. Thus we are in the situation of Differential Graded Algebra, Remark 22.27.10. If we ever need this remark we will provide a precise statement with a detailed proof here.

35.16. Cohomology and base change, IV

This section continues the discussion of Cohomology of Schemes, Section 29.20.

Lemma 35.16.1. *Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. For E in $D_{QCoh}(\mathcal{O}_X)$ and K in $D_{QCoh}(\mathcal{O}_Y)$ we have*

$$Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K)$$

Proof. Without any assumptions there is a map $Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K \rightarrow Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K)$. Namely, it is the adjoint to the canonical map

$$Lf^*(Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K) = Lf^*(Rf_*(E)) \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K \longrightarrow E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K$$

coming from the map $Lf^*Rf_*E \rightarrow E$. See Cohomology, Lemmas 20.28.2 and 20.29.1. To check it is an isomorphism we may work locally on Y . Hence we reduce to the case that Y is affine.

Suppose that $K = \bigoplus K_i$ is a direct sum of some complexes $K_i \in D_{QCoh}(\mathcal{O}_Y)$. If the statement holds for each K_i , then it holds for K . Namely, the functors Lf^* and $\otimes^{\mathbf{L}}$ preserve direct sums by construction and Rf_* commutes with direct sums (for complexes with quasi-coherent cohomology sheaves) by Lemma 35.4.2. Moreover, suppose that $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle in $D_{QCoh}(Y)$. Then if the statement of the lemma holds for two of K, L, M , then it holds for the third (as the functors involved are exact functors of triangulated categories).

Assume Y affine, say $Y = \text{Spec}(A)$. The functor $\sim : D(A) \rightarrow D_{QCoh}(\mathcal{O}_Y)$ is an equivalence (Lemma 35.3.4). Let T be the property for $K \in D(A)$ that the statement of the lemma holds for \tilde{K} . The discussion above and More on Algebra, Remark 15.45.11 shows that it suffices to prove T holds for $A[k]$. This finishes the proof, as the statement of the lemma is clear for shifts of the structure sheaf. \square

Definition 35.16.2. Let S be a scheme. Let X, Y be schemes over S . We say X and Y are *Tor independent over S* if for every $x \in X$ and $y \in Y$ mapping to the same point $s \in S$ the rings $\mathcal{O}_{X,x}$ and $\mathcal{O}_{Y,y}$ are Tor independent over $\mathcal{O}_{S,s}$ (see More on Algebra, Definition 15.47.1).

Lemma 35.16.3. *Let $g : S' \rightarrow S$ be a morphism of schemes. Let $f : X \rightarrow S$ be quasi-compact and quasi-separated. Consider the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

*If X and S' are Tor independent over S , then for all $E \in D_{QCoh}(\mathcal{O}_X)$ we have $Rf'_*Lh^*E = Lg^*Rf_*E$.*

Proof. For any object E of $D(\mathcal{O}_X)$ we can use Cohomology, Remark 20.29.2 to get a canonical base change map $Lg^*Rf_*E \rightarrow Rf'_*Lh^*E$. To check this is an

isomorphism we may work locally on S' . Hence we may assume $g : S' \rightarrow S$ is a morphism of affine schemes. In particular, g is affine and it suffices to show that

$$Rg_*Lg^*Rf_*E \rightarrow Rg_*Rf'_*Lh^*E = Rf_*(Rh_*Lh^*E)$$

is an isomorphism, see Lemma 35.4.3 (and use Lemmas 35.3.6, 35.3.7, and 35.4.1 to see that the objects Rf'_*Lh^*E and Lg^*Rf_*E have quasi-coherent cohomology sheaves). Note that h is affine as well (Morphisms, Lemma 28.13.8). By Lemma 35.4.4 the map becomes a map

$$Rf_*E \otimes_{\mathcal{O}_S}^{\mathbf{L}} g_*\mathcal{O}_{S'} \longrightarrow Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} h_*\mathcal{O}_{S'})$$

Observe that $h_*\mathcal{O}_{S'} = f^*g_*\mathcal{O}_{S'}$. Thus by Lemma 35.16.1 it suffices to prove that $Lf^*g_*\mathcal{O}_{S'} = f^*g_*\mathcal{O}_{S'}$. This follows from our assumption that X and S' are Tor independent over S . Namely, to check it we may work locally on X , hence we may also assume X is affine. Say $X = \text{Spec}(A)$, $S = \text{Spec}(R)$ and $S' = \text{Spec}(R')$. Our assumption implies that A and R' are Tor independent over R (More on Algebra, Lemma 15.47.4), i.e., $\text{Tor}_i^R(A, R') = 0$ for $i > 0$. In other words $A \otimes_R^{\mathbf{L}} R' = A \otimes_R R'$ which exactly means that $Lf^*g_*\mathcal{O}_{S'} = f^*g_*\mathcal{O}_{S'}$ (use Lemma 35.3.6). \square

The following two lemmas remain true if we replace \mathcal{G} with a bounded complex of quasi-coherent \mathcal{O}_X -modules each flat over S .

Lemma 35.16.4. *Let $f : X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $E \in D_{QCoh}(\mathcal{O}_X)$. Let \mathcal{G} be a quasi-coherent \mathcal{O}_X -module flat over S . Then formation of*

$$Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$$

commutes with arbitrary base change (see proof for precise statement).

Proof. The statement means the following. Let $g : S' \rightarrow S$ be a morphism of schemes and consider the base change diagram

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{\quad g \quad} & S \end{array}$$

in other words $X' = S' \times_S X$. Set $E' = Lh^*E$ and $\mathcal{G}' = h^*\mathcal{G}$ (here we do **not** use the derived pullback). The lemma asserts that we have

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) = Rf'_*(E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}')$$

To prove this, note that in Cohomology, Remark 20.29.2 we have constructed an arrow

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \longrightarrow R(f')_*(Lh^*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})) = R(f')_*(E' \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lh^*\mathcal{G})$$

which we can compose with the map $Lh^*\mathcal{G} \rightarrow h^*\mathcal{G}$ to get a canonical map

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \longrightarrow Rf'_*(E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}')$$

To check this map is an isomorphism we may work locally on S' . Hence we may assume $g : S' \rightarrow S$ is a morphism of affine schemes. In this case, we will use the induction principle to prove this map is always an isomorphism for any quasi-compact and quasi-separated X over S (Cohomology of Schemes, Lemma 29.4.1).

Suppose $X = \text{Spec}(A)$ is affine. The functor $\sim : D(A) \rightarrow D_{QCoh}(\mathcal{O}_X)$ is an equivalence (Lemma 35.3.4). Let T be the property for $K \in D(A)$ that the canonical

arrow above is an isomorphism for $E = \tilde{K}$. If we have $T(K_i)$ for a family of objects K_i , then we have $T(\bigoplus K_i)$. Namely, derived tensor product and derived pullback commute with direct sums and the same holds for total direct image in this case by Lemma 35.4.2. Moreover, if T holds for two out of three objects of a distinguished triangle, then it holds for the third (Derived Categories, Lemma 13.4.3). By More on Algebra, Remark 15.45.11 this shows that it suffices to prove T holds for $A[k]$. This reduces us to the case $E = \mathcal{O}_X$. In this case we are saying that $Lg^*f_*\mathcal{G} = g^*f_*\mathcal{G}$ (by flatness of \mathcal{G} over S) equals $f'_*h^*\mathcal{G}$ which holds by Cohomology of Schemes, Lemma 29.5.1.

The induction step. Suppose that $X = U \cup V$ is an open covering with $U, V, U \cap V$ quasi-compact such that the result holds for the restriction of E and \mathcal{G} to U, V , and $U \cap V$. Denote $a = f|_U, b = f|_V$ and $c = f|_{U \cap V}$. Let $a' : U' \rightarrow S', b' : V' \rightarrow S'$ and $c' : U' \cap V' \rightarrow S'$ be the base changes of a, b , and c . Note that formation of $-\otimes^{\mathbf{L}}-$ commutes with restriction to opens. Set $H = E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ and $H' = E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}'$. Using the distinguished triangles from relative Mayer-Vietoris (Cohomology, Lemma 20.30.8) we obtain a commutative diagram

$$\begin{array}{ccc}
 Lg^*Rf_*H & \longrightarrow & Rf'_*H' \\
 \downarrow & & \downarrow \\
 Lg^*Ra_*H|_U \oplus Lg^*Rb_*H|_V & \longrightarrow & Ra'_*H'|_{U'} \oplus Rb'_*H'|_{V'} \\
 \downarrow & & \downarrow \\
 Lg^*Rc_*H|_{U \cap V} & \longrightarrow & Rc'_*H'|_{U' \cap V'} \\
 \downarrow & & \downarrow \\
 Lg^*Rf_*H[1] & \longrightarrow & Rf'_*H'[1]
 \end{array}$$

Since the 2nd and 3rd horizontal arrows are isomorphisms so is the first (Derived Categories, Lemma 13.4.3) and the proof of the lemma is finished. \square

Lemma 35.16.5. *Let $f : X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a quasi-coherent \mathcal{O}_X -module flat over S . Then formation of*

$$Rf_*R\mathcal{H}om(E, \mathcal{G})$$

commutes with arbitrary base change (see proof for precise statement).

Proof. The statement means the following. Let $g : S' \rightarrow S$ be a morphism of schemes and consider the base change diagram

$$\begin{array}{ccc}
 X' & \xrightarrow{h} & X \\
 f' \downarrow & & \downarrow f \\
 S' & \xrightarrow{g} & S
 \end{array}$$

in other words $X' = S' \times_S X$. Set $E' = Lh^*E$ and $\mathcal{G}' = h^*\mathcal{G}$ (here we do **not** use the derived pullback). The lemma asserts that we have

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) = Rf'_*R\mathcal{H}om(E', \mathcal{G}')$$

To prove this, note that in Cohomology, Remark 20.34.10 we have constructed an arrow

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) \longrightarrow R(f')_*R\mathcal{H}om(Lh^*E, Lh^*\mathcal{G})$$

which we can compose with the map $Lh^*\mathcal{G} \rightarrow h^*\mathcal{G}$ to get a canonical map

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) \rightarrow Rf'_*R\mathcal{H}om(E', \mathcal{G}')$$

With these preliminaries out of the way, we deduce the result from Lemma 35.16.4. Namely, since E is a perfect complex there exists a dual perfect complex E_{dual} , see Cohomology, Lemma 20.38.10, such that $R\mathcal{H}om(E, \mathcal{G}) = E_{dual} \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$. We omit the verification that the base change map of Lemma 35.16.4 for E_{dual} agrees with the base change map for E constructed above. \square

35.17. Producing perfect complexes

The following lemma is our main technical tool for producing perfect complexes. Later versions of this result will reduce to this by Noetherian approximation, see Section 35.20.

Lemma 35.17.1. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D(\mathcal{O}_X)$ such that*

- (1) $E \in D_{Coh}^b(\mathcal{O}_X)$,
- (2) *the scheme theoretic support of $H^i(E)$ is proper over S for all i ,*
- (3) E *has finite tor dimension as an object of $D(f^{-1}\mathcal{O}_S)$.*

*Then Rf_*E is a perfect object of $D(\mathcal{O}_S)$.*

Proof. By Lemma 35.5.1 we see that Rf_*E is an object of $D_{Coh}^b(\mathcal{O}_S)$. Hence Rf_*E is pseudo-coherent (Lemma 35.9.4). Hence it suffices to show that Rf_*E has finite tor dimension, see Cohomology, Lemma 20.38.4. By Lemma 35.9.6 it suffices to check that $Rf_*(E) \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}$ has universally bounded cohomology for all quasi-coherent sheaves \mathcal{F} on S . Bounded from above is clear as $Rf_*(E)$ is bounded from above. Let $T \subset X$ be the union of the supports of $H^i(E)$ for all i . Then T is proper over S by assumptions (1) and (2). In particular there exists a quasi-compact open $X' \subset X$ containing T . Setting $f' = f|_{X'}$ we have $Rf_*(E) = Rf'_*(E|_{X'})$ because E restricts to zero on $X \setminus T$. Thus we may replace X by X' and assume f is quasi-compact. Moreover, f is quasi-separated by Morphisms, Lemma 28.16.7. Now

$$Rf_*(E) \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F} = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*\mathcal{F}) = Rf_*(E \otimes_{f^{-1}\mathcal{O}_S}^{\mathbf{L}} f^{-1}\mathcal{F})$$

by Lemma 35.16.1 and Cohomology, Lemma 20.28.3. By assumption (3) the complex $E \otimes_{f^{-1}\mathcal{O}_S}^{\mathbf{L}} f^{-1}\mathcal{F}$ has cohomology sheaves in a given finite range, say $[a, b]$. Then Rf_* of it has cohomology in the range $[a, \infty)$ and we win. \square

35.18. Cohomology, Ext groups, and base change

The results in this section will be used to verify one of Artin's criteria for Quot functors, Hilbert schemes, and other moduli problems.

Lemma 35.18.1. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a coherent \mathcal{O}_X -module flat over S with scheme theoretic support proper over S .*

Then $K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$ is a perfect object of $D(\mathcal{O}_S)$ and there are functorial isomorphisms

$$H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}) \longrightarrow H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}))$$

for \mathcal{F} quasi-coherent on S compatible with boundary maps (see proof).

Proof. We have

$$\mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F} = \mathcal{G} \otimes_{f^{-1}\mathcal{O}_S}^{\mathbf{L}} f^{-1} \mathcal{F} = \mathcal{G} \otimes_{f^{-1}\mathcal{O}_S} f^{-1} \mathcal{F} = \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}$$

the first equality by Cohomology, Lemma 20.28.3, the second as \mathcal{G} is a flat $f^{-1}\mathcal{O}_S$ -module, and the third by definition of pullbacks. Hence we obtain

$$\begin{aligned} H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})) &= H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F}) \\ &= H^i(S, Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F})) \\ &= H^i(S, Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}) \\ &= H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}) \end{aligned}$$

The first equality by the above, the second by Leray (Cohomology, Lemma 20.14.1), and the third equality by Lemma 35.16.1. The object K is perfect by Lemma 35.17.1. We check the lemma applies: Locally E is isomorphic to a finite complex of finite free \mathcal{O}_X -modules. Hence locally $E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ is isomorphic to a finite complex whose terms are finite direct sums of copies \mathcal{G} . This immediately implies the hypotheses on the cohomology sheaves $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$. The hypothesis on the tor dimension also follows as \mathcal{G} is flat over $f^{-1}\mathcal{O}_S$.

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ of quasi-coherent \mathcal{O}_S -modules, the isomorphisms fit into commutative diagrams

$$\begin{array}{ccc} H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_3) & \longrightarrow & H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3)) \\ \delta \downarrow & & \downarrow \delta \\ H^{i+1}(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1) & \longrightarrow & H^{i+1}(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1)) \end{array}$$

where the boundary maps come from the distinguished triangle

$$K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_2 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_3 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1[1]$$

and the distinguished triangle in $D(\mathcal{O}_X)$ associated to the short exact sequence

$$0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_2 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3 \rightarrow 0$$

This sequence is exact because \mathcal{G} is flat over S . We omit the verification of the commutativity of the displayed diagram. \square

Lemma 35.18.2. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a coherent \mathcal{O}_X -module flat over S with scheme theoretic support proper over S . Then $K = Rf_* R\mathcal{H}om(E, \mathcal{G})$ is a perfect object of $D(\mathcal{O}_S)$ and there are functorial isomorphisms*

$$H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}) \longrightarrow Ext_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

for \mathcal{F} quasi-coherent on S compatible with boundary maps (see proof).

Proof. Since E is a perfect complex there exists a dual perfect complex E_{dual} , see Cohomology, Lemma 20.38.10. Observe that $R\mathcal{H}om(E, \mathcal{G}) = E_{dual} \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ and that

$$\mathrm{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) = H^i(X, E_{dual} \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}))$$

by construction of E_{dual} . Thus the perfectness of K and the isomorphisms follow from the corresponding results of Lemma 35.18.1 applied to E_{dual} and \mathcal{G} .

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ then the isomorphisms fit into commutative diagrams

$$\begin{array}{ccc} H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_3) & \longrightarrow & \mathrm{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3) \\ \delta \downarrow & & \downarrow \delta \\ H^{i+1}(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1) & \longrightarrow & \mathrm{Ext}_{\mathcal{O}_X}^{i+1}(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1) \end{array}$$

where the boundary maps come from the distinguished triangle

$$K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_2 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_3 \rightarrow K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F}_1[1]$$

and the distinguished triangle in $D(\mathcal{O}_X)$ associated to the short exact sequence

$$0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_2 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3 \rightarrow 0$$

This sequence is exact because \mathcal{G} is flat over S . We omit the verification of the commutativity of the displayed diagram. \square

Lemma 35.18.3. *Let S be a Noetherian scheme. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D(\mathcal{O}_X)$ and \mathcal{G} an \mathcal{O}_X -module. Assume*

- (1) $E \in D_{Coh}^-(\mathcal{O}_X)$, and
- (2) \mathcal{G} is a coherent \mathcal{O}_X -module flat over S with scheme theoretic support is proper over S .

Then for every $m \in \mathbf{Z}$ there exists a perfect object K of $D(\mathcal{O}_S)$ and functorial maps

$$\alpha_{\mathcal{F}}^i : \mathrm{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \longrightarrow H^i(S, K \otimes_{\mathcal{O}_S}^{\mathbf{L}} \mathcal{F})$$

for \mathcal{F} quasi-coherent on S compatible with boundary maps (see proof) such that $\alpha_{\mathcal{F}}^i$ is an isomorphism for $i \leq m$.

Proof. We may replace X by a quasi-compact open neighbourhood of the support of \mathcal{G} , hence we may assume X is Noetherian. In this case X and f are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow E$ by a perfect complex P of $(X, E, -m - 1)$ (possible by Theorem 35.12.6). Then the induced map

$$\mathrm{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \longrightarrow \mathrm{Ext}_{\mathcal{O}_X}^i(P, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

is an isomorphism for $i \leq m$. Namely, the kernel, resp. cokernel of this map is a quotient, resp. submodule of

$$\mathrm{Ext}_{\mathcal{O}_X}^i(C, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \quad \text{resp.} \quad \mathrm{Ext}_{\mathcal{O}_X}^{i+1}(C, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

where C is the cone of $P \rightarrow E$. Since C has vanishing cohomology sheaves in degrees $\geq -m - 1$ these Ext-groups are zero for $i \leq m + 1$ by Derived Categories, Lemma 13.27.3. This reduces us to the case that E is a perfect complex which is Lemma 35.18.2.

The statement on boundaries is explained in the proof of Lemma 35.18.2. \square

35.19. Limits and derived categories

In this section we collect some results about the derived category of a scheme which is the limit of an inverse system of schemes. More precisely, we will work in the following setting.

Situation 35.19.1. Let $S = \lim_{i \in I} S_i$ be a limit of a directed system of schemes over S with affine transition morphisms $f_{i' i} : S_{i'} \rightarrow S_i$. We assume that S_i is quasi-compact and quasi-separated for all $i \in I$. We denote $f_i : S \rightarrow S_i$ the projection. We also fix an element $0 \in I$.

Lemma 35.19.2. *In Situation 35.19.1. Let E_0 and K_0 be objects of $D(\mathcal{O}_{S_0})$. Set $E_i = Lf_{i0}^* E_0$ and $K_i = Lf_{i0}^* K_0$ for $i \geq 0$ and set $E = Lf_0^* E_0$ and $K = Lf_0^* K_0$. Then the map*

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D(\mathcal{O}_{S_i})}(E_i, K_i) \longrightarrow \operatorname{Hom}_{D(\mathcal{O}_S)}(E, K)$$

is an isomorphism if either

- (1) E_0 is perfect and $K_0 \in D_{QCoh}(\mathcal{O}_{S_0})$, or
- (2) E_0 is pseudo-coherent and $K_0 \in D_{QCoh}(\mathcal{O}_{S_0})$ has finite tor dimension.

Proof. For every open $U_0 \subset S_0$ consider the condition P that the canonical map

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D(\mathcal{O}_{U_i})}(E_i|_{U_i}, K_i|_{U_i}) \longrightarrow \operatorname{Hom}_{D(\mathcal{O}_U)}(E|_U, K|_U)$$

is an isomorphism, where $U = f_0^{-1}(U_0)$ and $U_i = f_{i0}^{-1}(U_0)$. We will prove P holds for all quasi-compact opens U_0 by the induction principle of Cohomology of Schemes, Lemma 29.4.1. Condition (2) of this lemma follows immediately from Mayer-Vietoris for hom in the derived category, see Cohomology, Lemma 20.30.6. Thus it suffices to prove the lemma when S_0 is affine.

Assume S_0 is affine. Say $S_0 = \operatorname{Spec}(A_0)$, $S_i = \operatorname{Spec}(A_i)$, and $S = \operatorname{Spec}(A)$. We will use Lemma 35.3.4 without further mention.

In case (1) the object E_0^\bullet corresponds to a finite complex of finite projective A_0 -modules, see Lemma 35.9.7. We may represent the object K_0 by a K-flat complex K_0^\bullet of A_0 -modules. In this situation we are trying to prove

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D(A_i)}(E_0^\bullet \otimes_{A_0} A_i, K_0^\bullet \otimes_{A_0} A_i) \longrightarrow \operatorname{Hom}_{D(A)}(E_0^\bullet \otimes_{A_0} A, K_0^\bullet \otimes_{A_0} A)$$

Because E_0^\bullet is a bounded above complex of projective modules we can rewrite this as

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{K(A_0)}(E_0^\bullet, K_0^\bullet \otimes_{A_0} A_i) \longrightarrow \operatorname{Hom}_{K(A_0)}(E_0^\bullet, K_0^\bullet \otimes_{A_0} A)$$

Since there are only a finite number of nonzero modules E_0^n and since these are all finitely presented modules, this map is an isomorphism.

In case (2) the object E_0 corresponds to a bounded above complex E_0^\bullet of finite free A_0 -modules, see Lemma 35.9.3. We may represent K_0 by a finite complex K_0^\bullet of flat A_0 -modules, see Lemma 35.9.5 and More on Algebra, Lemma 15.51.3. In particular K_0^\bullet is K-flat and we can argue as before to arrive at the map

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{K(A_0)}(E_0^\bullet, K_0^\bullet \otimes_{A_0} A_i) \longrightarrow \operatorname{Hom}_{K(A_0)}(E_0^\bullet, K_0^\bullet \otimes_{A_0} A)$$

It is clear that this map is an isomorphism (only a finite number of terms are involved since K_0^\bullet is bounded). \square

Lemma 35.19.3. *In Situation 35.19.1 the category of perfect objects of $D(\mathcal{O}_S)$ is the colimit of the categories of perfect objects of $D(\mathcal{O}_{S_i})$.*

Proof. For every open $U_0 \subset S_0$ consider the condition P that the functor

$$\operatorname{colim}_{i \geq 0} D_{\text{perf}}(\mathcal{O}_{U_i}) \longrightarrow D_{\text{perf}}(\mathcal{O}_U)$$

is an equivalence where $_{\text{perf}}$ indicates the full subcategory of perfect objects and where $U = f_0^{-1}(U_0)$ and $U_i = f_{i0}^{-1}(U_0)$. We will prove P holds for all quasi-compact opens U_0 by the induction principle of Cohomology of Schemes, Lemma 29.4.1. First, we observe that we already know the functor is fully faithful by Lemma 35.19.2. Thus it suffices to prove essential surjectivity.

We first check condition (2) of the induction principle. Thus suppose that we have $S_0 = U_0 \cup V_0$ and that P holds for U_0, V_0 , and $U_0 \cap V_0$. Let E be a perfect object of $D(\mathcal{O}_S)$. We can find $i \geq 0$ and $E_{U,i}$ perfect on U_i and $E_{V,i}$ perfect on V_i whose pullback to U and V are isomorphic to $E|_U$ and $E|_V$. Denote

$$a : E_{U,i} \rightarrow (Rf_{i,*}E)|_{U_i} \quad \text{and} \quad b : E_{V,i} \rightarrow (Rf_{i,*}E)|_{V_i}$$

the maps adjoint to the isomorphisms $Lf_i^*E_{U,i} \rightarrow E|_U$ and $Lf_i^*E_{V,i} \rightarrow E|_V$. By fully faithfulness, after increasing i , we can find an isomorphism $c : E_{U,i}|_{U_i \cap V_i} \rightarrow E_{V,i}|_{U_i \cap V_i}$ which pulls back to the identifications

$$Lf_i^*E_{U,i}|_{U \cap V} \rightarrow E|_{U \cap V} \rightarrow Lf_i^*E_{V,i}|_{U \cap V}.$$

Apply Cohomology, Lemma 20.30.10 to get an object E_i on S_i and a map $d : E_i \rightarrow Rf_{i,*}E$ which restricts to the maps a and b over U_i and V_i . Then it is clear that E_i is perfect and that d is adjoint to an isomorphism $Lf_i^*E_i \rightarrow E$.

Finally, we check condition (1) of the induction principle, in other words, we check the lemma holds when S_0 is affine. Say $S_0 = \operatorname{Spec}(A_0)$, $S_i = \operatorname{Spec}(A_i)$, and $S = \operatorname{Spec}(A)$. Using Lemmas 35.3.4 and 35.9.7 we see that we have to show that

$$D_{\text{perf}}(A) = \operatorname{colim} D_{\text{perf}}(A_i)$$

This is clear from the fact that perfect complexes over rings are given by finite complexes of finite projective (hence finitely presented) modules. \square

35.20. Cohomology and base change, V

A final section on cohomology and base change continueing the discussion of Sections 35.16 and 35.17. An easy to grok special case is given in Remark 35.20.2.

Lemma 35.20.1. *Let $f : X \rightarrow S$ be a morphism of finite presentation. Let $E \in D(\mathcal{O}_X)$ be a perfect object. Let \mathcal{G} be a finitely presented \mathcal{O}_X -module, flat over S , with support proper over S . Then*

$$K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$$

is a perfect object of $D(\mathcal{O}_S)$ and its formation commutes with arbitrary base change.

Proof. The statement on base change is Lemma 35.16.4. Thus it suffices to show that K is a perfect object. If S is Noetherian, then this follows from Lemma 35.18.1. We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.

The question is local on S , hence we may assume S is affine. Say $S = \operatorname{Spec}(R)$. We write $R = \operatorname{colim} R_i$ as a filtered colimit of Noetherian rings R_i . By Limits, Lemma 31.9.1 there exists an i and a scheme X_i of finite presentation over R_i whose base change to R is X . By Limits, Lemma 31.9.2 we may assume after increasing i , that there exists a finitely presented \mathcal{O}_{X_i} -module \mathcal{G}_i whose pullback to X is \mathcal{G} . After

increasing i we may assume \mathcal{G}_i is flat over R_i , see Limits, Lemma 31.9.3. After increasing i we may assume the support of \mathcal{G}_i is proper over R_i , see Limits, Lemma 31.12.7. Finally, by Lemma 35.19.3 we may, after increasing i , assume there exists a perfect object E_i of $D(\mathcal{O}_{X_i})$ whose pullback to X is E . Applying Lemma 35.18.1 to $X_i \rightarrow \text{Spec}(R_i)$, E_i , \mathcal{G}_i and using the base change property already shown we obtain the result. \square

Remark 35.20.2. Let R be a ring. Let X be a scheme of finite presentation over R . Let \mathcal{G} be a finitely presented \mathcal{O}_X -module flat over R with scheme theoretic support proper over R . By Lemma 35.20.1 there exists a finite complex of finite projective R -modules M^\bullet such that we have

$$R\Gamma(X_{R'}, \mathcal{G}_{R'}) = M^\bullet \otimes_R R'$$

functorially in the R -algebra R' .

Lemma 35.20.3. *Let $f : X \rightarrow S$ be a morphism of finite presentation. Let $E \in D(\mathcal{O}_X)$ be a perfect object. Let \mathcal{G} be a finitely presented \mathcal{O}_X -module, flat over S , with support proper over S . Then*

$$K = Rf_* R\mathcal{H}om(E, \mathcal{G})$$

is a perfect object of $D(\mathcal{O}_S)$ and its formation commutes with arbitrary base change.

Proof. The statement on base change is Lemma 35.16.5. Thus it suffices to show that K is a perfect object. If S is Noetherian, then this follows from Lemma 35.18.2. We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.

The question is local on S , hence we may assume S is affine. Say $S = \text{Spec}(R)$. We write $R = \text{colim } R_i$ as a filtered colimit of Noetherian rings R_i . By Limits, Lemma 31.9.1 there exists an i and a scheme X_i of finite presentation over R_i whose base change to R is X . By Limits, Lemma 31.9.2 we may assume after increasing i , that there exists a finitely presented \mathcal{O}_{X_i} -module \mathcal{G}_i whose pullback to X is \mathcal{G} . After increasing i we may assume \mathcal{G}_i is flat over R_i , see Limits, Lemma 31.9.3. After increasing i we may assume the support of \mathcal{G}_i is proper over R_i , see Limits, Lemma 31.12.7. Finally, by Lemma 35.19.3 we may, after increasing i , assume there exists a perfect object E_i of $D(\mathcal{O}_{X_i})$ whose pullback to X is E . Applying Lemma 35.18.2 to $X_i \rightarrow \text{Spec}(R_i)$, E_i , \mathcal{G}_i and using the base change property already shown we obtain the result. \square

More on Morphisms

36.1. Introduction

In this chapter we continue our study of properties of morphisms of schemes. A fundamental reference is [DG67].

36.2. Thickenings

The following terminology may not be completely standard, but it is convenient.

Definition 36.2.1. Thickenings.

- (1) We say a scheme X' is a *thickening* of a scheme X if X is a closed subscheme of X' and the underlying topological spaces are equal.
- (2) We say a scheme X' is a *first order thickening* of a scheme X if X is a closed subscheme of X' and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X'}$ defining X has square zero.
- (3) Given two thickenings $X \subset X'$ and $Y \subset Y'$ a *morphism of thickenings* is a morphism $f' : X' \rightarrow Y'$ such that $f'(X) \subset Y$, i.e., such that $f'|_X$ factors through the closed subscheme Y . In this situation we set $f = f'|_X : X \rightarrow Y$ and we say that $(f, f') : (X \subset X') \rightarrow (Y \subset Y')$ is a morphism of thickenings.
- (4) Let S be a scheme. We similarly define *thickenings over S* , and *morphisms of thickenings over S* . This means that the schemes X, X', Y, Y' above are schemes over S , and that the morphisms $X \rightarrow X', Y \rightarrow Y'$ and $f' : X' \rightarrow Y'$ are morphisms over S .

Finite order thickenings. Let $i_X : X \rightarrow X'$ be a thickening. Any local section of the kernel $\mathcal{I} = \text{Ker}(i_X^\sharp)$ is locally nilpotent. Let us say that $X \subset X'$ is a *finite order thickening* if the ideal sheaf \mathcal{I} is “globally” nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1} = 0$. Technically the class of finite order thickenings $X \subset X'$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$0 \subset \mathcal{I}^n \subset \mathcal{I}^{n-1} \subset \dots \subset \mathcal{I} \subset \mathcal{O}_{X'}$$

and we see that X' is filtered by closed subspaces

$$X = X_0 \subset X_1 \subset \dots \subset X_{n-1} \subset X_{n+1} = X'$$

such that each pair $X_i \subset X_{i+1}$ is a first order thickening over S . Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.

First order thickening are described as follows (see Modules, Lemma 17.23.11).

Lemma 36.2.2. *Let X be a scheme over a base S . Consider a short exact sequence*

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_X \rightarrow 0$$

of sheaves on X where \mathcal{A} is a sheaf of $f^{-1}\mathcal{O}_S$ -algebras, $\mathcal{A} \rightarrow \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_S$ -algebras, and \mathcal{I} is its kernel. If

- (1) \mathcal{I} is an ideal of square zero in \mathcal{A} , and
- (2) \mathcal{I} is quasi-coherent as an \mathcal{O}_X -module

then $X' = (X, \mathcal{A})$ is a scheme and $X \rightarrow X'$ is a first order thickening over S . Moreover, any first order thickening over S is of this form.

Proof. It is clear that X' is a locally ringed space. Let $U = \text{Spec}(B)$ be an affine open of X . Set $A = \Gamma(U, \mathcal{A})$. Note that since $H^1(U, \mathcal{I}) = 0$ (see Cohomology of Schemes, Lemma 29.2.2) the map $A \rightarrow B$ is surjective. By assumption the kernel $I = \mathcal{I}(U)$ is an ideal of square zero in the ring A . By Schemes, Lemma 25.6.4 there is a canonical morphism of locally ringed spaces

$$(U, \mathcal{A}|_U) \longrightarrow \text{Spec}(A)$$

coming from the map $B \rightarrow \Gamma(U, \mathcal{A})$. Since this morphism fits into the commutative diagram

$$\begin{array}{ccc} (U, \mathcal{O}_X|_U) & \longrightarrow & \text{Spec}(B) \\ \downarrow & & \downarrow \\ (U, \mathcal{A}|_U) & \longrightarrow & \text{Spec}(A) \end{array}$$

we see that it is a homeomorphism on underlying topological spaces. Thus to see that it is an isomorphism, it suffices to check it induces an isomorphism on the local rings. For $u \in U$ corresponding to the prime $\mathfrak{p} \subset A$ we obtain a commutative diagram of short exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & I_{\mathfrak{p}} & \longrightarrow & A_{\mathfrak{p}} & \longrightarrow & B_{\mathfrak{p}} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{I}_u & \longrightarrow & \mathcal{A}_u & \longrightarrow & \mathcal{O}_{X,u} \longrightarrow 0. \end{array}$$

The left and right vertical arrows are isomorphisms because \mathcal{I} and \mathcal{O}_X are quasi-coherent sheaves. Hence also the middle map is an isomorphism. Hence every point of $X' = (X, \mathcal{A})$ has an affine neighbourhood and X' is a scheme as desired. \square

Lemma 36.2.3. *Any thickening of an affine scheme is affine.*

Proof. This is a special case of Limits, Proposition 31.10.2. \square

Proof for a finite order thickening. Suppose that $X \subset X'$ is a finite order thickening with X affine. Then we may use Serre's criterion to prove X' is affine. More precisely, we will use Cohomology of Schemes, Lemma 29.3.1. Let \mathcal{F} be a quasi-coherent $\mathcal{O}_{X'}$ -module. It suffices to show that $H^1(X', \mathcal{F}) = 0$. Denote $i : X \rightarrow X'$ the given closed immersion and denote $\mathcal{I} = \text{Ker}(i^\sharp : \mathcal{O}_{X'} \rightarrow i_*\mathcal{O}_X)$. By our discussion of finite order thickenings (following Definition 36.2.1) there exists an $n \geq 0$ and a filtration

$$0 = \mathcal{F}_{n+1} \subset \mathcal{F}_n \subset \mathcal{F}_{n-1} \subset \dots \subset \mathcal{F}_0 = \mathcal{F}$$

by quasi-coherent submodules such that $\mathcal{F}_a/\mathcal{F}_{a+1}$ is annihilated by \mathcal{I} . Namely, we can take $\mathcal{F}_a = \mathcal{I}^a \mathcal{F}$. Then $\mathcal{F}_a/\mathcal{F}_{a+1} = i_* \mathcal{G}_a$ for some quasi-coherent \mathcal{O}_X -module \mathcal{G}_a , see Morphisms, Lemma 28.4.1. We obtain

$$H^1(X', \mathcal{F}_a/\mathcal{F}_{a+1}) = H^1(X', i_* \mathcal{G}_a) = H^1(X, \mathcal{G}_a) = 0$$

The second equality comes from Cohomology of Schemes, Lemma 29.2.4 and the last equality from Cohomology of Schemes, Lemma 29.2.2. Thus \mathcal{F} has a finite filtration whose successive quotients have vanishing first cohomology and it follows by a simple induction argument that $H^1(X', \mathcal{F}) = 0$. \square

Lemma 36.2.4. *Let $S \subset S'$ be a thickening of schemes. Let $X' \rightarrow S'$ be a morphism and set $X = S \times_{S'} X'$. Then $(X \subset X') \rightarrow (S \subset S')$ is a morphism of thickenings. If $S \subset S'$ is a first (resp. finite order) thickening, then $X \subset X'$ is a first (resp. finite order) thickening.*

Proof. Omitted. \square

Lemma 36.2.5. *Let $(f, f') : (X \subset X') \rightarrow (S \subset S')$ be a morphism of thickenings. Then*

- (1) *f is an affine morphism if and only if f' is an affine morphism,*
- (2) *f is a surjective morphism if and only if f' is a surjective morphism,*
- (3) *f is quasi-compact if and only if f' quasi-compact,*
- (4) *f is universally closed if and only if f' is universally closed,*
- (5) *f is integral if and only if f' is integral,*
- (6) *f is (quasi-)separated if and only if f' is (quasi-)separated,*
- (7) *f is universally injective if and only if f' is universally injective,*
- (8) *f is universally open if and only if f' is universally open, and*
- (9) *add more here.*

Proof. Observe that $S \rightarrow S'$ and $X \rightarrow X'$ are universal homeomorphisms (see for example Morphisms, Lemma 28.45.4). This immediately implies parts (2), (3), (4), (7), and (8). Part (1) follows from Lemma 36.2.3 which tells us that there is a 1-to-1 correspondence between affine opens of S and S' and between affine opens of X and X' . Part (5) follows from (1) and (4) by Morphisms, Lemma 28.44.7. Finally, note that

$$S \times_X S = S \times_{X'} S \rightarrow S \times_{X'} S' \rightarrow S' \times_{X'} S'$$

is a thickening (the two arrows are thickenings by Lemma 36.2.4). Hence applying (3) and (4) to the morphism $(S \subset S') \rightarrow (S \times_X S \rightarrow S' \times_{X'} S')$ we obtain (6). \square

Lemma 36.2.6. *Let $(f, f') : (X \subset X') \rightarrow (S \subset S')$ be a morphism of thickenings such that $X = S \times_{S'} X'$. If $S \subset S'$ is a finite order thickening, then*

- (1) *f is a closed immersion if and only if f' is a closed immersion,*
- (2) *f is locally of finite type if and only if f' is locally of finite type,*
- (3) *f is locally quasi-finite if and only if f' is locally quasi-finite,*
- (4) *f is locally of finite type of relative dimension d if and only if f' is locally of finite type of relative dimension d ,*
- (5) *f is unramified if and only if f' is unramified,*
- (6) *f is proper if and only if f' is proper,*
- (7) *f is a finite morphism if and only if f' is a finite morphism, and*
- (8) *add more here.*

Proof. The properties \mathcal{P} listed in the lemma are all stable under base change, hence if f' has property \mathcal{P} , then so does f . See Schemes, Lemma 25.18.2, and Morphisms, Lemmas 28.16.4, 28.21.13, 28.30.2, 28.36.5, 28.42.5, 28.44.6.

The interesting direction in each case is therefore to assume that f has the property and deduce that f' has it too. By induction on the order of the thickening we may assume that $S \subset S'$ is a first order thickening, see discussion immediately following Definition 36.2.1.

Most of the proofs will use a reduction to the affine case. Let $U' \subset S'$ be an affine open and let $V' \subset X'$ be an affine open lying over U' . Let $U' = \text{Spec}(A')$ and denote $I \subset A'$ be the ideal defining the closed subscheme $U' \cap S$. Say $V' = \text{Spec}(B')$. Then $V' \cap X = \text{Spec}(B'/IB')$. Setting $A = A'/I$ and $B = B'/IB'$ we get a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & IB' & \longrightarrow & B' & \longrightarrow & B \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & IA' & \longrightarrow & A' & \longrightarrow & A \longrightarrow 0 \end{array}$$

with exact rows and $I^2 = 0$.

The translation of (1) into algebra: If $A \rightarrow B$ is surjective, then $A' \rightarrow B'$ is surjective. This follows from Nakayama's lemma (Algebra, Lemma 10.19.1).

The translation of (2) into algebra: If $A \rightarrow B$ is a finite type ring map, then $A' \rightarrow B'$ is a finite type ring map. This follows from Nakayama's lemma (Algebra, Lemma 10.19.1) applied to a map $A'[x_1, \dots, x_n] \rightarrow B'$ such that $A[x_1, \dots, x_n] \rightarrow B$ is surjective.

Proof of (3). Follows from (2) and that quasi-finiteness of a morphism which is locally of finite type can be checked on fibres, see Morphisms, Lemma 28.21.6.

Proof of (4). Follows from (2) and that the additional property of "being of relative dimension d " can be checked on fibres (by definition, see Morphisms, Definition 28.30.1).

The translation of (5) into algebra: If $A \rightarrow B$ is unramified map, then $A' \rightarrow B'$ is unramified. Since $A \rightarrow B$ is of finite type we see that $A' \rightarrow B'$ is of finite type by (2) above. Since $A \rightarrow B$ is unramified we have $\Omega_{B/A} = 0$. By Algebra, Lemma 10.127.12 we have $0 = \Omega_{B/A} = \Omega_{B'/A'}/I\Omega_{B'/A'}$. Hence $\Omega_{B'/A'} = 0$ by Nakayama's lemma (Algebra, Lemma 10.19.1). Thus $A' \rightarrow B'$ is unramified.

Proof of (6). Follows by combining (2) with results of Lemma 36.2.5 and the fact that proper equals quasi-compact + separated + locally of finite type + universally closed.

Proof of (7). Follows by combining (2) with results of Lemma 36.2.5 and using the fact that finite equals integral + locally of finite type (Morphisms, Lemma 28.44.4). \square

36.3. First order infinitesimal neighbourhood

A natural construction of first order thickenings is the following. Suppose that $i : Z \rightarrow X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme $Z \subset U$. Let $\mathcal{I} \subset \mathcal{O}_U$ be the

quasi-coherent sheaf of ideals defining Z in U . Then we can consider the closed subscheme $Z' \subset U$ defined by the quasi-coherent sheaf of ideals \mathcal{I}^2 .

Definition 36.3.1. Let $i : Z \rightarrow X$ be an immersion of schemes. The *first order infinitesimal neighbourhood* of Z in X is the first order thickening $Z \subset Z'$ over X described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open U).

Lemma 36.3.2. *Let $i : Z \rightarrow X$ be an immersion of schemes. The first order infinitesimal neighbourhood Z' of Z in X has the following universal property: Given any commutative diagram*

$$\begin{array}{ccc} Z & \xleftarrow{a} & T \\ \downarrow i & & \downarrow \\ X & \xleftarrow{b} & T' \end{array}$$

where $T \subset T'$ is a first order thickening over X , there exists a unique morphism $(a', a) : (T \subset T') \rightarrow (Z \subset Z')$ of thickenings over X .

Proof. Let $U \subset X$ be the open used in the construction of Z' , i.e., an open such that Z is identified with a closed subscheme of U cut out by the quasi-coherent sheaf of ideals \mathcal{I} . Since $|T| = |T'|$ we see that $b(T') \subset U$. Hence we can think of b as a morphism into U . Let $\mathcal{J} \subset \mathcal{O}_{T'}$ be the ideal cutting out T . Since $b(T) \subset Z$ by the diagram above we see that $b^\sharp(b^{-1}\mathcal{I}) \subset \mathcal{J}$. As T' is a first order thickening of T we see that $\mathcal{J}^2 = 0$ hence $b^\sharp(b^{-1}(\mathcal{I}^2)) = 0$. By Schemes, Lemma 25.4.6 this implies that b factors through Z' . Denote $a' : T' \rightarrow Z'$ this factorization and everything is clear. □

Lemma 36.3.3. *Let $i : Z \rightarrow X$ be an immersion of schemes. Let $Z \subset Z'$ be the first order infinitesimal neighbourhood of Z in X . Then the diagram*

$$\begin{array}{ccc} Z & \longrightarrow & Z' \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

induces a map of conormal sheaves $\mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Z'}$ by Morphisms, Lemma 28.33.3. This map is an isomorphism.

Proof. This is clear from the construction of Z' above. □

36.4. Formally unramified morphisms

Recall that a ring map $R \rightarrow A$ is called *formally unramified* (see Algebra, Definition 10.141.1) if for every commutative solid diagram

$$\begin{array}{ccc} A & \longrightarrow & B/I \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & B \end{array}$$

where $I \subset B$ is an ideal of square zero, at most one dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 36.4.1. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *formally unramified* if given any solid commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & T \\ f \downarrow & \nearrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists at most one dotted arrow making the diagram commute.

We first prove some formal lemmas, i.e., lemmas which can be proved by drawing the corresponding diagrams.

Lemma 36.4.2. *If $f : X \rightarrow S$ is a formally unramified morphism, then given any solid commutative diagram*

$$\begin{array}{ccc} X & \longleftarrow & T \\ f \downarrow & \nearrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of schemes over S there exists at most one dotted arrow making the diagram commute. In other words, in Definition 36.4.1 the condition that T be affine may be dropped.

Proof. This is true because a morphism is determined by its restrictions to affine opens. \square

Lemma 36.4.3. *A composition of formally unramified morphisms is formally unramified.*

Proof. This is formal. \square

Lemma 36.4.4. *A base change of a formally unramified morphism is formally unramified.*

Proof. This is formal. \square

Lemma 36.4.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open such that $f(U) \subset V$. If f is formally unramified, so is $f|_U : U \rightarrow V$.*

Proof. Consider a solid diagram

$$\begin{array}{ccc} U & \longleftarrow & T \\ f|_U \downarrow & \nearrow a & \downarrow i \\ V & \longleftarrow & T' \end{array}$$

as in Definition 36.4.1. If f is formally ramified, then there exists at most one S -morphism $a' : T' \rightarrow X$ such that $a'|_T = a$. Hence clearly there exists at most one such morphism into U . \square

Lemma 36.4.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume X and S are affine. Then f is formally unramified if and only if $\mathcal{O}_S(S) \rightarrow \mathcal{O}_X(X)$ is a formally unramified ring map.*

Proof. This is immediate from the definitions (Definition 36.4.1 and Algebra, Definition 10.141.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5. \square

Here is a characterization in terms of the sheaf of differentials.

Lemma 36.4.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Then f is formally unramified if and only if $\Omega_{X/S} = 0$.*

Proof. We give two proofs.

First proof. It suffices to show that $\Omega_{X/S}$ is zero on the members of an affine open covering of X . Choose an affine open $U \subset X$ with $f(U) \subset V$ where $V \subset S$ is an affine open of S . By Lemma 36.4.5 the restriction $f_U : U \rightarrow V$ is formally unramified. By Morphisms, Lemma 28.34.5 we see that $\Omega_{X/S}|_U$ is the quasi-coherent sheaf associated to the $\mathcal{O}_X(U)$ -module $\Omega_{\mathcal{O}_X(U)/\mathcal{O}_S(V)}$. By Lemma 36.4.6 we see that $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is a formally unramified ring map. Hence by Algebra, Lemma 10.141.2 we conclude that $\Omega_{X/S}|_U = 0$ as desired.

Second proof. We recall some of the arguments of the proof of Morphisms, Lemma 28.34.5. Let $W \subset X \times_S X$ be an open such that $\Delta : X \rightarrow X \times_S X$ induces a closed immersion into W . Let $\mathcal{J} \subset \mathcal{O}_W$ be the ideal sheaf of this closed immersion. Let $X' \subset W$ be the closed subscheme defined by the quasi-coherent sheaf of ideals \mathcal{J}^2 . Consider the two morphisms $p_1, p_2 : X' \rightarrow X$ induced by the two projections $X \times_S X \rightarrow X$. Note that p_1 and p_2 agree when composed with $\Delta : X \rightarrow X'$ and that $X \rightarrow X'$ is a closed immersion defined by an ideal whose square is zero. Moreover there is a short exact sequence

$$0 \rightarrow \mathcal{J}/\mathcal{J}^2 \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$$

and $\Omega_{X/S} = \mathcal{J}/\mathcal{J}^2$. Moreover, $\mathcal{J}/\mathcal{J}^2$ is generated by the local sections $p_1^\sharp(f) - p_2^\sharp(f)$ for f a local section of \mathcal{O}_X .

Suppose that $f : X \rightarrow S$ is formally unramified. By assumption this means that $p_1 = p_2$ when restricted to any affine open $T' \subset X'$. Hence $p_1 = p_2$. By what was said above we conclude that $\Omega_{X/S} = \mathcal{J}/\mathcal{J}^2 = 0$.

Conversely, suppose that $\Omega_{X/S} = 0$. Then $X' = X$. Take any pair of morphisms $f'_1, f'_2 : T' \rightarrow X$ fitting as dotted arrows in the diagram of Definition 36.4.1. This gives a morphism $(f'_1, f'_2) : T' \rightarrow X \times_S X$. Since $f'_1|_T = f'_2|_T$ and $|T| = |T'|$ we see that the image of T' under (f'_1, f'_2) is contained in the open W chosen above. Since $(f'_1, f'_2)(T) \subset \Delta(X)$ and since T is defined by an ideal of square zero in T' we see that (f'_1, f'_2) factors through X' . As $X' = X$ we conclude $f'_1 = f'_2$ as desired. \square

Lemma 36.4.8. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is unramified (resp. G -unramified), and*
- (2) *the morphism f is locally of finite type (resp. locally of finite presentation) and formally unramified.*

Proof. Use Lemma 36.4.7 and Morphisms, Lemma 28.36.2. \square

36.5. Universal first order thickenings

Let $h : Z \rightarrow X$ be a morphism of schemes. A *universal first order thickening* of Z over X is a first order thickening $Z \subset Z'$ over X such that given any first order thickening $T \subset T'$ over X and a solid commutative diagram

$$\begin{array}{ccc}
 & Z & \longleftarrow & T & \\
 & \swarrow & & \searrow & \\
 & Z' & \overset{\cdots a' \cdots}{\longleftarrow} & T' & \\
 & \searrow & & \swarrow & \\
 & & X & &
 \end{array}$$

there exists a unique dotted arrow making the diagram commute. Note that in this situation $(a, a') : (T \subset T') \rightarrow (Z \subset Z')$ is a morphism of thickenings over X . Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if h is formally unramified then it does.

Lemma 36.5.1. *Let $h : Z \rightarrow X$ be a formally unramified morphism of schemes. There exists a universal first order thickening $Z \subset Z'$ of Z over X .*

Proof. During this proof we will say $Z \subset Z'$ is a universal first order thickening of Z over X if it satisfies the condition of the lemma. We will construct the universal first order thickening $Z \subset Z'$ over X by glueing, starting with the affine case which is Algebra, Lemma 10.142.1. We begin with some general remarks.

If a universal first order thickening of Z over X exists, then it is unique up to unique isomorphism. Moreover, suppose that $V \subset Z$ and $U \subset X$ are open subschemes such that $h(V) \subset U$. Let $Z \subset Z'$ be a universal first order thickening of Z over X . Let $V' \subset Z'$ be the open subscheme such that $V = Z \cap V'$. Then we claim that $V \subset V'$ is the universal first order thickening of V over U . Namely, suppose given any diagram

$$\begin{array}{ccc}
 V & \longleftarrow & T \\
 h \downarrow & & \downarrow \\
 U & \longleftarrow & T'
 \end{array}$$

where $T \subset T'$ is a first order thickening over U . By the universal property of Z' we obtain $(a, a') : (T \subset T') \rightarrow (Z \subset Z')$. But since we have equality $|T| = |T'|$ of underlying topological spaces we see that $a'(T') \subset V'$. Hence we may think of (a, a') as a morphism of thickenings $(a, a') : (T \subset T') \rightarrow (V \subset V')$ over U . Uniqueness is clear also. In a completely similar manner one proves that if $h(Z) \subset U$ and $Z \subset Z'$ is a universal first order thickening over U , then $Z \subset Z'$ is a universal first order thickening over X .

Before we glue affine pieces let us show that the lemma holds if Z and X are affine. Say $X = \text{Spec}(R)$ and $Z = \text{Spec}(S)$. By Algebra, Lemma 10.142.1 there exists a first order thickening $Z \subset Z'$ over X which has the universal property of the lemma

for diagrams

$$\begin{array}{ccc} Z & \xleftarrow{a} & T \\ h \downarrow & & \downarrow \\ X & \xleftarrow{b} & T' \end{array}$$

where T, T' are affine. Given a general diagram we can choose an affine open covering $T' = \bigcup T'_i$ and we obtain morphisms $a'_i : T'_i \rightarrow Z'$ over X such that $a'_i|_{T'_i} = a|_{T'_i}$. By uniqueness we see that a'_i and a'_j agree on any affine open of $T'_i \cap T'_j$. Hence the morphisms a'_i glue to a global morphism $a' : T' \rightarrow Z'$ over X as desired. Thus the lemma holds if X and Z are affine.

Choose an affine open covering $Z = \bigcup Z_i$ such that each Z_i maps into an affine open U_i of X . By Lemma 36.4.5 the morphisms $Z_i \rightarrow U_i$ are formally unramified. Hence by the affine case we obtain universal first order thickenings $Z_i \subset Z'_i$ over U_i . By the general remarks above $Z_i \subset Z'_i$ is also a universal first order thickening of Z_i over X . Let $Z'_{i,j} \subset Z'_i$ be the open subscheme such that $Z_i \cap Z_j = Z'_{i,j} \cap Z_i$. By the general remarks we see that both $Z'_{i,j}$ and $Z'_{j,i}$ are universal first order thickenings of $Z_i \cap Z_j$ over X . Thus, by the first of our general remarks, we see that there is a canonical isomorphism $\varphi_{ij} : Z'_{i,j} \rightarrow Z'_{j,i}$ inducing the identity on $Z_i \cap Z_j$. We claim that these morphisms satisfy the cocycle condition of Schemes, Section 25.14. (Verification omitted. Hint: Use that $Z'_{i,j} \cap Z'_{i,k}$ is the universal first order thickening of $Z_i \cap Z_j \cap Z_k$ which determines it up to unique isomorphism by what was said above.) Hence we can use the results of Schemes, Section 25.14 to get a first order thickening $Z \subset Z'$ over X which the property that the open subscheme $Z'_i \subset Z'$ with $Z_i = Z'_i \cap Z$ is a universal first order thickening of Z_i over X .

It turns out that this implies formally that Z' is a universal first order thickening of Z over X . Namely, we have the universal property for any diagram

$$\begin{array}{ccc} Z & \xleftarrow{a} & T \\ h \downarrow & & \downarrow \\ X & \xleftarrow{b} & T' \end{array}$$

where $a(T)$ is contained in some Z_i . Given a general diagram we can choose an open covering $T' = \bigcup T'_i$ such that $a(T'_i) \subset Z_i$. We obtain morphisms $a'_i : T'_i \rightarrow Z'$ over X such that $a'_i|_{T'_i} = a|_{T'_i}$. We see that a'_i and a'_j necessarily agree on $T'_i \cap T'_j$ since both $a'_i|_{T'_i \cap T'_j}$ and $a'_j|_{T'_i \cap T'_j}$ are solutions of the problem of mapping into the universal first order thickening $Z'_i \cap Z'_j$ of $Z_i \cap Z_j$ over X . Hence the morphisms a'_i glue to a global morphism $a' : T' \rightarrow Z'$ over X as desired. This finishes the proof. \square

Definition 36.5.2. Let $h : Z \rightarrow X$ be a formally unramified morphism of schemes.

- (1) The *universal first order thickening* of Z over X is the thickening $Z \subset Z'$ constructed in Lemma 36.5.1.
- (2) The *conormal sheaf of Z over X* is the conormal sheaf of Z in its universal first order thickening Z' over X .

We often denote the conormal sheaf $\mathcal{C}_{Z/X}$ in this situation.

Thus we see that there is a short exact sequence of sheaves

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{O}_{Z'} \rightarrow \mathcal{O}_Z \rightarrow 0$$

on Z . The following lemma proves that there is no conflict between this definition and the definition in case $Z \rightarrow X$ is an immersion.

Lemma 36.5.3. *Let $i : Z \rightarrow X$ be an immersion of schemes. Then*

- (1) *i is formally unramified,*
- (2) *the universal first order thickening of Z over X is the first order infinitesimal neighbourhood of Z in X of Definition 36.3.1, and*
- (3) *the conormal sheaf of i in the sense of Morphisms, Definition 28.33.1 agrees with the conormal sheaf of i in the sense of Definition 36.5.2.*

Proof. By Morphisms, Lemmas 28.36.7 and 28.36.8 an immersion is unramified, hence formally unramified by Lemma 36.4.8. The other assertions follow by combining Lemmas 36.3.2 and 36.3.3 and the definitions. \square

Lemma 36.5.4. *Let $Z \rightarrow X$ be a formally unramified morphism of schemes. Then the universal first order thickening Z' is formally unramified over X .*

Proof. There are two proofs. The first is to show that $\Omega_{Z'/X} = 0$ by working affine locally and applying Algebra, Lemma 10.142.5. Then Lemma 36.4.7 implies what we want. The second is a direct argument as follows.

Let $T \subset T'$ be a first order thickening. Let

$$\begin{array}{ccc} Z' & \xleftarrow{c} & T \\ \downarrow & \swarrow a,b & \downarrow \\ X & \xleftarrow{\quad} & T' \end{array}$$

be a commutative diagram. Consider two morphisms $a, b : T' \rightarrow Z'$ fitting into the diagram. Set $T_0 = c^{-1}(Z) \subset T$ and $T'_a = a^{-1}(Z)$ (scheme theoretically). Since Z' is a first order thickening of Z , we see that T' is a first order thickening of T'_a . Moreover, since $c = a|_T$ we see that $T_0 = T \cap T'_a$ (scheme theoretically). As T' is a first order thickening of T it follows that T'_a is a first order thickening of T_0 . Now $a|_{T'_a}$ and $b|_{T'_a}$ are morphisms of T'_a into Z' over X which agree on T_0 as morphisms into Z . Hence by the universal property of Z' we conclude that $a|_{T'_a} = b|_{T'_a}$. Thus a and b are morphism from the first order thickening T' of T'_a whose restrictions to T'_a agree as morphisms into Z . Thus using the universal property of Z' once more we conclude that $a = b$. In other words, the defining property of a formally unramified morphism holds for $Z' \rightarrow X$ as desired. \square

Lemma 36.5.5. *Consider a commutative diagram of schemes*

$$\begin{array}{ccc} Z & \xrightarrow{h} & X \\ f \downarrow & & \downarrow g \\ W & \xrightarrow{h'} & Y \end{array}$$

with h and h' formally unramified. Let $Z \subset Z'$ be the universal first order thickening of Z over X . Let $W \subset W'$ be the universal first order thickening of W over Y .

There exists a canonical morphism $(f, f') : (Z, Z') \rightarrow (W, W')$ of thickenings over Y which fits into the following commutative diagram

In particular the morphism (f, f') of thickenings induces a morphism of conormal sheaves $f^*C_{W/Y} \rightarrow C_{Z/X}$.

Proof. The first assertion is clear from the universal property of W' . The induced map on conormal sheaves is the map of Morphisms, Lemma 28.33.3 applied to $(Z \subset Z') \rightarrow (W \subset W')$. \square

Lemma 36.5.6. *Let*

be a fibre product diagram in the category of schemes with h' formally unramified. Then h is formally unramified and if $W \subset W'$ is the universal first order thickening of W over Y , then $Z = X \times_Y W \subset X \times_Y W'$ is the universal first order thickening of Z over X . In particular the canonical map $f^*C_{W/Y} \rightarrow C_{Z/X}$ of Lemma 36.5.5 is surjective.

Proof. The morphism h is formally unramified by Lemma 36.4.4. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Morphisms, Lemma 28.33.4 for why this implies that the map of conormal sheaves is surjective. \square

Lemma 36.5.7. *Let*

be a fibre product diagram in the category of schemes with h' formally unramified and g flat. In this case the corresponding map $Z' \rightarrow W'$ of universal first order thickenings is flat, and $f^*C_{W/Y} \rightarrow C_{Z/X}$ is an isomorphism.

Proof. Flatness is preserved under base change, see Morphisms, Lemma 28.26.7. Hence the first statement follows from the description of W' in Lemma 36.5.6. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Morphisms, Lemma 28.33.4 for why this implies that the map of conormal sheaves is an isomorphism. \square

Lemma 36.5.8. *Taking the universal first order thickenings commutes with taking opens. More precisely, let $h : Z \rightarrow X$ be a formally unramified morphism of schemes. Let $V \subset Z$, $U \subset X$ be opens such that $h(V) \subset U$. Let Z' be the universal first order thickening of Z over X . Then $h|_V : V \rightarrow U$ is formally unramified and the universal first order thickening of V over U is the open subscheme $V' \subset Z'$ such that $V = Z \cap V'$. In particular, $\mathcal{C}_{Z/X}|_V = \mathcal{C}_{V/U}$.*

Proof. The first statement is Lemma 36.4.5. The compatibility of universal thickenings can be deduced from the proof of Lemma 36.5.1, or from Algebra, Lemma 10.142.4 or deduced from Lemma 36.5.7. \square

Lemma 36.5.9. *Let $h : Z \rightarrow X$ be a formally unramified morphism of schemes over S . Let $Z \subset Z'$ be the universal first order thickening of Z over X with structure morphism $h' : Z' \rightarrow X$. The canonical map*

$$c_{h'} : (h')^* \Omega_{X/S} \longrightarrow \Omega_{Z'/S}$$

induces an isomorphism $h^ \Omega_{X/S} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z$.*

Proof. The map $c_{h'}$ is the map defined in Morphisms, Lemma 28.34.8. If $i : Z \rightarrow Z'$ is the given closed immersion, then $i^* c_{h'}$ is a map $h^* \Omega_{X/S} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z$. Checking that it is an isomorphism reduces to the affine case by localization, see Lemma 36.5.8 and Morphisms, Lemma 28.34.3. In this case the result is Algebra, Lemma 10.142.5. \square

Lemma 36.5.10. *Let $h : Z \rightarrow X$ be a formally unramified morphism of schemes over S . There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \rightarrow h^* \Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0.$$

The first arrow is induced by $d_{Z'/S}$ where Z' is the universal first order neighbourhood of Z over X .

Proof. We know that there is a canonical exact sequence

$$\mathcal{C}_{Z/Z'} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z \rightarrow \Omega_{Z/S} \rightarrow 0.$$

see Morphisms, Lemma 28.34.15. Hence the result follows on applying Lemma 36.5.9. \square

Lemma 36.5.11. *Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ & \searrow i & \downarrow \\ & & Y \\ & \swarrow j & \\ & & \end{array}$$

be a commutative diagram of schemes where i and j are formally unramified. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

where the first arrow comes from Lemma 36.5.5 and the second from Lemma 36.5.10.

Proof. Denote $Z \rightarrow Z'$ the universal first order thickening of Z over X . Denote $Z \rightarrow Z''$ the universal first order thickening of Z over Y . By Lemma 36.5.10 here is a canonical morphism $Z' \rightarrow Z''$ so that we have a commutative diagram

$$\begin{array}{ccccc} Z & \longrightarrow & Z' & \longrightarrow & X \\ & \searrow^{i'} & \downarrow & & \downarrow \\ & & Z'' & \longrightarrow & Y \end{array}$$

Apply Morphisms, Lemma 28.34.18 to the left triangle to get an exact sequence

$$\mathcal{C}_{Z/Z''} \rightarrow \mathcal{C}_{Z/Z'} \rightarrow (i')^* \Omega_{Z'/Z''} \rightarrow 0$$

As Z'' is formally unramified over Y (see Lemma 36.5.4) we have $\Omega_{Z'/Z''} = \Omega_{Z/Y}$ (by combining Lemma 36.4.7 and Morphisms, Lemma 28.34.9). Then we have $(i')^* \Omega_{Z'/Z''} = i'^* \Omega_{Z/Y}$ by Lemma 36.5.9. \square

Lemma 36.5.12. *Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of schemes.*

- (1) *If $Z \subset Z'$ is the universal first order thickening of Z over X and $Y \subset Y'$ is the universal first order thickening of Y over X , then there is a morphism $Z' \rightarrow Y'$ and $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y .*
- (2) *There is a canonical exact sequence*

$$i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

where the maps come from Lemma 36.5.5 and $i : Z \rightarrow Y$ is the first morphism.

Proof. The map $h : Z' \rightarrow Y'$ in (1) comes from Lemma 36.5.5. The assertion that $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y is clear from the universal properties of Z' and Y' . By Morphisms, Lemma 28.33.5 we have an exact sequence

$$(i')^* \mathcal{C}_{Y \times_{Y'} Z'/Z'} \rightarrow \mathcal{C}_{Z/Z'} \rightarrow \mathcal{C}_{Z/Y \times_{Y'} Z'} \rightarrow 0$$

where $i' : Z \rightarrow Y \times_{Y'} Z'$ is the given morphism. By Morphisms, Lemma 28.33.4 there exists a surjection $h^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{Y \times_{Y'} Z'/Z'}$. Combined with the equalities $\mathcal{C}_{Y/Y'} = \mathcal{C}_{Y/X}$, $\mathcal{C}_{Z/Z'} = \mathcal{C}_{Z/X}$, and $\mathcal{C}_{Z/Y \times_{Y'} Z'} = \mathcal{C}_{Z/Y}$ this proves the lemma. \square

36.6. Formally étale morphisms

Recall that a ring map $R \rightarrow A$ is called *formally étale* (see Algebra, Definition 10.143.1) if for every commutative solid diagram

$$\begin{array}{ccc} A & \longrightarrow & B/I \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & B \end{array}$$

where $I \subset B$ is an ideal of square zero, there exists exactly one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 36.6.1. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *formally étale* if given any solid commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & T \\ f \downarrow & \nearrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists exactly one dotted arrow making the diagram commute.

It is clear that a formally étale morphism is formally unramified. Hence if $f : X \rightarrow S$ is formally étale, then $\Omega_{X/S}$ is zero, see Lemma 36.4.7.

Lemma 36.6.2. *If $f : X \rightarrow S$ is a formally étale morphism, then given any solid commutative diagram*

$$\begin{array}{ccc} X & \longleftarrow & T \\ f \downarrow & \nearrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of schemes over S there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 36.6.1 the condition that T be affine may be dropped.

Proof. Let $T' = \bigcup T'_i$ be an affine open covering, and let $T_i = T \cap T'_i$. Then we get morphisms $a'_i : T'_i \rightarrow X$ fitting into the diagram. By uniqueness we see that a'_i and a'_j agree on any affine open subscheme of $T'_i \cap T'_j$. Hence a'_i and a'_j agree on $T'_i \cap T'_j$. Thus we see that the morphisms a'_i glue to a global morphism $a' : T' \rightarrow X$. The uniqueness of a' we have seen in Lemma 36.4.2. \square

Lemma 36.6.3. *A composition of formally étale morphisms is formally étale.*

Proof. This is formal. \square

Lemma 36.6.4. *A base change of a formally étale morphism is formally étale.*

Proof. This is formal. \square

Lemma 36.6.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If f is formally étale, so is $f|_U : U \rightarrow V$.*

Proof. Consider a solid diagram

$$\begin{array}{ccc} U & \longleftarrow & T \\ f|_U \downarrow & \nearrow a & \downarrow i \\ V & \longleftarrow & T' \end{array}$$

as in Definition 36.6.1. If f is formally ramified, then there exists exactly one S -morphism $a' : T' \rightarrow X$ such that $a'|_T = a$. Since $|T'| = |T|$ we conclude that $a'(T') \subset U$ which gives our unique morphism from T' into U . \square

Lemma 36.6.6. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) f is formally étale,

- (2) f is formally unramified and the universal first order thickening of X over S is equal to X ,
- (3) f is formally unramified and $\mathcal{C}_{X/S} = 0$, and
- (4) $\Omega_{X/S} = 0$ and $\mathcal{C}_{X/S} = 0$.

Proof. Actually, the last assertion only make sense because $\Omega_{X/S} = 0$ implies that $\mathcal{C}_{X/S}$ is defined via Lemma 36.4.7 and Definition 36.5.2. This also makes it clear that (3) and (4) are equivalent.

Either of the assumptions (1), (2), and (3) imply that f is formally unramified. Hence we may assume f is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening X' of X over S and the fact that $X = X' \Leftrightarrow \mathcal{C}_{X/S} = 0$ since after all by definition $\mathcal{C}_{X/S} = \mathcal{C}_{X/X'}$ is the ideal sheaf of X in X' . \square

Lemma 36.6.7. *An unramified flat morphism is formally étale.*

Proof. Say $X \rightarrow S$ is unramified and flat. Then $\Delta : X \rightarrow X \times_S X$ is an open immersion, see Morphisms, Lemma 28.36.13. We have to show that $\mathcal{C}_{X/S}$ is zero. Consider the two projections $p, q : X \times_S X \rightarrow X$. As f is formally unramified (see Lemma 36.4.8), q is formally unramified (see Lemma 36.4.4). As f is flat, p is flat, see Morphisms, Lemma 28.26.7. Hence $p^*\mathcal{C}_{X/S} = \mathcal{C}_q$ by Lemma 36.5.7 where \mathcal{C}_q denotes the conormal sheaf of the formally unramified morphism $q : X \times_S X \rightarrow X$. But $\Delta(X) \subset X \times_S X$ is an open subscheme which maps isomorphically to X via q . Hence by Lemma 36.5.8 we see that $\mathcal{C}_q|_{\Delta(X)} = \mathcal{C}_{X/X} = 0$. In other words, the pullback of $\mathcal{C}_{X/S}$ to X via the identity morphism is zero, i.e., $\mathcal{C}_{X/S} = 0$. \square

Lemma 36.6.8. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume X and S are affine. Then f is formally étale if and only if $\mathcal{O}_S(S) \rightarrow \mathcal{O}_X(X)$ is a formally étale ring map.*

Proof. This is immediate from the definitions (Definition 36.6.1 and Algebra, Definition 10.143.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5. \square

Lemma 36.6.9. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is étale, and*
- (2) *the morphism f is locally of finite presentation and formally étale.*

Proof. Assume f is étale. An étale morphism is locally of finite presentation, flat and unramified, see Morphisms, Section 28.37. Hence f is locally of finite presentation and formally étale, see Lemma 36.6.7.

Conversely, suppose that f is locally of finite presentation and formally étale. Being étale is local in the Zariski topology on X and S , see Morphisms, Lemma 28.37.2. By Lemma 36.6.5 we can cover X by affine opens U which map into affine opens V such that $U \rightarrow V$ is formally étale (and of finite presentation, see Morphisms, Lemma 28.22.2). By Lemma 36.6.8 we see that the ring maps $\mathcal{O}(V) \rightarrow \mathcal{O}(U)$ are formally étale (and of finite presentation). We win by Algebra, Lemma 10.143.2. (We will give another proof of this implication when we discuss formally smooth morphisms.) \square

36.7. Infinitesimal deformations of maps

In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening X' of X can be seen as a sheaf on X .

Lemma 36.7.1. *Let S be a scheme. Let $X \subset X'$ and $Y \subset Y'$ be two first order thickenings over S . Let $(a, a'), (b, b') : (X \subset X') \rightarrow (Y \subset Y')$ be two morphisms of thickenings over S . Assume that*

- (1) $a = b$, and
- (2) the two maps $a^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ (Morphisms, Lemma 28.33.3) are equal.

Then the map $(a')^\sharp - (b')^\sharp$ factors as

$$\mathcal{O}_{Y'} \rightarrow \mathcal{O}_Y \xrightarrow{D} a_* \mathcal{C}_{X/X'} \rightarrow a_* \mathcal{O}_{X'}$$

where D is an \mathcal{O}_S -derivation.

Proof. Instead of working on Y we work on X . The advantage is that the pullback functor a^{-1} is exact. Using (1) and (2) we obtain a commutative diagram with exact rows

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathcal{C}_{X/X'} & \longrightarrow & \mathcal{O}_{X'} & \longrightarrow & \mathcal{O}_X & \longrightarrow & 0 \\ & & \uparrow & & \uparrow \uparrow & & \uparrow & & \\ & & & & (a')^\sharp & & (b')^\sharp & & \\ 0 & \longrightarrow & a^{-1} \mathcal{C}_{Y/Y'} & \longrightarrow & a^{-1} \mathcal{O}_{Y'} & \longrightarrow & a^{-1} \mathcal{O}_Y & \longrightarrow & 0 \end{array}$$

Now it is a general fact that in such a situation the difference of the \mathcal{O}_S -algebra maps $(a')^\sharp$ and $(b')^\sharp$ is an \mathcal{O}_S -derivation from $a^{-1} \mathcal{O}_Y$ to $\mathcal{C}_{X/X'}$. By adjointness of the functors a^{-1} and a_* this is the same thing as an \mathcal{O}_S -derivation from \mathcal{O}_Y into $a_* \mathcal{C}_{X/X'}$. Some details omitted. \square

Note that in the situation of the lemma above we may write D as

$$(36.7.1.1) \quad D = d_{Y/S} \circ \theta$$

where θ is an \mathcal{O}_Y -linear map $\theta : \Omega_{Y/S} \rightarrow a_* \mathcal{C}_{X/X'}$. Of course, then by adjunction again we may view θ as an \mathcal{O}_X -linear map $\theta : a^* \Omega_{Y/S} \rightarrow \mathcal{C}_{X/X'}$.

Lemma 36.7.2. *Let S be a scheme. Let $(a, a') : (X \subset X') \rightarrow (Y \subset Y')$ be a morphism of first order thickenings over S . Let*

$$\theta : a^* \Omega_{Y/S} \rightarrow \mathcal{C}_{X/X'}$$

be an \mathcal{O}_X -linear map. Then there exists a unique morphism of pairs $(b, b') : (X \subset X') \rightarrow (Y \subset Y')$ such that (1) and (2) of Lemma 36.7.1 hold and the derivation D and θ are related by Equation (36.7.1.1).

Proof. We simply set $b = a$ and we define $(b')^\sharp$ to be the map

$$(a')^\sharp + D : a^{-1} \mathcal{O}_{Y'} \rightarrow \mathcal{O}_{X'}$$

where D is as in Equation (36.7.1.1). We omit the verification that $(b')^\sharp$ is a map of sheaves of \mathcal{O}_S -algebras and that (1) and (2) of Lemma 36.7.1 hold. Equation (36.7.1.1) holds by construction. \square

Lemma 36.7.3. *Let S be a scheme. Let $X \subset X'$ and $Y \subset Y'$ be first order thickenings over S . Assume given a morphism $a : X \rightarrow Y$ and a map $A : a^*\mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ of \mathcal{O}_X -modules. For an open subscheme $U' \subset X'$ consider morphisms $a' : U' \rightarrow Y'$ such that*

- (1) a' is a morphism over S ,
- (2) $a'|_U = a|_U$, and
- (3) the induced map $a^*\mathcal{C}_{Y/Y'}|_U \rightarrow \mathcal{C}_{X/X'}|_U$ is the restriction of A to U .

Here $U = X \cap U'$. Then the rule

$$(36.7.3.1) \quad U' \mapsto \{a' : U' \rightarrow Y' \text{ such that (1), (2), (3) hold.}\}$$

defines a sheaf of sets on X' .

Proof. Denote \mathcal{F} the rule of the lemma. The restriction mapping $\mathcal{F}(U') \rightarrow \mathcal{F}(V')$ for $V' \subset U' \subset X'$ of \mathcal{F} is really the restriction map $a' \mapsto a'|_{V'}$. With this definition in place it is clear that \mathcal{F} is a sheaf since morphisms are defined locally. \square

In the following lemma we identify sheaves on X and any thickening of X .

Lemma 36.7.4. *Same notation and assumptions as in Lemma 36.7.3. There is an action of the sheaf*

$$\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/S}, \mathcal{C}_{X/X'})$$

on the sheaf (36.7.3.1). Moreover, the action is simply transitive for any open $U' \subset X'$ over which the sheaf (36.7.3.1) has a section.

Proof. This is a combination of Lemmas 36.7.1, 36.7.2, and 36.7.3. \square

Remark 36.7.5. A special case of Lemmas 36.7.1, 36.7.2, 36.7.3, and 36.7.4 is where $Y = Y'$. In this case the map A is always zero. The sheaf of Lemma 36.7.3 is just given by the rule

$$U' \mapsto \{a' : U' \rightarrow Y \text{ over } S \text{ with } a'|_U = a|_U\}$$

and we act on this by the sheaf $\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/S}, \mathcal{C}_{X/X'})$. The action of a local section θ on a' is sometimes indicated by $\theta \cdot a'$. Note that this means nothing else than the fact that $(a')^\sharp$ and $(\theta \cdot a')^\sharp$ differ by a derivation D which is related to θ by Equation (36.7.1.1).

Lemma 36.7.6. *Let S be a scheme. Let $X \subset X'$ be a first order thickening over S . Let Y be a scheme over S . Let $a', b' : X' \rightarrow Y$ be two morphisms over S with $a = a'|_X = b'|_X$. This gives rise to a commutative diagram*

$$\begin{array}{ccc} X & \longrightarrow & X' \\ a \downarrow & & \downarrow (b', a') \\ Y & \xrightarrow{\Delta_{Y/S}} & Y \times_S Y \end{array}$$

Since the horizontal arrows are immersions with conormal sheaves $\mathcal{C}_{X/X'}$ and $\Omega_{Y/S}$, by Morphisms, Lemma 28.33.3, we obtain a map $\theta : a^\Omega_{Y/S} \rightarrow \mathcal{C}_{X/X'}$. Then this θ and the derivation D of Lemma 36.7.1 are related by Equation (36.7.1.1).*

Proof. Omitted. Hint: The equality may be checked on affine opens where it comes from the following computation. If f is a local section of \mathcal{O}_Y , then $1 \otimes f - f \otimes 1$ is a local section of $\mathcal{C}_{Y/(Y \times_S Y)}$ corresponding to $d_{Y/S}(f)$. It is mapped to the local section $(a')^\sharp(f) - (b')^\sharp(f) = D(f)$ of $\mathcal{C}_{X/X'}$. In other words, $\theta(d_{Y/S}(f)) = D(f)$. \square

For later purposes we need a result that roughly states that the construction of Lemma 36.7.2 is compatible with étale localization.

Lemma 36.7.7. *Let*

$$\begin{array}{ccc} X_1 & \xleftarrow{f} & X_2 \\ \downarrow & & \downarrow \\ S_1 & \xleftarrow{\quad} & S_2 \end{array}$$

be a commutative diagram of schemes with $X_2 \rightarrow X_1$ and $S_2 \rightarrow S_1$ étale. Then the map $c_f : f^*\Omega_{X_1/S_1} \rightarrow \Omega_{X_2/S_2}$ of Morphisms, Lemma 28.34.8 is an isomorphism.

Proof. We recall that an étale morphism $U \rightarrow V$ is a smooth morphism with $\Omega_{U/V} = 0$. Using this we see that Morphisms, Lemma 28.34.9 implies $\Omega_{X_2/S_2} = \Omega_{X_2/S_1}$ and Morphisms, Lemma 28.35.16 implies that the map $f^*\Omega_{X_1/S_1} \rightarrow \Omega_{X_2/S_1}$ (for the morphism f seen as a morphism over S_1) is an isomorphism. Hence the lemma follows. \square

Lemma 36.7.8. *Consider a commutative diagram of schemes*

$$\begin{array}{ccccc} T_2 & \longrightarrow & T'_2 & \xrightarrow{a'_2} & X_2 \\ \downarrow h & & \downarrow h' & \searrow f & \downarrow \\ T_1 & \longrightarrow & T'_1 & \xrightarrow{a'_1} & X_1 \\ & & & & \downarrow \\ & & & & S_1 \longleftarrow S_2 \end{array}$$

and assume that

- (1) $i_1 : T_1 \rightarrow T'_1$ is a first order thickening,
- (2) $i_2 : T_2 \rightarrow T'_2$ is a first order thickening, and
- (3) $X_2 \rightarrow X_1$ and $S_2 \rightarrow S_1$ are étale.

Write $a_i = a'_i \circ i_k$ for $k = 1, 2$. For any \mathcal{O}_{T_1} -linear map $\theta_1 : a_1^*\Omega_{X_1/S_1} \rightarrow \mathcal{C}_{T_1/T'_1}$ let θ_2 be the composition

$$a_2^*\Omega_{X_2/S_2} \xlongequal{\quad} h^*a_1^*\Omega_{X_1/S_1} \xrightarrow{h^*\theta_1} h^*\mathcal{C}_{T_1/T'_1} \longrightarrow \mathcal{C}_{T_2/T'_2}$$

(equality sign is explained in the proof). Then the diagram

$$\begin{array}{ccc} T'_2 & \xrightarrow{\theta_2 \cdot a'_2} & X_2 \\ \downarrow & & \downarrow \\ T'_1 & \xrightarrow{\theta_1 \cdot a'_1} & X_1 \end{array}$$

commutes where the actions $\theta_2 \cdot a'_2$ and $\theta_1 \cdot a'_1$ are as in Remark 36.7.5.

Proof. The equality sign comes from the identification $f^*\Omega_{X_1/S_1} = \Omega_{X_2/S_2}$ of Lemma 36.7.7. Namely, using this we have $a_2^*\Omega_{X_2/S_2} = a_2^*f^*\Omega_{X_1/S_1} = h^*a_1^*\Omega_{X_1/S_1}$ because $f \circ a_2 = a_1 \circ h$. Having said this, the commutativity of the diagram may

be checked on affine opens. Hence we may assume the schemes in the initial big diagram are affine. Thus we obtain a commutative diagram of rings

$$\begin{array}{ccccc}
 B_2/I_2 & \longleftarrow & B_2 & \longleftarrow & A_2 \\
 \uparrow & & \uparrow h' & & \nearrow f \\
 B_1/I_1 & \longleftarrow & B_1 & \longleftarrow & A_1 \\
 & & \uparrow a'_1 & & \uparrow \\
 & & R_1 & \longrightarrow & R_2
 \end{array}$$

with $I_1^2 = 0$ and $I_2^2 = 0$ and moreover with the property that $A_2 \otimes_{A_1} \Omega_{A_1/R_1} \rightarrow \Omega_{A_2/R_2}$ is an isomorphism. Then $\theta_1 : B_1/I_1 \otimes_{A_1} \Omega_{A_1/R_1} \rightarrow I_1$ is B_1 -linear. This gives an R_1 -derivation $D_1 = \theta_1 \circ d_{A_1/R_1} : A_1 \rightarrow I_1$. In a similar way we see that $\theta_2 : B_2/I_2 \otimes_{A_2} \Omega_{A_2/R_2} \rightarrow I_2$ gives rise to a R_2 -derivation $D_2 = \theta_2 \circ d_{A_2/R_2} : A_2 \rightarrow I_2$. The construction of θ_2 implies the following compatibility between θ_1 and θ_2 : for every $x \in A_1$ we have

$$h'(D_1(x)) = D_2(f(x))$$

as elements of I_2 . Now by the construction of the action in Lemma 36.7.2 and Remark 36.7.5 we know that $\theta_1 \cdot a'_1$ corresponds to the ring map $a'_1 + D_1 : A_1 \rightarrow B_1$ and $\theta_2 \cdot a'_2$ corresponds to the ring map $a'_2 + D_2 : A_2 \rightarrow B_2$. By the displayed equality above we obtain that $h' \circ (a'_1 + D_1) = (a'_2 + D_2) \circ f$ as desired. \square

Remark 36.7.9. Lemma 36.7.8 can be improved in the following way. Suppose that we have a commutative diagram of schemes as in Lemma 36.7.8 but we do not assume that $X_2 \rightarrow X_1$ and $S_2 \rightarrow S_1$ are étale. Next, suppose we have $\theta_1 : a_1^* \Omega_{X_1/S_1} \rightarrow \mathcal{I}_1$ and $\theta_2 : a_2^* \Omega_{X_2/S_2} \rightarrow \mathcal{I}_2$ such that for a local section t of \mathcal{O}_{X_1} we have $(h')^* \theta_1(a_1^*(d_{X_1/S_1}(t))) = \theta_2(a_2^*(d_{X_2/S_2}(f^*t)))$, i.e., such that

$$\begin{array}{ccc}
 f_* \mathcal{O}_{X_2} & \xrightarrow{f_* D_2} & f_* a_{2,*} \mathcal{C}_{T_2/T'_2} \\
 \uparrow f^\# & & \uparrow \text{induced by } (h')^\# \\
 \mathcal{O}_{X_1} & \xrightarrow{D_1} & a_{1,*} \mathcal{C}_{T_1/T'_1}
 \end{array}$$

is commutative where D_i corresponds to θ_i as in Equation (36.7.1.1). Then we have the conclusion of Lemma 36.7.8. The importance of the condition that both $X_2 \rightarrow X_1$ and $S_2 \rightarrow S_1$ are étale is that it allows us to construct a θ_2 from θ_1 .

36.8. Infinitesimal deformations of schemes

The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

Lemma 36.8.1. *Let $(f, f') : (X \subset X') \rightarrow (S \subset S')$ be a morphism of first order thickenings. Assume that f is flat. Then the following are equivalent*

- (1) f' is flat and $X = S \times_{S'} X'$, and
- (2) the canonical map $f^* \mathcal{C}_{S/S'} \rightarrow \mathcal{C}_{X/X'}$ is an isomorphism.

Proof. As the problem is local on X' we may assume that X, X', S, S' are affine schemes. Say $S' = \text{Spec}(A')$, $X' = \text{Spec}(B')$, $S = \text{Spec}(A)$, $X = \text{Spec}(B)$ with

$A = A'/I$ and $B = B'/J$ for some square zero ideals. Then we obtain the following commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & J & \longrightarrow & B' & \longrightarrow & B \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & I & \longrightarrow & A' & \longrightarrow & A \longrightarrow 0 \end{array}$$

with exact rows. The canonical map of the lemma is the map

$$I \otimes_A B = I \otimes_{A'} B' \longrightarrow J.$$

The assumption that f is flat signifies that $A \rightarrow B$ is flat.

Assume (1). Then $A' \rightarrow B'$ is flat and $J = IB'$. Flatness implies $\mathrm{Tor}_1^{A'}(B', A) = 0$ (see Algebra, Lemma 10.72.7). This means $I \otimes_{A'} B' \rightarrow B'$ is injective (see Algebra, Remark 10.72.8). Hence we see that $I \otimes_A B \rightarrow J$ is an isomorphism.

Assume (2). Then it follows that $J = IB'$, so that $X = S \times_{S'} X'$. Moreover, we get $\mathrm{Tor}_1^{A'}(B', A'/I) = 0$ by reversing the implications in the previous paragraph. Hence B' is flat over A' by Algebra, Lemma 10.95.8. \square

The following lemma is the “nilpotent” version of the “critère de platitude par fibres”, see Section 36.13.

Lemma 36.8.2. *Consider a commutative diagram*

$$\begin{array}{ccc} (X \subset X') & \xrightarrow{(f, f')} & (Y \subset Y') \\ & \searrow & \swarrow \\ & (S \subset S') & \end{array}$$

of thickenings. Assume

- (1) X' is flat over S' ,
- (2) f is flat,
- (3) $S \subset S'$ is a finite order thickening, and
- (4) $X = S \times_{S'} X'$ and $Y = S \times_{S'} Y'$.

Then f' is flat and Y' is flat over S' at all points in the image of f' .

Proof. Immediate consequence of Algebra, Lemma 10.97.8. \square

Many properties of morphisms of schemes are preserved under flat deformations.

Lemma 36.8.3. *Consider a commutative diagram*

$$\begin{array}{ccc} (X \subset X') & \xrightarrow{(f, f')} & (Y \subset Y') \\ & \searrow & \swarrow \\ & (S \subset S') & \end{array}$$

of thickenings. Assume $S \subset S'$ is a finite order thickening, X' and Y' flat over S' and $X = S \times_{S'} X'$ and $Y = S \times_{S'} Y'$. Then

- (1) f is flat if and only if f' is flat,
- (2) f is an isomorphism if and only if f' is an isomorphism,
- (3) f is an open immersion if and only if f' is an open immersion,

- (4) f is quasi-compact if and only if f' is quasi-compact,
- (5) f is universally closed if and only if f' is universally closed,
- (6) f is (quasi-)separated if and only if f' is (quasi-)separated,
- (7) f is a monomorphism if and only if f' is a monomorphism,
- (8) f is surjective if and only if f' is surjective,
- (9) f is universally injective if and only if f' is universally injective,
- (10) f is affine if and only if f' is affine,
- (11) f is locally of finite type if and only if f' is locally of finite type,
- (12) f is quasi-finite if and only if f' is quasi-finite,
- (13) f is locally of finite presentation if and only if f' is locally of finite presentation,
- (14) f is locally of finite type of relative dimension d if and only if f' is locally of finite type of relative dimension d ,
- (15) f is universally open if and only if f' is universally open,
- (16) f is syntomic if and only if f' is syntomic,
- (17) f is smooth if and only if f' is smooth,
- (18) f is unramified if and only if f' is unramified,
- (19) f is étale if and only if f' is étale,
- (20) f is proper if and only if f' is proper,
- (21) f is integral if and only if f' is integral,
- (22) f is finite if and only if f' is finite,
- (23) f is finite locally free (of rank d) if and only if f' is finite locally free (of rank d), and
- (24) add more here.

Proof. The assumptions on X and Y mean that f is the base change of f' by $X \rightarrow X'$. The properties \mathcal{P} listed in (1) – (23) above are all stable under base change, hence if f' has property \mathcal{P} , then so does f . See Schemes, Lemmas 25.18.2, 25.19.3, 25.21.13, and 25.23.5 and Morphisms, Lemmas 28.11.4, 28.12.4, 28.13.8, 28.16.4, 28.21.13, 28.22.4, 28.30.2, 28.32.4, 28.35.5, 28.36.5, 28.37.4, 28.42.5, 28.44.6, and 28.46.4.

The interesting direction in each case is therefore to assume that f has the property and deduce that f' has it too. By induction on the order of the thickening we may assume that $S \subset S'$ is a first order thickening, see discussion immediately following Definition 36.2.1. We make a couple of general remarks which we will use without further mention in the arguments below. (I) Let $W' \subset S'$ be an affine open and let $U' \subset X'$ and $V' \subset Y'$ be affine opens lying over W' with $f'(U') \subset V'$. Let $W = \text{Spec}(R)$ and denote $I \subset R$ be the ideal defining the closed subscheme $W \cap S$. Say $U' = \text{Spec}(B')$ and $V' = \text{Spec}(A')$. Then we get a commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & IB' & \longrightarrow & B' & \longrightarrow & B & \longrightarrow & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 0 & \longrightarrow & IA' & \longrightarrow & A' & \longrightarrow & A & \longrightarrow & 0
 \end{array}$$

with exact rows. Moreover, $IA' \cong I \otimes_R A$ and $IB' \cong I \otimes_R B$, see proof of Lemma 36.8.1. (II) The morphisms $X \rightarrow X'$ and $Y \rightarrow Y'$ are universal homeomorphisms. Hence the topology of the maps f and f' (after any base change) is identical. (III) If f is flat, then f' is flat, see Lemma 36.8.2.

Ad (1). This is general remark (III).

Ad (2). Assume f is an isomorphism. Choose an affine open $V' \subset Y'$ and set $U' = (f')^{-1}(V')$. Then $V = Y \cap V'$ is affine which implies that $V \cong f^{-1}(V) = U = Y \times_{Y'} U'$ is affine. By Lemma 36.2.3 we see that U' is affine. Hence $IB' \cong I \otimes_R B \cong I \otimes_R A \cong IA'$ and $A \cong B$. By the exactness of the rows in the diagram above we see that $A' \cong B'$, i.e., $U' \cong V'$. Thus f' is an isomorphism.

Ad (3). Assume f is an open immersion. Then f is an isomorphism of X with an open subscheme $V \subset Y$. Let $V' \subset Y'$ be the open subscheme whose underlying topological space is V . Then f' is a map from X' to V' which is an isomorphism by (2). Hence f' is an open immersion.

Ad (4). Immediate from remark (II). See also Lemma 36.2.5 for a more general statement.

Ad (5). Immediate from remark (II). See also Lemma 36.2.5 for a more general statement.

Ad (6). Note that $X \times_Y X = Y \times_{Y'} (X' \times_{Y'} X')$ so that $X' \times_{Y'} X'$ is a thickening of $X \times_Y X$. Hence the topology of the maps $\Delta_{X/Y}$ and $\Delta_{X'/Y'}$ matches and we win. See also Lemma 36.2.5 for a more general statement.

Ad (7). Assume f is a monomorphism. Consider the diagonal morphism $\Delta_{X'/Y'} : X' \rightarrow X' \times_{Y'} X'$. Because f is a monomorphism and because $X' \times_{Y'} X'$ is a thickening of $X \times_Y X$ we see that $\Delta_{X'/Y'}$ is surjective. Hence Lemma 36.8.2 implies that $X' \times_{Y'} X'$ is flat over S' . Then (2) shows that $\Delta_{X'/Y'}$ is an isomorphism.

Ad (8). This is clear. See also Lemma 36.2.5 for a more general statement.

Ad (9). Immediate from remark (II). See also Lemma 36.2.5 for a more general statement.

Ad (10). Assume f is affine. Choose an affine open $V' \subset Y'$ and set $U' = (f')^{-1}(V')$. Then $V = Y \cap V'$ is affine which implies that $U = Y \times_{Y'} U'$ is affine. By Lemma 36.2.3 we see that U' is affine. Hence f' is affine. See also Lemma 36.2.5 for a more general statement.

Ad (11). Via remark (I) comes down to proving $A' \rightarrow B'$ is of finite type if $A \rightarrow B$ is of finite type. Suppose that $x_1, \dots, x_n \in B'$ are elements whose images in B generate B as an A -algebra. Then $A'[x_1, \dots, x_n] \rightarrow B$ is surjective as both $A'[x_1, \dots, x_n] \rightarrow B$ is surjective and $I \otimes_R A[x_1, \dots, x_n] \rightarrow I \otimes_R B$ is surjective. See also Lemma 36.2.6 for a more general statement.

Ad (12). Follows from (11) and that quasi-finiteness of a morphism of finite type can be checked on fibres, see Morphisms, Lemma 28.21.6. See also Lemma 36.2.6 for a more general statement.

Ad (13). Via remark (I) comes down to proving $A' \rightarrow B'$ is of finite presentation if $A \rightarrow B$ is of finite presentation. We may assume that $B' = A'[x_1, \dots, x_n]/K'$ for some ideal K' by (11). We get a short exact sequence

$$0 \rightarrow K' \rightarrow A'[x_1, \dots, x_n] \rightarrow B' \rightarrow 0$$

As B' is flat over R' we see that $K' \otimes_{R'} R$ is the kernel of the surjection $A[x_1, \dots, x_n] \rightarrow B$. By assumption on $A \rightarrow B$ there exist finitely many $f'_1, \dots, f'_m \in K'$ whose images in $A[x_1, \dots, x_n]$ generate this kernel. Since I is nilpotent we see that f'_1, \dots, f'_m generate K' by Nakayama's lemma, see Algebra, Lemma 10.19.1.

Ad (14). Follows from (11) and general remark (II). See also Lemma 36.2.6 for a more general statement.

Ad (15). Immediate from general remark (II). See also Lemma 36.2.5 for a more general statement.

Ad (16). Assume f is syntomic. By (13) f' is locally of finite presentation, by general remark (III) f' is flat and the fibres of f' are the fibres of f . Hence f' is syntomic by Morphisms, Lemma 28.32.11.

Ad (17). Assume f is smooth. By (13) f' is locally of finite presentation, by general remark (III) f' is flat, and the fibres of f' are the fibres of f . Hence f' is smooth by Morphisms, Lemma 28.35.3.

Ad (18). Assume f unramified. By (11) f' is locally of finite type and the fibres of f' are the fibres of f . Hence f' is unramified by Morphisms, Lemma 28.36.12. See also Lemma 36.2.6 for a more general statement.

Ad (19). Assume f étale. By (13) f' is locally of finite presentation, by general remark (III) f' is flat, and the fibres of f' are the fibres of f . Hence f' is étale by Morphisms, Lemma 28.37.8.

Ad (20). This follows from a combination of (6), (11), (4), and (5). See also Lemma 36.2.6 for a more general statement.

Ad (21). Combine (5) and (10) with Morphisms, Lemma 28.44.7. See also Lemma 36.2.5 for a more general statement.

Ad (22). Combine (21), and (11) with Morphisms, Lemma 28.44.4. See also Lemma 36.2.6 for a more general statement.

Ad (23). Assume f finite locally free. By (22) we see that f' is finite, by general remark (III) f' is flat, and by (13) f' is locally of finite presentation. Hence f' is finite locally free by Morphisms, Lemma 28.46.2. \square

36.9. Formally smooth morphisms

Michael Artin's position on differential criteria of smoothness (e.g., Morphisms, Lemma 28.35.14) is that they are basically useless (in practice). In this section we introduce the notion of a formally smooth morphism $X \rightarrow S$. Such a morphism is characterized by the property that T -valued points of X lift to infinitesimal thickenings of T provided T is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma 36.9.7. It turns out that this criterion is often easier to use than the differential criteria mentioned above.

Recall that a ring map $R \rightarrow A$ is called *formally smooth* (see Algebra, Definition 10.133.1) if for every commutative solid diagram

$$\begin{array}{ccc} A & \longrightarrow & B/I \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & B \end{array}$$

where $I \subset B$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 36.9.1. Let $f : X \rightarrow S$ be a morphism of schemes. We say f is *formally smooth* if given any solid commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & T \\ f \downarrow & \dashrightarrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists a dotted arrow making the diagram commute.

In the cases of formally unramified and formally étale morphisms the condition that T' be affine could be dropped, see Lemmas 36.4.2 and 36.6.2. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow Zariski locally on T' . In fact, analyzing the proof of Lemma 36.9.7 shows that this would be equivalent to the definition as it currently stands.

Lemma 36.9.2. *A composition of formally smooth morphisms is formally smooth.*

Proof. Omitted. \square

Lemma 36.9.3. *A base change of a formally smooth morphism is formally smooth.*

Proof. Omitted, but see Algebra, Lemma 10.133.2 for the algebraic version. \square

Lemma 36.9.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Then f is formally étale if and only if f is formally smooth and formally unramified.*

Proof. Omitted. \square

Lemma 36.9.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If f is formally smooth, so is $f|_U : U \rightarrow V$.*

Proof. Consider a solid diagram

$$\begin{array}{ccc} U & \longleftarrow & T \\ f|_U \downarrow & \dashrightarrow & \downarrow i \\ V & \longleftarrow & T' \end{array}$$

as in Definition 36.9.1. If f is formally smooth, then there exists an S -morphism $a' : T' \rightarrow X$ such that $a'|_T = a$. Since the underlying sets of T and T' are the same we see that a' is a morphism into U (see Schemes, Section 25.3). And it clearly is a V -morphism as well. Hence the dotted arrow above as desired. \square

Lemma 36.9.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume X and S are affine. Then f is formally smooth if and only if $\mathcal{O}_S(S) \rightarrow \mathcal{O}_X(X)$ is a formally smooth ring map.*

Proof. This is immediate from the definitions (Definition 36.9.1 and Algebra, Definition 10.133.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5. \square

The following lemma is the main result of this section. It is a victory of the functorial point of view in that it implies (combined with Limits, Proposition 31.5.1) that we can recognize whether a morphism $f : X \rightarrow S$ is smooth in terms of “simple” properties of the functor $h_X : \text{Sch}/S \rightarrow \text{Sets}$.

Lemma 36.9.7 (Infinitesimal lifting criterion). *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *The morphism f is smooth, and*
- (2) *the morphism f is locally of finite presentation and formally smooth.*

Proof. Assume $f : X \rightarrow S$ is locally of finite presentation and formally smooth. Consider a pair of affine opens $\text{Spec}(A) = U \subset X$ and $\text{Spec}(R) = V \subset S$ such that $f(U) \subset V$. By Lemma 36.9.5 we see that $U \rightarrow V$ is formally smooth. By Lemma 36.9.6 we see that $R \rightarrow A$ is formally smooth. By Morphisms, Lemma 28.22.2 we see that $R \rightarrow A$ is of finite presentation. By Algebra, Proposition 10.133.13 we see that $R \rightarrow A$ is smooth. Hence by the definition of a smooth morphism we see that $X \rightarrow S$ is smooth.

Conversely, assume that $f : X \rightarrow S$ is smooth. Consider a solid commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{a} & T \\ f \downarrow & \nearrow & \downarrow i \\ S & \xleftarrow{\quad} & T' \end{array}$$

as in Definition 36.9.1. We will show the dotted arrow exists thereby proving that f is formally smooth.

Let \mathcal{F} be the sheaf of sets on T' of Lemma 36.7.3, see also Remark 36.7.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/S}, \mathcal{C}_{T/T'})$$

be the sheaf of \mathcal{O}_T -modules on T introduced in Lemma 36.7.4. Our goal is simply to show that $\mathcal{F}(T) \neq \emptyset$. In other words we are trying to show that \mathcal{F} is a trivial \mathcal{H} -torsor on T (see Cohomology, Section 20.5). There are two steps: (I) To show that \mathcal{F} is a torsor we have to show that $\mathcal{F}_t \neq \emptyset$ for all $t \in T$ (see Cohomology, Definition 20.5.1). (II) To show that \mathcal{F} is the trivial torsor it suffices to show that $H^1(T, \mathcal{H}) = 0$ (see Cohomology, Lemma 20.5.3 – we may use either cohomology of \mathcal{H} as an abelian sheaf or as an \mathcal{O}_T -module, see Cohomology, Lemma 20.14.3).

First we prove (I). To see this, for every $t \in T$ we can choose an affine open $U \subset T$ neighbourhood of t such that $a(U)$ is contained in an affine open $\text{Spec}(A) = W \subset X$ which maps to an affine open $\text{Spec}(R) = V \subset S$. By Morphisms, Lemma 28.35.2 the ring map $R \rightarrow A$ is smooth. Hence by Algebra, Proposition 10.133.13 the ring map $R \rightarrow A$ is formally smooth. Lemma 36.9.6 in turn implies that $W \rightarrow V$ is formally

smooth. Hence we can lift $a|_U : U \rightarrow W$ to a V -morphism $a' : U' \rightarrow W \subset X$ showing that $\mathcal{F}(U) \neq \emptyset$.

Finally we prove (II). By Morphisms, Lemma 28.34.13 we see that $\Omega_{X/S}$ is of finite presentation (it is even finite locally free by Morphisms, Lemma 28.35.12). Hence $a^*\Omega_{X/S}$ is of finite presentation (see Modules, Lemma 17.11.4). Hence the sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/S}, \mathcal{C}_{T/T'})$ is quasi-coherent by the discussion in Schemes, Section 25.24. Thus by Cohomology of Schemes, Lemma 29.2.2 we have $H^1(T, \mathcal{H}) = 0$ as desired. \square

Locally projective quasi-coherent modules are defined in Properties, Section 27.19.

Lemma 36.9.8. *Let $f : X \rightarrow Y$ be a formally smooth morphism of schemes. Then $\Omega_{X/Y}$ is locally projective on X .*

Proof. Choose $U \subset X$ and $V \subset Y$ affine open such that $f(U) \subset V$. By Lemma 36.9.5 $f|_U : U \rightarrow V$ is formally smooth. Hence $\Gamma(V, \mathcal{O}_V) \rightarrow \Gamma(U, \mathcal{O}_U)$ is a formally smooth ring map, see Lemma 36.9.6. Hence by Algebra, Lemma 10.133.7 the $\Gamma(U, \mathcal{O}_U)$ -module $\Omega_{\Gamma(U, \mathcal{O}_U)/\Gamma(V, \mathcal{O}_V)}$ is projective. Hence $\Omega_{U/V}$ is locally projective, see Properties, Section 27.19. \square

Lemma 36.9.9. *Let $f : X \rightarrow Y$, $g : Y \rightarrow S$ be morphisms of schemes. Assume f is formally smooth. Then*

$$0 \rightarrow f^*\Omega_{Y/S} \rightarrow \Omega_{X/S} \rightarrow \Omega_{X/Y} \rightarrow 0$$

(see Morphisms, Lemma 28.34.9) is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ formally smooth, then the sequence

$$0 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of Algebra, Lemma 10.127.7 is exact. This is Algebra, Lemma 10.133.9. \square

Lemma 36.9.10. *Let $h : Z \rightarrow X$ be a formally unramified morphism of schemes over S . Assume that Z is formally smooth over S . Then the canonical exact sequence*

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0$$

of Lemma 36.5.10 is short exact.

Proof. Let $Z \rightarrow Z'$ be the universal first order thickening of Z over X . From the proof of Lemma 36.5.10 we see that our sequence is identified with the sequence

$$\mathcal{C}_{Z/Z'} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z \rightarrow \Omega_{Z/S} \rightarrow 0.$$

Since $Z \rightarrow S$ is formally smooth we can locally on Z' find a left inverse $Z' \rightarrow Z$ over S to the inclusion map $Z \rightarrow Z'$. Thus the sequence is locally split, see Morphisms, Lemma 28.34.16. \square

Lemma 36.9.11. *Let*

$$\begin{array}{ccc} Z & \longrightarrow & X \\ & \searrow i & \downarrow f \\ & & Y \end{array}$$

be a commutative diagram of schemes where i and j are formally unramified and f is formally smooth. Then the canonical exact sequence

$$0 \rightarrow \mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

of Lemma 36.5.11 is exact and locally split.

Proof. Denote $Z \rightarrow Z'$ the universal first order thickening of Z over X . Denote $Z \rightarrow Z''$ the universal first order thickening of Z over Y . By Lemma 36.5.10 here is a canonical morphism $Z' \rightarrow Z''$ so that we have a commutative diagram

$$\begin{array}{ccccc} Z & \longrightarrow & Z' & \longrightarrow & X \\ & \searrow^{i'} & \downarrow k & & \downarrow f \\ & & Z'' & \longrightarrow & Y \end{array}$$

In the proof of Lemma 36.5.11 we identified the sequence above with the sequence

$$\mathcal{C}_{Z/Z''} \rightarrow \mathcal{C}_{Z/Z'} \rightarrow (i')^* \Omega_{Z'/Z''} \rightarrow 0$$

Let $U'' \subset Z''$ be an affine open. Denote $U \subset Z$ and $U' \subset Z'$ the corresponding affine open subschemes. As f is formally smooth there exists a morphism $h : U'' \rightarrow X$ which agrees with i on U and such that $f \circ h$ equals $b|_{U''}$. Since Z' is the universal first order thickening we obtain a unique morphism $g : U'' \rightarrow Z'$ such that $g = a \circ h$. The universal property of Z'' implies that $k \circ g$ is the inclusion map $U'' \rightarrow Z''$. Hence g is a left inverse to k . Picture

$$\begin{array}{ccc} U & \longrightarrow & Z' \\ \downarrow & \nearrow g & \downarrow k \\ U'' & \longrightarrow & Z'' \end{array}$$

Thus g induces a map $\mathcal{C}_{Z/Z'}|_U \rightarrow \mathcal{C}_{Z/Z''}|_U$ which is a left inverse to the map $\mathcal{C}_{Z/Z''} \rightarrow \mathcal{C}_{Z/Z'}$ over U . □

36.10. Smoothness over a Noetherian base

It turns out that if the base is Noetherian then we can get away with less in the formulation of formal smoothness. In some sense the following lemmas are the beginning of deformation theory.

Lemma 36.10.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Assume that S is locally Noetherian and f locally of finite type. The following are equivalent:*

- (1) f is smooth at x ,
- (2) for every solid commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{\alpha} & \text{Spec}(B) \\ \downarrow f & \nearrow \text{dotted} & \downarrow i \\ S & \xleftarrow{\beta} & \text{Spec}(B') \end{array}$$

where $B' \rightarrow B$ is a surjection of local rings with $\text{Ker}(B' \rightarrow B)$ of square zero, and α mapping the closed point of $\text{Spec}(B)$ to x there exists a dotted arrow making the diagram commute,

- (3) same as in (2) but with $B' \rightarrow B$ ranging over small extensions (see Algebra, Definition 10.136.1), and

- (4) same as in (2) but with $B' \rightarrow B$ ranging over small extensions such that α induces an isomorphism $\kappa(x) \rightarrow \kappa(\mathfrak{m})$ where $\mathfrak{m} \subset B$ is the maximal ideal.

Proof. Choose an affine neighbourhood $V \subset S$ of $f(x)$ and choose an affine neighbourhood $U \subset X$ of x such that $f(U) \subset V$. For any “test” diagram as in (2) the morphism α will map $\text{Spec}(B)$ into U and the morphism β will map $\text{Spec}(B')$ into V (see Schemes, Section 25.13). Hence the lemma reduces to the morphism $f|_U : U \rightarrow V$ of affines. (Indeed, V is Noetherian and $f|_U$ is of finite type, see Properties, Lemma 27.5.2 and Morphisms, Lemma 28.16.2.) In this affine case the lemma is identical to Algebra, Lemma 10.136.2. \square

Sometimes it is useful to know that one only needs to check the lifting criterion for small extensions “centered” at points of finite type (see Morphisms, Section 28.17).

Lemma 36.10.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that S is locally Noetherian and f locally of finite type. The following are equivalent:*

- (1) f is smooth,
- (2) for every solid commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{\alpha} & \text{Spec}(B) \\ f \downarrow & \nearrow & \downarrow i \\ S & \xleftarrow{\beta} & \text{Spec}(B') \end{array}$$

where $B' \rightarrow B$ is a small extension of Artinian local rings and β of finite type (!) there exists a dotted arrow making the diagram commute.

Proof. If f is smooth, then the infinitesimal lifting criterion (Lemma 36.9.7) says f is formally smooth and (2) holds.

Assume (2). The set of points $x \in X$ where f is not smooth forms a closed subset T of X . By the discussion in Morphisms, Section 28.17, if $T \neq \emptyset$ there exists a point $x \in T \subset X$ such that the morphism

$$\text{Spec}(\kappa(x)) \rightarrow X \rightarrow S$$

is of finite type (namely, pick any point x of T which is closed in an affine open of X). By Morphisms, Lemma 28.17.2 given any local Artinian ring B' with residue field $\kappa(x)$ then any morphism $\beta : \text{Spec}(B') \rightarrow S$ is of finite type. Thus we see that all the diagrams used in Lemma 36.10.1 (4) correspond to diagrams as in the current lemma (2). Whence $X \rightarrow S$ is smooth at x a contradiction. \square

Here is a useful application.

Lemma 36.10.3. *Let $f : X \rightarrow S$ be a finite type morphism of locally Noetherian schemes. Let $Z \subset S$ be a closed subscheme with n th infinitesimal neighbourhood $Z_n \subset S$. Set $X_n = Z_n \times_S X$.*

- (1) If $X_n \rightarrow Z_n$ is smooth for all n , then f is smooth at every point of $f^{-1}(Z)$.
- (2) If $X_n \rightarrow Z_n$ is étale for all n , then f is étale at every point of $f^{-1}(Z)$.

Proof. Assume $X_n \rightarrow Z_n$ is smooth for all n . Let $x \in X$ be a point lying over a point of Z . Given a small extension $B' \rightarrow B$ and morphisms α, β as in Lemma 36.10.1 part (3) the maximal ideal of B' is nilpotent (as B' is Artinian) and hence the morphism β factors through Z_n and α factors through X_n for a suitable n .

Thus the lifting property for $X_n \rightarrow Z_n$ kicks in to get the desired dotted arrow in the diagram. This proves (1). Part (2) follows from (1) and the fact that a morphism is étale if and only if it is smooth of relative dimension 0. \square

36.11. Pushouts in the category of schemes

In this section we collect some results on pushouts in the category of schemes. See Categories, Section 36.11 for a general discussion of pushouts in any category.

Lemma 36.11.1. *Let $X \rightarrow X'$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Then there exists a pushout*

$$\begin{array}{ccc} X & \longrightarrow & X' \\ f \downarrow & & \downarrow f' \\ Y & \longrightarrow & Y \amalg_X X' \end{array}$$

in the category of schemes. Moreover $Y' = Y \amalg_X X'$ is a thickening of Y and

$$\mathcal{O}_{Y'} = \mathcal{O}_Y \times_{f_* \mathcal{O}_X} f'_* \mathcal{O}_{X'}$$

as sheaves on $|Y| = |Y'|$.

Proof. We first construct Y' as a ringed space. Namely, as topological space we take $Y' = Y$. Denote $f' : X' \rightarrow Y'$ the map of topological spaces which equals f . As structure sheaf $\mathcal{O}_{Y'}$ we take the right hand side of the equation of the lemma. To see that Y' is a scheme, we have to show that any point has an affine neighbourhood. Since the formation of the fibre product of sheaves commutes with restricting to opens, we may assume Y is affine. Then X is affine (as f is affine) and X' is affine as well (see Lemma 36.2.3). Say $Y \leftarrow X \rightarrow X'$ corresponds to $B \rightarrow A \leftarrow A'$. Set $B' = B \times_A A'$; this is the global sections of $\mathcal{O}_{Y'}$. As $A' \rightarrow A$ is surjective with locally nilpotent kernel we see that $B' \rightarrow B$ is surjective with locally nilpotent kernel. Hence $\text{Spec}(B') = \text{Spec}(B)$ (as topological spaces). We claim that $Y' = \text{Spec}(B')$. To see this we will show for $g' \in B'$ with image $g \in B$ that $\mathcal{O}_{Y'}(D(g)) = B'_{g'}$. Namely, by More on Algebra, Lemma 15.4.3 we see that

$$(B')_{g'} = B_g \times_{A_h} A'_{h'}$$

where $h \in A, h' \in A'$ are the images of g' . Since B_g , resp. A_h , resp. $A'_{h'}$ is equal to $\mathcal{O}_Y(D(g))$, resp. $f_* \mathcal{O}_X(D(g))$, resp. $f'_* \mathcal{O}_{X'}(D(g))$ the claim follows.

Finally, we prove the universal property of the pushout holds for Y' and the morphisms $Y \rightarrow Y'$ and $X' \rightarrow Y'$. Namely, let S be a scheme and let $b : Y \rightarrow S$ and $a' : X' \rightarrow S$ be morphisms such that

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow & & \downarrow a' \\ Y & \xrightarrow{b} & S \end{array}$$

commutes. Note that $a' = b \circ f'$ on underlying topological spaces. Denote also $(a')^\sharp : b^{-1} \mathcal{O}_S \rightarrow f'_* \mathcal{O}_{X'}$ the map which is adjoint to $(a')^\sharp : (a')^{-1} \mathcal{O}_S = (f')^{-1} b^{-1} \mathcal{O}_S \rightarrow \mathcal{O}_{X'}$. Then we get a map

$$b^{-1} \mathcal{O}_S \xrightarrow{(b^\sharp, (a')^\sharp)} \mathcal{O}_Y \times_{f_* \mathcal{O}_X} f'_* \mathcal{O}_{X'} = \mathcal{O}_{Y'}$$

which defines a morphism of ringed spaces $b' : Y' \rightarrow S$ compatible with a' and b . Since $Y \subset Y'$ is a thickening it follows that b' is a morphism of locally ringed spaces, i.e., a morphism of schemes. This finishes the proof. \square

In the following lemma we use the fibre product of categories as defined in Categories, Example 4.29.3.

Lemma 36.11.2. *Let $X \rightarrow X'$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Let $Y' = Y \amalg_X X'$ be the pushout (see Lemma 36.11.1). Base change gives a functor*

$$F : (\text{Sch}/Y') \longrightarrow (\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$$

given by $V' \mapsto (V' \times_{Y'} Y, V' \times_{Y'} X', 1)$ which has a left adjoint

$$G : (\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X') \longrightarrow (\text{Sch}/Y')$$

which sends the triple (V, U', φ) to the pushout $V \amalg_{(V \times_Y X)} U'$. Finally, $F \circ G$ is isomorphic to the identity functor.

Proof. Let (V, U', φ) be an object of the fibre product category. Set $U = U' \times_{X'} X$. Note that $U \rightarrow U'$ is a thickening. Since $\varphi : V \times_Y X \rightarrow U' \times_{X'} X = U$ is an isomorphism we have a morphism $U \rightarrow V$ over $X \rightarrow Y$ which identifies U with the fibre product $X \times_Y V$. In particular $U \rightarrow V$ is affine, see Morphisms, Lemma 28.13.8. Hence we can apply Lemma 36.11.1 to get a pushout $V' = V \amalg_U U'$. Denote $V' \rightarrow Y'$ the morphism we obtain in virtue of the fact that V' is a pushout and because we are given morphisms $V \rightarrow Y$ and $U' \rightarrow X'$ agreeing on U as morphisms into Y' . Setting $G(V, U', \varphi) = V'$ gives the functor G .

Let us prove that G is a left adjoint to F . Let Z be a scheme over Y' . We have to show that

$$\text{Mor}(V', Z) = \text{Mor}((V, U', \varphi), F(Z))$$

where the morphism sets are taken in their respective categories. Let $g' : V' \rightarrow Z$ be a morphism. Denote \tilde{g} , resp. \tilde{f}' the composition of g' with the morphism $V \rightarrow V'$, resp. $U' \rightarrow V'$. Base change \tilde{g} , resp. \tilde{f}' by $Y \rightarrow Y'$, resp. $X' \rightarrow Y'$ to get a morphism $g : V \rightarrow Z \times_{Y'} Y$, resp. $f' : U' \rightarrow Z \times_{Y'} X'$. Then (g, f') is an element of the right hand side of the equation above (details omitted). Conversely, suppose that $(g, f') : (V, U', \varphi) \rightarrow F(Z)$ is an element of the right hand side. We may consider the composition $\tilde{g} : V \rightarrow Z$, resp. $\tilde{f}' : U' \rightarrow Z$ of g , resp. f' by $Z \times_{Y'} X' \rightarrow Z$, resp. $Z \times_{Y'} Y \rightarrow Z$. Then \tilde{g} and \tilde{f}' agree as morphism from U to Z . By the universal property of pushout, we obtain a morphism $g' : V' \rightarrow Z$, i.e., an element of the left hand side. We omit the verification that these constructions are mutually inverse.

To prove that $F \circ G$ is isomorphic to the identity we have to show that the adjunction mapping $(V, U', \varphi) \rightarrow F(G(V, U', \varphi))$ is an isomorphism. To do this we may work affine locally. Say $X = \text{Spec}(A)$, $X' = \text{Spec}(A')$, and $Y = \text{Spec}(B)$. Then $A' \rightarrow A$ and $B \rightarrow A$ are ring maps as in More on Algebra, Lemma 15.4.5 and $Y' = \text{Spec}(B')$ with $B' = B \times_A A'$. Next, suppose that $V = \text{Spec}(D)$, $U' = \text{Spec}(C')$ and φ is given by an A -algebra isomorphism $D \otimes_B A \rightarrow C' \otimes_{A'} A = C'/IC'$. Set $D' = D \times_{C'/IC'} C'$. In this case the statement we have to prove is that $D' \otimes_{B'} B \cong D$ and $D' \otimes_{B'} A' \cong C'$. This is a special case of More on Algebra, Lemma 15.4.5. \square

Lemma 36.11.3. *Let $X \rightarrow X'$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Let $Y' = Y \amalg_X X'$ be the pushout (see Lemma 36.11.1). Let $V' \rightarrow Y'$ be a morphism of schemes. Set $V = Y \times_{Y'} V'$, $U' = X' \times_{Y'} V'$, and $U = X \times_{Y'} V'$. There is an equivalence of categories between*

- (1) *quasi-coherent $\mathcal{O}_{V'}$ -modules flat over Y' , and*
- (2) *the category of triples $(\mathcal{G}, \mathcal{F}', \varphi)$ where*
 - (a) *\mathcal{G} is a quasi-coherent \mathcal{O}_V -module flat over Y ,*
 - (b) *\mathcal{F}' is a quasi-coherent $\mathcal{O}_{U'}$ -module flat over X , and*
 - (c) *$\varphi : (U \rightarrow V)^* \mathcal{G} \rightarrow (U \rightarrow U')^* \mathcal{F}'$ is an isomorphism of \mathcal{O}_U -modules.*

The equivalence maps \mathcal{G}' to $((V \rightarrow V')^ \mathcal{G}', (U' \rightarrow V')^* \mathcal{G}', \text{can})$. Suppose \mathcal{G}' corresponds to the triple $(\mathcal{G}, \mathcal{F}', \varphi)$. Then*

- (a) *\mathcal{G}' is a finite type $\mathcal{O}_{V'}$ -module if and only if \mathcal{G} and \mathcal{F}' are finite type \mathcal{O}_Y and $\mathcal{O}_{U'}$ -modules.*
- (b) *if $V' \rightarrow Y'$ is locally of finite presentation, then \mathcal{G}' is an $\mathcal{O}_{V'}$ -module of finite presentation if and only if \mathcal{G} and \mathcal{F}' are \mathcal{O}_Y and $\mathcal{O}_{U'}$ -modules of finite presentation.*

Proof. A quasi-inverse functor assigns to the triple $(\mathcal{G}, \mathcal{F}', \varphi)$ the fibre product

$$(V \rightarrow V')^* \mathcal{G} \times_{(U \rightarrow V')^* \mathcal{F}'} (U' \rightarrow V')^* \mathcal{F}'$$

where $\mathcal{F} = (U \rightarrow U')^* \mathcal{F}'$. This works, because on affines we recover the equivalence of More on Algebra, Lemma 15.4.12. Some details omitted.

Parts (a) and (b) follow from More on Algebra, Lemmas 15.4.11 and 15.4.13. \square

Lemma 36.11.4. *In the situation of Lemma 36.11.2. If $V' = G(V, U', \varphi)$ for some triple (V, U', φ) , then*

- (1) *$V' \rightarrow Y'$ is locally of finite type if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are locally of finite type,*
- (2) *$V' \rightarrow Y'$ is flat if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are flat,*
- (3) *$V' \rightarrow Y'$ is flat and locally of finite presentation if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are flat and locally of finite presentation,*
- (4) *$V' \rightarrow Y'$ is smooth if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are smooth,*
- (5) *$V' \rightarrow Y'$ is étale if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are étale, and*
- (6) *add more here as needed.*

If W' is flat over Y' , then the adjunction mapping $G(F(W')) \rightarrow W'$ is an isomorphism. Hence F and G define mutually quasi-inverse functors between the category of schemes flat over Y' and the category of triples (V, U', φ) with $V \rightarrow Y$ and $U' \rightarrow X'$ flat.

Proof. Looking over affine pieces the assertions of this lemma are equivalent to the corresponding assertions of More on Algebra, Lemma 15.4.14. \square

36.12. Openness of the flat locus

This result takes some work to prove, and (perhaps) deserves its own section. Here it is.

Theorem 36.12.1. *Let S be a scheme. Let $f : X \rightarrow S$ be a morphism which is locally of finite presentation. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module which is locally*

of finite presentation. Then

$$U = \{x \in X \mid \mathcal{F} \text{ is flat over } S \text{ at } x\}$$

is open in X .

Proof. We may test for openness locally on X hence we may assume that f is a morphism of affine schemes. In this case the theorem is exactly Algebra, Theorem 10.125.4. \square

Lemma 36.12.2. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

be a cartesian diagram of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x' \in X'$ with images $x = g'(x')$ and $s' = g(x')$.

- (1) If \mathcal{F} is flat over S at x , then $(g')^*\mathcal{F}$ is flat over S' at x' .
- (2) If g is flat at s' and $(g')^*\mathcal{F}$ is flat over S' at x' , then \mathcal{F} is flat over S at x .

In particular, if g is flat, f is locally of finite presentation, and \mathcal{F} is locally of finite presentation, then formation of the open subset of Theorem 36.12.1 commutes with base change.

Proof. Consider the commutative diagram of local rings

$$\begin{array}{ccc} \mathcal{O}_{X',x'} & \longleftarrow & \mathcal{O}_{X,x} \\ \uparrow & & \uparrow \\ \mathcal{O}_{S',s'} & \longleftarrow & \mathcal{O}_{S,s} \end{array}$$

Note that $\mathcal{O}_{X',x'}$ is a localization of $\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{S,s}} \mathcal{O}_{S',s'}$, and that $((g')^*\mathcal{F})_{x'}$ is equal to $\mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{X',x'}$. Hence the lemma follows from Algebra, Lemma 10.96.1. \square

36.13. Critère de platitude par fibres

Consider a commutative diagram of schemes (left hand diagram)

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow & \swarrow \\ & S & \end{array} \quad \begin{array}{ccc} X_s & \xrightarrow{f_s} & Y_s \\ & \searrow & \swarrow \\ & \text{Spec}(\kappa(s)) & \end{array}$$

and a quasi-coherent \mathcal{O}_X -module \mathcal{F} . Given a point $x \in X$ lying over $s \in S$ with image $y = f(x)$ we consider the question: Is \mathcal{F} flat over Y at x ? If \mathcal{F} is flat over S at x , then the theorem states this question is intimately related to the question of whether the restriction of \mathcal{F} to the fibre

$$\mathcal{F}_s = (X_s \rightarrow X)^*\mathcal{F}$$

is flat over Y_s at x . Below you will find a “Noetherian” version, a “finitely presented” version, and earlier we treated a “nilpotent” version, see Lemma 36.8.2.

Theorem 36.13.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in X$. Set $y = f(x)$ and $s \in S$ the image of x in S . Assume S, X, Y locally Noetherian, \mathcal{F} coherent, and $\mathcal{F}_x \neq 0$. Then the following are equivalent:*

- (1) \mathcal{F} is flat over S at x , and \mathcal{F}_s is flat over Y_s at x , and
- (2) Y is flat over S at y and \mathcal{F} is flat over Y at x .

Proof. Consider the ring maps

$$\mathcal{O}_{S,s} \longrightarrow \mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,x}$$

and the module \mathcal{F}_x . The stalk of \mathcal{F}_s at x is the module $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ and the local ring of Y_s at y is $\mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$. Thus the implication (1) \Rightarrow (2) is Algebra, Lemma 10.95.15. If (2) holds, then the first ring map is faithfully flat and \mathcal{F}_x is flat over $\mathcal{O}_{Y,y}$ so by Algebra, Lemma 10.38.3 we see that \mathcal{F}_x is flat over $\mathcal{O}_{S,s}$. Moreover, $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ is the base change of the flat module \mathcal{F}_x by $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$, hence flat by Algebra, Lemma 10.38.6. \square

Here is the non-Noetherian version.

Theorem 36.13.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume*

- (1) X is locally of finite presentation over S ,
- (2) \mathcal{F} an \mathcal{O}_X -module of finite presentation, and
- (3) Y is locally of finite type over S .

Let $x \in X$. Set $y = f(x)$ and let $s \in S$ be the image of x in S . If $\mathcal{F}_x \neq 0$, then the following are equivalent:

- (1) \mathcal{F} is flat over S at x , and \mathcal{F}_s is flat over Y_s at x , and
- (2) Y is flat over S at y and \mathcal{F} is flat over Y at x .

Moreover, the set of points x where (1) and (2) hold is open in $\text{Supp}(\mathcal{F})$.

Proof. Consider the ring maps

$$\mathcal{O}_{S,s} \longrightarrow \mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,x}$$

and the module \mathcal{F}_x . The stalk of \mathcal{F}_s at x is the module $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ and the local ring of Y_s at y is $\mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$. Thus the implication (1) \Rightarrow (2) is Algebra, Lemma 10.124.9. If (2) holds, then the first ring map is faithfully flat and \mathcal{F}_x is flat over $\mathcal{O}_{Y,y}$ so by Algebra, Lemma 10.38.3 we see that \mathcal{F}_x is flat over $\mathcal{O}_{S,s}$. Moreover, $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ is the base change of the flat module \mathcal{F}_x by $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$, hence flat by Algebra, Lemma 10.38.6.

By Morphisms, Lemma 28.22.11 the morphism f is locally of finite presentation. Consider the set

$$(36.13.2.1) \quad U = \{x \in X \mid \mathcal{F} \text{ flat at } x \text{ over both } Y \text{ and } S\}.$$

This set is open in X by Theorem 36.12.1. Note that if $x \in U$, then \mathcal{F}_s is flat at x over Y_s as a base change of a flat module under the morphism $Y_s \rightarrow Y$, see Morphisms, Lemma 28.26.6. Hence at every point of $U \cap \text{Supp}(\mathcal{F})$ condition (1) is satisfied. On the other hand, it is clear that if $x \in \text{Supp}(\mathcal{F})$ satisfies (1) and (2), then $x \in U$. Thus the open set we are looking for is $U \cap \text{Supp}(\mathcal{F})$. \square

These theorems are often used in the following simplified forms. We give only the global statements – of course there are also pointwise versions.

Lemma 36.13.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Assume*

- (1) S, X, Y are locally Noetherian,
- (2) X is flat over S ,
- (3) for every $s \in S$ the morphism $f_s : X_s \rightarrow Y_s$ is flat.

Then f is flat. If f is also surjective, then Y is flat over S .

Proof. This is a special case of Theorem 36.13.1. □

Lemma 36.13.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Assume*

- (1) X is locally of finite presentation over S ,
- (2) X is flat over S ,
- (3) for every $s \in S$ the morphism $f_s : X_s \rightarrow Y_s$ is flat, and
- (4) Y is locally of finite type over S .

Then f is flat. If f is also surjective, then Y is flat over S .

Proof. This is a special case of Theorem 36.13.2. □

Lemma 36.13.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume*

- (1) X is locally of finite presentation over S ,
- (2) \mathcal{F} an \mathcal{O}_X -module of finite presentation,
- (3) \mathcal{F} is flat over S , and
- (4) Y is locally of finite type over S .

Then the set

$$U = \{x \in X \mid \mathcal{F} \text{ flat at } x \text{ over } Y\}.$$

is open in X and its formation commutes with arbitrary base change: If $S' \rightarrow S$ is a morphism of schemes, and U' is the set of points of $X' = X \times_S S'$ where $\mathcal{F}' = \mathcal{F} \times_S S'$ is flat over $Y' = Y \times_S S'$, then $U' = U \times_S S'$.

Proof. By Morphisms, Lemma 28.22.11 the morphism f is locally of finite presentation. Hence U is open by Theorem 36.12.1. Because we have assumed that \mathcal{F} is flat over S we see that Theorem 36.13.2 implies

$$U = \{x \in X \mid \mathcal{F}_s \text{ flat at } x \text{ over } Y_s\}.$$

where s always denotes the image of x in S . (This description also works trivially when $\mathcal{F}_x = 0$.) Moreover, the assumptions of the lemma remain in force for the morphism $f' : X' \rightarrow Y'$ and the sheaf \mathcal{F}' . Hence U' has a similar description. In other words, it suffices to prove that given $s' \in S'$ mapping to $s \in S$ we have

$$\{x' \in X'_{s'} \mid \mathcal{F}'_{s'} \text{ flat at } x' \text{ over } Y'_{s'}\}$$

is the inverse image of the corresponding locus in X_s . This is true by Lemma 36.12.2 because in the cartesian diagram

$$\begin{array}{ccc} X'_{s'} & \longrightarrow & X_s \\ \downarrow & & \downarrow \\ Y'_{s'} & \longrightarrow & Y_s \end{array}$$

the horizontal morphisms are flat as they are base changes by the flat morphism $\text{Spec}(\kappa(s')) \rightarrow \text{Spec}(\kappa(s))$. \square

Lemma 36.13.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Assume*

- (1) X is locally of finite presentation over S ,
- (2) X is flat over S , and
- (3) Y is locally of finite type over S .

Then the set

$$U = \{x \in X \mid X \text{ flat at } x \text{ over } Y\}.$$

is open in X and its formation commutes with arbitrary base change.

Proof. This is a special case of Lemma 36.13.5. \square

The following lemma is a variant of Algebra, Lemma 10.95.4. Note that the hypothesis that $(\mathcal{F}_s)_x$ is a flat $\mathcal{O}_{X_s, x}$ -module means that $(\mathcal{F}_s)_x$ is a free $\mathcal{O}_{X_s, x}$ -module which is always the case if $x \in X_s$ is a generic point of an irreducible component of X_s and X_s is reduced (namely, in this case $\mathcal{O}_{X_s, x}$ is a field, see Algebra, Lemma 10.24.1).

Lemma 36.13.7. *Let $f : X \rightarrow S$ be a morphism of schemes of finite presentation. Let \mathcal{F} be a finitely presented \mathcal{O}_X -module. Let $x \in X$ with image $s \in S$. If \mathcal{F} is flat at x over S and $(\mathcal{F}_s)_x$ is a flat $\mathcal{O}_{X_s, x}$ -module, then \mathcal{F} is finite free in a neighbourhood of x .*

Proof. If $\mathcal{F}_x \otimes \kappa(x)$ is zero, then $\mathcal{F}_x = 0$ by Nakayama's lemma (Algebra, Lemma 10.19.1) and hence \mathcal{F} is zero in a neighbourhood of x (Modules, Lemma 17.9.5) and the lemma holds. Thus we may assume $\mathcal{F}_x \otimes \kappa(x)$ is not zero and we see that Theorem 36.13.2 applies with $f = \text{id} : X \rightarrow X$. We conclude that \mathcal{F}_x is flat over $\mathcal{O}_{X, x}$. Hence \mathcal{F}_x is free, see Algebra, Lemma 10.75.4 for example. Choose an open neighbourhood $x \in U \subset X$ and sections $s_1, \dots, s_r \in \mathcal{F}(U)$ which map to a basis in \mathcal{F}_x . The corresponding map $\psi : \mathcal{O}_U^{\oplus r} \rightarrow \mathcal{F}|_U$ is surjective after shrinking U (Modules, Lemma 17.9.5). Then $\text{Ker}(\psi)$ is of finite type (see Modules, Lemma 17.11.3) and $\text{Ker}(\psi)_x = 0$. Whence after shrinking U once more ψ is an isomorphism. \square

36.14. Normalization revisited

Normalization commutes with smooth base change.

Lemma 36.14.1. *Let $f : Y \rightarrow X$ be a smooth morphism of schemes. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The integral closure of \mathcal{O}_Y in $f^*\mathcal{A}$ is equal to $f^*\mathcal{A}'$ where $\mathcal{A}' \subset \mathcal{A}$ is the integral closure of \mathcal{O}_X in \mathcal{A} .*

Proof. This is a translation of Algebra, Lemma 10.140.4 into the language of schemes. Details omitted. \square

Lemma 36.14.2 (Normalization commutes with smooth base change). *Let*

$$\begin{array}{ccc} Y_2 & \longrightarrow & Y_1 \\ f_2 \downarrow & & \downarrow f_1 \\ X_2 & \xrightarrow{\varphi} & X_1 \end{array}$$

be a fibre square in the category of schemes. Assume f_1 is quasi-compact and quasi-separated, and φ is smooth. Let $Y_i \rightarrow X'_i \rightarrow X_i$ be the normalization of X_i in Y_i . Then $X'_2 \cong X_2 \times_{X_1} X'_1$.

Proof. The base change of the factorization $Y_1 \rightarrow X'_1 \rightarrow X_1$ to X_2 is a factorization $Y_2 \rightarrow X_2 \times_{X_1} X'_1 \rightarrow X_1$ and $X_2 \times_{X_1} X'_1 \rightarrow X_1$ is integral (Morphisms, Lemma 28.44.6). Hence we get a morphism $h : X'_2 \rightarrow X_2 \times_{X_1} X'_1$ by the universal property of Morphisms, Lemma 28.48.4. Observe that X'_2 is the relative spectrum of the integral closure of \mathcal{O}_{X_2} in $f_{2,*}\mathcal{O}_{Y_2}$. If $\mathcal{A}' \subset f_{1,*}\mathcal{O}_{Y_1}$ denotes the integral closure of \mathcal{O}_{X_2} , then $X_2 \times_{X_1} X'_1$ is the relative spectrum of $\varphi^*\mathcal{A}'$, see Constructions, Lemma 26.4.6. By Cohomology of Schemes, Lemma 29.5.2 we know that $f_{2,*}\mathcal{O}_{Y_2} = \varphi^*f_{1,*}\mathcal{O}_{Y_1}$. Hence the result follows from Lemma 36.14.1. \square

Lemma 36.14.3 (Normalization and smooth morphisms). *Let $X \rightarrow Y$ be a smooth morphism of schemes. Assume every quasi-compact open of Y has finitely many irreducible components. Then the same is true for X and there is a canonical isomorphism $X^\nu = X \times_Y Y^\nu$.*

Proof. As $X \rightarrow Y$ is flat we see that generic points of irreducible components of X map to generic points of irreducible components of Y , see Morphisms, Lemma 28.26.8. On the other hand, the fibres of $X \rightarrow Y$ are locally Noetherian because they are locally of finite type over a field. Thus every quasi-compact open of X has finitely many irreducible components. Note that $X_{red} = X \times_Y Y_{red}$ as a scheme smooth over a reduced scheme is reduced, see Descent, Lemma 34.14.1. Hence we may assume that X and Y are reduced (as the normalization of a scheme is equal to the normalization of its reduction by definition). Next, note that $X' = X \times_Y Y^\nu$ is a normal scheme by Descent, Lemma 34.14.2. The morphism $X' \rightarrow Y^\nu$ is smooth (hence flat) thus the generic points of irreducible components of X' lie over generic points of irreducible components of Y^ν . Since $Y^\nu \rightarrow Y$ is birational we conclude that $X' \rightarrow X$ is birational too (because $X' \rightarrow Y^\nu$ induces an isomorphism on fibres over generic points of Y). We conclude that there exists a factorization $X^\nu \rightarrow X' \rightarrow X$, see Morphisms, Lemma 28.48.15 which is an isomorphism as X' is normal and integral over X . \square

36.15. Normal morphisms

In the article [DM69] of Deligne and Mumford the notion of a normal morphism is mentioned. This is just one in a series of types¹ of morphisms that can all be defined similarly. Over time we will add these in their own sections as needed.

Definition 36.15.1. Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

- (1) Let $x \in X$, and $y = f(x)$. We say that f is *normal at x* if f is flat at x , and the scheme X_y is geometrically normal at x over $\kappa(y)$ (see Varieties, Definition 32.8.1).
- (2) We say f is a *normal morphism* if f is normal at every point of X .

So the condition that the morphism $X \rightarrow Y$ is normal is stronger than just requiring all the fibres to be normal locally Noetherian schemes.

¹ The other types are coprof $\leq k$, Cohen-Macaulay, (S_k) , regular, (R_k) , and reduced. See [DG67, IV Definition 6.8.1].

Lemma 36.15.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent*

- (1) f is normal, and
- (2) f is flat and its fibres are geometrically normal schemes.

Proof. This follows directly from the definitions. \square

Lemma 36.15.3. *A smooth morphism is normal.*

Proof. Let $f : X \rightarrow Y$ be a smooth morphism. As f is locally of finite presentation, see Morphisms, Lemma 28.35.8 the fibres X_y are locally of finite type over a field, hence locally Noetherian. Moreover, f is flat, see Morphisms, Lemma 28.35.9. Finally, the fibres X_y are smooth over a field (by Morphisms, Lemma 28.35.5) and hence geometrically normal by Varieties, Lemma 32.15.4. Thus f is normal by Lemma 36.15.2. \square

We want to show that this notion is local on the source and target for the smooth topology. First we deal with the property of having locally Noetherian fibres.

Lemma 36.15.4. *The property $\mathcal{P}(f) =$ “the fibres of f are locally Noetherian” is local in the fppf topology on the source and the target.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \rightarrow Y\}_{i \in I}$ be an fppf covering of Y . Denote $f_i : X_i \rightarrow Y_i$ the base change of f by φ_i . Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = \text{Spec}(\kappa(y_i)) \times_{\text{Spec}(\kappa(y))} X_y.$$

Moreover, as φ_i is of finite presentation the field extension $\kappa(y) \subset \kappa(y_i)$ is finitely generated. Hence in this situation we have that X_y is locally Noetherian if and only if X_{i,y_i} is locally Noetherian, see Varieties, Lemma 32.9.1. This fact implies locality on the target.

Let $\{X_i \rightarrow X\}$ be an fppf covering of X . Let $y \in Y$. In this case $\{X_{i,y} \rightarrow X_y\}$ is an fppf covering of the fibre. Hence the locality on the source follows from Descent, Lemma 34.12.1. \square

Lemma 36.15.5. *The property $\mathcal{P}(f) =$ “the fibres of f are locally Noetherian and f is normal” is local in the fppf topology on the target and local in the smooth topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f) \wedge \mathcal{P}_3(f)$ where $\mathcal{P}_1(f) =$ “the fibres of f are locally Noetherian”, $\mathcal{P}_2(f) =$ “ f is flat”, and $\mathcal{P}_3(f) =$ “the fibres of f are geometrically normal”. We have already seen that \mathcal{P}_1 and \mathcal{P}_2 are local in the fppf topology on the source and the target, see Lemma 36.15.4, and Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with \mathcal{P}_3 .

Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \rightarrow Y\}_{i \in I}$ be an fpqc covering of Y . Denote $f_i : X_i \rightarrow Y_i$ the base change of f by φ_i . Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = \text{Spec}(\kappa(y_i)) \times_{\text{Spec}(\kappa(y))} X_y.$$

Hence in this situation we have that X_y is geometrically normal if and only if X_{i,y_i} is geometrically normal, see Varieties, Lemma 32.8.4. This fact implies \mathcal{P}_3 is fpqc local on the target.

Let $\{X_i \rightarrow X\}$ be a smooth covering of X . Let $y \in Y$. In this case $\{X_{i,y} \rightarrow X_y\}$ is a smooth covering of the fibre. Hence the locality of \mathcal{P}_3 for the smooth topology on the source follows from Descent, Lemma 34.14.2. Combining the above the lemma follows. \square

36.16. Regular morphisms

Compare with Section 36.15. The algebraic version of this notion is discussed in More on Algebra, Section 15.30.

Definition 36.16.1. Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

- (1) Let $x \in X$, and $y = f(x)$. We say that f is *regular at x* if f is flat at x , and the scheme X_y is geometrically regular at x over $\kappa(y)$ (see Varieties, Definition 32.10.1).
- (2) We say f is a *regular morphism* if f is regular at every point of X .

The condition that the morphism $X \rightarrow Y$ is regular is stronger than just requiring all the fibres to be regular locally Noetherian schemes.

Lemma 36.16.2. Let $f : X \rightarrow Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent

- (1) f is regular,
- (2) f is flat and its fibres are geometrically regular schemes,
- (3) for every pair of affine opens $U \subset X$, $V \subset Y$ with $f(U) \subset V$ the ring map $\mathcal{O}(V) \rightarrow \mathcal{O}(U)$ is regular,
- (4) there exists an open covering $Y = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$ is regular, and
- (5) there exists an affine open covering $Y = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring maps $\mathcal{O}(V_j) \rightarrow \mathcal{O}(U_i)$ are regular.

Proof. The equivalence of (1) and (2) is immediate from the definitions. Let $x \in X$ with $y = f(x)$. By definition f is flat at x if and only if $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ is a flat ring map, and X_y is geometrically regular at x over $\kappa(y)$ if and only if $\mathcal{O}_{X_y,x} = \mathcal{O}_{X,x}/\mathfrak{m}_y \mathcal{O}_{X,x}$ is a geometrically regular algebra over $\kappa(y)$. Hence whether or not f is regular at x depends only on the local homomorphism of local rings $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$. Thus the equivalence of (1) and (4) is clear.

Recall (More on Algebra, Definition 15.30.1) that a ring map $A \rightarrow B$ is regular if and only if it is flat and the fibre rings $B \otimes_A \kappa(\mathfrak{p})$ are Noetherian and geometrically regular for all primes $\mathfrak{p} \subset A$. By Varieties, Lemma 32.10.3 this is equivalent to $\text{Spec}(B \otimes_A \kappa(\mathfrak{p}))$ being a geometrically regular scheme over $\kappa(\mathfrak{p})$. Thus we see that (2) implies (3). It is clear that (3) implies (5). Finally, assume (5). This implies that f is flat (see Morphisms, Lemma 28.26.3). Moreover, if $y \in Y$, then $y \in V_j$ for some j and we see that $X_y = \bigcup_{i \in I_j} U_{i,y}$ with each $U_{i,y}$ geometrically regular over $\kappa(y)$ by Varieties, Lemma 32.10.3. Another application of Varieties, Lemma 32.10.3 shows that X_y is geometrically regular. Hence (2) holds and the proof of the lemma is finished. \square

Lemma 36.16.3. A smooth morphism is regular.

Proof. Let $f : X \rightarrow Y$ be a smooth morphism. As f is locally of finite presentation, see Morphisms, Lemma 28.35.8 the fibres X_y are locally of finite type over a field, hence locally Noetherian. Moreover, f is flat, see Morphisms, Lemma 28.35.9. Finally, the fibres X_y are smooth over a field (by Morphisms, Lemma 28.35.5) and hence geometrically regular by Varieties, Lemma 32.15.4. Thus f is regular by Lemma 36.16.2. \square

Lemma 36.16.4. *The property $\mathcal{P}(f) =$ “the fibres of f are locally Noetherian and f is regular” is local in the fppf topology on the target and local in the smooth topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f) \wedge \mathcal{P}_3(f)$ where $\mathcal{P}_1(f) =$ “the fibres of f are locally Noetherian”, $\mathcal{P}_2(f) =$ “ f is flat”, and $\mathcal{P}_3(f) =$ “the fibres of f are geometrically regular”. We have already seen that \mathcal{P}_1 and \mathcal{P}_2 are local in the fppf topology on the source and the target, see Lemma 36.15.4, and Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with \mathcal{P}_3 .

Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \rightarrow Y\}_{i \in I}$ be an fpqc covering of Y . Denote $f_i : X_i \rightarrow Y_i$ the base change of f by φ_i . Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = \mathrm{Spec}(\kappa(y_i)) \times_{\mathrm{Spec}(\kappa(y))} X_y.$$

Hence in this situation we have that X_y is geometrically regular if and only if X_{i,y_i} is geometrically regular, see Varieties, Lemma 32.10.4. This fact implies \mathcal{P}_3 is fpqc local on the target.

Let $\{X_i \rightarrow X\}$ be a smooth covering of X . Let $y \in Y$. In this case $\{X_{i,y} \rightarrow X_y\}$ is a smooth covering of the fibre. Hence the locality of \mathcal{P}_3 for the smooth topology on the source follows from Descent, Lemma 34.14.4. Combining the above the lemma follows. \square

36.17. Cohen-Macaulay morphisms

Compare with Section 36.15. Note that, as pointed out in Algebra, Section 10.155 and Varieties, Section 32.11 “geometrically Cohen-Macaulay” is the same as plain Cohen-Macaulay.

Definition 36.17.1. Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

- (1) Let $x \in X$, and $y = f(x)$. We say that f is *Cohen-Macaulay at x* if f is flat at x , and the local ring of the scheme X_y at x is Cohen-Macaulay.
- (2) We say f is a *Cohen-Macaulay morphism* if f is Cohen-Macaulay at every point of X .

Here is a translation.

Lemma 36.17.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent*

- (1) f is Cohen-Macaulay, and
- (2) f is flat and its fibres are Cohen-Macaulay schemes.

Proof. This follows directly from the definitions. \square

Lemma 36.17.3. *Let $f : X \rightarrow Y$ be a morphism of locally Noetherian schemes which is locally of finite type and Cohen-Macaulay. For every point x in X with image y in Y ,*

$$\dim_x(X) = \dim_y(Y) + \dim_x(X_y),$$

where X_y denotes the fiber over y .

Proof. After replacing X by an open neighborhood of x , there is a natural number d such that all fibers of $X \rightarrow Y$ have dimension d at every point, see Morphisms, Lemma 28.30.4. Then f is flat, locally of finite type and of relative dimension d . Hence the result follows from Morphisms, Lemma 28.30.6. \square

Lemma 36.17.4. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes. Let $Y' \rightarrow Y$ be locally of finite type. Let $f' : X' = X_{Y'} \rightarrow Y'$ be the base change of f . Let $x' \in X'$ be a point with image $x \in X$.*

- (1) *If f is Cohen-Macaulay at x , then the base change $f' : X' \rightarrow Y'$ is Cohen-Macaulay at x' .*
- (2) *If $Y' \rightarrow Y$ is flat at $f'(x')$ and f' is Cohen-Macaulay at x' , then f is Cohen-Macaulay at x .*

Proof. Note that the assumption on $Y' \rightarrow Y$ means that for $y' \in Y'$ mapping to $y \in Y$ the field extension $\kappa(y) \subset \kappa(y')$ is finitely generated. Hence also all the fibres $X'_{y'} = (X_y)_{\kappa(y')}$ are locally Noetherian, see Varieties, Lemma 32.9.1. Thus the lemma makes sense. Set $y' = f'(x')$ and $y = f(x)$. Hence we get the following commutative diagram of local rings

$$\begin{array}{ccc} \mathcal{O}_{X',x'} & \longleftarrow & \mathcal{O}_{X,x} \\ \uparrow & & \uparrow \\ \mathcal{O}_{Y',y'} & \longleftarrow & \mathcal{O}_{Y,y} \end{array}$$

where the upper left corner is a localization of the tensor product of the upper right and lower left corners over the lower right corner.

Assume f is Cohen-Macaulay at x . The flatness of $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ implies the flatness of $\mathcal{O}_{Y',y'} \rightarrow \mathcal{O}_{X',x'}$, see Algebra, Lemma 10.96.1. The fact that $\mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$ is Cohen-Macaulay implies that $\mathcal{O}_{X',x'}/\mathfrak{m}_{y'}\mathcal{O}_{X',x'}$, see Varieties, Lemma 32.11.1. Hence we see that f' is Cohen-Macaulay at x' .

Assume $Y' \rightarrow Y$ is flat at y' and f' is Cohen-Macaulay at x' . The flatness of $\mathcal{O}_{Y',y'} \rightarrow \mathcal{O}_{X',x'}$ and $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{Y',y'}$ implies the flatness of $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$, see Algebra, Lemma 10.96.1. The fact that $\mathcal{O}_{X',x'}/\mathfrak{m}_{y'}\mathcal{O}_{X',x'}$ is Cohen-Macaulay implies that $\mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$, see Varieties, Lemma 32.11.1. Hence we see that f is Cohen-Macaulay at x . \square

Lemma 36.17.5. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. Let*

$$W = \{x \in X \mid f \text{ is Cohen-Macaulay at } x\}$$

Then

- (1) $W = \{x \in X \mid \mathcal{O}_{X_{f(x)},x} \text{ is Cohen-Macaulay}\}$,
- (2) W is open in X ,

- (3) W dense in every fibre of $X \rightarrow S$,
 (4) the formation of W commutes with arbitrary base change of f : For any morphism $g : S' \rightarrow S$, consider the base change $f' : X' \rightarrow S'$ of f and the projection $g' : X' \rightarrow X$. Then the corresponding set W' for the morphism f' is equal to $W' = (g')^{-1}(W)$.

Proof. As f is flat with locally Noetherian fibres the equality in (1) holds by definition. Parts (2) and (3) follow from Algebra, Lemma 10.126.5. Part (4) follows either from Algebra, Lemma 10.126.7 or Varieties, Lemma 32.11.1. \square

Lemma 36.17.6. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. For $d \geq 0$ there exist opens $U_d \subset X$ with the following properties*

- (1) $W = \bigcup_{d \geq 0} U_d$ is dense in every fibre of f , and
 (2) $U_d \rightarrow S$ is of relative dimension d (see Morphisms, Definition 28.30.1).

Proof. This follows by combining Lemma 36.17.5 with Morphisms, Lemma 28.30.4. \square

Lemma 36.17.7. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. Suppose $x' \rightsquigarrow x$ is a specialization of points of X with image $s' \rightsquigarrow s$ in S . If x is a generic point of an irreducible component of X_s then $\dim_{x'}(X_{s'}) = \dim_x(X_s)$.*

Proof. The point x is contained in U_d for some d , where U_d as in Lemma 36.17.6. \square

Lemma 36.17.8. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. Let $n \geq 0$ and let $U \subset S$ be a dense open such that $\dim(X_u) \leq n$ for all $u \in U$. Then $\dim(X_s) \leq n$ for all $s \in S$.*

Proof. Let $W \subset X$ be the open subscheme constructed and studied in Lemmas 36.17.5 and 36.17.6. Note that every generic point of every fibre is contained in W , hence it suffices to prove the result for W . Since $W = \bigcup_{d \geq 0} U_d$, it suffices to prove that $U_d = \emptyset$ for $d > n$. Since f is flat and locally of finite presentation it is open hence $f(U_d)$ is open (Morphisms, Lemma 28.26.9). Thus if U_d is not empty, then $f(U_d) \cap U \neq \emptyset$. The lemma follows. \square

Lemma 36.17.9. *The property $\mathcal{P}(f) =$ “the fibres of f are locally Noetherian and f is Cohen-Macaulay” is local in the fppf topology on the target and local in the syntomic topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f)$ where $\mathcal{P}_1(f) =$ “ f is flat”, and $\mathcal{P}_2(f) =$ “the fibres of f are locally Noetherian and Cohen-Macaulay”. We know that \mathcal{P}_1 is local in the fppf topology on the source and the target, see Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with \mathcal{P}_2 .

Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \rightarrow Y\}_{i \in I}$ be an fppf covering of Y . Denote $f_i : X_i \rightarrow Y_i$ the base change of f by φ_i . Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = \text{Spec}(\kappa(y_i)) \times_{\text{Spec}(\kappa(y))} X_y.$$

and that $\kappa(y) \subset \kappa(y_i)$ is a finitely generated field extension. Hence if X_y is locally Noetherian, then X_{i,y_i} is locally Noetherian, see Varieties, Lemma 32.9.1. And if

in addition X_y is Cohen-Macaulay, then X_{i,y_i} is Cohen-Macaulay, see Varieties, Lemma 32.11.1. Thus \mathcal{P}_2 is fppf local on the target.

Let $\{X_i \rightarrow X\}$ be a syntomic covering of X . Let $y \in Y$. In this case $\{X_{i,y} \rightarrow X_y\}$ is a syntomic covering of the fibre. Hence the locality of \mathcal{P}_2 for the syntomic topology on the source follows from Descent, Lemma 34.13.2. Combining the above the lemma follows. \square

36.18. Slicing Cohen-Macaulay morphisms

The results in this section eventually lead to the assertion that the fppf topology is the same as the “finitely presented, flat, quasi-finite” topology. The following lemma is very closely related to Divisors, Lemma 30.10.7.

Lemma 36.18.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$. Assume*

- (1) *f is locally of finite presentation,*
- (2) *f is flat at x , and*
- (3) *the image \bar{h} of h in $\mathcal{O}_{X_s,x} = \mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x}$ is a nonzerodivisor.*

Then there exists an affine open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \rightarrow S$ flat and locally of finite presentation.

Proof. We are going to prove this by reducing to the Noetherian case. By openness of flatness (see Theorem 36.12.1) we may assume, after replacing X by an open neighbourhood of x , that $X \rightarrow S$ is flat. We may also assume that X and S are affine. After possible shrinking X a bit we may assume that there exists an $h \in \Gamma(X, \mathcal{O}_X)$ which maps to our given h .

We may write $S = \text{Spec}(A)$ and we may write $A = \text{colim}_i A_i$ as a directed colimit of finite type \mathbf{Z} algebras. Then by Algebra, Lemma 10.156.1 or Limits, Lemmas 31.9.1, 31.7.2, and 31.9.1 we can find a cartesian diagram

$$\begin{array}{ccc} X & \longrightarrow & X_0 \\ f \downarrow & & \downarrow f_0 \\ S & \longrightarrow & S_0 \end{array}$$

with f_0 flat and of finite presentation, X_0 affine, and S_0 affine and Noetherian. Let $x_0 \in X_0$, resp. $s_0 \in S_0$ be the image of x , resp. s . We may also assume there exists an element $h_0 \in \Gamma(X_0, \mathcal{O}_{X_0})$ which restricts to h on X . (If you used the algebra reference above then this is clear; if you used the references to the chapter on limits then this follows from Limits, Lemma 31.9.1 by thinking of h as a morphism $X \rightarrow \mathbf{A}_S^1$.) Note that $\mathcal{O}_{X_s,x}$ is a localization of $\mathcal{O}_{(X_0)_{s_0},x_0} \otimes_{\kappa(s_0)} \kappa(s)$, so that $\mathcal{O}_{(X_0)_{s_0},x_0} \rightarrow \mathcal{O}_{X_s,x}$ is a flat local ring map, in particular faithfully flat. Hence the image $\bar{h}_0 \in \mathcal{O}_{(X_0)_{s_0},x_0}$ is contained in $\mathfrak{m}_{(X_0)_{s_0},x_0}$ and is a nonzerodivisor. We claim that after replacing X_0 by a principal open neighbourhood of x_0 the element h_0 is a nonzerodivisor in $B_0 = \Gamma(X_0, \mathcal{O}_{X_0})$ such that B_0/h_0B_0 is flat over $A_0 = \Gamma(S_0, \mathcal{O}_{S_0})$. If so then

$$0 \rightarrow B_0 \xrightarrow{h_0} B_0 \rightarrow B_0/h_0B_0 \rightarrow 0$$

is a short exact sequence of flat A_0 -modules. Hence this remains exact on tensoring with A (by Algebra, Lemma 10.38.11) and the lemma follows.

It remains to prove the claim above. The corresponding algebra statement is the following (we drop the subscript $_0$ here): Let $A \rightarrow B$ be a flat, finite type ring map of Noetherian rings. Let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{p} \subset A$. Assume $h \in \mathfrak{q}$ maps to a nonzerodivisor in $B_{\mathfrak{q}}/\mathfrak{p}B_{\mathfrak{q}}$. Goal: show that after possible replacing B by B_g for some $g \in B, g \notin \mathfrak{q}$ the element h becomes a nonzerodivisor and B/hB becomes flat over A . By Algebra, Lemma 10.95.2 we see that h is a nonzerodivisor in $B_{\mathfrak{q}}$ and that $B_{\mathfrak{q}}/hB_{\mathfrak{q}}$ is flat over A . By openness of flatness, see Algebra, Theorem 10.125.4 or Theorem 36.12.1 we see that B/hB is flat over A after replacing B by B_g for some $g \in B, g \notin \mathfrak{q}$. Finally, let $I = \{b \in B \mid hb = 0\}$ be the annihilator of h . Then $IB_{\mathfrak{q}} = 0$ as h is a nonzerodivisor in $B_{\mathfrak{q}}$. Also I is finitely generated as B is Noetherian. Hence there exists a $g \in B, g \notin \mathfrak{q}$ such that $IB_g = 0$. After replacing B by B_g we see that h is a nonzerodivisor. \square

Lemma 36.18.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h_1, \dots, h_r \in \mathcal{O}_{X,x}$. Assume*

- (1) *f is locally of finite presentation,*
- (2) *f is flat at x , and*
- (3) *the images of h_1, \dots, h_r in $\mathcal{O}_{X_s,x} = \mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x}$ form a regular sequence.*

Then there exists an affine open neighbourhood $U \subset X$ of x such that h_1, \dots, h_r come from $h_1, \dots, h_r \in \Gamma(U, \mathcal{O}_U)$ and such that $Z = V(h_1, \dots, h_r) \rightarrow U$ is a regular immersion with $x \in Z$ and $Z \rightarrow S$ flat and locally of finite presentation. Moreover, the base change $Z_{S'} \rightarrow U_{S'}$ is a regular immersion for any scheme S' over S .

Proof. (Our conventions on regular sequences imply that $h_i \in \mathfrak{m}_x$ for each i .) The case $r = 1$ follows from Lemma 36.18.1 combined with Divisors, Lemma 30.10.1 to see that $V(h_1)$ remains an effective Cartier divisor after base change. The case $r > 1$ follows from a straightforward induction on r (applying the result for $r = 1$ exactly r times; details omitted).

Another way to prove the lemma is using the material from Divisors, Section 30.14. Namely, first by openness of flatness (see Theorem 36.12.1) we may assume, after replacing X by an open neighbourhood of x , that $X \rightarrow S$ is flat. We may also assume that X and S are affine. After possible shrinking X a bit we may assume that we have $h_1, \dots, h_r \in \Gamma(X, \mathcal{O}_X)$. Set $Z = V(h_1, \dots, h_r)$. Note that X_s is a Noetherian scheme (because it is an algebraic $\kappa(s)$ -scheme, see Varieties, Section 32.13) and that the topology on X_s is induced from the topology on X (see Schemes, Lemma 25.18.5). Hence after shrinking X a bit more we may assume that $Z_s \subset X_s$ is a regular immersion cut out by the r elements $h_i|_{X_s}$, see Divisors, Lemma 30.12.8 and its proof. It is also clear that $r = \dim_x(X_s) - \dim_x(Z_s)$ because

$$\begin{aligned} \dim_x(X_s) &= \dim(\mathcal{O}_{X_s,x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim_x(Z_s) &= \dim(\mathcal{O}_{Z_s,x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim(\mathcal{O}_{X_s,x}) &= \dim(\mathcal{O}_{Z_s,x}) + r \end{aligned}$$

the first two equalities by Algebra, Lemma 10.112.3 and the second by r times applying Algebra, Lemma 10.59.11. Hence Divisors, Lemma 30.14.6 part (3) applies to show that (after Zariski shrinking X) the morphism $Z \rightarrow X$ is a regular

immersion to which Divisors, Lemma 30.14.4 applies (which gives the flatness and the statement on base change). \square

Lemma 36.18.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

- (1) *f is locally of finite presentation,*
- (2) *f is flat at x , and*
- (3) *$\mathcal{O}_{X_s, x}$ has depth ≥ 1 .*

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \rightarrow S$ is flat and of finite presentation.

Proof. Pick any $h \in \mathfrak{m}_x \subset \mathcal{O}_{X, x}$ which maps to a nonzerodivisor in $\mathcal{O}_{X_s, x}$ and apply Lemma 36.18.1. \square

Lemma 36.18.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

- (1) *f is locally of finite presentation,*
- (2) *f is Cohen-Macaulay at x , and*
- (3) *x is a closed point of X_s .*

Then there exists a regular immersion $Z \rightarrow X$ containing x such that

- (a) *$Z \rightarrow S$ is flat and locally of finite presentation,*
- (b) *$Z \rightarrow S$ is locally quasi-finite, and*
- (c) *$Z_s = \{x\}$ set theoretically.*

Proof. We may and do replace S by an affine open neighbourhood of s . We will prove the lemma for affine S by induction on $d = \dim_x(X_s)$.

The case $d = 0$. In this case we show that we may take Z to be an open neighbourhood of x . (Note that an open immersion is a regular immersion.) Namely, if $d = 0$, then $X \rightarrow S$ is quasi-finite at x , see Morphisms, Lemma 28.30.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \rightarrow S$ is quasi-finite, see Morphisms, Lemma 28.49.2. Thus after replacing X by U we see that the fibre X_s is a finite discrete set. Hence after replacing X by a further affine open neighbourhood of X we see that that $f^{-1}(\{s\}) = \{x\}$ (because the topology on X_s is induced from the topology on X , see Schemes, Lemma 25.18.5). This proves the lemma in this case.

Next, assume $d > 0$. Note that because x is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 28.21.3). Thus we see

$$\text{depth}(\mathcal{O}_{X_s, x}) = \dim(\mathcal{O}_{X_s, x}) = d > 0$$

the first equality as $\mathcal{O}_{X_s, x}$ is Cohen-Macaulay and the second by Morphisms, Lemma 28.29.1. Thus we may apply Lemma 36.18.3 to find a diagram

$$\begin{array}{ccccc} D & \longrightarrow & U & \longrightarrow & X \\ & \searrow & \searrow & \searrow & \downarrow \\ & & & & S \end{array}$$

with $x \in D$. Note that $\mathcal{O}_{D_s, x} = \mathcal{O}_{X_s, x}/(\bar{h})$ for some nonzerodivisor \bar{h} , see Divisors, Lemma 30.10.1. Hence $\mathcal{O}_{D_s, x}$ is Cohen-Macaulay of dimension one less than

the dimension of $\mathcal{O}_{X_s, x}$, see Algebra, Lemma 10.100.2 for example. Thus the morphism $D \rightarrow S$ is flat, locally of finite presentation, and Cohen-Macaulay at x with $\dim_x(D_s) = \dim_x(X_s) - 1 = d - 1$. By induction hypothesis we can find a regular immersion $Z \rightarrow D$ having properties (a), (b), (c). As $Z \rightarrow D \rightarrow U$ are both regular immersions, we see that also $Z \rightarrow U$ is a regular immersion by Divisors, Lemma 30.13.7. This finishes the proof. \square

Lemma 36.18.5. *Let $f : X \rightarrow S$ be a flat morphism of schemes which is locally of finite presentation. Let $s \in S$ be a point in the image of f . Then there exists a commutative diagram*

$$\begin{array}{ccc} S' & \xrightarrow{\quad} & X \\ & \searrow g & \swarrow f \\ & & S \end{array}$$

where $g : S' \rightarrow S$ is flat, locally of finite presentation, locally quasi-finite, and $s \in g(S')$.

Proof. The fibre X_s is not empty by assumption. Hence there exists a closed point $x \in X_s$ where f is Cohen-Macaulay, see Lemma 36.17.5. Apply Lemma 36.18.4 and set $S' = S$. \square

The following lemma shows that sheaves for the fppf topology are the same thing as sheaves for the “quasi-finite, flat, finite presentation” topology.

Lemma 36.18.6. *Let S be a scheme. Let $\mathcal{U} = \{S_i \rightarrow S\}_{i \in I}$ be an fppf covering of S , see Topologies, Definition 33.7.1. Then there exists an fppf covering $\mathcal{V} = \{T_j \rightarrow S\}_{j \in J}$ which refines (see Sites, Definition 7.8.1) \mathcal{U} such that each $T_j \rightarrow S$ is locally quasi-finite.*

Proof. For every $s \in S$ there exists an $i \in I$ such that s is in the image of $S_i \rightarrow S$. By Lemma 36.18.5 we can find a morphism $g_s : T_s \rightarrow S$ such that $s \in g_s(T_s)$ which is flat, locally of finite presentation and locally quasi-finite and such that g_s factors through $S_i \rightarrow S$. Hence $\{T_s \rightarrow S\}$ is the desired covering of S that refines \mathcal{U} . \square

36.19. Generic fibres

Some results on the relationship between generic fibres and nearby fibres.

Lemma 36.19.1. *Let $f : X \rightarrow Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η . If $X_\eta = \emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_V = V \times_Y X = \emptyset$.*

Proof. Follows immediately from the more general Morphisms, Lemma 28.8.4. \square

Lemma 36.19.2. *Let $f : X \rightarrow Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η . If $X_\eta \neq \emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_V = V \times_Y X \rightarrow V$ is surjective.*

Proof. This follows, upon taking affine opens, from Algebra, Lemma 10.29.2. (Of course it also follows from generic flatness.) \square

Lemma 36.19.3. *Let $f : X \rightarrow Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η . If $Z \subset X$ is a closed subset with Z_η nowhere dense in X_η , then there exists a nonempty open $V \subset Y$ such that Z_y is nowhere dense in X_y for all $y \in V$.*

Proof. Let $Y' \subset Y$ be the reduction of Y . Set $X' = Y' \times_Y X$ and $Z' = Y' \times_Y Z$. As $Y' \rightarrow Y$ is a universal homeomorphism by Morphisms, Lemma 28.45.4 we see that it suffices to prove the lemma for $Z' \subset X' \rightarrow Y'$. Thus we may assume that Y is integral, see Properties, Lemma 27.3.4. By Morphisms, Proposition 28.28.1 there exists a nonempty affine open $V \subset Y$ such that $X_V \rightarrow V$ and $Z_V \rightarrow Z$ are flat and of finite presentation. We claim that V works. Pick $y \in V$. If Z_y has a nonempty interior, then Z_y contains a generic point ξ of an irreducible component of X_y . Note that $\eta \rightsquigarrow f(\xi)$. Since $Z_V \rightarrow V$ is flat we can choose a specialization $\xi' \rightsquigarrow \xi$, $\xi' \in Z$ with $f(\xi') = \eta$, see Morphisms, Lemma 28.26.8. By Lemma 36.17.7 we see that

$$\dim_{\xi'}(Z_\eta) = \dim_\xi(Z_y) = \dim_\xi(X_y) = \dim_{\xi'}(X_\eta).$$

Hence some irreducible component of Z_η passing through ξ' has dimension $\dim_{\xi'}(X_\eta)$ which contradicts the assumption that Z_η is nowhere dense in X_η and we win. \square

Lemma 36.19.4. *Let $f : X \rightarrow Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η . Let $U \subset X$ be an open subscheme such that U_η is scheme theoretically dense in X_η . Then there exists a nonempty open $V \subset Y$ such that U_y is scheme theoretically dense in X_y for all $y \in V$.*

Proof. Let $Y' \subset Y$ be the reduction of Y . Let $X' = Y' \times_Y X$ and $U' = Y' \times_Y U$. As $Y' \rightarrow Y$ induces a bijection on points, and as $U' \rightarrow U$ and $X' \rightarrow X$ induce isomorphisms of scheme theoretic fibres, we may replace Y by Y' and X by X' . Thus we may assume that Y is integral, see Properties, Lemma 27.3.4. We may also replace Y by a nonempty affine open. In other words we may assume that $Y = \text{Spec}(A)$ where A is a domain with fraction field K .

As f is of finite type we see that X is quasi-compact. Write $X = X_1 \cup \dots \cup X_n$ for some affine opens X_i . By Morphisms, Definition 28.7.1 we see that $U_i = X_i \cap U$ is an open subscheme of X_i such that $U_{i,\eta}$ is scheme theoretically dense in $X_{i,\eta}$. Thus it suffices to prove the result for the pairs (X_i, U_i) , in other words we may assume that X is affine.

Write $X = \text{Spec}(B)$. Note that B_K is Noetherian as it is a finite type K -algebra. Hence U_η is quasi-compact. Thus we can find finitely many $g_1, \dots, g_m \in B$ such that $D(g_j) \subset U$ and such that $U_\eta = D(g_1)_\eta \cup \dots \cup D(g_m)_\eta$. The fact that U_η is scheme theoretically dense in X_η means that $B_K \rightarrow \bigoplus_j (B_K)_{g_j}$ is injective, see Morphisms, Example 28.7.4. By Algebra, Lemma 10.22.4 this is equivalent to the injectivity of $B_K \rightarrow \bigoplus_{j=1, \dots, m} B_K$, $b \mapsto (g_1 b, \dots, g_m b)$. Let M be the cokernel of this map over A , i.e., such that we have an exact sequence

$$0 \rightarrow I \rightarrow B \xrightarrow{(g_1, \dots, g_m)} \bigoplus_{j=1, \dots, m} B \rightarrow M \rightarrow 0$$

After replacing A by A_h for some nonzero h we may assume that B is a flat, finitely presented A -algebra, and that M is flat over A , see Algebra, Lemma 10.114.3. The flatness of B over A implies that B is torsion free as an A -module, see More on Algebra, Lemma 15.15.3. Hence $B \subset B_K$. By assumption $I_K = 0$ which implies that $I = 0$ (as $I \subset B \subset B_K$ is a subset of I_K). Hence now we have a short exact sequence

$$0 \rightarrow B \xrightarrow{(g_1, \dots, g_m)} \bigoplus_{j=1, \dots, m} B \rightarrow M \rightarrow 0$$

with M flat over A . Hence for every homomorphism $A \rightarrow \kappa$ where κ is a field, we obtain a short exact sequence

$$0 \rightarrow B \otimes_A \kappa \xrightarrow{(g_1 \otimes 1, \dots, g_m \otimes 1)} \bigoplus_{j=1, \dots, m} B \otimes_A \kappa \rightarrow M \otimes_A \kappa \rightarrow 0$$

see Algebra, Lemma 10.38.11. Reversing the arguments above this means that $\bigcup D(g_j \otimes 1)$ is scheme theoretically dense in $\text{Spec}(B \otimes_A \kappa)$. As $\bigcup D(g_j \otimes 1) = \bigcup D(g_j)_\kappa \subset U_\kappa$ we obtain that U_κ is scheme theoretically dense in X_κ which is what we wanted to prove. \square

Suppose given a morphism of schemes $f : X \rightarrow Y$ and a point $y \in Y$. Recall that the fibre X_y is homeomorphic to the subset $f^{-1}(\{y\})$ of X with induced topology, see Schemes, Lemma 25.18.5. Suppose given a closed subset $T(y) \subset X_y$. Let T be the closure of $T(y)$ in X . Endow T with the induced reduced scheme structure. Then T is a closed subscheme of X with the property that $T_y = T(y)$ set-theoretically. In fact T is the smallest closed subscheme of X with this property. Thus it is “harmless” to denote a closed subset of X_y by T_y if we so desire. In the following lemma we apply this to the generic fibre of f .

Lemma 36.19.5. *Let $f : X \rightarrow Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η . Let $X_\eta = Z_{1,\eta} \cup \dots \cup Z_{n,\eta}$ be a covering of the generic fibre by closed subsets of X_η . Let Z_i be the closure of $Z_{i,\eta}$ in X (see discussion above). Then there exists a nonempty open $V \subset Y$ such that $X_y = Z_{1,y} \cup \dots \cup Z_{n,y}$ for all $y \in V$.*

Proof. If Y is Noetherian then $U = X \setminus (Z_1 \cup \dots \cup Z_n)$ is of finite type over Y and we can directly apply Lemma 36.19.1 to get that $U_V = \emptyset$ for a nonempty open $V \subset Y$. In general we argue as follows. As the question is topological we may replace Y by its reduction. Thus Y is integral, see Properties, Lemma 27.3.4. After shrinking Y we may assume that $X \rightarrow Y$ is flat, see Morphisms, Proposition 28.28.1. In this case every point x in X_y is a specialization of a point $x' \in X_\eta$ by Morphisms, Lemma 28.26.8. As the Z_i are closed in X and cover the generic fibre this implies that $X_y = \bigcup Z_{i,y}$ for $y \in Y$ as desired. \square

The following lemma says that generic fibres of morphisms whose source is reduced are reduced.

Lemma 36.19.6. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\eta \in Y$ be a generic point of an irreducible component of Y . Then $(X_\eta)_{red} = (X_{red})_\eta$.*

Proof. Choose an affine neighbourhood $\text{Spec}(A) \subset Y$ of η . Choose an affine open $\text{Spec}(B) \subset X$ mapping into $\text{Spec}(A)$ via the morphism f . Let $\mathfrak{p} \subset A$ be the minimal prime corresponding to η . Let B_{red} be the quotient of B by $\sqrt{(0)}$. The algebraic content of the lemma is that $B_{red} \otimes_A \kappa(\mathfrak{p})$ is reduced. To prove this, suppose that $x \in B_{red} \otimes_A \kappa(\mathfrak{p})$ is nilpotent. Say $x^n = 0$ for some $n > 0$. Pick an $f \in A$, $f \notin \mathfrak{p}$ such that fx is the image of $y \in B_{red}$. Then $gy^n \in \mathfrak{p}B_{red}$ for some $g \in A$, $g \notin \mathfrak{p}$. By Algebra, Lemma 10.24.1 we see that $\mathfrak{p}A_\mathfrak{p}$ is locally nilpotent. By Algebra, Lemma 10.31.2 we see that $\mathfrak{p}(B_{red})_\mathfrak{p}$ is locally nilpotent. Hence we conclude that gy^n is nilpotent in $(B_{red})_\mathfrak{p}$. Thus there exists a $h \in A$, $h \notin \mathfrak{p}$ and an $m > 0$ such that $h(gy^n)^m = 0$ in B_{red} . This implies that hgy is nilpotent in B_{red} , i.e., that $hgy = 0$. Of course this means that $x = 0$ as desired. \square

Lemma 36.19.7. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that Y is irreducible and f is of finite type. There exists a diagram*

$$\begin{array}{ccccc} X' & \xrightarrow{g'} & X_V & \longrightarrow & X \\ f' \downarrow & & \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & V & \longrightarrow & Y \end{array}$$

where

- (1) V is a nonempty open of Y ,
- (2) $X_V = V \times_Y X$,
- (3) $g : Y' \rightarrow V$ is a finite universal homeomorphism,
- (4) $X' = (Y' \times_Y X)_{red} = (Y' \times_V X_V)_{red}$,
- (5) g' is a finite universal homeomorphism,
- (6) Y' is an integral affine scheme,
- (7) f' is flat and of finite presentation, and
- (8) the generic fibre of f' is geometrically reduced.

Proof. Let $V = \text{Spec}(A)$ be a nonempty affine open of Y . By assumption the radical of A is a prime ideal \mathfrak{p} . Let $K = f.f(A/\mathfrak{p})$ be the fraction field. Let p be the characteristic of K if positive and 1 if the characteristic is zero. By Varieties, Lemma 32.4.11 there exists a finite purely inseparable field extension $K \subset K'$ such that $X_{K'}$ is geometrically reduced over K' . Choose elements $x_1, \dots, x_n \in K'$ which generate K' over K and such that some p -power of x_i is in A/\mathfrak{p} . Let $A' \subset K'$ be the finite A -subalgebra of K' generated by x_1, \dots, x_n . Note that A' is a domain with fraction field K' . By Algebra, Lemma 10.45.2 we see that $A \rightarrow A'$ is a universal homeomorphism. Set $Y' = \text{Spec}(A')$. Set $X' = (Y' \times_Y X)_{red}$. The generic fibre of $X' \rightarrow Y'$ is $(X_K)_{red}$ by Lemma 36.19.6 which is geometrically reduced by construction. Note that $X' \rightarrow X_V$ is a finite universal homeomorphism as the composition of the reduction morphism $X' \rightarrow Y' \times_Y X$ (see Morphisms, Lemma 28.45.4) and the base change of g . At this point all of the properties of the lemma hold except for possibly (7). This can be achieved by shrinking Y' and hence V , see Morphisms, Proposition 28.28.1. \square

Lemma 36.19.8. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume that Y is irreducible and f is of finite type. There exists a diagram*

$$\begin{array}{ccccc} X' & \xrightarrow{g'} & X_V & \longrightarrow & X \\ f' \downarrow & & \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & V & \longrightarrow & Y \end{array}$$

where

- (1) V is a nonempty open of Y ,
- (2) $X_V = V \times_Y X$,
- (3) $g : Y' \rightarrow V$ is surjective finite étale,
- (4) $X' = Y' \times_Y X = Y' \times_V X_V$,
- (5) g' is surjective finite étale,
- (6) Y' is an irreducible affine scheme, and
- (7) all irreducible components of the generic fibre of f' are geometrically irreducible.

Proof. Let $V = \text{Spec}(A)$ be a nonempty affine open of Y . By assumption the radical of A is a prime ideal \mathfrak{p} . Let $K = f.f.(A/\mathfrak{p})$ be the fraction field. By Varieties, Lemma 32.6.14 there exists a finite separable field extension $K \subset K'$ such that all irreducible components of $X_{K'}$ are geometrically irreducible over K' . Choose an element $\alpha \in K'$ which generates K' over K , see Fields, Lemma 9.18.1. Let $P(T) \in K[T]$ be the minimal polynomial for α over K . After replacing α by $f\alpha$ for some $f \in A$, $f \notin \mathfrak{p}$ we may assume that there exists a monic polynomial $T^d + a_1T^{d-1} + \dots + a_d \in A[T]$ which maps to $P(T) \in K[T]$ under the map $A[T] \rightarrow K[T]$. Set $A' = A[T]/(P)$. Then $A \rightarrow A'$ is a finite free ring map such that there exists a unique prime \mathfrak{q} lying over \mathfrak{p} , such that $K = \kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}) = K'$ is finite separable, and such that $\mathfrak{p}A'_\mathfrak{q}$ is the maximal ideal of $A'_\mathfrak{q}$. Hence $g : Y' = \text{Spec}(A') \rightarrow V = \text{Spec}(A)$ is étale at \mathfrak{q} , see Algebra, Lemma 10.138.7. This means that there exists an open $W \subset \text{Spec}(A')$ such that $g|_W : W \rightarrow \text{Spec}(A)$ is étale. Since g is finite and since \mathfrak{q} is the only point lying over \mathfrak{p} we see that $Z = g(Y' \setminus W)$ is a closed subset of V not containing \mathfrak{p} . Hence after replacing V by a principal affine open of V which does not meet Z we obtain that g is finite étale. \square

Lemma 36.19.9. *Let S be an integral scheme with generic point η . Let $f : X \rightarrow S$ and $g : Y \rightarrow S$ be morphisms of schemes such that*

- (1) f, g are locally of finite type,
- (2) X_η, Y_η are integral with generic points x, y , and
- (3) $\kappa(x) \cong \kappa(y)$ as $\kappa(\eta)$ -extensions.

Then there exist open subschemes $U \subset X, V \subset Y$ and an S -isomorphism $U \rightarrow V$ which induces the given isomorphism of residue fields.

Proof. The question is local around the points η, x, y . Hence we may replace S, X, Y by affine neighbourhoods of η, x, y and hence reduce to the case that S, X, Y are affine. Say $S = \text{Spec}(R)$ and $X = \text{Spec}(A), Y = \text{Spec}(B)$. By Algebra, Lemma 10.114.3 we may also assume that A and B are flat and of finite presentation over R . Denote $K = f.f.(R)$. The rings A, B are torsion free as R -modules because A, B are flat over R , see More on Algebra, Lemma 15.15.3. Since $A \otimes_R K$ and $B \otimes_R K$ are domains by assumption it follows that A and B are domains. Set $L = f.f.(A)$ and $M = f.f.(B)$. Let $\varphi : L \rightarrow M$ be the given isomorphism of K -extensions.

Choose elements $x_1, \dots, x_n \in A$ which generate A as an R -algebra, and choose elements $y_1, \dots, y_m \in B$ which generate B as an R -algebra. Write $\varphi(x_i) = b_i/b$ for some $b, b_i \in B$. In other words, b is a common denominator for the elements $\varphi(x_i) \in M = f.f.(B)$. Similarly, write $\varphi^{-1}(y_j) = a_j/a$ for some $a, a_j \in A$. Note that $\varphi(a) \in B_b$ because a can be written as a polynomial in the x_i . Similarly we have $\varphi^{-1}(b) \in A_a$. Thus φ gives an isomorphism

$$A_a \longrightarrow B_b$$

of R -algebras and the lemma is proven. \square

36.20. Relative assassins

Lemma 36.20.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\xi \in \text{Ass}_{X/S}(\mathcal{F})$ and set $Z = \overline{\{\xi\}} \subset X$. If f is locally of finite type and \mathcal{F} is a finite type \mathcal{O}_X -module, then there exists a nonempty open $V \subset Z$ such that for every $s \in f(V)$ the generic points of V_s are elements of $\text{Ass}_{X/S}(\mathcal{F})$.*

Proof. We may replace S by an affine open neighbourhood of $f(\xi)$ and X by an affine open neighbourhood of ξ . Hence we may assume $S = \text{Spec}(A)$, $X = \text{Spec}(B)$ and that f is given by the finite type ring map $A \rightarrow B$, see Morphisms, Lemma 28.16.2. Moreover, we may write $\mathcal{F} = \widetilde{M}$ for some finite B -module M , see Properties, Lemma 27.16.1. Let $\mathfrak{q} \subset B$ be the prime corresponding to ξ and let $\mathfrak{p} \subset A$ be the corresponding prime of A . By assumption $\mathfrak{q} \in \text{Ass}_B(M \otimes_A \kappa(\mathfrak{p}))$, see Algebra, Remark 10.64.6 and Divisors, Lemma 30.2.2. With this notation $Z = V(\mathfrak{q}) \subset \text{Spec}(B)$. In particular $f(Z) \subset V(\mathfrak{p})$. Hence clearly it suffices to prove the lemma after replacing A , B , and M by $A/\mathfrak{p}A$, $B/\mathfrak{p}B$, and $M/\mathfrak{p}M$. In other words we may assume that A is a domain with fraction field K and $\mathfrak{q} \subset B$ is an associated prime of $M \otimes_A K$.

At this point we can use generic flatness. Namely, by Algebra, Lemma 10.114.3 there exists a nonzero $g \in A$ such that M_g is flat as an A_g -module. After replacing A by A_g we may assume that M is flat as an A -module.

In this case, by Algebra, Lemma 10.64.4 we see that \mathfrak{q} is also an associated prime of M . Hence we obtain an injective B -module map $B/\mathfrak{q} \rightarrow M$. Let Q be the cokernel so that we obtain a short exact sequence

$$0 \rightarrow B/\mathfrak{q} \rightarrow M \rightarrow Q \rightarrow 0$$

of finite B -modules. After applying generic flatness Algebra, Lemma 10.114.3 once more, this time to the B -module Q , we may assume that Q is a flat A -module. In particular we may assume the short exact sequence above is universally injective, see Algebra, Lemma 10.38.11. In this situation $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}') \subset M \otimes_A \kappa(\mathfrak{p}')$ for any prime \mathfrak{p}' of A . The lemma follows as a minimal prime \mathfrak{q}' of the support of $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}')$ is an associated prime of $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}')$ by Divisors, Lemma 30.2.8. \square

Lemma 36.20.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $U \subset X$ be an open subscheme. Assume*

- (1) f is of finite type,
- (2) \mathcal{F} is of finite type,
- (3) Y is irreducible with generic point η , and
- (4) $\text{Ass}_{X_\eta}(\mathcal{F}_\eta)$ is not contained in U_η .

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ the set $\text{Ass}_{X_y}(\mathcal{F}_y)$ is not contained in U_y .

Proof. Let $\xi \in \text{Ass}_{X_\eta}(\mathcal{F}_\eta)$ be a point which is not contained in U_η . Set $Z = \overline{\{\xi\}}$. By assumption $U \cap Z$ is not dense in the irreducible scheme Z_η . Hence by Lemma 36.19.3 after replacing Y by a nonempty open we may assume that $U_y \cap Z_y$ is nowhere dense in Z_y . On the other hand, by Lemma 36.20.1 there exists a nonempty open $V \subset Z$ such that every generic point of V_y is an associated point of \mathcal{F}_y . By Lemma 36.19.2 the set $f(V)$ contains a nonempty open subset of Y and we win. \square

Lemma 36.20.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $U \subset X$ be an open subscheme. Assume*

- (1) f is of finite type,
- (2) \mathcal{F} is of finite type,
- (3) Y is irreducible with generic point η , and
- (4) $\text{Ass}_{X_\eta}(\mathcal{F}_\eta) \subset U_\eta$.

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ we have $\text{Ass}_{X_y}(\mathcal{F}_y) \subset U_y$.

Proof. (This proof is the same as the proof of Lemma 36.19.4. We urge the reader to read that proof first.) Since the statement is about fibres it is clear that we may replace Y by its reduction. Hence we may assume that Y is integral, see Properties, Lemma 27.3.4. We may also assume that $Y = \text{Spec}(A)$ is affine. Then A is a domain with fraction field K .

As f is of finite type we see that X is quasi-compact. Write $X = X_1 \cup \dots \cup X_n$ for some affine opens X_i and set $\mathcal{F}_i = \mathcal{F}|_{X_i}$. By assumption the generic fibre of $U_i = X_i \cap U$ contains $\text{Ass}_{X_{i,\eta}}(\mathcal{F}_{i,\eta})$. Thus it suffices to prove the result for the triples $(X_i, \mathcal{F}_i, U_i)$, in other words we may assume that X is affine.

Write $X = \text{Spec}(B)$. Let N be a finite B -module such that $\mathcal{F} = \tilde{N}$. Note that B_K is Noetherian as it is a finite type K -algebra. Hence U_η is quasi-compact. Thus we can find finitely many $g_1, \dots, g_m \in B$ such that $D(g_j) \subset U$ and such that $U_\eta = D(g_1)_\eta \cup \dots \cup D(g_m)_\eta$. Since $\text{Ass}_{X_\eta}(\mathcal{F}_\eta) \subset U_\eta$ we see that $N_K \rightarrow \bigoplus_j (N_K)_{g_j}$ is injective. By Algebra, Lemma 10.22.4 this is equivalent to the injectivity of $N_K \rightarrow \bigoplus_{j=1, \dots, m} N_K, n \mapsto (g_1 n, \dots, g_m n)$. Let I and M be the kernel and cokernel of this map over A , i.e., such that we have an exact sequence

$$0 \rightarrow I \rightarrow N \xrightarrow{(g_1, \dots, g_m)} \bigoplus_{j=1, \dots, m} N \rightarrow M \rightarrow 0$$

After replacing A by A_h for some nonzero h we may assume that B is a flat, finitely presented A -algebra and that both M and N are flat over A , see Algebra, Lemma 10.114.3. The flatness of N over A implies that N is torsion free as an A -module, see More on Algebra, Lemma 15.15.3. Hence $N \subset N_K$. By construction $I_K = 0$ which implies that $I = 0$ (as $I \subset N \subset N_K$ is a subset of I_K). Hence now we have a short exact sequence

$$0 \rightarrow N \xrightarrow{(g_1, \dots, g_m)} \bigoplus_{j=1, \dots, m} N \rightarrow M \rightarrow 0$$

with M flat over A . Hence for every homomorphism $A \rightarrow \kappa$ where κ is a field, we obtain a short exact sequence

$$0 \rightarrow N \otimes_A \kappa \xrightarrow{(g_1 \otimes 1, \dots, g_m \otimes 1)} \bigoplus_{j=1, \dots, m} N \otimes_A \kappa \rightarrow M \otimes_A \kappa \rightarrow 0$$

see Algebra, Lemma 10.38.11. Reversing the arguments above this means that $\bigcup D(g_j \otimes 1)$ contains $\text{Ass}_{B \otimes_A \kappa}(N \otimes_A \kappa)$. As $\bigcup D(g_j \otimes 1) = \bigcup D(g_j)_\kappa \subset U_\kappa$ we obtain that U_κ contains $\text{Ass}_{X \otimes \kappa}(\mathcal{F} \otimes \kappa)$ which is what we wanted to prove. \square

Lemma 36.20.4. *Let $f : X \rightarrow S$ be a morphism which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. Let $U \subset X$ be an open subscheme. Let $g : S' \rightarrow S$ be a morphism of schemes, let $f' : X' = X_{S'} \rightarrow S'$ be the base change of f , let $g' : X' \rightarrow X$ be the projection, set $\mathcal{F}' = (g')^* \mathcal{F}$, and set $U' = (g')^{-1}(U)$. Finally, let $s' \in S'$ with image $s = g(s')$. In this case*

$$\text{Ass}_{X_s}(\mathcal{F}_s) \subset U_s \Leftrightarrow \text{Ass}_{X'_{s'}}(\mathcal{F}'_{s'}) \subset U'_{s'}.$$

Proof. This follows immediately from Divisors, Lemma 30.7.2. See also Divisors, Remark 30.7.3. \square

Lemma 36.20.5. *Let $f : X \rightarrow Y$ be a morphism of finite presentation. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite presentation. Let $U \subset X$ be an open subscheme such that $U \rightarrow Y$ is quasi-compact. Then the set*

$$E = \{y \in Y \mid \text{Ass}_{X_y}(\mathcal{F}_y) \subset U_y\}$$

is locally constructible in Y .

Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E \cap V$ is constructible in V . Thus we may assume that Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation whose base change to Y recovers f . After possibly increasing i we may assume there exists a quasi-coherent \mathcal{O}_{X_i} -module \mathcal{F}_i of finite presentation whose pullback to X is isomorphic to \mathcal{F} , see Limits, Lemma 31.9.2. After possibly increasing i one more time we may assume there exists an open subscheme $U_i \subset X_i$ whose inverse image in X is U , see Limits, Lemma 31.3.8. By Lemma 36.20.4 it suffices to prove the lemma for f_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15.3 to prove that E is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in Z . This follows from Lemmas 36.20.2 and 36.20.3 applied to the base change $(X, \mathcal{F}, U) \times_Y Z$ over Z . \square

36.21. Reduced fibres

Lemma 36.21.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η is nonreduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y is nonreduced.*

Proof. Let $Y' \subset Y$ be the reduction of Y . Let $X' \rightarrow Y'$ be the base change of f . Note that $Y' \rightarrow Y$ induces a bijection on points and that $X' \rightarrow X$ identifies fibres. Hence we may assume that Y' is reduced, i.e., integral, see Properties, Lemma 27.3.4. We may also replace Y by an affine open. Hence we may assume that $Y = \text{Spec}(A)$ with A a domain. Denote $K = f.f.(A)$ the fraction field of A . Pick an affine open $\text{Spec}(B) = U \subset X$ and a section $h_\eta \in \Gamma(U_\eta, \mathcal{O}_{U_\eta}) = B_K$ which is nonzero and nilpotent. After shrinking Y we may assume that h comes from $h \in \Gamma(U, \mathcal{O}_U) = B$. After shrinking Y a bit more we may assume that h is nilpotent. Let $I = \{b \in B \mid hb = 0\}$ be the annihilator of h . Then $C = B/I$ is a finite type A -algebra whose generic fiber $(B/I)_K$ is nonzero (as $h_\eta \neq 0$). We apply generic flatness to $A \rightarrow C$ and $A \rightarrow B/hB$, see Algebra, Lemma 10.114.3, and we obtain a $g \in A$, $g \neq 0$ such that C_g is free as an A_g -module and $(B/hB)_g$ is flat as an A_g -module. Replace Y by $D(g) \subset Y$. Now we have the short exact sequence

$$0 \rightarrow C \rightarrow B \rightarrow B/hB \rightarrow 0.$$

with B/hB flat over A and with C nonzero free as an A -module. It follows that for any homomorphism $A \rightarrow \kappa$ to a field the ring $C \otimes_A \kappa$ is nonzero and the sequence

$$0 \rightarrow C \otimes_A \kappa \rightarrow B \otimes_A \kappa \rightarrow B/hB \otimes_A \kappa \rightarrow 0$$

is exact, see Algebra, Lemma 10.38.11. Note that $B/hB \otimes_A \kappa = (B \otimes_A \kappa)/h(B \otimes_A \kappa)$ by right exactness of tensor product. Thus we conclude that multiplication by h is

not zero on $B \otimes_A \kappa$. This clearly means that for any point $y \in Y$ the element h restricts to a nonzero element of U_y , whence X_y is nonreduced. \square

Lemma 36.21.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $g : Y' \rightarrow Y$ be any morphism, and denote $f' : X' \rightarrow Y'$ the base change of f . Then*

$$\begin{aligned} & \{y' \in Y' \mid X'_{y'} \text{ is geometrically reduced}\} \\ &= g^{-1}(\{y \in Y \mid X_y \text{ is geometrically reduced}\}). \end{aligned}$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically reduced over $\kappa(y')$ if and only if X_y is geometrically reduced over $\kappa(y)$. This follows from Varieties, Lemma 32.4.6. \square

Lemma 36.21.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η is not geometrically reduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y is not geometrically reduced.*

Proof. Apply Lemma 36.19.7 to get

$$\begin{array}{ccccc} X' & \xrightarrow{g'} & X_V & \longrightarrow & X \\ f' \downarrow & & \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & V & \longrightarrow & Y \end{array}$$

with all the properties mentioned in that lemma. Let η' be the generic point of Y' . Consider the morphism $X' \rightarrow X_{Y'}$ (which is the reduction morphism) and the resulting morphism of generic fibres $X'_{\eta'} \rightarrow X_{\eta'}$. Since $X'_{\eta'}$ is geometrically reduced, and X_η is not this cannot be an isomorphism, see Varieties, Lemma 32.4.6. Hence $X_{\eta'}$ is nonreduced. Hence by Lemma 36.21.1 the fibres of $X_{Y'} \rightarrow Y'$ are nonreduced at all points $y' \in V'$ of a nonempty open $V' \subset Y'$. Since $g : Y' \rightarrow Y$ is a homeomorphism Lemma 36.21.2 proves that $g(V')$ is the open we are looking for. \square

Lemma 36.21.4. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume*

- (1) Y is irreducible with generic point η ,
- (2) X_η is geometrically reduced, and
- (3) f is of finite type.

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \rightarrow V$ has geometrically reduced fibres.

Proof. Let $Y' \subset Y$ be the reduction of Y . Let $X' \rightarrow Y'$ be the base change of f . Note that $Y' \rightarrow Y$ induces a bijection on points and that $X' \rightarrow X$ identifies fibres. Hence we may assume that Y' is reduced, i.e., integral, see Properties, Lemma 27.3.4. We may also replace Y by an affine open. Hence we may assume that $Y = \text{Spec}(A)$ with A a domain. Denote $K = f.f.(A)$ the fraction field of A . After shrinking Y a bit we may also assume that $X \rightarrow Y$ is flat and of finite presentation, see Morphisms, Proposition 28.28.1.

As X_η is geometrically reduced there exists an open dense subset $V \subset X_\eta$ such that $V \rightarrow \text{Spec}(K)$ is smooth, see Varieties, Lemma 32.15.7. Let $U \subset X$ be the set of points where f is smooth. By Morphisms, Lemma 28.35.15 we see that $V \subset U_\eta$. Thus the generic fibre of U is dense in the generic fibre of X . Since X_η is reduced,

it follows that U_η is scheme theoretically dense in X_η , see Morphisms, Lemma 28.7.8. We note that as $U \rightarrow Y$ is smooth all the fibres of $U \rightarrow Y$ are geometrically reduced. Thus it suffices to show that, after shrinking Y , for all $y \in Y$ the scheme U_y is scheme theoretically dense in X_y , see Morphisms, Lemma 28.7.9. This follows from Lemma 36.19.4. \square

Lemma 36.21.5. *Let $f : X \rightarrow Y$ be a morphism of finite presentation. Then the set*

$$E = \{y \in Y \mid X_y \text{ is geometrically reduced}\}$$

is locally constructible in Y .

Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E \cap V$ is constructible in V . Thus we may assume that Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation whose base change to Y recovers f . By Lemma 36.21.2 it suffices to prove the lemma for f_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15.3 to prove that E is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in Z . If X_ξ is geometrically reduced, then Lemma 36.21.4 (applied to the morphism $X_Z \rightarrow Z$) implies that all fibres X_y are geometrically reduced for a nonempty open $V \subset Z$. If X_ξ is not geometrically reduced, then Lemma 36.21.3 (applied to the morphism $X_Z \rightarrow Z$) implies that all fibres X_y are geometrically reduced for a nonempty open $V \subset Z$. Thus we win. \square

36.22. Irreducible components of fibres

Lemma 36.22.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has n irreducible components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has at least n irreducible components.*

Proof. As the question is purely topological we may replace X and Y by their reductions. In particular this implies that Y is integral, see Properties, Lemma 27.3.4. Let $X_\eta = X_{1,\eta} \cup \dots \cup X_{n,\eta}$ be the decomposition of X_η into irreducible components. Let $X_i \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i,\eta}$. Note that $Z_{i,j} = X_i \cap X_j$ is a closed subset of X_i whose generic fibre $Z_{i,j,\eta}$ is nowhere dense in $X_{i,\eta}$. Hence after shrinking Y we may assume that $Z_{i,j,y}$ is nowhere dense in $X_{i,y}$ for every $y \in Y$, see Lemma 36.19.3. After shrinking Y some more we may assume that $X_y = \bigcup X_{i,y}$ for $y \in Y$, see Lemma 36.19.5. Moreover, after shrinking Y we may assume that each $X_i \rightarrow Y$ is flat and of finite presentation, see Morphisms, Proposition 28.28.1. The morphisms $X_i \rightarrow Y$ are open, see Morphisms, Lemma 28.26.9. Thus there exists an open neighbourhood V of η which is contained in $f(X_i)$ for each i . For each $y \in V$ the schemes $X_{i,y}$ are nonempty closed subsets of X_y , we have $X_y = \bigcup X_{i,y}$ and the intersections $Z_{i,j,y} = X_{i,y} \cap X_{j,y}$ are not dense in $X_{i,y}$. Clearly this implies that X_y has at least n irreducible components. \square

Lemma 36.22.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $g : Y' \rightarrow Y$ be any morphism, and denote $f' : X' \rightarrow Y'$ the base change of f . Then*

$$\begin{aligned} & \{y' \in Y' \mid X'_{y'} \text{ is geometrically irreducible}\} \\ &= g^{-1}(\{y \in Y \mid X_y \text{ is geometrically irreducible}\}). \end{aligned}$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically irreducible over $\kappa(y')$ if and only if X_y is geometrically irreducible over $\kappa(y)$. This follows from Varieties, Lemma 32.6.2. \square

Lemma 36.22.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let*

$$n_{X/Y} : Y \rightarrow \{0, 1, 2, 3, \dots, \infty\}$$

be the function which associates to $y \in Y$ the number of irreducible components of $(X_y)_K$ where K is a separably closed extension of $\kappa(y)$. This is well defined and if $g : Y' \rightarrow Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \rightarrow Y'$ is the base change of f .

Proof. Suppose that $y' \in Y'$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K' \supset \kappa(y')$ are separably closed extensions. Then we may choose a commutative diagram

$$\begin{array}{ccccc} K & \longrightarrow & K'' & \longleftarrow & K' \\ \uparrow & & & & \uparrow \\ \kappa(y) & \longrightarrow & & \longrightarrow & \kappa(y') \end{array}$$

of fields. The result follows as the morphisms of schemes

$$(X'_{y'})_{K'} \longleftarrow (X'_{y'})_{K''} = (X_y)_{K''} \longrightarrow (X_y)_K$$

induce bijections between irreducible components, see Varieties, Lemma 32.6.7. \square

Lemma 36.22.4. *Let A be a domain with fraction field K . Let $P \in A[x_1, \dots, x_n]$. Denote \bar{K} the algebraic closure of K . Assume P is irreducible in $\bar{K}[x_1, \dots, x_n]$. Then there exists a $f \in A$ such that $P^\varphi \in \kappa[x_1, \dots, x_n]$ is irreducible for all homomorphisms $\varphi : A_f \rightarrow \kappa$ into fields.*

Proof. There exists an automorphism Ψ of $A[x_1, \dots, x_n]$ over A such that $\Psi(P) = ax_n^d +$ lower order terms in x_n with $a \neq 0$, see Algebra, Lemma 10.111.2. We may replace P by $\Psi(P)$ and we may replace A by A_a . Thus we may assume that P is monic in x_n of degree $d > 0$. For $i = 1, \dots, n - 1$ let d_i be the degree of P in x_i . Note that this implies that P^φ is monic of degree d in x_n and has degree $\leq d_i$ in x_i for every homomorphism $\varphi : A \rightarrow \kappa$ where κ is a field. Thus if P^φ is reducible, then we can write

$$P^\varphi = Q_1 Q_2$$

with Q_1, Q_2 monic of degree $e_1, e_2 \geq 0$ in x_n with $e_1 + e_2 = d$ and having degree $\leq d_i$ in x_i for $i = 1, \dots, n - 1$. In other words we can write

$$(36.22.4.1) \quad Q_j = x_n^{e_j} + \sum_{0 \leq l < e_j} \left(\sum_{L \in \mathcal{L}} a_{j,l,L} x^L \right) x_n^l$$

where the sum is over the set \mathcal{L} of multi-indices L of the form $L = (l_1, \dots, l_{n-1})$ with $0 \leq l_i \leq d_i$. For any $e_1, e_2 \geq 0$ with $e_1 + e_2 = d$ we consider the A -algebra

$$B_{e_1, e_2} = A[\{a_{1, l, L}\}_{0 \leq l < e_1, L \in \mathcal{L}}, \{a_{2, l, L}\}_{0 \leq l < e_2, L \in \mathcal{L}}]/(\text{relations})$$

where the (relations) is the ideal generated by the coefficients of the polynomial

$$P - Q_1 Q_2 \in A[\{a_{1, l, L}\}_{0 \leq l < e_1, L \in \mathcal{L}}, \{a_{2, l, L}\}_{0 \leq l < e_2, L \in \mathcal{L}}][x_1, \dots, x_n]$$

with Q_1 and Q_2 defined as in (36.22.4.1). OK, and the assumption that P is irreducible over \bar{K} implies that there does not exist any A -algebra homomorphism $B_{e_1, e_2} \rightarrow \bar{K}$. By the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1 this means that $B_{e_1, e_2} \otimes_A \bar{K} = 0$. As B_{e_1, e_2} is a finitely generated A -algebra this signifies that we can find an $f_{e_1, e_2} \in A$ such that $(B_{e_1, e_2})_{f_{e_1, e_2}} = 0$. By construction this means that if $\varphi : A_{f_{e_1, e_2}} \rightarrow \kappa$ is a homomorphism to a field, then P^φ does not have a factorization $P^\varphi = \bar{Q}_1 \bar{Q}_2$ with \bar{Q}_1 of degree e_1 in x_n and \bar{Q}_2 of degree e_2 in x_n . Thus taking $f = \prod_{e_1, e_2 \geq 0, e_1 + e_2 = d} f_{e_1, e_2}$ we win. \square

Lemma 36.22.5. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume*

- (1) Y is irreducible with generic point η ,
- (2) X_η is geometrically irreducible, and
- (3) f is of finite type.

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \rightarrow V$ has geometrically irreducible fibres.

First proof of Lemma 36.22.5. We give two proofs of the lemma. These are essentially equivalent; the second is more self contained but a bit longer. Choose a diagram

$$\begin{array}{ccccc} X' & \xrightarrow{\quad} & X_V & \longrightarrow & X \\ f' \downarrow & & \downarrow & & \downarrow f \\ Y' & \xrightarrow{\quad} & V & \longrightarrow & Y \end{array}$$

as in Lemma 36.19.7. Note that the generic fibre of f' is the reduction of the geometric fibre of f (see Lemma 36.19.6) and hence is geometrically irreducible. Suppose that the lemma holds for the morphism f' . Then after shrinking V all the fibres of f' are geometrically irreducible. As $X' = (Y' \times_V X_V)_{red}$ this implies that all the fibres of $Y' \times_V X_V$ are geometrically irreducible. Hence by Lemma 36.22.2 all the fibres of $X_V \rightarrow V$ are geometrically irreducible and we win. In this way we see that we may assume that the generic fibre is geometrically reduced as well as geometrically irreducible and we may assume $Y = \text{Spec}(A)$ with A a domain.

Let $x \in X_\eta$ be the generic point. As X_η is geometrically irreducible and reduced we see that $L = \kappa(x)$ is a finitely generated extension of $K = \kappa(\eta) = f.f.(A)$ which is geometrically reduced and geometrically irreducible, see Varieties, Lemmas 32.4.2 and 32.6.6. In particular the field extension $K \subset L$ is separable, see Algebra, Lemma 10.43.1. Hence we can find $x_1, \dots, x_{r+1} \in L$ which generate L over K and such that x_1, \dots, x_r is a transcendence basis for L over K , see Algebra, Lemma 10.41.3. Let $P \in K(x_1, \dots, x_r)[T]$ be the minimal polynomial for x_{r+1} . Clearing denominators we may assume that P has coefficients in $A[x_1, \dots, x_r]$. Note that as L is geometrically reduced and geometrically irreducible over K , the polynomial P is irreducible in $\bar{K}[x_1, \dots, x_r, T]$ where \bar{K} is the algebraic closure of K . Denote

$$B' = A[x_1, \dots, x_{r+1}]/(P(x_{r+1}))$$

and set $X' = \text{Spec}(B')$. By construction the fraction field of B' is isomorphic to $L = \kappa(x)$ as K -extensions. Hence there exists an open $U \subset X$, and open $U' \subset X'$ and a Y -isomorphism $U \rightarrow U'$, see Lemma 36.19.9. Here is a diagram:

$$\begin{array}{ccccccc}
 X & \longleftarrow & U & \xlongequal{\quad} & U' & \longrightarrow & X' \xlongequal{\quad} \text{Spec}(B') \\
 & \searrow & \downarrow & & \downarrow & \swarrow & \\
 & & Y & \xlongequal{\quad} & Y & &
 \end{array}$$

Note that $U_\eta \subset X_\eta$ and $U'_\eta \subset X'_\eta$ are dense opens. Thus after shrinking Y by applying Lemma 36.19.3 we obtain that U_y is dense in X_y and U'_y is dense in X'_y for all $y \in Y$. Thus it suffices to prove the lemma for $X' \rightarrow Y$ which is the content of Lemma 36.22.4. □

Second proof of Lemma 36.22.5. Let $Y' \subset Y$ be the reduction of Y . Let $X' \rightarrow X$ be the reduction of X . Note that $X' \rightarrow X \rightarrow Y$ factors through Y' , see Schemes, Lemma 25.12.6. As $Y' \rightarrow Y$ and $X' \rightarrow X$ are universal homeomorphisms by Morphisms, Lemma 28.45.4 we see that it suffices to prove the lemma for $X' \rightarrow Y'$. Thus we may assume that X and Y are reduced. In particular Y is integral, see Properties, Lemma 27.3.4. Thus by Morphisms, Proposition 28.28.1 there exists a nonempty affine open $V \subset Y$ such that $X_V \rightarrow V$ is flat and of finite presentation. After replacing Y by V we may assume, in addition to (1), (2), (3) that Y is integral affine, X is reduced, and f is flat and of finite presentation. In particular f is universally open, see Morphisms, Lemma 28.26.9.

Pick a nonempty affine open $U \subset X$. Then $U \rightarrow Y$ is flat and of finite presentation with geometrically irreducible generic fibre. The complement $X_\eta \setminus U_\eta$ is nowhere dense. Thus after shrinking Y we may assume $U_y \subset X_y$ is open dense for all $y \in Y$, see Lemma 36.19.3. Thus we may replace X by U and we reduce to the case where Y is integral affine and X is reduced affine, flat and of finite presentation over Y with geometrically irreducible generic fibre X_η .

Write $X = \text{Spec}(B)$ and $Y = \text{Spec}(A)$. Then A is a domain, B is reduced, $A \rightarrow B$ is flat of finite presentation, and B_K is geometrically irreducible over $K = f.f.(A)$. In particular we see that B_K is a domain. Let $L = f.f.(B_K)$ be its fraction field. Note that L is a finitely generated field extension of K as B is an A -algebra of finite presentation. Let $K \subset K'$ be a finite purely inseparable extension such that $(L \otimes_K K')_{red}$ is a separably generated field extension, see Algebra, Lemma 10.44.3. Choose $x_1, \dots, x_n \in K'$ which generate the field extension K' over K , and such that $x_i^{q_i} \in A$ for some prime power q_i (proof existence x_i omitted). Let A' be the A -subalgebra of K' generated by x_1, \dots, x_n . Then A' is a finite A -subalgebra $A' \subset K'$ whose fraction field is K' . Note that $\text{Spec}(A') \rightarrow \text{Spec}(A)$ is a universal homeomorphism, see Algebra, Lemma 10.45.2. Hence it suffices to prove the result after base changing to $\text{Spec}(A')$. We are going to replace A by A' and B by $(B \otimes_A A')_{red}$ to arrive at the situation where L is a separably generated field extension of K . Of course it may happen that $(B \otimes_A A')_{red}$ is no longer flat, or of finite presentation over A' , but this can be remedied by replacing A' by A'_f for a suitable $f \in A'$, see Algebra, Lemma 10.114.3.

At this point we know that A is a domain, B is reduced, $A \rightarrow B$ is flat and of finite presentation, B_K is a domain, and $L = f.f.(B_K)$ is a separably generated field extension of $K = f.f.(A)$. By Algebra, Lemma 10.41.3 we may write

$L = K(x_1, \dots, x_{r+1})$ where x_1, \dots, x_r are algebraically independent over K , and x_{r+1} is separable over $K(x_1, \dots, x_r)$. After clearing denominators we may assume that the minimal polynomial $P \in K(x_1, \dots, x_r)[T]$ of x_{r+1} over $K(x_1, \dots, x_r)$ has coefficients in $A[x_1, \dots, x_r]$. Note that since L/K is separable and since L is geometrically irreducible over K , the polynomial P is irreducible over the algebraic closure \overline{K} of K . Denote

$$B' = A[x_1, \dots, x_{r+1}]/(P(x_{r+1})).$$

By construction the fraction fields of B and B' are isomorphic as K -extensions. Hence there exists an isomorphism of A -algebras $B_h \cong B'_{h'}$ for suitable $h \in B$ and $h' \in B'$, see Lemma 36.19.9. In other words X and $X' = \text{Spec}(B')$ have a common affine open U . Here is a diagram:

After shrinking Y once more (by applying Lemma 36.19.3 to $Z = X \setminus U$ in X and $Z' = X' \setminus U$ in X') we see that U_y is dense in X_y and U_y is dense in X'_y for all $y \in Y$. Thus it suffices to prove the lemma for $X' \rightarrow Y$ which is the content of Lemma 36.22.4. \square

Lemma 36.22.6. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically irreducible components of fibres of f introduced in Lemma 36.22.3. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $n_{X/Y}|_V$ is constant.*

Proof. Let Z be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \rightarrow Z$ be the base change of f . Clearly it suffices to prove the lemma for f_Z and the generic point of Z . Hence we may assume that Y is an integral scheme, see Properties, Lemma 27.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $n_{X/Y}|_V$ is constant.

We apply Lemma 36.19.8 to $f : X \rightarrow Y$ and we get $g : Y' \rightarrow V \subset Y$. As $g : Y' \rightarrow V$ is surjective finite étale, in particular open (see Morphisms, Lemma 28.37.13), it suffices to prove that there exists an open $V' \subset Y'$ such that $n_{X'/Y'}|_{V'}$ is constant, see Lemma 36.22.3. Thus we see that we may assume that all irreducible components of the generic fibre X_η are geometrically irreducible over $\kappa(\eta)$.

At this point suppose that $X_\eta = X_{1,\eta} \cup \dots \cup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. In particular $n_{X/Y}(\eta) = n$. Let X_i be the closure of $X_{i,\eta}$ in X . After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 36.19.5. After shrinking Y some more we see that each fibre of f has at least n irreducible components, see Lemma 36.22.1. Hence $n_{X/Y}(y) \geq n$ for all $y \in Y$. After shrinking Y some more we obtain that $X_{i,y}$ is geometrically irreducible for each i and all $y \in Y$, see Lemma 36.22.5. Since $X_y = \bigcup X_{i,y}$ this shows that $n_{X/Y}(y) \leq n$ and finishes the proof. \square

Lemma 36.22.7. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically irreducible components of fibres*

of f introduced in Lemma 36.22.3. Assume f of finite presentation. Then the level sets

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y .

Proof. Fix n . Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V . Thus we may assume that Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation whose base change to Y recovers f . By Lemma 36.22.3 it suffices to prove the lemma for f_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z . Let $\xi \in Z$ be the generic point. Then Lemma 36.22.6 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z . This clearly implies what we want. \square

36.23. Connected components of fibres

Lemma 36.23.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has n connected components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has at least n connected components.*

Proof. As the question is purely topological we may replace X and Y by their reductions. In particular this implies that Y is integral, see Properties, Lemma 27.3.4. Let $X_\eta = X_{1,\eta} \cup \dots \cup X_{n,\eta}$ be the decomposition of X_η into connected components. Let $X_i \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i,\eta}$. Note that $Z_{i,j} = X_i \cap X_j$ is a closed subset of X whose generic fibre $Z_{i,j,\eta}$ is empty. Hence after shrinking Y we may assume that $Z_{i,j} = \emptyset$, see Lemma 36.19.1. After shrinking Y some more we may assume that $X_y = \bigcup X_{i,y}$ for $y \in Y$, see Lemma 36.19.5. Moreover, after shrinking Y we may assume that each $X_i \rightarrow Y$ is flat and of finite presentation, see Morphisms, Proposition 28.28.1. The morphisms $X_i \rightarrow Y$ are open, see Morphisms, Lemma 28.26.9. Thus there exists an open neighbourhood V of η which is contained in $f(X_i)$ for each i . For each $y \in V$ the schemes $X_{i,y}$ are nonempty closed subsets of X_y , we have $X_y = \bigcup X_{i,y}$ and the intersections $Z_{i,j,y} = X_{i,y} \cap X_{j,y}$ are empty! Clearly this implies that X_y has at least n connected components. \square

Lemma 36.23.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $g : Y' \rightarrow Y$ be any morphism, and denote $f' : X' \rightarrow Y'$ the base change of f . Then*

$$\begin{aligned} & \{y' \in Y' \mid X'_{y'} \text{ is geometrically connected}\} \\ &= g^{-1}(\{y \in Y \mid X_y \text{ is geometrically connected}\}). \end{aligned}$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically connected over $\kappa(y')$ if and only if X_y is geometrically connected over $\kappa(y)$. This follows from Varieties, Lemma 32.5.3. \square

Lemma 36.23.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let*

$$n_{X/Y} : Y \rightarrow \{0, 1, 2, 3, \dots, \infty\}$$

be the function which associates to $y \in Y$ the number of connected components of $(X_y)_K$ where K is a separably closed extension of $\kappa(y)$. This is well defined and if $g : Y' \rightarrow Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \rightarrow Y'$ is the base change of f .

Proof. Suppose that $y' \in Y'$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K' \supset \kappa(y')$ are separably closed extensions. Then we may choose a commutative diagram

$$\begin{array}{ccccc} K & \longrightarrow & K'' & \longleftarrow & K' \\ \uparrow & & & & \uparrow \\ \kappa(y) & \longrightarrow & & & \kappa(y') \end{array}$$

of fields. The result follows as the morphisms of schemes

$$(X'_{y'})_{K'} \longleftarrow (X'_{y'})_{K''} = (X_y)_{K''} \longrightarrow (X_y)_K$$

induce bijections between connected components, see Varieties, Lemma 32.5.6. \square

Lemma 36.23.4. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume*

- (1) *Y is irreducible with generic point η ,*
- (2) *X_η is geometrically connected, and*
- (3) *f is of finite type.*

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \rightarrow V$ has geometrically connected fibres.

Proof. Choose a diagram

$$\begin{array}{ccccc} X' & \xrightarrow{g'} & X_V & \longrightarrow & X \\ f' \downarrow & & \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & V & \longrightarrow & Y \end{array}$$

as in Lemma 36.19.8. Note that the generic fibre of f' is geometrically connected (for example by Lemma 36.23.3). Suppose that the lemma holds for the morphism f' . This means that there exists a nonempty open $W \subset Y'$ such that every fibre of $X' \rightarrow Y'$ over W is geometrically connected. Then, as g is an open morphism by Morphisms, Lemma 28.37.13 all the fibres of f at points of the nonempty open $V = g(W)$ are geometrically connected, see Lemma 36.23.3. In this way we see that we may assume that the irreducible components of the generic fibre X_η are geometrically irreducible.

Let Y' be the reduction of Y , and set $X' = Y' \times_Y X$. Then it suffices to prove the lemma for the morphism $X' \rightarrow Y'$ (for example by Lemma 36.23.3 once again). Since the generic fibre of $X' \rightarrow Y'$ is the same as the generic fibre of $X \rightarrow Y$ we see that we may assume that Y is irreducible and reduced (i.e., integral, see Properties, Lemma 27.3.4) and that the irreducible components of the generic fibre X_η are geometrically irreducible.

At this point suppose that $X_\eta = X_{1,\eta} \cup \dots \cup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. Let X_i be the closure of $X_{i,\eta}$ in X . After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 36.19.5. Let $Z_{i,j} = X_i \cap X_j$. Let

$$\{1, \dots, n\} \times \{1, \dots, n\} = I \amalg J$$

where $(i, j) \in I$ if $Z_{i,j,\eta} = \emptyset$ and $(i, j) \in J$ if $Z_{i,j,\eta} \neq \emptyset$. After shrinking Y we may assume that $Z_{i,j} = \emptyset$ for all $(i, j) \in I$, see Lemma 36.19.1. After shrinking Y we obtain that $X_{i,y}$ is geometrically irreducible for each i and all $y \in Y$, see Lemma 36.22.5. After shrinking Y some more we achieve the situation where each $Z_{i,j} \rightarrow Y$ is flat and of finite presentation for all $(i, j) \in J$, see Morphisms, Proposition 28.28.1. This means that $f(Z_{i,j}) \subset Y$ is open, see Morphisms, Lemma 28.26.9. We claim that

$$V = \bigcap_{(i,j) \in J} f(Z_{i,j})$$

works, i.e., that X_y is geometrically connected for each $y \in V$. Namely, the fact that X_η is connected implies that the equivalence relation generated by the pairs in J has only one equivalence class. Now if $y \in V$ and $K \supset \kappa(y)$ is a separably closed extension, then the irreducible components of $(X_y)_K$ are the fibres $(X_{i,y})_K$. Moreover, we see by construction and $y \in V$ that $(X_{i,y})_K$ meets $(X_{j,y})_K$ if and only if $(i, j) \in J$. Hence the remark on equivalence classes shows that $(X_y)_K$ is connected and we win. \square

Lemma 36.23.5. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically connected components of fibres of f introduced in Lemma 36.23.3. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $n_{X/Y}|_V$ is constant.*

Proof. Let Z be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \rightarrow Z$ be the base change of f . Clearly it suffices to prove the lemma for f_Z and the generic point of Z . Hence we may assume that Y is an integral scheme, see Properties, Lemma 27.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $n_{X/Y}|_V$ is constant.

We apply Lemma 36.19.8 to $f : X \rightarrow Y$ and we get $g : Y' \rightarrow V \subset Y$. As $g : Y' \rightarrow V$ is surjective finite étale, in particular open (see Morphisms, Lemma 28.37.13), it suffices to prove that there exists an open $V' \subset Y'$ such that $n_{X'/Y'}|_{V'}$ is constant, see Lemma 36.22.3. Thus we see that we may assume that all irreducible components of the generic fibre X_η are geometrically irreducible over $\kappa(\eta)$. By Varieties, Lemma 32.6.15 this implies that also the connected components of X_η are geometrically connected.

At this point suppose that $X_\eta = X_{1,\eta} \cup \dots \cup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) connected components. In particular $n_{X/Y}(\eta) = n$. Let X_i be the closure of $X_{i,\eta}$ in X . After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 36.19.5. After shrinking Y some more we see that each fibre of f has at least n connected components, see Lemma 36.23.1. Hence $n_{X/Y}(y) \geq n$ for all $y \in Y$. After shrinking Y some more we obtain that $X_{i,y}$ is geometrically connected for each i and all $y \in Y$, see Lemma 36.23.4. Since $X_y = \bigcup X_{i,y}$ this shows that $n_{X/Y}(y) \leq n$ and finishes the proof. \square

Lemma 36.23.6. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometric connected components of fibres of f introduced in Lemma 36.23.3. Assume f of finite presentation. Then the level sets*

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y .

Proof. Fix n . Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V . Thus we may assume that Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation whose base change to Y recovers f . By Lemma 36.23.3 it suffices to prove the lemma for f_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z . Let $\xi \in Z$ be the generic point. Then Lemma 36.23.5 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z . This clearly implies what we want. \square

Lemma 36.23.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume that*

- (1) *S is the spectrum of a discrete valuation ring,*
- (2) *f is flat,*
- (3) *X is connected,*
- (4) *the closed fibre X_s is reduced.*

Then the generic fibre X_η is connected.

Proof. Write $Y = \text{Spec}(R)$ and let $\pi \in R$ be a uniformizer. To get a contradiction assume that X_η is disconnected. This means there exists a nontrivial idempotent $e \in \Gamma(X_\eta, \mathcal{O}_{X_\eta})$. Let $U = \text{Spec}(A)$ be any affine open in X . Note that π is a nonzerodivisor on A as A is flat over R , see More on Algebra, Lemma 15.15.3 for example. Then $e|_{U_\eta}$ corresponds to an element $e \in A[1/\pi]$. Let $z \in A$ be an element such that $e = z/\pi^n$ with $n \geq 0$ minimal. Note that $z^2 = \pi^n z$. This means that $z \bmod \pi A$ is nilpotent if $n > 0$. By assumption $A/\pi A$ is reduced, and hence minimality of n implies $n = 0$. Thus we conclude that $e \in A$! In other words $e \in \Gamma(X, \mathcal{O}_X)$. As X is connected it follows that e is a trivial idempotent which is a contradiction. \square

36.24. Connected components meeting a section

The results in this section are in particular applicable to a group scheme $G \rightarrow S$ and its neutral section $e : S \rightarrow G$.

Situation 36.24.1. Here $f : X \rightarrow Y$ be a morphism of schemes, and $s : Y \rightarrow X$ is a section of f . For every $y \in Y$ we denote X_y^0 the connected component of X_y containing $s(y)$. Finally, we set $X^0 = \bigcup_{y \in Y} X_y^0$.

Lemma 36.24.2. *Let $f : X \rightarrow Y$, $s : Y \rightarrow X$ be as in Situation 36.24.1. If $g : Y' \rightarrow Y$ is any morphism, consider the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow f' & \nearrow g' & \downarrow f \\ Y' & \xrightarrow{\quad g \quad} & Y \end{array} \begin{array}{c} \left. \begin{array}{c} \nearrow s' \\ \searrow s \end{array} \right\} \end{array}$$

so that we obtain $(X')^0 \subset X'$. Then $(X')^0 = (g')^{-1}(X^0)$.

Proof. Let $y' \in Y'$ with image $y \in Y$. We may think of X_y^0 as a closed subscheme of X_y , see for example Morphisms, Definition 28.27.3. As $s(y) \in X_y^0$ we conclude from Varieties, Lemma 32.5.14 that X_y^0 is a geometrically connected scheme over $\kappa(y)$. Hence $X_y^0 \times_y y' \rightarrow X_{y'}'$ is a connected closed subscheme which contains $s'(y')$. Thus $X_y^0 \times_y y' \subset (X_{y'}')^0$. The other inclusion $X_y^0 \times_y y' \supset (X_{y'}')^0$ is clear as the image of $(X_{y'}')^0$ in X_y is a connected subset of X_y which contains $s(y)$. \square

Lemma 36.24.3. *Let $f : X \rightarrow Y$, $s : Y \rightarrow X$ be as in Situation 36.24.1. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that the inverse image of X^0 in the base change X_V is open and closed in X_V .*

Proof. Let $Z \subset Y$ be the induced reduced closed subscheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \rightarrow Z$ and $s_Z : Z \rightarrow X_Z$ be the base changes of f and s . By Lemma 36.24.2 we have $(X_Z)^0 = (X^0)_Z$. Hence it suffices to prove the lemma for the morphism $X_Z \rightarrow Z$ and the point $x \in X_Z$ which maps to the generic point of Z . In other words we have reduced the problem to the case where Y is an integral scheme (see Properties, Lemma 27.3.4) with generic point η . Our goal is to show that after shrinking Y the subset X^0 becomes an open and closed subset of X .

Note that the scheme X_η is of finite type over a field, hence Noetherian. Thus its connected components are open as well as closed. Hence we may write $X_\eta = X_\eta^0 \amalg T_\eta$ for some open and closed subset T_η of X_η . Next, let $T \subset X$ be the closure of T_η and let $X^{00} \subset X$ be the closure of X_η^0 . Note that T_η , resp. X_η^0 is the generic fibre of T , resp. X^{00} , see discussion preceding Lemma 36.19.5. Moreover, that lemma implies that after shrinking Y we may assume that $X = X^{00} \cup T$ (set theoretically). Note that $(T \cap X^{00})_\eta = T_\eta \cap X_\eta^0 = \emptyset$. Hence after shrinking Y we may assume that $T \cap X^{00} = \emptyset$, see Lemma 36.19.1. In particular X^{00} is open in X . Note that X_η^0 is connected and has a rational point, namely $s(\eta)$, hence it is geometrically connected, see Varieties, Lemma 32.5.14. Thus after shrinking Y we may assume that all fibres of $X^{00} \rightarrow Y$ are geometrically connected, see Lemma 36.23.4. At this point it follows that the fibres X_y^{00} are open, closed, and connected subsets of X_y containing $\sigma(y)$. It follows that $X^0 = X^{00}$ and we win. \square

Lemma 36.24.4. *Let $f : X \rightarrow Y$, $s : Y \rightarrow X$ be as in Situation 36.24.1. If f is of finite presentation then X^0 is locally constructible in X .*

Proof. Let $x \in X$. We have to show that there exists an open neighbourhood U of x such that $X^0 \cap U$ is constructible in U . This reduces us to the case where Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation, endowed with a section $s_i : \text{Spec}(A_i) \rightarrow X_i$ whose base change to Y recovers f and the section s . By Lemma 36.24.2 it suffices to

prove the lemma for f_i, s_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

Assume Y is a Noetherian affine scheme. Since f is of finite presentation, i.e., of finite type, we see that X is a Noetherian scheme too, see Morphisms, Lemma 28.16.6. In order to prove the lemma in this case it suffices to show that for every irreducible closed subset $Z \subset X$ the intersection $Z \cap X^0$ either contains a nonempty open of Z or is not dense in Z , see Topology, Lemma 5.15.3. Let $x \in Z$ be the generic point, and let $y = f(x)$. By Lemma 36.24.3 there exists a nonempty open subset $V \subset \overline{\{y\}}$ such that $X^0 \cap X_V$ is open and closed in X_V . Since $f(Z) \subset \overline{\{y\}}$ and $f(x) = y \in V$ we see that $W = f^{-1}(V) \cap Z$ is a nonempty open subset of Z . It follows that $X^0 \cap W$ is open and closed in W . Since W is irreducible we see that $X^0 \cap W$ is either empty or equal to W . This proves the lemma. \square

Lemma 36.24.5. *Let $f : X \rightarrow Y$, $s : Y \rightarrow X$ be as in Situation 36.24.1. Let $y \in Y$ be a point. Assume*

- (1) *f is of finite presentation and flat, and*
- (2) *the fibre X_y is geometrically reduced.*

Then X^0 is a neighbourhood of X_y^0 in X .

Proof. We may replace Y with an affine open neighbourhood of y . Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation, endowed with a section $s_i : \text{Spec}(A_i) \rightarrow X_i$ whose base change to Y recovers f and the section s . After possibly increasing i we may also assume that f_i is flat, see Limits, Lemma 31.7.6. Let y_i be the image of y in Y_i . Note that $X_y = (X_{i,y_i}) \times_{y_i} y$. Hence X_{i,y_i} is geometrically reduced, see Varieties, Lemma 32.4.6. By Lemma 36.24.2 it suffices to prove the lemma for the system $f_i, s_i, y_i \in Y_i$. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

Assume Y is the spectrum of a Noetherian ring. Since f is of finite presentation, i.e., of finite type, we see that X is a Noetherian scheme too, see Morphisms, Lemma 28.16.6. Let $x \in X^0$ be a point lying over y . By Topology, Lemma 5.15.4 it suffices to prove that for any irreducible closed $Z \subset X$ passing through x the intersection $X^0 \cap Z$ is dense in Z . In particular it suffices to prove that the generic point $x' \in Z$ is in X^0 . By Properties, Lemma 27.5.9 we can find a discrete valuation ring R and a morphism $\text{Spec}(R) \rightarrow X$ which maps the special point to x and the generic point to x' . We are going to think of $\text{Spec}(R)$ as a scheme over Y via the composition $\text{Spec}(R) \rightarrow X \rightarrow Y$. By Lemma 36.24.2 we have that $(X_R)^0$ is the inverse image of X^0 . By construction we have a second section $t : \text{Spec}(R) \rightarrow X_R$ (besides the base change s_R of s) of the structure morphism $X_R \rightarrow \text{Spec}(R)$ such that $t(\eta_R)$ is a point of X_R which maps to x' and $t(0_R)$ is a point of X_R which maps to x . Note that $t(0_R)$ is in $(X_R)^0$ and that $t(\eta_R) \rightsquigarrow t(0_R)$. Thus it suffices to prove that this implies that $t(\eta_R) \in (X_R)^0$. Hence it suffices to prove the lemma in the case where Y is the spectrum of a discrete valuation ring and y its closed point.

Assume Y is the spectrum of a discrete valuation ring and y is its closed point. Our goal is to prove that X^0 is a neighbourhood of X_y^0 . Note that X_y^0 is open and closed in X_y as X_y has finitely many irreducible components. Hence the complement $C = X_y \setminus X_y^0$ is closed in X . Thus $U = X \setminus C$ is an open neighbourhood of X_y^0 and $U^0 = X^0$. Hence it suffices to prove the result for the morphism $U \rightarrow Y$. In other

words, we may assume that X_y is connected. Suppose that X is disconnected, say $X = X_1 \amalg \dots \amalg X_n$ is a decomposition into connected components. Then $s(Y)$ is completely contained in one of the X_i . Say $s(Y) \subset X_1$. Then $X^0 \subset X_1$. Hence we may replace X by X_1 and assume that X is connected. At this point Lemma 36.23.7 implies that X_η is connected, i.e., $X^0 = X$ and we win. \square

Lemma 36.24.6. *Let $f : X \rightarrow Y$, $s : Y \rightarrow X$ be as in Situation 36.24.1. Assume*

- (1) *f is of finite presentation and flat, and*
- (2) *all fibres of f are geometrically reduced.*

Then X^0 is open in X .

Proof. This is an immediate consequence of Lemma 36.24.5. \square

36.25. Dimension of fibres

Lemma 36.25.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has dimension n , then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has dimension n .*

Proof. Let $Z = \{x \in X \mid \dim_x(X_{f(x)}) > n\}$. By Morphisms, Lemma 28.29.4 this is a closed subset of X . By assumption $Z_\eta = \emptyset$. Hence by Lemma 36.19.1 we may shrink Y and assume that $Z = \emptyset$. Let $Z' = \{x \in X \mid \dim_x(X_{f(x)}) > n - 1\} = \{x \in X \mid \dim_x(X_{f(x)}) = n\}$. As before this is a closed subset of X . By assumption we have $Z'_\eta \neq \emptyset$. Hence after shrinking Y we may assume that $Z' \rightarrow Y$ is surjective, see Lemma 36.19.2. Hence we win. \square

Lemma 36.25.2. *Let $f : X \rightarrow Y$ be a morphism of finite type. Let*

$$n_{X/Y} : Y \rightarrow \{0, 1, 2, 3, \dots, \infty\}$$

be the function which associates to $y \in Y$ the dimension of X_y . If $g : Y' \rightarrow Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \rightarrow Y'$ is the base change of f .

Proof. This follows from Morphisms, Lemma 28.29.3. \square

Lemma 36.25.3. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y giving the dimension of fibres of f introduced in Lemma 36.25.2. Assume f of finite presentation. Then the level sets*

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y .

Proof. Fix n . Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V . Thus we may assume that Y is affine. Write $Y = \text{Spec}(A)$ and $A = \text{colim } A_i$ as a directed limit of finite type \mathbf{Z} -algebras. By Limits, Lemma 31.9.1 we can find an i and a morphism $f_i : X_i \rightarrow \text{Spec}(A_i)$ of finite presentation whose base change to Y recovers f . By Lemma 36.25.2 it suffices to prove the lemma for f_i . Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible

closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z . Let $\xi \in Z$ be the generic point. Then Lemma 36.25.1 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z . This implies what we want. \square

36.26. Limit arguments

Some lemmas involving limits of schemes, and Noetherian approximation. We stick mostly to the affine case. Some of these lemmas are special cases of lemmas in the chapter on limits.

Lemma 36.26.1. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Then there exists a cartesian diagram*

$$\begin{array}{ccc} X_0 & \xleftarrow{g} & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \xleftarrow{\quad} & S \end{array}$$

such that

- (1) X_0, S_0 are affine schemes,
- (2) S_0 of finite type over \mathbf{Z} ,
- (3) f_0 is finite of finite type.

Proof. Write $S = \text{Spec}(A)$ and $X = \text{Spec}(B)$. As f is of finite presentation we see that B is of finite presentation as an A -algebra, see Morphisms, Lemma 28.22.2. Thus the lemma follows from Algebra, Lemma 10.123.15. \square

Lemma 36.26.2. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite presentation. Then there exists a diagram as in Lemma 36.26.1 such that there exists a coherent \mathcal{O}_{X_0} -module \mathcal{F}_0 with $g^*\mathcal{F}_0 = \mathcal{F}$.*

Proof. Write $S = \text{Spec}(A)$, $X = \text{Spec}(B)$, and $\mathcal{F} = \widetilde{M}$. As f is of finite presentation we see that B is of finite presentation as an A -algebra, see Morphisms, Lemma 28.22.2. As \mathcal{F} is of finite presentation over \mathcal{O}_X we see that M is of finite presentation as a B -module, see Properties, Lemma 27.16.2. Thus the lemma follows from Algebra, Lemma 10.123.15. \square

Lemma 36.26.3. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite presentation and flat over S . Then we may choose a diagram as in Lemma 36.26.2 and sheaf \mathcal{F}_0 such that in addition \mathcal{F}_0 is flat over S_0 .*

Proof. Write $S = \text{Spec}(A)$, $X = \text{Spec}(B)$, and $\mathcal{F} = \widetilde{M}$. As f is of finite presentation we see that B is of finite presentation as an A -algebra, see Morphisms, Lemma 28.22.2. As \mathcal{F} is of finite presentation over \mathcal{O}_X we see that M is of finite presentation as a B -module, see Properties, Lemma 27.16.2. As \mathcal{F} is flat over S we see that M is flat over A , see Morphisms, Lemma 28.26.2. Thus the lemma follows from Algebra, Lemma 10.156.1. \square

Lemma 36.26.4. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation and flat. Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 is flat.*

Proof. This is a special case of Lemma 36.26.3. \square

Lemma 36.26.5. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is smooth. Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 is smooth.*

Proof. Write $S = \text{Spec}(A)$, $X = \text{Spec}(B)$, and as f is smooth we see that B is smooth as an A -algebra, see Morphisms, Lemma 28.35.2. Hence the lemma follows from Algebra, Lemma 10.133.14. \square

Lemma 36.26.6. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically reduced fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 has geometrically reduced fibres.*

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

$$\begin{array}{ccc} X_0 & \xleftarrow{g} & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \xleftarrow{h} & S \end{array}$$

of affine schemes with $X_0 \rightarrow S_0$ a finite type morphism of schemes of finite type over \mathbf{Z} . By Lemma 36.21.5 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically reduced is a constructible subset. By Lemma 36.21.2 we have $h(S) \subset E$. Write $S_0 = \text{Spec}(A_0)$ and $S = \text{Spec}(A)$. Write $A = \text{colim}_i A_i$ as a direct colimit of finite type A_0 -algebras. By Limits, Lemma 31.3.7 we see that $\text{Spec}(A_i) \rightarrow S_0$ has image contained in E for some i . After replacing S_0 by $\text{Spec}(A_i)$ and X_0 by $X_0 \times_{S_0} \text{Spec}(A_i)$ we see that all fibres of f_0 are geometrically reduced. \square

Lemma 36.26.7. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically irreducible fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 has geometrically irreducible fibres.*

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

$$\begin{array}{ccc} X_0 & \xleftarrow{g} & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \xleftarrow{h} & S \end{array}$$

of affine schemes with $X_0 \rightarrow S_0$ a finite type morphism of schemes of finite type over \mathbf{Z} . By Lemma 36.22.7 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically irreducible is a constructible subset. By Lemma 36.22.2 we have $h(S) \subset E$. Write $S_0 = \text{Spec}(A_0)$ and $S = \text{Spec}(A)$. Write $A = \text{colim}_i A_i$ as a direct colimit of finite type A_0 -algebras. By Limits, Lemma 31.3.7 we see that $\text{Spec}(A_i) \rightarrow S_0$ has image contained in E for some i . After replacing S_0 by $\text{Spec}(A_i)$ and X_0 by $X_0 \times_{S_0} \text{Spec}(A_i)$ we see that all fibres of f_0 are geometrically irreducible. \square

Lemma 36.26.8. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically connected fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 has geometrically connected fibres.*

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

$$\begin{array}{ccc} X_0 & \longleftarrow & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \longleftarrow & S \end{array}$$

of affine schemes with $X_0 \rightarrow S_0$ a finite type morphism of schemes of finite type over \mathbf{Z} . By Lemma 36.23.6 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically connected is a constructible subset. By Lemma 36.23.2 we have $h(S) \subset E$. Write $S_0 = \text{Spec}(A_0)$ and $S = \text{Spec}(A)$. Write $A = \text{colim}_i A_i$ as a direct colimit of finite type A_0 -algebras. By Limits, Lemma 31.3.7 we see that $\text{Spec}(A_i) \rightarrow S_0$ has image contained in E for some i . After replacing S_0 by $\text{Spec}(A_i)$ and X_0 by $X_0 \times_{S_0} \text{Spec}(A_i)$ we see that all fibres of f_0 are geometrically connected. \square

Lemma 36.26.9. *Let $d \geq 0$ be an integer. Let $f : X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation all of whose fibres have dimension d . Then there exists a diagram as in Lemma 36.26.1 such that in addition all fibres of f_0 have dimension d .*

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

$$\begin{array}{ccc} X_0 & \longleftarrow & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \longleftarrow & S \end{array}$$

of affine schemes with $X_0 \rightarrow S_0$ a finite type morphism of schemes of finite type over \mathbf{Z} . By Lemma 36.25.3 the set $E \subset S_0$ of points where the fibre of f_0 has dimension d is a constructible subset. By Lemma 36.25.2 we have $h(S) \subset E$. Write $S_0 = \text{Spec}(A_0)$ and $S = \text{Spec}(A)$. Write $A = \text{colim}_i A_i$ as a direct colimit of finite type A_0 -algebras. By Limits, Lemma 31.3.7 we see that $\text{Spec}(A_i) \rightarrow S_0$ has image contained in E for some i . After replacing S_0 by $\text{Spec}(A_i)$ and X_0 by $X_0 \times_{S_0} \text{Spec}(A_i)$ we see that all fibres of f_0 have dimension d . \square

Lemma 36.26.10. *Let $f : X \rightarrow S$ be a morphism of affine schemes, which is standard syntomic (see Morphisms, Definition 28.32.1). Then there exists a diagram as in Lemma 36.26.1 such that in addition f_0 is standard syntomic.*

Proof. This lemma is a copy of Algebra, Lemma 10.131.12. \square

Lemma 36.26.11. *(Noetherian approximation and combining properties.) Let P, Q be properties of morphisms of schemes which are stable under base change. Let $f : X \rightarrow S$ be a morphism of finite presentation of affine schemes. Assume we can find cartesian diagrams*

$$\begin{array}{ccc} X_1 & \longleftarrow & X \\ f_1 \downarrow & & \downarrow f \\ S_1 & \longleftarrow & S \end{array} \quad \text{and} \quad \begin{array}{ccc} X_2 & \longleftarrow & X \\ f_2 \downarrow & & \downarrow f \\ S_2 & \longleftarrow & S \end{array}$$

of affine schemes, with S_1, S_2 of finite type over \mathbf{Z} and f_1, f_2 of finite type such that f_1 has property P and f_2 has property Q . Then we can find a cartesian diagram

$$\begin{array}{ccc} X_0 & \longleftarrow & X \\ f_0 \downarrow & & \downarrow f \\ S_0 & \longleftarrow & S \end{array}$$

of affine schemes with S_0 of finite type over \mathbf{Z} and f_0 of finite type such that f_0 has both property P and property Q .

Proof. The given pair of diagrams correspond to cocartesian diagrams of rings

$$\begin{array}{ccc} B_1 & \longrightarrow & B \\ \uparrow & & \uparrow \\ A_1 & \longrightarrow & A \end{array} \quad \text{and} \quad \begin{array}{ccc} B_2 & \longrightarrow & B \\ \uparrow & & \uparrow \\ A_2 & \longrightarrow & A \end{array}$$

Let $A_0 \subset A$ be a finite type \mathbf{Z} -subalgebra of A containing the image of both $A_1 \rightarrow A$ and $A_2 \rightarrow A$. Such a subalgebra exists because by assumption both A_1 and A_2 are of finite type over \mathbf{Z} . Note that the rings $B_{0,1} = B_1 \otimes_{A_1} A_0$ and $B_{0,2} = B_2 \otimes_{A_2} A_0$ are finite type A_0 -algebras with the property that $B_{0,1} \otimes_{A_0} A \cong B \cong B_{0,2} \otimes_{A_0} A$ as A -algebras. As A is the directed colimit of its finite type A_0 -subalgebras, by Limits, Lemma 31.9.1 we may assume after enlarging A_0 that there exists an isomorphism $B_{0,1} \cong B_{0,2}$ as A_0 -algebras. Since properties P and Q are assumed stable under base change we conclude that setting $S_0 = \text{Spec}(A_0)$ and

$$X_0 = X_1 \times_{S_1} S_0 = \text{Spec}(B_{0,1}) \cong \text{Spec}(B_{0,2}) = X_2 \times_{S_2} S_0$$

works. □

36.27. Étale neighbourhoods

It turns out that some properties of morphisms are easier to study after doing an étale base change. It is convenient to introduce the following terminology.

Definition 36.27.1. Let S be a scheme. Let $s \in S$ be a point.

- (1) An *étale neighbourhood* of (S, s) is a pair (U, u) together with an étale morphism of schemes $\varphi : U \rightarrow S$ such that $\varphi(u) = s$.
- (2) A *morphism of étale neighbourhoods* $f : (V, v) \rightarrow (U, u)$ of (S, s) is simply a morphism of S -schemes $f : V \rightarrow U$ such that $f(v) = u$.
- (3) An *elementary étale neighbourhood* is an étale neighbourhood $\varphi : (U, u) \rightarrow (S, s)$ such that $\kappa(s) = \kappa(u)$.

If $f : (V, v) \rightarrow (U, u)$ is a morphism of étale neighbourhoods, then f is automatically étale, see Morphisms, Lemma 28.37.18. Hence it turns (V, v) into an étale neighbourhood of (U, u) . Of course, since the composition of étale morphisms is étale (Morphisms, Lemma 28.37.3) we see that conversely any étale neighbourhood (V, v) of (U, u) is an étale neighbourhood of (S, s) as well. We also remark that if $U \subset S$ is an open neighbourhood of s , then $(U, s) \rightarrow (S, s)$ is an étale neighbourhood. This follows from the fact that an open immersion is étale (Morphisms, Lemma 28.37.9). We will use these remarks without further mention throughout this section.

Note that $\kappa(s) \subset \kappa(u)$ is a finite separable extension if $(U, u) \rightarrow (S, s)$ is an étale neighbourhood, see Morphisms, Lemma 28.37.15.

Lemma 36.27.2. *Let S be a scheme. Let $s \in S$. Let $\kappa(s) \subset k$ be a finite separable field extension. Then there exists an étale neighbourhood $(U, u) \rightarrow (S, s)$ such that the field extension $\kappa(s) \subset \kappa(u)$ is isomorphic to $\kappa(s) \subset k$.*

Proof. We may assume S is affine. In this case the lemma follows from Algebra, Lemma 10.138.16. □

Lemma 36.27.3. *Let S be a scheme, and let s be a point of S . The category of étale neighborhoods has the following properties:*

- (1) *Let $(U_i, u_i)_{i=1,2}$ be two étale neighborhoods of s in S . Then there exists a third étale neighborhood (U, u) and morphisms $(U, u) \rightarrow (U_i, u_i)$, $i = 1, 2$.*
- (2) *Let $h_1, h_2 : (U, u) \rightarrow (U', u')$ be two morphisms between étale neighborhoods of s . Assume h_1, h_2 induce the same map $\kappa(u') \rightarrow \kappa(u)$ of residue fields. Then there exist an étale neighborhood (U'', u'') and a morphism $h : (U'', u'') \rightarrow (U, u)$ which equalizes h_1 and h_2 , i.e., such that $h_1 \circ h = h_2 \circ h$.*

Proof. For part (1), consider the fibre product $U = U_1 \times_S U_2$. It is étale over both U_1 and U_2 because étale morphisms are preserved under base change, see Morphisms, Lemma 28.37.4. There is a point of U mapping to both u_1 and u_2 for example by the description of points of a fibre product in Schemes, Lemma 25.17.5. For part (2), define U'' as the fibre product

$$\begin{array}{ccc}
 U'' & \longrightarrow & U \\
 \downarrow & & \downarrow (h_1, h_2) \\
 U' & \xrightarrow{\Delta} & U' \times_S U'
 \end{array}$$

Since h_1 and h_2 induce the same map of residue fields $\kappa(u') \rightarrow \kappa(u)$ there exists a point $u'' \in U''$ lying over u' with $\kappa(u'') = \kappa(u')$. In particular $U'' \neq \emptyset$. Moreover, since U' is étale over S , so is the fibre product $U' \times_S U'$ (see Morphisms, Lemmas 28.37.4 and 28.37.3). Hence the vertical arrow (h_1, h_2) is étale by Morphisms, Lemma 28.37.18. Therefore U'' is étale over U' by base change, and hence also étale over S (because compositions of étale morphisms are étale). Thus (U'', u'') is a solution to the problem. □

Lemma 36.27.4. *Let S be a scheme, and let s be a point of S . The category of elementary étale neighborhoods of (S, s) is cofiltered (see Categories, Definition 4.20.1).*

Proof. This is immediate from the definitions and Lemma 36.27.3. □

Lemma 36.27.5. *Let S be a scheme. Let $s \in S$. Then we have*

$$\mathcal{O}_{S,s}^h = \operatorname{colim}_{(U,u)} \mathcal{O}(U)$$

where the colimit is over the filtered category which is opposite to the category of elementary étale neighbourhoods (U, u) of (S, s) .

Proof. Let $\text{Spec}(A) \subset S$ be an affine neighbourhood of s . Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s . With these choices we have canonical isomorphisms $\mathcal{O}_{S,s} = A_{\mathfrak{p}}$ and $\kappa(s) = \kappa(\mathfrak{p})$. A cofinal system of elementary étale neighbourhoods is given by those elementary étale neighbourhoods (U, u) such that U is affine and $U \rightarrow S$ factors through $\text{Spec}(A)$. In other words, we see that the right hand side is equal to $\text{colim}_{(B, \mathfrak{q})} B$ where the colimit is over étale A -algebras B endowed with a prime \mathfrak{q} lying over \mathfrak{p} with $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$. Thus the lemma follows from Algebra, Lemma 10.145.21. \square

36.28. Slicing smooth morphisms

In this section we explain a result that roughly states that smooth coverings of a scheme S can be refined by étale coverings. The technique to prove this relies on a slicing argument.

Lemma 36.28.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$. Assume*

- (1) *f is smooth at x , and*
- (2) *the image $d\bar{h}$ of dh in*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is nonzero.

Then there exists an affine open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \rightarrow S$ smooth.

Proof. As f is smooth at x we may assume, after replacing X by an open neighbourhood of x that f is smooth. In particular we see that f is flat and locally of finite presentation. By Lemma 36.18.1 we already know there exists an open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \rightarrow S$ flat and of finite presentation. By Morphisms, Lemma 28.34.15 we have a short exact sequence

$$\mathcal{C}_{D/U} \rightarrow i^* \Omega_{U/S} \rightarrow \Omega_{D/S} \rightarrow 0$$

where $i : D \rightarrow U$ is the closed immersion and $\mathcal{C}_{D/U}$ is the conormal sheaf of D in U . As D is an effective Cartier divisor cut out by $h \in \Gamma(U, \mathcal{O}_U)$ we see that $\mathcal{C}_{D/U} = h \cdot \mathcal{O}_S$. Since $U \rightarrow S$ is smooth the sheaf $\Omega_{U/S}$ is finite locally free, hence its pullback $i^* \Omega_{U/S}$ is finite locally free also. The first arrow of the sequence maps the free generator h to the section $dh|_D$ of $i^* \Omega_{U/S}$ which has nonzero value in the fibre $\Omega_{U/S,x} \otimes \kappa(x)$ by assumption. By right exactness of $\otimes \kappa(x)$ we conclude that

$$\dim_{\kappa(x)} (\Omega_{D/S,x} \otimes \kappa(x)) = \dim_{\kappa(x)} (\Omega_{U/S,x} \otimes \kappa(x)) - 1.$$

By Morphisms, Lemma 28.35.14 we see that $\Omega_{U/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(U_s)$ elements. By the displayed formula we see that $\Omega_{D/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(U_s) - 1$ elements. Note that $\dim_x(D_s) = \dim_x(U_s) - 1$ for example because $\dim(\mathcal{O}_{D_s,x}) = \dim(\mathcal{O}_{U_s,x}) - 1$ by Algebra, Lemma 10.59.11 (also $D_s \subset U_s$ is effective Cartier, see Divisors, Lemma 30.10.1) and then using Morphisms, Lemma 28.29.1. Thus we conclude that $\Omega_{D/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(D_s)$ elements and we conclude that $D \rightarrow S$ is smooth at x by Morphisms, Lemma 28.35.14 again. After shrinking U we get that $D \rightarrow S$ is smooth and we win. \square

Lemma 36.28.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

- (1) *f is smooth at x , and*
- (2) *the map*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) \longrightarrow \Omega_{\kappa(x)/\kappa(s)}$$

has a nonzero kernel.

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \rightarrow S$ is smooth.

Proof. Write $k = \kappa(s)$ and $R = \mathcal{O}_{X_s,x}$. Denote \mathfrak{m} the maximal ideal of R and $\kappa = R/\mathfrak{m}$ so that $\kappa = \kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 10.127.8) we have $\Omega_{X_s/s,x} = \Omega_{R/k}$. By Algebra, Lemma 10.127.9 there is an exact sequence

$$\mathfrak{m}/\mathfrak{m}^2 \xrightarrow{d} \Omega_{R/k} \otimes_R \kappa \rightarrow \Omega_{\kappa/k} \rightarrow 0.$$

Hence if (2) holds, there exists an element $\bar{h} \in \mathfrak{m}$ such that $d\bar{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X,x}$ of \bar{h} and apply Lemma 36.28.1. □

Remark 36.28.3. The second condition in Lemma 36.28.2 is necessary even if x is a closed point of a positive dimensional fibre. An example is the following: Let k be a field of characteristic $p > 0$ which is imperfect. Let $a \in k$ be an element which is not a p th power. Let $\mathfrak{m} = (x, y^p - a) \subset k[x, y]$. This corresponds to a closed point w of $X = \mathbf{A}_k^2$. Set $S = \mathbf{A}_k^1$ and let $f : X \rightarrow S$ be the morphism corresponding to $k[x] \rightarrow k[x, y]$. Then there does not exist any commutative diagram

$$\begin{array}{ccc} S' & \xrightarrow{\quad h \quad} & X \\ & \searrow g & \swarrow f \\ & & S \end{array}$$

with g étale and w in the image of h . This is clear as the residue field extension $\kappa(f(w)) \subset \kappa(w)$ is purely inseparable, but for any $s' \in S'$ with $g(s') = f(w)$ the extension $\kappa(f(w)) \subset \kappa(s')$ would be separable.

If you assume the residue field extension is separable then the phenomenon of Remark 36.28.3 does not happen. Here is the precise result.

Lemma 36.28.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

- (1) *f is smooth at x ,*
- (2) *the residue field extension $\kappa(s) \subset \kappa(x)$ is separable, and*
- (3) *x is not a generic point of X_s .*

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \rightarrow S$ is smooth.

Proof. Write $k = \kappa(s)$ and $R = \mathcal{O}_{X_s,x}$. Denote \mathfrak{m} the maximal ideal of R and $\kappa = R/\mathfrak{m}$ so that $\kappa = \kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 10.127.8) we have $\Omega_{X_s/s,x} = \Omega_{R/k}$. By assumption (2) and Algebra, Lemma 10.135.4 the map

$$d : \mathfrak{m}/\mathfrak{m}^2 \longrightarrow \Omega_{R/k} \otimes_R \kappa(\mathfrak{m})$$

is injective. Assumption (3) implies that $\mathfrak{m}/\mathfrak{m}^2 \neq 0$. Thus there exists an element $\bar{h} \in \mathfrak{m}$ such that $d\bar{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X,x}$ of \bar{h} and apply Lemma 36.28.1. \square

The subscheme Z constructed in the following lemma is really a complete intersection in an affine open neighbourhood of x . If we ever need this we will explicitly formulate a separate lemma stating this fact.

Lemma 36.28.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

- (1) f is smooth at x , and
- (2) x is a closed point of X_s and $\kappa(s) \subset \kappa(x)$ is separable.

Then there exists an immersion $Z \rightarrow X$ containing x such that

- (1) $Z \rightarrow S$ is étale, and
- (2) $Z_s = \{x\}$ set theoretically.

Proof. We may and do replace S by an affine open neighbourhood of s . We may and do replace X by an affine open neighbourhood of x such that $X \rightarrow S$ is smooth. We will prove the lemma for smooth morphisms of affines by induction on $d = \dim_x(X_s)$.

The case $d = 0$. In this case we show that we may take Z to be an open neighbourhood of x . Namely, if $d = 0$, then $X \rightarrow S$ is quasi-finite at x , see Morphisms, Lemma 28.30.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \rightarrow S$ is quasi-finite, see Morphisms, Lemma 28.49.2. Thus after replacing X by U we see that X is quasi-finite and smooth over S , hence smooth of relative dimension 0 over S , hence étale over S . Moreover, the fibre X_s is a finite discrete set. Hence after replacing X by a further affine open neighbourhood of X we see that that $f^{-1}(\{s\}) = \{x\}$ (because the topology on X_s is induced from the topology on X , see Schemes, Lemma 25.18.5). This proves the lemma in this case.

Next, assume $d > 0$. Note that because x is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 28.21.3). Thus we see $\Omega_{\kappa(x)/\kappa(s)} = 0$ as this holds for algebraic separable field extensions. Thus we may apply Lemma 36.28.2 to find a diagram

$$\begin{array}{ccccc}
 D & \longrightarrow & U & \longrightarrow & X \\
 & & & \searrow & \downarrow \\
 & & & & S
 \end{array}$$

with $x \in D$. Note that $\dim_x(D_s) = \dim_x(X_s) - 1$ for example because $\dim(\mathcal{O}_{D_s,x}) = \dim(\mathcal{O}_{X_s,x}) - 1$ by Algebra, Lemma 10.59.11 (also $D_s \subset X_s$ is effective Cartier, see Divisors, Lemma 30.10.1) and then using Morphisms, Lemma 28.29.1. Thus the morphism $D \rightarrow S$ is smooth with $\dim_x(D_s) = \dim_x(X_s) - 1 = d - 1$. By induction hypothesis we can find an immersion $Z \rightarrow D$ as desired, which finishes the proof. \square

Lemma 36.28.6. *Let $f : X \rightarrow S$ be a smooth morphism of schemes. Let $s \in S$ be a point in the image of f . Then there exists an étale neighbourhood $(S', s') \rightarrow (S, s)$ and a S -morphism $S' \rightarrow X$.*

First proof of Lemma 36.28.6. By assumption $X_s \neq \emptyset$. By Varieties, Lemma 32.15.6 there exists a closed point $x \in X_s$ such that $\kappa(x)$ is a finite separable field extension of $\kappa(s)$. Hence by Lemma 36.28.5 there exists an immersion $Z \rightarrow X$ such that $Z \rightarrow S$ is étale and such that $x \in Z$. Take $(S', s') = (Z, x)$. \square

Second proof of Lemma 36.28.6. Pick a point $x \in X$ with $f(x) = s$. Choose a diagram

$$\begin{array}{ccc} X & \longleftarrow & U \xrightarrow{\pi} \mathbf{A}_V^d \\ \downarrow & & \downarrow \swarrow \\ Y & \longleftarrow & V \end{array}$$

with π étale, $x \in U$ and $V = \text{Spec}(R)$ affine, see Morphisms, Lemma 28.37.20. In particular $s \in V$. The morphism $\pi : U \rightarrow \mathbf{A}_V^d$ is open, see Morphisms, Lemma 28.37.13. Thus $W = \pi(V) \cap \mathbf{A}_s^d$ is a nonempty open subset of \mathbf{A}_s^d . Let $w \in W$ be a point with $\kappa(s) \subset \kappa(w)$ finite separable, see Varieties, Lemma 32.15.5. By Algebra, Lemma 10.110.1 there exist d elements $\bar{f}_1, \dots, \bar{f}_d \in \kappa(s)[x_1, \dots, x_d]$ which generate the maximal ideal corresponding to w in $\kappa(s)[x_1, \dots, x_n]$. After replacing R by a principal localization we may assume there are $f_1, \dots, f_d \in R[x_1, \dots, x_d]$ which map to $\bar{f}_1, \dots, \bar{f}_d \in \kappa(s)[x_1, \dots, x_d]$. Consider the R -algebra

$$R' = R[x_1, \dots, x_d]/(f_1, \dots, f_d)$$

and set $S' = \text{Spec}(R')$. By construction we have a closed immersion $j : S' \rightarrow \mathbf{A}_V^d$ over V . By construction the fibre of $S' \rightarrow V$ over s is a single point s' whose residue field is finite separable over $\kappa(s)$. Let $\mathfrak{q}' \subset R'$ be the corresponding prime. By Algebra, Lemma 10.131.11 we see that $(R')_{\mathfrak{q}'}$ is a relative global complete intersection over R for some $g \in R'$, $g \notin \mathfrak{q}'$. Thus $S' \rightarrow V$ is flat and of finite presentation in a neighbourhood of s' , see Algebra, Lemma 10.131.14. By construction the scheme theoretic fibre of $S' \rightarrow V$ over s is $\text{Spec}(\kappa(s'))$. Hence it follows from Morphisms, Lemma 28.37.15 that $S' \rightarrow S$ is étale at s' . Set

$$S'' = U \times_{\pi, \mathbf{A}_V^d, j} S'.$$

By construction there exists a point $s'' \in S''$ which maps to s' via the projection $p : S'' \rightarrow S'$. Note that p is étale as the base change of the étale morphism π , see Morphisms, Lemma 28.37.4. Choose a small affine neighbourhood $S''' \subset S''$ of s'' which maps into the nonempty open neighbourhood of $s' \in S'$ where the morphism $S' \rightarrow S$ is étale. Then the étale neighbourhood $(S''', s'') \rightarrow (S, s)$ is a solution to the problem posed by the lemma. \square

The following lemma shows that sheaves for the smooth topology are the same thing as sheaves for the étale topology.

Lemma 36.28.7. *Let S be a scheme. Let $\mathcal{U} = \{S_i \rightarrow S\}_{i \in I}$ be a smooth covering of S , see Topologies, Definition 33.5.1. Then there exists an étale covering $\mathcal{V} = \{T_j \rightarrow S\}_{j \in J}$ (see Topologies, Definition 33.4.1) which refines (see Sites, Definition 7.8.1) \mathcal{U} .*

Proof. For every $s \in S$ there exists an $i \in I$ such that s is in the image of $S_i \rightarrow S$. By Lemma 36.28.6 we can find an étale morphism $g_s : T_s \rightarrow S$ such that $s \in g_s(T)_s$ and such that g_s factors through $S_i \rightarrow S$. Hence $\{T_s \rightarrow S\}$ is an étale covering of S that refines \mathcal{U} . \square

36.29. Finite free locally dominates étale

In this section we explain a result that roughly states that étale coverings of a scheme S can be refined by Zariski coverings of finite locally free covers of S .

Lemma 36.29.1. *Let S be a scheme. Let $s \in S$. Let $f : (U, u) \rightarrow (S, s)$ be an étale neighbourhood. There exists an affine open neighbourhood $s \in V \subset S$ and a surjective, finite locally free morphism $\pi : T \rightarrow V$ such that for every $t \in \pi^{-1}(s)$ there exists an open neighbourhood $t \in W_t \subset T$ and a commutative diagram*

$$\begin{array}{ccccc} T & \longleftarrow & W_t & \xrightarrow{h_t} & U \\ & & \searrow & & \swarrow \\ & & & & S \\ \downarrow \pi & & & & \\ V & \xrightarrow{\quad} & & & \end{array}$$

with $h_t(t) = u$.

Proof. The problem is local on S hence we may replace S by any open neighbourhood of s . We may also replace U by an open neighbourhood of u . Hence, by Morphisms, Lemma 28.37.14 we may assume that $U \rightarrow S$ is a standard étale morphism of affine schemes. In this case the lemma (with $V = S$) follows from Algebra, Lemma 10.138.18. \square

Lemma 36.29.2. *Let $f : U \rightarrow S$ be a surjective étale morphism of affine schemes. There exists a surjective, finite locally free morphism $\pi : T \rightarrow S$ and a finite open covering $T = T_1 \cup \dots \cup T_n$ such that each $T_i \rightarrow S$ factors through $U \rightarrow S$. Diagram:*

$$\begin{array}{ccc} & \coprod T_i & \\ & \swarrow \quad \searrow & \\ T & & U \\ & \searrow \pi \quad \swarrow f & \\ & S & \end{array}$$

where the south-west arrow is a Zariski-covering.

Proof. This is a restatement of Algebra, Lemma 10.138.19. \square

Remark 36.29.3. In terms of topologies the lemmas above mean the following. Let S be any scheme. Let $\{f_i : U_i \rightarrow S\}$ be an étale covering of S . There exists a Zariski open covering $S = \bigcup V_j$, for each j a finite locally free, surjective morphism $W_j \rightarrow V_j$, and for each j a Zariski open covering $\{W_{j,k} \rightarrow W_j\}$ such that the family $\{W_{j,k} \rightarrow S\}$ refines the given étale covering $\{f_i : U_i \rightarrow S\}$. What does this mean in practice? Well, for example, suppose we have a descent problem which we know how to solve for Zariski coverings and for fppf coverings of the form $\{\pi : T \rightarrow S\}$ with π finite locally free and surjective. Then this descent problem has an affirmative answer for étale coverings as well. This trick was used by Gabber in his proof that $\text{Br}(X) = \text{Br}'(X)$ for an affine scheme X , see [Hoo82].

36.30. Étale localization of quasi-finite morphisms

Now we come to a series of lemmas around the theme “quasi-finite morphisms become finite after étale localization”. The general idea is the following. Suppose

given a morphism of schemes $f : X \rightarrow S$ and a point $s \in S$. Let $\varphi : (U, u) \rightarrow (S, s)$ be an étale neighbourhood of s in S . Consider the fibre product $X_U = U \times_S X$ and the basic diagram

$$(36.30.0.1) \quad \begin{array}{ccccc} V & \longrightarrow & X_U & \longrightarrow & X \\ & \searrow & \downarrow & & \downarrow f \\ & & U & \xrightarrow{\varphi} & S \end{array}$$

where $V \subset X_U$ is open. Is there some standard model for the morphism $f_U : X_U \rightarrow U$, or for the morphism $V \rightarrow U$ for suitable opens V ? Of course the answer is no in general. But for quasi-finite morphisms we can say something.

Lemma 36.30.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume that*

- (1) *f is locally of finite type, and*
- (2) *$x \in X_s$ is isolated².*

Then there exist

- (a) *an elementary étale neighbourhood $(U, u) \rightarrow (S, s)$,*
- (b) *an open subscheme $V \subset X_U$ (see 36.30.0.1)*

such that

- (i) *$V \rightarrow U$ is a finite morphism,*
- (ii) *there is a unique point v of V mapping to u in U , and*
- (iii) *the point v maps to x under the morphism $X_U \rightarrow X$, inducing $\kappa(x) = \kappa(v)$.*

Moreover, for any elementary étale neighbourhood $(U', u') \rightarrow (U, u)$ setting $V' = U' \times_U V \subset X_{U'}$ the triple (U', u', V') satisfies the properties (i), (ii), and (iii) as well.

Proof. Let $Y \subset X$, $W \subset S$ be affine opens such that $f(Y) \subset W$ and such that $x \in Y$. Note that x is also an isolated point of the fibre of the morphism $f|_Y : Y \rightarrow W$. If we can prove the theorem for $f|_Y : Y \rightarrow W$, then the theorem follows for f . Hence we reduce to the case where f is a morphism of affine schemes. This case is Algebra, Lemma 10.138.22. \square

In the preceding and following lemma we do not assume that the morphism f is separated. This means that the opens V , V_i created in them are not necessarily closed in X_U . Moreover, if we choose the neighbourhood U to be affine, then each V_i is affine, but the intersections $V_i \cap V_j$ need not be affine (in the nonseparated case).

Lemma 36.30.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x_1, \dots, x_n \in X$ be points having the same image s in S . Assume that*

- (1) *f is locally of finite type, and*
- (2) *$x_i \in X_s$ is isolated for $i = 1, \dots, n$.*

Then there exist

- (a) *an elementary étale neighbourhood $(U, u) \rightarrow (S, s)$,*
- (b) *for each i an open subscheme $V_i \subset X_U$,*

²In the presence of (1) this means that f is quasi-finite at x , see Morphisms, Lemma 28.21.6.

such that for each i we have

- (i) $V_i \rightarrow U$ is a finite morphism,
- (ii) there is a unique point v_i of V_i mapping to u in U , and
- (iii) the point v_i maps to x_i in X and $\kappa(x_i) = \kappa(v_i)$.

Proof. We will use induction on n . Namely, suppose $(U, u) \rightarrow (S, s)$ and $V_i \subset X_U$, $i = 1, \dots, n-1$ work for x_1, \dots, x_{n-1} . Since $\kappa(s) = \kappa(u)$ the fibre $(X_U)_u = X_s$. Hence there exists a unique point $x'_n \in X_u \subset X_U$ corresponding to $x_n \in X_s$. Also x'_n is isolated in X_u . Hence by Lemma 36.30.1 there exists an elementary étale neighbourhood $(U', u') \rightarrow (U, u)$ and an open $V_n \subset X_{U'}$ which works for x'_n and hence for x_n . By the final assertion of Lemma 36.30.1 the open subschemes $V'_i = U' \times_U V_i$ for $i = 1, \dots, n-1$ still work with respect to x_1, \dots, x_{n-1} . Hence we win. \square

If we allow a nontrivial field extension $\kappa(s) \subset \kappa(u)$, i.e., general étale neighbourhoods, then we can split the points as follows.

Lemma 36.30.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x_1, \dots, x_n \in X$ be points having the same image s in S . Assume that*

- (1) f is locally of finite type, and
- (2) $x_i \in X_s$ is isolated for $i = 1, \dots, n$.

Then there exist

- (a) an étale neighbourhood $(U, u) \rightarrow (S, s)$,
- (b) for each i an integer m_i and open subschemes $V_{i,j} \subset X_U$, $j = 1, \dots, m_i$

such that we have

- (i) each $V_{i,j} \rightarrow U$ is a finite morphism,
- (ii) there is a unique point $v_{i,j}$ of $V_{i,j}$ mapping to u in U with $\kappa(u) \subset \kappa(v_{i,j})$ finite purely inseparable,
- (iv) if $v_{i,j} = v_{i',j'}$, then $i = i'$ and $j = j'$, and
- (iii) the points $v_{i,j}$ map to x_i in X and no other points of $(X_U)_u$ map to x_i .

Proof. This proof is a variant of the proof of Algebra, Lemma 10.138.24 in the language of schemes. By Morphisms, Lemma 28.21.6 the morphism f is quasi-finite at each of the points x_i . Hence $\kappa(s) \subset \kappa(x_i)$ is finite for each i (Morphisms, Lemma 28.21.5). For each i , let $\kappa(s) \subset L_i \subset \kappa(x_i)$ be the subfield such that $L_i/\kappa(s)$ is separable, and $\kappa(x_i)/L_i$ is purely inseparable. Choose a finite Galois extension $\kappa(s) \subset L$ such that there exist $\kappa(s)$ -embeddings $L_i \rightarrow L$ for $i = 1, \dots, n$. Choose an étale neighbourhood $(U, u) \rightarrow (S, s)$ such that $L \cong \kappa(u)$ as $\kappa(s)$ -extensions (Lemma 36.27.2).

Let $y_{i,j}$, $j = 1, \dots, m_i$ be the points of X_U lying over $x_i \in X$ and $u \in U$. By Schemes, Lemma 25.17.5 these points $y_{i,j}$ correspond exactly to the primes in the rings $\kappa(u) \otimes_{\kappa(s)} \kappa(x_i)$. This also explains why there are finitely many; in fact $m_i = [L_i : \kappa(s)]$ but we do not need this. By our choice of L (and elementary field theory) we see that $\kappa(u) \subset \kappa(y_{i,j})$ is finite purely inseparable for each pair i, j . Also, by Morphisms, Lemma 28.21.13 for example, the morphism $X_U \rightarrow U$ is quasi-finite at the points $y_{i,j}$ for all i, j .

Apply Lemma 36.30.2 to the morphism $X_U \rightarrow U$, the point $u \in U$ and the points $y_{i,j} \in (X_U)_u$. This gives an étale neighbourhood $(U', u') \rightarrow (U, u)$ with $\kappa(u) = \kappa(u')$ and opens $V_{i,j} \subset X_{U'}$ with the properties (i), (ii), and (iii) of that lemma. We

claim that the étale neighbourhood $(U', u') \rightarrow (S, s)$ and the opens $V_{i,j} \subset X_{U'}$ are a solution to the problem posed by the lemma. We omit the verifications. \square

Lemma 36.30.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Let $x_1, \dots, x_n \in X_s$. Assume that*

- (1) f is locally of finite type,
- (2) f is separated, and
- (3) x_1, \dots, x_n are pairwise distinct isolated points of X_s .

Then there exists an elementary étale neighbourhood $(U, u) \rightarrow (S, s)$ and a decomposition

$$U \times_S X = W \coprod V_1 \coprod \dots \coprod V_n$$

into open and closed subschemes such that the morphisms $V_i \rightarrow U$ are finite, the fibres of $V_i \rightarrow U$ over u are singletons $\{v_i\}$, each v_i maps to x_i with $\kappa(x_i) = \kappa(v_i)$, and the fibre of $W \rightarrow U$ over u contains no points mapping to any of the x_i .

Proof. Choose $(U, u) \rightarrow (S, s)$ and $V_i \subset X_U$ as in Lemma 36.30.2. Since $X_U \rightarrow U$ is separated (Schemes, Lemma 25.21.13) and $V_i \rightarrow U$ is finite hence proper (Morphisms, Lemma 28.44.10) we see that $V_i \subset X_U$ is closed by Morphisms, Lemma 28.42.7. Hence $V_i \cap V_j$ is a closed subset of V_i which does not contain v_i . Hence the image of $V_i \cap V_j$ in U is a closed set (because $V_i \rightarrow U$ proper) not containing u . After shrinking U we may therefore assume that $V_i \cap V_j = \emptyset$ for all i, j . This gives the decomposition as in the lemma. \square

Here is the variant where we reduce to purely inseparable field extensions.

Lemma 36.30.5. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Let $x_1, \dots, x_n \in X_s$. Assume that*

- (1) f is locally of finite type,
- (2) f is separated, and
- (3) x_1, \dots, x_n are pairwise distinct isolated points of X_s .

Then there exists an étale neighbourhood $(U, u) \rightarrow (S, s)$ and a decomposition

$$U \times_S X = W \coprod \coprod_{i=1, \dots, n} \coprod_{j=1, \dots, m_i} V_{i,j}$$

into open and closed subschemes such that the morphisms $V_{i,j} \rightarrow U$ are finite, the fibres of $V_{i,j} \rightarrow U$ over u are singletons $\{v_{i,j}\}$, each $v_{i,j}$ maps to x_i , $\kappa(u) \subset \kappa(v_{i,j})$ is purely inseparable, and the fibre of $W \rightarrow U$ over u contains no points mapping to any of the x_i .

Proof. This is proved in exactly the same way as the proof of Lemma 36.30.4 except that it uses Lemma 36.30.3 instead of Lemma 36.30.2. \square

The following version may be a little easier to parse.

Lemma 36.30.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that*

- (1) f is locally of finite type,
- (2) f is separated, and
- (3) X_s has at most finitely many isolated points.

Then there exists an elementary étale neighbourhood $(U, u) \rightarrow (S, s)$ and a decomposition

$$U \times_S X = W \coprod V$$

into open and closed subschemes such that the morphism $V \rightarrow U$ is finite, and the fibre W_u of the morphism $W \rightarrow U$ contains no isolated points. In particular, if $f^{-1}(s)$ is a finite set, then $W_u = \emptyset$.

Proof. This is clear from Lemma 36.30.4 by choosing x_1, \dots, x_n the complete set of isolated points of X_s and setting $V = \bigcup V_i$. \square

36.31. Zariski's Main Theorem

We can use the results Section 36.30 to prove the scheme theoretic version of Zariski's main theorem.

Lemma 36.31.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is of finite type and separated. Let S' be the normalization of S in X , see Morphisms, Definition 28.48.3. Picture:*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & S' \\ & \searrow f & \swarrow \nu \\ & & S \end{array}$$

Then there exists an open subscheme $U' \subset S'$ such that

- (1) $(f')^{-1}(U') \rightarrow U'$ is an isomorphism, and
- (2) $(f')^{-1}(U') \subset X$ is the set of points at which f is quasi-finite.

Proof. By Morphisms, Lemma 28.49.2 the subset $U \subset X$ of points where f is quasi-finite is open. The lemma is equivalent to

- (a) $U' = f'(U) \subset S'$ is open,
- (b) $U = f^{-1}(U')$, and
- (c) $U \rightarrow U'$ is an isomorphism.

Let $x \in U$ be arbitrary. We claim there exists an open neighbourhood $f'(x) \in V \subset S'$ such that $(f')^{-1}V \rightarrow V$ is an isomorphism. We first prove the claim implies the lemma. Namely, then $(f')^{-1}V \cong V$ is both locally of finite type over S (as an open subscheme of X) and for $v \in V$ the residue field extension $\kappa(v) \supset \kappa(\nu(v))$ is algebraic (as $V \subset S'$ and S' is integral over S). Hence the fibres of $V \rightarrow S$ are discrete (Morphisms, Lemma 28.21.2) and $(f')^{-1}V \rightarrow S$ is locally quasi-finite (Morphisms, Lemma 28.21.8). This implies $(f')^{-1}V \subset U$ and $V \subset U'$. Since x was arbitrary we see that (a), (b), and (c) are true.

Let $s = f(x)$. Let $(T, t) \rightarrow (S, s)$ be an elementary étale neighbourhood. Denote by a subscript T the base change to T . Let $y = (x, t) \in X_T$ be the unique point in the fibre X_t lying over x . Note that $U_T \subset X_T$ is the set of points where f_T is quasi-finite, see Morphisms, Lemma 28.21.13. Note that

$$X_T \xrightarrow{f'_T} S'_T \xrightarrow{\nu_T} T$$

is the normalization of T in X_T , see Lemma 36.14.2. Suppose that the claim holds for $y \in U_T \subset X_T \rightarrow S'_T \rightarrow T$, i.e., suppose that we can find an open neighbourhood $f'_T(y) \in V' \subset S'_T$ such that $(f'_T)^{-1}V' \rightarrow V'$ is an isomorphism. The morphism

$S'_T \rightarrow S'$ is étale hence the image $V \subset S'$ of V' is open. Observe that $f'(x) \in V$ as $f'_T(y) \in V'$. Observe that

$$\begin{array}{ccc} (f'_T)^{-1}V' & \longrightarrow & (f')^{-1}(V) \\ \downarrow & & \downarrow \\ V' & \longrightarrow & V \end{array}$$

is a fibre square (as $S'_T \times_{S'} X = X_T$). Since the left vertical arrow is an isomorphism and $\{V' \rightarrow V\}$ is a étale covering, we conclude that the right vertical arrow is an isomorphism by Descent, Lemma 34.19.15. In other words, the claim holds for $x \in U \subset X \rightarrow S' \rightarrow S$.

By the result of the previous paragraph we may replace S by an elementary étale neighbourhood of $s = f(x)$ in order to prove the claim. Thus we may assume there is a decomposition

$$X = V \amalg W$$

into open and closed subschemes where $V \rightarrow S$ is finite and $x \in V$, see Lemma 36.30.4. Since X is a disjoint union of V and W over S and since $V \rightarrow S$ is finite we see that the normalization of S in X is the morphism

$$X = V \amalg W \longrightarrow V \amalg W' \longrightarrow S$$

where W' is the normalization of S in W , see Morphisms, Lemmas 28.48.7, 28.44.4, and 28.48.8. The claim follows and we win. \square

Lemma 36.31.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is quasi-finite and separated. Let S' be the normalization of S in X , see Morphisms, Definition 28.48.3. Picture:*

$$\begin{array}{ccc} X & \xrightarrow{f'} & S' \\ & \searrow f & \swarrow \nu \\ & & S \end{array}$$

Then f' is a quasi-compact open immersion and ν is integral. In particular f is quasi-affine.

Proof. This follows from Lemma 36.31.1. Namely, by that lemma there exists an open subscheme $U' \subset S'$ such that $(f')^{-1}(U') = X$ (!) and $X \rightarrow U'$ is an isomorphism! In other words, f' is an open immersion. Note that f' is quasi-compact as f is quasi-compact and $\nu : S' \rightarrow S$ is separated (Schemes, Lemma 25.21.15). It follows that f is quasi-affine by Morphisms, Lemma 28.14.3. \square

Lemma 36.31.3. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume f is quasi-finite and separated and assume that S is quasi-compact and quasi-separated. Then there exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{j} & T \\ & \searrow f & \swarrow \pi \\ & & S \end{array}$$

where j is a quasi-compact open immersion and π is finite.

Proof. Let $X \rightarrow S' \rightarrow S$ be as in the conclusion of Lemma 36.31.2. By Properties, Lemma 27.20.13 we can write $\nu_*\mathcal{O}_{S'} = \operatorname{colim}_{i \in I} \mathcal{A}_i$ as a directed colimit of finite quasi-coherent \mathcal{O}_X -algebras $\mathcal{A}_i \subset \nu_*\mathcal{O}_{S'}$. Then $\pi_i : T_i = \operatorname{Spec}_S(\mathcal{A}_i) \rightarrow S$ is a finite morphism for each i . Note that the transition morphisms $T_{i'} \rightarrow T_i$ are affine and that $S' = \lim T_i$.

By Limits, Lemma 31.3.8 there exists an i and a quasi-compact open $U_i \subset T_i$ whose inverse image in S' equals $f'(X)$. For $i' \geq i$ let $U_{i'}$ be the inverse image of U_i in $T_{i'}$. Then $X \cong f'(X) = \lim_{i' \geq i} U_{i'}$, see Limits, Lemma 31.2.2. By Limits, Lemma 31.3.13 we see that $X \rightarrow U_{i'}$ is a closed immersion for some $i' \geq i$. (In fact $X \cong U_{i'}$ for sufficiently large i' but we don't need this.) Hence $X \rightarrow T_{i'}$ is an immersion. By Morphisms, Lemma 28.3.2 we can factor this as $X \rightarrow T \rightarrow T_{i'}$ where the first arrow is an open immersion and the second a closed immersion. Thus we win. \square

Lemma 36.31.4. *Let $f : X \rightarrow S$ be a morphism of schemes and $U \subset S$ an open. If*

- (1) *f is separated, locally of finite presentation³, and flat,*
- (2) *$f^{-1}(U) \rightarrow U$ is an isomorphism, and*
- (3) *$U \subset S$ is retrocompact and scheme theoretically dense,*

then f is an open immersion.

Proof. The image $f(X) \subset S$ is open (Morphisms, Lemma 28.26.9) hence we may replace S by $f(X)$. Thus we have to prove that f is an isomorphism. We may assume S is affine. We can reduce to the case that X is quasi-compact because it suffices to show that any quasi-compact open $X' \subset X$ whose image is S maps isomorphically to S . Thus we may assume f is quasi-compact. All the fibers of f have dimension 0, see Lemma 36.17.8. Hence f is quasi-finite, see Morphisms, Lemma 28.30.5. Let $s \in S$. Choose an elementary étale neighbourhood $g : (T, t) \rightarrow (S, s)$ such that $X \times_S T = V \amalg W$ with $V \rightarrow T$ finite and $W_t = \emptyset$, see Lemma 36.30.6. Denote $\pi : V \amalg W \rightarrow T$ the given morphism. Since π is flat and locally of finite presentation, we see that $\pi(V)$ is open in T (Morphisms, Lemma 28.26.9). After shrinking T we may assume that $T = \pi(V)$. Since f is an isomorphism over U we see that π is an isomorphism over $g^{-1}U$. Since $\pi(V) = T$ this implies that $\pi^{-1}g^{-1}U$ is contained in V . By Morphisms, Lemma 28.26.13 we see that $\pi^{-1}g^{-1}U \subset V \amalg W$ is scheme theoretically dense. Hence we deduce that $W = \emptyset$. Thus $X \times_S T = V$ is finite over T . Shrinking T once more we may assume T is affine. Then V is affine too and we see that

$$\Gamma(T, \mathcal{O}_T) = \Gamma(g^{-1}U, \mathcal{O}_T) = \Gamma(\pi^{-1}g^{-1}U, \mathcal{O}_V) = \Gamma(V, \mathcal{O}_V)$$

because the inverse image of U is schematically dense in both T and V (see above). Thus $X \times_S T \rightarrow T$ is an isomorphism. This implies that f is an isomorphism, for example by Descent, Lemma 34.19.15. \square

Lemma 36.31.5. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent:*

- (1) *f is finite,*
- (2) *f is proper with finite fibres.*
- (3) *f is universally closed, separated, locally of finite type and has finite fibres.*

³You can replace “finite presentation” with “finite type” by More on Flatness, Lemma 37.10.12.

Proof. We have (1) implies (2) by Morphisms, Lemmas 28.44.10, 28.21.10, and 28.44.9. By definition (2) implies (3).

Assume (3). Pick $s \in S$. By Morphisms, Lemma 28.21.7 we see that all the finitely many points of X_s are isolated in X_s . Choose an elementary étale neighbourhood $(U, u) \rightarrow (S, s)$ and decomposition $X_U = V \amalg W$ as in Lemma 36.30.6. Note that $W_u = \emptyset$ because all points of X_s are isolated. Since f is universally closed we see that the image of W in U is a closed set not containing u . After shrinking U we may assume that $W = \emptyset$. In other words we see that $X_U = V$ is finite over U . Since $s \in S$ was arbitrary this means there exists a family $\{U_i \rightarrow S\}$ of étale morphisms whose images cover S such that the base changes $X_{U_i} \rightarrow U_i$ are finite. Note that $\{U_i \rightarrow S\}$ is an étale covering, see Topologies, Definition 33.4.1. Hence it is an fpqc covering, see Topologies, Lemma 33.8.6. Hence we conclude f is finite by Descent, Lemma 34.19.21. \square

As a consequence we have the following useful results.

Lemma 36.31.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that f is proper and $f^{-1}(\{s\})$ is a finite set. Then there exists an open neighbourhood $V \subset S$ of s such that $f|_{f^{-1}(V)} : f^{-1}(V) \rightarrow V$ is finite.*

Proof. The morphism f is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 28.21.7. By Morphisms, Lemma 28.49.2 the set of points at which f is quasi-finite is an open $U \subset X$. Let $Z = X \setminus U$. Then $s \notin f(Z)$. Since f is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of s with $Z \cap V = \emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 28.21.9), hence has finite fibres (Morphisms, Lemma 28.21.10), hence is finite by Lemma 36.31.5. \square

Lemma 36.31.7. *Consider a commutative diagram of schemes*

$$\begin{array}{ccc} X & \xrightarrow{h} & Y \\ & \searrow f & \swarrow g \\ & & S \end{array}$$

Let $s \in S$. Assume

- (1) $X \rightarrow S$ is a proper morphism,
- (2) $Y \rightarrow S$ is separated and locally of finite type, and
- (3) the image of $X_s \rightarrow Y_s$ is finite.

Then there is an open subspace $U \subset S$ containing s such that $X_U \rightarrow Y_U$ factors through a closed subscheme $Z \subset Y_U$ finite over U .

Proof. Let $Z \subset Y$ be the scheme theoretic image of h , see Morphisms, Section 28.6. By Morphisms, Lemma 28.42.9 the morphism $X \rightarrow Z$ is surjective and $Z \rightarrow S$ is proper. Thus $X_s \rightarrow Z_s$ is surjective. We see that either (3) implies Z_s is finite. Hence $Z \rightarrow S$ is finite in an open neighbourhood of s by Lemma 36.31.6. \square

Lemma 36.31.8. *Let $f : Y \rightarrow X$ be a quasi-finite morphism. There exists a dense open $U \subset X$ such that $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$ is finite.*

Proof. If $U_i \subset X$, $i \in I$ is a collection of opens such that the restrictions $f|_{f^{-1}(U_i)} : f^{-1}(U_i) \rightarrow U_i$ are finite, then with $U = \bigcup U_i$ the restriction $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$

is finite, see Morphisms, Lemma 28.44.3. Thus the problem is local on X and we may assume that X is affine.

Assume X is affine. Write $Y = \bigcup_{j=1, \dots, m} V_j$ with V_j affine. This is possible since f is quasi-finite and hence in particular quasi-compact. Each $V_j \rightarrow X$ is quasi-finite and separated. Let $\eta \in X$ be a generic point of an irreducible component of X . We see from Morphisms, Lemmas 28.21.10 and 28.47.1 that there exists an open neighbourhood $\eta \in U_\eta$ such that $f^{-1}(U_\eta) \cap V_j \rightarrow U_\eta$ is finite. We may choose U_η such that it works for each $j = 1, \dots, m$. Note that the collection of generic points of X is dense in X . Thus we see there exists a dense open $W = \bigcup_\eta U_\eta$ such that each $f^{-1}(W) \cap V_j \rightarrow W$ is finite. It suffices to show that there exists a dense open $U \subset W$ such that $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$ is finite. Thus we may replace X by an affine open subscheme of W and assume that each $V_j \rightarrow X$ is finite.

Assume X is affine, $Y = \bigcup_{j=1, \dots, m} V_j$ with V_j affine, and the restrictions $f|_{V_j} : V_j \rightarrow X$ are finite. Set

$$\Delta_{ij} = (\overline{V_i \cap V_j} \setminus V_i \cap V_j) \cap V_j.$$

This is a nowhere dense closed subset of V_j because it is the boundary of the open subset $V_i \cap V_j$ in V_j . By Morphisms, Lemma 28.46.7 the image $f(\Delta_{ij})$ is a nowhere dense closed subset of X . By Topology, Lemma 5.20.2 the union $T = \bigcup f(\Delta_{ij})$ is a nowhere dense closed subset of X . Thus $U = X \setminus T$ is a dense open subset of X . We claim that $f|_{f^{-1}(U)} : f^{-1}(U) \rightarrow U$ is finite. To see this let $U' \subset U$ be an affine open. Set $Y' = f^{-1}(U') = U' \times_X Y$, $V'_j = Y' \cap V_j = U' \times_X V_j$. Consider the restriction

$$f' = f|_{Y'} : Y' \rightarrow U'$$

of f . This morphism now has the property that $Y' = \bigcup_{j=1, \dots, m} V'_j$ is an affine open covering, each $V'_j \rightarrow U'$ is finite, and $V'_i \cap V'_j$ is (open and) closed both in V'_i and V'_j . Hence $V'_i \cap V'_j$ is affine, and the map

$$\mathcal{O}(V'_i) \otimes_{\mathbf{Z}} \mathcal{O}(V'_j) \rightarrow \mathcal{O}(V'_i \cap V'_j)$$

is surjective. This implies that Y' is separated, see Schemes, Lemma 25.21.8. Finally, consider the commutative diagram

$$\begin{array}{ccc} \coprod_{j=1, \dots, m} V'_j & \xrightarrow{\quad} & Y' \\ & \searrow & \swarrow \\ & U' & \end{array}$$

The south-east arrow is finite, hence proper, the horizontal arrow is surjective, and the south-west arrow is separated. Hence by Morphisms, Lemma 28.42.8 we conclude that $Y' \rightarrow U'$ is proper. Since it is also quasi-finite, we see that it is finite by Lemma 36.31.5, and we win. \square

Lemma 36.31.9. *Let $f : X \rightarrow S$ be flat, locally of finite presentation, separated, locally quasi-finite with universally bounded fibres. Then there exist closed subsets*

$$\emptyset = Z_{-1} \subset Z_0 \subset Z_1 \subset Z_2 \subset \dots \subset Z_n = S$$

such that with $S_r = Z_r \setminus Z_{r-1}$ the stratification $S = \coprod_{r=0, \dots, n} S_r$ is characterized by the following universal property: Given $g : T \rightarrow S$ the projection $X \times_S T \rightarrow T$ is finite locally free of degree r if and only if $g(T) \subset S_r$ (set theoretically).

Proof. Let n be an integer bounding the degree of the fibres of $X \rightarrow S$. By Morphisms, Lemma 28.50.4 we see that any base change has degrees of fibres bounded by n also. In particular, all the integers r that occur in the statement of the lemma will be $\leq n$. We will prove the lemma by induction on n . The base case is $n = 0$ which is obvious.

We claim the set of points $s \in S$ with $\deg_{\kappa(s)}(X_s) = n$ is an open subset $S_n \subset S$ and that $X \times_S S_n \rightarrow S_n$ is finite locally free of degree n . Namely, suppose that $s \in S$ is such a point. Choose an elementary étale morphism $(U, u) \rightarrow (S, s)$ and a decomposition $U \times_S X = W \amalg V$ as in Lemma 36.30.6. Since $V \rightarrow U$ is finite, flat, and locally of finite presentation, we see that $V \rightarrow U$ is finite locally free, see Morphisms, Lemma 28.46.2. After shrinking U to a smaller neighbourhood of u we may assume $V \rightarrow U$ is finite locally free of some degree d , see Morphisms, Lemma 28.46.5. As $u \mapsto s$ and $W_u = \emptyset$ we see that $d = n$. Since n is the maximum degree of a fibre we see that $W = \emptyset$. Thus $U \times_S X \rightarrow U$ is finite locally free of degree n . By Descent, Lemma 34.19.28 we conclude that $X \rightarrow S$ is finite locally free of degree n over $\text{Im}(U \rightarrow S)$ which is an open neighbourhood of s (Morphisms, Lemma 28.37.13). This proves the claim.

Let $S' = S \setminus S_n$ endowed with the reduced induced scheme structure and set $X' = X \times_S S'$. Note that the degrees of fibres of $X' \rightarrow S'$ are universally bounded by $n - 1$. By induction we find a stratification $S' = S_0 \amalg \dots \amalg S_{n-1}$ adapted to the morphism $X' \rightarrow S'$. We claim that $S = \coprod_{r=0, \dots, n} S_r$ works for the morphism $X \rightarrow S$. Let $g : T \rightarrow S$ be a morphism of schemes and assume that $X \times_S T \rightarrow T$ is finite locally free of degree r . As remarked above this implies that $r \leq n$. If $r = n$, then it is clear that $T \rightarrow S$ factors through S_n . If $r < n$, then $g(T) \subset S' = S \setminus S_n$ (set theoretically) hence $T_{red} \rightarrow S$ factors through S' , see Schemes, Lemma 25.12.6. Note that $X \times_S T_{red} \rightarrow T_{red}$ is also finite locally free of degree r as a base change. By the universal property of the stratification $S' = \coprod_{r=0, \dots, n-1} S_r$ we see that $g(T) = g(T_{red})$ is contained in S_r . Conversely, suppose that we have $g : T \rightarrow S$ such that $g(T) \subset S_r$ (set theoretically). If $r = n$, then g factors through S_n and it is clear that $X \times_S T \rightarrow T$ is finite locally free of degree n as a base change. If $r < n$, then $X \times_S T \rightarrow T$ is a morphism which is separated, flat, and locally of finite presentation, such that the restriction to T_{red} is finite locally free of degree r . Since $T_{red} \rightarrow T$ is a universal homeomorphism, we conclude that $X \times_S T_{red} \rightarrow X \times_S T$ is a universal homeomorphism too and hence $X \times_S T \rightarrow T$ is universally closed (as this is true for the finite morphism $X \times_S T_{red} \rightarrow T_{red}$). It follows that $X \times_S T \rightarrow T$ is finite, for example by Lemma 36.31.5. Then we can use Morphisms, Lemma 28.46.2 to see that $X \times_S T \rightarrow T$ is finite locally free. Finally, the degree is r as all the fibres have degree r . \square

Lemma 36.31.10. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, separated, and quasi-finite. Then there exist closed subsets*

$$\emptyset = Z_{-1} \subset Z_0 \subset Z_1 \subset Z_2 \subset \dots \subset S$$

such that with $S_r = Z_r \setminus Z_{r-1}$ the stratification $S = \coprod S_r$ is characterized by the following universal property: Given a morphism $g : T \rightarrow S$ the projection $X \times_S T \rightarrow T$ is finite locally free of degree r if and only if $g(T) \subset S_r$ (set theoretically). Moreover, the inclusion maps $S_r \rightarrow S$ are quasi-compact.

Proof. The question is local on S , hence we may assume that S is affine. By Morphisms, Lemma 28.50.8 the fibres of f are universally bounded in this case. Hence the existence of the stratification follows from Lemma 36.31.9.

We will show that $U_r = S \setminus Z_r \rightarrow S$ is quasi-compact for each $r \geq 0$. This will prove the final statement by elementary topology. Since a composition of quasi-compact maps is quasi-compact it suffices to prove that $U_r \rightarrow U_{r-1}$ is quasi-compact. Choose an affine open $W \subset U_{r-1}$. Write $W = \text{Spec}(A)$. Then $Z_r \cap W = V(I)$ for some ideal $I \subset A$ and $X \times_S \text{Spec}(A/I) \rightarrow \text{Spec}(A/I)$ is finite locally free of degree r . Note that $A/I = \text{colim } A/I_i$ where $I_i \subset I$ runs through the finitely generated ideals. By Limits, Lemma 31.7.7 we see that $X \times_S \text{Spec}(A/I_i) \rightarrow \text{Spec}(A/I_i)$ is finite locally free of degree r for some i . (This uses that $X \rightarrow S$ is of finite presentation, as it is locally of finite presentation, separated, and quasi-compact.) Hence $\text{Spec}(A/I_i) \rightarrow \text{Spec}(A) = W$ factors (set theoretically) through $Z_r \cap W$. It follows that $Z_r \cap W = V(I_i)$ is the zero set of a finite subset of elements of A . This means that $W \setminus Z_r$ is a finite union of standard opens, hence quasi-compact, as desired. \square

Lemma 36.31.11. *Let $f : X \rightarrow S$ be a flat, locally of finite presentation, separated, and locally quasi-finite morphism of schemes. Then there exist open subschemes*

$$S = U_0 \supset U_1 \supset U_2 \supset \dots$$

such that a morphism $\text{Spec}(k) \rightarrow S$ factors through U_d if and only if $X \times_S \text{Spec}(k)$ has degree $\geq d$ over k .

Proof. The statement simply means that the collection of points where the degree of the fibre is $\geq d$ is open. Thus we can work locally on S and assume S is affine. In this case, for every $W \subset X$ quasi-compact open, the set of points $U_d(W)$ where the fibres of $W \rightarrow S$ have degree $\geq d$ is open by Lemma 36.31.10. Since $U_d = \bigcup_W U_d(W)$ the result follows. \square

Lemma 36.31.12. *Let $f : X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, and locally quasi-finite. Let $g \in \Gamma(X, \mathcal{O}_X)$ nonzero. Then there exist an open $V \subset X$ such that $g|_V \neq 0$, an open $U \subset S$ fitting into a commutative diagram*

$$\begin{array}{ccc} V & \longrightarrow & X \\ \pi \downarrow & & \downarrow f \\ U & \longrightarrow & S, \end{array}$$

a quasi-coherent subsheaf $\mathcal{F} \subset \mathcal{O}_U$, an integer $r > 0$, and an injective \mathcal{O}_U -module map $\mathcal{F}^{\oplus r} \rightarrow \pi_ \mathcal{O}_V$ whose image contains $g|_V$.*

Proof. We may assume X and S affine. We obtain a filtration $\emptyset = Z_{-1} \subset Z_0 \subset Z_1 \subset Z_2 \subset \dots \subset Z_n = S$ as in Lemmas 36.31.9 and 36.31.10. Let $T \subset X$ be the scheme theoretic support of the finite \mathcal{O}_X -module $\text{Im}(g : \mathcal{O}_X \rightarrow \mathcal{O}_X)$. Note that T is the support of g as a section of \mathcal{O}_X (Modules, Definition 17.5.1) and for any open $V \subset X$ we have $g|_V \neq 0$ if and only if $V \cap T \neq \emptyset$. Let r be the smallest integer such that $f(T) \subset Z_r$ set theoretically. Let $\xi \in T$ be a generic point of an irreducible component of T such that $f(\xi) \notin Z_{r-1}$ (and hence $f(\xi) \in Z_r$). We may replace S by an affine neighbourhood of $f(\xi)$ contained in $S \setminus Z_{r-1}$. Write $S = \text{Spec}(A)$ and let $I = (a_1, \dots, a_m) \subset A$ be a finitely generated ideal such that $V(I) = Z_r$

(set theoretically, see Algebra, Lemma 10.28.1). Since the support of g is contained in $f^{-1}V(I)$ by our choice of r we see that there exists an integer N such that $a_j^N g = 0$ for $j = 1, \dots, m$. Replacing a_j by a_j^r we may assume that $Ig = 0$. For any A -module M write $M[I]$ for the I -torsion of M , i.e., $M[I] = \{m \in M \mid Im = 0\}$. Write $X = \text{Spec}(B)$, so $g \in B[I]$. Since $A \rightarrow B$ is flat we see that

$$B[I] = A[I] \otimes_A B \cong A[I] \otimes_{A/I} B/IB$$

By our choice of Z_r , the A/I -module B/IB is finite locally free of rank r . Hence after replacing S by a smaller affine open neighbourhood of $f(\xi)$ we may assume that $B/IB \cong (A/IA)^{\oplus r}$ as A/I -modules. Choose a map $\psi : A^{\oplus r} \rightarrow B$ which reduces modulo I to the isomorphism of the previous sentence. Then we see that the induced map

$$A[I]^{\oplus r} \rightarrow B[I]$$

is an isomorphism. The lemma follows by taking \mathcal{F} the quasi-coherent sheaf associated to the A -module $A[I]$ and the map $\mathcal{F}^{\oplus r} \rightarrow \pi_* \mathcal{O}_V$ the one corresponding to $A[I]^{\oplus r} \subset A^{\oplus r} \rightarrow B$. \square

Lemma 36.31.13. *Let $f : X \rightarrow Y$ be a separated, locally quasi-finite morphism with Y affine. Then every finite set of points of X is contained in an open affine of X .*

Proof. Let $x_1, \dots, x_n \in X$. Choose a quasi-compact open $U \subset X$ with $x_i \in U$. Then $U \rightarrow Y$ is quasi-affine by Lemma 36.31.2. Hence there exists an affine open $V \subset U$ containing x_1, \dots, x_n by Properties, Lemma 27.27.5. \square

Lemma 36.31.14. *Let $U \rightarrow X$ be a surjective étale morphism of schemes. Assume X is quasi-compact and quasi-separated. Then there exists a surjective integral morphism $Y \rightarrow X$, such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through U . In fact, we may assume $Y \rightarrow X$ is finite and of finite presentation.*

Proof. Since X is quasi-compact, there exist finitely many affine opens $U_i \subset U$ such that $U' = \coprod U_i \rightarrow X$ is surjective. After replacing U by U' , we see that we may assume U is affine. Then there exists an integer d bounding the degree of the geometric fibres of $U \rightarrow X$ (see Morphisms, Lemma 28.50.8). We will prove the lemma by induction on d for all quasi-compact and separated schemes U mapping surjective and étale onto X . If $d = 1$, then $U = X$ and the result holds with $Y = U$. Assume $d > 1$.

We apply Lemma 36.31.2 and we obtain a factorization

$$\begin{array}{ccc} U & \xrightarrow{j} & Y \\ & \searrow & \swarrow \pi \\ & X & \end{array}$$

with π integral and j a quasi-compact open immersion. We may and do assume that $j(U)$ is scheme theoretically dense in Y . Note that

$$U \times_X Y = U \amalg W$$

where the first summand is the image of $U \rightarrow U \times_X Y$ (which is closed by Schemes, Lemma 25.21.11 and open because it is étale as a morphism between schemes étale

over Y) and the second summand is the (open and closed) complement. The image $V \subset Y$ of W is an open subscheme containing $Y \setminus U$.

The étale morphism $W \rightarrow Y$ has geometric fibres of cardinality $< d$. Namely, this is clear for geometric points of $U \subset Y$ by inspection. Since $U \subset Y$ is dense, it holds for all geometric points of Y for example by Lemma 36.31.9 (the degree of the fibres of a quasi-compact étale morphism does not go up under specialization). Thus we may apply the induction hypothesis to $W \rightarrow V$ and find a surjective integral morphism $Z \rightarrow V$ with Z a scheme, which Zariski locally factors through W . Choose a factorization $Z \rightarrow Z' \rightarrow Y$ with $Z' \rightarrow Y$ integral and $Z \rightarrow Z'$ open immersion (Lemma 36.31.2). After replacing Z' by the scheme theoretic closure of Z in Z' we may assume that Z is scheme theoretically dense in Z' . After doing this we have $Z' \times_Y V = Z$. Finally, let $T \subset Y$ be the induced reduced closed subscheme structure on $Y \setminus V$. Consider the morphism

$$Z' \amalg T \rightarrow X$$

This is a surjective integral morphism by construction. Since $T \subset U$ it is clear that the morphism $T \rightarrow X$ factors through U . On the other hand, let $z \in Z'$ be a point. If $z \notin Z$, then z maps to a point of $Y \setminus V \subset U$ and we find a neighbourhood of z on which the morphism factors through U . If $z \in Z$, then we have a neighbourhood $V \subset Z$ which factors through $W \subset U \times_X Y$ and hence through U . This proves existence.

Assume we have found $Y \rightarrow X$ integral and surjective which Zariski locally factors through U . Choose a finite affine open covering $Y = \bigcup V_j$ such that $V_j \rightarrow X$ factors through U . We can write $Y = \lim Y_i$ with $Y_i \rightarrow X$ finite and of finite presentation, see Limits, Lemma 31.6.2. For large enough i we can find affine opens $V_{i,j} \subset Y_i$ whose inverse image in Y recovers V_j , see Limits, Lemma 31.3.8. For even larger i the morphisms $V_j \rightarrow U$ over X come from morphisms $V_{i,j} \rightarrow U$ over X , see Limits, Proposition 31.5.1. This finishes the proof. \square

36.32. Application to morphisms with connected fibres

In this section we prove some lemmas that produce morphisms all of whose fibres are geometrically connected or geometrically integral. This will be useful in our study of the local structure of morphisms of finite type later.

Lemma 36.32.1. *Consider a diagram of morphisms of schemes*

$$\begin{array}{ccc} Z & \xrightarrow{\sigma} & X \\ & \searrow & \downarrow \\ & & Y \end{array}$$

at a point $y \in Y$. Assume

- (1) $X \rightarrow Y$ is of finite presentation and flat,
- (2) $Z \rightarrow Y$ is finite locally free,
- (3) $Z_y \neq \emptyset$,
- (4) all fibres of $X \rightarrow Y$ are geometrically reduced, and
- (5) X_y is geometrically connected over $\kappa(y)$.

Then there exists an open $X^0 \subset X$ such that $X_y^0 = X_y$ and such that all nonempty fibres of $X^0 \rightarrow Y$ are geometrically connected.

Proof. In this proof we will use that flat, finite presentation, finite locally free are properties that are preserved under base change and composition. We will also use that a finite locally free morphism is both open and closed. You can find these facts as Morphisms, Lemmas 28.26.7, 28.22.4, 28.46.4, 28.26.5, 28.22.3, 28.46.3, 28.26.9, and 28.44.10.

Note that $X_Z \rightarrow Z$ is flat morphism of finite presentation which has a section s coming from σ . Let X_Z^0 denote the subset of X_Z defined in Situation 36.24.1. By Lemma 36.24.6 it is an open subset of X_Z .

The pullback $X_{Z \times_Y Z}$ of X to $Z \times_Y Z$ comes equipped with two sections s_0, s_1 , namely the base changes of s by $\text{pr}_0, \text{pr}_1 : Z \times_Y Z \rightarrow Z$. The construction of Situation 36.24.1 gives two subsets $(X_{Z \times_Y Z})_{s_0}^0$ and $(X_{Z \times_Y Z})_{s_1}^0$. By Lemma 36.24.2 these are the inverse images of X_Z^0 under the morphisms $1_X \times \text{pr}_0, 1_X \times \text{pr}_1 : X_{Z \times_Y Z} \rightarrow X_Z$. In particular these subsets are open.

Let $(Z \times_Y Z)_y = \{z_1, \dots, z_n\}$. As X_y is geometrically connected, we see that the fibres of $(X_{Z \times_Y Z})_{s_0}^0$ and $(X_{Z \times_Y Z})_{s_1}^0$ over each z_i agree (being equal to the whole fibre). Another way to say this is that

$$s_0(z_i) \in (X_{Z \times_Y Z})_{s_1}^0 \quad \text{and} \quad s_1(z_i) \in (X_{Z \times_Y Z})_{s_0}^0.$$

Since the sets $(X_{Z \times_Y Z})_{s_0}^0$ and $(X_{Z \times_Y Z})_{s_1}^0$ are open in $X_{Z \times_Y Z}$ there exists an open neighbourhood $W \subset Z \times_Y Z$ of $(Z \times_Y Z)_y$ such that

$$s_0(W) \subset (X_{Z \times_Y Z})_{s_1}^0 \quad \text{and} \quad s_1(W) \subset (X_{Z \times_Y Z})_{s_0}^0.$$

Then it follows directly from the construction in Situation 36.24.1 that

$$p^{-1}(W) \cap (X_{Z \times_Y Z})_{s_0}^0 = p^{-1}(W) \cap (X_{Z \times_Y Z})_{s_1}^0$$

where $p : X_{Z \times_Y Z} \rightarrow Z \times_W Z$ is the projection. Because $Z \times_Y Z \rightarrow Y$ is finite locally free, hence open and closed, there exists an open neighbourhood $V \subset Y$ of y such that $q^{-1}(V) \subset W$, where $q : Z \times_Y Z \rightarrow Y$ is the structure morphism. To prove the lemma we may replace Y by V . After we do this we see that $X_Z^0 \subset Y_Z$ is an open such that

$$(1_X \times \text{pr}_0)^{-1}(X_Z^0) = (1_X \times \text{pr}_1)^{-1}(X_Z^0).$$

This means that the image $X^0 \subset X$ of X_Z^0 is an open such that $(X_Z \rightarrow X)^{-1}(X^0) = X_Z^0$, see Descent, Lemma 34.9.2. At this point it is clear that X^0 is the desired open subscheme. \square

Lemma 36.32.2. *Let $h : Y \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_s$ be an open subscheme. Assume*

- (1) *h is flat and of finite presentation,*
- (2) *all fibres of h are geometrically reduced, and*
- (3) *T is geometrically connected over $\kappa(s)$.*

Then we can find an elementary étale neighbourhood $(S', s') \rightarrow (S, s)$ and an open $V \subset Y_{S'}$ such that

- (a) *all fibres of $V \rightarrow S'$ are geometrically connected,*
- (b) *$V_{s'} = T \times_s s'$.*

Proof. The problem is clearly local on S , hence we may replace S by an affine open neighbourhood of s . The topology on Y_s is induced from the topology on X , see Schemes, Lemma 25.18.5. Hence we can find a quasi-compact open $V \subset Y$ such that $V_s = T$. The restriction of h to V is quasi-compact (as S affine and V quasi-compact), quasi-separated, locally of finite presentation, and flat hence flat of finite presentation. Thus after replacing Y by V we may assume, in addition to (1) and (2) that $Y_s = T$ and S affine.

Pick a point $y \in Y_s$ such that h is Cohen-Macaulay at y , see Lemma 36.17.5. By Lemma 36.18.4 there exists a diagram

$$\begin{array}{ccc} Z & \longrightarrow & Y \\ & \searrow & \downarrow \\ & & S \end{array}$$

such that $Z \rightarrow S$ is flat, locally of finite presentation, locally quasi-finite with $Z_s = \{z\}$. Apply Lemma 36.30.1 to find an elementary neighbourhood $(S', s') \rightarrow (S, s)$ and an open $Z' \subset Z_{S'} = S' \times_S Z$ with $Z' \rightarrow S'$ finite with a unique point $z' \in Z'$ lying over s . Note that $Z' \rightarrow S'$ is also locally of finite presentation and flat (as an open of the base change of $Z \rightarrow S$), hence $Z' \rightarrow S'$ is finite locally free, see Morphisms, Lemma 28.46.2. Note that $Y_{S'} \rightarrow S'$ is flat and of finite presentation with geometrically reduced fibres as a base change of h . Also $Y_{s'} = Y_s$ is geometrically connected. Apply Lemma 36.32.1 to $Z' \rightarrow Y_{S'}$ over S' to get $V \subset Y_{S'}$ satisfying (2) whose fibres over S' are either empty or geometrically connected. As $V \rightarrow S'$ is open (Morphisms, Lemma 28.26.9), after shrinking S' we may assume $V \rightarrow S'$ is surjective, whence (1) holds. \square

Lemma 36.32.3. *Let $h : Y \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_s$ be an open subscheme. Assume*

- (1) *h is of finite presentation,*
- (2) *h is normal, and*
- (3) *T is geometrically irreducible over $\kappa(s)$.*

Then we can find an elementary étale neighbourhood $(S', s') \rightarrow (S, s)$ and an open $V \subset Y_{S'}$ such that

- (a) *all fibres of $V \rightarrow S'$ are geometrically integral,*
- (b) *$V_{s'} = T \times_s s'$.*

Proof. Apply Lemma 36.32.2 to find an elementary étale neighbourhood $(S', s') \rightarrow (S, s)$ and an open $V \subset Y_{S'}$ such that all fibres of $V \rightarrow S'$ are geometrically integral and $V_{s'} = T \times_s s'$. Note that $V \rightarrow S'$ is open, see Morphisms, Lemma 28.26.9. Hence after replacing S' by the image of $V \rightarrow S'$ we see that all fibres of $V \rightarrow S'$ are nonempty. As V is an open of the base change of h all fibres of $V \rightarrow S'$ are geometrically normal, see Lemma 36.15.2. In particular, they are geometrically reduced. To finish the proof we have to show they are geometrically irreducible. But, if $t \in S'$ then V_t is of finite type over $\kappa(t)$ and hence $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is of finite type over $\overline{\kappa(t)}$ hence Noetherian. By choice of $S' \rightarrow S$ the scheme $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is connected. Hence $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is irreducible by Properties, Lemma 27.7.6 and we win. \square

36.33. Application to the structure of finite type morphisms

The result in this section can be found in [GR71]. Loosely stated it says that a finite type morphism is étale locally on the source and target the composition of a finite morphism by a smooth morphism with geometrically connected fibres of relative dimension equal to the fibre dimension of the original morphism.

Lemma 36.33.1. *Let $f : X \rightarrow S$ be a morphism. Let $x \in X$ and set $s = f(x)$. Assume that f is locally of finite type and that $n = \dim_x(X_s)$. Then there exists a commutative diagram*

$$\begin{array}{ccc}
 X & \xleftarrow{g} & X' \\
 \downarrow & & \downarrow \pi \\
 & & Y \\
 \downarrow & & \downarrow h \\
 S & \xlongequal{\quad} & S
 \end{array}
 \qquad
 \begin{array}{ccc}
 x & \xleftarrow{\quad} & x' \\
 \downarrow & & \downarrow \\
 & & y \\
 \downarrow & & \downarrow \\
 s & \xlongequal{\quad} & s
 \end{array}$$

and a point $x' \in X'$ with $g(x') = x$ such that with $y = \pi(x')$ we have

- (1) $h : Y \rightarrow S$ is smooth of relative dimension n ,
- (2) $g : (X', x') \rightarrow (X, x)$ is an elementary étale neighbourhood,
- (3) π is finite, and $\pi^{-1}(\{y\}) = \{x'\}$, and
- (4) $\kappa(y)$ is a purely transcendental extension of $\kappa(s)$.

Moreover, if f is locally of finite presentation then π is of finite presentation.

Proof. The problem is local on X and S , hence we may assume that X and S are affine. By Algebra, Lemma 10.121.3 after replacing X by a standard open neighbourhood of x in X we may assume there is a factorization

$$X \xrightarrow{\pi} \mathbf{A}_S^n \longrightarrow S$$

such that π is quasi-finite and such that $\kappa(\pi(x))$ is purely transcendental over $\kappa(s)$. By Lemma 36.30.1 there exists an elementary étale neighbourhood

$$(Y, y) \rightarrow (\mathbf{A}_S^n, \pi(x))$$

and an open $X' \subset X \times_{\mathbf{A}_S^n} Y$ which contains a unique point x' lying over y such that $X' \rightarrow Y$ is finite. This proves (1) – (4) hold. For the final assertion, use Morphisms, Lemma 28.22.11. \square

Lemma 36.33.2. *Let $f : X \rightarrow S$ be a morphism. Let $x \in X$ and set $s = f(x)$. Assume that f is locally of finite type and that $n = \dim_x(X_s)$. Then there exists a commutative diagram*

$$\begin{array}{ccc}
 X & \xleftarrow{g} & X' \\
 \downarrow & & \downarrow \pi \\
 & & Y' \\
 \downarrow & & \downarrow h \\
 S & \xleftarrow{e} & S'
 \end{array}
 \qquad
 \begin{array}{ccc}
 x & \xleftarrow{\quad} & x' \\
 \downarrow & & \downarrow \\
 & & y' \\
 \downarrow & & \downarrow \\
 s & \xleftarrow{\quad} & s'
 \end{array}$$

and a point $x' \in X'$ with $g(x') = x$ such that with $y' = \pi(x')$, $s' = h(y')$ we have

- (1) $h : Y' \rightarrow S'$ is smooth of relative dimension n ,

- (2) all fibres of $Y' \rightarrow S'$ are geometrically integral,
- (3) $g : (X', x') \rightarrow (X, x)$ is an elementary étale neighbourhood,
- (4) π is finite, and $\pi^{-1}(\{y'\}) = \{x'\}$,
- (5) $\kappa(y')$ is a purely transcendental extension of $\kappa(s')$, and
- (6) $e : (S', s') \rightarrow (S, s)$ is an elementary étale neighbourhood.

Moreover, if f is locally of finite presentation, then π is of finite presentation.

Proof. The question is local on S , hence we may replace S by an affine open neighbourhood of s . Next, we apply Lemma 36.33.1 to get a commutative diagram

$$\begin{array}{ccc}
 X & \xleftarrow{g} & X' \\
 \downarrow & & \downarrow \pi \\
 & & Y \\
 & & \downarrow h \\
 S & \xlongequal{\quad} & S
 \end{array}
 \qquad
 \begin{array}{ccc}
 x & \xleftarrow{\quad} & x' \\
 \downarrow & & \downarrow \\
 & & y \\
 & & \downarrow \\
 s & \xlongequal{\quad} & s
 \end{array}$$

where h is smooth of relative dimension n and $\kappa(y)$ is a purely transcendental extension of $\kappa(s)$. Since the question is local on X also, we may replace Y by an affine neighbourhood of y (and X' by the inverse image of this under π). As S is affine this guarantees that $Y \rightarrow S$ is quasi-compact, separated and smooth, in particular of finite presentation. Let T be the connected component of Y_s containing y . As Y_s is Noetherian we see that T is open. We also see that T is geometrically connected over $\kappa(s)$ by Varieties, Lemma 32.5.14. Since T is also smooth over $\kappa(s)$ it is geometrically normal, see Varieties, Lemma 32.15.4. We conclude that T is geometrically irreducible over $\kappa(s)$ (as a connected Noetherian normal scheme is irreducible, see Properties, Lemma 27.7.6). Finally, note that the smooth morphism h is normal by Lemma 36.15.3. At this point we have verified all assumption of Lemma 36.32.3 hold for the morphism $h : Y \rightarrow S$ and open $T \subset Y_s$. As a result of applying Lemma 36.32.3 we obtain $e : S' \rightarrow S, s' \in S', Y'$ as in the commutative diagram

$$\begin{array}{ccccccc}
 X & \xleftarrow{g} & X' & \xleftarrow{\quad} & X' \times_Y Y' \\
 \downarrow & & \downarrow \pi & & \downarrow \\
 & & Y & \xleftarrow{\quad} & Y' \\
 & & \downarrow h & & \downarrow \\
 S & \xlongequal{\quad} & S & \xleftarrow{e} & S'
 \end{array}
 \qquad
 \begin{array}{ccccccc}
 x & \xleftarrow{\quad} & x' & \xleftarrow{\quad} & (x', s') \\
 \downarrow & & \downarrow & & \downarrow \\
 & & y & \xleftarrow{\quad} & (y, s') \\
 & & \downarrow & & \downarrow \\
 s & \xlongequal{\quad} & s & \xleftarrow{\quad} & s'
 \end{array}$$

where $e : (S', s') \rightarrow (S, s)$ is an elementary étale neighbourhood, and where $Y' \subset Y_{S'}$ is an open neighbourhood all of whose fibres over S' are geometrically irreducible, such that $Y'_s = T$ via the identification $Y_s = Y_{S', s'}$. Let $(y, s') \in Y'$ be the point corresponding to $y \in T$; this is also the unique point of $Y \times_S S'$ lying over y with residue field equal to $\kappa(y)$ which maps to s' in S' . Similarly, let $(x', s') \in X' \times_Y Y' \subset X' \times_S S'$ be the unique point over x' with residue field equal to $\kappa(x')$ lying over s' . Then the outer part of this diagram is a solution to the problem posed in the lemma. Some minor details omitted. \square

Lemma 36.33.3. *Assumption and notation as in Lemma 36.33.2. In addition to properties (1) – (6) we may also arrange it so that*

(7) S', Y', X' are affine.

Proof. Note that if Y' is affine, then X' is affine as π is finite. Choose an affine open neighbourhood $U' \subset S'$ of s' . Choose an affine open neighbourhood $V' \subset h^{-1}(U')$ of y' . Let $W' = h(V')$. This is an open neighbourhood of s' in S' , see Morphisms, Lemma 28.35.10, contained in U' . Choose an affine open neighbourhood $U'' \subset W'$ of s' . Then $h^{-1}(U'') \cap V'$ is affine because it is equal to $U'' \times_{U'} V'$. By construction $h^{-1}(U'') \cap V' \rightarrow U''$ is a surjective smooth morphism whose fibres are (nonempty) open subschemes of geometrically integral fibres of $Y' \rightarrow S'$, and hence geometrically integral. Thus we may replace S' by U'' and Y' by $h^{-1}(U'') \cap V'$. \square

The significance of the property $\pi^{-1}(\{y'\}) = \{x'\}$ is partially explained by the following lemma.

Lemma 36.33.4. *Let $\pi : X \rightarrow Y$ be a finite morphism. Let $x \in X$ with $y = \pi(x)$ such that $\pi^{-1}(\{y\}) = \{x\}$. Then*

- (1) *For every neighbourhood $U \subset X$ of x in X , there exists a neighbourhood $V \subset Y$ of y such that $\pi^{-1}(V) \subset U$.*
- (2) *The ring map $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ is finite.*
- (3) *If π is of finite presentation, then $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ is of finite presentation.*
- (4) *For any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have $\mathcal{F}_x = \pi_* \mathcal{F}_y$ as $\mathcal{O}_{Y,y}$ -modules.*

Proof. The first assertion is purely topological; use that π is a continuous and closed map such that $\pi^{-1}(\{y\}) = \{x\}$. To prove the second and third parts we may assume $X = \text{Spec}(B)$ and $Y = \text{Spec}(A)$. Then $A \rightarrow B$ is a finite ring map and y corresponds to a prime \mathfrak{p} of A such that there exists a unique prime \mathfrak{q} of B lying over \mathfrak{p} . Then $B_{\mathfrak{q}} = B_{\mathfrak{p}}$, see Algebra, Lemma 10.40.11. In other words, the map $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is equal to the map $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{p}}$ you get from localizing $A \rightarrow B$ at \mathfrak{p} . Thus (2) and (3) follow from simple properties of localization (some details omitted). For the final statement, suppose that $\mathcal{F} = \widetilde{M}$ for some B -module M . Then $\mathcal{F} = M_{\mathfrak{q}}$ and $\pi_* \mathcal{F}_y = M_{\mathfrak{p}}$. By the above these localizations agree. Alternatively you can use part (1) and the definition of stalks to see that $\mathcal{F}_x = \pi_* \mathcal{F}_y$ directly. \square

36.34. Application to the fppf topology

We can use the above étale localization techniques to prove the following result describing the fppf topology as being equal to the topology “generated by” Zariski coverings and by coverings of the form $\{f : T \rightarrow S\}$ where f is surjective finite locally free.

Lemma 36.34.1. *Let S be a scheme. Let $\{S_i \rightarrow S\}_{i \in I}$ be an fppf covering. Then there exist*

- (1) *a Zariski open covering $S = \bigcup U_j$,*
- (2) *surjective finite locally free morphisms $W_j \rightarrow U_j$,*
- (3) *Zariski open coverings $W_j = \bigcup_k W_{j,k}$,*
- (4) *surjective finite locally free morphisms $T_{j,k} \rightarrow W_{j,k}$*

such that the fppf covering $\{T_{j,k} \rightarrow S\}$ refines the given covering $\{S_i \rightarrow S\}$.

Proof. We may assume that each $S_i \rightarrow S$ is locally quasi-finite, see Lemma 36.18.6.

Fix a point $s \in S$. Pick an $i \in I$ and a point $s_i \in S_i$ mapping to s . Choose an elementary étale neighbourhood $(S', s) \rightarrow (S, s)$ such that there exists an open

$$S_i \times_S S' \supset V$$

which contains a unique point $v \in V$ mapping to $s \in S'$ and such that $V \rightarrow S'$ is finite, see Lemma 36.30.1. Then $V \rightarrow S'$ is finite locally free, because it is finite and because $S_i \times_S S' \rightarrow S'$ is flat and locally of finite presentation as a base change of the morphism $S_i \rightarrow S$, see Morphisms, Lemmas 28.22.4, 28.26.7, and 28.46.2. Hence $V \rightarrow S'$ is open, and after shrinking S' we may assume that $V \rightarrow S'$ is surjective finite locally free. Since we can do this for every point of S we conclude that $\{S_i \rightarrow S\}$ can be refined by a covering of the form $\{V_a \rightarrow S\}_{a \in A}$ where each $V_a \rightarrow S$ factors as $V_a \rightarrow S'_a \rightarrow S$ with $S'_a \rightarrow S$ étale and $V_a \rightarrow S'_a$ surjective finite locally free.

By Remark 36.29.3 there exists a Zariski open covering $S = \bigcup U_j$, for each j a finite locally free, surjective morphism $W_j \rightarrow U_j$, and for each j a Zariski open covering $\{W_{j,k} \rightarrow W_j\}$ such that the family $\{W_{j,k} \rightarrow S\}$ refines the étale covering $\{S'_a \rightarrow S\}$, i.e., for each pair j, k there exists an $a(j, k)$ and a factorization $W_{j,k} \rightarrow S'_{a(j,k)} \rightarrow S$ of the morphism $W_{j,k} \rightarrow S$. Set $T_{j,k} = W_{j,k} \times_{S'_{a(j,k)}} V_a$ and everything is clear. \square

36.35. Closed points in fibres

Some of the material in this section is taken from the preprint [OP10].

Lemma 36.35.1. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $Z \subset X$ be a closed subscheme. Let $s \in S$. Assume*

- (1) S is irreducible with generic point η ,
- (2) X is irreducible,
- (3) f is dominant,
- (4) f is locally of finite type,
- (5) $\dim(X_s) \leq \dim(X_\eta)$,
- (6) Z is locally principal in X , and
- (7) $Z_\eta = \emptyset$.

Then the fibre Z_s is (set theoretically) a union of irreducible components of X_s .

Proof. Let X_{red} denote the reduction of X . Then $Z \cap X_{red}$ is a locally principal closed subscheme of X_{red} , see Divisors, Lemma 30.9.10. Hence we may assume that X is reduced. In other words X is integral, see Properties, Lemma 27.3.4. In this case the morphism $X \rightarrow S$ factors through S_{red} , see Schemes, Lemma 25.12.6. Thus we may replace S by S_{red} and assume that S is integral too.

The assertion that f is dominant signifies that the generic point of X is mapped to η , see Morphisms, Lemma 28.8.5. Moreover, the scheme X_η is an integral scheme which is locally of finite type over the field $\kappa(\eta)$. Hence $d = \dim(X_\eta) \geq 0$ is equal to $\dim_\xi(X_\eta)$ for every point ξ of X_η , see Algebra, Lemmas 10.110.4 and 10.110.5. In view of Morphisms, Lemma 28.29.4 and condition (5) we conclude that $\dim_x(X_s) = d$ for every $x \in X_s$.

In the Noetherian case the assertion can be proved as follows. If the lemma does not hold there exists $x \in Z_s$ which is a generic point of an irreducible component of Z_s but not a generic point of any irreducible component of X_s . Then we see

that $\dim_x(Z_s) \leq d - 1$, because $\dim_x(X_s) = d$ and in a neighbourhood of x in X_s the closed subscheme Z_s does not contain any of the irreducible components of X_s . Hence after replacing X by an open neighbourhood of x we may assume that $\dim_z(Z_{f(z)}) \leq d - 1$ for all $z \in Z$, see Morphisms, Lemma 28.29.4. Let $\xi' \in Z$ be a generic point of an irreducible component of Z and set $s' = f(\xi')$. As $Z \neq X$ is locally principal we see that $\dim(\mathcal{O}_{X,\xi}) = 1$, see Algebra, Lemma 10.59.10 (this is where we use X is Noetherian). Let $\xi \in X$ be the generic point of X and let ξ_1 be a generic point of any irreducible component of $X_{s'}$ which contains ξ' . Then we see that we have the specializations

$$\xi \rightsquigarrow \xi_1 \rightsquigarrow \xi'.$$

As $\dim(\mathcal{O}_{X,\xi}) = 1$ one of the two specializations has to be an equality. By assumption $s' \neq \eta$, hence the first specialization is not an equality. Hence $\xi' = \xi_1$ is a generic point of an irreducible component of $X_{s'}$. Applying Morphisms, Lemma 28.29.4 one more time this implies $\dim_{\xi'}(Z_{s'}) = \dim_{\xi'}(X_{s'}) \geq \dim(X_\eta) = d$ which gives the desired contradiction.

In the general case we reduce to the Noetherian case as follows. If the lemma is false then there exists a point $x \in X$ lying over s such that x is a generic point of an irreducible component of Z_s , but not a generic point of any of the irreducible components of X_s . Let $U \subset S$ be an affine neighbourhood of s and let $V \subset X$ be an affine neighbourhood of x with $f(V) \subset U$. Write $U = \text{Spec}(A)$ and $V = \text{Spec}(B)$ so that $f|_V$ is given by a ring map $A \rightarrow B$. Let $\mathfrak{q} \subset B$, resp. $\mathfrak{p} \subset A$ be the prime corresponding to x , resp. s . After possibly shrinking V we may assume $Z \cap V$ is cut out by some element $g \in B$. Denote $K = f.f.(A)$. What we know at this point is the following:

- (1) $A \subset B$ is a finitely generated extension of domains,
- (2) the element $g \otimes 1$ is invertible in $B \otimes_A K$,
- (3) $d = \dim(B \otimes_A K) = \dim(B \otimes_A \kappa(\mathfrak{p}))$,
- (4) $g \otimes 1$ is not a unit of $B \otimes_A \kappa(\mathfrak{p})$, and
- (5) $g \otimes 1$ is not in any of the minimal primes of $B \otimes_A \kappa(\mathfrak{p})$.

We are seeking a contradiction.

Pick elements $x_1, \dots, x_n \in B$ which generate B over A . For a finitely generated \mathbf{Z} -algebra $A_0 \subset A$ let $B_0 \subset B$ be the A_0 -subalgebra generated by x_1, \dots, x_n , denote $K_0 = f.f.(A_0)$, and set $\mathfrak{p}_0 = A_0 \cap \mathfrak{p}$. We claim that when A_0 is large enough then (1) – (5) also hold for the system $(A_0 \subset B_0, g, \mathfrak{p}_0)$.

We prove each of the conditions in turn. Part (1) holds by construction. For part (2) write $(g \otimes 1)h = 1$ for some $h \otimes 1/a \in B \otimes_A K$. Write $g = \sum a_I x^I$, $h = \sum a'_I x^I$ (multi-index notation) for some coefficients $a_I, a'_I \in A$. As soon as A_0 contains a and the a_I, a'_I then (2) holds because $B_0 \otimes_{A_0} K_0 \subset B \otimes_A K$ (as localizations of the injective map $B_0 \rightarrow B$). To achieve (3) consider the exact sequence

$$0 \rightarrow I \rightarrow A[X_1, \dots, X_n] \rightarrow B \rightarrow 0$$

which defines I where the second map sends X_i to x_i . Since \otimes is right exact we see that $I \otimes_A K$, respectively $I \otimes_A \kappa(\mathfrak{p})$ is the kernel of the surjection $K[X_1, \dots, X_n] \rightarrow B \otimes_A K$, respectively $\kappa(\mathfrak{p})[X_1, \dots, X_n] \rightarrow B \otimes_A \kappa(\mathfrak{p})$. As a polynomial ring over a field is Noetherian there exist finitely many elements $h_j \in I$, $j = 1, \dots, m$ which

generate $I \otimes_A K$ and $I \otimes_A \kappa(\mathfrak{p})$. Write $h_j = \sum a_{j,I} X^I$. As soon as A_0 contains all $a_{j,I}$ we get to the situation where

$$B_0 \otimes_{A_0} K_0 \otimes_{K_0} K = B \otimes_A K \quad \text{and} \quad B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0) \otimes_{\kappa(\mathfrak{p}_0)} \kappa(\mathfrak{p}) = B \otimes_A \kappa(\mathfrak{p}).$$

By either Morphisms, Lemma 28.29.3 or Algebra, Lemma 10.112.5 we see that the dimension equalities of (3) are satisfied. Part (4) is immediate. As $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0) \subset B \otimes_A \kappa(\mathfrak{p})$ each minimal prime of $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)$ lies under a minimal prime of $B \otimes_A \kappa(\mathfrak{p})$ by Algebra, Lemma 10.29.6. This implies that (5) holds. In this way we reduce the problem to the Noetherian case which we have dealt with above. \square

Here is an algebraic application of the lemma above. The fourth assumption of the lemma holds if $A \rightarrow B$ is flat, see Lemma 36.35.3.

Lemma 36.35.2. *Let $A \rightarrow B$ be a local homomorphism of local rings, and $g \in \mathfrak{m}_B$. Assume*

- (1) *A and B are domains and $A \subset B$,*
- (2) *B is essentially of finite type over A ,*
- (3) *g is not contained in any minimal prime over $\mathfrak{m}_A B$, and*
- (4) *$\dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B)) = \text{trdeg}_A(B)$.*

Then $A \subset B/gB$, i.e., the generic point of $\text{Spec}(A)$ is in the image of the morphism $\text{Spec}(B/gB) \rightarrow \text{Spec}(A)$.

Proof. Note that the two assertions are equivalent by Algebra, Lemma 10.29.6. To start the proof let C be an A -algebra of finite type and \mathfrak{q} a prime of C such that $B = C_{\mathfrak{q}}$. Of course we may assume that C is a domain and that $g \in C$. After replacing C by a localization we see that $\dim(C/\mathfrak{m}_A C) = \dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B))$, see Morphisms, Lemma 28.29.1. Setting $K = f.f.(A)$ we see by the same reference that $\dim(C \otimes_A K) = \text{trdeg}_A(B)$. Hence assumption (4) means that the generic and closed fibres of the morphism $\text{Spec}(C) \rightarrow \text{Spec}(A)$ have the same dimension.

Suppose that the lemma is false. Then $(B/gB) \otimes_A K = 0$. This means that $g \otimes 1$ is invertible in $B \otimes_A K = C_{\mathfrak{q}} \otimes_A K$. As $C_{\mathfrak{q}}$ is a limit of principal localizations we conclude that $g \otimes 1$ is invertible in $C_h \otimes_A K$ for some $h \in C$, $h \notin \mathfrak{q}$. Thus after replacing C by C_h we may assume that $(C/gC) \otimes_A K = 0$. We do one more replacement of C to make sure that the minimal primes of $C/\mathfrak{m}_A C$ correspond one-to-one with the minimal primes of $B/\mathfrak{m}_A B$. At this point we apply Lemma 36.35.1 to $X = \text{Spec}(C) \rightarrow \text{Spec}(A) = S$ and the locally closed subscheme $Z = \text{Spec}(C/gC)$. Since $Z_K = \emptyset$ we see that $Z \otimes \kappa(\mathfrak{m}_A)$ has to contain an irreducible component of $X \otimes \kappa(\mathfrak{m}_A) = \text{Spec}(C/\mathfrak{m}_A C)$. But this contradicts the assumption that g is not contained in any prime minimal over $\mathfrak{m}_A B$. The lemma follows. \square

Lemma 36.35.3. *Let $A \rightarrow B$ be a local homomorphism of local rings. Assume*

- (1) *A and B are domains and $A \subset B$,*
- (2) *B is essentially of finite type over A , and*
- (3) *B is flat over A .*

Then we have

$$\dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B)) = \text{trdeg}_A(B).$$

Proof. Let C be an A -algebra of finite type and \mathfrak{q} a prime of C such that $B = C_{\mathfrak{q}}$. We may assume C is a domain. We have $\dim_{\mathfrak{q}}(C/\mathfrak{m}_A C) = \dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B))$, see Morphisms, Lemma 28.29.1. Setting $K = f.f.(A)$ we see

by the same reference that $\dim(C \otimes_A K) = \text{trdeg}_A(B)$. Thus we are really trying to prove that $\dim_{\mathfrak{q}}(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$. Choose a valuation ring A' in K dominating A , see Algebra, Lemma 10.48.2. Set $C' = C \otimes_A A'$. Choose a prime \mathfrak{q}' of C' lying over \mathfrak{q} ; such a prime exists because

$$C'/\mathfrak{m}_{A'} C' = C/\mathfrak{m}_A C \otimes_{\kappa(\mathfrak{m}_A)} \kappa(\mathfrak{m}_{A'})$$

which proves that $C/\mathfrak{m}_A C \rightarrow C'/\mathfrak{m}_{A'} C'$ is faithfully flat. This also proves that $\dim_{\mathfrak{q}}(C/\mathfrak{m}_A C) = \dim_{\mathfrak{q}'}(C'/\mathfrak{m}_{A'} C')$, see Algebra, Lemma 10.112.6. Note that $B' = C'_{\mathfrak{q}'}$ is a localization of $B \otimes_A A'$. Hence B' is flat over A' . The generic fibre $B' \otimes_{A'} K$ is a localization of $B \otimes_A K$. Hence B' is a domain. If we prove the lemma for $A' \subset B'$, then we get the equality $\dim_{\mathfrak{q}'}(C'/\mathfrak{m}_{A'} C') = \dim(C' \otimes_{A'} K)$ which implies the desired equality $\dim_{\mathfrak{q}}(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$ by what was said above. This reduces the lemma to the case where A is a valuation ring.

Let $A \subset B$ be as in the lemma with A a valuation ring. As before write $B = C_{\mathfrak{q}}$ for some domain C of finite type over A . By Algebra, Lemma 10.121.9 we obtain $\dim(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$ and we win. \square

Lemma 36.35.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \rightsquigarrow x'$ be a specialization of points in X . Set $s = f(x)$ and $s' = f(x')$. Assume*

- (1) x' is a closed point of $X_{s'}$, and
- (2) f is locally of finite type.

Then the set

$$\{x_1 \in X \text{ such that } f(x_1) = s \text{ and } x_1 \text{ is closed in } X_s \text{ and } x \rightsquigarrow x_1 \rightsquigarrow x'\}$$

is dense in the closure of x in X_s .

Proof. We apply Schemes, Lemma 25.20.4 to the specialization $x \rightsquigarrow x'$. This produces a morphism $\varphi : \text{Spec}(B) \rightarrow X$ where B is a valuation ring such that φ maps the generic point to x and the closed point to x' . We may also assume that $\kappa(x) = f.\#(B)$. Let $A = B \cap \kappa(s)$. Note that this is a valuation ring (see Algebra, Lemma 10.48.6) which dominates the image of $\mathcal{O}_{S,s'} \rightarrow \kappa(s)$. Consider the commutative diagram

$$\begin{array}{ccccc} \text{Spec}(B) & \longrightarrow & X_A & \longrightarrow & X \\ & \searrow & \downarrow & & \downarrow \\ & & \text{Spec}(A) & \longrightarrow & S \end{array}$$

The generic (resp. closed) point of B maps to a point x_A (resp. x'_A) of X_A lying over the generic (resp. closed) point of $\text{Spec}(A)$. Note that x'_A is a closed point of the special fibre of X_A by Morphisms, Lemma 28.21.4. Note that the generic fibre of $X_A \rightarrow \text{Spec}(A)$ is isomorphic to X_s . Thus we have reduced the lemma to the case where S is the spectrum of a valuation ring, $s = \eta \in S$ is the generic point, and $s' \in S$ is the closed point.

We will prove the lemma by induction on $\dim_x(X_\eta)$. If $\dim_x(X_\eta) = 0$, then there are no other points of X_η specializing to x and x is closed in its fibre, see Morphisms, Lemma 28.21.6, and the result holds. Assume $\dim_x(X_\eta) > 0$.

Let $X' \subset X$ be the reduced induced scheme structure on the irreducible closed subscheme $\overline{\{x\}}$ of X , see Schemes, Definition 25.12.5. To prove the lemma we may

replace X by X' as this only decreases $\dim_x(X_\eta)$. Hence we may also assume that X is an integral scheme and that x is its generic point. In addition, we may replace X by an affine neighbourhood of x' . Thus we have $X = \text{Spec}(B)$ where $A \subset B$ is a finite type extension of domains. Note that in this case $\dim_x(X_\eta) = \dim(X_\eta) = \dim(X_{s'})$, and that in fact $X_{s'}$ is equidimensional, see Algebra, Lemma 10.121.9.

Let $W \subset X_\eta$ be a proper closed subset (this is the subset we want to “avoid”). As X_s is of finite type over a field we see that W has finitely many irreducible components $W = W_1 \cup \dots \cup W_n$. Let $\mathfrak{q}_j \subset B$, $j = 1, \dots, r$ be the corresponding prime ideals. Let $\mathfrak{q} \subset B$ be the maximal ideal corresponding to the point x' . Let $\mathfrak{p}_1, \dots, \mathfrak{p}_s \subset B$ be the minimal primes lying over $\mathfrak{m}_A B$. There are finitely many as these correspond to the irreducible components of the Noetherian scheme $X_{s'}$. Moreover, each of these irreducible components has dimension > 0 (see above) hence we see that $\mathfrak{p}_i \neq \mathfrak{q}$ for all i . Now, pick an element $g \in \mathfrak{q}$ such that $g \notin \mathfrak{q}_j$ for all j and $g \notin \mathfrak{p}_i$ for all i , see Algebra, Lemma 10.14.2. Denote $Z \subset X$ the locally principal closed subscheme defined by h . Let $Z_\eta = Z_{1,\eta} \cup \dots \cup Z_{n,\eta}$, $n \geq 0$ be the decomposition of the generic fibre of Z into irreducible components (finitely many as the generic fibre is Noetherian). Denote $Z_i \subset X$ the closure of $Z_{i,\eta}$. After replacing X by a smaller affine neighbourhood we may assume that $x \in Z_i$ for each $i = 1, \dots, n$. By construction $Z \cap X_{s'}$ does not contain any irreducible component of $X_{s'}$. Hence by Lemma 36.35.1 we conclude that $Z_\eta \neq \emptyset$! In other words $n \geq 1$. Letting $x_1 \in Z_1$ be the generic point we see that $x_1 \rightsquigarrow x'$ and $f(x_1) = \eta$. Also, by construction $Z_{1,\eta} \cap W_j \subset W_j$ is a proper closed subset. Hence every irreducible component of $Z_{1,\eta} \cap W_j$ has codimension ≥ 2 in X_η whereas $\text{codim}(Z_{1,\eta}, X_\eta) = 1$ by Algebra, Lemma 10.59.10. Thus $W \cap Z_{1,\eta}$ is a proper closed subset. At this point we see that the induction hypothesis applies to $Z_1 \rightarrow S$ and the specialization $x_1 \rightsquigarrow x'$. This produces a closed point x_2 of $Z_{1,\eta}$ not contained in W which specializes to x' . Thus we obtain $x \rightsquigarrow x_2 \rightsquigarrow x'$, the point x_2 is closed in X_η , and $x_2 \notin W$ as desired. \square

Remark 36.35.5. The proof of Lemma 36.35.4 actually shows that there exists a sequence of specializations

$$x \rightsquigarrow x_1 \rightsquigarrow x_2 \rightsquigarrow \dots \rightsquigarrow x_d \rightsquigarrow x'$$

where all x_i are in the fibre X_s , each specialization is immediate, and x_d is a closed point of X_s . The integer $d = \text{trdeg}_{\kappa(s)}(\kappa(x)) = \dim(\overline{\{x\}})$ where the closure is taken in X_s . Moreover, the points x_i can be chosen to avoid any closed subset of X_s which does not contain the point x .

Examples, Section 82.31 shows that the following lemma is false if A is not assumed Noetherian.

Lemma 36.35.6. *Let $\varphi : A \rightarrow B$ be a local ring map of local rings. Let $V \subset \text{Spec}(B)$ be an open subscheme which contains at least one prime not lying over \mathfrak{m}_A . Assume A is Noetherian, φ essentially of finite type, and $A/\mathfrak{m}_A \subset B/\mathfrak{m}_B$ is finite. Then there exists a $\mathfrak{q} \in V$, $\mathfrak{m}_A \neq \mathfrak{q} \cap A$ such that $A \rightarrow B/\mathfrak{q}$ is the localization of a quasi-finite ring map.*

Proof. Since A is Noetherian and $A \rightarrow B$ is essentially of finite type, we know that B is Noetherian too. By Properties, Lemma 27.6.4 the topological space

$\text{Spec}(B) \setminus \{\mathfrak{m}_B\}$ is Jacobson. Hence we can choose a closed point \mathfrak{q} which is contained in the nonempty open

$$V \setminus \{\mathfrak{q} \subset B \mid \mathfrak{m}_A = \mathfrak{q} \cap A\}.$$

(Nonempty by assumption, open because $\{\mathfrak{m}_A\}$ is a closed subset of $\text{Spec}(A)$.) Then $\text{Spec}(B/\mathfrak{q})$ has two points, namely \mathfrak{m}_B and \mathfrak{q} and \mathfrak{q} does not lie over \mathfrak{m}_A . Write $B/\mathfrak{q} = C_{\mathfrak{m}}$ for some finite type A -algebra C and prime ideal \mathfrak{m} . Then $A \rightarrow C$ is quasi-finite at \mathfrak{m} by Algebra, Lemma 10.118.2 (2). Hence by Algebra, Lemma 10.119.14 we see that after replacing C by a principal localization the ring map $A \rightarrow C$ is quasi-finite. \square

Lemma 36.35.7. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $x \in X$ with image $s \in S$. Let $U \subset X$ be an open subscheme. Assume f locally of finite type, S locally Noetherian, x a closed point of X_s , and assume there exists a point $x' \in U$ with $x' \rightsquigarrow x$ and $f(x') \neq s$. Then there exists a closed subscheme $Z \subset X$ such that (a) $x \in Z$, (b) $f|_Z : Z \rightarrow S$ is quasi-finite at x , and (c) there exists a $z \in Z$, $z \in U$, $z \rightsquigarrow x$ and $f(z) \neq s$.*

Proof. This is a reformulation of Lemma 36.35.6. Namely, set $A = \mathcal{O}_{S,s}$ and $B = \mathcal{O}_{X,x}$. Denote $V \subset \text{Spec}(B)$ the inverse image of U . The ring map $f^\# : A \rightarrow B$ is essentially of finite type. By assumption there exists at least one point of V which does not map to the closed point of $\text{Spec}(A)$. Hence all the assumptions of Lemma 36.35.6 hold and we obtain a prime $\mathfrak{q} \subset B$ which does not lie over \mathfrak{m}_A and such that $A \rightarrow B/\mathfrak{q}$ is the localization of a quasi-finite ring map. Let $z \in X$ be the image of the point \mathfrak{q} under the canonical morphism $\text{Spec}(B) \rightarrow X$. Set $Z = \overline{\{z\}}$ with the induced reduced scheme structure. As $z \rightsquigarrow x$ we see that $x \in Z$ and $\mathcal{O}_{Z,x} = B/\mathfrak{q}$. By construction $Z \rightarrow S$ is quasi-finite at x . \square

Remark 36.35.8. We can use Lemma 36.35.6 or its variant Lemma 36.35.7 to give an alternative proof of Lemma 36.35.4 in case S is locally Noetherian. Here is a rough sketch. Namely, first replace S by the spectrum of the local ring at s' . Then we may use induction on $\dim(S)$. The case $\dim(S) = 0$ is trivial because then $s' = s$. Replace X by the reduced induced scheme structure on $\overline{\{x\}}$. Apply Lemma 36.35.7 to $X \rightarrow S$ and $x' \mapsto s'$ and any nonempty open $U \subset X$ containing x . This gives us a closed subscheme $x' \in Z \subset X$ a point $z \in Z$ such that $Z \rightarrow S$ is quasi-finite at x' and such that $f(z) \neq s'$. Then z is a closed point of $X_{f(z)}$, and $z \rightsquigarrow x'$. As $f(z) \neq s'$ we see $\dim(\mathcal{O}_{S,f(z)}) < \dim(S)$. Since x is the generic point of X we see $x \rightsquigarrow z$, hence $s = f(x) \rightsquigarrow f(z)$. Apply the induction hypothesis to $s \rightsquigarrow f(z)$ and $z \mapsto f(z)$ to win.

Lemma 36.35.9. *Suppose that $f : X \rightarrow S$ is locally of finite type, S locally Noetherian, $x \in X$ a closed point of its fibre X_s , and $U \subset X$ an open subscheme such that $U \cap X_s = \emptyset$ and $x \in \overline{U}$, then the conclusions of Lemma 36.35.7 hold.*

Proof. Namely, we can reduce this to the cited lemma as follows: First we replace X and S by affine neighbourhoods of x and s . Then X is Noetherian, in particular U is quasi-compact (see Morphisms, Lemma 28.16.6 and Topology, Lemmas 5.8.2 and 5.11.13). Hence there exists a specialization $x' \rightsquigarrow x$ with $x' \in U$ (see Morphisms, Lemma 28.6.5). Note that $f(x') \neq s$. Thus we see all hypotheses of the lemma are satisfied and we win. \square

36.36. Stein factorization

Stein factorization is the statement that a proper morphism $f : X \rightarrow S$ with $f_*\mathcal{O}_X = \mathcal{O}_S$ has connected fibres.

Lemma 36.36.1. *Let S be a scheme. Let $f : X \rightarrow S$ be a universally closed and quasi-separated morphism. There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{f'} & S' \\ & \searrow f & \swarrow \pi \\ & & S \end{array}$$

with the following properties:

- (1) the morphism f' is universally closed, quasi-compact, quasi-separated and surjective,
- (2) the morphism $\pi : S' \rightarrow S$ is integral,
- (3) we have $f'_*\mathcal{O}_X = \mathcal{O}_{S'}$,
- (4) we have $S' = \text{Spec}_S(f_*\mathcal{O}_X)$, and
- (5) S' is the normalization of S in X , see Morphisms, Definition 28.48.3.

Proof. By Morphisms, Lemma 28.42.10 the morphism f is quasi-compact. Hence the normalization S' of S in X is defined (Morphisms, Definition 28.48.3) we obtain the factorization and (5) and (2) hold by construction. By Morphisms, Lemma 28.48.9 we see that (4) holds. The morphism f' is universally closed by Morphisms, Lemma 28.42.7. It is quasi-compact by Schemes, Lemma 25.21.15 and quasi-separated by Schemes, Lemma 25.21.14.

To show the remaining statements we may assume the base scheme S is affine, say $S = \text{Spec}(R)$. Then $S' = \text{Spec}(A)$ with $A = \Gamma(X, \mathcal{O}_X)$ an integral R -algebra. Thus it is clear that $f'_*\mathcal{O}_X$ is $\mathcal{O}_{S'}$ (because $f'_*\mathcal{O}_X$ is quasi-coherent, by Schemes, Lemma 25.24.1, and hence equal to \tilde{A}). This proves (3).

Let us show that f' is surjective. As f' is universally closed (see above) the image of f' is a closed subset $V(I) \subset S' = \text{Spec}(A)$. Pick $h \in I$. Then $h|_X = f^\sharp(h)$ is a global section of the structure sheaf of X which vanishes at every point. As X is quasi-compact this means that $h|_X$ is a nilpotent section, i.e., $h^n|_X = 0$ for some $n > 0$. But $A = \Gamma(X, \mathcal{O}_X)$, hence $h^n = 0$. In other words I is contained in the radical ideal of A and we conclude that $V(I) = S'$ as desired. \square

Lemma 36.36.2. *Let $f : X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Then X_s is geometrically connected, if and only if for every étale neighbourhood $(U, u) \rightarrow (S, s)$ the base change $X_U \rightarrow U$ has connected fibre X_u .*

Proof. If X_s is geometrically connected, then any base change of it is connected. On the other hand, suppose that X_s is not geometrically connected. Then by Varieties, Lemma 32.5.11 we see that $X_s \times_{\text{Spec}(\kappa(s))} \text{Spec}(k)$ is disconnected for some finite separable field extension $\kappa(s) \subset k$. By Lemma 36.27.2 there exists an affine étale neighbourhood $(U, u) \rightarrow (S, s)$ such that $\kappa(s) \subset \kappa(u)$ is identified with $\kappa(s) \subset k$. In this case X_u is disconnected. \square

Theorem 36.36.3 (Stein factorization; Noetherian case). *Let S be a locally Noetherian scheme. Let $f : X \rightarrow S$ be a proper morphism. There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{\quad f' \quad} & S' \\ & \searrow f & \swarrow \pi \\ & & S \end{array}$$

with the following properties:

- (1) the morphism f' is proper with geometrically connected fibres,
- (2) the morphism $\pi : S' \rightarrow S$ is finite,
- (3) we have $f'_* \mathcal{O}_X = \mathcal{O}_{S'}$,
- (4) we have $S' = \text{Spec}_S(f_* \mathcal{O}_X)$, and
- (5) S' is the normalization of S in X , see Morphisms, Definition 28.48.3.

Proof. Let $f = \pi \circ f'$ be the factorization of Lemma 36.36.1. Note that besides the conclusions of Lemma 36.36.1 we also have that f' is separated (Schemes, Lemma 25.21.14) and finite type (Morphisms, Lemma 28.16.8). Hence f' is proper. By Cohomology of Schemes, Proposition 29.17.2 we see that $f_* \mathcal{O}_X$ is a coherent \mathcal{O}_S -module. Hence we see that π is finite, i.e., (2) holds.

This proves all but the most interesting assertion, namely that all the fibres of f' are geometrically connected. It is clear from the discussion above that we may replace S by S' , and we may therefore assume that S is Noetherian, affine, $f : X \rightarrow S$ is proper, and $f_* \mathcal{O}_X = \mathcal{O}_S$. Let $s \in S$ be a point of S . We have to show that X_s is geometrically connected. By Lemma 36.36.2 we see that it suffices to show X_u is connected for every étale neighbourhood $(U, u) \rightarrow (S, s)$. We may assume U is affine. Thus U is Noetherian (Morphisms, Lemma 28.16.6), the base change $f_U : X_U \rightarrow U$ is proper (Morphisms, Lemma 28.42.5), and that also $(f_U)_* \mathcal{O}_{X_U} = \mathcal{O}_U$ (Cohomology of Schemes, Lemma 29.5.2). Hence after replacing $(f : X \rightarrow S, s)$ by the base change $(f_U : X_U \rightarrow U, u)$ it suffices to prove that the fibre X_s is connected.

At this point we apply the theorem on formal functions, more precisely Cohomology of Schemes, Lemma 29.18.7. It tells us that

$$\mathcal{O}_{S,s}^\wedge = \lim_n H^0(X_n, \mathcal{O}_{X_n})$$

where X_n is the n th infinitesimal neighbourhood of X_s . Since the underlying topological space of X_n is equal to that of X_s we see that if $X_s = T_1 \amalg T_2$ is a disjoint union of nonempty open and closed subschemes, then similarly $X_n = T_{1,n} \amalg T_{2,n}$ for all n . And this in turn means $H^0(X_n, \mathcal{O}_{X_n})$ contains a nontrivial idempotent $e_{1,n}$, namely the function which is identically 1 on $T_{1,n}$ and identically 0 on $T_{2,n}$. It is clear that $e_{1,n+1}$ restricts to $e_{1,n}$ on X_n . Hence $e_1 = \lim e_{1,n}$ is a nontrivial idempotent of the limit. This contradicts the fact that $\mathcal{O}_{S,s}^\wedge$ is a local ring. Thus the assumption was wrong, i.e., X_s is connected, and we win. \square

Theorem 36.36.4 (Stein factorization; general case). *Let S be a scheme. Let $f : X \rightarrow S$ be a proper morphism. There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{\quad f' \quad} & S' \\ & \searrow f & \swarrow \pi \\ & & S \end{array}$$

with the following properties:

- (1) the morphism f' is proper with geometrically connected fibres,
- (2) the morphism $\pi : S' \rightarrow S$ is integral,
- (3) we have $f'_*\mathcal{O}_X = \mathcal{O}_{S'}$,
- (4) we have $S' = \text{Spec}_S(f_*\mathcal{O}_X)$, and
- (5) S' is the normalization of S in X , see Morphisms, Definition 28.48.3.

Proof. We may apply Lemma 36.36.1 to get the morphism $f' : X \rightarrow S'$. Note that besides the conclusions of Lemma 36.36.1 we also have that f' is separated (Schemes, Lemma 25.21.14) and finite type (Morphisms, Lemma 28.16.8). Hence f' is proper. At this point we have proved all of the statements except for the statement that f' has geometrically connected fibres.

We may assume that $S = \text{Spec}(R)$ is affine. Set $R' = \Gamma(X, \mathcal{O}_X)$. Then $S' = \text{Spec}(R')$. Thus we may replace S by S' and assume that $S = \text{Spec}(R)$ is affine $R = \Gamma(X, \mathcal{O}_X)$. Next, let $s \in S$ be a point. Let $U \rightarrow S$ be an étale morphism of affine schemes and let $u \in U$ be a point mapping to s . Let $X_U \rightarrow U$ be the base change of X . By Lemma 36.36.2 it suffices to show that the fibre of $X_U \rightarrow U$ over u is connected. By Cohomology of Schemes, Lemma 29.5.2 we see that $\Gamma(X_U, \mathcal{O}_{X_U}) = \Gamma(U, \mathcal{O}_U)$. Hence we have to show: Given $S = \text{Spec}(R)$ affine, $X \rightarrow S$ proper with $\Gamma(X, \mathcal{O}_X) = R$ and $s \in S$ is a point, the fibre X_s is connected.

By Limits, Lemma 31.12.6 we can write $(X \rightarrow S) = \lim(X_i \rightarrow S_i)$ with $X_i \rightarrow S_i$ proper and of finite presentation and S_i Noetherian. For i large enough S_i is affine (Limits, Lemma 31.3.10). Say $S_i = \text{Spec}(R_i)$. Let $R'_i = \Gamma(X_i, \mathcal{O}_{X_i})$. Observe that we have ring maps $R_i \rightarrow R'_i \rightarrow R$. Namely, we have the first because X_i is a scheme over R_i and the second because we have $X \rightarrow X_i$ and $R = \Gamma(X, \mathcal{O}_X)$. Note that $R = \text{colim } R'_i$ by Limits, Lemma 31.3.3. Then

$$\begin{array}{ccc} X & \longrightarrow & X_i \\ \downarrow & & \downarrow \\ S & \longrightarrow & S'_i \longrightarrow S_i \end{array}$$

is commutative with $S'_i = \text{Spec}(R'_i)$. Let $s'_i \in S'_i$ be the image of s . We have $X_s = \lim X_{i,s'_i}$ because $X = \lim X_i$, $S = \lim S'_i$, and $\kappa(s) = \text{colim } \kappa(s'_i)$. Now let $X_s = U \amalg V$ with U and V open and closed. Then U, V are the inverse images of opens U_i, V_i in X_{i,s'_i} (Limits, Lemma 31.3.8). By Theorem 36.36.3 the fibres of $X_i \rightarrow S'_i$ are connected, hence either U or V is empty. This finishes the proof. \square

36.37. Descending separated locally quasi-finite morphisms

In this section we show that “separated locally quasi-finite morphisms satisfy descent for fppf-coverings”. See Descent, Definition 34.32.1 for terminology. This is in the marvellous (for many reasons) paper by Raynaud and Gruson hidden in the proof of [GR71, Lemma 5.7.1]. It can also be found in [Mur95], and [ABD⁺66, Exposé X, Lemma 5.4] under the additional hypothesis that the morphism is locally of finite presentation. Here is the formal statement.

Lemma 36.37.1. *Let S be a scheme. Let $\{X_i \rightarrow S\}_{i \in I}$ be an fppf covering, see Topologies, Definition 33.7.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to*

$\{X_i \rightarrow S\}$. If each morphism $V_i \rightarrow X_i$ is separated and locally quasi-finite, then the descent datum is effective.

Proof. Being separated and being locally quasi-finite are properties of morphisms of schemes which are preserved under any base change, see Schemes, Lemma 25.21.13 and Morphisms, Lemma 28.21.13. Hence Descent, Lemma 34.32.2 applies and it suffices to prove the statement of the lemma in case the fppf-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of finite presentation of affines. Say $X = \text{Spec}(A)$ and $S = \text{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $\pi : V \rightarrow X$ is separated and locally quasi-finite.

Let $W^1 \subset V$ be any affine open. Consider $W = \text{pr}_1(\varphi(W^1 \times_S X)) \subset V$. Here is a picture

Ok, and now since $X \rightarrow S$ is flat and of finite presentation it is universally open (Morphisms, Lemma 28.26.9). Hence we conclude that W is open. Moreover, it is also clearly the case that W is quasi-compact, and $W^1 \subset W$. Moreover, we note that $\varphi(W \times_S X) = X \times_S W$ by the cocycle condition for φ . Hence we obtain a new descent datum (W, φ') by restricting φ to $W \times_S X$. Note that the morphism $W \rightarrow X$ is quasi-compact, separated and locally quasi-finite. This implies that it is separated and quasi-finite by definition. Hence it is quasi-affine by Lemma 36.31.2. Thus by Descent, Lemma 34.34.1 we see that the descent datum (W, φ') is effective.

In other words, we find that there exists an open covering $V = \bigcup W_i$ by quasi-compact opens W_i which are stable for the descent morphism φ . Moreover, for each such quasi-compact open $W \subset V$ the corresponding descent data (W, φ') is effective. It is an exercise to show this means the original descent datum is effective by gluing the schemes obtained from descending the opens W_i (details omitted). \square

36.38. Relative finite presentation

Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module. In More on Algebra, Section 15.58 we defined what it means for M to be finitely presented relative to R . We also proved this notion has good localization properties and glues. Hence we can define the corresponding global notion as follows.

Definition 36.38.1. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. We say \mathcal{F} is *finitely presented relative to S* or *of finite presentation relative to S* if there exists an affine open

covering $S = \bigcup V_i$ and for every i an affine open covering $f^{-1}(V_i) = \bigcup_j U_{ij}$ such that $\mathcal{F}(U_{ij})$ is a $\mathcal{O}_X(U_{ij})$ -module of finite presentation relative to $\mathcal{O}_S(V_i)$.

Note that this implies that \mathcal{F} is a finite type \mathcal{O}_X -module. If $X \rightarrow S$ is just locally of finite type, then \mathcal{F} may be of finite presentation relative to S , without $X \rightarrow S$ being locally of finite presentation. We will see that $X \rightarrow S$ is locally of finite presentation if and only if \mathcal{O}_X is of finite presentation relative to S .

Lemma 36.38.2. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The following are equivalent*

- (1) \mathcal{F} is of finite presentation relative to S ,
- (2) for every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the $\mathcal{O}_X(U)$ -module $\mathcal{F}(U)$ is finitely presented relative to $\mathcal{O}_S(V)$.

Moreover, if this is true, then for every open subschemes $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the restriction $\mathcal{F}|_U$ is of finite presentation relative to V .

Proof. The final statement is clear from the equivalence of (1) and (2). It is also clear that (2) implies (1). Assume (1) holds. Let $S = \bigcup V_i$ and $f^{-1}(V_i) = \bigcup U_{ij}$ be affine open coverings as in Definition 36.38.1. Let $U \subset X$ and $V \subset S$ be as in (2). By More on Algebra, Lemma 15.58.8 it suffices to find a standard affine open covering $U = \bigcup U_k$ of U such that $\mathcal{F}(U_k)$ is finitely presented relative to $\mathcal{O}_S(V)$. In other words, for every $u \in U$ it suffices to find a standard affine open $u \in U' \subset U$ such that $\mathcal{F}(U')$ is finitely presented relative to $\mathcal{O}_S(V)$. Pick i such that $f(u) \in V_i$ and then pick j such that $u \in U_{ij}$. By Schemes, Lemma 25.11.5 we can find $v \in V' \subset V \cap V_i$ which is standard affine open in V' and V_i . Then $f^{-1}V' \cap U$, resp. $f^{-1}V' \cap U_{ij}$ are standard affine opens of U , resp. U_{ij} . Applying the lemma again we can find $u \in U' \subset f^{-1}V' \cap U \cap U_{ij}$ which is standard affine open in both $f^{-1}V' \cap U$ and $f^{-1}V' \cap U_{ij}$. Thus U' is also a standard affine open of U and U_{ij} . By More on Algebra, Lemma 15.58.4 the assumption that $\mathcal{F}(U_{ij})$ is finitely presented relative to $\mathcal{O}_S(V_i)$ implies that $\mathcal{F}(U')$ is finitely presented relative to $\mathcal{O}_S(V_i)$. Since $\mathcal{O}_X(U') = \mathcal{O}_X(U') \otimes_{\mathcal{O}_S(V_i)} \mathcal{O}_S(V')$ we see from More on Algebra, Lemma 15.58.5 that $\mathcal{F}(U')$ is finitely presented relative to $\mathcal{O}_S(V')$. Applying More on Algebra, Lemma 15.58.4 again we conclude that $\mathcal{F}(U')$ is finitely presented relative to $\mathcal{O}_S(V)$. This finishes the proof. \square

Lemma 36.38.3. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module.*

- (1) *If f is locally of finite presentation, then \mathcal{F} is of finite presentation relative to S if and only if \mathcal{F} is of finite presentation.*
- (2) *The morphism f is locally of finite presentation if and only if \mathcal{O}_X is of finite presentation relative to S .*

Proof. Follows immediately from the definitions, see discussion following More on Algebra, Definition 15.58.2. \square

Lemma 36.38.4. *Let $\pi : X \rightarrow Y$ be a finite morphism of schemes locally of finite type over a base scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then \mathcal{F} is of finite presentation relative to S if and only if $\pi_*\mathcal{F}$ is of finite presentation relative to S .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.3 into the language of schemes. \square

Lemma 36.38.5. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $S' \rightarrow S$ be a morphism of schemes, set $X' = X \times_S S'$ and denote \mathcal{F}' the pullback of \mathcal{F} to X' . If \mathcal{F} is of finite presentation relative to S , then \mathcal{F}' is of finite presentation relative to S' .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.5 into the language of schemes. \square

Lemma 36.38.6. *Let $X \rightarrow Y \rightarrow S$ be morphisms of schemes which are locally of finite type. Let \mathcal{G} be a quasi-coherent \mathcal{O}_Y -module. If $f : X \rightarrow Y$ is locally of finite presentation and \mathcal{G} of finite presentation relative to S , then $f^*\mathcal{G}$ is of finite presentation relative to S .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.6 into the language of schemes. \square

Lemma 36.38.7. *Let $X \rightarrow Y \rightarrow S$ be morphisms of schemes which are locally of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If $Y \rightarrow S$ is locally of finite presentation and \mathcal{F} is of finite presentation relative to Y , then \mathcal{F} is of finite presentation relative to S .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.7 into the language of schemes. \square

Lemma 36.38.8. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$ be a short exact sequence of quasi-coherent \mathcal{O}_X -modules.*

- (1) *If $\mathcal{F}', \mathcal{F}''$ are finitely presented relative to S , then so is \mathcal{F} .*
- (2) *If \mathcal{F}' is a finite type \mathcal{O}_X -module and \mathcal{F} is finitely presented relative to S , then \mathcal{F}'' is finitely presented relative to S .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.9 into the language of schemes. \square

Lemma 36.38.9. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}, \mathcal{F}'$ be quasi-coherent \mathcal{O}_X -modules. If $\mathcal{F} \oplus \mathcal{F}'$ is finitely presented relative to S , then so are \mathcal{F} and \mathcal{F}' .*

Proof. Translation of the result of More on Algebra, Lemma 15.58.10 into the language of schemes. \square

36.39. Relative pseudo-coherence

This section is the analogue of More on Algebra, Section 15.59 for schemes. We strongly urge the reader to take a look at that section first.

Lemma 36.39.1. *Let $X \rightarrow S$ be a finite type morphism of affine schemes. Let E be an object of $D(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$. The following are equivalent*

- (1) *for some closed immersion $i : X \rightarrow \mathbf{A}_S^n$ the object Ri_*E of $D(\mathcal{O}_{\mathbf{A}_S^n})$ is m -pseudo-coherent, and*
- (2) *for all closed immersions $i : X \rightarrow \mathbf{A}_S^n$ the object Ri_*E of $D(\mathcal{O}_{\mathbf{A}_S^n})$ is m -pseudo-coherent.*

Proof. Say $S = \text{Spec}(R)$ and $X = \text{Spec}(A)$. Let i correspond to the surjection $\alpha : R[x_1, \dots, x_n] \rightarrow A$ and let $X \rightarrow \mathbf{A}_S^m$ correspond to $\beta : R[y_1, \dots, y_m] \rightarrow A$. Choose $f_j \in R[x_1, \dots, x_n]$ with $\alpha(f_j) = \beta(y_j)$ and $g_i \in R[y_1, \dots, y_m]$ with $\beta(g_i) = \alpha(x_i)$. Then we get a commutative diagram

$$\begin{array}{ccc} R[x_1, \dots, x_n, y_1, \dots, y_m] & \xrightarrow{y_j \mapsto f_j} & R[x_1, \dots, x_n] \\ \downarrow x_i \mapsto g_i & & \downarrow \\ R[y_1, \dots, y_m] & \xrightarrow{\quad\quad\quad} & A \end{array}$$

corresponding to the commutative diagram of closed immersions

$$\begin{array}{ccc} \mathbf{A}_S^{n+m} & \longleftarrow & \mathbf{A}_S^n \\ \uparrow & & \uparrow \\ \mathbf{A}_S^m & \longleftarrow & X \end{array}$$

Thus it suffices to show that under a closed immersion

$$f : \mathbf{A}_S^m \rightarrow \mathbf{A}_S^{n+m}$$

an object E of $D(\mathcal{O}_{\mathbf{A}_S^m})$ is m -pseudo-coherent if and only if Rf_*E is m -pseudo-coherent. This follows from Derived Categories of Schemes, Lemma 35.10.5 and the fact that $f_*\mathcal{O}_{\mathbf{A}_S^m}$ is pseudo-coherent on \mathbf{A}_S^{n+m} . This is straightforward to prove directly, but it also follows from Derived Categories of Schemes, Lemma 35.9.3 and More on Algebra, Lemma 15.59.3. \square

Recall that if $f : X \rightarrow S$ is a morphism of scheme which is locally of finite type, then for every pair of affine opens $U \subset X$ and $V \subset S$ such that $f(U) \subset V$, the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is of finite type (Morphisms, Lemma 28.16.2). Hence there always exist closed immersions $U \rightarrow \mathbf{A}_V^n$ and the following definition makes sense.

Definition 36.39.2. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let E be an object of $D(\mathcal{O}_X)$. Let \mathcal{F} be an \mathcal{O}_X -module. Fix $m \in \mathbf{Z}$.

- (1) We say E is *m-pseudo-coherent relative to S* if there exists an affine open covering $S = \bigcup V_i$ and for each i an affine open covering $f^{-1}(V_i) = \bigcup U_{ij}$ such that the equivalent conditions of Lemma 36.39.1 are satisfied for each of the pairs $(U_{ij} \rightarrow V_i, E|_{U_{ij}})$.
- (2) We say E is *pseudo-coherent relative to S* if E is m -pseudo-coherent relative to S for all $m \in \mathbf{Z}$.
- (3) We say \mathcal{F} is *m-pseudo-coherent relative to S* if \mathcal{F} viewed as an object of $D(\mathcal{O}_X)$ is m -pseudo-coherent relative to S .
- (4) We say \mathcal{F} is *pseudo-coherent relative to S* if \mathcal{F} viewed as an object of $D(\mathcal{O}_X)$ is pseudo-coherent relative to S .

If X is quasi-compact and E is m -pseudo-coherent relative to S for some m , then E is bounded above. We first prove the condition of relative pseudo-coherence localizes well.

Lemma 36.39.3. *Let S be an affine scheme. Let $V \subset S$ be a standard open. Let $X \rightarrow V$ be a finite type morphism of affine schemes. Let $U \subset X$ be an affine open. Let E be an object of $D(\mathcal{O}_X)$. If the equivalent conditions of Lemma 36.39.1 are*

satisfied for the pair $(X \rightarrow V, E)$, then the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(U \rightarrow S, E|_U)$.

Proof. Write $S = \text{Spec}(R)$, $V = D(f)$, $X = \text{Spec}(A)$, and $U = D(g)$. Assume the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(X \rightarrow V, E)$.

Choose $R_f[x_1, \dots, x_n] \rightarrow A$ surjective. Write $R_f = R[x_0]/(fx_0 - 1)$. Then $R[x_0, x_1, \dots, x_n] \rightarrow A$ is surjective, and $R_f[x_1, \dots, x_n]$ is pseudo-coherent as an $R[x_0, \dots, x_n]$ -module. Thus we have

$$X \rightarrow \mathbf{A}_V^n \rightarrow \mathbf{A}_S^{n+1}$$

and we can apply Derived Categories of Schemes, Lemma 35.10.5 to conclude that the pushforward E' of E to \mathbf{A}_S^{n+1} is m -pseudo-coherent.

Choose an element $g' \in R[x_0, x_1, \dots, x_n]$ which maps to $g \in A$. Consider the surjection $R[x_0, \dots, x_{n+1}] \rightarrow R[x_0, \dots, x_n, 1/g']$. We obtain

$$\begin{array}{ccc} X & \longleftarrow & U \\ \downarrow & & \searrow \\ \mathbf{A}_S^{n+1} & \longleftarrow D(g') \longrightarrow & \mathbf{A}_S^{n+2} \end{array}$$

where the lower left arrow is an open immersion and the lower right arrow is a closed immersion. We conclude as before that the pushforward of $E'|_{D(g')}$ to \mathbf{A}_S^{n+2} is m -pseudo-coherent. Since this is also the pushforward of $E|_U$ to \mathbf{A}_S^{n+2} we conclude the lemma is true. \square

Lemma 36.39.4. *Let $X \rightarrow S$ be a finite type morphism of affine schemes. Let E be an object of $D(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$. Let $X = \bigcup U_i$ be a standard affine open covering. The following are equivalent*

- (1) *the equivalent conditions of Lemma 36.39.1 hold for the pairs $(U_i \rightarrow S, E|_{U_i})$,*
- (2) *the equivalent conditions of Lemma 36.39.1 hold for the pair $(X \rightarrow S, E)$.*

Proof. The implication (2) \Rightarrow (1) is Lemma 36.39.3. Assume (1). Say $S = \text{Spec}(R)$ and $X = \text{Spec}(A)$ and $U_i = D(f_i)$. Write $1 = \sum f_i g_i$ in A . Consider the surjections

$$R[x_i, y_i, z_i] \rightarrow R[x_i, y_i, z_i]/(\sum y_i z_i - 1) \rightarrow A.$$

which sends y_i to f_i and z_i to g_i . Note that $R[x_i, y_i, z_i]/(\sum y_i z_i - 1)$ is pseudo-coherent as an $R[x_i, y_i, z_i]$ -module. Thus it suffices to prove that the pushforward of E to $T = \text{Spec}(R[x_i, y_i, z_i]/(\sum y_i z_i - 1))$ is m -pseudo-coherent, see Derived Categories of Schemes, Lemma 35.10.5. For each i_0 it suffices to prove the restriction of this pushforward to $W_{i_0} = \text{Spec}(R[x_i, y_i, z_i, 1/y_{i_0}]/(\sum y_i z_i - 1))$ is m -pseudo-coherent. Note that there is a commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & U_{i_0} \\ \downarrow & & \downarrow \\ T & \longleftarrow & W_{i_0} \end{array}$$

which implies that the pushforward of E to T restricted to W_{i_0} is the pushforward of $E|_{U_{i_0}}$ to W_{i_0} . Since $R[x_i, y_i, z_i, 1/y_{i_0}]/(\sum y_i z_i - 1)$ is isomorphic to a polynomial ring over R this proves what we want. \square

Lemma 36.39.5. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let E be an object of $D(\mathcal{O}_X)$. Fix $m \in \mathbf{Z}$. The following are equivalent*

- (1) E is m -pseudo-coherent relative to S ,
- (2) for every affine opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(U \rightarrow V, E|_U)$.

Moreover, if this is true, then for every open subschemes $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the restriction $E|_U$ is m -pseudo-coherent relative to V .

Proof. The final statement is clear from the equivalence of (1) and (2). It is also clear that (2) implies (1). Assume (1) holds. Let $S = \bigcup V_i$ and $f^{-1}(V_i) = \bigcup U_{ij}$ be affine open coverings as in Definition 36.39.2. Let $U \subset X$ and $V \subset S$ be as in (2). By Lemma 36.39.4 it suffices to find a standard open covering $U = \bigcup U_k$ of U such that the equivalent conditions of Lemma 36.39.1 are satisfied for the pairs $(U_k \rightarrow V, E|_{U_k})$. In other words, for every $u \in U$ it suffices to find a standard affine open $u \in U' \subset U$ such that the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(U' \rightarrow V, E|_{U'})$. Pick i such that $f(u) \in V_i$ and then pick j such that $u \in U_{ij}$. By Schemes, Lemma 25.11.5 we can find $v \in V' \subset V \cap V_i$ which is standard affine open in V' and V_i . Then $f^{-1}V' \cap U$, resp. $f^{-1}V' \cap U_{ij}$ are standard affine opens of U , resp. U_{ij} . Applying the lemma again we can find $u \in U' \subset f^{-1}V' \cap U \cap U_{ij}$ which is standard affine open in both $f^{-1}V' \cap U$ and $f^{-1}V' \cap U_{ij}$. Thus U' is also a standard affine open of U and U_{ij} . By Lemma 36.39.3 the assumption that the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(U_{ij} \rightarrow V_i, E|_{U_{ij}})$ implies that the equivalent conditions of Lemma 36.39.1 are satisfied for the pair $(U' \rightarrow V, E|_{U'})$. \square

For objects of the derived category whose cohomology sheaves are quasi-coherent, we can relate relative m -pseudo-coherence to the notion defined in More on Algebra, Definition 15.59.4. We will use the fact that for an affine scheme $U = \text{Spec}(A)$ the functor $R\Gamma(U, -)$ induces an equivalence between $D_{Q\text{Coh}}(\mathcal{O}_U)$ and $D(A)$, see Derived Categories of Schemes, Lemma 35.3.4. This functor is compatible with pullbacks: if E is an object of $D_{Q\text{Coh}}(\mathcal{O}_U)$ and $A \rightarrow B$ is a ring map corresponding to a morphism of affine schemes $g : V = \text{Spec}(B) \rightarrow \text{Spec}(A) = U$, then $R\Gamma(V, Lg^*E) = R\Gamma(U, E) \otimes_A^L B$. See Derived Categories of Schemes, Lemma 35.3.6.

Lemma 36.39.6. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let E be an object of $D_{Q\text{Coh}}(\mathcal{O}_X)$. Fix $m \in \mathbf{Z}$. The following are equivalent*

- (1) E is m -pseudo-coherent relative to S ,
- (2) there exists an affine open covering $S = \bigcup V_i$ and for each i an affine open covering $f^{-1}(V_i) = \bigcup U_{ij}$ such that the complex of $\mathcal{O}_X(U_{ij})$ -modules $R\Gamma(U_{ij}, E)$ is m -pseudo-coherent relative to $\mathcal{O}_S(V_i)$, and
- (3) for every affine opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the complex of $\mathcal{O}_X(U)$ -modules $R\Gamma(U, E)$ is m -pseudo-coherent relative to $\mathcal{O}_S(V)$.

Proof. Let U and V be as in (2) and choose a closed immersion $i : U \rightarrow \mathbf{A}_V^n$. A formal argument, using Lemma 36.39.5, shows it suffices to prove that $Ri_*(E|_U)$ is m -pseudo-coherent if and only if $R\Gamma(U, E)$ is m -pseudo-coherent relative to $\mathcal{O}_S(V)$. Say $U = \text{Spec}(A)$, $V = \text{Spec}(R)$, and $\mathbf{A}_V^n = \text{Spec}(R[x_1, \dots, x_n])$. By the remarks preceding the lemma, $E|_U$ is quasi-isomorphic to the complex of quasi-coherent sheaves on U associated to the object $R\Gamma(U, E)$ of $D(A)$. Note that

$R\Gamma(U, E) = R\Gamma(\mathbf{A}_V^n, Ri_*(E|_U))$ as i is a closed immersion (and hence i_* is exact). Thus Ri_*E is associated to $R\Gamma(U, E)$ viewed as an object of $D(R[x_1, \dots, x_n])$. We conclude as m -pseudo-coherence of $Ri_*(E|_U)$ is equivalent to m -pseudo-coherence of $R\Gamma(E, U)$ in $D(R[x_1, \dots, x_n])$ by Derived Categories of Schemes, Lemma 35.9.3 which is equivalent to $R\Gamma(U, E)$ is m -pseudo-coherent relative to $R = \mathcal{O}_S(V)$ by definition. \square

Lemma 36.39.7. *Let $i : X \rightarrow Y$ morphism of schemes locally of finite type over a base scheme S . Assume that i induces a homeomorphism of X with a closed subset of Y . Let E be an object of $D(\mathcal{O}_X)$. Then E is m -pseudo-coherent relative to S if and only if Ri_*E is m -pseudo-coherent relative to S .*

Proof. By Morphisms, Lemma 28.45.2 the morphism i is affine. Thus we may assume S, Y , and X are affine. Say $S = \text{Spec}(R)$, $Y = \text{Spec}(A)$, and $X = \text{Spec}(B)$. The condition means that $A/\text{rad}(A) \rightarrow B/\text{rad}(B)$ is surjective. As B is of finite type over A , we can find $b_1, \dots, b_m \in \text{rad}(B)$ which generate B as an A -algebra. Say $b_j^N = 0$ for all j . Consider the diagram of rings

$$\begin{array}{ccccc} B & \longleftarrow & R[x_i, y_j]/(y_j^N) & \longleftarrow & R[x_i, y_j] \\ \uparrow & & \uparrow & \nearrow & \\ A & \longleftarrow & R[x_i] & & \end{array}$$

which translates into a diagram

$$\begin{array}{ccccc} X & \longrightarrow & T & \longrightarrow & \mathbf{A}_S^{n+m} \\ \downarrow & & \downarrow & \nearrow & \\ Y & \longrightarrow & \mathbf{A}_S^n & & \end{array}$$

of affine schemes. By Lemma 36.39.5 we see that E is m -pseudo-coherent relative to S if and only if its pushforward to \mathbf{A}_S^{n+m} is m -pseudo-coherent. By Derived Categories of Schemes, Lemma 35.10.5 we see that this is true if and only if its pushforward to T is m -pseudo-coherent. The same lemma shows that this holds if and only if the pushforward to \mathbf{A}_S^n is m -pseudo-coherent. Again by Lemma 36.39.5 this holds if and only if Ri_*E is m -pseudo-coherent relative to S . \square

Lemma 36.39.8. *Let $\pi : X \rightarrow Y$ be a finite morphism of schemes locally of finite type over a base scheme S . Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Then E is m -pseudo-coherent relative to S if and only if $R\pi_*E$ is m -pseudo-coherent relative to S .*

Proof. Translation of the result of More on Algebra, Lemma 15.59.5 into the language of schemes. Observe that $R\pi_*$ indeed maps $D_{QCoh}(\mathcal{O}_X)$ into $D_{QCoh}(\mathcal{O}_Y)$ by Derived Categories of Schemes, Lemma 35.4.1. To do the translation use Lemma 36.39.5. \square

Lemma 36.39.9. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let (E, E', E'') be a distinguished triangle of $D(\mathcal{O}_X)$. Let $m \in \mathbf{Z}$.*

- (1) *If E is $(m+1)$ -pseudo-coherent relative to S and E' is m -pseudo-coherent relative to S then E'' is m -pseudo-coherent relative to S .*

- (2) If E, E'' are m -pseudo-coherent relative to S , then E' is m -pseudo-coherent relative to S .
- (3) If E' is $(m+1)$ -pseudo-coherent relative to S and E'' is m -pseudo-coherent relative to S , then E is $(m+1)$ -pseudo-coherent relative to S .

Moreover, if two out of three of E, E', E'' are pseudo-coherent relative to S , the so is the third.

Proof. Immediate from Lemma 36.39.5 and Cohomology, Lemma 20.36.4. \square

Lemma 36.39.10. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let \mathcal{F} be an \mathcal{O}_X -module. Then*

- (1) \mathcal{F} is m -pseudo-coherent relative to S for all $m > 0$,
- (2) \mathcal{F} is 0-pseudo-coherent relative to S if and only if \mathcal{F} is a finite type \mathcal{O}_X -module,
- (3) \mathcal{F} is (-1) -pseudo-coherent relative to S if and only if \mathcal{F} is quasi-coherent and finitely presented relative to S .

Proof. Part (1) is immediate from the definition. To see part (3) we may work locally on X (both properties are local). Thus we may assume X and S are affine. Choose a closed immersion $i : X \rightarrow \mathbf{A}_S^n$. Then we see that \mathcal{F} is (-1) -pseudo-coherent relative to S if and only if $i_*\mathcal{F}$ is (-1) -pseudo-coherent, which is true if and only if $i_*\mathcal{F}$ is an $\mathcal{O}_{\mathbf{A}_S^n}$ -module of finite presentation, see Cohomology, Lemma 20.36.9. A module of finite presentation is quasi-coherent, see Modules, Lemma 17.11.2. By Morphisms, Lemma 28.4.1 we see that \mathcal{F} is quasi-coherent if and only if $i_*\mathcal{F}$ is quasi-coherent. Having said this part (3) follows. The proof of (2) is similar but less involved. \square

Lemma 36.39.11. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let E, K be objects of $D(\mathcal{O}_X)$. If $E \oplus K$ is m -pseudo-coherent relative to S so are E and K .*

Proof. Follows from Cohomology, Lemma 20.36.6 and the definitions. \square

Lemma 36.39.12. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let \mathcal{F}^\bullet be a (locally) bounded above complex of \mathcal{O}_X -modules such that \mathcal{F}^i is $(m-i)$ -pseudo-coherent relative to S for all i . Then \mathcal{F}^\bullet is m -pseudo-coherent relative to S .*

Proof. Follows from Cohomology, Lemma 20.36.7 and the definitions. \square

Lemma 36.39.13. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let E be an object of $D(\mathcal{O}_X)$. If E is (locally) bounded above and $H^i(E)$ is $(m-i)$ -pseudo-coherent relative to S for all i , then E is m -pseudo-coherent relative to S .*

Proof. Follows from Cohomology, Lemma 20.36.8 and the definitions. \square

Lemma 36.39.14. *Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let E be an object of $D(\mathcal{O}_X)$ which is m -pseudo-coherent relative to S . Let $S' \rightarrow S$ be a morphism of schemes. Set $X' = X \times_S S'$ and denote E' the derived pullback of E to X' . If S' and X are Tor independent over S , then E' is m -pseudo-coherent relative to S' .*

Proof. The problem is local on X and X' hence we may assume X, S, S' , and X' are affine. Choose a closed immersion $i : X \rightarrow \mathbf{A}_S^n$ and denote $i' : X' \rightarrow \mathbf{A}_{S'}^n$, the base change to S' . Denote $g : X' \rightarrow X$ and $g' : \mathbf{A}_{S'}^n \rightarrow \mathbf{A}_S^n$ the projections, so $E' = Lg^*E$. Since X and S' are tor-independent over S , the base change map (Cohomology, Remark 20.29.2) induces an isomorphism

$$Ri'_*(Lg^*E) = L(g')^* Ri_*E$$

Namely, for a point $x' \in X'$ lying over $x \in X$ the base change map on stalks at x' is the map

$$E_x \otimes_{\mathcal{O}_{\mathbf{A}_S^n, x}}^{\mathbf{L}} \mathcal{O}_{\mathbf{A}_{S'}, x'} \longrightarrow E_x \otimes_{\mathcal{O}_{X, x}}^{\mathbf{L}} \mathcal{O}_{X', x'}$$

coming from the closed immersions i and i' . Note that the source is quasi-isomorphic to a localization of $E_x \otimes_{\mathcal{O}_{S, s}}^{\mathbf{L}} \mathcal{O}_{S', s'}$ which is isomorphic to the target as $\mathcal{O}_{X', x'}$ is isomorphic to (the same) localization of $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{S, s}}^{\mathbf{L}} \mathcal{O}_{S', s'}$ by assumption. We conclude the lemma holds by an application of Cohomology, Lemma 20.36.3. \square

Lemma 36.39.15. *Let $f : X \rightarrow Y$ be a morphism of schemes locally of finite type over a base S . Let $m \in \mathbf{Z}$. Let E be an object of $D(\mathcal{O}_Y)$. Assume*

- (1) \mathcal{O}_X is pseudo-coherent relative to Y^4 , and
- (2) E is m -pseudo-coherent relative to S .

*Then Lf^*E is m -pseudo-coherent relative to S .*

Proof. The problem is local on X . Thus we may assume X, Y , and S are affine. Arguing as in the proof of More on Algebra, Lemma 15.59.13 we can find a commutative diagram

$$\begin{array}{ccccc} X & \longrightarrow & \mathbf{A}_Y^m & \longrightarrow & \mathbf{A}_S^{n+m} \\ \downarrow f & \searrow p & & \searrow & \\ Y & \longrightarrow & \mathbf{A}_S^n & & \end{array}$$

Observe that

$$Ri_*Lf^*E = Ri_*Li^*Lp^*E = Lp^*E \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}}^{\mathbf{L}} Ri_*\mathcal{O}_X$$

by Derived Categories of Schemes, Lemma 35.16.1. By assumption and the fact that Y is affine, we can represent $Ri_*\mathcal{O}_X = i_*\mathcal{O}_X$ by a complexes of finite free $\mathcal{O}_{\mathbf{A}_Y^n}$ -modules \mathcal{F}^\bullet , with $\mathcal{F}^i = 0$ for $i > 0$ (details omitted; use Derived Categories of Schemes, Lemma 35.9.3 and More on Algebra, Lemma 15.59.7). By assumption E is bounded above, say $H^i(E) = 0$ for $i > a$. Represent E by a complex \mathcal{E}^\bullet of \mathcal{O}_Y -modules with $\mathcal{E}^i = 0$ for $i > a$. Then the derived tensor product above is represented by $\text{Tot}(p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^\bullet)$.

Thus we have to show that $j_*\text{Tot}(p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^\bullet)$ is m -pseudo-coherent as a complex of $\mathcal{O}_{\mathbf{A}_S^{n+m}}$ -modules. Note that $\text{Tot}(p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^\bullet)$ has a filtration by subcomplexes with successive quotients the complexes $p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^i[-i]$. Note that for $i \ll 0$ the complexes $p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^i[-i]$ have zero cohomology in degrees $\leq m$ and hence are m -pseudo-coherent. Hence, applying Lemma 36.39.9 and induction, it suffices to show that $p^*\mathcal{E}^\bullet \otimes_{\mathcal{O}_{\mathbf{A}_Y^n}} \mathcal{F}^i[-i]$ is pseudo-coherent relative to S for all i . Note that $\mathcal{F}^i = 0$ for $i > 0$. Since also \mathcal{F}^i is finite free this reduces to proving that

⁴This means f is pseudo-coherent, see Definition 36.40.2.

$p^*\mathcal{E}^\bullet$ is m -pseudo-coherent relative to R which follows from Lemma 36.39.14 for instance. \square

Lemma 36.39.16. *Let $f : X \rightarrow Y$ be a morphism of schemes locally of finite type over a base S . Let $m \in \mathbf{Z}$. Let E be an object of $D(\mathcal{O}_X)$. Assume \mathcal{O}_Y is pseudo-coherent relative to S ⁵. Then the following are equivalent*

- (1) E is m -pseudo-coherent relative to Y , and
- (2) E is m -pseudo-coherent relative to S .

Proof. The question is local on X , hence we may assume X, Y , and S are affine. Arguing as in the proof of More on Algebra, Lemma 15.59.13 we can find a commutative diagram

$$\begin{array}{ccccc}
 X & \xrightarrow{\quad i \quad} & \mathbf{A}_Y^m & \xrightarrow{\quad j \quad} & \mathbf{A}_S^{n+m} \\
 \downarrow f & \swarrow p & & \swarrow & \\
 Y & \xrightarrow{\quad} & \mathbf{A}_S^n & &
 \end{array}$$

The assumption that \mathcal{O}_Y is pseudo-coherent relative to S implies that $\mathcal{O}_{\mathbf{A}_Y^m}$ is pseudo-coherent relative to \mathbf{A}_S^n (by flat base change; this can be seen by using for example Lemma 36.39.14). This in turn implies that $j_*\mathcal{O}_{\mathbf{A}_Y^m}$ is pseudo-coherent as an $\mathcal{O}_{\mathbf{A}_S^{n+m}}$ -module. Then the equivalence of the lemma follows from Derived Categories of Schemes, Lemma 35.10.5. \square

Lemma 36.39.17. *Let*

$$\begin{array}{ccc}
 X & \xrightarrow{\quad i \quad} & P \\
 & \searrow & \swarrow \\
 & & S
 \end{array}$$

be a commutative diagram of schemes. Assume i is a closed immersion and $P \rightarrow S$ flat and locally of finite presentation. Let E be an object of $D(\mathcal{O}_X)$. Then the following are equivalent

- (1) E is m -pseudo-coherent relative to S ,
- (2) Ri_*E is m -pseudo-coherent relative to S , and
- (3) Ri_*E is m -pseudo-coherent on P .

Proof. The equivalence of (1) and (2) is Lemma 36.39.8. The equivalence of (2) and (3) follows from Lemma 36.39.16 applied to $\text{id} : P \rightarrow P$ provided we can show that \mathcal{O}_P is pseudo-coherent relative to S . This follows from More on Algebra, Lemma 15.60.4 and the definitions. \square

36.40. Pseudo-coherent morphisms

Avoid reading this section at all cost. If you need some of this material, first take a look at the corresponding algebra sections, see More on Algebra, Sections 15.50, 15.59, and 15.60. For now the only thing you need to know is that a ring map $A \rightarrow B$ is pseudo-coherent if and only if $B = A[x_1, \dots, x_n]/I$ and B as an $A[x_1, \dots, x_n]$ -module has a resolution by finite free $A[x_1, \dots, x_n]$ -modules.

Lemma 36.40.1. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

⁵This means $Y \rightarrow S$ is pseudo-coherent, see Definition 36.40.2.

- (1) there exist an affine open covering $S = \bigcup V_j$ and for each j an affine open covering $f^{-1}(V_j) = \bigcup U_{ji}$ such that $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_{ij})$ is a pseudo-coherent ring map,
- (2) for every pair of affine opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is pseudo-coherent, and
- (3) f is locally of finite type and \mathcal{O}_X is pseudo-coherent relative to S .

Proof. To see the equivalence of (1) and (2) it suffices to check conditions (1)(a), (b), (c) of Morphisms, Definition 28.15.1 for the property of being a pseudo-coherent ring map. These properties follow (using localization is flat) from More on Algebra, Lemmas 15.59.12, 15.59.11, and 15.59.16.

If (1) holds, then f is locally of finite type as a pseudo-coherent ring map is of finite type by definition. Moreover, (1) implies via Lemma 36.39.6 and the definitions that \mathcal{O}_X is pseudo-coherent relative to S . Conversely, if (3) holds, then we see that for every U and V as in (2) the ring $\mathcal{O}_X(U)$ is of finite type over $\mathcal{O}_S(V)$ and $\mathcal{O}_X(U)$ is as a module pseudo-coherent relative to $\mathcal{O}_S(V)$, see Lemmas 36.39.5 and 36.39.6. This is the definition of a pseudo-coherent ring map, hence (2) and (1) hold. \square

Definition 36.40.2. A morphism of schemes $f : X \rightarrow S$ is called *pseudo-coherent* if the equivalent conditions of Lemma 36.40.1 are satisfied. In this case we also say that X is pseudo-coherent over S .

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

Lemma 36.40.3. *A flat base change of a pseudo-coherent morphism is pseudo-coherent.*

Proof. This translates into the following algebra result: Let $A \rightarrow B$ be a pseudo-coherent ring map. Let $A \rightarrow A'$ be flat. Then $A' \rightarrow B \otimes_A A'$ is pseudo-coherent. This follows from the more general More on Algebra, Lemma 15.59.12. \square

Lemma 36.40.4. *A composition of pseudo-coherent morphisms of schemes is pseudo-coherent.*

Proof. This translates into the following algebra result: If $A \rightarrow B \rightarrow C$ are composable pseudo-coherent ring maps then $A \rightarrow C$ is pseudo-coherent. This follows from either More on Algebra, Lemma 15.59.13 or More on Algebra, Lemma 15.59.15. \square

Lemma 36.40.5. *A pseudo-coherent morphism is locally of finite presentation.*

Proof. Immediate from the definitions. \square

Lemma 36.40.6. *A flat morphism which is locally of finite presentation is pseudo-coherent.*

Proof. This follows from the fact that a flat ring map of finite presentation is pseudo-coherent (and even perfect), see More on Algebra, Lemma 15.60.4. \square

Lemma 36.40.7. *Let $f : X \rightarrow Y$ be a morphism of schemes pseudo-coherent over a base scheme S . Then f is pseudo-coherent.*

Proof. This translates into the following algebra result: If $R \rightarrow A \rightarrow B$ are composable ring maps and $R \rightarrow A$, $R \rightarrow B$ pseudo-coherent, then $R \rightarrow B$ is pseudo-coherent. This follows from More on Algebra, Lemma 15.59.15. \square

Lemma 36.40.8. *Let $f : X \rightarrow S$ be a morphism of schemes. If S is locally Noetherian, then f is pseudo-coherent if and only if f is locally of finite type.*

Proof. This translates into the following algebra result: If $R \rightarrow A$ is a finite type ring map with R Noetherian, then $R \rightarrow A$ is pseudo-coherent if and only if $R \rightarrow A$ is of finite type. To see this, note that a pseudo-coherent ring map is of finite type by definition. Conversely, if $R \rightarrow A$ is of finite type, then we can write $A = R[x_1, \dots, x_n]/I$ and it follows from More on Algebra, Lemma 15.50.16 that A is pseudo-coherent as an $R[x_1, \dots, x_n]$ -module, i.e., $R \rightarrow A$ is a pseudo-coherent ring map. \square

Lemma 36.40.9. *The property $\mathcal{P}(f) = \text{“}f \text{ is pseudo-coherent”}$ is fpqc local on the base.*

Proof. We will use the criterion of Descent, Lemma 34.18.4 to prove this. By Definition 36.40.2 being pseudo-coherent is Zariski local on the base. By Lemma 36.40.3 being pseudo-coherent is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 34.18.4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $C = A[x_1, \dots, x_n]/I$ be an A -algebra. If $C \otimes_A B$ is pseudo-coherent as an $B[x_1, \dots, x_n]$ -module, then C is pseudo-coherent as a $A[x_1, \dots, x_n]$ -module. This is More on Algebra, Lemma 15.50.15. \square

Lemma 36.40.10. *Let $A \rightarrow B$ be a flat ring map of finite presentation. Let $I \subset B$ be an ideal. Then $A \rightarrow B/I$ is pseudo-coherent if and only if I is pseudo-coherent as a B -module.*

Proof. Choose a presentation $B = A[x_1, \dots, x_n]/J$. Note that B is pseudo-coherent as an $A[x_1, \dots, x_n]$ -module because $A \rightarrow B$ is a pseudo-coherent ring map by Lemma 36.40.6. Note that $A \rightarrow B/I$ is pseudo-coherent if and only if B/I is pseudo-coherent as an $A[x_1, \dots, x_n]$ -module. By More on Algebra, Lemma 15.50.11 we see this is equivalent to the condition that B/I is pseudo-coherent as a B -module. This proves the lemma as the short exact sequence $0 \rightarrow I \rightarrow B \rightarrow B/I \rightarrow 0$ shows that I is pseudo-coherent if and only if B/I is (see More on Algebra, Lemma 15.50.6). \square

The following lemma will be obsoleted by the stronger Lemma 36.40.12.

Lemma 36.40.11. *The property $\mathcal{P}(f) = \text{“}f \text{ is pseudo-coherent”}$ is syntomic local on the source.*

Proof. We will use the criterion of Descent, Lemma 34.22.3 to prove this. It follows from Lemmas 36.40.6 and 36.40.4 that being pseudo-coherent is preserved under precomposing with flat morphisms locally of finite presentation, in particular under precomposing with syntomic morphisms (see Morphisms, Lemmas 28.32.7 and 28.32.6). It is clear from Definition 36.40.2 that being pseudo-coherent is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 34.22.3 it suffices to prove the following: Suppose $X' \rightarrow X \rightarrow Y$ are morphisms of affine schemes with $X' \rightarrow X$ syntomic and $X' \rightarrow Y$ pseudo-coherent. Then $X \rightarrow Y$ is pseudo-coherent. To see this, note that in any case $X \rightarrow Y$

is of finite presentation by Descent, Lemma 34.10.1. Choose a closed immersion $X \rightarrow \mathbf{A}_Y^n$. By Algebra, Lemma 10.131.18 we can find an affine open covering $X' = \bigcup_{i=1, \dots, n} X'_i$ and syntomic morphisms $W_i \rightarrow \mathbf{A}_Y^n$ lifting the morphisms $X'_i \rightarrow X$, i.e., such that there are fibre product diagrams

$$\begin{array}{ccc} X'_i & \longrightarrow & W_i \\ \downarrow & & \downarrow \\ X & \longrightarrow & \mathbf{A}_Y^n \end{array}$$

After replacing X' by $\coprod X'_i$ and setting $W = \coprod W_i$ we obtain a fibre product diagram

$$\begin{array}{ccc} X' & \longrightarrow & W \\ \downarrow & & \downarrow h \\ X & \longrightarrow & \mathbf{A}_Y^n \end{array}$$

with $W \rightarrow \mathbf{A}_Y^n$ flat and of finite presentation and $X' \rightarrow X$ still pseudo-coherent. Since $W \rightarrow \mathbf{A}_Y^n$ is open (see Morphisms, Lemma 28.26.9) and $X' \rightarrow X$ is surjective we can find $f \in \Gamma(\mathbf{A}_Y^n, \mathcal{O})$ such that $X \subset D(f) \subset \text{Im}(h)$. Write $Y = \text{Spec}(R)$, $X = \text{Spec}(A)$, $X' = \text{Spec}(A')$ and $W = \text{Spec}(B)$, $A = R[x_1, \dots, x_n]/I$ and $A' = B/IB$. Then $R \rightarrow A'$ is pseudo-coherent. Picture

$$\begin{array}{ccc} A' = B/IB & \longleftarrow & B \\ \uparrow & & \uparrow \\ A = R[x_1, \dots, x_n]/I & \longleftarrow & R[x_1, \dots, x_n] \end{array}$$

By Lemma 36.40.10 we see that IB is pseudo-coherent as a B -module. The ring map $R[x_1, \dots, x_n]_f \rightarrow B_f$ is faithfully flat by our choice of f above. This implies that $I_f \subset R[x_1, \dots, x_n]_f$ is pseudo-coherent, see More on Algebra, Lemma 15.50.15. Applying Lemma 36.40.10 one more time we see that $R \rightarrow A$ is pseudo-coherent. \square

Lemma 36.40.12. *The property $\mathcal{P}(f)$ = “ f is pseudo-coherent” is fppf local on the source.*

Proof. Let $f : X \rightarrow S$ be a morphism of schemes. Let $\{g_i : X_i \rightarrow X\}$ be an fppf covering such that each composition $f \circ g_i$ is pseudo-coherent. According to Lemma 36.34.1 there exist

- (1) a Zariski open covering $X = \bigcup U_j$,
- (2) surjective finite locally free morphisms $W_j \rightarrow U_j$,
- (3) Zariski open coverings $W_j = \bigcup_k W_{j,k}$,
- (4) surjective finite locally free morphisms $T_{j,k} \rightarrow W_{j,k}$

such that the fppf covering $\{h_{j,k} : T_{j,k} \rightarrow X\}$ refines the given covering $\{X_i \rightarrow X\}$. Denote $\psi_{j,k} : T_{j,k} \rightarrow X_{\alpha(j,k)}$ the morphisms that witness the fact that $\{T_{j,k} \rightarrow X\}$ refines the given covering $\{X_i \rightarrow X\}$. Note that $T_{j,k} \rightarrow X$ is a flat, locally finitely presented morphism, so both X_i and $T_{j,k}$ are pseudo-coherent over X by Lemma 36.40.6. Hence $\psi_{j,k} : T_{j,k} \rightarrow X_i$ is pseudo-coherent, see Lemma 36.40.7. Hence $T_{j,k} \rightarrow S$ is pseudo coherent as the composition of $\psi_{j,k}$ and $f \circ g_{\alpha(j,k)}$, see Lemma 36.40.4. Thus we see we have reduced the lemma to the case of a Zariski open

covering (which is OK) and the case of a covering given by a single surjective finite locally free morphism which we deal with in the following paragraph.

Assume that $X' \rightarrow X \rightarrow S$ is a sequence of morphisms of schemes with $X' \rightarrow X$ surjective finite locally free and $X' \rightarrow Y$ pseudo-coherent. Our goal is to show that $X \rightarrow S$ is pseudo-coherent. Note that by Descent, Lemma 34.10.3 the morphism $X \rightarrow S$ is locally of finite presentation. It is clear that the problem reduces to the case that X' , X and S are affine and $X' \rightarrow X$ is free of some rank $r > 0$. The corresponding algebra problem is the following: Suppose $R \rightarrow A \rightarrow A'$ are ring maps such that $R \rightarrow A'$ is pseudo-coherent, $R \rightarrow A$ is of finite presentation, and $A' \cong A^{\oplus r}$ as an A -module. Goal: Show $R \rightarrow A$ is pseudo-coherent. The assumption that $R \rightarrow A'$ is pseudo-coherent means that A' as an A' -module is pseudo-coherent relative to R . By More on Algebra, Lemma 15.59.5 this implies that A' as an A -module is pseudo-coherent relative to R . Since $A' \cong A^{\oplus r}$ as an A -module we see that A as an A -module is pseudo-coherent relative to R , see More on Algebra, Lemma 15.59.8. This by definition means that $R \rightarrow A$ is pseudo-coherent and we win. \square

36.41. Perfect morphisms

In order to understand the material in this section you have to understand the material of the section on pseudo-coherent morphisms just a little bit. For now the only thing you need to know is that a ring map $A \rightarrow B$ is perfect if and only if it is pseudo-coherent and B has finite tor dimension as an A -module.

Lemma 36.41.1. *Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. The following are equivalent*

- (1) *there exist an affine open covering $S = \bigcup V_j$ and for each j an affine open covering $f^{-1}(V_j) = \bigcup U_{ji}$ such that $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_{ij})$ is a perfect ring map, and*
- (2) *for every pair of affine opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is perfect.*

Proof. Assume (1) and let U, V be as in (2). It follows from Lemma 36.40.1 that $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is pseudo-coherent. Hence it suffices to prove that the property of a ring map being "of finite tor dimension" satisfies conditions (1)(a), (b), (c) of Morphisms, Definition 28.15.1. These properties follow from More on Algebra, Lemmas 15.51.9, 15.51.12, and 15.51.13. Some details omitted. \square

Definition 36.41.2. A morphism of schemes $f : X \rightarrow S$ is called *perfect* if the equivalent conditions of Lemma 36.40.1 are satisfied. In this case we also say that X is perfect over S .

Note that a perfect morphism is in particular pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

Lemma 36.41.3. *A flat base change of a perfect morphism is perfect.*

Proof. This translates into the following algebra result: Let $A \rightarrow B$ be a perfect ring map. Let $A \rightarrow A'$ be flat. Then $A' \rightarrow B \otimes_A A'$ is perfect. This result for pseudo-coherent ring maps we have seen in Lemma 36.40.3. The corresponding fact for finite tor dimension follows from More on Algebra, Lemma 15.51.12. \square

Lemma 36.41.4. *A composition of perfect morphisms of schemes is perfect.*

Proof. This translates into the following algebra result: If $A \rightarrow B \rightarrow C$ are composable perfect ring maps then $A \rightarrow C$ is perfect. We have seen this is the case for pseudo-coherent in Lemma 36.40.4 and its proof. By assumption there exist integers n, m such that B has tor dimension $\leq n$ over A and C has tor dimension $\leq m$ over B . Then for any A -module M we have

$$M \otimes_A^{\mathbf{L}} C = (M \otimes_A^{\mathbf{L}} B) \otimes_B^{\mathbf{L}} C$$

and the spectral sequence of More on Algebra, Example 15.48.4 shows that $\mathrm{Tor}_p^A(M, C) = 0$ for $p > n + m$ as desired. \square

Lemma 36.41.5. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) f is flat and perfect, and
- (2) f is flat and locally of finite presentation.

Proof. The implication (2) \Rightarrow (1) is More on Algebra, Lemma 15.60.4. The converse follows from the fact that a pseudo-coherent morphism is locally of finite presentation, see Lemma 36.40.5. \square

Lemma 36.41.6. *Let $f : X \rightarrow S$ be a morphism of schemes. Assume S is regular and f is locally of finite type. Then f is perfect.*

Proof. See More on Algebra, Lemma 15.60.5. \square

Lemma 36.41.7. *A regular immersion of schemes is perfect. A Koszul-regular immersion of schemes is perfect.*

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.13.2, it suffices to prove the second statement. This translates into the following algebraic statement: Suppose that $I \subset A$ is an ideal generated by a Koszul-regular sequence f_1, \dots, f_r of A . Then $A \rightarrow A/I$ is a perfect ring map. Since $A \rightarrow A/I$ is surjective this is a presentation of A/I by a polynomial algebra over A . Hence it suffices to see that A/I is pseudo-coherent as an A -module and has finite tor dimension. By definition of a Koszul sequence the Koszul complex $K(A, f_1, \dots, f_r)$ is a finite free resolution of A/I . Hence A/I is a perfect complex of A -modules and we win. \square

Lemma 36.41.8. *Let*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow & \swarrow \\ & S & \end{array}$$

be a commutative diagram of morphisms of schemes. Assume $Y \rightarrow S$ smooth and $X \rightarrow S$ perfect. Then $f : X \rightarrow Y$ is perfect.

Proof. We can factor f as the composition

$$X \longrightarrow X \times_S Y \longrightarrow Y$$

where the first morphism is the map $i = (1, f)$ and the second morphism is the projection. Since $Y \rightarrow S$ is flat, see Morphisms, Lemma 28.35.9, we see that $X \times_S Y \rightarrow Y$ is perfect by Lemma 36.41.3. As $Y \rightarrow S$ is smooth, also $X \times_S Y \rightarrow$

X is smooth, see Morphisms, Lemma 28.35.5. Hence i is a section of a smooth morphism, therefore i is a regular immersion, see Divisors, Lemma 30.14.7. This implies that i is perfect, see Lemma 36.41.7. We conclude that f is perfect because the composition of perfect morphisms is perfect, see Lemma 36.41.4. \square

Remark 36.41.9. It is not true that a morphism between schemes X, Y perfect over a base S is perfect. An example is $S = \text{Spec}(k)$, $X = \text{Spec}(k)$, $Y = \text{Spec}(k[x]/(x^2))$ and $X \rightarrow Y$ the unique S -morphism.

Lemma 36.41.10. *The property $\mathcal{P}(f) = "f \text{ is perfect}"$ is fpqc local on the base.*

Proof. We will use the criterion of Descent, Lemma 34.18.4 to prove this. By Definition 36.41.2 being perfect is Zariski local on the base. By Lemma 36.41.3 being perfect is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 34.18.4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $C = A[x_1, \dots, x_n]/I$ be an A -algebra. If $C \otimes_A B$ is perfect as a $B[x_1, \dots, x_n]$ -module, then C is perfect as a $A[x_1, \dots, x_n]$ -module. This is More on Algebra, Lemma 15.56.12. \square

Lemma 36.41.11. *Let $f : X \rightarrow S$ be a pseudo-coherent morphism of schemes. Then f is perfect if and only if for every $x \in X$ the ring $\mathcal{O}_{X,x}$ has finite tor dimension as an $\mathcal{O}_{S,f(x)}$ -module.*

Proof. This translates into the following algebra problem. Suppose that $A \rightarrow B$ is a pseudo-coherent ring map. Write $B = A[x_1, \dots, x_n]/I$. Then the following are equivalent

- (1) $B_{\mathfrak{q}}$ has finite tor dimension over $A_{\mathfrak{p}}$ for all \mathfrak{q} (with $\mathfrak{p} = A \cap \mathfrak{q}$), and
- (2) B is perfect as an $A[x_1, \dots, x_n]$ -module.

The implication (2) \Rightarrow (1) is clear. For the converse, consider a prime \mathfrak{q} of B lying over \mathfrak{p} as in (1). Let \mathfrak{q}' be the prime of $A[x_1, \dots, x_n]$ corresponding to \mathfrak{q} . By More on Algebra, Lemma 15.56.19 applied to $A_{\mathfrak{p}} \rightarrow A[x_1, \dots, x_n]_{\mathfrak{q}'}$ we see that $B_{\mathfrak{q}}$ is a perfect $A[x_1, \dots, x_n]_{\mathfrak{q}'}$ -module. Hence B is a perfect $A[x_1, \dots, x_n]$ -module by More on Algebra, Lemma 15.56.18. Some details omitted. \square

Lemma 36.41.12. *The property $\mathcal{P}(f) = "f \text{ is perfect}"$ is fppf local on the source.*

Proof. Let $\{g_i : X_i \rightarrow X\}_{i \in I}$ be an fppf covering of schemes and let $f : X \rightarrow S$ be a morphism such that each $f \circ g_i$ is perfect. By Lemma 36.40.12 we conclude that f is pseudo-coherent. Hence by Lemma 36.41.11 it suffices to check that $\mathcal{O}_{X,x}$ is an $\mathcal{O}_{S,f(x)}$ -module of finite tor dimension for all $x \in X$. Pick $i \in I$ and $x_i \in X_i$ mapping to x . Then we see that \mathcal{O}_{X_i, x_i} has finite tor dimension over $\mathcal{O}_{S,f(x)}$ and that $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{X_i, x_i}$ is faithfully flat. The desired conclusion follows from More on Algebra, Lemma 15.51.14. \square

Lemma 36.41.13. *Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of schemes. Assume*

- (1) X is locally Noetherian,
- (2) $j \circ i$ is a regular immersion, and
- (3) i is perfect.

Then i and j are regular immersions.

Proof. Since X (and hence Y) is locally Noetherian all 4 types of regular immersions agree, and moreover we may check whether a morphism is a regular immersion on the level of local rings, see Divisors, Lemma 30.12.8. Thus the result follows from Divided Power Algebra, Lemma 23.7.5. \square

36.42. Local complete intersection morphisms

In Divisors, Section 30.13 we have defined 4 different types of regular immersions: regular, Koszul-regular, H_1 -regular, and quasi-regular. In this section we consider morphisms $f : X \rightarrow S$ which locally on X factors as

$$\begin{array}{ccc} X & \xrightarrow{\quad i \quad} & \mathbf{A}_S^n \\ & \searrow & \swarrow \\ & S & \end{array}$$

where i is a $*$ -regular immersion for $*$ $\in \{\emptyset, \text{Koszul}, H_1, \text{quasi}\}$. However, we don't know how to prove that this condition is independent of the factorization if $*$ $= \emptyset$, i.e., when we require i to be a regular immersion. On the other hand, we want a local complete intersection morphism to be perfect, which is only going to be true if $*$ $= \text{Koszul}$ or $*$ $= \emptyset$. Hence we will define a *local complete intersection morphism* or *Koszul morphism* to be a morphism of schemes $f : X \rightarrow S$ that locally on X has a factorization as above with i a Koszul-regular immersion. To see that this works we first prove this is independent of the chosen factorizations.

Lemma 36.42.1. *Let S be a scheme. Let U, P, P' be schemes over S . Let $u \in U$. Let $i : U \rightarrow P, i' : U \rightarrow P'$ be immersions over S . Assume P and P' smooth over S . Then the following are equivalent*

- (1) i is a Koszul-regular immersion in a neighbourhood of x , and
- (2) i' is a Koszul-regular immersion in a neighbourhood of x .

Proof. Assume i is a Koszul-regular immersion in a neighbourhood of x . Consider the morphism $j = (i, i') : U \rightarrow P \times_S P' = P''$. Since $P'' = P \times_S P' \rightarrow P$ is smooth, it follows from Divisors, Lemma 30.14.8 that j is a Koszul-regular immersion, whereupon it follows from Divisors, Lemma 30.14.11 that i' is a Koszul-regular immersion. \square

Before we state the definition, let us make the following simple remark. Let $f : X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $x \in X$. Then there exist an open neighbourhood $U \subset X$ and a factorization of $f|_U$ as the composition of an immersion $i : U \rightarrow \mathbf{A}_S^n$ followed by the projection $\mathbf{A}_S^n \rightarrow S$ which is smooth. Picture

$$\begin{array}{ccc} X & \longleftarrow U & \xrightarrow{\quad i \quad} \mathbf{A}_S^n = P \\ & \searrow & \swarrow \pi \\ & S & \end{array}$$

In fact you can do this with any affine open neighbourhood U of x in X , see Morphisms, Lemma 28.40.2.

Definition 36.42.2. Let $f : X \rightarrow S$ be a morphism of schemes.

- (1) Let $x \in X$. We say that f is *Koszul at x* if f is of finite type at x and there exists an open neighbourhood and a factorization of $f|_U$ as $\pi \circ i$ where $i : U \rightarrow P$ is a Koszul-regular immersion and $\pi : P \rightarrow S$ is smooth.
- (2) We say f is a *Koszul morphism*, or that f is a *local complete intersection morphism* if f is Koszul at every point.

We have seen above that the choice of the factorization $f|_U = \pi \circ i$ is irrelevant, i.e., given a factorization of $f|_U$ as an immersion i followed by a smooth morphism π , whether or not i is Koszul regular in a neighbourhood of x is an intrinsic property of f at x . Let us record this here explicitly as a lemma so that we can refer to it

Lemma 36.42.3. *Let $f : X \rightarrow S$ be a local complete intersection morphism. Let P be a scheme smooth over S . Let $U \subset X$ be an open subscheme and $i : U \rightarrow P$ an immersion of schemes over S . Then i is a Koszul-regular immersion.*

Proof. This is the defining property of a local complete intersection morphism. See discussion above. \square

It seems like a good idea to collect here some properties in common with all Koszul morphisms.

Lemma 36.42.4. *Let $f : X \rightarrow S$ be a local complete intersection morphism. Then*

- (1) f is locally of finite presentation,
- (2) f is pseudo-coherent, and
- (3) f is perfect.

Proof. Since a perfect morphism is pseudo-coherent (because a perfect ring map is pseudo-coherent) and a pseudo-coherent morphism is locally of finite presentation (because a pseudo-coherent ring map is of finite presentation) it suffices to prove the last statement. Being perfect is a local property, hence we may assume that f factors as $\pi \circ i$ where π is smooth and i is a Koszul-regular immersion. A Koszul-regular immersion is perfect, see Lemma 36.41.7. A smooth morphism is perfect as it is flat and locally of finite presentation, see Lemma 36.41.5. Finally a composition of perfect morphisms is perfect, see Lemma 36.41.4. \square

Lemma 36.42.5. *Let $f : X = \text{Spec}(B) \rightarrow S = \text{Spec}(A)$ be a morphism of affine schemes. Then f is a local complete intersection morphism if and only if $A \rightarrow B$ is a local complete intersection homomorphism, see More on Algebra, Definition 15.23.2.*

Proof. Follows immediately from the definitions. \square

Beware that a base change of a Koszul morphism is not Koszul in general.

Lemma 36.42.6. *A flat base change of a local complete intersection morphism is a local complete intersection morphism.*

Proof. Omitted. Hint: This is true because a base change of a smooth morphism is smooth and a flat base change of a Koszul-regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.13.3. \square

Lemma 36.42.7. *A composition of local complete intersection morphisms is a local complete intersection morphism.*

Proof. Let $g : Y \rightarrow S$ and $f : X \rightarrow Y$ be local complete intersection morphisms. Let $x \in X$ and set $y = f(x)$. Choose an open neighbourhood $V \subset Y$ of y and a factorization $g|_V = \pi \circ i$ for some Koszul-regular immersion $i : V \rightarrow P$ and smooth morphism $\pi : P \rightarrow S$. Next choose an open neighbourhood U of $x \in X$ and a factorization $f|_U = \pi' \circ i'$ for some Koszul-regular immersion $i' : U \rightarrow P'$ and smooth morphism $\pi' : P' \rightarrow Y$. In fact, we may assume that $P' = \mathbf{A}_V^n$, see discussion preceding and following Definition 36.42.2. Picture:

$$\begin{array}{ccccc}
 X & \longleftarrow & U & \xrightarrow{i'} & P' = \mathbf{A}_V^n \\
 \downarrow & & & & \downarrow \\
 Y & \longleftarrow & & & V & \xrightarrow{i} & P \\
 \downarrow & & & & & & \downarrow \\
 S & \longleftarrow & & & & & S
 \end{array}$$

Set $P'' = \mathbf{A}_P^n$. Then $U \rightarrow P' \rightarrow P''$ is a Koszul-regular immersion as a composition of Koszul-regular immersions, namely i' and the flat base change of i via $P'' \rightarrow P$, see Divisors, Lemma 30.13.3 and Divisors, Lemma 30.13.7. Also $P'' \rightarrow P \rightarrow S$ is smooth as a composition of smooth morphisms, see Morphisms, Lemma 28.35.4. Hence we conclude that $X \rightarrow S$ is Koszul at x as desired. \square

Lemma 36.42.8. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) f is flat and a local complete intersection morphism, and
- (2) f is syntomic.

Proof. Assume (2). By Morphisms, Lemma 28.32.10 for every point x of X there exist affine open neighbourhoods U of x and V of $f(x)$ such that $f|_U : U \rightarrow V$ is standard syntomic. This means that $U = \text{Spec}(R[x_1, \dots, x_n]/(f_1, \dots, f_c)) \rightarrow V = \text{Spec}(R)$ where $R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a relative global complete intersection over R . By Algebra, Lemma 10.131.13 the sequence f_1, \dots, f_c is a regular sequence in each local ring $R[x_1, \dots, x_n]_{\mathfrak{q}}$ for every prime $\mathfrak{q} \supset (f_1, \dots, f_c)$. Consider the Koszul complex $K_{\bullet} = K_{\bullet}(R[x_1, \dots, x_n], f_1, \dots, f_c)$ with homology groups $H_i = H_i(K_{\bullet})$. By More on Algebra, Lemma 15.21.2 we see that $(H_i)_{\mathfrak{q}} = 0, i > 0$ for every \mathfrak{q} as above. On the other hand, by More on Algebra, Lemma 15.20.6 we see that H_i is annihilated by (f_1, \dots, f_c) . Hence we see that $H_i = 0, i > 0$ and f_1, \dots, f_c is a Koszul-regular sequence. This proves that $U \rightarrow V$ factors as a Koszul-regular immersion $U \rightarrow \mathbf{A}_V^n$ followed by a smooth morphism as desired.

Assume (1). Then f is a flat and locally of finite presentation (Lemma 36.42.4). Hence, according to Morphisms, Lemma 28.32.10 it suffices to show that the local rings $\mathcal{O}_{X_s, x}$ are local complete intersection rings. Choose, locally on X , a factorization $f = \pi \circ i$ for some Koszul-regular immersion $i : X \rightarrow P$ and smooth morphism $\pi : P \rightarrow S$. Note that $X \rightarrow P$ is a relative quasi-regular immersion over S , see Divisors, Definition 30.14.2. Hence according to Divisors, Lemma 30.14.4 we see that $X \rightarrow P$ is a regular immersion and the same remains true after any base change. Thus each fibre is a regular immersion, whence all the local rings of all the fibres of X are local complete intersections. \square

Lemma 36.42.9. *A regular immersion of schemes is a local complete intersection morphism. A Koszul-regular immersion of schemes is a local complete intersection morphism.*

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.13.2, it suffices to prove the second statement. The second statement follows immediately from the definition. \square

Lemma 36.42.10. *Let*

be a commutative diagram of morphisms of schemes. Assume $Y \rightarrow S$ smooth and $X \rightarrow S$ is a local complete intersection morphism. Then $f : X \rightarrow Y$ is a local complete intersection morphism.

Proof. Immediate from the definitions. \square

The following lemma is of a different nature.

Lemma 36.42.11. *Let*

be a commutative diagram of morphisms of schemes. Assume

- (1) S is locally Noetherian,
- (2) $Y \rightarrow S$ is locally of finite type,
- (3) $f : X \rightarrow Y$ is perfect,
- (4) $X \rightarrow S$ is a local complete intersection morphism.

Then $X \rightarrow Y$ is a local complete intersection morphism and $Y \rightarrow S$ is Koszul at $f(x)$ for all $x \in X$.

Proof. In the course of this proof all schemes will be locally Noetherian and all rings will be Noetherian. We will use without further mention that regular sequences and Koszul regular sequences agree in this setting, see More on Algebra, Lemma 15.21.6. Moreover, whether an ideal (resp. ideal sheaf) is regular may be checked on local rings (resp. stalks), see Algebra, Lemma 10.67.8 (resp. Divisors, Lemma 30.12.8)

The question is local. Hence we may assume S, X, Y are affine. In this situation we may choose a commutative diagram

whose horizontal arrows are closed immersions. Let $x \in X$ be a point and consider the corresponding commutative diagram of local rings

$$\begin{array}{ccccc}
 J & \longrightarrow & \mathcal{O}_{\mathbf{A}_S^{n+m},x} & \longrightarrow & \mathcal{O}_{X,x} \\
 \uparrow & & \uparrow & & \uparrow \\
 I & \longrightarrow & \mathcal{O}_{\mathbf{A}_S^n,f(x)} & \longrightarrow & \mathcal{O}_{Y,f(x)}
 \end{array}$$

where J and I are the kernels of the horizontal arrows. Since $X \rightarrow S$ is a local complete intersection morphism, the ideal J is generated by a regular sequence. Since $X \rightarrow Y$ is perfect the ring $\mathcal{O}_{X,x}$ has finite tor dimension over $\mathcal{O}_{Y,f(x)}$. Hence we may apply Divided Power Algebra, Lemma 23.7.6 to conclude that I and J/I are generated by regular sequences. By our initial remarks, this finishes the proof. \square

Lemma 36.42.12. *The property $\mathcal{P}(f) = \text{“}f \text{ is a local complete intersection morphism”}$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow S$ be a morphism of schemes. Let $\{S_i \rightarrow S\}$ be an fpqc covering of S . Assume that each base change $f_i : X_i \rightarrow S_i$ of f is a local complete intersection morphism. Note that this implies in particular that f is locally of finite type, see Lemma 36.42.4 and Descent, Lemma 34.19.8. Let $x \in X$. Choose an open neighbourhood U of x and an immersion $j : U \rightarrow \mathbf{A}_S^n$ over S (see discussion preceding Definition 36.42.2). We have to show that j is a Koszul-regular immersion. Since f_i is a local complete intersection morphism, we see that the base change $j_i : U \times_S S_i \rightarrow \mathbf{A}_{S_i}^n$ is a Koszul-regular immersion, see Lemma 36.42.3. Because $\{\mathbf{A}_{S_i}^n \rightarrow \mathbf{A}_S^n\}$ is a fpqc covering we see from Descent, Lemma 34.19.30 that j is a Koszul-regular immersion as desired. \square

Lemma 36.42.13. *The property $\mathcal{P}(f) = \text{“}f \text{ is a local complete intersection morphism”}$ is syntomic local on the source.*

Proof. We will use the criterion of Descent, Lemma 34.22.3 to prove this. It follows from Lemmas 36.42.8 and 36.42.7 that being a local complete intersection morphism is preserved under precomposing with syntomic morphisms. It is clear from Definition 36.42.2 that being a local complete intersection morphism is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 34.22.3 it suffices to prove the following: Suppose $X' \rightarrow X \rightarrow Y$ are morphisms of affine schemes with $X' \rightarrow X$ syntomic and $X' \rightarrow Y$ a local complete intersection morphism. Then $X \rightarrow Y$ is a local complete intersection morphism. To see this, note that in any case $X \rightarrow Y$ is of finite presentation by Descent, Lemma 34.10.1. Choose a closed immersion $X \rightarrow \mathbf{A}_Y^n$. By Algebra, Lemma 10.131.18 we can find an affine open covering $X' = \bigcup_{i=1,\dots,n} X'_i$ and syntomic morphisms $W_i \rightarrow \mathbf{A}_Y^n$ lifting the morphisms $X'_i \rightarrow X$, i.e., such that there are fibre product diagrams

$$\begin{array}{ccc}
 X'_i & \longrightarrow & W_i \\
 \downarrow & & \downarrow \\
 X & \longrightarrow & \mathbf{A}_Y^n
 \end{array}$$

After replacing X' by $\coprod X'_i$ and setting $W = \coprod W_i$ we obtain a fibre product diagram of affine schemes

$$\begin{array}{ccc} X' & \longrightarrow & W \\ \downarrow & & \downarrow h \\ X & \longrightarrow & \mathbf{A}_Y^n \end{array}$$

with $h : W \rightarrow \mathbf{A}_Y^n$ syntomic and $X' \rightarrow Y$ still a local complete intersection morphism. Since $W \rightarrow \mathbf{A}_Y^n$ is open (see Morphisms, Lemma 28.26.9) and $X' \rightarrow X$ is surjective we see that X is contained in the image of $W \rightarrow \mathbf{A}_Y^n$. Choose a closed immersion $W \rightarrow \mathbf{A}_Y^{n+m}$ over \mathbf{A}_Y^n . Now the diagram looks like

$$\begin{array}{ccccc} X' & \longrightarrow & W & \longrightarrow & \mathbf{A}_Y^{n+m} \\ \downarrow & & \downarrow h & \nearrow & \\ X & \longrightarrow & \mathbf{A}_Y^n & & \end{array}$$

Because h is syntomic and hence a local complete intersection morphism (see above) the morphism $W \rightarrow \mathbf{A}_Y^{n+m}$ is a Koszul-regular immersion. Because $X' \rightarrow Y$ is a local complete intersection morphism the morphism $X' \rightarrow \mathbf{A}_Y^{n+m}$ is a Koszul-regular immersion. We conclude from Divisors, Lemma 30.13.8 that $X' \rightarrow W$ is a Koszul-regular immersion. Hence, since being a Koszul-regular immersion is fpqc local on the target (see Descent, Lemma 34.19.30) we conclude that $X \rightarrow \mathbf{A}_Y^n$ is a Koszul-regular immersion which is what we had to show. \square

Lemma 36.42.14. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . Assume both X and Y are flat and locally of finite presentation over S . Then the set*

$$\{x \in X \mid f \text{ Koszul at } x\}.$$

is open in X and its formation commutes with arbitrary base change $S' \rightarrow S$.

Proof. The set is open by definition (see Definition 36.42.2). Let $S' \rightarrow S$ be a morphism of schemes. Set $X' = S' \times_S X$, $Y' = S' \times_S Y$, and denote $f' : X' \rightarrow Y'$ the base change of f . Let $x' \in X'$ be a point such that f' is Koszul at x' . Denote $s' \in S'$, $x \in X$, $y' \in Y'$, $y \in Y$, $s \in S$ the image of x' . Note that f is locally of finite presentation, see Morphisms, Lemma 28.22.11. Hence we may choose an affine neighbourhood $U \subset X$ of x and an immersion $i : U \rightarrow \mathbf{A}_Y^n$. Denote $U' = S' \times_S U$ and $i' : U' \rightarrow \mathbf{A}_{Y'}^n$, the base change of i . The assumption that f' is Koszul at x' implies that i' is a Koszul-regular immersion in a neighbourhood of x' , see Lemma 36.42.3. The scheme X' is flat and locally of finite presentation over S' as a base change of X (see Morphisms, Lemmas 28.26.7 and 28.22.4). Hence i' is a relative H_1 -regular immersion over S' in a neighbourhood of x' (see Divisors, Definition 30.14.2). Thus the base change $i'_{s'} : U'_{s'} \rightarrow \mathbf{A}_{Y'_{s'}}^n$ is a H_1 -regular immersion in an open neighbourhood of x' , see Divisors, Lemma 30.14.1 and the discussion following Divisors, Definition 30.14.2. Since $s' = \text{Spec}(\kappa(s')) \rightarrow \text{Spec}(\kappa(s)) = s$ is a surjective flat universally open morphism (see Morphisms, Lemma 28.24.4) we conclude that the base change $i_s : U_s \rightarrow \mathbf{A}_{Y_s}^n$ is an H_1 -regular immersion in a neighbourhood of x , see Descent, Lemma 34.19.30. Finally, note that \mathbf{A}_Y^n is flat and locally of finite presentation over S , hence Divisors, Lemma 30.14.6 implies that i is a (Koszul-)regular immersion in a neighbourhood of x as desired. \square

Lemma 36.42.15. *Let $f : X \rightarrow Y$ be a local complete intersection morphism of schemes. Then f is unramified if and only if f is formally unramified and in this case the conormal sheaf $\mathcal{C}_{X/Y}$ is finite locally free on X .*

Proof. The first assertion follows immediately from Lemma 36.4.8 and the fact that a local complete intersection morphism is locally of finite type. To compute the conormal sheaf of f we choose, locally on X , a factorization of f as $f = p \circ i$ where $i : X \rightarrow V$ is a Koszul-regular immersion and $V \rightarrow Y$ is smooth. By Lemma 36.9.11 we see that $\mathcal{C}_{X/Y}$ is a locally direct summand of $\mathcal{C}_{X/V}$ which is finite locally free as i is a Koszul-regular (hence quasi-regular) immersion, see Divisors, Lemma 30.13.5. \square

Lemma 36.42.16. *Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of schemes. Assume that $Z \rightarrow Y$ is a local complete intersection morphism. The exact sequence*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

of Lemma 36.5.12 is short exact.

Proof. The question is local on Z hence we may assume there exists a factorization $Z \rightarrow \mathbf{A}_Y^n \rightarrow Y$ of the morphism $Z \rightarrow Y$. Then we get a commutative diagram

$$\begin{array}{ccccc} Z & \xrightarrow{\quad} & \mathbf{A}_Y^n & \longrightarrow & \mathbf{A}_X^n \\ \parallel & & \downarrow & & \downarrow \\ Z & \xrightarrow{\quad i \quad} & Y & \longrightarrow & X \end{array}$$

As $Z \rightarrow Y$ is a local complete intersection morphism, we see that $Z \rightarrow \mathbf{A}_Y^n$ is a Koszul-regular immersion. Hence by Divisors, Lemma 30.13.6 the sequence

$$0 \rightarrow (i')^* \mathcal{C}_{\mathbf{A}_Y^n/\mathbf{A}_X^n} \rightarrow \mathcal{C}_{Z/\mathbf{A}_X^n} \rightarrow \mathcal{C}_{Z/\mathbf{A}_Y^n} \rightarrow 0$$

is exact and locally split. Note that $i^* \mathcal{C}_{Y/X} = (i')^* \mathcal{C}_{\mathbf{A}_Y^n/\mathbf{A}_X^n}$ by Lemma 36.5.7 and note that the diagram

$$\begin{array}{ccc} (i')^* \mathcal{C}_{\mathbf{A}_Y^n/\mathbf{A}_X^n} & \longrightarrow & \mathcal{C}_{Z/\mathbf{A}_X^n} \\ \cong \uparrow & & \uparrow \\ i^* \mathcal{C}_{Y/X} & \longrightarrow & \mathcal{C}_{Z/X} \end{array}$$

is commutative. Hence the lower horizontal arrow is a locally split injection. This proves the lemma. \square

36.43. Exact sequences of differentials and conormal sheaves

In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to a pair of composable morphisms of schemes.

In the sequences below each of the maps are as constructed in either Morphisms, Lemma 28.34.8 or Lemma 36.5.5. Let $g : Z \rightarrow Y$ and $f : Y \rightarrow X$ be morphisms of schemes.

- (1) There is a canonical exact sequence

$$g^* \Omega_{Y/X} \rightarrow \Omega_{Z/X} \rightarrow \Omega_{Z/Y} \rightarrow 0,$$

see Morphisms, Lemma 28.34.9. If $g : Z \rightarrow Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.9.

- (2) If g is formally unramified, then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow g^*\Omega_{Y/X} \rightarrow \Omega_{Z/X} \rightarrow 0,$$

see Lemma 36.5.10. If $f \circ g : Z \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.10.

- (3) If g and $f \circ g$ are formally unramified, then there is a canonical exact sequence

$$\mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow g^*\Omega_{Y/X} \rightarrow 0,$$

see Lemma 36.5.11. If $f : Y \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.11.

- (4) If g and f are formally unramified, then there is a canonical exact sequence

$$g^*\mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0.$$

see Lemma 36.5.12. If $g : Z \rightarrow Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 36.42.16.

36.44. Weakly étale morphisms

A ring homomorphism $A \rightarrow B$ is weakly étale if both $A \rightarrow B$ and $B \otimes_A B \rightarrow B$ are flat, see More on Algebra, Definition 15.67.1. The analogous notion for morphisms of schemes is the following.

Definition 36.44.1. A morphism of schemes $X \rightarrow Y$ is *weakly étale* or *absolutely flat* if both $X \rightarrow Y$ and the diagonal morphism $X \rightarrow X \times_Y X$ are flat.

An étale morphism is weakly étale and conversely it turns out that a weakly étale morphism is indeed somewhat like an étale morphism. For example, if $X \rightarrow Y$ is weakly étale, then $L_{X/Y} = 0$, as follows from Cotangent, Lemma 70.8.4. We will prove a very precise result relating weakly étale morphisms to étale morphisms later (see Pro-étale Cohomology, Section 46.9). In this section we stick with the basics.

Lemma 36.44.2. *Let $f : X \rightarrow Y$ be a morphism of schemes. The following are equivalent*

- (1) $X \rightarrow Y$ is weakly étale, and
- (2) for every $x \in X$ the ring map $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$ is weakly étale.

Proof. Observe that under both assumptions (1) and (2) the morphism f is flat. Thus we may assume f is flat. Let $x \in X$ with image $y = f(x)$ in Y . There are canonical maps of rings

$$\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \longrightarrow \mathcal{O}_{X \times_Y X, \Delta_{X/Y}(x)} \longrightarrow \mathcal{O}_{X,x}$$

where the first map is a localization (hence flat) and the second map is a surjection (hence an epimorphism of rings). Condition (1) means that for all x the second arrow is flat. Condition (2) is that for all x the composition is flat. These conditions are equivalent by Algebra, Lemma 10.38.3 and More on Algebra, Lemma 15.67.2. \square

Lemma 36.44.3. *Let $X \rightarrow Y$ be a morphism of schemes such that $X \rightarrow X \times_Y X$ is flat. Let \mathcal{F} be an \mathcal{O}_X -module. If \mathcal{F} is flat over Y , then \mathcal{F} is flat over X .*

Proof. Let $x \in X$ with image $y = f(x)$ in Y . Since $X \rightarrow X \times_Y X$ is flat, we see that $\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{X,x}$ is flat. Hence the result follows from More on Algebra, Lemma 15.67.2 and the definitions. \square

Lemma 36.44.4. *Let $f : X \rightarrow S$ be a morphism of schemes. The following are equivalent*

- (1) *The morphism f is weakly étale.*
- (2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \rightarrow \mathcal{O}_X(U)$ is weakly étale.*
- (3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \rightarrow V_j$, $j \in J, i \in I_j$ is weakly étale.*
- (4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \rightarrow \mathcal{O}_X(U_i)$ is weakly étale, for all $j \in J, i \in I_j$.*

Moreover, if f is weakly étale then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \rightarrow V$ is weakly-étale.

Proof. Suppose given open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$. Then $U \times_V U \subset X \times_Y X$ is open (Schemes, Lemma 25.17.3) and the diagonal $\Delta_{U/V}$ of $f|_U : U \rightarrow V$ is the restriction $\Delta_{X/Y}|_U : U \rightarrow U \times_V U$. Since flatness is a local property of morphisms of schemes (Morphisms, Lemma 28.26.3) the final statement of the lemma is follows as well as the equivalence of (1) and (3). If X and Y are affine, then $X \rightarrow Y$ is weakly étale if and only if $\mathcal{O}_Y(Y) \rightarrow \mathcal{O}_X(X)$ is weakly étale (use again Morphisms, Lemma 28.26.3). Thus (1) and (3) are also equivalent to (2) and (4). \square

Lemma 36.44.5. *Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes.*

- (1) *If $X \rightarrow X \times_Y X$ and $Y \rightarrow Y \times_Z Y$ are flat, then $X \rightarrow X \times_Z X$ is flat.*
- (2) *If $X \rightarrow Y$ and $Y \rightarrow Z$ are weakly étale, then $X \rightarrow Z$ is weakly étale.*

Proof. Part (1) follows from the factorization

$$X \rightarrow X \times_Y X \rightarrow X \times_Z X$$

of the diagonal of X over Z , the fact that

$$X \times_Y X = (X \times_Z X) \times_{(Y \times_Z Y)} Y,$$

the fact that a base change of a flat morphism is flat, and the fact that the composition of flat morphisms is flat (Morphisms, Lemmas 28.26.7 and 28.26.5). Part (2) follows from part (1) and the fact (just used) that the composition of flat morphisms is flat. \square

Lemma 36.44.6. *Let $X \rightarrow Y$ and $Y' \rightarrow Y$ be morphisms of schemes and let $X' = Y' \times_Y X$ be the base change of X .*

- (1) *If $X \rightarrow X \times_Y X$ is flat, then $X' \rightarrow X' \times_{Y'} X'$ is flat.*
- (2) *If $X \rightarrow Y$ is weakly étale, then $X' \rightarrow Y'$ is weakly étale.*

Proof. Assume $X \rightarrow X \times_Y X$ is flat. The morphism $X' \rightarrow X' \times_{Y'} X'$ is the base change of $X \rightarrow X \times_Y X$ by $Y' \rightarrow Y$. Hence it is flat by Morphisms, Lemmas 28.26.7. This proves (1). Part (2) follows from (1) and the fact (just used) that the base change of a flat morphism is flat. \square

Lemma 36.44.7. *Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes. Assume that $X \rightarrow Y$ is flat and surjective and that $X \rightarrow X \times_Z X$ is flat. Then $Y \rightarrow Y \times_Z Y$ is flat.*

Proof. Consider the commutative diagram

$$\begin{array}{ccc} X & \longrightarrow & X \times_Z X \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Y \times_Z Y \end{array}$$

The top horizontal arrow is flat and the vertical arrows are flat. Hence X is flat over $Y \times_Z Y$. By Morphisms, Lemma 28.26.11 we see that Y is flat over $Y \times_Z Y$. \square

Lemma 36.44.8. *Let $f : X \rightarrow Y$ be a weakly étale morphism of schemes. Then f is formally unramified, i.e., $\Omega_{X/Y} = 0$.*

Proof. Recall that f is formally unramified if and only if $\Omega_{X/Y} = 0$ by Lemma 36.4.7. Via Lemma 36.44.4 and Morphisms, Lemma 28.34.5 this follows from the case of rings which is More on Algebra, Lemma 15.67.12. \square

Lemma 36.44.9. *Let $f : X \rightarrow Y$ be a morphism of schemes. Then $X \rightarrow Y$ is weakly étale in each of the following cases*

- (1) $X \rightarrow Y$ is a flat monomorphism,
- (2) $X \rightarrow Y$ is an open immersion,
- (3) $X \rightarrow Y$ is flat and unramified,
- (4) $X \rightarrow Y$ is étale.

Proof. If (1) holds, then $\Delta_{X/Y}$ is an isomorphism, hence certainly f is weakly étale. Case (2) is a special case of (1). The diagonal of an unramified morphism is an open immersion (Morphisms, Lemma 28.36.13), hence flat. Thus a flat unramified morphism is weakly étale. An étale morphism is flat and unramified (Morphisms, Lemma 28.37.5), hence (4) follows from (3). \square

Lemma 36.44.10. *Let $f : X \rightarrow Y$ be a morphism of schemes. If Y is reduced and f weakly étale, then X is reduced.*

Proof. Via Lemma 36.44.4 this follows from the case of rings which is More on Algebra, Lemma 15.67.8. \square

The following lemma uses a nontrivial result about weakly étale ring maps.

Lemma 36.44.11. *Let $f : X \rightarrow Y$ be a morphism of schemes. The following are equivalent*

- (1) f is weakly étale, and
- (2) for $x \in X$ the local ring map $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$ induces an isomorphism on strict henselizations.

Proof. Let $x \in X$ be a point with image $y = f(x)$ in Y . Choose a separable algebraic closure κ^{sep} of $\kappa(x)$. Let $\mathcal{O}_{X,x}^{sh}$ be the strict henselization corresponding to κ^{sep} and $\mathcal{O}_{Y,y}^{sh}$ the strict henselization relative to the separable algebraic closure

of $\kappa(y)$ in κ^{sep} . Consider the commutative diagram

$$\begin{array}{ccc} \mathcal{O}_{X,x} & \longrightarrow & \mathcal{O}_{X,x}^{sh} \\ \uparrow & & \uparrow \\ \mathcal{O}_{Y,y} & \longrightarrow & \mathcal{O}_{Y,y}^{sh} \end{array}$$

local homomorphisms of local rings, see Algebra, Lemma 10.145.26. Since the strict henselization is a filtered colimit of étale ring maps, More on Algebra, Lemma 15.67.13 shows the horizontal maps are weakly étale. Moreover, the horizontal maps are faithfully flat by More on Algebra, Lemma 15.34.1.

Assume f weakly étale. By Lemma 36.44.2 the left vertical arrow is weakly étale. By More on Algebra, Lemmas 15.67.9 and 15.67.11 the right vertical arrow is weakly étale. By More on Algebra, Theorem 15.67.24 we conclude the right vertical map is an isomorphism.

Assume $\mathcal{O}_{Y,y}^{sh} \rightarrow \mathcal{O}_{X,x}^{sh}$ is an isomorphism. Then $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}^{sh}$ is weakly étale. Since $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{X,x}^{sh}$ is faithfully flat we conclude that $\mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$ is weakly étale by More on Algebra, Lemma 15.67.10. Thus (2) implies (1) by Lemma 36.44.2. \square

Lemma 36.44.12. *Let $f : X \rightarrow Y$ be a morphism of schemes. If Y is a normal scheme and f weakly étale, then X is a normal scheme.*

Proof. By More on Algebra, Lemma 15.34.6 a scheme S is normal if and only if for all $s \in S$ the strict henselization of $\mathcal{O}_{S,s}$ is a normal domain. Hence the lemma follows from Lemma 36.44.11. \square

Lemma 36.44.13. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of schemes over S . If X, Y are weakly étale over S , then f is weakly étale.*

Proof. We will use Morphisms, Lemmas 28.26.7 and 28.26.5 without further mention. Write $X \rightarrow Y$ as the composition $X \rightarrow X \times_S Y \rightarrow Y$. The second morphism is flat as the base change of the flat morphism $X \rightarrow S$. The first is the base change of the flat morphism $Y \rightarrow Y \times_S Y$ by the morphism $X \times_S Y \rightarrow Y \times_S Y$, hence flat. Thus $X \rightarrow Y$ is flat. The morphism $X \times_Y X \rightarrow X \times_S X$ is an immersion. Thus Lemma 36.44.3 implies, that since X is flat over $X \times_S X$ it follows that X is flat over $X \times_Y X$. \square

36.45. Reduced fibre theorem

In this section we discuss the simplest kind of theorem of the kind advertised by the title. Although the proof of the result is kind of laborious, in essence it follows in a straightforward manner from Epp's result on eliminating ramification, see More on Algebra, Theorem 15.69.21.

Let A be a Dedekind domain with fraction field K . Let X be a scheme flat and of finite type over A . Let L be a finite extension of K . Let B be the integral closure of A in L . Then B is a Dedekind domain (Algebra, Lemma 10.116.14). Let $X_B = X \times_{\text{Spec}(A)} \text{Spec}(B)$ be the base change. Then $X_B \rightarrow \text{Spec}(B)$ is of finite type (Morphisms, Lemma 28.16.4). Hence X_B is Noetherian (Morphisms, Lemma

28.16.6). Thus the normalization $\nu : Y \rightarrow X_B$ exists (see Morphisms, Definition 28.48.12 and the discussion following). Picture

$$(36.45.0.1) \quad \begin{array}{ccccc} Y & \xrightarrow{\nu} & X_B & \longrightarrow & X \\ & \searrow & \downarrow & & \downarrow \\ & & \text{Spec}(B) & \longrightarrow & \text{Spec}(A) \end{array}$$

We sometimes call Y the *normalized base change* of X . In general the morphism ν may not be finite. But if A is a Nagata ring (a condition that is virtually always satisfied in practice) then ν is of finite and Y is of finite type over B , see Morphisms, Lemmas 28.48.18 and 28.19.1.

Taking the normalized base change commutes with composition. More precisely, if $K \subset L \subset M$ are finite extensions of fields with integral closures $A \subset B \subset C$ then the normalized base change Z of $Y \rightarrow \text{Spec}(B)$ relative to $L \subset M$ is equal to the normalized base change of $X \rightarrow \text{Spec}(A)$ relative to $K \subset M$.

Theorem 36.45.1. *Let A be a Dedekind ring with fraction field K . Let X be a scheme flat and of finite type over A . Assume A is a Nagata ring. There exists a finite extension $K \subset L$ such that the normalized base change Y is smooth over $\text{Spec}(B)$ at all generic points of all fibres.*

Proof. During the proof we will repeatedly use that formation of the set of points where a (flat, finitely presented) morphism like $X \rightarrow \text{Spec}(A)$ is smooth commutes with base change, see Morphisms, Lemma 28.35.15.

We first choose a finite extension $K \subset L$ such that $(X_L)_{red}$ is geometrically reduced over L , see Varieties, Lemma 32.4.11. Since $Y \rightarrow (X_B)_{red}$ is birational we see applying Varieties, Lemma 32.4.8 that Y_L is geometrically reduced over L as well. Hence $Y_L \rightarrow \text{Spec}(L)$ is smooth on a dense open $V \subset Y_L$ by Varieties, Lemma 32.15.7. Thus the smooth locus $U \subset Y$ of the morphism $Y \rightarrow \text{Spec}(B)$ is open (by Morphisms, Definition 28.35.1) and is dense in the generic fibre. Replacing A by B and X by Y we reduce to the case treated in the next paragraph.

Assume X is normal and the smooth locus $U \subset X$ of $X \rightarrow \text{Spec}(A)$ is dense in the generic fibre. This implies that U is dense in all but finitely many fibres, see Lemma 36.19.3. Let $x_1, \dots, x_r \in X \setminus U$ be the finitely many generic points of irreducible components of $X \setminus U$ which are moreover generic points of irreducible components of fibres of $X \rightarrow \text{Spec}(A)$. Set $\mathcal{O}_i = \mathcal{O}_{X, x_i}$. Let A_i be the localization of A at the maximal ideal corresponding to the image of x_i in $\text{Spec}(A)$. By More on Algebra, Proposition 15.69.23 there exist finite extensions $K \subset K_i$ which are solutions for the extension of discrete valuation rings $A_i \rightarrow \mathcal{O}_i$. Let $K \subset L$ be a finite extension dominating all of the extensions $K \subset K_i$. Then $K \subset L$ is still a solution for $A_i \rightarrow \mathcal{O}_i$ by More on Algebra, Lemma 15.69.4.

Consider the diagram (36.45.0.1) with the extension L/K we just produced. Note that $U_B \subset X_B$ is smooth over B , hence normal (for example use Algebra, Lemma 10.151.7). Thus $Y \rightarrow X_B$ is an isomorphism over U_B . Let $y \in Y$ be a generic point of an irreducible component of a fibre of $Y \rightarrow \text{Spec}(B)$ lying over the maximal ideal $\mathfrak{m} \subset B$. Assume that $y \notin U_B$. Then y maps to one of the points x_i . It follows that $\mathcal{O}_{Y, y}$ is a local ring of the integral closure of \mathcal{O}_i in $R(X) \otimes_K L$ (details omitted). Hence because $K \subset L$ is a solution for $A_i \rightarrow \mathcal{O}_i$ we see that $B_{\mathfrak{m}} \rightarrow \mathcal{O}_{Y, y}$ is formally

smooth (this is the definition of being a "solution"). In other words, $\mathfrak{m}\mathcal{O}_{Y,y} = \mathfrak{m}_y$ and the residue field extension is separable. Hence the local ring of the fibre at y is $\kappa(y)$. This implies the fibre is smooth over $\kappa(\mathfrak{m})$ at y for example by Algebra, Lemma 10.135.5. This finishes the proof. \square

36.46. Ind-quasi-affine morphisms

A bit of theory to be used later.

Definition 36.46.1. A scheme X is *ind-quasi-affine* if every quasi-compact open of X is quasi-affine. Similarly, a morphism of schemes $X \rightarrow Y$ is *ind-quasi-affine* if $f^{-1}(V)$ is ind-quasi-affine for each affine open V in Y .

An example of an ind-quasi-affine scheme is an open of an affine scheme or an open of a quasi-projective scheme. An ind-quasi-affine scheme X is separated because any two affine opens U, V are contained in a separated open subscheme of X , namely $U \cup V$. Similarly an ind-quasi-affine morphism is separated.

Lemma 36.46.2. *The property of being ind-quasi-affine is stable under base change.*

Proof. Let $f : X \rightarrow Y$ be an ind-quasi-affine morphism. Let Z be an affine scheme and let $Z \rightarrow Y$ be a morphism. To show: $Z \times_Y X$ is ind-quasi-affine. Let $W \subset Z \times_Y X$ be a quasi-compact open. We can find finitely many affine opens V_1, \dots, V_n of Y and finitely many quasi-compact opens $U_i \subset f^{-1}(V_i)$ such that Z maps into $\bigcup V_i$ and W maps into $\bigcup U_i$. Then we may replace Y by $\bigcup V_i$ and X by $\bigcup U_i$. In this case $f^{-1}(V_i)$ is quasi-compact open (details omitted; use that f is separated) and hence quasi-affine. Thus now $X \rightarrow Y$ is a quasi-affine morphism (Morphisms, Lemma 28.14.3) and the result follows from the fact that the base change of a quasi-affine morphism is quasi-affine (Morphisms, Lemma 28.14.5). \square

Lemma 36.46.3. *The property of being ind-quasi-affine is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of schemes. Let $\{g_i : Y_i \rightarrow Y\}$ be an fpqc covering such that the base change $f_i : X_i \rightarrow Y_i$ is ind-quasi-affine for all i . We will show f is ind-quasi-affine. Namely, let $U \subset X$ be a quasi-compact open mapping into an affine open $V \subset Y$. We have to show that U is quasi-affine. Let $V_j \subset Y_i$, $j = 1, \dots, m$ be affine opens such that $V = \bigcup g_{ij}(V_j)$ (exist by definition of fpqc coverings). Then $V_i \times_Y X \rightarrow V_i$ is ind-quasi-affine as well. Hence we may replace Y by V and $\{g_i : Y_i \rightarrow Y\}$ by the finite covering $\{V_j \rightarrow V\}$. We may replace X by U , because $V_j \times_Y U \subset V_j \times_Y X$ is open and hence $V_j \times_Y U \rightarrow V_j$ is ind-quasi-affine as well (ind-quasi-affineness is inherited by opens). Hence we may assume X is quasi-compact and Y affine. In this case we have to show that X is quasi-affine and we know that X_i is quasi-affine. Thus the result follows from Descent, Lemma 34.19.18. \square

Lemma 36.46.4. *A separated locally quasi-finite morphism of schemes is ind-quasi-affine.*

Proof. Let $f : X \rightarrow Y$ be a separated locally quasi-finite morphism of schemes. Let $V \subset Y$ be affine and $U \subset f^{-1}(V)$ quasi-compact open. We have to show U is quasi-affine. Since $U \rightarrow V$ is a separated quasi-finite morphism of schemes, this follows from Zariski's Main Theorem. See Lemma 36.31.2. \square

More on Flatness

37.1. Introduction

In this chapter, we discuss some advanced results on flat modules and flat morphisms of schemes. Most of these results can be found in the paper [GR71] by Raynaud and Gruson.

Before reading this chapter we advise the reader to take a look at the following results (this list also serves as a pointer to previous results):

- (1) General discussion on flat modules in Algebra, Section 10.38.
- (2) The relationship between Tor-groups and flatness, see Algebra, Section 10.72.
- (3) Criteria for flatness, see Algebra, Section 10.95 (Noetherian case), Algebra, Section 10.97 (Artinian case), Algebra, Section 10.124 (non-Noetherian case), and finally More on Morphisms, Section 36.13.
- (4) Generic flatness, see Algebra, Section 10.114 and Morphisms, Section 28.28.
- (5) Openness of the flat locus, see Algebra, Section 10.125 and More on Morphisms, Section 36.12.
- (6) Flattening, see More on Algebra, Sections 15.9, 15.10, 15.11, 15.12, and 15.13.
- (7) Additional results in More on Algebra, Sections 15.14, 15.15, 15.17, and 15.18.

37.2. Lemmas on étale localization

In this section we list some lemmas on étale localization which will be useful later in this chapter. Please skip this section on a first reading.

Lemma 37.2.1. *Let $i : Z \rightarrow X$ be a closed immersion of affine schemes. Let $Z' \rightarrow Z$ be an étale morphism with Z' affine. Then there exists an étale morphism $X' \rightarrow X$ with X' affine such that $Z' \cong Z \times_X X'$ as schemes over Z .*

Proof. See Algebra, Lemma 10.138.11. □

Lemma 37.2.2. *Let*

$$\begin{array}{ccc} X & \longleftarrow & X' \\ \downarrow & & \downarrow \\ S & \longleftarrow & S' \end{array}$$

be a commutative diagram of schemes with $X' \rightarrow X$ and $S' \rightarrow S$ étale. Let $s' \in S'$ be a point. Then

$$X' \times_{S'} \text{Spec}(\mathcal{O}_{S',s'}) \longrightarrow X \times_S \text{Spec}(\mathcal{O}_{S',s'})$$

is étale.

Proof. This is true because $X' \rightarrow X_{S'}$ is étale as a morphism of schemes étale over X , see Morphisms, Lemma 28.37.18 and the base change of an étale morphism is étale, see Morphisms, Lemma 28.37.4. \square

Lemma 37.2.3. *Let $X \rightarrow T \rightarrow S$ be morphisms of schemes with $T \rightarrow S$ étale. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in X$ be a point. Then*

$$\mathcal{F} \text{ flat over } S \text{ at } x \Leftrightarrow \mathcal{F} \text{ flat over } T \text{ at } x$$

In particular \mathcal{F} is flat over S if and only if \mathcal{F} is flat over T .

Proof. As an étale morphism is a flat morphism (see Morphisms, Lemma 28.37.12) the implication “ \Leftarrow ” follows from Algebra, Lemma 10.38.3. For the converse assume that \mathcal{F} is flat at x over S . Denote $\tilde{x} \in X \times_S T$ the point lying over x in X and over the image of x in T in T . Then $(X \times_S T \rightarrow X)^*\mathcal{F}$ is flat at \tilde{x} over T via $\text{pr}_2 : X \times_S T \rightarrow T$, see Morphisms, Lemma 28.26.6. The diagonal $\Delta_{T/S} : T \rightarrow T \times_S T$ is an open immersion; combine Morphisms, Lemmas 28.36.13 and 28.37.5. So X is identified with open subscheme of $X \times_S T$, the restriction of pr_2 to this open is the given morphism $X \rightarrow T$, the point \tilde{x} corresponds to the point x in this open, and $(X \times_S T \rightarrow X)^*\mathcal{F}$ restricted to this open is \mathcal{F} . Whence we see that \mathcal{F} is flat at x over T . \square

Lemma 37.2.4. *Let $T \rightarrow S$ be an étale morphism. Let $t \in T$ with image $s \in S$. Let M be a $\mathcal{O}_{T,t}$ -module. Then*

$$M \text{ flat over } \mathcal{O}_{S,s} \Leftrightarrow M \text{ flat over } \mathcal{O}_{T,t}.$$

Proof. We may replace S by an affine neighbourhood of s and after that T by an affine neighbourhood of t . Set $\mathcal{F} = (\text{Spec}(\mathcal{O}_{T,t}) \rightarrow T)_*\widetilde{M}$. This is a quasi-coherent sheaf (see Schemes, Lemma 25.24.1 or argue directly) on T whose stalk at t is M (details omitted). Apply Lemma 37.2.3. \square

Lemma 37.2.5. *Let S be a scheme and $s \in S$ a point. Denote $\mathcal{O}_{S,s}^h$ (resp. $\mathcal{O}_{S,s}^{sh}$) the henselization (resp. strict henselization), see Algebra, Definition 10.145.18. Let M^{sh} be a $\mathcal{O}_{S,s}^{sh}$ -module. The following are equivalent*

- (1) M^{sh} is flat over $\mathcal{O}_{S,s}$,
- (2) M^{sh} is flat over $\mathcal{O}_{S,s}^h$, and
- (3) M^{sh} is flat over $\mathcal{O}_{S,s}^{sh}$.

If $M^{sh} = M^h \otimes_{\mathcal{O}_{S,s}^h} \mathcal{O}_{S,s}^{sh}$ this is also equivalent to

- (4) M^h is flat over $\mathcal{O}_{S,s}$, and
- (5) M^h is flat over $\mathcal{O}_{S,s}^h$.

If $M^h = M \otimes_{\mathcal{O}_{S,s}} \mathcal{O}_{S,s}^h$ this is also equivalent to

- (6) M is flat over $\mathcal{O}_{S,s}$.

Proof. We may assume that S is an affine scheme. It is shown in Algebra, Lemmas 10.145.21 and 10.145.27 that $\mathcal{O}_{S,s}^h$ and $\mathcal{O}_{S,s}^{sh}$ are filtered colimits of the rings $\mathcal{O}_{T,t}$ where $T \rightarrow S$ is étale and affine. Hence the local ring maps $\mathcal{O}_{S,s} \rightarrow \mathcal{O}_{S,s}^h \rightarrow \mathcal{O}_{S,s}^{sh}$ are flat as directed colimits of étale ring maps, see Algebra, Lemma 10.38.2. Hence (3) \Rightarrow (2) \Rightarrow (1) and (5) \Rightarrow (4) follow from Algebra, Lemma 10.38.3. Of course these maps are faithfully flat, see Algebra, Lemma 10.38.16. Hence the equivalences

(6) \Leftrightarrow (5) and (5) \Leftrightarrow (3) follow from Algebra, Lemma 10.38.7. Thus it suffices to show that (1) \Rightarrow (2) \Rightarrow (3) and (4) \Rightarrow (5).

Assume (1). By Lemma 37.2.4 we see that M^{sh} is flat over $\mathcal{O}_{T,t}$ for any étale neighbourhood $(T,t) \rightarrow (S,s)$. Since $\mathcal{O}_{S,s}^h$ and $\mathcal{O}_{S,s}^{sh}$ are directed colimits of local rings of the form $\mathcal{O}_{T,t}$ (see above) we conclude that M^{sh} is flat over $\mathcal{O}_{S,s}^h$ and $\mathcal{O}_{S,s}^{sh}$ by Algebra, Lemma 10.38.5. Thus (1) implies (2) and (3). Of course this implies also (2) \Rightarrow (3) by replacing $\mathcal{O}_{S,s}$ by $\mathcal{O}_{S,s}^h$. The same argument applies to prove (4) \Rightarrow (5). \square

Lemma 37.2.6. *Let $g : T \rightarrow S$ be a finite flat morphism of schemes. Let \mathcal{G} be a quasi-coherent \mathcal{O}_S -module. Let $t \in T$ be a point with image $s \in S$. Then*

$$t \in \text{WeakAss}(g^*\mathcal{G}) \Leftrightarrow s \in \text{WeakAss}(\mathcal{G})$$

Proof. The implication “ \Leftarrow ” follows immediately from Divisors, Lemma 30.6.4. Assume $t \in \text{WeakAss}(g^*\mathcal{G})$. Let $\text{Spec}(A) \subset S$ be an affine open neighbourhood of s . Let \mathcal{G} be the quasi-coherent sheaf associated to the A -module M . Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s . As g is finite flat we have $g^{-1}(\text{Spec}(A)) = \text{Spec}(B)$ for some finite flat A -algebra B . Note that $g^*\mathcal{G}$ is the quasi-coherent $\mathcal{O}_{\text{Spec}(B)}$ -module associated to the B -module $M \otimes_A B$ and $g_*g^*\mathcal{G}$ is the quasi-coherent $\mathcal{O}_{\text{Spec}(A)}$ -module associated to the A -module $M \otimes_A B$. By Algebra, Lemma 10.75.4 we have $B_{\mathfrak{p}} \cong A_{\mathfrak{p}}^{\oplus n}$ for some integer $n \geq 0$. Note that $n \geq 1$ as we assumed there exists at least one point of T lying over s . Hence we see by looking at stalks that

$$s \in \text{WeakAss}(\mathcal{G}) \Leftrightarrow s \in \text{WeakAss}(g_*g^*\mathcal{G})$$

Now the assumption that $t \in \text{WeakAss}(g^*\mathcal{G})$ implies that $s \in \text{WeakAss}(g_*g^*\mathcal{G})$ by Divisors, Lemma 30.6.3 and hence by the above $s \in \text{WeakAss}(\mathcal{G})$. \square

Lemma 37.2.7. *Let $h : U \rightarrow S$ be an étale morphism of schemes. Let \mathcal{G} be a quasi-coherent \mathcal{O}_S -module. Let $u \in U$ be a point with image $s \in S$. Then*

$$u \in \text{WeakAss}(h^*\mathcal{G}) \Leftrightarrow s \in \text{WeakAss}(\mathcal{G})$$

Proof. After replacing S and U by affine neighbourhoods of s and u we may assume that g is a standard étale morphism of affines, see Morphisms, Lemma 28.37.14. Thus we may assume $S = \text{Spec}(A)$ and $X = \text{Spec}(A[x, 1/g]/(f))$, where f is monic and f' is invertible in $A[x, 1/g]$. Note that $A[x, 1/g]/(f) = (A[x]/(f))_g$ is also the localization of the finite free A -algebra $A[x]/(f)$. Hence we may think of U as an open subscheme of the scheme $T = \text{Spec}(A[x]/(f))$ which is finite locally free over S . This reduces us to Lemma 37.2.6 above. \square

37.3. The local structure of a finite type module

The key technical lemma that makes a lot of the arguments in this chapter work is the geometric Lemma 37.3.2.

Lemma 37.3.1. *Let $f : X \rightarrow S$ be a finite type morphism of affine schemes. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Let $x \in X$ with image $s = f(x)$ in S . Set $\mathcal{F}_s = \mathcal{F}|_{X_s}$. Then there exist a closed immersion $i : Z \rightarrow X$ of finite presentation, and a quasi-coherent finite type \mathcal{O}_Z -module \mathcal{G} such that $i_*\mathcal{G} = \mathcal{F}$ and $Z_s = \text{Supp}(\mathcal{F}_s)$.*

Proof. Say the morphism $f : X \rightarrow S$ is given by the ring map $A \rightarrow B$ and that \mathcal{F} is the quasi-coherent sheaf associated to the B -module M . By Morphisms, Lemma 28.16.2 we know that $A \rightarrow B$ is a finite type ring map, and by Properties, Lemma 27.16.1 we know that M is a finite B -module. In particular the support of \mathcal{F} is the closed subscheme of $\text{Spec}(B)$ cut out by the annihilator $I = \{x \in B \mid xm = 0 \ \forall m \in M\}$ of M , see Algebra, Lemma 10.39.5. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x and let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s . Note that $X_s = \text{Spec}(B \otimes_A \kappa(\mathfrak{p}))$ and that \mathcal{F}_s is the quasi-coherent sheaf associated to the $B \otimes_A \kappa(\mathfrak{p})$ module $M \otimes_A \kappa(\mathfrak{p})$. By Morphisms, Lemma 28.5.3 the support of \mathcal{F}_s is equal to $V(I(B \otimes_A \kappa(\mathfrak{p})))$. Since $B \otimes_A \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$ there exist finitely many elements $f_1, \dots, f_m \in I$ such that

$$I(B \otimes_A \kappa(\mathfrak{p})) = (f_1, \dots, f_m)(B \otimes_A \kappa(\mathfrak{p})).$$

Denote $Z \subset X$ the closed subscheme cut out by (f_1, \dots, f_m) , in a formula $Z = \text{Spec}(B/(f_1, \dots, f_m))$. Since M is annihilated by I we can think of M as an $B/(f_1, \dots, f_m)$ -module. In other words, \mathcal{F} is the pushforward of a finite type module on Z . As $Z_s = \text{Supp}(\mathcal{F}_s)$ by construction, this proves the lemma. \square

Lemma 37.3.2. *Let $f : X \rightarrow S$ be morphism of schemes which is locally of finite type. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Let $x \in X$ with image $s = f(x)$ in S . Set $\mathcal{F}_s = \mathcal{F}|_{X_s}$ and $n = \dim_x(\text{Supp}(\mathcal{F}_s))$. Then we can construct*

- (1) elementary étale neighbourhoods $g : (X', x') \rightarrow (X, x)$, $e : (S', s') \rightarrow (S, s)$,
- (2) a commutative diagram

$$\begin{array}{ccccc}
 X & \xleftarrow{g} & X' & \xleftarrow{i} & Z' \\
 \downarrow f & & \downarrow & & \downarrow \pi \\
 & & & & Y' \\
 & & & & \downarrow h \\
 S & \xleftarrow{e} & S' & \xlongequal{\quad} & S'
 \end{array}$$

- (3) a point $z' \in Z'$ with $i(z') = x'$, $y' = \pi(z')$, $h(y') = s'$,
- (4) a finite type quasi-coherent $\mathcal{O}_{Z'}$ -module \mathcal{G} ,

such that the following properties hold

- (1) X', Z', Y', S' are affine schemes,
- (2) i is a closed immersion of finite presentation,
- (3) $i_*(\mathcal{G}) \cong g^*\mathcal{F}$,
- (4) π is finite and $\pi^{-1}(\{y'\}) = \{z'\}$,
- (5) the extension $\kappa(s') \subset \kappa(y')$ is purely transcendental,
- (6) h is smooth of relative dimension n with geometrically integral fibres.

Proof. Let $V \subset S$ be an affine neighbourhood of s . Let $U \subset f^{-1}(V)$ be an affine neighbourhood of x . Then it suffices to prove the lemma for $f|_U : U \rightarrow V$ and $\mathcal{F}|_U$. Hence in the rest of the proof we assume that X and S are affine.

First, suppose that $X_s = \text{Supp}(\mathcal{F}_s)$, in particular $n = \dim_x(X_s)$. Apply More on Morphisms, Lemmas 36.33.2 and 36.33.3. This gives us a commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{g} & X' \\ \downarrow & & \downarrow \pi \\ & & Y' \\ & & \downarrow h \\ S & \xleftarrow{e} & S' \end{array}$$

and point $x' \in X'$. We set $Z' = X'$, $i = \text{id}$, and $\mathcal{G} = g^*\mathcal{F}$ to obtain a solution in this case.

In general choose a closed immersion $Z \rightarrow X$ and a sheaf \mathcal{G} on Z as in Lemma 37.3.1. Applying the result of the previous paragraph to $Z \rightarrow S$ and \mathcal{G} we obtain a diagram

$$\begin{array}{ccccc} X & \xleftarrow{\quad} & Z & \xleftarrow{g} & Z' \\ \downarrow f & & \downarrow f|_Z & & \downarrow \pi \\ & & & & Y' \\ & & & & \downarrow h \\ S & \xlongequal{\quad} & S & \xleftarrow{e} & S' \end{array}$$

and point $z' \in Z'$ satisfying all the required properties. We will use Lemma 37.2.1 to embed Z' into a scheme étale over X . We cannot apply the lemma directly as we want X' to be a scheme over S' . Instead we consider the morphisms

$$Z' \longrightarrow Z \times_S S' \longrightarrow X \times_S S'$$

The first morphism is étale by Morphisms, Lemma 28.37.18. The second is a closed immersion as a base change of a closed immersion. Finally, as X, S, S', Z, Z' are all affine we may apply Lemma 37.2.1 to get an étale morphism of affine schemes $X' \rightarrow X \times_S S'$ such that

$$Z' = (Z \times_S S') \times_{(X \times_S S')} X' = Z \times_X X'.$$

As $Z \rightarrow X$ is a closed immersion of finite presentation, so is $Z' \rightarrow X'$. Let $x' \in X'$ be the point corresponding to $z' \in Z'$. Then the completed diagram

$$\begin{array}{ccccc} X & \xleftarrow{\quad} & X' & \xleftarrow{i} & Z' \\ \downarrow & & \downarrow & & \downarrow \pi \\ & & & & Y' \\ & & & & \downarrow h \\ S & \xleftarrow{e} & S' & \xlongequal{\quad} & S' \end{array}$$

is a solution of the original problem. □

Lemma 37.3.3. *Assumptions and notation as in Lemma 37.3.2. If f is locally of finite presentation then π is of finite presentation. In this case the following are equivalent*

- (1) \mathcal{F} is an \mathcal{O}_X -module of finite presentation in a neighbourhood of x ,
- (2) \mathcal{G} is an $\mathcal{O}_{Z'}$ -module of finite presentation in a neighbourhood of z' , and
- (3) $\pi_*\mathcal{G}$ is an $\mathcal{O}_{Y'}$ -module of finite presentation in a neighbourhood of y' .

Still assuming f locally of finite presentation the following are equivalent to each other

- (a) \mathcal{F}_x is an $\mathcal{O}_{X,x}$ -module of finite presentation,
- (b) $\mathcal{G}_{z'}$ is an $\mathcal{O}_{Z',z'}$ -module of finite presentation, and
- (c) $(\pi_*\mathcal{G})_{y'}$ is an $\mathcal{O}_{Y',y'}$ -module of finite presentation.

Proof. Assume f locally of finite presentation. Then $Z' \rightarrow S$ is locally of finite presentation as a composition of such, see Morphisms, Lemma 28.22.3. Note that $Y' \rightarrow S$ is also locally of finite presentation as a composition of a smooth and an étale morphism. Hence Morphisms, Lemma 28.22.11 implies π is locally of finite presentation. Since π is finite we conclude that it is also separated and quasi-compact, hence π is actually of finite presentation.

To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^*\mathcal{F}$ is a $\mathcal{O}_{X'}$ -module of finite presentation in a neighbourhood of x' . The pullback of a module of finite presentation is of finite presentation, see Modules, Lemma 17.11.4. Hence (1) \Rightarrow (4). The étale morphism g is open, see Morphisms, Lemma 28.37.13. Hence for any open neighbourhood $U' \subset X'$ of x' , the image $g(U')$ is an open neighbourhood of x and the map $\{U' \rightarrow g(U')\}$ is an étale covering. Thus (4) \Rightarrow (1) by Descent, Lemma 34.6.3. Using Descent, Lemma 34.6.10 and some easy topological arguments (see More on Morphisms, Lemma 36.33.4) we see that (4) \Leftrightarrow (2) \Leftrightarrow (3).

To prove the equivalence of (a), (b), (c) consider the ring maps

$$\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{X',x'} \rightarrow \mathcal{O}_{Z',z'} \leftarrow \mathcal{O}_{Y',y'}$$

The first ring map is faithfully flat. Hence \mathcal{F}_x is of finite presentation over $\mathcal{O}_{X,x}$ if and only if $g^*\mathcal{F}_{x'}$ is of finite presentation over $\mathcal{O}_{X',x'}$, see Algebra, Lemma 10.80.2. The second ring map is surjective (hence finite) and finitely presented by assumption, hence $g^*\mathcal{F}_{x'}$ is of finite presentation over $\mathcal{O}_{X',x'}$ if and only if $\mathcal{G}_{z'}$ is of finite presentation over $\mathcal{O}_{Z',z'}$, see Algebra, Lemma 10.7.4. Because π is finite, of finite presentation, and $\pi^{-1}(\{y'\}) = \{x'\}$ the ring homomorphism $\mathcal{O}_{Y',y'} \leftarrow \mathcal{O}_{Z',z'}$ is finite and of finite presentation, see More on Morphisms, Lemma 36.33.4. Hence $\mathcal{G}_{z'}$ is of finite presentation over $\mathcal{O}_{Z',z'}$ if and only if $\pi_*\mathcal{G}_{y'}$ is of finite presentation over $\mathcal{O}_{Y',y'}$, see Algebra, Lemma 10.7.4. \square

Lemma 37.3.4. *Assumptions and notation as in Lemma 37.3.2. The following are equivalent*

- (1) \mathcal{F} is flat over S in a neighbourhood of x ,
- (2) \mathcal{G} is flat over S' in a neighbourhood of z' , and
- (3) $\pi_*\mathcal{G}$ is flat over S' in a neighbourhood of y' .

The following are equivalent also

- (a) \mathcal{F}_x is flat over $\mathcal{O}_{S,s}$,
- (b) $\mathcal{G}_{z'}$ is flat over $\mathcal{O}_{S',s'}$, and
- (c) $(\pi_*\mathcal{G})_{y'}$ is flat over $\mathcal{O}_{S',s'}$.

Proof. To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^*\mathcal{F}$ is flat over S in a neighbourhood of x' . We will use Lemma 37.2.3 to equate flatness over S and S' without further mention. The étale morphism g is flat and open,

see Morphisms, Lemma 28.37.13. Hence for any open neighbourhood $U' \subset X'$ of x' , the image $g(U')$ is an open neighbourhood of x and the map $U' \rightarrow g(U')$ is surjective and flat. Thus (4) \Leftrightarrow (1) by Morphisms, Lemma 28.26.11. Note that

$$\Gamma(X', g^* \mathcal{F}) = \Gamma(Z', \mathcal{G}) = \Gamma(Y', \pi_* \mathcal{G})$$

Hence the flatness of $g^* \mathcal{F}$, \mathcal{G} and $\pi_* \mathcal{G}$ over S' are all equivalent (this uses that X' , Z' , Y' , and S' are all affine). Some omitted topological arguments (compare More on Morphisms, Lemma 36.33.4) regarding affine neighbourhoods now show that (4) \Leftrightarrow (2) \Leftrightarrow (3).

To prove the equivalence of (a), (b), (c) consider the commutative diagram of local ring maps

$$\begin{array}{ccccccc} \mathcal{O}_{X',x'} & \xrightarrow{\iota} & \mathcal{O}_{Z',z'} & \xleftarrow{\alpha} & \mathcal{O}_{Y',y'} & \xleftarrow{\beta} & \mathcal{O}_{S',s'} \\ & \uparrow \gamma & & & & & \uparrow \epsilon \\ \mathcal{O}_{X,x} & & & \xleftarrow{\varphi} & & & \mathcal{O}_{S,s} \end{array}$$

We will use Lemma 37.2.4 to equate flatness over $\mathcal{O}_{S,s}$ and $\mathcal{O}_{S',s'}$ without further mention. The map γ is faithfully flat. Hence \mathcal{F}_x is flat over $\mathcal{O}_{S,s}$ if and only if $g^* \mathcal{F}_{x'}$ is flat over $\mathcal{O}_{S',s'}$, see Algebra, Lemma 10.38.8. As $\mathcal{O}_{S',s'}$ -modules the modules $g^* \mathcal{F}_{x'}$, $\mathcal{G}_{z'}$, and $\pi_* \mathcal{G}_{y'}$ are all isomorphic, see More on Morphisms, Lemma 36.33.4. This finishes the proof. \square

37.4. One step dévissage

In this section we explain what is a one step dévissage of a module. A one step dévissage exist étale locally on base and target. We discuss base change, Zariski shrinking and étale localization of a one step dévissage.

Definition 37.4.1. Let S be a scheme. Let X be locally of finite type over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. Let $s \in S$ be a point. A *one step dévissage of $\mathcal{F}/X/S$ over s* is given by morphisms of schemes over S

$$X \xleftarrow{i} Z \xrightarrow{\pi} Y$$

and a quasi-coherent \mathcal{O}_Z -module \mathcal{G} of finite type such that

- (1) X, S, Z and Y are affine,
- (2) i is a closed immersion of finite presentation,
- (3) $\mathcal{F} \cong i_* \mathcal{G}$,
- (4) π is finite, and
- (5) the structure morphism $Y \rightarrow S$ is smooth with geometrically irreducible fibres of dimension $\dim(\text{Supp}(\mathcal{F}_s))$.

In this case we say $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F}/X/S$ over s .

Note that such a one step dévissage can only exist if X and S are affine. In the definition above we only require X to be (locally) of finite type over S and we continue working in this setting below. In [GR71] the authors use consistently the setup where $X \rightarrow S$ is locally of finite presentation and \mathcal{F} quasi-coherent \mathcal{O}_X -module of finite type. The advantage of this choice is that it “makes sense” to ask for \mathcal{F} to be of finite presentation as an \mathcal{O}_X -module, whereas in our setting it “does not make sense”. Please see More on Morphisms, Section 36.38 for a discussion; the observations made there show that in our setup we may consider the condition of \mathcal{F}

being “locally of finite presentation relative to S ”, and we could work consistently with this notion. Instead however, we will rely on the results of Lemma 37.3.3 and the observations in Remark 37.6.3 to deal with this issue in an ad hoc fashion whenever it comes up.

Definition 37.4.2. Let S be a scheme. Let X be locally of finite type over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. Let $x \in X$ be a point with image s in S . A one step dévissage of $\mathcal{F}/X/S$ at x is a system $(Z, Y, i, \pi, \mathcal{G}, z, y)$, where $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F}/X/S$ over s and

- (1) $\dim_x(\text{Supp}(\mathcal{F}_s)) = \dim(\text{Supp}(\mathcal{F}_s))$,
- (2) $z \in Z$ is a point with $i(z) = x$ and $\pi(z) = y$,
- (3) we have $\pi^{-1}(\{y\}) = \{z\}$,
- (4) the extension $\kappa(s) \subset \kappa(y)$ is purely transcendental.

A one step dévissage of $\mathcal{F}/X/S$ at x can only exist if X and S are affine. Condition (1) assures us that $Y \rightarrow S$ has relative dimension equal to $\dim_x(\text{Supp}(\mathcal{F}_s))$ via condition (5) of Definition 37.4.1.

Lemma 37.4.3. Let $f : X \rightarrow S$ be morphism of schemes which is locally of finite type. Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Let $x \in X$ with image $s = f(x)$ in S . Then there exists a commutative diagram of pointed schemes

$$\begin{array}{ccc} (X, x) & \xleftarrow{g} & (X', x') \\ f \downarrow & & \downarrow \\ (S, s) & \xleftarrow{\quad} & (S', s') \end{array}$$

such that $(S', s') \rightarrow (S, s)$ and $(X', x') \rightarrow (X, x)$ are elementary étale neighbourhoods, and such that $g^*\mathcal{F}/X'/S'$ has a one step dévissage at x' .

Proof. This is immediate from Definition 37.4.2 and Lemma 37.3.2. □

Lemma 37.4.4. Let S, X, \mathcal{F}, s be as in Definition 37.4.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F}/X/S$ over s . Let $(S', s') \rightarrow (S, s)$ be any morphism of pointed schemes. Given this data let X', Z', Y', i', π' be the base changes of X, Z, Y, i, π via $S' \rightarrow S$. Let \mathcal{F}' be the pullback of \mathcal{F} to X' and let \mathcal{G}' be the pullback of \mathcal{G} to Z' . If S' is affine, then $(Z', Y', i', \pi', \mathcal{G}')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ over s' .

Proof. Fibre products of affines are affine, see Schemes, Lemma 25.17.2. Base change preserves closed immersions, morphisms of finite presentation, finite morphisms, smooth morphisms, morphisms with geometrically irreducible fibres, and morphisms of relative dimension n , see Morphisms, Lemmas 28.2.4, 28.22.4, 28.44.6, 28.35.5, 28.30.2, and More on Morphisms, Lemma 36.22.2. We have $i'_*\mathcal{G}' \cong \mathcal{F}'$ because pushforward along the finite morphism i commutes with base change, see Cohomology of Schemes, Lemma 29.5.1. We have $\dim(\text{Supp}(\mathcal{F}_s)) = \dim(\text{Supp}(\mathcal{F}'_{s'}))$ by Morphisms, Lemma 28.29.3 because

$$\text{Supp}(\mathcal{F}_s) \times_s s' = \text{Supp}(\mathcal{F}'_{s'}).$$

This proves the lemma. □

Lemma 37.4.5. *Let S, X, \mathcal{F}, x, s be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x . Let $(S', s') \rightarrow (S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s) = \kappa(s')$. Let $(Z', Y', i', \pi', \mathcal{G}')$ be as constructed in Lemma 37.4.4 and let $x' \in X'$ (resp. $z' \in Z', y' \in Y'$) be the unique point mapping to both $x \in X$ (resp. $z \in Z, y \in Y$) and $s' \in S'$. If S' is affine, then $(Z', Y', i', \pi', \mathcal{G}', z', y')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ at x' .*

Proof. By Lemma 37.4.4 $(Z', Y', i', \pi', \mathcal{G}')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ over s' . Properties (1) – (4) of Definition 37.4.2 hold for $(Z', Y', i', \pi', \mathcal{G}', z', y')$ as the assumption that $\kappa(s) = \kappa(s')$ insures that the fibres $X'_{s'}, Z'_{s'}$, and $Y'_{s'}$ are isomorphic to X_s, Z_s , and Y_s . \square

Definition 37.4.6. Let S, X, \mathcal{F}, x, s be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x . Let us define a *standard shrinking* of this situation to be given by standard opens $S' \subset S, X' \subset X, Z' \subset Z$, and $Y' \subset Y$ such that $s \in S', x \in X', z \in Z'$, and $y \in Y'$ and such that

$$(Z', Y', i|_{Z'}, \pi|_{Z'}, \mathcal{G}|_{Z'}, z, y)$$

is a one step dévissage of $\mathcal{F}|_{X'}/X'/S'$ at x .

Lemma 37.4.7. *With assumption and notation as in Definition 37.4.6 we have:*

- (1) *If $S' \subset S$ is a standard open neighbourhood of s , then setting $X' = X_{S'}$, $Z' = Z_{S'}$ and $Y' = Y_{S'}$ we obtain a standard shrinking.*
- (2) *Let $W \subset Y$ be a standard open neighbourhood of y . Then there exists a standard shrinking with $Y' = W \times_S S'$.*
- (3) *Let $U \subset X$ be an open neighbourhood of x . Then there exists a standard shrinking with $X' \subset U$.*

Proof. Part (1) is immediate from Lemma 37.4.5 and the fact that the inverse image of a standard open under a morphism of affine schemes is a standard open, see Algebra, Lemma 10.16.4.

Let $W \subset Y$ as in (2). Because $Y \rightarrow S$ is smooth it is open, see Morphisms, Lemma 28.35.10. Hence we can find a standard open neighbourhood S' of s contained in the image of W . Then the fibres of $W_{S'} \rightarrow S'$ are nonempty open subschemes of the fibres of $Y \rightarrow S$ over S' and hence geometrically irreducible too. Setting $Y' = W_{S'}$ and $Z' = \pi^{-1}(Y')$ we see that $Z' \subset Z$ is a standard open neighbourhood of z . Let $\bar{h} \in \Gamma(Z, \mathcal{O}_Z)$ be a function such that $Z' = D(\bar{h})$. As $i : Z \rightarrow X$ is a closed immersion, we can find a function $h \in \Gamma(X, \mathcal{O}_X)$ such that $i^\#(h) = \bar{h}$. Take $X' = D(h) \subset X$. In this way we obtain a standard shrinking as in (2).

Let $U \subset X$ be as in (3). We may after shrinking U assume that U is a standard open. By More on Morphisms, Lemma 36.33.4 there exists a standard open $W \subset Y$ neighbourhood of y such that $\pi^{-1}(W) \subset i^{-1}(U)$. Apply (2) to get a standard shrinking X', S', Z', Y' with $Y' = W_{S'}$. Since $Z' \subset \pi^{-1}(W) \subset i^{-1}(U)$ we may replace X' by $X' \cap U$ (still a standard open as U is also standard open) without violating any of the conditions defining a standard shrinking. Hence we win. \square

Lemma 37.4.8. *Let S, X, \mathcal{F}, x, s be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x . Let*

$$\begin{array}{ccc} (Y, y) & \longleftarrow & (Y', y') \\ \downarrow & & \downarrow \\ (S, s) & \longleftarrow & (S', s') \end{array}$$

be a commutative diagram of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods. Then there exists a commutative diagram

$$\begin{array}{ccccc} & & (X'', x'') & \longleftarrow & (Z'', z'') \\ & \swarrow & \downarrow & \swarrow & \downarrow \\ (X, x) & \longleftarrow & (Z, z) & \longleftarrow & (S'', s'') & \longleftarrow & (Y'', y'') \\ \downarrow & & \downarrow & \swarrow & \downarrow & \swarrow & \downarrow \\ (S, s) & \longleftarrow & (Y, y) & \longleftarrow & (S', s') & \longleftarrow & (Y', y') \end{array}$$

of pointed schemes with the following properties:

- (1) $(S'', s'') \rightarrow (S', s')$ is an elementary étale neighbourhood and the morphism $S'' \rightarrow S$ is the composition $S'' \rightarrow S' \rightarrow S$,
- (2) Y'' is an open subscheme of $Y' \times_{S'} S''$,
- (3) $Z'' = Z \times_Y Y''$,
- (4) $(X'', x'') \rightarrow (X, x)$ is an elementary étale neighbourhood, and
- (5) $(Z'', Y'', i'', \pi'', \mathcal{G}'', z'', y'')$ is a one step dévissage at x'' of the sheaf \mathcal{F}'' .

Here \mathcal{F}'' (resp. \mathcal{G}'') is the pullback of \mathcal{F} (resp. \mathcal{G}) via the morphism $X'' \rightarrow X$ (resp. $Z'' \rightarrow Z$) and $i'' : Z'' \rightarrow X''$ and $\pi'' : Z'' \rightarrow Y''$ are as in the diagram.

Proof. Let $(S'', s'') \rightarrow (S', s')$ be any elementary étale neighbourhood with S'' affine. Let $Y'' \subset Y' \times_{S'} S''$ be any affine open neighbourhood containing the point $y'' = (y', s'')$. Then we obtain an affine (Z'', z'') by (3). Moreover $Z_{S''} \rightarrow X_{S''}$ is a closed immersion and $Z'' \rightarrow Z_{S''}$ is an étale morphism. Hence Lemma 37.2.1 applies and we can find an étale morphism $X'' \rightarrow X_{S'}$ of affines such that $Z'' \cong X'' \times_{X_{S'}} Z_{S'}$. Denote $i'' : Z'' \rightarrow X''$ the corresponding closed immersion. Setting $x'' = i''(z'')$ we obtain a commutative diagram as in the lemma. Properties (1), (2), (3), and (4) hold by construction. Thus it suffices to show that (5) holds for a suitable choice of $(S'', s'') \rightarrow (S', s')$ and Y'' .

We first list those properties which hold for any choice of $(S'', s'') \rightarrow (S', s')$ and Y'' as in the first paragraph. As we have $Z'' = X'' \times_X Z$ by construction we see that $i''_* \mathcal{G}'' = \mathcal{F}''$ (with notation as in the statement of the lemma), see Cohomology of Schemes, Lemma 29.5.1. Set $n = \dim(\text{Supp}(\mathcal{F}_s)) = \dim_x(\text{Supp}(\mathcal{F}_s))$. The morphism $Y'' \rightarrow S''$ is smooth of relative dimension n (because $Y' \rightarrow S'$ is smooth of relative dimension n as the composition $Y' \rightarrow Y_{S'} \rightarrow S'$ of an étale and smooth morphism of relative dimension n and because base change preserves smooth morphisms of relative dimension n). We have $\kappa(y'') = \kappa(y)$ and $\kappa(s) = \kappa(s'')$ hence $\kappa(y'')$ is a purely transcendental extension of $\kappa(s'')$. The morphism of fibres $X''_{s''} \rightarrow X_s$ is an étale morphism of affine schemes over $\kappa(s) = \kappa(s'')$ mapping the point x'' to the

point x and pulling back \mathcal{F}_s to $\mathcal{F}_{s''}$. Hence

$$\dim(\text{Supp}(\mathcal{F}_{s''})) = \dim(\text{Supp}(\mathcal{F}_s)) = n = \dim_x(\text{Supp}(\mathcal{F}_s)) = \dim_{x''}(\text{Supp}(\mathcal{F}_{s''}))$$

because dimension is invariant under étale localization, see Descent, Lemma 34.17.2. As $\pi'' : Z'' \rightarrow Y''$ is the base change of π we see that π'' is finite and as $\kappa(y) = \kappa(y'')$ we see that $\pi^{-1}(\{y''\}) = \{z''\}$.

At this point we have verified all the conditions of Definition 37.4.1 except we have not verified that $Y'' \rightarrow S''$ has geometrically irreducible fibres. Of course in general this is not going to be true, and it is at this point that we will use that $\kappa(s) \subset \kappa(y)$ is purely transcendental. Namely, let $T \subset Y'_s$ be the irreducible component of Y'_s containing $y' = (y, s')$. Note that T is an open subscheme of Y'_s as this is a smooth scheme over $\kappa(s')$. By Varieties, Lemma 32.5.14 we see that T is geometrically connected because $\kappa(s') = \kappa(s)$ is algebraically closed in $\kappa(y') = \kappa(y)$. As T is smooth we see that T is geometrically irreducible. Hence More on Morphisms, Lemma 36.32.3 applies and we can find an elementary étale morphism $(S'', s'') \rightarrow (S', s')$ and an affine open $Y'' \subset Y'_{s''}$ such that all fibres of $Y'' \rightarrow S''$ are geometrically irreducible and such that $T = Y'_{s''}$. After shrinking (first Y'' and then S'') we may assume that both Y'' and S'' are affine. This finishes the proof of the lemma. \square

Lemma 37.4.9. *Let S, X, \mathcal{F}, s be as in Definition 37.4.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F}/X/S$ over s . Let $\xi \in Y_s$ be the (unique) generic point. Then there exists an integer $r > 0$ and an \mathcal{O}_Y -module map*

$$\alpha : \mathcal{O}_Y^{\oplus r} \longrightarrow \pi_* \mathcal{G}$$

such that

$$\alpha : \kappa(\xi)^{\oplus r} \longrightarrow (\pi_* \mathcal{G})_{\xi} \otimes_{\mathcal{O}_{Y, \xi}} \kappa(\xi)$$

is an isomorphism. Moreover, in this case we have

$$\dim(\text{Supp}(\text{Coker}(\alpha)_s)) < \dim(\text{Supp}(\mathcal{F}_s)).$$

Proof. By assumption the schemes S and Y are affine. Write $S = \text{Spec}(A)$ and $Y = \text{Spec}(B)$. As π is finite the \mathcal{O}_Y -module $\pi_* \mathcal{G}$ is a finite type quasi-coherent \mathcal{O}_Y -module. Hence $\pi_* \mathcal{G} = \tilde{N}$ for some finite B -module N . Let $\mathfrak{p} \subset B$ be the prime ideal corresponding to ξ . To obtain α set $r = \dim_{\kappa(\mathfrak{p})} N \otimes_B \kappa(\mathfrak{p})$ and pick $x_1, \dots, x_r \in N$ which form a basis of $N \otimes_B \kappa(\mathfrak{p})$. Take $\alpha : B^{\oplus r} \rightarrow N$ to be the map given by the formula $\alpha(b_1, \dots, b_r) = \sum b_i x_i$. It is clear that $\alpha : \kappa(\mathfrak{p})^{\oplus r} \rightarrow N \otimes_B \kappa(\mathfrak{p})$ is an isomorphism as desired. Finally, suppose α is any map with this property. Then $N' = \text{Coker}(\alpha)$ is a finite B -module such that $N' \otimes_B \kappa(\mathfrak{p}) = 0$. By Nakayama's lemma (Algebra, Lemma 10.19.1) we see that $N'_\mathfrak{p} = 0$. Since the fibre Y_s is geometrically irreducible of dimension n with generic point ξ and since we have just seen that ξ is not in the support of $\text{Coker}(\alpha)$ the last assertion of the lemma holds. \square

37.5. Complete dévissage

In this section we explain what is a complete dévissage of a module and prove that such exist. The material in this section is mainly bookkeeping.

Definition 37.5.1. Let S be a scheme. Let X be locally of finite type over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. Let $s \in S$ be a point. A *complete dévissage of $\mathcal{F}/X/S$ over s* is given by a diagram

of schemes over S , finite type quasi-coherent \mathcal{O}_{Z_k} -modules \mathcal{G}_k , and \mathcal{O}_{Y_k} -module maps

$$\alpha_k : \mathcal{O}_{Y_k}^{\oplus r_k} \longrightarrow \pi_{k,*}\mathcal{G}_k, \quad k = 1, \dots, n$$

satisfying the following properties:

- (1) $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ is a one step dévissage of $\mathcal{F}/X/S$ over s ,
- (2) the map α_k induces an isomorphism

$$\kappa(\xi_k)^{\oplus r_k} \longrightarrow (\pi_{k,*}\mathcal{G}_k)_{\xi_k} \otimes_{\mathcal{O}_{Y_k, \xi_k}} \kappa(\xi_k)$$

- where $\xi_k \in (Y_k)_s$ is the unique generic point,
- (3) for $k = 2, \dots, n$ the system $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k)$ is a one step dévissage of $\text{Coker}(\alpha_{k-1})/Y_{k-1}/S$ over s ,
- (4) $\text{Coker}(\alpha_n) = 0$.

In this case we say that $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)_{k=1, \dots, n}$ is a complete dévissage of $\mathcal{F}/X/S$ over s .

Definition 37.5.2. Let S be a scheme. Let X be locally of finite type over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module of finite type. Let $x \in X$ be a point with image $s \in S$. A *complete dévissage of $\mathcal{F}/X/S$ at x* is given by a system

$$(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1, \dots, n}$$

such that $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)$ is a complete dévissage of $\mathcal{F}/X/S$ over s , and such that

- (1) $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1, z_1, y_1)$ is a one step dévissage of $\mathcal{F}/X/S$ at x ,
- (2) for $k = 2, \dots, n$ the system $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, z_k, y_k)$ is a one step dévissage of $\text{Coker}(\alpha_{k-1})/Y_{k-1}/S$ at y_{k-1} .

Again we remark that a complete dévissage can only exist if X and S are affine.

Lemma 37.5.3. Let S, X, \mathcal{F}, s be as in Definition 37.5.1. Let $(S', s') \rightarrow (S, s)$ be any morphism of pointed schemes. Let $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)_{k=1, \dots, n}$ be a complete dévissage of $\mathcal{F}/X/S$ over s . Given this data let $X', Z'_k, Y'_k, i'_k, \pi'_k$ be the base changes of X, Z_k, Y_k, i_k, π_k via $S' \rightarrow S$. Let \mathcal{F}' be the pullback of \mathcal{F} to X' and let \mathcal{G}'_k be

the pullback of \mathcal{G}_k to Z'_k . Let α'_k be the pullback of α_k to Y'_k . If S' is affine, then $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k)_{k=1, \dots, n}$ is a complete dévissage of $\mathcal{F}'/X'/S'$ over s' .

Proof. By Lemma 37.4.4 we know that the base change of a one step dévissage is a one step dévissage. Hence it suffices to prove that formation of $\text{Coker}(\alpha_k)$ commutes with base change and that condition (2) of Definition 37.5.1 is preserved by base change. The first is true as $\pi'_{k,*} \mathcal{G}'_k$ is the pullback of $\pi_{k,*} \mathcal{G}_k$ (by Cohomology of Schemes, Lemma 29.5.1) and because \otimes is right exact. The second because by the same token we have

$$(\pi_{k,*} \mathcal{G}_k)_{\xi_k} \otimes_{\mathcal{O}_{Y_k, \xi_k}} \kappa(\xi_k) \otimes_{\kappa(\xi_k)} \kappa(\xi'_k) \cong (\pi'_{k,*} \mathcal{G}'_k)_{\xi'_k} \otimes_{\mathcal{O}_{Y'_k, \xi'_k}} \kappa(\xi'_k)$$

with obvious notation. □

Lemma 37.5.4. *Let S, X, \mathcal{F}, x, s be as in Definition 37.5.2. Let $(S', s') \rightarrow (S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s) = \kappa(s')$. Let $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1, \dots, n}$ be a complete dévissage of $\mathcal{F}/X/S$ at x . Let $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k)_{k=1, \dots, n}$ be as constructed in Lemma 37.5.3 and let $x' \in X'$ (resp. $z'_k \in Z'_k, y'_k \in Y'_k$) be the unique point mapping to both $x \in X$ (resp. $z_k \in Z_k, y_k \in Y_k$) and $s' \in S'$. If S' is affine, then $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k, z'_k, y'_k)_{k=1, \dots, n}$ is a complete dévissage of $\mathcal{F}'/X'/S'$ at x' .*

Proof. Combine Lemma 37.5.3 and Lemma 37.4.5. □

Definition 37.5.5. Let S, X, \mathcal{F}, x, s be as in Definition 37.5.2. Consider a complete dévissage $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1, \dots, n}$ of $\mathcal{F}/X/S$ at x . Let us define a *standard shrinking* of this situation to be given by standard opens $S' \subset S, X' \subset X, Z'_k \subset Z_k$, and $Y'_k \subset Y_k$ such that $s_k \in S', x_k \in X', z_k \in Z',$ and $y_k \in Y'$ and such that

$$(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k, z_k, y_k)_{k=1, \dots, n}$$

is a one step dévissage of $\mathcal{F}'/X'/S'$ at x where $\mathcal{G}'_k = \mathcal{G}_k|_{Z'_k}$ and $\mathcal{F}' = \mathcal{F}|_{X'}$.

Lemma 37.5.6. *With assumption and notation as in Definition 37.5.5 we have:*

- (1) *If $S' \subset S$ is a standard open neighbourhood of s , then setting $X' = X_{S'}, Z'_k = Z_{S'},$ and $Y'_k = Y_{S'}$ we obtain a standard shrinking.*
- (2) *Let $W \subset Y_n$ be a standard open neighbourhood of y . Then there exists a standard shrinking with $Y'_n = W \times_S S'$.*
- (3) *Let $U \subset X$ be an open neighbourhood of x . Then there exists a standard shrinking with $X' \subset U$.*

Proof. Part (1) is immediate from Lemmas 37.5.4 and 37.4.7.

Proof of (2). For convenience denote $X = Y_0$. We apply Lemma 37.4.7 (2) to find a standard shrinking S', Y'_{n-1}, Z'_n, Y'_n of the one step dévissage of $\text{Coker}(\alpha_{n-1})/Y_{n-1}/S$ at y_{n-1} with $Y'_n = W \times_S S'$. We may repeat this procedure and find a standard shrinking $S'', Y''_{n-2}, Z''_{n-1}, Y''_{n-1}$ of the one step dévissage of $\text{Coker}(\alpha_{n-2})/Y_{n-2}/S$ at y_{n-2} with $Y''_{n-1} = Y'_{n-1} \times_S S''$. We may continue in this manner until we obtain $S^{(n)}, Y_0^{(n)}, Z_1^{(n)}, Y_1^{(n)}$. At this point it is clear that we obtain our desired standard shrinking by taking $S^{(n)}, X^{(n)}, Z_k^{(n-k)} \times_S S^{(n)},$ and $Y_k^{(n-k)} \times_S S^{(n)}$ with the desired property.

Proof of (3). We use induction on the length of the complete dévissage. First we apply Lemma 37.4.7 (3) to find a standard shrinking S', X', Z'_1, Y'_1 of the one

step dévissage of $\mathcal{F}/X/S$ at x with $X' \subset U$. If $n = 1$, then we are done. If $n > 1$, then by induction we can find a standard shrinking $S'', Y_1'', Z_k'',$ and Y_k'' of the complete dévissage $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=2, \dots, n}$ of $\text{Coker}(\alpha_1)/Y_1/S$ at x such that $Y_1'' \subset Y_1'$. Using Lemma 37.4.7 (2) we can find $S''' \subset S', X''' \subset X', Z_1'''$ and $Y_1''' = Y_1'' \times_S S'''$ which is a standard shrinking. The solution to our problem is to take

$$S''', X''', Z_1''', Y_1''', Z_2'' \times_S S''', Y_2'' \times_S S''', \dots, Z_n'' \times_S S''', Y_n'' \times_S S'''$$

This ends the proof of the lemma. □

Proposition 37.5.7. *Let S be a scheme. Let X be locally of finite type over S . Let $x \in X$ be a point with image $s \in S$. There exists a commutative diagram*

$$\begin{array}{ccc} (X, x) & \xleftarrow{g} & (X', x') \\ \downarrow & & \downarrow \\ (S, s) & \xleftarrow{\quad} & (S', s') \end{array}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a complete dévissage at x .

Proof. We prove this by induction on the integer $d = \dim_x(\text{Supp}(\mathcal{F}_s))$. By Lemma 37.4.3 there exists a diagram

$$\begin{array}{ccc} (X, x) & \xleftarrow{g} & (X', x') \\ \downarrow & & \downarrow \\ (S, s) & \xleftarrow{\quad} & (S', s') \end{array}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a one step dévissage at x' . The local nature of the problem implies that we may replace $(X, x) \rightarrow (S, s)$ by $(X', x') \rightarrow (S', s')$. Thus after doing so we may assume that there exists a one step dévissage $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ of $\mathcal{F}/X/S$ at x .

We apply Lemma 37.4.9 to find a map

$$\alpha_1 : \mathcal{O}_{Y_1}^{\oplus r_1} \longrightarrow \pi_{1,*}\mathcal{G}_1$$

which induces an isomorphism of vector spaces over $\kappa(\xi_1)$ where $\xi_1 \in Y_1$ is the unique generic point of the fibre of Y_1 over s . Moreover $\dim_{y_1}(\text{Supp}(\text{Coker}(\alpha_1)_s)) < d$. It may happen that the stalk of $\text{Coker}(\alpha_1)_s$ at y_1 is zero. In this case we may shrink Y_1 by Lemma 37.4.7 (2) and assume that $\text{Coker}(\alpha_1) = 0$ so we obtain a complete dévissage of length zero.

Assume now that the stalk of $\text{Coker}(\alpha_1)_s$ at y_1 is not zero. In this case, by induction, there exists a commutative diagram

$$(37.5.7.1) \quad \begin{array}{ccc} (Y_1, y_1) & \xleftarrow{h} & (Y_1', y_1') \\ \downarrow & & \downarrow \\ (S, s) & \xleftarrow{\quad} & (S', s') \end{array}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $h^*\text{Coker}(\alpha_1)/Y'_1/S'$ has a complete dévissage

$$(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=2, \dots, n}$$

at y'_1 . (In particular $i_2 : Z_2 \rightarrow Y'_1$ is a closed immersion into Y'_2 .) At this point we apply Lemma 37.4.8 to S, X, \mathcal{F}, x, s , the system $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ and diagram (37.5.7.1). We obtain a diagram

$$\begin{array}{ccccc}
 & & (X'', x'') & \longleftarrow & (Z''_1, z''_1) \\
