- (1) *Let \mathcal{F} be a sheaf of sets on $X_{\acute{e}tale}$. Then we have $f_{pro\text{-}\acute{e}tale,*}\epsilon^{-1}\mathcal{F} = \epsilon^{-1}f_{\acute{e}tale,*}\mathcal{F}$.*
- (2) *Let \mathcal{F} be an abelian sheaf on $X_{\acute{e}tale}$. Then we have $Rf_{pro\text{-}\acute{e}tale,*}\epsilon^{-1}\mathcal{F} = \epsilon^{-1}Rf_{\acute{e}tale,*}\mathcal{F}$.*

Proof. Proof of (1). Let \mathcal{F} be a sheaf of sets on $X_{\acute{e}tale}$. There is a canonical map $\epsilon^{-1}f_{\acute{e}tale,*}\mathcal{F} \rightarrow f_{pro\text{-}\acute{e}tale,*}\epsilon^{-1}\mathcal{F}$, see Sites, Section 7.44. To show it is an isomorphism we may work (Zariski) locally on Y , hence we may assume Y is affine. In this case every object of $Y_{pro\text{-}\acute{e}tale}$ has a covering by objects $V = \lim V_i$ which are limits of affine schemes V_i étale over Y (by Proposition 46.9.1 for example). Evaluating the map $\epsilon^{-1}f_{\acute{e}tale,*}\mathcal{F} \rightarrow f_{pro\text{-}\acute{e}tale,*}\epsilon^{-1}\mathcal{F}$ on V we obtain a map

$$\text{colim } \Gamma(X \times_Y V_i, \mathcal{F}) \longrightarrow \Gamma(X \times_Y V, \epsilon^*\mathcal{F}).$$

see Lemma 46.18.1 for the left hand side. By Lemma 46.18.1 we have

$$\Gamma(X \times_Y V, \epsilon^*\mathcal{F}) = \Gamma(X \times_Y V, \mathcal{F})$$

Hence the result holds by Étale Cohomology, Lemma 44.52.3.

Proof of (2). Arguing in exactly the same manner as above we see that it suffices to show that

$$\text{colim } H_{\acute{e}tale}^i(X \times_Y V_i, \mathcal{F}) \longrightarrow H_{\acute{e}tale}^i(X \times_Y V, \mathcal{F})$$

which follows once more from Étale Cohomology, Lemma 44.52.3. □

46.22. Finite morphisms and pro-étale sites

It is not clear that a finite morphism of schemes determines an exact pushforward on abelian pro-étale sheaves.

Lemma 46.22.1. *Let $f : Z \rightarrow X$ be a finite morphism of schemes which is locally of finite presentation. Then $f_{\text{pro-étale},*} : \text{Ab}(Z_{\text{pro-étale}}) \rightarrow \text{Ab}(X_{\text{pro-étale}})$ is exact.*

Proof. To prove this we may work (Zariski) locally on X and assume that X is affine, say $X = \text{Spec}(A)$. Then $Z = \text{Spec}(B)$ for some finite A -algebra B of finite presentation. The construction in the proof of Proposition 46.10.3 produces a faithfully flat, ind-étale ring map $A \rightarrow D$ with D w-contractible. We may check exactness of a sequence of sheaves by evaluating on $U = \text{Spec}(D)$ be such an object. Then $f_{\text{pro-étale},*}\mathcal{F}$ evaluated at U is equal to \mathcal{F} evaluated at $V = \text{Spec}(D \otimes_A B)$. Since $D \otimes_A B$ is w-contractible by Lemma 46.10.6 evaluation at V is exact. \square

46.23. Closed immersions and pro-étale sites

It is not clear (and likely false) that a closed immersion of schemes determines an exact pushforward on abelian pro-étale sheaves.

Lemma 46.23.1. *Let $i : Z \rightarrow X$ be a closed immersion morphism of affine schemes. Denote X_{app} and Z_{app} the sites introduced in Lemma 46.11.24. The base change functor*

$$u : X_{\text{app}} \rightarrow Z_{\text{app}}, \quad U \mapsto u(U) = U \times_X Z$$

is continuous and has a fully faithful left adjoint v . For V in Z_{app} the morphism $V \rightarrow v(V)$ is a closed immersion identifying V with $u(v(V)) = v(V) \times_X Z$ and every point of $v(V)$ specializes to a point of V . The functor v is cocontinuous and sends coverings to coverings.

Proof. The existence of the adjoint follows immediately from Lemma 46.7.7 and the definitions. It is clear that u is continuous from the definition of coverings in X_{app} .

Write $X = \text{Spec}(A)$ and $Z = \text{Spec}(A/I)$. Let $V = \text{Spec}(\overline{C})$ be an object of Z_{app} and let $v(V) = \text{Spec}(C)$. We have seen in the statement of Lemma 46.7.7 that V equals $v(V) \times_X Z = \text{Spec}(C/IC)$. Any $g \in C$ which maps to an invertible element of $C/IC = \overline{C}$ is invertible in C . Namely, we have the A -algebra maps $C \rightarrow C_g \rightarrow C/IC$ and by adjointness we obtain an C -algebra map $C_g \rightarrow C$. Thus every point of $v(V)$ specializes to a point of V .

Suppose that $\{V_i \rightarrow V\}$ is a covering in Z_{app} . Then $\{v(V_i) \rightarrow v(V)\}$ is a finite family of morphisms of Z_{app} such that every point of $V \subset v(V)$ is in the image of one of the maps $v(V_i) \rightarrow v(V)$. As the morphisms $v(V_i) \rightarrow v(V)$ are flat (since they are weakly étale) we conclude that $\{v(V_i) \rightarrow v(V)\}$ is jointly surjective. This proves that v sends coverings to coverings.

Let V be an object of Z_{app} and let $\{U_i \rightarrow v(V)\}$ be a covering in X_{app} . Then we see that $\{u(U_i) \rightarrow u(v(V)) = V\}$ is a covering of Z_{app} . By adjointness we obtain morphisms $v(u(U_i)) \rightarrow U_i$. Thus the family $\{v(u(U_i)) \rightarrow v(V)\}$ refines the given covering and we conclude that v is cocontinuous. \square

Lemma 46.23.2. *Let $Z \rightarrow X$ be a closed immersion morphism of affine schemes. The corresponding morphism of topoi $i = i_{\text{pro-étale}}$ is equal to the morphism of topoi associated to the fully faithful cocontinuous functor $v : Z_{\text{app}} \rightarrow X_{\text{app}}$ of Lemma 46.23.1. It follows that*

- (1) $i^{-1}\mathcal{F}$ is the sheaf associated to the presheaf $V \mapsto \mathcal{F}(v(V))$,
- (2) for a weakly contractible object V of Z_{app} we have $i^{-1}\mathcal{F}(V) = \mathcal{F}(v(V))$,
- (3) $i^{-1} : \text{Sh}(X_{\text{pro-étale}}) \rightarrow \text{Sh}(Z_{\text{pro-étale}})$ has a left adjoint i_1^{Sh} ,
- (4) $i^{-1} : \text{Ab}(X_{\text{pro-étale}}) \rightarrow \text{Ab}(Z_{\text{pro-étale}})$ has a left adjoint $i_!$,
- (5) $\text{id} \rightarrow i^{-1}i_1^{\text{Sh}}$, $\text{id} \rightarrow i^{-1}i_!$, and $i^{-1}i_* \rightarrow \text{id}$ are isomorphisms, and
- (6) i_* , i_1^{Sh} and $i_!$ are fully faithful.

Proof. By Lemma 46.11.24 we may describe $i_{\text{pro-étale}}$ in terms of the morphism of sites $u : X_{\text{app}} \rightarrow Z_{\text{app}}$, $V \mapsto V \times_X Z$. The first statement of the lemma follows from Sites, Lemma 7.21.2 (but with the roles of u and v reversed).

Proof of (1). By the description of i as the morphism of topoi associated to v this holds by the construction, see Sites, Lemma 7.20.1.

Proof of (2). Since the functor v sends coverings to coverings by Lemma 46.23.1 we see that the presheaf $\mathcal{G} : V \mapsto \mathcal{F}(v(V))$ is a separated presheaf (Sites, Definition 7.10.9). Hence the sheafification of \mathcal{G} is \mathcal{G}^+ , see Sites, Theorem 7.10.10. Next, let V be a weakly contractible object of Z_{app} . Let $\mathcal{V} = \{V_i \rightarrow V\}_{i=1, \dots, n}$ be any covering in Z_{app} . Set $\mathcal{V}' = \{\coprod V_i \rightarrow V\}$. Since v commutes with finite disjoint unions (as a left adjoint or by the construction) and since \mathcal{F} sends finite disjoint unions into products, we see that

$$H^0(\mathcal{V}, \mathcal{G}) = H^0(\mathcal{V}', \mathcal{G})$$

(notation as in Sites, Section 7.10; compare with Étale Cohomology, Lemma 44.22.1). Thus we may assume the covering is given by a single morphism, like so $\{V' \rightarrow V\}$. Since V is weakly contractible, this covering can be refined by the trivial covering $\{V \rightarrow V\}$. It therefore follows that the value of $\mathcal{G}^+ = i^{-1}\mathcal{F}$ on V is simply $\mathcal{F}(v(V))$ and (2) is proved.

Proof of (3). Every object of Z_{app} has a covering by weakly contractible objects (Lemma 46.11.27). By the above we see that we would have $i_1^{\text{Sh}}h_V = h_{v(V)}$ for V weakly contractible if i_1^{Sh} existed. The existence of i_1^{Sh} then follows from Sites, Lemma 7.23.1.

Proof of (4). Existence of $i_!$ follows in the same way by setting $i_!\mathbf{Z}_V = \mathbf{Z}_{v(V)}$ for V weakly contractible in Z_{app} , using similar for direct sums, and applying Homology, Lemma 12.25.6. Details omitted.

Proof of (5). Let V be a contractible object of Z_{app} . Then $i^{-1}i_1^{\text{Sh}}h_V = i^{-1}h_{v(V)} = h_{u(v(V))} = h_V$. (It is a general fact that $i^{-1}h_U = h_{u(U)}$.) Since the sheaves h_V for V contractible generate $\text{Sh}(Z_{\text{app}})$ (Sites, Lemma 7.13.5) we conclude $\text{id} \rightarrow i^{-1}i_1^{\text{Sh}}$ is an isomorphism. Similarly for the map $\text{id} \rightarrow i^{-1}i_!$. Then $(i^{-1}i_*\mathcal{H})(V) = i_*\mathcal{H}(v(V)) = \mathcal{H}(u(v(V))) = \mathcal{H}(V)$ and we find that $i^{-1}i_* \rightarrow \text{id}$ is an isomorphism.

The fully faithfulness statements of (6) now follow from Categories, Lemma 4.24.3. \square

Lemma 46.23.3. *Let $i : Z \rightarrow X$ be a closed immersion of schemes. Then*

- (1) $i_{\text{pro-étale}}^{-1}$ commutes with limits,

- (2) $i_{\text{pro-étale},*}$ is fully faithful, and
 (3) $i_{\text{pro-étale}}^{-1} i_{\text{pro-étale},*} \cong \text{id}_{\text{Sh}(Z_{\text{pro-étale}})}$.

Proof. Assertions (2) and (3) are equivalent by Sites, Lemma 7.40.1. Parts (1) and (3) are (Zariski) local on X , hence we may assume that X is affine. In this case the result follows from Lemma 46.23.2. \square

Lemma 46.23.4. *Let $i : Z \rightarrow X$ be an integral universally injective and surjective morphism of schemes. Then $i_{\text{pro-étale},*}$ and $i_{\text{pro-étale}}^{-1}$ are quasi-inverse equivalences of categories of pro-étale topoi.*

Proof. There is an immediate reduction to the case that X is affine. Then Z is affine too. Set $A = \mathcal{O}(X)$ and $B = \mathcal{O}(Z)$. Then the categories of étale algebras over A and B are equivalent, see Étale Cohomology, Theorem 44.46.1 and Remark 44.46.2. Thus the categories of ind-étale algebras over A and B are equivalent. In other words the categories X_{app} and Z_{app} of Lemma 46.11.24 are equivalent. We omit the verification that this equivalence sends coverings to coverings and vice versa. Thus the result as Lemma 46.11.24 tells us the pro-étale topos is the topos of sheaves on X_{app} . \square

Lemma 46.23.5. *Let $i : Z \rightarrow X$ be a closed immersion of schemes. Let $U \rightarrow X$ be an object of $X_{\text{pro-étale}}$ such that*

- (1) U is affine and weakly contractible, and
 (2) every point of U specializes to a point of $U \times_X Z$.

Then $i_{\text{pro-étale}}^{-1} \mathcal{F}(U \times_X Z) = \mathcal{F}(U)$ for all abelian sheaves on $X_{\text{pro-étale}}$.

Proof. Since pullback commutes with restriction, we may replace X by U . Thus we may assume that X is affine and weakly contractible and that every point of X specializes to a point of Z . By Lemma 46.23.2 part (1) it suffices to show that $v(Z) = X$ in this case. Thus we have to show: If A is a w-contractible ring, $I \subset A$ an ideal contained in the radical of A and $A \rightarrow B \rightarrow A/I$ is a factorization with $A \rightarrow B$ ind-étale, then there is a unique section $B \rightarrow A$ compatible with maps to A/I . Observe that $B/IB = A/I \times R$ as A/I -algebras. After replacing B by a localization we may assume $B/IB = A/I$. Note that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is surjective as the image contains $V(I)$ and hence all closed points and is closed under specialization. Since A is w-contractible there is a section $B \rightarrow A$. Since $B/IB = A/I$ this section is compatible with the map to A/I . We omit the proof of uniqueness (hint: use that A and B have isomorphic local rings at maximal ideals of A). \square

Lemma 46.23.6. *Let $i : Z \rightarrow X$ be a closed immersion of schemes. If $X \setminus i(Z)$ is a retrocompact open of X , then $i_{\text{pro-étale},*}$ is exact.*

Proof. The question is local on X hence we may assume X is affine. Say $X = \text{Spec}(A)$ and $Z = \text{Spec}(A/I)$. There exist $f_1, \dots, f_r \in I$ such that $Z = V(f_1, \dots, f_r)$ set theoretically, see Algebra, Lemma 10.28.1. By Lemma 46.23.4 we may assume that $Z = \text{Spec}(A/(f_1, \dots, f_r))$. In this case the functor $i_{\text{pro-étale},*}$ is exact by Lemma 46.22.1. \square

46.24. Extension by zero

The general material in Modules on Sites, Section 18.19 allows us to make the following definition.

Definition 46.24.1. Let $j : U \rightarrow X$ be a weakly étale morphism of schemes.

- (1) The restriction functor $j^{-1} : Sh(X_{pro\text{-}étale}) \rightarrow Sh(U_{pro\text{-}étale})$ has a left adjoint $j_!^{Sh} : Sh(X_{pro\text{-}étale}) \rightarrow Sh(U_{pro\text{-}étale})$.
- (2) The restriction functor $j^{-1} : Ab(X_{pro\text{-}étale}) \rightarrow Ab(U_{pro\text{-}étale})$ has a left adjoint which is denoted $j_! : Ab(U_{pro\text{-}étale}) \rightarrow Ab(X_{pro\text{-}étale})$ and called *extension by zero*.
- (3) Let Λ be a ring. The functor $j^{-1} : Mod(X_{pro\text{-}étale}, \Lambda) \rightarrow Mod(U_{pro\text{-}étale}, \Lambda)$ has a left adjoint $j_! : Mod(U_{pro\text{-}étale}, \Lambda) \rightarrow Mod(X_{pro\text{-}étale}, \Lambda)$ and called *extension by zero*.

As usual we compare this to what happens in the étale case.

Lemma 46.24.2. *Let $j : U \rightarrow X$ be an étale morphism of schemes. Let \mathcal{G} be an abelian sheaf on $U_{étale}$. Then $\epsilon^{-1}j_!\mathcal{G} = j_!\epsilon^{-1}\mathcal{G}$ as sheaves on $X_{pro\text{-}étale}$.*

Proof. This is true because both are left adjoints to $j_{pro\text{-}étale,*}\epsilon^{-1} = \epsilon^{-1}j_{étale,*}$, see Lemma 46.21.1. \square

Lemma 46.24.3. *Let $j : U \rightarrow X$ be a weakly étale morphism of schemes. Let $i : Z \rightarrow X$ be a closed immersion such that $U \times_X Z = \emptyset$. Let $V \rightarrow X$ be an affine object of $X_{pro\text{-}étale}$ such that every point of V specializes to a point of $V_Z = Z \times_X V$. Then $j_!\mathcal{F}(V) = 0$ for all abelian sheaves on $U_{pro\text{-}étale}$.*

Proof. Let $\{V_i \rightarrow V\}$ be a pro-étale covering. The lemma follows if we can refine this covering to a covering where the members have no morphisms into U over X (see construction of $j_!$ in Modules on Sites, Section 18.19). First refine the covering to get a finite covering with V_i affine. For each i let $V_i = \text{Spec}(A_i)$ and let $Z_i \subset V_i$ be the inverse image of Z . Set $W_i = \text{Spec}(A_{i,Z_i})$ with notation as in Lemma 46.5.1. Then $\coprod W_i \rightarrow V$ is weakly étale and the image contains all points of V_Z . Hence the image contains all points of V by our assumption on specializations. Thus $\{W_i \rightarrow V\}$ is a pro-étale covering refining the given one. But each point in W_i specializes to a point lying over Z , hence there are no morphisms $W_i \rightarrow U$ over X . \square

Lemma 46.24.4. *Let $j : U \rightarrow X$ be an open immersion of schemes. Then $id \cong j^{-1}j_!$ and $j^{-1}j_* \cong id$ and the functors $j_!$ and j_* are fully faithful.*

Proof. See Sites, Lemma 7.26.4 and Categories, Lemma 4.24.3. \square

Here is the relationship between extension by zero and restriction to the complementary closed subscheme.

Lemma 46.24.5. *Let X be a scheme. Let $Z \subset X$ be a closed subscheme and let $U \subset X$ be the complement. Denote $i : Z \rightarrow X$ and $j : U \rightarrow X$ the inclusion morphisms. Assume that j is a quasi-compact morphism. For every abelian sheaf on $X_{pro\text{-}étale}$ there is a canonical short exact sequence*

$$0 \rightarrow j_!j^{-1}\mathcal{F} \rightarrow \mathcal{F} \rightarrow i_*i^{-1}\mathcal{F} \rightarrow 0$$

on $X_{pro\text{-}étale}$ where all the functors are for the pro-étale topology.

Proof. We obtain the maps by the adjointness properties of the functors involved. It suffices to show that $X_{\text{pro-étale}}$ has enough objects (Sites, Definition 7.39.2) on which the sequence evaluates to a short exact sequence. Let $V = \text{Spec}(A)$ be an affine object of $X_{\text{pro-étale}}$ such that A is w-contractible (there are enough objects of this type). Then $V \times_X Z$ is cut out by an ideal $I \subset A$. The assumption that j is quasi-compact implies there exist $f_1, \dots, f_r \in I$ such that $V(I) = V(f_1, \dots, f_r)$. We obtain a faithfully flat, ind-Zariski ring map

$$A \longrightarrow A_{f_1} \times \dots \times A_{f_r} \times A_{\tilde{V}(I)}$$

with $A_{\tilde{V}(I)}$ as in Lemma 46.5.1. Since $V_i = \text{Spec}(A_{f_i}) \rightarrow X$ factors through U we have

$$j_! j^{-1} \mathcal{F}(V_i) = \mathcal{F}(V_i) \quad \text{and} \quad i_* i^{-1} \mathcal{F}(V_i) = 0$$

On the other hand, for the scheme $V^\sim = \text{Spec}(A_{\tilde{V}(I)})$ we have

$$j_! j^{-1} \mathcal{F}(V^\sim) = 0 \quad \text{and} \quad \mathcal{F}(V^\sim) = i_* i^{-1} \mathcal{F}(V^\sim)$$

the first equality by Lemma 46.24.3 and the second by Lemmas 46.23.5 and 46.10.7. Thus the sequence evaluates to an exact sequence on $\text{Spec}(A_{f_1} \times \dots \times A_{f_r} \times A_{\tilde{V}(I)})$ and the lemma is proved. \square

Lemma 46.24.6. *Let $j : U \rightarrow X$ be a quasi-compact open immersion morphism of schemes. The functor $j_! : \text{Ab}(U_{\text{pro-étale}}) \rightarrow \text{Ab}(X_{\text{pro-étale}})$ commutes with limits.*

Proof. Since $j_!$ is exact it suffices to show that $j_!$ commutes with products. The question is local on X , hence we may assume X affine. Let \mathcal{G} be an abelian sheaf on $U_{\text{pro-étale}}$. Note that there always is a canonical map

$$j_! \mathcal{G} \rightarrow j_* \mathcal{G}$$

see Modules on Sites, Remark 18.19.7. In our particular case this map can be obtained from the fact that $j^{-1} j_* \mathcal{G} = \mathcal{G}$. Hence applying the exact sequence of Lemma 46.24.5 we get

$$0 \rightarrow j_! \mathcal{G} \rightarrow j_* \mathcal{G} \rightarrow i_* i^{-1} j_* \mathcal{G} \rightarrow 0$$

where $i : Z \rightarrow X$ is the inclusion of the reduced induced scheme structure on the complement $Z = X \setminus U$. The functors j_* and i_* commute with products as right adjoints. The functor i^{-1} commutes with products by Lemma 46.23.3. Hence $j_!$ does because on the pro-étale site products are exact (Cohomology on Sites, Proposition 21.38.2). \square

46.25. Constructible sheaves on the pro-étale site

We stick to constructible sheaves of Λ -modules for a Noetherian ring. In the future we intend to discuss constructible sheaves of sets, groups, etc.

Definition 46.25.1. Let X be a scheme. Let Λ be a Noetherian ring. A sheaf of Λ -modules on $X_{\text{pro-étale}}$ is *constructible* if for every affine open $U \subset X$ there exists a finite decomposition of U into constructible locally closed subschemes $U = \coprod_i U_i$ such that $\mathcal{F}|_{U_i}$ is of finite type and locally constant for all i .

Again this does not give anything “new”.

Lemma 46.25.2. *Let X be a scheme. Let Λ be a Noetherian ring. The functor ϵ^{-1} defines an equivalence of categories*

$$\left\{ \begin{array}{l} \text{constructible sheaves of} \\ \Lambda\text{-modules on } X_{\acute{e}tale} \end{array} \right\} \longleftrightarrow \left\{ \begin{array}{l} \text{constructible sheaves of} \\ \Lambda\text{-modules on } X_{\text{pro-}\acute{e}tale} \end{array} \right\}$$

between constructible sheaves of Λ -modules on $X_{\acute{e}tale}$ and constructible sheaves of Λ -modules on $X_{\text{pro-}\acute{e}tale}$.

Proof. By Lemma 46.18.2 the functor ϵ^{-1} is fully faithful and commutes with pullback (restriction) to the strata. Hence ϵ^{-1} of a constructible étale sheaf is a constructible pro-étale sheaf. To finish the proof let \mathcal{F} be a constructible sheaf of Λ -modules on $X_{\text{pro-}\acute{e}tale}$ as in Definition 46.25.1. There is a canonical map

$$\epsilon^{-1}\epsilon_*\mathcal{F} \longrightarrow \mathcal{F}$$

We will show this map is an isomorphism. This will prove that \mathcal{F} is in the essential image of ϵ^{-1} and finish the proof (details omitted).

To prove this we may assume that X is affine. In this case we have a finite partition $X = \coprod_i X_i$ by constructible locally closed strata such that $\mathcal{F}|_{X_i}$ is locally constant of finite type. Let $U \subset X$ be one of the open strata in the partition and let $Z \subset X$ be the reduced induced structure on the complement. By Lemma 46.24.5 we have a short exact sequence

$$0 \rightarrow j_!j^{-1}\mathcal{F} \rightarrow \mathcal{F} \rightarrow i_*i^{-1}\mathcal{F} \rightarrow 0$$

on $X_{\text{pro-}\acute{e}tale}$. Functoriality gives a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \epsilon^{-1}\epsilon_*j_!j^{-1}\mathcal{F} & \longrightarrow & \epsilon^{-1}\epsilon_*\mathcal{F} & \longrightarrow & \epsilon^{-1}\epsilon_*i_*i^{-1}\mathcal{F} \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & j_!j^{-1}\mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & i_*i^{-1}\mathcal{F} \longrightarrow 0 \end{array}$$

By induction on the length of the partition we know that on the one hand $\epsilon^{-1}\epsilon_*i_*i^{-1}\mathcal{F} \rightarrow i^{-1}\mathcal{F}$ and $\epsilon^{-1}\epsilon_*j^{-1}\mathcal{F} \rightarrow j^{-1}\mathcal{F}$ are isomorphisms and on the other that $i^{-1}\mathcal{F} = \epsilon^{-1}\mathcal{A}$ and $j^{-1}\mathcal{F} = \epsilon^{-1}\mathcal{B}$ for some constructible sheaves of Λ -modules \mathcal{A} on $Z_{\acute{e}tale}$ and \mathcal{B} on $U_{\acute{e}tale}$. Then

$$\epsilon^{-1}\epsilon_*j_!j^{-1}\mathcal{F} = \epsilon^{-1}\epsilon_*j_!\epsilon^{-1}\mathcal{B} = \epsilon^{-1}\epsilon_*\epsilon^{-1}j_!\mathcal{B} = \epsilon^{-1}j_!\mathcal{B} = j_!\epsilon^{-1}\mathcal{B} = j_!j^{-1}\mathcal{F}$$

the second equality by Lemma 46.24.2, the third equality by Lemma 46.18.2, and the fourth equality by Lemma 46.24.2 again. Similarly, we have

$$\epsilon^{-1}\epsilon_*i_*i^{-1}\mathcal{F} = \epsilon^{-1}\epsilon_*i_*\epsilon^{-1}\mathcal{A} = \epsilon^{-1}\epsilon_*\epsilon^{-1}i_*\mathcal{A} = \epsilon^{-1}i_*\mathcal{A} = i_*\epsilon^{-1}\mathcal{A} = i_*i^{-1}\mathcal{F}$$

this time using Lemma 46.21.1. By the five lemma we conclude the vertical map in the middle of the big diagram is an isomorphism. \square

Lemma 46.25.3. *Let X be a scheme. Let Λ be a Noetherian ring. The category of constructible sheaves of Λ -modules on $X_{\text{pro-}\acute{e}tale}$ is a weak Serre subcategory of $\text{Mod}(X_{\text{pro-}\acute{e}tale}, \Lambda)$.*

Proof. This is a formal consequence of Lemmas 46.25.2 and 46.18.7 and the result for the étale site (Étale Cohomology, Lemma 44.69.6). \square

Lemma 46.25.4. *Let X be a scheme. Let Λ be a Noetherian ring. Let $D_c(X_{\acute{e}tale}, \Lambda)$, resp. $D_c(X_{pro\text{-}\acute{e}tale}, \Lambda)$ be the full subcategory of $D(X_{\acute{e}tale}, \Lambda)$, resp. $D(X_{pro\text{-}\acute{e}tale}, \Lambda)$ consisting of those complexes whose cohomology sheaves are constructible sheaves of Λ -modules. Then*

$$\epsilon^{-1} : D_c^+(X_{\acute{e}tale}, \Lambda) \longrightarrow D_c^+(X_{pro\text{-}\acute{e}tale}, \Lambda)$$

is an equivalence of categories.

Proof. The categories $D_c(X_{\acute{e}tale}, \Lambda)$ and $D_c(X_{pro\text{-}\acute{e}tale}, \Lambda)$ are strictly full, saturated, triangulated subcategories of $D(X_{\acute{e}tale}, \Lambda)$ and $D(X_{pro\text{-}\acute{e}tale}, \Lambda)$ by Étale Cohomology, Lemma 44.69.6 and Lemma 46.25.3 and Derived Categories, Section 13.13. The statement of the lemma follows by combining Lemmas 46.18.7 and 46.25.2. \square

Lemma 46.25.5. *Let X be a scheme. Let Λ be a Noetherian ring. Let $K, L \in D_c^-(X_{pro\text{-}\acute{e}tale}, \Lambda)$. Then $K \otimes_{\Lambda}^L L$ is in $D_c^-(X_{pro\text{-}\acute{e}tale}, \Lambda)$.*

Proof. Note that $H^i(K \otimes_{\Lambda}^L L)$ is the same as $H^i(\tau_{\geq i-1} K \otimes_{\Lambda}^L \tau_{\geq i-1} L)$. Thus we may assume K and L are bounded. In this case we can apply Lemma 46.25.4 to reduce to the case of the étale site, see Étale Cohomology, Lemma 44.90.6. \square

Lemma 46.25.6. *Let X be a scheme. Let Λ be a Noetherian ring. Let K be an object of $D(X_{pro\text{-}\acute{e}tale}, \Lambda)$. Set $K_n = K \otimes_{\Lambda}^L \Lambda/I^n$. If K_1 is in $D_c^-(X_{pro\text{-}\acute{e}tale}, \Lambda/I)$, then K_n is in $D_c^-(X_{pro\text{-}\acute{e}tale}, \Lambda/I^n)$ for all n .*

Proof. Consider the distinguished triangles

$$K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}} \rightarrow K_{n+1} \rightarrow K_n \rightarrow K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}}[1]$$

and the isomorphisms

$$K \otimes_{\Lambda}^L \underline{I^n/I^{n+1}} = K_1 \otimes_{\Lambda/I}^L \underline{I^n/I^{n+1}}$$

By Lemma 46.25.5 we see that this tensor product has constructible cohomology sheaves (and vanishing when K_1 has vanishing cohomology). Hence by induction on n using Lemma 46.25.3 we see that each K_n has constructible cohomology sheaves. \square

46.26. Constructible adic sheaves

In this section we define the notion of a constructible Λ -sheaf as well as some variants.

Definition 46.26.1. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let X be a scheme. Let \mathcal{F} be a sheaf of Λ -modules on $X_{pro\text{-}\acute{e}tale}$.

- (1) We say \mathcal{F} is a *constructible Λ -sheaf* if $\mathcal{F} = \lim \mathcal{F}/I^n \mathcal{F}$ and each $\mathcal{F}/I^n \mathcal{F}$ is a constructible sheaf of Λ/I^n -modules.
- (2) If \mathcal{F} is a constructible Λ -sheaf, then we say \mathcal{F} is *lisse* if each $\mathcal{F}/I^n \mathcal{F}$ is locally constant.
- (3) We say \mathcal{F} is *adic lisse*³ if there exists a I -adically complete Λ -module M with M/IM finite such that \mathcal{F} is locally isomorphic to

$$\underline{M}^{\wedge} = \lim \underline{M/I^n M}.$$

³This may be nonstandard notation.

- (4) We say \mathcal{F} is *adic constructible*⁴ if for every affine open $U \subset X$ there exists a decomposition $U = \coprod U_i$ into constructible locally closed subschemes such that $\mathcal{F}|_{U_i}$ is adic lisse.

The definition of a constructible Λ -sheaf is equivalent to the one in [Gro77, Exposé VI, Definition 1.1.1] when $\Lambda = \mathbf{Z}_\ell$ and $I = (\ell)$. It is clear that we have the implications

$$\begin{array}{ccc} \text{lisse adic} & \xrightarrow{\hspace{2cm}} & \text{adic constructible} \\ \Downarrow & & \Downarrow \\ \text{lisse constructible } \Lambda\text{-sheaf} & \xrightarrow{\hspace{2cm}} & \text{constructible } \Lambda\text{-sheaf} \end{array}$$

The vertical arrows can be inverted in some cases (see Lemmas 46.26.2 and 46.26.5). In general neither the category of adic constructible sheaves nor the category of adic constructible sheaves is closed under kernels and cokernels.

Namely, let X be an affine scheme whose underlying topological space $|X|$ is homeomorphic to $\Lambda = \mathbf{Z}_\ell$, see Example 46.6.3. Denote $f : |X| \rightarrow \mathbf{Z}_\ell = \Lambda$ a homeomorphism. We can think of f as a section of $\underline{\Lambda}^\wedge$ over X and multiplication by f then defines a two term complex

$$\underline{\Lambda}^\wedge \xrightarrow{f} \underline{\Lambda}^\wedge$$

on $X_{pro\text{-}\acute{e}tale}$. The sheaf $\underline{\Lambda}^\wedge$ is adic lisse. However, the cokernel of the map above, is not adic constructible, as the isomorphism type of the stalks of this cokernel attains infinitely many values: $\mathbf{Z}/\ell^n\mathbf{Z}$ and \mathbf{Z}_ℓ . The cokernel is a constructible \mathbf{Z}_ℓ -sheaf. However, the kernel is not even a constructible \mathbf{Z}_ℓ -sheaf as it is zero a non-quasi-compact open but not zero.

Lemma 46.26.2. *Let X be a Noetherian scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let \mathcal{F} be a constructible Λ -sheaf on $X_{pro\text{-}\acute{e}tale}$. Then there exists a finite partition $X = \coprod X_i$ by locally closed subschemes such that the restriction $\mathcal{F}|_{X_i}$ is lisse.*

Proof. Let $R = \bigoplus I^n/I^{n+1}$. Observe that R is a Noetherian ring. Since each of the sheaves $\mathcal{F}/I^n\mathcal{F}$ is a constructible sheaf of $\Lambda/I^n\Lambda$ -modules also $I^n\mathcal{F}/I^{n+1}\mathcal{F}$ is a constructible sheaf of Λ/I -modules and hence the pullback of a constructible sheaf \mathcal{G}_n on $X_{\acute{e}tale}$ by Lemma 46.25.2. Set $\mathcal{G} = \bigoplus \mathcal{G}_n$. This is a sheaf of R -modules on $X_{\acute{e}tale}$ and the map

$$\mathcal{G}_0 \otimes_{\Lambda/I} \underline{R} \longrightarrow \mathcal{G}$$

is surjective because the maps

$$\mathcal{F}/I\mathcal{F} \otimes \underline{I^n/I^{n+1}} \rightarrow I^n\mathcal{F}/I^{n+1}\mathcal{F}$$

are surjective. Hence \mathcal{G} is a constructible sheaf of R -modules by Étale Cohomology, Proposition 44.72.1. Choose a partition $X = \coprod X_i$ such that $\mathcal{G}|_{X_i}$ is a locally constant sheaf of R -modules of finite type (Étale Cohomology, Lemma 44.69.2). We claim this is a partition as in the lemma. Namely, replacing X by X_i we may assume \mathcal{G} is locally constant. It follows that each of the sheaves $I^n\mathcal{F}/I^{n+1}\mathcal{F}$ is locally constant. Using the short exact sequences

$$0 \rightarrow I^n\mathcal{F}/I^{n+1}\mathcal{F} \rightarrow \mathcal{F}/I^{n+1}\mathcal{F} \rightarrow \mathcal{F}/I^n\mathcal{F} \rightarrow 0$$

⁴This may be nonstandard notation.

induction and Modules on Sites, Lemma 18.42.5 the lemma follows. \square

Lemma 46.26.3. *Let X be a weakly contractible affine scheme. Let Λ be a Noetherian ring and $I \subset \Lambda$ be an ideal. Let \mathcal{F} be a sheaf of Λ -modules on $X_{\text{pro-étale}}$ such that*

- (1) $\mathcal{F} = \varinjlim \mathcal{F}/I^n \mathcal{F}$,
- (2) $\mathcal{F}/I^n \mathcal{F}$ is a constant sheaf of Λ/I^n -modules,
- (3) $\mathcal{F}/I \mathcal{F}$ is of finite type.

Then $\mathcal{F} \cong \underline{M}^\wedge$ where M is a finite Λ^\wedge -module.

Proof. Pick a Λ/I^n -module M_n such that $\mathcal{F}/I^n \mathcal{F} \cong \underline{M}_n$. Since we have the surjections $\mathcal{F}/I^{n+1} \mathcal{F} \rightarrow \mathcal{F}/I^n \mathcal{F}$ we conclude that there exist surjections $M_{n+1} \rightarrow M_n$ inducing isomorphisms $M_{n+1}/I^n M_{n+1} \rightarrow M_n$. Fix a choice of such surjections and set $M = \varinjlim M_n$. Then M is an I -adically complete Λ -module with $M/I^n M = M_n$, see Algebra, Lemma 10.94.1. Since M_1 is a finite type Λ -module (Modules on Sites, Lemma 18.41.5) we see that M is a finite Λ^\wedge -module. Consider the sheaves

$$\mathcal{I}_n = \text{Isom}(\underline{M}_n, \mathcal{F}/I^n \mathcal{F})$$

on $X_{\text{pro-étale}}$. Modding out by I^n defines a transition map

$$\mathcal{I}_{n+1} \rightarrow \mathcal{I}_n$$

By our choice of M_n the sheaf \mathcal{I}_n is a torsor under

$$\text{Isom}(\underline{M}_n, \underline{M}_n) = \text{Isom}_\Lambda(M_n, M_n)$$

(Modules on Sites, Lemma 18.42.4) since $\mathcal{F}/I^n \mathcal{F}$ is (étale) locally isomorphic to \underline{M}_n . It follows from More on Algebra, Lemma 15.66.1 that the system of sheaves (\mathcal{I}_n) is Mittag-Leffler. For each n let $\mathcal{I}'_n \subset \mathcal{I}_n$ be the image of $\mathcal{I}_N \rightarrow \mathcal{I}_n$ for all $N \gg n$. Then

$$\dots \rightarrow \mathcal{I}'_3 \rightarrow \mathcal{I}'_2 \rightarrow \mathcal{I}'_1 \rightarrow *$$

is a sequence of sheaves of sets on $X_{\text{pro-étale}}$ with surjective transition maps. Since $*(X)$ is a singleton (not empty) and since evaluating at X transforms surjective maps of sheaves of sets into surjections of sets, we can pick $s \in \varinjlim \mathcal{I}'_n(X)$. The sections define isomorphisms $\underline{M}^\wedge \rightarrow \varinjlim \mathcal{F}/I^n \mathcal{F} = \mathcal{F}$ and the proof is done. \square

Lemma 46.26.4. *Let X be a connected scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. If \mathcal{F} is a lisse constructible Λ -sheaf on $X_{\text{pro-étale}}$, then \mathcal{F} is adic lisse.*

Proof. By Lemma 46.18.8 we have $\mathcal{F}/I^n \mathcal{F} = \epsilon^{-1} \mathcal{G}_n$ for some locally constant sheaf \mathcal{G}_n of Λ/I^n -modules. By Étale Cohomology, Lemma 44.68.8 there exists a finite Λ/I^n -module M_n such that \mathcal{G}_n is locally isomorphic to \underline{M}_n . Choose a covering $\{W_t \rightarrow X\}_{t \in T}$ with each W_t affine and weakly contractible. Then $\mathcal{F}|_{W_t}$ satisfies the assumptions of Lemma 46.26.3 and hence $\mathcal{F}|_{W_t} \cong \underline{N}_t^\wedge$ for some finite Λ^\wedge -module N_t . Note that $N_t/I^n N_t \cong M_n$ for all t and n . Hence $N_t \cong N_{t'}$ for all $t, t' \in T$, see More on Algebra, Lemma 15.66.2. This proves that \mathcal{F} is adic lisse. \square

Lemma 46.26.5. *Let X be a Noetherian scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let \mathcal{F} be a constructible Λ -sheaf on $X_{\text{pro-étale}}$. Then \mathcal{F} is adic constructible.*

Proof. This is a consequence of Lemmas 46.26.2 and 46.26.4, the fact that a Noetherian scheme is locally connected (Topology, Lemma 5.8.6), and the definitions. \square

It will be useful to identify the constructible Λ -sheaves inside the category of derived complete sheaves of Λ -modules. It turns out that the naive analogue of More on Algebra, Lemma 15.64.22 is wrong in this setting. However, here is the analogue of More on Algebra, Lemma 15.64.21.

Lemma 46.26.6. *Let X be a scheme. Let Λ be a ring and let $I \subset \Lambda$ be a finitely generated ideal. Let \mathcal{F} be a sheaf of Λ -modules on $X_{\text{pro-étale}}$. If \mathcal{F} is derived complete and $\mathcal{F}/I\mathcal{F} = 0$, then $\mathcal{F} = 0$.*

Proof. Assume that $\mathcal{F}/I\mathcal{F}$ is zero. Let $I = (f_1, \dots, f_r)$. Let $i < r$ be the largest integer such that $\mathcal{G} = \mathcal{F}/(f_1, \dots, f_i)\mathcal{F}$ is nonzero. If i does not exist, then $\mathcal{F} = 0$ which is what we want to show. Then \mathcal{G} is derived complete as a cokernel of a map between derived complete modules, see Proposition 46.17.1. By our choice of i we have that $f_{i+1} : \mathcal{G} \rightarrow \mathcal{G}$ is surjective. Hence

$$\lim(\dots \rightarrow \mathcal{G} \xrightarrow{f_{i+1}} \mathcal{G} \xrightarrow{f_{i+1}} \mathcal{G})$$

is nonzero, contradicting the derived completeness of \mathcal{G} . \square

Lemma 46.26.7. *Let X be a weakly contractible affine scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let \mathcal{F} be a derived complete sheaf of Λ -modules on $X_{\text{pro-étale}}$ with $\mathcal{F}/I\mathcal{F}$ a locally constant sheaf of Λ/I -modules of finite type. Then there exists an integer t and a surjective map*

$$(\underline{\Lambda}^\wedge)^{\oplus t} \rightarrow \mathcal{F}$$

Proof. Since X is weakly contractible, there exists a finite disjoint open covering $X = \coprod U_i$ such that $\mathcal{F}/I\mathcal{F}|_{U_i}$ is isomorphic to the constant sheaf associated to a finite Λ/I -module M_i . Choose finitely many generators m_{ij} of M_i . We can find sections $s_{ij} \in \mathcal{F}(X)$ restricting to m_{ij} viewed as a section of $\mathcal{F}/I\mathcal{F}$ over U_i . Let t be the total number of s_{ij} . Then we obtain a map

$$\alpha : \underline{\Lambda}^{\oplus t} \rightarrow \mathcal{F}$$

which is surjective modulo I by construction. By Lemma 46.16.1 the derived completion of $\underline{\Lambda}^{\oplus t}$ is the sheaf $(\underline{\Lambda}^\wedge)^{\oplus t}$. Since \mathcal{F} is derived complete we see that α factors through a map

$$\alpha^\wedge : (\underline{\Lambda}^\wedge)^{\oplus t} \rightarrow \mathcal{F}$$

Then $\mathcal{Q} = \text{Coker}(\alpha^\wedge)$ is a derived complete sheaf of Λ -modules by Proposition 46.17.1. By construction $\mathcal{Q}/I\mathcal{Q} = 0$. It follows from Lemma 46.26.6 that $\mathcal{Q} = 0$ which is what we wanted to show. \square

46.27. A suitable derived category

Let X be a scheme. It will turn out that for many schemes X a suitable derived category of ℓ -adic sheaves can be gotten by considering the derived complete objects K of $D(X_{\text{pro-étale}}, \Lambda)$ with the property that $K \otimes_{\Lambda}^{\mathbf{L}} \mathbf{F}_\ell$ is bounded with constructible cohomology sheaves. Here is the general definition.

Definition 46.27.1. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let X be a scheme. An object K of $D(X_{\text{pro-étale}}, \Lambda)$ is called *constructible* if

- (1) K is derived complete with respect to I ,
- (2) $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I$ has constructible cohomology sheaves and locally has finite tor dimension.

We denote $D_{cons}(X, \Lambda)$ the full subcategory of constructible K in $D(X_{pro\text{-}\acute{e}tale}, \Lambda)$.

Recall that with our conventions a complex of finite tor dimension is bounded (Cohomology on Sites, Definition 21.35.1). In fact, let's collect everything proved so far in a lemma.

Lemma 46.27.2. *In the situation above suppose K is in $D_{cons}(X, \Lambda)$ and X is quasi-compact. Set $K_n = K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I^n$. There exist a, b such that*

- (1) $K = R\lim K_n$ and $H^i(K) = 0$ for $i \notin [a, b]$,
- (2) each K_n has tor amplitude in $[a, b]$,
- (3) each K_n has constructible cohomology sheaves,
- (4) each $K_n = \epsilon^{-1}L_n$ for some $L_n \in D_{ctf}(X_{\acute{e}tale}, \Lambda/I^n)$ (*Étale Cohomology, Definition 44.90.7*).

Proof. By definition of local having finite tor dimension, we can find a, b such that K_1 has tor amplitude in $[a, b]$. Part (2) follows from Cohomology on Sites, Lemma 21.35.8. Then (1) follows as K is derived complete by the description of limits in Cohomology on Sites, Proposition 21.38.2 and the fact that $H^b(K_{n+1}) \rightarrow H^b(K_n)$ is surjective as $K_n = K_{n+1} \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I^n$. Part (3) follows from Lemma 46.25.6, Part (4) follows from Lemma 46.25.4 and the fact that L_n has finite tor dimension because K_n does (small argument omitted). \square

Lemma 46.27.3. *Let X be a weakly contractible affine scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let K be an object of $D_{cons}(X, \Lambda)$ such that the cohomology sheaves of $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I$ are locally constant. Then there exists a finite disjoint open covering $X = \coprod U_i$ and for each i a finite collection of finite projective Λ^\wedge -modules M_a, \dots, M_b such that $K|_{U_i}$ is represented by a complex*

$$(\underline{M}^a)^\wedge \rightarrow \dots \rightarrow (\underline{M}^b)^\wedge$$

in $D(U_{i,pro\text{-}\acute{e}tale}, \Lambda)$ for some maps of sheaves of Λ -modules $(\underline{M}^i)^\wedge \rightarrow (\underline{M}^{i+1})^\wedge$.

Proof. We freely use the results of Lemma 46.27.2. Choose a, b as in that lemma. We will prove the lemma by induction on $b - a$. Let $\mathcal{F} = H^b(K)$. Note that \mathcal{F} is a derived complete sheaf of Λ -modules by Proposition 46.17.1. Moreover $\mathcal{F}/I\mathcal{F}$ is a locally constant sheaf of Λ/I -modules of finite type. Apply Lemma 46.26.7 to get a surjection $\rho : (\underline{\Lambda}^\wedge)^{\oplus t} \rightarrow \mathcal{F}$.

If $a = b$, then $K = \mathcal{F}[-b]$. In this case we see that

$$\mathcal{F} \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I = \mathcal{F}/I\mathcal{F}$$

As X is weakly contractible and $\mathcal{F}/I\mathcal{F}$ locally constant, we can find a finite disjoint union decomposition $X = \coprod U_i$ by affine opens U_i and Λ/I -modules \overline{M}_i such that $\mathcal{F}/I\mathcal{F}$ restricts to \overline{M}_i on U_i . After refining the covering we may assume the map

$$\rho|_{U_i} \text{ mod } I : \underline{\Lambda}/I^{\oplus t} \longrightarrow \overline{M}_i$$

is equal to α_i for some surjective module map $\alpha_i : \Lambda/I^{\oplus t} \rightarrow \overline{M}_i$, see Modules on Sites, Lemma 18.42.3. Note that each \overline{M}_i is a finite Λ/I -module. Since $\mathcal{F}/I\mathcal{F}$ has tor amplitude in $[0, 0]$ we conclude that \overline{M}_i is a flat Λ/I -module. Hence \overline{M}_i is finite

projective (Algebra, Lemma 10.75.2). Hence we can find a projector $\bar{p}_i : (\Lambda/I)^{\oplus t} \rightarrow (\Lambda/I)^{\oplus t}$ whose image maps isomorphically to \bar{M}_i under the map α_i . We can lift \bar{p}_i to a projector $p_i : (\Lambda^\wedge)^{\oplus t} \rightarrow (\Lambda^\wedge)^{\oplus t}$ ⁵. Then $M_i = \text{Im}(p_i)$ is a finite I -adically complete Λ^\wedge -module with $M_i/IM_i = \bar{M}_i$. Over U_i consider the maps

$$\underline{M}_i^\wedge \rightarrow (\underline{\Lambda}^\wedge)^{\oplus t} \rightarrow \mathcal{F}|_{U_i}$$

By construction the composition induces an isomorphism modulo I . The source and target are derived complete, hence so are the cokernel \mathcal{Q} and the kernel \mathcal{K} . We have $\mathcal{Q}/I\mathcal{Q} = 0$ by construction hence \mathcal{Q} is zero by Lemma 46.26.6. Then

$$0 \rightarrow \mathcal{K}/I\mathcal{K} \rightarrow \bar{M}_i \rightarrow \mathcal{F}/I\mathcal{F} \rightarrow 0$$

is exact by the vanishing of Tor_1 see at the start of this paragraph; also use that $\underline{\Lambda}^\wedge/I\underline{\Lambda}^\wedge$ by Modules on Sites, Lemma 18.41.4 to see that $\underline{M}_i^\wedge/IM_i^\wedge = \bar{M}_i$. Hence $\mathcal{K}/I\mathcal{K} = 0$ by construction and we conclude that $\mathcal{K} = 0$ as before. This proves the result in case $a = b$.

If $b > a$, then we lift the map ρ to a map

$$\tilde{\rho} : (\underline{\Lambda}^\wedge)^{\oplus t}[-b] \rightarrow K$$

in $D(X_{\text{pro-étale}}, \Lambda)$. This is possible as we can think of K as a complex of $\underline{\Lambda}^\wedge$ -modules by discussion in the introduction to Section 46.16 and because $X_{\text{pro-étale}}$ is weakly contractible hence there is no obstruction to lifting the elements $\rho(e_s) \in H^0(X, \mathcal{F})$ to elements of $H^b(X, K)$. Fitting $\tilde{\rho}$ into a distinguished triangle

$$(\underline{\Lambda}^\wedge)^{\oplus t}[-b] \rightarrow K \rightarrow L \rightarrow (\underline{\Lambda}^\wedge)^{\oplus t}[-b+1]$$

we see that L is an object of $D_{\text{cons}}(X, \Lambda)$ such that $L \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda}/I$ has tor amplitude contained in $[a, b-1]$ (details omitted). By induction we can describe L locally as stated in the lemma, say L is isomorphic to

$$(\underline{M}^a)^\wedge \rightarrow \dots \rightarrow (\underline{M}^{b-1})^\wedge$$

The map $L \rightarrow (\underline{\Lambda}^\wedge)^{\oplus t}[-b+1]$ corresponds to a map $(\underline{M}^{b-1})^\wedge \rightarrow (\underline{\Lambda}^\wedge)^{\oplus t}$ which allows us to extend the complex by one. The corresponding complex is isomorphic to K in the derived category by the properties of triangulated categories. This finishes the proof. \square

Motivated by what happens for constructible Λ -sheaves we introduce the following notion.

Definition 46.27.4. Let X be a scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let $K \in D(X_{\text{pro-étale}}, \Lambda)$.

- (1) We say K is *adic lisse*⁶ if there exists a finite complex of finite projective Λ^\wedge -modules M^\bullet such that K is locally isomorphic to

$$\underline{M}^a \rightarrow \dots \rightarrow \underline{M}^b$$

- (2) We say K is *adic constructible*⁷ if for every affine open $U \subset X$ there exists a decomposition $U = \coprod U_i$ into constructible locally closed subschemes such that $K|_{U_i}$ is adic lisse.

⁵Proof: by Algebra, Lemma 10.31.6 we can lift \bar{p}_i to a compatible system of projectors $p_{i,n} : (\Lambda/I^n)^{\oplus t} \rightarrow (\Lambda/I^n)^{\oplus t}$ and then we set $p_i = \lim p_{i,n}$ which works because $\Lambda^\wedge = \lim \Lambda/I^n$.

⁶This may be nonstandard notation

⁷This may be nonstandard notation.

The difference between the local structure obtained in Lemma 46.27.3 and the structure of an adic lisse complex is that the maps $\underline{M}^{i^\wedge} \rightarrow \underline{M}^{i+1}^\wedge$ in Lemma 46.27.3 need not be constant, whereas in the definition above they are required to be constant.

Lemma 46.27.5. *Let X be a weakly contractible affine scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let K be an object of $D_{\text{cons}}(X, \Lambda)$ such that $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n}$ is isomorphic in $D(X_{\text{pro-étale}}, \Lambda/I^n)$ to a complex of constant sheaves of Λ/I^n -modules. Then*

$$H^0(X, K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n})$$

has the Mittag-Leffler condition.

Proof. Say $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n}$ is isomorphic to $\underline{E_n}$ for some object E_n of $D(\Lambda/I^n)$. Since $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I}$ has finite tor dimension and has finite type cohomology sheaves we see that E_1 is perfect (see More on Algebra, Lemma 15.56.2). The transition maps

$$K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^{n+1}} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n}$$

locally come from (possibly many distinct) maps of complexes $E_{n+1} \rightarrow E_n$ in $D(\Lambda/I^{n+1})$ see Cohomology on Sites, Lemma 21.40.3. For each n choose one such map and observe that it induces an isomorphism $E_{n+1} \otimes_{\Lambda/I^{n+1}}^{\mathbf{L}} \underline{\Lambda/I^n} \rightarrow E_n$ in $D(\Lambda/I^n)$. By More on Algebra, Lemma 15.65.3 we can find a finite complex M^\bullet of finite projective Λ^\wedge -modules and isomorphisms $\underline{M^\bullet/I^n M^\bullet} \rightarrow E_n$ in $D(\Lambda/I^n)$ compatible with the transition maps.

Now observe that for each finite collection of indices $n > m > k$ the triple of maps

$$H^0(X, K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n}) \rightarrow H^0(X, K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^m}) \rightarrow H^0(X, K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^k})$$

is isomorphic to

$$H^0(X, \underline{M^\bullet/I^n M^\bullet}) \rightarrow H^0(X, \underline{M^\bullet/I^m M^\bullet}) \rightarrow H^0(X, \underline{M^\bullet/I^k M^\bullet})$$

Namely, choose any isomorphism

$$\underline{M^\bullet/I^n M^\bullet} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda/I^n}$$

induces similar isomorphisms module I^m and I^k and we see that the assertion is true. Thus to prove the lemma it suffices to show that the system $H^0(X, \underline{M^\bullet/I^n M^\bullet})$ has Mittag-Leffler. Since taking sections over X is exact, it suffices to prove that the system of Λ -modules

$$H^0(M^\bullet/I^n M^\bullet)$$

has Mittag-Leffler. Set $A = \Lambda^\wedge$ and consider the spectral sequence

$$\text{Tor}_{-p}^A(H^q(M^\bullet), A/I^n A) \Rightarrow H^{p+q}(M^\bullet/I^n M^\bullet)$$

By More on Algebra, Lemma 15.19.3 the pro-systems $\{\text{Tor}_{-p}^A(H^q(M^\bullet), A/I^n A)\}$ are zero for $p > 0$. Thus the pro-system $\{H^0(M^\bullet/I^n M^\bullet)\}$ is equal to the pro-system $\{H^0(M^\bullet)/I^n H^0(M^\bullet)\}$ and the lemma is proved. \square

Lemma 46.27.6. *Let X be a connected scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. If K is in $D_{\text{cons}}(X, \Lambda)$ such that $K \otimes_{\Lambda} \underline{\Lambda/I}$ has locally constant cohomology sheaves, then K is adic lisse (Definition 46.27.4).*

Proof. Write $K_n = K \otimes_{\Lambda}^{\mathbf{L}} \Lambda/I^n$. We will use the results of Lemma 46.27.2 without further mention. By Cohomology on Sites, Lemma 21.40.5 we see that K_n has locally constant cohomology sheaves for all n . We have $K_n = \epsilon^{-1}L_n$ some L_n in $D_{ctf}(X_{\acute{e}tale}, \Lambda/I^n)$ with locally constant cohomology sheaves. By Étale Cohomology, Lemma 44.90.14 there exist perfect $M_n \in D(\Lambda/I^n)$ such that L_n is étale locally isomorphic to \underline{M}_n . The maps $L_{n+1} \rightarrow L_n$ corresponding to $K_{n+1} \rightarrow K_n$ induces isomorphisms $\underline{L}_{n+1} \otimes_{\Lambda/I^{n+1}}^{\mathbf{L}} \Lambda/I^n \rightarrow L_n$. Looking locally on X we conclude that there exist maps $M_{n+1} \rightarrow M_n$ in $D(\Lambda/I^{n+1})$ inducing isomorphisms $M_{n+1} \otimes_{\Lambda/I^{n+1}} \Lambda/I^n \rightarrow M_n$, see Cohomology on Sites, Lemma 21.40.3. Fix a choice of such maps. By More on Algebra, Lemma 15.65.3 we can find a finite complex M^\bullet of finite projective Λ^\wedge -modules and isomorphisms $M^\bullet/I^n M^\bullet \rightarrow M_n$ in $D(\Lambda/I^n)$ compatible with the transition maps. To finish the proof we will show that K is locally isomorphic to

$$\underline{M}^{\wedge} = \lim M^\bullet/I^n M^\bullet = R \lim M^\bullet/I^n M^\bullet$$

Let E^\bullet be the dual complex to M^\bullet , see More on Algebra, Lemma 15.56.21 and its proof. Consider the objects

$$H_n = R \mathcal{H}om_{\Lambda/I^n}(M^\bullet/I^n M^\bullet, K_n) = \underline{E}^\bullet/I^n \underline{E}^\bullet \otimes_{\Lambda/I^n}^{\mathbf{L}} K_n$$

of $D(X_{\text{pro-}\acute{e}tale}, \Lambda/I^n)$. Modding out by I^n defines a transition map $H_{n+1} \rightarrow H_n$. Set $H = R \lim H_n$. Then H is an object of $D_{\text{cons}}(X, \Lambda)$ (details omitted) with $H \otimes_{\Lambda}^{\mathbf{L}} \Lambda/I^n = H_n$. Choose a covering $\{W_t \rightarrow X\}_{t \in T}$ with each W_t affine and weakly contractible. By our choice of M^\bullet we see that

$$\begin{aligned} H_n|_{W_t} &\cong R \mathcal{H}om_{\Lambda/I^n}(M^\bullet/I^n M^\bullet, M^\bullet/I^n M^\bullet) \\ &= \underline{\text{Tot}}(\underline{E}^\bullet/I^n \underline{E}^\bullet \otimes_{\Lambda/I^n} M^\bullet/I^n M^\bullet) \end{aligned}$$

Thus we may apply Lemma 46.27.5 to $H = R \lim H_n$. We conclude the system $H^0(W_t, H_n)$ satisfies Mittag-Leffler. Since for all $n \gg 1$ there is an element of $H^0(W_t, H_n)$ which maps to an isomorphism in

$$H^0(W_t, H_1) = \text{Hom}(\underline{M}^\bullet/IM^\bullet, K_1)$$

we find an element $(\varphi_{t,n})$ in the inverse limit which produces an isomorphism mod I . Then

$$R \lim \varphi_{t,n} : \underline{M}^{\wedge}|_{W_t} = R \lim M^\bullet/I^n M^\bullet|_{W_t} \longrightarrow R \lim K_n|_{W_t} = K|_{W_t}$$

is an isomorphism. This finishes the proof. □

Proposition 46.27.7. *Let X be a Noetherian scheme. Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal. Let K be an object of $D_{\text{cons}}(X, \Lambda)$. Then K is adic constructible (Definition 46.27.4).*

Proof. This is a consequence of Lemma 46.27.6 and the fact that a Noetherian scheme is locally connected (Topology, Lemma 5.8.6), and the definitions. □

46.28. Proper base change

In this section we explain how to prove the proper base change theorem for derived complete objects on the pro-étale site using the proper base change theorem for étale cohomology following the general theme that we use the pro-étale topology only to deal with “limit issues” and we use results proved for the étale topology to handle everything else.

Theorem 46.28.1. *Let $f : X \rightarrow Y$ be a proper morphism of schemes. Let $g : Y' \rightarrow Y$ be a morphism of schemes giving rise to the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{\quad g \quad} & Y \end{array}$$

Let Λ be a Noetherian ring and let $I \subset \Lambda$ be an ideal such that Λ/I is torsion. Let K be an object of $D(X_{\text{pro-étale}})$ such that

- (1) K is derived complete, and
- (2) $K \otimes_{\Lambda}^{\mathbf{L}} \Lambda/I^n$ is bounded below with cohomology sheaves coming from $X_{\text{étale}}$,
- (3) Λ/I^n is a perfect Λ -module⁸.

Then the base change map

$$Lg_{\text{comp}}^* Rf_* K \longrightarrow Rf'_* L(g')_{\text{comp}}^* K$$

is an isomorphism.

Proof. We omit the construction of the base change map (this uses only formal properties of derived pushforward and completed derived pullback, compare with Cohomology on Sites, Remark 21.19.2). Write $K_n = K \otimes_{\Lambda}^{\mathbf{L}} \Lambda/I^n$. By Lemma 46.16.1 we have $K = R\lim K_n$ because K is derived complete. By Lemmas 46.16.2 and 46.16.1 we can unwind the left hand side

$$Lg_{\text{comp}}^* Rf_* K = R\lim Lg^*(Rf_* K) \otimes_{\Lambda}^{\mathbf{L}} \Lambda/I^n = R\lim Lg^* Rf_* K_n$$

the last equality because Λ/I^n is a perfect module and the projection formula (Cohomology on Sites, Lemma 21.37.1). Using Lemma 46.16.2 we can unwind the right hand side

$$Rf'_* L(g')_{\text{comp}}^* K = Rf'_* R\lim L(g')^* K_n = R\lim Rf'_* L(g')^* K_n$$

the last equality because Rf'_* commutes with $R\lim$ (Cohomology on Sites, Lemma 21.21.2). Thus it suffices to show the maps

$$Lg^* Rf_* K_n \longrightarrow Rf'_* L(g')^* K_n$$

are isomorphisms. By Lemma 46.18.7 and our second condition we can write $K_n = \epsilon^{-1}L_n$ for some $L_n \in D^+(X_{\text{étale}}, \Lambda/I^n)$. By Lemma 46.21.1 and the fact that ϵ^{-1} commutes with pullbacks we obtain

$$Lg^* Rf_* K_n = Lg^* Rf_* \epsilon^* L_n = Lg^* \epsilon^{-1} Rf_* L_n = \epsilon^{-1} Lg^* Rf_* L_n$$

and

$$Rf'_* L(g')^* K_n = Rf'_* L(g')^* \epsilon^{-1} L_n = Rf'_* \epsilon^{-1} L(g')^* L_n = \epsilon^{-1} Rf'_* L(g')^* L_n$$

(this also uses that L_n is bounded below). Finally, by the proper base change theorem for étale cohomology (Étale Cohomology, Theorem 44.77.11) we have

$$Lg^* Rf_* L_n = Rf'_* L(g')^* L_n$$

(again using that L_n is bounded below) and the theorem is proved. □

⁸This assumption can be removed if K is a constructible complex, see [BS13].

Algebraic Spaces

47.1. Introduction

Algebraic spaces were first introduced by Michael Artin, see [Art69b], [Art70], [Art73], [Art71b], [Art71a], [Art69a], [Art69c], and [Art74]. Some of the foundational material was developed jointly with Knutson, who produced the book [Knu71]. Artin defined (see [Art69c, Definition 1.3]) an algebraic space as a sheaf for the étale topology which is locally in the étale topology representable. In most of Artin's work the categories of schemes considered are schemes locally of finite type over a fixed excellent Noetherian base.

Our definition is slightly different. First of all we consider sheaves for the fppf topology. This is just a technical point and scarcely makes any difference. Second, we include the condition that the diagonal is representable.

After defining algebraic spaces we make some foundational observations. The main result in this chapter is that with our definitions an algebraic space is the same thing as an étale equivalence relation, see the discussion in Section 47.9 and Theorem 47.10.5. The analogue of this theorem in Artin's setting is [Art69c, Theorem 1.5], or [Knu71, Proposition II.1.7]. In other words, the sheaf defined by an étale equivalence relation has a representable diagonal. It follows that our definition agrees with Artin's original definition in a broad sense. It also means that one can give examples of algebraic spaces by simply writing down an étale equivalence relation.

In Section 47.13 we introduce various separation axioms on algebraic spaces that we have found in the literature. Finally in Section 47.14 we give some weird and not so weird examples of algebraic spaces.

47.2. General remarks

We work in a suitable big fppf site Sch_{fppf} as in Topologies, Definition 33.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf} . We will record elsewhere what changes if you change the big fppf site (insert future reference here).

We will always work relative to a base S contained in Sch_{fppf} . And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 33.7.8. The absolute case can be recovered by taking $S = \text{Spec}(\mathbf{Z})$.

If U, T are schemes over S , then we denote $U(T)$ for the set of T -valued points over S . In a formula: $U(T) = \text{Mor}_S(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see Descent, Lemma 34.9.3. Hence the topology on Sch_{fppf} is weaker than the canonical topology and all representable presheaves are sheaves.

47.3. Representable morphisms of presheaves

Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformation of functors, see Categories, Definition 4.8.2. This means that for every $U \in Ob((Sch/S)_{fppf})$ and any $\xi \in G(U)$ the fiber product $h_U \times_{\xi, G} F$ is representable. Choose a representing object V_ξ and an isomorphism $h_{V_\xi} \rightarrow h_U \times_G F$. By the Yoneda lemma, see Categories, Lemma 4.3.5, the projection $h_{V_\xi} \rightarrow h_U \times_G F \rightarrow h_U$ comes from a unique morphism of schemes $a_\xi : V_\xi \rightarrow U$. Suggestively we could represent this by the diagram

$$\begin{array}{ccccc} V_\xi & \xrightarrow{\sim} & h_{V_\xi} & \longrightarrow & F \\ a_\xi \downarrow & & \downarrow & & \downarrow a \\ U & \xrightarrow{\sim} & h_U & \xrightarrow{\xi} & G \end{array}$$

where the squiggly arrows represent the Yoneda embedding. Here are some lemmas about this notion that work in great generality.

Lemma 47.3.1. *Let S, X, Y be objects of Sch_{fppf} . Let $f : X \rightarrow Y$ be a morphism of schemes. Then*

$$h_f : h_X \longrightarrow h_Y$$

is a representable transformation of functors.

Proof. This is formal and relies only on the fact that the category $(Sch/S)_{fppf}$ has fibre products. □

Lemma 47.3.2. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G, b : G \rightarrow H$ be representable transformations of functors. Then*

$$b \circ a : F \longrightarrow H$$

is a representable transformation of functors.

Proof. This is entirely formal and works in any category. □

Lemma 47.3.3. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformations of functors. Let $b : H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{array}{ccc} H \times_{b, G, a} F & \xrightarrow{\quad} & F \\ a' \downarrow & & \downarrow a \\ H & \xrightarrow{\quad b \quad} & G \end{array}$$

Then the base change a' is a representable transformation of functors.

Proof. This is entirely formal and works in any category. □

Lemma 47.3.4. *Let S be a scheme contained in Sch_{fppf} . Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \rightarrow Sets$, $i = 1, 2$. Let $a_i : F_i \rightarrow G_i$, $i = 1, 2$ be representable transformations of functors. Then*

$$a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$$

is a representable transformation of functors.

Proof. Write $a_1 \times a_2$ as the composition $F_1 \times F_2 \rightarrow G_1 \times F_2 \rightarrow G_1 \times G_2$. The first arrow is the base change of a_1 by the map $G_1 \times F_2 \rightarrow G_1$, and the second arrow is the base change of a_2 by the map $G_1 \times G_2 \rightarrow G_2$. Hence this lemma is a formal consequence of Lemmas 47.3.2 and 47.3.3. \square

Lemma 47.3.5. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformation of functors. If G is a sheaf, then so is F .*

Proof. Let $\{\varphi_i : T_i \rightarrow T\}$ be a covering of the site $(Sch/S)_{fppf}$. Let $s_i \in F(T_i)$ which satisfy the sheaf condition. Then $\sigma_i = a(s_i) \in G(T_i)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_i = \sigma|_{T_i}$. By assumption $F' = h_T \times_{\sigma, G, a} F$ is a representable presheaf and hence (see remarks in Section 47.2) a sheaf. Note that $(\varphi_i, s_i) \in F'(T_i)$ satisfy the sheaf condition also, and hence come from some unique $(id_T, s) \in F'(T)$. Clearly s is the section of F we are looking for. \square

Lemma 47.3.6. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformation of functors. Then $\Delta_{F/G} : F \rightarrow F \times_G F$ is representable.*

Proof. Let $U \in \text{Ob}((Sch/S)_{fppf})$. Let $\xi = (\xi_1, \xi_2) \in (F \times_G F)(U)$. Set $\xi' = a(\xi_1) = a(\xi_2) \in G(U)$. By assumption there exist a scheme V and a morphism $V \rightarrow U$ representing the fibre product $h_U \times_{\xi', G} F$. In particular, the elements ξ_1, ξ_2 give morphisms $f_1, f_2 : U \rightarrow V$ over U . Because V represents the fibre product $h_U \times_{\xi', G} F$ and because $\xi' = a \circ \xi_1 = a \circ \xi_2$ we see that if $g : U' \rightarrow U$ is a morphism then

$$g^* \xi_1 = g^* \xi_2 \Leftrightarrow f_1 \circ g = f_2 \circ g.$$

In other words, we see that $h_U \times_{\xi, F \times_G F} F$ is represented by $V \times_{\Delta, V \times V, (f_1, f_2)} U$ which is a scheme. \square

47.4. Lists of useful properties of morphisms of schemes

For ease of reference we list in the following remarks the properties of morphisms which possess some of the properties required of them in later results.

Remark 47.4.1. Here is a list of properties/types of morphisms which are *stable under arbitrary base change*:

- (1) closed, open, and locally closed immersions, see Schemes, Lemma 25.18.2,
- (2) quasi-compact, see Schemes, Lemma 25.19.3,
- (3) universally closed, see Schemes, Definition 25.20.1,
- (4) (quasi-)separated, see Schemes, Lemma 25.21.13,
- (5) monomorphism, see Schemes, Lemma 25.23.5
- (6) surjective, see Morphisms, Lemma 28.11.4,
- (7) universally injective, see Morphisms, Lemma 28.12.2,
- (8) affine, see Morphisms, Lemma 28.13.8,

- (9) quasi-affine, see Morphisms, Lemma 28.14.5,
- (10) (locally) of finite type, see Morphisms, Lemma 28.16.4,
- (11) (locally) quasi-finite, see Morphisms, Lemma 28.21.13,
- (12) (locally) of finite presentation, see Morphisms, Lemma 28.22.4,
- (13) locally of finite type of relative dimension d , see Morphisms, Lemma 28.30.2,
- (14) universally open, see Morphisms, Definition 28.24.1,
- (15) flat, see Morphisms, Lemma 28.26.7,
- (16) syntomic, see Morphisms, Lemma 28.32.4,
- (17) smooth, see Morphisms, Lemma 28.35.5,
- (18) unramified (resp. G-unramified), see Morphisms, Lemma 28.36.5,
- (19) étale, see Morphisms, Lemma 28.37.4,
- (20) proper, see Morphisms, Lemma 28.42.5,
- (21) H-projective, see Morphisms, Lemma 28.43.8,
- (22) (locally) projective, see Morphisms, Lemma 28.43.9,
- (23) finite or integral, see Morphisms, Lemma 28.44.6,
- (24) finite locally free, see Morphisms, Lemma 28.46.4.

Add more as needed.

Remark 47.4.2. Of the properties of morphisms which are stable under base change (as listed in Remark 47.4.1) the following are also *stable under compositions*:

- (1) closed, open and locally closed immersions, see Schemes, Lemma 25.24.3,
- (2) quasi-compact, see Schemes, Lemma 25.19.4,
- (3) universally closed, see Morphisms, Lemma 28.42.4,
- (4) (quasi-)separated, see Schemes, Lemma 25.21.13,
- (5) monomorphism, see Schemes, Lemma 25.23.4,
- (6) surjective, see Morphisms, Lemma 28.11.2,
- (7) universally injective, see Morphisms, Lemma 28.12.5,
- (8) affine, see Morphisms, Lemma 28.13.7,
- (9) quasi-affine, see Morphisms, Lemma 28.14.4,
- (10) (locally) of finite type, see Morphisms, Lemma 28.16.3,
- (11) (locally) quasi-finite, see Morphisms, Lemma 28.21.12,
- (12) (locally) of finite presentation, see Morphisms, Lemma 28.22.3,
- (13) universally open, see Morphisms, Lemma 28.24.3,
- (14) flat, see Morphisms, Lemma 28.26.5,
- (15) syntomic, see Morphisms, Lemma 28.32.3,
- (16) smooth, see Morphisms, Lemma 28.35.4,
- (17) unramified (resp. G-unramified), see Morphisms, Lemma 28.36.4,
- (18) étale, see Morphisms, Lemma 28.37.3,
- (19) proper, see Morphisms, Lemma 28.42.4,
- (20) H-projective, see Morphisms, Lemma 28.43.7,
- (21) finite or integral, see Morphisms, Lemma 28.44.5,
- (22) finite locally free, see Morphisms, Lemma 28.46.3.

Add more as needed.

Remark 47.4.3. Of the properties mentioned which are stable under base change (as listed in Remark 47.4.1) the following are also *fppc local on the base* (and a fortiori *fppf local on the base*):

- (1) for immersions we have this for

- (a) closed immersions, see Descent, Lemma 34.19.17,
- (b) open immersions, see Descent, Lemma 34.19.14, and
- (c) quasi-compact immersions, see Descent, Lemma 34.19.19,
- (2) quasi-compact, see Descent, Lemma 34.19.1,
- (3) universally closed, see Descent, Lemma 34.19.3,
- (4) (quasi-)separated, see Descent, Lemmas 34.19.2, and 34.19.5,
- (5) monomorphism, see Descent, Lemma 34.19.29,
- (6) surjective, see Descent, Lemma 34.19.6,
- (7) universally injective, see Descent, Lemma 34.19.7,
- (8) affine, see Descent, Lemma 34.19.16,
- (9) quasi-affine, see Descent, Lemma 34.19.18,
- (10) (locally) of finite type, see Descent, Lemmas 34.19.8, and 34.19.10,
- (11) (locally) quasi-finite, see Descent, Lemma 34.19.22,
- (12) (locally) of finite presentation, see Descent, Lemmas 34.19.9, and 34.19.11,
- (13) locally of finite type of relative dimension d , see Descent, Lemma 34.19.23,
- (14) universally open, see Descent, Lemma 34.19.4,
- (15) flat, see Descent, Lemma 34.19.13,
- (16) syntomic, see Descent, Lemma 34.19.24,
- (17) smooth, see Descent, Lemma 34.19.25,
- (18) unramified (resp. G-unramified), see Descent, Lemma 34.19.26,
- (19) étale, see Descent, Lemma 34.19.27,
- (20) proper, see Descent, Lemma 34.19.12,
- (21) finite or integral, see Descent, Lemma 34.19.21,
- (22) finite locally free, see Descent, Lemma 34.19.28.

Note that the property of being an “immersion” may not be fpqc local on the base, but in Descent, Lemma 34.20.1 we proved that it is fppf local on the base.

47.5. Properties of representable morphisms of presheaves

Here is the definition that makes this work.

Definition 47.5.1. With S , and $a : F \rightarrow G$ representable as above. Let \mathcal{P} be a property of morphisms of schemes which

- (1) is preserved under any base change, see Schemes, Definition 25.18.3, and
- (2) is fppf local on the base, see Descent, Definition 34.18.1.

In this case we say that a has *property* \mathcal{P} if for every $U \in \text{Ob}((\text{Sch}/S)_{\text{fppf}})$ and any $\xi \in G(U)$ the resulting morphism of schemes $V_\xi \rightarrow U$ has property \mathcal{P} .

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn’t make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

Remark 47.5.2. Consider the property $\mathcal{P} = \text{“surjective”}$. In this case there could be some ambiguity if we say “let $F \rightarrow G$ be a surjective map”. Namely, we could mean the notion defined in Definition 47.5.1 above, or we could mean a surjective map of presheaves, see Sites, Definition 7.3.1, or, if both F and G are sheaves, we could mean a surjective map of sheaves, see Sites, Definition 7.12.1, If not mentioned otherwise when discussing morphisms of algebraic spaces we will always mean the

first. See Lemma 47.5.9 for a case where surjectivity implies surjectivity as a map of sheaves.

Here is a sanity check.

Lemma 47.5.3. *Let S, X, Y be objects of Sch_{fppf} . Let $f : X \rightarrow Y$ be a morphism of schemes. Let \mathcal{P} be as in Definition 47.5.1. Then $h_X \rightarrow h_Y$ has property \mathcal{P} if and only if f has property \mathcal{P} .*

Proof. Note that the lemma makes sense by Lemma 47.3.1. Proof omitted. \square

Lemma 47.5.4. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let \mathcal{P} be a property as in Definition 47.5.1 which is stable under composition. Let $a : F \rightarrow G, b : G \rightarrow H$ be representable transformations of functors. If a and b have property \mathcal{P} so does $b \circ a : F \rightarrow H$.*

Proof. Note that the lemma makes sense by Lemma 47.3.2. Proof omitted. \square

Lemma 47.5.5. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let \mathcal{P} be a property as in Definition 47.5.1. Let $a : F \rightarrow G$ be a representable transformation of functors. Let $b : H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{array}{ccc} H \times_{b,G,a} F & \xrightarrow{\quad} & F \\ a' \downarrow & & \downarrow a \\ H & \xrightarrow{\quad b \quad} & G \end{array}$$

If a has property \mathcal{P} then also the base change a' has property \mathcal{P} .

Proof. Note that the lemma makes sense by Lemma 47.3.3. Proof omitted. \square

Lemma 47.5.6. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let \mathcal{P} be a property as in Definition 47.5.1. Let $a : F \rightarrow G$ be a representable transformation of functors. Let $b : H \rightarrow G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{array}{ccc} H \times_{b,G,a} F & \xrightarrow{\quad} & F \\ a' \downarrow & & \downarrow a \\ H & \xrightarrow{\quad b \quad} & G \end{array}$$

Assume that b induces a surjective map of fppf sheaves $H^\# \rightarrow G^\#$. In this case, if a' has property \mathcal{P} , then also a has property \mathcal{P} .

Proof. First we remark that by Lemma 47.3.3 the transformation a' is representable. Let $U \in \text{Ob}((Sch/S)_{fppf})$, and let $\xi \in G(U)$. By assumption there exists an fppf covering $\{U_i \rightarrow U\}_{i \in I}$ and elements $\xi_i \in H(U_i)$ mapping to $\xi|_{U_i}$ via b . From general category theory it follows that for each i we have a fibre product diagram

$$\begin{array}{ccc} U_i \times_{\xi_i, H, a'} (H \times_{b, G, a} F) & \longrightarrow & U \times_{\xi, G, a} F \\ \downarrow & & \downarrow \\ U_i & \longrightarrow & U \end{array}$$

By assumption the left vertical arrow is a morphism of schemes which has property \mathcal{P} . Since \mathcal{P} is local in the fppf topology this implies that also the right vertical arrow has property \mathcal{P} as desired. \square

Lemma 47.5.7. *Let S be a scheme contained in Sch_{fppf} . Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \rightarrow Sets$, $i = 1, 2$. Let $a_i : F_i \rightarrow G_i$, $i = 1, 2$ be representable transformations of functors. Let \mathcal{P} be a property as in Definition 47.5.1 which is stable under composition. If a_1 and a_2 have property \mathcal{P} so does $a_1 \times a_2 : F_1 \times F_2 \rightarrow G_1 \times G_2$.*

Proof. Note that the lemma makes sense by Lemma 47.3.4. Proof omitted. \square

Lemma 47.5.8. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformation of functors. Let $\mathcal{P}, \mathcal{P}'$ be properties as in Definition 47.5.1. Suppose that for any morphism of schemes $f : X \rightarrow Y$ we have $\mathcal{P}(f) \Rightarrow \mathcal{P}'(f)$. If a has property \mathcal{P} then a has property \mathcal{P}' .*

Proof. Formal. \square

Lemma 47.5.9. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be sheaves. Let $a : F \rightarrow G$ be representable, flat, locally of finite presentation, and surjective. Then $a : F \rightarrow G$ is surjective as a map of sheaves.*

Proof. Let T be a scheme over S and let $g : T \rightarrow G$ be a T -valued point of G . By assumption $T' = F \times_G T$ is (representable by) a scheme and the morphism $T' \rightarrow T$ is a flat, locally of finite presentation, and surjective. Hence $\{T' \rightarrow T\}$ is an fppf covering such that $g|_{T'} \in G(T')$ comes from an element of $F(T')$, namely the map $T' \rightarrow F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 7.12.1. \square

Here is a characterization of those functors for which the diagonal is representable.

Lemma 47.5.10. *Let S be a scheme contained in Sch_{fppf} . Let F be a presheaf of sets on $(Sch/S)_{fppf}$. The following are equivalent:*

- (1) *The diagonal $F \rightarrow F \times F$ is representable.*
- (2) *For every scheme U over S , $U/S \in \text{Ob}((Sch/S)_{fppf})$ and any $\xi \in F(U)$ the map $\xi : h_U \rightarrow F$ is representable.*

Proof. This is completely formal, see Categories, Lemma 4.8.4. It depends only on the fact that the category $(Sch/S)_{fppf}$ has products of pairs of objects and fibre products, see Topologies, Lemma 33.7.10. \square

In the situation of the lemma, for any morphism $\xi : h_U \rightarrow F$ as in the lemma, it makes sense to say that ξ has property \mathcal{P} , for any property as in Definition 47.5.1. In particular this holds for $\mathcal{P} = \text{“surjective”}$ and $\mathcal{P} = \text{“étale”}$, see Remark 47.4.3 above. We will use these in the definition of algebraic spaces below.

47.6. Algebraic spaces

Here is the definition.

Definition 47.6.1. Let S be a scheme contained in Sch_{fppf} . An *algebraic space over S* is a presheaf

$$F : (Sch/S)_{fppf}^{opp} \longrightarrow Sets$$

with the following properties

- (1) The presheaf F is a sheaf.
- (2) The diagonal morphism $F \rightarrow F \times F$ is representable.
- (3) There exists a scheme $U \in \text{Ob}(\text{Sch}_{fppf})$ and a map $h_U \rightarrow F$ which is surjective, and étale.

There are two differences with the “usual” definition, for example the definition in Knutson’s book [Knu71].

The first is that we require F to be a sheaf in the fppf topology. One reason for doing this is that many natural examples of algebraic spaces satisfy the sheaf condition for the fppf coverings (and even for fpqc coverings). Also, one of the reasons that algebraic spaces have been so useful is via Michael Artin’s results on algebraic spaces. Built into his method is a condition which guarantees the result is locally of finite presentation over S . Combined it somehow seems to us that the fppf topology is the natural topology to work with. In the end the category of algebraic spaces ends up being the same. See Bootstrap, Section 62.12.

The second is that we only require the diagonal map for F to be representable, whereas in [Knu71] it is required that it also be quasi-compact. If $F = h_U$ for some scheme U over S this corresponds to the condition that U be quasi-separated. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of F be representable, and simply add an addition hypothesis wherever this is necessary. In any case it has the pleasing consequence that the following lemma is true.

Lemma 47.6.2. *A scheme is an algebraic space. More precisely, given a scheme $T \in \text{Ob}((\text{Sch}/S)_{fppf})$ the representable functor h_T is an algebraic space.*

Proof. The functor h_T is a sheaf by our remarks in Section 47.2. The diagonal $h_T \rightarrow h_T \times h_T = h_{T \times T}$ is representable because $(\text{Sch}/S)_{fppf}$ has fibre products. The identity map $h_T \rightarrow h_T$ is surjective étale. \square

Definition 47.6.3. Let F, F' be algebraic spaces over S . A *morphism* $f : F \rightarrow F'$ of algebraic spaces over S is a transformation of functors from F to F' .

The category of algebraic spaces over S contains the category $(\text{Sch}/S)_{fppf}$ as a full subcategory via the Yoneda embedding $T/S \mapsto h_T$. From now on we no longer distinguish between a scheme T/S and the algebraic space it represents. Thus when we say “Let $f : T \rightarrow F$ be a morphism from the scheme T to the algebraic space F ”, we mean that $T \in \text{Ob}((\text{Sch}/S)_{fppf})$, that F is an algebraic space over S , and that $f : h_T \rightarrow F$ is a morphism of algebraic spaces over S .

47.7. Fibre products of algebraic spaces

The category of algebraic spaces over S has both products and fibre products.

Lemma 47.7.1. *Let S be a scheme contained in Sch_{fppf} . Let F, G be algebraic spaces over S . Then $F \times G$ is an algebraic space, and is a product in the category of algebraic spaces over S .*

Proof. It is clear that $H = F \times G$ is a sheaf. The diagonal of H is simply the product of the diagonals of F and G . Hence it is representable by Lemma 47.3.4. Finally, if $U \rightarrow F$ and $V \rightarrow G$ are surjective étale morphisms, with $U, V \in \text{Ob}((\text{Sch}/S)_{fppf})$, then $U \times V \rightarrow F \times G$ is surjective étale by Lemma 47.5.7. \square

Lemma 47.7.2. *Let S be a scheme contained in Sch_{fppf} . Let H be a sheaf on $(Sch/S)_{fppf}$ whose diagonal is representable. Let F, G be algebraic spaces over S . Let $F \rightarrow H, G \rightarrow H$ be maps of sheaves. Then $F \times_H G$ is an algebraic space.*

Proof. We check the 3 conditions of Definition 47.6.1. A fibre product of sheaves is a sheaf, hence $F \times_H G$ is a sheaf. The diagonal of $F \times_H G$ is the left vertical arrow in

$$\begin{array}{ccc} F \times_H G & \longrightarrow & F \times G \\ \Delta \downarrow & & \downarrow \Delta_F \times \Delta_G \\ (F \times F) \times_{(H \times H)} (G \times G) & \longrightarrow & (F \times F) \times (G \times G) \end{array}$$

which is cartesian. Hence Δ is representable as the base change of the morphism on the right which is representable, see Lemmas 47.3.4 and 47.3.3. Finally, let $U, V \in \text{Ob}((Sch/S)_{fppf})$ and $a : U \rightarrow F, b : V \rightarrow G$ be surjective and étale. As Δ_H is representable, we see that $U \times_H V$ is a scheme. The morphism

$$U \times_H V \longrightarrow F \times_H G$$

is surjective and étale as a composition of the base changes $U \times_H V \rightarrow U \times_H G$ and $U \times_H G \rightarrow F \times_H G$ of the étale surjective morphisms $U \rightarrow F$ and $V \rightarrow G$, see Lemmas 47.3.2 and 47.3.3. This proves the last condition of Definition 47.6.1 holds and we conclude that $F \times_H G$ is an algebraic space. \square

Lemma 47.7.3. *Let S be a scheme contained in Sch_{fppf} . Let $F \rightarrow H, G \rightarrow H$ be morphisms of algebraic spaces over S . Then $F \times_H G$ is an algebraic space, and is a fibre product in the category of algebraic spaces over S .*

Proof. It follows from the stronger Lemma 47.7.2 that $F \times_H G$ is an algebraic space. It is clear that $F \times_H G$ is a fibre product in the category of algebraic spaces over S since that is a full subcategory of the category of (pre)sheaves of sets on $(Sch/S)_{fppf}$. \square

47.8. Glueing algebraic spaces

In this section we really start abusing notation and not distinguish between schemes and the spaces they represent.

Lemma 47.8.1. *Let $S \in \text{Ob}(Sch_{fppf})$. Let $U \in \text{Ob}((Sch/S)_{fppf})$. Given a set I and sheaves F_i on $\text{Ob}((Sch/S)_{fppf})$, if $U \cong \coprod_{i \in I} F_i$ as sheaves, then each F_i is representable by an open and closed subscheme U_i and $U \cong \coprod U_i$ as schemes.*

Proof. By assumption this means there exists an fppf covering $\{U_j \rightarrow U\}_{j \in J}$ such that each $U_j \rightarrow U$ factors through $F_{i(j)}$ for some $i(j) \in I$. Denote $V_j = \text{Im}(U_j \rightarrow U)$. This is an open of U by Morphisms, Lemma 28.26.9, and $\{U_j \rightarrow V_j\}$ is an fppf covering. Hence it follows that $V_j \rightarrow U$ factors through $F_{i(j)}$ since $F_{i(j)}$ is a subsheaf. It follows from $F_i \cap F_{i'} = \emptyset, i \neq i'$ that $V_j \cap V_{j'} = \emptyset$ unless $i(j) = i(j')$. Hence we can take $U_i = \bigcup_{j, i(j)=i} V_j$ and everything is clear. \square

Lemma 47.8.2. *Let $S \in \text{Ob}(Sch_{fppf})$. Let F be an algebraic space over S . Given a set I and sheaves F_i on $\text{Ob}((Sch/S)_{fppf})$, if $F \cong \coprod_{i \in I} F_i$ as sheaves, then each F_i is an algebraic space over S .*

Proof. It follows directly from the representability of $F \rightarrow F \times F$ that each diagonal morphism $F_i \rightarrow F_i \times F_i$ is representable. Choose a scheme U in $(Sch/S)_{fppf}$ and a surjective étale morphism $U \rightarrow \coprod F_i$ (this exist by hypothesis). By considering the inverse image of F_i we get a decomposition of U (as a sheaf) into a coproduct of sheaves. By Lemma 47.8.1 we get correspondingly $U \cong \coprod U_i$. Then it follows easily that $U_i \rightarrow F_i$ is surjective and étale (from the corresponding property of $U \rightarrow F$). \square

The condition on the size of I and the F_i in the following lemma may be ignored by those not worried about set theoretic questions.

Lemma 47.8.3. *Let $S \in \text{Ob}(Sch_{fppf})$. Suppose given a set I and algebraic spaces F_i , $i \in I$. Then $F = \coprod_{i \in I} F_i$ is an algebraic space provided I , and the F_i are not too “large”: for example if we can choose surjective étale morphisms $U_i \rightarrow F_i$ such that $\coprod_{i \in I} U_i$ is isomorphic to an object of $(Sch/S)_{fppf}$, then F is an algebraic space.*

Proof. By construction F is a sheaf. We omit the verification that the diagonal morphism of F is representable. Finally, if U is an object of $(Sch/S)_{fppf}$ isomorphic to $\coprod_{i \in I} U_i$ then it is straightforward to verify that the resulting map $U \rightarrow \coprod F_i$ is surjective and étale. \square

Here is the analogue of Schemes, Lemma 25.15.4.

Lemma 47.8.4. *Let $S \in \text{Ob}(Sch_{fppf})$. Let F be a presheaf of sets on $(Sch/S)_{fppf}$. Assume*

- (1) F is a sheaf,
- (2) there exists an index set I and subfunctors $F_i \subset F$ such that
 - (a) each F_i is an algebraic space,
 - (b) each $F_i \rightarrow F$ is a representable,
 - (c) each $F_i \rightarrow F$ is an open immersion (see Definition 47.5.1),
 - (d) the map $\coprod F_i \rightarrow F$ is surjective as a map of sheaves, and
 - (e) $\coprod F_i$ is an algebraic space (set theoretic condition, see Lemma 47.8.3).

Then F is an algebraic space.

Proof. Let T be an object of $(Sch/S)_{fppf}$. Let $T \rightarrow F$ be a morphism. By assumption (2)(b) and (2)(c) the fibre product $F_i \times_F T$ is representable by an open subscheme $V_i \subset T$. It follows that $(\coprod F_i) \times_F T$ is represented by the scheme $\coprod V_i$ over T . By assumption (2)(d) there exists an fppf covering $\{T_j \rightarrow T\}_{j \in J}$ such that $T_j \rightarrow T \rightarrow F$ factors through F_i , $i = i(j)$. Hence $T_j \rightarrow T$ factors through the open subscheme $V_{i(j)} \subset T$. Since $\{T_j \rightarrow T\}$ is jointly surjective, it follows that $T = \bigcup V_i$ is an open covering. In particular, the transformation of functors $\coprod F_i \rightarrow F$ is representable and surjective in the sense of Definition 47.5.1 (see Remark 47.5.2 for a discussion).

Next, let $T' \rightarrow F$ be a second morphism from an object in $(Sch/S)_{fppf}$. Write as above $T' = \bigcup V'_i$ with $V'_i = T' \times_F F_i$. To show that the diagonal $F \rightarrow F \times F$ is representable we have to show that $G = T \times_F T'$ is representable, see Lemma 47.5.10. Consider the subfunctors $G_i = G \times_F F_i$. Note that $G_i = V_i \times_{F_i} V'_i$, and hence is representable as F_i is an algebraic space. By the above the G_i form a Zariski covering of G . Hence by Schemes, Lemma 25.15.4 we see G is representable.

Choose a scheme $U \in \text{Ob}((\text{Sch}/S)_{\text{fppf}})$ and a surjective étale morphism $U \rightarrow \coprod F_i$ (this exist by hypothesis). We may write $U = \coprod U_i$ with U_i the inverse image of F_i , see Lemma 47.8.1. We claim that $U \rightarrow F$ is surjective and étale. Surjectivity follows as $\coprod F_i \rightarrow F$ is surjective (see first paragraph of the proof) by applying Lemma 47.5.4. Consider the fibre product $U \times_F T$ where $T \rightarrow F$ is as above. We have to show that $U \times_F T \rightarrow T$ is étale. Since $U \times_F T = \coprod U_i \times_F T$ it suffices to show each $U_i \times_F T \rightarrow T$ is étale. Since $U_i \times_F T = U_i \times_{F_i} V_i$ this follows from the fact that $U_i \rightarrow F_i$ is étale and $V_i \rightarrow T$ is an open immersion (and Morphisms, Lemmas 28.37.9 and 28.37.3). \square

47.9. Presentations of algebraic spaces

Given an algebraic space we can find a “presentation” of it.

Lemma 47.9.1. *Let F be an algebraic space over S . Let $f : U \rightarrow F$ be a surjective étale morphism from a scheme to F . Set $R = U \times_S U$. Then*

- (1) $j : R \rightarrow U \times_S U$ defines an equivalence relation on U over S (see Groupoids, Definition 38.3.1).
- (2) the morphisms $s, t : R \rightarrow U$ are étale, and
- (3) the diagram

$$R \begin{array}{c} \xrightarrow{\quad} \\ \rightrightarrows \end{array} U \longrightarrow F$$

is a coequalizer diagram in $\text{Sh}((\text{Sch}/S)_{\text{fppf}})$.

Proof. Let T/S be an object of $(\text{Sch}/S)_{\text{fppf}}$. Then $R(T) = \{(a, b) \in U(T) \times U(T) \mid f \circ a = f \circ b\}$ which clearly defines an equivalence relation on $U(T)$. The morphisms $s, t : R \rightarrow U$ are étale because the morphism $U \rightarrow F$ is étale.

To prove (3) we first show that $U \rightarrow F$ is a surjection of sheaves, see Sites, Definition 7.12.1. Let $\xi \in F(T)$ with T as above. Let $V = T \times_{\xi, F, f} U$. By assumption V is a scheme and $V \rightarrow T$ is surjective étale. Hence $\{V \rightarrow T\}$ is a covering for the fppf topology. Since $\xi|_V$ factors through U by construction we conclude $U \rightarrow F$ is surjective. Surjectivity implies that F is the coequalizer of the diagram by Sites, Lemma 7.12.3. \square

This lemma suggests the following definitions.

Definition 47.9.2. Let S be a scheme. Let U be a scheme over S . An *étale equivalence relation* on U over S is an equivalence relation $j : R \rightarrow U \times_S U$ such that $s, t : R \rightarrow U$ are étale morphisms of schemes.

Definition 47.9.3. Let F be an algebraic space over S . A *presentation* of F is given by a scheme U over S and an étale equivalence relation R on U over S , and a surjective étale morphism $U \rightarrow F$ such that $R = U \times_F U$.

Equivalently we could ask for the existence of an isomorphism

$$U/R \cong F$$

where the quotient U/R is as defined in Groupoids, Section 38.18. To construct algebraic spaces we will study the converse question, namely, for which equivalence relations the quotient sheaf U/R is an algebraic space. It will finally turn out this is always the case if R is an étale equivalence relation on U over S , see Theorem 47.10.5.

47.10. Algebraic spaces and equivalence relations

Suppose given a scheme U over S and an étale equivalence relation R on U over S . We would like to show this defines an algebraic space. We will produce a series of lemmas that prove the quotient sheaf U/R (see Groupoids, Definition 38.18.1) has all the properties required of it in Definition 47.6.1.

Lemma 47.10.1. *Let S be a scheme. Let U be a scheme over S . Let $j = (s, t) : R \rightarrow U \times_S U$ be an étale equivalence relation on U over S . Let $U' \rightarrow U$ be an étale morphism. Let R' be the restriction of R to U' , see Groupoids, Definition 38.3.3. Then $j' : R' \rightarrow U' \times_S U'$ is an étale equivalence relation also.*

Proof. It is clear from the description of s', t' in Groupoids, Lemma 38.16.1 that $s', t' : R' \rightarrow U'$ are étale as compositions of base changes of étale morphisms (see Morphisms, Lemma 28.37.4 and 28.37.3). \square

We will often use the following lemma to find open subspaces of algebraic spaces. A slight improvement (with more general hypotheses) of this lemma is Bootstrap, Lemma 62.7.1.

Lemma 47.10.2. *Let S be a scheme. Let U be a scheme over S . Let $j = (s, t) : R \rightarrow U \times_S U$ be a pre-relation. Let $g : U' \rightarrow U$ be a morphism. Assume*

- (1) j is an equivalence relation,
- (2) $s, t : R \rightarrow U$ are surjective, flat and locally of finite presentation,
- (3) g is flat and locally of finite presentation.

Let $R' = R|_{U'}$ be the restriction of R to U' . Then $U'/R' \rightarrow U/R$ is representable, and is an open immersion.

Proof. By Groupoids, Lemma 38.3.2 the morphism $j' = (t', s') : R' \rightarrow U' \times_S U'$ defines an equivalence relation. Since g is flat and locally of finite presentation we see that g is universally open as well (Morphisms, Lemma 28.26.9). For the same reason s, t are universally open as well. Let $W^1 = g(U') \subset U$, and let $W = t(s^{-1}(W^1))$. Then W^1 and W are open in U . Moreover, as j is an equivalence relation we have $t(s^{-1}(W)) = W$ (see Groupoids, Lemma 38.17.2 for example).

By Groupoids, Lemma 38.18.5 the map of sheaves $F' = U'/R' \rightarrow F = U/R$ is injective. Let $a : T \rightarrow F$ be a morphism from a scheme into U/R . We have to show that $T \times_F F'$ is representable by an open subscheme of T .

The morphism a is given by the following data: an fppf covering $\{\varphi_j : T_j \rightarrow T\}_{j \in J}$ of T and morphisms $a_j : T_j \rightarrow U$ such that the maps

$$a_j \times a_{j'} : T_j \times_T T_{j'} \longrightarrow U \times_S U$$

factor through $j : R \rightarrow U \times_S U$ via some (unique) maps $r_{jj'} : T_j \times_T T_{j'} \rightarrow R$. The system (a_j) corresponds to a in the sense that the diagrams

$$\begin{array}{ccc} T_j & \xrightarrow{a_j} & U \\ \downarrow & & \downarrow \\ T & \xrightarrow{a} & F \end{array}$$

commute.

Consider the open subsets $W_j = a_j^{-1}(W) \subset T_j$. Since $t(s^{-1}(W)) = W$ we see that

$$W_j \times_T T_{j'} = r_{jj'}^{-1}(t^{-1}(W)) = r_{jj'}^{-1}(s^{-1}(W)) = T_j \times_T W_{j'}.$$

By Descent, Lemma 34.9.2 this means there exists an open $W_T \subset T$ such that $\varphi_j^{-1}(W_T) = W_j$ for all $j \in J$. We claim that $W_T \rightarrow T$ represents $T \times_F F' \rightarrow T$.

First, let us show that $W_T \rightarrow T \rightarrow F$ is an element of $F'(W_T)$. Since $\{W_j \rightarrow W_T\}_{j \in J}$ is an fppf covering of W_T , it is enough to show that each $W_j \rightarrow U \rightarrow F$ is an element of $F'(W_j)$ (as F' is a sheaf for the fppf topology). Consider the commutative diagram

$$\begin{array}{ccccc} W'_j & \xrightarrow{\quad} & U' & & \\ \downarrow & \searrow & \downarrow g & & \\ & & s^{-1}(W^1) & \xrightarrow{s} & W^1 \\ & & \downarrow t & & \downarrow \\ W_j & \xrightarrow{a_j|_{W_j}} & W & \xrightarrow{\quad} & F \end{array}$$

where $W'_j = W_j \times_W s^{-1}(W^1) \times_{W^1} U'$. Since t and g are surjective, flat and locally of finite presentation, so is $W'_j \rightarrow W_j$. Hence the restriction of the element $W_j \rightarrow U \rightarrow F$ to W'_j is an element of F' as desired.

Suppose that $f : T' \rightarrow T$ is a morphism of schemes such that $a|_{T'} \in F'(T')$. We have to show that f factors through the open W_T . Since $\{T' \times_T T_j \rightarrow T\}$ is an fppf covering of T' it is enough to show each $T' \times_T T_j \rightarrow T$ factors through W_T . Hence we may assume f factors as $\varphi_j \circ f_j : T' \rightarrow T_j \rightarrow T$ for some j . In this case the condition $a|_{T'} \in F'(T')$ means that there exists some fppf covering $\{\psi_i : T'_i \rightarrow T'\}_{i \in I}$ and some morphisms $b_i : T'_i \rightarrow U'$ such that

$$\begin{array}{ccccc} T'_i & \xrightarrow{b_i} & U' & \xrightarrow{g} & U \\ f_j \circ \psi_i \downarrow & & & & \downarrow \\ T_j & \xrightarrow{a_j} & U & \xrightarrow{\quad} & F \end{array}$$

is commutative. This commutativity means that there exists a morphism $r'_i : T'_i \rightarrow R$ such that $t \circ r'_i = a_j \circ f_j \circ \psi_i$, and $s \circ r'_i = g \circ b_i$. This implies that $\text{Im}(f_j \circ \psi_i) \subset W_j$ and we win. \square

The following lemma is not completely trivial although it looks like it should be trivial.

Lemma 47.10.3. *Let S be a scheme. Let U be a scheme over S . Let $j = (s, t) : R \rightarrow U \times_S U$ be an étale equivalence relation on U over S . If the quotient U/R is an algebraic space, then $U \rightarrow U/R$ is étale and surjective. Hence $(U, R, U \rightarrow U/R)$ is a presentation of the algebraic space U/R .*

Proof. Denote $c : U \rightarrow U/R$ the morphism in question. Let T be a scheme and let $a : T \rightarrow U/R$ be a morphism. We have to show that the morphism (of schemes) $\pi : T \times_{a, U/R, c} U \rightarrow T$ is étale and surjective. The morphism a corresponds to an fppf covering $\{\varphi_i : T_i \rightarrow T\}$ and morphisms $a_i : T_i \rightarrow U$ such

that $a_i \times a_{i'} : T_i \times_T T_{i'} \rightarrow U \times_S U$ factors through R , and such that $c \circ a_i = \varphi_i \circ a$. Hence

$$T_i \times_{\varphi_i, T} T \times_{a, U/R, c} U = T_i \times_{c \circ a_i, U/R, c} U = T_i \times_{a_i, U} U \times_{c, U/R, c} U = T_i \times_{a_i, U, t} R.$$

Since t is étale and surjective we conclude that the base change of π to T_i is surjective and étale. Since the property of being surjective and étale is local on the base in the fpqc topology (see Remark 47.4.3) we win. \square

Lemma 47.10.4. *Let S be a scheme. Let U be a scheme over S . Let $j = (s, t) : R \rightarrow U \times_S U$ be an étale equivalence relation on U over S . Assume that U is affine. Then the quotient $F = U/R$ is an algebraic space, and $U \rightarrow F$ is étale and surjective.*

Proof. Since $j : R \rightarrow U \times_S U$ is a monomorphism we see that j is separated (see Schemes, Lemma 25.23.3). Since U is affine we see that $U \times_S U$ (which comes equipped with a monomorphism into the affine scheme $U \times U$) is separated. Hence we see that R is separated. In particular the morphisms s, t are separated as well as étale.

Since the composition $R \rightarrow U \times_S U \rightarrow U$ is locally of finite type we conclude that j is locally of finite type (see Morphisms, Lemma 28.16.8). As j is also a monomorphism it has finite fibres and we see that j is locally quasi-finite by Morphisms, Lemma 28.21.7. Altogether we see that j is separated and locally quasi-finite.

Our first step is to show that the quotient map $c : U \rightarrow F$ is representable. Consider a scheme T and a morphism $a : T \rightarrow F$. We have to show that the sheaf $G = T \times_{a, F, c} U$ is representable. As seen in the proofs of Lemmas 47.10.2 and 47.10.3 there exists an fppf covering $\{\varphi_i : T_i \rightarrow T\}_{i \in I}$ and morphisms $a_i : T_i \rightarrow U$ such that $a_i \times a_{i'} : T_i \times_T T_{i'} \rightarrow U \times_S U$ factors through R , and such that $c \circ a_i = \varphi_i \circ a$. As in the proof of Lemma 47.10.3 we see that

$$\begin{aligned} T_i \times_{\varphi_i, T} G &= T_i \times_{\varphi_i, T} T \times_{a, U/R, c} U \\ &= T_i \times_{c \circ a_i, U/R, c} U \\ &= T_i \times_{a_i, U} U \times_{c, U/R, c} U \\ &= T_i \times_{a_i, U, t} R \end{aligned}$$

Since t is separated and étale, and in particular separated and locally quasi-finite (by Morphisms, Lemmas 28.36.10 and 28.37.16) we see that the restriction of G to each T_i is representable by a morphism of schemes $X_i \rightarrow T_i$ which is separated and locally quasi-finite. By Descent, Lemma 34.35.1 we obtain a descent datum $(X_i, \varphi_{ii'})$ relative to the fppf-covering $\{T_i \rightarrow T\}$. Since each $X_i \rightarrow T_i$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 36.37.1 that this descent datum is effective. Hence by Descent, Lemma 34.35.1 (2) we conclude that G is representable as desired.

The second step of the proof is to show that $U \rightarrow F$ is surjective and étale. This is clear from the above since in the first step above we saw that $G = T \times_{a, F, c} U$ is a scheme over T which base changes to schemes $X_i \rightarrow T_i$ which are surjective and étale. Thus $G \rightarrow T$ is surjective and étale (see Remark 47.4.3). Alternatively one can reread the proof of Lemma 47.10.3 in the current situation.

The third and final step is to show that the diagonal map $F \rightarrow F \times F$ is representable. We first observe that the diagram

$$\begin{array}{ccc} R & \longrightarrow & F \\ j \downarrow & & \downarrow \Delta \\ U \times_S U & \longrightarrow & F \times F \end{array}$$

is a fibre product square. By Lemma 47.3.4 the morphism $U \times_S U \rightarrow F \times F$ is representable (note that $h_U \times h_U = h_{U \times_S U}$). Moreover, by Lemma 47.5.7 the morphism $U \times_S U \rightarrow F \times F$ is surjective and étale (note also that étale and surjective occur in the lists of Remarks 47.4.3 and 47.4.2). It follows either from Lemma 47.3.3 and the diagram above, or by writing $R \rightarrow F$ as $R \rightarrow U \rightarrow F$ and Lemmas 47.3.1 and 47.3.2 that $R \rightarrow F$ is representable as well. Let T be a scheme and let $a : T \rightarrow F \times F$ be a morphism. We have to show that $G = T \times_{a, F \times F, \Delta} F$ is representable. By what was said above the morphism (of schemes)

$$T' = (U \times_S U) \times_{F \times F, a} T \longrightarrow T$$

is surjective and étale. Hence $\{T' \rightarrow T\}$ is an étale covering of T . Note also that

$$T' \times_T G = T' \times_{U \times_S U, j} R$$

as can be seen contemplating the following cube

$$\begin{array}{ccccc} & & R & \longrightarrow & F \\ & \nearrow & \downarrow & & \downarrow \\ T' \times_T G & \longrightarrow & G & \longrightarrow & F \\ & \searrow & \downarrow & & \downarrow \\ & & U \times_S U & \longrightarrow & F \times F \\ & \nearrow & \downarrow & & \downarrow \\ T' & \longrightarrow & T & \longrightarrow & F \times F \end{array}$$

Hence we see that the restriction of G to T' is representable by a scheme X , and moreover that the morphism $X \rightarrow T'$ is a base change of the morphism j . Hence $X \rightarrow T'$ is separated and locally quasi-finite (see second paragraph of the proof). By Descent, Lemma 34.35.1 we obtain a descent datum (X, φ) relative to the fppf-covering $\{T' \rightarrow T\}$. Since $X \rightarrow T$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 36.37.1 that this descent datum is effective. Hence by Descent, Lemma 34.35.1 (2) we conclude that G is representable as desired. \square

Theorem 47.10.5. *Let S be a scheme. Let U be a scheme over S . Let $j = (s, t) : R \rightarrow U \times_S U$ be an étale equivalence relation on U over S . Then the quotient U/R is an algebraic space, and $U \rightarrow U/R$ is étale and surjective, in other words $(U, R, U \rightarrow U/R)$ is a presentation of U/R .*

Proof. By Lemma 47.10.3 it suffices to prove that U/R is an algebraic space. Let $U' \rightarrow U$ be a surjective, étale morphism. Then $\{U' \rightarrow U\}$ is in particular an fppf covering. Let R' be the restriction of R to U' , see Groupoids, Definition 38.3.3. According to Groupoids, Lemma 38.18.6 we see that $U/R \cong U'/R'$. By Lemma 47.10.1 R' is an étale equivalence relation on U' . Thus we may replace U by U' .

We apply the previous remark to $U' = \coprod U_i$, where $U = \bigcup U_i$ is an affine open covering of S . Hence we may and do assume that $U = \coprod U_i$ where each U_i is an affine scheme.

Consider the restriction R_i of R to U_i . By Lemma 47.10.1 this is an étale equivalence relation. Set $F_i = U_i/R_i$ and $F = U/R$. It is clear that $\coprod F_i \rightarrow F$ is surjective. By Lemma 47.10.2 each $F_i \rightarrow F$ is representable, and an open immersion. By Lemma 47.10.4 applied to (U_i, R_i) we see that F_i is an algebraic space. Then by Lemma 47.10.3 we see that $U_i \rightarrow F_i$ is étale and surjective. From Lemma 47.8.3 it follows that $\coprod F_i$ is an algebraic space. Finally, we have verified all hypotheses of Lemma 47.8.4 and it follows that $F = U/R$ is an algebraic space. \square

47.11. Algebraic spaces, retrofitted

We start building our arsenal of lemmas dealing with algebraic spaces.

Lemma 47.11.1. *Let S be a scheme contained in Sch_{fppf} . Let F be an algebraic space over S . Let $G \rightarrow F$ be a representable transformation of functors. Then G is an algebraic space.*

Proof. By Lemma 47.3.5 we see that G is a sheaf. The diagram

$$\begin{array}{ccc} G \times_F G & \longrightarrow & F \\ \downarrow & & \downarrow \Delta_F \\ G \times G & \longrightarrow & F \times F \end{array}$$

is cartesian. Hence we see that $G \times_F G \rightarrow G \times G$ is representable by Lemma 47.3.3. By Lemma 47.3.6 we see that $G \rightarrow G \times_F G$ is representable. Hence $\Delta_G : G \rightarrow G \times G$ is representable as a composition of representable transformations, see Lemma 47.3.2. Finally, let U be an object of $(Sch/S)_{fppf}$ and let $U \rightarrow F$ be surjective and étale. By assumption $U \times_F G$ is representable by a scheme U' . By Lemma 47.5.5 the morphism $U' \rightarrow G$ is surjective and étale. This verifies the final condition of Definition 47.6.1 and we win. \square

Lemma 47.11.2. *Let S be a scheme contained in Sch_{fppf} . Let F, G be algebraic spaces over S . Let $G \rightarrow F$ be a representable morphism. Let $U \in \text{Ob}((Sch/S)_{fppf})$, and $q : U \rightarrow F$ surjective and étale. Set $V = G \times_F U$. Finally, let \mathcal{P} be a property of morphisms of schemes as in Definition 47.5.1. Then $G \rightarrow F$ has property \mathcal{P} if and only if $V \rightarrow U$ has property \mathcal{P} .*

Proof. (This lemma follows from Lemmas 47.5.5 and 47.5.6, but we give a direct proof here also.) It is clear from the definitions that if $G \rightarrow F$ has property \mathcal{P} , then $V \rightarrow U$ has property \mathcal{P} . Conversely, assume $V \rightarrow U$ has property \mathcal{P} . Let $T \rightarrow F$ be a morphism from a scheme to F . Let $T' = T \times_F G$ which is a scheme since $G \rightarrow F$ is representable. We have to show that $T' \rightarrow T$ has property \mathcal{P} . Consider the commutative diagram of schemes

$$\begin{array}{ccccc} V & \longleftarrow & T \times_F V & \longrightarrow & T \times_F G = T' \\ \downarrow & & \downarrow & & \downarrow \\ U & \longleftarrow & T \times_F U & \longrightarrow & T \end{array}$$

where both squares are fibre product squares. Hence we conclude the middle arrow has property \mathcal{P} as a base change of $V \rightarrow U$. Finally, $\{T \times_F U \rightarrow T\}$ is a fppf covering as it is surjective étale, and hence we conclude that $T' \rightarrow T$ has property \mathcal{P} as it is local on the base in the fppf topology. \square

Lemma 47.11.3. *Let S be a scheme contained in Sch_{fppf} . Let $G \rightarrow F$ be a transformation of presheaves on $(Sch/S)_{fppf}$. Let \mathcal{P} be a property of morphisms of schemes. Assume*

- (1) \mathcal{P} is preserved under any base change, fppf local on the base, and morphisms of type \mathcal{P} satisfy descent for fppf coverings, see Descent, Definition 34.32.1,
- (2) G is a sheaf,
- (3) F is an algebraic space,
- (4) there exists a $U \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $U \rightarrow F$ such that $V = G \times_F U$ is representable, and
- (5) $V \rightarrow U$ has \mathcal{P} .

Then G is an algebraic space, $G \rightarrow F$ is representable and has property \mathcal{P} .

Proof. Let $R = U \times_F U$, and denote $t, s : R \rightarrow U$ the projection morphisms as usual. Let T be a scheme and let $T \rightarrow F$ be a morphism. Then $U \times_F T \rightarrow T$ is surjective étale, hence $\{U \times_F T \rightarrow T\}$ is a covering for the étale topology. Consider

$$W = G \times_F (U \times_F T) = V \times_F T = V \times_U (U \times_F T).$$

It is a scheme since F is an algebraic space. The morphism $W \rightarrow U \times_F T$ has property \mathcal{P} since it is a base change of $V \rightarrow U$. There is an isomorphism

$$\begin{aligned} W \times_T (U \times_F T) &= (G \times_F (U \times_F T)) \times_T (U \times_F T) \\ &= (U \times_F T) \times_T (G \times_F (U \times_F T)) \\ &= (U \times_F T) \times_T W \end{aligned}$$

over $(U \times_F T) \times_T (U \times_F T)$. The middle equality maps $((g, (u_1, t)), (u_2, t))$ to $((u_1, t), (g, (u_2, t)))$. This defines a descent datum for $W/U \times_F T/T$, see Descent, Definition 34.30.1. This follows from Descent, Lemma 34.35.1. Namely we have a sheaf $G \times_F T$, whose base change to $U \times_F T$ is represented by W and the isomorphism above is the one from the proof of Descent, Lemma 34.35.1. By assumption on \mathcal{P} the descent datum above is representable. Hence by the last statement of Descent, Lemma 34.35.1 we see that $G \times_F T$ is representable. This proves that $G \rightarrow F$ is a representable transformation of functors.

As $G \rightarrow F$ is representable, we see that G is an algebraic space by Lemma 47.11.1. The fact that $G \rightarrow F$ has property \mathcal{P} now follows from Lemma 47.11.2. \square

Lemma 47.11.4. *Let S be a scheme contained in Sch_{fppf} . Let F, G be algebraic spaces over S . Let $a : F \rightarrow G$ be a morphism. Given any $V \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $q : V \rightarrow G$ there exists a $U \in \text{Ob}((Sch/S)_{fppf})$ and a commutative diagram*

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ p \downarrow & & \downarrow q \\ F & \xrightarrow{a} & G \end{array}$$

with p surjective and étale.

Proof. First choose $W \in \text{Ob}((Sch/S)_{fppf})$ with surjective étale morphism $W \rightarrow F$. Next, put $U = W \times_G V$. Since G is an algebraic space we see that U is isomorphic to an object of $(Sch/S)_{fppf}$. As q is surjective étale, we see that $U \rightarrow W$ is surjective étale (see Lemma 47.5.5). Thus $U \rightarrow F$ is surjective étale as a composition of surjective étale morphisms (see Lemma 47.5.4). \square

47.12. Immersions and Zariski coverings of algebraic spaces

At this point an interesting phenomenon occurs. We have already defined the notion of an open immersion of algebraic spaces (through Definition 47.5.1) but we have yet to define the notion of a *point*¹. Thus the *Zariski topology* of an algebraic space has already been defined, but there is no space yet!

Perhaps superfluously we formally introduce immersions as follows.

Definition 47.12.1. Let $S \in \text{Ob}(Sch_{fppf})$ be a scheme. Let F be an algebraic space over S .

- (1) A morphism of algebraic spaces over S is called an *open immersion* if it is representable, and an open immersion in the sense of Definition 47.5.1.
- (2) An *open subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \rightarrow F$ is an open immersion.
- (3) A morphism of algebraic spaces over S is called a *closed immersion* if it is representable, and a closed immersion in the sense of Definition 47.5.1.
- (4) A *closed subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \rightarrow F$ is a closed immersion.
- (5) A morphism of algebraic spaces over S is called an *immersion* if it is representable, and an immersion in the sense of Definition 47.5.1.
- (6) A *locally closed subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \rightarrow F$ is an immersion.

We note that these definitions make sense since an immersion is in particular a monomorphism (see Schemes, Lemma 25.23.7 and Lemma 47.5.8), and hence the image of an immersion $G \rightarrow F$ of algebraic spaces is a subfunctor $F' \subset F$ which is (canonically) isomorphic to G . Thus some of the discussion of Schemes, Section 25.10 carries over to the setting of algebraic spaces.

Lemma 47.12.2. *Let $S \in \text{Ob}(Sch_{fppf})$ be a scheme. A composition of (closed, resp. open) immersions of algebraic spaces over S is a (closed, resp. open) immersion of algebraic spaces over S .*

Proof. See Lemma 47.5.4 and Remarks 47.4.3 (see very last line of that remark) and 47.4.2. \square

Lemma 47.12.3. *Let $S \in \text{Ob}(Sch_{fppf})$ be a scheme. A base change of a (closed, resp. open) immersion of algebraic spaces over S is a (closed, resp. open) immersion of algebraic spaces over S .*

Proof. See Lemma 47.5.5 and Remark 47.4.3 (see very last line of that remark). \square

¹We will associate a topological space to an algebraic space in Properties of Spaces, Section 48.4, and its opens will correspond exactly to the open subspaces defined below.

Lemma 47.12.4. *Let $S \in \text{Ob}(\text{Sch}_{fppf})$ be a scheme. Let F be an algebraic space over S . Let F_1, F_2 be locally closed subspaces of F . If $F_1 \subset F_2$ as subfunctors of F , then F_1 is a locally closed subspace of F_2 . Similarly for closed and open subspaces.*

Proof. Let $T \rightarrow F_2$ be a morphism with T a scheme. Since $F_2 \rightarrow F$ is a monomorphism, we see that $T \times_{F_2} F_1 = T \times_F F_1$. The lemma follows formally from this. \square

Let us formally define the notion of a Zariski open covering of algebraic spaces. Note that in Lemma 47.8.4 we have already encountered such open coverings as a method for constructing algebraic spaces.

Definition 47.12.5. Let $S \in \text{Ob}(\text{Sch}_{fppf})$ be a scheme. Let F be an algebraic space over S . A *Zariski covering* $\{F_i \subset F\}_{i \in I}$ of F is given by a set I , a collection of open subspaces $F_i \subset F$ such that $\coprod_{i \in I} F_i \rightarrow F$ is a surjective map of sheaves.

Note that if T is a schemes, and $a : T \rightarrow F$ is a morphism, then each of the fibre products $T \times_F F_i$ is identified with an open subscheme $T_i \subset T$. The final condition of the definition signifies exactly that $T = \bigcup_{i \in I} T_i$.

It is clear that the collection F_{Zar} of open subspaces of F is a set (as $(\text{Sch}/S)_{fppf}$ is a site, hence a set). Moreover, we can turn F_{Zar} into a category by letting the morphisms be inclusions of subfunctors (which are automatically open immersions by Lemma 47.12.4). Finally, Definition 47.12.5 provides the notion of a Zariski covering $\{F_i \rightarrow F\}_{i \in I}$ in the category F_{Zar} . Hence, just as in the case of a topological space (see Sites, Example 7.6.4) by suitably choosing a set of coverings we may obtain a Zariski site of the algebraic space F .

Definition 47.12.6. Let $S \in \text{Ob}(\text{Sch}_{fppf})$ be a scheme. Let F be an algebraic space over S . A *small Zariski site* F_{Zar} of an algebraic space F is one of the sites described above.

Hence this gives a notion of what it means for something to be true Zariski locally on an algebraic space, which is how we will use this notion. In general the Zariski topology is not fine enough for our purposes. For example we can consider the category of Zariski sheaves on an algebraic space. It will turn out that this is not the correct thing to consider, even for quasi-coherent sheaves. One only gets the desired result when using the étale or fppf site of F to define quasi-coherent sheaves.

47.13. Separation conditions on algebraic spaces

A separation condition on an algebraic space F is a condition on the diagonal morphism $F \rightarrow F \times F$. Let us first list the properties the diagonal has automatically. Since the diagonal is representable by definition the following lemma makes sense (through Definition 47.5.1).

Lemma 47.13.1. *Let S be a scheme contained in Sch_{fppf} . Let F be an algebraic space over S . Let $\Delta : F \rightarrow F \times F$ be the diagonal morphism. Then*

- (1) Δ is locally of finite type,
- (2) Δ is a monomorphism,
- (3) Δ is separated, and
- (4) Δ is locally quasi-finite.

Proof. Let $F = U/R$ be a presentation of F . As in the proof of Lemma 47.10.4 the diagram

$$\begin{array}{ccc} R & \longrightarrow & F \\ j \downarrow & & \downarrow \Delta \\ U \times_S U & \longrightarrow & F \times F \end{array}$$

is cartesian. Hence according to Lemma 47.11.2 it suffices to show that j has the properties listed in the lemma. (Note that each of the properties (1) – (4) occur in the lists of Remarks 47.4.1 and 47.4.3.) Since j is an equivalence relation it is a monomorphism. Hence it is separated by Schemes, Lemma 25.23.3. As R is an étale equivalence relation we see that $s, t : R \rightarrow U$ are étale. Hence s, t are locally of finite type. Then it follows from Morphisms, Lemma 28.16.8 that j is locally of finite type. Finally, as it is a monomorphism its fibres are finite. Thus we conclude that it is locally quasi-finite by Morphisms, Lemma 28.21.7. \square

Here are some common types of separation conditions, relative to the base scheme S . There is also an absolute notion of these conditions which we will discuss in Properties of Spaces, Section 48.3. Moreover, we will discuss separation conditions for a morphism of algebraic spaces in Morphisms of Spaces, Section 49.4.

Definition 47.13.2. Let S be a scheme contained in Sch_{fppf} . Let F be an algebraic space over S . Let $\Delta : F \rightarrow F \times F$ be the diagonal morphism.

- (1) We say F is *separated over S* if Δ is a closed immersion.
- (2) We say F is *locally separated over S* ² if Δ is an immersion.
- (3) We say F is *quasi-separated over S* if Δ is quasi-compact.
- (4) We say F is *Zariski locally quasi-separated over S* ³ if there exists a Zariski covering $F = \bigcup_{i \in I} F_i$ such that each F_i is quasi-separated.

Note that if the diagonal is quasi-compact (when F is separated or quasi-separated) then the diagonal is actually quasi-finite and separated, hence quasi-affine (by More on Morphisms, Lemma 36.31.2).

47.14. Examples of algebraic spaces

In this section we construct some examples of algebraic spaces. Some of these were suggested by B. Conrad. Since we do not yet have a lot of theory at our disposal the discussion is a bit awkward in some places.

Example 47.14.1. Let k be a field of characteristic $\neq 2$. Let $U = \mathbf{A}_k^1$. Set

$$j : R = \Delta \coprod \Gamma \longrightarrow U \times_k U$$

where $\Delta = \{(x, x) \mid x \in \mathbf{A}_k^1\}$ and $\Gamma = \{(x, -x) \mid x \in \mathbf{A}_k^1, x \neq 0\}$. It is clear that $s, t : R \rightarrow U$ are étale, and hence j is an étale equivalence relation. The quotient $X = U/R$ is an algebraic space by Theorem 47.10.5. Since R is quasi-compact we see that X is quasi-separated. On the other hand, X is not locally separated because the morphism j is not an immersion.

²In the literature this often refers to quasi-separated and locally separated algebraic spaces.

³This definition was suggested by B. Conrad.

Example 47.14.2. Let k be a field. Let $k \subset k'$ be a degree 2 Galois extension with $\text{Gal}(k'/k) = \{1, \sigma\}$. Let $S = \text{Spec}(k[x])$ and $U = \text{Spec}(k'[x])$. Note that

$$U \times_S U = \text{Spec}((k' \otimes_k k')[x]) = \Delta(U) \coprod \Delta'(U)$$

where $\Delta' = (1, \sigma) : U \rightarrow U \times_S U$. Take

$$R = \Delta(U) \coprod \Delta'(U \setminus \{0_U\})$$

where $0_U \in U$ denotes the k' -rational point whose x -coordinate is zero. It is easy to see that R is an étale equivalence relation on U over S and hence $X = U/R$ is an algebraic space by Theorem 47.10.5. Here are some properties of X (some of which will not make sense until later):

- (1) $X \rightarrow S$ is an isomorphism over $S \setminus \{0_S\}$,
- (2) the morphism $X \rightarrow S$ is étale (see Properties of Spaces, Definition 48.13.2)
- (3) the fibre 0_X of $X \rightarrow S$ over 0_S is isomorphic to $\text{Spec}(k') = 0_U$,
- (4) X is not a scheme because if it were, then $\mathcal{O}_{X,0_X}$ would be a local domain $(\mathcal{O}, \mathfrak{m}, \kappa)$ with fraction field $k(x)$, with $x \in \mathfrak{m}$ and residue field $\kappa = k'$ which is impossible,
- (5) X is not separated, but it is locally separated and quasi-separated,
- (6) there exists a surjective, finite, étale morphism $S' \rightarrow S$ such that the base change $X' = S' \times_S X$ is a scheme (namely, if we base change to $S' = \text{Spec}(k'[x])$ then U splits into two copies of S' and X' becomes isomorphic to the affine line with 0 doubled, see Schemes, Example 25.14.3), and
- (7) if we think of X as a finite type algebraic space over $\text{Spec}(k)$, then similarly the base change $X_{k'}$ is a scheme but X is not a scheme.

In particular, this gives an example of a descent datum for schemes relative to the covering $\{\text{Spec}(k') \rightarrow \text{Spec}(k)\}$ which is not effective.

See also Examples, Lemma 82.56.1, which shows that descent data need not be effective even for a projective morphism of schemes. That example gives a smooth separated algebraic space of dimension 3 over \mathbf{C} which is not a scheme.

We will use the following lemma as a convenient way to construct algebraic spaces as quotients of schemes by free group actions.

Lemma 47.14.3. *Let $U \rightarrow S$ be a morphism of Sch_{fppf} . Let G be an abstract group. Let $G \rightarrow \text{Aut}_S(U)$ be a group homomorphism. Assume*

- (*) *if $u \in U$ is a point, and $g(u) = u$ for some non-identity element $g \in G$, then g induces a nontrivial automorphism of $\kappa(u)$.*

Then

$$j : R = \coprod_{g \in G} U \longrightarrow U \times_S U, \quad (g, x) \longmapsto (g(x), x)$$

is an étale equivalence relation and hence

$$F = U/R$$

is an algebraic space by Theorem 47.10.5.

Proof. In the statement of the lemma the symbol $\text{Aut}_S(U)$ denotes the group of automorphisms of U over S . Assume (*) holds. Let us show that

$$j : R = \coprod_{g \in G} U \longrightarrow U \times_S U, \quad (g, x) \longmapsto (g(x), x)$$

is a monomorphism. This signifies that if T is a nonempty scheme, and $h : T \rightarrow U$ is a T -valued point such that $g \circ h = g' \circ h$ then $g = g'$. Suppose $T \neq \emptyset$, $h : T \rightarrow U$ and $g \circ h = g' \circ h$. Let $t \in T$. Consider the composition $\text{Spec}(\kappa(t)) \rightarrow \text{Spec}(\kappa(h(t))) \rightarrow U$. Then we conclude that $g^{-1} \circ g'$ fixes $u = h(t)$ and acts as the identity on its residue field. Hence $g = g'$ by (*).

Thus if (*) holds we see that j is a relation (see Groupoids, Definition 38.3.1). Moreover, it is an equivalence relation since on T -valued points for a connected scheme T we see that $R(T) = G \times U(T) \rightarrow U(T) \times U(T)$ (recall that we always work over S). Moreover, the morphisms $s, t : R \rightarrow U$ are étale since R is a disjoint product of copies of U . This proves that $j : R \rightarrow U \times_S U$ is an étale equivalence relation. \square

Given a scheme U and an action of a group G on U we say the action of G on U is *free* if condition (*) of Lemma 47.14.3 holds. This is equivalent to the notion of a free action of the constant group scheme G_S on U as defined in Groupoids, Definition 38.8.2. The lemma can be interpreted as saying that quotients of schemes by free actions of groups exist in the category of algebraic spaces.

Definition 47.14.4. Notation $U \rightarrow S$, G , R as in Lemma 47.14.3. If the action of G on U satisfies (*) we say G *acts freely* on the scheme U . In this case the algebraic space U/R is denoted U/G and is called the *quotient of U by G* .

This notation is consistent with the notation U/G introduced in Groupoids, Definition 38.18.1. We will later make sense of the quotient as an algebraic stack without any assumptions on the action whatsoever; when we do this we will use the notation $[U/G]$. Before we discuss the examples we prove some more lemmas to facilitate the discussion. Here is a lemma discussing the various separation conditions for this quotient when G is finite.

Lemma 47.14.5. *Notation and assumptions as in Lemma 47.14.3. Assume G is finite. Then*

- (1) *if $U \rightarrow S$ is quasi-separated, then U/G is quasi-separated, and*
- (2) *if $U \rightarrow S$ is separated, then U/G is separated.*

Proof. In the proof of Lemma 47.13.1 we saw that it suffices to prove the corresponding properties for the morphism $j : R \rightarrow U \times_S U$. If $U \rightarrow S$ is quasi-separated, then for every affine open $V \subset U$ the opens $g(V) \cap V$ are quasi-compact. It follows that j is quasi-compact. If $U \rightarrow S$ is separated, the diagonal $\Delta_{U/S}$ is a closed immersion. Hence $j : R \rightarrow U \times_S U$ is a finite coproduct of closed immersions with disjoint images. Hence j is a closed immersion. \square

Lemma 47.14.6. *Notation and assumptions as in Lemma 47.14.3. If $\text{Spec}(k) \rightarrow U/G$ is a morphism, then there exist*

- (1) *a finite Galois extension $k \subset k'$,*
- (2) *a finite subgroup $H \subset G$,*
- (3) *an isomorphism $H \rightarrow \text{Gal}(k'/k)$, and*
- (4) *an H -equivariant morphism $\text{Spec}(k') \rightarrow U$.*

Conversely, such data determine a morphism $\text{Spec}(k) \rightarrow U/G$.

Proof. Consider the fibre product $V = \text{Spec}(k) \times_{U/G} U$. Here is a diagram

$$\begin{array}{ccc} V & \longrightarrow & U \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \longrightarrow & U/G \end{array}$$

This is a nonempty scheme étale over $\text{Spec}(k)$ and hence is a disjoint union of spectra of fields finite separable over k (Morphisms, Lemma 28.37.7). So write $V = \coprod_{i \in I} \text{Spec}(k_i)$. The action of G on U induces an action of G on $V = \coprod \text{Spec}(k_i)$. Pick an i , and let $H \subset G$ be the stabilizer of i . Since

$$V \times_{\text{Spec}(k)} V = \text{Spec}(k) \times_{U/G} U \times_{U/G} U = \text{Spec}(k) \times_{U/G} U \times G = V \times G$$

we see that (a) the orbit of $\text{Spec}(k_i)$ is V and (b) $\text{Spec}(k_i \otimes_k k_i) = \text{Spec}(k_i) \times H$. Thus H is finite and is the Galois group of k_i/k . We omit the converse construction. \square

It follows from this lemma for example that if k'/k is a finite Galois extension, then $\text{Spec}(k')/\text{Gal}(k'/k) \cong \text{Spec}(k)$. What happens if the extension is infinite? Here is an example.

Example 47.14.7. Let $S = \text{Spec}(\mathbf{Q})$. Let $U = \text{Spec}(\overline{\mathbf{Q}})$. Let $G = \text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ with obvious action on U . Then by construction property (*) of Lemma 47.14.3 holds and we obtain an algebraic space

$$X = \text{Spec}(\overline{\mathbf{Q}})/G \longrightarrow S = \text{Spec}(\mathbf{Q}).$$

Of course this is totally ridiculous as an approximation of $S!$ Namely, by the Artin-Schreier theorem, see [Jac64, Theorem 17, page 316], the only finite subgroups of $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ are $\{1\}$ and the conjugates of the order two group $\text{Gal}(\overline{\mathbf{Q}}/\overline{\mathbf{Q}} \cap \mathbf{R})$. Hence, if $\text{Spec}(k) \rightarrow X$ is a morphism with k algebraic over \mathbf{Q} , then it follows from Lemma 47.14.6 and the theorem just mentioned that either k is $\overline{\mathbf{Q}}$ or isomorphic to $\overline{\mathbf{Q}} \cap \mathbf{R}$.

What is wrong with the example above is that the Galois group comes equipped with a topology, and this should somehow be part of any construction of a quotient of $\text{Spec}(\overline{\mathbf{Q}})$. The following example is much more reasonable in my opinion and may actually occur in “nature”.

Example 47.14.8. Let k be a field of characteristic zero. Let $U = \mathbf{A}_k^1$ and let $G = \mathbf{Z}$. As action we take $n(x) = x + n$, i.e., the action of \mathbf{Z} on the affine line by translation. The only fixed point is the generic point and it is clearly the case that \mathbf{Z} injects into the automorphism group of the field $k(x)$. (This is where we use the characteristic zero assumption.) Consider the morphism

$$\gamma : \text{Spec}(k(x)) \longrightarrow X = \mathbf{A}_k^1/\mathbf{Z}$$

of the generic point of the affine line into the quotient. We claim that this morphism does not factor through any monomorphism $\text{Spec}(L) \rightarrow X$ of the spectrum of a field to X . (Contrary to what happens for schemes, see Schemes, Section 25.13.) In fact, since \mathbf{Z} does not have any finite subgroups we see from Lemma 47.14.6 that for any such factorization $k(x) = L$. Finally, γ is not a monomorphism since

$$\text{Spec}(k(x)) \times_{\gamma, X, \gamma} \text{Spec}(k(x)) \cong \text{Spec}(k(x)) \times \mathbf{Z}.$$

This example suggests that in order to define points of an algebraic space X we should consider equivalence classes of morphisms from spectra of fields into X and not the set of monomorphisms from spectra of fields.

We finish with a truly awful example.

Example 47.14.9. Let k be a field. Let $A = \prod_{n \in \mathbf{N}} k$ be the infinite product. Set $U = \text{Spec}(A)$ seen as a scheme over $S = \text{Spec}(k)$. Note that the projection maps $\text{pr}_n : A \rightarrow k$ define open and closed immersions $f_n : S \rightarrow U$. Set

$$R = U \amalg \coprod_{(n,m) \in \mathbf{N}^2, n \neq m} S$$

with morphism j equal to $\Delta_{U/S}$ on the component U and $j = (f_n, f_m)$ on the component S corresponding to (n, m) . It is clear from the remark above that s, t are étale. It is also clear that j is an equivalence relation. Hence we obtain an algebraic space

$$X = U/R.$$

To see what this means we specialize to the case where the field k is finite with q elements. Let us first discuss the topological space $|U|$ associated to the scheme U a little bit. All elements of A satisfy $x^q = x$. Hence every residue field of A is isomorphic to k , and all points of U are closed. But the topology on U isn't the discrete topology. Let $u_n \in |U|$ be the point corresponding to f_n . As mentioned above the points u_n are the open points (and hence isolated). This implies there have to be other points since we know U is quasi-compact, see Algebra, Lemma 10.16.10 (hence not equal to an infinite discrete set). Another way to see this is because the (proper) ideal

$$I = \{x = (x_n) \in A \mid \text{all but a finite number of } x_n \text{ are zero}\}$$

is contained in a maximal ideal. Note also that every element x of A is of the form $x = ue$ where u is a unit and e is an idempotent. Hence a basis for the topology of A consists of open and closed subsets (see Algebra, Lemma 10.20.1.) So the topology on $|U|$ is totally disconnected, but nontrivial. Finally, note that $\{u_n\}$ is dense in $|U|$.

We will later define a topological space $|X|$ associated to X , see Properties of Spaces, Section 48.4. What can we say about $|X|$? It turns out that the map $|U| \rightarrow |X|$ is surjective and continuous. All the points u_n map to the same point x_0 of $|X|$, and none of the other points get identified. Since $\{u_n\}$ is dense in $|U|$ we conclude that the closure of x_0 in $|X|$ is $|X|$. In other words $|X|$ is irreducible and x_0 is a generic point of $|X|$. This seems bizarre since also x_0 is the image of a section $S \rightarrow X$ of the structure morphism $X \rightarrow S$ (and in the case of schemes this would imply it was a closed point, see Morphisms, Lemma 28.21.2).

Whatever you think is actually going on in this example, it certainly shows that some care has to be exercised when defining irreducible components, connectedness, etc of algebraic spaces.

47.15. Change of big site

In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. Here is a precise statement of the result.

Lemma 47.15.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf} . Assume that Sch_{fppf} is contained in Sch'_{fppf} , see Topologies, Section 33.10. Let S be an object of Sch_{fppf} . Let*

$$\begin{aligned} g &: Sh((Sch/S)_{fppf}) \longrightarrow Sh((Sch'/S)_{fppf}), \\ f &: Sh((Sch'/S)_{fppf}) \longrightarrow Sh((Sch/S)_{fppf}) \end{aligned}$$

be the morphisms of topoi of Topologies, Lemma 33.10.2. Let F be a sheaf of sets on $(Sch/S)_{fppf}$. Then

- (1) if F is representable by a scheme $X \in \text{Ob}((Sch/S)_{fppf})$ over S , then $f^{-1}F$ is representable too, in fact it is representable by the same scheme X , now viewed as an object of $(Sch'/S)_{fppf}$, and
- (2) if F is an algebraic space over S , then $f^{-1}F$ is an algebraic space over S also.

Proof. Let $X \in \text{Ob}((Sch/S)_{fppf})$. Let us write h_X for the representable sheaf on $(Sch/S)_{fppf}$ associated to X , and h'_X for the representable sheaf on $(Sch'/S)_{fppf}$ associated to X . By the description of f^{-1} in Topologies, Section 33.10 we see that $f^{-1}h_X = h'_X$. This proves (1).

Next, suppose that F is an algebraic space over S . By Lemma 47.9.1 this means that $F = h_U/h_R$ for some étale equivalence relation $R \rightarrow U \times_S U$ in $(Sch/S)_{fppf}$. Since f^{-1} is an exact functor we conclude that $f^{-1}F = h'_U/h'_R$. Hence $f^{-1}F$ is an algebraic space over S by Theorem 47.10.5. \square

Note that this lemma is purely set theoretical and has virtually no content. Moreover, it is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.

Lemma 47.15.2. *Suppose Sch_{fppf} is contained in Sch'_{fppf} . Let S be an object of Sch_{fppf} . Denote Spaces/S the category of algebraic spaces over S defined using Sch_{fppf} . Similarly, denote Spaces'/S the category of algebraic spaces over S defined using Sch'_{fppf} . The construction of Lemma 47.15.1 defines a fully faithful functor*

$$\text{Spaces}/S \longrightarrow \text{Spaces}'/S$$

whose essential image consists of those $X' \in \text{Ob}(\text{Spaces}'/S)$ such that there exist $U, R \in \text{Ob}((Sch/S)_{fppf})$ ⁴ and morphisms

$$U \longrightarrow X' \quad \text{and} \quad R \longrightarrow U \times_{X'} U$$

in $Sh((Sch'/S)_{fppf})$ which are surjective as maps of sheaves (for example if the displayed morphisms are surjective and étale).

Proof. In Sites, Lemma 7.20.8 we have seen that the functor $f^{-1} : Sh((Sch/S)_{fppf}) \rightarrow Sh((Sch'/S)_{fppf})$ is fully faithful (see discussion in Topologies, Section 33.10). Hence we see that the displayed functor of the lemma is fully faithful.

⁴Requiring the existence of R is necessary because of our choice of the function *Bound* in Sets, Equation (3.9.1.1). The size of the fibre product $U \times_{X'} U$ can grow faster than *Bound* in terms of the size of U . We can illustrate this by setting $S = \text{Spec}(A)$, $U = \text{Spec}(A[x_i, i \in I])$ and $R = \coprod_{(\lambda_i) \in A^I} \text{Spec}(A[x_i, y_i]/(x_i - \lambda_i y_i))$. In this case the size of R grows like κ^κ where κ is the size of U .

Suppose that $X' \in \text{Ob}(\text{Spaces}'/S)$ such that there exists $U \in \text{Ob}((\text{Sch}/S)_{\text{fppf}})$ and a map $U \rightarrow X'$ in $\text{Sh}((\text{Sch}'/S)_{\text{fppf}})$ which is surjective as a map of sheaves. Let $U' \rightarrow X'$ be a surjective étale morphism with $U' \in \text{Ob}((\text{Sch}'/S)_{\text{fppf}})$. Let $\kappa = \text{size}(U)$, see Sets, Section 3.9. Then U has an affine open covering $U = \bigcup_{i \in I} U_i$ with $|I| \leq \kappa$. Observe that $U' \times_{X'} U \rightarrow U$ is étale and surjective. For each i we can pick a quasi-compact open $U'_i \subset U'$ such that $U'_i \times_{X'} U_i \rightarrow U_i$ is surjective (because the scheme $U' \times_{X'} U_i$ is the union of the Zariski opens $W \times_{X'} U_i$ for $W \subset U'$ affine and because $U' \times_{X'} U_i \rightarrow U_i$ is étale hence open). Then $\coprod_{i \in I} U'_i \rightarrow X$ is surjective étale because of our assumption that $U \rightarrow X$ and hence $\coprod U_i \rightarrow X$ is a surjection of sheaves (details omitted). Because $U'_i \times_{X'} U \rightarrow U'_i$ is a surjection of sheaves and because U'_i is quasi-compact, we can find a quasi-compact open $W_i \subset U'_i \times_{X'} U$ such that $W_i \rightarrow U'_i$ is surjective as a map of sheaves (details omitted). Then $W_i \rightarrow U$ is étale and we conclude that $\text{size}(W_i) \leq \text{size}(U)$, see Sets, Lemma 3.9.7. By Sets, Lemma 3.9.11 we conclude that $\text{size}(U'_i) \leq \text{size}(U)$. Hence $\coprod_{i \in I} U'_i$ is isomorphic to an object of $(\text{Sch}/S)_{\text{fppf}}$ by Sets, Lemma 3.9.5.

Now let $X', U \rightarrow X'$ and $R \rightarrow U \times_{X'} U$ be as in the statement of the lemma. In the previous paragraph we have seen that we can find $U' \in \text{Ob}((\text{Sch}/S)_{\text{fppf}})$ and a surjective étale morphism $U' \rightarrow X'$ in $\text{Sh}((\text{Sch}'/S)_{\text{fppf}})$. Then $U' \times_{X'} U \rightarrow U'$ is a surjection of sheaves, i.e., we can find an fppf covering $\{U'_i \rightarrow U'\}$ such that $U'_i \rightarrow U'$ factors through $U' \times_{X'} U \rightarrow U'$. By Sets, Lemma 3.9.12 we can find $\tilde{U} \rightarrow U'$ which is surjective, flat, and locally of finite presentation, with $\text{size}(\tilde{U}) \leq \text{size}(U')$, such that $\tilde{U} \rightarrow U'$ factors through $U' \times_{X'} U \rightarrow U'$. Then we consider

$$\begin{array}{ccccc} U' \times_{X'} U' & \longleftarrow & \tilde{U} \times_{X'} \tilde{U} & \longrightarrow & U \times_{X'} U \\ \downarrow & & \downarrow & & \downarrow \\ U' \times_S U' & \longleftarrow & \tilde{U} \times_S \tilde{U} & \longrightarrow & U \times_S U \end{array}$$

The squares are cartesian. We know the objects of the bottom row are represented by objects of $(\text{Sch}/S)_{\text{fppf}}$. By the result of the argument of the previous paragraph, the same is true for $U \times_{X'} U$ (as we have the surjection of sheaves $R \rightarrow U \times_{X'} U$ by assumption). Since $(\text{Sch}/S)_{\text{fppf}}$ is closed under fibre products (by construction), we see that $\tilde{U} \times_{X'} \tilde{U}$ is represented by an object of $(\text{Sch}/S)_{\text{fppf}}$. Finally, the map $\tilde{U} \times_{X'} \tilde{U} \rightarrow U' \times_{X'} U'$ is a surjection of fppf sheaves as $\tilde{U} \rightarrow U'$ is so. Thus we can once more apply the result of the previous paragraph to conclude that $R' = U' \times_{X'} U'$ is represented by an object of $(\text{Sch}/S)_{\text{fppf}}$. At this point Lemma 47.9.1 and Theorem 47.10.5 imply that $X = h_{U'}/h_{R'}$ is an object of Spaces/S such that $f^{-1}X \cong X'$ as desired. \square

47.16. Change of base scheme

In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \rightarrow S'$ of base schemes, any algebraic space over S can be viewed as an algebraic space over S' . And, given an algebraic space F' over S' there is a base change F'_S which is an algebraic space over S . We explain only what happens in case $S \rightarrow S'$ is a morphism of the big fppf site under consideration, if only S or S' is contained in the big site, then one first enlarges the big site as in Section 47.15.

Lemma 47.16.1. *Suppose given a big site Sch_{fppf} . Let $g : S \rightarrow S'$ be morphism of Sch_{fppf} . Let $j : (Sch/S)_{fppf} \rightarrow (Sch/S')_{fppf}$ be the corresponding localization functor. Let F be a sheaf of sets on $(Sch/S)_{fppf}$. Then*

- (1) *for a scheme T' over S' we have $j_!F(T'/S') = \coprod_{\varphi: T' \rightarrow S} F(T' \xrightarrow{\varphi} S)$,*
- (2) *if F is representable by a scheme $X \in \text{Ob}((Sch/S)_{fppf})$, then $j_!F$ is representable by $j(X)$ which is X viewed as a scheme over S' , and*
- (3) *if F is an algebraic space over S , then $j_!F$ is an algebraic space over S' , and if $F = U/R$ is a presentation, then $j_!F = j(U)/j(R)$ is a presentation.*

Let F' be a sheaf of sets on $(Sch/S')_{fppf}$. Then

- (4) *for a scheme T over S we have $j^{-1}F'(T/S) = F'(T/S')$,*
- (5) *if F' is representable by a scheme $X' \in \text{Ob}((Sch/S')_{fppf})$, then $j^{-1}F'$ is representable, namely by $X'_S = S \times_{S'} X'$, and*
- (6) *if F' is an algebraic space, then $j^{-1}F'$ is an algebraic space, and if $F' = U'/R'$ is a presentation, then $j^{-1}F' = U'_S/R'_S$ is a presentation.*

Proof. The functors $j_!$, j_* and j^{-1} are defined in Sites, Lemma 7.24.7 where it is also shown that $j = j_{S/S'}$ is the localization of $(Sch/S')_{fppf}$ at the object S/S' . Hence all of the material on localization functors is available for j . The formula in (1) is Sites, Lemma 7.26.1. By definition $j_!$ is the left adjoint to restriction j^{-1} , hence $j_!$ is right exact. By Sites, Lemma 7.24.5 it also commutes with fibre products and equalizers. By Sites, Lemma 7.24.3 we see that $j_!h_X = h_{j(X)}$ hence (2) holds. If F is an algebraic space over S , then we can write $F = U/R$ (Lemma 47.9.1) and we get

$$j_!F = j(U)/j(R)$$

because $j_!$ being right exact commutes with coequalizers, and moreover $j(R) = j(U) \times_{j_!F} j(U)$ as $j_!$ commutes with fibre products. Since the morphisms $j(s), j(t) : j(R) \rightarrow j(U)$ are simply the morphisms $s, t : R \rightarrow U$ (but viewed as morphisms of schemes over S'), they are still étale. Thus $(j(U), j(R), s, t)$ is an étale equivalence relation. Hence by Theorem 47.10.5 we conclude that $j_!F$ is an algebraic space.

Proof of (4), (5), and (6). The description of j^{-1} is in Sites, Section 7.24. The restriction of the representable sheaf associated to X'/S' is the representable sheaf associated to $X'_S = S \times_{S'} X'$ by Sites, Lemma 7.26.2. The restriction functor j^{-1} is exact, hence $j^{-1}F' = U'_S/R'_S$. Again by exactness the sheaf R'_S is still an equivalence relation on U'_S . Finally the two maps $R'_S \rightarrow U'_S$ are étale as base changes of the étale morphisms $R' \rightarrow U'$. Hence $j^{-1}F' = U'_S/R'_S$ is an algebraic space by Theorem 47.10.5 and we win. \square

Note how the presentation $j_!F = j(U)/j(R)$ is just the presentation of F but viewed as a presentation by schemes over S' . Hence the following definition makes sense.

Definition 47.16.2. Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site.

- (1) If F' is an algebraic space over S' , then the *base change of F' to S* is the algebraic space $j^{-1}F'$ described in Lemma 47.16.1. We denote it F'_S .
- (2) If F is an algebraic space over S , then F *viewed as an algebraic space over S'* is the algebraic space $j_!F$ over S' described in Lemma 47.16.1. We often simply denote this F ; if not then we will write $j_!F$.

The algebraic space $j_!F$ comes equipped with a canonical morphism $j_!F \rightarrow S$ of algebraic spaces over S' . This is true simply because the sheaf $j_!F$ maps to h_S (see for example the explicit description in Lemma 47.16.1). In fact, in Sites, Lemma 7.24.4 we have seen that the category of sheaves on $(Sch/S)_{fppf}$ is equivalent to the category of pairs $(\mathcal{F}', \mathcal{F}' \rightarrow h_S)$ consisting of a sheaf on $(Sch/S')_{fppf}$ and a map of sheaves $\mathcal{F}' \rightarrow h_S$. The equivalence assigns to the sheaf \mathcal{F} the pair $(j_!\mathcal{F}, j_!\mathcal{F} \rightarrow h_S)$. This, combined with the above, leads to the following result for categories of algebraic spaces.

Lemma 47.16.3. *Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. The construction above give an equivalence of categories*

$$\left\{ \begin{array}{l} \text{category of algebraic} \\ \text{spaces over } S \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{category of pairs } (F', F' \rightarrow S) \text{ consisting} \\ \text{of an algebraic space } F' \text{ over } S' \text{ and a} \\ \text{morphism } F' \rightarrow S \text{ of algebraic spaces over } S' \end{array} \right\}$$

Proof. Let F be an algebraic space over S . The functor from left to right assigns the pair $(j_!F, j_!F \rightarrow S)$ of F which is an object of the right hand side by Lemma 47.16.1. Since this defines an equivalence of categories of sheaves by Sites, Lemma 7.24.4 to finish the proof it suffices to show: if F is a sheaf and $j_!F$ is an algebraic space, then F is an algebraic space. To do this, write $j_!F = U'/R'$ as in Lemma 47.9.1 with $U', R' \in \text{Ob}((Sch/S')_{fppf})$. Then the compositions $U' \rightarrow j_!F \rightarrow S$ and $R' \rightarrow j_!F \rightarrow S$ are morphisms of schemes over S' . Denote U, R the corresponding objects of $(Sch/S)_{fppf}$. The two morphisms $R' \rightarrow U'$ are morphisms over S and hence correspond to morphisms $R \rightarrow U$. Since these are simply the same morphisms (but viewed over S) we see that we get an étale equivalence relation over S . As $j_!$ defines an equivalence of categories of sheaves (see reference above) we see that $F = U/R$ and by Theorem 47.10.5 we see that F is an algebraic space. \square

The following lemma is a slight rephrasing of the above.

Lemma 47.16.4. *Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. Let F' be a sheaf on $(Sch/S')_{fppf}$. The following are equivalent:*

- (1) *The restriction $F'|_{(Sch/S)_{fppf}}$ is an algebraic space over S , and*
- (2) *the sheaf $h_S \times F'$ is an algebraic space over S' .*

Proof. The restriction and the product match under the equivalence of categories of Sites, Lemma 7.24.4 so that Lemma 47.16.3 above gives the result. \square

We finish this section with a lemma on a compatibility.

Lemma 47.16.5. *Let Sch_{fppf} be a big fppf site. Let $S \rightarrow S'$ be a morphism of this site. Let F be an algebraic space over S . Let T be a scheme over S and let $f : T \rightarrow F$ be a morphism over S . Let $f' : T' \rightarrow F'$ be the morphism over S' we get from f by applying the equivalence of categories described in Lemma 47.16.3. For any property \mathcal{P} as in Definition 47.5.1 we have $\mathcal{P}(f') \Leftrightarrow \mathcal{P}(f)$.*

Proof. Suppose that U is a scheme over S , and $U \rightarrow F$ is a surjective étale morphism. Denote U' the scheme U viewed as a scheme over S' . In Lemma 47.16.1 we have seen that $U' \rightarrow F'$ is surjective étale. Since

$$j(T \times_{f,F} U) = T' \times_{f',F'} U'$$

the morphism of schemes $T \times_{f,F} U \rightarrow U$ is identified with the morphism of schemes $T' \times_{f',F'} U' \rightarrow U'$. It is the same morphism, just viewed over different base schemes. Hence the lemma follows from Lemma 47.11.2. \square

Properties of Algebraic Spaces

48.1. Introduction

Please see Spaces, Section 47.1 for a brief introduction to algebraic spaces, and please read some of that chapter for our basic definitions and conventions concerning algebraic spaces. In this chapter we start introducing some basic notions and properties of algebraic spaces. A fundamental reference for the case of quasi-separated algebraic spaces is [Knu71].

The discussion is somewhat awkward at times since we made the design decision to first talk about properties of algebraic spaces by themselves, and only later about properties of morphisms of algebraic spaces. We make an exception for this rule regarding *étale morphisms* of algebraic spaces, which we introduce in Section 48.13. But until that section whenever we say a morphism has a certain property, it automatically means the source of the morphism is a scheme (or perhaps the morphism is representable).

Some of the material in the chapter (especially regarding points) will be improved upon in the chapter on decent algebraic spaces.

48.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$. The reason is that we want to avoid confusion when changing base schemes, as in Spaces, Section 47.16.

48.3. Separation axioms

In this section we collect all the “absolute” separation conditions of algebraic spaces. Since in our language any algebraic space is an algebraic space over some definite base scheme, any absolute property of X over S corresponds to a conditions imposed on X viewed as an algebraic space over $\text{Spec}(\mathbf{Z})$. Here is the precise formulation.

Definition 48.3.1. (Compare Spaces, Definition 47.13.2.) Consider a big fppf site $Sch_{fppf} = (Sch/\text{Spec}(\mathbf{Z}))_{fppf}$. Let X be an algebraic space over $\text{Spec}(\mathbf{Z})$. Let $\Delta : X \rightarrow X \times X$ be the diagonal morphism.

- (1) We say X is *separated* if Δ is a closed immersion.
- (2) We say X is *locally separated*¹ if Δ is an immersion.

¹In the literature this often refers to quasi-separated and locally separated algebraic spaces.

- (3) We say X is *quasi-separated* if Δ is quasi-compact.
- (4) We say X is *Zariski locally quasi-separated*² if there exists a Zariski covering $X = \bigcup_{i \in I} X_i$ (see Spaces, Definition 47.12.5) such that each X_i is quasi-separated.

Let S is a scheme contained in Sch_{fppf} , and let X be an algebraic space over S . Then we say X is *separated*, *locally separated*, *quasi-separated*, or *Zariski locally quasi-separated* if X viewed as an algebraic space over $\text{Spec}(\mathbf{Z})$ (see Spaces, Definition 47.16.2) has the corresponding property.

It is true that an algebraic space X over S which is separated (in the absolute sense above) is separated over S (and similarly for the other absolute separation properties above). This will be discussed in great detail in Morphisms of Spaces, Section 49.4. We will see in Lemma 48.6.6 that being Zariski locally separated is independent of the base scheme (hence equivalent to the absolute notion).

Lemma 48.3.2. *Let S be a scheme. Let X be an algebraic space over S . We have the following implications among the separation axioms of Definition 48.3.1:*

- (1) *separated implies all the others,*
- (2) *quasi-separated implies Zariski locally quasi-separated.*

Proof. Omitted. □

Lemma 48.3.3. *Let S be a scheme. Let X be an algebraic space over S . The following are equivalent*

- (1) *X is a quasi-separated algebraic space,*
- (2) *for $U \rightarrow X, V \rightarrow X$ with U, V quasi-compact schemes the fibre product $U \times_X V$ is quasi-compact,*
- (3) *for $U \rightarrow X, V \rightarrow X$ with U, V affine the fibre product $U \times_X V$ is quasi-compact.*

Proof. Using Spaces, Lemma 47.16.3 we see that we may assume $S = \text{Spec}(\mathbf{Z})$. Since $U \times_X V = X \times_{X \times X} (U \times V)$ and since $U \times V$ is quasi-compact if U and V are so, we see that (1) implies (2). It is clear that (2) implies (3). Assume (3). Choose a scheme W and a surjective étale morphism $W \rightarrow X$. Then $W \times W \rightarrow X \times X$ is surjective étale. Hence it suffices to show that

$$j : W \times_X W = X \times_{(X \times X)} (W \times W) \rightarrow W \times W$$

is quasi-compact, see Spaces, Lemma 47.5.6. If $U \subset W$ and $V \subset W$ are affine opens, then $j^{-1}(U \times V) = U \times_X V$ is quasi-compact by assumption. Since the affine opens $U \times V$ form an affine open covering of $W \times W$ (Schemes, Lemma 25.17.4) we conclude by Schemes, Lemma 25.19.2. □

Lemma 48.3.4. *Let S be a scheme. Let X be an algebraic space over S . The following are equivalent*

- (1) *X is a separated algebraic space,*
- (2) *for $U \rightarrow X, V \rightarrow X$ with U, V affine the fibre product $U \times_X V$ is affine and*

$$\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \longrightarrow \mathcal{O}(U \times_X V)$$

is surjective.

² This notion was suggested by B. Conrad.

Proof. Using Spaces, Lemma 47.16.3 we see that we may assume $S = \text{Spec}(\mathbf{Z})$. Since $U \times_X V = X \times_{X \times X} (U \times V)$ and since $U \times V$ is affine if U and V are so, we see that (1) implies (2). Assume (2). Choose a scheme W and a surjective étale morphism $W \rightarrow X$. Then $W \times W \rightarrow X \times X$ is surjective étale. Hence it suffices to show that

$$j : W \times_X W = X \times_{(X \times X)} (W \times W) \rightarrow W \times W$$

is a closed immersion, see Spaces, Lemma 47.5.6. If $U \subset W$ and $V \subset W$ are affine opens, then $j^{-1}(U \times V) = U \times_X V$ is affine by assumption and the map $U \times_X V \rightarrow U \times V$ is a closed immersion because the corresponding ring map is surjective. Since the affine opens $U \times V$ form an affine open covering of $W \times W$ (Schemes, Lemma 25.17.4) we conclude by Morphisms, Lemma 28.2.1. \square

48.4. Points of algebraic spaces

As is clear from Spaces, Example 47.14.8 a point of an algebraic space should not be defined as a monomorphism from the spectrum of a field. Instead we define them as equivalence classes of morphisms of spectra of fields exactly as explained in Schemes, Section 25.13.

Let S be a scheme. Let F be a presheaf on $(\text{Sch}/S)_{\text{fpf}}$. Let K is a field. Consider a morphism

$$\text{Spec}(K) \longrightarrow F.$$

By the Yoneda Lemma this is given by an element $p \in F(\text{Spec}(K))$. We say that two such pairs $(\text{Spec}(K), p)$ and $(\text{Spec}(L), q)$ are *equivalent* if there exists a third field Ω and a commutative diagram

$$\begin{array}{ccc} \text{Spec}(\Omega) & \longrightarrow & \text{Spec}(L) \\ \downarrow & & \downarrow q \\ \text{Spec}(K) & \xrightarrow{p} & F. \end{array}$$

In other words, there are field extensions $K \rightarrow \Omega$ and $L \rightarrow \Omega$ such that p and q map to the same element of $F(\text{Spec}(\Omega))$. We omit the verification that this defines an equivalence relation.

Definition 48.4.1. Let S be a scheme. Let X be an algebraic space over S . A *point* of X is an equivalence class of morphisms from spectra of fields into X . The set of points of X is denoted $|X|$.

Note that if $f : X \rightarrow Y$ is a morphism of algebraic spaces over S , then there is an induced map $|f| : |X| \rightarrow |Y|$ which maps a representative $x : \text{Spec}(K) \rightarrow X$ to the representative $f \circ x : \text{Spec}(K) \rightarrow Y$.

Lemma 48.4.2. *Let S be a scheme. Let X be a scheme over S . The points of X as a scheme are in canonical 1-1 correspondence with the points of X as an algebraic space.*

Proof. This is Schemes, Lemma 25.13.3. \square

Lemma 48.4.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z \times_Y X & \longrightarrow & X \\ \downarrow & & \downarrow \\ Z & \longrightarrow & Y \end{array}$$

be a cartesian diagram of algebraic spaces. Then the map of sets of points

$$|Z \times_Y X| \longrightarrow |Z| \times_{|Y|} |X|$$

is surjective.

Proof. Namely, suppose given fields K, L and morphisms $\mathrm{Spec}(K) \rightarrow X, \mathrm{Spec}(L) \rightarrow Z$, then the assumption that they agree as elements of $|Y|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $\mathrm{Spec}(M) \rightarrow \mathrm{Spec}(K) \rightarrow X \rightarrow Y$ and $\mathrm{Spec}(M) \rightarrow \mathrm{Spec}(L) \rightarrow Z \rightarrow Y$ agree. And this is exactly the condition which says you get a morphism $\mathrm{Spec}(M) \rightarrow Z \times_Y X$. \square

Lemma 48.4.4. *Let S be a scheme. Let X be an algebraic space over S . Let $f : T \rightarrow X$ be a morphism from a scheme to X . The following are equivalent*

- (1) *$f : T \rightarrow X$ is surjective (according to Spaces, Definition 47.5.1), and*
- (2) *$|f| : |T| \rightarrow |X|$ is surjective.*

Proof. Assume (1). Let $x : \mathrm{Spec}(K) \rightarrow X$ be a morphism from the spectrum of a field into X . By assumption the morphism of schemes $\mathrm{Spec}(K) \times_X T \rightarrow \mathrm{Spec}(K)$ is surjective. Hence there exists a field extension $K \subset K'$ and a morphism $\mathrm{Spec}(K') \rightarrow \mathrm{Spec}(K) \times_X T$ such that the left square in the diagram

$$\begin{array}{ccccc} \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) \times_X T & \longrightarrow & T \\ \downarrow & & \downarrow & & \downarrow \\ \mathrm{Spec}(K) & \xlongequal{\quad} & \mathrm{Spec}(K) & \xrightarrow{x} & X \end{array}$$

is commutative. This shows that $|f| : |T| \rightarrow |X|$ is surjective.

Assume (2). Let $Z \rightarrow X$ be a morphism where Z is a scheme. We have to show that the morphism of schemes $Z \times_X T \rightarrow T$ is surjective, i.e., that $|Z \times_X T| \rightarrow |Z|$ is surjective. This follows from (2) and Lemma 48.4.3. \square

Lemma 48.4.5. *Let S be a scheme. Let X be an algebraic space over S . Let $X = U/R$ be a presentation of X , see Spaces, Definition 47.9.3. Then the image of $|R| \rightarrow |U| \times |U|$ is an equivalence relation and $|X|$ is the quotient of $|U|$ by this equivalence relation.*

Proof. The assumption means that U is a scheme, $p : U \rightarrow X$ is a surjective, étale morphism, $R = U \times_X U$ is a scheme and defines an étale equivalence relation on U such that $X = U/R$ as sheaves. By Lemma 48.4.4 we see that $|U| \rightarrow |X|$ is surjective. By Lemma 48.4.3 the map

$$|R| \longrightarrow |U| \times_{|X|} |U|$$

is surjective. Hence the image of $|R| \rightarrow |U| \times |U|$ is exactly the set of pairs $(u_1, u_2) \in |U| \times |U|$ such that u_1 and u_2 have the same image in $|X|$. Combining these two statements we get the result of the lemma. \square

Lemma 48.4.6. *Let S be a scheme. There exists a unique topology on the set of points of algebraic spaces over S with the following properties:*

- (1) *for every morphism of algebraic spaces $X \rightarrow Y$ over S the map $|X| \rightarrow |Y|$ is continuous, and*
- (2) *for every étale morphism $U \rightarrow X$ with U a scheme the map of topological spaces $|U| \rightarrow |X|$ is continuous and open.*

Proof. Let X be an algebraic space over S . Let $p : U \rightarrow X$ be a surjective étale morphism where U is a scheme over S . We define $W \subset |X|$ is open if and only if $|p|^{-1}(W)$ is an open subset of $|U|$. This is a topology on $|X|$.

Let us prove that the topology is independent of the choice of the presentation. To do this it suffices to show that if U' is a scheme, and $U' \rightarrow X$ is an étale morphism, then the map $|U'| \rightarrow |X|$ (with topology on $|X|$ defined using $U \rightarrow X$ as above) is open and continuous; which in addition will prove that (2) holds. Set $U'' = U \times_X U'$, so that we have the commutative diagram

$$\begin{array}{ccc} U'' & \longrightarrow & U' \\ \downarrow & & \downarrow \\ U & \longrightarrow & X \end{array}$$

As $U \rightarrow X$ and $U' \rightarrow X$ are étale we see that both $U'' \rightarrow U$ and $U'' \rightarrow U'$ are étale morphisms of schemes. Moreover, $U'' \rightarrow U'$ is surjective. Hence we get a commutative diagram of maps of sets

$$\begin{array}{ccc} |U''| & \longrightarrow & |U'| \\ \downarrow & & \downarrow \\ |U| & \longrightarrow & |X| \end{array}$$

The lower horizontal arrow is surjective (see Lemma 48.4.4 or Lemma 48.4.5) and continuous by definition of the topology on $|X|$. The top horizontal arrow is surjective, continuous, and open by Morphisms, Lemma 28.37.13. The left vertical arrow is continuous and open (by Morphisms, Lemma 28.37.13 again.) Hence it follows formally that the right vertical arrow is continuous and open.

To finish the proof we prove (1). Let $a : X \rightarrow Y$ be a morphism of algebraic spaces. According to Spaces, Lemma 47.11.4 we can find a diagram

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{a} & Y \end{array}$$

where U and V are schemes, and p and q are surjective and étale. This gives rise to the diagram

$$\begin{array}{ccc} |U| & \xrightarrow{\alpha} & |V| \\ p \downarrow & & \downarrow q \\ |X| & \xrightarrow{a} & |Y| \end{array}$$

where all but the lower horizontal arrows are known to be continuous and the two vertical arrows are surjective and open. It follows that the lower horizontal arrow is continuous as desired. \square

Definition 48.4.7. Let S be a scheme. Let X be an algebraic space over S . The underlying *topological space* of X is the set of points $|X|$ endowed with the topology constructed in Lemma 48.4.6.

It turns out that this topological space carries the same information as the small Zariski site X_{Zar} of Spaces, Definition 47.12.6.

Lemma 48.4.8. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *The rule $X' \mapsto |X'|$ defines an inclusion preserving bijection between open subspaces X' (see Spaces, Definition 47.12.1) of X , and opens of the topological space $|X|$.*
- (2) *A family $\{X_i \subset X\}_{i \in I}$ of open subspaces of X is a Zariski covering (see Spaces, Definition 47.12.5) if and only if $|X| = \bigcup |X_i|$.*

In other words, the small Zariski site X_{Zar} of X is canonically identified with a site associated to the topological space $|X|$ (see Sites, Example 7.6.4).

Proof. In order to prove (1) let us construct the inverse of the rule. Namely, suppose that $W \subset |X|$ is open. Choose a presentation $X = U/R$ corresponding to the surjective étale map $p : U \rightarrow X$ and étale maps $s, t : R \rightarrow U$. By construction we see that $|p|^{-1}(W)$ is an open of U . Denote $W' \subset U$ the corresponding open subscheme. It is clear that $R' = s^{-1}(W') = t^{-1}(W')$ is a Zariski open of R which defines an étale equivalence relation on W' . By Spaces, Lemma 47.10.2 the morphism $X' = W'/R' \rightarrow X$ is an open immersion. Hence X' is an algebraic space by Spaces, Lemma 47.11.1. By construction $|X'| = W$, i.e., X' is a subspace of X corresponding to W . Thus (1) is proved.

To prove (2), note that if $\{X_i \subset X\}_{i \in I}$ is a collection of open subspaces, then it is a Zariski covering if and only if the $U = \bigcup U \times_X X_i$ is an open covering. This follows from the definition of a Zariski covering and the fact that the morphism $U \rightarrow X$ is surjective as a map of presheaves on $(Sch/S)_{fppf}$. On the other hand, we see that $|X| = \bigcup |X_i|$ if and only if $U = \bigcup U \times_X X_i$ by Lemma 48.4.5 (and the fact that the projections $U \times_X X_i \rightarrow X_i$ are surjective and étale). Thus the equivalence of (2) follows. \square

Lemma 48.4.9. *Let S be a scheme. Let X, Y be algebraic spaces over S . Let $X' \subset X$ be an open subspace. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Then f factors through X' if and only if $|f| : |Y| \rightarrow |X|$ factors through $|X'| \subset |X|$.*

Proof. By Spaces, Lemma 47.12.3 we see that $Y' = Y \times_X X' \rightarrow Y$ is an open immersion. If $|f|(|Y|) \subset |X'|$, then clearly $|Y'| = |Y|$. Hence $Y' = Y$ by Lemma 48.4.8. \square

Lemma 48.4.10. *Let S be a scheme. Let X be an algebraic spaces over S . Let U be a scheme and let $f : U \rightarrow X$ be an étale morphism. Let $X' \subset X$ be the open subspace corresponding to the open $|f|(|U|) \subset |X|$ via Lemma 48.4.8. Then f factors through a surjective étale morphism $f' : U \rightarrow X'$. Moreover, if $R = U \times_X U$, then $R = U \times_{X'} U$ and X' has the presentation $X' = U/R$.*

Proof. The existence of the factorization follows from Lemma 48.4.9. The morphism f' is surjective according to Lemma 48.4.4. To see f' is étale, suppose that $T \rightarrow X'$ is a morphism where T is a scheme. Then $T \times_X U = T \times_{X'} U$ as $X'' \rightarrow X$ is a monomorphism of sheaves. Thus the projection $T \times_{X'} U \rightarrow T$ is étale as we assumed f étale. We have $U \times_X U = U \times_{X'} U$ as $X' \rightarrow X$ is a monomorphism. Then $X' = U/R$ follows from Spaces, Lemma 47.9.1. \square

Lemma 48.4.11. *Let S be a scheme. Let X be an algebraic space over S . Consider the map*

$$\{\mathrm{Spec}(k) \rightarrow X \text{ monomorphism}\} \longrightarrow |X|$$

This map is injective.

Proof. Suppose that $\varphi_i : \mathrm{Spec}(k_i) \rightarrow X$ are monomorphisms for $i = 1, 2$. If φ_1 and φ_2 define the same point of $|X|$, then we see that the scheme

$$Y = \mathrm{Spec}(k_1) \times_{\varphi_1, X, \varphi_2} \mathrm{Spec}(k_2)$$

is nonempty. Since the base change of a monomorphism is a monomorphism this means that the projection morphisms $Y \rightarrow \mathrm{Spec}(k_i)$ are monomorphisms. Hence $\mathrm{Spec}(k_1) = Y = \mathrm{Spec}(k_2)$ as schemes over X , see Schemes, Lemma 25.23.10. We conclude that $\varphi_1 = \varphi_2$, which proves the lemma. \square

We will see in Decent Spaces, Lemma 50.10.1 that this map is a bijection when X is decent.

48.5. Quasi-compact spaces

Definition 48.5.1. Let S be a scheme. Let X be an algebraic space over S . We say X is *quasi-compact* if there exists a surjective étale morphism $U \rightarrow X$ with U quasi-compact.

Lemma 48.5.2. *Let S be a scheme. Let X be an algebraic space over S . Then X is quasi-compact if and only if $|X|$ is quasi-compact.*

Proof. Choose a scheme U and an étale surjective morphism $U \rightarrow X$. We will use Lemma 48.4.4. If U is quasi-compact, then since $|U| \rightarrow |X|$ is surjective we conclude that $|X|$ is quasi-compact. If $|X|$ is quasi-compact, then since $|U| \rightarrow |X|$ is open we see that there exists a quasi-compact open $U' \subset U$ such that $|U'| \rightarrow |X|$ is surjective (and still étale). Hence we win. \square

Lemma 48.5.3. *A finite disjoint union of quasi-compact algebraic spaces is a quasi-compact algebraic space.*

Proof. This is clear from Lemma 48.5.2 and the corresponding topological fact. \square

Example 48.5.4. The space $\mathbf{A}_{\mathbf{Q}}^1/\mathbf{Z}$ is a quasi-compact algebraic space.

Lemma 48.5.5. *Let S be a scheme. Let X be an algebraic space over S . Every point of $|X|$ has a fundamental system of open quasi-compact neighbourhoods. In particular $|X|$ is locally quasi-compact in the sense of Topology, Definition 5.12.1.*

Proof. This follows formally from the fact that there exists a scheme U and a surjective, open, continuous map $U \rightarrow |X|$ of topological spaces. To be a bit more precise, if $u \in U$ maps to $x \in |X|$, then the images of the affine neighbourhoods of u will give a fundamental system of quasi-compact open neighbourhoods of x . \square

48.6. Special coverings

In this section we collect some straightforward lemmas on the existence of étale surjective coverings of algebraic spaces.

Lemma 48.6.1. *Let S be a scheme. Let X be an algebraic space over S . There exists a surjective étale morphism $U \rightarrow X$ where U is a disjoint union of affine schemes. We may in addition assume each of these affines maps into an affine open of S .*

Proof. Let $V \rightarrow X$ be a surjective étale morphism. Let $V = \bigcup_{i \in I} V_i$ be a Zariski open covering such that each V_i maps into an affine open of S . Then set $U = \coprod_{i \in I} V_i$ with induced morphism $U \rightarrow V \rightarrow X$. This is étale and surjective as a composition of étale and surjective representable transformations of functors (via the general principle Spaces, Lemma 47.5.4 and Morphisms, Lemmas 28.11.2 and 28.37.3). \square

Lemma 48.6.2. *Let S be a scheme. Let X be an algebraic space over S . There exists a Zariski covering $X = \bigcup X_i$ such that each algebraic space X_i has a surjective étale covering by an affine scheme. We may in addition assume each X_i maps into an affine open of S .*

Proof. By Lemma 48.6.1 we can find a surjective étale morphism $U = \coprod U_i \rightarrow X$, with U_i affine and mapping into an affine open of S . Let $X_i \subset X$ be the open subspace of X such that $U_i \rightarrow X$ factors through an étale surjective morphism $U_i \rightarrow X_i$, see Lemma 48.4.10. Since $U = \bigcup U_i$ we see that $X = \bigcup X_i$. As $U_i \rightarrow X_i$ is surjective it follows that $X_i \rightarrow S$ maps into an affine open of S . \square

Lemma 48.6.3. *Let S be a scheme. Let X be an algebraic space over S . Then X is quasi-compact if and only if there exists an étale surjective morphism $U \rightarrow X$ with U an affine scheme.*

Proof. If there exists an étale surjective morphism $U \rightarrow X$ with U affine then X is quasi-compact by Definition 48.5.1. Conversely, if X is quasi-compact, then $|X|$ is quasi-compact. Let $U = \coprod_{i \in I} U_i$ be a disjoint union of affine schemes with an étale and surjective map $\varphi : U \rightarrow X$ (Lemma 48.6.1). Then $|X| = \bigcup \varphi(|U_i|)$ and by quasi-compactness there is a finite subset i_1, \dots, i_n such that $|X| = \bigcup \varphi(|U_{i_j}|)$. Hence $U_{i_1} \cup \dots \cup U_{i_n}$ is an affine scheme with a finite surjective morphism towards X . \square

The following lemma will be obsoleted by the discussion of separated morphisms in the chapter on morphisms of algebraic spaces.

Lemma 48.6.4. *Let S be a scheme. Let X be an algebraic space over S . Let U be a separated scheme and $U \rightarrow X$ étale. Then $U \rightarrow X$ is separated, and $R = U \times_X U$ is a separated scheme.*

Proof. Let $X' \subset X$ be the open subscheme such that $U \rightarrow X$ factors through an étale surjection $U \rightarrow X'$, see Lemma 48.4.10. If $U \rightarrow X'$ is separated, then so is $U \rightarrow X$, see Spaces, Lemma 47.5.4 (as the open immersion $X' \rightarrow X$ is separated by Spaces, Lemma 47.5.8 and Schemes, Lemma 25.23.7). Moreover, since $U \times_{X'} U = U \times_X U$ it suffices to prove the result after replacing X by X' ,

i.e., we may assume $U \rightarrow X$ surjective. Consider the commutative diagram

$$\begin{array}{ccc} R = U \times_X U & \longrightarrow & U \\ \downarrow & & \downarrow \\ U & \longrightarrow & X \end{array}$$

In the proof of Spaces, Lemma 47.13.1 we have seen that $j : R \rightarrow U \times_S U$ is separated. The morphism of schemes $U \rightarrow S$ is separated as U is a separated scheme, see Schemes, Lemma 25.21.14. Hence $U \times_S U \rightarrow U$ is separated as a base change, see Schemes, Lemma 25.21.13. Hence the scheme $U \times_S U$ is separated (by the same lemma). Since j is separated we see in the same way that R is separated. Hence $R \rightarrow U$ is a separated morphism (by Schemes, Lemma 25.21.14 again). Thus by Spaces, Lemma 47.11.2 and the diagram above we conclude that $U \rightarrow X$ is separated. \square

Lemma 48.6.5. *Let S be a scheme. Let X be an algebraic space over S . If there exists a quasi-separated scheme U and a surjective étale morphism $U \rightarrow X$ such that either of the projections $U \times_X U \rightarrow U$ is quasi-compact, then X is quasi-separated.*

Proof. We may think of X as an algebraic space over \mathbf{Z} . Consider the cartesian diagram

$$\begin{array}{ccc} U \times_X U & \longrightarrow & X \\ j \downarrow & & \downarrow \Delta \\ U \times U & \longrightarrow & X \times X \end{array}$$

Since U is quasi-separated the projection $U \times U \rightarrow U$ is quasi-separated (as a base change of a quasi-separated morphism of schemes, see Schemes, Lemma 25.21.13). Hence the assumption in the lemma implies j is quasi-compact by Schemes, Lemma 25.21.15. By Spaces, Lemma 47.11.2 we see that Δ is quasi-compact as desired. \square

Lemma 48.6.6. *Let S be a scheme. Let X be an algebraic space over S . The following are equivalent*

- (1) X is Zariski locally quasi-separated over S ,
- (2) X is Zariski locally quasi-separated,
- (3) there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists an affine scheme U_i and a quasi-compact surjective étale morphism $U_i \rightarrow X_i$, and
- (4) there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists an affine scheme U_i which maps into an affine open of S and a quasi-compact surjective étale morphism $U_i \rightarrow X_i$.

Proof. Assume $U_i \rightarrow X_i \subset X$ are as in (3). To prove (4) choose for each i a finite affine open covering $U_i = U_{i1} \cup \dots \cup U_{in_i}$ such that each U_{ij} maps into an affine open of S . The compositions $U_{ij} \rightarrow U_i \rightarrow X_i$ are étale and quasi-compact (see Spaces, Lemma 47.5.4). Let $X_{ij} \subset X_i$ be the open subspace corresponding to the image of $|U_{ij}| \rightarrow |X_i|$, see Lemma 48.4.10. Note that $U_{ij} \rightarrow X_{ij}$ is quasi-compact as $X_{ij} \subset X_i$ is a monomorphism and as $U_{ij} \rightarrow X$ is quasi-compact. Then $X = \bigcup X_{ij}$ is a covering as in (4). The implication (4) \Rightarrow (3) is immediate.

Assume (4). To show that X is Zariski locally quasi-separated over S it suffices to show that X_i is quasi-separated over S . Hence we may assume there exists an

affine scheme U mapping into an affine open of S and a quasi-compact surjective étale morphism $U \rightarrow X$. Consider the fibre product square

$$\begin{array}{ccc} U \times_X U & \longrightarrow & U \times_S U \\ \downarrow & & \downarrow \\ X & \xrightarrow{\Delta_{X/S}} & X \times_S X \end{array}$$

The right vertical arrow is surjective étale (see Spaces, Lemma 47.5.7) and $U \times_S U$ is affine (as U maps into an affine open of S , see Schemes, Section 25.17), and $U \times_X U$ is quasi-compact because the projection $U \times_X U \rightarrow U$ is quasi-compact as a base change of $U \rightarrow X$. It follows from Spaces, Lemma 47.11.2 that $\Delta_{X/S}$ is quasi-compact as desired.

Assume (1). To prove (3) there is an immediate reduction to the case where X is quasi-separated over S . By Lemma 48.6.2 we can find a Zariski open covering $X = \bigcup X_i$ such that each X_i maps into an affine open of S , and such that there exist affine schemes U_i and surjective étale morphisms $U_i \rightarrow X_i$. Since $U_i \rightarrow S$ maps into an affine open of S we see that $U_i \times_S U_i$ is affine, see Schemes, Section 25.17. As X is quasi-separated over S , the morphisms

$$R_i = U_i \times_{X_i} U_i = U_i \times_X U_i \longrightarrow U_i \times_S U_i$$

as base changes of $\Delta_{X/S}$ are quasi-compact. Hence we conclude that R_i is a quasi-compact scheme. This in turn implies that each projection $R_i \rightarrow U_i$ is quasi-compact. Hence, applying Spaces, Lemma 47.11.2 to the covering $U_i \rightarrow X_i$ and the morphism $U_i \rightarrow X_i$ we conclude that the morphisms $U_i \rightarrow X_i$ are quasi-compact as desired.

At this point we see that (1), (3), and (4) are equivalent. Since (3) does not refer to the base scheme we conclude that these are also equivalent with (2). \square

48.7. Properties of Spaces defined by properties of schemes

Any étale local property of schemes gives rise to a corresponding property of algebraic spaces via the following lemma.

Lemma 48.7.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{P} be a property of schemes which is local in the étale topology, see Descent, Definition 34.11.1. The following are equivalent*

- (1) *for some scheme U and surjective étale morphism $U \rightarrow X$ the scheme U has property \mathcal{P} , and*
- (2) *for every scheme U and every étale morphism $U \rightarrow X$ the scheme U has property \mathcal{P} .*

If X is representable this is equivalent to $\mathcal{P}(X)$.

Proof. The implication (2) \Rightarrow (1) is immediate. For the converse, choose a surjective étale morphism $U \rightarrow X$ with U a scheme that has \mathcal{P} and let V be an étale X -scheme. Then $U \times_X V \rightarrow V$ is an étale surjection of schemes, so V inherits \mathcal{P} from $U \times_X V$, which in turn inherits \mathcal{P} from U (see discussion following Descent, Definition 34.11.1). The last claim is clear from (1) and Descent, Definition 34.11.1. \square

Definition 48.7.2. Let \mathcal{P} be a property of schemes which is local in the étale topology. Let S be a scheme. Let X be an algebraic space over S . We say X has property \mathcal{P} if any of the equivalent conditions of Lemma 48.7.1 hold.

Remark 48.7.3. Here is a list of properties which are local for the étale topology (keep in mind that the fpqc, fppf, syntomic, and smooth topologies are stronger than the étale topology):

- (1) locally Noetherian, see Descent, Lemma 34.12.1,
- (2) Jacobson, see Descent, Lemma 34.12.2,
- (3) locally Noetherian and (S_k) , see Descent, Lemma 34.13.1,
- (4) Cohen-Macaulay, see Descent, Lemma 34.13.2,
- (5) reduced, see Descent, Lemma 34.14.1,
- (6) normal, see Descent, Lemma 34.14.2,
- (7) locally Noetherian and (R_k) , see Descent, Lemma 34.14.3,
- (8) regular, see Descent, Lemma 34.14.4,
- (9) Nagata, see Descent, Lemma 34.14.5.

Any étale local property of germs of schemes gives rise to a corresponding property of algebraic spaces. Here is the obligatory lemma.

Lemma 48.7.4. *Let \mathcal{P} be a property of germs of schemes which is étale local, see Descent, Definition 34.17.1. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point of X . Consider étale morphisms $a : U \rightarrow X$ where U is a scheme. The following are equivalent*

- (1) for any $U \rightarrow X$ as above and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$, and
- (2) for some $U \rightarrow X$ as above and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$.

If X is representable, then this is equivalent to $\mathcal{P}(X, x)$.

Proof. Omitted. □

Definition 48.7.5. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. Let \mathcal{P} be a property of germs of schemes which is étale local. We say X has property \mathcal{P} at x if any of the equivalent conditions of Lemma 48.7.4 hold.

48.8. Dimension at a point

We can use Descent, Lemma 34.17.2 to define the dimension of an algebraic space X at a point x . This will give us a different notion than the topological one (i.e., the dimension of $|X|$ at x).

Definition 48.8.1. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point of X . We define the *dimension of X at x* to be the element $\dim_x(X) \in \{0, 1, 2, \dots, \infty\}$ such that $\dim_x(X) = \dim_u(U)$ for any (equivalently some) pair $(a : U \rightarrow X, u)$ consisting of an étale morphism $a : U \rightarrow X$ from a scheme to X and a point $u \in U$ with $a(u) = x$. See Definition 48.7.5, Lemma 48.7.4, and Descent, Lemma 34.17.2.

Warning: It is **not** the case that $\dim_x(X) = \dim_x(|X|)$ in general. A counter example is the algebraic space X of Spaces, Example 47.14.9. Namely, in this example we have $\dim_x(X) = 0$ and $\dim_x(|X|) = 1$ (this holds for any $x \in |X|$). In particular, it also means that the dimension of X (as defined below) is different from the dimension of $|X|$.

Definition 48.8.2. Let S be a scheme. Let X be an algebraic space over S . The *dimension* $\dim(X)$ of X is defined by the rule

$$\dim(X) = \sup_{x \in |X|} \dim_x(X)$$

By Properties, Lemma 27.10.2 we see that this is the usual notion if X is a scheme. There is another integer that measures the dimension of a scheme at a point, namely the dimension of the local ring. This invariant is compatible with étale morphisms also, see Section 48.20.

48.9. Reduced spaces

We have already defined reduced algebraic spaces in Section 48.7. Here we just prove some simple lemmas regarding reduced algebraic spaces.

Lemma 48.9.1. *Let S be a scheme. Let $Z \rightarrow X$ be an immersion of algebraic spaces. Then $|Z| \rightarrow |X|$ is a homeomorphism of $|Z|$ onto a locally closed subset of $|X|$.*

Proof. Let U be a scheme and $U \rightarrow X$ a surjective étale morphism. Then $Z \times_X U \rightarrow U$ is an immersion of schemes, hence gives a homeomorphism of $|Z \times_X U|$ with a locally closed subset T' of $|U|$. By Lemma 48.4.3 the subset T' is the inverse image of the image T of $|Z| \rightarrow |X|$. The map $|Z| \rightarrow |X|$ is injective because the transformation of functors $Z \rightarrow X$ is injective, see Spaces, Section 47.12. By Topology, Lemma 5.5.4 we see that T is locally closed in $|X|$. Moreover, the continuous map $|Z| \rightarrow T$ is a homeomorphism as the map $|Z \times_X U| \rightarrow T'$ is a homeomorphism and $|Z \times_Y U| \rightarrow |Z|$ is submersive. \square

The following lemma will help us construct (locally) closed subspaces.

Lemma 48.9.2. *Let S be a scheme. Let $j : R \rightarrow U \times_S U$ be an étale equivalence relation. Let $X = U/R$ be the associated algebraic space (Spaces, Theorem 47.10.5). There is a canonical bijection*

$$R\text{-invariant locally closed subschemes } Z' \text{ of } U \leftrightarrow \text{locally closed subspaces } Z \text{ of } X$$

Moreover, if $Z \rightarrow X$ is closed (resp. open) if and only if $Z' \rightarrow U$ is closed (resp. open).

Proof. Denote $\varphi : U \rightarrow X$ the canonical map. The bijection sends $Z \rightarrow X$ to $Z' = Z \times_X U \rightarrow U$. It is immediate from the definition that $Z' \rightarrow U$ is an immersion, resp. closed immersion, resp. open immersion if $Z \rightarrow X$ is so. It is also clear that Z' is R -invariant (see Groupoids, Definition 38.17.1).

Conversely, assume that $Z' \rightarrow U$ is an immersion which is R -invariant. Let R' be the restriction of R to Z' , see Groupoids, Definition 38.16.2. Since $R' = R \times_{s,U} Z' = Z' \times_{U,t} R$ in this case we see that R' is an étale equivalence relation on Z' . By Spaces, Theorem 47.10.5 we see $Z = Z'/R'$ is an algebraic space. By construction we have $U \times_X Z = Z'$, so $U \times_X Z \rightarrow Z$ is an immersion. Note that the property “immersion” is preserved under base change and fppf local on the base (see Spaces, Section 47.4). Moreover, immersions are separated and locally quasi-finite (see Schemes, Lemma 25.23.7 and Morphisms, Lemma 28.21.15). Hence by More on Morphisms, Lemma 36.37.1 immersions satisfy descent for fppf covering. This means all the hypotheses of Spaces, Lemma 47.11.3 are satisfied for $Z \rightarrow X$, \mathcal{P} = “immersion”, and the étale

surjective morphism $U \rightarrow X$. We conclude that $Z \rightarrow X$ is representable and an immersion, which is the definition of a subspace (see Spaces, Definition 47.12.1).

It is clear that these constructions are inverse to each other and we win. \square

Lemma 48.9.3. *Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. There exists a unique closed subspace $Z \subset X$ with the following properties: (a) we have $|Z| = T$, and (b) Z is reduced.*

Proof. Let $U \rightarrow X$ be a surjective étale morphism, where U is a scheme. Set $R = U \times_X U$, so that $X = U/R$, see Spaces, Lemma 47.9.1. As usual we denote $s, t : R \rightarrow U$ the two projection morphisms. By Lemma 48.4.5 we see that T corresponds to a closed subset $T' \subset |U|$ such that $s^{-1}(T') = t^{-1}(T')$. Let $Z' \subset U$ be the reduced induced scheme structure on T' . In this case the fibre products $Z' \times_{U,t} R$ and $Z' \times_{U,s} R$ are closed subschemes of R (Schemes, Lemma 25.18.2) which are étale over Z' (Morphisms, Lemma 28.37.4), and hence reduced (because being reduced is local in the étale topology, see Remark 48.7.3). Since they have the same underlying topological space (see above) we conclude that $Z' \times_{U,t} R = Z' \times_{U,s} R$. Thus we can apply Lemma 48.9.2 to obtain a closed subspace $Z \subset X$ whose pullback to U is Z' . By construction $|Z| = T$ and Z is reduced. This proves existence. We omit the proof of uniqueness. \square

Lemma 48.9.4. *Let S be a scheme. Let X, Y be algebraic spaces over S . Let $Z \subset X$ be a closed subspace. Assume Y is reduced. A morphism $f : Y \rightarrow X$ factors through Z if and only if $f(|Y|) \subset |Z|$.*

Proof. Assume $f(|Y|) \subset |Z|$. Choose a diagram

$$\begin{array}{ccc} V & \xrightarrow{\quad h \quad} & U \\ b \downarrow & & \downarrow a \\ Y & \xrightarrow{\quad f \quad} & X \end{array}$$

where U, V are schemes, and the vertical arrows are surjective and étale. The scheme V is reduced, see Lemma 48.7.1. Hence h factors through $a^{-1}(Z)$ by Schemes, Lemma 25.12.6. So $a \circ h$ factors through Z . As $Z \subset X$ is a subsheaf, and $V \rightarrow Y$ is a surjection of sheaves on $(Sch/S)_{fppf}$ we conclude that $X \rightarrow Y$ factors through Z . \square

Definition 48.9.5. Let S be a scheme, and let X be an algebraic space over S . Let $Z \subset |X|$ be a closed subset. An *algebraic space structure on Z* is given by a closed subspace Z' of X with $|Z'|$ equal to Z . The *reduced induced algebraic space structure on Z* is the one constructed in Lemma 48.9.3. The *reduction X_{red} of X* is the reduced induced algebraic space structure on $|X|$.

48.10. The schematic locus

Every algebraic space has a largest open subspace which is a scheme; this is more or less clear but we also write out the proof below. Of course this subspace may be empty, for example if $X = \mathbf{A}_{\mathbf{Q}}^1/\mathbf{Z}$ (the universal counter example). On the other hand, if X is for example quasi-separated, then this largest open subscheme is actually dense in X !

Lemma 48.10.1. *Let S be a scheme. Let X be an algebraic space over S . There exists a largest open subspace $X' \subset X$ which is a scheme.*

Proof. Let $U \rightarrow X$ be an étale surjective morphism, where U is a scheme. Let $R = U \times_X U$. The open subspaces of X correspond 1 – 1 with open subschemes of U which are R -invariant. Hence there is a set of them. Let $X_i, i \in I$ be the set of open subspaces of X which are schemes, i.e., are representable. Consider the open subspace $X' \subset X$ whose underlying set of points is the open $\bigcup |X_i|$ of $|X|$. By Lemma 48.4.4 we see that

$$\coprod X_i \longrightarrow X'$$

is a surjective map of sheaves on $(Sch/S)_{fppf}$. But since each $X_i \rightarrow X'$ is representable by open immersions we see that in fact the map is surjective in the Zariski topology. (Because if $T \rightarrow X'$ is a morphism from a scheme into X' , then $X_i \times'_X T$ is an open subscheme of T .) Hence we can apply Schemes, Lemma 25.15.4 to see that X' is a scheme. \square

In the rest of this section we say that an open subspace X' of an algebraic space X is *dense* if the corresponding open subset $|X'| \subset |X|$ is dense.

Lemma 48.10.2. *Let S be a scheme. Let X be an algebraic space over S . If there exists a finite, étale, surjective morphism $U \rightarrow X$ where U is a scheme, then there exists a dense open subspace of X which is a scheme.*

Proof. Assume X is an algebraic space, U a scheme, and $U \rightarrow X$ is a finite étale surjective morphism. Write $R = U \times_X U$ and denote $s, t : R \rightarrow U$ the projections as usual. Note that s, t are surjective, finite and étale. Claim: The union of the R -invariant affine opens of U is topologically dense in U .

Proof of the claim³. Let $W \subset U$ be an affine open. Set $W' = t(s^{-1}(W)) \subset U$. Since $s^{-1}(W)$ is affine (hence quasi-compact) we see that $W' \subset U$ is a quasi-compact open. By Properties, Lemma 27.27.3 there exists a dense open $W'' \subset W'$ which is a separated scheme. Set $\Delta' = W' \setminus W''$. This is a nowhere dense closed subset of W' . Since $t|_{s^{-1}(W)} : s^{-1}(W) \rightarrow W'$ is open (because it is étale) we see that the inverse image $(t|_{s^{-1}(W)})^{-1}(\Delta') \subset s^{-1}(W)$ is a nowhere dense closed subset (see Topology, Lemma 5.20.6). Hence, by Morphisms, Lemma 28.46.7 we see that

$$\Delta = s((t|_{s^{-1}(W)})^{-1}(\Delta'))$$

is a nowhere dense closed subset of W . Pick any point $\eta \in W, \eta \notin \Delta$ which is a generic point of an irreducible component of W (and hence of U). By our choices above the finite set $t(s^{-1}(\{\eta\})) = \{\eta_1, \dots, \eta_n\}$ is contained in the separated scheme W'' . Note that the fibres of s are finite discrete spaces, and that generalizations lift along the étale morphism t , see Morphisms, Lemmas 28.37.12 and 28.26.8. In this way we see that each η_i is a generic point of an irreducible component of W'' . Thus, by Properties, Lemma 27.27.1 we can find an affine open $V \subset W''$ such that $\{\eta_1, \dots, \eta_n\} \subset V$. By Groupoids, Lemma 38.22.1 this implies that η is contained in an R -invariant affine open subscheme of U . The claim follows as W was chosen as an arbitrary affine open of U and because the set of generic points of irreducible components of $W \setminus \Delta$ is dense in W .

³The claim is easier to prove if U is assumed quasi-separated, since in that case Properties, Lemma 27.27.1 may be applied immediately to the R -equivalence class of any generic point of U .

Using the claim we can finish the proof. Namely, if $W \subset U$ is an R -invariant affine open, then the restriction R_W of R to W equals $R_W = s^{-1}(W) = t^{-1}(W)$ (see Groupoids, Definition 38.17.1 and discussion following it). In particular the maps $R_W \rightarrow W$ are finite étale also. It follows in particular that R_W is affine. Thus we see that W/R_W is a scheme, by Groupoids, Proposition 38.21.8. On the other hand, W/R_W is an open subspace of X by Spaces, Lemma 47.10.2. Hence having a dense collection of points contained in R -invariant affine open of U certainly implies that the schematic locus of X (see Lemma 48.10.1) is open dense in X . \square

We will improve the following proposition to the case of decent algebraic spaces in Decent Spaces, Theorem 50.9.2.

Proposition 48.10.3. *Let S be a scheme. Let X be an algebraic space over S . If X is Zariski locally quasi-separated (for example if X is quasi-separated), then there exists a dense open subspace of X which is a scheme.*

Proof. By Lemma 48.10.1 and Lemma 48.6.6 we may assume that there exists an affine scheme U and a surjective, quasi-compact, étale morphism $U \rightarrow X$. Set $R = U \times_X U$, and denote $s, t : R \rightarrow U$ the projections as usual. Note that s, t are surjective, quasi-compact and étale, hence also quasi-finite (see Étale Morphisms, Section 40.11). By More on Morphisms, Lemma 36.31.8 there exists a dense open subscheme $W \subset U$ such that $s^{-1}(W) \rightarrow W$ is finite. By Descent, Lemma 34.19.21 being finite is fpqc (and in particular étale) local on the target. Hence we may apply More on Groupoids, Lemma 39.5.4 which says that the largest open $W \subset U$ over which s is finite is R -invariant. It is still dense of course. The restriction R_W of R to W equals $R_W = s^{-1}(W) = t^{-1}(W)$ (see Groupoids, Definition 38.17.1 and discussion following it). By construction $s_W, t_W : R_W \rightarrow W$ are finite étale. If we can show the open subspace $W/R_W \subset X$ (see Spaces, Lemma 47.10.2) contains a dense open subspace which is a scheme, then the proposition follows for X . This reduces us to Lemma 48.10.2. \square

48.11. Obtaining a scheme

We have used in the previous section that the quotient U/R of an affine scheme U by an equivalence relation R is a scheme if the morphisms $s, t : R \rightarrow U$ are finite étale. This is a special case of the following result.

Proposition 48.11.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Assume*

- (1) $s, t : R \rightarrow U$ finite locally free,
- (2) $j = (t, s)$ is an equivalence, and
- (3) for a dense set of points $u \in U$ the R -equivalence class $t(s^{-1}(\{u\}))$ is contained in an affine open of U .

Then there exists a finite locally free morphism $U \rightarrow M$ of schemes over S such that $R = U \times_M U$ and such that M represents the quotient sheaf U/R in the fppf topology.

Proof. By assumption (3) and Groupoids, Lemma 38.22.1 we can find an open covering $U = \bigcup U_i$ such that each U_i is an R -invariant affine open of U . Set $R_i = R|_{U_i}$. Consider the fppf sheaves $F = U/R$ and $F_i = U_i/R_i$. By Spaces, Lemma 47.10.2 the morphisms $F_i \rightarrow F$ are representable and open immersions. By

Groupoids, Proposition 38.21.8 the sheaves F_i are representable by affine schemes. Hence we conclude that F is representable by a scheme, see Schemes, Lemma 25.15.4. \square

For example, if U is isomorphic to a locally closed subscheme of an affine scheme or isomorphic to a locally closed subscheme of $\text{Proj}(A)$ for some graded ring A , then the third assumption holds by Properties, Lemma 27.27.5. In particular we can apply this to free actions of finite groups and finite group schemes on quasi-affine or quasi-projective schemes. For example, the quotient X/G of a quasi-projective variety X by a free action of a finite group G is a scheme. Here is a detailed statement.

Lemma 48.11.2. *Let S be a scheme. Let $G \rightarrow S$ be a group scheme. Let $X \rightarrow S$ be a morphism of schemes. Let $a : G \times_S X \rightarrow X$ be an action. Assume that*

- (1) $G \rightarrow S$ is finite locally free,
- (2) the action a is free,
- (3) $X \rightarrow S$ is affine, or quasi-affine, or projective, or quasi-projective, or X is isomorphic to an open subscheme of an affine scheme or isomorphic to an open subscheme of $\text{Proj}(A)$ for some graded ring A .

Then the fppf quotient sheaf X/G is a scheme.

Proof. Since the action is free the morphism $j = (a, \text{pr}) : G \times_S X \rightarrow X \times_S X$ is a monomorphism and hence an equivalence relation, see Groupoids, Lemma 38.8.3. The maps $s, t : G \times_S X \rightarrow X$ are finite locally free as we've assumed that $G \rightarrow S$ is finite locally free. To conclude it now suffices to prove the last assumption of Proposition 48.11.1 holds. Since the action of G is over S it suffices to prove that any finite set of points in a fibre of $X \rightarrow S$ is contained in an affine open of X . If X is isomorphic to an open subscheme of an affine scheme or isomorphic to an open subscheme of $\text{Proj}(A)$ for some graded ring A this follows from Properties, Lemma 27.27.5. In the remaining cases, we may replace S by an affine open and we get back to the case we just dealt with. Some details omitted. \square

48.12. Points on quasi-separated spaces

Points can behave very badly on algebraic spaces in the generality introduced in the stacks project. However, for quasi-separated spaces their behaviour is mostly like the behaviour of points on schemes. We prove a few results on this in this section.

The following lemma is a key lemma which we will use to prove that certain algebraic spaces are isomorphic to the spectrum of a field.

Lemma 48.12.1. *Let S be a scheme. Let k be a field. Let X be an algebraic space over S and assume that there exists a surjective étale morphism $\text{Spec}(k) \rightarrow X$. If X is quasi-separated, then $X \cong \text{Spec}(k')$ where $k' \subset k$ is a finite separable extension.*

Proof. Set $R = \text{Spec}(k) \times_X \text{Spec}(k)$, so that we have a fibre product diagram

$$\begin{array}{ccc} R & \xrightarrow{s} & \text{Spec}(k) \\ \downarrow t & & \downarrow \\ \text{Spec}(k) & \longrightarrow & X \end{array}$$

By Spaces, Lemma 47.9.1 we know $X = \text{Spec}(k)/R$ is the quotient sheaf. Because $\text{Spec}(k) \rightarrow X$ is étale, the morphisms s and t are étale. Hence $R = \coprod_{i \in I} \text{Spec}(k_i)$ is a disjoint union of spectra of fields, and both s and t induce finite separable field extensions $s, t : k \subset k_i$, see Morphisms, Lemma 28.37.7. Because

$$R = \text{Spec}(k) \times_X \text{Spec}(k) = (\text{Spec}(k) \times_S \text{Spec}(k)) \times_{X \times_S X, \Delta} X$$

and since Δ is quasi-compact by assumption we conclude that $R \rightarrow \text{Spec}(k) \times_S \text{Spec}(k)$ is quasi-compact. Hence R is quasi-compact as $\text{Spec}(k) \times_S \text{Spec}(k)$ is affine. We conclude that I is finite. This implies that s and t are finite locally free morphisms. Hence by Groupoids, Proposition 38.21.8 we conclude that $\text{Spec}(k)/R$ is represented by $\text{Spec}(k')$, with $k' \subset k$ finite locally free where

$$k' = \{x \in k \mid s_i(x) = t_i(x) \text{ for all } i \in I\}$$

It is easy to see that k' is a field. \square

Remark 48.12.2. The lemma above holds for decent algebraic spaces, see Decent Spaces, Lemma 50.10.2. In fact a decent algebraic space with one point is a scheme, see Decent Spaces, Lemma 50.12.1. This also holds when X is locally separated, because a locally separated algebraic space is decent, see Decent Spaces, Lemma 50.13.2.

Lemma 48.12.3. *Let S be a scheme. Let X be an algebraic space over S . Let U be a scheme. Let $\varphi : U \rightarrow X$ be an étale morphism such that the projections $R = U \times_X U \rightarrow U$ are quasi-compact; for example if φ is quasi-compact. Then the fibres of*

$$|U| \rightarrow |X| \quad \text{and} \quad |R| \rightarrow |X|$$

are finite.

Proof. Denote $R = U \times_X U$, and $s, t : R \rightarrow U$ the projections. Let $u \in U$ be a point, and let $x \in |X|$ be its image. The fibre of $|U| \rightarrow |X|$ over x is equal to $s(t^{-1}(\{u\}))$ by Lemma 48.4.3, and the fibre of $|R| \rightarrow |X|$ over x is $t^{-1}(s(t^{-1}(\{u\})))$. Since $t : R \rightarrow U$ is étale and quasi-compact, it has finite fibres (as its fibres are disjoint unions of spectra of fields by Morphisms, Lemma 28.37.7 and quasi-compact). Hence we win. \square

Lemma 48.12.4. *Let S be a scheme. Let X be a Zariski locally quasi-separated algebraic space over S . Then the topological space $|X|$ is sober (see Topology, Definition 5.7.4).*

Proof. Combining Topology, Lemma 5.7.5 and Lemma 48.6.6 we see that we may assume that there exists an affine scheme U and a surjective, quasi-compact, étale morphism $U \rightarrow X$. Set $R = U \times_X U$ with projection maps $s, t : R \rightarrow U$. Applying Lemma 48.12.3 we see that the fibres of s, t are finite. It follows all the assumptions of Topology, Lemma 5.18.7 are met, and we conclude that $|X|$ is Kolmogorov⁴.

It remains to show that every irreducible closed subset $T \subset |X|$ has a generic point. By Lemma 48.9.3 there exists a closed subspace $Z \subset X$ with $|Z| = |T|$. Note that $U \times_X Z \rightarrow Z$ is a quasi-compact, surjective, étale morphism from an affine scheme to Z , hence Z is Zariski locally quasi-separated by Lemma 48.6.6. By

⁴ Actually we use here also Schemes, Lemma 25.11.1 (soberness schemes), Morphisms, Lemmas 28.37.12 and 28.26.8 (generalizations lift along étale morphisms), Lemma 48.4.5 (points on an algebraic space in terms of a presentation), and Lemma 48.4.6 (openness quotient map).

Proposition 48.10.3 we see that there exists an open dense subspace $Z' \subset Z$ which is a scheme. This means that $|Z'| \subset T$ is open dense. Hence the topological space $|Z'|$ is irreducible, which means that Z' is an irreducible scheme. By Schemes, Lemma 25.11.1 we conclude that $|Z'|$ is the closure of a single point $\eta \in |Z'| \subset T$ and hence also $T = \overline{\{\eta\}}$, and we win. \square

Lemma 48.12.5. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . The topological space $|X|$ is a spectral space.*

Proof. By Topology, Definition 5.22.1 we have to check that $|X|$ is sober, quasi-compact, has a basis of quasi-compact opens, and the intersection of any two quasi-compact opens is quasi-compact. By Lemma 48.12.4 we see that $|X|$ is sober. By Lemma 48.5.2 we see that $|X|$ is quasi-compact. By Lemma 48.6.3 there exists an affine scheme U and a surjective étale morphism $f : U \rightarrow X$. Since $|f| : |U| \rightarrow |X|$ is open and continuous and since $|U|$ has a basis of quasi-compact opens, we conclude that $|X|$ has a basis of quasi-compact opens. Finally, suppose that $A, B \subset |X|$ are quasi-compact open. Then $|f|^{-1}(A), |f|^{-1}(B)$ are quasi-compact open subsets of $|U|$. Since U is affine we may apply Algebra, Lemma 10.16.10 to see that $|f|^{-1}(A) \cap |f|^{-1}(B)$ is quasi-compact. As

$$A \cap B = |f|(|f|^{-1}(A) \cap |f|^{-1}(B))$$

we conclude that $A \cap B$ is quasi-compact and the proof is finished. \square

48.13. Étale morphisms of algebraic spaces

This section really belongs in the chapter on morphisms of algebraic spaces, but we need the notion of an algebraic space étale over another in order to define the small étale site of an algebraic space. Thus we need to do some preliminary work on étale morphisms from schemes to algebraic spaces, and étale morphisms between algebraic spaces. For more about étale morphisms of algebraic spaces, see Morphisms of Spaces, Section 49.36.

Lemma 48.13.1. *Let S be a scheme. Let X be an algebraic space over S . Let U, U' be schemes over S .*

- (1) *If $U \rightarrow U'$ is an étale morphism of schemes, and if $U' \rightarrow X$ is an étale morphism from U' to X , then the composition $U \rightarrow X$ is an étale morphism from U to X .*
- (2) *If $\varphi : U \rightarrow X$ and $\varphi' : U' \rightarrow X$ are étale morphisms towards X , and if $\chi : U \rightarrow U'$ is a morphism of schemes such that $\varphi = \varphi' \circ \chi$, then χ is an étale morphism of schemes.*

Proof. Recall that our definition of an étale morphism from a scheme into an algebraic space comes from Spaces, Definition 47.5.1 via the fact that any morphism from a scheme into an algebraic space is representable. Part (1) of the lemma follows from this, the fact that étale morphisms are preserved under composition (Morphisms, Lemma 28.37.3) and Spaces, Lemmas 47.5.4 and 47.5.3 (which are formal). To prove part (2) choose a scheme W over S and a surjective étale morphism $W \rightarrow X$. Consider the base change $\chi_W : W \times_X U \rightarrow W \times_X U'$ of χ . As $W \times_X U$ and $W \times_X U'$ are étale over W , we conclude that χ_W is étale, by Morphisms, Lemma

28.37.19. On the other hand, in the commutative diagram

$$\begin{array}{ccc} W \times_X U & \longrightarrow & W \times_X U' \\ \downarrow & & \downarrow \\ U & \longrightarrow & U' \end{array}$$

the two vertical arrows are étale and surjective. Hence by Descent, Lemma 34.10.4 we conclude that $U \rightarrow U'$ is étale. \square

Definition 48.13.2. Let S be a scheme. A morphism $f : X \rightarrow Y$ between algebraic spaces over S is called *étale* if and only if for every étale morphism $\varphi : U \rightarrow X$ where U is a scheme, the composition $\varphi \circ f$ is étale also.

If X and Y are schemes, then this agrees with the usual notion of an étale morphism of schemes. In fact, whenever $X \rightarrow Y$ is a representable morphism of algebraic spaces, then this agrees with the notion defined via Spaces, Definition 47.5.1. This follows by combining Lemma 48.13.3 below and Spaces, Lemma 47.11.2.

Lemma 48.13.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is étale,
- (2) there exists a surjective étale morphism $\varphi : U \rightarrow X$, where U is a scheme, such that the composition $f \circ \varphi$ is étale (as a morphism of algebraic spaces),
- (3) there exists a surjective étale morphism $\psi : V \rightarrow Y$, where V is a scheme, such that the base change $V \times_X Y \rightarrow V$ is étale (as a morphism of algebraic spaces),
- (4) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and the left vertical arrow is surjective such that the horizontal arrow is étale.

Proof. Let us prove that (4) implies (1). Assume a diagram as in (4) given. Let $W \rightarrow X$ be an étale morphism with W a scheme. Then we see that $W \times_X U \rightarrow U$ is étale. Hence $W \times_X U \rightarrow V$ is étale, and also $W \times_X U \rightarrow Y$ is étale by Lemma 48.13.1 (1). Since also the projection $W \times_X U \rightarrow W$ is surjective and étale, we conclude from Lemma 48.13.1 (2) that $W \rightarrow Y$ is étale.

Let us prove that (1) implies (4). Assume (1). Choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $U \rightarrow X$ and $V \rightarrow Y$ are surjective and étale, see Spaces, Lemma 47.11.4. By assumption the morphism $U \rightarrow Y$ is étale, and hence $U \rightarrow V$ is étale by Lemma 48.13.1 (2).

We omit the proof that (2) and (3) are also equivalent to (1). \square

Lemma 48.13.4. *The composition of two étale morphisms of algebraic spaces is étale.*

Proof. This is immediate from the definition. \square

Lemma 48.13.5. *The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.*

Proof. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces over S . Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Then $U \rightarrow Y$ is étale, hence in the diagram

$$\begin{array}{ccc} W \times_Y U & \longrightarrow & W \\ \downarrow & & \downarrow \\ Z \times_Y X & \longrightarrow & Z \end{array}$$

the top horizontal arrow is étale. Moreover, the left vertical arrow is surjective and étale (verification omitted). Hence we conclude that the lower horizontal arrow is étale by Lemma 48.13.3. \square

Lemma 48.13.6. *Let S be a scheme. Let X, Y, Z be algebraic spaces. Let $g : X \rightarrow Z$, $h : Y \rightarrow Z$ be étale morphisms and let $f : X \rightarrow Y$ be a morphism such that $h \circ f = g$. Then f is étale.*

Proof. Choose a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\chi} & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $U \rightarrow X$ and $V \rightarrow Y$ are surjective and étale, see Spaces, Lemma 47.11.4. By assumption the morphisms $\varphi : U \rightarrow X \rightarrow Z$ and $\psi : V \rightarrow Y \rightarrow Z$ are étale. Moreover, $\psi \circ \chi = \varphi$ by our assumption on f, g, h . Hence $U \rightarrow V$ is étale by Lemma 48.13.1 part (2). \square

Lemma 48.13.7. *Let S be a scheme. If $X \rightarrow Y$ is an étale morphism of algebraic spaces over S , then the associated map $|X| \rightarrow |Y|$ of topological spaces is open.*

Proof. This is clear from the diagram in Lemma 48.13.3 and Lemma 48.4.6. \square

Finally, here is a fun lemma. It is not true that an algebraic space with an étale morphism towards a scheme is a scheme, see Spaces, Example 47.14.2. But it is true if the target is the spectrum of a field.

Lemma 48.13.8. *Let S be a scheme. Let $X \rightarrow \text{Spec}(k)$ be étale morphism over S , where k is a field. Then X is a scheme.*

Proof. Let U be an affine scheme, and let $U \rightarrow X$ be an étale morphism. By Definition 48.13.2 we see that $U \rightarrow \text{Spec}(k)$ is an étale morphism. Hence $U = \coprod_{i=1, \dots, n} \text{Spec}(k_i)$ is a finite disjoint union of spectra of finite separable extensions k_i of k , see Morphisms, Lemma 28.37.7. The $R = U \times_X U \rightarrow U \times_{\text{Spec}(k)} U$ is a monomorphism and $U \times_{\text{Spec}(k)} U$ is also a finite disjoint union of spectra of finite separable extensions of k . Hence by Schemes, Lemma 25.23.10 we see that R is

similarly a finite disjoint union of spectra of finite separable extensions of k . This U and R are affine and both projections $R \rightarrow U$ are finite locally free. Hence U/R is a scheme by Groupoids, Proposition 38.21.8. By Spaces, Lemma 47.10.2 it is also an open subspace of X . By Lemma 48.10.1 we conclude that X is a scheme. \square

48.14. Spaces and fpqc coverings

Let S be a scheme. An algebraic space over S is defined as a sheaf in the fppf topology with additional properties. Hence it is not immediately clear that it satisfies the sheaf property for the fpqc topology (see Topologies, Definition 33.8.12). In this section we give Gabber’s argument showing this is true. However, when we say that the algebraic space X satisfies the sheaf property for the fpqc topology we really only consider fpqc coverings $\{f_i : T_i \rightarrow T\}_{i \in I}$ such that T, T_i are objects of the big site $(Sch/S)_{fppf}$ (as per our conventions, see Section 48.2).

Proposition 48.14.1 (Gabber). *Let S be a scheme. Let X be an algebraic space over S . Then X satisfies the sheaf property for the fpqc topology.*

Proof. Since X is a sheaf for the Zariski topology it suffices to show the following. Given a surjective flat morphism of affines $f : T' \rightarrow T$ we have: $X(T)$ is the equalizer of the two maps $X(T') \rightarrow X(T' \times_T T')$. See Topologies, Lemma 33.8.13 (there is a little argument omitted here because the lemma cited is formulated for functors defined on the category of all schemes).

Let $a, b : T \rightarrow X$ be two morphisms such that $a \circ f = b \circ f$. We have to show $a = b$. Consider the fibre product

$$E = X \times_{\Delta_{X/S}, X \times_S X, (a,b)} T.$$

By Spaces, Lemma 47.13.1 the morphism $\Delta_{X/S}$ is a representable monomorphism. Hence $E \rightarrow T$ is a monomorphism of schemes. Our assumption that $a \circ f = b \circ f$ implies that $T' \rightarrow T$ factors (uniquely) through E . Consider the commutative diagram

$$\begin{array}{ccc} T' \times_T E & \longrightarrow & E \\ \downarrow & \nearrow & \downarrow \\ T' & \longrightarrow & T \end{array}$$

Since the projection $T' \times_T E \rightarrow T'$ is a monomorphism with a section we conclude it is an isomorphism. Hence we conclude that $E \rightarrow T$ is an isomorphism by Descent, Lemma 34.19.15. This means $a = b$ as desired.

Next, let $c : T' \rightarrow X$ be a morphism such that the two compositions $T' \times_T T' \rightarrow T' \rightarrow X$ are the same. We have to find a morphism $a : T \rightarrow X$ whose composition with $T' \rightarrow T$ is c . Choose an affine scheme U and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow |X|$ contains the image of $|c| : |T'| \rightarrow |X|$. This is possible by Lemmas 48.4.6 and 48.6.1, the fact that a finite union of affines is affine, and the fact that $|T'|$ is quasi-compact (small argument omitted). Since $U \rightarrow X$ is separated (Lemma 48.6.4), we see that

$$V = U \times_{X,c} T' \longrightarrow T'$$

is a surjective, étale, separated morphism of schemes (to see that it is surjective use Lemma 48.4.3 and our choice of $U \rightarrow X$). The fact that $c \circ \text{pr}_0 = c \circ \text{pr}_1$ means

that we obtain a descent datum on $V/T'/T$ (Descent, Definition 34.30.1) because

$$\begin{aligned} V \times_{T'} (T' \times_T T') &= U \times_{X, \text{copr}_0} (T' \times_T T') \\ &= (T' \times_T T') \times_{\text{copr}_1, X} U \\ &= (T' \times_T T') \times_{T'} V \end{aligned}$$

The morphism $V \rightarrow T'$ is ind-quasi-affine by More on Morphisms, Lemma 36.46.4 (because étale morphisms are locally quasi-finite, see Morphisms, Lemma 28.37.6). By More on Groupoids, Lemma 39.14.3 the descent datum is effective. Say $W \rightarrow T$ is a morphism such that there is an isomorphism $\alpha : T' \times_T W \rightarrow V$ compatible with the given descent datum on V and the canonical descent datum on $T' \times_T W$. Then $W \rightarrow T$ is surjective and étale (Descent, Lemmas 34.19.6 and 34.19.27). Consider the composition

$$b' : T' \times_T W \longrightarrow V = U \times_{X, c} T' \longrightarrow U$$

The two compositions $c' \circ (\text{pr}_0, 1), c' \circ (\text{pr}_1, 1) : (T' \times_T T') \times_T W \rightarrow T' \times_T W \rightarrow U$ agree by our choice of α and the corresponding property of c (computation omitted). Hence b' descends to a morphism $b : W \rightarrow U$ by Descent, Lemma 34.9.3. The diagram

$$\begin{array}{ccccc} T' \times_T W & \longrightarrow & W & \xrightarrow{b} & U \\ \downarrow & & & & \downarrow \\ T' & \xrightarrow{c} & & & X \end{array}$$

is commutative. What this means is that we have proved the existence of a étale locally on T , i.e., we have an $a' : W \rightarrow X$. However, since we have proved uniqueness in the first paragraph, we find that this étale local solutions satisfy the glueing condition, i.e., we have $\text{pr}_0^* a' = \text{pr}_1^* a'$ as elements of $X(W \times_T W)$. Since X is an étale sheaf we find a unique $a \in X(T)$ restricting to a' on W . \square

48.15. The étale site of an algebraic space

In this section we define the small étale site of an algebraic space. This is the analogue of the small étale site $S_{\text{étale}}$ of a scheme. Lemma 48.13.1 implies that in the definition below any morphism between objects of the étale site of X is étale, and that any scheme étale over an object of $X_{\text{étale}}$ is also an object of $X_{\text{étale}}$.

Definition 48.15.1. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S , and let $Sch_{\text{étale}}$ be the corresponding big étale site (i.e., having the same underlying category). Let X be an algebraic space over S . The *small étale site* $X_{\text{étale}}$ of X is defined as follows:

- (1) An object of $X_{\text{étale}}$ is a morphism $\varphi : U \rightarrow X$ where $U \in \text{Ob}((Sch/S)_{\text{étale}})$ is a scheme and φ is an étale morphism,
- (2) a morphism $(\varphi : U \rightarrow X) \rightarrow (\varphi' : U' \rightarrow X)$ is given by a morphism of schemes $\chi : U \rightarrow U'$ such that $\varphi = \varphi' \circ \chi$, and
- (3) a family of morphisms $\{(U_i \rightarrow X) \rightarrow (U \rightarrow X)\}_{i \in I}$ of $X_{\text{étale}}$ is a covering if and only if $\{U_i \rightarrow U\}_{i \in I}$ is a covering of $(Sch/S)_{\text{étale}}$.

A consequence of our choice is that the étale site of an algebraic space in general does not have a final object! On the other hand, if X happens to be a scheme, then the definition above agrees with Topologies, Definition 33.4.8.

There are several other choices we could have made here. For example we could have considered all *algebraic spaces* U which are étale over X , or we could have considered all *affine schemes* U which are étale over X . We decided not to do so, since we like to think of plain old schemes as the fundamental objects of algebraic geometry. On the other hand, we do need these notions also, since the small étale site of an algebraic space is not sufficiently flexible, especially when discussing functoriality of the small étale site, see Lemma 48.15.7 below.

Definition 48.15.2. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S , and let $Sch_{étale}$ be the corresponding big étale site (i.e., having the same underlying category). Let X be an algebraic space over S . The site $X_{spaces,étale}$ of X is defined as follows:

- (1) An object of $X_{spaces,étale}$ is a morphism $\varphi : U \rightarrow X$ where U is an algebraic space over S and φ is an étale morphism of algebraic spaces over S ,
- (2) a morphism $(\varphi : U \rightarrow X) \rightarrow (\varphi' : U' \rightarrow X)$ of $X_{spaces,étale}$ is given by a morphism of algebraic spaces $\chi : U \rightarrow U'$ such that $\varphi = \varphi' \circ \chi$, and
- (3) a family of morphisms $\{\varphi_i : (U_i \rightarrow X) \rightarrow (U \rightarrow X)\}_{i \in I}$ of $X_{spaces,étale}$ is a covering if and only if $|U| = \bigcup \varphi_i(|U_i|)$.

(As usual we choose a set of coverings of this type, including at least the coverings in $X_{étale}$, as in Sets, Lemma 3.11.1 to turn $X_{spaces,étale}$ into a site.)

Since the identity morphism of X is étale it is clear that $X_{spaces,étale}$ does have a final object. Let us show right away that the corresponding topos equals the small étale topos of X .

Lemma 48.15.3. *The functor*

$$X_{étale} \longrightarrow X_{spaces,étale}, \quad U/X \longmapsto U/X$$

is a special cocontinuous functor (Sites, Definition 7.28.2) and hence induces an equivalence of topoi $Sh(X_{étale}) \rightarrow Sh(X_{spaces,étale})$.

Proof. We have to show that the functor satisfies the assumptions (1) – (5) of Sites, Lemma 7.28.1. It is clear that the functor is continuous and cocontinuous, which proves assumptions (1) and (2). Assumptions (3) and (4) hold simply because the functor is fully faithful. Assumption (5) holds, because an algebraic space by definition has a covering by a scheme. \square

Remark 48.15.4. Let us explain the meaning of Lemma 48.15.3. Let S be a scheme, and let X be an algebraic space over S . Let \mathcal{F} be a sheaf on the small étale site $X_{étale}$ of X . The lemma says that there exists a unique sheaf \mathcal{F}' on $X_{spaces,étale}$ which restricts back to \mathcal{F} on the subcategory $X_{étale}$. If $U \rightarrow X$ is an étale morphism of algebraic spaces, then how do we compute $\mathcal{F}'(U)$? Well, by definition of an algebraic space there exists a scheme U' and a surjective étale morphism $U' \rightarrow U$. Then $\{U' \rightarrow U\}$ is a covering in $X_{spaces,étale}$ and hence we get an equalizer diagram

$$\mathcal{F}'(U) \longrightarrow \mathcal{F}(U') \rightrightarrows \mathcal{F}(U' \times_U U').$$

Note that $U' \times_U U'$ is a scheme, and hence we may write \mathcal{F} and not \mathcal{F}' . Thus we see how to compute \mathcal{F}' when given the sheaf \mathcal{F} .

Lemma 48.15.5. *Let S be a scheme. Let X be an algebraic space over S . Let $X_{\text{affine},\text{étale}}$ denote the full subcategory of $X_{\text{étale}}$ whose objects are those $U/X \in \text{Ob}(X_{\text{étale}})$ with U affine. A covering of $X_{\text{affine},\text{étale}}$ will be a standard étale covering, see Topologies, Definition 33.4.5. Then restriction*

$$\mathcal{F} \mapsto \mathcal{F}|_{X_{\text{affine},\text{étale}}}$$

defines an equivalence of topoi $\text{Sh}(S_{\text{étale}}) \cong \text{Sh}(S_{\text{affine},\text{étale}})$.

Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 7.28.1 by checking that the inclusion functor $X_{\text{affine},\text{étale}} \rightarrow X_{\text{étale}}$ is a special cocontinuous functor as in Sites, Definition 7.28.2. \square

Definition 48.15.6. Let S be a scheme. Let X be an algebraic space over S . The *étale topos* of X , or more precisely the *small étale topos* of X is the category $\text{Sh}(X_{\text{étale}})$ of sheaves of sets on $X_{\text{étale}}$.

By Lemma 48.15.3 we have $\text{Sh}(X_{\text{étale}}) = \text{Sh}(X_{\text{spaces},\text{étale}})$, so we can also think of this as the category of sheaves of sets on $X_{\text{spaces},\text{étale}}$. Similarly, by Lemma 48.15.5 we see that $\text{Sh}(X_{\text{étale}}) = \text{Sh}(X_{\text{affine},\text{étale}})$. It turns out that the topos is functorial with respect to morphisms of algebraic spaces. Here is a precise statement.

Lemma 48.15.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .*

- (1) *The continuous functor*

$$Y_{\text{spaces},\text{étale}} \longrightarrow X_{\text{spaces},\text{étale}}, \quad V \mapsto X \times_Y V$$

induces a morphism of sites

$$f_{\text{spaces},\text{étale}} : X_{\text{spaces},\text{étale}} \rightarrow Y_{\text{spaces},\text{étale}}.$$

- (2) *The rule $f \mapsto f_{\text{spaces},\text{étale}}$ is compatible with compositions, in other words $(f \circ g)_{\text{spaces},\text{étale}} = f_{\text{spaces},\text{étale}} \circ g_{\text{spaces},\text{étale}}$ (see Sites, Definition 7.15.4).*
 (3) *The morphism of topoi associated to $f_{\text{spaces},\text{étale}}$ induces, via Lemma 48.15.3, a morphism of topoi $f_{\text{small}} : \text{Sh}(X_{\text{étale}}) \rightarrow \text{Sh}(Y_{\text{étale}})$ whose construction is compatible with compositions.*
 (4) *If f is a representable morphism of algebraic spaces, then f_{small} comes from a morphism of sites $X_{\text{étale}} \rightarrow Y_{\text{étale}}$, corresponding to the continuous functor $V \mapsto X \times_Y V$.*

Proof. Let us show that the functor described in (1) satisfies the assumptions of Sites, Proposition 7.15.6. Thus we have to show that $Y_{\text{spaces},\text{étale}}$ has a final object (namely Y) and that the functor transforms this into a final object in $X_{\text{spaces},\text{étale}}$ (namely X). This is clear as $X \times_Y Y = X$ in any category. Next, we have to show that $Y_{\text{spaces},\text{étale}}$ has fibre products. This is true since the category of algebraic spaces has fibre products, and since $V \times_Y V'$ is étale over Y if V and V' are étale over Y (see Lemmas 48.13.4 and 48.13.5 above). OK, so the proposition applies and we see that we get a morphism of sites as described in (1).

Part (2) you get by unwinding the definitions. Part (3) is clear by using the equivalences for X and Y from Lemma 48.15.3 above. Part (4) follows, because if f is

representable, then the functors above fit into a commutative diagram

$$\begin{array}{ccc} X_{\acute{e}tale} & \longrightarrow & X_{spaces,\acute{e}tale} \\ \uparrow & & \uparrow \\ Y_{\acute{e}tale} & \longrightarrow & Y_{spaces,\acute{e}tale} \end{array}$$

of categories. □

We can do a little bit better than the lemma above in describing the relationship between sheaves on X and sheaves on Y . Namely, we can formulate this in terms of f -maps, compare Sheaves, Definition 6.21.7, as follows.

Definition 48.15.8. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a sheaf of sets on $X_{\acute{e}tale}$ and let \mathcal{G} be a sheaf of sets on $Y_{\acute{e}tale}$. An f -map $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ is a collection of maps $\varphi_{(U,V,g)} : \mathcal{G}(V) \rightarrow \mathcal{F}(U)$ indexed by commutative diagrams

$$\begin{array}{ccc} U & \longrightarrow & X \\ g \downarrow & & \downarrow f \\ V & \longrightarrow & Y \end{array}$$

where $U \in X_{\acute{e}tale}$, $V \in Y_{\acute{e}tale}$ such that whenever given an extended diagram

$$\begin{array}{ccccc} U' & \longrightarrow & U & \longrightarrow & X \\ g' \downarrow & & g \downarrow & & \downarrow f \\ V' & \longrightarrow & V & \longrightarrow & Y \end{array}$$

with $V' \rightarrow V$ and $U' \rightarrow U$ étale morphisms of schemes the diagram

$$\begin{array}{ccc} \mathcal{G}(V) & \xrightarrow{\varphi_{(U,V,g)}} & \mathcal{F}(U) \\ \text{restriction of } \mathcal{G} \downarrow & & \downarrow \text{restriction of } \mathcal{F} \\ \mathcal{G}(V') & \xrightarrow{\varphi_{(U',V',g')}} & \mathcal{F}(U') \end{array}$$

commutes.

Lemma 48.15.9. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a sheaf of sets on $X_{\acute{e}tale}$ and let \mathcal{G} be a sheaf of sets on $Y_{\acute{e}tale}$. There are canonical bijections between the following three sets:

- (1) The set of maps $\mathcal{G} \rightarrow f_{small,*}\mathcal{F}$.
- (2) The set of maps $f_{small}^{-1}\mathcal{G} \rightarrow \mathcal{F}$.
- (3) The set of f -maps $\varphi : \mathcal{G} \rightarrow \mathcal{F}$.

Proof. Note that (1) and (2) are the same because the functors $f_{small,*}$ and f_{small}^{-1} are a pair of adjoint functors. Suppose that $\alpha : f_{small}^{-1}\mathcal{G} \rightarrow \mathcal{F}$ is a map of sheaves on $Y_{\acute{e}tale}$. Let a diagram

$$\begin{array}{ccc} U & \longrightarrow & X \\ g \downarrow & j_U & \downarrow f \\ V & \longrightarrow & Y \\ & j_V & \end{array}$$

as in Definition 48.15.8 be given. By the commutativity of the diagram we also get a map $g_{small}^{-1}(j_V)^{-1}\mathcal{G} \rightarrow (j_U)^{-1}\mathcal{F}$ (compare Sites, Section 7.24 for the description of the localization functors). Hence we certainly get a map $\varphi_{(V,U,g)} : \mathcal{G}(V) = (j_V)^{-1}\mathcal{G}(V) \rightarrow (j_U)^{-1}\mathcal{F}(U) = \mathcal{F}(U)$. We omit the verification that this rule is compatible with further restrictions and defines an f -map from \mathcal{G} to \mathcal{F} .

Conversely, suppose that we are given an f -map $\varphi = (\varphi_{(U,V,g)})$. Let \mathcal{G}' (resp. \mathcal{F}') denote the extension of \mathcal{G} (resp. \mathcal{F}) to $Y_{spaces,étale}$ (resp. $X_{spaces,étale}$), see Lemma 48.15.3. Then we have to construct a map of sheaves

$$\mathcal{G}' \longrightarrow (f_{spaces,étale})_*\mathcal{F}'$$

To do this, let $V \rightarrow Y$ be an étale morphism of algebraic spaces. We have to construct a map of sets

$$\mathcal{G}'(V) \rightarrow \mathcal{F}'(X \times_Y V)$$

Choose an étale surjective morphism $V' \rightarrow V$ with V' a scheme, and after that choose an étale surjective morphism $U' \rightarrow X \times_U V'$ with U' a scheme. We get a morphism of schemes $g' : U' \rightarrow V'$ and also a morphism of schemes

$$g'' : U' \times_{X \times_Y V} U' \longrightarrow V' \times_V V'$$

Consider the following diagram

$$\begin{array}{ccccc} \mathcal{F}'(X \times_Y V) & \longrightarrow & \mathcal{F}(U') & \xrightarrow{\cong} & \mathcal{F}(U' \times_{X \times_Y V} U') \\ \uparrow \text{dotted} & & \uparrow \varphi_{(U',V',g')} & & \uparrow \varphi_{(U'',V'',g'')} \\ \mathcal{G}'(X \times_Y V) & \longrightarrow & \mathcal{G}(V') & \xrightarrow{\cong} & \mathcal{G}(V' \times_V V') \end{array}$$

The compatibility of the maps $\varphi \dots$ with restriction shows that the two right squares commute. The definition of coverings in $X_{spaces,étale}$ shows that the horizontal rows are equalizer diagrams. Hence we get the dotted arrow. We leave it to the reader to show that these arrows are compatible with the restriction mappings. \square

If the morphism of algebraic spaces $X \rightarrow Y$ is étale, then the morphism of topoi $Sh(X_{étale}) \rightarrow Sh(Y_{étale})$ is a localization. Here is a statement.

Lemma 48.15.10. *Let S be a scheme, and let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is étale. In this case there is a functor*

$$j : X_{étale} \rightarrow Y_{étale}, \quad (\varphi : U \rightarrow X) \mapsto (f \circ \varphi : U \rightarrow Y)$$

which is cocontinuous. The morphism of topoi f_{small} is the morphism of topoi associated to j , see Sites, Lemma 7.20.1. Moreover, j is continuous as well, hence Sites, Lemma 7.20.5 applies. In particular $f_{small}^{-1}\mathcal{G}(U) = \mathcal{G}(jU)$ for all sheaves \mathcal{G} on $Y_{étale}$.

Proof. Note that by our very definition of an étale morphism of algebraic spaces (Definition 48.13.2) it is indeed the case that the rule given defines a functor j as indicated. It is clear that j is cocontinuous and continuous, simply because a covering $\{U_i \rightarrow U\}$ of $j(\varphi : U \rightarrow X)$ in $Y_{étale}$ is the same thing as a covering of $(\varphi : U \rightarrow X)$ in $X_{étale}$. It remains to show that j induces the same morphism of

topoi as f_{small} . To see this we consider the diagram

$$\begin{array}{ccc} X_{\acute{e}tale} & \longrightarrow & X_{spaces,\acute{e}tale} \\ \downarrow j & & \downarrow j_{spaces} \\ Y_{\acute{e}tale} & \longrightarrow & Y_{spaces,\acute{e}tale} \end{array} \quad \left. \vphantom{\begin{array}{ccc} X_{\acute{e}tale} & \longrightarrow & X_{spaces,\acute{e}tale} \\ \downarrow j & & \downarrow j_{spaces} \\ Y_{\acute{e}tale} & \longrightarrow & Y_{spaces,\acute{e}tale} \end{array}} \right) v: V \mapsto X \times_Y V$$

of categories. Here the functor j_{spaces} is the obvious extension of j to the category $X_{spaces,\acute{e}tale}$. Thus the inner square is commutative. In fact j_{spaces} can be identified with the localization functor $j_X : Y_{spaces,\acute{e}tale}/X \rightarrow Y_{spaces,\acute{e}tale}$ discussed in Sites, Section 7.24. Hence, by Sites, Lemma 7.26.2 the cocontinuous functor j_{spaces} and the functor v of the diagram induce the same morphism of topoi. By Sites, Lemma 7.20.2 the commutativity of the inner square (consisting of cocontinuous functors between sites) gives a commutative diagram of associated morphisms of topoi. Hence, by the construction of f_{small} in Lemma 48.15.7 we win. \square

The lemma above says that the pullback of \mathcal{G} via an étale morphism $f : X \rightarrow Y$ of algebraic spaces is simply the restriction of \mathcal{G} to the category $X_{\acute{e}tale}$. We will often use the short hand

$$(48.15.10.1) \quad \mathcal{G}|_{X_{\acute{e}tale}} = f_{small}^{-1}\mathcal{G}$$

to indicate this. Note that the functor $j : X_{\acute{e}tale} \rightarrow Y_{\acute{e}tale}$ of the lemma in this situation is faithful, but not fully faithful in general. We will discuss this in a more technical fashion in Section 48.25.

Lemma 48.15.11. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \longrightarrow & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

be a cartesian square of algebraic spaces over S . Let \mathcal{F} be a sheaf on $X_{\acute{e}tale}$. If g is étale, then

- (1) $f'_{small,*}(\mathcal{F}|_{X'}) = (f_{small,*}\mathcal{F})|_{Y'}$ in $Sh(Y'_{\acute{e}tale})^5$, and
- (2) if \mathcal{F} is an abelian sheaf, then $R^i f'_{small,*}(\mathcal{F}|_{X'}) = (R^i f_{small,*}\mathcal{F})|_{Y'}$.

Proof. Consider the following diagram of functors

$$\begin{array}{ccc} X'_{spaces,\acute{e}tale} & \xrightarrow{j} & X_{spaces,\acute{e}tale} \\ \uparrow V' \mapsto V' \times_{Y'} X' & & \uparrow V \mapsto V \times_Y X \\ Y'_{spaces,\acute{e}tale} & \xrightarrow{j} & Y_{spaces,\acute{e}tale} \end{array}$$

The horizontal arrows are localizations and the vertical arrows induce morphisms of sites. Hence the last statement of Sites, Lemma 7.27.1 gives (1). To see (2) apply (1) to an injective resolution of \mathcal{F} and use that restriction is exact and preserves injectives (see Cohomology on Sites, Lemma 21.8.1). \square

⁵Also $(f')_{small}^{-1}(\mathcal{G}|_{Y'}) = (f_{small}^{-1}\mathcal{G})|_{X'}$ because of commutativity of the diagram and (48.15.10.1)

The following lemma says that you can think of a sheaf on the small étale site of an algebraic space as a compatible collection of sheaves on the small étale sites of schemes étale over the space. Please note that all the comparison mappings c_f in the lemma are isomorphisms, which is compatible with Topologies, Lemma 33.4.18 and the fact that all morphisms between objects of $X_{\text{étale}}$ are étale.

Lemma 48.15.12. *Let S be a scheme. Let X be an algebraic space over S . A sheaf \mathcal{F} on $X_{\text{étale}}$ is given by the following data:*

- (1) *for every $U \in \text{Ob}(X_{\text{étale}})$ a sheaf \mathcal{F}_U on $U_{\text{étale}}$,*
- (2) *for every $f : U' \rightarrow U$ in $X_{\text{étale}}$ an isomorphism $c_f : f_{\text{small}}^{-1}\mathcal{F}_U \rightarrow \mathcal{F}_{U'}$.*

These data are subject to the condition that given any $f : U' \rightarrow U$ and $g : U'' \rightarrow U'$ in $X_{\text{étale}}$ the composition $g_{\text{small}}^{-1}c_f \circ c_g$ is equal to $c_{f \circ g}$.

Proof. Given a sheaf \mathcal{F} on $X_{\text{étale}}$ and an object $\varphi : U \rightarrow X$ of $X_{\text{étale}}$ we set $\mathcal{F}_U = \varphi_{\text{small}}^{-1}\mathcal{F}$. If $\varphi' : U' \rightarrow X$ is a second object of $X_{\text{étale}}$, and $f : U' \rightarrow U$ is a morphism between them, then the isomorphism c_f comes from the fact that $f_{\text{small}}^{-1} \circ \varphi_{\text{small}}^{-1} = (\varphi')_{\text{small}}^{-1}$, see Lemma 48.15.7. The condition on the transitivity of the isomorphisms c_f follows from the functoriality of the small étale sites also; verification omitted.

Conversely, suppose we are given a collection of data (\mathcal{F}_U, c_f) as in the lemma. In this case we simply define \mathcal{F} by the rule $U \mapsto \mathcal{F}_U(U)$. Details omitted. \square

Let S be a scheme. Let X be an algebraic space over S . Let $X = U/R$ be a presentation of X coming from any surjective étale morphism $\varphi : U \rightarrow X$, see Spaces, Definition 47.9.3. In particular, we obtain a groupoid (U, R, s, t, c, e, i) such that $j = (t, s) : R \rightarrow U \times_S U$, see Groupoids, Lemma 38.11.3.

Lemma 48.15.13. *With S , $\varphi : U \rightarrow X$, and (U, R, s, t, c, e, i) as above. For any sheaf \mathcal{F} on $X_{\text{étale}}$ the sheaf⁶ $\mathcal{G} = \varphi^{-1}\mathcal{F}$ comes equipped with a canonical isomorphism*

$$\alpha : t^{-1}\mathcal{G} \longrightarrow s^{-1}\mathcal{G}$$

such that the diagram

$$\begin{array}{ccc}
 & pr_1^{-1}t^{-1}\mathcal{G} & \xrightarrow[pr_1^{-1}\alpha]{} pr_1^{-1}s^{-1}\mathcal{G} \\
 & \parallel & \parallel \\
 pr_0^{-1}s^{-1}\mathcal{G} & & c^{-1}s^{-1}\mathcal{G} \\
 & \swarrow pr_0^{-1}\alpha & \searrow c^{-1}\alpha \\
 & pr_0^{-1}t^{-1}\mathcal{G} & = c^{-1}t^{-1}\mathcal{G}
 \end{array}$$

is a commutative. The functor $\mathcal{F} \mapsto (\mathcal{G}, \alpha)$ defines an equivalence of categories between sheaves on $X_{\text{étale}}$ and pairs (\mathcal{G}, α) as above.

First proof of Lemma 48.15.13. Let $\mathcal{C} = X_{\text{spaces, étale}}$. By Lemma 48.15.10 and its proof we have $U_{\text{spaces, étale}} = \mathcal{C}/U$ and the pullback functor φ^{-1} is just the

⁶In this lemma and its proof we write simply φ^{-1} instead of $\varphi_{\text{small}}^{-1}$ and similarly for all the other pullbacks.

restriction functor. Moreover, $\{U \rightarrow X\}$ is a covering of the site \mathcal{C} and $R = U \times_X U$. The isomorphism α is just the canonical identification

$$(\mathcal{F}|_{\mathcal{C}/U})|_{\mathcal{C}/U \times_X U} = (\mathcal{F}|_{\mathcal{C}/U})|_{\mathcal{C}/U \times_X U}$$

and the commutativity of the diagram is the cocycle condition for glueing data. Hence this lemma is a special case of glueing of sheaves, see Sites, Section 7.25. \square

Second proof of Lemma 48.15.13. The existence of α comes from the fact that $\varphi \circ t = \varphi \circ s$ and that pullback is functorial in the morphism, see Lemma 48.15.7. In exactly the same way, i.e., by functoriality of pullback, we see that the isomorphism α fits into the commutative diagram. The construction $\mathcal{F} \mapsto (\varphi^{-1}\mathcal{F}, \alpha)$ is clearly functorial in the sheaf \mathcal{F} . Hence we obtain the functor.

Conversely, suppose that (\mathcal{G}, α) is a pair. Let $V \rightarrow X$ be an object of $X_{\acute{e}tale}$. In this case the morphism $V' = U \times_X V \rightarrow V$ is a surjective étale morphism of schemes, and hence $\{V' \rightarrow V\}$ is an étale covering of V . Set $\mathcal{G}' = (V' \rightarrow V)^{-1}\mathcal{G}$. Since $R = U \times_X U$ with $t = \text{pr}_0$ and $s = \text{pr}_1$ we see that $V' \times_V V' = R \times_X V$ with projection maps $s', t' : V' \times_V V' \rightarrow V'$ equal to the pullbacks of t and s . Hence α pulls back to an isomorphism $\alpha' : (t')^{-1}\mathcal{G}' \rightarrow (s')^{-1}\mathcal{G}'$. Having said this we simply define

$$\mathcal{F}(V) = \text{Equalizer}(\mathcal{G}(V') \rightrightarrows \mathcal{G}(V' \times_V V')).$$

We omit the verification that this defines a sheaf. To see that $\mathcal{G}(V) = \mathcal{F}(V)$ if there exists a morphism $V \rightarrow U$ note that in this case the equalizer is $H^0(\{V' \rightarrow V\}, \mathcal{G}) = \mathcal{G}(V)$. \square

48.16. Points of the small étale site

This section is the analogue of Étale Cohomology, Section 44.29.

Definition 48.16.1. Let S be a scheme. Let X be an algebraic space over S .

- (1) A *geometric point* of X is a morphism $\bar{x} : \text{Spec}(k) \rightarrow X$, where k is an algebraically closed field. We often abuse notation and write $\bar{x} = \text{Spec}(k)$.
- (2) For every geometric point \bar{x} we have the corresponding “image” point $x \in |X|$. We say that \bar{x} is a *geometric point lying over* x .

It turns out that we can take stalks of sheaves on $X_{\acute{e}tale}$ at geometric point exactly in the same way as was done in the case of the small étale site of a scheme. In order to do this we define the notion of an étale neighbourhood as follows.

Definition 48.16.2. Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X .

- (1) An *étale neighborhood* of \bar{x} of X is a commutative diagram

$$\begin{array}{ccc} & & U \\ & \nearrow \bar{u} & \downarrow \varphi \\ \bar{x} & \xrightarrow{\bar{x}} & X \end{array}$$

where φ is an étale morphism of algebraic spaces over S . We will use the notation $\varphi : (U, \bar{u}) \rightarrow (X, \bar{x})$ to indicate this situation.

- (2) A *morphism of étale neighborhoods* $(U, \bar{u}) \rightarrow (U', \bar{u}')$ is an X -morphism $h : U \rightarrow U'$ such that $\bar{u}' = h \circ \bar{u}$.

Note that we allow U to be an algebraic space. When we take stalks of a sheaf on $X_{\text{étale}}$ we have to restrict to those U which are in $X_{\text{étale}}$, and so in this case we will only consider the case where U is a scheme. Alternately we can work with the site $X_{\text{space, étale}}$ and consider all étale neighbourhoods. And there won't be any difference because of the last assertion in the following lemma.

Lemma 48.16.3. *Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X . The category of étale neighborhoods is cofiltered. More precisely:*

- (1) *Let $(U_i, \bar{u}_i)_{i=1,2}$ be two étale neighborhoods of \bar{x} in X . Then there exists a third étale neighborhood (U, \bar{u}) and morphisms $(U, \bar{u}) \rightarrow (U_i, \bar{u}_i)$, $i = 1, 2$.*
- (2) *Let $h_1, h_2 : (U, \bar{u}) \rightarrow (U', \bar{u}')$ be two morphisms between étale neighborhoods of \bar{x} . Then there exist an étale neighborhood (U'', \bar{u}'') and a morphism $h : (U'', \bar{u}'') \rightarrow (U, \bar{u})$ which equalizes h_1 and h_2 , i.e., such that $h_1 \circ h = h_2 \circ h$.*

Moreover, given any étale neighbourhood $(U, \bar{u}) \rightarrow (X, \bar{x})$ there exists a morphism of étale neighbourhoods $(U', \bar{u}') \rightarrow (U, \bar{u})$ where U' is a scheme.

Proof. For part (1), consider the fibre product $U = U_1 \times_X U_2$. It is étale over both U_1 and U_2 because étale morphisms are preserved under base change and composition, see Lemmas 48.13.5 and 48.13.4. The map $\bar{u} \rightarrow U$ defined by (\bar{u}_1, \bar{u}_2) gives it the structure of an étale neighborhood mapping to both U_1 and U_2 .

For part (2), define U'' as the fibre product

$$\begin{array}{ccc} U'' & \longrightarrow & U \\ \downarrow & & \downarrow (h_1, h_2) \\ U' & \xrightarrow{\Delta} & U' \times_X U' \end{array}$$

Since \bar{u} and \bar{u}' agree over X with \bar{x} , we see that $\bar{u}'' = (\bar{u}, \bar{u}')$ is a geometric point of U'' . In particular $U'' \neq \emptyset$. Moreover, since U' is étale over X , so is the fibre product $U' \times_X U'$ (as seen above in the case of $U_1 \times_X U_2$). Hence the vertical arrow (h_1, h_2) is étale by Lemma 48.13.6. Therefore U'' is étale over U' by base change, and hence also étale over X (because compositions of étale morphisms are étale). Thus (U'', \bar{u}'') is a solution to the problem posed by (2).

To see the final assertion, choose any surjective étale morphism $U' \rightarrow U$ where U' is a scheme. Then $U' \times_U \bar{u}$ is a scheme surjective and étale over $\bar{u} = \text{Spec}(k)$ with k algebraically closed. It follows (see Morphisms, Lemma 28.37.7) that $U' \times_U \bar{u} \rightarrow \bar{u}$ has a section which gives us the desired \bar{u}' . \square

Lemma 48.16.4. *Let S be a scheme. Let X be an algebraic space over S . Let $\bar{x} : \text{Spec}(k) \rightarrow X$ be a geometric point of X lying over $x \in |X|$. Let $\varphi : U \rightarrow X$ be an étale morphism of algebraic spaces and let $u \in |U|$ with $\varphi(u) = x$. Then there exists a geometric point $\bar{u} : \text{Spec}(k) \rightarrow U$ lying over u with $\bar{x} = \varphi \circ \bar{u}$.*

Proof. Choose an affine scheme U' with $u' \in U'$ and an étale morphism $U' \rightarrow U$ which maps u' to u . If we can prove the lemma for $(U', u') \rightarrow (X, x)$ then the lemma follows. Hence we may assume that U is a scheme, in particular that $U \rightarrow X$ is

representable. Then look at the cartesian diagram

$$\begin{array}{ccc} \mathrm{Spec}(k) \times_{\bar{x}, X, \varphi} U & \xrightarrow{\mathrm{pr}_2} & U \\ \mathrm{pr}_1 \downarrow & & \downarrow \varphi \\ \mathrm{Spec}(k) & \xrightarrow{\bar{x}} & X \end{array}$$

The projection pr_1 is the base change of an étale morphisms so it is étale, see Lemma 48.13.5. Therefore, the scheme $\mathrm{Spec}(k) \times_{\bar{x}, X, \varphi} U$ is a disjoint union of finite separable extensions of k , see Morphisms, Lemma 28.37.7. But k is algebraically closed, so all these extensions are trivial, so $\mathrm{Spec}(k) \times_{\bar{x}, X, \varphi} U$ is a disjoint union of copies of $\mathrm{Spec}(k)$ and each of these corresponds to a geometric point \bar{u} with $f \circ \bar{u} = \bar{x}$. By Lemma 48.4.3 the map

$$|\mathrm{Spec}(k) \times_{\bar{x}, X, \varphi} U| \longrightarrow |\mathrm{Spec}(k)| \times_{|X|} |U|$$

is surjective, hence we can pick \bar{u} to lie over u . □

Lemma 48.16.5. *Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X . Let (U, \bar{u}) an étale neighborhood of \bar{x} . Let $\{\varphi_i : U_i \rightarrow U\}_{i \in I}$ be an étale covering in $X_{\mathrm{spaces}, \text{étale}}$. Then there exist $i \in I$ and $\bar{u}_i : \bar{x} \rightarrow U_i$ such that $\varphi_i : (U_i, \bar{u}_i) \rightarrow (U, \bar{u})$ is a morphism of étale neighborhoods.*

Proof. Let $u \in |U|$ be the image of \bar{u} . As $|U| = \bigcup_{i \in I} \varphi_i(|U_i|)$ there exists an i and a point $u_i \in U_i$ mapping to u . Apply Lemma 48.16.4 to $(U_i, u_i) \rightarrow (U, u)$ and \bar{u} to get the desired geometric point. □

Definition 48.16.6. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a presheaf on $X_{\text{étale}}$. Let \bar{x} be a geometric point of X . The *stalk* of \mathcal{F} at \bar{x} is

$$\mathcal{F}_{\bar{x}} = \mathrm{colim}_{(U, \bar{u})} \mathcal{F}(U)$$

where (U, \bar{u}) runs over all étale neighborhoods of \bar{x} in X with $U \in \mathrm{Ob}(X_{\text{étale}})$.

By Lemma 48.16.3, this colimit is over a filtered index category, namely the opposite of the category of étale neighborhoods in $X_{\text{étale}}$. More precisely Lemma 48.16.3 says the opposite of the category of all étale neighbourhoods is filtered, and the full subcategory of those which are in $X_{\text{étale}}$ is a cofinal subcategory hence also filtered.

This means an element of $\mathcal{F}_{\bar{x}}$ can be thought of as a triple (U, \bar{u}, σ) where $U \in \mathrm{Ob}(X_{\text{étale}})$ and $\sigma \in \mathcal{F}(U)$. Two triples $(U, \bar{u}, \sigma), (U', \bar{u}', \sigma')$ define the same element of the stalk if there exists a third étale neighbourhood (U'', \bar{u}'') , $U'' \in \mathrm{Ob}(X_{\text{étale}})$ and morphisms of étale neighbourhoods $h : (U'', \bar{u}'') \rightarrow (U, \bar{u}), h' : (U'', \bar{u}'') \rightarrow (U', \bar{u}')$ such that $h^* \sigma = (h')^* \sigma'$ in $\mathcal{F}(U'')$. See Categories, Section 4.19.

This also implies that if \mathcal{F}' is the sheaf on $X_{\mathrm{spaces}, \text{étale}}$ corresponding to \mathcal{F} on $X_{\text{étale}}$, then

$$(48.16.6.1) \quad \mathcal{F}_{\bar{x}} = \mathrm{colim}_{(U, \bar{u})} \mathcal{F}'(U)$$

where now the colimit is over all the étale neighbourhoods of \bar{x} . We will often jump between the point of view of using $X_{\text{étale}}$ and $X_{\mathrm{spaces}, \text{étale}}$ without further mention.

In particular this means that if \mathcal{F} is a presheaf of abelian groups, rings, etc then $\mathcal{F}_{\bar{x}}$ is an abelian group, ring, etc simply by the usual way of defining the group structure on a directed colimit of abelian groups, rings, etc.

Lemma 48.16.7. *Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X . Consider the functor*

$$u : X_{\acute{e}tale} \longrightarrow \text{Sets}, \quad U \longmapsto |U_{\bar{x}}|$$

Then u defines a point p of the site $X_{\acute{e}tale}$ (Sites, Definition 7.31.2) and its associated stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ (Sites, Equation 7.31.1.1) is the functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ defined above.

Proof. In the proof of Lemma 48.16.5 we have seen that the scheme $U_{\bar{x}}$ is a disjoint union of schemes isomorphic to \bar{x} . Thus we can also think of $|U_{\bar{x}}|$ as the set of geometric points of U lying over \bar{x} , i.e., as the collection of morphisms $\bar{u} : \bar{x} \rightarrow U$ fitting into the diagram of Definition 48.16.1. From this it follows that $u(X)$ is a singleton, and that $u(U \times_V W) = u(U) \times_{u(V)} u(W)$ whenever $U \rightarrow V$ and $W \rightarrow V$ are morphisms in $X_{\acute{e}tale}$. And, given a covering $\{U_i \rightarrow U\}_{i \in I}$ in $X_{\acute{e}tale}$ we see that $\coprod u(U_i) \rightarrow u(U)$ is surjective by Lemma 48.16.5. Hence Sites, Proposition 7.32.2 applies, so p is a point of the site $X_{\acute{e}tale}$. Finally, the our functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is given by exactly the same colimit as the functor $\mathcal{F} \mapsto \mathcal{F}_p$ associated to p in Sites, Equation 7.31.1.1 which proves the final assertion. \square

Lemma 48.16.8. *Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X .*

- (1) *The stalk functor $PAb(X_{\acute{e}tale}) \rightarrow Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is exact.*
- (2) *We have $(\mathcal{F}^\#)_{\bar{x}} = \mathcal{F}_{\bar{x}}$ for any presheaf of sets \mathcal{F} on $X_{\acute{e}tale}$.*
- (3) *The functor $Ab(X_{\acute{e}tale}) \rightarrow Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is exact.*
- (4) *Similarly the functors $PSh(X_{\acute{e}tale}) \rightarrow \text{Sets}$ and $Sh(X_{\acute{e}tale}) \rightarrow \text{Sets}$ given by the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ are exact (see Categories, Definition 4.23.1) and commute with arbitrary colimits.*

Proof. This result follows from the general material in Modules on Sites, Section 18.35. This is true because $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ comes from a point of the small étale site of X , see Lemma 48.16.7. See the proof of Étale Cohomology, Lemma 44.29.9 for a direct proof of some of these statements in the setting of the small étale site of a scheme. \square

We will see below that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is really the pullback along the morphism \bar{x} . In that sense the following lemma is a generalization of the lemma above.

Lemma 48.16.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .*

- (1) *The functor $f_{small}^{-1} : Ab(Y_{\acute{e}tale}) \rightarrow Ab(X_{\acute{e}tale})$ is exact.*
- (2) *The functor $f_{small}^{-1} : Sh(Y_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is exact, i.e., it commutes with finite limits and colimits, see Categories, Definition 4.23.1.*
- (3) *For any étale morphism $V \rightarrow Y$ of algebraic spaces we have $f_{small}^{-1} h_V = h_{X \times_Y V}$.*
- (4) *Let $\bar{x} \rightarrow X$ be a geometric point. Let \mathcal{G} be a sheaf on $Y_{\acute{e}tale}$. Then there is a canonical identification*

$$(f_{small}^{-1} \mathcal{G})_{\bar{x}} = \mathcal{G}_{\bar{y}}$$

where $\bar{y} = f \circ \bar{x}$.

Proof. Recall that f_{small} is defined via $f_{spaces,small}$ in Lemma 48.15.7. Parts (1), (2) and (3) are general consequences of the fact that $f_{spaces,étale} : X_{spaces,étale} \rightarrow Y_{spaces,étale}$ is a morphism of sites, see Sites, Definition 7.15.1 for (2), Modules on Sites, Lemma 18.30.2 for (1), and Sites, Lemma 7.14.5 for (3).

Proof of (4). This statement is a special case of Sites, Lemma 7.33.1 via Lemma 48.16.7. We also provide a direct proof. Note that by Lemma 48.16.8. taking stalks commutes with sheafification. Let \mathcal{G}' be the sheaf on $Y_{spaces,étale}$ whose restriction to $Y_{étale}$ is \mathcal{G} . Recall that $f_{spaces,étale}^{-1}\mathcal{G}'$ is the sheaf associated to the presheaf

$$U \longrightarrow \operatorname{colim}_{U \rightarrow X \times_Y V} \mathcal{G}'(V),$$

see Sites, Sections 7.14 and 7.5. Thus we have

$$\begin{aligned} (f_{spaces,étale}^{-1}\mathcal{G}')_{\bar{x}} &= \operatorname{colim}_{(U, \bar{u})} f_{spaces,étale}^{-1}\mathcal{G}'(U) \\ &= \operatorname{colim}_{(U, \bar{u})} \operatorname{colim}_{a:U \rightarrow X \times_Y V} \mathcal{G}'(V) \\ &= \operatorname{colim}_{(V, \bar{v})} \mathcal{G}'(V) \\ &= \mathcal{G}'_{\bar{v}} \end{aligned}$$

in the third equality the pair (U, \bar{u}) and the map $a : U \rightarrow X \times_Y V$ corresponds to the pair $(V, a \circ \bar{u})$. Since the stalk of \mathcal{G}' (resp. $f_{spaces,étale}^{-1}\mathcal{G}'$) agrees with the stalk of \mathcal{G} (resp. $f_{small}^{-1}\mathcal{G}$), see Equation (48.16.6.1) the result follows. \square

Remark 48.16.10. This remark is the analogue of Étale Cohomology, Remark 44.57.6. Let S be a scheme. Let X be an algebraic space over S . Let $\bar{x} : \operatorname{Spec}(k) \rightarrow X$ be a geometric point of X . By Étale Cohomology, Theorem 44.57.3 the category of sheaves on $\operatorname{Spec}(k)_{étale}$ is equivalent to the category of sets (by taking a sheaf to its global sections). Hence it follows from Lemma 48.16.9 part (4) applied to the morphism \bar{x} that the functor

$$\operatorname{Sh}(X_{étale}) \longrightarrow \operatorname{Sets}, \quad \mathcal{F} \longmapsto \mathcal{F}_{\bar{x}}$$

is isomorphic to the functor

$$\operatorname{Sh}(X_{étale}) \longrightarrow \operatorname{Sh}(\operatorname{Spec}(k)_{étale}) = \operatorname{Sets}, \quad \mathcal{F} \longmapsto \bar{x}^*\mathcal{F}$$

Hence we may view the stalk functors as pullback functors along geometric morphisms (and not just some abstract morphisms of topoi as in the result of Lemma 48.16.7).

Remark 48.16.11. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. We claim that for any pair of geometric points \bar{x} and \bar{x}' lying over x the stalk functors are isomorphic. By definition of $|X|$ we can find a third geometric point \bar{x}'' so that there exists a commutative diagram

$$\begin{array}{ccc} \bar{x}'' & \longrightarrow & \bar{x}' \\ & \searrow \bar{x}'' & \downarrow \bar{x}' \\ \bar{x} & \xrightarrow{\bar{x}} & X \end{array}$$

Since the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$ is given by pullback along the morphism \bar{x} (and similarly for the others) we conclude by functoriality of pullbacks.

The following theorem says that the small étale site of an algebraic space has enough points.

Theorem 48.16.12. *Let S be a scheme. Let X be an algebraic space over S . A map $a : \mathcal{F} \rightarrow \mathcal{G}$ of sheaves of sets is injective (resp. surjective) if and only if the map on stalks $a_{\bar{x}} : \mathcal{F}_{\bar{x}} \rightarrow \mathcal{G}_{\bar{x}}$ is injective (resp. surjective) for all geometric points of X . A sequence of abelian sheaves on $X_{\acute{e}tale}$ is exact if and only if it is exact on all stalks at geometric points of S .*

Proof. We know the theorem is true if X is a scheme, see *Étale Cohomology*, Theorem 44.29.10. Choose a surjective étale morphism $f : U \rightarrow X$ where U is a scheme. Since $\{U \rightarrow X\}$ is a covering (in $X_{spaces, \acute{e}tale}$) we can check whether a map of sheaves is injective, or surjective by restricting to U . Now if $\bar{u} : \text{Spec}(k) \rightarrow U$ is a geometric point of U , then $(\mathcal{F}|_U)_{\bar{u}} = \mathcal{F}_{\bar{x}}$ where $\bar{x} = f \circ \bar{u}$. (This is clear from the colimits defining the stalks at \bar{u} and \bar{x} , but it also follows from Lemma 48.16.9.) Hence the result for U implies the result for X and we win. \square

The following lemma should be skipped on a first reading.

Lemma 48.16.13. *Let S be a scheme. Let X be an algebraic space over S . Let $p : \text{Sh}(pt) \rightarrow \text{Sh}(X_{\acute{e}tale})$ be a point of the small étale topos of X . Then there exists a geometric point \bar{x} of X such that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ is isomorphic to the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\bar{x}}$.*

Proof. By Sites, Lemma 7.31.7 there is a one to one correspondence between points of the site and points of the associated topos. Hence we may assume that p is given by a functor $u : X_{\acute{e}tale} \rightarrow \text{Sets}$ which defines a point of the site $X_{\acute{e}tale}$. Let $U \in \text{Ob}(X_{\acute{e}tale})$ be an object whose structure morphism $j : U \rightarrow X$ is surjective. Note that h_U is a sheaf which surjects onto the final sheaf. Since taking stalks is exact we see that $(h_U)_p = u(U)$ is not empty (use Sites, Lemma 7.31.3). Pick $x \in u(U)$. By Sites, Lemma 7.34.1 we obtain a point $q : \text{Sh}(pt) \rightarrow \text{Sh}(U_{\acute{e}tale})$ such that $p = j_{small} \circ q$, so that $\mathcal{F}_p = (\mathcal{F}|_U)_q$ functorially. By *Étale Cohomology*, Lemma 44.29.12 there is a geometric point \bar{u} of U and a functorial isomorphism $\mathcal{G}_q = \mathcal{G}_{\bar{u}}$ for $\mathcal{G} \in \text{Sh}(U_{\acute{e}tale})$. Set $\bar{x} = j \circ \bar{u}$. Then we see that $\mathcal{F}_{\bar{x}} \cong (\mathcal{F}|_U)_{\bar{u}}$ functorially in \mathcal{F} on $X_{\acute{e}tale}$ by Lemma 48.16.9 and we win. \square

48.17. Supports of abelian sheaves

First we talk about supports of local sections.

Lemma 48.17.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a subsheaf of the final object of the étale topos of X (see Sites, Example 7.10.2). Then there exists a unique open $W \subset X$ such that $\mathcal{F} = h_W$.*

Proof. The condition means that $\mathcal{F}(U)$ is a singleton or empty for all $\varphi : U \rightarrow X$ in $\text{Ob}(X_{spaces, \acute{e}tale})$. In particular local sections always glue. If $\mathcal{F}(U) \neq \emptyset$, then $\mathcal{F}(\varphi(U)) \neq \emptyset$ because $\varphi(U) \subset X$ is an open subspace (Lemma 48.13.7) and $\{\varphi : U \rightarrow \varphi(U)\}$ is a covering in $X_{spaces, \acute{e}tale}$. Take $W = \bigcup_{\varphi : U \rightarrow S, \mathcal{F}(U) \neq \emptyset} \varphi(U)$ to conclude. \square

Lemma 48.17.2. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be an abelian sheaf on $X_{spaces, \acute{e}tale}$. Let $\sigma \in \mathcal{F}(U)$ be a local section. There exists an open subspace $W \subset U$ such that*

- (1) $W \subset U$ is the largest open subspace of U such that $\sigma|_W = 0$,

(2) for every $\varphi : V \rightarrow U$ in $X_{\acute{e}tale}$ we have

$$\sigma|_V = 0 \Leftrightarrow \varphi(V) \subset W,$$

(3) for every geometric point \bar{u} of U we have

$$(U, \bar{u}, \sigma) = 0 \text{ in } \mathcal{F}_{\bar{s}} \Leftrightarrow \bar{u} \in W$$

where $\bar{s} = (U \rightarrow S) \circ \bar{u}$.

Proof. Since \mathcal{F} is a sheaf in the étale topology the restriction of \mathcal{F} to U_{Zar} is a sheaf on U in the Zariski topology. Hence there exists a Zariski open W having property (1), see Modules, Lemma 17.5.2. Let $\varphi : V \rightarrow U$ be an arrow of $X_{\acute{e}tale}$. Note that $\varphi(V) \subset U$ is an open subspace (Lemma 48.13.7) and that $\{V \rightarrow \varphi(V)\}$ is an étale covering. Hence if $\sigma|_V = 0$, then by the sheaf condition for \mathcal{F} we see that $\sigma|_{\varphi(V)} = 0$. This proves (2). To prove (3) we have to show that if (U, \bar{u}, σ) defines the zero element of $\mathcal{F}_{\bar{s}}$, then $\bar{u} \in W$. This is true because the assumption means there exists a morphism of étale neighbourhoods $(V, \bar{v}) \rightarrow (U, \bar{u})$ such that $\sigma|_V = 0$. Hence by (2) we see that $V \rightarrow U$ maps into W , and hence $\bar{u} \in W$. \square

Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. Let \mathcal{F} be a sheaf on $X_{\acute{e}tale}$. By Remark 48.16.11 the isomorphism class of the stalk of the sheaf \mathcal{F} at a geometric points lying over x is well defined.

Definition 48.17.3. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be an abelian sheaf on $X_{\acute{e}tale}$.

- (1) The *support* of \mathcal{F} is the set of points $x \in |X|$ such that $\mathcal{F}_{\bar{x}} \neq 0$ for any (some) geometric point \bar{x} lying over x .
- (2) Let $\sigma \in \mathcal{F}(U)$ be a section. The *support* of σ is the closed subset $U \setminus W$, where $W \subset U$ is the largest open subset of U on which σ restricts to zero (see Lemma 48.17.2).

Lemma 48.17.4. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be an abelian sheaf on $X_{\acute{e}tale}$. Let $U \in \text{Ob}(X_{\acute{e}tale})$ and $\sigma \in \mathcal{F}(U)$.

- (1) The support of σ is closed in $|X|$.
- (2) The support of $\sigma + \sigma'$ is contained in the union of the supports of $\sigma, \sigma' \in \mathcal{F}(X)$.
- (3) If $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a map of abelian sheaves on $X_{\acute{e}tale}$, then the support of $\varphi(\sigma)$ is contained in the support of $\sigma \in \mathcal{F}(U)$.
- (4) The support of \mathcal{F} is the union of the images of the supports of all local sections of \mathcal{F} .
- (5) If $\mathcal{F} \rightarrow \mathcal{G}$ is surjective then the support of \mathcal{G} is a subset of the support of \mathcal{F} .
- (6) If $\mathcal{F} \rightarrow \mathcal{G}$ is injective then the support of \mathcal{F} is a subset of the support of \mathcal{G} .

Proof. Part (1) holds by definition. Parts (2) and (3) hold because they holds for the restriction of \mathcal{F} and \mathcal{G} to U_{Zar} , see Modules, Lemma 17.5.2. Part (4) is a direct consequence of Lemma 48.17.2 part (3). Parts (5) and (6) follow from the other parts. \square

Lemma 48.17.5. The support of a sheaf of rings on the small étale site of an algebraic space is closed.

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1 = 0$, and hence the support of a sheaf of rings is the support of the unit section. \square

48.18. The structure sheaf of an algebraic space

The structure sheaf of an algebraic space is the sheaf of rings of the following lemma.

Lemma 48.18.1. *Let S be a scheme. Let X be an algebraic space over S . The rule $U \mapsto \Gamma(U, \mathcal{O}_U)$ defines a sheaf of rings on $X_{\acute{e}tale}$.*

Proof. Immediate from the definition of a covering and Descent, Lemma 34.7.1. \square

Definition 48.18.2. Let S be a scheme. Let X be an algebraic space over S . The *structure sheaf* of X is the sheaf of rings \mathcal{O}_X on the small étale site $X_{\acute{e}tale}$ described in Lemma 48.18.1.

According to Lemma 48.15.12 the sheaf \mathcal{O}_X corresponds to a system of étale sheaves $(\mathcal{O}_X)_U$ for U ranging through the objects of $X_{\acute{e}tale}$. It is clear from the proof of that lemma and our definition that we have simply $(\mathcal{O}_X)_U = \mathcal{O}_U$ where \mathcal{O}_U is the structure sheaf of $U_{\acute{e}tale}$ as introduced in Descent, Definition 34.7.2. In particular, if X is a scheme we recover the sheaf \mathcal{O}_X on the small étale site of X .

Via the equivalence $Sh(X_{\acute{e}tale}) = Sh(X_{spaces, \acute{e}tale})$ of Lemma 48.15.3 we may also think of \mathcal{O}_X as a sheaf of rings on $X_{spaces, \acute{e}tale}$. It is explained in Remark 48.15.4 how to compute $\mathcal{O}_X(Y)$, and in particular $\mathcal{O}_X(X)$, when $Y \rightarrow X$ is an object of $X_{spaces, \acute{e}tale}$.

Lemma 48.18.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then there is a canonical map $f^\sharp : f_{small}^{-1}\mathcal{O}_Y \rightarrow \mathcal{O}_X$ such that*

$$(f_{small}, f^\sharp) : (X_{\acute{e}tale}, \mathcal{O}_X) \longrightarrow (Y_{\acute{e}tale}, \mathcal{O}_Y)$$

is a morphism of ringed topoi. Furthermore,

- (1) *The construction $f \mapsto (f_{small}, f^\sharp)$ is compatible with compositions.*
- (2) *If f is a morphism of schemes, then f^\sharp is the map described in Descent, Remark 34.7.4.*

Proof. By Lemma 48.15.9 it suffices to give an f -map from \mathcal{O}_Y to \mathcal{O}_X . In other words, for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & X \\ g \downarrow & & \downarrow f \\ V & \longrightarrow & Y \end{array}$$

where $U \in X_{\acute{e}tale}$, $V \in Y_{\acute{e}tale}$ we have to give a map of rings $(f^\sharp)_{(U, V, g)} : \Gamma(V, \mathcal{O}_V) \rightarrow \Gamma(U, \mathcal{O}_U)$. Of course we just take $(f^\sharp)_{(U, V, g)} = g^\sharp$. It is clear that this is compatible with restriction mappings and hence indeed gives an f -map. We omit checking compatibility with compositions and agreement with the construction in Descent, Remark 34.7.4. \square

48.19. Stalks of the structure sheaf

This section is the analogue of Étale Cohomology, Section 48.19.

Lemma 48.19.1. *Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X . Let (U, \bar{u}) be an étale neighbourhood of \bar{x} where U is a scheme. Then we have*

$$\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{U, \bar{u}} = \mathcal{O}_{U, u}^{sh}$$

where the left hand side is the stalk of the structure sheaf of X , and the right hand side is the strict henselization of the local ring of U at the point u at which \bar{u} is centered.

Proof. We know that the structure sheaf \mathcal{O}_U on $U_{\text{étale}}$ is the restriction of the structure sheaf of X . Hence the first equality follows from Lemma 48.16.9 part (4). The second equality is explained in Étale Cohomology, Lemma 44.33.1. \square

Definition 48.19.2. Let S be a scheme. Let X be an algebraic space over S . Let \bar{x} be a geometric point of X lying over the point $x \in |X|$.

- (1) The *étale local ring of X at \bar{x}* is the stalk of the structure sheaf \mathcal{O}_X on $X_{\text{étale}}$ at \bar{x} . Notation: $\mathcal{O}_{X, \bar{x}}$.
- (2) The *strict henselization of X at \bar{x}* is the scheme $\text{Spec}(\mathcal{O}_{X, \bar{x}})$.

The isomorphism type of the strict henselization of X at \bar{x} (as a scheme over X) depends only on the point $x \in |X|$ and not on the choice of the geometric point lying over x , see Remark 48.16.11.

Lemma 48.19.3. *Let S be a scheme. Let X be an algebraic space over S . The small étale site $X_{\text{étale}}$ endowed with its structure sheaf \mathcal{O}_X is a locally ringed site, see Modules on Sites, Definition 18.39.4.*

Proof. This follows because the stalks $\mathcal{O}_{X, \bar{x}}$ are local, and because $S_{\text{étale}}$ has enough points, see Lemmas 48.19.1 and Theorem 48.16.12. See Modules on Sites, Lemma 18.39.2 and 18.39.3 for the fact that this implies the small étale site is locally ringed. \square

48.20. Dimension of local rings

It turns out the dimension of the local ring of an algebraic space is a well defined concept.

Lemma 48.20.1. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point. Let $d \in \{0, 1, 2, \dots, \infty\}$. The following are equivalent*

- (1) *for some scheme U and étale morphism $a : U \rightarrow X$ and point $u \in U$ with $a(u) = x$ we have $\dim(\mathcal{O}_{U, u}) = d$,*
- (2) *for any scheme U , any étale morphism $a : U \rightarrow X$, and any point $u \in U$ with $a(u) = x$ we have $\dim(\mathcal{O}_{U, u}) = d$,*
- (3) *$\dim(\mathcal{O}_{X, \bar{x}}) = d$ for some geometric point \bar{x} lying over x , and*
- (4) *$\dim(\mathcal{O}_{X, \bar{x}}) = d$ for any geometric point \bar{x} lying over x .*

Proof. The equivalence of (1) and (2) follows from a combination of Lemma 48.7.4 and Descent, Lemma 34.17.3. The equivalence of (3) and (4) follows from the fact that the isomorphism type of $\mathcal{O}_{X, \bar{x}}$ only depends on $x \in |X|$, see Remark 48.16.11.

Using Lemma 48.19.1 the equivalence of (1)+(2) and (3)+(4) comes down to the following statement: Given any local ring R we have $\dim(R) = \dim(R^{sh})$. This is More on Algebra, Lemma 15.34.7. \square

Definition 48.20.2. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point. The *dimension of the local ring of X at x* is the element $d \in \{0, 1, 2, \dots, \infty\}$ satisfying the equivalent conditions of Lemma 48.20.1.

Lemma 48.20.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be an étale morphism of algebraic spaces over S . Let $x \in X$. Then (1) $\dim_x(X) = \dim_{f(x)}(Y)$ and (2) the dimension of the local ring of X at x equals the dimension of the local ring of Y at y . If f is surjective, then (3) $\dim(X) = \dim(Y)$.*

Proof. Choose a scheme U and a point $u \in U$ and an étale morphism $U \rightarrow X$ which maps u to x . Then the composition $U \rightarrow Y$ is also étale and maps u to y . Thus the statements (1) and (2) follow as the relevant integers are defined in terms of the behaviour of the scheme U at u . See Definition 48.8.1 for (1). Part (3) is an immediate consequence of (1), see Definition 48.8.2. \square

48.21. Local irreducibility

A point on an algebraic space has a well defined étale local ring, which corresponds to the strict henselization of the local ring in the case of a scheme. In general we cannot see how many irreducible components of the algebraic space pass through the given point from the étale local ring. Here is something we can do.

Lemma 48.21.1. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point. The following are equivalent*

- (1) *for any scheme U and étale morphism $a : U \rightarrow X$ and $u \in U$ with $a(u) = x$ the local ring $\mathcal{O}_{U,u}$ has a unique minimal prime,*
- (2) *for any scheme U and étale morphism $a : U \rightarrow X$ and $u \in U$ with $a(u) = x$ there is a unique irreducible component of U through u , and*
- (3) *$\mathcal{O}_{X,\bar{x}}$ has a unique minimal prime for any geometric point \bar{x} lying over x .*

Proof. The equivalence of (1) and (2) follows from the fact that irreducible components of U passing through u are in 1 – 1 correspondence with minimal primes of the local ring of U at u . Let $a : U \rightarrow X$ and $u \in U$ be as in (1). Then $\mathcal{O}_{U,u} \rightarrow \mathcal{O}_{X,\bar{x}}$ is flat in particular injective. Hence if $f, g \in \mathcal{O}_{U,u}$ are non-nilpotent elements such that $fg = 0$, then the same is true in $\mathcal{O}_{X,\bar{x}}$. Conversely, suppose that $f, g \in \mathcal{O}_{X,\bar{x}}$ are non-nilpotent such that $fg = 0$. Since $\mathcal{O}_{X,\bar{x}}$ is the filtered colimit of the rings $\mathcal{O}_{U,u}$ we see that f, g are the images of elements of $\mathcal{O}_{U,u}$ for some choice of $a : U \rightarrow X$. Hence we see that $\mathcal{O}_{U,u}$ doesn't have a unique minimal prime. In this way we see the equivalence of (1) and (3). \square

Definition 48.21.2. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. We say that X is *geometrically unibranch at x* if the equivalent conditions of Lemma 48.21.1 hold. We say that X is *geometrically unibranch* if X is geometrically unibranch at every $x \in |X|$.

To prove this is consistent with the definition of [DG67] for schemes we offer the following lemma (see [Art66, Lemma 2.2]).

Lemma 48.21.3. *Let A be a local ring. Let A^{sh} be a strict henselization of A . The following are equivalent*

- (1) A^{sh} has a unique minimal prime, and
- (2) A has a unique minimal prime \mathfrak{p} and the integral closure A' of A/\mathfrak{p} in its fraction field is a local ring whose residue field is purely inseparable over the residue field of A .

Proof. Denote \mathfrak{m} the maximal ideal of the ring A . Denote κ, κ^{sh} the residue field of A, A^{sh} .

Assume (1). Let \mathfrak{p}^{sh} be the unique minimal prime of A^{sh} . The flatness of $A \rightarrow A^{sh}$ implies that $\mathfrak{p} = A \cap \mathfrak{p}^{sh}$ is the unique minimal prime of A (by going down, see Algebra, Lemma 10.38.17). Also, since $A^{sh}/\mathfrak{p}A^{sh} = (A/\mathfrak{p})^{sh}$ (see Algebra, Lemma 10.145.30) is reduced by More on Algebra, Lemma 15.34.4 we see that $\mathfrak{p}^{sh} = \mathfrak{p}A^{sh}$. Since $A \rightarrow A'$ is integral, every maximal ideal of A' lies over \mathfrak{m} (by going up for integral ring maps, see Algebra, Lemma 10.35.20). If A' is not local, then we can find distinct maximal ideals $\mathfrak{m}_1, \mathfrak{m}_2$. Choosing elements $f_1, f_2 \in A'$ with $f_i \in \mathfrak{m}_i, f_i \notin \mathfrak{m}_{3-i}$ we find a finite subalgebra $B = A[f_1, f_2] \subset A'$ with distinct maximal ideals $B \cap \mathfrak{m}_i, i = 1, 2$. If A' is local with maximal ideal \mathfrak{m}' , but $A/\mathfrak{m} \subset A'/\mathfrak{m}'$ is not purely inseparable, then we can find a $f \in A'$ whose image in A'/\mathfrak{m}' generates finite, not purely inseparable extension of A/\mathfrak{m} and we find a finite local subalgebra $B = A[f] \subset A'$ whose residue field is not a purely inseparable extension of A/\mathfrak{m} . Note that the inclusions

$$A/\mathfrak{p} \subset B \subset \kappa(\mathfrak{p})$$

give, on tensoring with the flat ring map $A \rightarrow A^{sh}$ the inclusions

$$A^{sh}/\mathfrak{p}^{sh} \subset B \otimes_A A^{sh} \subset \kappa(\mathfrak{p}) \otimes_A A^{sh} \subset \kappa(\mathfrak{p}^{sh})$$

the last inclusion because $\kappa(\mathfrak{p}) \otimes_A A^{sh} = \kappa(\mathfrak{p}) \otimes_{A/\mathfrak{p}} A^{sh}/\mathfrak{p}^{sh}$ is a localization of the domain A^{sh}/\mathfrak{p}^{sh} . Note that $B \otimes_A \kappa^{sh}$ has at least two maximal ideals because $B/\mathfrak{m}B$ either has two maximal ideals or one whose residue field is not purely inseparable over κ , and because κ^{sh} is separably algebraically closed. Hence, as A^{sh} is strictly henselian we see that $B \otimes_A A^{sh}$ is a product of ≥ 2 local rings, see Algebra, Lemma 10.145.7. But we've just seen that $B \otimes_A A^{sh}$ is a subring of a domain and we get a contradiction.

Assume (2). Let $A \rightarrow B$ be a local map of local rings which is a localization of an étale A -algebra. In particular \mathfrak{m}_B is the unique prime containing $\mathfrak{m}_A B$. Then $B' = A' \otimes_A B$ is integral over B and the assumption that $A \rightarrow A'$ is local with purely inseparable residue field extension implies that B' is local. On the other hand, $A' \rightarrow B'$ is the localization of an étale ring map, hence B' is normal, see Algebra, Lemma 10.151.7. Thus B' is a (local) normal domain. Finally, we have

$$B/\mathfrak{p}B \subset B \otimes_A \kappa(\mathfrak{p}) = B' \otimes_{A'} f.f.(A') \subset f.f.(B')$$

Hence $B/\mathfrak{p}B$ is a domain, which implies that B has a unique minimal prime (since by flatness of $A \rightarrow B$ these all have to lie over \mathfrak{p}). Hence, by Lemma 48.21.1 we see that A^{sh} has a unique minimal prime. \square

48.22. Noetherian spaces

We have already defined locally Noetherian algebraic spaces in Section 48.7.

Definition 48.22.1. Let S be a scheme. Let X be an algebraic space over S . We say X is *Noetherian* if X is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic space X is not just quasi-compact and locally Noetherian, but also quasi-separated. This does not conflict with the definition of a Noetherian scheme, as a locally Noetherian scheme is quasi-separated, see Properties, Lemma 27.5.4. This does not hold for algebraic spaces. Namely, $X = \mathbf{A}_k^1/\mathbf{Z}$, see Spaces, Example 47.14.8 is locally Noetherian and quasi-compact but not quasi-separated (hence not Noetherian according to our definitions).

A consequence of the choice made above is that an algebraic space of finite type over a Noetherian algebraic space is not automatically Noetherian, i.e., the analogue of Morphisms, Lemma 28.16.6 does not hold. The correct statement is that an algebraic space of finite presentation over a Noetherian algebraic space is Noetherian (see Morphisms of Spaces, Lemma 49.27.6).

A Noetherian algebraic space X is very close to being a scheme. In the rest of this section we collect some lemmas to illustrate this.

Lemma 48.22.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If X is locally Noetherian then $|X|$ is a locally Noetherian topological space.*
- (2) *If X is quasi-compact and locally Noetherian, then $|X|$ is a Noetherian topological space.*

Proof. Assume X is locally Noetherian. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. As X is locally Noetherian we see that U is locally Noetherian. By Properties, Lemma 27.5.5 this means that $|U|$ is a locally Noetherian topological space. Since $|U| \rightarrow |X|$ is open and surjective we conclude that $|X|$ is locally Noetherian by Topology, Lemma 5.8.3. This proves (1). If X is quasi-compact and locally Noetherian, then $|X|$ is quasi-compact and locally Noetherian. Hence $|X|$ is Noetherian by Topology, Lemma 5.11.14. \square

Lemma 48.22.3. *Let S be a scheme. Let X be an algebraic space over S . If X is Noetherian, then $|X|$ is a sober Noetherian topological space.*

Proof. A quasi-separated algebraic space has an underlying sober topological space, see Lemma 48.12.4. It is Noetherian by Lemma 48.22.2. \square

Lemma 48.22.4. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \bar{x} be a geometric point of X . Then $\mathcal{O}_{X,\bar{x}}$ is a Noetherian local ring.*

Proof. Choose an étale neighbourhood (U, \bar{u}) of \bar{x} where U is a scheme. Then $\mathcal{O}_{X,\bar{x}}$ is the strict henselization of the local ring of U at u , see Lemma 48.19.1. By our definition of Noetherian spaces the scheme U is Noetherian. Hence we conclude by More on Algebra, Lemma 15.34.3. \square

48.23. Regular algebraic spaces

We have already defined regular algebraic spaces in Section 48.7.

Lemma 48.23.1. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . The following are equivalent*

- (1) *X is regular, and*
- (2) *every étale local ring $\mathcal{O}_{X,\bar{x}}$ is regular.*

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By assumption U is locally Noetherian. Moreover, every étale local ring $\mathcal{O}_{X,\bar{x}}$ is the strict henselization of a local ring on U and conversely, see Lemma 48.19.1. Thus by More on Algebra, Lemma 15.34.10 we see that (2) is equivalent to every local ring of U being regular, i.e., U being a regular scheme (see Properties, Lemma 27.9.2). This equivalent to (1) by Definition 48.7.2. \square

We can use Descent, Lemma 34.17.4 to define what it means for an algebraic space X to be regular at a point x .

Definition 48.23.2. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point. We say X is regular at x if $\mathcal{O}_{U,u}$ is a regular local ring for any (equivalently some) pair $(a : U \rightarrow X, u)$ consisting of an étale morphism $a : U \rightarrow X$ from a scheme to X and a point $u \in U$ with $a(u) = x$.

See Definition 48.7.5, Lemma 48.7.4, and Descent, Lemma 34.17.4.

Lemma 48.23.3. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$ be a point. The following are equivalent

- (1) X is regular at x , and
- (2) the étale local ring $\mathcal{O}_{X,\bar{x}}$ is regular for any (equivalently some) geometric point \bar{x} lying over x .

Proof. Let U be a scheme, $u \in U$ a point, and let $a : U \rightarrow X$ be an étale morphism mapping u to x . For any geometric point \bar{x} of X lying over x , the étale local ring $\mathcal{O}_{X,\bar{x}}$ is the strict henselization of a local ring on U at u , see Lemma 48.19.1. Thus we conclude by More on Algebra, Lemma 15.34.10. \square

48.24. Sheaves of modules on algebraic spaces

If X is an algebraic space, then a sheaf of modules on X is a sheaf of \mathcal{O}_X -modules on the small étale site of X where \mathcal{O}_X is the structure sheaf of X . The category of sheaves of modules is denoted $Mod(\mathcal{O}_X)$.

Given a morphism $f : X \rightarrow Y$ of algebraic spaces, by Lemma 48.18.3 we get a morphism of ringed topoi and hence by Modules on Sites, Definition 18.13.1 we get well defined pullback and direct image functors

$$(48.24.0.1) \quad f^* : Mod(\mathcal{O}_Y) \longrightarrow Mod(\mathcal{O}_X), \quad f_* : Mod(\mathcal{O}_X) \longrightarrow Mod(\mathcal{O}_Y)$$

which are adjoint in the usual way. If $g : Y \rightarrow Z$ is another morphism of algebraic spaces over S , then we have $(g \circ f)^* = f^* \circ g^*$ and $(g \circ f)_* = g_* \circ f_*$ simply because the morphisms of ringed topoi compose in the corresponding way (by the lemma).

Lemma 48.24.1. Let S be a scheme. Let $f : X \rightarrow Y$ be an étale morphism of algebraic spaces over S . Then $f^{-1}\mathcal{O}_Y = \mathcal{O}_X$, and $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G}$ for any sheaf of \mathcal{O}_Y -modules \mathcal{G} . In particular, $f^* : Mod(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_Y)$ is exact.

Proof. By the description of inverse image in Lemma 48.15.10 and the definition of the structure sheaves it is clear that $f_{small}^{-1}\mathcal{O}_Y = \mathcal{O}_X$. Since the pullback

$$f^*\mathcal{G} = f_{small}^{-1}\mathcal{G} \otimes_{f_{small}^{-1}\mathcal{O}_Y} \mathcal{O}_X$$

by definition we conclude that $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G}$. The exactness is clear because f_{small}^{-1} is exact, as f_{small} is a morphism of topoi. \square

We continue our abuse of notation introduced in Equation (48.15.10.1) by writing

$$(48.24.1.1) \quad \mathcal{G}|_{X_{\acute{e}tale}} = f^*\mathcal{G} = f_{small}^{-1}\mathcal{G}$$

in the situation of the lemma above. We will discuss this in a more technical fashion in Section 48.25.

Lemma 48.24.2. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \longrightarrow & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

be a cartesian square of algebraic spaces over S . Let $\mathcal{F} \in \text{Mod}(\mathcal{O}_X)$. If g is étale, then $f'_(\mathcal{F}|_{X'}) = (f_*\mathcal{F})|_{Y'}$ ⁷ and $R^i f'_*(\mathcal{F}|_{X'}) = (R^i f_*\mathcal{F})|_{Y'}$ in $\text{Mod}(\mathcal{O}_{Y'})$.*

Proof. This is a reformulation of Lemma 48.15.11 in the case of modules. □

Lemma 48.24.3. *Let S be a scheme. Let X be an algebraic space over S . A sheaf \mathcal{F} of \mathcal{O}_X -modules is given by the following data:*

- (1) *for every $U \in \text{Ob}(X_{\acute{e}tale})$ a sheaf \mathcal{F}_U of \mathcal{O}_U -modules on $U_{\acute{e}tale}$,*
- (2) *for every $f : U' \rightarrow U$ in $X_{\acute{e}tale}$ an isomorphism $c_f : f_{small}^*\mathcal{F}_U \rightarrow \mathcal{F}_{U'}$.*

These data are subject to the condition that given any $f : U' \rightarrow U$ and $g : U'' \rightarrow U'$ in $X_{\acute{e}tale}$ the composition $g_{small}^{-1}c_f \circ c_g$ is equal to $c_{f \circ g}$.

Proof. Combine Lemmas 48.24.1 and 48.15.12, and use the fact that any morphism between objects of $X_{\acute{e}tale}$ is an étale morphism of schemes. □

48.25. Étale localization

Reading this section should be avoided at all cost.

Let $X \rightarrow Y$ be an étale morphism of algebraic spaces. Then X is an object of $Y_{spaces, \acute{e}tale}$ and it is immediate from the definitions, see also the proof of Lemma 48.15.10, that

$$(48.25.0.1) \quad X_{spaces, \acute{e}tale} = Y_{spaces, \acute{e}tale}/X$$

where the right hand side is the localization of the site $Y_{spaces, \acute{e}tale}$ at the object X , see Sites, Definition 7.24.1. Moreover, this identification is compatible with the structure sheaves by Lemma 48.24.1. Hence the ringed site $(X_{spaces, \acute{e}tale}, \mathcal{O}_X)$ is identified with the localization of the ringed site $(Y_{spaces, \acute{e}tale}, \mathcal{O}_Y)$ at the object X :

$$(48.25.0.2) \quad (X_{spaces, \acute{e}tale}, \mathcal{O}_X) = (Y_{spaces, \acute{e}tale}/X, \mathcal{O}_Y|_{Y_{spaces, \acute{e}tale}/X})$$

The localization of a ringed site used on the right hand side is defined in Modules on Sites, Definition 18.19.1.

Assume now $X \rightarrow Y$ is an étale morphism of algebraic spaces and X is a scheme. Then X is an object of $Y_{\acute{e}tale}$ and it follows that

$$(48.25.0.3) \quad X_{\acute{e}tale} = Y_{\acute{e}tale}/X$$

and

$$(48.25.0.4) \quad (X_{\acute{e}tale}, \mathcal{O}_X) = (Y_{\acute{e}tale}/X, \mathcal{O}_Y|_{Y_{\acute{e}tale}/X})$$

⁷Also $(f')^*(\mathcal{G}|_{Y'}) = (f^*\mathcal{G})|_{X'}$ by commutativity of the diagram and (48.24.1.1)

as above.

Finally, if $X \rightarrow Y$ is an étale morphism of algebraic spaces and X is an affine scheme, then X is an object of $Y_{\text{affine}, \text{étale}}$ and

$$(48.25.0.5) \quad X_{\text{affine}, \text{étale}} = Y_{\text{affine}, \text{étale}}/X$$

and

$$(48.25.0.6) \quad (X_{\text{affine}, \text{étale}}, \mathcal{O}_X) = (Y_{\text{affine}, \text{étale}}/X, \mathcal{O}_Y|_{Y_{\text{affine}, \text{étale}}/X})$$

as above.

Next, we show that these localizations are compatible with morphisms.

Lemma 48.25.1. *Let S be a scheme. Let*

$$\begin{array}{ccc} U & \xrightarrow{g} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{f} & Y \end{array}$$

be a commutative diagram of algebraic spaces over S with p and q étale. Via the identifications (48.25.0.2) for $U \rightarrow X$ and $V \rightarrow Y$ the morphism of ringed topoi

$$(g_{\text{spaces}, \text{étale}}, g^\sharp) : (\text{Sh}(U_{\text{spaces}, \text{étale}}), \mathcal{O}_U) \longrightarrow (\text{Sh}(V_{\text{spaces}, \text{étale}}), \mathcal{O}_V)$$

is 2-isomorphic to the morphism $(f_{\text{spaces}, \text{étale}, c}, f_c^\sharp)$ constructed in Modules on Sites, Lemma 18.20.2 starting with the morphism of ringed sites $(f_{\text{spaces}, \text{étale}}, f^\sharp)$ and the map $c : U \rightarrow V \times_Y X$ corresponding to g .

Proof. The morphism $(f_{\text{spaces}, \text{étale}, c}, f_c^\sharp)$ is defined as a composition $f' \circ j$ of a localization and a base change map. Similarly g is a composition $U \rightarrow V \times_Y X \rightarrow V$. Hence it suffices to prove the lemma in the following two cases: (1) $f = \text{id}$, and (2) $U = X \times_Y V$. In case (1) the morphism $g : U \rightarrow V$ is étale, see Lemma 48.13.6. Hence $(g_{\text{spaces}, \text{étale}}, g^\sharp)$ is a localization morphism by the discussion surrounding Equations (48.25.0.1) and (48.25.0.2) which is exactly the content of the lemma in this case. In case (2) the morphism $g_{\text{spaces}, \text{étale}}$ comes from the morphism of ringed sites given by the functor $V_{\text{spaces}, \text{étale}} \rightarrow U_{\text{spaces}, \text{étale}}$, $V'/V \mapsto V' \times_V U/U$ which is also what the morphism f' is defined by, see Sites, Lemma 7.27.1. We omit the verification that $(f')^\sharp = g^\sharp$ in this case (both are the restriction of f^\sharp to $U_{\text{spaces}, \text{étale}}$). \square

Lemma 48.25.2. *Same notation and assumptions as in Lemma 48.25.1 except that we also assume U and V are schemes. Via the identifications (48.25.0.4) for $U \rightarrow X$ and $V \rightarrow Y$ the morphism of ringed topoi*

$$(g_{\text{small}}, g^\sharp) : (\text{Sh}(U_{\text{étale}}), \mathcal{O}_U) \longrightarrow (\text{Sh}(V_{\text{étale}}), \mathcal{O}_V)$$

is 2-isomorphic to the morphism $(f_{\text{small}, s}, f_s^\sharp)$ constructed in Modules on Sites, Lemma 18.22.3 starting with $(f_{\text{small}}, f^\sharp)$ and the map $s : h_U \rightarrow f_{\text{small}}^{-1}h_V$ corresponding to g .

Proof. Note that $(g_{\text{small}}, g^\sharp)$ is 2-isomorphic as a morphism of ringed topoi to the morphism of ringed topoi associated to the morphism of ringed sites $(g_{\text{spaces}, \text{étale}}, g^\sharp)$. Hence we conclude by Lemma 48.25.1 and Modules on Sites, Lemma 18.22.4. \square

48.26. Recovering morphisms

In this section we prove that the rule which associates to an algebraic space its locally ringed small étale topos is fully faithful in a suitable sense, see Theorem 48.26.4.

Lemma 48.26.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The morphism of ringed topoi (f_{small}, f^\sharp) associated to f is a morphism of locally ringed topoi, see *Modules on Sites, Definition 18.39.8*.*

Proof. Note that the assertion makes sense since we have seen that $(X_{\acute{e}tale}, \mathcal{O}_{X_{\acute{e}tale}})$ and $(Y_{\acute{e}tale}, \mathcal{O}_{Y_{\acute{e}tale}})$ are locally ringed sites, see Lemma 48.19.3. Moreover, we know that $X_{\acute{e}tale}$ has enough points, see Theorem 48.16.12. Hence it suffices to prove that (f_{small}, f^\sharp) satisfies condition (3) of *Modules on Sites, Lemma 18.39.7*. To see this take a point p of $X_{\acute{e}tale}$. By Lemma 48.16.13 p corresponds to a geometric point \bar{x} of X . By Lemma 48.16.9 the point $q = f_{small} \circ p$ corresponds to the geometric point $\bar{y} = f \circ \bar{x}$ of Y . Hence the assertion we have to prove is that the induced map of étale local rings

$$\mathcal{O}_{Y, \bar{y}} \longrightarrow \mathcal{O}_{X, \bar{x}}$$

is a local ring map. You can prove this directly, but instead we deduce it from the corresponding result for schemes. To do this choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U and V are schemes, and the vertical arrows are surjective étale (see *Spaces, Lemma 47.11.4*). Choose a lift $\bar{u} : \bar{x} \rightarrow U$ (possible by Lemma 48.16.5). Set $\bar{v} = \psi \circ \bar{u}$. We obtain a commutative diagram of étale local rings

$$\begin{array}{ccc} \mathcal{O}_{U, \bar{u}} & \longleftarrow & \mathcal{O}_{V, \bar{v}} \\ \uparrow & & \uparrow \\ \mathcal{O}_{X, \bar{x}} & \longleftarrow & \mathcal{O}_{Y, \bar{y}} \end{array}$$

By Étale Cohomology, Lemma 44.41.1 the top horizontal arrow is a local ring map. Finally by Lemma 48.19.1 the vertical arrows are isomorphisms. Hence we win. \square

Lemma 48.26.2. *Let S be a scheme. Let X, Y be algebraic spaces over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let t be a 2-morphism from (f_{small}, f^\sharp) to itself, see *Modules on Sites, Definition 18.8.1*. Then $t = id$.*

Proof. Let X' , resp. Y' be X viewed as an algebraic space over $\text{Spec}(\mathbf{Z})$, see *Spaces, Definition 47.16.2*. It is clear from the construction that (X_{small}, \mathcal{O}) is equal to $(X'_{small}, \mathcal{O})$ and similarly for Y . Hence we may work with X' and Y' . In other words we may assume that $S = \text{Spec}(\mathbf{Z})$.

Assume $S = \text{Spec}(\mathbf{Z})$, $f : X \rightarrow Y$ and t are as in the lemma. This means that $t : f_{small}^{-1} \rightarrow f_{small}^{-1}$ is a transformation of functors such that the diagram

$$\begin{array}{ccc} f_{small}^{-1} \mathcal{O}_Y & \xleftarrow{t} & f_{small}^{-1} \mathcal{O}_Y \\ & \searrow f^\# & \swarrow f^\# \\ & \mathcal{O}_X & \end{array}$$

is commutative. Suppose $V \rightarrow Y$ is étale with V affine. Write $V = \text{Spec}(B)$. Choose generators $b_j \in B$, $j \in J$ for B as a \mathbf{Z} -algebra. Set $T = \text{Spec}(\mathbf{Z}[\{x_j\}_{j \in J}])$. In the following we will use that $\text{Mor}_{Sch}(U, T) = \prod_{j \in J} \Gamma(U, \mathcal{O}_U)$ for any scheme U without further mention. The surjective ring map $\mathbf{Z}[x_j] \rightarrow B$, $x_j \mapsto b_j$ corresponds to a closed immersion $V \rightarrow T$. We obtain a monomorphism

$$i : V \longrightarrow T_Y = T \times Y$$

of algebraic spaces over Y . In terms of sheaves on $Y_{\text{étale}}$ the morphism i induces an injection $h_i : h_V \rightarrow \prod_{j \in J} \mathcal{O}_Y$ of sheaves. The base change $i' : X \times_Y V \rightarrow T_X$ of i to X is a monomorphism too (Spaces, Lemma 47.5.5). Hence $i' : X \times_Y V \rightarrow T_X$ is a monomorphism, which in turn means that $h_{i'} : h_{X \times_Y V} \rightarrow \prod_{j \in J} \mathcal{O}_X$ is an injection of sheaves. Via the identification $f_{small}^{-1} h_V = h_{X \times_Y V}$ of Lemma 48.16.9 the map $h_{i'}$ is equal to

$$f_{small}^{-1} h_V \xrightarrow{f^{-1} h_i} \prod_{j \in J} f_{small}^{-1} \mathcal{O}_Y \xrightarrow{\prod f^\#} \prod_{j \in J} \mathcal{O}_X$$

(verification omitted). This means that the map $t : f_{small}^{-1} h_V \rightarrow f_{small}^{-1} h_V$ fits into the commutative diagram

$$\begin{array}{ccccc} f_{small}^{-1} h_V & \xrightarrow{f^{-1} h_i} & \prod_{j \in J} f_{small}^{-1} \mathcal{O}_Y & \xrightarrow{\prod f^\#} & \prod_{j \in J} \mathcal{O}_X \\ \downarrow t & & \downarrow \prod t & & \downarrow \text{id} \\ f_{small}^{-1} h_V & \xrightarrow{f^{-1} h_i} & \prod_{j \in J} f_{small}^{-1} \mathcal{O}_Y & \xrightarrow{\prod f^\#} & \prod_{j \in J} \mathcal{O}_X \end{array}$$

The commutativity of the right square holds by our assumption on t explained above. Since the composition of the horizontal arrows is injective by the discussion above we conclude that the left vertical arrow is the identity map as well. Any sheaf of sets on $Y_{\text{étale}}$ admits a surjection from a (huge) coproduct of sheaves of the form h_V with V affine (combine Lemma 48.15.5 with Sites, Lemma 7.13.5). Thus we conclude that $t : f_{small}^{-1} \rightarrow f_{small}^{-1}$ is the identity transformation as desired. \square

Lemma 48.26.3. *Let S be a scheme. Let X, Y be algebraic spaces over S . Any two morphisms $a, b : X \rightarrow Y$ of algebraic spaces over S for which there exists a 2-isomorphism $(a_{small}, a^\#) \cong (b_{small}, b^\#)$ in the 2-category of ringed topoi are equal.*

Proof. Let $t : a_{small}^{-1} \rightarrow b_{small}^{-1}$ be the 2-isomorphism. We may equivalently think of t as a transformation $t : a_{spaces, \text{étale}}^{-1} \rightarrow b_{spaces, \text{étale}}^{-1}$ since there is not difference between sheaves on $X_{\text{étale}}$ and sheaves on $X_{spaces, \text{étale}}$. Choose a commutative

diagram

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{a} & Y \end{array}$$

where U and V are schemes, and p and q are surjective étale. Consider the diagram

$$\begin{array}{ccc} h_U & \xrightarrow{\alpha} & a_{spaces, \acute{e}tale}^{-1} h_V \\ \parallel & & \downarrow t \\ h_U & \cdots \cdots \cdots & b_{spaces, \acute{e}tale}^{-1} h_V \end{array}$$

Since the sheaf $b_{spaces, \acute{e}tale}^{-1} h_V$ is isomorphic to $h_{V \times_{Y, b} X}$ we see that the dotted arrow comes from a morphism of schemes $\beta : U \rightarrow V$ fitting into a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\beta} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{b} & Y \end{array}$$

We claim that there exists a sequence of 2-isomorphisms

$$\begin{aligned} (\alpha_{small}, \alpha^\sharp) &\cong (\alpha_{spaces, \acute{e}tale}, \alpha^\sharp) \\ &\cong (a_{spaces, \acute{e}tale, c}, a_c^\sharp) \\ &\cong (b_{spaces, \acute{e}tale, d}, b_d^\sharp) \\ &\cong (\beta_{spaces, \acute{e}tale}, \beta^\sharp) \\ &\cong (\beta_{small}, \beta^\sharp) \end{aligned}$$

The first and the last 2-isomorphisms come from the identifications between sheaves on $U_{spaces, \acute{e}tale}$ and sheaves on $U_{\acute{e}tale}$ and similarly for V . The second and fourth 2-isomorphisms are those of Lemma 48.25.1 with $c : U \rightarrow X \times_{a, Y} V$ induced by α and $d : U \rightarrow X \times_{b, Y} V$ induced by β . The middle 2-isomorphism comes from the transformation t . Namely, the functor $a_{spaces, \acute{e}tale, c}^{-1}$ corresponds to the functor

$$(\mathcal{H} \rightarrow h_V) \mapsto (a_{spaces, \acute{e}tale}^{-1} \mathcal{H} \times_{a_{spaces, \acute{e}tale}^{-1} h_V, \alpha} h_U \rightarrow h_U)$$

and similarly for $b_{spaces, \acute{e}tale, d}^{-1}$, see Sites, Lemma 7.27.3. This uses the identification of sheaves on $Y_{spaces, \acute{e}tale}/V$ as arrows $(\mathcal{H} \rightarrow h_V)$ in $Sh(Y_{spaces, \acute{e}tale})$ and similarly for U/X , see Sites, Lemma 7.24.4. Via this identification the structure sheaf \mathcal{O}_V corresponds to the pair $(\mathcal{O}_Y \times_{h_V} \rightarrow h_V)$ and similarly for \mathcal{O}_U , see Modules on Sites, Lemma 18.21.3. Since t switches α and β we see that t induces an isomorphism

$$t : a_{spaces, \acute{e}tale}^{-1} \mathcal{H} \times_{a_{spaces, \acute{e}tale}^{-1} h_V, \alpha} h_U \longrightarrow b_{spaces, \acute{e}tale}^{-1} \mathcal{H} \times_{b_{spaces, \acute{e}tale}^{-1} h_V, \beta} h_U$$

over h_U functorially in $(\mathcal{H} \rightarrow h_V)$. Also, t is compatible with a_c^\sharp and b_d^\sharp as t is compatible with a^\sharp and b^\sharp by our description of the structure sheaves \mathcal{O}_U and \mathcal{O}_V above. Hence, the morphisms of ringed topoi $(\alpha_{small}, \alpha^\sharp)$ and $(\beta_{small}, \beta^\sharp)$ are 2-isomorphic. By Étale Cohomology, Lemma 44.41.3 we conclude $\alpha = \beta$! Since $p : U \rightarrow X$ is a surjection of sheaves it follows that $a = b$. \square

Here is the main result of this section.

Theorem 48.26.4. *Let X, Y be algebraic spaces over $\text{Spec}(\mathbf{Z})$. Let*

$$(g, g^\sharp) : (\text{Sh}(X_{\acute{e}tale}), \mathcal{O}_X) \longrightarrow (\text{Sh}(Y_{\acute{e}tale}), \mathcal{O}_Y)$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of algebraic spaces $f : X \rightarrow Y$ such that (g, g^\sharp) is isomorphic to (f_{small}, f^\sharp) . In other words, the construction

$$\text{Spaces}/\text{Spec}(\mathbf{Z}) \longrightarrow \text{Locally ringed topoi}, \quad X \longrightarrow (X_{\acute{e}tale}, \mathcal{O}_X)$$

is fully faithful (morphisms up to 2-isomorphisms on the right hand side).

Proof. The uniqueness we have seen in Lemma 48.26.3. Thus it suffices to prove existence. In this proof we will freely use the identifications of Equation (48.25.0.4) as well as the result of Lemma 48.25.2.

Let $U \in \text{Ob}(X_{\acute{e}tale})$, let $V \in \text{Ob}(Y_{\acute{e}tale})$ and let $s \in g^{-1}h_V(U)$ be a section. We may think of s as a map of sheaves $s : h_U \rightarrow g^{-1}h_V$. By Modules on Sites, Lemma 18.22.3 we obtain a commutative diagram of morphisms of ringed topoi

$$\begin{array}{ccc} (\text{Sh}(X_{\acute{e}tale}/U), \mathcal{O}_U) & \xrightarrow{(j, j^\sharp)} & (\text{Sh}(X_{\acute{e}tale}), \mathcal{O}_X) \\ (g_s, g_s^\sharp) \downarrow & & \downarrow (g, g^\sharp) \\ (\text{Sh}(V_{\acute{e}tale}), \mathcal{O}_V) & \xrightarrow{\quad} & (\text{Sh}(Y_{\acute{e}tale}), \mathcal{O}_Y). \end{array}$$

By Étale Cohomology, Theorem 44.41.5 we obtain a unique morphism of schemes $f_s : U \rightarrow V$ such that (g_s, g_s^\sharp) is 2-isomorphic to $(f_{s,small}, f_s^\sharp)$. The construction $(U, V, s) \rightsquigarrow f_s$ just explained satisfies the following functoriality property: Suppose given morphisms $a : U' \rightarrow U$ in $X_{\acute{e}tale}$ and $b : V' \rightarrow V$ in $Y_{\acute{e}tale}$ and a map $s' : h_{U'} \rightarrow g^{-1}h_{V'}$ such that the diagram

$$\begin{array}{ccc} h_{U'} & \xrightarrow{s'} & g^{-1}h_{V'} \\ a \downarrow & & \downarrow g^{-1}b \\ h_U & \xrightarrow{s} & g^{-1}h_V \end{array}$$

commutes. Then the diagram

$$\begin{array}{ccc} U' & \xrightarrow{f_{s'}} & u(V') \\ a \downarrow & & \downarrow u(b) \\ U & \xrightarrow{f_s} & u(V) \end{array}$$

of schemes commutes. The reason this is true is that the same condition holds for the morphisms (g_s, g_s^\sharp) constructed in Modules on Sites, Lemma 18.22.3 and the uniqueness in Étale Cohomology, Theorem 44.41.5.

The problem is to glue the morphisms f_s to a morphism of algebraic spaces. To do this first choose a scheme V and a surjective étale morphism $V \rightarrow Y$. This means that $h_V \rightarrow *$ is surjective and hence $g^{-1}h_V \rightarrow *$ is surjective too. This means there exists a scheme U and a surjective étale morphism $U \rightarrow X$ and a morphism $s : h_U \rightarrow g^{-1}h_V$. Next, set $R = V \times_Y V$ and $R' = U \times_X U$. Then we get $g^{-1}h_R = g^{-1}h_V \times g^{-1}h_V$ as g^{-1} is exact. Thus s induces a morphism

$s \times s : h_{R'} \rightarrow g^{-1}h_R$. Applying the constructions above we see that we get a commutative diagram of morphisms of schemes

$$\begin{array}{ccc} R' & \xrightarrow{\quad} & R \\ \downarrow & \searrow f_{s \times s} & \downarrow \\ U & \xrightarrow{f_s} & V \end{array}$$

Since we have $X = U/R'$ and $Y = V/R$ (see Spaces, Lemma 47.9.1) we conclude that this diagram defines a morphism of algebraic spaces $f : X \rightarrow Y$ fitting into an obvious commutative diagram. Now we still have to show that (f_{small}, f^\sharp) is 2-isomorphic to (g, g^\sharp) . Let $t_V : f_{s,small}^{-1} \rightarrow g_s^{-1}$ and $t_R : f_{s \times s,small}^{-1} \rightarrow g_{s \times s}^{-1}$ be the 2-isomorphisms which are given to us by the construction above. Let \mathcal{G} be a sheaf on $Y_{\acute{e}tale}$. Then we see that t_V defines an isomorphism

$$f_{small}^{-1}\mathcal{G}|_{U_{\acute{e}tale}} = f_{s,small}^{-1}\mathcal{G}|_{V_{\acute{e}tale}} \xrightarrow{t_V} g_s^{-1}\mathcal{G}|_{V_{\acute{e}tale}} = g^{-1}\mathcal{G}|_{U_{\acute{e}tale}}.$$

Moreover, this isomorphism pulled back to R' via either projection $R' \rightarrow U$ is the isomorphism

$$f_{small}^{-1}\mathcal{G}|_{R'_{\acute{e}tale}} = f_{s \times s,small}^{-1}\mathcal{G}|_{R_{\acute{e}tale}} \xrightarrow{t_R} g_{s \times s}^{-1}\mathcal{G}|_{R_{\acute{e}tale}} = g^{-1}\mathcal{G}|_{R'_{\acute{e}tale}}.$$

Since $\{U \rightarrow X\}$ is a covering in the site $X_{spaces,\acute{e}tale}$ this means the first displayed isomorphism descends to an isomorphism $t : f_{small}^{-1}\mathcal{G} \rightarrow g^{-1}\mathcal{G}$ of sheaves (small detail omitted). The isomorphism is functorial in \mathcal{G} since t_V and t_R are transformations of functors. Finally, t is compatible with f^\sharp and g^\sharp as t_V and t_R are (some details omitted). This finishes the proof of the theorem. \square

Lemma 48.26.5. *Let X, Y be algebraic spaces over \mathbf{Z} . If*

$$(g, g^\sharp) : (Sh(X_{\acute{e}tale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{\acute{e}tale}), \mathcal{O}_Y)$$

is an isomorphism of ringed topoi, then there exists a unique morphism $f : X \rightarrow Y$ of algebraic spaces such that (g, g^\sharp) is isomorphic to (f_{small}, f^\sharp) and moreover f is an isomorphism of algebraic spaces.

Proof. By Theorem 48.26.4 it suffices to show that (g, g^\sharp) is a morphism of locally ringed topoi. By Modules on Sites, Lemma 18.39.7 (and since the site $X_{\acute{e}tale}$ has enough points) it suffices to check that the map $\mathcal{O}_{Y,q} \rightarrow \mathcal{O}_{X,p}$ induced by g^\sharp is a local ring map where $q = f \circ p$ and p is any point of $X_{\acute{e}tale}$. As it is an isomorphism this is clear. \square

48.27. Quasi-coherent sheaves on algebraic spaces

In Descent, Section 34.7 we have seen that for a scheme U , there is no difference between a quasi-coherent \mathcal{O}_U -module on U , or a quasi-coherent \mathcal{O} -module on the small étale site of U . Hence the following definition is compatible with our original notion of a quasi-coherent sheaf on a scheme (Schemes, Section 25.24), when applied to a representable algebraic space.

Definition 48.27.1. Let S be a scheme. Let X be an algebraic space over S . A *quasi-coherent* \mathcal{O}_X -module is a quasi-coherent module on the ringed site $(X_{\acute{e}tale}, \mathcal{O}_X)$ in the sense of Modules on Sites, Definition 18.23.1. The category of quasi-coherent sheaves on X is denoted $QCoh(\mathcal{O}_X)$.

Note that as being quasi-coherent is an intrinsic notion (see Modules on Sites, Lemma 18.23.2) this is equivalent to saying that the corresponding \mathcal{O}_X -module on $X_{spaces, \acute{e}tale}$ is quasi-coherent.

As usual, quasi-coherent sheaves behave well with respect to pullback.

Lemma 48.27.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The pullback functor $f^* : Mod(\mathcal{O}_Y) \rightarrow Mod(\mathcal{O}_X)$ preserves quasi-coherent sheaves.*

Proof. This is a general fact, see Modules on Sites, Lemma 18.23.4. □

Note that this pullback functor agrees with the usual pullback functor between quasi-coherent sheaves of modules if X and Y happen to be schemes, see Descent, Proposition 34.7.14. Here is the obligatory lemma comparing this with quasi-coherent sheaves on the objects of the small étale site of X .

Lemma 48.27.3. *Let S be a scheme. Let X be an algebraic space over S . A quasi-coherent \mathcal{O}_X -module \mathcal{F} is given by the following data:*

- (1) for every $U \in \text{Ob}(X_{\acute{e}tale})$ a quasi-coherent \mathcal{O}_U -module \mathcal{F}_U on $U_{\acute{e}tale}$,
- (2) for every $f : U' \rightarrow U$ in $X_{\acute{e}tale}$ an isomorphism $c_f : f_{small}^* \mathcal{F}_U \rightarrow \mathcal{F}_{U'}$.

These data are subject to the condition that given any $f : U' \rightarrow U$ and $g : U'' \rightarrow U'$ in $X_{\acute{e}tale}$ the composition $g_{small}^{-1} c_f \circ c_g$ is equal to $c_{f \circ g}$.

Proof. Combine Lemmas 48.27.2 and 48.24.3. □

Lemma 48.27.4. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in |X|$ be a point and let \bar{x} be a geometric point lying over x . Finally, let $\varphi : (U, \bar{u}) \rightarrow (X, \bar{x})$ be an étale neighbourhood where U is a scheme. Then*

$$(\varphi^* \mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X, \bar{x}} = \mathcal{F}_{\bar{x}}$$

where $u \in U$ is the image of \bar{u} .

Proof. Note that $\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{U,u}^{sh}$ by Lemma 48.19.1 hence the tensor product makes sense. Moreover, from Definition 48.16.6 it is clear that

$$\mathcal{F}_{\bar{x}} = \text{colim}(\varphi^* \mathcal{F})_u$$

where the colimit is over $\varphi : (U, \bar{u}) \rightarrow (X, \bar{x})$ as in the lemma. Hence there is a canonical map from left to right in the statement of the lemma. We have a similar colimit description for $\mathcal{O}_{X, \bar{x}}$ and by Lemma 48.27.3 we have

$$((\varphi')^* \mathcal{F})_{u'} = (\varphi^* \mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{U',u'}$$

whenever $(U', \bar{u}') \rightarrow (U, \bar{u})$ is a morphism of étale neighbourhoods. To complete the proof we use that \otimes commutes with colimits. □

Lemma 48.27.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{G} be a quasi-coherent \mathcal{O}_Y -module. Let \bar{x} be a geometric point of X and let $\bar{y} = f \circ \bar{x}$ be the image in Y . Then there is a canonical isomorphism*

$$(f^* \mathcal{G})_{\bar{x}} = \mathcal{G}_{\bar{y}} \otimes_{\mathcal{O}_{Y, \bar{y}}} \mathcal{O}_{X, \bar{x}}$$

of the stalk of the pullback with the tensor product of the stalk with the local ring of X at \bar{x} .

Proof. Since $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G} \otimes_{f_{small}^{-1}\mathcal{O}_Y} \mathcal{O}_X$ this follows from the description of stalks of pullbacks in Lemma 48.16.9 and the fact that taking stalks commutes with tensor products. A more direct way to see this is as follows. Choose a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{a} & Y \end{array}$$

where U and V are schemes, and p and q are surjective étale. By Lemma 48.16.4 we can choose a geometric point \bar{u} of U such that $\bar{x} = p \circ \bar{u}$. Set $\bar{v} = \alpha \circ \bar{u}$. Then we see that

$$\begin{aligned} (f^*\mathcal{G})_{\bar{x}} &= (p^*f^*\mathcal{G})_{\bar{u}} \otimes_{\mathcal{O}_{U,\bar{u}}} \mathcal{O}_{X,\bar{x}} \\ &= (\alpha^*q^*\mathcal{G})_{\bar{u}} \otimes_{\mathcal{O}_{U,\bar{u}}} \mathcal{O}_{X,\bar{x}} \\ &= (q^*\mathcal{G})_{\bar{v}} \otimes_{\mathcal{O}_{V,\bar{v}}} \mathcal{O}_{U,\bar{u}} \otimes_{\mathcal{O}_{U,\bar{u}}} \mathcal{O}_{X,\bar{x}} \\ &= (q^*\mathcal{G})_{\bar{v}} \otimes_{\mathcal{O}_{V,\bar{v}}} \mathcal{O}_{X,\bar{x}} \\ &= (q^*\mathcal{G})_{\bar{v}} \otimes_{\mathcal{O}_{V,\bar{v}}} \mathcal{O}_{Y,\bar{y}} \otimes_{\mathcal{O}_{Y,\bar{y}}} \mathcal{O}_{X,\bar{x}} \\ &= \mathcal{G}_{\bar{y}} \otimes_{\mathcal{O}_{Y,\bar{y}}} \mathcal{O}_{X,\bar{x}} \end{aligned}$$

Here we have used Lemma 48.27.4 (twice) and the corresponding result for pullbacks of quasi-coherent sheaves on schemes, see Sheaves, Lemma 6.26.4. \square

Lemma 48.27.6. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a sheaf of \mathcal{O}_X -modules. The following are equivalent*

- (1) \mathcal{F} is a quasi-coherent \mathcal{O}_X -module,
- (2) there exists an étale morphism $f : Y \rightarrow X$ of algebraic spaces over S with $|f| : |Y| \rightarrow |X|$ surjective such that $f^*\mathcal{F}$ is quasi-coherent on Y ,
- (3) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that $\varphi^*\mathcal{F}$ is a quasi-coherent \mathcal{O}_U -module, and
- (4) for every affine scheme U and étale morphism $\varphi : U \rightarrow X$ the restriction $\varphi^*\mathcal{F}$ is a quasi-coherent \mathcal{O}_U -module.

Proof. It is clear that (1) implies (2) by considering id_X . Assume $f : Y \rightarrow X$ is as in (2), and let $V \rightarrow Y$ be a surjective étale morphism from a scheme towards Y . Then the composition $V \rightarrow X$ is surjective étale as well and by Lemma 48.27.2 the pullback of \mathcal{F} to V is quasi-coherent as well. Hence we see that (2) implies (3).

Let $U \rightarrow X$ be as in (3). Let us use the abuse of notation introduced in Equation (48.24.1.1). As $\mathcal{F}|_{U_{\acute{e}tale}}$ is quasi-coherent there exists an étale covering $\{U_i \rightarrow U\}$ such that $\mathcal{F}|_{U_i, \acute{e}tale}$ has a global presentation, see Modules on Sites, Definition 18.17.1 and Lemma 18.23.3. Let $V \rightarrow X$ be an object of $X_{\acute{e}tale}$. Since $U \rightarrow X$ is surjective and étale, the family of maps $\{U_i \times_X V \rightarrow V\}$ is an étale covering of V . Via the morphisms $U_i \times_X V \rightarrow U_i$ we can restrict the global presentations of $\mathcal{F}|_{U_i, \acute{e}tale}$ to get a global presentation of $\mathcal{F}|_{(U_i \times_X V)_{\acute{e}tale}}$. Hence the sheaf \mathcal{F} on $X_{\acute{e}tale}$ satisfies the condition of Modules on Sites, Definition 18.23.1 and hence is quasi-coherent.

The equivalence of (3) and (4) comes from the fact that any scheme has an affine open covering. \square

Lemma 48.27.7. *Let S be a scheme. Let X be an algebraic space over S . The category $QCoh(\mathcal{O}_X)$ of quasi-coherent sheaves on X has the following properties:*

- (1) *Any direct sum of quasi-coherent sheaves is quasi-coherent.*
- (2) *Any colimit of quasi-coherent sheaves is quasi-coherent.*
- (3) *The kernel and cokernel of a morphism of quasi-coherent sheaves is quasi-coherent.*
- (4) *Given a short exact sequence of \mathcal{O}_X -modules $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ if two out of three are quasi-coherent so is the third.*
- (5) *Given two quasi-coherent \mathcal{O}_X -modules the tensor product is quasi-coherent.*
- (6) *Given two quasi-coherent \mathcal{O}_X -modules \mathcal{F}, \mathcal{G} such that \mathcal{F} is of finite presentation (see Section 48.28), then the internal hom $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is quasi-coherent.*

Proof. Note that we have the corresponding result for quasi-coherent modules on schemes, see Schemes, Section 25.24. We will reduce the lemma to this case by étale localization. Choose a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. In order to formulate this proof correctly, we temporarily go back to making the (pedantic) distinction between a quasi-coherent sheaf \mathcal{G} on the scheme U and the associated quasi-coherent sheaf \mathcal{G}^a (see Descent, Definition 34.7.2) on $U_{\text{étale}}$. We have a commutative diagram

$$\begin{array}{ccc} QCoh(\mathcal{O}_X) & \longrightarrow & QCoh(\mathcal{O}_U) \\ \downarrow & & \downarrow \\ Mod(\mathcal{O}_X) & \longrightarrow & Mod(\mathcal{O}_U) \end{array}$$

The bottom horizontal arrow is the restriction functor (48.24.1.1) $\mathcal{G} \mapsto \mathcal{G}|_{U_{\text{étale}}}$. This functor has both a left adjoint and a right adjoint, see Modules on Sites, Section 18.19, hence commutes with all limits and colimits. Moreover, we know that an object of $Mod(\mathcal{O}_X)$ is in $QCoh(\mathcal{O}_X)$ if and only if its restriction to U is in $QCoh(\mathcal{O}_U)$, see Lemma 48.27.6. Let \mathcal{F}_i be a family of quasi-coherent \mathcal{O}_X -modules. Then $\bigoplus \mathcal{F}_i$ is an \mathcal{O}_X -module whose restriction to U is the direct sum of the restrictions. Let \mathcal{G}_i be a quasi-coherent sheaf on U with $\mathcal{F}_i|_{U_{\text{étale}}} = \mathcal{G}_i^a$. Combining the above with Descent, Lemma 34.7.13 we see that

$$\left(\bigoplus \mathcal{F}_i\right)|_{U_{\text{étale}}} = \bigoplus \mathcal{F}_i|_{U_{\text{étale}}} = \bigoplus \mathcal{G}_i^a = \left(\bigoplus \mathcal{G}_i\right)^a$$

hence $\bigoplus \mathcal{F}_i$ is quasi-coherent and (1) follows. The other statements are proved just so (using the same references). \square

It is in general not the case that the pushforward of a quasi-coherent sheaf along a morphism of algebraic spaces is quasi-coherent. We will return to this issue in Morphisms of Spaces, Section 49.11.

48.28. Properties of modules

In Modules on Sites, Sections 18.17, 18.23, and Definition 18.28.1 we have defined a number of intrinsic properties of modules of \mathcal{O} -module on any ringed topos. If X is an algebraic space, we will apply these notions freely to modules on the ringed site $(X_{\text{étale}}, \mathcal{O}_X)$, or equivalently on the ringed site $(X_{\text{spaces, étale}}, \mathcal{O}_X)$.

Global properties \mathcal{P} :

- (a) *free*,
- (b) *finite free*,
- (c) *generated by global sections*,
- (d) *generated by finitely many global sections*,
- (e) *having a global presentation*, and
- (f) *having a global finite presentation*.

Local properties \mathcal{P} :

- (g) *locally free*,
- (f) *finite locally free*,
- (h) *locally generated by sections*,
- (i) *locally generated by r sections*,
- (j) *finite type*,
- (k) *quasi-coherent* (see Section 48.27),
- (l) *of finite presentation*,
- (m) *coherent*, and
- (n) *flat*.

Here are some results which follow immediately from the definitions:

- (1) In each case, except for \mathcal{P} = “coherent”, the property is preserved under pullback, see Modules on Sites, Lemmas 18.17.2, 18.23.4, and 18.38.3.
- (2) Each of the properties above (including coherent) are preserved under pullbacks by étale morphisms of algebraic spaces (because in this case pullback is given by restriction, see Lemma 48.15.10).
- (3) Assume $f : Y \rightarrow X$ is a surjective étale morphism of algebraic spaces. For each of the local properties (g) – (m), the fact that $f^*\mathcal{F}$ has \mathcal{P} implies that \mathcal{F} has \mathcal{P} . This follows as $\{Y \rightarrow X\}$ is a covering in $X_{spaces, étale}$ and Modules on Sites, Lemma 18.23.3.
- (4) If X is a scheme, \mathcal{F} is a quasi-coherent module on $X_{étale}$, and \mathcal{P} any property except “coherent” or “locally free”, then \mathcal{P} for \mathcal{F} on $X_{étale}$ is equivalent to the corresponding property for $\mathcal{F}|_{X_{zar}}$, i.e., it corresponds to \mathcal{P} for \mathcal{F} when we think of it as a quasi-coherent sheaf on the scheme X . See Descent, Lemma 34.7.12.
- (5) If X is a locally Noetherian scheme, \mathcal{F} is a quasi-coherent module on $X_{étale}$, then \mathcal{F} is coherent on $X_{étale}$ if and only if $\mathcal{F}|_{X_{zar}}$ is coherent, i.e., it corresponds to the usual notion of a coherent sheaf on the scheme X being coherent. See Descent, Lemma 34.7.12.

48.29. Locally projective modules

Recall that in Properties, Section 27.19 we defined the notion of a locally projective quasi-coherent module.

Lemma 48.29.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The following are equivalent*

- (1) *for some scheme U and surjective étale morphism $U \rightarrow X$ the restriction $\mathcal{F}|_U$ is locally projective on U , and*
- (2) *for any scheme U and any étale morphism $U \rightarrow X$ the restriction $\mathcal{F}|_U$ is locally projective on U .*

Proof. Let $U \rightarrow X$ be as in (1) and let $V \rightarrow X$ be étale where V is a scheme. Then $\{U \times_X V \rightarrow V\}$ is an fppf covering of schemes. Hence if $\mathcal{F}|_U$ is locally projective,

then $\mathcal{F}|_{U \times_X V}$ is locally projective (see Properties, Lemma 27.19.3) and hence $\mathcal{F}|_V$ is locally projective, see Descent, Lemma 34.6.7. \square

Definition 48.29.2. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. We say \mathcal{F} is *locally projective* if the equivalent conditions of Lemma 48.29.1 are satisfied.

Lemma 48.29.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{G} be a quasi-coherent \mathcal{O}_Y -module. If \mathcal{G} is locally projective on Y , then $f^*\mathcal{G}$ is locally projective on X .*

Proof. Choose a surjective étale morphism $V \rightarrow Y$ with V a scheme. Choose a surjective étale morphism $U \rightarrow V \times_Y X$ with U a scheme. Denote $\psi : U \rightarrow V$ the induced morphism. Then

$$f^*\mathcal{G}|_U = \psi^*(\mathcal{G}|_V)$$

Hence the lemma follows from the definition and the result in the case of schemes, see Properties, Lemma 27.19.3. \square

48.30. Quasi-coherent sheaves and presentations

Let S be a scheme. Let X be an algebraic space over S . Let $X = U/R$ be a presentation of X coming from any surjective étale morphism $\varphi : U \rightarrow X$, see Spaces, Definition 47.9.3. In particular, we obtain a groupoid (U, R, s, t, c) , such that $j = (t, s) : R \rightarrow U \times_S U$, see Groupoids, Lemma 38.11.3. In Groupoids, Definition 38.12.1 we have defined the notion of a quasi-coherent sheaf on an arbitrary groupoid. With these notions in place we have the following observation.

Proposition 48.30.1. *With S , $\varphi : U \rightarrow X$, and (U, R, s, t, c) as above. For any quasi-coherent \mathcal{O}_X -module \mathcal{F} the sheaf $\varphi^*\mathcal{F}$ comes equipped with a canonical isomorphism*

$$\alpha : t^*\varphi^*\mathcal{F} \longrightarrow s^*\varphi^*\mathcal{F}$$

which satisfies the conditions of Groupoids, Definition 38.12.1 and therefore defines a quasi-coherent sheaf on (U, R, s, t, c) . The functor $\mathcal{F} \mapsto (\varphi^\mathcal{F}, \alpha)$ defines an equivalence of categories*

$$\begin{array}{ccc} \text{Quasi-coherent} & \longleftrightarrow & \text{Quasi-coherent modules} \\ \mathcal{O}_X\text{-modules} & & \text{on } (U, R, s, t, c) \end{array}$$

Proof. In the statement of the proposition, and in this proof we think of a quasi-coherent sheaf on a scheme as a quasi-coherent sheaf on the small étale site of that scheme. This is permissible by the results of Descent, Section 34.7.

The existence of α comes from the fact that $\varphi \circ t = \varphi \circ s$ and that pullback is functorial in the morphism, see discussion surrounding Equation (48.24.0.1). In exactly the same way, i.e., by functoriality of pullback, we see that the isomorphism α satisfies condition (1) of Groupoids, Definition 38.12.1. To see condition (2) of the definition it suffices to see that α is an isomorphism which is clear. The construction $\mathcal{F} \mapsto (\varphi^*\mathcal{F}, \alpha)$ is clearly functorial in the quasi-coherent sheaf \mathcal{F} . Hence we obtain the functor from left to right in the displayed formula of the lemma.

Conversely, suppose that (\mathcal{F}, α) is a quasi-coherent sheaf on (U, R, s, t, c) . Let $V \rightarrow X$ be an object of $X_{\text{étale}}$. In this case the morphism $V' = U \times_X V \rightarrow V$ is a surjective étale morphism of schemes, and hence $\{V' \rightarrow V\}$ is an étale covering of V . Moreover, the quasi-coherent sheaf \mathcal{F} pulls back to a quasi-coherent sheaf \mathcal{F}' on

V' . Since $R = U \times_X U$ with $t = \text{pr}_0$ and $s = \text{pr}_1$ we see that $V' \times_V V' = R \times_X V'$ with projection maps $V' \times_V V' \rightarrow V'$ equal to the pullbacks of t and s . Hence α pulls back to an isomorphism $\alpha' : \text{pr}_0^* \mathcal{F}' \rightarrow \text{pr}_1^* \mathcal{F}'$, and the pair (\mathcal{F}', α') is a descent datum for quasi-coherent sheaves with respect to $\{V' \rightarrow V\}$. By Descent, Proposition 34.5.2 this descent datum is effective, and we obtain a quasi-coherent \mathcal{O}_V -module \mathcal{F}_V on $V_{\text{étale}}$. To see that this gives a quasi-coherent sheaf on $X_{\text{étale}}$ we have to show (by Lemma 48.27.3) that for any morphism $f : V_1 \rightarrow V_2$ in $X_{\text{étale}}$ there is a canonical isomorphism $c_f : \mathcal{F}_{V_1} \rightarrow \mathcal{F}_{V_2}$ compatible with compositions of morphisms. We omit the verification. We also omit the verification that this defines a functor from the category on the right to the category on the left which is inverse to the functor described above. \square

Proposition 48.30.2. *Let S be a scheme Let X be an algebraic space over S .*

- (1) *The category $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category. Consequently, $QCoh(\mathcal{O}_X)$ has enough injectives and all limits.*
- (2) *The inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$ has a right adjoint⁸*

$$Q : Mod(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

such that for every quasi-coherent sheaf \mathcal{F} the adjunction mapping $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism.

Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 27.21.4. We advise the reader to read that proof first.

Part (1) means $QCoh(\mathcal{O}_X)$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Lemma 48.27.7 colimits in $QCoh(\mathcal{O}_X)$ exist and agree with colimits in $Mod(\mathcal{O}_X)$. By Modules on Sites, Lemma 18.14.2 filtered colimits are exact. Hence (a) and (b) hold.

To construct a generator, choose a presentation $X = U/R$ so that (U, R, s, t, c) is an étale groupoid scheme and in particular s and t are flat morphisms of schemes. Pick a cardinal κ as in Groupoids, Lemma 38.13.6. Pick a collection $(\mathcal{E}_t, \alpha_t)_{t \in T}$ of κ -generated quasi-coherent modules on (U, R, s, t, c) as in Groupoids, Lemma 38.13.5. Let \mathcal{F}_t be the quasi-coherent module on X which corresponds to the quasi-coherent module $(\mathcal{E}_t, \alpha_t)$ via the equivalence of categories of Proposition 48.30.1. Then we see that every quasi-coherent module \mathcal{H} is the directed colimit of its quasi-coherent submodules which are isomorphic to one of the \mathcal{F}_t . Thus $\bigoplus_t \mathcal{F}_t$ is a generator of $QCoh(\mathcal{O}_X)$ and we conclude that (c) holds. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11.6 and Lemma 19.13.2.

Proof of (2). To construct Q we use the following general procedure. Given an object \mathcal{F} of $Mod(\mathcal{O}_X)$ we consider the functor

$$QCoh(\mathcal{O}_X)^{opp} \longrightarrow Sets, \quad \mathcal{G} \longmapsto \text{Hom}_X(\mathcal{G}, \mathcal{F})$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\text{Hom}_X(\mathcal{G}, \mathcal{F}) = \text{Hom}_X(\mathcal{G}, Q(\mathcal{F}))$ for \mathcal{G} in $QCoh(\mathcal{O}_X)$. By the Yoneda lemma (Categories, Lemma 4.3.5) the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in \mathcal{F} . By construction Q is a right adjoint to the inclusion functor. The fact that

⁸This functor is sometimes called the *coherator*.

$Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when \mathcal{F} is quasi-coherent is a formal consequence of the fact that the inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$ is fully faithful. \square

48.31. Morphisms towards schemes

Here is the analogue of Schemes, Lemma 25.6.4.

Lemma 48.31.1. *Let X be an algebraic space over \mathbf{Z} . Let T be an affine scheme. The map*

$$\text{Mor}(X, T) \longrightarrow \text{Hom}(\Gamma(T, \mathcal{O}_T), \Gamma(X, \mathcal{O}_X))$$

which maps f to $f^\#$ (on global sections) is bijective.

Proof. We construct the inverse of the map. Let $\varphi : \Gamma(T, \mathcal{O}_T) \rightarrow \Gamma(X, \mathcal{O}_X)$ be a ring map. Choose a presentation $X = U/R$, see Spaces, Definition 47.9.3. By Schemes, Lemma 25.6.4 the composition

$$\Gamma(T, \mathcal{O}_T) \rightarrow \Gamma(X, \mathcal{O}_X) \rightarrow \Gamma(U, \mathcal{O}_U)$$

corresponds to a unique morphism of schemes $g : U \rightarrow T$. By the same lemma the two compositions $R \rightarrow U \rightarrow T$ are equal. Hence we obtain a morphism $f : X = U/R \rightarrow T$ such that $U \rightarrow X \rightarrow T$ equals g . By construction the diagram

$$\begin{array}{ccc} \Gamma(U, \mathcal{O}_U) & \xleftarrow{f^\#} & \Gamma(X, \mathcal{O}_X) \\ & \searrow^{g^\#} & \uparrow \varphi \\ & & \Gamma(T, \mathcal{O}_T) \end{array}$$

commutes. Hence $f^\#$ equals φ because $U \rightarrow X$ is an étale covering and \mathcal{O}_X is a sheaf on $X_{\text{étale}}$. The uniqueness of f follows from the uniqueness of g . \square

48.32. Quotients by free actions

Let S be a scheme. Let X be an algebraic space over S . Let G be an abstract group. Let $a : G \rightarrow \text{Aut}(X)$ be a homomorphism, i.e., a is an *action* of G on X . We will say the action is *free* if for every scheme T over S the map

$$G \times X(T) \longrightarrow X(T)$$

is free. (We cannot use a criterion as in Spaces, Lemma 47.14.3 because points may not have well defined residue fields.) In case the action is free we're going to construct the quotient X/G as an algebraic space. This is a special case of the general Bootstrap, Lemma 62.11.7 that we will prove later.

Lemma 48.32.1. *Let S be a scheme. Let X be an algebraic space over S . Let G be an abstract group with a free action on X . Then the quotient sheaf X/G is an algebraic space.*

Proof. The statement means that the sheaf F associated to the presheaf

$$T \longmapsto X(T)/G$$

is an algebraic space. To see this we will construct a presentation. Namely, choose a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. Set $V = \coprod_{g \in G} U$ and set $\psi : V \rightarrow X$ equal to $a(g) \circ \varphi$ on the component corresponding to $g \in G$. Let G act on V by permuting the components, i.e., $g_0 \in G$ maps the component corresponding to g to the component corresponding to g_0g via the identity morphism of U . Then

ψ is a G -equivariant morphism, i.e., we reduce to the case dealt with in the next paragraph.

Assume that there exists a G -action on U and that $U \rightarrow X$ is surjective, étale and G -equivariant. In this case there is an induced action of G on $R = U \times_X U$ compatible with the projection mappings $t, s : R \rightarrow U$. Now we claim that

$$X/G = U / \coprod_{g \in G} R$$

where the map

$$j : \coprod_{g \in G} R \longrightarrow U \times_S U$$

is given by $(r, g) \mapsto (t(r), g(s(r)))$. Note that j is a monomorphism: If $(t(r), g(s(r))) = (t(r'), g'(s(r')))$, then $t(r) = t(r')$, hence r and r' have the same image in X under both s and t , hence $g = g'$ (as G acts freely on X), hence $s(r) = s(r')$, hence $r = r'$ (as R is an equivalence relation on U). Moreover j is an equivalence relation (details omitted). Both projections $\coprod_{g \in G} R \rightarrow U$ are étale, as s and t are étale. Thus j is an étale equivalence relation and $U / \coprod_{g \in G} R$ is an algebraic space by Spaces, Theorem 47.10.5. There is a map

$$U / \coprod_{g \in G} R \longrightarrow X/G$$

induced by the map $U \rightarrow X$. We omit the proof that it is an isomorphism of sheaves. \square

Morphisms of Algebraic Spaces

49.1. Introduction

In this chapter we introduce some types of morphisms of algebraic spaces. A reference is [Knu71].

The goal is to extend the definition of each of the types of morphisms of schemes defined in the chapters on schemes, and on morphisms of schemes to the category of algebraic spaces. Each case is slightly different and it seems best to treat them all separately.

49.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

49.3. Properties of representable morphisms

Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces. In Spaces, Section 47.5 we defined what it means for f to have property \mathcal{P} in case \mathcal{P} is a property of morphisms of schemes which

- (1) is preserved under any base change, see Schemes, Definition 25.18.3, and
- (2) is fppf local on the base, see Descent, Definition 34.18.1.

Namely, in this case we say f has property \mathcal{P} if and only if for every scheme U and any morphism $U \rightarrow Y$ the morphism of schemes $X \times_Y U \rightarrow U$ has property \mathcal{P} .

According to the lists in Spaces, Section 47.4 this applies to the following properties: (1)(a) closed immersions, (1)(b) open immersions, (1)(c) quasi-compact immersions, (2) quasi-compact, (3) universally-closed, (4) (quasi-)separated, (5) monomorphism, (6) surjective, (7) universally injective, (8) affine, (9) quasi-affine, (10) (locally) of finite type, (11) (locally) quasi-finite, (12) (locally) of finite presentation, (13) locally of finite type of relative dimension d , (14) universally open, (15) flat, (16) syntomic, (17) smooth, (18) unramified (resp. G-unramified), (19) étale, (20) proper, (21) finite or integral, (22) finite locally free, and (23) immersion.

In this chapter we will redefine these notions for not necessarily representable morphisms of algebraic spaces. Whenever we do this we will make sure that the new definition agrees with the old one, in order to avoid ambiguity.

Note that the definition above applies whenever X is a scheme, since a morphism from a scheme to an algebraic space is representable. And in particular it applies when both X and Y are schemes. In Spaces, Lemma 47.5.3 we have seen that in this case the definitions match, and no ambiguity arise.

Furthermore, in Spaces, Lemma 47.5.5 we have seen that the property of representable morphisms of algebraic spaces so defined is stable under arbitrary base change by a morphism of algebraic spaces. And finally, in Spaces, Lemmas 47.5.4 and 47.5.7 we have seen that if \mathcal{P} is stable under compositions, which holds for the properties (1)(a), (1)(b), (1)(c), (2) – (23), except (13) above, then taking products of representable morphisms preserves property \mathcal{P} and compositions of representable morphisms preserves property \mathcal{P} .

We will use these facts below, and whenever we do we will simply refer to this section as a reference.

49.4. Separation axioms

It makes sense to list some a priori properties of the diagonal of a morphism of algebraic spaces.

Lemma 49.4.1. *Let S be a scheme contained in Sch_{fppf} . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\Delta_{X/Y} : X \rightarrow X \times_Y X$ be the diagonal morphism. Then*

- (1) $\Delta_{X/Y}$ is representable,
- (2) $\Delta_{X/Y}$ is locally of finite type,
- (3) $\Delta_{X/Y}$ is a monomorphism,
- (4) $\Delta_{X/Y}$ is separated, and
- (5) $\Delta_{X/Y}$ is locally quasi-finite.

Proof. We are going to use the fact that $\Delta_{X/S}$ is representable (by definition of an algebraic space) and that it satisfies properties (2) – (5), see Spaces, Lemma 47.13.1. Note that we have a factorization

$$X \longrightarrow X \times_Y X \longrightarrow X \times_S X$$

of the diagonal $\Delta_{X/S} : X \rightarrow X \times_S X$. Since $X \times_Y X \rightarrow X \times_S X$ is a monomorphism, and since $\Delta_{X/S}$ is representable, it follows formally that $\Delta_{X/Y}$ is representable. In particular, the rest of the statements now make sense, see Section 49.3.

Choose a surjective étale morphism $U \rightarrow X$, with U a scheme. Consider the diagram

$$\begin{array}{ccccc} R = U \times_X U & \longrightarrow & U \times_Y U & \longrightarrow & U \times_S U \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & X \times_Y X & \longrightarrow & X \times_S X \end{array}$$

Both squares are cartesian, hence so is the outer rectangle. The top row consists of schemes, and the vertical arrows are surjective étale morphisms. By Spaces, Lemma 47.11.2 the properties (2) – (5) for $\Delta_{X/Y}$ are equivalent to those of $R \rightarrow U \times_Y U$. In the proof of Spaces, Lemma 47.13.1 we have seen that $R \rightarrow U \times_S U$ has properties (2) – (5). The morphism $U \times_Y U \rightarrow U \times_S U$ is a monomorphism of schemes. These facts imply that $R \rightarrow U \times_Y U$ have properties (2) – (5).

Namely: For (3), note that $R \rightarrow U \times_Y U$ is a monomorphism as the composition $R \rightarrow U \times_S U$ is a monomorphism. For (2), note that $R \rightarrow U \times_Y U$ is locally of finite type, as the composition $R \rightarrow U \times_S U$ is locally of finite type (Morphisms, Lemma 28.16.8). A monomorphism which is locally of finite type is locally quasi-finite because it has finite fibres (Morphisms, Lemma 28.21.7), hence (5). A monomorphism is separated (Schemes, Lemma 25.23.3), hence (4). \square

Definition 49.4.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\Delta_{X/Y} : X \rightarrow X \times_Y X$ be the diagonal morphism.

- (1) We say f is *separated* if $\Delta_{X/Y}$ is a closed immersion.
- (2) We say f is *locally separated*¹ if $\Delta_{X/Y}$ is an immersion.
- (3) We say f is *quasi-separated* if $\Delta_{X/Y}$ is quasi-compact.

This definition makes sense since $\Delta_{X/Y}$ is representable, and hence we know what it means for it to have one of the properties described in the definition. We will see below (Lemma 49.4.13) that this definition matches the ones we already have for morphisms of schemes and representable morphisms.

Lemma 49.4.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is separated, then f is locally separated and f is quasi-separated.*

Proof. This is true, via the general principle Spaces, Lemma 47.5.8, because a closed immersion of schemes is an immersion and is quasi-compact. \square

Lemma 49.4.4. *All of the separation axioms listed in Definition 49.4.2 are stable under base change.*

Proof. Let $f : X \rightarrow Y$ and $Y' \rightarrow Y$ be morphisms of algebraic spaces. Let $f' : X' \rightarrow Y'$ be the base change of f by $Y' \rightarrow Y$. Then $\Delta_{X'/Y'}$ is the base change of $\Delta_{X/Y}$ by the morphism $X' \times_{Y'} X' \rightarrow X \times_Y X$. By the results of Section 49.3 each of the properties of the diagonal used in Definition 49.4.2 is stable under base change. Hence the lemma is true. \square

Lemma 49.4.5. *Let S be a scheme. Let $f : X \rightarrow Z$, $g : Y \rightarrow Z$ and $Z \rightarrow T$ be morphisms of algebraic spaces over S . Consider the induced morphism $i : X \times_Z Y \rightarrow X \times_T Y$. Then*

- (1) i is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,
- (2) if $Z \rightarrow T$ is locally separated, then i is an immersion,
- (3) if $Z \rightarrow T$ is separated, then i is a closed immersion, and
- (4) if $Z \rightarrow T$ is quasi-separated, then i is quasi-compact.

Proof. By general category theory the following diagram

$$\begin{array}{ccc} X \times_Z Y & \xrightarrow{i} & X \times_T Y \\ \downarrow & & \downarrow \\ Z & \xrightarrow{\Delta_{Z/T}} & Z \times_T Z \end{array}$$

is a fibre product diagram. Hence i is the base change of the diagonal morphism $\Delta_{Z/T}$. Thus the lemma follows from Lemma 49.4.1, and the material in Section 49.3. \square

¹In the literature this term often refers to quasi-separated and locally separated morphisms.

Lemma 49.4.6. *Let S be a scheme. Let T be an algebraic space over S . Let $g : X \rightarrow Y$ be a morphism of algebraic spaces over T . Consider the graph $i : X \rightarrow X \times_T Y$ of g . Then*

- (1) *i is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,*
- (2) *if $Y \rightarrow T$ is locally separated, then i is an immersion,*
- (3) *if $Y \rightarrow T$ is separated, then i is a closed immersion, and*
- (4) *if $Y \rightarrow T$ is quasi-separated, then i is quasi-compact.*

Proof. This is a special case of Lemma 49.4.5 applied to the morphism $X = X \times_Y Y \rightarrow X \times_T Y$. \square

Lemma 49.4.7. *Let S be a scheme. Let $f : X \rightarrow T$ be a morphism of algebraic spaces over S . Let $s : T \rightarrow X$ be a section of f (in a formula $f \circ s = \text{id}_T$). Then*

- (1) *s is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,*
- (2) *if f is locally separated, then s is an immersion,*
- (3) *if f is separated, then s is a closed immersion, and*
- (4) *if f is quasi-separated, then s is quasi-compact.*

Proof. This is a special case of Lemma 49.4.6 applied to $g = s$ so the morphism $i = s : T \rightarrow T \times_T X$. \square

Lemma 49.4.8. *All of the separation axioms listed in Definition 49.4.2 are stable under composition of morphisms.*

Proof. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces to which the axiom in question applies. The diagonal $\Delta_{X/Z}$ is the composition

$$X \longrightarrow X \times_Y X \longrightarrow X \times_Z X.$$

Our separation axiom is defined by requiring the diagonal to have some property \mathcal{P} . By Lemma 49.4.5 above we see that the second arrow also has this property. Hence the lemma follows since the composition of (representable) morphisms with property \mathcal{P} also is a morphism with property \mathcal{P} , see Section 49.3. \square

Lemma 49.4.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .*

- (1) *If Y is separated and f is separated, then X is separated.*
- (2) *If Y is quasi-separated and f is quasi-separated, then X is quasi-separated.*
- (3) *If Y is locally separated and f is locally separated, then X is locally separated.*
- (4) *If Y is separated over S and f is separated, then X is separated over S .*
- (5) *If Y is quasi-separated over S and f is quasi-separated, then X is quasi-separated over S .*
- (6) *If Y is locally separated over S and f is locally separated, then X is locally separated over S .*

Proof. Parts (4), (5), and (6) follow immediately from Lemma 49.4.8 and Spaces, Definition 47.13.2. Parts (1), (2), and (3) reduce to parts (4), (5), and (6) by thinking of X and Y as algebraic spaces over $\text{Spec}(\mathbf{Z})$, see Properties of Spaces, Definition 48.3.1. \square

Lemma 49.4.10. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces over S .*

- (1) *If $g \circ f$ is separated then so is f .*
- (2) *If $g \circ f$ is locally separated then so is f .*
- (3) *If $g \circ f$ is quasi-separated then so is f .*

Proof. Consider the factorization

$$X \rightarrow X \times_Y X \rightarrow X \times_Z X$$

of the diagonal morphism of $g \circ f$. In any case the last morphism is a monomorphism. Hence for any scheme T and morphism $T \rightarrow X \times_Y X$ we have the equality

$$X \times_{(X \times_Y X)} T = X \times_{(X \times_Z X)} T.$$

Hence the result is clear. \square

Lemma 49.4.11. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If X is separated then X is separated over S .*
- (2) *If X is locally separated then X is locally separated over S .*
- (3) *If X is quasi-separated then X is quasi-separated over S .*

Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (4) *If X is separated over S then f is separated.*
- (5) *If X is locally separated over S then f is locally separated.*
- (6) *If X is quasi-separated over S then f is quasi-separated.*

Proof. Parts (4), (5), and (6) follow immediately from Lemma 49.4.10 and Spaces, Definition 47.13.2. Parts (1), (2), and (3) follow from parts (4), (5), and (6) by thinking of X and Y as algebraic spaces over $\text{Spec}(\mathbf{Z})$, see Properties of Spaces, Definition 48.3.1. \square

Lemma 49.4.12. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{P} be any of the separation axioms of Definition 49.4.2. The following are equivalent*

- (1) *f is \mathcal{P} ,*
- (2) *for every scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is \mathcal{P} ,*
- (3) *for every affine scheme Z and every morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is \mathcal{P} ,*
- (4) *for every affine scheme Z and every morphism $Z \rightarrow Y$ the algebraic space $Z \times_Y X$ is \mathcal{P} (see Properties of Spaces, Definition 48.3.1),*
- (5) *there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_Y X \rightarrow V$ has \mathcal{P} , and*
- (6) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ has \mathcal{P} .*

Proof. We will repeatedly use Lemma 49.4.4 without further mention. In particular, it is clear that (1) implies (2) and (2) implies (3).

Let us prove that (3) and (4) are equivalent. Note that if Z is an affine scheme, then the morphism $Z \rightarrow \text{Spec}(\mathbf{Z})$ is a separated morphism as a morphism of algebraic spaces over $\text{Spec}(\mathbf{Z})$. If $Z \times_Y X \rightarrow Z$ is \mathcal{P} , then $Z \times_Y X \rightarrow \text{Spec}(\mathbf{Z})$ is \mathcal{P} as a composition (see Lemma 49.4.8). Hence the algebraic space $Z \times_Y X$ is \mathcal{P} .

Conversely, if the algebraic space $Z \times_Y X$ is \mathcal{P} , then $Z \times_Y X \rightarrow \mathrm{Spec}(\mathbf{Z})$ is \mathcal{P} , and hence by Lemma 49.4.10 we see that $Z \times_Y X \rightarrow Z$ is \mathcal{P} .

Let us prove that (3) implies (5). Assume (3). Let V be a scheme and let $V \rightarrow Y$ be étale surjective. We have to show that $V \times_Y X \rightarrow V$ has property \mathcal{P} . In other words, we have to show that the morphism

$$V \times_Y X \longrightarrow (V \times_Y X) \times_V (V \times_Y X) = V \times_Y X \times_Y X$$

has the corresponding property (i.e., is a closed immersion, immersion, or quasi-compact). Let $V = \bigcup V_j$ be an affine open covering of V . By assumption we know that each of the morphisms

$$V_j \times_Y X \longrightarrow V_j \times_Y X \times_Y X$$

does have the corresponding property. Since being a closed immersion, immersion, quasi-compact immersion, or quasi-compact is Zariski local on the target, and since the V_j cover V we get the desired conclusion.

Let us prove that (5) implies (1). Let $V \rightarrow Y$ be as in (5). Then we have the fibre product diagram

$$\begin{array}{ccc} V \times_Y X & \longrightarrow & X \\ \downarrow & & \downarrow \\ V \times_Y X \times_Y X & \longrightarrow & X \times_Y X \end{array}$$

By assumption the left vertical arrow is a closed immersion, immersion, quasi-compact immersion, or quasi-compact. It follows from Spaces, Lemma 47.5.6 that also the right vertical arrow is a closed immersion, immersion, quasi-compact immersion, or quasi-compact.

It is clear that (1) implies (6) by taking the covering $Y = \bigcup Y_i$. Assume $Y = \bigcup Y_i$ is as in (6). Choose schemes V_i and surjective étale morphisms $V_i \rightarrow Y_i$. Note that the morphisms $V_i \times_Y X \rightarrow V_i$ have \mathcal{P} as they are base changes of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$. Set $V = \coprod V_i$. Then $V \rightarrow Y$ is a morphism as in (5) (details omitted). Hence (6) implies (5) and we are done. \square

Lemma 49.4.13. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S .*

- (1) *The morphism f is locally separated.*
- (2) *The morphism f is (quasi-)separated in the sense of Definition 49.4.2 above if and only if f is (quasi-)separated in the sense of Section 49.3.*

In particular, if $f : X \rightarrow Y$ is a morphism of schemes over S , then f is (quasi-)separated in the sense of Definition 49.4.2 if and only if f is (quasi-)separated as a morphism of schemes.

Proof. This is the equivalence of (1) and (2) of Lemma 49.4.12 combined with the fact that any morphism of schemes is locally separated, see Schemes, Lemma 25.21.2. \square

49.5. Surjective morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be surjective.

Lemma 49.5.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is surjective if and only if $|f| : |X| \rightarrow |Y|$ is surjective.*

Proof. Namely, if $f : X \rightarrow Y$ is representable, then it is surjective if and only if for every scheme T and every morphism $T \rightarrow Y$ the base change $f_T : T \times_Y X \rightarrow T$ of f is a surjective morphism of schemes, in other words, if and only if $|f_T|$ is surjective. By Properties of Spaces, Lemma 48.4.3 the map $|T \times_Y X| \rightarrow |T| \times_{|Y|} |X|$ is always surjective. Hence $|f_T| : |T \times_Y X| \rightarrow |T|$ is surjective if $|f| : |X| \rightarrow |Y|$ is surjective. Conversely, if $|f_T|$ is surjective for every $T \rightarrow Y$ as above, then by taking T to be the spectrum of a field we conclude that $|X| \rightarrow |Y|$ is surjective. \square

This clears the way for the following definition.

Definition 49.5.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *surjective* if the map $|f| : |X| \rightarrow |Y|$ of associated topological spaces is surjective.

Lemma 49.5.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is surjective,
- (2) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is surjective,
- (3) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is surjective,
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a surjective morphism,
- (5) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is surjective,
- (6) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are surjective étale such that the top horizontal arrow is surjective, and

- (7) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is surjective.

Proof. Omitted. \square

Lemma 49.5.4. *The composition of surjective morphisms is surjective.*

Proof. This is immediate from the definition. \square

Lemma 49.5.5. *The base change of a surjective morphism is surjective.*

Proof. Follows immediately from Properties of Spaces, Lemma 48.4.3. \square

49.6. Open morphisms

For a representable morphism of algebraic spaces we have already defined (in Section 49.3) what it means to be universally open. Hence before we give the natural definition we check that it agrees with this in the representable case.

Lemma 49.6.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . The following are equivalent*

- (1) f is universally open, and
- (2) for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces $|Z \times_Y X| \rightarrow |Z|$ is open.

Proof. Assume (1), and let $Z \rightarrow Y$ be as in (2). Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. By assumption the morphism of schemes $V \times_Y X \rightarrow V$ is universally open. By Properties of Spaces, Section 48.4 in the commutative diagram

$$\begin{array}{ccc} |V \times_Y X| & \longrightarrow & |Z \times_Y X| \\ \downarrow & & \downarrow \\ |V| & \longrightarrow & |Z| \end{array}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_Y X| \longrightarrow |V| \times_{|Z|} |Z \times_Y X|$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication (2) \Rightarrow (1) is immediate from the definitions. \square

Thus we may use the following natural definition.

Definition 49.6.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *open* if the map of topological spaces $|f| : |X| \rightarrow |Y|$ is open.
- (2) We say f is *universally open* if for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces

$$|Z \times_Y X| \rightarrow |Z|$$

is open, i.e., the base change $Z \times_Y X \rightarrow Z$ is open.

Note that an étale morphism of algebraic spaces is universally open, see Properties of Spaces, Definition 48.13.2 and Lemmas 48.13.7 and 48.13.5.

Lemma 49.6.3. *The base change of a universally open morphism of algebraic spaces by any morphism of algebraic spaces is universally open.*

Proof. This is immediate from the definition. \square

Lemma 49.6.4. *The composition of a pair of (universally) open morphisms of algebraic spaces is (universally) open.*

Proof. Omitted. \square

Lemma 49.6.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is universally open,
- (2) for every scheme Z and every morphism $Z \rightarrow Y$ the projection $|Z \times_Y X| \rightarrow |Z|$ is open,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the projection $|Z \times_Y X| \rightarrow |Z|$ is open, and
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a universally open morphism of algebraic spaces, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is universally open.

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).

Assume (3). Choose a surjective étale morphism $V \rightarrow Y$. We are going to show that $V \times_Y X \rightarrow V$ is a universally open morphism of algebraic spaces. Let $Z \rightarrow V$ be a morphism from an algebraic space to V . Let $W \rightarrow Z$ be a surjective étale morphism where $W = \coprod W_i$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 48.6.1. Then we have the following commutative diagram

$$\begin{array}{ccccccc}
 \coprod_i |W_i \times_Y X| & \xlongequal{\quad} & |W \times_Y X| & \longrightarrow & |Z \times_Y X| & \xlongequal{\quad} & |Z \times_V (V \times_Y X)| \\
 \downarrow & & \downarrow & & \downarrow & & \swarrow \\
 \coprod |W_i| & \xlongequal{\quad} & |W| & \longrightarrow & |Z| & &
 \end{array}$$

We have to show the south-east arrow is open. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 48.13.7). By assumption (3), and the fact that W_i is affine we see that the left vertical arrows are open. Hence it follows that the right vertical arrow is open.

Assume $V \rightarrow Y$ is as in (4). We will show that f is universally open. Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Consider the diagram

$$\begin{array}{ccccc}
 |(V \times_Y Z) \times_V (V \times_Y X)| & \xlongequal{\quad} & |V \times_Y X| & \longrightarrow & |Z \times_Y X| \\
 & \searrow & \downarrow & & \downarrow \\
 & & |V \times_Y Z| & \longrightarrow & |Z|
 \end{array}$$

The south-west arrow is open by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 48.13.7). It follows that the right vertical arrow is open.

Of course (1) implies (5) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (5). Then for any $Z \rightarrow Y$ we get a corresponding Zariski covering $Z = \bigcup Z_i$ such that the base change of f to Z_i is open. By a simple topological argument this implies that $Z \times_Y X \rightarrow Z$ is open. Hence (1) holds. \square

Lemma 49.6.6. *Let S be a scheme. Let $p : X \rightarrow \text{Spec}(k)$ be a morphism of algebraic spaces over S where k is a field. Then $p : X \rightarrow \text{Spec}(k)$ is universally open.*

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. The composition $U \rightarrow \text{Spec}(k)$ is universally open (as a morphism of schemes) by Morphisms, Lemma 28.24.4. Let $Z \rightarrow \text{Spec}(k)$ be a morphism of schemes. Then

$U \times_{\mathrm{Spec}(k)} Z \rightarrow X \times_{\mathrm{Spec}(k)} Z$ is surjective, see Lemma 49.5.5. Hence the first of the maps

$$|U \times_{\mathrm{Spec}(k)} Z| \rightarrow |X \times_{\mathrm{Spec}(k)} Z| \rightarrow |Z|$$

is surjective. Since the composition is open by the above we conclude that the second map is open as well. Whence p is universally open by Lemma 49.6.5. \square

49.7. Submersive morphisms

Definition 49.7.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *submersive*² if the continuous map $|X| \rightarrow |Y|$ is submersive, see Topology, Definition 5.5.3.
- (2) We say f is *universally submersive* if for every morphism of algebraic spaces $Y' \rightarrow Y$ the base change $Y' \times_Y X \rightarrow Y'$ is submersive.

We note that a submersive morphism is in particular surjective.

49.8. Quasi-compact morphisms

By Section 49.3 we know what it means for a representable morphism of algebraic spaces to be quasi-compact. In order to formulate the definition for a general morphism of algebraic spaces we make the following observation.

Lemma 49.8.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is quasi-compact, and
- (2) for every quasi-compact algebraic space Z and any morphism $Z \rightarrow Y$ the algebraic space $Z \times_Y X$ is quasi-compact.

Proof. Assume (1), and let $Z \rightarrow Y$ be a morphism of algebraic spaces with Z quasi-compact. By Properties of Spaces, Definition 48.5.1 there exists a quasi-compact scheme U and a surjective étale morphism $U \rightarrow Z$. Since f is representable and quasi-compact we see by definition that $U \times_Y X$ is a scheme, and that $U \times_Y X \rightarrow U$ is quasi-compact. Hence $U \times_Y X$ is a quasi-compact scheme. The morphism $U \times_Y X \rightarrow Z \times_Y X$ is étale and surjective (as the base change of the representable étale and surjective morphism $U \rightarrow Z$, see Section 49.3). Hence by definition $Z \times_Y X$ is quasi-compact.

Assume (2). Let $Z \rightarrow Y$ be a morphism, where Z is a scheme. We have to show that $p : Z \times_Y X \rightarrow Z$ is quasi-compact. Let $U \subset Z$ be affine open. Then $p^{-1}(U) = U \times_Y X$ and the scheme $U \times_Y X$ is quasi-compact by assumption (2). Hence p is quasi-compact, see Schemes, Section 25.19. \square

This motivates the following definition.

Definition 49.8.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *quasi-compact* if for every quasi-compact algebraic space Z and morphism $Z \rightarrow Y$ the fibre product $Z \times_Y X$ is quasi-compact.

By Lemma 49.8.1 above this agrees with the already existing notion for representable morphisms of algebraic spaces.

²This is very different from the notion of a submersion of differential manifolds.

Lemma 49.8.3. *The base change of a quasi-compact morphism of algebraic spaces by any morphism of algebraic spaces is quasi-compact.*

Proof. Omitted. Hint: Transitivity of fibre products. \square

Lemma 49.8.4. *The composition of a pair of quasi-compact morphisms of algebraic spaces is quasi-compact.*

Proof. Omitted. Hint: Transitivity of fibre products. \square

Lemma 49.8.5. *Let S be a scheme.*

- (1) *If $X \rightarrow Y$ is a surjective morphism of algebraic spaces over S , and X is quasi-compact then Y is quasi-compact.*
- (2) *If*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

is a commutative diagram of morphisms of algebraic spaces over S and f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Assume X is quasi-compact and $X \rightarrow Y$ is surjective. By Definition 49.5.2 the map $|X| \rightarrow |Y|$ is surjective, hence we see Y is quasi-compact by Properties of Spaces, Lemma 48.5.2 and the topological fact that the image of a quasi-compact space under a continuous map is quasi-compact, see Topology, Lemma 5.11.7. Let f, p, q be as in (2). Let $T \rightarrow Z$ be a morphism whose source is a quasi-compact algebraic space. By assumption $T \times_Z X$ is quasi-compact. By Lemma 49.5.5 the morphism $T \times_Z X \rightarrow T \times_Z Y$ is surjective. Hence by part (1) we see $T \times_Z Y$ is quasi-compact too. Thus q is quasi-compact. \square

Lemma 49.8.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $g : Y' \rightarrow Y$ be a universally open and surjective morphism of algebraic spaces such that the base change $f' : X' \rightarrow Y'$ is quasi-compact. Then f is quasi-compact.*

Proof. Let $Z \rightarrow Y$ be a morphism of algebraic spaces with Z quasi-compact. As g is universally open and surjective, we see that $Y' \times_Y Z \rightarrow Z$ is open and surjective. As every point of $|Y' \times_Y Z|$ has a fundamental system of quasi-compact open neighbourhoods (see Properties of Spaces, Lemma 48.5.5) we can find a quasi-compact open $W \subset |Y' \times_Y Z|$ which surjects onto Z . Denote $f'' : W \times_Y X \rightarrow W$ the base change of f' by $W \rightarrow Y'$. By assumption $W \times_Y X$ is quasi-compact. As $W \rightarrow Z$ is surjective we see that $W \times_Y X \rightarrow Z \times_Y X$ is surjective. Hence $Z \times_Y X$ is quasi-compact by Lemma 49.8.5. Thus f is quasi-compact. \square

Lemma 49.8.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) *f is quasi-compact,*
- (2) *for every scheme Z and any morphism $Z \rightarrow Y$ the morphism of algebraic spaces $Z \times_Y X \rightarrow Z$ is quasi-compact,*
- (3) *for every affine scheme Z and any morphism $Z \rightarrow Y$ the algebraic space $Z \times_Y X$ is quasi-compact,*

- (4) *there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a quasi-compact morphism of algebraic spaces, and*
- (5) *there exists a surjective étale morphism $Y' \rightarrow Y$ of algebraic spaces such that $Y' \times_Y X \rightarrow Y'$ is a quasi-compact morphism of algebraic spaces, and*
- (6) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is quasi-compact.*

Proof. We will use Lemma 49.8.3 without further mention. It is clear that (1) implies (2) and that (2) implies (3). Assume (3). Let Z be a quasi-compact algebraic space over S , and let $Z \rightarrow Y$ be a morphism. By Properties of Spaces, Lemma 48.6.3 there exists an affine scheme U and a surjective étale morphism $U \rightarrow Z$. Then $U \times_Y X \rightarrow Z \times_Y X$ is a surjective morphism of algebraic spaces, see Lemma 49.5.5. By assumption $|U \times_Y X|$ is quasi-compact. It surjects onto $|Z \times_Y X|$, hence we conclude that $|Z \times_Y X|$ is quasi-compact, see Topology, Lemma 5.11.7. This proves that (3) implies (1).

The implications (1) \Rightarrow (4), (4) \Rightarrow (5) are clear. The implication (5) \Rightarrow (1) follows from Lemma 49.8.6 and the fact that an étale morphism of algebraic spaces is universally open (see discussion following Definition 49.6.2).

Of course (1) implies (6) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (6). Let Z be affine and let $Z \rightarrow Y$ be a morphism. Then there exists a finite standard affine covering $Z = Z_1 \cup \dots \cup Z_n$ such that each $Z_j \rightarrow Y$ factors through Y_{i_j} for some i_j . Hence the algebraic space

$$Z_j \times_Y X = Z_j \times_{Y_{i_j}} f^{-1}(Y_{i_j})$$

is quasi-compact. Since $Z \times_Y X = \bigcup_{j=1, \dots, n} Z_j \times_Y X$ is a Zariski covering we see that $|Z \times_Y X| = \bigcup_{j=1, \dots, n} |Z_j \times_Y X|$ (see Properties of Spaces, Lemma 48.4.8) is a finite union of quasi-compact spaces, hence quasi-compact. Thus we see that (6) implies (3). \square

The following (and the next) lemma guarantees in particular that a morphism $X \rightarrow \text{Spec}(A)$ is quasi-compact as soon as X is a quasi-compact algebraic space

Lemma 49.8.8. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces over S . If $g \circ f$ is quasi-compact and g is quasi-separated then f is quasi-compact.*

Proof. This is true because f equals the composition $(1, f) : X \rightarrow X \times_Z Y \rightarrow Y$. The first map is quasi-compact by Lemma 49.4.7 because it is a section of the quasi-separated morphism $X \times_Z Y \rightarrow X$ (a base change of g , see Lemma 49.4.4). The second map is quasi-compact as it is the base change of f , see Lemma 49.8.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 49.8.4. \square

Lemma 49.8.9. *Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over a scheme S .*

- (1) *If X is quasi-compact and Y is quasi-separated, then f is quasi-compact.*
- (2) *If X is quasi-compact and quasi-separated and Y is quasi-separated, then f is quasi-compact and quasi-separated.*
- (3) *A fibre product of quasi-compact and quasi-separated algebraic spaces is quasi-compact and quasi-separated.*

Proof. Part (1) follows from Lemma 49.8.8 with $Z = S = \text{Spec}(\mathbf{Z})$. Part (2) follows from (1) and Lemma 49.4.10. For (3) let $X \rightarrow Y$ and $Z \rightarrow Y$ be morphisms of quasi-compact and quasi-separated algebraic spaces. Then $X \times_Y Z \rightarrow Z$ is quasi-compact and quasi-separated as a base change of $X \rightarrow Y$ using (2) and Lemmas 49.8.3 and 49.4.4. Hence $X \times_Y Z$ is quasi-compact and quasi-separated as an algebraic space quasi-compact and quasi-separated over Z , see Lemmas 49.4.9 and 49.8.4. \square

49.9. Universally closed morphisms

For a representable morphism of algebraic spaces we have already defined (in Section 49.3) what it means to be universally closed. Hence before we give the natural definition we check that it agrees with this in the representable case.

Lemma 49.9.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . The following are equivalent*

- (1) f is universally closed, and
- (2) for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces $|Z \times_Y X| \rightarrow |Z|$ is closed.

Proof. Assume (1), and let $Z \rightarrow Y$ be as in (2). Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. By assumption the morphism of schemes $V \times_Y X \rightarrow V$ is universally closed. By Properties of Spaces, Section 48.4 in the commutative diagram

$$\begin{array}{ccc} |V \times_Y X| & \longrightarrow & |Z \times_Y X| \\ \downarrow & & \downarrow \\ |V| & \longrightarrow & |Z| \end{array}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_Y X| \longrightarrow |V| \times_{|Y|} |Z \times_Y X|$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication (2) \Rightarrow (1) is immediate from the definitions. \square

Thus we may use the following natural definition.

Definition 49.9.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *closed* if the map of topological spaces $|X| \rightarrow |Y|$ is closed.
- (2) We say f is *universally closed* if for every morphism of algebraic spaces $Z \rightarrow Y$ the morphism of topological spaces

$$|Z \times_Y X| \rightarrow |Z|$$

is closed, i.e., the base change $Z \times_Y X \rightarrow Z$ is closed.

Lemma 49.9.3. *The base change of a universally closed morphism of algebraic spaces by any morphism of algebraic spaces is universally closed.*

Proof. This is immediate from the definition. \square

Lemma 49.9.4. *The composition of a pair of (universally) closed morphisms of algebraic spaces is (universally) closed.*

Proof. Omitted. □

Lemma 49.9.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is universally closed,
- (2) for every scheme Z and every morphism $Z \rightarrow Y$ the projection $|Z \times_Y X| \rightarrow |Z|$ is closed,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the projection $|Z \times_Y X| \rightarrow |Z|$ is closed,
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a universally closed morphism of algebraic spaces, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is universally closed.

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).

Assume (3). Choose a surjective étale morphism $V \rightarrow Y$. We are going to show that $V \times_Y X \rightarrow V$ is a universally closed morphism of algebraic spaces. Let $Z \rightarrow V$ be a morphism from an algebraic space to V . Let $W \rightarrow Z$ be a surjective étale morphism where $W = \coprod W_i$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 48.6.1. Then we have the following commutative diagram

$$\begin{array}{ccccc}
 \coprod_i |W_i \times_Y X| & \xlongequal{\quad} & |W \times_Y X| & \longrightarrow & |Z \times_Y X| \xlongequal{\quad} |Z \times_V (V \times_Y X)| \\
 \downarrow & & \downarrow & & \downarrow \swarrow \\
 \coprod_i |W_i| & \xlongequal{\quad} & |W| & \longrightarrow & |Z|
 \end{array}$$

We have to show the south-east arrow is closed. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 48.13.7). By assumption (3), and the fact that W_i is affine we see that the left vertical arrows are closed. Hence it follows that the right vertical arrow is closed.

Assume (4). We will show that f is universally closed. Let $Z \rightarrow Y$ be a morphism of algebraic spaces. Consider the diagram

$$\begin{array}{ccc}
 |(V \times_Y Z) \times_V (V \times_Y X)| & \xlongequal{\quad} & |V \times_Y X| \longrightarrow |Z \times_Y X| \\
 \searrow & & \downarrow \qquad \qquad \downarrow \\
 & & |V \times_Y Z| \longrightarrow |Z|
 \end{array}$$

The south-west arrow is closed by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 48.13.7). It follows that the right vertical arrow is closed.

Of course (1) implies (5) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (5). Then for any $Z \rightarrow Y$ we get a corresponding Zariski covering $Z = \bigcup Z_i$ such that the base change of f to Z_i is closed. By a simple topological argument this implies that $Z \times_Y X \rightarrow Z$ is closed. Hence (1) holds. □

Example 49.9.6. Strange example of a universally closed morphism. Let $\mathbf{Q} \subset k$ be a field of characteristic zero. Let $X = \mathbf{A}_k^1/\mathbf{Z}$ as in Spaces, Example 47.14.8. We claim the structure morphism $p : X \rightarrow \text{Spec}(k)$ is universally closed. Namely, if

Z/k is a scheme, and $T \subset |X \times_k Z|$ is closed, then T corresponds to a \mathbf{Z} -invariant closed subset of $T' \subset |\mathbf{A}^1 \times Z|$. It is easy to see that this implies that T' is the inverse image of a subset T'' of Z . By Morphisms, Lemma 28.26.10 we have that $T'' \subset Z$ is closed. Of course T'' is the image of T . Hence p is universally closed by Lemma 49.9.5.

Lemma 49.9.7. *Let S be a scheme. A universally closed morphism of algebraic spaces over S is quasi-compact.*

Proof. This proof is a repeat of the proof in the case of schemes, see Morphisms, Lemma 28.42.10. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that f is not quasi-compact. Our goal is to show that f is not universally closed. By Lemma 49.8.7 there exists an affine scheme Z and a morphism $Z \rightarrow Y$ such that $Z \times_Y X \rightarrow Z$ is not quasi-compact. To achieve our goal it suffices to show that $Z \times_Y X \rightarrow Z$ is not universally closed, hence we may assume that $Y = \text{Spec}(B)$ for some ring B .

Write $X = \bigcup_{i \in I} X_i$ where the X_i are quasi-compact open subspaces of X . For example, choose a surjective étale morphism $U \rightarrow X$ where U is a scheme, choose an affine open covering $U = \bigcup U_i$ and let $X_i \subset X$ be the image of U_i . We will use later that the morphisms $X_i \rightarrow Y$ are quasi-compact, see Lemma 49.8.8. Let $T = \text{Spec}(B[a_i; i \in I])$. Let $T_i = D(a_i) \subset T$. Let $Z \subset T \times_Y X$ be the reduced closed subspace whose underlying closed set of points is $|T \times_Y Z| \setminus \bigcup_{i \in I} |T_i \times_Y X_i|$, see Properties of Spaces, Lemma 48.9.3. (Note that $T_i \times_Y X_i$ is an open subspace of $T \times_Y X$ as $T_i \rightarrow T$ and $X_i \rightarrow X$ are open immersions, see Spaces, Lemmas 47.12.3 and 47.12.2.) Here is a diagram

$$\begin{array}{ccccc}
 Z & \longrightarrow & T \times_Y X & \xrightarrow{q} & X \\
 & \searrow & \downarrow f_T & & \downarrow f \\
 & & T & \xrightarrow{p} & Y
 \end{array}$$

It suffices to prove that the image $f_T(|Z|)$ is not closed in $|T|$.

We claim there exists a point $y \in Y$ such that there is no affine open neighborhood V of y in Y such that X_V is quasi-compact. If not then we can cover Y with finitely many such V and for each V the morphism $X_V \rightarrow V$ is quasi-compact by Lemma 49.8.8 and then Lemma 49.8.7 implies f quasi-compact, a contradiction. Fix a $y \in Y$ as in the claim.

Let $t \in T$ be the point lying over y with $\kappa(t) = \kappa(y)$ such that $a_i = 1$ in $\kappa(t)$ for all i . Suppose $z \in |Z|$ with $f_T(z) = t$. Then $q(t) \in X_i$ for some i . Hence $f_T(z) \notin T_i$ by construction of Z , which contradicts the fact that $t \in T_i$ by construction. Hence we see that $t \in |T| \setminus f_T(|Z|)$.

Assume $f_T(|Z|)$ is closed in $|T|$. Then there exists an element $g \in B[a_i; i \in I]$ with $f_T(|Z|) \subset V(g)$ but $t \notin V(g)$. Hence the image of g in $\kappa(t)$ is nonzero. In particular some coefficient of g has nonzero image in $\kappa(y)$. Hence this coefficient is invertible on some affine open neighborhood V of y . Let J be the finite set of $j \in I$ such that the variable a_j appears in g . Since X_V is not quasi-compact and each $X_{i,V}$ is quasi-compact, we may choose a point $x \in |X_V| \setminus \bigcup_{j \in J} |X_{j,V}|$. In other words, $x \in |X| \setminus \bigcup_{j \in J} |X_j|$ and x lies above some $v \in V$. Since g has a coefficient that is invertible on V , we can find a point $t' \in T$ lying above v such that $t' \notin V(g)$ and

$t' \in V(a_i)$ for all $i \notin J$. This is true because $V(a_i; i \in I \setminus J) = \text{Spec}(B[a_j; j \in J])$ and the set of points of this scheme lying over v is bijective with $\text{Spec}(\kappa(v)[a_j; j \in J])$ and g restricts to a nonzero element of this polynomial ring by construction. In other words $t' \notin T_i$ for each $i \notin J$. By Properties of Spaces, Lemma 48.4.3 we can find a point z of $X \times_Y T$ mapping to $x \in X$ and to $t' \in T$. Since $x \notin |X_j|$ for $j \in J$ and $t' \notin T_i$ for $i \in I \setminus J$ we see that $z \in |Z|$. On the other hand $f_T(z) = t' \notin V(g)$ which contradicts $f_T(Z) \subset V(g)$. Thus the assumption “ $f_T(|Z|)$ closed” is wrong and we conclude indeed that f_T is not closed as desired. \square

The target of a separated algebraic space under a surjective universally closed morphism is separated.

Lemma 49.9.8. *Let S be a scheme. Let B be an algebraic space over S . Let $f : X \rightarrow Y$ be a surjective universally closed morphism of algebraic spaces over B .*

- (1) *If X is quasi-separated, then Y is quasi-separated.*
- (2) *If X is separated, then Y is separated.*
- (3) *If X is quasi-separated over B , then Y is quasi-separated over B .*
- (4) *If X is separated over B , then Y is separated over B .*

Proof. Parts (1) and (2) are a consequence of (3) and (4) for $S = B = \text{Spec}(\mathbf{Z})$ (see Properties of Spaces, Definition 48.3.1). Consider the commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\Delta_{X/B}} & X \times_B X \\ \downarrow & & \downarrow \\ Y & \xrightarrow{\Delta_{Y/B}} & Y \times_B Y \end{array}$$

The left vertical arrow is surjective (i.e., universally surjective). The right vertical arrow is universally closed as a composition of the universally closed morphisms $X \times_B X \rightarrow X \times_B Y \rightarrow Y \times_B Y$. Hence it is also quasi-compact, see Lemma 49.9.7.

Assume X is quasi-separated over B , i.e., $\Delta_{X/B}$ is quasi-compact. Then if Z is quasi-compact and $Z \rightarrow Y \times_B Y$ is a morphism, then $Z \times_{Y \times_B Y} X \rightarrow Z \times_{Y \times_B Y} Y$ is surjective and $Z \times_{Y \times_B Y} X$ is quasi-compact by our remarks above. We conclude that $\Delta_{Y/B}$ is quasi-compact, i.e., Y is quasi-separated over B .

Assume X is separated over B , i.e., $\Delta_{X/B}$ is a closed immersion. Then if Z is affine, and $Z \rightarrow Y \times_B Y$ is a morphism, then $Z \times_{Y \times_B Y} X \rightarrow Z \times_{Y \times_B Y} Y$ is surjective and $Z \times_{Y \times_B Y} X \rightarrow Z$ is universally closed by our remarks above. We conclude that $\Delta_{Y/B}$ is universally closed. It follows that $\Delta_{Y/B}$ is representable, locally of finite type, a monomorphism (see Lemma 49.4.1) and universally closed, hence a closed immersion, see Étale Morphisms, Lemma 40.7.2 (and also the abstract principle Spaces, Lemma 47.5.8). Thus Y is separated over B . \square

49.10. Monomorphisms

A representable morphism $X \rightarrow Y$ of algebraic spaces is a monomorphism according to Section 49.3 if for every scheme Z and morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is representable by a monomorphism of schemes. This means exactly that $Z \times_Y X \rightarrow Z$ is an injective map of sheaves on $(\text{Sch}/S)_{fppf}$. Since this is supposed to hold for all Z and all maps $Z \rightarrow Y$ this is in turn equivalent to the map $X \rightarrow Y$ being an injective map of sheaves on $(\text{Sch}/S)_{fppf}$. Thus we may define

a monomorphism of a (possibly nonrepresentable³) morphism of algebraic spaces as follows.

Definition 49.10.1. Let S be a scheme. A morphism of algebraic spaces over S is called a *monomorphism* if it is an injective map of sheaves, i.e., a monomorphism in the category of sheaves on $(Sch/S)_{fppf}$.

The following lemma shows that this also means that it is a monomorphism in the category of algebraic spaces over S .

Lemma 49.10.2. *Let S be a scheme. Let $j : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) j is a monomorphism (as in Definition 49.10.1),
- (2) j is a monomorphism in the category of algebraic spaces over S , and
- (3) the diagonal morphism $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is an isomorphism.

Proof. Note that $X \times_Y X$ is both the fibre product in the category of sheaves on $(Sch/S)_{fppf}$ and the fibre product in the category of algebraic spaces over S , see Spaces, Lemma 47.7.3. The equivalence of (1) and (3) is a general characterization of injective maps of sheaves on any site. The equivalence of (2) and (3) is a characterization of monomorphisms in any category with fibre products. \square

Lemma 49.10.3. *A monomorphism of algebraic spaces is separated.*

Proof. This is true because an isomorphism is a closed immersion, and Lemma 49.10.2 above. \square

Lemma 49.10.4. *A composition of monomorphisms is a monomorphism.*

Proof. True because a composition of injective sheaf maps is injective. \square

Lemma 49.10.5. *The base change of a monomorphism is a monomorphism.*

Proof. This is a general fact about fibre products in a category of sheaves. \square

Lemma 49.10.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is a monomorphism,
- (2) for every scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is a monomorphism,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is a monomorphism,
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_Y X \rightarrow V$ is a monomorphism, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is a monomorphism.

Proof. We will use without further mention that a base change of a monomorphism is a monomorphism, see Lemma 49.10.5. In particular it is clear that (1) \Rightarrow (2) \Rightarrow (3) \Rightarrow (4) (by taking V to be a disjoint union of affine schemes étale over Y , see Properties of Spaces, Lemma 48.6.1). Let V be a scheme, and let $V \rightarrow Y$ be

³We do not know whether or not every monomorphism of algebraic spaces is representable. If you do, please email stacks.project@gmail.com.

a surjective étale morphism. If $V \times_Y X \rightarrow V$ is a monomorphism, then it follows that $X \rightarrow Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

$$\begin{array}{ccc} \mathcal{F} & \xrightarrow{a} & \mathcal{G} \\ b \downarrow & & \downarrow c \\ \mathcal{H} & \xrightarrow{d} & \mathcal{I} \end{array} \quad \mathcal{F} = \mathcal{H} \times_{\mathcal{I}} \mathcal{G}$$

if c is a surjection of sheaves, and a is injective, then also d is injective. Thus (4) implies (1). Proof of the equivalence of (5) and (1) is omitted. \square

Lemma 49.10.7. *An immersion of algebraic spaces is a monomorphism. In particular, any immersion is separated.*

Proof. Let $f : X \rightarrow Y$ be an immersion of algebraic spaces. For any morphism $Z \rightarrow Y$ with Z representable the base change $Z \times_Y X \rightarrow Z$ is an immersion of schemes, hence a monomorphism, see Schemes, Lemma 25.23.7. Hence f is representable, and a monomorphism. \square

We will improve on the following lemma in Decent Spaces, Lemma 50.17.1.

Lemma 49.10.8. *Let S be a scheme. Let k be a field and let $Z \rightarrow \text{Spec}(k)$ be a monomorphism of algebraic spaces over S . Then either $Z = \emptyset$ or $Z = \text{Spec}(k)$.*

Proof. By Lemmas 49.10.3 and 49.4.9 we see that Z is a separated algebraic space. Hence there exists an open dense subspace $Z' \subset Z$ which is a scheme, see Properties of Spaces, Proposition 48.10.3. By Schemes, Lemma 25.23.10 we see that either $Z' = \emptyset$ or $Z' \cong \text{Spec}(k)$. In the first case we conclude that $Z = \emptyset$ and in the second case we conclude that $Z' = Z = \text{Spec}(k)$ as $Z \rightarrow \text{Spec}(k)$ is a monomorphism which is an isomorphism over Z' . \square

Lemma 49.10.9. *Let S be a scheme. If $X \rightarrow Y$ is a monomorphism of algebraic spaces over S , then $|X| \rightarrow |Y|$ is injective.*

Proof. Immediate from the definitions. \square

49.11. Pushforward of quasi-coherent sheaves

We first prove a simple lemma that relates pushforward of sheaves of modules for a morphism of algebraic spaces to pushforward of sheaves of modules for a morphism of schemes.

Lemma 49.11.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $U \rightarrow X$ be a surjective étale morphism from a scheme to X . Set $R = U \times_X U$ and denote $t, s : R \rightarrow U$ the projection morphisms as usual. Denote $a : U \rightarrow Y$ and $b : R \rightarrow Y$ the induced morphisms. For any object \mathcal{F} of $\text{Mod}(\mathcal{O}_X)$ there exists an exact sequence*

$$0 \rightarrow f_* \mathcal{F} \rightarrow a_*(\mathcal{F}|_U) \rightarrow b_*(\mathcal{F}|_R)$$

where the second arrow is the difference $t^* - s^*$.

Proof. We denote \mathcal{F} also its extension to a sheaf of modules on $X_{\text{spaces}, \text{étale}}$, see Properties of Spaces, Remark 48.15.4. Let $V \rightarrow Y$ be an object of $Y_{\text{étale}}$. Then $V \times_Y X$ is an object of $X_{\text{spaces}, \text{étale}}$, and by definition $f_* \mathcal{F}(V) = \mathcal{F}(V \times_Y X)$. Since $U \rightarrow X$ is surjective étale, we see that $\{V \times_Y U \rightarrow V \times_Y X\}$ is a covering. Also,

we have $(V \times_Y U) \times_X (V \times_Y U) = V \times_Y R$. Hence, by the sheaf condition of \mathcal{F} on $X_{spaces, \acute{e}tale}$ we have a short exact sequence

$$0 \rightarrow \mathcal{F}(V \times_Y X) \rightarrow \mathcal{F}(V \times_Y U) \rightarrow \mathcal{F}(V \times_Y R)$$

where the second arrow is the difference of restricting via t or s . This exact sequence is functorial in V and hence we obtain the lemma. \square

Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces X and Y over S . By Descent, Proposition 34.7.14 the functor $f_* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Y)$ agrees with the usual functor if we think of X and Y as schemes.

More generally, suppose $f : X \rightarrow Y$ is a representable, quasi-compact, and quasi-separated morphism of algebraic spaces over S . Let V be a scheme and let $V \rightarrow Y$ be an étale surjective morphism. Let $U = V \times_Y X$ and let $f' : U \rightarrow V$ be the base change of f . Then for any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have

$$(49.11.1.1) \quad f'_*(\mathcal{F}|_U) = (f_*\mathcal{F})|_V,$$

see Properties of Spaces, Lemma 48.24.2. And because $f' : U \rightarrow V$ is a quasi-compact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $f'_*(\mathcal{F}|_U)$ by thinking of $\mathcal{F}|_U$ as a quasi-coherent sheaf on the scheme U , and f' as a morphism of schemes. We will frequently use this without further mention.

The next level of generality is to consider an arbitrary quasi-compact and quasi-separated morphism of algebraic spaces.

Lemma 49.11.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is quasi-compact and quasi-separated, then f_* transforms quasi-coherent \mathcal{O}_X -modules into quasi-coherent \mathcal{O}_Y -modules.*

Proof. Let \mathcal{F} be a quasi-coherent sheaf on X . We have to show that $f_*\mathcal{F}$ is a quasi-coherent sheaf on Y . For this it suffices to show that for any affine scheme V and étale morphism $V \rightarrow Y$ the restriction of $f_*\mathcal{F}$ to V is quasi-coherent, see Properties of Spaces, Lemma 48.27.6. Let $f' : V \times_Y X \rightarrow V$ be the base change of f by $V \rightarrow Y$. Note that f' is also quasi-compact and quasi-separated, see Lemmas 49.8.3 and 49.4.4. By (49.11.1.1) we know that the restriction of $f_*\mathcal{F}$ to V is f'_* of the restriction of \mathcal{F} to $V \times_Y X$. Hence we may replace f by f' , and assume that Y is an affine scheme.

Assume Y is an affine scheme. Since f is quasi-compact we see that X is quasi-compact. Thus we may choose an affine scheme U and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 48.6.3. By Lemma 49.11.1 we get an exact sequence

$$0 \rightarrow f_*\mathcal{F} \rightarrow a_*(\mathcal{F}|_U) \rightarrow b_*(\mathcal{F}|_R).$$

where $R = U \times_X U$. As $X \rightarrow Y$ is quasi-separated we see that $R \rightarrow U \times_Y U$ is a quasi-compact monomorphism. This implies that R is a quasi-compact separated scheme (as U and Y are affine at this point). Hence $a : U \rightarrow Y$ and $b : R \rightarrow Y$ are quasi-compact and quasi-separated morphisms of schemes. Thus by Descent, Proposition 34.7.14 the sheaves $a_*(\mathcal{F}|_U)$ and $b_*(\mathcal{F}|_R)$ are quasi-coherent (see also the discussion preceding this lemma). This implies that $f_*\mathcal{F}$ is a kernel of quasi-coherent modules, and hence itself quasi-coherent, see Properties of Spaces, Lemma 48.27.7. \square

Higher direct images are discussed in Cohomology of Spaces, Section 51.3.

49.12. Immersions

Open, closed and locally closed immersions of algebraic spaces were defined in Spaces, Section 47.12. Namely, a morphism of algebraic spaces is a *closed immersion* (resp. *open immersion*, resp. *immersion*) if it is representable and a closed immersion (resp. open immersion, resp. immersion) in the sense of Section 49.3.

In particular these types of morphisms are stable under base change and compositions of morphisms in the category of algebraic spaces over S , see Spaces, Lemmas 47.12.2 and 47.12.3.

Lemma 49.12.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is a closed immersion (resp. open immersion, resp. immersion),
- (2) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is a closed immersion (resp. open immersion, resp. immersion),
- (3) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is a closed immersion (resp. open immersion, resp. immersion),
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a closed immersion (resp. open immersion, resp. immersion), and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is a closed immersion (resp. open immersion, resp. immersion).

Proof. Using that a base change of a closed immersion (resp. open immersion, resp. immersion) is another one it is clear that (1) implies (2) and (2) implies (3). Also (3) implies (4) since we can take V to be a disjoint union of affines, see Properties of Spaces, Lemma 48.6.1.

Assume $V \rightarrow Y$ is as in (4). Let \mathcal{P} be the property closed immersion (resp. open immersion, resp. immersion) of morphisms of schemes. Note that property \mathcal{P} is preserved under any base change and fppf local on the base (see Section 49.3). Moreover, morphisms of type \mathcal{P} are separated and locally quasi-finite (in each of the three cases, see Schemes, Lemma 25.23.7, and Morphisms, Lemma 28.21.15). Hence by More on Morphisms, Lemma 36.37.1 the morphisms of type \mathcal{P} satisfy descent for fppf covering. Thus Spaces, Lemma 47.11.3 applies and we see that $X \rightarrow Y$ is representable and has property \mathcal{P} , in other words (1) holds.

The equivalence of (1) and (5) follows from the fact that \mathcal{P} is Zariski local on the target (since we saw above that \mathcal{P} is in fact fppf local on the target). \square

Lemma 49.12.2. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over S .*

- (1) *If $Z \rightarrow X$ is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism, then $Z \rightarrow Y$ is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism.*
- (2) *If $Z \rightarrow X$ is an immersion and $Y \rightarrow X$ is locally separated, then $Z \rightarrow Y$ is an immersion.*

- (3) If $Z \rightarrow X$ is a closed immersion and $Y \rightarrow X$ is separated, then $Z \rightarrow Y$ is a closed immersion.

Proof. In each case the proof is to contemplate the commutative diagram

$$\begin{array}{ccccc}
 Z & \longrightarrow & Y \times_X Z & \longrightarrow & Z \\
 & \searrow & \downarrow & & \downarrow \\
 & & Y & \longrightarrow & X
 \end{array}$$

where the composition of the top horizontal arrows is the identity. Let us prove (1). The first horizontal arrow is a section of $Y \times_X Z \rightarrow Z$, whence representable, locally of finite type, locally quasi-finite, separated, and a monomorphism by Lemma 49.4.7. The arrow $Y \times_X Z \rightarrow Y$ is a base change of $Z \rightarrow X$ hence is representable, locally of finite type, locally quasi-finite, separated, and a monomorphism (as each of these properties of morphisms of schemes is stable under base change, see Spaces, Remark 47.4.1). Hence the same is true for the composition (as each of these properties of morphisms of schemes is stable under composition, see Spaces, Remark 47.4.2). This proves (1). The other results are proved in exactly the same manner. \square

Lemma 49.12.3. Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Then $|i| : |Z| \rightarrow |X|$ is a homeomorphism onto a locally closed subset, and i is a closed immersion if and only if the image $|i|(|Z|) \subset |X|$ is a closed subset.

Proof. The first statement is Properties of Spaces, Lemma 48.9.1. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By assumption $T = U \times_X Z$ is a scheme and the morphism $j : T \rightarrow U$ is an immersion of schemes. By Lemma 49.12.1 the morphism i is a closed immersion if and only if j is a closed immersion. By Schemes, Lemma 25.10.4 this is true if and only if $j(T)$ is closed in U . However, the subset $j(T) \subset U$ is the inverse image of $|i|(|Z|) \subset |X|$, see Properties of Spaces, Lemma 48.4.3. This finishes the proof. \square

Remark 49.12.4. Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Since i is a monomorphism we may think of $|Z|$ as a subset of $|X|$; in the rest of this remark we do so. Let $\partial|Z|$ be the boundary of $|Z|$ in the topological space $|X|$. In a formula

$$\partial|Z| = \overline{|Z|} \setminus |Z|.$$

Let ∂Z be the reduced closed subspace of X with $|\partial Z| = \partial|Z|$ obtained by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 48.9.5. By construction we see that $|Z|$ is closed in $|X| \setminus |\partial Z| = |X \setminus \partial Z|$. Hence it is true that any immersion of algebraic spaces can be factored as a closed immersion followed by an open immersion (but not the other way in general, see Morphisms, Example 28.3.4).

Remark 49.12.5. Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a locally closed subset. Let ∂T be the boundary of T in the topological space $|X|$. In a formula

$$\partial T = \overline{T} \setminus T.$$

Let $U \subset X$ be the open subspace of X with $|U| = |X| \setminus \partial T$, see Properties of Spaces, Lemma 48.4.8. Let Z be the reduced closed subspace of U with $|Z| = T$ obtained

by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 48.9.5. By construction $Z \rightarrow U$ is a closed immersion of algebraic spaces and $U \rightarrow X$ is an open immersion, hence $Z \rightarrow X$ is an immersion of algebraic spaces over S (see Spaces, Lemma 47.12.2). Note that Z is a reduced algebraic space and that $|Z| = T$ as subsets of $|X|$. We sometimes say Z is the *reduced induced subspace structure* on T .

Lemma 49.12.6. *Let S be a scheme. Let $Z \rightarrow X$ be an immersion of algebraic spaces over S . Assume $Z \rightarrow X$ is quasi-compact. There exists a factorization $Z \rightarrow \bar{Z} \rightarrow X$ where $Z \rightarrow \bar{Z}$ is an open immersion and $\bar{Z} \rightarrow X$ is a closed immersion.*

Proof. Let U be a scheme and let $U \rightarrow X$ be surjective étale. As usual denote $R = U \times_X U$ with projections $s, t : R \rightarrow U$. Set $T = Z \times_U X$. Let $\bar{T} \subset U$ be the scheme theoretic image of $T \rightarrow U$. Note that $s^{-1}\bar{T} = t^{-1}\bar{T}$ as taking scheme theoretic images of quasi-compact morphisms commute with flat base change, see Morphisms, Lemma 28.26.14. Hence we obtain a closed subspace $\bar{Z} \subset X$ whose pullback to U is \bar{T} , see Properties of Spaces, Lemma 48.9.2. By Morphisms, Lemma 28.7.7 the morphism $T \rightarrow \bar{T}$ is an open immersion. It follows that $Z \rightarrow \bar{Z}$ is an open immersion and we win. \square

49.13. Closed immersions

In this section we elucidate some of the results obtained previously on immersions of algebraic spaces. See Spaces, Section 47.12 and Section 49.12 in this chapter. This section is the analogue of Morphisms, Section 28.2 for algebraic spaces.

Lemma 49.13.1. *Let S be a scheme. Let X be an algebraic space over S . For every closed immersion $i : Z \rightarrow X$ the sheaf $i_*\mathcal{O}_Z$ is a quasi-coherent \mathcal{O}_X -module, the map $i^\# : \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective and its kernel is a quasi-coherent sheaf of ideals. The rule $Z \mapsto \text{Ker}(\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z)$ defines an inclusion reversing bijection*

$$\begin{array}{ccc} \text{closed subspaces} & \longrightarrow & \text{quasi-coherent sheaves} \\ Z \subset X & \longrightarrow & \text{of ideals } \mathcal{I} \subset \mathcal{O}_X \end{array}$$

Moreover, given a closed subscheme Z corresponding to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ a morphism of algebraic spaces $h : Y \rightarrow X$ factors through Z if and only if the map $h^*\mathcal{I} \rightarrow h^*\mathcal{O}_X = \mathcal{O}_Y$ is zero.

Proof. Let $U \rightarrow X$ be a surjective étale morphism whose source is a scheme. Consider the diagram

$$\begin{array}{ccc} U \times_X Z & \longrightarrow & Z \\ i' \downarrow & & \downarrow i \\ U & \longrightarrow & X \end{array}$$

By Lemma 49.12.1 we see that i is a closed immersion if and only if i' is a closed immersion. By Properties of Spaces, Lemma 48.24.2 we see that $i'_*\mathcal{O}_{U \times_X Z}$ is the restriction of $i_*\mathcal{O}_Z$ to U . Hence the assertions on $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ are equivalent to the corresponding assertions on $\mathcal{O}_U \rightarrow i'_*\mathcal{O}_{U \times_X Z}$. And since i' is a closed immersion of schemes, these results follow from Morphisms, Lemma 28.2.1.

Let us prove that given a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ the formula

$$Z(\mathcal{I}) = \{h : T \rightarrow X \mid h^*\mathcal{I} \rightarrow \mathcal{O}_T \text{ is zero}\}$$

defines a closed subspace of X . It is clearly a subfunctor of X . To show that $Z \rightarrow X$ is representable by closed immersions, let $\varphi : U \rightarrow X$ be a morphism from a scheme towards X . Then $Z \times_X U$ is represented by the analogous subfunctor of U corresponding to the sheaf of ideals $\text{Im}(\varphi^*\mathcal{I} \rightarrow \mathcal{O}_U)$. By Properties of Spaces, Lemma 48.27.2 the \mathcal{O}_U -module $\varphi^*\mathcal{I}$ is quasi-coherent on U , and hence $\text{Im}(\varphi^*\mathcal{I} \rightarrow \mathcal{O}_U)$ is a quasi-coherent sheaf of ideals on U . By Schemes, Lemma 25.4.6 we conclude that $Z \times_X U$ is represented by the closed subscheme of U associated to $\text{Im}(\varphi^*\mathcal{I} \rightarrow \mathcal{O}_U)$. Thus Z is a closed subspace of X .

In the formula for Z above the inputs T are schemes since algebraic spaces are sheaves on $(\text{Sch}/S)_{\text{fppf}}$. We omit the verification that the same formula remains true if T is an algebraic space. \square

Definition 49.13.2. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset X$ be a closed subspace. The *inverse image* $f^{-1}(Z)$ of the closed subspace Z is the closed subspace $Z \times_X Y$ of Y .

This definition makes sense by Lemma 49.12.1. If $\mathcal{I} \subset \mathcal{O}_X$ is the quasi-coherent sheaf of ideals corresponding to Z via Lemma 49.13.1 then $f^{-1}\mathcal{I}\mathcal{O}_Y = \text{Im}(f^*\mathcal{I} \rightarrow \mathcal{O}_Y)$ is the sheaf of ideals corresponding to $f^{-1}(Z)$.

Lemma 49.13.3. *A closed immersion of algebraic spaces is quasi-compact.*

Proof. This follows from Schemes, Lemma 25.19.5 by general principles, see Spaces, Lemma 47.5.8. \square

Lemma 49.13.4. *A closed immersion of algebraic spaces is separated.*

Proof. This follows from Schemes, Lemma 25.23.7 by general principles, see Spaces, Lemma 47.5.8. \square

Lemma 49.13.5. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S .*

(1) *The functor*

$$i_{\text{small},*} : \text{Sh}(Z_{\text{étale}}) \longrightarrow \text{Sh}(X_{\text{étale}})$$

is fully faithful and its essential image is those sheaves of sets \mathcal{F} on $X_{\text{étale}}$ whose restriction to $X \setminus Z$ is isomorphic to $$, and*

(2) *the functor*

$$i_{\text{small},*} : \text{Ab}(Z_{\text{étale}}) \longrightarrow \text{Ab}(X_{\text{étale}})$$

is fully faithful and its essential image is those abelian sheaves on $X_{\text{étale}}$ whose support is contained in Z .

In both cases i_{small}^{-1} is a left inverse to the functor $i_{\text{small},}$.*

Proof. Let U be a scheme and let $U \rightarrow X$ be surjective étale. Set $V = Z \times_X U$. Then V is a scheme and $i' : V \rightarrow U$ is a closed immersion of schemes. By Properties of Spaces, Lemma 48.15.11 for any sheaf \mathcal{G} on Z we have

$$(i_{\text{small}}^{-1}i_{\text{small},*}\mathcal{G})|_V = (i')_{\text{small}}^{-1}i'_{\text{small},*}(\mathcal{G}|_V)$$

By Étale Cohomology, Proposition 44.47.4 the map $(i')_{\text{small}}^{-1}i'_{\text{small},*}(\mathcal{G}|_V) \rightarrow \mathcal{G}|_V$ is an isomorphism. Since $V \rightarrow Z$ is surjective and étale this implies that $i_{\text{small}}^{-1}i_{\text{small},*}\mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism. This clearly implies that $i_{\text{small},*}$ is fully faithful, see Sites,

Lemma 7.40.1. To prove the statement on the essential image, consider a sheaf of sets \mathcal{F} on $X_{\acute{e}tale}$ whose restriction to $X \setminus Z$ is isomorphic to $*$. As in the proof of Étale Cohomology, Proposition 44.47.4 we consider the adjunction mapping

$$\mathcal{F} \longrightarrow i_{small,*} i_{small}^{-1} \mathcal{F}.$$

As in the first part we see that the restriction of this map to U is an isomorphism by the corresponding result for the case of schemes. Since U is an étale covering of X we conclude it is an isomorphism. \square

The following lemma holds more generally in the setting of a closed immersion of topoi (insert future reference here).

Lemma 49.13.6. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let \mathcal{A} be a sheaf of rings on $X_{\acute{e}tale}$. Let \mathcal{B} be a sheaf of rings on $Z_{\acute{e}tale}$. Let $\varphi : \mathcal{A} \rightarrow i_{small,*} \mathcal{B}$ (or what is the same thing $\varphi : i_{small}^{-1} \mathcal{A} \rightarrow \mathcal{B}$) be a homomorphism of sheaves of rings. Then for any sheaf of \mathcal{A} -modules \mathcal{F} the adjunction mapping $\mathcal{F} \rightarrow i_{small,*} i_{small}^{-1} \mathcal{F}$ induces an isomorphism*

$$\mathcal{F} \otimes_{\mathcal{A}} i_{small,*} \mathcal{B} \longrightarrow i_{small,*} (i_{small}^{-1} \mathcal{F} \otimes_{i_{small}^{-1} \mathcal{A}} \mathcal{B}).$$

Proof. During this proof we drop the subscript *small* from the notation. There is a map $i^{-1} \mathcal{F} \rightarrow i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}$ to which we can apply i_* and compose with the adjunction map:

$$\mathcal{F} \longrightarrow i_*(i^{-1} \mathcal{F}) \longrightarrow i_*(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}).$$

The composition is \mathcal{A} -linear where \mathcal{A} acts on the target via φ . Note that this target $i_*(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B})$ has a canonical $i_* \mathcal{B}$ -module structure. Hence by the universal property of tensor product we obtain a map as in the lemma.

Let \mathcal{G} be a sheaf of $i_* \mathcal{B}$ -modules on $X_{\acute{e}tale}$. Since the support of the sheaf of rings $i_* \mathcal{B}$ is contained in Z we see that the support of \mathcal{G} is contained in Z . Hence by Lemma 49.13.5 we conclude that there exists a unique sheaf of \mathcal{B} -modules \mathcal{H} and an isomorphism $i_* \mathcal{H} = \mathcal{G}$ as $i_* \mathcal{B}$ -modules. To show that the map of the lemma is an isomorphism we show that the right hand side of the arrow satisfies the universal property enjoyed by the tensor product on the left (i.e., we will use Yoneda's lemma, see Categories, Lemma 4.3.5). To see this we have to show that maps into \mathcal{G} agree. This can be seen using the following sequence of canonical isomorphisms

$$\begin{aligned} \mathrm{Hom}_{i_* \mathcal{B}}(\mathcal{F} \otimes_{\mathcal{A}} i_* \mathcal{B}, \mathcal{G}) &= \mathrm{Hom}_{\mathcal{A}}(\mathcal{F}, \mathcal{G}) \\ &= \mathrm{Hom}_{\mathcal{A}}(\mathcal{F}, i_*(\mathcal{H})) \\ &= \mathrm{Hom}_{i^{-1} \mathcal{A}}(i^{-1} \mathcal{F}, \mathcal{H}) \\ &= \mathrm{Hom}_{\mathcal{B}}(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}, \mathcal{H}) \\ &= \mathrm{Hom}_{i_* \mathcal{B}}(i_*(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}), i_* \mathcal{H}) \\ &= \mathrm{Hom}_{i_* \mathcal{B}}(i_*(i^{-1} \mathcal{F} \otimes_{i^{-1} \mathcal{A}} \mathcal{B}), \mathcal{G}) \end{aligned}$$

The fifth equality holds because of the equivalence of categories in Lemma 49.13.5. \square

49.14. Closed immersions and quasi-coherent sheaves

This section is the analogue of Morphisms, Section 28.4.

Lemma 49.14.1. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z .*

- (1) *For any \mathcal{O}_X -module \mathcal{F} the adjunction map $\mathcal{F} \rightarrow i_*i^*\mathcal{F}$ induces an isomorphism $\mathcal{F}/\mathcal{I}\mathcal{F} \cong i_*i^*\mathcal{F}$.*
- (2) *The functor i^* is a left inverse to i_* , i.e., for any \mathcal{O}_Z -module \mathcal{G} the adjunction map $i^*i_*\mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism.*
- (3) *The functor*

$$i_* : QCoh(\mathcal{O}_Z) \longrightarrow QCoh(\mathcal{O}_X)$$

is exact, fully faithful, with essential image those quasi-coherent \mathcal{O}_X -modules \mathcal{F} such that $\mathcal{I}\mathcal{F} = 0$.

Proof. During this proof we work exclusively with sheaves on the small étale sites, and we use i_*, i^{-1}, \dots to denote pushforward and pullback of sheaves of abelian groups instead of $i_{small,*}, i_{small}^{-1}$.

Let \mathcal{F} be an \mathcal{O}_X -module. By Lemma 49.13.6 we see that $i_*i^*\mathcal{F} = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_Z$. By Lemma 49.13.1 we see that we have a short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z \rightarrow 0$$

It follows from properties of the tensor product that $\mathcal{F} \otimes_{\mathcal{O}_X} i_*\mathcal{O}_Z = \mathcal{F}/\mathcal{I}\mathcal{F}$. This proves (1) (except that we omit the verification that the map is induced by the adjunction mapping).

Let \mathcal{G} be any \mathcal{O}_Z -module. By Lemma 49.13.5 we see that $i^{-1}i_*\mathcal{G} = \mathcal{G}$. Hence to prove (2) we have to show that the canonical map $\mathcal{G} \otimes_{i^{-1}\mathcal{O}_X} \mathcal{O}_Z \rightarrow \mathcal{G}$ is an isomorphism. This follows from general properties of tensor products if we can show that $i^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_Z$ is surjective. By Lemma 49.13.5 it suffices to prove that $i_*i^{-1}\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ is surjective. Since the surjective map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ factors through this map we see that (2) holds.

Finally we prove the most interesting part of the lemma, namely part (3). A closed immersion is quasi-compact and separated, see Lemmas 49.13.3 and 49.13.4. Hence Lemma 49.11.2 applies and the pushforward of a quasi-coherent sheaf on Z is indeed a quasi-coherent sheaf on X . Thus we obtain our functor $i_*^{QCoh} : QCoh(\mathcal{O}_Z) \rightarrow QCoh(\mathcal{O}_X)$. It is clear from part (2) that i_*^{QCoh} is fully faithful since it has a left inverse, namely i^* .

Now we turn to the description of the essential image of the functor i_* . It is clear that $\mathcal{I}(i_*\mathcal{G}) = 0$ for any \mathcal{O}_Z -module, since \mathcal{I} is the kernel of the map $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$ which is the map we use to put an \mathcal{O}_X -module structure on $i_*\mathcal{G}$. Next, suppose that \mathcal{F} is any quasi-coherent \mathcal{O}_X -module such that $\mathcal{I}\mathcal{F} = 0$. Then we see that \mathcal{F} is an $i_*\mathcal{O}_Z$ -module because $i_*\mathcal{O}_Z = \mathcal{O}_X/\mathcal{I}$. Hence in particular its support is contained in Z . We apply Lemma 49.13.5 to see that $\mathcal{F} \cong i_*\mathcal{G}$ for some \mathcal{O}_Z -module \mathcal{G} . The only small detail left over is to see why \mathcal{G} is quasi-coherent. This is true because $\mathcal{G} \cong i^*\mathcal{F}$ by part (2) and Properties of Spaces, Lemma 48.27.2. □

Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces. Because of the lemma above we often, by abuse of notation, denote \mathcal{F} the sheaf $i_*\mathcal{F}$ on X .

Lemma 49.14.2. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{G} \subset \mathcal{F}$ be a \mathcal{O}_X -submodule. There exists a unique quasi-coherent \mathcal{O}_X -submodule $\mathcal{G}' \subset \mathcal{G}$ with the following property: For every quasi-coherent \mathcal{O}_X -module \mathcal{H} the map*

$$\mathrm{Hom}_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G}') \longrightarrow \mathrm{Hom}_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G})$$

is bijective. In particular \mathcal{G}' is the largest quasi-coherent \mathcal{O}_X -submodule of \mathcal{F} contained in \mathcal{G} .

Proof. Let \mathcal{G}_a , $a \in A$ be the set of quasi-coherent \mathcal{O}_X -submodules contained in \mathcal{G} . Then the image \mathcal{G}' of

$$\bigoplus_{a \in A} \mathcal{G}_a \longrightarrow \mathcal{F}$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on X is quasi-coherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see Properties of Spaces, Lemma 48.27.7. The module \mathcal{G}' is contained in \mathcal{G} . Hence this is the largest quasi-coherent \mathcal{O}_X -module contained in \mathcal{G} .

To prove the formula, let \mathcal{H} be a quasi-coherent \mathcal{O}_X -module and let $\alpha : \mathcal{H} \rightarrow \mathcal{G}$ be an \mathcal{O}_X -module map. The image of the composition $\mathcal{H} \rightarrow \mathcal{G} \rightarrow \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in \mathcal{G}' . Hence α factors through \mathcal{G}' as desired. \square

Lemma 49.14.3. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . There is a functor⁴ $i^! : \mathrm{QCoh}(\mathcal{O}_X) \rightarrow \mathrm{QCoh}(\mathcal{O}_Z)$ which is a right adjoint to i_* . (Compare Modules, Lemma 17.6.3.)*

Proof. Given quasi-coherent \mathcal{O}_X -module \mathcal{G} we consider the subsheaf $\mathcal{H}_Z(\mathcal{G})$ of local sections annihilated by \mathcal{I} . By Lemma 49.14.2 there is a canonical largest quasi-coherent \mathcal{O}_X -submodule $\mathcal{H}_Z(\mathcal{G})'$. By construction we have

$$\mathrm{Hom}_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{H}_Z(\mathcal{G})') = \mathrm{Hom}_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{G})$$

for any quasi-coherent \mathcal{O}_Z -module \mathcal{F} . Hence we can set $i^!\mathcal{G} = i^*(\mathcal{H}_Z(\mathcal{G})')$. Details omitted. \square

49.15. Supports of modules

In this section we collect some elementary results on supports of quasi-coherent modules on algebraic spaces. Let X be an algebraic space. The support of an abelian sheaf on $X_{\text{étale}}$ has been defined in Properties of Spaces, Section 48.17. We use the same definition for supports of modules. The following lemma tells us this agrees with the notion as defined for quasi-coherent modules on schemes.

Lemma 49.15.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let U be a scheme and let $\varphi : U \rightarrow X$ be an étale morphism. Then*

$$\mathrm{Supp}(\varphi^*\mathcal{F}) = |\varphi|^{-1}(\mathrm{Supp}(\mathcal{F}))$$

where the left hand side is the support of $\varphi^\mathcal{F}$ as a quasi-coherent module on the scheme U .*

⁴This is likely nonstandard notation.

Proof. Let $u \in U$ be a (usual) point and let \bar{x} be a geometric point lying over u . By Properties of Spaces, Lemma 48.27.4 we have $(\varphi^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\bar{x}} = \mathcal{F}_{\bar{x}}$. Since $\mathcal{O}_{U,u} \rightarrow \mathcal{O}_{X,\bar{x}}$ is the strict henselization by Properties of Spaces, Lemma 48.19.1 we see that it is faithfully flat (see More on Algebra, Lemma 15.34.1). Thus we see that $(\varphi^*\mathcal{F})_u = 0$ if and only if $\mathcal{F}_{\bar{x}} = 0$. This proves the lemma. \square

For finite type quasi-coherent modules the support is closed, can be checked on fibres, and commutes with base change.

Lemma 49.15.2. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Then*

- (1) *The support of \mathcal{F} is closed.*
- (2) *For a geometric point \bar{x} lying over $x \in |X|$ we have*

$$x \in \text{Supp}(\mathcal{F}) \Leftrightarrow \mathcal{F}_{\bar{x}} \neq 0 \Leftrightarrow \mathcal{F}_{\bar{x}} \otimes_{\mathcal{O}_{X,\bar{x}}} \kappa(\bar{x}) \neq 0.$$

- (3) *For any morphism of algebraic spaces $f : Y \rightarrow X$ the pullback $f^*\mathcal{F}$ is of finite type as well and we have $\text{Supp}(f^*\mathcal{F}) = f^{-1}(\text{Supp}(\mathcal{F}))$.*

Proof. Choose a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. By Lemma 49.15.1 the inverse image of the support of \mathcal{F} is the support of $\varphi^*\mathcal{F}$ which is closed by Morphisms, Lemma 28.5.3. Thus (1) follows from the definition of the topology on $|X|$.

The first equivalence in (2) is the definition of support. The second equivalence follows from Nakayama's lemma, see Algebra, Lemma 10.19.1.

Let $f : Y \rightarrow X$ be as in (3). Note that $f^*\mathcal{F}$ is of finite type by Properties of Spaces, Section 48.28. For the final assertion, let \bar{y} be a geometric point of Y mapping to the geometric point \bar{x} on X . Recall that

$$(f^*\mathcal{F})_{\bar{y}} = \mathcal{F}_{\bar{x}} \otimes_{\mathcal{O}_{X,\bar{x}}} \mathcal{O}_{Y,\bar{y}},$$

see Properties of Spaces, Lemma 48.27.5. Hence $(f^*\mathcal{F})_{\bar{y}} \otimes \kappa(\bar{y})$ is nonzero if and only if $\mathcal{F}_{\bar{x}} \otimes \kappa(\bar{x})$ is nonzero. By (2) this implies $x \in \text{Supp}(\mathcal{F})$ if and only if $y \in \text{Supp}(f^*\mathcal{F})$, which is the content of assertion (3). \square

Our next task is to show that the scheme theoretic support of a finite type quasi-coherent module (see Morphisms, Definition 28.5.5) also makes sense for finite type quasi-coherent modules on algebraic spaces.

Lemma 49.15.3. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. There exists a smallest closed subspace $i : Z \rightarrow X$ such that there exists a quasi-coherent \mathcal{O}_Z -module \mathcal{G} with $i_*\mathcal{G} \cong \mathcal{F}$. Moreover:*

- (1) *If U is a scheme and $\varphi : U \rightarrow X$ is an étale morphism then $Z \times_X U$ is the scheme theoretic support of $\varphi^*\mathcal{F}$.*
- (2) *The quasi-coherent sheaf \mathcal{G} is unique up to unique isomorphism.*
- (3) *The quasi-coherent sheaf \mathcal{G} is of finite type.*
- (4) *The support of \mathcal{G} and of \mathcal{F} is Z .*

Proof. Choose a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. Let $R = U \times_X U$ with projections $s, t : R \rightarrow U$. Let $i' : Z' \rightarrow U$ be the scheme theoretic support of $\varphi^*\mathcal{F}$ and let \mathcal{G}' be the (unique up to unique isomorphism) finite type quasi-coherent $\mathcal{O}_{Z'}$ -module with $i'_*\mathcal{G}' = \varphi^*\mathcal{F}$, see Morphisms, Lemma 28.5.4. As

$s^*\varphi^*\mathcal{F} = t^*\varphi^*\mathcal{F}$ we see that $R' = s^{-1}Z' = t^{-1}Z'$ as closed subschemes of R by Morphisms, Lemma 28.26.12. Thus we may apply Properties of Spaces, Lemma 48.9.2 to find a closed subspace $i : Z \rightarrow X$ whose pullback to U is Z' . Writing $s', t' : R' \rightarrow Z'$ the projections and $j' : R' \rightarrow R$ the given closed immersion, we see that

$$j'_*(s')^*\mathcal{G}' = s^*i'_*\mathcal{G}' = s^*\varphi^*\mathcal{F} = t^*\varphi^*\mathcal{F} = t^*i'_*\mathcal{G}' = j'_*(t')^*\mathcal{G}'$$

(the first and the last equality by Cohomology of Schemes, Lemma 29.5.2). Hence the uniqueness of Morphisms, Lemma 28.26.12 applied to $R' \rightarrow R$ gives an isomorphism $\alpha : (t')^*\mathcal{G}' \rightarrow (s')^*\mathcal{G}'$ compatible with the canonical isomorphism $t^*\varphi^*\mathcal{F} = s^*\varphi^*\mathcal{F}$ via j'_* . Clearly α satisfies the cocycle condition, hence we may apply Properties of Spaces, Proposition 48.30.1 to obtain a quasi-coherent module \mathcal{G} on Z whose restriction to Z' is \mathcal{G}' compatible with α . Again using the equivalence of the proposition mentioned above (this time for X) we conclude that $i_*\mathcal{G} \cong \mathcal{F}$.

This proves existence. The other properties of the lemma follow by comparing with the result for schemes using Lemma 49.15.1. Detailed proofs omitted. \square

Definition 49.15.4. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. The *scheme theoretic support* of \mathcal{F} is the closed subspace $Z \subset X$ constructed in Lemma 49.15.3.

In this situation we often think of \mathcal{F} as a quasi-coherent sheaf of finite type on Z (via the equivalence of categories of Lemma 49.14.1).

49.16. Scheme theoretic image

Caution: Some of the material in this section is ultra-general and behaves differently from what you might expect.

Lemma 49.16.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . There exists a closed subspace $Z \subset Y$ such that f factors through Z and such that for any other closed subspace $Z' \subset Y$ such that f factors through Z' we have $Z \subset Z'$.*

Proof. Let $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$. If \mathcal{I} is quasi-coherent then we just take Z to be the closed subscheme determined by \mathcal{I} , see Lemma 49.13.1. In general the lemma requires us to show that there exists a largest quasi-coherent sheaf of ideals \mathcal{I}' contained in \mathcal{I} . This follows from Lemma 49.14.2. \square

Suppose that in the situation of Lemma 49.16.1 above X and Y are representable. Then the closed subspace $Z \subset Y$ found in the lemma agrees with the closed subscheme $Z \subset Y$ found in Morphisms, Lemma 28.6.1. The reason is that closed subspaces (or subschemes) are in a inclusion reversing correspondence with quasi-coherent ideal sheaves on $X_{\acute{e}tale}$ and X . As the category of quasi-coherent modules on $X_{\acute{e}tale}$ and X are the same (Properties of Spaces, Section 48.27) we conclude. Thus the following definition agrees with the earlier definition for morphisms of schemes.

Definition 49.16.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The *scheme theoretic image* of f is the smallest closed subspace $Z \subset Y$ through which f factors, see Lemma 49.16.1 above.

We often just denote $f : X \rightarrow Z$ the factorization of f . If the morphism f is not quasi-compact, then (in general) the construction of the scheme theoretic image does not commute with restriction to open subspaces of Y .

Lemma 49.16.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $Z \subset Y$ be the scheme theoretic image of f . If f is quasi-compact then*

- (1) *the sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$ is quasi-coherent,*
- (2) *the scheme theoretic image Z is the closed subspace corresponding to \mathcal{I} ,*
- (3) *for any étale morphism $V \rightarrow Y$ the scheme theoretic image of $X \times_Y V \rightarrow V$ is equal to $Z \times_Y V$, and*
- (4) *the image $|f|(|X|) \subset |Z|$ is a dense subset of $|Z|$.*

Proof. To prove (3) it suffices to prove (1) since the formation of \mathcal{I} commutes with étale localization. If (1) holds then in the proof of Lemma 49.16.1 we showed (2). Let us prove that \mathcal{I} is quasi-coherent. Since the property of being quasi-coherent is étale local we may assume Y is an affine scheme. As f is quasi-compact, we can find an affine scheme U and a surjective étale morphism $U \rightarrow X$. Denote f' the composition $U \rightarrow X \rightarrow Y$. Then $f_*\mathcal{O}_X$ is a subsheaf of $f'_*\mathcal{O}_U$, and hence $\mathcal{I} = \text{Ker}(\mathcal{O}_Y \rightarrow \mathcal{O}_{X'})$. By Lemma 49.11.2 the sheaf $f'_*\mathcal{O}_U$ is quasi-coherent on Y . Hence \mathcal{I} is quasi-coherent as a kernel of a map between coherent modules. Finally, part (4) follows from parts (1), (2), and (3) as the ideal \mathcal{I} will be the unit ideal in any point of $|Y|$ which is not contained in the closure of $|f|(|X|)$. \square

Lemma 49.16.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume X is reduced. Then*

- (1) *the scheme theoretic image Z of f is the reduced induced algebraic space structure on $\overline{|f|(|X|)}$, and*
- (2) *for any étale morphism $V \rightarrow Y$ the scheme theoretic image of $X \times_Y V \rightarrow V$ is equal to $Z \times_Y V$.*

Proof. Part (1) is true because the reduced induced algebraic space structure on $\overline{|f|(|X|)}$ is the smallest closed subspace of Y through which f factors, see Properties of Spaces, Lemma 48.9.4. Part (2) follows from (1), the fact that $|V| \rightarrow |Y|$ is open, and the fact that being reduced is preserved under étale localization. \square

Lemma 49.16.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact morphism of algebraic spaces over S . Let Z be the scheme theoretic image of f . Let $z \in |Z|$. There exists a valuation ring A with fraction field K and a commutative diagram*

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Z \longrightarrow Y \end{array}$$

such that the closed point of $\text{Spec}(A)$ maps to z .

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Let $Z' \subset V$ be the scheme theoretic image of $X \times_Y V \rightarrow V$. By Lemma 49.16.3 $Z' = Z \times_Y V$. Thus we can choose a point $z' \in Z'$ mapping to z . By Morphisms, Lemma 28.6.5

we can choose a diagram

$$\begin{array}{ccc}
 \mathrm{Spec}(K) & \longrightarrow & X \times_Y V \\
 \downarrow & & \swarrow \quad \downarrow \\
 \mathrm{Spec}(A) & \longrightarrow & Z' \longrightarrow V
 \end{array}$$

such that the closed point of $\mathrm{Spec}(A)$ maps to z' . Composing with the projections $Z' \rightarrow Z$ and $X \times_Y V \rightarrow X$ we obtain a solution. \square

49.17. Scheme theoretic closure and density

This section is the analogue of Morphisms, Section 28.7.

Lemma 49.17.1. *Let S be a scheme. Let $W \subset S$ be a scheme theoretically dense open subscheme (Morphisms, Definition 28.7.1). Let $f : X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, and locally quasi-finite. Then $f^{-1}(W)$ is scheme theoretically dense in X .*

Proof. We will use the characterization of Morphisms, Lemma 28.7.5. Assume $V \subset X$ is an open and $g \in \Gamma(V, \mathcal{O}_V)$ is a function which restricts to zero on $f^{-1}(W) \cap V$. We have to show that $g = 0$. Assume $g \neq 0$ to get a contradiction. By More on Morphisms, Lemma 36.31.12 we may shrink V , find an open $U \subset S$ fitting into a commutative diagram

$$\begin{array}{ccc}
 V & \longrightarrow & X \\
 \pi \downarrow & & \downarrow f \\
 U & \longrightarrow & S,
 \end{array}$$

a quasi-coherent subsheaf $\mathcal{F} \subset \mathcal{O}_U$, an integer $r > 0$, and an injective \mathcal{O}_U -module map $\mathcal{F}^{\oplus r} \rightarrow \pi_* \mathcal{O}_V$ whose image contains $g|_U$. Say $(g_1, \dots, g_r) \in \Gamma(U, \mathcal{F}^{\oplus r})$ maps to g . Then we see that $g_i|_{W \cap U} = 0$ because $g|_{f^{-1}W \cap V} = 0$. Hence $g_i = 0$ because $\mathcal{F} \subset \mathcal{O}_U$ and W is scheme theoretically dense in S . This implies $g = 0$ which is the desired contradiction. \square

Lemma 49.17.2. *Let S be a scheme. Let X be an algebraic space over S . Let $U \subset X$ be an open subspace. The following are equivalent*

- (1) *for every étale morphism $\varphi : V \rightarrow X$ (of algebraic spaces) the scheme theoretic closure of $\varphi^{-1}(U)$ in V is equal to V ,*
- (2) *there exists a scheme V and a surjective étale morphism $\varphi : V \rightarrow X$ such that the scheme theoretic closure of $\varphi^{-1}(U)$ in V is equal to V ,*

Proof. Observe that if $V \rightarrow V'$ is a morphism of algebraic spaces étale over X , and $Z \subset V$, resp. $Z' \subset V'$ is the scheme theoretic closure of $U \times_X V$, resp. $U \times_X V'$ in V , resp. V' , then Z maps into Z' . Thus if $V \rightarrow V'$ is surjective and étale then $Z = V$ implies $Z' = V'$. Next, note that an étale morphism is flat, locally of finite presentation, and locally quasi-finite (see Morphisms, Section 28.37). Thus Lemma 49.17.1 implies that if V and V' are schemes, then $Z' = V'$ implies $Z = V$. A formal argument using that every algebraic space has an étale covering by a scheme shows that (1) and (2) are equivalent. \square

It follows from Lemma 49.17.2 that the following definition is compatible with the definition in the case of schemes.

Definition 49.17.3. Let S be a scheme. Let X be an algebraic space over S . Let $U \subset X$ be an open subspace.

- (1) The scheme theoretic image of the morphism $U \rightarrow X$ is called the *scheme theoretic closure of U in X* .
- (2) We say U is *scheme theoretically dense in X* if the equivalent conditions of Lemma 49.17.2 are satisfied.

With this definition it is **not** the case that U is scheme theoretically dense in X if and only if the scheme theoretic closure of U is X . This is somewhat inelegant. But with suitable finiteness conditions we will see that it does hold.

Lemma 49.17.4. *Let S be a scheme. Let X be an algebraic space over S . Let $U \subset X$ be an open subspace. If $U \rightarrow X$ is quasi-compact, then U is scheme theoretically dense in X if and only if the scheme theoretic closure of U in X is X .*

Proof. Follows from Lemma 49.16.3 part (3). \square

Lemma 49.17.5. *Let S be a scheme. Let $j : U \rightarrow X$ be an open immersion of algebraic spaces over S . Then U is scheme theoretically dense in X if and only if $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is injective.*

Proof. If $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is injective, then the same is true when restricted to any algebraic space V étale over X . Hence the scheme theoretic closure of $U \times_X V$ in V is equal to V , see proof of Lemma 49.16.1. Conversely, assume the scheme theoretic closure of $U \times_X V$ is equal to V for all V étale over X . Suppose that $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$ is not injective. Then we can find an affine, say $V = \text{Spec}(A)$, étale over X and a nonzero element $f \in A$ such that f maps to zero in $\Gamma(V \times_X U, \mathcal{O})$. In this case the scheme theoretic closure of $V \times_X U$ in V is clearly contained in $\text{Spec}(A/(f))$ a contradiction. \square

Lemma 49.17.6. *Let S be a scheme. Let X be an algebraic space over S . If U, V are scheme theoretically dense open subspaces of X , then so is $U \cap V$.*

Proof. Let $W \rightarrow X$ be any étale morphism. Consider the map $\mathcal{O}(W) \rightarrow \mathcal{O}(W \times_X V) \rightarrow \mathcal{O}(W \times_X (V \cap U))$. By Lemma 49.17.5 both maps are injective. Hence the composite is injective. Hence by Lemma 49.17.5 $U \cap V$ is scheme theoretically dense in X . \square

Lemma 49.17.7. *Let S be a scheme. Let $h : Z \rightarrow X$ be an immersion of algebraic spaces over S . Assume either $Z \rightarrow X$ is quasi-compact or Z is reduced. Let $\overline{Z} \subset X$ be the scheme theoretic image of h . Then the morphism $Z \rightarrow \overline{Z}$ is an open immersion which identifies Z with a scheme theoretically dense open subspace of \overline{Z} . Moreover, Z is topologically dense in \overline{Z} .*

Proof. In both cases the formation of Z commutes with étale localization, see Lemmas 49.16.3 and 49.16.4. Hence this lemma follows from the case of schemes, see Morphisms, Lemma 28.7.7. \square

Lemma 49.17.8. *Let S be a scheme. Let B be an algebraic space over S . Let $f, g : X \rightarrow B$ be morphisms of algebraic spaces over B . Let $U \subset X$ be an open subspace such that $f|_U = g|_U$. If the scheme theoretic closure of U in X is X and $Y \rightarrow B$ is separated, then $f = g$.*

Proof. As $Y \rightarrow B$ is separated the fibre product $Y \times_{\Delta, Y \times_B Y, (f, g)} X$ is a closed subspace $Z \subset X$. As $f|_U = g|_U$ we see that $U \subset Z$. Hence $Z = X$ as U is assumed scheme theoretically dense in X . \square

49.18. Dominant morphisms

We copy the definition of a dominant morphism of schemes to get the notion of a dominant morphism of algebraic spaces. We caution the reader that this definition is not well behaved unless the morphism is quasi-compact and the algebraic spaces satisfy some separation axioms.

Definition 49.18.1. Let S be a scheme. A morphism $f : X \rightarrow Y$ of algebraic spaces over S is called *dominant* if the image of $|f| : |X| \rightarrow |Y|$ is dense in $|Y|$.

49.19. Universally injective morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be universally injective. For a field K over S (recall this means that we are given a structure morphism $\text{Spec}(K) \rightarrow S$) and an algebraic space X over S we write $X(K) = \text{Mor}_S(\text{Spec}(K), X)$. We first translate the condition for representable morphisms into a condition on the functor of points.

Lemma 49.19.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is universally injective if and only if for all fields K the map $X(K) \rightarrow Y(K)$ is injective.*

Proof. We are going to use Morphisms, Lemma 28.12.2 without further mention. Suppose that f is universally injective. Then for any field K and any morphism $\text{Spec}(K) \rightarrow Y$ the morphism of schemes $\text{Spec}(K) \times_Y X \rightarrow \text{Spec}(K)$ is universally injective. Hence there exists at most one section of the morphism $\text{Spec}(K) \times_Y X \rightarrow \text{Spec}(K)$. Hence the map $X(K) \rightarrow Y(K)$ is injective. Conversely, suppose that for every field K the map $X(K) \rightarrow Y(K)$ is injective. Let $T \rightarrow Y$ be a morphism from a scheme into Y , and consider the base change $f_T : T \times_Y X \rightarrow T$. For any field K we have

$$(T \times_Y X)(K) = T(K) \times_{Y(K)} X(K)$$

by definition of the fibre product, and hence the injectivity of $X(K) \rightarrow Y(K)$ guarantees the injectivity of $(T \times_Y X)(K) \rightarrow T(K)$ which means that f_T is universally injective as desired. \square

Next, we translate the property that the transformation between field valued points is injective into something more geometric.

Lemma 49.19.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) *the map $X(K) \rightarrow Y(K)$ is injective for every field K over S*
- (2) *for every morphism $Y' \rightarrow Y$ of algebraic spaces over S the induced map $|Y' \times_Y X| \rightarrow |Y'|$ is injective, and*
- (3) *the diagonal morphism $X \rightarrow X \times_Y X$ is surjective.*

Proof. Assume (1). Let $g : Y' \rightarrow Y$ be a morphism of algebraic spaces, and denote $f' : Y' \times_Y X \rightarrow Y'$ the base change of f . Let $K_i, i = 1, 2$ be fields and let $\varphi_i : \text{Spec}(K_i) \rightarrow Y' \times_Y X$ be morphisms such that $f' \circ \varphi_1$ and $f' \circ \varphi_2$ define the same element of $|Y'|$. By definition this means there exists a field Ω and embeddings

$\alpha_i : K_i \subset \Omega$ such that the two morphisms $f' \circ \varphi_i \circ \alpha_i : \text{Spec}(\Omega) \rightarrow Y'$ are equal. Here is the corresponding commutative diagram

$$\begin{array}{ccccc}
 \text{Spec}(\Omega) & \xrightarrow{\alpha_2} & \text{Spec}(K_2) & & \\
 & \searrow^{\alpha_1} & \searrow^{\varphi_2} & & \\
 & & \text{Spec}(K_1) & \xrightarrow{\varphi_1} & Y' \times_Y X \xrightarrow{g'} X \\
 & & & & \downarrow f' \qquad \downarrow f \\
 & & & & Y' \xrightarrow{g} Y.
 \end{array}$$

In particular the compositions $g \circ f' \circ \varphi_i \circ \alpha_i$ are equal. By assumption (1) this implies that the morphism $g' \circ \varphi_i \circ \alpha_i$ are equal, where $g' : Y' \times_Y X \rightarrow X$ is the projection. By the universal property of the fibre product we conclude that the morphisms $\varphi_i \circ \alpha_i : \text{Spec}(\Omega) \rightarrow Y' \times_Y X$ are equal. In other words φ_1 and φ_2 define the same point of $Y' \times_Y X$. We conclude that (2) holds.

Assume (2). Let K be a field over S , and let $a, b : \text{Spec}(K) \rightarrow X$ be two morphisms such that $f \circ a = f \circ b$. Denote $c : \text{Spec}(K) \rightarrow Y$ the common value. By assumption $|\text{Spec}(K) \times_{c,Y} X| \rightarrow |\text{Spec}(K)|$ is injective. This means there exists a field Ω and embeddings $\alpha_i : K \rightarrow \Omega$ such that

$$\begin{array}{ccc}
 \text{Spec}(\Omega) & \xrightarrow{\alpha_1} & \text{Spec}(K) \\
 \alpha_2 \downarrow & & \downarrow a \\
 \text{Spec}(K) & \xrightarrow{b} & \text{Spec}(K) \times_{c,Y} X
 \end{array}$$

is commutative. Composing with the projection to $\text{Spec}(K)$ we see that $\alpha_1 = \alpha_2$. Denote the common value α . Then we see that $\{\alpha : \text{Spec}(\Omega) \rightarrow \text{Spec}(K)\}$ is a fpqc covering of $\text{Spec}(K)$ such that the two morphisms a, b become equal on the members of the covering. By Properties of Spaces, Proposition 48.14.1 we conclude that $a = b$. We conclude that (1) holds.

Assume (3). Let $x, x' \in |X|$ be a pair of points such that $f(x) = f(x')$ in $|Y|$. By Properties of Spaces, Lemma 48.4.3 we see there exists a $x'' \in |X \times_Y X|$ whose projections are x and x' . By assumption and Properties of Spaces, Lemma 48.4.4 there exists a $x''' \in |X|$ with $\Delta_{X/Y}(x''') = x''$. Thus $x = x'$. In other words f is injective. Since condition (3) is stable under base change we see that f satisfies (2).

Assume (2). Then in particular $|X \times_Y X| \rightarrow |X|$ is injective which implies immediately that $|\Delta_{X/Y}| : |X| \rightarrow |X \times_Y X|$ is surjective, which implies that $\Delta_{X/Y}$ is surjective by Properties of Spaces, Lemma 48.4.4. \square

By the two lemmas above the following definition does not conflict with the already defined notion of a universally injective representable morphism of algebraic spaces.

Definition 49.19.3. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *universally injective* if for every morphism $Y' \rightarrow Y$ the induced map $|Y' \times_Y X| \rightarrow |Y'|$ is injective.

To be sure this means that any or all of the equivalent conditions of Lemma 49.19.2 hold.

Remark 49.19.4. A universally injective morphism of schemes is separated, see Morphisms, Lemma 28.12.3. This is not the case for morphisms of algebraic spaces. Namely, the algebraic space $X = \mathbf{A}_k^1/\{x \sim -x \mid x \neq 0\}$ constructed in Spaces, Example 47.14.1 comes equipped with a morphism $X \rightarrow \mathbf{A}_k^1$ which maps the point with coordinate x to the point with coordinate x^2 . This is an isomorphism away from 0, and there is a unique point of X lying above 0. As X isn't separated this is a universally injective morphism of algebraic spaces which is not separated.

Lemma 49.19.5. *The base change of a universally injective morphism is universally injective.*

Proof. Omitted. Hint: This is formal. □

Lemma 49.19.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is universally injective,
- (2) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is universally injective,
- (3) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is universally injective,
- (4) there exists a scheme Z and a surjective morphism $Z \rightarrow Y$ such that $Z \times_Y X \rightarrow Z$ is universally injective, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is universally injective.

Proof. We will use that being universally injective is preserved under base change (Lemma 49.19.5) without further mention in this proof. It is clear that (1) \Rightarrow (2) \Rightarrow (3) \Rightarrow (4).

Assume $g : Z \rightarrow Y$ as in (4). Let $y : \text{Spec}(K) \rightarrow Y$ be a morphism from the spectrum of a field into Y . By assumption we can find an extension field $\alpha : K \subset K'$ and a morphism $z : \text{Spec}(K') \rightarrow Z$ such that $y \circ \alpha = g \circ z$ (with obvious abuse of notation). By assumption the morphism $Z \times_Y X \rightarrow Z$ is universally injective, hence there is at most one lift of $g \circ z : \text{Spec}(K') \rightarrow Y$ to a morphism into X . Since $\{\alpha : \text{Spec}(K') \rightarrow \text{Spec}(K)\}$ is a fpqc covering this implies there is at most one lift of $y : \text{Spec}(K) \rightarrow Y$ to a morphism into X , see Properties of Spaces, Proposition 48.14.1. Thus we see that (1) holds.

We omit the verification that (5) is equivalent to (1). □

Lemma 49.19.7. *A composition of universally injective morphisms is universally injective.*

Proof. Omitted. □

49.20. Affine morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be affine.

Lemma 49.20.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is affine if and only if for all affine schemes Z and morphisms $Z \rightarrow Y$ the scheme $X \times_Y Z$ is affine.*

Proof. This follows directly from the definition of an affine morphism of schemes (Morphisms, Definition 28.13.1). \square

This clears the way for the following definition.

Definition 49.20.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *affine* if for every affine scheme Z and morphism $Z \rightarrow Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme.

Lemma 49.20.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is representable and affine,
- (2) f is affine,
- (3) for every affine scheme V and étale morphism $V \rightarrow Y$ the scheme $X \times_Y V$ is affine,
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is affine, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is affine.

Proof. It is clear that (1) implies (2), that (2) implies (3), and that (3) implies (4) by taking V to be a disjoint union of affines étale over Y , see Properties of Spaces, Lemma 48.6.1. Assume $V \rightarrow Y$ is as in (4). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 48.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \rightarrow V$ is affine. This means we can apply Spaces, Lemma 47.11.3 because the class of affine morphisms satisfies all the required properties (see Morphisms, Lemmas 28.13.8 and Descent, Lemmas 34.19.16 and 34.33.1). The conclusion of applying this lemma is that f is representable and affine, i.e., (1) holds.

The equivalence of (1) and (5) follows from the fact that being affine is Zariski local on the target (the reference above shows that being affine is in fact fpqc local on the target). \square

Lemma 49.20.4. *The composition of affine morphisms is affine.*

Proof. Omitted. Hint: Transitivity of fibre products. \square

Lemma 49.20.5. *The base change of an affine morphism is affine.*

Proof. Omitted. Hint: Transitivity of fibre products. \square

Lemma 49.20.6. *A closed immersion is affine.*

Proof. Follows immediately from the corresponding statement for morphisms of schemes, see Morphisms, Lemma 28.13.9. \square

Lemma 49.20.7. *Let S be a scheme. Let X be an algebraic space over S . There is an anti-equivalence of categories*

$$\begin{array}{ccc} \text{algebraic space} & \longleftrightarrow & \text{quasi-coherent sheaves} \\ \text{affine over } X & & \text{of } \mathcal{O}_X\text{-algebras} \end{array}$$

which associates to $f : Y \rightarrow X$ the sheaf $f_\mathcal{O}_Y$. Moreover, this equivalence is compatible with arbitrary base change.*

Proof. This lemma is the analogue of Morphisms, Lemma 28.13.5. Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. We will construct an affine morphism of algebraic spaces $\pi : Y = \underline{\text{Spec}}_X(\mathcal{A}) \rightarrow X$ with $\pi_*\mathcal{O}_Y \cong \mathcal{A}$. To do this, choose a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. As usual denote $R = U \times_X U$ with projections $s, t : R \rightarrow U$. Denote $\psi : R \rightarrow X$ the composition $\psi = \varphi \circ s = \varphi \circ t$. By the aforementioned lemma there exists an affine morphisms of schemes $\pi_0 : V \rightarrow U$ and $\pi_1 : W \rightarrow R$ with $\pi_{0,*}\mathcal{O}_V \cong \varphi^*\mathcal{A}$ and $\pi_{1,*}\mathcal{O}_W \cong \psi^*\mathcal{A}$. Since the construction is compatible with base change there exist morphisms $s', t' : W \rightarrow V$ such that the diagrams

$$\begin{array}{ccc} W & \xrightarrow{s'} & V \\ \downarrow & & \downarrow \\ R & \xrightarrow{s} & U \end{array} \quad \text{and} \quad \begin{array}{ccc} W & \xrightarrow{t'} & V \\ \downarrow & & \downarrow \\ R & \xrightarrow{t} & U \end{array}$$

are cartesian. It follows that s', t' are étale. It is a formal consequence of the above that $(t', s') : W \rightarrow V \times_S V$ is a monomorphism. We omit the verification that $W \rightarrow V \times_S V$ is an equivalence relation (hint: think about the pullback of \mathcal{A} to $U \times_X U \times_X U = R \times_{s,U,t} R$). The quotient sheaf $Y = V/W$ is an algebraic space, see Spaces, Theorem 47.10.5. By Groupoids, Lemma 38.18.7 we see that $Y \times_X U \cong V$. Hence $Y \rightarrow X$ is affine by Lemma 49.20.3. Finally, the isomorphism of

$$(Y \times_X U \rightarrow U)_*\mathcal{O}_{Y \times_X U} = \pi_{0,*}\mathcal{O}_V \cong \varphi^*\mathcal{A}$$

is compatible with glueing isomorphisms, whence $(Y \rightarrow X)_*\mathcal{O}_Y \cong \mathcal{A}$ by Properties of Spaces, Proposition 48.30.1. We omit the verification that this construction is compatible with base change. \square

Definition 49.20.8. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The *relative spectrum of \mathcal{A} over X* , or simply the *spectrum of \mathcal{A} over X* is the affine morphism $\underline{\text{Spec}}(\mathcal{A}) \rightarrow X$ corresponding to \mathcal{A} under the equivalence of categories of Lemma 49.20.7.

Forming the relative spectrum commutes with arbitrary base change.

Remark 49.20.9. Let S be a scheme. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Then f has a canonical factorization

$$Y \longrightarrow \underline{\text{Spec}}_X(f_*\mathcal{O}_Y) \longrightarrow X$$

This makes sense because $f_*\mathcal{O}_Y$ is quasi-coherent by Lemma 49.11.2. The morphism $Y \rightarrow \underline{\text{Spec}}_X(f_*\mathcal{O}_Y)$ comes from the canonical \mathcal{O}_Y -algebra map $f^*f_*\mathcal{O}_Y \rightarrow \mathcal{O}_Y$ which corresponds to a canonical morphism $Y \rightarrow Y \times_X \underline{\text{Spec}}_X(f_*\mathcal{O}_Y)$ over Y (see Lemma 49.20.7) whence a factorization of f as above.

Lemma 49.20.10. *Let S be a scheme. Let $f : Y \rightarrow X$ be an affine morphism of algebraic spaces over S . Let $\mathcal{A} = f_*\mathcal{O}_Y$. The functor $\mathcal{F} \mapsto f_*\mathcal{F}$ induces an equivalence of categories*

$$\left\{ \begin{array}{c} \text{category of quasi-coherent} \\ \mathcal{O}_Y\text{-modules} \end{array} \right\} \longrightarrow \left\{ \begin{array}{c} \text{category of quasi-coherent} \\ \mathcal{A}\text{-modules} \end{array} \right\}$$

Moreover, an \mathcal{A} -module is quasi-coherent as an \mathcal{O}_X -module if and only if it is quasi-coherent as an \mathcal{A} -module.

Proof. Omitted. \square

Lemma 49.20.11. *Let S be a scheme. Let B be an algebraic space over S . Suppose $g : X \rightarrow Y$ is a morphism of algebraic spaces over B .*

- (1) *If X is affine over B and $\Delta : Y \rightarrow Y \times_B Y$ is affine, then g is affine.*
- (2) *If X is affine over B and Y is separated over B , then g is affine.*
- (3) *A morphism from an affine scheme to an algebraic space with affine diagonal is affine.*
- (4) *A morphism from an affine scheme to a separated algebraic space is affine.*

Proof. Proof of (1). The base change $X \times_B Y \rightarrow Y$ is affine by Lemma 49.20.5. The morphism $(1, g) : X \rightarrow X \times_B Y$ is the base change of $Y \rightarrow Y \times_B Y$ by the morphism $X \times_B Y \rightarrow Y \times_B Y$. Hence it is affine by Lemma 49.20.5. The composition of affine morphisms is affine (see Lemma 49.20.4) and (1) follows. Part (2) follows from (1) as a closed immersion is affine (see Lemma 49.20.6) and Y/B separated means Δ is a closed immersion. Parts (3) and (4) are special cases of (1) and (2). \square

Lemma 49.20.12. *Let S be a scheme. Let X be a quasi-separated algebraic space over S . Let A be an Artinian ring. Any morphism $\text{Spec}(A) \rightarrow X$ is affine.*

Proof. Let $U \rightarrow X$ be an étale morphism with U affine. To prove the lemma we have to show that $\text{Spec}(A) \times_X U$ is affine, see Lemma 49.20.3. Since X is quasi-separated the scheme $\text{Spec}(A) \times_X U$ is quasi-compact. Moreover, the projection morphism $\text{Spec}(A) \times_X U \rightarrow \text{Spec}(A)$ is étale. Hence this morphism has finite discrete fibers and moreover the topology on $\text{Spec}(A)$ is discrete. Thus $\text{Spec}(A) \times_X U$ is a scheme whose underlying topological space is a finite discrete set. We are done by Schemes, Lemma 25.11.7. \square

49.21. Quasi-affine morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be quasi-affine.

Lemma 49.21.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is quasi-affine if and only if for all affine schemes Z and morphisms $Z \rightarrow Y$ the scheme $X \times_Y Z$ is quasi-affine.*

Proof. This follows directly from the definition of a quasi-affine morphism of schemes (Morphisms, Definition 28.14.1). \square

This clears the way for the following definition.

Definition 49.21.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *quasi-affine* if for every affine scheme Z and morphism $Z \rightarrow Y$ the algebraic space $X \times_Y Z$ is representable by a quasi-affine scheme.

Lemma 49.21.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) *f is representable and quasi-affine,*
- (2) *f is quasi-affine,*
- (3) *there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is quasi-affine, and*
- (4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is quasi-affine.*

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y , see Properties of Spaces, Lemma 48.6.1. Assume $V \rightarrow Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is a quasi-affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 48.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \rightarrow V$ is quasi-affine. This means we can apply Spaces, Lemma 47.11.3 because the class of quasi-affine morphisms satisfies all the required properties (see Morphisms, Lemmas 28.14.5 and Descent, Lemmas 34.19.18 and 34.34.1). The conclusion of applying this lemma is that f is representable and quasi-affine, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being quasi-affine is Zariski local on the target (the reference above shows that being quasi-affine is in fact fpqc local on the target). \square

Lemma 49.21.4. *The composition of quasi-affine morphisms is quasi-affine.*

Proof. Omitted. \square

Lemma 49.21.5. *The base change of a quasi-affine morphism is quasi-affine.*

Proof. Omitted. \square

Lemma 49.21.6. *Let S be a scheme. A quasi-compact and quasi-separated morphism of algebraic spaces $f : Y \rightarrow X$ is quasi-affine if and only if the canonical factorization $Y \rightarrow \underline{\mathrm{Spec}}_X(f_*\mathcal{O}_Y)$ (Remark 49.20.9) is an open immersion.*

Proof. Let $U \rightarrow X$ be a surjective morphism where U is a scheme. Since we may check whether f is quasi-affine after base change to U (Lemma 49.21.3), since $f_*\mathcal{O}_Y|_U$ is equal to $(Y \times_X U \rightarrow U)_*\mathcal{O}_{Y \times_X U}$ (Properties of Spaces, Lemma 48.24.2), and since formation of relative spectrum commutes with base change (Lemma 49.20.7), we see that the assertion reduces to the case that X is a scheme. If X is a scheme and either f is quasi-affine or $Y \rightarrow \underline{\mathrm{Spec}}_X(f_*\mathcal{O}_Y)$ is an open immersion, then Y is a scheme as well. Thus we reduce to Morphisms, Lemma 28.14.3. \square

49.22. Types of morphisms étale local on source-and-target

Given a property of morphisms of schemes which is *étale local on the source-and-target*, see Descent, Definition 34.28.3 we may use it to define a corresponding property of morphisms of algebraic spaces, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 49.22.1. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Consider commutative diagrams*

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale. The following are equivalent

- (1) for any diagram as above the morphism h has property \mathcal{P} , and
- (2) for some diagram as above with $a : U \rightarrow X$ surjective the morphism h has property \mathcal{P} .

If X and Y are representable, then this is also equivalent to f (as a morphism of schemes) having property \mathcal{P} . If \mathcal{P} is also preserved under any base change, and f ppf local on the base, then for representable morphisms f this is also equivalent to f having property \mathcal{P} in the sense of Section 49.3.

Proof. Let us prove the equivalence of (1) and (2). The implication (1) \Rightarrow (2) is immediate (taking into account Spaces, Lemma 47.11.4). Assume

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array} \quad \begin{array}{ccc} U' & \xrightarrow{h'} & V' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

are two diagrams as in the lemma. Assume $U \rightarrow X$ is surjective and h has property \mathcal{P} . To show that (2) implies (1) we have to prove that h' has \mathcal{P} . To do this consider the diagram

$$\begin{array}{ccccc} U & \longleftarrow & U \times_X U' & \longrightarrow & U' \\ h \downarrow & & \downarrow (h, h') & & \downarrow h' \\ V & \longleftarrow & V \times_Y V' & \longrightarrow & V' \end{array}$$

By Descent, Lemma 34.28.5 we see that h has \mathcal{P} implies (h, h') has \mathcal{P} and since $U \times_X U' \rightarrow U'$ is surjective this implies (by the same lemma) that h' has \mathcal{P} .

If X and Y are representable, then Descent, Lemma 34.28.5 applies which shows that (1) and (2) are equivalent to f having \mathcal{P} .

Finally, suppose f is representable, and U, V, a, b, h are as in part (2) of the lemma, and that \mathcal{P} is preserved under arbitrary base change. We have to show that for any scheme Z and morphism $Z \rightarrow X$ the base change $Z \times_Y X \rightarrow Z$ has property \mathcal{P} . Consider the diagram

$$\begin{array}{ccc} Z \times_Y U & \longrightarrow & Z \times_Y V \\ \downarrow & & \downarrow \\ Z \times_Y X & \longrightarrow & Z \end{array}$$

Note that the top horizontal arrow is a base change of h and hence has property \mathcal{P} . The left vertical arrow is étale and surjective and the right vertical arrow is étale. Thus Descent, Lemma 34.28.5 once again kicks in and shows that $Z \times_Y X \rightarrow Z$ has property \mathcal{P} . \square

Definition 49.22.2. Let S be a scheme. Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. We say a morphism $f : X \rightarrow Y$ of algebraic spaces over S has property \mathcal{P} if the equivalent conditions of Lemma 49.22.1 hold.

Here are a couple of obvious remarks.

Remark 49.22.3. Let S be a scheme. Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. Suppose that moreover \mathcal{P} is stable under compositions. Then the class of morphisms of algebraic spaces having property \mathcal{P} is stable under composition.

Remark 49.22.4. Let S be a scheme. Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. Suppose that moreover \mathcal{P} is stable under base change. Then the class of morphisms of algebraic spaces having property \mathcal{P} is stable under base change.

Given a property of morphisms of germs of schemes which is *étale local on the source-and-target*, see Descent, Definition 34.29.1 we may use it to define a corresponding property of morphisms of algebraic spaces at a point, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 49.22.5. *Let \mathcal{Q} be a property of morphisms of germs which is étale local on the source-and-target. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$ be a point of X . Consider the diagrams*

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array} \quad \begin{array}{ccc} u & \longrightarrow & v \\ \downarrow & & \downarrow \\ x & \longrightarrow & y \end{array}$$

where U and V are schemes, a, b are étale, and u, v, x, y are points of the corresponding spaces. The following are equivalent

- (1) for any diagram as above we have $\mathcal{Q}((U, u) \rightarrow (V, v))$, and
- (2) for some diagram as above we have $\mathcal{Q}((U, u) \rightarrow (V, v))$.

If X and Y are representable, then this is also equivalent to $\mathcal{Q}((X, x) \rightarrow (Y, y))$.

Proof. Omitted. Hint: Very similar to the proof of Lemma 49.22.1. □

Definition 49.22.6. Let \mathcal{Q} be a property of morphisms of germs of schemes which is étale local on the source-and-target. Let S be a scheme. Given a morphism $f : X \rightarrow Y$ of algebraic spaces over S and a point $x \in |X|$ we say that f has property \mathcal{Q} at x if the equivalent conditions of Lemma 49.22.5 hold.

The following lemma should not be used blindly to go from a property of morphisms to a property of morphisms at a point. For example if \mathcal{P} is the property of being flat, then the property \mathcal{Q} in the following lemma means “ f is flat in an open neighbourhood of x ” which is not the same as “ f is flat at x ”.

Lemma 49.22.7. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property \mathcal{Q} of morphisms of germs associated to \mathcal{P} in Descent, Lemma 34.29.2. Then*

- (1) \mathcal{Q} is étale local on the source-and-target.
- (2) given a morphism of algebraic spaces $f : X \rightarrow Y$ and $x \in |X|$ the following are equivalent
 - (a) f has \mathcal{Q} at x , and
 - (b) there is an open neighbourhood $X' \subset X$ of x such that $X' \rightarrow Y$ has \mathcal{P} .
- (3) given a morphism of algebraic spaces $f : X \rightarrow Y$ the following are equivalent:
 - (a) f has \mathcal{P} ,
 - (b) for every $x \in |X|$ the morphism f has \mathcal{Q} at x .

Proof. See Descent, Lemma 34.29.2 for (1). The implication (1)(a) \Rightarrow (2)(b) follows on letting $X' = a(U) \subset X$ given a diagram as in Lemma 49.22.5. The implication (2)(b) \Rightarrow (1)(a) is clear. The equivalence of (3)(a) and (3)(b) follows from the corresponding result for morphisms of schemes, see Descent, Lemma 34.29.3. \square

Remark 49.22.8. We will apply Lemma 49.22.7 above to all cases listed in Descent, Remark 34.28.7 except “flat”. In each case we will do this by defining f to have property \mathcal{P} at x if f has \mathcal{P} in a neighbourhood of x .

49.23. Morphisms of finite type

The property “locally of finite type” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.16.4, and Descent, Lemmas 34.19.8. Hence, by Lemma 49.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.23.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f *locally of finite type* if the equivalent conditions of Lemma 49.22.1 hold with $\mathcal{P} =$ locally of finite type.
- (2) Let $x \in |X|$. We say f is of *finite type at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is locally of finite type.
- (3) We say f is of *finite type* if it is locally of finite type and quasi-compact.

Consider the algebraic space $\mathbf{A}_k^1/\mathbf{Z}$ of Spaces, Example 47.14.8. The morphism $\mathbf{A}_k^1/\mathbf{Z} \rightarrow \text{Spec}(k)$ is of finite type.

Lemma 49.23.2. *The composition of finite type morphisms is of finite type. The same holds for locally of finite type.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.16.3. \square

Lemma 49.23.3. *A base change of a finite type morphism is finite type. The same holds for locally of finite type.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.16.4. \square

Lemma 49.23.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is locally of finite type,
- (2) for every $x \in |X|$ the morphism f is of finite type at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally of finite type,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally of finite type,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is locally of finite type,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is locally of finite type,

(7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite type,

(8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, $U \rightarrow X$ is surjective, and the top horizontal arrow is locally of finite type, and

(9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is locally of finite type.

Proof. Each of the conditions (2), (3), (4), (5), (6), (7), and (9) imply condition (8) in a straightforward manner. For example, if (5) holds, then we can choose a scheme V which is a disjoint union of affines and a surjective morphism $V \rightarrow Y$ (see Properties of Spaces, Lemma 48.6.1). Then $V \times_Y X \rightarrow V$ is locally of finite type by (5). Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Then $U \rightarrow V$ is locally of finite type by Lemma 49.23.2. Hence (8) is true.

The conditions (1), (7), and (8) are equivalent by definition.

To finish the proof, we show that (1) implies all of the conditions (2), (3), (4), (5), (6), and (9). For (2) this is immediate. For (3), (4), (5), and (9) this follows from the fact that being locally of finite type is preserved under base change, see Lemma 49.23.3. For (6) we can take $U = X$ and we're done. \square

Lemma 49.23.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type and Y is locally Noetherian, then X is locally Noetherian.*

Proof. Let

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

be a commutative diagram where U, V are schemes and the vertical arrows are surjective étale. If f is locally of finite type, then $U \rightarrow V$ is locally of finite type. If Y is locally Noetherian, then V is locally Noetherian. By Morphisms, Lemma 28.16.6 we see that U is locally Noetherian, which means that X is locally Noetherian. \square

Lemma 49.23.6. *Let S be a scheme. Let $f : X \rightarrow Y, g : Y \rightarrow Z$ be morphisms of algebraic spaces over S . If $g \circ f : X \rightarrow Z$ is locally of finite type, then $f : X \rightarrow Y$ is locally of finite type.*

Proof. We can find a diagram

$$\begin{array}{ccccc} U & \longrightarrow & V & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z \end{array}$$

where U, V, W are schemes, the vertical arrows are étale and surjective, see Spaces, Lemma 47.11.4. At this point we can use Lemma 49.23.4 and Morphisms, Lemma 28.16.8 to conclude. \square

Lemma 49.23.7. *An immersion is locally of finite type.*

Proof. Follows from the general principle Spaces, Lemma 47.5.8 and Morphisms, Lemmas 28.16.5. \square

49.24. Points and geometric points

In this section we make some remarks on points and geometric points (see Properties of Spaces, Definition 48.16.1). One way to think about a geometric point of X is to consider a geometric point $\bar{s} : \text{Spec}(k) \rightarrow S$ of S and a lift of \bar{s} to a morphism \bar{x} into X . Here is a diagram

$$\begin{array}{ccc} \text{Spec}(k) & \xrightarrow{\bar{x}} & X \\ & \searrow \bar{s} & \downarrow \\ & & S \end{array}$$

We often say “let k be an algebraically closed field over S ” to indicate that $\text{Spec}(k)$ comes equipped with a morphism $\text{Spec}(k) \rightarrow S$. In this situation we write

$$X(k) = \text{Mor}_S(\text{Spec}(k), X) = \{\bar{x} \in X \text{ lying over } \bar{s}\}$$

for the set of k -valued points of X . In this case the map $X(k) \rightarrow |X|$ maps into the subset $|X_s| \subset |X|$. Here $X_s = \text{Spec}(\kappa(s)) \times_S X$, where $s \in S$ is the point corresponding to \bar{s} . As $\text{Spec}(\kappa(s)) \rightarrow S$ is a monomorphism, also the base change $X_s \rightarrow X$ is a monomorphism, and $|X_s|$ is indeed a subset of $|X|$.

Lemma 49.24.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type. The following are equivalent:*

- (1) f is surjective, and
- (2) for every algebraically closed field k over S the induced map $X(k) \rightarrow Y(k)$ is surjective.

Proof. Choose a diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

with U, V schemes over S and vertical arrows surjective and étale, see Spaces, Lemma 47.11.4. Since f is locally of finite type we see that $U \rightarrow V$ is locally of finite type.

Assume (1) and let $\bar{y} \in Y(k)$. Then $U \rightarrow Y$ is surjective and locally of finite type by Lemmas 49.5.4 and 49.23.2. Let $Z = U \times_{Y, \bar{y}} \text{Spec}(k)$. This is a scheme. The projection $Z \rightarrow \text{Spec}(k)$ is surjective and locally of finite type by Lemmas 49.5.5

and 49.23.3. It follows from Varieties, Lemma 32.12.1 that Z has a k valued point \bar{z} . The image $\bar{x} \in X(k)$ of \bar{z} maps to \bar{y} as desired.

Assume (2). By Properties of Spaces, Lemma 48.4.4 it suffices to show that $|X| \rightarrow |Y|$ is surjective. Let $y \in |Y|$. Choose a $u \in U$ mapping to y . Let $k \supset \kappa(u)$ be an algebraic closure. Denote $\bar{u} \in U(k)$ the corresponding point and $\bar{y} \in Y(k)$ its image. By assumption there exists a $\bar{x} \in X(k)$ mapping to \bar{y} . Then it is clear that the image $x \in |X|$ of \bar{x} maps to y . \square

In order to state the next lemma we introduce the following notation. Given a scheme T we denote

$$\lambda(T) = \sup\{\aleph_0, |\kappa(t)|; t \in T\}.$$

In words $\lambda(T)$ is the smallest infinite cardinal bounding all the cardinalities of residue fields of T . Note that if R is a ring then the cardinality of any residue field $\kappa(\mathfrak{p})$ of R is bounded by the cardinality of R (details omitted). This implies that $\lambda(T) \leq \text{size}(T)$ where $\text{size}(T)$ is the size of the scheme T as introduced in Sets, Section 3.9. If $K \subset L$ is a finitely generated field extension then $|K| \leq |L| \leq \max\{\aleph_0, |K|\}$. It follows that if $T' \rightarrow T$ is a morphism of schemes which is locally of finite type then $\lambda(T') \leq \lambda(T)$, and if $T' \rightarrow T$ is also surjective then equality holds. Next, suppose that S is a scheme and that X is an algebraic space over S . In this case we define

$$\lambda(X) := \lambda(U)$$

where U is any scheme over S which has a surjective étale morphism towards X . The reason that this is independent of the choice of U is that given a pair of such schemes U and U' the fibre product $U \times_X U'$ is a scheme which admits a surjective étale morphism to both U and U' , whence $\lambda(U) = \lambda(U \times_X U') = \lambda(U')$ by the discussion above.

Lemma 49.24.2. *Let S be a scheme. Let X, Y be algebraic spaces over S .*

- (1) *As k ranges over all algebraically closed fields over S the collection of geometric points $\bar{y} \in Y(k)$ cover all of $|Y|$.*
- (2) *As k ranges over all algebraically closed fields over S with $|k| \geq \lambda(Y)$ and $|k| > \lambda(X)$ the geometric points $\bar{y} \in Y(k)$ cover all of $|Y|$.*
- (3) *For any geometric point $\bar{s} : \text{Spec}(k) \rightarrow S$ where k has cardinality $> \lambda(X)$ the map*

$$X(k) \longrightarrow |X_{\bar{s}}|$$

is surjective.

- (4) *Let $X \rightarrow Y$ be a morphism of algebraic spaces over S . For any geometric point $\bar{s} : \text{Spec}(k) \rightarrow S$ where k has cardinality $> \lambda(X)$ the map*

$$X(k) \longrightarrow |X| \times_{|Y|} Y(k)$$

is surjective.

- (5) *Let $X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*
 - (a) *the map $X \rightarrow Y$ is surjective,*
 - (b) *for all algebraically closed fields k over S with $|k| > \lambda(X)$, and $|k| \geq \lambda(Y)$ the map $X(k) \rightarrow Y(k)$ is surjective.*

Proof. To prove part (1) choose a surjective étale morphism $V \rightarrow Y$ where V is a scheme. For each $v \in V$ choose an algebraic closure $\kappa(v) \subset k_v$. Consider the morphisms $\bar{x} : \text{Spec}(k_v) \rightarrow V \rightarrow Y$. By construction of $|Y|$ these cover $|Y|$.

To prove part (2) we will use the following two facts whose proofs we omit: (i) If K is a field and \bar{K} is algebraic closure then $|\bar{K}| \leq \max\{\aleph_0, |K|\}$. (ii) For any algebraically closed field k and any cardinal \aleph , $\aleph \geq |k|$ there exists an extension of algebraically closed fields $k \subset k'$ with $|k'| = \aleph$. Now we set $\aleph = \max\{\lambda(X), \lambda(Y)\}^+$. Here $\lambda^+ > \lambda$ indicates the next bigger cardinal, see Sets, Section 3.6. Now (i) implies that the fields k_u constructed in the first paragraph of the proof all have cardinality bounded by $\lambda(X)$. Hence by (ii) we can find extensions $k_u \subset k'_u$ such that $|k'_u| = \aleph$. The morphisms $\bar{x}' : \text{Spec}(k'_u) \rightarrow X$ cover $|X|$ as desired. To really finish the proof of (2) we need to show that the schemes $\text{Spec}(k'_u)$ are (isomorphic to) objects of Sch_{fppf} because our conventions are that all schemes are objects of Sch_{fppf} ; the rest of this paragraph should be skipped by anyone who is not interested in set theoretical considerations. By construction there exists an object T of Sch_{fppf} such that $\lambda(X)$ and $\lambda(Y)$ are bounded by $\text{size}(T)$. By our construction of the category Sch_{fppf} in Topologies, Definitions 33.7.6 as the category Sch_α constructed in Sets, Lemma 3.9.2 we see that any scheme whose size is $\leq \text{size}(T)^+$ is isomorphic to an object of Sch_{fppf} . See the expression for the function $Bound$ in Sets, Equation (3.9.1.1). Since $\aleph \leq \text{size}(T)^+$ we conclude.

The notation X_s in part (3) means the fibre product $\text{Spec}(\kappa(s)) \times_S X$, where $s \in S$ is the point corresponding to \bar{s} . Hence part (2) follows from (4) with $Y = \text{Spec}(\kappa(s))$.

Let us prove (4). Let $X \rightarrow Y$ be a morphism of algebraic spaces over S . Let k be an algebraically closed field over S of cardinality $> \lambda(X)$. Let $\bar{y} \in Y(k)$ and $x \in |X|$ which map to the same element y of $|Y|$. We have to find $\bar{x} \in X(k)$ mapping to x and \bar{y} . Choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

with U, V schemes over S and vertical arrows surjective and étale, see Spaces, Lemma 47.11.4. Choose a $u \in |U|$ which maps to x , and denote $v \in |V|$ the image. We will think of $u = \text{Spec}(\kappa(u))$ and $v = \text{Spec}(\kappa(v))$ as schemes. Note that $V \times_Y \text{Spec}(k)$ is a scheme étale over k . Hence it is a disjoint union of spectra of finite separable extensions of k , see Morphisms, Lemma 28.37.7. As v maps to y we see that $v \times_Y \text{Spec}(k)$ is a nonempty scheme. As $v \rightarrow V$ is a monomorphism, we see that $v \times_Y \text{Spec}(k) \rightarrow V \times_Y \text{Spec}(k)$ is a monomorphism. Hence $v \times_Y \text{Spec}(k)$ is a disjoint union of spectra of finite separable extensions of k , by Schemes, Lemma 25.23.10. We conclude that the morphism $v \times_Y \text{Spec}(k) \rightarrow \text{Spec}(k)$ has a section, i.e., we can find a morphism $\bar{v} : \text{Spec}(k) \rightarrow V$ lying over v and over \bar{y} . Finally we consider the scheme

$$u \times_{V, \bar{v}} \text{Spec}(k) = \text{Spec}(\kappa(u) \otimes_{\kappa(v)} k)$$

where $\kappa(v) \rightarrow k$ is the field map defining the morphism \bar{v} . Since the cardinality of k is larger than the cardinality of $\kappa(u)$ by assumption we may apply Algebra, Lemma 10.34.12 to see that any maximal ideal $\mathfrak{m} \subset \kappa(u) \otimes_{\kappa(v)} k$ has a residue field which is algebraic over k and hence equal to k . Such a maximal ideal will hence produce

a morphism $\bar{u} : \text{Spec}(k) \rightarrow U$ lying over u and mapping to \bar{v} . The composition $\text{Spec}(k) \rightarrow U \rightarrow X$ will be the desired geometric point $\bar{x} \in X(k)$. This concludes the proof of part (4).

Part (5) is a formal consequence of parts (2) and (4) and Properties of Spaces, Lemma 48.4.4. \square

49.25. Points of finite type

Let S be a scheme. Let X be an algebraic space over S . A finite type point $x \in |X|$ is a point which can be represented by a morphism $\text{Spec}(k) \rightarrow X$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always “enough of them” for example.

Lemma 49.25.1. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The following are equivalent:*

- (1) *There exists a morphism $\text{Spec}(k) \rightarrow X$ which is locally of finite type and represents x .*
- (2) *There exists a scheme U , a closed point $u \in U$, and an étale morphism $\varphi : U \rightarrow X$ such that $\varphi(u) = x$.*

Proof. Let $u \in U$ and $U \rightarrow X$ be as in (2). Then $\text{Spec}(\kappa(u)) \rightarrow U$ is of finite type, and $U \rightarrow X$ is representable and locally of finite type (by the general principle Spaces, Lemma 47.5.8 and Morphisms, Lemmas 28.37.11 and 28.22.8). Hence we see (1) holds by Lemma 49.23.2.

Conversely, assume $\text{Spec}(k) \rightarrow X$ is locally of finite type and represents x . Let $U \rightarrow X$ be a surjective étale morphism where U is a scheme. By assumption $U \times_X \text{Spec}(k) \rightarrow U$ is locally of finite type. Pick a finite type point v of $U \times_X \text{Spec}(k)$ (there exists at least one, see Morphisms, Lemma 28.17.4). By Morphisms, Lemma 28.17.5 the image $u \in U$ of v is a finite type point of U . Hence by Morphisms, Lemma 28.17.4 after shrinking U we may assume that u is a closed point of U , i.e., (2) holds. \square

Definition 49.25.2. Let S be a scheme. Let X be an algebraic space over S . We say a point $x \in |X|$ is a *finite type point*⁵ if the equivalent conditions of Lemma 49.25.1 are satisfied. We denote $X_{\text{ft-pts}}$ the set of finite type points of X .

We can describe the set of finite type points as follows.

Lemma 49.25.3. *Let S be a scheme. Let X be an algebraic space over S . We have*

$$X_{\text{ft-pts}} = \bigcup_{\varphi: U \rightarrow X \text{ étale}} |\varphi|(U_0)$$

where U_0 is the set of closed points of U . Here we may let U range over all schemes étale over X or over all affine schemes étale over X .

Proof. Immediate from Lemma 49.25.1. \square

Lemma 49.25.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type, then $f(X_{\text{ft-pts}}) \subset Y_{\text{ft-pts}}$.*

⁵This is a slight abuse of language as it would perhaps be more correct to say “locally finite type point”.

Proof. Take $x \in X_{\text{ft-pts}}$. Represent x by a locally finite type morphism $x : \text{Spec}(k) \rightarrow X$. Then $f \circ x$ is locally of finite type by Lemma 49.23.2. Hence $f(x) \in Y_{\text{ft-pts}}$. \square

Lemma 49.25.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type and surjective, then $f(X_{\text{ft-pts}}) = Y_{\text{ft-pts}}$.*

Proof. We have $f(X_{\text{ft-pts}}) \subset Y_{\text{ft-pts}}$ by Lemma 49.25.4. Let $y \in |Y|$ be a finite type point. Represent y by a morphism $\text{Spec}(k) \rightarrow Y$ which is locally of finite type. As f is surjective the algebraic space $X_k = \text{Spec}(k) \times_Y X$ is nonempty, therefore has a finite type point $x \in |X_k|$ by Lemma 49.25.3. Now $X_k \rightarrow X$ is a morphism which is locally of finite type as a base change of $\text{Spec}(k) \rightarrow Y$ (Lemma 49.23.3). Hence the image of x in X is a finite type point by Lemma 49.25.4 which maps to y by construction. \square

Lemma 49.25.6. *Let S be a scheme. Let X be an algebraic space over S . For any locally closed subset $T \subset |X|$ we have*

$$T \neq \emptyset \Rightarrow T \cap X_{\text{ft-pts}} \neq \emptyset.$$

In particular, for any closed subset $T \subset |X|$ we see that $T \cap X_{\text{ft-pts}}$ is dense in T .

Proof. Let $i : Z \rightarrow X$ be the reduced induce subspace structure on T , see Remark 49.12.5. Any immersion is locally of finite type, see Lemma 49.23.7. Hence by Lemma 49.25.4 we see $Z_{\text{ft-pts}} \subset X_{\text{ft-pts}} \cap T$. Finally, any nonempty affine scheme U with an étale morphism towards Z has at least one closed point. Hence Z has at least one finite type point by Lemma 49.25.3. The lemma follows. \square

Here is another, more technical, characterization of a finite type point on an algebraic space.

Lemma 49.25.7. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The following are equivalent:*

- (1) x is a finite type point,
- (2) there exists an algebraic space Z whose underlying topological space $|Z|$ is a singleton, and a morphism $f : Z \rightarrow X$ which is locally of finite type such that $\{x\} = |f|(|Z|)$, and
- (3) there exists an algebraic space Z and a morphism $f : Z \rightarrow X$ with the following properties:
 - (a) there is a surjective étale morphism $z : \text{Spec}(k) \rightarrow Z$ where k is a field,
 - (b) f is locally of finite type,
 - (c) f is a monomorphism, and
 - (d) $x = f(z)$.

Proof. Assume x is a finite type point. Choose an affine scheme U , a closed point $u \in U$, and an étale morphism $\varphi : U \rightarrow X$ with $\varphi(u) = x$, see Lemma 49.25.3. Set $u = \text{Spec}(\kappa(u))$ as usual. The projection morphisms $u \times_X u \rightarrow u$ are the compositions

$$u \times_X u \rightarrow u \times_X U \rightarrow u \times_X X = u$$

where the first arrow is a closed immersion (a base change of $u \rightarrow U$) and the second arrow is étale (a base change of the étale morphism $U \rightarrow X$). Hence $u \times_X U$ is a disjoint union of spectra of finite separable extensions of k (see Morphisms, Lemma

28.37.7) and therefore the closed subscheme $u \times_X u$ is a disjoint union of finite separable extension of k , i.e., $u \times_X u \rightarrow u$ is étale. By Spaces, Theorem 47.10.5 we see that $Z = u/u \times_X u$ is an algebraic space. By construction the diagram

$$\begin{array}{ccc} u & \longrightarrow & U \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

is commutative with étale vertical arrows. Hence $Z \rightarrow X$ is locally of finite type (see Lemma 49.23.4). By construction the morphism $Z \rightarrow X$ is a monomorphism and the image of z is x . Thus (3) holds.

It is clear that (3) implies (2). If (2) holds then x is a finite type point of X by Lemma 49.25.4 (and Lemma 49.25.6 to see that $Z_{\text{ft-pts}}$ is nonempty, i.e., the unique point of Z is a finite type point of Z). \square

49.26. Quasi-finite morphisms

The property “locally quasi-finite” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.21.13, and Descent, Lemma 34.19.22. Hence, by Lemma 49.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally quasi-finite as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.26.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *locally quasi-finite* if the equivalent conditions of Lemma 49.22.1 hold with $\mathcal{P} =$ locally quasi-finite.
- (2) Let $x \in |X|$. We say f is *quasi-finite at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is locally quasi-finite.
- (3) A morphism of algebraic spaces $f : X \rightarrow Y$ is *quasi-finite* if it is locally quasi-finite and quasi-compact.

The last part is compatible with the notion of quasi-finiteness for morphisms of schemes by Morphisms, Lemma 28.21.9.

Lemma 49.26.2. Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y' \rightarrow Y$ be morphisms of algebraic spaces over S . Denote $f' : X' \rightarrow Y'$ the base change of f by g . Denote $g' : X' \rightarrow X$ the projection. Assume f is locally of finite type. Let $W \subset |X|$, resp. $W' \subset |X'|$ be the set of points where f , resp. f' is quasi-finite.

- (1) $W \subset |X|$ and $W' \subset |X'|$ are open,
- (2) $W' = (g')^{-1}(W)$, i.e., formation of the locus where f is quasi-finite commutes with base change,
- (3) the base change of a locally quasi-finite morphism is locally quasi-finite, and
- (4) the base change of a quasi-finite morphism is quasi-finite.

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Choose a scheme V' and

a surjective étale morphism $V' \rightarrow Y' \times_Y V$. Set $U' = V' \times_V U$ so that $U' \rightarrow X'$ is a surjective étale morphism as well. Picture

$$\begin{array}{ccc}
 U' & \longrightarrow & U \\
 \downarrow & & \downarrow \\
 V' & \longrightarrow & V
 \end{array}
 \quad \text{lying over} \quad
 \begin{array}{ccc}
 X' & \longrightarrow & X \\
 \downarrow & & \downarrow \\
 Y' & \longrightarrow & Y
 \end{array}$$

Choose $u \in |U|$ with image $x \in |X|$. The property of being "locally quasi-finite" is étale local on the source-and-target, see Descent, Remark 34.28.7. Hence Lemmas 49.22.5 and 49.22.7 apply and we see that $f : X \rightarrow Y$ is quasi-finite at x if and only if $U \rightarrow V$ is quasi-finite at u . Similarly for $f' : X' \rightarrow Y'$ and the morphism $U' \rightarrow V'$. Hence parts (1), (2), and (3) reduce to Morphisms, Lemmas 28.21.13 and 28.49.2. Part (4) follows from (3) and Lemma 49.8.3. \square

Lemma 49.26.3. *The composition of quasi-finite morphisms is quasi-finite. The same holds for locally quasi-finite.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.21.12. \square

Lemma 49.26.4. *A base change of a quasi-finite morphism is quasi-finite. The same holds for locally quasi-finite.*

Proof. Immediate consequence of Lemma 49.26.2. \square

The following lemma characterizes locally quasi-finite morphisms as those morphisms which are locally of finite type and have "discrete fibres". However, this is not the same thing as asking $|X| \rightarrow |Y|$ to have discrete fibres as the discussion in Examples, Section 82.42 shows.

Lemma 49.26.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. Assume f is locally of finite type. The following are equivalent*

- (1) f is locally quasi-finite,
- (2) for every morphism $\text{Spec}(k) \rightarrow Y$ where k is a field the space $|X_k|$ is discrete. Here $X_k = \text{Spec}(k) \times_Y X$.

Proof. Assume f is locally quasi-finite. Let $\text{Spec}(k) \rightarrow Y$ be as in (2). Choose a surjective étale morphism $U \rightarrow X$ where U is a scheme. Then $U_k = \text{Spec}(k) \times_Y U \rightarrow X_k$ is an étale morphism of algebraic spaces by Properties of Spaces, Lemma 48.13.5. By Lemma 49.26.4 we see that $X_k \rightarrow \text{Spec}(k)$ is locally quasi-finite. By definition this means that $U_k \rightarrow \text{Spec}(k)$ is locally quasi-finite. Hence $|U_k|$ is discrete by Morphisms, Lemma 28.21.8. Since $|U_k| \rightarrow |X_k|$ is surjective and open we conclude that $|X_k|$ is discrete.

Conversely, assume (2). Choose a surjective étale morphism $V \rightarrow Y$ where V is a scheme. Choose a surjective étale morphism $U \rightarrow V \times_Y X$ where U is a scheme. Note that $U \rightarrow V$ is locally of finite type as f is locally of finite type. Picture

$$\begin{array}{ccccc}
 U & \longrightarrow & X \times_Y V & \longrightarrow & V \\
 & \searrow & \downarrow & & \downarrow \\
 & & X & \longrightarrow & Y
 \end{array}$$

If f is not locally quasi-finite then $U \rightarrow V$ is not locally quasi-finite. Hence there exists a specialization $u \rightsquigarrow u'$ for some $u, u' \in U$ lying over the same point $v \in V$,

see Morphisms, Lemma 28.21.6. We claim that u, u' do not have the same image in $X_v = \text{Spec}(\kappa(v)) \times_Y X$ which will contradict the assumption that $|X_v|$ is discrete as desired. Let $d = \text{trdeg}_{\kappa(v)}(\kappa(u))$ and $d' = \text{trdeg}_{\kappa(v)}(\kappa(u'))$. Then we see that $d > d'$ by Morphisms, Lemma 28.29.6. Note that U_v (the fibre of $U \rightarrow V$ over v) is the fibre product of U and X_v over $X \times_Y V$, hence $U_v \rightarrow X_v$ is étale (as a base change of the étale morphism $U \rightarrow X \times_Y V$). If $u, u' \in U_v$ map to the same element of $|X_v|$ then there exists a point $r \in R_v = U_v \times_{X_v} U_v$ with $t(r) = u$ and $s(r) = u'$, see Properties of Spaces, Lemma 48.4.3. Note that $s, t : R_v \rightarrow U_v$ are étale morphisms of schemes over $\kappa(v)$, hence $\kappa(u) \subset \kappa(r) \supset \kappa(u')$ are finite separable extensions of fields over $\kappa(v)$ (see Morphisms, Lemma 28.37.7). We conclude that the transcendence degrees are equal. This contradiction finishes the proof. \square

Lemma 49.26.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is locally quasi-finite,
- (2) for every $x \in |X|$ the morphism f is quasi-finite at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally quasi-finite,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally quasi-finite,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is locally quasi-finite,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is locally quasi-finite,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally quasi-finite,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is locally quasi-finite, and

- (9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is locally quasi-finite.

Proof. Omitted. \square

Lemma 49.26.7. *An immersion is locally quasi-finite.*

Proof. Omitted. \square

Lemma 49.26.8. *Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over S . If $X \rightarrow Z$ is locally quasi-finite, then $X \rightarrow Y$ is locally quasi-finite.*

Proof. Choose a commutative diagram

$$\begin{array}{ccccc} U & \longrightarrow & V & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z \end{array}$$

with vertical arrows étale and surjective. (See Spaces, Lemma 47.11.4.) Apply Morphisms, Lemma 28.21.16 to the top row. \square

Lemma 49.26.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a finite type morphism of algebraic spaces over S . Let $y \in |Y|$. There are at most finitely many points of $|X|$ lying over y at which f is quasi-finite.*

Proof. Choose a field k and a morphism $\text{Spec}(k) \rightarrow Y$ in the equivalence class determined by y . The fibre $X_k = \text{Spec}(k) \times_Y X$ is an algebraic space of finite type over a field, in particular quasi-compact. The map $|X_k| \rightarrow |X|$ surjects onto the fibre of $|X| \rightarrow |Y|$ over y (Properties of Spaces, Lemma 48.4.3). Moreover, the set of points where $X_k \rightarrow \text{Spec}(k)$ is quasi-finite maps onto the set of points lying over y where f is quasi-finite by Lemma 49.26.2. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X_k$ (Properties of Spaces, Lemma 48.6.3). Then $U \rightarrow \text{Spec}(k)$ is a morphism of finite type and there are at most a finite number of points where this morphism is quasi-finite, see Morphisms, Lemma 28.21.14. Since $X_k \rightarrow \text{Spec}(k)$ is quasi-finite at a point x' if and only if it is the image of a point of U where $U \rightarrow \text{Spec}(k)$ is quasi-finite, we conclude. \square

Lemma 49.26.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type and a monomorphism, then f is separated and locally quasi-finite.*

Proof. A monomorphism is separated, see Lemma 49.10.3. By Lemma 49.26.6 it suffices to prove the lemma after performing a base change by $Z \rightarrow Y$ with Z affine. Hence we may assume that Y is an affine scheme. Choose an affine scheme U and an étale morphism $U \rightarrow X$. Since $X \rightarrow Y$ is locally of finite type the morphism of affine schemes $U \rightarrow Y$ is of finite type. Since $X \rightarrow Y$ is a monomorphism we have $U \times_X U = U \times_Y U$. In particular the maps $U \times_Y U \rightarrow U$ are étale. Let $y \in Y$. Then either U_y is empty, or $\text{Spec}(\kappa(u)) \times_{\text{Spec}(\kappa(y))} U_y$ is isomorphic to the fibre of $U \times_Y U \rightarrow U$ over u for some $u \in U$ lying over y . This implies that the fibres of $U \rightarrow Y$ are finite discrete sets (as $U \times_Y U \rightarrow U$ is an étale morphism of affine schemes, see Morphisms, Lemma 28.37.7). Hence $U \rightarrow Y$ is quasi-finite, see Morphisms, Lemma 28.21.6. As $U \rightarrow X$ was an arbitrary étale morphism with U affine this implies that $X \rightarrow Y$ is locally quasi-finite. \square

49.27. Morphisms of finite presentation

The property “locally of finite presentation” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.22.4, and Descent, Lemma 34.19.9. Hence, by Lemma 49.22.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.27.1. Let S be a scheme. Let $X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *locally of finite presentation* if the equivalent conditions of Lemma 49.22.1 hold with \mathcal{P} = “locally of finite presentation”.
- (2) Let $x \in |X|$. We say f is of *finite presentation at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is locally of finite presentation⁶.
- (3) A morphism of algebraic spaces $f : X \rightarrow Y$ is of *finite presentation* if it is locally of finite presentation, quasi-compact and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation.

Lemma 49.27.2. *The composition of morphisms of finite presentation is of finite presentation. The same holds for locally of finite presentation.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.22.3. Also use the result for quasi-compact and for quasi-separated morphisms (Lemmas 49.8.4 and 49.4.8). \square

Lemma 49.27.3. *A base change of a morphism of finite presentation is of finite presentation. The same holds for locally of finite presentation.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.22.4. Also use the result for quasi-compact and for quasi-separated morphisms (Lemmas 49.8.3 and 49.4.4). \square

Lemma 49.27.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is locally of finite presentation,
- (2) for every $x \in |X|$ the morphism f is of finite presentation at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally of finite presentation,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is locally of finite presentation,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is locally of finite presentation,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is locally of finite presentation,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite presentation,

⁶It seems awkward to use “locally of finite presentation at x ”, but the current terminology may be misleading in the sense that “of finite presentation at x ” does **not** mean that there is an open neighbourhood $X' \subset X$ such that $f|_{X'}$ is of finite presentation.

(8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is locally of finite presentation, and

(9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is locally of finite presentation.

Proof. Omitted. □

Lemma 49.27.5. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces which is locally of finite presentation. This means there exists a diagram as in Lemma 49.22.1 with h locally of finite presentation and surjective vertical arrow a . By Morphisms, Lemma 28.22.8 h is locally of finite type. Hence $X \rightarrow Y$ is locally of finite type by definition. If f is of finite presentation then it is quasi-compact and it follows that f is of finite type. □

Lemma 49.27.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is of finite presentation and Y is Noetherian, then X is Noetherian.*

Proof. Assume f is of finite presentation and Y Noetherian. By Lemmas 49.27.5 and 49.23.5 we see that X is locally Noetherian. As f is quasi-compact and Y is quasi-compact we see that X is quasi-compact. As f is of finite presentation it is quasi-separated (see Definition 49.27.1) and as Y is Noetherian it is quasi-separated (see Properties of Spaces, Definition 48.22.1). Hence X is quasi-separated by Lemma 49.4.9. Hence we have checked all three conditions of Properties of Spaces, Definition 48.22.1 and we win. □

Lemma 49.27.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .*

- (1) *If Y is locally Noetherian and f locally of finite type then f is locally of finite presentation.*
- (2) *If Y is locally Noetherian and f of finite type and quasi-separated then f is of finite presentation.*

Proof. Assume $f : X \rightarrow Y$ locally of finite type and Y locally Noetherian. This means there exists a diagram as in Lemma 49.22.1 with h locally of finite type and surjective vertical arrow a . By Morphisms, Lemma 28.22.9 h is locally of finite presentation. Hence $X \rightarrow Y$ is locally of finite presentation by definition. This proves (1). If f is of finite type and quasi-separated then it is also quasi-compact and quasi-separated and (2) follows immediately. □

Lemma 49.27.8. *Let S be a scheme. Let Y be an algebraic space over S which is quasi-compact and quasi-separated. If X is of finite presentation over Y , then X is quasi-compact and quasi-separated.*

Proof. Omitted. □

Lemma 49.27.9. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be morphisms of algebraic spaces over S . If X is locally of finite presentation over Z , and Y is locally of finite type over Z , then f is locally of finite presentation.*

Proof. Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Then choose a scheme V and a surjective étale morphism $V \rightarrow W \times_Z Y$. Finally choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. By definition U is locally of finite presentation over W and V is locally of finite type over W . By Morphisms, Lemma 28.22.11 the morphism $U \rightarrow V$ is locally of finite presentation. Hence f is locally of finite presentation. □

Lemma 49.27.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S with diagonal $\Delta : X \rightarrow X \times_Y X$. If f is locally of finite type then Δ is locally of finite presentation. If f is quasi-separated and locally of finite type, then Δ is of finite presentation.*

Proof. Note that Δ is a morphism over X (via the second projection $X \times_Y X \rightarrow X$). Assume f is locally of finite type. Note that X is of finite presentation over X and $X \times_Y X$ is of finite type over X (by Lemma 49.23.3). Thus the first statement holds by Lemma 49.27.9. The second statement follows from the first, the definitions, and the fact that a diagonal morphism is separated (Lemma 49.4.1). □

Lemma 49.27.11. *An open immersion of algebraic spaces is locally of finite presentation.*

Proof. An open immersion is by definition representable, hence we can use the general principle Spaces, Lemma 47.5.8 and Morphisms, Lemma 28.22.5. □

Lemma 49.27.12. *A closed immersion $i : Z \rightarrow X$ is of finite presentation if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I} = \text{Ker}(\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z)$ is of finite type (as an \mathcal{O}_X -module).*

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. By Lemma 49.27.4 we see that $i' : Z \times_X U \rightarrow U$ is of finite presentation if and only if i is. By Properties of Spaces, Section 48.28 we see that \mathcal{I} is of finite type if and only if $\mathcal{I}|_U = \text{Ker}(\mathcal{O}_U \rightarrow i'_*\mathcal{O}_{Z \times_X U})$ is. Hence the result follows from the case of schemes, see Morphisms, Lemma 28.22.7. □

49.28. Flat morphisms

The property “flat” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.26.7 and Descent, Lemma 34.19.13. Hence, by Lemma 49.22.1 above, we may define the notion of a flat morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.28.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *flat* if the equivalent conditions of Lemma 49.22.1 with \mathcal{P} = “flat”.
- (2) Let $x \in |X|$. We say f is *flat at x* if the equivalent conditions of Lemma 49.22.5 holds with \mathcal{Q} = “induced map local rings is flat”.

Note that the second part makes sense by Descent, Lemma 34.29.4.

We do a quick sanity check.

Lemma 49.28.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then f is flat if and only if f is flat at all points of $|X|$.*

Proof. Choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes, the vertical arrows are étale, and a is surjective. By definition f is flat if and only if h is flat (Definition 49.22.2). By definition f is flat at $x \in |X|$ if and only if h is flat at some (equivalently any) $u \in U$ which maps to x (Definition 49.22.6). Thus the lemma follows from the fact that a morphism of schemes is flat if and only if it is flat at all points of the source (Morphisms, Definition 28.26.1). \square

Lemma 49.28.3. *The composition of flat morphisms is flat.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.26.5. \square

Lemma 49.28.4. *The base change of a flat morphism is flat.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.26.7. \square

Lemma 49.28.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is flat,
- (2) for every $x \in |X|$ the morphism f is flat at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is flat,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is flat,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is flat,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is flat,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is flat,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is flat, and

- (9) there exists a Zariski coverings $Y = \bigcup Y_i$ and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is flat.

Proof. Omitted. □

Lemma 49.28.6. *A flat morphism locally of finite presentation is universally open.*

Proof. Let $f : X \rightarrow Y$ be a flat morphism locally of finite presentation of algebraic spaces over S . Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 47.11.4. By Lemmas 49.28.5 and 49.27.4 the morphism α is flat and locally of finite presentation. Hence by Morphisms, Lemma 28.26.9 we see that α is universally open. Hence $X \rightarrow Y$ is universally open according to Lemma 49.6.5. □

Lemma 49.28.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a flat, quasi-compact, surjective morphism of algebraic spaces over S . A subset $T \subset |Y|$ is open (resp. closed) if and only if $f^{-1}(|T|)$ is open (resp. closed) in $|X|$. In other words f is submersive, and in fact universally submersive.*

Proof. Choose affine schemes V_i and étale morphisms $V_i \rightarrow Y$ such that $V = \coprod V_i \rightarrow Y$ is surjective, see Properties of Spaces, Lemma 48.6.1. For each i the algebraic space $V_i \times_Y X$ is quasi-compact. Hence we can find an affine scheme U_i and a surjective étale morphism $U_i \rightarrow V_i \times_Y X$, see Properties of Spaces, Lemma 48.6.3. Then the composition $U_i \rightarrow V_i \times_Y X \rightarrow V_i$ is a surjective, flat morphism of affines. Of course then $U = \coprod U_i \rightarrow X$ is surjective and étale and $U = V \times_Y X$. Moreover, the morphism $U \rightarrow V$ is the disjoint union of the morphisms $U_i \rightarrow V_i$. Hence $U \rightarrow V$ is surjective, quasi-compact and flat. Consider the diagram

$$\begin{array}{ccc} U & \longrightarrow & X \\ \downarrow & & \downarrow \\ V & \longrightarrow & Y \end{array}$$

By definition of the topology on $|Y|$ the set T is closed (resp. open) if and only if $g^{-1}(T) \subset |V|$ is closed (resp. open). The same holds for $f^{-1}(T)$ and its inverse image in $|U|$. Since $U \rightarrow V$ is quasi-compact, surjective, and flat we win by Morphisms, Lemma 28.26.10. □

Lemma 49.28.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \bar{x} be a geometric point of X lying over the point $x \in |X|$. Let $\bar{y} = f \circ \bar{x}$. The following are equivalent*

- (1) f is flat at x , and
- (2) the map on étale local rings $\mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{X, \bar{x}}$ is flat.

Proof. Choose a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \searrow h & \downarrow b \\ X & \xrightarrow{\quad f \quad} & Y \end{array}$$

where U and V are schemes, a, b are étale, and $u \in U$ mapping to x . We can find a geometric point $\bar{u} : \text{Spec}(k) \rightarrow U$ lying over u with $\bar{x} = a \circ \bar{u}$, see Properties of Spaces, Lemma 48.16.4. Set $\bar{v} = h \circ \bar{u}$ with image $v \in V$. We know that

$$\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{U, u}^{sh} \quad \text{and} \quad \mathcal{O}_{Y, \bar{y}} = \mathcal{O}_{V, v}^{sh}$$

see Properties of Spaces, Lemma 48.19.1. We obtain a commutative diagram

$$\begin{array}{ccc} \mathcal{O}_{U, u} & \longrightarrow & \mathcal{O}_{X, \bar{x}} \\ \uparrow & & \uparrow \\ \mathcal{O}_{V, v} & \longrightarrow & \mathcal{O}_{Y, \bar{y}} \end{array}$$

of local rings with flat horizontal arrows. We have to show that the left vertical arrow is flat if and only if the right vertical arrow is. Algebra, Lemma 10.38.8 tells us $\mathcal{O}_{U, u}$ is flat over $\mathcal{O}_{V, v}$ if and only if $\mathcal{O}_{X, \bar{x}}$ is flat over $\mathcal{O}_{Y, \bar{y}}$. Hence the result follows from More on Flatness, Lemma 37.2.5. \square

Lemma 49.28.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then f is flat if and only if the morphism of sites $(f_{small}, f^\#) : (X_{\acute{e}tale}, \mathcal{O}_X) \rightarrow (Y_{\acute{e}tale}, \mathcal{O}_Y)$ associated to f is flat.*

Proof. Flatness of $(f_{small}, f^\#)$ is defined in terms of flatness of \mathcal{O}_X as a $f_{small}^{-1}\mathcal{O}_Y$ -module. This can be checked at stalks, see Modules on Sites, Lemma 18.38.2 and Properties of Spaces, Theorem 48.16.12. But we’ve already seen that flatness of f can be checked on stalks, see Lemma 49.28.8. \square

Lemma 49.28.10. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module with scheme theoretic support $Z \subset X$. If f is flat, then $f^{-1}(Z)$ is the scheme theoretic support of $f^*\mathcal{F}$.*

Proof. Using the characterization of the scheme theoretic support as given in Lemma 49.15.3 and using the characterization of flat morphisms in terms of étale coverings in Lemma 49.28.5 we reduce to the case of schemes which is Morphisms, Lemma 28.26.12. \square

Lemma 49.28.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a flat morphism of algebraic spaces over S . Let $V \rightarrow Y$ be a quasi-compact open immersion. If V is scheme theoretically dense in Y , then $f^{-1}V$ is scheme theoretically dense in X .*

Proof. Using the characterization of scheme theoretically dense opens in Lemma 49.17.2 and using the characterization of flat morphisms in terms of étale coverings in Lemma 49.28.5 we reduce to the case of schemes which is Morphisms, Lemma 28.26.13. \square

Lemma 49.28.12. *Let S be a scheme. Let $f : X \rightarrow Y$ be a flat morphism of algebraic spaces over S . Let $g : V \rightarrow Y$ be a quasi-compact morphism of algebraic spaces. Let $Z \subset Y$ be the scheme theoretic image of g and let $Z' \subset X$ be the scheme theoretic image of the base change $V \times_Y X \rightarrow X$. Then $Z' = f^{-1}Z$.*

Proof. Let $Y' \rightarrow Y$ be a surjective étale morphism such that Y' is a disjoint union of affine schemes (Properties of Spaces, Lemma 48.6.1). Let $X' \rightarrow X \times_Y Y'$ be a surjective étale morphism such that X' is a disjoint union of affine schemes. By Lemma 49.28.5 the morphism $X' \rightarrow Y'$ is flat. Set $V' = V \times_Y Y'$. By Lemma 49.16.3 the inverse image of Z in Y' is the scheme theoretic image of $V' \rightarrow Y'$ and the inverse image of Z' in X' is the scheme theoretic image of $V' \times_{Y'} X' \rightarrow X'$. Since $X' \rightarrow X$ is surjective étale, it suffices to prove the result in the case of the morphisms $X' \rightarrow Y'$ and $V' \rightarrow Y'$. Thus we may assume X and Y are affine schemes. In this case V is a quasi-compact algebraic space. Choose an affine scheme W and a surjective étale morphism $W \rightarrow V$ (Properties of Spaces, Lemma 48.6.3). It is clear that the scheme theoretic image of $V \rightarrow Y$ agrees with the scheme theoretic image of $W \rightarrow Y$ and similarly for $V \times_Y X \rightarrow Y$ and $W \times_Y X \rightarrow X$. Thus we reduce to the case of schemes which is Morphisms, Lemma 28.26.14. \square

49.29. Flat modules

In this section we define what it means for a module to be flat at a point. To do this we will use the notion of the stalk of a sheaf on the small étale site $X_{\text{étale}}$ of an algebraic space, see Properties of Spaces, Definition 48.16.6.

Lemma 49.29.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X . Let $x \in |X|$. The following are equivalent*

- (1) *for some commutative diagram*

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes, a, b are étale, and $u \in U$ mapping to x the module $a^\mathcal{F}$ is flat at u over V ,*

- (2) *the stalk $\mathcal{F}_{\bar{x}}$ is flat over the étale local ring $\mathcal{O}_{Y, \bar{y}}$ where \bar{x} is any geometric point lying over x and $\bar{y} = f \circ \bar{x}$.*

Proof. During this proof we fix a geometric point $\bar{x} : \text{Spec}(k) \rightarrow X$ over x and we denote $\bar{y} = f \circ \bar{x}$ its image in Y . Given a diagram as in (1) we can find a geometric point $\bar{u} : \text{Spec}(k) \rightarrow U$ lying over u with $\bar{x} = a \circ \bar{u}$, see Properties of Spaces, Lemma 48.16.4. Set $\bar{v} = h \circ \bar{u}$ with image $v \in V$. We know that

$$\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{U, u}^{sh} \quad \text{and} \quad \mathcal{O}_{Y, \bar{y}} = \mathcal{O}_{V, v}^{sh}$$

see Properties of Spaces, Lemma 48.19.1. We obtain a commutative diagram

$$\begin{array}{ccc} \mathcal{O}_{U, u} & \longrightarrow & \mathcal{O}_{X, \bar{x}} \\ \uparrow & & \uparrow \\ \mathcal{O}_{V, v} & \longrightarrow & \mathcal{O}_{Y, \bar{y}} \end{array}$$

of local rings. Finally, we have

$$\mathcal{F}_{\bar{x}} = (\varphi^* \mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\bar{x}}$$

by Properties of Spaces, Lemma 48.27.4. Thus Algebra, Lemma 10.38.8 tells us $(\varphi^* \mathcal{F})_u$ is flat over $\mathcal{O}_{V,v}$ if and only if $\mathcal{F}_{\bar{x}}$ is flat over $\mathcal{O}_{V,v}$. Hence the result follows from More on Flatness, Lemma 37.2.5. \square

Definition 49.29.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X .

- (1) Let $x \in |X|$. We say \mathcal{F} is *flat at x over Y* if the equivalent conditions of Lemma 49.29.1 hold.
- (2) We say \mathcal{F} is *flat over Y* if \mathcal{F} is flat over Y at all $x \in |X|$.

Having defined this we have the obligatory base change lemma. This lemma implies that formation of the flat locus of a quasi-coherent sheaf commutes with flat base change.

Lemma 49.29.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \xrightarrow{\quad g' \quad} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{\quad g \quad} & Y \end{array}$$

be a cartesian diagram of algebraic spaces over S . Let $x' \in |X'|$ with image $x \in |X|$. Let \mathcal{F} be a quasi-coherent sheaf on X and denote $\mathcal{F}' = (g')^ \mathcal{F}$.*

- (1) *If \mathcal{F} is flat at x over Y then \mathcal{F}' is flat at x' over Y' .*
- (2) *If g is flat at $f'(x')$ and \mathcal{F}' is flat at x' over Y' , then \mathcal{F} is flat at x over Y .*

In particular, if \mathcal{F} is flat over Y , then \mathcal{F}' is flat over Y' .

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Choose a scheme V' and a surjective étale morphism $V' \rightarrow V \times_Y Y'$. Then $U' = V' \times_V U$ is a scheme endowed with a surjective étale morphism $U' = V' \times_V U \rightarrow Y' \times_Y X = X'$. Pick $u' \in U'$ mapping to $x' \in |X'|$. Then we can check flatness of \mathcal{F}' at x' over Y' in terms of flatness of $\mathcal{F}'|_{U'}$ at u' over V' . Hence the lemma follows from More on Morphisms, Lemma 36.12.2. \square

The following lemma discusses “composition” of flat morphisms in terms of modules. It also shows that flatness satisfies a kind of top down descent.

Lemma 49.29.4. *Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X . Let $x \in |X|$ with image $y \in |Y|$.*

- (1) *If \mathcal{F} is flat at x over Y and Y is flat at y over Z , then \mathcal{F} is flat at x over Z .*
- (2) *Let $x : \text{Spec}(K) \rightarrow X$ be a representative of x . If*
 - (a) *\mathcal{F} is flat at x over Y ,*
 - (b) *$x^* \mathcal{F} \neq 0$, and*
 - (c) *\mathcal{F} is flat at x over Z ,**then Y is flat at y over Z .*

- (3) Let \bar{x} be a geometric point of X lying over x with image \bar{y} in Y . If $\mathcal{F}_{\bar{x}}$ is a faithfully flat $\mathcal{O}_{Y, \bar{y}}$ -module and \mathcal{F} is flat at x over Z , then Y is flat at y over Z .

Proof. Pick \bar{x} and \bar{y} as in part (3) and denote \bar{z} the induced geometric point of Z . Via the characterization of flatness in Lemmas 49.29.1 and 49.28.8 the lemma reduces to a purely algebraic question on the local ring map $\mathcal{O}_{Z, \bar{z}} \rightarrow \mathcal{O}_{Y, \bar{y}}$ and the module $\mathcal{F}_{\bar{x}}$. Part (1) follows from Algebra, Lemma 10.38.3. We remark that condition (2)(b) guarantees that $\mathcal{F}_{\bar{x}}/\mathfrak{m}_{\bar{y}}\mathcal{F}_{\bar{x}}$ is nonzero. Hence (2)(a) + (2)(b) imply that $\mathcal{F}_{\bar{x}}$ is a faithfully flat $\mathcal{O}_{Y, \bar{y}}$ -module, see Algebra, Lemma 10.38.14. Thus (2) is a special case of (3). Finally, (3) follows from Algebra, Lemma 10.38.9. \square

Sometimes the base change happens “up on top”. Here is a precise statement.

Lemma 49.29.5. *Let S be a scheme. Let $f : X \rightarrow Y$, $g : Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let \mathcal{G} be a quasi-coherent sheaf on Y . Let $x \in |X|$ with image $y \in |Y|$. If f is flat at x , then*

$$\mathcal{G} \text{ flat over } Z \text{ at } y \Leftrightarrow f^*\mathcal{G} \text{ flat over } Z \text{ at } x.$$

In particular: If f is surjective and flat, then \mathcal{G} is flat over Z , if and only if $f^\mathcal{G}$ is flat over Z .*

Proof. Pick a geometric point \bar{x} of X and denote \bar{y} the image in Y and \bar{z} the image in Z . Via the characterization of flatness in Lemmas 49.29.1 and 49.28.8 and the description of the stalk of $f^*\mathcal{G}$ at \bar{x} of Properties of Spaces, Lemma 48.27.5 the lemma reduces to a purely algebraic question on the local ring maps $\mathcal{O}_{Z, \bar{z}} \rightarrow \mathcal{O}_{Y, \bar{y}} \rightarrow \mathcal{O}_{X, \bar{x}}$ and the module $\mathcal{G}_{\bar{y}}$. This algebraic statement is Algebra, Lemma 10.38.8. \square

49.30. Generic flatness

This section is the analogue of Morphisms, Section 28.28.

Proposition 49.30.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Assume*

- (1) Y is reduced,
- (2) f is of finite type, and
- (3) \mathcal{F} is a finite type \mathcal{O}_X -module.

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_W \rightarrow W$ of f is flat, locally of finite presentation, and quasi-compact and such that $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over \mathcal{O}_{X_W} .

Proof. Let V be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. Let $X_V = V \times_Y X$ and let \mathcal{F}_V be the restriction of \mathcal{F} to X_V . Suppose that the result holds for the morphism $X_V \rightarrow V$ and the sheaf \mathcal{F}_V . Then there exists an open subscheme $V' \subset V$ such that $X_{V'} \rightarrow V'$ is flat and of finite presentation and $\mathcal{F}_{V'}$ is an $\mathcal{O}_{X_{V'}}$ -module of finite presentation flat over V' . Let $W \subset Y$ be the image of the étale morphism $V' \rightarrow Y$, see Properties of Spaces, Lemma 48.4.10. Then $V' \rightarrow W$ is a surjective étale morphism, hence we see that $X_W \rightarrow W$ is flat, locally of finite presentation, and quasi-compact by Lemmas 49.27.4, 49.28.5, and 49.8.7. By the discussion in Properties of Spaces, Section 48.28 we see that \mathcal{F}_W is of finite presentation as a \mathcal{O}_{X_W} -module and by Lemma 49.29.3 we see that \mathcal{F}_W is flat over W . This argument reduces the proposition to the case where Y is a scheme.

Suppose we can prove the proposition when Y is an affine scheme. Let $f : X \rightarrow Y$ be a finite type morphism of algebraic spaces over S with Y a scheme, and let \mathcal{F} be a finite type, quasi-coherent \mathcal{O}_X -module. Choose an affine open covering $Y = \bigcup V_j$. By assumption we can find dense open $W_j \subset V_j$ such that $X_{W_j} \rightarrow W_j$ is flat, locally of finite presentation, and quasi-compact and such that $\mathcal{F}|_{X_{W_j}}$ is flat over W_j and of finite presentation as an $\mathcal{O}_{X_{W_j}}$ -module. In this situation we simply take $W = \bigcup W_j$ and we win. Hence we reduce the proposition to the case where Y is an affine scheme.

Let Y be an affine scheme over S , let $f : X \rightarrow Y$ be a finite type morphism of algebraic spaces over S , and let \mathcal{F} be a finite type, quasi-coherent \mathcal{O}_X -module. Since f is of finite type it is quasi-compact, hence X is quasi-compact. Thus we can find an affine scheme U and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 48.6.3. Note that $U \rightarrow Y$ is of finite type (this is what it means for f to be of finite type in this case). Hence we can apply Morphisms, Proposition 28.28.2 to see that there exists a dense open $W \subset Y$ such that $U_W \rightarrow W$ is flat and of finite presentation and such that $\mathcal{F}|_{U_W}$ is flat over W and of finite presentation as an \mathcal{O}_{U_W} -module. According to our definitions this means that the base change $X_W \rightarrow W$ of f is flat, locally of finite presentation, and quasi-compact and $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over \mathcal{O}_{X_W} . \square

We cannot improve the result of the lemma above to requiring $X_W \rightarrow W$ to be of finite presentation as $\mathbf{A}_{\mathbf{Q}}^1/\mathbf{Z} \rightarrow \mathrm{Spec}(\mathbf{Q})$ gives a counter example. The problem is that the diagonal morphism $\Delta_{X/Y}$ may not be quasi-compact, i.e., f may not be quasi-separated. Clearly, this is also the only problem.

Proposition 49.30.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf of \mathcal{O}_X -modules. Assume*

- (1) Y is reduced,
- (2) f is quasi-separated,
- (3) f is of finite type, and
- (4) \mathcal{F} is a finite type \mathcal{O}_X -module.

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_W \rightarrow W$ of f is flat and of finite presentation and such that $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over \mathcal{O}_{X_W} .

Proof. This follows immediately from Proposition 49.30.1 and the fact that “of finite presentation” = “locally of finite presentation” + “quasi-compact” + “quasi-separated”. \square

49.31. Relative dimension

In this section we define the relative dimension of a morphism of algebraic spaces at a point, and some closely related properties.

Definition 49.31.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$. Let $d, r \in \{0, 1, 2, \dots, \infty\}$.

- (1) We say the *dimension of the local ring of the fibre of f at x* is d if the equivalent conditions of Lemma 49.22.5 hold for the property \mathcal{P}_d described in Descent, Lemma 34.29.6.

- (2) We say the *transcendence degree of $x/f(x)$* is r if the equivalent conditions of Lemma 49.22.5 hold for the property \mathcal{P}_r described in Descent, Lemma 34.29.7.
- (3) We say the *f has relative dimension d at x* if the equivalent conditions of Lemma 49.22.5 hold for the property \mathcal{P}_d described in Descent, Lemma 34.29.8.

Let us spell out what this means. Namely, choose some diagrams

$$\begin{array}{ccc}
 U & \xrightarrow{\quad} & V \\
 \downarrow a & & \downarrow b \\
 X & \xrightarrow{f} & Y
 \end{array}
 \qquad
 \begin{array}{ccc}
 u & \xrightarrow{\quad} & v \\
 \downarrow & & \downarrow \\
 x & \xrightarrow{\quad} & y
 \end{array}$$

as in Lemma 49.22.5. Then we have

$$\begin{aligned}
 \text{relative dimension of } f \text{ at } x &= \dim_u(U_v) \\
 \text{dimension of local ring of the fibre of } f \text{ at } x &= \dim(\mathcal{O}_{U_v, u}) \\
 \text{transcendence degree of } x/f(x) &= \text{trdeg}_{\kappa(v)}(\kappa(u))
 \end{aligned}$$

Note that if $Y = \text{Spec}(k)$ is the spectrum of a field, then the relative dimension of X/Y at x is the same as $\dim_x(X)$, the transcendence degree of $x/f(x)$ is the transcendence degree over k , and the dimension of the local ring of the fibre of f at x is just the dimension of the local ring at x , i.e., the relative notions become absolute notions in that case.

Definition 49.31.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $d \in \{0, 1, 2, \dots\}$.

- (1) We say f has *relative dimension $\leq d$* if f has relative dimension $\leq d$ at all $x \in |X|$.
- (2) We say f has *relative dimension d* if f has relative dimension d at all $x \in |X|$.

Having relative dimension *equal to d* means roughly speaking that all nonempty fibres are equidimensional of dimension d .

Lemma 49.31.3. Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let $x \in |X|$ and let $y \in |Y|$, $z \in |Z|$ be the images. Assume $X \rightarrow Y$ is locally quasi-finite and $Y \rightarrow Z$ locally of finite type. Then the transcendence degree of x/z is equal to the transcendence degree of y/z .

Proof. We can choose commutative diagrams

$$\begin{array}{ccccc}
 U & \longrightarrow & V & \longrightarrow & W \\
 \downarrow & & \downarrow & & \downarrow \\
 X & \longrightarrow & Y & \longrightarrow & Z
 \end{array}
 \qquad
 \begin{array}{ccccc}
 u & \longrightarrow & v & \longrightarrow & w \\
 \downarrow & & \downarrow & & \downarrow \\
 x & \longrightarrow & y & \longrightarrow & z
 \end{array}$$

where U, V, W are schemes and the vertical arrows are étale. By definition the morphism $U \rightarrow V$ is locally quasi-finite which implies that $\kappa(v) \subset \kappa(u)$ is finite, see Morphisms, Lemma 28.21.5. Hence the result is clear. \square

Lemma 49.31.4. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of locally Noetherian algebraic spaces over S which is flat, locally of finite type and of relative dimension d . For every point x in $|X|$ with image y in $|Y|$ we have $\dim_x(X) = \dim_y(Y) + d$.

Proof. By definition of the dimension of an algebraic space at a point (Properties of Spaces, Definition 48.8.1) and by definition of having relative dimension d , this reduces to the corresponding statement for schemes (Morphisms, Lemma 28.30.6). \square

49.32. Morphisms and dimensions of fibres

This section is the analogue of Morphisms, Section 28.29. The formulations in this section are a bit awkward since we do not have local rings of algebraic spaces at points.

Lemma 49.32.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$. Assume f is locally of finite type. Then we have*

$$\begin{aligned} & \text{relative dimension of } f \text{ at } x \\ & = \\ & \text{dimension of local ring of the fibre of } f \text{ at } x \\ & + \\ & \text{transcendence degree of } x/f(x) \end{aligned}$$

where the notation is as in Definition 49.31.1.

Proof. This follows immediately from Morphisms, Lemma 28.29.1 applied to $h : U \rightarrow V$ and $u \in U$ as in Lemma 49.22.5. \square

Lemma 49.32.2. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let $x \in |X|$ and set $y = f(x)$. Assume f and g locally of finite type. Then*

$$\begin{aligned} & \text{relative dimension of } g \circ f \text{ at } x \\ & \leq \\ & \text{relative dimension of } f \text{ at } x \\ & + \\ & \text{relative dimension of } g \text{ at } y \end{aligned}$$

Moreover, equality holds if for some morphism $\text{Spec}(k) \rightarrow Z$ from the spectrum of a field in the class of $g(f(x)) = g(y)$ the morphism $X_k \rightarrow Y_k$ is flat at x . This holds for example if f is flat at x .

Proof. Choose a diagram

$$\begin{array}{ccccc} U & \longrightarrow & V & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z \end{array}$$

with U, V, W schemes and vertical arrows étale and surjective. (See Spaces, Lemma 47.11.4.) Choose $u \in U$ mapping to x . Set v, w equal to the images of u in V, W . Apply Morphisms, Lemma 28.29.2 to the top row and the points u, v, w . Details omitted. \square

Lemma 49.32.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{\quad} & Y \end{array}$$

be a fibre product diagram of algebraic spaces over S . Let $x' \in |X'|$. Set $x = g'(x')$. Assume f locally of finite type. Then we have

$$\begin{aligned} & \text{relative dimension of } f \text{ at } x \\ & = \\ & \text{relative dimension of } f' \text{ at } x' \end{aligned}$$

Proof. Choose a surjective étale morphism $V \rightarrow Y$ with V a scheme. By Spaces, Lemma 47.11.4 we may choose morphisms of schemes $V' \rightarrow V$ lifting the morphism g and $U \rightarrow V$ lifting the morphism f such that $V' \rightarrow Y'$ and $U \rightarrow X$ are also surjective and étale. Set $U' = V' \times_V U$. Then the induced morphism $U' \rightarrow X'$ is also surjective and étale (argument omitted). Hence we can choose a $u' \in U'$ mapping to x' . At this point the result follows by applying Morphisms, Lemma 28.29.3 to the diagram of schemes involving U', U, V', V and the point u' . \square

Lemma 49.32.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $n \geq 0$. Assume f is locally of finite type. The set*

$$W_n = \{x \in |X| \text{ such that the relative dimension of } f \text{ at } x \leq n\}$$

is open in $|X|$.

Proof. Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 47.11.4. By Morphisms, Lemma 28.29.4 the set U_n of points where h has relative dimension $\leq n$ is open in U . By our definition of relative dimension for morphisms of algebraic spaces at points we see that $U_n = a^{-1}(W_n)$. The lemma follows by definition of the topology on $|X|$. \square

Lemma 49.32.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $n \geq 0$. Assume f is locally of finite presentation. The open*

$$W_n = \{x \in |X| \text{ such that the relative dimension of } f \text{ at } x \leq n\}$$

of Lemma 49.32.4 is retrocompact in $|X|$. (See Topology, Definition 5.11.1.)

Proof. Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 47.11.4. In the proof of Lemma 49.32.4 we have seen that $a^{-1}(W_n) = U_n$ is the corresponding set for the morphism h . By Morphisms, Lemma 28.29.5 we see that U_n is retrocompact in U . The lemma follows by definition of the topology on $|X|$, compare with Properties of Spaces, Lemma 48.5.5 and its proof. \square

Lemma 49.32.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type. Then f is locally quasi-finite if and only if f has relative dimension 0 at each $x \in |X|$.*

Proof. Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 47.11.4. The definitions imply that h is locally quasi-finite if and only if f is locally quasi-finite, and that f has relative dimension 0 at all $x \in |X|$ if and only if h has relative dimension 0 at all $u \in U$. Hence the result follows from the result for h which is Morphisms, Lemma 28.30.5. \square

Lemma 49.32.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type. Then there exists a canonical open subspace $X' \subset X$ such that $f|_{X'} : X' \rightarrow Y$ is locally quasi-finite, and such that the relative dimension of f at any $x \in |X|$, $x \notin |X'|$ is ≥ 1 . Formation of X' commutes with arbitrary base change.*

Proof. Combine Lemmas 49.32.4, 49.32.6, and 49.32.3. \square

Lemma 49.32.8. *Let S be a scheme. Consider a cartesian diagram*

$$\begin{array}{ccc} X & \xleftarrow{p} & F \\ \downarrow & & \downarrow \\ Y & \xleftarrow{\quad} & \text{Spec}(k) \end{array}$$

where $X \rightarrow Y$ is a morphism of algebraic spaces over S which is locally of finite type and where k is a field over S . Let $z \in |F|$ be such that $\dim_z(F) = 0$. Then, after replacing X by an open subspace containing $p(z)$, the morphism

$$X \longrightarrow Y$$

is locally quasi-finite.

Proof. Let $X' \subset X$ be the open subspace over which f is locally quasi-finite found in Lemma 49.32.7. Since the formation of X' commutes with arbitrary base change we see that $z \in X' \times_Y \text{Spec}(k)$. Hence the lemma is clear. \square

49.33. Syntomic morphisms

The property “syntomic” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.32.4 and Descent, Lemma 34.19.24. Hence, by Lemma 49.22.1 above, we may define the notion of a syntomic morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.33.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *syntomic* if the equivalent conditions of Lemma 49.22.1 hold with \mathcal{P} = “syntomic”.
- (2) Let $x \in |X|$. We say f is *syntomic at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is syntomic.

Lemma 49.33.2. *The composition of syntomic morphisms is syntomic.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.32.3. □

Lemma 49.33.3. *The base change of a syntomic morphism is syntomic.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.32.4. □

Lemma 49.33.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is syntomic,
- (2) for every $x \in |X|$ the morphism f is syntomic at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is syntomic,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is syntomic,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a syntomic morphism,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is syntomic,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is syntomic,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is syntomic, and

- (9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is syntomic.

Proof. Omitted. □

49.34. Smooth morphisms

The property “smooth” of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.35.5 and Descent, Lemma 34.19.25. Hence, by Lemma 49.22.1 above, we may define the notion of a smooth morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.34.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *smooth* if the equivalent conditions of Lemma 49.22.1 hold with \mathcal{P} = “smooth”.
- (2) Let $x \in |X|$. We say f is *smooth at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is smooth.

Lemma 49.34.2. *The composition of smooth morphisms is smooth.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.35.4. □

Lemma 49.34.3. *The base change of a smooth morphism is smooth.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.35.5. □

Lemma 49.34.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is smooth,
- (2) for every $x \in |X|$ the morphism f is smooth at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is smooth,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is smooth,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is a smooth morphism,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is smooth,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is smooth,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is smooth, and

- (9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is smooth.

Proof. Omitted. □

Lemma 49.34.5. *A smooth morphism of algebraic spaces is locally of finite presentation.*

Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 49.22.1 with h smooth and surjective vertical arrow a . By Morphisms, Lemma 28.35.8 h is locally of finite presentation. Hence $X \rightarrow Y$ is locally of finite presentation by definition. □

Lemma 49.34.6. *A smooth morphism of algebraic spaces is locally of finite type.*

Proof. Combine Lemmas 49.34.5 and 49.27.5. \square

Lemma 49.34.7. *A smooth morphism of algebraic spaces is flat.*

Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 49.22.1 with h smooth and surjective vertical arrow a . By Morphisms, Lemma 28.35.8 h is flat. Hence $X \rightarrow Y$ is flat by definition. \square

Lemma 49.34.8. *A smooth morphism of algebraic spaces is syntomic.*

Proof. Let $X \rightarrow Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 49.22.1 with h smooth and surjective vertical arrow a . By Morphisms, Lemma 28.35.7 h is syntomic. Hence $X \rightarrow Y$ is syntomic by definition. \square

Lemma 49.34.9. *Let X and Y be locally Noetherian algebraic spaces over a scheme S , and let $f : X \rightarrow Y$ be a smooth morphism. For every point $x \in |X|$ with image $y \in |Y|$,*

$$\dim_x(X) = \dim_y(Y) + \dim_x(X_y)$$

where $\dim_x(X_y)$ is the relative dimension of f at x as in Definition 49.31.1.

Proof. By definition of the dimension of an algebraic space at a point (Properties of Spaces, Definition 48.8.1), this reduces to the corresponding statement for schemes (Morphisms, Lemma 28.35.21). \square

49.35. Unramified morphisms

The property “unramified” (resp. “G-unramified”) of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 34.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 28.36.5 and Descent, Lemma 34.19.26. Hence, by Lemma 49.22.1 above, we may define the notion of an unramified morphism (resp. G-unramified morphism) of algebraic spaces as follows and it agrees with the already existing notion defined in Section 49.3 when the morphism is representable.

Definition 49.35.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *unramified* if the equivalent conditions of Lemma 49.22.1 hold with $\mathcal{P} = \text{unramified}$.
- (2) Let $x \in |X|$. We say f is *unramified at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is unramified.
- (3) We say f is *G-unramified* if the equivalent conditions of Lemma 49.22.1 hold with $\mathcal{P} = \text{G-unramified}$.
- (4) Let $x \in |X|$. We say f is *G-unramified at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is G-unramified.

Because of the following lemma, from here on we will only develop theory for unramified morphisms, and whenever we want to use a G-unramified morphism we will simply say “an unramified morphism locally of finite presentation”.

Lemma 49.35.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then f is G -unramified if and only if f is unramified and locally of finite presentation.*

Proof. Consider any diagram as in Lemma 49.22.1. Then all we are saying is that the morphism h is G -unramified if and only if it is unramified and locally of finite presentation. This is clear from Morphisms, Definition 28.36.1. \square

Lemma 49.35.3. *The composition of unramified morphisms is unramified.*

Proof. See Remark 49.22.3 and Morphisms, Lemma 28.36.4. \square

Lemma 49.35.4. *The base change of an unramified morphism is unramified.*

Proof. See Remark 49.22.4 and Morphisms, Lemma 28.36.5. \square

Lemma 49.35.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is unramified,
- (2) for every $x \in |X|$ the morphism f is unramified at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is unramified,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is unramified,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is an unramified morphism,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is unramified,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is unramified,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ is surjective such that the top horizontal arrow is unramified, and

- (9) there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is unramified.

Proof. Omitted. \square

Lemma 49.35.6. *An unramified morphism of algebraic spaces is locally of finite type.*

Proof. Via a diagram as in Lemma 49.22.1 this translates into Morphisms, Lemma 28.36.9. \square

Lemma 49.35.7. *If f is unramified at x then f is quasi-finite at x . In particular, an unramified morphism is locally quasi-finite.*

Proof. Via a diagram as in Lemma 49.22.1 this translates into Morphisms, Lemma 28.36.10. \square

Lemma 49.35.8. *An immersion of algebraic spaces is unramified.*

Proof. Let $i : X \rightarrow Y$ be an immersion of algebraic spaces. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Then $V \times_Y X \rightarrow V$ is an immersion of schemes, hence unramified (see Morphisms, Lemmas 28.36.7 and 28.36.8). Thus by definition i is unramified. \square

Lemma 49.35.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .*

- (1) *If f is unramified, then the diagonal morphism $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is an open immersion.*
- (2) *If f is locally of finite type and $\Delta_{X/Y}$ is an open immersion, then f is unramified.*

Proof. We know in any case that $\Delta_{X/Y}$ is a representable monomorphism, see Lemma 49.4.1. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. Consider the commutative diagram

$$\begin{array}{ccccc}
 U & \xrightarrow{\quad} & U \times_V U & \longrightarrow & V \\
 \downarrow & & \downarrow & & \downarrow \Delta_{V/Y} \\
 X & \xrightarrow{\Delta_{X/Y}} & X \times_Y X & \longrightarrow & V \times_Y V
 \end{array}$$

with cartesian right square. The left vertical arrow is surjective étale. The right vertical arrow is étale as a morphism between schemes étale over Y , see Properties of Spaces, Lemma 48.13.6. Hence the middle vertical arrow is étale too (but it need not be surjective).

Assume f is unramified. Then $U \rightarrow V$ is unramified, hence $\Delta_{U/V}$ is an open immersion by Morphisms, Lemma 28.36.13. Looking at the left square of the diagram above we conclude that $\Delta_{X/Y}$ is an étale morphism, see Properties of Spaces, Lemma 48.13.3. Hence $\Delta_{X/Y}$ is a representable étale monomorphism, which implies that it is an open immersion by Étale Morphisms, Theorem 40.14.1. (See also Spaces, Lemma 47.5.8 for the translation from schemes language into the language of functors.)

Assume that f is locally of finite type and that $\Delta_{X/Y}$ is an open immersion. This implies that $U \rightarrow V$ is locally of finite type too (by definition of a morphism of algebraic spaces which is locally of finite type). Looking at the displayed diagram above we conclude that $\Delta_{U/V}$ is étale as a morphism between schemes étale over $X \times_Y X$, see Properties of Spaces, Lemma 48.13.6. But since $\Delta_{U/V}$ is the diagonal of a morphism between schemes we see that it is in any case an immersion, see Schemes, Lemma 25.21.2. Hence it is an open immersion, and we conclude that $U \rightarrow V$ is unramified by Morphisms, Lemma 28.36.13. This in turn means that f is unramified by definition. \square

Lemma 49.35.10. *Let S be a scheme. Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces over S . Assume that $X \rightarrow Z$ is locally of finite type. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset |X|$ is the set of points where f is unramified. Moreover, for any morphism of algebraic spaces $Z' \rightarrow Z$, if $f' : X' \rightarrow Y'$ is the base change of f by $Z' \rightarrow Z$, then $U(f')$ is the inverse image of $U(f)$ under the projection $X' \rightarrow X$.

Proof. This lemma is the analogue of Morphisms, Lemma 28.36.15 and in fact we will deduce the lemma from it. By Definition 49.35.1 the set $\{x \in |X| : f \text{ is unramified at } x\}$ is open in X . Hence we only need to prove the final statement. By Lemma 49.23.6 the morphism $X \rightarrow Y$ is locally of finite type. By Lemma 49.23.3 the morphism $X' \rightarrow Y'$ is locally of finite type.

Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Choose a scheme V and a surjective étale morphism $V \rightarrow W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Finally, choose a scheme W' and a surjective étale morphism $W' \rightarrow W \times_Z Z'$. Set $V' = W' \times_W V$ and $U' = W' \times_W U$, so that we obtain surjective étale morphisms $V' \rightarrow Y'$ and $U' \rightarrow X'$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 48.13.7). This combined with Lemma 49.35.5 implies that $U(f)$ is the image in $|X|$ of the set T of points in U where the morphism $U \rightarrow V$ is unramified. Similarly, $U(f')$ is the image in $|X'|$ of the set T' of points in U' where the morphism $U' \rightarrow V'$ is unramified. Now, by construction the diagram

$$\begin{array}{ccc} U' & \longrightarrow & U \\ \downarrow & & \downarrow \\ V' & \longrightarrow & V \end{array}$$

is cartesian (in the category of schemes). Hence the aforementioned Morphisms, Lemma 28.36.15 applies to show that T' is the inverse image of T . Since $|U'| \rightarrow |X'|$ is surjective this implies the lemma. \square

Lemma 49.35.11. *Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over S . If $X \rightarrow Z$ is unramified, then $X \rightarrow Y$ is unramified.*

Proof. Choose a commutative diagram

$$\begin{array}{ccccc} U & \longrightarrow & V & \longrightarrow & W \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z \end{array}$$

with vertical arrows étale and surjective. (See Spaces, Lemma 47.11.4.) Apply Morphisms, Lemma 28.36.16 to the top row. \square

49.36. Étale morphisms

The notion of an étale morphism of algebraic spaces was defined in Properties of Spaces, Definition 48.13.2. Here is what it means for a morphism to be étale at a point.

Definition 49.36.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$. We say f is *étale at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is étale

Lemma 49.36.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:

- (1) f is étale,
- (2) for every $x \in |X|$ the morphism f is étale at x ,
- (3) for every scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is étale,
- (4) for every affine scheme Z and any morphism $Z \rightarrow Y$ the morphism $Z \times_Y X \rightarrow Z$ is étale,
- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is an étale morphism,
- (6) there exists a scheme U and a surjective étale morphism $\varphi : U \rightarrow X$ such that the composition $f \circ \varphi$ is étale,
- (7) for every commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is étale,

- (8) there exists a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where U, V are schemes, the vertical arrows are étale, and $U \rightarrow X$ surjective such that the top horizontal arrow is étale, and

- (9) there exist Zariski coverings $Y = \bigcup Y_i$ and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \rightarrow Y_i$ is étale.

Proof. Combine Properties of Spaces, Lemmas 48.13.3, 48.13.5 and 48.13.4. Some details omitted. \square

Lemma 49.36.3. The composition of two étale morphisms of algebraic spaces is étale.

Proof. This is a copy of Properties of Spaces, Lemma 48.13.4. \square

Lemma 49.36.4. The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.

Proof. This is a copy of Properties of Spaces, Lemma 48.13.5. \square

Lemma 49.36.5. *An étale morphism of algebraic spaces is locally quasi-finite.*

Proof. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces, see Properties of Spaces, Definition 48.13.2. By Properties of Spaces, Lemma 48.13.3 we see this means there exists a diagram as in Lemma 49.22.1 with h étale and surjective vertical arrow a . By Morphisms, Lemma 28.37.6 h is locally quasi-finite. Hence $X \rightarrow Y$ is locally quasi-finite by definition. \square

Lemma 49.36.6. *An étale morphism of algebraic spaces is smooth.*

Proof. The proof is identical to the proof of Lemma 49.36.5. It uses the fact that an étale morphism of schemes is smooth (by definition of an étale morphism of schemes). \square

Lemma 49.36.7. *An étale morphism of algebraic spaces is flat.*

Proof. The proof is identical to the proof of Lemma 49.36.5. It uses Morphisms, Lemma 28.37.12. \square

Lemma 49.36.8. *An étale morphism of algebraic spaces is locally of finite presentation.*

Proof. The proof is identical to the proof of Lemma 49.36.5. It uses Morphisms, Lemma 28.37.11. \square

Lemma 49.36.9. *An étale morphism of algebraic spaces is locally of finite type.*

Proof. An étale morphism is locally of finite presentation and a morphism locally of finite presentation is locally of finite type, see Lemmas 49.36.8 and 49.27.5. \square

Lemma 49.36.10. *An étale morphism of algebraic spaces is unramified.*

Proof. The proof is identical to the proof of Lemma 49.36.5. It uses Morphisms, Lemma 28.37.5. \square

Lemma 49.36.11. *Let S be a scheme. Let X, Y be algebraic spaces étale over an algebraic space Z . Any morphism $X \rightarrow Y$ over Z is étale.*

Proof. This is a copy of Properties of Spaces, Lemma 48.13.6. \square

Lemma 49.36.12. *A locally finitely presented, flat, unramified morphism of algebraic spaces is étale.*

Proof. Let $X \rightarrow Y$ be a locally finitely presented, flat, unramified morphism of algebraic spaces. By Properties of Spaces, Lemma 48.13.3 we see this means there exists a diagram as in Lemma 49.22.1 with h locally finitely presented, flat, unramified and surjective vertical arrow a . By Morphisms, Lemma 28.37.16 h is étale. Hence $X \rightarrow Y$ is étale by definition. \square

49.37. Proper morphisms

The notion of a proper morphism plays an important role in algebraic geometry. Here is the definition of a proper morphism of algebraic spaces.

Definition 49.37.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *proper* if f is separated, finite type, and universally closed.

Lemma 49.37.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is proper,
- (2) for every scheme Z and every morphism $Z \rightarrow Y$ the projection $Z \times_Y X \rightarrow Z$ is proper,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the projection $Z \times_Y X \rightarrow Z$ is proper,
- (4) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is proper, and
- (5) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is proper.

Proof. Combine Lemmas 49.4.12, 49.23.4, 49.8.7, and 49.9.5. □

Lemma 49.37.3. *A base change of a proper morphism is proper.*

Proof. See Lemmas 49.4.4, 49.23.3, and 49.9.3. □

Lemma 49.37.4. *A composition of proper morphisms is proper.*

Proof. See Lemmas 49.4.8, 49.23.2, and 49.9.4. □

Lemma 49.37.5. *A closed immersion of algebraic spaces is a proper morphism of algebraic spaces.*

Proof. As a closed immersion is by definition representable this follows from Spaces, Lemma 47.5.8 and the corresponding result for morphisms of schemes, see Morphisms, Lemma 28.42.6. □

Lemma 49.37.6. *Let S be a scheme. Consider a commutative diagram of algebraic spaces*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & Y \\ & \searrow & \swarrow \\ & & B \end{array}$$

over S .

- (1) *If $X \rightarrow B$ is universally closed and $Y \rightarrow B$ is separated, then the morphism $X \rightarrow Y$ is universally closed. In particular, the image of $|X|$ in $|Y|$ is closed.*
- (2) *If $X \rightarrow B$ is proper and $Y \rightarrow B$ is separated, then the morphism $X \rightarrow Y$ is proper.*

Proof. Assume $X \rightarrow B$ is universally closed and $Y \rightarrow B$ is separated. We factor the morphism as $X \rightarrow X \times_B Y \rightarrow Y$. The first morphism is a closed immersion, see Lemma 49.4.6 hence universally closed. The projection $X \times_B Y \rightarrow Y$ is the base change of a universally closed morphism and hence universally closed, see Lemma 49.9.3. Thus $X \rightarrow Y$ is universally closed as the composition of universally closed morphisms, see Lemma 49.9.4. This proves (1). To deduce (2) combine (1) with Lemmas 49.4.10, 49.8.8, and 49.23.6. □

Lemma 49.37.7. *Let S be a scheme. Let B be an algebraic space over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over B . If X is universally closed over B and f is surjective then Y is universally closed over B . In particular, if also Y is separated and of finite type over B , then Y is proper over B .*

Proof. Assume X is universally closed and f surjective. Denote $p : X \rightarrow B$, $q : Y \rightarrow B$ the structure morphisms. Let $B' \rightarrow B$ be a morphism of algebraic spaces over S . The base change $f' : X_{B'} \rightarrow Y_{B'}$ is surjective (Lemma 49.5.5), and the base change $p' : X_{B'} \rightarrow B'$ is closed. If $T \subset Y_{B'}$ is closed, then $(f')^{-1}(T) \subset X_{B'}$ is closed, hence $p'((f')^{-1}(T)) = q'(T)$ is closed. So q' is closed. \square

Lemma 49.37.8. *Let S be a scheme. Let*

be a commutative diagram of morphism of algebraic spaces over S . Assume

- (1) $X \rightarrow B$ is a proper morphism,
- (2) $Y \rightarrow B$ is separated and locally of finite type,

Then the scheme theoretic image $Z \subset Y$ of h is proper over B and $X \rightarrow Z$ is surjective.

Proof. The scheme theoretic image of h is constructed in Section 49.16. Observe that h is quasi-compact (Lemma 49.8.9) hence $|h|(|X|) \subset |Z|$ is dense (Lemma 49.16.3). On the other hand $|h|(|X|)$ is closed in $|Y|$ (Lemma 49.37.6) hence $X \rightarrow Z$ is surjective. Thus $Z \rightarrow B$ is a proper (Lemma 49.37.7). \square

Lemma 49.37.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is separated,
- (2) $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is universally closed, and
- (3) $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is proper.

Proof. The implication (1) \Rightarrow (3) follows from Lemma 49.37.5. We will use Spaces, Lemma 47.5.8 without further mention in the rest of the proof. Recall that $\Delta_{X/Y}$ is a representable monomorphism which is locally of finite type, see Lemma 49.4.1. Since proper \Rightarrow universally closed for morphisms of schemes we conclude that (3) implies (2). If $\Delta_{X/Y}$ is universally closed then Étale Morphisms, Lemma 40.7.2 implies that it is a closed immersion. Thus (2) \Rightarrow (1) and we win. \square

49.38. Valuative criteria

We first formally state the definition and then we discuss how this differs from the case of morphisms of schemes.

Definition 49.38.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f satisfies the uniqueness part of the valuative criterion if given any commutative solid diagram

where A is a valuation ring with field of fractions K , there exists at most one dotted arrow (without requiring existence). We say f satisfies the existence part of the

valuative criterion if given any solid diagram as above there exists an extension $K \subset K'$ of fields, a valuation ring $A' \subset K'$ dominating A and a morphism $\text{Spec}(A') \rightarrow X$ such that the following diagram commutes

$$\begin{array}{ccccc} \text{Spec}(K') & \longrightarrow & \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \nearrow & & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(A) & \longrightarrow & Y \end{array}$$

We say f satisfies the *valuative criterion* if f satisfies both the existence and uniqueness part.

The formulation of the existence part of the valuative criterion is slightly different for morphisms of algebraic spaces, since it may be necessary to extend the fraction field of the valuation ring. In practice this difference almost never plays a role.

- (1) Checking the uniqueness part of the valuative criterion never involves any fraction field extensions, hence this is exactly the same as in the case of schemes.
- (2) It is necessary to allow for field extensions in general, see Example 49.38.6.
- (3) For morphisms of algebraic spaces it always suffices to take a finite separable extensions $K \subset K'$ in the existence part of the valuative criterion, see Lemma 49.38.3.
- (4) If $f : X \rightarrow Y$ is a separated morphism of algebraic spaces, then we can always take $K = K'$ when we check the existence part of the valuative criterion, see Lemma 49.38.5.
- (5) In particular, for a quasi-compact and quasi-separated morphism $f : X \rightarrow Y$, we get an equivalence between “ f is separated and universally closed” and “ f satisfies the usual valuative criterion”, see Decent Spaces, Lemma 50.14.4. In particular, the valuative criterion for properness is the usual one, see Decent Spaces, Lemma 50.14.5.

The results of (5) come later because their proof uses an argument concerning specializations of points on algebraic spaces, which is a topic we address in great detail in the chapter on decent spaces.

As a first step in the theory, we show that the criterion is identical to the criterion as formulated for morphisms of schemes in case the morphism of algebraic spaces is representable.

Lemma 49.38.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is representable. The following are equivalent*

- (1) f satisfies the existence part of the valuation criterion as in Definition 49.38.1,
- (2) given any commutative solid diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K , there exists a dotted arrow, i.e., f satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.

Proof. It suffices to show that given a commutative diagram of the form

$$\begin{array}{ccccc} \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & & \nearrow \varphi & & \downarrow \\ \mathrm{Spec}(A') & \longrightarrow & \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

as in Definition 49.38.1, then we can find a morphism $\mathrm{Spec}(A) \rightarrow X$ fitting into the diagram too. Set $X_A = \mathrm{Spec}(A) \times_Y Y$. As f is representable we see that X_A is a scheme. The morphism φ gives a morphism $\varphi' : \mathrm{Spec}(A') \rightarrow X_A$. Let $x \in X_A$ be the image of the closed point of $\varphi' : \mathrm{Spec}(A') \rightarrow X_A$. Then we have the following commutative diagram of rings

$$\begin{array}{ccccc} K' & \longleftarrow & K & \longleftarrow & \mathcal{O}_{X_A, x} \\ \uparrow & & \nearrow & & \uparrow \\ A' & \longleftarrow & A & \longleftarrow & A \end{array}$$

Since A is a valuation ring, and since A' dominates A , we see that $K \cap A' = A$. Hence the ring map $\mathcal{O}_{X_A, x} \rightarrow K$ has image contained in A . Whence a morphism $\mathrm{Spec}(A) \rightarrow X_A$ (see Schemes, Section 25.13) as desired. \square

Lemma 49.38.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f satisfies the existence part of the valuative criterion as in Definition 49.38.1,
- (2) f satisfies the existence part of the valuative criterion as in Definition 49.38.1 modified by requiring the extension $K \subset K'$ to be finite separable.

Proof. We have to show that (1) implies (2). Suppose given a diagram

$$\begin{array}{ccccc} \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & & \nearrow & & \downarrow \\ \mathrm{Spec}(A') & \longrightarrow & \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

as in Definition 49.38.1 with $K \subset K'$ arbitrary. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Then

$$\mathrm{Spec}(A') \times_X U \longrightarrow \mathrm{Spec}(A')$$

is surjective étale. Let p be a point of $\mathrm{Spec}(A') \times_X U$ mapping to the closed point of $\mathrm{Spec}(A')$. Let $p' \rightsquigarrow p$ be a generalization of p mapping to the generic point of $\mathrm{Spec}(A')$. Such a generalization exists because generalizations lift along flat morphisms of schemes, see Morphisms, Lemma 28.26.8. Then p' corresponds to a point of the scheme $\mathrm{Spec}(K') \times_X U$. Note that

$$\mathrm{Spec}(K') \times_X U = \mathrm{Spec}(K') \times_{\mathrm{Spec}(K)} (\mathrm{Spec}(K) \times_X U)$$

Hence p' maps to a point $q' \in \text{Spec}(K) \times_X U$ whose residue field is a finite separable extension of K . Finally, $p' \rightsquigarrow p$ maps to a specialization $u' \rightsquigarrow u$ on the scheme U . With all this notation we get the following diagram of rings

This means that the ring $B \subset \kappa(q')$ generated by the images of A and $\mathcal{O}_{U, u}$ maps to a subring of $\kappa(p')$ contained in the image B' of $\mathcal{O}_{\text{Spec}(A') \times_X U, p} \rightarrow \kappa(p')$. Note that B' is a local ring. Let $\mathfrak{m} \subset B$ be the maximal ideal. By construction $A \cap \mathfrak{m}$, (resp. $\mathcal{O}_{U, u} \cap \mathfrak{m}$, resp. $A' \cap \mathfrak{m}$) is the maximal ideal of A (resp. $\mathcal{O}_{U, u}$, resp. A'). Set $\mathfrak{q} = B \cap \mathfrak{m}$. This is a prime ideal such that $A \cap \mathfrak{q}$ is the maximal ideal of A . Hence $B_{\mathfrak{q}} \subset \kappa(q')$ is a local ring dominating A . By Algebra, Lemma 10.48.2 we can find a valuation ring $A_1 \subset \kappa(q')$ with field of fractions $\kappa(q')$ dominating $B_{\mathfrak{q}}$. The (local) ring map $\mathcal{O}_{U, u} \rightarrow A_1$ gives a morphism $\text{Spec}(A_1) \rightarrow U \rightarrow X$ such that the diagram

is commutative. Since $f.f.(A_1) = \kappa(q') \supset K$ is finite separable by construction the lemma is proved. \square

Lemma 49.38.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a separated morphism of algebraic spaces over S . Suppose given a diagram*

as in Definition 49.38.1 with $K \subset K'$ arbitrary. Then the dotted arrow exists making the diagram commute.

Proof. We have to show that we can find a morphism $\text{Spec}(A) \rightarrow X$ fitting into the diagram.

Consider the base change $X_A = \text{Spec}(A) \times_Y X$ of X . Then $X_A \rightarrow \text{Spec}(A)$ is a separated morphism of algebraic spaces (Lemma 49.4.4). Base changing all the morphisms of the diagram above we obtain

Thus we may replace X by X_A , assume that $Y = \text{Spec}(A)$ and that we have a diagram as above. We may and do replace X by a quasi-compact open subspace containing the image of $|\text{Spec}(A')| \rightarrow |X|$.

The morphism $\text{Spec}(A') \rightarrow X$ is quasi-compact by Lemma 49.8.8. Let $Z \subset X$ be the scheme theoretic image of $\text{Spec}(A') \rightarrow X$. Then Z is a reduced (Lemma 49.16.4), quasi-compact (as a closed subspace of X), separated (as a closed subspace of X) algebraic space over A . Consider the base change

$$\text{Spec}(K') = \text{Spec}(A') \times_{\text{Spec}(A)} \text{Spec}(K) \rightarrow X \times_{\text{Spec}(A)} \text{Spec}(K) = X_K$$

of the morphism $\text{Spec}(A') \rightarrow X$ by the flat morphism of schemes $\text{Spec}(K) \rightarrow \text{Spec}(A)$. By Lemma 49.28.12 we see that the scheme theoretic image of this morphism is the base change Z_K of Z . On the other hand, by assumption (i.e., the commutative diagram above) this morphism factors through a morphism $\text{Spec}(K) \rightarrow Z_K$ which is a section to the structure morphism $Z_K \rightarrow \text{Spec}(K)$. As Z_K is separated, this section is a closed immersion (Lemma 49.4.7). We conclude that $Z_K = \text{Spec}(K)$.

Let $V \rightarrow Z$ be a surjective étale morphism with V an affine scheme (Properties of Spaces, Lemma 48.6.3). Say $V = \text{Spec}(B)$. Then $V \times_Z \text{Spec}(A') = \text{Spec}(C)$ is affine as Z is separated. Note that $B \rightarrow C$ is injective as V is the scheme theoretic image of $V \times_Z \text{Spec}(A') \rightarrow V$ by Lemma 49.16.3. On the other hand, $A' \rightarrow C$ is étale as corresponds to the base change of $V \rightarrow Z$. Since A' is a torsion free A -module, the flatness of $A' \rightarrow C$ implies C is a torsion free A -module, hence B is a torsion free A -module. Note that being torsion free as an A -module is equivalent to being flat (More on Algebra, Lemma 15.15.4). Next, we write

$$V \times_Z V = \text{Spec}(B')$$

Note that the two ring maps $B \rightarrow B'$ are étale as $V \rightarrow Z$ is étale. The canonical surjective map $B \otimes_A B \rightarrow B'$ becomes an isomorphism after tensoring with K over A because $Z_K = \text{Spec}(K)$. However, $B \otimes_A B$ is torsion free as an A -module by our remarks above. Thus $B' = B \otimes_A B$. It follows that the base change of the ring map $A \rightarrow B$ by the faithfully flat ring map $A \rightarrow B$ is étale (note that $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is surjective as $X \rightarrow \text{Spec}(A)$ is surjective). Hence $A \rightarrow B$ is étale (Descent, Lemma 34.19.27), in other words, $V \rightarrow X$ is étale. Since we have $V \times_Z V = V \times_{\text{Spec}(A)} V$ we conclude that $Z = \text{Spec}(A)$ as algebraic spaces (for example by Spaces, Lemma 47.9.1) and the proof is complete. \square

Lemma 49.38.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a separated morphism of algebraic spaces over S . The following are equivalent*

- (1) *f satisfies the existence part of the valuation criterion as in Definition 49.38.1,*
- (2) *given any commutative solid diagram*

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K , there exists a dotted arrow, i.e., f satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.

Proof. We have to show that (1) implies (2). Suppose given a commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

as in part (2). By (1) there exists a commutative diagram

$$\begin{array}{ccccc} \text{Spec}(K') & \longrightarrow & \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & & \nearrow & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(A) & \longrightarrow & Y \end{array}$$

as in Definition 49.38.1 with $K \subset K'$ arbitrary. By Lemma 49.38.4 we can find a morphism $\text{Spec}(A) \rightarrow X$ fitting into the diagram, i.e., (2) holds. \square

Example 49.38.6. Consider the algebraic space X constructed in Spaces, Example 47.14.2. Recall that it is the affine line with zero doubled in a Galois twisted relative to a degree two Galois extension $k \subset k'$. As such it comes with a morphism

$$\pi : X \longrightarrow S = \mathbf{A}_k^1$$

which is quasi-compact. We claim that π is universally closed. Namely, after base change by $\text{Spec}(k') \rightarrow \text{Spec}(k)$ the morphism π is identified with the morphism

$$\text{affine line with zero doubled} \longrightarrow \text{affine line}$$

which is universally closed (some details omitted). Since the morphism $\text{Spec}(k') \rightarrow \text{Spec}(k)$ is universally closed and surjective, a diagram chase shows that π is universally closed. On the other hand, consider the diagram

$$\begin{array}{ccc} \text{Spec}(k((x))) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \pi \\ \text{Spec}(k[[x]]) & \longrightarrow & \mathbf{A}_k^1 \end{array}$$

Since the unique point of X above $0 \in \mathbf{A}_k^1$ corresponds to a monomorphism $\text{Spec}(k') \rightarrow X$ it is clear there cannot exist a dotted arrow! This shows that a finite separable field extension is needed in general.

Lemma 49.38.7. *The base change of a morphism of algebraic spaces which satisfies the existence part of (resp. uniqueness part of) the valuative criterion by any morphism of algebraic spaces satisfies the existence part of (resp. uniqueness part of) the valuative criterion.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over the scheme S . Let $Z \rightarrow Y$ be any morphism of algebraic spaces over S . Consider a solid commutative

diagram of the following shape

$$\begin{array}{ccccc}
 \mathrm{Spec}(K) & \longrightarrow & Z \times_Y X & \longrightarrow & X \\
 \downarrow & \nearrow \text{dashed} & \downarrow & \nearrow \text{dashed} & \downarrow \\
 \mathrm{Spec}(A) & \longrightarrow & Z & \longrightarrow & Y
 \end{array}$$

Then the set of north-west dotted arrows making the diagram commute is in 1-1 correspondence with the set of west-north-west dotted arrows making the diagram commute. This proves the lemma in the case of “uniqueness”. For the existence part, assume f satisfies the existence part of the valuative criterion. If we are given a solid commutative diagram as above, then by assumption there exists an extension $K \subset K'$ of fields and a valuation ring $A' \subset K'$ dominating A and a morphism $\mathrm{Spec}(A') \rightarrow X$ fitting into the following commutative diagram

$$\begin{array}{ccccccc}
 \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) & \longrightarrow & Z \times_Y X & \longrightarrow & X \\
 \downarrow & & & & & & \downarrow \\
 \mathrm{Spec}(A') & \longrightarrow & \mathrm{Spec}(A) & \longrightarrow & Z & \longrightarrow & Y
 \end{array}$$

And by the remarks above the skew arrow corresponds to an arrow $\mathrm{Spec}(A') \rightarrow Z \times_Y X$ as desired. \square

Lemma 49.38.8. *The composition of two morphisms of algebraic spaces which satisfy the (existence part of, resp. uniqueness part of) the valuative criterion satisfies the (existence part of, resp. uniqueness part of) the valuative criterion.*

Proof. Let $f : X \rightarrow Y, g : Y \rightarrow Z$ be morphisms of algebraic spaces over the scheme S . Consider a solid commutative diagram of the following shape

$$\begin{array}{ccc}
 \mathrm{Spec}(K) & \longrightarrow & X \\
 \downarrow & \nearrow \text{dashed} & \downarrow f \\
 & & Y \\
 \downarrow & \nearrow \text{dashed} & \downarrow g \\
 \mathrm{Spec}(A) & \longrightarrow & Z
 \end{array}$$

If we have the uniqueness part for g , then there exists at most one north-west dotted arrow making the diagram commute. If we also have the uniqueness part for f , then we have at most one north-north-west dotted arrow making the diagram commute. The proof in the existence case comes from contemplating the following diagram

$$\begin{array}{ccccccc}
 \mathrm{Spec}(K'') & \longrightarrow & \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) & \longrightarrow & X \\
 \downarrow & & & & & & \downarrow f \\
 & \nearrow & & & & & Y \\
 \downarrow & \nearrow & & & & & \downarrow g \\
 \mathrm{Spec}(A'') & \longrightarrow & \mathrm{Spec}(A') & \longrightarrow & \mathrm{Spec}(A) & \longrightarrow & Z
 \end{array}$$

Namely, the existence part for g gives us the extension K' , the valuation ring A' and the arrow $\mathrm{Spec}(A') \rightarrow Y$, whereupon the existence part for f gives us the extension K'' , the valuation ring A'' and the arrow $\mathrm{Spec}(A'') \rightarrow X$. \square

49.39. Valuative criterion for universal closedness

The existence part of the valuative criterion implies universal closedness for quasi-compact morphisms, see Lemma 49.39.1. In the case of schemes, this is an “if and only if” statement, but for morphisms of algebraic spaces this is wrong. Example 49.9.6 shows that $\mathbf{A}_k^1/\mathbf{Z} \rightarrow \mathrm{Spec}(k)$ is universally closed, but it is easy to see that the existence part of the valuative criterion fails. We revisit this topic in Decent Spaces, Section 50.14 and show the converse holds if the source of the morphism is a decent space (see also Decent Spaces, Lemma 50.15.11 for a relative version).

Lemma 49.39.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume*

- (1) *f is quasi-compact, and*
- (2) *f satisfies the existence part of the valuative criterion.*

Then f is universally closed.

Proof. By Lemmas 49.8.3 and 49.38.7 properties (1) and (2) are preserved under any base change. By Lemma 49.9.5 we only have to show that $T \times_Y X \rightarrow T$ is universally closed, whenever T is an affine scheme over S mapping into Y . Hence it suffices to prove: If Y is an affine scheme, $f : X \rightarrow Y$ is quasi-compact and satisfies the existence part of the valuative criterion, then $f : |X| \rightarrow |Y|$ is closed. In this situation X is a quasi-compact algebraic space. By Properties of Spaces, Lemma 48.6.3 there exists an affine scheme U and a surjective étale morphism $\varphi : U \rightarrow X$. Let $T \subset |X|$ closed. The inverse image $\varphi^{-1}(T) \subset U$ is closed, and hence is the set of points of an affine closed subscheme $Z \subset U$. Thus, by Algebra, Lemma 10.40.5 we see that $f(T) = f(\varphi(|Z|)) \subset |Y|$ is closed if it is closed under specialization.

Let $y' \rightsquigarrow y$ be a specialization in Y with $y' \in f(T)$. Choose a point $x' \in T \subset |X|$ mapping to y' under f . We may represent x' by a morphism $\mathrm{Spec}(K) \rightarrow X$ for some field K . Thus we have the following diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \xrightarrow{x'} & X \\ \downarrow & & \downarrow f \\ \mathrm{Spec}(\mathcal{O}_{Y,y}) & \longrightarrow & Y, \end{array}$$

see Schemes, Section 25.13 for the existence of the left vertical map. Choose a valuation ring $A \subset K$ dominating the image of the ring map $\mathcal{O}_{Y,y} \rightarrow K$ (this is possible since the image is a local ring and not a field as $y' \neq y$, see Algebra, Lemma 10.48.2). By assumption there exists a field extension $K \subset K'$ and a valuation ring $A' \subset K'$ dominating A , and a morphism $\mathrm{Spec}(A') \rightarrow X$ fitting into the commutative diagram. Since A' dominates A , and A dominates $\mathcal{O}_{Y,y}$ we see that the closed point of $\mathrm{Spec}(A')$ maps to a point $x \in X$ with $f(x) = y$ which is a specialization of x' . Hence $x \in T$ as T is closed, and hence $y \in f(T)$ as desired. \square

Lemma 49.39.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a flat morphism. Let $\mathrm{Spec}(A) \rightarrow Y$ be a morphism where A is a valuation ring. If the closed point of*

$\text{Spec}(A)$ maps to a point of $|Y|$ in the image of $|X| \rightarrow |Y|$, then there exists a commutative diagram

$$\begin{array}{ccc} \text{Spec}(A') & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where $A \rightarrow A'$ is a local ring map of valuation rings.

Proof. Omitted. □

Lemma 49.39.3. *Let S be a scheme. Let $f : X \rightarrow Y$ and $h : U \rightarrow Y$ be morphisms of algebraic spaces over S . If*

- (1) *f and h are quasi-compact,*
- (2) *$|h|(|U|)$ is dense in $|X|$, and*

given any commutative solid diagram

$$\begin{array}{ccccc} \text{Spec}(K) & \longrightarrow & U & \longrightarrow & X \\ \downarrow & & \nearrow \text{---} & & \downarrow \\ \text{Spec}(A) & \longrightarrow & & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K

- (3) *there exists at most one dotted arrow making the diagram commute, and*
- (4) *there exists an extension $K \subset K'$ of fields, a valuation ring $A' \subset K'$ dominating A and a morphism $\text{Spec}(A') \rightarrow X$ such that the following diagram commutes*

$$\begin{array}{ccccccc} \text{Spec}(K') & \longrightarrow & \text{Spec}(K) & \longrightarrow & U & \longrightarrow & X \\ \downarrow & & & & & & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(A) & \longrightarrow & & \longrightarrow & Y \end{array}$$

then f is universally closed. If moreover

- (5) *f is quasi-separated*

then f is separated and universally closed.

Proof. Assume (1), (2), (3), and (4). We will verify the existence part of the valuative criterion for f which will imply f is universally closed by Lemma 49.39.1. To do this, consider a commutative diagram

$$(49.39.3.1) \quad \begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring and K is the fraction field of A . Note that since valuation rings and fields are reduced, we may replace U , X , and S by their respective reductions by Properties of Spaces, Lemma 48.9.4. In this case the assumption that $h(U)$ is dense means that the scheme theoretic image of $h : U \rightarrow X$ is X , see Lemma 49.16.4.

Reduction to the case Y affine. Choose an étale morphism $\text{Spec}(R) \rightarrow Y$ such that the closed point of $\text{Spec}(A)$ maps to an element of $\text{Im}(|\text{Spec}(R)| \rightarrow |Y|)$. By Lemma 49.39.2 we can find a local ring map $A \rightarrow A'$ of valuation rings and a morphism $\text{Spec}(A') \rightarrow \text{Spec}(R)$ fitting into a commutative diagram

$$\begin{array}{ccc} \text{Spec}(A') & \longrightarrow & \text{Spec}(R) \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

Since in Definition 49.38.1 we allow for extensions of valuation rings it is clear that we may replace A by A' , Y by $\text{Spec}(R)$, X by $X \times_Y \text{Spec}(R)$ and U by $U \times_Y \text{Spec}(R)$.

From now on we assume that $Y = \text{Spec}(R)$ is an affine scheme. Let $\text{Spec}(B) \rightarrow X$ be an étale morphism from an affine scheme such that the morphism $\text{Spec}(K) \rightarrow X$ is in the image of $|\text{Spec}(B)| \rightarrow |X|$. Since we may replace K by an extension $K' \supset K$ and A by a valuation ring $A' \subset K'$ dominating A (which exists by Algebra, Lemma 10.48.2), we may assume the morphism $\text{Spec}(K) \rightarrow X$ factors through $\text{Spec}(B)$ (by definition of $|X|$). In other words, we may think of K as a B -algebra. Choose a polynomial algebra P over B and a B -algebra surjection $P \rightarrow K$. Then $\text{Spec}(P) \rightarrow X$ is flat as a composition $\text{Spec}(P) \rightarrow \text{Spec}(B) \rightarrow X$. Hence the scheme theoretic image of the morphism $U \times_X \text{Spec}(P) \rightarrow \text{Spec}(P)$ is $\text{Spec}(P)$ by Lemma 49.28.12. By Lemma 49.16.5 we can find a commutative diagram

$$\begin{array}{ccc} \text{Spec}(K') & \longrightarrow & U \times_X \text{Spec}(P) \\ \downarrow & & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(P) \end{array}$$

where A' is a valuation ring and K' is the fraction field of A' such that the closed point of $\text{Spec}(A')$ maps to $\text{Spec}(K) \subset \text{Spec}(P)$. In other words, there is a B -algebra map $\varphi : K \rightarrow A'/\mathfrak{m}_{A'}$. Choose a valuation ring $A'' \subset A'/\mathfrak{m}_{A'}$ dominating $\varphi(A)$ with field of fractions $K'' = A''/\mathfrak{m}_{A''}$ (Algebra, Lemma 10.48.2). We set

$$C = \{\lambda \in A' \mid \lambda \bmod \mathfrak{m}_{A'} \in A''\}.$$

which is a valuation ring by Algebra, Lemma 10.48.9. As C is an R -algebra with fraction field K' , we obtain a solid commutative diagram

$$\begin{array}{ccccccc} \text{Spec}(K'_1) & \dashrightarrow & \text{Spec}(K') & \longrightarrow & U & \twoheadrightarrow & X \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \text{Spec}(C_1) & \dashrightarrow & \text{Spec}(C) & \longrightarrow & & & Y \end{array}$$

as in the statement of the lemma. Thus assumption (4) produces $C \rightarrow C_1$ and the dotted arrows making the diagram commute. Let $A'_1 = (C_1)_{\mathfrak{p}}$ be the localization of C_1 at a prime $\mathfrak{p} \subset C_1$ lying over $\mathfrak{m}_{A'} \subset C$. Since $C \rightarrow C_1$ is flat by More on Algebra, Lemma 15.15.4 such a prime \mathfrak{p} exists by Algebra, Lemmas 10.38.16 and 10.38.15. Note that A' is the localization of C at $\mathfrak{m}_{A'}$ and that A'_1 is a valuation ring (Algebra, Lemma 10.48.8). In other words, $A' \rightarrow A'_1$ is a local ring map of

valuation rings. Assumption (3) implies

$$\begin{array}{ccccc} \text{Spec}(A'_1) & \longrightarrow & \text{Spec}(C_1) & \longrightarrow & X \\ \downarrow & & & & \uparrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(P) & \longrightarrow & \text{Spec}(B) \end{array}$$

commutes. Hence the restriction of the morphism $\text{Spec}(C_1) \rightarrow X$ to $\text{Spec}(C_1/\mathfrak{p})$ restricts to the composition

$$\text{Spec}(\kappa(\mathfrak{p})) \rightarrow \text{Spec}(A'/\mathfrak{m}_{A'}) = \text{Spec}(K'') \rightarrow \text{Spec}(K) \rightarrow X$$

on the generic point of $\text{Spec}(C_1/\mathfrak{p})$. Moreover, C_1/\mathfrak{p} is a valuation ring (Algebra, Lemma 10.48.8) dominating A'' which dominates A . Thus the morphism $\text{Spec}(C_1/\mathfrak{p}) \rightarrow X$ witnesses the existence part of the valuative criterion for the diagram (49.39.3.1) as desired.

Next, suppose that (5) is satisfied as well, i.e., the morphism $\Delta : X \rightarrow X \times_S X$ is quasi-compact. In this case assumptions (1) – (4) hold for h and Δ . Hence the first part of the proof shows that Δ is universally closed. By Lemma 49.37.9 we conclude that f is separated. \square

49.40. Valuative criterion of separatedness

Lemma 49.40.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is separated, then f satisfies the uniqueness part of the valuative criterion.*

Proof. Let a diagram as in Definition 49.38.1 be given. Suppose there are two distinct morphisms $a, b : \text{Spec}(A) \rightarrow X$ fitting into the diagram. Let $Z \subset \text{Spec}(A)$ be the equalizer of a and b . Then $Z = \text{Spec}(A) \times_{(a,b), X \times_Y X, \Delta} X$. If f is separated, then Δ is a closed immersion, and this is a closed subscheme of $\text{Spec}(A)$. By assumption it contains the generic point of $\text{Spec}(A)$. Since A is a domain this implies $Z = \text{Spec}(A)$. Hence $a = b$ as desired. \square

Lemma 49.40.2 (Valuative criterion separatedness). *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume*

- (1) *the morphism f is quasi-separated, and*
- (2) *the morphism f satisfies the uniqueness part of the valuative criterion.*

Then f is separated.

Proof. Assumption (1) means $\Delta_{X/Y}$ is quasi-compact. We claim the morphism $\Delta_{X/Y} : X \rightarrow X \times_Y X$ satisfies the existence part of the valuative criterion. Let a solid commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \text{Spec}(A) & \longrightarrow & X \times_Y X \end{array}$$

be given. The lower right arrow corresponds to a pair of morphisms $a, b : \text{Spec}(A) \rightarrow X$ over Y . By assumption (2) we see that $a = b$. Hence using a as the dotted arrow works. Hence Lemma 49.39.1 applies, and we see that $\Delta_{X/Y}$ is universally closed. Since always $\Delta_{X/Y}$ is locally of finite type and separated, we conclude from More on

Morphisms, Lemma 36.31.5 that $\Delta_{X/Y}$ is a finite morphism (also, use the general principle of Spaces, Lemma 47.5.8). At this point $\Delta_{X/Y}$ is a representable, finite monomorphism, hence a closed immersion by Morphisms, Lemma 28.44.13. \square

49.41. Integral and finite morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be integral (resp. finite).

Lemma 49.41.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is integral (resp. finite) if and only if for all affine schemes Z and morphisms $Z \rightarrow Y$ the scheme $X \times_Y Z$ is affine and integral (resp. finite) over Z .*

Proof. This follows directly from the definition of an integral (resp. finite) morphism of schemes (Morphisms, Definition 28.44.1). \square

This clears the way for the following definition.

Definition 49.41.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say that f is *integral* if for every affine scheme Z and morphisms $Z \rightarrow Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme integral over Z .
- (2) We say that f is *finite* if for every affine scheme Z and morphisms $Z \rightarrow Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme finite over Z .

Lemma 49.41.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is representable and integral (resp. finite),
- (2) f is integral (resp. finite),
- (3) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is integral (resp. finite), and
- (4) there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \rightarrow Y_i$ is integral (resp. finite).

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y , see Properties of Spaces, Lemma 48.6.1. Assume $V \rightarrow Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 48.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \rightarrow V$ is affine. This means we can apply Spaces, Lemma 47.11.3 because the class of integral (resp. finite) morphisms satisfies all the required properties (see Morphisms, Lemmas 28.44.6 and Descent, Lemmas 34.19.20, 34.19.21, and 34.33.1). The conclusion of applying this lemma is that f is representable and integral (resp. finite), i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being integral (resp. finite) is Zariski local on the target (the reference above shows that being integral or finite is in fact fpqc local on the target). \square

Lemma 49.41.4. *The composition of integral (resp. finite) morphisms is integral (resp. finite).*

Proof. Omitted. □

Lemma 49.41.5. *The base change of an integral (resp. finite) morphism is integral (resp. finite).*

Proof. Omitted. □

Lemma 49.41.6. *A finite morphism of algebraic spaces is integral. An integral morphism of algebraic spaces which is locally of finite type is finite.*

Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into Y , see Lemmas 49.41.3. Hence this lemma follows from the same lemma for the case of schemes, see Morphisms, Lemma 28.44.4. □

Lemma 49.41.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is integral, and
- (2) f is affine and universally closed.

Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into Y , see Lemmas 49.41.3, 49.20.3, and 49.9.5. Hence the result follows from Morphisms, Lemma 28.44.7. □

Lemma 49.41.8. *A finite morphism of algebraic spaces is quasi-finite.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. By Definition 49.41.2 and Lemmas 49.8.7 and 49.26.6 both properties may be checked after base change to an affine over Y , i.e., we may assume Y affine. If f is finite then X is a scheme. Hence the result follows from the corresponding result for schemes, see Morphisms, Lemma 28.44.9. □

Lemma 49.41.9. *A finite morphism of algebraic spaces is proper.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. We think of proper as synonymous to “finite type, separated, and universally closed”. By Definition 49.41.2 and Lemmas 49.23.4, 49.4.12, and 49.9.5 both properties may be checked after base change to an affine over Y , i.e., we may assume Y affine. If f is finite then X is a scheme. Hence the result follows from the corresponding result for schemes, see Morphisms, Lemma 28.44.10. □

Lemma 49.41.10. *A closed immersion is finite (and a fortiori integral).*

Proof. Omitted. □

Lemma 49.41.11. *Let S be a scheme. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces over S .*

- (1) *If $g \circ f$ is finite and g separated then f is finite.*
- (2) *If $g \circ f$ is integral and g separated then f is integral.*

Proof. Assume $g \circ f$ is finite (resp. integral) and g separated. The base change $X \times_Z Y \rightarrow Y$ is finite (resp. integral) by Lemma 49.41.5. The morphism $X \rightarrow X \times_Z Y$ is a closed immersion as $Y \rightarrow Z$ is separated, see Lemma 49.4.7. A closed immersion is finite (resp. integral), see Lemma 49.41.10. The composition of finite (resp. integral) morphisms is finite (resp. integral), see Lemma 49.41.4. Thus we win. \square

49.42. Finite locally free morphisms

We have already defined in Section 49.3 what it means for a representable morphism of algebraic spaces to be finite locally free.

Lemma 49.42.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is finite locally free if and only if f is affine and the sheaf $f_*\mathcal{O}_X$ is a finite locally free \mathcal{O}_Y -module.*

Proof. Assume f is finite locally free (as defined in Section 49.3). This means that for every morphism $V \rightarrow Y$ whose source is a scheme the base change $f' : V \times_Y X \rightarrow V$ is a finite locally free morphism of schemes. This in turn means (by the definition of a finite locally free morphism of schemes) that $f'_*\mathcal{O}_{V \times_Y X}$ is a finite locally free \mathcal{O}_V -module. We may choose $V \rightarrow Y$ to be surjective and étale. By Properties of Spaces, Lemma 48.24.2 we conclude the restriction of $f_*\mathcal{O}_X$ to V is finite locally free. Hence by Modules on Sites, Lemma 18.23.3 applied to the sheaf $f_*\mathcal{O}_X$ on $Y_{\text{spaces, étale}}$ we conclude that $f_*\mathcal{O}_X$ is finite locally free.

Conversely, assume f is affine and that $f_*\mathcal{O}_X$ is a finite locally free \mathcal{O}_Y -module. Let V be a scheme, and let $V \rightarrow Y$ be a surjective étale morphism. Again by Properties of Spaces, Lemma 48.24.2 we see that $f'_*\mathcal{O}_{V \times_Y X}$ is finite locally free. Hence $f' : V \times_Y X \rightarrow V$ is finite locally free (as it is also affine). By Spaces, Lemma 47.11.3 we conclude that f is finite locally free (use Morphisms, Lemma 28.46.4 Descent, Lemmas 34.19.28 and 34.33.1). Thus we win. \square

This clears the way for the following definition.

Definition 49.42.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say that f is *finite locally free* if f is affine and $f_*\mathcal{O}_X$ is a finite locally free \mathcal{O}_Y -module. In this case we say f has *rank* or *degree* d if the sheaf $f_*\mathcal{O}_X$ is finite locally free of rank d .

Lemma 49.42.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is representable and finite locally free,
- (2) f is finite locally free,
- (3) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that $V \times_Y X \rightarrow V$ is finite locally free, and
- (4) there exists a Zariski covering $Y = \bigcup Y_i$ such that each morphism $f^{-1}(Y_i) \rightarrow Y_i$ is finite locally free.

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y , see Properties of Spaces, Lemma 48.6.1. Assume $V \rightarrow Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 48.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \rightarrow V$ is affine.

This means we can apply Spaces, Lemma 47.11.3 because the class of finite locally free morphisms satisfies all the required properties (see Morphisms, Lemma 28.46.4 Descent, Lemmas 34.19.28 and 34.33.1). The conclusion of applying this lemma is that f is representable and finite locally free, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being finite locally free is Zariski local on the target (the reference above shows that being finite locally free is in fact fpqc local on the target). \square

Lemma 49.42.4. *The composition of finite locally free morphisms is finite locally free.*

Proof. Omitted. \square

Lemma 49.42.5. *The base change of a finite locally free morphism is finite locally free.*

Proof. Omitted. \square

Lemma 49.42.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is finite locally free,
- (2) f is finite, flat, and locally of finite presentation.

If Y is locally Noetherian these are also equivalent to

- (3) f is finite and flat.

Proof. In each of the three cases the morphism is representable and you can check the property after base change by a surjective étale morphism $V \rightarrow Y$, see Lemmas 49.41.3, 49.42.3, 49.28.5, and 49.27.4. If Y is locally Noetherian, then V is locally Noetherian. Hence the result follows from the corresponding result in the schemes case, see Morphisms, Lemma 28.46.2. \square

49.43. Normalization of algebraic spaces

This section is the analogue of Morphisms, Section 28.48.

Lemma 49.43.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. There exists a quasi-coherent sheaf of \mathcal{O}_X -algebras $\mathcal{A}' \subset \mathcal{A}$ such that for any affine object U of $X_{\text{étale}}$ the ring $\mathcal{A}'(U) \subset \mathcal{A}(U)$ is the integral closure of $\mathcal{O}_X(U)$ in $\mathcal{A}(U)$.*

Proof. By Properties of Spaces, Lemma 48.15.5 it suffices to prove that the rule given above defines a quasi-coherent module on $X_{\text{affine,étale}}$. To see this it suffices to show the following: Let $U_1 \rightarrow U_2$ be a morphism of affine objects of $X_{\text{étale}}$. Say $U_i = \text{Spec}(R_i)$. Say $\mathcal{A}|_{(U_1)_{\text{étale}}}$ is the quasi-coherent sheaf associated to the R_2 -algebra A . Let $A' \subset A$ be the integral closure of R_2 in A . Then $A' \otimes_{R_2} R_1$ is the integral closure of R_1 in $A \otimes_{R_2} R_1$. This is Algebra, Lemma 10.140.2. \square

Definition 49.43.2. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The *integral closure of \mathcal{O}_X in \mathcal{A}* is the quasi-coherent \mathcal{O}_X -subalgebra $\mathcal{A}' \subset \mathcal{A}$ constructed in Lemma 49.43.1 above.

We will apply this in particular when $\mathcal{A} = f_*\mathcal{O}_Y$ for a quasi-compact and quasi-separated morphism of algebraic spaces $f : Y \rightarrow X$ (see Lemma 49.11.2). We can then take the relative spectrum of the quasi-coherent \mathcal{O}_X -algebra (Lemma 49.20.7) to obtain the normalization of X in Y .

Definition 49.43.3. Let S be a scheme. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let \mathcal{O}' be the integral closure of \mathcal{O}_X in $f_*\mathcal{O}_Y$. The *normalization of X in Y* is the morphism of algebraic spaces

$$\nu : X' = \underline{\mathrm{Spec}}_X(\mathcal{O}') \rightarrow X$$

over S . It comes equipped with a natural factorization

$$Y \xrightarrow{f'} X' \xrightarrow{\nu} X$$

of the initial morphism f .

To get the factorization, use Remark 49.20.9 and functoriality of the Spec construction.

Lemma 49.43.4. *Let S be a scheme. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $Y \rightarrow X' \rightarrow X$ be the normalization of X in Y .*

- (1) *If $W \rightarrow X$ is an étale morphism of algebraic spaces over S , then $W \times_X X'$ is the normalization of W in $W \times_X Y$.*
- (2) *If Y and X are representable, then Y' is representable and is canonically isomorphic to the normalization of the scheme X in the scheme Y as constructed in Morphisms, Section 28.48.*

Proof. It is immediate from the construction that the formation of the normalization of X in Y commutes with étale base change, i.e., part (1) holds. On the other hand, if X and Y are schemes, then for $U \subset X$ affine open, $f_*\mathcal{O}_Y(U) = \mathcal{O}_Y(f^{-1}(U))$ and hence $\nu^{-1}(U)$ is the spectrum of exactly the same ring as we get in the corresponding construction for schemes. \square

Here is a characterization of this construction.

Lemma 49.43.5. *Let S be a scheme. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . The factorization $f = \nu \circ f'$, where $\nu : X' \rightarrow X$ is the normalization of X in Y is characterized by the following two properties:*

- (1) *the morphism ν is integral, and*
- (2) *for any factorization $f = \pi \circ g$, with $\pi : Z \rightarrow X$ integral, there exists a commutative diagram*

$$\begin{array}{ccc} Y & \xrightarrow{g} & Z \\ f' \downarrow & \nearrow h & \downarrow \pi \\ X' & \xrightarrow{\nu} & X \end{array}$$

for a unique morphism $h : X' \rightarrow Z$.

Moreover, in (2) the morphism $h : X' \rightarrow Z$ is the normalization of Z in Y .

Proof. Let $\mathcal{O}' \subset f_*\mathcal{O}_Y$ be the integral closure of \mathcal{O}_X as in Definition 49.43.3. The morphism ν is integral by construction, which proves (1). Assume given a factorization $f = \pi \circ g$ with $\pi : Z \rightarrow X$ integral as in (2). By Definition 49.41.2 π is affine, and hence Z is the relative spectrum of a quasi-coherent sheaf of \mathcal{O}_X -algebras \mathcal{B} . The morphism $g : X \rightarrow Z$ corresponds to a map of \mathcal{O}_X -algebras $\chi : \mathcal{B} \rightarrow f_*\mathcal{O}_Y$. Since $\mathcal{B}(U)$ is integral over $\mathcal{O}_X(U)$ for every affine U étale over X (by Definition 49.41.2) we see from Lemma 49.43.1 that $\chi(\mathcal{B}) \subset \mathcal{O}'$. By the functoriality of the relative spectrum Lemma 49.20.7 this provides us with a unique morphism $h : X' \rightarrow Z$. We omit the verification that the diagram commutes.

It is clear that (1) and (2) characterize the factorization $f = \nu \circ f'$ since it characterizes it as an initial object in a category. The morphism h in (2) is integral by Lemma 49.41.11. Given a factorization $g = \pi' \circ g'$ with $\pi' : Z' \rightarrow Z$ integral, we get a factorization $f = (\pi \circ \pi') \circ g'$ and we get a morphism $h' : X' \rightarrow Z'$. Uniqueness implies that $\pi' \circ h' = h$. Hence the characterization (1), (2) applies to the morphism $h : X' \rightarrow Z$ which gives the last statement of the lemma. \square

Lemma 49.43.6. *Let S be a scheme. Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Suppose that $Y = Y_1 \coprod Y_2$ is a disjoint union of two algebraic spaces. Write $f_i = f|_{Y_i}$. Let X'_i be the normalization of X in Y_i . Then $X'_1 \coprod X'_2$ is the normalization of X in Y .*

Proof. Omitted. \square

Lemma 49.43.7. *Let S be a scheme. Let $f : Y \rightarrow X$ be an integral morphism of algebraic spaces over S . Then the integral closure of X in Y is equal to Y .*

Proof. Omitted. \square

Lemma 49.43.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact, quasi-separated and universally closed morphisms of algebraic spaces over S . Then $f_*\mathcal{O}_X$ is integral over \mathcal{O}_Y . In other words, the normalization of Y in X is equal to the factorization*

$$X \longrightarrow \underline{\text{Spec}}_Y(f_*\mathcal{O}_X) \longrightarrow Y$$

of Remark 49.20.9.

Proof. The question is étale local on Y , hence we may reduce to the case where $Y = \text{Spec}(R)$ is affine. Let $h \in \Gamma(X, \mathcal{O}_X)$. We have to show that h satisfies a monic equation over R . Think of h as a morphism as in the following commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{h} & \mathbf{A}_Y^1 \\ & \searrow f & \swarrow \\ & & Y \end{array}$$

Let $Z \subset \mathbf{A}_Y^1$ be the scheme theoretic image of h , see Definition 49.16.2. The morphism h is quasi-compact as f is quasi-compact and $\mathbf{A}_Y^1 \rightarrow Y$ is separated, see Lemma 49.8.8. By Lemma 49.16.3 the morphism $X \rightarrow Z$ has dense image on underlying topological spaces. By Lemma 49.37.6 the morphism $X \rightarrow Z$ is closed. Hence $h(X) = Z$ (set theoretically). Thus we can use Lemma 49.37.7 to conclude that $Z \rightarrow Y$ is universally closed (and even proper). Since $Z \subset \mathbf{A}_Y^1$, we see that $Z \rightarrow Y$ is affine and proper, hence integral by Lemma 49.41.7. Writing

$\mathbf{A}_Y^1 = \text{Spec}(R[T])$ we conclude that the ideal $I \subset R[T]$ of Z contains a monic polynomial $P(T) \in R[T]$. Hence $P(h) = 0$ and we win. \square

Lemma 49.43.9. *Let S be a scheme. Let X be an algebraic space over S . Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. Assume that every quasi-compact open of U has finitely many irreducible components. Then there exists an integral morphism of algebraic spaces*

$$X^\nu \longrightarrow X$$

such that $X^\nu \times_X U$ is the normalization of U .

Proof. Set $R = U \times_X U$ with projections $s, t : R \rightarrow U$ and $j = (t, s) : R \rightarrow U \times_S U$ so that $X = U/R$, see Spaces, Lemma 47.9.1. The assumption on U means that the normalization U^ν of U is defined, see Morphisms, Definition 28.48.12. By More on Morphisms, Lemma 36.14.3 taking normalization commutes with étale morphisms of schemes. Thus we see that the normalization R^ν of R is isomorphic to both $R \times_{s,U} U^\nu$ and $U^\nu \times_{U,t} R$. Thus we obtain two étale morphisms $s^\nu : R^\nu \rightarrow U^\nu$ and $t^\nu : R^\nu \rightarrow U^\nu$ of schemes. The induced morphism $j^\nu : R^\nu \rightarrow U^\nu \times_S U^\nu$ is a monomorphism as R^ν is a subscheme of the restriction of R to U^ν . A formal computation with fibre products shows that $R^\nu \times_{s^\nu, U^\nu, t^\nu} R^\nu$ is the normalization of $R \times_{s,U,t} R$. Hence the (étale) morphism $c : R \times_{s,U,t} R \rightarrow R$ extends to c^ν as well. Combined we see that we obtain an étale equivalence relation. Setting $X^\nu = U^\nu/R^\nu$ (Spaces, Theorem 47.10.5) we win by Groupoids, Lemma 38.18.7. \square

49.44. Separated, locally quasi-finite morphisms

In this section we prove that an algebraic space which is locally quasi-finite and separated over a scheme, is representable. This implies that a separated and locally quasi-finite morphism is representable (see Lemma 49.45.1). But first... a lemma (which will be obsoleted by Proposition 49.44.2).

Lemma 49.44.1. *Let S be a scheme. Consider a commutative diagram*

of algebraic spaces over S . Assume

- (1) $T' \rightarrow T$ is an étale morphism of affine schemes,
- (2) $X \rightarrow T$ is a separated, locally quasi-finite morphism,
- (3) V' is an open subspace of $T' \times_T X$, and
- (4) $V' \rightarrow T'$ is quasi-affine.

In this situation the image U of V' in X is a quasi-compact open subspace of X which is representable.

Proof. We first make some trivial observations. Note that V' is representable by Lemma 49.21.3. It is also quasi-compact (as a quasi-affine scheme over an affine scheme, see Morphisms, Lemma 28.14.2). Since $T' \times_T X \rightarrow X$ is étale (Properties of Spaces, Lemma 48.13.5) the map $|T' \times_T X| \rightarrow |X|$ is open, see Properties of Spaces, Lemma 48.13.7. Let $U \subset X$ be the open subspace corresponding to the image of $|V'|$, see Properties of Spaces, Lemma 48.4.8. As $|V'|$ is quasi-compact

we see that $|U|$ is quasi-compact, hence U is a quasi-compact algebraic space, by Properties of Spaces, Lemma 48.5.2.

By Morphisms, Lemma 28.50.8 the morphism $T' \rightarrow T$ is universally bounded. Hence we can do induction on the integer n bounding the degree of the fibres of $T' \rightarrow T$, see Morphisms, Lemma 28.50.7 for a description of this integer in the case of an étale morphism. If $n = 1$, then $T' \rightarrow T$ is an open immersion (see Étale Morphisms, Theorem 40.14.1), and the result is clear. Assume $n > 1$.

Consider the affine scheme $T'' = T' \times_T T'$. As $T' \rightarrow T$ is étale we have a decomposition (into open and closed affine subschemes) $T'' = \Delta(T') \amalg T^*$. Namely $\Delta = \Delta_{T'/T}$ is open by Morphisms, Lemma 28.36.13 and closed because $T' \rightarrow T$ is separated as a morphism of affines. As a base change the degrees of the fibres of the second projection $\text{pr}_1 : T' \times_T T' \rightarrow T'$ are bounded by n , see Morphisms, Lemma 28.50.4. On the other hand, $\text{pr}_1|_{\Delta(T')} : \Delta(T') \rightarrow T'$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 28.50.7 we conclude the degrees of the fibres of the restriction $\text{pr}_1|_{T^*} : T^* \rightarrow T'$ are bounded by $n - 1$. Hence the induction hypothesis applied to the diagram

$$\begin{array}{ccccc}
 p_0^{-1}(V') \cap X^* & \longrightarrow & X^* & \longrightarrow & X' \\
 & \searrow & \downarrow & \text{pr}_1|_{X^*} & \downarrow \\
 & & T^* & \xrightarrow{\text{pr}_1|_{T^*}} & T'
 \end{array}$$

gives that $p_1(p_0^{-1}(V') \cap X^*)$ is a quasi-compact scheme. Here we set $X'' = T'' \times_T X$, $X^* = T^* \times_T X$, and $X' = T' \times_T X$, and $p_0, p_1 : X'' \rightarrow X'$ are the base changes of pr_0, pr_1 . Most of the hypotheses of the lemma imply by base change the corresponding hypothesis for the diagram above. For example $p_0^{-1}(V') = T'' \times_{T'} V'$ is a scheme quasi-affine over T'' as a base change. Some verifications omitted.

By Properties of Spaces, Lemma 48.10.1 we conclude that

$$p_1(p_0^{-1}(V')) = V' \cup p_1(p_0^{-1}(V') \cap X^*)$$

is a quasi-compact scheme. Moreover, it is clear that $p_1(p_0^{-1}(V'))$ is the inverse image of the quasi-compact open subspace $U \subset X$ discussed in the first paragraph of the proof. In other words, $T' \times_T U$ is a scheme! Note that $T' \times_T U$ is quasi-compact and separated and locally quasi-finite over T' , as $T' \times_T X \rightarrow T'$ is locally quasi-finite and separated being a base change of the original morphism $X \rightarrow T$ (see Lemmas 49.4.4 and 49.26.4). This implies by More on Morphisms, Lemma 36.31.2 that $T' \times_T U \rightarrow T'$ is quasi-affine.

By Descent, Lemma 34.35.1 this gives a descent datum on $T' \times_T U/T'$ relative to the étale covering $\{T' \rightarrow W\}$, where $W \subset T$ is the image of the morphism $T' \rightarrow T$. Because U' is quasi-affine over T' we see from Descent, Lemma 34.34.1 that this datum is effective, and by the last part of Descent, Lemma 34.35.1 this implies that U is a scheme as desired. Some minor details omitted. \square

Proposition 49.44.2. *Let S be a scheme. Let $f : X \rightarrow T$ be a morphism of algebraic spaces over S . Assume*

- (1) T is representable,
- (2) f is locally quasi-finite, and
- (3) f is separated.

Then X is representable.

Proof. Let $T = \bigcup T_i$ be an affine open covering of the scheme T . If we can show that the open subspaces $X_i = f^{-1}(T_i)$ are representable, then X is representable, see Properties of Spaces, Lemma 48.10.1. Note that $X_i = T_i \times_T X$ and that locally quasi-finite and separated are both stable under base change, see Lemmas 49.4.4 and 49.26.4. Hence we may assume T is an affine scheme.

By Properties of Spaces, Lemma 48.6.2 there exists a Zariski covering $X = \bigcup X_i$ such that each X_i has a surjective étale covering by an affine scheme. By Properties of Spaces, Lemma 48.10.1 again it suffices to prove the proposition for each X_i . Hence we may assume there exists an affine scheme U and a surjective étale morphism $U \rightarrow X$. This reduces us to the situation in the next paragraph.

Assume we have

$$U \longrightarrow X \longrightarrow T$$

where U and T are affine schemes, $U \rightarrow X$ is étale surjective, and $X \rightarrow T$ is separated and locally quasi-finite. By Lemmas 49.36.5 and 49.26.3 the morphism $U \rightarrow T$ is locally quasi-finite. Since U and T are affine it is quasi-finite. Set $R = U \times_X U$. Then $X = U/R$, see Spaces, Lemma 47.9.1. As $X \rightarrow T$ is separated the morphism $R \rightarrow U \times_T U$ is a closed immersion, see Lemma 49.4.5. In particular R is an affine scheme also. As $U \rightarrow X$ is étale the projection morphisms $t, s : R \rightarrow U$ are étale as well. In particular s and t are quasi-finite, flat and of finite presentation (see Morphisms, Lemmas 28.37.6, 28.37.12 and 28.37.11).

Let (U, R, s, t, c) be the groupoid associated to the étale equivalence relation R on U . Let $u \in U$ be a point, and denote $p \in T$ its image. We are going to use More on Groupoids, Lemma 39.12.2 for the groupoid (U, R, s, t, c) over the scheme T with points p and u as above. By the discussion in the previous paragraph all the assumptions (1) – (7) of that lemma are satisfied. Hence we get an étale neighbourhood $(T', p') \rightarrow (T, p)$ and disjoint union decompositions

$$U_{T'} = U' \amalg W, \quad R_{T'} = R' \amalg W'$$

and $u' \in U'$ satisfying conclusions (a), (b), (c), (d), (e), (f), (g), and (h) of the aforementioned More on Groupoids, Lemma 39.12.2. We may and do assume that T' is affine (after possibly shrinking T'). Conclusion (h) implies that $R' = U' \times_{X_{T'}} U'$ with projection mappings identified with the restrictions of s' and t' . Thus $(U', R', s'|_{R'}, t'|_{R'}, c'|_{R' \times_{U', s'} R'})$ of conclusion (g) is an étale equivalence relation. By Spaces, Lemma 47.10.2 we conclude that U'/R' is an open subspace of $X_{T'}$. By conclusion (d) the schemes U', R' are affine and the morphisms $s'|_{R'}, t'|_{R'}$ are finite étale. Hence Groupoids, Proposition 38.21.8 kicks in and we see that U'/R' is an affine scheme.

We conclude that for every pair of points (u, p) as above we can find an étale neighbourhood $(T', p') \rightarrow (T, p)$ with $\kappa(p) = \kappa(p')$ and a point $u' \in U_{T'}$ mapping to u such that the image x' of u' in $|X_{T'}|$ has an open neighbourhood V' in $X_{T'}$ which is an affine scheme. We apply Lemma 49.44.1 to obtain an open subspace $W \subset X$ which is a scheme, and which contains x (the image of u in $|X|$). Since this works for every x we see that X is a scheme by Properties of Spaces, Lemma 48.10.1. This ends the proof. \square

49.45. Applications

An alternative proof of the following lemma is to see it as a consequence of Zariski's main theorem for (nonrepresentable) morphisms of algebraic spaces as discussed in More on Morphisms of Spaces, Section 58.24. Namely, More on Morphisms of Spaces, Lemma 58.24.2 implies that a quasi-finite and separated morphism of algebraic spaces is quasi-affine and therefore representable.

Lemma 49.45.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally quasi-finite and separated, then f is representable.*

Proof. This is immediate from Proposition 49.44.2 and the fact that being locally quasi-finite and separated is preserved under any base change, see Lemmas 49.26.4 and 49.4.4. \square

Lemma 49.45.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an étale and universally injective morphism of algebraic spaces over S . Then f is an open immersion.*

Proof. Let $T \rightarrow Y$ be a morphism from a scheme into Y . If we can show that $X \times_Y T \rightarrow T$ is an open immersion, then we are done. Since being étale and being universally injective are properties of morphisms stable under base change (see Lemmas 49.36.4 and 49.19.5) we may assume that Y is a scheme. Note that the diagonal $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is étale, a monomorphism, and surjective by Lemma 49.19.2. Hence we see that $\Delta_{X/Y}$ is an isomorphism (see Spaces, Lemma 47.5.9), in particular we see that X is separated over Y . It follows that X is a scheme too, by Proposition 49.44.2. Finally, $X \rightarrow Y$ is an open immersion by the fundamental theorem for étale morphisms of schemes, see Étale Morphisms, Theorem 40.14.1. \square

49.46. Zariski's Main Theorem (representable case)

This is the version you can prove using that normalization commutes with étale localization. Before we can prove more powerful versions (for non-representable morphisms) we need to develop more tools. See More on Morphisms of Spaces, Section 58.24.

Lemma 49.46.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is representable, of finite type, and separated. Let Y' be the normalization of Y in X . Picture:*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \nu \\ & & Y \end{array}$$

Then there exists an open subspace $U' \subset Y'$ such that

- (1) $(f')^{-1}(U') \rightarrow U'$ is an isomorphism, and
- (2) $(f')^{-1}(U') \subset X$ is the set of points at which f is quasi-finite.

Proof. Let $W \rightarrow Y$ be a surjective étale morphism where W is a scheme. Then $W \times_Y X$ is a scheme as well. By Lemma 49.43.4 the algebraic space $W \times_Y Y'$ is representable and is the normalization of the scheme W in the scheme $W \times_Y X$.

Picture

$$\begin{array}{ccc} W \times_Y X & \xrightarrow{(1, f')} & W \times_Y Y' \\ & \searrow (1, f) & \swarrow (1, \nu) \\ & W & \end{array}$$

By More on Morphisms, Lemma 36.31.1 the result of the lemma holds over W . Let $V' \subset W \times_Y Y'$ be the open subscheme such that

- (1) $(1, f')^{-1}(V') \rightarrow V'$ is an isomorphism, and
- (2) $(1, f')^{-1}(V') \subset W \times_Y X$ is the set of points at which $(1, f)$ is quasi-finite.

By Lemma 49.32.7 there is a maximal open set of points $U \subset X$ where f is quasi-finite and $W \times_Y U = (1, f')^{-1}(V')$. The morphism $f'|_U : U \rightarrow Y'$ is an open immersion by Lemma 49.12.1 as its base change to W is the isomorphism $(1, f')^{-1}(V') \rightarrow V'$ followed by the open immersion $V' \rightarrow W \times_Y Y'$. Setting $U' = \text{Im}(U \rightarrow Y')$ finishes the proof (omitted: the verification that $(f')^{-1}(U') = U$). \square

In the following lemma we can drop the assumption of being representable as we've shown that a locally quasi-finite separated morphism is representable.

Lemma 49.46.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-finite and separated. Let Y' be the normalization of Y in X . Picture:*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \nu \\ & Y & \end{array}$$

Then f' is a quasi-compact open immersion and ν is integral. In particular f is quasi-affine.

Proof. By Lemma 49.45.1 the morphism f is representable. Hence we may apply Lemma 49.46.1. Thus there exists an open subspace $U' \subset Y'$ such that $(f')^{-1}(U') = X$ (!) and $X \rightarrow U'$ is an isomorphism! In other words, f' is an open immersion. Note that f' is quasi-compact as f is quasi-compact and $\nu : Y' \rightarrow Y$ is separated (Lemma 49.8.8). Hence for every affine scheme Z and morphism $Z \rightarrow Y$ the fibre product $Z \times_Y X$ is a quasi-compact open subscheme of the affine scheme $Z \times_Y Y'$. Hence f is quasi-affine by definition. \square

49.47. Universal homeomorphisms

In Morphisms, Section 28.45 we have shown that a morphism of schemes is a universal homeomorphism if and only if it is integral, universally injective, and surjective. In particular the class of universal homeomorphisms of schemes is closed under composition and arbitrary base change and is fppf local on the base (as this is true for integral, universally injective, and surjective morphisms). Thus, if we apply the discussion in Section 49.3 to this notion we see that we know what it means for a representable morphism of algebraic spaces to be a universal homeomorphism.

Lemma 49.47.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Then f is a universal homeomorphism (as discussed above) if and only if for every morphism of algebraic spaces $Z \rightarrow Y$ the base change map $Z \times_Y X \rightarrow Z$ induces a homeomorphism $|Z \times_Y X| \rightarrow |Z|$.*

Proof. If for every morphism of algebraic spaces $Z \rightarrow Y$ the base change map $Z \times_Y X \rightarrow Z$ induces a homeomorphism $|Z \times_Y X| \rightarrow |Z|$, then the same is true whenever Z is a scheme, which formally implies that f is a universal homeomorphism in the sense of Section 49.3. Conversely, if f is a universal homeomorphism in the sense of Section 49.3 then $X \rightarrow Y$ is integral, universally injective and surjective (by Spaces, Lemma 47.5.8 and Morphisms, Lemma 28.45.3). Hence f is universally closed, see Lemma 49.41.7 and universally injective and (universally) surjective, i.e., f is a universal homeomorphism. \square

Definition 49.47.2. Let S be a scheme. A morphism $f : X \rightarrow Y$ of algebraic spaces over S is called a *universal homeomorphism* if and only if for every morphism of algebraic spaces $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ induces a homeomorphism $|Z \times_Y X| \rightarrow |Z|$.

This definition does not clash with the pre-existing definition for representable morphisms of algebraic spaces by our Lemma 49.47.1. For morphisms of algebraic spaces it is not the case that universal homeomorphisms are always integral.

Example 49.47.3. This is a continuation of Remark 49.19.4. Consider the algebraic space $X = \mathbf{A}_k^1 / \{x \sim -x \mid x \neq 0\}$. There are morphisms

$$\mathbf{A}_k^1 \longrightarrow X \longrightarrow \mathbf{A}_k^1$$

such that the first arrow is étale surjective, the second arrow is universally injective, and the composition is the map $x \mapsto x^2$. Hence the composition is universally closed. Thus it follows that the map $X \rightarrow \mathbf{A}_k^1$ is a universal homeomorphism, but $X \rightarrow \mathbf{A}_k^1$ is not separated.

Let S be a scheme. Let $f : X \rightarrow Y$ be a universal homeomorphism of algebraic spaces over S . Then f is universally closed, hence is quasi-compact, see Lemma 49.9.7. But f need not be separated (see example above), and not even quasi-separated: an example is to take infinite dimensional affine space $\mathbf{A}^\infty = \text{Spec}(k[x_1, x_2, \dots])$ modulo the equivalence relation given by flipping finitely many signs (details omitted).

Lemma 49.47.4. *Let S be a scheme. Let X be an algebraic space over S . The canonical closed immersion $X_{\text{red}} \rightarrow X$ (see Properties of Spaces, Definition 48.9.5) is a universal homeomorphism.*

Proof. Omitted. \square

We put the following result here as we do not currently have a better place to put it.

Lemma 49.47.5. *Let S be a scheme. Let $f : Y \rightarrow X$ be a universally injective, integral morphism of algebraic spaces over S .*

(1) *The functor*

$$f_{\text{small},*} : \text{Sh}(Y_{\text{étale}}) \longrightarrow \text{Sh}(X_{\text{étale}})$$

is fully faithful and its essential image is those sheaves of sets \mathcal{F} on $X_{\text{étale}}$ whose restriction to $|X| \setminus f(|Y|)$ is isomorphic to $$, and*

(2) *the functor*

$$f_{\text{small},*} : \text{Ab}(Y_{\text{étale}}) \longrightarrow \text{Ab}(X_{\text{étale}})$$

is fully faithful and its essential image is those abelian sheaves on $Y_{\acute{e}tale}$ whose support is contained in $f(|Y|)$.

In both cases f_{small}^{-1} is a left inverse to the functor $f_{small,}$.*

Proof. Since f is integral it is universally closed (Lemma 49.41.7). In particular, $f(|Y|)$ is a closed subset of $|X|$ and the statements make sense. The rest of the proof is identical to the proof of Lemma 49.13.5 except that we use Étale Cohomology, Proposition 44.48.1 instead of Étale Cohomology, Proposition 44.47.4. \square

Decent Algebraic Spaces

50.1. Introduction

In this chapter we talk study “local” properties of general algebraic spaces, i.e., those algebraic spaces which aren’t quasi-separated. Quasi-separated algebraic spaces are studied in [Knu71]. It turns out that essentially new phenomena happen, especially regarding points and specializations of points, on more general algebraic spaces. On the other hand, for most basic results on algebraic spaces, one needn’t worry about these phenomena, which is why we have decided to have this material in a separate chapter following the standard development of the theory.

50.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

50.3. Universally bounded fibres

We briefly discuss what it means for a morphism from a scheme to an algebraic space to have universally bounded fibres. Please refer to Morphisms, Section 28.50 for similar definitions and results on morphisms of schemes.

Definition 50.3.1. Let S be a scheme. Let X be an algebraic space over S , and let U be a scheme over S . Let $f : U \rightarrow X$ be a morphism over S . We say the *fibres of f are universally bounded*¹ if there exists an integer n such that for all fields k and all morphisms $\text{Spec}(k) \rightarrow X$ the fibre product $\text{Spec}(k) \times_X U$ is a finite scheme over k whose degree over k is $\leq n$.

This definition makes sense because the fibre product $\text{Spec}(k) \times_Y X$ is a scheme. Moreover, if Y is a scheme we recover the notion of Morphisms, Definition 28.50.1 by virtue of Morphisms, Lemma 28.50.2.

Lemma 50.3.2. *Let S be a scheme. Let X be an algebraic space over S . Let $V \rightarrow U$ be a morphism of schemes over S , and let $U \rightarrow X$ be a morphism from U to X . If the fibres of $V \rightarrow U$ and $U \rightarrow X$ are universally bounded, then so are the fibres of $V \rightarrow X$.*

¹This is probably nonstandard notation.

Proof. Let n be an integer which works for $V \rightarrow U$, and let m be an integer which works for $U \rightarrow X$ in Definition 50.3.1. Let $\text{Spec}(k) \rightarrow X$ be a morphism, where k is a field. Consider the morphisms

$$\text{Spec}(k) \times_X V \longrightarrow \text{Spec}(k) \times_X U \longrightarrow \text{Spec}(k).$$

By assumption the scheme $\text{Spec}(k) \times_X U$ is finite of degree at most m over k , and n is an integer which bounds the degree of the fibres of the first morphism. Hence by Morphisms, Lemma 28.50.3 we conclude that $\text{Spec}(k) \times_X V$ is finite over k of degree at most nm . \square

Lemma 50.3.3. *Let S be a scheme. Let $Y \rightarrow X$ be a representable morphism of algebraic spaces over S . Let $U \rightarrow X$ be a morphism from a scheme to X . If the fibres of $U \rightarrow X$ are universally bounded, then the fibres of $U \times_X Y \rightarrow Y$ are universally bounded.*

Proof. This is clear from the definition, and properties of fibre products. (Note that $U \times_X Y$ is a scheme as we assumed $Y \rightarrow X$ representable, so the definition applies.) \square

Lemma 50.3.4. *Let S be a scheme. Let $g : Y \rightarrow X$ be a representable morphism of algebraic spaces over S . Let $f : U \rightarrow X$ be a morphism from a scheme towards X . Let $f' : U \times_X Y \rightarrow Y$ be the base change of f . If*

$$\text{Im}(|f| : |U| \rightarrow |X|) \subset \text{Im}(|g| : |Y| \rightarrow |X|)$$

and f' has universally bounded fibres, then f has universally bounded fibres.

Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibre products $\text{Spec}(k) \times_Y (U \times_X Y)$ as in Definition 50.3.1 for the morphism f' . We claim that n works for f also. Namely, suppose that $x : \text{Spec}(k) \rightarrow X$ is a morphism from the spectrum of a field. Then either $\text{Spec}(k) \times_X U$ is empty (and there is nothing to prove), or x is in the image of $|f|$. By Properties of Spaces, Lemma 48.4.3 and the assumption of the lemma we see that this means there exists a field extension $k \subset k'$ and a commutative diagram

$$\begin{array}{ccc} \text{Spec}(k') & \longrightarrow & Y \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \longrightarrow & X \end{array}$$

Hence we see that

$$\text{Spec}(k') \times_Y (U \times_X Y) = \text{Spec}(k') \times_{\text{Spec}(k)} (\text{Spec}(k) \times_X U)$$

Since the scheme $\text{Spec}(k') \times_Y (U \times_X Y)$ is assumed finite of degree $\leq n$ over k' it follows that also $\text{Spec}(k) \times_X U$ is finite of degree $\leq n$ over k as desired. (Some details omitted.) \square

Lemma 50.3.5. *Let S be a scheme. Let X be an algebraic space over S . Consider a commutative diagram*

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ & \searrow g & \swarrow h \\ & & X \end{array}$$

where U and V are schemes. If g has universally bounded fibres, and f is surjective and flat, then also h has universally bounded fibres.

Proof. Assume g has universally bounded fibres, and f is surjective and flat. Say $n \geq 0$ is an integer which bounds the degrees of the schemes $\text{Spec}(k) \times_X U$ as in Definition 50.3.1. We claim n also works for h . Let $\text{Spec}(k) \rightarrow X$ be a morphism from the spectrum of a field to X . Consider the morphism of schemes

$$\text{Spec}(k) \times_X V \longrightarrow \text{Spec}(k) \times_X U$$

It is flat and surjective. By assumption the scheme on the left is finite of degree $\leq n$ over $\text{Spec}(k)$. It follows from Morphisms, Lemma 28.50.9 that the degree of the scheme on the right is also bounded by n as desired. \square

Lemma 50.3.6. *Let S be a scheme. Let X be an algebraic space over S , and let U be a scheme over S . Let $\varphi : U \rightarrow X$ be a morphism over S . If the fibres of φ are universally bounded, then there exists an integer n such that each fibre of $|U| \rightarrow |X|$ has at most n elements.*

Proof. The integer n of Definition 50.3.1 works. Namely, pick $x \in |X|$. Represent x by a morphism $x : \text{Spec}(k) \rightarrow X$. Then we get a commutative diagram

$$\begin{array}{ccc} \text{Spec}(k) \times_X U & \longrightarrow & U \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \xrightarrow{x} & X \end{array}$$

which shows (via Properties of Spaces, Lemma 48.4.3) that the inverse image of x in $|U|$ is the image of the top horizontal arrow. Since $\text{Spec}(k) \times_X U$ is finite of degree $\leq n$ over k it has at most n points. \square

50.4. Finiteness conditions and points

In this section we elaborate on the question of when points can be represented by monomorphisms from spectra of fields into the space.

Remark 50.4.1. Before we give the proof of the next lemma let us recall some facts about étale morphisms of schemes:

- (1) An étale morphism is flat and hence generalizations lift along an étale morphism (Morphisms, Lemmas 28.37.12 and 28.26.8).
- (2) An étale morphism is unramified, an unramified morphism is locally quasi-finite, hence fibres are discrete (Morphisms, Lemmas 28.37.16, 28.36.10, and 28.21.6).
- (3) A quasi-compact étale morphism is quasi-finite and in particular has finite fibres (Morphisms, Lemmas 28.21.9 and 28.21.10).
- (4) An étale scheme over a field k is a disjoint union of spectra of finite separable field extension of k (Morphisms, Lemma 28.37.7).

For a general discussion of étale morphisms, please see Étale Morphisms, Section 40.11.

Lemma 50.4.2. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The following are equivalent:*

- (1) *there exists a family of schemes U_i and étale morphisms $\varphi_i : U_i \rightarrow X$ such that $\coprod \varphi_i : \coprod U_i \rightarrow X$ is surjective, and such that for each i the fibre of $|U_i| \rightarrow |X|$ over x is finite, and*
- (2) *for every affine scheme U and étale morphism $\varphi : U \rightarrow X$ the fibre of $|U| \rightarrow |X|$ over x is finite.*

Proof. The implication (2) \Rightarrow (1) is trivial. Let $\varphi_i : U_i \rightarrow X$ be a family of étale morphisms as in (1). Let $\varphi : U \rightarrow X$ be an étale morphism from an affine scheme towards X . Consider the fibre product diagrams

$$\begin{array}{ccc}
 U \times_X U_i & \xrightarrow{p_i} & U_i \\
 q_i \downarrow & & \downarrow \varphi_i \\
 U & \xrightarrow{\varphi} & X
 \end{array}
 \qquad
 \begin{array}{ccc}
 \coprod U \times_X U_i & \xrightarrow{\coprod p_i} & \coprod U_i \\
 \coprod q_i \downarrow & & \downarrow \coprod \varphi_i \\
 U & \xrightarrow{\varphi} & X
 \end{array}$$

Since q_i is étale it is open (see Remark 50.4.1). Moreover, the morphism $\coprod q_i$ is surjective. Hence there exist finitely many indices i_1, \dots, i_n and a quasi-compact opens $W_{i_j} \subset U \times_X U_{i_j}$ which surject onto U . The morphism p_i is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 28.50.8 to see the fibres of $p_{i_j}|_{W_{i_j}} : W_{i_j} \rightarrow U_{i_j}$ are finite. Hence by Properties of Spaces, Lemma 48.4.3 and the assumption on φ_i we conclude that the fibre of φ over x is finite. In other words (2) holds. \square

Lemma 50.4.3. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The following are equivalent:*

- (1) *there exists a scheme U , an étale morphism $\varphi : U \rightarrow X$, and points $u, u' \in U$ mapping to x such that setting $R = U \times_X U$ the fibre of*

$$|R| \rightarrow |U| \times_{|X|} |U|$$

over (u, u') is finite,

- (2) *for every scheme U , étale morphism $\varphi : U \rightarrow X$ and any points $u, u' \in U$ mapping to x setting $R = U \times_X U$ the fibre of*

$$|R| \rightarrow |U| \times_{|X|} |U|$$

over (u, u') is finite,

- (3) *there exists a morphism $\text{Spec}(k) \rightarrow X$ with k a field in the equivalence class of x such that the projections $\text{Spec}(k) \times_X \text{Spec}(k) \rightarrow \text{Spec}(k)$ are étale and quasi-compact, and*
- (4) *there exists a monomorphism $\text{Spec}(k) \rightarrow X$ with k a field in the equivalence class of x .*

Proof. Assume (1), i.e., let $\varphi : U \rightarrow X$ be an étale morphism from a scheme towards X , and let u, u' be points of U lying over x such that the fibre of $|R| \rightarrow |U| \times_{|X|} |U|$ over (u, u') is a finite set. In this proof we think of a point $u = \text{Spec}(\kappa(u))$ as a scheme. Note that $u \rightarrow U, u' \rightarrow U$ are monomorphisms (see Schemes, Lemma 25.23.6), hence $u \times_X u' \rightarrow R = U \times_X U$ is a monomorphism. In this language the assumption really means that $u \times_X u'$ is a scheme whose underlying topological space has finitely many points. Let $\psi : W \rightarrow X$ be an étale morphism from a scheme towards X . Let $w, w' \in W$ be points of W mapping to

x . We have to show that $w \times_X w'$ is a scheme whose underlying topological space has finitely many points. Consider the fibre product diagram

$$\begin{array}{ccc} W \times_X U & \xrightarrow{p} & U \\ q \downarrow & & \downarrow \varphi \\ W & \xrightarrow{\psi} & X \end{array}$$

As x is the image of u and u' we may pick points \tilde{w}, \tilde{w}' in $W \times_X U$ with $q(\tilde{w}) = w$, $q(\tilde{w}') = w'$, $u = p(\tilde{w})$ and $u' = p(\tilde{w}')$, see Properties of Spaces, Lemma 48.4.3. As p, q are étale the field extensions $\kappa(w) \subset \kappa(\tilde{w}) \supset \kappa(u)$ and $\kappa(w') \subset \kappa(\tilde{w}') \supset \kappa(u')$ are finite separable, see Remark 50.4.1. Then we get a commutative diagram

$$\begin{array}{ccccc} w \times_X w' & \longleftarrow & \tilde{w} \times_X \tilde{w}' & \longrightarrow & u \times_X u' \\ \downarrow & & \downarrow & & \downarrow \\ w \times_X w' & \longleftarrow & \tilde{w} \times_S \tilde{w}' & \longrightarrow & u \times_S u' \end{array}$$

where the squares are fibre product squares. The lower horizontal morphisms are étale and quasi-compact, as any scheme of the form $\text{Spec}(k) \times_S \text{Spec}(k')$ is affine, and by our observations about the field extensions above. Thus we see that the top horizontal arrows are étale and quasi-compact and hence have finite fibres. We have seen above that $|u \times_X u'|$ is finite, so we conclude that $|w \times_X w'|$ is finite. In other words, (2) holds.

Assume (2). Let $U \rightarrow X$ be an étale morphism from a scheme U such that x is in the image of $|U| \rightarrow |X|$. Let $u \in U$ be a point mapping to x . Then we have seen in the previous paragraph that $u = \text{Spec}(\kappa(u)) \rightarrow X$ has the property that $u \times_X u$ has a finite underlying topological space. On the other hand, the projection maps $u \times_X u \rightarrow u$ are the composition

$$u \times_X u \longrightarrow u \times_X U \longrightarrow u \times_X X = u,$$

i.e., the composition of a monomorphism (the base change of the monomorphism $u \rightarrow U$) by an étale morphism (the base change of the étale morphism $U \rightarrow X$). Hence $u \times_X U$ is a disjoint union of spectra of fields finite separable over $\kappa(u)$ (see Remark 50.4.1). Since $u \times_X u$ is finite the image of it in $u \times_X U$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. By Schemes, Lemma 25.23.10 we conclude that $u \times_X u$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. In other words, we see that $u \times_X u \rightarrow u$ is quasi-compact and étale. This means that (3) holds.

Let us prove that (3) implies (4). Let $\text{Spec}(k) \rightarrow X$ be a morphism from the spectrum of a field into X , in the equivalence class of x such that the two projections $t, s : R = \text{Spec}(k) \times_X \text{Spec}(k) \rightarrow \text{Spec}(k)$ are quasi-compact and étale. This means in particular that R is an étale equivalence relation on $\text{Spec}(k)$. By Spaces, Theorem 47.10.5 we know that the quotient sheaf $X' = \text{Spec}(k)/R$ is an algebraic space. By Groupoids, Lemma 38.18.6 the map $X' \rightarrow X$ is a monomorphism. Since s, t are quasi-compact, we see that R is quasi-compact and hence Properties of Spaces, Lemma 48.12.1 applies to X' , and we see that $X' = \text{Spec}(k')$ for some field k' . Hence we get a factorization

$$\text{Spec}(k) \longrightarrow \text{Spec}(k') \longrightarrow X$$

which shows that $\text{Spec}(k') \rightarrow X$ is a monomorphism mapping to $x \in |X|$. In other words (4) holds.

Finally, we prove that (4) implies (1). Let $\text{Spec}(k) \rightarrow X$ be a monomorphism with k a field in the equivalence class of x . Let $U \rightarrow X$ be a surjective étale morphism from a scheme U to X . Let $u \in U$ be a point over x . Since $\text{Spec}(k) \times_X u$ is nonempty, and since $\text{Spec}(k) \times_X u \rightarrow u$ is a monomorphism we conclude that $\text{Spec}(k) \times_X u = u$ (see Schemes, Lemma 25.23.10). Hence $u \rightarrow U \rightarrow X$ factors through $\text{Spec}(k) \rightarrow X$, here is a picture

$$\begin{array}{ccc} u & \longrightarrow & U \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \longrightarrow & X \end{array}$$

Since the right vertical arrow is étale this implies that $k \subset \kappa(u)$ is a finite separable extension. Hence we conclude that

$$u \times_X u = u \times_{\text{Spec}(k)} u$$

is a finite scheme, and we win by the discussion of the meaning of property (1) in the first paragraph of this proof. \square

Lemma 50.4.4. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. Let U be a scheme and let $\varphi : U \rightarrow X$ be an étale morphism. The following are equivalent:*

- (1) *x is in the image of $|U| \rightarrow |X|$, and setting $R = U \times_X U$ the fibres of both*

$$|U| \longrightarrow |X| \quad \text{and} \quad |R| \longrightarrow |X|$$
over x are finite,
- (2) *there exists a monomorphism $\text{Spec}(k) \rightarrow X$ with k a field in the equivalence class of x , and the fibre product $\text{Spec}(k) \times_X U$ is a finite nonempty scheme over k .*

Proof. Assume (1). This clearly implies the first condition of Lemma 50.4.3 and hence we obtain a monomorphism $\text{Spec}(k) \rightarrow X$ in the class of x . Taking the fibre product we see that $\text{Spec}(k) \times_X U \rightarrow \text{Spec}(k)$ is a scheme étale over $\text{Spec}(k)$ with finitely many points, hence a finite nonempty scheme over k , i.e., (2) holds.

Assume (2). By assumption x is in the image of $|U| \rightarrow |X|$. The finiteness of the fibre of $|U| \rightarrow |X|$ over x is clear since this fibre is equal to $|\text{Spec}(k) \times_X U|$ by Properties of Spaces, Lemma 48.4.3. The finiteness of the fibre of $|R| \rightarrow |X|$ above x is also clear since it is equal to the set underlying the scheme

$$(\text{Spec}(k) \times_X U) \times_{\text{Spec}(k)} (\text{Spec}(k) \times_X U)$$

which is finite over k . Thus (1) holds. \square

Lemma 50.4.5. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The following are equivalent:*

- (1) *for every affine scheme U , any étale morphism $\varphi : U \rightarrow X$ setting $R = U \times_X U$ the fibres of both*

$$|U| \longrightarrow |X| \quad \text{and} \quad |R| \longrightarrow |X|$$
over x are finite,

- (2) *there exist schemes U_i and étale morphisms $U_i \rightarrow X$ such that $\coprod U_i \rightarrow X$ is surjective and for each i , setting $R_i = U_i \times_X U_i$ the fibres of both*

$$|U_i| \longrightarrow |X| \quad \text{and} \quad |R_i| \longrightarrow |X|$$

over x are finite,

- (3) *there exists a monomorphism $\text{Spec}(k) \rightarrow X$ with k a field in the equivalence class of x , and for any affine scheme U and étale morphism $U \rightarrow X$ the fibre product $\text{Spec}(k) \times_X U$ is a finite scheme over k , and*
 (4) *there exists a quasi-compact monomorphism $\text{Spec}(k) \rightarrow X$ with k a field in the equivalence class of x .*

Proof. The equivalence of (1) and (3) follows on applying Lemma 50.4.4 to every étale morphism $U \rightarrow X$ with U affine. It is clear that (3) implies (2). Assume $U_i \rightarrow X$ and R_i are as in (2). We conclude from Lemma 50.4.2 that for any affine scheme U and étale morphism $U \rightarrow X$ the fibre of $|U| \rightarrow |X|$ over x is finite. Say this fibre is $\{u_1, \dots, u_n\}$. Then, as Lemma 50.4.3 (1) applies to $U_i \rightarrow X$ for some i such that x is in the image of $|U_i| \rightarrow |X|$, we see that the fibre of $|R = U \times_X U| \rightarrow |U| \times_{|X|} |U|$ is finite over (u_a, u_b) , $a, b \in \{1, \dots, n\}$. Hence the fibre of $|R| \rightarrow |X|$ over x is finite. In this way we see that (1) holds. At this point we know that (1), (2), and (3) are equivalent.

If (4) holds, then for any affine scheme U and étale morphism $U \rightarrow X$ the scheme $\text{Spec}(k) \times_X U$ is on the one hand étale over k (hence a disjoint union of spectra of finite separable extensions of k by Remark 50.4.1) and on the other hand quasi-compact over U (hence quasi-compact). Thus we see that (3) holds. Conversely, if $U_i \rightarrow X$ is as in (2) and $\text{Spec}(k) \rightarrow X$ is a monomorphism as in (3), then

$$\coprod \text{Spec}(k) \times_X U_i \longrightarrow \coprod U_i$$

is quasi-compact (because over each U_i we see that $\text{Spec}(k) \times_X U_i$ is a finite disjoint union spectra of fields). Thus $\text{Spec}(k) \rightarrow X$ is quasi-compact by Morphisms of Spaces, Lemma 49.8.7. \square

Lemma 50.4.6. *Let S be a scheme. Let X be an algebraic space over S . The following are equivalent:*

- (1) *there exist schemes U_i and étale morphisms $U_i \rightarrow X$ such that $\coprod U_i \rightarrow X$ is surjective and each $U_i \rightarrow X$ has universally bounded fibres, and*
 (2) *for every affine scheme U and étale morphism $\varphi : U \rightarrow X$ the fibres of $U \rightarrow X$ are universally bounded.*

Proof. The implication (2) \Rightarrow (1) is trivial. Assume (1). Let $(\varphi_i : U_i \rightarrow X)_{i \in I}$ be a collection of étale morphisms from schemes towards X , covering X , such that each φ_i has universally bounded fibres. Let $\psi : U \rightarrow X$ be an étale morphism from an affine scheme towards X . For each i consider the fibre product diagram

$$\begin{array}{ccc} U \times_X U_i & \xrightarrow{p_i} & U_i \\ q_i \downarrow & & \downarrow \varphi_i \\ U & \xrightarrow{\psi} & X \end{array}$$

Since q_i is étale it is open (see Remark 50.4.1). Moreover, we have $U = \bigcup \text{Im}(q_i)$, since the family $(\varphi_i)_{i \in I}$ is surjective. Since U is affine, hence quasi-compact we can finite finitely many $i_1, \dots, i_n \in I$ and quasi-compact opens $W_j \subset U \times_X U_{i_j}$

such that $U = \bigcup p_{i_j}(W_j)$. The morphism p_{i_j} is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 28.50.8 to see the fibres of $p_{i_j}|_{W_j} : W_j \rightarrow U_{i_j}$ are universally bounded. Hence by Lemma 50.3.2 we see that the fibres of $W_j \rightarrow X$ are universally bounded. Thus also $\coprod_{j=1, \dots, n} W_j \rightarrow X$ has universally bounded fibres. Since $\coprod_{j=1, \dots, n} W_j \rightarrow X$ factors through the surjective étale map $\coprod q_{i_j}|_{W_j} : \coprod_{j=1, \dots, n} W_j \rightarrow U$ we see that the fibres of $U \rightarrow X$ are universally bounded by Lemma 50.3.5. In other words (2) holds. \square

Lemma 50.4.7. *Let S be a scheme. Let X be an algebraic space over S . The following are equivalent:*

- (1) *there exists a Zariski covering $X = \bigcup X_i$ and for each i a scheme U_i and a quasi-compact surjective étale morphism $U_i \rightarrow X_i$, and*
- (2) *there exist schemes U_i and étale morphisms $U_i \rightarrow X$ such that the projections $U_i \times_X U_i \rightarrow U_i$ are quasi-compact and $\coprod U_i \rightarrow X$ is surjective.*

Proof. If (1) holds then the morphisms $U_i \rightarrow X_i \rightarrow X$ are étale (combine Morphisms, Lemma 28.37.3 and Spaces, Lemmas 47.5.4 and 47.5.3). Moreover, as $U_i \times_X U_i = U_i \times_{X_i} U_i$, both projections $U_i \times_X U_i \rightarrow U_i$ are quasi-compact.

If (2) holds then let $X_i \subset X$ be the open subspace corresponding to the image of the open map $|U_i| \rightarrow |X|$, see Properties of Spaces, Lemma 48.4.10. The morphisms $U_i \rightarrow X_i$ are surjective. Hence $U_i \rightarrow X_i$ is surjective étale, and the projections $U_i \times_{X_i} U_i \rightarrow U_i$ are quasi-compact, because $U_i \times_{X_i} U_i = U_i \times_X U_i$. Thus by Spaces, Lemma 47.11.2 the morphisms $U_i \rightarrow X_i$ are quasi-compact. \square

50.5. Conditions on algebraic spaces

In this section we discuss the relationship between various natural conditions on algebraic spaces we have seen above. Please read Section 50.6 to get a feeling for the meaning of these conditions.

Lemma 50.5.1. *Let S be a scheme. Let X be an algebraic space over S . Consider the following conditions on X :*

- (α) *For every $x \in |X|$, the equivalent conditions of Lemma 50.4.2 hold.*
- (β) *For every $x \in |X|$, the equivalent conditions of Lemma 50.4.3 hold.*
- (γ) *For every $x \in |X|$, the equivalent conditions of Lemma 50.4.5 hold.*
- (δ) *The equivalent conditions of Lemma 50.4.6 hold.*
- (ϵ) *The equivalent conditions of Lemma 50.4.7 hold.*
- (ζ) *The space X is Zariski locally quasi-separated.*
- (η) *The space X is quasi-separated.*
- (θ) *The space X is representable, i.e., X is a scheme.*
- (ι) *The space X is a quasi-separated scheme.*

We have

Proof. The implication $(\gamma) \iff (\alpha) + (\beta)$ is immediate. The implications in the diamond on the left are clear from the definitions.

Assume (ζ) , i.e., that X is Zariski locally quasi-separated. Then (ϵ) holds by Properties of Spaces, Lemma 48.6.6.

Assume (ϵ) . By Lemma 50.4.7 there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists a scheme U_i and a quasi-compact surjective étale morphism $U_i \rightarrow X_i$. Choose an i and an affine open subscheme $W \subset U_i$. It suffices to show that $W \rightarrow X$ has universally bounded fibres, since then the family of all these morphisms $W \rightarrow X$ covers X . To do this we consider the diagram

$$\begin{array}{ccc}
 W \times_X U_i & \xrightarrow{p} & U_i \\
 q \downarrow & & \downarrow \\
 W & \longrightarrow & X
 \end{array}$$

Since $W \rightarrow X$ factors through X_i we see that $W \times_X U_i = W \times_{X_i} U_i$, and hence q is quasi-compact. Since W is affine this implies that the scheme $W \times_X U_i$ is quasi-compact. Thus we may apply Morphisms, Lemma 28.50.8 and we conclude that p has universally bounded fibres. From Lemma 50.3.4 we conclude that $W \rightarrow X$ has universally bounded fibres as well.

Assume (δ) . Let U be an affine scheme, and let $U \rightarrow X$ be an étale morphism. By assumption the fibres of the morphism $U \rightarrow X$ are universally bounded. Thus also the fibres of both projections $R = U \times_X U \rightarrow U$ are universally bounded, see Lemma 50.3.3. And by Lemma 50.3.2 also the fibres of $R \rightarrow X$ are universally bounded. Hence for any $x \in X$ the fibres of $|U| \rightarrow |X|$ and $|R| \rightarrow |X|$ over x are finite, see Lemma 50.3.6. In other words, the equivalent conditions of Lemma 50.4.5 hold. This proves that $(\delta) \implies (\gamma)$. \square

Lemma 50.5.2. *Let S be a scheme. Let \mathcal{P} be one of the properties (α) , (β) , (γ) , (δ) , (ϵ) , (ζ) , or (θ) of algebraic spaces listed in Lemma 50.5.1. Then if X is an algebraic space over S , and $X = \bigcup X_i$ is a Zariski open covering such that each X_i has \mathcal{P} , then X has \mathcal{P} .*

Proof. Let X be an algebraic space over S , and let $X = \bigcup X_i$ is a Zariski open covering such that each X_i has \mathcal{P} .

The case $\mathcal{P} = (\alpha)$. The condition (α) for X_i means that for every $x \in |X_i|$ and every affine scheme U , and étale morphism $\varphi : U \rightarrow X_i$ the fibre of $\varphi : |U| \rightarrow |X_i|$ over x is finite. Consider $x \in X$, an affine scheme U and an étale morphism $U \rightarrow X$. Since $X = \bigcup X_i$ is a Zariski open covering there exists a finite affine open covering $U = U_1 \cup \dots \cup U_n$ such that each $U_j \rightarrow X$ factors through some X_{i_j} . By assumption

the fibres of $|U_j| \rightarrow |X_{i_j}|$ over x are finite for $j = 1, \dots, n$. Clearly this means that the fibre of $|U| \rightarrow |X|$ over x is finite. This proves the result for (α) .

The case $\mathcal{P} = (\beta)$. The condition (β) for X_i means that every $x \in |X_i|$ is represented by a monomorphism from the spectrum of a field towards X_i . Hence the same follows for X as $X_i \rightarrow X$ is a monomorphism and $X = \bigcup X_i$.

The case $\mathcal{P} = (\gamma)$. Note that $(\gamma) = (\alpha) + (\beta)$ by Lemma 50.5.1 hence the lemma for (γ) follows from the cases treated above.

The case $\mathcal{P} = (\delta)$. The condition (δ) for X_i means there exist schemes U_{i_j} and étale morphisms $U_{i_j} \rightarrow X_i$ with universally bounded fibres which cover X_i . These schemes also give an étale surjective morphism $\coprod U_{i_j} \rightarrow X$ and $U_{i_j} \rightarrow X$ still has universally bounded fibres.

The case $\mathcal{P} = (\epsilon)$. The condition (ϵ) for X_i means we can find a set J_i and morphisms $\varphi_{i_j} : U_{i_j} \rightarrow X_i$ such that each φ_{i_j} is étale, both projections $U_{i_j} \times_{X_i} U_{i_j} \rightarrow U_{i_j}$ are quasi-compact, and $\coprod_{j \in J_i} U_{i_j} \rightarrow X_i$ is surjective. In this case the compositions $U_{i_j} \rightarrow X_i \rightarrow X$ are étale (combine Morphisms, Lemmas 28.37.3 and 28.37.9 and Spaces, Lemmas 47.5.4 and 47.5.3). Since $X_i \subset X$ is a subspace we see that $U_{i_j} \times_{X_i} U_{i_j} = U_{i_j} \times_X U_{i_j}$, and hence the condition on fibre products is preserved. And clearly $\coprod_{i,j} U_{i_j} \rightarrow X$ is surjective. Hence X satisfies (ϵ) .

The case $\mathcal{P} = (\zeta)$. The condition (ζ) for X_i means that X_i is Zariski locally quasi-separated. It is immediately clear that this means X is Zariski locally quasi-separated.

For (θ) , see Properties of Spaces, Lemma 48.10.1. □

Lemma 50.5.3. *Let S be a scheme. Let \mathcal{P} be one of the properties (β) , (γ) , (δ) , (ϵ) , or (θ) of algebraic spaces listed in Lemma 50.5.1. Let X, Y be algebraic spaces over S . Let $X \rightarrow Y$ be a representable morphism. If Y has property \mathcal{P} , so does X .*

Proof. Assume $f : X \rightarrow Y$ is a representable morphism of algebraic spaces, and assume that Y has \mathcal{P} . Let $x \in |X|$, and set $y = f(x) \in |Y|$.

The case $\mathcal{P} = (\beta)$. Condition (β) for Y means there exists a monomorphism $\text{Spec}(k) \rightarrow Y$ representing y . The fibre product $X_y = \text{Spec}(k) \times_Y X$ is a scheme, and x corresponds to a point of X_y , i.e., to a monomorphism $\text{Spec}(k') \rightarrow X_y$. As $X_y \rightarrow X$ is a monomorphism also we see that x is represented by the monomorphism $\text{Spec}(k') \rightarrow X_y \rightarrow X$. In other words (β) holds for X .

The case $\mathcal{P} = (\gamma)$. Since $(\gamma) \Rightarrow (\beta)$ we have seen in the preceding paragraph that y and x can be represented by monomorphisms as in the following diagram

$$\begin{array}{ccc} \text{Spec}(k') & \xrightarrow{x} & X \\ \downarrow & & \downarrow \\ \text{Spec}(k) & \xrightarrow{y} & Y \end{array}$$

Also, by definition of property (γ) via Lemma 50.4.5 (2) there exist schemes V_i and étale morphisms $V_i \rightarrow Y$ such that $\coprod V_i \rightarrow Y$ is surjective and for each i , setting $R_i = V_i \times_Y V_i$ the fibres of both

$$|V_i| \longrightarrow |Y| \quad \text{and} \quad |R_i| \longrightarrow |Y|$$

over y are finite. This means that the schemes $(V_i)_y$ and $(R_i)_y$ are finite schemes over $y = \text{Spec}(k)$. As $X \rightarrow Y$ is representable, the fibre products $U_i = V_i \times_Y X$ are schemes. The morphisms $U_i \rightarrow X$ are étale, and $\coprod U_i \rightarrow X$ is surjective. Finally, for each i we have

$$(U_i)_x = (V_i \times_Y X)_x = (V_i)_y \times_{\text{Spec}(k)} \text{Spec}(k')$$

and

$$(U_i \times_X U_i)_x = ((V_i \times_Y X) \times_X (V_i \times_Y X))_x = (R_i)_y \times_{\text{Spec}(k)} \text{Spec}(k')$$

hence these are finite over k' as base changes of the finite schemes $(V_i)_y$ and $(R_i)_y$. This implies that (γ) holds for X , again via the second condition of Lemma 50.4.5.

The case $\mathcal{P} = (\delta)$. Let $V \rightarrow Y$ be an étale morphism with V an affine scheme. Since Y has property (δ) this morphism has universally bounded fibres. By Lemma 50.3.3 the base change $V \times_Y X \rightarrow X$ also has universally bounded fibres. Hence the first part of Lemma 50.4.6 applies and we see that Y also has property (δ) .

The case $\mathcal{P} = (\epsilon)$. We will repeatedly use Spaces, Lemma 47.5.5. Let $V_i \rightarrow Y$ be as in Lemma 50.4.7 (2). Set $U_i = X \times_Y V_i$. The morphisms $U_i \rightarrow X$ are étale, and $\coprod U_i \rightarrow X$ is surjective. Because $U_i \times_X U_i = X \times_Y (V_i \times_Y V_i)$ we see that the projections $U_i \times_Y U_i \rightarrow U_i$ are base changes of the projections $V_i \times_Y V_i \rightarrow V_i$, and so quasi-compact as well. Hence X satisfies Lemma 50.4.7 (2).

The case $\mathcal{P} = (\theta)$. In this case the result is Categories, Lemma 4.8.3. □

50.6. Reasonable and decent algebraic spaces

In Lemma 50.5.1 we have seen a number of conditions on algebraic spaces related to the behaviour of étale morphisms from affine schemes into X and related to the existence of special étale coverings of X by schemes. We tabulate the different types of conditions here:

(α)	fibres of étale morphisms from affines are finite
(β)	points come from monomorphisms of spectra of fields
(γ)	points come from quasi-compact monomorphisms of spectra of fields
(δ)	fibres of étale morphisms from affines are universally bounded
(ε)	cover by étale morphisms from schemes quasi-compact onto their image

The conditions in the following definition are not exactly conditions on the diagonal of X , but they are in some sense separation conditions on X .

Definition 50.6.1. Let S be a scheme. Let X be an algebraic space over S .

- (1) We say X is *decent* if for every point $x \in X$ the equivalent conditions of Lemma 50.4.5 hold, in other words property (γ) of Lemma 50.5.1 holds.
- (2) We say X is *reasonable* if the equivalent conditions of Lemma 50.4.6 hold, in other words property (δ) of Lemma 50.5.1 holds.
- (3) We say X is *very reasonable* if the equivalent conditions of Lemma 50.4.7 hold, i.e., property (ϵ) of Lemma 50.5.1 holds.

We have the following implications among these conditions on algebraic spaces:

The notion of a very reasonable algebraic space is obsolete. It was introduced because the assumption was needed to prove some results which are now proven for the class of decent spaces. The class of decent spaces is the largest class of spaces X where one has a good relationship between the topology of $|X|$ and properties of X itself.

Example 50.6.2. The algebraic space $\mathbf{A}_{\mathbf{Q}}^1/\mathbf{Z}$ constructed in Spaces, Example 47.14.8 is not decent as its “generic point” cannot be represented by a monomorphism from the spectrum of a point.

Remark 50.6.3. Reasonable algebraic spaces are technically easier to work with than very reasonable algebraic spaces. For example, if $X \rightarrow Y$ is a quasi-compact étale surjective morphism of algebraic spaces and X is reasonable, then so is Y , see Lemma 50.15.8 but we don’t know if this is true for the property “very reasonable”. Below we give another technical property enjoyed by reasonable algebraic spaces.

Lemma 50.6.4. *Let S be a scheme. Let X be a quasi-compact reasonable algebraic space. Then there exists a directed system of quasi-compact and quasi-separated algebraic spaces X_i such that $X = \text{colim}_i X_i$ (colimit in the category of sheaves).*

Proof. We sketch the proof. By Properties of Spaces, Lemma 48.6.3 we have $X = U/R$ with U affine. In this case, reasonable means $U \rightarrow X$ is universally bounded. Hence there exists an integer N such that the “fibres” of $U \rightarrow X$ have degree at most N , see Definition 50.3.1. Denote $s, t : R \rightarrow U$ and $c : R \times_{s,U,t} R \rightarrow R$ the groupoid structural maps.

Claim: for every quasi-compact open $A \subset R$ there exists an open $R' \subset R$ such that

- (1) $A \subset R'$,
- (2) R' is quasi-compact, and
- (3) $(U, R', s|_{R'}, t|_{R'}, c|_{R' \times_{s,U,t} R'})$ is a groupoid scheme.

Note that $e : U \rightarrow R$ is open as it is a section of the étale morphism $s : R \rightarrow U$, see Étale Morphisms, Proposition 40.6.1. Moreover U is affine hence quasi-compact. Hence we may replace A by $A \cup e(U) \subset R$, and assume that A contains $e(U)$. Next, we define inductively $A^1 = A$, and

$$A^n = c(A^{n-1} \times_{s,U,t} A) \subset R$$

for $n \geq 2$. Arguing inductively, we see that A^n is quasi-compact for all $n \geq 2$, as the image of the quasi-compact fibre product $A^{n-1} \times_{s,U,t} A$. If k is an algebraically closed field over S , and we consider k -points then

$$A^n(k) = \left\{ (u, u') \in U(k) : \begin{array}{l} \text{there exist } u = u_1, u_2, \dots, u_n \in U(k) \text{ with} \\ (u_i, u_{i+1}) \in A \text{ for all } i = 1, \dots, n-1. \end{array} \right\}$$

But as the fibres of $U(k) \rightarrow X(k)$ have size at most N we see that if $n > N$ then we get a repeat in the sequence above, and we can shorten it proving $A^N = A^n$ for all $n \geq N$. This implies that $R' = A^N$ gives a groupoid scheme $(U, R', s|_{R'}, t|_{R'}, c|_{R' \times_{s, U, t} R'})$, proving the claim above.

Consider the map of sheaves on $(Sch/S)_{fppf}$

$$\operatorname{colim}_{R' \subset R} U/R' \longrightarrow U/R$$

where $R' \subset R$ runs over the quasi-compact open subschemes of R which give étale equivalence relations as above. Each of the quotients U/R' is an algebraic space (see Spaces, Theorem 47.10.5). Since R' is quasi-compact, and U affine the morphism $R' \rightarrow U \times_{\operatorname{Spec}(\mathbf{Z})} U$ is quasi-compact, and hence U/R' is quasi-separated. Finally, if T is a quasi-compact scheme, then

$$\operatorname{colim}_{R' \subset R} U(T)/R'(T) \longrightarrow U(T)/R(T)$$

is a bijection, since every morphism from T into R ends up in one of the open subrelations R' by the claim above. This clearly implies that the colimit of the sheaves U/R' is U/R . In other words the algebraic space $X = U/R$ is the colimit of the quasi-separated algebraic spaces U/R' . \square

Lemma 50.6.5. *Let S be a scheme. Let X, Y be algebraic spaces over S . Let $X \rightarrow Y$ be a representable morphism. If Y is decent (resp. reasonable), then so is X .*

Proof. Translation of Lemma 50.5.3. \square

Lemma 50.6.6. *Let S be a scheme. Let $X \rightarrow Y$ be an étale morphism of algebraic spaces over S . If Y is decent, resp. reasonable, then so is X .*

Proof. Let U be an affine scheme and $U \rightarrow X$ an étale morphism. Set $R = U \times_X U$ and $R' = U \times_Y U$. Note that $R \rightarrow R'$ is a monomorphism.

Let $x \in |X|$. To show that X is decent, we have to show that the fibres of $|U| \rightarrow |X|$ and $|R| \rightarrow |X|$ over x are finite. But if Y is decent, then the fibres of $|U| \rightarrow |Y|$ and $|R'| \rightarrow |Y|$ are finite. Hence the result for “decent”.

To show that X is reasonable, we have to show that the fibres of $U \rightarrow X$ are universally bounded. However, if Y is reasonable, then the fibres of $U \rightarrow Y$ are universally bounded, which immediately implies the same thing for the fibres of $U \rightarrow X$. Hence the result for “reasonable”. \square

50.7. Points and specializations

There exists an étale morphism of algebraic spaces $f : X \rightarrow Y$ and a nontrivial specializations between points in a fibre of $|f| : |X| \rightarrow |Y|$, see Examples, Lemma 82.42.1. If the source of the morphism is a scheme we can avoid this by imposing condition (α) on Y .

Lemma 50.7.1. *Let S be a scheme. Let X be an algebraic space over S . Let $U \rightarrow X$ be an étale morphism from a scheme to X . Assume $u, u' \in |U|$ map to the same point x of $|X|$, and $u' \rightsquigarrow u$. If the pair (X, x) satisfies the equivalent conditions of Lemma 50.4.2 then $u = u'$.*

Proof. Assume the pair (X, x) satisfies the equivalent conditions for Lemma 50.4.2. Let U be a scheme, $U \rightarrow X$ étale, and let $u, u' \in |U|$ map to x of $|X|$, and $u' \rightsquigarrow u$. We may and do replace U by an affine neighbourhood of u . Let $t, s : R = U \times_X U \rightarrow U$ be the étale projection maps.

Pick a point $r \in R$ with $t(r) = u$ and $s(r) = u'$. This is possible by Properties of Spaces, Lemma 48.4.5. Because generalizations lift along the étale morphism t (Remark 50.4.1) we can find a specialization $r' \rightsquigarrow r$ with $t(r') = u'$. Set $u'' = s(r')$. Then $u'' \rightsquigarrow u'$. Thus we may repeat and find $r'' \rightsquigarrow r'$ with $t(r'') = u''$. Set $u''' = s(r'')$, and so on. Here is a picture:

In Remark 50.4.1 we have seen that there are no specializations among points in the fibres of the étale morphism s . Hence if $u^{(n+1)} = u^{(n)}$ for some n , then also $r^{(n)} = r^{(n-1)}$ and hence also (by taking t) $u^{(n)} = u^{(n-1)}$. This then forces the whole tower to collapse, in particular $u = u'$. Thus we see that if $u \neq u'$, then all the specializations are strict and $\{u, u', u'', \dots\}$ is an infinite set of points in U which map to the point x in $|X|$. As we chose U affine this contradicts the second part of Lemma 50.4.2, as desired. \square

Lemma 50.7.2. *Let S be an algebraic space. Let X be an algebraic space over S . Let $x, x' \in |X|$ and assume $x' \rightsquigarrow x$, i.e., x is a specialization of x' . Assume the pair (X, x') satisfies the equivalent conditions of Lemma 50.4.5. Then for every étale morphism $\varphi : U \rightarrow X$ from a scheme U and any $u \in U$ with $\varphi(u) = x$, exists a point $u' \in U$, $u' \rightsquigarrow u$ with $\varphi(u') = x'$.*

Proof. We may replace U by an affine open neighbourhood of u . Hence we may assume that U is affine. As x is in the image of the open map $|U| \rightarrow |X|$, so is x' . Thus we may replace X by the Zariski open subspace corresponding to the image of $|U| \rightarrow |X|$, see Properties of Spaces, Lemma 48.4.10. In other words we may assume that $U \rightarrow X$ is surjective and étale. Let $s, t : R = U \times_X U \rightarrow U$ be the projections. By our assumption that (X, x') satisfies the equivalent conditions of Lemma 50.4.5 we see that the fibres of $|U| \rightarrow |X|$ and $|R| \rightarrow |X|$ over x' are finite. Say $\{u'_1, \dots, u'_n\} \subset U$ and $\{r'_1, \dots, r'_m\} \subset R$ form the complete inverse image of $\{x'\}$. Consider the closed sets

$$T = \overline{\{u'_1\}} \cup \dots \cup \overline{\{u'_n\}} \subset |U|, \quad T' = \overline{\{r'_1\}} \cup \dots \cup \overline{\{r'_m\}} \subset |R|.$$

Trivially we have $s(T') \subset T$. Because R is an equivalence relation we also have $t(T') = s(T')$ as the set $\{r'_j\}$ is invariant under the inverse of R by construction. Let $w \in T$ be any point. Then $u'_i \rightsquigarrow w$ for some i . Choose $r \in R$ with $s(r) = w$. Since generalizations lift along $s : R \rightarrow U$, see Remark 50.4.1, we can find $r' \rightsquigarrow r$

with $s(r') = u'_i$. Then $r' = r'_j$ for some j and we conclude that $w \in s(T')$. Hence $T = s(T') = t(T')$ is an $|R|$ -invariant closed set in $|U|$. This means T is the inverse image of a closed (!) subset $T'' = \overline{\varphi(T)}$ of $|X|$, see Properties of Spaces, Lemmas 48.4.5 and 48.4.6. Hence $T'' = \overline{\{x'\}}$. Thus T contains some point u_1 mapping to x as $x \in T''$. I.e., we see that for some i there exists a specialization $u'_i \rightsquigarrow u_1$ which maps to the given specialization $x' \rightsquigarrow x$.

To finish the proof, choose a point $r \in R$ such that $s(r) = u$ and $t(r) = u_1$ (using Properties of Spaces, Lemma 48.4.3). As generalizations lift along t , and $u'_i \rightsquigarrow u_1$ we can find a specialization $r' \rightsquigarrow r$ such that $t(r') = u'_i$. Set $u' = s(r')$. Then $u' \rightsquigarrow u$ and $\varphi(u') = x'$ as desired. \square

50.8. Stratifying algebraic spaces by schemes

In this section we prove that a quasi-compact and quasi-separated algebraic space has a finite stratification by locally closed subspaces each of which is a scheme and such that the glueing of the parts is by elementary distinguished squares. We first prove a slightly weaker result for reasonable algebraic spaces.

Lemma 50.8.1. *Let S be a scheme. Let $W \rightarrow X$ be a morphism of a scheme W to an algebraic space X which is flat, locally of finite presentation, separated, locally quasi-finite with universally bounded fibres. There exist reduced closed subspaces*

$$\emptyset = Z_{-1} \subset Z_0 \subset Z_1 \subset Z_2 \subset \dots \subset Z_n = X$$

such that with $X_r = Z_r \setminus Z_{r-1}$ the stratification $X = \coprod_{r=0, \dots, n} X_r$ is characterized by the following universal property: Given $g : T \rightarrow X$ the projection $W \times_X T \rightarrow T$ is finite locally free of degree r if and only if $g(|T|) \subset |X_r|$.

Proof. Let n be an integer bounding the degrees of the fibres of $W \rightarrow X$. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Apply More on Morphisms, Lemma 36.31.9 to $W \times_X U \rightarrow U$. We obtain closed subsets

$$\emptyset = Y_{-1} \subset Y_0 \subset Y_1 \subset Y_2 \subset \dots \subset Y_n = U$$

characterized by the property stated in the lemma for the morphism $W \times_X U \rightarrow U$. Clearly, the formation of these closed subsets commutes with base change. Setting $R = U \times_X U$ with projection maps $s, t : R \rightarrow U$ we conclude that

$$s^{-1}(Y_r) = t^{-1}(Y_r)$$

as closed subsets of R . In other words the closed subsets $Y_r \subset U$ are R -invariant. This means that $|Y_r|$ is the inverse image of a closed subset $Z_r \subset |X|$. Denote $Z_r \subset X$ also the reduced induced algebraic space structure, see Properties of Spaces, Definition 48.9.5.

Let $g : T \rightarrow X$ be a morphism of algebraic spaces. Choose a scheme V and a surjective étale morphism $V \rightarrow T$. To prove the final assertion of the lemma it suffices to prove the assertion for the composition $V \rightarrow X$ (by our definition of finite locally free morphisms, see Morphisms of Spaces, Section 49.42). Similarly, the morphism of schemes $W \times_X V \rightarrow V$ is finite locally free of degree r if and only if the morphism of schemes

$$W \times_X (U \times_X V) \longrightarrow U \times_X V$$

is finite locally free of degree r (see Descent, Lemma 34.19.28). By construction this happens if and only if $|U \times_X V| \rightarrow |U|$ maps into $|Y_r|$, which is true if and only if $|V| \rightarrow |X|$ maps into $|Z_r|$. \square

Lemma 50.8.2. *Let S be a scheme. Let $W \rightarrow X$ be a morphism of a scheme W to an algebraic space X which is flat, locally of finite presentation, separated, and locally quasi-finite. Then there exist open subspaces*

$$X = X_0 \supset X_1 \supset X_2 \supset \dots$$

such that a morphism $\mathrm{Spec}(k) \rightarrow X$ factors through X_d if and only if $W \times_X \mathrm{Spec}(k)$ has degree $\geq d$ over k .

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Apply More on Morphisms, Lemma 36.31.11 to $W \times_X U \rightarrow U$. We obtain open subschemes

$$U = U_0 \supset U_1 \supset U_2 \supset \dots$$

characterized by the property stated in the lemma for the morphism $W \times_X U \rightarrow U$. Clearly, the formation of these closed subsets commutes with base change. Setting $R = U \times_X U$ with projection maps $s, t : R \rightarrow U$ we conclude that

$$s^{-1}(U_d) = t^{-1}(U_d)$$

as open subschemes of R . In other words the open subschemes $U_d \subset U$ are R -invariant. This means that U_d is the inverse image of an open subspace $X_d \subset X$ (Properties of Spaces, Lemma 48.9.2). \square

Lemma 50.8.3. *Let S be a scheme. Let X be a quasi-compact, reasonable algebraic space over S . There exist an integer n and open subspaces*

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

with the following property: setting $T_p = U_p \setminus U_{p+1}$ (with reduced induced subspace structure) there exists a separated scheme V_p and a surjective étale morphism $f_p : V_p \rightarrow U_p$ such that $f_p^{-1}(T_p) \rightarrow T_p$ is an isomorphism.

Proof. By Properties of Spaces, Lemma 48.6.3 we can choose an affine scheme U and a surjective étale morphism $U \rightarrow X$. Let n be an integer bounding the degrees of the fibres of $U \rightarrow X$ which exists as X is reasonable, see Definition 50.6.1. For $p \geq 0$ set

$$W_p = U \times_X \dots \times_X U \setminus \text{all diagonals}$$

where the fibre product has p factors. Since U is separated, the morphism $U \rightarrow X$ is separated and all fibre products $U \times_X \dots \times_X U$ are separated schemes. Since $U \rightarrow X$ is separated the diagonal $U \rightarrow U \times_X U$ is a closed immersion. Since $U \rightarrow X$ is étale the diagonal $U \rightarrow U \times_X U$ is an open immersion, see Morphisms of Spaces, Lemmas 49.36.10 and 49.35.9. Similarly, all the diagonal morphisms are open and closed immersions and W_p is an open and closed subscheme of $U \times_X \dots \times_X U$. Moreover, the morphism

$$U \times_X \dots \times_X U \longrightarrow U \times_{\mathrm{Spec}(\mathbf{Z})} \dots \times_{\mathrm{Spec}(\mathbf{Z})} U$$

is locally quasi-finite and separated (Morphisms of Spaces, Lemma 49.4.5) and its target is an affine scheme. Hence every finite set of points of $U \times_X \dots \times_X U$ is contained in an affine open, see More on Morphisms, Lemma 36.31.13. Therefore, the same is true for W_p . There is a free action of the symmetric group S_p on W_p over X (because we threw out the fix point locus from $U \times_X \dots \times_X U$). By the

above and Properties of Spaces, Proposition 48.11.1 the quotient $V_p = W_p/S_p$ is a scheme. Since the action of S_p on W_p was over X , there is a morphism $V_p \rightarrow X$. Since $W_p \rightarrow X$ is étale and since $W_p \rightarrow V_p$ is surjective étale, it follows that also $V_p \rightarrow X$ is étale, see Properties of Spaces, Lemma 48.13.3.

We let $U_p \subset X$ be the open subspace which is the image of $V_p \rightarrow X$. By construction morphism $\text{Spec}(k) \rightarrow X$ with k algebraically closed, factors through U_p if and only if $U \times_X \text{Spec}(k)$ has $\geq p$ points. It follows that the U_p give a filtration of X as stated in the lemma. Moreover, $\text{Spec}(k) \rightarrow X$ factors through T_p if and only if $U \times_X \text{Spec}(k)$ has exactly p points. In this case we see that $V_p \times_X \text{Spec}(k)$ has exactly one point. Set $Z_p = f_p^{-1}(T_p) \subset V_p$. This is a closed subscheme of V_p . Then $Z_p \rightarrow T_p$ is an étale morphism between algebraic spaces which induces a bijection on k -valued points for any algebraically closed field k . To be sure this implies that $Z_p \rightarrow T_p$ is universally injective, whence an open immersion by Morphisms of Spaces, Lemma 49.45.2 hence an isomorphism and we win. \square

Lemma 50.8.4. *Let S be a scheme. Let X be a quasi-compact, reasonable algebraic space over S . There exist an integer n and open subspaces*

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

such that each $T_p = U_p \setminus U_{p+1}$ (with reduced induced subspace structure) is a scheme.

Proof. Immediate consequence of Lemma 50.8.3. \square

The following result is almost identical to [GR71, Proposition 5.7.8].

Lemma 50.8.5. *Let X be a quasi-compact and quasi-separated algebraic space over $\text{Spec}(\mathbf{Z})$. There exist an integer n and open subspaces*

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

with the following property: setting $T_p = U_p \setminus U_{p+1}$ (with reduced induced subspace structure) there exists a quasi-compact separated scheme V_p and a surjective étale morphism $f_p : V_p \rightarrow U_p$ such that $f_p^{-1}(T_p) \rightarrow T_p$ is an isomorphism.

Proof. The proof of this lemma is identical to the proof of Lemma 50.8.3. Observe that a quasi-separated space is reasonable, see Decent Spaces, Lemma 50.5.1 and Decent Spaces, Definition 50.6.1. At the end of the argument we add that since X is quasi-separated the schemes $V \times_X \dots \times_X V$ are all quasi-compact. Hence the schemes W_p are quasi-compact. Hence the schemes $V_p = W_p/S_p$ are quasi-compact. \square

50.9. Schematic locus

In this section we prove that a decent algebraic space has a dense open subspace which is a scheme. We first prove this for reasonable algebraic spaces.

Proposition 50.9.1. *Let S be a scheme. Let X be an algebraic space over S . If X is reasonable, then there exists a dense open subspace of X which is a scheme.*

Proof. By Properties of Spaces, Lemma 48.10.1 the question is local on X . Hence we may assume there exists an affine scheme U and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma 48.6.1). Let n be an integer bounding the degrees of the fibres of $U \rightarrow X$ which exists as X is reasonable, see Definition 50.6.1. We will argue by induction on n that whenever

- (1) $U \rightarrow X$ is a surjective étale morphism whose fibres have degree $\leq n$, and
- (2) U is isomorphic to a locally closed subscheme of an affine scheme

then the schematic locus is dense in X .

Let $X_n \subset X$ be the open subspace which is the complement of the closed subspace $Z_{n-1} \subset X$ constructed in Lemma 50.8.1 using the morphism $U \rightarrow X$. Let $U_n \subset U$ be the inverse image of X_n . Then $U_n \rightarrow X_n$ is finite locally free of degree n . Hence X_n is a scheme by Properties of Spaces, Proposition 48.11.1 (and the fact that any finite set of points of U_n is contained in an affine open of U_n , see Properties, Lemma 27.27.5).

Let $X' \subset X$ be the open subspace such that $|X'|$ is the interior of $|Z_{n-1}|$ in $|X|$ (see Topology, Definition 5.20.1). Let $U' \subset U$ be the inverse image. Then $U' \rightarrow X'$ is surjective étale and has degrees of fibres bounded by $n - 1$. By induction we see that the schematic locus of X' is an open dense $X'' \subset X'$. By elementary topology we see that $X'' \cup X_n \subset X$ is open and dense and we win. \square

Theorem 50.9.2 (David Rydh). *Let S be a scheme. Let X be an algebraic space over S . If X is decent, then there exists a dense open subspace of X which is a scheme.*

Proof. Assume X is a decent algebraic space for which the theorem is false. By Properties of Spaces, Lemma 48.10.1 there exists a largest open subspace $X' \subset X$ which is a scheme. Since X' is not dense in X , there exists an open subspace $X'' \subset X$ such that $|X''| \cap |X'| = \emptyset$. Replacing X by X'' we get a nonempty decent algebraic space X which does not contain *any* open subspace which is a scheme.

Choose a nonempty affine scheme U and an étale morphism $U \rightarrow X$. We may and do replace X by the open subscheme corresponding to the image of $|U| \rightarrow |X|$. Consider the sequence of open subspaces

$$X = X_0 \supset X_1 \supset X_2 \dots$$

constructed in Lemma 50.8.2 for the morphism $U \rightarrow X$. Note that $X_0 = X_1$ as $U \rightarrow X$ is surjective. Let $U = U_0 = U_1 \supset U_2 \dots$ be the induced sequence of open subschemes of U .

Choose a nonempty open affine $V_1 \subset U_1$ (for example $V_1 = U_1$). By induction we will construct a sequence of nonempty affine opens $V_1 \supset V_2 \supset \dots$ with $V_n \subset U_n$. Namely, having constructed V_1, \dots, V_{n-1} we can always choose V_n unless $V_{n-1} \cap U_n = \emptyset$. But if $V_{n-1} \cap U_n = \emptyset$, then the open subspace $X' \subset X$ with $|X'| = \text{Im}(|V_{n-1}| \rightarrow |X|)$ is contained in $|X| \setminus |X_n|$. Hence $V_{n-1} \rightarrow X'$ is an étale morphism whose fibres have degree bounded by $n - 1$. In other words, X' is reasonable (by definition), hence X' contains a nonempty open subscheme by Proposition 50.9.1. This is a contradiction which shows that we can pick V_n .

By Limits, Lemma 31.3.4 the limit $V_\infty = \lim V_n$ is a nonempty scheme. Pick a morphism $\text{Spec}(k) \rightarrow V_\infty$. The composition $\text{Spec}(k) \rightarrow V_\infty \rightarrow U \rightarrow X$ has image contained in all X_d by construction. In other words, the fibred $U \times_X \text{Spec}(k)$ has infinite degree which contradicts the definition of a decent space. This contradiction finishes the proof of the theorem. \square

50.10. Points on spaces

In this section we prove some properties of points on decent algebraic spaces.

Lemma 50.10.1. *Let S be a scheme. Let X be an algebraic space over S . Consider the map*

$$\{\mathrm{Spec}(k) \rightarrow X \text{ monomorphism}\} \longrightarrow |X|$$

This map is always injective. If X is decent then this map is a bijection.

Proof. We have seen in Properties of Spaces, Lemma 48.4.11 that the map is an injection in general. By Lemma 50.5.1 it is surjective when X is decent (actually one can say this is part of the definition of being decent). \square

The following lemma is a tiny bit stronger than Properties of Spaces, Lemma 48.12.1. We will improve this lemma in Lemma 50.12.1.

Lemma 50.10.2. *Let S be a scheme. Let k be a field. Let X be an algebraic space over S and assume that there exists a surjective étale morphism $\mathrm{Spec}(k) \rightarrow X$. If X is decent, then $X \cong \mathrm{Spec}(k')$ where $k' \subset k$ is a finite separable extension.*

Proof. The assumption implies that $|X| = \{x\}$ is a singleton. Since X is decent we can find a quasi-compact monomorphism $\mathrm{Spec}(k') \rightarrow X$ whose image is x . Then the projection $U = \mathrm{Spec}(k') \times_X \mathrm{Spec}(k) \rightarrow \mathrm{Spec}(k)$ is a monomorphism, whence $U = \mathrm{Spec}(k)$, see Schemes, Lemma 25.23.10. Hence the projection $\mathrm{Spec}(k) = U \rightarrow \mathrm{Spec}(k')$ is étale and we win. \square

The following lemma shows that specialization of points behaves well on decent algebraic spaces. Spaces, Example 47.14.9 shows that this is **not** true in general.

Lemma 50.10.3. *Let S be a scheme. Let X be a decent algebraic space over S . Let $U \rightarrow X$ be an étale morphism from a scheme to X . If $u, u' \in |U|$ map to the same point of $|X|$, and $u' \rightsquigarrow u$, then $u = u'$.*

Proof. Combine Lemmas 50.5.1 and 50.7.1. \square

Lemma 50.10.4. *Let S be an algebraic space. Let X be a decent algebraic space over S . Let $x, x' \in |X|$ and assume $x' \rightsquigarrow x$, i.e., x is a specialization of x' . Then for every étale morphism $\varphi : U \rightarrow X$ from a scheme U and any $u \in U$ with $\varphi(u) = x$, exists a point $u' \in U$, $u' \rightsquigarrow u$ with $\varphi(u') = x'$.*

Proof. Combine Lemmas 50.5.1 and 50.7.2. \square

Lemma 50.10.5. *Let S be a scheme. Let X be a decent algebraic space over S . Then $|X|$ is Kolmogorov (see Topology, Definition 5.7.4).*

Proof. Let $x_1, x_2 \in |X|$ with $x_1 \rightsquigarrow x_2$ and $x_2 \rightsquigarrow x_1$. We have to show that $x_1 = x_2$. Pick a scheme U and an étale morphism $U \rightarrow X$ such that x_1, x_2 are both in the image of $|U| \rightarrow |X|$. By Lemma 50.10.4 we can find a specialization $u_1 \rightsquigarrow u_2$ in U mapping to $x_1 \rightsquigarrow x_2$. By Lemma 50.10.4 we can find $u'_2 \rightsquigarrow u_1$ mapping to $x_2 \rightsquigarrow x_1$. This means that $u'_2 \rightsquigarrow u_2$ is a specialization between points of U mapping to the same point of X , namely x_2 . This is not possible, unless $u'_2 = u_2$, see Lemma 50.10.3. Hence also $u_1 = u_2$ as desired. \square

Proposition 50.10.6. *Let S be a scheme. Let X be a decent algebraic space over S . Then the topological space $|X|$ is sober (see Topology, Definition 5.7.4).*

Proof. We have seen in Lemma 50.10.5 that $|X|$ is Kolmogorov. Hence it remains to show that every irreducible closed subset $T \subset |X|$ has a generic point. By Properties of Spaces, Lemma 48.9.3 there exists a closed subspace $Z \subset X$ with $|Z| = |T|$. By definition this means that $Z \rightarrow X$ is a representable morphism of algebraic spaces. Hence Z is a decent algebraic space by Lemma 50.5.3. By Theorem 50.9.2 we see that there exists an open dense subspace $Z' \subset Z$ which is a scheme. This means that $|Z'| \subset |T|$ is open dense. Hence the topological space $|Z'|$ is irreducible, which means that Z' is an irreducible scheme. By Schemes, Lemma 25.11.1 we conclude that $|Z'|$ is the closure of a single point $\eta \in T$ and hence also $T = \overline{\{\eta\}}$, and we win. \square

For decent algebraic spaces dimension works as expected.

Lemma 50.10.7. *Let S be a scheme. Dimension as defined in Properties of Spaces, Section 48.8 behaves well on decent algebraic spaces X over S .*

- (1) *If $x \in |X|$, then $\dim_x(|X|) = \dim_x(X)$, and*
- (2) *$\dim(|X|) = \dim(X)$.*

Proof. Proof of (1). Choose a scheme U with a point $u \in U$ and an étale morphism $h : U \rightarrow X$ mapping u to x . By definition the dimension of X at x is $\dim_u(|U|)$. Thus we may pick U such that $\dim_x(X) = \dim(|U|)$. Let d be an integer. If $\dim(U) \geq d$, then there exists a sequence of nontrivial specializations $u_d \rightsquigarrow \dots \rightsquigarrow u_0$ in U . Taking the image we find a corresponding sequence $h(u_d) \rightsquigarrow \dots \rightsquigarrow h(u_0)$ each of which is nontrivial by Lemma 50.10.3. Hence we see that the image of $|U|$ in $|X|$ has dimension at least d . Conversely, suppose that $x_d \rightsquigarrow \dots \rightsquigarrow x_0$ is a sequence of specializations in $|X|$ with x_0 in the image of $|U| \rightarrow |X|$. Then we can lift this to a sequence of specializations in U by Lemma 50.10.4.

Part (2) is an immediate consequence of part (1) and the definitions. \square

Lemma 50.10.8. *Let S be a scheme. Let X be a decent algebraic space over S . Let $x \in |X|$. The following are equivalent*

- (1) *x is a generic point of an irreducible component of $|X|$,*
- (2) *for any étale morphism $(Y, y) \rightarrow (X, x)$ of pointed algebraic spaces, y is a generic point of an irreducible component of $|Y|$,*
- (3) *the dimension of the local ring of X at x is zero (Properties of Spaces, Definition 48.20.2).*

Proof. Observe that any Y as in (2) is decent by Lemma 50.6.6. Thus it suffices to prove the equivalence of (1) and (3) as then the equivalence with (2) follows since the dimension of the local ring of Y at y is equal to the dimension of the local ring of X at x . Let $f : U \rightarrow X$ be an étale morphism from an affine scheme and let $u \in U$ be a point mapping to x .

Assume (1). Let $u' \rightsquigarrow u$ be a specialization in U . Then $f(u') = f(u) = x$. By Lemma 50.10.3 we see that $u' = u$. Hence u is a generic point of an irreducible component of U . Thus $\dim(\mathcal{O}_{U,u}) = 0$ and we see that (2) holds.

Assume (2). The point x is contained in an irreducible component $T \subset |X|$. Since $|X|$ is sober (Proposition 50.10.6) we T has a generic point x' . Of course $x' \rightsquigarrow x$. Then we can lift this specialization to $u' \rightsquigarrow u$ in U (Lemma 50.10.4). This contradicts the assumption that $\dim(\mathcal{O}_{U,u}) = 0$ unless $u' = u$, i.e., $x' = x$. \square

Lemma 50.10.9. *Let S be a scheme. Let $X \rightarrow Y$ be a locally quasi-finite morphism of algebraic spaces over S . Let $x \in |X|$ with image $y \in |Y|$. Then the dimension of the local ring of Y at y is \geq to the dimension of the local ring of X at x .*

Proof. The definition of the dimension of the local ring of a point on an algebraic space is given in Properties of Spaces, Definition 48.20.2. Choose an étale morphism $(V, v) \rightarrow (Y, y)$ where V is a scheme. Choose an étale morphism $U \rightarrow V \times_Y X$ and a point $u \in U$ mapping to $x \in |X|$ and $v \in V$. Then $U \rightarrow V$ is locally quasi-finite and we have to prove that

$$\dim(\mathcal{O}_{V,v}) \geq \dim(\mathcal{O}_{U,u})$$

This is Algebra, Lemma 10.121.4. \square

50.11. Reduced singleton spaces

A *singleton* space is an algebraic space X such that $|X|$ is a singleton. It turns out that these can be more interesting than just being the spectrum of a field, see Spaces, Example 47.14.7. We develop a tiny bit of machinery to be able to talk about these.

Lemma 50.11.1. *Let S be a scheme. Let Z be an algebraic space over S . Let k be a field and let $\text{Spec}(k) \rightarrow Z$ be surjective and flat. Then any morphism $\text{Spec}(k') \rightarrow Z$ where k' is a field is surjective and flat.*

Proof. Consider the fibre square

$$\begin{array}{ccc} T & \longrightarrow & \text{Spec}(k) \\ \downarrow & & \downarrow \\ \text{Spec}(k') & \longrightarrow & Z \end{array}$$

Note that $T \rightarrow \text{Spec}(k')$ is flat and surjective hence T is not empty. On the other hand $T \rightarrow \text{Spec}(k)$ is flat as k is a field. Hence $T \rightarrow Z$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 49.29.5 that $\text{Spec}(k') \rightarrow Z$ is flat. It is surjective as by assumption $|Z|$ is a singleton. \square

Lemma 50.11.2. *Let S be a scheme. Let Z be an algebraic space over S . The following are equivalent*

- (1) Z is reduced and $|Z|$ is a singleton,
- (2) there exists a surjective flat morphism $\text{Spec}(k) \rightarrow Z$ where k is a field, and
- (3) there exists a locally of finite type, surjective, flat morphism $\text{Spec}(k) \rightarrow Z$ where k is a field.

Proof. Assume (1). Let W be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Then W is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of W . Since W is reduced we have $\mathcal{O}_{W,\eta} = \kappa(\eta)$. It follows that the canonical morphism $\eta = \text{Spec}(\kappa(\eta)) \rightarrow W$ is flat. We see that the composition $\eta \rightarrow Z$ is flat (see Morphisms of Spaces, Lemma 49.28.3). It is also surjective as $|Z|$ is a singleton. In other words (2) holds.

Assume (2). Let W be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Choose a field k and a surjective flat morphism $\text{Spec}(k) \rightarrow Z$. Then $W \times_Z \text{Spec}(k)$

is a scheme étale over k . Hence $W \times_Z \text{Spec}(k)$ is a disjoint union of spectra of fields (see Remark 50.4.1), in particular reduced. Since $W \times_Z \text{Spec}(k) \rightarrow W$ is surjective and flat we conclude that W is reduced (Descent, Lemma 34.15.1). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme W and an étale morphism $W \rightarrow Z$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. The composition

$$\text{Spec}(k) \xrightarrow{w} W \longrightarrow Z$$

is locally of finite type by Morphisms of Spaces, Lemmas 49.23.2 and 49.36.9. It is also flat and surjective by Lemma 50.11.1. Hence (3) holds. \square

The following lemma singles out a slightly better class of singleton algebraic spaces than the preceding lemma.

Lemma 50.11.3. *Let S be a scheme. Let Z be an algebraic space over S . The following are equivalent*

- (1) Z is reduced, locally Noetherian, and $|Z|$ is a singleton, and
- (2) there exists a locally finitely presented, surjective, flat morphism $\text{Spec}(k) \rightarrow Z$ where k is a field.

Proof. Assume (2) holds. By Lemma 50.11.2 we see that Z is reduced and $|Z|$ is a singleton. Let W be a scheme and let $W \rightarrow Z$ be a surjective étale morphism. Choose a field k and a locally finitely presented, surjective, flat morphism $\text{Spec}(k) \rightarrow Z$. Then $W \times_Z \text{Spec}(k)$ is a scheme étale over k , hence a disjoint union of spectra of fields (see Remark 50.4.1), hence locally Noetherian. Since $W \times_Z \text{Spec}(k) \rightarrow W$ is flat, surjective, and locally of finite presentation, we see that $\{W \times_Z \text{Spec}(k) \rightarrow W\}$ is an fppf covering and we conclude that W is locally Noetherian (Descent, Lemma 34.12.1). In other words (1) holds.

Assume (1). Pick a nonempty affine scheme W and an étale morphism $W \rightarrow Z$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. Because W is locally Noetherian the morphism $w : \text{Spec}(k) \rightarrow W$ is of finite presentation, see Morphisms, Lemma 28.22.7. Hence the composition

$$\text{Spec}(k) \xrightarrow{w} W \longrightarrow Z$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 49.27.2 and 49.36.8. It is also flat and surjective by Lemma 50.11.1. Hence (2) holds. \square

Lemma 50.11.4. *Let S be a scheme. Let $Z' \rightarrow Z$ be a monomorphism of algebraic spaces over S . Assume there exists a field k and a locally finitely presented, surjective, flat morphism $\text{Spec}(k) \rightarrow Z$. Then either Z' is empty or $Z' = Z$.*

Proof. We may assume that Z' is nonempty. In this case the fibre product $T = Z' \times_Z \text{Spec}(k)$ is nonempty, see Properties of Spaces, Lemma 48.4.3. Now T is an algebraic space and the projection $T \rightarrow \text{Spec}(k)$ is a monomorphism. Hence $T = \text{Spec}(k)$, see Morphisms of Spaces, Lemma 49.10.8. We conclude that $\text{Spec}(k) \rightarrow Z$ factors through Z' . But as $\text{Spec}(k) \rightarrow Z$ is surjective, flat and locally of finite presentation, we see that $\text{Spec}(k) \rightarrow Z$ is surjective as a map of sheaves on $(\text{Sch}/S)_{\text{fppf}}$ (see Spaces, Remark 47.5.2) and we conclude that $Z' = Z$. \square

The following lemma says that to each point of an algebraic space we can associate a canonical reduced, locally Noetherian singleton algebraic space.

Lemma 50.11.5. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. Then there exists a unique monomorphism $Z \rightarrow X$ of algebraic spaces over S such that Z is an algebraic space which satisfies the equivalent conditions of Lemma 50.11.3 and such that the image of $|Z| \rightarrow |X|$ is $\{x\}$.*

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Set $R = U \times_X U$ so that $X = U/R$ is a presentation (see Spaces, Section 47.9). Set

$$U' = \coprod_{u \in U \text{ lying over } x} \text{Spec}(\kappa(u)).$$

The canonical morphism $U' \rightarrow U$ is a monomorphism. Let

$$R' = U' \times_X U' = R \times_{(U \times_S U)} (U' \times_S U').$$

Because $U' \rightarrow U$ is a monomorphism we see that the projections $s', t' : R' \rightarrow U'$ factor as a monomorphism followed by an étale morphism. Hence, as U' is a disjoint union of spectra of fields, using Remark 50.4.1, and using Schemes, Lemma 25.23.10 we conclude that R' is a disjoint union of spectra of fields and that the morphisms $s', t' : R' \rightarrow U'$ are étale. Hence $Z = U'/R'$ is an algebraic space by Spaces, Theorem 47.10.5. As R' is the restriction of R by $U' \rightarrow U$ we see $Z \rightarrow X$ is a monomorphism by Groupoids, Lemma 38.18.6. Since $Z \rightarrow X$ is a monomorphism we see that $|Z| \rightarrow |X|$ is injective, see Morphisms of Spaces, Lemma 49.10.9. By Properties of Spaces, Lemma 48.4.3 we see that

$$|U'| = |Z \times_X U'| \rightarrow |Z| \times_{|X|} |U'|$$

is surjective which implies (by our choice of U') that $|Z| \rightarrow |X|$ has image $\{x\}$. We conclude that $|Z|$ is a singleton. Finally, by construction U' is locally Noetherian and reduced, i.e., we see that Z satisfies the equivalent conditions of Lemma 50.11.3.

Let us prove uniqueness of $Z \rightarrow X$. Suppose that $Z' \rightarrow X$ is a second such monomorphism of algebraic spaces. Then the projections

$$Z' \longleftarrow Z' \times_X Z \longrightarrow Z$$

are monomorphisms. The algebraic space in the middle is nonempty by Properties of Spaces, Lemma 48.4.3. Hence the two projections are isomorphisms by Lemma 50.11.4 and we win. \square

We introduce the following terminology which foreshadows the residual gerbes we will introduce later, see Properties of Stacks, Definition 77.11.8.

Definition 50.11.6. Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. The *residual space of X at x^2* is the monomorphism $Z_x \rightarrow X$ constructed in Lemma 50.11.5.

In particular we know that Z_x is a locally Noetherian, reduced, singleton algebraic space and that there exists a field and a surjective, flat, locally finitely presented morphism

$$\text{Spec}(k) \longrightarrow Z_x.$$

It turns out that Z_x is a regular algebraic space as follows from the following lemma.

Lemma 50.11.7. *A reduced, locally Noetherian singleton algebraic space Z is regular.*

²This is nonstandard notation.

Proof. Let Z be a reduced, locally Noetherian singleton algebraic space over a scheme S . Let $W \rightarrow Z$ be a surjective étale morphism where W is a scheme. Let k be a field and let $\text{Spec}(k) \rightarrow Z$ be surjective, flat, and locally of finite presentation (see Lemma 50.11.3). The scheme $T = W \times_Z \text{Spec}(k)$ is étale over k in particular regular, see Remark 50.4.1. Since $T \rightarrow W$ is locally of finite presentation, flat, and surjective it follows that W is regular, see Descent, Lemma 34.15.2. By definition this means that Z is regular. \square

50.12. Decent spaces

In this section we collect some useful facts on decent spaces.

Lemma 50.12.1. *Let S be a scheme. Let X be a decent algebraic space over S .*

- (1) *If $|X|$ is a singleton then X is a scheme.*
- (2) *If $|X|$ is a singleton and X is reduced, then $X \cong \text{Spec}(k)$ for some field k .*

Proof. Assume $|X|$ is a singleton. It follows immediately from Theorem 50.9.2 that X is a scheme, but we can also argue directly as follows. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$. Set $R = U \times_X U$. Then U and R have finitely many points by Lemma 50.4.5 (and the definition of a decent space). All of these points are closed in U and R by Lemma 50.10.3. It follows that U and R are affine schemes. We may shrink U to a singleton space. Then U is the spectrum of a henselian local ring, see Algebra, Lemma 10.145.11. The projections $R \rightarrow U$ are étale, hence finite étale because U is the spectrum of a 0-dimensional henselian local ring, see Algebra, Lemma 10.145.3. It follows that X is a scheme by Groupoids, Proposition 38.21.8.

Part (2) follows from (1) and the fact that a reduced singleton scheme is the spectrum of a field. \square

Remark 50.12.2. We will see in Limits of Spaces, Lemma 52.15.3 that an algebraic space whose reduction is a scheme is a scheme.

Lemma 50.12.3. *Let S be a scheme. Let X be a decent algebraic space over S . Consider a commutative diagram*

$$\begin{array}{ccc} \text{Spec}(k) & \longrightarrow & X \\ & \searrow & \swarrow \\ & & S \end{array}$$

Assume that the image point $s \in S$ of $\text{Spec}(k) \rightarrow S$ is a closed point and that $\kappa(s) \subset k$ is algebraic. Then the image x of $\text{Spec}(k) \rightarrow X$ is a closed point of $|X|$.

Proof. Suppose that $x \rightsquigarrow x'$ for some $x' \in |X|$. Choose an étale morphism $U \rightarrow X$ where U is a scheme and a point $u' \in U'$ mapping to x' . Choose a specialization $u \rightsquigarrow u'$ in U with u mapping to x in X , see Lemma 50.10.4. Then u is the image of a point w of the scheme $W = \text{Spec}(k) \times_X U$. Since the projection $W \rightarrow \text{Spec}(k)$ is étale we see that $\kappa(w) \supset k$ is finite. Hence $\kappa(w) \supset \kappa(s)$ is algebraic. Hence $\kappa(u) \supset \kappa(s)$ is algebraic. Thus u is a closed point of U by Morphisms, Lemma 28.21.2. Thus $u = u'$, whence $x = x'$. \square

Lemma 50.12.4. *Let S be a scheme. Let X be a decent algebraic space over S . Consider a commutative diagram*

$$\begin{array}{ccc} \mathrm{Spec}(k) & \longrightarrow & X \\ & \searrow & \swarrow \\ & & S \end{array}$$

Assume that the image point $s \in S$ of $\mathrm{Spec}(k) \rightarrow S$ is a closed point and that $\kappa(s) \subset k$ is finite. Then $\mathrm{Spec}(k) \rightarrow X$ is finite morphism. If $\kappa(s) = k$ then $\mathrm{Spec}(k) \rightarrow X$ is closed immersion.

Proof. By Lemma 50.12.3 the image point $x \in |X|$ is closed. Let $Z \subset X$ be the reduced closed subspace with $|Z| = \{x\}$ (Properties of Spaces, Lemma 48.9.3). Note that Z is a decent algebraic space by Lemma 50.6.5. By Lemma 50.12.1 we see that $Z = \mathrm{Spec}(k')$ for some field k' . Of course $k \supset k' \supset \kappa(s)$. Then $\mathrm{Spec}(k) \rightarrow Z$ is a finite morphism of schemes and $Z \rightarrow X$ is a finite morphism as it is a closed immersion. Hence $\mathrm{Spec}(k) \rightarrow X$ is finite (Morphisms of Spaces, Lemma 49.41.4). If $k = \kappa(s)$, then $\mathrm{Spec}(k) = Z$ and $\mathrm{Spec}(k) \rightarrow X$ is a closed immersion. \square

Lemma 50.12.5. *Let S be a scheme. Suppose X is a decent algebraic space over S . Let $x \in |X|$ be a closed point. Then x can be represented by a closed immersion $i : \mathrm{Spec}(k) \rightarrow X$ from the spectrum of a field.*

Proof. We know that x can be represented by a quasi-compact monomorphism $i : \mathrm{Spec}(k) \rightarrow X$ where k is a field (Definition 50.6.1). Let $U \rightarrow X$ be an étale morphism where U is an affine scheme. As x is closed and X decent, the fibre F of $|U| \rightarrow |X|$ over x consists of closed points (Lemma 50.10.3). As i is a monomorphism, so is $U_k = U \times_X \mathrm{Spec}(k) \rightarrow U$. In particular, the map $|U_k| \rightarrow F$ is injective. Since U_k is quasi-compact and étale over a field, we see that U_k is a finite disjoint union of spectra of fields (Remark 50.4.1). Say $U_k = \mathrm{Spec}(k_1) \amalg \dots \amalg \mathrm{Spec}(k_r)$. Since $\mathrm{Spec}(k_i) \rightarrow U$ is a monomorphism, we see that its image u_i has residue field $\kappa(u_i) = k_i$. Since $u_i \in F$ is a closed point we conclude the morphism $\mathrm{Spec}(k_i) \rightarrow U$ is a closed immersion. As the u_i are pairwise distinct, $U_k \rightarrow U$ is a closed immersion. Hence i is a closed immersion (Morphisms of Spaces, Lemma 49.12.1). This finishes the proof. \square

50.13. Locally separated spaces

It turns out that a locally separated algebraic space is decent.

Lemma 50.13.1. *Let A be a ring. Let k be a field. Let \mathfrak{p}_n , $n \geq 1$ be a sequence of pairwise distinct primes of A . Moreover, for each n let $k \rightarrow \kappa(\mathfrak{p})$ be an embedding. Then the closure of the image of*

$$\coprod_{n \neq m} \mathrm{Spec}(\kappa(\mathfrak{p}_n) \otimes_k \kappa(\mathfrak{p}_m)) \longrightarrow \mathrm{Spec}(A \otimes A)$$

meets the diagonal.

Proof. Set $k_n = \kappa(\mathfrak{p}_n)$. We may assume that $A = \prod k_n$. Denote $x_n = \mathrm{Spec}(k_n)$ the open and closed point corresponding to $A \rightarrow k_n$. Then $\mathrm{Spec}(A) = Z \amalg \{x_n\}$ where Z is a nonempty closed subset. Namely, $Z = V(e_n; n \geq 1)$ where e_n is the idempotent of A corresponding to the factor k_n and Z is nonempty as the ideal

generated by the e_n is not equal to A . We will show that the closure of the image contains $\Delta(Z)$. The kernel of the map

$$\left(\prod k_n\right) \otimes_k \left(\prod k_m\right) \longrightarrow \prod_{n \neq m} k_n \otimes_k k_m$$

is the ideal generated by $e_n \otimes e_n$, $n \geq 1$. Hence the closure of the image of the map on spectra is $V(e_n \otimes e_n; n \geq 1)$ whose intersection with $\Delta(\text{Spec}(A))$ is $\Delta(Z)$. Thus it suffices to show that

$$\prod_{n \neq m} \text{Spec}(k_n \otimes_k k_m) \longrightarrow \text{Spec}\left(\prod_{n \neq m} k_n \otimes_k k_m\right)$$

has dense image. This follows as the family of ring maps $\prod_{n \neq m} k_n \otimes_k k_m \rightarrow k_n \otimes_k k_m$ is jointly injective. \square

Lemma 50.13.2 (David Rydh). *A locally separated algebraic space is decent.*

Proof. Let S be a base scheme. Let X be a locally separated algebraic space over S . Let $x \in |X|$. Choose a scheme U , an étale morphism $U \rightarrow X$, and a point $u \in U$ mapping to x in $|X|$. As usual we identify $u = \text{Spec}(\kappa(u))$. As X is locally separated the morphism

$$u \times_X u \rightarrow u \times u$$

is an immersion (Morphisms of Spaces, Lemma 49.4.5). Hence More on Groupoids, Lemma 39.10.5 tells us that it is a closed immersion (use Schemes, Lemma 25.10.4). As $u \times_X u \rightarrow u \times_X U$ is a monomorphism (base change of $u \rightarrow U$) and as $u \times_X U \rightarrow u$ is étale we conclude that $u \times_X u$ is a disjoint union of spectra of fields (see Remark 50.4.1 and Schemes, Lemma 25.23.10). Since it is also closed in the affine scheme $u \times u$ we conclude $u \times_X u$ is a finite disjoint union of spectra of fields. Thus x can be represented by a monomorphism $\text{Spec}(k) \rightarrow X$ where k is a field, see Lemma 50.4.3.

Next, let $U = \text{Spec}(A)$ be an affine scheme and let $U \rightarrow X$ be an étale morphism. To finish the proof it suffices to show that $F = U \times_X \text{Spec}(k)$ is finite. Write $F = \coprod_{i \in I} \text{Spec}(k_i)$ as the disjoint union of finite separable extensions of k . We have to show that I is finite. Set $R = U \times_X U$. As X is locally separated, the morphism $j : R \rightarrow U \times U$ is an immersion. Let $e : U \rightarrow R$ be the diagonal map. Using that e is a morphism between étale schemes over U such that $\Delta = j \circ e$ is a closed immersion, we conclude that $R = e(U) \coprod W$ for some open and closed subscheme $W \subset R$. Since j is an immersion and $j|_{e(U)}$ is a closed immersion we conclude that $\overline{j(W)} \cap \Delta(U) = \emptyset$ in $U \times U$. Note that W contains $\text{Spec}(k_i \otimes_k k_{i'})$ for all $i \neq i'$, $i, i' \in I$. By Lemma 50.13.1 we conclude that I is finite as desired. \square

50.14. Valuative criterion

For a quasi-compact morphism from a decent space the valuative criterion is necessary in order for the morphism to be universally closed.

Proposition 50.14.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-compact, and X is decent. Then f is universally closed if and only if the existence part of the valuative criterion holds.*

Proof. In Morphisms of Spaces, Lemma 49.39.1 we have seen one of the implications. To prove the other, assume that f is universally closed. Let

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

be a diagram as in Morphisms of Spaces, Definition 49.38.1. Let $X_A = \mathrm{Spec}(A) \times_Y X$, so that we have

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X_A \\ & \searrow & \downarrow \\ & & \mathrm{Spec}(A) \end{array}$$

By Morphisms of Spaces, Lemma 49.8.3 we see that $X_A \rightarrow \mathrm{Spec}(A)$ is quasi-compact. Since $X_A \rightarrow X$ is representable, we see that X_A is decent also, see Lemma 50.5.3. Moreover, as f is universally closed, we see that $X_A \rightarrow \mathrm{Spec}(A)$ is universally closed. Hence we may and do replace X by X_A and Y by $\mathrm{Spec}(A)$.

Let $x' \in |X|$ be the equivalence class of $\mathrm{Spec}(K) \rightarrow X$. Let $y \in |Y| = |\mathrm{Spec}(A)|$ be the closed point. Set $y' = f(x')$; it is the generic point of $\mathrm{Spec}(A)$. Since f is universally closed we see that $f(\overline{\{x'\}})$ contains $\overline{\{y'\}}$, and hence contains y . Let $x \in \overline{\{x'\}}$ be a point such that $f(x) = y$. Let U be a scheme, and $\varphi : U \rightarrow X$ an étale morphism such that there exists a $u \in U$ with $\varphi(u) = x$. By Lemma 50.7.2 and our assumption that X is decent there exists a specialization $u' \rightsquigarrow u$ on U with $\varphi(u') = x'$. This means that there exists a common field extension $K \subset K' \supset \kappa(u')$ such that

$$\begin{array}{ccc} \mathrm{Spec}(K') & \longrightarrow & U \\ \downarrow & & \downarrow \\ \mathrm{Spec}(K) & \longrightarrow & X \\ & \searrow & \downarrow \\ & & \mathrm{Spec}(A) \end{array}$$

is commutative. This gives the following commutative diagram of rings

$$\begin{array}{ccc} K' & \longleftarrow & \mathcal{O}_{U,u} \\ \uparrow & & \uparrow \\ K & & A \\ & \swarrow & \uparrow \end{array}$$

By Algebra, Lemma 10.48.2 we can find a valuation ring $A' \subset K'$ dominating the image of $\mathcal{O}_{U,u}$ in K' . Since by construction $\mathcal{O}_{U,u}$ dominates A we see that A' dominates A also. Hence we obtain a diagram resembling the second diagram of Morphisms of Spaces, Definition 49.38.1 and the proposition is proved. \square

The following lemma is a special case of the more general Lemma 50.15.11.

Lemma 50.14.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-compact and quasi-separated. Then f is universally closed if and only if the existence part of the valuative criterion holds (Morphisms of Spaces, Definition 49.38.1).*

Proof. This is a combination of Morphisms of Spaces, Lemma 49.39.1 and Proposition 50.14.1. Namely, the implication in one direction is given by Morphisms of Spaces, Lemma 49.39.1. For the converse, assume f is quasi-separated, quasi-compact, and universally closed and assume given a diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

as in Morphisms of Spaces, Definition 49.38.1. A formal argument shows that the existence of the desired diagram

$$\begin{array}{ccccc} \mathrm{Spec}(K') & \longrightarrow & \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & & & \nearrow & \downarrow \\ \mathrm{Spec}(A') & \longrightarrow & \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

can be reduced to the case of the morphism $X_A \rightarrow \mathrm{Spec}(A)$. In this case the algebraic space X_A is quasi-separated, hence decent (property (γ) of Lemma 50.5.1). Hence the existence of $A \subset A'$ and the arrow $\mathrm{Spec}(A') \rightarrow X_A$ follows from Proposition 50.14.1. \square

Lemma 50.14.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-compact and separated. Then the following are equivalent*

- (1) f is universally closed,
- (2) the existence part of the valuative criterion holds as in Morphisms of Spaces, Definition 49.38.1, and
- (3) given any commutative solid diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \dashrightarrow & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K , there exists a dotted arrow, i.e., f satisfies the existence part of the valuative criterion as in Schemes, Definition 25.20.3.

Proof. Since f is separated parts (2) and (3) are equivalent by Morphisms of Spaces, Lemma 49.38.5. The equivalence of (3) and (1) follows from Lemma 50.14.2. \square

Lemma 50.14.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-compact and quasi-separated. Then the following are equivalent*

- (1) f is separated and universally closed,
- (2) the valuative criterion holds as in *Morphisms of Spaces*, Definition 49.38.1,
- (3) given any commutative solid diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K , there exists a unique dotted arrow, i.e., f satisfies the valuative criterion as in *Schemes*, Definition 25.20.3.

Proof. Since f is quasi-separated, the uniqueness part of the valuative criterion implies f is separated (Morphisms of Spaces, Lemma 49.40.2). Conversely, if f is separated, then it satisfies the uniqueness part of the valuative criterion (Morphisms of Spaces, Lemma 49.40.1). Having said this, we see that in each of the three cases the morphism f is separated and satisfies the uniqueness part of the valuative criterion. In this case the lemma is a formal consequence of Lemma 50.14.3. \square

Lemma 50.14.5 (Valuative criterion for properness). *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is of finite type and quasi-separated. Then the following are equivalent*

- (1) f is proper,
- (2) the valuative criterion holds as in *Morphisms of Spaces*, Definition 49.38.1,
- (3) given any commutative solid diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a valuation ring with field of fractions K , there exists a unique dotted arrow, i.e., f satisfies the valuative criterion as in *Schemes*, Definition 25.20.3.

Proof. Formal consequence of Lemma 50.14.4 and the definitions. \square

50.15. Relative conditions

This is a (yet another) technical section dealing with conditions on algebraic spaces having to do with points. It is probably a good idea to skip this section.

Definition 50.15.1. Let S be a scheme. We say an algebraic space X over S has property (β) if X has the corresponding property of Lemma 50.5.1. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f has property (β) if for any scheme T and morphism $T \rightarrow Y$ the fibre product $T \times_Y X$ has property (β) .

- (2) We say f is *decent* if for any scheme T and morphism $T \rightarrow Y$ the fibre product $T \times_Y X$ is a decent algebraic space.
- (3) We say f is *reasonable* if for any scheme T and morphism $T \rightarrow Y$ the fibre product $T \times_Y X$ is a reasonable algebraic space.
- (4) We say f is *very reasonable* if for any scheme T and morphism $T \rightarrow Y$ the fibre product $T \times_Y X$ is a very reasonable algebraic space.

We refer to Remark 50.15.10 for an informal discussion. It will turn out that the class of very reasonable morphisms is not so useful, but that the classes of decent and reasonable morphisms are useful.

Lemma 50.15.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We have the following implications among the conditions on f :*

Proof. This is clear from the definitions, Lemma 50.5.1 and Morphisms of Spaces, Lemma 49.4.12. \square

Here is another sanity check.

Lemma 50.15.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If X is decent (resp. is reasonable, resp. has property (β)) of Lemma 50.5.1), then f is decent (resp. reasonable, resp. has property (β)).*

Proof. Let T be a scheme and let $T \rightarrow Y$ be a morphism. Then $T \rightarrow Y$ is representable, hence the base change $T \times_Y X \rightarrow X$ is representable. Hence if X is decent (or reasonable), then so is $T \times_Y X$, see Lemma 50.6.5. Similarly, for property (β) , see Lemma 50.5.3. \square

Lemma 50.15.4. *Having property (β) , being decent, or being reasonable is preserved under arbitrary base change.*

Proof. This is immediate from the definition. \square

Lemma 50.15.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\omega \in \{\beta, \text{decent}, \text{reasonable}\}$. Suppose that Y has property (ω) and $f : X \rightarrow Y$ has (ω) . Then X has (ω) .*

Proof. Let us prove the lemma in case $\omega = \beta$. In this case we have to show that any $x \in |X|$ is represented by a monomorphism from the spectrum of a field into X . Let $y = f(x) \in |Y|$. By assumption there exists a field k and a monomorphism $\text{Spec}(k) \rightarrow Y$ representing y . Then x corresponds to a point x' of $\text{Spec}(k) \times_Y X$. By assumption x' is represented by a monomorphism $\text{Spec}(k') \rightarrow \text{Spec}(k) \times_Y X$. Clearly the composition $\text{Spec}(k') \rightarrow X$ is a monomorphism representing x .

Let us prove the lemma in case $\omega = \textit{decent}$. Let $x \in |X|$ and $y = f(x) \in |Y|$. By the result of the preceding paragraph we can choose a diagram

$$\begin{array}{ccc} \mathrm{Spec}(k') & \xrightarrow{x} & X \\ \downarrow & & \downarrow f \\ \mathrm{Spec}(k) & \xrightarrow{y} & Y \end{array}$$

whose horizontal arrows monomorphisms. As Y is decent the morphism y is quasi-compact. As f is decent the algebraic space $\mathrm{Spec}(k) \times_Y X$ is decent. Hence the monomorphism $\mathrm{Spec}(k') \rightarrow \mathrm{Spec}(k) \times_Y X$ is quasi-compact. Then the monomorphism $x : \mathrm{Spec}(k') \rightarrow X$ is quasi-compact as a composition of quasi-compact morphisms (use Morphisms of Spaces, Lemmas 49.8.3 and 49.8.4). As the point x was arbitrary this implies X is decent.

Let us prove the lemma in case $\omega = \textit{reasonable}$. Choose $V \rightarrow Y$ étale with V an affine scheme. Choose $U \rightarrow V \times_Y X$ étale with U an affine scheme. By assumption $V \rightarrow Y$ has universally bounded fibres. By Lemma 50.3.3 the morphism $V \times_Y X \rightarrow X$ has universally bounded fibres. By assumption on f we see that $U \rightarrow V \times_Y X$ has universally bounded fibres. By Lemma 50.3.2 the composition $U \rightarrow X$ has universally bounded fibres. Hence there exists sufficiently many étale morphisms $U \rightarrow X$ from schemes with universally bounded fibres, and we conclude that X is reasonable. \square

Lemma 50.15.6. *Having property (β) , being decent, or being reasonable is preserved under compositions.*

Proof. Let $\omega \in \{\beta, \textit{decent}, \textit{reasonable}\}$. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be morphisms of algebraic spaces over the scheme S . Assume f and g both have property (ω) . Then we have to show that for any scheme T and morphism $T \rightarrow Z$ the space $T \times_Z X$ has (ω) . By Lemma 50.15.4 this reduces us to the following claim: Suppose that Y is an algebraic space having property (ω) , and that $f : X \rightarrow Y$ is a morphism with (ω) . Then X has (ω) . This is the content of Lemma 50.15.5. \square

Lemma 50.15.7. *Let S be a scheme. Let $f : X \rightarrow Y$, $g : Z \rightarrow Y$ be morphisms of algebraic spaces over S . If X and Y are decent (resp. reasonable, resp. have property (β) of Lemma 50.5.1), then so does $X \times_Y Z$.*

Proof. Namely, by Lemma 50.15.3 the morphism $X \rightarrow Y$ has the property. Then the base change $X \times_Y Z \rightarrow Z$ has the property by Lemma 50.15.4. And finally this implies $X \times_Y Z$ has the property by Lemma 50.15.5. \square

Lemma 50.15.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\mathcal{P} \in \{(\beta), \textit{decent}, \textit{reasonable}\}$. Assume*

- (1) f is quasi-compact,
- (2) f is étale,
- (3) $|f| : |X| \rightarrow |Y|$ is surjective, and
- (4) the algebraic space X has property \mathcal{P} .

Then Y has property \mathcal{P} .

Proof. Let us prove this in case $\mathcal{P} = (\beta)$. Let $y \in |Y|$ be a point. We have to show that y can be represented by a monomorphism from a field. Choose a point $x \in |X|$ with $f(x) = y$. By assumption we may represent x by a monomorphism

$\text{Spec}(k) \rightarrow X$, with k a field. By Lemma 50.4.3 it suffices to show that the projections $\text{Spec}(k) \times_Y \text{Spec}(k) \rightarrow \text{Spec}(k)$ are étale and quasi-compact. We can factor the first projection as

$$\text{Spec}(k) \times_Y \text{Spec}(k) \longrightarrow \text{Spec}(k) \times_Y X \longrightarrow \text{Spec}(k)$$

The first morphism is a monomorphism, and the second is étale and quasi-compact. By Properties of Spaces, Lemma 48.13.8 we see that $\text{Spec}(k) \times_Y X$ is a scheme. Hence it is a finite disjoint union of spectra of finite separable field extensions of k . By Schemes, Lemma 25.23.10 we see that the first arrow identifies $\text{Spec}(k) \times_Y \text{Spec}(k)$ with a finite disjoint union of spectra of finite separable field extensions of k . Hence the projection morphism is étale and quasi-compact.

Let us prove this in case $\mathcal{P} = \textit{decent}$. We have already seen in the first paragraph of the proof that this implies that every $y \in |Y|$ can be represented by a monomorphism $y : \text{Spec}(k) \rightarrow Y$. Pick such a y . Pick an affine scheme U and an étale morphism $U \rightarrow X$ such that the image of $|U| \rightarrow |Y|$ contains y . By Lemma 50.4.5 it suffices to show that U_y is a finite scheme over k . The fibre product $X_y = \text{Spec}(k) \times_Y X$ is a quasi-compact étale algebraic space over k . Hence by Properties of Spaces, Lemma 48.13.8 it is a scheme. So it is a finite disjoint union of spectra of finite separable extensions of k . Say $X_y = \{x_1, \dots, x_n\}$ so x_i is given by $x_i : \text{Spec}(k_i) \rightarrow X$ with $[k_i : k] < \infty$. By assumption X is decent, so the schemes $U_{x_i} = \text{Spec}(k_i) \times_X U$ are finite over k_i . Finally, we note that $U_y = \coprod U_{x_i}$ as a scheme and we conclude that U_y is finite over k as desired.

Let us prove this in case $\mathcal{P} = \textit{reasonable}$. Pick an affine scheme V and an étale morphism $V \rightarrow Y$. We have to show the fibres of $V \rightarrow Y$ are universally bounded. The algebraic space $V \times_Y X$ is quasi-compact. Thus we can find an affine scheme W and a surjective étale morphism $W \rightarrow V \times_Y X$, see Properties of Spaces, Lemma 48.6.3. Here is a picture (solid diagram)

$$\begin{array}{ccccc} W & \longrightarrow & V \times_Y X & \longrightarrow & X & \xleftarrow{x} & \text{Spec}(k) \\ & \searrow & \downarrow & & \downarrow f & \swarrow y & \\ & & V & \longrightarrow & Y & & \end{array}$$

The morphism $W \rightarrow X$ is universally bounded by our assumption that the space X is reasonable. Let n be an integer bounding the degrees of the fibres of $W \rightarrow X$. We claim that the same integer works for bounding the fibres of $V \rightarrow Y$. Namely, suppose $y \in |Y|$ is a point. Then there exists a $x \in |X|$ with $f(x) = y$ (see above). This means we can find a field k and morphisms x, y given as dotted arrows in the diagram above. In particular we get a surjective étale morphism

$$\text{Spec}(k) \times_{x,X} W \rightarrow \text{Spec}(k) \times_{x,X} (V \times_Y X) = \text{Spec}(k) \times_{y,Y} V$$

which shows that the degree of $\text{Spec}(k) \times_{y,Y} V$ over k is less than or equal to the degree of $\text{Spec}(k) \times_{x,X} W$ over k , i.e., $\leq n$, and we win. (This last part of the argument is the same as the argument in the proof of Lemma 50.3.4. Unfortunately that lemma is not general enough because it only applies to representable morphisms.) \square

Lemma 50.15.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\mathcal{P} \in \{(\beta), \textit{decent}, \textit{reasonable}, \textit{very reasonable}\}$. The following are equivalent*

- (1) f is \mathcal{P} ,
- (2) for every affine scheme Z and every morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f is \mathcal{P} ,
- (3) for every affine scheme Z and every morphism $Z \rightarrow Y$ the algebraic space $Z \times_Y X$ is \mathcal{P} , and
- (4) there exists a Zariski covering $Y = \bigcup Y_i$ such that each morphism $f^{-1}(Y_i) \rightarrow Y_i$ has \mathcal{P} .

If $\mathcal{P} \in \{(\beta), \text{decent}, \text{reasonable}\}$, then this is also equivalent to

- (5) there exists a scheme V and a surjective étale morphism $V \rightarrow Y$ such that the base change $V \times_Y X \rightarrow V$ has \mathcal{P} .

Proof. The implications (1) \Rightarrow (2) \Rightarrow (3) \Rightarrow (4) are trivial. The implication (3) \Rightarrow (1) can be seen as follows. Let $Z \rightarrow Y$ be a morphism whose source is a scheme over S . Consider the algebraic space $Z \times_Y X$. If we assume (3), then for any affine open $W \subset Z$, the open subspace $W \times_Y X$ of $Z \times_Y X$ has property \mathcal{P} . Hence by Lemma 50.5.2 the space $Z \times_Y X$ has property \mathcal{P} , i.e., (1) holds. A similar argument (omitted) shows that (4) implies (1).

The implication (1) \Rightarrow (5) is trivial. Let $V \rightarrow Y$ be an étale morphism from a scheme as in (5). Let Z be an affine scheme, and let $Z \rightarrow Y$ be a morphism. Consider the diagram

$$\begin{array}{ccc} Z \times_Y V & \xrightarrow{q} & V \\ p \downarrow & & \downarrow \\ Z & \longrightarrow & Y \end{array}$$

Since p is étale, and hence open, we can choose finitely many affine open subschemes $W_i \subset Z \times_Y V$ such that $Z = \bigcup p(W_i)$. Consider the commutative diagram

$$\begin{array}{ccccc} V \times_Y X & \longleftarrow & (\coprod W_i) \times_Y X & \longrightarrow & Z \times_Y X \\ \downarrow & & \downarrow & & \downarrow \\ V & \longleftarrow & \coprod W_i & \longrightarrow & Z \end{array}$$

We know $V \times_Y X$ has property \mathcal{P} . By Lemma 50.5.3 we see that $(\coprod W_i) \times_Y X$ has property \mathcal{P} . Note that the morphism $(\coprod W_i) \times_Y X \rightarrow Z \times_Y X$ is étale and quasi-compact as the base change of $\coprod W_i \rightarrow Z$. Hence by Lemma 50.15.8 we conclude that $Z \times_Y X$ has property \mathcal{P} . \square

Remark 50.15.10. An informal description of the properties (β) , decent, reasonable, very reasonable was given in Section 50.6. A morphism has one of these properties if (very) loosely speaking the fibres of the morphism have the corresponding properties. Being decent is useful to prove things about specializations of points on $|X|$. Being reasonable is a bit stronger and technically quite easy to work with.

Here is a lemma we promised earlier which uses decent morphisms.

Lemma 50.15.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-compact and decent. (For example if f is representable, or quasi-separated, see Lemma 50.15.2.) Then f is universally closed if and only if the existence part of the valuative criterion holds.*

Proof. In Morphisms of Spaces, Lemma 49.39.1 we proved that any quasi-compact morphism which satisfies the existence part of the valuative criterion is universally closed. To prove the other, assume that f is universally closed. In the proof of Proposition 50.14.1 we have seen that it suffices to show, for any valuation ring A , and any morphism $\text{Spec}(A) \rightarrow Y$, that the base change $f_A : X_A \rightarrow \text{Spec}(A)$ satisfies the existence part of the valuative criterion. By definition the algebraic space X_A has property (γ) and hence Proposition 50.14.1 applies to the morphism f_A and we win. \square

50.16. Points of fibres

Let S be a scheme. Consider a cartesian diagram

$$(50.16.0.1) \quad \begin{array}{ccc} W & \xrightarrow{q} & Z \\ p \downarrow & & \downarrow g \\ X & \xrightarrow{f} & Y \end{array}$$

of algebraic spaces over S . Let $x \in |X|$ and $z \in |Z|$ be points mapping to the same point $y \in |Y|$. We may ask: When is the set

$$(50.16.0.2) \quad F_{x,z} = \{w \in |W| \text{ such that } p(w) = x \text{ and } q(w) = z\}$$

finite?

Example 50.16.1. If X, Y, Z are schemes, then the set $F_{x,z}$ is equal to the spectrum of $\kappa(x) \otimes_{\kappa(y)} \kappa(z)$ (Schemes, Lemma 25.17.5). Thus we obtain a finite set if either $\kappa(y) \subset \kappa(x)$ is finite or if $\kappa(y) \subset \kappa(z)$ is finite. In particular, this is always the case if g is quasi-finite at z (Morphisms, Lemma 28.21.5).

Example 50.16.2. Let K be a characteristic 0 field endowed with an automorphism σ of infinite order. Set $Y = \text{Spec}(K)/\mathbf{Z}$ and $X = \mathbf{A}_K^1/\mathbf{Z}$ where \mathbf{Z} acts on K via σ and on $\mathbf{A}_K^1 = \text{Spec}(K[t])$ via $t \mapsto t + 1$. Let $Z = \text{Spec}(K)$. Then $W = \mathbf{A}_K^1$. Picture

$$\begin{array}{ccc} \mathbf{A}_K^1 & \xrightarrow{q} & \text{Spec}(K) \\ p \downarrow & & \downarrow g \\ \mathbf{A}_K^1/\mathbf{Z} & \xrightarrow{f} & \text{Spec}(K)/\mathbf{Z} \end{array}$$

Take x corresponding to $t = 0$ and z the unique point of $\text{Spec}(K)$. Then we see that $F_{x,z} = \mathbf{Z}$ as a set.

Lemma 50.16.3. *In the situation of (50.16.0.1) if $Z' \rightarrow Z$ is a morphism and $z' \in |Z'|$ maps to z , then the induced map $F_{x,z'} \rightarrow F_{x,z}$ is surjective.*

Proof. Set $W' = X \times_Y Z' = W \times_Z Z'$. Then $|W'| \rightarrow |W| \times_{|Z|} |Z'|$ is surjective by Properties of Spaces, Lemma 48.4.3. Hence the surjectivity of $F_{x,z'} \rightarrow F_{x,z}$. \square

Lemma 50.16.4. *In diagram (50.16.0.1) the set (50.16.0.2) is finite if f is of finite type and f is quasi-finite at x .*

Proof. The morphism p is quasi-finite at every $w \in F_{x,z}$, see Morphisms of Spaces, Lemma 49.26.2. Hence the lemma follows from Morphisms of Spaces, Lemma 49.26.9. \square

Lemma 50.16.5. *In diagram (50.16.0.1) the set (50.16.0.2) is finite if y can be represented by a monomorphism $\text{Spec}(k) \rightarrow Y$ where k is a field and g is quasi-finite at z . (Special case: Y is decent and g is étale.)*

Proof. By Lemma 50.16.3 applied twice we may replace Z by $Z_k = \text{Spec}(k) \times_Y Z$ and X by $X_k = \text{Spec}(k) \times_Y X$. We may and do replace Y by $\text{Spec}(k)$ as well. Note that $Z_k \rightarrow \text{Spec}(k)$ is quasi-finite at z by Morphisms of Spaces, Lemma 49.26.2. Choose a scheme V , a point $v \in V$, and an étale morphism $V \rightarrow Z_k$ mapping v to z . Choose a scheme U , a point $u \in U$, and an étale morphism $U \rightarrow X_k$ mapping u to x . Again by Lemma 50.16.3 it suffices to show $F_{u,v}$ is finite for the diagram

$$\begin{array}{ccc} U \times_{\text{Spec}(k)} V & \longrightarrow & V \\ \downarrow & & \downarrow \\ U & \longrightarrow & \text{Spec}(k) \end{array}$$

The morphism $V \rightarrow \text{Spec}(k)$ is quasi-finite at v (follows from the general discussion in Morphisms of Spaces, Section 49.22 and the definition of being quasi-finite at a point). At this point the finiteness follows from Example 50.16.1. The parenthetical remark of the statement of the lemma follows from the fact that on decent spaces points are represented by monomorphisms from fields and from the fact that an étale morphism of algebraic spaces is quasi-finite. \square

Lemma 50.16.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $y \in |Y|$ and assume that y is represented by a quasi-compact monomorphism $\text{Spec}(k) \rightarrow Y$. Then $|X_k| \rightarrow |X|$ is a homeomorphism onto $f^{-1}(\{y\}) \subset |X|$ with induced topology.*

Proof. We will use Properties of Spaces, Lemma 48.13.7 and Morphisms of Spaces, Lemma 49.10.9 without further mention. Let $V \rightarrow Y$ be an étale morphism with V affine such that there exists a $v \in V$ mapping to y . Since $\text{Spec}(k) \rightarrow Y$ is quasi-compact there are a finite number of points of V mapping to y (Lemma 50.4.5). After shrinking V we may assume v is the only one. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Consider the commutative diagram

$$\begin{array}{ccccc} U & \longleftarrow & U_V & \longleftarrow & U_v \\ \downarrow & & \downarrow & & \downarrow \\ X & \longleftarrow & X_V & \longleftarrow & X_v \\ \downarrow & & \downarrow & & \downarrow \\ Y & \longleftarrow & V & \longleftarrow & v \end{array}$$

Since $U_v \rightarrow U_V$ identifies U_v with a subset of U_V with the induced topology (Schemes, Lemma 25.18.5), and since $|U_V| \rightarrow |X_V|$ and $|U_v| \rightarrow |X_v|$ are surjective and open, we see that $|X_v| \rightarrow |X_V|$ is a homeomorphism onto its image (with induced topology). On the other hand, the inverse image of $f^{-1}(\{y\})$ under the open map $|X_V| \rightarrow |X|$ is equal to $|X_v|$. We conclude that $|X_v| \rightarrow f^{-1}(\{y\})$ is open. The morphism $X_v \rightarrow X$ factors through X_k and $|X_k| \rightarrow |X|$ is injective with image $f^{-1}(\{y\})$ by Properties of Spaces, Lemma 48.4.3. Using $|X_v| \rightarrow |X_k| \rightarrow f^{-1}(\{y\})$ the lemma follows because $X_v \rightarrow X_k$ is surjective. \square

Lemma 50.16.7. *Let X be an algebraic space locally of finite type over a field k . Let $x \in |X|$. Consider the conditions*

- (1) $\dim_x(|X|) = 0$,
- (2) x is closed in $|X|$ and if $x' \rightsquigarrow x$ in $|X|$ then $x' = x$,
- (3) x is an isolated point of $|X|$,
- (4) $\dim_x(X) = 0$,
- (5) $X \rightarrow \text{Spec}(k)$ is quasi-finite at x .

Then (2), (3), (4), and (5) are equivalent. If X is decent, then (1) is equivalent to the others.

Proof. Parts (4) and (5) are equivalent for example by Morphisms of Spaces, Lemmas 49.32.7 and 49.32.8.

Let $U \rightarrow X$ be an étale morphism where U is an affine scheme and let $u \in U$ be a point mapping to x . Moreover, if x is a closed point, e.g., in case (2) or (3), then we may and do assume that u is a closed point. Observe that $\dim_u(U) = \dim_x(X)$ by definition and that this is equal to $\dim(\mathcal{O}_{U,u})$ if u is a closed point, see Algebra, Lemma 10.110.6.

If $\dim_x(X) > 0$ and u is closed, by the arguments above we can choose a nontrivial specialization $u' \rightsquigarrow u$ in U . Then the transcendence degree of $\kappa(u')$ over k exceeds the transcendence degree of $\kappa(u)$ over k . It follows that the images x and x' in X are distinct, because the transcendence degree of x/k and x'/k are well defined, see Morphisms of Spaces, Definition 49.31.1. This applies in particular in cases (2) and (3) and we conclude that (2) and (3) imply (4).

Conversely, if $X \rightarrow \text{Spec}(k)$ is locally quasi-finite at x , then $U \rightarrow \text{Spec}(k)$ is locally quasi-finite at u , hence u is an isolated point of U (Morphisms, Lemma 28.21.6). It follows that (5) implies (2) and (3) as $|U| \rightarrow |X|$ is continuous and open.

Assume X is decent and (1) holds. Then $\dim_x(X) = \dim_x(|X|)$ by Lemma 50.10.7 and the proof is complete. \square

Lemma 50.16.8. *Let X be an algebraic space locally of finite type over a field k . Consider the conditions*

- (1) $|X|$ is a finite set,
- (2) $|X|$ is a discrete space,
- (3) $\dim(|X|) = 0$,
- (4) $\dim(X) = 0$,
- (5) $X \rightarrow \text{Spec}(k)$ is locally quasi-finite,

Then (2), (3), (4), and (5) are equivalent. If X is decent, then (1) implies the others.

Proof. Parts (4) and (5) are equivalent for example by Morphisms of Spaces, Lemma 49.32.7.

Let $U \rightarrow X$ be a surjective étale morphism where U is a scheme.

If $\dim(U) > 0$, then choose a nontrivial specialization $u \rightsquigarrow u'$ in U and the transcendence degree of $\kappa(u)$ over k exceeds the transcendence degree of $\kappa(u')$ over k . It follows that the images x and x' in X are distinct, because the transcendence degree of x/k and x'/k is well defined, see Morphisms of Spaces, Definition 49.31.1. We conclude that (2) and (3) imply (4).

Conversely, if $X \rightarrow \text{Spec}(k)$ is locally quasi-finite, then U is locally Noetherian (Morphisms, Lemma 28.16.6) of dimension 0 (Morphisms, Lemma 28.30.5) and hence is a disjoint union of spectra of Artinian local rings (Properties, Lemma 27.10.3). Hence U is a discrete topological space, and since $|U| \rightarrow |X|$ is continuous and open, the same is true for $|X|$. In other words, (4) implies (2) and (3).

Assume X is decent and (1) holds. Then we may choose U above to be affine. The fibres of $|U| \rightarrow |X|$ are finite (this is a part of the defining property of decent spaces). Hence U is a finite type scheme over k with finitely many points. Hence U is quasi-finite over k (Morphisms, Lemma 28.21.7) which by definition means that $X \rightarrow \text{Spec}(k)$ is locally quasi-finite. \square

Lemma 50.16.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is locally of finite type. Let $x \in |X|$ with image $y \in |Y|$. Let $F = f^{-1}(\{y\})$ with induced topology from $|X|$. Let k be a field and let $\text{Spec}(k) \rightarrow Y$ be in the equivalence class defining y . Set $X_k = \text{Spec}(k) \times_Y X$. Let $\tilde{x} \in |X_k|$ map to $x \in |X|$. Consider the following conditions*

- (1) $\dim_x(F) = 0$,
- (2) x is isolated in F ,
- (3) x is closed in F and if $x' \rightsquigarrow x$ in F , then $x = x'$,
- (4) $\dim_{\tilde{x}}(|X_k|) = 0$,
- (5) \tilde{x} is isolated in $|X_k|$,
- (6) \tilde{x} is closed in $|X_k|$ and if $\tilde{x}' \rightsquigarrow \tilde{x}$ in $|X_k|$, then $\tilde{x} = \tilde{x}'$,
- (7) $\dim_{\tilde{x}}(X_k) = 0$,
- (8) f is quasi-finite at x .

Then we have

$$(4) \xrightarrow[f \text{ decent}]{} (5) \iff (6) \iff (7) \iff (8)$$

If Y is decent, then conditions (2) and (3) are equivalent to each other and to conditions (5), (6), (7), and (8). If Y and X are decent, then all conditions are equivalent.

Proof. By Lemma 50.16.7 conditions (5), (6), and (7) are equivalent to each other and to the condition that $X_k \rightarrow \text{Spec}(k)$ is quasi-finite at \tilde{x} . Thus by Morphisms of Spaces, Lemma 49.26.2 they are also equivalent to (8). If f is decent, then X_k is a decent algebraic space and Lemma 50.16.7 shows that (4) implies (5).

If Y is decent, then we can pick a quasi-compact monomorphism $\text{Spec}(k') \rightarrow Y$ in the equivalence class of y . In this case Lemma 50.16.6 tells us that $|X_{k'}| \rightarrow F$ is a homeomorphism. Combined with the arguments given above this implies the remaining statements of the lemma; details omitted. \square

Lemma 50.16.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is locally of finite type. Let $y \in |Y|$. Let k be a field and let $\text{Spec}(k) \rightarrow Y$ be in the equivalence class defining y . Set $X_k = \text{Spec}(k) \times_Y X$ and let $F = f^{-1}(\{y\})$ with the induced topology from $|X|$. Consider the following conditions*

- (1) F is finite,
- (2) F is a discrete topological space,
- (3) $\dim(F) = 0$,
- (4) $|X_k|$ is a finite set,

- (5) $|X_k|$ is a discrete space,
- (6) $\dim(|X_k|) = 0$,
- (7) $\dim(X_k) = 0$,
- (8) f is quasi-finite at all points of $|X|$ lying over y .

Then we have

$$(1) \iff (4) \xrightarrow[f \text{ decent}]{} (5) \iff (6) \iff (7) \iff (8)$$

If Y is decent, then conditions (2) and (3) are equivalent to each other and to conditions (5), (6), (7), and (8). If Y and X are decent, then (1) implies all the other conditions.

Proof. By Lemma 50.16.8 conditions (5), (6), and (7) are equivalent to each other and to the condition that $X_k \rightarrow \text{Spec}(k)$ is locally quasi-finite. Thus by Morphisms of Spaces, Lemma 49.26.2 they are also equivalent to (8). If f is decent, then X_k is a decent algebraic space and Lemma 50.16.8 shows that (4) implies (5).

The map $|X_k| \rightarrow F$ is surjective by Properties of Spaces, Lemma 48.4.3 and we see (4) \Rightarrow (1).

If Y is decent, then we can pick a quasi-compact monomorphism $\text{Spec}(k') \rightarrow Y$ in the equivalence class of y . In this case Lemma 50.16.6 tells us that $|X_{k'}| \rightarrow F$ is a homeomorphism. Combined with the arguments given above this implies the remaining statements of the lemma; details omitted. \square

50.17. Monomorphisms

Here is another case where monomorphisms are representable.

Lemma 50.17.1. *Let S be a scheme. Let Y be a disjoint union of spectra of zero dimensional local rings over S . Let $f : X \rightarrow Y$ be a monomorphism of algebraic spaces over S . Then f is representable, i.e., X is a scheme.*

Proof. This immediately reduces to the case $Y = \text{Spec}(A)$ where A is a zero dimensional local ring, i.e., $\text{Spec}(A) = \{\mathfrak{m}_A\}$ is a singleton. If $X = \emptyset$, then there is nothing to prove. If not, choose a nonempty affine scheme $U = \text{Spec}(B)$ and an étale morphism $U \rightarrow X$. As $|X|$ is a singleton (as a subset of $|Y|$, see Morphisms of Spaces, Lemma 49.10.9) we see that $U \rightarrow X$ is surjective. Note that $U \times_X U = U \times_Y U = \text{Spec}(B \otimes_A B)$. Thus we see that the ring maps $B \rightarrow B \otimes_A B$ are étale. Since

$$(B \otimes_A B)/\mathfrak{m}_A(B \otimes_A B) = (B/\mathfrak{m}_A B) \otimes_{A/\mathfrak{m}_A} (B/\mathfrak{m}_A B)$$

we see that $B/\mathfrak{m}_A B \rightarrow (B \otimes_A B)/\mathfrak{m}_A(B \otimes_A B)$ is flat and in fact free of rank equal to the dimension of $B/\mathfrak{m}_A B$ as a A/\mathfrak{m}_A -vector space. Since $B \rightarrow B \otimes_A B$ is étale, this can only happen if this dimension is finite (see for example Morphisms, Lemmas 28.50.7 and 28.50.8). Every prime of B lies over \mathfrak{m}_A (the unique prime of A). Hence $\text{Spec}(B) = \text{Spec}(B/\mathfrak{m}_A)$ as a topological space, and this space is a finite discrete set as $B/\mathfrak{m}_A B$ is an Artinian ring, see Algebra, Lemmas 10.51.2 and 10.51.6. Hence all prime ideals of B are maximal and $B = B_1 \times \dots \times B_n$ is a product of finitely many local rings of dimension zero, see Algebra, Lemma 10.51.5. Thus $B \rightarrow B \otimes_A B$ is finite étale as all the local rings B_i are henselian by Algebra, Lemma 10.145.11. Thus X is an affine scheme by Groupoids, Proposition 38.21.8. \square

50.18. Birational morphisms

The following definition of a birational morphism of algebraic spaces seems to be the closest to our definition (Morphisms, Definition 28.9.1) of a birational morphism of schemes.

Definition 50.18.1. Let S be a scheme. Let X and Y algebraic spaces over S . Assume X and Y are decent and that $|X|$ and $|Y|$ have finitely many irreducible components. We say a morphism $f : X \rightarrow Y$ is *birational* if

- (1) $|f|$ induces a bijection between the set of generic points of irreducible components of $|X|$ and the set of generic points of the irreducible components of $|Y|$, and
- (2) for every generic point $x \in |X|$ of an irreducible component the local ring map $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$ is an isomorphism (see clarification below).

Clarification: Since X and Y are decent the topological spaces $|X|$ and $|Y|$ are sober (Proposition 50.10.6). Hence condition (1) makes sense. Moreover, because we have assumed that $|X|$ and $|Y|$ have finitely many irreducible components, we see that the generic points $x_1, \dots, x_n \in |X|$, resp. $y_1, \dots, y_n \in |Y|$ are contained in any dense open of $|X|$, resp. $|Y|$. In particular, they are contained in the schematic locus of X , resp. Y by Theorem 50.9.2. Thus we can define \mathcal{O}_{X,x_i} , resp. \mathcal{O}_{Y,y_i} to be the local ring of this scheme at x_i , resp. y_i .

Another and perhaps better way to say all of this is that the morphism $f : X \rightarrow Y$ is birational if there exist dense open subspaces $X' \subset X$ and $Y' \subset Y$ such that

- (1) $f(X') \subset Y'$,
- (2) X' and Y' are representable, and
- (3) $f|_{X'} : X' \rightarrow Y'$ is birational in the sense of Morphisms, Definition 28.9.1.

However, we do insist that X and Y are decent with finitely many irreducible components.

Lemma 50.18.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which are decent and have finitely many irreducible components. If f is birational then f is dominant.*

Proof. Follows immediately from the definitions. See Morphisms of Spaces, Definition 49.18.1. \square

Cohomology of Algebraic Spaces

51.1. Introduction

In this chapter we write about cohomology of algebraic spaces. Although we prove some results on cohomology of abelian sheaves, we focus mainly on cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapter “Cohomology of Schemes”. Some of the results in this chapter can be found in [Knu71].

An important missing ingredient in this chapter is the *induction principle*, i.e., the analogue for quasi-compact and quasi-separated algebraic spaces of Cohomology of Schemes, Lemma 29.4.1. This is formulated precisely and proved in detail in Derived Categories of Spaces, Section 57.8. Instead of the induction principle, in this chapter we use the alternating Čech complex, see Section 51.5. It is designed to prove vanishing statements such as Proposition 51.6.2, but in some cases the induction principle is a more powerful and perhaps more “standard” tool. We encourage the reader to take a look at the induction principle after reading some of the material in this section.

51.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

51.3. Higher direct images

Before discussing what happens with higher direct images of quasi-coherent sheaves we formulate and prove a result which holds for all abelian sheaves (in particular also quasi-coherent modules).

Lemma 51.3.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be an integral (for example finite) morphism of algebraic spaces. Then $f_* : Ab(X_{\acute{e}tale}) \rightarrow Ab(Y_{\acute{e}tale})$ is an exact functor and $R^p f_* = 0$ for $p > 0$.*

Proof. By Properties of Spaces, Lemma 48.15.11 we may compute the higher direct images on an étale cover of Y . Hence we may assume Y is a scheme. This implies that X is a scheme (Morphisms of Spaces, Lemma 49.41.3). In this case we may apply Étale Cohomology, Lemma 44.44.5. For the finite case the reader may wish to consult the less technical Étale Cohomology, Proposition 44.55.2. \square

Let S be a scheme. Let X be a representable algebraic space over S . Let \mathcal{F} be a quasi-coherent module on X (see Properties of Spaces, Section 48.27). By Descent, Proposition 34.7.10 the cohomology groups $H^i(X, \mathcal{F})$ agree with the usual cohomology group computed in the Zariski topology of the corresponding quasi-coherent module on the scheme representing X .

More generally, let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces X and Y . Let \mathcal{F} be a quasi-coherent module on X . By Descent, Lemma 34.7.15 the sheaf $R^i f_* \mathcal{F}$ agrees with the usual higher direct image computed for the Zariski topology of the quasi-coherent module on the scheme representing X mapping to the scheme representing Y .

More generally still, suppose $f : X \rightarrow Y$ is a representable, quasi-compact, and quasi-separated morphism of algebraic spaces over S . Let V be a scheme and let $V \rightarrow Y$ be an étale surjective morphism. Let $U = V \times_Y X$ and let $f' : U \rightarrow V$ be the base change of f . Then for any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have

$$(51.3.1.1) \quad R^i f'_*(\mathcal{F}|_U) = (R^i f_* \mathcal{F})|_V,$$

see Properties of Spaces, Lemma 48.24.2. And because $f' : U \rightarrow V$ is a quasi-compact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $R^i f'_*(\mathcal{F}|_U)$ by thinking of $\mathcal{F}|_U$ as a quasi-coherent sheaf on the scheme U , and f' as a morphism of schemes. We will frequently use this without further mention.

Next, we prove that higher direct images of quasi-coherent sheaves are quasi-coherent for any quasi-compact and quasi-separated morphism of algebraic spaces. In the proof we use a trick; a “better” proof would use a relative Čech complex, as discussed in Sheaves on Stacks, Sections 73.17 and 73.18 ff.

Lemma 51.3.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is quasi-compact and quasi-separated, then $R^i f_*$ transforms quasi-coherent \mathcal{O}_X -modules into quasi-coherent \mathcal{O}_Y -modules.*

Proof. Let $V \rightarrow Y$ be an étale morphism where V is an affine scheme. Set $U = V \times_Y X$ and denote $f' : U \rightarrow V$ the induced morphism. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. By Properties of Spaces, Lemma 48.24.2 we have $R^i f'_*(\mathcal{F}|_U) = (R^i f_* \mathcal{F})|_V$. Since the property of being a quasi-coherent module is local in the étale topology on Y (see Properties of Spaces, Lemma 48.27.6) we may replace Y by V , i.e., we may assume Y is an affine scheme.

Assume Y is affine. Since f is quasi-compact we see that X is quasi-compact. Thus we may choose an affine scheme U and a surjective étale morphism $g : U \rightarrow X$, see Properties of Spaces, Lemma 48.6.3. Picture

$$\begin{array}{ccc} U & \xrightarrow{g} & X \\ & \searrow & \downarrow f \\ & & Y \end{array}$$

$f \circ g$

The morphism $g : U \rightarrow X$ is representable, separated and quasi-compact because X is quasi-separated. Hence the lemma holds for g (by the discussion above the lemma). It also holds for $f \circ g : U \rightarrow Y$ (as this is a morphism of affine schemes).

In the situation described in the previous paragraph we will show by induction on n that IH_n : for any quasi-coherent sheaf \mathcal{F} on X the sheaves $R^i f_* \mathcal{F}$ are quasi-coherent for $i \leq n$. The case $n = 0$ follows from Morphisms of Spaces, Lemma 49.11.2. Assume IH_n . In the rest of the proof we show that IH_{n+1} holds.

Let \mathcal{H} be a quasi-coherent \mathcal{O}_U -module. Consider the Leray spectral sequence

$$E_2^{p,q} = R^p f_* R^q g_* \mathcal{H} \Rightarrow R^{p+q}(f \circ g)_* \mathcal{H}$$

Cohomology on Sites, Lemma 21.14.7. As $R^q g_* \mathcal{H}$ is quasi-coherent by IH_n all the sheaves $R^p f_* R^q g_* \mathcal{H}$ are quasi-coherent for $p \leq n$. The sheaves $R^{p+q}(f \circ g)_* \mathcal{H}$ are all quasi-coherent (in fact zero for $p + q > 0$ but we do not need this). Looking in degrees $\leq n + 1$ the only module which we do not yet know is quasi-coherent is $E_2^{n+1,0} = R^{n+1} f_* g_* \mathcal{H}$. Moreover, the differentials $d_r^{n+1,0} : E_r^{n+1,0} \rightarrow E_r^{n+1+r,1-r}$ are zero as the target is zero. Using that $QCoh(\mathcal{O}_X)$ is a weak Serre subcategory of $Mod(\mathcal{O}_X)$ (Properties of Spaces, Lemma 48.27.7) it follows that $R^{n+1} f_* g_* \mathcal{H}$ is quasi-coherent (details omitted).

Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Set $\mathcal{H} = g^* \mathcal{F}$. The adjunction mapping $\mathcal{F} \rightarrow g_* g^* \mathcal{F} = g_* \mathcal{H}$ is injective as $U \rightarrow X$ is surjective étale. Consider the exact sequence

$$0 \rightarrow \mathcal{F} \rightarrow g_* \mathcal{H} \rightarrow \mathcal{G} \rightarrow 0$$

where \mathcal{G} is the cokernel of the first map and in particular quasi-coherent. Applying the long exact cohomology sequence we obtain

$$R^n f_* g_* \mathcal{H} \rightarrow R^n f_* \mathcal{G} \rightarrow R^{n+1} f_* \mathcal{F} \rightarrow R^{n+1} f_* g_* \mathcal{H} \rightarrow R^{n+1} f_* \mathcal{G}$$

The cokernel of the first arrow is quasi-coherent and we have seen above that $R^{n+1} f_* g_* \mathcal{H}$ is quasi-coherent. Thus $R^{n+1} f_* \mathcal{F}$ has a 2-step filtration where the first step is quasi-coherent and the second a submodule of a quasi-coherent sheaf. Since \mathcal{F} is an arbitrary quasi-coherent \mathcal{O}_X -module, this result also holds for \mathcal{G} . Thus we can choose an exact sequence $0 \rightarrow \mathcal{A} \rightarrow R^{n+1} f_* \mathcal{G} \rightarrow \mathcal{B}$ with \mathcal{A}, \mathcal{B} quasi-coherent \mathcal{O}_Y -modules. Then the kernel \mathcal{K} of $R^{n+1} f_* g_* \mathcal{H} \rightarrow R^{n+1} f_* \mathcal{G} \rightarrow \mathcal{B}$ is quasi-coherent, whereupon we obtain a map $\mathcal{K} \rightarrow \mathcal{A}$ whose kernel \mathcal{K}' is quasi-coherent too. Hence $R^{n+1} f_* \mathcal{F}$ sits in an exact sequence

$$R^n f_* g_* \mathcal{H} \rightarrow R^n f_* \mathcal{G} \rightarrow R^{n+1} f_* \mathcal{F} \rightarrow \mathcal{K}' \rightarrow 0$$

with all modules quasi-coherent except for possibly $R^{n+1} f_* \mathcal{F}$. We conclude that $R^{n+1} f_* \mathcal{F}$ is quasi-coherent, i.e., IH_{n+1} holds as desired. \square

Lemma 51.3.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over S . For any quasi-coherent \mathcal{O}_X -module \mathcal{F} and any affine object V of $Y_{\text{étale}}$ we have*

$$H^q(V \times_Y X, \mathcal{F}) = H^0(V, R^q f_* \mathcal{F})$$

for all $q \in \mathbf{Z}$.

Proof. Since formation of Rf_* commutes with étale localization (Properties of Spaces, Lemma 48.24.2) we may replace Y by V and assume $Y = V$ is affine. Consider the Leray spectral sequence $E_2^{p,q} = H^p(Y, R^q f_* \mathcal{F})$ converging to $H^{p+q}(X, \mathcal{F})$, see Cohomology on Sites, Lemma 21.14.5. By Lemma 51.3.2 we see that the sheaves $R^q f_* \mathcal{F}$ are quasi-coherent. By Cohomology of Schemes, Lemma 29.2.2 we see that $E_2^{p,q} = 0$ when $p > 0$. Hence the spectral sequence degenerates at E_2 and we win. \square

51.4. Colimits and cohomology

The following lemma in particular applies to diagrams of quasi-coherent sheaves.

Lemma 51.4.1. *Let S be a scheme. Let X be an algebraic space over S . If X is quasi-compact and quasi-separated, then*

$$\operatorname{colim}_i H^p(X, \mathcal{F}_i) \longrightarrow H^p(X, \operatorname{colim}_i \mathcal{F}_i)$$

is an isomorphism for every filtered diagram of abelian sheaves on $X_{\text{étale}}$.

Proof. This follows from Cohomology on Sites, Lemma 21.16.1. Namely, let $\mathcal{B} \subset \operatorname{Ob}(X_{\text{spaces, étale}})$ be the set of quasi-compact and quasi-separated spaces étale over X . Note that if $U \in \mathcal{B}$ then, because U is quasi-compact, the collection of finite coverings $\{U_i \rightarrow U\}$ with $U_i \in \mathcal{B}$ is cofinal in the set of coverings of U in $X_{\text{étale}}$. By Morphisms of Spaces, Lemma 49.8.9 the set \mathcal{B} satisfies all the assumptions of Cohomology on Sites, Lemma 21.16.1. Since $X \in \mathcal{B}$ we win. \square

Lemma 51.4.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $\mathcal{F} = \operatorname{colim} \mathcal{F}_i$ be a filtered colimit of abelian sheaves on $X_{\text{étale}}$. Then for any $p \geq 0$ we have*

$$R^p f_* \mathcal{F} = \operatorname{colim} R^p f_* \mathcal{F}_i.$$

Proof. Recall that $R^p f_* \mathcal{F}$ is the sheaf on $Y_{\text{spaces, étale}}$ associated to $V \mapsto H^p(V \times_Y X, \mathcal{F})$, see Cohomology on Sites, Lemma 21.8.4 and Properties of Spaces, Lemma 48.15.7. Recall that the colimit is the sheaf associated to the presheaf colimit. Hence we can apply Lemma 51.4.1 to $H^p(V \times_Y X, -)$ where V is affine to conclude (because when V is affine, then $V \times_Y X$ is quasi-compact and quasi-separated). Strictly speaking this also uses Properties of Spaces, Lemma 48.15.5 to see that there exist enough affine objects. \square

The following lemma tells us that finitely presented modules behave as expected in quasi-compact and quasi-separated algebraic spaces.

Lemma 51.4.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let I be a partially ordered set and let $(\mathcal{F}_i, \varphi_{ii'})$ be a system over I of quasi-coherent \mathcal{O}_X -modules. Let \mathcal{G} be an \mathcal{O}_X -module of finite presentation. Then we have*

$$\operatorname{colim}_i \operatorname{Hom}_X(\mathcal{G}, \mathcal{F}_i) = \operatorname{Hom}_X(\mathcal{G}, \operatorname{colim}_i \mathcal{F}_i).$$

Proof. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$. Set $R = U \times_X U$. Note that R is a quasi-compact (as X is quasi-separated and U quasi-compact) and separated (as U is separated) scheme. Hence we have

$$\operatorname{colim}_i \operatorname{Hom}_U(\mathcal{G}|_U, \mathcal{F}_i|_U) = \operatorname{Hom}_U(\mathcal{G}|_U, \operatorname{colim}_i \mathcal{F}_i|_U).$$

by Modules, Lemma 17.11.6 (and the material on restriction to schemes étale over X , see Properties of Spaces, Sections 48.27 and 48.28). Similarly for R . Since $QCoh(\mathcal{O}_X) = QCoh(U, R, s, t, c)$ (see Properties of Spaces, Proposition 48.30.1) the result follows formally. \square

51.5. The alternating Čech complex

Let S be a scheme. Let $f : U \rightarrow X$ be an étale morphism of algebraic spaces over S . The functor

$$j : U_{spaces, \acute{e}tale} \rightarrow X_{spaces, \acute{e}tale}, \quad V/U \mapsto V/X$$

induces an equivalence of $U_{spaces, \acute{e}tale}$ with the localization $X_{spaces, \acute{e}tale}/U$, see Properties of Spaces, Section 48.25. Hence there exist functors

$$f_! : Ab(U_{\acute{e}tale}) \rightarrow Ab(X_{\acute{e}tale}), \quad f_! : Mod(\mathcal{O}_U) \rightarrow Mod(\mathcal{O}_X),$$

which are left adjoint to

$$f^{-1} : Ab(X_{\acute{e}tale}) \rightarrow Ab(U_{\acute{e}tale}), \quad f^* : Mod(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_U)$$

see Modules on Sites, Section 18.19. Warning: This functor, a priori, has nothing to do with cohomology with compact supports! We dubbed this functor “extension by zero” in the reference above. Note that the two versions of $f_!$ agree as $f^* = f^{-1}$ for sheaves of \mathcal{O}_X -modules.

As we are going to use this construction below let us recall some of its properties. Given an abelian sheaf \mathcal{G} on $U_{\acute{e}tale}$ the sheaf $f_!\mathcal{G}$ is the sheafification of the presheaf

$$V/X \mapsto f_!\mathcal{G}(V) = \bigoplus_{\varphi \in \text{Mor}_X(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U),$$

see Modules on Sites, Lemma 18.19.2. Moreover, if \mathcal{G} is an \mathcal{O}_U -module, then $f_!\mathcal{G}$ is the sheafification of the exact same presheaf of abelian groups which is endowed with an \mathcal{O}_X -module structure in an obvious way (see loc. cit.). Let $\bar{x} : \text{Spec}(k) \rightarrow X$ be a geometric point. Then there is a canonical identification

$$(f_!\mathcal{G})_{\bar{x}} = \bigoplus_{\bar{u}} \mathcal{G}_{\bar{u}}$$

where the sum is over all $\bar{u} : \text{Spec}(k) \rightarrow U$ such that $f \circ \bar{u} = \bar{x}$, see Modules on Sites, Lemma 18.37.1 and Properties of Spaces, Lemma 48.16.13. In the following we are going to study the sheaf $f_!\underline{\mathbf{Z}}$. Here $\underline{\mathbf{Z}}$ denotes the constant sheaf on $X_{\acute{e}tale}$ or $U_{\acute{e}tale}$.

Lemma 51.5.1. *Let S be a scheme. Let $f_i : U_i \rightarrow X$ be étale morphisms of algebraic spaces over S . Then there are isomorphisms*

$$f_{1,!}\underline{\mathbf{Z}} \otimes_{\mathbf{Z}} f_{2,!}\underline{\mathbf{Z}} \rightarrow f_{12,!}\underline{\mathbf{Z}}$$

where $f_{12} : U_1 \times_X U_2 \rightarrow X$ is the structure morphism and

$$(f_1 \amalg f_2)_!\underline{\mathbf{Z}} \rightarrow f_{1,!}\underline{\mathbf{Z}} \oplus f_{2,!}\underline{\mathbf{Z}}$$

Proof. Once we have defined the map it will be an isomorphism by our description of stalks above. To define the map it suffices to work on the level of presheaves. Thus we have to define a map

$$\left(\bigoplus_{\varphi_1 \in \text{Mor}_X(V, U_1)} \mathbf{Z} \right) \otimes_{\mathbf{Z}} \left(\bigoplus_{\varphi_2 \in \text{Mor}_X(V, U_2)} \mathbf{Z} \right) \rightarrow \bigoplus_{\varphi \in \text{Mor}_X(V, U_1 \times_X U_2)} \mathbf{Z}$$

We map the element $1_{\varphi_1} \otimes 1_{\varphi_2}$ to the element $1_{\varphi_1 \times \varphi_2}$ with obvious notation. We omit the proof of the second equality. \square

Another important feature is the trace map

$$\mathrm{Tr}_f : f_! \underline{\mathbf{Z}} \longrightarrow \underline{\mathbf{Z}}.$$

The trace map is adjoint to the map $\underline{\mathbf{Z}} \rightarrow f^{-1} \underline{\mathbf{Z}}$ (which is an isomorphism). If \bar{x} is above, then Tr_f on stalks at \bar{x} is the map

$$(\mathrm{Tr}_f)_{\bar{x}} : (f_! \underline{\mathbf{Z}})_{\bar{x}} = \bigoplus_{\bar{u}} \underline{\mathbf{Z}} \longrightarrow \underline{\mathbf{Z}} = \underline{\mathbf{Z}}_{\bar{x}}$$

which sums the given integers. This is true because it is adjoint to the map $1 : \underline{\mathbf{Z}} \rightarrow f^{-1} \underline{\mathbf{Z}}$. In particular, if f is surjective as well as étale then Tr_f is surjective.

Assume that $f : U \rightarrow X$ is a surjective étale morphism of algebraic spaces. Consider the *Koszul complex* associated to the trace map we discussed above

$$\dots \rightarrow \wedge^3 f_! \underline{\mathbf{Z}} \rightarrow \wedge^2 f_! \underline{\mathbf{Z}} \rightarrow f_! \underline{\mathbf{Z}} \rightarrow \underline{\mathbf{Z}} \rightarrow 0$$

Here the exterior powers are over the sheaf of rings $\underline{\mathbf{Z}}$. The maps are defined by the rule

$$e_1 \wedge \dots \wedge e_n \mapsto \sum_{i=1, \dots, n} (-1)^{i+1} \mathrm{Tr}_f(e_i) e_1 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_n$$

where e_1, \dots, e_n are local sections of $f_! \underline{\mathbf{Z}}$. Let \bar{x} be a geometric point of X and set $M_{\bar{x}} = (f_! \underline{\mathbf{Z}})_{\bar{x}} = \bigoplus_{\bar{u}} \underline{\mathbf{Z}}$. Then the stalk of the complex above at \bar{x} is the complex

$$\dots \rightarrow \wedge^3 M_{\bar{x}} \rightarrow \wedge^2 M_{\bar{x}} \rightarrow M_{\bar{x}} \rightarrow \underline{\mathbf{Z}} \rightarrow 0$$

which is exact because $M_{\bar{x}} \rightarrow \underline{\mathbf{Z}}$ is surjective, see More on Algebra, Lemma 15.20.5. Hence if we let $K^\bullet = K^\bullet(f)$ be the complex with $K^i = \wedge^{i+1} f_! \underline{\mathbf{Z}}$, then we obtain a quasi-isomorphism

$$(51.5.1.1) \quad K^\bullet \longrightarrow \underline{\mathbf{Z}}[0]$$

We use the complex K^\bullet to define what we call the alternating Čech complex associated to $f : U \rightarrow X$.

Definition 51.5.2. Let S be a scheme. Let $f : U \rightarrow X$ be a surjective étale morphism of algebraic spaces over S . Let \mathcal{F} be an object of $Ab(X_{\acute{e}tale})$. The *alternating Čech complex*¹ $\check{C}_{alt}^\bullet(f, \mathcal{F})$ associated to \mathcal{F} and f is the complex

$$\mathrm{Hom}(K^0, \mathcal{F}) \rightarrow \mathrm{Hom}(K^1, \mathcal{F}) \rightarrow \mathrm{Hom}(K^2, \mathcal{F}) \rightarrow \dots$$

with Hom groups computed in $Ab(X_{\acute{e}tale})$.

The reader may verify that if $U = \coprod U_i$ and $f|_{U_i} : U_i \rightarrow X$ is the open immersion of a subspace, then $\check{C}_{alt}^\bullet(f, \mathcal{F})$ agrees with the complex introduced in Cohomology, Section 20.24 for the Zariski covering $X = \bigcup U_i$ and the restriction of \mathcal{F} to the Zariski site of X . What is more important however, is to relate the cohomology of the alternating Čech complex to the cohomology.

Lemma 51.5.3. *Let S be a scheme. Let $f : U \rightarrow X$ be a surjective étale morphism of algebraic spaces over S . Let \mathcal{F} be an object of $Ab(X_{\acute{e}tale})$. There exists a canonical map*

$$\check{C}_{alt}^\bullet(f, \mathcal{F}) \longrightarrow R\Gamma(X, \mathcal{F})$$

in $D(Ab)$. Moreover, there is a spectral sequence with E_1 -page

$$E_1^{p,q} = \mathrm{Ext}_{Ab(X_{\acute{e}tale})}^q(K^p, \mathcal{F})$$

converging to $H^{p+q}(X, \mathcal{F})$ where $K^p = \wedge^{p+1} f_! \underline{\mathbf{Z}}$.

¹This may be nonstandard notation

Proof. Recall that we have the quasi-isomorphism $K^\bullet \rightarrow \underline{\mathbf{Z}}[0]$, see (51.5.1.1). Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in $Ab(X_{\acute{e}tale})$. Consider the double complex $A^{\bullet, \bullet}$ with terms

$$A^{p,q} = \text{Hom}(K^p, \mathcal{I}^q)$$

where the differential $d_1^{p,q} : A^{p,q} \rightarrow A^{p+1,q}$ is the one coming from the differential $K^{p+1} \rightarrow K^p$ and the differential $d_2^{p,q} : A^{p,q} \rightarrow A^{p,q+1}$ is the one coming from the differential $\mathcal{I}^q \rightarrow \mathcal{I}^{q+1}$. Denote sA^\bullet the total complex associated to the double complex $A^{\bullet, \bullet}$. We will use the two spectral sequences $({}^I E_r, {}^I d_r)$ and $({}^{II} E_r, {}^{II} d_r)$ associated to this double complex, see Homology, Section 12.22.

Because K^\bullet is a resolution of $\underline{\mathbf{Z}}$ we see that the complexes

$$A^{\bullet, q} : \text{Hom}(K^0, \mathcal{I}^q) \rightarrow \text{Hom}(K^1, \mathcal{I}^q) \rightarrow \text{Hom}(K^2, \mathcal{I}^q) \rightarrow \dots$$

are acyclic in positive degrees and have H^0 equal to $\Gamma(X, \mathcal{I}^q)$. Hence by Homology, Lemma 12.22.7 and its proof the spectral sequence $({}^{II} E_r, {}^{II} d_r)$ degenerates, and the natural map

$$\mathcal{I}^\bullet(X) \longrightarrow sA^\bullet$$

is a quasi-isomorphism of complexes of abelian groups. In particular we conclude that $H^n(sA^\bullet) = H^n(X, \mathcal{F})$.

The map $\check{C}_{alt}^\bullet(f, \mathcal{F}) \rightarrow R\Gamma(X, \mathcal{F})$ of the lemma is the composition of $\check{C}_{alt}^\bullet(f, \mathcal{F}) \rightarrow SA^\bullet$ with the inverse of the displayed quasi-isomorphism.

Finally, consider the spectral sequence $({}^I E_r, {}^I d_r)$. We have

$$E_1^{p,q} = q\text{th cohomology of } \text{Hom}(K^p, \mathcal{I}^0) \rightarrow \text{Hom}(K^p, \mathcal{I}^1) \rightarrow \text{Hom}(K^p, \mathcal{I}^2) \rightarrow \dots$$

This proves the lemma. □

It follows from the lemma that it is important to understand the ext groups $\text{Ext}_{Ab(X_{\acute{e}tale})}(K^p, \mathcal{F})$, i.e., the right derived functors of $\mathcal{F} \mapsto \text{Hom}(K^p, \mathcal{F})$.

Lemma 51.5.4. *Let S be a scheme. Let $f : U \rightarrow X$ be a surjective, étale, and separated morphism of algebraic spaces over S . For $p \geq 0$ set*

$$W_p = U \times_X \dots \times_X U \setminus \text{all diagonals}$$

where the fibre product has $p+1$ factors. There is a free action of S_{p+1} on W_p over X and

$$\text{Hom}(K^p, \mathcal{F}) = S_{p+1}\text{-anti-invariant elements of } \mathcal{F}(W_p)$$

functorially in \mathcal{F} where $K^p = \wedge^{p+1} f_! \underline{\mathbf{Z}}$.

Proof. Because $U \rightarrow X$ is separated the diagonal $U \rightarrow U \times_X U$ is a closed immersion. Since $U \rightarrow X$ is étale the diagonal $U \rightarrow U \times_X U$ is an open immersion, see Morphisms of Spaces, Lemmas 49.36.10 and 49.35.9. Hence W_p is an open and closed subspace of $U^{p+1} = U \times_X \dots \times_X U$. The action of S_{p+1} on W_p is free as we've thrown out the fixed points of the action. By Lemma 51.5.1 we see that

$$(f_! \underline{\mathbf{Z}})^{\otimes p+1} = f_!^{p+1} \underline{\mathbf{Z}} = (W_p \rightarrow X)_! \underline{\mathbf{Z}} \oplus \text{Rest}$$

where $f^{p+1} : U^{p+1} \rightarrow X$ is the structure morphism. Looking at stalks over a geometric point \bar{x} of X we see that

$$\left(\bigoplus_{\bar{u} \rightarrow \bar{x}} \mathbf{Z} \right)^{\otimes p+1} \longrightarrow (W_p \rightarrow X)_! \underline{\mathbf{Z}}_{\bar{x}}$$

is the quotient whose kernel is generated by all tensors $1_{\bar{u}_0} \otimes \dots \otimes 1_{\bar{u}_p}$ where $\bar{u}_i = \bar{u}_j$ for some $i \neq j$. Thus the quotient map

$$(f_! \mathbf{Z})^{\otimes p+1} \longrightarrow \wedge^{p+1} f_! \mathbf{Z}$$

factors through $(W_p \rightarrow X)_! \mathbf{Z}$, i.e., we get

$$(f_! \mathbf{Z})^{\otimes p+1} \longrightarrow (W_p \rightarrow X)_! \mathbf{Z} \longrightarrow \wedge^{p+1} f_! \mathbf{Z}$$

This already proves that $\text{Hom}(K^p, \mathcal{F})$ is (functorially) a subgroup of

$$\text{Hom}((W_p \rightarrow X)_! \mathbf{Z}, \mathcal{F}) = \mathcal{F}(W_p)$$

To identify it with the S_{p+1} -anti-invariants we have to prove that the surjection $(W_p \rightarrow X)_! \mathbf{Z} \rightarrow \wedge^{p+1} f_! \mathbf{Z}$ is the maximal S_{p+1} -anti-invariant quotient. In other words, we have to show that $\wedge^{p+1} f_! \mathbf{Z}$ is the quotient of $(W_p \rightarrow X)_! \mathbf{Z}$ by the subsheaf generated by the local sections $s - \text{sign}(\sigma)\sigma(s)$ where s is a local section of $(W_p \rightarrow X)_! \mathbf{Z}$. This can be checked on the stacks, where it is clear. \square

Lemma 51.5.5. *Let S be a scheme. Let W be an algebraic space over S . Let G be a finite group acting freely on W . Let $U = W/G$, see *Properties of Spaces*, Lemma 48.32.1. Let $\chi : G \rightarrow \{+1, -1\}$ be a character. Then there exists a rank 1 locally free sheaf of \mathbf{Z} -modules $\mathbf{Z}(\chi)$ on $U_{\text{étale}}$ such that for every abelian sheaf \mathcal{F} on $U_{\text{étale}}$ we have*

$$H^0(W, \mathcal{F}|_W)^\chi = H^0(U, \mathcal{F} \otimes_{\mathbf{Z}} \mathbf{Z}(\chi))$$

Proof. The quotient morphism $q : W \rightarrow U$ is a G -torsor, i.e., there exists a surjective étale morphism $U' \rightarrow U$ such that $W \times_U U' = \coprod_{g \in G} U'$ as spaces with G -action over U' . (Namely, $U' = W$ works.) Hence $q_* \mathbf{Z}$ is a finite locally free \mathbf{Z} -module with an action of G . For any geometric point \bar{u} of U , then we get G -equivariant isomorphisms

$$(q_* \mathbf{Z})_{\bar{u}} = \bigoplus_{\bar{w} \rightarrow \bar{u}} \mathbf{Z} = \bigoplus_{g \in G} \mathbf{Z} = \mathbf{Z}[G]$$

where the second = uses a geometric point \bar{w}_0 lying over \bar{u} and maps the summand corresponding to $g \in G$ to the summand corresponding to $g(\bar{w}_0)$. We have

$$H^0(W, \mathcal{F}|_W) = H^0(U, \mathcal{F} \otimes_{\mathbf{Z}} q_* \mathbf{Z})$$

because $q_* \mathcal{F}|_W = \mathcal{F} \otimes_{\mathbf{Z}} q_* \mathbf{Z}$ as one can check by restricting to U' . Let

$$\mathbf{Z}(\chi) = (q_* \mathbf{Z})^\chi \subset q_* \mathbf{Z}$$

be the subsheaf of sections that transform according to χ . For any geometric point \bar{u} of U we have

$$\mathbf{Z}(\chi)_{\bar{u}} = \mathbf{Z} \cdot \sum_g \chi(g)g \subset \mathbf{Z}[G] = (q_* \mathbf{Z})_{\bar{u}}$$

It follows that $\mathbf{Z}(\chi)$ is locally free of rank 1 (more precisely, this should be checked after restricting to U'). Note that for any \mathbf{Z} -module M the χ -semi-invariants of $M[G]$ are the elements of the form $m \cdot \sum_g \chi(g)g$. Thus we see that for any abelian sheaf \mathcal{F} on U we have

$$(\mathcal{F} \otimes_{\mathbf{Z}} q_* \mathbf{Z})^\chi = \mathcal{F} \otimes_{\mathbf{Z}} \mathbf{Z}(\chi)$$

because we have equality at all stalks. The result of the lemma follows by taking global sections. \square

Now we can put everything together and obtain the following pleasing result.

Lemma 51.5.6. *Let S be a scheme. Let $f : U \rightarrow X$ be a surjective, étale, and separated morphism of algebraic spaces over S . For $p \geq 0$ set*

$$W_p = U \times_X \dots \times_X U \setminus \text{all diagonals}$$

(with $p + 1$ factors) as in Lemma 51.5.4. Let $\chi_p : S_{p+1} \rightarrow \{+1, -1\}$ be the sign character. Let $U_p = W_p/S_{p+1}$ and $\underline{\mathbf{Z}}(\chi_p)$ be as in Lemma 51.5.5. Then the spectral sequence of Lemma 51.5.3 has E_1 -page

$$E_1^{p,q} = H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$$

and converges to $H^{p+q}(X, \mathcal{F})$.

Proof. Note that since the action of S_{p+1} on W_p is over X we do obtain a morphism $U_p \rightarrow X$. Since $W_p \rightarrow X$ is étale and since $W_p \rightarrow U_p$ is surjective étale, it follows that also $U_p \rightarrow X$ is étale, see Morphisms of Spaces, Lemma 49.36.2. Therefore an injective object of $Ab(X_{\text{étale}})$ restricts to an injective object of $Ab(U_p, \text{étale})$, see Cohomology on Sites, Lemma 21.8.1. Moreover, the functor $\mathcal{G} \mapsto \mathcal{G} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)$ is an auto-equivalence of $Ab(U_p)$, whence transforms injective objects into injective objects and is exact (because $\underline{\mathbf{Z}}(\chi_p)$ is an invertible $\underline{\mathbf{Z}}$ -module). Thus given an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ in $Ab(X_{\text{étale}})$ the complex

$$\Gamma(U_p, \mathcal{I}^0|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \rightarrow \Gamma(U_p, \mathcal{I}^1|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \rightarrow \Gamma(U_p, \mathcal{I}^2|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \rightarrow \dots$$

computes $H^*(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$. On the other hand, by Lemma 51.5.5 it is equal to the complex of S_{p+1} -anti-invariants in

$$\Gamma(W_p, \mathcal{I}^0) \rightarrow \Gamma(W_p, \mathcal{I}^1) \rightarrow \Gamma(W_p, \mathcal{I}^2) \rightarrow \dots$$

which by Lemma 51.5.4 is equal to the complex

$$\text{Hom}(K^p, \mathcal{I}^0) \rightarrow \text{Hom}(K^p, \mathcal{I}^1) \rightarrow \text{Hom}(K^p, \mathcal{I}^2) \rightarrow \dots$$

which computes $\text{Ext}_{Ab(X_{\text{étale}})}^*(K^p, \mathcal{F})$. Putting everything together we win. \square

51.6. Higher vanishing for quasi-coherent sheaves

In this section we show that given a quasi-compact and quasi-separated algebraic space X there exists an integer $n = n(X)$ such that the cohomology of any quasi-coherent sheaf on X vanishes beyond degree n .

Lemma 51.6.1. *With S, W, G, U, χ as in Lemma 51.5.5. If \mathcal{F} is a quasi-coherent \mathcal{O}_U -module, then so is $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$.*

Proof. The \mathcal{O}_U -module structure is clear. To check that $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$ is quasi-coherent it suffices to check étale locally. Hence the lemma follows as $\underline{\mathbf{Z}}(\chi)$ is finite locally free as a $\underline{\mathbf{Z}}$ -module. \square

The following proposition is interesting even if X is a scheme. It is the natural generalization of Cohomology of Schemes, Lemma 29.4.2. Before we state it, observe that given an étale morphism $f : U \rightarrow X$ from an affine scheme towards a quasi-separated algebraic space X the fibres of f are universally bounded, in particular there exists an integer d such that the fibres of $|U| \rightarrow |X|$ all have size at most d ; this is the implication $(\eta) \Rightarrow (\delta)$ of Decent Spaces, Lemma 50.5.1.

Proposition 51.6.2. *Let S be a scheme. Let X be an algebraic space over S . Assume X is quasi-compact and separated. Let U be an affine scheme, and let $f : U \rightarrow X$ be a surjective étale morphism. Let d be an upper bound for the size of the fibres of $|U| \rightarrow |X|$. Then for any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have $H^q(X, \mathcal{F}) = 0$ for $q \geq d$.*

Proof. We will use the spectral sequence of Lemma 51.5.6. The lemma applies since f is separated as U is separated, see Morphisms of Spaces, Lemma 49.4.10. Since X is separated the scheme $U \times_X \dots \times_X U$ is a closed subscheme of $U \times_{\mathrm{Spec}(\mathbf{Z})} \dots \times_{\mathrm{Spec}(\mathbf{Z})} U$ hence is affine. Thus W_p is affine. Hence $U_p = W_p/S_{p+1}$ is an affine scheme by Groupoids, Proposition 38.21.8. The discussion in Section 51.3 shows that cohomology of quasi-coherent sheaves on W_p (as an algebraic space) agrees with the cohomology of the corresponding quasi-coherent sheaf on the underlying affine scheme, hence vanishes in positive degrees by Cohomology of Schemes, Lemma 29.2.2. By Lemma 51.6.1 the sheaves $\mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)$ are quasi-coherent. Hence $H^q(W_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero when $q > 0$. By our definition of the integer d we see that $W_p = \emptyset$ for $p \geq d$. Hence also $H^0(W_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero when $p \geq d$. This proves the proposition. \square

In the following lemma we establish that a quasi-compact and quasi-separated algebraic space has finite cohomological dimension for quasi-coherent modules. We are explicit about the bound only because we will use it later to prove a similar result for higher direct images.

Lemma 51.6.3. *Let S be a scheme. Let X be an algebraic space over S . Assume X is quasi-compact and quasi-separated. Then we can choose*

- (1) *an affine scheme U ,*
- (2) *a surjective étale morphism $f : U \rightarrow X$,*
- (3) *an integer d bounding the degrees of the fibres of $U \rightarrow X$,*
- (4) *for every $p = 0, 1, \dots, d$ a surjective étale morphism $V_p \rightarrow U_p$ from an affine scheme V_p where U_p is as in Lemma 51.5.6, and*
- (5) *an integer d_p bounding the degree of the fibres of $V_p \rightarrow U_p$.*

Moreover, whenever we have (1) – (5), then for any quasi-coherent \mathcal{O}_X -module \mathcal{F} we have $H^q(X, \mathcal{F}) = 0$ for $q \geq \max(d_p + p)$.

Proof. Since X is quasi-compact we can find a surjective étale morphism $U \rightarrow X$ with U affine, see Properties of Spaces, Lemma 48.6.3. By Decent Spaces, Lemma 50.5.1 the fibres of f are universally bounded, hence we can find d . We have $U_p = W_p/S_{p+1}$ and $W_p \subset U \times_X \dots \times_X U$ is open and closed. Since X is quasi-separated the schemes W_p are quasi-compact, hence U_p is quasi-compact. Since U is separated, the schemes W_p are separated, hence U_p is separated by (the absolute version of) Spaces, Lemma 47.14.5. By Properties of Spaces, Lemma 48.6.3 we can find the morphisms $V_p \rightarrow W_p$. By Decent Spaces, Lemma 50.5.1 we can find the integers d_p .

At this point the proof uses the spectral sequence

$$E_1^{p,q} = H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \Rightarrow H^{p+q}(X, \mathcal{F})$$

see Lemma 51.5.6. By definition of the integer d we see that $U_p = \emptyset$ for $p \geq d$. By Proposition 51.6.2 and Lemma 51.6.1 we see that $H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero for $q \geq d_p$ for $p = 0, \dots, d$. Whence the lemma. \square

51.7. Vanishing for higher direct images

We apply the results of Section 51.6 to obtain vanishing of higher direct images of quasi-coherent sheaves for quasi-compact and quasi-separated morphisms. This is useful because it allows one to argue by descending induction on the cohomological degree in certain situations.

Lemma 51.7.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that*

- (1) f is quasi-compact and quasi-separated, and
- (2) Y is quasi-compact.

Then there exists an integer $n(X \rightarrow Y)$ such that for any algebraic space Y' , any morphism $Y' \rightarrow Y$ and any quasi-coherent sheaf \mathcal{F}' on $X' = Y' \times_Y X$ the higher direct images $R^i f'_ \mathcal{F}'$ are zero for $i \geq n(X \rightarrow Y)$.*

Proof. Let $V \rightarrow Y$ be a surjective étale morphism where V is an affine scheme, see Properties of Spaces, Lemma 48.6.3. Suppose we prove the result for the base change $f_V : V \times_Y X \rightarrow V$. Then the result holds for f with $n(X \rightarrow Y) = n(X_V \rightarrow V)$. Namely, if $Y' \rightarrow Y$ and \mathcal{F}' are as in the lemma, then $R^i f'_* \mathcal{F}'|_{V \times_Y Y'}$ is equal to $R^i f'_{V,*} \mathcal{F}'|_{X'_V}$ where $f'_V : X'_V = V \times_Y Y' \times_Y X \rightarrow V \times_Y Y' = Y'_V$, see Properties of Spaces, Lemma 48.24.2. Thus we may assume that Y is an affine scheme.

Moreover, to prove the vanishing for all $Y' \rightarrow Y$ and \mathcal{F}' it suffices to do so when Y' is an affine scheme. In this case, $R^i f'_* \mathcal{F}'$ is quasi-coherent by Lemma 51.3.2. Hence it suffices to prove that $H^i(X', \mathcal{F}') = 0$, because $H^i(X', \mathcal{F}') = H^0(Y', R^i f'_* \mathcal{F}')$ by Cohomology on Sites, Lemma 21.14.6 and the vanishing of higher cohomology of quasi-coherent sheaves on affine algebraic spaces (Proposition 51.6.2).

Choose $U \rightarrow X$, d , $V_p \rightarrow U_p$ and d_p as in Lemma 51.6.3. For any affine scheme Y' and morphism $Y' \rightarrow Y$ denote $X' = Y' \times_Y X$, $U' = Y' \times_Y U$, $V'_p = Y' \times_Y V_p$. Then $U' \rightarrow X'$, $d' = d$, $V'_p \rightarrow U'_p$ and $d'_p = d$ is a collection of choices as in Lemma 51.6.3 for the algebraic space X' (details omitted). Hence we see that $H^i(X', \mathcal{F}') = 0$ for $i \geq \max(p + d_p)$ and we win. \square

Lemma 51.7.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Then $R^i f_* \mathcal{F} = 0$ for $i > 0$ and any quasi-coherent \mathcal{O}_X -module \mathcal{F} .*

Proof. Recall that an affine morphism of algebraic spaces is representable. Hence this follows from (51.3.1.1) and Cohomology of Schemes, Lemma 29.2.3. \square

51.8. Cohomology with support in a closed subspace

This section is the analogue of Cohomology, Section 20.22 and Étale Cohomology, Section 44.73 for abelian sheaves on algebraic spaces.

Let S be a scheme. Let X be an algebraic space over S and let $Z \subset X$ be a closed subspace. Let \mathcal{F} be an abelian sheaf on $X_{\text{étale}}$. We let

$$\Gamma_Z(X, \mathcal{F}) = \{s \in \mathcal{F}(X) \mid \text{Supp}(s) \subset Z\}$$

be the sections with support in Z (Properties of Spaces, Definition 48.17.3). This is a left exact functor which is not exact in general. Hence we obtain a derived functor

$$R\Gamma_Z(X, -) : D(X_{\text{étale}}) \longrightarrow D(\text{Ab})$$

and cohomology groups with support in Z defined by $H_Z^q(X, \mathcal{F}) = R^q\Gamma_Z(X, \mathcal{F})$.

Let \mathcal{I} be an injective abelian sheaf on $X_{\acute{e}tale}$. Let $U \subset X$ be the open subspace which is the complement of Z . Then the restriction map $\mathcal{I}(X) \rightarrow \mathcal{I}(U)$ is surjective (Cohomology on Sites, Lemma 21.12.6) with kernel $\Gamma_Z(X, \mathcal{I})$. It immediately follows that for $K \in D(X_{\acute{e}tale})$ there is a distinguished triangle

$$R\Gamma_Z(X, K) \rightarrow R\Gamma(X, K) \rightarrow R\Gamma(U, K) \rightarrow R\Gamma_Z(X, K)[1]$$

in $D(Ab)$. As a consequence we obtain a long exact cohomology sequence

$$\dots \rightarrow H_Z^i(X, K) \rightarrow H^i(X, K) \rightarrow H^i(U, K) \rightarrow H_Z^{i+1}(X, K) \rightarrow \dots$$

for any K in $D(X_{\acute{e}tale})$.

For an abelian sheaf \mathcal{F} on $X_{\acute{e}tale}$ we can consider the *subsheaf of sections with support in Z* , denoted $\mathcal{H}_Z(\mathcal{F})$, defined by the rule

$$\mathcal{H}_Z(\mathcal{F})(U) = \{s \in \mathcal{F}(U) \mid \text{Supp}(s) \subset U \times_X Z\}$$

Here we use the support of a section from Properties of Spaces, Definition 48.17.3. Using the equivalence of Morphisms of Spaces, Lemma 49.13.5 we may view $\mathcal{H}_Z(\mathcal{F})$ as an abelian sheaf on $Z_{\acute{e}tale}$. Thus we obtain a functor

$$Ab(X_{\acute{e}tale}) \longrightarrow Ab(Z_{\acute{e}tale}), \quad \mathcal{F} \longmapsto \mathcal{H}_Z(\mathcal{F})$$

which is left exact, but in general not exact.

Lemma 51.8.1. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let \mathcal{I} be an injective abelian sheaf on $X_{\acute{e}tale}$. Then $\mathcal{H}_Z(\mathcal{I})$ is an injective abelian sheaf on $Z_{\acute{e}tale}$.*

Proof. Observe that for any abelian sheaf \mathcal{G} on $Z_{\acute{e}tale}$ we have

$$\text{Hom}_Z(\mathcal{G}, \mathcal{H}_Z(\mathcal{F})) = \text{Hom}_X(i_*\mathcal{G}, \mathcal{F})$$

because after all any section of $i_*\mathcal{G}$ has support in Z . Since i_* is exact (Lemma 51.3.1) and as \mathcal{I} is injective on $X_{\acute{e}tale}$ we conclude that $\mathcal{H}_Z(\mathcal{I})$ is injective on $Z_{\acute{e}tale}$. \square

Denote

$$R\mathcal{H}_Z : D(X_{\acute{e}tale}) \longrightarrow D(Z_{\acute{e}tale})$$

the derived functor. We set $\mathcal{H}_Z^q(\mathcal{F}) = R^q\mathcal{H}_Z(\mathcal{F})$ so that $\mathcal{H}_Z^0(\mathcal{F}) = \mathcal{H}_Z(\mathcal{F})$. By the lemma above we have a Grothendieck spectral sequence

$$E_2^{p,q} = H^p(Z, \mathcal{H}_Z^q(\mathcal{F})) \Rightarrow H_Z^{p+q}(X, \mathcal{F})$$

Lemma 51.8.2. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let \mathcal{G} be an injective abelian sheaf on $Z_{\acute{e}tale}$. Then $\mathcal{H}_Z^p(i_*\mathcal{G}) = 0$ for $p > 0$.*

Proof. This is true because the functor i_* is exact (Lemma 51.3.1) and transforms injective abelian sheaves into injective abelian sheaves (Cohomology on Sites, Lemma 21.14.2). \square

Lemma 51.8.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be an étale morphism of algebraic spaces over S . Let $Z \subset Y$ be a closed subspace such that $f^{-1}(Z) \rightarrow Z$ is an isomorphism of algebraic spaces. Let \mathcal{F} be an abelian sheaf on X . Then*

$$\mathcal{H}_Z^q(\mathcal{F}) = \mathcal{H}_{f^{-1}(Z)}^q(f^{-1}\mathcal{F})$$

as abelian sheaves on $Z = f^{-1}(Z)$ and we have $H_Z^q(Y, \mathcal{F}) = H_{f^{-1}(Z)}^q(X, f^{-1}\mathcal{F})$.

Proof. Because f is étale an injective resolution of \mathcal{F} pulls back to an injective resolution of $f^{-1}\mathcal{F}$. Hence it suffices to check the equality for $\mathcal{H}_Z(-)$ which follows from the definitions. The proof for cohomology with supports is the same. Some details omitted. \square

Let S be a scheme and let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset. We denote $D_T(X_{\text{étale}})$ the strictly full saturated triangulated subcategory of $D(X_{\text{étale}})$ consisting of objects whose cohomology sheaves are supported on T .

Lemma 51.8.4. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . The map $Ri_* = i_* : D(Z_{\text{étale}}) \rightarrow D(X_{\text{étale}})$ induces an equivalence $D(Z_{\text{étale}}) \rightarrow D_{|Z|}(X_{\text{étale}})$ with quasi-inverse*

$$i^{-1}|_{D_Z(X_{\text{étale}})} = R\mathcal{H}_Z|_{D_{|Z|}(X_{\text{étale}})}$$

Proof. Recall that i^{-1} and i_* is an adjoint pair of exact functors such that $i^{-1}i_*$ is isomorphic to the identify functor on abelian sheaves. See Properties of Spaces, Lemma 48.16.9 and Morphisms of Spaces, Lemma 49.13.5. Thus $i_* : D(Z_{\text{étale}}) \rightarrow D_Z(X_{\text{étale}})$ is fully faithful and i^{-1} determines a left inverse. On the other hand, suppose that K is an object of $D_Z(X_{\text{étale}})$ and consider the adjunction map $K \rightarrow i_*i^{-1}K$. Using exactness of i_* and i^{-1} this induces the adjunction maps $H^n(K) \rightarrow i_*i^{-1}H^n(K)$ on cohomology sheaves. Since these cohomology sheaves are supported on Z we see these adjunction maps are isomorphisms and we conclude that $D(Z_{\text{étale}}) \rightarrow D_Z(X_{\text{étale}})$ is an equivalence.

To finish the proof we have to show that $R\mathcal{H}_Z(K) = i^{-1}K$ if K is an object of $D_Z(X_{\text{étale}})$. To do this we can use that $K = i_*i^{-1}K$ as we've just proved this is the case. Then we can choose a K-injective representative \mathcal{I}^\bullet for $i^{-1}K$. Since i_* is the right adjoint to the exact functor i^{-1} , the complex $i_*\mathcal{I}^\bullet$ is K-injective (Derived Categories, Lemma 13.29.10). We see that $R\mathcal{H}_Z(K)$ is computed by $\mathcal{H}_Z(i_*\mathcal{I}^\bullet) = \mathcal{I}^\bullet$ as desired. \square

51.9. Vanishing above the dimension

Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . In this case $|X|$ is a spectral space, see Properties of Spaces, Lemma 48.12.5. Moreover, the dimension of X (as defined in Properties of Spaces, Definition 48.8.2) is equal to the Krull dimension of $|X|$, see Decent Spaces, Lemma 50.10.7. We will show that for quasi-coherent sheaves on X we have vanishing of cohomology above the dimension. This result is already interesting for quasi-separated algebraic spaces of finite type over a field.

Lemma 51.9.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Assume $\dim(X) \leq d$ for some integer d . Let \mathcal{F} be a quasi-coherent sheaf \mathcal{F} on X .*

- (1) $H^q(X, \mathcal{F}) = 0$ for $q > d$,
- (2) $H^d(X, \mathcal{F}) \rightarrow H^d(U, \mathcal{F})$ is surjective for any quasi-compact open $U \subset X$,
- (3) $H_Z^q(X, \mathcal{F}) = 0$ for $q > d$ for any closed subspace $Z \subset X$ whose complement is quasi-compact.

Proof. By Properties of Spaces, Lemma 48.20.3 every algebraic space Y étale over X has dimension $\leq d$. If Y is quasi-separated, the dimension of Y is equal to the Krull dimension of $|Y|$ by Decent Spaces, Lemma 50.10.7. Also, if Y is a scheme, then étale cohomology of \mathcal{F} over Y , resp. étale cohomology of \mathcal{F} with support in a closed subscheme, agrees with usual cohomology of \mathcal{F} , resp. usual cohomology with support in the closed subscheme. See Descent, Proposition 34.7.10 and Étale Cohomology, Lemma 44.73.5. We will use these facts without further mention.

By Decent Spaces, Lemma 50.8.5 there exist an integer n and open subspaces

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

with the following property: setting $T_p = U_p \setminus U_{p+1}$ (with reduced induced subspace structure) there exists a quasi-compact separated scheme V_p and a surjective étale morphism $f_p : V_p \rightarrow U_p$ such that $f_p^{-1}(T_p) \rightarrow T_p$ is an isomorphism.

As $U_n = V_n$ is a scheme, our initial remarks imply the cohomology of \mathcal{F} over U_n vanishes in degrees $> d$ by Cohomology, Proposition 20.23.4. Suppose we have shown, by induction, that $H^q(U_{p+1}, \mathcal{F}|_{U_{p+1}}) = 0$ for $q > d$. It suffices to show $H_{T_p}^q(U_p, \mathcal{F})$ for $q > d$ is zero in order to conclude the vanishing of cohomology of \mathcal{F} over U_p in degrees $> d$. However, we have

$$H_{T_p}^q(U_p, \mathcal{F}) = H_{f_p^{-1}(T_p)}^q(V_p, \mathcal{F})$$

by Lemma 51.8.3 and as V_p is a scheme we obtain the desired vanishing from Cohomology, Proposition 20.23.4. In this way we conclude that (1) is true.

To prove (2) let $U \subset X$ be a quasi-compact open subspace. Consider the open subspace $U' = U \cup U_n$. Let $Z = U' \setminus U$. Then $g : U_n \rightarrow U'$ is an étale morphism such that $g^{-1}(Z) \rightarrow Z$ is an isomorphism. Hence by Lemma 51.8.3 we have $H_Z^q(U', \mathcal{F}) = H_Z^q(U_n, \mathcal{F})$ which vanishes in degree $> d$ because U_n is a scheme and we can apply Cohomology, Proposition 20.23.4. We conclude that $H^d(U', \mathcal{F}) \rightarrow H^d(U, \mathcal{F})$ is surjective. Assume, by induction, that we have reduced our problem to the case where U contains U_{p+1} . Then we set $U' = U \cup U_p$, set $Z = U' \setminus U$, and we argue using the morphism $f_p : V_p \rightarrow U'$ which is étale and has the property that $f_p^{-1}(Z) \rightarrow Z$ is an isomorphism. In other words, we again see that

$$H_Z^q(U', \mathcal{F}) = H_{f_p^{-1}(Z)}^q(V_p, \mathcal{F})$$

and we again see this vanishes in degrees $> d$. We conclude that $H^d(U', \mathcal{F}) \rightarrow H^d(U, \mathcal{F})$ is surjective. Eventually we reach the stage where $U_1 = X \subset U$ which finishes the proof.

A formal argument shows that (2) implies (3). □

51.10. Cohomology and base change, I

Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X . Suppose further that $g : Y' \rightarrow Y$ is a morphism of algebraic spaces over S . Denote $X' = X_{Y'} = Y' \times_Y X$ the base change of X and denote $f' : X' \rightarrow Y'$ the base change of f . Also write $g' : X' \rightarrow X$ the projection,

and set $\mathcal{F}' = (g')^*\mathcal{F}$. Here is a diagram representing the situation:

$$(51.10.0.1) \quad \begin{array}{ccccc} \mathcal{F}' = (g')^*\mathcal{F} & & X' \xrightarrow{g'} X & & \mathcal{F} \\ & & \downarrow f' & & \downarrow f \\ Rf'_*\mathcal{F}' & & Y' \xrightarrow{g} Y & & Rf_*\mathcal{F} \end{array}$$

Here is the basic result for a flat base change.

Lemma 51.10.1. *In the situation above, assume that g is flat and that f is quasi-compact and quasi-separated. Then we have*

$$R^p f'_*\mathcal{F}' = g^* R^p f_*\mathcal{F}$$

for all $p \geq 0$ with notation as in (51.10.0.1).

Proof. The morphism g' is flat by Morphisms of Spaces, Lemma 49.28.4. Note that flatness of g and g' is equivalent to flatness of the morphisms of small étale ringed sites, see Morphisms of Spaces, Lemma 49.28.9. Hence we can apply Cohomology on Sites, Lemma 21.15.1 to obtain a base change map

$$g^* R^p f_*\mathcal{F} \longrightarrow R^p f'_*\mathcal{F}'$$

To prove this map is an isomorphism we can work locally in the étale topology on Y' . Thus we may assume that Y and Y' are affine schemes. Say $Y = \text{Spec}(A)$ and $Y' = \text{Spec}(B)$. In this case we are really trying to show that the map

$$H^p(X, \mathcal{F}) \otimes_A B \longrightarrow H^p(X_B, \mathcal{F}_B)$$

is an isomorphism where $X_B = \text{Spec}(B) \times_{\text{Spec}(A)} X$ and \mathcal{F}_B is the pullback of \mathcal{F} to X_B .

Fix $A \rightarrow B$ a flat ring map and let X be a quasi-compact and quasi-separated algebraic space over A . Note that $g' : X_B \rightarrow X$ is affine as a base change of $\text{Spec}(B) \rightarrow \text{Spec}(A)$. Hence the higher direct images $R^i(g')_*\mathcal{F}_B$ are zero by Lemma 51.7.2. Thus $H^p(X_B, \mathcal{F}_B) = H^p(X, g'_*\mathcal{F}_B)$, see Cohomology on Sites, Lemma 21.14.6. Moreover, we have

$$g'_*\mathcal{F}_B = \mathcal{F} \otimes_{\underline{A}} \underline{B}$$

where $\underline{A}, \underline{B}$ denotes the constant sheaf of rings with value A, B . Namely, it is clear that there is a map from right to left. For any affine scheme U étale over X we have

$$\begin{aligned} g'_*\mathcal{F}_B(U) &= \mathcal{F}_B(\text{Spec}(B) \times_{\text{Spec}(A)} U) \\ &= \Gamma(\text{Spec}(B) \times_{\text{Spec}(A)} U, (\text{Spec}(B) \times_{\text{Spec}(A)} U \rightarrow U)^*\mathcal{F}|_U) \\ &= B \otimes_A \mathcal{F}(U) \end{aligned}$$

hence the map is an isomorphism. Write $B = \text{colim } M_i$ as a filtered colimit of finite free A -modules M_i using Lazard's theorem, see Algebra, Theorem 10.78.4.

We deduce that

$$\begin{aligned}
 H^p(X, g'_* \mathcal{F}_B) &= H^p(X, \mathcal{F} \otimes_{\underline{A}} B) \\
 &= H^p(X, \operatorname{colim}_i \mathcal{F} \otimes_{\underline{A}} \underline{M}_i) \\
 &= \operatorname{colim}_i H^p(X, \mathcal{F} \otimes_{\underline{A}} \underline{M}_i) \\
 &= \operatorname{colim}_i H^p(X, \mathcal{F}) \otimes_A M_i \\
 &= H^p(X, \mathcal{F}) \otimes_A \operatorname{colim}_i M_i \\
 &= H^p(X, \mathcal{F}) \otimes_A B
 \end{aligned}$$

The first equality because $g'_* \mathcal{F}_B = \mathcal{F} \otimes_{\underline{A}} B$ as seen above. The second because \otimes commutes with colimits. The third equality because cohomology on X commutes with colimits (see Lemma 51.4.1). The fourth equality because M_i is finite free (i.e., because cohomology commutes with finite direct sums). The fifth because \otimes commutes with colimits. The sixth by choice of our system. \square

Lemma 51.10.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. In this case $f_* \mathcal{F} \cong Rf_* \mathcal{F}$ is a quasi-coherent sheaf, and for every diagram (51.10.0.1) we have $g^* f_* \mathcal{F} = f'_*(g')^* \mathcal{F}$.*

Proof. By the discussion surrounding (51.3.1.1) this reduces to the case of an affine morphism of schemes which is treated in Cohomology of Schemes, Lemma 29.5.1. \square

51.11. Coherent modules on locally Noetherian algebraic spaces

This section is the analogue of Cohomology of Schemes, Section 29.9. In Modules on Sites, Definition 18.23.1 we have defined coherent modules on any ringed topos. We use this notion to define coherent modules on locally Noetherian algebraic spaces. Although it is possible to work with coherent modules more generally we resist the urge to do so.

Definition 51.11.1. Let S be a scheme. Let X be a locally Noetherian algebraic space over S . A quasi-coherent module \mathcal{F} on X is called *coherent* if \mathcal{F} is a coherent \mathcal{O}_X -module on the site $X_{\acute{e}tale}$ in the sense of Modules on Sites, Definition 18.23.1.

Of course this definition is a bit hard to work with. We usually use the characterization given in the lemma below.

Lemma 51.11.2. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let \mathcal{F} be an \mathcal{O}_X -module. The following are equivalent*

- (1) \mathcal{F} is coherent,
- (2) \mathcal{F} is a quasi-coherent, finite type \mathcal{O}_X -module,
- (3) \mathcal{F} is a finitely presented \mathcal{O}_X -module,
- (4) for any étale morphism $\varphi : U \rightarrow X$ where U is a scheme the pullback $\varphi^* \mathcal{F}$ is a coherent module on U , and
- (5) there exists a surjective étale morphism $\varphi : U \rightarrow X$ where U is a scheme such that the pullback $\varphi^* \mathcal{F}$ is a coherent module on U .

In particular \mathcal{O}_X is coherent, any invertible \mathcal{O}_X -module is coherent, and more generally any finite locally free \mathcal{O}_X -module is coherent.

Proof. To be sure, if X is a locally Noetherian algebraic space and $U \rightarrow X$ is an étale morphism, then U is locally Noetherian, see Properties of Spaces, Section 48.7. The lemma then follows from the points (1) – (5) made in Properties of Spaces, Section 48.28 and the corresponding result for coherent modules on locally Noetherian schemes, see Cohomology of Schemes, Lemma 29.9.1. \square

Lemma 51.11.3. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . The category of coherent \mathcal{O}_X -modules is abelian. More precisely, the kernel and cokernel of a map of coherent \mathcal{O}_X -modules are coherent. Any extension of coherent sheaves is coherent.*

Proof. Choose a scheme U and a surjective étale morphism $f : U \rightarrow X$. Pullback f^* is an exact functor as it equals a restriction functor, see Properties of Spaces, Equation (48.24.1.1). By Lemma 51.11.2 we can check whether an \mathcal{O}_X -module \mathcal{F} is coherent by checking whether $f^*\mathcal{F}$ is coherent. Hence the lemma follows from the case of schemes which is Cohomology of Schemes, Lemma 29.9.2. \square

Coherent modules form a Serre subcategory of the category of quasi-coherent \mathcal{O}_X -modules. This does not hold for modules on a general ringed topos.

Lemma 51.11.4. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let \mathcal{F} be a coherent \mathcal{O}_X -module. Any quasi-coherent submodule of \mathcal{F} is coherent. Any quasi-coherent quotient module of \mathcal{F} is coherent.*

Proof. Choose a scheme U and a surjective étale morphism $f : U \rightarrow X$. Pullback f^* is an exact functor as it equals a restriction functor, see Properties of Spaces, Equation (48.24.1.1). By Lemma 51.11.2 we can check whether an \mathcal{O}_X -module \mathcal{G} is coherent by checking whether $f^*\mathcal{G}$ is coherent. Hence the lemma follows from the case of schemes which is Cohomology of Schemes, Lemma 29.9.3. \square

Lemma 51.11.5. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. The \mathcal{O}_X -modules $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ and $\text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ are coherent.*

Proof. Via Lemma 51.11.2 this follows from the result for schemes, see Cohomology of Schemes, Lemma 29.9.4. \square

Lemma 51.11.6. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Let $\varphi : \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of \mathcal{O}_X -modules. Let \bar{x} be a geometric point of X lying over $x \in |X|$.*

- (1) *If $\mathcal{F}_{\bar{x}} = 0$ then there exists an open neighbourhood $X' \subset X$ of x such that $\mathcal{F}|_{X'} = 0$.*
- (2) *If $\varphi_{\bar{x}} : \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is injective, then there exists an open neighbourhood $X' \subset X$ of x such that $\varphi|_{X'}$ is injective.*
- (3) *If $\varphi_{\bar{x}} : \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is surjective, then there exists an open neighbourhood $X' \subset X$ of x such that $\varphi|_{X'}$ is surjective.*
- (4) *If $\varphi_{\bar{x}} : \mathcal{G}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}}$ is bijective, then there exists an open neighbourhood $X' \subset X$ of x such that $\varphi|_{X'}$ is an isomorphism.*

Proof. Let $\varphi : U \rightarrow X$ be an étale morphism where U is a scheme and let $u \in U$ be a point mapping to x . By Properties of Spaces, Lemmas 48.27.4 and 48.19.1 as well as More on Algebra, Lemma 15.34.1 we see that $\varphi_{\bar{x}}$ is injective, surjective, or bijective if and only if $\varphi_u : \varphi^*\mathcal{F}_u \rightarrow \varphi^*\mathcal{G}_u$ has the corresponding property. Thus we

can apply the schemes version of this lemma to see that (after possibly shrinking U) the map $\varphi^*\mathcal{F} \rightarrow \varphi^*\mathcal{G}$ is injective, surjective, or an isomorphism. Let $X' \subset X$ be the open subspace corresponding to $|\varphi|(|U|) \subset |X|$, see Properties of Spaces, Lemma 48.4.8. Since $\{U \rightarrow X'\}$ is a covering for the étale topology, we conclude that $\varphi|_{X'}$ is injective, surjective, or an isomorphism as desired. Finally, observe that (1) follows from (2) by looking at the map $\mathcal{F} \rightarrow 0$. \square

Lemma 51.11.7. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S . Let \mathcal{F} be a coherent \mathcal{O}_X -module. Let $i : Z \rightarrow X$ be the scheme theoretic support of \mathcal{F} and \mathcal{G} the quasi-coherent \mathcal{O}_Z -module such that $i_*\mathcal{G} = \mathcal{F}$, see Morphisms of Spaces, Definition 49.15.4. Then \mathcal{G} is a coherent \mathcal{O}_Z -module.*

Proof. The statement of the lemma makes sense as a coherent module is in particular of finite type. Moreover, as $Z \rightarrow X$ is a closed immersion it is locally of finite type and hence Z is locally Noetherian, see Morphisms of Spaces, Lemmas 49.23.7 and 49.23.5. Finally, as \mathcal{G} is of finite type it is a coherent \mathcal{O}_Z -module by Lemma 51.11.2 \square

Lemma 51.11.8. *Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of locally Noetherian algebraic spaces over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z . The functor i_* induces an equivalence between the category of coherent \mathcal{O}_X -modules annihilated by \mathcal{I} and the category of coherent \mathcal{O}_Z -modules.*

Proof. The functor is fully faithful by Morphisms of Spaces, Lemma 49.14.1. Let \mathcal{F} be a coherent \mathcal{O}_X -module annihilated by \mathcal{I} . By Morphisms of Spaces, Lemma 49.14.1 we can write $\mathcal{F} = i_*\mathcal{G}$ for some quasi-coherent sheaf \mathcal{G} on Z . To check that \mathcal{G} is coherent we can work étale locally (Lemma 51.11.2). Choosing an étale covering by a scheme we conclude that \mathcal{G} is coherent by the case of schemes (Cohomology of Schemes, Lemma 29.9.8). Hence the functor is fully faithful and the proof is done. \square

Lemma 51.11.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a finite morphism of algebraic spaces over S with Y locally Noetherian. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Assume f is finite and Y locally Noetherian. Then $R^p f_*\mathcal{F} = 0$ for $p > 0$ and $f_*\mathcal{F}$ is coherent.*

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Then $V \times_Y X \rightarrow V$ is a finite morphism of locally Noetherian schemes. By (51.3.1.1) we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.9.9. \square

51.12. Coherent sheaves on Noetherian spaces

In this section we mention some properties of coherent sheaves on Noetherian algebraic spaces.

Lemma 51.12.1. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent \mathcal{O}_X -module. The ascending chain condition holds for quasi-coherent submodules of \mathcal{F} . In other words, given any sequence*

$$\mathcal{F}_1 \subset \mathcal{F}_2 \subset \dots \subset \mathcal{F}$$

of quasi-coherent submodules, then $\mathcal{F}_n = \mathcal{F}_{n+1} = \dots$ for some $n \geq 0$.

Proof. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 48.6.3). Then U is a Noetherian scheme (by Morphisms of Spaces, Lemma 49.23.5). If $\mathcal{F}_n|_U = \mathcal{F}_{n+1}|_U = \dots$ then $\mathcal{F}_n = \mathcal{F}_{n+1} = \dots$. Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.1. \square

Lemma 51.12.2. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent sheaf on X . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals corresponding to a closed subspace $Z \subset X$. Then there is some $n \geq 0$ such that $\mathcal{I}^n \mathcal{F} = 0$ if and only if $\text{Supp}(\mathcal{F}) \subset Z$ (set theoretically).*

Proof. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 48.6.3). Then U is a Noetherian scheme (by Morphisms of Spaces, Lemma 49.23.5). Note that $\mathcal{I}^n \mathcal{F}|_U = 0$ if and only if $\mathcal{I}^n \mathcal{F} = 0$ and similarly for the condition on the support. Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.2. \square

Lemma 51.12.3 (Artin-Rees). *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent sheaf on X . Let $\mathcal{G} \subset \mathcal{F}$ be a quasi-coherent subsheaf. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Then there exists a $c \geq 0$ such that for all $n \geq c$ we have*

$$\mathcal{I}^{n-c}(\mathcal{I}^c \mathcal{F} \cap \mathcal{G}) = \mathcal{I}^n \mathcal{F}$$

Proof. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$ (see Properties of Spaces, Lemma 48.6.3). Then U is a Noetherian scheme (by Morphisms of Spaces, Lemma 49.23.5). The equality of the lemma holds if and only if it holds after restricting to U . Hence the result follows from the case of schemes, see Cohomology of Schemes, Lemma 29.10.3. \square

Lemma 51.12.4. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let \mathcal{G} be a coherent \mathcal{O}_X -module. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Denote $Z \subset X$ the corresponding closed subspace and set $U = X \setminus Z$. There is a canonical isomorphism*

$$\text{colim}_n \text{Hom}_{\mathcal{O}_X}(\mathcal{I}^n \mathcal{G}, \mathcal{F}) \longrightarrow \text{Hom}_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U).$$

In particular we have an isomorphism

$$\text{colim}_n \text{Hom}_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \longrightarrow \Gamma(U, \mathcal{F}).$$

Proof. Let W be an affine scheme and let $W \rightarrow X$ be a surjective étale morphism (see Properties of Spaces, Lemma 48.6.3). Set $R = W \times_X W$. Then W and R are Noetherian schemes, see Morphisms of Spaces, Lemma 49.23.5. Hence the result hold for the restrictions of \mathcal{F} , \mathcal{G} , and \mathcal{I} , U , Z to W and R by Cohomology of Schemes, Lemma 29.10.4. It follows formally that the result holds over X . \square

51.13. Devissage of coherent sheaves

This section is the analogue of Cohomology of Schemes, Section 29.12.

Lemma 51.13.1. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent sheaf on X . Suppose that $\text{Supp}(\mathcal{F}) = Z \cup Z'$ with Z , Z' closed. Then there exists a short exact sequence of coherent sheaves*

$$0 \rightarrow \mathcal{G}' \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow 0$$

with $\text{Supp}(\mathcal{G}') \subset Z'$ and $\text{Supp}(\mathcal{G}) \subset Z$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals defining the reduced induced closed subspace structure on Z , see Properties of Spaces, Lemma 48.9.3. Consider the subsheaves $\mathcal{G}'_n = \mathcal{I}^n \mathcal{F}$ and the quotients $\mathcal{G}_n = \mathcal{F}/\mathcal{I}^n \mathcal{F}$. For each n we have a short exact sequence

$$0 \rightarrow \mathcal{G}'_n \rightarrow \mathcal{F} \rightarrow \mathcal{G}_n \rightarrow 0$$

For every geometric point \bar{x} of $Z' \setminus Z$ we have $\mathcal{I}_{\bar{x}} = \mathcal{O}_{X, \bar{x}}$ and hence $\mathcal{G}_{n, \bar{x}} = 0$. Thus we see that $\text{Supp}(\mathcal{G}_n) \subset Z$. Note that $X \setminus Z'$ is a Noetherian algebraic space. Hence by Lemma 51.12.2 there exists an n such that $\mathcal{G}'_n|_{X \setminus Z'} = \mathcal{I}^n \mathcal{F}|_{X \setminus Z'} = 0$. For such an n we see that $\text{Supp}(\mathcal{G}'_n) \subset Z'$. Thus setting $\mathcal{G}' = \mathcal{G}'_n$ and $\mathcal{G} = \mathcal{G}_n$ works. \square

In the following we will freely use the scheme theoretic support of finite type modules as defined in Morphisms of Spaces, Definition 49.15.4.

Lemma 51.13.2. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent sheaf on X . Assume that the scheme theoretic support of \mathcal{F} is a reduced $Z \subset X$ with $|Z|$ irreducible. Then there exist an integer $r > 0$, a nonzero sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$, and an injective map of coherent sheaves*

$$i_* (\mathcal{I}^{\oplus r}) \rightarrow \mathcal{F}$$

whose cokernel is supported on a proper closed subspace of Z .

Proof. By assumption there exists a coherent \mathcal{O}_Z -module \mathcal{G} with support Z and $\mathcal{F} \cong i_* \mathcal{G}$, see Lemma 51.11.7. Hence it suffices to prove the lemma for the case $Z = X$ and $i = \text{id}$.

By Properties of Spaces, Proposition 48.10.3 there exists a dense open subspace $U \subset X$ which is a scheme. Note that U is a Noetherian integral scheme. After shrinking U we may assume that $\mathcal{F}|_U \cong \mathcal{O}_U^{\oplus r}$ (for example by Cohomology of Schemes, Lemma 29.12.2 or by a direct algebra argument). Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals whose associated closed subspace is the complement of U in X (see for example Properties of Spaces, Section 48.9). By Lemma 51.12.4 there exists an $n \geq 0$ and a morphism $\mathcal{I}^n (\mathcal{O}_X^{\oplus r}) \rightarrow \mathcal{F}$ which recovers our isomorphism over U . Since $\mathcal{I}^n (\mathcal{O}_X^{\oplus r}) = (\mathcal{I}^n)^{\oplus r}$ we get a map as in the lemma. It is injective: namely, if σ is a nonzero section of $\mathcal{I}^{\oplus r}$ over a scheme W étale over X , then because X hence W is reduced the support of σ contains a nonempty open of W . But the kernel of $(\mathcal{I}^n)^{\oplus r} \rightarrow \mathcal{F}$ is zero over a dense open, hence σ cannot be a section of the kernel. \square

Lemma 51.13.3. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{F} be a coherent sheaf on X . There exists a filtration*

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that for each $j = 1, \dots, m$ there exists a reduced closed subspace $Z_j \subset X$ with $|Z_j|$ irreducible and a sheaf of ideals $\mathcal{I}_j \subset \mathcal{O}_{Z_j}$ such that

$$\mathcal{F}_j/\mathcal{F}_{j-1} \cong (Z_j \rightarrow X)_* \mathcal{I}_j$$

Proof. Consider the collection

$$\mathcal{T} = \left\{ T \subset |X| \text{ closed such that there exists a coherent sheaf } \mathcal{F} \right. \\ \left. \text{with } \text{Supp}(\mathcal{F}) = T \text{ for which the lemma is wrong} \right\}$$

We are trying to show that \mathcal{T} is empty. If not, then because $|X|$ is Noetherian (Properties of Spaces, Lemma 48.22.2) we can choose a minimal element $T \in \mathcal{T}$. This means that there exists a coherent sheaf \mathcal{F} on X whose support is T and for which the lemma does not hold. Clearly $T \neq \emptyset$ since the only sheaf whose support is empty is the zero sheaf for which the lemma does hold (with $m = 0$).

If T is not irreducible, then we can write $T = Z_1 \cup Z_2$ with Z_1, Z_2 closed and strictly smaller than T . Then we can apply Lemma 51.13.1 to get a short exact sequence of coherent sheaves

$$0 \rightarrow \mathcal{G}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{G}_2 \rightarrow 0$$

with $\text{Supp}(\mathcal{G}_i) \subset Z_i$. By minimality of T each of \mathcal{G}_i has a filtration as in the statement of the lemma. By considering the induced filtration on \mathcal{F} we arrive at a contradiction. Hence we conclude that T is irreducible.

Suppose T is irreducible. Let \mathcal{J} be the sheaf of ideals defining the reduced induced closed subspace structure on T , see Properties of Spaces, Lemma 48.9.3. By Lemma 51.12.2 we see there exists an $n \geq 0$ such that $\mathcal{J}^n \mathcal{F} = 0$. Hence we obtain a filtration

$$0 = \mathcal{I}^n \mathcal{F} \subset \mathcal{I}^{n-1} \mathcal{F} \subset \dots \subset \mathcal{I} \mathcal{F} \subset \mathcal{F}$$

each of whose successive subquotients is annihilated by \mathcal{J} . Hence if each of these subquotients has a filtration as in the statement of the lemma then also \mathcal{F} does. In other words we may assume that \mathcal{J} does annihilate \mathcal{F} .

Assume T is irreducible and $\mathcal{J} \mathcal{F} = 0$ where \mathcal{J} is as above. Then the scheme theoretic support of \mathcal{F} is T , see Morphisms of Spaces, Lemma 49.14.1. Hence we can apply Lemma 51.13.2. This gives a short exact sequence

$$0 \rightarrow i_*(\mathcal{I}^{\oplus r}) \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0$$

where the support of \mathcal{Q} is a proper closed subset of T . Hence we see that \mathcal{Q} has a filtration of the desired type by minimality of T . But then clearly \mathcal{F} does too, which is our final contradiction. \square

Lemma 51.13.4. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{P} be a property of coherent sheaves on X . Assume*

- (1) *For any short exact sequence of coherent sheaves*

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$$

if \mathcal{F}_i , $i = 1, 2$ have property \mathcal{P} then so does \mathcal{F} .

- (2) *For every reduced closed subspace $Z \subset X$ with $|Z|$ irreducible and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have \mathcal{P} for $i_* \mathcal{I}$.*

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. First note that if \mathcal{F} is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property \mathcal{P} , then so does \mathcal{F} . This follows from the property (1) for \mathcal{P} . On the other hand, by Lemma 51.13.3 we can filter any \mathcal{F} with successive subquotients as in (2). Hence the lemma follows. \square

Here is a more useful variant of the lemma above.

Lemma 51.13.5. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{P} be a property of coherent sheaves on X . Assume*

- (1) For any short exact sequence of coherent sheaves

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$$

if \mathcal{F}_i , $i = 1, 2$ have property \mathcal{P} then so does \mathcal{F} .

- (2) If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.
 (3) For every reduced closed subspace $i : Z \rightarrow X$ with $|Z|$ irreducible there exists a coherent sheaf \mathcal{G} on Z such that
- $\text{Supp}(\mathcal{G}) = Z$,
 - for every nonzero quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{I}\mathcal{G}$ such that $\text{Supp}(\mathcal{G}/\mathcal{G}')$ is proper closed in Z and such that \mathcal{P} holds for $i_*\mathcal{G}'$.

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. Consider the collection

$$\mathcal{T} = \left\{ T \subset |X| \text{ closed such that there exists a coherent sheaf } \mathcal{F} \right. \\ \left. \text{with } \text{Supp}(\mathcal{F}) = T \text{ for which the lemma is wrong} \right\}$$

We are trying to show that \mathcal{T} is empty. If not, then because $|X|$ is Noetherian (Properties of Spaces, Lemma 48.22.2) we can choose a minimal element $T \in \mathcal{T}$. This means that there exists a coherent sheaf \mathcal{F} on X whose support is T and for which the lemma does not hold. Clearly $T \neq \emptyset$ because the only sheaf with support in \emptyset for which \mathcal{P} does hold (by property (2)).

If T is not irreducible, then we can write $T = Z_1 \cup Z_2$ with Z_1, Z_2 closed and strictly smaller than T . Then we can apply Lemma 51.13.1 to get a short exact sequence of coherent sheaves

$$0 \rightarrow \mathcal{G}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{G}_2 \rightarrow 0$$

with $\text{Supp}(\mathcal{G}_i) \subset Z_i$. By minimality of T each of \mathcal{G}_i has \mathcal{P} . Hence \mathcal{F} has property \mathcal{P} by (1), a contradiction.

Suppose T is irreducible. Let \mathcal{J} be the sheaf of ideals defining the reduced induced closed subspace structure on T , see Properties of Spaces, Lemma 48.9.3. By Lemma 51.12.2 we see there exists an $n \geq 0$ such that $\mathcal{J}^n \mathcal{F} = 0$. Hence we obtain a filtration

$$0 = \mathcal{I}^n \mathcal{F} \subset \mathcal{I}^{n-1} \mathcal{F} \subset \dots \subset \mathcal{I} \mathcal{F} \subset \mathcal{F}$$

each of whose successive subquotients is annihilated by \mathcal{J} . Hence if each of these subquotients has a filtration as in the statement of the lemma then also \mathcal{F} does. In other words we may assume that \mathcal{J} does annihilate \mathcal{F} .

Assume T is irreducible and $\mathcal{J}\mathcal{F} = 0$ where \mathcal{J} is as above. Denote $i : Z \rightarrow X$ the closed subspace corresponding to \mathcal{J} . Then $\mathcal{F} = i_*\mathcal{H}$ for some coherent \mathcal{O}_Z -module \mathcal{H} , see Morphisms of Spaces, Lemma 49.14.1 and Lemma 51.11.7. Let \mathcal{G} be the coherent sheaf on Z satisfying (3)(a) and (3)(b). We apply Lemma 51.13.2 to get injective maps

$$\mathcal{I}_1^{\oplus r_1} \rightarrow \mathcal{H} \quad \text{and} \quad \mathcal{I}_2^{\oplus r_2} \rightarrow \mathcal{G}$$

where the support of the cokernels are proper closed in Z . Hence we find a nonempty open $V \subset Z$ such that

$$\mathcal{H}_V^{\oplus r_2} \cong \mathcal{G}_V^{\oplus r_1}$$

Let $\mathcal{I} \subset \mathcal{O}_Z$ be a quasi-coherent ideal sheaf cutting out $Z \setminus V$ we obtain (Lemma 51.12.4) a map

$$\mathcal{I}^n \mathcal{G}^{\oplus r_1} \rightarrow \mathcal{H}^{\oplus r_2}$$

which is an isomorphism over V . The kernel is supported on $Z \setminus V$ hence annihilated by some power of \mathcal{I} , see Lemma 51.12.2. Thus after increasing n we may assume the displayed map is injective, see Lemma 51.12.3. Applying (3)(b) we find $\mathcal{G}' \subset \mathcal{I}^n \mathcal{G}$ such that

$$(i_* \mathcal{G}')^{\oplus r_1} \longrightarrow i_* \mathcal{H}^{\oplus r_2} = \mathcal{F}^{\oplus r_2}$$

is injective with cokernel supported in a proper closed subset of Z and such that property \mathcal{P} holds for $i_* \mathcal{G}'$. By (1) property \mathcal{P} holds for $(i_* \mathcal{G}')^{\oplus r_1}$. By (1) and minimality of $T = |Z|$ property \mathcal{P} holds for $\mathcal{F}^{\oplus r_2}$. And finally by (2) property \mathcal{P} holds for \mathcal{F} which is the desired contradiction. \square

Lemma 51.13.6. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let \mathcal{P} be a property of coherent sheaves on X . Assume*

- (1) *For any short exact sequence of coherent sheaves on X if two out of three have property \mathcal{P} so does the third.*
- (2) *If \mathcal{P} holds for a direct sum of coherent sheaves then it holds for both.*
- (3) *For every reduced closed subspace $i : Z \rightarrow X$ with $|Z|$ irreducible there exists a coherent sheaf \mathcal{G} on X whose scheme theoretic support is Z such that \mathcal{P} holds for \mathcal{G} .*

Then property \mathcal{P} holds for every coherent sheaf on X .

Proof. We will show that conditions (1) and (2) of Lemma 51.13.4 hold. This is clear for condition (1). To show that (2) holds, let

$$\mathcal{T} = \left\{ \begin{array}{l} i : Z \rightarrow X \text{ reduced closed subspace with } |Z| \text{ irreducible such} \\ \text{that } i_* \mathcal{I} \text{ does not have } \mathcal{P} \text{ for some quasi-coherent } \mathcal{I} \subset \mathcal{O}_Z \end{array} \right\}$$

If \mathcal{T} is nonempty, then since X is Noetherian, we can find an $i : Z \rightarrow X$ which is minimal in \mathcal{T} . We will show that this leads to a contradiction.

Let \mathcal{G} be the sheaf whose scheme theoretic support is Z whose existence is assumed in assumption (3). Let $\varphi : i_* \mathcal{I}^{\oplus r} \rightarrow \mathcal{G}$ be as in Lemma 51.13.2. Let

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \dots \subset \mathcal{F}_m = \text{Coker}(\varphi)$$

be a filtration as in Lemma 51.13.3. By minimality of Z and assumption (1) we see that $\text{Coker}(\varphi)$ has property \mathcal{P} . As φ is injective we conclude using assumption (1) once more that $i_* \mathcal{I}^{\oplus r}$ has property \mathcal{P} . Using assumption (2) we conclude that $i_* \mathcal{I}$ has property \mathcal{P} .

Finally, if $\mathcal{J} \subset \mathcal{O}_Z$ is a second quasi-coherent sheaf of ideals, set $\mathcal{K} = \mathcal{I} \cap \mathcal{J}$ and consider the short exact sequences

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{I} \rightarrow \mathcal{I}/\mathcal{K} \rightarrow 0 \quad \text{and} \quad 0 \rightarrow \mathcal{K} \rightarrow \mathcal{J} \rightarrow \mathcal{J}/\mathcal{K} \rightarrow 0$$

Arguing as above, using the minimality of Z , we see that $i_* \mathcal{I}/\mathcal{K}$ and $i_* \mathcal{J}/\mathcal{K}$ satisfy \mathcal{P} . Hence by assumption (1) we conclude that $i_* \mathcal{K}$ and then $i_* \mathcal{J}$ satisfy \mathcal{P} . In other words, Z is not an element of \mathcal{T} which is the desired contradiction. \square

51.14. Limits of coherent modules

A colimit of coherent modules (on a locally Noetherian algebraic space) is typically not coherent. But it is quasi-coherent as any colimit of quasi-coherent modules on an algebraic space is quasi-coherent, see Properties of Spaces, Lemma 48.27.7. Conversely, if the algebraic space is Noetherian, then every quasi-coherent module is a filtered colimit of coherent modules.

Lemma 51.14.1. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Every quasi-coherent \mathcal{O}_X -module is the filtered colimit of its coherent submodules.*

Proof. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are coherent \mathcal{O}_X -submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another coherent \mathcal{O}_X -submodule which contains both of them (see Lemmas 51.11.3 and 51.11.4). In this way we see that the system is directed. Hence it now suffices to show that \mathcal{F} can be written as a filtered colimit of coherent modules, as then we can take the images of these modules in \mathcal{F} to conclude there are enough of them.

Let U be an affine scheme and $U \rightarrow X$ a surjective étale morphism. Set $R = U \times_X U$ so that $X = U/R$ as usual. By Properties of Spaces, Proposition 48.30.1 we see that $QCoh(\mathcal{O}_X) = QCoh(U, R, s, t, c)$. Hence we reduce to showing the corresponding thing for $QCoh(U, R, s, t, c)$. Thus the result follows from the more general Groupoids, Lemma 38.13.3. \square

Lemma 51.14.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S with Y Noetherian. Then every quasi-coherent \mathcal{O}_X -module is a filtered colimit of finitely presented \mathcal{O}_X -modules.*

Proof. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Write $f_*\mathcal{F} = \text{colim } \mathcal{H}_i$ with \mathcal{H}_i a coherent \mathcal{O}_Y -module, see Lemma 51.14.1. By Lemma 51.11.2 the modules \mathcal{H}_i are \mathcal{O}_Y -modules of finite presentation. Hence $f^*\mathcal{H}_i$ is an \mathcal{O}_X -module of finite presentation, see Properties of Spaces, Section 48.28. We claim the map

$$\text{colim } f^*\mathcal{H}_i = f^*f_*\mathcal{F} \rightarrow \mathcal{F}$$

is surjective as f is assumed affine, Namely, choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Set $U = X \times_Y V$. Then U is a scheme, $f' : U \rightarrow V$ is affine, and $U \rightarrow X$ is surjective étale. By Properties of Spaces, Lemma 48.24.2 we see that $f'_*(\mathcal{F}|_U) = f_*\mathcal{F}|_V$ and similarly for pullbacks. Thus the restriction of $f^*f_*\mathcal{F} \rightarrow \mathcal{F}$ to U is the map

$$f^*f_*\mathcal{F}|_U = (f')^*(f_*\mathcal{F}|_V) = (f')^*f'_*(\mathcal{F}|_U) \rightarrow \mathcal{F}|_U$$

which is surjective as f' is an affine morphism of schemes. Hence the claim holds.

We conclude that every quasi-coherent module on X is a quotient of a filtered colimit of finitely presented modules. In particular, we see that \mathcal{F} is a cokernel of a map

$$\text{colim}_{j \in J} \mathcal{G}_j \longrightarrow \text{colim}_{i \in I} \mathcal{H}_i$$

with \mathcal{G}_j and \mathcal{H}_i finitely presented. Note that for every $j \in J$ there exist $i \in I$ and a morphism $\alpha : \mathcal{G}_j \rightarrow \mathcal{H}_i$ such that

$$\begin{array}{ccc} \mathcal{G}_j & \xrightarrow{\alpha} & \mathcal{H}_i \\ \downarrow & & \downarrow \\ \text{colim}_{j \in J} \mathcal{G}_j & \longrightarrow & \text{colim}_{i \in I} \mathcal{H}_i \end{array}$$

commutes, see Lemma 51.4.3. In this situation $\text{Coker}(\alpha)$ is a finitely presented \mathcal{O}_X -module which comes endowed with a map $\text{Coker}(\alpha) \rightarrow \mathcal{F}$. Consider the set K

of triples (i, j, α) as above. We say that $(i, j, \alpha) \leq (i', j', \alpha')$ if and only if $i \leq i'$, $j \leq j'$, and the diagram

$$\begin{array}{ccc} \mathcal{G}_j & \xrightarrow{\alpha} & \mathcal{H}_i \\ \downarrow & & \downarrow \\ \mathcal{G}_{j'} & \xrightarrow{\alpha'} & \mathcal{H}_{i'} \end{array}$$

commutes. It follows from the above that K is a directed partially ordered set,

$$\mathcal{F} = \operatorname{colim}_{(i,j,\alpha) \in K} \operatorname{Coker}(\alpha),$$

and we win. \square

51.15. Vanishing cohomology

In this section we show that a quasi-compact and quasi-separated algebraic space is affine if it has vanishing higher cohomology for all quasi-coherent sheaves. We do this in a sequence of lemmas all of which will become obsolete once we prove Proposition 51.15.9.

Situation 51.15.1. Here S is a scheme and X is a quasi-compact and quasi-separated algebraic space over S with the following property: For every quasi-coherent \mathcal{O}_X -module \mathcal{F} we have $H^1(X, \mathcal{F}) = 0$. We set $A = \Gamma(X, \mathcal{O}_X)$.

We would like to show that the canonical morphism

$$p : X \longrightarrow \operatorname{Spec}(A)$$

(see Properties of Spaces, Lemma 48.31.1) is an isomorphism. If M is an A -module we denote $M \otimes_A \mathcal{O}_X$ the quasi-coherent module $p^* \widetilde{M}$.

Lemma 51.15.2. *In Situation 51.15.1 for an A -module M we have $p_*(M \otimes_A \mathcal{O}_X) = \widetilde{M}$ and $\Gamma(X, M \otimes_A \mathcal{O}_X) = M$.*

Proof. The equality $p_*(M \otimes_A \mathcal{O}_X) = \widetilde{M}$ follows from the equality $\Gamma(X, M \otimes_A \mathcal{O}_X) = M$ as $p_*(M \otimes_A \mathcal{O}_X)$ is a quasi-coherent module on $\operatorname{Spec}(A)$ by Morphisms of Spaces, Lemma 49.11.2. Observe that $\Gamma(X, \bigoplus_{i \in I} \mathcal{O}_X) = \bigoplus_{i \in I} A$ by Lemma 51.4.1. Hence the lemma holds for free modules. Choose a short exact sequence $F_1 \rightarrow F_0 \rightarrow M$ where F_0, F_1 are free A -modules. Since $H^1(X, -)$ is zero the global sections functor is right exact. Moreover the pullback p^* is right exact as well. Hence we see that

$$\Gamma(X, F_1 \otimes_A \mathcal{O}_X) \rightarrow \Gamma(X, F_0 \otimes_A \mathcal{O}_X) \rightarrow \Gamma(X, M \otimes_A \mathcal{O}_X) \rightarrow 0$$

is exact. The result follows. \square

The following lemma shows that Situation 51.15.1 is preserved by base change of $X \rightarrow \operatorname{Spec}(A)$ by $\operatorname{Spec}(A') \rightarrow \operatorname{Spec}(A)$.

Lemma 51.15.3. *In Situation 51.15.1.*

- (1) *Given an affine morphism $X' \rightarrow X$ of algebraic spaces, we have $H^1(X', \mathcal{F}') = 0$ for every quasi-coherent $\mathcal{O}_{X'}$ -module \mathcal{F}' .*
- (2) *Given an A -algebra A' setting $X' = X \times_{\operatorname{Spec}(A)} \operatorname{Spec}(A')$ the morphism $X' \rightarrow X$ is affine and $\Gamma(X', \mathcal{O}_{X'}) = A'$.*

Proof. Part (1) follows from Lemma 51.7.2 and the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.5). Let $A \rightarrow A'$ be as in (2). Then $X' \rightarrow X$ is affine because affine morphisms are preserved under base change (Morphisms of Spaces, Lemma 49.20.5) and the fact that a morphism of affine schemes is affine. The equality $\Gamma(X', \mathcal{O}_{X'}) = A'$ follows as $(X' \rightarrow X)_* \mathcal{O}_{X'} = A' \otimes_A \mathcal{O}_X$ by Lemma 51.10.2 and thus

$$\Gamma(X', \mathcal{O}_{X'}) = \Gamma(X, (X' \rightarrow X)_* \mathcal{O}_{X'}) = \Gamma(X, A' \otimes_A \mathcal{O}_X) = A'$$

by Lemma 51.15.2. □

Lemma 51.15.4. *In Situation 51.15.1. Let $Z_0, Z_1 \subset |X|$ be disjoint closed subsets. Then there exists an $a \in A$ such that $Z_0 \subset V(a)$ and $Z_1 \subset V(a - 1)$.*

Proof. We may and do endow Z_0, Z_1 with the reduced induced subspace structure (Properties of Spaces, Definition 48.9.5) and we denote $i_0 : Z_0 \rightarrow X$ and $i_1 : Z_1 \rightarrow X$ the corresponding closed immersions. Since $Z_0 \cap Z_1 = \emptyset$ we see that the canonical map of quasi-coherent \mathcal{O}_X -modules

$$\mathcal{O}_X \longrightarrow i_{0,*} \mathcal{O}_{Z_0} \oplus i_{1,*} \mathcal{O}_{Z_1}$$

is surjective (look at stalks at geometric points). Since $H^1(X, -)$ is zero on the kernel of this map the induced map of global sections is surjective. Thus we can find $a \in A$ which maps to the global section $(0, 1)$ of the right hand side. □

Lemma 51.15.5. *In Situation 51.15.1 the morphism $p : X \rightarrow \text{Spec}(A)$ is surjective.*

Proof. Let $A \rightarrow k$ be a ring homomorphism where k is a field. It suffices to show that $X_k = \text{Spec}(k) \times_{\text{Spec}(A)} X$ is nonempty. By Lemma 51.15.3 we have $\Gamma(X_k, \mathcal{O}) = k$. Hence X_k is nonempty. □

Lemma 51.15.6. *In Situation 51.15.1 the morphism $p : X \rightarrow \text{Spec}(A)$ is universally closed.*

Proof. Let $Z \subset |X|$ be a closed subset. We may and do endow Z with the reduced induced subspace structure (Properties of Spaces, Definition 48.9.5) and we denote $i : Z \rightarrow X$ the corresponding closed immersions. Then i is affine (Morphisms of Spaces, Lemma 49.20.6). Hence Z is another algebraic space as in Situation 51.15.1 by Lemma 51.15.3. Set $B = \Gamma(Z, \mathcal{O}_Z)$. Since $\mathcal{O}_X \rightarrow i_* \mathcal{O}_Z$ is surjective, we see that $A \rightarrow B$ is surjective by the vanishing of H^1 of the kernel. Consider the commutative diagram

$$\begin{array}{ccc} Z & \xrightarrow{\quad i \quad} & X \\ \downarrow & & \downarrow \\ \text{Spec}(B) & \longrightarrow & \text{Spec}(A) \end{array}$$

By Lemma 51.15.5 the map $Z \rightarrow \text{Spec}(B)$ is surjective and by the above $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is a closed immersion. Thus p is closed.

By Lemma 51.15.3 we see that the base change of p by $\text{Spec}(A') \rightarrow \text{Spec}(A)$ is closed for every ring map $A \rightarrow A'$. Hence p is universally closed by Morphisms of Spaces, Lemma 49.9.5. □

Lemma 51.15.7. *In Situation 51.15.1 the morphism $p : X \rightarrow \text{Spec}(A)$ is universally injective.*

Proof. Let $A \rightarrow k$ be a ring homomorphism where k is a field. It suffices to show that $\text{Spec}(k) \times_{\text{Spec}(A)} X$ has at most one point (see Morphisms of Spaces, Lemma 49.19.6). Using Lemma 51.15.3 we may assume that A is a field and we have to show that $|X|$ has at most one point.

Let's think of X as an algebraic space over $\text{Spec}(k)$ and let's use the notation $X(K)$ to denote K -valued points of X for any extension $k \subset K$, see Morphisms of Spaces, Section 49.24. If $k \subset K$ is an algebraically closed field extension of large transcendence degree, then we see that $X(K) \rightarrow |X|$ is surjective, see Morphisms of Spaces, Lemma 49.24.2. Hence, after replacing k by K , we see that it suffices to prove that $X(k)$ is a singleton (in the case $A = k$).

Let $x, x' \in X(k)$. By Decent Spaces, Lemma 50.12.3 we see that x and x' are closed points of $|X|$. Hence x and x' map to distinct points of $\text{Spec}(k)$ if $x \neq x'$ by Lemma 51.15.4. We conclude that $x = x'$ as desired. \square

Lemma 51.15.8. *In Situation 51.15.1 the morphism $p : X \rightarrow \text{Spec}(A)$ is separated.*

Proof. We will use the results of Lemmas 51.15.2, 51.15.3, 51.15.5, 51.15.6, and 51.15.7 without further mention. We will use the valuative criterion of separatedness, see Morphisms of Spaces, Lemma 49.40.2. Let R be a valuation ring over A with fraction field K . Let $\text{Spec}(K) \rightarrow X$ be a morphism over $\text{Spec}(A)$. We have to show that we can extend this to a morphism $\text{Spec}(R) \rightarrow X$ in at most one way. We may replace A by R and X by $\text{Spec}(R) \times_{\text{Spec}(A)} X$. Hence we may assume that $A = R$ is a valuation ring with field of fractions K and that we have a K -point x in X .

Let $X' \subset X$ be the scheme theoretic image of $x : \text{Spec}(K) \rightarrow X$. Then $\Gamma(X', \mathcal{O}_{X'})$ is a subring of K containing A . If not equal to A , then there is no extension of x at all and the result is true. If not, then we may replace X by X' by one of the lemmas mentioned at the start of the proof.

Let $U = \text{Spec}(B)$ be an affine scheme and let $U \rightarrow X$ be a surjective étale morphism. Then $U \times_{X,x} \text{Spec}(K)$ is a quasi-compact scheme étale over K . Hence $U \times_{X,x} \text{Spec}(K) = \text{Spec}(C)$ is affine and

$$C = K_1 \times \dots \times K_n$$

with each K_i a finite separable extension of K (Morphisms, Lemma 28.37.7). The scheme theoretic image of $U \times_{X,x} \text{Spec}(K) \rightarrow U$ is U (Morphisms of Spaces, Lemma 49.16.3). which implies that $B \subset C$ (Morphisms, Example 28.6.4). Thus B is a reduced flat A -algebra (use More on Algebra, Lemma 15.15.4). Choose a finite Galois extension $K \subset K'$ such that each K_i embeds into K' over K and choose a valuation ring $A' \subset K'$ dominating A (see Algebra, Lemma 10.48.2). After replacing A by A' , X by $\text{Spec}(A') \times_{\text{Spec}(A)} X$, x by the morphism

$$x' : \text{Spec}(K') \longrightarrow \text{Spec}(A') \times_{\text{Spec}(A)} \text{Spec}(K) \xrightarrow{(1,x)} \text{Spec}(A') \times_{\text{Spec}(A)} X,$$

and U by $\text{Spec}(A') \times_{\text{Spec}(A)} U$ we may assume that $K_i = K$ for all i (small detail omitted; note in particular that it still suffices to show that x' has at most one extension).

If X is normal then B is a finite product $B = B_1 \times \dots \times B_n$ of normal domains (see Algebra, Lemma 10.36.14). Each of these has fraction field K by the above. One

of these rings B_i , say B_1 has a prime ideal lying over \mathfrak{m}_A because $X \rightarrow \text{Spec}(A)$ is surjective. Then $A = B_1$ as A is a valuation ring. Thus we see that there exists an étale morphism $\text{Spec}(A) \rightarrow X$. Of course this implies that $X = \text{Spec}(A)$ (for example by Morphisms of Spaces, Lemma 49.45.2 and the fact that $\text{Spec}(A) \rightarrow X$ is surjective as $|X| = |\text{Spec}(A)|$) and we win in the case that X is normal.

In the general (possibly nonnormal) case we see that $U = \text{Spec}(B)$ has finitely many irreducible components (as all minimal primes of B lie over $(0) \subset A$ by flatness of $A \rightarrow B$). Thus we may consider the normalization $X^\nu \rightarrow X$ of X , see Morphisms of Spaces, Lemma 49.43.9. Note that $X^\nu \rightarrow X$ is integral hence affine and universally closed (see Morphisms of Spaces, Lemma 49.41.7). Note that $X^\nu \times_X U = U^\nu$, in particular $X^\nu \rightarrow \text{Spec}(A)$ is flat (as the integral closure of B in its total quotient ring is torsion free over A hence flat). Set $A^\nu = \Gamma(X^\nu, \mathcal{O}_{X^\nu})$ and consider the diagram

$$\begin{array}{ccc} X^\nu & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A^\nu) & \longrightarrow & \text{Spec}(A) \end{array}$$

By the lemmas mentioned at the beginning of the proof, the left vertical arrow is (universally) surjective and the right vertical arrow is universally closed. Since the top horizontal arrow is universally closed by construction we conclude that $\text{Spec}(A^\nu) \rightarrow \text{Spec}(A)$ is universally closed. Hence $A \subset A^\nu$ is integral, see Morphisms, Lemma 28.44.7. Finally, A^ν is a torsion free A -algebra with $A^\nu \otimes_A K = K$ (as $\text{Spec}(K)$ maps onto $X_K = X^\nu_K$). Hence $A = A^\nu$. Observe that $x : \text{Spec}(K) \rightarrow X$ lifts to $x^\nu : \text{Spec}(K) \rightarrow X^\nu$ and that

$$U^\nu \times_{X^\nu, x^\nu} \text{Spec}(K) = X \times_{U, x} \text{Spec}(K) = \coprod_{i=1, \dots, n} \text{Spec}(K)$$

as normalization does not change the scheme U over its generic points. Finally, as $X^\nu \rightarrow X$ is universally closed any morphism $\text{Spec}(A) \rightarrow X$ extending x lifts to a morphism into X^ν extending x^ν (see Decent Spaces, Proposition 50.14.1). Thus it suffices there is at most one morphism $\text{Spec}(A) \rightarrow X^\nu$ extending x^ν . This was proved above. \square

Proposition 51.15.9. *A quasi-compact and quasi-separated algebraic space is affine if and only if all higher cohomology groups of quasi-coherent sheaves vanish. More precisely, any algebraic space as in Situation 51.15.1 is an affine scheme.*

Proof. Choose an affine scheme $U = \text{Spec}(B)$ and a surjective étale morphism $\varphi : U \rightarrow X$. Set $R = U \times_X U$. As p is separated (Lemma 51.15.8) we see that R is a closed subscheme of $U \times_{\text{Spec}(A)} U = \text{Spec}(B \otimes_A B)$. Hence $R = \text{Spec}(C)$ is affine too and the ring map

$$B \otimes_A B \longrightarrow C$$

is surjective. Let us denote the two maps $s, t : B \rightarrow C$ as usual. Pick $g_1, \dots, g_m \in B$ such that $s(g_1), \dots, s(g_m)$ generate C over $t : B \rightarrow C$ (which is possible as $t : B \rightarrow C$ is of finite presentation and the displayed map is surjective). Then g_1, \dots, g_m give global sections of $\varphi_* \mathcal{O}_U$ and the map

$$\mathcal{O}_X[z_1, \dots, z_n] \longrightarrow \varphi_* \mathcal{O}_U, \quad z_j \longmapsto g_j$$

is surjective: you can check this by restricting to U . Namely, $\varphi^*\varphi_*\mathcal{O}_U = t_*\mathcal{O}_R$ (by Lemma 51.10.1) hence you get exactly the condition that $s(g_i)$ generate C over $t : B \rightarrow C$. By the vanishing of H^1 of the kernel we see that

$$\Gamma(X, \mathcal{O}_X[x_1, \dots, x_n]) = A[x_1, \dots, x_n] \longrightarrow \Gamma(X, \varphi_*\mathcal{O}_U) = \Gamma(U, \mathcal{O}_U) = B$$

is surjective. Thus we conclude that B is a finite type A -algebra. Hence $X \rightarrow \text{Spec}(A)$ is of finite type and separated. By Lemma 51.15.7 and Morphisms of Spaces, Lemma 49.26.5 it is also locally quasi-finite. Hence $X \rightarrow \text{Spec}(A)$ is representable by Morphisms of Spaces, Lemma 49.45.1 and X is a scheme. Finally X is affine, hence equal to $\text{Spec}(A)$, by an application of Cohomology of Schemes, Lemma 29.3.1. \square

51.16. Finite morphisms and affines

This section is the analogue of Cohomology of Schemes, Section 29.13.

Lemma 51.16.1. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Assume*

- (1) f finite,
- (2) f surjective,
- (3) Y affine, and
- (4) X Noetherian.

Then X is affine.

Proof. We will prove that under the assumptions of the lemma for any coherent \mathcal{O}_X -module \mathcal{F} we have $H^1(X, \mathcal{F}) = 0$. This implies that $H^1(X, \mathcal{F}) = 0$ for every quasi-coherent \mathcal{O}_X -module \mathcal{F} by Lemmas 51.14.1 and 51.4.1. Then it follows that X is affine from Proposition 51.15.9.

Let \mathcal{P} be the property of coherent sheaves \mathcal{F} on X defined by the rule

$$\mathcal{P}(\mathcal{F}) \Leftrightarrow H^1(X, \mathcal{F}) = 0.$$

We are going to apply Lemma 51.13.5. Thus we have to verify (1), (2) and (3) of that lemma for \mathcal{P} . Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves. Property (2) follows since $H^1(X, -)$ is an additive functor. To see (3) let $i : Z \rightarrow X$ be a reduced closed subspace with $|Z|$ irreducible. Let $W = Z \times_X Y$ and denote $i' : W \rightarrow Y$ the corresponding closed immersion. Denote $f' : W \rightarrow Z$ the other projection which is a finite morphism of algebraic spaces. Since W is a closed subscheme of Y , it is affine. We claim that $\mathcal{G} = f_*i'_*\mathcal{O}_W = i_*f'_*\mathcal{O}_W$ satisfies properties (3)(a) and (3)(b) of Lemma 51.13.5 which will finish the proof. Property (3)(a) is clear as $W \rightarrow Z$ is surjective (because f is surjective). To see (3)(b) let \mathcal{I} be a nonzero quasi-coherent sheaf of ideals on Z . We simply take $\mathcal{G}' = \mathcal{I}\mathcal{G}$. Namely, we have

$$\mathcal{I}\mathcal{G} = f'_*(\mathcal{I}')$$

where $\mathcal{I}' = \text{Im}((f')^*\mathcal{I} \rightarrow \mathcal{O}_W)$. This is true because f' is a (representable) affine morphism of algebraic spaces and hence the result can be checked on an étale covering of Z by a scheme in which case the result is Cohomology of Schemes, Lemma 29.13.2. Finally, f' is affine, hence $R^1f'_*\mathcal{I}' = 0$ by Lemma 51.7.2. As W is affine we have $H^1(W, \mathcal{I}') = 0$ hence the Leray spectral sequence (in the form Cohomology on Sites, Lemma 21.14.6) implies that $H^1(Z, f'_*\mathcal{I}') = 0$. Since

$i : Z \rightarrow X$ is affine we conclude that $R^1 i_* f'_* \mathcal{T}' = 0$ hence $H^1(X, i_* f'_* \mathcal{T}') = 0$ by Leray again and we win. \square

51.17. A weak version of Chow's lemma

In this section we quickly prove the following lemma in order to help us prove the basic results on cohomology of coherent modules on proper algebraic spaces.

Lemma 51.17.1. *Let A be a ring. Let X be an algebraic space over $\text{Spec}(A)$ whose structure morphism $X \rightarrow \text{Spec}(A)$ is separated of finite type. Then there exists a proper surjective morphism $X' \rightarrow X$ where X' is a scheme which is H-quasi-projective over $\text{Spec}(A)$.*

Proof. Let W be an affine scheme and let $f : W \rightarrow X$ be a surjective étale morphism. There exists an integer d such that all geometric fibres of f have $\leq d$ points (because X is a separated algebraic hence reasonable, see Decent Spaces, Lemma 50.5.1). Picking d minimal we get a nonempty open $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite étale of degree d , see Decent Spaces, Lemma 50.8.1. Let

$$V \subset W \times_X W \times_X \dots \times_X W$$

(d factors in the fibre product) be the complement of all the diagonals. Because $W \rightarrow X$ is separated the diagonal $W \rightarrow W \times_X W$ is a closed immersion. Since $W \rightarrow X$ is étale the diagonal $W \rightarrow W \times_X W$ is an open immersion, see Morphisms of Spaces, Lemmas 49.36.10 and 49.35.9. Hence the diagonals are open and closed subschemes of the quasi-compact scheme $W \times_X \dots \times_X W$. In particular we conclude V is a quasi-compact scheme. Choose an open immersion $W \subset Y$ with Y H-projective over A (this is possible as W is affine and of finite type over A ; for example we can use Morphisms, Lemmas 28.40.2 and 28.43.11). Let

$$Z \subset Y \times_A Y \times_A \dots \times_A Y$$

be the scheme theoretic image of the composition $V \rightarrow W \times_X \dots \times_X W \rightarrow Y \times_A \dots \times_A Y$. Observe that this morphism is quasi-compact since V is quasi-compact and $Y \times_A \dots \times_A Y$ is separated. Note that $V \rightarrow Z$ is an open immersion as $V \rightarrow Y \times_A \dots \times_A Y$ is an immersion, see Morphisms, Lemma 28.7.7. The projection morphisms give d morphisms $g_i : Z \rightarrow Y$. These morphisms g_i are projective as Y is projective over A , see material in Morphisms, Section 28.43. We set

$$X' = \bigcup g_i^{-1}(W) \subset Z$$

There is a morphism $X' \rightarrow X$ whose restriction to $g_i^{-1}(W)$ is the composition $g_i^{-1}(W) \rightarrow W \rightarrow X$. Namely, these morphisms agree over V hence agree over $g_i^{-1}(W) \cap g_j^{-1}(W)$ by Morphisms of Spaces, Lemma 49.17.8. Claim: the morphism $X' \rightarrow X$ is proper.

If the claim holds, then the lemma follows by induction on d . Namely, by construction X' is H-quasi-projective over $\text{Spec}(A)$. The image of $X' \rightarrow X$ contains the open U as V surjects onto U . Denote T the reduced induced algebraic space structure on $X \setminus U$. Then $T \times_X W$ is a closed subscheme of W , hence affine. Moreover, the morphism $T \times_X W \rightarrow T$ is étale and every geometric fibre has $< d$ points. By induction hypothesis there exists a proper surjective morphism $T' \rightarrow T$ where T' is a scheme H-quasi-projective over $\text{Spec}(A)$. Since T is a closed subspace of X we see

that $T' \rightarrow X$ is a proper morphism. Thus the lemma follows by taking the proper surjective morphism $X' \amalg T' \rightarrow X$.

Proof of the claim. By construction the morphism $X' \rightarrow X$ is separated and of finite type. We will check conditions (1) – (4) of Morphisms of Spaces, Lemma 49.39.3 for the morphisms $V \rightarrow X'$ and $X' \rightarrow X$. Conditions (1) and (2) we have seen above. Condition (3) holds as $X' \rightarrow X$ is separated (as a morphism whose source is a separated algebraic space). Thus it suffices to check liftability to X' for diagrams

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & V \\ \downarrow & & \downarrow \\ \mathrm{Spec}(R) & \longrightarrow & X \end{array}$$

where R is a valuation ring with fraction field K . Note that the top horizontal map is given by d pairwise distinct K -valued points w_1, \dots, w_d of W . In fact, this is a complete set of inverse images of the point $x \in X(K)$ coming from the diagram. Since $W \rightarrow X$ is surjective, we can, after possibly replacing R by an extension of valuation rings, lift the morphism $\mathrm{Spec}(R) \rightarrow X$ to a morphism $w : \mathrm{Spec}(R) \rightarrow W$, see Morphisms of Spaces, Lemma 49.39.2. Since w_1, \dots, w_d is a complete collection of inverse images of x we see that $w|_{\mathrm{Spec}(K)}$ is equal to one of them, say w_i . Thus we see that we get a commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & Z \\ \downarrow & & \downarrow g_i \\ \mathrm{Spec}(R) & \xrightarrow{w} & Y \end{array}$$

By the valuative criterion of properness for the projective morphism g_i we can lift w to $z : \mathrm{Spec}(R) \rightarrow Z$, see Morphisms, Lemma 28.43.5 and Schemes, Proposition 25.20.6. The image of z is in $g_i^{-1}(W) \subset X'$ and the proof is complete. \square

51.18. Noetherian valuative criterion

We prove a version of the valuative criterion for properness using discrete valuation rings. A lot more can be added here. In particular, we should formulate and prove the analogues to Limits, Lemmas 31.12.1, 31.12.2, 31.12.3, 31.13.2, and 31.13.3.

Lemma 51.18.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. Assume*

- (1) Y is locally Noetherian,
- (2) f is locally of finite type and quasi-separated,
- (3) for every commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow & \downarrow \\ \mathrm{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a discrete valuation ring and K its fraction field, there is at most one dotted arrow making the diagram commute.

Then f is separated.

Proof. To prove f is separated, we may work étale locally on Y (Morphisms of Spaces, Lemma 49.4.12). Choose an affine scheme U and an étale morphism $U \rightarrow X \times_Y X$. Set $V = X \times_{\Delta, X \times_Y X} U$ which is quasi-compact because f is quasi-separated. Consider a commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & V \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \text{Spec}(A) & \longrightarrow & U \end{array}$$

We can interpret the composition $\text{Spec}(A) \rightarrow U \rightarrow X \times_Y X$ as a pair of morphisms $a, b : \text{Spec}(A) \rightarrow X$ agreeing as morphisms into Y and equal when restricted to $\text{Spec}(K)$. Hence our assumption (3) guarantees $a = b$ and we find the dotted arrow in the diagram. By Limits, Lemma 31.12.3 we conclude that $V \rightarrow U$ is proper. In other words, Δ is proper. Since Δ is a monomorphism, we find that Δ is a closed immersion (Étale Morphisms, Lemma 40.7.2) as desired. \square

Lemma 51.18.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. Assume*

- (1) Y is locally Noetherian,
- (2) f is of finite type and quasi-separated,
- (3) for every commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a discrete valuation ring and K its fraction field, there is a unique dotted arrow making the diagram commute.

Then f is proper.

Proof. It suffices to prove f is universally closed because f is separated by Lemma 51.18.1. To do this we may work étale locally on Y (Morphisms of Spaces, Lemma 49.9.5). Hence we may assume Y is a Noetherian affine scheme. Choose $X' \rightarrow X$ as in the weak form of Chow’s lemma (Lemma 51.17.1). We claim that $X' \rightarrow \text{Spec}(A)$ is universally closed. The claim implies the lemma by Morphisms of Spaces, Lemma 49.37.7. To prove this, according to Limits, Lemma 31.13.3 it suffices to prove that in every solid commutative diagram

$$\begin{array}{ccccc} \text{Spec}(K) & \longrightarrow & X' & \longrightarrow & X \\ \downarrow & & \nearrow \text{dotted } a & \nearrow \text{dotted } b & \downarrow \\ \text{Spec}(A) & \longrightarrow & & \longrightarrow & Y \end{array}$$

where A is a dvr with fraction field K we can find the dotted arrow a . By assumption we can find the dotted arrow b . Then the morphism $X' \times_{X, b} \text{Spec}(A) \rightarrow \text{Spec}(A)$ is a proper morphism of schemes and by the valuative criterion for morphisms of schemes we can lift b to the desired morphism a . \square

Remark 51.18.3 (Variant for complete discrete valuation rings). In Lemmas 51.18.1 and 51.18.2 it suffices to consider complete discrete valuation rings. To be precise in Lemma 51.18.1 we can replace condition (3) by the following condition: Given any commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a complete discrete valuation ring with fraction field K there exists at most one dotted arrow making the diagram commute. Namely, given any diagram as in Lemma 51.18.1 (3) the completion A^\wedge is a discrete valuation ring (More on Algebra, Lemma 15.32.5) and the uniqueness of the arrow $\text{Spec}(A^\wedge) \rightarrow X$ implies the uniqueness of the arrow $\text{Spec}(A) \rightarrow X$ for example by Properties of Spaces, Proposition 48.14.1. Similarly in Lemma 51.18.2 we can replace condition (3) by the following condition: Given any commutative diagram

$$\begin{array}{ccc} \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & \downarrow \\ \text{Spec}(A) & \longrightarrow & Y \end{array}$$

where A is a complete discrete valuation ring with fraction field K there exists an extension $A \subset A'$ of complete discrete valuation rings inducing a fraction field extension $K \subset K'$ such that there exists a unique arrow $\text{Spec}(A') \rightarrow X$ making the diagram

$$\begin{array}{ccccc} \text{Spec}(K') & \longrightarrow & \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & & \nearrow & \downarrow \\ \text{Spec}(A') & \longrightarrow & \text{Spec}(A) & \longrightarrow & Y \end{array}$$

commute. Namely, given any diagram as in Lemma 51.18.2 part (3) the existence of any commutative diagram

$$\begin{array}{ccccc} \text{Spec}(L) & \longrightarrow & \text{Spec}(K) & \longrightarrow & X \\ \downarrow & & & \nearrow & \downarrow \\ \text{Spec}(B) & \longrightarrow & \text{Spec}(A) & \longrightarrow & Y \end{array}$$

for *any* extension $A \subset B$ of discrete valuation rings will imply there exists an arrow $\text{Spec}(A) \rightarrow X$ fitting into the diagram. This was shown in Morphisms of Spaces, Lemma 49.38.4. In fact, it follows from these considerations that it suffices to look for dotted arrows in diagrams for any class of discrete valuation rings such that, given any discrete valuation ring, there is an extension of it that is in the class. For example, we could take complete discrete valuation rings with algebraically closed residue field.

51.19. Higher direct images of coherent sheaves

In this section we prove the fundamental fact that the higher direct images of a coherent sheaf under a proper morphism are coherent. First we prove a helper lemma.

Lemma 51.19.1. *Let S be a scheme. Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{\quad i \quad} & \mathbf{P}_Y^n \\ & \searrow f & \downarrow \\ & & Y \end{array}$$

of algebraic spaces over S . Assume i is a closed immersion and Y Noetherian. Set $\mathcal{L} = i^ \mathcal{O}_{\mathbf{P}_Y^n}(1)$. Let \mathcal{F} be a coherent module on X . Then there exists an integer d_0 such that for all $d \geq d_0$ we have $R^p f_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes d}) = 0$ for all $p > 0$.*

Proof. Checking whether $R^p f_*(\mathcal{F} \otimes \mathcal{L}^{\otimes d})$ is zero can be done étale locally on Y , see Equation (51.3.1.1). Hence we may assume Y is the spectrum of a Noetherian ring. In this case X is a scheme and the result follows from Cohomology of Schemes, Lemma 29.15.4. \square

Lemma 51.19.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper morphism of algebraic spaces over S with Y locally Noetherian. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $R^i f_* \mathcal{F}$ is a coherent \mathcal{O}_Y -module for all $i \geq 0$.*

Proof. We first remark that X is a locally Noetherian algebraic space by Morphisms of Spaces, Lemma 49.23.5. Hence the statement of the lemma makes sense. Moreover, computing $R^i f_* \mathcal{F}$ commutes with étale localization on Y (Properties of Spaces, Lemma 48.24.2) and checking whether $R^i f_* \mathcal{F}$ coherent can be done étale locally on Y (Lemma 51.11.2). Hence we may assume that $Y = \text{Spec}(A)$ is a Noetherian affine scheme.

Assume $Y = \text{Spec}(A)$ is an affine scheme. Note that f is locally of finite presentation (Morphisms of Spaces, Lemma 49.27.7). Thus it is of finite presentation, hence X is Noetherian (Morphisms of Spaces, Lemma 49.27.6). Thus Lemma 51.13.6 applies to the category of coherent modules of X . For a coherent sheaf \mathcal{F} on X we say \mathcal{P} holds if and only if $R^i f_* \mathcal{F}$ is a coherent module on $\text{Spec}(A)$. We will show that conditions (1), (2), and (3) of Lemma 51.13.6 hold for this property thereby finishing the proof of the lemma.

Verification of condition (1). Let

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

be a short exact sequence of coherent sheaves on X . Consider the long exact sequence of higher direct images

$$R^{p-1} f_* \mathcal{F}_3 \rightarrow R^p f_* \mathcal{F}_1 \rightarrow R^p f_* \mathcal{F}_2 \rightarrow R^p f_* \mathcal{F}_3 \rightarrow R^{p+1} f_* \mathcal{F}_1$$

Then it is clear that if 2-out-of-3 of the sheaves \mathcal{F}_i have property \mathcal{P} , then the higher direct images of the third are sandwiched in this exact complex between two coherent sheaves. Hence these higher direct images are also coherent by Lemmas 51.11.3 and 51.11.4. Hence property \mathcal{P} holds for the third as well.

Verification of condition (2). This follows immediately from the fact that $R^i f_*(\mathcal{F}_1 \oplus \mathcal{F}_2) = R^i f_* \mathcal{F}_1 \oplus R^i f_* \mathcal{F}_2$ and that a summand of a coherent module is coherent (see lemmas cited above).

Verification of condition (3). Let $i : Z \rightarrow X$ be a closed immersion with Z reduced and $|Z|$ irreducible. Set $g = f \circ i : Z \rightarrow \text{Spec}(A)$. Let \mathcal{G} be a coherent module on Z whose scheme theoretic support is equal to Z such that $R^p g_* \mathcal{G}$ is coherent for all p . Then $\mathcal{F} = i_* \mathcal{G}$ is a coherent module on X whose support scheme theoretic support is Z such that $R^p f_* \mathcal{F} = R^p g_* \mathcal{G}$. To see this use the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.7) and the fact that $R^q i_* \mathcal{G} = 0$ for $q > 0$ by Lemma 51.7.2 and the fact that a closed immersion is affine. (Morphisms of Spaces, Lemma 49.20.6). Thus we reduce to finding a coherent sheaf \mathcal{G} on Z with support equal to Z such that $R^p g_* \mathcal{G}$ is coherent for all p .

We apply Lemma 51.17.1 to the morphism $Z \rightarrow \text{Spec}(A)$. Thus we get a diagram

$$\begin{array}{ccccc}
 Z & \longleftarrow & Z' & \longrightarrow & \mathbf{P}_A^n \\
 & \searrow & \downarrow & \swarrow & \\
 & g & & g' & \\
 & & & & \text{Spec}(A)
 \end{array}$$

with $\pi : Z' \rightarrow Z$ proper surjective and i an immersion. Since $Z \rightarrow \text{Spec}(A)$ is proper we conclude that g' is proper (Morphisms of Spaces, Lemma 49.37.4). Hence i is a closed immersion (Morphisms of Spaces, Lemmas 49.37.6 and 49.12.3). It follows that the morphism $i' = (i, \pi) : \mathbf{P}_A^n \times_{\text{Spec}(A)} Z' = \mathbf{P}_Z^n$ is a closed immersion (Morphisms of Spaces, Lemma 49.4.6). Set

$$\mathcal{L} = i^* \mathcal{O}_{\mathbf{P}_A^n}(1) = (i')^* \mathcal{O}_{\mathbf{P}_Z^n}(1)$$

We may apply Lemma 51.19.1 to \mathcal{L} and π as well as \mathcal{L} and g' . Hence for all $d \gg 0$ we have $R^p \pi_* \mathcal{L}^{\otimes d} = 0$ for all $p > 0$ and $R^p (g')_* \mathcal{L}^{\otimes d} = 0$ for all $p > 0$. Set $\mathcal{G} = \pi_* \mathcal{L}^{\otimes d}$. By the Leray spectral sequence (Cohomology on Sites, Lemma 21.14.7) we have

$$E_2^{p,q} = R^p g_* R^q \pi_* \mathcal{L}^{\otimes d} \Rightarrow R^{p+q} (g')_* \mathcal{L}^{\otimes d}$$

and by choice of d the only nonzero terms in $E_2^{p,q}$ are those with $q = 0$ and the only nonzero terms of $R^{p+q} (g')_* \mathcal{L}^{\otimes d}$ are those with $p = q = 0$. This implies that $R^p g_* \mathcal{G} = 0$ for $p > 0$ and that $g_* \mathcal{G} = (g')_* \mathcal{L}^{\otimes d}$. Applying Cohomology of Schemes, Lemma 29.17.1 we see that $g_* \mathcal{G} = (g')_* \mathcal{L}^{\otimes d}$ is coherent.

We still have to check that the support of \mathcal{G} is Z . This follows from the fact that $\mathcal{L}^{\otimes d}$ has lots of global sections. We spell it out here. Note that $\mathcal{L}^{\otimes d}$ is globally generated for all $d \geq 0$ because the same is true for $\mathcal{O}_{\mathbf{P}^n}(d)$. Pick a point $z \in Z'$ mapping to the generic point ξ of Z which we can do as π is surjective. (Observe that Z does indeed have a generic point as $|Z|$ is irreducible and Z is Noetherian, hence quasi-separated, hence $|Z|$ is a sober topological space by Properties of Spaces, Lemma 48.12.4.) Pick $s \in \Gamma(Z', \mathcal{L}^{\otimes d})$ which does not vanish at z . Since $\Gamma(Z, \mathcal{G}) = \Gamma(Z', \mathcal{L}^{\otimes d})$ we may think of s as a global section of \mathcal{G} . Choose a geometric point \bar{z} of Z' lying over z and denote $\bar{\xi} = g' \circ \bar{z}$ the corresponding geometric point of Z . The adjunction map

$$(g')^* \mathcal{G} = (g')^* g'_* \mathcal{L}^{\otimes d} \longrightarrow \mathcal{L}^{\otimes d}$$

induces a map of stalks $\mathcal{G}_{\bar{\xi}} \rightarrow \mathcal{L}_{\bar{z}}$, see Properties of Spaces, Lemma 48.27.5. Moreover the adjunction map sends the pullback of s (viewed as a section of \mathcal{G}) to s

(viewed as a section of $\mathcal{L}^{\otimes d}$). Thus the image of s in the vector space which is the source of the arrow

$$\mathcal{G}_{\bar{\xi}} \otimes \kappa(\bar{\xi}) \longrightarrow \mathcal{L}_{\bar{z}}^{\otimes d} \otimes \kappa(\bar{z})$$

isn't zero since by choice of s the image in the target of the arrow is nonzero. Hence ξ is in the support of \mathcal{G} (Morphisms of Spaces, Lemma 49.15.2). Since $|Z|$ is irreducible and Z is reduced we conclude that the scheme theoretic support of \mathcal{G} is all of Z as desired. \square

Remark 51.19.3. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type and Y locally Noetherian. Then X is locally Noetherian (Morphisms of Spaces, Lemma 49.23.5). Let \mathcal{F} be a coherent \mathcal{O}_X -module. Assume the scheme theoretic support Z of \mathcal{F} is proper over Y . we claim $R^p f_* \mathcal{F}$ is a coherent \mathcal{O}_Y -module for all $p \geq 0$. Namely, Let $i : Z \rightarrow X$ be the closed immersion and write $\mathcal{F} = i_* \mathcal{G}$ for some coherent module \mathcal{G} on Z (Lemma 51.11.7). Denoting $g : Z \rightarrow S$ the composition $f \circ i$ we see that $R^p g_* \mathcal{G}$ is coherent on S by Lemma 51.19.2. On the other hand, $R^q i_* \mathcal{G} = 0$ for $q > 0$ (Lemma 51.11.9). By Cohomology on Sites, Lemma 21.14.7 we get $R^p f_* \mathcal{F} = R^p g_* \mathcal{G}$ and the claim.

Lemma 51.19.4. *Let A be a Noetherian ring. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism of algebraic spaces. Let \mathcal{F} be a coherent \mathcal{O}_X -module. Then $H^i(X, \mathcal{F})$ is finite A -module for all $i \geq 0$.*

Proof. This is just the affine case of Lemma 51.19.2. Namely, by Lemma 51.3.2 we know that $R^i f_* \mathcal{F}$ is a quasi-coherent sheaf. Hence it is the quasi-coherent sheaf associated to the A -module $\Gamma(\text{Spec}(A), R^i f_* \mathcal{F}) = H^i(X, \mathcal{F})$. The equality holds by Cohomology on Sites, Lemma 21.14.6 and vanishing of higher cohomology groups of quasi-coherent modules on affine schemes (Cohomology of Schemes, Lemma 29.2.2). By Lemma 51.11.2 we see $R^i f_* \mathcal{F}$ is a coherent sheaf if and only if $H^i(X, \mathcal{F})$ is an A -module of finite type. Hence Lemma 51.19.2 gives us the conclusion. \square

Lemma 51.19.5. *Let A be a Noetherian ring. Let B be a finitely generated graded A -algebra. Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism of algebraic spaces. Set $\mathcal{B} = f^* \tilde{B}$. Let \mathcal{F} be a quasi-coherent graded \mathcal{B} -module of finite type. For every $p \geq 0$ the graded B -module $H^p(X, \mathcal{F})$ is a finite B -module.*

Proof. To prove this we consider the fibre product diagram

$$\begin{array}{ccc} X' = \text{Spec}(B) \times_{\text{Spec}(A)} X & \xrightarrow{\pi} & X \\ f' \downarrow & & \downarrow f \\ \text{Spec}(B) & \longrightarrow & \text{Spec}(A) \end{array}$$

Note that f' is a proper morphism, see Morphisms of Spaces, Lemma 49.37.3. Also, B is a finitely generated A -algebra, and hence Noetherian (Algebra, Lemma 10.30.1). This implies that X' is a Noetherian algebraic space (Morphisms of Spaces, Lemma 49.27.6). Note that X' is the relative spectrum of the quasi-coherent \mathcal{O}_X -algebra \mathcal{B} by Morphisms of Spaces, Lemma 49.20.7. Since \mathcal{F} is a quasi-coherent \mathcal{B} -module we see that there is a unique quasi-coherent $\mathcal{O}_{X'}$ -module \mathcal{F}' such that $\pi_* \mathcal{F}' = \mathcal{F}$, see Morphisms of Spaces, Lemma 49.20.10. Since \mathcal{F} is finite type as a \mathcal{B} -module we conclude that \mathcal{F}' is a finite type $\mathcal{O}_{X'}$ -module (details omitted). In

other words, \mathcal{F}' is a coherent $\mathcal{O}_{X'}$ -module (Lemma 51.11.2). Since the morphism $\pi : X' \rightarrow X$ is affine we have

$$H^p(X, \mathcal{F}) = H^p(X', \mathcal{F}')$$

by Lemma 51.7.2 and Cohomology on Sites, Lemma 21.14.6. Thus the lemma follows from Lemma 51.19.4. \square

51.20. The theorem on formal functions

This section is the analogue of Cohomology of Schemes, Section 29.18. We encourage the reader to read that section first.

Situation 51.20.1. Here A is a Noetherian ring and $I \subset A$ is an ideal. Also, $f : X \rightarrow \text{Spec}(A)$ is a proper morphism of algebraic spaces and \mathcal{F} is a coherent sheaf on X .

In this situation we denote $I^n\mathcal{F}$ the quasi-coherent submodule of \mathcal{F} generated as an \mathcal{O}_X -module by products of local sections of \mathcal{F} and elements of I^n . In other words, it is the image of the map $f^*\tilde{I} \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{F}$.

Lemma 51.20.2. *In Situation 51.20.1. Set $B = \bigoplus_{n \geq 0} I^n$. Then for every $p \geq 0$ the graded B -module $\bigoplus_{n \geq 0} H^p(X, I^n\mathcal{F})$ is a finite B -module.*

Proof. Let $\mathcal{B} = \bigoplus I^n \mathcal{O}_X = f^*\tilde{B}$. Then $\bigoplus I^n\mathcal{F}$ is a finite type graded \mathcal{B} -module. Hence the result follows from Lemma 51.19.5. \square

Lemma 51.20.3. *In Situation 51.20.1. For every $p \geq 0$ there exists an integer $c \geq 0$ such that*

- (1) *the multiplication map $I^{n-c} \otimes H^p(X, I^c\mathcal{F}) \rightarrow H^p(X, I^n\mathcal{F})$ is surjective for all $n \geq c$, and*
- (2) *the image of $H^p(X, I^{n+m}\mathcal{F}) \rightarrow H^p(X, I^n\mathcal{F})$ is contained in the submodule $I^{m-c}H^p(X, I^n\mathcal{F})$ for all $n \geq 0, m \geq c$.*

Proof. By Lemma 51.20.2 we can find $d_1, \dots, d_t \geq 0$, and $x_i \in H^p(X, I^{d_i}\mathcal{F})$ such that $\bigoplus_{n \geq 0} H^p(X, I^n\mathcal{F})$ is generated by x_1, \dots, x_t over $B = \bigoplus_{n \geq 0} I^n$. Take $c = \max\{d_i\}$. It is clear that (1) holds. For (2) let $b = \max(0, n - c)$. Consider the commutative diagram of A -modules

$$\begin{CD} I^{n+m-c-b} \otimes I^b \otimes H^p(X, I^c\mathcal{F}) @>>> I^{n+m-c} \otimes H^p(X, I^c\mathcal{F}) @>>> H^p(X, I^{n+m}\mathcal{F}) \\ @VVV @VVV @VVV \\ I^{n+m-c-b} \otimes H^p(X, I^n\mathcal{F}) @>>> H^p(X, I^n\mathcal{F}) \end{CD}$$

By part (1) of the lemma the composition of the horizontal arrows is surjective if $n + m \geq c$. On the other hand, it is clear that $n + m - c - b \geq m - c$. Hence part (2). \square

Lemma 51.20.4. *In Situation 51.20.1. Fix $p \geq 0$.*

- (1) *There exists a $c_1 \geq 0$ such that for all $n \geq c_1$ we have*

$$\text{Ker}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n\mathcal{F})) \subset I^{n-c_1}H^p(X, \mathcal{F}).$$

(2) *The inverse system*

$$(H^p(X, \mathcal{F}/I^n \mathcal{F}))_{n \in \mathbf{N}}$$

satisfies the Mittag-Leffler condition (see Homology, Definition 12.27.2).

(3) *In fact for any p and n there exists a $c_2(n) \geq n$ such that*

$$\text{Im}(H^p(X, \mathcal{F}/I^k \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) = \text{Im}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F}))$$

for all $k \geq c_2(n)$.

Proof. Let $c_1 = \max\{c_p, c_{p+1}\}$, where c_p, c_{p+1} are the integers found in Lemma 51.20.3 for H^p and H^{p+1} . We will use this constant in the proofs of (1), (2) and (3).

Let us prove part (1). Consider the short exact sequence

$$0 \rightarrow I^n \mathcal{F} \rightarrow \mathcal{F} \rightarrow \mathcal{F}/I^n \mathcal{F} \rightarrow 0$$

From the long exact cohomology sequence we see that

$$\text{Ker}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) = \text{Im}(H^p(X, I^n \mathcal{F}) \rightarrow H^p(X, \mathcal{F}))$$

Hence by our choice of c_1 we see that this is contained in $I^{n-c_1} H^p(X, \mathcal{F})$ for $n \geq c_1$.

Note that part (3) implies part (2) by definition of the Mittag-Leffler condition.

Let us prove part (3). Fix an n throughout the rest of the proof. Consider the commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & I^n \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{F}/I^n \mathcal{F} & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I^{n+m} \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & \mathcal{F}/I^{n+m} \mathcal{F} & \longrightarrow & 0 \end{array}$$

This gives rise to the following commutative diagram

$$\begin{array}{ccccccc} H^p(X, I^n \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}/I^n \mathcal{F}) & \xrightarrow{\delta} & H^{p+1}(X, I^n \mathcal{F}) \\ \uparrow & & \uparrow & & \uparrow & & \uparrow \\ H^p(X, I^{n+m} \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}) & \longrightarrow & H^p(X, \mathcal{F}/I^{n+m} \mathcal{F}) & \longrightarrow & H^{p+1}(X, I^{n+m} \mathcal{F}) \end{array}$$

If $m \geq c_1$ we see that the image of a is contained in $I^{m-c_1} H^{p+1}(X, I^n \mathcal{F})$. By the Artin-Rees lemma (see Algebra, Lemma 10.49.3) there exists an integer $c_3(n)$ such that

$$I^N H^{p+1}(X, I^n \mathcal{F}) \cap \text{Im}(\delta) \subset \delta \left(I^{N-c_3(n)} H^p(X, \mathcal{F}/I^n \mathcal{F}) \right)$$

for all $N \geq c_3(n)$. As $H^p(X, \mathcal{F}/I^n \mathcal{F})$ is annihilated by I^n , we see that if $m \geq c_3(n) + c_1 + n$, then

$$\text{Im}(H^p(X, \mathcal{F}/I^{n+m} \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})) = \text{Im}(H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F}))$$

In other words, part (3) holds with $c_2(n) = c_3(n) + c_1 + n$. □

Theorem 51.20.5 (Theorem on formal functions). *In Situation 51.20.1. Fix $p \geq 0$. The system of maps*

$$H^p(X, \mathcal{F})/I^n H^p(X, \mathcal{F}) \longrightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})$$

define an isomorphism of limits

$$H^p(X, \mathcal{F})^\wedge \longrightarrow \lim_n H^p(X, \mathcal{F}/I^n \mathcal{F})$$

where the left hand side is the completion of the A -module $H^p(X, \mathcal{F})$ with respect to the ideal I , see Algebra, Section 10.93. Moreover, this is in fact a homeomorphism for the limit topologies.

Proof. In fact, this follows immediately from Lemma 51.20.4. We spell out the details. Set $M = H^p(X, \mathcal{F})$ and $M_n = H^p(X, \mathcal{F}/I^n \mathcal{F})$. Denote $N_n = \text{Im}(M \rightarrow M_n)$. By the description of the limit in Homology, Section 12.27 we have

$$\lim_n M_n = \{(x_n) \in \prod M_n \mid \varphi_i(x_n) = x_{n-1}, n = 2, 3, \dots\}$$

Pick an element $x = (x_n) \in \lim_n M_n$. By Lemma 51.20.4 part (3) we have $x_n \in N_n$ for all n since by definition x_n is the image of some $x_{n+m} \in M_{n+m}$ for all m . By Lemma 51.20.4 part (1) we see that there exists a factorization

$$M \rightarrow N_n \rightarrow M/I^{n-c_1} M$$

of the reduction map. Denote $y_n \in M/I^{n-c_1} M$ the image of x_n for $n \geq c_1$. Since for $n' \geq n$ the composition $M \rightarrow M_{n'} \rightarrow M_n$ is the given map $M \rightarrow M_n$ we see that $y_{n'}$ maps to y_n under the canonical map $M/I^{n'-c_1} M \rightarrow M/I^{n-c_1} M$. Hence $y = (y_{n+c_1})$ defines an element of $\lim_n M/I^n M$. We omit the verification that y maps to x under the map

$$M^\wedge = \lim_n M/I^n M \longrightarrow \lim_n M_n$$

of the lemma. We also omit the verification on topologies. □

Lemma 51.20.6. *Let A be a ring. Let $I \subset A$ be an ideal. Assume A is Noetherian and complete with respect to I . Let $f : X \rightarrow \text{Spec}(A)$ be a proper morphism of algebraic spaces. Let \mathcal{F} be a coherent sheaf on X . Then*

$$H^p(X, \mathcal{F}) = \lim_n H^p(X, \mathcal{F}/I^n \mathcal{F})$$

for all $p \geq 0$.

Proof. This is a reformulation of the theorem on formal functions (Theorem 51.20.5) in the case of a complete Noetherian base ring. Namely, in this case the A -module $H^p(X, \mathcal{F})$ is finite (Lemma 51.19.4) hence I -adically complete (Algebra, Lemma 10.93.2) and we see that completion on the left hand side is not necessary. □

Lemma 51.20.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S and let \mathcal{F} be a quasi-coherent sheaf on Y . Assume*

- (1) Y locally Noetherian,
- (2) f proper, and
- (3) \mathcal{F} coherent.

Let \bar{y} be a geometric point of Y . Consider the “infinitesimal neighbourhoods”

$$\begin{array}{ccc} X_n = \text{Spec}(\mathcal{O}_{Y, \bar{y}}/\mathfrak{m}_{\bar{y}}^n) \times_Y X & \xrightarrow{i_n} & X \\ f_n \downarrow & & \downarrow f \\ \text{Spec}(\mathcal{O}_{Y, \bar{y}}/\mathfrak{m}_{\bar{y}}^n) & \xrightarrow{c_n} & Y \end{array}$$

of the fibre $X_1 = X_{\bar{y}}$ and set $\mathcal{F}_n = i_n^* \mathcal{F}$. Then we have

$$(R^p f_* \mathcal{F})_{\bar{y}}^\wedge \cong \lim_n H^p(X_n, \mathcal{F}_n)$$

as $\mathcal{O}_{Y, \bar{y}}^\wedge$ -modules.

Proof. This is just a reformulation of a special case of the theorem on formal functions, Theorem 51.20.5. Let us spell it out. Note that $\mathcal{O}_{Y,\bar{y}}$ is a Noetherian local ring, see Properties of Spaces, Lemma 48.22.4. Consider the canonical morphism $c : \text{Spec}(\mathcal{O}_{Y,\bar{y}}) \rightarrow Y$. This is a flat morphism as it identifies local rings. Denote $f' : X' \rightarrow \text{Spec}(\mathcal{O}_{Y,\bar{y}})$ the base change of f to this local ring. We see that $c^*R^p f_* \mathcal{F} = R^p f'_* \mathcal{F}'$ by Lemma 51.10.1. Moreover, we have canonical identifications $X_n = X'_n$ for all $n \geq 1$.

Hence we may assume that $Y = \text{Spec}(A)$ is the spectrum of a strictly henselian Noetherian local ring A with maximal ideal \mathfrak{m} and that $\bar{y} \rightarrow Y$ is equal to $\text{Spec}(A/\mathfrak{m}) \rightarrow Y$. It follows that

$$(R^p f_* \mathcal{F})_{\bar{y}} = \Gamma(Y, R^p f_* \mathcal{F}) = H^p(X, \mathcal{F})$$

because (Y, \bar{y}) is an initial object in the category of étale neighbourhoods of \bar{y} . The morphisms c_n are each closed immersions. Hence their base changes i_n are closed immersions as well. Note that $i_{n,*} \mathcal{F}_n = i_{n,*} i_n^* \mathcal{F} = \mathcal{F}/\mathfrak{m}^n \mathcal{F}$. By the Leray spectral sequence for i_n , and Lemma 51.11.9 we see that

$$H^p(X_n, \mathcal{F}_n) = H^p(X, i_{n,*} \mathcal{F}) = H^p(X, \mathcal{F}/\mathfrak{m}^n \mathcal{F})$$

Hence we may indeed apply the theorem on formal functions to compute the limit in the statement of the lemma and we win. □

Here is a lemma which we will generalize later to fibres of dimension > 0 , namely the next lemma.

Lemma 51.20.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \bar{y} be a geometric point of Y . Assume*

- (1) Y locally Noetherian,
- (2) f is proper, and
- (3) $X_{\bar{y}}$ has discrete underlying topological space.

Then for any coherent sheaf \mathcal{F} on X we have $(R^p f_ \mathcal{F})_{\bar{y}} = 0$ for all $p > 0$.*

Proof. Let $\kappa(\bar{y})$ be the residue field of the local ring of $\mathcal{O}_{Y,\bar{y}}$. As in Lemma 51.20.7 we set $X_{\bar{y}} = X_1 = \text{Spec}(\kappa(\bar{y})) \times_Y X$. By Morphisms of Spaces, Lemma 49.32.8 the morphism $f : X \rightarrow Y$ is quasi-finite at each of the points of the fibre of $X \rightarrow Y$ over \bar{y} . It follows that $X_{\bar{y}} \rightarrow \bar{y}$ is separated and quasi-finite. Hence $X_{\bar{y}}$ is a scheme by Morphisms of Spaces, Proposition 49.44.2. Since it is quasi-compact its underlying topological space is a finite discrete space. Then it is an affine scheme by Schemes, Lemma 25.11.7. By Lemma 51.16.1 it follows that the algebraic spaces X_n are affine schemes as well. Moreover, the underlying topological of each X_n is the same as that of X_1 . Hence it follows that $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > 0$. Hence we see that $(R^p f_* \mathcal{F})_{\bar{y}}^{\wedge} = 0$ by Lemma 51.20.7. Note that $R^p f_* \mathcal{F}$ is coherent by Lemma 51.19.2 and hence $R^p f_* \mathcal{F}_{\bar{y}}$ is a finite $\mathcal{O}_{Y,\bar{y}}$ -module. By Algebra, Lemma 10.93.2 this implies that $(R^p f_* \mathcal{F})_{\bar{y}} = 0$. □

Lemma 51.20.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \bar{y} be a geometric point of Y . Assume*

- (1) Y locally Noetherian,
- (2) f is proper, and
- (3) $\dim(X_{\bar{y}}) = d$.

Then for any coherent sheaf \mathcal{F} on X we have $(R^p f_ \mathcal{F})_{\bar{y}} = 0$ for all $p > d$.*

Proof. Let $\kappa(\bar{y})$ be the residue field of the local ring of $\mathcal{O}_{Y, \bar{y}}$. As in Lemma 51.20.7 we set $X_{\bar{y}} = X_1 = \text{Spec}(\kappa(\bar{y})) \times_Y X$. Moreover, the underlying topological space of each infinitesimal neighbourhood X_n is the same as that of $X_{\bar{y}}$. Hence $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > d$ by Lemma 51.9.1. Hence we see that $(R^p f_* \mathcal{F})_{\bar{y}}^\wedge = 0$ by Lemma 51.20.7 for $p > d$. Note that $R^p f_* \mathcal{F}$ is coherent by Lemma 51.19.2 and hence $R^p f_* \mathcal{F}_{\bar{y}}$ is a finite $\mathcal{O}_{Y, \bar{y}}$ -module. By Algebra, Lemma 10.93.2 this implies that $(R^p f_* \mathcal{F})_{\bar{y}} = 0$. \square

51.21. Applications of the theorem on formal functions

We will add more here as needed.

Lemma 51.21.1. *(For a more general version see More on Morphisms of Spaces, Lemma 58.24.5). Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume Y is locally Noetherian. The following are equivalent*

- (1) f is finite, and
- (2) f is proper and $|X_k|$ is a discrete space for every morphism $\text{Spec}(k) \rightarrow Y$ where k is a field.

Proof. A finite morphism is proper according to Morphisms of Spaces, Lemma 49.41.9. A finite morphism is quasi-finite according to Morphisms of Spaces, Lemma 49.41.8. A quasi-finite morphism has discrete fibres X_k , see Morphisms of Spaces, Lemma 49.26.5. Hence a finite morphism is proper and has discrete fibres X_k .

Assume f is proper with discrete fibres X_k . We want to show f is finite. In fact it suffices to prove f is affine. Namely, if f is affine, then it follows that f is integral by Morphisms of Spaces, Lemma 49.41.7 whereupon it follows from Morphisms of Spaces, Lemma 49.41.6 that f is finite.

To show that f is affine we may assume that Y is affine, and our goal is to show that X is affine too. Since f is proper we see that X is separated and quasi-compact. We will show that for any coherent \mathcal{O}_X -module \mathcal{F} we have $H^1(X, \mathcal{F}) = 0$. This implies that $H^1(X, \mathcal{F}) = 0$ for every quasi-coherent \mathcal{O}_X -module \mathcal{F} by Lemmas 51.14.1 and 51.4.1. Then it follows that X is affine from Proposition 51.15.9. By Lemma 51.20.8 we conclude that the stalks of $R^1 f_* \mathcal{F}$ are zero for all geometric points of Y . In other words, $R^1 f_* \mathcal{F} = 0$. Hence we see from the Leray Spectral Sequence for f that $H^1(X, \mathcal{F}) = H^1(Y, f_* \mathcal{F})$. Since Y is affine, and $f_* \mathcal{F}$ is quasi-coherent (Morphisms of Spaces, Lemma 49.11.2) we conclude $H^1(Y, f_* \mathcal{F}) = 0$ from Cohomology of Schemes, Lemma 29.2.2. Hence $H^1(X, \mathcal{F}) = 0$ as desired. \square

As a consequence we have the following useful result.

Lemma 51.21.2. *(For a more general version see More on Morphisms of Spaces, Lemma 58.24.6). Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \bar{y} be a geometric point of Y . Assume*

- (1) Y is locally Noetherian,
- (2) f is proper, and
- (3) $|X_{\bar{y}}|$ is finite.

Then there exists an open neighbourhood $V \subset Y$ of \bar{y} such that $f|_{f^{-1}(V)} : f^{-1}(V) \rightarrow V$ is finite.

Proof. The morphism f is quasi-finite at all the geometric points of X lying over \bar{y} by Morphisms of Spaces, Lemma 49.32.8. By Morphisms of Spaces, Lemma 49.32.7 the set of points at which f is quasi-finite is an open subspace $U \subset X$. Let $Z = X \setminus U$. Then $\bar{y} \notin f(Z)$. Since f is proper the set $f(Z) \subset Y$ is closed. Choose any open neighbourhood $V \subset Y$ of \bar{y} with $Z \cap V = \emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence $f^{-1}(V) \rightarrow V$ has discrete fibres X_k (Morphisms of Spaces, Lemma 49.26.5) which are quasi-compact hence finite. Thus $f^{-1}(V) \rightarrow V$ is finite by Lemma 51.21.1. \square

Limits of Algebraic Spaces

52.1. Introduction

In this chapter we put material related to limits of algebraic spaces. A first topic is the characterization of algebraic spaces F locally of finite presentation over the base S as limit preserving functors. We continue with a study of limits of inverse systems over directed partially ordered sets with affine transition maps. We discuss absolute Noetherian approximation for quasi-compact and quasi-separated algebraic spaces following [CLO12]. Another approach is due to David Rydh (see [Ryd08]) whose results also cover absolute Noetherian approximation for certain algebraic stacks.

52.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

52.3. Morphisms of finite presentation

In this section we generalize Limits, Proposition 31.5.1 to morphisms of algebraic spaces. The motivation for the following definition comes from the proposition just cited.

Definition 52.3.1. Let S be a scheme.

- (1) A functor $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ is said to be *locally of finite presentation* or *limit preserving* if for every affine scheme T over S which is a limit $T = \lim T_i$ of a directed inverse system of affine schemes T_i over S , we have

$$F(T) = \text{colim } F(T_i).$$

We sometimes say that F is *locally of finite presentation over S* .

- (2) Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. A transformation of functors $a : F \rightarrow G$ is *locally of finite presentation* if for every scheme T over S and every $y \in G(T)$ the functor

$$F_y : (Sch/T)_{fppf}^{opp} \longrightarrow Sets, \quad T'/T \longmapsto \{x \in F(T') \mid a(x) = y|_{T'}\}$$

is locally of finite presentation over T^1 . We sometimes say that F is *relatively limit preserving* over G .

¹The characterization (2) in Lemma 52.3.2 may be easier to parse.

The functor F_y is in some sense the fiber of $a : F \rightarrow G$ over y , except that it is a presheaf on the big fppf site of T . A formula for this functor is:

$$(52.3.1.1) \quad F_y = F|_{(Sch/T)_{fppf}} \times_{G|_{(Sch/T)_{fppf}}} *$$

Here $*$ is the final object in the category of (pre)sheaves on $(Sch/T)_{fppf}$ (see Sites, Example 7.10.2) and the map $* \rightarrow G|_{(Sch/T)_{fppf}}$ is given by y . Note that if $j : (Sch/T)_{fppf} \rightarrow (Sch/S)_{fppf}$ is the localization functor, then the formula above becomes $F_y = j^{-1}F \times_{j^{-1}G} *$ and $j_!F_y$ is just the fiber product $F \times_{G,y} T$. (See Sites, Section 7.24, for information on localization, and especially Sites, Remark 7.24.9 for information on $j_!$ for presheaves.)

At this point we temporarily have two definitions of what it means for a morphism $X \rightarrow Y$ of algebraic spaces over S to be locally of finite presentation. Namely, one by Morphisms of Spaces, Definition 49.27.1 and one using that $X \rightarrow Y$ is a transformation of functors so that Definition 52.3.1 applies. We will show in Proposition 52.3.9 that these two definitions agree.

Lemma 52.3.2. *Let S be a scheme. Let $a : F \rightarrow G$ be a transformation of functors $(Sch/S)_{fppf}^{opp} \rightarrow Sets$. The following are equivalent*

- (1) F is relatively limit preserving over G , and
- (2) for every every affine scheme T over S which is a limit $T = \lim T_i$ of a directed inverse system of affine schemes T_i over S the diagram of sets

$$\begin{array}{ccc} \text{colim}_i F(T_i) & \longrightarrow & F(T) \\ a \downarrow & & \downarrow a \\ \text{colim}_i G(T_i) & \longrightarrow & G(T) \end{array}$$

is a fibre product diagram.

Proof. Assume (1). Consider $T = \lim_{i \in I} T_i$ as in (2). Let (y, x_T) be an element of the fibre product $\text{colim}_i G(T_i) \times_{G(T)} F(T)$. Then y comes from $y_i \in G(T_i)$ for some i . Consider the functor F_{y_i} on $(Sch/T_i)_{fppf}$ as in Definition 52.3.1. We see that $x_T \in F_{y_i}(T)$. Moreover $T = \lim_{i' \geq i} T_{i'}$ is a directed system of affine schemes over T_i . Hence (1) implies that x_T the image of a unique element x of $\text{colim}_{i' \geq i} F_{y_i}(T_{i'})$. Thus x is the unique element of $\text{colim} F(T_i)$ which maps to the pair (y, x_T) . This proves that (2) holds.

Assume (2). Let T be a scheme and $y_T \in G(T)$. We have to show that F_{y_T} is limit preserving. Let $T' = \lim_{i \in I} T'_i$ be an affine scheme over T which is the directed limit of affine scheme T'_i over T . Let $x_{T'} \in F_{y_T}$. Pick $i \in I$ which is possible as I is a directed partially ordered set. Denote $y_i \in F(T'_i)$ the image of $y_{T'}$. Then we see that $(y_i, x_{T'})$ is an element of the fibre product $\text{colim}_i G(T'_i) \times_{G(T')} F(T')$. Hence by (2) we get a unique element x of $\text{colim}_i F(T'_i)$ mapping to $(y_i, x_{T'})$. It is clear that x defines an element of $\text{colim}_i F_y(T'_i)$ mapping to $x_{T'}$ and we win. \square

Lemma 52.3.3. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$, $b : G \rightarrow H$ be transformations of functors. If a and b are locally of finite presentation, then*

$$b \circ a : F \longrightarrow H$$

is locally of finite presentation.

Proof. Let $T = \lim_{i \in I} T_i$ as in characterization (2) of Lemma 52.3.2. Consider the diagram

$$\begin{array}{ccc} \operatorname{colim}_i F(T_i) & \longrightarrow & F(T) \\ a \downarrow & & \downarrow a \\ \operatorname{colim}_i G(T_i) & \longrightarrow & G(T) \\ b \downarrow & & \downarrow b \\ \operatorname{colim}_i H(T_i) & \longrightarrow & H(T) \end{array}$$

By assumption the two squares are fibre product squares. Hence the outer rectangle is a fibre product diagram too which proves the lemma. \square

Lemma 52.3.4. *Let S be a scheme contained in $\operatorname{Sch}_{\text{fppf}}$. Let $F, G, H : (\operatorname{Sch}/S)_{\text{fppf}}^{\text{opp}} \rightarrow \operatorname{Sets}$. Let $a : F \rightarrow G, b : H \rightarrow G$ be transformations of functors. Consider the fibre product diagram*

$$\begin{array}{ccc} H \times_{b, G, a} F & \longrightarrow & F \\ a' \downarrow & & \downarrow a \\ H & \xrightarrow{b} & G \end{array}$$

If a is locally of finite presentation, then the base change a' is locally of finite presentation.

Proof. Omitted. Hint: This is formal. \square

Lemma 52.3.5. *Let T be an affine scheme which is written as a limit $T = \lim_{i \in I} T_i$ of a directed inverse system of affine schemes.*

- (1) *Let $\mathcal{V} = \{V_j \rightarrow T\}_{j=1, \dots, m}$ be a standard fppf covering of T , see Topologies, Definition 33.7.5. Then there exists an index i and a standard fppf covering $\mathcal{V}_i = \{V_{i,j} \rightarrow T_i\}_{j=1, \dots, m}$ whose base change $T \times_{T_i} \mathcal{V}_i$ to T is isomorphic to \mathcal{V} .*
- (2) *Let $\mathcal{V}_i, \mathcal{V}'_i$ be a pair of standard fppf coverings of T_i . If $f : T \times_{T_i} \mathcal{V} \rightarrow T \times_{T_i} \mathcal{V}'_i$ is a morphism of coverings of T , then there exists an index $i' \geq i$ and a morphism $f_{i'} : T_{i'} \times_{T_i} \mathcal{V} \rightarrow T_{i'} \times_{T_i} \mathcal{V}'_i$ whose base change to T is f .*
- (3) *If $f, g : \mathcal{V} \rightarrow \mathcal{V}'_i$ are morphisms of standard fppf coverings of T_i whose base changes f_T, g_T to T are equal then there exists an index $i' \geq i$ such that $f_{T_{i'}} = g_{T_{i'}}$.*

In other words, the category of standard fppf coverings of T is the colimit over I of the categories of standard fppf coverings of T_i

Proof. By Limits, Lemma 31.9.1 the category of schemes of finite presentation over T is the colimit over I of the categories of finite presentation over T_i . By Limits, Lemmas 31.7.2 and 31.7.6 the same is true for category of schemes which are affine, flat and of finite presentation over T . To finish the proof of the lemma it suffices to show that if $\{V_{j,i} \rightarrow T_i\}_{j=1, \dots, m}$ is a finite family of flat finitely presented morphisms with $V_{j,i}$ affine, and the base change $\coprod_j T \times_{T_i} V_{j,i} \rightarrow T$ is surjective, then for some $i' \geq i$ the morphism $\coprod T_{i'} \times_{T_i} V_{j,i} \rightarrow T_{i'}$ is surjective. Denote $W_{i'} \subset T_{i'}$, resp. $W \subset T$ the image. Of course $W = T$ by assumption. Since the morphisms are flat and of finite presentation we see that W_i is a quasi-compact open of T_i , see Morphisms, Lemma 28.26.9. Moreover, $W = T \times_{T_i} W_i$ (formation of image

commutes with base change). Hence by Limits, Lemma 31.3.8 we conclude that $W_{i'} = T_{i'}$ for some large enough i' and we win. \square

Lemma 52.3.6. *Let S be a scheme contained in Sch_{fppf} . Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. If F is locally of finite presentation over S then its sheafification $F^\#$ is locally of finite presentation over S .*

Proof. Assume F is locally of finite presentation. It suffices to show that F^+ is locally of finite presentation, since $F^\# = (F^+)^+$, see Sites, Theorem 7.10.10. Let T be an affine scheme over S , and let $T = \lim T_i$ be written as the directed limit of an inverse system of affine S schemes. Recall that $F^+(T)$ is the colimit of $\check{H}^0(\mathcal{V}, F)$ where the limit is over all coverings of T in $(Sch/S)_{fppf}$. Any fppf covering of an affine scheme can be refined by a standard fppf covering, see Topologies, Lemma 33.7.4. Hence we can write

$$F^+(T) = \operatorname{colim}_{\mathcal{V} \text{ standard covering } T} \check{H}^0(\mathcal{V}, F).$$

By Lemma 52.3.5 we may rewrite this as

$$\operatorname{colim}_{i \in I} \operatorname{colim}_{\mathcal{V}_i \text{ standard covering } T_i} \check{H}^0(T \times_{T_i} \mathcal{V}_i, F).$$

(The order of the colimits is irrelevant by Categories, Lemma 4.14.9.) Given a standard fppf covering $\mathcal{V}_i = \{V_j \rightarrow T_i\}_{j=1, \dots, m}$ of T_i we see that

$$T \times_{T_i} V_j = \lim_{i' \geq i} T_{i'} \times_T V_j$$

by Limits, Lemma 31.2.3, and similarly

$$T \times_{T_i} (V_j \times_{T_i} V_{j'}) = \lim_{i' \geq i} T_{i'} \times_T (V_j \times_{T_i} V_{j'}).$$

As the presheaf F is locally of finite presentation this means that

$$\check{H}^0(T \times_{T_i} \mathcal{V}_i, F) = \operatorname{colim}_{i' \geq i} \check{H}^0(T_{i'} \times_{T_i} \mathcal{V}_i, F).$$

Hence the colimit expression for $F^+(T)$ above collapses to

$$\operatorname{colim}_{i \in I} \operatorname{colim}_{\mathcal{V} \text{ standard covering } T_i} \check{H}^0(\mathcal{V}, F) = \operatorname{colim}_{i \in I} F^+(T_i).$$

In other words $F^+(T) = \operatorname{colim}_i F^+(T_i)$ and hence the lemma holds. \square

Lemma 52.3.7. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Assume that*

- (1) F is a sheaf, and
- (2) there exists an fppf covering $\{U_j \rightarrow S\}_{j \in J}$ such that $F|_{(Sch/U_j)_{fppf}}$ is locally of finite presentation.

Then F is locally of finite presentation.

Proof. Let T be an affine scheme over S . Let I be a directed partially ordered set, and let T_i be an inverse system of affine schemes over S such that $T = \lim T_i$. We have to show that the canonical map $\operatorname{colim} F(T_i) \rightarrow F(T)$ is bijective.

Choose some $0 \in I$ and choose a standard fppf covering $\{V_{0,k} \rightarrow T_0\}_{k=1, \dots, m}$ which refines the pullback $\{U_j \times_S T_0 \rightarrow T_0\}$ of the given fppf covering of S . For each $i \geq 0$ we set $V_{i,k} = T_i \times_{T_0} V_{0,k}$, and we set $V_k = T \times_{T_0} V_{0,k}$. Note that $V_k = \lim_{i \geq 0} V_{i,k}$, see Limits, Lemma 31.2.3.

Suppose that $x, x' \in \operatorname{colim} F(T_i)$ map to the same element of $F(T)$. Say x, x' are given by elements $x_i, x'_i \in F(T_i)$ for some $i \in I$ (we may choose the same i for

both as I is directed). By assumption (2) and the fact that x_i, x'_i map to the same element of $F(T)$ this implies that

$$x_i|_{V_{i',k}} = x'_i|_{V_{i',k}}$$

for some suitably large $i' \in I$. We can choose the same i' for each k as $k \in \{1, \dots, m\}$ ranges over a finite set. Since $\{V_{i',k} \rightarrow T_{i'}\}$ is an fppf covering and F is a sheaf this implies that $x_i|_{T_{i'}} = x'_i|_{T_{i'}}$ as desired. This proves that the map $\text{colim } F(T_i) \rightarrow F(T)$ is injective.

To show surjectivity we argue in a similar fashion. Let $x \in F(T)$. By assumption (2) for each k we can choose a i such that $x|_{V_k}$ comes from an element $x_{i,k} \in F(V_{i,k})$. As before we may choose a single i which works for all k . By the injectivity proved above we see that

$$x_{i,k}|_{V_{i',k} \times_{T_{i'}} V_{i',l}} = x_{i,l}|_{V_{i',k} \times_{T_{i'}} V_{i',l}}$$

for some large enough i' . Hence by the sheaf condition of F the elements $x_{i,k}|_{V_{i',k}}$ glue to an element $x_{i'} \in F(T_{i'})$ as desired. \square

Lemma 52.3.8. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (\text{Sch}/S)_{fppf}^{opp} \rightarrow \text{Sets}$ be functors. If $a : F \rightarrow G$ is a transformation which is locally of finite presentation, then the induced transformation of sheaves $F^\# \rightarrow G^\#$ is of finite presentation.*

Proof. Suppose that T is a scheme and $y \in G^\#(T)$. We have to show the functor $F_y^\# : (\text{Sch}/T)_{fppf}^{opp} \rightarrow \text{Sets}$ constructed from $F^\# \rightarrow G^\#$ and y as in Definition 52.3.1 is locally of finite presentation. By Equation (52.3.1.1) we see that $F_y^\#$ is a sheaf. Choose an fppf covering $\{V_j \rightarrow T\}_{j \in J}$ such that $y|_{V_j}$ comes from an element $y_j \in F(V_j)$. Note that the restriction of $F^\#$ to $(\text{Sch}/V_j)_{fppf}$ is just $F_{y_j}^\#$. If we can show that $F_{y_j}^\#$ is locally of finite presentation then Lemma 52.3.7 guarantees that $F_y^\#$ is locally of finite presentation and we win. This reduces us to the case $y \in G(T)$.

Let $y \in G(T)$. In this case we claim that $F_y^\# = (F_y)^\#$. This follows from Equation (52.3.1.1). Thus this case follows from Lemma 52.3.6. \square

Proposition 52.3.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) *The morphism f is a morphism of algebraic spaces which is locally of finite presentation, see Morphisms of Spaces, Definition 49.27.1.*
- (2) *The morphism $f : X \rightarrow Y$ is locally of finite presentation as a transformation of functors, see Definition 52.3.1.*

Proof. Assume (1). Let T be a scheme and let $y \in Y(T)$. We have to show that $T \times_X Y$ is locally of finite presentation over T in the sense of Definition 52.3.1. Hence we are reduced to proving that if X is an algebraic space which is locally of finite presentation over S as an algebraic space, then it is locally of finite presentation as a functor $X : (\text{Sch}/S)_{fppf}^{opp} \rightarrow \text{Sets}$. To see this choose a presentation $X = U/R$, see Spaces, Definition 47.9.3. It follows from Morphisms of Spaces, Definition 49.27.1 that both U and R are schemes which are locally of finite presentation over S . Hence by Limits, Proposition 31.5.1 we have

$$U(T) = \text{colim } U(T_i), \quad R(T) = \text{colim } R(T_i)$$

whenever $T = \lim_i T_i$ in $(Sch/S)_{fppf}$. It follows that the presheaf

$$(Sch/S)_{fppf}^{opp} \longrightarrow Sets, \quad W \longmapsto U(W)/R(W)$$

is locally of finite presentation. Hence by Lemma 52.3.6 its sheafification $X = U/R$ is locally of finite presentation too.

Assume (2). Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Next, choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. By Lemma 52.3.4 the transformation of functors $V \times_Y X \rightarrow V$ is locally of finite presentation. By Morphisms of Spaces, Lemma 49.36.8 the morphism of algebraic spaces $U \rightarrow V \times_Y X$ is locally of finite presentation, hence locally of finite presentation as a transformation of functors by the first part of the proof. By Lemma 52.3.3 the composition $U \rightarrow V \times_Y X \rightarrow V$ is locally of finite presentation as a transformation of functors. Hence the morphism of schemes $U \rightarrow V$ is locally of finite presentation by Limits, Proposition 31.5.1 (modulo a set theoretic remark, see last paragraph of the proof). This means, by definition, that (1) holds.

Set theoretic remark. Let $U \rightarrow V$ be a morphism of $(Sch/S)_{fppf}$. In the statement of Limits, Proposition 31.5.1 we characterize $U \rightarrow V$ as being locally of finite presentation if for *all* directed inverse systems $(T_i, f_{ii'})$ of affine schemes over V we have $U(T) = \text{colim } V(T_i)$, but in the current setting we may only consider affine schemes T_i over V which are (isomorphic to) an object of $(Sch/S)_{fppf}$. So we have to make sure that there are enough affines in $(Sch/S)_{fppf}$ to make the proof work. Inspecting the proof of (2) \Rightarrow (1) of Limits, Proposition 31.5.1 we see that the question reduces to the case that U and V are affine. Say $U = \text{Spec}(A)$ and $V = \text{Spec}(B)$. By construction of $(Sch/S)_{fppf}$ the spectrum of any ring of cardinality $\leq |B|$ is isomorphic to an object of $(Sch/S)_{fppf}$. Hence it suffices to observe that in the "only if" part of the proof of Algebra, Lemma 10.123.2 only A -algebras of cardinality $\leq |B|$ are used. \square

Remark 52.3.10. Here is an important special case of Proposition 52.3.9. Let S be a scheme. Let X be an algebraic space over S . Then X is locally of finite presentation over S if and only if X , as a functor $(Sch/S)^{opp} \rightarrow Sets$, is limit preserving. Compare with Limits, Remark 31.5.2.

52.4. Limits of algebraic spaces

The following lemma explains how we think of limits of algebraic spaces in this chapter. We will use (without further mention) that the base change of an affine morphism of algebraic spaces is affine (see Morphisms of Spaces, Lemma 49.20.5).

Lemma 52.4.1. *Let S be a scheme. Let I be a directed partially ordered set. Let $(X_i, f_{ii'})$ be an inverse system over I in the category of algebraic spaces over S . If the morphisms $f_{ii'} : X_i \rightarrow X_{i'}$ are affine, then the limit $X = \lim_i X_i$ (as an fppf sheaf) is an algebraic space. Moreover,*

- (1) *each of the morphisms $f_i : X \rightarrow X_i$ is affine,*
- (2) *for any $i \in I$ and any morphism of algebraic spaces $T \rightarrow X_i$ we have*

$$X \times_{X_i} T = \lim_{i' \geq i} X_{i'} \times_{X_i} T.$$

as algebraic spaces over S .

Proof. Part (2) is a formal consequence of the existence of the limit $X = \lim X_i$ as an algebraic space over S . Choose an element $0 \in I$ (this is possible as a directed partially ordered set is nonempty). Choose a scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $R_0 = U_0 \times_{X_0} U_0$ so that $X_0 = U_0/R_0$. For $i \geq 0$ set $U_i = X_i \times_{X_0} U_0$ and $R_i = X_i \times_{X_0} R_0 = U_i \times_{X_i} U_i$. By Limits, Lemma 31.2.2 we see that $U = \lim_{i \geq 0} U_i$ and $R = \lim_{i \geq 0} R_i$ are schemes. Moreover, the two morphisms $s, t : R \rightarrow U$ are the base change of the two projections $R_0 \rightarrow U_0$ by the morphism $U \rightarrow U_0$, in particular étale. The morphism $R \rightarrow U \times_S U$ defines an equivalence relation as directed a limit of equivalence relations is an equivalence relation. Hence the morphism $R \rightarrow U \times_S U$ is an étale equivalence relation. We claim that the natural map

$$(52.4.1.1) \quad U/R \longrightarrow \lim X_i$$

is an isomorphism of fppf sheaves on the category of schemes over S . The claim implies $X = \lim X_i$ is an algebraic space by Spaces, Theorem 47.10.5.

Let Z be a scheme and let $a : Z \rightarrow \lim X_i$ be a morphism. Then $a = (a_i)$ where $a_i : Z \rightarrow X_i$. Set $W_0 = Z \times_{a_0, X_0} U_0$. Note that $W_0 = Z \times_{a_i, X_i} U_i$ for all $i \geq 0$ by our choice of $U_i \rightarrow X_i$ above. Hence we obtain a morphism $W_0 \rightarrow \lim_{i \geq 0} U_i = U$. Since $W_0 \rightarrow Z$ is surjective and étale, we conclude that (52.4.1.1) is a surjective map of sheaves. Finally, suppose that Z is a scheme and that $a, b : Z \rightarrow U/R$ are two morphisms which are equalized by (52.4.1.1). We have to show that $a = b$. After replacing Z by the members of an fppf covering we may assume there exist morphisms $a', b' : Z \rightarrow U$ which give rise to a and b . The condition that a, b are equalized by (52.4.1.1) means that for each $i \geq 0$ the compositions $a'_i, b'_i : Z \rightarrow U \rightarrow U_i$ are equal as morphisms into $U_i/R_i = X_i$. Hence $(a'_i, b'_i) : Z \rightarrow U_i \times_S U_i$ factors through R_i , say by some morphism $c_i : Z \rightarrow R_i$. Since $R = \lim_{i \geq 0} R_i$ we see that $c = \lim c_i : Z \rightarrow R$ is a morphism which shows that a, b are equal as morphisms of Z into U/R .

Part (1) follows as we have seen above that $U_i \times_{X_i} X = U$ and $U \rightarrow U_i$ is affine by construction. \square

Lemma 52.4.2. *Let S be a scheme. Let I be a directed partially ordered set. Let $(X_i, f_{ii'})$ be an inverse system over I of algebraic spaces over S with affine transition maps. Let $X = \lim_i X_i$. Let $0 \in I$. Suppose that $T \rightarrow X_0$ is a morphism of algebraic spaces. Then*

$$T \times_{X_0} X = \lim_{i \geq 0} T \times_{X_0} X_i$$

as algebraic spaces over S .

Proof. The limit X is an algebraic space by Lemma 52.4.1. The equality is formal, see Categories, Lemma 4.14.9. \square

52.5. Descending properties

This section is the analogue of Limits, Section 31.3.

Situation 52.5.1. Let S be a scheme. Let $X = \lim_{i \in I} X_i$ be a limit of a directed system of algebraic spaces over S with affine transition morphisms (Lemma 52.4.1). We assume that X_i is quasi-compact and quasi-separated for all $i \in I$. We also choose an element $0 \in I$.

The following lemma holds a little bit more generally (namely when we just assume each X_i is a decent algebraic space).

Lemma 52.5.2. *In Situation 52.5.1 we have $|X| = \lim |X_i|$.*

Proof. There is a canonical map $|X| \rightarrow \lim |X_i|$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U_i = X_i \times_{X_0} U_0$ and $U = X \times_{X_0} U_0$. Set $R_i = U_i \times_{X_i} U_i$ and $R = U \times_X U$. Recall that $U = \lim U_i$ and $R = \lim R_i$, see proof of Lemma 52.4.1. Recall that $|X| = |U|/|R|$ and $|X_i| = |U_i|/|R_i|$. By Limits, Lemma 31.3.2 we have $|U| = \lim |U_i|$ and $|R| = \lim |R_i|$.

Surjectivity of $|X| \rightarrow \lim |X_i|$. Let $(x_i) \in \lim |X_i|$. Denote $S_i \subset |U_i|$ the inverse image of x_i . This is a finite nonempty set by Properties of Spaces, Lemma 48.12.3. Hence $\lim S_i$ is nonempty, see Categories, Lemma 4.21.5. Let $(u_i) \in \lim S_i \subset \lim |U_i|$. By the above this determines a point $u \in |U|$ which maps to an $x \in |X|$ mapping to the given element (x_i) of $\lim |X_i|$.

Injectivity of $|X| \rightarrow \lim |X_i|$. Suppose that $x, x' \in |X|$ map to the same point of $\lim |X_i|$. Choose lifts $u, u' \in |U|$ and denote $u_i, u'_i \in |U_i|$ the images. For each i let $T_i \subset |R_i|$ be the set of points mapping to $(u_i, u'_i) \in |U_i| \times |U_i|$. This is a finite set by Properties of Spaces, Lemma 48.12.3 which is nonempty as we've assumed that x and x' map to the same point of X_i . Hence $\lim T_i$ is nonempty, see Categories, Lemma 4.21.5. As before let $r \in |R| = \lim |R_i|$ be a point corresponding to an element of $\lim T_i$. Then r maps to (u, u') in $|U| \times |U|$ by construction and we see that $x = x'$ in $|X|$ as desired. \square

Lemma 52.5.3. *In Situation 52.5.1, if each X_i is nonempty, then $|X|$ is nonempty.*

Proof. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U_i = X_i \times_{X_0} U_0$ and $U = X \times_{X_0} U_0$. Then each U_i is a nonempty affine scheme. Hence $U = \lim U_i$ is nonempty (Limits, Lemma 31.3.4) and thus X is nonempty. \square

Lemma 52.5.4. *Notation and assumptions as in Situation 52.5.1. Suppose that \mathcal{F}_0 is a quasi-coherent sheaf on X_0 . Set $\mathcal{F}_i = f_{0i}^* \mathcal{F}_0$ for $i \geq 0$ and set $\mathcal{F} = f_0^* \mathcal{F}_0$. Then*

$$\Gamma(X, \mathcal{F}) = \operatorname{colim}_{i \geq 0} \Gamma(X_i, \mathcal{F}_i)$$

Proof. Choose a surjective étale morphism $U_0 \rightarrow X_0$ where U_0 is an affine scheme (Properties of Spaces, Lemma 48.6.3). Set $U_i = X_i \times_{X_0} U_0$. Set $R_0 = U_0 \times_{X_0} U_0$ and $R_i = R_0 \times_{X_0} X_i$. In the proof of Lemma 52.4.1 we have seen that there exists a presentation $X = U/R$ with $U = \lim U_i$ and $R = \lim R_i$. Note that U_i and U are affine and that R_i and R are quasi-compact and separated (as X_i is quasi-separated). Hence Limits, Lemma 31.3.3 implies that

$$\mathcal{F}(U) = \operatorname{colim} \mathcal{F}_i(U_i) \quad \text{and} \quad \mathcal{F}(R) = \operatorname{colim} \mathcal{F}_i(R_i).$$

The lemma follows as $\Gamma(X, \mathcal{F}) = \operatorname{Ker}(\mathcal{F}(U) \rightarrow \mathcal{F}(R))$ and similarly $\Gamma(X_i, \mathcal{F}_i) = \operatorname{Ker}(\mathcal{F}_i(U_i) \rightarrow \mathcal{F}_i(R_i))$ \square

Lemma 52.5.5. *Notation and assumptions as in Situation 52.5.1. For any quasi-compact open subspace $U \subset X$ there exists an i and a quasi-compact open $U_i \subset X_i$ whose inverse image in X is U .*

Proof. Follows formally from the construction of limits in Lemma 52.4.1 and the corresponding result for schemes: Limits, Lemma 31.3.8. \square

The following lemma will be superseded by the stronger Lemma 52.6.9.

Lemma 52.5.6. *Notation and assumptions as in Situation 52.5.1. Let $f_0 : Y_0 \rightarrow Z_0$ be a morphism of algebraic spaces over X_0 . Assume (a) $Y_0 \rightarrow X_0$ and $Z_0 \rightarrow X_0$ are representable, (b) Y_0, Z_0 quasi-compact and quasi-separated, (c) f_0 locally of finite presentation, and (d) $Y_0 \times_{X_0} X \rightarrow Z_0 \times_{X_0} X$ an isomorphism. Then there exists an $i \geq 0$ such that $Y_0 \times_{X_0} X_i \rightarrow Z_0 \times_{X_0} X_i$ is an isomorphism.*

Proof. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U_i = U_0 \times_{X_0} X_i$ and $U = U_0 \times_{X_0} X$. Apply Limits, Lemma 31.7.9 to see that $Y_0 \times_{X_0} U_i \rightarrow Z_0 \times_{X_0} U_i$ is an isomorphism of schemes for some $i \geq 0$ (details omitted). As $U_i \rightarrow X_i$ is surjective étale, it follows that $Y_0 \times_{X_0} X_i \rightarrow Z_0 \times_{X_0} X_i$ is an isomorphism (details omitted). \square

Lemma 52.5.7. *Notation and assumptions as in Situation 52.5.1. If X is separated, then X_i is separated for some $i \in I$.*

Proof. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. For $i \geq 0$ set $U_i = U_0 \times_{X_0} X_i$ and set $U = U_0 \times_{X_0} X$. Note that U_i and U are affine schemes which come equipped with surjective étale morphisms $U_i \rightarrow X_i$ and $U \rightarrow X$. Set $R_i = U_i \times_{X_i} U_i$ and $R = U \times_X U$ with projections $s_i, t_i : R_i \rightarrow U_i$ and $s, t : R \rightarrow U$. Note that R_i and R are quasi-compact separated schemes (as the algebraic spaces X_i and X are quasi-separated). The maps $s_i : R_i \rightarrow U_i$ and $s : R \rightarrow U$ are of finite type. By definition X_i is separated if and only if $(t_i, s_i) : R_i \rightarrow U_i \times U_i$ is a closed immersion, and since X is separated by assumption, the morphism $(t, s) : R \rightarrow U \times U$ is a closed immersion. Since $R \rightarrow U$ is of finite type, there exists an i such that the morphism $R \rightarrow U_i \times U$ is a closed immersion (Limits, Lemma 31.3.13). Fix such an $i \in I$. Apply Limits, Lemma 31.7.4 to the system of morphisms $R_{i'} \rightarrow U_i \times U_{i'}$ for $i' \geq i$ (this is permissible as indeed $R_{i'} = R_i \times_{U_i \times U_i} U_i \times U_{i'}$) to see that $R_{i'} \rightarrow U_i \times U_{i'}$ is a closed immersion for i' sufficiently large. This implies immediately that $R_{i'} \rightarrow U_{i'} \times U_{i'}$ is a closed immersion finishing the proof of the lemma. \square

Lemma 52.5.8. *Notation and assumptions as in Situation 52.5.1. If X is affine, then there exists an i such that X_i is affine.*

Proof. Choose $0 \in I$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U = U_0 \times_{X_0} X$ and $U_i = U_0 \times_{X_0} X_i$ for $i \geq 0$. Since the transition morphisms are affine, the algebraic spaces U_i and U are affine. Thus $U \rightarrow X$ is an étale morphism of affine schemes. Hence we can write $X = \text{Spec}(A)$, $U = \text{Spec}(B)$ and

$$B = A[x_1, \dots, x_n]/(g_1, \dots, g_n)$$

such that $\Delta = \det(\partial g_\lambda / \partial x_\mu)$ is invertible in B , see Algebra, Lemma 10.138.2. Set $A_i = \mathcal{O}_{X_i}(X_i)$. We have $A = \text{colim } A_i$ by Lemma 52.5.4. After increasing 0 we may assume we have $g_{1,i}, \dots, g_{n,i} \in A_i[x_1, \dots, x_n]$ mapping to g_1, \dots, g_n . Set

$$B_i = A_i[x_1, \dots, x_n]/(g_{1,i}, \dots, g_{n,i})$$

for all $i \geq 0$. Increasing 0 if necessary we may assume that $\Delta_i = \det(\partial g_{\lambda,i} / \partial x_\mu)$ is invertible in B_i for all $i \geq 0$. Thus $A_i \rightarrow B_i$ is an étale ring map. After increasing 0 we may assume also that $\text{Spec}(B_i) \rightarrow \text{Spec}(A_i)$ is surjective, see Limits, Lemma 31.7.11. Increasing 0 yet again we may choose elements $h_{1,i}, \dots, h_{n,i} \in \mathcal{O}_{U_i}(U_i)$

which map to the classes of x_1, \dots, x_n in $B = \mathcal{O}_U(U)$ and such that $g_{\lambda,i}(h_{\nu,i}) = 0$ in $\mathcal{O}_{U_i}(U_i)$. Thus we obtain a commutative diagram

$$(52.5.8.1) \quad \begin{array}{ccc} X_i & \longleftarrow & U_i \\ \downarrow & & \downarrow \\ \mathrm{Spec}(A_i) & \longleftarrow & \mathrm{Spec}(B_i) \end{array}$$

By construction $B_i = B_0 \otimes_{A_0} A_i$ and $B = B_0 \otimes_{A_0} A$. Consider the morphism

$$f_0 : U_0 \longrightarrow X_0 \times_{\mathrm{Spec}(A_0)} \mathrm{Spec}(B_0)$$

This is a morphism of quasi-compact and quasi-separated algebraic spaces representable, separated and étale over X_0 . The base change of f_0 to X is an isomorphism by our choices. Hence Lemma 52.5.6 guarantees that there exists an i such that the base change of f_0 to X_i is an isomorphism, in other words the diagram (52.5.8.1) is cartesian. Thus Descent, Lemma 34.35.1 applied to the fppf covering $\{\mathrm{Spec}(B_i) \rightarrow \mathrm{Spec}(A_i)\}$ combined with Descent, Lemma 34.33.1 give that $X_i \rightarrow \mathrm{Spec}(A_i)$ is representable by a scheme affine over $\mathrm{Spec}(A_i)$ as desired. (Of course it then also follows that $X_i = \mathrm{Spec}(A_i)$ but we don't need this.) \square

Lemma 52.5.9. *Notation and assumptions as in Situation 52.5.1. If X is a scheme, then there exists an i such that X_i is a scheme.*

Proof. Choose a finite affine open covering $X = \bigcup W_j$. By Lemma 52.5.5 we can find an $i \in I$ and open subspaces $W_{j,i} \subset X_i$ whose base change to X is $W_j \rightarrow X$. By Lemma 52.5.8 we may assume that each $W_{j,i}$ is an affine scheme. This means that X_i is a scheme (see for example Properties of Spaces, Section 48.10). \square

Lemma 52.5.10. *Let S be a scheme. Let B be an algebraic space over S . Let $X = \lim X_i$ be a directed limit of algebraic spaces over B with affine transition morphisms. Let $Y \rightarrow X$ be a morphism of algebraic spaces over B .*

- (1) *If $Y \rightarrow X$ is a closed immersion, X_i quasi-compact, and $Y \rightarrow B$ locally of finite type, then $Y \rightarrow X_i$ is a closed immersion for i large enough.*
- (2) *If $Y \rightarrow X$ is an immersion, X_i quasi-separated, $Y \rightarrow B$ locally of finite type, and Y quasi-compact, then $Y \rightarrow X_i$ is an immersion for i large enough.*
- (3) *If $Y \rightarrow X$ is an isomorphism, X_i quasi-compact, $X_i \rightarrow B$ locally of finite type, the transition morphisms $X_{i'} \rightarrow X_i$ are closed immersions, and $Y \rightarrow B$ is locally of finite presentation, then $Y \rightarrow X_i$ is an isomorphism for i large enough.*
- (4) *If $Y \rightarrow X$ is a monomorphism, X_i quasi-separated, $Y \rightarrow B$ locally of finite type, and Y quasi-compact, then $Y \rightarrow X_i$ is a monomorphism for i large enough.*

Proof. Proof of (1). Choose $0 \in I$. As X_0 is quasi-compact, we can choose an affine scheme W and an étale morphism $W \rightarrow B$ such that the image of $|X_0| \rightarrow |B|$ is contained in $|W| \rightarrow |B|$. Choose an affine scheme U_0 and an étale morphism $U_0 \rightarrow X_0 \times_B W$ such that $U_0 \rightarrow X_0$ is surjective. (This is possible by our choice of W and the fact that X_0 is quasi-compact; details omitted.) Let $V \rightarrow Y$, resp. $U \rightarrow X$, resp. $U_i \rightarrow X_i$ be the base change of $U_0 \rightarrow X_0$ (for $i \geq 0$). It suffices to prove that $V \rightarrow U_i$ is a closed immersion for i sufficiently large. Thus we reduce

to proving the result for $V \rightarrow U = \lim U_i$ over W . This follows from the case of schemes, which is Limits, Lemma 31.3.13.

Proof of (2). Choose $0 \in I$. Choose a quasi-compact open subspace $X'_0 \subset X_0$ such that $Y \rightarrow X_0$ factors through X'_0 . After replacing X_i by the inverse image of X'_0 for $i \geq 0$ we may assume all X'_i are quasi-compact and quasi-separated. Let $U \subset X$ be a quasi-compact open such that $Y \rightarrow X$ factors through a closed immersion $Y \rightarrow U$ (U exists as Y is quasi-compact). By Lemma 52.5.5 we may assume that $U = \lim U_i$ with $U_i \subset X_i$ quasi-compact open. By part (1) we see that $Y \rightarrow U_i$ is a closed immersion for some i . Thus (2) holds.

Proof of (3). Choose $0 \in I$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U_i = X_i \times_{X_0} U_0$, $U = X \times_{X_0} U_0 = Y \times_{X_0} U_0$. Then $U = \lim U_i$ is a limit of affine schemes, the transition maps of the system are closed immersions, and $U \rightarrow U_0$ is of finite presentation (because $U \rightarrow B$ is locally of finite presentation and $U_0 \rightarrow B$ is locally of finite type and Morphisms of Spaces, Lemma 49.27.9). Thus we've reduced to the following algebra fact: If $A = \lim A_i$ is a directed colimit of R -algebras with surjective transition maps and A of finite presentation over A_0 , then $A = A_i$ for some i . Namely, write $A = A_0/(f_1, \dots, f_n)$. Pick i such that f_1, \dots, f_n map to zero under the surjective map $A_0 \rightarrow A_i$.

Proof of (4). Set $Z_i = Y \times_{X_i} Y$. As the transition morphisms $X_{i'} \rightarrow X_i$ are affine hence separated, the transition morphisms $Z_{i'} \rightarrow Z_i$ are closed immersions, see Morphisms of Spaces, Lemma 49.4.5. We have $\lim Z_i = Y \times_X Y = Y$ as $Y \rightarrow X$ is a monomorphism. Choose $0 \in I$. Since $Y \rightarrow X_0$ is locally of finite type (Morphisms of Spaces, Lemma 49.23.6) the morphism $Y \rightarrow Z_0$ is locally of finite presentation (Morphisms of Spaces, Lemma 49.27.10). The morphisms $Z_i \rightarrow Z_0$ are locally of finite type (they are closed immersions). Finally, $Z_i = Y \times_{X_i} Y$ is quasi-compact as X_i is quasi-separated and Y is quasi-compact. Thus part (3) applies to $Y = \lim_{i \geq 0} Z_i$ over Z_0 and we conclude $Y = Z_i$ for some i . This proves (4) and the lemma. \square

Lemma 52.5.11. *Let S be a scheme. Let Y be an algebraic space over S . Let $X = \lim X_i$ be a directed limit of algebraic spaces over Y with affine transition morphisms. Assume*

- (1) Y is quasi-separated,
- (2) X_i is quasi-compact and quasi-separated,
- (3) the morphism $X \rightarrow Y$ is separated.

Then $X_i \rightarrow Y$ is separated for all i large enough.

Proof. Let $0 \in I$. Choose an affine scheme W and an étale morphism $W \rightarrow Y$ such that the image of $|W| \rightarrow |Y|$ contains the image of $|X_0| \rightarrow |Y|$. This is possible as X_0 is quasi-compact. It suffices to check that $W \times_Y X_i \rightarrow W$ is separated for some $i \geq 0$ because the diagonal of $W \times_Y X_i$ over W is the base change of $X_i \rightarrow X_i \times_Y X_i$ by the surjective étale morphism $(X_i \times_Y X_i) \times_Y W \rightarrow X_i \times_Y X_i$. Since Y is quasi-separated the algebraic spaces $W \times_Y X_i$ are quasi-compact (as well as quasi-separated). Thus we may base change to W and assume Y is an affine scheme. When Y is an affine scheme, we have to show that X_i is a separated algebraic space for i large enough and we are given that X is a separated algebraic space. Thus this case follows from Lemma 52.5.7. \square

Lemma 52.5.12. *Let S be a scheme. Let Y be an algebraic space over S . Let $X = \lim X_i$ be a directed limit of algebraic spaces over Y with affine transition morphisms. Assume*

- (1) Y quasi-compact and quasi-separated,
- (2) X_i quasi-compact and quasi-separated,
- (3) $X \rightarrow Y$ affine.

Then $X_i \rightarrow Y$ is affine for i large enough.

Proof. Choose an affine scheme W and a surjective étale morphism $W \rightarrow Y$. Then $X \times_Y W$ is affine and it suffices to check that $X_i \times_Y W$ is affine for some i (Morphisms of Spaces, Lemma 49.20.3). This follows from Lemma 52.5.8. \square

Lemma 52.5.13. *Let S be a scheme. Let Y be an algebraic space over S . Let $X = \lim X_i$ be a directed limit of algebraic spaces over Y with affine transition morphisms. Assume*

- (1) Y quasi-compact and quasi-separated,
- (2) X_i quasi-compact and quasi-separated,
- (3) the transition morphisms $X_{i'} \rightarrow X_i$ are finite,
- (4) $X_i \rightarrow Y$ locally of finite type
- (5) $X \rightarrow Y$ integral.

Then $X_i \rightarrow Y$ is finite for i large enough.

Proof. Choose an affine scheme W and a surjective étale morphism $W \rightarrow Y$. Then $X \times_Y W$ is finite over W and it suffices to check that $X_i \times_Y W$ is finite over W for some i (Morphisms of Spaces, Lemma 49.41.3). By Lemma 52.5.9 this reduces us to the case of schemes. In the case of schemes it follows from Limits, Lemma 31.3.16. \square

Lemma 52.5.14. *Let S be a scheme. Let Y be an algebraic space over S . Let $X = \lim X_i$ be a directed limit of algebraic spaces over Y with affine transition morphisms. Assume*

- (1) Y quasi-compact and quasi-separated,
- (2) X_i quasi-compact and quasi-separated,
- (3) the transition morphisms $X_{i'} \rightarrow X_i$ are closed immersions,
- (4) $X_i \rightarrow Y$ locally of finite type
- (5) $X \rightarrow Y$ is a closed immersion.

Then $X_i \rightarrow Y$ is a closed immersion for i large enough.

Proof. Choose an affine scheme W and a surjective étale morphism $W \rightarrow Y$. Then $X \times_Y W$ is a closed subspace of W and it suffices to check that $X_i \times_Y W$ is a closed subspace W for some i (Morphisms of Spaces, Lemma 49.12.1). By Lemma 52.5.9 this reduces us to the case of schemes. In the case of schemes it follows from Limits, Lemma 31.3.17. \square

52.6. Descending properties of morphisms

This section is the analogue of Section 52.5 for properties of morphisms. We will work in the following situation.

Situation 52.6.1. Let S be a scheme. Let $B = \lim B_i$ be a limit of a directed system of algebraic spaces over S with affine transition morphisms (Lemma 52.4.1).

Let $0 \in I$ and let $f_0 : X_0 \rightarrow Y_0$ be a morphism of algebraic spaces over B_0 . Assume B_0, X_0, Y_0 are quasi-compact and quasi-separated. Let $f_i : X_i \rightarrow Y_i$ be the base change of f_0 to B_i and let $f : X \rightarrow Y$ be the base change of f_0 to B .

Lemma 52.6.2. *With notation and assumptions as in Situation 52.6.1. If*

- (1) f is étale,
- (2) f_0 is locally of finite presentation,

then f_i is étale for some $i \geq 0$.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow V_0 \times_{Y_0} X_0$. Diagram

$$\begin{array}{ccc} U_0 & \longrightarrow & V_0 \\ \downarrow & & \downarrow \\ X_0 & \longrightarrow & Y_0 \end{array}$$

The vertical arrows are surjective and étale by construction. We can base change this diagram to B_i or B to get

$$\begin{array}{ccc} U_i & \longrightarrow & V_i \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & Y_i \end{array} \quad \text{and} \quad \begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

Note that U_i, V_i, U, V are affine schemes, the vertical morphisms are surjective étale, and the limit of the morphisms $U_i \rightarrow V_i$ is $U \rightarrow V$. Recall that $X_i \rightarrow Y_i$ is étale if and only if $U_i \rightarrow V_i$ is étale and similarly $X \rightarrow Y$ is étale if and only if $U \rightarrow V$ is étale (Morphisms of Spaces, Definition 49.36.1). Since f_0 is locally of finite presentation, so is the morphism $U_0 \rightarrow V_0$. Hence the lemma follows from Limits, Lemma 31.7.8. □

Lemma 52.6.3. *With notation and assumptions as in Situation 52.6.1. If*

- (1) f is surjective,
- (2) f_0 is locally of finite presentation,

then f_i is surjective for some $i \geq 0$.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow V_0 \times_{Y_0} X_0$. Diagram

$$\begin{array}{ccc} U_0 & \longrightarrow & V_0 \\ \downarrow & & \downarrow \\ X_0 & \longrightarrow & Y_0 \end{array}$$

The vertical arrows are surjective and étale by construction. We can base change this diagram to B_i or B to get

$$\begin{array}{ccc} U_i & \longrightarrow & V_i \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & Y_i \end{array} \quad \text{and} \quad \begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

Note that U_i, V_i, U, V are affine schemes, the vertical morphisms are surjective étale, the limit of the morphisms $U_i \rightarrow V_i$ is $U \rightarrow V$, and the morphisms $U_i \rightarrow X_i \times_{Y_i} V_i$ and $U \rightarrow X \times_Y V$ are surjective (as base changes of $U_0 \rightarrow X_0 \times_{Y_0} V_0$). In particular, we see that $X_i \rightarrow Y_i$ is surjective if and only if $U_i \rightarrow V_i$ is surjective and similarly $X \rightarrow Y$ is surjective if and only if $U \rightarrow V$ is surjective. Since f_0 is locally of finite presentation, so is the morphism $U_0 \rightarrow V_0$. Hence the lemma follows from the case of schemes (Limits, Lemma 31.7.11). \square

Lemma 52.6.4. *Notation and assumptions as in Situation 52.6.1. If*

- (1) f is universally injective,
- (2) f_0 is locally of finite type,

then f_i is universally injective for some $i \geq 0$.

Proof. Recall that a morphism $X \rightarrow Y$ is universally injective if and only if the diagonal $X \rightarrow X \times_Y X$ is surjective (Morphisms of Spaces, Definition 49.19.3 and Lemma 49.19.2). Observe that $X_0 \rightarrow X_0 \times_{Y_0} X_0$ is of locally of finite presentation (Morphisms of Spaces, Lemma 49.27.10). Hence the lemma follows from Lemma 52.6.3 by considering the morphism $X_0 \rightarrow X_0 \times_{Y_0} X_0$. \square

Lemma 52.6.5. *Notation and assumptions as in Situation 52.6.1. If f is affine, then f_i is affine for some $i \geq 0$.*

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Set $V_i = V_0 \times_{Y_0} Y_i$ and $V = V_0 \times_{Y_0} Y$. Since f is affine we see that $V \times_Y X = \lim V_i \times_{Y_i} X_i$ is affine. By Lemma 52.5.8 we see that $V_i \times_{Y_i} X_i$ is affine for some $i \geq 0$. For this i the morphism f_i is affine (Morphisms of Spaces, Lemma 49.20.3). \square

Lemma 52.6.6. *Notation and assumptions as in Situation 52.6.1. If*

- (1) f is finite,
- (2) f_0 is locally of finite type,

then f_i is finite for some $i \geq 0$.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Set $V_i = V_0 \times_{Y_0} Y_i$ and $V = V_0 \times_{Y_0} Y$. Since f is finite we see that $V \times_Y X = \lim V_i \times_{Y_i} X_i$ is a scheme finite over V . By Lemma 52.5.8 we see that $V_i \times_{Y_i} X_i$ is affine for some $i \geq 0$. Increasing i if necessary we find that $V_i \times_{Y_i} X_i \rightarrow V_i$ is finite by Limits, Lemma 31.7.3. For this i the morphism f_i is finite (Morphisms of Spaces, Lemma 49.41.3). \square

Lemma 52.6.7. *Notation and assumptions as in Situation 52.6.1. If*

- (1) f is a closed immersion,
- (2) f_0 is locally of finite type,

then f_i is a closed immersion for some $i \geq 0$.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Set $V_i = V_0 \times_{Y_0} Y_i$ and $V = V_0 \times_{Y_0} Y$. Since f is a closed immersion we see that $V \times_Y X = \lim V_i \times_{Y_i} X_i$ is a closed subscheme of the affine scheme V . By Lemma 52.5.8 we see that $V_i \times_{Y_i} X_i$ is affine for some $i \geq 0$. Increasing i if necessary we find that $V_i \times_{Y_i} X_i \rightarrow V_i$ is a closed immersion by Limits, Lemma 31.7.4. For this i the morphism f_i is a closed immersion (Morphisms of Spaces, Lemma 49.41.3). \square

Lemma 52.6.8. *Notation and assumptions as in Situation 52.6.1. If f is separated, then f_i is separated for some $i \geq 0$.*

Proof. Apply Lemma 52.6.7 to the diagonal morphism $\Delta_{X_0/Y_0} : X_0 \rightarrow X_0 \times_{Y_0} X_0$. (Diagonal morphisms are locally of finite type and the fibre product $X_0 \times_{Y_0} X_0$ is quasi-compact and quasi-separated. Some details omitted.) \square

Lemma 52.6.9. *Notation and assumptions as in Situation 52.6.1. If*

- (1) f is a isomorphism,
- (2) f_0 is locally of finite presentation,

then f_i is a isomorphism for some $i \geq 0$.

Proof. Being an isomorphism is equivalent to being étale, universally injective, and surjective, see Morphisms of Spaces, Lemma 49.45.2. Thus the lemma follows from Lemmas 52.6.2, 52.6.3, and 52.6.4. \square

Lemma 52.6.10. *Notation and assumptions as in Situation 52.6.1. If*

- (1) f is a monomorphism,
- (2) f_0 is locally of finite type,

then f_i is a monomorphism for some $i \geq 0$.

Proof. Recall that a morphism is a monomorphism if and only if the diagonal is an isomorphism. The morphism $X_0 \rightarrow X_0 \times_{Y_0} X_0$ is locally of finite presentation by Morphisms of Spaces, Lemma 49.27.10. Since $X_0 \times_{Y_0} X_0$ is quasi-compact and quasi-separated we conclude from Lemma 52.6.9 that $\Delta_i : X_i \rightarrow X_i \times_{Y_i} X_i$ is an isomorphism for some $i \geq 0$. For this i the morphism f_i is a monomorphism. \square

Lemma 52.6.11. *Notation and assumptions as in Situation 52.6.1. Let \mathcal{F}_0 be a quasi-coherent \mathcal{O}_{X_0} -module and denote \mathcal{F}_i the pullback to X_i and \mathcal{F} the pullback to X . If*

- (1) \mathcal{F} is flat over Y ,
- (2) \mathcal{F}_0 is of finite presentation, and
- (3) f_0 is locally of finite presentation,

then \mathcal{F}_i is flat over Y_i for some $i \geq 0$. In particular, if f_0 is locally of finite presentation and f is flat, then f_i is flat for some $i \geq 0$.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow V_0 \times_{Y_0} X_0$. Diagram

$$\begin{array}{ccc} U_0 & \longrightarrow & V_0 \\ \downarrow & & \downarrow \\ X_0 & \longrightarrow & Y_0 \end{array}$$

The vertical arrows are surjective and étale by construction. We can base change this diagram to B_i or B to get

$$\begin{array}{ccc} U_i & \longrightarrow & V_i \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & Y_i \end{array} \quad \text{and} \quad \begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

Note that U_i, V_i, U, V are affine schemes, the vertical morphisms are surjective étale, and the limit of the morphisms $U_i \rightarrow V_i$ is $U \rightarrow V$. Recall that \mathcal{F}_i is flat over Y_i if and only if $\mathcal{F}_i|_{U_i}$ is flat over V_i and similarly \mathcal{F} is flat over Y if and only if $\mathcal{F}|_U$ is flat over V (Morphisms of Spaces, Definition 49.28.1). Since f_0 is locally of finite presentation, so is the morphism $U_0 \rightarrow V_0$. Hence the lemma follows from Limits, Lemma 31.9.3. \square

Lemma 52.6.12. *Assumptions and notation as in Situation 52.6.1. If*

- (1) f is proper, and
- (2) f_0 is locally of finite type,

then there exists an i such that f_i is proper.

Proof. Choose an affine scheme V_0 and a surjective étale morphism $V_0 \rightarrow Y_0$. Set $V_i = Y_i \times_{Y_0} V_0$ and $V = Y \times_{Y_0} V_0$. It suffices to prove that the base change of f_i to V_i is proper, see Morphisms of Spaces, Lemma 49.37.2. Thus we may assume Y_0 is affine.

By Lemma 52.6.8 we see that f_i is separated for some $i \geq 0$. Replacing 0 by i we may assume that f_0 is separated. Observe that f_0 is quasi-compact. Thus f_0 is separated and of finite type. By Cohomology of Spaces, Lemma 51.17.1 we can choose a diagram

$$\begin{array}{ccccc} X_0 & \xleftarrow{\pi} & X'_0 & \longrightarrow & \mathbf{P}^n_{Y_0} \\ & \searrow & \downarrow & \swarrow & \\ & & Y_0 & & \end{array}$$

where $X'_0 \rightarrow \mathbf{P}^n_{Y_0}$ is an immersion, and $\pi : X'_0 \rightarrow X_0$ is proper and surjective. Introduce $X' = X'_0 \times_{Y_0} Y$ and $X'_i = X'_0 \times_{Y_0} Y_i$. By Morphisms of Spaces, Lemmas 49.37.4 and 49.37.3 we see that $X' \rightarrow Y$ is proper. Hence $X' \rightarrow \mathbf{P}^n_Y$ is a closed immersion (Morphisms of Spaces, Lemma 49.37.6). By Morphisms of Spaces, Lemma 49.37.7 it suffices to prove that $X'_i \rightarrow Y_i$ is proper for some i . By Lemma 52.6.7 we find that $X'_i \rightarrow \mathbf{P}^n_{Y_i}$ is a closed immersion for i large enough. Then $X'_i \rightarrow Y_i$ is proper and we win. \square

52.7. Descending relative objects

The following lemma is typical of the type of results in this section.

Lemma 52.7.1. *Let S be a scheme. Let I be a directed partially ordered set. Let $(X_i, f_{ii'})$ be an inverse system over I of algebraic spaces over S . Assume*

- (1) the morphisms $f_{ii'} : X_i \rightarrow X_{i'}$ are affine,
- (2) the spaces X_i are quasi-compact and quasi-separated.

Let $X = \lim_i X_i$. Then the category of algebraic spaces of finite presentation over X is the colimit over I of the categories of algebraic spaces of finite presentation over X_i .

Proof. Pick $0 \in I$. Choose a surjective étale morphism $U_0 \rightarrow X_0$ where U_0 is an affine scheme (Properties of Spaces, Lemma 48.6.3). Set $U_i = X_i \times_{X_0} U_0$. Set $R_0 = U_0 \times_{X_0} U_0$ and $R_i = R_0 \times_{X_0} X_i$. Denote $s_i, t_i : R_i \rightarrow U_i$ and $s, t : R \rightarrow U$ the two projections. In the proof of Lemma 52.4.1 we have seen that there exists a presentation $X = U/R$ with $U = \lim U_i$ and $R = \lim R_i$. Note that U_i and

U are affine and that R_i and R are quasi-compact and separated (as X_i is quasi-separated). Let Y be an algebraic space over S and let $Y \rightarrow X$ be a morphism of finite presentation. Set $V = U \times_X Y$. This is an algebraic space of finite presentation over U . Choose an affine scheme W and a surjective étale morphism $W \rightarrow V$. Then $W \rightarrow Y$ is surjective étale as well. Set $R' = W \times_Y W$ so that $Y = W/R'$ (see Spaces, Section 47.9). Note that W is a scheme of finite presentation over U and that R' is a scheme of finite presentation over R (details omitted). By Limits, Lemma 31.9.1 we can find an index i and a morphism of schemes $W_i \rightarrow U_i$ of finite presentation whose base change to U gives $W \rightarrow U$. Similarly we can find, after possibly increasing i , a scheme R'_i of finite presentation over R_i whose base change to R is R' . The projection morphisms $s', t' : R' \rightarrow W$ are morphisms over the projection morphisms $s, t : R \rightarrow U$. Hence we can view s' , resp. t' as a morphism between schemes of finite presentation over U (with structure morphism $R' \rightarrow U$ given by $R' \rightarrow R$ followed by s , resp. t). Hence we can apply Limits, Lemma 31.9.1 again to see that, after possibly increasing i , there exist morphisms $s'_i, t'_i : R'_i \rightarrow W_i$, whose base change to U is s', t' . By Limits, Lemmas 31.7.8 and 31.7.10 we may assume that s'_i, t'_i are étale and that $j'_i : R'_i \rightarrow W_i \times_{X_i} W_i$ is a monomorphism (here we view j'_i as a morphism of schemes of finite presentation over U_i via one of the projections – it doesn't matter which one). Setting $Y_i = W_i/R'_i$ (see Spaces, Theorem 47.10.5) we obtain an algebraic space of finite presentation over X_i whose base change to X is isomorphic to Y .

This shows that every algebraic space of finite presentation over X comes from an algebraic space of finite presentation over some X_i , i.e., it shows that the functor of the lemma is essentially surjective. To show that it is fully faithful, consider an index $0 \in I$ and two algebraic spaces Y_0, Z_0 of finite presentation over X_0 . Set $Y_i = X_i \times_{X_0} Y_0$, $Z_i = X_i \times_{X_0} Z_0$, and $Z = X \times_{X_0} Z_0$. Let $\alpha : Y \rightarrow Z$ be a morphism of algebraic spaces over X . Choose a surjective étale morphism $V_0 \rightarrow Y_0$ where V_0 is an affine scheme. Set $V_i = V_0 \times_{Y_0} Y_i$ and $V = V_0 \times_{Y_0} Y$ which are affine schemes endowed with surjective étale morphisms to Y_i and Y . The composition $V \rightarrow Y \rightarrow Z \rightarrow Z_0$ comes from a (essentially unique) morphism $V_i \rightarrow Z_0$ for some $i \geq 0$ by Proposition 52.3.9 (applied to $Z_0 \rightarrow X_0$ which is of finite presentation by assumption). After increasing i the two compositions

$$V_i \times_{Y_i} V_i \rightarrow V_i \rightarrow Z_0$$

are equal as this is true in the limit. Hence we obtain a (essentially unique) morphism $Y_i \rightarrow Z_0$. Since this is a morphism over X_0 it induces a morphism into $Z_i = Z_0 \times_{X_0} X_i$ as desired. \square

Lemma 52.7.2. *With notation and assumptions as in Lemma 52.7.1. The category of \mathcal{O}_X -modules of finite presentation is the colimit over I of the categories \mathcal{O}_{X_i} -modules of finite presentation.*

Proof. Choose $0 \in I$. Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X_0$. Set $U_i = X_i \times_{X_0} U_0$. Set $R_0 = U_0 \times_{X_0} U_0$ and $R_i = R_0 \times_{X_0} X_i$. Denote $s_i, t_i : R_i \rightarrow U_i$ and $s, t : R \rightarrow U$ the two projections. In the proof of Lemma 52.4.1 we have seen that there exists a presentation $X = U/R$ with $U = \lim U_i$ and $R = \lim R_i$. Note that U_i and U are affine and that R_i and R are quasi-compact and separated (as X_i is quasi-separated). Moreover, it is also true that $R \times_{s, U, t} R = \text{colim } R_i \times_{s_i, U_i, t_i} R_i$. Thus we know that $QCoh(\mathcal{O}_U) = \text{colim } QCoh(\mathcal{O}_{U_i})$,

$QCoh(\mathcal{O}_R) = \operatorname{colim} QCoh(\mathcal{O}_{R_i})$, and $QCoh(\mathcal{O}_{R \times_{s,U,t} R}) = \operatorname{colim} QCoh(\mathcal{O}_{R_i \times_{s_i, U_i, t_i} R_i})$ by Limits, Lemma 31.9.2. We have $QCoh(\mathcal{O}_X) = QCoh(U, R, s, t, c)$ and $QCoh(\mathcal{O}_{X_i}) = QCoh(U_i, R_i, s_i, t_i, c_i)$, see Properties of Spaces, Proposition 48.30.1. Thus the result follows formally. \square

52.8. Absolute Noetherian approximation

The following result is [CLO12, Theorem 1.2.2]. A key ingredient in the proof is Decent Spaces, Lemma 50.8.5.

Proposition 52.8.1. *Let X be a quasi-compact and quasi-separated algebraic space over $\operatorname{Spec}(\mathbf{Z})$. There exist a directed partially ordered set I and an inverse system of algebraic spaces $(X_i, f_{ii'})$ over I such that*

- (1) *the transition morphisms $f_{ii'}$ are affine*
- (2) *each X_i is quasi-separated and of finite type over \mathbf{Z} , and*
- (3) *$X = \lim X_i$.*

Proof. We apply Decent Spaces, Lemma 50.8.5 to get open subspaces $U_p \subset X$, schemes V_p , and morphisms $f_p : V_p \rightarrow U_p$ with properties as stated. Note that $f_n : V_n \rightarrow U_n$ is an étale morphism of algebraic spaces whose restriction to the inverse image of $T_n = (V_n)_{red}$ is an isomorphism. Hence f_n is an isomorphism, for example by Morphisms of Spaces, Lemma 49.45.2. In particular U_n is a quasi-compact and separated scheme. Thus we can write $U_n = \lim U_{n,i}$ as a directed limit of schemes of finite type over \mathbf{Z} with affine transition morphisms, see Limits, Proposition 31.4.4. Thus, applying descending induction on p , we see that we have reduced to the problem posed in the following paragraph.

Here we have $U \subset X$, $U = \lim U_i$, $Z \subset X$, and $f : V \rightarrow X$ with the following properties

- (1) X is a quasi-compact and quasi-separated algebraic space,
- (2) V is a quasi-compact and separated scheme,
- (3) $U \subset X$ is a quasi-compact open subspace,
- (4) $(U_i, g_{ii'})$ is a directed system of quasi-separated algebraic spaces of finite type over \mathbf{Z} with affine transition morphisms whose limit is U ,
- (5) $Z \subset X$ is a closed subspace such that $|X| = |U| \amalg |Z|$,
- (6) $f : V \rightarrow X$ is a surjective étale morphism such that $f^{-1}(Z) \rightarrow Z$ is an isomorphism.

Problem: Show that the conclusion of the proposition holds for X .

Note that $W = f^{-1}(U) \subset V$ is a quasi-compact open subscheme étale over U . Hence we may apply Lemmas 52.7.1 and 52.6.2 to find an index $0 \in I$ and an étale morphism $W_0 \rightarrow U_0$ of finite presentation whose base change to U produces W . Setting $W_i = W_0 \times_{U_0} U_i$ we see that $W = \lim_{i \geq 0} W_i$. After increasing 0 we may assume the W_i are schemes, see Lemma 52.5.9. Moreover, W_i is of finite type over \mathbf{Z} .

Apply Limits, Lemma 31.4.3 to $W = \lim_{i \geq 0} W_i$ and the inclusion $W \subset V$. Replace I by the directed partially ordered set J found in that lemma. This allows us to write V as a directed limit $V = \lim V_i$ of finite type schemes over \mathbf{Z} with affine transition maps such that each V_i contains W_i as an open subscheme (compatible

with transition morphisms). For each i we can form the push out

$$\begin{array}{ccc} W_i & \longrightarrow & V_i \\ \Delta \downarrow & & \downarrow \\ W_i \times_{U_i} W_i & \longrightarrow & R_i \end{array}$$

in the category of schemes. Namely, the left vertical and upper horizontal arrows are open immersions of schemes. In other words, we can construct R_i as the glueing of V_i and $W_i \times_{U_i} W_i$ along the common open W_i (see Schemes, Section 25.14). Note that the étale projection maps $W_i \times_{U_i} W_i \rightarrow W_i$ extend to étale morphisms $s_i, t_i : R_i \rightarrow V_i$. It is clear that the morphism $j_i = (t_i, s_i) : R_i \rightarrow V_i \times V_i$ is an étale equivalence relation on V_i . Note that $W_i \times_{U_i} W_i$ is quasi-compact (as U_i is quasi-separated and W_i quasi-compact) and V_i is quasi-compact, hence R_i is quasi-compact. For $i \geq i'$ the diagram

$$(52.8.1.1) \quad \begin{array}{ccc} R_i & \longrightarrow & R_{i'} \\ s_i \downarrow & & \downarrow s_{i'} \\ V_i & \longrightarrow & V_{i'} \end{array}$$

is cartesian because

$$(W_{i'} \times_{U_{i'}} W_{i'}) \times_{U_{i'}} U_i = W_{i'} \times_{U_{i'}} U_i \times_{U_i} U_i \times_{U_{i'}} W_{i'} = W_i \times_{U_i} W_i.$$

Consider the algebraic space $X_i = V_i/R_i$ (see Spaces, Theorem 47.10.5). As V_i is of finite type over \mathbf{Z} and R_i is quasi-compact we see that X_i is quasi-separated and of finite type over \mathbf{Z} (see Properties of Spaces, Lemma 48.6.5 and Morphisms of Spaces, Lemmas 49.8.5 and 49.23.4). As the construction of R_i above is compatible with transition morphisms, we obtain morphisms of algebraic spaces $X_i \rightarrow X_{i'}$ for $i \geq i'$. The commutative diagrams

$$\begin{array}{ccc} V_i & \longrightarrow & V_{i'} \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & X_{i'} \end{array}$$

are cartesian as (52.8.1.1) is cartesian, see Groupoids, Lemma 38.18.7. Since $V_i \rightarrow V_{i'}$ is affine, this implies that $X_i \rightarrow X_{i'}$ is affine, see Morphisms of Spaces, Lemma 49.20.3. Thus we can form the limit $X' = \lim X_i$ by Lemma 52.4.1. We claim that $X \cong X'$ which finishes the proof of the proposition.

Proof of the claim. Set $R = \lim R_i$. By construction the algebraic space X' comes equipped with a surjective étale morphism $V \rightarrow X'$ such that

$$V \times_{X'} V \cong R$$

(use Lemma 52.4.1). By construction $\lim W_i \times_{U_i} W_i = W \times_U W$ and $V = \lim V_i$ so that R is the union of $W \times_U W$ and V glued along W . Property (6) implies the projections $V \times_X V \rightarrow V$ are isomorphisms over $f^{-1}(Z) \subset V$. Hence the scheme $V \times_X V$ is the union of the opens $\Delta_{V/X}(V)$ and $W \times_U W$ which intersect along $\Delta_{W/X}(W)$. We conclude that there exists a unique isomorphism $R \cong V \times_X V$

compatible with the projections to V . Since $V \rightarrow X$ and $V \rightarrow X'$ are surjective étale we see that

$$X = V/V \times_X V = V/R = V/V \times_{X'} V = X'$$

by Spaces, Lemma 47.9.1 and we win. \square

52.9. Applications

The following lemma can also be deduced directly from Decent Spaces, Lemma 50.8.5 without passing through absolute Noetherian approximation.

Lemma 52.9.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Every quasi-coherent \mathcal{O}_X -module is a filtered colimit of finitely presented \mathcal{O}_X -modules.*

Proof. We may view X as an algebraic space over $\text{Spec}(\mathbf{Z})$, see Spaces, Definition 47.16.2 and Properties of Spaces, Definition 48.3.1. Thus we may apply Proposition 52.8.1 and write $X = \lim X_i$ with X_i of finite presentation over \mathbf{Z} . Thus X_i is a Noetherian algebraic space, see Morphisms of Spaces, Lemma 49.27.6. The morphism $X \rightarrow X_i$ is affine, see Lemma 52.4.1. Conclusion by Cohomology of Spaces, Lemma 51.14.2. \square

The rest of this section consists of straightforward applications of Lemma 52.9.1.

Lemma 52.9.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Then \mathcal{F} is the directed colimit of its finite type quasi-coherent submodules.*

Proof. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are finite type quasi-coherent \mathcal{O}_X -submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another finite type quasi-coherent \mathcal{O}_X -submodule which contains both of them. In this way we see that the system is directed. To show that \mathcal{F} is the colimit of this system, write $\mathcal{F} = \text{colim}_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 52.9.1. Then the images $\mathcal{G}_i = \text{Im}(\mathcal{F}_i \rightarrow \mathcal{F})$ are finite type quasi-coherent subsheaves of \mathcal{F} . Since \mathcal{F} is the colimit of these the result follows. \square

Lemma 52.9.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{F} be a finite type quasi-coherent \mathcal{O}_X -module. Then we can write $\mathcal{F} = \lim \mathcal{F}_i$ where each \mathcal{F}_i is an \mathcal{O}_X -module of finite presentation and all transition maps $\mathcal{F}_i \rightarrow \mathcal{F}_{i'}$ surjective.*

Proof. Write $\mathcal{F} = \text{colim} \mathcal{G}_i$ as a filtered colimit of finitely presented \mathcal{O}_X -modules (Lemma 52.9.1). We claim that $\mathcal{G}_i \rightarrow \mathcal{F}$ is surjective for some i . Namely, choose an étale surjection $U \rightarrow X$ where U is an affine scheme. Choose finitely many sections $s_k \in \mathcal{F}(U)$ generating $\mathcal{F}|_U$. Since U is affine we see that s_k is in the image of $\mathcal{G}_i \rightarrow \mathcal{F}$ for i large enough. Hence $\mathcal{G}_i \rightarrow \mathcal{F}$ is surjective for i large enough. Choose such an i and let $\mathcal{K} \subset \mathcal{G}_i$ be the kernel of the map $\mathcal{G}_i \rightarrow \mathcal{F}$. Write $\mathcal{K} = \text{colim} \mathcal{K}_a$ as the filtered colimit of its finite type quasi-coherent submodules (Lemma 52.9.2). Then $\mathcal{F} = \text{colim} \mathcal{G}_i/\mathcal{K}_a$ is a solution to the problem posed by the lemma. \square

Let X be an algebraic space. In the following lemma we use the notion of a *finitely presented quasi-coherent \mathcal{O}_X -algebra* \mathcal{A} . This means that for every affine $U = \text{Spec}(R)$ étale over X we have $\mathcal{A}|_U = \tilde{A}$ where A is a (commutative) R -algebra which is of finite presentation as an R -algebra.

Lemma 52.9.4. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be a quasi-coherent \mathcal{O}_X -algebra. Then \mathcal{A} is a directed colimit of finitely presented quasi-coherent \mathcal{O}_X -algebras.*

Proof. First we write $\mathcal{A} = \operatorname{colim}_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 52.9.1. For each i let $\mathcal{B}_i = \operatorname{Sym}(\mathcal{F}_i)$ be the symmetric algebra on \mathcal{F}_i over \mathcal{O}_X . Write $\mathcal{I}_i = \operatorname{Ker}(\mathcal{B}_i \rightarrow \mathcal{A})$. Write $\mathcal{I}_i = \operatorname{colim}_j \mathcal{F}_{i,j}$ where $\mathcal{F}_{i,j}$ is a finite type quasi-coherent submodule of \mathcal{I}_i , see Lemma 52.9.2. Set $\mathcal{I}_{i,j} \subset \mathcal{I}_i$ equal to the \mathcal{B}_i -ideal generated by $\mathcal{F}_{i,j}$. Set $\mathcal{A}_{i,j} = \mathcal{B}_i/\mathcal{I}_{i,j}$. Then $\mathcal{A}_{i,j}$ is a quasi-coherent finitely presented \mathcal{O}_X -algebra. Define $(i, j) \leq (i', j')$ if $i \leq i'$ and the map $\mathcal{B}_i \rightarrow \mathcal{B}_{i'}$ maps the ideal $\mathcal{I}_{i,j}$ into the ideal $\mathcal{I}_{i',j'}$. Then it is clear that $\mathcal{A} = \operatorname{colim}_{i,j} \mathcal{A}_{i,j}$. \square

Let X be an algebraic space. In the following lemma we use the notion of a *quasi-coherent \mathcal{O}_X -algebra \mathcal{A} of finite type*. This means that for every affine $U = \operatorname{Spec}(R)$ étale over X we have $\mathcal{A}|_U = \tilde{A}$ where A is a (commutative) R -algebra which is of finite type as an R -algebra.

Lemma 52.9.5. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be a quasi-coherent \mathcal{O}_X -algebra. Then \mathcal{A} is the directed colimit of its finite type quasi-coherent \mathcal{O}_X -subalgebras.*

Proof. Omitted. Hint: Compare with the proof of Lemma 52.9.2. \square

Let X be an algebraic space. In the following lemma we use the notion of a *finite (resp. integral) quasi-coherent \mathcal{O}_X -algebra \mathcal{A}* . This means that for every affine $U = \operatorname{Spec}(R)$ étale over X we have $\mathcal{A}|_U = \tilde{A}$ where A is a (commutative) R -algebra which is finite (resp. integral) as an R -algebra.

Lemma 52.9.6. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be a finite quasi-coherent \mathcal{O}_X -algebra. Then $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ is a directed colimit of finite and finitely presented quasi-coherent \mathcal{O}_X -algebras with surjective transition maps.*

Proof. By Lemma 52.9.3 there exists a finitely presented \mathcal{O}_X -module \mathcal{F} and a surjection $\mathcal{F} \rightarrow \mathcal{A}$. Using the algebra structure we obtain a surjection

$$\operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}) \longrightarrow \mathcal{A}$$

Denote \mathcal{J} the kernel. Write $\mathcal{J} = \operatorname{colim} \mathcal{E}_i$ as a filtered colimit of finite type \mathcal{O}_X -submodules \mathcal{E}_i (Lemma 52.9.2). Set

$$\mathcal{A}_i = \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F})/(\mathcal{E}_i)$$

where (\mathcal{E}_i) indicates the ideal sheaf generated by the image of $\mathcal{E}_i \rightarrow \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F})$. Then each \mathcal{A}_i is a finitely presented \mathcal{O}_X -algebra, the transition maps are surjective, and $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$. To finish the proof we still have to show that \mathcal{A}_i is a finite \mathcal{O}_X -algebra for i sufficiently large. To do this we choose an étale surjective map $U \rightarrow X$ where U is an affine scheme. Take generators $f_1, \dots, f_m \in \Gamma(U, \mathcal{F})$. As $\mathcal{A}(U)$ is a finite $\mathcal{O}_X(U)$ -algebra we see that for each j there exists a monic polynomial $P_j \in \mathcal{O}(U)[T]$ such that $P_j(f_j)$ is zero in $\mathcal{A}(U)$. Since $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ by construction, we have $P_j(f_j) = 0$ in $\mathcal{A}_i(U)$ for all sufficiently large i . For such i the algebras \mathcal{A}_i are finite. \square

Lemma 52.9.7. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be an integral quasi-coherent \mathcal{O}_X -algebra. Then*

- (1) \mathcal{A} is the directed colimit of its finite quasi-coherent \mathcal{O}_X -subalgebras, and
- (2) \mathcal{A} is a directed colimit of finite and finitely presented \mathcal{O}_X -algebras.

Proof. By Lemma 52.9.5 we have $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ where $\mathcal{A}_i \subset \mathcal{A}$ runs through the quasi-coherent \mathcal{O}_X -subalgebras of finite type. Any finite type quasi-coherent \mathcal{O}_X -subalgebra of \mathcal{A} is finite (use Algebra, Lemma 10.35.5 on affine schemes étale over X). This proves (1).

To prove (2), write $\mathcal{A} = \operatorname{colim} \mathcal{F}_i$ as a colimit of finitely presented \mathcal{O}_X -modules using Lemma 52.9.1. For each i , let \mathcal{J}_i be the kernel of the map

$$\operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i) \longrightarrow \mathcal{A}$$

For $i' \geq i$ there is an induced map $\mathcal{J}_i \rightarrow \mathcal{J}_{i'}$ and we have $\mathcal{A} = \operatorname{colim} \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/\mathcal{J}_i$. Moreover, the quasi-coherent \mathcal{O}_X -algebras $\operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/\mathcal{J}_i$ are finite (see above). Write $\mathcal{J}_i = \operatorname{colim} \mathcal{E}_{ik}$ as a colimit of finitely presented \mathcal{O}_X -modules. Given $i' \geq i$ and k there exists a k' such that we have a map $\mathcal{E}_{ik} \rightarrow \mathcal{E}_{i'k'}$ making

$$\begin{array}{ccc} \mathcal{J}_i & \longrightarrow & \mathcal{J}_{i'} \\ \uparrow & & \uparrow \\ \mathcal{E}_{ik} & \longrightarrow & \mathcal{E}_{i'k'} \end{array}$$

commute. This follows from Cohomology of Spaces, Lemma 51.4.3. This induces a map

$$\mathcal{A}_{ik} = \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_i)/(\mathcal{E}_{ik}) \longrightarrow \operatorname{Sym}_{\mathcal{O}_X}^*(\mathcal{F}_{i'})/(\mathcal{E}_{i'k'}) = \mathcal{A}_{i'k'}$$

where (\mathcal{E}_{ik}) denotes the ideal generated by \mathcal{E}_{ik} . The quasi-coherent \mathcal{O}_X -algebras \mathcal{A}_{ki} are of finite presentation and finite for k large enough (see proof of Lemma 52.9.6). Finally, we have

$$\operatorname{colim} \mathcal{A}_{ik} = \operatorname{colim} \mathcal{A}_i = \mathcal{A}$$

Namely, the first equality was shown in the proof of Lemma 52.9.6 and the second equality because \mathcal{A} is the colimit of the modules \mathcal{F}_i . □

Lemma 52.9.8. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $U \subset X$ be a quasi-compact open. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{G} \subset \mathcal{F}|_U$ be a quasi-coherent \mathcal{O}_U -submodule which is of finite type. Then there exists a quasi-coherent submodule $\mathcal{G}' \subset \mathcal{F}$ which is of finite type such that $\mathcal{G}'|_U = \mathcal{G}$.*

Proof. Denote $j : U \rightarrow X$ the inclusion morphism. As X is quasi-separated and U quasi-compact, the morphism j is quasi-compact. Hence $j_*\mathcal{G} \subset j_*\mathcal{F}|_U$ are quasi-coherent modules on X (Morphisms of Spaces, Lemma 49.11.2). Let $\mathcal{H} = \operatorname{Ker}(j_*\mathcal{G} \oplus \mathcal{F} \rightarrow j_*\mathcal{F}|_U)$. Then $\mathcal{H}|_U = \mathcal{G}$. By Lemma 52.9.2 we can find a finite type quasi-coherent submodule $\mathcal{H}' \subset \mathcal{H}$ such that $\mathcal{H}'|_U = \mathcal{H}|_U = \mathcal{G}$. Set $\mathcal{G}' = \operatorname{Im}(\mathcal{H}' \rightarrow \mathcal{F})$ to conclude. □

52.10. Relative approximation

The title of this section refers to the following result.

Lemma 52.10.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that*

- (1) X is quasi-compact and quasi-separated, and
- (2) Y is quasi-separated.

Then $X = \lim X_i$ is a limit of a directed system of algebraic spaces X_i of finite presentation over Y with affine transition morphisms over Y .

Proof. Since $|f|(|X|)$ is quasi-compact we may replace Y by a quasi-compact open subspace whose set of points contains $|f|(|X|)$. Hence we may assume Y is quasi-compact as well. Write $X = \lim X_a$ and $Y = \lim Y_b$ as in Proposition 52.8.1, i.e., with X_a and Y_b of finite type over \mathbf{Z} and with affine transition morphisms. By Proposition 52.3.9 we find that for each b there exists an a and a morphism $f_{a,b} : X_a \rightarrow Y_b$ making the diagram

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & & \downarrow \\ X_a & \longrightarrow & Y_b \end{array}$$

commute. Moreover the same proposition implies that, given a second triple $(a', b', f_{a',b'})$, there exists an $a'' \geq a'$ such that the compositions $X_{a''} \rightarrow X_a \rightarrow X_b$ and $X_{a''} \rightarrow X_{a'} \rightarrow X_{b'} \rightarrow X_b$ are equal. Consider the set of triples $(a, b, f_{a,b})$ endowed with the partial ordering

$$(a, b, f_{a,b}) \geq (a', b', f_{a',b'}) \Leftrightarrow a \geq a', b' \geq b, \text{ and } f_{a',b'} \circ h_{a,a'} = g_{b',b} \circ f_{a,b}$$

where $h_{a,a'} : X_a \rightarrow X_{a'}$ and $g_{b',b} : Y_{b'} \rightarrow Y_b$ are the transition morphisms. The remarks above show that this system is directed. It follows formally from the equalities $X = \lim X_a$ and $Y = \lim Y_b$ that

$$X = \lim_{(a,b,f_{a,b})} X_a \times_{f_{a,b}, Y_b} Y.$$

where the limit is over our directed system above. The transition morphisms $X_a \times_{Y_b} Y \rightarrow X_{a'} \times_{Y_{b'}} Y$ are affine as the composition

$$X_a \times_{Y_b} Y \rightarrow X_a \times_{Y_{b'}} Y \rightarrow X_{a'} \times_{Y_{b'}} Y$$

where the first morphism is a closed immersion (by Morphisms of Spaces, Lemma 49.4.5) and the second is a base change of an affine morphism (Morphisms of Spaces, Lemma 49.20.5) and the composition of affine morphisms is affine (Morphisms of Spaces, Lemma 49.20.4). The morphisms $f_{a,b}$ are of finite presentation (Morphisms of Spaces, Lemmas 49.27.7 and 49.27.9) and hence the base changes $X_a \times_{f_{a,b}, S_b} S \rightarrow S$ are of finite presentation (Morphisms of Spaces, Lemma 49.27.3). \square

52.11. Finite type closed in finite presentation

This section is the analogue of Limits, Section 31.8.

Lemma 52.11.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . If Y quasi-compact and quasi-separated, then X is a directed limit $X = \lim X_i$ with each X_i affine and of finite presentation over Y .*

Proof. Consider the quasi-coherent \mathcal{O}_Y -module $\mathcal{A} = f_*\mathcal{O}_X$. By Lemma 52.9.4 we can write $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ as a directed colimit of finitely presented \mathcal{O}_Y -algebras \mathcal{A}_i . Set $X_i = \operatorname{Spec}_Y(\mathcal{A}_i)$, see Morphisms of Spaces, Definition 49.20.8. By construction $X_i \rightarrow Y$ is affine and of finite presentation and $X = \lim X_i$. \square

Lemma 52.11.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be an integral morphism of algebraic spaces over S . Assume Y quasi-compact and quasi-separated. Then X can be written as a directed limit $X = \lim X_i$ where X_i are finite and of finite presentation over Y .*

Proof. Consider the finite quasi-coherent \mathcal{O}_Y -module $\mathcal{A} = f_*\mathcal{O}_X$. By Lemma 52.9.7 we can write $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ as a directed colimit of finite and finitely presented \mathcal{O}_Y -algebras \mathcal{A}_i . Set $X_i = \operatorname{Spec}_Y(\mathcal{A}_i)$, see Morphisms of Spaces, Definition 49.20.8. By construction $X_i \rightarrow Y$ is finite and of finite presentation and $X = \lim X_i$. \square

Lemma 52.11.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a finite morphism of algebraic spaces over S . Assume Y quasi-compact and quasi-separated. Then X can be written as a directed limit $X = \lim X_i$ where the transition maps are closed immersions and the objects X_i are finite and of finite presentation over Y .*

Proof. Consider the finite quasi-coherent \mathcal{O}_Y -module $\mathcal{A} = f_*\mathcal{O}_X$. By Lemma 52.9.6 we can write $\mathcal{A} = \operatorname{colim} \mathcal{A}_i$ as a directed colimit of finite and finitely presented \mathcal{O}_Y -algebras \mathcal{A}_i with surjective transition maps. Set $X_i = \operatorname{Spec}_Y(\mathcal{A}_i)$, see Morphisms of Spaces, Definition 49.20.8. By construction $X_i \rightarrow Y$ is finite and of finite presentation, the transition maps are closed immersions, and $X = \lim X_i$. \square

Lemma 52.11.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a closed immersion of algebraic spaces over S . Assume Y quasi-compact and quasi-separated. Then X can be written as a directed limit $X = \lim X_i$ where the transition maps are closed immersions and the morphisms $X_i \rightarrow Y$ are closed immersions of finite presentation.*

Proof. Let $\mathcal{I} \subset \mathcal{O}_Y$ be the quasi-coherent sheaf of ideals defining X as a closed subspace of Y . By Lemma 52.9.2 we can write $\mathcal{I} = \operatorname{colim} \mathcal{I}_i$ as the filtered colimit of its finite type quasi-coherent submodules. Let X_i be the closed subspace of X cut out by \mathcal{I}_i . Then $X_i \rightarrow Y$ is a closed immersion of finite presentation, and $X = \lim X_i$. Some details omitted. \square

Lemma 52.11.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume*

- (1) *f is locally of finite type and quasi-affine, and*
- (2) *Y is quasi-compact and quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \rightarrow Y$ and a closed immersion $X \rightarrow X'$ over Y .

Proof. By Morphisms of Spaces, Lemma 49.21.6 we can find a factorization $X \rightarrow Z \rightarrow Y$ where $X \rightarrow Z$ is a quasi-compact open immersion and $Z \rightarrow Y$ is affine. Write $Z = \lim Z_i$ with Z_i affine and of finite presentation over Y (Lemma 52.11.1). For some $0 \in I$ we can find a quasi-compact open $U_0 \subset Z_0$ such that X is isomorphic to the inverse image of U_0 in Z (Lemma 52.5.5). Let U_i be the inverse image of U_0 in Z_i , so $U = \lim U_i$. By Lemma 52.5.10 we see that $X \rightarrow U_i$ is a closed immersion for some i large enough. Setting $X' = U_i$ finishes the proof. \square

Lemma 52.11.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume:*

- (1) *f is of locally of finite type.*
- (2) *X is quasi-compact and quasi-separated, and*
- (3) *Y is quasi-compact and quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \rightarrow Y$ and a closed immersion $X \rightarrow X'$ of algebraic spaces over Y .

Proof. By Proposition 52.8.1 we can write $X = \lim_i X_i$ with X_i quasi-separated of finite type over \mathbf{Z} and with transition morphisms $f_{i' i} : X_{i'} \rightarrow X_i$ affine. Consider the commutative diagram

$$\begin{array}{ccccc} X & \longrightarrow & X_{i,Y} & \longrightarrow & X_i \\ & \searrow & \downarrow & & \downarrow \\ & & Y & \longrightarrow & \text{Spec}(\mathbf{Z}) \end{array}$$

Note that X_i is of finite presentation over $\text{Spec}(\mathbf{Z})$, see Morphisms of Spaces, Lemma 49.27.7. Hence the base change $X_{i,Y} \rightarrow Y$ is of finite presentation by Morphisms of Spaces, Lemma 49.27.3. Observe that $\lim X_{i,Y} = X \times Y$ and that $X \rightarrow X \times Y$ is a monomorphism. By Lemma 52.5.10 we see that $X \rightarrow X_{i,Y}$ is a monomorphism for i large enough. Fix such an i . Note that $X \rightarrow X_{i,Y}$ is locally of finite type (Morphisms of Spaces, Lemma 49.23.6) and a monomorphism, hence separated and locally quasi-finite (Morphisms of Spaces, Lemma 49.26.10). Hence $X \rightarrow X_{i,Y}$ is representable. Hence $X \rightarrow X_{i,Y}$ is quasi-affine because we can use the principle Spaces, Lemma 47.5.8 and the result for morphisms of schemes More on Morphisms, Lemma 36.31.2. Thus Lemma 52.11.5 gives a factorization $X \rightarrow X' \rightarrow X_{i,Y}$ with $X \rightarrow X'$ a closed immersion and $X' \rightarrow X_{i,Y}$ of finite presentation. Finally, $X' \rightarrow Y$ is of finite presentation as a composition of morphisms of finite presentation (Morphisms of Spaces, Lemma 49.27.2). \square

Proposition 52.11.7. *Let S be a scheme. $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume*

- (1) *f is of finite type and separated, and*
- (2) *Y is quasi-compact and quasi-separated.*

Then there exists a separated morphism of finite presentation $f' : X' \rightarrow Y$ and a closed immersion $X \rightarrow X'$ over Y .

Proof. By Lemma 52.11.6 there is a closed immersion $X \rightarrow Z$ with Z/Y of finite presentation. Let $\mathcal{I} \subset \mathcal{O}_Z$ be the quasi-coherent sheaf of ideals defining X as a closed subscheme of Z . By Lemma 52.9.2 we can write \mathcal{I} as a directed colimit $\mathcal{I} = \text{colim}_{a \in A} \mathcal{I}_a$ of its quasi-coherent sheaves of ideals of finite type. Let $X_a \subset Z$ be the closed subspace defined by \mathcal{I}_a . These form an inverse system indexed by A . The transition morphisms $X_a \rightarrow X_{a'}$ are affine because they are closed immersions. Each X_a is quasi-compact and quasi-separated since it is a closed subspace of Z and Z is quasi-compact and quasi-separated by our assumptions. We have $X = \lim_a X_a$ as follows directly from the fact that $\mathcal{I} = \text{colim}_{a \in A} \mathcal{I}_a$. Each of the morphisms $X_a \rightarrow Z$ is of finite presentation, see Morphisms, Lemma 28.22.7. Hence the morphisms $X_a \rightarrow Y$ are of finite presentation. Thus it suffices to show that $X_a \rightarrow Y$

is separated for some $a \in A$. This follows from Lemma 52.5.11 as we have assumed that $X \rightarrow Y$ is separated. \square

52.12. Approximating proper morphisms

Lemma 52.12.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper morphism of algebraic spaces over S with Y quasi-compact and quasi-separated. Then $X = \lim X_i$ with $X_i \rightarrow Y$ proper and of finite presentation.*

Proof. By Proposition 52.11.7 we can find a closed immersion $X \rightarrow X'$ with X' separated and of finite presentation over Y . By Lemma 52.11.4 we can write $X = \lim X_i$ with $X_i \rightarrow X'$ a closed immersion of finite presentation. We claim that for all i large enough the morphism $X_i \rightarrow Y$ is proper which finishes the proof.

To prove this we may assume that Y is an affine scheme, see Morphisms of Spaces, Lemma 49.37.2. Next, we use the weak version of Chow's lemma, see Cohomology of Spaces, Lemma 51.17.1, to find a diagram

$$\begin{array}{ccccc} X' & \longleftarrow & X'' & \longrightarrow & \mathbf{P}_Y^n \\ & \searrow & \downarrow & \swarrow & \\ & & Y & & \end{array}$$

where $X'' \rightarrow \mathbf{P}_Y^n$ is an immersion, and $\pi : X'' \rightarrow X'$ is proper and surjective. Denote $X'_i \subset X''$, resp. $\pi^{-1}(X)$ the scheme theoretic inverse image of $X_i \subset X'$, resp. $X \subset X'$. Then $\lim X'_i = \pi^{-1}(X)$. Since $\pi^{-1}(X) \rightarrow Y$ is proper (Morphisms of Spaces, Lemmas 49.37.4), we see that $\pi^{-1}(X) \rightarrow \mathbf{P}_Y^n$ is a closed immersion (Morphisms of Spaces, Lemmas 49.37.6 and 49.12.3). Hence for i large enough we find that $X'_i \rightarrow \mathbf{P}_Y^n$ is a closed immersion by Lemma 52.5.14. Thus X'_i is proper over Y . For such i the morphism $X_i \rightarrow Y$ is proper by Morphisms of Spaces, Lemma 49.37.7. \square

Lemma 52.12.2. *Let $f : X \rightarrow Y$ be a proper morphism of algebraic spaces over \mathbf{Z} with Y quasi-compact and quasi-separated. Then $(X \rightarrow Y) = \lim(X_i \rightarrow Y_i)$ with Y_i of finite presentation over \mathbf{Z} and $X_i \rightarrow Y_i$ proper and of finite presentation.*

Proof. By Lemma 52.12.1 we can write $X = \lim_{k \in K} X_k$ with $X_k \rightarrow Y$ proper and of finite presentation. Next, by absolute Noetherian approximation (Proposition 52.8.1) we can write $Y = \lim_{j \in J} Y_j$ with Y_j of finite presentation over \mathbf{Z} . For each k there exists a j and a morphism $X_{k,j} \rightarrow Y_j$ of finite presentation with $X_k \cong Y \times_{Y_j} X_{k,j}$ as algebraic spaces over Y , see Lemma 52.7.1. After increasing j we may assume $X_{k,j} \rightarrow Y_j$ is proper, see Lemma 52.6.12. The set I will be consist of these pairs (k, j) and the corresponding morphism is $X_{k,j} \rightarrow Y_j$. For every $k' \geq k$ we can find a $j' \geq j$ and a morphism $X_{j',k'} \rightarrow X_{j,k}$ over $Y_{j'} \rightarrow Y_j$ whose base change to Y gives the morphism $X_{k'} \rightarrow X_k$ (follows again from Lemma 52.7.1). These morphisms form the transition morphisms of the system. Some details omitted. \square

Recall the scheme theoretic support of a finite type quasi-coherent module, see Morphisms of Spaces, Definition 49.15.4.

Lemma 52.12.3. *Assumptions and notation as in Situation 52.6.1. Let \mathcal{F}_0 be a quasi-coherent \mathcal{O}_{X_0} -module. Denote \mathcal{F} and \mathcal{F}_i the pullbacks of \mathcal{F}_0 to X and X_i . Assume*

- (1) f_0 is locally of finite type,
- (2) \mathcal{F}_0 is of finite type,
- (3) the scheme theoretic support of \mathcal{F} is proper over Y .

Then the scheme theoretic support of \mathcal{F}_i is proper over Y_i for some i .

Proof. We may replace X_0 by the scheme theoretic support of \mathcal{F}_0 . By Morphisms of Spaces, Lemma 49.15.2 this guarantees that X_i is the support of \mathcal{F}_i and X is the support of \mathcal{F} . Then, if $Z \subset X$ denotes the scheme theoretic support of \mathcal{F} , we see that $Z \rightarrow X$ is a universal homeomorphism. We conclude that $X \rightarrow Y$ is proper as this is true for $Z \rightarrow Y$ by assumption, see Morphisms, Lemma 28.42.8. By Lemma 52.6.12 we see that $X_i \rightarrow Y$ is proper for some i . Then it follows that the scheme theoretic support Z_i of \mathcal{F}_i is proper over Y by Morphisms of Spaces, Lemmas 49.37.5 and 49.37.4. \square

52.13. Embedding into affine space

Some technical lemmas to be used in the proof of Chow's lemma later.

Lemma 52.13.1. *Let S be a scheme. Let $f : U \rightarrow X$ be a morphism of algebraic spaces over S . Assume U is an affine scheme, f is locally of finite type, and X quasi-separated and locally separated. Then there exists an immersion $U \rightarrow \mathbf{A}_X^n$ over X .*

Proof. Say $U = \text{Spec}(A)$. Write $A = \text{colim } A_i$ as a filtered colimit of finite type \mathbf{Z} -subalgebras. For each i the morphism $U \rightarrow U_i = \text{Spec}(A_i)$ induces a morphism

$$U \longrightarrow X \times U_i$$

over X . In the limit the morphism $U \rightarrow X \times U$ is an immersion as X is locally separated, see Morphisms of Spaces, Lemma 49.4.6. By Lemma 52.5.10 we see that $U \rightarrow X \times U_i$ is an immersion for some i . Since U_i is isomorphic to a closed subscheme of \mathbf{A}_Z^n the lemma follows. \square

Remark 52.13.2. We have seen in Examples, Section 82.22 that Lemma 52.13.1 does not hold if we drop the assumption that X be locally separated. This raises the question: Does Lemma 52.13.1 hold if we drop the assumption that X be quasi-separated? If you know the answer, please email stacks.project@gmail.com.

Lemma 52.13.3. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Assume X Noetherian and f of finite presentation. Then there exists a dense open $V \subset Y$ and an immersion $V \rightarrow \mathbf{A}_X^n$.*

Proof. The assumptions imply that Y is Noetherian (Morphisms of Spaces, Lemma 49.27.6). Then Y is quasi-separated, hence has a dense open subscheme (Properties of Spaces, Proposition 48.10.3). Thus we may assume that Y is a Noetherian scheme. By removing intersections of irreducible components of Y (use Topology, Lemma 5.8.2 and Properties, Lemma 27.5.5) we may assume that Y is a disjoint union of irreducible Noetherian schemes. Since there is an immersion

$$\mathbf{A}_X^n \amalg \mathbf{A}_X^m \longrightarrow \mathbf{A}_X^{\max(n,m)+1}$$

(details omitted) we see that it suffices to prove the result in case Y is irreducible.

Assume Y is an irreducible scheme. Let $T \subset |X|$ be the closure of the image of $f : Y \rightarrow X$. Note that since $|Y|$ and $|X|$ are sober topological spaces (Properties

of Spaces, Lemma 48.12.4) T is irreducible with a unique generic point ξ which is the image of the generic point η of Y . Let $\mathcal{I} \subset X$ be a quasi-coherent sheaf of ideals cutting out the reduced induced space structure on T (Properties of Spaces, Definition 48.9.5). Since $\mathcal{O}_{Y,\eta}$ is an Artinian local ring we see that for some $n > 0$ we have $f^{-1}\mathcal{I}^n\mathcal{O}_{Y,\eta} = 0$. As $f^{-1}\mathcal{I}\mathcal{O}_Y$ is a finite type quasi-coherent ideal we conclude that $f^{-1}\mathcal{I}^n\mathcal{O}_V = 0$ for some nonempty open $V \subset Y$. Let $Z \subset X$ be the closed subspace cut out by \mathcal{I}^n . By construction $V \rightarrow Y \rightarrow X$ factors through Z . Because $\mathbf{A}_Z^n \rightarrow \mathbf{A}_X^n$ is an immersion, we may replace X by Z and Y by V . Hence we reach the situation where Y and X are irreducible and $Y \rightarrow X$ maps the generic point of Y onto the generic point of X .

Assume Y and X are irreducible, Y is a scheme, and $Y \rightarrow X$ maps the generic point of Y onto the generic point of X . By Properties of Spaces, Proposition 48.10.3 X has a dense open subscheme $U \subset X$. Choose a nonempty affine open $V \subset Y$ whose image in X is contained in U . By Morphisms, Lemma 28.40.2 we may factor $V \rightarrow U$ as $V \rightarrow \mathbf{A}_U^n \rightarrow U$. Composing with $\mathbf{A}_U^n \rightarrow \mathbf{A}_X^n$ we obtain the desired immersion. \square

52.14. Sections with support in a closed subset

This section is the analogue of Properties, Section 27.22.

Lemma 52.14.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space. Let $U \subset X$ be an open subspace. The following are equivalent:*

- (1) $U \rightarrow X$ is quasi-compact,
- (2) U is quasi-compact, and
- (3) there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ such that $|X| \setminus |U| = |V(\mathcal{I})|$.

Proof. Let W be an affine scheme and let $\varphi : W \rightarrow X$ be a surjective étale morphism, see Properties of Spaces, Lemma 48.6.3. If (1) holds, then $\varphi^{-1}(U) \rightarrow W$ is quasi-compact, hence $\varphi^{-1}(U)$ is quasi-compact, hence U is quasi-compact (as $|\varphi^{-1}(U)| \rightarrow |U|$ is surjective). If (2) holds, then $\varphi^{-1}(U)$ is quasi-compact because φ is quasi-compact since X is quasi-separated (Morphisms of Spaces, Lemma 49.8.9). Hence $\varphi^{-1}(U) \rightarrow W$ is a quasi-compact morphism of schemes by Properties, Lemma 27.22.1. It follows that $U \rightarrow X$ is quasi-compact by Morphisms of Spaces, Lemma 49.8.7. Thus (1) and (2) are equivalent.

Assume (1) and (2). By Properties of Spaces, Lemma 48.9.3 there exists a unique quasi-coherent sheaf of ideals \mathcal{J} cutting out the reduced induced closed subspace structure on $|X| \setminus |U|$. Note that $\mathcal{J}|_U = \mathcal{O}_U$ which is an \mathcal{O}_U -modules of finite type. As U is quasi-compact it follows from Lemma 52.9.2 that there exists a quasi-coherent subsheaf $\mathcal{I} \subset \mathcal{J}$ which is of finite type and has the property that $\mathcal{I}|_U = \mathcal{J}|_U$. Then $|X| \setminus |U| = |V(\mathcal{I})|$ and we obtain (3). Conversely, if \mathcal{I} is as in (3), then $\varphi^{-1}(U) \subset W$ is a quasi-compact open by the lemma for schemes (Properties, Lemma 27.22.1) applied to $\varphi^{-1}\mathcal{I}$ on W . Thus (2) holds. \square

Lemma 52.14.2. *Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Consider the sheaf of \mathcal{O}_X -modules \mathcal{F}' which associates to every object U of $X_{\text{étale}}$ the module*

$$\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}s = 0\}$$

Assume \mathcal{I} is of finite type. Then

- (1) \mathcal{F}' is a quasi-coherent sheaf of \mathcal{O}_X -modules,
- (2) for affine U in $X_{\text{étale}}$ we have $\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}(U)s = 0\}$, and
- (3) $\mathcal{F}'_x = \{s \in \mathcal{F}_x \mid \mathcal{I}_x s = 0\}$.

Proof. It is clear that the rule defining \mathcal{F}' gives a subsheaf of \mathcal{F} . Hence we may work étale locally on X to verify the other statements. Thus the lemma reduces to the case of schemes which is Properties, Lemma 27.22.2. \square

Definition 52.14.3. Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The subsheaf $\mathcal{F}' \subset \mathcal{F}$ defined in Lemma 52.14.2 above is called the *subsheaf of sections annihilated by \mathcal{I}* .

Lemma 52.14.4. Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $\mathcal{I} \subset \mathcal{O}_Y$ be a quasi-coherent sheaf of ideals of finite type. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of sections annihilated by $f^{-1}\mathcal{I}\mathcal{O}_X$. Then $f_*\mathcal{F}' \subset f_*\mathcal{F}$ is the subsheaf of sections annihilated by \mathcal{I} .

Proof. Omitted. Hint: The assumption that f is quasi-compact and quasi-separated implies that $f_*\mathcal{F}$ is quasi-coherent (Morphisms of Spaces, Lemma 49.11.2) so that Lemma 52.14.2 applies to \mathcal{I} and $f_*\mathcal{F}$. \square

Next we come to the sheaf of sections supported in a closed subset. Again this isn't always a quasi-coherent sheaf, but if the complement of the closed is "retrocompact" in the given algebraic space, then it is.

Lemma 52.14.5. Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset and let $U \subset X$ be the open subspace such that $T \amalg |U| = |X|$. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Consider the sheaf of \mathcal{O}_X -modules \mathcal{F}' which associates to every object $\varphi : W \rightarrow X$ of $X_{\text{étale}}$ the module

$$\mathcal{F}'(W) = \{s \in \mathcal{F}(W) \mid \text{the support of } s \text{ is contained in } |\varphi|^{-1}(T)\}$$

If $U \rightarrow X$ is quasi-compact, then

- (1) for W affine there exist a finitely generated ideal $I \subset \mathcal{O}_X(W)$ such that $|\varphi|^{-1}(T) = V(I)$,
- (2) for W and I as in (1) we have $\mathcal{F}'(W) = \{x \in \mathcal{F}(W) \mid I^n x = 0 \text{ for some } n\}$,
- (3) \mathcal{F}' is a quasi-coherent sheaf of \mathcal{O}_X -modules.

Proof. It is clear that the rule defining \mathcal{F}' gives a subsheaf of \mathcal{F} . Hence we may work étale locally on X to verify the other statements. Thus the lemma reduces to the case of schemes which is Properties, Lemma 27.22.5. \square

Definition 52.14.6. Let S be a scheme. Let X be an algebraic space over S . Let $T \subset |X|$ be a closed subset whose complement corresponds to an open subspace $U \subset X$ with quasi-compact inclusion morphism $U \rightarrow X$. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. The quasi-coherent subsheaf $\mathcal{F}' \subset \mathcal{F}$ defined in Lemma 52.14.5 above is called the *subsheaf of sections supported on T* .

Lemma 52.14.7. Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $T \subset |Y|$ be a closed subset. Assume $|Y| \setminus T$ corresponds to an open subspace $V \subset Y$ such that $V \rightarrow Y$ is

quasi-compact. Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of sections supported on $|f|^{-1}T$. Then $f_\mathcal{F}' \subset f_*\mathcal{F}$ is the subsheaf of sections supported on T .*

Proof. Omitted. Hints: $|X| \setminus |f|^{-1}T$ is the support of the open subspace $U = f^{-1}V \subset X$. Since $V \rightarrow Y$ is quasi-compact, so is $U \rightarrow X$ (by base change). The assumption that f is quasi-compact and quasi-separated implies that $f_*\mathcal{F}$ is quasi-coherent. Hence Lemma 52.14.5 applies to T and $f_*\mathcal{F}$ as well as to $|f|^{-1}T$ and \mathcal{F} . The equality of the given quasi-coherent modules is immediate from the definitions. \square

52.15. Characterizing affine spaces

This section is the analogue of Limits, Section 31.10.

Lemma 52.15.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that f is surjective and finite, and assume that X is affine. Then Y is affine.*

Proof. We may and do view $f : X \rightarrow Y$ as a morphism of algebraic space over $\text{Spec}(\mathbf{Z})$ (see Spaces, Definition 47.16.2). Note that a finite morphism is affine and universally closed, see Morphisms of Spaces, Lemma 49.41.7. By Morphisms of Spaces, Lemma 49.9.8 we see that Y is a separated algebraic space. As f is surjective and X is quasi-compact we see that Y is quasi-compact.

By Lemma 52.11.3 we can write $X = \lim X_a$ with each $X_a \rightarrow Y$ finite and of finite presentation. By Lemma 52.5.8 we see that X_a is affine for a large enough. Hence we may and do assume that $f : X \rightarrow Y$ is finite, surjective, and of finite presentation.

By Proposition 52.8.1 we may write $Y = \lim Y_i$ as a directed limit of algebraic spaces of finite presentation over \mathbf{Z} . By Lemma 52.7.1 we can find $0 \in I$ and a morphism $X_0 \rightarrow Y_0$ of finite presentation such that $X_i = X_0 \times_{Y_0} Y_i$ for $i \geq 0$ and such that $X = \lim_i X_i$. By Lemma 52.6.6 we see that $X_i \rightarrow Y_i$ is finite for i large enough. By Lemma 52.6.3 we see that $X_i \rightarrow Y_i$ is surjective for i large enough. By Lemma 52.5.8 we see that X_i is affine for i large enough. Hence for i large enough we can apply Cohomology of Spaces, Lemma 51.16.1 to conclude that Y_i is affine. This implies that Y is affine and we conclude. \square

Proposition 52.15.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that f is surjective and integral, and assume that X is affine. Then Y is affine.*

Proof. We may and do view $f : X \rightarrow Y$ as a morphism of algebraic space over $\text{Spec}(\mathbf{Z})$ (see Spaces, Definition 47.16.2). Note that integral morphisms are affine and universally closed, see Morphisms of Spaces, Lemma 49.41.7. By Morphisms of Spaces, Lemma 49.9.8 we see that Y is a separated algebraic space. As f is surjective and X is quasi-compact we see that Y is quasi-compact.

Consider the sheaf $\mathcal{A} = f_*\mathcal{O}_X$. This is a quasi-coherent sheaf of \mathcal{O}_Y -algebras, see Morphisms of Spaces, Lemma 49.11.2. By Lemma 52.9.1 we can write $\mathcal{A} = \text{colim}_i \mathcal{F}_i$ as a filtered colimit of finite type \mathcal{O}_Y -modules. Let $\mathcal{A}_i \subset \mathcal{A}$ be the \mathcal{O}_Y -subalgebra

generated by \mathcal{F}_i . Since the map of algebras $\mathcal{O}_Y \rightarrow \mathcal{A}$ is integral, we see that each \mathcal{A}_i is a finite quasi-coherent \mathcal{O}_Y -algebra. Hence

$$X_i = \underline{\text{Spec}}_Y(\mathcal{A}_i) \longrightarrow Y$$

is a finite morphism of algebraic spaces. (Insert future reference to $\underline{\text{Spec}}$ construction for algebraic spaces here.) It is clear that $X = \lim_i X_i$. Hence by Lemma 52.5.8 we see that for i sufficiently large the scheme X_i is affine. Moreover, since $X \rightarrow Y$ factors through each X_i we see that $X_i \rightarrow Y$ is surjective. Hence we conclude that Y is affine by Lemma 52.15.1. \square

The following corollary of the result above can be found in [CLO12].

Lemma 52.15.3. *Let S be a scheme. Let X be an algebraic space over S . If X_{red} is a scheme, then X is a scheme.*

Proof. Let $U' \subset X_{red}$ be an open affine subscheme. Let $U \subset X$ be the open subspace corresponding to the open $|U'| \subset |X_{red}| = |X|$. Then $U' \rightarrow U$ is surjective and integral. Hence U is affine by Proposition 52.15.2. Thus every point is contained in an open subscheme of X , i.e., X is a scheme. \square

Lemma 52.15.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is integral and induces a bijection $|X| \rightarrow |Y|$. Then X is a scheme if and only if Y is a scheme.*

Proof. An integral morphism is representable by definition, hence if Y is a scheme, so is X . Conversely, assume that X is a scheme. Let $U \subset X$ be an affine open. An integral morphism is closed and $|f|$ is bijective, hence $|f|(|U|) \subset |Y|$ is open as the complement of $|f|(|X| \setminus |U|)$. Let $V \subset Y$ be the open subspace with $|V| = |f|(|U|)$, see Properties of Spaces, Lemma 48.4.8. Then $U \rightarrow V$ is integral and surjective, hence V is an affine scheme by Proposition 52.15.2. This concludes the proof. \square

Lemma 52.15.5. *Let S be a scheme. Let $f : X \rightarrow B$ and $B' \rightarrow B$ be morphisms of algebraic spaces over S . Assume*

- (1) $B' \rightarrow B$ is a closed immersion,
- (2) $|B'| \rightarrow |B|$ is bijective,
- (3) $X \times_B B' \rightarrow B'$ is a closed immersion, and
- (4) $X \rightarrow B$ is of finite type or $B' \rightarrow B$ is of finite presentation.

Then $f : X \rightarrow B$ is a closed immersion.

Proof. Assumptions (1) and (2) imply that $B_{red} = B'_{red}$. Set $X' = X \times_B B'$. Then $X' \rightarrow X$ is closed immersion and $X'_{red} = X_{red}$. Let $U \rightarrow B$ be an étale morphism with U affine. Then $X' \times_B U \rightarrow X \times_B U$ is a closed immersion of algebraic spaces inducing an isomorphism on underlying reduced spaces. Since $X' \times_B U$ is a scheme (as $B' \rightarrow B$ and $X' \rightarrow B'$ are representable) so is $X \times_B U$ by Lemma 52.15.3. Hence $X \rightarrow B$ is representable too. Thus we reduce to the case of schemes, see Morphisms, Lemma 28.45.5. \square

52.16. Finite cover by a scheme

As an application of Zariski's main theorem and the limit results of this chapter, we prove that given any quasi-compact and quasi-separated algebraic space X , there is a scheme Y and a surjective, finite morphism $Y \rightarrow X$. The following lemma will be obsoleted by the full result later on.

Lemma 52.16.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S .*

- (1) *There exists a surjective integral morphism $Y \rightarrow X$ where Y is a scheme,*
- (2) *given a surjective étale morphism $U \rightarrow X$ we may choose $Y \rightarrow X$ such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through U .*

Proof. Part (1) is the special case of part (2) where $U = X$. Choose a surjective étale morphism $U' \rightarrow U$ where U' is a scheme. It is clear that we may replace U by U' and hence we may assume U is a scheme. Since X is quasi-compact, there exist finitely many affine opens $U_i \subset U$ such that $U' = \coprod U_i \rightarrow X$ is surjective. After replacing U by U' again, we see that we may assume U is affine. Since X is quasi-separated, hence reasonable, there exists an integer d bounding the degree of the geometric fibres of $U \rightarrow X$ (see Decent Spaces, Lemma 50.5.1). We will prove the lemma by induction on d for all quasi-compact and separated schemes U mapping surjectively and étale onto X . If $d = 1$, then $U = X$ and the result holds with $Y = U$. Assume $d > 1$.

We apply Morphisms of Spaces, Lemma 49.46.2 and we obtain a factorization

$$\begin{array}{ccc} U & \xrightarrow{\quad j \quad} & Y \\ & \searrow & \swarrow \pi \\ & X & \end{array}$$

with π integral and j a quasi-compact open immersion. We may and do assume that $j(U)$ is scheme theoretically dense in Y . Note that

$$U \times_X Y = U \amalg W$$

where the first summand is the image of $U \rightarrow U \times_X Y$ (which is closed by Morphisms of Spaces, Lemma 49.4.6 and open because it is étale as a morphism between algebraic spaces étale over Y) and the second summand is the (open and closed) complement. The image $V \subset Y$ of W is an open subspace containing $Y \setminus U$.

The étale morphism $W \rightarrow Y$ has geometric fibres of cardinality $< d$. Namely, this is clear for geometric points of $U \subset Y$ by inspection. Since $|U| \subset |Y|$ is dense, it holds for all geometric points of Y for example by Decent Spaces, Lemma 50.8.1 (the degree of the fibres of a quasi-compact étale morphism does not go up under specialization). Thus we may apply the induction hypothesis to $W \rightarrow V$ and find a surjective integral morphism $Z \rightarrow V$ with Z a scheme, which Zariski locally factors through W . Choose a factorization $Z \rightarrow Z' \rightarrow Y$ with $Z' \rightarrow Y$ integral and $Z \rightarrow Z'$ open immersion (Morphisms of Spaces, Lemma 49.46.2). After replacing Z' by the scheme theoretic closure of Z in Z' we may assume that Z is scheme theoretically dense in Z' . After doing this we have $Z' \times_Y V = Z$. Finally, let $T \subset Y$ be the induced closed subspace structure on $Y \setminus V$. Consider the morphism

$$Z' \amalg T \rightarrow X$$

This is a surjective integral morphism by construction. Since $T \subset U$ it is clear that the morphism $T \rightarrow X$ factors through U . On the other hand, let $z \in Z'$ be a point. If $z \notin Z$, then z maps to a point of $Y \setminus V \subset U$ and we find a neighbourhood of z on which the morphism factors through U . If $z \in Z$, then we have a neighbourhood $V \subset Z$ which factors through $W \subset U \times_X Y$ and hence through U . \square

Proposition 52.16.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S .*

- (1) *There exists a surjective finite morphism $Y \rightarrow X$ of finite presentation where Y is a scheme,*
- (2) *given a surjective étale morphism $U \rightarrow X$ we may choose $Y \rightarrow X$ such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through U .*

Proof. Part (1) is the special case of (2) with $U = X$. Let $Y \rightarrow X$ be as in Lemma 52.16.1. Choose a finite affine open covering $Y = \bigcup V_j$ such that $V_j \rightarrow X$ factors through U . We can write $Y = \lim Y_i$ with $Y_i \rightarrow X$ finite and of finite presentation, see Lemma 52.11.2. For large enough i the algebraic space Y_i is a scheme, see Lemma 52.5.9. For large enough i we can find affine opens $V_{i,j} \subset Y_i$ whose inverse image in Y recovers V_j , see Lemma 52.5.5. For even larger i the morphisms $V_j \rightarrow U$ over X come from morphisms $V_{i,j} \rightarrow U$ over X , see Proposition 52.3.9. This finishes the proof. \square

Divisors on Algebraic Spaces

53.1. Introduction

In this chapter we study divisors on algebraic spaces and related topics. A basic reference for algebraic spaces is [Knu71].

53.2. Effective Cartier divisors

For some reason it seem convenient to define the notion of an effective Cartier divisor before anything else. Note that in Morphisms of Spaces, Section 49.13 we discussed the correspondence between closed subspaces and quasi-coherent sheaves of ideals. Moreover, in Properties of Spaces, Section 48.28, we discussed properties of quasi-coherent modules, in particular “locally generated by 1 element”. These references show that the following definition is compatible with the definition for schemes.

Definition 53.2.1. Let S be a scheme. Let X be an algebraic space over S .

- (1) A *locally principal closed subspace* of X is a closed subspace whose sheaf of ideals is locally generated by 1 element.
- (2) An *effective Cartier divisor* on X is a closed subspace $D \subset X$ such that the ideal sheaf $\mathcal{I}_D \subset \mathcal{O}_X$ is an invertible \mathcal{O}_X -module.

Thus an effective Cartier divisor is a locally principal closed subspace, but the converse is not always true. Effective Cartier divisors are closed subspaces of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zerodivisor. In particular they are nowhere dense.

Lemma 53.2.2. *Let S be a scheme. Let X be an algebraic space over S . Let $D \subset X$ be a closed subspace. The following are equivalent:*

- (1) *The subspace D is an effective Cartier divisor on X .*
- (2) *For some scheme U and surjective étale morphism $U \rightarrow X$ the inverse image $D \times_X U$ is an effective Cartier divisor on U .*
- (3) *For every scheme U and every étale morphism $U \rightarrow X$ the inverse image $D \times_X U$ is an effective Cartier divisor on U .*
- (4) *For every $x \in |D|$ there exists an étale morphism $(U, u) \rightarrow (X, x)$ of pointed algebraic spaces such that $U = \text{Spec}(A)$ and $D \times_X U = \text{Spec}(A/(f))$ with $f \in A$ not a zerodivisor.*

Proof. The equivalence of (1) – (3) follows from Definition 53.2.1 and the references preceding it. Assume (1) and let $x \in |D|$. Choose a scheme W and a surjective étale morphism $W \rightarrow X$. Choose $w \in D \times_X W$ mapping to x . By (3) $D \times_X W$ is an effective Cartier divisor on W . Hence we can find affine étale neighbourhood U by choosing an affine open neighbourhood of w in W as in Divisors, Lemma 30.9.2.

Assume (2). Then we see that $\mathcal{I}_D|_U$ is invertible by Divisors, Lemma 30.9.2. Since we can find an étale covering of X by the collection of all such U and $X \setminus D$, we conclude that \mathcal{I}_D is an invertible \mathcal{O}_X -module. \square

Lemma 53.2.3. *Let S be a scheme. Let X be an algebraic space over S . Let $Z \subset X$ be a locally principal closed subspace. Let $U = X \setminus Z$. Then $U \rightarrow X$ is an affine morphism.*

Proof. The question is étale local on X , see Morphisms of Spaces, Lemmas 49.20.3 and Lemma 53.2.2. Thus this follows from the case of schemes which is Divisors, Lemma 30.9.3. \square

Lemma 53.2.4. *Let S be a scheme. Let X be an algebraic space over S . Let $D \subset X$ be an effective Cartier divisor. Let $U = X \setminus D$. Then $U \rightarrow X$ is an affine morphism and U is scheme theoretically dense in X .*

Proof. Affineness is Lemma 53.2.3. The density question is étale local on X by Morphisms of Spaces, Definition 49.17.3. Thus this follows from the case of schemes which is Divisors, Lemma 30.9.4. \square

Lemma 53.2.5. *Let S be a scheme. Let X be an algebraic space over S . Let $D \subset X$ be an effective Cartier divisor. Let $x \in |D|$. If $\dim_x(X) < \infty$, then $\dim_x(D) < \dim_x(X)$.*

Proof. Both the definition of an effective Cartier divisor and of the dimension of an algebraic space at a point (Properties of Spaces, Definition 48.8.1) are étale local. Hence this lemma follows from the case of schemes which is Divisors, Lemma 30.9.5. \square

Definition 53.2.6. Let S be a scheme. Let X be an algebraic space over S . Given effective Cartier divisors D_1, D_2 on X we set $D = D_1 + D_2$ equal to the closed subspace of X corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_1}\mathcal{I}_{D_2} \subset \mathcal{O}_S$. We call this the *sum of the effective Cartier divisors D_1 and D_2* .

It is clear that we may define the sum $\sum n_i D_i$ given finitely many effective Cartier divisors D_i on X and nonnegative integers n_i .

Lemma 53.2.7. *The sum of two effective Cartier divisors is an effective Cartier divisor.*

Proof. Omitted. Étale locally this reduces to the following simple algebra fact: if $f_1, f_2 \in A$ are nonzerodivisors of a ring A , then $f_1 f_2 \in A$ is a nonzerodivisor. \square

Lemma 53.2.8. *Let S be a scheme. Let X be an algebraic space over S . Let Z, Y be two closed subspaces of X with ideal sheaves \mathcal{I} and \mathcal{J} . If $\mathcal{I}\mathcal{J}$ defines an effective Cartier divisor $D \subset X$, then Z and Y are effective Cartier divisors and $D = Z + Y$.*

Proof. By Lemma 53.2.2 this reduces to the case of schemes which is Divisors, Lemma 30.9.9. \square

Recall that we have defined the inverse image of a closed subspace under any morphism of algebraic spaces in Morphisms of Spaces, Definition 49.13.2.

Lemma 53.2.9. *Let S be a scheme. Let $f : X' \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset X$ be a locally principal closed subspace. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subspace of X' .*

Proof. Omitted. □

Definition 53.2.10. Let S be a scheme. Let $f : X' \rightarrow X$ be a morphism of algebraic spaces over S . Let $D \subset X$ be an effective Cartier divisor. We say the *pullback of D by f* is defined if the closed subspace $f^{-1}(D) \subset X'$ is an effective Cartier divisor. In this case we denote it either f^*D or $f^{-1}(D)$ and we call it the *pullback of the effective Cartier divisor*.

The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice.

Lemma 53.2.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $D \subset Y$ be an effective Cartier divisor. The pullback of D by f is defined in each of the following cases:*

- (1) f is flat, and
- (2) add more here as needed.

Proof. Omitted. □

Lemma 53.2.12. *Let S be a scheme. Let $f : X' \rightarrow X$ be a morphism of algebraic spaces over S . Let D_1, D_2 be effective Cartier divisors on X . If the pullbacks of D_1 and D_2 are defined then the pullback of $D = D_1 + D_2$ is defined and $f^*D = f^*D_1 + f^*D_2$.*

Proof. Omitted. □

Definition 53.2.13. Let S be a scheme. Let X be an algebraic space over S and let $D \subset X$ be an effective Cartier divisor. The *invertible sheaf $\mathcal{O}_X(D)$ associated to D* is given by

$$\mathcal{O}_X(D) := \text{Hom}_{\mathcal{O}_X}(\mathcal{I}_D, \mathcal{O}_X) = \mathcal{I}_D^{\otimes -1}.$$

The canonical section, usually denoted 1 or 1_D , is the global section of $\mathcal{O}_X(D)$ corresponding to the inclusion mapping $\mathcal{I}_D \rightarrow \mathcal{O}_X$.

Lemma 53.2.14. *Let S be a scheme. Let X be an algebraic space over S . Let D_1, D_2 be effective Cartier divisors on X . Let $D = D_1 + D_2$. Then there is a unique isomorphism*

$$\mathcal{O}_X(D_1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(D_2) \longrightarrow \mathcal{O}_X(D)$$

which maps $1_{D_1} \otimes 1_{D_2}$ to 1_D .

Proof. Omitted. □

Definition 53.2.15. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{L} be an invertible sheaf on X . A global section $s \in \Gamma(X, \mathcal{L})$ is called a *regular section* if the map $\mathcal{O}_X \rightarrow \mathcal{L}$, $f \mapsto fs$ is injective.

Lemma 53.2.16. *Let S be a scheme. Let X be an algebraic space over S . Let $f \in \Gamma(X, \mathcal{O}_X)$. The following are equivalent:*

- (1) f is a regular section, and
- (2) for any $x \in X$ the image $f \in \mathcal{O}_{X, \bar{x}}$ is not a zerodivisor.
- (3) for any affine $U = \text{Spec}(A)$ étale over X the restriction $f|_U$ is a nonzerodivisor of A , and
- (4) there exists a scheme U and a surjective étale morphism $U \rightarrow X$ such that $f|_U$ is a regular section of \mathcal{O}_U .

Proof. Omitted. □

Note that a global section s of an invertible \mathcal{O}_X -module \mathcal{L} may be seen as an \mathcal{O}_X -module map $s : \mathcal{O}_X \rightarrow \mathcal{L}$. Its dual is therefore a map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$. (See Modules on Sites, Lemma 18.31.2 for the dual invertible sheaf.)

Definition 53.2.17. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{L} be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$. The *zero scheme* of s is the closed subspace $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ which is the image of the map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$.

Lemma 53.2.18. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{L} be an invertible \mathcal{O}_X -module. Let $s \in \Gamma(X, \mathcal{L})$.*

- (1) *Consider closed immersions $i : Z \rightarrow X$ such that $i^*s \in \Gamma(Z, i^*\mathcal{L})$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the maximal element of this ordered set.*
- (2) *For any morphism of algebraic spaces $f : Y \rightarrow X$ over S we have $f^*s = 0$ in $\Gamma(Y, f^*\mathcal{L})$ if and only if f factors through $Z(s)$.*
- (3) *The zero scheme $Z(s)$ is a locally principal closed subspace of X .*
- (4) *The zero scheme $Z(s)$ is an effective Cartier divisor on X if and only if s is a regular section of \mathcal{L} .*

Proof. Omitted. □

Lemma 53.2.19. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $D \subset X$ is an effective Cartier divisor, then the canonical section 1_D of $\mathcal{O}_X(D)$ is regular.*
- (2) *Conversely, if s is a regular section of the invertible sheaf \mathcal{L} , then there exists a unique effective Cartier divisor $D = Z(s) \subset X$ and a unique isomorphism $\mathcal{O}_X(D) \rightarrow \mathcal{L}$ which maps 1_D to s .*

The constructions $D \mapsto (\mathcal{O}_X(D), 1_D)$ and $(\mathcal{L}, s) \mapsto Z(s)$ give mutually inverse maps

$$\{\text{effective Cartier divisors on } X\} \leftrightarrow \left\{ \begin{array}{l} \text{pairs } (\mathcal{L}, s) \text{ consisting of an invertible} \\ \mathcal{O}_X\text{-module and a regular global section} \end{array} \right\}$$

Proof. Omitted. □

53.3. Relative Proj

This section revisits the construction of the relative proj in the setting of algebraic spaces. The material in this section corresponds to the material in Constructions, Section 26.16 and Divisors, Section 30.16 in the case of schemes.

Situation 53.3.1. Here S is a scheme, X is an algebraic space over S , and \mathcal{A} is a quasi-coherent graded \mathcal{O}_X -algebra.

In Situation 53.3.1 we are going to define a functor $F : (\text{Sch}/S)_{fppf}^{opp} \rightarrow \text{Sets}$ which will turn out to be an algebraic space. We will follow (mutatis mutandis) the procedure of Constructions, Section 26.16. First, given a scheme T over S we define a *quadruple over T* to be a system $(d, f : T \rightarrow X, \mathcal{L}, \psi)$

- (1) $d \geq 1$ is an integer,
- (2) $f : T \rightarrow X$ is a morphism over S ,
- (3) \mathcal{L} is an invertible \mathcal{O}_T -module, and

- (4) $\psi : f^* \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a homomorphism of graded \mathcal{O}_T -algebras such that $f^* \mathcal{A}_d \rightarrow \mathcal{L}$ is surjective.

We say two quadruples $(d, f, \mathcal{L}, \psi)$ and $(d', f', \mathcal{L}', \psi')$ are *equivalent*¹ if and only if we have $f = f'$ and for some positive integer $m = ad = a'd'$ there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \rightarrow (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{f^* \mathcal{A}^{(m)}}$ and $\psi'|_{f'^* \mathcal{A}^{(m)}}$ agree as graded ring maps $f^* \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes mn}$. Given a quadruple $(d, f, \mathcal{L}, \psi)$ and a morphism $h : T' \rightarrow T$ we have the pullback $(d, f \circ h, h^* \mathcal{L}, h^* \psi)$. Pullback preserves the equivalence relation. Finally, for a *quasi-compact* scheme T over S we set

$$F(T) = \text{the set of equivalence classes of quadruples over } T$$

and for an arbitrary scheme T over S we set

$$F(T) = \lim_{V \subset T \text{ quasi-compact open}} F(V).$$

In other words, an element ξ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where V ranges over the quasi-compact opens of T . Thus we have defined our functor

$$(53.3.1.1) \quad F : \text{Sch}^{opp} \longrightarrow \text{Sets}$$

There is a morphism $F \rightarrow X$ of functors sending the quadruple $(d, f, \mathcal{L}, \psi)$ to f .

Lemma 53.3.2. *In Situation 53.3.1. The functor F above is an algebraic space. For any morphism $g : Z \rightarrow X$ where Z is a scheme there is a canonical isomorphism $\text{Proj}_Z(g^* \mathcal{A}) = Z \times_X F$ compatible with further base change.*

Proof. It suffices to prove the second assertion, see Spaces, Lemma 47.11.1. Let $g : Z \rightarrow X$ be a morphism where Z is a scheme. Let F' be the functor of quadruples associated to the graded quasi-coherent \mathcal{O}_Z -algebra $g^* \mathcal{A}$. Then there is a canonical isomorphism $F' = Z \times_X F$, sending a quadruple $(d, f : T \rightarrow Z, \mathcal{L}, \psi)$ for F' to $(d, g \circ f, \mathcal{L}, \psi)$ (details omitted, see proof of Constructions, Lemma 26.16.1). By Constructions, Lemmas 26.16.4, 26.16.5, and 26.16.6 and Definition 26.16.7 we see that F' is representable by $\text{Proj}_Z(g^* \mathcal{A})$. \square

The lemma above tells us the following definition makes sense.

Definition 53.3.3. Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_X -algebras. The *relative homogeneous spectrum of \mathcal{A} over X* , or the *homogeneous spectrum of \mathcal{A} over X* , or the *relative Proj of \mathcal{A} over X* is the algebraic space F over X of Lemma 53.3.2. We denote it $\pi : \text{Proj}_X(\mathcal{A}) \rightarrow X$.

In particular the structure morphism of the relative Proj is representable by construction. We can also think about the relative Proj via glueing. Let $\varphi : U \rightarrow X$ be a surjective étale morphism, where U is a scheme. Set $R = U \times_X U$ with projection morphisms $s, t : R \rightarrow U$. By Lemma 53.3.2 there exists a canonical isomorphism

$$\gamma : \text{Proj}_U(\varphi^* \mathcal{A}) \longrightarrow \text{Proj}_X(\mathcal{A}) \times_X U$$

¹This definition is motivated by Constructions, Lemma 26.16.4. The advantage of choosing this one is that it clearly defines an equivalence relation.

over U . Let $\alpha : t^*\varphi^*\mathcal{A} \rightarrow s^*\varphi^*\mathcal{A}$ be the canonical isomorphism of Properties of Spaces, Proposition 48.30.1. Then the diagram

$$\begin{array}{ccc}
 & \underline{\text{Proj}}_U(\varphi^*\mathcal{A}) \times_{U,s} R \equiv \underline{\text{Proj}}_R(s^*\varphi^*\mathcal{A}) & \\
 & \nearrow^{s^*\gamma} & \downarrow \text{induced by } \alpha \\
 \underline{\text{Proj}}_X(\mathcal{A}) \times_X R & & \\
 & \searrow_{t^*\gamma} & \\
 & \underline{\text{Proj}}_U(\varphi^*\mathcal{A}) \times_{U,t} R \equiv \underline{\text{Proj}}_R(t^*\varphi^*\mathcal{A}) &
 \end{array}$$

is commutative (the equal signs come from Constructions, Lemma 26.16.10). Thus, if we denote $\mathcal{A}_U, \mathcal{A}_R$ the pullback of \mathcal{A} to U, R , then $P = \underline{\text{Proj}}_X(\mathcal{A})$ has an étale covering by the scheme $P_U = \underline{\text{Proj}}_U(\mathcal{A}_U)$ and $P_U \times_P P_U$ is equal to $P_R = \underline{\text{Proj}}_R(\mathcal{A}_R)$. Using these remarks we can argue in the usual fashion using étale localization to transfer results on the relative proj from the case of schemes to the case of algebraic spaces.

Lemma 53.3.4. *In Situation 53.3.1. The relative Proj comes equipped with a quasi-coherent sheaf of \mathbf{Z} -graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_X(\mathcal{A})}(n)$ and a canonical homomorphism of graded algebras*

$$\psi : \pi^*\mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{\underline{\text{Proj}}_X(\mathcal{A})}(n)$$

whose base change to any scheme over X agrees with Constructions, Lemma 26.15.5.

Proof. As in the discussion following Definition 53.3.3 choose a scheme U and a surjective étale morphism $U \rightarrow X$, set $R = U \times_X U$ with projections $s, t : R \rightarrow U$, $\mathcal{A}_U = \mathcal{A}|_U$, $\mathcal{A}_R = \mathcal{A}|_R$, and $\pi : P = \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$, $\pi_U : P_U = \underline{\text{Proj}}_U(\mathcal{A}_U)$ and $\pi_R : P_R = \underline{\text{Proj}}_U(\mathcal{A}_R)$. By the Constructions, Lemma 26.15.5 we have a quasi-coherent sheaf of \mathbf{Z} -graded \mathcal{O}_{P_U} -algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{P_U}(n)$ and a canonical map $\psi_U : \pi_U^*\mathcal{A}_U \rightarrow \bigoplus_{n \geq 0} \mathcal{O}_{P_U}(n)$ and similarly for P_R . By Constructions, Lemma 26.16.10 the pullback of $\mathcal{O}_{P_U}(n)$ and ψ_U by either projection $P_R \rightarrow P_U$ is equal to $\mathcal{O}_{P_R}(n)$ and ψ_R . By Properties of Spaces, Proposition 48.30.1 we obtain $\mathcal{O}_P(n)$ and ψ . We omit the verification of compatibility with pullback to arbitrary schemes over X . \square

Having constructed the relative Proj we turn to some basic properties.

Lemma 53.3.5. *Let S be a scheme. Let $g : X' \rightarrow X$ be a morphism of algebraic spaces over S and let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_X -algebras. Then there is a canonical isomorphism*

$$r : \underline{\text{Proj}}_{X'}(g^*\mathcal{A}) \longrightarrow X' \times_X \underline{\text{Proj}}_X(\mathcal{A})$$

as well as a corresponding isomorphism

$$\theta : r^*pr_2^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_X(\mathcal{A})}(d) \right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_{X'}(g^*\mathcal{A})}(d)$$

of \mathbf{Z} -graded $\mathcal{O}_{\underline{\text{Proj}}_{X'}(g^*\mathcal{A})}$ -algebras.

Proof. Let F be the functor (53.3.1.1) and let F' be the corresponding functor defined using $g^*\mathcal{A}$ on X' . We claim there is a canonical isomorphism $r : F' \rightarrow X' \times_X F$ of functors (and of course r is the isomorphism of the lemma). It suffices to construct the bijection $r : F'(T) \rightarrow X'(T) \times_{X(T)} F(T)$ for quasi-compact schemes T over S . First, if $\xi = (d', f', \mathcal{L}', \psi')$ is a quadruple over T for F' , then we can set $r(\xi) = (f', (d', g \circ f', \mathcal{L}', \psi'))$. This makes sense as $(g \circ f')^*\mathcal{A}^{(d)} = (f')^*(g^*\mathcal{A})^{(d)}$. The inverse map sends the pair $(f', (d, f, \mathcal{L}, \psi))$ to the quadruple $(d, f', \mathcal{L}, \psi)$. We omit the proof of the final assertion (hint: reduce to the case of schemes by étale localization and apply Constructions, Lemma 26.16.10). \square

Lemma 53.3.6. *In Situation 53.3.1 the morphism $\pi : \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ is separated.*

Proof. By Morphisms of Spaces, Lemma 49.4.12 and the construction of the relative Proj this follows from the case of schemes which is Constructions, Lemma 26.16.9. \square

Lemma 53.3.7. *In Situation 53.3.1. If one of the following holds*

- (1) \mathcal{A} is of finite type as a sheaf of \mathcal{A}_0 -algebras,
- (2) \mathcal{A} is generated by \mathcal{A}_1 as an \mathcal{A}_0 -algebra and \mathcal{A}_1 is a finite type \mathcal{A}_0 -module,
- (3) there exists a finite type quasi-coherent \mathcal{A}_0 -submodule $\mathcal{F} \subset \mathcal{A}_+$ such that $\mathcal{A}_+/\mathcal{F}\mathcal{A}$ is a locally nilpotent sheaf of ideals of $\mathcal{A}/\mathcal{F}\mathcal{A}$,

then $\pi : \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ is quasi-compact.

Proof. By Morphisms of Spaces, Lemma 49.8.7 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.16.1. \square

Lemma 53.3.8. *In Situation 53.3.1. If \mathcal{A} is of finite type as a sheaf of \mathcal{O}_X -algebras, then $\pi : \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ is of finite type.*

Proof. By Morphisms of Spaces, Lemma 49.23.4 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.16.2. \square

Lemma 53.3.9. *In Situation 53.3.1. If $\mathcal{O}_X \rightarrow \mathcal{A}_0$ is an integral algebra map² and \mathcal{A} is of finite type as an \mathcal{A}_0 -algebra, then $\pi : \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ is universally closed.*

Proof. By Morphisms of Spaces, Lemma 49.9.5 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.16.3. \square

Lemma 53.3.10. *In Situation 53.3.1. The following conditions are equivalent*

- (1) \mathcal{A}_0 is a finite type \mathcal{O}_X -module and \mathcal{A} is of finite type as an \mathcal{A}_0 -algebra,
- (2) \mathcal{A}_0 is a finite type \mathcal{O}_X -module and \mathcal{A} is of finite type as an \mathcal{O}_X -algebra.

If these conditions hold, then $\pi : \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ is proper.

Proof. By Morphisms of Spaces, Lemma 49.37.2 and the construction of the relative Proj this follows from the case of schemes which is Divisors, Lemma 30.16.3. \square

Lemma 53.3.11. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent sheaf of graded \mathcal{O}_X -modules generated as an \mathcal{A}_0 -algebra by \mathcal{A}_1 . With $P = \underline{\text{Proj}}_X(\mathcal{A})$ we have*

²In other words, the integral closure of \mathcal{O}_X in \mathcal{A}_0 , see Morphisms of Spaces, Definition 49.43.2, equals \mathcal{A}_0 .

- (1) P represents the functor F_1 which associates to T over S the set of isomorphism classes of triples (f, \mathcal{L}, ψ) , where $f : T \rightarrow X$ is a morphism over S , \mathcal{L} is an invertible \mathcal{O}_T -module, and $\psi : f^* \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a map of graded \mathcal{O}_T -algebras inducing a surjection $f^* \mathcal{A}_1 \rightarrow \mathcal{L}$,
- (2) the canonical map $\pi^* \mathcal{A}_1 \rightarrow \mathcal{O}_P(1)$ is surjective, and
- (3) each $\mathcal{O}_P(n)$ is invertible and the multiplication maps induce isomorphisms $\mathcal{O}_P(n) \otimes_{\mathcal{O}_P} \mathcal{O}_P(m) = \mathcal{O}_P(n + m)$.

Proof. Omitted. See Constructions, Lemma 26.16.11 for the case of schemes. \square

53.4. Functoriality of relative proj

This section is the analogue of Constructions, Section 26.18.

Lemma 53.4.1. *Let S be a scheme. Let X be an algebraic space over S . Let $\psi : \mathcal{A} \rightarrow \mathcal{B}$ be a map of quasi-coherent graded \mathcal{O}_X -algebras. Set $P = \text{Proj}_X(\mathcal{A}) \rightarrow X$ and $Q = \text{Proj}_X(\mathcal{B}) \rightarrow X$. There is a canonical open subspace $U(\psi) \subset Q$ and a canonical morphism of algebraic spaces*

$$r_\psi : U(\psi) \longrightarrow P$$

over X and a map of \mathbf{Z} -graded $\mathcal{O}_{U(\psi)}$ -algebras

$$\theta = \theta_\psi : r_\psi^* \left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_P(d) \right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d).$$

The triple $(U(\psi), r_\psi, \theta)$ is characterized by the property that for any scheme W étale over X the triple

$$(U(\psi) \times_X W, \quad r_\psi|_{U(\psi) \times_X W} : U(\psi) \times_X W \rightarrow P \times_X W, \quad \theta|_{U(\psi) \times_X W})$$

is equal to the triple associated to $\psi : \mathcal{A}|_W \rightarrow \mathcal{B}|_W$ of Constructions, Lemma 26.18.1.

Proof. This lemma follows from étale localization and the case of schemes, see discussion following Definition 53.3.3. Details omitted. \square

Lemma 53.4.2. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} , \mathcal{B} , and \mathcal{C} be quasi-coherent graded \mathcal{O}_X -algebras. Set $P = \text{Proj}_X(\mathcal{A})$, $Q = \text{Proj}_X(\mathcal{B})$ and $R = \text{Proj}_X(\mathcal{C})$. Let $\varphi : \mathcal{A} \rightarrow \mathcal{B}$, $\psi : \mathcal{B} \rightarrow \mathcal{C}$ be graded \mathcal{O}_X -algebra maps. Then we have*

$$U(\psi \circ \varphi) = r_\varphi^{-1}(U(\psi)) \quad \text{and} \quad r_{\psi \circ \varphi} = r_\varphi \circ r_\psi|_{U(\psi \circ \varphi)}.$$

In addition we have

$$\theta_\psi \circ r_\psi^* \theta_\varphi = \theta_{\psi \circ \varphi}$$

with obvious notation.

Proof. Omitted. \square

Lemma 53.4.3. *With hypotheses and notation as in Lemma 53.4.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is surjective for $d \gg 0$. Then*

- (1) $U(\psi) = Q$,
- (2) $r_\psi : Q \rightarrow R$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_P(n) \rightarrow \mathcal{O}_Q(n)$ are surjective but not isomorphisms in general (even if $\mathcal{A} \rightarrow \mathcal{B}$ is surjective).

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.3) by étale localization. \square

Lemma 53.4.4. *With hypotheses and notation as in Lemma 53.4.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is an isomorphism for all $d \gg 0$. Then*

- (1) $U(\psi) = Q$,
- (2) $r_\psi : Q \rightarrow P$ is an isomorphism, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_P(n) \rightarrow \mathcal{O}_Q(n)$ are isomorphisms.

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.4) by étale localization. \square

Lemma 53.4.5. *With hypotheses and notation as in Lemma 53.4.1 above. Assume $\mathcal{A}_d \rightarrow \mathcal{B}_d$ is surjective for $d \gg 0$ and that \mathcal{A} is generated by \mathcal{A}_1 over \mathcal{A}_0 . Then*

- (1) $U(\psi) = Q$,
- (2) $r_\psi : Q \rightarrow P$ is a closed immersion, and
- (3) the maps $\theta : r_\psi^* \mathcal{O}_P(n) \rightarrow \mathcal{O}_Q(n)$ are isomorphisms.

Proof. Follows from the case of schemes (Constructions, Lemma 26.18.5) by étale localization. \square

53.5. Closed subspaces of relative proj

Some auxiliary lemmas about closed subspaces of relative proj. This section is the analogue of Divisors, Section 30.17.

Lemma 53.5.1. *Let S be a scheme. Let X be an algebraic space over S . Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_X -algebra. Let $\pi : P = \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow P$ be a closed subspace. Denote $\mathcal{I} \subset \mathcal{A}$ the kernel of the canonical map*

$$\mathcal{A} \longrightarrow \bigoplus_{d \geq 0} \pi_* ((i_* \mathcal{O}_Z)(d))$$

If π is quasi-compact, then there is an isomorphism $Z = \underline{\text{Proj}}_X(\mathcal{A}/\mathcal{I})$.

Proof. The morphism π is separated by Lemma 53.3.6. As π is quasi-compact, π_* transforms quasi-coherent modules into quasi-coherent modules, see Morphisms of Spaces, Lemma 49.11.2. Hence \mathcal{I} is a quasi-coherent \mathcal{O}_X -module. In particular, $\mathcal{B} = \mathcal{A}/\mathcal{I}$ is a quasi-coherent graded \mathcal{O}_X -algebra. The functoriality morphism $Z' = \underline{\text{Proj}}_X(\mathcal{B}) \rightarrow \underline{\text{Proj}}_X(\mathcal{A})$ is everywhere defined and a closed immersion, see Lemma 53.4.3. Hence it suffices to prove $Z = Z'$ as closed subspaces of P .

Having said this, the question is étale local on the base and we reduce to the case of schemes (Divisors, Lemma 30.17.1) by étale localization. \square

In case the closed subspace is locally cut out by finitely many equations we can define it by a finite type ideal sheaf of \mathcal{A} .

Lemma 53.5.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_X -algebra. Let $\pi : P = \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow P$ be a closed subscheme. If π is quasi-compact and i of finite presentation, then there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_X -submodule $\mathcal{F} \subset \mathcal{A}_d$ such that $Z = \underline{\text{Proj}}_X(\mathcal{A}/\mathcal{F}\mathcal{A})$.*

Proof. The reader can redo the arguments used in the case of schemes. However, we will show the lemma follows from the case of schemes by a trick. Let $\mathcal{I} \subset \mathcal{A}$ be the quasi-coherent graded ideal cutting out Z of Lemma 53.5.1. Choose an affine scheme U and a surjective étale morphism $U \rightarrow X$, see Properties of Spaces, Lemma 48.6.3. By the case of schemes (Divisors, Lemma 30.17.2) there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_U -submodule $\mathcal{F}' \subset \mathcal{I}_d|_U \subset \mathcal{A}_d|_U$ such that $Z \times_X U$ is equal to $\underline{\text{Proj}}_U(\mathcal{A}|_U/\mathcal{F}'\mathcal{A}|_U)$. By Limits of Spaces, Lemma 52.9.2 we can find a finite type quasi-coherent submodule $\mathcal{F} \subset \mathcal{I}_d$ such that $\mathcal{F}' \subset \mathcal{F}|_U$. Let $Z' = \underline{\text{Proj}}_X(\mathcal{A}/\mathcal{F}\mathcal{A})$. Then $Z' \rightarrow X$ is a closed immersion (Lemma 53.4.5) and $Z \subset Z'$ as $\mathcal{F}\mathcal{A} \subset \mathcal{I}$. On the other hand, $Z' \times_X U \subset Z \times_X U$ by our choice of \mathcal{F} . Thus $Z = Z'$ as desired. \square

Lemma 53.5.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let \mathcal{A} be a quasi-coherent graded \mathcal{O}_X -algebra. Let $\pi : P = \underline{\text{Proj}}_X(\mathcal{A}) \rightarrow X$ be the relative Proj of \mathcal{A} . Let $i : Z \rightarrow X$ be a closed subspace. Let $U \subset X$ be an open. Assume that*

- (1) π is quasi-compact,
- (2) i of finite presentation,
- (3) $|U| \cap |\pi|(|i|(|Z|)) = \emptyset$,
- (4) U is quasi-compact,
- (5) \mathcal{A}_n is a finite type \mathcal{O}_X -module for all n .

Then there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_X -submodule $\mathcal{F} \subset \mathcal{A}_d$ with (a) $Z = \underline{\text{Proj}}_X(\mathcal{A}/\mathcal{F}\mathcal{A})$ and (b) the support of $\mathcal{A}_d/\mathcal{F}$ is disjoint from U .

Proof. We use the same trick as in the proof of Lemma 53.5.2 to reduce to the case of schemes. Let $\mathcal{I} \subset \mathcal{A}$ be the quasi-coherent graded ideal cutting out Z of Lemma 53.5.1. Choose an affine scheme W and a surjective étale morphism $W \rightarrow X$, see Properties of Spaces, Lemma 48.6.3. By the case of schemes (Divisors, Lemma 30.17.3) there exists a $d > 0$ and a quasi-coherent finite type \mathcal{O}_W -submodule $\mathcal{F}' \subset \mathcal{I}_d|_W \subset \mathcal{A}_d|_W$ such that (a) $Z \times_X W$ is equal to $\underline{\text{Proj}}_W(\mathcal{A}|_W/\mathcal{F}'\mathcal{A}|_W)$ and (b) the support of $\mathcal{A}_d|_W/\mathcal{F}'$ is disjoint from $U \times_X W$. By Limits of Spaces, Lemma 52.9.2 we can find a finite type quasi-coherent submodule $\mathcal{F} \subset \mathcal{I}_d$ such that $\mathcal{F}' \subset \mathcal{F}|_W$. Let $Z' = \underline{\text{Proj}}_X(\mathcal{A}/\mathcal{F}\mathcal{A})$. Then $Z' \rightarrow X$ is a closed immersion (Lemma 53.4.5) and $Z \subset Z'$ as $\mathcal{F}\mathcal{A} \subset \mathcal{I}$. On the other hand, $Z' \times_X W \subset Z \times_X W$ by our choice of \mathcal{F} . Thus $Z = Z'$. Finally, we see that $\mathcal{A}_d/\mathcal{F}$ is supported on $X \setminus U$ as $\mathcal{A}_d|_W/\mathcal{F}|_W$ is a quotient of $\mathcal{A}_d|_W/\mathcal{F}'$ which is supported on $W \setminus U \times_X W$. Thus the lemma follows. \square

53.6. Blowing up

Blowing up is an important tool in algebraic geometry.

Definition 53.6.1. Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subscheme corresponding to \mathcal{I} (Morphisms of Spaces, Lemma 49.13.1). The *blowing up of X along Z* , or the *blowing up of X in the ideal sheaf \mathcal{I}* is the morphism

$$b : \underline{\text{Proj}}_X \left(\bigoplus_{n \geq 0} \mathcal{I}^n \right) \longrightarrow X$$

The *exceptional divisor* of the blow up is the inverse image $b^{-1}(Z)$. Sometimes Z is called the *center* of the blowup.

We will see later that the exceptional divisor is an effective Cartier divisor. Moreover, the blowing up is characterized as the “smallest” algebraic space over X such that the inverse image of Z is an effective Cartier divisor.

If $b : X' \rightarrow X$ is the blow up of X in Z , then we often denote $\mathcal{O}_{X'}(n)$ the twists of the structure sheaf. Note that these are invertible $\mathcal{O}_{X'}$ -modules and that $\mathcal{O}_{X'}(n) = \mathcal{O}_{X'}(1)^{\otimes n}$ because X' is the relative Proj of a quasi-coherent graded \mathcal{O}_X -algebra which is generated in degree 1, see Lemma 53.3.11.

Lemma 53.6.2. *Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $U = \text{Spec}(A)$ be an affine scheme étale over X and let $I \subset A$ be the ideal corresponding to $\mathcal{I}|_U$. If $X' \rightarrow X$ is the blow up of X in \mathcal{I} , then there is a canonical isomorphism*

$$U \times_X X' = \text{Proj}\left(\bigoplus_{d \geq 0} I^d\right)$$

of schemes over U , where the right hand side is the homogeneous spectrum of the Rees algebra of I in A . Moreover, $U \times_X X'$ has an affine open covering by spectra of the affine blowup algebras $A[\frac{I}{a}]$.

Proof. Note that the restriction $\mathcal{I}|_U$ is equal to the pullback of \mathcal{I} via the morphism $U \rightarrow X$, see Properties of Spaces, Section 48.24. Thus the lemma follows on combining Lemma 53.3.2 with Divisors, Lemma 30.18.2. \square

Lemma 53.6.3. *Let S be a scheme. Let $X_1 \rightarrow X_2$ be a flat morphism of algebraic spaces over S . Let $Z_2 \subset X_2$ be a closed subspace. Let Z_1 be the inverse image of Z_2 in X_1 . Let X'_i be the blow up of Z_i in X_i . Then there exists a cartesian diagram*

$$\begin{array}{ccc} X'_1 & \longrightarrow & X'_2 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X_2 \end{array}$$

of algebraic spaces over S .

Proof. Let \mathcal{I}_2 be the ideal sheaf of Z_2 in X_2 . Denote $g : X_1 \rightarrow X_2$ the given morphism. Then the ideal sheaf \mathcal{I}_1 of Z_1 is the image of $g^*\mathcal{I}_2 \rightarrow \mathcal{O}_{X_1}$ (see Morphisms of Spaces, Definition 49.13.2 and discussion following the definition). By Lemma 53.3.5 we see that $X_1 \times_{X_2} X'_2$ is the relative Proj of $\bigoplus_{n \geq 0} g^*\mathcal{I}_2^n$. Because g is flat the map $g^*\mathcal{I}_2^n \rightarrow \mathcal{O}_{X_1}$ is injective with image \mathcal{I}_1^n . Thus we see that $X_1 \times_{X_2} X'_2 = X'_1$. \square

Lemma 53.6.4. *Let S be a scheme. Let X be an algebraic space over S . Let $Z \subset X$ be a closed subspace. The blowing up $b : X' \rightarrow X$ of Z in X has the following properties:*

- (1) $b|_{b^{-1}(X \setminus Z)} : b^{-1}(X \setminus Z) \rightarrow X \setminus Z$ is an isomorphism,
- (2) the exceptional divisor $E = b^{-1}(Z)$ is an effective Cartier divisor on X' ,
- (3) there is a canonical isomorphism $\mathcal{O}_{X'}(-1) = \mathcal{O}_{X'}(E)$

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 53.6.3) we can prove each of these statements after base change to U . This reduces us to the case of schemes. In this case the result is Divisors, Lemma 30.18.4. \square

Lemma 53.6.5 (Universal property blowing up). *Let S be a scheme. Let X be an algebraic space over S . Let $Z \subset X$ be a closed subspace. Let \mathcal{C} be the full subcategory of (Spaces/X) consisting of $Y \rightarrow X$ such that the inverse image of Z is an effective Cartier divisor on Y . Then the blowing up $b : X' \rightarrow X$ of Z in X is a final object of \mathcal{C} .*

Proof. We see that $b : X' \rightarrow X$ is an object of \mathcal{C} according to Lemma 53.6.4. Let $f : Y \rightarrow X$ be an object of \mathcal{C} . We have to show there exists a unique morphism $Y \rightarrow X'$ over X . Let $D = f^{-1}(Z)$. Let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal sheaf of Z and let \mathcal{I}_D be the ideal sheaf of D . Then $f^*\mathcal{I} \rightarrow \mathcal{I}_D$ is a surjection to an invertible \mathcal{O}_Y -module. This extends to a map $\psi : \bigoplus f^*\mathcal{I}^d \rightarrow \bigoplus \mathcal{I}_D^d$ of graded \mathcal{O}_Y -algebras. (We observe that $\mathcal{I}_D^d = \mathcal{I}_D^{\otimes d}$ as D is an effective Cartier divisor.) By Lemma 53.3.11. the triple $(f : Y \rightarrow X, \mathcal{I}_D, \psi)$ defines a morphism $Y \rightarrow X'$ over X . The restriction

$$Y \setminus D \longrightarrow X' \setminus b^{-1}(Z) = X \setminus Z$$

is unique. The open $Y \setminus D$ is scheme theoretically dense in Y according to Lemma 53.2.4. Thus the morphism $Y \rightarrow X'$ is unique by Morphisms of Spaces, Lemma 49.17.8 (also b is separated by Lemma 53.3.6). \square

Lemma 53.6.6. *Let S be a scheme. Let X be an algebraic space over S . Let $Z \subset X$ be an effective Cartier divisor. The blowup of X in Z is the identity morphism of X .*

Proof. Immediate from the universal property of blowups (Lemma 53.6.5). \square

Lemma 53.6.7. *Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If X is reduced, then the blow up X' of X in \mathcal{I} is reduced.*

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 53.6.3) we can prove each of these statements after base change to U . This reduces us to the case of schemes. In this case the result is Divisors, Lemma 30.18.8. \square

Lemma 53.6.8. *Let S be a scheme. Let X be an algebraic space over S . Let $b : X' \rightarrow X$ be a blow up of X in a closed subspace. For any effective Cartier divisor D on X the pullback $b^{-1}D$ is defined (see Definition 53.2.10).*

Proof. By Lemmas 53.6.2 and 53.2.2 this reduces to the following algebra fact: Let A be a ring, $I \subset A$ an ideal, $a \in I$, and $x \in A$ a nonzerodivisor. Then the image of x in $A[\frac{I}{a}]$ is a nonzerodivisor. Namely, suppose that $x(y/a^n) = 0$ in $A[\frac{I}{a}]$. Then $a^m xy = 0$ in A for some m . Hence $a^m y = 0$ as x is a nonzerodivisor. Whence y/a^n is zero in $A[\frac{I}{a}]$ as desired. \square

Lemma 53.6.9. *Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ and \mathcal{J} be quasi-coherent sheaves of ideals. Let $b : X' \rightarrow X$ be the blowing up of X in \mathcal{I} . Let $b' : X'' \rightarrow X'$ be the blowing up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$. Then $X'' \rightarrow X$ is canonically isomorphic to the blowing up of X in $\mathcal{I}\mathcal{J}$.*

Proof. Let $E \subset X'$ be the exceptional divisor of b which is an effective Cartier divisor by Lemma 53.6.4. Then $(b')^{-1}E$ is an effective Cartier divisor on X'' by Lemma 53.6.8. Let $E' \subset X''$ be the exceptional divisor of b' (also an effective Cartier divisor). Consider the effective Cartier divisor $E'' = E' + (b')^{-1}E$. By construction

the ideal of E'' is $(b \circ b')^{-1}\mathcal{I}(b \circ b')^{-1}\mathcal{J}\mathcal{O}_{X''}$. Hence according to Lemma 53.6.5 there is a canonical morphism from X'' to the blowup $c : Y \rightarrow X$ of X in $\mathcal{I}\mathcal{J}$. Conversely, as $\mathcal{I}\mathcal{J}$ pulls back to an invertible ideal we see that $c^{-1}\mathcal{I}\mathcal{O}_Y$ defines an effective Cartier divisor, see Lemma 53.2.8. Thus a morphism $c' : Y \rightarrow X'$ over X by Lemma 53.6.5. Then $(c')^{-1}b^{-1}\mathcal{J}\mathcal{O}_{X'} = c^{-1}\mathcal{J}\mathcal{O}_Y$ which also defines an effective Cartier divisor. Thus a morphism $c'' : Y \rightarrow X''$ over X' . We omit the verification that this morphism is inverse to the morphism $X'' \rightarrow Y$ constructed earlier. \square

Lemma 53.6.10. *Let S be a scheme. Let X be an algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $b : X' \rightarrow X$ be the blowing up of X in the ideal sheaf \mathcal{I} . If \mathcal{I} is of finite type, then $b : X' \rightarrow X$ is a proper morphism.*

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 53.6.3) we can prove each of these statements after base change to U (see Morphisms of Spaces, Lemma 49.37.2). This reduces us to the case of schemes. In this case the morphism b is projective by Divisors, Lemma 30.18.11 hence proper by Morphisms, Lemma 28.43.5. \square

Lemma 53.6.11. *Let S be a scheme and let X be an algebraic space over S . Assume X is quasi-compact and quasi-separated. Let $Z \subset X$ be a closed subspace of finite presentation. Let $b : X' \rightarrow X$ be the blowing up with center Z . Let $Z' \subset X'$ be a closed subspace of finite presentation. Let $X'' \rightarrow X'$ be the blowing up with center Z' . There exists a closed subspace $Y \subset X$ of finite presentation, such that*

- (1) $|Y| = |Z| \cup |b|(|Z'|)$, and
- (2) the composition $X'' \rightarrow X$ is isomorphic to the blowing up of X in Y .

Proof. The condition that $Z \rightarrow X$ is of finite presentation means that Z is cut out by a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$, see Morphisms of Spaces, Lemma 49.27.12. Write $\mathcal{A} = \bigoplus_{n \geq 0} \mathcal{I}^n$ so that $X' = \text{Proj}(\mathcal{A})$. Note that $X \setminus Z$ is a quasi-compact open subspace of X by Limits of Spaces, Lemma 52.14.1. Since $b^{-1}(X \setminus Z) \rightarrow X \setminus Z$ is an isomorphism (Lemma 53.6.4) the same result shows that $b^{-1}(X \setminus Z) \setminus Z'$ is quasi-compact open subspace in X' . Hence $U = X \setminus (Z \cup b(Z'))$ is quasi-compact open subspace in X . By Lemma 53.5.3 there exist a $d > 0$ and a finite type \mathcal{O}_X -submodule $\mathcal{F} \subset \mathcal{I}^d$ such that $Z' = \text{Proj}(\mathcal{A}/\mathcal{F}\mathcal{A})$ and such that the support of $\mathcal{I}^d/\mathcal{F}$ is contained in $X \setminus U$.

Since $\mathcal{F} \subset \mathcal{I}^d$ is an \mathcal{O}_X -submodule we may think of $\mathcal{F} \subset \mathcal{I}^d \subset \mathcal{O}_X$ as a finite type quasi-coherent sheaf of ideals on X . Let's denote this $\mathcal{J} \subset \mathcal{O}_X$ to prevent confusion. Since $\mathcal{I}^d/\mathcal{J}$ and $\mathcal{O}/\mathcal{I}^d$ are supported on $|X| \setminus |U|$ we see that $|V(\mathcal{J})|$ is contained in $|X| \setminus |U|$. Conversely, as $\mathcal{J} \subset \mathcal{I}^d$ we see that $|Z| \subset |V(\mathcal{J})|$. Over $X \setminus Z \cong X' \setminus b^{-1}(Z)$ the sheaf of ideals \mathcal{J} cuts out Z' (see displayed formula below). Hence $|V(\mathcal{J})|$ equals $|Z| \cup |b|(|Z'|)$. It follows that also $|V(\mathcal{I}\mathcal{J})| = |Z| \cup |b|(|Z'|)$. Moreover, $\mathcal{I}\mathcal{J}$ is an ideal of finite type as a product of two such. We claim that $X'' \rightarrow X$ is isomorphic to the blowing up of X in $\mathcal{I}\mathcal{J}$ which finishes the proof of the lemma by setting $Y = V(\mathcal{I}\mathcal{J})$.

First, recall that the blow up of X in $\mathcal{I}\mathcal{J}$ is the same as the blow up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$, see Lemma 53.6.9. Hence it suffices to show that the blow up of X' in $b^{-1}\mathcal{J}\mathcal{O}_{X'}$ agrees with the blow up of X' in Z' . We will show that

$$b^{-1}\mathcal{J}\mathcal{O}_{X'} = \mathcal{I}_E^d \mathcal{I}_{Z'}$$

as ideal sheaves on X'' . This will prove what we want as \mathcal{I}_E^d cuts out the effective Cartier divisor dE and we can use Lemmas 53.6.6 and 53.6.9.

To see the displayed equality of the ideals we may work locally. With notation $A, I, a \in I$ as in Lemma 53.6.2 we see that \mathcal{F} corresponds to an R -submodule $M \subset I^d$ mapping isomorphically to an ideal $J \subset R$. The condition $Z' = \underline{\text{Proj}}(\mathcal{A}/\mathcal{F}\mathcal{A})$ means that $Z' \cap \text{Spec}(A[\frac{I}{a}])$ is cut out by the ideal generated by the elements $m/a^d, m \in M$. Say the element $m \in M$ corresponds to the function $f \in J$. Then in the affine blowup algebra $A' = A[\frac{I}{a}]$ we see that $f = (a^d m)/a^d = a^d(m/a^d)$. Thus the equality holds. \square

53.7. Strict transform

This section is the analogue of Divisors, Section 30.19. Let S be a scheme, let B be an algebraic space over S , and let $Z \subset B$ be a closed subspace. Let $b : B' \rightarrow B$ be the blowing up of B in Z and denote $E \subset B'$ the exceptional divisor $E = b^{-1}Z$. In the following we will often consider an algebraic space X over B and form the cartesian diagram

$$\begin{array}{ccccc} \text{pr}_{B'}^{-1}E & \longrightarrow & X \times_B B' & \xrightarrow{\text{pr}_X} & X \\ \downarrow & & \downarrow \text{pr}_{B'} & & \downarrow f \\ E & \longrightarrow & B' & \longrightarrow & B \end{array}$$

Since E is an effective Cartier divisor (Lemma 53.6.4) we see that $\text{pr}_{B'}^{-1}E \subset X \times_B B'$ is locally principal (Lemma 53.2.9). Thus the inclusion morphism of the complement of $\text{pr}_{B'}^{-1}E$ in $X \times_B B'$ is affine and in particular quasi-compact (Lemma 53.2.3). Consequently, for a quasi-coherent $\mathcal{O}_{X \times_B B'}$ -module \mathcal{G} the subsheaf of sections supported on $|\text{pr}_{B'}^{-1}E|$ is a quasi-coherent submodule, see Limits of Spaces, Lemma 52.14.5. If \mathcal{G} is a quasi-coherent sheaf of algebras, e.g., $\mathcal{G} = \mathcal{O}_{X \times_B B'}$, then this subsheaf is an ideal of \mathcal{G} .

Definition 53.7.1. With $Z \subset B$ and $f : X \rightarrow B$ as above.

- (1) Given a quasi-coherent \mathcal{O}_X -module \mathcal{F} the *strict transform* of \mathcal{F} with respect to the blowup of B in Z is the quotient \mathcal{F}' of $\text{pr}_X^* \mathcal{F}$ by the submodule of sections supported on $|\text{pr}_{B'}^{-1}E|$.
- (2) The *strict transform* of X is the closed subscheme $X' \subset X \times_B B'$ cut out by the quasi-coherent ideal of sections of $\mathcal{O}_{X \times_B B'}$ supported on $|\text{pr}_{B'}^{-1}E|$.

Note that taking the strict transform along a blowup depends on the closed subspace used for the blowup (and not just on the morphism $B' \rightarrow B$).

Lemma 53.7.2 (Étale localization and strict transform). *In the situation of Definition 53.7.1. Let*

$$\begin{array}{ccc} U & \longrightarrow & X \\ \downarrow & & \downarrow \\ V & \longrightarrow & B \end{array}$$

be a commutative diagram of morphisms with U and V schemes and étale horizontal arrows. Let $V' \rightarrow V$ be the blowup of V in $Z \times_B V$. Then

- (1) $V' = V \times_B B'$ and the maps $V' \rightarrow B'$ and $U \times_V V' \rightarrow X \times_B B'$ are étale,

- (2) the strict transform U' of U relative to $V' \rightarrow V$ is equal to $X' \times_X U$ where X' is the strict transform of X relative to $B' \rightarrow B$, and
- (3) for a quasi-coherent \mathcal{O}_X -module \mathcal{F} the restriction of the strict transform \mathcal{F}' to $U \times_V V'$ is the strict transform of $\mathcal{F}|_U$ relative to $V' \rightarrow V$.

Proof. Part (1) follows from the fact that blowup commutes with flat base change (Lemma 53.6.3), the fact that étale morphisms are flat, and that the base change of an étale morphism is étale. Part (3) then follows from the fact that taking the sheaf of sections supported on a closed commutes with pullback by étale morphisms, see Limits of Spaces, Lemma 52.14.5. Part (2) follows from (3) applied to $\mathcal{F} = \mathcal{O}_X$. \square

Lemma 53.7.3. *In the situation of Definition 53.7.1.*

- (1) The strict transform X' of X is the blowup of X in the closed subspace $f^{-1}Z$ of X .
- (2) For a quasi-coherent \mathcal{O}_X -module \mathcal{F} the strict transform \mathcal{F}' is canonically isomorphic to the pushforward along $X' \rightarrow X \times_B B'$ of the strict transform of \mathcal{F} relative to the blowing up $X' \rightarrow X$.

Proof. Let $X'' \rightarrow X$ be the blowup of X in $f^{-1}Z$. By the universal property of blowing up (Lemma 53.6.5) there exists a commutative diagram

$$\begin{array}{ccc} X'' & \longrightarrow & X \\ \downarrow & & \downarrow \\ B' & \longrightarrow & B \end{array}$$

whence a morphism $i : X'' \rightarrow X \times_B B'$. The first assertion of the lemma is that i is a closed immersion with image X' . The second assertion of the lemma is that $\mathcal{F}' = i_* \mathcal{F}''$ where \mathcal{F}'' is the strict transform of \mathcal{F} with respect to the blowing up $X'' \rightarrow X$. We can check these assertions étale locally on X , hence we reduce to the case of schemes (Divisors, Lemma 30.19.2). Some details omitted. \square

Lemma 53.7.4. *In the situation of Definition 53.7.1.*

- (1) If X is flat over B at all points lying over Z , then the strict transform of X is equal to the base change $X \times_B B'$.
- (2) Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If \mathcal{F} is flat over B at all points lying over Z , then the strict transform \mathcal{F}' of \mathcal{F} is equal to the pullback $pr_X^* \mathcal{F}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.19.3) by étale localization (Lemma 53.7.2). \square

Lemma 53.7.5. *Let S be a scheme. Let B be an algebraic space over S . Let $Z \subset B$ be a closed subspace. Let $b : B' \rightarrow B$ be the blowing up of Z in B . Let $g : X \rightarrow Y$ be an affine morphism of spaces over B . Let \mathcal{F} be a quasi-coherent sheaf on X . Let $g' : X \times_B B' \rightarrow Y \times_B B'$ be the base change of g . Let \mathcal{F}' be the strict transform of \mathcal{F} relative to b . Then $g'_* \mathcal{F}'$ is the strict transform of $g_* \mathcal{F}$.*

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.19.4) by étale localization (Lemma 53.7.2). \square

Lemma 53.7.6. *Let S be a scheme. Let B be an algebraic space over S . Let $Z \subset B$ be a closed subspace. Let $D \subset B$ be an effective Cartier divisor. Let $Z' \subset B$*

be the closed subspace cut out by the product of the ideal sheaves of Z and D . Let $B' \rightarrow B$ be the blowup of B in Z .

- (1) The blowup of B in Z' is isomorphic to $B' \rightarrow B$.
- (2) Let $f : X \rightarrow B$ be a morphism of algebraic spaces and let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. If the subsheaf of \mathcal{F} of sections supported on $|f^{-1}D|$ is zero, then the strict transform of \mathcal{F} relative to the blowing up in Z agrees with the strict transform of \mathcal{F} relative to the blowing up of B in Z' .

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.19.5) by étale localization (Lemma 53.7.2). \square

Lemma 53.7.7. Let S be a scheme. Let B be an algebraic space over S . Let $Z \subset B$ be a closed subspace. Let $b : B' \rightarrow B$ be the blowing up with center Z . Let $Z' \subset B'$ be a closed subspace. Let $B'' \rightarrow B'$ be the blowing up with center Z' . Let $Y \subset B$ be a closed subscheme such that $|Y| = |Z| \cup |b^{-1}(Z')|$ and the composition $B'' \rightarrow B$ is isomorphic to the blowing up of B in Y . In this situation, given any scheme X over B and $\mathcal{F} \in \text{QCoh}(\mathcal{O}_X)$ we have

- (1) the strict transform of \mathcal{F} with respect to the blowing up of B in Y is equal to the strict transform of \mathcal{F} with respect to the blowup $B'' \rightarrow B'$ in Z' of the strict transform of \mathcal{F} with respect to the blowup $B' \rightarrow B$ of B in Z , and
- (2) the strict transform of X with respect to the blowing up of B in Y is equal to the strict transform of X with respect to the blowup $B'' \rightarrow B'$ in Z' of the strict transform of X with respect to the blowup $B' \rightarrow B$ of B in Z .

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.19.6) by étale localization (Lemma 53.7.2). \square

Lemma 53.7.8. In the situation of Definition 53.7.1. Suppose that

$$0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$$

is an exact sequence of quasi-coherent sheaves on X which remains exact after any base change $T \rightarrow B$. Then the strict transforms of \mathcal{F}_i relative to any blowup $B' \rightarrow B$ form a short exact sequence $0 \rightarrow \mathcal{F}'_1 \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F}'_3 \rightarrow 0$ too.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 30.19.7) by étale localization (Lemma 53.7.2). \square

53.8. Admissible blowups

To have a bit more control over our blowups we introduce the following standard terminology.

Definition 53.8.1. Let S be a scheme. Let X be an algebraic space over S . Let $U \subset X$ be an open subspace. A morphism $X' \rightarrow X$ is called a U -admissible blowup if there exists a closed immersion $Z \rightarrow X$ of finite presentation with Z disjoint from U such that X' is isomorphic to the blow up of X in Z .

We recall that $Z \rightarrow X$ is of finite presentation if and only if the ideal sheaf $\mathcal{I}_Z \subset \mathcal{O}_X$ is of finite type, see Morphisms of Spaces, Lemma 49.27.12. In particular, a U -admissible blowup is a proper morphism, see Lemma 53.6.10. Note that there can be multiple centers which give rise to the same morphism. Hence the requirement is just the existence of some center disjoint from U which produces X' . Finally, as

the morphism $b : X' \rightarrow X$ is an isomorphism over U (see Lemma 53.6.4) we will often abuse notation and think of U as an open subspace of X' as well.

Lemma 53.8.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $U \subset X$ be a quasi-compact open subspace. Let $b : X' \rightarrow X$ be a U -admissible blowup. Let $X'' \rightarrow X'$ be a U -admissible blowup. Then the composition $X'' \rightarrow X$ is a U -admissible blowup.*

Proof. Immediate from the more precise Lemma 53.6.11. \square

Lemma 53.8.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space. Let $U, V \subset X$ be quasi-compact open subspaces. Let $b : V' \rightarrow V$ be a $U \cap V$ -admissible blowup. Then there exists a U -admissible blowup $X' \rightarrow X$ whose restriction to V is V' .*

Proof. Let $\mathcal{I} \subset \mathcal{O}_V$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I})$ is disjoint from $U \cap V$ and such that V' is isomorphic to the blow up of V in \mathcal{I} . Let $\mathcal{I}' \subset \mathcal{O}_{U \cup V}$ be the quasi-coherent sheaf of ideals whose restriction to U is \mathcal{O}_U and whose restriction to V is \mathcal{I} . By Limits of Spaces, Lemma 52.9.8 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ whose restriction to $U \cup V$ is \mathcal{I}' . The lemma follows. \square

Lemma 53.8.4. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $U \subset X$ be a quasi-compact open subspace. Let $b_i : X_i \rightarrow X$, $i = 1, \dots, n$ be U -admissible blowups. There exists a U -admissible blowup $b : X' \rightarrow X$ such that (a) b factors as $X' \rightarrow X_i \rightarrow X$ for $i = 1, \dots, n$ and (b) each of the morphisms $X' \rightarrow X_i$ is a U -admissible blowup.*

Proof. Let $\mathcal{I}_i \subset \mathcal{O}_X$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}_i)$ is disjoint from U and such that X_i is isomorphic to the blow up of X in \mathcal{I}_i . Set $\mathcal{I} = \mathcal{I}_1 \cdot \dots \cdot \mathcal{I}_n$ and let X' be the blowup of X in \mathcal{I} . Then $X' \rightarrow X$ factors through b_i by Lemma 53.6.9. \square

Lemma 53.8.5. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let U, V be quasi-compact disjoint open subspaces of X . Then there exist a $U \cup V$ -admissible blowup $b : X' \rightarrow X$ such that X' is a disjoint union of open subspaces $X' = X'_1 \amalg X'_2$ with $b^{-1}(U) \subset X'_1$ and $b^{-1}(V) \subset X'_2$.*

Proof. Choose a finite type quasi-coherent sheaf of ideals \mathcal{I} , resp. \mathcal{J} such that $X \setminus U = V(\mathcal{I})$, resp. $X \setminus V = V(\mathcal{J})$, see Limits of Spaces, Lemma 52.14.1. Then $|V(\mathcal{I}\mathcal{J})| = |X|$. Hence $\mathcal{I}\mathcal{J}$ is a locally nilpotent sheaf of ideals. Since \mathcal{I} and \mathcal{J} are of finite type and X is quasi-compact there exists an $n > 0$ such that $\mathcal{I}^n \mathcal{J}^n = 0$. We may and do replace \mathcal{I} by \mathcal{I}^n and \mathcal{J} by \mathcal{J}^n . Whence $\mathcal{I}\mathcal{J} = 0$. Let $b : X' \rightarrow X$ be the blowing up in $\mathcal{I} + \mathcal{J}$. This is $U \cup V$ -admissible as $|V(\mathcal{I} + \mathcal{J})| = |X| \setminus |U \cup V|$. We will show that X' is a disjoint union of open subspaces $X' = X'_1 \amalg X'_2$ as in the statement of the lemma.

Since $|V(\mathcal{I} + \mathcal{J})|$ is the complement of $|U \cup V|$ we conclude that $V \cup U$ is scheme theoretically dense in X' , see Lemmas 53.6.4 and 53.2.4. Thus if such a decomposition $X' = X'_1 \amalg X'_2$ into open and closed subspaces exists, then X'_1 is the scheme theoretic closure of U in X' and similarly X'_2 is the scheme theoretic closure of V in X' . Since $U \rightarrow X'$ and $V \rightarrow X'$ are quasi-compact taking scheme theoretic closures commutes with étale localization (Morphisms of Spaces, Lemma 49.16.3).

Hence to verify the existence of X'_1 and X'_2 we may work étale locally on X . This reduces us to the case of schemes which is treated in the proof of Divisors, Lemma 30.20.5. \square

Algebraic Spaces over Fields

54.1. Introduction

This chapter is the analogue of the chapter on varieties in the setting of algebraic spaces. A reference for algebraic spaces is [Knu71].

54.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

54.3. Geometric components

Lemma 54.3.1. *Let k be an algebraically closed field. Let A, B be strictly henselian local k -algebras with residue field equal to k . Let C be the strict henselization of $A \otimes_k B$ at the maximal ideal $\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B$. Then the minimal primes of C correspond 1-to-1 to pairs of minimal primes of A and B .*

Proof. First note that a minimal prime \mathfrak{r} of C maps to a minimal prime \mathfrak{p} in A and to a minimal prime \mathfrak{q} of B because the ring maps $A \rightarrow C$ and $B \rightarrow C$ are flat (by going down for flat ring map Algebra, Lemma 10.38.17). Hence it suffices to show that the strict henselization of $(A/\mathfrak{p} \otimes_k B/\mathfrak{q})_{\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B}$ has a unique minimal prime ideal. By Algebra, Lemma 10.145.30 the rings $A/\mathfrak{p}, B/\mathfrak{q}$ are strictly henselian. Hence we may assume that A and B are strictly henselian local domains and our goal is to show that C has a unique minimal prime. By Properties of Spaces, Lemma 48.21.3. we see that the integral closure A' of A in its fraction field is a normal local domain with residue field k and similarly for the integral closure B' of B into its fraction field. By Algebra, Lemma 10.153.4 we see that $A' \otimes_k B'$ is a normal ring. Hence its localization

$$R = (A' \otimes_k B')_{\mathfrak{m}_{A' \otimes_k B' + A' \otimes_k \mathfrak{m}_{B'}}$$

is a normal local domain. Note that $A \otimes_k B \rightarrow A' \otimes_k B'$ is integral (hence going up holds – Algebra, Lemma 10.35.20) and that $\mathfrak{m}_{A'} \otimes_k B' + A' \otimes_k \mathfrak{m}_{B'}$ is the unique maximal ideal of $A' \otimes_k B'$ lying over $\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B$. Hence we see that

$$R = (A' \otimes_k B')_{\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B}$$

by Algebra, Lemma 10.40.11. It follows that

$$(A \otimes_k B)_{\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B} \longrightarrow R$$

is integral. We conclude that R is the integral closure of $(A \otimes_k B)_{\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B}$ in its fraction field, and by Properties of Spaces, Lemma 48.21.3 once again we conclude that C has a unique prime ideal. \square

54.4. Generically finite morphisms

This section discusses for morphisms of algebraic spaces the material discussed in Morphisms, Section 28.47 and Varieties, Section 32.24 for morphisms of schemes.

Lemma 54.4.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that f is quasi-separated of finite type and Y is decent. Let $y \in |Y|$ be a generic point of an irreducible component of $|Y|$. The following are equivalent:*

- (1) *the set $f^{-1}(\{y\})$ is finite,*
- (2) *$X \rightarrow Y$ is quasi-finite at all points of $|X|$ over y ,*
- (3) *there exists an open subspace $Y' \subset Y$ with $y \in |Y'|$ such that $Y' \times_Y X \rightarrow Y'$ is finite.*

Proof. Since Y is decent and f is quasi-separated, we see that X is decent too; to see this use Decent Spaces, Lemmas 50.15.2 and 50.15.5. Hence Decent Spaces, Lemma 50.16.10 applies and we see that (1) implies (2). On the other hand, we see that (2) implies (1) by Morphisms of Spaces, Lemma 49.26.9. The same lemma also shows that (3) implies (1).

Assume the equivalent conditions of (1) and (2). Choose an affine scheme V and an étale morphism $V \rightarrow Y$ mapping a point $v \in V$ to y . Then v is a generic point of an irreducible component of V by Decent Spaces, Lemma 50.10.8. Choose an affine scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Then $U \rightarrow V$ is of finite type. The morphism $U \rightarrow V$ is quasi-finite at every point lying over v by (2). It follows that the fibre of $U \rightarrow V$ over v is finite (Morphisms, Lemma 28.21.14). By Morphisms, Lemma 28.47.1 after shrinking V we may assume that $U \rightarrow V$ is finite. Let

$$R = U \times_{V \times_Y X} U$$

Since f is quasi-separated, we see that $V \times_Y X$ is quasi-separated and hence R is a quasi-compact scheme. Moreover the morphisms $R \rightarrow V$ is quasi-finite as the composition of an étale morphism $R \rightarrow U$ and a finite morphism $U \rightarrow V$. Hence we may apply Morphisms, Lemma 28.47.1 once more and after shrinking V we may assume that $R \rightarrow V$ is finite as well. This of course implies that the two projections $R \rightarrow V$ are finite étale. It follows that $V/R = V \times_Y X$ is an affine scheme, see Groupoids, Proposition 38.21.8. By Morphisms, Lemma 28.42.8 we conclude that $V \times_Y X \rightarrow V$ is proper and by Morphisms, Lemma 28.44.10 we conclude that $V \times_Y X \rightarrow V$ is finite. Finally, we let $Y' \subset Y$ be the open subspace of Y corresponding to the image of $|V| \rightarrow |Y|$. By Morphisms of Spaces, Lemma 49.41.3 we conclude that $Y' \times_Y X \rightarrow Y'$ is finite as the base change to V is finite and as $V \rightarrow Y'$ is a surjective étale morphism. \square

Lemma 54.4.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that f is quasi-separated and locally of finite type and Y is quasi-separated. Let $y \in |Y|$ be a generic point of an irreducible component of $|Y|$. The following are equivalent:*

- (1) *the set $f^{-1}(\{y\})$ is finite,*

- (2) *there exist open subspaces $X' \subset X$ and $Y' \subset Y$ with $f(X') \subset Y'$, $y \in |Y'|$, and $f^{-1}(\{y\}) \subset |X'|$ such that $f|_{X'} : X' \rightarrow Y'$ is finite.*

Proof. This is just an application of Lemma 54.4.1. we may first replace Y by a quasi-compact open subspace containing y . If (1) holds, then we can find a quasi-compact open subspace $X' \subset X$ containing $f^{-1}(\{y\})$. Since Y is quasi-separated, the morphism $f|_{X'} : X' \rightarrow Y$ is quasi-compact and quasi-separated (Morphisms of Spaces, Lemma 49.8.9). Applying Lemma 54.4.1 to $f|_{X'} : X' \rightarrow Y$ we see that (2) holds. We omit the proof that (2) implies (1). \square

Lemma 54.4.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type, Y is locally Noetherian, and X is a decent algebraic space. Let $y \in Y$ be a point such that the dimension of the local ring at y is ≤ 1 . Assume in addition one of the following conditions is satisfied*

- (1) *for every generic point x of an irreducible component of $|X|$ the transcendence degree of $x/f(x)$ is 0,*
- (2) *for every generic point x of an irreducible component of $|X|$ such that $f(x) \rightsquigarrow y$ the transcendence degree of $x/f(x)$ is 0,*
- (3) *f is quasi-finite at every generic point of $|X|$,*
- (4) *f is quasi-finite at a dense set of points of $|X|$,*
- (5) *add more here.*

Then f is quasi-finite at every point of X lying over y .

Proof. Observe that X is locally Noetherian (Morphisms of Spaces, Lemma 49.23.5) and hence $|X|$ is locally Noetherian (Properties of Spaces, Lemma 48.22.2). Since X is decent $|X|$ is also a sober topological space (Decent Spaces, Proposition 50.10.6). The set of points at which morphism is quasi-finite is open (Morphisms of Spaces, Lemma 49.26.2). A dense open of a sober locally Noetherian topological space contains all generic point of irreducible components, hence (4) implies (3). Condition (3) implies condition (1) for example by Morphisms of Spaces, Lemma 49.31.3 applied to $X \rightarrow Y \rightarrow Y$. Condition (1) implies condition (2). Thus it suffices to prove the lemma in case (2) holds.

We want to reduce the proof to the case of schemes. To do this we choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & X \\ g \downarrow & & \downarrow f \\ V & \longrightarrow & Y \end{array}$$

where U, V are schemes and where the horizontal arrows are étale. Say $v \in V$ maps to y . Let $u \in U$ be a generic point of an irreducible component of U . Then $\dim(\mathcal{O}_{U,u}) = 0$ which implies that $x = f(u)$ is a generic point of an irreducible component of $|X|$ by Decent Spaces, Lemma 50.10.8. Moreover, if $g(u) \rightsquigarrow v$, then of course $f(x) \rightsquigarrow y$. Thus we see that $\kappa(u)/\kappa(g(u))$ is a field extension of transcendence degree 0. In other words, assumption (2) of Varieties, Lemma 32.24.1 is satisfied for $g : U \rightarrow V$ and $v \in V$. We conclude that g is quasi-finite at all points of U lying over v as desired. \square

Lemma 54.4.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is proper, Y is locally Noetherian, and X is a decent*

algebraic space. Let $y \in Y$ be a point such that the dimension of the local ring at y is ≤ 1 . Assume in addition one of the following conditions is satisfied

- (1) for every generic point x of an irreducible component of $|X|$ the transcendence degree of $x/f(x)$ is 0,
- (2) for every generic point x of an irreducible component of $|X|$ such that $f(x) \rightsquigarrow y$ the transcendence degree of $x/f(x)$ is 0,
- (3) f is quasi-finite at every generic point of $|X|$,
- (4) f is quasi-finite at a dense set of points of $|X|$,
- (5) add more here.

Then there exists an open subspace $Y' \subset Y$ containing y such that $Y' \times_Y X \rightarrow Y'$ is finite.

Proof. By Lemma 54.4.3 the morphism f is quasi-finite at every point lying over y . Let $\text{Spec}(k) \rightarrow Y$ be any morphism from the spectrum of a field in the equivalence class of y . Then $|X_k|$ is a discrete space (Decent Spaces, Lemma 50.16.10). Since X_k is quasi-compact as f is proper we conclude that $|X_k|$ is finite. Thus we can apply Cohomology of Spaces, Lemma 51.21.2 to conclude. \square

54.5. Integral algebraic spaces

We have not yet defined the notion of an integral algebraic space. The problem is that being integral is not an étale local property of schemes. We could use the property, that X is reduced and $|X|$ is irreducible, given in Properties, Lemma 27.3.4 to define integral algebraic spaces. In this case the algebraic space described in Spaces, Example 47.14.9 would be integral which does not seem right. To avoid this type of pathology we will in addition assume that X is a decent algebraic space, although perhaps a weaker alternative exists.

Definition 54.5.1. Let S be a scheme. We say an algebraic space X over S is *integral* if it is reduced, decent, and $|X|$ is irreducible.

In this case the irreducible topological space $|X|$ is sober (Decent Spaces, Proposition 50.10.6). Hence it has a unique generic point x . Then x is contained in the schematic locus of X (Decent Spaces, Theorem 50.9.2) and we can look at its residue field as a substitute for the function field of X (not yet defined; insert future reference here).

The following lemma characterizes dominant morphisms of finite degree between integral algebraic spaces.

Lemma 54.5.2. Let S be a scheme. Let X, Y be integral algebraic spaces over S . Let $x \in |X|$ and $y \in |Y|$ be the generic points. Let $f : X \rightarrow Y$ be locally of finite type. Assume f is dominant (Morphisms of Spaces, Definition 49.18.1). The following are equivalent:

- (1) the transcendence degree of x/y is 0,
- (2) the extension $\kappa(x) \supset \kappa(y)$ (see proof) is finite,
- (3) there exist nonempty affine opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $f|_U : U \rightarrow V$ is finite,
- (4) f is quasi-finite at x , and
- (5) x is the only point of $|X|$ mapping to y .

If f is separated, or if f is quasi-compact, then these are also equivalent to

- (6) *there exists a nonempty affine open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.*

Proof. By elementary topology, we see that $f(x) = y$ as f is dominant. Let $Y' \subset Y$ be the schematic locus of Y and let $X' \subset f^{-1}(Y')$ be the schematic locus of X . By the discussion above, using Decent Spaces, Proposition 50.10.6 and Decent Spaces, Theorem 50.9.2, we see that $x \in |X'|$ and $y \in |Y'|$. Then $f|_{X'} : X' \rightarrow Y'$ is a morphism of integral schemes which is locally of finite type. Thus we see that (1), (2), (3) are equivalent by Morphisms, Lemma 28.47.4.

Condition (4) implies condition (1) by Morphisms of Spaces, Lemma 49.31.3 applied that $X \rightarrow Y \rightarrow Y$. On the other hand, condition (3) implies condition (4) as a finite morphism is quasi-finite and as $x \in U$ because x is the generic point. Thus (1) – (4) are equivalent.

Assume the equivalent conditions (1) – (4). Suppose that $x' \mapsto y$. Then $x \rightsquigarrow x'$ is a specialization in the fibre of $|X| \rightarrow |Y|$ over y . If $x' \neq x$, then f is not quasi-finite at x by Decent Spaces, Lemma 50.16.9. Hence $x = x'$ and (5) holds. Conversely, if (5) holds, then (5) holds for the morphism of schemes $X' \rightarrow Y'$ (see above) and we can use Morphisms, Lemma 28.47.4 to see that (1) holds.

Observe that (6) implies the equivalent conditions (1) – (5) without any further assumptions on f . Assume (1) – (5) hold. To prove (6) we may shrink Y and assume that Y is an affine scheme and that there exists an affine open $U \subset X$ such that $U \rightarrow Y$ is finite.

Assume f is quasi-compact. Then $Z = X \setminus U$ is a quasi-compact closed subspace of X such that $y \notin f(Z)$. Then there exists an open neighbourhood of y which is disjoint from $f(Z)$ (details omitted; hint: use a variant of Morphisms, Lemma 28.8.3). After shrinking Y we obtain $X = U$.

Assume f separated. Then $U \rightarrow X$ has closed image by Morphisms of Spaces, Lemma 49.37.6. Since $|X|$ is irreducible we get $U = X$. \square

Definition 54.5.3. Let S be a scheme. Let X and Y be integral algebraic spaces over S . Let $f : X \rightarrow Y$ be locally of finite type and dominant. Assume any of the equivalent conditions (1) – (5) of Lemma 54.5.2. Let $x \in |X|$ and $y \in |Y|$ be the generic points. Then the positive integer

$$\deg(X/Y) = [\kappa(x) : \kappa(y)]$$

is called the *degree of X over Y* .

54.6. Modifications and alterations

Using our notion of an integral algebraic space we can define a modification as follows.

Definition 54.6.1. Let S be a scheme. Let X be an integral algebraic space. A *modification of X* is a birational proper morphism $f : X' \rightarrow X$ of algebraic spaces over S with X' integral.

For birational morphisms of algebraic spaces, see Decent Spaces, Definition 50.18.1.

Lemma 54.6.2. *Let $f : X' \rightarrow X$ be a modification as in Definition 54.6.1. There exists a nonempty open $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is an isomorphism.*

Proof. By Lemma 54.5.2 there exists a nonempty $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite. By generic flatness (Morphisms of Spaces, Proposition 49.30.1) we may assume $f^{-1}(U) \rightarrow U$ is flat and of finite presentation. So $f^{-1}(U) \rightarrow U$ is finite locally free (Morphisms of Spaces, Lemma 49.42.6). Since f is birational, the degree of X' over X is 1. Hence $f^{-1}(U) \rightarrow U$ is finite locally free of degree 1, in other words it is an isomorphism. \square

Definition 54.6.3. Let S be a scheme. Let X be an integral algebraic space over S . An *alteration* of X is a proper dominant morphism $f : Y \rightarrow X$ of algebraic spaces over S with Y integral such that $f^{-1}(U) \rightarrow U$ is finite for some nonempty open $U \subset X$.

If $f : Y \rightarrow X$ is a dominant and proper morphism between integral algebraic spaces, then it is an alteration as soon as the induced extension of residue fields in generic points is finite. Here is the precise statement.

Lemma 54.6.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper dominant morphism of integral algebraic spaces over S . Then f is an alteration if and only if any of the equivalent conditions (1) – (6) of Lemma 54.5.2 hold.*

Proof. Immediate consequence of the lemma referenced in the statement. \square

54.7. Schematic locus

We have already proven a number of results on the schematic locus of an algebraic space in Properties of Spaces, Sections 48.10 and 48.11 and Decent Spaces, Section 50.9.

Lemma 54.7.1. *Let X be an algebraic space over some base scheme S . In each of the following cases X is a scheme:*

- (1) X is quasi-compact and quasi-separated and $\dim(X) = 0$,
- (2) X is locally of finite type over a field k and $\dim(X) = 0$,
- (3) X is Noetherian and $\dim(X) = 0$, and
- (4) add more here.

Proof. Cases (2) and (3) follow immediately from case (1) but we will give a separate proofs of (2) and (3) as these proofs use significantly less theory.

Proof of (3). Let U be an affine scheme and let $U \rightarrow X$ be an étale morphism. Set $R = U \times_X U$. The two projection morphisms $s, t : R \rightarrow U$ are étale morphisms of schemes. By Properties of Spaces, Definition 48.8.2 we see that $\dim(U) = 0$ and $\dim(R) = 0$. Since R is a locally Noetherian scheme of dimension 0, we see that R is a disjoint union of spectra of Artinian local rings (Properties, Lemma 27.10.3). Since we assumed that X is Noetherian (so quasi-separated) we conclude that R is quasi-compact. Hence R is an affine scheme (use Schemes, Lemma 25.6.8). The étale morphisms $s, t : R \rightarrow U$ induce finite residue field extensions. Hence s and t are finite by Algebra, Lemma 10.52.3 (small detail omitted). Thus Groupoids, Proposition 38.21.8 shows that $X = U/R$ is an affine scheme.

Proof of (2) – almost identical to the proof of (4). Let U be an affine scheme and let $U \rightarrow X$ be an étale morphism. Set $R = U \times_X U$. The two projection morphisms $s, t : R \rightarrow U$ are étale morphisms of schemes. By Properties of Spaces, Definition 48.8.2 we see that $\dim(U) = 0$ and similarly $\dim(R) = 0$. On the other hand, the morphism $U \rightarrow \text{Spec}(k)$ is locally of finite type as the composition of the étale

morphism $U \rightarrow X$ and $X \rightarrow \text{Spec}(k)$, see Morphisms of Spaces, Lemmas 49.23.2 and 49.36.9. Similarly, $R \rightarrow \text{Spec}(k)$ is locally of finite type. Hence by Varieties, Lemma 32.13.2 we see that U and R are disjoint unions of spectra of local Artinian k -algebras finite over k . The same thing is therefore true of $U \times_{\text{Spec}(k)} U$. As

$$R = U \times_X U \longrightarrow U \times_{\text{Spec}(k)} U$$

is a monomorphism, we see that R is a finite(!) union of spectra of finite k -algebras. It follows that R is affine, see Schemes, Lemma 25.6.8. Applying Varieties, Lemma 32.13.2 once more we see that R is finite over k . Hence s, t are finite, see Morphisms, Lemma 28.44.12. Thus Groupoids, Proposition 38.21.8 shows that the open subspace U/R of X is an affine scheme. Since the schematic locus of X is an open subspace (see Properties of Spaces, Lemma 48.10.1), and since $U \rightarrow X$ was an arbitrary étale morphism from an affine scheme we conclude that X is a scheme.

Proof of (1). By Cohomology of Spaces, Lemma 51.9.1 we have vanishing of higher cohomology groups for all quasi-coherent sheaves \mathcal{F} on X . Hence X is affine (in particular a scheme) by Cohomology of Spaces, Proposition 51.15.9. \square

Please compare the following lemma to Decent Spaces, Lemma 50.16.8.

Lemma 54.7.2. *Let k be a field. Let X be an algebraic space over k . The following are equivalent*

- (1) X is locally quasi-finite over k ,
- (2) X is locally of finite type over k and has dimension 0,
- (3) X is a scheme and is locally quasi-finite over k ,
- (4) X is a scheme and is locally of finite type over k and has dimension 0, and
- (5) X is a disjoint union of spectra of Artinian local k -algebras A over k with $\dim_k(A) < \infty$.

Proof. Because we are over a field relative dimension of X/k is the same as the dimension of X . Hence by Morphisms of Spaces, Lemma 49.32.6 we see that (1) and (2) are equivalent. Hence it follows from Lemma 54.7.1 (and trivial implications) that (1) – (4) are equivalent. Finally, Varieties, Lemma 32.13.2 shows that (1) – (4) are equivalent with (5). \square

Lemma 54.7.3. *Let k be a field. Let $f : X \rightarrow Y$ be a monomorphism of algebraic spaces over k . If Y is locally quasi-finite over k so is X .*

Proof. Assume Y is locally quasi-finite over k . By Lemma 54.7.2 we see that $Y = \coprod \text{Spec}(A_i)$ where each A_i is an Artinian local ring finite over k . By Decent Spaces, Lemma 50.17.1 we see that X is a scheme. Consider $X_i = f^{-1}(\text{Spec}(A_i))$. Then X_i has either one or zero points. If X_i has zero points there is nothing to prove. If X_i has one point, then $X_i = \text{Spec}(B_i)$ with B_i a zero dimensional local ring and $A_i \rightarrow B_i$ is an epimorphism of rings. In particular $A_i/\mathfrak{m}_{A_i} = B_i/\mathfrak{m}_{A_i}B_i$ and we see that $A_i \rightarrow B_i$ is surjective by Nakayama's lemma, Algebra, Lemma 10.19.1 (because \mathfrak{m}_{A_i} is a nilpotent ideal!). Thus B_i is a finite local k -algebra, and we conclude by Lemma 54.7.2 that $X \rightarrow \text{Spec}(k)$ is locally quasi-finite. \square

The following lemma tells us that a quasi-separated algebraic space is a scheme away from codimension 1.

Lemma 54.7.4. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. If X is quasi-separated and x is a generic point of an irreducible component of $|X|$, then there exists an open subspace of X containing x which is a scheme.*

Proof. We can replace X by an quasi-compact neighbourhood of x , hence we may assume X is quasi-compact and quasi-separated. Choose a stratification

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

and $f_p : V_p \rightarrow U_p$ and $T_p = U_p \setminus U_{p+1}$ as in Decent Spaces, Lemma 50.8.5. Then $x \in T_p$ for a unique p . Let $v \in f_p^{-1}(T_p)$ be the corresponding point. Note that v is a generic point of an irreducible component of V_p by Decent Spaces, Lemma 50.10.8. Since U_{p+1} is quasi-compact and $f_p : V_p \rightarrow U_p$ is a quasi-compact morphism (Morphisms of Spaces, Lemma 49.8.9), we see that $f_p^{-1}(T_p) = V_p \setminus f_p^{-1}(U_{p+1})$ is a constructible closed subset of V_p . Hence an open neighbourhood W of $v \in V_p$ is contained in $f_p^{-1}(T_p)$, see Properties, Lemma 27.2.2. Then $f_p(W) \subset X$ is an open neighbourhood of x and $f_p|_W : W \rightarrow f_p(W)$ is an étale morphism which induces an isomorphism on the reductions (by our choice of the stratification). It follows that $W \rightarrow f_p(W)$ is an isomorphism (Morphisms of Spaces, Lemma 49.45.2). This concludes the proof. \square

The following lemma says that a separated locally Noetherian algebraic space is a scheme in codimension 1, i.e., away from codimension 2.

Lemma 54.7.5. *Let S be a scheme. Let X be an algebraic space over S . Let $x \in |X|$. If X is separated, locally Noetherian, and the dimension of the local ring of X at x is ≤ 1 (Properties of Spaces, Definition 48.20.2), then there exists an open subspace of X containing x which is a scheme.*

Proof. (Please see the remark below for a different approach avoiding the material on finite groupoids.) We can replace X by an quasi-compact neighbourhood of x , hence we may assume X is quasi-compact, separated, and Noetherian. There exists a scheme U and a finite surjective morphism $U \rightarrow X$, see Limits of Spaces, Proposition 52.16.2. Let $R = U \times_X U$. Then $j : R \rightarrow U \times_S U$ is an equivalence relation and we obtain a groupoid scheme (U, R, s, t, c) over S with s, t finite and U Noetherian and separated. Let $\{u_1, \dots, u_n\} \subset U$ be the set of points mapping to x . Then $\dim(\mathcal{O}_{U, u_i}) \leq 1$ by Decent Spaces, Lemma 50.10.9.

By More on Groupoids, Lemma 39.13.10 there exists an R -invariant affine open $W \subset U$ containing the orbit $\{u_1, \dots, u_n\}$. Since $U \rightarrow X$ is finite surjective the continuous map $|U| \rightarrow |X|$ is closed surjective, hence submersive by Topology, Lemma 5.5.5. Thus $f(W)$ is open and there is an open subspace $X' \subset X$ with $f : W \rightarrow X'$ a surjective finite morphism. Then X' is an affine scheme by Cohomology of Spaces, Lemma 51.16.1 and the proof is finished. \square

Remark 54.7.6. Here is a sketch of a proof of Lemma 54.7.5 which avoids using More on Groupoids, Lemma 39.13.10.

Step 1. We may assume X is a reduced Noetherian separated algebraic space (for example by Cohomology of Spaces, Lemma 51.16.1 or by Limits of Spaces, Lemma 52.15.3) and we may choose a finite surjective morphism $Y \rightarrow X$ where Y is a Noetherian scheme (by Limits of Spaces, Proposition 52.16.2).

Step 2. After replacing X by an open neighbourhood of x , there exists a birational finite morphism $X' \rightarrow X$ and a closed subscheme $Y' \subset X' \times_X Y$ such that $Y' \rightarrow X'$ is surjective finite locally free. Namely, because X is reduced there is a dense open subspace $U \subset X$ over which Y is flat (Morphisms of Spaces, Proposition 49.30.1). Then we can choose a U -admissible blow up $b : \tilde{X} \rightarrow X$ such that the strict transform \tilde{Y} of Y is flat over \tilde{X} , see More on Morphisms of Spaces, Lemma 58.28.1. (An alternative is to use Hilbert schemes if one wants to avoid using the result on blow ups). Then we let $X' \subset \tilde{X}$ be the scheme theoretic closure of $b^{-1}(U)$ and $Y' = X' \times_{\tilde{X}} \tilde{Y}$. Since x is a codimension 1 point, we see that $X' \rightarrow X$ is finite over a neighbourhood of x (Lemma 54.4.4).

Step 3. After shrinking X to a smaller neighbourhood of x we get that X' is a scheme. This holds because Y' is a scheme and $Y' \rightarrow X'$ being finite locally free and because every finite set of codimension 1 points of Y' is contained in an affine open. Use Properties of Spaces, Proposition 48.11.1 and Varieties, Proposition 32.22.7.

Step 4. There exists an affine open $W' \subset X'$ containing all points lying over x which is the inverse image of an open subspace of X . To prove this let $Z \subset X$ be the closure of the set of points where $X' \rightarrow X$ is not an isomorphism. We may assume $x \in Z$ otherwise we are already done. Then x is a generic point of an irreducible component of Z and after shrinking X we may assume Z is an affine scheme (Lemma 54.7.4). Then the inverse image $Z' \subset X'$ is an affine scheme as well. Say $x_1, \dots, x_n \in Z'$ are the points mapping to x . Then we can find an affine open W' in X' whose intersection with Z' is the inverse image of a principal open of Z containing x . Namely, we first pick an affine open $W' \subset X'$ containing x_1, \dots, x_n using Varieties, Proposition 32.22.7. Then we pick a principal open $D(f) \subset Z$ containing x whose inverse image $D(f|_{Z'})$ is contained in $W' \cap Z'$. Then we pick $f' \in \Gamma(W', \mathcal{O}_{W'})$ restricting to $f|_{Z'}$ and we replace W' by $D(f') \subset W'$. Since $X' \rightarrow X$ is an isomorphism away from $Z' \rightarrow Z$ the choice of W' guarantees that the image $W \subset X$ of W' is open with inverse image W' in X' .

Step 5. Then $W' \rightarrow W$ is a finite surjective morphism and W is a scheme by Cohomology of Spaces, Lemma 51.16.1 and the proof is complete.

54.8. Geometrically connected algebraic spaces

If X is a connected algebraic space over a field, then it can happen that X becomes disconnected after extending the ground field. This does not happen for geometrically connected schemes.

Definition 54.8.1. Let X be an algebraic space over the field k . We say X is *geometrically connected* over k if the base change $X_{k'}$ is connected for every field extension k' of k .

By convention a connected topological space is nonempty; hence a fortiori geometrically connected algebraic spaces are nonempty.

Lemma 54.8.2. *Let X be an algebraic space over the field k . Let $k \subset k'$ be a field extension. Then X is geometrically connected over k if and only if $X_{k'}$ is geometrically connected over k' .*

Proof. If X is geometrically connected over k , then it is clear that $X_{k'}$ is geometrically connected over k' . For the converse, note that for any field extension $k \subset k''$ there exists a common field extension $k' \subset k'''$ and $k'' \subset k'''$. As the morphism $X_{k'''} \rightarrow X_{k''}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the connectedness of $X_{k'''}$ implies the connectedness of $X_{k''}$. Thus if $X_{k'}$ is geometrically connected over k' then X is geometrically connected over k . \square

Lemma 54.8.3. *Let k be a field. Let X, Y be algebraic spaces over k . Assume X is geometrically connected over k . Then the projection morphism*

$$p : X \times_k Y \longrightarrow Y$$

induces a bijection between connected components.

Proof. Let $y \in |Y|$ be represented by a morphism $\text{Spec}(K) \rightarrow Y$ where K is a field. The fibre of $|X \times_k Y| \rightarrow |Y|$ over y is the image of $|Y_K| \rightarrow |X \times_k Y|$ by Properties of Spaces, Lemma 48.4.3. Thus these fibres are connected by our assumption that Y is geometrically connected. By Morphisms of Spaces, Lemma 49.6.6 the map $|p|$ is open. Thus we may apply Topology, Lemma 5.6.5 to conclude. \square

Lemma 54.8.4. *Let $k \subset k'$ be an extension of fields. Let X be an algebraic space over k . Assume k separably algebraically closed. Then the morphism $X_{k'} \rightarrow X$ induces a bijection of connected components. In particular, X is geometrically connected over k if and only if X is connected.*

Proof. Since k is separably algebraically closed we see that k' is geometrically connected over k , see Algebra, Lemma 10.46.4. Hence $Z = \text{Spec}(k')$ is geometrically connected over k by Varieties, Lemma 32.5.5. Since $X_{k'} = Z \times_k X$ the result is a special case of Lemma 54.8.3. \square

Lemma 54.8.5. *Let k be a field. Let X be an algebraic space over k . Let \bar{k} be a separable algebraic closure of k . Then X is geometrically connected if and only if the base change $X_{\bar{k}}$ is connected.*

Proof. Assume $X_{\bar{k}}$ is connected. Let $k \subset k'$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}'$ such that k' embeds into \bar{k}' as an extension of k . By Lemma 54.8.4 we see that $X_{\bar{k}'}$ is connected. Since $X_{\bar{k}'} \rightarrow X_{k'}$ is surjective we conclude that $X_{k'}$ is connected as desired. \square

Let k be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. For example \bar{k} could be the separable algebraic closure of k . For any $\sigma \in \text{Gal}(\bar{k}/k)$ we get a corresponding automorphism $\text{Spec}(\sigma) : \text{Spec}(\bar{k}) \rightarrow \text{Spec}(\bar{k})$. Note that $\text{Spec}(\sigma) \circ \text{Spec}(\tau) = \text{Spec}(\tau \circ \sigma)$. Hence we get an action

$$\text{Gal}(\bar{k}/k)^{opp} \times \text{Spec}(\bar{k}) \longrightarrow \text{Spec}(\bar{k})$$

of the opposite group on the scheme $\text{Spec}(\bar{k})$. Let X be an algebraic space over k . Since $X_{\bar{k}} = \text{Spec}(\bar{k}) \times_{\text{Spec}(k)} X$ by definition we see that the action above induces a canonical action

$$(54.8.5.1) \quad \text{Gal}(\bar{k}/k)^{opp} \times X_{\bar{k}} \longrightarrow X_{\bar{k}}.$$

Lemma 54.8.6. *Let k be a field. Let X be an algebraic space over k . Let \bar{k} be a (possibly infinite) Galois extension of k . Let $V \subset X_{\bar{k}}$ be a quasi-compact open. Then*

- (1) *there exists a finite subextension $k \subset k' \subset \bar{k}$ and a quasi-compact open $V' \subset X_{k'}$ such that $V = (V')_{\bar{k}}$,*
- (2) *there exists an open subgroup $H \subset \text{Gal}(\bar{k}/k)$ such that $\sigma(V) = V$ for all $\sigma \in H$.*

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Choose a quasi-compact open $W \subset U_{\bar{k}}$ whose image in $X_{\bar{k}}$ is V . This is possible because $|U_{\bar{k}}| \rightarrow |X_{\bar{k}}|$ is continuous and because $|U_{\bar{k}}|$ has a basis of quasi-compact opens. We can apply Varieties, Lemma 32.5.9 to $W \subset U_{\bar{k}}$ to obtain the lemma. \square

Lemma 54.8.7. *Let k be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let X be an algebraic space over k . Let $\bar{T} \subset |X_{\bar{k}}|$ have the following properties*

- (1) *\bar{T} is a closed subset of $|X_{\bar{k}}|$,*
- (2) *for every $\sigma \in \text{Gal}(\bar{k}/k)$ we have $\sigma(\bar{T}) = \bar{T}$.*

Then there exists a closed subset $T \subset |X|$ whose inverse image in $|X_{k'}|$ is \bar{T} .

Proof. Let $T \subset |X|$ be the image of \bar{T} . Since $|X_{\bar{k}}| \rightarrow |X|$ is surjective, the statement means that T is closed and that its inverse image is \bar{T} . Choose a scheme U and a surjective étale morphism $U \rightarrow X$. By the case of schemes (see Varieties, Lemma 32.5.10) there exists a closed subset $T' \subset |U|$ whose inverse image in $|U_{\bar{k}}|$ is the inverse image of \bar{T} . Since $|U_{\bar{k}}| \rightarrow |X_{\bar{k}}|$ is surjective, we see that T' is the inverse image of T via $|U| \rightarrow |X|$. By our construction of the topology on $|X|$ this means that T is closed. In the same manner one sees that \bar{T} is the inverse image of T . \square

Lemma 54.8.8. *Let k be a field. Let X be an algebraic space over k . The following are equivalent*

- (1) *X is geometrically connected,*
- (2) *for every finite separable field extension $k \subset k'$ the scheme $X_{k'}$ is connected.*

Proof. This proof is identical to the proof of Varieties, Lemma 32.5.11 except that we replace Varieties, Lemma 32.5.7 by Lemma 54.8.5, we replace Varieties, Lemma 32.5.9 by Lemma 54.8.6, and we replace Varieties, Lemma 32.5.10 by Lemma 54.8.7. We urge the reader to read that proof in stead of this one.

It follows immediately from the definition that (1) implies (2). Assume that X is not geometrically connected. Let $k \subset \bar{k}$ be a separable algebraic closure of k . By Lemma 54.8.5 it follows that $X_{\bar{k}}$ is disconnected. Say $X_{\bar{k}} = \bar{U} \amalg \bar{V}$ with \bar{U} and \bar{V} open, closed, and nonempty algebraic subspaces of $X_{\bar{k}}$.

Suppose that $W \subset X$ is any quasi-compact open subspace. Then $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are open and closed subspaces of $W_{\bar{k}}$. In particular $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are quasi-compact, and by Lemma 54.8.6 both $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are defined over a finite subextension and invariant under an open subgroup of $\text{Gal}(\bar{k}/k)$. We will use this without further mention in the following.

Pick $W_0 \subset X$ quasi-compact open subspace such that both $W_{0,\bar{k}} \cap \bar{U}$ and $W_{0,\bar{k}} \cap \bar{V}$ are nonempty. Choose a finite subextension $k \subset k' \subset \bar{k}$ and a decomposition $W_{0,k'} = U'_0 \amalg V'_0$ into open and closed subsets such that $W_{0,\bar{k}} \cap \bar{U} = (U'_0)_{\bar{k}}$ and $W_{0,\bar{k}} \cap \bar{V} = (V'_0)_{\bar{k}}$. Let $H = \text{Gal}(\bar{k}/k') \subset \text{Gal}(\bar{k}/k)$. In particular $\sigma(W_{0,\bar{k}} \cap \bar{U}) = W_{0,\bar{k}} \cap \bar{U}$ and similarly for \bar{V} .

Having chosen W_0, k' as above, for every quasi-compact open subspace $W \subset X$ we set

$$U_W = \bigcap_{\sigma \in H} \sigma(W_{\bar{k}} \cap \bar{U}), \quad V_W = \bigcup_{\sigma \in H} \sigma(W_{\bar{k}} \cap \bar{V}).$$

Now, since $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are fixed by an open subgroup of $\text{Gal}(\bar{k}/k)$ we see that the union and intersection above are finite. Hence U_W and V_W are both open and closed subspaces. Also, by construction $W_{\bar{k}} = U_W \amalg V_W$.

We claim that if $W \subset W' \subset X$ are quasi-compact open subspaces, then $W_{\bar{k}} \cap U_{W'} = U_W$ and $W_{\bar{k}} \cap V_{W'} = V_W$. Verification omitted. Hence we see that upon defining $U = \bigcup_{W \subset X} U_W$ and $V = \bigcup_{W \subset X} V_W$ we obtain $X_{\bar{k}} = U \amalg V$ is a disjoint union of open and closed subsets. It is clear that V is nonempty as it is constructed by taking unions (locally). On the other hand, U is nonempty since it contains $W_0 \cap \bar{U}$ by construction. Finally, $U, V \subset X_{\bar{k}}$ are closed and H -invariant by construction. Hence by Lemma 54.8.7 we have $U = (U')_{\bar{k}}$, and $V = (V')_{\bar{k}}$ for some closed $U', V' \subset X_{k'}$. Clearly $X_{k'} = U' \amalg V'$ and we see that $X_{k'}$ is disconnected as desired. \square

54.9. Spaces smooth over fields

Lemma 54.9.1. *Let k be a field. Let X be an algebraic space smooth over k . Then X is a regular algebraic space.*

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. The morphism $U \rightarrow \text{Spec}(k)$ is smooth as a composition of an étale (hence smooth) morphism and a smooth morphism (see Morphisms of Spaces, Lemmas 49.36.6 and 49.34.2). Hence U is regular by Varieties, Lemma 32.15.3. By Properties of Spaces, Definition 48.7.2 this means that X is regular. \square

Lemma 54.9.2. *Let k be a field. Let X be an algebraic space smooth over $\text{Spec}(k)$. The set of $x \in |X|$ which are image of morphisms $\text{Spec}(k') \rightarrow X$ with $k' \supset k$ finite separable is dense in $|X|$.*

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. The morphism $U \rightarrow \text{Spec}(k)$ is smooth as a composition of an étale (hence smooth) morphism and a smooth morphism (see Morphisms of Spaces, Lemmas 49.36.6 and 49.34.2). Hence we can apply Varieties, Lemma 32.15.6 to see that the closed points of U whose residue fields are finite separable over k are dense. This implies the lemma by our definition of the topology on $|X|$. \square

Topologies on Algebraic Spaces

55.1. Introduction

In this chapter we introduce some topologies on the category of algebraic spaces. Compare with the material in [Gro71], [BLR90], [LMB00] and [Knu71]. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 7.6.2) which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

55.2. The general procedure

In this section we explain a general procedure for producing the sites we will be working with. This discussion will make little or no sense unless the reader has read Topologies, Section 33.2.

Let S be a base scheme. Take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with S and any set of schemes over S you want to be included. Choose any set of coverings Cov_{fppf} on Sch_α as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings. Let Sch_{fppf} denote the big fppf site so obtained, and let $(Sch/S)_{fppf}$ denote the corresponding big fppf site of S . (The above is entirely as prescribed in Topologies, Section 33.7.)

Given choices as above the category of algebraic spaces over S has a set of isomorphism classes. One way to see this is to use the fact that any algebraic space over S is of the form U/R for some étale equivalence relation $j : R \rightarrow U \times_S U$ with $U, R \in \text{Ob}((Sch/S)_{fppf})$, see Spaces, Lemma 47.9.1. Hence we can find a full subcategory $Spaces/S$ of the category of algebraic spaces over S which has a set of objects such that each algebraic space is isomorphic to an object of $Spaces/S$. We fix a choice of such a category.

In the sections below, given a topology τ , the big site $(Spaces/S)_\tau$ (resp. the big site $(Spaces/X)_\tau$ of an algebraic space X over S) has as underlying category the category $Spaces/S$ (resp. the subcategory $Spaces/X$ of $Spaces/S$, see Categories, Example 4.2.13). The procedure for turning this into a site is as usual by defining a class of τ -coverings and using Sets, Lemma 3.11.1 to choose a sufficiently large set of coverings which defines the topology.

We point out that the *small étale site* $X_{\text{étale}}$ of an algebraic space X has already been defined in Properties of Spaces, Definition 48.15.1. Its objects are schemes étale over X , of which there are plenty by definition of an algebraic spaces. However, a more natural site, from the perspective of this chapter (compare Topologies, Definition 33.4.8) is the site $X_{spaces, \text{étale}}$ of Properties of Spaces, Definition 48.15.2.

These two sites define the same topos, see Properties of Spaces, Lemma 48.15.3. We will not redefine these in this chapter; instead we will simply use them.

Finally, we intend not to define the Zariski sites, since these do not seem particularly useful (although the Zariski topology is occasionally useful).

55.3. Fpqc topology

We briefly discuss the notion of an fpqc covering of algebraic spaces. Please compare with Topologies, Section 33.8. We will show in Descent on Spaces, Proposition 56.4.1 that quasi-coherent sheaves descent along these.

Definition 55.3.1. Let S be a scheme, and let X be an algebraic space over S . An *fpqc covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces such that each f_i is flat and such that for every affine scheme Z and morphism $h : Z \rightarrow X$ there exists a standard fpqc covering $\{g_j : Z_j \rightarrow Z\}_{j=1, \dots, n}$ which refines the family $\{X_i \times_X Z \rightarrow Z\}_{i \in I}$.

In other words, there exists indices $i_1, \dots, i_n \in I$ and morphisms $h_j : U_j \rightarrow X_{i_j}$ such that $f_{i_j} \circ h_j = h \circ g_j$. Note that if X and all X_i are representable, this is the same as a fpqc covering of schemes by Topologies, Lemma 33.8.11.

Lemma 55.3.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is an fpqc covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is an fpqc covering and for each i we have an fpqc covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is an fpqc covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is an fpqc covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is an fpqc covering.*

Proof. Part (1) is clear. Consider $g : X' \rightarrow X$ and $\{X_i \rightarrow X\}_{i \in I}$ an fpqc covering as in (3). By Morphisms of Spaces, Lemma 49.28.4 the morphisms $X' \times_X X_i \rightarrow X'$ are flat. If $h' : Z \rightarrow X'$ is a morphism from an affine scheme towards X' , then set $h = g \circ h' : Z \rightarrow X$. The assumption on $\{X_i \rightarrow X\}_{i \in I}$ means there exists a standard fpqc covering $\{Z_j \rightarrow Z\}_{j=1, \dots, n}$ and morphisms $Z_j \rightarrow X_{i(j)}$ covering h for certain $i(j) \in I$. By the universal property of the fibre product we obtain morphisms $Z_j \rightarrow X' \times_X X_{i(j)}$ over h' also. Hence $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is an fpqc covering. This proves (3).

Let $\{X_i \rightarrow X\}_{i \in I}$ and $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$ be as in (2). Let $h : Z \rightarrow X$ be a morphism from an affine scheme towards X . By assumption there exists a standard fpqc covering $\{Z_j \rightarrow Z\}_{j=1, \dots, n}$ and morphisms $h_j : Z_j \rightarrow X_{i(j)}$ covering h for some indices $i(j) \in I$. By assumption there exist standard fpqc coverings $\{Z_{j,l} \rightarrow Z_j\}_{l=1, \dots, n(j)}$ and morphisms $Z_{j,l} \rightarrow X_{i(j)j(l)}$ covering h_j for some indices $j(l) \in J_{i(j)}$. By Topologies, Lemma 33.8.10 the family $\{Z_{j,l} \rightarrow Z\}$ is a standard fpqc covering. Hence we conclude that $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is an fpqc covering. \square

Lemma 55.3.3. *Let S be a scheme, and let X be an algebraic space over S . Suppose that $\{f_i : X_i \rightarrow X\}_{i \in I}$ is a family of morphisms of algebraic spaces with target X . Let $U \rightarrow X$ be a surjective étale morphism from a scheme towards X . Then $\{f_i : X_i \rightarrow X\}_{i \in I}$ is an fpqc covering of X if and only if $\{U \times_X X_i \rightarrow U\}_{i \in I}$ is an fpqc covering of U .*

Proof. If $\{X_i \rightarrow X\}_{i \in I}$ is an fpqc covering, then so is $\{U \times_X X_i \rightarrow U\}_{i \in I}$ by Lemma 55.3.2. Assume that $\{U \times_X X_i \rightarrow U\}_{i \in I}$ is an fpqc covering. Let $h : Z \rightarrow X$ be a morphism from an affine scheme towards X . Then we see that $U \times_X Z \rightarrow Z$ is a surjective étale morphism of schemes, in particular open. Hence we can find finitely many affine opens W_1, \dots, W_t of $U \times_X Z$ whose images cover Z . For each j we may apply the condition that $\{U \times_X X_i \rightarrow U\}_{i \in I}$ is an fpqc covering to the morphism $W_j \rightarrow U$, and obtain a standard fpqc covering $\{W_{jl} \rightarrow W_j\}$ which refines $\{W_j \times_X X_i \rightarrow W_j\}_{i \in I}$. Hence $\{W_{jl} \rightarrow Z\}$ is a standard fpqc covering of Z (see Topologies, Lemma 33.8.10) which refines $\{Z \times_X X_i \rightarrow Z\}$ and we win. \square

Lemma 55.3.4. *Let S be a scheme, and let X be an algebraic space over S . Suppose that $\mathcal{U} = \{f_i : X_i \rightarrow X\}_{i \in I}$ is an fpqc covering of X . Then there exists a refinement $\mathcal{V} = \{g_i : T_i \rightarrow X\}$ of \mathcal{U} which is an fpqc covering such that each T_i is a scheme.*

Proof. Omitted. Hint: For each i choose a scheme T_i and a surjective étale morphism $T_i \rightarrow X_i$. Then check that $\{T_i \rightarrow X\}$ is an fpqc covering. \square

To be continued...

55.4. Fppf topology

In this section we discuss the notion of an fppf covering of algebraic spaces, and we define the big fppf site of an algebraic space. Please compare with Topologies, Section 33.7.

Definition 55.4.1. Let S be a scheme, and let X be an algebraic space over S . An *fppf covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces over S such that each f_i is flat and locally of finite presentation and such that

$$|X| = \bigcup_{i \in I} |f_i|(|X_i|),$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.7.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of an fppf covering of schemes.

Lemma 55.4.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is an fppf covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is an fppf covering and for each i we have an fppf covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is an fppf covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is an fppf covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is an fppf covering.*

Proof. Omitted. \square

Lemma 55.4.3. *Let S be a scheme, and let X be an algebraic space over S . Suppose that $\mathcal{U} = \{f_i : X_i \rightarrow X\}_{i \in I}$ is an fppf covering of X . Then there exists a refinement $\mathcal{V} = \{g_i : T_i \rightarrow X\}$ of \mathcal{U} which is an fppf covering such that each T_i is a scheme.*

Proof. Omitted. Hint: For each i choose a scheme T_i and a surjective étale morphism $T_i \rightarrow X_i$. Then check that $\{T_i \rightarrow X\}$ is an fppf covering. \square

Lemma 55.4.4. *Let S be a scheme. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fppf covering of algebraic spaces over S . Then the map of sheaves*

$$\coprod X_i \longrightarrow X$$

is surjective.

Proof. This follows from Spaces, Lemma 47.5.9. See also Spaces, Remark 47.5.2 in case you are confused about the meaning of this lemma. \square

To be continued...

55.5. Syntomic topology

In this section we discuss the notion of a syntomic covering of algebraic spaces, and we define the big syntomic site of an algebraic space. Please compare with Topologies, Section 33.6.

Definition 55.5.1. Let S be a scheme, and let X be an algebraic space over S . A *syntomic covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces over S such that each f_i is syntomic and such that

$$|X| = \bigcup_{i \in I} |f_i|(|X_i|),$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.6.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a syntomic covering of schemes.

Lemma 55.5.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is a syntomic covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is a syntomic covering and for each i we have a syntomic covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a syntomic covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is a syntomic covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is a syntomic covering.*

Proof. Omitted. \square

To be continued...

55.6. Smooth topology

In this section we discuss the notion of a smooth covering of algebraic spaces, and we define the big smooth site of an algebraic space. Please compare with Topologies, Section 33.5.

Definition 55.6.1. Let S be a scheme, and let X be an algebraic space over S . A *smooth covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces over S such that each f_i is smooth and such that

$$|X| = \bigcup_{i \in I} |f_i|(|X_i|),$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.5.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a smooth covering of schemes.

Lemma 55.6.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is a smooth covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is a smooth covering and for each i we have a smooth covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a smooth covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is a smooth covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is a smooth covering.*

Proof. Omitted. □

To be continued...

55.7. Étale topology

In this section we discuss the notion of a étale covering of algebraic spaces, and we define the big étale site of an algebraic space. Please compare with Topologies, Section 33.4.

Definition 55.7.1. Let S be a scheme, and let X be an algebraic space over S . A *étale covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces over S such that each f_i is étale and such that

$$|X| = \bigcup_{i \in I} |f_i|(|X_i|),$$

i.e., the morphisms are jointly surjective.

This is exactly the same as Topologies, Definition 33.4.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a étale covering of schemes.

Lemma 55.7.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is a étale covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is a étale covering and for each i we have a étale covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a étale covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is a étale covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is a étale covering.*

Proof. Omitted. □

To be continued...

55.8. Zariski topology

In Spaces, Section 47.12 we introduced the notion of a Zariski covering of an algebraic space by open subspaces. Here is the corresponding notion with open subspaces replaces by open immersions.

Definition 55.8.1. Let S be a scheme, and let X be an algebraic space over S . A *Zariski covering* of X is a family of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ of algebraic spaces over S such that each f_i is an open immersion and such that

$$|X| = \bigcup_{i \in I} |f_i|(|X_i|),$$

i.e., the morphisms are jointly surjective.

Although Zariski coverings are occasionally useful the corresponding topology on the category of algebraic spaces is really too coarse, and not particularly useful. Still, it does define a site.

Lemma 55.8.2. *Let S be a scheme. Let X be an algebraic space over S .*

- (1) *If $X' \rightarrow X$ is an isomorphism then $\{X' \rightarrow X\}$ is a Zariski covering of X .*
- (2) *If $\{X_i \rightarrow X\}_{i \in I}$ is a Zariski covering and for each i we have a Zariski covering $\{X_{ij} \rightarrow X_i\}_{j \in J_i}$, then $\{X_{ij} \rightarrow X\}_{i \in I, j \in J_i}$ is a Zariski covering.*
- (3) *If $\{X_i \rightarrow X\}_{i \in I}$ is a Zariski covering and $X' \rightarrow X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \rightarrow X'\}_{i \in I}$ is a Zariski covering.*

Proof. Omitted. □

Descent and Algebraic Spaces

56.1. Introduction

In the chapter on topologies on algebraic spaces (see Topologies on Spaces, Section 55.1) we introduced étale, fppf, smooth, syntomic and fpqc coverings of algebraic spaces. In this chapter we discuss what kind of structures over algebraic spaces can be descended through such coverings. See for example [Gro95a], [Gro95b], [Gro95e], [Gro95f], [Gro95c], and [Gro95d].

56.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

56.3. Descent data for quasi-coherent sheaves

This section is the analogue of Descent, Section 34.2 for algebraic spaces. It makes sense to read that section first.

Definition 56.3.1. Let S be a scheme. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target X .

- (1) A *descent datum* $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given family is given by a quasi-coherent sheaf \mathcal{F}_i on X_i for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{X_i \times_X X_j}$ -modules $\varphi_{ij} : \text{pr}_0^* \mathcal{F}_i \rightarrow \text{pr}_1^* \mathcal{F}_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{array}{ccc}
 \text{pr}_0^* \mathcal{F}_i & \xrightarrow{\quad \text{pr}_{02}^* \varphi_{ik} \quad} & \text{pr}_2^* \mathcal{F}_k \\
 \searrow \text{pr}_{01}^* \varphi_{ij} & & \nearrow \text{pr}_{12}^* \varphi_{jk} \\
 & \text{pr}_1^* \mathcal{F}_j &
 \end{array}$$

of $\mathcal{O}_{X_i \times_X X_j \times_X X_k}$ -modules commutes. This is called the *cocycle condition*.

- (2) A *morphism* $\psi : (\mathcal{F}_i, \varphi_{ij}) \rightarrow (\mathcal{F}'_i, \varphi'_{ij})$ of descent data is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms of \mathcal{O}_{X_i} -modules $\psi_i : \mathcal{F}_i \rightarrow \mathcal{F}'_i$ such that all the

diagrams

$$\begin{array}{ccc}
 \mathrm{pr}_0^* \mathcal{F}_i & \xrightarrow{\varphi_{ij}} & \mathrm{pr}_1^* \mathcal{F}_j \\
 \mathrm{pr}_0^* \psi_i \downarrow & & \downarrow \mathrm{pr}_1^* \psi_j \\
 \mathrm{pr}_0^* \mathcal{F}'_i & \xrightarrow{\varphi'_{ij}} & \mathrm{pr}_1^* \mathcal{F}'_j
 \end{array}$$

commute.

Lemma 56.3.2. *Let S be a scheme. Let $\mathcal{U} = \{U_i \rightarrow U\}_{i \in I}$ and $\mathcal{V} = \{V_j \rightarrow V\}_{j \in J}$ be families of morphisms of algebraic spaces over S with fixed targets. Let $(g, \alpha : I \rightarrow J, (g_i)) : \mathcal{U} \rightarrow \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Let $(\mathcal{F}_j, \varphi_{jj'})$ be a descent datum for quasi-coherent sheaves with respect to the family $\{V_j \rightarrow V\}_{j \in J}$. Then*

- (1) *The system*

$$(g_i^* \mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$

is a descent datum with respect to the family $\{U_i \rightarrow U\}_{i \in I}$.

- (2) *This construction is functorial in the descent datum $(\mathcal{F}_j, \varphi_{jj'})$.*
- (3) *Given a second morphism $(g', \alpha' : I \rightarrow J, (g'_i))$ of families of maps with fixed target with $g = g'$ there exists a functorial isomorphism of descent data*

$$(g_i^* \mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')}) \cong ((g'_i)^* \mathcal{F}_{\alpha'(i)}, (g'_i \times g'_{i'})^* \varphi_{\alpha'(i)\alpha'(i')}).$$

Proof. Omitted. Hint: The maps $g_i^* \mathcal{F}_{\alpha(i)} \rightarrow (g'_i)^* \mathcal{F}_{\alpha'(i)}$ which give the isomorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i)\alpha'(i)}$ by the morphisms $(g_i, g'_i) : U_i \rightarrow V_{\alpha(i)} \times_V V_{\alpha'(i)}$. □

Let $g : U \rightarrow V$ be a morphism of algebraic spaces. The lemma above tells us that there is a well defined pullback functor between the categories of descent data relative to families of maps with target V and U provided there is a morphism between those families of maps which “lives over g ”.

Definition 56.3.3. Let S be a scheme. Let $\{U_i \rightarrow U\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target.

- (1) Let \mathcal{F} be a quasi-coherent \mathcal{O}_U -module. We call the unique descent on \mathcal{F} datum with respect to the covering $\{U \rightarrow U\}$ the *trivial descent datum*.
- (2) The pullback of the trivial descent datum to $\{U_i \rightarrow U\}$ is called the *canonical descent datum*. Notation: $(\mathcal{F}|_{U_i}, can)$.
- (3) A descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given family is said to be *effective* if there exists a quasi-coherent sheaf \mathcal{F} on U such that $(\mathcal{F}_i, \varphi_{ij})$ is isomorphic to $(\mathcal{F}|_{U_i}, can)$.

Lemma 56.3.4. *Let S be a scheme. Let U be an algebraic space over S . Let $\{U_i \rightarrow U\}$ be a Zariski covering of U , see Topologies on Spaces, Definition 55.8.1. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U} = \{U_i \rightarrow U\}$ is effective. Moreover, the functor from the category of quasi-coherent \mathcal{O}_U -modules to the category of descent data with respect to $\{U_i \rightarrow U\}$ is fully faithful.*

Proof. Omitted. □

56.4. Fpqc descent of quasi-coherent sheaves

The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.

Proposition 56.4.1. *Let S be a scheme. Let $\{X_i \rightarrow X\}$ be an fpqc covering of algebraic spaces over S , see Topologies on Spaces, Definition 55.3.1. Any descent datum on quasi-coherent sheaves for $\{X_i \rightarrow X\}$ is effective. Moreover, the functor from the category of quasi-coherent \mathcal{O}_X -modules to the category of descent data with respect to $\{X_i \rightarrow X\}$ is fully faithful.*

Proof. This is more or less a formal consequence of the corresponding result for schemes, see Descent, Proposition 34.5.2. Here is a strategy for a proof:

- (1) The fact that $\{X_i \rightarrow X\}$ is a refinement of the trivial covering $\{X \rightarrow X\}$ gives, via Lemma 56.3.2, a functor $QCoh(\mathcal{O}_X) \rightarrow DD(\{X_i \rightarrow X\})$ from the category of quasi-coherent \mathcal{O}_X -modules to the category of descent data for the given family.
- (2) In order to prove the proposition we will construct a quasi-inverse functor $back : DD(\{X_i \rightarrow X\}) \rightarrow QCoh(\mathcal{O}_X)$.
- (3) Applying again Lemma 56.3.2 we see that there is a functor $DD(\{X_i \rightarrow X\}) \rightarrow DD(\{T_j \rightarrow X\})$ if $\{T_j \rightarrow X\}$ is a refinement of the given family. Hence in order to construct the functor $back$ we may assume that each X_i is a scheme, see Topologies on Spaces, Lemma 55.3.4. This reduces us to the case where all the X_i are schemes.
- (4) A quasi-coherent sheaf on X is by definition a quasi-coherent \mathcal{O}_X -module on $X_{\acute{e}tale}$. Now for any $U \in \text{Ob}(X_{\acute{e}tale})$ we get an fppf covering $\{U_i \times_X X_i \rightarrow U\}$ by schemes and a morphism $g : \{U_i \times_X X_i \rightarrow U\} \rightarrow \{X_i \rightarrow X\}$ of coverings lying over $U \rightarrow X$. Given a descent datum $\xi = (\mathcal{F}_i, \varphi_{ij})$ we obtain a quasi-coherent \mathcal{O}_U -module $\mathcal{F}_{\xi,U}$ corresponding to the pullback $g^*\xi$ of Lemma 56.3.2 to the covering of U and using effectivity for fppf covering of schemes, see Descent, Proposition 34.5.2.
- (5) Check that $\xi \mapsto \mathcal{F}_{\xi,U}$ is functorial in ξ . Omitted.
- (6) Check that $\xi \mapsto \mathcal{F}_{\xi,U}$ is compatible with morphisms $U \rightarrow U'$ of the site $X_{\acute{e}tale}$, so that the system of sheaves $\mathcal{F}_{\xi,U}$ corresponds to a quasi-coherent \mathcal{F}_{ξ} on $X_{\acute{e}tale}$, see Properties of Spaces, Lemma 48.27.3. Details omitted.
- (7) Check that $back : \xi \mapsto \mathcal{F}_{\xi}$ is quasi-inverse to the functor constructed in (1). Omitted.

This finishes the proof. □

56.5. Descent of finiteness properties of modules

This section is the analogue for the case of algebraic spaces of Descent, Section 34.6. The goal is to show that one can check a quasi-coherent module has a certain finiteness conditions by checking on the members of a covering. We will repeatedly use the following proof scheme. Suppose that X is an algebraic space, and that $\{X_i \rightarrow X\}$ is a fppf (resp. fpqc) covering. Let $U \rightarrow X$ be a surjective étale morphism such that U is a scheme. Then there exists an fppf (resp. fpqc) covering $\{Y_j \rightarrow X\}$ such that

- (1) $\{Y_j \rightarrow X\}$ is a refinement of $\{X_i \rightarrow X\}$,
- (2) each Y_j is a scheme, and

- (3) each morphism $Y_j \rightarrow X$ factors through U , and
 (4) $\{Y_j \rightarrow U\}$ is an fppf (resp. fpqc) covering of U .

Namely, first refine $\{X_i \rightarrow X\}$ by an fppf (resp. fpqc) covering such that each X_i is a scheme, see Topologies on Spaces, Lemma 55.4.3, resp. Lemma 55.3.4. Then set $Y_i = U \times_X X_i$. A quasi-coherent \mathcal{O}_X -module \mathcal{F} is of finite type, of finite presentation, etc if and only if the quasi-coherent \mathcal{O}_U -module $\mathcal{F}|_U$ is of finite type, of finite presentation, etc. Hence we can use the existence of the refinement $\{Y_j \rightarrow X\}$ to reduce the proof of the following lemmas to the case of schemes. We will indicate this by saying that “*the result follows from the case of schemes by étale localization*”.

Lemma 56.5.1. *Let X be an algebraic space over a scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a finite type \mathcal{O}_{X_i} -module. Then \mathcal{F} is a finite type \mathcal{O}_X -module.*

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.1, by étale localization. \square

Lemma 56.5.2. *Let X be an algebraic space over a scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is an \mathcal{O}_{X_i} -module of finite presentation. Then \mathcal{F} is an \mathcal{O}_X -module of finite presentation.*

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.3, by étale localization. \square

Lemma 56.5.3. *Let X be an algebraic space over a scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a flat \mathcal{O}_{X_i} -module. Then \mathcal{F} is a flat \mathcal{O}_X -module.*

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.5, by étale localization. \square

Lemma 56.5.4. *Let X be an algebraic space over a scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a finite locally free \mathcal{O}_{X_i} -module. Then \mathcal{F} is a finite locally free \mathcal{O}_X -module.*

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.6, by étale localization. \square

The definition of a locally projective quasi-coherent sheaf can be found in Properties of Spaces, Section 48.29. It is also proved there that this notion is preserved under pullback.

Lemma 56.5.5. *Let X be an algebraic space over a scheme S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $\{f_i : X_i \rightarrow X\}_{i \in I}$ be an fpqc covering such that each $f_i^* \mathcal{F}$ is a locally projective \mathcal{O}_{X_i} -module. Then \mathcal{F} is a locally projective \mathcal{O}_X -module.*

Proof. This follows from the case of schemes, see Descent, Lemma 34.6.7, by étale localization. \square

We also add here two results which are related to the results above, but are of a slightly different nature.

Lemma 56.5.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is a finite morphism. Then \mathcal{F} is an \mathcal{O}_X -module of finite type if and only if $f_*\mathcal{F}$ is an \mathcal{O}_Y -module of finite type.*

Proof. As f is finite it is representable. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Then $U = V \times_Y X$ is a scheme with a surjective étale morphism towards X and a finite morphism $\psi : U \rightarrow V$ (the base change of f). Since $\psi_*(\mathcal{F}|_U) = f_*\mathcal{F}|_V$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 34.6.9. \square

Lemma 56.5.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume f is finite and of finite presentation. Then \mathcal{F} is an \mathcal{O}_X -module of finite presentation if and only if $f_*\mathcal{F}$ is an \mathcal{O}_Y -module of finite presentation.*

Proof. As f is finite it is representable. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Then $U = V \times_Y X$ is a scheme with a surjective étale morphism towards X and a finite morphism $\psi : U \rightarrow V$ (the base change of f). Since $\psi_*(\mathcal{F}|_U) = f_*\mathcal{F}|_V$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 34.6.10. \square

56.6. Fpqc coverings

This section is the analogue of Descent, Section 34.9. At the moment we do not know if all of the material for fpqc coverings of schemes holds also for algebraic spaces.

Lemma 56.6.1. *Let S be a scheme. Let $\{f_i : T_i \rightarrow T\}_{i \in I}$ be an fpqc covering of algebraic spaces over S . Suppose that for each i we have an open subspace $W_i \subset T_i$ such that for all $i, j \in I$ we have $pr_0^{-1}(W_i) = pr_1^{-1}(W_j)$ as open subspaces of $T_i \times_T T_j$. Then there exists a unique open subspace $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i .*

Proof. By Topologies on Spaces, Lemma 55.3.4 we may assume each T_i is a scheme. Choose a scheme U and a surjective étale morphism $U \rightarrow T$. Then $\{T_i \times_T U \rightarrow U\}$ is an fpqc covering of U and $T_i \times_T U$ is a scheme for each i . Hence we see that the collection of opens $W_i \times_T U$ comes from a unique open subscheme $W' \subset U$ by Descent, Lemma 34.9.2. As $U \rightarrow X$ is open we can define $W \subset X$ the Zariski open which is the image of W' , see Properties of Spaces, Section 48.4. We omit the verification that this works, i.e., that W_i is the inverse image of W for each i . \square

Lemma 56.6.2. *Let S be a scheme. Let $\{T_i \rightarrow T\}$ be an fpqc covering of algebraic spaces over S , see Topologies on Spaces, Definition 55.3.1. Then given an algebraic space B over S the sequence*

$$\mathrm{Mor}_S(T, B) \longrightarrow \prod_i \mathrm{Mor}_S(T_i, B) \rightrightarrows \prod_{i,j} \mathrm{Mor}_S(T_i \times_T T_j, B)$$

is an equalizer diagram. In other words, every representable functor on the category of algebraic spaces over S satisfies the sheaf condition for fpqc coverings.

Proof. We know this is true if $\{T_i \rightarrow T\}$ is an fpqc covering of schemes, see Properties of Spaces, Proposition 48.14.1. This is the key fact and we encourage the reader to skip the rest of the proof which is formal. Choose a scheme U and a

surjective étale morphism $U \rightarrow T$. Let U_i be a scheme and let $U_i \rightarrow T_i \times_T U$ be a surjective étale morphism. Then $\{U_i \rightarrow U\}$ is an fpqc covering. This follows from Topologies on Spaces, Lemmas 55.3.2 and 55.3.3. By the above we have the result for $\{U_i \rightarrow U\}$.

What this means is the following: Suppose that $b_i : T_i \rightarrow B$ is a family of morphisms with $b_i \circ \text{pr}_0 = b_j \circ \text{pr}_1$ as morphisms $T_i \times_T T_j \rightarrow B$. Then we let $a_i : U_i \rightarrow B$ be the composition of $U_i \rightarrow T_i$ with b_i . By what was said above we find a unique morphism $a : U \rightarrow B$ such that a_i is the composition of a with $U_i \rightarrow U$. The uniqueness guarantees that $a \circ \text{pr}_0 = a \circ \text{pr}_1$ as morphisms $U \times_T U \rightarrow B$. Then since $T = U/(U \times_T U)$ as a sheaf, we find that a comes from a unique morphism $b : T \rightarrow B$. Chasing diagrams we find that b is the morphism we are looking for. \square

56.7. Descent of finiteness properties of morphisms

The following type of lemma is occasionally useful.

Lemma 56.7.1. *Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphism of algebraic spaces. Let P be one of the following properties of morphisms of algebraic spaces over S : flat, locally finite type, locally finite presentation. Assume that $X \rightarrow Z$ has P and that $X \rightarrow Y$ is a surjection of sheaves on $(\text{Sch}/S)_{\text{fppf}}$. Then $Y \rightarrow Z$ is P .*

Proof. Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Choose a scheme V and a surjective étale morphism $V \rightarrow W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. By assumption we can find an fppf covering $\{V_i \rightarrow V\}$ and lifts $V_i \rightarrow X$ of the morphism $V_i \rightarrow Y$. Since $U \rightarrow X$ is surjective étale we see that over the members of the fppf covering $\{V_i \times_X U \rightarrow V\}$ we have lifts into U . Hence $U \rightarrow V$ induces a surjection of sheaves on $(\text{Sch}/S)_{\text{fppf}}$. By our definition of what it means to have property P for a morphism of algebraic spaces (see Morphisms of Spaces, Definition 49.28.1, Definition 49.23.1, and Definition 49.27.1) we see that $U \rightarrow W$ has P and we have to show $V \rightarrow W$ has P . Thus we reduce the question to the case of morphisms of schemes which is treated in Descent, Lemma 34.10.8. \square

A more standard case of the above lemma is the following. (The version with “flat” follows from Morphisms of Spaces, Lemma 49.29.5.)

Lemma 56.7.2. *Let S be a scheme. Let*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & B \end{array}$$

be a commutative diagram of morphisms of algebraic spaces over S . Assume that f is surjective, flat, and locally of finite presentation and assume that p is locally of finite presentation (resp. locally of finite type). Then q is locally of finite presentation (resp. locally of finite type).

Proof. Since $\{X \rightarrow Y\}$ is an fppf covering, it induces a surjection of fppf sheaves (Topologies on Spaces, Lemma 55.4.4) and the lemma is a special case of Lemma 56.7.1. On the other hand, an easier argument is to deduce it from the analogue for schemes. Namely, the problem is étale local on B and Y (Morphisms of Spaces, Lemmas 49.23.4 and 49.27.4). Hence we may assume that B and Y are affine

schemes. Since $|X| \rightarrow |Y|$ is open (Morphisms of Spaces, Lemma 49.28.6), we can choose an affine scheme U and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.3. \square

Lemma 56.7.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & B \end{array}$$

be a commutative diagram of morphisms of algebraic spaces over S . Assume that

- (1) *f is surjective, and syntomic (resp. smooth, resp. étale),*
- (2) *p is syntomic (resp. smooth, resp. étale).*

Then q is syntomic (resp. smooth, resp. étale).

Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on B and Y (Morphisms of Spaces, Lemmas 49.33.4, 49.34.4, and 49.36.2). Hence we may assume that B and Y are affine schemes. Since $|X| \rightarrow |Y|$ is open (Morphisms of Spaces, Lemma 49.28.6), we can choose an affine scheme U and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.4. \square

Actually we can strengthen this result as follows.

Lemma 56.7.4. *Let S be a scheme. Let*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & B \end{array}$$

be a commutative diagram of morphisms of algebraic spaces over S . Assume that

- (1) *f is surjective, flat, and locally of finite presentation,*
- (2) *p is smooth (resp. étale).*

Then q is smooth (resp. étale).

Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on B and Y (Morphisms of Spaces, Lemmas 49.34.4 and 49.36.2). Hence we may assume that B and Y are affine schemes. Since $|X| \rightarrow |Y|$ is open (Morphisms of Spaces, Lemma 49.28.6), we can choose an affine scheme U and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.5. \square

Lemma 56.7.5. *Let S be a scheme. Let*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & B \end{array}$$

be a commutative diagram of morphisms of algebraic spaces over S . Assume that

- (1) *f is surjective, flat, and locally of finite presentation,*
- (2) *p is syntomic.*

Then both q and f are syntomic.

Proof. We deduce this from the analogue for schemes. Namely, the problem is étale local on B and Y (Morphisms of Spaces, Lemma 49.33.4). Hence we may assume that B and Y are affine schemes. Since $|X| \rightarrow |Y|$ is open (Morphisms of Spaces, Lemma 49.28.6), we can choose an affine scheme U and an étale morphism $U \rightarrow X$ such that the composition $U \rightarrow Y$ is surjective. In this case the result follows from Descent, Lemma 34.10.7. \square

56.8. Descending properties of spaces

In this section we put some results of the following kind.

Lemma 56.8.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$. If f is flat at x and X is geometrically unibranch at x , then Y is geometrically unibranch at $f(x)$.*

Proof. Consider the map of étale local rings $\mathcal{O}_{Y,f(\bar{x})} \rightarrow \mathcal{O}_{X,\bar{x}}$. By Morphisms of Spaces, Lemma 49.28.8 this is flat. Hence if $\mathcal{O}_{X,\bar{x}}$ has a unique minimal prime, so does $\mathcal{O}_{Y,f(\bar{x})}$ (by going down, see Algebra, Lemma 10.38.17). \square

Lemma 56.8.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is flat and surjective and X is reduced, then Y is reduced.*

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. As f is surjective and flat, the morphism of schemes $U \rightarrow V$ is surjective and flat. In this way we reduce the problem to the case of schemes (as reducedness of X and Y is defined in terms of reducedness of U and V , see Properties of Spaces, Section 48.7). The case of schemes is Descent, Lemma 34.15.1. \square

Lemma 56.8.3. *Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is locally Noetherian, then Y is locally Noetherian.*

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. As f is surjective, flat, and locally of finite presentation the morphism of schemes $U \rightarrow V$ is surjective, flat, and locally of finite presentation. In this way we reduce the problem to the case of schemes (as being locally Noetherian for X and Y is defined in terms of being locally Noetherian of U and V , see Properties of Spaces, Section 48.7). In the case of schemes the result follows from Descent, Lemma 34.12.1. \square

Lemma 56.8.4. *Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is regular, then Y is regular.*

Proof. By Lemma 56.8.3 we know that Y is locally Noetherian. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. It suffices to prove that the local rings of V are all regular local rings, see Properties, Lemma 27.9.2. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. As f is surjective and flat the morphism of schemes $U \rightarrow V$ is surjective and flat. By assumption U is a regular scheme in particular all of its local rings are regular (by the lemma above). Hence the lemma follows from Algebra, Lemma 10.106.9. \square

56.9. Descending properties of morphisms

In this section we introduce the notion of when a property of morphisms of algebraic spaces is local on the target in a topology. Please compare with Descent, Section 34.18.

Definition 56.9.1. Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S . Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale\}$. We say \mathcal{P} is τ local on the base, or τ local on the target, or local on the base for the τ -topology if for any τ -covering $\{Y_i \rightarrow Y\}_{i \in I}$ of algebraic spaces and any morphism of algebraic spaces $f : X \rightarrow Y$ we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } Y_i \times_Y X \rightarrow Y_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property \mathcal{P} holds for $X \rightarrow Y$ if and only if it holds for any arrow $X' \rightarrow Y'$ isomorphic to $X \rightarrow Y$. If a property is τ -local on the target then it is preserved by base changes by morphisms which occur in τ -coverings. Here is a formal statement.

Lemma 56.9.2. Let S be a scheme. Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale\}$. Let \mathcal{P} be a property of morphisms of algebraic spaces over S which is τ local on the target. Let $f : X \rightarrow Y$ have property \mathcal{P} . For any morphism $Y' \rightarrow Y$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. $\acute{e}tale$, the base change $f' : Y' \times_Y X \rightarrow Y'$ of f has property \mathcal{P} .

Proof. This is true because we can fit $Y' \rightarrow Y$ into a family of morphisms which forms a τ -covering. \square

A simple often used consequence of the above is that if $f : X \rightarrow Y$ has property \mathcal{P} which is τ -local on the target and $f(X) \subset V$ for some open subspace $V \subset Y$, then also the induced morphism $X \rightarrow V$ has \mathcal{P} . Proof: The base change f by $V \rightarrow Y$ gives $X \rightarrow V$.

Lemma 56.9.3. Let S be a scheme. Let $\tau \in \{fppf, syntomic, smooth, \acute{e}tale\}$. Let \mathcal{P} be a property of morphisms of algebraic spaces over S which is τ local on the target. For any morphism of algebraic spaces $f : X \rightarrow Y$ over S there exists a largest open subspace $W(f) \subset Y$ such that the restriction $X_{W(f)} \rightarrow W(f)$ has \mathcal{P} . Moreover,

- (1) if $g : Y' \rightarrow Y$ is a morphism of algebraic spaces which is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$ and the base change $f' : X_{Y'} \rightarrow Y'$ has \mathcal{P} , then g factors through $W(f)$,
- (2) if $g : Y' \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$, then $W(f') = g^{-1}(W(f))$, and
- (3) if $\{g_i : Y_i \rightarrow Y\}$ is a τ -covering, then $g_i^{-1}(W(f)) = W(f_i)$, where f_i is the base change of f by $Y_i \rightarrow Y$.

Proof. Consider the union $W_{set} \subset |Y|$ of the images $g(|Y'|) \subset |Y|$ of morphisms $g : Y' \rightarrow Y$ with the properties:

- (1) g is flat and locally of finite presentation, syntomic, smooth, or $\acute{e}tale$, and
- (2) the base change $Y' \times_{g,Y} X \rightarrow Y'$ has property \mathcal{P} .

Since such a morphism g is open (see Morphisms of Spaces, Lemma 49.28.6) we see that W_{set} is an open subset of $|Y|$. Denote $W \subset Y$ the open subspace whose underlying set of points is W_{set} , see Properties of Spaces, Lemma 48.4.8. Since \mathcal{P}

is local in the τ topology the restriction $X_W \rightarrow W$ has property \mathcal{P} because we are given a covering $\{Y' \rightarrow W\}$ of W such that the pullbacks have \mathcal{P} . This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W(f') \supset g^{-1}(W(f))$ because \mathcal{P} is stable under base change by flat and locally of finite presentation, syntomic, smooth, or étale morphisms, see Lemma 56.9.2. On the other hand, if $Y'' \subset Y'$ is an open such that $X_{Y''} \rightarrow Y''$ has property \mathcal{P} , then $Y'' \rightarrow Y$ factors through W by construction, i.e., $Y'' \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each morphism $Y_i \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a τ -covering. \square

Lemma 56.9.4. *Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S . Assume*

- (1) *if $X_i \rightarrow Y_i$, $i = 1, 2$ have property \mathcal{P} so does $X_1 \amalg X_2 \rightarrow Y_1 \amalg Y_2$,*
- (2) *a morphism of algebraic spaces $f : X \rightarrow Y$ has property \mathcal{P} if and only if for every affine scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ of f has property \mathcal{P} , and*
- (3) *for any surjective flat morphism of affine schemes $Z' \rightarrow Z$ over S and a morphism $f : X \rightarrow Z$ from an algebraic space to Z we have*

$$f' : Z' \times_Z X \rightarrow Z' \text{ has } \mathcal{P} \Rightarrow f \text{ has } \mathcal{P}.$$

Then \mathcal{P} is fpqc local on the base.

Proof. If \mathcal{P} has property (2), then it is automatically stable under any base change. Hence the direct implication in Definition 56.9.1.

Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an fpqc covering of algebraic spaces over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume each base change $f_i : Y_i \times_Y X \rightarrow Y_i$ has property \mathcal{P} . Our goal is to show that f has \mathcal{P} . Let Z be an affine scheme, and let $Z \rightarrow Y$ be a morphism. By (2) it suffices to show that the morphism of algebraic spaces $Z \times_Y X \rightarrow Z$ has \mathcal{P} . Since $\{Y_i \rightarrow Y\}_{i \in I}$ is an fpqc covering we know there exists a standard fpqc covering $\{Z_j \rightarrow Z\}_{j=1, \dots, n}$ and morphisms $Z_j \rightarrow Y_{i_j}$ over Y for suitable indices $i_j \in I$. Since f_{i_j} has \mathcal{P} we see that

$$Z_j \times_Y X = Z_j \times_{Y_{i_j}} (Y_{i_j} \times_Y X) \longrightarrow Z_j$$

has \mathcal{P} as a base change of f_{i_j} (see first remark of the proof). Set $Z' = \coprod_{j=1, \dots, n} Z_j$, so that $Z' \rightarrow Z$ is a flat and surjective morphism of affine schemes over S . By (1) we conclude that $Z' \times_Y X \rightarrow Z'$ has property \mathcal{P} . Since this is the base change of the morphism $Z \times_Y X \rightarrow Z$ by the morphism $Z' \rightarrow Z$ we conclude that $Z \times_Y X \rightarrow Z$ has property \mathcal{P} as desired. \square

56.10. Descending properties of morphisms in the fpqc topology

In this section we find a large number of properties of morphisms of algebraic spaces which are local on the base in the fpqc topology. Please compare with Descent, Section 34.19 for the case of morphisms of schemes.

Lemma 56.10.1. *Let S be a scheme. The property $\mathcal{P}(f) = \text{“}f \text{ is quasi-compact”}$ is fpqc local on the base on algebraic spaces over S .*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.8.7. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is quasi-compact. We have to show that f is quasi-compact. To see this, using Morphisms of Spaces, Lemma 49.8.7 again, it is enough to show that for every affine scheme Y and morphism $Y \rightarrow Z$ the fibre product $Y \times_Z X$ is quasi-compact. Here is a picture:

$$(56.10.1.1) \quad \begin{array}{ccccc} Y \times_Z Z' \times_Z X & \xrightarrow{\quad} & Z' \times_Z X & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & Y \times_Z X & & X & \\ & \downarrow & \downarrow f' & \downarrow f & \\ Y \times_Z Z' & \xrightarrow{\quad} & Z' & & \\ & \searrow & \downarrow & \searrow & \\ & Y & \xrightarrow{\quad} & Z & \end{array}$$

Note that all squares are cartesian and the bottom square consists of affine schemes. The assumption that f' is quasi-compact combined with the fact that $Y \times_Z Z'$ is affine implies that $Y \times_Z Z' \times_Z X$ is quasi-compact. Since

$$Y \times_Z Z' \times_Z X \longrightarrow Y \times_Z X$$

is surjective as a base change of $Z' \rightarrow Z$ we conclude that $Y \times_Z X$ is quasi-compact, see Morphisms of Spaces, Lemma 49.8.5. This finishes the proof. \square

Lemma 56.10.2. *Let S be a scheme. The property $\mathcal{P}(f) = \text{“}f \text{ is quasi-separated”}$ is fpqc local on the base on algebraic spaces over S .*

Proof. A base change of a quasi-separated morphism is quasi-separated, see Morphisms of Spaces, Lemma 49.4.4. Hence the direct implication in Definition 56.9.1.

Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an fpqc covering of algebraic spaces over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume each base change $X_i := Y_i \times_Y X \rightarrow Y_i$ is quasi-separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is quasi-compact. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 55.3.2 hence $\{Y_i \times_Y (X \times_Y X) \rightarrow X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \rightarrow X \times_Y X$. Hence it follows from Lemma 56.10.1 that Δ is quasi-compact, i.e., f is quasi-separated. \square

Lemma 56.10.3. *Let S be a scheme. The property $\mathcal{P}(f) = \text{“}f \text{ is universally closed”}$ is fpqc local on the base on algebraic spaces over S .*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.9.5. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is universally closed. We have to show that f is universally closed. To see this, using Morphisms of

Spaces, Lemma 49.9.5 again, it is enough to show that for every affine scheme Y and morphism $Y \rightarrow Z$ the map $|Y \times_Z X| \rightarrow |Y|$ is closed. Consider the cube (56.10.1.1). The assumption that f' is universally closed implies that $|Y \times_Z Z' \times_Z X| \rightarrow |Y \times_Z Z'|$ is closed. As $Y \times_Z Z' \rightarrow Y$ is surjective and flat as a base change of $Z' \rightarrow Z$ we see the map $|Y \times_Z Z'| \rightarrow |Y|$ is submersive, see Morphisms, Lemma 28.26.10. Moreover the map

$$|Y \times_Z Z' \times_Z X| \longrightarrow |Y \times_Z Z'| \times_{|Y|} |Y \times_Z X|$$

is surjective, see Properties of Spaces, Lemma 48.4.3. It follows by elementary topology that $|Y \times_Z X| \rightarrow |Y|$ is closed. \square

Lemma 56.10.4. *Let S be a scheme. The property $\mathcal{P}(f) = \text{“}f \text{ is universally open”}$ is fpqc local on the base on algebraic spaces over S .*

Proof. The proof is the same as the proof of Lemma 56.10.3. \square

Lemma 56.10.5. *The property $\mathcal{P}(f) = \text{“}f \text{ is surjective”}$ is fpqc local on the base.*

Proof. Omitted. (Hint: Use Properties of Spaces, Lemma 48.4.3.) \square

Lemma 56.10.6. *The property $\mathcal{P}(f) = \text{“}f \text{ is universally injective”}$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.9.5. Let $Z' \rightarrow Z$ be a flat surjective morphism of affine schemes over S and let $f : X \rightarrow Z$ be a morphism from an algebraic space to Z . Assume that the base change $f' : X' \rightarrow Z'$ is universally injective. Let K be a field, and let $a, b : \text{Spec}(K) \rightarrow X$ be two morphisms such that $f \circ a = f \circ b$. As $Z' \rightarrow Z$ is surjective there exists a field extension $K \subset K'$ and a morphism $\text{Spec}(K') \rightarrow Z'$ such that the following solid diagram commutes

As the square is cartesian we get the two dotted arrows a', b' making the diagram commute. Since $X' \rightarrow Z'$ is universally injective we get $a' = b'$. This forces $a = b$ as $\{\text{Spec}(K') \rightarrow \text{Spec}(K)\}$ is an fpqc covering, see Properties of Spaces, Proposition 48.14.1. Hence f is universally injective as desired. \square

Lemma 56.10.7. *The property $\mathcal{P}(f) = \text{“}f \text{ is locally of finite type”}$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.23.4. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is locally of finite type. We have to show that f is locally of finite type. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.23.4 again, it is enough to show that $U \rightarrow Z$ is locally of finite type. Since f' is locally

of finite type, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is locally of finite type. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally of finite type by Descent, Lemma 34.19.8 as desired. \square

Lemma 56.10.8. *The property $\mathcal{P}(f) = “f \text{ is locally of finite presentation}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.27.4. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is locally of finite presentation. We have to show that f is locally of finite presentation. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.27.4 again, it is enough to show that $U \rightarrow Z$ is locally of finite presentation. Since f' is locally of finite presentation, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is locally of finite presentation. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally of finite presentation by Descent, Lemma 34.19.9 as desired. \square

Lemma 56.10.9. *The property $\mathcal{P}(f) = “f \text{ is of finite type}”$ is fpqc local on the base.*

Proof. Combine Lemmas 56.10.1 and 56.10.7. \square

Lemma 56.10.10. *The property $\mathcal{P}(f) = “f \text{ is of finite presentation}”$ is fpqc local on the base.*

Proof. Combine Lemmas 56.10.1, 56.10.2 and 56.10.8. \square

Lemma 56.10.11. *The property $\mathcal{P}(f) = “f \text{ is flat}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.28.5. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is flat. We have to show that f is flat. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.28.5 again, it is enough to show that $U \rightarrow Z$ is flat. Since f' is flat, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is flat. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is flat by Descent, Lemma 34.19.13 as desired. \square

Lemma 56.10.12. *The property $\mathcal{P}(f) = “f \text{ is an open immersion}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.12.1. Consider a cartesian diagram

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ Z' & \longrightarrow & Z \end{array}$$

of algebraic spaces over S where $Z' \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X' \rightarrow Z'$ is an open immersion. We have to show that $X \rightarrow Z$ is an open immersion. Note that $|X'| \subset |Z'|$ corresponds to an open subscheme $U' \subset Z'$ (isomorphic to X') with the property that $\text{pr}_0^{-1}(U') = \text{pr}_1^{-1}(U')$ as open subschemes of $Z' \times_Z Z'$. Hence there exists an open subscheme $U \subset Z$ such that $X' = (Z' \rightarrow Z)^{-1}(U)$, see Descent, Lemma 34.9.2. By Properties of Spaces, Proposition 48.14.1 we see that X satisfies the sheaf condition for the fpqc topology. Now we have the fpqc covering $\mathcal{U} = \{U' \rightarrow U\}$ and the element $U' \rightarrow X' \rightarrow X \in \check{H}^0(\mathcal{U}, X)$. By the sheaf condition we obtain a morphism $U \rightarrow X$ such that

$$\begin{array}{ccc}
 U' & \longrightarrow & U \\
 \downarrow \cong & & \downarrow \\
 X' & \longrightarrow & X \\
 \downarrow & & \downarrow \\
 Z' & \longrightarrow & Z
 \end{array}$$

is commutative. On the other hand, we know that for any scheme T pver S and T -valued point $T \rightarrow X$ the composition $T \rightarrow X \rightarrow Z$ is a morphism such that $Z' \times_Z T \rightarrow Z'$ factors through U' . Clearly this means that $T \rightarrow Z$ factors through U . In other words the map of sheaves $U \rightarrow X$ is bijective and we win. \square

Lemma 56.10.13. *The property $\mathcal{P}(f)$ = “ f is an isomorphism” is fpqc local on the base.*

Proof. Combine Lemmas 56.10.5 and 56.10.12. \square

Lemma 56.10.14. *The property $\mathcal{P}(f)$ = “ f is affine” is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.20.3. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is affine. Let X' be a scheme representing $Z' \times_Z X$. We obtain a canonical isomorphism

$$\varphi : X' \times_Z Z' \longrightarrow Z' \times_Z X'$$

since both schemes represent the algebraic space $Z' \times_Z Z' \times_Z X$. This is a descent datum for $X'/Z'/Z$, see Descent, Definition 34.30.1 (verification omitted, compare with Descent, Lemma 34.35.1). Since $X' \rightarrow Z'$ is affine this descent datum is effective, see Descent, Lemma 34.33.1. Thus there exists a scheme $Y \rightarrow Z$ over Z and an isomorphism $\psi : Z' \times_Z Y \rightarrow X'$ compatible with descent data. Of course $Y \rightarrow Z$ is affine (by construction or by Descent, Lemma 34.19.16). Note that $\mathcal{Y} = \{Z' \times_Z Y \rightarrow Y\}$ is a fpqc covering, and interpreting ψ as an element of $X(Z' \times_Z Y)$ we see that $\psi \in \check{H}^0(\mathcal{Y}, X)$. By the sheaf condition for X with respect to this covering (see Properties of Spaces, Proposition 48.14.1) we obtain a morphism $Y \rightarrow X$. By construction the base change of this to Z' is an isomorphism, hence an isomorphism by Lemma 56.10.13. This proves that X is representable by an affine scheme and we win. \square

Lemma 56.10.15. *The property $\mathcal{P}(f)$ = “ f is a closed immersion” is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.12.1. Consider a cartesian diagram

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ Z' & \longrightarrow & Z \end{array}$$

of algebraic spaces over S where $Z' \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X' \rightarrow Z'$ is a closed immersion. We have to show that $X \rightarrow Z$ is a closed immersion. The morphism $X' \rightarrow Z'$ is affine. Hence by Lemma 56.10.14 we see that X is a scheme and $X \rightarrow Z$ is affine. It follows from Descent, Lemma 34.19.17 that $X \rightarrow Z$ is a closed immersion as desired. \square

Lemma 56.10.16. *The property $\mathcal{P}(f) = “f \text{ is separated}”$ is fpqc local on the base.*

Proof. A base change of a separated morphism is separated, see Morphisms of Spaces, Lemma 49.4.4. Hence the direct implication in Definition 56.9.1.

Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an fpqc covering of algebraic spaces over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume each base change $X_i := Y_i \times_Y X \rightarrow Y_i$ is separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is a closed immersion. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 55.3.2 hence $\{Y_i \times_Y (X \times_Y X) \rightarrow X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \rightarrow X \times_Y X$. Hence it follows from Lemma 56.10.15 that Δ is a closed immersion, i.e., f is separated. \square

Lemma 56.10.17. *The property $\mathcal{P}(f) = “f \text{ is proper}”$ is fpqc local on the base.*

Proof. The lemma follows by combining Lemmas 56.10.3, 56.10.16 and 56.10.9. \square

Lemma 56.10.18. *The property $\mathcal{P}(f) = “f \text{ is quasi-affine}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.21.3. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is quasi-affine. Let X' be a scheme representing $Z' \times_Z X$. We obtain a canonical isomorphism

$$\varphi : X' \times_Z Z' \longrightarrow Z' \times_Z X'$$

since both schemes represent the algebraic space $Z' \times_Z Z' \times_Z X$. This is a descent datum for $X'/Z'/Z$, see Descent, Definition 34.30.1 (verification omitted, compare with Descent, Lemma 34.35.1). Since $X' \rightarrow Z'$ is quasi-affine this descent datum is effective, see Descent, Lemma 34.34.1. Thus there exists a scheme $Y \rightarrow Z$ over Z and an isomorphism $\psi : Z' \times_Z Y \rightarrow X'$ compatible with descent data. Of course $Y \rightarrow Z$ is quasi-affine (by construction or by Descent, Lemma 34.19.18). Note that $\mathcal{Y} = \{Z' \times_Z Y \rightarrow Y\}$ is a fpqc covering, and interpreting ψ as an element of $X(Z' \times_Z Y)$ we see that $\psi \in \check{H}^0(\mathcal{Y}, X)$. By the sheaf condition for X (see Properties of Spaces, Proposition 48.14.1) we obtain a morphism $Y \rightarrow X$. By construction

the base change of this to Z' is an isomorphism, hence an isomorphism by Lemma 56.10.13. This proves that X is representable by a quasi-affine scheme and we win. \square

Lemma 56.10.19. *The property $\mathcal{P}(f) = “f \text{ is a quasi-compact immersion}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemmas 49.12.1 and 49.8.7. Consider a cartesian diagram

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ Z' & \longrightarrow & Z \end{array}$$

of algebraic spaces over S where $Z' \rightarrow Z$ is a surjective flat morphism of affine schemes, and $X' \rightarrow Z'$ is a quasi-compact immersion. We have to show that $X \rightarrow Z$ is a closed immersion. The morphism $X' \rightarrow Z'$ is quasi-affine. Hence by Lemma 56.10.18 we see that X is a scheme and $X \rightarrow Z$ is quasi-affine. It follows from Descent, Lemma 34.19.19 that $X \rightarrow Z$ is a quasi-compact immersion as desired. \square

Lemma 56.10.20. *The property $\mathcal{P}(f) = “f \text{ is integral}”$ is fpqc local on the base.*

Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms of Spaces, Lemma 49.41.7. Hence the lemma follows on combining Lemmas 56.10.3 and 56.10.14. \square

Lemma 56.10.21. *The property $\mathcal{P}(f) = “f \text{ is finite}”$ is fpqc local on the base.*

Proof. A finite morphism is the same thing as an integral, morphism which is locally of finite type. See Morphisms of Spaces, Lemma 49.41.6. Hence the lemma follows on combining Lemmas 56.10.7 and 56.10.20. \square

Lemma 56.10.22. *The properties $\mathcal{P}(f) = “f \text{ is locally quasi-finite}”$ and $\mathcal{P}(f) = “f \text{ is quasi-finite}”$ are fpqc local on the base.*

Proof. We have already seen that “quasi-compact” is fpqc local on the base, see Lemma 56.10.1. Hence it is enough to prove the lemma for “locally quasi-finite”. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.26.6. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is locally quasi-finite. We have to show that f is locally quasi-finite. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.26.6 again, it is enough to show that $U \rightarrow Z$ is locally quasi-finite. Since f' is locally quasi-finite, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is locally quasi-finite. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is locally quasi-finite by Descent, Lemma 34.19.22 as desired. \square

Lemma 56.10.23. *The property $\mathcal{P}(f) = “f \text{ is syntomic}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.33.4. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is syntomic. We have to show that f is syntomic. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.33.4 again, it is enough to show that $U \rightarrow Z$ is syntomic. Since f' is syntomic, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is syntomic. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is syntomic by Descent, Lemma 34.19.24 as desired. \square

Lemma 56.10.24. *The property $\mathcal{P}(f) = “f \text{ is smooth}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.34.4. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is smooth. We have to show that f is smooth. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.34.4 again, it is enough to show that $U \rightarrow Z$ is smooth. Since f' is smooth, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is smooth. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is smooth by Descent, Lemma 34.19.25 as desired. \square

Lemma 56.10.25. *The property $\mathcal{P}(f) = “f \text{ is unramified}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.35.5. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is unramified. We have to show that f is unramified. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.35.5 again, it is enough to show that $U \rightarrow Z$ is unramified. Since f' is unramified, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is unramified. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is unramified by Descent, Lemma 34.19.26 as desired. \square

Lemma 56.10.26. *The property $\mathcal{P}(f) = “f \text{ is étale}”$ is fpqc local on the base.*

Proof. We will use Lemma 56.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 49.36.2. Let $Z' \rightarrow Z$ be a surjective flat morphism of affine schemes over S . Let $f : X \rightarrow Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \rightarrow Z'$ is étale. We have to show that f is étale. Let U be a scheme and let $U \rightarrow X$ be surjective and étale. By Morphisms of Spaces, Lemma 49.36.2 again, it is enough to show that $U \rightarrow Z$ is étale. Since f' is étale, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \rightarrow Z'$ is étale. As $\{Z' \rightarrow Z\}$ is an fpqc covering we conclude that $U \rightarrow Z$ is étale by Descent, Lemma 34.19.27 as desired. \square

Lemma 56.10.27. *The property $\mathcal{P}(f) = “f \text{ is finite locally free}”$ is fpqc local on the base.*

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms of Spaces, Lemma 49.42.6). Hence this follows from Lemmas 56.10.21, 56.10.11, and 56.10.8. \square

Lemma 56.10.28. *The property $\mathcal{P}(f) = “f \text{ is a monomorphism}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. Let $\{Y_i \rightarrow Y\}$ be an fpqc covering, and assume each of the base changes $f_i : X_i \rightarrow Y_i$ of f is a monomorphism. We have to show that f is a monomorphism.

First proof. Note that f is a monomorphism if and only if $\Delta : X \rightarrow X \times_Y X$ is an isomorphism. By applying this to f_i we see that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is an isomorphism. The base change of an fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 55.3.2 hence $\{Y_i \times_Y (X \times_Y X) \rightarrow X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \rightarrow X \times_Y X$. Hence it follows from Lemma 56.10.13 that Δ is an isomorphism, i.e., f is a monomorphism.

Second proof. Let V be a scheme, and let $V \rightarrow Y$ be a surjective étale morphism. If we can show that $V \times_Y X \rightarrow V$ is a monomorphism, then it follows that $X \rightarrow Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

$$\begin{array}{ccc} \mathcal{F} & \xrightarrow{a} & \mathcal{G} \\ b \downarrow & & \downarrow c \\ \mathcal{H} & \xrightarrow{d} & \mathcal{I} \end{array} \quad \mathcal{F} = \mathcal{H} \times_{\mathcal{I}} \mathcal{G}$$

if c is a surjection of sheaves, and a is injective, then also d is injective. This reduces the problem to the case where Y is a scheme. Moreover, in this case we may assume that the algebraic spaces Y_i are schemes also, since we can always refine the covering to place ourselves in this situation, see Topologies on Spaces, Lemma 55.3.4.

Assume $\{Y_i \rightarrow Y\}$ is an fpqc covering of schemes. Let $a, b : T \rightarrow X$ be two morphisms such that $f \circ a = f \circ b$. We have to show that $a = b$. Since f_i is a monomorphism we see that $a_i = b_i$, where $a_i, b_i : Y_i \times_Y T \rightarrow X_i$ are the base changes. In particular the compositions $Y_i \times_Y T \rightarrow T \rightarrow X$ are equal. Since $\{Y_i \times_Y T \rightarrow T\}$ is an fpqc covering we deduce that $a = b$ from Properties of Spaces, Proposition 48.14.1. \square

56.11. Descending properties of morphisms in the fppf topology

In this section we find some properties of morphisms of algebraic spaces for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

Lemma 56.11.1. *The property $\mathcal{P}(f) = “f \text{ is an immersion}”$ is fppf local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces. Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an fppf covering of Y . Let $f_i : X_i \rightarrow Y_i$ be the base change of f .

If f is an immersion, then each f_i is an immersion by Spaces, Lemma 47.12.3. This proves the direct implication in Definition 56.9.1.

Conversely, assume each f_i is an immersion. By Morphisms of Spaces, Lemma 49.10.7 this implies each f_i is separated. By Morphisms of Spaces, Lemma 49.26.7 this implies each f_i is locally quasi-finite. Hence we see that f is locally quasi-finite and separated, by applying Lemmas 56.10.16 and 56.10.22. By Morphisms of Spaces, Lemma 49.45.1 this implies that f is representable!

By Morphisms of Spaces, Lemma 49.12.1 it suffices to show that for every scheme Z and morphism $Z \rightarrow Y$ the base change $Z \times_Y X \rightarrow Z$ is an immersion. By Topologies on Spaces, Lemma 55.4.3 we can find an fppf covering $\{Z_i \rightarrow Z\}$ by schemes which refines the pullback of the covering $\{Y_i \rightarrow Y\}$ to Z . Hence we see that $Z \times_Y X \rightarrow Z$ (which is a morphism of schemes according to the result of the preceding paragraph) becomes an immersion after pulling back to the members of an fppf (by schemes) of Z . Hence $Z \times_Y X \rightarrow Z$ is an immersion by the result for schemes, see Descent, Lemma 34.20.1. \square

Lemma 56.11.2. *The property $\mathcal{P}(f) = “f \text{ is locally separated}”$ is fppf local on the base.*

Proof. A base change of a locally separated morphism is locally separated, see Morphisms of Spaces, Lemma 49.4.4. Hence the direct implication in Definition 56.9.1.

Let $\{Y_i \rightarrow Y\}_{i \in I}$ be an fppf covering of algebraic spaces over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume each base change $X_i := Y_i \times_Y X \rightarrow Y_i$ is locally separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is an immersion. The base change of a fppf covering is an fppf covering, see Topologies on Spaces, Lemma 55.4.2 hence $\{Y_i \times_Y (X \times_Y X) \rightarrow X \times_Y X\}$ is an fppf covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \rightarrow X \times_Y X$. Hence it follows from Lemma 56.11.1 that Δ is an immersion, i.e., f is locally separated. \square

56.12. Properties of morphisms local on the source

In this section we define what it means for a property of morphisms of algebraic spaces to be local on the source. Please compare with Descent, Section 34.22.

Definition 56.12.1. Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S . Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale\}$. We say \mathcal{P} is τ local on the source, or local on the source for the τ -topology if for any morphism $f : X \rightarrow Y$ of algebraic spaces over S , and any τ -covering $\{X_i \rightarrow X\}_{i \in I}$ of algebraic spaces we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } X_i \rightarrow Y \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property \mathcal{P} holds for $X \rightarrow Y$ if and only if it holds for any arrow $X' \rightarrow Y'$ isomorphic to $X \rightarrow Y$. If a property is τ -local on the source then it is preserved by precomposing with morphisms which occur in τ -coverings. Here is a formal statement.

Lemma 56.12.2. *Let S be a scheme. Let $\tau \in \{fpqc, fppf, syntomic, smooth, \acute{e}tale\}$. Let \mathcal{P} be a property of morphisms of algebraic spaces over S which is τ local on the source. Let $f : X \rightarrow Y$ have property \mathcal{P} . For any morphism $a : X' \rightarrow$*

X which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. smooth, resp. étale, the composition $f \circ a : X' \rightarrow Y$ has property \mathcal{P} .

Proof. This is true because we can fit $X' \rightarrow X$ into a family of morphisms which forms a τ -covering. \square

Lemma 56.12.3. *Let S be a scheme. Let $\tau \in \{\text{fpqc}, \text{fppf}, \text{syntomic}, \text{smooth}, \text{étale}\}$. Suppose that \mathcal{P} is a property of morphisms of schemes over S which is étale local on the source-and-target. Denote $\mathcal{P}_{\text{spaces}}$ the corresponding property of morphisms of algebraic spaces over S , see *Morphisms of Spaces*, Definition 49.22.2. If \mathcal{P} is local on the source for the τ -topology, then $\mathcal{P}_{\text{spaces}}$ is local on the source for the τ -topology.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\{X_i \rightarrow X\}_{i \in I}$ be a τ -covering of algebraic spaces. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. For each i choose a scheme U_i and a surjective étale morphism $U_i \rightarrow X_i \times_X U$.

Note that $\{X_i \times_X U \rightarrow U\}_{i \in I}$ is a τ -covering. Note that each $\{U_i \rightarrow X_i \times_X U\}$ is an étale covering, hence a τ -covering. Hence $\{U_i \rightarrow U\}_{i \in I}$ is a τ -covering of algebraic spaces over S . But since U and each U_i is a scheme we see that $\{U_i \rightarrow U\}_{i \in I}$ is a τ -covering of schemes over S .

Now we have

$$\begin{aligned} f \text{ has } \mathcal{P}_{\text{spaces}} &\Leftrightarrow U \rightarrow V \text{ has } \mathcal{P} \\ &\Leftrightarrow \text{each } U_i \rightarrow V \text{ has } \mathcal{P} \\ &\Leftrightarrow \text{each } X_i \rightarrow Y \text{ has } \mathcal{P}_{\text{spaces}}. \end{aligned}$$

the first and last equivalence by the definition of $\mathcal{P}_{\text{spaces}}$ the middle equivalence because we assumed \mathcal{P} is local on the source in the τ -topology. \square

56.13. Properties of morphisms local in the fpqc topology on the source

Here are some properties of morphisms that are fpqc local on the source.

Lemma 56.13.1. *The property $\mathcal{P}(f) = \text{“}f \text{ is flat”}$ is fpqc local on the source.*

Proof. Follows from Lemma 56.12.3 using *Morphisms of Spaces*, Definition 49.28.1 and *Descent*, Lemma 34.23.1. \square

56.14. Properties of morphisms local in the fppf topology on the source

Here are some properties of morphisms that are fppf local on the source.

Lemma 56.14.1. *The property $\mathcal{P}(f) = \text{“}f \text{ is locally of finite presentation”}$ is fppf local on the source.*

Proof. Follows from Lemma 56.12.3 using *Morphisms of Spaces*, Definition 49.27.1 and *Descent*, Lemma 34.24.1. \square

Lemma 56.14.2. *The property $\mathcal{P}(f) = \text{“}f \text{ is locally of finite type”}$ is fppf local on the source.*

Proof. Follows from Lemma 56.12.3 using *Morphisms of Spaces*, Definition 49.23.1 and *Descent*, Lemma 34.24.2. \square

Lemma 56.14.3. *The property $\mathcal{P}(f) = “f \text{ is open}”$ is fppf local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.6.2 and Descent, Lemma 34.24.3. \square

Lemma 56.14.4. *The property $\mathcal{P}(f) = “f \text{ is universally open}”$ is fppf local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.6.2 and Descent, Lemma 34.24.4. \square

56.15. Properties of morphisms local in the syntomic topology on the source

Here are some properties of morphisms that are syntomic local on the source.

Lemma 56.15.1. *The property $\mathcal{P}(f) = “f \text{ is syntomic}”$ is syntomic local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.33.1 and Descent, Lemma 34.25.1. \square

56.16. Properties of morphisms local in the smooth topology on the source

Here are some properties of morphisms that are smooth local on the source.

Lemma 56.16.1. *The property $\mathcal{P}(f) = “f \text{ is smooth}”$ is smooth local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.34.1 and Descent, Lemma 34.26.1. \square

56.17. Properties of morphisms local in the étale topology on the source

Here are some properties of morphisms that are étale local on the source.

Lemma 56.17.1. *The property $\mathcal{P}(f) = “f \text{ is étale}”$ is étale local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.36.1 and Descent, Lemma 34.27.1. \square

Lemma 56.17.2. *The property $\mathcal{P}(f) = “f \text{ is locally quasi-finite}”$ is étale local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.26.1 and Descent, Lemma 34.27.2. \square

Lemma 56.17.3. *The property $\mathcal{P}(f) = “f \text{ is unramified}”$ is étale local on the source.*

Proof. Follows from Lemma 56.12.3 using Morphisms of Spaces, Definition 49.35.1 and Descent, Lemma 34.27.3. \square

56.18. Properties of morphisms smooth local on source-and-target

Let \mathcal{P} be a property of morphisms of algebraic spaces. There is an intuitive meaning to the phrase “ \mathcal{P} is smooth local on the source and target”. However, it turns out that this notion is not the same as asking \mathcal{P} to be both smooth local on the source and smooth local on the target. We have discussed a similar phenomenon (for the étale topology and the category of schemes) in great detail in Descent, Section 34.28 (for a quick overview take a look at Descent, Remark 34.28.8). However, there is an important difference between the case of the smooth and the étale topology. To see this difference we encourage the reader to ponder the difference between Descent, Lemma 34.28.4 and Lemma 56.18.2 as well as the difference between Descent, Lemma 34.28.5 and Lemma 56.18.3. Namely, in the étale setting the choice of the étale “covering” of the target is immaterial, whereas in the smooth setting it is not.

Definition 56.18.1. Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S . We say \mathcal{P} is *smooth local on source-and-target* if

- (1) (stable under precomposing with smooth maps) if $f : X \rightarrow Y$ is smooth and $g : Y \rightarrow Z$ has \mathcal{P} , then $g \circ f$ has \mathcal{P} ,
- (2) (stable under smooth base change) if $f : X \rightarrow Y$ has \mathcal{P} and $Y' \rightarrow Y$ is smooth, then the base change $f' : Y' \times_Y X \rightarrow Y'$ has \mathcal{P} , and
- (3) (locality) given a morphism $f : X \rightarrow Y$ the following are equivalent
 - (a) f has \mathcal{P} ,
 - (b) for every $x \in |X|$ there exists a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad h \quad} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{\quad f \quad} & Y \end{array}$$

with smooth vertical arrows and $u \in |U|$ with $a(u) = x$ such that h has \mathcal{P} .

The above serves as our definition. In the lemmas below we will show that this is equivalent to \mathcal{P} being local on the target, local on the source, and stable under post-composing by smooth morphisms.

Lemma 56.18.2. *Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S which is smooth local on source-and-target. Then*

- (1) \mathcal{P} is smooth local on the source,
- (2) \mathcal{P} is smooth local on the target,
- (3) \mathcal{P} is stable under postcomposing with smooth morphisms: if $f : X \rightarrow Y$ has \mathcal{P} and $g : Y \rightarrow Z$ is smooth, then $g \circ f$ has \mathcal{P} , and

Proof. We write everything out completely.

Proof of (1). Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\{X_i \rightarrow X\}_{i \in I}$ be a smooth covering of X . If each composition $h_i : X_i \rightarrow Y$ has \mathcal{P} , then for each $|x| \in X$ we can find an $i \in I$ and a point $x_i \in |X_i|$ mapping to x . Then $(X_i, x_i) \rightarrow (X, x)$ is a smooth morphism of pairs, and $\text{id}_Y : Y \rightarrow Y$ is a smooth morphism, and h_i is as in part (3) of Definition 56.18.1. Thus we see that f has \mathcal{P} . Conversely, if f has \mathcal{P} then each $X_i \rightarrow Y$ has \mathcal{P} by Definition 56.18.1 part (1).

Proof of (2). Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\{Y_i \rightarrow Y\}_{i \in I}$ be a smooth covering of Y . Write $X_i = Y_i \times_Y X$ and $h_i : X_i \rightarrow Y_i$ for the base change of f . If each $h_i : X_i \rightarrow Y_i$ has \mathcal{P} , then for each $x \in |X|$ we pick an $i \in I$ and a point $x_i \in |X_i|$ mapping to x . Then $(X_i, x_i) \rightarrow (X, x)$ is a smooth morphism of pairs, $Y_i \rightarrow Y$ is smooth, and h_i is as in part (3) of Definition 56.18.1. Thus we see that f has \mathcal{P} . Conversely, if f has \mathcal{P} , then each $X_i \rightarrow Y_i$ has \mathcal{P} by Definition 56.18.1 part (2).

Proof of (3). Assume $f : X \rightarrow Y$ has \mathcal{P} and $g : Y \rightarrow Z$ is smooth. For every $x \in |X|$ we can think of $(X, x) \rightarrow (X, x)$ as a smooth morphism of pairs, $Y \rightarrow Z$ is a smooth morphism, and $h = f$ is as in part (3) of Definition 56.18.1. Thus we see that $g \circ f$ has \mathcal{P} . \square

The following lemma is the analogue of Morphisms, Lemma 28.15.4.

Lemma 56.18.3. *Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S which is smooth local on source-and-target. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (a) f has property \mathcal{P} ,
- (b) for every $x \in |X|$ there exists a smooth morphism of pairs $a : (U, u) \rightarrow (X, x)$, a smooth morphism $b : V \rightarrow Y$, and a morphism $h : U \rightarrow V$ such that $f \circ a = b \circ h$ and h has \mathcal{P} ,
- (c) for some commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

with a, b smooth and a surjective the morphism h has \mathcal{P} ,

- (d) for any commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

with b smooth and $U \rightarrow X \times_Y V$ smooth the morphism h has \mathcal{P} ,

- (e) there exists a smooth covering $\{Y_i \rightarrow Y\}_{i \in I}$ such that each base change $Y_i \times_Y X \rightarrow Y_i$ has \mathcal{P} ,
- (f) there exists a smooth covering $\{X_i \rightarrow X\}_{i \in I}$ such that each composition $X_i \rightarrow Y$ has \mathcal{P} ,
- (g) there exists a smooth covering $\{Y_i \rightarrow Y\}_{i \in I}$ and for each $i \in I$ a smooth covering $\{X_{ij} \rightarrow Y_i \times_Y X\}_{j \in J_i}$ such that each morphism $X_{ij} \rightarrow Y_i$ has \mathcal{P} .

Proof. The equivalence of (a) and (b) is part of Definition 56.18.1. The equivalence of (a) and (e) is Lemma 56.18.2 part (2). The equivalence of (a) and (f) is Lemma 56.18.2 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).

It is clear that (c) implies (b). If (b) holds, then for any $x \in |X|$ we can choose a smooth morphism of pairs $a_x : (U_x, u_x) \rightarrow (X, x)$, a smooth morphism $b_x : V_x \rightarrow Y$, and a morphism $h_x : U_x \rightarrow V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has \mathcal{P} . Then

$h = \coprod h_x : \coprod U_x \rightarrow \coprod V_x$ with $a = \coprod a_x$ and $b = \coprod b_x$ is a diagram as in (c). (Note that h has property \mathcal{P} as $\{V_x \rightarrow \coprod V_x\}$ is a smooth covering and \mathcal{P} is smooth local on the target.) Thus (b) is equivalent to (c).

Now we know that (a), (b), (c), (e), (f), and (g) are equivalent. Suppose (a) holds. Let U, V, a, b, h be as in (d). Then $X \times_Y V \rightarrow V$ has \mathcal{P} as \mathcal{P} is stable under smooth base change, whence $U \rightarrow V$ has \mathcal{P} as \mathcal{P} is stable under precomposing with smooth morphisms. Conversely, if (d) holds, then setting $U = X$ and $V = Y$ we see that f has \mathcal{P} . \square

Lemma 56.18.4. *Let S be a scheme. Let \mathcal{P} be a property of morphisms of algebraic spaces over S . Assume*

- (1) \mathcal{P} is smooth local on the source,
- (2) \mathcal{P} is smooth local on the target, and
- (3) \mathcal{P} is stable under postcomposing with smooth morphisms: if $f : X \rightarrow Y$ has \mathcal{P} and $Y \subset Z$ is a smooth morphism then $X \rightarrow Z$ has \mathcal{P} .

Then \mathcal{P} is smooth local on the source-and-target.

Proof. Let \mathcal{P} be a property of morphisms of algebraic spaces which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 56.12.2 we see that \mathcal{P} is stable under precomposing with smooth morphisms. By Lemma 56.9.2 we see that \mathcal{P} is stable under smooth base change. Hence it suffices to prove part (3) of Definition 56.18.1 holds.

More precisely, suppose that $f : X \rightarrow Y$ is a morphism of algebraic spaces over S which satisfies Definition 56.18.1 part (3)(b). In other words, for every $x \in X$ there exists a smooth morphism $a_x : U_x \rightarrow X$, a point $u_x \in |U_x|$ mapping to x , a smooth morphism $b_x : V_x \rightarrow Y$, and a morphism $h_x : U_x \rightarrow V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has \mathcal{P} . The proof of the lemma is complete once we show that f has \mathcal{P} . Set $U = \coprod U_x$, $a = \coprod a_x$, $V = \coprod V_x$, $b = \coprod b_x$, and $h = \coprod h_x$. We obtain a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{h} & V \\ a \downarrow & & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

with a, b smooth, a surjective. Note that h has \mathcal{P} as each h_x does and \mathcal{P} is smooth local on the target. Because a is surjective and \mathcal{P} is smooth local on the source, it suffices to prove that $b \circ h$ has \mathcal{P} . This follows as we assumed that \mathcal{P} is stable under postcomposing with a smooth morphism and as b is smooth. \square

Remark 56.18.5. Using Lemma 56.18.4 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are smooth local on the source-and-target. In each case we list the lemma which implies the property is smooth local on the source and the lemma which implies the property is smooth local on the target. In each case the third assumption of Lemma 56.18.4 is trivial to check, and we omit it. Here is the list:

- (1) flat, see Lemmas 56.13.1 and 56.10.11,
- (2) locally of finite presentation, see Lemmas 56.14.1 and 56.10.8,
- (3) locally finite type, see Lemmas 56.14.2 and 56.10.7,
- (4) universally open, see Lemmas 56.14.4 and 56.10.4,

- (5) syntomic, see Lemmas 56.15.1 and 56.10.23,
- (6) smooth, see Lemmas 56.16.1 and 56.10.24,
- (7) add more here as needed.

56.19. Descent data for spaces over spaces

This section is the analogue of Descent, Section 34.30 for algebraic spaces. Most of the arguments in this section are formal relying only on the definition of a descent datum.

Definition 56.19.1. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S .

- (1) Let $V \rightarrow Y$ be a morphism of algebraic spaces. A *descent datum* for $V/Y/X$ is an isomorphism $\varphi : V \times_X Y \rightarrow Y \times_X V$ of algebraic spaces over $Y \times_X Y$ satisfying the *cocycle condition* that the diagram

$$\begin{array}{ccc}
 V \times_X Y \times_X Y & \xrightarrow{\varphi_{02}} & Y \times_X Y \times_X V \\
 \searrow \varphi_{01} & & \nearrow \varphi_{12} \\
 & Y \times_X Y \times_X Y &
 \end{array}$$

commutes (with obvious notation).

- (2) We also say that the pair $(V/Y, \varphi)$ is a *descent datum relative to $Y \rightarrow X$* .
- (3) A *morphism $f : (V/Y, \varphi) \rightarrow (V'/Y, \varphi')$ of descent data relative to $Y \rightarrow X$* is a morphism $f : V \rightarrow V'$ of algebraic spaces over Y such that the diagram

$$\begin{array}{ccc}
 V \times_X Y & \xrightarrow{\varphi} & Y \times_X V \\
 f \times \text{id}_Y \downarrow & & \downarrow \text{id}_Y \times f \\
 V' \times_X Y & \xrightarrow{\varphi'} & Y \times_X V'
 \end{array}$$

commutes.

Remark 56.19.2. Let S be a scheme. Let $Y \rightarrow X$ be a morphism of algebraic spaces over S . Let $(V/Y, \varphi)$ be a descent datum relative to $Y \rightarrow X$. We may think of the isomorphism φ as an isomorphism

$$(Y \times_X Y) \times_{\text{pr}_0, Y} V \longrightarrow (Y \times_X Y) \times_{\text{pr}_1, Y} V$$

of algebraic spaces over $Y \times_X Y$. So loosely speaking one may think of φ as a map $\varphi : \text{pr}_0^* V \rightarrow \text{pr}_1^* V$. The cocycle condition then says that $\text{pr}_{02}^* \varphi = \text{pr}_{12}^* \varphi \circ \text{pr}_{01}^* \varphi$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

Here is the definition in case you have a family of morphisms with fixed target.

Definition 56.19.3. Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target X .

- (1) A *descent datum (V_i, φ_{ij}) relative to the family $\{X_i \rightarrow X\}$* is given by an algebraic space V_i over X_i for each $i \in I$, an isomorphism $\varphi_{ij} : V_i \times_X X_j \rightarrow$

¹Unfortunately, we have chosen the “wrong” direction for our arrow here. In Definitions 56.19.1 and 56.19.3 we should have the opposite direction to what was done in Definition 56.3.1 by the general principle that “functions” and “spaces” are dual.

$X_i \times_X V_j$ of algebraic spaces over $X_i \times_X X_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{array}{ccc}
 V_i \times_X X_j \times_X X_k & \xrightarrow{\quad \quad \quad} & X_i \times_X X_j \times_X V_k \\
 \searrow \text{pr}_{01}^* \varphi_{ij} & \text{pr}_{02}^* \varphi_{ik} & \nearrow \text{pr}_{12}^* \varphi_{jk} \\
 & X_i \times_X V_j \times_X X_k &
 \end{array}$$

of algebraic spaces over $X_i \times_X X_j \times_X X_k$ commutes (with obvious notation).

- (2) A morphism $\psi : (V_i, \varphi_{ij}) \rightarrow (V'_i, \varphi'_{ij})$ of descent data is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms $\psi_i : V_i \rightarrow V'_i$ of algebraic spaces over X_i such that all the diagrams

$$\begin{array}{ccc}
 V_i \times_X X_j & \xrightarrow{\varphi_{ij}} & X_i \times_X V_j \\
 \psi_i \times \text{id} \downarrow & & \downarrow \text{id} \times \psi_j \\
 V'_i \times_X X_j & \xrightarrow{\varphi'_{ij}} & X_i \times_X V'_j
 \end{array}$$

commute.

Remark 56.19.4. Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target X . Let (V_i, φ_{ij}) be a descent datum relative to $\{X_i \rightarrow X\}$. We may think of the isomorphisms φ_{ij} as isomorphisms

$$(X_i \times_X X_j) \times_{\text{pr}_0, X_i} V_i \longrightarrow (X_i \times_X X_j) \times_{\text{pr}_1, X_j} V_j$$

of algebraic spaces over $X_i \times_X X_j$. So loosely speaking one may think of φ_{ij} as an isomorphism $\text{pr}_0^* V_i \rightarrow \text{pr}_1^* V_j$ over $X_i \times_X X_j$. The cocycle condition then says that $\text{pr}_{02}^* \varphi_{ik} = \text{pr}_{12}^* \varphi_{jk} \circ \text{pr}_{01}^* \varphi_{ij}$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

The reason we will usually work with the version of a family consisting of a single morphism is the following lemma.

Lemma 56.19.5. *Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target X . Set $Y = \coprod_{i \in I} X_i$. There is a canonical equivalence of categories*

$$\begin{array}{ccc}
 \text{category of descent data} & & \text{category of descent data} \\
 \text{relative to the family } \{X_i \rightarrow X\}_{i \in I} & \xrightarrow{\quad} & \text{relative to } Y/X
 \end{array}$$

which maps (V_i, φ_{ij}) to (V, φ) with $V = \coprod_{i \in I} V_i$ and $\varphi = \coprod \varphi_{ij}$.

Proof. Observe that $Y \times_X Y = \coprod_{ij} X_i \times_X X_j$ and similarly for higher fibre products. Giving a morphism $V \rightarrow Y$ is exactly the same as giving a family $V_i \rightarrow X_i$. And giving a descent datum φ is exactly the same as giving a family φ_{ij} . \square

Lemma 56.19.6. *Pullback of descent data. Let S be a scheme.*

- (1) *Let*

$$\begin{array}{ccc}
 Y' & \xrightarrow{\quad} & Y \\
 a' \downarrow & & \downarrow a \\
 X' & \xrightarrow{h} & X
 \end{array}$$

be a commutative diagram of algebraic spaces over S . The construction

$$(V \rightarrow Y, \varphi) \longmapsto f^*(V \rightarrow Y, \varphi) = (V' \rightarrow Y', \varphi')$$

where $V' = Y' \times_Y V$ and where φ' is defined as the composition

$$\begin{aligned} V' \times_{X'} Y' & \longlongequal{\quad} (Y' \times_Y V) \times_{X'} Y' \longlongequal{\quad} (Y' \times_{X'} Y') \times_{Y \times_X Y} (V \times_X Y) \\ & \hspace{25em} \downarrow \text{id} \times \varphi \\ Y' \times_{X'} V' & \longlongequal{\quad} Y' \times_{X'} (Y' \times_Y V) \longlongequal{\quad} (Y' \times_X Y') \times_{Y \times_X Y} (Y \times_X V) \end{aligned}$$

defines a functor from the category of descent data relative to $Y \rightarrow X$ to the category of descent data relative to $Y' \rightarrow X'$.

- (2) Given two morphisms $f_i : Y' \rightarrow Y$, $i = 0, 1$ making the diagram commute the functors f_0^* and f_1^* are canonically isomorphic.

Proof. We omit the proof of (1), but we remark that the morphism φ' is the morphism $(f \times f)^*\varphi$ in the notation introduced in Remark 56.19.2. For (2) we indicate which morphism $f_0^*V \rightarrow f_1^*V$ gives the functorial isomorphism. Namely, since f_0 and f_1 both fit into the commutative diagram we see there is a unique morphism $r : Y' \rightarrow Y \times_X Y$ with $f_i = \text{pr}_i \circ r$. Then we take

$$\begin{aligned} f_0^*V & = Y' \times_{f_0, Y} V \\ & = Y' \times_{\text{pr}_0 \circ r, Y} V \\ & = Y' \times_{r, Y \times_X Y} (Y \times_X Y) \times_{\text{pr}_0, Y} V \\ & \xrightarrow{\varphi} Y' \times_{r, Y \times_X Y} (Y \times_X Y) \times_{\text{pr}_1, Y} V \\ & = Y' \times_{\text{pr}_1 \circ r, Y} V \\ & = Y' \times_{f_1, Y} V \\ & = f_1^*V \end{aligned}$$

We omit the verification that this works. □

Definition 56.19.7. With $S, X, X', Y, Y', f, a, a', h$ as in Lemma 56.19.6 the functor

$$(V, \varphi) \longmapsto f^*(V, \varphi)$$

constructed in that lemma is called the *pullback functor* on descent data.

Lemma 56.19.8. Let S be a scheme. Let $\mathcal{U}' = \{X'_i \rightarrow X'\}_{i \in I'}$ and $\mathcal{U} = \{X_j \rightarrow X\}_{j \in I}$ be families of morphisms with fixed target. Let $\alpha : I' \rightarrow I$, $g : X' \rightarrow X$ and $g_i : X'_i \rightarrow X_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.

- (1) Let (V_i, φ_{ij}) be a descent datum relative to the family \mathcal{U} . The system

$$(g_i^*V_{\alpha(i)}, (g_i \times g_j)^* \varphi_{\alpha(i)\alpha(j)})$$

(with notation as in Remark 56.19.4) is a descent datum relative to \mathcal{U}' .

- (2) This construction defines a functor between the category of descent data relative to \mathcal{U} and the category of descent data relative to \mathcal{U}' .
- (3) Given a second $\beta : I' \rightarrow I$, $h : X' \rightarrow X$ and $h'_i : X'_i \rightarrow X_{\beta(i)}$ morphism of families of maps with fixed target, then if $g = h$ the two resulting functors between descent data are canonically isomorphic.

- (4) *These functors agree, via Lemma 56.19.5, with the pullback functors constructed in Lemma 56.19.6.*

Proof. This follows from Lemma 56.19.6 via the correspondence of Lemma 56.19.5. \square

Definition 56.19.9. With $\mathcal{U}' = \{X'_i \rightarrow X'\}_{i \in I'}$, $\mathcal{U} = \{X_i \rightarrow X\}_{i \in I}$, $\alpha : I' \rightarrow I$, $g : X' \rightarrow X$, and $g_i : X'_i \rightarrow X_{\alpha(i)}$ as in Lemma 56.19.8 the functor

$$(V_i, \varphi_{ij}) \longmapsto (g_i^* V_{\alpha(i)}, (g_i \times g_j)^* \varphi_{\alpha(i)\alpha(j)})$$

constructed in that lemma is called the *pullback functor* on descent data.

If \mathcal{U} and \mathcal{U}' have the same target X , and if \mathcal{U}' refines \mathcal{U} (see Sites, Definition 7.8.1) but no explicit pair (α, g_i) is given, then we can still talk about the pullback functor since we have seen in Lemma 56.19.8 that the choice of the pair does not matter (up to a canonical isomorphism).

Definition 56.19.10. Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S .

- (1) Given an algebraic space U over X we have the *trivial descent datum* of U relative to $\text{id} : X \rightarrow X$, namely the identity morphism on U .
- (2) By Lemma 56.19.6 we get a *canonical descent datum* on $Y \times_X U$ relative to $Y \rightarrow X$ by pulling back the trivial descent datum via f . We often denote $(Y \times_X U, \text{can})$ this descent datum.
- (3) A descent datum (V, φ) relative to Y/X is called *effective* if (V, φ) is isomorphic to the canonical descent datum $(Y \times_X U, \text{can})$ for some algebraic space U over X .

Thus being effective means there exists an algebraic space U over X and an isomorphism $\psi : V \rightarrow Y \times_X U$ over Y such that φ is equal to the composition

$$V \times_X Y \xrightarrow{\psi \times \text{id}_Y} Y \times_X U \times_S Y = Y \times_X Y \times_X U \xrightarrow{\text{id}_Y \times \psi^{-1}} Y \times_X U$$

There is a slight problem here which is that this definition (in spirit) conflicts with the definition given in Descent, Definition 34.30.10 in case Y and X are schemes. However, it will always be clear from context which version we mean.

Definition 56.19.11. Let S be a scheme. Let $\{X_i \rightarrow X\}$ be a family of morphisms of algebraic spaces over S with fixed target X .

- (1) Given an algebraic space U over X we have a *canonical descent datum* on the family of algebraic spaces $X_i \times_X U$ by pulling back the trivial descent datum for U relative to $\{\text{id} : S \rightarrow S\}$. We denote this descent datum $(X_i \times_X U, \text{can})$.
- (2) A descent datum (V_i, φ_{ij}) relative to $\{X_i \rightarrow X\}$ is called *effective* if there exists an algebraic space U over X such that (V_i, φ_{ij}) is isomorphic to $(X_i \times_X U, \text{can})$.

56.20. Descent data in terms of sheaves

This section is the analogue of Descent, Section 34.35. It is slightly different as algebraic spaces are already sheaves.

Lemma 56.20.1. *Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be an fpppf covering of algebraic spaces over S (Topologies on Spaces, Definition 55.4.1). There is an equivalence of categories*

$$\left\{ \begin{array}{l} \text{descent data } (V_i, \varphi_{ij}) \\ \text{relative to } \{X_i \rightarrow X\} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} \text{sheaves } F \text{ on } (Sch/S)_{fppf} \text{ endowed} \\ \text{with a map } F \rightarrow X \text{ such that each} \\ X_i \times_X F \text{ is an algebraic space} \end{array} \right\}.$$

Moreover,

- (1) *the algebraic space $X_i \times_X F$ on the right hand side corresponds to V_i on the left hand side, and*
- (2) *the sheaf F is an algebraic space² if and only if the corresponding descent datum (X_i, φ_{ij}) is effective.*

Proof. Let us construct the functor from right to left. Let $F \rightarrow X$ be a map of sheaves on $(Sch/S)_{fppf}$ such that each $V_i = X_i \times_X F$ is an algebraic space. We have the projection $V_i \rightarrow X_i$. Then both $V_i \times_X X_j$ and $X_i \times_X V_j$ represent the sheaf $X_i \times_X F \times_X X_j$ and hence we obtain an isomorphism

$$\varphi_{ii'} : V_i \times_X X_j \rightarrow X_i \times_X V_j$$

It is straightforward to see that the maps φ_{ij} are morphisms over $X_i \times_X X_j$ and satisfy the cocycle condition. The functor from right to left is given by this construction $F \mapsto (V_i, \varphi_{ij})$.

Let us construct a functor from left to right. The isomorphisms φ_{ij} give isomorphisms

$$\varphi_{ij} : V_i \times_X X_j \longrightarrow X_i \times_X V_j$$

over $X_i \times X_j$. Set F equal to the coequalizer in the following diagram

$$\coprod_{i,i'} V_i \times_X X_j \begin{array}{c} \xrightarrow{\text{pr}_0} \\ \xrightarrow{\text{pr}_1 \circ \varphi_{ij}} \end{array} \coprod_i V_i \longrightarrow F$$

The cocycle condition guarantees that F comes with a map $F \rightarrow X$ and that $X_i \times_X F$ is isomorphic to V_i . The functor from left to right is given by this construction $(V_i, \varphi_{ij}) \mapsto F$.

We omit the verification that these constructions are mutually quasi-inverse functors. The final statements (1) and (2) follow from the constructions. \square

Derived Categories of Spaces

57.1. Introduction

In this chapter we discuss derived categories of modules on algebraic spaces. There do not seem to be good introductory references addressing this topic; it is covered in the literature by referring to papers dealing with derived categories of modules on algebraic stacks, for example see [Ols07b].

57.2. Conventions

If \mathcal{A} is an abelian category and M is an object of \mathcal{A} then we also denote M the object of $K(\mathcal{A})$ and/or $D(\mathcal{A})$ corresponding to the complex which has M in degree 0 and is zero in all other degrees.

If we have a ring A , then $K(A)$ denotes the homotopy category of complexes of A -modules and $D(A)$ the associated derived category. Similarly, if we have a ringed space (X, \mathcal{O}_X) the symbol $K(\mathcal{O}_X)$ denotes the homotopy category of complexes of \mathcal{O}_X -modules and $D(\mathcal{O}_X)$ the associated derived category.

57.3. Generalities

In this section we put some general results on cohomology of unbounded complexes of modules on algebraic spaces.

Lemma 57.3.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Given an étale morphism $V \rightarrow Y$, set $U = V \times_Y X$ and denote $g : U \rightarrow V$ the projection morphism. Then $(Rf_*E)|_V = Rg_*(E|_U)$ for E in $D(\mathcal{O}_X)$.*

Proof. Represent E by a K-injective complex \mathcal{I}^\bullet of \mathcal{O}_X -modules. Then $Rf_*(E) = f_*\mathcal{I}^\bullet$ and $Rg_*(E|_U) = g_*(\mathcal{I}^\bullet|_U)$ by Cohomology on Sites, Lemma 21.20.1. Hence the result follows from Properties of Spaces, Lemma 48.24.2. \square

Definition 57.3.2. Let S be a scheme. Let X be an algebraic space over S . Let E be an object of $D(\mathcal{O}_X)$. Let $T \subset |X|$ be a closed subset. We say E is *supported on T* if the cohomology sheaves $H^i(E)$ are supported on T .

57.4. Derived category of quasi-coherent modules on the small étale site

Let X be a scheme. In this section we show that $D_{QCoh}(\mathcal{O}_X)$ can be defined in terms of the small étale site $X_{\acute{e}tale}$ of X . Denote $\mathcal{O}_{\acute{e}tale}$ the structure sheaf on $X_{\acute{e}tale}$. Consider the morphism of ringed sites

$$(57.4.0.1) \quad \epsilon : (X_{\acute{e}tale}, \mathcal{O}_{\acute{e}tale}) \longrightarrow (X_{Zar}, \mathcal{O}_X).$$

denoted $\text{id}_{\text{small}, \acute{e}tale, Zar}$ in Descent, Lemma 34.7.5.

Lemma 57.4.1. *The morphism ϵ of (57.4.0.1) is a flat morphism of ringed sites. In particular the functor $\epsilon^* : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ is exact. Moreover, if $\epsilon^*\mathcal{F} = 0$, then $\mathcal{F} = 0$.*

Proof. The second assertion follows from the first by Modules on Sites, Lemma 18.30.2. To prove the first assertion we have to show that $\mathcal{O}_{\acute{e}t\grave{a}l\epsilon}$ is a flat $\epsilon^{-1}\mathcal{O}_X$ -module. To do this it suffices to check $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{\acute{e}t\grave{a}l\epsilon,\bar{x}}$ is flat for any geometric point \bar{x} of X , see Modules on Sites, Lemma 18.38.2, Sites, Lemma 7.33.1, and Étale Cohomology, Remarks 44.29.11. By Étale Cohomology, Lemma 44.33.1 we see that $\mathcal{O}_{\acute{e}t\grave{a}l\epsilon,\bar{x}}$ is the strict henselization of $\mathcal{O}_{X,x}$. Thus $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{\acute{e}t\grave{a}l\epsilon,\bar{x}}$ is faithfully flat by More on Algebra, Lemma 15.34.1. The final statement follows also: if $\epsilon^*\mathcal{F} = 0$, then

$$0 = \epsilon^*\mathcal{F}_{\bar{x}} = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{\acute{e}t\grave{a}l\epsilon}$$

(Modules on Sites, Lemma 18.35.4) for all geometric points \bar{x} . By faithful flatness of $\mathcal{O}_{X,x} \rightarrow \mathcal{O}_{\acute{e}t\grave{a}l\epsilon,\bar{x}}$ we conclude $\mathcal{F}_x = 0$ for all $x \in X$. □

Let X be a scheme. Notation as in (57.4.0.1). Recall that $\epsilon^* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ is an equivalence by Descent, Proposition 34.7.11 and Remark 34.7.6. Moreover, $QCoh(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ forms a Serre subcategory of $\text{Mod}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ by Descent, Lemma 34.7.13. Hence we can let $D_{QCoh}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ be the triangulated subcategory of $D(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ whose objects are the complexes with quasi-coherent cohomology sheaves, see Derived Categories, Section 13.13. The functor ϵ^* is exact (Lemma 57.4.1) hence induces $\epsilon^* : D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ and since pullbacks of quasi-coherent modules are quasi-coherent also $\epsilon^* : D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$.

Lemma 57.4.2. *Let X be a scheme. The functor $\epsilon^* : D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ defined above is an equivalence.*

Proof. We will prove this by showing the functor $R\epsilon_* : D(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon}) \rightarrow D(\mathcal{O}_X)$ induces a quasi-inverse.

Every quasi-coherent $\mathcal{O}_{\acute{e}t\grave{a}l\epsilon}$ -module \mathcal{H} is of the form $\epsilon^*\mathcal{F}$ for some quasi-coherent \mathcal{O}_X -module \mathcal{F} , see Descent, Proposition 34.7.11. Since $\mathcal{F} = \epsilon_*\mathcal{H}$ in this case (as ϵ_* is the restriction to $X_{Zar} \subset X_{\acute{e}t\grave{a}l\epsilon}$) we conclude that the adjunction map $\epsilon^*\epsilon_*\mathcal{H} \rightarrow \mathcal{H}$ is an isomorphism for all quasi-coherent $\mathcal{O}_{\acute{e}t\grave{a}l\epsilon}$ -modules \mathcal{H} .

Let E be an object of $D_{QCoh}(\mathcal{O}_{\acute{e}t\grave{a}l\epsilon})$ and denote $\mathcal{H}^i = H^i(E)$ its i th cohomology sheaf. Let \mathcal{B} be the set of affine objects of $X_{\acute{e}t\grave{a}l\epsilon}$. Then $H^p(U, \mathcal{H}^i) = 0$ for all $p > 0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. According to Cohomology on Sites, Lemma 21.22.3 this implies E is represented by a K-injective complex \mathcal{I}^\bullet and $\mathcal{I}^\bullet = \lim \mathcal{I}_n^\bullet$ where each \mathcal{I}_n^\bullet is a bounded below complex of injectives, the maps in the system $\dots \rightarrow \mathcal{I}_2^\bullet \rightarrow \mathcal{I}_1^\bullet$ are termwise split surjections, and each \mathcal{I}_n^\bullet is quasi-isomorphic to $\tau_{\geq -n}E$. In particular,

$$R\epsilon_*E = \epsilon_*\mathcal{I}^\bullet = \lim \epsilon_*\mathcal{I}_n^\bullet$$

For every $U \in \mathcal{B}$ we have

$$H^m(\mathcal{I}_n^\bullet(U)) = \begin{cases} \mathcal{H}^m(U) & \text{if } m \geq -n \\ 0 & \text{if } m < -n \end{cases}$$

by the vanishing of $H^p(U, \mathcal{H}^i)$ for $p > 0$, the spectral sequence Derived Categories, Lemma 13.21.3, and the fact that $\tau_{\geq -n}E \cong \mathcal{I}_n^\bullet$. Hence we can apply Homology,

Lemma 12.27.7 to the sequence of complexes

$$\lim_n \mathcal{I}_n^{m-2}(U) \rightarrow \lim_n \mathcal{I}_n^{m-1}(U) \rightarrow \lim_n \mathcal{I}_n^m(U) \rightarrow \lim_n \mathcal{I}_n^{m+1}(U)$$

to conclude that $H^m(\mathcal{I}^\bullet(U)) = \mathcal{H}^m(U)$ for $U \in \mathcal{B}$. Since ϵ_* is restriction to X_{Zar} we see, on applying the above to $U \subset X$ affine open, that $H^m(\epsilon_* \mathcal{I}^\bullet) = \epsilon_* \mathcal{H}^m$. Thus $R\epsilon_*$ indeed gives rise to a functor

$$R\epsilon_* : D_{QCoh}(\mathcal{O}_{\acute{e}tale}) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

For our object E of $D_{QCoh}(\mathcal{O}_{\acute{e}tale})$ above the adjunction map $\epsilon^* R\epsilon_* E \rightarrow E$ is an isomorphism as we've seen that the cohomology sheaves of $R\epsilon_* E$ are $\epsilon_* \mathcal{H}^m$ and we have $\epsilon^* \epsilon_* \mathcal{H}^m = \mathcal{H}^m$ (see above). For $F \in D_{QCoh}(\mathcal{O}_X)$ the adjunction map $F \rightarrow R\epsilon_* \epsilon^* F$ is an isomorphism for the same reason, i.e., because the cohomology sheaves of $R\epsilon_* \epsilon^* F$ are isomorphic to $\epsilon_* H^m(\epsilon^* F) = \epsilon_* \epsilon^* H^m(F) = H^m(F)$. \square

57.5. Derived category of quasi-coherent modules

Let S be a scheme. Lemma 57.4.2 shows that the category $D_{QCoh}(\mathcal{O}_S)$ can be defined in terms of complexes of \mathcal{O}_S -modules on the scheme S or by complexes of \mathcal{O} -modules on the small étale site of S . Hence the following definition is compatible with the definition in the case of schemes.

Definition 57.5.1. Let S be a scheme. Let X be an algebraic space over S . The *derived category of \mathcal{O}_X -modules with quasi-coherent cohomology sheaves* is denoted $D_{QCoh}(\mathcal{O}_X)$.

This makes sense by Properties of Spaces, Lemma 48.27.7 and Derived Categories, Section 13.13. Thus we obtain a canonical functor

$$(57.5.1.1) \quad D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

see Derived Categories, Equation (13.13.1.1).

Observe that a flat morphism $f : Y \rightarrow X$ of algebraic spaces induces an exact functor $f^* : Mod(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_Y)$, see Morphisms of Spaces, Lemma 49.28.9 and Modules on Sites, Lemma 18.30.2. In particular $Lf^* : D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_Y)$ is computed on any representative complex (Derived Categories, Lemma 13.17.8). We will write $Lf^* = f^*$ when f is flat and we have $H^i(f^* E) = f^* H^i(E)$ for E in $D(\mathcal{O}_X)$ in this case. We will use this often when f is étale. Of course in the étale case the pullback functor is just the restriction to $Y_{\acute{e}tale}$, see Properties of Spaces, Equation (48.24.1.1).

Lemma 57.5.2. *Let S be a scheme. Let X be an algebraic space over S . Let E be an object of $D(\mathcal{O}_X)$. The following are equivalent*

- (1) E is in $D_{QCoh}(\mathcal{O}_X)$,
- (2) for every étale morphism $\varphi : U \rightarrow X$ where U is an affine scheme $\varphi^* E$ is an object of $D_{QCoh}(\mathcal{O}_U)$,
- (3) for every étale morphism $\varphi : U \rightarrow X$ where U is a scheme $\varphi^* E$ is an object of $D_{QCoh}(\mathcal{O}_U)$,
- (4) there exists a surjective étale morphism $\varphi : U \rightarrow X$ where U is a scheme such that $\varphi^* E$ is an object of $D_{QCoh}(\mathcal{O}_U)$, and
- (5) there exists a surjective étale morphism of algebraic spaces $f : Y \rightarrow X$ such that $Lf^* E$ is an object of $D_{QCoh}(\mathcal{O}_Y)$.

Proof. This follows immediately from the discussion preceding the lemma and Properties of Spaces, Lemma 48.27.6. \square

Lemma 57.5.3. *Let S be a scheme. Let X be an algebraic space over S . Then $D_{QCoh}(\mathcal{O}_X)$ has direct sums.*

Proof. By Injectives, Lemma 19.13.4 the derived category $D(\mathcal{O}_X)$ has direct sums and they are computed by taking termwise direct sums of any representatives. Thus it is clear that the cohomology sheaf of a direct sum is the direct sum of the cohomology sheaves as taking direct sums is an exact functor (in any Grothendieck abelian category). The lemma follows as the direct sum of quasi-coherent sheaves is quasi-coherent, see Properties of Spaces, Lemma 48.27.7. \square

Lemma 57.5.4. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . The functor Lf^* sends $D_{QCoh}(\mathcal{O}_X)$ into $D_{QCoh}(\mathcal{O}_Y)$.*

Proof. Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \searrow h & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes, the vertical arrows are étale, and a is surjective. Since $a^* \circ Lf^* = Lh^* \circ b^*$ the result follows from Lemma 57.5.2 and the case of schemes which is Derived Categories of Schemes, Lemma 35.3.6. \square

Lemma 57.5.5. *Let S be a scheme. Let X be an algebraic space over S . For objects K, L of $D_{QCoh}(\mathcal{O}_X)$ the derived tensor product $K \otimes^{\mathbf{L}} L$ is in $D_{QCoh}(\mathcal{O}_X)$.*

Proof. Let $\varphi : U \rightarrow X$ be a surjective étale morphism from a scheme U . Since $\varphi^*(K \otimes^{\mathbf{L}}_{\mathcal{O}_X} L) = \varphi^*K \otimes^{\mathbf{L}}_{\mathcal{O}_U} \varphi^*L$ we see from Lemma 57.5.2 that this follows from the case of schemes which is Derived Categories of Schemes, Lemma 35.3.7. \square

The following lemma will help us to “compute” a right derived functor on an object of $D_{QCoh}(\mathcal{O}_X)$.

Lemma 57.5.6. *Let S be a scheme. Let X be an algebraic space over S . Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Then there exists an inverse system \mathcal{I}_n^\bullet of complexes of \mathcal{O}_X -modules such that*

- (1) $\mathcal{I}^\bullet = \lim_n \mathcal{I}_n^\bullet$ represents E ,
- (2) \mathcal{I}_n^\bullet is a bounded below complex of injectives,
- (3) $\mathcal{I}^\bullet \rightarrow \mathcal{I}_n^\bullet$ induces an identification $\tau_{\geq -n} E \rightarrow \mathcal{I}_n^\bullet$ in $D(\mathcal{O}_X)$,
- (4) the transition maps $\mathcal{I}_{n+1}^\bullet \rightarrow \mathcal{I}_n^\bullet$ are termwise split surjections, and
- (5) \mathcal{I}^\bullet is a K -injective complex of \mathcal{O}_X -modules.

Moreover, E is the derived limit of the inverse system of its canonical truncations $\tau_{\geq -n} E$.

Proof. Denote $\mathcal{H}^i = H^i(E)$ the i th cohomology sheaf of E . Let \mathcal{B} be the set of affine objects of $X_{\text{étale}}$. Then $H^p(U, \mathcal{H}^i) = 0$ for all $p > 0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$ as U is an affine scheme. See discussion in Cohomology of Spaces, Section 51.3 and Cohomology of Schemes, Lemma 29.2.2. Thus the lemma follows from Cohomology on Sites, Lemmas 21.22.3 and 21.22.4. \square

Lemma 57.5.7. *Let S be a scheme. Let X be an algebraic space over S . Let $F : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Ab}$ be a functor and $N \geq 0$ an integer. Assume that*

- (1) *F is left exact,*
- (2) *F commutes with countable direct products,*
- (3) *$R^p F(\mathcal{F}) = 0$ for all $p \geq N$ and \mathcal{F} quasi-coherent.*

Then for $E \in D_{QCoh}(\mathcal{O}_X)$ the maps $R^p F(E) \rightarrow R^p F(\tau_{\geq p-N+1} E)$ are isomorphisms.

Proof. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. By shifting the complex we see it suffices to prove the assertion for $p = 0$. Choose $\mathcal{I}^\bullet = \lim \mathcal{I}_n^\bullet$ as in Lemma 57.5.6. As \mathcal{I}^\bullet is K-injective $R^0 F(E)$ is represented by $F(\mathcal{I}^\bullet)$. As F commutes with countable direct products, and since the maps $\mathcal{I}_n^m \rightarrow \mathcal{I}_{n-1}^m$ are split surjections, we get $F(\mathcal{I}^\bullet) = \lim F(\mathcal{I}_n^\bullet)$. The cohomology of

$$(57.5.7.1) \quad F(\mathcal{I}_n^{-2}) \rightarrow F(\mathcal{I}_n^{-1}) \rightarrow F(\mathcal{I}_n^0) \rightarrow F(\mathcal{I}_n^1)$$

in degree 0, resp. -1 is equal to $R^0 F(\tau_{\geq -n} E)$, resp. $R^{-1} F(\tau_{\geq -n} E)$ because \mathcal{I}_n^\bullet is a bounded below complex of injectives representing $\tau_{\geq -n} E$. We have a distinguished triangle

$$H^{-n}(E)[n] \rightarrow \tau_{\geq -n} E \rightarrow \tau_{\geq -n+1} E \rightarrow H^{-n}(E)[n+1]$$

(Derived Categories, Remark 13.12.4) in $D(\mathcal{O}_X)$. Since $H^{-n}(E)$ is quasi-coherent we have

$$R^p F(H^{-n}(E)[n]) = R^{p+n} F(H^{-n}(E)) = 0$$

for $p+n \geq N$ and

$$R^p F(H^{-n}(E)[n+1]) = R^{p+n+1} F(H^{-n}(E)) = 0$$

for $p+n+1 \geq N$. We conclude that

$$R^p F(\tau_{\geq -n} E) \rightarrow R^p F(\tau_{\geq -n+1} E)$$

is an isomorphism for all $n \gg p$ and an isomorphism for $n \geq N$ for $p = 0$. Thus Homology, Lemma 12.27.7 applies to the system of sequences (57.5.7.1) and we conclude that $R^0 F(E) = \lim R^0 F(\tau_{\geq -n} E)$. By the above the system $R^0 F(\tau_{\geq -n} E)$ is constant starting with $n = N - 1$ as desired. \square

57.6. Total direct image

The following lemma is the analogue of Cohomology of Spaces, Lemma 51.7.1.

Lemma 57.6.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over S .*

- (1) *The functor Rf_* sends $D_{QCoh}(\mathcal{O}_X)$ into $D_{QCoh}(\mathcal{O}_Y)$.*
- (2) *If Y is quasi-compact, there exists an integer $N = N(X, Y, f)$ such that for an object E of $D_{QCoh}(\mathcal{O}_X)$ with $H^m(E) = 0$ for $m > 0$ we have $H^m(Rf_* E) = 0$ for $m > N$.*
- (3) *In fact, if Y is quasi-compact we can find $N = N(X, Y, f)$ such that for every morphism of algebraic spaces $Y' \rightarrow Y$ the same conclusion holds for the functor $R(f')_*$ where $f' : X' \rightarrow Y'$ is the base change of f .*

Proof. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. To prove (1) we have to show that $Rf_* E$ has quasi-coherent cohomology sheaves. This question is local on Y , hence we may assume Y is quasi-compact. Pick $N = N(X, Y, f)$ as in Cohomology of Spaces, Lemma 51.7.1. Thus $R^p f_* \mathcal{F} = 0$ for all quasi-coherent \mathcal{O}_X -modules \mathcal{F} and all

$p \geq N$. In particular, for any affine object V of $Y_{\acute{e}tale}$ we have $H^p(V \times_Y X, \mathcal{F}) = 0$ for $p \geq N$, see Cohomology of Spaces, Lemma 51.3.3.

Let E be an object of $D_{Qcoh}(\mathcal{O}_X)$. Choose $\mathcal{I}^\bullet = \lim \mathcal{I}_n^\bullet$ as in Lemma 57.5.6. As \mathcal{I}^\bullet is K-injective Rf_*E is represented by $f_*\mathcal{I}^\bullet = \lim f_*\mathcal{I}_n^\bullet$. Let V be an affine object of $Y_{\acute{e}tale}$. The cohomology $H^m(f_*\mathcal{I}_n^\bullet(V))$ of

$$f_*\mathcal{I}_n^{m-1}(V) \rightarrow f_*\mathcal{I}_n^m(V) \rightarrow f_*\mathcal{I}_n^{m+1}(V)$$

is equal to $H^m(V \times_Y X, \tau_{\geq -n}E)$ because \mathcal{I}_n^\bullet is a bounded below complex of injectives representing $\tau_{\geq -n}E$. We have a distinguished triangle

$$H^{-n}(E)[n] \rightarrow \tau_{\geq -n}E \rightarrow \tau_{\geq -n+1}E \rightarrow H^{-n}(E)[n+1]$$

in $D(\mathcal{O}_X)$. Since $H^{-n}(E)$ is quasi-coherent we have $H^m(V \times_Y X, H^{-n}(E)[n]) = 0$ for $n+m \geq N$ by our choice of N . Similarly, $H^m(V \times_Y X, H^{-n}(E)[n+1]) = 0$ for $n+m+1 \geq N$. We conclude that

$$H^m(f_*\mathcal{I}_n^\bullet(V)) \rightarrow H^m(f_*\mathcal{I}_{n-1}^\bullet(V))$$

is an isomorphism for all $n \geq N - m$. Thus Cohomology on Sites, Lemma 21.22.1 applies to show that the m th cohomology sheaf of $\lim f_*\mathcal{I}_n^\bullet$ agrees with the m th cohomology sheaf of $f_*\mathcal{I}_n^\bullet$ for $n \geq N - m$. Since these cohomology sheaves are quasi-coherent by Cohomology of Spaces, Lemma 51.3.2 we get (1).

Finally, we show that (2) and (3) hold with our choice of N . Namely, the stabilization proven above gives that $H^m(Rf_*E)$ is equal to $H^m(Rf_*(\tau_{\geq -n}E))$ for all n large enough which means we can work with objects in $D^+(\mathcal{O}_X)$ in order to prove (2) and (3). In this case we can for example use the spectral sequence

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E$$

(Derived Categories, Lemma 13.21.3) and the vanishing of $R^p f_* H^q(E)$ for $p \geq N$ to conclude. Some details omitted. \square

Lemma 57.6.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-separated and quasi-compact morphism of algebraic spaces over S . Then $Rf_* : D_{Qcoh}(\mathcal{O}_X) \rightarrow D_{Qcoh}(\mathcal{O}_S)$ commutes with direct sums.*

Proof. Let E_i be a family of objects of $D_{Qcoh}(\mathcal{O}_X)$ and set $E = \bigoplus E_i$. We want to show that the map

$$\bigoplus Rf_* E_i \longrightarrow Rf_* E$$

is an isomorphism. We will show it induces an isomorphism on cohomology sheaves in degree 0 which will imply the lemma. Choose an integer N as in Lemma 57.6.1. Then $R^0 f_* E = R^0 f_* \tau_{\geq -N} E$ and $R^0 f_* E_i = R^0 f_* \tau_{\geq -N} E_i$ by the lemma cited. Observe that $\tau_{\geq -N} E = \bigoplus \tau_{\geq -N} E_i$. Thus we may assume all of the E_i have vanishing cohomology sheaves in degrees $< -N$. Next we use the spectral sequences

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E \quad \text{and} \quad R^p f_* H^q(E_i) \Rightarrow R^{p+q} f_* E_i$$

(Derived Categories, Lemma 13.21.3) to reduce to the case of a direct sum of quasi-coherent sheaves. This case is handled by Cohomology of Spaces, Lemma 51.4.2. \square

Remark 57.6.3. Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces X and Y over S . Let $f_0 : X_0 \rightarrow Y_0$ be a morphism of schemes representing f (awkward but temporary notation). Then we claim the diagrams

$$\begin{array}{ccc} D_{QCoh}(\mathcal{O}_{X_0}) & \xlongequal[\text{Lemma 57.4.2}]{} & D_{QCoh}(\mathcal{O}_X) \\ Rf_{0,*} \downarrow & & \downarrow Rf_* \\ D_{QCoh}(\mathcal{O}_{Y_0}) & \xlongequal[\text{Lemma 57.4.2}]{} & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

(Lemma 57.6.1 and Derived Categories of Schemes, Lemma 35.4.1) and

$$\begin{array}{ccc} D_{QCoh}(\mathcal{O}_{X_0}) & \xlongequal[\text{Lemma 57.4.2}]{} & D_{QCoh}(\mathcal{O}_X) \\ Lf_0^* \uparrow & & \uparrow Lf^* \\ D_{QCoh}(\mathcal{O}_{Y_0}) & \xlongequal[\text{Lemma 57.4.2}]{} & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

(Lemma 57.5.4 and Derived Categories of Schemes, Lemma 35.3.6) are commutative. The result for Lf^* and Lf_0^* follows as the equivalences $D_{QCoh}(\mathcal{O}_{X_0}) \rightarrow D_{QCoh}(\mathcal{O}_X)$ and $D_{QCoh}(\mathcal{O}_{Y_0}) \rightarrow D_{QCoh}(\mathcal{O}_Y)$ of Lemma 57.4.2 come from pulling back by the (flat) morphisms of ringed sites $\epsilon : X_{\acute{e}tale} \rightarrow X_{0,Zar}$ and $\epsilon : Y_{\acute{e}tale} \rightarrow Y_{0,Zar}$ and the diagram of ringed sites

$$\begin{array}{ccc} X_{0,Zar} & \xleftarrow{\epsilon} & X_{\acute{e}tale} \\ f_0 \downarrow & & \downarrow f \\ Y_{0,Zar} & \xleftarrow{\epsilon} & Y_{\acute{e}tale} \end{array}$$

is commutative (details omitted). In fact the commutativity of the first diagram also follows as the proof of Lemma 57.4.2 shows that the functor $R\epsilon_*$ gives the equivalences $D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_{X_0})$ and $D_{QCoh}(\mathcal{O}_Y) \rightarrow D_{QCoh}(\mathcal{O}_{Y_0})$.

Lemma 57.6.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Then $Rf_* : D_{QCoh}(\mathcal{O}_X) \rightarrow D_{QCoh}(\mathcal{O}_Y)$ reflects isomorphisms.*

Proof. The statement means that a morphism $\alpha : E \rightarrow F$ of $D_{QCoh}(\mathcal{O}_X)$ is an isomorphism if $Rf_*\alpha$ is an isomorphism. We may check this on cohomology sheaves. In particular, the question is étale local on Y . Hence we may assume Y and therefore X is affine. In this case the problem reduces to the case of schemes (Derived Categories of Schemes, Lemma 35.4.3) via Lemma 57.4.2 and Remark 57.6.3. \square

Lemma 57.6.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . For E in $D_{QCoh}(\mathcal{O}_Y)$ we have $Rf_*Lf^*E = E \otimes_{\mathcal{O}_Y}^{\mathbf{L}} f_*\mathcal{O}_X$.*

Proof. Since f is affine the map $f_*\mathcal{O}_X \rightarrow Rf_*\mathcal{O}_X$ is an isomorphism (Cohomology of Spaces, Lemma 51.7.2). There is a canonical map $E \otimes^{\mathbf{L}} f_*\mathcal{O}_X = E \otimes^{\mathbf{L}} Rf_*\mathcal{O}_X \rightarrow Rf_*Lf^*E$ adjoint to the map

$$Lf^*(E \otimes^{\mathbf{L}} Rf_*\mathcal{O}_X) = Lf^*E \otimes^{\mathbf{L}} Lf^*Rf_*\mathcal{O}_X \rightarrow Lf^*E \otimes^{\mathbf{L}} \mathcal{O}_X = Lf^*E$$

coming from $1 : Lf^*E \rightarrow Lf^*E$ and the canonical map $Lf^*Rf_*\mathcal{O}_X \rightarrow \mathcal{O}_X$. To check the map so constructed is an isomorphism we may work locally on Y . Hence

we may assume Y and therefore X is affine. In this case the problem reduces to the case of schemes (Derived Categories of Schemes, Lemma 35.4.4) via Lemma 57.4.2 and Remark 57.6.3. \square

57.7. Derived category of coherent modules

Let S be a scheme. Let X be a locally Noetherian algebraic space over S . In this case the category $\text{Coh}(\mathcal{O}_X) \subset \text{Mod}(\mathcal{O}_X)$ of coherent \mathcal{O}_X -modules is a weak Serre subcategory, see Homology, Section 12.9 and Cohomology of Spaces, Lemma 51.11.3. Denote

$$D_{\text{Coh}}(\mathcal{O}_X) \subset D(\mathcal{O}_X)$$

the subcategory of complexes whose cohomology sheaves are coherent, see Derived Categories, Section 13.13. Thus we obtain a canonical functor

$$(57.7.0.1) \quad D(\text{Coh}(\mathcal{O}_X)) \longrightarrow D_{\text{Coh}}(\mathcal{O}_X)$$

see Derived Categories, Equation (13.13.1.1).

Lemma 57.7.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type and Y is Noetherian. Let E be an object of $D_{\text{Coh}}^b(\mathcal{O}_X)$ such that the scheme theoretic support of $H^i(E)$ is proper over Y for all i . Then Rf_*E is an object of $D_{\text{Coh}}^b(\mathcal{O}_Y)$.*

Proof. Consider the spectral sequence

$$R^p f_* H^q(E) \Rightarrow R^{p+q} f_* E$$

see Derived Categories, Lemma 13.21.3. By assumption and Cohomology of Spaces, Remark 51.19.3 the sheaves $R^p f_* H^q(E)$ are coherent. Hence $R^{p+q} f_* E$ is coherent, i.e., $E \in D_{\text{Coh}}^b(\mathcal{O}_S)$. Boundedness from below is trivial. Boundedness from above follows from Cohomology of Spaces, Lemma 51.7.1 or from Lemma 57.6.1. \square

57.8. Induction principle

In this section we discuss an induction principle for algebraic spaces analogous to what is Cohomology of Schemes, Lemma 57.8.3 for schemes. To formulate it we introduce the notion of an *elementary distinguished square*; this terminology is borrowed from [MV99]. The principle as formulated here is implicit in the paper [GR71] by Raynaud and Gruson. A related principle for algebraic stacks is [Ryd10, Theorem D] by David Rydh.

Definition 57.8.1. Let S be a scheme. A commutative diagram

$$\begin{array}{ccc} U \times_W V & \longrightarrow & V \\ \downarrow & & \downarrow f \\ U & \xrightarrow{j} & W \end{array}$$

of algebraic spaces over S is called an *elementary distinguished square* if

- (1) U is an open subspace of W and j is the inclusion morphism,
- (2) f is étale, and
- (3) setting $T = W \setminus U$ (with reduced induced subspace structure) the morphism $f^{-1}(T) \rightarrow T$ is an isomorphism.

We will indicate this by saying: “Let $(U \subset W, f : V \rightarrow W)$ be an elementary distinguished square.”

Note that if $(U \subset W, f : V \rightarrow W)$ is an elementary distinguished square, then we have $W = U \cup f(V)$. Thus $\{U \rightarrow W, V \rightarrow W\}$ is an étale covering of W . It turns out that these étale coverings have nice properties and that in some sense there are “enough” of them.

Lemma 57.8.2. *Let S be a scheme. Let $(U \subset W, f : V \rightarrow W)$ be an elementary distinguished square of algebraic spaces over S .*

- (1) *If $V' \subset V$ and $U \subset U' \subset W$ are open subspaces and $W' = U' \cup f(V')$ then $(U' \subset W', f|_{V'} : V' \rightarrow W')$ is an elementary distinguished square.*
- (2) *If $p : W' \rightarrow W$ is a morphism of algebraic spaces, then $(p^{-1}(U) \subset W', V \times_W W' \rightarrow W')$ is an elementary distinguished square.*

Proof. Omitted. □

Lemma 57.8.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let P be a property of the quasi-compact and quasi-separated objects of $X_{\text{spaces}, \text{étale}}$. Assume that*

- (1) *P holds for every affine object of $X_{\text{spaces}, \text{étale}}$,*
- (2) *for every elementary distinguished square $(U \subset W, f : V \rightarrow W)$ such that*
 - (a) *W is a quasi-compact and quasi-separated object of $X_{\text{spaces}, \text{étale}}$,*
 - (b) *U is quasi-compact,*
 - (c) *V is affine, and*
 - (d) *P holds for U, V , and $U \times_W V$,**then P holds for W .*

Then P holds for every quasi-compact and quasi-separated object of $X_{\text{spaces}, \text{étale}}$ and in particular for X .

Proof. We first claim that P holds for every representable quasi-compact and quasi-separated object of $X_{\text{spaces}, \text{étale}}$. Namely, suppose that $U \rightarrow X$ is étale and U is a quasi-compact and quasi-separated scheme. By assumption (1) property P holds for every affine open of U . Moreover, if $W, V \subset U$ are quasi-compact open with V affine and P holds for W, V , and $W \cap V$, then P holds for $W \cup V$ by (2) (as the pair $(W \subset W \cup V, V \rightarrow W \cup V)$ is an elementary distinguished square). Thus P holds for U by the induction principle for schemes, see Cohomology of Schemes, Lemma 29.4.1.

To finish the proof it suffices to prove P holds for X (because we can simply replace X by any quasi-compact and quasi-separated object of $X_{\text{spaces}, \text{étale}}$ we want to prove the result for). We will use the filtration

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

and the morphisms $f_p : V_p \rightarrow U_p$ of Decent Spaces, Lemma 50.8.5. We will prove that P holds for U_p by descending induction on p . Note that P holds for U_{n+1} by (1) as an empty algebraic space is affine. Assume P holds for U_{p+1} . Note that $(U_{p+1} \subset U_p, f_p : V_p \rightarrow U_p)$ is an elementary distinguished square, but (2) may not apply as V_p may not be affine. However, as V_p is a quasi-compact scheme we may choose a finite affine open covering $V_p = V_{p,1} \cup \dots \cup V_{p,m}$. Set $W_{p,0} = U_{p+1}$ and

$$W_{p,i} = U_{p+1} \cup f_p(V_{p,1} \cup \dots \cup V_{p,i})$$

for $i = 1, \dots, m$. These are quasi-compact open subspaces of X . Then we have

$$U_{p+1} = W_{p,0} \subset W_{p,1} \subset \dots \subset W_{p,m} = U_p$$

and the pairs

$$(W_{p,0} \subset W_{p,1}, f_p|_{V_{p,1}}), (W_{p,1} \subset W_{p,2}, f_p|_{V_{p,2}}), \dots, (W_{p,m-1} \subset W_{p,m}, f_p|_{V_{p,m}})$$

are elementary distinguished squares by Lemma 57.8.2. Note that P holds for each $V_{p,1}$ (as affine schemes) and for $W_{p,i} \times_{W_{p,i+1}} V_{p,i+1}$ as this is a quasi-compact open of $V_{p,i+1}$ and hence P holds for it by the first paragraph of this proof. Thus (2) applies to each of these and we inductively conclude P holds for $W_{p,1}, \dots, W_{p,m} = U_p$. \square

Lemma 57.8.4. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $\mathcal{B} \subset \text{Ob}(X_{\text{spaces}, \text{étale}})$. Let P be a property of the elements of \mathcal{B} . Assume that*

- (1) every $W \in \mathcal{B}$ is quasi-compact and quasi-separated,
- (2) if $W \in \mathcal{B}$ and $U \subset W$ is quasi-compact open, then $U \in \mathcal{B}$,
- (3) if $V \in \text{Ob}(X_{\text{spaces}, \text{étale}})$ is affine, then (a) $V \in \mathcal{B}$ and (b) P holds for V ,
- (4) for every elementary distinguished square $(U \subset W, f : V \rightarrow W)$ such that
 - (a) $W \in \mathcal{B}$,
 - (b) U is quasi-compact,
 - (c) V is affine, and
 - (d) P holds for U, V , and $U \times_W V$,
 then P holds for W .

Then P holds for every $W \in \mathcal{B}$.

Proof. This is proved in exactly the same manner as the proof of Lemma 57.8.3. (We remark that (4)(d) makes sense as $U \times_W V$ is a quasi-compact open of V hence an element of \mathcal{B} by conditions (2) and (3).) \square

Remark 57.8.5. How to choose the collection \mathcal{B} in Lemma 57.8.4? Here are some examples:

- (1) If X is quasi-compact and separated, then we can choose \mathcal{B} to be the set of quasi-compact and separated objects of $X_{\text{spaces}, \text{étale}}$. Then $X \in \mathcal{B}$ and \mathcal{B} satisfies (1), (2), and (3)(a). With this choice of \mathcal{B} Lemma 57.8.4 reproduces Lemma 57.8.3.
- (2) If X is quasi-compact with affine diagonal, then we can choose \mathcal{B} to be the set of objects of $X_{\text{spaces}, \text{étale}}$ which are quasi-compact and have affine diagonal. Again $X \in \mathcal{B}$ and \mathcal{B} satisfies (1), (2), and (3)(a).
- (3) If X is quasi-compact and quasi-separated, then the smallest subset \mathcal{B} which contains X and satisfies (1), (2), and (3)(a) is given by the rule $W \in \mathcal{B}$ if and only if either W is a quasi-compact open subspace of X , or W is a quasi-compact open of an affine object of $X_{\text{spaces}, \text{étale}}$.

Here is a variant where we extend the truth from an open to larger opens.

Lemma 57.8.6. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $W \subset X$ be a quasi-compact open subspace. Let P be a property of quasi-compact open subspaces of X . Assume that*

- (1) P holds for W , and
- (2) for every elementary distinguished square $(W_1 \subset W_2, f : V \rightarrow W_2)$ where such that
 - (a) W_1, W_2 are quasi-compact open subspaces of X ,
 - (b) $W \subset W_1$,
 - (c) V is affine, and

- (d) P holds for W_1 ,
then P holds for W_2 .

Then P holds for X .

Proof. We can deduce this from Lemma 57.8.4, but instead we will give a direct argument by explicitly redoing the proof of Lemma 57.8.3. We will use the filtration

$$\emptyset = U_{n+1} \subset U_n \subset U_{n-1} \subset \dots \subset U_1 = X$$

and the morphisms $f_p : V_p \rightarrow U_p$ of Decent Spaces, Lemma 50.8.5. We will prove that P holds for $W_p = W \cup U_p$ by descending induction on p . This will finish the proof as $W_1 = X$. Note that P holds for $W_{n+1} = W \cap U_{n+1} = W$ by (1). Assume P holds for W_{p+1} . Observe that $W_p \setminus W_{p+1}$ (with reduced induced subspace structure) is a closed subspace of $U_p \setminus U_{p+1}$. Since $(U_{p+1} \subset U_p, f_p : V_p \rightarrow U_p)$ is an elementary distinguished square, the same is true for $(W_{p+1} \subset W_p, f_p : V_p \rightarrow W_p)$. However (2) may not apply as V_p may not be affine. However, as V_p is a quasi-compact scheme we may choose a finite affine open covering $V_p = V_{p,1} \cup \dots \cup V_{p,m}$. Set $W_{p,0} = W_{p+1}$ and

$$W_{p,i} = W_{p+1} \cup f_p(V_{p,1} \cup \dots \cup V_{p,i})$$

for $i = 1, \dots, m$. These are quasi-compact open subspaces of X containing W . Then we have

$$W_{p+1} = W_{p,0} \subset W_{p,1} \subset \dots \subset W_{p,m} = W_p$$

and the pairs

$$(W_{p,0} \subset W_{p,1}, f_p|_{V_{p,1}}), (W_{p,1} \subset W_{p,2}, f_p|_{V_{p,2}}), \dots, (W_{p,m-1} \subset W_{p,m}, f_p|_{V_{p,m}})$$

are elementary distinguished squares by Lemma 57.8.2. Now (2) applies to each of these and we inductively conclude P holds for $W_{p,1}, \dots, W_{p,m} = W_p$. \square

57.9. Mayer-Vietoris

In this section we prove that an elementary distinguished triangle gives rise to various Mayer-Vietoris sequences.

Let S be a scheme. Let $U \rightarrow X$ be an étale morphism of algebraic spaces over S . In Properties of Spaces, Section 48.25 it was shown that $U_{spaces, étale} = X_{spaces, étale}/U$ compatible with structure sheaves. Hence in this situation we often think of the morphism $j_U : U \rightarrow X$ as a localization morphism (see Modules on Sites, Definition 18.19.1). In particular we think of pullback j_U^* as restriction to U and we often denote it by $|_U$; this is compatible with Properties of Spaces, Equation (48.24.1.1). In particular we see that

$$(57.9.0.1) \quad (\mathcal{F}|_U)_{\bar{u}} = \mathcal{F}_{\bar{x}}$$

if \bar{u} is a geometric point of U and \bar{x} the image of \bar{u} in X . Moreover, restriction has an exact left adjoint $j_{U!}$, see Modules on Sites, Lemmas 18.19.2 and 18.19.3. Finally, recall that if \mathcal{G} is an \mathcal{O}_X -module, then

$$(57.9.0.2) \quad (j_{U!}\mathcal{G})_{\bar{x}} = \bigoplus_{\bar{u}} \mathcal{G}_{\bar{u}}$$

for any geometric point $\bar{x} : \text{Spec}(k) \rightarrow X$ where the direct sum is over those morphism $\bar{u} : \text{Spec}(k) \rightarrow U$ such that $j_U \circ \bar{u} = \bar{x}$, see Modules on Sites, Lemma 18.37.1 and Properties of Spaces, Lemma 48.16.13.

Lemma 57.9.1. *Let S be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S .*

(1) *For a sheaf of \mathcal{O}_X -modules \mathcal{F} we have a short exact sequence*

$$0 \rightarrow j_{U \times_X V!} \mathcal{F}|_{U \times_X V} \rightarrow j_{U!} \mathcal{F}|_U \oplus j_{V!} \mathcal{F}|_V \rightarrow \mathcal{F} \rightarrow 0$$

(2) *For an object E of $D(\mathcal{O}_X)$ we have a distinguished triangle*

$$j_{U \times_X V!} E|_{U \times_X V} \rightarrow j_{U!} E|_U \oplus j_{V!} E|_V \rightarrow E \rightarrow j_{U \times_X V!} E|_{U \times_X V}[1]$$

in $D(\mathcal{O}_X)$.

Proof. To show the sequence of (1) is exact we may check on stalks at geometric points by Properties of Spaces, Theorem 48.16.12. Let \bar{x} be a geometric point of X . By Equations (57.9.0.1) and (57.9.0.2) taking stalks at \bar{x} we obtain the sequence

$$0 \rightarrow \bigoplus_{(\bar{u}, \bar{v})} \mathcal{F}_{\bar{x}} \rightarrow \bigoplus_{\bar{u}} \mathcal{F}_{\bar{x}} \oplus \bigoplus_{\bar{v}} \mathcal{F}_{\bar{x}} \rightarrow \mathcal{F}_{\bar{x}} \rightarrow 0$$

This sequence is exact because for every \bar{x} there either is exactly one \bar{u} mapping to \bar{x} , or there is no \bar{u} and exactly one \bar{v} mapping to \bar{x} .

Proof of (2). We have seen in Cohomology on Sites, Section 21.20 that the restriction functors and the extension by zero functors on derived categories are computed by just applying the functor to any complex. Let \mathcal{E}^\bullet be a complex of \mathcal{O}_X -modules representing E . The distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes of \mathcal{O}_X -modules

$$0 \rightarrow j_{U \times_X V!} \mathcal{E}^\bullet|_{U \times_X V} \rightarrow j_{U!} \mathcal{E}^\bullet|_U \oplus j_{V!} \mathcal{E}^\bullet|_V \rightarrow \mathcal{E}^\bullet \rightarrow 0$$

which is short exact by (1). □

Lemma 57.9.2. *Let S be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S .*

(1) *For every sheaf of \mathcal{O}_X -modules \mathcal{F} we have a short exact sequence*

$$0 \rightarrow \mathcal{F} \rightarrow j_{U,*} \mathcal{F}|_U \oplus j_{V,*} \mathcal{F}|_V \rightarrow j_{U \times_X V,*} \mathcal{F}|_{U \times_X V} \rightarrow 0$$

(2) *For any object E of $D(\mathcal{O}_X)$ we have a distinguished triangle*

$$E \rightarrow Rj_{U,*} E|_U \oplus Rj_{V,*} E|_V \rightarrow Rj_{U \times_X V,*} E|_{U \times_X V} \rightarrow E[1]$$

in $D(\mathcal{O}_X)$.

Proof. Let W be an object of $X_{\acute{e}tale}$. We claim the sequence

$$0 \rightarrow \mathcal{F}(W) \rightarrow \mathcal{F}(W \times_X U) \oplus \mathcal{F}(W \times_X V) \rightarrow \mathcal{F}(W \times_X U \times_X V)$$

is exact and that an element of the last group can locally on W be lifted to the middle one. By Lemma 57.8.2 the pair $(W \times_X U \subset W, V \times_X W \rightarrow W)$ is an elementary distinguished square. Thus we may assume $W = X$ and it suffices to prove the same thing for

$$0 \rightarrow \mathcal{F}(X) \rightarrow \mathcal{F}(U) \oplus \mathcal{F}(V) \rightarrow \mathcal{F}(U \times_X V)$$

We have seen that

$$0 \rightarrow j_{U \times_X V!} \mathcal{O}_{U \times_X V} \rightarrow j_{U!} \mathcal{O}_U \oplus j_{V!} \mathcal{O}_V \rightarrow \mathcal{O}_X \rightarrow 0$$

is a exact sequence of \mathcal{O}_X -modules in Lemma 57.9.1 and applying the right exact functor $\text{Hom}_{\mathcal{O}_X}(-, \mathcal{F})$ gives the sequence above. This also means that the

obstruction to lifting $s \in \mathcal{F}(U \times_X V)$ to an element of $\mathcal{F}(U) \oplus \mathcal{F}(V)$ lies in $\text{Ext}_{\mathcal{O}_X}^1(\mathcal{O}_X, \mathcal{F}) = H^1(X, \mathcal{F})$. By locality of cohomology (Cohomology on Sites, Lemma 21.8.3) this obstruction vanishes étale locally on X and the proof of (1) is complete.

Proof of (2). Choose a K-injective complex \mathcal{I}^\bullet representing E whose terms \mathcal{I}^n are injective objects of $\text{Mod}(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. Then $\mathcal{I}^\bullet|_U$ is a K-injective complex (Cohomology on Sites, Lemma 21.20.1). Hence $Rj_{U,*}E|_U$ is represented by $j_{U,*}\mathcal{I}^\bullet|_U$. Similarly for V and $U \times_X V$. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow \mathcal{I}^\bullet \rightarrow j_{U,*}\mathcal{I}^\bullet|_U \oplus j_{V,*}\mathcal{I}^\bullet|_V \rightarrow j_{U \times_X V,*}\mathcal{I}^\bullet|_{U \times_X V} \rightarrow 0.$$

This sequence is exact by (1). □

Lemma 57.9.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square. Denote $a = f|_U : U \rightarrow Y$, $b = f|_V : V \rightarrow Y$, and $c = f|_{U \times_X V} : U \times_X V \rightarrow Y$ the restrictions. For every object E of $D(\mathcal{O}_X)$ there exists a distinguished triangle*

$$Rf_*E \rightarrow Ra_*(E|_U) \oplus Rb_*(E|_V) \rightarrow Rc_*(E|_{U \times_X V}) \rightarrow Rf_*E[1]$$

in $D(\mathcal{O}_Y)$. This triangle is functorial in E .

Proof. Choose a K-injective complex \mathcal{I}^\bullet representing E . We may assume \mathcal{I}^n is an injective object of $\text{Mod}(\mathcal{O}_X)$ for all n , see Injectives, Theorem 19.12.6. Then Rf_*E is computed by $f_*\mathcal{I}^\bullet$. Similarly for U , V , and $U \cap V$ by Cohomology on Sites, Lemma 21.20.1. Hence the distinguished triangle of the lemma is the distinguished triangle associated (by Derived Categories, Section 13.12 and especially Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow f_*\mathcal{I}^\bullet \rightarrow a_*\mathcal{I}^\bullet|_U \oplus b_*\mathcal{I}^\bullet|_V \rightarrow c_*\mathcal{I}^\bullet|_{U \times_X V} \rightarrow 0.$$

To see this is a short exact sequence of complexes we argue as follows. Pick an injective object \mathcal{I} of $\text{Mod}(\mathcal{O}_X)$. Apply f_* to the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow j_{U,*}\mathcal{I}|_U \oplus j_{V,*}\mathcal{I}|_V \rightarrow j_{U \times_X V,*}\mathcal{I}|_{U \times_X V} \rightarrow 0$$

of Lemma 57.9.2 and use that $R^1f_*\mathcal{I} = 0$ to get a short exact sequence

$$0 \rightarrow f_*\mathcal{I} \rightarrow f_*j_{U,*}\mathcal{I}|_U \oplus f_*j_{V,*}\mathcal{I}|_V \rightarrow f_*j_{U \times_X V,*}\mathcal{I}|_{U \times_X V} \rightarrow 0$$

The proof is finished by observing that $a_* = f_*j_{U,*}$ and similarly for b_* and c_* . □

Lemma 57.9.4. *Let S be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S . For objects E, F of $D(\mathcal{O}_X)$ we have a Mayer-Vietoris sequence*

$$\begin{array}{ccc} \dots & \longrightarrow & \text{Ext}^{-1}(E_{U \times_X V}, F_{U \times_X V}) \\ & \nearrow & \\ \text{Hom}(E, F) & \longleftarrow \text{Hom}(E_U, F_U) \oplus \text{Hom}(E_V, F_V) \longrightarrow & \text{Hom}(E_{U \times_X V}, F_{U \times_X V}) \end{array}$$

where the subscripts denote restrictions to the relevant opens and the Hom's are taken in the relevant derived categories.

Proof. Use the distinguished triangle of Lemma 57.9.1 to obtain a long exact sequence of Hom's (from Derived Categories, Lemma 13.4.2) and use that $\mathrm{Hom}(j_{U!}E|_U, F) = \mathrm{Hom}(E|_U, F|_U)$ by Cohomology on Sites, Lemma 21.20.2. \square

Lemma 57.9.5. *Let S be a scheme. Let $j : U \rightarrow X$ be an étale morphism of algebraic spaces over S . Given an étale morphism $V \rightarrow Y$, set $W = V \times_X U$ and denote $j_W : W \rightarrow V$ the projection morphism. Then $(j_!E)|_V = j_{W!}(E|_W)$ for E in $D(\mathcal{O}_U)$.*

Proof. This is true because $(j_!\mathcal{F})|_V = j_{W!}(\mathcal{F}|_W)$ for an \mathcal{O}_X -module \mathcal{F} as follows immediately from the construction of the functors $j_!$ and $j_{W!}$, see Modules on Sites, Lemma 18.19.2. \square

Lemma 57.9.6. *Let S be a scheme. Let $(U \subset X, j : V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S . Set $T = |X| \setminus |U|$.*

- (1) *If E is an object of $D(\mathcal{O}_X)$ supported on T , then (a) $E \rightarrow Rj_*(E|_V)$ and (b) $j_!(E|_V) \rightarrow E$ are isomorphisms.*
- (2) *If F is an object of $D(\mathcal{O}_V)$ supported on $j^{-1}T$, then (a) $F \rightarrow (j_!F)|_V$, (b) $(Rj_*F)|_V \rightarrow F$, and (c) $j_!F \rightarrow Rj_*F$ are isomorphisms.*

Proof. Let E be an object of $D(\mathcal{O}_X)$ whose cohomology sheaves are supported on T . Then we see that $E|_U = 0$ and $E|_{U \times_X V} = 0$ as T doesn't meet U and $j^{-1}T$ doesn't meet $U \times_X V$. Thus (1)(a) follows from Lemma 57.9.2. In exactly the same way (1)(b) follows from Lemma 57.9.1.

Let F be an object of $D(\mathcal{O}_V)$ whose cohomology sheaves are supported on $j^{-1}T$. By Lemma 57.3.1 we have $(Rj_*F)|_U = Rj_{W,*}(F|_W) = 0$ because $F|_W = 0$ by our assumption. Similarly $(j_!F)|_U = j_{W!}(F|_W) = 0$ by Lemma 57.9.5. Thus $j_!F$ and Rj_*F are supported on T and $(j_!F)|_V$ and $(Rj_*F)|_V$ are supported on $j^{-1}(T)$. To check that the maps (2)(a), (b), (c) are isomorphisms in the derived category, it suffices to check that these maps induce isomorphisms on stalks of cohomology sheaves at geometric points of T and $j^{-1}(T)$ by Properties of Spaces, Theorem 48.16.12. This we may do after replacing X by V , U by $U \times_X V$, V by $V \times_X V$ and F by $F|_{V \times_X V}$ (restriction via first projection), see Lemmas 57.3.1, 57.9.5, and 57.8.2. Since $V \times_X V \rightarrow V$ has a section this reduces (2) to the case that $j : V \rightarrow X$ has a section.

Assume j has a section $\sigma : X \rightarrow V$. Set $V' = \sigma(X)$. This is an open subspace of V . Set $U' = j^{-1}(U)$. This is another open subspace of V . Then $(U' \subset V, V' \rightarrow V)$ is an elementary distinguished square. Observe that $F|_{U'} = 0$ and $F|_{V' \cap U'} = 0$ because F is supported on $j^{-1}(T)$. Denote $j' : V' \rightarrow V$ the open immersion and $j_{V'} : V' \rightarrow X$ the composition $V' \rightarrow V \rightarrow X$ which is the inverse of σ . Set $F' = \sigma^*F$. The distinguished triangles of Lemmas 57.9.1 and 57.9.2 show that $F = j'_!(F|_{V'})$ and $F = Rj'_*(F|_{V'})$. It follows that $j_!F = j_!j'_!(F|_{V'}) = j_{V'}F = F'$ because $j_{V'} : V' \rightarrow X$ is an isomorphism and the inverse of σ . Similarly, $Rj_*F = Rj_*Rj'_*F = Rj_{V',*}F = F'$. This proves (2)(c). To prove (2)(a) and (2)(b) it suffices to show that $F = F'|_V$. This is clear because both F and $F'|_V$ restrict to zero on U' and $U' \cap V'$ and the same object on V' . \square

We can glue complexes!

Lemma 57.9.7. *Let S be a scheme. Let $(U \subset X, V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S . Suppose given*

- (1) an object E of $D(\mathcal{O}_X)$,
- (2) a morphism $a : A \rightarrow E|_U$ of $D(\mathcal{O}_U)$,
- (3) a morphism $b : B \rightarrow E|_V$ of $D(\mathcal{O}_V)$,
- (4) an isomorphism $c : A|_{U \times_X V} \rightarrow B|_{U \times_X V}$

such that

$$a|_{U \times_X V} = b|_{U \times_X V} \circ c.$$

Then there exists a morphism $F \rightarrow E$ in $D(\mathcal{O}_X)$ whose restriction to U is isomorphic to a and whose restriction to V is isomorphic to b .

Proof. Denote $j_U, j_V, j_{U \times_X V}$ the corresponding morphisms towards X . Choose a distinguished triangle

$$F \rightarrow Rj_{U,*}A \oplus Rj_{V,*}B \rightarrow Rj_{U \times_X V,*}(B|_{U \times_X V}) \rightarrow F[1]$$

Here the map $Rj_{V,*}B \rightarrow Rj_{U \times_X V,*}(B|_{U \times_X V})$ is the obvious one. The map $Rj_{U,*}A \rightarrow Rj_{U \times_X V,*}(B|_{U \times_X V})$ is the composition of $Rj_{U,*}A \rightarrow Rj_{U \times_X V,*}(A|_{U \times_X V})$ with $Rj_{U \times_X V,*}c$. Restricting to U we obtain

$$F|_U \rightarrow A \oplus (Rj_{V,*}B)|_U \rightarrow (Rj_{U \times_X V,*}(B|_{U \times_X V}))|_U \rightarrow F|_U[1]$$

Denote $j : U \times_X V \rightarrow U$. Compatibility of restriction and total direct image (Lemma 57.3.1) shows that both $(Rj_{V,*}B)|_U$ and $(Rj_{U \times_X V,*}(B|_{U \times_X V}))|_U$ are canonically isomorphic to $Rj_*(B|_{U \times_X V})$. Hence the second arrow of the last displayed equation has a section, and we conclude that the morphism $F|_U \rightarrow A$ is an isomorphism.

To see that the morphism $F|_V \rightarrow B$ is an isomorphism we will use a trick. Namely, choose a distinguished triangle

$$F|_V \rightarrow B \rightarrow B' \rightarrow F[1]|_V$$

in $D(\mathcal{O}_V)$. Since $F|_U \rightarrow A$ is an isomorphism, and since we have the isomorphism $c : A|_{U \times_X V} \rightarrow B|_{U \times_X V}$ the restriction of $F|_V \rightarrow B$ is an isomorphism over $U \times_X V$. Thus B' is supported on $j_V^{-1}(T)$ where $T = |X| \setminus |U|$. On the other hand, there is a morphism of distinguished triangles

$$\begin{array}{ccccccc} F & \longrightarrow & Rj_{U,*}F|_U \oplus Rj_{V,*}F|_V & \longrightarrow & Rj_{U \times_X V,*}F|_{U \times_X V} & \longrightarrow & F[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ F & \longrightarrow & Rj_{U,*}A \oplus Rj_{V,*}B & \longrightarrow & Rj_{U \times_X V,*}(B|_{U \times_X V}) & \longrightarrow & F[1] \end{array}$$

The all of the vertical maps in this diagram are isomorphisms, except for the map $Rj_{V,*}F|_V \rightarrow Rj_{V,*}B$, hence that is an isomorphism too (Derived Categories, Lemma 13.4.3). This implies that $Rj_{V,*}B' = 0$. Hence $B' = 0$ by Lemma 57.9.6.

The existence of the morphism $F \rightarrow E$ follows from the Mayer-Vietoris sequence for Hom, see Lemma 57.9.4. \square

57.10. The coherator

Let S be a scheme. Let X be an algebraic space over S . The *coherator* is a functor

$$Q_X : Mod(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

which is right adjoint to the inclusion functor $QCoh(\mathcal{O}_X) \rightarrow Mod(\mathcal{O}_X)$. It exists for any algebraic space X and moreover the adjunction mapping $Q_X(\mathcal{F}) \rightarrow \mathcal{F}$

is an isomorphism for every quasi-coherent module \mathcal{F} , see Properties of Spaces, Proposition 48.30.2. Since Q_X is left exact (as a right adjoint) we can consider its right derived extension

$$RQ_X : D(\mathcal{O}_X) \longrightarrow D(QCoh(\mathcal{O}_X)).$$

As this functor is constructed by applying Q_X to a K-injective replacement we see that RQ_X is a right adjoint to the canonical functor $D(QCoh(\mathcal{O}_X)) \rightarrow D(\mathcal{O}_X)$.

Lemma 57.10.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Then f_* defines a derived functor $f_* : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$. This functor has the property that*

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \\ f_* \downarrow & & \downarrow Rf_* \\ D(QCoh(\mathcal{O}_Y)) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

commutes.

Proof. The functor $f_* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Y)$ is exact, see Cohomology of Spaces, Lemma 51.7.2. Hence f_* defines a derived functor $f_* : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ by simply applying f_* to any representative complex, see Derived Categories, Lemma 13.17.8. For any complex of \mathcal{O}_X -modules \mathcal{F}^\bullet there is a canonical map $f_*\mathcal{F}^\bullet \rightarrow Rf_*\mathcal{F}^\bullet$. To finish the proof we show this is a quasi-isomorphism when \mathcal{F}^\bullet is a complex with each \mathcal{F}^n quasi-coherent. The statement is étale local on Y hence we may assume Y affine. As an affine morphism is representable we reduce to the case of schemes by the compatibility of Remark 57.6.3. The case of schemes is Derived Categories of Schemes, Lemma 35.6.1. \square

Lemma 57.10.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume that*

- (1) *f is quasi-compact, quasi-separated, and flat, and*
- (2) *denoting*

$$\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$$

the right derived functor of $f_ : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_Y)$ the diagram*

$$\begin{array}{ccc} D(QCoh(\mathcal{O}_X)) & \longrightarrow & D_{QCoh}(\mathcal{O}_X) \\ \Phi \downarrow & & \downarrow Rf_* \\ D(QCoh(\mathcal{O}_Y)) & \longrightarrow & D_{QCoh}(\mathcal{O}_Y) \end{array}$$

commutes.

Then $RQ_Y \circ Rf_ = \Phi \circ RQ_X$.*

Proof. Since f is quasi-compact and quasi-separated, we see that f_* preserve quasi-coherence, see Morphisms of Spaces, Lemma 49.11.2. Recall that $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category (Properties of Spaces, Proposition 48.30.2). Hence any K in $D(QCoh(\mathcal{O}_X))$ can be represented by a K-injective complex \mathcal{I}^\bullet of $QCoh(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. Then we can define $\Phi(K) = f_*\mathcal{I}^\bullet$.

Since f is flat, the functor f^* is exact. Hence f^* defines $f^* : D(\mathcal{O}_Y) \rightarrow D(\mathcal{O}_X)$ and also $f^* : D(QCoh(\mathcal{O}_Y)) \rightarrow D(QCoh(\mathcal{O}_X))$. The functor $f^* = Lf^* : D(\mathcal{O}_Y) \rightarrow$

$D(\mathcal{O}_X)$ is left adjoint to $Rf_* : D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_Y)$, see Cohomology on Sites, Lemma 21.19.1. Similarly, the functor $f^* : D(QCoh(\mathcal{O}_Y)) \rightarrow D(QCoh(\mathcal{O}_X))$ is left adjoint to $\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ by Derived Categories, Lemma 13.28.4.

Let A be an object of $D(QCoh(\mathcal{O}_Y))$ and E an object of $D(\mathcal{O}_X)$. Then

$$\begin{aligned} \text{Hom}_{D(QCoh(\mathcal{O}_Y))}(A, RQ_Y(Rf_*E)) &= \text{Hom}_{D(\mathcal{O}_Y)}(A, Rf_*E) \\ &= \text{Hom}_{D(\mathcal{O}_X)}(f^*A, E) \\ &= \text{Hom}_{D(QCoh(\mathcal{O}_X))}(f^*A, RQ_X(E)) \\ &= \text{Hom}_{D(QCoh(\mathcal{O}_Y))}(A, \Phi(RQ_X(E))) \end{aligned}$$

This implies what we want. □

Lemma 57.10.3. *Let S be a scheme. Let X be an affine algebraic space over S . Set $A = \Gamma(X, \mathcal{O}_X)$. Then*

- (1) $Q_X : \text{Mod}(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_X)$ is the functor which sends \mathcal{F} to the quasi-coherent \mathcal{O}_X -module associated to the A -module $\Gamma(X, \mathcal{F})$,
- (2) $RQ_X : D(\mathcal{O}_X) \rightarrow D(QCoh(\mathcal{O}_X))$ is the functor which sends E to the complex of quasi-coherent \mathcal{O}_X -modules associated to the object $R\Gamma(X, E)$ of $D(A)$,
- (3) restricted to $D_{QCoh}(\mathcal{O}_X)$ the functor RQ_X defines a quasi-inverse to (57.5.1.1).

Proof. Let $X_0 = \text{Spec}(A)$ be the affine scheme representing X . Recall that there is a morphism of ringed sites $\epsilon : X_{\acute{e}t\acute{a}l\acute{e}} \rightarrow X_{0,Zar}$ which induces equivalences

$$QCoh(\mathcal{O}_X) \begin{array}{c} \xrightarrow{\epsilon_*} \\ \xleftarrow{\epsilon^*} \end{array} QCoh(\mathcal{O}_{X_0}),$$

see Lemma 57.4.2. Hence we see that $Q_X = \epsilon^* \circ Q_{X_0} \circ \epsilon_*$ by uniqueness of adjoint functors. Hence (1) follows from the description of Q_{X_0} in Derived Categories of Schemes, Lemma 35.6.3 and the fact that $\Gamma(X_0, \epsilon_*\mathcal{F}) = \Gamma(X, \mathcal{F})$. Part (2) follows from (1) and the fact that the functor from A -modules to quasi-coherent \mathcal{O}_X -modules is exact. The third assertion now follows from the result for schemes (Derived Categories of Schemes, Lemma 35.6.3) and Lemma 57.4.2. □

Proposition 57.10.4. *Let S be a scheme. Let X be a quasi-compact algebraic space over S with affine diagonal. Then the functor (57.5.1.1)*

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

Proof. We first use the induction principle to prove i_X is fully faithful. Let $\mathcal{B} \subset \text{Ob}(X_{spaces,\acute{e}t\acute{a}l\acute{e}})$ be the set of objects which are quasi-compact and have affine diagonal. For $U \in \mathcal{B}$ let $P(U) =$ “the functor $i_U : D(QCoh(\mathcal{O}_U)) \rightarrow D_{QCoh}(\mathcal{O}_U)$ is fully faithful”. By Remark 57.8.5 conditions (1), (2), and (3)(a) of Lemma 57.8.4 hold and we are left with proving (3)(b) and (4). Condition (3)(b) holds by Lemma 57.10.3.

Let $(U \subset W, V \rightarrow W)$ be an elementary distinguished square with V affine. Assume that P holds for U, V , and $U \times_W V$. We have to show that P holds for W . We may replace X by W , i.e., we may assume $W = X$ (we do this just to simplify the notation).

Suppose that A, B are objects of $D(QCoh(\mathcal{O}_X))$. We want to show that

$$\mathrm{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B) \longrightarrow \mathrm{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B))$$

is bijective. Let $T = |X| \setminus |U|$.

Assume first $i_X(B)$ is supported on T . In this case the map

$$i_X(B) \rightarrow Rj_{V,*}(i_X(B)|_V) = Rj_{V,*}(i_V(B|_V))$$

is a quasi-isomorphism (Lemma 57.9.6). The morphism $V \rightarrow X$ is affine as V is affine and X has affine diagonal (Morphisms of Spaces, Lemma 49.20.11). Thus we have an object $j_{V,*}(B|_V)$ in $QCoh(\mathcal{O}_X)$ and an isomorphism $i_X(j_{V,*}(B|_V)) \rightarrow Rj_{V,*}(i_V(B|_V))$ in $D(\mathcal{O}_X)$ (Lemma 57.10.1). Moreover, $j_{V,*}$ and $-|_V$ are adjoint functors on the derived categories of quasi-coherent modules, see proof Lemma 57.10.2. The adjunction map $B \rightarrow j_{V,*}(B|_V)$ becomes an isomorphism after applying i_X , whence is an isomorphism in $D(QCoh(\mathcal{O}_X))$. Hence

$$\begin{aligned} \mathrm{Mor}_{D(QCoh(\mathcal{O}_X))}(A, B) &= \mathrm{Mor}_{D(QCoh(\mathcal{O}_X))}(A, j_{V,*}(B|_V)) \\ &= \mathrm{Mor}_{D(QCoh(\mathcal{O}_V))}(A|_V, B|_V) \\ &= \mathrm{Mor}_{D(\mathcal{O}_V)}(i_V(A|_V), i_V(B|_V)) \\ &= \mathrm{Mor}_{D(\mathcal{O}_X)}(i_X(A), Rj_{V,*}(i_V(B|_V))) \\ &= \mathrm{Mor}_{D(\mathcal{O}_X)}(i_X(A), i_X(B)) \end{aligned}$$

as desired.

In general, choose any complex \mathcal{B}^\bullet of quasi-coherent \mathcal{O}_X -modules representing B . Next, choose any quasi-isomorphism $s : \mathcal{B}^\bullet|_U \rightarrow \mathcal{C}^\bullet$ of complexes of quasi-coherent modules on U . As $j_U : U \rightarrow X$ is quasi-compact and quasi-separated the functor $j_{U,*}$ transforms quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 49.11.2). Thus there is a canonical map $\mathcal{B}^\bullet \rightarrow j_{U,*}(\mathcal{B}^\bullet|_U) \rightarrow j_{U,*}\mathcal{C}^\bullet$ of complexes of quasi-coherent modules on X . Set $B'' = j_{U,*}\mathcal{C}^\bullet$ in $D(QCoh(\mathcal{O}_X))$ and choose a distinguished triangle

$$B \rightarrow B'' \rightarrow B' \rightarrow B^\bullet[1]$$

in $D(QCoh(\mathcal{O}_X))$. Since the first arrow of the triangle restricts to an isomorphism over U we see that B' is supported on T . Hence in the diagram

$$\begin{array}{ccc} \mathrm{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B'[-1]) & \longrightarrow & \mathrm{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B')[-1]) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B) & \longrightarrow & \mathrm{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B)) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B'') & \longrightarrow & \mathrm{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B'')) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B') & \longrightarrow & \mathrm{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B')) \end{array}$$

we have exact columns and the top and bottom horizontal arrows are bijective. Finally, choose a complex \mathcal{A}^\bullet of quasi-coherent modules representing A .

Let $\alpha : i_X(A) \rightarrow i_X(B)$ be a morphism between in $D(\mathcal{O}_X)$. The restriction $\alpha|_U$ comes from a morphism in $D(QCoh(\mathcal{O}_U))$ by assumption. Hence there exists a choice of $s : \mathcal{B}^\bullet|_U \rightarrow \mathcal{C}^\bullet$ as above such that $\alpha|_U$ is represented by an actual map of complexes $\mathcal{A}^\bullet|_U \rightarrow \mathcal{C}^\bullet$. This corresponds to a map of complexes $\mathcal{A} \rightarrow j_{U,*}\mathcal{C}^\bullet$. In other words, the image of α in $\text{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B''))$ comes from an element of $\text{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B'')$. A diagram chase then shows that α comes from a morphism $A \rightarrow B$ in $D(QCoh(\mathcal{O}_X))$. Finally, suppose that $a : A \rightarrow B$ is a morphism of $D(QCoh(\mathcal{O}_X))$ which becomes zero in $D(\mathcal{O}_X)$. After choosing \mathcal{B}^\bullet suitably, we may assume a is represented by a morphism of complexes $a^\bullet : \mathcal{A}^\bullet \rightarrow \mathcal{B}^\bullet$. Since P holds for U the restriction $a^\bullet|_U$ is zero in $D(QCoh(\mathcal{O}_U))$. Thus we can choose s such that $s \circ a^\bullet|_U : \mathcal{A}^\bullet|_U \rightarrow \mathcal{C}^\bullet$ is homotopic to zero. Applying the functor $j_{U,*}$ we conclude that $\mathcal{A}^\bullet \rightarrow j_{U,*}\mathcal{C}^\bullet$ is homotopic to zero. Thus a maps to zero in $\text{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B'')$. Thus we may assume that a is the image of an element of $b \in \text{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B'[-1])$. The image of b in $\text{Hom}_{D(\mathcal{O}_X)}(i_X(A), i_X(B')[-1])$ comes from a $\gamma \in \text{Hom}_{D(\mathcal{O}_X)}(A, B''[-1])$ (as a maps to zero in the group on the right). Since we've seen above the horizontal arrows are surjective, we see that γ comes from a c in $\text{Hom}_{D(QCoh(\mathcal{O}_X))}(A, B''[-1])$ which implies $a = 0$ as desired.

Since i_X is fully faithful with right adjoint RQ_X we see that $RQ_X \circ i_X = \text{id}$ (Categories, Lemma 4.24.3). To finish the proof we show that for any E in $D_{QCoh}(\mathcal{O}_X)$ the map $i_X(RQ_X(E)) \rightarrow E$ is an isomorphism. Choose a distinguished triangle

$$i_X(RQ_X(E)) \rightarrow E \rightarrow E' \rightarrow i_X(RQ_X(E))[1]$$

in $D_{QCoh}(\mathcal{O}_X)$. A formal argument using the above shows that $i_X(RQ_X(E')) = 0$. Thus it suffices to prove that for $E \in D_{QCoh}(\mathcal{O}_X)$ the condition $i_X(RQ_X(E)) = 0$ implies that $E = 0$. Consider an étale morphism $j : V \rightarrow X$ with V affine. By Lemmas 57.10.3, 57.10.1, and 57.10.2 we have

$$Rj_*(E|_V) = Rj_*(i_V(RQ_V(E|_V))) = i_X(j_*(RQ_V(E|_V))) = i_X(RQ_X(Rj_*(E|_V)))$$

Choose a distinguished triangle

$$E \rightarrow Rj_*(E|_V) \rightarrow E' \rightarrow E[1]$$

Apply RQ_X to get a distinguished triangle

$$0 \rightarrow RQ_X(Rj_*(E|_V)) \rightarrow RQ_X(E') \rightarrow 0[1]$$

in other words the map in the middle is an isomorphism. Combined with the string of equalities above we find that our first distinguished triangle becomes a distinguished triangle

$$E \rightarrow i_X(RQ_X(E')) \rightarrow E' \rightarrow E[1]$$

where the middle morphism is the adjunction map. However, the composition $E \rightarrow E'$ is zero, hence $E \rightarrow i_X(RQ_X(E'))$ is zero by adjunction! Since this morphism is isomorphic to the morphism $E \rightarrow Rj_*(E|_V)$ adjoint to $\text{id} : E|_V \rightarrow E|_V$ we conclude that $E|_V$ is zero. Since this holds for all affine V étale over X we conclude E is zero as desired. \square

Remark 57.10.5. Analyzing the proof of Proposition 57.10.4 we see that we have shown the following. Let X be a quasi-compact and quasi-separated scheme. Suppose that for every étale morphism $j : V \rightarrow X$ with V affine the right derived functor

$$\Phi : D(QCoh(\mathcal{O}_U)) \rightarrow D(QCoh(\mathcal{O}_X))$$

of the left exact functor $j_* : QCoh(\mathcal{O}_V) \rightarrow QCoh(\mathcal{O}_X)$ fits into a commutative diagram

$$\begin{CD} D(QCoh(\mathcal{O}_V)) @>{i_V}>> D_{QCoh}(\mathcal{O}_V) \\ @V{\Phi}VV @VV{Rj_*}V \\ D(QCoh(\mathcal{O}_X)) @>{i_X}>> D_{QCoh}(\mathcal{O}_X) \end{CD}$$

Then the functor (57.5.1.1)

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

57.11. The coherator for Noetherian spaces

We need a little bit more about injective modules to treat the case of a Noetherian algebraic space.

Lemma 57.11.1. *Let S be a Noetherian affine scheme. Every injective object of $QCoh(\mathcal{O}_S)$ is a filtered colimit $\text{colim}_i \mathcal{F}_i$ of quasi-coherent sheaves of the form*

$$\mathcal{F}_i = (Z_i \rightarrow S)_* \mathcal{G}_i$$

where Z_i is the spectrum of an Artinian ring and \mathcal{G}_i is a coherent module on Z_i .

Proof. Let $S = \text{Spec}(A)$. Let \mathcal{J} be an injective object of $QCoh(\mathcal{O}_S)$. Since $QCoh(\mathcal{O}_S)$ is equivalent to the category of A -modules we see that \mathcal{J} is equal to \tilde{J} for some injective A -module J . By Dualizing Complexes, Proposition 43.5.9 we can write $J = \bigoplus E_\alpha$ with E_α indecomposable and therefore isomorphic to the injective hull of a residue field at a point. Thus (because finite disjoint unions of Artinian schemes are Artinian) we may assume that J is the injective hull of $\kappa(\mathfrak{p})$ for some prime \mathfrak{p} of A . Then $J = \bigcup J[\mathfrak{p}^n]$ where $J[\mathfrak{p}^n]$ is the injective hull of $\kappa(\mathfrak{p})$ over $A/\mathfrak{p}^n A_{\mathfrak{p}}$, see Dualizing Complexes, Lemma 43.7.3. Thus \tilde{J} is the colimit of the sheaves $(Z_n \rightarrow X)_* \mathcal{G}_n$ where $Z_n = \text{Spec}(A_{\mathfrak{p}}/\mathfrak{p}^n A_{\mathfrak{p}})$ and \mathcal{G}_n the coherent sheaf associated to the finite $A/\mathfrak{p}^n A_{\mathfrak{p}}$ -module $J[\mathfrak{p}^n]$. Finiteness follows from Dualizing Complexes, Lemma 43.6.1. \square

Lemma 57.11.2. *Let S be an affine scheme. Let X be a Noetherian algebraic space over S . Every injective object of $QCoh(\mathcal{O}_X)$ is a direct summand of a filtered colimit $\text{colim}_i \mathcal{F}_i$ of quasi-coherent sheaves of the form*

$$\mathcal{F}_i = (Z_i \rightarrow X)_* \mathcal{G}_i$$

where Z_i is the spectrum of an Artinian ring and \mathcal{G}_i is a coherent module on Z_i .

Proof. Choose an affine scheme U and a surjective étale morphism $j : U \rightarrow X$ (Properties of Spaces, Lemma 48.6.3). Then U is a Noetherian affine scheme. Choose an injective object \mathcal{J}' of $QCoh(\mathcal{O}_U)$ such that there exists an injection $\mathcal{J}|_U \rightarrow \mathcal{J}'$. Then

$$\mathcal{J} \rightarrow j_* \mathcal{J}'$$

is an injective morphism in $QCoh(\mathcal{O}_X)$, hence identifies \mathcal{J} as a direct summand of $j_* \mathcal{J}'$. Thus the result follows from the corresponding result for \mathcal{J}' proved in Lemma 57.11.1. \square

Lemma 57.11.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a flat, quasi-compact, and quasi-separated morphism of algebraic spaces over S . If \mathcal{J} is an injective object of $QCoh(\mathcal{O}_X)$, then $f_*\mathcal{J}$ is an injective object of $QCoh(\mathcal{O}_Y)$.*

Proof. Since f is quasi-compact and quasi-separated, the functor f_* transforms quasi-coherent sheaves into quasi-coherent sheaves (Morphisms of Spaces, Lemma 49.11.2). The functor f^* is a left adjoint to f_* which transforms injections into injections. Hence the result follows from Homology, Lemma 12.25.1 \square

Lemma 57.11.4. *Let S be a scheme. Let X be a Noetherian algebraic space over S . If \mathcal{J} is an injective object of $QCoh(\mathcal{O}_X)$, then*

- (1) $H^p(U, \mathcal{J}|_U) = 0$ for $p > 0$ and for every quasi-compact and quasi-separated algebraic space U étale over X ,
- (2) for any morphism $f : X \rightarrow Y$ of algebraic spaces over S with Y quasi-separated we have $R^p f_*\mathcal{J} = 0$ for $p > 0$.

Proof. Proof of (1). Write \mathcal{J} as a direct summand of $\text{colim } \mathcal{F}_i$ with $\mathcal{F}_i = (Z_i \rightarrow X)_*\mathcal{G}_i$ as in Lemma 57.11.2. It is clear that it suffices to prove the vanishing for $\text{colim } \mathcal{F}_i$. Since pullback commutes with colimits and since U is quasi-compact and quasi-separated, it suffices to prove $H^p(U, \mathcal{F}_i|_U) = 0$ for $p > 0$, see Cohomology of Spaces, Lemma 51.4.1. Observe that $Z_i \rightarrow X$ is an affine morphism, see Morphisms of Spaces, Lemma 49.20.12. Thus

$$\mathcal{F}_i|_U = (Z_i \times_X U \rightarrow U)_*\mathcal{G}'_i = R(Z_i \times_X U \rightarrow U)_*\mathcal{G}'_i$$

where \mathcal{G}'_i is the pullback of \mathcal{G}_i to $Z_i \times_X U$, see Cohomology of Spaces, Lemma 51.10.2. Since $Z_i \times_X U$ is affine we conclude that \mathcal{G}'_i has no higher cohomology on $Z_i \times_X U$. By the Leray spectral sequence we conclude the same thing is true for $\mathcal{F}_i|_U$ (Cohomology on Sites, Lemma 21.14.6).

Proof of (2). Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $V \rightarrow Y$ be an étale morphism with V affine. Then $V \times_Y X \rightarrow X$ is an étale morphism and $V \times_Y X$ is a quasi-compact and quasi-separated algebraic space étale over X (details omitted). Hence $H^p(V \times_Y X, \mathcal{J})$ is zero by part (1). Since $R^p f_*\mathcal{J}$ is the sheaf associated to the presheaf $V \mapsto H^p(V \times_Y X, \mathcal{J})$ the result is proved. \square

Lemma 57.11.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of Noetherian algebraic spaces over S . Then f_* on quasi-coherent sheaves has a right derived extension $\Phi : D(QCoh(\mathcal{O}_X)) \rightarrow D(QCoh(\mathcal{O}_Y))$ such that the diagram*

$$\begin{CD} D(QCoh(\mathcal{O}_X)) @>>> D_{QCoh}(\mathcal{O}_X) \\ @V \Phi VV @VV Rf_* V \\ D(QCoh(\mathcal{O}_Y)) @>>> D_{QCoh}(\mathcal{O}_Y) \end{CD}$$

commutes.

Proof. Since X and Y are Noetherian the morphism is quasi-compact and quasi-separated (see Morphisms of Spaces, Lemma 49.8.9). Thus f_* preserve quasi-coherence, see Morphisms of Spaces, Lemma 49.11.2. Next, Let K be an object of $D(QCoh(\mathcal{O}_X))$. Since $QCoh(\mathcal{O}_X)$ is a Grothendieck abelian category (Properties of Spaces, Proposition 48.30.2), we can represent K by a K-injective complex \mathcal{I}^\bullet such

that each \mathcal{I}^n is an injective object of $QCoh(\mathcal{O}_X)$, see Injectives, Theorem 19.12.6. Thus we see that the functor Φ is defined by setting

$$\Phi(K) = f_*\mathcal{I}^\bullet$$

where the right hand side is viewed as an object of $D(QCoh(\mathcal{O}_Y))$. To finish the proof of the lemma it suffices to show that the canonical map

$$f_*\mathcal{I}^\bullet \longrightarrow Rf_*\mathcal{I}^\bullet$$

is an isomorphism in $D(\mathcal{O}_Y)$. To see this it suffices to prove the map induces an isomorphism on cohomology sheaves. Pick any $m \in \mathbf{Z}$. Let $N = N(X, Y, f)$ be as in Lemma 57.6.1. Consider the short exact sequence

$$0 \rightarrow \sigma_{\geq m-N-1}\mathcal{I}^\bullet \rightarrow \mathcal{I}^\bullet \rightarrow \sigma_{\leq m-N-2}\mathcal{I}^\bullet \rightarrow 0$$

of complexes of quasi-coherent sheaves on X . By Lemma 57.6.1 we see that the cohomology sheaves of $Rf_*\sigma_{\leq m-N-2}\mathcal{I}^\bullet$ are zero in degrees $\geq m-1$. Thus we see that $R^m f_*\mathcal{I}^\bullet$ is isomorphic to $R^m f_*\sigma_{\geq m-N-1}\mathcal{I}^\bullet$. In other words, we may assume that \mathcal{I}^\bullet is a bounded below complex of injective objects of $QCoh(\mathcal{O}_X)$. This case follows from Leray’s acyclicity lemma (Derived Categories, Lemma 13.17.7) with required vanishing because of Lemma 57.11.4. \square

Proposition 57.11.6. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Then the functor (57.5.1.1)*

$$D(QCoh(\mathcal{O}_X)) \longrightarrow D_{QCoh}(\mathcal{O}_X)$$

is an equivalence with quasi-inverse given by RQ_X .

Proof. This follows using the exact same argument as in the proof of Proposition 57.10.4 using Lemma 57.11.5. See discussion in Remark 57.10.5. \square

57.12. Pseudo-coherent and perfect complexes

In this section we study the general notions defined in Cohomology on Sites, Sections 21.33, 21.34, 21.35, and 21.36 for the étale site of an algebraic space. In particular we match this with what happens for schemes.

First we compare the notion of a pseudo-coherent complex on a scheme and on its associated small étale site.

Lemma 57.12.1. *Let X be a scheme. Let \mathcal{F} be an \mathcal{O}_X -module. The following are equivalent*

- (1) \mathcal{F} is of finite type as an \mathcal{O}_X -module, and
- (2) $\epsilon^*\mathcal{F}$ is of finite type as an $\mathcal{O}_{\text{étale}}$ -module on the small étale site of X .

Here ϵ is as in (57.4.0.1).

Proof. The implication (1) \Rightarrow (2) is a general fact, see Modules on Sites, Lemma 18.23.4. Assume (2). By assumption there exists an étale covering $\{f_i : X_i \rightarrow X\}$ such that $\epsilon^*\mathcal{F}|_{(X_i)_{\text{étale}}}$ is generated by finitely many sections. Let $x \in X$. We will show that \mathcal{F} is generated by finitely many sections in a neighbourhood of x . Say x is in the image of $X_i \rightarrow X$ and denote $X' = X_i$. Let $s_1, \dots, s_n \in \Gamma(X', \epsilon^*\mathcal{F}|_{X'_{\text{étale}}})$ be generating sections. As $\epsilon^*\mathcal{F} = \epsilon^{-1}\mathcal{F} \otimes_{\epsilon^{-1}\mathcal{O}_X} \mathcal{O}_{\text{étale}}$ we can find an étale morphism $X'' \rightarrow X'$ such that x is in the image of $X'' \rightarrow X$ and such that $s_i|_{X''} = \sum s_{ij} \otimes a_{ij}$ for some sections $s_{ij} \in \epsilon^{-1}\mathcal{F}(X'')$ and $a_{ij} \in \mathcal{O}_{\text{étale}}(X'')$. Denote $U \subset X$ the image of $X'' \rightarrow X$. This is an open subscheme as $f'' : X'' \rightarrow X$ is étale (Morphisms,

Lemma 28.37.13). After possibly shrinking X'' more we may assume s_{ij} come from elements $t_{ij} \in \mathcal{F}(U)$ as follows from the construction of the inverse image functor ϵ^{-1} . Now we claim that t_{ij} generate $\mathcal{F}|_U$ which finishes the proof of the lemma. Namely, the corresponding map $\mathcal{O}_U^{\oplus N} \rightarrow \mathcal{F}|_U$ has the property that its pullback by f'' to X'' is surjective. Since $f'' : X'' \rightarrow U$ is a surjective flat morphism of schemes, this implies that $\mathcal{O}_U^{\oplus N} \rightarrow \mathcal{F}|_U$ is surjective by looking at stalks and using that $\mathcal{O}_{U, f''(z)} \rightarrow \mathcal{O}_{X'', z}$ is faithfully flat for all $z \in X''$. \square

In the situation above the morphism of sites ϵ is flat hence defines a pullback on complexes of modules.

Lemma 57.12.2. *Let X be a scheme. Let E be an object of $D(\mathcal{O}_X)$. The following are equivalent*

- (1) E is m -pseudo-coherent, and
- (2) ϵ^*E is m -pseudo-coherent on the small étale site of X .

Here ϵ is as in (57.4.0.1).

Proof. The implication (1) \Rightarrow (2) is a general fact, see Cohomology on Sites, Lemma 21.34.3. Assume ϵ^*E is m -pseudo-coherent. We will use without further mention that ϵ^* is an exact functor and that therefore

$$\epsilon^*H^i(E) = H^i(\epsilon^*E).$$

To show that E is m -pseudo-coherent we may work locally on X , hence we may assume that X is quasi-compact (for example affine). Since X is quasi-compact every étale covering $\{U_i \rightarrow X\}$ has a finite refinement. Thus we see that ϵ^*E is an object of $D^-(\mathcal{O}_{\text{étale}})$, see comments following Cohomology on Sites, Definition 21.34.1. By Lemma 57.4.1 it follows that E is an object of $D^-(\mathcal{O}_X)$.

Let $n \in \mathbf{Z}$ be the largest integer such that $H^n(E)$ is nonzero; then n is also the largest integer such that $H^n(\epsilon^*E)$ is nonzero. We will prove the lemma by induction on $n - m$. If $n < m$, then the lemma is clearly true. If $n \geq m$, then $H^n(\epsilon^*E)$ is a finite $\mathcal{O}_{\text{étale}}$ -module, see Cohomology on Sites, Lemma 21.34.7. Hence $H^n(E)$ is a finite \mathcal{O}_X -module, see Lemma 57.12.1. After replacing X by the members of an open covering, we may assume there exists a surjection $\mathcal{O}_X^{\oplus t} \rightarrow H^n(E)$. We may locally on X lift this to a map of complexes $\alpha : \mathcal{O}_X^{\oplus t}[-n] \rightarrow E$ (details omitted). Choose a distinguished triangle

$$\mathcal{O}_X^{\oplus t}[-n] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_X^{\oplus t}[-n+1]$$

Then C has vanishing cohomology in degrees $\geq n$. On the other hand, the complex ϵ^*C is m -pseudo-coherent, see Cohomology on Sites, Lemma 21.34.4. Hence by induction we see that C is m -pseudo-coherent. Applying Cohomology on Sites, Lemma 21.34.4 once more we conclude. \square

Lemma 57.12.3. *Let X be a scheme. Let E be an object of $D(\mathcal{O}_X)$. Then*

- (1) E has tor amplitude in $[a, b]$ if and only if ϵ^*E has tor amplitude in $[a, b]$.
- (2) E has finite tor dimension if and only if ϵ^*E has finite tor dimension.

Here ϵ is as in (57.4.0.1).

Proof. The easy implication follows from the general result contained in Cohomology on Sites, Lemma 21.35.4 (and the fact that the small étale site of X has enough points, see Étale Cohomology, Remarks 44.29.11). For the converse, assume that

ϵ^*E has tor amplitude in $[a, b]$ Let \mathcal{F} be an \mathcal{O}_X -module. As ϵ is a flat morphism of ringed sites (Lemma 57.4.1) we have

$$\epsilon^*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}) = \epsilon^*E \otimes_{\mathcal{O}_{\acute{e}tale}}^{\mathbf{L}} \epsilon^*\mathcal{F}$$

Thus the (assumed) vanishing of cohomology sheaves on the right hand side implies the desired vanishing of the cohomology sheaves of $E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}$ via Lemma 57.4.1. \square

Lemma 57.12.4. *Let X be a scheme. Let E be an object of $D(\mathcal{O}_X)$. Then E is a perfect object of $D(\mathcal{O}_X)$ if and only if ϵ^*E is a perfect object of $D(\mathcal{O}_{\acute{e}tale})$. Here ϵ is as in (57.4.0.1).*

Proof. The easy implication follows from the general result contained in Cohomology on Sites, Lemma 21.36.5 (and the fact that the small étale site of X has enough points, see Étale Cohomology, Remarks 44.29.11). For the converse, we can use the equivalence of Cohomology on Sites, Lemma 21.36.4 and the corresponding results for pseudo-coherent and complexes of finite tor dimension, namely Lemmas 57.12.2 and 57.12.3. Some details omitted. \square

Lemma 57.12.5. *Let S be a scheme. Let X be an algebraic space over S . If E is an m -pseudo-coherent object of $D(\mathcal{O}_X)$, then $H^i(E)$ is a quasi-coherent \mathcal{O}_X -module for $i > m$. If E is pseudo-coherent, then E is an object of $D_{QCoh}(\mathcal{O}_X)$.*

Proof. Locally $H^i(E)$ is isomorphic to $H^i(\mathcal{E}^\bullet)$ with \mathcal{E}^\bullet strictly perfect. The sheaves \mathcal{E}^i are direct summands of finite free modules, hence quasi-coherent. The lemma follows. \square

Lemma 57.12.6. *Let S be a scheme. Let X be a Noetherian algebraic space over S . Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. For $m \in \mathbf{Z}$ the following are equivalent*

- (1) $H^i(E)$ is coherent for $i \geq m$ and zero for $i \gg 0$, and
- (2) E is m -pseudo-coherent.

In particular, E is pseudo-coherent if and only if E is an object of $D_{Coh}^-(\mathcal{O}_X)$.

Proof. As X is quasi-compact we can find an affine scheme U and a surjective étale morphism $U \rightarrow X$ (Properties of Spaces, Lemma 48.6.3). Observe that U is Noetherian. Note that E is m -pseudo-coherent if and only if $E|_U$ is m -pseudo-coherent (follows from the definition or from Cohomology on Sites, Lemma 21.34.2). Similarly, $H^i(E)$ is coherent if and only if $H^i(E)|_U = H^i(E|_U)$ is coherent (see Cohomology of Spaces, Lemma 51.11.2). Thus we may assume that X is representable.

If X is representable by a scheme X_0 then (Lemma 57.4.2) we can write $E = \epsilon^*E_0$ where E_0 is an object of $D_{QCoh}(\mathcal{O}_{X_0})$ and $\epsilon : X_{\acute{e}tale} \rightarrow (X_0)_{Zar}$ is as in (57.4.0.1). In this case E is m -pseudo-coherent if and only if E_0 is by Lemma 57.12.2. Similarly, $H^i(E_0)$ is of finite type (i.e., coherent) if and only if $H^i(E)$ is by Lemma 57.12.1. Finally, $H^i(E_0) = 0$ if and only if $H^i(E) = 0$ by Lemma 57.4.1. Thus we reduce to the case of schemes which is Derived Categories of Schemes, Lemma 35.9.4. \square

Lemma 57.12.7. *Let S be a scheme. Let X be a quasi-separated algebraic space over S . Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Let $a \leq b$. The following are equivalent*

- (1) E has tor amplitude in $[a, b]$, and
- (2) for all \mathcal{F} in $QCoh(\mathcal{O}_X)$ we have $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{F}) = 0$ for $i \notin [a, b]$.

Proof. It is clear that (1) implies (2). Assume (2). Let $j : U \rightarrow X$ be an étale morphism with U affine. As X is quasi-separated $j : U \rightarrow X$ is quasi-compact and separated, hence j_* transforms quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 49.11.2). Thus the functor $QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_U)$ is essentially surjective. It follows that condition (2) implies the vanishing of $H^i(E|_U \otimes_{\mathcal{O}_U}^{\mathbf{L}} \mathcal{G})$ for $i \notin [a, b]$ for all quasi-coherent \mathcal{O}_U -modules \mathcal{G} . Since it suffices to prove that $E|_U$ has tor amplitude in $[a, b]$ we reduce to the case where X is representable.

If X is representable by a scheme X_0 then (Lemma 57.4.2) we can write $E = \epsilon^* E_0$ where E_0 is an object of $D_{QCoh}(\mathcal{O}_{X_0})$ and $\epsilon : X_{\text{étale}} \rightarrow (X_0)_{\text{Zar}}$ is as in (57.4.0.1). For every quasi-coherent module \mathcal{F}_0 on X_0 the module $\epsilon^* \mathcal{F}_0$ is quasi-coherent on X and

$$H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \epsilon^* \mathcal{F}_0) = \epsilon^* H^i(E_0 \otimes_{\mathcal{O}_{X_0}}^{\mathbf{L}} \mathcal{F}_0)$$

as ϵ is flat (Lemma 57.4.1). Moreover, the vanishing of these sheaves for $i \notin [a, b]$ implies the same thing for $H^i(E_0 \otimes_{\mathcal{O}_{X_0}}^{\mathbf{L}} \mathcal{F}_0)$ by the same lemma. Thus we've reduced the problem to the case of schemes which is treated in Derived Categories of Schemes, Lemma 35.9.6. \square

Lemma 57.12.8. *Let X be a scheme. Let E, F be objects of $D(\mathcal{O}_X)$. Assume either*

- (1) *E is pseudo-coherent and F lies in $D^+(\mathcal{O}_X)$, or*
- (2) *E is perfect and F arbitrary,*

then there is a canonical isomorphism

$$\epsilon^* R\mathcal{H}om(E, F) \longrightarrow R\mathcal{H}om(\epsilon^* E, \epsilon^* F)$$

Here ϵ is as in (57.4.0.1).

Proof. Recall that ϵ is flat (Lemma 57.4.1) and hence $\epsilon^* = L\epsilon^*$. There is a canonical map from left to right by Cohomology on Sites, Remark 21.26.9. To see this is an isomorphism we can work locally, i.e., we may assume X is an affine scheme.

In case (1) we can represent E by a bounded above complex \mathcal{E}^\bullet of finite free \mathcal{O}_X -modules, see Derived Categories of Schemes, Lemma 35.11.2. We may also represent F by a bounded below complex \mathcal{F}^\bullet of \mathcal{O}_X -modules. Applying Cohomology, Lemma 20.35.10 we see that $R\mathcal{H}om(E, F)$ is represented by the complex with terms

$$\bigoplus_{n=-p+q} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}^p, \mathcal{F}^q)$$

Applying Cohomology on Sites, Lemma 21.33.10 we see that $R\mathcal{H}om(\epsilon^* E, \epsilon^* F)$ is represented by the complex with terms

$$\bigoplus_{n=-p+q} \mathcal{H}om_{\mathcal{O}_{\text{étale}}}(\epsilon^* \mathcal{E}^p, \epsilon^* \mathcal{F}^q)$$

Thus the statement of the lemma boils down to the true fact that the canonical map

$$\epsilon^* \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \longrightarrow \mathcal{H}om_{\mathcal{O}_{\text{étale}}}(\epsilon^* \mathcal{E}, \epsilon^* \mathcal{F})$$

is an isomorphism for any \mathcal{O}_X -module \mathcal{F} and finite free \mathcal{O}_X -module \mathcal{E} .

In case (2) we can represent E by a strictly perfect complex \mathcal{E}^\bullet of \mathcal{O}_X -modules, use Derived Categories of Schemes, Lemmas 35.3.4 and 35.9.7 and the fact that a

perfect complex of modules is represented by a finite complex of finite projective modules. Thus we can do the exact same proof as above, replacing the reference to Cohomology, Lemma 20.35.10 by a reference to Cohomology, Lemma 20.35.9. \square

Lemma 57.12.9. *Let S be a scheme. Let X be an algebraic space over S . Let L, K be objects of $D(\mathcal{O}_X)$. If either*

- (1) L in $D_{QCoh}^+(\mathcal{O}_X)$ and K is pseudo-coherent,
- (2) L in $D_{QCoh}(\mathcal{O}_X)$ and K is perfect,

then $R\mathcal{H}om(K, L)$ is in $D_{QCoh}(\mathcal{O}_X)$.

Proof. This follows from the analogue for schemes (Derived Categories of Schemes, Lemma 35.9.8) via the criterion of Lemma 57.5.2, the criterion of Lemmas 57.12.2 and 57.12.4, and the result of Lemma 57.12.8. \square

57.13. Approximation by perfect complexes

In this section we continue the discussion started in Derived Categories of Schemes, Section 35.12.

Definition 57.13.1. Let S be a scheme. Let X be an algebraic space over S . Consider triples (T, E, m) where

- (1) $T \subset |X|$ is a closed subset,
- (2) E is an object of $D_{QCoh}(\mathcal{O}_X)$, and
- (3) $m \in \mathbf{Z}$.

We say *approximation holds for the triple (T, E, m)* if there exists a perfect object P of $D(\mathcal{O}_X)$ supported on T and a map $\alpha : P \rightarrow E$ which induces isomorphisms $H^i(P) \rightarrow H^i(E)$ for $i > m$ and a surjection $H^m(P) \rightarrow H^m(E)$.

Approximation cannot hold for every triple. Please read the remarks following Derived Categories of Schemes, Definition 35.12.1 to see why.

Definition 57.13.2. Let S be a scheme. Let X be an algebraic space over S . We say *approximation by perfect complexes holds on X* if for any closed subset $T \subset |X|$ such that the morphism $X \setminus T \rightarrow X$ is quasi-compact there exists an integer r such that for every triple (T, E, m) as in Definition 57.13.1 with

- (1) E is $(m - r)$ -pseudo-coherent, and
- (2) $H^i(E)$ is supported on T for $i \geq m - r$

approximation holds.

Lemma 57.13.3. *Let S be a scheme. Let $(U \subset X, j : V \rightarrow X)$ be an elementary distinguished square of algebraic space over S . Let E be a perfect object of $D(\mathcal{O}_V)$ supported on $j^{-1}(T)$ where $T = |X| \setminus |U|$. Then Rj_*E is a perfect object of $D(\mathcal{O}_X)$.*

Proof. Being perfect is local on $X_{\acute{e}tale}$. Thus it suffices to check that Rj_*E is perfect when restricted to U and V . We have $Rj_*E|_V = E$ by Lemma 57.9.6 which is perfect. We have $Rj_*E|_U = 0$ because $E|_{V \setminus j^{-1}(T)} = 0$ (use Lemma 57.3.1). \square

Lemma 57.13.4. *Let S be a scheme. Let $(U \subset X, j : V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S . Let T be a closed subset of $|X| \setminus |U|$ and let (T, E, m) be a triple as in Definition 57.13.1. If*

- (1) *approximation holds for $(j^{-1}T, E|_V, m)$, and*
- (2) *the sheaves $H^i(E)$ for $i \geq m$ are supported on T ,*

then approximation holds for (T, E, m) .

Proof. Let $P \rightarrow E|_V$ be an approximation of the triple $(j^{-1}T, E|_V, m)$ over V . Then Rj_*P is a perfect object of $D(\mathcal{O}_X)$ by Lemma 57.13.3. On the other hand, $Rj_*P = j_!P$ by Lemma 57.9.6. We see that $j_!P$ is supported on T for example by (57.9.0.2). Hence we obtain an approximation $Rj_*P = j_!P \rightarrow j_!(E|_V) \rightarrow E$. \square

Lemma 57.13.5. *Let S be a scheme. Let X be an algebraic space over S which is representable by an affine scheme. Then approximation holds for every triple (T, E, m) as in Definition 57.13.1 such that there exists an integer $r \geq 0$ with*

- (1) E is m -pseudo-coherent,
- (2) $H^i(E)$ is supported on T for $i \geq m - r + 1$,
- (3) $X \setminus T$ is the union of r affine opens.

In particular, approximation by perfect complexes holds for affine schemes.

Proof. Let X_0 be an affine scheme representing X . Let $T_0 \subset X_0$ be the closed subset corresponding to T . Let $\epsilon : X_{\text{étale}} \rightarrow X_{0, \text{zar}}$ be the morphism (57.4.0.1). We may write $E = \epsilon^*E_0$ for some object E_0 of $D_{Q\text{Coh}}(\mathcal{O}_{X_0})$, see Lemma 57.4.2. Then E_0 is m -pseudo-coherent, see Lemma 57.12.2. Comparing stalks of cohomology sheaves (see proof of Lemma 57.4.1) we see that $H^i(E_0)$ is supported on T_0 for $i \geq m - r + 1$. By Derived Categories of Schemes, Lemma 35.12.4 there exists an approximation $P_0 \rightarrow E_0$ of (T_0, E_0, m) . By Lemma 57.12.4 we see that $P = \epsilon^*P_0$ is a perfect object of $D(\mathcal{O}_X)$. Pulling back we obtain an approximation $P = \epsilon^*P_0 \rightarrow \epsilon^*E_0 = E$ as desired. \square

Lemma 57.13.6. *Let S be a scheme. Let $(U \subset X, j : V \rightarrow X)$ be an elementary distinguished square of algebraic spaces over S . Assume U quasi-compact, V affine, and $U \times_X V$ quasi-compact. If approximation by perfect complexes holds on U , then approximation by perfect complexes holds on X .*

Proof. Let $T \subset |X|$ be a closed subset with $X \setminus T \rightarrow X$ quasi-compact. Let r_U be the integer of Definition 57.13.2 adapted to the pair $(U, T \cap |U|)$. Set $T' = T \setminus |U|$. Endow T' with the induced reduced subspace structure. Since $|T'|$ is contained in $|X| \setminus |U|$ we see that $j^{-1}(T') \rightarrow T'$ is an isomorphism. Moreover, $V \setminus j^{-1}(T')$ is quasi-compact as it is the fibre product of $U \times_X V$ with $X \setminus T$ over X and we've assumed $U \times_X V$ quasi-compact and $X \setminus T \rightarrow X$ quasi-compact. Let r' be the number of affines needed to cover $V \setminus j^{-1}(T')$. We claim that $r = \max(r_U, r')$ works for the pair (X, T) .

To see this choose a triple (T, E, m) such that E is $(m - r)$ -pseudo-coherent and $H^i(E)$ is supported on T for $i \geq m - r$. Let t be the largest integer such that $H^t(E)|_U$ is nonzero. (Such an integer exists as U is quasi-compact and $E|_U$ is $(m - r)$ -pseudo-coherent.) We will prove that E can be approximated by induction on t .

Base case: $t \leq m - r'$. This means that $H^i(E)$ is supported on T' for $i \geq m - r'$. Hence Lemma 57.13.5 guarantees the existence of an approximation $P \rightarrow E|_V$ of $(T', E|_V, m)$ on V . Applying Lemma 57.13.4 we see that (T', E, m) can be approximated. Such an approximation is also an approximation of (T, E, m) .

Induction step. Choose an approximation $P \rightarrow E|_U$ of $(T \cap |U|, E|_U, m)$. This in particular gives a surjection $H^t(P) \rightarrow H^t(E|_U)$. In the rest of the proof we will use the equivalence of Lemma 57.4.2 (and the compatibilities of Remark 57.6.3) for

the representable algebraic spaces V and $U \times_X V$. We will also use the fact that $(m - r)$ -pseudo-coherence, resp. perfectness on the Zariski site and étale site agree, see Lemmas 57.12.2 and 57.12.4. Thus we can use the results of Derived Categories of Schemes, Section 35.11 for the open immersion $U \times_X V \subset V$. In this way Derived Categories of Schemes, Lemma 35.11.8 implies there exists a perfect object Q in $D(\mathcal{O}_V)$ supported on $j^{-1}(T)$ and an isomorphism $Q|_{U \times_X V} \rightarrow (P \oplus P[1])|_{U \times_X V}$. By Derived Categories of Schemes, Lemma 35.11.5 we can replace Q by $Q \otimes^L I$ and assume that the map

$$Q|_{U \times_X V} \rightarrow (P \oplus P[1])|_{U \times_X V} \rightarrow P|_{U \times_X V} \rightarrow E|_{U \times_X V}$$

lifts to $Q \rightarrow E|_V$. By Lemma 57.9.7 we find an morphism $a : R \rightarrow E$ of $D(\mathcal{O}_X)$ such that $a|_U$ is isomorphic to $P \oplus P[1] \rightarrow E|_U$ and $a|_V$ isomorphic to $Q \rightarrow E|_V$. Thus R is perfect and supported on T and the map $H^t(R) \rightarrow H^t(E)$ is surjective on restriction to U . Choose a distinguished triangle

$$R \rightarrow E \rightarrow E' \rightarrow R[1]$$

Then E' is $(m - r)$ -pseudo-coherent (Cohomology on Sites, Lemma 21.34.4), $H^i(E')|_U = 0$ for $i \geq t$, and $H^i(E')$ is supported on T for $i \geq m - r$. By induction we find an approximation $R' \rightarrow E'$ of (T, E', m) . Fit the composition $R' \rightarrow E' \rightarrow R[1]$ into a distinguished triangle $R \rightarrow R'' \rightarrow R' \rightarrow R[1]$ and extend the morphisms $R' \rightarrow E'$ and $R[1] \rightarrow R[1]$ into a morphism of distinguished triangles

$$\begin{array}{ccccccc} R & \longrightarrow & R'' & \longrightarrow & R' & \longrightarrow & R[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ R & \longrightarrow & E & \longrightarrow & E' & \longrightarrow & R[1] \end{array}$$

using TR3. Then R'' is a perfect complex (Cohomology on Sites, Lemma 21.36.6) supported on T . An easy diagram chase shows that $R'' \rightarrow E$ is the desired approximation. □

Theorem 57.13.7. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Then approximation by perfect complexes holds on X .*

Proof. This follows from the induction principle of Lemma 57.8.3 and Lemmas 57.13.6 and 57.13.5. □

57.14. Generating derived categories

This section is the analogue of Derived Categories of Schemes, Section 35.13. However, we first prove the following lemma which is the analogue of Derived Categories of Schemes, Lemma 35.11.9.

Lemma 57.14.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $W \subset X$ be a quasi-compact open. Let $T \subset |X|$ be a closed subset such that $X \setminus T \rightarrow X$ is a quasi-compact morphism. Let E be an object of $D_{QCoh}(\mathcal{O}_X)$. Let $\alpha : P \rightarrow E|_W$ be a map where P is a perfect object of $D(\mathcal{O}_W)$ supported on $T \cap W$. Then there exists a map $\beta : R \rightarrow E$ where R is a perfect object of $D(\mathcal{O}_X)$ supported on T such that P is a direct summand of $R|_W$ in $D(\mathcal{O}_W)$ compatible α and $\beta|_W$.*

Proof. We will use the induction principle of Lemma 57.8.6 to prove this. Thus we immediately reduce to the case where we have an elementary distinguished square $(W \subset X, f : V \rightarrow X)$ with V affine and $P \rightarrow E|_W$ as in the statement of the lemma. In the rest of the proof we will use Lemma 57.4.2 (and the compatibilities of Remark 57.6.3) for the representable algebraic spaces V and $W \times_X V$. We will also use the fact that perfectness on the Zariski site and étale site agree, see Lemma 57.12.4.

By Derived Categories of Schemes, Lemma 35.11.8 we can choose a perfect object Q in $D(\mathcal{O}_V)$ supported on $f^{-1}T$ and an isomorphism $Q|_{W \times_X V} \rightarrow (P \oplus P[1])|_{W \times_X V}$. By Derived Categories of Schemes, Lemma 35.11.5 we can replace Q by $Q \otimes^{\mathbf{L}} I$ (still supported on $f^{-1}T$) and assume that the map

$$Q|_{W \times_X V} \rightarrow (P \oplus P[1])|_{W \times_X V} \longrightarrow P|_{W \times_X V} \longrightarrow E|_{W \times_X V}$$

lifts to $Q \rightarrow E|_V$. By Lemma 57.9.7 we find an morphism $a : R \rightarrow E$ of $D(\mathcal{O}_X)$ such that $a|_W$ is isomorphic to $P \oplus P[1] \rightarrow E|_W$ and $a|_V$ isomorphic to $Q \rightarrow E|_V$. Thus R is perfect and supported on T as desired. \square

Remark 57.14.2. The proof of Lemma 57.14.1 shows that

$$R|_W = P \oplus P^{\oplus n_1}[1] \oplus \dots \oplus P^{\oplus n_m}[m]$$

for some $m \geq 0$ and $n_j \geq 0$. Thus the highest degree cohomology sheaf of $R|_W$ equals that of P . By repeating the construction for the map $P^{\oplus n_1}[1] \oplus \dots \oplus P^{\oplus n_m}[m] \rightarrow R|_W$, taking cones, and using induction we can achieve equality of cohomology sheaves of $R|_W$ and P above any given degree.

Lemma 57.14.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let W be a quasi-compact open subspace of X . Let P be a perfect object of $D(\mathcal{O}_W)$. Then P is a direct summand of the restriction of a perfect object of $D(\mathcal{O}_X)$.*

Proof. Special case of Lemma 57.14.1. \square

Theorem 57.14.4. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . The category $D_{QCoh}(\mathcal{O}_X)$ can be generated by a single perfect object. More precisely, there exists a perfect object P of $D(\mathcal{O}_X)$ such that for $E \in D_{QCoh}(\mathcal{O}_X)$ the following are equivalent*

- (1) $E = 0$, and
- (2) $\mathrm{Hom}_{D(\mathcal{O}_X)}(P[n], E) = 0$ for all $n \in \mathbf{Z}$.

Proof. We will prove this using the induction principle of Lemma 57.8.3

If X is affine, then \mathcal{O}_X is a perfect generator. This follows from Lemma 57.4.2 and Derived Categories of Schemes, Lemma 35.3.4.

Assume that $(U \subset X, f : V \rightarrow X)$ is an elementary distinguished square with U quasi-compact such that the theorem holds for U and V is an affine scheme. Let P be a perfect object of $D(\mathcal{O}_U)$ which is a generator for $D_{QCoh}(\mathcal{O}_U)$. Using Lemma 57.14.3 we may choose a perfect object Q of $D(\mathcal{O}_X)$ whose restriction to U is a direct sum one of whose summands is P . Say $V = \mathrm{Spec}(A)$. Let $Z \subset V$ be the reduced closed subscheme which is the inverse image of $X \setminus U$ and maps isomorphically to it (see Definition 57.8.1). This is a retrocompact closed subset of V . Choose $f_1, \dots, f_r \in A$ such that $Z = V(f_1, \dots, f_r)$. Let $K \in D(\mathcal{O}_V)$ be

the perfect object corresponding to the Koszul complex on f_1, \dots, f_r over A . Note that since K is supported on Z , the pushforward $K' = Rf_*K$ is a perfect object of $D(\mathcal{O}_X)$ whose restriction to V is K (see Lemmas 57.13.3 and 57.9.6). We claim that $Q \oplus K'$ is a generator for $D_{QCoh}(\mathcal{O}_X)$.

Let E be an object of $D_{QCoh}(\mathcal{O}_X)$ such that there are no nontrivial maps from any shift of $Q \oplus K'$ into E . By Lemma 57.9.6 we have $K' = f_!K$ and hence

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(K'[n], E) = \mathrm{Hom}_{D(\mathcal{O}_V)}(K[n], E|_V)$$

Thus by Derived Categories of Schemes, Lemma 35.13.2 (using also Lemma 57.4.2) the vanishing of these groups implies that $E|_V$ is isomorphic to $R(U \times_X V \rightarrow V)_*E|_{U \times_X V}$. This implies that $E = R(U \rightarrow X)_*E|_U$ (small detail omitted). If this is the case then

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(Q[n], E) = \mathrm{Hom}_{D(\mathcal{O}_U)}(Q|_U[n], E|_U)$$

which contains $\mathrm{Hom}_{D(\mathcal{O}_U)}(P[n], E|_U)$ as a direct summand. Thus by our choice of P the vanishing of these groups implies that $E|_U$ is zero. Whence E is zero. \square

The following result is an strengthening of Theorem 57.14.4 proved using exactly the same methods. Let $T \subset |X|$ be a closed subset where X is an algebraic space. Let's denote $D_T(\mathcal{O}_X)$ the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on T .

Lemma 57.14.5. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $T \subset |X|$ be a closed subset such that $|X| \setminus T$ is quasi-compact. With notation as above, the category $D_{QCoh,T}(\mathcal{O}_X)$ is generated by a single perfect object.*

Proof. We will prove this using the induction principle of Lemma 57.8.3. The property is true for representable quasi-compact and quasi-separated objects of the site $X_{spaces, \acute{e}tale}$ by Derived Categories of Schemes, Lemma 35.13.5.

Assume that $(U \subset X, f : V \rightarrow X)$ is an elementary distinguished square such that the lemma holds for U and V is affine. To finish the proof we have to show that the result holds for X . Let P be a perfect object of $D(\mathcal{O}_U)$ supported on $T \cap U$ which is a generator for $D_{QCoh,T \cap U}(\mathcal{O}_U)$. Using Lemma 57.14.1 we may choose a perfect object Q of $D(\mathcal{O}_X)$ supported on T whose restriction to U is a direct sum one of whose summands is P . Write $V = \mathrm{Spec}(B)$. Let $Z = X \setminus U$. Then $f^{-1}Z$ is a closed subset of V such that $V \setminus f^{-1}Z$ is quasi-compact. As X is quasi-separated, it follows that $f^{-1}Z \cap f^{-1}T = f^{-1}(Z \cap T)$ is a closed subset of V such that $W = V \setminus f^{-1}(Z \cap T)$ is quasi-compact. Thus we can choose $g_1, \dots, g_s \in B$ such that $f^{-1}(Z \cap T) = V(g_1, \dots, g_r)$. Let $K \in D(\mathcal{O}_V)$ be the perfect object corresponding to the Koszul complex on g_1, \dots, g_s over B . Note that since K is supported on $f^{-1}(Z \cap T) \subset V$ closed, the pushforward $K' = R(V \rightarrow X)_*K$ is a perfect object of $D(\mathcal{O}_X)$ whose restriction to V is K (see Lemmas 57.13.3 and 57.9.6). We claim that $Q \oplus K'$ is a generator for $D_{QCoh,T}(\mathcal{O}_X)$.

Let E be an object of $D_{QCoh,T}(\mathcal{O}_X)$ such that there are no nontrivial maps from any shift of $Q \oplus K'$ into E . By Lemma 57.9.6 we have $K' = R(V \rightarrow X)_!K$ and hence

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(K'[n], E) = \mathrm{Hom}_{D(\mathcal{O}_V)}(K[n], E|_V)$$

Thus by Derived Categories of Schemes, Lemma 35.13.2 we have $E|_V = Rj_*E|_W$ where $j : W \rightarrow V$ is the inclusion. Picture

$$\begin{array}{ccccc}
 W & \xrightarrow{\quad} & V & \xleftarrow{\quad} & Z \cap T \\
 \uparrow j' & \nearrow j'' & & \nwarrow & \downarrow \\
 V \setminus f^{-1}Z & & & & Z
 \end{array}$$

Since E is supported on T we see that $E|_W$ is supported on $f^{-1}T \cap W = f^{-1}T \cap (V \setminus f^{-1}Z)$ which is closed in W . We conclude that

$$E|_V = Rj_*(E|_W) = Rj_*(Rj'_*(E|_{U \cap V})) = Rj''_*(E|_{U \cap V})$$

Here the second equality is part (1) of Cohomology, Lemma 20.30.9 which applies because V is a scheme and E has quasi-coherent cohomology sheaves hence push-forward along the quasi-compact open immersion j' agrees with pushforward on the underlying schemes, see Remark 57.6.3. This implies that $E = R(U \rightarrow X)_*E|_U$ (small detail omitted). If this is the case then

$$\mathrm{Hom}_{D(\mathcal{O}_X)}(Q[n], E) = \mathrm{Hom}_{D(\mathcal{O}_U)}(Q|_U[n], E|_U)$$

which contains $\mathrm{Hom}_{D(\mathcal{O}_U)}(P[n], E|_U)$ as a direct summand. Thus by our choice of P the vanishing of these groups implies that $E|_U$ is zero. Whence E is zero. \square

57.15. Compact and perfect objects

This section is the analogue of Derived Categories of Schemes, Section 35.14.

Proposition 57.15.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . An object of $D_{QCoh}(\mathcal{O}_X)$ is compact if and only if it is perfect.*

Proof. By Cohomology on Sites, Lemma 21.39.1 the perfect objects even define compact objects of $D(\mathcal{O}_X)$. Conversely, let K be a compact object of $D_{QCoh}(\mathcal{O}_X)$. To show that K is perfect, it suffices to show that $K|_U$ is perfect for every affine scheme U étale over X , see Cohomology on Sites, Lemma 21.36.2. Observe that $j : U \rightarrow X$ is a quasi-compact and separated morphism. Hence $Rj_* : D_{QCoh}(\mathcal{O}_U) \rightarrow D_{QCoh}(\mathcal{O}_X)$ commutes with direct sums, see Lemma 57.6.2. Thus the adjointness of restriction to U and Rj_* implies that $K|_U$ is a perfect object of $D_{QCoh}(\mathcal{O}_U)$. Hence we reduce to the case that X is affine, in particular a quasi-compact and quasi-separated scheme. Via Lemma 57.4.2 and 57.12.4 we reduce to the case of schemes, i.e., to Derived Categories of Schemes, Proposition 35.14.1. \square

The following result is a strengthening of Proposition 57.15.1. Let $T \subset |X|$ be a closed subset where X is an algebraic space. As before $D_T(\mathcal{O}_X)$ denotes the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on T . Since taking direct sums commutes with taking cohomology sheaves, it follows that $D_T(\mathcal{O}_X)$ has direct sums and that they are equal to direct sums in $D(\mathcal{O}_X)$.

Lemma 57.15.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $T \subset |X|$ be a closed subset such that $|X| \setminus T$ is quasi-compact. An object of $D_{QCoh,T}(\mathcal{O}_X)$ is compact if and only if it is perfect as an object of $D(\mathcal{O}_X)$.*

Proof. We observe that $D_{QCoh,T}(\mathcal{O}_X)$ is a triangulated category with direct sums by the remark preceding the lemma. By Cohomology on Sites, Lemma 21.39.1 the perfect objects define compact objects of $D(\mathcal{O}_X)$ hence a fortiori of any subcategory preserved under taking direct sums. For the converse we will use there exists a generator $E \in D_{QCoh,T}(\mathcal{O}_X)$ which is a perfect complex of \mathcal{O}_X -modules, see Lemma 57.14.5. Hence by the above, E is compact. Then it follows from Derived Categories, Proposition 13.34.6 that E is a classical generator of the full subcategory of compact objects of $D_{QCoh,T}(\mathcal{O}_X)$. Thus any compact object can be constructed out of E by a finite sequence of operations consisting of (a) taking shifts, (b) taking finite direct sums, (c) taking cones, and (d) taking direct summands. Each of these operations preserves the property of being perfect and the result follows. \square

The following lemma is an application of the ideas that go into the proof of the preceding lemma.

Lemma 57.15.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $T \subset |X|$ be a closed subset such that the complement $U \subset X$ is quasi-compact. Let $\alpha : P \rightarrow E$ be a morphism of $D_{QCoh}(\mathcal{O}_X)$ with either*

- (1) P is perfect and E supported on T , or
- (2) P pseudo-coherent, E supported on T , and E bounded below.

Then there exists a perfect complex of \mathcal{O}_X -modules I and a map $I \rightarrow \mathcal{O}_X[0]$ such that $I \otimes^{\mathbf{L}} P \rightarrow E$ is zero and such that $I|_U \rightarrow \mathcal{O}_U[0]$ is an isomorphism.

Proof. Set $\mathcal{D} = D_{QCoh,T}(\mathcal{O}_X)$. In both cases the complex $K = R\mathcal{H}om(P, E)$ is an object of \mathcal{D} . See Lemma 57.12.9 for quasi-coherence. It is clear that K is supported on T as formation of $R\mathcal{H}om$ commutes with restriction to opens. The map α defines an element of $H^0(K) = \text{Hom}_{D(\mathcal{O}_X)}(\mathcal{O}_X[0], K)$. Then it suffices to prove the result for the map $\alpha : \mathcal{O}_X[0] \rightarrow K$.

Let $E \in \mathcal{D}$ be a perfect generator, see Lemma 57.14.5. Write

$$K = \text{hocolim} K_n$$

as in Derived Categories, Lemma 13.34.3 using the generator E . Since the functor $\mathcal{D} \rightarrow D(\mathcal{O}_X)$ commutes with direct sums, we see that $K = \text{hocolim} K_n$ also in $D(\mathcal{O}_X)$. Since \mathcal{O}_X is a compact object of $D(\mathcal{O}_X)$ we find an n and a morphism $\alpha_n : \mathcal{O}_X \rightarrow K_n$ which gives rise to α . By Derived Categories, Lemma 13.34.4 applied to the morphism $\mathcal{O}_X[0] \rightarrow K_n$ in the ambient category $D(\mathcal{O}_X)$ we see that α_n factors as $\mathcal{O}_X[0] \rightarrow Q \rightarrow K_n$ where Q is an object of $\langle E \rangle$. We conclude that Q is a perfect complex supported on T .

Choose a distinguished triangle

$$I \rightarrow \mathcal{O}_X[0] \rightarrow Q \rightarrow I[1]$$

By construction I is perfect, the map $I \rightarrow \mathcal{O}_X[0]$ restricts to an isomorphism over U , and the composition $I \rightarrow K$ is zero as α factors through Q . This proves the lemma. \square

57.16. Derived categories as module categories

The section is the analogue of Derived Categories of Schemes, Section 35.15.

Lemma 57.16.1. *Let S be a scheme. Let X be an algebraic space over S . Let K^\bullet be a complex of \mathcal{O}_X -modules whose cohomology sheaves are quasi-coherent. Let $(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, K^\bullet)$ be the endomorphism differential graded algebra. Then the functor*

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O}_X)$$

of Differential Graded Algebra, Lemma 22.25.3 has image contained in $D_{QCoh}(\mathcal{O}_X)$.

Proof. Let P be a differential graded E -module with property P . Let F_\bullet be a filtration on P as in Differential Graded Algebra, Section 22.13. Then we have

$$P \otimes_E K^\bullet = \text{hocolim } F_i P \otimes_E K^\bullet$$

Each of the $F_i P$ has a finite filtration whose graded pieces are direct sums of $E[k]$. The result follows easily. \square

The following lemma can be strengthened (there is a uniformity in the vanishing over all L with nonzero cohomology sheaves only in a fixed range).

Lemma 57.16.2. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let K, L be objects of $D(\mathcal{O}_X)$ with K perfect and L in $D_{QCoh}^b(\mathcal{O}_X)$. Then $\text{Ext}_D^n(\mathcal{O}_X)(K, L)$ is nonzero for only a finite number of n .*

Proof. Since K is perfect we have

$$\text{Ext}_{D(\mathcal{O}_X)}^i(K, L) = H^i(X, K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L)$$

where K^\wedge is the “dual” perfect complex to K , see Cohomology on Sites, Lemma 21.36.9. Note that $P = K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L$ is in $D_{QCoh}(X)$ by Lemmas 57.5.5 and 57.12.5 (to see that a perfect complex has quasi-coherent cohomology sheaves). On the other hand, the spectral sequence

$$E_1^{p,q} = H^p(K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} H^q(L)) \Rightarrow H^{p+q}(K^\wedge \otimes_{\mathcal{O}_X}^{\mathbf{L}} L) = H^{p+q}(P),$$

the boundedness of L , and the finite tor amplitude of K^\wedge show that P has only finitely many nonzero cohomology sheaves. It follows that $H^n(X, P) = 0$ for $n \ll 0$. But also $H^n(X, P) = 0$ for $n \gg 0$ by Cohomology of Spaces, Lemma 51.6.3 and the spectral sequence expressing $H^n(X, P^\bullet)$ in terms of $H^p(X, H^q(P^\bullet))$ using that the cohomology sheaves of P are quasi-coherent. \square

The following is the analogue of Derived Categories of Schemes, Theorem 35.15.3.

Theorem 57.16.3. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Then there exist a differential graded algebra (E, d) with only a finite number of nonzero cohomology groups $H^i(E)$ such that $D_{QCoh}(\mathcal{O}_X)$ is equivalent to $D(E, d)$.*

Proof. Let K^\bullet be a K-injective complex of \mathcal{O} -modules which is perfect and generates $D_{QCoh}(\mathcal{O}_X)$. Such a thing exists by Theorem 57.14.4 and the existence of K-injective resolutions. We will show the theorem holds with

$$(E, d) = \text{Hom}_{\text{Comp}^{dg}(\mathcal{O}_X)}(K^\bullet, K^\bullet)$$

where $\text{Comp}^{dg}(\mathcal{O}_X)$ is the differential graded category of complexes of \mathcal{O} -modules. Please see Differential Graded Algebra, Section 22.25. Since K^\bullet is K-injective we have

$$(57.16.3.1) \quad H^n(E) = \text{Ext}_{D(\mathcal{O}_X)}^n(K^\bullet, K^\bullet)$$

for all $n \in \mathbf{Z}$. Only a finite number of these Exts are nonzero by Lemma 57.16.2. Consider the functor

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D(\mathcal{O}_X)$$

of Differential Graded Algebra, Lemma 22.25.3. Since K^\bullet is perfect, it defines a compact object of $D(\mathcal{O}_X)$, see Proposition 57.15.1. Combined with (57.16.3.1) the functor above is fully faithful as follows from Differential Graded Algebra, Lemmas 22.25.5. It has a right adjoint

$$R\mathrm{Hom}(K^\bullet, -) : D(\mathcal{O}_X) \longrightarrow D(E, d)$$

by Differential Graded Algebra, Lemmas 22.25.4 which is a left quasi-inverse functor by generalities on adjoint functors. On the other hand, it follows from Lemma 57.16.1 that we obtain

$$- \otimes_E^{\mathbf{L}} K^\bullet : D(E, d) \longrightarrow D_{Q\mathrm{Coh}}(\mathcal{O}_X)$$

and by our choice of K^\bullet as a generator of $D_{Q\mathrm{Coh}}(\mathcal{O}_X)$ the kernel of the adjoint restricted to $D_{Q\mathrm{Coh}}(\mathcal{O}_X)$ is zero. A formal argument shows that we obtain the desired equivalence, see Derived Categories, Lemma 13.7.2. \square

57.17. Cohomology and base change, IV

This section is the analogue of Derived Categories of Schemes, Section 35.16.

Lemma 57.17.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . For E in $D_{Q\mathrm{Coh}}(\mathcal{O}_X)$ and K in $D_{Q\mathrm{Coh}}(\mathcal{O}_Y)$ we have*

$$Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K)$$

Proof. Without any assumptions there is a map $Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K \rightarrow Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K)$. Namely, it is the adjoint to the canonical map

$$Lf^*(Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} K) = Lf^*(Rf_*(E)) \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K \longrightarrow E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^*K$$

coming from the map $Lf^*Rf_*E \rightarrow E$. See Cohomology on Sites, Lemmas 21.18.4 and 21.19.1. To check it is an isomorphism we may work étale locally on Y . Hence we reduce to the case that Y is an affine scheme.

Suppose that $K = \bigoplus K_i$ is a direct sum of some complexes $K_i \in D_{Q\mathrm{Coh}}(\mathcal{O}_Y)$. If the statement holds for each K_i , then it holds for K . Namely, the functors Lf^* and $\otimes^{\mathbf{L}}$ preserve direct sums by construction and Rf_* commutes with direct sums (for complexes with quasi-coherent cohomology sheaves) by Lemma 57.6.2. Moreover, suppose that $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle in $D_{Q\mathrm{Coh}}(Y)$. Then if the statement of the lemma holds for two of K, L, M , then it holds for the third (as the functors involved are exact functors of triangulated categories).

Assume Y affine, say $Y = \mathrm{Spec}(A)$. The functor $\sim : D(A) \rightarrow D_{Q\mathrm{Coh}}(\mathcal{O}_Y)$ is an equivalence by Lemma 57.4.2 and Derived Categories of Schemes, Lemma 35.3.4. Let T be the property for $K \in D(A)$ that the statement of the lemma holds for \tilde{K} . The discussion above and More on Algebra, Remark 15.45.11 shows that it suffices to prove T holds for $A[k]$. This finishes the proof, as the statement of the lemma is clear for shifts of the structure sheaf. \square

Definition 57.17.2. Let S be a scheme. Let B be an algebraic space over S . Let X, Y be algebraic spaces over B . We say X and Y are *Tor independent over B* if and only if for every commutative diagram

$$\begin{array}{ccc} \mathrm{Spec}(k) & \xrightarrow{\quad \bar{x} \quad} & X \\ \bar{y} \downarrow & \searrow \bar{b} & \downarrow \\ Y & \xrightarrow{\quad \quad} & B \end{array}$$

of geometric points the rings $\mathcal{O}_{X, \bar{x}}$ and $\mathcal{O}_{Y, \bar{y}}$ are Tor independent over $\mathcal{O}_{B, \bar{b}}$ (see More on Algebra, Definition 15.47.1).

The following lemma shows in particular that this definition agrees with our definition in the case of representable algebraic spaces.

Lemma 57.17.3. *Let S be a scheme. Let B be an algebraic space over S . Let X, Y be algebraic spaces over B . The following are equivalent*

- (1) *X and Y are Tor independent over B ,*
- (2) *for every commutative diagram*

$$\begin{array}{ccccc} U & \longrightarrow & W & \longleftarrow & V \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & B & \longleftarrow & Y \end{array}$$

- with étale vertical arrows U and V are Tor independent over W ,*
- (3) *for some commutative diagram as in (2) with (a) $W \rightarrow B$ étale surjective, (b) $U \rightarrow X \times_B W$ étale surjective, (c) $V \rightarrow Y \times_B W$ étale surjective, the spaces U and V are Tor independent over W , and*
- (4) *for some commutative diagram as in (3) with U, V, W schemes, the schemes U and V are Tor independent over W in the sense of Derived Categories of Schemes, Definition 35.16.2.*

Proof. For an étale morphism $\varphi : U \rightarrow X$ of algebraic spaces and geometric point \bar{u} the map of local rings $\mathcal{O}_{X, \varphi(\bar{u})} \rightarrow \mathcal{O}_{U, \bar{u}}$ is an isomorphism. Hence the equivalence of (1) and (2) follows. So does the implication (1) \Rightarrow (3). Assume (3) and pick a diagram of geometric points as in Definition 57.17.2. The assumptions imply that we can first lift \bar{b} to a geometric point \bar{w} of W , then lift the geometric point (\bar{x}, \bar{b}) to a geometric point \bar{u} of U , and finally lift the geometric point (\bar{y}, \bar{b}) to a geometric point \bar{v} of V . Use Properties of Spaces, Lemma 48.16.4 to find the lifts. Using the remark on local rings above we conclude that the condition of the definition is satisfied for the given diagram.

Having made these initial points, it is clear that (4) comes down to the statement that Definition 57.17.2 agrees with Derived Categories of Schemes, Definition 35.16.2 when X, Y , and B are schemes.

Let $\bar{x}, \bar{b}, \bar{y}$ be as in Definition 57.17.2 lying over the points x, y, b . Recall that $\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{X, x}^{sh}$ (Properties of Spaces, Lemma 48.19.1) and similarly for the other two. By Algebra, Lemma 10.145.28 we see that $\mathcal{O}_{X, \bar{x}}$ is a strict henselization of $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{B, \bar{b}}$. In particular, the ring map

$$\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{B, b}} \mathcal{O}_{B, \bar{b}} \longrightarrow \mathcal{O}_{X, \bar{x}}$$

is flat (More on Algebra, Lemma 15.34.1). By More on Algebra, Lemma 15.47.3 we see that

$$\mathrm{Tor}_i^{\mathcal{O}_{B,b}}(\mathcal{O}_{X,x}, \mathcal{O}_{Y,y}) \otimes_{\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{B,b}} \mathcal{O}_{Y,y}} (\mathcal{O}_{X,\bar{x}} \otimes_{\mathcal{O}_{B,\bar{b}}} \mathcal{O}_{Y,\bar{y}}) = \mathrm{Tor}_i^{\mathcal{O}_{B,\bar{b}}}(\mathcal{O}_{X,\bar{x}}, \mathcal{O}_{Y,\bar{y}})$$

Hence it follows that if X and Y are Tor independent over B as schemes, then X and Y are Tor independent as algebraic spaces over B .

For the converse, we may assume $X, Y,$ and B are affine. Observe that the ring map

$$\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{B,b}} \mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,\bar{x}} \otimes_{\mathcal{O}_{B,\bar{b}}} \mathcal{O}_{Y,\bar{y}}$$

is flat by the observations given above. Moreover, the image of the map on spectra includes all primes $\mathfrak{s} \subset \mathcal{O}_{X,x} \otimes_{\mathcal{O}_{B,b}} \mathcal{O}_{Y,y}$ lying over \mathfrak{m}_x and \mathfrak{m}_y . Hence from this and the displayed formula of Tor's above we see that if X and Y are Tor independent over B as algebraic spaces, then

$$\mathrm{Tor}_i^{\mathcal{O}_{B,b}}(\mathcal{O}_{X,x}, \mathcal{O}_{Y,y})_{\mathfrak{s}} = 0$$

for all $i > 0$ and all \mathfrak{s} as above. By More on Algebra, Lemma 15.47.4 applied to the ring maps $\Gamma(B, \mathcal{O}_B) \rightarrow \Gamma(X, \mathcal{O}_X)$ and $\Gamma(B, \mathcal{O}_B) \rightarrow \Gamma(Y, \mathcal{O}_Y)$ this implies that X and Y are Tor independent over B . \square

Lemma 57.17.4. *Let S be a scheme. Let $g : Y' \rightarrow Y$ be a morphism of algebraic spaces over S . Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Consider the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{h} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

*If X and Y' are Tor independent over Y , then for all $E \in D_{Qcoh}(\mathcal{O}_X)$ we have $Rf'_*Lh^*E = Lg_*Rf_*E$.*

Proof. For any object E of $D(\mathcal{O}_X)$ we can use Cohomology on Sites, Remark 21.19.2 to get a canonical base change map $Lg_*Rf_*E \rightarrow Rf'_*Lh^*E$. To check this is an isomorphism we may work étale locally on Y' . Hence we may assume $g : Y' \rightarrow Y$ is a morphism of affine schemes. In particular, g is affine and it suffices to show that

$$Rg_*Lg_*Rf_*E \rightarrow Rg_*Rf'_*Lh^*E = Rf_*(Rh_*Lh^*E)$$

is an isomorphism, see Lemma 57.6.4 (and use Lemmas 57.5.4, 57.5.5, and 57.6.1 to see that the objects Rf'_*Lh^*E and Lg_*Rf_*E have quasi-coherent cohomology sheaves). Note that h is affine as well (Morphisms of Spaces, Lemma 49.20.5). By Lemma 57.6.5 the map becomes a map

$$Rf_*E \otimes_{\mathcal{O}_Y}^L g_*\mathcal{O}_{Y'} \longrightarrow Rf_*(E \otimes_{\mathcal{O}_X}^L h_*\mathcal{O}_{X'})$$

Observe that $h_*\mathcal{O}_{X'} = f^*g_*\mathcal{O}_{Y'}$. Thus by Lemma 57.17.1 it suffices to prove that $Lf^*g_*\mathcal{O}_{Y'} = f^*g_*\mathcal{O}_{Y'}$. This follows from our assumption that X and Y' are Tor independent over Y . Namely, to check it we may work étale locally on X , hence we may also assume X is affine. Say $X = \mathrm{Spec}(A)$, $Y = \mathrm{Spec}(R)$ and $Y' = \mathrm{Spec}(R')$. Our assumption implies that A and R' are Tor independent over R (see Lemma 57.17.3 and More on Algebra, Lemma 15.47.4), i.e., $\mathrm{Tor}_i^R(A, R') = 0$ for $i > 0$. In other words $A \otimes_R^L R' = A \otimes_R R'$ which exactly means that $Lf^*g_*\mathcal{O}_{Y'} = f^*g_*\mathcal{O}_{Y'}$. \square

The following two lemmas remain true if we replace \mathcal{G} with a bounded complex of quasi-coherent \mathcal{O}_X -modules each flat over S .

Lemma 57.17.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $E \in D_{QCoh}(\mathcal{O}_X)$. Let \mathcal{G} be a quasi-coherent \mathcal{O}_X -module flat over Y . Then formation of*

$$Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$$

commutes with arbitrary base change (see proof for precise statement).

Proof. The statement means the following. Let $g : Y' \rightarrow Y$ be a morphism of algebraic spaces and consider the base change diagram

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{\quad g \quad} & Y \end{array}$$

in other words $X' = Y' \times_Y X$. Set $E' = Lh^*E$ and $\mathcal{G}' = h^*\mathcal{G}$ (here we do **not** use the derived pullback). The lemma asserts that we have

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) = Rf'_*(E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}')$$

To prove this, note that in Cohomology on Sites, Remark 21.19.2 we have constructed an arrow

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \longrightarrow R(f')_*(Lh^*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})) = R(f')_*(E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} lh^*\mathcal{G})$$

which we can compose with the map $Lh^*\mathcal{G} \rightarrow h^*\mathcal{G}$ to get a canonical map

$$Lg^*Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \longrightarrow Rf'_*(E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}')$$

To check this map is an isomorphism we may work étale locally on Y' . Hence we may assume $g : Y' \rightarrow Y$ is a morphism of affine schemes. In this case, we will use the induction principle to prove this map is always an isomorphism for any quasi-compact and quasi-separated algebraic space X over Y (Lemma 57.8.3).

If X is a scheme (for example affine), then the result holds. Namely, E comes from an object of the derived category of the underlying scheme by Lemma 57.4.2. Furthermore, the constructions Rf_* (derived pushforward) and Lg^* (derived pullback) are (in the current situation) compatible with pulling back from the Zariski site (Remark 57.6.3). Thus in this case the result follows from the case of schemes which is Derived Categories of Schemes, Lemma 35.16.4.

The induction step. Let $(U \subset X, f : V \rightarrow X)$ be an elementary distinguished square with $U, V, U \times_X V$ quasi-compact such that the result holds for the restriction of E and \mathcal{G} to U, V , and $U \times_X V$. Denote $a = f|_U, b = f|_V$ and $c = f|_{U \times_X V}$. Let $a' : U' \rightarrow Y', b' : V' \rightarrow Y'$ and $c' : U' \times_{X'} V' \rightarrow Y'$ be the base changes of a, b , and c . Note that formation of $R\mathcal{H}om$ commutes with restriction (Cohomology on Sites, Lemma 21.26.3). Set $H = E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ and $H' = E' \otimes_{\mathcal{O}_{X'}}^{\mathbf{L}} \mathcal{G}'$. Using the distinguished triangles from relative Mayer-Vietoris (Lemma 57.9.3) we obtain a commutative

diagram

$$\begin{array}{ccc}
 Lg^*Rf_*H & \longrightarrow & Rf'_*H' \\
 \downarrow & & \downarrow \\
 Lg^*Ra_*H|_U \oplus Lg^*Rb_*H|_V & \longrightarrow & Ra'_*H'|_{U'} \oplus Rb'_*H'|_{V'} \\
 \downarrow & & \downarrow \\
 Lg^*Rc_*H|_{U \times_X V} & \longrightarrow & Rc'_*H'|_{U' \times_{X'} V'} \\
 \downarrow & & \downarrow \\
 Lg^*Rf_*H[1] & \longrightarrow & Rf'_*H'[1]
 \end{array}$$

Since the 2nd and 3rd horizontal arrows are isomorphisms so is the first (Derived Categories, Lemma 13.4.3) and the proof of the lemma is finished. \square

Lemma 57.17.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of algebraic spaces over S . Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a quasi-coherent \mathcal{O}_X -module flat over Y . Then formation of*

$$Rf_*R\mathcal{H}om(E, \mathcal{G})$$

commutes with arbitrary base change (see proof for precise statement).

Proof. The statement means the following. Let $g : Y' \rightarrow Y$ be a morphism of algebraic spaces and consider the base change diagram

$$\begin{array}{ccc}
 X' & \xrightarrow{h} & X \\
 f' \downarrow & & \downarrow f \\
 Y' & \xrightarrow{g} & Y
 \end{array}$$

in other words $X' = Y' \times_Y X$. Set $E' = Lh^*E$ and $\mathcal{G}' = h^*\mathcal{G}$ (here we do **not** use the derived pullback). The lemma asserts that we have

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) = Rf'_*R\mathcal{H}om(E', \mathcal{G}')$$

To prove this, note that in Cohomology on Sites, Remark 21.26.10 we have constructed an arrow

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) \longrightarrow R(f')_*R\mathcal{H}om(Lh^*E, Lh^*\mathcal{G})$$

which we can compose with the map $Lh^*\mathcal{G} \rightarrow h^*\mathcal{G}$ to get a canonical map

$$Lg^*Rf_*R\mathcal{H}om(E, \mathcal{G}) \rightarrow Rf'_*R\mathcal{H}om(E', \mathcal{G}')$$

With these preliminaries out of the way, we deduce the result from Lemma 57.17.5. Namely, since E is a perfect complex there exists a dual perfect complex E_{dual} , see Cohomology on Sites, Lemma 21.36.9, such that $R\mathcal{H}om(E, \mathcal{G}) = E_{dual} \otimes_{\mathcal{O}_X}^L \mathcal{G}$. We omit the verification that the base change map of Lemma 57.17.5 for E_{dual} agrees with the base change map for E constructed above. \square

57.18. Producing perfect complexes

The following lemma is our main technical tool for producing perfect complexes. Later versions of this result will reduce to this by Noetherian approximation.

Lemma 57.18.1. *Let S be a scheme. Let Y be a Noetherian algebraic space over S . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D(\mathcal{O}_X)$ such that*

- (1) $E \in D_{\text{Coh}}^b(\mathcal{O}_X)$,
- (2) *the scheme theoretic support of $H^i(E)$ is proper over Y for all i ,*
- (3) E *has finite tor dimension as an object of $D(f^{-1}\mathcal{O}_Y)$.*

*Then Rf_*E is a perfect object of $D(\mathcal{O}_Y)$.*

Proof. By Lemma 57.7.1 we see that Rf_*E is an object of $D_{\text{Coh}}^b(\mathcal{O}_Y)$. Hence Rf_*E is pseudo-coherent (Lemma 57.12.6). Hence it suffices to show that Rf_*E has finite tor dimension, see Cohomology on Sites, Lemma 21.36.4. By Lemma 57.12.7 it suffices to check that $Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} \mathcal{F}$ has universally bounded cohomology for all quasi-coherent sheaves \mathcal{F} on Y . Bounded from above is clear as $Rf_*(E)$ is bounded from above. Let $T \subset X$ be the union of the supports of $H^i(E)$ for all i . Then T is proper over Y by assumptions (1) and (2). In particular there exists a quasi-compact open subspace $X' \subset X$ containing T . Setting $f' = f|_{X'}$ we have $Rf_*(E) = Rf'_*(E|_{X'})$ because E restricts to zero on $X \setminus T$. Thus we may replace X by X' and assume f is quasi-compact. We have assumed f is quasi-separated. Thus

$$Rf_*(E) \otimes_{\mathcal{O}_Y}^{\mathbf{L}} \mathcal{F} = Rf_* \left(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F} \right) = Rf_* \left(E \otimes_{f^{-1}\mathcal{O}_Y}^{\mathbf{L}} f^{-1} \mathcal{F} \right)$$

by Lemma 57.17.1 and Cohomology on Sites, Lemma 21.18.5. By assumption (3) the complex $E \otimes_{f^{-1}\mathcal{O}_Y}^{\mathbf{L}} f^{-1} \mathcal{F}$ has cohomology sheaves in a given finite range, say $[a, b]$. Then Rf_* of it has cohomology in the range $[a, \infty)$ and we win. \square

57.19. Computing Ext groups and base change

The results in this section will be used to verify one of Artin's criteria for Quot functors, Hilbert schemes, and other moduli problems.

Lemma 57.19.1. *Let S be a scheme. Let B be a Noetherian algebraic space over S . Let $f : X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a coherent \mathcal{O}_X -module flat over B with scheme theoretic support proper over B . Then $K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$ is a perfect object of $D(\mathcal{O}_B)$ and there are functorial isomorphisms*

$$H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}) \longrightarrow H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}))$$

for \mathcal{F} quasi-coherent on B compatible with boundary maps (see proof).

Proof. We have

$$\mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F} = \mathcal{G} \otimes_{f^{-1}\mathcal{O}_B}^{\mathbf{L}} f^{-1} \mathcal{F} = \mathcal{G} \otimes_{f^{-1}\mathcal{O}_B} f^{-1} \mathcal{F} = \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}$$

the first equality by Cohomology on Sites, Lemma 21.18.5, the second as \mathcal{G} is a flat $f^{-1}\mathcal{O}_B$ -module, and the third by definition of pullbacks. Hence we obtain

$$\begin{aligned} H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})) &= H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F}) \\ &= H^i(B, Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_X}^{\mathbf{L}} Lf^* \mathcal{F})) \\ &= H^i(B, Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}) \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}) \\ &= H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}) \end{aligned}$$

The first equality by the above, the second by Leray (Cohomology on Sites, Remark 21.14.4), and the third equality by Lemma 57.17.1. The object K is perfect by Lemma 57.18.1. We check the lemma applies. Locally E is isomorphic to a finite complex of finite free \mathcal{O}_X -modules. Hence locally $E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ is isomorphic to a finite complex whose terms are finite direct sums of copies of \mathcal{G} . This immediately implies the hypotheses on the cohomology sheaves $H^i(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$. The hypothesis on finite tor dimension follows as \mathcal{G} is flat over $f^{-1}\mathcal{O}_B$.

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ then the isomorphisms fit into commutative diagrams

$$\begin{array}{ccc} H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_3) & \longrightarrow & H^i(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3)) \\ \delta \downarrow & & \downarrow \delta \\ H^{i+1}(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1) & \longrightarrow & H^{i+1}(X, E \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1)) \end{array}$$

where the boundary maps come from the distinguished triangle

$$K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_2 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_3 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1[1]$$

and the distinguished triangle in $D(\mathcal{O}_X)$ associated to the short exact sequence

$$0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_2 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3 \rightarrow 0$$

This sequence is exact because \mathcal{G} is flat over B . We omit the verification of the commutativity of the displayed diagram. \square

Lemma 57.19.2. *Let S be a scheme. Let B be a Noetherian algebraic space over S . Let $f : X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D(\mathcal{O}_X)$ be perfect. Let \mathcal{G} be a coherent \mathcal{O}_X -module flat over B with scheme theoretic support proper over B . Then*

$$K = Rf_* R\mathcal{H}om(E, \mathcal{G})$$

is a perfect object of $D(\mathcal{O}_B)$ and there are functorial isomorphisms

$$H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}) \longrightarrow \text{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

for \mathcal{F} quasi-coherent on B compatible with boundary maps (see proof).

Proof. Since E is a perfect complex there exists a dual perfect complex E_{dual} , see Cohomology on Sites, Lemma 21.36.9. Observe that $R\mathcal{H}om(E, \mathcal{G}) = E_{dual} \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G}$ and that

$$\text{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) = H^i(X, E_{dual} \otimes_{\mathcal{O}_X}^{\mathbf{L}} (\mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}))$$

by construction of E_{dual} . Thus the perfectness of K and the isomorphisms follow from the corresponding results of Lemma 57.19.1 applied to E_{dual} and \mathcal{G} .

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$ then the isomorphisms fit into commutative diagrams

$$\begin{array}{ccc} H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_3) & \longrightarrow & \text{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3) \\ \delta \downarrow & & \downarrow \delta \\ H^{i+1}(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1) & \longrightarrow & \text{Ext}_{\mathcal{O}_X}^{i+1}(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1) \end{array}$$

where the boundary maps come from the distinguished triangle

$$K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_2 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_3 \rightarrow K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F}_1[1]$$

and the distinguished triangle in $D(\mathcal{O}_X)$ associated to the short exact sequence

$$0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_1 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_2 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}_3 \rightarrow 0$$

This sequence is exact because \mathcal{G} is flat over B . We omit the verification of the commutativity of the displayed diagram. \square

Lemma 57.19.3. *Let S be a scheme. Let B be a Noetherian algebraic space over S . Let $f : X \rightarrow B$ be a morphism of algebraic spaces which is locally of finite type and quasi-separated. Let $E \in D(\mathcal{O}_X)$ and \mathcal{G} an \mathcal{O}_X -module. Assume*

- (1) $E \in D_{\text{Coh}}^-(\mathcal{O}_X)$, and
- (2) \mathcal{G} is a coherent \mathcal{O}_X -module flat over B with scheme theoretic support proper over B .

Then for every $m \in \mathbf{Z}$ there exists a perfect object K of $D(\mathcal{O}_B)$ and functorial maps

$$\alpha_{\mathcal{F}}^i : \text{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \longrightarrow H^i(B, K \otimes_{\mathcal{O}_B}^{\mathbf{L}} \mathcal{F})$$

for \mathcal{F} quasi-coherent on B compatible with boundary maps (see proof) such that $\alpha_{\mathcal{F}}^i$ is an isomorphism for $i \leq m$.

Proof. We may replace X by a quasi-compact open neighbourhood of the support of \mathcal{G} , hence we may assume X is Noetherian. In this case X and f are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow E$ by a perfect complex P of $(X, E, -m - 1)$ (possible by Theorem 57.13.7). Then the induced map

$$\text{Ext}_{\mathcal{O}_X}^i(E, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \longrightarrow \text{Ext}_{\mathcal{O}_X}^i(P, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

is an isomorphism for $i \leq m$. Namely, the kernel, resp. cokernel of this map is a quotient, resp. submodule of

$$\text{Ext}_{\mathcal{O}_X}^i(C, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F}) \quad \text{resp.} \quad \text{Ext}_{\mathcal{O}_X}^{i+1}(C, \mathcal{G} \otimes_{\mathcal{O}_X} f^* \mathcal{F})$$

where C is the cone of $P \rightarrow E$. Since C has vanishing cohomology sheaves in degrees $\geq -m - 1$ these Ext-groups are zero for $i \leq m + 1$ by Derived Categories, Lemma 13.27.3. This reduces us to the case that E is a perfect complex which is Lemma 57.19.2.

The statement on boundaries is explained in the proof of Lemma 57.19.2. \square

57.20. Limits and derived categories

In this section we collect some results about the derived category of an algebraic space which is the limit of an inverse system of algebraic spaces. More precisely, we will work in the following setting.

Situation 57.20.1. Let S be a scheme. Let $X = \lim_{i \in I} X_i$ be a limit of a directed system of algebraic spaces over S with affine transition morphisms $f_{i' i} : X_{i'} \rightarrow X_i$. We denote $f_i : X \rightarrow X_i$ the projection. We assume that X_i is quasi-compact and quasi-separated for all $i \in I$. We also choose an element $0 \in I$.

Lemma 57.20.2. *In Situation 57.20.1. Let E_0 and K_0 be objects of $D(\mathcal{O}_{X_0})$. Set $E_i = Lf_{i0}^* E_0$ and $K_i = Lf_{i0}^* K_0$ for $i \geq 0$ and set $E = Lf_0^* E_0$ and $K = Lf_0^* K_0$. Then the map*

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D(\mathcal{O}_{X_i})}(E_i, K_i) \longrightarrow \operatorname{Hom}_{D(\mathcal{O}_X)}(E, K)$$

is an isomorphism if either

- (1) E_0 is perfect and $K_0 \in D_{QCoh}(\mathcal{O}_{X_0})$, or
- (2) E_0 is pseudo-coherent and $K_0 \in D_{QCoh}(\mathcal{O}_{X_0})$ has finite tor dimension.

Proof. For every quasi-compact and quasi-separated object U_0 of $(X_0)_{spaces, \acute{e}tale}$ consider the condition P that the canonical map

$$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D(\mathcal{O}_{U_i})}(E_i|_{U_i}, K_i|_{U_i}) \longrightarrow \operatorname{Hom}_{D(\mathcal{O}_U)}(E|_U, K|_U)$$

is an isomorphism, where $U = X \times_{X_0} U_0$ and $U_i = X_i \times_{X_0} U_0$. We will prove P holds for each U_0 by the induction principle of Lemma 57.8.3. Condition (2) of this lemma follows immediately from Mayer-Vietoris for hom in the derived category, see Lemma 57.9.4. Thus it suffices to prove the lemma when X_0 is affine.

If X_0 is affine, then the result follows from the case of schemes, see Derived Categories of Schemes, Lemma 35.19.2. To see this use the equivalence of Lemma 57.4.2 and use the translation of properties explained in Lemmas 57.12.2, 57.12.3, and 57.12.4. \square

Lemma 57.20.3. *In Situation 57.20.1 the category of perfect objects of $D(\mathcal{O}_X)$ is the colimit of the categories of perfect objects of $D(\mathcal{O}_{X_i})$.*

Proof. For every quasi-compact and quasi-separated object U_0 of $(X_0)_{spaces, \acute{e}tale}$ consider the condition P that the functor

$$\operatorname{colim}_{i \geq 0} D_{perf}(\mathcal{O}_{U_i}) \longrightarrow D_{perf}(\mathcal{O}_U)$$

is an equivalence where $perf$ indicates the full subcategory of perfect objects and where $U = X \times_{X_0} U_0$ and $U_i = X_i \times_{X_0} U_0$. We will prove P holds for every U_0 by the induction principle of Lemma 57.8.3. First, we observe that we already know the functor is fully faithful by Lemma 57.20.2. Thus it suffices to prove essential surjectivity.

We first check condition (2) of the induction principle. Thus suppose that we have an elementary distinguished square $(U_0 \subset X_0, V_0 \rightarrow X_0)$ and that P holds for U_0 , V_0 , and $U_0 \times_{X_0} V_0$. Let E be a perfect object of $D(\mathcal{O}_X)$. We can find $i \geq 0$ and $E_{U,i}$ perfect on U_i and $E_{V,i}$ perfect on V_i whose pullback to U and V are isomorphic to $E|_U$ and $E|_V$. Denote

$$a : E_{U,i} \rightarrow (R(X \rightarrow X_i)_* E)|_{U_i} \quad \text{and} \quad b : E_{V,i} \rightarrow (R(X \rightarrow X_i)_* E)|_{V_i}$$

the maps adjoint to the isomorphisms $L(U \rightarrow U_i)^* E_{U,i} \rightarrow E|_U$ and $L(V \rightarrow V_i)^* E_{V,i} \rightarrow E|_V$. By fully faithfulness, after increasing i , we can find an isomorphism $c : E_{U,i}|_{U_i \times_{X_i} V_i} \rightarrow E_{V,i}|_{U_i \times_{X_i} V_i}$ which pulls back to the identifications

$$L(U \rightarrow U_i)^* E_{U,i}|_{U \times_X V} \rightarrow E|_{U \times_X V} \rightarrow L(V \rightarrow V_i)^* E_{V,i}|_{U \times_X V}.$$

Apply Lemma 57.9.7 to get an object E_i on X_i and a map $d : E_i \rightarrow R(X \rightarrow X_i)_* E$ which restricts to the maps a and b over U_i and V_i . Then it is clear that E_i is perfect and that d is adjoint to an isomorphism $L(X \rightarrow X_i)^* E_i \rightarrow E$.

Finally, we check condition (1) of the induction principle, in other words, we check the lemma holds when X_0 is affine. This follows from the case of schemes, see Derived Categories of Schemes, Lemma 35.19.3. To see this use the equivalence of Lemma 57.4.2 and use the translation of Lemma 57.12.4. \square

57.21. Cohomology and base change, V

A final section on cohomology and base change continuing the discussion of Sections 57.17 and 57.18. An easy to grok special case is given in Remark 57.21.2.

Lemma 57.21.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of finite presentation between algebraic spaces over S . Let $E \in D(\mathcal{O}_X)$ be a perfect object. Let \mathcal{G} be a finitely presented \mathcal{O}_X -module, flat over Y , with support proper over Y . Then*

$$K = Rf_*(E \otimes_{\mathcal{O}_X}^{\mathbf{L}} \mathcal{G})$$

is a perfect object of $D(\mathcal{O}_Y)$ and its formation commutes with arbitrary base change.

Proof. The statement on base change is Lemma 57.17.5. Thus it suffices to show that K is a perfect object. If Y is Noetherian, then this follows from Lemma 57.19.1. We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.

The question is local on Y , hence we may assume Y is affine. Say $Y = \text{Spec}(R)$. We write $R = \text{colim } R_i$ as a filtered colimit of Noetherian rings R_i . By Limits of Spaces, Lemma 52.7.1 there exists an i and an algebraic space X_i of finite presentation over R_i whose base change to R is X . By Limits of Spaces, Lemma 52.7.2 we may assume after increasing i , that there exists a finitely presented \mathcal{O}_{X_i} -module \mathcal{G}_i whose pullback to X is \mathcal{G} . After increasing i we may assume \mathcal{G}_i is flat over R_i , see Limits of Spaces, Lemma 52.6.11. After increasing i we may assume the support of \mathcal{G}_i is proper over R_i , see Limits of Spaces, Lemma 52.12.3. Finally, by Lemma 57.12.4 we may, after increasing i , assume there exists a perfect object E_i of $D(\mathcal{O}_{X_i})$ whose pullback to X is E . Applying Lemma 57.19.1 to $X_i \rightarrow \text{Spec}(R_i)$, E_i , \mathcal{G}_i and using the base change property already shown we obtain the result. \square

Remark 57.21.2. Let R be a ring. Let X be an algebraic space of finite presentation over R . Let \mathcal{G} be a finitely presented \mathcal{O}_X -module flat over R with scheme theoretic support proper over R . By Lemma 57.21.1 there exists a finite complex of finite projective R -modules M^\bullet such that we have

$$R\Gamma(X_{R'}, \mathcal{G}_{R'}) = M^\bullet \otimes_R R'$$

functorially in the R -algebra R' .

Lemma 57.21.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of finite presentation between algebraic spaces over S . Let $E \in D(\mathcal{O}_X)$ be a perfect object. Let \mathcal{G} be a finitely presented \mathcal{O}_X -module, flat over Y , with support proper over Y . Then*

$$K = Rf_* R\mathcal{H}om(E, \mathcal{G})$$

is a perfect object of $D(\mathcal{O}_Y)$ and its formation commutes with arbitrary base change.

Proof. The statement on base change is Lemma 57.17.6. Thus it suffices to show that K is a perfect object. If Y is Noetherian, then this follows from Lemma 57.19.2. We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.

The question is local on Y , hence we may assume Y is affine. Say $Y = \text{Spec}(R)$. We write $R = \text{colim } R_i$ as a filtered colimit of Noetherian rings R_i . By Limits of Spaces, Lemma 52.7.1 there exists an i and an algebraic space X_i of finite presentation over R_i whose base change to R is X . More on Morphisms of Spaces

58.1. Introduction

In this chapter we continue our study of properties of morphisms of algebraic spaces. A fundamental reference is [Knu71].

58.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

58.3. Radicial morphisms

It turns out that a radicial morphism is not the same thing as a universally injective morphism, contrary to what happens with morphisms of schemes. In fact it is a bit stronger.

Definition 58.3.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . We say f is *radicial* if for any morphism $\text{Spec}(K) \rightarrow Y$ where K is a field the reduction $(\text{Spec}(K) \times_Y X)_{red}$ is either empty or representable by the spectrum of a purely inseparable field extension of K .

Lemma 58.3.2. *A radicial morphism of algebraic spaces is universally injective.*

Proof. Let S be a scheme. Let $f : X \rightarrow Y$ be a radicial morphism of algebraic spaces over S . It is clear from the definition that given a morphism $\text{Spec}(K) \rightarrow Y$ there is at most one lift of this morphism to a morphism into X . Hence we conclude that f is universally injective by Morphisms of Spaces, Lemma 49.19.2. \square

Example 58.3.3. It is no longer true that universally injective is equivalent to radicial. For example the morphism

$$X = [\text{Spec}(\overline{\mathbf{Q}})/\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})] \longrightarrow S = \text{Spec}(\mathbf{Q})$$

of Spaces, Example 47.14.7 is universally injective, but is not radicial in the sense above.

Nonetheless it is often the case that the reverse implication holds.

Lemma 58.3.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a universally injective morphism of algebraic spaces over S .*

- (1) *If f is decent then f is radicial.*

- (2) If f is quasi-separated then f is radicial.
 (3) If f is locally separated then f is radicial.

Proof. Let \mathcal{P} be a property of morphisms of algebraic spaces which is stable under base change and composition and holds for closed immersions. Assume $f : X \rightarrow Y$ has \mathcal{P} and is universally injective. Then, in the situation of Definition 58.3.1 the morphism $(\mathrm{Spec}(K) \times_Y X)_{red} \rightarrow \mathrm{Spec}(K)$ is universally injective and has \mathcal{P} . This reduces the problem of proving

$$\mathcal{P} + \text{universally injective} \Rightarrow \text{radicial}$$

to the problem of proving that any nonempty reduced algebraic space X over field whose structure morphism $X \rightarrow \mathrm{Spec}(K)$ is universally injective and \mathcal{P} is representable by the spectrum of a field. Namely, then $X \rightarrow \mathrm{Spec}(K)$ will be a morphism of schemes and we conclude by the equivalence of radicial and universally injective for morphisms of schemes, see Morphisms, Lemma 28.12.2.

Let us prove (1). Assume f is decent and universally injective. By Decent Spaces, Lemmas 50.15.4, 50.15.6, and 50.15.2 (to see that an immersion is decent) we see that the discussion in the first paragraph applies. Let X be a nonempty decent reduced algebraic space universally injective over a field K . In particular we see that $|X|$ is a singleton. By Decent Spaces, Lemma 50.12.1 we conclude that $X \cong \mathrm{Spec}(L)$ for some extension $K \subset L$ as desired.

A quasi-separated morphism is decent, see Decent Spaces, Lemma 50.15.2. Hence (1) implies (2).

Let us prove (3). Recall that the separation axioms are stable under base change and composition and that closed immersions are separated, see Morphisms of Spaces, Lemmas 49.4.4, 49.4.8, and 49.10.7. Thus the discussion in the first paragraph of the proof applies. Let X be a reduced algebraic space universally injective and locally separated over a field K . In particular $|X|$ is a singleton hence X is quasi-compact, see Properties of Spaces, Lemma 48.5.2. We can find a surjective étale morphism $U \rightarrow X$ with U affine, see Properties of Spaces, Lemma 48.6.3. Consider the morphism of schemes

$$j : U \times_X U \longrightarrow U \times_{\mathrm{Spec}(K)} U$$

As $X \rightarrow \mathrm{Spec}(K)$ is universally injective j is surjective, and as $X \rightarrow \mathrm{Spec}(K)$ is locally separated j is an immersion. A surjective immersion is a closed immersion, see Schemes, Lemma 25.10.4. Hence $R = U \times_X U$ is affine as a closed subscheme of an affine scheme. In particular R is quasi-compact. It follows that $X = U/R$ is quasi-separated, and the result follows from (2). \square

Remark 58.3.5. Let $X \rightarrow Y$ be a morphism of algebraic spaces. For some applications (of radicial morphisms) it is enough to require that for every $\mathrm{Spec}(K) \rightarrow Y$ where K is a field

- (1) the space $|\mathrm{Spec}(K) \times_Y X|$ is a singleton,
- (2) there exists a monomorphism $\mathrm{Spec}(L) \rightarrow \mathrm{Spec}(K) \times_Y X$, and
- (3) $K \subset L$ is purely inseparable.

If needed later we will may call such a morphism *weakly radicial*. For example if $X \rightarrow Y$ is a surjective weakly radicial morphism then $X(k) \rightarrow Y(k)$ is surjective for every algebraically closed field k . Note that the base change $X_{\overline{\mathbf{Q}}} \rightarrow \mathrm{Spec}(\overline{\mathbf{Q}})$ of the morphism in Example 58.3.3 is weakly radicial, but not radicial. The analogue

of Lemma 58.3.4 is that if $X \rightarrow Y$ has property (β) and is universally injective, then it is weakly radical (proof omitted).

Lemma 58.3.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume*

- (1) *f is locally of finite type,*
- (2) *for every étale morphism $V \rightarrow Y$ the map $|X \times_Y V| \rightarrow |V|$ is injective.*

Then f is universally injective.

Proof. The question is étale local on Y by Morphisms of Spaces, Lemma 49.19.6. Hence we may assume that Y is a scheme. Then Y is in particular decent and by Decent Spaces, Lemma 50.16.9 we see that f is locally quasi-finite. Let $y \in Y$ be a point and let X_y be the scheme theoretic fibre. Assume X_y is not empty. By Spaces over Fields, Lemma 54.7.2 we see that X_y is a scheme which is locally quasi-finite over $\kappa(y)$. Since $|X_y| \subset |X|$ is the fibre of $|X| \rightarrow |Y|$ over y we see that X_y has a unique point x . The same is true for $X_y \times_{\text{Spec}(\kappa(y))} \text{Spec}(k)$ for any finite separable extension $\kappa(y) \subset k$ because we can realize k as the residue field at a point lying over y in an étale scheme over Y , see More on Morphisms, Lemma 36.27.2. Thus X_y is geometrically connected, see Varieties, Lemma 32.5.11. This implies that the finite extension $\kappa(y) \subset \kappa(x)$ is purely inseparable.

We conclude (in the case that Y is a scheme) that for every $y \in Y$ either the fibre X_y is empty, or $(X_y)_{\text{red}} = \text{Spec}(\kappa(x))$ with $\kappa(y) \subset \kappa(x)$ purely inseparable. Hence f is radical (some details omitted), whence universally injective by Lemma 58.3.2. \square

58.4. Conormal sheaf of an immersion

Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals, see Morphisms of Spaces, Lemma 49.13.1. Consider the short exact sequence

$$0 \rightarrow \mathcal{I}^2 \rightarrow \mathcal{I} \rightarrow \mathcal{I}/\mathcal{I}^2 \rightarrow 0$$

of quasi-coherent sheaves on X . Since the sheaf $\mathcal{I}/\mathcal{I}^2$ is annihilated by \mathcal{I} it corresponds to a sheaf on Z by Morphisms of Spaces, Lemma 49.14.1. This quasi-coherent \mathcal{O}_Z -module is the *conormal sheaf of Z in X* and is often denoted $\mathcal{I}/\mathcal{I}^2$ by the abuse of notation mentioned in Morphisms of Spaces, Section 49.14.

In case $i : Z \rightarrow X$ is a (locally closed) immersion we define the conormal sheaf of i as the conormal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$, see Morphisms of Spaces, Remark 49.12.4. It is often denoted $\mathcal{I}/\mathcal{I}^2$ where \mathcal{I} is the ideal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$.

Definition 58.4.1. Let $i : Z \rightarrow X$ be an immersion. The *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X* or the *conormal sheaf of i* is the quasi-coherent \mathcal{O}_Z -module $\mathcal{I}/\mathcal{I}^2$ described above.

In [DG67, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z/X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z/X}$ for the *normal sheaf of the immersion*. It is defined as

$$\mathcal{N}_{Z/X} = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{C}_{Z/X}, \mathcal{O}_Z) = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{I}/\mathcal{I}^2, \mathcal{O}_Z)$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

Lemma 58.4.2. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion. Let $\varphi : U \rightarrow X$ be an étale morphism where U is a scheme. Set $Z_U = U \times_X Z$ which is a locally closed subscheme of U . Then*

$$\mathcal{C}_{Z/X}|_{Z_U} = \mathcal{C}_{Z_U/U}$$

canonically and functorially in U .

Proof. Let $T \subset X$ be a closed subspace such that i defines a closed immersion into $X \setminus T$. Let \mathcal{I} be the quasi-coherent sheaf of ideals on $X \setminus T$ defining Z . Then the lemma just states that $\mathcal{I}|_{U \setminus \varphi^{-1}(T)}$ is the sheaf of ideals of the immersion $Z_U \rightarrow U \setminus \varphi^{-1}(T)$. This is clear from the construction of \mathcal{I} in Morphisms of Spaces, Lemma 49.13.1. \square

Lemma 58.4.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ f \downarrow & \searrow i & \downarrow g \\ Z' & \xrightarrow{i'} & X' \end{array}$$

be a commutative diagram of algebraic spaces over S . Assume i, i' immersions. There is a canonical map of \mathcal{O}_Z -modules

$$f^* \mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$$

Proof. First find open subspaces $U' \subset X'$ and $U \subset X$ such that $g(U) \subset U'$ and such that $i(Z) \subset U$ and $i'(Z') \subset U'$ are closed (proof existence omitted). Replacing X by U and X' by U' we may assume that i and i' are closed immersions. Let $\mathcal{I}' \subset \mathcal{O}_{X'}$ and $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaves of ideals associated to i' and i , see Morphisms of Spaces, Lemma 49.13.1. Consider the composition

$$g^{-1}\mathcal{I}' \rightarrow g^{-1}\mathcal{O}_{X'} \xrightarrow{g^\sharp} \mathcal{O}_X \rightarrow \mathcal{O}_X/\mathcal{I} = i_*\mathcal{O}_Z$$

Since $g(i(Z)) \subset Z'$ we conclude this composition is zero (see statement on factorizations in Morphisms of Spaces, Lemma 49.13.1). Thus we obtain a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{I} & \longrightarrow & \mathcal{O}_X & \longrightarrow & i_*\mathcal{O}_Z \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & g^{-1}\mathcal{I}' & \longrightarrow & g^{-1}\mathcal{O}_{X'} & \longrightarrow & g^{-1}i'_*\mathcal{O}_{Z'} \longrightarrow 0 \end{array}$$

The lower row is exact since g^{-1} is an exact functor. By exactness we also see that $(g^{-1}\mathcal{I}')^2 = g^{-1}((\mathcal{I}')^2)$. Hence the diagram induces a map $g^{-1}(\mathcal{I}'/(\mathcal{I}')^2) \rightarrow \mathcal{I}/\mathcal{I}^2$. Pulling back (using i^{-1} for example) to Z we obtain $i^{-1}g^{-1}(\mathcal{I}'/(\mathcal{I}')^2) \rightarrow \mathcal{C}_{Z/X}$. Since $i^{-1}g^{-1} = f^{-1}(i')^{-1}$ this gives a map $f^{-1}\mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$, which induces the desired map. \square

Lemma 58.4.4. *Let S be a scheme. The conormal sheaf of Definition 58.4.1, and its functoriality of Lemma 58.4.3 satisfy the following properties:*

- (1) If $Z \rightarrow X$ is an immersion of schemes over S , then the conormal sheaf agrees with the one from Morphisms, Definition 28.33.1.
- (2) If in Lemma 58.4.3 all the spaces are schemes, then the map $f^*\mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$ is the same as the one constructed in Morphisms, Lemma 28.33.3.
- (3) Given a commutative diagram

$$\begin{array}{ccc}
 Z & \longrightarrow & X \\
 f \downarrow & & \downarrow g \\
 Z' & \xrightarrow{i'} & X' \\
 f' \downarrow & & \downarrow g' \\
 Z'' & \xrightarrow{i''} & X''
 \end{array}$$

then the map $(f' \circ f)^*\mathcal{C}_{Z''/X''} \rightarrow \mathcal{C}_{Z/X}$ is the same as the composition of $f^*\mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$ with the pullback by f of $(f')^*\mathcal{C}_{Z''/X''} \rightarrow \mathcal{C}_{Z'/X'}$

Proof. Omitted. Note that Part (1) is a special case of Lemma 58.4.2. □

Lemma 58.4.5. *Let S be a scheme. Let*

$$\begin{array}{ccc}
 Z & \longrightarrow & X \\
 f \downarrow & & \downarrow g \\
 Z' & \xrightarrow{i'} & X'
 \end{array}$$

be a fibre product diagram of algebraic spaces over S . Assume i, i' immersions. Then the canonical map $f^\mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$ of Lemma 58.4.3 is surjective. If g is flat, then it is an isomorphism.*

Proof. Choose a commutative diagram

$$\begin{array}{ccc}
 U & \longrightarrow & X \\
 \downarrow & & \downarrow \\
 U' & \longrightarrow & X'
 \end{array}$$

where U, U' are schemes and the horizontal arrows are surjective and étale, see Spaces, Lemma 47.11.4. Then using Lemmas 58.4.2 and 58.4.4 we see that the question reduces to the case of a morphism of schemes. In the schemes case this is Morphisms, Lemma 28.33.4. □

Lemma 58.4.6. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be immersions of algebraic spaces. Then there is a canonical exact sequence*

$$i^*\mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

where the maps come from Lemma 58.4.3 and $i : Z \rightarrow Y$ is the first morphism.

Proof. Let U be a scheme and let $U \rightarrow X$ be a surjective étale morphism. Via Lemmas 58.4.2 and 58.4.4 the exactness of the sequence translates immediately into the exactness of the corresponding sequence for the immersions of schemes $Z \times_X U \rightarrow Y \times_X U \rightarrow U$. Hence the lemma follows from Morphisms, Lemma 28.33.5. □

58.5. The normal cone of an immersion

Let S be a scheme. Let $i : Z \rightarrow X$ be a closed immersion of algebraic spaces over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals, see Morphisms of Spaces, Lemma 49.13.1. Consider the quasi-coherent sheaf of graded \mathcal{O}_X -algebras $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$. Since the sheaves $\mathcal{I}^n / \mathcal{I}^{n+1}$ are each annihilated by \mathcal{I} this graded algebra corresponds to a quasi-coherent sheaf of graded \mathcal{O}_Z -algebras by Morphisms of Spaces, Lemma 49.14.1. This quasi-coherent graded \mathcal{O}_Z -algebra is called the *conormal algebra of Z in X* and is often simply denoted $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ by the abuse of notation mentioned in Morphisms of Spaces, Section 49.14.

In case $i : Z \rightarrow X$ is a (locally closed) immersion we define the conormal algebra of i as the conormal algebra of the closed immersion $i : Z \rightarrow X \setminus \partial Z$, see Morphisms of Spaces, Remark 49.12.4. It is often denoted $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ where \mathcal{I} is the ideal sheaf of the closed immersion $i : Z \rightarrow X \setminus \partial Z$.

Definition 58.5.1. Let $i : Z \rightarrow X$ be an immersion. The *conormal algebra $\mathcal{C}_{Z/X,*}$ of Z in X* or the *conormal algebra of i* is the quasi-coherent sheaf of graded \mathcal{O}_Z -algebras $\bigoplus_{n \geq 0} \mathcal{I}^n / \mathcal{I}^{n+1}$ described above.

Thus $\mathcal{C}_{Z/X,1} = \mathcal{C}_{Z/X}$ is the conormal sheaf of the immersion. Also $\mathcal{C}_{Z/X,0} = \mathcal{O}_Z$ and $\mathcal{C}_{Z/X,n}$ is a quasi-coherent \mathcal{O}_Z -module characterized by the property

$$(58.5.1.1) \quad i_* \mathcal{C}_{Z/X,n} = \mathcal{I}^n / \mathcal{I}^{n+1}$$

where $i : Z \rightarrow X \setminus \partial Z$ and \mathcal{I} is the ideal sheaf of i as above. Finally, note that there is a canonical surjective map

$$(58.5.1.2) \quad \text{Sym}^*(\mathcal{C}_{Z/X}) \longrightarrow \mathcal{C}_{Z/X,*}$$

of quasi-coherent graded \mathcal{O}_Z -algebras which is an isomorphism in degrees 0 and 1.

Lemma 58.5.2. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Let $\varphi : U \rightarrow X$ be an étale morphism where U is a scheme. Set $Z_U = U \times_X Z$ which is a locally closed subscheme of U . Then*

$$\mathcal{C}_{Z/X,*} |_{Z_U} = \mathcal{C}_{Z_U/U,*}$$

canonically and functorially in U .

Proof. Let $T \subset X$ be a closed subspace such that i defines a closed immersion into $X \setminus T$. Let \mathcal{I} be the quasi-coherent sheaf of ideals on $X \setminus T$ defining Z . Then the lemma follows from the fact that $\mathcal{I}|_{U \setminus \varphi^{-1}(T)}$ is the sheaf of ideals of the immersion $Z_U \rightarrow U \setminus \varphi^{-1}(T)$. This is clear from the construction of \mathcal{I} in Morphisms of Spaces, Lemma 49.13.1. □

Lemma 58.5.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{\quad} & X \\ f \downarrow & & \downarrow g \\ Z' & \xrightarrow{\quad} & X' \end{array}$$

be a commutative diagram of algebraic spaces over S . Assume i, i' immersions. There is a canonical map of graded \mathcal{O}_Z -algebras

$$f^* \mathcal{C}_{Z'/X',*} \longrightarrow \mathcal{C}_{Z/X,*}$$

Proof. First find open subspaces $U' \subset X'$ and $U \subset X$ such that $g(U) \subset U'$ and such that $i(Z) \subset U$ and $i(Z') \subset U'$ are closed (proof existence omitted). Replacing X by U and X' by U' we may assume that i and i' are closed immersions. Let $\mathcal{I}' \subset \mathcal{O}_{X'}$ and $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaves of ideals associated to i' and i , see Morphisms of Spaces, Lemma 49.13.1. Consider the composition

$$g^{-1}\mathcal{I}' \rightarrow g^{-1}\mathcal{O}_{X'} \xrightarrow{g^\sharp} \mathcal{O}_X \rightarrow \mathcal{O}_X/\mathcal{I} = i_*\mathcal{O}_Z$$

Since $g(i(Z)) \subset Z'$ we conclude this composition is zero (see statement on factorizations in Morphisms of Spaces, Lemma 49.13.1). Thus we obtain a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{I} & \longrightarrow & \mathcal{O}_X & \longrightarrow & i_*\mathcal{O}_Z \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & g^{-1}\mathcal{I}' & \longrightarrow & g^{-1}\mathcal{O}_{X'} & \longrightarrow & g^{-1}i'_*\mathcal{O}_{Z'} \longrightarrow 0 \end{array}$$

The lower row is exact since g^{-1} is an exact functor. By exactness we also see that $(g^{-1}\mathcal{I}')^n = g^{-1}((\mathcal{I}')^n)$ for all $n \geq 1$. Hence the diagram induces a map $g^{-1}((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \rightarrow \mathcal{I}^n/\mathcal{I}^{n+1}$. Pulling back (using i^{-1} for example) to Z we obtain $i^{-1}g^{-1}((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \rightarrow \mathcal{C}_{Z/X,n}$. Since $i^{-1}g^{-1} = f^{-1}(i')^{-1}$ this gives maps $f^{-1}\mathcal{C}_{Z'/X',n} \rightarrow \mathcal{C}_{Z/X,n}$, which induce the desired map. \square

Lemma 58.5.4. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \longrightarrow & X \\ f \downarrow & & \downarrow g \\ Z' & \xrightarrow{i'} & X' \end{array}$$

be a cartesian square of algebraic spaces over S with i, i' immersions. Then the canonical map $f^\mathcal{C}_{Z'/X',*} \rightarrow \mathcal{C}_{Z/X,*}$ of Lemma 58.5.3 is surjective. If g is flat, then it is an isomorphism.*

Proof. We may check the statement after étale localizing X' . In this case we may assume $X' \rightarrow X$ is a morphism of schemes, hence Z and Z' are schemes and the result follows from the case of schemes, see Divisors, Lemma 30.11.4. \square

We use the same conventions for cones and vector bundles over algebraic spaces as we do for schemes (where we use the conventions of EGA), see Constructions, Sections 26.7 and 26.6. In particular, a vector bundle is a very general gadget (and not locally isomorphic to an affine space bundle).

Definition 58.5.5. Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . The *normal cone* $C_Z X$ of Z in X is

$$C_Z X = \underline{\mathrm{Spec}}_Z(\mathcal{C}_{Z/X,*})$$

see Morphisms of Spaces, Definition 49.20.8. The *normal bundle* of Z in X is the vector bundle

$$N_Z X = \underline{\mathrm{Spec}}_Z(\mathrm{Sym}(\mathcal{C}_{Z/X}))$$

Thus $C_Z X \rightarrow Z$ is a cone over Z and $N_Z X \rightarrow Z$ is a vector bundle over Z . Moreover, the canonical surjection (58.5.1.2) of graded algebras defines a canonical closed immersion

$$(58.5.5.1) \quad C_Z X \longrightarrow N_Z X$$

of cones over Z .

58.6. Sheaf of differentials of a morphism

We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.127), the corresponding section in the chapter on morphism of schemes (Morphisms, Section 28.34) as well as Modules on Sites, Section 18.32. We first show that the notion of sheaf of differentials for a morphism of schemes agrees with the corresponding morphism of small étale (ringed) sites.

To clearly state the following lemma we temporarily go back to denoting \mathcal{F}^a the sheaf of $\mathcal{O}_{X_{\text{étale}}}$ -modules associated to a quasi-coherent \mathcal{O}_X -module \mathcal{F} on the scheme X , see Descent, Definition 34.7.2.

Lemma 58.6.1. *Let $f : X \rightarrow Y$ be a morphism of schemes. Let $f_{\text{small}} : X_{\text{étale}} \rightarrow Y_{\text{étale}}$ be the associated morphism of small étale sites, see Descent, Remark 34.7.4. Then there is a canonical isomorphism*

$$(\Omega_{X/Y})^a = \Omega_{X_{\text{étale}}/Y_{\text{étale}}}$$

compatible with universal derivations. Here the first module is the sheaf on $X_{\text{étale}}$ associated to the quasi-coherent \mathcal{O}_X -module $\Omega_{X/Y}$, see Morphisms, Definition 28.34.1, and the second module is the one from Modules on Sites, Definition 18.32.3.

Proof. Let $h : U \rightarrow X$ be an étale morphism. In this case the natural map $h^* \Omega_{X/Y} \rightarrow \Omega_{U/Y}$ is an isomorphism, see More on Morphisms, Lemma 36.7.7. This means that there is a natural $\mathcal{O}_{Y_{\text{étale}}}$ -derivation

$$d^a : \mathcal{O}_{X_{\text{étale}}} \longrightarrow (\Omega_{X/Y})^a$$

since we have just seen that the value of $(\Omega_{X/Y})^a$ on any object U of $X_{\text{étale}}$ is canonically identified with $\Gamma(U, \Omega_{U/Y})$. By the universal property of $d_{X/Y} : \mathcal{O}_{X_{\text{étale}}} \rightarrow \Omega_{X_{\text{étale}}/Y_{\text{étale}}}$ there is a unique $\mathcal{O}_{X_{\text{étale}}}$ -linear map $c : \Omega_{X_{\text{étale}}/Y_{\text{étale}}} \rightarrow (\Omega_{X/Y})^a$ such that $d^a = c \circ d_{X/Y}$.

Conversely, suppose that \mathcal{F} is an $\mathcal{O}_{X_{\text{étale}}}$ -module and $D : \mathcal{O}_{X_{\text{étale}}} \rightarrow \mathcal{F}$ is a $\mathcal{O}_{Y_{\text{étale}}}$ -derivation. Then we can simply restrict D to the small Zariski site X_{Zar} of X . Since sheaves on X_{Zar} agree with sheaves on X , see Descent, Remark 34.7.3, we see that $D|_{X_{\text{Zar}}} : \mathcal{O}_X \rightarrow \mathcal{F}|_{X_{\text{Zar}}}$ is just a “usual” Y -derivation. Hence we obtain a map $\psi : \Omega_{X/Y} \rightarrow \mathcal{F}|_{X_{\text{Zar}}}$ such that $D|_{X_{\text{Zar}}} = \psi \circ d$. In particular, if we apply this with $\mathcal{F} = \Omega_{X_{\text{étale}}/Y_{\text{étale}}}$ we obtain a map

$$c' : \Omega_{X/Y} \longrightarrow \Omega_{X_{\text{étale}}/Y_{\text{étale}}}|_{X_{\text{Zar}}}$$

Consider the morphism of ringed sites $\text{id}_{\text{small}, \text{étale}, \text{Zar}} : X_{\text{étale}} \rightarrow X_{\text{Zar}}$ discussed in Descent, Remark 34.7.4 and Lemma 34.7.5. Since the restriction functor $\mathcal{F} \mapsto \mathcal{F}|_{X_{\text{Zar}}}$ is equal to $\text{id}_{\text{small}, \text{étale}, \text{Zar}, *}$, since $\text{id}_{\text{small}, \text{étale}, \text{Zar}}^*$ is left adjoint to $\text{id}_{\text{small}, \text{étale}, \text{Zar}, *}$ and since $(\Omega_{X/Y})^a = \text{id}_{\text{small}, \text{étale}, \text{Zar}}^* \Omega_{X/Y}$ we see that c' is adjoint to a map

$$c'' : (\Omega_{X/Y})^a \longrightarrow \Omega_{X_{\text{étale}}/Y_{\text{étale}}}.$$

We claim that c'' and c' are mutually inverse. This claim finishes the proof of the lemma. To see this it is enough to show that $c''(d(f)) = d_{X/Y}(f)$ and $c(d_{X/Y}(f)) = d(f)$ if f is a local section of \mathcal{O}_X over an open of X . We omit the verification. \square

This clears the way for the following definition. For an alternative, see Remark 58.6.5.

Definition 58.6.2. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The *sheaf of differentials* $\Omega_{X/Y}$ of X over Y is sheaf of differentials (Modules on Sites, Definition 18.32.10) for the morphism of ringed topoi

$$(f_{small}, f^\#) : (X_{\acute{e}tale}, \mathcal{O}_X) \rightarrow (Y_{\acute{e}tale}, \mathcal{O}_Y)$$

of Properties of Spaces, Lemma 48.18.3. The *universal Y -derivation* will be denoted $d_{X/Y} : \mathcal{O}_X \rightarrow \Omega_{X/Y}$.

By Lemma 58.6.1 this does not conflict with the already existing notion in case X and Y are representable. From now on, if X and Y are representable, we no longer distinguish between the sheaf of differentials defined above and the one defined in Morphisms, Definition 28.34.1. We want to relate this to the usual modules of differentials for morphisms of schemes. Here is the key lemma.

Lemma 58.6.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Consider any commutative diagram*

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ a \downarrow & \psi & \downarrow b \\ X & \xrightarrow{f} & Y \end{array}$$

where the vertical arrows are étale morphisms of algebraic spaces. Then

$$\Omega_{X/Y}|_{U_{\acute{e}tale}} = \Omega_{U/V}$$

In particular, if U, V are schemes, then this is equal to the usual sheaf of differentials of the morphism of schemes $U \rightarrow V$.

Proof. By Properties of Spaces, Lemma 48.15.10 and Equation (48.15.10.1) we may think of the restriction of a sheaf on $X_{\acute{e}tale}$ to $U_{\acute{e}tale}$ as the pullback by a_{small} . Similarly for b . By Modules on Sites, Lemma 18.32.6 we have

$$\Omega_{X/Y}|_{U_{\acute{e}tale}} = \Omega_{\mathcal{O}_{U_{\acute{e}tale}}/a_{small}^{-1}f_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}}}$$

Since $a_{small}^{-1}f_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}} = \psi_{small}^{-1}b_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}} = \psi_{small}^{-1}\mathcal{O}_{V_{\acute{e}tale}}$ we see that the lemma holds. \square

Lemma 58.6.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then $\Omega_{X/Y}$ is a quasi-coherent \mathcal{O}_X -module.*

Proof. Choose a diagram as in Lemma 58.6.3 with a and b surjective and U and V schemes. Then we see that $\Omega_{X/Y}|_U = \Omega_{U/V}$ which is quasi-coherent (for example by Morphisms, Lemma 28.34.7). Hence we conclude that $\Omega_{X/Y}$ is quasi-coherent by Properties of Spaces, Lemma 48.27.6. \square

Remark 58.6.5. Now that we know that $\Omega_{X/Y}$ is quasi-coherent we can attempt to construct it in another manner. For example we can use the result of Properties of Spaces, Section 48.30 to construct the sheaf of differentials by glueing. For example

if Y is a scheme and if $U \rightarrow X$ is a surjective étale morphism from a scheme towards X , then we see that $\Omega_{U/Y}$ is a quasi-coherent \mathcal{O}_U -module, and since $s, t : R \rightarrow U$ are étale we get an isomorphism

$$\alpha : s^* \Omega_{U/Y} \rightarrow \Omega_{R/Y} \rightarrow t^* \Omega_{U/Y}$$

by using Morphisms, Lemma 28.35.16. You check that this satisfies the cocycle condition and you're done. If Y is not a scheme, then you define $\Omega_{U/Y}$ as the cokernel of the map $(U \rightarrow Y)^* \Omega_{Y/S} \rightarrow \Omega_{U/S}$, and proceed as before. This two step process is a little bit ugly. Another possibility is to glue the sheaves $\Omega_{U/V}$ for any diagram as in Lemma 58.6.3 but this is not very elegant either. Both approaches will work however, and will give a slightly more elementary construction of the sheaf of differentials.

Lemma 58.6.6. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \xrightarrow{\quad} & X \\ \downarrow & & \downarrow \\ Y' & \xrightarrow{\quad} & Y \end{array}$$

be a commutative diagram of algebraic spaces. The map $f^\sharp : \mathcal{O}_X \rightarrow f_ \mathcal{O}_{X'}$, composed with the map $f_* d_{X'/Y'} : f_* \mathcal{O}_{X'} \rightarrow f_* \Omega_{X'/Y'}$ is a Y -derivation. Hence we obtain a canonical map of \mathcal{O}_X -modules $\Omega_{X/Y} \rightarrow f_* \Omega_{X'/Y'}$, and by adjointness of f_* and f^* a canonical $\mathcal{O}_{X'}$ -module homomorphism*

$$c_f : f^* \Omega_{X/Y} \longrightarrow \Omega_{X'/Y'}.$$

It is uniquely characterized by the property that $f^ d_{X/Y}(t)$ maps to $d_{X'/Y'}(f^*t)$ for any local section t of \mathcal{O}_X .*

Proof. This is a special case of Modules on Sites, Lemma 18.32.11. □

Lemma 58.6.7. *Let S be a scheme. Let*

$$\begin{array}{ccccc} X'' & \xrightarrow{\quad g \quad} & X' & \xrightarrow{\quad f \quad} & X \\ \downarrow & & \downarrow & & \downarrow \\ Y'' & \xrightarrow{\quad} & Y' & \xrightarrow{\quad} & Y \end{array}$$

be a commutative diagram of algebraic spaces over S . Then we have

$$c_{f \circ g} = c_g \circ g^* c_f$$

as maps $(f \circ g)^ \Omega_{X/Y} \rightarrow \Omega_{X''/Y''}$.*

Proof. Omitted. Hint: Use the characterization of $c_f, c_g, c_{f \circ g}$ in terms of the effect these maps have on local sections. □

Lemma 58.6.8. *Let S be a scheme. Let $f : X \rightarrow Y, g : Y \rightarrow B$ be morphisms of algebraic spaces over S . Then there is a canonical exact sequence*

$$f^* \Omega_{Y/B} \rightarrow \Omega_{X/B} \rightarrow \Omega_{X/Y} \rightarrow 0$$

where the maps come from applications of Lemma 58.6.6.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.9, of this result via étale localization, see Lemma 58.6.3. □

Lemma 58.6.9. *Let S be a scheme. If $X \rightarrow Y$ is an immersion of algebraic spaces over S then $\Omega_{X/S}$ is zero.*

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.14, of this result via étale localization, see Lemma 58.6.3. \square

Lemma 58.6.10. *Let S be a scheme. Let B be an algebraic space over S . Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over B . There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/B} \rightarrow \Omega_{Z/B} \rightarrow 0$$

where the first arrow is induced by $d_{X/B}$ and the second arrow comes from Lemma 58.6.6.

Proof. This is the algebraic spaces version of Morphisms, Lemma 28.34.15 and will be a consequence of that lemma by étale localization, see Lemmas 58.6.3 and 58.4.2. However, we should make sure we can define the first arrow globally. Hence we explain the meaning of “induced by $d_{X/B}$ ” here. Namely, we may assume that i is a closed immersion after replacing X by an open subspace. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals corresponding to $Z \subset X$. Then $d_{X/S} : \mathcal{I} \rightarrow \Omega_{X/S}$ maps the subsheaf $\mathcal{I}^2 \subset \mathcal{I}$ to $\mathcal{I}\Omega_{X/S}$. Hence it induces a map $\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{X/S}/\mathcal{I}\Omega_{X/S}$ which is $\mathcal{O}_X/\mathcal{I}$ -linear. By Morphisms of Spaces, Lemma 49.14.1 this corresponds to a map $\mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/S}$ as desired. \square

Lemma 58.6.11. *Let S be a scheme. Let B be an algebraic space over S . Let $i : Z \rightarrow X$ be an immersion of schemes over B , and assume i (étale locally) has a left inverse. Then the canonical sequence*

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/B} \rightarrow \Omega_{Z/B} \rightarrow 0$$

of Lemma 58.6.10 is (étale locally) split exact.

Proof. Clarification: we claim that if $g : X \rightarrow Z$ is a left inverse of i , then i^*c_g is a right inverse of the map $i^*\Omega_{X/B} \rightarrow \Omega_{Z/B}$. Having said this, the result follows from the corresponding result for morphisms of schemes by étale localization, see Lemmas 58.6.3 and 58.4.2. \square

Lemma 58.6.12. *Let S be a scheme. Let $X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $g : Y' \rightarrow Y$ be a morphism of algebraic spaces over S . Let $X' = X_{Y'}$ be the base change of X . Denote $g' : X' \rightarrow X$ the projection. Then the map*

$$(g')^*\Omega_{X/Y} \rightarrow \Omega_{X'/Y'}$$

of Lemma 58.6.6 is an isomorphism.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.10 and étale localization, see Lemma 58.6.3. \square

Lemma 58.6.13. *Let S be a scheme. Let $f : X \rightarrow B$ and $g : Y \rightarrow B$ be morphisms of algebraic spaces over S with the same target. Let $p : X \times_B Y \rightarrow X$ and $q : X \times_B Y \rightarrow Y$ be the projection morphisms. The maps from Lemma 58.6.6*

$$p^*\Omega_{X/S} \oplus q^*\Omega_{Y/S} \longrightarrow \Omega_{X \times_S Y/S}$$

give an isomorphism.

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.11 and étale localization, see Lemma 58.6.3. \square

Lemma 58.6.14. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type, then $\Omega_{X/Y}$ is a finite type \mathcal{O}_X -module.*

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.12 and étale localization, see Lemma 58.6.3. \square

Lemma 58.6.15. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is locally of finite type, then $\Omega_{X/Y}$ is an \mathcal{O}_X -module of finite presentation.*

Proof. Follows from the schemes version, see Morphisms, Lemma 28.34.13 and étale localization, see Lemma 58.6.3. \square

58.7. Topological invariance of the étale site

We show that the site $X_{spaces, \acute{e}tale}$ is a “topological invariant”. It then follows that $X_{\acute{e}tale}$, which consists of the representable objects in $X_{spaces, \acute{e}tale}$, is a topological invariant too, see Lemma 58.7.2.

Theorem 58.7.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is integral, universally injective and surjective. The functor*

$$V \mapsto V_X = X \times_Y V$$

defines an equivalence of categories $Y_{spaces, \acute{e}tale} \rightarrow X_{spaces, \acute{e}tale}$.

Proof. The morphism f is representable and a universal homeomorphism, see Morphisms of Spaces, Section 49.47.

We first prove that the functor is faithful. Suppose that V', V are objects of $Y_{spaces, \acute{e}tale}$ and that $a, b : V' \rightarrow V$ are distinct morphisms over Y . Since V', V are étale over Y the equalizer

$$E = V' \times_{(a,b), V \times_Y V, \Delta_{V/Y}} V$$

of a, b is étale over Y also. Hence $E \rightarrow V'$ is an étale monomorphism (i.e., an open immersion) which is an isomorphism if and only if it is surjective. Since $X \rightarrow Y$ is a universal homeomorphism we see that this is the case if and only if $E_X = V'_X$, i.e., if and only if $a_X = b_X$.

Next, we prove that the functor is fully faithful. Suppose that V', V are objects of $Y_{spaces, \acute{e}tale}$ and that $c : V'_X \rightarrow V_X$ is a morphism over X . We want to construct a morphism $a : V' \rightarrow V$ over Y such that $a_X = c$. Let $a' : V'' \rightarrow V'$ be a surjective étale morphism such that V'' is a separated algebraic space. If we can construct a morphism $a'' : V'' \rightarrow V$ such that $a''_X = c \circ a'_X$, then the two compositions

$$V'' \times_{V'} V'' \xrightarrow{\text{Pr}_i} V'' \xrightarrow{a''} V$$

will be equal by the faithfulness of the functor proved in the first paragraph. Hence a'' will factor through a unique morphism $a : V' \rightarrow V$ as V' is (as a sheaf) the quotient of V'' by the equivalence relation $V'' \times_{V'} V''$. Hence we may assume that V' is separated. In this case the graph

$$\Gamma_c \subset (V' \times_Y V)_X$$

is open and closed (details omitted). Since $X \rightarrow Y$ is a universal homeomorphism, there exists an open and closed subspace $\Gamma \subset V' \times_Y V$ such that $\Gamma_X = \Gamma_c$. The projection $\Gamma \rightarrow V'$ is an étale morphism whose base change to X is an isomorphism. Hence $\Gamma \rightarrow V'$ is étale, universally injective, and surjective, so an isomorphism by Morphisms of Spaces, Lemma 49.45.2. Thus Γ is the graph of a morphism $a : V' \rightarrow V$ as desired.

Finally, we prove that the functor is essentially surjective. Suppose that U is an object of $X_{spaces, \acute{e}tale}$. We have to find an object V of $Y_{spaces, \acute{e}tale}$ such that $V_X \cong U$. Let $U' \rightarrow U$ be a surjective étale morphism such that $U' \cong V'_X$ and $U' \times_U U' \cong V''_X$ for some objects V'', V' of $Y_{spaces, \acute{e}tale}$. Then by fully faithfulness of the functor we obtain morphisms $s, t : V'' \rightarrow V'$ with $t_X = \text{pr}_0$ and $s_X = \text{pr}_1$ as morphisms $U' \times_U U' \rightarrow U'$. Using that $(\text{pr}_0, \text{pr}_1) : U' \times_U U' \rightarrow U' \times_S U'$ is an étale equivalence relation, and that $U' \rightarrow V'$ and $U' \times_U U' \rightarrow V''$ are universally injective and surjective we deduce that $(t, s) : V'' \rightarrow V' \times_S V'$ is an étale equivalence relation. Then the quotient $V = V'/V''$ (see Spaces, Theorem 47.10.5) is an algebraic space V over Y . There is a morphism $V' \rightarrow V$ such that $V'' = V' \times_V V'$. Thus we obtain a morphism $V \rightarrow Y$ (see Descent on Spaces, Lemma 56.6.2). On base change to X we see that we have a morphism $U' \rightarrow V_X$ and a compatible isomorphism $U' \times_{V_X} U' = U' \times_U U'$, which implies that $V_X \cong U$ (by the lemma just cited once more).

Pick a scheme W and a surjective étale morphism $W \rightarrow Y$. Pick a scheme U' and a surjective étale morphism $U' \rightarrow U \times_X W_X$. Note that U' and $U' \times_U U'$ are schemes étale over X whose structure morphism to X factors through the scheme W_X . Hence by Étale Cohomology, Theorem 44.46.1 there exist schemes V', V'' étale over W whose base change to W_X is isomorphic to respectively U' and $U' \times_U U'$. This finishes the proof. \square

Lemma 58.7.2. *With assumption and notation as in Theorem 58.7.1 the equivalence of categories $Y_{spaces, \acute{e}tale} \rightarrow X_{spaces, \acute{e}tale}$ restricts to an equivalence of categories $Y_{\acute{e}tale} \rightarrow X_{\acute{e}tale}$.*

Proof. This is just the statement that given an object $V \in Y_{spaces, \acute{e}tale}$ we have V is a scheme if and only if $V \times_Y X$ is a scheme. Since $V \times_Y X \rightarrow V$ is integral, universally injective, and surjective (as a base change of $X \rightarrow Y$) this follows from Limits of Spaces, Lemma 52.15.4. \square

Remark 58.7.3. A universal homeomorphism of algebraic spaces need not be representable, see Morphisms of Spaces, Example 49.47.3. The argument in the proof of Theorem 58.7.1 above cannot be used in this case. In fact we do not know whether given a universal homeomorphism of algebraic spaces $f : X \rightarrow Y$ the categories $X_{spaces, \acute{e}tale}$ and $Y_{spaces, \acute{e}tale}$ are equivalent. If you do, please email stacks.project@gmail.com.

58.8. Thickenings

The following terminology may not be completely standard, but it is convenient.

Definition 58.8.1. *Thickenings.* Let S be a scheme.

- (1) We say an algebraic space X' is a *thickening* of an algebraic space X if X is a closed subspace of X' and the associated topological spaces are equal.

- (2) We say X' is a *first order thickening* of X if X is a closed subspace of X' and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X'}$ defining X has square zero.
- (3) Given two thickenings $X \subset X'$ and $Y \subset Y'$ a *morphism of thickenings* is a morphism $f' : X' \rightarrow Y'$ such that $f(X) \subset Y$, i.e., such that $f'|_X$ factors through the closed subspace Y . In this situation we set $f = f'|_X : X \rightarrow Y$ and we say that $(f, f') : (X \subset X') \rightarrow (Y \subset Y')$ is a morphism of thickenings.
- (4) Let B be an algebraic space. We similarly define *thickenings over B* , and *morphisms of thickenings over B* . This means that the spaces X, X', Y, Y' above are algebraic spaces endowed with a structure morphism to B , and that the morphisms $X \rightarrow X', Y \rightarrow Y'$ and $f' : X' \rightarrow Y'$ are morphisms over B .

The fundamental equivalence. Note that if $X \subset X'$ is a thickening, then $X \rightarrow X'$ is integral and universally bijective. This implies that

$$(58.8.1.1) \quad X_{spaces, \acute{e}tale} = X'_{spaces, \acute{e}tale}$$

via the pullback functor, see Theorem 58.7.1. Hence we may think of $\mathcal{O}_{X'}$ as a sheaf on $X_{spaces, \acute{e}tale}$. Thus a canonical equivalence of locally ringed topoi

$$(58.8.1.2) \quad (Sh(X'_{spaces, \acute{e}tale}), \mathcal{O}_{X'}) \cong (Sh(X_{spaces, \acute{e}tale}), \mathcal{O}_{X'})$$

Below we will frequently combine this with the fully faithfulness result of Properties of Spaces, Theorem 48.26.4. For example the closed immersion $i_X : X \rightarrow X'$ corresponds to the surjective map $i_X^\# : \mathcal{O}_{X'} \rightarrow \mathcal{O}_X$.

Let S be a scheme, and let B be an algebraic space over S . Let $(f, f') : (X \subset X') \rightarrow (Y \subset Y')$ be a morphism of thickenings over B . Note that the diagram of continuous functors

$$\begin{array}{ccc} X_{spaces, \acute{e}tale} & \longleftarrow & Y_{spaces, \acute{e}tale} \\ \uparrow & & \uparrow \\ X'_{spaces, \acute{e}tale} & \longleftarrow & Y'_{spaces, \acute{e}tale} \end{array}$$

is commutative and the vertical arrows are equivalences. Hence $f_{spaces, \acute{e}tale}, f_{small}, f'_{spaces, \acute{e}tale},$ and f'_{small} all define the same morphism of topoi. Thus we may think of

$$(f')^\# : f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_{Y'} \longrightarrow \mathcal{O}_{X'}$$

as a map of sheaves of \mathcal{O}_B -algebras fitting into the commutative diagram

$$\begin{array}{ccc} f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_Y & \xrightarrow{f^\#} & \mathcal{O}_X \\ i_Y^\# \uparrow & & \uparrow i_X^\# \\ f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_{Y'} & \xrightarrow{(f')^\#} & \mathcal{O}_{X'} \end{array}$$

Here $i_X : X \rightarrow X'$ and $i_Y : Y \rightarrow Y'$ are the names of the given closed immersions.

Lemma 58.8.2. *Let S be a scheme. Let B be an algebraic space over S . Let $X \subset X'$ and $Y \subset Y'$ be thickenings of algebraic spaces over B . Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over B . Given any map of \mathcal{O}_B -algebras*

$$\alpha : f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_{Y'} \rightarrow \mathcal{O}_{X'}$$

such that

$$\begin{array}{ccc}
 f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_Y & \xrightarrow{f^\#} & \mathcal{O}_X \\
 i_Y^\# \uparrow & & \uparrow i_X^\# \\
 f_{spaces, \acute{e}tale}^{-1} \mathcal{O}_{Y'} & \xrightarrow{\alpha} & \mathcal{O}_{X'}
 \end{array}$$

commutes, there exists a unique morphism of (f, f') of thickenings over B such that $\alpha = (f')^\#$.

Proof. To find f' , by Properties of Spaces, Theorem 48.26.4, all we have to do is show that the morphism of ringed topoi

$$(f_{spaces, \acute{e}tale}, \alpha) : (Sh(X_{spaces, \acute{e}tale}), \mathcal{O}_{X'}) \longrightarrow (Sh(Y_{spaces, \acute{e}tale}), \mathcal{O}_{Y'})$$

is a morphism of locally ringed topoi. This follows directly from the definition of morphisms of locally ringed topoi (Modules on Sites, Definition 18.39.8), the fact that $(f, f^\#)$ is a morphism of locally ringed topoi (Properties of Spaces, Lemma 48.26.1), that α fits into the given commutative diagram, and the fact that the kernels of $i_X^\#$ and $i_Y^\#$ are locally nilpotent. Finally, the fact that $f' \circ i_X = i_Y \circ f$ follows from the commutativity of the diagram and another application of Properties of Spaces, Theorem 48.26.4. We omit the verification that f' is a morphism over B . \square

Lemma 58.8.3. *Let S be a scheme. Let $X \subset X'$ be a thickening of algebraic spaces over S . For any open subspace $U \subset X$ there exists a unique open subspace $U' \subset X'$ such that $U = X \times_{X'} U'$.*

Proof. Let $U' \rightarrow X'$ be the object of $X'_{spaces, \acute{e}tale}$ corresponding to the object $U \rightarrow X$ of $X_{spaces, \acute{e}tale}$ via (58.8.1.1). The morphism $U' \rightarrow X'$ is étale and universally injective, hence an open immersion, see Morphisms of Spaces, Lemma 49.45.2. \square

Finite order thickenings. Let $i_X : X \rightarrow X'$ be a thickening of algebraic spaces. Any local section of the kernel $\mathcal{I} = \text{Ker}(i_X^\#) \subset \mathcal{O}_{X'}$ is locally nilpotent. Let us say that $X \subset X'$ is a *finite order thickening* if the ideal sheaf \mathcal{I} is “globally” nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1} = 0$. Technically the class of finite order thickenings $X \subset X'$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$0 \subset \mathcal{I}^n \subset \mathcal{I}^{n-1} \subset \dots \subset \mathcal{I} \subset \mathcal{O}_{X'}$$

and we see that X' is filtered by closed subspaces

$$X = X_0 \subset X_1 \subset \dots \subset X_{n-1} \subset X_{n+1} = X'$$

such that each pair $X_i \subset X_{i+1}$ is a first order thickening over B . Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.

Lemma 58.8.4. *Let S be a scheme. Let $X \subset X'$ be a thickening of algebraic spaces over S . Let U be an affine object of $X_{spaces, \acute{e}tale}$. Then*

$$\Gamma(U, \mathcal{O}_{X'}) \rightarrow \Gamma(U, \mathcal{O}_X)$$

is surjective where we think of $\mathcal{O}_{X'}$ as a sheaf on $X_{spaces, \acute{e}tale}$ via (58.8.1.2).

Proof. Let $U' \rightarrow X'$ be the étale morphism of algebraic spaces such that $U = X \times_{X'} U'$, see Theorem 58.7.1. By Limits of Spaces, Lemma 52.15.1 we see that U' is an affine scheme. Hence $\Gamma(U, \mathcal{O}_{X'}) = \Gamma(U', \mathcal{O}_{U'}) \rightarrow \Gamma(U, \mathcal{O}_U)$ is surjective as $U \rightarrow U'$ is a closed immersion of affine schemes. Below we give a direct proof for finite order thickenings which is the case most used in practice. \square

Proof for finite order thickenings. We may assume that $X \subset X'$ is a first order thickening by the principle explained above. Denote \mathcal{I} the kernel of the surjection $\mathcal{O}_{X'} \rightarrow \mathcal{O}_X$. As \mathcal{I} is a quasi-coherent $\mathcal{O}_{X'}$ -module and since $\mathcal{I}^2 = 0$ by the definition of a first order thickening we may apply Morphisms of Spaces, Lemma 49.14.1 to see that \mathcal{I} is a quasi-coherent \mathcal{O}_X -module. Hence the lemma follows from the long exact cohomology sequence associated to the short exact sequence

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0$$

and the fact that $H_{\text{étale}}^1(U, \mathcal{I}) = 0$ as \mathcal{I} is quasi-coherent, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. \square

Lemma 58.8.5. *Let S be a scheme. Let $X \subset X'$ be a thickening of algebraic spaces over S . If X is (representable by) a scheme, then so is X' .*

Proof. Note that $X'_{\text{red}} = X_{\text{red}}$. Hence if X is a scheme, then X'_{red} is a scheme. Thus the result follows from Limits of Spaces, Lemma 52.15.3. Below we give a direct proof for finite order thickenings which is the case most often used in practice. \square

Proof for finite order thickenings. It suffices to prove this when X' is a first order thickening of X . By Properties of Spaces, Lemma 48.10.1 there is a largest open subspace of X' which is a scheme. Thus we have to show that every point x of $|X'| = |X|$ is contained in an open subspace of X' which is a scheme. Using Lemma 58.8.3 we may replace $X \subset X'$ by $U \subset U'$ with $x \in U$ and U an affine scheme. Hence we may assume that X is affine. Thus we reduce to the case discussed in the next paragraph.

Assume $X \subset X'$ is a first order thickening where X is an affine scheme. Set $A = \Gamma(X, \mathcal{O}_X)$ and $A' = \Gamma(X', \mathcal{O}_{X'})$. By Lemma 58.8.4 the map $A \rightarrow A'$ is surjective. The kernel I is an ideal of square zero. By Properties of Spaces, Lemma 48.31.1 we obtain a canonical morphism $f : X' \rightarrow \text{Spec}(A')$ which fits into the following commutative diagram

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \parallel & & \downarrow f \\ \text{Spec}(A) & \longrightarrow & \text{Spec}(A') \end{array}$$

Because the horizontal arrows are thickenings it is clear that f is universally injective and surjective. Hence it suffices to show that f is étale, since then Morphisms of Spaces, Lemma 49.45.2 will imply that f is an isomorphism.

To prove that f is étale choose an affine scheme U' and an étale morphism $U' \rightarrow X'$. It suffices to show that $U' \rightarrow X' \rightarrow \text{Spec}(A')$ is étale, see Properties of Spaces, Definition 48.13.2. Write $U' = \text{Spec}(B')$. Set $U = X \times_{X'} U'$. Since U is a closed subspace of U' , it is a closed subscheme, hence $U = \text{Spec}(B)$ with $B' \rightarrow B$ surjective. Denote $J = \text{Ker}(B' \rightarrow B)$ and note that $J = \Gamma(U, \mathcal{I})$ where

$\mathcal{I} = \text{Ker}(\mathcal{O}_{X'} \rightarrow \mathcal{O}_X)$ on $X_{spaces, \acute{e}tale}$ as in the proof of Lemma 58.8.4. The morphism $U' \rightarrow X' \rightarrow \text{Spec}(A')$ induces a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & J & \longrightarrow & B' & \longrightarrow & B & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I & \longrightarrow & A' & \longrightarrow & A & \longrightarrow & 0 \end{array}$$

Now, since \mathcal{I} is a quasi-coherent \mathcal{O}_X -module we have $\mathcal{I} = (\tilde{I})^a$, see Descent, Definition 34.7.2 for notation and Descent, Proposition 34.7.11 for why this is true. Hence we see that $J = I \otimes_A B$. Finally, note that $A \rightarrow B$ is étale as $U \rightarrow X$ is étale as the base change of the étale morphism $U' \rightarrow X'$. We conclude that $A' \rightarrow B'$ is étale by Algebra, Lemma 10.138.12. \square

Lemma 58.8.6. *Let S be a scheme. Let $X \subset X'$ be a thickening of algebraic spaces over S . The functor*

$$V' \mapsto V = X \times_{X'} V'$$

defines an equivalence of categories $X'_{\acute{e}tale} \rightarrow X_{\acute{e}tale}$.

Proof. The functor $V' \mapsto V$ defines an equivalence of categories $X'_{spaces, \acute{e}tale} \rightarrow X_{spaces, \acute{e}tale}$, see Theorem 58.7.1. Thus it suffices to show that V is a scheme if and only if V' is a scheme. This is the content of Lemma 58.8.5. \square

First order thickenings are described as follows.

Lemma 58.8.7. *Let S be a scheme. Let $f : X \rightarrow B$ be a morphism of algebraic spaces over S . Consider a short exact sequence*

$$0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_X \rightarrow 0$$

of sheaves on $X_{\acute{e}tale}$ where \mathcal{A} is a sheaf of $f^{-1}\mathcal{O}_B$ -algebras, $\mathcal{A} \rightarrow \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_B$ -algebras, and \mathcal{I} is its kernel. If

- (1) \mathcal{I} is an ideal of square zero in \mathcal{A} , and
- (2) \mathcal{I} is quasi-coherent as an \mathcal{O}_X -module

then there exists a first order thickening $X \subset X'$ over B and an isomorphism $\mathcal{O}_{X'} \rightarrow \mathcal{A}$ of $f^{-1}\mathcal{O}_B$ -algebras compatible with the surjections to \mathcal{O}_X .

Proof. In this proof we redo some of the arguments used in the proofs of Lemmas 58.8.4 and 58.8.5. We first handle the case $B = S = \text{Spec}(\mathbf{Z})$. Let U be an affine scheme, and let $U \rightarrow X$ be étale. Then

$$0 \rightarrow \mathcal{I}(U) \rightarrow \mathcal{A}(U) \rightarrow \mathcal{O}_X(U) \rightarrow 0$$

is exact as $H^1(U_{\acute{e}tale}, \mathcal{I}) = 0$ as \mathcal{I} is quasi-coherent, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. If $V \rightarrow U$ is a morphism of affine objects of $X_{spaces, \acute{e}tale}$ then

$$\mathcal{I}(V) = \mathcal{I}(U) \otimes_{\mathcal{O}_X(U)} \mathcal{O}_X(V)$$

since \mathcal{I} is a quasi-coherent \mathcal{O}_X -module, see Descent, Proposition 34.7.11. Hence $\mathcal{A}(U) \rightarrow \mathcal{A}(V)$ is an étale ring map, see Algebra, Lemma 10.138.12. Hence we see that

$$U \mapsto U' = \text{Spec}(\mathcal{A}(U))$$

is a functor from $X_{\text{affine}, \text{étale}}$ to the category of affine schemes and étale morphisms. In fact, we claim that this functor can be extended to a functor $U \mapsto U'$ on all of $X_{\text{étale}}$. To see this, if U is an object of $X_{\text{étale}}$, note that

$$0 \rightarrow \mathcal{I}|_{U_{Z_{\text{ar}}}} \rightarrow \mathcal{A}|_{U_{Z_{\text{ar}}}} \rightarrow \mathcal{O}_X|_{U_{Z_{\text{ar}}}} \rightarrow 0$$

and $\mathcal{I}|_{U_{Z_{\text{ar}}}}$ is a quasi-coherent sheaf on U , see Descent, Proposition 34.7.14. Hence by More on Morphisms, Lemma 36.2.2 we obtain a first order thickening $U \subset U'$ of schemes such that $\mathcal{O}_{U'}$ is isomorphic to $\mathcal{A}|_{U_{Z_{\text{ar}}}}$. It is clear that this construction is compatible with the construction for affines above.

Choose a presentation $X = U/R$, see Spaces, Definition 47.9.3 so that $s, t : R \rightarrow U$ define an étale equivalence relation. Applying the functor above we obtain an étale equivalence relation $s', t' : R' \rightarrow U'$ in schemes. Consider the algebraic space $X' = U'/R'$ (see Spaces, Theorem 47.10.5). The morphism $X = U/R \rightarrow U'/R' = X'$ is a first order thickening. Consider $\mathcal{O}_{X'}$ viewed as a sheaf on $X_{\text{étale}}$. By construction we have an isomorphism

$$\gamma : \mathcal{O}_{X'}|_{U_{\text{étale}}} \longrightarrow \mathcal{A}|_{U_{\text{étale}}}$$

such that $s^{-1}\gamma$ agrees with $t^{-1}\gamma$ on $R_{\text{étale}}$. Hence by Properties of Spaces, Lemma 48.15.13 this implies that γ comes from a unique isomorphism $\mathcal{O}_{X'} \rightarrow \mathcal{A}$ as desired.

To handle the case of a general base algebraic space B , we first construct X' as an algebraic space over \mathbf{Z} as above. Then we use the isomorphism $\mathcal{O}_{X'} \rightarrow \mathcal{A}$ to define $f^{-1}\mathcal{O}_B \rightarrow \mathcal{O}_{X'}$. According to Lemma 58.8.2 this defines a morphism $X' \rightarrow B$ compatible with the given morphism $X \rightarrow B$ and we are done. \square

Lemma 58.8.8. *Let S be a scheme. Let $Y \subset Y'$ be a thickening of algebraic spaces over S . Let $X' \rightarrow Y'$ be a morphism and set $X = Y \times_{Y'} X'$. Then $(X \subset X') \rightarrow (Y \subset Y')$ is a morphism of thickenings. If $Y \subset Y'$ is a first (resp. finite order) thickening, then $X \subset X'$ is a first (resp. finite order) thickening.*

Proof. Omitted. \square

Lemma 58.8.9. *Let S be a scheme. Let $(f, f') : (X \subset X') \rightarrow (Y \subset Y')$ be a morphism of thickenings of algebraic spaces over S . Then*

- (1) f is an affine morphism if and only if f' is an affine morphism,
- (2) f is a surjective morphism if and only if f' is a surjective morphism,
- (3) f is quasi-compact if and only if f' quasi-compact,
- (4) f is universally closed if and only if f' is universally closed,
- (5) f is integral if and only if f' is integral,
- (6) f is (quasi-)separated if and only if f' is (quasi-)separated,
- (7) f is universally injective if and only if f' is universally injective,
- (8) f is universally open if and only if f' is universally open, and
- (9) add more here.

Proof. Observe that $Y \rightarrow Y'$ and $X \rightarrow X'$ are integral and universal homeomorphisms. This immediately implies parts (2), (3), (4), (7), and (8). Part (1) follows from Limits of Spaces, Proposition 52.15.2 which tells us that there is a 1-to-1 correspondence between affine schemes étale over X and X' and between affine schemes étale over Y and Y' . Part (5) follows from (1) and (4) by Morphisms of Spaces, Lemma 49.41.7. Finally, note that

$$X \times_Y X = X \times_{Y'} X \rightarrow X \times_{Y'} X' \rightarrow X' \times_{Y'} X'$$

is a thickening (the two arrows are thickenings by Lemma 58.8.8). Hence applying (3) and (4) to the morphism $(X \subset X') \rightarrow (X \times_Y X \rightarrow X' \times_{Y'} X')$ we obtain (6). \square

Lemma 58.8.10. *Let $(f, f') : (X \subset X') \rightarrow (S \subset S')$ be a morphism of thickenings such that $X = S \times_{S'} X'$. If $S \subset S'$ is a finite order thickening, then*

- (1) *f is a closed immersion if and only if f' is a closed immersion,*
- (2) *f is locally of finite type if and only if f' is locally of finite type,*
- (3) *f is locally quasi-finite if and only if f' is locally quasi-finite,*
- (4) *f is locally of finite type of relative dimension d if and only if f' is locally of finite type of relative dimension d ,*
- (5) *f is unramified if and only if f' is unramified,*
- (6) *f is proper if and only if f' is proper,*
- (7) *f is a finite morphism if and only if f' is a finite morphism, and*
- (8) *add more here.*

Proof. Choose a scheme V' and a surjective étale morphism $V' \rightarrow Y'$. Choose a scheme U' and a surjective étale morphism $U' \rightarrow X' \times_{Y'} V'$. Set $V = Y \times_{Y'} V'$ and $U = X \times_{X'} U'$. Then for étale local properties of morphisms we can reduce to the morphism of thickenings of schemes $(U \subset U') \rightarrow (V \subset V')$ and apply More on Morphisms, Lemma 36.2.5. This proves (2), (3), (4), and (5).

The properties of morphisms in (1), (6), (7) are stable under base change, hence if f' has property \mathcal{P} , then so does f . See Spaces, Lemma 47.12.3, and Morphisms of Spaces, Lemmas 49.37.3, 49.41.5.

The interesting direction in (1), (6), (7) to assume that f has the property and deduce that f' has it too. By induction on the order of the thickening we may assume that $S \subset S'$ is a first order thickening, see discussion on finite order thickenings above.

Proof of (1). Choose a scheme V' and a surjective étale morphism $V' \rightarrow Y'$. Set $V = Y \times_{Y'} V'$, $U' = X' \times_{Y'} V'$ and $U = X \times_Y V$. Then $U \rightarrow V$ is a closed immersion, which implies that U is a scheme, which in turn implies that U' is a scheme (Lemma 58.8.5). Thus we can apply the lemma in the case of schemes to $(U \subset U') \rightarrow (V \subset V')$ to conclude.

Proof of (6). Follows by combining (2) with results of Lemma 58.8.9 and the fact that proper equals quasi-compact + separated + locally of finite type + universally closed.

Proof of (7). Follows by combining (2) with results of Lemma 58.8.9 and using the fact that finite equals integral + locally of finite type (Morphisms, Lemma 28.44.4). \square

58.9. First order infinitesimal neighbourhood

A natural construction of first order thickenings is the following. Suppose that $i : Z \rightarrow X$ be an immersion of algebraic spaces. Choose an open subspace $U \subset X$ such that i identifies Z with a closed subspace $Z \subset U$ (see Morphisms of Spaces, Remark 49.12.4). Let $\mathcal{I} \subset \mathcal{O}_U$ be the quasi-coherent sheaf of ideals defining Z in U , see Morphisms of Spaces, Lemma 49.13.1. Then we can consider the closed subspace $Z' \subset U$ defined by the quasi-coherent sheaf of ideals \mathcal{I}^2 .

Definition 58.9.1. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces. The *first order infinitesimal neighbourhood* of Z in X is the first order thickening $Z \subset Z'$ over X described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open U).

Lemma 58.9.2. *Let $i : Z \rightarrow X$ be an immersion of algebraic spaces. The first order infinitesimal neighbourhood Z' of Z in X has the following universal property: Given any commutative diagram*

$$\begin{array}{ccc} Z & \xleftarrow{a} & T \\ i \downarrow & & \downarrow \\ X & \xleftarrow{b} & T' \end{array}$$

where $T \subset T'$ is a first order thickening over X , there exists a unique morphism $(a', a) : (T \subset T') \rightarrow (Z \subset Z')$ of thickenings over X .

Proof. Let $U \subset X$ be the open subspace used in the construction of Z' , i.e., an open such that Z is identified with a closed subspace of U cut out by the quasi-coherent sheaf of ideals \mathcal{I} . Since $|T| = |T'|$ we see that $|b|(|T'|) \subset |U|$. Hence we can think of b as a morphism into U , see Properties of Spaces, Lemma 48.4.9. Let $\mathcal{J} \subset \mathcal{O}_{T'}$ be the square zero quasi-coherent sheaf of ideals cutting out T . By the commutativity of the diagram we have $b|_T = i \circ a$ where $i : Z \rightarrow U$ is the closed immersion. We conclude that $b^\sharp(b^{-1}\mathcal{I}) \subset \mathcal{J}$ by Morphisms of Spaces, Lemma 49.13.1. As T' is a first order thickening of T we see that $\mathcal{J}^2 = 0$ hence $b^\sharp(b^{-1}(\mathcal{I}^2)) = 0$. By Morphisms of Spaces, Lemma 49.13.1 this implies that b factors through Z' . Letting $a' : T' \rightarrow Z'$ be this factorization we win. \square

Lemma 58.9.3. *Let $i : Z \rightarrow X$ be an immersion of algebraic spaces. Let $Z \subset Z'$ be the first order infinitesimal neighbourhood of Z in X . Then the diagram*

$$\begin{array}{ccc} Z & \longrightarrow & Z' \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

induces a map of conormal sheaves $\mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Z'}$ by Lemma 58.4.3. This map is an isomorphism.

Proof. This is clear from the construction of Z' above. \square

58.10. Formally smooth, étale, unramified transformations

Recall that a ring map $R \rightarrow A$ is called *formally smooth*, resp. *formally étale*, resp. *formally unramified* (see Algebra, Definition 10.133.1, resp. Definition 10.143.1, resp. Definition 10.141.1) if for every commutative solid diagram

$$\begin{array}{ccc} A & \longrightarrow & B/I \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & B \end{array}$$

where $I \subset B$ is an ideal of square zero, there exists a, resp. exists a unique, resp. exists at most one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of algebraic spaces, and more generally functors.

Definition 58.10.1. Let S be a scheme. Let $a : F \rightarrow G$ be a transformation of functors $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Consider commutative solid diagrams of the form

$$\begin{array}{ccc} F & \longleftarrow & T \\ a \downarrow & \nearrow & \downarrow i \\ G & \longleftarrow & T' \end{array}$$

where T and T' are affine schemes and i is a closed immersion defined by an ideal of square zero.

- (1) We say a is *formally smooth* if given any solid diagram as above there exists a dotted arrow making the diagram commute¹.
- (2) We say a is *formally étale* if given any solid diagram as above there exists exactly one dotted arrow making the diagram commute.
- (3) We say a is *formally unramified* if given any solid diagram as above there exists at most one dotted arrow making the diagram commute.

Lemma 58.10.2. Let S be a scheme. Let $a : F \rightarrow G$ be a transformation of functors $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Then a is *formally étale* if and only if a is both *formally smooth* and *formally unramified*.

Proof. Formal from the definition. □

Lemma 58.10.3. *Composition.*

- (1) A composition of *formally smooth* transformations of functors is *formally smooth*.
- (2) A composition of *formally étale* transformations of functors is *formally étale*.
- (3) A composition of *formally unramified* transformations of functors is *formally unramified*.

Proof. This is formal. □

Lemma 58.10.4. Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$, $b : H \rightarrow G$ be transformations of functors. Consider the fibre product diagram

$$\begin{array}{ccc} H \times_{b, G, a} F & \xrightarrow{\quad} & F \\ a' \downarrow & & \downarrow a \\ H & \xrightarrow{\quad b \quad} & G \end{array}$$

- (1) If a is *formally smooth*, then the base change a' is *formally smooth*.
- (2) If a is *formally étale*, then the base change a' is *formally étale*.
- (3) If a is *formally unramified*, then the base change a' is *formally unramified*.

¹This is just one possible definition that one can make here. Another slightly weaker condition would be to require that the dotted arrow exists fppf locally on T' . This weaker notion has in some sense better formal properties.

Proof. This is formal. □

Lemma 58.10.5. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a representable transformation of functors.*

- (1) *If a is smooth then a is formally smooth.*
- (2) *If a is étale, then a is formally étale.*
- (3) *If a is unramified, then a is formally unramified.*

Proof. Consider a solid commutative diagram

$$\begin{array}{ccc}
 F & \longleftarrow & T \\
 a \downarrow & \nearrow \text{---} & \downarrow i \\
 G & \longleftarrow & T'
 \end{array}$$

as in Definition 58.10.1. Then $F \times_G T'$ is a scheme smooth (resp. étale, resp. unramified) over T' . Hence by More on Morphisms, Lemma 36.9.7 (resp. Lemma 36.6.9, resp. Lemma 36.4.8) we can fill in (resp. uniquely fill in, resp. fill in in at most one way) the dotted arrow in the diagram

$$\begin{array}{ccc}
 F \times_G T' & \longleftarrow & T \\
 \downarrow & \nearrow \text{---} & \downarrow i \\
 T' & \longleftarrow & T'
 \end{array}$$

and hence we also obtain the corresponding assertion in the first diagram. □

Lemma 58.10.6. *Let S be a scheme contained in Sch_{fppf} . Let $F, G, H : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$, $b : G \rightarrow H$ be transformations of functors. Assume that a is representable, surjective, and étale.*

- (1) *If b is formally smooth, then $b \circ a$ is formally smooth.*
- (2) *If b is formally étale, then $b \circ a$ is formally étale.*
- (3) *If b is formally unramified, then $b \circ a$ is formally unramified.*

Conversely, consider a solid commutative diagram

$$\begin{array}{ccc}
 G & \longleftarrow & T \\
 b \downarrow & \nearrow \text{---} & \downarrow i \\
 H & \longleftarrow & T'
 \end{array}$$

with T' an affine scheme over S and $i : T \rightarrow T'$ a closed immersion defined by an ideal of square zero.

- (4) *If $b \circ a$ is formally smooth, then for every $t \in T$ there exists an étale morphism of affines $U' \rightarrow T'$ and a morphism $U' \rightarrow G$ such that*

$$\begin{array}{ccccc}
 G & \longleftarrow & T & \longleftarrow & T \times_{T'} U' \\
 b \downarrow & & & \searrow & \downarrow \\
 H & \longleftarrow & T' & \longleftarrow & U'
 \end{array}$$

commutes and t is in the image of $U' \rightarrow T'$.

- (5) *If $b \circ a$ is formally unramified, then there exists at most one dotted arrow in the diagram above, i.e., b is formally unramified.*

(6) *If $b \circ a$ is formally étale, then there exists exactly one dotted arrow in the diagram above, i.e., b is formally étale.*

Proof. Assume b is formally smooth (resp. formally étale, resp. formally unramified). Since an étale morphism is both smooth and unramified we see that a is representable and smooth (resp. étale, resp. unramified). Hence parts (1), (2) and (3) follow from a combination of Lemma 58.10.5 and Lemma 58.10.3.

Assume that $b \circ a$ is formally smooth. Consider a diagram as in the statement of the lemma. Let $W = F \times_G T$. By assumption W is a scheme surjective étale over T . By Étale Morphisms, Theorem 40.15.2 there exists a scheme W' étale over T' such that $W = T \times_{T'} W'$. Choose an affine open subscheme $U' \subset W'$ such that t is in the image of $U' \rightarrow T'$. Because $b \circ a$ is formally smooth we see that there exist morphisms $U' \rightarrow F$ such that

$$\begin{array}{ccccc}
 F & \longleftarrow & W & \longleftarrow & T \times_{T'} U' \\
 \downarrow b \circ a & & & \searrow & \downarrow \\
 H & \longleftarrow & T' & \longleftarrow & U'
 \end{array}$$

commutes. Taking the composition $U' \rightarrow F \rightarrow G$ gives a map as in part (5) of the lemma.

Assume that $f, g : T' \rightarrow G$ are two dotted arrows fitting into the diagram of the lemma. Let $W = F \times_G T$. By assumption W is a scheme surjective étale over T . By Étale Morphisms, Theorem 40.15.2 there exists a scheme W' étale over T' such that $W = T \times_{T'} W'$. Since a is formally étale the compositions

$$W' \rightarrow T' \xrightarrow{f} G \quad \text{and} \quad W' \rightarrow T' \xrightarrow{g} G$$

lift to morphisms $f', g' : W' \rightarrow F$ (lift on affine opens and glue by uniqueness). Now if $b \circ a : F \rightarrow H$ is formally unramified, then $f' = g'$ and hence $f = g$ as $W' \rightarrow T'$ is an étale covering. This proves part (6) of the lemma.

Assume that $b \circ a$ is formally étale. Then by part (4) we can étale locally on T' find a dotted arrow fitting into the diagram and by part (5) this dotted arrow is unique. Hence we may glue the local solutions to get assertion (6). Some details omitted. \square

Remark 58.10.7. It is tempting to think that in the situation of Lemma 58.10.6 we have “ b formally smooth” \Leftrightarrow “ $b \circ a$ formally smooth”. However, this is likely not true in general.

Lemma 58.10.8. *Let S be a scheme. Let $F, G, H : (\text{Sch}/S)_{fppf}^{opp} \rightarrow \text{Sets}$. Let $a : F \rightarrow G$, $b : G \rightarrow H$ be transformations of functors. Assume b is formally unramified.*

- (1) *If $b \circ a$ is formally unramified then a is formally unramified.*
- (2) *If $b \circ a$ is formally étale then a is formally étale.*
- (3) *If $b \circ a$ is formally smooth then a is formally smooth.*

Proof. Let $T \subset T'$ be a closed immersion of affine schemes defined by an ideal of square zero. Let $g' : T' \rightarrow G$ and $f : T \rightarrow F$ be given such that $g'|_T = a \circ f$. Because b is formally unramified, there is a one to one correspondence between

$$\{f' : T' \rightarrow F \mid f = f'|_T \text{ and } a \circ f' = g'\}$$

and

$$\{f' : T' \rightarrow F \mid f = f'|_T \text{ and } b \circ a \circ f' = b \circ g'\}.$$

From this the lemma follows formally. □

58.11. Formally unramified morphisms

In this section we work out what it means that a morphism of algebraic spaces is formally unramified.

Definition 58.11.1. Let S be a scheme. A morphism $f : X \rightarrow Y$ of algebraic spaces over S is said to be *formally unramified* if it is formally unramified as a transformation of functors as in Definition 58.10.1.

We will not restate the results proved in the more general setting of formally unramified transformations of functors in Section 58.10. It turns out we can characterize this property in terms of vanishing of the module of relative differentials, see Lemma 58.11.6.

Lemma 58.11.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is formally unramified,
- (2) for every diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally unramified (as in *More on Morphisms*, Definition 36.4.1), and

- (3) for one such diagram with surjective vertical arrows the morphism ψ is formally unramified.

Proof. Assume f is formally unramified. By Lemma 58.10.5 the morphisms $U \rightarrow X$ and $V \rightarrow Y$ are formally unramified. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally unramified. Then it follows from Lemma 58.10.8 that $U \rightarrow V$ is formally unramified. Thus (1) implies (2). And (2) implies (3) trivially

Assume given a diagram as in (3). By Lemma 58.10.5 the morphism $V \rightarrow Y$ is formally unramified. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally unramified. Then it follows from Lemma 58.10.6 that $X \rightarrow Y$ is formally unramified, i.e., (1) holds. □

Lemma 58.11.3. *Let S be a scheme. If $f : X \rightarrow Y$ is a formally unramified morphism of algebraic spaces over S , then given any solid commutative diagram*

$$\begin{array}{ccc} X & \longleftarrow & T \\ \downarrow f & \nearrow & \downarrow i \\ S & \longleftarrow & T' \end{array}$$

where $T \subset T'$ is a first order thickening of algebraic spaces over S there exists at most one dotted arrow making the diagram commute. In other words, in Definition 58.11.1 the condition that T be an affine scheme may be dropped.

Proof. This is true because there exists a surjective étale morphism $U' \rightarrow T'$ where U' is a disjoint union of affine schemes (see Properties of Spaces, Lemma 48.6.1) and a morphism $T' \rightarrow X$ is determined by its restriction to U' . \square

Lemma 58.11.4. *A composition of formally unramified morphisms is formally unramified.*

Proof. This is formal. \square

Lemma 58.11.5. *A base change of a formally unramified morphism is formally unramified.*

Proof. This is formal. \square

Lemma 58.11.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is formally unramified, and
- (2) $\Omega_{X/Y} = 0$.

Proof. This is a combination of Lemma 58.11.2, More on Morphisms, Lemma 36.4.7, and Lemma 58.6.3. \square

Lemma 58.11.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) The morphism f is unramified,
- (2) the morphism f is locally of finite type and $\Omega_{X/Y} = 0$, and
- (3) the morphism f is locally of finite type and formally unramified.

Proof. Choose a diagram

$$\begin{array}{ccc} U & \xrightarrow{\psi} & V \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale and surjective. Then we see

$$\begin{aligned} f \text{ unramified} &\Leftrightarrow \psi \text{ unramified} \\ &\Leftrightarrow \psi \text{ locally finite type and } \Omega_{U/V} = 0 \\ &\Leftrightarrow f \text{ locally finite type and } \Omega_{X/Y} = 0 \\ &\Leftrightarrow f \text{ locally finite type and formally unramified} \end{aligned}$$

Here we have used Morphisms, Lemma 28.36.2 and Lemma 58.11.6. \square

Lemma 58.11.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is unramified and a monomorphism,
- (2) f is unramified and universally injective,
- (3) f is locally of finite type and a monomorphism,
- (4) f is universally injective, locally of finite type, and formally unramified.

Moreover, in this case f is also representable, separated, and locally quasi-finite.

Proof. We have seen in Lemma 58.11.7 that being formally unramified and locally of finite type is the same thing as being unramified. Hence (4) is equivalent to (2). A monomorphism is certainly formally unramified hence (3) implies (4). It is clear that (1) implies (3). Finally, if (2) holds, then $\Delta : X \rightarrow X \times_Y X$ is both an open immersion (Morphisms of Spaces, Lemma 49.35.9) and surjective (Morphisms of Spaces, Lemma 49.19.2) hence an isomorphism, i.e., f is a monomorphism. In this way we see that (2) implies (1). Finally, we see that f is representable, separated, and locally quasi-finite by Morphisms of Spaces, Lemmas 49.26.10 and 49.45.1. \square

Lemma 58.11.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is a closed immersion,
- (2) f is universally closed, unramified, and a monomorphism,
- (3) f is universally closed, unramified, and universally injective,
- (4) f is universally closed, locally of finite type, and a monomorphism,
- (5) f is universally closed, universally injective, locally of finite type, and formally unramified.

Proof. The equivalence of (2) – (5) follows immediately from Lemma 58.11.8. Moreover, if (2) – (5) are satisfied then f is representable. Similarly, if (1) is satisfied then f is representable. Hence the result follows from the case of schemes, see Étale Morphisms, Lemma 40.7.2. \square

58.12. Universal first order thickenings

Let S be a scheme. Let $h : Z \rightarrow X$ be a morphism of algebraic spaces over S . A *universal first order thickening* of Z over X is a first order thickening $Z \subset Z'$ over X such that given any first order thickening $T \subset T'$ over X and a solid commutative diagram

$$(58.12.0.1) \quad \begin{array}{ccc} & Z & \longleftarrow \xrightarrow{a} T \\ & \swarrow & \searrow \\ Z' & \longleftarrow \xrightarrow{a'} & T' \\ & \searrow & \swarrow \\ & X & \end{array}$$

there exists a unique dotted arrow making the diagram commute. Note that in this situation $(a, a') : (T \subset T') \rightarrow (Z \subset Z')$ is a morphism of thickenings over X . Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if h is formally unramified then it does. Before we prove this, let us show that a universal first order thickening in the category of schemes is a universal first order thickening in the category of algebraic spaces.

Lemma 58.12.1. *Let S be a scheme. Let $h : Z \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset Z'$ be a first order thickening over X . The following are equivalent*

- (1) $Z \subset Z'$ is a universal first order thickening,
- (2) for any diagram (58.12.0.1) with T' a scheme a unique dotted arrow exists making the diagram commute, and

- (3) for any diagram (58.12.0.1) with T' an affine scheme a unique dotted arrow exists making the diagram commute.

Proof. The implications (1) \Rightarrow (2) \Rightarrow (3) are formal. Assume (3) a assume given an arbitrary diagram (58.12.0.1). Choose a presentation $T' = U'/R'$, see Spaces, Definition 47.9.3. We may assume that $U' = \coprod U'_i$ is a disjoint union of affines, so $R' = U' \times_{T'} U' = \coprod_{i,j} U'_i \times'_T U'_j$. For each pair (i, j) choose an affine open covering $U'_i \times'_T U'_j = \bigcup_k R'_{ijk}$. Denote U_i, R_{ijk} the fibre products with T over T' . Then each $U_i \subset U'_i$ and $R_{ijk} \subset R'_{ijk}$ is a first order thickening of affine schemes. Denote $a_i : U_i \rightarrow Z$, resp. $a_{ijk} : R_{ijk} \rightarrow Z$ the composition of $a : T \rightarrow Z$ with the morphism $U_i \rightarrow T$, resp. $R_{ijk} \rightarrow T$. By (3) applied to $a_i : U_i \rightarrow Z$ we obtain unique morphisms $a'_i : U'_i \rightarrow Z'$. By (3) applied to a_{ijk} we see that the two compositions $R'_{ijk} \rightarrow R'_i \rightarrow Z'$ and $R'_{ijk} \rightarrow R'_j \rightarrow Z'$ are equal. Hence $a' = \coprod a'_i : U' = \coprod U'_i \rightarrow Z'$ descends to the quotient sheaf $T' = U'/R'$ and we win. \square

Lemma 58.12.2. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over S . If $Z \subset Z'$ is a universal first order thickening of Z over Y and $Y \rightarrow X$ is formally étale, then $Z \subset Z'$ is a universal first order thickening of Z over X .*

Proof. This is formal. Namely, by Lemma 58.12.1 it suffices to consider solid commutative diagrams (58.12.0.1) with T' an affine scheme. The composition $T \rightarrow Z \rightarrow Y$ lifts uniquely to $T' \rightarrow Y$ as $Y \rightarrow X$ is assumed formally étale. Hence the fact that $Z \subset Z'$ is a universal first order thickening over Y produces the desired morphism $a' : T' \rightarrow Z'$. \square

Lemma 58.12.3. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be morphisms of algebraic spaces over S . Assume $Z \rightarrow Y$ is étale.*

- (1) *If $Y \subset Y'$ is a universal first order thickening of Y over X , then the unique étale morphism $Z' \rightarrow Y'$ such that $Z = Y \times_{Y'} Z'$ (see Theorem 58.7.1) is a universal first order thickening of Z over X .*
- (2) *If $Z \rightarrow Y$ is surjective and $(Z \subset Z') \rightarrow (Y \subset Y')$ is an étale morphism of first order thickenings over X and Z' is a universal first order thickening of Z over X , then Y' is a universal first order thickening of Y over X .*

Proof. Proof of (1). By Lemma 58.12.1 it suffices to consider solid commutative diagrams (58.12.0.1) with T' an affine scheme. The composition $T \rightarrow Z \rightarrow Y$ lifts uniquely to $T' \rightarrow Y'$ as Y' is the universal first order thickening. Then the fact that $Z' \rightarrow Y'$ is étale implies (see Lemma 58.10.5) that $T' \rightarrow Y'$ lifts to the desired morphism $a' : T' \rightarrow Z'$.

Proof of (2). Let $T \subset T'$ be a first order thickening over X and let $a : T \rightarrow Y$ be a morphism. Set $W = T \times_Y Z$ and denote $c : W \rightarrow Z$ the projection. Let $W' \rightarrow T'$ be the unique étale morphism such that $W = T \times_{T'} W'$, see Theorem 58.7.1. Note that $W' \rightarrow T'$ is surjective as $Z \rightarrow Y$ is surjective. By assumption we obtain a unique morphism $c' : W' \rightarrow Z'$ over X restricting to c on W . By uniqueness the two restrictions of c' to $W' \times_{T'} W'$ are equal (as the two restrictions of c to $W \times_T W$ are equal). Hence c' descends to a unique morphism $a' : T' \rightarrow Y'$ and we win. \square

Lemma 58.12.4. *Let S be a scheme. Let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over S . There exists a universal first order thickening $Z \subset Z'$ of Z over X .*

Proof. Choose any commutative diagram

$$\begin{array}{ccc} V & \longrightarrow & U \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

where V and U are schemes and the vertical arrows are étale. Note that $V \rightarrow U$ is a formally unramified morphism of schemes, see Lemma 58.11.2. Combining Lemma 58.12.1 and More on Morphisms, Lemma 36.5.1 we see that a universal first order thickening $V \subset V'$ of V over U exists. By Lemma 58.12.2 part (1) V' is a universal first order thickening of V over X .

Fix a scheme U and a surjective étale morphism $U \rightarrow X$. The argument above shows that for any $V \rightarrow Z$ étale with V a scheme such that $V \rightarrow Z \rightarrow X$ factors through U a universal first order thickening $V \subset V'$ of V over X exists (but does not depend on the chosen factorization of $V \rightarrow X$ through U). Now we may choose V such that $V \rightarrow Z$ is surjective étale (see Spaces, Lemma 47.11.4). Then $R = V \times_Z V$ a scheme étale over Z such that $R \rightarrow X$ factors through U also. Hence we obtain universal first order thickenings $V \subset V'$ and $R \subset R'$ over X . As $V \subset V'$ is a universal first order thickening, the two projections $s, t : R \rightarrow V$ lift to morphisms $s', t' : R' \rightarrow V'$. By Lemma 58.12.3 as R' is the universal first order thickening of R over X these morphisms are étale. Then $(t', s') : R' \rightarrow V'$ is an étale equivalence relation and we can set $Z' = V'/R'$. Since $V' \rightarrow Z'$ is surjective étale and v' is the universal first order thickening of V over X we conclude from Lemma 58.12.2 part (2) that Z' is a universal first order thickening of Z over X . \square

Definition 58.12.5. Let S be a scheme. Let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over S .

- (1) The *universal first order thickening* of Z over X is the thickening $Z \subset Z'$ constructed in Lemma 58.12.4.
- (2) The *conormal sheaf of Z over X* is the conormal sheaf of Z in its universal first order thickening Z' over X .

We often denote the conormal sheaf $\mathcal{C}_{Z/X}$ in this situation.

Thus we see that there is a short exact sequence of sheaves

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{O}_{Z'} \rightarrow \mathcal{O}_Z \rightarrow 0$$

on $Z_{\text{étale}}$ and $\mathcal{C}_{Z/X}$ is a quasi-coherent \mathcal{O}_Z -module. The following lemma proves that there is no conflict between this definition and the definition in case $Z \rightarrow X$ is an immersion.

Lemma 58.12.6. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Then*

- (1) *i is formally unramified,*
- (2) *the universal first order thickening of Z over X is the first order infinitesimal neighbourhood of Z in X of Definition 58.9.1,*

- (3) the conormal sheaf of i in the sense of Definition 58.4.1 agrees with the conormal sheaf of i in the sense of Definition 58.12.5.

Proof. An immersion of algebraic spaces is by definition a representable morphism. Hence by Morphisms, Lemmas 28.36.7 and 28.36.8 an immersion is unramified (via the abstract principle of Spaces, Lemma 47.5.8). Hence it is formally unramified by Lemma 58.11.7. The other assertions follow by combining Lemmas 58.9.2 and 58.9.3 and the definitions. \square

Lemma 58.12.7. *Let S be a scheme. Let $Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over S . Then the universal first order thickening Z' is formally unramified over X .*

Proof. Let $T \subset T'$ be a first order thickening of affine schemes over X . Let

$$\begin{array}{ccc} Z' & \xleftarrow{c} & T \\ \downarrow & \swarrow a,b & \downarrow \\ X & \xleftarrow{} & T' \end{array}$$

be a commutative diagram. Set $T_0 = c^{-1}(Z) \subset T$ and $T'_a = a^{-1}(Z)$ (scheme theoretically). Since Z' is a first order thickening of Z , we see that T' is a first order thickening of T'_a . Moreover, since $c = a|_T$ we see that $T_0 = T \cap T'_a$ (scheme theoretically). As T' is a first order thickening of T it follows that T'_a is a first order thickening of T_0 . Now $a|_{T'_a}$ and $b|_{T'_a}$ are morphisms of T'_a into Z' over X which agree on T_0 as morphisms into Z . Hence by the universal property of Z' we conclude that $a|_{T'_a} = b|_{T'_a}$. Thus a and b are morphism from the first order thickening T' of T_a whose restrictions to T'_a agree as morphisms into Z . Thus using the universal property of Z' once more we conclude that $a = b$. In other words, the defining property of a formally unramified morphism holds for $Z' \rightarrow X$ as desired. \square

Lemma 58.12.8. *Let S be a scheme Consider a commutative diagram of algebraic spaces over S*

$$\begin{array}{ccc} Z & \xrightarrow{h} & X \\ f \downarrow & & \downarrow g \\ W & \xrightarrow{h'} & Y \end{array}$$

with h and h' formally unramified. Let $Z \subset Z'$ be the universal first order thickening of Z over X . Let $W \subset W'$ be the universal first order thickening of W over Y . There exists a canonical morphism $(f, f') : (Z, Z') \rightarrow (W, W')$ of thickenings over Y which fits into the following commutative diagram

$$\begin{array}{ccccc} & & & & Z' \\ & & & & \downarrow f' \\ Z & \xrightarrow{\quad} & X & \xrightarrow{\quad} & W' \\ f \downarrow & & \downarrow & & \downarrow \\ W & \xrightarrow{\quad} & Y & & \end{array}$$

In particular the morphism (f, f') of thickenings induces a morphism of conormal sheaves $f^*C_{W/Y} \rightarrow C_{Z/X}$.

Proof. The first assertion is clear from the universal property of W' . The induced map on conormal sheaves is the map of Lemma 58.4.3 applied to $(Z \subset Z') \rightarrow (W \subset W')$. \square

Lemma 58.12.9. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{h} & X \\ f \downarrow & & \downarrow g \\ W & \xrightarrow{h'} & Y \end{array}$$

be a fibre product diagram of algebraic spaces over S with h' formally unramified. Then h is formally unramified and if $W \subset W'$ is the universal first order thickening of W over Y , then $Z = X \times_Y W \subset X \times_Y W'$ is the universal first order thickening of Z over X . In particular the canonical map $f^ \mathcal{C}_{W/Y} \rightarrow \mathcal{C}_{Z/X}$ of Lemma 58.12.8 is surjective.*

Proof. The morphism h is formally unramified by Lemma 58.11.5. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Lemma 58.4.5 for why this implies that the map of conormal sheaves is surjective. \square

Lemma 58.12.10. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{h} & X \\ f \downarrow & & \downarrow g \\ W & \xrightarrow{h'} & Y \end{array}$$

be a fibre product diagram of algebraic spaces over S with h' formally unramified and g flat. In this case the corresponding map $Z' \rightarrow W'$ of universal first order thickenings is flat, and $f^ \mathcal{C}_{W/Y} \rightarrow \mathcal{C}_{Z/X}$ is an isomorphism.*

Proof. Flatness is preserved under base change, see Morphisms of Spaces, Lemma 49.28.4. Hence the first statement follows from the description of W' in Lemma 58.12.9. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Lemma 58.4.5 for why this implies that the map of conormal sheaves is an isomorphism. \square

Lemma 58.12.11. *Taking the universal first order thickenings commutes with étale localization. More precisely, let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over a base scheme S . Let*

$$\begin{array}{ccc} V & \longrightarrow & U \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

be a commutative diagram with étale vertical arrows. Let Z' be the universal first order thickening of Z over X . Then $V \rightarrow U$ is formally unramified and the universal first order thickening V' of V over U is étale over Z' . In particular, $\mathcal{C}_{Z'/X}|_{V'} = \mathcal{C}_{V'/U}$.

Proof. The first statement is Lemma 58.11.2. The compatibility of universal first order thickenings is a consequence of Lemmas 58.12.2 and 58.12.3. \square

Lemma 58.12.12. *Let S be a scheme. Let B be an algebraic space over S . Let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over B . Let $Z \subset Z'$ be the universal first order thickening of Z over X with structure morphism $h' : Z' \rightarrow X$. The canonical map*

$$dh' : (h')^* \Omega_{X/B} \rightarrow \Omega_{Z'/B}$$

induces an isomorphism $h^ \Omega_{X/B} \rightarrow \Omega_{Z'/B} \otimes \mathcal{O}_Z$.*

Proof. The map $c_{h'}$ is the map defined in Lemma 58.6.6. If $i : Z \rightarrow Z'$ is the given closed immersion, then $i^* c_{h'}$ is a map $h^* \Omega_{X/S} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z$. Checking that it is an isomorphism reduces to the case of schemes by étale localization, see Lemma 58.12.11 and Lemma 58.6.3. In this case the result is More on Morphisms, Lemma 36.5.9. \square

Lemma 58.12.13. *Let S be a scheme. Let B be an algebraic space over S . Let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over B . There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \rightarrow h^* \Omega_{X/B} \rightarrow \Omega_{Z/B} \rightarrow 0.$$

The first arrow is induced by $d_{Z'/B}$ where Z' is the universal first order neighbourhood of Z over X .

Proof. We know that there is a canonical exact sequence

$$\mathcal{C}_{Z/Z'} \rightarrow \Omega_{Z'/S} \otimes \mathcal{O}_Z \rightarrow \Omega_{Z/S} \rightarrow 0.$$

see Lemma 58.6.10. Hence the result follows on applying Lemma 58.12.12. \square

Lemma 58.12.14. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{i} & X \\ & \searrow j & \downarrow \\ & & Y \end{array}$$

be a commutative diagram of algebraic spaces over S where i and j are formally unramified. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

where the first arrow comes from Lemma 58.12.8 and the second from Lemma 58.12.13.

Proof. Since the maps have been defined, checking the sequence is exact reduces to the case of schemes by étale localization, see Lemma 58.12.11 and Lemma 58.6.3. In this case the result is More on Morphisms, Lemma 36.5.11. \square

Lemma 58.12.15. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of algebraic spaces over S .*

- (1) *If $Z \subset Z'$ is the universal first order thickening of Z over X and $Y \subset Y'$ is the universal first order thickening of Y over X , then there is a morphism $Z' \rightarrow Y'$ and $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y .*

(2) *There is a canonical exact sequence*

$$i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

where the maps come from Lemma 58.12.8 and $i : Z \rightarrow Y$ is the first morphism.

Proof. The map $h : Z' \rightarrow Y'$ in (1) comes from Lemma 58.12.8. The assertion that $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y is clear from the universal properties of Z' and Y' . By Lemma 58.4.6 we have an exact sequence

$$(i')^* \mathcal{C}_{Y \times_{Y'} Z'/Z'} \rightarrow \mathcal{C}_{Z/Z'} \rightarrow \mathcal{C}_{Z/Y \times_{Y'} Z'} \rightarrow 0$$

where $i' : Z \rightarrow Y \times_{Y'} Z'$ is the given morphism. By Lemma 58.4.5 there exists a surjection $h^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{Y \times_{Y'} Z'/Z'}$. Combined with the equalities $\mathcal{C}_{Y/Y'} = \mathcal{C}_{Y/X}$, $\mathcal{C}_{Z/Z'} = \mathcal{C}_{Z/X}$, and $\mathcal{C}_{Z/Y \times_{Y'} Z'} = \mathcal{C}_{Z/Y}$ this proves the lemma. \square

58.13. Formally étale morphisms

In this section we work out what it means that a morphism of algebraic spaces is formally étale.

Definition 58.13.1. Let S be a scheme. A morphism $f : X \rightarrow Y$ of algebraic spaces over S is said to be *formally étale* if it is formally étale as a transformation of functors as in Definition 58.10.1.

We will not restate the results proved in the more general setting of formally étale transformations of functors in Section 58.10.

Lemma 58.13.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is formally étale,
- (2) for every diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{\quad f \quad} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally étale (as in *More on Morphisms*, Definition 36.6.1), and

- (3) for one such diagram with surjective vertical arrows the morphism ψ is formally étale.

Proof. Assume f is formally étale. By Lemma 58.10.5 the morphisms $U \rightarrow X$ and $V \rightarrow Y$ are formally étale. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally étale. Then it follows from Lemma 58.10.8 that $U \rightarrow V$ is formally étale. Thus (1) implies (2). And (2) implies (3) trivially

Assume given a diagram as in (3). By Lemma 58.10.5 the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally étale. Then it follows from Lemma 58.10.6 that $X \rightarrow Y$ is formally étale, i.e., (1) holds. \square

Lemma 58.13.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a formally étale morphism of algebraic spaces over S . Then given any solid commutative diagram*

$$\begin{array}{ccc} X & \xleftarrow{a} & T \\ f \downarrow & \nearrow \text{---} & \downarrow i \\ Y & \xleftarrow{\quad} & T' \end{array}$$

where $T \subset T'$ is a first order thickening of algebraic spaces over Y there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 58.13.1 the condition that T be affine may be dropped.

Proof. Let $U' \rightarrow T'$ be a surjective étale morphism where $U' = \coprod U'_i$ is a disjoint union of affine schemes. Let $U_i = T \times_{T'} U'_i$. Then we get morphisms $a'_i : U'_i \rightarrow X$ such that $a'_i|_{U_i}$ equals the composition $U_i \rightarrow T \rightarrow X$. By uniqueness (see Lemma 58.11.3) we see that a'_i and a'_j agree on the fibre product $U'_i \times_{T'} U'_j$. Hence $\coprod a'_i : U' \rightarrow X$ descends to give a unique morphism $a' : T' \rightarrow X$. \square

Lemma 58.13.4. *A composition of formally étale morphisms is formally étale.*

Proof. This is formal. \square

Lemma 58.13.5. *A base change of a formally étale morphism is formally étale.*

Proof. This is formal. \square

Lemma 58.13.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is formally étale,
- (2) f is formally unramified and the universal first order thickening of X over Y is equal to X ,
- (3) f is formally unramified and $\mathcal{C}_{X/Y} = 0$, and
- (4) $\Omega_{X/Y} = 0$ and $\mathcal{C}_{X/Y} = 0$.

Proof. Actually, the last assertion only make sense because $\Omega_{X/Y} = 0$ implies that $\mathcal{C}_{X/Y}$ is defined via Lemma 58.11.6 and Definition 58.12.5. This also makes it clear that (3) and (4) are equivalent.

Either of the assumptions (1), (2), and (3) imply that f is formally unramified. Hence we may assume f is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening X' of X over S and the fact that $X = X' \Leftrightarrow \mathcal{C}_{X/Y} = 0$ since after all by definition $\mathcal{C}_{X/Y} = \mathcal{C}_{X/X'}$ is the ideal sheaf of X in X' . \square

Lemma 58.13.7. *An unramified flat morphism is formally étale.*

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.6.7 and étale localization, see Lemmas 58.11.2 and 58.13.2 and Morphisms of Spaces, Lemma 49.28.5. \square

Lemma 58.13.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) The morphism f is étale, and
- (2) the morphism f is locally of finite presentation and formally étale.

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.6.9 and étale localization, see Lemma 58.13.2 and Morphisms of Spaces, Lemmas 49.27.4 and 49.36.2. \square

58.14. Infinitesimal deformations of maps

In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening X' of X can be seen as a sheaf on X , see Equations (58.8.1.1) and (58.8.1.2).

Lemma 58.14.1. *Let S be a scheme. Let B be an algebraic space over S . Let $X \subset X'$ and $Y \subset Y'$ be two first order thickenings of algebraic spaces over B . Let $(a, a'), (b, b') : (X \subset X') \rightarrow (Y \subset Y')$ be two morphisms of thickenings over B . Assume that*

- (1) $a = b$, and
- (2) the two maps $a^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ (Lemma 58.4.3) are equal.

Then the map $(a')^\sharp - (b')^\sharp$ factors as

$$\mathcal{O}_{Y'} \rightarrow \mathcal{O}_Y \xrightarrow{D} a_* \mathcal{C}_{X/X'} \rightarrow a_* \mathcal{O}_{X'}$$

where D is an \mathcal{O}_B -derivation.

Proof. Instead of working on Y we work on X . The advantage is that the pullback functor a^{-1} is exact. Using (1) and (2) we obtain a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{C}_{X/X'} & \longrightarrow & \mathcal{O}_{X'} & \longrightarrow & \mathcal{O}_X \longrightarrow 0 \\ & & \uparrow & & \uparrow \uparrow & & \uparrow \\ 0 & \longrightarrow & a^{-1} \mathcal{C}_{Y/Y'} & \longrightarrow & a^{-1} \mathcal{O}_{Y'} & \longrightarrow & a^{-1} \mathcal{O}_Y \longrightarrow 0 \end{array}$$

$(a')^\sharp$ $(b')^\sharp$

Now it is a general fact that in such a situation the difference of the \mathcal{O}_B -algebra maps $(a')^\sharp$ and $(b')^\sharp$ is an \mathcal{O}_B -derivation from $a^{-1} \mathcal{O}_Y$ to $\mathcal{C}_{X/X'}$. By adjointness of the functors a^{-1} and a_* this is the same thing as an \mathcal{O}_B -derivation from \mathcal{O}_Y into $a_* \mathcal{C}_{X/X'}$. Some details omitted. \square

Note that in the situation of the lemma above we may write D as

$$(58.14.1.1) \quad D = d_{Y/B} \circ \theta$$

where θ is an \mathcal{O}_Y -linear map $\theta : \Omega_{Y/B} \rightarrow a_* \mathcal{C}_{X/X'}$. Of course, then by adjunction again we may view θ as an \mathcal{O}_X -linear map $\theta : a^* \Omega_{Y/B} \rightarrow \mathcal{C}_{X/X'}$.

Lemma 58.14.2. *Let S be a scheme. Let B be an algebraic space over S . Let $(a, a') : (X \subset X') \rightarrow (Y \subset Y')$ be a morphism of first order thickenings over B . Let*

$$\theta : a^* \Omega_{Y/B} \rightarrow \mathcal{C}_{X/X'}$$

be an \mathcal{O}_X -linear map. Then there exists a unique morphism of pairs $(b, b') : (X \subset X') \rightarrow (Y \subset Y')$ such that (1) and (2) of Lemma 58.14.1 hold and the derivation D and θ are related by Equation (58.14.1.1).

Proof. Consider the map

$$\alpha = (a')^\sharp + D : a^{-1} \mathcal{O}_{Y'} \rightarrow \mathcal{O}_{X'}$$

where D is as in Equation (58.14.1.1). As D is an \mathcal{O}_B -derivation it follows that α is a map of sheaves of \mathcal{O}_B -algebras. By construction we have $i_X^\# \circ \alpha = a^\# \circ i_Y^\#$ where $i_X : X \rightarrow X'$ and $i_Y : Y \rightarrow Y'$ are the given closed immersions. By Lemma 58.8.2 we obtain a unique morphism $(a, b') : (X \subset X') \rightarrow (Y \subset Y')$ of thickenings over B such that $\alpha = (b')^\#$. Setting $b = a$ we win. \square

Lemma 58.14.3. *Let S be a scheme. Let B be an algebraic space over S . Let $X \subset X'$ and $Y \subset Y'$ be first order thickenings over B . Assume given a morphism $a : X \rightarrow Y$ and a map $A : a^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ of \mathcal{O}_X -modules. For an object U' of $(X')_{\text{spaces}, \text{étale}}$ with $U = X \times_{X'} U'$ consider morphisms $a' : U' \rightarrow Y'$ such that*

- (1) a' is a morphism over B ,
- (2) $a'|_U = a|_U$, and
- (3) the induced map $a^* \mathcal{C}_{Y/Y'}|_U \rightarrow \mathcal{C}_{X/X'}|_U$ is the restriction of A to U .

Then the rule

$$(58.14.3.1) \quad U' \mapsto \{a' : U' \rightarrow Y' \text{ such that (1), (2), (3) hold.}\}$$

defines a sheaf of sets on $(X')_{\text{spaces}, \text{étale}}$.

Proof. Denote \mathcal{F} the rule of the lemma. The restriction mapping $\mathcal{F}(U') \rightarrow \mathcal{F}(V')$ for $V' \subset U' \subset X'$ of \mathcal{F} is really the restriction map $a' \mapsto a'|_{V'}$. With this definition in place it is clear that \mathcal{F} is a sheaf since morphisms of algebraic spaces satisfy étale descent, see Descent on Spaces, Lemma 56.6.2. \square

Lemma 58.14.4. *Same notation and assumptions as in Lemma 58.14.3. We identify sheaves on X and X' via (58.8.1.1). There is an action of the sheaf*

$$\text{Hom}_{\mathcal{O}_X}(a^* \Omega_{Y/B}, \mathcal{C}_{X/X'})$$

on the sheaf (58.14.3.1). Moreover, the action is simply transitive for any object U' of $(X')_{\text{spaces}, \text{étale}}$ over which the sheaf (58.14.3.1) has a section.

Proof. This is a combination of Lemmas 58.14.1, 58.14.2, and 58.14.3. \square

Remark 58.14.5. A special case of Lemmas 58.14.1, 58.14.2, 58.14.3, and 58.14.4 is where $Y = Y'$. In this case the map A is always zero. The sheaf of Lemma 58.14.3 is just given by the rule

$$U' \mapsto \{a' : U' \rightarrow Y \text{ over } S \text{ with } a'|_U = a|_U\}$$

and we act on this by the sheaf $\text{Hom}_{\mathcal{O}_X}(a^* \Omega_{Y/B}, \mathcal{C}_{X/X'})$. The action of a local section θ on a' is sometimes indicated by $\theta \cdot a'$. Note that this means nothing else than the fact that $(a')^\#$ and $(\theta \cdot a')^\#$ differ by a derivation D which is related to θ by Equation (58.14.1.1).

58.15. Infinitesimal deformations of algebraic spaces

The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

Lemma 58.15.1. *Let S be a scheme. Let $(f, f') : (X \subset X') \rightarrow (Y \subset Y')$ be a morphism of first order thickenings of algebraic spaces over S . Assume that f is flat. Then the following are equivalent*

- (1) f' is flat and $X = Y \times_{Y'} X'$, and
- (2) the canonical map $f^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ is an isomorphism.

Proof. Choose a scheme V' and a surjective étale morphism $V' \rightarrow Y'$. Choose a scheme U' and a surjective étale morphism $U' \rightarrow X' \times_{Y'} V'$. Set $U = X \times_{X'} U'$ and $V = Y \times_{Y'} V'$. According to our definition of a flat morphism of algebraic spaces we see that the induced map $g : U \rightarrow V$ is a flat morphism of schemes and that f' is flat if and only if the corresponding morphism $g' : U' \rightarrow V'$ is flat. Also, $X = Y \times_{Y'} X'$ if and only if $U = V \times_{V'} U'$. Finally, the map $f^* \mathcal{C}_{Y/Y'} \rightarrow \mathcal{C}_{X/X'}$ is an isomorphism if and only if $g^* \mathcal{C}_{V/V'} \rightarrow \mathcal{C}_{U/U'}$ is an isomorphism. Hence the lemma follows from its analogue for morphisms of schemes, see More on Morphisms, Lemma 36.8.1. \square

58.16. Formally smooth morphisms

In this section we introduce the notion of a formally smooth morphism $X \rightarrow Y$ of algebraic spaces. Such a morphism is characterized by the property that T -valued points of X lift to infinitesimal thickenings of T provided T is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma 58.16.6. It turns out that this criterion is often easier to use than the Jacobian criterion.

Definition 58.16.1. Let S be a scheme. A morphism $f : X \rightarrow Y$ of algebraic spaces over S is said to be *formally smooth* if it is formally smooth as a transformation of functors as in Definition 58.10.1.

In the cases of formally unramified and formally étale morphisms the condition that T' be affine could be dropped, see Lemmas 58.11.3 and 58.13.3. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow étale locally on T' . In fact, analyzing the proof of Lemma 58.16.6 shows that this would be equivalent to the definition as it currently stands. It is also true that requiring the existence of the dotted arrow fppf locally on T' would be sufficient, but that is slightly more difficult to prove.

We will not restate the results proved in the more general setting of formally smooth transformations of functors in Section 58.10.

Lemma 58.16.2. *A composition of formally smooth morphisms is formally smooth.*

Proof. Omitted. \square

Lemma 58.16.3. *A base change of a formally smooth morphism is formally smooth.*

Proof. Omitted, but see Algebra, Lemma 10.133.2 for the algebraic version. \square

Lemma 58.16.4. *Let $f : X \rightarrow S$ be a morphism of schemes. Then f is formally étale if and only if f is formally smooth and formally unramified.*

Proof. Omitted. \square

Here is a helper lemma which will be superseded by Lemma 58.16.9.

Lemma 58.16.5. *Let S be a scheme. Let*

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

be a commutative diagram of morphisms of algebraic spaces over S . If the vertical arrows are étale and f is formally smooth, then ψ is formally smooth.

Proof. By Lemma 58.10.5 the morphisms $U \rightarrow X$ and $V \rightarrow Y$ are formally étale. By Lemma 58.10.3 the composition $U \rightarrow Y$ is formally smooth. By Lemma 58.10.8 we see $\psi : U \rightarrow V$ is formally smooth. \square

The following lemma is the main result of this section. It implies, combined with Limits of Spaces, Proposition 52.3.9, that we can recognize whether a morphism of algebraic spaces $f : X \rightarrow Y$ is smooth in terms of “simple” properties of the transformation of functors $X \rightarrow Y$.

Lemma 58.16.6 (Infinitesimal lifting criterion). *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) *The morphism f is smooth.*
- (2) *The morphism f is locally of finite presentation, and formally smooth.*

Proof. Assume $f : X \rightarrow Y$ is locally of finite presentation and formally smooth. Consider a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale and surjective. By Lemma 58.16.5 we see $\psi : U \rightarrow V$ is formally smooth. By Morphisms of Spaces, Lemma 49.27.4 the morphism ψ is locally of finite presentation. Hence by the case of schemes the morphism ψ is smooth, see More on Morphisms, Lemma 36.9.7. Hence f is smooth, see Morphisms of Spaces, Lemma 49.34.4.

Conversely, assume that $f : X \rightarrow Y$ is smooth. Consider a solid commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & T \\ \downarrow f & \nearrow a & \downarrow i \\ Y & \longleftarrow & T' \end{array}$$

as in Definition 58.16.1. We will show the dotted arrow exists thereby proving that f is formally smooth. Let \mathcal{F} be the sheaf of sets on $(T')_{spaces, \acute{e}tale}$ of Lemma 58.14.3, see also Remark 58.14.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^* \Omega_{X/Y}, \mathcal{C}_{T/T'})$$

be the sheaf of \mathcal{O}_T -modules on $T_{\acute{e}tale}$ introduced in Lemma 58.14.4. The action $\mathcal{H} \times \mathcal{F} \rightarrow \mathcal{F}$ turns \mathcal{F} into a pseudo \mathcal{H} -torsor, see Cohomology on Sites, Definition 21.5.1. Our goal is to show that \mathcal{F} is a trivial \mathcal{H} -torsor. There are two steps: (I) To show that \mathcal{F} is a torsor we have to show that \mathcal{F} has étale locally a section. (II) To show that \mathcal{F} is the trivial torsor it suffices to show that $H^1(T_{\acute{e}tale}, \mathcal{H}) = 0$, see Cohomology on Sites, Lemma 21.5.3.

First we prove (I). To see this choose a commutative diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale and surjective. As f is assumed smooth we see that ψ is smooth and hence formally smooth by Lemma 58.10.5. By the same lemma the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally smooth. Then (I) follows from Lemma 58.10.6 part (4).

Finally we prove (II). By Lemma 58.6.15 we see that $\Omega_{X/S}$ is of finite presentation. Hence $a^*\Omega_{X/S}$ is of finite presentation (see Properties of Spaces, Section 48.28). Hence the sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'})$ is quasi-coherent by Properties of Spaces, Lemma 48.27.7. Thus by Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2 we have

$$H^1(T_{spaces, \acute{e}tale}, \mathcal{H}) = H^1(T_{\acute{e}tale}, \mathcal{H}) = H^1(T, \mathcal{H}) = 0$$

as desired. \square

We do a bit more work to show that being formally smooth is étale local on the source. To begin we show that a formally smooth morphism has a nice sheaf of differentials. The notion of a locally projective quasi-coherent module is defined in Properties of Spaces, Section 48.29.

Lemma 58.16.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a formally smooth morphism of algebraic spaces over S . Then $\Omega_{X/Y}$ is locally projective on X .*

Proof. Choose a diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are affine(!) schemes and the vertical arrows are étale. By Lemma 58.16.5 we see $\psi : U \rightarrow V$ is formally smooth. Hence $\Gamma(V, \mathcal{O}_V) \rightarrow \Gamma(U, \mathcal{O}_U)$ is a formally smooth ring map, see More on Morphisms, Lemma 36.9.6. Hence by Algebra, Lemma 10.133.7 the $\Gamma(U, \mathcal{O}_U)$ -module $\Omega_{\Gamma(U, \mathcal{O}_U)/\Gamma(V, \mathcal{O}_V)}$ is projective. Hence $\Omega_{U/V}$ is locally projective, see Properties, Section 27.19. Since $\Omega_{X/Y}|_U = \Omega_{U/V}$ we see that $\Omega_{X/Y}$ is locally projective too. (Because we can find an étale covering of X by the affine U 's fitting into diagrams as above – details omitted.) \square

Lemma 58.16.8. *Let T be an affine scheme. Let \mathcal{F}, \mathcal{G} be quasi-coherent \mathcal{O}_T -modules on $T_{\acute{e}tale}$. Consider the internal hom sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(\mathcal{F}, \mathcal{G})$ on $T_{\acute{e}tale}$. If \mathcal{F} is locally projective, then $H^1(T_{\acute{e}tale}, \mathcal{H}) = 0$.*

Proof. By the definition of a locally projective sheaf on an algebraic space (see Properties of Spaces, Definition 48.29.2) we see that $\mathcal{F}_{Zar} = \mathcal{F}|_{T_{Zar}}$ is a locally projective sheaf on the scheme T . Thus \mathcal{F}_{Zar} is a direct summand of a free $\mathcal{O}_{T_{Zar}}$ -module. Whereupon we conclude (as $\mathcal{F} = (\mathcal{F}_{Zar})^a$, see Descent, Proposition 34.7.11) that \mathcal{F} is a direct summand of a free \mathcal{O}_T -module on $T_{\acute{e}tale}$. Hence we may assume that $\mathcal{F} = \bigoplus_{i \in I} \mathcal{O}_T$ is a free module. In this case $\mathcal{H} = \prod_{i \in I} \mathcal{G}$

is a product of quasi-coherent modules. By Cohomology on Sites, Lemma 21.12.5 we conclude that $H^1 = 0$ because the cohomology of a quasi-coherent sheaf on an affine scheme is zero, see Descent, Proposition 34.7.10 and Cohomology of Schemes, Lemma 29.2.2. \square

Lemma 58.16.9. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is formally smooth,
- (2) for every diagram

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally smooth (as in More on Morphisms, Definition 36.4.1), and

- (3) for one such diagram with surjective vertical arrows the morphism ψ is formally smooth.

Proof. We have seen that (1) implies (2) and (3) in Lemma 58.16.5. Assume (3). The proof that f is formally smooth is entirely similar to the proof of (1) \Rightarrow (2) of Lemma 58.16.6.

Consider a solid commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & T \\ \downarrow f & \nearrow a & \downarrow i \\ Y & \longleftarrow & T' \end{array}$$

as in Definition 58.16.1. We will show the dotted arrow exists thereby proving that f is formally smooth. Let \mathcal{F} be the sheaf of sets on $(T')_{spaces, \acute{e}tale}$ of Lemma 58.14.3, see also Remark 58.14.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^* \Omega_{X/Y}, \mathcal{C}_{T/T'})$$

be the sheaf of \mathcal{O}_T -modules on $T_{\acute{e}tale}$ introduced in Lemma 58.14.4. The action $\mathcal{H} \times \mathcal{F} \rightarrow \mathcal{F}$ turns \mathcal{F} into a pseudo \mathcal{H} -torsor, see Cohomology on Sites, Definition 21.5.1. Our goal is to show that \mathcal{F} is a trivial \mathcal{H} -torsor. There are two steps: (I) To show that \mathcal{F} is a torsor we have to show that \mathcal{F} has étale locally a section. (II) To show that \mathcal{F} is the trivial torsor it suffices to show that $H^1(T_{\acute{e}tale}, \mathcal{H}) = 0$, see Cohomology on Sites, Lemma 21.5.3.

First we prove (I). To see this consider a diagram (which exists because we are assuming (3))

$$\begin{array}{ccc} U & \longrightarrow & V \\ \downarrow & \psi & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where U and V are schemes, the vertical arrows are étale and surjective, and ψ is formally smooth. By Lemma 58.10.5 the morphism $V \rightarrow Y$ is formally étale. Thus by Lemma 58.10.3 the composition $U \rightarrow Y$ is formally smooth. Then (I) follows from Lemma 58.10.6 part (4).

Finally we prove (II). By Lemma 58.16.7 we see that $\Omega_{U/V}$ locally projective. Hence $\Omega_{X/Y}$ is locally projective, see Descent on Spaces, Lemma 56.5.5. Hence $a^*\Omega_{X/Y}$ is locally projective, see Properties of Spaces, Lemma 48.29.3. Hence

$$H^1(T_{\acute{e}tale}, \mathcal{H}) = H^1(T_{\acute{e}tale}, \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'}) = 0$$

by Lemma 58.16.8 as desired. □

Lemma 58.16.10. *The property $\mathcal{P}(f) = “f \text{ is formally smooth}”$ is fpqc local on the base.*

Proof. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over a scheme S . Choose an index set I and diagrams

$$\begin{array}{ccc} U_i & \xrightarrow{\psi_i} & V_i \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

with étale vertical arrows and U_i, V_i affine schemes. Moreover, assume that $\coprod U_i \rightarrow X$ and $\coprod V_i \rightarrow Y$ are surjective, see Properties of Spaces, Lemma 48.6.1. By Lemma 58.16.9 we see that f is formally smooth if and only if each of the morphisms ψ_i are formally smooth. Hence we reduce to the case of a morphism of affine schemes. In this case the result follows from Algebra, Lemma 10.133.15. Some details omitted. □

Lemma 58.16.11. *Let S be a scheme. Let $f : X \rightarrow Y, g : Y \rightarrow Z$ be morphisms of algebraic spaces over S . Assume f is formally smooth. Then*

$$0 \rightarrow f^*\Omega_{Y/Z} \rightarrow \Omega_{X/Z} \rightarrow \Omega_{X/Y} \rightarrow 0$$

Lemma 58.6.8 is short exact.

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 36.9.9, by étale localization, see Lemmas 58.16.9 and 58.6.3. □

Lemma 58.16.12. *Let S be a scheme. Let B be an algebraic space over S . Let $h : Z \rightarrow X$ be a formally unramified morphism of algebraic spaces over B . Assume that Z is formally smooth over B . Then the canonical exact sequence*

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^*\Omega_{X/B} \rightarrow \Omega_{Z/B} \rightarrow 0$$

of Lemma 58.12.13 is short exact.

Proof. Let $Z \rightarrow Z'$ be the universal first order thickening of Z over X . From the proof of Lemma 58.12.13 we see that our sequence is identified with the sequence

$$\mathcal{C}_{Z/Z'} \rightarrow \Omega_{Z'/B} \otimes \mathcal{O}_Z \rightarrow \Omega_{Z/B} \rightarrow 0.$$

Since $Z \rightarrow S$ is formally smooth we can étale locally on Z' find a left inverse $Z' \rightarrow Z$ over B to the inclusion map $Z \rightarrow Z'$. Thus the sequence is étale locally split, see Lemma 58.6.11. □

Lemma 58.16.13. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{i} & X \\ & \searrow j & \downarrow f \\ & & Y \end{array}$$

be a commutative diagram of algebraic spaces over S where i and j are formally unramified and f is formally smooth. Then the canonical exact sequence

$$0 \rightarrow \mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0$$

of Lemma 58.12.14 is exact and locally split.

Proof. Denote $Z \rightarrow Z'$ the universal first order thickening of Z over X . Denote $Z \rightarrow Z''$ the universal first order thickening of Z over Y . By Lemma 58.12.13 here is a canonical morphism $Z' \rightarrow Z''$ so that we have a commutative diagram

$$\begin{array}{ccccc} Z & \longrightarrow & Z' & \longrightarrow & X \\ & \searrow^{i'} & \downarrow k & & \downarrow f \\ & & Z'' & \longrightarrow & Y \\ & \swarrow_{j'} & & & \end{array}$$

The sequence above is identified with the sequence

$$\mathcal{C}_{Z/Z''} \rightarrow \mathcal{C}_{Z/Z'} \rightarrow (i')^* \Omega_{Z'/Z''} \rightarrow 0$$

via our definitions concerning conormal sheaves of formally unramified morphisms. Let $U'' \rightarrow Z''$ be an étale morphism with U'' affine. Denote $U \rightarrow Z$ and $U' \rightarrow Z'$ the corresponding affine schemes étale over Z and Z' . As f is formally smooth there exists a morphism $h : U'' \rightarrow X$ which agrees with i on U and such that $f \circ h$ equals $b|_{U''}$. Since Z' is the universal first order thickening we obtain a unique morphism $g : U'' \rightarrow Z'$ such that $g = a \circ h$. The universal property of Z'' implies that $k \circ g$ is the inclusion map $U'' \rightarrow Z''$. Hence g is a left inverse to k . Picture

$$\begin{array}{ccc} U & \longrightarrow & Z' \\ \downarrow & \nearrow g & \downarrow k \\ U'' & \longrightarrow & Z'' \end{array}$$

Thus g induces a map $\mathcal{C}_{Z/Z'}|_U \rightarrow \mathcal{C}_{Z/Z''}|_U$ which is a left inverse to the map $\mathcal{C}_{Z/Z''} \rightarrow \mathcal{C}_{Z/Z'}$ over U . □

58.17. Smoothness over a Noetherian base

This section is the analogue of More on Morphisms, Section 36.10.

Lemma 58.17.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$. Assume that Y is locally Noetherian and f locally of finite type. The following are equivalent:*

- (1) f is smooth at x ,
- (2) for every solid commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{\alpha} & \text{Spec}(B) \\ \downarrow f & \nearrow & \downarrow i \\ Y & \xleftarrow{\beta} & \text{Spec}(B') \end{array}$$

where $B' \rightarrow B$ is a surjection of local rings with $\text{Ker}(B' \rightarrow B)$ of square zero, and α mapping the closed point of $\text{Spec}(B)$ to x there exists a dotted arrow making the diagram commute, and

- (3) same as in (2) but with $B' \rightarrow B$ ranging over small extensions (see Algebra, Definition 10.136.1).

Proof. Condition (1) means there is an open subspace $X' \subset X$ such that $X' \rightarrow Y$ is smooth. Hence (1) implies conditions (2) and (3) by Lemma 58.16.6. Condition (2) implies condition (3) trivially. Assume (3). Choose a commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & U \\ \downarrow & & \downarrow \\ Y & \longleftarrow & V \end{array}$$

with U and V affine, horizontal arrows étale and such that there is a point $u \in U$ mapping to x . Next, consider a diagram

$$\begin{array}{ccccc} X & \longleftarrow & U & \xleftarrow{\alpha} & \text{Spec}(B) \\ \downarrow & & \downarrow & & \downarrow i \\ Y & \longleftarrow & V & \xleftarrow{\beta} & \text{Spec}(B') \end{array}$$

as in (3) but for $u \in U \rightarrow V$. Let $\gamma : \text{Spec}(B') \rightarrow X$ be the arrow we get from our assumption that (3) holds for X . Because $U \rightarrow X$ is étale and hence formally étale (Lemma 58.13.8) the morphism γ has a unique lift to U compatible with α . Then because $V \rightarrow Y$ is étale hence formally étale this lift is compatible with β . Hence (3) holds for $u \in U \rightarrow V$ and we conclude that $U \rightarrow V$ is smooth at u by More on Morphisms, Lemma 36.10.1. This proves that $X \rightarrow Y$ is smooth at x , thereby finishing the proof. \square

Sometimes it is useful to know that one only needs to check the lifting criterion for small extensions “centered” at points of finite type (see Morphisms of Spaces, Section 49.25).

Lemma 58.17.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume Y is locally Noetherian and f locally of finite type. The following are equivalent:*

- (1) f is smooth,
- (2) for every solid commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{\alpha} & \text{Spec}(B) \\ \downarrow f & \swarrow \text{dotted} & \downarrow i \\ Y & \xleftarrow{\beta} & \text{Spec}(B') \end{array}$$

where $B' \rightarrow B$ is a small extension of Artinian local rings and β of finite type (!) there exists a dotted arrow making the diagram commute.

Proof. If f is smooth, then the infinitesimal lifting criterion (Lemma 58.16.6) says f is formally smooth and (2) holds.

Assume f is not smooth. The set of points $x \in X$ where f is not smooth forms a closed subset T of $|X|$. By Morphisms of Spaces, Lemma 49.25.6, there exists a point $x \in T \subset X$ with $x \in X_{\text{ft-pts}}$. Choose a commutative diagram

$$\begin{array}{ccc} X & \longleftarrow & U \\ \downarrow & & \downarrow \\ Y & \longleftarrow & V \end{array} \quad \begin{array}{c} u \\ \downarrow \\ v \end{array}$$

with U and V affine, horizontal arrows étale and such that there is a point $u \in U$ mapping to x . Then u is a finite type point of U . Since $U \rightarrow V$ is not smooth at the point u , by More on Morphisms, Lemma 36.10.1 there is a diagram

$$\begin{array}{ccccc}
 X & \longleftarrow & U & \longleftarrow & \text{Spec}(B) \\
 \downarrow & & \downarrow & \swarrow \alpha & \downarrow i \\
 Y & \longleftarrow & V & \longleftarrow & \text{Spec}(B')
 \end{array}$$

with $B' \rightarrow B$ a small extension of (Artinian) local rings such that the residue field of B is equal to $\kappa(v)$ and such that the dotted arrow does not exist. Since $U \rightarrow V$ is of finite type, we see that v is a finite type point of V . By Morphisms, Lemma 28.17.2 the morphism β is of finite type, hence the composition $\text{Spec}(B) \rightarrow Y$ is of finite type also. Arguing exactly as in the proof of Lemma 58.17.1 (using that $U \rightarrow X$ and $V \rightarrow Y$ are étale hence formally étale) we see that there cannot be an arrow $\text{Spec}(B) \rightarrow X$ fitting into the outer rectangle of the last displayed diagram. In other words, (2) doesn't hold and the proof is complete. \square

Here is a useful application.

Lemma 58.17.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is locally of finite type and Y locally Noetherian. Let $Z \subset Y$ be a closed subspace with n th infinitesimal neighbourhood $Z_n \subset Y$. Set $X_n = Z_n \times_Y X$.*

- (1) *If $X_n \rightarrow Z_n$ is smooth for all n , then f is smooth at every point of $f^{-1}(Z)$.*
- (2) *If $X_n \rightarrow Z_n$ is étale for all n , then f is étale at every point of $f^{-1}(Z)$.*

Proof. Assume $X_n \rightarrow Z_n$ is smooth for all n . Let $x \in X$ be a point lying over a point of Z . Given a small extension $B' \rightarrow B$ and morphisms α, β as in Lemma 58.17.1 part (3) the maximal ideal of B' is nilpotent (as B' is Artinian) and hence the morphism β factors through Z_n and α factors through X_n for a suitable n . Thus the lifting property for $X_n \rightarrow Z_n$ kicks in to get the desired dotted arrow in the diagram. This proves (1). Part (2) follows from (1) and the fact that a morphism is étale if and only if it is smooth of relative dimension 0. \square

58.18. Openness of the flat locus

This section is analogue of More on Morphisms, Section 36.12. Note that we have defined the notion of flatness for quasi-coherent modules on algebraic spaces in Morphisms of Spaces, Section 49.29.

Theorem 58.18.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent sheaf on X . Assume f is locally of finite presentation and that \mathcal{F} is an \mathcal{O}_X -module which is locally of finite presentation. Then*

$$\{x \in |X| : \mathcal{F} \text{ is flat over } Y \text{ at } x\}$$

is open in $|X|$.

Proof. Choose a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\alpha} & V \\ p \downarrow & & \downarrow q \\ X & \xrightarrow{a} & Y \end{array}$$

with U, V schemes and p, q surjective and étale as in Spaces, Lemma 47.11.4. By More on Morphisms, Theorem 36.12.1 the set $U' = \{u \in |U| : p^*\mathcal{F} \text{ is flat over } V \text{ at } u\}$ is open in U . By Morphisms of Spaces, Definition 49.29.2 the image of U' in $|X|$ is the set of the theorem. Hence we are done because the map $|U| \rightarrow |X|$ is open, see Properties of Spaces, Lemma 48.4.6. \square

Lemma 58.18.2. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

be a cartesian diagram of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume g is flat, f is locally of finite presentation, and \mathcal{F} is locally of finite presentation. Then

$$\{x' \in |X'| : (g')^*\mathcal{F} \text{ is flat over } Y' \text{ at } x'\}$$

is the inverse image of the open subset of Theorem 58.18.1 under the continuous map $|g'| : |X'| \rightarrow |X|$.

Proof. This follows from Morphisms of Spaces, Lemma 49.29.3. \square

58.19. Critère de platitude par fibres

Let S be a scheme. Consider a commutative diagram of algebraic spaces over S

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow g & \swarrow h \\ & & Z \end{array}$$

and a quasi-coherent \mathcal{O}_X -module \mathcal{F} . Given a point $x \in |X|$ we consider the question as to whether \mathcal{F} is flat over Y at x . If \mathcal{F} is flat over Z at x , then the theorem below states this question is intimately related to the question of whether the restriction of \mathcal{F} to the fibre of $X \rightarrow Z$ over $g(x)$ is flat over the fibre of $Y \rightarrow Z$ over $g(x)$. To make sense out of this we offer the following preliminary lemma.

Lemma 58.19.1. *In the situation above the following are equivalent*

- (1) *Pick a geometric point \bar{x} of X lying over x . Set $\bar{y} = f \circ \bar{x}$ and $\bar{z} = g \circ \bar{x}$. Then the module $\mathcal{F}_{\bar{x}}/\mathfrak{m}_{\bar{z}}\mathcal{F}_{\bar{x}}$ is flat over $\mathcal{O}_{Y,\bar{y}}/\mathfrak{m}_{\bar{z}}\mathcal{O}_{Y,\bar{y}}$.*
- (2) *Pick a morphism $x : \text{Spec}(K) \rightarrow X$ in the equivalence class of x . Set $z = g \circ x$, $X_z = \text{Spec}(K) \times_{z,Z} X$, $Y_z = \text{Spec}(K) \times_{z,Z} Y$, and \mathcal{F}_z the pullback of \mathcal{F} to X_z . Then \mathcal{F}_z is flat at x over Y_z (as defined in Morphisms of Spaces, Definition 49.29.2).*

(3) Pick a commutative diagram

where U, V, W are schemes, and a, b, c are étale, and a point $u \in U$ mapping to x . Let $w \in W$ be the image of u . Let \mathcal{F}_w be the pullback of \mathcal{F} to the fibre U_w of $U \rightarrow W$ at w . Then \mathcal{F}_w is flat over V_w at u .

Proof. Note that in (2) the morphism $x : \text{Spec}(K) \rightarrow X$ defines a K -rational point of X_z , hence the statement makes sense. Moreover, the condition in (2) is independent of the choice of $\text{Spec}(K) \rightarrow X$ in the equivalence class of x (details omitted; this will also follow from the arguments below because the other conditions do not depend on this choice). Also note that we can always choose a diagram as in (3) by: first choosing a scheme W and a surjective étale morphism $W \rightarrow Z$, then choosing a scheme V and a surjective étale morphism $V \rightarrow W \times_Z Y$, and finally choosing a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Having made these choices we set $U \rightarrow W$ equal to the composition $U \rightarrow V \rightarrow W$ and we can pick a point $u \in U$ mapping to x because the morphism $U \rightarrow X$ is surjective.

Suppose given both a diagram as in (3) and a geometric point $\bar{x} : \text{Spec}(k) \rightarrow X$ as in (1). By Properties of Spaces, Lemma 48.16.4 we can choose a geometric point $\bar{u} : \text{Spec}(k) \rightarrow U$ lying over u such that $\bar{x} = a \circ \bar{u}$. Denote $\bar{v} : \text{Spec}(k) \rightarrow V$ and $\bar{w} : \text{Spec}(k) \rightarrow W$ the induced geometric points of V and W . In this setting we know that $\mathcal{O}_{X, \bar{x}} = \mathcal{O}_{U, \bar{u}}^{sh}$ and similarly for Y and Z , see Properties of Spaces, Lemma 48.19.1. In the same vein we have

$$\mathcal{F}_{\bar{x}} = (a^* \mathcal{F})_u \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{U, u}^{sh}$$

see Properties of Spaces, Lemma 48.27.4. Note that the stalk of \mathcal{F}_w at u is given by

$$(\mathcal{F}_w)_u = (a^* \mathcal{F})_u / \mathfrak{m}_w (a^* \mathcal{F})_u$$

and the local ring of V_w at v is given by

$$\mathcal{O}_{V_w, v} = \mathcal{O}_{V, v} / \mathfrak{m}_w \mathcal{O}_{V, v}.$$

Since $\mathfrak{m}_{\bar{z}} = \mathfrak{m}_w \mathcal{O}_{Z, \bar{z}} = \mathfrak{m}_w \mathcal{O}_{W, w}^{sh}$ we see that

$$\begin{aligned} \mathcal{F}_{\bar{x}} / \mathfrak{m}_{\bar{z}} \mathcal{F}_{\bar{x}} &= (a^* \mathcal{F})_u \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \bar{x}} / \mathfrak{m}_{\bar{z}} \mathcal{O}_{X, \bar{x}} \\ &= (\mathcal{F}_w)_u \otimes_{\mathcal{O}_{U_w, u}} \mathcal{O}_{U, u}^{sh} / \mathfrak{m}_w \mathcal{O}_{U, u}^{sh} \\ &= (\mathcal{F}_w)_u \otimes_{\mathcal{O}_{U_w, u}} \mathcal{O}_{U_w, \bar{u}}^{sh} \\ &= (\mathcal{F}_w)_{\bar{u}} \end{aligned}$$

the penultimate equality by Algebra, Lemma 10.145.30 and the last equality by Properties of Spaces, Lemma 48.27.4. The same arguments applied to the structure sheaves of V and Y show that

$$\mathcal{O}_{V_w, \bar{v}}^{sh} = \mathcal{O}_{V, v}^{sh} / \mathfrak{m}_w \mathcal{O}_{V, v}^{sh} = \mathcal{O}_{Y, \bar{y}} / \mathfrak{m}_{\bar{z}} \mathcal{O}_{Y, \bar{y}}.$$

OK, and now we can use Morphisms of Spaces, Lemma 49.29.1 to see that (1) is equivalent to (3).

Finally we prove the equivalence of (2) and (3). To do this we pick a field extension \tilde{K} of K and a morphism $\tilde{x} : \text{Spec}(\tilde{K}) \rightarrow U$ which lies over u (this is possible because $u \times_{X,x} \text{Spec}(K)$ is a nonempty scheme). Set $\tilde{z} : \text{Spec}(\tilde{K}) \rightarrow U \rightarrow W$ be the composition. We obtain a commutative diagram

where $z = \text{Spec}(K)$ and $w = \text{Spec}(\kappa(w))$. Now it is clear that \mathcal{F}_w and \mathcal{F}_z pull back to the same module on $U_w \times_w \tilde{z}$. This leads to a commutative diagram

both of whose squares are cartesian and whose bottom horizontal arrows are flat: the lower left horizontal arrow is the composition of the morphism $Y \times_Z \tilde{z} \rightarrow Y \times_Z z = Y_z$ (base change of a flat morphism), the étale morphism $V \times_Z \tilde{z} \rightarrow Y \times_Z \tilde{z}$, and the étale morphism $V \times_W \tilde{z} \rightarrow V \times_Z \tilde{z}$. Thus it follows from Morphisms of Spaces, Lemma 49.29.3 that

$$\mathcal{F}_z \text{ flat at } x \text{ over } Y_z \Leftrightarrow \mathcal{F}|_{U_w \times_w \tilde{z}} \text{ flat at } \tilde{x} \text{ over } V_w \times_w \tilde{z} \Leftrightarrow \mathcal{F}_w \text{ flat at } u \text{ over } V_w$$

and we win. □

Definition 58.19.2. Let S be a scheme. Let $X \rightarrow Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $x \in |X|$ be a point and denote $z \in |Z|$ its image.

- (1) We say *the restriction of \mathcal{F} to its fibre over z is flat at x over the fibre of Y over z* if the equivalent conditions of Lemma 58.19.1 are satisfied.
- (2) We say *the fibre of X over z is flat at x over the fibre of Y over z* if the equivalent conditions of Lemma 58.19.1 hold with $\mathcal{F} = \mathcal{O}_X$.
- (3) We say *the fibre of X over z is flat over the fibre of Y over z* if for all $x \in |X|$ lying over z the fibre of X over z is flat at x over the fibre of Y over z .

With this definition in hand we can state a version of the criterion as follows. The Noetherian version can be found in Section 58.20.

Theorem 58.19.3. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be a morphisms of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume*

- (1) X is locally of finite presentation over Z ,
- (2) \mathcal{F} an \mathcal{O}_X -module of finite presentation, and
- (3) Y is locally of finite type over Z .

Let $x \in |X|$ and let $y \in |Y|$ and $z \in |Z|$ be the images of x . If $\mathcal{F}_{\bar{x}} \neq 0$, then the following are equivalent:

- (1) \mathcal{F} is flat over Z at x and the restriction of \mathcal{F} to its fibre over z is flat at x over the fibre of Y over z , and
- (2) Y is flat over Z at y and \mathcal{F} is flat over Y at x .

Moreover, the set of points x where (1) and (2) hold is open in $\text{Supp}(\mathcal{F})$.

Proof. Choose a diagram as in Lemma 58.19.1 part (3). It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^*\mathcal{F}$, and the point $u \in U$. Thus the theorem follows from the corresponding result for schemes which is More on Morphisms, Theorem 36.13.2. \square

Lemma 58.19.4. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over S . Assume*

- (1) X is locally of finite presentation over Z ,
- (2) X is flat over Z ,
- (3) for every $z \in |Z|$ the fibre of X over z is flat over the fibre of Y over z , and
- (4) Y is locally of finite type over Z .

Then f is flat. If f is also surjective, then Y is flat over Z .

Proof. This is a special case of Theorem 58.19.3. \square

Lemma 58.19.5. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be morphisms of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume*

- (1) X is locally of finite presentation over Z ,
- (2) \mathcal{F} an \mathcal{O}_X -module of finite presentation,
- (3) \mathcal{F} is flat over Z , and
- (4) Y is locally of finite type over Z .

Then the set

$$A = \{x \in |X| : \mathcal{F} \text{ flat at } x \text{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change: If $Z' \rightarrow Z$ is a morphism of algebraic spaces, and A' is the set of points of $X' = X \times_Z Z'$ where $\mathcal{F}' = \mathcal{F} \times_Z Z'$ is flat over $Y' = Y \times_Z Z'$, then A' is the inverse image of A under the continuous map $|X'| \rightarrow |X|$.

Proof. One way to prove this is to translate the proof as given in More on Morphisms, Lemma 36.13.4 into the category of algebraic spaces. Instead we will prove this by reducing to the case of schemes. Namely, choose a diagram as in Lemma 58.19.1 part (3) such that a , b , and c are surjective. It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^*\mathcal{F}$, and the point $u \in U$. The only minor point to make is that given a morphism of algebraic spaces $Z' \rightarrow Z$ we choose a scheme W' and a surjective étale morphism $W' \rightarrow W \times_Z Z'$. Then we set $U' = W' \times_W U$ and $V' = W' \times_W V$. We write a', b', c' for the morphisms from U', V', W' to X', Y', Z' . In this case A , resp. A' are images of the open subsets of U , resp. U' associated to $a^*\mathcal{F}$, resp. $(a')^*\mathcal{F}'$. This indeed does reduce the lemma to More on Morphisms, Lemma 36.13.4. \square

Lemma 58.19.6. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over S . Assume*

- (1) X is locally of finite presentation over Z ,
- (2) X is flat over Z , and
- (3) Y is locally of finite type over Z .

Then the set

$$\{x \in |X| : X \text{ flat at } x \text{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change $Z' \rightarrow Z$.

Proof. This is a special case of Lemma 58.19.5. \square

58.20. Flatness over a Noetherian base

Here is the “Critère de platitude par fibres” in the Noetherian case.

Theorem 58.20.1. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be a morphisms of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Assume*

- (1) X, Y, Z locally Noetherian, and
- (2) \mathcal{F} a coherent \mathcal{O}_X -module.

Let $x \in |X|$ and let $y \in |Y|$ and $z \in |Z|$ be the images of x . If $\mathcal{F}_{\bar{x}} \neq 0$, then the following are equivalent:

- (1) \mathcal{F} is flat over Z at x and the restriction of \mathcal{F} to its fibre over z is flat at x over the fibre of Y over z , and
- (2) Y is flat over Z at y and \mathcal{F} is flat over Y at x .

Proof. Choose a diagram as in Lemma 58.19.1 part (3). It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \rightarrow V \rightarrow W$, the quasi-coherent sheaf $a^*\mathcal{F}$, and the point $u \in U$. Thus the theorem follows from the corresponding result for schemes which is More on Morphisms, Theorem 36.13.1. \square

Lemma 58.20.2. *Let S be a scheme. Let $f : X \rightarrow Y$ and $Y \rightarrow Z$ be a morphism of algebraic spaces over S . Assume*

- (1) X, Y, Z locally Noetherian,
- (2) X is flat over Z ,
- (3) for every $z \in |Z|$ the fibre of X over z is flat over the fibre of Y over z .

Then f is flat. If f is also surjective, then Y is flat over Z .

Proof. This is a special case of Theorem 58.20.1. \square

Just like for checking smoothness, if the base is Noetherian it suffices to check flatness over Artinian rings. Here is a sample statement.

Lemma 58.20.3. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let X be an algebraic space locally of finite presentation over $S = \text{Spec}(A)$. For $n \geq 1$ set $S_n = \text{Spec}(A/I^n)$ and $X_n = S_n \times_S X$. Let \mathcal{F} be coherent \mathcal{O}_X -module. If for every $n \geq 1$ the pullback \mathcal{F}_n of \mathcal{F} to X is flat over S_n , then the (open) locus where \mathcal{F} is flat over X contains the inverse image of $V(I)$ under $X \rightarrow S$.*

Proof. The locus where \mathcal{F} is flat over S is open in $|X|$ by Theorem 58.18.1. The statement is insensitive to replacing X by the members of an étale covering, hence we may assume X is an affine scheme. In this case the result follows immediately from Algebra, Lemma 10.95.11. Some details omitted. \square

58.21. Normalization revisited

Normalization commutes with smooth base change.

Lemma 58.21.1. *Let S be a scheme. Let $f : Y \rightarrow X$ be a smooth morphism of algebraic spaces over S . Let \mathcal{A} be a quasi-coherent sheaf of \mathcal{O}_X -algebras. The integral closure of \mathcal{O}_Y in $f^*\mathcal{A}$ is equal to $f^*\mathcal{A}'$ where $\mathcal{A}' \subset \mathcal{A}$ is the integral closure of \mathcal{O}_X in \mathcal{A} .*

Proof. By our construction of the integral closure, see Morphisms of Spaces, Definition 49.43.2, this reduces immediately to the case where X and Y are affine. In this case the result is Algebra, Lemma 10.140.4. \square

Lemma 58.21.2 (Normalization commutes with smooth base change). *Let S be a scheme. Let*

$$\begin{array}{ccc} Y_2 & \longrightarrow & Y_1 \\ \downarrow & & \downarrow f \\ X_2 & \xrightarrow{\varphi} & X_1 \end{array}$$

be a fibre square of algebraic spaces over S . Assume f is quasi-compact and quasi-separated and φ is smooth. Let $Y_i \rightarrow X'_i \rightarrow X_i$ be the normalization of X_i in Y_i . Then $X'_2 \cong X_2 \times_{X_1} X'_1$.

Proof. The base change of the factorization $Y_1 \rightarrow X'_1 \rightarrow X_1$ to X_2 is a factorization $Y_2 \rightarrow X_2 \times_{X_1} X'_1 \rightarrow X_1$ and $X_2 \times_{X_1} X'_1 \rightarrow X_1$ is integral (Morphisms of Spaces, Lemma 49.41.5). Hence we get a morphism $h : X'_2 \rightarrow X_2 \times_{X_1} X'_1$ by the universal property of Morphisms of Spaces, Lemma 49.43.5. Observe that X'_2 is the relative spectrum of the integral closure of \mathcal{O}_{X_2} in $f_{2,*}\mathcal{O}_{Y_2}$. If $\mathcal{A}' \subset f_{1,*}\mathcal{O}_{Y_1}$ denotes the integral closure of \mathcal{O}_{X_2} , then $X_2 \times_{X_1} X'_1$ is the relative spectrum of $\varphi^*\mathcal{A}'$ as the construction of the relative spectrum commutes with arbitrary base change. By Cohomology of Spaces, Lemma 51.10.1 we know that $f_{2,*}\mathcal{O}_{Y_2} = \varphi^*f_{1,*}\mathcal{O}_{Y_1}$. Hence the result follows from Lemma 58.21.1. \square

58.22. Slicing Cohen-Macaulay morphisms

Let S be a scheme. Let X be an algebraic space over S . Let $f_1, \dots, f_r \in \Gamma(X, \mathcal{O}_X)$. In this case we denote $V(f_1, \dots, f_r)$ the closed subspace of X cut out by f_1, \dots, f_r . More precisely, we can define $V(f_1, \dots, f_r)$ as the closed subspace of X corresponding to the quasi-coherent sheaf of ideals generated by f_1, \dots, f_r , see Morphisms of Spaces, Lemma 49.13.1. Alternatively, we can choose a presentation $X = U/R$ and consider the closed subscheme $Z \subset U$ cut out by $f_1|_U, \dots, f_r|_U$. It is clear that Z is an R -invariant (see Groupoids, Definition 38.17.1) closed subscheme and we may set $V(f_1, \dots, f_r) = Z/R_Z$.

Lemma 58.22.1. *Let S be a scheme. Consider a cartesian diagram*

$$\begin{array}{ccc} X & \longleftarrow & F \\ \downarrow & & \downarrow p \\ Y & \longleftarrow & \text{Spec}(k) \end{array}$$

where $X \rightarrow Y$ is a morphism of algebraic spaces over S which is flat and locally of finite presentation, and where k is a field over S . Let $f_1, \dots, f_r \in \Gamma(X, \mathcal{O}_X)$ and

$z \in |F|$ such that f_1, \dots, f_r map to a regular sequence in the local ring $\mathcal{O}_{F, \bar{z}}$. Then, after replacing X by an open subspace containing $p(z)$, the morphism

$$V(f_1, \dots, f_r) \longrightarrow Y$$

is flat and locally of finite presentation.

Proof. Set $Z = V(f_1, \dots, f_r)$. It is clear that $Z \rightarrow X$ is locally of finite presentation, hence the composition $Z \rightarrow Y$ is locally of finite presentation, see Morphisms of Spaces, Lemma 49.27.2. Hence it suffices to show that $Z \rightarrow Y$ is flat in a neighbourhood of $p(z)$. Let $k \subset k'$ be an extension field. Then $F' = F \times_{\text{Spec}(k)} \text{Spec}(k')$ is surjective and flat over F , hence we can find a point $z' \in |F'|$ mapping to z and the local ring map $\mathcal{O}_{F, \bar{z}} \rightarrow \mathcal{O}_{F', \bar{z}'}$ is flat, see Morphisms of Spaces, Lemma 49.28.8. Hence the image of f_1, \dots, f_r in $\mathcal{O}_{F', \bar{z}'}$ is a regular sequence too, see Algebra, Lemma 10.67.7. Thus, during the proof we may replace k by an extension field. In particular, we may assume that $z \in |F|$ comes from a section $z : \text{Spec}(k) \rightarrow F$ of the structure morphism $F \rightarrow \text{Spec}(k)$.

Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow X \times_Y V$. After possibly enlarging k once more we may assume that $\text{Spec}(k) \rightarrow F \rightarrow X$ factors through U (as $U \rightarrow X$ is surjective). Let $u : \text{Spec}(k) \rightarrow U$ be such a factorization and denote $v \in V$ the image of u . Note that the morphisms

$$U_v \times_{\text{Spec}(\kappa(v))} \text{Spec}(k) = U \times_V \text{Spec}(k) \rightarrow U \times_Y \text{Spec}(k) \rightarrow F$$

are étale (the first as the base change of $V \rightarrow V \times_Y V$ and the second as the base change of $U \rightarrow X$). Moreover, by construction the point $u : \text{Spec}(k) \rightarrow U$ gives a point of the left most space which maps to z on the right. Hence the elements f_1, \dots, f_r map to a regular sequence in the local ring on the right of the following map

$$\mathcal{O}_{U_v, u} \longrightarrow \mathcal{O}_{U_v \times_{\text{Spec}(\kappa(v))} \text{Spec}(k), \bar{u}} = \mathcal{O}_{U \times_Y \text{Spec}(k), \bar{u}}.$$

But since the displayed arrow is flat (combine More on Flatness, Lemma 37.2.5 and Morphisms of Spaces, Lemma 49.28.8) we see from Algebra, Lemma 10.67.7 that f_1, \dots, f_r maps to a regular sequence in $\mathcal{O}_{U_v, u}$. By More on Morphisms, Lemma 36.18.2 we conclude that the morphism of schemes

$$V(f_1, \dots, f_r) \times_X U = V(f_1|_U, \dots, f_r|_U) \rightarrow V$$

is flat in an open neighbourhood U' of u . Let $X' \subset X$ be the open subspace corresponding to the image of $|U'| \rightarrow |X|$ (see Properties of Spaces, Lemmas 48.4.6 and 48.4.8). We conclude that $V(f_1, \dots, f_r) \cap X' \rightarrow Y$ is flat (see Morphisms of Spaces, Definition 49.28.1) as we have the commutative diagram

$$\begin{array}{ccc} V(f_1, \dots, f_r) \times_X U' & \longrightarrow & V \\ a \downarrow & & \downarrow b \\ V(f_1, \dots, f_r) \cap X' & \longrightarrow & Y \end{array}$$

with a, b étale and a surjective. □

58.23. Étale localization of morphisms

The section is the analogue of More on Morphisms, Section 36.30.

Lemma 58.23.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $y \in |Y|$. Let $x_1, \dots, x_n \in |X|$ mapping to y . Assume that*

- (1) *f is locally of finite type,*
- (2) *f is separated,*
- (3) *f is quasi-finite at x_1, \dots, x_n , and*
- (4) *f is quasi-compact or Y is decent.*

Then there exists an étale morphism $(U, u) \rightarrow (Y, y)$ of pointed algebraic spaces and a decomposition

$$U \times_Y X = W \amalg V$$

into open and closed subspaces such that the morphism $V \rightarrow U$ is finite, every point of the fibre of $|V| \rightarrow |U|$ over u maps to an x_i , and the fibre of $|W| \rightarrow |U|$ over u contains no point mapping to an x_i .

Proof. Let $(U, u) \rightarrow (Y, y)$ be an étale morphism of algebraic spaces and consider the set of $w \in |U \times_Y X|$ mapping to $u \in |U|$ and one of the $x_i \in |X|$. By Decent Spaces, Lemma 50.16.4 (if f is of finite type) or Decent Spaces, Lemma 50.16.5 (if Y is decent) this set is finite. It follows that we may replace f by the base change $U \times_Y X \rightarrow U$ and x_1, \dots, x_n by the set of these w . In particular we may and do assume that Y is an affine scheme, whence X is a separated algebraic space.

Choose an affine scheme Z and an étale morphism $Z \rightarrow X$ such that x_1, \dots, x_n are in the image of $|Z| \rightarrow |X|$. The fibres of $|Z| \rightarrow |X|$ are finite, see Properties of Spaces, Lemma 48.12.3 (or the more general discussion in Decent Spaces, Section 50.6). Let $\{z_1, \dots, z_m\} \subset |Z|$ be the preimage of $\{x_1, \dots, x_n\}$. By More on Morphisms, Lemma 36.30.4 there exists an étale morphism $(U, u) \rightarrow (Y, y)$ such that $U \times_Y Z = Z_1 \amalg Z_2$ with $Z_1 \rightarrow U$ finite and $(Z_1)_y = \{z_1, \dots, z_m\}$. We may assume that U is affine and hence Z_1 is affine too.

Since f is separated, the image V of $Z_1 \rightarrow X$ is both open and closed (Morphisms of Spaces, Lemma 49.37.6). Set $W = X \setminus V$ to get a decomposition as in the lemma. To finish the proof we have to show that $V \rightarrow U$ is finite. As $Z_1 \rightarrow V$ is surjective and étale, V is the quotient of Z_1 by the étale equivalence relation $R = Z_1 \times_V Z_1$, see Spaces, Lemma 47.9.1. Since f is separated, $V \rightarrow U$ is separated and R is closed in $Z_1 \times_U Z_1$. Since $Z_1 \rightarrow U$ is finite, the projections $s, t : R \rightarrow Z_1$ are finite. Thus V is an affine scheme by Groupoids, Proposition 38.21.8. By Morphisms, Lemma 28.42.8 we conclude that $V \rightarrow U$ is proper and by Morphisms, Lemma 28.44.10 we conclude that $V \rightarrow U$ is finite, thereby finishing the proof. \square

Lemma 58.23.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $x \in |X|$ with image $y \in |Y|$. Assume that*

- (1) *f is locally of finite type,*
- (2) *f is separated, and*
- (3) *f is quasi-finite at x .*

Then there exists an étale morphism $(U, u) \rightarrow (Y, y)$ of pointed algebraic spaces and a decomposition

$$U \times_Y X = W \amalg V$$

into open and closed subspaces such that the morphism $V \rightarrow U$ is finite and there exists a point $v \in |V|$ which maps to x in $|X|$ and u in $|U|$.

Proof. Pick a scheme U , a point $u \in U$, and an étale morphism $U \rightarrow Y$ mapping u to y . There exists a point $x' \in |U \times_Y X|$ mapping to x in $|X|$ and u in $|U|$ (Properties of Spaces, Lemma 48.4.3). To finish, apply Lemma 58.23.1 to the morphism $U \times_Y X \rightarrow U$ and the point x' . It applies because U is a scheme and hence u comes from the monomorphism $\text{Spec}(\kappa(u)) \rightarrow U$. \square

58.24. Zariski's Main Theorem

In this section we apply the results of the previous section to prove Zariski's main theorem for morphisms of algebraic spaces. This section is the analogue of More on Morphisms, Section 36.31.

Lemma 58.24.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is of finite type and separated. Let Y' be the normalization of Y in X . Picture:*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \nu \\ & & Y \end{array}$$

Then there exists an open subspace $U' \subset Y'$ such that

- (1) $(f')^{-1}(U') \rightarrow U'$ is an isomorphism, and
- (2) $(f')^{-1}(U') \subset X$ is the set of points at which f is quasi-finite.

Proof. By Morphisms of Spaces, Lemma 49.32.7 there is an open subspace $U \subset X$ corresponding to the points of $|X|$ where f is quasi-finite. We have to prove

- (a) the image of $|U| \rightarrow |Y'|$ is $|U'|$ for some open subspace U' of Y' ,
- (b) $U = f^{-1}(U')$, and
- (c) $U \rightarrow U'$ is an isomorphism.

Since formation of U commutes with arbitrary base change (Morphisms of Spaces, Lemma 49.32.7), since formation of the normalization Y' commutes with smooth base change (Lemma 58.21.2), since étale morphisms are open, and since “being an isomorphism” is fpqc local on the base (Descent on Spaces, Lemma 56.10.13), it suffices to prove (a), (b), (c) étale locally on Y (some details omitted). Thus we may assume Y is an affine scheme. This implies that Y' is an (affine) scheme as well.

Let $x \in |U|$. Claim: there exists an open neighbourhood $f'(x) \in V \subset Y'$ such that $(f')^{-1}V \rightarrow V$ is an isomorphism. We first prove the claim implies the lemma. Namely, then $(f')^{-1}V \cong V$ is a scheme (as an open of Y'), locally of finite type over Y (as an open subspace of X), and for $v \in V$ the residue field extension $\kappa(v) \supset \kappa(\nu(v))$ is algebraic (as $V \subset Y'$ and Y' is integral over Y). Hence the fibres of $V \rightarrow Y$ are discrete (Morphisms, Lemma 28.21.2) and $(f')^{-1}V \rightarrow Y$ is locally quasi-finite (Morphisms, Lemma 28.21.8). This implies $(f')^{-1}V \subset U$ and $V \subset U'$. Since x was arbitrary we see that (a), (b), and (c) are true.

Let $y = f(x) \in |Y|$. Let $(T, t) \rightarrow (Y, y)$ be an étale morphism of pointed schemes. Denote by a subscript T the base change to T . Let $z \in X_T$ be a point in the fibre

X_t lying over x . Note that $U_T \subset X_T$ is the set of points where f_T is quasi-finite, see Morphisms of Spaces, Lemma 49.32.7. Note that

$$X_T \xrightarrow{f'_T} Y'_T \xrightarrow{\nu_T} T$$

is the normalization of T in X_T , see Lemma 58.21.2. Suppose that the claim holds for $z \in U_T \subset X_T \rightarrow Y'_T \rightarrow T$, i.e., suppose that we can find an open neighbourhood $f'_T(z) \in V' \subset Y'_T$ such that $(f'_T)^{-1}V' \rightarrow V'$ is an isomorphism. The morphism $Y'_T \rightarrow Y'$ is étale hence the image $V \subset Y'$ of V' is open. Observe that $f'(x) \in V$ as $f'_T(z) \in V'$. Observe that

$$\begin{array}{ccc} (f'_T)^{-1}V' & \longrightarrow & (f')^{-1}(V) \\ \downarrow & & \downarrow \\ V' & \longrightarrow & V \end{array}$$

is a fibre square (as $Y'_T \times_{Y'} X = X_T$). Since the left vertical arrow is an isomorphism and $\{V' \rightarrow V\}$ is a étale covering, we conclude that the right vertical arrow is an isomorphism by Descent on Spaces, Lemma 56.10.13. In other words, the claim holds for $x \in U \subset X \rightarrow Y' \rightarrow Y$.

By the result of the previous paragraph to prove the claim for $x \in |U|$, we may replace Y by an étale neighbourhood T of $y = f(x)$ and x by any point lying over x in $T \times_Y X$. Thus we may assume there is a decomposition

$$X = V \amalg W$$

into open and closed subspaces where $V \rightarrow Y$ is finite and $x \in V$, see Lemma 58.23.1. Since X is a disjoint union of V and W over Y and since $V \rightarrow Y$ is finite we see that the normalization of Y in X is the morphism

$$X = V \amalg W \longrightarrow V \amalg W' \longrightarrow S$$

where W' is the normalization of Y in W , see Morphisms of Spaces, Lemmas 49.43.6, 49.41.6, and 49.43.7. The claim follows and we win. \square

The following lemma is a duplicate of Morphisms of Spaces, Lemma 49.46.2. The reason for having two copies of the same lemma is that the proofs are somewhat different. The proof given below rests on Zariski's Main Theorem for nonrepresentable morphisms of algebraic spaces as presented above, whereas the proof of Morphisms of Spaces, Lemma 49.46.2 rests on Morphisms of Spaces, Proposition 49.44.2 to reduce to the case of morphisms of schemes.

Lemma 58.24.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-finite and separated. Let Y' be the normalization of Y in X . Picture:*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \nu \\ & Y & \end{array}$$

Then f' is a quasi-compact open immersion and ν is integral. In particular f is quasi-affine.

Proof. This follows from Lemma 58.24.1. Namely, by that lemma there exists an open subspace $U' \subset Y'$ such that $(f')^{-1}(U') = X$ (!) and $X \rightarrow U'$ is an isomorphism! In other words, f' is an open immersion. Note that f' is quasi-compact as f is quasi-compact and $\nu : Y' \rightarrow Y$ is separated (Morphisms of Spaces, Lemma 49.8.8). Hence for every affine scheme Z and morphism $Z \rightarrow Y$ the fibre product $Z \times_Y X$ is a quasi-compact open subscheme of the affine scheme $Z \times_Y Y'$. Hence f is quasi-affine by definition. \square

Lemma 58.24.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f is quasi-finite and separated and assume that Y is quasi-compact and quasi-separated. Then there exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{\quad j \quad} & T \\ & \searrow f & \swarrow \pi \\ & & Y \end{array}$$

where j is a quasi-compact open immersion and π is finite.

Proof. Let $X \rightarrow Y' \rightarrow Y$ be as in the conclusion of Lemma 58.24.2. By Limits of Spaces, Lemma 52.9.7 we can write $\nu_*\mathcal{O}_{Y'} = \operatorname{colim}_{i \in I} \mathcal{A}_i$ as a directed colimit of finite quasi-coherent \mathcal{O}_X -algebras $\mathcal{A}_i \subset \nu_*\mathcal{O}_{Y'}$. Then $\pi_i : T_i = \operatorname{Spec}_Y(\mathcal{A}_i) \rightarrow Y$ is a finite morphism for each i . Note that the transition morphisms $T_{i'} \rightarrow T_i$ are affine and that $Y' = \lim T_i$.

By Limits of Spaces, Lemma 52.5.5 there exists an i and a quasi-compact open $U_i \subset T_i$ whose inverse image in Y' equals $f'(X)$. For $i' \geq i$ let $U_{i'}$ be the inverse image of U_i in $T_{i'}$. Then $X \cong f'(X) = \lim_{i' \geq i} U_{i'}$, see Limits of Spaces, Lemma 52.4.1. By Limits of Spaces, Lemma 52.5.10 we see that $X \rightarrow U_{i'}$ is a closed immersion for some $i' \geq i$. (In fact $X \cong U_{i'}$ for sufficiently large i' but we don't need this.) Hence $X \rightarrow T_{i'}$ is an immersion. By Morphisms of Spaces, Lemma 49.12.6 we can factor this as $X \rightarrow T \rightarrow T_{i'}$ where the first arrow is an open immersion and the second a closed immersion. Thus we win. \square

Lemma 58.24.4. *With notation and hypotheses as in Lemma 58.24.3. Assume moreover that f is locally of finite presentation. Then we can choose the factorization such that T is finite and of finite presentation over Y .*

Proof. By Limits of Spaces, Lemma 52.11.3 we can write $T = \lim T_i$ where all T_i are finite and of finite presentation over Y and the transition morphisms $T_{i'} \rightarrow T_i$ are closed immersions. By Limits of Spaces, Lemma 52.5.5 there exists an i and an open subscheme $U_i \subset T_i$ whose inverse image in T is X . By Limits of Spaces, Lemma 52.5.10 we see that $X \cong U_i$ for large enough i . Replacing T by T_i finishes the proof. \square

Lemma 58.24.5. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent:*

- (1) f is finite,
- (2) f is proper and locally quasi-finite,
- (3) f is proper and $|X_k|$ is a discrete space for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where k is a field,
- (4) f is universally closed, separated, locally of finite type and $|X_k|$ is a discrete space for every morphism $\operatorname{Spec}(k) \rightarrow Y$ where k is a field.

Proof. We have (1) \Rightarrow (2) by Morphisms of Spaces, Lemmas 49.41.9, 49.41.8. We have (2) \Rightarrow (3) by Morphisms of Spaces, Lemma 49.26.5. By definition (3) implies (4).

Assume (4). Since f is universally closed it is quasi-compact (Morphisms of Spaces, Lemma 49.9.7). Pick a point y of $|Y|$. We represent y by a morphism $\text{Spec}(k) \rightarrow Y$. Note that $|X_k|$ is finite discrete as a quasi-compact discrete space. The map $|X_k| \rightarrow |X|$ surjects onto the fibre of $|X| \rightarrow |Y|$ over y (Properties of Spaces, Lemma 48.4.3). By Morphisms of Spaces, Lemma 49.32.8 we see that $X \rightarrow Y$ is quasi-finite at all the points of the fibre of $|X| \rightarrow |Y|$ over y . Choose an elementary étale neighbourhood $(U, u) \rightarrow (Y, y)$ and decomposition $X_U = V \coprod W$ as in Lemma 58.23.1 adapted to all the points of $|X|$ lying over y . Note that $W_u = \emptyset$ because we used all the points in the fibre of $|X| \rightarrow |Y|$ over y . Since f is universally closed we see that the image of $|W|$ in $|U|$ is a closed set not containing u . After shrinking U we may assume that $W = \emptyset$. In other words we see that $X_U = V$ is finite over U . Since $y \in |Y|$ was arbitrary this means there exists a family $\{U_i \rightarrow Y\}$ of étale morphisms whose images cover Y such that the base changes $X_{U_i} \rightarrow U_i$ are finite. We conclude that f is finite by Morphisms of Spaces, Lemma 49.41.3. \square

As a consequence we have the following useful result.

Lemma 58.24.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $y \in |Y|$. Assume*

- (1) f is proper, and
- (2) f is quasi-finite at all $x \in |X|$ lying over y (Decent Spaces, Lemma 50.16.10).

Then there exists an open neighbourhood $V \subset Y$ of y such that $f|_{f^{-1}(V)} : f^{-1}(V) \rightarrow V$ is finite.

Proof. By Morphisms of Spaces, Lemma 49.32.7 the set of points at which f is quasi-finite is an open $U \subset X$. Let $Z = X \setminus U$. Then $y \notin f(Z)$. Since f is proper the set $f(Z) \subset Y$ is closed. Choose any open neighbourhood $V \subset Y$ of y with $Z \cap V = \emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence $f^{-1}(V) \rightarrow V$ is finite by Lemma 58.24.5. \square

Lemma 58.24.7. *Let S be a scheme. Let*

be a commutative diagram of morphism of algebraic spaces over S . Let $b \in B$ and let $\text{Spec}(k) \rightarrow B$ be a morphism in the equivalence class of b . Assume

- (1) $X \rightarrow B$ is a proper morphism,
- (2) $Y \rightarrow B$ is separated and locally of finite type,
- (3) one of the following is true
 - (a) the image of $|X_k| \rightarrow |Y_k|$ is finite,
 - (b) the image of $|f|^{-1}(\{b\})$ in $|Y|$ is finite and B is decent.

Then there is an open subspace $B' \subset B$ containing b such that $X_{B'} \rightarrow Y_{B'}$ factors through a closed subspace $Z \subset Y_{B'}$ finite over B' .

Proof. Let $Z \subset Y$ be the scheme theoretic image of h , see Morphisms of Spaces, Section 49.16. By Morphisms of Spaces, Lemma 49.37.8 the morphism $X \rightarrow Z$ is surjective and $Z \rightarrow B$ is proper. Thus

$$\{x \in |X| \text{ lying over } b\} \rightarrow \{z \in |Z| \text{ lying over } b\}$$

and $|X_k| \rightarrow |Z_k|$ are surjective. We see that either (3)(a) or (3)(b) imply that $Z \rightarrow B$ is quasi-finite all all points of $|Z|$ lying over b by Decent Spaces, Lemma 50.16.10. Hence $Z \rightarrow B$ is finite in an open neighbourhood of b by Lemma 58.24.6. \square

58.25. Stein factorization

Stein factorization is the statement that a proper morphism $f : X \rightarrow S$ with $f_*\mathcal{O}_X = \mathcal{O}_S$ has connected fibres.

Lemma 58.25.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a universally closed, quasi-compact and quasi-separated morphism of algebraic spaces over S . There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \pi \\ & & Y \end{array}$$

with the following properties:

- (1) the morphism f' is universally closed, quasi-compact, quasi-separated and surjective,
- (2) the morphism $\pi : Y' \rightarrow Y$ is integral,
- (3) we have $f'_*\mathcal{O}_X = \mathcal{O}_{Y'}$,
- (4) we have $Y' = \underline{\text{Spec}}_Y(f_*\mathcal{O}_X)$, and
- (5) Y' is the normalization of Y in X as defined in Morphisms of Spaces, Definition 49.43.3.

Proof. We just define Y' as the normalization of Y in X , so (5) and (2) hold automatically. By Morphisms of Spaces, Lemma 49.43.8 we see that (4) holds. The morphism f' is universally closed by Morphisms of Spaces, Lemma 49.37.6. It is quasi-compact by Morphisms of Spaces, Lemma 49.8.8 and quasi-separated by Morphisms of Spaces, Lemma 49.4.10.

To show the remaining statements we may assume the base Y is affine (as taking normalization commutes with étale localization). Say $Y = \text{Spec}(R)$. Then $Y' = \text{Spec}(A)$ with $A = \Gamma(X, \mathcal{O}_X)$ an integral R -algebra. Thus it is clear that $f'_*\mathcal{O}_X$ is $\mathcal{O}_{Y'}$ (because $f'_*\mathcal{O}_X$ is quasi-coherent, by Morphisms of Spaces, Lemma 49.11.2, and hence equal to \hat{A}). This proves (3).

Let us show that f' is surjective. As f' is universally closed (see above) the image of f' is a closed subset $V(I) \subset S' = \text{Spec}(A)$. Pick $h \in I$. Then $h|_X = f^\sharp(h)$ is a global section of the structure sheaf of X which vanishes at every point. As X is quasi-compact this means that $h|_X$ is a nilpotent section, i.e., $h^n|_X = 0$ for some $n > 0$. But $A = \Gamma(X, \mathcal{O}_X)$, hence $h^n = 0$. In other words I is contained in the radical ideal of A and we conclude that $V(I) = S'$ as desired. \square

Let $f : X \rightarrow Y$ be a morphism of algebraic spaces and let $\bar{y} : \text{Spec}(k) \rightarrow Y$ be a geometric point. Then the fibre of f over \bar{y} is the algebraic space $X_{\bar{y}} =$

$X \times_{Y, \bar{y}} \text{Spec}(k)$ over k . If Y is a scheme and $y \in Y$ is a point, then we denote $X_y = X \times_Y \text{Spec}(\kappa(y))$ the fibre as usual.

Lemma 58.25.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \bar{y} be a geometric point of Y . Then $X_{\bar{y}}$ is connected, if and only if for every étale neighbourhood $(V, \bar{v}) \rightarrow (Y, \bar{y})$ where V is a scheme the base change $X_V \rightarrow V$ has connected fibre X_v .*

Proof. Since the category of étale neighbourhoods of \bar{y} is cofiltered and contains a cofinal collection of schemes (Properties of Spaces, Lemma 48.16.3) we may replace Y by one of these neighbourhoods and assume that Y is a scheme. Let $y \in Y$ be the point corresponding to \bar{y} . Then X_y is geometrically connected over $\kappa(y)$ if and only if $X_{\bar{y}}$ is connected and if and only if $(X_y)_{k'}$ is connected for every finite separable extension k' of $\kappa(y)$. See Spaces over Fields, Section 54.8 and especially Lemma 54.8.8. By More on Morphisms, Lemma 36.27.2 there exists an affine étale neighbourhood $(V, v) \rightarrow (Y, y)$ such that $\kappa(s) \subset \kappa(u)$ is identified with $\kappa(s) \subset k'$ any given finite separable extension. The lemma follows. \square

Theorem 58.25.3 (Stein factorization; Noetherian case). *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper morphism of algebraic spaces over S with Y locally Noetherian. There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y' \\ & \searrow f & \swarrow \pi \\ & & Y \end{array}$$

with the following properties:

- (1) the morphism f' is proper with connected geometric fibres,
- (2) the morphism $\pi : Y' \rightarrow Y$ is finite,
- (3) we have $f'_* \mathcal{O}_X = \mathcal{O}_{Y'}$,
- (4) we have $Y' = \underline{\text{Spec}}_Y(f_* \mathcal{O}_X)$, and
- (5) Y' is the normalization of Y in X , see Morphisms, Definition 28.48.3.

Proof. Let $f = \pi \circ f'$ be the factorization of Lemma 58.25.1. Note that besides the conclusions of Lemma 58.25.1 we also have that f' is separated (Morphisms of Spaces, Lemma 49.4.10) and finite type (Morphisms of Spaces, Lemma 49.23.6). Hence f' is proper. By Cohomology of Spaces, Lemma 51.19.2 we see that $f_* \mathcal{O}_X$ is a coherent \mathcal{O}_Y -module. Hence we see that π is finite, i.e., (2) holds.

This proves all but the most interesting assertion, namely that the geometric fibres of f' are connected. It is clear from the discussion above that we may replace Y by Y' . Then Y is locally Noetherian, $f : X \rightarrow Y$ is proper, and $f_* \mathcal{O}_X = \mathcal{O}_Y$. Let \bar{y} be a geometric point of Y . At this point we apply the theorem on formal functions, more precisely Cohomology of Spaces, Lemma 51.20.7. It tells us that

$$\mathcal{O}_{Y, \bar{y}}^\wedge = \lim_n H^0(X_n, \mathcal{O}_{X_n})$$

where $X_n = \text{Spec}(\mathcal{O}_{Y, \bar{y}}/\mathfrak{m}_{\bar{y}}^n) \times_Y X$. Note that $X_1 = X_{\bar{y}} \rightarrow X_n$ is a (finite order) thickening and hence the underlying topological space of X_n is equal to that of $X_{\bar{y}}$. Thus, if $X_{\bar{y}} = T_1 \amalg T_2$ is a disjoint union of nonempty open and closed subspaces, then similarly $X_n = T_{1,n} \amalg T_{2,n}$ for all n . And this in turn means $H^0(X_n, \mathcal{O}_{X_n})$ contains a nontrivial idempotent $e_{1,n}$, namely the function which is identically 1

on $T_{1,n}$ and identically 0 on $T_{2,n}$. It is clear that $e_{1,n+1}$ restricts to $e_{1,n}$ on X_n . Hence $e_1 = \lim e_{1,n}$ is a nontrivial idempotent of the limit. This contradicts the fact that $\mathcal{O}_{\bar{Y},\bar{y}}$ is a local ring. Thus the assumption was wrong, i.e., $X_{\bar{y}}$ is connected as desired. \square

Theorem 58.25.4 (Stein factorization; general case). *Let S be a scheme. Let $f : X \rightarrow Y$ be a proper morphism of algebraic spaces over S . There exists a factorization*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & Y' \\ & \searrow f & \swarrow \pi \\ & & Y \end{array}$$

with the following properties:

- (1) the morphism f' is proper with connected geometric fibres,
- (2) the morphism $\pi : Y' \rightarrow Y$ is integral,
- (3) we have $f'_*\mathcal{O}_X = \mathcal{O}_{Y'}$,
- (4) we have $Y' = \underline{\text{Spec}}_Y(f_*\mathcal{O}_X)$, and
- (5) Y' is the normalization of Y in X , see *Morphisms, Definition 28.48.3*.

Proof. We may apply Lemma 58.25.1 to get the morphism $f' : X \rightarrow Y'$. Note that besides the conclusions of Lemma 58.25.1 we also have that f' is separated (*Morphisms of Spaces, Lemma 49.4.10*) and finite type (*Morphisms of Spaces, Lemma 49.23.6*). Hence f' is proper. At this point we have proved all of the statements except for the statement that f' has connected geometric fibres.

It is clear from the discussion that we may replace Y by Y' . Then $f : X \rightarrow Y$ is proper and $f_*\mathcal{O}_X = \mathcal{O}_Y$. Note that these conditions are preserved under flat base change (*Morphisms of Spaces, Lemma 49.37.3* and *Cohomology of Spaces, Lemma 51.10.1*). Let \bar{y} be a geometric point of Y . By Lemma 58.25.2 and the remark just made we reduce to the case where Y is a scheme, $y \in Y$ is a point, $f : X \rightarrow Y$ is a proper algebraic space over Y with $f_*\mathcal{O}_X = \mathcal{O}_Y$, and we have to show the fibre X_y is connected. Replacing Y by an affine neighbourhood of y we may assume that $Y = \text{Spec}(R)$ is affine. Then $f_*\mathcal{O}_X = \mathcal{O}_Y$ signifies that the ring map $R \rightarrow \Gamma(X, \mathcal{O}_X)$ is bijective.

By Limits of Spaces, Lemma 52.12.2 we can write $(X \rightarrow Y) = \lim(X_i \rightarrow Y_i)$ with $X_i \rightarrow Y_i$ proper and of finite presentation and Y_i Noetherian. For i large enough Y_i is affine (*Limits of Spaces, Lemma 52.5.8*). Say $Y_i = \text{Spec}(R_i)$. Let $R'_i = \Gamma(X_i, \mathcal{O}_{X_i})$. Observe that we have ring maps $R_i \rightarrow R'_i \rightarrow R$. Namely, we have the first because X_i is an algebraic space over R_i and the second because we have $X \rightarrow X_i$ and $R = \Gamma(X, \mathcal{O}_X)$. Note that $R = \text{colim } R'_i$ by Limits of Spaces, Lemma 52.5.4. Then

$$\begin{array}{ccccc} X & \longrightarrow & X_i & & \\ \downarrow & & \downarrow & & \\ Y & \longrightarrow & Y'_i & \longrightarrow & Y_i \end{array}$$

is commutative with $Y'_i = \text{Spec}(R'_i)$. Let $y'_i \in Y'_i$ be the image of y . We have $X_y = \lim X_{i,y'_i}$ because $X = \lim X_i$, $Y = \lim Y'_i$, and $\kappa(y) = \text{colim } \kappa(y'_i)$. Now let $X_y = U \amalg V$ with U and V open and closed. Then U, V are the inverse images of opens U_i, V_i in X_{i,y'_i} (*Limits of Spaces, Lemma 52.5.5*). By Theorem 58.25.3 the

fibres of $X_i \rightarrow Y_i'$ are connected, hence either U or V is empty. This finishes the proof. \square

58.26. Extending properties from an open

In this section we collect a number of results of the form: If $f : X \rightarrow Y$ is a flat morphism of algebraic spaces and f satisfies some property over a dense open of Y , then f satisfies the same property over all of Y .

Lemma 58.26.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let \mathcal{F} be a quasi-coherent \mathcal{O}_X -module. Let $V \subset Y$ be an open subspace. Assume*

- (1) f is locally of finite presentation,
- (2) \mathcal{F} is of finite type and flat over Y ,
- (3) $V \rightarrow Y$ is quasi-compact and scheme theoretically dense,
- (4) $\mathcal{F}|_{f^{-1}V}$ is of finite presentation.

Then \mathcal{F} is of finite presentation.

Proof. It suffices to prove the pullback of \mathcal{F} to a scheme surjective and étale over X is of finite presentation. Hence we may assume X is a scheme. Similarly, we can replace Y by a scheme surjective and étale and over Y (the inverse image of V in this scheme is scheme theoretically dense, see Morphisms of Spaces, Section 49.17). Thus we reduce to the case of schemes which is More on Flatness, Lemma 37.10.11. \square

Lemma 58.26.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $V \subset Y$ be an open subspace. Assume*

- (1) f is locally of finite type and flat,
- (2) $V \rightarrow Y$ is quasi-compact and scheme theoretically dense,
- (3) $f|_{f^{-1}V} : f^{-1}V \rightarrow V$ is locally of finite presentation.

Then f is of locally of finite presentation.

Proof. The proof is identical to the proof of Lemma 58.26.1 except one uses More on Flatness, Lemma 37.10.12. \square

Lemma 58.26.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $V \subset Y$ be an open subspace. Let $d \geq 0$. Assume*

- (1) f is flat and locally of finite presentation,
- (2) $V \subset Y$ is scheme theoretically dense, and
- (3) $f|_{f^{-1}V} : f^{-1}V \rightarrow V$ has relative dimension $\leq d$.

Then $f : X \rightarrow Y$ has relative dimension $\leq d$.

Proof. By definition the property of having relative dimension $\leq d$ can be checked on an étale covering, see Morphisms of Spaces, Sections 49.31. Thus it suffices to prove f has relative dimension $\leq d$ after replacing X by a scheme surjective and étale over X . Similarly, we can replace Y by a scheme surjective and étale and over Y . The inverse image of V in this scheme is scheme theoretically dense, see Morphisms of Spaces, Section 49.17. Since a scheme theoretically dense open of a scheme is in particular dense, we reduce to the case of schemes which is More on Morphisms, Lemma 36.17.8. \square

Lemma 58.26.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $V \subset Y$ be an open subspace. If*

- (1) *f is separated, locally of finite type, and flat,*
- (2) *$f^{-1}(V) \rightarrow V$ is an isomorphism, and*
- (3) *$V \rightarrow Y$ is quasi-compact and scheme theoretically dense,*

then f is an open immersion.

Proof. Applying Lemma 58.26.2 we see that f is locally of finite presentation. Applying Lemma 58.26.3 we see that f has relative dimension ≤ 0 . By Morphisms of Spaces, Lemma 49.32.6 this implies that f is locally quasi-finite. By Morphisms of Spaces, Lemma 49.45.1 this implies that f is representable. By Descent on Spaces, Lemma 56.10.12 we can check whether f is an open immersion étale locally on Y . Hence we may assume that Y is a scheme. Since f is representable, we reduce to the case of schemes which is More on Morphisms, Lemma 36.31.4. \square

58.27. Blowing up and flatness

Instead of redoing the work in More on Flatness, Section 37.27 we prove an analogue of More on Flatness, Lemma 37.27.6 which tells us that the problem of finding a suitable blowup is often étale local on the base.

Lemma 58.27.1. *Let S be a scheme. Let X be a quasi-compact and quasi-separated algebraic space over S . Let $\varphi : W \rightarrow X$ be a quasi-compact separated étale morphism. Let $U \subset X$ be a quasi-compact open subspace. Let $\mathcal{I} \subset \mathcal{O}_U$ be a finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}) \cap \varphi^{-1}(U) = \emptyset$. Then there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ such that*

- (1) *$V(\mathcal{J}) \cap U = \emptyset$, and*
- (2) *$\varphi^{-1}(\mathcal{J})\mathcal{O}_W = \mathcal{I}\mathcal{I}'$ for some finite type quasi-coherent ideal $\mathcal{I}' \subset \mathcal{O}_W$.*

Proof. Choose a factorization $W \rightarrow Y \rightarrow X$ where $j : W \rightarrow Y$ is a quasi-compact open immersion and $\pi : Y \rightarrow X$ is a finite morphism of finite presentation (Lemma 58.24.4). Let $V = j(W) \cup \pi^{-1}(U) \subset Y$. Note that \mathcal{I} on $W \cong j(W)$ and $\mathcal{O}_{\pi^{-1}(U)}$ glue to a finite type quasi-coherent sheaf of ideals $\mathcal{I}_1 \subset \mathcal{O}_V$. By Limits of Spaces, Lemma 52.9.8 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I}_2 \subset \mathcal{O}_Y$ such that $\mathcal{I}_2|_V = \mathcal{I}_1$. In other words, $\mathcal{I}_2 \subset \mathcal{O}_Y$ is a finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}_2)$ is disjoint from $\pi^{-1}(U)$ and $j^{-1}\mathcal{I}_2 = \mathcal{I}$. Denote $i : Z \rightarrow Y$ the corresponding closed immersion which is of finite presentation (Morphisms of Spaces, Lemma 49.27.12). In particular the composition $\tau = \pi \circ i : Z \rightarrow X$ is finite and of finite presentation (Morphisms of Spaces, Lemmas 49.27.2 and 49.41.4).

Let $\mathcal{F} = \tau_*\mathcal{O}_Z$ which we think of as a quasi-coherent \mathcal{O}_X -module. By Descent on Spaces, Lemma 56.5.7 we see that \mathcal{F} is a finitely presented \mathcal{O}_X -module. Let $\mathcal{J} = \text{Fit}_0(\mathcal{F})$. (Insert reference to fitting modules on ringed topoi here.) This is a finite type quasi-coherent sheaf of ideals on X (as \mathcal{F} is of finite presentation, see More on Algebra, Lemma 15.5.4). Part (1) of the lemma holds because $|\tau|(|Z|) \cap |U| = \emptyset$ by our choice of \mathcal{I}_2 and because the 0th fitting ideal of the trivial module equals the structure sheaf. To prove (2) note that $\varphi^{-1}(\mathcal{J})\mathcal{O}_W = \text{Fit}_0(\varphi^*\mathcal{F})$ because taking fitting ideals commutes with base change. On the other hand, as $\varphi : W \rightarrow X$ is separated and étale we see that $(1, j) : W \rightarrow W \times_X Y$ is an open and closed immersion. Hence $W \times_Y Z = V(\mathcal{I}) \amalg Z'$ for some finite and finitely presented

morphism of algebraic spaces $\tau' : Z' \rightarrow W$. Thus we see that

$$\begin{aligned} \mathrm{Fit}_0(\varphi^*\mathcal{F}) &= \mathrm{Fit}_0((W \times_Y Z \rightarrow W)_*\mathcal{O}_{W \times_Y Z}) \\ &= \mathrm{Fit}_0(\mathcal{O}_W/\mathcal{I}) \cdot \mathrm{Fit}_0(\tau'_*\mathcal{O}_{Z'}) \\ &= \mathcal{I} \cdot \mathrm{Fit}_0(\tau'_*\mathcal{O}_{Z'}) \end{aligned}$$

the second equality by More on Algebra, Lemma 15.5.4 translated in sheaves on ringed topoi. Setting $\mathcal{I}' = \mathrm{Fit}_0(\tau'_*\mathcal{O}_{Z'})$ finishes the proof of the lemma. \square

Theorem 58.27.2. *Let S be a scheme. Let B be a quasi-compact and quasi-separated algebraic space over S . Let X be an algebraic space over B . Let \mathcal{F} be a quasi-coherent module on X . Let $U \subset B$ be a quasi-compact open subspace. Assume*

- (1) X is quasi-compact,
- (2) X is locally of finite presentation over B ,
- (3) \mathcal{F} is a module of finite type,
- (4) \mathcal{F}_U is of finite presentation, and
- (5) \mathcal{F}_U is flat over U .

Then there exists a U -admissible blowup $B' \rightarrow B$ such that the strict transform \mathcal{F}' of \mathcal{F} is an $\mathcal{O}_{X \times_B B'}$ -module of finite presentation and flat over B' .

Proof. Choose an affine scheme V and a surjective étale morphism $V \rightarrow X$. Because strict transform commutes with étale localization (Divisors on Spaces, Lemma 53.7.2) it suffices to prove the result with X replaced by V . Hence we may assume that $X \rightarrow B$ is representable (in addition to the hypotheses of the lemma).

Assume that $X \rightarrow B$ is representable. Choose an affine scheme W and a surjective étale morphism $\varphi : W \rightarrow B$. Note that $X \times_B W$ is a scheme. By the case of schemes (More on Flatness, Theorem 37.27.8) we can find a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_W$ such that (a) $|V(\mathcal{I})| \cap |\varphi^{-1}(U)| = \emptyset$ and (b) the strict transform of $\mathcal{F}|_{X \times_B W}$ with respect to the blowing up $W' \rightarrow W$ in \mathcal{I} becomes flat over W' and is a module of finite presentation. Choose a finite type sheaf of ideals $\mathcal{J} \subset \mathcal{O}_B$ as in Lemma 58.27.1. Let $B' \rightarrow B$ be the blowing up of \mathcal{J} . We claim that this blow up works. Namely, it is clear that $B' \rightarrow B$ is U -admissible by our choice of ideal \mathcal{J} . Moreover, the base change $B' \times_B W \rightarrow W$ is the blowup of W in $\varphi^{-1}\mathcal{J} = \mathcal{I}\mathcal{I}'$ (compatibility of blowup with flat base change, see Divisors on Spaces, Lemma 53.6.3). Hence there is a factorization

$$W \times_B B' \rightarrow W' \rightarrow W$$

where the first morphism is a blowup as well, see Divisors on Spaces, Lemma 53.6.9). The restriction of \mathcal{F}' (which lives on $B' \times_B X$) to $W \times_B B' \times_B X$ is the strict transform of $\mathcal{F}|_{X \times_B W}$ (Divisors on Spaces, Lemma 53.7.2) and hence is the twice repeated strict transform of $\mathcal{F}|_{X \times_B W}$ by the two blowups displayed above (Divisors on Spaces, Lemma 53.7.7). After the first blow up our sheaf is already flat over the base and of finite presentation (by construction). Whence this holds after the second strict transform as well (since this is a pullback by Divisors on Spaces, Lemma 53.7.4). Thus we see that the restriction of \mathcal{F}' to an étale cover of $B' \times_B X$ has the desired properties and the theorem is proved. \square

58.28. Applications

In this section we apply the result on flattening by blowing up.

Lemma 58.28.1. *Let S be a scheme. Let B be a quasi-compact and quasi-separated algebraic space over S . Let X be an algebraic space over B . Let $U \subset B$ be a quasi-compact open subspace. Assume*

- (1) $X \rightarrow B$ is of finite type and quasi-separated, and
- (2) $X_U \rightarrow U$ is flat and locally of finite presentation.

Then there exists a U -admissible blowup $B' \rightarrow B$ such that the strict transform of X is flat and of finite presentation over B' .

Proof. Let $B' \rightarrow B$ be a U -admissible blowup. Note that the strict transform of X is quasi-compact and quasi-separated over B' as X is quasi-compact and quasi-separated over B . Hence we only need to worry about finding a U -admissible blowup such that the strict transform becomes flat and locally of finite presentation. We cannot directly apply Theorem 58.27.2 because X is not locally of finite presentation over B .

Choose an affine scheme V and a surjective étale morphism $V \rightarrow X$. (This is possible as X is quasi-compact as a finite type space over the quasi-compact space B .) Then it suffices to show the result for the morphism $V \rightarrow B$ (as strict transform commutes with étale localization, see Divisors on Spaces, Lemma 53.7.2). Hence we may assume that $X \rightarrow B$ is separated as well as finite type. In this case we can find a closed immersion $i : X \rightarrow Y$ with $Y \rightarrow B$ separated and of finite presentation, see Limits of Spaces, Proposition 52.11.7.

Apply Theorem 58.27.2 to $\mathcal{F} = i_*\mathcal{O}_X$ on Y/B . We find a U -admissible blowup $B' \rightarrow B$ such that that strict transform of \mathcal{F} is flat over B' and of finite presentation. Let X' be the strict transform of X under the blowup $B' \rightarrow B$. Let $i' : X' \rightarrow Y \times_B B'$ be the induced morphism. Since taking strict transform commutes with pushforward along affine morphisms (Divisors on Spaces, Lemma 53.7.5), we see that $i'_*\mathcal{O}_{X'}$ is flat over B' and of finite presentation as a $\mathcal{O}_{Y \times_B B'}$ -module. Thus $X' \rightarrow B'$ is flat and locally of finite presentation. This implies the lemma by our earlier remarks. \square

Lemma 58.28.2. *Let S be a scheme. Let $\varphi : X \rightarrow B$ be a morphism of algebraic spaces over S . Assume φ is of finite type with B quasi-compact and quasi-separated. Let $U \subset B$ be a quasi-compact open subspace such that $\varphi^{-1}U \rightarrow U$ is an isomorphism. Then there exists a U -admissible blowup $B' \rightarrow B$ such that U is scheme theoretically dense in B' and such that the strict transform X' of X is isomorphic to an open subspace of B' .*

Proof. As the composition of U -admissible blowups is U -admissible (Divisors on Spaces, Lemma 53.8.2) we can proceed in stages. Pick a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_B$ with $|B| \setminus |U| = |V(\mathcal{I})|$. Replace B by the blowup of B in \mathcal{I} and X by the strict transform of X . After this replacement $B \setminus U$ is the support of an effective Cartier divisor D (Divisors on Spaces, Lemma 53.6.4). In particular U is scheme theoretically dense in B (Divisors on Spaces, Lemma 53.2.4). Next, we do another U -admissible blowup to get to the situation where $X \rightarrow B$ is flat and of finite presentation, see Lemma 58.28.1. Note that U is still scheme theoretically dense in B . Hence $X \rightarrow B$ is an open immersion by Lemma 58.26.4. \square

The following lemma says that a modification can be dominated by a blowup.

Lemma 58.28.3. *Let S be a scheme. Let $\varphi : X \rightarrow B$ be a proper morphism of algebraic spaces over S . Assume B quasi-compact and quasi-separated. Let $U \subset B$ be a quasi-compact open subspace such that $\varphi^{-1}U \rightarrow U$ is an isomorphism. Then there exists a U -admissible blowup $B' \rightarrow B$ which dominates X , i.e., such that there exists a factorization $B' \rightarrow X \rightarrow B$ of the blowup morphism.*

Proof. By Lemma 58.28.2 we may find a U -admissible blowup $B' \rightarrow B$ such that the strict transform X' is an open subspace of B' and U is scheme theoretically dense in B' . Since $X' \rightarrow B'$ is proper we see that $|X'|$ is closed in $|B'|$. As $U \subset B'$ is dense $X' = B'$. \square

58.29. Chow's lemma

In this section we prove some variants of Chow's lemma. Since we have yet to define projective morphisms of algebraic spaces, the statements will involve representable proper morphisms, rather than projective ones.

Lemma 58.29.1. *Let S be a scheme. Let Y be a quasi-compact and quasi-separated algebraic space over S . Let $U \rightarrow X_1$ and $U \rightarrow X_2$ be open immersions of algebraic spaces over Y and assume U, X_1, X_2 of finite type and separated over Y . Then there exists a commutative diagram*

$$\begin{array}{ccccc} X'_1 & \longrightarrow & X & \longleftarrow & X'_2 \\ \downarrow & \nearrow & \uparrow & \nwarrow & \downarrow \\ X_1 & \longleftarrow & U & \longrightarrow & X_2 \end{array}$$

of algebraic spaces over Y where $X'_i \rightarrow X_i$ is a U -admissible blowup, $X'_i \rightarrow X$ is an open immersion, and X is separated and finite type over Y .

Proof. Throughout the proof all the algebraic spaces will be separated of finite type over Y . This in particular implies these algebraic spaces and the morphisms between them will be quasi-compact and quasi-separated. We will use that if $U \rightarrow W$ is an immersion of such spaces over Y , then the scheme theoretic image Z of U in W is a closed subspace of W and $U \rightarrow Z$ is an open immersion, $U \subset Z$ is scheme theoretically dense, and $|U| \subset |Z|$ is dense. See Morphisms of Spaces, Lemma 49.17.7.

Let $X_{12} \subset X_1 \times_Y X_2$ be the scheme theoretic image of $U \rightarrow X_1 \times_Y X_2$. We claim the projections $p_i : X_{12} \rightarrow X_i$ induce isomorphisms $p_i^{-1}(U) \rightarrow U$. Namely, $p_i : X_{12} \rightarrow X_i$ is separated and $U \rightarrow X_{12}$ is a section of p_i . Hence $U \rightarrow p_i^{-1}(U)$ is a closed immersion (Morphisms of Spaces, Lemma 49.4.6) as well as scheme theoretically dense whence an isomorphism. Choose a U -admissible blowup $X'_i \rightarrow X_i$ such that the strict transform X'_{i2} of X_{12} is isomorphic to an open subspace of X'_i , see Lemma 58.28.2. Let $\mathcal{I}_i \subset \mathcal{O}_{X_i}$ be the corresponding finite type quasi-coherent sheaf of ideals. Recall that $X'_{i2} \rightarrow X_{12}$ is the blowup in $p_i^{-1}\mathcal{I}_i\mathcal{O}_{X_{12}}$. Let X'_{12} be the blowup of X_{12} in $p_1^{-1}\mathcal{I}_1p_2^{-1}\mathcal{I}_2\mathcal{O}_{X_{12}}$. We obtain a commutative diagram

$$\begin{array}{ccc} X'_{12} & \longrightarrow & X'_{12} \\ \downarrow & & \downarrow \\ X_{12} & \longrightarrow & X_{12} \end{array}$$

where all the morphisms are U -admissible blowing ups. Choose a finite type quasi-coherent sheaf of ideals \mathcal{J}_i on X_i^i extending the pull back of \mathcal{I}_{1-i} to X_{12}^i (see Limits of Spaces, Lemma 52.9.8). Let $X_i' \rightarrow X_i^i$ be the blowing up in \mathcal{J}_i . By construction $X'_{12} \subset X_i'$ is an open subspace and the diagram

$$\begin{array}{ccc} X'_{12} & \longrightarrow & X_i' \\ \downarrow & & \downarrow \\ X_{12}^i & \longrightarrow & X_i^i \end{array}$$

is commutative with vertical arrows blowing ups and horizontal arrows open immersions. Note that $X'_{12} \rightarrow X'_1 \times_Y X'_2$ is an immersion and proper (use that $X'_{12} \rightarrow X_{12}$ is proper and $X_{12} \rightarrow X_1 \times_Y X_2$ is closed and $X'_1 \times_Y X'_2 \rightarrow X_1 \times_Y X_2$ is separated and apply Morphisms of Spaces, Lemma 49.37.6). Thus $X'_{12} \rightarrow X'_1 \times_Y X'_2$ is a closed immersion. It follows that if we define X by glueing X'_1 and X'_2 along the common open subspace X'_{12} , then $X \rightarrow Y$ is of finite type and separated (details omitted). As compositions of U -admissible blowups are U -admissible blowups (Divisors on Spaces, Lemma 53.8.2) the lemma is proved. \square

Lemma 58.29.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $U \subset X$ be an open subscheme. Assume*

- (1) U is quasi-compact,
- (2) Y is quasi-compact and quasi-separated,
- (3) there exists an immersion $U \rightarrow \mathbf{P}_Y^n$ over Y ,
- (4) f is of finite type and separated.

Then there exists a commutative diagram

$$\begin{array}{ccc} X' & \longrightarrow & \overline{X}' \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $X' \rightarrow X$ is a U -admissible blowup, $X' \rightarrow \overline{X}'$ is an open immersion, and $\overline{X}' \rightarrow Y$ is a proper and representable morphism of algebraic spaces.

Proof. Let $Z \subset \mathbf{P}_Y^n$ be the scheme theoretic image of the immersion $U \rightarrow \mathbf{P}_Y^n$. Since $U \rightarrow \mathbf{P}_Y^n$ is quasi-compact we see that $U \subset Z$ is a (scheme theoretically) dense open subspace (Morphisms of Spaces, Lemma 49.17.7). Apply Lemma 58.29.1 to find a diagram

$$\begin{array}{ccccc} X' & \longrightarrow & \overline{X}' & \longleftarrow & Z' \\ \downarrow & \nearrow & \uparrow & \nwarrow & \downarrow \\ X & \longleftarrow & U & \longrightarrow & Z \end{array}$$

with properties as listed in the statement of that lemma. Since $Z' \rightarrow Z \rightarrow Y$ is proper we see that $Z' \subset \overline{X}'$ is closed (see Morphisms of Spaces, Lemma 49.37.6). After replacing \overline{X}' by a further U -admissible blowup we may assume that U is scheme theoretically dense in \overline{X}' (details omitted; use Divisors on Spaces, Lemmas 53.6.4 and 53.2.4). It follows that $Z' = \overline{X}'$ and the lemma is proved. \square

Lemma 58.29.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f separated, of finite type, and Y Noetherian. Then there exists a commutative diagram*

$$\begin{array}{ccc} X' & \longrightarrow & \overline{X}' \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $X' \rightarrow X$ is a U -admissible blowup for some dense open $U \subset X$, the morphism $X' \rightarrow \overline{X}'$ is an open immersion, and $\overline{X}' \rightarrow Y$ is a proper and representable morphism of algebraic spaces.

Proof. By Limits of Spaces, Lemma 52.13.3 there exists a dense open subspace $U \subset X$ and an immersion $U \rightarrow \mathbf{A}_Y^n$ over Y . Composing with the open immersion $\mathbf{A}_Y^n \rightarrow \mathbf{P}_Y^n$ we obtain a situation as in Lemma 58.29.2 and the result follows. \square

Remark 58.29.4. In Lemma 58.29.2 the morphism $\overline{X}' \rightarrow Y$ is a composition

$$\overline{X}' \rightarrow Z \rightarrow \mathbf{P}_Y^n \rightarrow Y$$

where $b : \overline{X}' \rightarrow Z$ is a U -admissible blowing up (in particular $b|_U : U \rightarrow b(U)$ is an isomorphism onto an open subspace of Z) and where $Z \rightarrow \mathbf{P}_Y^n$ is a closed immersion. This is immediate from the proof. It follows that the morphism $\overline{X}' \rightarrow Y$ obtained in the statement of Lemma 58.29.3 has a factorization of this type as well.

The following result is [Knu71, IV Theorem 3.1]. Note that the immersion $X' \rightarrow \mathbf{P}_Y^n$ is quasi-compact, hence can be factored as $X' \rightarrow \overline{X}' \rightarrow \mathbf{P}_Y^n$ where the first morphism is an open immersion and the second morphism a closed immersion (Morphisms of Spaces, Lemma 49.17.7).

Lemma 58.29.5 (Chow's lemma). *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f separated of finite type, and Y separated and Noetherian. Then there exists a commutative diagram*

$$\begin{array}{ccc} X' & \longrightarrow & \mathbf{P}_Y^n \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $X' \rightarrow X$ is a U -admissible blowup for some dense open $U \subset X$ and the morphism $X' \rightarrow \mathbf{P}_Y^n$ is an immersion.

Proof. In this first paragraph of the proof we reduce the lemma to the case where Y is of finite type over $\mathrm{Spec}(\mathbf{Z})$. We may and do replace the base scheme S by $\mathrm{Spec}(\mathbf{Z})$. We can write $Y = \lim Y_i$ as a directed limit of separated algebraic spaces of finite type over $\mathrm{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition 52.8.1 and Lemma 52.5.7. For all i sufficiently large we can find a separated finite type morphism $X_i \rightarrow Y_i$ such that $X = Y \times_{Y_i} X_i$, see Limits of Spaces, Lemmas 52.7.1 and 52.6.8. Let η_1, \dots, η_n be the generic points of the irreducible components of $|X|$ (X is Noetherian as a finite type separated algebraic space over the Noetherian algebraic space Y and therefore $|X|$ is a Noetherian topological space). By Limits of Spaces, Lemma 52.5.2 we find that the images of η_1, \dots, η_n in $|X_i|$ are distinct for i large enough. We may replace X_i by the scheme theoretic image of the (quasi-compact,

in fact affine) morphism $X \rightarrow X_i$. After this replacement we see that the images of η_1, \dots, η_n in $|X_i|$ are the generic points of the irreducible components of $|X_i|$, see Morphisms of Spaces, Lemma 49.16.3. Having said this, suppose we can find a diagram

$$\begin{array}{ccc} X'_i & \longrightarrow & \mathbf{P}_{Y_i}^n \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & Y \end{array}$$

where $X'_i \rightarrow X_i$ is a U_i -admissible blowup for some dense open $U_i \subset X_i$ and the morphism $X'_i \rightarrow \mathbf{P}_{Y_i}^n$ is an immersion. Then the strict transform $X' \rightarrow X$ of X relative to $X'_i \rightarrow X_i$ is a U -admissible blowing up where $U \subset X$ is the inverse image of U_i in X . Because of our carefully chosen index i it follows that $\eta_1, \dots, \eta_n \in |U|$ and $U \subset X$ is dense. Moreover, $X' \rightarrow \mathbf{P}_Y^n$ is an immersion as X' is closed in $X'_i \times_{X_i} X = X'_i \times_{Y_i} Y$ which comes with an immersion into \mathbf{P}_Y^n . Thus we have reduced to the situation of the following paragraph.

Assume that Y is separated of finite type over $\mathrm{Spec}(\mathbf{Z})$. Then $X \rightarrow \mathrm{Spec}(\mathbf{Z})$ is separated of finite type as well. We apply Lemma 58.29.3 to find a diagram

$$\begin{array}{ccc} X' & \longrightarrow & \overline{X}' \\ \downarrow & & \downarrow \\ X & \longrightarrow & \mathrm{Spec}(\mathbf{Z}) \end{array}$$

where $X' \rightarrow X$ is a U -admissible blowup for some dense open $U \subset X$ and $X' \rightarrow \overline{X}'$ is an open immersion and $\overline{X}' \rightarrow \mathrm{Spec}(\mathbf{Z})$ is representable and proper. In fact, by Remark 58.29.4 we see that $\overline{X}' \rightarrow \mathrm{Spec}(\mathbf{Z})$ can be factored as

$$\overline{X}' \rightarrow Z \rightarrow \mathbf{P}_{\mathbf{Z}}^n \rightarrow \mathrm{Spec}(\mathbf{Z}).$$

where the first morphism is a U -admissible blowing up, the second morphism is a closed immersion, and the third morphism is the structure morphism. Note that Z has an ample invertible sheaf, namely $\mathcal{O}_{\mathbf{P}^n}(1)|_Z$. Hence $\overline{X}' \rightarrow Z$ is a H-projective morphism by Morphisms, Lemma 28.43.13. It follows that $\overline{X}' \rightarrow \mathrm{Spec}(\mathbf{Z})$ is H-projective by Morphisms, Lemma 28.43.7. Thus there exists a closed immersion $\overline{X}' \rightarrow \mathbf{P}_{\mathrm{Spec}(\mathbf{Z})}^n$. It follows that the diagonal map $X' \rightarrow Y \times_{\mathrm{Spec}(\mathbf{Z})} \mathbf{P}_{\mathrm{Spec}(\mathbf{Z})}^n = \mathbf{P}_Y^n$ is an immersion and we win. \square

58.30. Variants of Chow's Lemma

In this section we prove a number of variants of Chow's lemma dealing with morphisms between non-Noetherian algebraic spaces. The Noetherian versions are Lemma 58.29.3 and Lemma 58.29.5.

Lemma 58.30.1. *Let S be a scheme. Let Y be a quasi-compact and quasi-separated algebraic space over S . Let $f : X \rightarrow Y$ be a separated morphism of finite type. Then*

there exists a commutative diagram

$$\begin{array}{ccc} X' & \longrightarrow & \overline{X}' \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $X' \rightarrow X$ is proper surjective, $X' \rightarrow \overline{X}'$ is an open immersion, and $\overline{X}' \rightarrow Y$ is proper and representable morphism of algebraic spaces.

Proof. By Limits of Spaces, Proposition 52.11.7 we can find a closed immersion $X \rightarrow X_1$ where X_1 is separated and of finite presentation over Y . Clearly, if we prove the assertion for $X_1 \rightarrow Y$, then the result follows for X . Hence we may assume that X is of finite presentation over Y .

We may and do replace the base scheme S by $\text{Spec}(\mathbf{Z})$. Write $Y = \lim_i Y_i$ as a directed limit of quasi-separated algebraic spaces of finite type over $\text{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition 52.8.1. By Limits of Spaces, Lemma 52.7.1 we can find an index $i \in I$ and a scheme $X_i \rightarrow Y_i$ of finite presentation so that $X = Y \times_{Y_i} X_i$. By Limits of Spaces, Lemma 52.6.8 we may assume that $X_i \rightarrow Y_i$ is separated. Clearly, if we prove the assertion for X_i over Y_i , then the assertion holds for X . The case $X_i \rightarrow Y_i$ is treated by Lemma 58.29.3. \square

Lemma 58.30.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Assume f separated of finite type, and Y separated and quasi-compact. Then there exists a commutative diagram*

$$\begin{array}{ccc} X' & \longrightarrow & \mathbf{P}_Y^n \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

where $X' \rightarrow X$ is proper surjective morphism and the morphism $X' \rightarrow \mathbf{P}_Y^n$ is an immersion.

Proof. By Limits of Spaces, Proposition 52.11.7 we can find a closed immersion $X \rightarrow X_1$ where X_1 is separated and of finite presentation over Y . Clearly, if we prove the assertion for $X_1 \rightarrow Y$, then the result follows for X . Hence we may assume that X is of finite presentation over Y .

We may and do replace the base scheme S by $\text{Spec}(\mathbf{Z})$. Write $Y = \lim_i Y_i$ as a directed limit of quasi-separated algebraic spaces of finite type over $\text{Spec}(\mathbf{Z})$, see Limits of Spaces, Proposition 52.8.1. By Limits of Spaces, Lemma 52.5.7 we may assume that Y_i is separated for all i . By Limits of Spaces, Lemma 52.7.1 we can find an index $i \in I$ and a scheme $X_i \rightarrow Y_i$ of finite presentation so that $X = Y \times_{Y_i} X_i$. By Limits of Spaces, Lemma 52.6.8 we may assume that $X_i \rightarrow Y_i$ is separated. Clearly, if we prove the assertion for X_i over Y_i , then the assertion holds for X . The case $X_i \rightarrow Y_i$ is treated by Lemma 58.29.5. \square

58.31. Grothendieck's existence theorem

In this section we discuss Grothendieck's existence theorem for algebraic spaces. Instead of developing a theory of "formal algebraic spaces" we temporarily develop

a bit of language that replaces the notion of a “coherent module on a Noetherian adic formal space”.

Let S be a scheme. Let X be a Noetherian algebraic space over S . Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Below we will consider inverse systems (\mathcal{F}_n) of coherent \mathcal{O}_X -modules such that

- (1) \mathcal{F}_n is annihilated by \mathcal{I}^n , and
- (2) the transition maps induce isomorphisms $\mathcal{F}_{n+1}/\mathcal{I}^n \mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$.

A morphism $\alpha : (\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ of such inverse systems is simply a compatible system of morphisms $\alpha_n : \mathcal{F}_n \rightarrow \mathcal{G}_n$. Let us denote the category of these inverse systems with $\text{Coh}(X, \mathcal{I})$. We will develop some theory regarding these systems that will parallel to the corresponding results in the case of schemes, see Cohomology of Schemes, Sections 29.21, 29.22, and 29.23.

Functoriality. Let $f : X \rightarrow Y$ be a morphism of Noetherian algebraic spaces over a scheme S , and let $\mathcal{J} \subset \mathcal{O}_Y$ be a quasi-coherent sheaf of ideals. Set $\mathcal{I} = f^{-1}\mathcal{J}\mathcal{O}_X$. In this situation there is a functor

$$f^* : \text{Coh}(Y, \mathcal{J}) \longrightarrow \text{Coh}(X, \mathcal{I})$$

which sends (\mathcal{G}_n) to $(f^*\mathcal{G}_n)$. Compare with Cohomology of Schemes, Lemma 29.22.1. If f is étale, then we may think of this as simply the restriction of the system to X , see Properties of Spaces, Equation 48.24.1.1.

Étale descent. Let S be a scheme. Let $U_0 \rightarrow X$ be a surjective étale morphism of Noetherian algebraic spaces. Set $U_1 = U_0 \times_X U_0$ and $U_2 = U_0 \times_X U_0 \times_X U_0$. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Set $\mathcal{I}_i = \mathcal{I}|_{U_i}$. In this situation we obtain a diagram of categories

$$\text{Coh}(X, \mathcal{I}) \longrightarrow \text{Coh}(U_0, \mathcal{I}_0) \rightrightarrows \text{Coh}(U_1, \mathcal{I}_1) \rightrightarrows \text{Coh}(U_2, \mathcal{I}_2)$$

an the first arrow presents $\text{Coh}(X, \mathcal{I})$ as the homotopy limit of the right part of the diagram. More precisely, given a *descent datum*, i.e., a pair $((\mathcal{G}_n), \varphi)$ where (\mathcal{G}_n) is an object of $\text{Coh}(U_0, \mathcal{I}_0)$ and $\varphi : \text{pr}_0^*(\mathcal{G}_n) \rightarrow \text{pr}_1^*(\mathcal{G}_n)$ is an isomorphism in $\text{Coh}(U_1, \mathcal{I}_1)$ satisfying the cocycle condition in $\text{Coh}(U_2, \mathcal{I}_2)$, then there exists a unique object (\mathcal{F}_n) of $\text{Coh}(X, \mathcal{I})$ whose associated canonical descent datum is isomorphic to $((\mathcal{G}_n), \varphi)$. Compare with Descent on Spaces, Definition 56.3.3. The proof of this statement follows immediately by applying Descent on Spaces, Proposition 56.4.1 to the descent data $(\mathcal{G}_n, \varphi_n)$ for varying n .

Lemma 58.31.1. *Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals.*

- (1) *The category $\text{Coh}(X, \mathcal{I})$ is abelian.*
- (2) *Exactness in $\text{Coh}(X, \mathcal{I})$ can be checked étale locally.*
- (3) *For any flat morphism $f : X' \rightarrow X$ of Noetherian algebraic spaces the functor $f^* : \text{Coh}(X, \mathcal{I}) \rightarrow \text{Coh}(X', f^{-1}\mathcal{I}\mathcal{O}_{X'})$ is exact.*

Proof. Proof of (1). Choose an affine scheme U_0 and a surjective étale morphism $U_0 \rightarrow X$. Set $U_1 = U_0 \times_X U_0$ and $U_2 = U_0 \times_X U_0 \times_X U_0$ as in our discussion of étale descent above. The categories $\text{Coh}(U_i, \mathcal{I}_i)$ are abelian (Cohomology of Schemes, Lemma 29.21.2) and the pullback functors are exact functors $\text{Coh}(U_0, \mathcal{I}_0) \rightarrow \text{Coh}(U_1, \mathcal{I}_1)$ and $\text{Coh}(U_1, \mathcal{I}_1) \rightarrow \text{Coh}(U_2, \mathcal{I}_2)$ (Cohomology of Schemes, Lemma 29.22.1). The lemma then follows formally from the description

of $\text{Coh}(X, \mathcal{I})$ as a category of descent data. Some details omitted; compare with the proof of Groupoids, Lemma 38.12.6.

Part (2) follows immediately from the discussion in the previous paragraph. In the situation of (3) choose a commutative diagram

$$\begin{array}{ccc} U' & \longrightarrow & U \\ \downarrow & & \downarrow \\ X' & \longrightarrow & X \end{array}$$

where U' and U are affine schemes and the vertical morphisms are surjective étale. Then $U' \rightarrow U$ is a flat morphism of Noetherian schemes (Morphisms of Spaces, Lemma 49.28.5) whence the pullback functor $\text{Coh}(U, \mathcal{I}\mathcal{O}_U) \rightarrow \text{Coh}(U', \mathcal{I}\mathcal{O}_{U'})$ is exact by Cohomology of Schemes, Lemma 29.22.1. Since we can check exactness in $\text{Coh}(X, \mathcal{O}_X)$ on U and similarly for X', U' the assertion follows. \square

Lemma 58.31.2. *Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. A map $(\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ is surjective in $\text{Coh}(X, \mathcal{I})$ if and only if $\mathcal{F}_1 \rightarrow \mathcal{G}_1$ is surjective.*

Proof. We can check on an affine étale cover of X by Lemma 58.31.1. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.21.3. \square

Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. There is a functor

$$(58.31.2.1) \quad \text{Coh}(\mathcal{O}_X) \longrightarrow \text{Coh}(X, \mathcal{I}), \quad \mathcal{F} \longmapsto \mathcal{F}^\wedge$$

which associates to the coherent \mathcal{O}_X -module \mathcal{F} the object $\mathcal{F}^\wedge = (\mathcal{F}/\mathcal{I}^n \mathcal{F})$ of $\text{Coh}(X, \mathcal{I})$.

Lemma 58.31.3. *The functor (58.31.2.1) is exact.*

Proof. It suffices to check this étale locally on X , see Lemma 58.31.1. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.21.5. \square

Lemma 58.31.4. *Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Set $\mathcal{H} = \text{Hom}_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$. Then*

$$\lim H^0(X, \mathcal{H}/\mathcal{I}^n \mathcal{H}) = \text{Mor}_{\text{Coh}(X, \mathcal{I})}(\mathcal{F}^\wedge, \mathcal{G}^\wedge).$$

Proof. Since \mathcal{H} is a sheaf on $X_{\text{étale}}$ and since we have étale descent for objects of $\text{Coh}(X, \mathcal{I})$ it suffices to prove this étale locally. Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.21.6. \square

We introduce the setting that we will focus on throughout the rest of this section.

Situation 58.31.5. Here A is a Noetherian ring complete with respect to an ideal I . Also $f : X \rightarrow \text{Spec}(A)$ is a finite type separated morphism of algebraic spaces and $\mathcal{I} = I\mathcal{O}_X$.

In this situation we denote

$$\text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$$

be the full subcategory of $Coh(\mathcal{O}_X)$ consisting of those coherent \mathcal{O}_X -modules whose scheme theoretic support is proper over $\text{Spec}(A)$. Similarly, we let

$$Coh_{\text{support proper over } A}(X, \mathcal{I})$$

be the full subcategory of $Coh(X, \mathcal{I})$ consisting of those objects (\mathcal{F}_n) such that the scheme theoretic support of \mathcal{F}_1 is proper over $\text{Spec}(A)$. Since the support of a quotient module is contained in the support of the module, it follows that (58.31.2.1) induces a functor

$$(58.31.5.1) \quad Coh_{\text{support proper over } A}(\mathcal{O}_X) \longrightarrow Coh_{\text{support proper over } A}(X, \mathcal{I})$$

Our first result is that this functor is fully faithful.

Lemma 58.31.6. *In Situation 58.31.5. Let \mathcal{F}, \mathcal{G} be coherent \mathcal{O}_X -modules. Assume that the intersection of the scheme theoretic supports of \mathcal{F} and \mathcal{G} is proper over $\text{Spec}(A)$. Then the map*

$$\text{Mor}_{Coh(\mathcal{O}_X)}(\mathcal{F}, \mathcal{G}) \longrightarrow \text{Mor}_{Coh(X, \mathcal{I})}(\mathcal{F}^\wedge, \mathcal{G}^\wedge)$$

coming from (58.31.2.1) is a bijection. In particular, (58.31.5.1) is fully faithful.

Proof. Let $\mathcal{H} = \text{Hom}_{\mathcal{O}_X}(\mathcal{G}, \mathcal{F})$. This is a coherent \mathcal{O}_X -module because its restriction of schemes étale over X is coherent by Modules, Lemma 17.19.4. By Lemma 58.31.4 the map

$$\lim_n H^0(X, \mathcal{H}/\mathcal{I}^n \mathcal{H}) \rightarrow \text{Mor}_{Coh(X, \mathcal{I})}(\mathcal{G}^\wedge, \mathcal{F}^\wedge)$$

is bijective. Let $i : Z \rightarrow X$ be the scheme theoretic support of \mathcal{H} . It is clear that Z is a closed subspace contained in the intersection of the scheme theoretic supports of \mathcal{F} and \mathcal{G} . Hence $Z \rightarrow \text{Spec}(A)$ is proper by assumption. Write $\mathcal{H} = i_* \mathcal{H}'$ for some coherent \mathcal{O}_Z -module \mathcal{H}' . We have $i_*(\mathcal{H}'/\mathcal{I}^n \mathcal{H}') = \mathcal{H}/\mathcal{I}^n \mathcal{H}$. Hence we obtain

$$\begin{aligned} \lim_n H^0(X, \mathcal{H}/\mathcal{I}^n \mathcal{H}) &= \lim_n H^0(Z, \mathcal{H}'/\mathcal{I}^n \mathcal{H}') \\ &= H^0(Z, \mathcal{H}') \\ &= H^0(X, \mathcal{H}) \\ &= \text{Mor}_{Coh(\mathcal{O}_X)}(\mathcal{F}, \mathcal{G}) \end{aligned}$$

the second equality by the theorem on formal functions (Cohomology of Spaces, Lemma 51.20.6). This proves the lemma. \square

Remark 58.31.7. Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_X$ be quasi-coherent sheaves of ideals. Let $\alpha : (\mathcal{F}_n) \rightarrow (\mathcal{G}_n)$ be a morphism of $Coh(X, \mathcal{I})$. Given an affine scheme $U = \text{Spec}(A)$ and a surjective étale morphism $U \rightarrow X$ denote $I, K \subset A$ the ideals corresponding to the restrictions $\mathcal{I}|_U, \mathcal{K}|_U$. Denote $\alpha_U : M \rightarrow N$ of finite A^\wedge -modules which corresponds to $\alpha|_U$ via Cohomology of Schemes, Lemma 29.21.1. We claim the following are equivalent

- (1) there exists an integer $t \geq 1$ such that $\text{Ker}(\alpha_n)$ and $\text{Coker}(\alpha_n)$ are annihilated by \mathcal{K}^t for all $n \geq 1$,
- (2) for any (or some) affine open $\text{Spec}(A) = U \subset X$ as above the modules $\text{Ker}(\alpha_U)$ and $\text{Coker}(\alpha_U)$ are annihilated by K^t for some integer $t \geq 1$.

If these equivalent conditions hold we will say that α is a *map whose kernel and cokernel are annihilated by a power of \mathcal{K}* . To see the equivalence we refer to Cohomology of Schemes, Remark 29.22.2.

Lemma 58.31.8. *Let S be a scheme. Let X be a Noetherian algebraic space over S and let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let \mathcal{G} be a coherent \mathcal{O}_X -module, (\mathcal{F}_n) an object of $\text{Coh}(X, \mathcal{I})$, and $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{G}^\wedge$ a map whose kernel and cokernel are annihilated by a power of \mathcal{I} . Then there exists a unique (up to unique isomorphism) triple (\mathcal{F}, a, β) where*

- (1) \mathcal{F} is a coherent \mathcal{O}_X -module,
- (2) $a : \mathcal{F} \rightarrow \mathcal{G}$ is an \mathcal{O}_X -module map whose kernel and cokernel are annihilated by a power of \mathcal{I} ,
- (3) $\beta : (\mathcal{F}_n) \rightarrow \mathcal{F}^\wedge$ is an isomorphism, and
- (4) $\alpha = a^\wedge \circ \beta$.

Proof. The uniqueness and étale descent for objects of $\text{Coh}(X, \mathcal{I})$ and $\text{Coh}(\mathcal{O}_X)$ implies it suffices to construct (\mathcal{F}, a, β) étale locally on X . Thus we reduce to the case of schemes which is Cohomology of Schemes, Lemma 29.22.3. \square

Lemma 58.31.9. *In Situation 58.31.5. Let $\mathcal{K} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $X_e \subset X$ be the closed subspace cut out by \mathcal{K}^e . Let $\mathcal{I}_e = \mathcal{I}\mathcal{O}_{X_e}$. Let (\mathcal{F}_n) be an object of $\text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$. Assume*

- (1) *the functor $\text{Coh}_{\text{support proper over } A}(\mathcal{O}_{X_e}) \rightarrow \text{Coh}_{\text{support proper over } A}(X_e, \mathcal{I}_e)$ is an equivalence for all $e \geq 1$, and*
- (2) *there exists an object \mathcal{H} of $\text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$ and a map $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{H}^\wedge$ whose kernel and cokernel are annihilated by a power of \mathcal{K} .*

Then (\mathcal{F}_n) is in the essential image of (58.31.5.1).

Proof. During this proof we will use without further mention that for a closed immersion $i : Z \rightarrow X$ the functor i_* gives an equivalence between the category of coherent modules on Z and coherent modules on X annihilated by the ideal sheaf of Z , see Cohomology of Spaces, Lemma 51.11.8. In particular we think of

$$\text{Coh}_{\text{support proper over } A}(\mathcal{O}_{X_e}) \subset \text{Coh}_{\text{support proper over } A}(\mathcal{O}_X)$$

as the full subcategory of consisting of modules annihilated by \mathcal{K}^e and

$$\text{Coh}_{\text{support proper over } A}(X_e, \mathcal{I}_e) \subset \text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$$

as the full subcategory of objects annihilated by \mathcal{K}^e . Moreover (1) tells us these two categories are equivalent under the completion functor (58.31.5.1).

Applying this equivalence we get a coherent \mathcal{O}_X -module \mathcal{G}_e annihilated by \mathcal{K}^e corresponding to the system $(\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n)$ of $\text{Coh}_{\text{support proper over } A}(X, \mathcal{I})$. The maps $\mathcal{F}_n/\mathcal{K}^{e+1}\mathcal{F}_n \rightarrow \mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n$ correspond to canonical maps $\mathcal{G}_{e+1} \rightarrow \mathcal{G}_e$ which induce isomorphisms $\mathcal{G}_{e+1}/\mathcal{K}^e\mathcal{G}_{e+1} \rightarrow \mathcal{G}_e$. We obtain an object (\mathcal{G}_e) of the category $\text{Coh}_{\text{support proper over } A}(X, \mathcal{K})$. The map α induces a system of maps

$$\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n \longrightarrow \mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H}$$

whence maps $\mathcal{G}_e \rightarrow \mathcal{H}/\mathcal{K}^e\mathcal{H}$ (by the equivalence of categories again). Let $t \geq 1$ be an integer, which exists by assumption (2), such that \mathcal{K}^t annihilates the kernel and cokernel of all the maps $\mathcal{F}_n \rightarrow \mathcal{H}/\mathcal{I}^n\mathcal{H}$. Then \mathcal{K}^{2t} annihilates the kernel and cokernel of the maps $\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n \rightarrow \mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H}$ (details omitted; see Cohomology of Schemes, Remark 29.22.2). Whereupon we conclude that \mathcal{K}^{4t} annihilates the kernel and the cokernel of the maps

$$\mathcal{G}_e \longrightarrow \mathcal{H}/\mathcal{K}^e\mathcal{H},$$

(details omitted; see Cohomology of Schemes, Remark 29.22.2). We apply Lemma 58.31.8 to obtain a coherent \mathcal{O}_X -module \mathcal{F} , a map $a : \mathcal{F} \rightarrow \mathcal{H}$ and an isomorphism $\beta : (\mathcal{G}_e) \rightarrow (\mathcal{F}/\mathcal{K}^e\mathcal{F})$ in $Coh(X, \mathcal{K})$. Working backwards, for a given n the triple $(\mathcal{F}/\mathcal{I}^n\mathcal{F}, a \bmod \mathcal{I}^n, \beta \bmod \mathcal{I}^n)$ is a triple as in the lemma for the morphism $\alpha_n \bmod \mathcal{K}^e : (\mathcal{F}_n/\mathcal{K}^e\mathcal{F}_n) \rightarrow (\mathcal{H}/(\mathcal{I}^n + \mathcal{K}^e)\mathcal{H})$ of $Coh(X, \mathcal{K})$. Thus the uniqueness in Lemma 58.31.8 gives a canonical isomorphism $\mathcal{F}/\mathcal{I}^n\mathcal{F} \rightarrow \mathcal{F}_n$ compatible with all the morphisms in sight.

To finish the proof of the lemma we still have to show that the scheme theoretic support of \mathcal{F} is proper over A . By construction the kernel of $a : \mathcal{F} \rightarrow \mathcal{H}$ is annihilated by a power of \mathcal{K} . Hence the support of this kernel is contained in the support of \mathcal{G}_1 . Since \mathcal{G}_1 is an object of $Coh_{\text{support proper over } A}(\mathcal{O}_{X_1})$ we see this is proper over A . Combined with the fact that the support of \mathcal{H} is proper over A we conclude that the support of \mathcal{F} is proper over A (some details omitted). \square

Lemma 58.31.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a representable proper morphism of Noetherian algebraic spaces over S . Let $\mathcal{J}, \mathcal{K} \subset \mathcal{O}_Y$ be quasi-coherent sheaves of ideals. Assume f is an isomorphism over $V = Y \setminus V(\mathcal{K})$. Set $\mathcal{I} = f^{-1}\mathcal{J}\mathcal{O}_X$. Let (\mathcal{G}_n) be an object of $Coh(Y, \mathcal{J})$, let \mathcal{F} be a coherent \mathcal{O}_X -module, and let $\beta : (f^*\mathcal{G}_n) \rightarrow \mathcal{F}^\wedge$ be an isomorphism in $Coh(X, \mathcal{I})$. Then there exists a map*

$$\alpha : (\mathcal{G}_n) \longrightarrow (f_*\mathcal{F})^\wedge$$

in $Coh(Y, \mathcal{J})$ whose kernel and cokernel are annihilated by a power of \mathcal{K} .

Proof. Since f is a proper morphism we see that $f_*\mathcal{F}$ is a coherent \mathcal{O}_Y -module (Cohomology of Spaces, Lemma 51.19.2). Thus the statement of the lemma makes sense. Consider the compositions

$$\gamma_n : \mathcal{G}_n \rightarrow f_*f^*\mathcal{G}_n \rightarrow f_*(\mathcal{F}/\mathcal{I}^n\mathcal{F}).$$

Here the first map is the adjunction map and the second is $f_*\beta_n$. We claim that there exists a unique α as in the lemma such that the compositions

$$\mathcal{G}_n \xrightarrow{\alpha_n} f_*\mathcal{F}/\mathcal{J}^n f_*\mathcal{F} \rightarrow f_*(\mathcal{F}/\mathcal{I}^n\mathcal{F})$$

equal γ_n for all n . Because of the uniqueness and étale descent for $Coh(Y, \mathcal{J})$ it suffices to prove this étale locally on Y . Thus we may assume Y is the spectrum of a Noetherian ring. As f is representable we see that X is a scheme as well. Thus we reduce to the case of schemes, see proof of Cohomology of Schemes, Lemma 29.22.5. \square

Theorem 58.31.11 (Grothendieck’s existence theorem). *In Situation 58.31.5 the functor (58.31.5.1) is an equivalence.*

Proof. We will use the equivalence of categories of Cohomology of Spaces, Lemma 51.11.8 without further mention in the proof of the theorem. By Lemma 58.31.6 the functor is fully faithful. Thus we need to prove the functor is essentially surjective.

Consider the collection Ξ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_X$ such that the statement holds for every object (\mathcal{F}_n) of $Coh_{\text{support proper over } A}(X, \mathcal{I})$ annihilated by \mathcal{K} . We want to show (0) is in Ξ . If not, then since X is Noetherian there exists a maximal quasi-coherent sheaf of ideals \mathcal{K} not in Ξ , see Cohomology of Spaces, Lemma 51.12.1. After replacing X by the closed subscheme of X corresponding to \mathcal{K} we may assume that every nonzero \mathcal{K} is in Ξ . Let (\mathcal{F}_n) be an object of

$Coh_{\text{support proper over } A}(X, \mathcal{I})$. We will show that this object is in the essential image, thereby completing the proof of the theorem.

Apply Chow's lemma (Lemma 58.29.5) to find a proper surjective morphism $f : Y \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that Y is H-quasi-projective over A . Note that Y is a scheme and f representable. Choose an open immersion $j : Y \rightarrow Y'$ with Y' projective over A , see Morphisms, Lemma 28.43.11. Let T_n be the scheme theoretic support of \mathcal{F}_n . Note that $|T_n| = |T_1|$, hence T_n is proper over A for all n (Morphisms of Spaces, Lemma 49.37.7). Then $f^*\mathcal{F}_n$ is supported on the closed subscheme $f^{-1}T_n$ which is proper over A (by Morphisms of Spaces, Lemma 49.37.4 and properness of f). In particular, the composition $f^{-1}T_n \rightarrow Y \rightarrow Y'$ is closed (Morphisms, Lemma 28.42.7). Let $T'_n \subset Y'$ be the corresponding closed subscheme; it is contained in the open subscheme Y and equal to $f^{-1}T_n$ as a closed subscheme of Y . Let \mathcal{F}'_n be the coherent $\mathcal{O}_{Y'}$ -module corresponding to $f^*\mathcal{F}_n$ viewed as a coherent module on Y' via the closed immersion $f^{-1}T_n = T'_n \subset Y'$. Then (\mathcal{F}'_n) is an object of $Coh(Y', \mathcal{I}\mathcal{O}_{Y'})$. By the projective case of Grothendieck's existence theorem (Cohomology of Schemes, Lemma 29.21.9) there exists a coherent $\mathcal{O}_{Y'}$ -module \mathcal{F}' and an isomorphism $(\mathcal{F}')^\wedge \cong (\mathcal{F}'_n)$ in $Coh(Y', \mathcal{I}\mathcal{O}_{Y'})$. Let $Z' \subset Y'$ be the scheme theoretic support of \mathcal{F}' . Since $\mathcal{F}'/\mathcal{I}\mathcal{F}' = \mathcal{F}'_1$ we see that $Z' \cap V(\mathcal{I}\mathcal{O}_{Y'}) = T'_1$ set-theoretically. The structure morphism $p' : Y' \rightarrow \text{Spec}(A)$ is proper, hence $p'(Z' \cap (Y' \setminus Y))$ is closed in $\text{Spec}(A)$. If nonempty, then it would contain a point of $V(\mathcal{I})$ as \mathcal{I} is contained in the radical of A (Algebra, Lemma 10.93.11). But we've seen above that $Z' \cap (p')^{-1}V(\mathcal{I}) = T'_1 \subset Y$ hence we conclude that $Z' \subset Y$. Thus $\mathcal{F}'|_Y$ is supported on a closed subscheme of Y proper over A .

Let \mathcal{K} be the quasi-coherent sheaf of ideals cutting out the reduced complement $X \setminus U$. By Cohomology of Spaces, Lemma 51.19.2 the \mathcal{O}_X -module $\mathcal{H} = f_*\mathcal{F}'$ is coherent and by Lemma 58.31.10 there exists a morphism $\alpha : (\mathcal{F}_n) \rightarrow \mathcal{H}^\wedge$ in the category $Coh_{\text{support proper over } A}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of \mathcal{K} . Let $Z_0 \subset X$ be the scheme theoretic support of \mathcal{H} . It is clear that $|Z_0| \subset f(|Z'|)$. Hence $Z_0 \rightarrow \text{Spec}(A)$ is proper (Morphisms of Spaces, Lemma 49.37.7). Thus \mathcal{H} is an object of $Coh_{\text{support proper over } A}(\mathcal{O}_X)$. Since each of the sheaves of ideals \mathcal{K}^e is an element of Ξ we see that the assumptions of Lemma 58.31.9 are satisfied and we conclude. \square

Remark 58.31.12 (Unwinding Grothendieck's existence theorem). Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_n = X \times_S S_n$. Picture:

$$\begin{array}{ccccccc}
 X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots & & X \\
 \downarrow & & \downarrow & & \downarrow & & & & \downarrow \\
 S_1 & \longrightarrow & S_2 & \longrightarrow & S_3 & \longrightarrow & \dots & & S
 \end{array}$$

In this situation we consider systems $(\mathcal{F}_n, \varphi_n)$ where

- (1) \mathcal{F}_n is a coherent \mathcal{O}_{X_n} -module,
- (2) $\varphi_n : i_n^*\mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$ is an isomorphism, and
- (3) $\text{Supp}(\mathcal{F}_1)$ is proper over S_1 .

Theorem 58.31.11 says that the completion functor

$$\begin{array}{ccc} \text{coherent } \mathcal{O}_X\text{-modules } \mathcal{F} & \longrightarrow & \text{systems } (\mathcal{F}_n) \\ \text{with support proper over } A & & \text{as above} \end{array}$$

is an equivalence of categories. In the special case that X is proper over A we can omit the conditions on the supports.

58.32. Grothendieck’s algebraization theorem

This section is the analogue of Cohomology of Schemes, Section 29.23. However, this section is missing the result on algebraization of deformations of proper algebraic spaces endowed with ample invertible sheaves, as a proper algebraic space which comes with an ample invertible sheaf is a scheme. Our first result is a translation of Grothendieck’s existence theorem in terms of closed subschemes and finite morphisms.

Lemma 58.32.1. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_n = X \times_S S_n$. Suppose given a commutative diagram*

$$\begin{array}{ccccccc} Z_1 & \longrightarrow & Z_2 & \longrightarrow & Z_3 & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \downarrow & & \\ X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots \end{array}$$

of algebraic spaces with cartesian squares. Assume that

- (1) $Z_1 \rightarrow X_1$ is a closed immersion, and
- (2) $Z_1 \rightarrow S_1$ is proper.

Then there exists a closed immersion of algebraic spaces $Z \rightarrow X$ such that $Z_n = Z \times_S S_n$ for all $n \geq 1$. Moreover, Z is proper over S .

Proof. Let’s write $j_n : Z_n \rightarrow X_n$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of j_n to X_1 is j_1 . Thus Limits of Spaces, Lemma 52.15.5 shows that j_n is a closed immersion. Set $\mathcal{F}_n = j_{n,*}\mathcal{O}_{Z_n}$, so that $j_n^\#$ is a surjection $\mathcal{O}_{X_n} \rightarrow \mathcal{F}_n$. Again using that the squares are cartesian we see that the pullback of \mathcal{F}_{n+1} to X_n is \mathcal{F}_n . Hence Grothendieck’s existence theorem, as reformulated in Remark 58.31.12, tells us there exists a map $\mathcal{O}_X \rightarrow \mathcal{F}$ of coherent \mathcal{O}_X -modules whose restriction to X_n recovers $\mathcal{O}_{X_n} \rightarrow \mathcal{F}_n$. Moreover, the support of \mathcal{F} is proper over S . As the completion functor is exact (Lemma 58.31.3) we see that $\mathcal{O}_X \rightarrow \mathcal{F}$ is surjective. Thus $\mathcal{F} = \mathcal{O}_X/\mathcal{J}$ for some quasi-coherent sheaf of ideals \mathcal{J} . Setting $Z = V(\mathcal{J})$ finishes the proof. \square

Lemma 58.32.2. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let $X \rightarrow S$ be a morphism of algebraic spaces that is separated and of finite type. For $n \geq 1$ we set $X_n = X \times_S S_n$. Suppose given a commutative diagram*

$$\begin{array}{ccccccc} Y_1 & \longrightarrow & Y_2 & \longrightarrow & Y_3 & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \downarrow & & \\ X_1 & \xrightarrow{i_1} & X_2 & \xrightarrow{i_2} & X_3 & \longrightarrow & \dots \end{array}$$

of algebraic spaces with cartesian squares. Assume that

- (1) $Y_1 \rightarrow X_1$ is a finite morphism, and
- (2) $Y_1 \rightarrow S_1$ is proper.

Then there exists a finite morphism of algebraic spaces $Y \rightarrow X$ such that $Y_n = Y \times_S S_n$ for all $n \geq 1$. Moreover, Y is proper over S .

Proof. Let's write $f_n : Y_n \rightarrow X_n$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of f_n to X_1 is f_1 . Thus Lemma 58.8.10 shows that f_n is a finite morphism. Set $\mathcal{F}_n = f_{n,*}\mathcal{O}_{Y_n}$. Using that the squares are cartesian we see that the pullback of \mathcal{F}_{n+1} to X_n is \mathcal{F}_n . Hence Grothendieck's existence theorem, as reformulated in Remark 58.31.12, tells us there exists a coherent \mathcal{O}_X -module \mathcal{F} whose restriction to X_n recovers \mathcal{F}_n . Moreover, the support of \mathcal{F} is proper over S . As the completion functor is fully faithful (Theorem 58.31.11) we see that the multiplication maps $\mathcal{F}_n \otimes_{\mathcal{O}_{X_n}} \mathcal{F}_n \rightarrow \mathcal{F}_n$ fit together to give an algebra structure on \mathcal{F} . Setting $Y = \underline{\text{Spec}}_X(\mathcal{F})$ finishes the proof. \square

Lemma 58.32.3. *Let A be a Noetherian ring complete with respect to an ideal I . Write $S = \text{Spec}(A)$ and $S_n = \text{Spec}(A/I^n)$. Let X, Y be algebraic spaces over S . For $n \geq 1$ we set $X_n = X \times_S S_n$ and $Y_n = Y \times_S S_n$. Suppose given a compatible system of commutative diagrams*

Assume that

- (1) $X \rightarrow S$ is proper, and
- (2) $Y \rightarrow S$ is separated of finite type.

Then there exists a unique morphism of algebraic spaces $g : X \rightarrow Y$ over S such that g_n is the base change of g to S_n .

Proof. The morphisms $(1, g_n) : X_n \rightarrow X_n \times_S Y_n$ are closed immersions because $Y_n \rightarrow S_n$ is separated (Morphisms of Spaces, Lemma 49.4.7). Thus by Lemma 58.32.1 there exists a closed subspace $Z \subset X \times_S Y$ proper over S whose base change to S_n recovers $X_n \subset X_n \times_S Y_n$. The first projection $p : Z \rightarrow X$ is a proper morphism (as Z is proper over S , see Morphisms of Spaces, Lemma 49.37.6) whose base change to S_n is an isomorphism for all n . In particular, $p : Z \rightarrow X$ is quasi-finite on an open subspace of Z containing every point of Z_0 for example by Morphisms of Spaces, Lemma 49.32.7. As Z is proper over S this open neighbourhood is all of Z . We conclude that $p : Z \rightarrow X$ is finite by Zariski's main theorem (for example apply Lemma 58.24.3 and use properness of Z over X to see that the immersion is a closed immersion). Applying the equivalence of Theorem 58.31.11 we see that $p_*\mathcal{O}_Z = \mathcal{O}_X$ as this is true modulo I^n for all n . Hence p is an isomorphism and we obtain the morphism g as the composition $X \cong Z \rightarrow Y$. We omit the proof of uniqueness. \square

58.33. Regular immersions

This section is the analogue of Divisors, Section 30.13 for morphisms of algebraic spaces. The reader is encouraged to read up on regular immersions of schemes in that section first.

In Divisors, Section 30.13 we defined four types of regular immersions for morphisms of schemes. Of these only three are (as far as we know) local on the target for the étale topology; as usual plain old regular immersions aren't. This is why for morphisms of algebraic spaces we cannot actually define regular immersions. (These kinds of annoyances prompted Grothendieck and his school to replace original notion of a regular immersion by a Koszul-regular immersions, see [BGI71, Exposee VII, Definition 1.4].) But we can define Koszul-regular, H_1 -regular, and quasi-regular immersions. Another remark is that since Koszul-regular immersions are not preserved by arbitrary base change, we cannot use the strategy of Morphisms of Spaces, Section 49.3 to define them. Similarly, as Koszul-regular immersions are not étale local on the source, we cannot use Morphisms of Spaces, Lemma 49.22.1 to define them either. We replace this lemma instead by the following.

Lemma 58.33.1. *Let \mathcal{P} be a property of morphisms of schemes which is étale local on the target. Let S be a scheme. Let $f : X \rightarrow Y$ be a representable morphism of algebraic spaces over S . Consider commutative diagrams*

$$\begin{array}{ccc} X \times_Y V & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

where V is a scheme and $V \rightarrow Y$ is étale. The following are equivalent

- (1) for any diagram as above the projection $X \times_Y V \rightarrow V$ has property \mathcal{P} , and
- (2) for some diagram as above with $V \rightarrow Y$ surjective the projection $X \times_Y V \rightarrow V$ has property \mathcal{P} .

If X and Y are representable, then this is also equivalent to f (as a morphism of schemes) having property \mathcal{P} .

Proof. Let us prove the equivalence of (1) and (2). The implication (1) \Rightarrow (2) is immediate. Assume

$$\begin{array}{ccc} X \times_Y V & \longrightarrow & V \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array} \quad \begin{array}{ccc} X \times_Y V' & \longrightarrow & V' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

are two diagrams as in the lemma. Assume $V \rightarrow Y$ is surjective and $X \times_Y V \rightarrow V$ has property \mathcal{P} . To show that (2) implies (1) we have to prove that $X \times_Y V' \rightarrow V'$ has \mathcal{P} . To do this consider the diagram

$$\begin{array}{ccccc} X \times_Y V & \longleftarrow & (X \times_Y V) \times_X (X \times_Y V') & \longrightarrow & X \times_Y V' \\ \downarrow & & \downarrow & & \downarrow \\ V & \longleftarrow & V \times_Y V' & \longrightarrow & V' \end{array}$$

By our assumption that \mathcal{P} is étale local on the source, we see that \mathcal{P} is preserved under étale base change, see Descent, Lemma 34.18.2. Hence if the left vertical

arrow has \mathcal{P} the so does the middle vertical arrow. Since $U \times_X U' \rightarrow U'$ is surjective and étale (hence defines an étale covering of U') this implies (as \mathcal{P} is assumed local for the étale topology on the target) that the left vertical arrow has \mathcal{P} .

If X and Y are representable, then we can take $\text{id}_Y : Y \rightarrow Y$ as our étale covering to see the final statement of the lemma is true. \square

Note that “being a Koszul-regular (resp. H_1 -regular, resp. quasi-regular) immersion” is a property of morphisms of schemes which is fpqc local on the target, see Descent, Lemma 34.19.30. Hence the following definition now makes sense.

Definition 58.33.2. Let S be a scheme. Let $i : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say i is a *Koszul-regular immersion* if i is representable and the equivalent conditions of Lemma 58.33.1 hold with $\mathcal{P}(f) = “f$ is a Koszul-regular immersion”.
- (2) We say i is an *H_1 -regular immersion* if i is representable and the equivalent conditions of Lemma 58.33.1 hold with $\mathcal{P}(f) = “f$ is an H_1 -regular immersion”.
- (3) We say i is a *quasi-regular immersion* if i is representable and the equivalent conditions of Lemma 58.33.1 hold with $\mathcal{P}(f) = “f$ is a quasi-regular immersion”.

Lemma 58.33.3. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . We have the following implications: i is Koszul-regular $\Rightarrow i$ is H_1 -regular $\Rightarrow i$ is quasi-regular.*

Proof. Via the definition this lemma immediately reduces to Divisors, Lemma 30.13.2. \square

Lemma 58.33.4. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Assume X is locally Noetherian. Then i is Koszul-regular $\Leftrightarrow i$ is H_1 -regular $\Leftrightarrow i$ is quasi-regular.*

Proof. Via Definition 58.33.2 (and the definition of a locally Noetherian algebraic space in Properties of Spaces, Section 48.7) this immediately translates to the case of schemes which is Divisors, Lemma 30.13.3. \square

Lemma 58.33.5. *Let S be a scheme. Let $i : Z \rightarrow X$ be a Koszul-regular, H_1 -regular, or quasi-regular immersion of algebraic spaces over S . Let $X' \rightarrow X$ be a flat morphism of algebraic spaces over S . Then the base change $i' : Z \times_X X' \rightarrow X'$ is a Koszul-regular, H_1 -regular, or quasi-regular immersion.*

Proof. Via Definition 58.33.2 (and the definition of a flat morphism of algebraic spaces in Morphisms of Spaces, Section 49.28) this lemma reduces to the case of schemes, see Divisors, Lemma 30.13.4. \square

Lemma 58.33.6. *Let S be a scheme. Let $i : Z \rightarrow X$ be an immersion of algebraic spaces over S . Then i is a quasi-regular immersion if and only if the following conditions are satisfied*

- (1) i is locally of finite presentation,
- (2) the conormal sheaf $\mathcal{C}_{Z/X}$ is finite locally free, and
- (3) the map (58.5.1.2) is an isomorphism.

Proof. Follows from the case of schemes (Divisors, Lemma 30.13.5) via étale localization (use Definition 58.33.2 and Lemma 58.5.2). \square

Lemma 58.33.7. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be immersions of algebraic spaces over S . Assume that $Z \rightarrow Y$ is H_1 -regular. Then the canonical sequence of Lemma 58.4.6*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

is exact and (étale) locally split.

Proof. Since $\mathcal{C}_{Z/Y}$ is finite locally free (see Lemma 58.33.6 and Lemma 58.33.3) it suffices to prove that the sequence is exact. It suffices to show that the first map is injective as the sequence is already right exact in general. After étale localization on X this reduces to the case of schemes, see Divisors, Lemma 30.13.6. \square

A composition of quasi-regular immersions may not be quasi-regular, see Algebra, Remark 10.68.8. The other types of regular immersions are preserved under composition.

Lemma 58.33.8. *Let S be a scheme. Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of algebraic spaces over S .*

- (1) *If i and j are Koszul-regular immersions, so is $j \circ i$.*
- (2) *If i and j are H_1 -regular immersions, so is $j \circ i$.*
- (3) *If i is an H_1 -regular immersion and j is a quasi-regular immersion, then $j \circ i$ is a quasi-regular immersion.*

Proof. Immediate from the case of schemes, see Divisors, Lemma 30.13.7. \square

Lemma 58.33.9. *Let S be a scheme. Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of algebraic spaces over S . Assume that the sequence*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

of Lemma 58.4.6 is exact and locally split.

- (1) *If $j \circ i$ is a quasi-regular immersion, so is i .*
- (2) *If $j \circ i$ is a H_1 -regular immersion, so is i .*
- (3) *If both j and $j \circ i$ are Koszul-regular immersions, so is i .*

Proof. Immediate from the case of schemes, see Divisors, Lemma 30.13.8. \square

Lemma 58.33.10. *Let S be a scheme. Let $i : Z \rightarrow Y$ and $j : Y \rightarrow X$ be immersions of algebraic spaces over S . Assume X is locally Noetherian. The following are equivalent*

- (1) *i and j are Koszul regular immersions,*
- (2) *i and $j \circ i$ are Koszul regular immersions,*
- (3) *$j \circ i$ is a Koszul regular immersion and the conormal sequence*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

is exact and locally split.

Proof. Immediate from the case of schemes, see Divisors, Lemma 30.13.9. \square

58.34. Pseudo-coherent morphisms

This section is the analogue of More on Morphisms, Section 36.40 for morphisms of schemes. The reader is encouraged to read up on pseudo-coherent morphisms of schemes in that section first.

The property “pseudo-coherent” of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 36.40.9 and 36.40.12 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 49.22.1 we may define the notion of a pseudo-coherent morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.40 when the algebraic spaces in question are representable.

Definition 58.34.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *pseudo-coherent* if the equivalent conditions of Morphisms of Spaces, Lemma 49.22.1 hold with \mathcal{P} = “pseudo-coherent”.
- (2) Let $x \in |X|$. We say f is *pseudo-coherent at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is pseudo-coherent.

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

Lemma 58.34.2. *A flat base change of a pseudo-coherent morphism is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.40.3. □

Lemma 58.34.3. *A composition of pseudo-coherent morphisms is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.40.4. □

Lemma 58.34.4. *A pseudo-coherent morphism is locally of finite presentation.*

Proof. Immediate from the definitions. □

Lemma 58.34.5. *A flat morphism which is locally of finite presentation is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.40.6. □

Lemma 58.34.6. *Let $f : X \rightarrow Y$ be a morphism of algebraic spaces pseudo-coherent over a base algebraic space B . Then f is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.40.7. □

Lemma 58.34.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If Y is locally Noetherian, then f is pseudo-coherent if and only if f is locally of finite type.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.40.8. □

58.35. Perfect morphisms

This section is the analogue of More on Morphisms, Section 36.41 for morphisms of schemes. The reader is encouraged to read up on perfect morphisms of schemes in that section first.

The property “perfect” of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 36.41.10 and 36.41.12 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 49.22.1 we may define the notion of a perfect morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.41 when the algebraic spaces in question are representable.

Definition 58.35.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is *perfect* if the equivalent conditions of Morphisms of Spaces, Lemma 49.22.1 hold with \mathcal{P} = “perfect”.
- (2) Let $x \in |X|$. We say f is *perfect at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is perfect.

Note that a perfect morphism is pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

Lemma 58.35.2. *A flat base change of a perfect morphism is perfect.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.41.3. □

Lemma 58.35.3. *A composition of perfect morphisms is perfect.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.41.4. □

Lemma 58.35.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is flat and perfect, and
- (2) f is flat and locally of finite presentation.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.41.5. □

58.36. Local complete intersection morphisms

This section is the analogue of More on Morphisms, Section 36.42 for morphisms of schemes. The reader is encouraged to read up on local complete intersection morphisms of schemes in that section first.

The property “being a local complete intersection morphism” of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 36.42.12 and 36.42.13 and Descent, Lemma 34.28.6. By Morphisms of Spaces, Lemma 49.22.1 we may define the notion of a local complete intersection morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 36.42 when the algebraic spaces in question are representable.

Definition 58.36.1. Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S .

- (1) We say f is a *Koszul morphism*, or that f is a *local complete intersection morphism* if the equivalent conditions of Morphisms of Spaces, Lemma 49.22.1 hold with $\mathcal{P}(f) = \text{“}f \text{ is a local complete intersection morphism”}$.
- (2) Let $x \in |X|$. We say f is *Koszul at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \rightarrow Y$ is a local complete intersection morphism.

In some sense the defining property of a local complete intersection morphism is the result of the following lemma.

Lemma 58.36.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over S . Let P be an algebraic space smooth over Y . Let $U \rightarrow X$ be an étale morphism of algebraic spaces and let $i : U \rightarrow P$ an immersion of algebraic spaces over Y . Picture:*

Then i is a Koszul-regular immersion of algebraic spaces.

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Choose a scheme W and a surjective étale morphism $W \rightarrow P \times_Y V$. Set $U' = U \times_P W$, which is a scheme étale over U . We have to show that $U' \rightarrow W$ is a Koszul-regular immersion of schemes, see Definition 58.33.2. By Definition 58.36.1 above the morphism of schemes $U' \rightarrow V$ is a local complete intersection morphism. Hence the result follows from More on Morphisms, Lemma 36.42.3. □

It seems like a good idea to collect here some properties in common with all Koszul morphisms.

Lemma 58.36.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over S . Then*

- (1) f is locally of finite presentation,
- (2) f is pseudo-coherent, and
- (3) f is perfect.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.4. □

Beware that a base change of a Koszul morphism is not Koszul in general.

Lemma 58.36.4. *A flat base change of a local complete intersection morphism is a local complete intersection morphism.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.6. □

Lemma 58.36.5. *A composition of local complete intersection morphisms is a local complete intersection morphism.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.7. \square

Lemma 58.36.6. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The following are equivalent*

- (1) f is flat and a local complete intersection morphism, and
- (2) f is syntomic.

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 36.42.8. \square

Lemma 58.36.7. *Let S be a scheme. Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{\quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces over S . Assume that both p and q are flat and locally of finite presentation. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset |X|$ is the set of points where f is Koszul. Moreover, for any morphism of algebraic spaces $Z' \rightarrow Z$, if $f' : X' \rightarrow Y'$ is the base change of f by $Z' \rightarrow Z$, then $U(f')$ is the inverse image of $U(f)$ under the projection $X' \rightarrow X$.

Proof. This lemma is the analogue of More on Morphisms, Lemma 36.42.14 and in fact we will deduce the lemma from it. By Definition 58.36.1 the set $\{x \in |X| : f \text{ is Koszul at } x\}$ is open in $|X|$ hence by Properties of Spaces, Lemma 48.4.8 it corresponds to an open subspace $U(f)$ of X . Hence we only need to prove the final statement.

Choose a scheme W and a surjective étale morphism $W \rightarrow Z$. Choose a scheme V and a surjective étale morphism $V \rightarrow W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \rightarrow V \times_Y X$. Finally, choose a scheme W' and a surjective étale morphism $W' \rightarrow W \times_Z Z'$. Set $V' = W' \times_W V$ and $U' = W' \times_W U$, so that we obtain surjective étale morphisms $V' \rightarrow Y'$ and $U' \rightarrow X'$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 48.13.7). Note that by definition $U(f)$ is the image in $|X|$ of the set T of points in U where the morphism of schemes $U \rightarrow V$ is Koszul. Similarly, $U(f')$ is the image in $|X'|$ of the set T' of points in U' where the morphism of schemes $U' \rightarrow V'$ is Koszul. Now, by construction the diagram

$$\begin{array}{ccc} U' & \longrightarrow & U \\ \downarrow & & \downarrow \\ V' & \longrightarrow & V \end{array}$$

is cartesian (in the category of schemes). Hence the aforementioned More on Morphisms, Lemma 36.42.14 applies to show that T' is the inverse image of T . Since $|U'| \rightarrow |X'|$ is surjective this implies the lemma. \square

Lemma 58.36.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a local complete intersection morphism of algebraic spaces over S . Then f is unramified if and only if f is*

formally unramified and in this case the conormal sheaf $\mathcal{C}_{X/Y}$ is finite locally free on X .

Proof. This follows from the corresponding result for morphisms of schemes, see More on Morphisms, Lemma 36.42.15, by étale localization, see Lemma 58.12.11. (Note that in the situation of this lemma the morphism $V \rightarrow U$ is unramified and a local complete intersection morphism by definition.) \square

Lemma 58.36.9. *Let S be a scheme. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of algebraic spaces over S . Assume that $Z \rightarrow Y$ is a local complete intersection morphism. The exact sequence*

$$0 \rightarrow i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

of Lemma 58.4.6 is short exact.

Proof. Choose a scheme U and a surjective étale morphism $U \rightarrow X$. Choose a scheme V and a surjective étale morphism $V \rightarrow U \times_X Y$. Choose a scheme W and a surjective étale morphism $W \rightarrow V \times_Y Z$. By Lemma 58.12.11 the morphisms $W \rightarrow V$ and $V \rightarrow U$ are formally unramified. Moreover the sequence $i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$ restricts to the corresponding sequence $i^* \mathcal{C}_{V/U} \rightarrow \mathcal{C}_{W/U} \rightarrow \mathcal{C}_{W/V} \rightarrow 0$ for $W \rightarrow V \rightarrow U$. Hence the result follows from the result for schemes (More on Morphisms, Lemma 36.42.16) as by definition the morphism $W \rightarrow V$ is a local complete intersection morphism. \square

58.37. When is a morphism an isomorphism?

More generally we can ask: “When does a morphism have property \mathcal{P} ?” A more precise question is the following. Suppose given a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Does there exist a monomorphism of algebraic spaces $W \rightarrow Z$ with the following two properties:

- (1) the base change $f_W : X_W \rightarrow Y_W$ has property \mathcal{P} , and
- (2) any morphism $Z' \rightarrow Z$ of algebraic spaces factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ has property \mathcal{P} .

In many cases, if $W \rightarrow Z$ exists, then it is an immersion, open immersion, or closed immersion.

The answer to this question may depend on auxiliary properties of the morphisms f , p , and q . An example is $\mathcal{P}(f) = “f$ is flat” which we have discussed for morphisms of schemes in the case $Y = S$ in great detail in the chapter “More on Flatness”, starting with More on Flatness, Section 37.19.

Lemma 58.37.1. *Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Assume that p is locally of finite type and closed. Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is unramified.

Proof. By Morphisms of Spaces, Lemma 49.35.10 there exists an open subspace $U(f) \subset X$ which is the set of points where f is unramified. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 48.4.8) with underlying set of points

$$|W| = |Z| \setminus |p|(|X| \setminus |U(f)|)$$

i.e., $z \in |Z|$ is a point of W if and only if f is unramified at every point of X above z . Note that this is open because we assumed that p is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 48.4.9) that W has the desired universal property. \square

Lemma 58.37.2. Consider a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Assume that

- (1) p is locally of finite type,
- (2) p is closed, and
- (3) $p_2 : X \times_Y X \rightarrow Z$ is closed.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is unramified and universally injective.

Proof. After replacing Z by the open subspace found in Lemma 58.37.1 we may assume that f is already unramified; note that this does not destroy assumption (2) or (3). By Morphisms of Spaces, Lemma 49.35.9 we see that $\Delta_{X/Y} : X \rightarrow X \times_Y X$ is an open immersion. This remains true after any base change. Hence by Morphisms of Spaces, Lemma 49.19.2 we see that $f_{Z'}$ is universally injective if and only if the base change of the diagonal $X_{Z'} \rightarrow (X \times_Y X)_{Z'}$ is an isomorphism. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 48.4.8) with underlying set of points

$$|W| = |Z| \setminus |p_2|(|X \times_Y X| \setminus \text{Im}(|\Delta_{X/Y}|))$$

i.e., $z \in |Z|$ is a point of W if and only if the fibre of $|X \times_Y X| \rightarrow |Z|$ over z is in the image of $|X| \rightarrow |X \times_Y X|$. Then it is clear from the discussion above that the restriction $p^{-1}(W) \rightarrow q^{-1}(W)$ of f is unramified and universally injective.

Conversely, suppose that $f_{Z'}$ is unramified and universally injective. In order to show that $Z' \rightarrow Z$ factors through W it suffices to show that $|Z'| \rightarrow |Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 48.4.9. Hence it suffices to prove the result when Z' is the spectrum of a field. Denote $z \in |Z|$ the image of $|Z'| \rightarrow |Z|$. The discussion above shows that

$$|X_{Z'}| \longrightarrow |(X \times_Y X)_{Z'}|$$

is surjective. By Properties of Spaces, Lemma 48.4.3 in the commutative diagram

$$\begin{array}{ccc} |X_{Z'}| & \longrightarrow & |(X \times_Y X)_{Z'}| \\ \downarrow & & \downarrow \\ |p|^{-1}(\{z\}) & \longrightarrow & |p_2|^{-1}(\{z\}) \end{array}$$

the vertical arrows are surjective. It follows that $z \in |W|$ as desired. □

Lemma 58.37.3. *Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Assume that

- (1) *p is locally of finite type,*
- (2) *p is universally closed, and*
- (3) *$q : Y \rightarrow Z$ is separated.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is a closed immersion.

Proof. We will use the characterization of closed immersions as universally closed, unramified, and universally injective morphisms, see Lemma 58.11.9. First, note that since p is universally closed and q is separated, we see that f is universally closed, see Morphisms of Spaces, Lemma 49.37.6. It follows that any base change of f is universally closed, see Morphisms of Spaces, Lemma 49.9.3. Thus to finish the proof of the lemma it suffices to prove that the assumptions of Lemma 58.37.2 are satisfied. The projection $\text{pr}_0 : X \times_Y X \rightarrow X$ is universally closed as a base change of f , see Morphisms of Spaces, Lemma 49.9.3. Hence $X \times_Y X \rightarrow Z$ is universally closed as a composition of universally closed morphisms (see Morphisms of Spaces, Lemma 49.9.4). This finishes the proof of the lemma. □

Lemma 58.37.4. *Consider a commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Assume that

- (1) *p is locally of finite presentation,*
- (2) *p is flat,*
- (3) *p is closed, and*
- (4) *q is locally of finite type.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is flat.

Proof. By Lemma 58.19.6 the set

$$A = \{x \in |X| : X \text{ flat at } x \text{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 48.4.8) with underlying set of points

$$|W| = |Z| \setminus |p|(|X| \setminus A)$$

i.e., $z \in |Z|$ is a point of W if and only if the whole fibre of $|X| \rightarrow |Z|$ over z is contained in A . This is open because p is closed. Since the formation of A commutes with arbitrary base change it follows that W works. \square

Lemma 58.37.5. *Consider a commutative diagram*

of algebraic spaces. Assume that

- (1) p is locally of finite presentation,
- (2) p is flat,
- (3) p is closed,
- (4) q is locally of finite type, and
- (5) q is closed.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is surjective and flat.

Proof. By Lemma 58.37.4 we may assume that f is flat. Note that f is locally of finite presentation by Morphisms of Spaces, Lemma 49.27.9. Hence f is open, see Morphisms of Spaces, Lemma 49.28.6. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 48.4.8) with underlying set of points

$$|W| = |Z| \setminus |q|(|Y| \setminus |f|(|X|)).$$

in other words for $z \in |Z|$ we have $z \in |W|$ if and only if the whole fibre of $|Y| \rightarrow |Z|$ over z is in the image of $|X| \rightarrow |Y|$. Since q is closed this set is open in $|Z|$. The morphism $X_W \rightarrow Y_W$ is surjective by construction. Finally, suppose that $X_{Z'} \rightarrow Y_{Z'}$ is surjective. In order to show that $Z' \rightarrow Z$ factors through W it suffices to show that $|Z'| \rightarrow |Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 48.4.9. Hence it suffices to prove the result when Z' is the spectrum of a field. Denote $z \in |Z|$ the image of $|Z'| \rightarrow |Z|$. By Properties of Spaces, Lemma 48.4.3 in the commutative diagram

the vertical arrows are surjective. It follows that $z \in |W|$ as desired. \square

Lemma 58.37.6. *Consider a commutative diagram*

of algebraic spaces. Assume that

- (1) p is locally of finite presentation,
- (2) p is flat,
- (3) p is universally closed,
- (4) q is locally of finite type,
- (5) q is closed, and
- (6) q is separated.

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is an isomorphism.

Proof. By Lemma 58.37.5 there exists an open subspace $W_1 \subset Z$ such that $f_{Z'}$ is surjective and flat if and only if $Z' \rightarrow Z$ factors through W_1 . By Lemma 58.37.3 there exists an open subspace $W_2 \subset Z$ such that $f_{Z'}$ is a closed immersion if and only if $Z' \rightarrow Z$ factors through W_2 . We claim that $W = W_1 \cap W_2$ works. Certainly, if $f_{Z'}$ is an isomorphism, then $Z' \rightarrow Z$ factors through W . Hence it suffices to show that f_W is an isomorphism. By construction f_W is a surjective flat closed immersion. In particular f_W is representable. Since a surjective flat closed immersion of schemes is an isomorphism (see Morphisms, Lemma 28.27.1) we win. (Note that actually f_W is locally of finite presentation, whence open, so you can avoid the use of this lemma if you like.) \square

Lemma 58.37.7. Consider a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\quad f \quad} & Y \\ & \searrow p & \swarrow q \\ & & Z \end{array}$$

of algebraic spaces. Assume that

- (1) p is flat and locally of finite presentation,
- (2) p is closed, and
- (3) q is flat and locally of finite presentation,

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \rightarrow Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \rightarrow Y_{Z'}$ is a local complete intersection morphism.

Proof. By Lemma 58.36.7 there exists an open subspace $U(f) \subset X$ which is the set of points where f is Koszul. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 48.4.8) with underlying set of points

$$|W| = |Z| \setminus |p| (|X| \setminus |U(f)|)$$

i.e., $z \in |Z|$ is a point of W if and only if f is Koszul at every point of X above z . Note that this is open because we assumed that p is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 48.4.9) that W has the desired universal property. \square

58.38. Exact sequences of differentials and conormal sheaves

In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to composable morphisms of algebraic spaces.

In the sequences below each of the maps are as constructed in either Lemma 58.6.6 or Lemma 58.12.8. Let S be a scheme. Let $g : Z \rightarrow Y$ and $f : Y \rightarrow X$ be morphisms of algebraic spaces over S .

- (1) There is a canonical exact sequence

$$g^*\Omega_{Y/X} \rightarrow \Omega_{Z/X} \rightarrow \Omega_{Z/Y} \rightarrow 0,$$

see Lemma 58.6.8. If $g : Z \rightarrow Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 58.16.11.

- (2) If g is formally unramified, then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow g^*\Omega_{Y/X} \rightarrow \Omega_{Z/X} \rightarrow 0,$$

see Lemma 58.12.13. If $f \circ g : Z \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 58.16.12.

- (3) if g and $f \circ g$ are formally unramified, then there is a canonical exact sequence

$$\mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow g^*\Omega_{Y/X} \rightarrow 0,$$

see Lemma 58.12.14. If $f : Y \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 58.16.13.

- (4) if g and f are formally unramified, then there is a canonical exact sequence

$$g^*\mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0.$$

see Lemma 58.12.15. If $g : Z \rightarrow Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 58.36.9.

Pushouts of Algebraic Spaces

59.1. Introduction

The goal of this chapter is to discuss pushouts in the category of algebraic spaces. This can be done with varying assumptions. A fairly general pushout construction is given in [TT13]: one of the morphisms is affine and the other is a closed immersion. We discuss a particular case of this in Section 59.2 where we assume one of the morphisms is affine and the other is a thickening, a situation that often comes up in deformation theory.

In Sections 59.3 and 59.4 we discuss diagrams

$$\begin{array}{ccc} f^{-1}(X \setminus Z) & \longrightarrow & Y \\ \downarrow & & \downarrow f \\ X \setminus Z & \longrightarrow & X \end{array}$$

where f is a quasi-compact and quasi-separated morphism of algebraic spaces, $Z \rightarrow X$ is a closed immersion of finite presentation, the map $f^{-1}(Z) \rightarrow Z$ is an isomorphism, and f is flat along $f^{-1}(Z)$. In this situation we glue quasi-coherent modules on $X \setminus Z$ and Y (in Section 59.3) to quasi-coherent modules on X and we glue algebraic spaces over $X \setminus Z$ and Y (in Section 59.4) to algebraic spaces over X .

In Section 59.5 we discuss how proper birational morphisms of Noetherian algebraic spaces give rise to coequalizer diagrams in algebraic spaces in some sense.

59.2. Pushouts in the category of algebraic spaces

This section is analogue of More on Morphisms, Section 36.11. We first prove a general result on colimits and algebraic spaces. To do this we discuss a bit of notation. Let S be a scheme. Let $\mathcal{I} \rightarrow (Sch/S)_{fppf}$, $i \mapsto X_i$ be a diagram (see Categories, Section 4.14). For each i we may consider the small étale site $X_{i, \text{étale}}$. For each morphism $i \rightarrow j$ of \mathcal{I} we have the morphism $X_i \rightarrow X_j$ and hence a pullback functor $X_{j, \text{étale}} \rightarrow X_{i, \text{étale}}$. Hence we obtain a pseudo functor from \mathcal{I}^{opp} into the 2-category of categories. Denote

$$\lim_i X_{i, \text{étale}}$$

the 2-limit (see insert future reference here). What does this mean concretely? An object of this limit is a system of étale morphisms $U_i \rightarrow X_i$ over \mathcal{I} such that for

each $i \rightarrow j$ in \mathcal{I} the diagram

$$\begin{array}{ccc} U_i & \longrightarrow & U_j \\ \downarrow & & \downarrow \\ X_i & \longrightarrow & X_j \end{array}$$

is cartesian. Morphisms between objects are defined in the obvious manner. Suppose that $f_i : X_i \rightarrow T$ is a family of morphisms such that for each $i \rightarrow j$ the composition $X_i \rightarrow X_j \rightarrow T$ is equal to f_i . Then we get a functor $T_{\acute{e}tale} \rightarrow \lim X_{i,\acute{e}tale}$. With this notation in hand we can formulate our lemma.

Lemma 59.2.1. *Let S be a scheme. Let $\mathcal{I} \rightarrow (Sch/S)_{fppf}$, $i \mapsto X_i$ be a diagram as above. Assume that*

- (1) $X = \operatorname{colim} X_i$ exists in the category of schemes,
- (2) $\coprod X_i \rightarrow X$ is surjective,
- (3) if $U \rightarrow X$ is étale and $U_i = X_i \times_X U$, then $U = \operatorname{colim} U_i$ in the category of schemes, and
- (4) the functor $X_{\acute{e}tale} \rightarrow \lim X_{i,\acute{e}tale}$ is an equivalence.

Then $X = \operatorname{colim} X_i$ in the category of algebraic spaces over S also.

Proof. Let Z be an algebraic space over S . Suppose that $f_i : X_i \rightarrow Z$ is a family of morphisms such that for each $i \rightarrow j$ the composition $X_i \rightarrow X_j \rightarrow Z$ is equal to f_i . We have to construct a morphism of algebraic spaces $f : X \rightarrow Z$ such that we can recover f_i as the composition $X_i \rightarrow X \rightarrow Z$. Let $W \rightarrow Z$ be a surjective étale morphism of a scheme to Z . For each i set $U_i = W \times_{Z, f_i} X_i$ and denote $h_i : U_i \rightarrow W$ the projection. Then $U_i \rightarrow X_i$ forms an object of $\lim X_{i,\acute{e}tale}$. By assumption (4) we can find an étale morphism $U \rightarrow X$ and (functorial) isomorphisms $U_i = X_i \times_X U$. By assumption (3) there exists a morphism $h : U \rightarrow W$ such that the compositions $U_i \rightarrow U \rightarrow W$ are h_i . Let $g : U \rightarrow Z$ be the composition of h with the map $W \rightarrow Z$. To finish the proof we have to show that $g : U \rightarrow Z$ descends to a morphism $X \rightarrow Z$. To do this, consider the morphism $(h, h) : U \times_X U \rightarrow W \times_Z W$. Composing with $U_i \times_{X_i} U_i \rightarrow U \times_X U$ we obtain (h_i, h_i) which factors through $W \times_Z W$. Since $U \times_X U$ is the colimit of the schemes $U_i \times_{X_i} U_i$ by (3) we see that (h, h) factors through $W \times_Z W$. Hence the two compositions $U \times_X U \rightarrow U \rightarrow W \rightarrow Z$ are equal. Because each $U_i \rightarrow X_i$ is surjective and assumption (2) we see that $U \rightarrow X$ is surjective. As Z is a sheaf for the étale topology, we conclude that $g : U \rightarrow Z$ descends to $f : X \rightarrow Z$ as desired. \square

Lemma 59.2.2. *Let S be a scheme. Let $X \rightarrow X'$ be a thickening of schemes over S and let $X \rightarrow Y$ be an affine morphism of schemes over S . Let $Y' = Y \amalg_X X'$ be the pushout in the category of schemes (see More on Morphisms, Lemma 36.11.1). Then Y' is also a pushout in the category of algebraic spaces over S .*

Proof. This is an immediate consequence of Lemma 59.2.1 and More on Morphisms, Lemmas 36.11.1, 36.11.2, and 36.11.4. \square

Lemma 59.2.3. *Let S be a scheme. Let $X \rightarrow X'$ be a thickening of algebraic spaces over S and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over S .*

Then there exists a pushout

$$\begin{array}{ccc} X & \longrightarrow & X' \\ f \downarrow & & \downarrow f' \\ Y & \longrightarrow & Y \amalg_X X' \end{array}$$

in the category of algebraic spaces over S . Moreover $Y' = Y \amalg_X X'$ is a thickening of Y and

$$\mathcal{O}_{Y'} = \mathcal{O}_Y \times_{f_* \mathcal{O}_X} f'_* \mathcal{O}_{X'}$$

as sheaves on $Y_{\text{étale}} = (Y')_{\text{étale}}$.

Proof. Choose a scheme V and a surjective étale morphism $V \rightarrow Y$. Set $U = V \times_Y X$. This is a scheme affine over V with a surjective étale morphism $U \rightarrow X$. By More on Morphisms of Spaces, Lemma 58.8.6 there exists a $U' \rightarrow X'$ surjective étale with $U = U' \times_{X'} X$. In particular the morphism of schemes $U \rightarrow U'$ is a thickening too. Apply More on Morphisms, Lemma 36.11.1 to obtain a pushout $V' = V \amalg_U U'$ in the category of schemes.

We repeat this procedure to construct a pushout

$$\begin{array}{ccc} U \times_X U & \longrightarrow & U' \times_{X'} U' \\ \downarrow & & \downarrow \\ V \times_Y V & \longrightarrow & R' \end{array}$$

in the category of schemes. Consider the morphisms

$$U \times_X U \rightarrow U \rightarrow V', \quad U' \times_{X'} U' \rightarrow U' \rightarrow V', \quad V \times_Y V \rightarrow V \rightarrow V'$$

where we use the first projection in each case. Clearly these glue to give a morphism $t' : R' \rightarrow V'$ which is étale by More on Morphisms, Lemma 36.11.4. Similarly, we obtain $s' : R' \rightarrow V'$ étale. The morphism $j' = (t', s') : R' \rightarrow V' \times_S V'$ is unramified (as t' is étale) and a monomorphism when restricted to the closed subscheme $V \times_Y V \subset R'$. As $V \times_Y V \subset R'$ is a thickening it follows that j' is a monomorphism too. Finally, j' is an equivalence relation as we can use the functoriality of pushouts of schemes to construct a morphism $c' : R' \times_{s', V', t'} R' \rightarrow R'$ (details omitted). At this point we set $Y' = U'/R'$, see Spaces, Theorem 47.10.5.

We have morphisms $X' = U'/U' \times_{X'} U' \rightarrow V'/R' = Y'$ and $Y = V/V \times_Y V \rightarrow V'/R' = Y'$. By construction these fit into the commutative diagram

$$\begin{array}{ccc} X & \longrightarrow & X' \\ f \downarrow & & \downarrow f' \\ Y & \longrightarrow & Y' \end{array}$$

Since $Y \rightarrow Y'$ is a thickening we have $Y_{\text{étale}} = (Y')_{\text{étale}}$, see More on Morphisms of Spaces, Lemma 58.8.6. The commutativity of the diagram gives a map of sheaves

$$\mathcal{O}_{Y'} \longrightarrow \mathcal{O}_Y \times_{f_* \mathcal{O}_X} f'_* \mathcal{O}_{X'}$$

on this set. By More on Morphisms, Lemma 36.11.1 this map is an isomorphism when we restrict to the scheme V' , hence it is an isomorphism.

To finish the proof we show that the diagram above is a pushout in the category of algebraic spaces. To see this, let Z be an algebraic space and let $a' : X' \rightarrow Z$ and $b : Y \rightarrow Z$ be morphisms of algebraic spaces. By Lemma 59.2.2 we obtain a unique morphism $h : V' \rightarrow Z$ fitting into the commutative diagrams

$$\begin{array}{ccc} U' & \longrightarrow & V' \\ \downarrow & & \downarrow h \\ X' & \xrightarrow{a'} & Z \end{array} \quad \text{and} \quad \begin{array}{ccc} V & \longrightarrow & V' \\ \downarrow & & \downarrow h \\ Y & \xrightarrow{b} & Z \end{array}$$

The uniqueness shows that $h \circ t' = h \circ s'$. Hence h factors uniquely as $V' \rightarrow Y' \rightarrow Z$ and we win. \square

In the following lemma we use the fibre product of categories as defined in Categories, Example 4.29.3.

Lemma 59.2.4. *Let S be a base scheme. Let $X \rightarrow X'$ be a thickening of algebraic spaces over S and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Let $Y' = Y \amalg_{X'} X'$ be the pushout (see Lemma 59.2.3). Base change gives a functor*

$$F : (\text{Spaces}/Y') \longrightarrow (\text{Spaces}/Y) \times_{(\text{Spaces}/Y')} (\text{Spaces}/X')$$

given by $V' \mapsto (V' \times_{Y'} Y, V' \times_{Y'} X', 1)$ which sends (Sch/Y') into $(\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$. The functor F has a left adjoint

$$G : (\text{Spaces}/Y) \times_{(\text{Spaces}/Y')} (\text{Spaces}/X') \longrightarrow (\text{Spaces}/Y')$$

which sends the triple (V, U', φ) to the pushout $V \amalg_{(V \times_Y X)} U'$ in the category of algebraic spaces over S . The functor G sends $(\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$ into (Sch/Y') .

Proof. The proof is completely formal. Since the morphisms $X \rightarrow X'$ and $X \rightarrow Y$ are representable it is clear that F sends (Sch/Y') into $(\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$.

Let us construct G . Let (V, U', φ) be an object of the fibre product category. Set $U = U' \times_{X'} X$. Note that $U \rightarrow U'$ is a thickening. Since $\varphi : V \times_Y X \rightarrow U' \times_{X'} X = U$ is an isomorphism we have a morphism $U \rightarrow V$ over $X \rightarrow Y$ which identifies U with the fibre product $X \times_Y V$. In particular $U \rightarrow V$ is affine, see Morphisms of Spaces, Lemma 49.20.5. Hence we can apply Lemma 59.2.3 to get a pushout $V' = V \amalg_U U'$. Denote $V' \rightarrow Y'$ the morphism we obtain in virtue of the fact that V' is a pushout and because we are given morphisms $V \rightarrow Y$ and $U' \rightarrow X'$ agreeing on U as morphisms into Y' . Setting $G(V, U', \varphi) = V'$ gives the functor G .

If (V, U', φ) is an object of $(\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$ then $U = U' \times_{X'} X$ is a scheme too and we can form the pushout $V' = V \amalg_U U'$ in the category of schemes by More on Morphisms, Lemma 36.11.1. By Lemma 59.2.2 this is also a pushout in the category of schemes, hence G sends $(\text{Sch}/Y) \times_{(\text{Sch}/Y')} (\text{Sch}/X')$ into (Sch/Y') .

Let us prove that G is a left adjoint to F . Let Z be an algebraic space over Y' . We have to show that

$$\text{Mor}(V', Z) = \text{Mor}((V, U', \varphi), F(Z))$$

where the morphism sets are taking in their respective categories. Let $g' : V' \rightarrow Z$ be a morphism. Denote \tilde{g} , resp. \tilde{f}' the composition of g' with the morphism $V \rightarrow V'$, resp. $U' \rightarrow V'$. Base change \tilde{g} , resp. \tilde{f}' by $Y \rightarrow Y'$, resp. $X' \rightarrow Y'$ to get a morphism $g : V \rightarrow Z \times_{Y'} Y$, resp. $f' : U' \rightarrow Z \times_{Y'} X'$. Then (g, f') is an element of the

right hand side of the equation above (details omitted). Conversely, suppose that $(g, f') : (V, U', \varphi) \rightarrow F(Z)$ is an element of the right hand side. We may consider the composition $\tilde{g} : V \rightarrow Z$, resp. $\tilde{f}' : U' \rightarrow Z$ of g , resp. f' by $Z \times_{Y'} X' \rightarrow Z$, resp. $Z \times_{Y'} Y \rightarrow Z$. Then \tilde{g} and \tilde{f}' agree as morphism from U to Z . By the universal property of pushout, we obtain a morphism $g' : V' \rightarrow Z$, i.e., an element of the left hand side. We omit the verification that these constructions are mutually inverse. \square

Lemma 59.2.5. *Let S be a scheme. Let*

$$\begin{array}{ccccc} A & \longrightarrow & C & \longrightarrow & E \\ \downarrow & & \downarrow & & \downarrow \\ B & \longrightarrow & D & \longrightarrow & F \end{array}$$

be a commutative diagram of algebraic spaces over S . Assume that A, B, C, D and A, B, E, F form cartesian squares and that $B \rightarrow D$ is surjective étale. Then C, D, E, F is a cartesian square.

Proof. This is formal. \square

Lemma 59.2.6. *In the situation of Lemma 59.2.4 the functor $F \circ G$ is isomorphic to the identity functor.*

Proof. We will prove that $F \circ G$ is isomorphic to the identity by reducing this to the corresponding statement of More on Morphisms, Lemma 36.11.2.

Choose a scheme Y_1 and a surjective étale morphism $Y_1 \rightarrow Y$. Set $X_1 = Y_1 \times_Y X$. This is a scheme affine over Y_1 with a surjective étale morphism $X_1 \rightarrow X$. By More on Morphisms of Spaces, Lemma 58.8.6 there exists a $X'_1 \rightarrow X'$ surjective étale with $X_1 = X'_1 \times_{X'} X$. In particular the morphism of schemes $X_1 \rightarrow X'_1$ is a thickening too. Apply More on Morphisms, Lemma 36.11.1 to obtain a pushout $Y'_1 = Y_1 \amalg_{X_1} X'_1$ in the category of schemes. In the proof of Lemma 59.2.3 we constructed Y' as a quotient of an étale equivalence relation on Y'_1 such that we get a commutative diagram

(59.2.6.1)

$$\begin{array}{ccccc} & & X & \longrightarrow & X' \\ & \nearrow & \downarrow & & \downarrow \\ X_1 & \longrightarrow & X'_1 & \longrightarrow & X' \\ \downarrow & & \downarrow & & \downarrow \\ & \nearrow & Y & \longrightarrow & Y' \\ Y_1 & \longrightarrow & Y'_1 & \longrightarrow & Y' \end{array}$$

where all squares except the front and back squares are cartesian (the front and back squares are pushouts) and the northeast arrows are surjective étale. Denote F_1, G_1 the functors constructed in More on Morphisms, Lemma 36.11.2 for the

front square. Then the diagram of categories

$$\begin{array}{ccc}
 (Sch/Y'_1) & \xleftarrow{G_1} & (Sch/Y_1) \times_{(Sch/Y'_1)} (Sch/X'_1) \\
 \downarrow & \xrightarrow{F_1} & \downarrow \\
 (Spaces/Y') & \xleftarrow{G} & (Spaces/Y) \times_{(Spaces/Y')} (Spaces/X') \\
 & \xrightarrow{F} &
 \end{array}$$

is commutative by simple considerations regarding base change functors and the agreement of pushouts in schemes with pushouts in spaces of Lemma 59.2.2.

Let (V, U', φ) be an object of $(Spaces/Y) \times_{(Spaces/Y')} (Spaces/X')$. Denote $U = U' \times_{X'} X$ so that $G(V, U', \varphi) = V \amalg_U U'$. Choose a scheme V_1 and a surjective étale morphism $V_1 \rightarrow Y_1 \times_Y V$. Set $U_1 = V_1 \times_Y X$. Then

$$U_1 = V_1 \times_Y X \longrightarrow (Y_1 \times_Y V) \times_Y X = X_1 \times_Y V = X_1 \times_X X \times_Y V = X_1 \times_X U$$

is surjective étale too. By More on Morphisms of Spaces, Lemma 58.8.6 there exists a thickening $U_1 \rightarrow U'_1$ and a surjective étale morphism $U'_1 \rightarrow X'_1 \times_{X'} U'$ whose base change to $X_1 \times_X U$ is the displayed morphism. At this point (V_1, U'_1, φ_1) is an object of $(Sch/Y_1) \times_{(Sch/Y'_1)} (Sch/X'_1)$. In the proof of Lemma 59.2.3 we constructed $G(V, U', \varphi) = V \amalg_U U'$ as a quotient of an étale equivalence relation on $G_1(V_1, U'_1, \varphi_1) = V_1 \amalg_{U_1} U'_1$ such that we get a commutative diagram

(59.2.6.2)

$$\begin{array}{ccccc}
 & & U & \xrightarrow{\quad} & U' \\
 & \nearrow & \downarrow & & \downarrow \\
 U_1 & \xrightarrow{\quad} & U'_1 & \nearrow & \\
 \downarrow & & \downarrow & & \downarrow \\
 & \nearrow & V & \xrightarrow{\quad} & G(V, U', \varphi) \\
 V_1 & \xrightarrow{\quad} & G_1(V_1, U'_1, \varphi_1) & \nearrow &
 \end{array}$$

where all squares except the front and back squares are cartesian (the front and back squares are pushouts) and the northeast arrows are surjective étale. In particular

$$G_1(V_1, U'_1, \varphi_1) \rightarrow G(V, U', \varphi)$$

is surjective étale.

Finally, we come to the proof of the lemma. We have to show that the adjunction mapping $(V, U', \varphi) \rightarrow F(G(V, U', \varphi))$ is an isomorphism. We know $(V_1, U'_1, \varphi_1) \rightarrow F_1(G_1(V_1, U'_1, \varphi_1))$ is an isomorphism by More on Morphisms, Lemma 36.11.2. Recall that F and F_1 are given by base change. Using the properties of (59.2.6.2) and Lemma 59.2.5 we see that $V \rightarrow G(V, U', \varphi) \times_{Y'} Y$ and $U' \rightarrow G(V, U', \varphi) \times_{Y'} X'$ are isomorphisms, i.e., $(V, U', \varphi) \rightarrow F(G(V, U', \varphi))$ is an isomorphism. \square

Lemma 59.2.7. *Let S be a base scheme. Let $X \rightarrow X'$ be a thickening of algebraic spaces over S and let $X \rightarrow Y$ be an affine morphism of algebraic spaces over S . Let $Y' = Y \amalg_X X'$ be the pushout (see Lemma 59.2.3). Let $V' \rightarrow Y'$ be a morphism of*

algebraic spaces over S . Set $V = Y \times_{Y'} V'$, $U' = X' \times_{Y'} V'$, and $U = X \times_{Y'} V'$. There is an equivalence of categories between

- (1) quasi-coherent $\mathcal{O}_{V'}$ -modules flat over Y' , and
- (2) the category of triples $(\mathcal{G}, \mathcal{F}', \varphi)$ where
 - (a) \mathcal{G} is a quasi-coherent \mathcal{O}_V -module flat over Y ,
 - (b) \mathcal{F}' is a quasi-coherent $\mathcal{O}_{U'}$ -module flat over X , and
 - (c) $\varphi : (U \rightarrow V)^*\mathcal{G} \rightarrow (U \rightarrow U')^*\mathcal{F}'$ is an isomorphism of \mathcal{O}_U -modules.

The equivalence maps \mathcal{G}' to $((V \rightarrow V')^*\mathcal{G}', (U' \rightarrow V')^*\mathcal{G}', \text{can})$. Suppose \mathcal{G}' corresponds to the triple $(\mathcal{G}, \mathcal{F}', \varphi)$. Then

- (a) \mathcal{G}' is a finite type $\mathcal{O}_{V'}$ -module if and only if \mathcal{G} and \mathcal{F}' are finite type \mathcal{O}_Y and $\mathcal{O}_{U'}$ -modules.
- (b) if $V' \rightarrow Y'$ is locally of finite presentation, then \mathcal{G}' is an $\mathcal{O}_{V'}$ -module of finite presentation if and only if \mathcal{G} and \mathcal{F}' are \mathcal{O}_Y and $\mathcal{O}_{U'}$ -modules of finite presentation.

Proof. A quasi-inverse functor assigns to the triple $(\mathcal{G}, \mathcal{F}', \varphi)$ the fibre product

$$(V \rightarrow V')_*\mathcal{G} \times_{(U \rightarrow V')_*\mathcal{F}'} (U' \rightarrow V')_*\mathcal{F}'$$

where $\mathcal{F} = (U \rightarrow U')^*\mathcal{F}'$. This works, because on affines étale over V' and Y' we recover the equivalence of More on Algebra, Lemma 15.4.12. Details omitted.

Parts (a) and (b) reduce by étale localization (Properties of Spaces, Section 48.28) to the case where V' and Y' are affine in which case the result follows from More on Algebra, Lemmas 15.4.11 and 15.4.13. \square

Lemma 59.2.8. *In the situation of Lemma 59.2.6. If $V' = G(V, U', \varphi)$ for some triple (V, U', φ) , then*

- (1) $V' \rightarrow Y'$ is locally of finite type if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are locally of finite type,
- (2) $V' \rightarrow Y'$ is flat if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are flat,
- (3) $V' \rightarrow Y'$ is flat and locally of finite presentation if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are flat and locally of finite presentation,
- (4) $V' \rightarrow Y'$ is smooth if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are smooth,
- (5) $V' \rightarrow Y'$ is étale if and only if $V \rightarrow Y$ and $U' \rightarrow X'$ are étale, and
- (6) add more here as needed.

If W' is flat over Y' , then the adjunction mapping $G(F(W')) \rightarrow W'$ is an isomorphism. Hence F and G define mutually quasi-inverse functors between the category of spaces flat over Y' and the category of triples (V, U', φ) with $V \rightarrow Y$ and $U' \rightarrow X'$ flat.

Proof. Choose a diagram (59.2.6.1) as in the proof of Lemma 59.2.6.

Proof of (1) – (5). Let (V, U', φ) be an object of $(\text{Spaces}/Y) \times_{(\text{Spaces}/Y')} (\text{Spaces}/X')$. Construct a diagram (59.2.6.2) as in the proof of Lemma 59.2.6. Then the base change of $G(V, U', \varphi) \rightarrow Y'$ to Y'_1 is $G_1(V_1, U'_1, \varphi_1) \rightarrow Y'_1$. Hence (1) – (5) follow immediately from the corresponding statements of More on Morphisms, Lemma 36.11.4 for schemes.

Suppose that $W' \rightarrow Y'$ is flat. Choose a scheme W'_1 and a surjective étale morphism $W'_1 \rightarrow Y'_1 \times_{Y'} W'$. Observe that $W'_1 \rightarrow W'$ is surjective étale as a composition of surjective étale morphisms. We know that $G_1(F_1(W'_1)) \rightarrow W'_1$ is an isomorphism

by More on Morphisms, Lemma 36.11.4 applied to W'_1 over Y'_1 and the front of the diagram (with functors G_1 and F_1 as in the proof of Lemma 59.2.6). Then the construction of $G(F(W'))$ (as a pushout, i.e., as constructed in Lemma 59.2.3) shows that $G_1(F_1(W'_1)) \rightarrow G(F(W))$ is surjective étale. Whereupon we conclude that $G(F(W)) \rightarrow W$ is étale, see for example Properties of Spaces, Lemma 48.13.3. But $G(F(W)) \rightarrow W$ is an isomorphism on underlying reduced algebraic spaces (by construction), hence it is an isomorphism. \square

59.3. Formal glueing of quasi-coherent modules

This section is the analogue of More on Algebra, Section 15.63. In the case of morphisms of schemes, the result can be found in the paper by Joyet [Joy96]; this is a good place to start reading. For a discussion of applications to descent problems for stacks, see the paper by Moret-Bailly [MB96]. In the case of an affine morphism of schemes there is a statement in the appendix of the paper [FR70] but one needs to add the hypothesis that the closed subscheme is cut out by a finitely generated ideal (as in the paper by Joyet) since otherwise the result does not hold. A generalization of this material to (higher) derived categories with potential applications to nonflat situations can be found in [Bha14, Section 5].

We start with a lemma on abelian sheaves supported on closed subsets.

Lemma 59.3.1. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset X$ closed subspace such that $f^{-1}Z \rightarrow Z$ is integral and universally injective. Let \bar{y} be a geometric point of Y and $\bar{x} = f(\bar{y})$. We have*

$$(Rf_*Q)_{\bar{x}} = Q_{\bar{y}}$$

in $D(Ab)$ for any object Q of $D(Y_{\text{étale}})$ supported on $|f^{-1}Z|$.

Proof. Consider the commutative diagram of algebraic spaces

$$\begin{array}{ccc} f^{-1}Z & \xrightarrow{\quad} & Y \\ f' \downarrow & & \downarrow f \\ Z & \xrightarrow{\quad i \quad} & X \end{array}$$

By Cohomology of Spaces, Lemma 51.8.4 we can write $Q = Ri'_*K'$ for some object K' of $D(f^{-1}Z_{\text{étale}})$. By Morphisms of Spaces, Lemma 49.47.5 we have $K' = (f')^{-1}K$ with $K = Rf'_*K'$. Then we have $Rf_*Q = Rf_*Ri'_*K' = Ri_*Rf'_*K' = Ri_*K$. Let \bar{z} be the geometric point of Z corresponding to \bar{x} and let \bar{z}' be the geometric point of $f^{-1}Z$ corresponding to \bar{y} . We obtain the result of the lemma as follows

$$Q_{\bar{y}} = (Ri'_*K')_{\bar{y}} = K'_{\bar{z}'} = (f')^{-1}K_{\bar{z}} = K_{\bar{z}} = Ri_*K_{\bar{x}} = Rf_*Q_{\bar{x}}$$

The middle equality holds because of the description of the stalk of a pullback given in Properties of Spaces, Lemma 48.16.9. \square

Lemma 59.3.2. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset X$ closed subspace such that $f^{-1}Z \rightarrow Z$ is integral and universally injective. Let \bar{y} be a geometric point of Y and $\bar{x} = f(\bar{y})$. Let \mathcal{G} be an abelian sheaf on Y . Then the map of two term complexes*

$$(f_*\mathcal{G}_{\bar{x}} \rightarrow (f \circ j')_*(\mathcal{G}|_V)_{\bar{x}}) \longrightarrow (\mathcal{G}_{\bar{y}} \rightarrow j'_*(\mathcal{G}|_V)_{\bar{y}})$$

induces an isomorphism on kernels and an injection on cokernels. Here $V = Y \setminus f^{-1}Z$ and $j' : V \rightarrow Y$ is the inclusion.

Proof. Choose a distinguished triangle

$$\mathcal{G} \rightarrow Rj'_*\mathcal{G}|_V \rightarrow Q \rightarrow \mathcal{G}[1]$$

in $D(Y_{\acute{e}tale})$. The cohomology sheaves of Q are supported on $|f^{-1}Z|$. We apply Rf_* and we obtain

$$Rf_*\mathcal{G} \rightarrow Rf_*Rj'_*\mathcal{G}|_V \rightarrow Rf_*Q \rightarrow Rf_*\mathcal{G}[1]$$

Taking stalks at \bar{x} we obtain an exact sequence

$$0 \rightarrow (R^{-1}f_*Q)_{\bar{x}} \rightarrow f_*\mathcal{G}_{\bar{x}} \rightarrow (f \circ j')_*(\mathcal{G}|_V)_{\bar{x}} \rightarrow (R^0f_*Q)_{\bar{x}}$$

We can compare this with the exact sequence

$$0 \rightarrow H^{-1}(Q)_{\bar{y}} \rightarrow \mathcal{G}_{\bar{y}} \rightarrow j'_*(\mathcal{G}|_V)_{\bar{y}} \rightarrow H^0(Q)_{\bar{y}}$$

Thus we see that the lemma follows because $Q_{\bar{y}} = Rf_*Q_{\bar{x}}$ by Lemma 59.3.1. \square

Lemma 59.3.3. *Let S be a scheme. Let X be an algebraic space over S . Let $f : Y \rightarrow X$ be a quasi-compact and quasi-separated morphism. Let \bar{x} be a geometric point of X and let $\text{Spec}(\mathcal{O}_{X,\bar{x}}) \rightarrow X$ be the canonical morphism. For a quasi-coherent module \mathcal{G} on Y we have*

$$f_*\mathcal{G}_{\bar{x}} = \Gamma(Y \times_X \text{Spec}(\mathcal{O}_{X,\bar{x}}), p^*\mathcal{F})$$

where $p : Y \times_X \text{Spec}(\mathcal{O}_{X,\bar{x}}) \rightarrow Y$ is the projection.

Proof. Observe that $f_*\mathcal{G}_{\bar{x}} = \Gamma(\text{Spec}(\mathcal{O}_{X,\bar{x}}), h^*f_*\mathcal{G})$ where $h : \text{Spec}(\mathcal{O}_{X,\bar{x}}) \rightarrow X$. Hence the result is true because h is flat so that Cohomology of Spaces, Lemma 51.10.1 applies. \square

Lemma 59.3.4. *Let S be a scheme. Let X be an algebraic space over S . Let $i : Z \rightarrow X$ be a closed immersion of finite presentation. Let $Q \in D_{QCoh}(\mathcal{O}_X)$ be supported on $|Z|$. Let \bar{x} be a geometric point of X and let $I_{\bar{x}} \subset \mathcal{O}_{X,\bar{x}}$ be the stalk of the ideal sheaf of Z . Then the cohomology modules $H^n(Q_{\bar{x}})$ are $I_{\bar{x}}$ -power torsion (see More on Algebra, Definition 15.62.1).*

Proof. Choose an affine scheme U and an étale morphism $U \rightarrow X$ such that \bar{x} lifts to a geometric point \bar{u} of U . Then we can replace X by U , Z by $U \times_X Z$, Q by the restriction $Q|_U$, and \bar{x} by \bar{u} . Thus we may assume that $X = \text{Spec}(A)$ is affine. Let $I \subset A$ be the ideal defining Z . Since $i : Z \rightarrow X$ is of finite presentation, the ideal $I = (f_1, \dots, f_r)$ is finitely generated. The object Q comes from a complex of A -modules M^\bullet , see Derived Categories of Spaces, Lemma 57.4.2 and Derived Categories of Schemes, Lemma 35.3.4. Since the cohomology sheaves of Q are supported on Z we see that the localization M_f^\bullet is acyclic for each $f \in I$. Take $x \in H^p(M^\bullet)$. By the above we can find n_i such that $f_i^{n_i}x = 0$ in $H^p(M^\bullet)$ for each i . Then with $n = \sum n_i$ we see that I^n annihilates x . Thus $H^p(M^\bullet)$ is I -power torsion. Since the ring map $A \rightarrow \mathcal{O}_{X,\bar{x}}$ is flat and since $I_{\bar{x}} = I\mathcal{O}_{X,\bar{x}}$ we conclude. \square

Lemma 59.3.5. *Let S be a scheme. Let $f : Y \rightarrow X$ be a morphism of algebraic spaces over S . Let $Z \subset X$ be a closed subspace. Assume $f^{-1}Z \rightarrow Z$ is an isomorphism and that f is flat in every point of $f^{-1}Z$. For any Q in $D_{QCoh}(\mathcal{O}_Y)$ supported on $|f^{-1}Z|$ we have $Lf^*Rf_*Q = Q$.*

Proof. We show the canonical map $Lf^*Rf_*Q \rightarrow Q$ is an isomorphism by checking on stalks at \bar{y} . If \bar{y} is not in $f^{-1}Z$, then both sides are zero and the result is true. Assume the image \bar{x} of \bar{y} is in Z . By Lemma 59.3.1 we have $Rf_*Q_{\bar{x}} = Q_{\bar{y}}$ and since f is flat at \bar{y} we see that

$$(Lf^*Rf_*Q)_{\bar{y}} = (Rf_*Q)_{\bar{x}} \otimes_{\mathcal{O}_{X,\bar{x}}} \mathcal{O}_{Y,\bar{y}} = Q_{\bar{y}} \otimes_{\mathcal{O}_{X,\bar{x}}} \mathcal{O}_{Y,\bar{y}}$$

Thus we have to check that the canonical map

$$Q_{\bar{y}} \otimes_{\mathcal{O}_{X,\bar{x}}} \mathcal{O}_{Y,\bar{y}} \longrightarrow Q_{\bar{y}}$$

is an isomorphism in the derived category. Let $I_{\bar{x}} \subset \mathcal{O}_{X,\bar{x}}$ be the stalk of the ideal sheaf defining Z . Since $Z \rightarrow X$ is locally of finite presentation this ideal is finitely generated and the cohomology groups of $Q_{\bar{y}}$ are $I_{\bar{y}} = I_{\bar{x}}\mathcal{O}_{Y,\bar{y}}$ -power torsion by Lemma 59.3.4 applied to Q on Y . It follows that they are also $I_{\bar{x}}$ -power torsion. The ring map $\mathcal{O}_{X,\bar{x}} \rightarrow \mathcal{O}_{Y,\bar{y}}$ is flat and induces an isomorphism after dividing by $I_{\bar{x}}$ and $I_{\bar{y}}$ because we assumed that $f^{-1}Z \rightarrow Z$ is an isomorphism. Hence we see that the cohomology modules of $Q_{\bar{y}} \otimes_{\mathcal{O}_{X,\bar{x}}} \mathcal{O}_{Y,\bar{y}}$ are equal to the cohomology modules of $Q_{\bar{y}}$ by More on Algebra, Lemma 15.63.2 which finishes the proof. \square

Situation 59.3.6. Here S is a base scheme, $f : Y \rightarrow X$ is a quasi-compact and quasi-separated morphism of algebraic spaces over S , and $Z \rightarrow X$ is a closed immersion of finite presentation. We assume that $f^{-1}(Z) \rightarrow Z$ is an isomorphism and that f is flat in every point $x \in |f^{-1}Z|$. We set $U = X \setminus Z$ and $V = Y \setminus f^{-1}(Z)$. Picture

$$\begin{array}{ccc} V & \xrightarrow{j'} & Y \\ f|_V \downarrow & & \downarrow f \\ U & \xrightarrow{j} & X \end{array}$$

In Situation 59.3.6 we define $QCoh(Y \rightarrow X, Z)$ as the category of triples $(\mathcal{H}, \mathcal{G}, \varphi)$ where \mathcal{H} is a quasi-coherent sheaf of \mathcal{O}_U -modules, \mathcal{G} is a quasi-coherent sheaf of \mathcal{O}_Y -modules, and $\varphi : f^*\mathcal{H} \rightarrow \mathcal{G}|_V$ is an isomorphism of \mathcal{O}_V -modules. There is a canonical functor

$$(59.3.6.1) \quad QCoh(\mathcal{O}_X) \longrightarrow QCoh(Y \rightarrow X, Z)$$

which maps \mathcal{F} to the system $(\mathcal{F}|_U, f^*\mathcal{F}, can)$. By analogy with the proof given in the affine case, we construct a functor in the opposite direction. To an object $(\mathcal{H}, \mathcal{G}, \varphi)$ we assign the \mathcal{O}_X -module

$$(59.3.6.2) \quad \text{Ker}(j_*\mathcal{H} \oplus f_*\mathcal{G} \rightarrow (f \circ j')_*\mathcal{G}|_V)$$

Observe that j and j' are quasi-compact morphisms as $Z \rightarrow X$ is of finite presentation. Hence f_* , j_* , and $(f \circ j')_*$ transform quasi-coherent modules into quasi-coherent modules (Morphisms of Spaces, Lemma 49.11.2). Thus the module (59.3.6.2) is quasi-coherent.

Lemma 59.3.7. *In Situation 59.3.6. The functor (59.3.6.2) is right adjoint to the functor (59.3.6.1).*

Proof. This follows easily from the adjointness of f^* to f_* and j^* to j_* . Details omitted. \square

Lemma 59.3.8. *In Situation 59.3.6. Let $X' \rightarrow X$ be a flat morphism of algebraic spaces. Set $Z' = X' \times_X Z$ and $Y' = X' \times_X Y$. The pullbacks $QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_{X'})$ and $QCoh(Y \rightarrow X, Z) \rightarrow QCoh(Y' \rightarrow X', Z')$ are compatible with the functors (59.3.6.2) and 59.3.6.1).*

Proof. This is true because pullback commutes with pullback and because flat pullback commutes with pushforward along quasi-compact and quasi-separated morphisms, see Cohomology of Spaces, Lemma 51.10.1. \square

Proposition 59.3.9. *In Situation 59.3.6 the functor (59.3.6.1) is an equivalence with quasi-inverse given by (59.3.6.2).*

Proof. We first treat the special case where X and Y are affine schemes and where the morphism f is flat. Say $X = \text{Spec}(R)$ and $Y = \text{Spec}(S)$. Then f corresponds to a flat ring map $R \rightarrow S$. Moreover, $Z \subset X$ is cut out by a finitely generated ideal $I \subset R$. Choose generators $f_1, \dots, f_t \in I$. By the description of quasi-coherent modules in terms of modules (Schemes, Section 25.7), we see that the category $QCoh(Y \rightarrow X, Z)$ is canonically equivalent to the category $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ of More on Algebra, Remark 15.63.10 such that the functors (59.3.6.1) and (59.3.6.2) correspond to the functors Can and H^0 . Hence the result follows from More on Algebra, Proposition 15.63.15 in this case.

We return to the general case. Let \mathcal{F} be a quasi-coherent module on X . We will show that

$$\alpha : \mathcal{F} \longrightarrow \text{Ker}(j_*\mathcal{F}|_U \oplus f_*f^*\mathcal{F} \rightarrow (f \circ j')_*f^*\mathcal{F}|_V)$$

is an isomorphism. Let $(\mathcal{H}, \mathcal{G}, \varphi)$ be an object of $QCoh(Y \rightarrow X, Z)$. We will show that

$$\beta : f^*\text{Ker}(j_*\mathcal{H} \oplus f_*\mathcal{G} \rightarrow (f \circ j')_*\mathcal{G}|_V) \longrightarrow \mathcal{G}$$

and

$$\gamma : j^*\text{Ker}(j_*\mathcal{H} \oplus f_*\mathcal{G} \rightarrow (f \circ j')_*\mathcal{G}|_V) \longrightarrow \mathcal{H}$$

are isomorphisms. To see these statements are true it suffices to look at stalks. Let \bar{y} be a geometric point of Y mapping to the geometric point \bar{x} of X .

Fix an object $(\mathcal{H}, \mathcal{G}, \varphi)$ of $QCoh(Y \rightarrow X, Z)$. By Lemma 59.3.2 and a diagram chase (omitted) the canonical map

$$\text{Ker}(j_*\mathcal{H} \oplus f_*\mathcal{G} \rightarrow (f \circ j')_*\mathcal{G}|_V)_{\bar{x}} \longrightarrow \text{Ker}(j_*\mathcal{H}_{\bar{x}} \oplus \mathcal{G}_{\bar{y}} \rightarrow j'_*\mathcal{G}_{\bar{y}})$$

is an isomorphism.

In particular, if \bar{y} is a geometric point of V , then we see that $j'_*\mathcal{G}_{\bar{y}} = \mathcal{G}_{\bar{y}}$ and hence that this kernel is equal to $\mathcal{H}_{\bar{x}}$. This easily implies that $\alpha_{\bar{x}}$, $\beta_{\bar{x}}$, and $\beta_{\bar{y}}$ are isomorphisms in this case.

Next, assume that \bar{y} is a point of $f^{-1}Z$. Let $I_{\bar{x}} \subset \mathcal{O}_{X, \bar{x}}$, resp. $I_{\bar{y}} \subset \mathcal{O}_{Y, \bar{y}}$ be the stalk of the ideal cutting out Z , resp. $f^{-1}Z$. Then $I_{\bar{x}}$ is a finitely generated ideal, $I_{\bar{y}} = I_{\bar{x}}\mathcal{O}_{Y, \bar{y}}$, and $\mathcal{O}_{X, \bar{x}} \rightarrow \mathcal{O}_{Y, \bar{y}}$ is a flat local homomorphism inducing an isomorphism $\mathcal{O}_{X, \bar{x}}/I_{\bar{x}} = \mathcal{O}_{Y, \bar{y}}/I_{\bar{y}}$. At this point we can bootstrap using the diagram

of categories

$$\begin{array}{ccc}
 & \xleftarrow{(59.3.6.2)} & \\
 Q\text{Coh}(\mathcal{O}_X) & \xrightarrow{(59.3.6.1)} & Q\text{Coh}(Y \rightarrow X, Z) \\
 \downarrow & & \downarrow \\
 \text{Mod}_{\mathcal{O}_{X,\bar{x}}} & \xrightarrow{\text{Can}} & \text{Glue}(\mathcal{O}_{X,\bar{x}} \rightarrow \mathcal{O}_{Y,\bar{y}}, f_1, \dots, f_t) \\
 & \xleftarrow{H^0} &
 \end{array}$$

Namely, as in the first paragraph of the proof we identify

$$\text{Glue}(\mathcal{O}_{X,\bar{x}} \rightarrow \mathcal{O}_{Y,\bar{y}}, f_1, \dots, f_t) = Q\text{Coh}(\text{Spec}(\mathcal{O}_{Y,\bar{y}}) \rightarrow \text{Spec}(\mathcal{O}_{X,\bar{x}}), V(I_{\bar{x}}))$$

The right vertical functor is given by pullback, and it is clear that the inner square is commutative. Our computation of the stalk of the kernel in the third paragraph of the proof combined with Lemma 59.3.3 implies that the outer square (using the curved arrows) commutes. Thus we conclude using the case of a flat morphism of affine schemes which we handled in the first paragraph of the proof. \square

Lemma 59.3.10. *In Situation 59.3.6 the functor Rf_* induces an equivalence between $D_{Q\text{Coh},|f^{-1}Z|}(\mathcal{O}_Y)$ and $D_{Q\text{Coh},|Z|}(\mathcal{O}_X)$ with quasi-inverse given by Lf^* .*

Proof. Since f is quasi-compact and quasi-separated we see that Rf_* defines a functor from $D_{Q\text{Coh},|f^{-1}Z|}(\mathcal{O}_Y)$ to $D_{Q\text{Coh},|Z|}(\mathcal{O}_X)$, see Derived Categories of Spaces, Lemma 57.6.1. By Derived Categories of Spaces, Lemma 57.5.4 we see that Lf^* maps $D_{Q\text{Coh},|Z|}(\mathcal{O}_X)$ into $D_{Q\text{Coh},|f^{-1}Z|}(\mathcal{O}_Y)$. In Lemma 59.3.5 we have seen that $Lf^*Rf_*Q = Q$ for Q in $D_{Q\text{Coh},|f^{-1}Z|}(\mathcal{O}_Y)$. By the dual of Derived Categories, Lemma 13.7.2 to finish the proof it suffices to show that $Lf^*K = 0$ implies $K = 0$ for K in $D_{Q\text{Coh},|Z|}(\mathcal{O}_X)$. This follows from the fact that f is flat at all points of $f^{-1}Z$ and the fact that $f^{-1}Z \rightarrow Z$ is surjective. \square

Lemma 59.3.11. *In Situation 59.3.6 there exists an fpqc covering $\{X_i \rightarrow X\}_{i \in I}$ refining the family $\{U \rightarrow X, Y \rightarrow X\}$.*

Proof. For the definition and general properties of fpqc coverings we refer to Topologies, Section 33.8. In particular, we can first choose an étale covering $\{X_i \rightarrow X\}$ with X_i affine and by base changing Y, Z , and U to each X_i we reduce to the case where X is affine. In this case U is quasi-compact and hence a finite union $U = U_1 \cup \dots \cup U_n$ of affine opens. Then Z is quasi-compact hence also $f^{-1}Z$ is quasi-compact. Thus we can choose an affine scheme W and an étale morphism $h : W \rightarrow Y$ such that $h^{-1}f^{-1}Z \rightarrow f^{-1}Z$ is surjective. Say $W = \text{Spec}(B)$ and $h^{-1}f^{-1}Z = V(J)$ where $J \subset B$ is an ideal of finite type. By Pro-étale Cohomology, Lemma 46.5.1 there exists a localization $B \rightarrow B'$ such that points of $\text{Spec}(B')$ correspond exactly to points of $W = \text{Spec}(B)$ specializing to $h^{-1}f^{-1}Z = V(J)$. It follows that the composition $\text{Spec}(B') \rightarrow \text{Spec}(B) = W \rightarrow Y \rightarrow X$ is flat as by assumption $f : Y \rightarrow X$ is flat at all the points of $f^{-1}Z$. Then $\{\text{Spec}(B') \rightarrow X, U_1 \rightarrow X, \dots, U_n \rightarrow X\}$ is an fpqc covering by Topologies, Lemma 33.8.2. \square

59.4. Formal glueing of algebraic spaces

In Situation 59.3.6 we consider the category $\text{Spaces}(X \rightarrow Y, Z)$ of commutative diagrams of algebraic spaces over S of the form

$$\begin{array}{ccccc} U' & \longleftarrow & V' & \longrightarrow & Y' \\ \downarrow & & \downarrow & & \downarrow \\ U & \longleftarrow & V & \longrightarrow & Y \end{array}$$

where both squares are cartesian. There is a canonical functor

$$(59.4.0.1) \quad \text{Spaces}/X \longrightarrow \text{Spaces}(Y \rightarrow X, Z)$$

which maps $X' \rightarrow X$ to the morphisms $U \times_X X' \leftarrow V \times_X X' \rightarrow Y \times_X X'$.

Lemma 59.4.1. *In Situation 59.3.6 the functor (59.4.0.1) restricts to an equivalence*

- (1) *from the category of algebraic spaces affine over X to the full subcategory of $\text{Spaces}(Y \rightarrow X, Z)$ consisting of $(U' \leftarrow V' \rightarrow Y')$ with $U' \rightarrow U$, $V' \rightarrow V$, and $Y' \rightarrow Y$ affine,*
- (2) *from the category of closed immersions $X' \rightarrow X$ to the full subcategory of $\text{Spaces}(Y \rightarrow X, Z)$ consisting of $(U' \leftarrow V' \rightarrow Y')$ with $U' \rightarrow U$, $V' \rightarrow V$, and $Y' \rightarrow Y$ closed immersions, and*
- (3) *same statement as in (2) for finite morphisms.*

Proof. The category of algebraic spaces affine over X is equivalent to the category of quasi-coherent sheaves \mathcal{A} of \mathcal{O}_X -algebras. The full subcategory of $\text{Spaces}(Y \rightarrow X, Z)$ consisting of $(U' \leftarrow V' \rightarrow Y')$ with $U' \rightarrow U$, $V' \rightarrow V$, and $Y' \rightarrow Y$ affine is equivalent to the category of algebra objects of $QCoh(Y \rightarrow X, Z)$. In both cases this follows from Morphisms of Spaces, Lemma 49.20.7 with quasi-inverse given by the relative spectrum construction (Morphisms of Spaces, Definition 49.20.8) which commutes with arbitrary base change. Thus part (1) of the lemma follows from Proposition 59.3.9.

Fully faithfulness in part (2) follows from part (1). For essential surjectivity, we reduce by part (1) to proving that $X' \rightarrow X$ is a closed immersion if and only if both $U \times_X X' \rightarrow U$ and $Y \times_X X' \rightarrow Y$ are closed immersions. By Lemma 59.3.11 $\{U \rightarrow X, Y \rightarrow X\}$ can be refined by an fpqc covering. Hence the result follows from Descent on Spaces, Lemma 56.10.15.

For (3) use the argument proving (2) and Descent on Spaces, Lemma 56.10.21. \square

Lemma 59.4.2. *In Situation 59.3.6 the functor (59.4.0.1) reflects isomorphisms.*

Proof. By a formal argument with base change, this reduces to the following question: A morphism $a : X' \rightarrow X$ of algebraic spaces such that $U \times_X X' \rightarrow U$ and $Y \times_X X' \rightarrow Y$ are isomorphisms, is an isomorphism. The family $\{U \rightarrow X, Y \rightarrow X\}$ can be refined by an fpqc covering by Lemma 59.3.11. Hence the result follows from Descent on Spaces, Lemma 56.10.13. \square

Lemma 59.4.3. *In Situation 59.3.6 the functor (59.4.0.1) is fully faithful on algebraic spaces separated over X . More precisely, it induces a bijection*

$$\text{Mor}_X(X'_1, X'_2) \longrightarrow \text{Mor}_{\text{Spaces}(Y \rightarrow X, Z)}(F(X'_1), F(X'_2))$$

whenever $X'_2 \rightarrow X$ is separated.

Proof. Since $X'_2 \rightarrow X$ is separated, the graph $i : X'_1 \rightarrow X'_1 \times_X X'_2$ of a morphism $X'_1 \rightarrow X'_2$ over X is a closed immersion, see Morphisms of Spaces, Lemma 49.4.6. Moreover a closed immersion $i : T \rightarrow X'_1 \times_X X'_2$ is the graph of a morphism if and only if $\text{pr}_1 \circ i$ is an isomorphism. The same is true for

- (1) the graph of a morphism $U \times_X X'_1 \rightarrow U \times_X X'_2$ over U ,
- (2) the graph of a morphism $V \times_X X'_1 \rightarrow V \times_X X'_2$ over V , and
- (3) the graph of a morphism $Y \times_X X'_1 \rightarrow Y \times_X X'_2$ over Y .

Moreover, if morphisms as in (1), (2), (3) fit together to form a morphism in the category $\text{Spaces}(Y \rightarrow X, Z)$, then these graphs fit together to give an object of $\text{Spaces}(Y \times_X (X'_1 \times_X X'_2) \rightarrow X'_1 \times_X X'_2, Z \times_X (X'_1 \times_X X'_2))$ whose triple of morphisms are closed immersions. The proof is finished by applying Lemmas 59.4.1 and 59.4.2. \square

59.5. Coequalizers and glueing

Let X be a Noetherian algebraic space and $Z \rightarrow X$ a closed subscheme. Let $X' \rightarrow X$ be the blowing up in Z . In this section we show that X can be recovered from X' , Z_n and glueing data where Z_n is the n th infinitesimal neighbourhood of Z in X .

Lemma 59.5.1. *Let S be a scheme. Let*

be a commutative diagram of algebraic spaces over S . Assume B Noetherian, g proper and surjective, and $X \rightarrow B$ separated of finite type. Let $R = Y \times_X Y$ with projection morphisms $t, s : R \rightarrow Y$. There exists a coequalizer X' of $s, t : R \rightarrow Y$ in the category of algebraic spaces separated over B . The morphism $X' \rightarrow X$ is a finite universal homeomorphism.

Proof. Denote $h : R \rightarrow X$ the given morphism. The sheaves

$$g_*\mathcal{O}_Y \quad \text{and} \quad h_*\mathcal{O}_R$$

are coherent \mathcal{O}_X -algebras (Cohomology of Spaces, Lemma 51.19.2). The X -morphisms s, t induce \mathcal{O}_X -algebra maps $s^\#, t^\#$ from the first to the second. Set

$$\mathcal{A} = \text{Equalizer}(s^\#, t^\# : g_*\mathcal{O}_Y \rightarrow h_*\mathcal{O}_R)$$

Then \mathcal{A} is a coherent \mathcal{O}_X -algebra and we can define

$$X' = \underline{\text{Spec}}_X(\mathcal{A})$$

as in Morphisms of Spaces, Definition 49.20.8. By Morphisms of Spaces, Remark 49.20.9 and functoriality of the $\underline{\text{Spec}}$ construction there is a factorization

$$Y \rightarrow X' \rightarrow X$$

and the morphism $g' : Y \rightarrow X'$ equalizes s and t . Since \mathcal{A} is a coherent \mathcal{O}_X -module it is clear that $X' \rightarrow X$ is a finite morphism of algebraic spaces. Since the surjective morphism $g : Y \rightarrow X$ factors through X' we see that $X' \rightarrow X$ is surjective.

To check that $X' \rightarrow X$ is a universal homeomorphism, it suffices to check that it is universally injective (as we've already seen that it is universally surjective and universally closed). To check this it suffices to check that $|X' \times_X U| \rightarrow |U|$ is

injective, for all $U \rightarrow X$ étale, see More on Morphisms of Spaces, Lemma 58.3.6. It suffices to check this in all cases where U is an affine scheme (minor detail omitted). Since the construction of X' commutes with étale localization, we may replace U by X . Hence it suffices to check that $|X'| \rightarrow |X|$ is injective when X is moreover an affine scheme. First observe that $|Y| \rightarrow |X'|$ is surjective, because $g' : Y \rightarrow X'$ is proper by Morphisms of Spaces, Lemma 49.37.6 (hence the image is closed) and $\mathcal{O}_{X'} \subset g'_* \mathcal{O}_Y$ by construction. Thus if $x_1, x_2 \in |X'|$ map to the same point in $|X|$, then we can lift x_1, x_2 to points $y_1, y_2 \in |Y|$ mapping to the same point of $|X|$. Then we can find an $r \in |R|$ with $s(r) = y_1$ and $t(r) = y_2$, see Properties of Spaces, Lemma 48.4.3). Since g' coequalizes s and t we conclude that $x_1 = x_2$ as desired.

To prove that X' is the coequalizer, let $W \rightarrow B$ be a separated morphism of algebraic spaces over S and let $a : Y \rightarrow W$ be a morphism over B which equalizes s and t . We will show that a factors in a unique manner through the morphism $g' : Y \rightarrow X'$. We will first reduce this to the case where $W \rightarrow B$ is separated of finite type by a limit argument (we recommend the reader skip this argument). Since Y is quasi-compact we can find a quasi-compact open subspace $W' \subset W$ such that a factors through W' . After replacing W by W' we may assume W is quasi-compact. By Limits of Spaces, Lemma 52.10.1 we can write $W = \lim_{i \in I} W_i$ as a cofiltered limit with affine transition morphisms with W_i of finite type over B . After shrinking I we may assume $W_i \rightarrow B$ is separated as well, see Limits of Spaces, Lemma 52.6.8. Since $W = \lim W_i$ we have $a = \lim a_i$ for some morphisms $a_i : Y \rightarrow W_i$. If we can prove a_i factors through g' for all i , then the same thing is true for a . This proves the reduction to the case of a finite type W .

Assume we have $a : Y \rightarrow W$ equalizing s and t with $W \rightarrow B$ separated and of finite type. Consider

$$\Gamma \subset X \times_B W$$

the scheme theoretic image of $(g, a) : Y \rightarrow X \times_B W$. Since g is proper we conclude $Y \rightarrow \Gamma$ is surjective and the projection $p : \Gamma \rightarrow X$ is proper, see Morphisms of Spaces, Lemma 49.37.8. Since both g and a equalize s and t , the morphism $Y \rightarrow \Gamma$ also equalizes s and t .

We claim that $p : \Gamma \rightarrow X$ is a universal homeomorphism. As in the proof of the corresponding fact for $X' \rightarrow X$, it suffices to show that p is universally injective. By More on Morphisms of Spaces, Lemma 58.3.6 it suffices to check $|\Gamma \times_X U| \rightarrow |U|$ is injective for every $U \rightarrow X$ étale. It suffices to check this for U affine (minor details omitted). Taking scheme theoretic image commutes with étale localization (Morphisms of Spaces, Lemma 49.16.3). Hence we may replace X by V and we conclude it suffices to show that $|\Gamma| \rightarrow |X|$ is injective. If $\gamma_1, \gamma_2 \in |\Gamma|$ map to the same point in $|X|$, then we can lift γ_1, γ_2 to points $y_1, y_2 \in |Y|$ mapping to the same point of $|X|$ (by surjectivity of $Y \rightarrow \Gamma$ we've seen above). Then we can find an $r \in |R|$ with $s(r) = y_1$ and $t(r) = y_2$, see Properties of Spaces, Lemma 48.4.3). Since $Y \rightarrow \Gamma$ coequalizes s and t we conclude that $\gamma_1 = \gamma_2$ as desired.

As a proper universal homeomorphism the morphism p is finite (see for example More on Morphisms of Spaces, Lemma 58.24.5). We conclude that

$$\Gamma = \underline{\text{Spec}}(p_* \mathcal{O}_\Gamma).$$

Since $Y \rightarrow \Gamma$ equalizes s and t the map $p_* \mathcal{O}_\Gamma \rightarrow g_* \mathcal{O}_Y$ factors through \mathcal{A} and we obtain a morphism $X' \rightarrow \Gamma$ by functoriality of the Spec construction. We can

compose this morphism with the projection $q : \Gamma \rightarrow W$ to get the desired morphism $X' \rightarrow W$. We omit the proof of uniqueness of the factorization. \square

We will work in the following situation.

Situation 59.5.2. Let S be a scheme. Let $X \rightarrow B$ be a separated finite type morphism of algebraic spaces over S with B Noetherian. Let $Z \rightarrow X$ be a closed immersion and let $U \subset X$ be the complementary open subspace. Finally, let $f : X' \rightarrow X$ be a proper morphism of algebraic spaces such that $f^{-1}(U) \rightarrow U$ is an isomorphism.

Lemma 59.5.3. *In Situation 59.5.2 let $Y = X' \amalg Z$ and $R = Y \times_X Y$ with projections $t, s : R \rightarrow Y$. There exists a coequalizer X_1 of $s, t : R \rightarrow Y$ in the category of algebraic spaces separated over B . The morphism $X_1 \rightarrow X$ is a finite universal homeomorphism, an isomorphism over U and $Z \rightarrow X$ lifts to X_1 .*

Proof. Existence of X_1 and the fact that $X_1 \rightarrow X$ is a finite universal homeomorphism is a special case of Lemma 59.5.1. The formation of X_1 commutes with étale localization on X (see proof of Lemma 59.5.1). Thus the morphisms $X_n \rightarrow X$ are isomorphisms over U . It is immediate from the construction that $Z \rightarrow X$ lifts to X_1 . \square

In Situation 59.5.2 for $n \geq 1$ let $Z_n \subset X$ be the n th order infinitesimal neighbourhood of Z in X , i.e., the closed subscheme defined by the n th power of the sheaf of ideals cutting out Z . Consider $Y_n = X' \amalg Z_n$ and $R_n = Y_n \times_X Y_n$ and the coequalizer

$$R_n \rightrightarrows Y_n \longrightarrow X_n \longrightarrow X$$

as in Lemma 59.5.3. The maps $Y_n \rightarrow Y_{n+1}$ and $R_n \rightarrow R_{n+1}$ induce morphisms

$$(59.5.3.1) \quad X_1 \rightarrow X_2 \rightarrow X_3 \rightarrow \dots \rightarrow X$$

Each of these morphisms is a universal homeomorphism as the morphisms $X_n \rightarrow X$ are universal homeomorphisms.

Lemma 59.5.4. *In (59.5.3.1) for all n large enough, there exists an m such that $X_n \rightarrow X_{n+m}$ factors through a closed immersion $X \rightarrow X_{n+m}$.*

Proof. Let's look a bit more closely at the construction of X_n and how it changes as we increase n . We have $X_n = \text{Spec}(\mathcal{A}_n)$ where \mathcal{A}_n is the equalizer of s_n^\sharp and t_n^\sharp going from $g_{n,*}\mathcal{O}_{Y_n}$ to $h_{n,*}\mathcal{O}_{R_n}$. Here $g_n : Y_n = X' \amalg Z_n \rightarrow X$ and $h_n : R_n = Y_n \times_X Y_n \rightarrow X$ are the given morphisms. Let $\mathcal{I} \subset \mathcal{O}_X$ be the coherent sheaf of ideals corresponding to Z . Then

$$g_{n,*}\mathcal{O}_{Y_n} = f_*\mathcal{O}_{X'} \times \mathcal{O}_X/\mathcal{I}^n$$

Similarly, we have a decomposition

$$R_n = X' \times_X X' \amalg X'' \times_X Z_n \amalg Z_n \times_X Z_n$$

Denote $f_n : X' \times_X Z_n \rightarrow X$ the restriction of f and denote

$$\mathcal{A} = \text{Equalizer}(f_*\mathcal{O}_{X'} \rightrightarrows (f \times f)_*\mathcal{O}_{X' \times_X X'})$$

Then we see that

$$\mathcal{A}_n = \text{Equalizer}(\mathcal{A} \times \mathcal{O}_X/\mathcal{I}^n \rightrightarrows f_{n,*}\mathcal{O}_{X' \times_X Z_n})$$

We have canonical maps

$$\mathcal{O}_X \rightarrow \dots \rightarrow \mathcal{A}_3 \rightarrow \mathcal{A}_2 \rightarrow \mathcal{A}_1$$

of coherent \mathcal{O}_X -algebras. The statement of the lemma means that for n large enough there exists an $m \geq 0$ such that the image of $\mathcal{A}_{n+m} \rightarrow \mathcal{A}_n$ is isomorphic to \mathcal{O}_X .

Since $X_n \rightarrow X$ is an isomorphism over U we see that the kernel of $\mathcal{O}_X \rightarrow \mathcal{A}_n$ is supported on $|Z|$. Since X is Noetherian, the sequence of kernels $\mathcal{J}_n = \text{Ker}(\mathcal{O}_X \rightarrow \mathcal{A}_n)$ stabilizes (Cohomology of Spaces, Lemma 51.12.1). Say $\mathcal{J}_{n_0} = \mathcal{J}_{n_0+1} = \dots = \mathcal{J}$. By Cohomology of Spaces, Lemma 51.12.2 we find that $\mathcal{I}^t \mathcal{J} = 0$ for some $t \geq 0$. On the other hand, there is an \mathcal{O}_X -algebra map $\mathcal{A}_n \rightarrow \mathcal{O}_X/\mathcal{I}^n$ and hence $\mathcal{J} \subset \mathcal{I}^n$ for all n . By Artin-Rees (Cohomology of Spaces, Lemma 51.12.3) we find that $\mathcal{J} \cap \mathcal{I}^n \subset \mathcal{I}^{n-c} \mathcal{J}$ for some $c \geq 0$ and all $n \gg 0$. We conclude that $\mathcal{J} = 0$.

Pick $n \geq n_0$ as in the previous paragraph. Then $\mathcal{O}_X \rightarrow \mathcal{A}_n$ is injective. Hence it now suffices to find $m \geq 0$ such that the image of $\mathcal{A}_{n+m} \rightarrow \mathcal{A}_n$ is equal to the image of \mathcal{O}_X . Observe that \mathcal{A}_n sits in a short exact sequence

$$0 \rightarrow \text{Ker}(\mathcal{A} \rightarrow f_{n,*} \mathcal{O}_{X' \times_X Z_n}) \rightarrow \mathcal{A}_n \rightarrow \mathcal{O}_X/\mathcal{I}^n \rightarrow 0$$

and similarly for \mathcal{A}_{n+m} . Hence it suffices to show

$$\text{Ker}(\mathcal{A} \rightarrow f_{n+m,*} \mathcal{O}_{X' \times_X Z_{n+m}}) \subset \text{Im}(\mathcal{I}^n \rightarrow \mathcal{A})$$

for some $m \geq 0$. To do this we may work étale locally on X and since X is Noetherian we may assume that X is a Noetherian affine scheme. Say $X = \text{Spec}(R)$ and \mathcal{I} corresponds to the ideal $I \subset R$. Let $\mathcal{A} = \tilde{A}$ for a finite R -algebra A . Let $f_* \mathcal{O}_{X'} = \tilde{B}$ for a finite R -algebra B . Then $R \rightarrow A \subset B$ and these maps become isomorphisms on inverting any element of I .

Note that $f_{n,*} \mathcal{O}_{X' \times_X Z_n}$ is equal to $f_*(\mathcal{O}_{X'}/I^n \mathcal{O}_{X'})$ in the notation used in Cohomology of Spaces, Section 51.20. By Cohomology of Spaces, Lemma 51.20.4 we see that there exists a $c \geq 0$ such that

$$\text{Ker}(B \rightarrow \Gamma(X, f_*(\mathcal{O}_{X'}/I^{n+m+c} \mathcal{O}_{X'})))$$

is contained in $I^{n+m} B$. On the other hand, as $R \rightarrow B$ is finite and an isomorphism after inverting any element of I we see that $I^{n+m} B \subset \text{Im}(I^n \rightarrow B)$ for m large enough (can be chosen independent of n). This finishes the proof as $A \subset B$. \square

Remark 59.5.5. The meaning of Lemma 59.5.4 is the the system $X_1 \rightarrow X_2 \rightarrow X_3 \rightarrow \dots$ is essentially constant with value X . See Categories, Definition 4.22.1.

Groupoids in Algebraic Spaces

60.1. Introduction

This chapter is devoted to generalities concerning groupoids in algebraic spaces. We recommend reading the beautiful paper [KM97] by Keel and Mori.

A lot of what we say here is a repeat of what we said in the chapter on groupoid schemes, see Groupoids, Section 38.1. The discussion of quotient stacks is new here.

60.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

We continue our convention to label projection maps starting with index 0, so we have $\text{pr}_0 : X \times_S Y \rightarrow X$ and $\text{pr}_1 : X \times_S Y \rightarrow Y$.

60.3. Notation

Let S be a scheme; this will be our base scheme and all algebraic spaces will be over S . Let B be an algebraic space over S ; this will be our base algebraic space, and often other algebraic spaces, and schemes will be over B . If we say that X is an algebraic space over B , then we mean that X is an algebraic space over S which comes equipped with structure morphism $X \rightarrow B$. Moreover, we try to reserve the letter T to denote a “test” scheme over B . In other words T is a scheme which comes equipped with a structure morphism $T \rightarrow B$. In this situation we denote $X(T)$ for the set of T -valued points of X over B . In a formula:

$$X(T) = \text{Mor}_B(T, X).$$

Similarly, given a second algebraic space Y over B we set

$$X(Y) = \text{Mor}_B(Y, X).$$

Suppose we are given algebraic spaces X, Y over B as above and a morphism $f : X \rightarrow Y$ over B . For any scheme T over B we get an induced map of sets

$$f : X(T) \longrightarrow Y(T)$$

which is functorial in the scheme T over B . As f is a map of sheaves on $(Sch/S)_{fppf}$ over the sheaf B it is clear that f determines and is determined by this rule. More generally, we use the same notation for maps between fibre products. For example, if X, Y, Z are algebraic spaces over B , and if $m : X \times_B Y \rightarrow Z \times_B Z$ is a morphism

of algebraic spaces over B , then we think of m as corresponding to a collection of maps between T -valued points

$$X(T) \times Y(T) \longrightarrow Z(T) \times Z(T).$$

And so on and so forth.

Finally, given two maps $f, g : X \rightarrow Y$ of algebraic spaces over B , if the induced maps $f, g : X(T) \rightarrow Y(T)$ are equal for every scheme T over B , then $f = g$, and hence also $f, g : X(Z) \rightarrow Y(Z)$ are equal for every third algebraic space Z over B . Hence, for example, to check the axioms for an group algebraic space G over B , it suffices to check commutativity of diagram on T -valued points where T is a scheme over B as we do in Definition 60.5.1 below.

60.4. Equivalence relations

Please refer to Groupoids, Section 38.3 for notation.

Definition 60.4.1. Let $B \rightarrow S$ as in Section 60.3. Let U be an algebraic space over B .

- (1) A *pre-relation* on U over B is any morphism $j : R \rightarrow U \times_B U$ of algebraic spaces over B . In this case we set $t = \text{pr}_0 \circ j$ and $s = \text{pr}_1 \circ j$, so that $j = (t, s)$.
- (2) A *relation* on U over B is a monomorphism $j : R \rightarrow U \times_B U$ of algebraic spaces over B .
- (3) A *pre-equivalence relation* is a pre-relation $j : R \rightarrow U \times_B U$ such that the image of $j : R(T) \rightarrow U(T) \times U(T)$ is an equivalence relation for all schemes T over B .
- (4) We say a morphism $R \rightarrow U \times_B U$ of algebraic spaces over B is an *equivalence relation on U over B* if and only if for every T over B the T -valued points of R define an equivalence relation on the set of T -valued points of U .

In other words, an equivalence relation is a pre-equivalence relation such that j is a relation.

Lemma 60.4.2. Let $B \rightarrow S$ as in Section 60.3. Let U be an algebraic space over B . Let $j : R \rightarrow U \times_B U$ be a pre-relation. Let $g : U' \rightarrow U$ be a morphism of algebraic spaces over B . Finally, set

$$R' = (U' \times_B U') \times_{U \times_B U} R \xrightarrow{j'} U' \times_B U'$$

Then j' is a pre-relation on U' over B . If j is a relation, then j' is a relation. If j is a pre-equivalence relation, then j' is a pre-equivalence relation. If j is an equivalence relation, then j' is an equivalence relation.

Proof. Omitted. □

Definition 60.4.3. Let $B \rightarrow S$ as in Section 60.3. Let U be an algebraic space over B . Let $j : R \rightarrow U \times_B U$ be a pre-relation. Let $g : U' \rightarrow U$ be a morphism of algebraic spaces over B . The pre-relation $j' : R' \rightarrow U' \times_B U'$ is called the *restriction*, or *pullback* of the pre-relation j to U' . In this situation we sometimes write $R' = R|_{U'}$.

Lemma 60.4.4. *Let $B \rightarrow S$ as in Section 60.3. Let $j : R \rightarrow U \times_B U$ be a pre-relation of algebraic spaces over B . Consider the relation on $|U|$ defined by the rule*

$$x \sim y \Leftrightarrow \exists r \in |R| : t(r) = x, s(r) = y.$$

If j is a pre-equivalence relation then this is an equivalence relation.

Proof. Suppose that $x \sim y$ and $y \sim z$. Pick $r \in |R|$ with $t(r) = x, s(r) = y$ and pick $r' \in |R|$ with $t(r') = y, s(r') = z$. We may pick a field K such that r and r' can be represented by morphisms $r, r' : \text{Spec}(K) \rightarrow R$ with $s \circ r = t \circ r'$. Denote $x = t \circ r, y = s \circ r = t \circ r',$ and $z = s \circ r',$ so $x, y, z : \text{Spec}(K) \rightarrow U$. By construction $(x, y) \in j(R(K))$ and $(y, z) \in j(R(K))$. Since j is a pre-equivalence relation we see that also $(x, z) \in j(R(K))$. This clearly implies that $x \sim z$.

The proof that \sim is reflexive and symmetric is omitted. □

60.5. Group algebraic spaces

Please refer to Groupoids, Section 38.4 for notation.

Definition 60.5.1. Let $B \rightarrow S$ as in Section 60.3.

- (1) A *group algebraic space over B* is a pair (G, m) , where G is an algebraic space over B and $m : G \times_B G \rightarrow G$ is a morphism of algebraic spaces over B with the following property: For every scheme T over B the pair $(G(T), m)$ is a group.
- (2) A *morphism $\psi : (G, m) \rightarrow (G', m')$ of group algebraic spaces over B* is a morphism $\psi : G \rightarrow G'$ of algebraic spaces over B such that for every T/B the induced map $\psi : G(T) \rightarrow G'(T)$ is a homomorphism of groups.

Let (G, m) be a group algebraic space over the algebraic space B . By the discussion in Groupoids, Section 38.4 we obtain morphisms of algebraic spaces over B (identity) $e : B \rightarrow G$ and (inverse) $i : B \rightarrow B$ such that for every T the quadruple $(G(T), m, e, i)$ satisfies the axioms of a group.

Let $(G, m), (G', m')$ be group algebraic spaces over B . Let $f : G \rightarrow G'$ be a morphism of algebraic spaces over B . It follows from the definition that f is a morphism of group algebraic spaces over B if and only if the following diagram is commutative:

$$\begin{array}{ccc} G \times_B G & \xrightarrow{f \times f} & G' \times_B G' \\ m \downarrow & & \downarrow m' \\ G & \xrightarrow{f} & G' \end{array}$$

Lemma 60.5.2. *Let $B \rightarrow S$ as in Section 60.3. Let (G, m) be a group algebraic space over B . Let $B' \rightarrow B$ be a morphism of algebraic spaces. The pullback $(G_{B'}, m_{B'})$ is a group algebraic space over B' .*

Proof. Omitted. □

60.6. Properties of group algebraic spaces

In this section we collect some simple properties of group algebraic spaces which hold over any base.

Lemma 60.6.1. *Let S be a scheme. Let B be an algebraic space over S . Let G be a group algebraic space over B . Then $G \rightarrow B$ is separated (resp. quasi-separated, resp. locally separated) if and only if the identity morphism $e : B \rightarrow G$ is a closed immersion (resp. quasi-compact, resp. an immersion).*

Proof. We recall that by Morphisms of Spaces, Lemma 49.4.7 we have that e is a closed immersion (resp. quasi-compact, resp. an immersion) if $G \rightarrow B$ is separated (resp. quasi-separated, resp. locally separated). For the converse, consider the diagram

$$\begin{array}{ccc} G & \xrightarrow{\Delta_{G/B}} & G \times_B G \\ \downarrow & & \downarrow (g, g') \mapsto m(i(g), g') \\ B & \xrightarrow{e} & G \end{array}$$

It is an exercise in the functorial point of view in algebraic geometry to show that this diagram is cartesian. In other words, we see that $\Delta_{G/B}$ is a base change of e . Hence if e is a closed immersion (resp. quasi-compact, resp. an immersion) so is $\Delta_{G/B}$, see Spaces, Lemma 47.12.3 (resp. Morphisms of Spaces, Lemma 49.8.3, resp. Spaces, Lemma 47.12.3). \square

60.7. Examples of group algebraic spaces

If $G \rightarrow S$ is a group scheme over the base scheme S , then the base change G_B to any algebraic space B over S is an group algebraic space over B by Lemma 60.5.2. We will frequently use this in the examples below.

Example 60.7.1 (Multiplicative group algebraic space). Let $B \rightarrow S$ as in Section 60.3. Consider the functor which associates to any scheme T over B the group $\Gamma(T, \mathcal{O}_T^*)$ of units in the global sections of the structure sheaf. This is representable by the group algebraic space

$$\mathbf{G}_{m,B} = B \times_S \mathbf{G}_{m,S}$$

over B . Here $\mathbf{G}_{m,S}$ is the multiplicative group scheme over S , see Groupoids, Example 38.5.1.

Example 60.7.2 (Roots of unity as a group algebraic space). Let $B \rightarrow S$ as in Section 60.3. Let $n \in \mathbf{N}$. Consider the functor which associates to any scheme T over B the subgroup of $\Gamma(T, \mathcal{O}_T^*)$ consisting of n th roots of unity. This is representable by the group algebraic space

$$\mu_{n,B} = B \times_S \mu_{n,S}$$

over B . Here $\mu_{n,S}$ is the group scheme of n th roots of unity over S , see Groupoids, Example 38.5.2.

Example 60.7.3 (Additive group algebraic space). Let $B \rightarrow S$ as in Section 60.3. Consider the functor which associates to any scheme T over B the group $\Gamma(T, \mathcal{O}_T)$ of global sections of the structure sheaf. This is representable by the group algebraic space

$$\mathbf{G}_{a,B} = B \times_S \mathbf{G}_{a,S}$$

over B . Here $\mathbf{G}_{a,S}$ is the additive group scheme over S , see Groupoids, Example 38.5.3.

Example 60.7.4 (General linear group algebraic space). Let $B \rightarrow S$ as in Section 60.3. Let $n \geq 1$. Consider the functor which associates to any scheme T over B the group

$$\mathrm{GL}_n(\Gamma(T, \mathcal{O}_T))$$

of invertible $n \times n$ matrices over the global sections of the structure sheaf. This is representable by the group algebraic space

$$\mathrm{GL}_{n,B} = B \times_S \mathrm{GL}_{n,S}$$

over B . Here $\mathbf{G}_{m,S}$ is the general linear group scheme over S , see Groupoids, Example 38.5.4.

Example 60.7.5. Let $B \rightarrow S$ as in Section 60.3. Let $n \geq 1$. The determinant defines a morphisms of group algebraic spaces

$$\det : \mathrm{GL}_{n,B} \longrightarrow \mathbf{G}_{m,B}$$

over B . It is the base change of the determinant morphism over S from Groupoids, Example 38.5.5.

Example 60.7.6 (Constant group algebraic space). Let $B \rightarrow S$ as in Section 60.3. Let G be an abstract group. Consider the functor which associates to any scheme T over B the group of locally constant maps $T \rightarrow G$ (where T has the Zariski topology and G the discrete topology). This is representable by the group algebraic space

$$G_B = B \times_S G_S$$

over B . Here G_S is the constant group scheme introduced in Groupoids, Example 38.5.6.

60.8. Actions of group algebraic spaces

Please refer to Groupoids, Section 38.8 for notation.

Definition 60.8.1. Let $B \rightarrow S$ as in Section 60.3. Let (G, m) be a group algebraic space over B . Let X be an algebraic space over B .

- (1) An *action of G on the algebraic space X/B* is a morphism $a : G \times_B X \rightarrow X$ over B such that for every scheme T over B the map $a : G(T) \times X(T) \rightarrow X(T)$ defines the structure of a $G(T)$ -set on $X(T)$.
- (2) Suppose that X, Y are algebraic spaces over B each endowed with an action of G . An *equivariant* or more precisely a *G -equivariant* morphism $\psi : X \rightarrow Y$ is a morphism of algebraic spaces over B such that for every T over B the map $\psi : X(T) \rightarrow Y(T)$ is a morphism of $G(T)$ -sets.

In situation (1) this means that the diagrams

$$(60.8.1.1) \quad \begin{array}{ccc} G \times_B G \times_B X & \xrightarrow{1_G \times a} & G \times_B X \\ m \times 1_X \downarrow & & \downarrow a \\ G \times_B X & \xrightarrow{a} & X \end{array} \quad \begin{array}{ccc} G \times_B X & \xrightarrow{a} & X \\ e \times 1_X \uparrow & \nearrow 1_X & \\ X & & \end{array}$$

are commutative. In situation (2) this just means that the diagram

$$\begin{array}{ccc} G \times_B X & \xrightarrow{\mathrm{id} \times f} & G \times_B Y \\ a \downarrow & & \downarrow a \\ X & \xrightarrow{f} & Y \end{array}$$

commutes.

Definition 60.8.2. Let $B \rightarrow S$, $G \rightarrow B$, and $X \rightarrow B$ as in Definition 60.8.1. Let $a : G \times_B X \rightarrow X$ be an action of G on X/B . We say the action is *free* if for every scheme T over B the action $a : G(T) \times X(T) \rightarrow X(T)$ is a free action of the group $G(T)$ on the set $X(T)$.

Lemma 60.8.3. *Situation as in Definition 60.8.2, The action a is free if and only if*

$$G \times_B X \rightarrow X \times_B X, \quad (g, x) \mapsto (a(g, x), x)$$

is a monomorphism of algebraic spaces.

Proof. Immediate from the definitions. \square

60.9. Principal homogeneous spaces

This section is the analogue of Groupoids, Section 38.9. We suggest reading that section first.

Definition 60.9.1. Let S be a scheme. Let B be an algebraic space over S . Let (G, m) be a group algebraic space over B . Let X be an algebraic space over B , and let $a : G \times_B X \rightarrow X$ be an action of G on X .

- (1) We say X is a *pseudo G -torsor* or that X is *formally principally homogeneous under G* if the induced morphism $G \times_B X \rightarrow X \times_B X$, $(g, x) \mapsto (a(g, x), x)$ is an isomorphism.
- (2) A pseudo G -torsor X is called *trivial* if there exists an G -equivariant isomorphism $G \rightarrow X$ over B where G acts on G by left multiplication.

It is clear that if $B' \rightarrow B$ is a morphism of algebraic spaces then the pullback $X_{B'}$ of a pseudo G -torsor over B is a pseudo $G_{B'}$ -torsor over B' .

Lemma 60.9.2. *In the situation of Definition 60.9.1.*

- (1) *The algebraic space X is a pseudo G -torsor if and only if for every scheme T over B the set $X(T)$ is either empty or the action of the group $G(T)$ on $X(T)$ is simply transitive.*
- (2) *A pseudo G -torsor X is trivial if and only if the morphism $X \rightarrow B$ has a section.*

Proof. Omitted. \square

Definition 60.9.3. Let S be a scheme. Let B be an algebraic space over S . Let (G, m) be a group algebraic space over B . Let X be a pseudo G -torsor over B .

- (1) We say X is a *principal homogeneous space*, or more precisely a *principal homogeneous G -space over B* if there exists a fpqc covering¹ $\{B_i \rightarrow B\}_{i \in I}$ such that each $X_{B_i} \rightarrow B_i$ has a section (i.e., is a trivial pseudo G_{B_i} -torsor).
- (2) Let $\tau \in \{\text{Zariski, étale, smooth, syntomic, fppf}\}$. We say X is a *G -torsor in the τ topology*, or a *τ G -torsor*, or simply a *τ torsor* if there exists a τ covering $\{B_i \rightarrow B\}_{i \in I}$ such that each $X_{B_i} \rightarrow B_i$ has a section.

¹The default type of torsor in Groupoids, Definition 38.9.3 is a pseudo torsor which is trivial on an fpqc covering. Since G , as an algebraic space, can be seen a sheaf of groups there already is a notion of a G -torsor which corresponds to fppf-torsor, see Lemma 60.9.4. Hence we use “principal homogeneous space” for a pseudo torsor which is fpqc locally trivial, and we try to avoid using the word torsor in this situation.

- (3) If X is a G -torsor, then we say that it is *quasi-isotrivial* if it is a torsor for the étale topology.
- (4) If X is a G -torsor, then we say that it is *locally trivial* if it is a torsor for the Zariski topology.

We sometimes say “let X be a G -principal homogeneous space over B ” to indicate that X is an algebraic space over B equipped with an action of G which turns it into a principal homogeneous space over B . Next we show that this agrees with the notation introduced earlier when both apply.

Lemma 60.9.4. *Let S be a scheme. Let (G, m) be a group algebraic space over S . Let X be an algebraic space over S , and let $a : G \times_S X \rightarrow X$ be an action of G on X . Then X is a G -torsor in the fppf-topology in the sense of Definition 60.9.3 if and only if X is a G -torsor on $(Sch/S)_{fppf}$ in the sense of Cohomology on Sites, Definition 21.5.1.*

Proof. Omitted. □

60.10. Equivariant quasi-coherent sheaves

Please compare with Groupoids, Section 38.10.

Definition 60.10.1. Let $B \rightarrow S$ as in Section 60.3. Let (G, m) be a group algebraic space over B , and let $a : G \times_B X \rightarrow X$ be an action of G on the algebraic space X over B . An G -equivariant quasi-coherent \mathcal{O}_X -module, or simply a *equivariant quasi-coherent \mathcal{O}_X -module*, is a pair (\mathcal{F}, α) , where \mathcal{F} is a quasi-coherent \mathcal{O}_X -module, and α is a $\mathcal{O}_{G \times_B X}$ -module map

$$\alpha : a^* \mathcal{F} \longrightarrow \text{pr}_1^* \mathcal{F}$$

where $\text{pr}_1 : G \times_B X \rightarrow X$ is the projection such that

- (1) the diagram

$$\begin{array}{ccc} (1_G \times a)^* \text{pr}_2^* \mathcal{F} & \xrightarrow{\text{pr}_{12}^* \alpha} & \text{pr}_2^* \mathcal{F} \\ (1_G \times a)^* \alpha \uparrow & & \uparrow (m \times 1_X)^* \alpha \\ (1_G \times a)^* a^* \mathcal{F} & \xlongequal{\quad} & (m \times 1_X)^* a^* \mathcal{F} \end{array}$$

is commutative in the category of $\mathcal{O}_{G \times_B G \times_B X}$ -modules, and

- (2) the pullback

$$(e \times 1_X)^* \alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

For explanation compare with the relevant diagrams of Equation (60.8.1.1).

Note that the commutativity of the first diagram guarantees that $(e \times 1_X)^* \alpha$ is an idempotent operator on \mathcal{F} , and hence condition (2) is just the condition that it is an isomorphism.

Lemma 60.10.2. *Let $B \rightarrow S$ as in Section 60.3. Let G be a group algebraic space over B . Let $f : X \rightarrow Y$ be a G -equivariant morphism between algebraic spaces over B endowed with G -actions. Then pullback f^* given by $(\mathcal{F}, \alpha) \mapsto (f^* \mathcal{F}, (1_G \times f)^* \alpha)$ defines a functor from the category of G -equivariant sheaves on X to the category of quasi-coherent G -equivariant sheaves on Y .*

Proof. Omitted. □

60.11. Groupoids in algebraic spaces

Please refer to Groupoids, Section 38.11 for notation.

Definition 60.11.1. Let $B \rightarrow S$ as in Section 60.3.

- (1) A *groupoid in algebraic spaces over B* is a quintuple (U, R, s, t, c) where U and R are algebraic spaces over B , and $s, t : R \rightarrow U$ and $c : R \times_{s, U, t} R \rightarrow R$ are morphisms of algebraic spaces over B with the following property: For any scheme T over B the quintuple

$$(U(T), R(T), s, t, c)$$

is a groupoid category.

- (2) A *morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoids in algebraic spaces over B* is given by morphisms of algebraic spaces $f : U \rightarrow U'$ and $f : R \rightarrow R'$ over B with the following property: For any scheme T over B the maps f define a functor from the groupoid category $(U(T), R(T), s, t, c)$ to the groupoid category $(U'(T), R'(T), s', t', c')$.

Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Note that there are unique morphisms of algebraic spaces $e : U \rightarrow R$ and $i : R \rightarrow R$ over B such that for every scheme T over B the induced map $e : U(T) \rightarrow R(T)$ is the identity, and $i : R(T) \rightarrow R(T)$ is the inverse of the groupoid category. The septuple (U, R, s, t, c, e, i) satisfies commutative diagrams corresponding to each of the axioms (1), (2)(a), (2)(b), (3)(a) and (3)(b) of Groupoids, Section 38.11. Conversely given a septuple with this property the quintuple (U, R, s, t, c) is a groupoid in algebraic spaces over B . Note that i is an isomorphism, and e is a section of both s and t . Moreover, given a groupoid in algebraic spaces over B we denote

$$j = (t, s) : R \longrightarrow U \times_B U$$

which is compatible with our conventions in Section 60.4 above. We sometimes say “let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B ” to stress the existence of identity and inverse.

Lemma 60.11.2. *Let $B \rightarrow S$ as in Section 60.3. Given a groupoid in algebraic spaces (U, R, s, t, c) over B the morphism $j : R \rightarrow U \times_B U$ is a pre-equivalence relation.*

Proof. Omitted. This is a nice exercise in the definitions. □

Lemma 60.11.3. *Let $B \rightarrow S$ as in Section 60.3. Given an equivalence relation $j : R \rightarrow U$ over B there is a unique way to extend it to a groupoid in algebraic spaces (U, R, s, t, c) over B .*

Proof. Omitted. This is a nice exercise in the definitions. □

Lemma 60.11.4. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . In the commutative diagram*

$$\begin{array}{ccccc}
 & & U & & \\
 & \nearrow t & & \nwarrow t & \\
 R & \xleftarrow{pr_0} & R \times_{s,U,t} R & \xrightarrow{c} & R \\
 \downarrow s & & \downarrow pr_1 & & \downarrow s \\
 U & \xleftarrow{t} & R & \xrightarrow{s} & U
 \end{array}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. \square

Lemma 60.11.5. *Let $B \rightarrow S$ be as in Section 60.3. Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B . The diagram*

(60.11.5.1)

$$\begin{array}{ccccc}
 R \times_{t,U,t} R & \xrightarrow{pr_1} & R & \xrightarrow{t} & U \\
 \downarrow pr_0 \times co(i,1) & & \downarrow id_R & & \downarrow id_U \\
 R \times_{s,U,t} R & \xrightarrow{c} & R & \xrightarrow{t} & U \\
 \downarrow pr_1 & & \downarrow s & & \\
 R & \xrightarrow{s} & U & & \\
 & & \xrightarrow{t} & &
 \end{array}$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

Proof. The commutativity of the diagram follows from the axioms of a groupoid. Note that, in terms of groupoids, the top left vertical arrow assigns to a pair of morphisms (α, β) with the same target, the pair of morphisms $(\alpha, \alpha^{-1} \circ \beta)$. In any groupoid this defines a bijection between $\text{Arrows}_{\times_{t,Ob,t}} \text{Arrows}$ and $\text{Arrows}_{\times_{s,Ob,t}} \text{Arrows}$. Hence the second assertion of the lemma. The last assertion follows from Lemma 60.11.4. \square

60.12. Quasi-coherent sheaves on groupoids

Please compare with Groupoids, Section 38.12.

Definition 60.12.1. Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . A *quasi-coherent module on (U, R, s, t, c)* is a pair (\mathcal{F}, α) , where \mathcal{F} is a quasi-coherent \mathcal{O}_U -module, and α is a \mathcal{O}_R -module map

$$\alpha : t^* \mathcal{F} \longrightarrow s^* \mathcal{F}$$

such that

(1) the diagram

$$\begin{array}{ccc}
 & \text{pr}_1^* t^* \mathcal{F} & \xrightarrow{\text{pr}_1^* \alpha} & \text{pr}_1^* s^* \mathcal{F} \\
 & \parallel & & \parallel \\
 \text{pr}_0^* s^* \mathcal{F} & & & c^* s^* \mathcal{F} \\
 & \swarrow \text{pr}_0^* \alpha & & \swarrow c^* \alpha \\
 & \text{pr}_0^* t^* \mathcal{F} & \xlongequal{\quad} & c^* t^* \mathcal{F}
 \end{array}$$

is a commutative in the category of $\mathcal{O}_{R \times_{s,U,t} R}$ -modules, and

(2) the pullback

$$e^* \alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

Compare with the commutative diagrams of Lemma 60.11.4.

The commutativity of the first diagram forces the operator $e^* \alpha$ to be idempotent. Hence the second condition can be reformulated as saying that $e^* \alpha$ is an isomorphism. In fact, the condition implies that α is an isomorphism.

Lemma 60.12.2. *Let S be a scheme, let (U, R, s, t, c) be a groupoid scheme over S . If (\mathcal{F}, α) is a quasi-coherent module on (U, R, s, t, c) then α is an isomorphism.*

Proof. Pull back the commutative diagram of Definition 60.12.1 by the morphism $(i, 1) : R \rightarrow R \times_{s,U,t} R$. Then we see that $i^* \alpha \circ \alpha = s^* e^* \alpha$. Pulling back by the morphism $(1, i)$ we obtain the relation $\alpha \circ i^* \alpha = t^* e^* \alpha$. By the second assumption these morphisms are the identity. Hence $i^* \alpha$ is an inverse of α . \square

Lemma 60.12.3. *Let $B \rightarrow S$ as in Section 60.3. Consider a morphism $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ of groupoid in algebraic spaces over B . Then pull-back f^* given by*

$$(\mathcal{F}, \alpha) \mapsto (f^* \mathcal{F}, f^* \alpha)$$

defines a functor from the category of quasi-coherent sheaves on (U', R', s', t', c') to the category of quasi-coherent sheaves on (U, R, s, t, c) .

Proof. Omitted. \square

Lemma 60.12.4. *Let $B \rightarrow S$ be as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . The category of quasi-coherent modules on (U, R, s, t, c) has colimits.*

Proof. Let $i \mapsto (\mathcal{F}_i, \alpha_i)$ be a diagram over the index category \mathcal{I} . We can form the colimit $\mathcal{F} = \text{colim } \mathcal{F}_i$ which is a quasi-coherent sheaf on U , see Properties of Spaces, Lemma 48.27.7. Since colimits commute with pullback we see that $s^* \mathcal{F} = \text{colim } s^* \mathcal{F}_i$ and similarly $t^* \mathcal{F} = \text{colim } t^* \mathcal{F}_i$. Hence we can set $\alpha = \text{colim } \alpha_i$. We omit the proof that (\mathcal{F}, α) is the colimit of the diagram in the category of quasi-coherent modules on (U, R, s, t, c) . \square

Lemma 60.12.5. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . If s, t are flat, then the category of quasi-coherent modules on (U, R, s, t, c) is abelian.*

Proof. Let $\varphi : (\mathcal{F}, \alpha) \rightarrow (\mathcal{G}, \beta)$ be a homomorphism of quasi-coherent modules on (U, R, s, t, c) . Since s is flat we see that

$$0 \rightarrow s^* \text{Ker}(\varphi) \rightarrow s^* \mathcal{F} \rightarrow s^* \mathcal{G} \rightarrow s^* \text{Coker}(\varphi) \rightarrow 0$$

is exact and similarly for pullback by t . Hence α and β induce isomorphisms $\kappa : t^* \text{Ker}(\varphi) \rightarrow s^* \text{Ker}(\varphi)$ and $\lambda : t^* \text{Coker}(\varphi) \rightarrow s^* \text{Coker}(\varphi)$ which satisfy the cocycle condition. Then it is straightforward to verify that $(\text{Ker}(\varphi), \kappa)$ and $(\text{Coker}(\varphi), \lambda)$ are a kernel and cokernel in the category of quasi-coherent modules on (U, R, s, t, c) . Moreover, the condition $\text{Coim}(\varphi) = \text{Im}(\varphi)$ follows because it holds over U . \square

60.13. Crystals in quasi-coherent sheaves

Let (I, Φ, j) be a pair consisting of a set I and a pre-relation $j : \Phi \rightarrow I \times I$. Assume given for every $i \in I$ a scheme X_i and for every $\phi \in \Phi$ a morphisms of schemes $f_\phi : X_{i'} \rightarrow X_i$ where $j(\phi) = (i, i')$. Set $X = (\{X_i\}_{i \in I}, \{f_\phi\}_{\phi \in \Phi})$. Define a *crystal in quasi-coherent modules on X* as a rule which associates to every $i \in \text{Ob}(\mathcal{I})$ a quasi-coherent sheaf \mathcal{F}_i on X_i and for every $\phi \in \Phi$ with $j(\phi) = (i, i')$ an isomorphism

$$\alpha_\phi : f_\phi^* \mathcal{F}_i \longrightarrow \mathcal{F}_{i'}$$

of quasi-coherent sheaves on $X_{i'}$. These crystals in quasi-coherent modules form an additive category $CQC(X)^2$. This category has colimits (proof is the same as the proof of Lemma 60.12.4). If all the morphisms f_ϕ are flat, then $CQC(X)$ is abelian (proof is the same as the proof of Lemma 60.12.5). Let κ be a cardinal. We say that a crystal in quasi-coherent modules \mathcal{F} on X is κ -generated if each \mathcal{F}_i is κ -generated (see Properties, Definition 27.21.1).

Lemma 60.13.1. *In the situation above, if all the morphisms f_ϕ are flat, then there exists a cardinal κ such that every object $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ of $CQC(X)$ is the directed colimit of its κ -generated submodules.*

Proof. In the lemma and in this proof a *submodule* of $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ means the data of a quasi-coherent submodule $\mathcal{G}_i \subset \mathcal{F}_i$ for all i such that $\alpha_\phi(f_\phi^* \mathcal{G}_i) = \mathcal{G}_{i'}$ as subsheaves of $\mathcal{F}_{i'}$ for all $\phi \in \Phi$. This makes sense because since f_ϕ is flat the pullback f_ϕ^* is exact, i.e., preserves subsheaves. The proof will be a variant to the proof of Properties, Lemma 27.21.3. We urge the reader to read that proof first.

We claim that it suffices to prove the lemma in case all the schemes X_i are affine. To see this let

$$J = \coprod_{i \in I} \{U \subset X_i \text{ affine open}\}$$

and let

$$\begin{aligned} \Psi = & \coprod_{\phi \in \Phi} \{(U, V) \mid U \subset X_i, V \subset X_{i'} \text{ affine open with } f_\phi(U) \subset V\} \\ & \coprod \coprod_{i \in I} \{(U, U') \mid U, U' \subset X_i \text{ affine open with } U \subset U'\} \end{aligned}$$

endowed with the obvious map $\Psi \rightarrow J \times J$. Then our (\mathcal{F}, α) induces a crystal in quasi-coherent sheaves $(\{\mathcal{H}_j\}_{j \in J}, \{\beta_\psi\}_{\psi \in \Psi})$ on $Y = (J, \Psi)$ by setting $\mathcal{H}_{(i, U)} = \mathcal{F}_i|_U$

²We could single out a set of triples $\phi, \phi', \phi'' \in \Phi$ with $j(\phi) = (i, i')$, $j(\phi') = (i', i'')$, and $j(\phi'') = (i, i'')$ such that $f_{\phi''} = f_\phi \circ f_{\phi'}$ and require that $\alpha_{\phi'} \circ f_{\phi'}^* \alpha_\phi = \alpha_{\phi''}$ for these triples. This would define an additive subcategory. For example the data (I, Φ) could be the set of objects and arrows of an index category and X could be a diagram of schemes over this index category. The result of Lemma 60.13.1 immediately gives the corresponding result in the subcategory.

for $(i, U) \in J$ and setting β_ψ for $\psi \in \Psi$ equal to the restriction of α_ϕ to U if $\psi = (\phi, U, V)$ and equal to $\text{id} : (\mathcal{F}_i|_U)|_U \rightarrow \mathcal{F}_i|_U$ when $\psi = (i, U, U')$. Moreover, submodules of $(\{\mathcal{H}_j\}_{j \in J}, \{\beta_\psi\}_{\psi \in \Psi})$ correspond 1-to-1 with submodules of $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$. We omit the proof (hint: use Sheaves, Section 6.30). Moreover, it is clear that if κ works for Y , then the same κ works for X (by the definition of κ -generated modules). Hence it suffices to prove the lemma for crystals in quasi-coherent sheaves on Y .

Assume that all the schemes X_i are affine. Let κ be an infinite cardinal larger than the cardinality of I or Φ . Let $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ be an object of $CQC(X)$. For each i write $X_i = \text{Spec}(A_i)$ and $M_i = \Gamma(X_i, \mathcal{F}_i)$. For every $\phi \in \Phi$ with $j(\phi) = (i, i')$ the map α_ϕ translates into an $A_{i'}$ -module isomorphism

$$\alpha_\phi : M_i \otimes_{A_i} A_{i'} \longrightarrow M_{i'}$$

Using the axiom of choice choose a rule

$$(\phi, m) \longmapsto S(\phi, m')$$

where the source is the collection of pairs (ϕ, m') such that $\phi \in \Phi$ with $j(\phi) = (i, i')$ and $m' \in M_{i'}$ and where the output is a finite subset $S(\phi, m') \subset M_i$ so that

$$m' = \alpha_\phi \left(\sum_{m \in S(\phi, m')} m \otimes a'_m \right)$$

for some $a'_m \in A_{i'}$.

Having made these choices we claim that any section of any \mathcal{F}_i over any X_i is in a κ -generated submodule. To see this suppose that we are given a collection $\mathcal{S} = \{S_i\}_{i \in I}$ of subsets $S_i \subset M_i$ each with cardinality at most κ . Then we define a new collection $\mathcal{S}' = \{S'_i\}_{i \in I}$ with

$$S'_i = S_i \cup \bigcup_{(\phi, m'), j(\phi)=(i, i'), m' \in S_{i'}} S(\phi, m')$$

Note that each S'_i still has cardinality at most κ . Set $\mathcal{S}^{(0)} = \mathcal{S}$, $\mathcal{S}^{(1)} = \mathcal{S}'$ and by induction $\mathcal{S}^{(n+1)} = (\mathcal{S}^{(n)})'$. Then set $S_i^{(\infty)} = \bigcup_{n \geq 0} S_i^{(n)}$ and $\mathcal{S}^{(\infty)} = \{S_i^{(\infty)}\}_{i \in I}$. By construction, for every $\phi \in \Phi$ with $j(\phi) = (i, i')$ and every $m' \in S_{i'}^{(\infty)}$ we can write m' as a finite linear combination of images $\alpha_\phi(m \otimes 1)$ with $m \in S_i^{(\infty)}$. Thus we see that setting N_i equal to the A_i -submodule of M_i generated by $S_i^{(\infty)}$ the corresponding quasi-coherent submodules $\widetilde{N}_i \subset \mathcal{F}_i$ form a κ -generated submodule. This finishes the proof. \square

Lemma 60.13.2. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . If s, t are flat, then there exists a set T and a family of objects $(\mathcal{F}_t, \alpha_t)_{t \in T}$ of $QCoh(U, R, s, t, c)$ such that every object (\mathcal{F}, α) is the directed colimit of its submodules isomorphic to one of the objects $(\mathcal{F}_t, \alpha_t)$.*

Proof. This lemma is a generalization of Groupoids, Lemma 38.13.6 which deals with the case of a groupoid in schemes. We can't quite use the same argument, so we use the material on "crystals of quasi-coherent sheaves" we developed above.

Choose a scheme W and a surjective étale morphism $W \rightarrow U$. Choose a scheme V and a surjective étale morphism $V \rightarrow W \times_{U, s} R$. Choose a scheme V' and a surjective étale morphism $V' \rightarrow R \times_{t, U} W$. Consider the collection of schemes

$$I = \{W, W \times_U W, V, V', V \times_R V'\}$$

and the set of morphisms of schemes

$$\Phi = \{\text{pr}_i : W \times_U W \rightarrow W, V \rightarrow W, V' \rightarrow W, V \times_R V' \rightarrow V, V \times_R V' \rightarrow V'\}$$

Set $X = (I, \Phi)$. Recall that we have defined a category $CQC(X)$ of crystals of quasi-coherent sheaves on X . There is a functor

$$QCoh(U, R, s, t, c) \longrightarrow CQC(X)$$

which assigns to (\mathcal{F}, α) the sheaf $\mathcal{F}|_W$ on W , the sheaf $\mathcal{F}|_{W \times_U W}$ on $W \times_U W$, the pullback of \mathcal{F} via $V \rightarrow W \times_{U,s} R \rightarrow W \rightarrow U$ on V , the pullback of \mathcal{F} via $V' \rightarrow R \times_{t,U} W \rightarrow W \rightarrow U$ on V' , and finally the pullback of \mathcal{F} via $V \times_R V' \rightarrow V \rightarrow W \times_{U,s} R \rightarrow W \rightarrow U$ on $V \times_R V'$. As comparison maps $\{\alpha_\phi\}_{\phi \in \Phi}$ we use the obvious ones (coming from associativity of pullbacks) except for the map $\phi = \text{pr}_{V'} : V \times_R V' \rightarrow V'$ we use the pullback of $\alpha : t^*\mathcal{F} \rightarrow s^*\mathcal{F}$ to $V \times_R V'$. This makes sense because of the following commutative diagram

The functor displayed above isn't an equivalence of categories. However, since $W \rightarrow U$ is surjective étale it is faithful³. Since all the morphisms in the diagram above are flat we see that it is an exact functor of abelian categories. Moreover, we claim that given (\mathcal{F}, α) with image $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ there is a 1-to-1 correspondence between quasi-coherent submodules of (\mathcal{F}, α) and $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$. Namely, given a submodule of $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ compatibility of the submodule over W with the projection maps $W \times_U W \rightarrow W$ will guarantee the submodule comes from a quasi-coherent submodule of \mathcal{F} (by Properties of Spaces, Proposition 48.30.1) and compatibility with $\alpha_{\text{pr}_{V'}}$ will insure this subsheaf is compatible with α (details omitted).

Choose a cardinal κ as in Lemma 60.13.1 for the system $X = (I, \Phi)$. It is clear from Properties, Lemma 27.21.2 that there is a set of isomorphism classes of κ -generated crystals in quasi-coherent sheaves on X . Hence the result is clear. \square

60.14. Groupoids and group spaces

Please compare with Groupoids, Section 38.14.

³In fact the functor is fully faithful, but we won't need this.

Lemma 60.14.1. *Let $B \rightarrow S$ as in Section 60.3. Let (G, m) be a group algebraic space over B with identity e_G and inverse i_G . Let X be an algebraic space over B and let $a : G \times_B X \rightarrow X$ be an action of G on X over B . Then we get a groupoid in algebraic spaces (U, R, s, t, c, e, i) over B in the following manner:*

- (1) We set $U = X$, and $R = G \times_B X$.
- (2) We set $s : R \rightarrow U$ equal to $(g, x) \mapsto x$.
- (3) We set $t : R \rightarrow U$ equal to $(g, x) \mapsto a(g, x)$.
- (4) We set $c : R \times_{s,U,t} R \rightarrow R$ equal to $((g, x), (g', x')) \mapsto (m(g, g'), x')$.
- (5) We set $e : U \rightarrow R$ equal to $x \mapsto (e_G(x), x)$.
- (6) We set $i : R \rightarrow R$ equal to $(g, x) \mapsto (i_G(g), a(g, x))$.

Proof. Omitted. Hint: It is enough to show that this works on the set level. For this use the description above the lemma describing g as an arrow from v to $a(g, v)$. □

Lemma 60.14.2. *Let $B \rightarrow S$ as in Section 60.3. Let (G, m) be a group algebraic space over B . Let X be an algebraic space over B and let $a : G \times_B X \rightarrow X$ be an action of G on X over B . Let (U, R, s, t, c) be the groupoid in algebraic spaces constructed in Lemma 60.14.1. The rule $(\mathcal{F}, \alpha) \mapsto (\mathcal{F}, \alpha)$ defines an equivalence of categories between G -equivariant \mathcal{O}_X -modules and the category of quasi-coherent modules on (U, R, s, t, c) .*

Proof. The assertion makes sense because $t = a$ and $s = \text{pr}_1$ as morphisms $R = G \times_B X \rightarrow X$, see Definitions 60.10.1 and 60.12.1. Using the translation in Lemma 60.14.1 the commutativity requirements of the two definitions match up exactly. □

60.15. The stabilizer group algebraic space

Please compare with Groupoids, Section 38.15. Given a groupoid in algebraic spaces we get a group algebraic space as follows.

Lemma 60.15.1. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . The algebraic space G defined by the cartesian square*

$$\begin{array}{ccc}
 G & \longrightarrow & R \\
 \downarrow & & \downarrow j=(t,s) \\
 U & \xrightarrow{\Delta} & U \times_B U
 \end{array}$$

is a group algebraic space over U with composition law m induced by the composition law c .

Proof. This is true because in a groupoid category the set of self maps of any object forms a group. □

Since Δ is a monomorphism we see that $G = j^{-1}(\Delta_{U/B})$ is a subsheaf of R . Thinking of it in this way, the structure morphism $G = j^{-1}(\Delta_{U/B}) \rightarrow U$ is induced by either s or t (it is the same), and m is induced by c .

Definition 60.15.2. Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . The group algebraic space $j^{-1}(\Delta_{U/B}) \rightarrow U$ is called the *stabilizer of the groupoid in algebraic spaces (U, R, s, t, c) .*

In the literature the stabilizer group algebraic space is often denoted S (because the word stabilizer starts with an “s” presumably); we cannot do this since we have already used S for the base scheme.

Lemma 60.15.3. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B , and let G/U be its stabilizer. Denote R_t/U the algebraic space R seen as an algebraic space over U via the morphism $t : R \rightarrow U$. There is a canonical left action*

$$a : G \times_U R_t \longrightarrow R_t$$

induced by the composition law c .

Proof. In terms of points over T/B we define $a(g, r) = c(g, r)$. □

60.16. Restricting groupoids

Please refer to Groupoids, Section 38.16 for notation.

Lemma 60.16.1. *Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $g : U' \rightarrow U$ be a morphism of algebraic spaces. Consider the following diagram*

$$\begin{array}{ccccc}
 & & & s' & \\
 & & & \curvearrowright & \\
 & R' & \longrightarrow & R \times_{s,U} U' & \longrightarrow & U' \\
 & \downarrow & & \downarrow & & \downarrow g \\
 t' \curvearrowleft & U' \times_{U,t} R & \longrightarrow & R & \xrightarrow{s} & U \\
 & \downarrow & & \downarrow t & & \\
 & U' & \xrightarrow{g} & U & &
 \end{array}$$

where all the squares are fibre product squares. Then there is a canonical composition law $c' : R' \times_{s',U',t'} R' \rightarrow R'$ such that (U', R', s', t', c') is a groupoid in algebraic spaces over B and such that $U' \rightarrow U, R' \rightarrow R$ defines a morphism $(U', R', s', t', c') \rightarrow (U, R, s, t, c)$ of groupoids in algebraic spaces over B . Moreover, for any scheme T over B the functor of groupoids

$$(U'(T), R'(T), s', t', c') \rightarrow (U(T), R(T), s, t, c)$$

is the restriction (see Groupoids, Section 38.16) of $(U(T), R(T), s, t, c)$ via the map $U'(T) \rightarrow U(T)$.

Proof. Omitted. □

Definition 60.16.2. Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $g : U' \rightarrow U$ be a morphism of algebraic spaces over B . The morphism of groupoids in algebraic spaces $(U', R', s', t', c') \rightarrow (U, R, s, t, c)$ constructed in Lemma 60.16.1 is called the *restriction of (U, R, s, t, c) to U'* . We sometime use the notation $R' = R|_{U'}$ in this case.

Lemma 60.16.3. *The notions of restricting groupoids and (pre-)equivalence relations defined in Definitions 60.16.2 and 60.4.3 agree via the constructions of Lemmas 60.11.2 and 60.11.3.*

Proof. What we are saying here is that R' of Lemma 60.16.1 is also equal to

$$R' = (U' \times_B U') \times_{U \times_B U} R \longrightarrow U' \times_B U'$$

In fact this might have been a clearer way to state that lemma. □

60.17. Invariant subspaces

In this section we discuss briefly the notion of an invariant subspace.

Definition 60.17.1. Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over the base B .

- (1) We say an open subspace $W \subset U$ is *R-invariant* if $t(s^{-1}(W)) \subset W$.
- (2) A locally closed subspace $Z \subset U$ is called *R-invariant* if $t^{-1}(Z) = s^{-1}(Z)$ as locally closed subspaces of R .
- (3) A monomorphism of algebraic spaces $T \rightarrow U$ is *R-invariant* if $T \times_{U,t} R = R \times_{s,U} T$ as algebraic spaces over R .

For an open subspace $W \subset U$ the R -invariance is also equivalent to requiring that $s^{-1}(W) = t^{-1}(W)$. If $W \subset U$ is R -invariant then the restriction of R to W is just $R_W = s^{-1}(W) = t^{-1}(W)$. Similarly, if $Z \subset U$ is an R -invariant locally closed subspace, then the restriction of R to Z is just $R_Z = s^{-1}(Z) = t^{-1}(Z)$.

Lemma 60.17.2. Let $B \rightarrow S$ as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B .

- (1) If s and t are open, then for every open $W \subset U$ the open $s(t^{-1}(W))$ is R -invariant.
- (2) If s and t are open and quasi-compact, then U has an open covering consisting of R -invariant quasi-compact open subspaces.

Proof. Assume s and t open and $W \subset U$ open. Since s is open we see that $W' = s(t^{-1}(W))$ is an open subspace of U . Now it is quite easy to using the functorial point of view that this is an R -invariant open subset of U , but we are going to argue this directly by some diagrams, since we think it is instructive. Note that $t^{-1}(W')$ is the image of the morphism

$$A := t^{-1}(W) \times_{s|_{t^{-1}(W)}, U, t} R \xrightarrow{\text{pr}_1} R$$

and that $s^{-1}(W')$ is the image of the morphism

$$B := R \times_{s, U, s|_{t^{-1}(W)}} t^{-1}(W) \xrightarrow{\text{pr}_0} R.$$

The algebraic spaces A, B on the left of the arrows above are open subspaces of $R \times_{s, U, t} R$ and $R \times_{s, U, s} R$ respectively. By Lemma 60.11.4 the diagram

$$\begin{array}{ccc} R \times_{s, U, t} R & \xrightarrow{\quad (\text{pr}_1, c) \quad} & R \times_{s, U, s} R \\ & \searrow \text{pr}_1 & \swarrow \text{pr}_0 \\ & & R \end{array}$$

is commutative, and the horizontal arrow is an isomorphism. Moreover, it is clear that $(\text{pr}_1, c)(A) = B$. Hence we conclude $s^{-1}(W') = t^{-1}(W')$, and W' is R -invariant. This proves (1).

Assume now that s, t are both open and quasi-compact. Then, if $W \subset U$ is a quasi-compact open, then also $W' = s(t^{-1}(W))$ is a quasi-compact open, and invariant

by the discussion above. Letting W range over images of affines étale over U we see (2). \square

60.18. Quotient sheaves

Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B . For each scheme S' over S we can take the equivalence relation $\sim_{S'}$ generated by the image of $j(S') : R(S') \rightarrow U(S') \times U(S')$. Hence we get a presheaf

$$(60.18.0.1) \quad \begin{array}{ccc} (Sch/S)_{fppf}^{opp} & \longrightarrow & Sets, \\ S' & \longmapsto & U(S')/\sim_{S'} \end{array}$$

Note that since j is a morphism of algebraic spaces over B and into $U \times_B U$ there is a canonical transformation of presheaves from the presheaf (60.18.0.1) to B .

Definition 60.18.1. Let $B \rightarrow S$ and the pre-relation $j : R \rightarrow U \times_B U$ be as above. In this setting the *quotient sheaf* U/R associated to j is the sheafification of the presheaf (60.18.0.1) on $(Sch/S)_{fppf}$. If $j : R \rightarrow U \times_B U$ comes from the action of a group algebraic space G over B on U as in Lemma 60.14.1 then we denote the quotient sheaf U/G .

This means exactly that the diagram

$$R \begin{array}{c} \rightrightarrows \\ \longrightarrow \end{array} U \longrightarrow U/R$$

is a coequalizer diagram in the category of sheaves of sets on $(Sch/S)_{fppf}$. Again there is a canonical map of sheaves $U/R \rightarrow B$ as j is a morphism of algebraic spaces over B into $U \times_B U$.

Remark 60.18.2. A variant of the construction above would have been to sheafify the functor

$$\begin{array}{ccc} (Spaces/B)_{fppf}^{opp} & \longrightarrow & Sets, \\ X & \longmapsto & U(X)/\sim_X \end{array}$$

where now $\sim_X \subset U(X) \times U(X)$ is the equivalence relation generated by the image of $j : R(X) \rightarrow U(X) \times U(X)$. Here of course $U(X) = \text{Mor}_B(X, U)$ and $R(X) = \text{Mor}_B(X, R)$. In fact, the result would have been the same, via the identifications of (insert future reference in Topologies of Spaces here).

Definition 60.18.3. In the situation of Definition 60.18.1. We say that the pre-relation j has a *quotient representable by an algebraic space* if the sheaf U/R is an algebraic space. We say that the pre-relation j has a *representable quotient* if the sheaf U/R is representable by a scheme. We will say a groupoid in algebraic spaces (U, R, s, t, c) over B has a *representable quotient* (resp. *quotient representable by an algebraic space*) if the quotient U/R with $j = (t, s)$ is representable (resp. an algebraic space).

If the quotient U/R is representable by M (either a scheme or an algebraic space over S), then it comes equipped with a canonical structure morphism $M \rightarrow B$ as we've seen above.

The following lemma characterizes M representing the quotient. It applies for example if $U \rightarrow M$ is flat, of finite presentation and surjective, and $R \cong U \times_M U$.

Lemma 60.18.4. *In the situation of Definition 60.18.1. Assume there is an algebraic space M over S , and a morphism $U \rightarrow M$ such that*

- (1) the morphism $U \rightarrow M$ equalizes s, t ,
- (2) the map $U \rightarrow M$ is a surjection of sheaves, and
- (3) the induced map $(t, s) : R \rightarrow U \times_M U$ is a surjection of sheaves.

In this case M represents the quotient sheaf U/R .

Proof. Condition (1) says that $U \rightarrow M$ factors through U/R . Condition (2) says that $U/R \rightarrow M$ is surjective as a map of sheaves. Condition (3) says that $U/R \rightarrow M$ is injective as a map of sheaves. Hence the lemma follows. \square

The following lemma is wrong if we do not require j to be a pre-equivalence relation (but just a pre-relation say).

Lemma 60.18.5. *Let S be a scheme. Let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-equivalence relation over B . For a scheme S' over S and $a, b \in U(S')$ the following are equivalent:*

- (1) a and b map to the same element of $(U/R)(S')$, and
- (2) there exists an fppf covering $\{f_i : S_i \rightarrow S'\}$ of S' and morphisms $r_i : S_i \rightarrow R$ such that $a \circ f_i = s \circ r_i$ and $b \circ f_i = t \circ r_i$.

In other words, in this case the map of sheaves

$$R \longrightarrow U \times_{U/R} U$$

is surjective.

Proof. Omitted. Hint: The reason this works is that the presheaf (60.18.0.1) in this case is really given by $T \mapsto U(T)/j(R(T))$ as $j(R(T)) \subset U(T) \times U(T)$ is an equivalence relation, see Definition 60.4.1. \square

Lemma 60.18.6. *Let S be a scheme. Let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B and $g : U' \rightarrow U$ a morphism of algebraic spaces over B . Let $j' : R' \rightarrow U' \times_B U'$ be the restriction of j to U' . The map of quotient sheaves*

$$U'/R' \longrightarrow U/R$$

is injective. If $U' \rightarrow U$ is surjective as a map of sheaves, for example if $\{g : U' \rightarrow U\}$ is an fppf covering (see *Topologies on Spaces*, Definition 55.4.1), then $U'/R' \rightarrow U/R$ is an isomorphism of sheaves.

Proof. Suppose $\xi, \xi' \in (U'/R')(S')$ are sections which map to the same section of U/R . Then we can find an fppf covering $\mathcal{S} = \{S_i \rightarrow S'\}$ of S' such that $\xi|_{S_i}, \xi'|_{S_i}$ are given by $a_i, a'_i \in U'(S_i)$. By Lemma 60.18.5 and the axioms of a site we may after refining \mathcal{T} assume there exist morphisms $r_i : S_i \rightarrow R$ such that $g \circ a_i = s \circ r_i$, $g \circ a'_i = t \circ r_i$. Since by construction $R' = R \times_{U \times_S U} (U' \times_S U')$ we see that $(r_i, (a_i, a'_i)) \in R'(S_i)$ and this shows that a_i and a'_i define the same section of U'/R' over S_i . By the sheaf condition this implies $\xi = \xi'$.

If $U' \rightarrow U$ is a surjective map of sheaves, then $U'/R' \rightarrow U/R$ is surjective also. Finally, if $\{g : U' \rightarrow U\}$ is a fppf covering, then the map of sheaves $U' \rightarrow U$ is surjective, see *Topologies on Spaces*, Lemma 55.4.4. \square

Lemma 60.18.7. *Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $g : U' \rightarrow U$ a morphism*

of algebraic spaces over B . Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) to U' . The map of quotient sheaves

$$U'/R' \longrightarrow U/R$$

is injective. If the composition

$$U' \times_{g, U, t} R \xrightarrow{\text{pr}_1} R \xrightarrow{s} U$$

\xrightarrow{h}

is a surjection of fppf sheaves then the map is bijective. This holds for example if $\{h : U' \times_{g, U, t} R \rightarrow U\}$ is an fppf-covering, or if $U' \rightarrow U$ is a surjection of sheaves, or if $\{g : U' \rightarrow U\}$ is a covering in the fppf topology.

Proof. Injectivity follows on combining Lemmas 60.11.2 and 60.18.6. To see surjectivity (see Sites, Section 7.12 for a characterization of surjective maps of sheaves) we argue as follows. Suppose that T is a scheme and $\sigma \in U/R(T)$. There exists a covering $\{T_i \rightarrow T\}$ such that $\sigma|_{T_i}$ is the image of some element $f_i \in U(T_i)$. Hence we may assume that σ is the image of $f \in U(T)$. By the assumption that h is a surjection of sheaves, we can find an fppf covering $\{\varphi_i : T_i \rightarrow T\}$ and morphisms $f_i : T_i \rightarrow U' \times_{g, U, t} R$ such that $f \circ \varphi_i = h \circ f_i$. Denote $f'_i = \text{pr}_0 \circ f_i : T_i \rightarrow U'$. Then we see that $f'_i \in U'(T_i)$ maps to $g \circ f'_i \in U(T_i)$ and that $g \circ f'_i \sim_{T_i} h \circ f_i = f \circ \varphi_i$ notation as in (60.18.0.1). Namely, the element of $R(T_i)$ giving the relation is $\text{pr}_1 \circ f_i$. This means that the restriction of σ to T_i is in the image of $U'/R'(T_i) \rightarrow U/R(T_i)$ as desired.

If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 55.4.4. If $U' \rightarrow U$ is surjective, then also h is surjective as s has a section (namely the neutral element e of the groupoid scheme). \square

60.19. Quotient stacks

In this section and the next few sections we describe a kind of generalization of Section 60.18 above and Groupoids, Section 38.18. It is different in the following way: We are going to take quotient stacks instead of quotient sheaves.

Let us assume we have a scheme S , and algebraic space B over S and a groupoid in algebraic spaces (U, R, s, t, c) over B . Given these data we consider the functor

$$(60.19.0.1) \quad \begin{array}{ccc} (Sch/S)_{fppf}^{opp} & \longrightarrow & \text{Groupoids} \\ S' & \longmapsto & (U(S'), R(S'), s, t, c) \end{array}$$

By Categories, Example 4.35.1 this “presheaf in groupoids” corresponds to a category fibred in groupoids over $(Sch/S)_{fppf}$. In this chapter we will denote this

$$[U/_p R] \rightarrow (Sch/S)_{fppf}$$

where the subscript $_p$ is there to distinguish from the quotient stack.

Definition 60.19.1. Quotient stacks. Let $B \rightarrow S$ be as above.

- (1) Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . The *quotient stack*

$$p : [U/R] \longrightarrow (Sch/S)_{fppf}$$

of (U, R, s, t, c) is the stackification (see Stacks, Lemma 8.9.1) of the category fibred in groupoids $[U/_p R]$ over $(Sch/S)_{fppf}$ associated to (60.19.0.1).

- (2) Let (G, m) be a group algebraic space over B . Let $a : G \times_B X \rightarrow X$ be an action of G on an algebraic space over B . The *quotient stack*

$$p : [X/G] \longrightarrow (Sch/S)_{fppf}$$

is the quotient stack associated to the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$ over B of Lemma 60.14.1.

Thus $[U/R]$ and $[X/G]$ are stacks in groupoids over $(Sch/S)_{fppf}$. These stacks will be very important later on and hence it makes sense to give a detailed description. Recall that given an algebraic space X over S we use the notation $\mathcal{S}_X \rightarrow (Sch/S)_{fppf}$ to denote the stack in sets associated to the sheaf X , see Categories, Lemma 4.36.6 and Stacks, Lemma 8.6.2.

Lemma 60.19.2. *Assume $B \rightarrow S$ and (U, R, s, t, c) as in Definition 60.19.1 (1). There are canonical 1-morphisms $\pi : \mathcal{S}_U \rightarrow [U/R]$, and $[U/R] \rightarrow \mathcal{S}_B$ of stacks in groupoids over $(Sch/S)_{fppf}$. The composition $\mathcal{S}_U \rightarrow \mathcal{S}_B$ is the 1-morphism associated to the structure morphism $U \rightarrow B$.*

Proof. During this proof let us denote $[U/pR]$ the category fibred in groupoids associated to the presheaf in groupoids (60.19.0.1). By construction of the stackification there is a 1-morphism $[U/pR] \rightarrow [U/R]$. The 1-morphism $\mathcal{S}_U \rightarrow [U/R]$ is simply the composition $\mathcal{S}_U \rightarrow [U/pR] \rightarrow [U/R]$, where the first arrow associates to the scheme S'/S and morphism $x : S' \rightarrow U$ over S the object $x \in U(S')$ of the fibre category of $[U/pR]$ over S' .

To construct the 1-morphism $[U/R] \rightarrow \mathcal{S}_B$ it is enough to construct the 1-morphism $[U/pR] \rightarrow \mathcal{S}_B$, see Stacks, Lemma 8.9.2. On objects over S'/S we just use the map

$$U(S') \longrightarrow B(S')$$

coming from the structure morphism $U \rightarrow B$. And clearly, if $a \in R(S')$ is an “arrow” with source $s(a) \in U(S')$ and target $t(a) \in U(S')$, then since s and t are morphisms *over* B these both map to the same element \bar{a} of $B(S')$. Hence we can map an arrow $a \in R(S')$ to the identity morphism of \bar{a} . (This is good because the fibre category $(\mathcal{S}_B)_{S'}$ only contains identities.) We omit the verification that this rule is compatible with pullback on these split fibred categories, and hence defines a 1-morphism $[U/pR] \rightarrow \mathcal{S}_B$ as desired.

We omit the verification of the last statement. □

Lemma 60.19.3. *Assumptions and notation as in Lemma 60.19.2. There exists a canonical 2-morphism $\alpha : \pi \circ s \rightarrow \pi \circ t$ making the diagram*

$$\begin{array}{ccc} \mathcal{S}_R & \xrightarrow{s} & \mathcal{S}_U \\ t \downarrow & & \downarrow \pi \\ \mathcal{S}_U & \xrightarrow{\pi} & [U/R] \end{array}$$

2-commutative.

Proof. Let S' be a scheme over S . Let $r : S' \rightarrow R$ be a morphism over S . Then $r \in R(S')$ is an isomorphism between the objects $s \circ r, t \circ r \in U(S')$. Moreover, this construction is compatible with pullbacks. This gives a canonical 2-morphism

$\alpha_p : \pi_p \circ s \rightarrow \pi_p \circ t$ where $\pi_p : \mathcal{S}_U \rightarrow [U/pR]$ is as in the proof of Lemma 60.19.2. Thus even the diagram

$$\begin{array}{ccc} \mathcal{S}_R & \xrightarrow{s} & \mathcal{S}_U \\ \downarrow t & & \downarrow \pi_p \\ \mathcal{S}_U & \xrightarrow{\pi_p} & [U/pR] \end{array}$$

is 2-commutative. Thus a fortiori the diagram of the lemma is 2-commutative. \square

Remark 60.19.4. In future chapters we will use the ambiguous notation where instead of writing \mathcal{S}_X for the stack in sets associated to X we simply write X . Using this notation the diagram of Lemma 60.19.3 becomes the familiar diagram

$$\begin{array}{ccc} R & \xrightarrow{s} & U \\ \downarrow t & & \downarrow \pi \\ U & \xrightarrow{\pi} & [U/R] \end{array}$$

In the following sections we will show that this diagram has many good properties. In particular we will show that it is a 2-fibre product (Section 60.21) and that it is close to being a 2-coequalizer of s and t (Section 60.22).

60.20. Functoriality of quotient stacks

A morphism of groupoids in algebraic spaces gives an associated morphism of quotient stacks.

Lemma 60.20.1. *Let S be a scheme. Let B be an algebraic space over S . Let $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ be a morphism of groupoids in algebraic spaces over B . Then f induces a canonical 1-morphism of quotient stacks*

$$[f] : [U/R] \rightarrow [U'/R'].$$

Proof. Denote $[U/pR]$ and $[U'/pR']$ the categories fibred in groupoids over the base site $(Sch/S)_{fppf}$ associated to the functors (60.19.0.1). It is clear that f defines a 1-morphism $[U/pR] \rightarrow [U'/pR']$ which we can compose with the stackyfication functor for $[U'/R']$ to get $[U/pR] \rightarrow [U'/R']$. Then, by the universal property of the stackyfication functor $[U/pR] \rightarrow [U/R]$, see Stacks, Lemma 8.9.2 we get $[U/R] \rightarrow [U'/R']$. \square

Let $B \rightarrow S$ and $f : (U, R, s, t, c) \rightarrow (U', R', s', t', c')$ be as in Lemma 60.20.1. In this situation, we define a third groupoid in algebraic spaces over B as follows, using the language of T -valued points where T is a (varying) scheme over B :

- (1) $U'' = U \times_{f, U', t'} R'$ so that a T -valued point is a pair (u, r') with $f(u) = t'(r')$,
- (2) $R'' = R \times_{f \circ s, U', t'} R'$ so that a T -valued point is a pair (r, r') with $f(s(r)) = t'(r')$,
- (3) $s'' : R'' \rightarrow U''$ is given by $s''(r, r') = (s(r), r')$,
- (4) $t'' : R'' \rightarrow U''$ is given by $t''(r, r') = (t(r), c'(f(r), r'))$,
- (5) $c'' : R'' \times_{s'', U'', t''} R'' \rightarrow R''$ is given by $c''((r_1, r'_1), (r_2, r'_2)) = (c(r_1, r_2), r'_2)$.

The formula for c'' makes sense as $s''(r_1, r'_1) = t''(r_2, r'_2)$. It is clear that c'' is associative. The identity e'' is given by $e''(u, r) = (e(u), r)$. The inverse of (r, r') is given by $(i(r), c'(f(r), r'))$. Thus we do indeed get a groupoid in algebraic spaces over B .

Clearly the maps $U'' \rightarrow U$ and $R'' \rightarrow R$ define a morphism $g : (U'', R'', s'', t'', c'') \rightarrow (U, R, s, t, c)$ of groupoids in algebraic spaces over B . Moreover, the maps $U'' \rightarrow U'$, $(u, r') \mapsto s'(r')$ and $R'' \rightarrow U'$, $(r, r') \mapsto s'(r')$ show that in fact $(U'', R'', s'', t'', c'')$ is a groupoid in algebraic spaces over U' .

Lemma 60.20.2. *Notation and assumption as in Lemma 60.20.1. Let $(U'', R'', s'', t'', c'')$ be the groupoid in algebraic spaces over B constructed above. There is a 2-commutative square*

$$\begin{array}{ccc} [U''/R''] & \xrightarrow{[g]} & [U/R] \\ \downarrow & & \downarrow [f] \\ \mathcal{S}_{U'} & \longrightarrow & [U'/R'] \end{array}$$

which identifies $[U''/R'']$ with the 2-fibre product.

Proof. The maps $[f]$ and $[g]$ come from an application of Lemma 60.20.1 and the other two maps come from Lemma 60.19.2 (and the fact that $(U'', R'', s'', t'', c'')$ lives over U'). To show the 2-fibre product property, it suffices to prove the lemma for the diagram

$$\begin{array}{ccc} [U''/{}_p R''] & \xrightarrow{[g]} & [U/{}_p R] \\ \downarrow & & \downarrow [f] \\ \mathcal{S}_{U'} & \longrightarrow & [U'/{}_p R'] \end{array}$$

of categories fibred in groupoids, see Stacks, Lemma 8.9.3. In other words, it suffices to show that an object of the 2-fibre product $\mathcal{S}_{U'} \times_{[U'/{}_p R']} [U/{}_p R]$ over T corresponds to a T -valued point of U'' and similarly for morphisms. And of course this is exactly how we constructed U'' and R'' in the first place.

In detail, an object of $\mathcal{S}_{U'} \times_{[U'/{}_p R']} [U/{}_p R]$ over T is a triple (u', u, r') where u' is a T -valued point of U' , u is a T -valued point of U , and r' is a morphism from u' to $f(u)$ in $[U'/R']_T$, i.e., r' is a T -valued point of R with $s'(r') = u'$ and $t'(r') = f(u)$. Clearly we can forget about u' without losing information and we see that these objects are in one-to-one correspondence with T -valued points of R'' .

Similarly for morphisms: Let (u'_1, u_1, r'_1) and (u'_2, u_2, r'_2) be two objects of the fibre product over T . Then a morphism from (u'_2, u_2, r'_2) to (u'_1, u_1, r'_1) is given by $(1, r)$ where $1 : u'_1 \rightarrow u'_2$ means simply $u'_1 = u'_2$ (this is so because $\mathcal{S}_{U'}$ is fibred in sets), and r is a T -valued point of R with $s(r) = u_2$, $t(r) = u_1$ and moreover $c'(f(r), r'_2) = r'_1$. Hence the arrow

$$(1, r) : (u'_2, u_2, r'_2) \rightarrow (u'_1, u_1, r'_1)$$

is completely determined by knowing the pair (r, r'_2) . Thus the functor of arrows is represented by R'' , and moreover the morphisms s'' , t'' , and c'' clearly correspond to source, target and composition in the 2-fibre product $\mathcal{S}_{U'} \times_{[U'/{}_p R']} [U/{}_p R]$. \square

60.21. The 2-cartesian square of a quotient stack

In this section we compute the *Isom*-sheaves for a quotient stack and we deduce that the defining diagram of a quotient stack is a 2-fibre product.

Lemma 60.21.1. *Assume $B \rightarrow S$, (U, R, s, t, c) and $\pi : \mathcal{S}_U \rightarrow [U/R]$ are as in Lemma 60.19.2. Let S' be a scheme over S . Let $x, y \in \text{Ob}([U/R]_{S'})$ be objects of the quotient stack over S' . If $x = \pi(x')$ and $y = \pi(y')$ for some morphisms $x', y' : S' \rightarrow U$, then*

$$\text{Isom}(x, y) = S' \times_{(y', x'), U \times_S U} R$$

as sheaves over S' .

Proof. Let $[U/pR]$ be the category fibred in groupoids associated to the presheaf in groupoids (60.19.0.1) as in the proof of Lemma 60.19.2. By construction the sheaf $\text{Isom}(x, y)$ is the sheaf associated to the presheaf $\text{Isom}(x', y')$. On the other hand, by definition of morphisms in $[U/pR]$ we have

$$\text{Isom}(x', y') = S' \times_{(y', x'), U \times_S U} R$$

and the right hand side is an algebraic space, therefore a sheaf. \square

Lemma 60.21.2. *Assume $B \rightarrow S$, (U, R, s, t, c) , and $\pi : \mathcal{S}_U \rightarrow [U/R]$ are as in Lemma 60.19.2. The 2-commutative square*

$$\begin{array}{ccc} \mathcal{S}_R & \xrightarrow{s} & \mathcal{S}_U \\ t \downarrow & & \downarrow \pi \\ \mathcal{S}_U & \xrightarrow{\pi} & [U/R] \end{array}$$

of Lemma 60.19.3 is a 2-fibre product of stacks in groupoids of $(\text{Sch}/S)_{\text{fppf}}$.

Proof. According to Stacks, Lemma 8.5.6 the lemma makes sense. It also tells us that we have to show that the functor

$$\mathcal{S}_R \longrightarrow \mathcal{S}_U \times_{[U/R]} \mathcal{S}_U$$

which maps $r : T \rightarrow R$ to $(T, t(r), s(r), \alpha(r))$ is an equivalence, where the right hand side is the 2-fibre product as described in Categories, Lemma 4.30.3. This is, after spelling out the definitions, exactly the content of Lemma 60.21.1. (Alternative proof: Work out the meaning of Lemma 60.20.2 in this situation will give you the result also.) \square

Lemma 60.21.3. *Assume $B \rightarrow S$ and (U, R, s, t, c) are as in Definition 60.19.1 (1). For any scheme T over S and objects x, y of $[U/R]$ over T the sheaf $\text{Isom}(x, y)$ on $(\text{Sch}/T)_{\text{fppf}}$ has the following property: There exists a fppf covering $\{T_i \rightarrow T\}_{i \in I}$ such that $\text{Isom}(x, y)|_{(\text{Sch}/T_i)_{\text{fppf}}}$ is representable by an algebraic space.*

Proof. Follows immediately from Lemma 60.21.1 and the fact that both x and y locally in the fppf topology come from objects of \mathcal{S}_U by construction of the quotient stack. \square

60.22. The 2-coequalizer property of a quotient stack

On a groupoid we have the composition, which leads to a cocycle condition for the canonical 2-morphism of the lemma above. To give the precise formulation we will use the notation introduced in Categories, Sections 4.26 and 4.27.

Lemma 60.22.1. *Assumptions and notation as in Lemmas 60.19.2 and 60.19.3. The vertical composition of*

$$\begin{array}{ccc}
 & \xrightarrow{\pi \circ s \circ pr_1 = \pi \circ s \circ c} & \\
 \mathcal{S}_{R \times_{s,U,t} R} & \begin{array}{c} \searrow \alpha \star id_{pr_1} \\ \xrightarrow{\pi \circ t \circ pr_1 = \pi \circ s \circ pr_0} \\ \swarrow \alpha \star id_{pr_0} \end{array} & \xrightarrow{\quad} [U/R] \\
 & \xrightarrow{\pi \circ t \circ pr_0 = \pi \circ t \circ c} &
 \end{array}$$

is the 2-morphism $\alpha \star id_c$. In a formula $\alpha \star id_c = (\alpha \star id_{pr_0}) \circ (\alpha \star id_{pr_1})$.

Proof. We make two remarks:

- (1) The formula $\alpha \star id_c = (\alpha \star id_{pr_0}) \circ (\alpha \star id_{pr_1})$ only makes sense if you realize the equalities $\pi \circ s \circ pr_1 = \pi \circ s \circ c$, $\pi \circ t \circ pr_1 = \pi \circ s \circ pr_0$, and $\pi \circ t \circ pr_0 = \pi \circ t \circ c$. Namely, the second one implies the vertical composition \circ makes sense, and the other two guarantee the two sides of the formula are 2-morphisms with the same source and target.
- (2) The reason the lemma holds is that composition in the category fibred in groupoids $[U/pR]$ associated to the presheaf in groupoids (60.19.0.1) comes from the composition law $c : R \times_{s,U,t} R \rightarrow R$.

We omit the proof of the lemma. □

Note that, in the situation of the lemma, we actually have the equalities $s \circ pr_1 = s \circ c$, $t \circ pr_1 = s \circ pr_0$, and $t \circ pr_0 = t \circ c$ before composing with π . Hence the formula in the lemma below makes sense in exactly the same way that the formula in the lemma above makes sense.

Lemma 60.22.2. *Assumptions and notation as in Lemmas 60.19.2 and 60.19.3. The 2-commutative diagram of Lemma 60.19.3 is a 2-coequalizer in the following sense: Given*

- (1) a stack in groupoids \mathcal{X} over $(Sch/S)_{fppf}$,
- (2) a 1-morphism $f : \mathcal{S}_U \rightarrow \mathcal{X}$, and
- (3) a 2-arrow $\beta : f \circ s \rightarrow f \circ t$

such that

$$\beta \star id_c = (\beta \star id_{pr_0}) \circ (\beta \star id_{pr_1})$$

then there exists a 1-morphism $[U/R] \rightarrow \mathcal{X}$ which makes the diagram

2-commute.

Proof. Suppose given \mathcal{X} , f and β as in the lemma. By Stacks, Lemma 8.9.2 it suffices to construct a 1-morphism $g : [U/pR] \rightarrow \mathcal{X}$. First we note that the 1-morphism $\mathcal{S}_U \rightarrow [U/pR]$ is bijective on objects. Hence on objects we can set $g(x) = f(x)$ for $x \in \text{Ob}(\mathcal{S}_U) = \text{Ob}([U/pR])$. A morphism $\varphi : x \rightarrow y$ of $[U/pR]$ arises from a commutative diagram

$$\begin{array}{ccc}
 S_2 & \xrightarrow{x} & U \\
 & \searrow \varphi & \uparrow s \\
 & & R \\
 h \downarrow & & \downarrow t \\
 S_1 & \xrightarrow{y} & U.
 \end{array}$$

Thus we can set $g(\varphi)$ equal to the composition

$$\begin{array}{ccccccc}
 f(x) & \equiv & f(s \circ \varphi) & \equiv & (f \circ s)(\varphi) & \xrightarrow{\beta} & (f \circ t)(\varphi) & \equiv & f(\varphi \circ t) & \equiv & f(y \circ h) \\
 & & & & & & & & & & \downarrow \\
 & & & & & & & & & & f(y).
 \end{array}$$

The vertical arrow is the result of applying the functor f to the canonical morphism $y \circ h \rightarrow y$ in \mathcal{S}_U (namely, the strongly cartesian morphism lifting h with target y). Let us verify that f so defined is compatible with composition, at least on fibre categories. So let S' be a scheme over S , and let $a : S' \rightarrow R \times_{s,U,t} R$ be a morphism. In this situation we set $x = s \circ \text{pr}_1 \circ a = s \circ c \circ a$, $y = t \circ \text{pr}_1 \circ a = s \circ \text{pr}_0 \circ a$, and $z = t \circ \text{pr}_0 \circ a = t \circ \text{pr}_0 \circ c$ to get a commutative diagram

$$\begin{array}{ccc}
 x & \xrightarrow{c \circ a} & z \\
 \text{pr}_1 \circ a \searrow & & \nearrow \text{pr}_0 \circ a \\
 & y &
 \end{array}$$

in the fibre category $[U/pR]_{S'}$. Moreover, any commutative triangle in this fibre category has this form. Then we see by our definitions above that f maps this to a commutative diagram if and only if the diagram

$$\begin{array}{ccc}
 (f \circ s)(c \circ a) & \xrightarrow{\beta} & (f \circ t)(c \circ a) \\
 \parallel & & \parallel \\
 (f \circ s)(\text{pr}_1 \circ a) & & (f \circ t)(\text{pr}_0 \circ a) \\
 \searrow \beta & & \nearrow \beta \\
 (f \circ t)(\text{pr}_1 \circ a) & \equiv & (f \circ s)(\text{pr}_0 \circ a)
 \end{array}$$

is commutative which is exactly the condition expressed by the formula in the lemma. We omit the verification that f maps identities to identities and is compatible with composition for arbitrary morphisms. \square

60.23. Explicit description of quotient stacks

In order to formulate the result we need to introduce some notation. Assume $B \rightarrow S$ and (U, R, s, t, c) are as in Definition 60.19.1 (1). Let T be a scheme over S . Let

$\mathcal{T} = \{T_i \rightarrow T\}_{i \in I}$ be an fppf covering. A $[U/R]$ -descent datum relative to \mathcal{T} is given by a system (u_i, r_{ij}) where

- (1) for each i a morphism $u_i : T_i \rightarrow U$, and
- (2) for each i, j a morphism $r_{ij} : T_i \times_T T_j \rightarrow R$

such that

- (a) as morphisms $T_i \times_T T_j \rightarrow U$ we have

$$s \circ r_{ij} = u_i \circ \text{pr}_0 \quad \text{and} \quad t \circ r_{ij} = u_j \circ \text{pr}_1,$$

- (b) as morphisms $T_i \times_T T_j \times_T T_k \rightarrow R$ we have

$$c \circ (r_{jk} \circ \text{pr}_{12}, r_{ij} \circ \text{pr}_{01}) = r_{ik} \circ \text{pr}_{02}.$$

A morphism $(u_i, r_{ij}) \rightarrow (u'_i, r'_{ij})$ between two $[U/R]$ -descent data over the same covering \mathcal{T} is a collection $(r_i : T_i \rightarrow R)$ such that

- (α) as morphisms $T_i \rightarrow U$ we have

$$u_i = s \circ r_i \quad \text{and} \quad u'_i = t \circ r_i$$

- (β) as morphisms $T_i \times_T T_j \rightarrow R$ we have

$$c \circ (r'_{ij}, r_i \circ \text{pr}_0) = c \circ (r_j \circ \text{pr}_1, r_{ij}).$$

There is a natural composition law on morphisms of descent data relative to a fixed covering and we obtain a category of descent data. This category is a groupoid. Finally, if $\mathcal{T}' = \{T'_j \rightarrow T\}_{j \in J}$ is a second fppf covering which refines \mathcal{T} then there is a notion of pullback of descent data. This is particularly easy to describe explicitly in this case. Namely, if $\alpha : J \rightarrow I$ and $\varphi_j : T'_j \rightarrow T_{\alpha(j)}$ is the morphism of coverings, then the pullback of the descent datum (u_i, r_{ij}) is simply

$$(u_{\alpha(j)} \circ \varphi_j, r_{\alpha(j)\alpha(j')} \circ \varphi_j \times \varphi_{j'}).$$

Pullback defined in this manner defines a functor from the category of descent data over \mathcal{T} to the category of descent data over \mathcal{T}' .

Lemma 60.23.1. *Assume $B \rightarrow S$ and (U, R, s, t, c) are as in Definition 60.19.1 (1). Let $\pi : \mathcal{S}_U \rightarrow [U/R]$ be as in Lemma 60.19.2. Let T be a scheme over S .*

- (1) *for every object x of the fibre category $[U/R]_T$ there exists an fppf covering $\{f_i : T_i \rightarrow T\}_{i \in I}$ such that $f_i^* x \cong \pi(u_i)$ for some $u_i \in U(T_i)$,*
- (2) *the composition of the isomorphisms*

$$\pi(u_i \circ \text{pr}_0) = \text{pr}_0^* \pi(u_i) \cong \text{pr}_0^* f_i^* x \cong \text{pr}_1^* f_j^* x \cong \text{pr}_1^* \pi(u_j) = \pi(u_j \circ \text{pr}_1)$$

are of the form $\pi(r_{ij})$ for certain morphisms $r_{ij} : T_i \times_T T_j \rightarrow R$,

- (3) *the system (u_i, r_{ij}) forms a $[U/R]$ -descent datum as defined above,*
- (4) *any $[U/R]$ -descent datum (u_i, r_{ij}) arises in this manner,*
- (5) *if x corresponds to (u_i, r_{ij}) as above, and $y \in \text{Ob}([U/R]_T)$ corresponds to (u'_i, r'_{ij}) then there is a canonical bijection*

$$\text{Mor}_{[U/R]_T}(x, y) \longleftrightarrow \left\{ \begin{array}{l} \text{morphisms } (u_i, r_{ij}) \rightarrow (u'_i, r'_{ij}) \\ \text{of } [U/R]\text{-descent data} \end{array} \right\}$$

- (6) *this correspondence is compatible with refinements of fppf coverings.*

Proof. Statement (1) is part of the construction of the stackification. Part (2) follows from Lemma 60.21.1. We omit the verification of (3). Part (4) is a translation of the fact that in a stack all descent data are effective. We omit the verifications of (5) and (6). \square

60.24. Restriction and quotient stacks

In this section we study what happens to the quotient stack when taking a restriction.

Lemma 60.24.1. *Notation and assumption as in Lemma 60.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

is fully faithful if and only if R is the restriction of R via the morphism $f : U \rightarrow U'$.

Proof. Let x, y be objects of $[U/R]$ over a scheme T/S . Let x', y' be the images of x, y in the category $[U'/R']_T$. The functor $[f]$ is fully faithful if and only if the map of sheaves

$$\text{Isom}(x, y) \longrightarrow \text{Isom}(x', y')$$

is an isomorphism for every T, x, y . We may test this locally on T (in the fppf topology). Hence, by Lemma 60.23.1 we may assume that x, y come from $a, b \in U(T)$. In that case we see that x', y' correspond to $f \circ a, f \circ b$. By Lemma 60.21.1 the displayed map of sheaves in this case becomes

$$T \times_{(a,b), U \times_B U} R \longrightarrow T \times_{f \circ a, f \circ b, U' \times_B U'} R'.$$

This is an isomorphism if R is the restriction, because in that case $R = (U \times_B U) \times_{U' \times_B U'} R'$, see Lemma 60.16.3 and its proof. Conversely, if the last displayed map is an isomorphism for all T, a, b , then it follows that $R = (U \times_B U) \times_{U' \times_B U'} R'$, i.e., R is the restriction of R' . \square

Lemma 60.24.2. *Notation and assumption as in Lemma 60.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

is an equivalence if and only if

- (1) (U, R, s, t, c) is the restriction of (U', R', s', t', c') via $f : U \rightarrow U'$, and
- (2) the map

$$U \times_{f, U', t'} R' \begin{array}{c} \xrightarrow{h} \\ \xrightarrow{\text{pr}_1} R' \xrightarrow{s'} U \end{array}$$

is a surjection of sheaves.

Part (2) holds for example if $\{h : U \times_{f, U', t'} R' \rightarrow U'\}$ is an fppf covering, or if $f : U \rightarrow U'$ is a surjection of sheaves, or if $\{f : U \rightarrow U'\}$ is an fppf covering.

Proof. We already know that part (1) is equivalent to fully faithfulness by Lemma 60.24.1. Hence we may assume that (1) holds and that $[f]$ is fully faithful. Our goal is to show, under these assumptions, that $[f]$ is an equivalence if and only if (2) holds. We may use Stacks, Lemma 8.4.8 which characterizes equivalences.

Assume (2). We will use Stacks, Lemma 8.4.8 to prove $[f]$ is an equivalence. Suppose that T is a scheme and $x' \in \text{Ob}([U'/R']_T)$. There exists a covering $\{g_i : T_i \rightarrow T\}$ such that $g_i^* x'$ is the image of some element $a'_i \in U'(T_i)$, see Lemma 60.23.1. Hence we may assume that x' is the image of $a' \in U'(T)$. By the assumption that h is a surjection of sheaves, we can find an fppf covering $\{\varphi_i : T_i \rightarrow T\}$ and morphisms $b_i : T_i \rightarrow U \times_{g, U', t'} R'$ such that $a' \circ \varphi_i = h \circ b_i$. Denote $a_i = \text{pr}_0 \circ b_i : T_i \rightarrow U$. Then we see that $a_i \in U(T_i)$ maps to $f \circ a_i \in U'(T_i)$

and that $f \circ a_i \cong_{T_i} h \circ b_i = a' \circ \varphi_i$, where \cong_{T_i} denotes isomorphism in the fibre category $[U'/R']_{T_i}$. Namely, the element of $R'(T_i)$ giving the isomorphism is $\text{pr}_1 \circ b_i$. This means that the restriction of x to T_i is in the essential image of the functor $[U/R]_{T_i} \rightarrow [U'/R']_{T_i}$ as desired.

Assume $[f]$ is an equivalence. Let $\xi' \in [U'/R']_{U'}$ denote the object corresponding to the identity morphism of U' . Applying Stacks, Lemma 8.4.8 we see there exists an fppf covering $\mathcal{U}' = \{g'_i : U'_i \rightarrow U'\}$ such that $(g'_i)^* \xi' \cong [f](\xi_i)$ for some ξ_i in $[U/R]_{U'_i}$. After refining the covering \mathcal{U}' (using Lemma 60.23.1) we may assume ξ_i comes from a morphism $a_i : U'_i \rightarrow U$. The fact that $[f](\xi_i) \cong (g'_i)^* \xi'$ means that, after possibly refining the covering \mathcal{U}' once more, there exist morphisms $r'_i : U'_i \rightarrow R'$ with $t' \circ r'_i = f \circ a_i$ and $s' \circ r'_i = \text{id}_{U'} \circ g'_i$. Picture

$$\begin{array}{ccc}
 U & \xleftarrow{a_i} & U'_i \\
 \downarrow f & & \swarrow r'_i \quad \downarrow g'_i \\
 U' & \xleftarrow{t'} R' \xrightarrow{s'} & U'
 \end{array}$$

Thus $(a_i, r'_i) : U'_i \rightarrow U \times_{g, U', t'} R'$ are morphisms such that $h \circ (a_i, r'_i) = g'_i$ and we conclude that $\{h : U \times_{g, U', t'} R' \rightarrow U'\}$ can be refined by the fppf covering \mathcal{U}' which means that h induces a surjection of sheaves, see Topologies on Spaces, Lemma 55.4.4.

If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 55.4.4. If $U' \rightarrow U$ is surjective, then also h is surjective as s has a section (namely the neutral element e of the groupoid in algebraic spaces). \square

Lemma 60.24.3. *Notation and assumption as in Lemma 60.20.1. Assume that*

$$\begin{array}{ccc}
 R & \xrightarrow{f} & R' \\
 \downarrow s & & \downarrow s' \\
 U & \xrightarrow{f} & U'
 \end{array}$$

is cartesian. Then

$$\begin{array}{ccc}
 \mathcal{S}_U & \longrightarrow & [U/R] \\
 \downarrow & & \downarrow [f] \\
 \mathcal{S}_{U'} & \longrightarrow & [U'/R']
 \end{array}$$

is a 2-fibre product square.

Proof. Applying the inverse isomorphisms $i : R \rightarrow R$ and $i' : R' \rightarrow R'$ to the (first) cartesian diagram of the statement of the lemma we see that

$$\begin{array}{ccc}
 R & \xrightarrow{f} & R' \\
 \downarrow t & & \downarrow t' \\
 U & \xrightarrow{f} & U'
 \end{array}$$

is cartesian as well. By Lemma 60.20.2 we have a 2-fibre square

$$\begin{array}{ccc} [U''/R''] & \longrightarrow & [U/R] \\ \downarrow & & \downarrow \\ \mathcal{S}_{U'} & \longrightarrow & [U'/R'] \end{array}$$

where $U'' = U \times_{f,U',t'} R'$ and $R'' = R \times_{f \circ s, U', t'} R'$. By the above we see that $(t, f) : R \rightarrow U''$ is an isomorphism, and that

$$R'' = R \times_{f \circ s, U', t'} R' = R \times_{s, U} U \times_{f, U', t'} R' = R \times_{s, U, t} \times R.$$

Explicitly the isomorphism $R \times_{s, U, t} R \rightarrow R''$ is given by the rule $(r_0, r_1) \mapsto (r_0, f(r_1))$. Moreover, s'', t'', c'' translate into the maps

$$R \times_{s, U, t} R \rightarrow R, \quad s''(r_0, r_1) = r_1, \quad t''(r_0, r_1) = c(r_0, r_1)$$

and

$$\begin{array}{ccc} c'' : (R \times_{s, U, t} R) \times_{s'', R, t''} (R \times_{s, U, t} R) & \longrightarrow & R \times_{s, U, t} R, \\ ((r_0, r_1), (r_2, r_3)) & \longmapsto & (c(r_0, r_2), r_3). \end{array}$$

Precomposing with the isomorphism

$$R \times_{s, U, s} R \rightarrow R \times_{s, U, t} R, \quad (r_0, r_1) \mapsto (c(r_0, i(r_1)), r_1)$$

we see that t'' and s'' turn into pr_0 and pr_1 and that c'' turns into $\text{pr}_{02} : R \times_{s, U, s} R \times_{s, U, s} R \rightarrow R \times_{s, U, s} R$. Hence we see that there is an isomorphism $[U''/R''] \cong [R/R \times_{s, U, s} R]$ where as a groupoid in algebraic spaces $(R, R \times_{s, U, s} R, s'', t'', c'')$ is the restriction of the trivial groupoid $(U, U, \text{id}, \text{id}, \text{id})$ via $s : R \rightarrow U$. Since $s : R \rightarrow U$ is a surjection of fppf sheaves (as it has a right inverse) the morphism

$$[U''/R''] \cong [R/R \times_{s, U, s} R] \rightarrow [U/U] = \mathcal{S}_U$$

is an equivalence by Lemma 60.24.2. This proves the lemma. \square

60.25. Inertia and quotient stacks

The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 8.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.32.

Lemma 60.25.1. *Assume $B \rightarrow S$ and (U, R, s, t, c) as in Definition 60.19.1 (1). Let G/U be the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i) , see Definition 60.15.2. Set $R' = R \times_{s, U} G$ and set*

- (1) $s' : R' \rightarrow G, (r, g) \mapsto g,$
- (2) $t' : R' \rightarrow G, (r, g) \mapsto c(r, c(g, i(r))),$
- (3) $c' : R' \times_{s', G, t'} R' \rightarrow R', ((r_1, g_1), (r_2, g_2)) \mapsto (c(r_1, r_2), g_1).$

Then (G, R', s', t', c') is a groupoid in algebraic spaces over B and

$$\mathcal{I}_{[U/R]} = [G/R'].$$

i.e., the associated quotient stack is the inertia stack of $[U/R]$.

Proof. By Stacks, Lemma 8.8.5 it suffices to prove that $\mathcal{I}_{[U/pR]} = [G/pR']$. Let T be a scheme over S . Recall that an object of the inertia fibred category of $[U/pR]$ over T is given by a pair (x, g) where x is an object of $[U/pR]$ over T and g is an automorphism of x in its fibre category over T . In other words, $x : T \rightarrow U$ and $g : T \rightarrow R$ such that $x = s \circ g = t \circ g$. This means exactly that $g : T \rightarrow G$.

A morphism in the inertia fibred category from $(x, g) \rightarrow (y, h)$ over T is given by $r : T \rightarrow R$ such that $s(r) = x$, $t(r) = y$ and $c(r, g) = c(h, r)$, see the commutative diagram in Categories, Lemma 4.32.1. In a formula

$$h = c(r, c(g, i(r))) = c(c(r, g), i(r)).$$

The notation $s(r)$, etc is a short hand for $s \circ r$, etc. The composition of $r_1 : (x_2, g_2) \rightarrow (x_1, g_1)$ and $r_2 : (x_1, g_1) \rightarrow (x_2, g_2)$ is $c(r_1, r_2) : (x_1, g_1) \rightarrow (x_3, g_3)$.

Note that in the above we could have written g in stead of (x, g) for an object of $\mathcal{I}_{[U/pR]}$ over T as x is the image of g under the structure morphism $G \rightarrow U$. Then the morphisms $g \rightarrow h$ in $\mathcal{I}_{[U/pR]}$ over T correspond exactly to morphisms $r' : T \rightarrow R'$ with $s'(r') = g$ and $t'(r') = h$. Moreover, the composition corresponds to the rule explained in (3). Thus the lemma is proved. \square

Lemma 60.25.2. *Assume $B \rightarrow S$ and (U, R, s, t, c) as in Definition 60.19.1 (1). Let G/U be the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i) , see Definition 60.15.2. There is a canonical 2-cartesian diagram*

$$\begin{array}{ccc} \mathcal{S}_G & \longrightarrow & \mathcal{S}_U \\ \downarrow & & \downarrow \\ \mathcal{I}_{[U/R]} & \longrightarrow & [U/R] \end{array}$$

of stacks in groupoids of $(Sch/S)_{fppf}$.

Proof. By Lemma 60.24.3 it suffices to prove that the morphism $s' : R' \rightarrow G$ of Lemma 60.25.1 isomorphic to the base change of s by the structure morphism $G \rightarrow U$. This base change property is clear from the construction of s' . \square

60.26. Gerbes and quotient stacks

In this section we relate quotient stacks to the discussion Stacks, Section 8.11 and especially gerbes as defined in Stacks, Definition 8.11.4. The stacks in groupoids occurring in this section are generally speaking not algebraic stacks!

Lemma 60.26.1. *Notation and assumption as in Lemma 60.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

turns $[U/R]$ into a gerbe over $[U'/R']$ if $f : U \rightarrow U'$ and $R \rightarrow R'|_U$ are surjective maps of fppf sheaves. Here $R'|_U$ is the restriction of R' to U via $f : U \rightarrow U'$.

Proof. We will verify that Stacks, Lemma 8.11.3 properties (2) (a) and (2) (b) hold. Property (2)(a) holds because $U \rightarrow U'$ is a surjective map of sheaves (use Lemma 60.23.1 to see that objects in $[U'/R']$ locally come from U'). To prove (2)(b) let x, y be objects of $[U/R]$ over a scheme T/S . Let x', y' be the images of x, y in the category $[U'/R']_T$. Condition (2)(b) requires us to check the map of sheaves

$$Isom(x, y) \longrightarrow Isom(x', y')$$

on $(Sch/T)_{fppf}$ is surjective. To see this we may work fppf locally on T and assume that come from $a, b \in U(T)$. In that case we see that x', y' correspond to $f \circ a, f \circ b$. By Lemma 60.21.1 the displayed map of sheaves in this case becomes

$$T \times_{(a,b), U \times_B U} R \longrightarrow T \times_{f \circ a, f \circ b, U' \times_B U'} R' = T \times_{(a,b), U \times_B U} R'|_U.$$

Hence the assumption that $R \rightarrow R'|_U$ is a surjective map of fppf sheaves on $(Sch/S)_{fppf}$ implies the desired surjectivity. \square

Lemma 60.26.2. *Let S be a scheme. Let B be an algebraic space over S . Let G be a group algebraic space over B . Endow B with the trivial action of G . The morphism*

$$[B/G] \longrightarrow \mathcal{S}_B$$

(Lemma 60.19.2) turns $[B/G]$ into a gerbe over B .

Proof. Immediate from Lemma 60.26.1 as the morphisms $B \rightarrow B$ and $B \times_B G \rightarrow B$ are surjective as morphisms of sheaves. \square

60.27. Quotient stacks and change of big site

We suggest skipping this section on a first reading. Pullbacks of stacks are defined in Stacks, Section 8.12.

Lemma 60.27.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf} . Assume that Sch_{fppf} is contained in Sch'_{fppf} , see Topologies, Section 33.10. Let $S \in \text{Ob}(Sch_{fppf})$. Let $B, U, R \in Sh((Sch/S)_{fppf})$ be algebraic spaces, and let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $f : (Sch'/S)_{fppf} \rightarrow (Sch/S)_{fppf}$ the morphism of sites corresponding to the inclusion functor $u : Sch_{fppf} \rightarrow Sch'_{fppf}$. Then we have a canonical equivalence*

$$[f^{-1}U/f^{-1}R] \longrightarrow f^{-1}[U/R]$$

of stacks in groupoids over $(Sch'/S)_{fppf}$.

Proof. Note that $f^{-1}B, f^{-1}U, f^{-1}R \in Sh((Sch'/S)_{fppf})$ are algebraic spaces by Spaces, Lemma 47.15.1 and hence $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a groupoid in algebraic spaces over $f^{-1}B$. Thus the statement makes sense.

The category $u_p[U/pR]$ is the localization of the category $u_{pp}[U/pR]$ at right multiplicative system I of morphisms. An object of $u_{pp}[U/pR]$ is a triple

$$(T', \phi : T' \rightarrow T, x)$$

where $T' \in \text{Ob}((Sch'/S)_{fppf})$, $T \in \text{Ob}((Sch/S)_{fppf})$, ϕ is a morphism of schemes over S , and $x : T \rightarrow U$ is a morphism of sheaves on $(Sch/S)_{fppf}$. Note that the morphism of schemes $\phi : T' \rightarrow T$ is the same thing as a morphism $\phi : T' \rightarrow u(T)$, and since $u(T)$ represents $f^{-1}T$ it is the same thing as a morphism $T' \rightarrow f^{-1}T$. Moreover, as f^{-1} on algebraic spaces is fully faithful, see Spaces, Lemma 47.15.2, we may think of x as a morphism $x : f^{-1}T \rightarrow f^{-1}U$ as well. From now on we will make such identifications without further mention. A morphism

$$(a, a', \alpha) : (T'_1, \phi_1 : T'_1 \rightarrow T_1, x_1) \longrightarrow (T'_2, \phi_2 : T'_2 \rightarrow T_2, x_2)$$

of $u_{pp}[U/pR]$ is a commutative diagram

$$\begin{array}{ccccc}
 & & & & U \\
 & & & & \uparrow s \\
 & & & x_1 \nearrow & \\
 T'_1 & \xrightarrow{\phi_1} & T_1 & \xrightarrow{\alpha} & R \\
 \downarrow a' & & \downarrow a & & \downarrow t \\
 T'_2 & \xrightarrow{\phi_2} & T_2 & \xrightarrow{x_2} & U
 \end{array}$$

and such a morphism is an element of I if and only if $T'_1 = T'_2$ and $a' = \text{id}$. We define a functor

$$u_{pp}[U/pR] \longrightarrow [f^{-1}U/pf^{-1}R]$$

by the rules

$$(T', \phi : T' \rightarrow T, x) \mapsto (x \circ \phi : T' \rightarrow f^{-1}U)$$

on objects and

$$(a, a', \alpha) \mapsto (\alpha \circ \phi_1 : T'_1 \rightarrow f^{-1}R)$$

on morphisms as above. It is clear that elements of I are transformed into isomorphisms as $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a groupoid in algebraic spaces over $f^{-1}B$. Hence this functor factors in a canonical way through a functor

$$u_p[U/pR] \longrightarrow [f^{-1}U/pf^{-1}R]$$

Applying stackification we obtain a functor of stacks

$$f^{-1}[U/R] \longrightarrow [f^{-1}U/f^{-1}R]$$

over $(Sch/S)_{fppf}$, as by Stacks, Lemma 8.12.11 the stack $f^{-1}[U/R]$ is the stackification of $u_p[U/pR]$.

At this point we have a morphism of stacks, and to verify that it is an equivalence it suffices to show that it is fully faithful and that objects are locally in the essential image, see Stacks, Lemmas 8.4.7 and 8.4.8. The statement on objects holds as $f^{-1}R$ admits a surjective étale morphism $f^{-1}W \rightarrow f^{-1}R$ for some object W of $(Sch/S)_{fppf}$. To show that the functor is “full”, it suffices to show that morphisms are locally in the image of the functor which holds as $f^{-1}U$ admits a surjective étale morphism $f^{-1}W \rightarrow f^{-1}U$ for some object W of $(Sch/S)_{fppf}$. We omit the proof that the functor is faithful. \square

60.28. Separation conditions

This really means conditions on the morphism $j : R \rightarrow U \times_B U$ when given a groupoid in algebraic spaces (U, R, s, t, c) over B . As in the previous section we first formulate the corresponding diagram.

Lemma 60.28.1. *Let $B \rightarrow S$ be as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $G \rightarrow U$ be the stabilizer group algebraic space. The commutative diagram*

$$\begin{CD} R @>f \mapsto (f, s(f))>> R \times_{s,U} U @>> U \\ @V \Delta_{R/U \times_B U} VV @VV V @VV V \\ R \times_{(U \times_B U)} R @>(f, g) \mapsto (f, f^{-1} \circ g)>> R \times_{s,U} G @>> G \end{CD}$$

the two left horizontal arrows are isomorphisms and the right square is a fibre product square.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. \square

Lemma 60.28.2. *Let $B \rightarrow S$ be as in Section 60.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $G \rightarrow U$ be the stabilizer group algebraic space.*

- (1) *The following are equivalent*
 - (a) *$j : R \rightarrow U \times_B U$ is separated,*

- (b) $G \rightarrow U$ is separated, and
- (c) $e : U \rightarrow G$ is a closed immersion.
- (2) The following are equivalent
 - (a) $j : R \rightarrow U \times_B U$ is locally separated,
 - (b) $G \rightarrow U$ is locally separated, and
 - (c) $e : U \rightarrow G$ is an immersion.
- (3) The following are equivalent
 - (a) $j : R \rightarrow U \times_B U$ is quasi-separated,
 - (b) $G \rightarrow U$ is quasi-separated, and
 - (c) $e : U \rightarrow G$ is quasi-compact.

Proof. The group algebraic space $G \rightarrow U$ is the base change of $R \rightarrow U \times_B U$ by the diagonal morphism $U \rightarrow U \times_B U$, see Lemma 60.15.1. Hence if j is separated (resp. locally separated, resp. quasi-separated), then $G \rightarrow U$ is separated (resp. locally separated, resp. quasi-separated). See Morphisms of Spaces, Lemma 49.4.4. Thus (a) \Rightarrow (b) in (1), (2), and (3).

Conversely, if $G \rightarrow U$ is separated (resp. locally separated, resp. quasi-separated), then the morphism $e : U \rightarrow G$, as a section of the structure morphism $G \rightarrow U$ is a closed immersion (resp. an immersion, resp. quasi-compact), see Morphisms of Spaces, Lemma 49.4.7. Thus (b) \Rightarrow (c) in (1), (2), and (3).

If e is a closed immersion (resp. an immersion, resp. quasi-compact) then by the result of Lemma 60.28.1 (and Spaces, Lemma 47.12.3, and Morphisms of Spaces, Lemma 49.8.3) we see that $\Delta_{R/U \times_B U}$ is a closed immersion (resp. an immersion, resp. quasi-compact). Thus (c) \Rightarrow (a) in (1), (2), and (3). \square

More on Groupoids in Spaces

61.1. Introduction

This chapter is devoted to advanced topics on groupoids in algebraic spaces. Even though the results are stated in terms of groupoids in algebraic spaces, the reader should keep in mind the 2-cartesian diagram

$$(61.1.0.1) \quad \begin{array}{ccc} R & \longrightarrow & U \\ \downarrow & & \downarrow \\ U & \longrightarrow & [U/R] \end{array}$$

where $[U/R]$ is the quotient stack, see Groupoids in Spaces, Remark 60.19.4. Many of the results are motivated by thinking about this diagram. See for example the beautiful paper [KM97] by Keel and Mori.

61.2. Notation

We continue to abide by the conventions and notation introduced in Groupoids in Spaces, Section 60.3.

61.3. Useful diagrams

We briefly restate the results of Groupoids in Spaces, Lemmas 60.11.4 and 60.11.5 for easy reference in this chapter. Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . In the commutative diagram

$$(61.3.0.2) \quad \begin{array}{ccccc} & & U & & \\ & \swarrow t & & \nwarrow t & \\ R & \xleftarrow{\text{pr}_0} & R \times_{s,U,t} R & \xrightarrow{c} & R \\ \downarrow s & & \downarrow \text{pr}_1 & & \downarrow s \\ U & \xleftarrow{t} & R & \xrightarrow{s} & U \end{array}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

The diagram

$$(61.3.0.3) \quad \begin{array}{ccccc} R \times_{t,U,t} R & \xrightarrow{\text{pr}_1} & R & \xrightarrow{t} & U \\ \text{pr}_0 \times \text{co}(i,1) \downarrow & & \downarrow \text{id}_R & & \downarrow \text{id}_U \\ R \times_{s,U,t} R & \xrightarrow{\text{pr}_0} & R & \xrightarrow{t} & U \\ \text{pr}_1 \downarrow & & \downarrow s & & \\ R & \xrightarrow{s} & U & & \\ & \xrightarrow{t} & & & \end{array}$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

61.4. Properties of groupoids

This section is the analogue of More on Groupoids, Section 39.5. The reader is strongly encouraged to read that section first.

The following lemma is the analogue of More on Groupoids, Lemma 39.5.4.

Lemma 61.4.1. *Let $B \rightarrow S$ be as in Section 61.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $\tau \in \{\text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Let \mathcal{P} be a property of morphisms of algebraic spaces which is τ -local on the target (Descent on Spaces, Definition 56.9.1). Assume $\{s : R \rightarrow U\}$ and $\{t : R \rightarrow U\}$ are coverings for the τ -topology. Let $W \subset U$ be the maximal open subspace such that $s^{-1}(W) \rightarrow W$ has property \mathcal{P} . Then W is R -invariant (Groupoids in Spaces, Definition 60.17.1).*

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 56.9.3. In Diagram (61.3.0.2) let $W_1 \subset R$ be the maximal open subscheme over which the morphism $\text{pr}_1 : R \times_{s,U,t} R \rightarrow R$ has property \mathcal{P} . It follows from the aforementioned Descent on Spaces, Lemma 56.9.3 and the assumption that $\{s : R \rightarrow U\}$ and $\{t : R \rightarrow U\}$ are coverings for the τ -topology that $t^{-1}(W) = W_1 = s^{-1}(W)$ as desired. \square

Lemma 61.4.2. *Let $B \rightarrow S$ be as in Section 61.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $G \rightarrow U$ be its stabilizer group algebraic space. Let $\tau \in \{\text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}\}$. Let \mathcal{P} be a property of morphisms of algebraic spaces which is τ -local on the target. Assume $\{s : R \rightarrow U\}$ and $\{t : R \rightarrow U\}$ are coverings for the τ -topology. Let $W \subset U$ be the maximal open subspace such that $G_W \rightarrow W$ has property \mathcal{P} . Then W is R -invariant (see Groupoids in Spaces, Definition 60.17.1).*

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 56.9.3. The morphism

$$G \times_{U,t} R \longrightarrow R \times_{s,U} G, \quad (g, r) \longmapsto (r, r^{-1} \circ g \circ r)$$

is an isomorphism of algebraic spaces over R (where \circ denotes composition in the groupoid). Hence $s^{-1}(W) = t^{-1}(W)$ by the properties of W proved in the aforementioned Descent on Spaces, Lemma 56.9.3. \square

61.5. Comparing fibres

This section is the analogue of More on Groupoids, Section 39.6. The reader is strongly encouraged to read that section first.

Lemma 61.5.1. *Let $B \rightarrow S$ be as in Section 61.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let K be a field and let $r, r' : \text{Spec}(K) \rightarrow R$ be morphisms such that $t \circ r = t \circ r' : \text{Spec}(K) \rightarrow U$. Set $u = s \circ r$, $u' = s \circ r'$ and denote $F_u = \text{Spec}(K) \times_{u, U, s} R$ and $F_{u'} = \text{Spec}(K) \times_{u', U, s} R$ the fibre products. Then $F_u \cong F_{u'}$ as algebraic spaces over K .*

Proof. We use the properties and the existence of Diagram (61.3.0.2). There exists a morphism $\xi : \text{Spec}(K) \rightarrow R \times_{s, U, t} R$ with $\text{pr}_0 \circ \xi = r$ and $c \circ \xi = r'$. Let $\tilde{r} = \text{pr}_1 \circ \xi : \text{Spec}(K) \rightarrow R$. Then looking at the bottom two squares of Diagram (61.3.0.2) we see that both F_u and $F_{u'}$ are identified with the algebraic space $\text{Spec}(K) \times_{\tilde{r}, R, \text{pr}_1} (R \times_{s, U, t} R)$. \square

Actually, in the situation of the lemma the morphisms of pairs $s : (R, r) \rightarrow (U, u)$ and $s : (R, r') \rightarrow (U, u')$ are locally isomorphic in the τ -topology, provided $\{s : R \rightarrow U\}$ is a τ -covering. We will insert a precise statement here if needed.

61.6. Restricting groupoids

In this section we collect a bunch of lemmas on properties of groupoids which are inherited by restrictions. Most of these lemmas can be proved by contemplating the defining diagram

$$(61.6.0.1) \quad \begin{array}{ccccc} & & s' & & \\ & & \curvearrowright & & \\ & R' & \longrightarrow & R \times_{s, U} U' & \longrightarrow & U' \\ & \downarrow & & \downarrow & & \downarrow g \\ t' & U' \times_{U, t} R & \longrightarrow & R & \xrightarrow{s} & U \\ & \downarrow & & \downarrow t & & \\ & U' & \xrightarrow{g} & U & & \end{array}$$

of a restriction. See Groupoids in Spaces, Lemma 60.16.1.

Lemma 61.6.1. *Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $g : U' \rightarrow U$ be a morphism of algebraic spaces over B . Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via g .*

- (1) *If s, t are locally of finite type and g is locally of finite type, then s', t' are locally of finite type.*
- (2) *If s, t are locally of finite presentation and g is locally of finite presentation, then s', t' are locally of finite presentation.*
- (3) *If s, t are flat and g is flat, then s', t' are flat.*
- (4) *Add more here.*

Proof. The property of being locally of finite type is stable under composition and arbitrary base change, see Morphisms of Spaces, Lemmas 49.23.2 and 49.23.3. Hence (1) is clear from Diagram (61.6.0.1). For the other cases, see Morphisms of Spaces, Lemmas 49.27.2, 49.27.3, 49.28.3, and 49.28.4. \square

61.7. Properties of groups over fields and groupoids on fields

The reader is advised to first look at the corresponding sections for groupoid schemes, see Groupoids, Section 38.7 and More on Groupoids, Section 39.9.

Situation 61.7.1. Here S is a scheme, k is a field over S , and (G, m) is a group algebraic spaces over $\text{Spec}(k)$.

Situation 61.7.2. Here S is a scheme, B is an algebraic space, and (U, R, s, t, c) is a groupoid in algebraic spaces over B with $U = \text{Spec}(k)$ for some field k .

Note that in Situation 61.7.1 we obtain a groupoid in algebraic spaces

$$(61.7.2.1) \quad (\text{Spec}(k), G, p, p, m)$$

where $p : G \rightarrow \text{Spec}(k)$ is the structure morphism of G , see Groupoids in Spaces, Lemma 60.14.1. This is a situation as in Situation 61.7.2. We will use this without further mention in the rest of this section.

Lemma 61.7.3. *In Situation 61.7.2 the composition morphism $c : R \times_{s,U,t} R \rightarrow R$ is flat and universally open. In Situation 61.7.1 the group law $m : G \times_k G \rightarrow G$ is flat and universally open.*

Proof. The composition is isomorphic to the projection map $\text{pr}_1 : R \times_{t,U,t} R \rightarrow R$ by Diagram (61.3.0.3). The projection is flat as a base change of the flat morphism t and open by Morphisms of Spaces, Lemma 49.6.6. The second assertion follows immediately from the first because m matches c in (61.7.2.1). \square

Note that the following lemma applies in particular when working with either quasi-separated or locally separated algebraic spaces (Decent Spaces, Lemma 50.13.2).

Lemma 61.7.4. *In Situation 61.7.2 assume R is a decent space. Then R is a separated algebraic space. In Situation 61.7.1 assume that G is a decent algebraic space. Then G is separated algebraic space.*

Proof. We first prove the second assertion. By Groupoids in Spaces, Lemma 60.6.1 we have to show that $e : S \rightarrow G$ is a closed immersion. This follows from Decent Spaces, Lemma 50.12.4.

Next, we prove the second assertion. To do this we may replace B by S . By the paragraph above the stabilizer group scheme $G \rightarrow U$ is separated. By Groupoids in Spaces, Lemma 60.28.2 the morphism $j = (t, s) : R \rightarrow U \times_S U$ is separated. As U is the spectrum of a field the scheme $U \times_S U$ is affine (by the construction of fibre products in Schemes, Section 25.17). Hence R is separated, see Morphisms of Spaces, Lemma 49.4.9. \square

Lemma 61.7.5. *In Situation 61.7.2. Let $k \subset k'$ be a field extension, $U' = \text{Spec}(k')$ and let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via $U' \rightarrow U$. In the defining diagram*

all the morphisms are surjective, flat, and universally open. The dotted arrow $R' \rightarrow R$ is in addition affine.

Proof. The morphism $U' \rightarrow U$ equals $\text{Spec}(k') \rightarrow \text{Spec}(k)$, hence is affine, surjective and flat. The morphisms $s, t : R \rightarrow U$ and the morphism $U' \rightarrow U$ are universally open by Morphisms, Lemma 28.24.4. Since R is not empty and U is the spectrum of a field the morphisms $s, t : R \rightarrow U$ are surjective and flat. Then you conclude by using Morphisms of Spaces, Lemmas 49.5.5, 49.5.4, 49.6.4, 49.20.5, 49.20.4, 49.28.4, and 49.28.3. \square

Lemma 61.7.6. *In Situation 61.7.2. For any point $r \in |R|$ there exist*

- (1) a field extension $k \subset k'$ with k' algebraically closed,
- (2) a point $r' : \text{Spec}(k') \rightarrow R'$ where (U', R', s', t', c') is the restriction of (U, R, s, t, c) via $\text{Spec}(k') \rightarrow \text{Spec}(k)$

such that

- (1) the point r' maps to r under the morphism $R' \rightarrow R$, and
- (2) the maps $s' \circ r', t' \circ r' : \text{Spec}(k') \rightarrow \text{Spec}(k')$ are automorphisms.

Proof. Let's represent r by a morphism $r : \text{Spec}(K) \rightarrow R$ for some field K . To prove the lemma we have to find an algebraically closed field k' and a commutative diagram

where $s, t : k \rightarrow K$ are the field maps coming from $s \circ r$ and $t \circ r$. In the proof of More on Groupoids, Lemma 39.9.5 it is shown how to construct such a diagram. \square

Lemma 61.7.7. *In Situation 61.7.2. If $r : \text{Spec}(k) \rightarrow R$ is a morphism such that $s \circ r, t \circ r$ are automorphisms of $\text{Spec}(k)$, then the map*

$$R \longrightarrow R, \quad x \longmapsto c(r, x)$$

is an automorphism $R \rightarrow R$ which maps e to r .

Proof. Proof is identical to the proof of More on Groupoids, Lemma 39.9.6. \square

Lemma 61.7.8. *In Situation 61.7.2 the algebraic space R is geometrically unibranch. In Situation 61.7.1 the algebraic space G is geometrically unibranch.*

Proof. Let $r \in |R|$. We have to show that R is geometrically unibranch at r . Combining Lemma 61.7.5 with Descent on Spaces, Lemma 56.8.1 we see that it suffices to prove this in case k is algebraically closed and r comes from a morphism $r : \text{Spec}(k) \rightarrow R$ such that $s \circ r$ and $t \circ r$ are automorphisms of $\text{Spec}(k)$. By Lemma 61.7.7 we reduce to the case that $r = e$ is the identity of R and k is algebraically closed.

Assume $r = e$ and k is algebraically closed. Let $A = \mathcal{O}_{R,e}$ be the étale local ring of R at e and let $C = \mathcal{O}_{R \times_{s,U,t} R, (e,e)}$ be the étale local ring of $R \times_{s,U,t} R$ at (e, e) . By Spaces over Fields, Lemma 54.3.1 the minimal prime ideals \mathfrak{q} of C correspond 1-to-1 to pairs of minimal primes $\mathfrak{p}, \mathfrak{p}' \subset A$. On the other hand, the composition law induces a flat ring map

$$\begin{array}{ccc} A & \xrightarrow{c^\#} & C \\ & & \uparrow \\ & & A \otimes_{s^\#, k, t^\#} A \end{array} \qquad \begin{array}{c} \mathfrak{q} \\ \downarrow \\ \mathfrak{p} \otimes A + A \otimes \mathfrak{p}' \end{array}$$

Note that $(c^\#)^{-1}(\mathfrak{q})$ contains both \mathfrak{p} and \mathfrak{p}' as the diagrams

$$\begin{array}{ccc} A & \xrightarrow{c^\#} & C \\ \uparrow & & \uparrow \\ A \otimes_{s^\#, k} k & \xleftarrow{1 \otimes e^\#} & A \otimes_{s^\#, k, t^\#} A \end{array} \qquad \begin{array}{ccc} A & \xrightarrow{c^\#} & C \\ \uparrow & & \uparrow \\ k \otimes_{k, t^\#} A & \xleftarrow{e^\# \otimes 1} & A \otimes_{s^\#, k, t^\#} A \end{array}$$

commute by (61.3.0.2). Since $c^\#$ is flat (as c is a flat morphism by Lemma 61.7.3), we see that $(c^\#)^{-1}(\mathfrak{q})$ is a minimal prime of A . Hence $\mathfrak{p} = (c^\#)^{-1}(\mathfrak{q}) = \mathfrak{p}'$. \square

In the following lemma we use dimension of algebraic spaces (at a point) as defined in Properties of Spaces, Section 48.8. We also use the dimension of the local ring defined in Properties of Spaces, Section 48.20 and transcendence degree of points, see Morphisms of Spaces, Section 49.31.

Lemma 61.7.9. *In Situation 61.7.2 assume s, t are locally of finite type. For all $r \in |R|$*

- (1) $\dim(R) = \dim_r(R)$,
- (2) *the transcendence degree of r over $\text{Spec}(k)$ via s equals the transcendence degree of r over $\text{Spec}(k)$ via t , and*
- (3) *if the transcendence degree mentioned in (2) is 0, then $\dim(R) = \dim(\mathcal{O}_{R,\bar{r}})$.*

Proof. Let $r \in |R|$. Denote $\text{trdeg}(r/s/k)$ the transcendence degree of r over $\text{Spec}(k)$ via s . Choose an étale morphism $\varphi : V \rightarrow R$ where V is a scheme and $v \in V$ mapping to r . Using the definitions mentioned above the lemma we see that

$$\dim_r(R) = \dim_v(V) = \dim(\mathcal{O}_{V,v}) + \text{trdeg}_{s(k)}(\kappa(v)) = \dim(\mathcal{O}_{R,\bar{r}}) + \text{trdeg}(r/s/k)$$

and similarly for t (the second equality by Morphisms, Lemma 28.29.1). Hence we see that $\text{trdeg}(r/s/k) = \text{trdeg}(r/t/k)$, i.e., (2) holds.

Let $k \subset k'$ be a field extension. Note that the restriction R' of R to $\text{Spec}(k')$ (see Lemma 61.7.5) is obtained from R by two base changes by morphisms of fields.

Thus Morphisms of Spaces, Lemma 49.32.3 shows the dimension of R at a point is unchanged by this operation. Hence in order to prove (1) we may assume, by Lemma 61.7.6, that r is represented by a morphism $r : \text{Spec}(k) \rightarrow R$ such that both $s \circ r$ and $t \circ r$ are automorphisms of $\text{Spec}(k)$. In this case there exists an automorphism $R \rightarrow R$ which maps r to e (Lemma 61.7.7). Hence we see that $\dim_r(R) = \dim_e(R)$ for any r . By definition this means that $\dim_r(R) = \dim(R)$.

Part (3) is a formal consequence of the results obtained in the discussion above. \square

Lemma 61.7.10. *In Situation 61.7.1 assume G locally of finite type. For all $g \in |G|$*

- (1) $\dim(G) = \dim_g(G)$,
- (2) *if the transcendence degree of g over k is 0, then $\dim(G) = \dim(\mathcal{O}_{G,\bar{g}})$.*

Proof. Immediate from Lemma 61.7.9 via (61.7.2.1). \square

Lemma 61.7.11. *In Situation 61.7.2 assume s, t are locally of finite type. Let $G = \text{Spec}(k) \times_{\Delta, \text{Spec}(k) \times_B \text{Spec}(k), t \times s} R$ be the stabilizer group algebraic space. Then we have $\dim(R) = \dim(G)$.*

Proof. Since G and R are equidimensional (see Lemmas 61.7.9 and 61.7.10) it suffices to prove that $\dim_e(R) = \dim_e(G)$. Let V be an affine scheme, $v \in V$, and let $\varphi : V \rightarrow R$ be an étale morphism of schemes such that $\varphi(v) = e$. Note that V is a Noetherian scheme as $s \circ \varphi$ is locally of finite type as a composition of morphisms locally of finite type and as V is quasi-compact (use Morphisms of Spaces, Lemmas 49.23.2, 49.36.8, and 49.27.5 and Morphisms, Lemma 28.16.6). Hence V is locally connected (see Properties, Lemma 27.5.5 and Topology, Lemma 5.8.6). Thus we may replace V by the connected component containing v (it is still affine as it is an open and closed subscheme of V). Set $T = V_{red}$ equal to the reduction of V . Consider the two morphisms $a, b : T \rightarrow \text{Spec}(k)$ given by $a = s \circ \varphi|_T$ and $b = t \circ \varphi|_T$. Note that a, b induce the same field map $k \rightarrow \kappa(v)$ because $\varphi(v) = e!$ Let $k_a \subset \Gamma(T, \mathcal{O}_T)$ be the integral closure of $a^\sharp(k) \subset \Gamma(T, \mathcal{O}_T)$. Similarly, let $k_b \subset \Gamma(T, \mathcal{O}_T)$ be the integral closure of $b^\sharp(k) \subset \Gamma(T, \mathcal{O}_T)$. By Varieties, Proposition 32.18.1 we see that $k_a = k_b$. Thus we obtain the following commutative diagram

As discussed above the long arrows are equal. Since $k_a = k_b \rightarrow \kappa(v)$ is injective we conclude that the two morphisms a and b agree. Hence $T \rightarrow R$ factors through G . It follows that $R_{red} = G_{red}$ in an open neighbourhood of e which certainly implies that $\dim_e(R) = \dim_e(G)$. \square

61.8. No rational curves on groups

In this section we prove that there are no nonconstant morphisms from \mathbf{P}^1 to a group scheme.

Lemma 61.8.1. *Let S be a scheme. Let B be an algebraic space over S . Let $f : X \rightarrow Y$ and $g : X \rightarrow Z$ be morphisms of algebraic spaces over B . Assume*

- (1) $Y \rightarrow B$ is separated,
- (2) g is surjective, flat, and locally of finite presentation,
- (3) there is a scheme theoretically dense open $V \subset Z$ such that $f|_{g^{-1}(V)} : g^{-1}(V) \rightarrow Y$ factors through V .

Then f factors through g .

Proof. Set $R = X \times_Z X$. By (2) we see that $Z = X/R$ as sheaves. Also (2) implies that the inverse image of V in R is scheme theoretically dense in R (Morphisms of Spaces, Lemma 49.28.11). Then we see that the two compositions $R \rightarrow X \rightarrow Y$ are equal by Morphisms of Spaces, Lemma 49.17.8. The lemma follows. \square

Lemma 61.8.2. *Let k be a field. Let $n \geq 1$ and let $(\mathbf{P}_k^1)^n$ be the n -fold self product over $\text{Spec}(k)$. Let $f : (\mathbf{P}_k^1)^n \rightarrow Z$ be a morphism of algebraic spaces over k . If Z is separated of finite type over k , then f factors as*

$$(\mathbf{P}_k^1)^n \xrightarrow{\text{projection}} (\mathbf{P}_k^1)^m \xrightarrow{\text{finite}} Z.$$

Proof. We may assume k is algebraically closed (details omitted); we only do this so we may argue using rational points, but the reader can work around this if she/he so desires. In the proof products are over k . The automorphism group algebraic space of $(\mathbf{P}_k^1)^n$ contains $G = (\text{GL}_{2,k})^n$. If $C \subset (\mathbf{P}_k^1)^n$ is a closed subvariety (in particular irreducible over k) which is mapped to a point, then we can apply More on Morphisms of Spaces, Lemma 58.24.7 to the morphism

$$G \times C \rightarrow G \times Z, \quad (g, c) \mapsto (g, f(g \cdot c))$$

over G . Hence $g(C)$ is mapped to a point for $g \in G(k)$ lying in a Zariski open $U \subset G$. Suppose $x = (x_1, \dots, x_n), y = (y_1, \dots, y_n)$ are k -valued points of $(\mathbf{P}_k^1)^n$. Let $I \subset \{1, \dots, n\}$ be the set of indices i such that $x_i = y_i$. Then

$$\{g(x) \mid g(y) = y, g \in U(k)\}$$

is Zariski dense in the fibre of the projection $\pi_I : (\mathbf{P}_k^1)^n \rightarrow \prod_{i \in I} \mathbf{P}_k^1$ (exercise). Hence if $x, y \in C(k)$ are distinct, we conclude that f maps the whole fibre of π_I containing x, y to a single point. Moreover, the $U(k)$ -orbit of C meets a Zariski open set of fibres of π_I . By Lemma 61.8.1 the morphism f factors through π_I . After repeating this process finitely many times we reach the stage where all fibres of f over k points are finite. In this case f is finite by More on Morphisms of Spaces, Lemma 58.24.6 and the fact that k points are dense in Z (Spaces over Fields, Lemma 54.9.2). \square

Lemma 61.8.3. *Let k be a field. Let G be a separated group algebraic space locally of finite type over k . There does not exist a nonconstant morphism $f : \mathbf{P}_k^1 \rightarrow G$ over $\text{Spec}(k)$.*

Proof. Assume f is nonconstant. Consider the morphisms

$$\mathbf{P}_k^1 \times_{\text{Spec}(k)} \dots \times_{\text{Spec}(k)} \mathbf{P}_k^1 \longrightarrow G, \quad (t_1, \dots, t_n) \longmapsto f(g_1) \dots f(g_n)$$

where on the right hand side we use multiplication in the group. By Lemma 61.8.2 and the assumption that f is nonconstant this morphism is finite onto its image. Hence $\dim(G) \geq n$ for all n , which is impossible by Lemma 61.7.10 and the fact that G is locally of finite type over k . \square

61.9. The finite part of a morphism

Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . For an algebraic space or a scheme T over S consider pairs (a, Z) where

$$(61.9.0.1) \quad \begin{aligned} a : T &\rightarrow Y \text{ is a morphism over } S, \\ Z &\subset T \times_Y X \text{ is an open subspace} \\ &\text{such that } \text{pr}_0|_Z : Z \rightarrow T \text{ is finite.} \end{aligned}$$

Suppose $h : T' \rightarrow T$ is a morphism of algebraic spaces over S and (a, Z) is a pair over T . Set $a' = a \circ h$ and $Z' = (h \times \text{id}_X)^{-1}(Z) = T' \times_T Z$. Then the pair (a', Z') satisfies (1), (2) over T' . This follows as finite morphisms are preserved under base change, see Morphisms of Spaces, Lemma 49.41.5. Thus we obtain a functor

$$(61.9.0.2) \quad \begin{array}{ccc} (X/Y)_{fin} : (Sch/S)^{opp} & \longrightarrow & Sets \\ T & \longmapsto & \{(a, Z) \text{ as above}\} \end{array}$$

For applications we are mainly interested in this functor $(X/Y)_{fin}$ when f is separated and locally of finite type. To get an idea of what this is all about, take a look at Remark 61.9.6.

Lemma 61.9.1. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then we have*

- (1) *The presheaf $(X/Y)_{fin}$ satisfies the sheaf condition for the fppf topology.*
- (2) *If T is an algebraic space over S , then there is a canonical bijection*

$$\text{Mor}_{Sh((Sch/S)_{fppf})}(T, (X/Y)_{fin}) = \{(a, Z) \text{ satisfying 61.9.0.1}\}$$

Proof. Let T be an algebraic space over S . Let $\{T_i \rightarrow T\}$ be an fppf covering (by algebraic spaces). Let $s_i = (a_i, Z_i)$ be pairs over T_i satisfying 61.9.0.1 such that we have $s_i|_{T_i \times_T T_j} = s_j|_{T_i \times_T T_j}$. First, this implies in particular that a_i and a_j define the same morphism $T_i \times_T T_j \rightarrow Y$. By Descent on Spaces, Lemma 56.6.2 we deduce that there exists a unique morphism $a : T \rightarrow Y$ such that a_i equals the composition $T_i \rightarrow T \rightarrow Y$. Second, this implies that $Z_i \subset T_i \times_Y X$ are open subspaces whose inverse images in $(T_i \times_T T_j) \times_Y X$ are equal. Since $\{T_i \times_Y X \rightarrow T \times_Y X\}$ is an fppf covering we deduce that there exists a unique open subspace $Z \subset T \times_Y X$ which restricts back to Z_i over T_i , see Descent on Spaces, Lemma 56.6.1. We claim that the projection $Z \rightarrow T$ is finite. This follows as being finite is local for the fpqc topology, see Descent on Spaces, Lemma 56.10.21.

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S . In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say “pair” we mean a pair satisfying conditions 61.9.0.1.

Let $v : T \rightarrow (X/Y)_{fin}$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \rightarrow T$. Then $v(p) \in (X/Y)_{fin}(U)$ corresponds to a pair (a_U, Z_U) over U . Let $R = U \times_T U$ with projections $t, s : R \rightarrow U$. As v is a transformation of functors we see that the pullbacks of (a_U, Z_U) by s and t agree. Hence, since $\{U \rightarrow T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, Z) over T .

Conversely, let (a, Z) be a pair over T . Let $U \rightarrow T$, $R = U \times_T U$, and $t, s : R \rightarrow U$ be as above. Then the restriction $(a, Z)|_U$ gives rise to a transformation of functors $v : h_U \rightarrow (X/Y)_{fin}$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the

two pullbacks $s^*(a, Z)|_U$ and $t^*(a, Z)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \rightarrow h_U$. Since $T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 47.9.1 and since $(X/Y)_{fin}$ is an fppf sheaf by (1) we conclude that v factors through a map $T \rightarrow (X/Y)_{fin}$.

We omit the verification that the two constructions above are mutually inverse. \square

Lemma 61.9.2. *Let S be a scheme. Consider a commutative diagram*

$$\begin{array}{ccc} X' & \xrightarrow{\quad j \quad} & X \\ & \searrow & \swarrow \\ & Y & \end{array}$$

of algebraic spaces over S . If j is an open immersion, then there is a canonical injective map of sheaves $j : (X'/Y)_{fin} \rightarrow (X/Y)_{fin}$.

Proof. If (a, Z) is a pair over T for X'/Y , then $(a, j(Z))$ is a pair over T for X/Y . \square

Lemma 61.9.3. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is locally of finite type. Let $X' \subset X$ be the maximal open subspace over which f is locally quasi-finite, see Morphisms of Spaces, Lemma 49.32.7. Then $(X/Y)_{fin} = (X'/Y)_{fin}$.*

Proof. Lemma 61.9.2 gives us an injective map $(X'/Y)_{fin} \rightarrow (X/Y)_{fin}$. Morphisms of Spaces, Lemma 49.32.7 assures us that formation of X' commutes with base change. Hence everything comes down to proving that if $Z \subset X$ is an open subspace such that $f|_Z : Z \rightarrow Y$ is finite, then $Z \subset X'$. This is true because a finite morphism is locally quasi-finite, see Morphisms of Spaces, Lemma 49.41.8. \square

Lemma 61.9.4. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let T be an algebraic space over S , and let (a, Z) be a pair as in 61.9.0.1. If f is separated, then Z is closed in $T \times_Y X$.*

Proof. A finite morphism of algebraic spaces is universally closed by Morphisms of Spaces, Lemma 49.41.9. Since f is separated so is the morphism $T \times_Y X \rightarrow T$, see Morphisms of Spaces, Lemma 49.4.4. Thus the closedness of Z follows from Morphisms of Spaces, Lemma 49.37.6. \square

Remark 61.9.5. Let $f : X \rightarrow Y$ be a separated morphism of algebraic spaces. The sheaf $(X/Y)_{fin}$ comes with a natural map $(X/Y)_{fin} \rightarrow Y$ by mapping the pair $(a, Z) \in (X/Y)_{fin}(T)$ to the element $a \in Y(T)$. We can use Lemma 61.9.4 to define operations

$$\star_i : (X/Y)_{fin} \times_Y (X/Y)_{fin} \longrightarrow (X/Y)_{fin}$$

by the rules

$$\begin{aligned} \star_1 & : ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \cup Z_2) \\ \star_2 & : ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \cap Z_2) \\ \star_3 & : ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \setminus Z_2) \\ \star_4 & : ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_2 \setminus Z_1). \end{aligned}$$

The reason this works is that $Z_1 \cap Z_2$ is both open and closed inside Z_1 and Z_2 (which also implies that $Z_1 \cup Z_2$ is the disjoint union of the other three pieces).

Thus we can think of $(X/Y)_{fin}$ as an \mathbf{F}_2 -algebras (without unit) over Y with multiplication given by $ss' = \star_2(s, s')$, and addition given by

$$s + s' = \star_1(\star_3(s, s'), \star_4(s, s'))$$

which boils down to taking the symmetric difference. Note that in this sheaf of algebras $0 = (1_Y, \emptyset)$ and that indeed $s + s = 0$ for any local section s . If $f : X \rightarrow Y$ is finite, then this algebra has a unit namely $1 = (1_Y, X)$ and $\star_3(s, s') = s(1 + s')$, and $\star_4(s, s') = (1 + s)s'$.

Remark 61.9.6. Let $f : X \rightarrow Y$ be a separated, locally quasi-finite morphism of schemes. In this case the sheaf $(X/Y)_{fin}$ is closely related to the sheaf $f_! \mathbf{F}_2$ (insert future reference here) on $Y_{\acute{e}tale}$. Namely, if $V \rightarrow Y$ is étale, and $s \in \Gamma(V, f_! \mathbf{F}_2)$, then $s \in \Gamma(V \times_Y X, \mathbf{F}_2)$ is a section with proper support $Z = \text{Supp}(s)$ over V . Since f is also locally quasi-finite we see that the projection $Z \rightarrow V$ is actually finite. Since the support of a section of a constant abelian sheaf is open we see that the pair $(V \rightarrow Y, \text{Supp}(s))$ satisfies 61.9.0.1. In fact, $f_! \mathbf{F}_2 \cong (X/Y)_{fin}|_{Y_{\acute{e}tale}}$ in this case which also explains the \mathbf{F}_2 -algebra structure introduced in Remark 61.9.5.

Lemma 61.9.7. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . The diagonal of $(X/Y)_{fin} \rightarrow Y$*

$$(X/Y)_{fin} \longrightarrow (X/Y)_{fin} \times_Y (X/Y)_{fin}$$

is representable (by schemes) and an open immersion and the “absolute” diagonal

$$(X/Y)_{fin} \longrightarrow (X/Y)_{fin} \times (X/Y)_{fin}$$

is representable (by schemes).

Proof. The second statement follows from the first as the absolute diagonal is the composition of the relative diagonal and a base change of the diagonal of Y (which is representable by schemes), see Spaces, Section 47.3. To prove the first assertion we have to show the following: Given a scheme T and two pairs (a, Z_1) and (a, Z_2) over T with identical first component satisfying 61.9.0.1 there is an open subscheme $V \subset T$ with the following property: For any morphism of schemes $h : T' \rightarrow T$ we have

$$h(T') \subset V \Leftrightarrow (T' \times_T Z_1 = T' \times_T Z_2 \text{ as subspaces of } T' \times_Y X)$$

Let us construct V . Note that $Z_1 \cap Z_2$ is open in Z_1 and in Z_2 . Since $\text{pr}_0|_{Z_i} : Z_i \rightarrow T$ is finite, hence proper (see Morphisms of Spaces, Lemma 49.41.9) we see that

$$E = \text{pr}_0|_{Z_1} (Z_1 \setminus Z_1 \cap Z_2) \cup \text{pr}_0|_{Z_2} (Z_2 \setminus Z_1 \cap Z_2)$$

is closed in T . Now it is clear that $V = T \setminus E$ works. \square

Lemma 61.9.8. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Suppose that U is a scheme, $U \rightarrow Y$ is an étale morphism and $Z \subset U \times_Y X$ is an open subspace finite over U . Then the induced morphism $U \rightarrow (X/Y)_{fin}$ is étale.*

Proof. This is formal from the description of the diagonal in Lemma 61.9.7 but we write it out since it is an important step in the development of the theory. We have to check that for any scheme T over S and a morphism $T \rightarrow (X/Y)_{fin}$ the projection map

$$T \times_{(X/Y)_{fin}} U \longrightarrow T$$

is étale. Note that

$$T \times_{(X/Y)_{fin}} U = (X/Y)_{fin} \times_{((X/Y)_{fin} \times_Y (X/Y)_{fin})} (T \times_Y U)$$

Applying the result of Lemma 61.9.7 we see that $T \times_{(X/Y)_{fin}} U$ is represented by an open subscheme of $T \times_Y U$. As the projection $T \times_Y U \rightarrow T$ is étale by Morphisms of Spaces, Lemma 49.36.4 we conclude. \square

Lemma 61.9.9. *Let S be a scheme. Let*

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ Y' & \longrightarrow & Y \end{array}$$

be a fibre product square of algebraic spaces over S . Then

$$\begin{array}{ccc} (X'/Y')_{fin} & \longrightarrow & (X/Y)_{fin} \\ \downarrow & & \downarrow \\ Y' & \longrightarrow & Y \end{array}$$

is a fibre product square of sheaves on $(Sch/S)_{fppf}$.

Proof. It follows immediately from the definitions that the sheaf $(X'/Y')_{fin}$ is equal to the sheaf $Y' \times_Y (X/Y)_{fin}$. \square

Lemma 61.9.10. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . If f is separated and locally quasi-finite, then there exists a scheme U étale over Y and a surjective étale morphism $U \rightarrow (X/Y)_{fin}$ over Y .*

Proof. Note that the assertion makes sense by the result of Lemma 61.9.7 on the diagonal of $(X/Y)_{fin}$, see Spaces, Lemma 47.5.10. Let V be a scheme and let $V \rightarrow Y$ be a surjective étale morphism. By Lemma 61.9.9 the morphism $(V \times_Y X/V)_{fin} \rightarrow (X/Y)_{fin}$ is a base change of the map $V \rightarrow Y$ and hence is surjective and étale, see Spaces, Lemma 47.5.5. Hence it suffices to prove the lemma for $(V \times_Y X/V)_{fin}$. (Here we implicitly use that the composition of representable, surjective, and étale transformations of functors is again representable, surjective, and étale, see Spaces, Lemmas 47.3.2 and 47.5.4, and Morphisms, Lemmas 28.11.2 and 28.37.3.) Note that the properties of being separated and locally quasi-finite are preserved under base change, see Morphisms of Spaces, Lemmas 49.4.4 and 49.26.4. Hence $V \times_Y X \rightarrow V$ is separated and locally quasi-finite as well, and by Morphisms of Spaces, Proposition 49.44.2 we see that $V \times_Y X$ is a scheme as well. Thus we may assume that $f : X \rightarrow Y$ is a separated and locally quasi-finite morphism of schemes.

Pick a point $y \in Y$. Pick $x_1, \dots, x_n \in X$ points lying over y . Pick an étale neighbourhood $a : (U, u) \rightarrow (Y, y)$ and a decomposition

$$U \times_S X = W \amalg \amalg_{i=1, \dots, n} \amalg_{j=1, \dots, m_j} V_{i,j}$$

as in More on Morphisms, Lemma 36.30.5. Pick any subset

$$I \subset \{(i, j) \mid 1 \leq i \leq n, 1 \leq j \leq m_i\}.$$

Given these choices we obtain a pair (a, Z) with $Z = \bigcup_{(i,j) \in I} V_{i,j}$ which satisfies conditions 61.9.0.1. In other words we obtain a morphism $U \rightarrow (X/Y)_{fin}$. The

construction of this morphism depends on all the things we picked above, so we should really write

$$U(y, n, x_1, \dots, x_n, a, I) \longrightarrow (X/Y)_{fin}$$

This morphism is étale by Lemma 61.9.8.

Claim: The disjoint union of all of these is surjective onto $(X/Y)_{fin}$. It is clear that if the claim holds, then the lemma is true.

To show surjectivity we have to show the following (see Spaces, Remark 47.5.2): Given a scheme T over S , a point $t \in T$, and a map $T \rightarrow (X/Y)_{fin}$ we can find a datum $(y, n, x_1, \dots, x_n, a, I)$ as above such that t is in the image of the projection map

$$U(y, n, x_1, \dots, x_n, a, I) \times_{(X/Y)_{fin}} T \longrightarrow T.$$

To prove this we may clearly replace T by $\text{Spec}(\overline{\kappa(t)})$ and $T \rightarrow (X/Y)_{fin}$ by the composition $\text{Spec}(\overline{\kappa(t)}) \rightarrow T \rightarrow (X/Y)_{fin}$. In other words, we may assume that T is the spectrum of an algebraically closed field.

Let $T = \text{Spec}(k)$ be the spectrum of an algebraically closed field k . The morphism $T \rightarrow (X/Y)_{fin}$ is given by a pair $(T \rightarrow Y, Z)$ satisfying conditions 61.9.0.1. Here is a picture:

$$\begin{array}{ccc} & Z & \longrightarrow X \\ & \downarrow & \downarrow \\ \text{Spec}(k) & \xlongequal{\quad} T & \longrightarrow Y \end{array}$$

Let $y \in Y$ be the image point of $T \rightarrow Y$. Since Z is finite over k it has finitely many points. Thus there exist finitely many points $x_1, \dots, x_n \in X$ such that the image of Z in X is contained in $\{x_1, \dots, x_n\}$. Choose $a : (U, u) \rightarrow (Y, y)$ adapted to y and x_1, \dots, x_n as above, which gives the diagram

$$\begin{array}{ccc} W \amalg \amalg_{i=1, \dots, n} \amalg_{j=1, \dots, m_j} V_{i,j} & \longrightarrow & X \\ \downarrow & & \downarrow \\ U & \longrightarrow & Y. \end{array}$$

Since k is algebraically closed and $\kappa(y) \subset \kappa(u)$ is finite separable we may factor the morphism $T = \text{Spec}(k) \rightarrow Y$ through the morphism $u = \text{Spec}(\kappa(u)) \rightarrow \text{Spec}(\kappa(y)) = y \subset Y$. With this choice we obtain the commutative diagram:

$$\begin{array}{ccccc} Z & \longrightarrow & W \amalg \amalg_{i=1, \dots, n} \amalg_{j=1, \dots, m_j} V_{i,j} & \longrightarrow & X \\ \downarrow & & \downarrow & & \downarrow \\ \text{Spec}(k) & \longrightarrow & U & \longrightarrow & Y \end{array}$$

We know that the image of the left upper arrow ends up in $\amalg V_{i,j}$. Recall also that Z is an open subscheme of $\text{Spec}(k) \times_Y X$ by definition of $(X/Y)_{fin}$ and that the right hand square is a fibre product square. Thus we see that

$$Z \subset \amalg_{i=1, \dots, n} \amalg_{j=1, \dots, m_j} \text{Spec}(k) \times_U V_{i,j}$$

is an open subscheme. By construction (see More on Morphisms, Lemma 36.30.5) each $V_{i,j}$ has a unique point $v_{i,j}$ lying over u with purely inseparable residue field

extension $\kappa(u) \subset \kappa(v_{i,j})$. Hence each scheme $\text{Spec}(k) \times_U V_{i,j}$ has exactly one point. Thus we see that

$$Z = \coprod_{(i,j) \in I} \text{Spec}(k) \times_U V_{i,j}$$

for a unique subset $I \subset \{(i, j) \mid 1 \leq i \leq n, 1 \leq j \leq m_i\}$. Unwinding the definitions this shows that

$$U(y, n, x_1, \dots, x_n, a, I) \times_{(X/Y)_{fin}} T$$

with I as found above is nonempty as desired. □

Proposition 61.9.11. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is separated and locally of finite type. Then $(X/Y)_{fin}$ is an algebraic space. Moreover, the morphism $(X/Y)_{fin} \rightarrow Y$ is étale.*

Proof. By Lemma 61.9.3 we may replace X by the open subscheme which is locally quasi-finite over Y . Hence we may assume that f is separated and locally quasi-finite. We will check the three conditions of Spaces, Definition 47.6.1. Condition (1) follows from Lemma 61.9.1. Condition (2) follows from Lemma 61.9.7. Finally, condition (3) follows from Lemma 61.9.10. Thus $(X/Y)_{fin}$ is an algebraic space. Moreover, that lemma shows that there exists a commutative diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & (X/Y)_{fin} \\ & \searrow & \swarrow \\ & Y & \end{array}$$

with horizontal arrow surjective and étale and south-east arrow étale. By Properties of Spaces, Lemma 48.13.3 this implies that the south-west arrow is étale as well. □

Remark 61.9.12. The condition that f be separated cannot be dropped from Proposition 61.9.11. An example is to take X the affine line with zero doubled, see Schemes, Example 25.14.3, $Y = \mathbf{A}_k^1$ the affine line, and $X \rightarrow Y$ the obvious map. Recall that over $0 \in Y$ there are two points 0_1 and 0_2 in X . Thus $(X/Y)_{fin}$ has four points over 0 , namely $\emptyset, \{0_1\}, \{0_2\}, \{0_1, 0_2\}$. Of these four points only three can be lifted to an open subscheme of $U \times_Y X$ finite over U for $U \rightarrow Y$ étale, namely $\emptyset, \{0_1\}, \{0_2\}$. This shows that $(X/Y)_{fin}$ if representable by an algebraic space is not étale over Y . Similar arguments show that $(X/Y)_{fin}$ is really not an algebraic space. Details omitted.

Remark 61.9.13. Let $Y = \mathbf{A}_{\mathbf{R}}^1$ be the affine line over the real numbers, and let $X = \text{Spec}(\mathbf{C})$ mapping to the \mathbf{R} -rational point 0 in Y . In this case the morphism $f : X \rightarrow Y$ is finite, but it is not the case that $(X/Y)_{fin}$ is a scheme. Namely, one can show that in this case the algebraic space $(X/Y)_{fin}$ is isomorphic to the algebraic space of Spaces, Example 47.14.2 associated to the extension $\mathbf{R} \subset \mathbf{C}$. Thus it is really necessary to leave the category of schemes in order to represent the sheaf $(X/Y)_{fin}$, even when f is a finite morphism.

Lemma 61.9.14. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S which is separated, flat, and locally of finite presentation. In this case*

- (1) $(X/Y)_{fin} \rightarrow Y$ is separated, representable, and étale, and
- (2) if Y is a scheme, then $(X/Y)_{fin}$ is (representable by) a scheme.

Proof. Since f is in particular separated and locally of finite type (see Morphisms of Spaces, Lemma 49.27.5) we see that $(X/Y)_{fin}$ is an algebraic space by Proposition 61.9.11. To prove that $(X/Y)_{fin} \rightarrow Y$ is separated we have to show the following: Given a scheme T and two pairs (a, Z_1) and (a, Z_2) over T with identical first component satisfying 61.9.0.1 there is a closed subscheme $V \subset T$ with the following property: For any morphism of schemes $h : T' \rightarrow T$ we have

$$h \text{ factors through } V \Leftrightarrow \left(T' \times_T Z_1 = T' \times_T Z_2 \text{ as subspaces of } T' \times_Y X \right)$$

In the proof of Lemma 61.9.7 we have seen that $V = T' \setminus E$ is an open subscheme of T' with closed complement

$$E = \text{pr}_0|_{Z_1} (Z_1 \setminus Z_1 \cap Z_2) \cup \text{pr}_0|_{Z_2} (Z_2 \setminus Z_1 \cap Z_2).$$

Thus everything comes down to showing that E is also open. By Lemma 61.9.4 we see that Z_1 and Z_2 are closed in $T' \times_Y X$. Hence $Z_1 \setminus Z_1 \cap Z_2$ is open in Z_1 . As f is flat and locally of finite presentation, so is $\text{pr}_0|_{Z_1}$. This is true as Z_1 is an open subspace of the base change $T' \times_Y X$, and Morphisms of Spaces, Lemmas 49.27.3 and Lemmas 49.28.4. Hence $\text{pr}_0|_{Z_1}$ is open, see Morphisms of Spaces, Lemma 49.28.6. Thus $\text{pr}_0|_{Z_1} (Z_1 \setminus Z_1 \cap Z_2)$ is open and it follows that E is open as desired.

We have already seen that $(X/Y)_{fin} \rightarrow Y$ is étale, see Proposition 61.9.11. Hence now we know it is locally quasi-finite (see Morphisms of Spaces, Lemma 49.36.5) and separated, hence representable by Morphisms of Spaces, Lemma 49.45.1. The final assertion is clear (if you like you can use Morphisms of Spaces, Proposition 49.44.2). \square

Variant: Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\sigma : Y \rightarrow X$ be a section of f . For an algebraic space or a scheme T over S consider pairs (a, Z) where

$$(61.9.14.1) \quad \begin{aligned} & a : T \rightarrow Y \text{ is a morphism over } S, \\ & Z \subset T \times_Y X \text{ is an open subspace} \\ & \text{such that } \text{pr}_0|_Z : Z \rightarrow T \text{ is finite and} \\ & (1_T, \sigma \circ a) : T \rightarrow T \times_Y X \text{ factors through } Z. \end{aligned}$$

We will denote $(X/Y, \sigma)_{fin}$ the subfunctor of $(X/Y)_{fin}$ parametrizing these pairs.

Lemma 61.9.15. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Let $\sigma : Y \rightarrow X$ be a section of f . Consider the transformation of functors*

$$t : (X/Y, \sigma)_{fin} \longrightarrow (X/Y)_{fin}.$$

defined above. Then

- (1) *t is representable by open immersions,*
- (2) *if f is separated, then t is representable by open and closed immersions,*
- (3) *if $(X/Y)_{fin}$ is an algebraic space, then $(X/Y, \sigma)_{fin}$ is an algebraic space and an open subspace of $(X/Y)_{fin}$, and*
- (4) *if $(X/Y)_{fin}$ is a scheme, then $(X/Y, \sigma)_{fin}$ is an open subscheme of it.*

Proof. Omitted. Hint: Given a pair (a, Z) over T as in (61.9.0.1) the inverse image of Z by $(1_T, \sigma \circ a) : T \rightarrow T \times_Y X$ is the open subscheme of T we are looking for. \square

61.10. Finite collections of arrows

Let \mathcal{C} be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 38.11 this corresponds to a septuple $(\text{Ob}, \text{Arrows}, s, t, c, e, i)$.

Using this data we can make another groupoid \mathcal{C}_{fin} as follows:

- (1) An object of \mathcal{C}_{fin} consists of a finite subset $Z \subset \text{Arrows}$ with the following properties:
 - (a) $s(Z) = \{u\}$ is a singleton, and
 - (b) $e(u) \in Z$.
- (2) A morphism of \mathcal{C}_{fin} consists of a pair (Z, z) , where Z is an object of \mathcal{C}_{fin} and $z \in Z$.
- (3) The source of (Z, z) is Z .
- (4) The target of (Z, z) is $t(Z, z) = \{z' \circ z^{-1}; z' \in Z\}$.
- (5) Given $(Z_1, z_1), (Z_2, z_2)$ such that $s(Z_1, z_1) = t(Z_2, z_2)$ the composition $(Z_1, z_1) \circ (Z_2, z_2)$ is $(Z_2, z_1 \circ z_2)$.

We omit the verification that this defines a groupoid. Pictorially an object of \mathcal{C}_{fin} can be viewed as a diagram

To make a morphism of \mathcal{C}_{fin} you pick one of the arrows and you precompose the other arrows by its inverse. For example if we pick the middle horizontal arrow then the target is the picture

Note that the cardinalities of $s(Z, z)$ and $t(Z, z)$ are equal. So \mathcal{C}_{fin} is really a countable disjoint union of groupoids.

61.11. The finite part of a groupoid

In this section we are going to use the idea explained in Section 61.10 to take the finite part of a groupoid in algebraic spaces.

Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B . Assumption: The morphisms s, t are separated and locally of finite type. This notation and assumption will be fixed throughout this section.

Denote R_s the algebraic space R seen as an algebraic space over U via s . Let $U' = (R_s/U, e)_{fin}$. Since s is separated and locally of finite type, by Proposition 61.9.11 and Lemma 61.9.15, we see that U' is an algebraic space endowed with an

étale morphism $g : U' \rightarrow U$. Moreover, by Lemma 61.9.1 there exists a universal open subspace $Z_{univ} \subset R \times_{s,U,g} U'$ which is finite over U' and such that $(1_{U'}, e \circ g) : U' \rightarrow R \times_{s,U,g} U'$ factors through Z_{univ} . Moreover, by Lemma 61.9.4 the open subspace Z_{univ} is also closed in $R \times_{s,U',g} U$. Picture so far:

$$\begin{array}{ccc}
 & Z_{univ} & \\
 & \downarrow & \searrow \\
 R \times_{s,U,g} U' & \longrightarrow & U' \\
 \downarrow & & \downarrow g \\
 R & \xrightarrow{s} & U
 \end{array}$$

Let T be a scheme over B . We see that a T -valued point of Z_{univ} may be viewed as a triple (u, Z, z) where

- (1) $u : T \rightarrow U$ is a T -valued point of U ,
- (2) $Z \subset R \times_{s,U,u} T$ is an open and closed subspace finite over T such that $(e \circ u, 1_T)$ factors through it, and
- (3) $z : T \rightarrow R$ is a T -valued point of R with $s \circ z = u$ and such that $(z, 1_T)$ factors through Z .

Having said this, it is morally clear from the discussion in Section 61.10 that we can turn (Z_{univ}, U') into a groupoid in algebraic spaces over B . To make sure will define the morphisms s', t', c', e', i' one by one using the functorial point of view. (Please don't read this before reading and understanding the simple construction in Section 61.10.)

The morphism $s' : Z_{univ} \rightarrow U'$ corresponds to the rule

$$s' : (u, Z, z) \mapsto (u, Z).$$

The morphism $t' : Z_{univ} \rightarrow U'$ is given by the rule

$$t' : (u, Z, z) \mapsto (t \circ z, c(Z, i \circ z)).$$

The entry $c(Z, i \circ z)$ makes sense as the map $c(-, i \circ z) : R \times_{s,U,u} T \rightarrow R \times_{s,U,t \circ z} T$ is an isomorphism with inverse $c(-, z)$. The morphism $e' : U' \rightarrow Z_{univ}$ is given by the rule

$$e' : (u, Z) \mapsto (u, Z, (e \circ u, 1_T)).$$

Note that this makes sense by the requirement that $(e \circ u, 1_T)$ factors through Z . The morphism $i' : Z_{univ} \rightarrow Z_{univ}$ is given by the rule

$$i' : (u, Z, z) \mapsto (t \circ z, c(Z, i \circ z), i \circ z).$$

Finally, composition is defined by the rule

$$c' : ((u_1, Z_1, z_1), (u_2, Z_2, z_2)) \mapsto (u_2, Z_2, z_1 \circ z_2).$$

We omit the verification that the axioms of a groupoid in algebraic spaces hold for $(U', Z_{univ}, s', t', c', e', i')$.

A final piece of information is that there is a canonical morphism of groupoids

$$(U', Z_{univ}, s', t', c', e', i') \longrightarrow (U, R, s, t, c, e, i)$$

Namely, the morphism $U' \rightarrow U$ is the morphism $g : U' \rightarrow U$ which is defined by the rule $(u, Z) \mapsto u$. The morphism $Z_{univ} \rightarrow R$ is defined by the rule $(u, Z, z) \mapsto z$. This finishes the construction. Let us summarize our findings as follows.

Lemma 61.11.1. *Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B . Assume the morphisms s, t are separated and locally of finite type. There exists a canonical morphism*

$$(U', Z_{univ}, s', t', c', e', i') \longrightarrow (U, R, s, t, c, e, i)$$

of groupoids in algebraic spaces over B where

- (1) $g : U' \rightarrow U$ is identified with $(R_s/U, e)_{fin} \rightarrow U$, and
- (2) $Z_{univ} \subset R \times_{s, U, g} U'$ is the universal open (and closed) subspace finite over U' which contains the base change of the unit e .

Proof. See discussion above. □

61.12. Étale localization of groupoid schemes

In this section we prove results similar to [KM97, Proposition 4.2]. We try to be a bit more general, and we try to avoid using Hilbert schemes by using the finite part of a morphism instead. The goal is to "split" a groupoid in algebraic spaces over a point after étale localization. Here is the definition (very similar to [KM97, Definition 4.1]).

Definition 61.12.1. Let S be a scheme. Let B be an algebraic space over S . Let (U, R, s, t, c) be a groupoid in algebraic spaces over B . Let $u \in |U|$ be a point.

- (1) We say R is *split over u* if there exists an open subspace $P \subset R$ such that
 - (a) $(U, P, s|_P, t|_P, c|_{P \times_{s, U, t} P})$ is a groupoid in algebraic spaces over B ,
 - (b) $s|_P, t|_P$ are finite, and
 - (c) $\{r \in |R| : s(r) = u, t(r) = u\} \subset P$.

The choice of such a P will be called a *splitting of R over u* .

- (2) We say R is *quasi-split over u* if there exists an open subspace $P \subset R$ such that
 - (a) $(U, P, s|_P, t|_P, c|_{P \times_{s, U, t} P})$ is a groupoid in algebraic spaces over B ,
 - (b) $s|_P, t|_P$ are finite, and
 - (c) $e(u) \in |P|$.

The choice of such a P will be called a *quasi-splitting of R over u* .

Note the similarity of the conditions on P to the conditions on pairs in (61.9.0.1). In particular, if s, t are separated, then P is also closed in R (see Lemma 61.9.4).

Suppose we start with a groupoid in algebraic spaces (U, R, s, t, c) over B and a point $u \in |U|$. Since the goal is to split the groupoid after étale localization we may as well replace U by an affine scheme (what we mean is that this is harmless for any possible application). Moreover, the additional hypotheses we are going to have to impose will force R to be a scheme at least in a neighbourhood of $\{r \in |R| : s(r) = u, t(r) = u\}$ or $e(u)$. This is why we start with a groupoid scheme as described below. However, our technique of proof leads us outside of the category of schemes, which is why we have formulated a splitting for the case of groupoids in algebraic spaces above. On the other hand, we know of no applications but the

¹This condition is implied by (a).

case where the morphisms s, t are also flat and of finite presentation, in which case we end up back in the category of schemes.

Situation 61.12.2. (Assumptions for splitting.) Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let $u \in U$ be a point. Assume that

- (1) $s, t : R \rightarrow U$ are separated,
- (2) s, t are locally of finite type,
- (3) the set $\{r \in R : s(r) = u, t(r) = u\}$ is finite, and
- (4) s is quasi-finite at each point of the set in (3).

Note that assumptions (3) and (4) are implied by the assumption that the fibre $s^{-1}(\{u\})$ is finite, see Morphisms, Lemma 28.21.7.

Situation 61.12.3. (Assumptions for quasi-splitting.) Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let $u \in U$ be a point. Assume that

- (1) $s, t : R \rightarrow U$ are separated,
- (2) s, t are locally of finite type, and
- (3) s is quasi-finite at $e(u)$.

It turns out that for applications to the existence theorems for algebraic spaces the case of quasi-splittings is sufficient. In fact, it is for us somehow a more natural case to consider, as in the stacks project there are no finiteness conditions on the diagonal of an algebraic space, hence the assumption that $\{r \in R : s(r) = u, t(r) = u\}$ is finite need not hold even for a presentation $X = U/R$ of an algebraic space X .

Lemma 61.12.4. *Assumptions and notation as in Situation 61.12.2. Then there exists an algebraic space U' , an étale morphism $U' \rightarrow U$, and a point $u' : \text{Spec}(\kappa(u)) \rightarrow U'$ lying over $u : \text{Spec}(\kappa(u)) \rightarrow U$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u' .*

Proof. Let $f : (U', Z_{univ}, s', t', c') \rightarrow (U, R, s, t, c)$ be as constructed in Lemma 61.11.1. Recall that $R' = R \times_{(U \times_S U)} (U' \times_S U')$. Thus we get a morphism $(f, t', s') : Z_{univ} \rightarrow R'$ of groupoids in algebraic spaces

$$(U', Z_{univ}, s', t', c') \rightarrow (U', R', s', t', c')$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times_{s, U, g} U'$ is open and $R' \rightarrow R \times_{s, U, g} U'$ is étale (as a base change of $U' \rightarrow U$) we see that $Z_{univ} \rightarrow R'$ is an open immersion. By construction the morphisms $s', t' : Z_{univ} \rightarrow U'$ are finite. It remains to find the point u' of U' .

We think of u as a morphism $\text{Spec}(\kappa(u)) \rightarrow U$ as in the statement of the lemma. Set $F_u = R \times_{s, U} \text{Spec}(\kappa(u))$. The set $\{r \in R : s(r) = u, t(r) = u\}$ is finite by assumption and $F_u \rightarrow \text{Spec}(\kappa(u))$ is quasi-finite at each of its elements. Hence we can find a decomposition into open and closed subschemes

$$F_u = Z_u \coprod Rest$$

for some scheme Z_u finite over $\kappa(u)$ whose support is $\{r \in R : s(r) = u, t(r) = u\}$. Note that $e(u) \in Z_u$. Hence by the construction of U' in Section 61.11 (u, Z_u) defines a $\text{Spec}(\kappa(u))$ -valued point u' of U' .

We still have to show that the set $\{r' \in |R'| : s'(r') = u', t'(r') = u'\}$ is contained in $|Z_{univ}|$. Pick any point r' in this set and represent it by a morphism $r' : \text{Spec}(k) \rightarrow R'$. Denote $z : \text{Spec}(k) \rightarrow R$ the composition of r' with the map $R' \rightarrow R$. Since

$\kappa(u) = \kappa(u')$, and since $s'(r') = u'$, $t(r') = u'$ no information is lost by considering the point z rather than the point r' , i.e., we can recover r' from the point z . For example z is an element of the set $\{r \in R : s(r) = u, t(r) = u\}$ by our assumption on r' . The composition $s \circ z : \text{Spec}(k) \rightarrow U$ factors through u , so we may think of $s \circ z$ as a morphism $\text{Spec}(k) \rightarrow \text{Spec}(\kappa(u))$. Hence we can consider the triple

$$(s \circ z, Z_u \times_{\text{Spec}(\kappa(u)), s \circ z} \text{Spec}(k), z)$$

where Z_u is as above. This defines a $\text{Spec}(k)$ -valued point of Z_{univ} above whose image under the map $Z_{univ} \rightarrow R'$ is the point r' by the relationship between z and r' mentioned above. This finishes the proof. \square

Lemma 61.12.5. *Assumptions and notation as in Situation 61.12.3. Then there exists an algebraic space U' , an étale morphism $U' \rightarrow U$, and a point $u' : \text{Spec}(\kappa(u)) \rightarrow U'$ lying over $u : \text{Spec}(\kappa(u)) \rightarrow U$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u' .*

Proof. The proof is almost exactly the same as the proof of Lemma 61.12.4. Let $f : (U', Z_{univ}, s', t', c') \rightarrow (U, R, s, t, c)$ be as constructed in Lemma 61.11.1. Recall that $R' = R \times_{(U \times_S U)} (U' \times_S U')$. Thus we get a morphism $(f, t', s') : Z_{univ} \rightarrow R'$ of groupoids in algebraic spaces

$$(U', Z_{univ}, s', t', c') \rightarrow (U', R', s', t', c')$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times_{s, U, g} U'$ is open and $R' \rightarrow R \times_{s, U, g} U'$ is étale (as a base change of $U' \rightarrow U$) we see that $Z_{univ} \rightarrow R'$ is an open immersion. By construction the morphisms $s', t' : Z_{univ} \rightarrow U'$ are finite. It remains to find the point u' of U' .

We think of u as a morphism $\text{Spec}(\kappa(u)) \rightarrow U$ as in the statement of the lemma. Set $F_u = R \times_{s, U} \text{Spec}(\kappa(u))$. The morphism $F_u \rightarrow \text{Spec}(\kappa(u))$ is quasi-finite at $e(u)$ by assumption. Hence we can find a decomposition into open and closed subschemes

$$F_u = Z_u \coprod Rest$$

for some scheme Z_u finite over $\kappa(u)$ whose support is $e(u)$. Hence by the construction of U' in Section 61.11 (u, Z_u) defines a $\text{Spec}(\kappa(u))$ -valued point u' of U' . To finish the proof we have to show that $e'(u') \in Z_{univ}$ which is clear. \square

Finally, when we add additional assumptions we obtain schemes.

Lemma 61.12.6. *Assumptions and notation as in Situation 61.12.2. Assume in addition that s, t are flat and locally of finite presentation. Then there exists a scheme U' , a separated étale morphism $U' \rightarrow U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u' .*

Proof. This follows from the construction of U' in the proof of Lemma 61.12.4 because in this case $U' = (R_s/U, e)_{fin}$ is a scheme separated over U by Lemmas 61.9.14 and 61.9.15. \square

Lemma 61.12.7. *Assumptions and notation as in Situation 61.12.3. Assume in addition that s, t are flat and locally of finite presentation. Then there exists a scheme U' , a separated étale morphism $U' \rightarrow U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u' .*

Proof. This follows from the construction of U' in the proof of Lemma 61.12.5 because in this case $U' = (R_s/U, e)_{fin}$ is a scheme separated over U by Lemmas 61.9.14 and 61.9.15. \square

In fact we can obtain affine schemes by applying an earlier result on finite locally free groupoids.

Lemma 61.12.8. *Assumptions and notation as in Situation 61.12.2. Assume in addition that s, t are flat and locally of finite presentation and that U is affine. Then there exists an affine scheme U' , an étale morphism $U' \rightarrow U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u' .*

Proof. Let $U' \rightarrow U$ and $u' \in U'$ be the étale morphism of schemes we found in Lemma 61.12.6. Let $P \subset R'$ be the splitting of R' over u' . By More on Groupoids, Lemma 39.8.1 the morphisms $s', t' : R' \rightarrow U'$ are flat and locally of finite presentation. They are finite by assumption. Hence s', t' are finite locally free, see Morphisms, Lemma 28.46.2. In particular $t(s^{-1}(u'))$ is a finite set of points $\{u'_1, u'_2, \dots, u'_n\}$ of U' . Choose a quasi-compact open $W \subset U'$ containing each u'_i . As U is affine the morphism $W \rightarrow U$ is quasi-compact (see Schemes, Lemma 25.19.2). The morphism $W \rightarrow U$ is also locally quasi-finite (see Morphisms, Lemma 28.37.6) and separated. Hence by More on Morphisms, Lemma 36.31.2 (a version of Zariski's Main Theorem) we conclude that W is quasi-affine. By Properties, Lemma 27.27.5 we see that $\{u'_1, \dots, u'_n\}$ are contained in an affine open of U' . Thus we may apply Groupoids, Lemma 38.22.1 to conclude that there exists an affine P -invariant open $U'' \subset U'$ which contains u' .

To finish the proof denote $R'' = R|_{U''}$ the restriction of R to U'' . This is the same as the restriction of R' to U'' . As $P \subset R'$ is an open and closed subscheme, so is $P|_{U''} \subset R''$. By construction the open subscheme $U'' \subset U'$ is P -invariant which means that $P|_{U''} = (s'|_P)^{-1}(U'') = (t'|_P)^{-1}(U'')$ (see discussion in Groupoids, Section 38.17) so the restrictions of s'' and t'' to $P|_{U''}$ are still finite. The subgroupoid scheme $P|_{U''}$ is still a splitting of R'' over u'' ; above we verified (a), (b) and (c) holds as $\{r' \in R' : t'(r') = u', s'(r') = u'\} = \{r'' \in R'' : t''(r'') = u', s''(r'') = u'\}$ trivially. The lemma is proved. \square

Lemma 61.12.9. *Assumptions and notation as in Situation 61.12.3. Assume in addition that s, t are flat and locally of finite presentation and that U is affine. Then there exists an affine scheme U' , an étale morphism $U' \rightarrow U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u' .*

Proof. The proof of this lemma is literally the same as the proof of Lemma 61.12.8 except that “splitting” needs to be replaced by “quasi-splitting” (2 times) and that the reference to Lemma 61.12.6. needs to be replaced by a reference to Lemma 61.12.7. \square

62.1. Introduction

In this chapter we use the material from the preceding sections to give criteria under which a presheaf of sets on the category of schemes is an algebraic space. Some of this material comes from the work of Artin, see [Art69b], [Art70], [Art73], [Art71b], [Art71a], [Art69a], [Art69c], and [Art74]. However, our method will be to use as much as possible arguments similar to those of the paper by Keel and Mori, see [KM97].

62.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf} . And all rings A considered have the property that $\text{Spec}(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S . In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

62.3. Morphisms representable by algebraic spaces

Here we define the notion of one presheaf being relatively representable by algebraic spaces over another, and we prove some properties of this notion.

Definition 62.3.1. Let S be a scheme contained in Sch_{fppf} . Let F, G be presheaves on Sch_{fppf}/S . We say a morphism $a : F \rightarrow G$ is *representable by algebraic spaces* if for every $U \in \text{Ob}((Sch/S)_{fppf})$ and any $\xi : U \rightarrow G$ the fiber product $U \times_{\xi, G} F$ is an algebraic space.

Here is a sanity check.

Lemma 62.3.2. *Let S be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over S . Then f is representable by algebraic spaces.*

Proof. This is formal. It relies on the fact that the category of algebraic spaces over S has fibre products, see Spaces, Lemma 47.7.3. \square

Lemma 62.3.3. *Let S be a scheme. Let*

$$\begin{array}{ccc} G' \times_G F & \longrightarrow & F \\ \downarrow a' & & \downarrow a \\ G' & \longrightarrow & G \end{array}$$

be a fibre square of presheaves on $(Sch/S)_{fppf}$. If a is representable by algebraic spaces so is a' .

Proof. Omitted. Hint: This is formal. \square

Lemma 62.3.4. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be representable by algebraic spaces. If G is a sheaf, then so is F .*

Proof. (Same as the proof of Spaces, Lemma 47.3.5.) Let $\{\varphi_i : T_i \rightarrow T\}$ be a covering of the site $(Sch/S)_{fppf}$. Let $s_i \in F(T_i)$ which satisfy the sheaf condition. Then $\sigma_i = a(s_i) \in G(T_i)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_i = \sigma|_{T_i}$. By assumption $F' = h_T \times_{\sigma, G, a} F$ is a sheaf. Note that $(\varphi_i, s_i) \in F'(T_i)$ satisfy the sheaf condition also, and hence come from some unique $(id_T, s) \in F'(T)$. Clearly s is the section of F we are looking for. \square

Lemma 62.3.5. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be representable by algebraic spaces. Then $\Delta_{F/G} : F \rightarrow F \times_G F$ is representable by algebraic spaces.*

Proof. (Same as the proof of Spaces, Lemma 47.3.6.) Let U be a scheme. Let $\xi = (\xi_1, \xi_2) \in (F \times_G F)(U)$. Set $\xi' = a(\xi_1) = a(\xi_2) \in G(U)$. By assumption there exist an algebraic space V and a morphism $V \rightarrow U$ representing the fibre product $U \times_{\xi', G} F$. In particular, the elements ξ_1, ξ_2 give morphisms $f_1, f_2 : U \rightarrow V$ over U . Because V represents the fibre product $U \times_{\xi', G} F$ and because $\xi' = a \circ \xi_1 = a \circ \xi_2$ we see that if $g : U' \rightarrow U$ is a morphism then

$$g^* \xi_1 = g^* \xi_2 \Leftrightarrow f_1 \circ g = f_2 \circ g.$$

In other words, we see that $U \times_{\xi, F \times_G F} F$ is represented by $V \times_{\Delta, V \times V, (f_1, f_2)} U$ which is an algebraic space. \square

The proof of Lemma 62.3.6 below is actually slightly tricky. Namely, we cannot use the argument of the proof of Spaces, Lemma 47.11.1 because we do not yet know that a composition of transformations representable by algebraic spaces is representable by algebraic spaces. In fact, we will use this lemma to prove that statement.

Lemma 62.3.6. *Let S be a scheme contained in Sch_{fppf} . Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be representable by algebraic spaces. If G is an algebraic space, then so is F .*

Proof. We have seen in Lemma 62.3.4 that F is a sheaf.

Let U be a scheme and let $U \rightarrow G$ be a surjective étale morphism. In this case $U \times_G F$ is an algebraic space. Let W be a scheme and let $W \rightarrow U \times_G F$ be a surjective étale morphism.

First we claim that $W \rightarrow F$ is representable. To see this let X be a scheme and let $X \rightarrow F$ be a morphism. Then

$$W \times_F X = W \times_{U \times_G F} U \times_G F \times_F X = W \times_{U \times_G F} (U \times_G X)$$

Since both $U \times_G F$ and G are algebraic spaces we see that this is a scheme.

Next, we claim that $W \rightarrow F$ is surjective and étale (this makes sense now that we know it is representable). This follows from the formula above since both $W \rightarrow U \times_G F$ and $U \rightarrow G$ are étale and surjective, hence $W \times_{U \times_G F} (U \times_G X) \rightarrow U \times_G X$ and $U \times_G X \rightarrow X$ are surjective and étale, and the composition of surjective étale morphisms is surjective and étale.

Set $R = W \times_F W$. By the above R is a scheme and the projections $t, s : R \rightarrow W$ are étale. It is clear that R is an equivalence relation, and $W \rightarrow F$ is a surjection of sheaves. Hence R is an étale equivalence relation and $F = W/R$. Hence F is an algebraic space by Spaces, Theorem 47.10.5. \square

Lemma 62.3.7. *Let S be a scheme. Let $a : F \rightarrow G$ be a map of presheaves on $(Sch/S)_{fppf}$. Suppose $a : F \rightarrow G$ is representable by algebraic spaces. If X is an algebraic space over S , and $X \rightarrow G$ is a map of presheaves then $X \times_G F$ is an algebraic space.*

Proof. By Lemma 62.3.3 the transformation $X \times_G F \rightarrow X$ is representable by algebraic spaces. Hence it is an algebraic space by Lemma 62.3.6. \square

Lemma 62.3.8. *Let S be a scheme. Let*

$$F \xrightarrow{a} G \xrightarrow{b} H$$

be maps of presheaves on $(Sch/S)_{fppf}$. If a and b are representable by algebraic spaces, so is $b \circ a$.

Proof. Let T be a scheme over S , and let $T \rightarrow H$ be a morphism. By assumption $T \times_H G$ is an algebraic space. Hence by Lemma 62.3.7 we see that $T \times_H F = (T \times_H G) \times_G F$ is an algebraic space as well. \square

Lemma 62.3.9. *Let S be a scheme. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \rightarrow Sets$, $i = 1, 2$. Let $a_i : F_i \rightarrow G_i$, $i = 1, 2$ be representable by algebraic spaces. Then*

$$a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$$

is a representable by algebraic spaces.

Proof. Write $a_1 \times a_2$ as the composition $F_1 \times F_2 \rightarrow G_1 \times F_2 \rightarrow G_1 \times G_2$. The first arrow is the base change of a_1 by the map $G_1 \times F_2 \rightarrow G_1$, and the second arrow is the base change of a_2 by the map $G_1 \times G_2 \rightarrow G_2$. Hence this lemma is a formal consequence of Lemmas 62.3.8 and 62.3.3. \square

Lemma 62.3.10. *Let S be a scheme. Let $a : F \rightarrow G$ and $b : G \rightarrow H$ be transformations of functors $(Sch/S)_{fppf}^{opp} \rightarrow Sets$. Assume*

- (1) $\Delta : G \rightarrow G \times_H G$ is representable by algebraic spaces, and
- (2) $b \circ a : F \rightarrow H$ is representable by algebraic spaces.

Then a is representable by algebraic spaces.

Proof. Let U be a scheme over S and let $\xi \in G(U)$. Then

$$U \times_{\xi, G, a} F = (U \times_{b(\xi), H, b \circ a} F) \times_{(\xi, a), (G \times_H G), \Delta} G$$

Hence the result using Lemma 62.3.7. \square

Lemma 62.3.11. *Let $S \in \text{Ob}(Sch_{fppf})$. Let F be a presheaf of sets on $(Sch/S)_{fppf}$. Assume*

- (1) F is a sheaf for the Zariski topology on $(Sch/S)_{fppf}$,
- (2) there exists an index set I and subfunctors $F_i \subset F$ such that
 - (a) each F_i is an fppf sheaf,
 - (b) each $F_i \rightarrow F$ is representable by algebraic spaces,
 - (c) $\coprod F_i \rightarrow F$ becomes surjective after fppf sheafification.

Then F is an fppf sheaf.

Proof. Let $T \in \text{Ob}((\text{Sch}/S)_{\text{fppf}})$ and let $s \in F(T)$. By (2)(c) there exists an fppf covering $\{T_j \rightarrow T\}$ such that $s|_{T_j}$ is a section of $F_{\alpha(j)}$ for some $\alpha(j) \in I$. Let $W_j \subset T$ be the image of $T_j \rightarrow T$ which is an open subscheme Morphisms, Lemma 28.26.9. By (2)(b) we see $F_{\alpha(j)} \times_{F, s|_{W_j}} W_j \rightarrow W_j$ is a monomorphism of algebraic spaces through which T_j factors. Since $\{T_j \rightarrow W_j\}$ is an fppf covering, we conclude that $F_{\alpha(j)} \times_{F, s|_{W_j}} W_j = W_j$, in other words $s|_{W_j} \in F_{\alpha(j)}(W_j)$. Hence we conclude that $\coprod F_i \rightarrow F$ is surjective for the Zariski topology.

Let $\{T_j \rightarrow T\}$ be an fppf covering in $(\text{Sch}/S)_{\text{fppf}}$. Let $s, s' \in F(T)$ with $s|_{T_j} = s'|_{T_j}$ for all j . We want to show that s, s' are equal. As F is a Zariski sheaf by (1) we may work Zariski locally on T . By the result of the previous paragraph we may assume there exist i such that $s \in F_i(T)$. Then we see that $s'|_{T_j}$ is a section of F_i . By (2)(b) we see $F_i \times_{F, s'} T \rightarrow T$ is a monomorphism of algebraic spaces through which all of the T_j factor. Hence we conclude that $s' \in F_i(T)$. Since F_i is a sheaf for the fppf topology we conclude that $s = s'$.

Let $\{T_j \rightarrow T\}$ be an fppf covering in $(\text{Sch}/S)_{\text{fppf}}$ and let $s_j \in F(T_j)$ such that $s_j|_{T_j \times_T T_{j'}} = s_{j'}|_{T_j \times_T T_{j'}}$. By assumption (2)(b) we may refine the covering and assume that $s_j \in F_{\alpha(j)}(T_j)$ for some $\alpha(j) \in I$. Let $W_j \subset T$ be the image of $T_j \rightarrow T$ which is an open subscheme Morphisms, Lemma 28.26.9. Then $\{T_j \rightarrow W_j\}$ is an fppf covering. Since $F_{\alpha(j)}$ is a sub presheaf of F we see that the two restrictions of s_j to $T_j \times_{W_j} T_j$ agree as elements of $F_{\alpha(j)}(T_j \times_{W_j} T_j)$. Hence, the sheaf condition for $F_{\alpha(j)}$ implies there exists a $s'_j \in F_{\alpha(j)}(W_j)$ whose restriction to T_j is s_j . For a pair of indices j and j' the sections $s'_j|_{W_j \cap W_{j'}}$ and $s'_{j'}|_{W_j \cap W_{j'}}$ of F agree by the result of the previous paragraph. This finishes the proof by the fact that F is a Zariski sheaf. \square

62.4. Properties of maps of presheaves representable by algebraic spaces

Here is the definition that makes this work.

Definition 62.4.1. Let S be a scheme. Let $a : F \rightarrow G$ be a map of presheaves on $(\text{Sch}/S)_{\text{fppf}}$ which is representable by algebraic spaces. Let \mathcal{P} be a property of morphisms of algebraic spaces which

- (1) is preserved under any base change, and
- (2) is fppf local on the base, see Descent on Spaces, Definition 56.9.1.

In this case we say that a has *property* \mathcal{P} if for every scheme U and $\xi : U \rightarrow G$ the resulting morphism of algebraic spaces $U \times_G F \rightarrow U$ has property \mathcal{P} .

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

The definition above applies¹ for example to the properties of being “surjective”, “quasi-compact”, “étale”, “flat”, “separated”, “(locally) of finite type”, “(locally)

¹Being preserved under base change holds by Morphisms of Spaces, Lemmas 49.5.5, 49.8.3, 49.36.4, 49.28.4, 49.4.4, 49.23.3, 49.26.4, 49.27.3, 49.37.3, and Spaces, Lemma 47.12.3. Being fppf local on the base holds by Descent on Spaces, Lemmas 56.10.5, 56.10.1, 56.10.26, 56.10.11, 56.10.16, 56.10.9, 56.10.22, 56.10.8, 56.10.17, and 56.10.15.

quasi-finite”, “(locally) of finite presentation”, “proper”, and “a closed immersion”. In other words, a is *surjective* (resp. *quasi-compact*, *étale*, *flat*, *separated*, *(locally) of finite type*, *(locally) quasi-finite*, *(locally) of finite presentation*, *proper*, *a closed immersion*) if for every scheme T and map $\xi : T \rightarrow G$ the morphism of algebraic spaces $T \times_{\xi, G} F \rightarrow T$ is surjective (resp. quasi-compact, étale, flat, separated, (locally) of finite type, (locally) quasi-finite, (locally) of finite presentation, proper, a closed immersion).

Next, we check consistency with the already existing notions. By Lemma 62.3.2 any morphism between algebraic spaces over S is representable by algebraic spaces. And by Morphisms of Spaces, Lemma 49.5.3 (resp. 49.8.7, 49.36.2, 49.28.5, 49.4.12, 49.23.4, 49.26.6, 49.27.4, 49.37.2, 49.12.1) the definition of surjective (resp. quasi-compact, étale, flat, separated, (locally) of finite type, (locally) quasi-finite, (locally) of finite presentation, proper, closed immersion) above agrees with the already existing definition of morphisms of algebraic spaces.

Some formal lemmas follow.

Lemma 62.4.2. *Let S be a scheme. Let \mathcal{P} be a property as in Definition 62.4.1. Let*

$$\begin{array}{ccc} G' \times_G F & \longrightarrow & F \\ \downarrow a' & & \downarrow a \\ G' & \longrightarrow & G \end{array}$$

be a fibre square of presheaves on $(Sch/S)_{fppf}$. If a is representable by algebraic spaces and has \mathcal{P} so does a' .

Proof. Omitted. Hint: This is formal. □

Lemma 62.4.3. *Let S be a scheme. Let \mathcal{P} be a property as in Definition 62.4.1, and assume \mathcal{P} is stable under composition. Let*

$$F \xrightarrow{a} G \xrightarrow{b} H$$

be maps of presheaves on $(Sch/S)_{fppf}$. If a, b are representable by algebraic spaces and has \mathcal{P} so does $b \circ a$.

Proof. Omitted. Hint: See Lemma 62.3.8 and use stability under composition. □

Lemma 62.4.4. *Let S be a scheme. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \rightarrow Sets$, $i = 1, 2$. Let $a_i : F_i \rightarrow G_i$, $i = 1, 2$ be representable by algebraic spaces. Let \mathcal{P} be a property as in Definition 62.4.1 which is stable under composition. If a_1 and a_2 have property \mathcal{P} so does $a_1 \times a_2 : F_1 \times F_2 \rightarrow G_1 \times G_2$.*

Proof. Note that the lemma makes sense by Lemma 62.3.9. Proof omitted. □

Lemma 62.4.5. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$. Let $a : F \rightarrow G$ be a transformation of functors representable by algebraic spaces. Let $\mathcal{P}, \mathcal{P}'$ be properties as in Definition 62.4.1. Suppose that for any morphism $f : X \rightarrow Y$ of algebraic spaces over S we have $\mathcal{P}(f) \Rightarrow \mathcal{P}'(f)$. If a has property \mathcal{P} , then a has property \mathcal{P}' .*

Proof. Formal. □

Lemma 62.4.6. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be sheaves. Let $a : F \rightarrow G$ be representable by algebraic spaces, flat, locally of finite presentation, and surjective. Then $a : F \rightarrow G$ is surjective as a map of sheaves.*

Proof. Let T be a scheme over S and let $g : T \rightarrow G$ be a T -valued point of G . By assumption $T' = F \times_G T$ is an algebraic space and the morphism $T' \rightarrow T$ is a flat, locally of finite presentation, and surjective morphism of algebraic spaces. Let $U \rightarrow T'$ be a surjective étale morphism, where U is a scheme. Then by the definition of flat morphisms of algebraic spaces the morphism of schemes $U \rightarrow T$ is flat. Similarly for “locally of finite presentation”. The morphism $U \rightarrow T$ is surjective also, see Morphisms of Spaces, Lemma 49.5.3. Hence we see that $\{U \rightarrow T\}$ is an fppf covering such that $g|_U \in G(U)$ comes from an element of $F(U)$, namely the map $U \rightarrow T' \rightarrow F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 7.12.1. \square

62.5. Bootstrapping the diagonal

Lemma 62.5.1. *Let S be a scheme. If F is a presheaf on $(Sch/S)_{fppf}$. The following are equivalent:*

- (1) $\Delta_F : F \rightarrow F \times F$ is representable by algebraic spaces,
- (2) for every scheme T any map $T \rightarrow F$ is representable by algebraic spaces, and
- (3) for every algebraic space X any map $X \rightarrow F$ is representable by algebraic spaces.

Proof. Assume (1). Let $X \rightarrow F$ be as in (3). Let T be a scheme, and let $T \rightarrow F$ be a morphism. Then we have

$$T \times_F X = (T \times_S X) \times_{F \times F, \Delta} F$$

which is an algebraic space by Lemma 62.3.7 and (1). Hence $X \rightarrow F$ is representable, i.e., (3) holds. The implication (3) \Rightarrow (2) is trivial. Assume (2). Let T be a scheme, and let $(a, b) : T \rightarrow F \times F$ be a morphism. Then

$$F \times_{\Delta_F, F \times F} T = T \times_{a, F, b} T$$

which is an algebraic space by assumption. Hence Δ_F is representable by algebraic spaces, i.e., (1) holds. \square

In particular if F is a presheaf satisfying the equivalent conditions of the lemma, then for any morphism $X \rightarrow F$ where X is an algebraic space it makes sense to say that $X \rightarrow F$ is surjective (resp. étale, flat, locally of finite presentation) by using Definition 62.4.1.

Before we actually do the bootstrap we prove a fun lemma.

Lemma 62.5.2. *Let S be a scheme. Let*

$$\begin{array}{ccc} E & \xrightarrow{a} & F \\ f \downarrow & & \downarrow g \\ H & \xrightarrow{b} & G \end{array}$$

be a cartesian diagram of sheaves on $(Sch/S)_{fppf}$, so $E = H \times_G F$. If

- (1) g is representable by algebraic spaces, surjective, flat, and locally of finite presentation, and

(2) a is representable by algebraic spaces, separated, and locally quasi-finite then b is representable (by schemes) as well as separated and locally quasi-finite.

Proof. Let T be a scheme, and let $T \rightarrow G$ be a morphism. We have to show that $T \times_G H$ is an algebraic space, and that the morphism $T \times_G H \rightarrow T$ is separated and locally quasi-finite. Thus we may base change the whole diagram to T and assume that G is a scheme. In this case F is an algebraic space. Let U be a scheme, and let $U \rightarrow F$ be a surjective étale morphism. Then $U \rightarrow F$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 49.36.7 and 49.36.8. By Lemma 62.3.8 $U \rightarrow G$ is surjective, flat and locally of finite presentation also. Note that the base change $E \times_F U \rightarrow U$ of a is still separated and locally quasi-finite (by Lemma 62.4.2). Hence we may replace the upper part of the diagram of the lemma by $E \times_F U \rightarrow U$. In other words, we may assume that $F \rightarrow G$ is a surjective, flat morphism of schemes which is locally of finite presentation. In particular, $\{F \rightarrow G\}$ is an fppf covering of schemes. By Morphisms of Spaces, Proposition 49.44.2 we conclude that E is a scheme also. By Descent, Lemma 34.35.1 the fact that $E = H \times_G F$ means that we get a descent datum on E relative to the fppf covering $\{F \rightarrow G\}$. By More on Morphisms, Lemma 36.37.1 this descent datum is effective. By Descent, Lemma 34.35.1 again this implies that H is a scheme. By Descent, Lemmas 34.19.5 and 34.19.22 it now follows that b is separated and locally quasi-finite. \square

Here is the result that the section title refers to.

Lemma 62.5.3. *Let S be a scheme. Let $F : (\text{Sch}/S)_{\text{fppf}}^{\text{opp}} \rightarrow \text{Sets}$ be a functor. Assume that*

- (1) *the presheaf F is a sheaf,*
- (2) *there exists an algebraic space X and a map $X \rightarrow F$ which is representable by algebraic spaces, surjective, flat and locally of finite presentation.*

Then Δ_F is representable (by schemes).

Proof. Let $U \rightarrow X$ be a surjective étale morphism from a scheme towards X . Then $U \rightarrow X$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 49.36.7 and 49.36.8. By Lemma 62.4.3 the composition $U \rightarrow F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation also. Thus we see that $R = U \times_F U$ is an algebraic space, see Lemma 62.3.7. The morphism of algebraic spaces $R \rightarrow U \times_S U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism, see Morphisms of Spaces, Lemma 49.10.2). Since $U \rightarrow F$ is locally of finite presentation, both morphisms $R \rightarrow U$ are locally of finite presentation, see Lemma 62.4.2. Hence $R \rightarrow U \times_S U$ is locally of finite type (use Morphisms of Spaces, Lemmas 49.27.5 and 49.23.6). Altogether this means that $R \rightarrow U \times_S U$ is a monomorphism which is locally of finite type, hence a separated and locally quasi-finite morphism, see Morphisms of Spaces, Lemma 49.26.10.

Now we are ready to prove that Δ_F is representable. Let T be a scheme, and let $(a, b) : T \rightarrow F \times F$ be a morphism. Set

$$T' = (U \times_S U) \times_{F \times F} T.$$

Note that $U \times_S U \rightarrow F \times F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation by Lemma 62.4.4. Hence T' is an algebraic space, and

the projection morphism $T' \rightarrow T$ is surjective, flat, and locally of finite presentation. Consider $Z = T \times_{F \times F} F$ (this is a sheaf) and

$$Z' = T' \times_{U \times_S U} R = T' \times_T Z.$$

We see that Z' is an algebraic space, and $Z' \rightarrow T'$ is separated and locally quasi-finite by the discussion in the first paragraph of the proof which showed that R is an algebraic space and that the morphism $R \rightarrow U \times_S U$ has those properties. Hence we may apply Lemma 62.5.2 to the diagram

$$\begin{array}{ccc} Z' & \longrightarrow & T' \\ \downarrow & & \downarrow \\ Z & \longrightarrow & T \end{array}$$

and we conclude. \square

Here is a variant of the result above.

Lemma 62.5.4. *Let S be a scheme. Let $F : (\text{Sch}/S)_{\text{fppf}}^{\text{opp}} \rightarrow \text{Sets}$ be a functor. Let X be a scheme and let $X \rightarrow F$ be representable by algebraic spaces and locally quasi-finite. Then $X \rightarrow F$ is representable (by schemes).*

Proof. Let T be a scheme and let $T \rightarrow F$ be a morphism. We have to show that the algebraic space $X \times_F T$ is representable by a scheme. Consider the morphism

$$X \times_F T \longrightarrow X \times_{\text{Spec}(\mathbf{Z})} \text{Spec}(A)$$

Since $X \times_F T \rightarrow T$ is locally quasi-finite, so is the displayed arrow (Morphisms of Spaces, Lemma 49.26.8). On the other hand, the displayed arrow is a monomorphism and hence separated (Morphisms of Spaces, Lemma 49.10.3). Thus $X \times_F T$ is a scheme by Morphisms of Spaces, Proposition 49.44.2. \square

62.6. Bootstrap

We warn the reader right away that the result of this section will be superseded by the stronger Theorem 62.10.1. On the other hand, the theorem in this section is quite a bit easier to prove and still provides quite a bit of insight into how things work, especially for those readers mainly interested in Deligne-Mumford stacks.

In Spaces, Section 47.6 we defined an algebraic space as a sheaf in the fppf topology whose diagonal is representable, and such that there exist a surjective étale morphism from a scheme towards it. In this section we show that a sheaf in the fppf topology whose diagonal is representable by algebraic spaces and which has an étale surjective covering by an algebraic space is also an algebraic space. In other words, the category of algebraic spaces is an enlargement of the category of schemes by those fppf sheaves F which have a representable diagonal and an étale covering by a scheme. The result of this section says that doing the same process again starting with the category of algebraic spaces, does not lead to yet another category.

Another motivation for the material in this section is that it will guarantee later that a Deligne-Mumford stack whose inertia stack is trivial is equivalent to an algebraic space, see Algebraic Stacks, Lemma 71.13.2.

Here is the main result of this section (as we mentioned above this will be superseded by the stronger Theorem 62.10.1).

Theorem 62.6.1. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Assume that*

- (1) *the presheaf F is a sheaf,*
- (2) *the diagonal morphism $F \rightarrow F \times F$ is representable by algebraic spaces, and*
- (3) *there exists an algebraic space X and a map $X \rightarrow F$ which is surjective, and étale.*

Then F is an algebraic space.

Proof. We will use the remarks directly below Definition 62.4.1 without further mention. In the situation of the theorem, let $U \rightarrow X$ be a surjective étale morphism from a scheme towards X . By Lemma 62.3.8 $U \rightarrow F$ is surjective and étale also. Hence the theorem boils down to proving that Δ_F is representable. This follows immediately from Lemma 62.5.3. On the other hand we can circumvent this lemma and show directly F is an algebraic space as in the next paragraph.

Let U be a scheme, and let $U \rightarrow F$ be surjective and étale. Set $R = U \times_F U$, which is an algebraic space (see Lemma 62.5.1). The morphism of algebraic spaces $R \rightarrow U \times_S U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism). Moreover, since $U \rightarrow F$ is étale, we see that $R \rightarrow U$ is étale, by Lemma 62.4.2. In particular, we see that $R \rightarrow U$ is locally quasi-finite, see Morphisms of Spaces, Lemma 49.36.5. We conclude that also $R \rightarrow U \times_S U$ is locally quasi-finite by Morphisms of Spaces, Lemma 49.26.8. Hence Morphisms of Spaces, Proposition 49.44.2 applies and R is a scheme. Hence $F = U/R$ is an algebraic space according to Spaces, Theorem 47.10.5. \square

62.7. Finding opens

First we prove a lemma which is a slight improvement and generalization of Spaces, Lemma 47.10.2 to quotient sheaves associated to groupoids.

Lemma 62.7.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let $g : U' \rightarrow U$ be a morphism. Assume*

- (1) *the composition*

$$U' \times_{g,U,t} R \begin{array}{c} \xrightarrow{h} \\ \xrightarrow{pr_1} R \xrightarrow{s} U \end{array}$$

has an open image $W \subset U$, and

- (2) *the resulting map $h : U' \times_{g,U,t} R \rightarrow W$ defines a surjection of sheaves in the fppf topology.*

Let $R' = R|_{U'}$ be the restriction of R to U' . Then the map of quotient sheaves

$$U'/R' \rightarrow U/R$$

in the fppf topology is representable, and is an open immersion.

Proof. Note that W is an R -invariant open subscheme of U . This is true because the set of points of W is the set of points of U which are equivalent in the sense of Groupoids, Lemma 38.3.4 to a point of $g(U') \subset U$ (the lemma applies as $j : R \rightarrow U \times_S U$ is a pre-equivalence relation by Groupoids, Lemma 38.11.2). Also $g : U' \rightarrow U$ factors through W . Let $R|_W$ be the restriction of R to W . Then it

follows that R' is also the restriction of $R|_W$ to U' . Hence we can factor the map of sheaves of the lemma as

$$U'/R' \longrightarrow W/R|_W \longrightarrow U/R$$

By Groupoids, Lemma 38.18.6 we see that the first arrow is an isomorphism of sheaves. Hence it suffices to show the lemma in case g is the immersion of an R -invariant open into U .

Assume $U' \subset U$ is an R -invariant open and g is the inclusion morphism. Set $F = U/R$ and $F' = U'/R'$. By Groupoids, Lemma 38.18.5 or 38.18.6 the map $F' \rightarrow F$ is injective. Let $\xi \in F(T)$. We have to show that $T \times_{\xi, F} F'$ is representable by an open subscheme of T . There exists an fppf covering $\{f_i : T_i \rightarrow T\}$ such that $\xi|_{T_i}$ is the image via $U \rightarrow U/R$ of a morphism $a_i : T_i \rightarrow U$. Set $V_i = s_i^{-1}(U')$. We claim that $V_i \times_T T_j = T_i \times_T V_j$ as open subschemes of $T_i \times_T T_j$.

As $a_i \circ \text{pr}_0$ and $a_j \circ \text{pr}_1$ are morphisms $T_i \times_T T_j \rightarrow U$ which both map to the section $\xi|_{T_i \times_T T_j} \in F(T_i \times_T T_j)$ we can find an fppf covering $\{f_{ijk} : T_{ijk} \rightarrow T_i \times_T T_j\}$ and morphisms $r_{ijk} : T_{ijk} \rightarrow R$ such that

$$a_i \circ \text{pr}_0 \circ f_{ijk} = s \circ r_{ijk}, \quad a_j \circ \text{pr}_1 \circ f_{ijk} = t \circ r_{ijk},$$

see Groupoids, Lemma 38.18.4. Since U' is R -invariant we have $s^{-1}(U') = t^{-1}(U')$ and hence $f_{ijk}^{-1}(V_i \times_T T_j) = f_{ijk}^{-1}(T_i \times_T V_j)$. As $\{f_{ijk}\}$ is surjective this implies the claim above. Hence by Descent, Lemma 34.9.2 there exists an open subscheme $V \subset T$ such that $f_i^{-1}(V) = V_i$. We claim that V represents $T \times_{\xi, F} F'$.

As a first step, we will show that $\xi|_V$ lies in $F'(V) \subset F(V)$. Namely, the family of morphisms $\{V_i \rightarrow V\}$ is an fppf covering, and by construction we have $\xi|_{V_i} \in F'(V_i)$. Hence by the sheaf property of F' we get $\xi|_V \in F'(V)$. Finally, let $T' \rightarrow T$ be a morphism of schemes and that $\xi|_{T'} \in F'(T')$. To finish the proof we have to show that $T' \rightarrow T$ factors through V . We can find a fppf covering $\{T'_j \rightarrow T'\}_{j \in J}$ and morphisms $b_j : T'_j \rightarrow U'$ such that $\xi|_{T'_j}$ is the image via $U' \rightarrow U/R$ of b_j . Clearly, it is enough to show that the compositions $T'_j \rightarrow T$ factor through V . Hence we may assume that $\xi|_{T'}$ is the image of a morphism $b : T' \rightarrow U'$. Now, it is enough to show that $T' \times_T T_i \rightarrow T_i$ factors through V_i . Over the scheme $T' \times_T T_i$ the restriction of ξ is the image of two elements of $(U/R)(T' \times_T T_i)$, namely $a_i \circ \text{pr}_1$, and $b \circ \text{pr}_0$, the second of which factors through the R -invariant open U' . Hence by Groupoids, Lemma 38.18.4 there exists a covering $\{h_k : Z_k \rightarrow T' \times_T T_i\}$ and morphisms $r_k : Z_k \rightarrow R$ such that $a_i \circ \text{pr}_1 \circ h_k = s \circ r_k$ and $b \circ \text{pr}_0 \circ h_k = t \circ r_k$. As U' is an R -invariant open the fact that b has image in U' then implies that each $a_i \circ \text{pr}_1 \circ h_k$ has image in U' . It follows from this that $T' \times_T T_i \rightarrow T_i$ has image in V_i by definition of V_i which concludes the proof. \square

62.8. Slicing equivalence relations

In this section we explain how to “improve” a given equivalence relation by slicing. This is not a kind of “étale slicing” that you may be used to but a much coarser kind of slicing.

Lemma 62.8.1. *Let S be a scheme. Let $j : R \rightarrow U \times_S U$ be an equivalence relation on schemes over S . Assume $s, t : R \rightarrow U$ are flat and locally of finite presentation.*

Then there exists an equivalence relation $j' : R' \rightarrow U' \times_S U'$ on schemes over S , and an isomorphism

$$U'/R' \longrightarrow U/R$$

induced by a morphism $U' \rightarrow U$ which maps R' into R such that $s', t' : R \rightarrow U$ are flat, locally of finite presentation and locally quasi-finite.

Proof. We will prove this lemma in several steps. We will use without further mention that an equivalence relation gives rise to a groupoid scheme and that the restriction of an equivalence relation is an equivalence relation, see Groupoids, Lemmas 38.3.2, 38.11.3, and 38.16.3.

Step 1: We may assume that $s, t : R \rightarrow U$ are locally of finite presentation and Cohen-Macaulay morphisms. Namely, as in More on Groupoids, Lemma 39.7.1 let $g : U' \rightarrow U$ be the open subscheme such that $t^{-1}(U') \subset R$ is the maximal open over which $s : R \rightarrow U$ is Cohen-Macaulay, and denote R' the restriction of R to U' . By the lemma cited above we see that

$$t^{-1}(U') \longleftarrow U' \times_{g, U, t} R \begin{array}{c} \xrightarrow{h} \\ \xrightarrow{\text{pr}_1} \end{array} R \xrightarrow{s} U$$

is surjective. Since h is flat and locally of finite presentation, we see that $\{h\}$ is a fppf covering. Hence by Groupoids, Lemma 38.18.6 we see that $U'/R' \rightarrow U/R$ is an isomorphism. By the construction of U' we see that s', t' are Cohen-Macaulay and locally of finite presentation.

Step 2. Assume s, t are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a point of finite type. By More on Groupoids, Lemma 39.11.4 there exists an affine scheme U' and a morphism $g : U' \rightarrow U$ such that

- (1) g is an immersion,
- (2) $u \in U'$,
- (3) g is locally of finite presentation,
- (4) h is flat, locally of finite presentation and locally quasi-finite, and
- (5) the morphisms $s', t' : R' \rightarrow U'$ are flat, locally of finite presentation and locally quasi-finite.

Here we have used the notation introduced in More on Groupoids, Situation 39.11.1.

Step 3. For each point $u \in U$ which is of finite type choose a $g_u : U'_u \rightarrow U$ as in Step 2 and denote R'_u the restriction of R to U'_u . Denote $h_u = s \circ \text{pr}_1 : U'_u \times_{g_u, U, t} R \rightarrow U$. Set $U' = \coprod_{u \in U} U'_u$, and $g = \coprod g_u$. Let R' be the restriction of R to U as above. We claim that the pair (U', g) works². Note that

$$\begin{aligned} R' &= \coprod_{u_1, u_2 \in U} (U'_{u_1} \times_{g_{u_1}, U, t} R) \times_R (R \times_{s, U, g_{u_2}} U'_{u_2}) \\ &= \coprod_{u_1, u_2 \in U} (U'_{u_1} \times_{g_{u_1}, U, t} R) \times_{h_{u_1}, U, g_{u_2}} U'_{u_2} \end{aligned}$$

Hence the projection $s' : R' \rightarrow U' = \coprod U'_{u_2}$ is flat, locally of finite presentation and locally quasi-finite as a base change of $\coprod h_{u_1}$. Finally, by construction the

²Here we should check that U' is not too large, i.e., that it is isomorphic to an object of the category Sch_{fppf} , see Section 62.2. This is a purely set theoretical matter; let us use the notion of size of a scheme introduced in Sets, Section 3.9. Note that each U'_u has size at most the size of U and that the cardinality of the index set is at most the cardinality of $|U|$ which is bounded by the size of U . Hence U' is isomorphic to an object of Sch_{fppf} by Sets, Lemma 3.9.9 part (6).

morphism $h : U' \times_{g,U,t} R \rightarrow U$ is equal to $\coprod h_u$ hence its image contains all points of finite type of U . Since each h_u is flat and locally of finite presentation we conclude that h is flat and locally of finite presentation. In particular, the image of h is open (see Morphisms, Lemma 28.26.9) and since the set of points of finite type is dense (see Morphisms, Lemma 28.17.7) we conclude that the image of h is U . This implies that $\{h\}$ is an fppf covering. By Groupoids, Lemma 38.18.6 this means that $U'/R' \rightarrow U/R$ is an isomorphism. This finishes the proof of the lemma. \square

62.9. Quotient by a subgroupoid

We need one more lemma before we can do our final bootstrap. Let us discuss what is going on in terms of “plain” groupoids before embarking on the scheme theoretic version.

Let \mathcal{C} be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 38.11 this corresponds to a quintuple $(\text{Ob}, \text{Arrows}, s, t, c)$. Suppose we are given a subset $P \subset \text{Arrows}$ such that $(\text{Ob}, P, s|_P, t|_P, c|_P)$ is also a groupoid and such that there are no nontrivial automorphisms in P . Then we can construct the quotient groupoid $(\overline{\text{Ob}}, \overline{\text{Arrows}}, \overline{s}, \overline{t}, \overline{c})$ as follows:

- (1) $\overline{\text{Ob}} = \text{Ob}/P$ is the set of P -isomorphism classes,
- (2) $\overline{\text{Arrows}} = P \backslash \text{Arrows}/P$ is the set of arrows in \mathcal{C} up to pre-composing and post-composing by arrows of P ,
- (3) the source and target maps $\overline{s}, \overline{t} : P \backslash \text{Arrows}/P \rightarrow \text{Ob}/P$ are induced by s, t ,
- (4) composition is defined by the rule $\overline{c}(\overline{a}, \overline{b}) = \overline{c(a, b)}$ which is well defined.

In fact, it turns out that the original groupoid $(\text{Ob}, \text{Arrows}, s, t, c)$ is canonically isomorphic to the restriction (see discussion in Groupoids, Section 38.16) of the groupoid $(\overline{\text{Ob}}, \overline{\text{Arrows}}, \overline{s}, \overline{t}, \overline{c})$ via the quotient map $g : \text{Ob} \rightarrow \overline{\text{Ob}}$. Recall that this means that

$$\text{Arrows} = \text{Ob} \times_{g, \overline{\text{Ob}}, \overline{t}} \overline{\text{Arrows}} \times_{\overline{s}, \overline{\text{Ob}}, g} \text{Ob}$$

which holds as P has no nontrivial automorphisms. We omit the details.

The following lemma holds in much greater generality, but this is the version we use in the proof of the final bootstrap (after which we can more easily prove the more general versions of this lemma).

Lemma 62.9.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let $P \rightarrow R$ be monomorphism of schemes. Assume that*

- (1) $(U, P, s|_P, t|_P, c|_{P \times_{s,U,t} P})$ is a groupoid scheme,
- (2) $s|_P, t|_P : P \rightarrow U$ are finite locally free,
- (3) $j|_P : P \rightarrow U \times_S U$ is a monomorphism.
- (4) U is affine, and
- (5) $j : R \rightarrow U \times_S U$ is separated and locally quasi-finite,

Then U/P is representable by an affine scheme \overline{U} , the quotient morphism $U \rightarrow \overline{U}$ is finite locally free, and $P = U \times_{\overline{U}} U$. Moreover, R is the restriction of a groupoid scheme $(\overline{U}, \overline{R}, \overline{s}, \overline{t}, \overline{c})$ on \overline{U} via the quotient morphism $U \rightarrow \overline{U}$.

Proof. Conditions (1), (2), (3), and (4) and Groupoids, Proposition 38.21.8 imply the affine scheme \overline{U} representing U/P exists, the morphism $U \rightarrow \overline{U}$ is finite locally

free, and $P = U \times_{\overline{U}} U$. The identification $P = U \times_{\overline{U}} U$ is such that $t|_P = \text{pr}_0$ and $s|_P = \text{pr}_1$, and such that composition is equal to $\text{pr}_{02} : U \times_{\overline{U}} U \times_{\overline{U}} U \rightarrow U \times_{\overline{U}} U$. A product of finite locally free morphisms is finite locally free (see Spaces, Lemma 47.5.7 and Morphisms, Lemmas 28.46.4 and 28.46.3). To get \overline{R} we are going to descend the scheme R via the finite locally free morphism $U \times_S U \rightarrow \overline{U} \times_S \overline{U}$. Namely, note that

$$(U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) = P \times_S P$$

by the above. Thus giving a descent datum (see Descent, Definition 34.30.1) for $R/U \times_S U/\overline{U} \times_S \overline{U}$ consists of an isomorphism

$$\varphi : R \times_{(U \times_S U), t \times t} (P \times_S P) \longrightarrow (P \times_S P) \times_{s \times s, (U \times_S U)} R$$

over $P \times_S P$ satisfying a cocycle condition. We define φ on T -valued points by the rule

$$\varphi : (r, (p, p')) \longmapsto ((p, p'), p^{-1} \circ r \circ p')$$

where the composition is taken in the groupoid category $(U(T), R(T), s, t, c)$. This makes sense because for $(r, (p, p'))$ to be a T -valued point of the source of φ it needs to be the case that $t(r) = t(p)$ and $s(r) = t(p')$. Note that this map is an isomorphism with inverse given by $((p, p'), r') \mapsto (p \circ r' \circ (p')^{-1}, (p, p'))$. To check the cocycle condition we have to verify that $\varphi_{02} = \varphi_{12} \circ \varphi_{01}$ as maps over

$$(U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) = (P \times_S P) \times_{s \times s, (U \times_S U), t \times t} (P \times_S P)$$

By explicit calculation we see that

$$\begin{aligned} \varphi_{02} & (r, (p_1, p'_1), (p_2, p'_2)) \mapsto ((p_1, p'_1), (p_2, p'_2), (p_1 \circ p_2)^{-1} \circ r \circ (p'_1 \circ p'_2)) \\ \varphi_{01} & (r, (p_1, p'_1), (p_2, p'_2)) \mapsto ((p_1, p'_1), p_1^{-1} \circ r \circ p'_1, (p_2, p'_2)) \\ \varphi_{12} & ((p_1, p'_1), r, (p_2, p'_2)) \mapsto ((p_1, p'_1), (p_2, p'_2), p_2^{-1} \circ r \circ p'_2) \end{aligned}$$

(with obvious notation) which implies what we want. As j is separated and locally quasi-finite by (5) we may apply More on Morphisms, Lemma 36.37.1 to get a scheme $\overline{R} \rightarrow \overline{U} \times_S \overline{U}$ and an isomorphism

$$R \rightarrow \overline{R} \times_{(\overline{U} \times_S \overline{U})} (U \times_S U)$$

which identifies the descent datum φ with the canonical descent datum on $\overline{R} \times_{(\overline{U} \times_S \overline{U})} (U \times_S U)$, see Descent, Definition 34.30.10.

Since $U \times_S U \rightarrow \overline{U} \times_S \overline{U}$ is finite locally free we conclude that $R \rightarrow \overline{R}$ is finite locally free as a base change. Hence $R \rightarrow \overline{R}$ is surjective as a map of sheaves on $(Sch/S)_{fppf}$. Our choice of φ implies that given T -valued points $r, r' \in R(T)$ these have the same image in \overline{R} if and only if $p^{-1} \circ r \circ p'$ for some $p, p' \in P(T)$. Thus \overline{R} represents the sheaf

$$T \longmapsto \overline{R(T)} = P(T) \backslash R(T) / P(T)$$

with notation as in the discussion preceding the lemma. Hence we can define the groupoid structure on $(\overline{U} = U/P, \overline{R} = P \backslash R/P)$ exactly as in the discussion of the “plain” groupoid case. It follows from this that (U, R, s, t, c) is the pullback of this groupoid structure via the morphism $U \rightarrow \overline{U}$. This concludes the proof. \square

62.10. Final bootstrap

The following result goes quite a bit beyond the earlier results.

Theorem 62.10.1. *Let S be a scheme. Let $F : (\text{Sch}/S)_{fppf}^{\text{opp}} \rightarrow \text{Sets}$ be a functor. Any one of the following conditions implies that F is an algebraic space:*

- (1) $F = U/R$ where (U, R, s, t, c) is a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation,
- (2) $F = U/R$ where (U, R, s, t, c) is a groupoid scheme over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation,
- (3) F is a sheaf and there exists an algebraic space U and a morphism $U \rightarrow F$ which is which is representable by algebraic spaces, surjective, flat and locally of finite presentation,
- (4) F is a sheaf and there exists a scheme U and a morphism $U \rightarrow F$ which is which is representable (by algebraic spaces or schemes), surjective, flat and locally of finite presentation,
- (5) F is a sheaf, Δ_F is representable by algebraic spaces, and there exists an algebraic space U and a morphism $U \rightarrow F$ which is surjective, flat, and locally of finite presentation, or
- (6) F is a sheaf, Δ_F is representable, and there exists a scheme U and a morphism $U \rightarrow F$ which is surjective, flat, and locally of finite presentation.

Proof. Trivial observations: (6) is a special case of (5) and (4) is a special case of (3). We first prove that cases (5) and (3) reduce to case (1). Namely, by bootstrapping the diagonal Lemma 62.5.3 we see that (3) implies (5). In case (5) we set $R = U \times_F U$ which is an algebraic space by assumption. Moreover, by assumption both projections $s, t : R \rightarrow U$ are surjective, flat and locally of finite presentation. The map $j : R \rightarrow U \times_S U$ is clearly an equivalence relation. By Lemma 62.4.6 the map $U \rightarrow F$ is a surjection of sheaves. Thus $F = U/R$ which reduces us to case (1).

Next, we show that (1) reduces to (2). Namely, let (U, R, s, t, c) be a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation. Choose a scheme U' and a surjective étale morphism $U' \rightarrow U$. Let $R' = R|_{U'}$ be the restriction of R to U' . By Groupoids in Spaces, Lemma 60.18.6 we see that $U/R = U'/R'$. Since $s', t' : R' \rightarrow U'$ are also flat and locally of finite presentation (see More on Groupoids in Spaces, Lemma 61.6.1) this reduces us to the case where U is a scheme. As j is an equivalence relation we see that j is a monomorphism. As $s : R \rightarrow U$ is locally of finite presentation we see that $j : R \rightarrow U \times_S U$ is locally of finite type, see Morphisms of Spaces, Lemma 49.23.6. By Morphisms of Spaces, Lemma 49.26.10 we see that j is locally quasi-finite and separated. Hence if U is a scheme, then R is a scheme by Morphisms of Spaces, Proposition 49.44.2. Thus we reduce to proving the theorem in case (2).

Assume $F = U/R$ where (U, R, s, t, c) is a groupoid scheme over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation. By Lemma 62.8.1 we reduce to that case where s, t are flat, locally of finite presentation, and locally quasi-finite. Let $U = \bigcup_{i \in I} U_i$ be an affine open

covering (with index set I of cardinality \leq than the size of U to avoid set theoretic problems later – most readers can safely ignore this remark). Let $(U_i, R_i, s_i, t_i, c_i)$ be the restriction of R to U_i . It is clear that s_i, t_i are still flat, locally of finite presentation, and locally quasi-finite as R_i is the open subscheme $s^{-1}(U_i) \cap t^{-1}(U_i)$ of R and s_i, t_i are the restrictions of s, t to this open. By Lemma 62.7.1 (or the simpler Spaces, Lemma 47.10.2) the map $U_i/R_i \rightarrow U/R$ is representable by open immersions. Hence if we can show that $F_i = U_i/R_i$ is an algebraic space, then $\coprod_{i \in I} F_i$ is an algebraic space by Spaces, Lemma 47.8.3. As $U = \bigcup U_i$ is an open covering it is clear that $\coprod F_i \rightarrow F$ is surjective. Thus it follows that U/R is an algebraic space, by Spaces, Lemma 47.8.4. In this way we reduce to the case where U is affine and s, t are flat, locally of finite presentation, and locally quasi-finite and j is an equivalence.

Assume (U, R, s, t, c) is a groupoid scheme over S , with U affine, such that s, t are flat, locally of finite presentation, and locally quasi-finite, and j is an equivalence relation. Choose $u \in U$. We apply More on Groupoids in Spaces, Lemma 61.12.9 to $u \in U, R, s, t, c$. We obtain an affine scheme U' , an étale morphism $g : U' \rightarrow U$, a point $u' \in U'$ with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ is quasi-split over u' . Note that the image $g(U')$ is open as g is étale and contains u' . Hence, repeatedly applying the lemma, we can find finitely many points $u_i \in U$, $i = 1, \dots, n$, affine schemes U'_i , étale morphisms $g_i : U'_i \rightarrow U$, points $u'_i \in U'_i$ with $g(u'_i) = u_i$ such that (a) each restriction R'_i is quasi-split over some point in U'_i and (b) $U = \bigcup_{i=1, \dots, n} g_i(U'_i)$. Now we rerun the last part of the argument in the preceding paragraph: Using Lemma 62.7.1 (or the simpler Spaces, Lemma 47.10.2) the map $U'_i/R'_i \rightarrow U/R$ is representable by open immersions. If we can show that $F_i = U'_i/R'_i$ is an algebraic space, then $\coprod_{i \in I} F_i$ is an algebraic space by Spaces, Lemma 47.8.3. As $\{g_i : U'_i \rightarrow U\}$ is an étale covering it is clear that $\coprod F_i \rightarrow F$ is surjective. Thus it follows that U/R is an algebraic space, by Spaces, Lemma 47.8.4. In this way we reduce to the case where U is affine and s, t are flat, locally of finite presentation, and locally quasi-finite, j is an equivalence, and R is quasi-split over u for some $u \in U$.

Assume (U, R, s, t, c) is a groupoid scheme over S , with U affine, $u \in U$ such that s, t are flat, locally of finite presentation, and locally quasi-finite and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation and R is quasi-split over u . Let $P \subset R$ be a quasi-splitting of R over u . By Lemma 62.9.1 we see that (U, R, s, t, c) is the restriction of a groupoid $(\bar{U}, \bar{R}, \bar{s}, \bar{t}, \bar{c})$ by a surjective finite locally free morphism $U \rightarrow \bar{U}$ such that $P = U \times_{\bar{U}} U$. Note that s, t are the base changes of the morphisms \bar{s}, \bar{t} by $U \rightarrow \bar{U}$. As $\{U \rightarrow \bar{U}\}$ is an fppf covering we conclude \bar{s}, \bar{t} are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 34.19.13, 34.19.9, and 34.19.22. Consider the commutative diagram

$$\begin{array}{ccccc}
 U \times_{\bar{U}} U & \xlongequal{\quad} & P & \longrightarrow & R \\
 & \searrow & \downarrow & & \downarrow \\
 & & \bar{U} & \xrightarrow{\bar{e}} & \bar{R}
 \end{array}$$

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since P is open in R (by definition of a quasi-splitting) we conclude that \bar{e} is an open immersion

by Descent, Lemma 34.19.14. An application of Groupoids, Lemma 38.18.5 shows that $U/R = \overline{U}/\overline{R}$. Hence we have reduced to the case where (U, R, s, t, c) is a groupoid scheme over S , with U affine, $u \in U$ such that s, t are flat, locally of finite presentation, and locally quasi-finite and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation and $e : U \rightarrow R$ is an open immersion!

But of course, if e is an open immersion and s, t are flat and locally of finite presentation then the morphisms t, s are étale. For example you can see this by applying More on Groupoids, Lemma 39.4.1 which shows that $\Omega_{R/U} = 0$ which in turn implies that $s, t : R \rightarrow U$ is G-unramified (see Morphisms, Lemma 28.36.2), which in turn implies that s, t are étale (see Morphisms, Lemma 28.37.16). And if s, t are étale then finally U/R is an algebraic space by Spaces, Theorem 47.10.5. \square

62.11. Applications

As a first application we obtain the following fundamental fact:

A sheaf which is fppf locally an algebraic space is an algebraic space.

This is the content of the following lemma. Note that assumption (2) is equivalent to the condition that $F|_{(Sch/S_i)_{fppf}}$ is an algebraic space, see Spaces, Lemma 47.16.4. Assumption (3) is a set theoretic condition which may be ignored by those not worried about set theoretic questions.

Lemma 62.11.1. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Let $\{S_i \rightarrow S\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Assume that*

- (1) F is a sheaf,
- (2) each $F_i = h_{S_i} \times F$ is an algebraic space, and
- (3) $\coprod_{i \in I} F_i$ is an algebraic space (see Spaces, Lemma 47.8.3).

Then F is an algebraic space.

Proof. Consider the morphism $\coprod F_i \rightarrow F$. This is the base change of $\coprod S_i \rightarrow S$ via $F \rightarrow S$. Hence it is representable, locally of finite presentation, flat and surjective by our definition of an fppf covering and Lemma 62.4.2. Thus Theorem 62.10.1 applies to show that F is an algebraic space. \square

As a second application we obtain

Any fppf descent datum for algebraic spaces is effective.

This is the content of the following lemma.

Lemma 62.11.2. *Let S be a scheme. Let $\{X_i \rightarrow X\}_{i \in I}$ be an fppf covering of algebraic spaces over S . Assume I is countable³. Then any descent datum for algebraic spaces relative to $\{X_i \rightarrow X\}$ is effective.*

Proof. By Descent on Spaces, Lemma 56.20.1 this translates into the statement that an fppf sheaf F endowed with a map $F \rightarrow X$ is an algebraic space provided that each $F \times_X X_i$ is an algebraic space. The restriction on the cardinality of I implies that coproducts of algebraic spaces indexed by I are algebraic spaces, see Spaces, Lemma 47.8.3 and Sets, Lemma 3.9.9. The morphism

$$\coprod F \times_X X_i \longrightarrow F$$

³We can allow larger index sets here if we can bound the size of the algebraic spaces which we are descending. If we ever need this we will add a more precise statement here.

is representable by algebraic spaces (as the base change of $\coprod X_i \rightarrow X$, see Lemma 62.3.3), and surjective, flat, and locally of finite presentation (as the base change of $\coprod X_i \rightarrow X$, see Lemma 62.4.2). Hence the lemma follows from Theorem 62.10.1. \square

Here is a different type of application.

Lemma 62.11.3. *Let S be a scheme. Let $a : F \rightarrow G$ and $b : G \rightarrow H$ be transformations of functors $(Sch/S)_{fppf}^{opp} \rightarrow Sets$. Assume*

- (1) F, G, H are sheaves,
- (2) $a : F \rightarrow G$ is representable by algebraic spaces, flat, locally of finite presentation, and surjective, and
- (3) $b \circ a : F \rightarrow H$ is representable by algebraic spaces.

Then b is representable by algebraic spaces.

Proof. Let U be a scheme over S and let $\xi \in H(U)$. We have to show that $U \times_{\xi, H} G$ is an algebraic space. On the other hand, we know that $U \times_{\xi, H} F$ is an algebraic space and that $U \times_{\xi, H} F \rightarrow U \times_{\xi, H} G$ is representable by algebraic spaces, flat, locally of finite presentation, and surjective as a base change of the morphism a (see Lemma 62.4.2). Thus the result follows from Theorem 62.10.1. \square

Here is a special case of Lemma 62.11.1 where we do not need to worry about set theoretical issues.

Lemma 62.11.4. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \rightarrow Sets$ be a functor. Let $\{S_i \rightarrow S\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Assume that*

- (1) F is a sheaf,
- (2) each $F_i = h_{S_i} \times F$ is an algebraic space, and
- (3) the morphisms $F_i \rightarrow S_i$ are of finite type.

Then F is an algebraic space.

Proof. We will use Lemma 62.11.1 above. To do this we will show that the assumption that F_i is of finite type over S_i to prove that the set theoretic condition in the lemma is satisfied (after perhaps refining the given covering of S a bit). We suggest the reader skip the rest of the proof.

If $S'_i \rightarrow S_i$ is a morphism of schemes then

$$h_{S'_i} \times F = h_{S'_i} \times_{h_{S_i}} h_{S_i} \times F = h_{S'_i} \times_{h_{S_i}} F_i$$

is an algebraic space of finite type over S'_i , see Spaces, Lemma 47.7.3 and Morphisms of Spaces, Lemma 49.23.3. Thus we may refine the given covering. After doing this we may assume: (a) each S_i is affine, and (b) the cardinality of I is at most the cardinality of the set of points of S . (Since to cover all of S it is enough that each point is in the image of $S_i \rightarrow S$ for some i .)

Since each S_i is affine and each F_i of finite type over S_i we conclude that F_i is quasi-compact. Hence by Properties of Spaces, Lemma 48.6.3 we can find an affine $U_i \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $U_i \rightarrow F_i$. The fact that $F_i \rightarrow S_i$ is locally of finite type then implies that $U_i \rightarrow S_i$ is locally of finite type, and in particular $U_i \rightarrow S$ is locally of finite type. By Sets, Lemma 3.9.7 we conclude that $\text{size}(U_i) \leq \text{size}(S)$. Since also $|I| \leq \text{size}(S)$ we conclude that $\coprod_{i \in I} U_i$ is isomorphic to an object of $(Sch/S)_{fppf}$ by Sets, Lemma 3.9.5 and the

construction of Sch . This implies that $\coprod F_i$ is an algebraic space by Spaces, Lemma 47.8.3 and we win. \square

Lemma 62.11.5. *Assume $B \rightarrow S$ and (U, R, s, t, c) are as in Groupoids in Spaces, Definition 60.19.1 (1). For any scheme T over S and objects x, y of $[U/R]$ over T the sheaf $Isom(x, y)$ on $(Sch/T)_{fppf}$ is an algebraic space.*

Proof. By Groupoids in Spaces, Lemma 60.21.3 there exists an fppf covering $\{T_i \rightarrow T\}_{i \in I}$ such that $Isom(x, y)|_{(Sch/T_i)_{fppf}}$ is an algebraic space for each i . By Spaces, Lemma 47.16.4 this means that each $F_i = h_{S_i} \times Isom(x, y)$ is an algebraic space. Thus to prove the lemma we only have to verify the set theoretic condition that $\coprod F_i$ is an algebraic space of Lemma 62.11.1 above to conclude. To do this we use Spaces, Lemma 47.8.3 which requires showing that I and the F_i are not “too large”. We suggest the reader skip the rest of the proof.

Choose $U' \in \text{Ob}(Sch/S)_{fppf}$ and a surjective étale morphism $U' \rightarrow U$. Let R' be the restriction of R to U' . Since $[U/R] = [U'/R']$ we may, after replacing U by U' , assume that U is a scheme. (This step is here so that the fibre products below are over a scheme.)

Note that if we refine the covering $\{T_i \rightarrow T\}$ then it remains true that each F_i is an algebraic space. Hence we may assume that each T_i is affine. Since $T_i \rightarrow T$ is locally of finite presentation, this then implies that $\text{size}(T_i) \leq \text{size}(T)$, see Sets, Lemma 3.9.7. We may also assume that the cardinality of the index set I is at most the cardinality of the set of points of T since to get a covering it suffices to check that each point of T is in the image. Hence $|I| \leq \text{size}(T)$. Choose $W \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $W \rightarrow R$. Note that in the proof of Groupoids in Spaces, Lemma 60.21.3 we showed that F_i is representable by $T_i \times_{(y_i, x_i), U \times_B U} R$ for some $x_i, y_i : T_i \rightarrow U$. Hence now we see that $V_i = T_i \times_{(y_i, x_i), U \times_B U} W$ is a scheme which comes with an étale surjection $V_i \rightarrow F_i$. By Sets, Lemma 3.9.6 we see that

$$\text{size}(V_i) \leq \max\{\text{size}(T_i), \text{size}(W)\} \leq \max\{\text{size}(T), \text{size}(W)\}$$

Hence, by Sets, Lemma 3.9.5 we conclude that

$$\text{size}\left(\coprod_{i \in I} V_i\right) \leq \max\{|I|, \text{size}(T), \text{size}(W)\}.$$

Hence we conclude by our construction of Sch that $\coprod_{i \in I} V_i$ is isomorphic to an object V of $(Sch/S)_{fppf}$. This verifies the hypothesis of Spaces, Lemma 47.8.3 and we win. \square

Lemma 62.11.6. *Let S be a scheme. Consider an algebraic space F of the form $F = U/R$ where (U, R, s, t, c) is a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \rightarrow U \times_S U$ is an equivalence relation. Then $U \rightarrow F$ is surjective, flat, and locally of finite presentation.*

Proof. This is almost but not quite a triviality. Namely, by Groupoids in Spaces, Lemma 60.18.5 and the fact that j is a monomorphism we see that $R = U \times_F U$. Choose a scheme W and a surjective étale morphism $W \rightarrow F$. As $U \rightarrow F$ is a surjection of sheaves we can find an fppf covering $\{W_i \rightarrow W\}$ and maps $W_i \rightarrow U$ lifting the morphisms $W_i \rightarrow F$. Then we see that

$$W_i \times_F U = W_i \times_U U \times_F U = W_i \times_{U, t} R$$

and the projection $W_i \times_F U \rightarrow W_i$ is the base change of $t : R \rightarrow U$ hence flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 49.28.4 and 49.27.3. Hence by Descent on Spaces, Lemmas 56.10.11 and 56.10.8 we see that $U \rightarrow F$ is flat and locally of finite presentation. It is surjective by Spaces, Remark 47.5.2. \square

Lemma 62.11.7. *Let S be a scheme. Let $X \rightarrow B$ be a morphism of algebraic spaces over S . Let G be a group algebraic space over B and let $a : G \times_B X \rightarrow X$ be an action of G on X/B . If*

- (1) *a is a free action, and*
- (2) *$G \rightarrow B$ is flat and locally of finite presentation,*

then X/G (see Groupoids in Spaces, Definition 60.18.1) is an algebraic space and $X \rightarrow X/G$ is surjective, flat, and locally of finite presentation.

Proof. The fact that X/G is an algebraic space is immediate from Theorem 62.10.1 and the definitions. Namely, $X/G = X/R$ where $R = G \times_B X$. The morphisms $s, t : G \times_B X \rightarrow X$ are flat and locally of finite presentation (clear for s as a base change of $G \rightarrow B$ and by symmetry using the inverse it follows for t) and the morphism $j : G \times_B X \rightarrow X \times_B X$ is a monomorphism by Groupoids in Spaces, Lemma 60.8.3 as the action is free. The assertions about the morphism $X \rightarrow X/G$ follow from Lemma 62.11.6. \square

Lemma 62.11.8. *Let $\{S_i \rightarrow S\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Let G be a group algebraic space over S , and denote $G_i = G_{S_i}$ the base changes. Suppose given*

- (1) *for each $i \in I$ an fppf G_i -torsor X_i over S_i , and*
- (2) *for each $i, j \in I$ a $G_{S_i \times_S S_j}$ -equivariant isomorphism $\varphi_{ij} : X_i \times_S S_j \rightarrow S_i \times_S X_j$ satisfying the cocycle condition over every $S_i \times_S S_j \times_S S_j$.*

Then there exists an fppf G -torsor X over S whose base change to S_i is isomorphic to X_i such that we recover the descent datum φ_{ij} .

Proof. We may think of X_i as a sheaf on $(Sch/S_i)_{fppf}$, see Spaces, Section 47.16. By Sites, Section 7.25 the descent datum (X_i, φ_{ij}) is effective in the sense that there exists a unique sheaf X on $(Sch/S)_{fppf}$ which recovers the algebraic spaces X_i after restricting back to $(Sch/S_i)_{fppf}$. Hence we see that $X_i = h_{S_i} \times X$. By Lemma 62.11.1 we see that X is an algebraic space, modulo verifying that $\coprod X_i$ is an algebraic space which we do at the end of the proof. By the equivalence of categories in Sites, Lemma 7.25.3 the action maps $G_i \times_{S_i} X_i \rightarrow X_i$ glue to give a map $a : G \times_S X \rightarrow X$. Now we have to show that a is an action and that X is a pseudo-torsor, and fppf locally trivial (see Groupoids in Spaces, Definition 60.9.3). These may be checked fppf locally, and hence follow from the corresponding properties of the actions $G_i \times_{S_i} X_i \rightarrow X_i$. Hence the lemma is true.

We suggest the reader skip the rest of the proof, which is purely set theoretical. Pick coverings $\{S_{ij} \rightarrow S_j\}_{j \in J_i}$ of $(Sch/S)_{fppf}$ which trivialize the G_i torsors X_i (possible by assumption, and Topologies, Lemma 33.7.7 part (1)). Then $\{S_{ij} \rightarrow S\}_{i \in I, j \in J_i}$ is a covering of $(Sch/S)_{fppf}$ and hence we may assume that each X_i is the trivial torsor! Of course we may also refine the covering further, hence we may assume that each S_i is affine and that the index set I has cardinality bounded by the cardinality of the set of points of S . Choose $U \in \text{Ob}((Sch/S)_{fppf})$ and a surjective étale morphism $U \rightarrow G$. Then we see that $U_i = U \times_S S_i$ comes with an

étale surjective morphism to $X_i \cong G_i$. By Sets, Lemma 3.9.6 we see $\text{size}(U_i) \leq \max\{\text{size}(U), \text{size}(S_i)\}$. By Sets, Lemma 3.9.7 we have $\text{size}(S_i) \leq \text{size}(S)$. Hence we see that $\text{size}(U_i) \leq \max\{\text{size}(U), \text{size}(S)\}$ for all $i \in I$. Together with the bound on $|I|$ we found above we conclude from Sets, Lemma 3.9.5 that $\text{size}(\coprod U_i) \leq \max\{\text{size}(U), \text{size}(S)\}$. Hence Spaces, Lemma 47.8.3 applies to show that $\coprod X_i$ is an algebraic space which is what we had to prove. \square

62.12. Algebraic spaces in the étale topology

Let S be a scheme. Instead of working with sheaves over the big fppf site $(Sch/S)_{fppf}$ we could work with sheaves over the big étale site $(Sch/S)_{\acute{e}tale}$. All of the material in Algebraic Spaces, Sections 47.3 and 47.5 makes sense for sheaves over $(Sch/S)_{\acute{e}tale}$. Thus we get a second notion of algebraic spaces by working in the étale topology. This notion is (a priori) weaker than the notion introduced in Algebraic Spaces, Definition 47.6.1 since a sheaf in the fppf topology is certainly a sheaf in the étale topology. However, the notions are equivalent as is shown by the following lemma.

Lemma 62.12.1. *Denote the common underlying category of Sch_{fppf} and $Sch_{\acute{e}tale}$ by Sch_α (see Topologies, Remark 33.9.1). Let S be an object of Sch_α .*

$$F : (Sch_\alpha/S)^{opp} \longrightarrow Sets$$

be a presheaf with the following properties:

- (1) F is a sheaf for the étale topology,
- (2) the diagonal $\Delta : F \rightarrow F \times F$ is representable, and
- (3) there exists $U \in \text{Ob}(Sch_\alpha/S)$ and $U \rightarrow F$ which is surjective and étale.

Then F is an algebraic space in the sense of Algebraic Spaces, Definition 47.6.1.

Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Spaces, Definition 47.6.1 are independent of the topology. This is true because these properties involve only the notion of a fibre product of presheaves, maps of presheaves, the notion of a representable transformation of functors, and what it means for such a transformation to be surjective and étale. Thus all we have to prove is that an étale sheaf F with properties (2) and (3) is also an fppf sheaf.

To do this, let $R = U \times_F U$. By (2) the presheaf R is representable by a scheme and by (3) the projections $R \rightarrow U$ are étale. Thus $j : R \rightarrow U \times_S U$ is an étale equivalence relation. Moreover $U \rightarrow F$ identifies F as the quotient of U by R for the étale topology: (a) if $T \rightarrow F$ is a morphism, then $\{T \times_F U \rightarrow T\}$ is an étale covering, hence $U \rightarrow F$ is a surjection of sheaves for the étale topology, (b) if $a, b : T \rightarrow U$ map to the same section of F , then $(a, b) : T \rightarrow R$ hence a and b have the same image in the quotient of U by R for the étale topology. Next, let U/R denote the quotient sheaf in the fppf topology which is an algebraic space by Spaces, Theorem 47.10.5. Thus we have morphisms (transformations of functors)

$$U \rightarrow F \rightarrow U/R.$$

By the aforementioned Spaces, Theorem 47.10.5 the composition is representable, surjective, and étale. Hence for any scheme T and morphism $T \rightarrow U/R$ the fibre product $V = T \times_{U/R} U$ is a scheme surjective and étale over T . In other words, $\{V \rightarrow U\}$ is an étale covering. This proves that $U \rightarrow U/R$ is surjective as a map of sheaves in the étale topology. It follows that $F \rightarrow U/R$ is surjective as a map of

sheaves in the étale topology. On the other hand, the map $F \rightarrow U/R$ is injective (as a map of presheaves) since $R = U \times_{U/R} U$ again by Spaces, Theorem 47.10.5. It follows that $F \rightarrow U/R$ is an isomorphism of étale sheaves, see Sites, Lemma 7.12.2 which concludes the proof. \square

In fact, it suffices to have a smooth cover by a scheme and it suffices to assume the diagonal is representable by algebraic spaces.

Lemma 62.12.2. *Denote the common underlying category of Sch_{fppf} and $Sch_{\acute{e}tale}$ by Sch_{α} (see Topologies, Remark 33.9.1). Let S be an object of Sch_{α} .*

$$F : (Sch_{\alpha}/S)^{opp} \longrightarrow Sets$$

be a presheaf with the following properties:

- (1) F is a sheaf for the étale topology,
- (2) the diagonal $\Delta : F \rightarrow F \times F$ is representable by algebraic spaces, and
- (3) there exists $U \in \text{Ob}(Sch_{\alpha}/S)$ and $U \rightarrow F$ which is surjective and smooth.

Then F is an algebraic space in the sense of Algebraic Spaces, Definition 47.6.1.

Proof. The proof mirrors the proof of Lemma 62.12.1. Let $R = U \times_F U$. By (2) the presheaf R is an algebraic space and by (3) the projections $R \rightarrow U$ are smooth and surjective. Denote (U, R, s, t, c) the groupoid associated to the equivalence relation $j : R \rightarrow U \times_S U$ (see Groupoids in Spaces, Lemma 60.11.3). By Theorem 62.10.1 we see that $X = U/R$ (quotient in the fppf-topology) is an algebraic space. Using that the smooth topology and the étale topology have the same sheaves (by More on Morphisms, Lemma 36.28.7) we see the map $U \rightarrow F$ identifies F as the quotient of U by R for the smooth topology (details omitted). Thus we have morphisms (transformations of functors)

$$U \rightarrow F \rightarrow X.$$

By Lemma 62.11.6 we see that $U \rightarrow X$ is surjective, flat and locally of finite presentation. By Groupoids in Spaces, Lemma 60.18.5 (and the fact that j is a monomorphism) we have $R = U \times_X U$. By Descent on Spaces, Lemma 56.10.24 we conclude that $U \rightarrow X$ is smooth and surjective (as the projections $R \rightarrow U$ are smooth and surjective and $\{U \rightarrow X\}$ is an fppf covering). Hence for any scheme T and morphism $T \rightarrow X$ the fibre product $T \times_X U$ is an algebraic space surjective and smooth over T . Choose a scheme V and a surjective étale morphism $V \rightarrow T \times_X U$. Then $\{V \rightarrow T\}$ is a smooth covering such that $V \rightarrow T \rightarrow X$ lifts to a morphism $V \rightarrow U$. This proves that $U \rightarrow X$ is surjective as a map of sheaves in the smooth topology. It follows that $F \rightarrow X$ is surjective as a map of sheaves in the smooth topology. On the other hand, the map $F \rightarrow X$ is injective (as a map of presheaves) since $R = U \times_X U$. It follows that $F \rightarrow X$ is an isomorphism of smooth (= étale) sheaves, see Sites, Lemma 7.12.2 which concludes the proof. \square

Quotients of Groupoids

63.1. Introduction

This chapter is devoted to generalities concerning groupoids and their quotients (as far as they exist). There is a lot of literature on this subject, see for example [MFK94], [Ses72], [Kol97], [KM97], [Kol08] and many more.

63.2. Conventions and notation

In this chapter the conventions and notation are those introduced in Groupoids in Spaces, Sections 60.2 and 60.3.

63.3. Invariant morphisms

Definition 63.3.1. Let S be a scheme, and let B be an algebraic space over S . Let $j = (t, s) : R \rightarrow U \times_B U$ be a pre-relation of algebraic spaces over B . We say a morphism $\phi : U \rightarrow X$ of algebraic spaces over B is R -invariant if the diagram

$$\begin{array}{ccc} R & \xrightarrow{s} & U \\ t \downarrow & & \downarrow \phi \\ U & \xrightarrow{\phi} & X \end{array}$$

is commutative. If $j : R \rightarrow U \times_B U$ comes from the action of a group algebraic space G on U over B as in Groupoids in Spaces, Lemma 60.14.1, then we say that ϕ is G -invariant.

In other words, a morphism $U \rightarrow X$ is R -invariant if it equalizes s and t . We can reformulate this in terms of associated quotient sheaves as follows.

Lemma 63.3.2. *Let S be a scheme, and let B be an algebraic space over S . Let $j = (t, s) : R \rightarrow U \times_B U$ be a pre-relation of algebraic spaces over B . A morphism of algebraic spaces $\phi : U \rightarrow X$ is R -invariant if and only if it factors as $U \rightarrow U/R \rightarrow X$.*

Proof. This is clear from the definition of the quotient sheaf in Groupoids in Spaces, Section 60.18. \square

Lemma 63.3.3. *Let S be a scheme, and let B be an algebraic space over S . Let $j = (t, s) : R \rightarrow U \times_B U$ be a pre-relation of algebraic spaces over B . Let $U \rightarrow X$ be an R -invariant morphism of algebraic spaces over B . Let $X' \rightarrow X$ be any morphism of algebraic spaces.*

- (1) *Setting $U' = X' \times_X U$, $R' = X' \times_X R$ we obtain a pre-relation $j' : R' \rightarrow U' \times_B U'$.*

- (2) The pre-relation $j' : R' \rightarrow U' \times_B U'$ is the restriction of $j : R \rightarrow U \times_B U$ via $U' \rightarrow U$, see *Groupoids in Spaces*, Definition 60.4.3.
- (3) If j is a relation, then j' is a relation.
- (4) If j is a pre-equivalence relation, then j' is a pre-equivalence relation.
- (5) If j is an equivalence relation, then j' is an equivalence relation.
- (6) If j comes from a groupoid in algebraic spaces (U, R, s, t, c) over B , then j' comes from the restriction of this groupoid to U' , see *Groupoids in Spaces*, Definition 60.16.2.
- (7) If j comes from the action of a group algebraic space G/B on U as in *Groupoids in Spaces*, Lemma 60.14.1 then j' comes from the induced action of G on U' .

Proof. Omitted. Hint: Functorial point of view combined with the picture:

$$\begin{array}{ccccc}
 R' = X' \times_X R & \longrightarrow & X' \times_X U = U' & & \\
 \downarrow & \searrow & \downarrow & \searrow & \\
 & & R & \longrightarrow & U \\
 & & \downarrow & & \downarrow \\
 U' = X' \times_X U & \longrightarrow & X' & & X \\
 & \searrow & \downarrow & \searrow & \\
 & & U & \longrightarrow & X
 \end{array}$$

□

Definition 63.3.4. In the situation of Lemma 63.3.3 we call $j' : R' \rightarrow U' \times_B U'$ the *pullback* of the pre-relation j to X' . We say it is a *flat pullback* if $X' \rightarrow X$ is a flat morphism of algebraic spaces.

63.4. Categorical quotients

This is the most basic kind of quotient one can consider.

Definition 63.4.1. Let S be a scheme, and let B be an algebraic space over S . Let $j = (t, s) : R \rightarrow U \times_B U$ be pre-relation in algebraic spaces over B .

- (1) We say a morphism $\phi : U \rightarrow X$ of algebraic spaces over B is a *categorical quotient* if it is R -invariant, and for every R -invariant morphism $\psi : U \rightarrow Y$ of algebraic spaces over B there exists a unique morphism $\chi : X \rightarrow Y$ such that $\psi = \phi \circ \chi$.
- (2) Let \mathcal{C} be a full subcategory of the category of algebraic spaces over B . Assume U, R are objects of \mathcal{C} . In this situation we say a morphism $\phi : U \rightarrow X$ of algebraic spaces over B is a *categorical quotient in \mathcal{C}* if $X \in \text{Ob}(\mathcal{C})$, and ϕ is R -invariant, and for every R -invariant morphism $\psi : U \rightarrow Y$ with $Y \in \text{Ob}(\mathcal{C})$ there exists a unique morphism $\chi : X \rightarrow Y$ such that $\psi = \phi \circ \chi$.
- (3) If $B = S$ and \mathcal{C} is the category of schemes over S , then we say $U \rightarrow X$ is a *categorical quotient in the category of schemes*, or simply a *categorical quotient in schemes*.

We often single out a category \mathcal{C} of algebraic spaces over B by some separation axiom, see Example 63.4.3 for some standard cases. Note that if $\phi : U \rightarrow X$ is a categorical quotient if and only if $U \rightarrow X$ is a coequalizer for the morphisms $t, s : R \rightarrow U$ in the category. Hence we immediately deduce the following lemma.

Lemma 63.4.2. *Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation in algebraic spaces over B . If a categorical quotient in the category of algebraic spaces over B exists, then it is unique up to unique isomorphism. Similarly for categorical quotients in full subcategories of Spaces/B .*

Proof. See Categories, Section 4.11. □

Example 63.4.3. Let S be a scheme, and let B be an algebraic space over S . Here are some standard examples of categories \mathcal{C} that we often come up when applying Definition 63.4.1:

- (1) \mathcal{C} is the category of all algebraic spaces over B ,
- (2) B is separated and \mathcal{C} is the category of all separated algebraic spaces over B ,
- (3) B is quasi-separated and \mathcal{C} is the category of all quasi-separated algebraic spaces over B ,
- (4) B is locally separated and \mathcal{C} is the category of all locally separated algebraic spaces over B ,
- (5) B is decent and \mathcal{C} is the category of all decent algebraic spaces over B , and
- (6) $S = B$ and \mathcal{C} is the category of schemes over S .

In this case, if $\phi : U \rightarrow X$ is a categorical quotient then we say $U \rightarrow X$ is (1) a *categorical quotient*, (2) a *categorical quotient in separated algebraic spaces*, (3) a *categorical quotient in quasi-separated algebraic spaces*, (4) a *categorical quotient in locally separated algebraic spaces*, (5) a *categorical quotient in decent algebraic spaces*, (6) a *categorical quotient in schemes*.

Definition 63.4.4. Let S be a scheme, and let B be an algebraic space over S . Let \mathcal{C} be a full subcategory of the category of algebraic spaces over B closed under fibre products. Let $j = (t, s) : R \rightarrow U \times_B U$ be pre-relation in \mathcal{C} , and let $U \rightarrow X$ be an R -invariant morphism with $X \in \text{Ob}(\mathcal{C})$.

- (1) We say $U \rightarrow X$ is a *universal categorical quotient* in \mathcal{C} if for every morphism $X' \rightarrow X$ in \mathcal{C} the morphism $U' = X' \times_X U \rightarrow X'$ is the categorical quotient in \mathcal{C} of the pullback $j' : R' \rightarrow U'$ of j .
- (2) We say $U \rightarrow X$ is a *uniform categorical quotient* in \mathcal{C} if for every flat morphism $X' \rightarrow X$ in \mathcal{C} the morphism $U' = X' \times_X U \rightarrow X'$ is the categorical quotient in \mathcal{C} of the pullback $j' : R' \rightarrow U'$ of j .

Lemma 63.4.5. *In the situation of Definition 63.4.1. If $\phi : U \rightarrow X$ is a categorical quotient and U is reduced, then X is reduced. The same holds for categorical quotients in a category of spaces \mathcal{C} listed in Example 63.4.3.*

Proof. Let X_{red} be the reduction of the algebraic space X . Since U is reduced the morphism $\phi : U \rightarrow X$ factors through $i : X_{\text{red}} \rightarrow X$ (insert future reference here). Denote this morphism by $\phi_{\text{red}} : U \rightarrow X_{\text{red}}$. Since $\phi \circ s = \phi \circ t$ we see that also $\phi_{\text{red}} \circ s = \phi_{\text{red}} \circ t$ (as $i : X_{\text{red}} \rightarrow X$ is a monomorphism). Hence by the universal

property of ϕ there exists a morphism $\chi : X \rightarrow X_{red}$ such that $\phi_{red} = \phi \circ \chi$. By uniqueness we see that $i \circ \chi = \text{id}_X$ and $\chi \circ i = \text{id}_{X_{red}}$. Hence i is an isomorphism and X is reduced.

To show that this argument works in a category \mathcal{C} one just needs to show that the reduction of an object of \mathcal{C} is an object of \mathcal{C} . We omit the verification that this holds for each of the standard examples. \square

63.5. Quotients as orbit spaces

Let $j = (t, s) : R \rightarrow U \times_B U$ be a pre-relation. If j is a pre-equivalence relation, then loosely speaking the “orbits” of R on U are the subsets $t(s^{-1}(\{u\}))$ of U . However, if j is just a pre-relation, then we need to take the equivalence relation generated by R .

Definition 63.5.1. Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B . If $u \in |U|$, then the *orbit*, or more precisely the *R-orbit* of u is

$$O_u = \left\{ u' \in |U| : \begin{array}{l} \exists n \geq 1, \exists u_0, \dots, u_n \in |U| \text{ such that} \\ \text{for all } i \in \{0, \dots, n-1\} \text{ either} \\ u_i = u_{i+1} \text{ or} \\ \exists r \in |R|, s(r) = u_i, t(r) = u_{i+1} \text{ or} \\ \exists r \in |R|, t(r) = u_i, s(r) = u_{i+1} \end{array} \right\}$$

It is clear that these are the equivalence classes of an equivalence relation, i.e., we have $u' \in O_u$ if and only if $u \in O_{u'}$. The following lemma is a reformulation of Groupoids in Spaces, Lemma 60.4.4.

Lemma 63.5.2. Let $B \rightarrow S$ as in Section 63.2. Let $j : R \rightarrow U \times_B U$ be a pre-equivalence relation of algebraic spaces over B . Then

$$O_u = \{u' \in |U| \text{ such that } \exists r \in |R|, s(r) = u, t(r) = u'\}.$$

Proof. By the aforementioned Groupoids in Spaces, Lemma 60.4.4 we see that the orbits O_u as defined in the lemma give a disjoint union decomposition of $|U|$. Thus we see they are equal to the orbits as defined in Definition 63.5.1. \square

Lemma 63.5.3. In the situation of Definition 63.5.1. Let $\phi : U \rightarrow X$ be an R -invariant morphism of algebraic spaces over B . Then $|\phi| : |U| \rightarrow |X|$ is constant on the orbits.

Proof. To see this we just have to show that $\phi(u) = \phi(u')$ for all $u, u' \in |U|$ such that there exists an $r \in |R|$ such that $s(r) = u$ and $t(r) = u'$. And this is clear since ϕ equalizes s and t . \square

There are several problems with considering the orbits $O_u \subset |U|$ as a tool for singling out properties of quotient maps. One issue is the following. Suppose that $\text{Spec}(k) \rightarrow B$ is a geometric point of B . Consider the canonical map

$$U(k) \longrightarrow |U|.$$

Then it is usually not the case that the equivalence classes of the equivalence relation generated by $j(R(k)) \subset U(k) \times U(k)$ are the inverse images of the orbits $O_u \subset |U|$. A silly example is to take $S = B = \text{Spec}(\mathbf{Z})$, $U = R = \text{Spec}(k)$ with $s = t = \text{id}_k$. Then $|U| = |R|$ is a single point but $U(k)/R(k)$ is enormous. A more interesting

example is to take $S = B = \text{Spec}(\mathbf{Q})$, choose some of number fields $K \subset L$, and set $U = \text{Spec}(L)$ and $R = \text{Spec}(L \otimes_K L)$ with obvious maps $s, t : R \rightarrow U$. In this case $|U|$ still has just one point, but the quotient

$$U(k)/R(k) = \text{Hom}(K, k)$$

consists of more than one element. We conclude from both examples that if $U \rightarrow X$ is an R -invariant map and if we want it to “separate orbits” we get a much stronger and interesting notion by considering the induced maps $U(k) \rightarrow X(k)$ and ask that those maps separate orbits.

There is an issue with this too. Namely, suppose that $S = B = \text{Spec}(\mathbf{R})$, $U = \text{Spec}(\mathbf{C})$, and $R = \text{Spec}(\mathbf{C}) \amalg \text{Spec}(K)$ for some field extension $\sigma : \mathbf{C} \rightarrow K$. Let the maps s, t be given by the identity on the component $\text{Spec}(\mathbf{C})$, but by $\sigma, \sigma \circ \tau$ on the second component where τ is complex conjugation. If K is a nontrivial extension of \mathbf{C} , then the two points $1, \tau \in U(\mathbf{C})$ are not equivalent under $j(R(\mathbf{C}))$. But after choosing an extension $\mathbf{C} \subset \Omega$ of sufficiently large cardinality (for example larger than the cardinality of K) then the images of $1, \tau \in U(\mathbf{C})$ in $U(\Omega)$ do become equivalent! It seems intuitively clear that this happens either because $s, t : R \rightarrow U$ are not locally of finite type or because the cardinality of the field k is not large enough.

Keeping this in mind we make the following definition.

Definition 63.5.4. Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B . Let $\text{Spec}(k) \rightarrow B$ be a geometric point of B .

- (1) We say $\bar{u}, \bar{u}' \in U(k)$ are *weakly R -equivalent* if they are in the same equivalence class for the equivalence relation generated by the relation $j(R(k)) \subset U(k) \times U(k)$.
- (2) We say $\bar{u}, \bar{u}' \in U(k)$ are *R -equivalent* if for some overfield $k \subset \Omega$ the images in $U(\Omega)$ are weakly R -equivalent.
- (3) The *weak orbit*, or more precisely the *weak R -orbit* of $\bar{u} \in U(k)$ is set of all elements of $U(k)$ which are weakly R -equivalent to \bar{u} .
- (4) The *orbit*, or more precisely the *R -orbit* of $\bar{u} \in U(k)$ is set of all elements of $U(k)$ which are R -equivalent to \bar{u} .

It turns out that in good cases orbits and weak orbits agree, see Lemma 63.5.7. The following lemma illustrates the difference in the special case of a pre-equivalence relation.

Lemma 63.5.5. Let S be a scheme, and let B be an algebraic space over S . Let $\text{Spec}(k) \rightarrow B$ be a geometric point of B . Let $j : R \rightarrow U \times_B U$ be a pre-equivalence relation over B . In this case the weak orbit of $\bar{u} \in U(k)$ is simply

$$\{\bar{u}' \in U(k) \text{ such that } \exists \bar{r} \in R(k), s(\bar{r}) = \bar{u}, t(\bar{r}) = \bar{u}'\}$$

and the orbit of $\bar{u} \in U(k)$ is

$$\{\bar{u}' \in U(k) : \exists \text{ field extension } k \subset K, \exists r \in R(K), s(r) = \bar{u}, t(r) = \bar{u}'\}$$

Proof. This is true because by definition of a pre-equivalence relation the image $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation. \square

Let us describe the recipe for turning any pre-relation into a pre-equivalence relation. We will use the morphisms

$$(63.5.5.1) \quad \begin{aligned} j_{diag} &: U &\longrightarrow & U \times_B U, & u &\longmapsto & (u, u) \\ j_{flip} &: R &\longrightarrow & U \times_B U, & r &\longmapsto & (s(r), t(r)) \\ j_{comp} &: R \times_{s,U,t} R &\longrightarrow & U \times_B U, & (r, r') &\longmapsto & (t(r), s(r')) \end{aligned}$$

We define $j_1 = (t_1, s_1) : R_1 \rightarrow U \times_B U$ to be the morphism

$$j \amalg j_{diag} \amalg j_{flip} : R \amalg U \amalg R \longrightarrow U \times_B U$$

with notation as in Equation (63.5.5.1). For $n > 1$ we set

$$j_n = (t_n, s_n) : R_n = R_1 \times_{s_1, U, t_{n-1}} R_{n-1} \longrightarrow U \times_B U$$

where t_n comes from t_1 precomposed with projection onto R_1 and s_n comes from s_{n-1} precomposed with projection onto R_{n-1} . Finally, we denote

$$j_\infty = (t_\infty, s_\infty) : R_\infty = \coprod_{n \geq 1} R_n \longrightarrow U \times_B U.$$

Lemma 63.5.6. *Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B . Then $j_\infty : R_\infty \rightarrow U \times_B U$ is a pre-equivalence relation over B . Moreover*

- (1) $\phi : U \rightarrow X$ is R -invariant if and only if it is R_∞ -invariant,
- (2) the canonical map of quotient sheaves $U/R \rightarrow U/R_\infty$ (see Groupoids in Spaces, Section 60.18) is an isomorphism,
- (3) weak R -orbits agree with weak R_∞ -orbits,
- (4) R -orbits agree with R_∞ -orbits,
- (5) if s, t are locally of finite type, then s_∞, t_∞ are locally of finite type,
- (6) add more here as needed.

Proof. Omitted. Hint for (5): Any property of s, t which is stable under composition and stable under base change, and Zariski local on the source will be inherited by s_∞, t_∞ . □

Lemma 63.5.7. *Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B . Let $\text{Spec}(k) \rightarrow B$ be a geometric point of B .*

- (1) If $s, t : R \rightarrow U$ are locally of finite type then weak R -equivalence on $U(k)$ agrees with R -equivalence, and weak R -orbits agree with R -orbits on $U(k)$.
- (2) If k has sufficiently large cardinality then weak R -equivalence on $U(k)$ agrees with R -equivalence, and weak R -orbits agree with R -orbits on $U(k)$.

Proof. We first prove (1). Assume s, t locally of finite type. By Lemma 63.5.6 we may assume that R is a pre-equivalence relation. Let k be an algebraically closed field over B . Suppose $\bar{u}, \bar{u}' \in U(k)$ are R -equivalent. Then for some extension field $k \subset \Omega$ there exists a point $\bar{r} \in R(\Omega)$ mapping to $(\bar{u}, \bar{u}') \in (U \times_B U)(\Omega)$, see Lemma 63.5.5. Hence

$$Z = R \times_{j, U \times_B U, (\bar{u}, \bar{u}')} \text{Spec}(k)$$

is nonempty. As s is locally of finite type we see that also j is locally of finite type, see Morphisms of Spaces, Lemma 49.23.6. This implies Z is a nonempty algebraic space locally of finite type over the algebraically closed field k (use Morphisms of Spaces, Lemma 49.23.3). Thus Z has a k -valued point, see Morphisms of Spaces,

Lemma 49.24.1. Hence we conclude there exists a $\bar{r} \in R(k)$ with $j(\bar{r}) = (\bar{u}, \bar{u}')$, and we conclude that \bar{u}, \bar{u}' are R -equivalent as desired.

The proof of part (2) is the same, except that it uses Morphisms of Spaces, Lemma 49.24.2 instead of Morphisms of Spaces, Lemma 49.24.1. This shows that the assertion holds as soon as $|k| > \lambda(R)$ with $\lambda(R)$ as introduced just above Morphisms of Spaces, Lemma 49.24.1. \square

In the following definition we use the terminology “ k is a field over B ” to mean that $\text{Spec}(k)$ comes equipped with a morphism $\text{Spec}(k) \rightarrow B$.

Definition 63.5.8. Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B .

- (1) We say $\phi : U \rightarrow X$ is *set-theoretically R -invariant* if and only if the map $U(k) \rightarrow X(k)$ equalizes the two maps $s, t : R(k) \rightarrow U(k)$ for every algebraically closed field k over B .
- (2) We say $\phi : U \rightarrow X$ *separates orbits*, or *separates R -orbits* if it is set-theoretically R -invariant and $\phi(\bar{u}) = \phi(\bar{u}')$ in $X(k)$ implies that $\bar{u}, \bar{u}' \in U(k)$ are in the same orbit for every algebraically closed field k over B .

In Example 63.5.12 we show that being set-theoretically invariant is “too weak” a notion in the category of algebraic spaces. A more geometric reformulation of what it means to be set-theoretically invariant or to separate orbits is in Lemma 63.5.17.

Lemma 63.5.9. *In the situation of Definition 63.5.8. A morphism $\phi : U \rightarrow X$ is set-theoretically R -invariant if and only if for any algebraically closed field k over B the map $U(k) \rightarrow X(k)$ is constant on orbits.*

Proof. This is true because the condition is supposed to hold for all algebraically closed fields over B . \square

Lemma 63.5.10. *In the situation of Definition 63.5.8. An invariant morphism is set-theoretically invariant.*

Proof. This is immediate from the definitions. \square

Lemma 63.5.11. *In the situation of Definition 63.5.8. Let $\phi : U \rightarrow X$ be a morphism of algebraic spaces over B . Assume*

- (1) ϕ is set-theoretically R -invariant,
- (2) R is reduced, and
- (3) X is locally separated over B .

Then ϕ is R -invariant.

Proof. Consider the equalizer

$$Z = R \times_{(\phi, \phi) \circ j, X \times_B X, \Delta_{X/B}} X$$

algebraic space. Then $Z \rightarrow R$ is an immersion by assumption (3). By assumption (1) $|Z| \rightarrow |R|$ is surjective. This implies that $Z \rightarrow R$ is a bijective closed immersion (use Schemes, Lemma 25.10.4) and by assumption (2) we conclude that $Z = R$. \square

Example 63.5.12. There exist reduced quasi-separated algebraic spaces X, Y and a pair of morphisms $a, b : Y \rightarrow X$ which agree on all k -valued points but are not equal. To get an example take $Y = \text{Spec}(k[[x]])$ and

$$X = \mathbf{A}_k^1 / (\Delta \amalg \{(x, -x) \mid x \neq 0\})$$

the algebraic space of Spaces, Example 47.14.1. The two morphisms $a, b : Y \rightarrow X$ come from the two maps $x \mapsto x$ and $x \mapsto -x$ from Y to $\mathbf{A}_k^1 = \text{Spec}(k[x])$. On the generic point the two maps are the same because on the open part $x \neq 0$ of the space X the functions x and $-x$ are equal. On the closed point the maps are obviously the same. It is also true that $a \neq b$. This implies that Lemma 63.5.11 does not hold with assumption (3) replaced by the assumption that X be quasi-separated. Namely, consider the diagram

$$\begin{array}{ccc} Y & \xrightarrow{\quad} & Y \\ & \searrow 1 & \downarrow a \\ & & Y \\ & \swarrow a & \downarrow \\ Y & \xrightarrow{\quad} & X \end{array}$$

then the composition $a \circ (-1) = b$. Hence we can set $R = Y$, $U = Y$, $s = 1$, $t = -1$, $\phi = a$ to get an example of a set-theoretically invariant morphism which is not invariant.

The example above is instructive because the map $Y \rightarrow X$ even separates orbits. It shows that in the category of algebraic spaces there are simply too many set-theoretically invariant morphisms lying around. Next, let us define what it means for R to be a set-theoretic equivalence relation, while remembering that we need to allow for field extensions to make this work correctly.

Definition 63.5.13. Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B .

- (1) We say j is a *set-theoretic pre-equivalence relation* if

$$\bar{u} \sim_R \bar{u}' \Leftrightarrow \exists \text{ field extension } k \subset K, \exists r \in R(K), \\ s(r) = \bar{u}, t(r) = \bar{u}'$$

defines an equivalence relation on $U(k)$ for all algebraically closed fields k over B .

- (2) We say j is a *set-theoretic equivalence relation* if j is universally injective and a set-theoretic pre-equivalence relation.

Let us reformulate this in more geometric terms.

Lemma 63.5.14. *In the situation of Definition 63.5.13. The following are equivalent:*

- (1) *The morphism j is a set-theoretic pre-equivalence relation.*
- (2) *The subset $j(|R|) \subset |U \times_B U|$ contains the image of $|j'|$ for any of the morphisms j' as in Equation (63.5.5.1).*
- (3) *For every algebraically closed field k over B of sufficiently large cardinality the subset $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.*

If s, t are locally of finite type these are also equivalent to

- (4) *For every algebraically closed field k over B the subset $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.*

Proof. Assume (2). Let k be an algebraically closed field over B . We are going to show that \sim_R is an equivalence relation. Suppose that $\bar{u}_i : \text{Spec}(k) \rightarrow U$, $i = 1, 2$ are k -valued points of U . Suppose that (\bar{u}_1, \bar{u}_2) is the image of a K -valued point

$r \in R(K)$. Consider the solid commutative diagram

$$\begin{array}{ccccc}
 \text{Spec}(K') & \dashrightarrow & \text{Spec}(k) & \longleftarrow & \text{Spec}(K) \\
 \downarrow & & \downarrow & & \downarrow \\
 R & \xrightarrow{j} & U \times_B U & \xleftarrow{j_{flip}} & R
 \end{array}$$

(\bar{u}_2, \bar{u}_1)

We also denote $r \in |R|$ the image of r . By assumption the image of $|j_{flip}|$ is contained in the image of $|j|$, in other words there exists a $r' \in |R|$ such that $|j|(r') = |j_{flip}|(r)$. But note that (\bar{u}_2, \bar{u}_1) is in the equivalence class that defines $|j|(r')$ (by the commutativity of the solid part of the diagram). This means there exists a field extension $k \subset K'$ and a morphism $r' : \text{Spec}(K) \rightarrow R$ (abusively denoted r' as well) with $j \circ r' = (\bar{u}_2, \bar{u}_1) \circ i$ where $i : \text{Spec}(K') \rightarrow \text{Spec}(K)$ is the obvious map. In other words the dotted part of the diagram commutes. This proves that \sim_R is a symmetric relation on $U(k)$. In the similar way, using that the image of $|j_{diag}|$ is contained in the image of $|j|$ we see that \sim_R is reflexive (details omitted).

To show that \sim_R is transitive assume given $\bar{u}_i : \text{Spec}(k) \rightarrow U$, $i = 1, 2, 3$ and field extensions $k \subset K_i$ and points $r_i : \text{Spec}(K_i) \rightarrow R$, $i = 1, 2$ such that $j(r_1) = (\bar{u}_1, \bar{u}_2)$ and $j(r_2) = (\bar{u}_2, \bar{u}_3)$. Then we may choose a commutative diagram of fields

$$\begin{array}{ccc}
 K & \longleftarrow & K_2 \\
 \uparrow & & \uparrow \\
 K_1 & \longleftarrow & k
 \end{array}$$

and we may think of $r_1, r_2 \in R(K)$. We consider the commutative solid diagram

$$\begin{array}{ccccc}
 \text{Spec}(K') & \dashrightarrow & \text{Spec}(k) & \longleftarrow & \text{Spec}(K) \\
 \downarrow & & \downarrow & & \downarrow \\
 R & \xrightarrow{j} & U \times_B U & \xleftarrow{j_{comp}} & R \times_{s,U,t} R
 \end{array}$$

(\bar{u}_1, \bar{u}_3) (r_1, r_2)

By exactly the same reasoning as in the first part of the proof, but this time using that $|j_{comp}|((r_1, r_2))$ is in the image of $|j|$, we conclude that a field K' and dotted arrows exist making the diagram commute. This proves that \sim_R is transitive and concludes the proof that (2) implies (1).

Assume (1) and let k be an algebraically closed field over B whose cardinality is larger than $\lambda(R)$, see Morphisms of Spaces, Lemma 49.24.2. Suppose that $\bar{u} \sim_R \bar{u}'$ with $\bar{u}, \bar{u}' \in U(k)$. By assumption there exists a point in $|R|$ mapping to $(\bar{u}, \bar{u}') \in |U \times_B U|$. Hence by Morphisms of Spaces, Lemma 49.24.2 we conclude there exists an $\bar{r} \in R(k)$ with $j(\bar{r}) = (\bar{u}, \bar{u}')$. In this way we see that (1) implies (3).

Assume (3). Let us show that $\text{Im}(|j_{comp}|) \subset \text{Im}(|j|)$. Pick any point $c \in |R \times_{s,U,t} R|$. We may represent this by a morphism $\bar{c} : \text{Spec}(k) \rightarrow R \times_{s,U,t} R$, with k over B having sufficiently large cardinality. By assumption we see that $j_{comp}(\bar{c}) \in U(k) \times U(k) = (U \times_B U)(k)$ is also the image $j(\bar{r})$ for some $\bar{r} \in R(k)$. Hence $j_{comp}(c) = j(r)$ in $|U \times_B U|$ as desired (with $r \in |R|$ the equivalence class of \bar{r}). The same argument shows also that $\text{Im}(|j_{diag}|) \subset \text{Im}(|j|)$ and $\text{Im}(|j_{flip}|) \subset \text{Im}(|j|)$ (details omitted). In this way we see that (3) implies (2). At this point we have shown that (1), (2) and (3) are all equivalent.

It is clear that (4) implies (3) (without any assumptions on s, t). To finish the proof of the lemma we show that (1) implies (4) if s, t are locally of finite type. Namely, let k be an algebraically closed field over B . Suppose that $\bar{u} \sim_R \bar{u}'$ with $\bar{u}, \bar{u}' \in U(k)$. By assumption the algebraic space $Z = R \times_{j, U \times_B U, (\bar{u}, \bar{u}')} \text{Spec}(k)$ is nonempty. On the other hand, since $j = (t, s)$ is locally of finite type the morphism $Z \rightarrow \text{Spec}(k)$ is locally of finite type as well (use Morphisms of Spaces, Lemmas 49.23.6 and 49.23.3). Hence Z has a k point by Morphisms of Spaces, Lemma 49.24.1 and we conclude that $(\bar{u}, \bar{u}') \in j(R(k))$ as desired. This finishes the proof of the lemma. \square

Lemma 63.5.15. *In the situation of Definition 63.5.13. The following are equivalent:*

- (1) *The morphism j is a set-theoretic equivalence relation.*
- (2) *The morphism j is universally injective and $j(|R|) \subset |U \times_B U|$ contains the image of $|j'|$ for any of the morphisms j' as in Equation (63.5.5.1).*
- (3) *For every algebraically closed field k over B of sufficiently large cardinality the map $j : R(k) \rightarrow U(k) \times U(k)$ is injective and its image is an equivalence relation.*

If j is decent, or locally separated, or quasi-separated these are also equivalent to

- (4) *For every algebraically closed field k over B the map $j : R(k) \rightarrow U(k) \times U(k)$ is injective and its image is an equivalence relation.*

Proof. The implications (1) \Rightarrow (2) and (2) \Rightarrow (3) follow from Lemma 63.5.14 and the definitions. The same lemma shows that (3) implies j is a set-theoretic pre-equivalence relation. But of course condition (3) also implies that j is universally injective, see Morphisms of Spaces, Lemma 49.19.2, so that j is indeed a set-theoretic equivalence relation. At this point we know that (1), (2), (3) are all equivalent.

Condition (4) implies (3) without any further hypotheses on j . Assume j is decent, or locally separated, or quasi-separated and the equivalent conditions (1), (2), (3) hold. By More on Morphisms of Spaces, Lemma 58.3.4 we see that j is radicial. Let k be any algebraically closed field over B . Let $\bar{u}, \bar{u}' \in U(k)$ with $\bar{u} \sim_R \bar{u}'$. We see that $R \times_{U \times_B U, (\bar{u}, \bar{u}')} \text{Spec}(k)$ is nonempty. Hence, as j is radicial, its reduction is the spectrum of a field purely inseparable over k . As $k = \bar{k}$ we see that it is the spectrum of k . Whence a point $\bar{r} \in R(k)$ with $t(\bar{r}) = \bar{u}$ and $s(\bar{r}) = \bar{u}'$ as desired. \square

Lemma 63.5.16. *Let S be a scheme, and let B be an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation over B .*

- (1) *If j is a pre-equivalence relation, then j is a set-theoretic pre-equivalence relation. This holds in particular when j comes from a groupoid in algebraic spaces, or from an action of a group algebraic space on U .*
- (2) *If j is an equivalence relation, then j is a set-theoretic equivalence relation.*

Proof. Omitted. \square

Lemma 63.5.17. *Let $B \rightarrow S$ be as in Section 63.2. Let $j : R \rightarrow U \times_B U$ be a pre-relation. Let $\phi : U \rightarrow X$ be a morphism of algebraic spaces over B . Consider*

the diagram

$$\begin{array}{ccc} (U \times_X U) \times_{(U \times_B U)} R & \xrightarrow{p} & R \\ \downarrow q & & \downarrow j \\ U \times_X U & \xrightarrow{c} & U \times_B U \end{array}$$

Then we have:

- (1) The morphism ϕ is set-theoretically invariant if and only if p is surjective.
- (2) If j is a set-theoretic pre-equivalence relation then ϕ separates orbits if and only if p and q are surjective.
- (3) If p and q are surjective, then j is a set-theoretic pre-equivalence relation (and ϕ separates orbits).
- (4) If ϕ is R -invariant and j is a set-theoretic pre-equivalence relation, then ϕ separates orbits if and only if the induced morphism $R \rightarrow U \times_X U$ is surjective.

Proof. Assume ϕ is set-theoretically invariant. This means that for any algebraically closed field k over B and any $\bar{r} \in R(k)$ we have $\phi(s(\bar{r})) = \phi(t(\bar{r}))$. Hence $((\phi(t(\bar{r})), \phi(s(\bar{r}))), \bar{r})$ defines a point in the fibre product mapping to \bar{r} via p . This shows that p is surjective. Conversely, assume p is surjective. Pick $\bar{r} \in R(k)$. As p is surjective, we can find a field extension $k \subset K$ and a K -valued point \tilde{r} of the fibre product with $p(\tilde{r}) = \bar{r}$. Then $q(\tilde{r}) \in U \times_X U$ maps to $(t(\bar{r}), s(\bar{r}))$ in $U \times_B U$ and we conclude that $\phi(s(\bar{r})) = \phi(t(\bar{r}))$. This proves that ϕ is set-theoretically invariant.

The proofs of (2), (3), and (4) are omitted. Hint: Assume k is an algebraically closed field over B of large cardinality. Consider the associated diagram of sets

$$\begin{array}{ccc} (U(k) \times_{X(k)} U(k)) \times_{U(k) \times U(k)} R(k) & \xrightarrow{p} & R(k) \\ \downarrow q & & \downarrow j \\ U(k) \times_{X(k)} U(k) & \xrightarrow{c} & U(k) \times U(k) \end{array}$$

By the lemmas above the equivalences posed in (2), (3), and (4) become set-theoretic questions related to the diagram we just displayed, using that surjectivity translates into surjectivity on k -valued points by Morphisms of Spaces, Lemma 49.24.2. \square

Because we have seen above that the notion of a set-theoretically invariant morphism is a rather weak one in the category of algebraic spaces, we define an orbit space for a pre-relation as follows.

Definition 63.5.18. Let $B \rightarrow S$ as in Section 63.2. Let $j : R \rightarrow U \times_B U$ be a pre-relation. We say $\phi : U \rightarrow X$ is an *orbit space for R* if

- (1) ϕ is R -invariant,
- (2) ϕ separates R -orbits, and
- (3) ϕ is surjective.

The definition of separating R -orbits involves a discussion of points with values in algebraically closed fields. But as we've seen in many cases this just corresponds to the surjectivity of certain canonically associated morphisms of algebraic spaces. We summarize some of the discussion above in the following characterization of orbit spaces.

Lemma 63.5.19. *Let $B \rightarrow S$ as in Section 63.2. Let $j : R \rightarrow U \times_B U$ be a set-theoretic pre-equivalence relation. A morphism $\phi : U \rightarrow X$ is an orbit space for R if and only if*

- (1) $\phi \circ s = \phi \circ t$, i.e., ϕ is invariant,
- (2) the induced morphism $(t, s) : R \rightarrow U \times_X U$ is surjective, and
- (3) the morphism $\phi : U \rightarrow X$ is surjective.

This characterization applies for example if j is a pre-equivalence relation, or comes from a groupoid in algebraic spaces over B , or comes from the action of a group algebraic space over B on U .

Proof. Follows immediately from Lemma 63.5.17 part (4). \square

In the following lemma it is (probably) not good enough to assume just that the morphisms s, t are locally of finite type. The reason is that it may happen that some map $\phi : U \rightarrow X$ is an orbit space, yet is not locally of finite type. In that case $U(k) \rightarrow X(k)$ may not be surjective for all algebraically closed fields k over B .

Lemma 63.5.20. *Let $B \rightarrow S$ as in Section 63.2. Let $j = (t, s) : R \rightarrow U \times_B U$ be a pre-relation. Assume R, U are locally of finite type over B . Let $\phi : U \rightarrow X$ be an R -invariant morphism of algebraic spaces over B . Then ϕ is an orbit space for R if and only if the natural map*

$$U(k)/(\text{equivalence relation generated by } j(R(k))) \longrightarrow X(k)$$

is bijective for all algebraically closed fields k over B .

Proof. Note that since U, R are locally of finite type over B all of the morphisms s, t, j, ϕ are locally of finite type, see Morphisms of Spaces, Lemma 49.23.6. We will also use without further mention Morphisms of Spaces, Lemma 49.24.1. Assume ϕ is an orbit space. Let k be any algebraically closed field over B . Let $\bar{x} \in X(k)$. Consider $U \times_{\phi, X, \bar{x}} \text{Spec}(k)$. This is a nonempty algebraic space which is locally of finite type over k . Hence it has a k -valued point. This shows the displayed map of the lemma is surjective. Suppose that $\bar{u}, \bar{u}' \in U(k)$ map to the same element of $X(k)$. By Definition 63.5.8 this means that \bar{u}, \bar{u}' are in the same R -orbit. By Lemma 63.5.7 this means that they are equivalent under the equivalence relation generated by $j(R(k))$. Thus the displayed morphism is injective.

Conversely, assume the displayed map is bijective for all algebraically closed fields k over B . This condition clearly implies that ϕ is surjective. We have already assumed that ϕ is R -invariant. Finally, the injectivity of all the displayed maps implies that ϕ separates orbits. Hence ϕ is an orbit space. \square

63.6. Coarse quotients

We only add this here so that we can later say that coarse quotients correspond to coarse moduli spaces (or moduli schemes).

Definition 63.6.1. Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. A morphism $\phi : U \rightarrow X$ of algebraic spaces over B is called a *coarse quotient* if

- (1) ϕ is a categorical quotient, and
- (2) ϕ is an orbit space.

If $S = B$, U , R are all schemes, then we say a morphism of schemes $\phi : U \rightarrow X$ is a *coarse quotient in schemes* if

- (1) ϕ is a categorical quotient in schemes, and
- (2) ϕ is an orbit space.

In many situations the algebraic spaces R and U are locally of finite type over B and the orbit space condition simply means that

$$U(k)/(\text{equivalence relation generated by } j(R(k))) \cong X(k)$$

for all algebraically closed fields k . See Lemma 63.5.20. If j is also a (set-theoretic) pre-equivalence relation, then the condition is simply equivalent to $U(k)/j(R(k)) \rightarrow X(k)$ being bijective for all algebraically closed fields k .

63.7. Topological properties

Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. We say a subset $T \subset |U|$ is *R-invariant* if $s^{-1}(T) = t^{-1}(T)$ as subsets of $|R|$. Note that if T is closed, then it may not be the case that the corresponding reduced closed subspace of U is *R-invariant* (as in Groupoids in Spaces, Definition 60.17.1) because the pullbacks $s^{-1}(T)$, $t^{-1}(T)$ may not be reduced. Here are some conditions that we can consider for an invariant morphism $\phi : U \rightarrow X$.

Definition 63.7.1. Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. Let $\phi : U \rightarrow X$ be an *R-invariant* morphism of algebraic spaces over B .

- (1) The morphism ϕ is submersive.
- (2) For any *R-invariant* closed subset $Z \subset |U|$ the image $\phi(Z)$ is closed in $|X|$.
- (3) Condition (2) holds and for any pair of *R-invariant* closed subsets $Z_1, Z_2 \subset |U|$ we have

$$\phi(Z_1 \cap Z_2) = \phi(Z_1) \cap \phi(Z_2)$$

- (4) The morphism $(t, s) : R \rightarrow U \times_X U$ is universally submersive.

For each of these properties we can also require them to hold after any flat pullback, or after any pullback, see Definition 63.3.4. In this case we say condition (1), (2), (3), or (4) holds *uniformly* or *universally*.

63.8. Invariant functions

In some cases it is convenient to pin down the structure sheaf of a quotient by requiring any invariant function to be a local section of the structure sheaf of the quotient.

Definition 63.8.1. Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. Let $\phi : U \rightarrow X$ be an *R-invariant* morphism. Denote $\phi' = \phi \circ s = \phi \circ t : R \rightarrow X$.

- (1) We denote $(\phi_* \mathcal{O}_U)^R$ the \mathcal{O}_X -sub-algebra of $\phi_* \mathcal{O}_U$ which is the equalizer of the two maps

$$\phi_* \mathcal{O}_U \begin{array}{c} \xrightarrow{\phi_* s^\sharp} \\ \xrightarrow{\phi_* t^\sharp} \end{array} \phi'_* \mathcal{O}_R$$

on $X_{\text{étale}}$. We sometimes call this the *sheaf of R -invariant functions on X* .

- (2) We say *the functions on X are the R -invariant functions on U* if the natural map $\mathcal{O}_X \rightarrow (\phi_* \mathcal{O}_U)^R$ is an isomorphism.

Of course we can require this property holds after any (flat or any) pullback, leading to a (uniform or) universal notion. This condition is often thrown in with other conditions in order to obtain a (more) unique quotient. And of course a good deal of motivation for the whole subject comes from the following special case: $U = \text{Spec}(A)$ is an affine scheme over a field $S = B = \text{Spec}(k)$ and where $R = G \times U$, with G an affine group scheme over k . In this case you have the option of taking for the quotient:

$$X = \text{Spec}(A^G)$$

so that at least the condition of the definition above is satisfied. Even though this is a nice thing you can do it is often not the right quotient; for example if $U = \text{GL}_{n,k}$ and G is the group of upper triangular matrices, then the above gives $X = \text{Spec}(k)$, whereas a much better quotient (namely the flag variety) exists.

63.9. Good quotients

Especially when taking quotients by group actions the following definition is useful.

Definition 63.9.1. Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. A morphism $\phi : U \rightarrow X$ of algebraic spaces over B is called a *good quotient* if

- (1) ϕ is invariant,
- (2) ϕ is affine,
- (3) ϕ is surjective,
- (4) condition (3) holds universally, and
- (5) the functions on X are the R -invariant functions on U .

In [Ses72] Seshadri gives almost the same definition, except that instead of (4) he simply requires the condition (3) to hold – he does not require it to hold universally.

63.10. Geometric quotients

This is Mumford’s definition of a geometric quotient (at least the definition from the first edition of GIT; as far as we can tell later editions changed “universally submersive” to “submersive”).

Definition 63.10.1. Let S be a scheme and B an algebraic space over S . Let $j : R \rightarrow U \times_B U$ be a pre-relation. A morphism $\phi : U \rightarrow X$ of algebraic spaces over B is called a *geometric quotient* if

- (1) ϕ is an orbit space,
- (2) condition (1) holds universally, i.e., ϕ is universally submersive, and
- (3) the functions on X are the R -invariant functions on U .

Simplicial Spaces

64.1. Introduction

This chapter develops some theory concerning simplicial topological spaces, simplicial ringed spaces, simplicial schemes, and simplicial algebraic spaces. The theory of simplicial spaces sometimes allows one to prove local to global principles which appear difficult to prove in other ways. Some example applications can be found in the papers [Fal03], [Kie72], and [Del74b].

We assume throughout that the reader is familiar with the basic concepts and results of the chapter Simplicial Methods, see Simplicial, Section 14.1. In particular, we continue to write X and not X_\bullet for a simplicial object.

64.2. Simplicial topological spaces

A *simplicial space* is a simplicial object in the category of topological spaces where morphisms are continuous maps of topological spaces. (We will use “simplicial algebraic space” to refer to simplicial objects in the category of algebraic spaces.) We may picture a simplicial space X as follows

$$X_2 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} X_1 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} X_0$$

Here there are two morphisms $d_0^1, d_1^1 : X_1 \rightarrow X_0$ and a single morphism $s_0^0 : X_0 \rightarrow X_1$, etc. It is important to keep in mind that $d_i^n : X_n \rightarrow X_{n-1}$ should be thought of as a “projection forgetting the i th coordinate” and $s_j^n : X_n \rightarrow X_{n+1}$ as the diagonal map repeating the j th coordinate.

Let X be a simplicial space. We associate a site X_{Zar} ¹ to X as follows.

- (1) An object of X_{Zar} is an open U of X_n for some n ,
- (2) a morphism $U \rightarrow V$ of X_{Zar} is given by a $\varphi : [m] \rightarrow [n]$ where n, m are such that $U \subset X_n, V \subset X_m$ and φ is such that $X(\varphi)(U) \subset V$, and
- (3) a covering $\{U_i \rightarrow U\}$ in X_{Zar} means that $U, U_i \subset X_n$ are open, the maps $U_i \rightarrow U$ are given by $\text{id} : [n] \rightarrow [n]$, and $U = \bigcup U_i$.

Note that in particular, if $U \rightarrow V$ is a morphism of X_{Zar} give by φ , then $X(\varphi) : X_n \rightarrow X_m$ does in fact induce a continuous map $U \rightarrow V$ of topological spaces.

It is clear that the above is a special case of a construction that associates to any diagram of topological spaces a site. We formulate the obligatory lemma.

Lemma 64.2.1. *Let X be a simplicial space. Then X_{Zar} as defined above is a site.*

Proof. Omitted. □

¹This notation is similar to the notation in Sites, Example 7.6.4 and Topologies, Definition 33.3.7.

Let X be a simplicial space. Let \mathcal{F} be a sheaf on X_{Zar} . It is clear from the definition of coverings, that the restriction of \mathcal{F} to the opens of X_n defines a sheaf \mathcal{F}_n on the topological space X_n . For every $\varphi : [m] \rightarrow [n]$ the restriction maps of \mathcal{F} for pairs $U \subset X_n, V \subset X_m$ with $X(\varphi)(U) \subset V$, define an $X(\varphi)$ -map $\mathcal{F}(\varphi) : \mathcal{F}_m \rightarrow \mathcal{F}_n$, see Sheaves, Definition 6.21.7. Moreover, given $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ we have

$$\mathcal{F}(\psi) \circ \mathcal{F}(\varphi) = \mathcal{F}(\varphi \circ \psi)$$

(LHS uses composition of f -maps, see Sheaves, Definition 6.21.9). Clearly, the converse is true as well: if we have a system $(\{\mathcal{F}_n\}_{n \geq 0}, \{\mathcal{F}(\varphi)\}_{\varphi \in \text{Arrows}(\Delta)})$ as above, satisfying the displayed equalities, then we obtain a sheaf on X_{Zar} .

Lemma 64.2.2. *Let X be a simplicial space. There is an equivalence of categories between*

- (1) $Sh(X_{Zar})$, and
- (2) category of systems $(\mathcal{F}_n, \mathcal{F}(\varphi))$ described above.

Proof. See discussion above. □

Lemma 64.2.3. *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. Then the functor $u : X_{Zar} \rightarrow Y_{Zar}$ which associates to the open $U \subset X_n$ the open $f_n^{-1}(U) \subset Y_n$ defines a morphism of sites $f_{Zar} : Y_{Zar} \rightarrow X_{Zar}$.*

Proof. It is clear that u is a continuous functor. Hence we obtain functors $f_{Zar,*} = u^s$ and $f_{Zar}^{-1} = u_s$, see Sites, Section 7.15. To see that we obtain a morphism of sites we have to show that u^s is exact. We will use Sites, Lemma 7.15.5 to see this. Let $V \subset Y_n$ be an open subset. The category \mathcal{I}_V^u (see Sites, Section 7.5) consists of pairs (U, φ) where $\varphi : [m] \rightarrow [n]$ and $U \subset X_m$ open such that $Y(\varphi)(V) \subset f_m^{-1}(U)$. Moreover, a morphism $(U, \varphi) \rightarrow (U', \varphi')$ is given by a $\psi : [m'] \rightarrow [m]$ such that $X(\psi)(U) \subset U'$ and $\varphi \circ \psi = \varphi'$. It is our task to show that \mathcal{I}_V^u is cofiltered.

We verify the conditions of Categories, Definition 4.20.1. Condition (1) holds because $(X_n, \text{id}_{[n]})$ is an object. Let (U, φ) be an object. The condition $Y(\varphi)(V) \subset f_m^{-1}(U)$ is equivalent to $V \subset f_n^{-1}(X(\varphi)^{-1}(U))$. Hence we obtain a morphism $(X(\varphi)^{-1}(U), \text{id}_{[n]}) \rightarrow (U, \varphi)$ given by setting $\psi = \varphi$. Moreover, given a pair of objects of the form $(U, \text{id}_{[n]})$ and $(U', \text{id}_{[n]})$ we see there exists an object, namely $(U \cap U', \text{id}_{[n]})$, which maps to both of them. Thus condition (2) holds. To verify condition (3) suppose given two morphisms $a, a' : (U, \varphi) \rightarrow (U', \varphi')$ given by $\psi, \psi' : [m'] \rightarrow [m]$. Then precomposing with the morphism $(X(\varphi)^{-1}(U), \text{id}_{[n]}) \rightarrow (U, \varphi)$ given by φ equalizes a, a' because $\varphi \circ \psi = \varphi' = \varphi \circ \psi'$. This finishes the proof. □

Lemma 64.2.4. *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. In terms of the description of sheaves in Lemma 64.2.2 the morphism f_{Zar} of Lemma 64.2.3 can be described as follows.*

- (1) If \mathcal{G} is a sheaf on Y , then $(f_{Zar,*}\mathcal{G})_n = f_{n,*}\mathcal{G}_n$.
- (2) If \mathcal{F} is a sheaf on X , then $(f_{Zar}^{-1}\mathcal{F})_n = f_n^{-1}\mathcal{F}_n$.

Proof. The first part is immediate from the definitions. For the second part, note that in the proof of Lemma 64.2.3 we have shown that for a $V \subset Y_n$ open the category $(\mathcal{I}_V^u)^{opp}$ contains as a cofinal subcategory the category of opens $U \subset X_n$ with $f_n^{-1}(U) \supset V$ and morphisms given by inclusions. Hence we see that the restriction of $u_p\mathcal{F}$ to opens of Y_n is the presheaf $f_{n,p}\mathcal{F}_n$ as defined in Sheaves, Lemma 6.21.3. Since $f_{Zar}^{-1}\mathcal{F} = u_s\mathcal{F}$ is the sheafification of $u_p\mathcal{F}$ and since sheafification uses

only coverings and since coverings in Y_{Zar} use only inclusions between opens on the same Y_n , the result follows from the fact that $f_n^{-1}\mathcal{F}_n$ is (correspondingly) the sheafification of $f_{n,p}\mathcal{F}_n$, see Sheaves, Section 6.21. \square

Let X be a topological space. In Sites, Example 7.6.4 we denoted X_{Zar} the site consisting of opens of X with inclusions as morphisms and coverings given by open coverings. We identify the topos $Sh(X_{Zar})$ with the category of sheaves on X .

Lemma 64.2.5. *Let X be a simplicial space. The functor $X_{n,Zar} \rightarrow X_{Zar}, U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g : Sh(X_n) \rightarrow Sh(X_{Zar})$ satisfies*

- (1) g^{-1} associates to the sheaf \mathcal{F} on X the sheaf \mathcal{F}_n on X_n ,
- (2) g^{-1} has a left adjoint $g_!^{Sh}$ which commutes with finite connected limits,
- (3) $g^{-1} : Ab(X_{Zar}) \rightarrow Ab(X_n)$ has a left adjoint $g_! : Ab(X_n) \rightarrow Ab(X_{Zar})$ which is exact.

Proof. Besides the properties of our functor mentioned in the statement, the category $X_{n,Zar}$ has fibre products and equalizers and the functor commutes with them (beware that X_{Zar} does not have all fibre products). Hence the lemma follows from the discussion in Sites, Sections 7.19 and 7.20 and Modules on Sites, Section 18.16. More precisely, Sites, Lemmas 7.20.1, 7.20.5, and 7.20.6 and Modules on Sites, Lemmas 18.16.2 and 18.16.3. \square

Lemma 64.2.6. *Let X be a simplicial space. If \mathcal{I} is an injective abelian sheaf on X_{Zar} , then \mathcal{I}_n is an injective abelian sheaf on X_n .*

Proof. This follows from Homology, Lemma 12.25.1 and Lemma 64.2.5. \square

Lemma 64.2.7. *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. Then*

$$\begin{array}{ccc} Sh(Y_n) & \xrightarrow{f_n} & Sh(X_n) \\ \downarrow & & \downarrow \\ Sh(Y_{Zar}) & \xrightarrow{f_{Zar}} & Sh(X_{Zar}) \end{array}$$

is a commutative diagram of topoi.

Proof. Direct from the description of pullback functors in Lemmas 64.2.4 and 64.2.5. \square

Let X be a topological space. Denote X_\bullet the constant simplicial topological space with value X . By Lemma 64.2.2 a sheaf on $X_{\bullet,Zar}$ is the same thing as a cosimplicial object in the category of sheaves on X .

Lemma 64.2.8. *Let X be a topological space. Let X_\bullet be the constant simplicial topological space with value X . The functor*

$$X_{\bullet,Zar} \longrightarrow X_{Zar}, \quad U \longmapsto U$$

is continuous and cocontinuous and defines a morphism of topoi $g : Sh(X_{\bullet,Zar}) \rightarrow Sh(X)$ as well as a left adjoint $g_!$ to g^{-1} . We have

- (1) g^{-1} associates to a sheaf on X the constant cosimplicial sheaf on X ,
- (2) $g_!$ associates to a sheaf \mathcal{F} on $X_{\bullet,Zar}$ the sheaf \mathcal{F}_0 , and
- (3) g_* associates to a sheaf \mathcal{F} on $X_{\bullet,Zar}$ the equalizer of the two maps $\mathcal{F}_0 \rightarrow \mathcal{F}_1$.

Proof. The statements about the functor are straightforward to verify. The existence of g and $g_!$ follow from Sites, Lemmas 7.20.1 and 7.20.5. The description of g^{-1} is immediate from Sites, Lemma 7.20.5. The description of g_* and $g_!$ follows as the functors given are right and left adjoint to g^{-1} . \square

Lemma 64.2.9. *Let Y be a simplicial space and X a topological space. Let $a : Y \rightarrow X$ be an augmentation (Simplicial, Definition 14.19.1). There is a canonical morphism of topoi*

$$a : \text{Sh}(Y_{Zar}) \rightarrow \text{Sh}(X)$$

which comes from composing the morphism $a_{Zar} : \text{Sh}(Y_{Zar}) \rightarrow \text{Sh}(X_{\bullet, Zar})$ of Lemma 64.2.3 with the morphism $g : \text{Sh}(X_{\bullet, Zar}) \rightarrow \text{Sh}(X)$ of Lemma 64.2.8.

Proof. This lemma proves itself. \square

Lemma 64.2.10. *Let X be a simplicial topological space. The complex of abelian presheaves on X_{Zar}*

$$\dots \rightarrow \mathbf{Z}_{X_2} \rightarrow \mathbf{Z}_{X_1} \rightarrow \mathbf{Z}_{X_0}$$

with boundary $\sum (-1)^i d_i^n$ is a resolution of the constant presheaf \mathbf{Z} .

Proof. Let $U \subset X_m$ be an object of X_{Zar} . Then the value of the complex above on U is the complex of abelian groups

$$\dots \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([2], [m])] \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([1], [m])] \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([0], [m])]$$

In other words, this is the complex associated to the free abelian group on the simplicial set $\Delta[m]$, see Simplicial, Example 14.11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see Simplicial, Example 14.25.7, and since “taking free abelian groups” is a functor, we see that the complex above is homotopy equivalent to the free abelian group on $\Delta[0]$ (Simplicial, Remark 14.25.4 and Lemma 14.26.2). This complex is acyclic in positive degrees and equal to \mathbf{Z} in degree 0. \square

Lemma 64.2.11. *Let X be a simplicial topological space. Let \mathcal{F} be an abelian sheaf on X . There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = H^q(X_p, \mathcal{F}_p)$$

converging to $H^{p+q}(X_{Zar}, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} .

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Consider the double complex with terms

$$A^{p,q} = \mathcal{I}^q(X_p)$$

and first differential given by the alternating sum along the maps d_i^{p+1} -maps $\mathcal{I}_p^q \rightarrow \mathcal{I}_{p+1}^q$, see Lemma 64.2.2. Note that

$$A^{p,q} = \Gamma(X_p, \mathcal{I}_p^q) = \text{Mor}_{PSH}(h_{X_p}, \mathcal{I}^q) = \text{Mor}_{PAb}(\mathbf{Z}_{X_p}, \mathcal{I}^q)$$

Hence it follows from Lemma 64.2.10 and Cohomology on Sites, Lemma 21.11.1 that the rows of the double complex are exact in positive degrees and evaluate to $\Gamma(X_{Zar}, \mathcal{I}^q)$ in degree 0. On the other hand, since restriction is exact (Lemma 64.2.5) the map

$$\mathcal{F}_p \rightarrow \mathcal{I}_p^\bullet$$

is a resolution. The sheaves \mathcal{I}_p^q are injective abelian sheaves on X_p (Lemma 64.2.6). Hence the cohomology of the columns computes the groups $H^q(X_p, \mathcal{F}_p)$. We conclude by applying Homology, Lemmas 12.22.6 and 12.22.7. \square

64.3. Simplicial sites and topoi

It seems natural to define a *simplicial site* as a simplicial object in the (big) category whose objects are sites and whose morphisms are morphisms of sites. See Sites, Definitions 7.6.2 and 7.15.1 with composition of morphisms as in Sites, Lemma 7.15.3. But here are some variants one might want to consider: (a) we could work with cocontinuous functors (see Sites, Sections 7.19 and 7.20) between sites instead, (b) we could work in a suitable 2-category of sites where one introduces the notion of a 2-morphism between morphisms of sites, (c) we could work in a 2-category constructed out of cocontinuous functors. Instead of picking one of these variants as a definition we will simply develop theory as needed.

Certainly a *simplicial topos* should probably be defined as a pseudo-functor from Δ^{opp} into the 2-category of topoi. See Categories, Definition 4.27.5 and Sites, Section 7.16 and 7.35. We will try to avoid working with such a beast if possible.

Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. This means that for every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a morphism of sites $f_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$. This morphism is given by a continuous functor in the opposite direction which we will denote $u_\varphi : \mathcal{C}_m \rightarrow \mathcal{C}_n$.

Lemma 64.3.1. *Let \mathcal{C} be a simplicial object in the category of sites. With notation as above we construct a site \mathcal{C}_{site} as follows.*

- (1) *An object of \mathcal{C}_{site} is an object U of \mathcal{C}_n for some n ,*
- (2) *a morphism $(\varphi, f) : U \rightarrow V$ of \mathcal{C}_{site} is given by a map $\varphi : [m] \rightarrow [n]$ with $U \in \text{Ob}(\mathcal{C}_n)$, $V \in \text{Ob}(\mathcal{C}_m)$ and a morphism $f : U \rightarrow u_\varphi(V)$ of \mathcal{C}_n , and*
- (3) *a covering $\{(id, f_i) : U_i \rightarrow U\}$ in \mathcal{C}_{site} is given by an n and a covering $\{f_i : U_i \rightarrow U\}$ of \mathcal{C}_n .*

Proof. Composition of $(\varphi, f) : U \rightarrow V$ with $(\psi, g) : V \rightarrow W$ is given by $(\varphi \circ \psi, u_\varphi(g) \circ f)$. This uses that $u_\varphi \circ u_\psi = u_{\varphi \circ \psi}$.

Let $\{(id, f_i) : U_i \rightarrow U\}$ be a covering as in (3) and let $(\varphi, g) : W \rightarrow U$ be a morphism with $W \in \text{Ob}(\mathcal{C}_m)$. We claim that

$$W \times_{(\varphi, g), U, (id, f_i)} U_i = W \times_{g, u_\varphi(U), u_\varphi(f_i)} u_\varphi(U_i)$$
