Let $I \subset R$ be the annihilator of M such that $\text{Spec}(R/I) = V(I) = \text{Supp}(M)$ (Lemma 10.39.5). By Lemmas 10.99.2 and 10.99.7 every maximal chain of primes in $V(I)$ has length ≥ 2 . Hence none of the minimal primes of $V(I)$ are equal to \mathfrak{p} . Thus we can use Lemma 10.14.2 to find a $f_1 \in \mathfrak{p}$ which is not contained in any of the minimal primes of $V(I)$. Then f_1 is a nonzerodivisor on M and M/f_1M has depth exactly one less by Lemma 10.99.4. By induction we can extend to an M -regular sequence $f_1, \dots, f_r \in \mathfrak{p}$ with $r = \text{depth}(M) - 1$. Since localization is exact, we find that f_1, \dots, f_r is a regular sequence on $M_{\mathfrak{p}}$ which is what we had to show. \square

Definition 10.99.10. Let R be a Noetherian ring. Let M be a finite R -module. We say M is *Cohen-Macaulay* if $M_{\mathfrak{p}}$ is a Cohen-Macaulay module over $R_{\mathfrak{p}}$ for all primes \mathfrak{p} of R .

By Lemma 10.99.9 it suffices to check this in the maximal ideals of R .

Lemma 10.99.11. *Let R be a Noetherian ring. Let M be a Cohen-Macaulay module over R . Then $M \otimes_R R[x_1, \dots, x_n]$ is a Cohen-Macaulay module over $R[x_1, \dots, x_n]$.*

Proof. By induction on the number of variables it suffices to prove this for $M[x] = M \otimes_R R[x]$ over $R[x]$. Let $\mathfrak{m} \subset R[x]$ be a maximal ideal, and let $\mathfrak{p} = R \cap \mathfrak{m}$. Let f_1, \dots, f_d be a $M_{\mathfrak{p}}$ -regular sequence in the maximal ideal of $R_{\mathfrak{p}}$ of length $d = \dim(M_{\mathfrak{p}})$. Note that since $R[x]$ is flat over R the localization $R[x]_{\mathfrak{m}}$ is flat over $R_{\mathfrak{p}}$. Hence, by Lemma 10.67.7, the sequence f_1, \dots, f_d is a $M[x]_{\mathfrak{m}}$ -regular sequence of length d in $R[x]_{\mathfrak{m}}$. The quotient

$$Q = M[x]_{\mathfrak{m}} / (f_1, \dots, f_d)M[x]_{\mathfrak{m}} = M_{\mathfrak{p}} / (f_1, \dots, f_d)M_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} R[x]_{\mathfrak{m}}$$

has support equal to the primes lying over \mathfrak{p} because $R_{\mathfrak{p}} \rightarrow R[x]_{\mathfrak{m}}$ is flat and the support of $M_{\mathfrak{p}}/(f_1, \dots, f_d)M_{\mathfrak{p}}$ is equal to $\{\mathfrak{p}\}$ (details omitted; hint: follows from Lemmas 10.39.4 and 10.39.5). Hence the dimension is 1. To finish the proof it suffices to find a single Q -regular element $f \in \mathfrak{m}$. Since \mathfrak{m} is a maximal ideal, the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{m})$ is finite (Theorem 10.33.1). Hence we can find $f \in \mathfrak{m}$ which viewed as a polynomial in x has leading coefficient not in \mathfrak{p} . Such an f acts as a nonzerodivisor on

$$M_{\mathfrak{p}}/(f_1, \dots, f_d)M_{\mathfrak{p}} \otimes_R R[x] = \bigoplus_{n \geq 0} M_{\mathfrak{p}}/(f_1, \dots, f_d)M_{\mathfrak{p}} \cdot x^n$$

and hence acts as a nonzerodivisor on Q . □

10.100. Cohen-Macaulay rings

Most of the results of this section are special cases of the results in Section 10.99.

Definition 10.100.1. A Noetherian local ring R is called *Cohen-Macaulay* if it is Cohen-Macaulay as a module over itself.

Note that this is equivalent to requiring the existence of a R -regular sequence x_1, \dots, x_d of the maximal ideal such that $R/(x_1, \dots, x_d)$ has dimension 0. We will usually just say “regular sequence” and not “ R -regular sequence”.

Lemma 10.100.2. *Let R be a Noetherian local Cohen-Macaulay ring with maximal ideal \mathfrak{m} . Let $x_1, \dots, x_c \in \mathfrak{m}$ be elements. Then*

$$x_1, \dots, x_c \text{ is a regular sequence} \Leftrightarrow \dim(R/(x_1, \dots, x_c)) = \dim(R) - c$$

If so x_1, \dots, x_c can be extended to a regular sequence of length $\dim(R)$ and each quotient $R/(x_1, \dots, x_i)$ is a Cohen-Macaulay ring of dimension $\dim(R) - i$.

Proof. Special case of Proposition 10.99.5. □

Lemma 10.100.3. *Let R be Noetherian local. Suppose R is Cohen-Macaulay of dimension d . Any maximal chain of ideals $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_n$ has length $n = d$.*

Proof. Special case of Lemma 10.99.7. □

Lemma 10.100.4. *Suppose R is a Noetherian local Cohen-Macaulay ring of dimension d . For any prime $\mathfrak{p} \subset R$ we have*

$$\dim(R) = \dim(R_{\mathfrak{p}}) + \dim(R/\mathfrak{p}).$$

Proof. Follows immediately from Lemma 10.100.3. (Also, this is a special case of Lemma 10.99.8.) □

Lemma 10.100.5. *Suppose R is a Cohen-Macaulay local ring. For any prime $\mathfrak{p} \subset R$ the ring $R_{\mathfrak{p}}$ is Cohen-Macaulay as well.*

Proof. Special case of Lemma 10.99.9. □

Definition 10.100.6. A Noetherian ring R is called *Cohen-Macaulay* if all its local rings are Cohen-Macaulay.

Lemma 10.100.7. *Suppose R is a Cohen-Macaulay ring. Any polynomial algebra over R is Cohen-Macaulay.*

Proof. Special case of Lemma 10.99.11. □

Lemma 10.100.8. *Let R be a Noetherian local Cohen-Macaulay ring of dimension d . Let $0 \rightarrow K \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$ be an exact sequence of R -modules with $K \neq 0$. Then either $\text{depth}(K) > \text{depth}(M)$ or $\text{depth}(K) = \text{depth}(M) = d$.*

Proof. If $\text{depth}(M) = 0$ the lemma is clear. Let $x \in \mathfrak{m}$ be a nonzerodivisor on M and on R . Then x is a nonzerodivisor on M and on K and it follows by an easy diagram chase that $0 \rightarrow K/xK \rightarrow (R/xR)^n \rightarrow M/xM \rightarrow 0$ is exact. Thus the result follows from the result for K/xK over R/xR which has smaller dimension. \square

Lemma 10.100.9. *Let R be a local Noetherian Cohen-Macaulay ring of dimension d . Let M be a finite R module of depth e . There exists an exact complex*

$$0 \rightarrow K \rightarrow F_{d-e-1} \rightarrow \dots \rightarrow F_0 \rightarrow M \rightarrow 0$$

with each F_i finite free and K maximal Cohen-Macaulay.

Proof. Immediate from the definition and Lemma 10.100.8. \square

Lemma 10.100.10. *Let $\varphi : A \rightarrow B$ be a map of local rings. Assume that B is Noetherian and Cohen-Macaulay and that $\mathfrak{m}_B = \sqrt{\varphi(\mathfrak{m}_A)B}$. Then there exists a sequence of elements $f_1, \dots, f_{\dim(B)}$ in A such that $\varphi(f_1), \dots, \varphi(f_{\dim(B)})$ is a regular sequence in B .*

Proof. By induction on $\dim(B)$ it suffices to prove: If $\dim(B) \geq 1$, then we can find an element f of A which maps to a nonzerodivisor in B . By Lemma 10.100.2 it suffices to find $f \in A$ whose image in B is not contained in any of the finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ of B . By the assumption that $\mathfrak{m}_B = \sqrt{\varphi(\mathfrak{m}_A)B}$ we see that $\mathfrak{m}_A \not\subseteq \varphi^{-1}(\mathfrak{q}_i)$. Hence we can find f by Lemma 10.14.2. \square

10.101. Catenary rings

Definition 10.101.1. A ring R is said to be *catenary* if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$, all maximal chains of primes $\mathfrak{p} = \mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_e = \mathfrak{q}$ have the same (finite) length.

Lemma 10.101.2. *A ring R is catenary if and only if the topological space $\text{Spec}(R)$ is catenary (see Topology, Definition 5.10.4).*

Proof. Immediate from the definition and the characterization of irreducible closed subsets. \square

Lemma 10.101.3. *Any localization of a catenary ring is catenary.*

Proof. Omitted. \square

Lemma 10.101.4. *Any quotient of a catenary ring is catenary.*

Proof. Omitted. \square

In general it is not the case that a finitely generated R -algebra is catenary if R is. Thus we make the following definition.

Definition 10.101.5. A ring R is said to be *universally catenary* if R is Noetherian and every R algebra of finite type is catenary.

By Lemma 10.101.4 this just means that R is Noetherian and that each polynomial algebra $R[x_1, \dots, x_n]$ is catenary.

Lemma 10.101.6. *A Cohen-Macaulay ring is universally catenary. More generally, if R is a Noetherian ring and M is a Cohen-Macaulay R -module with $\text{Supp}(M) = \text{Spec}(R)$, then R is universally Cohen-Macaulay.*

Proof. Since a polynomial algebra over R is Cohen-Macaulay, by Lemma 10.100.7, it suffices to show that a Cohen-Macaulay ring is catenary. Let R be Cohen-Macaulay and $\mathfrak{p} \subset \mathfrak{q}$ primes of R . By definition $R_{\mathfrak{q}}$ and $R_{\mathfrak{p}}$ are Cohen-Macaulay. Take a maximal chain of primes $\mathfrak{p} = \mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_n = \mathfrak{q}$. Next choose a maximal chain of primes $\mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \dots \subset \mathfrak{q}_m = \mathfrak{p}$. By Lemma 10.100.3 we have $n + m = \dim(R_{\mathfrak{q}})$. And we have $m = \dim(R_{\mathfrak{p}})$ by the same lemma. Hence $n = \dim(R_{\mathfrak{q}}) - \dim(R_{\mathfrak{p}})$ is independent of choices.

To prove the more general statement, argue exactly as above but using Lemmas 10.99.11 and 10.99.7. \square

10.102. Regular local rings

It is not that easy to show that all prime localizations of a regular local ring are regular. In fact, quite a bit of the material developed so far is geared towards a proof of this fact. See Proposition 10.106.5, and trace back the references.

Lemma 10.102.1. *Let R be a regular local ring with maximal ideal \mathfrak{m} . The graded ring $\bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is isomorphic to the graded polynomial algebra $\kappa(\mathfrak{m})[X_1, \dots, X_d]$.*

Proof. Let x_1, \dots, x_d be a minimal set of generators for the maximal ideal \mathfrak{m} . By Definition 10.59.9 this implies that $\dim(R) = d$. Write $\kappa = \kappa(\mathfrak{m})$. There is a surjection $\kappa[X_1, \dots, X_d] \rightarrow \bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$, which maps the class of x_i in $\mathfrak{m}/\mathfrak{m}^2$ to X_i . Since $d(R) = d$ by Proposition 10.59.8 we know that the numerical polynomial $n \mapsto \dim_{\kappa} \mathfrak{m}^n/\mathfrak{m}^{n+1}$ has degree $d - 1$. By Lemma 10.57.10 we conclude that the surjection $\kappa[X_1, \dots, X_d] \rightarrow \bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is an isomorphism. \square

Lemma 10.102.2. *Any regular local ring is a domain.*

Proof. We will use that $\bigcap \mathfrak{m}^n = 0$ by Lemma 10.49.4. Let $f, g \in R$ such that $fg = 0$. Suppose that $f \in \mathfrak{m}^a$ and $g \in \mathfrak{m}^b$, with a, b maximal. Since $fg = 0 \in \mathfrak{m}^{a+b+1}$ we see from the result of Lemma 10.102.1 that either $f \in \mathfrak{m}^{a+1}$ or $g \in \mathfrak{m}^{b+1}$. Contradiction. \square

Lemma 10.102.3. *Let R be a regular local ring and let x_1, \dots, x_d be a minimal set of generators for the maximal ideal \mathfrak{m} . Then x_1, \dots, x_d is a regular sequence, and each $R/(x_1, \dots, x_c)$ is a regular local ring of dimension $d - c$. In particular R is Cohen-Macaulay.*

Proof. Note that R/x_1R is a Noetherian local ring of dimension $\geq d - 1$ by Lemma 10.59.11 with x_2, \dots, x_d generating the maximal ideal. Hence it is a regular local ring by definition. Since R is a domain by Lemma 10.102.2 x_1 is a nonzerodivisor. \square

Lemma 10.102.4. *Let R be a regular local ring. Let $I \subset R$ be an ideal such that R/I is a regular local ring as well. Then there exists a minimal set of generators x_1, \dots, x_d for the maximal ideal \mathfrak{m} of R such that $I = (x_1, \dots, x_c)$ for some $0 \leq c \leq d$.*

Proof. Say $\dim(R) = d$ and $\dim(R/I) = d - c$. Denote $\bar{\mathfrak{m}} = \mathfrak{m}/I$ the maximal ideal of R/I . Let $\kappa = R/\mathfrak{m}$. We have

$$\dim_{\kappa}((I + \mathfrak{m}^2)/\mathfrak{m}^2) = \dim_{\kappa}(\mathfrak{m}/\mathfrak{m}^2) - \dim(\bar{\mathfrak{m}}/\bar{\mathfrak{m}}^2) = d - (d - c) = c$$

by the definition of a regular local ring. Hence we can choose $x_1, \dots, x_c \in I$ whose images in $\mathfrak{m}/\mathfrak{m}^2$ are linearly independent and supplement with x_{c+1}, \dots, x_d to get a minimal system of generators of \mathfrak{m} . The induced map $R/(x_1, \dots, x_c) \rightarrow R/I$ is a surjection between regular local rings of the same dimension (Lemma 10.102.3). It follows that the kernel is zero, i.e., $I = (x_1, \dots, x_c)$. Namely, if not then we would have $\dim(R/I) < \dim(R/(x_1, \dots, x_c))$ by Lemmas 10.102.2 and 10.59.11. \square

Lemma 10.102.5. *Let R be a Noetherian local ring. Let $x \in \mathfrak{m}$. Let M be a finite R -module such that x is a nonzerodivisor on M and M/xM is free over R/xR . Then M is free over R .*

Proof. Let m_1, \dots, m_r be elements of M which map to a R/xR -basis of M/xM . By Nakayama's Lemma 10.19.1 m_1, \dots, m_r generate M . If $\sum a_i m_i = 0$ is a relation, then $a_i \in xR$ for all i . Hence $a_i = b_i x$ for some $b_i \in R$. Hence the kernel K of $R^r \rightarrow M$ satisfies $xK = K$ and hence is zero by Nakayama's lemma. \square

Lemma 10.102.6. *Let R be a regular local ring. Any maximal Cohen-Macaulay module over R is free.*

Proof. Let M be a maximal Cohen-Macaulay module over R . Let $x \in \mathfrak{m}$ be part of a regular sequence generating \mathfrak{m} . Then x is a nonzerodivisor on M by Proposition 10.99.5, and M/xM is a maximal Cohen-Macaulay module over R/xR . By induction on $\dim(R)$ we see that M/xM is free. We win by Lemma 10.102.5. \square

Lemma 10.102.7. *Suppose R is a Noetherian local ring. Let $x \in \mathfrak{m}$ be a nonzerodivisor such that R/xR is a regular local ring. Then R is a regular local ring. More generally, if x_1, \dots, x_r is a regular sequence in R such that $R/(x_1, \dots, x_r)$ is a regular local ring, then R is a regular local ring.*

Proof. This is true because x together with the lifts of a system of minimal generators of the maximal ideal of R/xR will give $\dim(R)$ generators of \mathfrak{m} . Use Lemma 10.59.11. The last statement follows from the first and induction. \square

Lemma 10.102.8. *Let $(R_i, \varphi_{ii'})$ be a directed system of local rings whose transition maps are local ring maps. If each R_i is a regular local ring and $R = \operatorname{colim} R_i$ is Noetherian, then R is a regular local ring.*

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal; it is the colimit of the maximal ideal $\mathfrak{m}_i \subset R_i$. We prove the lemma by induction on $d = \dim \mathfrak{m}/\mathfrak{m}^2$. If $d = 0$, then $R = R/\mathfrak{m}$ is a field and R is a regular local ring. If $d > 0$ pick an $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$. For some i we can find an $x_i \in \mathfrak{m}_i$ mapping to x . Note that $R/xR = \operatorname{colim}_{i' \geq i} R_{i'}/x_i R_{i'}$ is a Noetherian local ring. By Lemma 10.102.3 we see that $R_{i'}/x_i R_{i'}$ is a regular local ring. Hence by induction we see that R/xR is a regular local ring. Since each R_i is a domain (Lemma 10.102.1) we see that R is a domain. Hence x is a nonzerodivisor and we conclude that R is a regular local ring by Lemma 10.102.7. \square

10.103. Epimorphisms of rings

In any category there is a notion of an *epimorphism*. Some of this material is taken from [Laz69] and [Maz68].

Lemma 10.103.1. *Let $R \rightarrow S$ be a ring map. The following are equivalent*

- (1) $R \rightarrow S$ is an epimorphism,
- (2) the two ring maps $S \rightarrow S \otimes_R S$ are equal,
- (3) either of the ring maps $S \rightarrow S \otimes_R S$ is an isomorphism, and
- (4) the ring map $S \otimes_R S \rightarrow S$ is an isomorphism.

Proof. Omitted. □

Lemma 10.103.2. *The composition of two epimorphisms of rings is an epimorphism.*

Proof. Omitted. Hint: This is true in any category. □

Lemma 10.103.3. *If $R \rightarrow S$ is an epimorphism of rings and $R \rightarrow R'$ is any ring map, then $R' \rightarrow R' \otimes_R S$ is an epimorphism.*

Proof. Omitted. Hint: True in any category with pushouts. □

Lemma 10.103.4. *If $A \rightarrow B \rightarrow C$ are ring maps and $A \rightarrow C$ is an epimorphism, so is $B \rightarrow C$.*

Proof. Omitted. Hint: This is true in any category. □

This means in particular, that if $R \rightarrow S$ is an epimorphism with image $\overline{R} \subset S$, then $\overline{R} \rightarrow S$ is an epimorphism. Hence while proving results for epimorphisms we may often assume the map is injective. The following lemma means in particular that every localization is an epimorphism.

Lemma 10.103.5. *Let $R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) $R \rightarrow S$ is an epimorphism, and
- (2) $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{p}}$ is an epimorphism for each prime \mathfrak{p} of R .

Proof. Since $S_{\mathfrak{p}} = R_{\mathfrak{p}} \otimes_R S$ (see Lemma 10.11.15) we see that (1) implies (2) by Lemma 10.103.3. Conversely, assume that (2) holds. Let $a, b : S \rightarrow A$ be two ring maps from S to a ring A equalizing the map $R \rightarrow S$. By assumption we see that for every prime \mathfrak{p} of R the induced maps $a_{\mathfrak{p}}, b_{\mathfrak{p}} : S_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}}$ are the same. Hence $a = b$ as $A \subset \prod_{\mathfrak{p}} A_{\mathfrak{p}}$, see Lemma 10.23.1. □

Lemma 10.103.6. *Let $R \rightarrow S$ be a ring map. The following are equivalent*

- (1) $R \rightarrow S$ is an epimorphism and finite, and
- (2) $R \rightarrow S$ is surjective.

Proof. (This lemma seems to have been reproved many times in the literature, and has many different proofs.) It is clear that a surjective ring map is an epimorphism. Suppose that $R \rightarrow S$ is a finite ring map such that $S \otimes_R S \rightarrow S$ is an isomorphism. Our goal is to show that $R \rightarrow S$ is surjective. Assume S/R is not zero. The exact sequence $R \rightarrow S \rightarrow S/R \rightarrow 0$ leads to an exact sequence

$$R \otimes_R S \rightarrow S \otimes_R S \rightarrow S/R \otimes_R S \rightarrow 0.$$

Our assumption implies that the first arrow is an isomorphism, hence we conclude that $S/R \otimes_R S = 0$. Hence also $S/R \otimes_R S/R = 0$. By Lemma 10.5.4 there exists

a surjection of R -modules $S/R \rightarrow R/I$ for some proper ideal $I \subset R$. Hence there exists a surjection $S/R \otimes_R S/R \rightarrow R/I \otimes_R R/I = R/I \neq 0$, contradiction. \square

Lemma 10.103.7. *A faithfully flat epimorphism is an isomorphism.*

Proof. This is clear from Lemma 10.103.1 part (3) as the map $S \rightarrow S \otimes_R S$ is the map $R \rightarrow S$ tensored with S . \square

Lemma 10.103.8. *If $k \rightarrow S$ is an epimorphism and k is a field, then $S = k$ or $S = 0$.*

Proof. This is clear from the result of Lemma 10.103.7 (as any nonzero algebra over k is faithfully flat), or by arguing directly that $R \rightarrow R \otimes_k R$ cannot be surjective unless $\dim_k(R) \leq 1$. \square

Lemma 10.103.9. *Let $R \rightarrow S$ be an epimorphism of rings. Then*

- (1) $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is injective, and
- (2) for $\mathfrak{q} \subset S$ lying over $\mathfrak{p} \subset R$ we have $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$.

Proof. Let \mathfrak{p} be a prime of R . The fibre of the map is the spectrum of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. By Lemma 10.103.3 the map $\kappa(\mathfrak{p}) \rightarrow S \otimes_R \kappa(\mathfrak{p})$ is an epimorphism, and hence by Lemma 10.103.8 we have either $S \otimes_R \kappa(\mathfrak{p}) = 0$ or $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})$ which proves (1) and (2). \square

Lemma 10.103.10. *Let R be a ring. Let M, N be R -modules. Let $\{x_i\}_{i \in I}$ be a set of generators of M . Let $\{y_j\}_{j \in J}$ be a set of generators of N . Let $\{m_j\}_{j \in J}$ be a family of elements of M with $m_j = 0$ for all but finitely many j . Then*

$$\sum_{j \in J} m_j \otimes y_j = 0 \text{ in } M \otimes_R N$$

is equivalent to the following: There exist $a_{i,j} \in R$ with $a_{i,j} = 0$ for all but finitely many pairs (i, j) such that

$$\begin{aligned} m_j &= \sum_{i \in I} a_{i,j} x_i \quad \text{for all } j \in J, \\ 0 &= \sum_{j \in J} a_{i,j} y_j \quad \text{for all } i \in I. \end{aligned}$$

Proof. The sufficiency is immediate. Suppose that $\sum_{j \in J} m_j \otimes y_j = 0$. Consider the short exact sequence

$$0 \rightarrow K \rightarrow \bigoplus_{j \in J} R \rightarrow N \rightarrow 0$$

where the j th basis vector of $\bigoplus_{j \in J} R$ maps to y_j . Tensor this with M to get the exact sequence

$$K \otimes_R M \rightarrow \bigoplus_{j \in J} M \rightarrow N \otimes_R M \rightarrow 0.$$

The assumption implies that there exist elements $k_i \in K$ such that $\sum k_i \otimes x_i$ maps to the element $(m_j)_{j \in J}$ of the middle. Writing $k_i = (a_{i,j})_{j \in J}$ and we obtain what we want. \square

Lemma 10.103.11. *Let $\varphi : R \rightarrow S$ be a ring map. Let $g \in S$. The following are equivalent:*

- (1) $g \otimes 1 = 1 \otimes g$ in $S \otimes_R S$, and
- (2) there exist $n \geq 0$ and elements $y_i, z_j \in S$ and $x_{i,j} \in R$ for $1 \leq i, j \leq n$ such that

- (a) $g = \sum_{i,j \leq n} x_{i,j} y_i z_j$,
 (b) for each j we have $\sum x_{i,j} y_i \in \varphi(R)$, and
 (c) for each i we have $\sum x_{i,j} z_j \in \varphi(R)$.

Proof. It is clear that (2) implies (1). Conversely, suppose that $g \otimes 1 = 1 \otimes g$. Choose generators $\{s_i\}_{i \in I}$ of S as an R -module with $0, 1 \in I$ and $s_0 = 1$ and $s_1 = g$. Apply Lemma 10.103.10 to the relation $g \otimes s_0 + (-1) \otimes s_1 = 0$. We see that there exist $a_{i,j} \in R$ such that $g = \sum_i a_{i,0} s_i$, $-1 = \sum_i a_{i,1} s_i$, and for $j \neq 0, 1$ we have $0 = \sum_i a_{i,j} s_i$, and moreover for all i we have $\sum_j a_{i,j} s_j = 0$. Then we have

$$\sum_{i,j \neq 0} a_{i,j} s_i s_j = -g + a_{0,0}$$

and for each $j \neq 0$ we have $\sum_{i \neq 0} a_{i,j} s_i \in R$. This proves that $-g + a_{0,0}$ can be written as in (2). It follows that g can be written as in (2). Details omitted. Hint: Show that the set of elements of S which have an expression as in (2) form an R -subalgebra of S . \square

Remark 10.103.12. Let $R \rightarrow S$ be a ring map. Sometimes the set of elements $g \in S$ such that $g \otimes 1 = 1 \otimes g$ is called the *epicenter* of S . It is an R -algebra. By the construction of Lemma 10.103.11 we get for each g in the epicenter a matrix factorization

$$(g) = YXZ$$

with $X \in \text{Mat}(n \times n, R)$, $Y \in \text{Mat}(1 \times n, S)$, and $Z \in \text{Mat}(n \times 1, S)$. Namely, let $x_{i,j}, y_i, z_j$ be as in part (2) of the lemma. Set $X = (x_{i,j})$, let y be the row vector whose entries are the y_i and let z be the column vector whose entries are the z_j . With this notation conditions (b) and (c) of Lemma 10.103.11 mean exactly that $YX \in \text{Mat}(1 \times n, R)$, $XZ \in \text{Mat}(n \times 1, R)$. It turns out to be very convenient to consider the triple of matrices (X, YX, XZ) . Given $n \in \mathbf{N}$ and a triple (P, U, V) we say that (P, U, V) is a *n-triple associated to g* if there exists a matrix factorization as above such that $P = X$, $U = YX$ and $V = XZ$.

Lemma 10.103.13. *Let $R \rightarrow S$ be an epimorphism of rings. Then the cardinality of S is at most the cardinality of R . In a formula: $|S| \leq |R|$.*

Proof. The condition that $R \rightarrow S$ is an epimorphism means that each $g \in S$ satisfies $g \otimes 1 = 1 \otimes g$, see Lemma 10.103.1. We are going to use the notation introduced in Remark 10.103.12. Suppose that $g, g' \in S$ and suppose that (P, U, V) is an n -triple which is associated to both g and g' . Then we claim that $g = g'$. Namely, write $(P, U, V) = (X, YX, XZ)$ for a matrix factorization $(g) = YXZ$ of g and write $(P, U, V) = (X', Y'X', X'Z')$ for a matrix factorization $(g') = Y'X'Z'$ of g' . Then we see that

$$(g) = YXZ = UZ = Y'X'Z' = Y'PZ = Y'XZ = Y'V = Y'X'Z' = (g')$$

and hence $g = g'$. This implies that the cardinality of S is bounded by the number of possible triples, which has cardinality at most $\sup_{n \in \mathbf{N}} |R|^n$. If R is infinite then this is at most $|R|$, see [Kun83, Ch. I, 10.13].

If R is a finite ring then the argument above only proves that S is at worst countable. In fact in this case R is Artinian and the map $R \rightarrow S$ is surjective. We omit the proof of this case. \square

Lemma 10.103.14. *Let $R \rightarrow S$ be an epimorphism of rings. Let N_1, N_2 be S -modules. Then $\text{Hom}_S(N_1, N_2) = \text{Hom}_R(N_1, N_2)$. In other words, the restriction functor $\text{Mod}_S \rightarrow \text{Mod}_R$ is fully faithful.*

Proof. Let $\varphi : N_1 \rightarrow N_2$ be an R -linear map. For any $x \in N_1$ consider the map $S \otimes_R S \rightarrow N_2$ defined by the rule $g \otimes g' \mapsto g\varphi(g'x)$. Since both maps $S \rightarrow S \otimes_R S$ are isomorphisms (Lemma 10.103.1), we conclude that $g\varphi(g'x) = gg'\varphi(x) = \varphi(gg'x)$. Thus φ is S -linear. \square

10.104. Pure ideals

The material in this section is discussed in many papers, see for example [Laz67], [Bko70], and [DM83].

Definition 10.104.1. Let R be a ring. We say that $I \subset R$ is *pure* if the quotient ring R/I is flat over R .

Lemma 10.104.2. *Let R be a ring. Let $I \subset R$ be an ideal. The following are equivalent:*

- (1) I is pure,
- (2) for every ideal $J \subset R$ we have $J \cap I = IJ$,
- (3) for every finitely generated ideal $J \subset R$ we have $J \cap I = JI$,
- (4) for every $x \in R$ we have $(x) \cap I = xI$,
- (5) for every $x \in I$ we have $x = yx$ for some $y \in I$,
- (6) for every $x_1, \dots, x_n \in I$ there exists a $y \in I$ such that $x_i = yx_i$ for all $i = 1, \dots, n$,
- (7) for every prime \mathfrak{p} of R we have $IR_{\mathfrak{p}} = 0$ or $IR_{\mathfrak{p}} = R_{\mathfrak{p}}$,
- (8) $\text{Supp}(I) = \text{Spec}(R) \setminus V(I)$,
- (9) I is the kernel of the map $R \rightarrow (1+I)^{-1}R$,
- (10) $R/I \cong S^{-1}R$ as R -algebras for some multiplicative subset S of R , and
- (11) $R/I \cong (1+I)^{-1}R$ as R -algebras.

Proof. For any ideal J of R we have the short exact sequence $0 \rightarrow J \rightarrow R \rightarrow R/J \rightarrow 0$. Tensoring with R/I we get an exact sequence $J \otimes_R R/I \rightarrow R/I \rightarrow R/I + J \rightarrow 0$ and $J \otimes_R R/I = R/JI$. Thus the equivalence of (1), (2), and (3) follows from Lemma 10.38.4. Moreover, these imply (4).

The implication (4) \Rightarrow (5) is trivial. Assume (5) and let $x_1, \dots, x_n \in I$. Choose $y_i \in I$ such that $x_i = y_i x_i$. Let $y \in I$ be the element such that $1 - y = \prod_{i=1, \dots, n} (1 - y_i)$. Then $x_i = yx_i$ for all $i = 1, \dots, n$. Hence (6) holds, and it follows that (5) \Leftrightarrow (6).

Assume (5). Let $x \in I$. Then $x = yx$ for some $y \in I$. Hence $x(1 - y) = 0$, which shows that x maps to zero in $(1+I)^{-1}R$. Of course the kernel of the map $R \rightarrow (1+I)^{-1}R$ is always contained in I . Hence we see that (5) implies (9). Assume (9). Then for any $x \in I$ we see that $x(1 - y) = 0$ for some $y \in I$. In other words, $x = yx$. We conclude that (5) is equivalent to (9).

Assume (5). Let \mathfrak{p} be a prime of R . If $\mathfrak{p} \notin V(I)$, then $IR_{\mathfrak{p}} = R_{\mathfrak{p}}$. If $\mathfrak{p} \in V(I)$, in other words, if $I \subset \mathfrak{p}$, then $x \in I$ implies $x(1 - y) = 0$ for some $y \in I$, implies x maps to zero in $R_{\mathfrak{p}}$, i.e., $IR_{\mathfrak{p}} = 0$. Thus we see that (7) holds.

Assume (7). Then $(R/I)_{\mathfrak{p}}$ is either 0 or $R_{\mathfrak{p}}$ for any prime \mathfrak{p} of R . Hence by Lemma 10.38.19 we see that (1) holds. At this point we see that all of (1) – (7) and (9) are equivalent.

As $IR_{\mathfrak{p}} = I_{\mathfrak{p}}$ we see that (7) implies (8). Finally, if (8) holds, then this means exactly that $I_{\mathfrak{p}}$ is the zero module if and only if $\mathfrak{p} \in V(I)$, which is clearly saying that (7) holds. Now (1) – (9) are equivalent.

Assume (1) – (9) hold. Then $R/I \subset (1+I)^{-1}R$ by (9) and the map $R/I \rightarrow (1+I)^{-1}R$ is also surjective by the description of localizations at primes afforded by (7). Hence (11) holds.

The implication (11) \Rightarrow (10) is trivial. And (10) implies that (1) holds because a localization of R is flat over R , see Lemma 10.38.19. \square

Lemma 10.104.3. *Let R be a ring. If $I, J \subset R$ are pure ideals, then $V(I) = V(J)$ implies $I = J$.*

Proof. For example, by property (7) of Lemma 10.104.2 we see that $I = \text{Ker}(R \rightarrow \prod_{\mathfrak{p} \in V(I)} R_{\mathfrak{p}})$ can be recovered from the closed subset associated to it. \square

Lemma 10.104.4. *Let R be a ring. The rule $I \mapsto V(I)$ determines a bijection*

$$\{I \subset R \text{ pure}\} \leftrightarrow \{Z \subset \text{Spec}(R) \text{ closed and closed under generalizations}\}$$

Proof. Let I be a pure ideal. Then since $R \rightarrow R/I$ is flat, by going up generalizations lift along the map $\text{Spec}(R/I) \rightarrow \text{Spec}(R)$. Hence $V(I)$ is closed under generalizations. This shows that the map is well defined. By Lemma 10.104.3 the map is injective. Suppose that $Z \subset \text{Spec}(R)$ is closed and closed under generalizations. Let $J \subset R$ be the radical ideal such that $Z = V(J)$. Let $I = \{x \in R : x \in xJ\}$. Note that I is an ideal. We claim that I is pure and that $V(I) = V(J)$. If the claim is true then the map of the lemma is surjective and the lemma holds.

Note that $I \subset J$, so that $V(J) \subset V(I)$. Let $I \subset \mathfrak{p}$ be a prime. Consider the multiplicative subset $S = (R \setminus \mathfrak{p})(1+J)$. By definition of I and $I \subset \mathfrak{p}$ we see that $0 \notin S$. Hence we can find a prime \mathfrak{q} of R which is disjoint from S , see Lemmas 10.9.4 and 10.16.5. Hence $\mathfrak{q} \subset \mathfrak{p}$ and $\mathfrak{q} \cap (1+J) = \emptyset$. This implies that $\mathfrak{q} + J$ is a proper ideal of R . Let \mathfrak{m} be a maximal ideal containing $\mathfrak{q} + J$. Then we get $\mathfrak{m} \in V(J)$ and hence $\mathfrak{q} \in V(J) = Z$ as Z was assumed to be closed under generalization. This in turn implies $\mathfrak{p} \in V(J)$ as $\mathfrak{q} \subset \mathfrak{p}$. Thus we see that $V(I) = V(J)$.

Finally, since $V(I) = V(J)$ (and J radical) we see that $J = \sqrt{I}$. Pick $x \in I$, so that $x = xy$ for some $y \in J$ by definition. Then $x = xy = xy^2 = \dots = xy^n$. Since $y^n \in I$ for some $n > 0$ we conclude that property (5) of Lemma 10.104.2 holds and we see that I is indeed pure. \square

Lemma 10.104.5. *Let R be a ring. Let $I \subset R$ be an ideal. The following are equivalent*

- (1) I is pure and finitely generated,
- (2) I is generated by an idempotent,
- (3) I is pure and $V(I)$ is open, and
- (4) R/I is a projective R -module.

Proof. If (1) holds, then $I = I \cap I = I^2$ by Lemma 10.104.2. Hence I is generated by an idempotent by Lemma 10.20.5. Thus (1) \Rightarrow (2). If (2) holds, then $I = (e)$ and $R = (1-e) \oplus (e)$ as an R -module hence R/I is flat and I is pure and $V(I) = D(1-e)$ is open. Thus (2) \Rightarrow (1) + (3). Finally, assume (3). Then $V(I)$ is open and closed, hence $V(I) = D(1-e)$ for some idempotent e of R , see Lemma 10.20.3. The ideal

$J = (e)$ is a pure ideal such that $V(J) = V(I)$ hence $I = J$ by Lemma 10.104.3. In this way we see that (3) \Rightarrow (2). By Lemma 10.75.2 we see that (4) is equivalent to the assertion that I is pure and R/I finitely presented. Moreover, R/I is finitely presented if and only if I is finitely generated, see Lemma 10.5.3. Hence (4) is equivalent to (1). \square

We can use the above to characterize those rings for which every finite flat module is finitely presented.

Lemma 10.104.6. *Let R be a ring. The following are equivalent:*

- (1) every $Z \subset \text{Spec}(R)$ which is closed and closed under generalizations is also open, and
- (2) any finite flat R -module is finite locally free.

Proof. If any finite flat R -module is finite locally free then the support of R/I where I is a pure ideal is open. Hence the implication (2) \Rightarrow (1) follows from Lemma 10.104.3.

For the converse assume that R satisfies (1). Let M be a finite flat R -module. The support $Z = \text{Supp}(M)$ of M is closed, see Lemma 10.39.5. On the other hand, if $\mathfrak{p} \subset \mathfrak{p}'$, then by Lemma 10.75.4 the module $M_{\mathfrak{p}'}$ is free, and $M_{\mathfrak{p}} = M_{\mathfrak{p}'} \otimes_{R_{\mathfrak{p}'}} R_{\mathfrak{p}}$. Hence $\mathfrak{p}' \in \text{Supp}(M) \Rightarrow \mathfrak{p} \in \text{Supp}(M)$, in other words, the support is closed under generalization. As R satisfies (1) we see that the support of M is open and closed. Suppose that M is generated by r elements m_1, \dots, m_r . The modules $\wedge^i(M)$, $i = 1, \dots, r$ are finite flat R -modules also, because $\wedge^i(M)_{\mathfrak{p}} = \wedge^i(M_{\mathfrak{p}})$ is free over $R_{\mathfrak{p}}$. Note that $\text{Supp}(\wedge^{i+1}(M)) \subset \text{Supp}(\wedge^i(M))$. Thus we see that there exists a decomposition

$$\text{Spec}(R) = U_0 \coprod U_1 \coprod \dots \coprod U_r$$

by open and closed subsets such that the support of $\wedge^i(M)$ is $U_r \cup \dots \cup U_i$ for all $i = 0, \dots, r$. Let \mathfrak{p} be a prime of R , and say $\mathfrak{p} \in U_i$. Note that $\wedge^i(M) \otimes_R \kappa(\mathfrak{p}) = \wedge^i(M \otimes_R \kappa(\mathfrak{p}))$. Hence, after possibly renumbering m_1, \dots, m_r we may assume that m_1, \dots, m_i generate $M \otimes_R \kappa(\mathfrak{p})$. By Nakayama's Lemma 10.19.1 we get a surjection

$$R_f^{\oplus i} \longrightarrow M_f, \quad (a_1, \dots, a_i) \longmapsto \sum a_i m_i$$

for some $f \in R$, $f \notin \mathfrak{p}$. We may also assume that $D(f) \subset U_i$. This means that $\wedge^i(M_f) = \wedge^i(M)_f$ is a flat R_f module whose support is all of $\text{Spec}(R_f)$. By the above it is generated by a single element, namely $m_1 \wedge \dots \wedge m_i$. Hence $\wedge^i(M)_f \cong R_f/J$ for some pure ideal $J \subset R_f$ with $V(J) = \text{Spec}(R_f)$. Clearly this means that $J = (0)$, see Lemma 10.104.3. Thus $m_1 \wedge \dots \wedge m_i$ is a basis for $\wedge^i(M_f)$ and it follows that the displayed map is injective as well as surjective. This proves that M is finite locally free as desired. \square

10.105. Rings of finite global dimension

The following lemma is often used to compare different projective resolutions of a given module.

Lemma 10.105.1 (Schanuel's lemma). *Let R be a ring. Let M be an R -module. Suppose that $0 \rightarrow K \rightarrow P_1 \rightarrow M \rightarrow 0$ and $0 \rightarrow L \rightarrow P_2 \rightarrow M \rightarrow 0$ are two short exact sequences, with P_i projective. Then $K \oplus P_2 \cong L \oplus P_1$.*

Proof. Consider the module N defined by the short exact sequence $0 \rightarrow N \rightarrow P_1 \oplus P_2 \rightarrow M \rightarrow 0$, where the last map is the sum of the two maps $P_i \rightarrow M$. It is easy to see that the projection $N \rightarrow P_1$ is surjective with kernel L , and that $N \rightarrow P_2$ is surjective with kernel K . Since P_i are projective we have $N \cong K \oplus P_2 \cong L \oplus P_1$. \square

Definition 10.105.2. Let R be a ring. Let M be an R -module. We say M has *finite projective dimension* if it has a finite length resolution by projective R -modules. The minimal length of such a resolution is called the *projective dimension* of M .

It is clear that the projective dimension of M is 0 if and only if M is a projective module. The following lemma explains to what extent the projective dimension is independent of the choice of a projective resolution.

Lemma 10.105.3. *Let R be a ring. Suppose that M is an R -module of projective dimension d . Suppose that $F_e \rightarrow F_{e-1} \rightarrow \dots \rightarrow F_0 \rightarrow M \rightarrow 0$ is exact with F_i projective and $e \geq d - 1$. Then the kernel of $F_e \rightarrow F_{e-1}$ is projective (or the kernel of $F_0 \rightarrow M$ is projective in case $e = 0$).*

Proof. We prove this by induction on d . If $d = 0$, then M is projective. In this case there is a splitting $F_0 = \text{Ker}(F_0 \rightarrow M) \oplus M$, and hence $\text{Ker}(F_0 \rightarrow M)$ is projective. This finishes the proof if $e = 0$, and if $e > 0$, then replacing M by $\text{Ker}(F_0 \rightarrow M)$ we decrease e .

Next assume $d > 0$. Let $0 \rightarrow P_d \rightarrow P_{d-1} \rightarrow \dots \rightarrow P_0 \rightarrow M \rightarrow 0$ be a minimal length finite resolution with P_i projective. According to Schanuel's Lemma 10.105.1 we have $P_0 \oplus \text{Ker}(F_0 \rightarrow M) \cong F_0 \oplus \text{Ker}(P_0 \rightarrow M)$. This proves the case $d = 1$, $e = 0$, because then the right hand side is $F_0 \oplus P_1$ which is projective. Hence now we may assume $e > 0$. The module $F_0 \oplus \text{Ker}(P_0 \rightarrow M)$ has the finite projective resolution $0 \rightarrow P_d \oplus F_0 \rightarrow P_{d-1} \oplus F_0 \rightarrow \dots \rightarrow P_1 \oplus F_0 \rightarrow \text{Ker}(P_0 \rightarrow M) \oplus F_0 \rightarrow 0$ of length $d - 1$. By induction on d we see that the kernel of $F_e \oplus P_0 \rightarrow F_{e-1} \oplus P_0$ is projective. This implies the lemma. \square

Lemma 10.105.4. *Let R be a ring. Let M be an R -module. Let $n \geq 0$. The following are equivalent*

- (1) M has projective dimension $\leq n$,
- (2) $\text{Ext}_R^i(M, N) = 0$ for all R -modules N and all $i \geq n + 1$, and
- (3) $\text{Ext}_R^{n+1}(M, N) = 0$ for all R -modules N .

Proof. Assume (1). Choose a free resolution $F_\bullet \rightarrow M$ of M . Denote $d_e : F_e \rightarrow F_{e-1}$. By Lemma 10.105.3 we see that $P_e = \text{Ker}(d_e)$ is projective for $e \geq n - 1$. This implies that $F_e \cong P_e \oplus P_{e-1}$ for $e \geq n$ where d_e maps the summand P_{e-1} isomorphically to P_{e-1} in F_{e-1} . Hence, for any R -module N the complex $\text{Hom}_R(F_\bullet, N)$ is split exact in degrees $\geq n + 1$. Whence (2) holds. The implication (2) \Rightarrow (3) is trivial.

Assume (3) holds. If $n = 0$ then M is projective by Lemma 10.74.2 and we see that (1) holds. If $n > 0$ choose a free R -module F and a surjection $F \rightarrow M$ with kernel K . By Lemma 10.69.7 and the vanishing of $\text{Ext}_R^i(F, N)$ for all $i > 0$ by part (1) we see that $\text{Ext}_R^n(K, N) = 0$ for all R -modules N . Hence by induction we see that K has projective dimension $\leq n - 1$. Then M has projective dimension $\leq n$ as any finite projective resolution of K gives a projective resolution of length one more for M by adding F to the front. \square

Lemma 10.105.5. *Let R be a ring. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence of R -modules.*

- (1) *If M has projective dimension $\leq n$ and M'' has projective dimension $\leq n + 1$, then M' has projective dimension $\leq n$.*
- (2) *If M' and M'' have projective dimension $\leq n$ then M has projective dimension $\leq n$.*
- (3) *If M' has projective dimension $\leq n$ and M has projective dimension $\leq n + 1$ then M'' has projective dimension $\leq n + 1$.*

Proof. Combine the characterization of projective dimension in Lemma 10.105.4 with the long exact sequence of ext groups in Lemma 10.69.7. \square

Definition 10.105.6. Let R be a ring. The ring R is said to have *finite global dimension* if there exists an integer n such that every R -module has a resolution by projective R -modules of length at most n . The minimal such n is then called the *global dimension* of R .

The argument in the proof of the following lemma can be found in the paper [Aus55] by Auslander.

Lemma 10.105.7. *Let R be a ring. The following are equivalent*

- (1) *R has finite global dimension $\leq n$,*
- (2) *every finite R -module has projective dimension $\leq n$, and*
- (3) *every cyclic R -module R/I has projective dimension $\leq n$.*

Proof. It is clear that (1) \Rightarrow (3). Assume (3). Since every finite R -module has a finite filtration by cyclic modules, see Lemma 10.5.4 we see that (2) follows by Lemma 10.105.5.

Assume (2). Let M be an arbitrary R -module. Choose a set $E \subset M$ of generators of M . Choose a well ordering on E . For $e \in E$ denote M_e the submodule of M generated by the elements $e' \in E$ with $e' \leq e$. Then $M = \bigcup_{e \in E} M_e$. Note that for each $e \in E$ the quotient

$$M_e / \bigcup_{e' < e} M_{e'}$$

is either zero or generated by one element, hence has projective dimension $\leq n$. To finish the proof we claim that any time we have a well-ordered set E and a module $M = \bigcup_{e \in E} M_e$ such that the quotients $M_e / \bigcup_{e' < e} M_{e'}$ have projective dimension $\leq n$, then M has projective dimension $\leq n$.

We may prove this statement by induction on n . If $n = 0$, then we will show, by transfinite induction that M is projective. Namely, for each $e \in E$ we may choose a splitting $M_e = \bigcup_{e' < e} M_{e'} \oplus P_e$ because $P_e = M_e / \bigcup_{e' < e} M_{e'}$ is projective. Hence it follows that $M = \bigoplus_{e \in E} P_e$ and we conclude that M is projective, see Lemma 10.74.3.

If $n > 0$, then for $e \in E$ we denote F_e the free R -module on the set of elements of M_e . Then we have a system of short exact sequences

$$0 \rightarrow K_e \rightarrow F_e \rightarrow M_e \rightarrow 0$$

over the well-ordered set E . Note that the transition maps $F_{e'} \rightarrow F_e$ and $K_{e'} \rightarrow K_e$ are injective too. Set $F = \bigcup F_e$ and $K = \bigcup K_e$. Then

$$0 \rightarrow K_e / \bigcup_{e' < e} K_{e'} \rightarrow F_e / \bigcup_{e' < e} F_{e'} \rightarrow M_e / \bigcup_{e' < e} M_{e'} \rightarrow 0$$

is a short exact sequence of R -modules too and $F_e/\bigcup_{e' < e} F_{e'}$ is the free R -module on the set of elements in M_e which are not contained in $\bigcup_{e' < e} M_{e'}$. Hence by Lemma 10.105.5 we see that the projective dimension of $K_e/\bigcup_{e' < e} K_{e'}$ is at most $n - 1$. By induction we conclude that K has projective dimension at most $n - 1$. Whence M has projective dimension at most n and we win. \square

Lemma 10.105.8. *Let R be a ring. Let M be an R -module. Let $S \subset R$ be a multiplicative subset.*

- (1) *If M has projective dimension $\leq n$, then $S^{-1}M$ has projective dimension $\leq n$ over $S^{-1}R$.*
- (2) *If R has finite global dimension $\leq n$, then $S^{-1}R$ has finite global dimension $\leq n$.*

Proof. Let $0 \rightarrow P_n \rightarrow P_{n-1} \rightarrow \dots \rightarrow P_0 \rightarrow M \rightarrow 0$ be a projective resolution. As localization is exact, see Proposition 10.9.12, and as each $S^{-1}P_i$ is a projective $S^{-1}R$ -module, see Lemma 10.91.1, we see that $0 \rightarrow S^{-1}P_n \rightarrow \dots \rightarrow S^{-1}P_0 \rightarrow S^{-1}M \rightarrow 0$ is a projective resolution of $S^{-1}M$. This proves (1). Let M' be an $S^{-1}R$ -module. Note that $M' = S^{-1}M'$. Hence we see that (2) follows from (1). \square

10.106. Regular rings and global dimension

We can use the material on rings of finite global dimension to give another characterization of regular local rings.

Proposition 10.106.1. *Let R be a regular local ring of dimension d . Every finite R -module M of depth e has a finite free resolution*

$$0 \rightarrow F_{d-e} \rightarrow \dots \rightarrow F_0 \rightarrow M \rightarrow 0.$$

In particular a regular local ring has global dimension $\leq d$.

Proof. This is clear in view of Lemma 10.102.6 and Lemma 10.100.9. \square

Lemma 10.106.2. *Let R be a Noetherian ring. Then R has finite global dimension if and only if there exists an integer n such that for all maximal ideals \mathfrak{m} of R the ring $R_{\mathfrak{m}}$ has global dimension $\leq n$.*

Proof. We saw, Lemma 10.105.8 that if R has finite global dimension n , then all the localizations $R_{\mathfrak{m}}$ have finite global dimension at most n . Conversely, suppose that all the $R_{\mathfrak{m}}$ have global dimension n . Let M be a finite R -module. Let $0 \rightarrow K_n \rightarrow F_{n-1} \rightarrow \dots \rightarrow F_0 \rightarrow M \rightarrow 0$ be a resolution with F_i finite free. Then K_n is a finite R -module. According to Lemma 10.105.3 and the assumption all the modules $K_n \otimes_R R_{\mathfrak{m}}$ are projective. Hence by Lemma 10.75.2 the module K_n is finite projective. \square

Lemma 10.106.3. *Suppose that R is a Noetherian local ring with maximal ideal \mathfrak{m} and residue field κ . In this case the projective dimension of κ is $\geq \dim_{\kappa} \mathfrak{m}/\mathfrak{m}^2$.*

Proof. Let x_1, \dots, x_n be elements of \mathfrak{m} whose images in $\mathfrak{m}/\mathfrak{m}^2$ form a basis. Consider the Koszul complex on x_1, \dots, x_n . This is the complex

$$0 \rightarrow \wedge^n R^n \rightarrow \wedge^{n-1} R^n \rightarrow \wedge^{n-2} R^n \rightarrow \dots \rightarrow \wedge^i R^n \rightarrow \dots \rightarrow R^n \rightarrow R$$

with maps given by

$$e_{j_1} \wedge \dots \wedge e_{j_i} \mapsto \sum_{a=1}^i (-1)^{i+1} x_{j_a} e_{j_1} \wedge \dots \wedge \hat{e}_{j_a} \wedge \dots \wedge e_{j_i}$$

It is easy to see that this is a complex $K_\bullet(R, x_\bullet)$. Note that the cokernel of the last map of $K_\bullet(R, x_\bullet)$ is clearly κ .

Now, let $F_\bullet \rightarrow \kappa$ by any finite resolution by finite free R -modules. By Lemma 10.98.2 we may assume all the maps in the complex F_\bullet have to property that $\text{Im}(F_i \rightarrow F_{i-1}) \subset \mathfrak{m}F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. By Lemma 10.69.4 we can find a map of complexes $\alpha : K_\bullet(R, x_\bullet) \rightarrow F_\bullet$ inducing the identity on κ . We will prove by induction that the maps $\alpha_i : \wedge^i R^n = K_i(R, x_\bullet) \rightarrow F_i$ have the property that $\alpha_i \otimes \kappa : \wedge^i \kappa^n \rightarrow F_i \otimes \kappa$ are injective. This will prove the lemma since it clearly shows that $F_n \neq 0$.

The result is clear for $i = 0$ because the composition $R \xrightarrow{\alpha_0} F_0 \rightarrow \kappa$ is nonzero. Note that F_0 must have rank 1 since otherwise the map $F_1 \rightarrow F_0$ whose cokernel is a single copy of κ cannot have image contained in $\mathfrak{m}F_0$. For α_1 we use that x_1, \dots, x_n is a minimal set of generators for \mathfrak{m} . Namely, we saw above that $F_0 = R$ and $F_1 \rightarrow F_0 = R$ has image \mathfrak{m} . We have a commutative diagram

$$\begin{array}{ccccc} R^n & = & K_1(R, x_\bullet) & \rightarrow & K_0(R, x_\bullet) & = & R \\ & & \downarrow & & \downarrow & & \downarrow \\ & & F_1 & \rightarrow & F_0 & = & R \end{array}$$

where the rightmost vertical arrow is given by multiplication by a unit. Hence we see that the image of the composition $R^n \rightarrow F_1 \rightarrow F_0 = R$ is also equal to \mathfrak{m} . Thus the map $R^n \otimes \kappa \rightarrow F_1 \otimes \kappa$ has to be injective since $\dim_\kappa(\mathfrak{m}/\mathfrak{m}^2) = n$.

Suppose the injectivity of $\alpha_j \otimes \kappa$ has been proved for all $j \leq i-1$. Consider the commutative diagram

$$\begin{array}{ccccc} \wedge^i R^n & = & K_i(R, x_\bullet) & \rightarrow & K_{i-1}(R, x_\bullet) & = & \wedge^{i-1} R^n \\ & & \downarrow & & \downarrow & & \\ & & F_i & \rightarrow & F_{i-1} & & \end{array}$$

We know that $\wedge^{i-1} \kappa^n \rightarrow F_{i-1} \otimes \kappa$ is injective. This proves that $\wedge^{i-1} \kappa^n \otimes_\kappa \mathfrak{m}/\mathfrak{m}^2 \rightarrow F_{i-1} \otimes \mathfrak{m}/\mathfrak{m}^2$ is injective. Also, by our choice of the complex, F_i maps into $\mathfrak{m}F_{i-1}$, and similarly for the Koszul complex. Hence we get a commutative diagram

$$\begin{array}{ccc} \wedge^i \kappa^n & \rightarrow & \wedge^{i-1} \kappa^n \otimes \mathfrak{m}/\mathfrak{m}^2 \\ \downarrow & & \downarrow \\ F_i \otimes \kappa & \rightarrow & F_{i-1} \otimes \mathfrak{m}/\mathfrak{m}^2 \end{array}$$

At this point it suffices to verify the map $\wedge^i \kappa^n \rightarrow \wedge^{i-1} \kappa^n \otimes \mathfrak{m}/\mathfrak{m}^2$ is injective, which can be done by hand. \square

Lemma 10.106.4. *Let R be a Noetherian local ring. Suppose that the residue field κ has finite projective dimension n over R . In this case $\dim(R) \geq n$.*

Proof. Let F_\bullet be a finite resolution of κ by finite free R -modules. By Lemma 10.98.2 we may assume all the maps in the complex F_\bullet have to property that $\text{Im}(F_i \rightarrow F_{i-1}) \subset \mathfrak{m}F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. Say $F_n \neq 0$ and $F_i = 0$ for $i > n$, so that the

projective dimension of κ is n . By Proposition 10.98.10 we see that $\text{depth}(I(\varphi_n)) \geq n$ since $I(\varphi_n)$ cannot equal R by our choice of the complex. Thus by Lemma 10.67.6 also $\dim(R) \geq n$. \square

Proposition 10.106.5. *A Noetherian local ring whose residue field has finite projective dimension is a regular local ring. In particular a Noetherian local ring of finite global dimension is a regular local ring.*

Proof. By Lemmas 10.106.3 and 10.106.4 we see that $\dim(R) \geq \dim_{\kappa}(\mathfrak{m}/\mathfrak{m}^2)$. Thus the result follows immediately from Definition 10.59.9. \square

Lemma 10.106.6. *A Noetherian local ring R is a regular local ring if and only if it has finite global dimension. In this case $R_{\mathfrak{p}}$ is a regular local ring for all primes \mathfrak{p} .*

Proof. By Propositions 10.106.5 and 10.106.1 we see that a Noetherian local ring is a regular local ring if and only if it has finite global dimension. Furthermore, any localization $R_{\mathfrak{p}}$ has finite global dimension, see Lemma 10.105.8, and hence is a regular local ring. \square

By Lemma 10.106.6 it makes sense to make the following definition, because it does not conflict with the earlier definition of a regular local ring.

Definition 10.106.7. A Noetherian ring R is said to be *regular* if all the localizations $R_{\mathfrak{p}}$ at primes are regular local rings.

It is enough to require the local rings at maximal ideals to be regular. Note that this is not the same as asking R to have finite global dimension, even assuming R is Noetherian. This is because there is an example of a regular Noetherian ring which does not have finite global dimension, namely because it does not have finite dimension.

Lemma 10.106.8. *Let R be a Noetherian ring. The following are equivalent:*

- (1) R has finite global dimension n ,
- (2) there exists an integer n such that all the localizations $R_{\mathfrak{m}}$ at maximal ideals are regular of dimension $\leq n$ with equality for at least one \mathfrak{m} , and
- (3) there exists an integer n such that all the localizations $R_{\mathfrak{p}}$ at prime ideals are regular of dimension $\leq n$ with equality for at least one \mathfrak{p} .

Proof. This is a reformulation of Lemma 10.106.2 in view of the discussion surrounding Definition 10.106.7. See especially Propositions 10.106.1 and 10.106.5. \square

Lemma 10.106.9. *Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume that $R \rightarrow S$ is flat and that S is regular. Then R is regular.*

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal and let $\kappa = R/\mathfrak{m}$ be the residue field. Let $d = \dim S$. Choose any resolution $F_{\bullet} \rightarrow \kappa$ with each F_i a finite free R -module. Set $K_d = \text{Ker}(F_{d-1} \rightarrow F_{d-2})$. By flatness of $R \rightarrow S$ the complex $0 \rightarrow K_d \otimes_R S \rightarrow F_{d-1} \otimes_R S \rightarrow \dots \rightarrow F_0 \otimes_R S \rightarrow \kappa \otimes_R S \rightarrow 0$ is still exact. Because the global dimension of S is d , see Proposition 10.106.1, we see that $K_d \otimes_R S$ is a finite free S -module (see also Lemma 10.105.3). By Lemma 10.75.5 we see that K_d is a finite free R -module. Hence κ has finite projective dimension and R is regular by Proposition 10.106.5. \square

10.107. Auslander-Buchsbaum

The following result can be found in [AB57].

Proposition 10.107.1. *Let R be a Noetherian local ring. Let M be a nonzero finite R -module which has finite projective dimension $\text{pd}_R(M)$. Then we have*

$$\text{depth}(R) = \text{pd}_R(M) + \text{depth}(M)$$

Proof. We prove this by induction on $\text{depth}(M)$. The most interesting case is the case $\text{depth}(M) = 0$. In this case, let

$$0 \rightarrow R^{n_e} \rightarrow R^{n_{e-1}} \rightarrow \dots \rightarrow R^{n_0} \rightarrow M \rightarrow 0$$

be a minimal finite free resolution, so $e = \text{pd}_R(M)$. By Lemma 10.98.2 we may assume all matrix coefficients of the maps in the complex are contained in the maximal ideal of R . Then on the one hand, by Proposition 10.98.10 we see that $\text{depth}(R) \geq e$. On the other hand, breaking the long exact sequence into short exact sequences

$$\begin{aligned} 0 \rightarrow R^{n_e} \rightarrow R^{n_{e-1}} \rightarrow K_{e-2} \rightarrow 0, \\ 0 \rightarrow K_{e-2} \rightarrow R^{n_{e-2}} \rightarrow K_{e-3} \rightarrow 0, \\ \dots, \\ 0 \rightarrow K_0 \rightarrow R^{n_0} \rightarrow M \rightarrow 0 \end{aligned}$$

we see, using Lemma 10.69.11, that

$$\begin{aligned} \text{depth}(K_{e-2}) &\geq \text{depth}(R) - 1, \\ \text{depth}(K_{e-3}) &\geq \text{depth}(R) - 2, \\ \dots, \\ \text{depth}(K_0) &\geq \text{depth}(R) - (e - 1), \\ \text{depth}(M) &\geq \text{depth}(R) - e \end{aligned}$$

and since $\text{depth}(M) = 0$ we conclude $\text{depth}(R) \leq e$. This finishes the proof of the case $\text{depth}(M) = 0$.

Induction step. If $\text{depth}(M) > 0$, then we pick $x \in \mathfrak{m}$ which is a nonzerodivisor on both M and R . This is possible, because either $\text{pd}_R(M) > 0$ and $\text{depth}(R) > 0$ by the aforementioned Proposition 10.98.10 or $\text{pd}_R(M) = 0$ in which case M is finite free hence also $\text{depth}(R) = \text{depth}(M) > 0$. Thus $\text{depth}(R \oplus M) > 0$ by Lemma 10.69.11 (for example) and we can find an $x \in \mathfrak{m}$ which is a nonzerodivisor on both R and M . Let

$$0 \rightarrow R^{n_e} \rightarrow R^{n_{e-1}} \rightarrow \dots \rightarrow R^{n_0} \rightarrow M \rightarrow 0$$

be a minimal resolution as above. An application of the snake lemma shows that

$$0 \rightarrow (R/xR)^{n_e} \rightarrow (R/xR)^{n_{e-1}} \rightarrow \dots \rightarrow (R/xR)^{n_0} \rightarrow M/xM \rightarrow 0$$

is a minimal resolution too. Thus $\text{pd}_R(M) = \text{pd}_{R/xR}(M/xM)$. By Lemma 10.69.12 we have $\text{depth}(R/xR) = \text{depth}(R) - 1$ and $\text{depth}(M/xM) = \text{depth}(M) - 1$. Till now depths have all been depths as R modules, but we observe that $\text{depth}_R(M/xM) = \text{depth}_{R/xR}(M/xM)$ and similarly for R/xR . By induction hypothesis we see that the Auslander-Buchsbaum formula holds for M/xM over R/xR . Since the depths of both R/xR and M/xM have decreased by one and the projective dimension has not changed we conclude. \square

10.108. Homomorphisms and dimension

This section contains a collection of easy results relating dimensions of rings when there are maps between them.

Lemma 10.108.1. *Suppose $R \rightarrow S$ is a ring map satisfying either going up, see Definition 10.40.1, or going down see Definition 10.40.1. Assume in addition that $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective. Then $\dim(R) \leq \dim(S)$.*

Proof. Assume going up. Take any chain $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_e$ of prime ideals in R . By surjectivity we may choose a prime \mathfrak{q}_0 mapping to \mathfrak{p}_0 . By going up we may extend this to a chain of length e of primes \mathfrak{q}_i lying over \mathfrak{p}_i . Thus $\dim(S) \geq \dim(R)$. The case of going down is exactly the same. See also Topology, Lemma 5.18.8 for a purely topological version. \square

Lemma 10.108.2. *Suppose that $R \rightarrow S$ is a ring map with the going up property, see Definition 10.40.1. If $\mathfrak{q} \subset S$ is a maximal ideal. Then the inverse image of \mathfrak{q} in R is a maximal ideal too.*

Proof. Trivial. \square

Lemma 10.108.3. *Suppose that $R \rightarrow S$ is a ring map such that S is integral over R . Then $\dim(R) \geq \dim(S)$, and every closed point of $\text{Spec}(S)$ maps to a closed point of $\text{Spec}(R)$.*

Proof. Immediate from Lemmas 10.35.18 and 10.108.2 and the definitions. \square

Lemma 10.108.4. *Suppose $R \subset S$ and S integral over R . Then $\dim(R) = \dim(S)$.*

Proof. This is a combination of Lemmas 10.35.20, 10.35.15, 10.108.1, and 10.108.3. \square

Definition 10.108.5. Suppose that $R \rightarrow S$ is a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} of R . The *local ring of the fibre at \mathfrak{q}* is the local ring

$$S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} = (S/\mathfrak{p}S)_{\mathfrak{q}} = (S \otimes_R \kappa(\mathfrak{p}))_{\mathfrak{q}}$$

Lemma 10.108.6. *Let $R \rightarrow S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} . Then*

$$\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}).$$

Proof. We use the characterization of dimension of Proposition 10.59.8. Let x_1, \dots, x_d be elements of \mathfrak{p} generating an ideal of definition of $R_{\mathfrak{p}}$ with $d = \dim(R_{\mathfrak{p}})$. Let y_1, \dots, y_e be elements of \mathfrak{q} generating an ideal of definition of $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ with $e = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. It is clear that $S_{\mathfrak{q}}/(x_1, \dots, x_d, y_1, \dots, y_e)$ has a nilpotent maximal ideal. Hence $x_1, \dots, x_d, y_1, \dots, y_e$ generate an ideal of definition if $S_{\mathfrak{q}}$. \square

Lemma 10.108.7. *Let $R \rightarrow S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} . Assume the going down property holds for $R \rightarrow S$ (for example if $R \rightarrow S$ is flat, see Lemma 10.38.17). Then*

$$\dim(S_{\mathfrak{q}}) = \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}).$$

Proof. By Lemma 10.108.6 we have an inequality $\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. To get equality, choose a chain of primes $\mathfrak{p}S \subset \mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \dots \subset \mathfrak{q}_d = \mathfrak{q}$ with $d = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. On the other hand, choose a chain of primes $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_e = \mathfrak{p}$ with $e = \dim(R_{\mathfrak{p}})$. By the going down theorem we may choose $\mathfrak{q}_{-1} \subset \mathfrak{q}_0$ lying over

\mathfrak{p}_{e-1} . And then we may choose $\mathfrak{q}_{-2} \subset \mathfrak{q}_{e-1}$ lying over \mathfrak{p}_{e-2} . Inductively we keep going until we get a chain $\mathfrak{q}_{-e} \subset \dots \subset \mathfrak{q}_d$ of length $e + d$. \square

Lemma 10.108.8. *Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume*

- (1) R is regular,
- (2) $S/\mathfrak{m}_R S$ is regular, and
- (3) $R \rightarrow S$ is flat.

Then S is regular.

Proof. By Lemma 10.108.7 we have $\dim(S) = \dim(R) + \dim(S/\mathfrak{m}_R S)$. Pick generators $x_1, \dots, x_d \in \mathfrak{m}_R$ with $d = \dim(R)$, and pick $y_1, \dots, y_e \in \mathfrak{m}_S$ which generate the maximal ideal of $S/\mathfrak{m}_R S$ with $e = \dim(S/\mathfrak{m}_R S)$. Then we see that $x_1, \dots, x_d, y_1, \dots, y_e$ are elements which generate the maximal ideal of S and $e + d = \dim(S)$. \square

The lemma below will later be used to show that rings of finite type over a field are Cohen-Macaulay if and only if they are quasi-finite flat over a polynomial ring. It is a partial converse to Lemma 10.124.1.

Lemma 10.108.9. *Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Assume R Cohen-Macaulay. If S is finite flat over R , or if S is flat over R and $\dim(S) \leq \dim(R)$, then S is Cohen-Macaulay and $\dim(R) = \dim(S)$.*

Proof. Let $x_1, \dots, x_d \in \mathfrak{m}_R$ be a regular sequence of length $d = \dim(R)$. By Lemma 10.67.7 this maps to a regular sequence in S . Hence S is Cohen-Macaulay if $\dim(S) \leq d$. This is true if S is finite flat over R by Lemma 10.108.4. And in the second case we assumed it. \square

10.109. The dimension formula

Recall the definitions of catenary (Definition 10.101.1) and universally catenary (Definition 10.101.5).

Lemma 10.109.1. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over the prime \mathfrak{p} of R . Assume that*

- (1) R is Noetherian,
- (2) $R \rightarrow S$ is of finite type,
- (3) R, S are domains, and
- (4) $R \subset S$.

Then we have

$$\text{height}(\mathfrak{q}) \leq \text{height}(\mathfrak{p}) + \text{trdeg}_R(S) - \text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q})$$

with equality if R is universally catenary.

Proof. Suppose that $R \subset S' \subset S$ is a finitely generated R -subalgebra of S . In this case set $\mathfrak{q}' = S' \cap \mathfrak{q}$. The lemma for the ring maps $R \rightarrow S'$ and $S' \rightarrow S$ implies the lemma for $R \rightarrow S$ by additivity of transcendence degree in towers of fields. Hence we can use induction on the number of generators of S over R and reduce to the case where S is generated by one element over R .

Case I: $S = R[x]$ is a polynomial algebra over R . In this case we have $\text{trdeg}_R(S) = 1$. Also $R \rightarrow S$ is flat and hence

$$\dim(S_{\mathfrak{q}}) = \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}/\mathfrak{p}S_{\mathfrak{q}}})$$

see Lemma 10.108.7. Let $\mathfrak{r} = \mathfrak{p}S$. Then $\text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}) = 1$ is equivalent to $\mathfrak{q} = \mathfrak{r}$, and implies that $\dim(S_{\mathfrak{q}/\mathfrak{p}S_{\mathfrak{q}}}) = 0$. In the same vein $\text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}) = 0$ is equivalent to having a strict inclusion $\mathfrak{r} \subset \mathfrak{q}$, which implies that $\dim(S_{\mathfrak{q}/\mathfrak{p}S_{\mathfrak{q}}}) = 1$. Thus we are done with case I with equality in every instance.

Case II: $S = R[x]/\mathfrak{n}$ with $\mathfrak{n} \neq 0$. In this case we have $\text{trdeg}_R(S) = 0$. Denote $\mathfrak{q}' \subset R[x]$ the prime corresponding to \mathfrak{q} . Thus we have

$$S_{\mathfrak{q}} = (R[x]_{\mathfrak{q}'}/\mathfrak{n}(R[x]_{\mathfrak{q}'}))$$

By the previous case we have $\dim((R[x]_{\mathfrak{q}'})_{\mathfrak{q}'}) = \dim(R_{\mathfrak{p}}) + 1 - \text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q})$. Since $\mathfrak{n} \neq 0$ we see that the dimension of $S_{\mathfrak{q}}$ decreases by at least one, see Lemma 10.59.11, which proves the inequality of the lemma. To see the equality in case R is universally catenary note that $\mathfrak{n} \subset R[x]$ is a height one prime as it corresponds to a nonzero prime in $f.f.(R)[x]$. Hence any maximal chain of primes in $R[x]_{\mathfrak{q}'}/\mathfrak{n}$ corresponds to a maximal chain of primes with length 1 greater between \mathfrak{q}' and (0) in $R[x]$. If R is universally catenary these all have the same length equal to the height of \mathfrak{q}' . This proves that $\dim(R[x]_{\mathfrak{q}'}/\mathfrak{n}) = \dim(R[x]_{\mathfrak{q}'}) - 1$ as desired. \square

The following lemma says that generically finite maps tend to be quasi-finite in codimension 1.

Lemma 10.109.2. *Let $A \rightarrow B$ be a ring map. Assume*

- (1) $A \subset B$ is an extension of domains.
- (2) A is Noetherian,
- (3) $A \rightarrow B$ is of finite type, and
- (4) the extension $f.f.(A) \subset f.f.(B)$ is finite.

Let $\mathfrak{p} \subset A$ be a prime of height 1. Then there are at most finitely many primes of B lying over \mathfrak{p} and they all have height 1.

Proof. By the dimension formula (Lemma 10.109.1) for any prime \mathfrak{q} lying over \mathfrak{p} we have

$$\dim(B_{\mathfrak{q}}) \leq \dim(A_{\mathfrak{p}}) - \text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}).$$

As the domain $B_{\mathfrak{q}}$ has at least 2 prime ideals we see that $\dim(B_{\mathfrak{q}}) \geq 1$. We conclude that $\dim(B_{\mathfrak{q}}) = 1$ and that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is algebraic. Hence \mathfrak{q} defines a closed point of its fibre $\text{Spec}(B \otimes_A \kappa(\mathfrak{p}))$, see Lemma 10.34.9. Since $B \otimes_A \kappa(\mathfrak{p})$ is a Noetherian ring the fibre $\text{Spec}(B \otimes_A \kappa(\mathfrak{p}))$ is a Noetherian topological space, see Lemma 10.30.5. A Noetherian topological space consisting of closed points is finite, see for example Topology, Lemma 5.8.2. \square

10.110. Dimension of finite type algebras over fields

In this section we compute the dimension of a polynomial ring over a field. We also prove that the dimension of a finite type domain over a field is the dimension of its local rings at maximal ideals. We will establish the connection with the transcendence degree over the ground field in Section 10.112.

Lemma 10.110.1. *Let \mathfrak{m} be a maximal ideal in $k[x_1, \dots, x_n]$. The ideal \mathfrak{m} is generated by n elements. The dimension of $k[x_1, \dots, x_n]_{\mathfrak{m}}$ is n . Hence $k[x_1, \dots, x_n]_{\mathfrak{m}}$ is a regular local ring of dimension n .*

Proof. By the Hilbert Nullstellensatz (Theorem 10.33.1) we know the residue field $\kappa = \kappa(\mathfrak{m})$ is a finite extension of k . Denote $\alpha_i \in \kappa$ the image of x_i . Denote $\kappa_i = k(\alpha_1, \dots, \alpha_i) \subset \kappa$, $i = 1, \dots, n$ and $\kappa_0 = k$. Note that $\kappa_i = k[\alpha_1, \dots, \alpha_i]$ by field theory. Define inductively elements $f_i \in \mathfrak{m} \cap k[x_1, \dots, x_i]$ as follows: Let $P_i(T) \in \kappa_{i-1}[T]$ be the monic minimal polynomial of α_i over κ_{i-1} . Let $Q_i(T) \in k[x_1, \dots, x_{i-1}][T]$ be a monic lift of $P_i(T)$ (of the same degree). Set $f_i = Q_i(x_i)$. Note that if $d_i = \deg_T(P_i) = \deg_T(Q_i) = \deg_{x_i}(f_i)$ then $d_1 d_2 \dots d_i = [\kappa_i : k]$ by elementary field theory.

We claim that for all $i = 0, 1, \dots, n$ there is an isomorphism

$$\psi_i : k[x_1, \dots, x_i]/(f_1, \dots, f_i) \cong \kappa_i.$$

By construction the composition $k[x_1, \dots, x_i] \rightarrow k[x_1, \dots, x_n] \rightarrow \kappa$ is surjective onto κ_i and f_1, \dots, f_i are in the kernel. This gives a surjective homomorphism. We prove ψ_i is injective by induction. It is clear for $i = 0$. Given the statement for i we prove it for $i + 1$. The ring extension $k[x_1, \dots, x_i]/(f_1, \dots, f_i) \rightarrow k[x_1, \dots, x_{i+1}]/(f_1, \dots, f_{i+1})$ is generated by 1 element over a field and one irreducible equation. By elementary field theory $k[x_1, \dots, x_{i+1}]/(f_1, \dots, f_{i+1})$ is a field, and hence ψ_i is injective.

This implies that $\mathfrak{m} = (f_1, \dots, f_n)$. Moreover, we also conclude that

$$k[x_1, \dots, x_n]/(f_1, \dots, f_i) \cong \kappa_i[x_{i+1}, \dots, x_n].$$

Hence (f_1, \dots, f_i) is a prime ideal. Thus

$$(0) \subset (f_1) \subset (f_1, f_2) \subset \dots \subset (f_1, \dots, f_n) = \mathfrak{m}$$

is a chain of primes of length n . The lemma follows. \square

Proposition 10.110.2. *A polynomial algebra in n variables over a field is a regular ring. It has global dimension n . All localizations at maximal ideals are regular local rings of dimension n .*

Proof. By Lemma 10.110.1 all localizations $k[x_1, \dots, x_n]_{\mathfrak{m}}$ at maximal ideals are regular local rings of dimension n . Hence we conclude by Lemma 10.106.8. \square

Lemma 10.110.3. *Let k be a field. Let $\mathfrak{p} \subset \mathfrak{q} \subset k[x_1, \dots, x_n]$ be a pair of primes. Any maximal chain of primes between \mathfrak{p} and \mathfrak{q} has length $\text{height}(\mathfrak{q}) - \text{height}(\mathfrak{p})$.*

Proof. By Proposition 10.110.2 any local ring of $k[x_1, \dots, x_n]$ is regular. Hence all local rings are Cohen-Macaulay, see Lemma 10.102.3. The local rings at maximal ideals have dimension n hence every maximal chain of primes in $k[x_1, \dots, x_n]$ has length n , see Lemma 10.100.3. Hence every maximal chain of primes between (0) and \mathfrak{p} has length $\text{height}(\mathfrak{p})$, see Lemma 10.100.4 for example. Putting these together leads to the assertion of the lemma. \square

Lemma 10.110.4. *Let k be a field. Let S be a finite type k -algebra which is an integral domain. Then $\dim(S) = \dim(S_{\mathfrak{m}})$ for any maximal ideal \mathfrak{m} of S . In words: every maximal chain of primes has length equal to the dimension of S .*

Proof. Write $S = k[x_1, \dots, x_n]/\mathfrak{p}$. By Proposition 10.110.2 and Lemma 10.110.3 all the maximal chains of primes in S (which necessarily end with a maximal ideal) have length $n - \text{height}(\mathfrak{p})$. Thus this number is the dimension of S and of $S_{\mathfrak{m}}$ for any maximal ideal \mathfrak{m} of S . \square

Recall that we defined the dimension $\dim_x(X)$ of a topological space X at a point x in Topology, Definition 5.9.1.

Lemma 10.110.5. *Let k be a field. Let S be a finite type k -algebra. Let $X = \text{Spec}(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal and let $x \in X$ be the corresponding point. The following numbers are equal*

- (1) $\dim_x(X)$,
- (2) $\max \dim(Z)$ where the maximum is over those irreducible components Z of X passing through x , and
- (3) $\min \dim(S_{\mathfrak{m}})$ where the minimum is over maximal ideals \mathfrak{m} with $\mathfrak{p} \subset \mathfrak{m}$.

Proof. Let $X = \bigcup_{i \in I} Z_i$ be the decomposition of X into its irreducible components. There are finitely many of them (see Lemmas 10.30.3 and 10.30.5). Let $I' = \{i \mid x \in Z_i\}$, and let $T = \bigcup_{i \notin I'} Z_i$. Then $U = X \setminus T$ is an open subset of X containing the point x . The number (2) is $\max_{i \in I'} \dim(Z_i)$. For any open $W \subset U$, with $x \in W$ the irreducible components of W are the irreducible sets $W_i = Z_i \cap W$ for $i \in I'$. Note that each W_i , $i \in I'$ contains a closed point because X is Jacobson, see Section 10.34. Since $W_i \subset Z_i$ we have $\dim(W_i) \leq \dim(Z_i)$. The existence of a closed point implies, via Lemma 10.110.4, that there is a chain of irreducible closed subsets of length equal to $\dim(Z_i)$ in the open W_i . Thus $\dim(W_i) = \dim(Z_i)$ for any $i \in I'$. Hence $\dim(W)$ is equal to the number (2). This proves that (1) = (2).

Let $\mathfrak{m} \supset \mathfrak{p}$ be any maximal ideal containing \mathfrak{p} . Let $x_0 \in X$ be the corresponding point. First of all, x_0 is contained in all the irreducible components Z_i , $i \in I'$. Let \mathfrak{q}_i denote the minimal primes of S corresponding to the irreducible components Z_i . For each i such that $x_0 \in Z_i$ (which is equivalent to $\mathfrak{m} \supset \mathfrak{q}_i$) we have a surjection

$$S_{\mathfrak{m}} \longrightarrow S_{\mathfrak{m}}/\mathfrak{q}_i S_{\mathfrak{m}} = (S/\mathfrak{q}_i)_{\mathfrak{m}}$$

Moreover, the primes $\mathfrak{q}_i S_{\mathfrak{m}}$ so obtained exhaust the minimal primes of the Noetherian local ring $S_{\mathfrak{m}}$, see Lemma 10.25.3. We conclude, using Lemma 10.110.4, that the dimension of $S_{\mathfrak{m}}$ is the maximum of the dimensions of the Z_i passing through x_0 . To finish the proof of the lemma it suffices to show that we can choose x_0 such that $x_0 \in Z_i \Rightarrow i \in I'$. Because S is Jacobson (as we saw above) it is enough to show that $V(\mathfrak{p}) \setminus T$ (with T as above) is nonempty. And this is clear since it contains the point x (i.e. \mathfrak{p}). \square

Lemma 10.110.6. *Let k be a field. Let S be a finite type k -algebra. Let $X = \text{Spec}(S)$. Let $\mathfrak{m} \subset S$ be a maximal ideal and let $x \in X$ be the associated closed point. Then $\dim_x(X) = \dim(S_{\mathfrak{m}})$.*

Proof. This is a special case of Lemma 10.110.5. \square

Lemma 10.110.7. *Let k be a field. Let S be a finite type k algebra. Assume that S is Cohen-Macaulay. Then $\text{Spec}(S) = \coprod T_d$ is a finite disjoint union of open and closed subsets T_d with T_d equidimensional (see Topology, Definition 5.9.4) of dimension d . Equivalently, S is a product of rings S_d , $d = 0, \dots, \dim(S)$ such that every maximal ideal \mathfrak{m} of S_d has height d .*

Proof. The equivalence of the two statements follows from Lemma 10.22.3. Let $\mathfrak{m} \subset S$ be a maximal ideal. Every maximal chain of primes in $S_{\mathfrak{m}}$ has the same length equal to $\dim(S_{\mathfrak{m}})$, see Lemma 10.100.3. Hence, the dimension of the irreducible components passing through the point corresponding to \mathfrak{m} all have dimension equal to $\dim(S_{\mathfrak{m}})$, see Lemma 10.110.4. Since $\text{Spec}(S)$ is a Jacobson topological space the intersection of any two irreducible components of it contains a closed point if nonempty, see Lemmas 10.34.2 and 10.34.4. Thus we have shown that any two irreducible components that meet have the same dimension. The lemma follows easily from this, and the fact that $\text{Spec}(S)$ has a finite number of irreducible components (see Lemmas 10.30.3 and 10.30.5). \square

10.111. Noether normalization

In this section we prove variants of the Noether normalization lemma. The key ingredient we will use is contained in the following two lemmas.

Lemma 10.111.1. *Let $n \in \mathbf{N}$. Let N be a finite nonempty set of multi-indices $\nu = (\nu_1, \dots, \nu_n)$. Given $e = (e_1, \dots, e_n)$ we set $e \cdot \nu = \sum e_i \nu_i$. Then for $e_1 \gg e_2 \gg \dots \gg e_{n-1} \gg e_n$ we have: If $\nu, \nu' \in N$ then*

$$(e \cdot \nu = e \cdot \nu') \Leftrightarrow (\nu = \nu')$$

Proof. Say $N = \{\nu_j\}$ with $\nu_j = (\nu_{j1}, \dots, \nu_{jn})$. Let $A_i = \max_j \nu_{ji} - \min_j \nu_{ji}$. If for each i we have $e_{i-1} > A_i e_i + A_{i+1} e_{i+1} + \dots + A_n e_n$ then the lemma holds. For suppose that $e \cdot (\nu - \nu') = 0$. Then for $n \geq 2$,

$$e_1(\nu_1 - \nu'_1) = \sum_{i=2}^n e_i(\nu'_i - \nu_i).$$

We may assume that $(\nu_1 - \nu'_1) \geq 0$. If $(\nu_1 - \nu'_1) > 0$, then

$$e_1(\nu_1 - \nu'_1) \geq e_1 > A_2 e_2 + \dots + A_n e_n \geq \sum_{i=2}^n e_i |\nu'_i - \nu_i| \geq \sum_{i=2}^n e_i (\nu'_i - \nu_i).$$

This contradiction implies that $\nu'_1 = \nu_1$. By induction, $\nu'_i = \nu_i$ for $2 \leq i \leq n$. \square

Lemma 10.111.2. *Let R be a ring. Let $g \in R[x_1, \dots, x_n]$ be an element which is nonconstant, i.e., $g \notin R$. For $e_1 \gg e_2 \gg \dots \gg e_{n-1} \gg e_n = 1$ the polynomial*

$$g(x_1 + x_n^{e_1}, x_2 + x_n^{e_2}, \dots, x_{n-1} + x_n^{e_{n-1}}, x_n) = ax_n^d + \text{lower order terms in } x_n$$

where $d > 0$ and $a \in R$ is one of the nonzero coefficients of g .

Proof. Write $g = \sum_{\nu \in N} a_{\nu} x^{\nu}$ with $a_{\nu} \in R$ not zero. Here N is a finite set of multi-indices as in Lemma 10.111.1 and $x^{\nu} = x_1^{\nu_1} \dots x_n^{\nu_n}$. Note that the leading term in

$$(x_1 + x_n^{e_1})^{\nu_1} \dots (x_{n-1} + x_n^{e_{n-1}})^{\nu_{n-1}} x_n^{\nu_n} \text{ is } x_n^{e_1 \nu_1 + \dots + e_{n-1} \nu_{n-1} + \nu_n}.$$

Hence the lemma follows from Lemma 10.111.1 which guarantees that there is exactly one nonzero term $a_{\nu} x^{\nu}$ of g which gives rise to the leading term of $g(x_1 + x_n^{e_1}, x_2 + x_n^{e_2}, \dots, x_{n-1} + x_n^{e_{n-1}}, x_n)$, i.e., $a = a_{\nu}$ for the unique $\nu \in N$ such that $e \cdot \nu$ is maximal. \square

Lemma 10.111.3. *Let k be a field. Let $S = k[x_1, \dots, x_n]/I$ for some ideal I . If $I \neq 0$, then there exist $y_1, \dots, y_{n-1} \in k[x_1, \dots, x_n]$ such that S is finite over $k[y_1, \dots, y_{n-1}]$. Moreover we may choose y_i to be in the \mathbf{Z} -subalgebra of $k[x_1, \dots, x_n]$ generated by x_1, \dots, x_n .*

Proof. Pick $f \in I$, $f \neq 0$. It suffices to show the lemma for $k[x_1, \dots, x_n]/(f)$ since S is a quotient of that ring. We will take $y_i = x_i - x_n^{e_i}$, $i = 1, \dots, n-1$ for suitable integers e_i . When does this work? It suffices to show that $\overline{x_n} \in k[x_1, \dots, x_n]/(f)$ is integral over the ring $k[y_1, \dots, y_{n-1}]$. The equation for $\overline{x_n}$ over this ring is

$$f(y_1 + x_n^{e_1}, \dots, y_{n-1} + x_n^{e_{n-1}}, x_n) = 0.$$

Hence we are done if we can show there exists integers e_i such that the leading coefficient with respect to x_n of the equation above is a nonzero element of k . This can be achieved for example by choosing $e_1 \gg e_2 \gg \dots \gg e_{n-1}$, see Lemma 10.111.2. \square

Lemma 10.111.4. *Let k be a field. Let $S = k[x_1, \dots, x_n]/I$ for some ideal I . There exist $r \geq 0$, and $y_1, \dots, y_r \in k[x_1, \dots, x_n]$ such that (a) the map $k[y_1, \dots, y_r] \rightarrow S$ is injective, and (b) the map $k[y_1, \dots, y_r] \rightarrow S$ is finite. In this case the integer r is the dimension of S . Moreover we may choose y_i to be in the \mathbf{Z} -subalgebra of $k[x_1, \dots, x_n]$ generated by x_1, \dots, x_n .*

Proof. By induction on n , with $n = 0$ being trivial. If $I = 0$, then take $r = n$ and $y_i = x_i$. If $I \neq 0$, then choose y_1, \dots, y_{n-1} as in Lemma 10.111.3. Let $S' \subset S$ be the subring generated by the images of the y_i . By induction we can choose r and $z_1, \dots, z_r \in k[y_1, \dots, y_{n-1}]$ such that (a), (b) hold for $k[z_1, \dots, z_r] \rightarrow S'$. Since $S' \rightarrow S$ is injective and finite we see (a), (b) hold for $k[z_1, \dots, z_r] \rightarrow S$. The last assertion follows from Lemma 10.108.4. \square

Lemma 10.111.5. *Let k be a field. Let S be a finite type k algebra and denote $X = \text{Spec}(S)$. Let \mathfrak{q} be a prime of S , and let $x \in X$ be the corresponding point. There exists a $g \in S$, $g \notin \mathfrak{q}$ such that $\dim(S_g) = \dim_x(X) =: d$ and such that there exists a finite injective map $k[y_1, \dots, y_d] \rightarrow S_g$.*

Proof. Note that by definition $\dim_x(X)$ is the minimum of the dimensions of S_g for $g \in S$, $g \notin \mathfrak{q}$, i.e., the minimum is attained. Thus the lemma follows from Lemma 10.111.4. \square

Lemma 10.111.6. *Let k be a field. Let $\mathfrak{q} \subset k[x_1, \dots, x_n]$ be a prime ideal. Set $r = \text{trdeg}_k \kappa(\mathfrak{q})$. Then there exists a finite ring map $\varphi : k[y_1, \dots, y_n] \rightarrow k[x_1, \dots, x_n]$ such that $\varphi^{-1}(\mathfrak{q}) = (y_{r+1}, \dots, y_n)$.*

Proof. By induction on n . The case $n = 0$ is clear. Assume $n > 0$. If $r = n$, then $\mathfrak{q} = (0)$ and the result is clear. Choose a nonzero $f \in \mathfrak{q}$. Of course f is nonconstant. After applying an automorphism of the form

$$k[x_1, \dots, x_n] \longrightarrow k[x_1, \dots, x_n], \quad x_n \mapsto x_n, \quad x_i \mapsto x_i + x_n^{e_i} \quad (i < n)$$

we may assume that f is monic in x_n over $k[x_1, \dots, x_{n-1}]$, see Lemma 10.111.2. Hence the ring map

$$k[y_1, \dots, y_n] \longrightarrow k[x_1, \dots, x_n], \quad y_n \mapsto f, \quad y_i \mapsto x_i \quad (i < n)$$

is finite. Moreover $y_n \in \mathfrak{q} \cap k[y_1, \dots, y_n]$ by construction. Thus $\mathfrak{q} \cap k[y_1, \dots, y_n] = \mathfrak{p}k[y_1, \dots, y_n] + (y_n)$ where $\mathfrak{p} \subset k[y_1, \dots, y_{n-1}]$ is a prime ideal. Note that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite, and hence $r = \text{trdeg}_k \kappa(\mathfrak{p})$. Apply the induction hypothesis to the pair $(k[y_1, \dots, y_{n-1}], \mathfrak{p})$ and we obtain a finite ring map $k[z_1, \dots, z_{n-1}] \rightarrow k[y_1, \dots, y_{n-1}]$ such that $\mathfrak{p} \cap k[z_1, \dots, z_{n-1}] = (z_{r+1}, \dots, z_{n-1})$. We extend the ring

map $k[z_1, \dots, z_{n-1}] \rightarrow k[y_1, \dots, y_{n-1}]$ to a ring map $k[z_1, \dots, z_n] \rightarrow k[y_1, \dots, y_n]$ by mapping z_n to y_n . The composition of the ring maps

$$k[z_1, \dots, z_n] \rightarrow k[y_1, \dots, y_n] \rightarrow k[x_1, \dots, x_n]$$

solves the problem. \square

Lemma 10.111.7. *Let $R \rightarrow S$ be an injective finite type map of domains. Then there exists an integer d and factorization*

$$R \rightarrow R[y_1, \dots, y_d] \rightarrow S' \rightarrow S$$

by injective maps such that S' is finite over $R[y_1, \dots, y_d]$ and such that $S'_f \cong S_f$ for some nonzero $f \in R$.

Proof. Pick $x_1, \dots, x_n \in S$ which generate S over R . Let $K = f.f.(R)$ and $S_K = S \otimes_R K$. By Lemma 10.111.4 we can find $y_1, \dots, y_d \in S$ such that $K[y_1, \dots, y_d] \rightarrow S_K$ is a finite injective map. Note that $y_i \in S$ because we may pick the y_j in the \mathbf{Z} -algebra generated by x_1, \dots, x_n . As a finite ring map is integral (see Lemma 10.35.3) we can find monic $P_i \in K[y_1, \dots, y_d][T]$ such that $P_i(x_i) = 0$ in S_K . Let $f \in R$ be a nonzero element such that $fP_i \in R[y_1, \dots, y_d][T]$ for all i . Set $x'_i = fx_i$ and let $S' \subset S$ be the subalgebra generated by y_1, \dots, y_d and x'_1, \dots, x'_n . Note that x'_i is integral over $R[y_1, \dots, y_d]$ as we have $Q_i(x'_i) = 0$ where $Q_i = f^{\deg_T(P_i)}P_i(T/f)$ which is a monic polynomial in T with coefficients in $R[y_1, \dots, y_d]$ by our choice of f . Hence $R[y_1, \dots, y_n] \subset S'$ is finite by Lemma 10.35.5. By construction $S'_f \cong S_f$ and we win. \square

10.112. Dimension of finite type algebras over fields, reprise

This section is a continuation of Section 10.110. In this section we establish the connection between dimension and transcendence degree over the ground field for finite type domains over a field.

Lemma 10.112.1. *Let k be a field. Let S be a finite type k algebra which is an integral domain. Let $K = f.f.(S)$ be the field of fractions of S . Let $r = \text{trdeg}(K/k)$ be the transcendence degree of K over k . Then $\dim(S) = r$. Moreover, the local ring of S at every maximal ideal has dimension r .*

Proof. We may write $S = k[x_1, \dots, x_n]/\mathfrak{p}$. By Lemma 10.110.3 all local rings of S at maximal ideals have the same dimension. Apply Lemma 10.111.4. We get a finite injective ring map

$$k[y_1, \dots, y_d] \rightarrow S$$

with $d = \dim(S)$. Clearly, $k(y_1, \dots, y_d) \subset K$ is a finite extension and we win. \square

Lemma 10.112.2. *Let k be a field. Let S be a finite type k -algebra. Let $\mathfrak{q} \subset \mathfrak{q}' \subset S$ be distinct prime ideals. Then $\text{trdeg}_k \kappa(\mathfrak{q}') < \text{trdeg}_k \kappa(\mathfrak{q})$.*

Proof. By Lemma 10.112.1 we have $\dim V(\mathfrak{q}) = \text{trdeg}_k \kappa(\mathfrak{q})$ and similarly for \mathfrak{q}' . Hence the result follows as the strict inclusion $V(\mathfrak{q}') \subset V(\mathfrak{q})$ implies a strict inequality of dimensions. \square

The following lemma generalizes Lemma 10.110.6.

Lemma 10.112.3. *Let k be a field. Let S be a finite type k algebra. Let $X = \text{Spec}(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal, and let $x \in X$ be the corresponding point. Then we have*

$$\dim_x(X) = \dim(S_{\mathfrak{p}}) + \text{trdeg}_k \kappa(\mathfrak{p}).$$

Proof. By Lemma 10.112.1 we know that $r = \text{trdeg}_k \kappa(\mathfrak{p})$ is equal to the dimension of $V(\mathfrak{p})$. Pick any maximal chain of primes $\mathfrak{p} \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_r$ starting with \mathfrak{p} in S . This has length r by Lemma 10.110.4. Let $\mathfrak{q}_j, j \in J$ be the minimal primes of S which are contained in \mathfrak{p} . These correspond 1 – 1 to minimal primes in $S_{\mathfrak{p}}$ via the rule $\mathfrak{q}_j \mapsto \mathfrak{q}_j S_{\mathfrak{p}}$. By Lemma 10.110.5 we know that $\dim_x(X)$ is equal to the maximum of the dimensions of the rings S/\mathfrak{q}_j . For each j pick a maximal chain of primes $\mathfrak{q}_j \subset \mathfrak{p}'_1 \subset \dots \subset \mathfrak{p}'_{s(j)} = \mathfrak{p}$. Then $\dim(S_{\mathfrak{p}}) = \max_{j \in J} s(j)$. Now, each chain

$$\mathfrak{q}_j \subset \mathfrak{p}'_1 \subset \dots \subset \mathfrak{p}'_{s(j)} = \mathfrak{p} \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_r$$

is a maximal chain in S/\mathfrak{q}_j , and by what was said before we have $\dim_x(X) = \max_{j \in J} r + s(j)$. The lemma follows. \square

The following lemma says that the codimension of one finite type Spec in another is the difference of heights.

Lemma 10.112.4. *Let k be a field. Let $S' \rightarrow S$ be a surjection of finite type k algebras. Let $\mathfrak{p} \subset S$ be a prime ideal, and let \mathfrak{p}' be the corresponding prime ideal of S' . Let $X = \text{Spec}(S)$, resp. $X' = \text{Spec}(S')$, and let $x \in X$, resp. $x' \in X'$ be the point corresponding to \mathfrak{p} , resp. \mathfrak{p}' . Then*

$$\dim_{x'} X' - \dim_x X = \text{height}(\mathfrak{p}') - \text{height}(\mathfrak{p}).$$

Proof. Immediate from Lemma 10.112.3. \square

Lemma 10.112.5. *Let k be a field. Let S be a finite type k -algebra. Let $k \subset K$ be a field extension. Then $\dim(S) = \dim(K \otimes_k S)$.*

Proof. By Lemma 10.111.4 there exists a finite injective map $k[y_1, \dots, y_d] \rightarrow S$ with $d = \dim(S)$. Since K is flat over k we also get a finite injective map $K[y_1, \dots, y_d] \rightarrow K \otimes_k S$. The result follows from Lemma 10.108.4. \square

Lemma 10.112.6. *Let k be a field. Let S be a finite type k -algebra. Set $X = \text{Spec}(S)$. Let $k \subset K$ be a field extension. Set $S_K = K \otimes_k S$, and $X_K = \text{Spec}(S_K)$. Let $\mathfrak{q} \subset S$ be a prime corresponding to $x \in X$ and let $\mathfrak{q}_K \subset S_K$ be a prime corresponding to $x_K \in X_K$ lying over \mathfrak{q} . Then $\dim_x X = \dim_{x_K} X_K$.*

Proof. Choose a presentation $S = k[x_1, \dots, x_n]/I$. This gives a presentation $K \otimes_k S = K[x_1, \dots, x_n]/(K \otimes_k I)$. Let $\mathfrak{q}'_K \subset K[x_1, \dots, x_n]$, resp. $\mathfrak{q}' \subset k[x_1, \dots, x_n]$ be the corresponding primes. Consider the following commutative diagram of Noetherian local rings

$$\begin{array}{ccc} K[x_1, \dots, x_n]_{\mathfrak{q}'_K} & \longrightarrow & (K \otimes_k S)_{\mathfrak{q}_K} \\ \uparrow & & \uparrow \\ k[x_1, \dots, x_n]_{\mathfrak{q}'} & \longrightarrow & S_{\mathfrak{q}} \end{array}$$

Both vertical arrows are flat because they are localizations of the flat ring maps $S \rightarrow S_K$ and $k[x_1, \dots, x_n] \rightarrow K[x_1, \dots, x_n]$. Moreover, the vertical arrows have the same fibre rings. Hence, we see from Lemma 10.108.7 that $\text{height}(\mathfrak{q}'_K) - \text{height}(\mathfrak{q}') =$

$\text{height}(\mathfrak{q}'_K) - \text{height}(\mathfrak{q}_K)$. Denote $x' \in X' = \text{Spec}(k[x_1, \dots, x_n])$ and $x'_K \in X'_K = \text{Spec}(K[x_1, \dots, x_n])$ the points corresponding to \mathfrak{q}' and \mathfrak{q}'_K . By Lemma 10.112.4 and what we showed above we have

$$\begin{aligned} n - \dim_x X &= \dim_{x'} X' - \dim_x X \\ &= \text{height}(\mathfrak{q}') - \text{height}(\mathfrak{q}) \\ &= \text{height}(\mathfrak{q}'_K) - \text{height}(\mathfrak{q}_K) \\ &= \dim_{x'_K} X'_K - \dim_{x_K} X_K \\ &= n - \dim_{x_K} X_K \end{aligned}$$

and the lemma follows. \square

10.113. Dimension of graded algebras over a field

Here is a basic result.

Lemma 10.113.1. *Let k be a field. Let S be a finitely generated graded algebra over k . Assume $S_0 = k$. Let $P(T) \in \mathbf{Q}[T]$ be the polynomial such that $\dim(S_d) = P(d)$ for all $d \gg 0$. See Proposition 10.57.7. Then*

- (1) *The irrelevant ideal S_+ is a maximal ideal \mathfrak{m} .*
- (2) *Any minimal prime of S is a homogeneous ideal and is contained in $S_+ = \mathfrak{m}$.*
- (3) *We have $\dim(S) = \deg(P) + 1 = \dim_x \text{Spec}(S)$ (with the convention that $\deg(0) = -1$) where x is the point corresponding to the maximal ideal $S_+ = \mathfrak{m}$.*
- (4) *The Hilbert function of the local ring $R = S_{\mathfrak{m}}$ is equal to the Hilbert function of S .*

Proof. The first statement is obvious. The second follows from Lemma 10.55.8. The equality $\dim(S) = \dim_x \text{Spec}(S)$ follows from the fact that every irreducible component passes through x according to (2). Hence we may compute this dimension as the dimension of the local ring $R = S_{\mathfrak{m}}$ with $\mathfrak{m} = S_+$ by Lemma 10.110.6. Since $\mathfrak{m}^d / \mathfrak{m}^{d+1} \cong \mathfrak{m}^d R / \mathfrak{m}^{d+1} R$ we see that the Hilbert function of the local ring R is equal to the Hilbert function of S , which is (4). We conclude the last equality of (3) by Proposition 10.59.8. \square

10.114. Generic flatness

Basically this says that a finite type algebra over a domain becomes flat after inverting a single element of the domain. There are several versions of this result (in increasing order of strength).

Lemma 10.114.1. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume*

- (1) *R is Noetherian,*
- (2) *R is a domain,*
- (3) *$R \rightarrow S$ is of finite type, and*
- (4) *M is a finite type S -module.*

Then there exists a nonzero $f \in R$ such that M_f is a free R_f -module.

Proof. Let K be the fraction field of R . Set $S_K = K \otimes_R S$. This is an algebra of finite type over K . We will argue by induction on $d = \dim(S_K)$ (which is finite

for example by Noether normalization, see Section 10.111). Fix $d \geq 0$. Assume we know that the lemma holds in all cases where $\dim(S_K) < d$.

Suppose given $R \rightarrow S$ and M as in the lemma with $\dim(S_K) = d$. By Lemma 10.61.1 there exists a filtration $0 \subset M_1 \subset M_2 \subset \dots \subset M_n = M$ so that M_i/M_{i-1} is isomorphic to S/\mathfrak{q} for some prime \mathfrak{q} of S . Note that $\dim((S/\mathfrak{q})_K) \leq \dim(S_K)$. Also, note that an extension of free modules is free (see basic notion 50). Thus we may assume $M = S$ and that S is a domain of finite type over R .

If $R \rightarrow S$ has a nontrivial kernel, then take a nonzero $f \in R$ in this kernel. In this case $S_f = 0$ and the lemma holds. (This is really the case $d = -1$ and the start of the induction.) Hence we may assume that $R \rightarrow S$ is a finite type extension of Noetherian domains.

Apply Lemma 10.111.7 and replace R by R_f (with f as in the lemma) to get a factorization

$$R \subset R[y_1, \dots, y_d] \subset S$$

where the second extension is finite. Note that $f.f.(R[y_1, \dots, y_d]) \subset f.f.(S)$ is a finite extension of fields. Choose $z_1, \dots, z_r \in S$ which form a basis for $f.f.(S)$ over $f.f.(R[y_1, \dots, y_d])$. This gives a short exact sequence

$$0 \rightarrow R[y_1, \dots, y_d]^{\oplus r} \xrightarrow{(z_1, \dots, z_r)} S \rightarrow N \rightarrow 0$$

By construction N is a finite $R[y_1, \dots, y_d]$ -module whose support does not contain the generic point (0) of $\text{Spec}(R[y_1, \dots, y_d])$. By Lemma 10.39.5 there exists a nonzero $g \in R[y_1, \dots, y_d]$ such that g annihilates N , so we may view N as a finite module over $S' = R[y_1, \dots, y_d]/(g)$. Since $\dim(S'_K) < d$ by induction there exists a nonzero $f \in R$ such that N_f is a free R_f -module. Since $(R[y_1, \dots, y_d])_f \cong R_f[y_1, \dots, y_d]$ is free also we conclude by the already mentioned fact that an extension of free modules is free. \square

Lemma 10.114.2. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume*

- (1) R is a domain,
- (2) $R \rightarrow S$ is of finite presentation, and
- (3) M is an S -module of finite presentation.

Then there exists a nonzero $f \in R$ such that M_f is a free R_f -module.

Proof. Write $S = R[x_1, \dots, x_n]/(g_1, \dots, g_m)$. For $g \in R[x_1, \dots, x_n]$ denote \bar{g} its image in S . We may write $M = S^{\oplus t}/\sum S n_i$ for some $n_i \in S^{\oplus t}$. Write $n_i = (\bar{g}_{i1}, \dots, \bar{g}_{it})$ for some $g_{ij} \in R[x_1, \dots, x_n]$. Let $R_0 \subset R$ be the subring generated by all the coefficients of all the elements $g_i, g_{ij} \in R[x_1, \dots, x_n]$. Define $S_0 = R_0[x_1, \dots, x_n]/(g_1, \dots, g_m)$. Define $M_0 = S_0^{\oplus t}/\sum S_0 n_i$. Then R_0 is a domain of finite type over \mathbf{Z} and hence Noetherian (see Lemma 10.30.1). Moreover via the injection $R_0 \rightarrow R$ we have $S \cong R \otimes_{R_0} S_0$ and $M \cong R \otimes_{R_0} M_0$. Applying Lemma 10.114.1 we obtain a nonzero $f \in R_0$ such that $(M_0)_f$ is a free $(R_0)_f$ -module. Hence $M_f = R_f \otimes_{(R_0)_f} (M_0)_f$ is a free R_f -module. \square

Lemma 10.114.3. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume*

- (1) R is a domain,
- (2) $R \rightarrow S$ is of finite type, and
- (3) M is a finite type S -module.

Then there exists a nonzero $f \in R$ such that

- (a) M_f and S_f are free as R_f -modules, and
 (b) S_f is a finitely presented R_f -algebra and M_f is a finitely presented S_f -module.

Proof. We first prove the lemma for $S = R[x_1, \dots, x_n]$, and then we deduce the result in general.

Assume $S = R[x_1, \dots, x_n]$. Choose elements m_1, \dots, m_t which generate M . This gives a short exact sequence

$$0 \rightarrow N \rightarrow S^{\oplus t} \xrightarrow{(m_1, \dots, m_t)} M \rightarrow 0.$$

Denote K the fraction field of R . Denote $S_K = K \otimes_R S = K[x_1, \dots, x_n]$, and similarly $N_K = K \otimes_R N$, $M_K = K \otimes_R M$. As $R \rightarrow K$ is flat the sequence remains flat after tensoring with K . As $S_K = K[x_1, \dots, x_n]$ is a Noetherian ring (see Lemma 10.30.1) we can find finitely many elements $n'_1, \dots, n'_s \in N_K$ which generate it. Choose $n_1, \dots, n_r \in N$ such that $n'_i = \sum a_{ij} n_j$ for some $a_{ij} \in K$. Set

$$M' = S^{\oplus t} / \sum_{i=1, \dots, r} S n_i$$

By construction M' is a finitely presented S -module, and there is a surjection $M' \rightarrow M$ which induces an isomorphism $M'_K \cong M_K$. We may apply Lemma 10.114.2 to $R \rightarrow S$ and M' and we find an $f \in R$ such that M'_f is a free R_f -module. Thus $M'_f \rightarrow M_f$ is a surjection of modules over the domain R_f where the source is a free module and which becomes an isomorphism upon tensoring with K . Thus it is injective as $M'_f \subset M'_K$ as it is free over the domain R_f . Hence $M'_f \rightarrow M_f$ is an isomorphism and the result is proved.

For the general case, choose a surjection $R[x_1, \dots, x_n] \rightarrow S$. Think of both S and M as finite modules over $R[x_1, \dots, x_n]$. By the special case proved above there exists a nonzero $f \in R$ such that both S_f and M_f are free as R_f -modules and finitely presented as $R_f[x_1, \dots, x_n]$ -modules. Clearly this implies that S_f is a finitely presented R_f -algebra and that M_f is a finitely presented S_f -module. \square

Let $R \rightarrow S$ be a ring map. Let M be an S -module. Consider the following condition on an element $f \in R$:

$$(10.114.3.1) \quad \begin{cases} S_f & \text{is of finite presentation over } R_f \\ M_f & \text{is of finite presentation as } S_f\text{-module} \\ S_f, M_f & \text{are free as } R_f\text{-modules} \end{cases}$$

We define

$$(10.114.3.2) \quad U(R \rightarrow S, M) = \bigcup_{f \in R \text{ with } (10.114.3.1)} D(f)$$

which is an open subset of $\text{Spec}(R)$.

Lemma 10.114.4. *Let $R \rightarrow S$ be a ring map. Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a short exact sequence of S -modules. Then*

$$U(R \rightarrow S, M_1) \cap U(R \rightarrow S, M_3) \subset U(R \rightarrow S, M_2).$$

Proof. Let $u \in U(R \rightarrow S, M_1) \cap U(R \rightarrow S, M_3)$. Choose $f_1, f_3 \in R$ such that $u \in D(f_1)$, $u \in D(f_3)$ and such that (10.114.3.1) holds for f_1 and M_1 and for f_3 and M_3 . Then set $f = f_1 f_3$. Then $u \in D(f)$ and (10.114.3.1) holds for f and both M_1 and M_3 . An extension of free modules is free, and an extension of

finitely presented modules is finitely presented (Lemma 10.5.3). Hence we see that (10.114.3.1) holds for f and M_2 . Thus $u \in U(R \rightarrow S, M_2)$ and we win. \square

Lemma 10.114.5. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Let $f \in R$. Using the identification $\text{Spec}(R_f) = D(f)$ we have $U(R_f \rightarrow S_f, M_f) = D(f) \cap U(R \rightarrow S, M)$.*

Proof. Suppose that $u \in U(R_f \rightarrow S_f, M_f)$. Then there exists an element $g \in R_f$ such that $u \in D(g)$ and such that (10.114.3.1) holds for the pair $((R_f)_g \rightarrow (S_f)_g, (M_f)_g)$. Write $g = a/f^n$ for some $a \in R$. Set $h = af$. Then $R_h = (R_f)_g$, $S_h = (S_f)_g$, and $M_h = (M_f)_g$. Moreover $u \in D(h)$. Hence $u \in U(R \rightarrow S, M)$. Conversely, suppose that $u \in D(f) \cap U(R \rightarrow S, M)$. Then there exists an element $g \in R$ such that $u \in D(g)$ and such that (10.114.3.1) holds for the pair $(R_g \rightarrow S_g, M_g)$. Then it is clear that (10.114.3.1) also holds for the pair $(R_{fg} \rightarrow S_{fg}, M_{fg}) = ((R_f)_g \rightarrow (S_f)_g, (M_f)_g)$. Hence $u \in U(R_f \rightarrow S_f, M_f)$ and we win. \square

Lemma 10.114.6. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Let $U \subset \text{Spec}(R)$ be a dense open. Assume there is a covering $U = \bigcup_{i \in I} D(f_i)$ of opens such that $U(R_{f_i} \rightarrow S_{f_i}, M_{f_i})$ is dense in $D(f_i)$ for each $i \in I$. Then $U(R \rightarrow S, M)$ is dense in $\text{Spec}(R)$.*

Proof. In view of Lemma 10.114.5 this is a purely topological statement. Namely, by that lemma we see that $U(R \rightarrow S, M) \cap D(f_i)$ is dense in $D(f_i)$ for each $i \in I$. By Topology, Lemma 5.20.4 we see that $U(R \rightarrow S, M) \cap U$ is dense in U . Since U is dense in $\text{Spec}(R)$ we conclude that $U(R \rightarrow S, M)$ is dense in $\text{Spec}(R)$. \square

Lemma 10.114.7. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume*

- (1) $R \rightarrow S$ is of finite type,
- (2) M is a finite S -module, and
- (3) R is reduced.

Then there exists a subset $U \subset \text{Spec}(R)$ such that

- (1) U is open and dense in $\text{Spec}(R)$,
- (2) for every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that we have
 - (a) M_f and S_f are free over R_f ,
 - (b) S_f is a finitely presented R_f -algebra, and
 - (c) M_f is a finitely presented S_f -module.

Proof. Note that the lemma is equivalent to the statement that the open $U(R \rightarrow S, M)$, see Equation (10.114.3.2), is dense in $\text{Spec}(R)$. We first prove the lemma for $S = R[x_1, \dots, x_n]$, and then we deduce the result in general.

Proof of the case $S = R[x_1, \dots, x_n]$ and M any finite module over S . Note that in this case $S_f = R_f[x_1, \dots, x_n]$ is free and of finite presentation over R_f , so we do not have to worry about the conditions regarding S , only those that concern M . We will use induction on n .

There exists a finite filtration

$$0 \subset M_1 \subset M_2 \subset \dots \subset M_t = M$$

such that $M_i/M_{i-1} \cong S/J_i$ for some ideal $J_i \subset S$, see Lemma 10.5.4. Since a finite intersection of dense opens is dense open, we see from Lemma 10.114.4 that

it suffices to prove the lemma for each of the modules R/J_i . Hence we may assume that $M = S/J$ for some ideal J of $S = R[x_1, \dots, x_n]$.

Let $I \subset R$ be the ideal generated by the coefficients of elements of J . Let $U_1 = \text{Spec}(R) \setminus V(I)$ and let

$$U_2 = \text{Spec}(R) \setminus \overline{U_1}.$$

Then it is clear that $U = U_1 \cup U_2$ is dense in $\text{Spec}(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_1$ or (b) $D(f) \subset U_2$. If for any such f the lemma holds for the pair $(R_f \rightarrow R_f[x_1, \dots, x_n], M_f)$ then by Lemma 10.114.6 we see that $U(R \rightarrow S, M)$ is dense in $\text{Spec}(R)$. Hence we may assume either (a) $I = R$, or (b) $V(I) = \text{Spec}(R)$.

In case (b) we actually have $I = 0$ as R is reduced! Hence $J = 0$ and $M = S$ and the lemma holds in this case.

In case (a) we have to do a little bit more work. Note that every element of I is actually the coefficient of a monomial of an element of J , because the set of coefficients of elements of J forms an ideal (details omitted). Hence we find an element

$$g = \sum_{K \in E} a_K x^K \in J$$

where E is a finite set of multi-indices $K = (k_1, \dots, k_n)$ with at least one coefficient a_{K_0} a unit in R . Actually we can find one which has a coefficient equal to 1 as $1 \in I$ in case (a). Let $m = \#\{K \in E \mid a_K \text{ is not a unit}\}$. Note that $0 \leq m \leq \#E - 1$. We will argue by induction on m .

The case $m = 0$. In this case all the coefficients a_K , $K \in E$ of g are units and $E \neq \emptyset$. If $E = \{K_0\}$ is a singleton and $K_0 = (0, \dots, 0)$, then g is a unit and $J = S$ so the result holds for sure. (This happens in particular when $n = 0$ and it provides the base case of the induction on n .) If not $E = \{(0, \dots, 0)\}$, then at least one K is not equal to $(0, \dots, 0)$, i.e., $g \notin R$. At this point we employ the usual trick of Noether normalization. Namely, we consider

$$G(y_1, \dots, y_n) = g(y_1 + y_n^{e_1}, y_2 + y_n^{e_2}, \dots, y_{n-1} + y_n^{e_{n-1}}, y_n)$$

with $0 \ll e_{n-1} \ll e_{n-2} \ll \dots \ll e_1$. By Lemma 10.111.2 it follows that $G(y_1, \dots, y_n)$ as a polynomial in y_n looks like

$$a_K y_n^{k_n + \sum_{i=1, \dots, n-1} e_i k_i} + \text{lower order terms in } y_n$$

As a_K is a unit we conclude that $M = R[x_1, \dots, x_n]/J$ is finite over $R[y_1, \dots, y_{n-1}]$. Hence $U(R \rightarrow R[x_1, \dots, x_n], M) = U(R \rightarrow R[y_1, \dots, y_{n-1}], M)$ and we win by induction on n .

The case $m > 0$. Pick a multi-index $K \in E$ such that a_K is not a unit. As before set $U_1 = \text{Spec}(R_{a_K}) = \text{Spec}(R) \setminus V(a_K)$ and set

$$U_2 = \text{Spec}(R) \setminus \overline{U_1}.$$

Then it is clear that $U = U_1 \cup U_2$ is dense in $\text{Spec}(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_1$ or (b) $D(f) \subset U_2$. If for any such f the lemma holds for the pair $(R_f \rightarrow R_f[x_1, \dots, x_n], M_f)$ then by Lemma 10.114.6 we see that $U(R \rightarrow S, M)$ is dense in $\text{Spec}(R)$. Hence we may assume either (a) $a_K R = R$, or (b) $V(a_K) = \text{Spec}(R)$. In case (a) the number m drops, as a_K has turned into a unit. In case (b), since R is reduced, we conclude that $a_K = 0$. Hence the set E decreases so the number m drops as well. In both cases we win by induction on m .

At this point we have proven the lemma in case $S = R[x_1, \dots, x_n]$. Assume that $(R \rightarrow S, M)$ is an arbitrary pair satisfying the conditions of the lemma. Choose a surjection $R[x_1, \dots, x_n] \rightarrow S$. Observe that, with the notation introduced in (10.114.3.2), we have

$$U(R \rightarrow S, M) = U(R \rightarrow R[x_1, \dots, x_n], S) \cap U(R \rightarrow R[x_1, \dots, x_n], S)$$

Hence as we've just finished proving the right two opens are dense also the open on the left is dense. \square

10.115. Around Krull-Akizuki

One application of Krull-Akizuki is to show that there are plenty of discrete valuation rings. More generally in this section we show how to construct discrete valuation rings dominating Noetherian local rings.

First we show how to dominate a Noetherian local domain by a 1-dimensional Noetherian local domain by blowing up the maximal ideal.

Lemma 10.115.1. *Let R be a local Noetherian domain with fraction field K . Assume R is not a field. Then there exist $R \subset R' \subset K$ with*

- (1) R' local Noetherian of dimension 1,
- (2) $R \rightarrow R'$ a local ring map, i.e., R' dominates R , and
- (3) $R \rightarrow R'$ essentially of finite type.

Proof. Choose any valuation ring $A \subset K$ dominating R (which exist by Lemma 10.48.2). Denote v the corresponding valuation. Let x_1, \dots, x_r be a minimal set of generators of the maximal ideal \mathfrak{m} of R . We may and do assume that $v(x_r) = \min\{v(x_1), \dots, v(x_r)\}$. Consider the ring

$$S = R[x_1/x_r, x_2/x_r, \dots, x_{r-1}/x_r] \subset K.$$

Note that $\mathfrak{m}S = x_r S$ is a principal ideal. Note that $S \subset A$ and that $v(x_r) > 0$, hence we see that $x_r S \neq S$. Choose a minimal prime \mathfrak{q} over $x_r S$. Then $\text{height}(\mathfrak{q}) = 1$ by Lemma 10.59.10 and \mathfrak{q} lies over \mathfrak{m} . Hence we see that $R' = S_{\mathfrak{q}}$ is a solution. \square

The spectrum of the ring R' in the following lemma is really the blow up of $\text{Spec}(R)$ in the maximal ideal of R (at least if case R is reduced).

Lemma 10.115.2. *Let R be a local ring with maximal ideal \mathfrak{m} . Assume R is Noetherian, dimension 1 and that $\dim(\mathfrak{m}/\mathfrak{m}^2) > 1$. Then there exists a ring map $R \rightarrow R'$ such that*

- (1) $R \rightarrow R'$ is finite,
- (2) $R \rightarrow R'$ is not an isomorphism, and
- (3) for every $f \in \mathfrak{m}$ the map $R_f \rightarrow R'_f$ is an isomorphism.

Proof. If \mathfrak{m} is an associated prime of R then we can take $R' = R/I$ with $I = \{x \in R \mid \mathfrak{m}x = 0\}$. Hence we may assume that $\text{depth}(R) = 1$. In other words, we may assume R is Cohen-Macaulay.

Denote $\kappa = R/\mathfrak{m}$ the residue field of R . Consider the graded κ -algebra $S = \bigoplus_{d \geq 0} \mathfrak{m}^d/\mathfrak{m}^{d+1}$. This is a Noetherian ring, and hence has finitely many minimal primes \mathfrak{q}_j . Since the dimension of R is 1 we know the Hilbert function of R is eventually constant, see Proposition 10.59.8. Hence there exists an integer $d_0 \geq 0$ and an integer $r > 0$ such that $\dim_{\kappa}(\mathfrak{m}^d/\mathfrak{m}^{d+1}) = r$ for all $d \geq d_0$. By Lemma

10.113.1 we have $\dim(S) = 1$ and each \mathfrak{q}_i is a homogeneous prime ideal. Note that $\dim(S) = 1$ implies none of the \mathfrak{q}_i is equal to S_+ . Hence by Lemma 10.55.6 we may choose $f \in S_+$ homogeneous not contained in any \mathfrak{q}_j . Then $\dim(S/fS) = 0$. This implies that $\dim_\kappa(S/fS) < \infty$, see for example Lemma 10.111.4. Hence we see that $fS_n = S_{n+\deg(f)}$ for all $n \gg 0$.

Set $d = \deg(f)$. Choose $x \in \mathfrak{m}^d$ which maps to f . Note that since $fS_n = S_{n+d}$ for $n \gg 0$ we have $x\mathfrak{m}^n = \mathfrak{m}^{n+d}$ by Nakayama's Lemma 10.19.1 for $n \gg 0$. Hence $\mathfrak{m} = \sqrt{(x)}$. Since R is Cohen-Macaulay this implies that x is a nonzerodivisor. Choose generators x_1, \dots, x_t of \mathfrak{m}^d as an ideal of R . Set

$$R' = R[x_1/x, x_2/x, \dots, x_t/x] \subset R[1/x].$$

Note that since x is a nonzerodivisor we have $R \subset R'$. Since $\mathfrak{m} = \sqrt{(x)}$ we see that x is invertible in R_g for any $g \in \mathfrak{m}$, whence (3).

We claim that R' is finite over R . Namely, choose n such that $x\mathfrak{m}^{nd} = \mathfrak{m}^{(n+1)d}$. Then we can write $x_i^{n+1} = x f_i(x_1, \dots, x_t)$ with $f_i \in R[X_1, \dots, X_t]$ homogeneous of degree n . Hence we see that

$$(x_i/x)^{n+1} = f_i(x_1/x, \dots, x_t/x)$$

in R' with the right hand side of degree $\leq n$. Hence any element in R' can be expressed as a sum of $(x_1/x)^{i_1} \dots (x_t/x)^{i_t}$ with $i_j \leq n$. This proves that R' is finite over R .

Finally we show that $R \neq R'$. We argue by contradiction. Suppose $R' = R$. This means that $x_1/x, \dots, x_t/x \in R$ for all i . In other words this means that $\mathfrak{m}^d = (x)$. Choose $y_1, \dots, y_s \in \mathfrak{m}$ a minimal generating set. The assumption of the lemma implies $s \geq 2$. For some $i_1, \dots, i_s \geq 0$, $\sum i_j = d$ we have $x = uy_1^{i_1} \dots y_s^{i_s}$ for some unit u in R . We may assume $i_1 > 0$. Then

$$y_1^{i_1-1} y_2^{i_2+1} y_3^{i_3} \dots y_s^{i_s} \in \mathfrak{m}^d$$

is a multiple of x hence a multiple of $y_1^{i_1} \dots y_s^{i_s}$. Hence we see that $y_2/y_1 \in R$. This is a contradiction with the minimality of y_1, \dots, y_s . \square

Example 10.115.3. Consider the Noetherian local ring

$$R = k[[x, y]]/(y^2)$$

It has dimension 1 and it is Cohen-Macaulay. The result of applying the procedure of Lemma 10.115.2 to R is the extension

$$k[[x, y]]/(y^2) \subset k[[x, z]]/(z^2), \quad y \mapsto xz$$

in other words it is gotten by adjoining y/x to R . The effect of repeating the construction $n > 1$ times is to adjoin the element y/x^n .

Example 10.115.4. Let k be a field of characteristic $p > 0$ such that k has infinite degree over its subfield k^p of p th powers. For example $k = \mathbf{F}_p(t_1, t_2, t_3, \dots)$. Consider the ring

$$A = \left\{ \sum a_i x^i \in k[[x]] \text{ such that } [k^p(a_0, a_1, a_2, \dots) : k^p] < \infty \right\}$$

Then A is a discrete valuation ring and its completion is $A^\wedge = k[[x]]$. Note that the field extension $f.f.(A) \subset f.f.(k[[x]])$ is infinite purely inseparable. Choose any

$f \in k[[x]]$, $f \notin A$. Let $R = A[f] \subset k[[x]]$. Then R is a Noetherian local domain of dimension 1 whose completion R^\wedge is nonreduced (think!).

Remark 10.115.5. Suppose that R is a 1-dimensional semi-local Noetherian domain. If there is a maximal ideal $\mathfrak{m} \subset R$ such that $R_{\mathfrak{m}}$ is not regular, then we may apply the procedure of (the proof of) Lemma 10.115.2 to (R, \mathfrak{m}) to get a finite ring extension $R \subset R_1$. (Note that $\text{Spec}(R_1) \rightarrow \text{Spec}(R)$ is the blow up of $\text{Spec}(R)$ in the ideal \mathfrak{m} .) Of course R_1 is a 1-dimensional semi-local Noetherian domain with the same fraction field as R . If R_1 is not a regular semi-local ring, then we may repeat the construction to get $R_1 \subset R_2$. Thus we get a sequence

$$R \subset R_1 \subset R_2 \subset R_3 \subset \dots$$

of finite ring extensions which may stop if R_n is regular for some n . Resolution of singularities would be the claim that eventually R_n is indeed regular. In reality this is not the case. Namely, there exists a characteristic 0 Noetherian local domain A of dimension 1 whose completion is nonreduced, see [FR70, Proposition 3.1] or our Examples, Section 82.15. For an example in characteristic $p > 0$ see Example 10.115.4. Since the construction of blowing up commutes with completion it is easy to see the sequence never stabilizes. See [Ben73] for a discussion (mostly in positive characteristic). On the other hand, if the completion of R in all of its maximal ideals is reduced, then the procedure stops (insert future reference here).

Lemma 10.115.6. *Let A be a ring. The following are equivalent.*

- (1) *The ring A is a discrete valuation ring.*
- (2) *The ring A is a valuation ring and Noetherian.*
- (3) *The ring A is a regular local ring of dimension 1.*
- (4) *The ring A is a Noetherian local domain with maximal ideal \mathfrak{m} generated by a single nonzero element.*
- (5) *The ring A is a Noetherian local normal domain of dimension 1.*

In this case if π is a generator of the maximal ideal of A , then every element of A can be uniquely written as $u\pi^n$, where $u \in A$ is a unit.

Proof. The equivalence of (1) and (2) is Lemma 10.48.18. Moreover, in the proof of Lemma 10.48.18 we saw that if A is a discrete valuation ring, then A is a PID, hence (3). Note that a regular local ring is a domain (see Lemma 10.102.2). Using this the equivalence of (3) and (4) follows from dimension theory, see Section 10.59.

Assume (3) and let π be a generator of the maximal ideal \mathfrak{m} . For all $n \geq 0$ we have $\dim_{A/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1} = 1$ because it is generated by π^n (and it cannot be zero). In particular $\mathfrak{m}^n = (\pi^n)$ and the graded ring $\bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is isomorphic to the polynomial ring $A/\mathfrak{m}[T]$. For $x \in A \setminus \{0\}$ define $v(x) = \max\{n \mid x \in \mathfrak{m}^n\}$. In other words $x = u\pi^{v(x)}$ with $u \in A^*$. By the remarks above we have $v(xy) = v(x) + v(y)$ for all $x, y \in A \setminus \{0\}$. We extend this to the field of fractions K of A by setting $v(a/b) = v(a) - v(b)$ (well defined by multiplicativity shown above). Then it is clear that A is the set of elements of K which have valuation ≥ 0 . Hence we see that A is a valuation ring by Lemma 10.48.16.

A valuation ring is a normal domain by Lemma 10.48.10. Hence we see that the equivalent conditions (1) – (3) imply (5). Assume (5). Suppose that \mathfrak{m} cannot be generated by 1 element to get a contradiction. Then Lemma 10.115.2 implies there is a finite ring map $A \rightarrow A'$ which is an isomorphism after inverting any nonzero

element of \mathfrak{m} but not an isomorphism. In particular $A' \subset f.f.(A)$. Since $A \rightarrow A'$ is finite it is integral (see Lemma 10.35.3). Since A is normal we get $A = A'$ a contradiction. \square

Definition 10.115.7. Let A be a discrete valuation ring. A *uniformizer* is an element $\pi \in A$ which generates the maximal ideal of A .

By Lemma 10.115.6 any two uniformizers of a discrete valuation ring are associates.

Lemma 10.115.8. Let R be a domain with fraction field K . Let M be an R -submodule of $K^{\oplus r}$. Assume R is local Noetherian of dimension 1. For any nonzero $x \in R$ we have $\text{length}_R(R/xR) < \infty$ and

$$\text{length}_R(M/xM) \leq r \cdot \text{length}_R(R/xR).$$

Proof. If x is a unit then the result is true. Hence we may assume $x \in \mathfrak{m}$ the maximal ideal of R . Since x is not zero and R is a domain we have $\dim(R/xR) = 0$, and hence R/xR has finite length. Consider $M \subset K^{\oplus r}$ as in the lemma. We may assume that the elements of M generate $K^{\oplus r}$ as a K -vector space after replacing $K^{\oplus r}$ by a smaller subspace if necessary.

Suppose first that M is a finite R -module. In that case we can clear denominators and assume $M \subset R^{\oplus r}$. Since M generates $K^{\oplus r}$ as a vectors space we see that $R^{\oplus r}/M$ has finite length. In particular there exists an integer $c \geq 0$ such that $x^c R^{\oplus r} \subset M$. Note that $M \supset xM \supset x^2M \supset \dots$ is a sequence of modules with successive quotients each isomorphic to M/xM . Hence we see that

$$n \text{length}_R(M/xM) = \text{length}_R(M/x^n M).$$

The same argument for $M = R^{\oplus r}$ shows that

$$n \text{length}_R(R^{\oplus r}/xR^{\oplus r}) = \text{length}_R(R^{\oplus r}/x^n R^{\oplus r}).$$

By our choice of c above we see that $x^n M$ is sandwiched between $x^n R^{\oplus r}$ and $x^{n+c} R^{\oplus r}$. This easily gives that

$$r(n+c) \text{length}_R(R/xR) \geq n \text{length}_R(M/xM) \geq r(n-c) \text{length}_R(R/xR)$$

Hence in the finite case we actually get the result of the lemma with equality.

Suppose now that M is not finite. Suppose that the length of M/xM is $\geq k$ for some natural number k . Then we can find

$$0 \subset N_0 \subset N_1 \subset N_2 \subset \dots \subset N_k \subset M/xM$$

with $N_i \neq N_{i+1}$ for $i = 0, \dots, k-1$. Choose an element $m_i \in M$ whose congruence class mod xM falls into N_i but not into N_{i-1} for $i = 1, \dots, k$. Consider the finite R -module $M' = Rm_1 + \dots + Rm_k \subset M$. Let $N'_i \subset M'/xM'$ be the inverse image of N_i . It is clear that $N'_i \neq N'_{i+1}$ by our choice of m_i . Hence we see that $\text{length}_R(M'/xM') \geq k$. By the finite case we conclude $k \leq r \text{length}_R(R/xR)$ as desired. \square

Here is a first application.

Lemma 10.115.9. Let $R \rightarrow S$ be a homomorphism of domains inducing an injection of fraction fields $K \subset L$. If R is Noetherian local of dimension 1 and $[L : K] < \infty$ then

- (1) each prime ideal \mathfrak{n}_i of S lying over the maximal ideal \mathfrak{m} of R is maximal,

- (2) *there are finitely many of these, and*
 (3) $[\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m})] < \infty$ *for each i .*

Proof. Pick $x \in \mathfrak{m}$ nonzero. Apply Lemma 10.115.8 to the submodule $S \subset L \cong K^{\oplus n}$ where $n = [L : K]$. Thus the ring S/xS has finite length over R . It follows that $S/\mathfrak{m}S$ has finite length over $\kappa(\mathfrak{m})$. In other words, $\dim_{\kappa(\mathfrak{m})} S/\mathfrak{m}S$ is finite (Lemma 10.50.6). Thus $S/\mathfrak{m}S$ is Artinian (Lemma 10.51.2). The structural results on Artinian rings implies parts (1) and (2), see for example Lemma 10.51.6. Part (3) is implied by the finiteness established above. \square

Lemma 10.115.10. *Let R be a domain with fraction field K . Let M be an R -submodule of $K^{\oplus r}$. Assume R is Noetherian of dimension 1. For any nonzero $x \in R$ we have $\text{length}_R(M/xM) < \infty$.*

Proof. Since R has dimension 1 we see that x is contained in finitely many primes $\mathfrak{m}_i, i = 1, \dots, n$, each maximal. Since R is Noetherian we see that R/xR is Artinian, see Proposition 10.59.6. Hence R/xR is a quotient of $\prod R/\mathfrak{m}_i^{e_i}$ for certain e_i because that $\mathfrak{m}_1^{e_1} \dots \mathfrak{m}_n^{e_n} \subset (x)$ for suitably large e_i as R/xR is Artinian (see Section 10.51). Hence M/xM similarly decomposes as a product $\prod (M/xM)_{\mathfrak{m}_i} = \prod M/(\mathfrak{m}_i^{e_i}, x)M$ of its localizations at the \mathfrak{m}_i . By Lemma 10.115.8 applied to $M_{\mathfrak{m}_i}$ over $R_{\mathfrak{m}_i}$ we see each $M_{\mathfrak{m}_i}/xM_{\mathfrak{m}_i} = (M/xM)_{\mathfrak{m}_i}$ has finite length over $R_{\mathfrak{m}_i}$. It easily follows that M/xM has finite length over R . \square

Lemma 10.115.11 (Krull-Akizuki). *Let R be a domain with fraction field K . Let $K \subset L$ be a finite extension of fields. Assume R is Noetherian and $\dim(R) = 1$. In this case any ring A with $R \subset A \subset L$ is Noetherian.*

Proof. To begin we may assume that L is the fraction field of A by replacing L by the fraction field of A if necessary. Let $I \subset A$ be an ideal. Clearly I generates L as a K -vector space. Hence we see that $I \cap R \neq (0)$. Pick any nonzero $x \in I \cap R$. Then we get $I/xA \subset A/xA$. By Lemma 10.115.10 the R -module A/xA has finite length as an R -module. Hence I/xA has finite length as an R -module. Hence I is finitely generated as an ideal in A . \square

Lemma 10.115.12. *Let R be a Noetherian local domain with fraction field K . Assume that R is not a field. Let $K \subset L$ be a finitely generated field extension. Then there exists discrete valuation ring A with fraction field L which dominates R .*

Proof. If L is not finite over K choose a transcendence basis x_1, \dots, x_r of L over K and replace R by $R[x_1, \dots, x_r]$ localized at the maximal ideal generated by \mathfrak{m}_R and x_1, \dots, x_r . Thus we may assume $K \subset L$ finite.

By Lemma 10.115.1 we may assume $\dim(R) = 1$.

Let $A \subset L$ be the integral closure of R in L . By Lemma 10.115.11 this is Noetherian. By Lemma 10.35.15 there is a prime ideal $\mathfrak{q} \subset A$ lying over the maximal ideal of R . By Lemma 10.115.6 the ring $A_{\mathfrak{q}}$ is a discrete valuation ring dominating R as desired. \square

10.116. Factorization

Here are some notions and relations between them that are typically taught in a first year course on algebra at the undergraduate level.

Definition 10.116.1. Let R be a domain.

- (1) Elements $x, y \in R$ are called *associates* if there exists a unit $u \in R^*$ such that $x = uy$.
- (2) An element $x \in R$ is called *irreducible* if it is nonzero, not a unit and whenever $x = yz$, $y, z \in R$, then y is either a unit or an associate of x .
- (3) An element $x \in R$ is called *prime* if the ideal generated by x is a prime ideal.

Lemma 10.116.2. Let R be a domain. Let $x, y \in R$. Then x, y are associates if and only if $(x) = (y)$.

Proof. If $x = uy$ for some unit $u \in R$, then $(x) \subset (y)$ and $y = u^{-1}x$ so also $(y) \subset (x)$. Conversely, suppose that $(x) = (y)$. Then $x = fy$ and $y = gx$ for some $f, g \in A$. Then $x = fgx$ and since R is a domain $fg = 1$. Thus x and y are associates. \square

Lemma 10.116.3. Let R be a domain. Consider the following conditions:

- (1) The ring R satisfies the ascending chain condition for principal ideals.
- (2) Every nonzero, nonunit element $a \in R$ has a factorization $a = b_1 \dots b_k$ with each b_i an irreducible element of R .

Then (1) implies (2).

Proof. Let x be a nonzero element, not a unit, which does not have a factorization into irreducibles. Set $x_1 = x$. We can write $x = yz$ where neither y nor z is irreducible or a unit. Then either y does not have a factorization into irreducibles, in which case we set $x_2 = y$, or z does not have a factorization into irreducibles, in which case we set $x_2 = z$. Continuing in this fashion we find a sequence

$$x_1 | x_2 | x_3 | \dots$$

of elements of R with x_n/x_{n+1} not a unit. This gives a strictly increasing sequence of principal ideals $(x_1) \subset (x_2) \subset (x_3) \subset \dots$ thereby finishing the proof. \square

Definition 10.116.4. A *unique factorization domain*, abbreviated *UFD*, is a domain R such that if $x \in R$ is a nonzero, nonunit, then x has a factorization into irreducibles, and if

$$x = a_1 \dots a_m = b_1 \dots b_n$$

are factorizations into irreducibles then $n = m$ and there exists a permutation $\sigma : \{1, \dots, n\} \rightarrow \{1, \dots, n\}$ such that a_i and $b_{\sigma(i)}$ are associates.

Lemma 10.116.5. Let R be a domain. Assume every nonzero, nonunit factors into irreducibles. Then R is a UFD if and only if every irreducible element is prime.

Proof. Assume R is a UFD and let $x \in R$ be an irreducible element. Say $ab \in (x)$, i.e., $ab = cx$. Choose factorizations $a = a_1 \dots a_n$, $b = b_1 \dots b_m$, and $c = c_1 \dots c_r$. By uniqueness of the factorization

$$a_1 \dots a_n b_1 \dots b_m = c_1 \dots c_r x$$

we find that x is an associate of one of the elements a_1, \dots, b_m . In other words, either $a \in (x)$ or $b \in (x)$ and we conclude that x is prime.

Assume every irreducible element is prime. We have to prove that factorization into irreducibles is unique up to permutation and taking associates. Say $a_1 \dots a_m = b_1 \dots b_n$ with a_i and b_j irreducible. Since a_1 is prime, we see that $b_j \in (a_1)$ for some

j . After renumbering we may assume $b_1 \in (a_1)$. Then $b_1 = a_1 u$ and since b_1 is irreducible we see that u is a unit. Hence a_1 and b_1 are associates and $a_2 \dots a_n = ub_2 \dots b_m$. By induction on $n + m$ we see that $n = m$ and a_i associate to $b_{\sigma(i)}$ for $i = 2, \dots, n$ as desired. \square

Lemma 10.116.6. *Let R be a Noetherian domain. Then R is a UFD if and only if every height 1 prime ideal is principal.*

Proof. Assume R is a UFD and let \mathfrak{p} be a height 1 prime ideal. Take $x \in \mathfrak{p}$ nonzero and let $x = a_1 \dots a_n$ be a factorization into irreducibles. Since \mathfrak{p} is prime we see that $a_i \in \mathfrak{p}$ for some i . By Lemma 10.116.5 the ideal (a_i) is prime. Since \mathfrak{p} has height 1 we conclude that $(a_i) = \mathfrak{p}$.

Assume every height 1 prime is principal. Since R is Noetherian every nonzero nonunit element x has a factorization into irreducibles, see Lemma 10.116.3. It suffices to prove that an irreducible element x is prime, see Lemma 10.116.5. Let $(x) \subset \mathfrak{p}$ be a prime minimal over (x) . Then \mathfrak{p} has height 1 by Lemma 10.59.10. By assumption $\mathfrak{p} = (y)$. Hence $x = yz$ and z is a unit as x is irreducible. Thus $(x) = (y)$ and we see that x is prime. \square

Lemma 10.116.7 (Nagata's criterion for factoriality). *Let A be a domain. Let $S \subset A$ be a multiplicative subset generated by prime elements. Let $x \in A$ be irreducible. Then*

- (1) *the image of x in $S^{-1}A$ is irreducible or a unit, and*
- (2) *x is prime if and only if the image of x in $S^{-1}A$ is a unit or a prime element in $S^{-1}A$.*

Moreover, then A is a UFD if and only if every element of A has a factorization into irreducibles and $S^{-1}A$ is a UFD.

Proof. Say $x = \alpha\beta$ for $\alpha, \beta \in S^{-1}A$. Then $\alpha = a/s$ and $\beta = b/s'$ for $a, b \in A$, $s, s' \in S$. Thus we get $ss'x = ab$. By assumption we can write $ss' = p_1 \dots p_r$ for some prime elements p_i . For each i the element p_i divides either a or b . Dividing we find a factorization $x = a'b'$ and $a = s''a'$, $b = s'''b'$ for some $s'', s''' \in S$. As x is irreducible, either a' or b' is a unit. Tracing back we find that either α or β is a unit. This proves (1).

Suppose x is prime. Then $A/(x)$ is a domain. Hence $S^{-1}A/xS^{-1}A = S^{-1}(A/(x))$ is a domain or zero. Thus x maps to a prime element or a unit.

Suppose that the image of x in $S^{-1}A$ is a unit. Then $yx = s$ for some $s \in S$ and $y \in A$. By assumption $s = p_1 \dots p_r$ with p_i a prime element. For each i either p_i divides y or p_i divides x . In the second case p_i and x are associates (as x is irreducible) and we are done. But if the first case happens for all $i = 1, \dots, r$, then x is a unit which is a contradiction.

Suppose that the image of x in $S^{-1}A$ is a prime element. Assume $a, b \in A$ and $ab \in (x)$. Then $sa = xy$ or $sb = xy$ for some $s \in S$ and $y \in A$. Say the first case happens. By assumption $s = p_1 \dots p_r$ with p_i a prime element. For each i either p_i divides y or p_i divides x . In the second case p_i and x are associates (as x is irreducible) and we are done. If the first case happens for all $i = 1, \dots, r$, then $a \in (x)$ as desired. This completes the proof of (2).

The final statement of the lemma follows from (1) and (2) and Lemma 10.116.5. \square

Lemma 10.116.8. *A unique factorization domain is normal.*

Proof. Let R be a UFD. Let x be an element of the fraction field of R which is integral over R . Say $x^d - a_1x^{d-1} - \dots - a_d = 0$ with $a_i \in R$. We can write $x = up_1^{e_1} \dots p_r^{e_r}$ with u a unit, $e_i \in \mathbf{Z}$, and p_1, \dots, p_r irreducible elements which are not associates. To prove the lemma we have to show $e_i \geq 0$. If not, say $e_1 < 0$, then for $N \gg 0$ we get

$$u^d p_2^{de_2+N} \dots p_r^{de_r+N} = p_1^{-de_1} p_2^N \dots p_r^N \left(\sum_{i=1, \dots, d} a_i x^{d-i} \right) \in (p_1)$$

which contradicts uniqueness of factorization in R . \square

Definition 10.116.9. A *principal ideal domain*, abbreviated *PID*, is a domain R such that every ideal is a principal ideal.

Lemma 10.116.10. *A principal ideal domain is a unique factorization domain.*

Proof. As a PID is Noetherian this follows from Lemma 10.116.6. \square

Definition 10.116.11. A *Dedekind domain* is a domain R such that every nonzero ideal $I \subset R$ can be written as a product

$$I = \mathfrak{p}_1 \dots \mathfrak{p}_r$$

of nonzero prime ideals uniquely up to permutation of the \mathfrak{p}_i .

Lemma 10.116.12. *Let A be a ring. Let I and J be nonzero ideals of A such that $IJ = (f)$ for some nonzerodivisor $f \in A$. Then I and J are finitely generated ideals and finitely locally free of rank 1 as A -modules.*

Proof. It suffices to show that I and J are finite locally free A -modules of rank 1, see Lemma 10.75.2. To do this, write $f = \sum_{i=1, \dots, n} x_i y_i$ with $x_i \in I$ and $y_i \in J$. We can also write $x_i y_i = a_i f$ for some $a_i \in A$. Since f is a nonzerodivisor we see that $\sum a_i = 1$. Thus it suffices to show that each I_{a_i} and J_{a_i} is free of rank 1 over A_{a_i} . After replacing A by A_{a_i} we conclude that $f = xy$ for some $x \in I$ and $y \in J$. Note that both x and y are nonzerodivisors. We claim that $I = (x)$ and $J = (y)$ which finishes the proof. Namely, if $x' \in I$, then $x'y = af = axy$ for some $a \in A$. Hence $x' = ax$ and we win. \square

Lemma 10.116.13. *Let R be a ring. The following are equivalent*

- (1) R is a Dedekind domain,
- (2) R is a Noetherian domain, and for every maximal ideal \mathfrak{m} the local ring $R_{\mathfrak{m}}$ is a discrete valuation ring, and
- (3) R is a Noetherian, normal domain, and $\dim(R) \leq 1$.

Proof. Assume (1). The argument is nontrivial because we did not assume that R was Noetherian in our definition of a Dedekind domain. Let $\mathfrak{p} \subset R$ be a prime ideal. Observe that $\mathfrak{p} \neq \mathfrak{p}^2$ by uniqueness of the factorizations in the definition. Pick $x \in \mathfrak{p}$ with $x \notin \mathfrak{p}^2$. Let $y \in \mathfrak{p}$ be a second element (for example $y = 0$). Write $(x, y) = \mathfrak{p}_1 \dots \mathfrak{p}_r$. Since $(x, y) \subset \mathfrak{p}$ at least one of the primes \mathfrak{p}_i is contained in \mathfrak{p} . But as $x \notin \mathfrak{p}^2$ there is at most one. Thus exactly one of $\mathfrak{p}_1, \dots, \mathfrak{p}_r$ is contained in \mathfrak{p} , say $\mathfrak{p}_1 \subset \mathfrak{p}$. We conclude that $(x, y)R_{\mathfrak{p}} = \mathfrak{p}_1 R_{\mathfrak{p}}$ is prime for every choice of y . We claim that $(x)R_{\mathfrak{p}} = \mathfrak{p}R_{\mathfrak{p}}$. Namely, pick $y \in \mathfrak{p}$. By the above applied with y^2 we see that $(x, y^2)R_{\mathfrak{p}}$ is prime. Hence $y \in (x, y^2)R_{\mathfrak{p}}$, i.e., $y = ax + by^2$ in $R_{\mathfrak{p}}$. Thus $(1 - by)y = ax \in (x)R_{\mathfrak{p}}$, i.e., $y \in (x)R_{\mathfrak{p}}$ as desired.

Writing $(x) = \mathfrak{p}_1 \dots \mathfrak{p}_r$ anew with $\mathfrak{p}_1 \subset \mathfrak{p}$ we conclude that $\mathfrak{p}_1 R_{\mathfrak{p}} = \mathfrak{p} R_{\mathfrak{p}}$, i.e., $\mathfrak{p}_1 = \mathfrak{p}$. Moreover, $\mathfrak{p}_1 = \mathfrak{p}$ is a finitely generated ideal of R by Lemma 10.116.12. We conclude that R is Noetherian by Lemma 10.27.9. Moreover, it follows that $R_{\mathfrak{m}}$ is a discrete valuation ring for every prime ideal \mathfrak{p} , see Lemma 10.115.6.

The equivalence of (2) and (3) follows from Lemmas 10.36.9 and 10.115.6. Assume (2) and (3) are satisfied. Let $I \subset R$ be an ideal. We will construct a factorization of I . If I is prime, then there is nothing to prove. If not, pick $I \subset \mathfrak{p}$ with $\mathfrak{p} \subset R$ maximal. Let $J = \{x \in R \mid x\mathfrak{p} \subset I\}$. We claim $J\mathfrak{p} = I$. It suffices to check this after localization at the maximal ideals \mathfrak{m} of A (the formation of J commutes with localization and we use Lemma 10.23.1). Then either $\mathfrak{p}R_{\mathfrak{m}} = R_{\mathfrak{m}}$ and the result is clear, or $\mathfrak{p}R_{\mathfrak{m}} = \mathfrak{m}R_{\mathfrak{m}}$. In the last case $\mathfrak{p}R_{\mathfrak{m}} = (\pi)$ and the case where \mathfrak{p} is principal is immediate. By Noetherian induction the ideal J has a factorization and we obtain the desired factorization of I . We omit the proof of uniqueness of the factorization. \square

The following is a variant of the Krull-Akizuki lemma.

Lemma 10.116.14. *Let A be a Noetherian domain of dimension 1 with fraction field K . Let $K \subset L$ be a finite extension. Let B be the integral closure of A in L . Then B is a Dedekind domain and $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is surjective, has finite fibres, and induces finite residue field extensions.*

Proof. By Krull-Akizuki (Lemma 10.115.11) the ring B is Noetherian. By Lemma 10.108.4 $\dim(B) = 1$. Thus B is a Dedekind domain by Lemma 10.116.13. Surjectivity of the map on spectra follows from Lemma 10.35.15. The last two statements follow from Lemma 10.115.9. \square

10.117. Orders of vanishing

Lemma 10.117.1. *Let R be a semi-local Noetherian ring of dimension 1. If $a, b \in R$ are nonzerodivisors then*

$$\text{length}_R(R/(ab)) = \text{length}_R(R/(a)) + \text{length}_R(R/(b))$$

and these lengths are finite.

Proof. We saw the finiteness in Lemma 10.115.10. Additivity holds since there is a short exact sequence $0 \rightarrow R/(a) \rightarrow R/(ab) \rightarrow R/(b) \rightarrow 0$ where the first map is given by multiplication by b . (Use length is additive, see Lemma 10.50.3.) \square

Definition 10.117.2. Suppose that K is a field, and $R \subset K$ is a local⁵ Noetherian subring of dimension 1 with fraction field K . In this case we define the *order of vanishing along R*

$$\text{ord}_R : K^* \longrightarrow \mathbf{Z}$$

by the rule

$$\text{ord}_R(x) = \text{length}_R(R/(x))$$

if $x \in R$ and we set $\text{ord}_R(x/y) = \text{ord}_R(x) - \text{ord}_R(y)$ for $x, y \in R$ both nonzero.

We can use the order of vanishing to compare lattices in a vector space. Here is the definition.

⁵We could also define this when R is only semi-local but this is probably never really what you want!

Definition 10.117.3. Let R be a Noetherian local domain of dimension 1 with fraction field K . Let V be a finite dimensional K -vector space. A *lattice in V* is a finite R -submodule $M \subset V$ such that $V = K \otimes_R M$.

The condition $V = K \otimes_R M$ signifies that M contains a basis for the vector space V . We remark that in many places in the literature the notion of a lattice may be defined only in case the ring R is a discrete valuation ring. If R is a discrete valuation ring then any lattice is a free R -module, and this may not be the case in general.

Lemma 10.117.4. *Let R be a Noetherian local domain of dimension 1 with fraction field K . Let V be a finite dimensional K -vector space.*

- (1) *If M is a lattice in V and $M \subset M' \subset V$ is an R -submodule of V containing M then the following are equivalent*
 - (a) *M' is a lattice,*
 - (b) *$\text{length}_R(M'/M)$ is finite, and*
 - (c) *M' is finitely generated.*
- (2) *If M is a lattice in V and $M' \subset M$ is an R -submodule of M then M' is a lattice if and only if $\text{length}_R(M/M')$ is finite.*
- (3) *If M, M' are lattices in V , then so are $M \cap M'$ and $M + M'$.*
- (4) *If $M \subset M' \subset M'' \subset V$ are lattices in V then*

$$\text{length}_R(M''/M) = \text{length}_R(M'/M) + \text{length}_R(M''/M').$$

- (5) *If M, M', N, N' are lattices in V and $N \subset M \cap M', M + M' \subset N'$, then we have*

$$\begin{aligned} & \text{length}_R(M/M \cap M') - \text{length}_R(M'/M \cap M') \\ &= \text{length}_R(M/N) - \text{length}_R(M'/N) \\ &= \text{length}_R(M + M'/M') - \text{length}_R(M + M'/M) \\ &= \text{length}_R(N'/M') - \text{length}_R(N'/M) \end{aligned}$$

Proof. Proof of (1). Assume (1)(a). Say y_1, \dots, y_m generate M' . Then each $y_i = x_i/f_i$ for some $x_i \in M$ and nonzero $f_i \in R$. Hence we see that $f_1 \dots f_m M' \subset M$. Since R is Noetherian local of dimension 1 we see that $\mathfrak{m}^n \subset (f_1 \dots f_m)$ for some n (for example combine Lemmas 10.59.11 and Proposition 10.59.6 or combine Lemmas 10.115.8 and 10.50.4). In other words $\mathfrak{m}^n M' \subset M$ for some n . Hence $\text{length}(M'/M) < \infty$ by Lemma 10.50.8, in other words (1)(b) holds. Assume (1)(b). Then M'/M is a finite R -module (see Lemma 10.50.2). Hence M' is a finite R -module as an extension of finite R -modules. Hence (1)(c). The implication (1)(c) \Rightarrow (1)(a) follows from the remark following Definition 10.117.3.

Proof of (2). Suppose M is a lattice in V and $M' \subset M$ is an R -submodule. We have seen in (1) that if M' is a lattice, then $\text{length}_R(M/M') < \infty$. Conversely, assume that $\text{length}_R(M/M') < \infty$. Then M' is finitely generated as R is Noetherian and for some n we have $\mathfrak{m}^n M \subset M'$ (Lemma 10.50.4). Hence it follows that M' contains a basis for V , and M' is a lattice.

Proof of (3). Assume M, M' are lattices in V . Since R is Noetherian the submodule $M \cap M'$ of M is finite. As M is a lattice we can find $x_1, \dots, x_n \in M$ which form a K -basis for V . Because M' is a lattice we can write $x_i = y_i/f_i$ with $y_i \in M'$ and $f_i \in R$. Hence $f_i x_i \in M \cap M'$. Hence $M \cap M'$ is a lattice also. The fact that $M + M'$ is a lattice follows from part (1).

Part (4) follows from additivity of lengths (Lemma 10.50.3) and the exact sequence

$$0 \rightarrow M'/M \rightarrow M''/M \rightarrow M''/M' \rightarrow 0$$

Part (5) follows from repeatedly applying part (4). \square

Definition 10.117.5. Let R be a Noetherian local domain of dimension 1 with fraction field K . Let V be a finite dimensional K -vector space. Let M, M' be two lattices in V . The *distance between M and M'* is the integer

$$d(M, M') = \text{length}_R(M/M \cap M') - \text{length}_R(M'/M \cap M')$$

of Lemma 10.117.4 part (5).

In particular, if $M' \subset M$, then $d(M, M') = \text{length}_R(M/M')$.

Lemma 10.117.6. Let R be a Noetherian local domain of dimension 1 with fraction field K . Let V be a finite dimensional K -vector space. This distance function has the property that

$$d(M, M'') = d(M, M') + d(M', M'')$$

whenever given three lattices M, M', M'' of V . In particular we have $d(M, M') = -d(M', M)$.

Proof. Omitted. \square

Lemma 10.117.7. Let R be a Noetherian local domain of dimension 1 with fraction field K . Let V be a finite dimensional K -vector space. Let $\varphi : V \rightarrow V$ be a K -linear isomorphism. For any lattice $M \subset V$ we have

$$d(M, \varphi(M)) = \text{ord}_R(\det(\varphi))$$

Proof. We can see that the integer $d(M, \varphi(M))$ does not depend on the lattice M as follows. Suppose that M' is a second such lattice. Then we see that

$$\begin{aligned} d(M, \varphi(M)) &= d(M, M') + d(M', \varphi(M)) \\ &= d(M, M') + d(\varphi(M'), \varphi(M)) + d(M', \varphi(M')) \end{aligned}$$

Since φ is an isomorphism we see that $d(\varphi(M'), \varphi(M)) = d(M', M) = -d(M, M')$, and hence $d(M, \varphi(M)) = d(M', \varphi(M'))$. Moreover, both sides of the equation (of the lemma) are additive in φ , i.e.,

$$\text{ord}_R(\det(\varphi \circ \psi)) = \text{ord}_R(\det(\varphi)) + \text{ord}_R(\det(\psi))$$

and also

$$\begin{aligned} d(M, \varphi(\psi(M))) &= d(M, \psi(M)) + d(\psi(M), \varphi(\psi(M))) \\ &= d(M, \psi(M)) + d(M, \varphi(M)) \end{aligned}$$

by the independence shown above. Hence it suffices to prove the lemma for generators of $\text{GL}(V)$. Choose an isomorphism $K^{\oplus n} \cong V$. Then $\text{GL}(V) = \text{GL}_n(K)$ is generated by elementary matrices E . The result is clear for E equal to the identity matrix. If $E = E_{ij}(\lambda)$ with $i \neq j$, $\lambda \in K$, $\lambda \neq 0$, for example

$$E_{12}(\lambda) = \begin{pmatrix} 1 & \lambda & \dots \\ 0 & 1 & \dots \\ \dots & \dots & \dots \end{pmatrix}$$

then with respect to a different basis we get $E_{12}(1)$. The result is clear for $E = E_{12}(1)$ by taking as lattice $R^{\oplus n} \subset K^{\oplus n}$. Finally, if $E = E_i(a)$, with $a \in K^*$ for example

$$E_1(a) = \begin{pmatrix} a & 0 & \dots \\ 0 & 1 & \dots \\ \dots & \dots & \dots \end{pmatrix}$$

then $E_1(a)(R^{\oplus b}) = aR \oplus R^{\oplus n-1}$ and it is clear that $d(R^{\oplus n}, aR \oplus R^{\oplus n-1}) = \text{ord}_R(a)$ as desired. \square

Lemma 10.117.8. *Let $A \rightarrow B$ be a ring map. Assume*

- (1) *A is a Noetherian local domain of dimension 1,*
- (2) *$A \subset B$ is a finite extension of domains.*

Let $K = f.f.(A)$ and $L = f.f.(B)$ so that L is a finite field extension of K . Let $y \in L^$ and $x = \text{Nm}_{L/K}(y)$. In this situation B is semi-local. Let \mathfrak{m}_i , $i = 1, \dots, n$ be the maximal ideals of B . Then*

$$\text{ord}_A(x) = \sum_i [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)] \text{ord}_{B_{\mathfrak{m}_i}}(y)$$

where ord is defined as in Definition 10.117.2.

Proof. The ring B is semi-local by Lemma 10.109.2. Write $y = b/b'$ for some $b, b' \in B$. By the additivity of ord and multiplicativity of Nm it suffices to prove the lemma for $y = b$ or $y = b'$. In other words we may assume $y \in B$. In this case the left hand side of the formula is

$$\sum [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)] \text{length}_{B_{\mathfrak{m}_i}}((B/yB)_{\mathfrak{m}_i})$$

By Lemma 10.50.12 this is equal to $\text{length}_A(B/yB)$. By Lemma 10.117.7 we have

$$\text{length}_A(B/yB) = d(B, yB) = \text{ord}_A(\det_K(L \xrightarrow{y} L)).$$

Since $x = \text{Nm}_{L/K}(y) = \det_K(L \xrightarrow{y} L)$ by definition the lemma is proved. \square

We can extend some of the results above to reduced 1-dimensional Noetherian local rings which are not domains by the following lemma.

Lemma 10.117.9. *Let (R, \mathfrak{m}) be a reduced Noetherian local ring of dimension 1 and let $x \in \mathfrak{m}$ be a nonzerodivisor. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ be the minimal primes of R . Then*

$$\text{length}_R(R/(x)) = \sum_i \text{ord}_{R/\mathfrak{q}_i}(x)$$

Proof. Note that $R_i = R/\mathfrak{q}_i$ is a Noetherian 1-dimensional local domain. Denote $K_i = f.f.(R_i)$. If x is a unit in R , then both sides are zero. Hence we may assume $x \in \mathfrak{m}$. Consider the map $\Psi : R \rightarrow \prod R_i$. As R is reduced this map is injective, see Lemma 10.16.2. By Lemma 10.24.4 we have $Q(R) = \prod K_i$. Hence the finite R -module $\text{Coker}(\Psi)$ is annihilated by a nonzerodivisor $y \in R$, hence has support $\{\mathfrak{m}\}$, is annihilated by some power of x and has finite length over R , see Lemma 10.61.3. Consider the short exact sequence

$$0 \rightarrow R \rightarrow \prod R_i \rightarrow \text{Coker}(\Psi) \rightarrow 0$$

Applying multiplication by x^n to this for $n \gg 0$ we obtain from the snake lemma

$$0 \rightarrow \text{Coker}(\Psi) \rightarrow R/x^n R \rightarrow \prod R_i/x^n R_i \rightarrow \text{Coker}(\Psi) \rightarrow 0$$

Thus we see that

$$\text{length}_R(R/x^n R) = \text{length}_R\left(\prod R_i/x^n R_i\right) = \sum \text{length}_R(R_i/x^n R_i)$$

by Lemma 10.50.3. By Lemma 10.50.5 we have $\text{length}_R(R_i/x^n R_i) = \text{length}_{R_i}(R_i/x^n R_i)$. Now the result follows from the additivity of Lemma 10.117.1 and the definition of the order of vanishing along R_i . \square

10.118. Quasi-finite maps

Consider a ring map $R \rightarrow S$ of finite type. A map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is quasi-finite at a point if that point is isolated in its fibre. This means that the fibre is zero dimensional at that point. In this section we study the basic properties of this important but technical notion. More advanced material can be found in the next section.

Lemma 10.118.1. *Let k be a field. Let S be a finite type k algebra. Let \mathfrak{q} be a prime of S . The following are equivalent:*

- (1) \mathfrak{q} is an isolated point of $\text{Spec}(S)$,
- (2) $S_{\mathfrak{q}}$ is finite over k ,
- (3) there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $D(g) = \{\mathfrak{q}\}$,
- (4) $\dim_{\mathfrak{q}} \text{Spec}(S) = 0$,
- (5) \mathfrak{q} is a closed point of $\text{Spec}(S)$ and $\dim(S_{\mathfrak{q}}) = 0$, and
- (6) the field extension $k \subset \kappa(\mathfrak{q})$ is finite and $\dim(S_{\mathfrak{q}}) = 0$.

In this case $S = S_{\mathfrak{q}} \times S'$ for some finite type k -algebra S' . Also, the element g as in (3) has the property $S_{\mathfrak{q}} = S_g$.

Proof. Suppose \mathfrak{q} is an isolated point of $\text{Spec}(S)$, i.e., $\{\mathfrak{q}\}$ is open in $\text{Spec}(S)$. Because $\text{Spec}(S)$ is a Jacobson space (see Lemmas 10.34.2 and 10.34.4) we see that \mathfrak{q} is a closed point. Hence $\{\mathfrak{q}\}$ is open and closed in $\text{Spec}(S)$. By Lemmas 10.20.3 and 10.22.3 we may write $S = S_1 \times S_2$ with \mathfrak{q} corresponding to the only point $\text{Spec}(S_1)$. Hence $S_1 = S_{\mathfrak{q}}$ is a zero dimensional ring of finite type over k . Hence it is finite over k for example by Lemma 10.111.4. We have proved (1) implies (2).

Suppose $S_{\mathfrak{q}}$ is finite over k . Then $S_{\mathfrak{q}}$ is Artinian local, see Lemma 10.51.2. So $\text{Spec}(S_{\mathfrak{q}}) = \{\mathfrak{q}S_{\mathfrak{q}}\}$ by Lemma 10.51.6. Consider the exact sequence $0 \rightarrow K \rightarrow S \rightarrow S_{\mathfrak{q}} \rightarrow Q \rightarrow 0$. It is clear that $K_{\mathfrak{q}} = Q_{\mathfrak{q}} = 0$. Also, K is a finite S -module as S is Noetherian and Q is a finite S -modules since $S_{\mathfrak{q}}$ is finite over k . Hence there exists $g \in S$, $g \notin \mathfrak{q}$ such that $K_g = Q_g = 0$. Thus $S_{\mathfrak{q}} = S_g$ and $D(g) = \{\mathfrak{q}\}$. We have proved that (2) implies (3).

Suppose $D(g) = \{\mathfrak{q}\}$. Since $D(g)$ is open by construction of the topology on $\text{Spec}(S)$ we see that \mathfrak{q} is an isolated point of $\text{Spec}(S)$. We have proved that (3) implies (1). In other words (1), (2) and (3) are equivalent.

Assume $\dim_{\mathfrak{q}} \text{Spec}(S) = 0$. This means that there is some open neighbourhood of \mathfrak{q} in $\text{Spec}(S)$ which has dimension zero. Then there is an open neighbourhood of the form $D(g)$ which has dimension zero. Since S_g is Noetherian we conclude that S_g is Artinian and $D(g) = \text{Spec}(S_g)$ is a finite discrete set, see Proposition 10.59.6. Thus \mathfrak{q} is an isolated point of $D(g)$ and, by the equivalence of (1) and (2) above applied to $\mathfrak{q}S_g \subset S_g$, we see that $S_{\mathfrak{q}} = (S_g)_{\mathfrak{q}S_g}$ is finite over k . Hence (4) implies (2). It is clear that (1) implies (4). Thus (1) – (4) are all equivalent.

Lemma 10.110.6 gives the implication (5) \Rightarrow (4). The implication (4) \Rightarrow (6) follows from Lemma 10.112.3. The implication (6) \Rightarrow (5) follows from Lemma 10.34.9. At this point we know (1) – (6) are equivalent.

The two statements at the end of the lemma we saw during the course of the proof of the equivalence of (1), (2) and (3) above. \square

Lemma 10.118.2. *Let $R \rightarrow S$ be a ring map of finite type. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $F = \text{Spec}(S \otimes_R \kappa(\mathfrak{p}))$ be the fibre of $\text{Spec}(S) \rightarrow \text{Spec}(R)$, see Remark 10.16.8. Denote $\bar{\mathfrak{q}} \in F$ the point corresponding to \mathfrak{q} . The following are equivalent*

- (1) $\bar{\mathfrak{q}}$ is an isolated point of F ,
- (2) $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ is finite over $\kappa(\mathfrak{p})$,
- (3) there exists a $g \in S$, $g \notin \mathfrak{q}$ such that the only prime of $D(g)$ mapping to \mathfrak{p} is \mathfrak{q} ,
- (4) $\dim_{\bar{\mathfrak{q}}}(F) = 0$,
- (5) $\bar{\mathfrak{q}}$ is a closed point of F and $\dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) = 0$, and
- (6) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite and $\dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) = 0$.

Proof. Note that $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} = (S \otimes_R \kappa(\mathfrak{p}))_{\bar{\mathfrak{q}}}$. Moreover $S \otimes_R \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$. The conditions correspond exactly to the conditions of Lemma 10.118.1 for the $\kappa(\mathfrak{p})$ -algebra $S \otimes_R \kappa(\mathfrak{p})$ and the prime $\bar{\mathfrak{q}}$, hence they are equivalent. \square

Definition 10.118.3. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime.

- (1) If the equivalent conditions of Lemma 10.118.2 are satisfied then we say $R \rightarrow S$ is *quasi-finite at \mathfrak{q}* .
- (2) We say a ring map $A \rightarrow B$ is *quasi-finite* if it is of finite type and quasi-finite at all primes of B .

Lemma 10.118.4. *Let $R \rightarrow S$ be a finite type ring map. Then $R \rightarrow S$ is quasi-finite if and only if for all primes $\mathfrak{p} \subset R$ the fibre $S \otimes_R \kappa(\mathfrak{p})$ is finite over $\kappa(\mathfrak{p})$.*

Proof. If the fibres are finite then the map is clearly quasi-finite. For the converse, note that $S \otimes_R \kappa(\mathfrak{p})$ is a $\kappa(\mathfrak{p})$ -algebra of finite type over k of dimension 0. Hence it is finite over k for example by Lemma 10.111.4. \square

Lemma 10.118.5. *Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $f \in R$, $f \notin \mathfrak{p}$ and $g \in S$, $g \notin \mathfrak{q}$. Then $R \rightarrow S$ is quasi-finite at \mathfrak{q} if and only if $R_f \rightarrow S_{fg}$ is quasi-finite at $\mathfrak{q}S_{fg}$.*

Proof. The fibre of $\text{Spec}(S_{fg}) \rightarrow \text{Spec}(R_f)$ is homeomorphic to an open subset of the fibre of $\text{Spec}(S) \rightarrow \text{Spec}(R)$. Hence the lemma follows from part (1) of the equivalent conditions of Lemma 10.118.2. \square

Lemma 10.118.6. *Let*

$$\begin{array}{ccc} S & \longrightarrow & S' \\ \uparrow & & \uparrow \\ R & \longrightarrow & R' \end{array} \qquad \begin{array}{ccc} \mathfrak{q} & \text{---} & \mathfrak{q}' \\ \downarrow & & \downarrow \\ \mathfrak{p} & \text{---} & \mathfrak{p}' \end{array}$$

be a commutative diagram of rings with primes as indicated. Assume $R \rightarrow S$ of finite type, and $S \otimes_R R' \rightarrow S'$ surjective. If $R \rightarrow S$ is quasi-finite at \mathfrak{q} , then $R' \rightarrow S'$ is quasi-finite at \mathfrak{q}' .

Proof. Write $S \otimes_R \kappa(\mathfrak{p}) = S_1 \times S_2$ with S_1 finite over $\kappa(\mathfrak{p})$ and such that \mathfrak{q} corresponds to a point of S_1 as in Lemma 10.118.1. Because $S \otimes_R R' \rightarrow S'$ surjective the canonical map $(S \otimes_R \kappa(\mathfrak{p})) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}') \rightarrow S' \otimes_{R'} \kappa(\mathfrak{p}')$ is surjective. Let S'_i be the image of $S_i \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$ in $S' \otimes_{R'} \kappa(\mathfrak{p}')$. Then $S' \otimes_{R'} \kappa(\mathfrak{p}') = S'_1 \times S'_2$ and S'_1 is finite over $\kappa(\mathfrak{p}')$. The map $S' \otimes_{R'} \kappa(\mathfrak{p}') \rightarrow \kappa(\mathfrak{q}')$ factors through S'_1 (i.e. it annihilates the factor S'_2) because the map $S \otimes_R \kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{q})$ factors through S_1 (i.e. it annihilates the factor S_2). Thus \mathfrak{q}' corresponds to a point of $\text{Spec}(S'_1)$ in the disjoint union decomposition of the fibre: $\text{Spec}(S' \otimes_{R'} \kappa(\mathfrak{p}')) = \text{Spec}(S'_1) \amalg \text{Spec}(S'_2)$. (See Lemma 10.20.2.) Since S'_1 is finite over a field, it is Artinian ring, and hence $\text{Spec}(S'_1)$ is a finite discrete set. (See Proposition 10.59.6.) We conclude \mathfrak{q}' is isolated in its fibre as desired. \square

Lemma 10.118.7. *A composition of quasi-finite ring maps is quasi-finite.*

Proof. Suppose $A \rightarrow B$ and $B \rightarrow C$ are quasi-finite ring maps. By Lemma 10.6.2 we see that $A \rightarrow C$ is of finite type. Let $\mathfrak{r} \subset C$ be a prime of C lying over $\mathfrak{q} \subset B$ and $\mathfrak{p} \subset A$. Since $A \rightarrow B$ and $B \rightarrow C$ are quasi-finite at \mathfrak{q} and \mathfrak{r} respectively, then there exist $b \in B$ and $c \in C$ such that \mathfrak{q} is the only prime of $D(b)$ which maps to \mathfrak{p} and similarly \mathfrak{r} is the only prime of $D(c)$ which maps to \mathfrak{q} . If $c' \in C$ is the image of $b \in B$, then \mathfrak{r} is the only prime of $D(cc')$ which maps to \mathfrak{p} . Therefore $A \rightarrow C$ is quasi-finite at \mathfrak{r} . \square

Lemma 10.118.8. *Let $R \rightarrow S$ be a ring map of finite type. Let $R \rightarrow R'$ be any ring map. Set $S' = R' \otimes_R S$.*

- (1) *The set $\{\mathfrak{q}' \mid R' \rightarrow S' \text{ quasi-finite at } \mathfrak{q}'\}$ is the inverse image of the corresponding set of $\text{Spec}(S)$ under the canonical map $\text{Spec}(S') \rightarrow \text{Spec}(S)$.*
- (2) *If $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is surjective, then $R \rightarrow S$ is quasi-finite if and only if $R' \rightarrow S'$ is quasi-finite.*
- (3) *Any base change of a quasi-finite ring map is quasi-finite.*

Proof. Let $\mathfrak{p}' \subset R'$ be a prime lying over $\mathfrak{p} \subset R$. Then the fibre ring $S' \otimes_{R'} \kappa(\mathfrak{p}')$ is the base change of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$ by the field extension $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p}')$. Hence the first assertion follows from the invariance of dimension under field extension (Lemma 10.112.6) and Lemma 10.118.1. The stability of quasi-finite maps under base change follows from this and the stability of finite type property under base change. The second assertion follows since the assumption implies that given a prime $\mathfrak{q} \subset S$ we can find a prime $\mathfrak{q}' \subset S'$ lying over it. \square

The following lemma is not quite about quasi-finite ring maps, but it does not seem to fit anywhere else so well.

Lemma 10.118.9. *Let $R \rightarrow S$ be a ring map of finite type. Let $\mathfrak{p} \subset R$ be a minimal prime. Assume that there are at most finitely many primes of S lying over \mathfrak{p} . Then there exists a $g \in R$, $g \notin \mathfrak{p}$ such that the ring map $R_g \rightarrow S_g$ is finite.*

Proof. Let x_1, \dots, x_n be generators of S over R . Since \mathfrak{p} is a minimal prime we have that $\mathfrak{p}R_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 10.24.1. Hence $\mathfrak{p}S_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 10.31.2. By assumption the finite type $\kappa(\mathfrak{p})$ -algebra $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$ has finitely many primes. Hence (for example by Lemmas 10.60.3 and 10.111.4) $\kappa(\mathfrak{p}) \rightarrow S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$ is a finite ring map. Thus we may find monic polynomials $P_i \in R_{\mathfrak{p}}[X]$ such that $P_i(x_i)$ maps to zero in $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$. By what we said above there exist $e_i \geq 1$ such that $P(x_i)^{e_i} = 0$ in $S_{\mathfrak{p}}$. Let $g_1 \in R$, $g_1 \notin \mathfrak{p}$ be an element such that

$P_i \in R[1/g_1]$ for all i . Next, let $g_2 \in R$, $g_2 \notin \mathfrak{p}$ be an element such that $P(x_i)^{e_i} = 0$ in $S_{g_1 g_2}$. Setting $g = g_1 g_2$ we win. \square

10.119. Zariski's Main Theorem

In this section our aim is to prove the algebraic version of Zariski's Main theorem. This theorem will be the basis of many further developments in the theory of schemes and morphisms of schemes later in the project.

Let $R \rightarrow S$ be a ring map of finite type. Our goal in this section is to show that the set of points of $\text{Spec}(S)$ where the map is quasi-finite is *open* (Theorem 10.119.13). In fact, it will turn out that there exists a finite ring map $R \rightarrow S'$ such that in some sense the quasi-finite locus of S/R is open in $\text{Spec}(S')$ (but we will not prove this in the algebra chapter since we do not develop the language of schemes here – for the case where $R \rightarrow S$ is quasi-finite see Lemma 10.119.15). These statements are somewhat tricky to prove and we do it by a long list of lemmas concerning integral and finite extensions of rings. This material may be found in [Ray70], and [Pes66]. We also found notes by Thierry Coquand helpful.

Lemma 10.119.1. *Let $\varphi : R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \dots + \varphi(a_n)t^n = 0$. Then $\varphi(a_n)t$ is integral over R .*

Proof. Namely, multiply the equation $\varphi(a_0) + \varphi(a_1)t + \dots + \varphi(a_n)t^n = 0$ with $\varphi(a_n)^{n-1}$ and write it as $\varphi(a_0 a_n^{n-1}) + \varphi(a_1 a_n^{n-2})(\varphi(a_n)t) + \dots + (\varphi(a_n)t)^n = 0$. \square

The following lemma is in some sense the key lemma in this section.

Lemma 10.119.2. *Let R be a ring. Let $\varphi : R[x] \rightarrow S$ be a ring map. Let $t \in S$. Assume that (a) t is integral over $R[x]$, and (b) there exists a monic $p \in R[x]$ such that $t\varphi(p) \in \text{Im}(\varphi)$. Then there exists a $q \in R[x]$ such that $t - \varphi(q)$ is integral over R .*

Proof. Write $t\varphi(p) = \varphi(r)$ for some $r \in R[x]$. Using euclidean division, write $r = qp + r'$ with $q, r' \in R[x]$ and $\deg(r') < \deg(p)$. We may replace t by $t - \varphi(q)$ which is still integral over $R[x]$, so that we obtain $t\varphi(p) = \varphi(r')$. In the ring S_t we may write this as $\varphi(p) - (1/t)\varphi(r') = 0$. This implies that $\varphi(x)$ gives an element of the localization S_t which is integral over $\varphi(R)[1/t] \subset S_t$. On the other hand, t is integral over the subring $\varphi(R)[\varphi(x)] \subset S$. Combined we conclude that t is integral over the subring $\varphi(R)[1/t] \subset S_t$, see Lemma 10.35.6. In other words there exists an equation of the form $t^d + \sum_{i < d} (\varphi(r_i)/t^{n_i})t^i = 0$ in S_t with $r_i \in R$. This means that $t^{d+N} + \sum_{i < d} \varphi(r_i)t^{i+N-n_i} = 0$ in S for some N large enough. In other words t is integral over R . \square

Lemma 10.119.3. *Let R be a ring and let $\varphi : R[x] \rightarrow S$ be a ring map. Let $t \in S$. If t is integral over $R[x]$, then there exists an $\ell \geq 0$ such that for every $a \in R$ the element $\varphi(a)^\ell t$ is integral over $\varphi_a : R[y] \rightarrow S$, defined by $y \mapsto \varphi(ax)$ and $r \mapsto \varphi(r)$ for $r \in R$.*

Proof. Say $t^d + \sum_{i < d} \varphi(f_i)t^i = 0$ with $f_i \in R[x]$. Let ℓ be the maximum degree in x of all the f_i . Multiply the equation by $\varphi(a)^\ell$ to get $\varphi(a)^\ell t^d + \sum_{i < d} \varphi(a^\ell f_i)t^i = 0$. Note that each $\varphi(a^\ell f_i)$ is in the image of φ_a . The result follows from Lemma 10.119.1. \square

Lemma 10.119.4. *Let R be a ring. Let $\varphi : R[x] \rightarrow S$ be a ring map. Let $t \in S$. Assume t is integral over $R[x]$. Let $p \in R[x]$, $p = a_0 + a_1x + \dots + a_kx^k$ such that $t\varphi(p) \in \text{Im}(\varphi)$. Then there exists a $q \in R[x]$ and $n \geq 0$ such that $\varphi(a_k)^nt - \varphi(q)$ is integral over R .*

Proof. By Lemma 10.119.3 there exists an $\ell \geq 0$ such that the element $\varphi(a_k)^\ell t$ is integral over the map $\varphi' : R[y] \rightarrow S$, $\varphi'(y) = \varphi(a_kx)$ and $\varphi'(r) = \varphi(r)$, for $r \in R$. The polynomial $p' = a_k^{\ell-1}a_0 + a_k^{\ell-2}a_1y + \dots + y^\ell$ is monic and $t\varphi'(p') = \varphi(a_k^{\ell-1})t\varphi(p) \in \text{Im}(\varphi)$. By definition of φ' this implies there exists a $n \geq \ell - 1$ such that $\varphi(a_k^n)t\varphi'(p') \in \text{Im}(\varphi')$. If also $n \geq \ell$, then $\varphi(a_k)^nt$ is still integral over $R[y]$. By Lemma 10.119.2 we see that $\varphi(a_k)^nt - \varphi'(q)$ is integral over R for some $q \in R[y]$. Again by the simple relationship between φ' and φ this implies the lemma. \square

Situation 10.119.5. Let R be a ring. Let $\varphi : R[x] \rightarrow S$ be finite. Let

$$J = \{g \in S \mid gS \subset \text{Im}(\varphi)\}$$

be the “conductor ideal” of φ . Assume $\varphi(R) \subset S$ integrally closed in S .

Lemma 10.119.6. *In Situation 10.119.5. Suppose $u \in S$, $a_0, \dots, a_k \in R$, $u\varphi(a_0 + a_1x + \dots + a_kx^k) \in J$. Then there exists an $m \geq 0$ such that $u\varphi(a_k)^m \in J$.*

Proof. Assume that S is generated by t_1, \dots, t_n as an $R[x]$ -module. In this case $J = \{g \in S \mid gt_i \in \text{Im}(\varphi) \text{ for all } i\}$. Note that each element ut_i is integral over $R[x]$, see Lemma 10.35.3. We have $\varphi(a_0 + a_1x + \dots + a_kx^k)ut_i \in \text{Im}(\varphi)$. By Lemma 10.119.4, for each i there exists an integer n_i and an element $q_i \in R[x]$ such that $\varphi(a_k^{n_i})ut_i - \varphi(q_i)$ is integral over R . By assumption this element is in $\varphi(R)$ and hence $\varphi(a_k^{n_i})ut_i \in \text{Im}(\varphi)$. It follows that $m = \max\{n_1, \dots, n_n\}$ works. \square

Lemma 10.119.7. *In Situation 10.119.5. Suppose $u \in S$, $a_0, \dots, a_k \in R$, $u\varphi(a_0 + a_1x + \dots + a_kx^k) \in \sqrt{J}$. Then $u\varphi(a_i) \in \sqrt{J}$ for all i .*

Proof. Under the assumptions of the lemma we have $u^n\varphi(a_0 + a_1x + \dots + a_kx^k)^n \in J$ for some $n \geq 1$. By Lemma 10.119.6 we deduce $u^n\varphi(a_k^{nm}) \in J$ for some $m \geq 1$. Thus $u\varphi(a_k) \in \sqrt{J}$, and so $u\varphi(a_0 + a_1x + \dots + a_kx^k) - u\varphi(a_k) = u\varphi(a_0 + a_1x + \dots + a_{k-1}x^{k-1}) \in \sqrt{J}$. We win by induction on k . \square

This lemma suggests the following definition.

Definition 10.119.8. Given an inclusion of rings $R \subset S$ and an element $x \in S$ we say that x is *strongly transcendental over R* if whenever $u(a_0 + a_1x + \dots + a_kx^k) = 0$ with $u \in S$ and $a_i \in R$, then we have $ua_i = 0$ for all i .

Note that if S is a domain then this is the same as saying that x as an element of the fraction field of S is transcendental over the fraction field of R .

Lemma 10.119.9. *Suppose $R \subset S$ is an inclusion of reduced rings and suppose that $x \in S$ is strongly transcendental over R . Let $\mathfrak{q} \subset S$ be a minimal prime and let $\mathfrak{p} = R \cap \mathfrak{q}$. Then the image of x in S/\mathfrak{q} is strongly transcendental over the subring R/\mathfrak{p} .*

Proof. Suppose $u(a_0 + a_1x + \dots + a_kx^k) \in \mathfrak{q}$. By Lemma 10.24.1 the local ring $S_{\mathfrak{q}}$ is a field, and hence $u(a_0 + a_1x + \dots + a_kx^k)$ is zero in $S_{\mathfrak{q}}$. Thus $uu'(a_0 + a_1x + \dots + a_kx^k) = 0$ for some $u' \in S$, $u' \notin \mathfrak{q}$. Since x is strongly transcendental over R we get $uu'a_i = 0$ for all i . This in turn implies that $ua_i \in \mathfrak{q}$. \square

Lemma 10.119.10. *Suppose $R \subset S$ is an inclusion of domains and let $x \in S$. Assume x is (strongly) transcendental over R and that S is finite over $R[x]$. Then $R \rightarrow S$ is not quasi-finite at any prime of S .*

Proof. As a first case, assume that R is normal, see Definition 10.36.10. By Lemma 10.36.13 we see that $R[x]$ is normal. Take a prime $\mathfrak{q} \subset S$, and set $\mathfrak{p} = R \cap \mathfrak{q}$. Assume that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite. This would be the case if $R \rightarrow S$ is quasi-finite at \mathfrak{q} . Let $\mathfrak{r} = R[x] \cap \mathfrak{q}$. Then since $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}) \subset \kappa(\mathfrak{q})$ we see that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r})$ is finite too. Thus the inclusion $\mathfrak{r} \supset \mathfrak{p}R[x]$ is strict. By going down for $R[x] \subset S$, see Proposition 10.37.7, we find a prime $\mathfrak{q}' \subset \mathfrak{q}$, lying over the prime $\mathfrak{p}R[x]$. Hence the fibre $\text{Spec}(S \otimes_R \kappa(\mathfrak{p}))$ contains a point not equal to \mathfrak{q} , namely \mathfrak{q}' , whose closure contains \mathfrak{q} and hence \mathfrak{q} is not isolated in its fibre.

If R is not normal, let $R \subset R' \subset K$ be the integral closure R' of R in its field of fractions K . Let $S \subset S' \subset L$ be the subring S' of the field of fractions L of S generated by R' and S . Note that by construction the map $S \otimes_R R' \rightarrow S'$ is surjective. This implies that $R'[x] \subset S'$ is finite. Also, the map $S \subset S'$ induces a surjection on Spec , see Lemma 10.35.15. We conclude by Lemma 10.118.6 and the normal case we just discussed. \square

Lemma 10.119.11. *Suppose $R \subset S$ is an inclusion of reduced rings. Assume $x \in S$ be strongly transcendental over R , and S finite over $R[x]$. Then $R \rightarrow S$ is not quasi-finite at any prime of S .*

Proof. Let $\mathfrak{q} \subset S$ be any prime. Choose a minimal prime $\mathfrak{q}' \subset \mathfrak{q}$. According to Lemmas 10.119.9 and 10.119.10 the extension $R/(R \cap \mathfrak{q}') \subset S/\mathfrak{q}'$ is not quasi-finite at the prime corresponding to \mathfrak{q} . By Lemma 10.118.6 the extension $R \rightarrow S$ is not quasi-finite at \mathfrak{q} . \square

Lemma 10.119.12. *Let R be a ring. Let $S = R[x]/I$. Let $\mathfrak{q} \subset S$ be a prime. Assume $R \rightarrow S$ is quasi-finite at \mathfrak{q} . Let $S' \subset S$ be the integral closure of R in S . Then there exists an element $g \in S'$, $g \notin \mathfrak{q}$ such that $S'_g \cong S_g$.*

Proof. Let \mathfrak{p} be the image of \mathfrak{q} in $\text{Spec}(R)$. The assumption that $R \rightarrow S$ is quasi-finite at \mathfrak{q} implies there exists an $f \in I$, $f = a_n x^n + \dots + a_0$ such that some $a_i \notin \mathfrak{p}$. In particular there exists a relation $b_m x^m + \dots + b_0 = 0$ with $b_j \in S'$, $j = 0, \dots, m$ and $b_j \notin \mathfrak{q} \cap S'$ for some j . We prove the lemma by induction on m .

The case $b_m \in \mathfrak{q}$. In this case we have $b_m x \in S'$ by Lemma 10.119.1. Set $b'_{m-1} = b_m x + b_{m-1}$. Then

$$b'_{m-1} x^{m-1} + b_{m-2} x^{m-2} + \dots + b_0 = 0$$

Since b'_{m-1} is congruent to b_{m-1} modulo $S' \cap \mathfrak{q}$ we see that it is still the case that one of $b'_{m-1}, b_{m-2}, \dots, b_0$ is not in $S' \cap \mathfrak{q}$. Thus we win by induction on m .

The case $b_m \notin \mathfrak{q}$. In this case x is integral over S'_{b_m} , in fact $b_m x \in S'$ by Lemma 10.119.1. Hence the injective map $S'_{b_m} \rightarrow S_{b_m}$ is also surjective, i.e., an isomorphism as desired. \square

Theorem 10.119.13 (Zariski's Main Theorem). *Let R be a ring. Let $R \rightarrow S$ be a finite type R -algebra. Let $S' \subset S$ be the integral closure of R in S . Let $\mathfrak{q} \subset S$ be a prime of S . If $R \rightarrow S$ is quasi-finite at \mathfrak{q} then there exists a $g \in S'$, $g \notin \mathfrak{q}$ such that $S'_g \cong S_g$.*

Proof. There exist finitely many elements $x_1, \dots, x_n \in S$ such that S is finite over the R -sub algebra generated by x_1, \dots, x_n . (For example generators of S over R .) We prove the proposition by induction on the minimal such number n .

The case $n = 0$ is trivial, because in this case $S' = S$, see Lemma 10.35.3.

The case $n = 1$. We may and do replace R by its integral closure in S , in particular this means that $R \subset S$. Consider the map $\varphi : R[x] \rightarrow S$, $x \mapsto x_1$. (We will see that φ is not injective below.) By assumption φ is finite. Hence we are in Situation 10.119.5. Let $J \subset S$ be the “conductor ideal” defined in Situation 10.119.5. Consider the diagram

$$\begin{array}{ccccccc}
 R[x] & \longrightarrow & S & \longrightarrow & S/\sqrt{J} & \longleftarrow & R/(R \cap \sqrt{J})[x] \\
 & & \uparrow & & \uparrow & & \nearrow \\
 & & R & \longrightarrow & R/(R \cap \sqrt{J}) & &
 \end{array}$$

According to Lemma 10.119.7 the image of x in the quotient S/\sqrt{J} is strongly transcendental over $R/(R \cap \sqrt{J})$. Hence by Lemma 10.119.11 the ring map $R/(R \cap \sqrt{J}) \rightarrow S/\sqrt{J}$ is not quasi-finite at any prime of S/\sqrt{J} . By Lemma 10.118.6 we deduce that \mathfrak{q} does not lie in $V(J) \subset \text{Spec}(S)$. Thus there exists an element $s \in J$, $s \notin \mathfrak{q}$. By definition of J we may write $s = \varphi(f)$ for some polynomial $f \in R[x]$. Now let $I = \text{Ker}(R[x] \rightarrow S)$. Since $\varphi(f) \in J$ we get $(R[x]/I)_f \cong S_{\varphi(f)}$. Also $s \notin \mathfrak{q}$ means that $f \notin \varphi^{-1}(\mathfrak{q})$. Thus $\varphi^{-1}(\mathfrak{q})$ is a prime of $R[x]/I$ at which $R \rightarrow R[x]/I$ is quasi-finite, see Lemma 10.118.5. Let $C \subset R[x]/I$ be the integral closure of R . By Lemma 10.119.12 there exists an element $h \in C$, $h \notin \varphi^{-1}(\mathfrak{q})$ such that $C_h \cong (R[x]/I)_h$. We conclude that $(R[x]/I)_{fh} = S_{\varphi(fh)}$ is isomorphic to a principal localization $C_{h'}$ of C for some $h' \in C$, $h' \notin \varphi^{-1}(\mathfrak{q})$. Since $\varphi(C) \subset S'$ we get $g = \varphi(h') \in S'$, $g \notin \mathfrak{q}$ and moreover the injective map $S'_g \rightarrow S_g$ is also surjective because by our choice of h' the map $C_{h'} \rightarrow S_g$ is surjective.

The case $n > 1$. Consider the subring $R' \subset S$ which is the integral closure of $R[x_1, \dots, x_{n-1}]$ in S . By Lemma 10.118.6 the extension S/R' is quasi-finite at \mathfrak{q} . Also, note that S is finite over $R'[x_n]$. By the case $n = 1$ above, there exists a $g' \in R'$, $g' \notin \mathfrak{q}$ such that $(R')_{g'} \cong S_{g'}$. At this point we cannot apply induction to $R \rightarrow R'$ since R' may not be finite type over R . Since S is finitely generated over R we deduce in particular that $(R')_{g'}$ is finitely generated over R . Say the elements g' , and $y_1/(g')^{n_1}, \dots, y_N/(g')^{n_N}$ with $y_i \in R'$ generate $(R')_{g'}$ over R . Let R'' be the R -sub algebra of R' generated by $x_1, \dots, x_{n-1}, y_1, \dots, y_N, g'$. This has the property $(R'')_{g'} \cong S_{g'}$. Surjectivity because of how we chose y_i , injectivity because $R'' \subset R'$, and localization is exact. Note that R'' is finite over $R[x_1, \dots, x_{n-1}]$ because of our choice of R' , see Lemma 10.35.4. Let $\mathfrak{q}'' = R'' \cap \mathfrak{q}$. Since $(R'')_{\mathfrak{q}''} = S_{\mathfrak{q}}$ we see that $R \rightarrow R''$ is quasi-finite at \mathfrak{q}'' , see Lemma 10.118.2. We apply our induction hypothesis to $R \rightarrow R''$, \mathfrak{q}'' and $x_1, \dots, x_{n-1} \in R''$ and we find a subring $R''' \subset R''$ which is integral over R and an element $g'' \in R'''$, $g'' \notin \mathfrak{q}''$ such that $(R''')_{g''} \cong (R'')_{g''}$. Write the image of g' in $(R'')_{g''}$ as $g'''/(g'')^n$ for some $g''' \in R'''$. Set $g = g''g''' \in R'''$. Then it is clear that $g \notin \mathfrak{q}$ and $(R''')_g \cong S_g$. Since by construction we have $R''' \subset S'$ we also have $S'_g \cong S_g$ as desired. \square

Lemma 10.119.14. *Let $R \rightarrow S$ be a finite type ring map. The set of points \mathfrak{q} of $\text{Spec}(S)$ at which S/R is quasi-finite is open in $\text{Spec}(S)$.*

Proof. Let $\mathfrak{q} \subset S$ be a point at which the ring map is quasi-finite. By Theorem 10.119.13 there exists an integral ring extension $R \rightarrow S'$, $S' \subset S$ and an element $g \in S'$, $g \notin \mathfrak{q}$ such that $S'_g \cong S_g$. Since S and hence S_g are of finite type over R we may find finitely many elements y_1, \dots, y_N of S' such that $S''_g \cong S$ where $S'' \subset S'$ is the sub R -algebra generated by g, y_1, \dots, y_N . Since S'' is finite over R (see Lemma 10.35.4) we see that S'' is quasi-finite over R (see Lemma 10.118.4). It is easy to see that this implies that S'_g is quasi-finite over R , for example because the property of being quasi-finite at a prime depends only on the local ring at the prime. Thus we see that S_g is quasi-finite over R . By the same token this implies that $R \rightarrow S$ is quasi-finite at every prime of S which lies in $D(g)$. \square

Lemma 10.119.15. *Let $R \rightarrow S$ be a finite type ring map. Suppose that S is quasi-finite over R . Let $S' \subset S$ be the integral closure of R in S . Then*

- (1) $\text{Spec}(S) \rightarrow \text{Spec}(S')$ is a homeomorphism onto an open subset,
- (2) if $g \in S'$ and $D(g)$ is contained in the image of the map, then $S'_g \cong S_g$,
and
- (3) there exists a finite R -algebra $S'' \subset S'$ such that (1) and (2) hold for the ring map $S'' \rightarrow S$.

Proof. Because S/R is quasi-finite we may apply Theorem 10.119.13 to each point \mathfrak{q} of $\text{Spec}(S)$. Since $\text{Spec}(S)$ is quasi-compact, see Lemma 10.16.10, we may choose a finite number of $g_i \in S'$, $i = 1, \dots, n$ such that $S'_{g_i} = S_{g_i}$, and such that g_1, \dots, g_n generate the unit ideal in S (in other words the standard opens of $\text{Spec}(S)$ associated to g_1, \dots, g_n cover all of $\text{Spec}(S)$).

Suppose that $D(g) \subset \text{Spec}(S')$ is contained in the image. Then $D(g) \subset \bigcup D(g_i)$. In other words, g_1, \dots, g_n generate the unit ideal of S'_g . Note that $S'_{gg_i} \cong S_{gg_i}$ by our choice of g_i . Hence $S'_g \cong S_g$ by Lemma 10.23.2.

We construct a finite algebra $S'' \subset S'$ as in (3). To do this note that each $S'_{g_i} \cong S_{g_i}$ is a finite type R -algebra. For each i pick some elements $y_{ij} \in S'$ such that each S'_{g_i} is generated as R -algebra by $1/g_i$ and the elements y_{ij} . Then set S'' equal to the sub R -algebra of S' generated by all g_i and all the y_{ij} . Details omitted. \square

10.120. Applications of Zariski's Main Theorem

Here is an immediate application characterizing the finite maps of 1-dimensional semi-local rings among the quasi-finite ones as those where equality always holds in the formula of Lemma 10.117.8.

Lemma 10.120.1. *Let $A \subset B$ be an extension of domains. Assume*

- (1) A is a local Noetherian ring of dimension 1,
- (2) $A \rightarrow B$ is of finite type, and
- (3) the extension $K = f.f.(A) \subset L = f.f.(B)$ is a finite field extension.

Then B is semi-local. Let $x \in \mathfrak{m}_A$, $x \neq 0$. Let \mathfrak{m}_i , $i = 1, \dots, n$ be the maximal ideals of B . Then

$$[L : K] \text{ord}_A(x) \geq \sum_i [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)] \text{ord}_{B_{\mathfrak{m}_i}}(x)$$

where ord is defined as in Definition 10.117.2. We have equality if and only if $A \rightarrow B$ is finite.

Proof. The ring B is semi-local by Lemma 10.109.2. Let B' be the integral closure of A in B . By Lemma 10.119.15 we can find a finite A -subalgebra $C \subset B'$ such that on setting $\mathfrak{n}_i = C \cap \mathfrak{m}_i$ we have $C_{\mathfrak{n}_i} \cong B_{\mathfrak{m}_i}$ and the primes $\mathfrak{n}_1, \dots, \mathfrak{n}_n$ are pairwise distinct. The ring C is semi-local by Lemma 10.109.2. Let $\mathfrak{p}_j, j = 1, \dots, m$ be the other maximal ideals of C (the “missing points”). By Lemma 10.117.8 we have

$$\text{ord}_A(x^{[L:K]}) = \sum_i [\kappa(\mathfrak{n}_i) : \kappa(\mathfrak{m}_A)] \text{ord}_{C_{\mathfrak{n}_i}}(x) + \sum_j [\kappa(\mathfrak{p}_j) : \kappa(\mathfrak{m}_A)] \text{ord}_{C_{\mathfrak{p}_j}}(x)$$

hence the inequality follows. In case of equality we conclude that $m = 0$ (no “missing points”). Hence $C \subset B$ is an inclusion of semi-local rings inducing a bijection on maximal ideals and an isomorphism on all localizations at maximal ideals. So if $b \in B$, then $I = \{x \in C \mid xb \in C\}$ is an ideal of C which is not contained in any of the maximal ideals of C , and hence $I = C$, hence $b \in C$. Thus $B = C$ and B is finite over A . \square

Here is a more standard application of Zariski’s main theorem to the structure of local homomorphisms of local rings.

Lemma 10.120.2. *Let $(R, \mathfrak{m}_R) \rightarrow (S, \mathfrak{m}_S)$ be a local homomorphism of local rings. Assume*

- (1) $R \rightarrow S$ is essentially of finite type,
- (2) $\kappa(\mathfrak{m}_R) \subset \kappa(\mathfrak{m}_S)$ is finite, and
- (3) $\dim(S/\mathfrak{m}_R S) = 0$.

Then S is the localization of a finite R -algebra.

Proof. Let S' be a finite type R -algebra such that $S = S'_{\mathfrak{q}'}$ for some prime \mathfrak{q}' of S' . By Definition 10.118.3 we see that $R \rightarrow S'$ is quasi-finite at \mathfrak{q}' . After replacing S' by $S'_{g'}$ for some $g' \in S', g' \notin \mathfrak{q}'$ we may assume that $R \rightarrow S'$ is quasi-finite, see Lemma 10.119.14. Then by Lemma 10.119.15 there exists a finite R -algebra S'' and elements $g' \in S', g' \notin \mathfrak{q}'$ and $g'' \in S''$ such that $S'_{g'} \cong S''_{g''}$ as R -algebras. This proves the lemma. \square

Lemma 10.120.3. *Let $R \rightarrow S$ be a ring map, \mathfrak{q} a prime of S lying over \mathfrak{p} in R . If*

- (1) R is Noetherian,
- (2) $R \rightarrow S$ is of finite type, and
- (3) $R \rightarrow S$ is quasi-finite at \mathfrak{q} ,

then $R_{\mathfrak{p}}^{\wedge} \otimes_R S = S_{\mathfrak{q}}^{\wedge} \times B$ for some $R_{\mathfrak{p}}^{\wedge}$ -algebra B .

Proof. There exists a finite R -algebra $S' \subset S$ and an element $g \in S', g \notin \mathfrak{q}' = S' \cap \mathfrak{q}$ such that $S'_g = S_g$ and in particular $S'_{\mathfrak{q}'} = S_{\mathfrak{q}}$, see Lemma 10.119.15. We have

$$R_{\mathfrak{p}}^{\wedge} \otimes_R S' = (S'_{\mathfrak{q}'})^{\wedge} \times B'$$

by Lemma 10.93.19. Note that we have a commutative diagram

$$\begin{array}{ccc} R_{\mathfrak{p}}^{\wedge} \otimes_R S & \longrightarrow & S_{\mathfrak{q}}^{\wedge} \\ \uparrow & & \uparrow \\ R_{\mathfrak{p}}^{\wedge} \otimes_R S' & \longrightarrow & (S'_{\mathfrak{q}'})^{\wedge} \end{array}$$

where the right vertical is an isomorphism and the lower horizontal arrow is the projection map of the product decomposition above. The lemma follows. \square

10.121. Dimension of fibres

We study the behaviour of dimensions of fibres, using Zariski's main theorem. Recall that we defined the dimension $\dim_x(X)$ of a topological space X at a point x in Topology, Definition 5.9.1.

Definition 10.121.1. Suppose that $R \rightarrow S$ is of finite type, and let $\mathfrak{q} \subset S$ be a prime lying over a prime \mathfrak{p} of R . We define the *relative dimension of S/R at \mathfrak{q}* , denoted $\dim_{\mathfrak{q}}(S/R)$, to be the dimension of $\text{Spec}(S \otimes_R \kappa(\mathfrak{p}))$ at the point corresponding to \mathfrak{q} . We let $\dim(S/R)$ be the supremum of $\dim_{\mathfrak{q}}(S/R)$ over all \mathfrak{q} . This is called the *relative dimension of S/R* .

In particular, $R \rightarrow S$ is quasi-finite at \mathfrak{q} if and only if $\dim_{\mathfrak{q}}(S/R) = 0$. The following lemma is more or less a reformulation of Zariski's Main Theorem.

Lemma 10.121.2. *Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime. Suppose that $\dim_{\mathfrak{q}}(S/R) = n$. There exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is quasi-finite over a polynomial algebra $R[t_1, \dots, t_n]$.*

Proof. The ring $\bar{S} = S \otimes_R \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$. Let $\bar{\mathfrak{q}}$ be the prime of \bar{S} corresponding to \mathfrak{q} . By definition of the dimension of a topological space at a point there exists an open $U \subset \text{Spec}(\bar{S})$ with $\bar{\mathfrak{q}} \in U$ and $\dim(U) = n$. Since the topology on $\text{Spec}(\bar{S})$ is induced from the topology on $\text{Spec}(S)$ (see Remark 10.16.8), we can find a $g \in S$, $g \notin \mathfrak{q}$ with image $\bar{g} \in \bar{S}$ such that $D(\bar{g}) \subset U$. Thus after replacing S by S_g we see that $\dim(\bar{S}) = n$.

Next, choose generators x_1, \dots, x_N for S as an R -algebra. By Lemma 10.111.4 there exist elements y_1, \dots, y_n in the \mathbf{Z} -subalgebra of S generated by x_1, \dots, x_N such that the map $R[t_1, \dots, t_n] \rightarrow S$, $t_i \mapsto y_i$ has the property that $\kappa(\mathfrak{p})[t_1, \dots, t_n] \rightarrow \bar{S}$ is finite. In particular, S is quasi-finite over $R[t_1, \dots, t_n]$ at \mathfrak{q} . Hence, by Lemma 10.119.14 we may replace S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ such that $R[t_1, \dots, t_n] \rightarrow S$ is quasi-finite. \square

Lemma 10.121.3. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} of R . Assume*

- (1) $R \rightarrow S$ is of finite type,
- (2) $\dim_{\mathfrak{q}}(S/R) = n$, and
- (3) $\text{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q}) = r$.

Then there exist $f \in R$, $f \notin \mathfrak{p}$, $g \in S$, $g \notin \mathfrak{q}$ and a quasi-finite ring map

$$\varphi : R_f[x_1, \dots, x_n] \longrightarrow S_g$$

such that $\varphi^{-1}(\mathfrak{q}S_g) = (\mathfrak{p}, x_{r+1}, \dots, x_n)R_f[x_{r+1}, \dots, x_n]$

Proof. After replacing S by a principal localization we may assume there exists a quasi-finite ring map $\varphi : R[t_1, \dots, t_n] \rightarrow S$, see Lemma 10.121.2. Set $\mathfrak{q}' = \varphi^{-1}(\mathfrak{q})$. Let $\bar{\mathfrak{q}}' \subset \kappa(\mathfrak{p})[t_1, \dots, t_n]$ be the prime corresponding to \mathfrak{q}' . By Lemma 10.111.6 there exists a finite ring map $\kappa(\mathfrak{p})[x_1, \dots, x_n] \rightarrow \kappa(\mathfrak{p})[t_1, \dots, t_n]$ such that the inverse image of $\bar{\mathfrak{q}}'$ is (x_{r+1}, \dots, x_n) . Let $\bar{h}_i \in \kappa(\mathfrak{p})[t_1, \dots, t_n]$ be the image of x_i . We can find an element $f \in R$, $f \notin \mathfrak{p}$ and $h_i \in R_f[t_1, \dots, t_n]$ which map to \bar{h}_i in $\kappa(\mathfrak{p})[t_1, \dots, t_n]$. Then the ring map

$$R_f[x_1, \dots, x_n] \longrightarrow R_f[t_1, \dots, t_n]$$

becomes finite after tensoring with $\kappa(\mathfrak{p})$. In particular, $R_f[t_1, \dots, t_n]$ is quasi-finite over $R_f[x_1, \dots, x_n]$ at the prime $\mathfrak{q}'R_f[t_1, \dots, t_n]$. Hence, by Lemma 10.119.14 there exists a $g \in R_f[t_1, \dots, t_n]$, $g \notin \mathfrak{q}'R_f[t_1, \dots, t_n]$ such that $R_f[x_1, \dots, x_n] \rightarrow R_f[t_1, \dots, t_n, 1/g]$ is quasi-finite. Thus we see that the composition

$$R_f[x_1, \dots, x_n] \longrightarrow R_f[t_1, \dots, t_n, 1/g] \longrightarrow S_{\varphi(g)}$$

is quasi-finite and we win. \square

Lemma 10.121.4. *Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. If $R \rightarrow S$ is quasi-finite at \mathfrak{q} , then $\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}})$.*

Proof. If $R_{\mathfrak{p}}$ is Noetherian (and hence $S_{\mathfrak{q}}$ Noetherian since it is essentially of finite type over $R_{\mathfrak{p}}$) then this follows immediately from Lemma 10.108.6 and the definitions. In the general case we can use Zariski's Main Theorem 10.119.13 to write $S_{\mathfrak{q}} = S'_{\mathfrak{q}'}$ for some ring S' integral over $R_{\mathfrak{p}}$. Thus the result follows from Lemma 10.108.3. \square

Lemma 10.121.5. *Let k be a field. Let S be a finite type k -algebra. Suppose there is a quasi-finite k -algebra map $k[t_1, \dots, t_n] \subset S$. Then $\dim(S) \leq n$.*

Proof. By Lemma 10.110.1 the dimension of any local ring of $k[t_1, \dots, t_n]$ is at most n . Thus the result follows from Lemma 10.121.4. \square

Lemma 10.121.6. *Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime. Suppose that $\dim_{\mathfrak{q}}(S/R) = n$. There exists an open neighbourhood V of \mathfrak{q} in $\text{Spec}(S)$ such that $\dim_{\mathfrak{q}'}(S/R) \leq n$ for all $\mathfrak{q}' \in V$.*

Proof. By Lemma 10.121.2 we see that we may assume that S is quasi-finite over a polynomial algebra $R[t_1, \dots, t_n]$. Considering the fibres, we reduce to Lemma 10.121.5. \square

In other words, the lemma says that the set of points where the fibre has dimension $\leq n$ is open in $\text{Spec}(S)$. The next lemma says that formation of this open commutes with base change. If the ring map is of finite presentation then this set is quasi-compact open (see below).

Lemma 10.121.7. *Let $R \rightarrow S$ be a finite type ring map. Let $R \rightarrow R'$ be any ring map. Set $S' = R' \otimes_R S$ and denote $f : \text{Spec}(S') \rightarrow \text{Spec}(S)$ the associated map on spectra. Let $n \geq 0$. The inverse image $f^{-1}(\{\mathfrak{q} \in \text{Spec}(S) \mid \dim_{\mathfrak{q}}(S/R) \leq n\})$ is equal to $\{\mathfrak{q}' \in \text{Spec}(S') \mid \dim_{\mathfrak{q}'}(S'/R') \leq n\}$.*

Proof. The condition is formulated in terms of dimensions of fibre rings which are of finite type over a field. Combined with Lemma 10.112.6 this yields the lemma. \square

Lemma 10.121.8. *Let $R \rightarrow S$ be a ring homomorphism of finite presentation. Let $n \geq 0$. The set*

$$V_n = \{\mathfrak{q} \in \text{Spec}(S) \mid \dim_{\mathfrak{q}}(S/R) \leq n\}$$

is a quasi-compact open subset of $\text{Spec}(S)$.

Proof. It is open by Lemma 10.121.6. Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ be a presentation of S . Let R_0 be the \mathbf{Z} -subalgebra of R generated by the coefficients of the polynomials f_i . Let $S_0 = R_0[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Then $S = R \otimes_{R_0} S_0$. By Lemma 10.121.7 V_n is the inverse image of an open $V_{0,n}$ under the quasi-compact

continuous map $\text{Spec}(S) \rightarrow \text{Spec}(S_0)$. Since S_0 is Noetherian we see that $V_{0,n}$ is quasi-compact. \square

Lemma 10.121.9. *Let R be a valuation ring with residue field k and field of fractions K . Let S be a domain containing R such that S is of finite type over R . If $S \otimes_R k$ is not the zero ring then*

$$\dim(S \otimes_R k) = \dim(S \otimes_R K)$$

In fact, $\text{Spec}(S \otimes_R k)$ is equidimensional.

Proof. It suffices to show that $\dim_{\mathfrak{q}}(S/k)$ is equal to $\dim(S \otimes_R K)$ for every prime \mathfrak{q} of S containing $\mathfrak{m}_R S$. Pick such a prime. By Lemma 10.121.6 the inequality $\dim_{\mathfrak{q}}(S/k) \geq \dim(S \otimes_R K)$ holds. Set $n = \dim_{\mathfrak{q}}(S/k)$. By Lemma 10.121.2 after replacing S by $S_{\mathfrak{g}}$ for some $g \in S$, $g \notin \mathfrak{q}$ there exists a quasi-finite ring map $R[t_1, \dots, t_n] \rightarrow S$. If $\dim(S \otimes_R K) < n$, then $K[t_1, \dots, t_n] \rightarrow S \otimes_R K$ has a nonzero kernel. Say $f = \sum a_I t_1^{i_1} \dots t_n^{i_n}$. After dividing f by a nonzero coefficient of f with minimal valuation, we may assume $f \in R[t_1, \dots, t_n]$ and some a_I does not map to zero in k . Hence the ring map $k[t_1, \dots, t_n] \rightarrow S \otimes_R k$ has a nonzero kernel which implies that $\dim(S \otimes_R k) < n$. Contradiction. \square

10.122. Algebras and modules of finite presentation

In this section we discuss some standard results where the key feature is that the assumption involves a finite type or finite presentation assumption.

Lemma 10.122.1. *Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \rightarrow S$ is of finite type if and only if $R' \rightarrow S'$ is of finite type.*

Proof. It is clear that if $R \rightarrow S$ is of finite type then $R' \rightarrow S'$ is of finite type. Assume that $R' \rightarrow S'$ is of finite type. Say y_1, \dots, y_m generate S' over R' . Write $y_j = \sum_i a_{ij} \otimes x_{ji}$ for some $a_{ij} \in R'$ and $x_{ji} \in S$. Let $A \subset S$ be the R -subalgebra generated by the x_{ij} . By flatness we have $A' := R' \otimes_R A \subset S'$, and by construction $y_j \in A'$. Hence $A' = S'$. By faithful flatness $A = S$. \square

Lemma 10.122.2. *Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \rightarrow S$ is of finite presentation if and only if $R' \rightarrow S'$ is of finite presentation.*

Proof. It is clear that if $R \rightarrow S$ is of finite presentation then $R' \rightarrow S'$ is of finite presentation. Assume that $R' \rightarrow S'$ is of finite presentation. By Lemma 10.122.1 we see that $R \rightarrow S$ is of finite type. Write $S = R[x_1, \dots, x_n]/I$. By flatness $S' = R'[x_1, \dots, x_n]/R' \otimes I$. Say g_1, \dots, g_m generate $R' \otimes I$ over $R'[x_1, \dots, x_n]$. Write $g_j = \sum_i a_{ij} \otimes f_{ji}$ for some $a_{ij} \in R'$ and $f_{ji} \in I$. Let $J \subset I$ be the ideal generated by the f_{ij} . By flatness we have $R' \otimes_R J \subset R' \otimes_R I$, and both are ideals over $R'[x_1, \dots, x_n]$. By construction $g_j \in R' \otimes_R J$. Hence $R' \otimes_R J = R' \otimes_R I$. By faithful flatness $J = I$. \square

Lemma 10.122.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let $S \subset R$ be a multiplicative subset. Set $R' = S^{-1}(R/I) = S^{-1}R/S^{-1}I$.*

- (1) *For any finite R' -module M' there exists a finite R -module M such that $S^{-1}(M/IM) \cong M'$.*

- (2) For any finitely presented R' -module M' there exists a finitely presented R -module M such that $S^{-1}(M/IM) \cong M'$.

Proof. Proof of (1). Choose a short exact sequence $0 \rightarrow K' \rightarrow (R')^{\oplus n} \rightarrow M' \rightarrow 0$. Let $K \subset R^{\oplus n}$ be the inverse image of K' under the map $R^{\oplus n} \rightarrow (R')^{\oplus n}$. Then $M = R^{\oplus n}/K$ works.

Proof of (2). Choose a presentation $(R')^{\oplus m} \rightarrow (R')^{\oplus n} \rightarrow M' \rightarrow 0$. Suppose that the first map is given by the matrix $A' = (a'_{ij})$ and the second map is determined by generators $x'_i \in M'$, $i = 1, \dots, n$. As $R' = S^{-1}(R/I)$ we can choose $s \in S$ and a matrix $A = (a_{ij})$ with coefficients in R such that $a'_{ij} = a_{ij}/s \pmod{S^{-1}I}$. Let M be the finitely presented R -module with presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$ where the first map is given by the matrix A and the second map is determined by generators $x_i \in M$, $i = 1, \dots, n$. Then the map $M \rightarrow M'$, $x_i \mapsto x'_i$ induces an isomorphism $S^{-1}(M/IM) \cong M'$. \square

Lemma 10.122.4. Let R be a ring. Let $S \subset R$ be a multiplicative subset. Let M be an R -module.

- (1) If $S^{-1}M$ is a finite $S^{-1}R$ -module then there exists a finite R -module M' and a map $M' \rightarrow M$ which induces an isomorphism $S^{-1}M' \rightarrow S^{-1}M$.
- (2) If $S^{-1}M$ is a finitely presented $S^{-1}R$ -module then there exists an R -module M' of finite presentation and a map $M' \rightarrow M$ which induces an isomorphism $S^{-1}M' \rightarrow S^{-1}M$.

Proof. Proof of (1). Let $x_1, \dots, x_n \in M$ be elements which generate $S^{-1}M$ as an $S^{-1}R$ -module. Let M' be the R -submodule of M generated by x_1, \dots, x_n .

Proof of (2). Let $x_1, \dots, x_n \in M$ be elements which generate $S^{-1}M$ as an $S^{-1}R$ -module. Let $K = \text{Ker}(R^{\oplus n} \rightarrow M)$ where the map is given by the rule $(a_1, \dots, a_n) \mapsto \sum a_i x_i$. By Lemma 10.5.3 we see that $S^{-1}K$ is a finite $S^{-1}R$ -module. By (1) we can find a finite submodule $K' \subset K$ with $S^{-1}K' = S^{-1}K$. Take $M' = \text{Coker}(K' \rightarrow R^{\oplus n})$. \square

Lemma 10.122.5. Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let M be an R -module.

- (1) If $M_{\mathfrak{p}}$ is a finite $R_{\mathfrak{p}}$ -module then there exists a finite R -module M' and a map $M' \rightarrow M$ which induces an isomorphism $M'_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}$.
- (2) If $M_{\mathfrak{p}}$ is a finitely presented $R_{\mathfrak{p}}$ -module then there exists an R -module M' of finite presentation and a map $M' \rightarrow M$ which induces an isomorphism $M'_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}$.

Proof. This is a special case of Lemma 10.122.4 \square

Lemma 10.122.6. Let $\varphi: R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Assume

- (1) S is of finite presentation over R ,
- (2) φ induces an isomorphism $R_{\mathfrak{p}} \cong S_{\mathfrak{q}}$.

Then there exist $f \in R$, $f \notin \mathfrak{p}$ and an R_f -algebra C such that $S_f \cong R_f \times C$ as R_f -algebras.

Proof. Write $S = R[x_1, \dots, x_n]/(g_1, \dots, g_m)$. Let $a_i \in R_{\mathfrak{p}}$ be an element mapping to the image of x_i in $S_{\mathfrak{q}}$. Write $a_i = b_i/f$ for some $f \in R$, $f \notin \mathfrak{p}$. After replacing R

by R_f and x_i by $x_i - a_i$ we may assume that $S = R[x_1, \dots, x_n]/(g_1, \dots, g_m)$ such that x_i maps to zero in $S_{\mathfrak{q}}$. Then if c_j denotes the constant term of g_j we conclude that c_i maps to zero in $R_{\mathfrak{p}}$. After another replacement of R we may assume that the constant coefficients c_j of the g_j are zero. Thus we obtain an R -algebra map $S \rightarrow R$, $x_i \mapsto 0$ whose kernel is the ideal (x_1, \dots, x_n) .

Note that $\mathfrak{q} = \mathfrak{p}S + (x_1, \dots, x_n)$. Write $g_j = \sum a_{ji}x_i + h.o.t.$. Since $S_{\mathfrak{q}} = R_{\mathfrak{p}}$ we have $\mathfrak{p} \otimes \kappa(\mathfrak{p}) = \mathfrak{q} \otimes \kappa(\mathfrak{q})$. It follows that $m \times n$ matrix $A = (a_{ij})$ defines a surjective map $\kappa(\mathfrak{p})^{\oplus m} \rightarrow \kappa(\mathfrak{p})^{\oplus n}$. Thus after inverting some element of R not in \mathfrak{p} we may assume there are $b_{ij} \in R$ such that $\sum b_{ij}g_j = x_i + h.o.t.$. We conclude that $(x_1, \dots, x_n) = (x_1, \dots, x_n)^2$ in S . It follows from Lemma 10.20.5 that (x_1, \dots, x_n) is generated by an idempotent e . Setting $C = eS$ finishes the proof. \square

Lemma 10.122.7. *Let R be a ring. Let S, S' be of finite presentation over R . Let $\mathfrak{q} \subset S$ and $\mathfrak{q}' \subset S'$ be primes. If $S_{\mathfrak{q}} \cong S_{\mathfrak{q}'}$ as R -algebras, then there exist $g \in S$, $g \notin \mathfrak{q}$ and $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S_g \cong S'_{g'}$ as R -algebras.*

Proof. Let $\psi : S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}'}$ be the isomorphism of the hypothesis of the lemma. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_r)$ and $S' = R[y_1, \dots, y_m]/J$. For each $i = 1, \dots, n$ choose a fraction h_i/g_i with $h_i, g_i \in R[y_1, \dots, y_m]$ and $g_i \bmod J$ not in \mathfrak{q}' which represents the image of x_i under ψ . After replacing S' by $S'_{g_1 \dots g_n}$ and $R[y_1, \dots, y_m, y_{m+1}]$ (mapping y_{m+1} to $1/(g_1 \dots g_n)$) we may assume that $\psi(x_i)$ is the image of some $h_i \in R[y_1, \dots, y_m]$. Consider the elements $f_j(h_1, \dots, h_n) \in R[y_1, \dots, y_m]$. Since ψ kills each f_j we see that there exists a $g \in R[y_1, \dots, y_m]$, $g \bmod J \notin \mathfrak{q}'$ such that $gf_j(h_1, \dots, h_n) \in J$ for each $j = 1, \dots, r$. After replacing S' by S'_g and $R[y_1, \dots, y_m, y_{m+1}]$ as before we may assume that $f_j(h_1, \dots, h_n) \in J$. Thus we obtain a ring map $S \rightarrow S'$, $x_i \mapsto h_i$ which induces ψ on local rings. By Lemma 10.6.2 the map $S' \rightarrow S$ is of finite presentation. By Lemma 10.122.6 we may assume that $S = S' \times C$. Thus localizing S at the idempotent corresponding to the factor C we obtain the result. \square

Lemma 10.122.8. *Let R be a ring. Let $I \subset R$ be a locally nilpotent ideal. Let $S \rightarrow S'$ be an R -algebra map such that $S \rightarrow S'/IS'$ is surjective and such that S' is of finite type over R . Then $S \rightarrow S'$ is surjective.*

Proof. Write $S' = R[x_1, \dots, x_m]/K$ for some ideal K . By assumption there exist $g_j = x_j + \sum \delta_{j,J}x^J \in R[x_1, \dots, x_m]$ with $\delta_{j,J} \in I$ and with $g_j \bmod K \in \text{Im}(S \rightarrow S')$. Hence it suffices to show that g_1, \dots, g_m generate $R[x_1, \dots, x_m]$. Let $R_0 \subset R$ be a finitely generated \mathbf{Z} -subalgebra of R containing at least the $\delta_{j,J}$. Then $R_0 \cap I$ is a nilpotent ideal (by Lemma 10.31.4). It follows that $R_0[x_1, \dots, x_m]$ is generated by g_1, \dots, g_m (because $x_j \mapsto g_j$ defines an automorphism of $R_0[x_1, \dots, x_m]$; details omitted). Since R is the union of the subrings R_0 we win. \square

Lemma 10.122.9. *Let R be a ring. Let $I \subset R$ be an ideal. Let $S \rightarrow S'$ be an R -algebra map. Let $IS \subset \mathfrak{q} \subset S$ be a prime ideal. Assume that*

- (1) $S \rightarrow S'$ is surjective,
- (2) $S_{\mathfrak{q}}/IS_{\mathfrak{q}} \rightarrow S'_{\mathfrak{q}}/IS'_{\mathfrak{q}}$ is an isomorphism,
- (3) S is of finite type over R ,
- (4) S' of finite presentation over R , and
- (5) $S'_{\mathfrak{q}}$ is flat over R .

Then $S_g \rightarrow S'_g$ is an isomorphism for some $g \in S$, $g \notin \mathfrak{q}$.

Proof. Let $J = \text{Ker}(S \rightarrow S')$. By Lemma 10.6.2 J is a finitely generated ideal. Since S'_q is flat over R we see that $J_q/IJ_q \subset S_q/IS_q$ (apply Lemma 10.38.11 to $0 \rightarrow J \rightarrow S \rightarrow S' \rightarrow 0$). By assumption (2) we see that J_q/IJ_q is zero. By Nakayama's lemma (Lemma 10.19.1) we see that there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $J_g = 0$. Hence $S_g \cong S'_g$ as desired. \square

Lemma 10.122.10. *Let R be a ring. Let $I \subset R$ be an ideal. Let $S \rightarrow S'$ be an R -algebra map. Assume that*

- (1) I is locally nilpotent,
- (2) $S/IS \rightarrow S'/IS'$ is an isomorphism,
- (3) S is of finite type over R ,
- (4) S' of finite presentation over R , and
- (5) S' is flat over R .

Then $S \rightarrow S'$ is an isomorphism.

Proof. By Lemma 10.122.8 the map $S \rightarrow S'$ is surjective. As I is locally nilpotent, so are the ideals IS and IS' (Lemma 10.31.2). Hence every prime ideal \mathfrak{q} of S contains IS and (trivially) $S_q/IS_q \cong S'_q/IS'_q$. Thus Lemma 10.122.9 applies and we see that $S_q \rightarrow S'_q$ is an isomorphism for every prime $\mathfrak{q} \subset S$. It follows that $S \rightarrow S'$ is injective for example by Lemma 10.23.1. \square

10.123. Colimits and maps of finite presentation

In this section we prove some preliminary lemmas which will eventually help us prove result using absolute Noetherian reduction. We begin discussing how we will think about colimits in this section.

Let (Λ, \geq) a partially ordered set. A system of rings over Λ is given by a ring R_λ for every $\lambda \in \Lambda$, and a morphism $R_\lambda \rightarrow R_\mu$ whenever $\lambda \leq \mu$. These morphisms have to satisfy the rule that $R_\lambda \rightarrow R_\mu \rightarrow R_\nu$ is equal to the map $R_\lambda \rightarrow R_\nu$ for all $\lambda \leq \mu \leq \nu$. See Categories, Section 4.21. We will often assume that (Λ, \leq) is *directed*, which means that Λ is nonempty and given $\lambda, \mu \in \Lambda$ there exists a $\nu \in \Lambda$ with $\lambda \leq \nu$ and $\mu \leq \nu$. Recall that the colimit $\text{colim}_\lambda R_\lambda$ is sometimes called a "direct limit" in this case (but we will not use this terminology).

Lemma 10.123.1. *Let $R \rightarrow A$ be a ring map. There exists a directed system A_λ of R -algebras of finite presentation such that $A = \text{colim}_\lambda A_\lambda$. If A is of finite type over R we may arrange it so that all the transition maps are surjective.*

Proof. Compare with the proof of Lemma 10.8.13. Consider any finite subset $S \subset A$, and any finite collection of polynomial relations E among the elements of S . So each $s \in S$ corresponds to $x_s \in A$ and each $e \in E$ consists of a polynomial $f_e \in R[X_s; s \in S]$ such that $f_e(x_s) = 0$. Let $A_{S,E} = R[X_s; s \in S]/(f_e; e \in E)$ which is a finitely presented R -algebra. There are canonical maps $A_{S,E} \rightarrow A$. If $S \subset S'$ and if the elements of E correspond, via the map $R[X_s; s \in S] \rightarrow R[X_s; s \in S']$, to a subset of E' , then there is an obvious map $A_{S,E} \rightarrow A_{S',E'}$ commuting with the maps to A . Thus, setting Λ equal the set of pairs (S, E) with ordering by inclusion as above, we get a directed partially ordered set. It is clear that the colimit of this directed system is A .

For the last statement, suppose $A = R[x_1, \dots, x_n]/I$. In this case, consider the subset $\Lambda' \subset \Lambda$ consisting of those systems (S, E) above with $S = \{x_1, \dots, x_n\}$. It is

easy to see that still $A = \operatorname{colim}_{\lambda' \in \Lambda'} A_{\lambda'}$. Moreover, the transition maps are clearly surjective. \square

It turns out that we can characterize ring maps of finite presentation as follows. This in some sense says that the algebras of finite presentation are the “compact” objects in the category of R -algebras.

Lemma 10.123.2. *Let $\varphi : R \rightarrow S$ be a ring map. Then φ is of finite presentation if and only if for every directed system A_λ of R -algebras we have*

$$\operatorname{colim}_\lambda \operatorname{Hom}_R(S, A_\lambda) = \operatorname{Hom}_R(S, \operatorname{colim}_\lambda A_\lambda)$$

Proof. Suppose $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. If $\chi : S \rightarrow \operatorname{colim} A_\lambda$ is a map, then each x_i maps to some element in the image of some A_{λ_i} . We may pick $\mu \geq \lambda_i$, $i = 1, \dots, n$ and assume $\chi(x_i)$ is the image of $y_i \in A_\mu$ for $i = 1, \dots, n$. Consider $z_j = f_j(y_1, \dots, y_n) \in A_\mu$. Since χ is a homomorphism the image of z_j in $\operatorname{colim}_\lambda A_\lambda$ is zero. Hence there exists a $\mu_j \geq \mu$ such that z_j maps to zero in A_{μ_j} . Pick $\nu \geq \mu_j$, $j = 1, \dots, m$. Then the images of z_1, \dots, z_m are zero in A_ν . This exactly means that the y_i map to elements $y'_i \in A_\nu$ which satisfy the relations $f_j(y'_1, \dots, y'_n) = 0$. Thus we obtain a ring map $S \rightarrow A_\nu$ as desired.

Conversely, suppose the displayed formula holds always. By Lemma 10.123.1 we may write $S = \operatorname{colim}_\lambda S_\lambda$ with S_λ of finite presentation over R . Then the identity map factors as

$$S \rightarrow S_\lambda \rightarrow S$$

for some λ . This implies that S is finitely presented over S_λ by Lemma 10.6.2 part (4) applied to $S \rightarrow S_\lambda \rightarrow S$. Applying part (2) of the same lemma to $R \rightarrow S_\lambda \rightarrow S$ we conclude that S is of finite presentation over R . \square

But more is true. Namely, given $R = \operatorname{colim}_\lambda R_\lambda$ we see that the category of finitely presented R -modules is equivalent to the limit of the category of finitely presented R_λ -modules. Similarly for the categories of finitely presented R -algebras.

Lemma 10.123.3. *Let A be a ring and let M, N be A -modules. Suppose that $R = \operatorname{colim}_{i \in I} R_i$ is a directed colimit of A -algebras.*

- (1) *If M is a finite A -module, and $u, u' : M \rightarrow N$ are A -module maps such that $u \otimes 1 = u' \otimes 1 : M \otimes_A R \rightarrow N \otimes_A R$ then for some i we have $u \otimes 1 = u' \otimes 1 : M \otimes_A R_i \rightarrow N \otimes_A R_i$.*
- (2) *If N is a finite A -module and $u : M \rightarrow N$ is an A -module map such that $u \otimes 1 : M \otimes_A R \rightarrow N \otimes_A R$ is surjective, then for some i the map $u \otimes 1 : M \otimes_A R_i \rightarrow N \otimes_A R_i$ is surjective.*
- (3) *If N is a finitely presented A -module, and $v : N \otimes_A R \rightarrow M \otimes_A R$ is an R -module map, then there exists an i and an R_i -module map $v_i : N \otimes_A R_i \rightarrow M \otimes_A R_i$ such that $v = v_i \otimes 1$.*
- (4) *If M is a finite A -module, N is a finitely presented A -module, and $u : M \rightarrow N$ is an R -module map such that $u \otimes 1 : M \otimes_A R \rightarrow N \otimes_A R$ is an isomorphism, then for some i the map $u \otimes 1 : M \otimes_A R_i \rightarrow N \otimes_A R_i$ is an isomorphism.*

Proof. To prove (1) assume u is as in (1) and let $x_1, \dots, x_m \in M$ be generators. Since $N \otimes_A R = \operatorname{colim}_i N \otimes_A R_i$ we may pick an $i \in I$ such that $u(x_j) \otimes 1 = u'(x_j) \otimes 1$ in $M \otimes_A R_i$, $j = 1, \dots, m$. For such an i we have $u \otimes 1 = u' \otimes 1 : M \otimes_A R_i \rightarrow N \otimes_A R_i$.

To prove (2) assume $u \otimes 1$ surjective and let $y_1, \dots, y_m \in N$ be generators. Since $N \otimes_A R = \text{colim}_i N \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in M \otimes_A R_i$, $j = 1, \dots, m$ whose images in $N \otimes_A R$ equal $y_j \otimes 1$. For such an i the map $u \otimes 1 : M \otimes_A R_i \rightarrow N \otimes_A R_i$ is surjective.

To prove (3) let $y_1, \dots, y_m \in N$ be generators. Let $K = \text{Ker}(A^{\oplus m} \rightarrow N)$ where the map is given by the rule $(a_1, \dots, a_m) \mapsto \sum a_j x_j$. Let k_1, \dots, k_t be generators for K . Say $k_s = (k_{s1}, \dots, k_{sm})$. Since $M \otimes_A R = \text{colim}_i M \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in M \otimes_A R_i$, $j = 1, \dots, m$ whose images in $M \otimes_A R$ equal $v(y_j \otimes 1)$. We want to use the z_j to define the map $v_i : N \otimes_A R_i \rightarrow M \otimes_A R_i$. Since $K \otimes_A R_i \rightarrow R_i^{\oplus m} \rightarrow N \otimes_A R_i \rightarrow 0$ is a presentation, it suffices to check that $\xi_s = \sum_j k_{sj} z_j$ is zero in $M \otimes_A R_i$ for each $s = 1, \dots, t$. This may not be the case, but since the image of ξ_s in $M \otimes_A R$ is zero we see that it will be the case after increasing i a bit.

To prove (4) assume $u \otimes 1$ is an isomorphism, that M is finite, and that N is finitely presented. Let $v : N \otimes_A R \rightarrow M \otimes_A R$ be an inverse to $u \otimes 1$. Apply part (3) to get a map $v_i : N \otimes_A R_i \rightarrow M \otimes_A R_i$ for some i . Apply part (1) to see that, after increasing i we have $v_i \circ (u \otimes 1) = \text{id}_{M \otimes_A R_i}$ and $(u \otimes 1) \circ v_i = \text{id}_{N \otimes_A R_i}$. \square

Lemma 10.123.4. *Suppose that $R = \text{colim}_{i \in I} R_i$ is a directed colimit of rings. Then the category of finitely presented R -modules is the colimit of the categories of finitely presented R_λ -modules. More precisely*

- (1) *Given a finitely presented R -module M there exists a $\lambda \in \Lambda$ and a finitely presented R_λ -module M_λ such that $M \cong M_\lambda \otimes_{R_\lambda} R$.*
- (2) *Given a $\lambda \in \Lambda$, finitely presented R_λ -modules M_λ, N_λ , and an R -module map $\varphi : M_\lambda \otimes_{R_\lambda} R \rightarrow N_\lambda \otimes_{R_\lambda} R$, then there exists a $\mu \geq \lambda$ and an R_μ -module map $\varphi_\mu : M_\lambda \otimes_{R_\lambda} R_\mu \rightarrow N_\lambda \otimes_{R_\lambda} R_\mu$ such that $\varphi = \varphi_\mu \otimes 1_R$.*
- (3) *Given a $\lambda \in \Lambda$, finitely presented R_λ -modules M_λ, N_λ , and R -module maps $\varphi_\lambda, \psi_\lambda : M_\lambda \rightarrow N_\lambda$ such that $\varphi \otimes 1_R = \psi \otimes 1_R$, then $\varphi \otimes 1_{R_\mu} = \psi \otimes 1_{R_\mu}$ for some $\mu \geq \lambda$.*

Proof. To prove (1) choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. Suppose that the first map is given by the matrix $A = (a_{ij})$. We can choose a $\lambda \in \Lambda$ and a matrix $A_\lambda = (a_{\lambda,ij})$ with coefficients in R_λ which maps to A in R . Then we simply let M_λ be the R_λ -module with presentation $R_\lambda^{\oplus m} \rightarrow R_\lambda^{\oplus n} \rightarrow M_\lambda \rightarrow 0$ where the first arrow is given by A_λ .

Parts (3) and (4) follow from Lemma 10.123.3. \square

Lemma 10.123.5. *Let A be a ring and let B, C be A -algebras. Suppose that $R = \text{colim}_{i \in I} R_i$ is a directed colimit of A -algebras.*

- (1) *If B is a finite type A -algebra, and $u, u' : B \rightarrow C$ are A -algebra maps such that $u \otimes 1 = u' \otimes 1 : B \otimes_A R \rightarrow C \otimes_A R$ then for some i we have $u \otimes 1 = u' \otimes 1 : B \otimes_A R_i \rightarrow C \otimes_A R_i$.*
- (2) *If C is a finite type A -algebra and $u : B \rightarrow C$ is an A -algebra map such that $u \otimes 1 : B \otimes_A R \rightarrow C \otimes_A R$ is surjective, then for some i the map $u \otimes 1 : B \otimes_A R_i \rightarrow C \otimes_A R_i$ is surjective.*
- (3) *If C is of finite presentation over A and $v : C \otimes_A R \rightarrow B \otimes_A R$ is an R -algebra map, then there exists an i and an R_i -algebra map $v_i : C \otimes_A R_i \rightarrow B \otimes_A R_i$ such that $v = v_i \otimes 1$.*

- (4) If B is a finite type A -algebra, C is a finitely presented A -algebra, and $u \otimes 1 : B \otimes_A R \rightarrow C \otimes_A R$ is an isomorphism, then for some i the map $u \otimes 1 : B \otimes_A R_i \rightarrow C \otimes_A R_i$ is an isomorphism.

Proof. To prove (1) assume u is as in (1) and let $x_1, \dots, x_m \in B$ be generators. Since $B \otimes_A R = \text{colim}_i B \otimes_A R_i$ we may pick an $i \in I$ such that $u(x_j) \otimes 1 = u'(x_j) \otimes 1$ in $B \otimes_A R_i$, $j = 1, \dots, m$. For such an i we have $u \otimes 1 = u' \otimes 1 : B \otimes_A R_i \rightarrow C \otimes_A R_i$.

To prove (2) assume $u \otimes 1$ surjective and let $y_1, \dots, y_m \in C$ be generators. Since $B \otimes_A R = \text{colim}_i B \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in B \otimes_A R_i$, $j = 1, \dots, m$ whose images in $C \otimes_A R$ equal $y_j \otimes 1$. For such an i the map $u \otimes 1 : B \otimes_A R_i \rightarrow C \otimes_A R_i$ is surjective.

To prove (3) let $c_1, \dots, c_m \in C$ be generators. Let $K = \text{Ker}(A[x_1, \dots, x_m] \rightarrow N)$ where the map is given by the rule $x_j \mapsto \sum c_j$. Let f_1, \dots, f_t be generators for K as an ideal in $A[x_1, \dots, x_m]$. We think of $f_j = f_j(x_1, \dots, x_m)$ as a polynomial. Since $B \otimes_A R = \text{colim}_i B \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in B \otimes_A R_i$, $j = 1, \dots, m$ whose images in $B \otimes_A R$ equal $v(c_j \otimes 1)$. We want to use the z_j to define a map $v_i : C \otimes_A R_i \rightarrow B \otimes_A R_i$. Since $K \otimes_A R_i \rightarrow R_i[x_1, \dots, x_m] \rightarrow C \otimes_A R_i \rightarrow 0$ is a presentation, it suffices to check that $\xi_s = f_j(z_1, \dots, z_m)$ is zero in $B \otimes_A R_i$ for each $s = 1, \dots, t$. This may not be the case, but since the image of ξ_s in $B \otimes_A R$ is zero we see that it will be the case after increasing i a bit.

To prove (4) assume $u \otimes 1$ is an isomorphism, that B is a finite type A -algebra, and that C is a finitely presented A -algebra. Let $v : B \otimes_A R \rightarrow C \otimes_A R$ be an inverse to $u \otimes 1$. Let $v_i : C \otimes_A R_i \rightarrow B \otimes_A R_i$ be as in part (3). Apply part (1) to see that, after increasing i we have $v_i \circ (u \otimes 1) = \text{id}_{B \otimes_A R_i}$ and $(u \otimes 1) \circ v_i = \text{id}_{C \otimes_A R_i}$. \square

Lemma 10.123.6. *Suppose that $R = \text{colim}_{i \in I} R_i$ is a directed colimit of rings. Then the category of finitely presented R -algebras is the colimit of the categories of finitely presented R_λ -algebras. More precisely*

- (1) *Given a finitely presented R -algebra A there exists a $\lambda \in \Lambda$ and a finitely presented R_λ -algebra A_λ such that $A \cong A_\lambda \otimes_{R_\lambda} R$.*
- (2) *Given a $\lambda \in \Lambda$, finitely presented R_λ -algebras A_λ, B_λ , and an R -algebra map $\varphi : A_\lambda \otimes_{R_\lambda} R \rightarrow B_\lambda \otimes_{R_\lambda} R$, then there exists a $\mu \geq \lambda$ and an R_μ -algebra map $\varphi_\mu : A_\lambda \otimes_{R_\lambda} R_\mu \rightarrow B_\lambda \otimes_{R_\lambda} R_\mu$ such that $\varphi = \varphi_\mu \otimes 1_R$.*
- (3) *Given a $\lambda \in \Lambda$, finitely presented R_λ -algebras A_λ, B_λ , and R -algebra maps $\varphi_\lambda, \psi_\lambda : A_\lambda \rightarrow B_\lambda$ such that $\varphi \otimes 1_R = \psi \otimes 1_R$, then $\varphi \otimes 1_{R_\mu} = \psi \otimes 1_{R_\mu}$ for some $\mu \geq \lambda$.*

Proof. To prove (1) choose a presentation $A = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. We can choose a $\lambda \in \Lambda$ and elements $f_{\lambda,j} \in R_\lambda[x_1, \dots, x_n]$ mapping to $f_j \in R[x_1, \dots, x_n]$. Then we simply let $A_\lambda = R_\lambda[x_1, \dots, x_n]/(f_{\lambda,1}, \dots, f_{\lambda,m})$.

Parts (3) and (4) follow from Lemma 10.123.5. \square

Lemma 10.123.7. *Suppose $R \rightarrow S$ is a local homomorphism of local rings. There exists a directed set (Λ, \leq) , and a system of local homomorphisms $R_\lambda \rightarrow S_\lambda$ of local rings such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is essentially of finite type over \mathbf{Z} .*
- (3) *Each S_λ is essentially of finite type over R_λ .*

Proof. Denote $\varphi : R \rightarrow S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of R and let $\mathfrak{n} \subset S$ be the maximal ideal of S . Let

$$\Lambda = \{(A, B) \mid A \subset R, B \subset S, \#A < \infty, \#B < \infty, \varphi(A) \subset B\}.$$

As partial ordering we take the inclusion relation. For each $\lambda = (A, B) \in \Lambda$ we let R'_λ be the sub \mathbf{Z} -algebra generated by $a \in A$, and we let S'_λ be the sub \mathbf{Z} -algebra generated by $b, b \in B$. Let R_λ be the localization of R'_λ at the prime ideal $R'_\lambda \cap \mathfrak{m}$ and let S_λ be the localization of S'_λ at the prime ideal $S'_\lambda \cap \mathfrak{n}$. In a picture

$$\begin{array}{ccccccc} B & \longrightarrow & S'_\lambda & \longrightarrow & S_\lambda & \longrightarrow & S \\ \uparrow & & \uparrow & & \uparrow & & \uparrow \\ A & \longrightarrow & R'_\lambda & \longrightarrow & R_\lambda & \longrightarrow & R \end{array}$$

The transition maps are clear. We leave the proofs of the other assertions to the reader. □

Lemma 10.123.8. *Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that S is essentially of finite type over R . Then there exists a directed set (Λ, \leq) , and a system of local homomorphisms $R_\lambda \rightarrow S_\lambda$ of local rings such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is essentially of finite type over \mathbf{Z} .*
- (3) *Each S_λ is essentially of finite type over R_λ .*
- (4) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ presents S_μ as the localization of a quotient of $S_\lambda \otimes_{R_\lambda} R_\mu$.*

Proof. Denote $\varphi : R \rightarrow S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of R and let $\mathfrak{n} \subset S$ be the maximal ideal of S . Let $x_1, \dots, x_n \in S$ be elements such that S is a localization of the sub R -algebra of S generated by x_1, \dots, x_n . In other words, S is a quotient of a localization of the polynomial ring $R[x_1, \dots, x_n]$.

Let $\Lambda = \{A \subset R \mid \#A < \infty\}$ be the set of finite subsets of R . As partial ordering we take the inclusion relation. For each $\lambda = A \in \Lambda$ we let R'_λ be the sub \mathbf{Z} -algebra generated by $a \in A$, and we let S'_λ be the sub \mathbf{Z} -algebra generated by $\varphi(a), a \in A$ and the elements x_1, \dots, x_n . Let R_λ be the localization of R'_λ at the prime ideal $R'_\lambda \cap \mathfrak{m}$ and let S_λ be the localization of S'_λ at the prime ideal $S'_\lambda \cap \mathfrak{n}$. In a picture

$$\begin{array}{ccccccc} \varphi(A) \coprod \{x_i\} & \longrightarrow & S'_\lambda & \longrightarrow & S_\lambda & \longrightarrow & S \\ \uparrow & & \uparrow & & \uparrow & & \uparrow \\ A & \longrightarrow & R'_\lambda & \longrightarrow & R_\lambda & \longrightarrow & R \end{array}$$

It is clear that if $A \subset B$ corresponds to $\lambda \leq \mu$ in Λ , then there are canonical maps $R_\lambda \rightarrow R_\mu$, and $S_\lambda \rightarrow S_\mu$ and we obtain a system over the directed set Λ .

The assertion that $R = \text{colim } R_\lambda$ is clear because all the maps $R_\lambda \rightarrow R$ are injective and any element of R eventually is in the image. The same argument works for $S = \text{colim } S_\lambda$. Assertions (2), (3) are true by construction. The final assertion holds because clearly the maps $S'_\lambda \otimes_{R'_\lambda} R'_\mu \rightarrow S'_\mu$ are surjective. □

Lemma 10.123.9. *Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that S is essentially of finite presentation over R . Then there exists a directed set (Λ, \leq) , and a system of local homomorphism $R_\lambda \rightarrow S_\lambda$ of local rings such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is essentially of finite type over \mathbf{Z} .*
- (3) *Each S_λ is essentially of finite type over R_λ .*
- (4) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ presents S_μ as the localization of $S_\lambda \otimes_{R_\lambda} R_\mu$ at a prime ideal.*

Proof. By assumption we may choose an isomorphism $\Phi : (R[x_1, \dots, x_n]/I)_{\mathfrak{q}} \rightarrow S$ where $I \subset R[x_1, \dots, x_n]$ is a finitely generated ideal, and $\mathfrak{q} \subset R[x_1, \dots, x_n]/I$ is a prime. (Note that $R \cap \mathfrak{q}$ is equal to the maximal ideal \mathfrak{m} of R .) We also choose generators $f_1, \dots, f_m \in I$ for the ideal I . Write R in any way as a colimit $R = \text{colim } R_\lambda$ over a directed set (Λ, \leq) , with each R_λ local and essentially of finite type over \mathbf{Z} . There exists some $\lambda_0 \in \Lambda$ such that f_j is the image of some $f_{j, \lambda_0} \in R_{\lambda_0}[x_1, \dots, x_n]$. For all $\lambda \geq \lambda_0$ denote $f_{j, \lambda} \in R_\lambda[x_1, \dots, x_n]$ the image of f_{j, λ_0} . Thus we obtain a system of ring maps

$$R_\lambda[x_1, \dots, x_n]/(f_{1, \lambda}, \dots, f_{m, \lambda}) \rightarrow R[x_1, \dots, x_n]/(f_1, \dots, f_m) \rightarrow S$$

Set \mathfrak{q}_λ the inverse image of \mathfrak{q} . Set $S_\lambda = (R_\lambda[x_1, \dots, x_n]/(f_{1, \lambda}, \dots, f_{m, \lambda}))_{\mathfrak{q}_\lambda}$. We leave it to the reader to see that this works. \square

Remark 10.123.10. Suppose that $R \rightarrow S$ is a local homomorphism of local rings, which is essentially of finite presentation. Take any system (Λ, \leq) , $R_\lambda \rightarrow S_\lambda$ with the properties listed in Lemma 10.123.8. What may happen is that this is the “wrong” system, namely, it may happen that property (4) of Lemma 10.123.9 is not satisfied. Here is an example. Let k be a field. Consider the ring

$$R = k[[z, y_1, y_2, \dots]]/(y_i^2 - zy_{i+1}).$$

Set $S = R/zR$. As system take $\Lambda = \mathbf{N}$ and $R_n = k[[z, y_1, \dots, y_n]]/(\{y_i^2 - zy_{i+1}\}_{i \leq n-1})$ and $S_n = R_n/(z, y_n^2)$. All the maps $S_n \otimes_{R_n} R_{n+1} \rightarrow S_{n+1}$ are not localizations (i.e., isomorphisms in this case) since $1 \otimes y_{n+1}^2$ maps to zero. If we take instead $S'_n = R_n/zR_n$ then the maps $S'_n \otimes_{R_n} R_{n+1} \rightarrow S'_{n+1}$ are isomorphisms. The moral of this remark is that we do have to be a little careful in choosing the systems.

Lemma 10.123.11. *Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that S is essentially of finite presentation over R . Let M be a finitely presented S -module. Then there exists a directed set (Λ, \leq) , and a system of local homomorphisms $R_\lambda \rightarrow S_\lambda$ of local rings together with S_λ -modules M_λ , such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$. The colimit of the system M_λ is M .*
- (2) *Each R_λ is essentially of finite type over \mathbf{Z} .*
- (3) *Each S_λ is essentially of finite type over R_λ .*
- (4) *Each M_λ is finite over S_λ .*
- (5) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ presents S_μ as the localization of $S_\lambda \otimes_{R_\lambda} R_\mu$ at a prime ideal.*
- (6) *For each $\lambda \leq \mu$ the map $M_\lambda \otimes_{S_\lambda} S_\mu \rightarrow M_\mu$ is an isomorphism.*

Proof. As in the proof of Lemma 10.123.9 we may first write $R = \text{colim } R_\lambda$ as a directed colimit of local \mathbf{Z} -algebras which are essentially of finite type. Next, we may assume that for some $\lambda_1 \in \Lambda$ there exist $f_{j, \lambda_1} \in R_{\lambda_1}[x_1, \dots, x_n]$ such that

$$S = \text{colim}_{\lambda \geq \lambda_1} S_\lambda, \text{ with } S_\lambda = (R_\lambda[x_1, \dots, x_n]/(f_{1, \lambda}, \dots, f_{m, \lambda}))_{\mathfrak{q}_\lambda}$$

Choose a presentation

$$S^{\oplus s} \rightarrow S^{\oplus t} \rightarrow M \rightarrow 0$$

of M over S . Let $A \in \text{Mat}(t \times s, S)$ be the matrix of the presentation. For some $\lambda_2 \in \Lambda$, $\lambda_2 \geq \lambda_1$ we can find a matrix $A_{\lambda_2} \in \text{Mat}(t \times s, S_{\lambda_2})$ which maps to A . For all $\lambda \geq \lambda_2$ we let $M_\lambda = \text{Coker}(S_\lambda^{\oplus s} \xrightarrow{A_\lambda} S_\lambda^{\oplus t})$. We leave it to the reader to see that this works. \square

Lemma 10.123.12. *Suppose $R \rightarrow S$ is a ring map. Then there exists a directed set (Λ, \leq) , and a system of ring maps $R_\lambda \rightarrow S_\lambda$ such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is of finite type over \mathbf{Z} .*
- (3) *Each S_λ is of finite type over R_λ .*

Proof. This is the non-local version of Lemma 10.123.7. Proof is similar and left to the reader. \square

Lemma 10.123.13. *Suppose $R \rightarrow S$ is a ring map. Assume that S is of finite type over R . Then there exists a directed set (Λ, \leq) , and a system of ring maps $R_\lambda \rightarrow S_\lambda$ such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is of finite type over \mathbf{Z} .*
- (3) *Each S_λ is of finite type over R_λ .*
- (4) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ presents S_μ as a quotient of $S_\lambda \otimes_{R_\lambda} R_\mu$.*

Proof. This is the non-local version of Lemma 10.123.8. Proof is similar and left to the reader. \square

Lemma 10.123.14. *Suppose $R \rightarrow S$ is a ring map. Assume that S is of finite presentation over R . Then there exists a directed set (Λ, \leq) , and a system of ring maps $R_\lambda \rightarrow S_\lambda$ such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$.*
- (2) *Each R_λ is of finite type over \mathbf{Z} .*
- (3) *Each S_λ is of finite type over R_λ .*
- (4) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ is an isomorphism.*

Proof. This is the non-local version of Lemma 10.123.9. Proof is similar and left to the reader. \square

Lemma 10.123.15. *Suppose $R \rightarrow S$ is a ring map. Assume that S is of finite presentation over R . Let M be a finitely presented S -module. Then there exists a directed set (Λ, \leq) , and a system of ring maps $R_\lambda \rightarrow S_\lambda$ together with S_λ -modules M_λ , such that*

- (1) *The colimit of the system $R_\lambda \rightarrow S_\lambda$ is equal to $R \rightarrow S$. The colimit of the system M_λ is M .*
- (2) *Each R_λ is of finite type over \mathbf{Z} .*
- (3) *Each S_λ is of finite type over R_λ .*
- (4) *Each M_λ is finite over S_λ .*
- (5) *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ is an isomorphism.*
- (6) *For each $\lambda \leq \mu$ the map $M_\lambda \otimes_{S_\lambda} S_\mu \rightarrow S_\mu$ is an isomorphism.*

In particular, for every $\lambda \in \Lambda$ we have

$$M = M_\lambda \otimes_{S_\lambda} S = M_\lambda \otimes_{R_\lambda} R.$$

Proof. This is the non-local version of Lemma 10.123.11. Proof is similar and left to the reader. \square

10.124. More flatness criteria

The following lemma is often used in algebraic geometry to show that a finite morphism from a normal surface to a smooth surface is flat. It is a partial converse to Lemma 10.108.9 because a finite local ring map certainly satisfies condition (3).

Lemma 10.124.1. *Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Assume*

- (1) R is regular,
- (2) S Cohen-Macaulay,
- (3) $\mathfrak{m}_S = \sqrt{\mathfrak{m}_R S}$, and
- (4) $\dim(R) = \dim(S)$.

Then $R \rightarrow S$ is flat.

Proof. By induction on $\dim(R)$. The case $\dim(R) = 0$ is trivial, because then R is a field. Assume $\dim(R) > 0$. By (4) this implies that $\dim(S) > 0$. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ be the minimal primes of S . Note that $\mathfrak{q}_i \neq \mathfrak{m}_S$, hence $\mathfrak{p}_i = R \cap \mathfrak{q}_i$ is not equal to \mathfrak{m}_R by (3). Pick $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$, and $x \notin \mathfrak{p}_i$, see Lemma 10.14.2. Hence we see that x is not contained in any of the minimal primes of S . Hence x is a nonzerodivisor on S by (2), see Lemma 10.100.2 and S/xS is Cohen-Macaulay with $\dim(S/xS) = \dim(S) - 1$. By (1) and Lemma 10.102.3 the ring R/xR is regular with $\dim(R/xR) = \dim(R) - 1$. By induction we see that $R/xR \rightarrow S/xS$ is flat. Hence we conclude by Lemma 10.95.10 (see also the remarks following it). \square

Lemma 10.124.2. *Let $R \rightarrow S$ be a homomorphism of Noetherian local rings. Assume that R is a regular local ring and that a regular system of parameters maps to a regular sequence in S . Then $R \rightarrow S$ is flat.*

Proof. Suppose that x_1, \dots, x_d are a system of parameters of R which map to a regular sequence in S . Note that $S/(x_1, \dots, x_d)S$ is flat over $R/(x_1, \dots, x_d)R$ as the latter is a field. Then x_d is a nonzerodivisor in $S/(x_1, \dots, x_{d-1})S$ hence $S/(x_1, \dots, x_{d-1})S$ is flat over $R/(x_1, \dots, x_{d-1})R$ by the local criterion of flatness (see Lemma 10.95.10 and remarks following). Then x_{d-1} is a nonzerodivisor in $S/(x_1, \dots, x_{d-2})S$ hence $S/(x_1, \dots, x_{d-2})S$ is flat over $R/(x_1, \dots, x_{d-2})R$ by the local criterion of flatness (see Lemma 10.95.10 and remarks following). Continue till one reaches the conclusion that S is flat over R . \square

The following lemma is the key to proving that results for finitely presented modules over finitely presented rings over a base ring follow from the corresponding results for finite modules in the Noetherian case.

Lemma 10.124.3. *Let $R \rightarrow S$, M , Λ , $R_\lambda \rightarrow S_\lambda$, M_λ be as in Lemma 10.123.11. Assume that M is flat over R . Then for some $\lambda \in \Lambda$ the module M_λ is flat over R_λ .*

Proof. Pick some $\lambda \in \Lambda$ and consider

$$\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/\mathfrak{m}_\lambda) = \mathrm{Ker}(\mathfrak{m}_\lambda \otimes_{R_\lambda} M_\lambda \rightarrow M_\lambda).$$

See Remark 10.72.8. The right hand side shows that this is a finitely generated S_λ -module (because S_λ is Noetherian and the modules in question are finite). Let ξ_1, \dots, ξ_n be generators. Because M is flat over R we have that $0 = \mathrm{Ker}(\mathfrak{m}_\lambda R \otimes_R M \rightarrow M)$. Since \otimes commutes with colimits we see there exists a $\lambda' \geq \lambda$ such that each ξ_i maps to zero in $\mathfrak{m}_\lambda R_{\lambda'} \otimes_{R_{\lambda'}} M_{\lambda'}$. Hence we see that

$$\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/\mathfrak{m}_\lambda) \longrightarrow \mathrm{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/\mathfrak{m}_\lambda R_{\lambda'})$$

is zero. Note that $M_\lambda \otimes_{R_\lambda} R_\lambda/\mathfrak{m}_\lambda$ is flat over $R_\lambda/\mathfrak{m}_\lambda$ because this last ring is a field. Hence we may apply Lemma 10.95.14 to get that $M_{\lambda'}$ is flat over $R_{\lambda'}$. \square

Using the lemma above we can start to reprove the results of Section 10.95 in the non-Noetherian case.

Lemma 10.124.4. *Suppose that $R \rightarrow S$ is a local homomorphism of local rings. Denote \mathfrak{m} the maximal ideal of R . Let $u : M \rightarrow N$ be a map of S -modules. Assume*

- (1) S is essentially of finite presentation over R ,
- (2) M, N are finitely presented over S ,
- (3) N is flat over R , and
- (4) $\bar{u} : M/\mathfrak{m}M \rightarrow N/\mathfrak{m}N$ is injective.

Then u is injective, and $N/u(M)$ is flat over R .

Proof. By Lemma 10.123.11 and its proof we can find a system $R_\lambda \rightarrow S_\lambda$ of local ring maps together with maps of S_λ -modules $u_\lambda : M_\lambda \rightarrow N_\lambda$ satisfying the conclusions (1) – (6) for both N and M of that lemma and such that the colimit of the maps u_λ is u . By Lemma 10.124.3 we may assume that N_λ is flat over R_λ for all sufficiently large λ . Denote $\mathfrak{m}_\lambda \subset R_\lambda$ the maximal ideal and $\kappa_\lambda = R_\lambda/\mathfrak{m}_\lambda$, resp. $\kappa = R/\mathfrak{m}$ the residue fields.

Consider the map

$$\Psi_\lambda : M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa \longrightarrow M/\mathfrak{m}M.$$

Since $S_\lambda/\mathfrak{m}_\lambda S_\lambda$ is essentially of finite type over the field κ_λ we see that the tensor product $S_\lambda/\mathfrak{m}_\lambda S_\lambda \otimes_{\kappa_\lambda} \kappa$ is essentially of finite type over κ . Hence it is a Noetherian ring and we conclude the kernel of Ψ_λ is finitely generated. Since $M/\mathfrak{m}M$ is the colimit of the system $M_\lambda/\mathfrak{m}_\lambda M_\lambda$ and κ is the colimit of the fields κ_λ there exists a $\lambda' > \lambda$ such that the kernel of Ψ_λ is generated by the kernel of

$$\Psi_{\lambda, \lambda'} : M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa_{\lambda'} \longrightarrow M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'}.$$

By construction there exists a multiplicative subset $W \subset S_\lambda \otimes_{R_\lambda} R_{\lambda'}$ such that $S_{\lambda'} = W^{-1}(S_\lambda \otimes_{R_\lambda} R_{\lambda'})$ and

$$W^{-1}(M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa_{\lambda'}) = M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'}.$$

Now suppose that x is an element of the kernel of

$$\Psi_{\lambda'} : M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'} \otimes_{\kappa_{\lambda'}} \kappa \longrightarrow M/\mathfrak{m}M.$$

Then for some $w \in W$ we have $w x \in M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes \kappa$. Hence $w x \in \mathrm{Ker}(\Psi_\lambda)$. Hence $w x$ is a linear combination of elements in the kernel of $\Psi_{\lambda, \lambda'}$. Hence $w x = 0$ in $M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'} \otimes_{\kappa_{\lambda'}} \kappa$, hence $x = 0$ because w is invertible in $S_{\lambda'}$. We conclude that the kernel of $\Psi_{\lambda'}$ is zero for all sufficiently large λ' !

By the result of the preceding paragraph we may assume that the kernel of Ψ_λ is zero for all λ sufficiently large, which implies that the map $M_\lambda/\mathfrak{m}_\lambda M_\lambda \rightarrow M/\mathfrak{m}M$ is injective. Combined with \bar{u} being injective this formally implies that also $\bar{u}_\lambda : M_\lambda/\mathfrak{m}_\lambda M_\lambda \rightarrow N_\lambda/\mathfrak{m}_\lambda N_\lambda$ is injective. By Lemma 10.95.1 we conclude that (for all sufficiently large λ) the map u_λ is injective and that $N_\lambda/u_\lambda(M_\lambda)$ is flat over R_λ . The lemma follows. \square

Lemma 10.124.5. *Suppose that $R \rightarrow S$ is a local ring homomorphism of local rings. Denote \mathfrak{m} the maximal ideal of R . Suppose*

- (1) S is essentially of finite presentation over R ,
- (2) S is flat over R , and
- (3) $f \in S$ is a nonzerodivisor in $S/\mathfrak{m}S$.

Then S/fS is flat over R , and f is a nonzerodivisor in S .

Proof. Follows directly from Lemma 10.124.4. \square

Lemma 10.124.6. *Suppose that $R \rightarrow S$ is a local ring homomorphism of local rings. Denote \mathfrak{m} the maximal ideal of R . Suppose*

- (1) $R \rightarrow S$ is essentially of finite presentation,
- (2) $R \rightarrow S$ is flat, and
- (3) f_1, \dots, f_c is a sequence of elements of S such that the images $\bar{f}_1, \dots, \bar{f}_c$ form a regular sequence in $S/\mathfrak{m}S$.

Then f_1, \dots, f_c is a regular sequence in S and each of the quotients $S/(f_1, \dots, f_i)$ is flat over R .

Proof. Induction and Lemma 10.124.5. \square

Here is the version of the local criterion of flatness for the case of local ring maps which are locally of finite presentation.

Lemma 10.124.7. *Let $R \rightarrow S$ be a local homomorphism of local rings. Let $I \neq R$ be an ideal in R . Let M be an S -module. Assume*

- (1) S is essentially of finite presentation over R ,
- (2) M is of finite presentation over S ,
- (3) $\text{Tor}_1^R(M, R/I) = 0$, and
- (4) M/IM is flat over R/I .

Then M is flat over R .

Proof. Let $\Lambda, R_\lambda \rightarrow S_\lambda, M_\lambda$ be as in Lemma 10.123.11. Denote $I_\lambda \subset R_\lambda$ the inverse image of I . In this case the system $R/I \rightarrow S/IS, M/IM, R_\lambda \rightarrow S_\lambda/I_\lambda S_\lambda$, and $M_\lambda/I_\lambda M_\lambda$ satisfies the conclusions of Lemma 10.123.11 as well. Hence by Lemma 10.124.3 we may assume (after shrinking the index set Λ) that $M_\lambda/I_\lambda M_\lambda$ is flat for all λ . Pick some λ and consider

$$\text{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/I_\lambda) = \text{Ker}(I_\lambda \otimes_{R_\lambda} M_\lambda \rightarrow M_\lambda).$$

See Remark 10.72.8. The right hand side shows that this is a finitely generated S_λ -module (because S_λ is Noetherian and the modules in question are finite). Let ξ_1, \dots, ξ_n be generators. Because $\text{Tor}_1^R(M, R/I) = 0$ and since \otimes commutes

with colimits we see there exists a $\lambda' \geq \lambda$ such that each ξ_i maps to zero in $\text{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'})$. The composition of the maps

$$\begin{array}{c}
 R_{\lambda'} \otimes_{R_\lambda} \text{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/I_\lambda) \\
 \downarrow \text{surjective by Lemma 10.95.12} \\
 \text{Tor}_1^{R_\lambda}(M_\lambda, R_{\lambda'}/I_\lambda R_{\lambda'}) \\
 \downarrow \text{surjective up to localization by Lemma 10.95.13} \\
 \text{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_\lambda R_{\lambda'}) \\
 \downarrow \text{surjective by Lemma 10.95.12} \\
 \text{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'}).
 \end{array}$$

is surjective up to a localization by the reasons indicated. The localization is necessary since $M_{\lambda'}$ is not equal to $M_\lambda \otimes_{R_\lambda} R_{\lambda'}$. Namely, it is equal to $M_\lambda \otimes_{S_\lambda} S_{\lambda'}$ and $S_{\lambda'}$ is the localization of $S_\lambda \otimes_{R_\lambda} R_{\lambda'}$ whence the statement up to a localization (or tensoring with $S_{\lambda'}$). Note that Lemma 10.95.12 applies to the first and third arrows because $M_\lambda/I_\lambda M_\lambda$ is flat over R_λ/I_λ and because $M_{\lambda'}/I_\lambda M_{\lambda'}$ is flat over $R_{\lambda'}/I_\lambda R_{\lambda'}$ as it is a base change of the flat module $M_\lambda/I_\lambda M_\lambda$. The composition maps the generators ξ_i to zero as we explained above. We finally conclude that $\text{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'})$ is zero. This implies that $M_{\lambda'}$ is flat over $R_{\lambda'}$ by Lemma 10.95.10. \square

Please compare the lemma below to Lemma 10.95.15 (the case of Noetherian local rings) and Lemma 10.97.8 (the case of a nilpotent ideal in the base).

Lemma 10.124.8 (Critère de platitude par fibres). *Let R, S, S' be local rings and let $R \rightarrow S \rightarrow S'$ be local ring homomorphisms. Let M be an S' -module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume*

- (1) *The ring maps $R \rightarrow S$ and $R \rightarrow S'$ are essentially of finite presentation.*
- (2) *The module M is of finite presentation over S' .*
- (3) *The module M is not zero.*
- (4) *The module $M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$ -module.*
- (5) *The module M is a flat R -module.*

Then S is flat over R and M is a flat S -module.

Proof. As in the proof of Lemma 10.123.9 we may first write $R = \text{colim } R_\lambda$ as a directed colimit of local \mathbf{Z} -algebras which are essentially of finite type. Denote \mathfrak{p}_λ the maximal ideal of R . Next, we may assume that for some $\lambda_1 \in \Lambda$ there exist $f_{j,\lambda_1} \in R_{\lambda_1}[x_1, \dots, x_n]$ such that

$$S = \text{colim}_{\lambda \geq \lambda_1} S_\lambda, \text{ with } S_\lambda = (R_\lambda[x_1, \dots, x_n]/(f_{1,\lambda}, \dots, f_{u,\lambda}))_{\mathfrak{q}_\lambda}$$

For some $\lambda_2 \in \Lambda$, $\lambda_2 \geq \lambda_1$ there exist $g_{j,\lambda_2} \in R_{\lambda_2}[x_1, \dots, x_n, y_1, \dots, y_m]$ with images $\bar{g}_{j,\lambda_2} \in S_{\lambda_2}[y_1, \dots, y_m]$ such that

$$S' = \text{colim}_{\lambda \geq \lambda_2} S'_\lambda, \text{ with } S'_\lambda = (S_\lambda[y_1, \dots, y_m]/(\bar{g}_{1,\lambda}, \dots, \bar{g}_{v,\lambda}))_{\bar{\mathfrak{q}}'_\lambda}$$

Note that this also implies that

$$S'_\lambda = (R_\lambda[x_1, \dots, x_n, y_1, \dots, y_m]/(g_{1,\lambda}, \dots, g_{v,\lambda}))_{\mathfrak{q}'_\lambda}$$

Choose a presentation

$$(S')^{\oplus s} \rightarrow (S')^{\oplus t} \rightarrow M \rightarrow 0$$

of M over S' . Let $A \in \text{Mat}(t \times s, S')$ be the matrix of the presentation. For some $\lambda_3 \in \Lambda$, $\lambda_3 \geq \lambda_2$ we can find a matrix $A_{\lambda_3} \in \text{Mat}(t \times s, S_{\lambda_3})$ which maps to A . For all $\lambda \geq \lambda_3$ we let $M_\lambda = \text{Coker}((S'_\lambda)^{\oplus s} \xrightarrow{A_\lambda} (S'_\lambda)^{\oplus t})$.

With these choices, we have for each $\lambda_3 \leq \lambda \leq \mu$ that $S_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S_\mu$ is a localization, $S'_\lambda \otimes_{S_\lambda} S_\mu \rightarrow S'_\mu$ is a localization, and the map $M_\lambda \otimes_{S'_\lambda} S'_\mu \rightarrow M_\mu$ is an isomorphism. This also implies that $S'_\lambda \otimes_{R_\lambda} R_\mu \rightarrow S'_\mu$ is a localization. Thus, since M is flat over R we see by Lemma 10.124.3 that for all λ big enough the module M_λ is flat over R_λ . Moreover, note that $\mathfrak{m} = \text{colim } \mathfrak{p}_\lambda$, $S/\mathfrak{m}S = \text{colim } S_\lambda/\mathfrak{p}_\lambda S_\lambda$, $S'/\mathfrak{m}S' = \text{colim } S'_\lambda/\mathfrak{p}_\lambda S'_\lambda$, and $M/\mathfrak{m}M = \text{colim } M_\lambda/\mathfrak{p}_\lambda M_\lambda$. Also, for each $\lambda_3 \leq \lambda \leq \mu$ we see (from the properties listed above) that

$$S'_\lambda/\mathfrak{p}_\lambda S'_\lambda \otimes_{S_\lambda/\mathfrak{p}_\lambda S_\lambda} S_\mu/\mathfrak{p}_\mu S_\mu \longrightarrow S'_\mu/\mathfrak{p}_\mu S'_\mu$$

is a localization, and the map

$$M_\lambda/\mathfrak{p}_\lambda M_\lambda \otimes_{S'_\lambda/\mathfrak{p}_\lambda S'_\lambda} S'_\mu/\mathfrak{p}_\mu S'_\mu \longrightarrow M_\mu/\mathfrak{p}_\mu M_\mu$$

is an isomorphism. Hence the system $(S_\lambda/\mathfrak{p}_\lambda S_\lambda \rightarrow S'_\lambda/\mathfrak{p}_\lambda S'_\lambda, M_\lambda/\mathfrak{p}_\lambda M_\lambda)$ is a system as in Lemma 10.123.11 as well. We may apply Lemma 10.124.3 again because $M/\mathfrak{m}M$ is assumed flat over $S/\mathfrak{m}S$ and we see that $M_\lambda/\mathfrak{p}_\lambda M_\lambda$ is flat over $S_\lambda/\mathfrak{p}_\lambda S_\lambda$ for all λ big enough. Thus for λ big enough the data $R_\lambda \rightarrow S_\lambda \rightarrow S'_\lambda, M_\lambda$ satisfies the hypotheses of Lemma 10.95.15. Pick such a λ . Then $S = S_\lambda \otimes_{R_\lambda} R$ is flat over R , and $M = M_\lambda \otimes_{S_\lambda} S'_\lambda$ is flat over S (since the base change of a flat module is flat). \square

The following is an easy consequence of the “critère de platitude par fibres” Lemma 10.124.8. For more results of this kind see More on Flatness, Section 37.1.

Lemma 10.124.9. *Let R, S, S' be local rings and let $R \rightarrow S \rightarrow S'$ be local ring homomorphisms. Let M be an S' -module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume*

- (1) $R \rightarrow S'$ is essentially of finite presentation,
- (2) $R \rightarrow S$ is essentially of finite type,
- (3) M is of finite presentation over S' ,
- (4) M is not zero,
- (5) $M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$ -module, and
- (6) M is a flat R -module.

Then S is essentially of finite presentation and flat over R and M is a flat S -module.

Proof. As S is essentially of finite presentation over R we can write $S = C_{\bar{\mathfrak{q}}}$ for some finite type R -algebra C . Write $C = R[x_1, \dots, x_n]/I$. Denote $\mathfrak{q} \subset R[x_1, \dots, x_n]$ be the prime ideal corresponding to $\bar{\mathfrak{q}}$. Then we see that $S = B/J$ where $B = R[x_1, \dots, x_n]_{\mathfrak{q}}$ is essentially of finite presentation over R and $J = IB$. We can find $f_1, \dots, f_k \in J$ such that the images $\bar{f}_i \in B/\mathfrak{m}B$ generate the image \bar{J} of J in the Noetherian ring $B/\mathfrak{m}B$. Hence there exist finitely generated ideals $J' \subset J$ such that $B/J' \rightarrow B/J$ induces an isomorphism

$$(B/J') \otimes_R R/\mathfrak{m} \longrightarrow B/J \otimes_R R/\mathfrak{m} = S/\mathfrak{m}S.$$

For any J' as above we see that Lemma 10.124.8 applies to the ring maps

$$R \longrightarrow B/J' \longrightarrow S'$$

and the module M . Hence we conclude that B/J' is flat over R for any choice J' as above. Now, if $J' \subset J'' \subset J$ are two finitely generated ideals as above, then we conclude that $B/J' \rightarrow B/J''$ is a surjective map between flat R -algebras which are essentially of finite presentation which is an isomorphism modulo \mathfrak{m} . Hence Lemma 10.124.4 implies that $B/J' = B/J''$, i.e., $J' = J''$. Clearly this means that J is finitely generated, i.e., S is essentially of finite presentation over R . Thus we may apply Lemma 10.124.8 to $R \rightarrow S \rightarrow S'$ and we win. \square

10.125. Openness of the flat locus

Lemma 10.125.1. *Let k be a field. Let S be a finite type k -algebra. Let f_1, \dots, f_i be elements of S . Assume that S is Cohen-Macaulay and equidimensional of dimension d , and that $\dim V(f_1, \dots, f_i) \leq d - i$. Then equality holds and f_1, \dots, f_i forms a regular sequence in $S_{\mathfrak{q}}$ for every prime \mathfrak{q} of $V(f_1, \dots, f_i)$.*

Proof. If S is Cohen-Macaulay and equidimensional of dimension d , then we have $\dim(S_{\mathfrak{m}}) = d$ for all maximal ideals \mathfrak{m} of S , see Lemma 10.110.7. By Proposition 10.99.5 we see that for all maximal ideals $\mathfrak{m} \in V(f_1, \dots, f_i)$ the sequence is a regular sequence in $S_{\mathfrak{m}}$ and the local ring $S_{\mathfrak{m}}/(f_1, \dots, f_i)$ is Cohen-Macaulay of dimension $d - i$. This actually means that $S/(f_1, \dots, f_i)$ is Cohen-Macaulay and equidimensional of dimension $d - i$. \square

Lemma 10.125.2. *Suppose that $R \rightarrow S$ is a ring map which is finite type, flat. Let d be an integer such that all fibres $S \otimes_R \kappa(\mathfrak{p})$ are Cohen-Macaulay and equidimensional of dimension d . Let f_1, \dots, f_i be elements of S . The set*

$\{\mathfrak{q} \in V(f_1, \dots, f_i) \mid f_1, \dots, f_i \text{ are a regular sequence in } S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \text{ where } \mathfrak{p} = R \cap \mathfrak{q}\}$
is open in $V(f_1, \dots, f_i)$.

Proof. Write $\bar{S} = S/(f_1, \dots, f_i)$. Suppose \mathfrak{q} is an element of the set defined in the lemma, and \mathfrak{p} is the corresponding prime of R . We will use relative dimension as defined in Definition 10.121.1. First, note that $d = \dim_{\mathfrak{q}}(S/R) = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + \text{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})$ by Lemma 10.112.3. Since f_1, \dots, f_i form a regular sequence in the Noetherian local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ general dimension theory tells us that $\dim(\bar{S}_{\mathfrak{q}}/\mathfrak{p}\bar{S}_{\mathfrak{q}}) = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) - i$. By the same Lemma 10.112.3 we then conclude that $\dim_{\mathfrak{q}}(\bar{S}/R) = \dim(\bar{S}_{\mathfrak{q}}/\mathfrak{p}\bar{S}_{\mathfrak{q}}) + \text{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q}) = d - i$. By Lemma 10.121.6 we have $\dim_{\mathfrak{q}'}(\bar{S}/R) \leq d - i$ for all $\mathfrak{q}' \in V(f_1, \dots, f_i) = \text{Spec}(\bar{S})$ in a neighbourhood of \mathfrak{q} . Thus after replacing S by S_g for some $g \in S, g \notin \mathfrak{q}$ we may assume that the inequality holds for all \mathfrak{q}' . The result follows from Lemma 10.125.1. \square

Lemma 10.125.3. *Let $R \rightarrow S$ is a ring map. Consider a finite homological complex of finite free S -modules:*

$$F_{\bullet} : 0 \rightarrow S^{n_e} \xrightarrow{\varphi_e} S^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \dots \xrightarrow{\varphi_{i+1}} S^{n_i} \xrightarrow{\varphi_i} S^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \dots \xrightarrow{\varphi_1} S^{n_0}$$

For every prime \mathfrak{q} of S consider the complex $\bar{F}_{\bullet, \mathfrak{q}} = F_{\bullet, \mathfrak{q}} \otimes_R \kappa(\mathfrak{p})$ where \mathfrak{p} is inverse image of \mathfrak{q} in R . Assume there exists an integer d such that $R \rightarrow S$ is finite type, flat with fibres $S \otimes_R \kappa(\mathfrak{p})$ Cohen-Macaulay of dimension d . The set

$$\{\mathfrak{q} \in \text{Spec}(S) \mid \bar{F}_{\bullet, \mathfrak{q}} \text{ is exact}\}$$

is open in $\text{Spec}(S)$.

Proof. Let \mathfrak{q} be an element of the set defined in the lemma. We are going to use Proposition 10.98.10 to show there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $D(g)$ is contained in the set defined in the lemma. In other words, we are going to show that after replacing S by S_g , the set of the lemma is all of $\text{Spec}(S)$. Thus during the proof we will, finitely often, replace S by such a localization. Recall that Proposition 10.98.10 characterizes exactness of complexes in terms of ranks of the maps φ_i and the ideals $I(\varphi_i)$, in case the ring is local. We first address the rank condition. Set $r_i = n_i - n_{i+1} + \dots + (-1)^{e-i} n_e$. Note that $r_i + r_{i+1} = n_i$ and note that r_i is the expected rank of φ_i (in the exact case).

By Lemma 10.95.5 we see that if $\overline{F}_{\bullet, \mathfrak{q}}$ is exact, then the localization $F_{\bullet, \mathfrak{q}}$ is exact. In particular the complex F_{\bullet} becomes exact after localizing by an element $g \in S$, $g \notin \mathfrak{q}$. In this case Proposition 10.98.10 applied to all localizations of S at prime ideals implies that all $(r_i + 1) \times (r_i + 1)$ -minors of φ_i are zero. Thus we see that the rank of φ_i is at most r_i .

Let $I_i \subset S$ denote the ideal generated by the $r_i \times r_i$ -minors of the matrix of φ_i . By Proposition 10.98.10 the complex $\overline{F}_{\bullet, \mathfrak{q}}$ is exact if and only if for every $1 \leq i \leq e$ we have either $(I_i)_{\mathfrak{q}} = S_{\mathfrak{q}}$ or $(I_i)_{\mathfrak{q}}$ contains a $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ -regular sequence of length i . Namely, by our choice of r_i above and by the bound on the ranks of the φ_i this is the only way the conditions of Proposition 10.98.10 can be satisfied.

If $(I_i)_{\mathfrak{q}} = S_{\mathfrak{q}}$, then after localizing S at some element $g \notin \mathfrak{q}$ we may assume that $I_i = S$. Clearly, this is an open condition.

If $(I_i)_{\mathfrak{q}} \neq S_{\mathfrak{q}}$, then we have a sequence $f_1, \dots, f_i \in (I_i)_{\mathfrak{q}}$ which form a regular sequence in $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$. Note that for any prime $\mathfrak{q}' \subset S$ such that $(f_1, \dots, f_i) \not\subset \mathfrak{q}'$ we have $(I_i)_{\mathfrak{q}'} = S_{\mathfrak{q}'}$. Thus the result follows from Lemma 10.125.2. \square

Theorem 10.125.4. *Let R be a ring. Let $R \rightarrow S$ be a ring map of finite presentation. Let M be a finitely presented S -module. The set*

$$\{\mathfrak{q} \in \text{Spec}(S) \mid M_{\mathfrak{q}} \text{ is flat over } R\}$$

is open in $\text{Spec}(S)$.

Proof. Let $\mathfrak{q} \in \text{Spec}(S)$ be a prime. Let $\mathfrak{p} \subset R$ be the inverse image of \mathfrak{q} in R . Note that $M_{\mathfrak{q}}$ is flat over R if and only if it is flat over $R_{\mathfrak{p}}$. Let us assume that $M_{\mathfrak{q}}$ is flat over R . We claim that there exists a $g \in S$, $g \notin \mathfrak{q}$ such that M_g is flat over R .

We first reduce to the case where R and S are of finite type over \mathbf{Z} . Choose a directed partially ordered set Λ and a system $(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda})$ as in Lemma 10.123.15. Set \mathfrak{p}_{λ} equal to the inverse image of \mathfrak{p} in R_{λ} . Set \mathfrak{q}_{λ} equal to the inverse image of \mathfrak{q} in S_{λ} . Then the system

$$((R_{\lambda})_{\mathfrak{p}_{\lambda}}, (S_{\lambda})_{\mathfrak{q}_{\lambda}}, (M_{\lambda})_{\mathfrak{q}_{\lambda}})$$

is a system as in Lemma 10.123.11. Hence by Lemma 10.124.3 we see that for some λ the module M_{λ} is flat over R_{λ} at the prime \mathfrak{q}_{λ} . Suppose we can prove our claim for the system $(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}, \mathfrak{q}_{\lambda})$. In other words, suppose that we can find a $g \in S_{\lambda}$, $g \notin \mathfrak{q}_{\lambda}$ such that $(M_{\lambda})_g$ is flat over R_{λ} . By Lemma 10.123.15 we have $M = M_{\lambda} \otimes_{R_{\lambda}} R$ and hence also $M_g = (M_{\lambda})_g \otimes_{R_{\lambda}} R$. Thus by Lemma 10.38.6 we deduce the claim for the system $(R \rightarrow S, M, \mathfrak{q})$.

At this point we may assume that R and S are of finite type over \mathbf{Z} . We may write S as a quotient of a polynomial ring $R[x_1, \dots, x_n]$. Of course, we may replace S by $R[x_1, \dots, x_n]$ and assume that S is a polynomial ring over R . In particular we see that $R \rightarrow S$ is flat and all fibres rings $S \otimes_R \kappa(\mathfrak{p})$ have global dimension n .

Choose a resolution F_\bullet of M over S with each F_i finite free, see Lemma 10.69.1. Let $K_n = \text{Ker}(F_{n-1} \rightarrow F_{n-2})$. Note that $(K_n)_{\mathfrak{q}}$ is flat over R , since each F_i is flat over R and by assumption on M , see Lemma 10.38.12. In addition, the sequence

$$0 \rightarrow K_n/\mathfrak{p}K_n \rightarrow F_{n-1}/\mathfrak{p}F_{n-1} \rightarrow \dots \rightarrow F_0/\mathfrak{p}F_0 \rightarrow M/\mathfrak{p}M \rightarrow 0$$

is exact upon localizing at \mathfrak{q} , because of vanishing of $\text{Tor}_i^{R_{\mathfrak{p}}}(\kappa(\mathfrak{p}), M_{\mathfrak{q}})$. Since the global dimension of $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ is n we conclude that $K_n/\mathfrak{p}K_n$ localized at \mathfrak{q} is a finite free module over $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$. By Lemma 10.95.4 $(K_n)_{\mathfrak{q}}$ is free over $S_{\mathfrak{q}}$. In particular, there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $(K_n)_g$ is finite free over S_g .

By Lemma 10.125.3 there exists a further localization S_g such that the complex

$$0 \rightarrow K_n \rightarrow F_{n-1} \rightarrow \dots \rightarrow F_0$$

is exact on *all fibres* of $R \rightarrow S$. By Lemma 10.95.5 this implies that the cokernel of $F_1 \rightarrow F_0$ is flat. This proves the theorem in the Noetherian case. \square

10.126. Openness of Cohen-Macaulay loci

In this section we characterize the Cohen-Macaulay property of finite type algebras in terms of flatness. We then use this to prove the set of points where such an algebra is Cohen-Macaulay is open.

Lemma 10.126.1. *Let S be a finite type algebra over a field k . Let $\varphi : k[y_1, \dots, y_d] \rightarrow S$ be a finite ring map. As subsets of $\text{Spec}(S)$ we have*

$$\{\mathfrak{q} \mid S_{\mathfrak{q}} \text{ flat over } k[y_1, \dots, y_d]\} = \{\mathfrak{q} \mid S_{\mathfrak{q}} \text{ CM and } \dim_{\mathfrak{q}}(S/k) = d\}$$

For notation see Definition 10.121.1.

Proof. Let $\mathfrak{q} \subset S$ be a prime. Denote $\mathfrak{p} = k[y_1, \dots, y_d] \cap \mathfrak{q}$. Note that always $\dim(S_{\mathfrak{q}}) \leq \dim(k[y_1, \dots, y_d]_{\mathfrak{p}})$ by Lemma 10.121.4 for example. Moreover, the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite and hence $\text{trdeg}_k(\kappa(\mathfrak{p})) = \text{trdeg}_k(\kappa(\mathfrak{q}))$.

Let \mathfrak{q} be an element of the left hand side. Then Lemma 10.108.9 applies and we conclude that $S_{\mathfrak{q}}$ is Cohen-Macaulay and $\dim(S_{\mathfrak{q}}) = \dim(k[y_1, \dots, y_d]_{\mathfrak{p}})$. Combined with the equality of transcendence degrees above and Lemma 10.112.3 this implies that $\dim_{\mathfrak{q}}(S/k) = d$. Hence \mathfrak{q} is an element of the right hand side.

Let \mathfrak{q} be an element of the right hand side. By the equality of transcendence degrees above, the assumption that $\dim_{\mathfrak{q}}(S/k) = d$ and Lemma 10.112.3 we conclude that $\dim(S_{\mathfrak{q}}) = \dim(k[y_1, \dots, y_d]_{\mathfrak{p}})$. Hence Lemma 10.124.1 applies and we see that \mathfrak{q} is an element of the left hand side. \square

Lemma 10.126.2. *Let S be a finite type algebra over a field k . The set of primes \mathfrak{q} such that $S_{\mathfrak{q}}$ is Cohen-Macaulay is open in S .*

This lemma is a special case of Lemma 10.126.4 below, so you can skip straight to the proof of that lemma if you like.

Proof. Let $\mathfrak{q} \subset S$ be a prime such that $S_{\mathfrak{q}}$ is Cohen-Macaulay. We have to show there exists a $g \in S$, $g \notin \mathfrak{q}$ such that the ring S_g is Cohen-Macaulay. For any $g \in S$, $g \notin \mathfrak{q}$ we may replace S by S_g and \mathfrak{q} by $\mathfrak{q}S_g$. Combining this with Lemmas 10.111.5 and 10.112.3 we may assume that there exists a finite injective ring map $k[y_1, \dots, y_d] \rightarrow S$ with $d = \dim(S_{\mathfrak{q}}) + \text{trdeg}_k(\kappa(\mathfrak{q}))$. Set $\mathfrak{p} = k[y_1, \dots, y_d] \cap \mathfrak{q}$. By construction we see that \mathfrak{q} is an element of the right hand side of the displayed equality of Lemma 10.126.1. Hence it is also an element of the left hand side.

By Theorem 10.125.4 we see that for some $g \in S$, $g \notin \mathfrak{q}$ the ring S_g is flat over $k[y_1, \dots, y_d]$. Hence by the equality of Lemma 10.126.1 again we conclude that all local rings of S_g are Cohen-Macaulay as desired. \square

Lemma 10.126.3. *Let k be a field. Let S be a finite type k algebra. The set of Cohen-Macaulay primes forms a dense open $U \subset \text{Spec}(S)$.*

Proof. The set is open by Lemma 10.126.2. It contains all minimal primes $\mathfrak{q} \subset S$ since the local ring at a minimal prime $S_{\mathfrak{q}}$ has dimension zero and hence is Cohen-Macaulay. \square

Lemma 10.126.4. *Let R be a ring. Let $R \rightarrow S$ be of finite presentation and flat. For any $d \geq 0$ the set*

$$\left\{ \begin{array}{l} \mathfrak{q} \in \text{Spec}(S) \text{ such that setting } \mathfrak{p} = R \cap \mathfrak{q} \text{ the fibre ring} \\ S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \text{ is Cohen-Macaulay and } \dim_{\mathfrak{q}}(S/R) = d \end{array} \right\}$$

is open in $\text{Spec}(S)$.

Proof. Let \mathfrak{q} be an element of the set indicated, with \mathfrak{p} the corresponding prime of R . We have to find a $g \in S$, $g \notin \mathfrak{q}$ such that all fibre rings of $R \rightarrow S_g$ are Cohen-Macaulay. During the course of the proof we may (finitely many times) replace S by S_g for a $g \in S$, $g \notin \mathfrak{q}$. Thus by Lemma 10.121.2 we may assume there is a quasi-finite ring map $R[t_1, \dots, t_d] \rightarrow S$ with $d = \dim_{\mathfrak{q}}(S/R)$. Let $\mathfrak{q}' = R[t_1, \dots, t_d] \cap \mathfrak{q}$. By Lemma 10.126.1 we see that the ring map

$$R[t_1, \dots, t_d]_{\mathfrak{q}'} / \mathfrak{p}R[t_1, \dots, t_d]_{\mathfrak{q}'} \longrightarrow S_{\mathfrak{q}} / \mathfrak{p}S_{\mathfrak{q}}$$

is flat. Hence by the critère de platitude par fibres Lemma 10.124.8 we see that $R[t_1, \dots, t_d]_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is flat. Hence by Theorem 10.125.4 we see that for some $g \in S$, $g \notin \mathfrak{q}$ the ring map $R[t_1, \dots, t_d] \rightarrow S_g$ is flat. Replacing S by S_g we see that for every prime $\mathfrak{r} \subset S$, setting $\mathfrak{r}' = R[t_1, \dots, t_d] \cap \mathfrak{r}$ and $\mathfrak{p}' = R \cap \mathfrak{r}$ the local ring map $R[t_1, \dots, t_d]_{\mathfrak{r}'} \rightarrow S_{\mathfrak{r}}$ is flat. Hence also the base change

$$R[t_1, \dots, t_d]_{\mathfrak{r}'} / \mathfrak{p}'R[t_1, \dots, t_d]_{\mathfrak{r}'} \longrightarrow S_{\mathfrak{r}} / \mathfrak{p}'S_{\mathfrak{r}}$$

is flat. Hence by Lemma 10.126.1 applied with $k = \kappa(\mathfrak{p}')$ we see \mathfrak{r} is in the set of the lemma as desired. \square

Lemma 10.126.5. *Let R be a ring. Let $R \rightarrow S$ be flat of finite presentation. The set of primes \mathfrak{q} such that the fibre ring $S_{\mathfrak{q}} \otimes_R \kappa(\mathfrak{p})$, with $\mathfrak{p} = R \cap \mathfrak{q}$ is Cohen-Macaulay is open and dense in every fibre of $\text{Spec}(S) \rightarrow \text{Spec}(R)$.*

Proof. The set, call it W , is open by Lemma 10.126.4. It is dense in the fibres because the intersection of W with a fibre is the corresponding set of the fibre to which Lemma 10.126.3 applies. \square

Lemma 10.126.6. *Let k be a field. Let S be a finite type k -algebra. Let $k \subset K$ be a field extension, and set $S_K = K \otimes_k S$. Let $\mathfrak{q} \subset S$ be a prime of S . Let $\mathfrak{q}_K \subset S_K$ be a prime of S_K lying over \mathfrak{q} . Then $S_{\mathfrak{q}}$ is Cohen-Macaulay if and only if $(S_K)_{\mathfrak{q}_K}$ is Cohen-Macaulay.*

Proof. During the course of the proof we may (finitely many times) replace S by S_g for any $g \in S$, $g \notin \mathfrak{q}$. Hence using Lemma 10.111.5 we may assume that $\dim(S) = \dim_{\mathfrak{q}}(S/k) =: d$ and find a finite injective map $k[x_1, \dots, x_d] \rightarrow S$. Note that this also induces a finite injective map $K[x_1, \dots, x_d] \rightarrow S_K$ by base change. By Lemma 10.112.6 we have $\dim_{\mathfrak{q}_K}(S_K/K) = d$. Set $\mathfrak{p} = k[x_1, \dots, x_d] \cap \mathfrak{q}$ and $\mathfrak{p}_K = K[x_1, \dots, x_d] \cap \mathfrak{q}_K$. Consider the following commutative diagram of Noetherian local rings

$$\begin{array}{ccc} S_{\mathfrak{q}} & \longrightarrow & (S_K)_{\mathfrak{q}_K} \\ \uparrow & & \uparrow \\ k[x_1, \dots, x_d]_{\mathfrak{p}} & \longrightarrow & K[x_1, \dots, x_d]_{\mathfrak{p}_K} \end{array}$$

By Lemma 10.126.1 we have to show that the left vertical arrow is flat if and only if the right vertical arrow is flat. Because the bottom arrow is flat this equivalence holds by Lemma 10.96.1. \square

Lemma 10.126.7. *Let R be a ring. Let $R \rightarrow S$ be of finite type. Let $R \rightarrow R'$ be any ring map. Set $S' = R' \otimes_R S$. Denote $f : \text{Spec}(S') \rightarrow \text{Spec}(S)$ the map associated to the ring map $S \rightarrow S'$. Set W equal to the set of primes \mathfrak{q} such that the fibre ring $S_{\mathfrak{q}} \otimes_R \kappa(\mathfrak{p})$, $\mathfrak{p} = R \cap \mathfrak{q}$ is Cohen-Macaulay, and let W' denote the analogue for S'/R' . Then $W' = f^{-1}(W)$.*

Proof. Trivial from Lemma 10.126.6 and the definitions. \square

Lemma 10.126.8. *Let R be a ring. Let $R \rightarrow S$ be a ring map which is (a) flat, (b) of finite presentation, (c) has Cohen-Macaulay fibres. Then $S = S_0 \times \dots \times S_n$ is a product of rings S_d such that each S_d satisfies (a), (b), (c) and has all fibres equidimensional of dimension d .*

Proof. For each integer d denote $W_d \subset \text{Spec}(S)$ the set defined in Lemma 10.126.4. Clearly we have $\text{Spec}(S) = \coprod W_d$, and each W_d is open by the lemma we just quoted. Hence the result follows from Lemma 10.22.3. \square

10.127. Differentials

In this section we define the module of differentials of a ring map.

Definition 10.127.1. Let $\varphi : R \rightarrow S$ be a ring map and let M be an S -module. A *derivation*, or more precisely an *R -derivation* into M is a map $D : S \rightarrow M$ which is additive, annihilates elements of $\varphi(R)$, and satisfies the *Leibniz rule*: $D(ab) = aD(b) + D(a)b$.

Note that $D(ra) = rD(a)$ if $r \in R$ and $a \in S$. The set of all R -derivations forms an S -module: Given two R -derivations D, D' the sum $D + D' : S \rightarrow M$, $a \mapsto D(a) + D'(a)$ is an R -derivation, and given an R -derivation D and an element $c \in S$ the scalar multiple $cD : S \rightarrow M$, $a \mapsto cD(a)$ is an R -derivation. We denote this S -module

$$\text{Der}_R(S, M).$$

Also, if $\alpha : M \rightarrow N$ is an S -module map, then the composition $\alpha \circ D$ is an R -derivation into N . In this way the assignment $M \mapsto \text{Der}_R(S, M)$ is a covariant functor.

Consider the following map of free S -modules

$$\bigoplus_{(a,b) \in S^2} S[(a,b)] \oplus \bigoplus_{(f,g) \in S^2} S[(f,g)] \oplus \bigoplus_{r \in R} S[r] \longrightarrow \bigoplus_{a \in S} S[a]$$

defined by the rules

$$[(a,b)] \mapsto [a+b] - [a] - [b], \quad [(f,g)] \mapsto [fg] - f[g] - g[f], \quad [r] \mapsto [\varphi(r)]$$

with obvious notation. Let $\Omega_{S/R}$ be the cokernel of this map. There is a map $d : S \rightarrow \Omega_{S/R}$ which maps a to the class da of $[a]$ in the cokernel. This is an R -derivation by the relations imposed on $\Omega_{S/R}$, in other words

$$d(a+b) = da + db, \quad d(fg) = fdg + gdf, \quad dr = 0$$

where $a, b, f, g \in S$ and $r \in R$.

Definition 10.127.2. The pair $(\Omega_{S/R}, d)$ is called the *module of Kähler differentials* or the *module of differentials* of S over R .

Lemma 10.127.3. *The module of differentials of S over R has the following universal property. The map*

$$\text{Hom}_S(\Omega_{S/R}, M) \longrightarrow \text{Der}_R(S, M), \quad \alpha \mapsto \alpha \circ d$$

is an isomorphism of functors.

Proof. By definition an R -derivation is a rule which associates to each $a \in S$ an element $D(a) \in M$. Thus D gives rise to a map $[D] : \bigoplus S[a] \rightarrow M$. However, the conditions of being an R -derivation exactly mean that $[D]$ annihilates the image of the map in the displayed presentation of $\Omega_{S/R}$ above. \square

Lemma 10.127.4. *Let I be a directed partially ordered set. Let $(R_i \rightarrow S_i, \varphi_{ii'})$ be a system of ring maps over I , see Categories, Section 4.21. Then we have*

$$\Omega_{S/R} = \text{colim}_i \Omega_{S_i/R_i}.$$

Proof. This is clear from the presentation of $\Omega_{S/R}$ given above. \square

Lemma 10.127.5. *Suppose that $R \rightarrow S$ is surjective. Then $\Omega_{S/R} = 0$.*

Proof. You can see this either because all R -derivations clearly have to be zero, or because the map in the presentation of $\Omega_{S/R}$ is surjective. \square

Suppose that

$$(10.127.5.1) \quad \begin{array}{ccc} S & \xrightarrow{\quad} & S' \\ \alpha \uparrow & \varphi & \uparrow \beta \\ R & \xrightarrow{\psi} & R' \end{array}$$

is a commutative diagram of rings. In this case there is a natural map of modules of differentials fitting into the commutative diagram

$$\begin{array}{ccc} \Omega_{S/R} & \longrightarrow & \Omega_{S'/R'} \\ \uparrow d & & \uparrow d \\ S & \longrightarrow & S' \end{array}$$

To construct the map just use the obvious map between the presentations for $\Omega_{S/R}$ and $\Omega_{S'/R'}$. Namely,

$$\begin{array}{ccc}
 \bigoplus S'[(a', b')] \oplus \bigoplus S'[(f', g')] \oplus \bigoplus S'[r'] & \longrightarrow & \bigoplus S'[a'] \\
 \left[\begin{array}{l} [(a, b)] \mapsto [(\varphi(a), \varphi(b))] \\ [(f, g)] \mapsto [(\varphi(f), \varphi(g))] \\ [r] \mapsto [\psi(r)] \end{array} \right. & \uparrow & \uparrow [a] \mapsto [\varphi(a)] \\
 \bigoplus S[(a, b)] \oplus \bigoplus S[(f, g)] \oplus \bigoplus S[r] & \longrightarrow & \bigoplus S[a]
 \end{array}$$

The result is simply that $f dg \in \Omega_{S/R}$ is mapped to $\varphi(f)d\varphi(g)$.

Lemma 10.127.6. *In diagram (10.127.5.1), suppose that $S \rightarrow S'$ is surjective with kernel $I \subset S$. Then $\Omega_{S/R} \rightarrow \Omega_{S'/R'}$ is surjective with kernel generated as an S -module by the elements $d\varphi(a)$, where $a \in S$ is such that $\varphi(a) \in \beta(R')$. (This includes in particular the elements $d(i)$, $i \in I$.)*

Proof. Consider the map of presentations above. Clearly the right vertical map of free modules is surjective. Thus the map is surjective. A diagram chase shows that the following elements generate the kernel as an S -module for sure: $ida, i \in I, a \in S$, and $d\varphi(a)$, with $a \in S$ such that $\varphi(a) = \beta(r')$ for some $r' \in R'$. Note that $\varphi(i) = \varphi(ia) = 0 = \beta(0)$, and that $d(ia) = ida + adi$. Hence $ida = d(ia) - adi$ is an S -linear combination of elements of the second kind. \square

Lemma 10.127.7. *Let $A \rightarrow B \rightarrow C$ be ring maps. Then there is a canonical exact sequence*

$$C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of C -modules.

Proof. We get a diagram (10.127.5.1) by putting $R = A, S = C, R' = B$, and $S' = C$. By Lemma 10.127.6 the map $\Omega_{C/A} \rightarrow \Omega_{C/B}$ is surjective, and the kernel is generated by the elements $d(c)$, where $c \in C$ is in the image of $B \rightarrow C$. The lemma follows. \square

Lemma 10.127.8. *Let $\varphi : A \rightarrow B$ be a ring map.*

- (1) *If $S \subset A$ is a multiplicative subset mapping to invertible elements of B , then $\Omega_{B/A} = \Omega_{B/S^{-1}A}$.*
- (2) *If $S \subset B$ is a multiplicative subset then $S^{-1}\Omega_{B/A} = \Omega_{S^{-1}B/A}$.*

Proof. To show the equality of (1) it is enough to show that any A -derivation $D : B \rightarrow M$ annihilates the elements $\varphi(s)^{-1}$. This is clear from the Leibniz rule applied to $1 = \varphi(s)\varphi(s)^{-1}$. To show (2) note that there is an obvious map $S^{-1}\Omega_{B/A} \rightarrow \Omega_{S^{-1}B/A}$. To show it is an isomorphism it is enough to show that there is a A -derivation d' of $S^{-1}B$ into $S^{-1}\Omega_{B/A}$. To define it we simply set $d'(b/s) = (1/s)db - (1/s^2)bds$. Details omitted. \square

Lemma 10.127.9. *In diagram (10.127.5.1), suppose that $S \rightarrow S'$ is surjective with kernel $I \subset S$, and assume that $R' = R$. Then there is a canonical exact sequence of S' -modules*

$$I/I^2 \longrightarrow \Omega_{S/R} \otimes_S S' \longrightarrow \Omega_{S'/R} \longrightarrow 0$$

The leftmost map is characterized by the rule that $f \in I$ maps to $df \otimes 1$.

Proof. The middle term is $\Omega_{S/R} \otimes_S S/I$. For $f \in I$ denote \bar{f} the image of f in I/I^2 . To show that the map $\bar{f} \mapsto df \otimes 1$ is well defined we just have to check that $df_1 f_2 \otimes 1 = 0$ if $f_1, f_2 \in I$. And this is clear from the Leibniz rule $df_1 f_2 \otimes 1 = (f_1 df_2 + f_2 df_1) \otimes 1 = df_2 \otimes f_1 + df_1 \otimes f_2 = 0$. A similar computation show this map is $S' = S/I$ -linear.

The map $\Omega_{S/R} \otimes_S S' \rightarrow \Omega_{S'/R}$ is the canonical S' -linear map associated to the S -linear map $\Omega_{S/R} \rightarrow \Omega_{S'/R}$. It is surjective because $\Omega_{S/R} \rightarrow \Omega_{S'/R}$ is surjective by Lemma 10.127.6.

The composite of the two maps is zero because df maps to zero in $\Omega_{S'/R}$ for $f \in I$. Note that exactness just says that the kernel of $\Omega_{S/R} \rightarrow \Omega_{S'/R}$ is generated as an S -submodule by the submodule $I\Omega_{S/R}$ together with the elements df , with $f \in I$. We know by Lemma 10.127.6 that this kernel is generated by the elements $d(a)$ where $\varphi(a) = \beta(r)$ for some $r \in R$. But then $a = \alpha(r) + a - \alpha(r)$, so $d(a) = d(a - \alpha(r))$. And $a - \alpha(r) \in I$ since $\varphi(a - \alpha(r)) = \varphi(a) - \varphi(\alpha(r)) = \beta(r) - \beta(r) = 0$. We conclude the elements df with $f \in I$ already generate the kernel as an S -module, as desired. \square

Lemma 10.127.10. *In diagram (10.127.5.1), suppose that $S \rightarrow S'$ is surjective with kernel $I \subset S$, and assume that $R' = R$. Moreover, assume that there exists an R -algebra map $S' \rightarrow S$ which is a right inverse to $S \rightarrow S'$. Then the exact sequence of S' -modules of Lemma 10.127.9 turns into a short exact sequence*

$$0 \longrightarrow I/I^2 \longrightarrow \Omega_{S/R} \otimes_S S' \longrightarrow \Omega_{S'/R} \longrightarrow 0$$

which is even a split short exact sequence.

Proof. Let $\beta : S' \rightarrow S$ be the right inverse to the surjection $\alpha : S \rightarrow S'$, so $S = I \oplus \beta(S')$. Clearly we can use $\beta : \Omega_{S'/R} \rightarrow \Omega_{S/R}$, to get a right inverse to the map $\Omega_{S/R} \otimes_S S' \rightarrow \Omega_{S'/R}$. On the other hand, consider the map

$$D : S \longrightarrow I/I^2, \quad x \longmapsto x - \beta(\alpha(x))$$

It is easy to show that D is an R -derivation (omitted). Moreover $x D(s) = 0$ if $x \in I, s \in S$. Hence, by the universal property D induces a map $\tau : \Omega_{S/R} \otimes_S S' \rightarrow I/I^2$. We omit the verification that it is a left inverse to $d : I/I^2 \rightarrow \Omega_{S/R} \otimes_S S'$. Hence we win. \square

Lemma 10.127.11. *Let $R \rightarrow S$ be a ring map. Let $I \subset S$ be an ideal. Let $n \geq 1$ be an integer. Set $S' = S/I^{n+1}$. The map $\Omega_{S/R} \rightarrow \Omega_{S'/R}$ induces an isomorphism*

$$\Omega_{S/R} \otimes_S S/I^n \longrightarrow \Omega_{S'/R} \otimes_{S'} S/I^n.$$

Proof. This follows from Lemma 10.127.9 and the fact that $d(I^{n+1}) \subset I^n \Omega_{S/R}$ by the Leibniz rule for d . \square

Lemma 10.127.12. *Suppose that we have ring maps $R \rightarrow R'$ and $R \rightarrow S$. Set $S' = S \otimes_R R'$, so that we obtain a diagram (10.127.5.1). Then the canonical map defined above induces an isomorphism $\Omega_{S/R} \otimes_R R' = \Omega_{S'/R}$.*

Proof. Let $d' : S' = S \otimes_R R' \rightarrow \Omega_{S/R} \otimes_R R'$ denote the map $d'(\sum a_i \otimes x_i) = d(a_i) \otimes x_i$. It exists because the map $S \times R' \rightarrow \Omega_{S/R} \otimes_R R'$, $(a, x) \mapsto da \otimes_R x$ is R -bilinear. This is an R' -derivation, as can be verified by a simple computation. We will show that $(\Omega_{S/R} \otimes_R R', d')$ satisfies the universal property. Let $D : S' \rightarrow M'$ be an R' derivation into an S' -module. The composition $S \rightarrow S' \rightarrow M'$ is an

R -derivation, hence we get an S -linear map $\varphi_D : \Omega_{S/R} \rightarrow M'$. We may tensor this with R' and get the map $\varphi'_D : \Omega_{S/R} \otimes_R R' \rightarrow M'$, $\varphi'_D(\eta \otimes x) = x\varphi_D(\eta)$. It is clear that $D = \varphi'_D \circ d'$. \square

The multiplication map $S \otimes_R S \rightarrow S$ is the R -algebra map which maps $a \otimes b$ to ab in S . It is also an S -algebra map, if we think of $S \otimes_R S$ as an S -algebra via either of the maps $S \rightarrow S \otimes_R S$.

Lemma 10.127.13. *Let $R \rightarrow S$ be a ring map. Let $J = \text{Ker}(S \otimes_R S \rightarrow S)$ be the kernel of the multiplication map. There is a canonical isomorphism of S -modules $\Omega_{S/R} \rightarrow J/J^2$, $adb \mapsto a \otimes b - ab \otimes 1$.*

Proof. First we show that the rule $adb \mapsto a \otimes b - ab \otimes 1$ is well defined. In order to do this we have to show that dr and $adb + bda - d(ab)$ map to zero. The first because $r \otimes 1 - 1 \otimes r = 0$ by definition of the tensor product. The second because $a \otimes b - ab \otimes 1 + b \otimes a - ba \otimes 1 = (a \otimes 1 - 1 \otimes a)(1 \otimes b - b \otimes 1)$ is in J^2 .

We construct a map in the other direction. We may think of $S \rightarrow S \otimes_R S$, $a \mapsto a \otimes 1$ as the base change of $R \rightarrow S$. Hence we have $\Omega_{S \otimes_R S/S} = \Omega_{S/R} \otimes_S (S \otimes_R S)$, by Lemma 10.127.12. At this point the sequence of Lemma 10.127.9 gives a map

$$J/J^2 \rightarrow \Omega_{S \otimes_R S/S} \otimes_{S \otimes_R S} S = (\Omega_{S/R} \otimes_S (S \otimes_R S)) \otimes_{S \otimes_R S} S = \Omega_{S/R}.$$

We leave it to the reader to see it is the inverse of the map above. \square

Lemma 10.127.14. *If $S = R[x_1, \dots, x_n]$, then $\Omega_{S/R}$ is a finite free S -module with basis dx_1, \dots, dx_n .*

Proof. We first show that dx_1, \dots, dx_n generate $\Omega_{S/R}$ as an S -module. To prove this we show that dg can be expressed as a sum $\sum g_i dx_i$ for any $g \in R[x_1, \dots, x_n]$. We do this by induction on the (total) degree of g . It is clear if the degree of g is 0, because then $dg = 0$. If the degree of g is > 0 , then we may write g as $c + \sum g_i x_i$ with $c \in R$ and $\deg(g_i) < \deg(g)$. By the Leibniz rule we have $dg = \sum g_i dx_i + \sum x_i dg_i$, and hence we win by induction.

Consider the R -derivation $\partial/\partial x_i : R[x_1, \dots, x_n] \rightarrow R[x_1, \dots, x_n]$. (We leave it to the reader to define this; the defining property being that $\partial/\partial x_i(x_j) = \delta_{ij}$.) By the universal property this corresponds to an S -module map $l_i : \Omega_{S/R} \rightarrow R[x_1, \dots, x_n]$ which maps dx_i to 1 and dx_j to 0 for $j \neq i$. Thus it is clear that there are no S -linear relations among the elements dx_1, \dots, dx_n . \square

Lemma 10.127.15. *Suppose $R \rightarrow S$ is of finite presentation. Then $\Omega_{S/R}$ is a finitely presented S -module.*

Proof. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. Write $I = (f_1, \dots, f_m)$. According to Lemma 10.127.9 there is an exact sequence of S -modules

$$I/I^2 \rightarrow \Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S \rightarrow \Omega_{S/R} \rightarrow 0$$

The result follows from the fact that I/I^2 is a finite S -module (generated by the images of the f_i), and that the middle term is finite free by Lemma 10.127.14. \square

Lemma 10.127.16. *Suppose $R \rightarrow S$ is of finite type. Then $\Omega_{S/R}$ is finitely generated S -module.*

Proof. This is very similar to, but easier than the proof of Lemma 10.127.15. \square

10.128. Finite order differential operators

In this section we introduce differential operators of finite order.

Definition 10.128.1. Let $R \rightarrow S$ be a ring map. Let M, N be S -modules. Let $k \geq 0$ be an integer. We inductively define a *differential operator* $D : M \rightarrow N$ of order k to be an R -linear map such that for all $g \in S$ the map $m \mapsto D(gm) - gD(m)$ is a differential operator of order $k - 1$. For the base case $k = 0$ we define a differential operator of order 0 to be an S -linear map.

If $D : M \rightarrow N$ is a differential operator of order k , then for all $g \in S$ the map gD is a differential operator of order k . The sum of two differential operators of order k is another. Hence the set of all these

$$\text{Diff}^k(M, N) = \text{Diff}_{S/R}^k(M, N)$$

is an S -module. We have

$$\text{Diff}^0(M, N) \subset \text{Diff}^1(M, N) \subset \text{Diff}^2(M, N) \subset \dots$$

Lemma 10.128.2. Let $R \rightarrow S$ be a ring map. Let L, M, N be S -modules. If $D : L \rightarrow M$ and $D' : M \rightarrow N$ are differential operators of order k and k' , then $D' \circ D$ is a differential operator of order $k + k'$.

Proof. Let $g \in S$. Then the map which sends $x \in L$ to

$$D'(D(gx)) - gD'(D(x)) = D'(D(gx)) - D'(gD(x)) + D'(gD(x)) - gD'(D(x))$$

is a sum of two compositions of differential operators of lower order. Hence the lemma follows by induction on $k + k'$. \square

Lemma 10.128.3. Let $R \rightarrow S$ be a ring map. Let M be an S -module. Let $k \geq 0$. There exists an S -module $P_{S/R}^k(M)$ and a canonical isomorphism

$$\text{Diff}_{S/R}^k(M, N) = \text{Hom}_S(P_{S/R}^k(M), N)$$

functorial in the S -module N .

Proof. The existence of $P_{S/R}^k(M)$ follows from general category theoretic arguments (insert future reference here), but we will also give a construction. Set $F = \bigoplus_{m \in M} S[m]$ where $[m]$ is a symbol indicating the basis element in the summand corresponding to m . Given any differential operator $D : M \rightarrow N$ we obtain an S -linear map $L_D : F \rightarrow N$ sending $[m]$ to $D(m)$. If D has order 0 then L_D annihilates the elements

$$[m + m'] - [m] - [m'], \quad g_0[m] - [g_0m]$$

where $g_0 \in S$ and $m, m' \in M$. If D has order 1, then L_D annihilates the elements

$$[m + m'] - [m] - [m'], \quad f[m] - [fm], \quad g_0g_1[m] - g_0[g_1m] - g_1[g_0m] + [g_1g_0m]$$

where $f \in R$, $g_0, g_1 \in S$, and $m \in M$. If D has order k , then L_D annihilates the elements $[m + m'] - [m] - [m']$, $f[m] - [fm]$, and the elements

$$g_0g_1 \dots g_k[m] - \sum g_0 \dots \hat{g}_i \dots g_k[g_i m] + \dots + (-1)^{k+1}[g_0 \dots g_k m]$$

Conversely, if $L : F \rightarrow N$ is an S -linear map annihilating all the elements listed in the previous sentence, then $m \mapsto L([m])$ is a differential operator of order k . Thus we see that $P_{S/R}^k(M)$ is the quotient of F by the submodule generated by these elements. \square

Definition 10.128.4. Let $R \rightarrow S$ be a ring map. Let M be an S -module. The module $P_{S/R}^k(M)$ constructed in Lemma 10.128.3 is called the *module of principal parts of order k* of M .

Note that the inclusions

$$\text{Diff}^0(M, N) \subset \text{Diff}^1(M, N) \subset \text{Diff}^2(M, N) \subset \dots$$

correspond via Yoneda's lemma (Categories, Lemma 4.3.5) to surjections

$$\dots \rightarrow P_{S/R}^2(M) \rightarrow P_{S/R}^1(M) \rightarrow P_{S/R}^0(M) = M$$

Example 10.128.5. Let $R \rightarrow S$ be a ring map and let N be an S -module. Observe that $\text{Diff}^1(S, N) = \text{Der}_R(S, N) \oplus N$. Namely, if $D : S \rightarrow S$ is a differential operator of order 1 then $\sigma_D : g \mapsto D(g) - gD(1)$ is a derivation and $D = \sigma_D + \lambda_{D(1)}$ where $\lambda_x : S \rightarrow N$ is the linear map sending g to gx . It follows that $P_{S/R}^1 = \Omega_{S/R} \oplus S$ by the universal property of $\Omega_{S/R}$.

Lemma 10.128.6. Let $R \rightarrow S$ be a ring map. Let M be an S -module. There is a canonical short exact sequence

$$0 \rightarrow \Omega_{S/R} \otimes_S M \rightarrow P_{S/R}^1(M) \rightarrow M \rightarrow 0$$

functorial in M called the *sequence of principal parts*.

Proof. The map $P_{S/R}^1(M) \rightarrow M$ is given above. Let N be an S -module and let $D : M \rightarrow N$ be a differential operator of order 1. For $m \in M$ the map

$$g \mapsto D(gm) - gD(m)$$

is an R -derivation $S \rightarrow N$ by the axioms for differential operators of order 1. Thus it corresponds to a linear map $D_m : \Omega_{S/R} \rightarrow N$ determined by the rule $adb \mapsto aD(bm) - abD(m)$ (see Lemma 10.127.3). The map

$$\Omega_{S/R} \times M \longrightarrow N, \quad (\eta, m) \mapsto D_m(\eta)$$

is S -bilinear (details omitted) and hence determines an S -linear map

$$\sigma_D : \Omega_{S/R} \otimes_S M \rightarrow N$$

In this way we obtain a map $\text{Diff}^1(M, N) \rightarrow \text{Hom}_S(\Omega_{S/R} \otimes_S M, N)$, $D \mapsto \sigma_D$ functorial in N . By the Yoneda lemma this corresponds a map $\Omega_{S/R} \otimes_S M \rightarrow P_{S/R}^1(M)$. It is immediate from the construction that this map is functorial in M . The sequence

$$\Omega_{S/R} \otimes_S M \rightarrow P_{S/R}^1(M) \rightarrow M \rightarrow 0$$

is exact because for every module N the sequence

$$0 \rightarrow \text{Hom}_S(M, N) \rightarrow \text{Diff}^1(M, N) \rightarrow \text{Hom}_S(\Omega_{S/R} \otimes_S M, N)$$

is exact by inspection.

To see that $\Omega_{S/R} \otimes_S M \rightarrow P_{S/R}^1(M)$ is injective we argue as follows. Choose an exact sequence

$$0 \rightarrow M' \rightarrow F \rightarrow M \rightarrow 0$$

with F a free S -module. This induces an exact sequence

$$0 \rightarrow \text{Diff}^1(M, N) \rightarrow \text{Diff}^1(F, N) \rightarrow \text{Diff}^1(M', N)$$

for all N . This proves that in the commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \Omega_{S/R} \otimes_S M' & \longrightarrow & P_{S/R}^1(M') & \longrightarrow & M' \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \Omega_{S/R} \otimes_S F & \longrightarrow & P_{S/R}^1(F) & \longrightarrow & F \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & \Omega_{S/R} \otimes_S M & \longrightarrow & P_{S/R}^1(M) & \longrightarrow & M \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 & & 0 & & 0 & & 0
 \end{array}$$

the middle column is exact. The left column is exact by right exactness of $\Omega_{S/R} \otimes_S -$. By the snake lemma (see Section 10.4) it suffices to prove exactness on the left for the free module F . Using that $P_{S/R}^1(-)$ commutes with direct sums we reduce to the case $M = S$. This case is a consequence of the discussion in Example 10.128.5. \square

Remark 10.128.7. Suppose given a commutative diagram of rings

$$\begin{array}{ccc}
 B & \longrightarrow & B' \\
 \uparrow & & \uparrow \\
 A & \longrightarrow & A'
 \end{array}$$

a B -module M , a B' -module M' , and a B -linear map $M \rightarrow M'$. Then we get a compatible system of module maps

$$\begin{array}{ccccccc}
 \dots & \longrightarrow & P_{B'/A'}^2(M') & \longrightarrow & P_{B'/A'}^1(M') & \longrightarrow & P_{B'/A'}^0(M') \\
 & & \uparrow & & \uparrow & & \uparrow \\
 \dots & \longrightarrow & P_{B/A}^2(M) & \longrightarrow & P_{B/A}^1(M) & \longrightarrow & P_{B/A}^0(M)
 \end{array}$$

These maps are compatible with further composition of maps of this type. The easiest way to see this is to use the description of the modules $P_{B/A}^k(M)$ in terms of generators and relations in the proof of Lemma 10.128.3 but it can also be seen directly from the universal property of these modules. Moreover, these maps are compatible with the short exact sequences of Lemma 10.128.6.

10.129. The naive cotangent complex

Let $R \rightarrow S$ be a ring map. Denote $R[S]$ the polynomial ring whose variables are the elements $s \in S$. Let's denote $[s] \in R[S]$ the variable corresponding to $s \in S$. Thus $R[S]$ is a free R -module on the basis elements $[s_1] \dots [s_n]$ where s_1, \dots, s_n is an unordered sequence of elements of S . There is a canonical surjection

$$(10.129.0.1) \quad R[S] \longrightarrow S, \quad [s] \longmapsto s$$

whose kernel we denote $I \subset R[S]$. It is a simple observation that I is generated by the elements $[s + s'] - [s] - [s']$, $[s][s'] - [ss']$ and $[r] - r$. According to Lemma

10.127.9 there is a canonical map

$$(10.129.0.2) \quad I/I^2 \longrightarrow \Omega_{R[S]/R} \otimes_{R[S]} S$$

whose cokernel is canonically isomorphic to $\Omega_{S/R}$. Observe that the S -module $\Omega_{R[S]/R} \otimes_{R[S]} S$ is free on the generators $d[s]$.

Definition 10.129.1. Let $R \rightarrow S$ be a ring map. The *naive cotangent complex* $NL_{S/R}$ is the chain complex (10.129.0.2)

$$NL_{S/R} = (I/I^2 \longrightarrow \Omega_{R[S]/R} \otimes_{R[S]} S)$$

with I/I^2 placed in (homological) degree 1 and $\Omega_{R[S]/R} \otimes_{R[S]} S$ placed in degree 0. We will denote $H_1(L_{S/R}) = H_1(NL_{S/R})$ ⁶ the homology in degree 1.

Before we continue let us say a few words about the actual cotangent complex (Cotangent, Section 70.3). Given a ring map $R \rightarrow S$ there exists a canonical simplicial R -algebra P_\bullet whose terms are polynomial algebras and which comes equipped with a canonical homotopy equivalence

$$P_\bullet \longrightarrow S$$

The cotangent complex $L_{S/R}$ of S over R is defined as the chain complex associated to the cosimplicial module

$$\Omega_{P_\bullet/R} \otimes_{P_\bullet} S$$

The naive cotangent complex as defined above is canonically isomorphic to the truncation $\tau_{\leq 1} L_{S/R}$ (see Homology, Section 12.13 and Cotangent, Section 70.10). In particular, it is indeed the case that $H_1(NL_{S/R}) = H_1(L_{S/R})$ so our definition is compatible with the one using the cotangent complex. Moreover, $H_0(L_{S/R}) = H_0(NL_{S/R}) = \Omega_{S/R}$ as we've seen above.

Let $R \rightarrow S$ be a ring map. A *presentation of S over R* is a surjection $\alpha : P \rightarrow S$ of R -algebras where P is a polynomial algebra (on a set of variables). Often, when S is of finite type over R we will indicate this by saying: “Let $R[x_1, \dots, x_n] \rightarrow S$ be a presentation of S/R ”, or “Let $0 \rightarrow I \rightarrow R[x_1, \dots, x_n] \rightarrow S \rightarrow 0$ be a presentation of S/R ” if we want to indicate that I is the kernel of the presentation. Note that the map $R[S] \rightarrow S$ used to define the naive cotangent complex is an example of a presentation.

Note that for every presentation α we obtain a two term chain complex of S -modules

$$NL(\alpha) : I/I^2 \longrightarrow \Omega_{P/R} \otimes_P S.$$

Here the term I/I^2 is placed in degree 1 and the term $\Omega_{P/R} \otimes_P S$ is placed in degree 0. The class of $f \in I$ in I/I^2 is mapped to $df \otimes 1$ in $\Omega_{P/R} \otimes_P S$. The cokernel of this complex is canonically $\Omega_{S/R}$, see Lemma 10.127.9. We call the complex $NL(\alpha)$ the *naive cotangent complex associated to the presentation $\alpha : P \rightarrow S$ of S/R* . Note that if $P = R[S]$ with its canonical surjection onto S , then we recover $NL_{S/R}$. If $P = R[x_1, \dots, x_n]$ then will sometimes use the notation $I/I^2 \rightarrow \bigoplus_{i=1, \dots, n} S dx_i$ to denote this complex.

⁶This module is sometimes denoted $\Gamma_{S/R}$ in the literature.

Suppose we are given a commutative diagram

$$(10.129.1.1) \quad \begin{array}{ccc} S & \xrightarrow{\quad} & S' \\ \uparrow & \phi & \uparrow \\ R & \xrightarrow{\quad} & R' \end{array}$$

of rings. Let $\alpha : P \rightarrow S$ be a presentation of S over R and let $\alpha' : P' \rightarrow S'$ be a presentation of S' over R' . A *morphism of presentations* from $\alpha : P \rightarrow S$ to $\alpha' : P' \rightarrow S'$ is defined to be an R -algebra map

$$\varphi : P \rightarrow P'$$

such that $\phi \circ \alpha = \alpha' \circ \varphi$. Note that in this case $\varphi(I) \subset I'$, where $I = \text{Ker}(\alpha)$ and $I' = \text{Ker}(\alpha')$. Thus φ induces a map of S -modules $I/I^2 \rightarrow I'/(I')^2$ and by functoriality of differentials also an S -module map $\Omega_{P/R} \otimes S \rightarrow \Omega_{P'/R'} \otimes S'$. These maps are compatible with the differentials of $NL(\alpha)$ and $NL(\alpha')$ and we obtain a map of naive cotangent complexes

$$NL(\alpha) \longrightarrow NL(\alpha').$$

It is often convenient to consider the induced map $NL(\alpha) \otimes_S S' \rightarrow NL(\alpha')$.

In the special case that $P = R[S]$ and $P' = R'[S']$ the map $\phi : S \rightarrow S'$ induces a canonical ring map $\varphi : P \rightarrow P'$ by the rule $[s] \mapsto [\phi(s)]$. Hence the construction above determines canonical(!) maps of chain complexes

$$NL_{S/R} \longrightarrow NL_{S'/R'}, \quad \text{and} \quad NL_{S/R} \otimes_S S' \longrightarrow NL_{S'/R'}$$

associated to the diagram (10.129.1.1). Note that this construction is compatible with composition: given a commutative diagram

$$\begin{array}{ccccc} S & \xrightarrow{\quad} & S' & \xrightarrow{\quad} & S'' \\ \uparrow & \phi & \uparrow & \phi' & \uparrow \\ R & \xrightarrow{\quad} & R' & \xrightarrow{\quad} & R'' \end{array}$$

we see that the composition of

$$NL_{S/R} \longrightarrow NL_{S'/R'} \longrightarrow NL_{S''/R''}$$

is the map $NL_{S/R} \rightarrow NL_{S''/R''}$ given by the outer square.

It turns out that $NL(\alpha)$ is homotopy equivalent to $NL_{S/R}$ and that the maps constructed above are well defined up to homotopy (homotopies of maps of complexes are discussed in Homology, Section 12.12 but we also spell out the exact meaning of the statements in the lemma below in its proof).

Lemma 10.129.2. *Suppose given a diagram (10.129.1.1). Let $\alpha : P \rightarrow S$ and $\alpha' : P' \rightarrow S'$ be presentations.*

- (1) *There exists a morphism of presentations from α to α' .*
- (2) *Any two morphisms of presentations induce homotopic morphisms of complexes $NL(\alpha) \rightarrow NL(\alpha')$.*
- (3) *The construction is compatible with compositions of morphisms of presentations (see proof for exact statement).*

- (4) If $R \rightarrow R'$ and $S \rightarrow S'$ are isomorphisms, then for any map φ of presentations from α to α' the induced map $NL(\alpha) \rightarrow NL(\alpha')$ is a homotopy equivalence and a quasi-isomorphism.

In particular, comparing α to the canonical presentation (10.129.0.1) we conclude there is a quasi-isomorphism $NL(\alpha) \rightarrow NL_{S/R}$ well defined up to homotopy and compatible with all functorialities (up to homotopy).

Proof. To construct a morphism φ from α to α' , write $P = R[x_a, a \in A]$. Choose for every a an element $f_a \in P'$ such that $\alpha'(f_a) = \phi(\alpha(x_a))$. Let $\varphi : P = R[x_a, a \in A] \rightarrow P'$ be the unique R -algebra map such that $\varphi(x_a) = f_a$. This gives the morphism.

Let φ and φ' morphisms of presentations from α to α' . Let $I = \text{Ker}(\alpha)$ and $I' = \text{Ker}(\alpha')$. We have to construct the diagonal map h in the diagram

$$\begin{array}{ccc}
 I/I^2 & \xrightarrow{d} & \Omega_{P/R} \otimes_P S \\
 \varphi_1 \downarrow & \searrow h & \downarrow \varphi_0 \\
 J/J^2 & \xrightarrow{d} & \Omega_{P'/R'} \otimes_{P'} S' \\
 & & \downarrow \varphi'_0
 \end{array}$$

where the vertical maps are induced by φ, φ' such that

$$\varphi_1 - \varphi'_1 = h \circ d \quad \text{and} \quad \varphi_0 - \varphi'_0 = d \circ h$$

Consider the map $D = \varphi - \varphi' : P \rightarrow P'$. Since both φ and φ' are compatible with α and α' we conclude that $\varphi - \varphi' : P \rightarrow I'$. Also $\varphi - \varphi'$ is R -linear and

$$(\varphi - \varphi')(fg) = \varphi(f)(\varphi - \varphi')(g) + (\varphi - \varphi')(f)\varphi'(g)$$

Hence the induced map $D : P \rightarrow I'/(I')^2$ is a R -derivation. Thus we obtain a canonical map $h : \Omega_{P/R} \otimes_P S \rightarrow I'/(I')^2$ such that $D = h \circ d$. A calculation (omitted) shows that h is the desired homotopy.

Suppose that we have a commutative diagram

$$\begin{array}{ccccc}
 S & \xrightarrow{\quad} & S' & \xrightarrow{\quad} & S'' \\
 \uparrow & & \uparrow & & \uparrow \\
 R & \xrightarrow{\quad} & R' & \xrightarrow{\quad} & R''
 \end{array}$$

with finite type vertical arrows. Suppose that

- (1) $\alpha : P \rightarrow S$,
- (2) $\alpha' : P' \rightarrow S'$, and
- (3) $\alpha'' : P'' \rightarrow S''$

are presentations. Suppose that

- (1) $\varphi : P \rightarrow P'$ is a morphism of presentations from α to α' and
- (2) $\varphi' : P' \rightarrow P''$ is a morphism of presentations from α' to α'' .

Then it is immediate that $\varphi' \circ \varphi : P \rightarrow P''$ is a morphism of presentations from α to α'' and that the induced map $NL(\alpha) \rightarrow NL(\alpha'')$ of naive cotangent complexes is the composition of the maps $NL(\alpha) \rightarrow NL(\alpha')$ and $NL(\alpha') \rightarrow NL(\alpha'')$ induced by φ and φ' .

In the simple case of complexes with 2 terms a quasi-isomorphism is just a map that induces an isomorphism on both the cokernel and the kernel of the maps

between the terms. Note that homotopic maps of 2 term complexes (as explained above) define the same maps on kernel and cokernel. Hence if φ is a map from a presentation α of S over R to itself, then the induced map $NL(\alpha) \rightarrow NL(\alpha)$ is a quasi-isomorphism being homotopic to the identity by part (2). To prove (4) in full generality, consider a morphism φ' from α' to α which exists by (1). The compositions $NL(\alpha) \rightarrow NL(\alpha') \rightarrow NL(\alpha)$ and $NL(\alpha') \rightarrow NL(\alpha) \rightarrow NL(\alpha')$ are homotopic to the identity maps by (3), hence these maps are homotopy equivalences by definition. It follows formally that both maps $NL(\alpha) \rightarrow NL(\alpha')$ and $NL(\alpha') \rightarrow NL(\alpha)$ are quasi-isomorphisms. Some details omitted. \square

Lemma 10.129.3. *Let $A \rightarrow B$ be a polynomial algebra. Then $NL_{B/A}$ is homotopy equivalent to the chain complex $(0 \rightarrow \Omega_{B/A})$ with $\Omega_{B/A}$ in degree 0.*

Proof. Follows from Lemma 10.129.2 and the fact that $A \rightarrow B$ is a presentation of B over A with zero kernel. \square

The following lemma is part of the motivation for introducing the naive cotangent complex. The cotangent complex extends this to a genuine long exact cohomology sequence. If $B \rightarrow C$ is a local complete intersection, then one can extend the sequence with a zero on the left, see More on Algebra, Lemma 15.23.6.

Lemma 10.129.4 (Jacobi-Zariski sequence). *Let $A \rightarrow B \rightarrow C$ be ring maps. Choose a presentation $\alpha : A[x_s, s \in S] \rightarrow B$ with kernel I . Choose a presentation $\beta : B[y_t, t \in T] \rightarrow C$ with kernel J . Let $\gamma : A[x_s, y_t] \rightarrow C$ be the induced presentation of C with kernel K . Then we get a canonical commutative diagram*

$$\begin{array}{ccccccc} 0 & \longrightarrow & \Omega_{A[x_s]/A} \otimes C & \longrightarrow & \Omega_{A[x_s, y_t]/A} \otimes C & \longrightarrow & \Omega_{B[y_t]/B} \otimes C \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ & & I/I^2 \otimes C & \longrightarrow & K/K^2 & \longrightarrow & J/J^2 \longrightarrow 0 \end{array}$$

with exact rows. We get the following exact sequence of homology groups

$$H_1(NL_{B/A} \otimes_B C) \rightarrow H_1(L_{C/A}) \rightarrow H_1(L_{C/B}) \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of C -modules extending the sequence of Lemma 10.127.7. If $\text{Tor}_1^B(\Omega_{B/A}, C) = 0$, then $H_1(NL_{B/A} \otimes_B C) = H_1(L_{B/A}) \otimes_B C$.

Proof. The precise definition of the maps is omitted. The exactness of the top row follows as the dx_s, dy_t form a basis for the middle module. The map γ factors

$$A[x_s, y_t] \rightarrow B[y_t] \rightarrow C$$

with surjective first arrow and second arrow equal to β . Thus we see that $K \rightarrow J$ is surjective. Moreover, the kernel of the first displayed arrow is $IA[x_s, y_t]$. Hence $I/I^2 \otimes C$ surjects onto the kernel of $K/K^2 \rightarrow J/J^2$. Finally, we can use Lemma 10.129.2 to identify the terms as homology groups of the naive cotangent complexes. The final assertion follows as the degree 0 term of the complex $NL_{B/A}$ is a free B -module. \square

Remark 10.129.5. Let $A \rightarrow B$ and $\phi : B \rightarrow C$ be ring maps. Then the composition $NL_{B/A} \rightarrow NL_{C/A} \rightarrow NL_{C/B}$ is homotopy equivalent to zero. Namely, this

composition is the functoriality of the naive cotangent complex for the square

$$\begin{array}{ccc} B & \longrightarrow & C \\ \uparrow & \phi & \uparrow \\ A & \longrightarrow & B \end{array}$$

Write $J = \text{Ker}(B[C] \rightarrow C)$. An explicit homotopy is given by the map $\Omega_{A[B]/A} \otimes_A B \rightarrow J/J^2$ which maps the basis element $d[b]$ to the class of $[\phi(b)] - b$ in J/J^2 .

Lemma 10.129.6. *Let $A \rightarrow B$ be a surjective ring map with kernel I . Then $NL_{B/A}$ is homotopy equivalent to the chain complex $(I/I^2 \rightarrow 0)$ with I/I^2 in degree 1. In particular $H_1(L_{B/A}) = I/I^2$.*

Proof. Follows from Lemma 10.129.2 and the fact that $A \rightarrow B$ is a presentation of B over A . □

Lemma 10.129.7. *Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is). Denote $I = \text{Ker}(A \rightarrow C)$ and $J = \text{Ker}(B \rightarrow C)$. Then the sequence*

$$I/I^2 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B B/J \rightarrow 0$$

is exact.

Proof. Follows from Lemma 10.129.4 and the description of the naive cotangent complexes $NL_{C/B}$ and $NL_{C/A}$ in Lemma 10.129.6. □

Lemma 10.129.8 (Flat base change). *Let $R \rightarrow S$ be a ring map. Let $\alpha : P \rightarrow S$ be a presentation. Let $R \rightarrow R'$ be a flat ring map. Let $\alpha' : P' \otimes_R R' \rightarrow S' = S \otimes_R R'$ be the induced presentation. Then $NL(\alpha) \otimes_R R' = NL(\alpha) \otimes_S S' = NL(\alpha')$. In particular, the canonical map*

$$NL_{S/R} \otimes_R R' \longrightarrow NL_{S \otimes_R R' / R'}$$

is a homotopy equivalence if $R \rightarrow R'$ is flat.

Proof. This is true because $\text{Ker}(\alpha') = R' \otimes_R \text{Ker}(\alpha)$ since $R \rightarrow R'$ is flat. □

Lemma 10.129.9. *Let $R_i \rightarrow S_i$ be a system of ring maps over the directed partially ordered set I . Set $R = \text{colim } R_i$ and $S = \text{colim } S_i$. Then $NL_{S/R} = \text{colim } NL_{S_i/R_i}$.*

Proof. Recall that $NL_{S/R}$ is the complex $I/I^2 \rightarrow \bigoplus_{s \in S} \text{Sd}[s]$ where $I \subset R[S]$ is the kernel of the canonical presentation $R[S] \rightarrow S$. Now it is clear that $R[S] = \text{colim } R_i[S_i]$ and similarly that $I = \text{colim } I_i$ where $I_i = \text{Ker}(R_i[S_i] \rightarrow S_i)$. Hence the lemma is clear. □

Lemma 10.129.10. *If $S \subset A$ is a multiplicative subset of A , then $NL_{S^{-1}A/A}$ is homotopy equivalent to the zero complex.*

Proof. Since $A \rightarrow S^{-1}A$ is flat we see that $NL_{S^{-1}A/A} \otimes_A S^{-1}A \rightarrow NL_{S^{-1}A/S^{-1}A}$ is a homotopy equivalence by flat base change (Lemma 10.129.8). Since the source of the arrow is isomorphic to $NL_{S^{-1}A/A}$ and the target of the arrow is zero (by Lemma 10.129.6) we win. □

Lemma 10.129.11. *Let $S \subset A$ is a multiplicative subset of A . Let $S^{-1}A \rightarrow B$ be a ring map. Then $NL_{B/A} \rightarrow NL_{B/S^{-1}A}$ is an homotopy equivalence.*

Proof. Choose a presentation $\alpha : P \rightarrow B$ of B over A . Then $\beta : S^{-1}P \rightarrow B$ is a presentation of B over $S^{-1}A$. A direct computation shows that we have $NL(\alpha) = NL(\beta)$ which proves the lemma as the naive cotangent complex is well defined up to homotopy by Lemma 10.129.2. \square

Lemma 10.129.12. *Let $A \rightarrow B$ be a ring map. Let $g \in B$. Suppose $\alpha : P \rightarrow B$ is a presentation with kernel I . Then a presentation of B_g over A is the map*

$$\beta : P[x] \longrightarrow B_g$$

extending α and sending x to $1/g$. The kernel J of β is generated by I and the element $fx - 1$ where $f \in P$ is an element mapped to $g \in B$ by α . In this situation we have

- (1) $J/J^2 = (I/I^2)_g \oplus B_g(fx - 1)$,
- (2) $\Omega_{P[x]/A} \otimes_{P[x]} B_g = \Omega_{P/A} \otimes_P B_g \oplus B_g dx$,
- (3) $NL(\beta) = NL(\alpha) \otimes_B B_g \oplus (B_g \xrightarrow{g} B_g)$

Hence the canonical map $NL_{B/A} \otimes_B B_g \rightarrow NL_{B_g/A}$ is a homotopy equivalence.

Proof. This lemma proves itself. \square

Lemma 10.129.13. *Let $A \rightarrow B$ be a ring map. Let $S \subset B$ be a multiplicative subset. The canonical map $NL_{B/A} \otimes_B S^{-1}B \rightarrow NL_{S^{-1}B/A}$ is a quasi-isomorphism.*

Proof. We have $S^{-1}B = \operatorname{colim}_{g \in S} B_g$ where we think of S as a directed partially ordered set (ordering by divisibility), see Lemma 10.9.9. By Lemma 10.129.12 each of the maps $NL_{B/A} \otimes_B B_g \rightarrow NL_{B_g/A}$ are quasi-isomorphisms. The lemma follows from Lemma 10.129.9. \square

Lemma 10.129.14. *Let R be a ring. Let $A_1 \rightarrow A_0$, and $B_1 \rightarrow B_0$ be two two term complexes. Suppose that there exist morphisms of complexes $\varphi : A_\bullet \rightarrow B_\bullet$ and $\psi : B_\bullet \rightarrow A_\bullet$ such that $\varphi \circ \psi$ and $\psi \circ \varphi$ are homotopic to the identity maps. Then $A_1 \oplus B_0 \cong B_1 \oplus A_0$ as R -modules.*

Proof. Choose a map $h : A_0 \rightarrow B_1$ such that

$$\operatorname{id}_{A_1} - \psi_1 \circ \varphi_1 = h \circ d_A \text{ and } \operatorname{id}_{A_0} - \psi_0 \circ \varphi_0 = d_A \circ h.$$

Similarly, choose a map $h' : B_0 \rightarrow A_1$ such that

$$\operatorname{id}_{B_1} - \varphi_1 \circ \psi_1 = h \circ d_B \text{ and } \operatorname{id}_{B_0} - \varphi_0 \circ \psi_0 = d_B \circ h.$$

A trivial computation shows that

$$\begin{pmatrix} \operatorname{id}_{A_1} & -h' \circ \psi_1 + h \circ \psi_0 \\ 0 & \operatorname{id}_{B_0} \end{pmatrix} = \begin{pmatrix} \psi_1 & h \\ -d_B & \varphi_0 \end{pmatrix} \begin{pmatrix} \varphi_1 & -h' \\ d_A & \psi_0 \end{pmatrix}$$

This shows that both matrices on the right hand side are invertible and proves the lemma. \square

Lemma 10.129.15. *Let $R \rightarrow S$ be a ring map of finite type. For any presentations $\alpha : R[x_1, \dots, x_n] \rightarrow S$, and $\beta : R[y_1, \dots, y_m] \rightarrow S$ we have*

$$I/I^2 \oplus S^{\oplus m} \cong J/J^2 \oplus S^{\oplus n}$$

as S -modules where $I = \operatorname{Ker}(\alpha)$ and $J = \operatorname{Ker}(\beta)$.

Proof. See Lemmas 10.129.2 and 10.129.14. \square

Lemma 10.129.16. *Let $R \rightarrow S$ be a ring map of finite type. Let $g \in S$. For any presentations $\alpha : R[x_1, \dots, x_n] \rightarrow S$, and $\beta : R[y_1, \dots, y_m] \rightarrow S_g$ we have*

$$(I/I^2)_g \oplus S_g^{\oplus m} \cong J/J^2 \oplus S_g^{\oplus n}$$

as S_g -modules where $I = \text{Ker}(\alpha)$ and $J = \text{Ker}(\beta)$.

Proof. By Lemma 10.129.15, we see that it suffices to prove this for a single choice of α and β . Thus we may take β the presentation of Lemma 10.129.12 and the result is clear. \square

10.130. Local complete intersections

The property of being a local complete intersection is somehow an intrinsic property of a Noetherian local ring. However, for the moment we just define this property for finite type algebras over a field.

Definition 10.130.1. Let k be a field. Let S be a finite type k -algebra.

- (1) We say that S is a *global complete intersection over k* if there exists a presentation $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ such that $\dim(S) = n - c$.
- (2) We say that S is a *local complete intersection over k* if there exists a covering $\text{Spec}(S) = \bigcup D(g_i)$ such that each of the rings S_{g_i} is a global complete intersection over k .

We will also use the convention that the zero ring is a global complete intersection over k .

Suppose S is a global complete intersection $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ as in the definition. Recall that $\dim(S) = n - c$ means that all irreducible components of $\text{Spec}(S)$ have dimension $\leq n - c$. Since all maximal ideals of the polynomial ring have local rings of dimension n we conclude that all irreducible components of $\text{Spec}(S)$ have dimension $\geq n - c$. See Section 10.59. In other words, $\text{Spec}(S)$ is equidimensional of dimension $n - c$.

Lemma 10.130.2. *Let k be a field. Let S be a finite type k -algebra. Let $g \in S$.*

- (1) *If S is a global complete intersection so is S_g .*
- (2) *If S is a local complete intersection so is S_g .*

Proof. The second statement follows immediately from the first. For the first, say that $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ with $n - c = \dim(S)$. By the remarks above S is equidimensional of dimension $n - c$, so $\dim(S_g) = n - c$ as well (or it is the zero ring in which case the lemma is true by convention). Let $g' \in k[x_1, \dots, x_n]$ be an element whose residue class corresponds to g . Then $S_g = k[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, x_{n+1}g' - 1)$ as desired. \square

Lemma 10.130.3. *Let k be a field. Let S be a finite type k -algebra. If S is a local complete intersection, then S is a Cohen-Macaulay ring.*

Proof. Choose a maximal prime \mathfrak{m} of S . We have to show that $S_{\mathfrak{m}}$ is Cohen-Macaulay. By assumption we may assume $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ with $\dim(S) = n - c$. Let $\mathfrak{m}' \subset k[x_1, \dots, x_n]$ be the maximal ideal corresponding to \mathfrak{m} . According to Proposition 10.110.2 the local ring $k[x_1, \dots, x_n]_{\mathfrak{m}'}$ is regular local of dimension n . In particular it is Cohen-Macaulay by Lemma 10.102.3. By dimension theory (see Section 10.59) the ring $S_{\mathfrak{m}} = k[x_1, \dots, x_n]_{\mathfrak{m}'}/(f_1, \dots, f_c)$ has dimension $\geq n - c$. By assumption $\dim(S_{\mathfrak{m}}) \leq n - c$. Thus we get equality.

This implies that f_1, \dots, f_c is a regular sequence in $k[x_1, \dots, x_n]_{\mathfrak{m}'}$ and that $S_{\mathfrak{m}}$ is Cohen-Macaulay, see Proposition 10.99.5. \square

The following is the technical key to the rest of the material in this section. An important feature of this lemma is that we may choose any presentation for the ring S , but that condition (1) does not depend on this choice.

Lemma 10.130.4. *Let k be a field. Let S be a finite type k -algebra. Let \mathfrak{q} be a prime of S . Choose any presentation $S = k[x_1, \dots, x_n]/I$. Let \mathfrak{q}' be the prime of $k[x_1, \dots, x_n]$ corresponding to \mathfrak{q} . Set $c = \text{height}(\mathfrak{q}') - \text{height}(\mathfrak{q})$, in other words $\dim_{\mathfrak{q}}(S) = n - c$ (see Lemma 10.112.4). The following are equivalent*

- (1) *There exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is a global complete intersection over k .*
- (2) *The ideal $I_{\mathfrak{q}'}$ $\subset k[x_1, \dots, x_n]_{\mathfrak{q}'}$ can be generated by c elements.*
- (3) *The conormal module $(I/I^2)_{\mathfrak{q}}$ can be generated by c elements over $S_{\mathfrak{q}}$.*
- (4) *The conormal module $(I/I^2)_{\mathfrak{q}}$ is a free $S_{\mathfrak{q}}$ -module of rank c .*
- (5) *The ideal $I_{\mathfrak{q}'}$ can be generated by a regular sequence in the regular local ring $k[x_1, \dots, x_n]_{\mathfrak{q}'}$.*

In this case any c elements of $I_{\mathfrak{q}'}$ which generate $I_{\mathfrak{q}'}/\mathfrak{q}'I_{\mathfrak{q}'}$ form a regular sequence in the local ring $k[x_1, \dots, x_n]_{\mathfrak{q}'}$.

Proof. Set $R = k[x_1, \dots, x_n]_{\mathfrak{q}'}$. This is a Cohen-Macaulay local ring of dimension $\text{height}(\mathfrak{q}')$, see for example Lemma 10.130.3. Moreover, $\bar{R} = R/IR = R/I_{\mathfrak{q}'} = S_{\mathfrak{q}}$ is a quotient of dimension $\text{height}(\mathfrak{q})$. Let $f_1, \dots, f_c \in I_{\mathfrak{q}'}$ be elements which generate $(I/I^2)_{\mathfrak{q}}$. By Lemma 10.19.1 we see that f_1, \dots, f_c generate $I_{\mathfrak{q}'}$. Since the dimensions work out, we conclude by Proposition 10.99.5 that f_1, \dots, f_c is a regular sequence in R . By Lemma 10.68.2 we see that $(I/I^2)_{\mathfrak{q}}$ is free. These arguments show that (2), (3), (4) are equivalent and that they imply the last statement of the lemma, and therefore they imply (5).

If (5) holds, say $I_{\mathfrak{q}'}$ is generated by a regular sequence of length e , then $\text{height}(\mathfrak{q}) = \dim(S_{\mathfrak{q}}) = \dim(k[x_1, \dots, x_n]_{\mathfrak{q}'}) - e = \text{height}(\mathfrak{q}') - e$ by dimension theory, see Section 10.59. We conclude that $e = c$. Thus (5) implies (2).

We continue with the notation introduced in the first paragraph. For each f_i we may find $d_i \in k[x_1, \dots, x_n]$, $d_i \notin \mathfrak{q}'$ such that $f'_i = d_i f_i \in k[x_1, \dots, x_n]$. Then it is still true that $I_{\mathfrak{q}'} = (f'_1, \dots, f'_c)R$. Hence there exists a $g' \in k[x_1, \dots, x_n]$, $g' \notin \mathfrak{q}'$ such that $I_{g'} = (f'_1, \dots, f'_c)$. Moreover, pick $g'' \in k[x_1, \dots, x_n]$, $g'' \notin \mathfrak{q}'$ such that $\dim(S_{g''}) = \dim_{\mathfrak{q}} \text{Spec}(S)$. By Lemma 10.112.4 this dimension is equal to $n - c$. Finally, set g equal to the image of $g'g''$ in S . Then we see that

$$S_g \cong k[x_1, \dots, x_n, x_{n+1}]/(f'_1, \dots, f'_c, x_{n+1}g'g'' - 1)$$

and by our choice of g'' this ring has dimension $n - c$. Therefore it is a global complete intersection. Thus each of (2), (3), and (4) implies (1).

Assume (1). Let $S_g \cong k[y_1, \dots, y_m]/(f_1, \dots, f_t)$ be a presentation of S_g as a global complete intersection. Write $J = (f_1, \dots, f_t)$. Let $\mathfrak{q}'' \subset k[y_1, \dots, y_m]$ be the prime corresponding to $\mathfrak{q}S_g$. Note that $t = m - \dim(S_g) = \text{height}(\mathfrak{q}'') - \text{height}(\mathfrak{q})$, see Lemma 10.112.4 for the last equality. As seen in the proof of Lemma 10.130.3 (and also above) the elements f_1, \dots, f_t form a regular sequence in the local ring

$k[y_1, \dots, y_m]_{\mathfrak{q}'}$. By Lemma 10.68.2 we see that $(J/J^2)_{\mathfrak{q}}$ is free of rank t . By Lemma 10.129.16 we have

$$J/J^2 \oplus S_g^n \cong (I/I^2)_g \oplus S_g^m$$

Thus $(I/I^2)_{\mathfrak{q}}$ is free of rank $t + n - m = m - \dim(S_g) + n - m = n - \dim(S_g) = \text{height}(\mathfrak{q}') - \text{height}(\mathfrak{q}) = c$. Thus we obtain (4). \square

The result of Lemma 10.130.4 suggests the following definition.

Definition 10.130.5. Let k be a field. Let S be a local k -algebra essentially of finite type over k . We say S is a *complete intersection (over k)* if there exists a local k -algebra R and elements $f_1, \dots, f_c \in \mathfrak{m}_R$ such that

- (1) R is essentially of finite type over k ,
- (2) R is a regular local ring,
- (3) f_1, \dots, f_c form a regular sequence in R , and
- (4) $S \cong R/(f_1, \dots, f_c)$ as k -algebras.

By the Cohen structure theorem (see Theorem 10.149.8) any complete Noetherian local ring may be written as the quotient of some regular complete local ring. Hence we may use the definition above to define the notion of a complete intersection ring for any complete Noetherian local ring. We will discuss this in Divided Power Algebra, Section 23.8. In the meantime the following lemma shows that such a definition makes sense.

Lemma 10.130.6. Let $A \rightarrow B \rightarrow C$ be surjective local ring homomorphisms. Assume A and B are regular local rings. The following are equivalent

- (1) $\text{Ker}(A \rightarrow C)$ is generated by a regular sequence,
- (2) $\text{Ker}(A \rightarrow C)$ is generated by $\dim(A) - \dim(C)$ elements,
- (3) $\text{Ker}(B \rightarrow C)$ is generated by a regular sequence, and
- (4) $\text{Ker}(B \rightarrow C)$ is generated by $\dim(B) - \dim(C)$ elements.

Proof. A regular local ring is Cohen-Macaulay, see Lemma 10.102.3. Hence the equivalences (1) \Leftrightarrow (2) and (3) \Leftrightarrow (4), see Proposition 10.99.5. By Lemma 10.102.4 the ideal $\text{Ker}(A \rightarrow B)$ can be generated by $\dim(A) - \dim(B)$ elements. Hence we see that (4) implies (2).

It remains to show that (1) implies (4). We do this by induction on $\dim(A) - \dim(B)$. The case $\dim(A) - \dim(B) = 0$ is trivial. Assume $\dim(A) > \dim(B)$. Write $I = \text{Ker}(A \rightarrow C)$ and $J = \text{Ker}(A \rightarrow B)$. Note that $J \subset I$. Our assumption is that the minimal number of generators of I is $\dim(A) - \dim(C)$. Let $\mathfrak{m} \subset A$ be the maximal ideal. Consider the maps

$$J/\mathfrak{m}J \rightarrow I/\mathfrak{m}I \rightarrow \mathfrak{m}/\mathfrak{m}^2$$

By Lemma 10.102.4 and its proof the composition is injective. Take any element $x \in J$ which is not zero in $J/\mathfrak{m}J$. By the above and Nakayama's lemma x is an element of a minimal set of generators of I . Hence we may replace A by A/xA and I by I/xA which decreases both $\dim(A)$ and the minimal number of generators of I by 1. Thus we win. \square

Lemma 10.130.7. Let k be a field. Let S be a local k -algebra essentially of finite type over k . The following are equivalent:

- (1) S is a complete intersection over k ,

- (2) for any surjection $R \rightarrow S$ with R a regular local ring essentially of finite presentation over k the ideal $\text{Ker}(R \rightarrow S)$ can be generated by a regular sequence,
- (3) for some surjection $R \rightarrow S$ with R a regular local ring essentially of finite presentation over k the ideal $\text{Ker}(R \rightarrow S)$ can be generated by $\dim(R) - \dim(S)$ elements,
- (4) there exists a global complete intersection A over k and a prime \mathfrak{a} of A such that $S \cong A_{\mathfrak{a}}$, and
- (5) there exists a local complete intersection A over k and a prime \mathfrak{a} of A such that $S \cong A_{\mathfrak{a}}$.

Proof. It is clear that (2) implies (1) and (1) implies (3). It is also clear that (4) implies (5). Let us show that (3) implies (4). Thus we assume there exists a surjection $R \rightarrow S$ with R a regular local ring essentially of finite presentation over k such that the ideal $\text{Ker}(R \rightarrow S)$ can be generated by $\dim(R) - \dim(S)$ elements. We may write $R = (k[x_1, \dots, x_n]/J)_{\mathfrak{q}}$ for some $J \subset k[x_1, \dots, x_n]$ and some prime $\mathfrak{q} \subset k[x_1, \dots, x_n]$ with $J \subset \mathfrak{q}$. Let $I \subset k[x_1, \dots, x_n]$ be the kernel of the map $k[x_1, \dots, x_n] \rightarrow S$ so that $S \cong (k[x_1, \dots, x_n]/I)_{\mathfrak{q}}$. By assumption $(I/J)_{\mathfrak{q}}$ is generated by $\dim(R) - \dim(S)$ elements. We conclude that $I_{\mathfrak{q}}$ can be generated by $\dim(k[x_1, \dots, x_n]_{\mathfrak{q}}) - \dim(S)$ elements by Lemma 10.130.6. From Lemma 10.130.4 we see that for some $g \in k[x_1, \dots, x_n]$, $g \notin \mathfrak{q}$ the algebra $(k[x_1, \dots, x_n]/I)_g$ is a global complete intersection and S is isomorphic to a local ring of it.

To finish the proof of the lemma we have to show that (5) implies (2). Assume (5) and let $\pi : R \rightarrow S$ be a surjection with R a regular local k -algebra essentially of finite type over k . By assumption we have $S = A_{\mathfrak{a}}$ for some local complete intersection A over k . Choose a presentation $R = (k[y_1, \dots, y_m]/J)_{\mathfrak{q}}$ with $J \subset \mathfrak{q} \subset k[y_1, \dots, y_m]$. We may and do assume that J is the kernel of the map $k[y_1, \dots, y_m] \rightarrow R$. Let $I \subset k[y_1, \dots, y_m]$ be the kernel of the map $k[y_1, \dots, y_m] \rightarrow S = A_{\mathfrak{a}}$. Then $J \subset I$ and $(I/J)_{\mathfrak{q}}$ is the kernel of the surjection $\pi : R \rightarrow S$. So $S = (k[y_1, \dots, y_m]/I)_{\mathfrak{q}}$.

By Lemma 10.122.7 we see that there exist $g \in A$, $g \notin \mathfrak{a}$ and $g' \in k[y_1, \dots, y_m]$, $g' \notin \mathfrak{q}$ such that $A_g \cong (k[y_1, \dots, y_m]/I)_{g'}$. After replacing A by A_g and $k[y_1, \dots, y_m]$ by $k[y_1, \dots, y_{m+1}]$ we may assume that $A \cong k[y_1, \dots, y_m]/I$. Consider the surjective maps of local rings

$$k[y_1, \dots, y_m]_{\mathfrak{q}} \rightarrow R \rightarrow S.$$

We have to show that the kernel of $R \rightarrow S$ is generated by a regular sequence. By Lemma 10.130.4 we know that $k[y_1, \dots, y_m]_{\mathfrak{q}} \rightarrow A_{\mathfrak{a}} = S$ has this property (as A is a local complete intersection over k). We win by Lemma 10.130.6. \square

Lemma 10.130.8. *Let k be a field. Let S be a finite type k -algebra. Let \mathfrak{q} be a prime of S . The following are equivalent:*

- (1) The local ring $S_{\mathfrak{q}}$ is a complete intersection ring (Definition 10.130.5).
- (2) There exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is a local complete intersection over k .
- (3) There exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is a global complete intersection over k .
- (4) For any presentation $S = k[x_1, \dots, x_n]/I$ with $\mathfrak{q}' \subset k[x_1, \dots, x_n]$ corresponding to \mathfrak{q} any of the equivalent conditions (1) – (5) of Lemma 10.130.4 hold.

Proof. This is a combination of Lemmas 10.130.4 and 10.130.7 and the definitions. \square

Lemma 10.130.9. *Let k be a field. Let S be a finite type k -algebra. The following are equivalent:*

- (1) *The ring S is a local complete intersection over k .*
- (2) *All local rings of S are complete intersection rings over k .*
- (3) *All localizations of S at maximal ideals are complete intersection rings over k .*

Proof. This follows from Lemma 10.130.8, the fact that $\text{Spec}(S)$ is quasi-compact and the definitions. \square

The following lemma says that being a complete intersection is preserved under change of base field (in a strong sense).

Lemma 10.130.10. *Let $k \subset K$ be a field extension. Let S be a finite type algebra over k . Let \mathfrak{q}_K be a prime of $S_K = K \otimes_k S$ and let \mathfrak{q} be the corresponding prime of S . Then $S_{\mathfrak{q}}$ is a complete intersection over k (Definition 10.130.5) if and only if $(S_K)_{\mathfrak{q}_K}$ is a complete intersection over K .*

Proof. Choose a presentation $S = k[x_1, \dots, x_n]/I$. This gives a presentation $S_K = K[x_1, \dots, x_n]/I_K$ where $I_K = K \otimes_k I$. Let $\mathfrak{q}'_K \subset K[x_1, \dots, x_n]$, resp. $\mathfrak{q}' \subset k[x_1, \dots, x_n]$ be the corresponding prime. We will show that the equivalent conditions of Lemma 10.130.4 hold for the pair $(S = k[x_1, \dots, x_n]/I, \mathfrak{q})$ if and only if they hold for the pair $(S_K = K[x_1, \dots, x_n]/I_K, \mathfrak{q}_K)$. The lemma will follow from this (see Lemma 10.130.8).

By Lemma 10.112.6 we have $\dim_{\mathfrak{q}} S = \dim_{\mathfrak{q}_K} S_K$. Hence the integer c occurring in Lemma 10.130.4 is the same for the pair $(S = k[x_1, \dots, x_n]/I, \mathfrak{q})$ as for the pair $(S_K = K[x_1, \dots, x_n]/I_K, \mathfrak{q}_K)$. On the other hand we have

$$\begin{aligned} I \otimes_{k[x_1, \dots, x_n]} \kappa(\mathfrak{q}') \otimes_{\kappa(\mathfrak{q}')} \kappa(\mathfrak{q}'_K) &= I \otimes_{k[x_1, \dots, x_n]} \kappa(\mathfrak{q}'_K) \\ &= I \otimes_{k[x_1, \dots, x_n]} K[x_1, \dots, x_n] \otimes_{K[x_1, \dots, x_n]} \kappa(\mathfrak{q}'_K) \\ &= (K \otimes_k I) \otimes_{K[x_1, \dots, x_n]} \kappa(\mathfrak{q}'_K) \\ &= I_K \otimes_{K[x_1, \dots, x_n]} \kappa(\mathfrak{q}'_K). \end{aligned}$$

Therefore, $\dim_{\kappa(\mathfrak{q}')} I \otimes_{k[x_1, \dots, x_n]} \kappa(\mathfrak{q}') = \dim_{\kappa(\mathfrak{q}'_K)} I_K \otimes_{K[x_1, \dots, x_n]} \kappa(\mathfrak{q}'_K)$. Thus it follows from Nakayama's Lemma 10.19.1 that the minimal number of generators of $I_{\mathfrak{q}'}$ is the same as the minimal number of generators of $(I_K)_{\mathfrak{q}'_K}$. Thus the lemma follows from characterization (2) of Lemma 10.130.4. \square

Lemma 10.130.11. *Let $k \rightarrow K$ be a field extension. Let S be a finite type k -algebra. Then S is a local complete intersection over k if and only if $S \otimes_k K$ is a local complete intersection over K .*

Proof. This follows from a combination of Lemmas 10.130.9 and 10.130.10. But we also give a different proof here (based on the same principles).

Set $S' = S \otimes_k K$. Let $\alpha : k[x_1, \dots, x_n] \rightarrow S$ be a presentation with kernel I . Let $\alpha' : K[x_1, \dots, x_n] \rightarrow S'$ be the induced presentation with kernel I' .

Suppose that S is a local complete intersection. Pick a prime $\mathfrak{q} \subset S'$. Denote \mathfrak{q}' the corresponding prime of $K[x_1, \dots, x_n]$, \mathfrak{p} the corresponding prime of S , and \mathfrak{p}' the

corresponding prime of $k[x_1, \dots, x_n]$. Consider the following diagram of Noetherian local rings

$$\begin{array}{ccc} S'_q & \longleftarrow & K[x_1, \dots, x_n]_{q'} \\ \uparrow & & \uparrow \\ S_p & \longleftarrow & k[x_1, \dots, x_n]_{p'} \end{array}$$

By Lemma 10.130.4 we know that S_p is cut out by some regular sequence f_1, \dots, f_e in $k[x_1, \dots, x_n]_{p'}$. Since the right vertical arrow is flat we see that the images of f_1, \dots, f_e form a regular sequence in $K[x_1, \dots, x_n]_{q'}$. Because tensoring with K over k is an exact functor we have $S'_q = K[x_1, \dots, x_n]_{q'}/(f_1, \dots, f_e)$. Hence by Lemma 10.130.4 again we see that S' is a local complete intersection in a neighbourhood of q . Since q was arbitrary we see that S' is a local complete intersection over K .

Suppose that S' is a local complete intersection. Pick a maximal ideal \mathfrak{m} of S . Let \mathfrak{m}' denote the corresponding maximal ideal of $k[x_1, \dots, x_n]$. Denote $\kappa = \kappa(\mathfrak{m})$ the residue field. By Remark 10.16.8 the primes of S' lying over \mathfrak{m} correspond to primes in $K \otimes_k \kappa$. By the Hilbert-Nullstellensatz Theorem 10.33.1 we have $[\kappa : k] < \infty$. Hence $K \otimes_k \kappa$ is finite nonzero over K . Hence $K \otimes_k \kappa$ has a finite number > 0 of primes which are all maximal, each of which has a residue field finite over K (see Section 10.51). Hence there are finitely many > 0 prime ideals $\mathfrak{n} \subset S'$ lying over \mathfrak{m} , each of which is maximal and has a residue field which is finite over K . Pick one, say $\mathfrak{n} \subset S'$, and let $\mathfrak{n}' \subset K[x_1, \dots, x_n]$ denote the corresponding prime ideal of $K[x_1, \dots, x_n]$. Note that since $V(\mathfrak{m}S')$ is finite, we see that \mathfrak{n} is an isolated closed point of it, and we deduce that $\mathfrak{m}S'_n$ is an ideal of definition of S'_n . This implies that $\dim(S_{\mathfrak{m}}) \geq \dim(S'_n)$, for example by Lemma 10.108.6 or by the characterization of dimension in terms of minimal number of generators of ideal of definition, see Section 10.59. (In reality the dimensions are equal but we do not need this.) Consider the corresponding diagram of Noetherian local rings

$$\begin{array}{ccc} S'_n & \longleftarrow & K[x_1, \dots, x_n]_{n'} \\ \uparrow & & \uparrow \\ S_{\mathfrak{m}} & \longleftarrow & k[x_1, \dots, x_n]_{m'} \end{array}$$

According to Lemma 10.129.8 we have $NL(\alpha) \otimes_S S' = NL(\alpha')$, in particular $I'/(I')^2 = I/I^2 \otimes_S S'$. Thus $(I/I^2)_{\mathfrak{m}} \otimes_{S_{\mathfrak{m}}} \kappa$ and $(I'/(I')^2)_{\mathfrak{n}} \otimes_{S'_n} \kappa(\mathfrak{n})$ have the same dimension. Since $(I'/(I')^2)_{\mathfrak{n}}$ is free of rank $n - \dim S'_n$ we deduce that $(I/I^2)_{\mathfrak{m}}$ can be generated by $n - \dim S'_n \leq n - \dim S_{\mathfrak{m}}$ elements. By Lemma 10.130.4 we see that S is a local complete intersection in a neighbourhood of \mathfrak{m} . Since \mathfrak{m} was any maximal ideal we conclude that S is a local complete intersection. \square

We end with a lemma which we will later use to prove that given ring maps $T \rightarrow A \rightarrow B$ where B is syntomic over T , and B is syntomic over A , then A is syntomic over T .

Lemma 10.130.12. *Let*

$$\begin{array}{ccc} B & \longleftarrow & S \\ \uparrow & & \uparrow \\ A & \longleftarrow & R \end{array}$$

be a commutative square of local rings. Assume

- (1) R and $\bar{S} = S/\mathfrak{m}_R S$ are regular local rings,
- (2) $A = R/I$ and $B = S/J$ for some ideals I, J ,
- (3) $J \subset S$ and $\bar{J} = J/\mathfrak{m}_R J \subset \bar{S}$ are generated by regular sequences, and
- (4) $A \rightarrow B$ and $R \rightarrow S$ are flat.

Then I is generated by a regular sequence.

Proof. Set $\bar{B} = B/\mathfrak{m}_R B = B/\mathfrak{m}_A B$ so that $\bar{B} = \bar{S}/\bar{J}$. Let $f_1, \dots, f_{\bar{c}} \in J$ be elements such that $\bar{f}_1, \dots, \bar{f}_{\bar{c}} \in \bar{J}$ form a regular sequence generating \bar{J} . Note that $\bar{c} = \dim(\bar{S}) - \dim(\bar{B})$, see Lemma 10.130.6. By Lemma 10.95.3 the ring $S/(f_1, \dots, f_{\bar{c}})$ is flat over R . Hence $S/(f_1, \dots, f_{\bar{c}}) + IS$ is flat over A . The map $S/(f_1, \dots, f_{\bar{c}}) + IS \rightarrow B$ is therefore a surjection of finite S/IS -modules flat over A which is an isomorphism modulo \mathfrak{m}_A , and hence an isomorphism by Lemma 10.95.1. In other words, $J = (f_1, \dots, f_{\bar{c}}) + IS$.

By Lemma 10.130.6 again the ideal J is generated by a regular sequence of $c = \dim(S) - \dim(B)$ elements. Hence $J/\mathfrak{m}_S J$ is a vector space of dimension c . By the description of J above there exist $g_1, \dots, g_{c-\bar{c}} \in I$ such that J is generated by $f_1, \dots, f_{\bar{c}}, g_1, \dots, g_{c-\bar{c}}$ (use Nakayama's Lemma 10.19.1). Consider the ring $A' = R/(g_1, \dots, g_{c-\bar{c}})$ and the surjection $A' \rightarrow A$. We see from the above that $B = S/(f_1, \dots, f_{\bar{c}}, g_1, \dots, g_{c-\bar{c}})$ is flat over A' (as $S/(f_1, \dots, f_{\bar{c}})$ is flat over R). Hence $A' \rightarrow B$ is injective (as it is faithfully flat, see Lemma 10.38.16). Since this map factors through A we get $A' = A$. Note that $\dim(B) = \dim(A) + \dim(\bar{B})$, and $\dim(S) = \dim(R) + \dim(\bar{S})$, see Lemma 10.108.7. Hence $c - \bar{c} = \dim(R) - \dim(A)$ by elementary algebra. Thus $I = (g_1, \dots, g_{c-\bar{c}})$ is generated by a regular sequence according to Lemma 10.130.6. \square

10.131. Syntomic morphisms

Syntomic ring maps are flat finitely presented ring maps all of whose fibers are local complete intersections. We discuss general local complete intersection ring maps in More on Algebra, Section 15.23.

Definition 10.131.1. A ring map $R \rightarrow S$ is called *syntomic*, or we say S is a *flat local complete intersection over R* if it is flat, of finite presentation, and if all of its fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are local complete intersections, see Definition 10.130.1.

Clearly, an algebra over a field is syntomic over the field if and only if it is a local complete intersection. Here is a pleasing feature of this definition.

Lemma 10.131.2. *Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \rightarrow S$ is syntomic if and only if $R' \rightarrow S'$ is syntomic.*

Proof. By Lemma 10.122.2 and Lemma 10.38.7 this holds for the property of being flat and for the property of being of finite presentation. The map $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is surjective, see Lemma 10.38.15. Thus it suffices to show given primes $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p} \subset R$ that $S \otimes_R \kappa(\mathfrak{p})$ is a local complete intersection if and only if $S' \otimes_{R'} \kappa(\mathfrak{p}')$ is a local complete intersection. Note that $S' \otimes_{R'} \kappa(\mathfrak{p}') = S \otimes_R \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$. Thus Lemma 10.130.11 applies. \square

Lemma 10.131.3. *Any base change of a syntomic map is syntomic.*

Proof. This is true for being flat, for being of finite presentation, and for having local complete intersections as fibres by Lemmas 10.38.6, 10.6.2 and 10.130.11. \square

Lemma 10.131.4. *Let $R \rightarrow S$ be a ring map. Suppose we have $g_1, \dots, g_m \in S$ which generate the unit ideal such that each $R \rightarrow S_{g_i}$ is syntomic. Then $R \rightarrow S$ is syntomic.*

Proof. This is true for being flat and for being of finite presentation by Lemmas 10.38.19 and 10.23.3. The property of having fibre rings which are local complete intersections is local on S by its very definition, see Definition 10.130.1. \square

Definition 10.131.5. Let $R \rightarrow S$ be a ring map. We say that $R \rightarrow S$ is a *relative global complete intersection* if we are given a presentation $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ such that every nonempty fibre has dimension $n - c$.

The following lemma is occasionally useful to find global presentations.

Lemma 10.131.6. *Let S be a finitely presented R -algebra which has a presentation $S = R[x_1, \dots, x_n]/I$ such that I/I^2 is free over S . Then S has a presentation $S = R[y_1, \dots, y_m]/(f_1, \dots, f_c)$ such that $(f_1, \dots, f_c)/(f_1, \dots, f_c)^2$ is free with basis given by the classes of f_1, \dots, f_c .*

Proof. Note that I is a finitely generated ideal by Lemma 10.6.3. Let $f_1, \dots, f_c \in I$ be elements which map to a basis of I/I^2 . By Nakayama's lemma (Lemma 10.19.1) there exists a $g \in 1 + I$ such that

$$g \cdot I \subset (f_1, \dots, f_c)$$

Hence we see that

$$S \cong R[x_1, \dots, x_n]/(f_1, \dots, f_c)[1/g] \cong R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, gx_{n+1} - 1)$$

as desired. \square

Example 10.131.7. Let $n, m \geq 1$ be integers. Consider the ring map

$$\begin{aligned} R = \mathbf{Z}[a_1, \dots, a_{n+m}] &\longrightarrow S = \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m] \\ a_1 &\longmapsto b_1 + c_1 \\ a_2 &\longmapsto b_2 + b_1 c_1 + c_2 \\ \dots &\dots \dots \\ a_{n+m} &\longmapsto b_n c_m \end{aligned}$$

In other words, this is the unique ring map of polynomial rings as indicated such that the polynomial factorization

$$x^n + a_1 x^{n-1} + \dots + a_{n+m} = (x^n + b_1 x^{n-1} + \dots + b_n)(x^m + c_1 x^{m-1} + \dots + c_m)$$

holds. Note that S is generated by $n + m$ elements over R (namely, b_i, c_j) and that there are $n + m$ equations (namely $a_k = a_k(b_i, c_j)$). In order to show that S is a relative global complete intersection over R it suffices to prove that all fibres have dimension 0.

To prove this, let $R \rightarrow k$ be a ring map into a field k . Say a_i maps to $\alpha_i \in k$. Consider the fibre ring $S_k = k \otimes_R S$. Let $k \rightarrow K$ be a field extension. A k -algebra map of $S_k \rightarrow K$ is the same thing as finding $\beta_1, \dots, \beta_n, \gamma_1, \dots, \gamma_m \in K$ such that $x^n + \alpha_1 x^{n-1} + \dots + \alpha_{n+m} = (x^n + \beta_1 x^{n-1} + \dots + \beta_n)(x^m + \gamma_1 x^{m-1} + \dots + \gamma_m)$.

Hence we see there are at most finitely many choices of such $n+m$ -tuples in K . This proves that all fibres have finitely many closed points (use Hilbert's Nullstellensatz to see they all correspond to solutions in \bar{k} for example) and hence that $R \rightarrow S$ is a relative global complete intersection.

Another way to argue this is to show $\mathbf{Z}[a_1, \dots, a_{n+m}] \rightarrow \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m]$ is actually also a *finite* ring map. Namely, by Lemma 10.37.5 each of b_i, c_j is integral over R , and hence $R \rightarrow S$ is finite by Lemma 10.35.4.

Example 10.131.8. Consider the ring map

$$\begin{aligned} R = \mathbf{Z}[a_1, \dots, a_n] &\longrightarrow S = \mathbf{Z}[\alpha_1, \dots, \alpha_n] \\ a_1 &\longmapsto \alpha_1 + \dots + \alpha_n \\ \dots &\dots \dots \\ a_n &\longmapsto \alpha_1 \dots \alpha_n \end{aligned}$$

In other words this is the unique ring map of polynomial rings as indicated such that

$$x^n + a_1x^{n-1} + \dots + a_n = \prod_{i=1}^n (x + \alpha_i)$$

holds in $\mathbf{Z}[\alpha_i, x]$. Another way to say this is that a_i maps to the i th elementary symmetric function in $\alpha_1, \dots, \alpha_n$. Note that S is generated by n elements over R subject to n equations. Hence to show that S is a global relative complete intersection over R we have to show that the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ have dimension 0. This follows as in Example 10.131.7 because the ring map $\mathbf{Z}[a_1, \dots, a_n] \rightarrow \mathbf{Z}[\alpha_1, \dots, \alpha_n]$ is actually *finite* since each $\alpha_i \in S$ satisfies the monic equation $x^n - a_1x^{n-1} + \dots + (-1)^n a_n$ over R .

Lemma 10.131.9. *Suppose that A is a ring, and $P(x) = x^n + b_1x^{n-1} + \dots + b_n \in A[x]$ is a monic polynomial over A . Then there exists a syntomic, finite locally free, faithfully flat ring extension $A \subset A'$ such that $P(x) = \prod_{i=1, \dots, n} (x - \beta_i)$ for certain $\beta_i \in A'$.*

Proof. Take $A' = A \otimes_R S$, where R and S are as in Example 10.131.8, where $R \rightarrow A$ maps a_i to b_i , and let $\beta_i = -1 \otimes \alpha_i$. □

Lemma 10.131.10. *Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ be a relative global complete intersection over R .*

- (1) *For any $R \rightarrow R'$ the base change $R' \otimes_R S = R'[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a relative global complete intersection.*
- (2) *For any $g \in S$ which is the image of $h \in R[x_1, \dots, x_n]$ the ring $S_g = R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, hx_{n+1} - 1)$ is a relative global complete intersection.*
- (3) *If $R \rightarrow S$ factors as $R \rightarrow R_f \rightarrow S$ for some $f \in R$. Then the ring $S = R_f[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a relative global complete intersection over R_f .*

Proof. By Lemma 10.112.5 the fibres of a base change have the same dimension as the fibres of the original map. Moreover $R' \otimes_R R[x_1, \dots, x_n]/(f_1, \dots, f_c) = R'[x_1, \dots, x_n]/(f_1, \dots, f_c)$. Thus (1) follows. The proof of (2) is that the localization at one element can be described as $S_g \cong S[x_{n+1}]/(gx_{n+1} - 1)$. Assertion (3) follows from (1) since under the assumptions of (3) we have $R_f \otimes_R S \cong S$. □

Lemma 10.131.11. *Let R be a ring. Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$. We will find $h \in R[x_1, \dots, x_n]$ which maps to $g \in S$ such that*

$$S_g = R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, hx_{n+1} - 1)$$

is a relative global complete intersection over R in each of the following cases:

- (1) *Let $I \subset R$ be an ideal. If the fibres of $\text{Spec}(S/IS) \rightarrow \text{Spec}(R/I)$ have dimension $n - c$, then we can find (h, g) as above such that g maps to $1 \in S/IS$.*
- (2) *Let $\mathfrak{p} \subset R$ be a prime. If $\dim(S \otimes_R \kappa(\mathfrak{p})) = n - c$, then we can find (h, g) as above such that g maps to a unit of $S \otimes_R \kappa(\mathfrak{p})$.*
- (3) *Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. If $\dim_{\mathfrak{q}}(S/R) = n - c$, then we can find (h, g) as above such that $g \notin \mathfrak{q}$.*

Proof. Ad (1). By Lemma 10.121.6 there exists an open subset $W \subset \text{Spec}(S)$ containing $V(IS)$ such that all fibres of $W \rightarrow \text{Spec}(R)$ have dimension $\leq n - c$. Say $W = \text{Spec}(S) \setminus V(J)$. Then $V(J) \cap V(IS) = \emptyset$ hence we can find a $g \in J$ which maps to $1 \in S/IS$. Let $h \in R[x_1, \dots, x_n]$ be any preimage of g .

Ad (2). By Lemma 10.121.6 there exists an open subset $W \subset \text{Spec}(S)$ containing $\text{Spec}(S \otimes_R \kappa(\mathfrak{p}))$ such that all fibres of $W \rightarrow \text{Spec}(R)$ have dimension $\leq n - c$. Say $W = \text{Spec}(S) \setminus V(J)$. Then $V(J \cdot S \otimes_R \kappa(\mathfrak{p})) = \emptyset$. Hence we can find a $g \in J$ which maps to a unit in $S \otimes_R \kappa(\mathfrak{p})$ (details omitted). Let $h \in R[x_1, \dots, x_n]$ be any preimage of g .

Ad (3). By Lemma 10.121.6 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that all nonempty fibres of $R \rightarrow S_g$ have dimension $\leq n - c$. Let $h \in R[x_1, \dots, x_n]$ be any element that maps to g . \square

The following lemma says we can do absolute Noetherian approximation for relative complete intersections.

Lemma 10.131.12. *Let R be a ring. Let S be a relative global complete intersection with presentation $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$. There exist a finite type \mathbf{Z} -subalgebra $R_0 \subset R$ such that $f_i \in R_0[x_1, \dots, x_n]$ and such that*

$$S_0 = R_0[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

is a relative global intersection over R_0 .

Proof. Let $R_0 \subset R$ be the \mathbf{Z} -algebra of R generated by all the coefficients of the polynomials f_1, \dots, f_c . Let $S_0 = R_0[x_1, \dots, x_n]/(f_1, \dots, f_c)$. Clearly, $S = R \otimes_{R_0} S_0$. Pick a prime $\mathfrak{q} \subset S$ and denote $\mathfrak{p} \subset R$, $\mathfrak{q}_0 \subset S_0$, and $\mathfrak{p}_0 \subset R_0$ the primes it lies over. Because $\dim(S \otimes_R \kappa(\mathfrak{p})) = n - c$ we also have $\dim(S_0 \otimes_{R_0} \kappa(\mathfrak{p}_0)) = n - c$, see Lemma 10.112.5. By Lemma 10.121.6 there exists a $g \in S_0$, $g \notin \mathfrak{q}_0$ such that all nonempty fibres of $R_0 \rightarrow (S_0)_g$ have dimension $\leq n - c$. As \mathfrak{q} was arbitrary and $\text{Spec}(S)$ quasi-compact, we can find finitely many $g_1, \dots, g_m \in S_0$ such that (a) for $j = 1, \dots, m$ the nonempty fibres of $R_0 \rightarrow (S_0)_{g_j}$ have dimension $\leq n - c$ and (b) the image of $\text{Spec}(S) \rightarrow \text{Spec}(S_0)$ is contained in $D(g_1) \cup \dots \cup D(g_m)$. In other words, the images of g_1, \dots, g_m in $S = R \otimes_{R_0} S_0$ generate the unit ideal. After increasing R_0 we may assume that g_1, \dots, g_m generate the unit ideal in S_0 . By (a) the nonempty fibres of $R_0 \rightarrow S_0$ all have dimension $\leq n - c$ and we conclude. \square

Lemma 10.131.13. *Let R be a ring. Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ be a relative global complete intersection. For every prime \mathfrak{q} of S , let \mathfrak{q}' denote the corresponding prime of $R[x_1, \dots, x_n]$. Then*

- (1) f_1, \dots, f_c is a regular sequence in the local ring $R[x_1, \dots, x_n]_{\mathfrak{q}'}$,
- (2) each of the rings $R[x_1, \dots, x_n]_{\mathfrak{q}'}/(f_1, \dots, f_i)$ is flat over R , and
- (3) the S -module $(f_1, \dots, f_c)/(f_1, \dots, f_c)^2$ is free with basis given by the elements $f_i \bmod (f_1, \dots, f_c)^2$.

Proof. First, by Lemma 10.68.2, part (3) follows from part (1). Parts (1) and (2) immediately reduce to the Noetherian case by Lemma 10.131.12 (some minor details omitted). Assume R is Noetherian. By Lemma 10.130.4 for example we see that f_1, \dots, f_c form a regular sequence in the local ring $R[x_1, \dots, x_n]_{\mathfrak{q}'} \otimes_R \kappa(\mathfrak{p})$. Moreover, the local ring $R[x_1, \dots, x_n]_{\mathfrak{q}'}$ is flat over $R_{\mathfrak{p}}$. Since R , and hence $R[x_1, \dots, x_n]_{\mathfrak{q}'}$ is Noetherian we may apply Lemma 10.95.3 to conclude. \square

Lemma 10.131.14. *A relative global complete intersection is syntomic, i.e., flat.*

Proof. Let $R \rightarrow S$ be a relative global complete intersection. The fibres are global complete intersections, and S is of finite presentation over R . Thus the only thing to prove is that $R \rightarrow S$ is flat. This is true by (2) of Lemma 10.131.13. \square

Lemma 10.131.15. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} of R . The following are equivalent:*

- (1) *There exists an element $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is syntomic.*
- (2) *There exists an element $g \in S$, $g \notin \mathfrak{q}$ such that S_g is a relative global complete intersection over R .*
- (3) *There exists an element $g \in S$, $g \notin \mathfrak{q}$, such that $R \rightarrow S_g$ is of finite presentation, the local ring map $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat, and the local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ is a complete intersection ring over $\kappa(\mathfrak{p})$ (see Definition 10.130.5).*

Proof. The implication (1) \Rightarrow (3) is Lemma 10.130.8. The implication (2) \Rightarrow (1) is Lemma 10.131.14. It remains to show that (3) implies (2).

Assume (3). After replacing S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ we may assume S is finitely presented over R . Choose a presentation $S = R[x_1, \dots, x_n]/I$. Let $c = n - \dim_{\mathfrak{q}}(S/R)$. Let $\mathfrak{q}' \subset R[x_1, \dots, x_n]$ be the prime corresponding to \mathfrak{q} . Write $\kappa(\mathfrak{p}) = k$. Note that $S \otimes_R k = k[x_1, \dots, x_n]/\bar{I}$ where $\bar{I} \subset k[x_1, \dots, x_n]$ is the ideal generated by the image of I . Let $\bar{\mathfrak{q}}' \subset k[x_1, \dots, x_n]$ be the prime ideal generated by the image of \mathfrak{q}' . By Lemma 10.130.8 we see that Lemma 10.130.4 holds for \bar{I} and $\bar{\mathfrak{q}}'$. Thus the dimension of $\bar{I}_{\bar{\mathfrak{q}}'}/\bar{\mathfrak{q}}'\bar{I}_{\bar{\mathfrak{q}}'}$ over $\kappa(\bar{\mathfrak{q}}')$ is c . Pick $f_1, \dots, f_c \in I$ mapping to a basis of this vector space. The images $\bar{f}_j \in \bar{I}$ generate $\bar{I}_{\bar{\mathfrak{q}}'}$ (by Lemma 10.130.4). Set $S' = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$. Let J be the kernel of the surjection $S' \rightarrow S$. Since S is of finite presentation J is a finitely generated ideal (Lemma 10.6.2). Consider the short exact sequence

$$0 \rightarrow J \rightarrow S' \rightarrow S \rightarrow 0$$

As $S_{\mathfrak{q}}$ is flat over R we see that $J_{\mathfrak{q}'} \otimes_R k \rightarrow S'_{\mathfrak{q}'} \otimes_R k$ is injective (Lemma 10.38.11). However, by construction $S'_{\mathfrak{q}'} \otimes_R k$ maps isomorphically to $S_{\mathfrak{q}} \otimes_R k$. Hence we conclude that $J_{\mathfrak{q}'} \otimes_R k = J_{\mathfrak{q}'}/\mathfrak{p}J_{\mathfrak{q}'} = 0$. By Nakayama's lemma (Lemma 10.19.1) we conclude that there exists a $g \in R[x_1, \dots, x_n]$, $g \notin \mathfrak{q}'$ such that $J_g = 0$. In other words $S'_g \cong S_g$. After further localizing we see that S' (and hence S) becomes a relative global complete intersection by Lemma 10.131.11 as desired. \square

Lemma 10.131.16. *Let R be a ring. Let $S = R[x_1, \dots, x_n]/I$ for some finitely generated ideal I . If $g \in S$ is such that S_g is syntomic over R , then $(I/I^2)_g$ is a finite projective S_g -module.*

Proof. By Lemma 10.131.15 there exist finitely many elements $g_1, \dots, g_m \in S$ which generate the unit ideal in S_g such that each S_{gg_j} is a relative global complete intersection over R . Since it suffices to prove that $(I/I^2)_{gg_j}$ is finite projective, see Lemma 10.75.2, we may assume that S_g is a relative global complete intersection. In this case the result follows from Lemmas 10.129.16 and 10.131.13. \square

Lemma 10.131.17. *Let $R \rightarrow S$, $S \rightarrow S'$ be ring maps.*

- (1) *If $R \rightarrow S$ and $S \rightarrow S'$ are syntomic, then $R \rightarrow S'$ is syntomic.*
- (2) *If $R \rightarrow S$ and $S \rightarrow S'$ are relative global complete intersections, then $R \rightarrow S'$ is a relative global complete intersection.*

Proof. Assume $R \rightarrow S$ and $S \rightarrow S'$ are syntomic. This implies that $R \rightarrow S'$ is flat by Lemma 10.38.3. It also implies that $R \rightarrow S'$ is of finite presentation by Lemma 10.6.2. Thus it suffices to show that the fibres of $R \rightarrow S'$ are local complete intersections. Choose a prime $\mathfrak{p} \subset R$. We have a factorization

$$\kappa(\mathfrak{p}) \rightarrow S \otimes_R \kappa(\mathfrak{p}) \rightarrow S' \otimes_R \kappa(\mathfrak{p}).$$

By assumption $S \otimes_R \kappa(\mathfrak{p})$ is a local complete intersection, and by Lemma 10.131.3 we see that $S \otimes_R \kappa(\mathfrak{p})$ is syntomic over $S \otimes_R \kappa(\mathfrak{p})$. After replacing S by $S \otimes_R \kappa(\mathfrak{p})$ and S' by $S' \otimes_R \kappa(\mathfrak{p})$ we may assume that R is a field. Say $R = k$.

Choose a prime $\mathfrak{q}' \subset S'$ lying over the prime \mathfrak{q} of S . Our goal is to find a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S'_{g'}$ is a global complete intersection over k . Choose a $g \in S$, $g \notin \mathfrak{q}$ such that $S_g = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a global complete intersection over k . Since $S_g \rightarrow S'_g$ is still syntomic also, and $g \notin \mathfrak{q}'$ we may replace S by S_g and S' by S'_g and assume that $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a global complete intersection over k . Next we choose a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S' = S[y_1, \dots, y_m]/(h_1, \dots, h_d)$ is a relative global complete intersection over S . Hence we have reduced to part (2) of the lemma.

Suppose that $R \rightarrow S$ and $S \rightarrow S'$ are relative global complete intersections. Say $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ and $S' = S[y_1, \dots, y_m]/(h_1, \dots, h_d)$. Then

$$S' \cong R[x_1, \dots, x_n, y_1, \dots, y_m]/(f_1, \dots, f_c, h'_1, \dots, h'_d)$$

for some lifts $h'_j \in R[x_1, \dots, x_n, y_1, \dots, y_m]$ of the h_j . Hence it suffices to bound the dimensions of the fibres. Thus we may yet again assume $R = k$ is a field. In this case we see that we have a ring, namely S , which is of finite type over k and equidimensional of dimension $n - c$, and a finite type ring map $S \rightarrow S'$ all of whose nonempty fibre rings are equidimensional of dimension $m - d$. Then, by Lemma 10.108.6 for example applied to localizations at maximal ideals of S' , we see that $\dim(S') \leq n - c + m - d$ as desired. \square

The following lemma will be improved later, see Smoothing Ring Maps, Proposition 16.4.2.

Lemma 10.131.18. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \rightarrow \bar{S}$ be a syntomic map. Then there exists elements $\bar{g}_i \in \bar{S}$ which generate the unit ideal of \bar{S} such that each $\bar{S}_{g_i} \cong S_i/IS_i$ for some relative global complete intersection S_i over R .*

Proof. By Lemma 10.131.15 we find a collection of elements $\bar{g}_i \in \bar{S}$ which generate the unit ideal of \bar{S} such that each \bar{S}_{g_i} is a relative global complete intersection over R/I . Hence we may assume that \bar{S} is a relative global complete intersection. Write $\bar{S} = (R/I)[x_1, \dots, x_n]/(\bar{f}_1, \dots, \bar{f}_c)$ as in Definition 10.131.5. Choose $f_1, \dots, f_c \in R[x_1, \dots, x_n]$ lifting $\bar{f}_1, \dots, \bar{f}_c$. Set $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$. Note that $S/IS \cong \bar{S}$. By Lemma 10.131.11 we can find $g \in S$ mapping to 1 in \bar{S} such that S_g is a relative global complete intersection over R . Since $\bar{S} \cong S_g/IS_g$ this finishes the proof. \square

10.132. Smooth ring maps

Let us motivate the definition of a smooth ring map by an example. Suppose R is a ring and $S = R[x, y]/(f)$ for some nonzero $f \in R[x, y]$. In this case there is an exact sequence

$$S \rightarrow Sdx \oplus Sdy \rightarrow \Omega_{S/R} \rightarrow 0$$

where the first arrow maps 1 to $\frac{\partial f}{\partial x}dx + \frac{\partial f}{\partial y}dy$ see Section 10.129. We conclude that $\Omega_{S/R}$ is locally free of rank 1 if the partial derivatives of f generate the unit ideal in S . In this case S is smooth of relative dimension 1 over R . But it can happen that $\Omega_{S/R}$ is locally free of rank 2 namely if both partial derivatives of f are zero. For example if for a prime p we have $p = 0$ in R and $f = x^p + y^p$ then this happens. Here $R \rightarrow S$ is a relative global complete intersection of relative dimension 1 which is not smooth. Hence, in order to check that a ring map is smooth it is not sufficient to check whether the module of differentials is free. The correct condition is the following.

Definition 10.132.1. A ring map $R \rightarrow S$ is *smooth* if it is of finite presentation and the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to a finite projective S -module placed in degree 0.

In particular, if $R \rightarrow S$ is smooth then the module $\Omega_{S/R}$ is a finite projective S -module. Moreover, by Lemma 10.132.2 the naive cotangent complex of any presentation has the same structure. Thus, for a surjection $\alpha : R[x_1, \dots, x_n] \rightarrow S$ with kernel I the map

$$I/I^2 \longrightarrow \Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S$$

is a split injection. In other words $\bigoplus_{i=1}^n Sdx_i \cong I/I^2 \oplus \Omega_{S/R}$ as S -modules. This implies that I/I^2 is a finite projective S -module too!

Lemma 10.132.2. *Let $R \rightarrow S$ be a ring map of finite presentation. If for some presentation α of S over R the naive cotangent complex $NL(\alpha)$ is quasi-isomorphic to a finite projective S -module placed in degree 0, then this holds for any presentation.*

Proof. Immediate from Lemma 10.129.2. \square

Lemma 10.132.3. *Let $R \rightarrow S$ be a smooth ring map. Any localization S_g is smooth over R . If $f \in R$ maps to an invertible element of S , then $R_f \rightarrow S$ is smooth.*

Proof. By Lemma 10.129.13 the naive cotangent complex for S_g over R is the base change of the naive cotangent complex of S over R . The assumption is that

the naive cotangent complex of S/R is $\Omega_{S/R}$ and that this is a finite projective S -module. Hence so is its base change. Thus S_g is smooth over R .

The second assertion follows in the same way from Lemma 10.129.11. \square

Lemma 10.132.4. *Let $R \rightarrow S$ be a smooth ring map. Let $R \rightarrow R'$ be any ring map. Then the base change $R' \rightarrow S' = R' \otimes_R S$ is smooth.*

Proof. Let $\alpha : R[x_1, \dots, x_n] \rightarrow S$ be a presentation with kernel I . Let $\alpha' : R'[x_1, \dots, x_n] \rightarrow R' \otimes_R S$ be the induced presentation. Let $I' = \text{Ker}(\alpha')$. Since $0 \rightarrow I \rightarrow R[x_1, \dots, x_n] \rightarrow S \rightarrow 0$ is exact, the sequence $R' \otimes_R I \rightarrow R'[x_1, \dots, x_n] \rightarrow R' \otimes_R S \rightarrow 0$ is exact. Thus $R' \otimes_R I \rightarrow I'$ is surjective. By Definition 10.132.1 there is a short exact sequence

$$0 \rightarrow I/I^2 \rightarrow \Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S \rightarrow \Omega_{S/R} \rightarrow 0$$

and the S -module $\Omega_{S/R}$ is finite projective. In particular I/I^2 is a direct summand of $\Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S$. Consider the commutative diagram

$$\begin{array}{ccc} R' \otimes_R (I/I^2) & \longrightarrow & R' \otimes_R (\Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S) \\ \downarrow & & \downarrow \\ I'/(I')^2 & \longrightarrow & \Omega_{R'[x_1, \dots, x_n]/R'} \otimes_{R'[x_1, \dots, x_n]} (R' \otimes_R S) \end{array}$$

Since the right vertical map is an isomorphism we see that the left vertical map is injective and surjective by what was said above. Thus we conclude that $NL(\alpha')$ is quasi-isomorphic to $\Omega_{S'/R'} \cong S' \otimes_S \Omega_{S/R}$. And this is finite projective since it is the base change of a finite projective module. \square

Lemma 10.132.5. *Let k be a field. Let S be a smooth k -algebra. Then S is a local complete intersection.*

Proof. By Lemmas 10.132.4 and 10.130.11 it suffices to prove this when k is algebraically closed. Choose a presentation $\alpha : k[x_1, \dots, x_n] \rightarrow S$ with kernel I . Let \mathfrak{m} be a maximal ideal of S , and let $\mathfrak{m}' \supset I$ be the corresponding maximal ideal of $k[x_1, \dots, x_n]$. We will show that condition (5) of Lemma 10.130.4 holds (with \mathfrak{m} instead of \mathfrak{q}). We may write $\mathfrak{m}' = (x_1 - a_1, \dots, x_n - a_n)$ for some $a_i \in k$, because k is algebraically closed, see Theorem 10.33.1. By our assumption that $k \rightarrow S$ is smooth the S -module map $d : I/I^2 \rightarrow \bigoplus_{i=1}^n S dx_i$ is a split injection. Hence the corresponding map $I/\mathfrak{m}'I \rightarrow \bigoplus \kappa(\mathfrak{m}') dx_i$ is injective. Say $\dim_{\kappa(\mathfrak{m}')} (I/\mathfrak{m}'I) = c$ and pick $f_1, \dots, f_c \in I$ which map to a $\kappa(\mathfrak{m}')$ -basis of $I/\mathfrak{m}'I$. By Nakayama's Lemma 10.19.1 we see that f_1, \dots, f_c generate $I_{\mathfrak{m}'}$ over $k[x_1, \dots, x_n]_{\mathfrak{m}'}$. Consider the commutative diagram

$$\begin{array}{ccccc} I & \longrightarrow & I/I^2 & \longrightarrow & I/\mathfrak{m}'I \\ \downarrow & & \downarrow & & \downarrow \\ \Omega_{k[x_1, \dots, x_n]/k} & \longrightarrow & \bigoplus S dx_i & \xrightarrow{dx_i \mapsto x_i - a_i} & \mathfrak{m}'/(\mathfrak{m}')^2 \end{array}$$

(proof commutativity omitted). The middle vertical map is the one defining the naive cotangent complex of α . Note that the right lower horizontal arrow induces an isomorphism $\bigoplus \kappa(\mathfrak{m}') dx_i \rightarrow \mathfrak{m}'/(\mathfrak{m}')^2$. Hence our generators f_1, \dots, f_c of $I_{\mathfrak{m}'}$ map to a collection of elements in $k[x_1, \dots, x_n]_{\mathfrak{m}'}$ whose classes in $\mathfrak{m}'/(\mathfrak{m}')^2$ are

linearly independent over $\kappa(\mathfrak{m}')$. Therefore they form a regular sequence in the ring $k[x_1, \dots, x_n]_{\mathfrak{m}'}$ by Lemma 10.102.3. This verifies condition (5) of Lemma 10.130.4 hence S_g is a global complete intersection over k for some $g \in S$, $g \notin \mathfrak{m}$. As this works for any maximal ideal of S we conclude that S is a local complete intersection over k . \square

Definition 10.132.6. Let R be a ring. Given integers $n \geq c \geq 0$ and $f_1, \dots, f_c \in R[x_1, \dots, x_n]$ we say

$$S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$$

is a *standard smooth algebra over R* if the polynomial

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \dots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \dots & \partial f_c/\partial x_2 \\ \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \dots & \partial f_c/\partial x_c \end{pmatrix}$$

maps to an invertible element in S .

Lemma 10.132.7. Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c) = R[x_1, \dots, x_n]/I$ be a standard smooth algebra. Then

- (1) the ring map $R \rightarrow S$ is smooth,
- (2) the S -module $\Omega_{S/R}$ is free on dx_{c+1}, \dots, dx_n ,
- (3) the S -module I/I^2 is free on the classes of f_1, \dots, f_c ,
- (4) for any $g \in S$ the ring map $R \rightarrow S_g$ is standard smooth,
- (5) for any ring map $R \rightarrow R'$ the base change $R' \rightarrow R' \otimes_R S$ is standard smooth,
- (6) if $f \in R$ maps to an invertible element in S , then $R_f \rightarrow S$ is standard smooth, and
- (7) the ring S is a relative global complete intersection over R .

Proof. Consider the naive cotangent complex of the given presentation

$$(f_1, \dots, f_c)/(f_1, \dots, f_c)^2 \longrightarrow \bigoplus_{i=1}^n S dx_i$$

Let us compose this map with the projection onto the first c direct summands of the direct sum. According to the definition of a standard smooth algebra the classes $f_i \bmod (f_1, \dots, f_c)^2$ map to a basis of $\bigoplus_{i=1}^c S dx_i$. We conclude that $(f_1, \dots, f_c)/(f_1, \dots, f_c)^2$ is free of rank c with a basis given by the elements $f_i \bmod (f_1, \dots, f_c)^2$, and that the homology in degree 0, i.e., $\Omega_{S/R}$, of the naive cotangent complex is a free S -module with basis the images of dx_{c+j} , $j = 1, \dots, n - c$. In particular, this proves $R \rightarrow S$ is smooth.

The proofs of (4) and (6) are omitted. But see the example below and the proof of Lemma 10.131.10.

Let $\varphi : R \rightarrow R'$ be any ring map. Denote $S' = R'[x_1, \dots, x_n]/(f_1^\varphi, \dots, f_c^\varphi)$ where f^φ is the polynomial obtained from $f \in R[x_1, \dots, x_n]$ by applying φ to all the coefficients. Then $S' \cong R' \otimes_R S$. Moreover, the determinant of Definition 10.132.6 for S'/R' is equal to g^φ . Its image in S' is therefore the image of g via $R[x_1, \dots, x_n] \rightarrow S \rightarrow S'$ and hence invertible. This proves (5).

To prove (7) it suffices to show that $S \otimes_R \kappa(\mathfrak{p})$ has dimension $n - c$. By (5) it suffices to prove that any standard smooth algebra $k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ over a field k has dimension $n - c$. We already know that $k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a

local complete intersection by Lemma 10.132.5. Hence, since I/I^2 is free of rank c we see that it dimension $n - c$, by Lemma 10.130.4 for example. \square

Example 10.132.8. Let R be a ring. Let $f_1, \dots, f_c \in R[x_1, \dots, x_n]$. Let

$$h = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \dots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \dots & \partial f_c/\partial x_2 \\ \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \dots & \partial f_c/\partial x_c \end{pmatrix}.$$

Set $S = R[x_1, \dots, x_{n+1}]/(f_1, \dots, f_c, x_{n+1}h - 1)$. This is an example of a standard smooth algebra, except that the presentation is wrong and the variables should be in the following order: $x_1, \dots, x_c, x_{n+1}, x_{c+1}, \dots, x_n$.

Lemma 10.132.9. *A composition of standard smooth ring maps is standard smooth.*

Proof. Suppose that $R \rightarrow S$ and $S \rightarrow S'$ are standard smooth. We choose presentations $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ and $S' = S[y_1, \dots, y_m]/(g_1, \dots, g_d)$. Choose elements $g'_j \in R[x_1, \dots, x_n, y_1, \dots, y_m]$ mapping to the g_j . In this way we see $S' = R[x_1, \dots, x_n, y_1, \dots, y_m]/(f_1, \dots, f_c, g'_1, \dots, g'_d)$. To show that S' is standard smooth it suffices to verify that the determinant

$$\det \begin{pmatrix} \partial f_1/\partial x_1 & \dots & \partial f_c/\partial x_1 & \partial g_1/\partial x_1 & \dots & \partial g_d/\partial x_1 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ \partial f_1/\partial x_c & \dots & \partial f_c/\partial x_c & \partial g_1/\partial x_c & \dots & \partial g_d/\partial x_c \\ 0 & \dots & 0 & \partial g_1/\partial y_1 & \dots & \partial g_d/\partial y_1 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & 0 & \partial g_1/\partial y_d & \dots & \partial g_d/\partial y_d \end{pmatrix}$$

is invertible in S' . This is clear since it is the product of the two determinants which were assumed to be invertible by hypothesis. \square

Lemma 10.132.10. *Let $R \rightarrow S$ be a smooth ring map. There exists an open covering of $\text{Spec}(S)$ by standard opens $D(g)$ such that each S_g is standard smooth over R . In particular $R \rightarrow S$ is syntomic.*

Proof. Choose a presentation $\alpha : R[x_1, \dots, x_n] \rightarrow S$ with kernel $I = (f_1, \dots, f_m)$. For every subset $E \subset \{1, \dots, m\}$ consider the open subset U_E where the classes $f_e, e \in E$ freely generate the finite projective S -module I/I^2 , see Lemma 10.76.3. We may cover $\text{Spec}(S)$ by standard opens $D(g)$ each completely contained in one of the opens U_E . For such a g we look at the presentation

$$\beta : R[x_1, \dots, x_n, x_{n+1}] \longrightarrow S_g$$

mapping x_{n+1} to $1/g$. Setting $J = \text{Ker}(\beta)$ we use Lemma 10.129.12 to see that $J/J^2 \cong (I/I^2)_g \oplus S_g$ is free. We may and do replace S by S_g . Then using Lemma 10.131.6 we may assume we have a presentation $\alpha : R[x_1, \dots, x_n] \rightarrow S$ with kernel $I = (f_1, \dots, f_c)$ such that I/I^2 is free on the classes of f_1, \dots, f_c .

Using the presentation α obtained at the end of the previous paragraph, we more or less repeat this argument with the basis elements dx_1, \dots, dx_n of $\Omega_{R[x_1, \dots, x_n]/R}$. Namely, for any subset $E \subset \{1, \dots, n\}$ of cardinality c we may consider the open subset U_E of $\text{Spec}(S)$ where the differential of $NL(\alpha)$ composed with the projection

$$S^{\oplus c} \cong I/I^2 \longrightarrow \Omega_{R[x_1, \dots, x_n]/R} \otimes_{R[x_1, \dots, x_n]} S \longrightarrow \bigoplus_{i \in E} \text{Sd}x_i$$

is an isomorphism. Again we may find a covering of $\text{Spec}(S)$ by (finitely many) standard opens $D(g)$ such that each $D(g)$ is completely contained in one of the opens U_E . By renumbering, we may assume $E = \{1, \dots, c\}$. For a g with $D(g) \subset U_E$ we look at the presentation

$$\beta : R[x_1, \dots, x_n, x_{n+1}] \rightarrow S_g$$

mapping x_{n+1} to $1/g$. Setting $J = \text{Ker}(\beta)$ we conclude from Lemma 10.129.12 that $J = (f_1, \dots, f_c, f x_{n+1} - 1)$ where $\alpha(f) = g$ and that the composition

$$J/J^2 \longrightarrow \Omega_{R[x_1, \dots, x_{n+1}]/R} \otimes_{R[x_1, \dots, x_{n+1}]} S_g \longrightarrow \bigoplus_{i=1}^c S_g dx_i \oplus S_g dx_{n+1}$$

is an isomorphism. Reordering the coordinates as $x_1, \dots, x_c, x_{n+1}, x_{c+1}, \dots, x_n$ we conclude that S_g is standard smooth over R as desired.

This finishes the proof as standard smooth algebras are syntomic (Lemmas 10.132.7 and 10.131.14) and being syntomic over R is local on S (Lemma 10.131.4). \square

Definition 10.132.11. Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S . We say $R \rightarrow S$ is *smooth at \mathfrak{q}* if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is smooth.

For ring maps of finite presentation we can characterize this as follows.

Lemma 10.132.12. *Let $R \rightarrow S$ be of finite presentation. Let \mathfrak{q} be a prime of S . The following are equivalent*

- (1) $R \rightarrow S$ is smooth at \mathfrak{q} ,
- (2) $H_1(L_{S/R})_{\mathfrak{q}} = 0$ and $\Omega_{S/R, \mathfrak{q}}$ is a projective $S_{\mathfrak{q}}$ -module, and
- (3) $H_1(L_{S/R})_{\mathfrak{q}} = 0$ and $\Omega_{S/R, \mathfrak{q}}$ is a flat $S_{\mathfrak{q}}$ -module.

Proof. We will use without further mention that formation of the naive cotangent complex commutes with localization, see Section 10.129, especially Lemma 10.129.13. It is clear that (1) implies (2) implies (3). Assume (3) holds. Note that $\Omega_{S/R}$ is a finitely presented S -module, see Lemma 10.127.15. Hence $\Omega_{S/R, \mathfrak{q}}$ is a finite free module by Lemma 10.75.4. Writing $S_{\mathfrak{q}}$ as the colimit of principal localizations we see from Lemma 10.123.4 that we can find a $g \in S$, $g \notin \mathfrak{q}$ such that $(\Omega_{S/R})_g$ is finite free. Choose a presentation $\alpha : R[x_1, \dots, x_n] \rightarrow S$ with kernel I . We may work with $NL(\alpha)$ instead of $NL_{S/R}$, see Lemma 10.129.2. The surjection

$$\Omega_{R[x_1, \dots, x_n]/R} \otimes_R S \rightarrow \Omega_{S/R} \rightarrow 0$$

has a right inverse after inverting g because $(\Omega_{S/R})_g$ is projective. Hence the image of $d : (I/I^2)_g \rightarrow \Omega_{R[x_1, \dots, x_n]/R} \otimes_R S_g$ is a direct summand and this map has a right inverse too. We conclude that $H_1(L_{S/R})_g$ is a quotient of $(I/I^2)_g$. In particular $H_1(L_{S/R})_g$ is a finite S_g -module. Thus the vanishing of $H_1(L_{S/R})_{\mathfrak{q}}$ implies the vanishing of $H_1(L_{S/R})_{gg'}$ for some $g' \in S$, $g' \notin \mathfrak{q}$. Then $R \rightarrow S_{gg'}$ is smooth by definition. \square

Lemma 10.132.13. *Let $R \rightarrow S$ be a ring map. Then $R \rightarrow S$ is smooth if and only if $R \rightarrow S$ is smooth at every prime \mathfrak{q} of S .*

Proof. The direct implication is trivial. Suppose that $R \rightarrow S$ is smooth at every prime \mathfrak{q} of S . Since $\text{Spec}(S)$ is quasi-compact, see Lemma 10.16.10, there exists a finite covering $\text{Spec}(S) = \bigcup D(g_i)$ such that each S_{g_i} is smooth. By Lemma 10.23.3 this implies that S is of finite presentation over R . According to Lemma 10.129.13 we see that $NL_{S/R} \otimes_S S_{g_i}$ is quasi-isomorphic to a finite projective S_{g_i} -module. By

Lemma 10.75.2 this implies that $NL_{S/R}$ is quasi-isomorphic to a finite projective S -module. \square

Lemma 10.132.14. *A composition of smooth ring maps is smooth.*

Proof. This follows from a combination of Lemmas 10.132.10, 10.132.9 and 10.132.13. (You can also prove this in many different ways; including easier ones.) \square

Lemma 10.132.15. *Let R be a ring. Let $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ be a relative global complete intersection. Let $\mathfrak{q} \subset S$ be a prime. Then $R \rightarrow S$ is smooth at \mathfrak{q} if and only if there exists a subset $I \subset \{1, \dots, n\}$ of cardinality c such that the polynomial*

$$g_I = \det(\partial f_j / \partial x_i)_{j=1, \dots, c, i \in I}.$$

does not map to an element of \mathfrak{q} .

Proof. By Lemma 10.131.13 we see that the naive cotangent complex associated to the given presentation of S is the complex

$$\bigoplus_{j=1}^c S \cdot f_j \longrightarrow \bigoplus_{i=1}^n S \cdot dx_i, \quad f_j \longmapsto \sum \frac{\partial f_j}{\partial x_i} dx_i.$$

The maximal minors of the matrix giving the map are exactly the polynomials g_I .

Assume g_I maps to $g \in S$, with $g \notin \mathfrak{q}$. Then the algebra S_g is smooth over R . Namely, its naive cotangent complex is quasi-isomorphic to the complex above localized at g , see Lemma 10.129.13. And by construction it is quasi-isomorphic to a free rank $n - c$ module in degree 0.

Conversely, suppose that all g_I end up in \mathfrak{q} . In this case the complex above tensored with $\kappa(\mathfrak{q})$ does not have maximal rank, and hence there is no localization by an element $g \in S$, $g \notin \mathfrak{q}$ where this map becomes a split injection. By Lemma 10.129.13 again there is no such localization which is smooth over R . \square

Lemma 10.132.16. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime \mathfrak{p} of R . Assume*

- (1) *there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is of finite presentation,*
- (2) *the local ring homomorphism $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat,*
- (3) *the fibre $S \otimes_R \kappa(\mathfrak{p})$ is smooth over $\kappa(\mathfrak{p})$ at the prime corresponding to \mathfrak{q} .*

Then $R \rightarrow S$ is smooth at \mathfrak{q} .

Proof. By Lemmas 10.131.15 and 10.132.5 we see that there exists a $g \in S$ such that S_g is a relative global complete intersection. Replacing S by S_g we may assume $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ is a relative global complete intersection. For any subset $I \subset \{1, \dots, n\}$ of cardinality c consider the polynomial $g_I = \det(\partial f_j / \partial x_i)_{j=1, \dots, c, i \in I}$ of Lemma 10.132.15. Note that the image \bar{g}_I of g_I in the polynomial ring $\kappa(\mathfrak{p})[x_1, \dots, x_n]$ is the determinant of the partial derivatives of the images \bar{f}_j of the f_j in the ring $\kappa(\mathfrak{p})[x_1, \dots, x_n]$. Thus the lemma follows by applying Lemma 10.132.15 both to $R \rightarrow S$ and to $\kappa(\mathfrak{p}) \rightarrow S \otimes_R \kappa(\mathfrak{p})$. \square

Note that the sets U, V in the following lemma are open by definition.

Lemma 10.132.17. *Let $R \rightarrow S$ be a ring map of finite presentation. Let $R \rightarrow R'$ be a flat ring map. Denote $S' = R' \otimes_R S$ the base change. Let $U \subset \text{Spec}(S)$ be the set of primes at which $R \rightarrow S$ is smooth. Let $V \subset \text{Spec}(S')$ the set of primes*

at which $R' \rightarrow S'$ is smooth. Then V is the inverse image of U under the map $f : \text{Spec}(S') \rightarrow \text{Spec}(S)$.

Proof. By Lemma 10.129.8 we see that $NL_{S/R} \otimes_S S'$ is homotopy equivalent to $NL_{S'/R'}$. This already implies that $f^{-1}(U) \subset V$.

Let $\mathfrak{q}' \subset S'$ be a prime lying over $\mathfrak{q} \subset S$. Assume $\mathfrak{q}' \in V$. We have to show that $\mathfrak{q} \in U$. Since $S \rightarrow S'$ is flat, we see that $S_{\mathfrak{q}} \rightarrow S'_{\mathfrak{q}'}$ is faithfully flat (Lemma 10.38.16). Thus the vanishing of $H_1(L_{S'/R'})_{\mathfrak{q}'}$ implies the vanishing of $H_1(L_{S/R})_{\mathfrak{q}}$. By Lemma 10.75.5 applied to the $S_{\mathfrak{q}}$ -module $(\Omega_{S/R})_{\mathfrak{q}}$ and the map $S_{\mathfrak{q}} \rightarrow S'_{\mathfrak{q}'}$, we see that $(\Omega_{S/R})_{\mathfrak{q}}$ is projective. Hence $R \rightarrow S$ is smooth at \mathfrak{q} by Lemma 10.132.12. \square

Lemma 10.132.18. *Let $k \subset K$ be a field extension. Let S be a finite type algebra over k . Let \mathfrak{q}_K be a prime of $S_K = K \otimes_k S$ and let \mathfrak{q} be the corresponding prime of S . Then S is smooth over k at \mathfrak{q} if and only if S_K is smooth at \mathfrak{q}_K over K .*

Proof. This is a special case of Lemma 10.132.17. \square

Lemma 10.132.19. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \rightarrow \bar{S}$ be a smooth ring map. Then there exists elements $\bar{g}_i \in \bar{S}$ which generate the unit ideal of \bar{S} such that each $\bar{S}_{g_i} \cong S_i/IS_i$ for some (standard) smooth ring S_i over R .*

Proof. By Lemma 10.132.10 we find a collection of elements $\bar{g}_i \in \bar{S}$ which generate the unit ideal of \bar{S} such that each \bar{S}_{g_i} is standard smooth over R/I . Hence we may assume that \bar{S} is standard smooth over R/I . Write $\bar{S} = (R/I)[x_1, \dots, x_n]/(\bar{f}_1, \dots, \bar{f}_c)$ as in Definition 10.132.6. Choose $f_1, \dots, f_c \in R[x_1, \dots, x_n]$ lifting $\bar{f}_1, \dots, \bar{f}_c$. Set $S = R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, x_{n+1}\Delta - 1)$ where $\Delta = \det(\frac{\partial f_i}{\partial x_i})_{i,j=1,\dots,c}$ as in Example 10.132.8. This proves the lemma. \square

10.133. Formally smooth maps

In this section we define formally smooth ring maps. It will turn out that a ring map of finite presentation is formally smooth if and only if it is smooth, see Proposition 10.133.13.

Definition 10.133.1. Let $R \rightarrow S$ be a ring map. We say S is *formally smooth over R* if for every commutative solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A/I \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & A \end{array}$$

where $I \subset A$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute.

Lemma 10.133.2. *Let $R \rightarrow S$ be a formally smooth ring map. Let $R \rightarrow R'$ be any ring map. Then the base change $S' = R' \otimes_R S$ is formally smooth over R' .*

Proof. Let a solid diagram

$$\begin{array}{ccccc} S & \longrightarrow & R' \otimes_R S & \longrightarrow & A/I \\ \uparrow & \searrow & \uparrow & \searrow & \uparrow \\ R & \longrightarrow & R' & \longrightarrow & A \end{array}$$

as in Definition 10.133.1 be given. By assumption the longer dotted arrow exists. By the universal property of tensor product we obtain the shorter dotted arrow. \square

Lemma 10.133.3. *A composition of formally smooth ring maps is formally smooth.*

Proof. Omitted. (Hint: This is completely formal, and follows from considering a suitable diagram.) \square

Lemma 10.133.4. *A polynomial ring over R is formally smooth over R .*

Proof. Suppose we have a diagram as in Definition 10.133.1 with $S = R[x_j; j \in J]$. Then there exists a dotted arrow simply by choosing lifts $a_j \in A$ of the elements in A/I to which the elements x_j map to under the top horizontal arrow. \square

Lemma 10.133.5. *Let $R \rightarrow S$ be a ring map. Let $P \rightarrow S$ be a surjective R -algebra map from a polynomial ring P onto S . Denote $J \subset P$ the kernel. Then $R \rightarrow S$ is formally smooth if and only if there exists an R -algebra map $\sigma : S \rightarrow P/J^2$ which is a right inverse to the surjection $P/J^2 \rightarrow S$.*

Proof. Assume $R \rightarrow S$ is formally smooth. Consider the commutative diagram

$$\begin{array}{ccc} S & \longrightarrow & P/J \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & P/J^2 \end{array}$$

By assumption the dotted arrow exists. This proves that σ exists.

Conversely, suppose we have a σ as in the lemma. Let a solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A/I \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Definition 10.133.1 be given. Because P is formally smooth by Lemma 10.133.4, there exists an R -algebra homomorphism $\psi : P \rightarrow A$ which lifts the map $P \rightarrow S \rightarrow A/I$. Clearly $\psi(J) \subset I$ and since $I^2 = 0$ we conclude that $\psi(J^2) = 0$. Hence ψ factors as $\bar{\psi} : P/J^2 \rightarrow A$. The desired dotted arrow is the composition $\bar{\psi} \circ \sigma : S \rightarrow A$. \square

Remark 10.133.6. Lemma 10.133.5 holds more generally whenever P is formally smooth over R .

Lemma 10.133.7. *Let $R \rightarrow S$ be a ring map. Let $P \rightarrow S$ be a surjective R -algebra map from a polynomial ring P onto S . Denote $J \subset P$ the kernel. Then $R \rightarrow S$ is formally smooth if and only if the sequence*

$$0 \rightarrow J/J^2 \rightarrow \Omega_{P/R} \otimes_R S \rightarrow \Omega_{S/R} \rightarrow 0$$

of Lemma 10.127.9 is a split exact sequence.

Proof. Assume S is formally smooth over R . By Lemma 10.133.5 this means there exists an R -algebra map $S \rightarrow P/J^2$ which is a left inverse to the canonical map $P/J^2 \rightarrow S$. This means that

$$P/J^2 \cong S \oplus J/J^2$$

as R -algebras. Note that the middle term of the exact sequence is $\Omega_{P/R} \otimes_P S \cong \Omega_{(P/J^2)/R} \otimes_R S$ by Lemma 10.127.11. A direct computation shows that

$$\Omega_{(S \oplus J/J^2)/R} \otimes_{(S \oplus J/J^2)} S = \Omega_{S/R} \oplus J/J^2$$

as desired.

Assume the exact sequence of the lemma is split exact. Choose a splitting $\sigma : \Omega_{S/R} \rightarrow \Omega_{P/R} \otimes_R S$. For each $\lambda \in S$ choose $x_\lambda \in P$ which maps to λ . Next, for each $\lambda \in S$ choose $f_\lambda \in J$ such that

$$df_\lambda = dx_\lambda - \sigma(d\lambda)$$

in the middle term of the exact sequence. We claim that $s : \lambda \mapsto x_\lambda - f_\lambda \pmod{J^2}$ is an R -algebra homomorphism $s : S \rightarrow P/J^2$. To prove this we will repeatedly use that if $h \in J$ and $dh = 0$ in $\Omega_{P/R} \otimes_R S$, then $h \in J^2$. Let $\lambda, \mu \in S$. Then $\sigma(d\lambda + d\mu - d(\lambda + \mu)) = 0$. This implies

$$d(x_\lambda + x_\mu - x_{\lambda+\mu} - f_\lambda - f_\mu + f_{\lambda+\mu}) = 0$$

which means that $x_\lambda + x_\mu - x_{\lambda+\mu} - f_\lambda - f_\mu + f_{\lambda+\mu} \in J^2$, which in turn means that $s(\lambda) + s(\mu) = s(\lambda + \mu)$. Similarly, we have $\sigma(\lambda d\mu + \mu d\lambda - d\lambda\mu) = 0$ which implies that

$$\mu(dx_\lambda - df_\lambda) + \lambda(dx_\mu - df_\mu) - dx_{\lambda\mu} - df_{\lambda\mu} = 0$$

in the middle term of the exact sequence. Moreover we have

$$d(x_\lambda x_\mu) = x_\lambda dx_\mu + x_\mu dx_\lambda = \lambda dx_\mu + \mu dx_\lambda$$

in the middle term again. Combined these equations mean that $x_\lambda x_\mu - x_{\lambda\mu} - \mu f_\lambda - \lambda f_\mu + f_{\lambda\mu} \in J^2$ which means that $s(\lambda)s(\mu) = s(\lambda\mu)$. If $\lambda \in R$, then $d\lambda = 0$ and we see that $df_\lambda = dx_\lambda$, hence $\lambda - x_\lambda + f_\lambda \in J^2$ and hence $s(\lambda) = \lambda$ as desired. At this point we can apply Lemma 10.133.5 to conclude that S/R is formally smooth. \square

Proposition 10.133.8. *Let $R \rightarrow S$ be a ring map. Consider a formally smooth R -algebra P and a surjection $P \rightarrow S$ with kernel J . The following are equivalent*

- (1) S is formally smooth over R ,
- (2) for some $P \rightarrow S$ as above there exists a section to $P/J^2 \rightarrow S$,
- (3) for all $P \rightarrow S$ as above there exists a section to $P/J^2 \rightarrow S$,
- (4) for some $P \rightarrow S$ as above the sequence $0 \rightarrow J/J^2 \rightarrow \Omega_{P/R} \otimes S \rightarrow \Omega_{S/R} \rightarrow 0$ is split exact,
- (5) for all $P \rightarrow S$ as above the sequence $0 \rightarrow J/J^2 \rightarrow \Omega_{P/R} \otimes S \rightarrow \Omega_{S/R} \rightarrow 0$ is split exact, and
- (6) the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to a projective S -module placed in degree 0.

Proof. It is clear that (1) implies (3) implies (2), see first part of the proof of Lemma 10.133.5. It is also true that (3) implies (5) implies (4) and that (2) implies (4), see first part of the proof of Lemma 10.133.7. Finally, Lemma 10.133.7 applied to the canonical surjection $R[S] \rightarrow S$ (10.129.0.1) shows that (1) implies (6).

Assume (4) and let's prove (6). Consider the sequence of Lemma 10.129.4 associated to the ring maps $R \rightarrow P \rightarrow S$. By the implication (1) \Rightarrow (6) proved above we see that $NL_{P/R} \otimes_R S$ is quasi-isomorphic to $\Omega_{P/R} \otimes_P S$ placed in degree 0. Hence $H_1(NL_{P/R} \otimes_P S) = 0$. Since $P \rightarrow S$ is surjective we see that $NL_{S/P}$ is homotopy equivalent to J/J^2 placed in degree 1 (Lemma 10.129.6). Thus we obtain the exact

sequence $0 \rightarrow H_1(L_{S/R}) \rightarrow J/J^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$. By assumption we see that $H_1(L_{S/R}) = 0$ and that $\Omega_{S/R}$ is a projective S -module. Thus (6) follows.

Finally, let's prove that (6) implies (1). The assumption means that the complex $J/J^2 \rightarrow \Omega_{P/R} \otimes_P S$ where $P = R[S]$ and $P \rightarrow S$ is the canonical surjection (10.129.0.1). Hence Lemma 10.133.7 shows that S is formally smooth over R . \square

Lemma 10.133.9. *Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $B \rightarrow C$ is formally smooth. Then the sequence*

$$0 \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of Lemma 10.127.7 is a split short exact sequence.

Proof. Follows from Proposition 10.133.8 and Lemma 10.129.4. \square

Lemma 10.133.10. *Let $A \rightarrow B \rightarrow C$ be ring maps with $A \rightarrow C$ formally smooth and $B \rightarrow C$ surjective with kernel $J \subset B$. Then the exact sequence*

$$0 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow 0$$

of Lemma 10.127.9 is split exact.

Proof. Follows from Proposition 10.133.8, Lemma 10.129.4, and Lemma 10.127.9. \square

Lemma 10.133.11. *Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is) and $A \rightarrow B$ formally smooth. Denote $I = \text{Ker}(A \rightarrow C)$ and $J = \text{Ker}(B \rightarrow C)$. Then the sequence*

$$0 \rightarrow I/I^2 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B B/J \rightarrow 0$$

of Lemma 10.129.7 is split exact.

Proof. Since $A \rightarrow B$ is formally smooth there exists a ring map $\sigma : B \rightarrow A/I^2$ whose composition with $A \rightarrow B$ equals the quotient map $A \rightarrow A/I^2$. Then σ induces a map $J/J^2 \rightarrow I/I^2$ which is inverse to the map $I/I^2 \rightarrow J/J^2$. \square

Lemma 10.133.12. *Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Assume*

- (1) $I^2 = 0$,
- (2) $R \rightarrow S$ is flat, and
- (3) $R/I \rightarrow S/IS$ is formally smooth.

Then $R \rightarrow S$ is formally smooth.

Proof. Assume (1), (2) and (3). Let $P = R[\{x_t\}_{t \in T}] \rightarrow S$ be a surjection of R -algebras with kernel J . Thus $0 \rightarrow J \rightarrow P \rightarrow S \rightarrow 0$ is a short exact sequence of flat R -modules. This implies that $I \otimes_R S = IS$, $I \otimes_R P = IP$ and $I \otimes_R J = IJ$ as well as $J \cap IP = IJ$. We will use throughout the proof that

$$\Omega_{(S/IS)/(R/I)} = \Omega_{S/R} \otimes_S (S/IS) = \Omega_{S/R} \otimes_R R/I = \Omega_{S/R}/I\Omega_{S/R}$$

and similarly for P (see Lemma 10.127.12). By Lemma 10.133.7 the sequence

$$(10.133.12.1) \quad 0 \rightarrow J/(IJ + J^2) \rightarrow \Omega_{P/R} \otimes_P S/IS \rightarrow \Omega_{S/R} \otimes_S S/IS \rightarrow 0$$

is split exact. Of course the middle term is $\bigoplus_{t \in T} S/IS dx_t$. Choose a splitting $\sigma : \Omega_{P/R} \otimes_P S/IS \rightarrow J/(IJ + J^2)$. For each $t \in T$ choose an element $f_t \in J$ which maps to $\sigma(dx_t)$ in $J/(IJ + J^2)$. This determines a unique S -module map

$$\tilde{\sigma} : \Omega_{P/R} \otimes_R S = \bigoplus S dx_t \longrightarrow J/J^2$$

with the property that $\tilde{\sigma}(dx_i) = f_i$. As σ is a section to d the difference

$$\Delta = \text{id}_{J/J^2} - \tilde{\sigma} \circ d$$

is a self map $J/J^2 \rightarrow J/J^2$ whose image is contained in $(IJ + J^2)/J^2$. In particular $\Delta((IJ + J^2)/J^2) = 0$ because $I^2 = 0$. This means that Δ factors as

$$J/J^2 \rightarrow J/(IJ + J^2) \xrightarrow{\bar{\Delta}} (IJ + J^2)/J^2 \rightarrow J/J^2$$

where $\bar{\Delta}$ is a S/IS -module map. Using again that the sequence (10.133.12.1) is split, we can find a S/IS -module map $\bar{\delta} : \Omega_{P/R} \otimes_P S/IS \rightarrow (IJ + J^2)/J^2$ such that $\bar{\delta} \circ d$ is equal to $\bar{\Delta}$. In the same manner as above the map $\bar{\delta}$ determines an S -module map $\delta : \Omega_{P/R} \otimes_P S \rightarrow J/J^2$. After replacing $\tilde{\sigma}$ by $\tilde{\sigma} + \delta$ a simple computation shows that $\Delta = 0$. In other words $\tilde{\sigma}$ is a section of $J/J^2 \rightarrow \Omega_{P/R} \otimes_P S$. By Lemma 10.133.7 we conclude that $R \rightarrow S$ is formally smooth. \square

Proposition 10.133.13. *Let $R \rightarrow S$ be a ring map. The following are equivalent*

- (1) $R \rightarrow S$ is of finite presentation and formally smooth,
- (2) $R \rightarrow S$ is smooth.

Proof. Follows from Proposition 10.133.8 and Definition 10.132.1. (Note that $\Omega_{S/R}$ is a finitely presented S -module if $R \rightarrow S$ is of finite presentation, see Lemma 10.127.15.) \square

Lemma 10.133.14. *Let $R \rightarrow S$ be a smooth ring map. Then there exists a subring $R_0 \subset R$ of finite type over \mathbf{Z} and a smooth ring map $R_0 \rightarrow S_0$ such that $S \cong R \otimes_{R_0} S_0$.*

Proof. We are going to use that smooth is equivalent to finite presentation and formally smooth, see Proposition 10.133.13. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and denote $I = (f_1, \dots, f_m)$. Choose a right inverse $\sigma : S \rightarrow R[x_1, \dots, x_n]/I^2$ to the projection to S as in Lemma 10.133.5. Choose $h_i \in R[x_1, \dots, x_n]$ such that $\sigma(x_i \bmod I) = h_i \bmod I^2$. The fact that σ is an R -algebra homomorphism $R[x_1, \dots, x_n]/I \rightarrow R[x_1, \dots, x_n]/I^2$ is equivalent to the condition that

$$f_j(h_1, \dots, h_n) = \sum_{j_1 j_2} a_{j_1 j_2} f_{j_1} f_{j_2}$$

for certain $a_{kl} \in R[x_1, \dots, x_n]$. Let $R_0 \subset R$ be the subring generated over \mathbf{Z} by all the coefficients of the polynomials f_j, h_i, a_{kl} . Set $S_0 = R_0[x_1, \dots, x_n]/(f_1, \dots, f_m)$, with $I_0 = (f_1, \dots, f_m)$. Let $\sigma_0 : S_0 \rightarrow R_0[x_1, \dots, x_n]/I_0^2$ defined by the rule $x_i \mapsto h_i \bmod I_0^2$; this works since the a_{lk} are defined over R_0 and satisfy the same relations. Thus by Lemma 10.133.5 the ring S_0 is formally smooth over R_0 . \square

Lemma 10.133.15. *Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R'$ be a faithfully flat ring map. Set $S' = S \otimes_R R'$. Then $R \rightarrow S$ is formally smooth if and only if $R' \rightarrow S'$ is formally smooth.*

Proof. If $R \rightarrow S$ is formally smooth, then $R' \rightarrow S'$ is formally smooth by Lemma 10.133.2. To prove the converse, assume $R' \rightarrow S'$ is formally smooth. Note that $N \otimes_R R' = N \otimes_S S'$ for any S -module N . In particular $S \rightarrow S'$ is faithfully flat also. Choose a polynomial ring $P = R[\{x_i\}_{i \in I}]$ and a surjection of R -algebras $P \rightarrow S$ with kernel J . Note that $P' = P \otimes_R R'$ is a polynomial algebra over R' . Since

$R \rightarrow R'$ is flat the kernel J' of the surjection $P' \rightarrow S'$ is $J \otimes_R R'$. Hence the split exact sequence (see Lemma 10.133.7)

$$0 \rightarrow J'/(J')^2 \rightarrow \Omega_{P'/R'} \otimes_{P'} S' \rightarrow \Omega_{S'/R'} \rightarrow 0$$

is the base change via $S \rightarrow S'$ of the corresponding sequence

$$J/J^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$$

see Lemma 10.127.9. As $S \rightarrow S'$ is faithfully flat we conclude two things: (1) this sequence (without ') is exact too, and (2) $\Omega_{S/R}$ is a projective S -module. Namely, $\Omega_{S'/R'}$ is projective as a direct sum of the free module $\Omega_{P'/R'} \otimes_{P'} S'$ and $\Omega_{S'/R} \otimes_S S' = \Omega_{S'/R'}$ by what we said above. Thus (2) follows by descent of projectivity through faithfully flat ring maps, see Theorem 10.92.5. Hence the sequence $0 \rightarrow J/J^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$ is exact also and we win by applying Lemma 10.133.7 once more. \square

It turns out that smooth ring maps satisfy the following strong lifting property.

Lemma 10.133.16. *Let $R \rightarrow S$ be a smooth ring map. Given a commutative solid diagram*

$$\begin{array}{ccc} S & \longrightarrow & A/I \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & A \end{array}$$

where $I \subset A$ is a locally nilpotent ideal, a dotted arrow exists which makes the diagram commute.

Proof. By Lemma 10.133.14 we can extend the diagram to a commutative diagram

$$\begin{array}{ccccc} S_0 & \longrightarrow & S & \longrightarrow & A/I \\ \uparrow & & \uparrow & \searrow & \uparrow \\ R_0 & \longrightarrow & R & \longrightarrow & A \end{array}$$

with $R_0 \rightarrow S_0$ smooth, R_0 of finite type over \mathbf{Z} , and $S = S_0 \otimes_{R_0} R$. Let $x_1, \dots, x_n \in S_0$ be generators of S_0 over R_0 . Let a_1, \dots, a_n be elements of A which map to the same elements in A/I as the elements x_1, \dots, x_n . Denote $A_0 \subset A$ the subring generated by the image of R_0 and the elements a_1, \dots, a_n . Set $I_0 = A_0 \cap I$. Then $A_0/I_0 \subset A/I$ and $S_0 \rightarrow A/I$ maps into A_0/I_0 . Thus it suffices to find the dotted arrow in the diagram

$$\begin{array}{ccc} S_0 & \longrightarrow & A_0/I_0 \\ \uparrow & \searrow & \uparrow \\ R_0 & \longrightarrow & A_0 \end{array}$$

The ring A_0 is of finite type over \mathbf{Z} by construction. Hence A_0 is Noetherian, whence I_0 is nilpotent, see Lemma 10.31.4. Say $I_0^n = 0$. By Proposition 10.133.13 we can successively lift the R_0 -algebra map $S_0 \rightarrow A_0/I_0$ to $S_0 \rightarrow A_0/I_0^2$, $S_0 \rightarrow A_0/I_0^3$, \dots , and finally $S_0 \rightarrow A_0/I_0^n = A_0$. \square

10.134. Smoothness and differentials

Some results on differentials and smooth ring maps.

Lemma 10.134.1. *Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ smooth, then the sequence*

$$0 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of Lemma 10.127.7 is exact.

Proof. This follows from the more general Lemma 10.133.9 because a smooth ring map is formally smooth, see Proposition 10.133.13. But it also follows directly from Lemma 10.129.4 since $H_1(L_{C/B}) = 0$ is part of the definition of smoothness of $B \rightarrow C$. \square

Lemma 10.134.2. *Let $A \rightarrow B \rightarrow C$ be ring maps with $A \rightarrow C$ smooth and $B \rightarrow C$ surjective with kernel $J \subset B$. Then the exact sequence*

$$0 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow 0$$

of Lemma 10.127.9 is split exact.

Proof. This follows from the more general Lemma 10.133.10 because a smooth ring map is formally smooth, see Proposition 10.133.13. \square

Lemma 10.134.3. *Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is) and $A \rightarrow B$ smooth. Denote $I = \text{Ker}(A \rightarrow C)$ and $J = \text{Ker}(B \rightarrow C)$. Then the sequence*

$$0 \rightarrow I/I^2 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B B/J \rightarrow 0$$

of Lemma 10.129.7 is exact.

Proof. This follows from the more general Lemma 10.133.11 because a smooth ring map is formally smooth, see Proposition 10.133.13. \square

Lemma 10.134.4. *Let $\varphi : R \rightarrow S$ be a smooth ring map. Let $\sigma : S \rightarrow R$ be a left inverse to φ . Set $I = \text{Ker}(\sigma)$. Then*

- (1) I/I^2 is a finite locally free R -module, and
- (2) if I/I^2 is free, then $S^\wedge \cong R[[t_1, \dots, t_d]]$ as R -algebras, where S^\wedge is the I -adic completion of S .

Proof. By Lemma 10.127.10 applied to $R \rightarrow S \rightarrow R$ we see that $I/I^2 = \Omega_{S/R} \otimes_{S, \sigma} R$. Since by definition of a smooth morphism the module $\Omega_{S/R}$ is finite locally free over S we deduce that (1) holds. If I/I^2 is free, then choose $f_1, \dots, f_d \in I$ whose images in I/I^2 form an R -basis. Consider the R -algebra map defined by

$$\Psi : R[[x_1, \dots, x_d]] \longrightarrow S^\wedge, \quad x_i \longmapsto f_i.$$

Denote $P = R[[x_1, \dots, x_d]]$ and $J = (x_1, \dots, x_d) \subset P$. We write $\Psi_n : P/J^n \rightarrow S/I^n$ for the induced map of quotient rings. Note that $S/I^2 = \varphi(R) \oplus I/I^2$. Thus Ψ_2 is an isomorphism. Denote $\sigma_2 : S/I^2 \rightarrow P/J^2$ the inverse of Ψ_2 . We will prove by induction on n that for all $n > 2$ there exists an inverse $\sigma_n : S/I^n \rightarrow P/J^n$ of Ψ_n .

Namely, as S is formally smooth over R (by Proposition 10.133.13) we see that in the solid diagram

$$\begin{array}{ccc} S & \cdots \rightarrow & P/J^n \\ & \searrow & \downarrow \\ & \sigma_{n-1} & P/J^{n-1} \end{array}$$

of R -algebras we can fill in the dotted arrow by some R -algebra map $\tau : S \rightarrow P/J^n$ making the diagram commute. This induces an R -algebra map $\bar{\tau} : S/I^n \rightarrow P/J^n$ which is equal to σ_{n-1} modulo J^n . By construction the map Ψ_n is surjective and now $\bar{\tau} \circ \Psi_n$ is an R -algebra endomorphism of P/J^n which maps x_i to $x_i + \delta_{i,n}$ with $\delta_{i,n} \in J^{n-1}/J^n$. It follows that Ψ_n is an isomorphism and hence it has an inverse σ_n . This proves the lemma. \square

10.135. Smooth algebras over fields

Warning: The following two lemmas do not hold over nonperfect fields in general.

Lemma 10.135.1. *Let k be an algebraically closed field. Let S be a finite type k -algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. Then*

$$\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) = \dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2.$$

Proof. Since k is algebraically closed we have $\kappa(\mathfrak{m}) = k$. We may choose a presentation $0 \rightarrow I \rightarrow k[x_1, \dots, x_n] \rightarrow S \rightarrow 0$ such that all x_i end up in \mathfrak{m} . Write $I = (f_1, \dots, f_m)$. Note that each f_i is contained in (x_1, \dots, x_n) , i.e., each f_i has zero constant term. Hence we may write

$$f_j = \sum a_{ij} x_i + \text{h.o.t.}$$

By Lemma 10.127.9 there is an exact sequence

$$\bigoplus S \cdot f_j \rightarrow \bigoplus S \cdot dx_i \rightarrow \Omega_{S/k} \rightarrow 0.$$

Tensoring with $\kappa(\mathfrak{m}) = k$ we get an exact sequence

$$\bigoplus k \cdot f_j \rightarrow \bigoplus k \cdot dx_i \rightarrow \Omega_{S/k} \otimes \kappa(\mathfrak{m}) \rightarrow 0.$$

The matrix of the map is given by the partial derivatives of the f_j evaluated at 0. In other words by the matrix (a_{ij}) . Similarly there is a short exact sequence

$$(f_1, \dots, f_m)/(x_1 f_1, \dots, x_n f_m) \rightarrow (x_1, \dots, x_n)/(x_1, \dots, x_n)^2 \rightarrow \mathfrak{m}/\mathfrak{m}^2 \rightarrow 0.$$

Note that the first map is given by expanding the f_j in terms of the x_i , i.e., by the same matrix (a_{ij}) . Hence the two numbers are the same. \square

Lemma 10.135.2. *Let k be an algebraically closed field. Let S be a finite type k -algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. The following are equivalent:*

- (1) *The ring $S_{\mathfrak{m}}$ is a regular local ring.*
- (2) *We have $\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) \leq \dim(S_{\mathfrak{m}})$.*
- (3) *We have $\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) = \dim(S_{\mathfrak{m}})$.*
- (4) *There exists a $g \in S$, $g \notin \mathfrak{m}$ such that S_g is smooth over k . In other words S/k is smooth at \mathfrak{m} .*

Proof. Note that (1), (2) and (3) are equivalent by Lemma 10.135.1 and Definition 10.106.7.

Assume that S is smooth at \mathfrak{q} . By Lemma 10.132.10 we see that S_g is standard smooth over k for a suitable $g \in S$, $g \notin \mathfrak{m}$. Hence by Lemma 10.132.7 we see that $\Omega_{S_g/k}$ is free of rank $\dim(S_g)$. Hence by Lemma 10.135.1 we see that $\dim(S_{\mathfrak{m}}) = \dim(\mathfrak{m}/\mathfrak{m}^2)$ in other words $S_{\mathfrak{m}}$ is regular.

Conversely, suppose that $S_{\mathfrak{m}}$ is regular. Let $d = \dim(S_{\mathfrak{m}}) = \dim \mathfrak{m}/\mathfrak{m}^2$. Choose a presentation $S = k[x_1, \dots, x_n]/I$ such that x_i maps to an element of \mathfrak{m} for all i . In other words, $\mathfrak{m}'' = (x_1, \dots, x_n)$ is the corresponding maximal ideal of $k[x_1, \dots, x_n]$. Note that we have a short exact sequence

$$I/\mathfrak{m}''I \rightarrow \mathfrak{m}''/(\mathfrak{m}'')^2 \rightarrow \mathfrak{m}/(\mathfrak{m})^2 \rightarrow 0$$

Pick $c = n - d$ elements $f_1, \dots, f_d \in I$ such that their images in $\mathfrak{m}''/(\mathfrak{m}'')^2$ span the kernel of the map to $\mathfrak{m}/(\mathfrak{m})^2$. This is clearly possible. Denote $J = (f_1, \dots, f_c)$. So $J \subset I$. Denote $S' = k[x_1, \dots, x_n]/J$ so there is a surjection $S' \rightarrow S$. Denote $\mathfrak{m}' = \mathfrak{m}''S'$ the corresponding maximal ideal of S' . Hence we have

$$\begin{array}{ccccc} k[x_1, \dots, x_n] & \longrightarrow & S' & \longrightarrow & S \\ \uparrow & & \uparrow & & \uparrow \\ \mathfrak{m}'' & \longrightarrow & \mathfrak{m}' & \longrightarrow & \mathfrak{m} \end{array}$$

By our choice of J the exact sequence

$$J/\mathfrak{m}''J \rightarrow \mathfrak{m}''/(\mathfrak{m}'')^2 \rightarrow \mathfrak{m}'/(\mathfrak{m}')^2 \rightarrow 0$$

shows that $\dim(\mathfrak{m}'/(\mathfrak{m}')^2) = d$. Since $S'_{\mathfrak{m}'}$ surjects onto $S_{\mathfrak{m}}$ we see that $\dim(S'_{\mathfrak{m}'}) \geq d$. Hence by the discussion preceding Definition 10.59.9 we conclude that $S'_{\mathfrak{m}'}$ is regular of dimension d as well. Because S' was cut out by $c = n - d$ equations we conclude that there exists a $g' \in S'$, $g' \notin \mathfrak{m}'$ such that $S'_{g'}$ is a global complete intersection over k , see Lemma 10.130.4. Also the map $S'_{\mathfrak{m}'} \rightarrow S_{\mathfrak{m}}$ is a surjection of Noetherian local domains of the same dimension and hence an isomorphism. By Lemma 10.122.7 we see that $S'_{g'} \cong S_g$ for some $g \in S$, $g \notin \mathfrak{m}$ and $g' \in S'$, $g' \notin \mathfrak{m}'$. All in all we conclude that after replacing S by a principal localization we may assume that S is a global complete intersection.

At this point we may write $S = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ with $\dim S = n - c$. Recall that the naive cotangent complex of this algebra is given by

$$\bigoplus S \cdot f_j \rightarrow \bigoplus S \cdot dx_i$$

see Lemma 10.131.13. By Lemma 10.132.15 in order to show that S is smooth at \mathfrak{m} we have to show that one of the $c \times c$ minors g_I of the matrix “ A ” giving the map above does not vanish at \mathfrak{m} . By Lemma 10.135.1 the matrix $A \bmod \mathfrak{m}$ has rank c . Thus we win. \square

Lemma 10.135.3. *Let k be any field. Let S be a finite type k -algebra. Let $X = \text{Spec}(S)$. Let $\mathfrak{q} \subset S$ be a prime corresponding to $x \in X$. The following are equivalent:*

- (1) *The k -algebra S is smooth at \mathfrak{q} over k .*
- (2) *We have $\dim_{\kappa(\mathfrak{q})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{q}) \leq \dim_x X$.*
- (3) *We have $\dim_{\kappa(\mathfrak{q})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{q}) = \dim_x X$.*

Moreover, in this case the local ring $S_{\mathfrak{q}}$ is regular.

Proof. If S is smooth at \mathfrak{q} over k , then there exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is standard smooth over k , see Lemma 10.132.10. A standard smooth algebra over k has a module of differentials which is free of rank equal to the dimension, see Lemma 10.132.7 (use that a relative global complete intersection over a field has dimension equal to the number of variables minus the number of equations). Thus we see that (1) implies (3). To finish the proof of the lemma it suffices to show that (2) implies (1) and that it implies that $S_{\mathfrak{q}}$ is regular.

Assume (2). By Nakayama's Lemma 10.19.1 we see that $\Omega_{S/k, \mathfrak{q}}$ can be generated by $\leq \dim_x X$ elements. We may replace S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ such that $\Omega_{S/k}$ is generated by at most $\dim_x X$ elements. Let $K \supset k$ be an algebraically closed field extension such that there exists a k -algebra map $\psi : \kappa(\mathfrak{q}) \rightarrow K$. Consider $S_K = K \otimes_k S$. Let $\mathfrak{m} \subset S_K$ be the maximal ideal corresponding to the surjection

$$S_K = K \otimes_k S \longrightarrow K \otimes_k \kappa(\mathfrak{q}) \xrightarrow{\text{id}_K \otimes \psi} K.$$

Note that $\mathfrak{m} \cap S = \mathfrak{q}$, in other words \mathfrak{m} lies over \mathfrak{q} . By Lemma 10.112.6 the dimension of $X_K = \text{Spec}(S_K)$ at the point corresponding to \mathfrak{m} is $\dim_x X$. By Lemma 10.110.6 this is equal to $\dim((S_K)_{\mathfrak{m}})$. By Lemma 10.127.12 the module of differentials of S_K over K is the base change of $\Omega_{S/k}$, hence also generated by at most $\dim_x X = \dim((S_K)_{\mathfrak{m}})$ elements. By Lemma 10.135.2 we see that S_K is smooth at \mathfrak{m} over K . By Lemma 10.132.17 this implies that S is smooth at \mathfrak{q} over k . This proves (1). Moreover, we know by Lemma 10.135.2 that the local ring $(S_K)_{\mathfrak{m}}$ is regular. Since $S_{\mathfrak{q}} \rightarrow (S_K)_{\mathfrak{m}}$ is flat we conclude from Lemma 10.106.9 that $S_{\mathfrak{q}}$ is regular. \square

The following lemma can be significantly generalized (in several different ways).

Lemma 10.135.4. *Let k be a field. Let R be a Noetherian local ring containing k . Assume that the residue field $\kappa = R/\mathfrak{m}$ is a finitely generated separable extension of k . Then the map*

$$d : \mathfrak{m}/\mathfrak{m}^2 \longrightarrow \Omega_{R/k} \otimes_R \kappa(\mathfrak{m})$$

is injective.

Proof. We may replace R by R/\mathfrak{m}^2 . Hence we may assume that $\mathfrak{m}^2 = 0$. By assumption we may write $\kappa = k(\bar{x}_1, \dots, \bar{x}_r, \bar{y})$ where $\bar{x}_1, \dots, \bar{x}_r$ is a transcendence basis of κ over k and \bar{y} is separable algebraic over $k(\bar{x}_1, \dots, \bar{x}_r)$. Say its minimal equation is $P(\bar{y}) = 0$ with $P(T) = T^d + \sum_{i < d} a_i T^i$, with $a_i \in k(\bar{x}_1, \dots, \bar{x}_r)$ and $P'(\bar{y}) \neq 0$. Choose any lifts $x_i \in R$ of the elements $\bar{x}_i \in \kappa$. This gives a commutative diagram

$$\begin{array}{ccc} R & \longrightarrow & \kappa \\ & \searrow \varphi & \uparrow \\ & & k(\bar{x}_1, \dots, \bar{x}_r) \end{array}$$

of k -algebras. We want to extend the left upwards arrow φ to a k -algebra map from κ to R . To do this choose any $y \in R$ lifting \bar{y} . To see that it defines a k -algebra map defined on $\kappa \cong k(\bar{x}_1, \dots, \bar{x}_r)[T]/(P)$ all we have to show is that we may choose y such that $P^\varphi(y) = 0$. If not then we compute for $\delta \in \mathfrak{m}$ that

$$P(y + \delta) = P(y) + P'(y)\delta$$

because $\mathfrak{m}^2 = 0$. Since $P'(y)\delta = P'(\bar{y})\delta$ we see that we can adjust our choice as desired. This shows that $R \cong \kappa \oplus \mathfrak{m}$ as k -algebras! From a direct computation of $\Omega_{\kappa \oplus \mathfrak{m}/k}$ the lemma follows. \square

Lemma 10.135.5. *Let k be a field. Let S be a finite type k -algebra. Let $\mathfrak{q} \subset S$ be a prime. Assume $\kappa(\mathfrak{q})$ is separable over k . The following are equivalent:*

- (1) *The algebra S is smooth at \mathfrak{q} over k .*
- (2) *The ring $S_{\mathfrak{q}}$ is regular.*

Proof. Denote $R = S_{\mathfrak{q}}$ and denote its maximal by \mathfrak{m} and its residue field κ . By Lemma 10.135.4 and 10.127.9 we see that there is a short exact sequence

$$0 \rightarrow \mathfrak{m}/\mathfrak{m}^2 \rightarrow \Omega_{R/k} \otimes_R \kappa \rightarrow \Omega_{\kappa/k} \rightarrow 0$$

Note that $\Omega_{R/k} = \Omega_{S/k, \mathfrak{q}}$, see Lemma 10.127.8. Moreover, since κ is separable over k we have $\dim_{\kappa} \Omega_{\kappa/k} = \text{trdeg}_k(\kappa)$. Hence we get

$$\dim_{\kappa} \Omega_{R/k} \otimes_R \kappa = \dim_{\kappa} \mathfrak{m}/\mathfrak{m}^2 + \text{trdeg}_k(\kappa) \geq \dim R + \text{trdeg}_k(\kappa) = \dim_{\mathfrak{q}} S$$

(see Lemma 10.112.3 for the last equality) with equality if and only if R is regular. Thus we win by applying Lemma 10.135.3. \square

Lemma 10.135.6. *Let $R \rightarrow S$ be a \mathbf{Q} -algebra map. Let $f \in S$ be such that $\Omega_{S/R} = Sdf \oplus C$ for some S -submodule C . Then*

- (1) *f is not nilpotent, and*
- (2) *if S is a Noetherian local ring, then f is a nonzerodivisor in S .*

Proof. For $a \in S$ write $d(a) = \theta(a)df + c(a)$ for some $\theta(a) \in S$ and $c(a) \in C$. Consider the R -derivation $S \rightarrow S$, $a \mapsto \theta(a)$. Note that $\theta(f) = 1$.

If $f^n = 0$ with $n > 1$ minimal, then $0 = \theta(f^n) = n f^{n-1}$ contradicting the minimality of n . We conclude that f is not nilpotent.

Suppose $fa = 0$. If f is a unit then $a = 0$ and we win. Assume f is not a unit. Then $0 = \theta(fa) = f\theta(a) + a$ by the Leibniz rule and hence $a \in (f)$. By induction suppose we have shown $fa = 0 \Rightarrow a \in (f^n)$. Then writing $a = f^n b$ we get $0 = \theta(f^{n+1}b) = (n+1)f^n b + f^{n+1}\theta(b)$. Hence $a = f^n b = -f^{n+1}\theta(b)/(n+1) \in (f^{n+1})$. Since in the Noetherian local ring S we have $\bigcap (f^n) = 0$, see Lemma 10.49.4 we win. \square

The following is probably quite useless in applications.

Lemma 10.135.7. *Let k be a field of characteristic 0. Let S be a finite type k -algebra. Let $\mathfrak{q} \subset S$ be a prime. The following are equivalent:*

- (1) *The algebra S is smooth at \mathfrak{q} over k .*
- (2) *The $S_{\mathfrak{q}}$ -module $\Omega_{S/k, \mathfrak{q}}$ is (finite) free.*
- (3) *The ring $S_{\mathfrak{q}}$ is regular.*

Proof. In characteristic zero any field extension is separable and hence the equivalence of (1) and (3) follows from Lemma 10.135.5. Also (1) implies (2) by definition of smooth algebras. Assume that $\Omega_{S/k, \mathfrak{q}}$ is free over $S_{\mathfrak{q}}$. We are going to use the notation and observations made in the proof of Lemma 10.135.5. So $R = S_{\mathfrak{q}}$ with maximal ideal \mathfrak{m} and residue field κ . Our goal is to prove R is regular.

If $\mathfrak{m}/\mathfrak{m}^2 = 0$, then $\mathfrak{m} = 0$ and $R \cong \kappa$. Hence R is regular and we win.

If $\mathfrak{m}/\mathfrak{m}^2 \neq 0$, then choose any $f \in \mathfrak{m}$ whose image in $\mathfrak{m}/\mathfrak{m}^2$ is not zero. By Lemma 10.135.4 we see that df has nonzero image in $\Omega_{R/k}/\mathfrak{m}\Omega_{R/k}$. By assumption $\Omega_{R/k} = \Omega_{S/k, \mathfrak{q}}$ is finite free and hence by Nakayama's Lemma 10.19.1 we see that df generates a direct summand. We apply Lemma 10.135.6 to deduce that f is a nonzerodivisor in R . Furthermore, by Lemma 10.127.9 we get an exact sequence

$$(f)/(f^2) \rightarrow \Omega_{R/k} \otimes_R R/fR \rightarrow \Omega_{(R/fR)/k} \rightarrow 0$$

This implies that $\Omega_{(R/fR)/k}$ is finite free as well. Hence by induction we see that R/fR is a regular local ring. Since $f \in \mathfrak{m}$ was a nonzerodivisor we conclude that R is regular, see Lemma 10.102.7. \square

Example 10.135.8. Lemma 10.135.7 does not hold in characteristic $p > 0$. The standard examples are the ring maps

$$\mathbf{F}_p \longrightarrow \mathbf{F}_p[x]/(x^p)$$

whose module of differentials is free but is clearly not smooth, and the ring map ($p > 2$)

$$\mathbf{F}_p(t) \rightarrow \mathbf{F}_p(t)[x, y]/(x^p + y^2 + \alpha)$$

which is not smooth at the prime $\mathfrak{q} = (y, x^p - \alpha)$ but is regular.

Using the material above we can characterize smoothness at the generic point in terms of field extensions.

Lemma 10.135.9. *Let $R \rightarrow S$ be an injective finite type ring map with R and S domains. Then $R \rightarrow S$ is smooth at $\mathfrak{q} = (0)$ if and only if $f.f.(R) \subset f.f.(S)$ is a separable extension of fields.*

Proof. Assume $R \rightarrow S$ is smooth at (0) . We may replace S by S_g for some nonzero $g \in S$ and assume that $R \rightarrow S$ is smooth. Set $K = f.f.(R)$. Then $K \rightarrow S \otimes_R K$ is smooth (Lemma 10.132.4). Moreover, for any field extension $K \subset K'$ the ring map $K' \rightarrow S \otimes_R K'$ is smooth as well. Hence $S \otimes_R K'$ is a regular ring by Lemma 10.135.3, in particular reduced. It follows that $S \otimes_R K$ is a geometrically reduced over K . Hence $f.f.(S)$ is geometrically reduced over K , see Lemma 10.42.3. Hence $f.f.(S)/K$ is separable by Lemma 10.43.1.

Conversely, assume that $f.f.(R) \subset f.f.(S)$ is separable. We may assume $R \rightarrow S$ is of finite presentation, see Lemma 10.29.1. It suffices to prove that $K \rightarrow S \otimes_R K$ is smooth at (0) , see Lemma 10.132.17. This follows from Lemma 10.135.5, the fact that a field is a regular ring, and the assumption that $f.f.(R) \rightarrow f.f.(S)$ is separable. \square

10.136. Smooth ring maps in the Noetherian case

Definition 10.136.1. Let $\varphi : B' \rightarrow B$ be a ring map. We say φ is a *small extension* if B' and B are local Artinian rings, φ is surjective and $I = \text{Ker}(\varphi)$ has length 1 as a B' -module.

Clearly this means that $I^2 = 0$ and that $I = (x)$ for some $x \in B'$ such that $\mathfrak{m}'x = 0$ where $\mathfrak{m}' \subset B'$ is the maximal ideal.

Lemma 10.136.2. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime ideal of S lying over $\mathfrak{p} \subset R$. Assume R is Noetherian and $R \rightarrow S$ of finite type. The following are equivalent:*

- (1) $R \rightarrow S$ is smooth at \mathfrak{q} ,
- (2) for every surjection of local R -algebras $(B', \mathfrak{m}') \rightarrow (B, \mathfrak{m})$ with $\text{Ker}(B' \rightarrow B)$ having square zero and every solid commutative diagram

such that $\mathfrak{q} = S \cap \mathfrak{m}$ there exists a dotted arrow making the diagram commute,

- (3) same as in (2) but with $B' \rightarrow B$ ranging over small extensions, and
- (4) same as in (2) but with $B' \rightarrow B$ ranging over small extensions such that in addition $S \rightarrow B$ induces an isomorphism $\kappa(\mathfrak{q}) \cong \kappa(\mathfrak{m})$.

Proof. Assume (1). This means there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is smooth. By Proposition 10.133.13 we know that $R \rightarrow S_g$ is formally smooth. Note that given any diagram as in (2) the map $S \rightarrow B$ factors automatically through $S_{\mathfrak{q}}$ and a fortiori through S_g . The formal smoothness of S_g over R gives us a morphism $S_g \rightarrow B'$ fitting into a similar diagram with S_g at the upper left corner. Composing with $S \rightarrow S_g$ gives the desired arrow. In other words, we have shown that (1) implies (2).

Clearly (2) implies (3) and (3) implies (4).

Assume (4). We are going to show that (1) holds, thereby finishing the proof of the lemma. Choose a presentation $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$. This is possible as S is of finite type over R and therefore of finite presentation (see Lemma 10.30.4). Set $I = (f_1, \dots, f_m)$. Consider the naive cotangent complex

$$d : I/I^2 \longrightarrow \bigoplus_{j=1}^m \text{Sd}x_j$$

of this presentation (see Section 10.129). It suffices to show that when we localize this complex at \mathfrak{q} then the map becomes a split injection, see Lemma 10.132.12. Denote $S' = R[x_1, \dots, x_n]/I^2$. By Lemma 10.127.11 we have

$$S \otimes_{S'} \Omega_{S'/R} = S \otimes_{R[x_1, \dots, x_n]} \Omega_{R[x_1, \dots, x_n]/R} = \bigoplus_{j=1}^m \text{Sd}x_j.$$

Thus the map

$$d : I/I^2 \longrightarrow S \otimes_{S'} \Omega_{S'/R}$$

is the same as the map in the naive cotangent complex above. In particular the truth of the assertion we are trying to prove depends only on the three rings $R \rightarrow S' \rightarrow S$. Let $\mathfrak{q}' \subset R[x_1, \dots, x_n]$ be the prime ideal corresponding to \mathfrak{q} . Since localization commutes with taking modules of differentials (Lemma 10.127.8) we see that it suffices to show that the map

$$(10.136.2.1) \quad d : I_{\mathfrak{q}'}/I_{\mathfrak{q}'}^2 \longrightarrow S_{\mathfrak{q}} \otimes_{S'_{\mathfrak{q}'}} \Omega_{S'_{\mathfrak{q}'}/R}$$

coming from $R \rightarrow S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is a split injection.

Let $N \in \mathbb{N}$ be an integer. Consider the ring

$$B'_N = S'_{\mathfrak{q}'}/(\mathfrak{q}')^N S'_{\mathfrak{q}'} = (S'/(\mathfrak{q}')^N S')_{\mathfrak{q}'}$$

and its quotient $B_N = B'_N/IB'_N$. Note that $B_N \cong S_{\mathfrak{q}}/\mathfrak{q}^N S_{\mathfrak{q}}$. Observe that B'_N is an Artinian local ring since it is the quotient of a local Noetherian ring by a

power of its maximal ideal. Consider a filtration of the kernel I_N of $B'_N \rightarrow B_N$ by B'_N -submodules

$$0 \subset J_{N,1} \subset J_{N,2} \subset \dots \subset J_{N,n(N)} = I_N$$

such that each successive quotient $J_{N,i}/J_{N,i-1}$ has length 1. (As B'_N is Artinian such a filtration exists.) This gives a sequence of small extensions

$$B'_N \rightarrow B'_N/J_{N,1} \rightarrow B'_N/J_{N,2} \rightarrow \dots \rightarrow B'_N/J_{N,n(N)} = B'_N/I_N = B_N = S_{\mathfrak{q}}/\mathfrak{q}^N S_{\mathfrak{q}}$$

Applying condition (4) successively to these small extensions starting with the map $S \rightarrow B_N$ we see there exists a commutative diagram

$$\begin{array}{ccc} S & \longrightarrow & B_N \\ \uparrow & \searrow & \uparrow \\ R & \longrightarrow & B'_N \end{array}$$

Clearly the ring map $S \rightarrow B'_N$ factors as $S \rightarrow S_{\mathfrak{q}} \rightarrow B'_N$ where $S_{\mathfrak{q}} \rightarrow B'_N$ is a local homomorphism of local rings. Moreover, since the maximal ideal of B'_N to the N th power is zero we conclude that $S_{\mathfrak{q}} \rightarrow B'_N$ factors through $S_{\mathfrak{q}}/(\mathfrak{q})^N S_{\mathfrak{q}} = B_N$. In other words we have shown that for all $N \in \mathbf{N}$ the surjection of R -algebras $B'_N \rightarrow B_N$ has a splitting.

Consider the presentation

$$I_N \rightarrow B_N \otimes_{B'_N} \Omega_{B'_N/R} \rightarrow \Omega_{B_N/R} \rightarrow 0$$

coming from the surjection $B'_N \rightarrow B_N$ with kernel I_N (see Lemma 10.127.9). By the above the R -algebra map $B'_N \rightarrow B_N$ has a right inverse. Hence by Lemma 10.127.10 we see that the sequence above is split exact! Thus for every N the map

$$I_N \longrightarrow B_N \otimes_{B'_N} \Omega_{B'_N/R}$$

is a split injection. The rest of the proof is gotten by unwinding what this means exactly. Note that

$$I_N = I_{\mathfrak{q}'} / (I_{\mathfrak{q}'}^2 + (\mathfrak{q}')^N \cap I_{\mathfrak{q}'})$$

By Artin-Rees (Lemma 10.49.2) we find a $c \geq 0$ such that

$$S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} I_N = S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} I_{\mathfrak{q}'} / I_{\mathfrak{q}'}^2$$

for all $N \geq c$ (these tensor product are just a fancy way of dividing by \mathfrak{q}^{N-c}). We may of course assume $c \geq 1$. By Lemma 10.127.11 we see that

$$S'_{\mathfrak{q}'} / (\mathfrak{q}')^{N-c} S'_{\mathfrak{q}'} \otimes_{S'_{\mathfrak{q}'}} \Omega_{B'_N/R} = S'_{\mathfrak{q}'} / (\mathfrak{q}')^{N-c} S'_{\mathfrak{q}'} \otimes_{S'_{\mathfrak{q}'}} \Omega_{S'_{\mathfrak{q}'}/R}$$

we can further tensor this by $B_N = S_{\mathfrak{q}}/\mathfrak{q}^N$ to see that

$$S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S'_{\mathfrak{q}'}} \Omega_{B'_N/R} = S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S'_{\mathfrak{q}'}} \Omega_{S'_{\mathfrak{q}'}/R}.$$

Since a split injection remains a split injection after tensoring with anything we see that

$$S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} (10.136.2.1) = S_{\mathfrak{q}}/\mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} (I_N \longrightarrow B_N \otimes_{B'_N} \Omega_{B'_N/R})$$

is a split injection for all $N \geq c$. By Lemma 10.71.1 we see that (10.136.2.1) is a split injection. This finishes the proof. \square

10.137. Overview of results on smooth ring maps

Here is a list of results on smooth ring maps that we proved in the preceding sections. For more precise statements and definitions please consult the references given.

- (1) A ring map $R \rightarrow S$ is smooth if it is of finite presentation and the naive cotangent complex of S/R is quasi-isomorphic to a finite projective S -module in degree 0, see Definition 10.132.1.
- (2) If S is smooth over R , then $\Omega_{S/R}$ is a finite projective S -module, see discussion following Definition 10.132.1.
- (3) The property of being smooth is local on S , see Lemma 10.132.13.
- (4) The property of being smooth is stable under base change, see Lemma 10.132.4.
- (5) The property of being smooth is stable under composition, see Lemma 10.132.14.
- (6) A smooth ring map is syntomic, in particular flat, see Lemma 10.132.10.
- (7) A finitely presented, flat ring map with smooth fibre rings is smooth, see Lemma 10.132.16.
- (8) A finitely presented ring map $R \rightarrow S$ is smooth if and only if it is formally smooth, see Proposition 10.133.13.
- (9) If $R \rightarrow S$ is a finite type ring map with R Noetherian then to check that $R \rightarrow S$ is smooth it suffices to check the lifting property of formal smoothness along small extensions of Artinian local rings, see Lemma 10.136.2.
- (10) A smooth ring map $R \rightarrow S$ is the base change of a smooth ring map $R_0 \rightarrow S_0$ with R_0 of finite type over \mathbf{Z} , see Lemma 10.133.14.
- (11) Formation of the set of points where a ring map is smooth commutes with flat base change, see Lemma 10.132.17.
- (12) If S is of finite type over an algebraically closed field k , and $\mathfrak{m} \subset S$ a maximal ideal, then the following are equivalent
 - (a) S is smooth over k in a neighbourhood of \mathfrak{m} ,
 - (b) $S_{\mathfrak{m}}$ is a regular local ring,
 - (c) $\dim(S_{\mathfrak{m}}) = \dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m})$.
 see Lemma 10.135.2.
- (13) If S is of finite type over a field k , and $\mathfrak{q} \subset S$ a prime ideal, then the following are equivalent
 - (a) S is smooth over k in a neighbourhood of \mathfrak{q} ,
 - (b) $\dim_{\mathfrak{q}}(S/k) = \dim_{\kappa(\mathfrak{q})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{q})$.
 see Lemma 10.135.3.
- (14) If S is smooth over a field, then all its local rings are regular, see Lemma 10.135.3.
- (15) If S is of finite type over a field k , $\mathfrak{q} \subset S$ a prime ideal, the field extension $k \subset \kappa(\mathfrak{q})$ is separable and $S_{\mathfrak{q}}$ is regular, then S is smooth over k at \mathfrak{q} , see Lemma 10.135.5.
- (16) If S is of finite type over a field k , if k has characteristic 0, if $\mathfrak{q} \subset S$ a prime ideal, and if $\Omega_{S/k, \mathfrak{q}}$ is free, then S is smooth over k at \mathfrak{q} , see Lemma 10.135.7.

Some of these results were proved using the notion of a standard smooth ring map, see Definition 10.132.6. This is the analogue of what a relative global complete intersection map is for the case of syntomic morphisms. It is also the easiest way to make examples.

10.138. Étale ring maps

An étale ring map is a smooth ring map whose relative dimension is equal to zero. This is the same as the following slightly more direct definition.

Definition 10.138.1. Let $R \rightarrow S$ be a ring map. We say $R \rightarrow S$ is *étale* if it is of finite presentation and the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to zero. Given a prime \mathfrak{q} of S we say that $R \rightarrow S$ is *étale at \mathfrak{q}* if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is étale.

In particular we see that $\Omega_{S/R} = 0$ if S is étale over R . If $R \rightarrow S$ is smooth, then $R \rightarrow S$ is étale if and only if $\Omega_{S/R} = 0$. From our results on smooth ring maps we automatically get a whole host of results for étale maps. We summarize these in Lemma 10.138.3 below. But before we do so we prove that *any* étale ring map is standard smooth.

Lemma 10.138.2. *Any étale ring map is standard smooth. More precisely, if $R \rightarrow S$ is étale, then there exists a presentation $S = R[x_1, \dots, x_n]/(f_1, \dots, f_n)$ such that the image of $\det(\partial f_j/\partial x_i)$ is invertible in S .*

Proof. Let $R \rightarrow S$ be étale. Choose a presentation $S = R[x_1, \dots, x_n]/I$. As $R \rightarrow S$ is étale we know that

$$d : I/I^2 \longrightarrow \bigoplus_{i=1, \dots, n} S dx_i$$

is an isomorphism, in particular I/I^2 is a free S -module. Thus by Lemma 10.131.6 we may assume (after possibly changing the presentation), that $I = (f_1, \dots, f_c)$ such that the classes $f_i \bmod I^2$ form a basis of I/I^2 . It follows immediately from the fact that the displayed map above is an isomorphism that $c = n$ and that $\det(\partial f_j/\partial x_i)$ is invertible in S . \square

Lemma 10.138.3. *Results on étale ring maps.*

- (1) *The ring map $R \rightarrow R_f$ is étale for any ring R and any $f \in R$.*
- (2) *Compositions of étale ring maps are étale.*
- (3) *A base change of an étale ring map is étale.*
- (4) *The property of being étale is local: Given a ring map $R \rightarrow S$ and elements $g_1, \dots, g_m \in S$ which generate the unit ideal such that $R \rightarrow S_{g_j}$ is étale for $j = 1, \dots, m$ then $R \rightarrow S$ is étale.*
- (5) *Given $R \rightarrow S$ of finite presentation, and a flat ring map $R \rightarrow R'$, set $S' = R' \otimes_R S$. The set of primes where $R \rightarrow S'$ is étale is the inverse image via $\text{Spec}(S') \rightarrow \text{Spec}(S)$ of the set of primes where $R \rightarrow S$ is étale.*
- (6) *An étale ring map is syntomic, in particular flat.*
- (7) *If S is finite type over a field k , then S is étale over k if and only if $\Omega_{S/k} = 0$.*
- (8) *Any étale ring map $R \rightarrow S$ is the base change of an étale ring map $R_0 \rightarrow S_0$ with R_0 of finite type over \mathbf{Z} .*

- (9) Let $A = \operatorname{colim} A_i$ be a filtered colimit of rings. Let $A \rightarrow B$ be an étale ring map. Then there exists an étale ring map $A_i \rightarrow B_i$ for some i such that $B \cong A \otimes_{A_i} B_i$.
- (10) Let A be a ring. Let S be a multiplicative subset of A . Let $S^{-1}A \rightarrow B'$ be étale. Then there exists an étale ring map $A \rightarrow B$ such that $B' \cong S^{-1}B$.

Proof. In each case we use the corresponding result for smooth ring maps with a small argument added to show that $\Omega_{S/R}$ is zero.

Proof of (1). The ring map $R \rightarrow R_f$ is smooth and $\Omega_{R_f/R} = 0$.

Proof of (2). The composition $A \rightarrow C$ of smooth maps $A \rightarrow B$ and $B \rightarrow C$ is smooth, see Lemma 10.132.14. By Lemma 10.127.7 we see that $\Omega_{C/A}$ is zero as both $\Omega_{C/B}$ and $\Omega_{B/A}$ are zero.

Proof of (3). Let $R \rightarrow S$ be étale and $R \rightarrow R'$ be arbitrary. Then $R' \rightarrow S' = R' \otimes_R S$ is smooth, see Lemma 10.132.4. Since $\Omega_{S'/R'} = S' \otimes_S \Omega_{S/R}$ by Lemma 10.127.12 we conclude that $\Omega_{S'/R'} = 0$. Hence $R' \rightarrow S'$ is étale.

Proof of (4). Assume the hypotheses of (4). By Lemma 10.132.13 we see that $R \rightarrow S$ is smooth. We are also given that $\Omega_{S_{g_i}/R} = (\Omega_{S/R})_{g_i} = 0$ for all i . Then $\Omega_{S/R} = 0$, see Lemma 10.23.2.

Proof of (5). The result for smooth maps is Lemma 10.132.17. In the proof of that lemma we used that $NL_{S/R} \otimes_S S'$ is homotopy equivalent to $NL_{S'/R'}$. This reduces us to showing that if M is a finitely presented S -module the set of primes \mathfrak{q}' of S' such that $(M \otimes_S S')_{\mathfrak{q}'} = 0$ is the inverse image of the set of primes \mathfrak{q} of S such that $M_{\mathfrak{q}} = 0$. This is true (proof omitted).

Proof of (6). Follows directly from the corresponding result for smooth ring maps (Lemma 10.132.10).

Proof of (7). Follows from Lemma 10.135.3 and the definitions.

Proof of (8). Lemma 10.133.14 gives the result for smooth ring maps. The resulting smooth ring map $R_0 \rightarrow S_0$ satisfies the hypotheses of Lemma 10.126.8, and hence we may replace S_0 by the factor of relative dimension 0 over R_0 .

Proof of (9). Follows from (8) since $R_0 \rightarrow A$ will factor through A_i for some i .

Proof of (10). Follows from (9), (1), and (2) since $S^{-1}A$ is a filtered colimit of principal localizations of A . \square

Next we work out in more detail what it means to be étale over a field.

Lemma 10.138.4. *Let k be a field. A ring map $k \rightarrow S$ is étale if and only if S is isomorphic as a k -algebra to a finite product of finite separable extensions of k .*

Proof. If $k \rightarrow k'$ is a finite separable field extension then we can write $k' = k(\alpha) \cong k[x]/(f)$. Here f is the minimal polynomial of the element α . Since k' is separable over k we have $\gcd(f, f') = 1$. This implies that $d : k' \cdot f \rightarrow k' \cdot dx$ is an isomorphism. Hence $k \rightarrow k'$ is étale.

Conversely, suppose that $k \rightarrow S$ is étale. Let \bar{k} be an algebraic closure of k . Then $S \otimes_k \bar{k}$ is étale over \bar{k} . Suppose we have the result over \bar{k} . Then $S \otimes_k \bar{k}$ is reduced and hence S is reduced. Also, $S \otimes_k \bar{k}$ is finite over \bar{k} and hence S is finite over k . Hence S is a finite product $S = \prod k_i$ of fields, see Lemma 10.51.2 and Proposition 10.59.6. The result over \bar{k} means $S \otimes_k \bar{k}$ is isomorphic to a finite product of copies

of \bar{k} , which implies that each $k \subset k_i$ is finite separable, see for example Lemmas 10.43.1 and 10.43.3. Thus we have reduced to the case $k = \bar{k}$. In this case Lemma 10.135.2 (combined with $\Omega_{S/k} = 0$) we see that $S_{\mathfrak{m}} \cong k$ for all maximal ideals $\mathfrak{m} \subset S$. This implies the result because S is the product of the localizations at its maximal ideals by Lemma 10.51.2 and Proposition 10.59.6 again. \square

Lemma 10.138.5. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over \mathfrak{p} in R . If S/R is étale at \mathfrak{q} then*

- (1) *we have $\mathfrak{p}S_{\mathfrak{q}} = \mathfrak{q}S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and*
- (2) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable.*

Proof. First we may replace S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ and assume that $R \rightarrow S$ is étale. Then the lemma follows from Lemma 10.138.4 by unwinding the fact that $S \otimes_R \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$. \square

Lemma 10.138.6. *An étale ring map is quasi-finite.*

Proof. Let $R \rightarrow S$ be an étale ring map. By definition $R \rightarrow S$ is of finite type. For any prime $\mathfrak{p} \subset R$ the fibre ring $S \otimes_R \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$ and hence a finite product of fields finite separable over $\kappa(\mathfrak{p})$, in particular finite over $\kappa(\mathfrak{p})$. Thus $R \rightarrow S$ is quasi-finite by Lemma 10.118.4. \square

Lemma 10.138.7. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over a prime \mathfrak{p} of R . If*

- (1) *$R \rightarrow S$ is of finite presentation,*
- (2) *$R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat*
- (3) *$\mathfrak{p}S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and*
- (4) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable,*

then $R \rightarrow S$ is étale at \mathfrak{q} .

Proof. Apply Lemma 10.118.2 to find a $g \in S$, $g \notin \mathfrak{q}$ such that \mathfrak{q} is the only prime of S_g lying over \mathfrak{p} . We may and do replace S by S_g . Then $S \otimes_R \kappa(\mathfrak{p})$ has a unique prime, hence is a local ring, hence is equal to $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \cong \kappa(\mathfrak{q})$. By Lemma 10.132.16 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is smooth. Replace S by S_g again we may assume that $R \rightarrow S$ is smooth. By Lemma 10.132.10 we may even assume that $R \rightarrow S$ is standard smooth, say $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$. Since $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$ has dimension 0 we conclude that $n = c$, i.e., if $R \rightarrow S$ is étale. \square

Lemma 10.138.8. *A ring map is étale if and only if it is flat, unramified, and of finite presentation.*

Proof. This follows by combining Lemmas 10.138.3 (flatness of étale maps), 10.138.5 (étale maps are unramified), and 10.138.7 (flat and unramified maps of finite presentation are étale). \square

Here is a completely new phenomenon.

Lemma 10.138.9. *Let $R \rightarrow S$ and $R \rightarrow S'$ be étale. Then any R -algebra map $S' \rightarrow S$ is étale.*

Proof. First of all we note that $S' \rightarrow S$ is of finite presentation by Lemma 10.6.2. Let $\mathfrak{q} \subset S$ be a prime ideal lying over the primes $\mathfrak{q}' \subset S'$ and $\mathfrak{p} \subset R$. By Lemma 10.138.5 the ring map $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} \rightarrow S'_{\mathfrak{q}'}/\mathfrak{p}S'_{\mathfrak{q}'}$ is a map finite separable extensions of

$\kappa(\mathfrak{p})$. In particular it is flat. Hence by Lemma 10.124.8 we see that $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is flat. Thus $S' \rightarrow S$ is flat. Moreover, the above also shows that $\mathfrak{q}'S_{\mathfrak{q}}$ is the maximal ideal of $S_{\mathfrak{q}}$ and that the residue field extension of $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is finite separable. Hence from Lemma 10.138.7 we conclude that $S' \rightarrow S$ is étale at \mathfrak{q} . Since being étale is local (see Lemma 10.138.3) we win. \square

Lemma 10.138.10. *Let $\varphi : R \rightarrow S$ be a ring map. If $R \rightarrow S$ is surjective, flat and finitely presented then there exist an idempotent $e \in R$ such that $S = R_e$.*

Proof. Since $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is a homeomorphism onto a closed subset (see Lemma 10.16.7) and is open (see Proposition 10.40.8) we see that the image is $D(e)$ for some idempotent $e \in R$ (see Lemma 10.20.3). Thus $R_e \rightarrow S$ induces a bijection on spectra. Now this map induces an isomorphism on all local rings for example by Lemmas 10.75.4 and 10.19.1. Then it follows that $R_e \rightarrow S$ is also injective, for example see Lemma 10.23.1. \square

Lemma 10.138.11. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \rightarrow \bar{S}$ be an étale ring map. Then there exists an étale ring map $R \rightarrow S$ such that $\bar{S} \cong S/IS$ as R/I -algebras.*

Proof. By Lemma 10.138.2 we can write $\bar{S} = (R/I)[x_1, \dots, x_n]/(\bar{f}_1, \dots, \bar{f}_n)$ as in Definition 10.132.6 with $\bar{\Delta} = \det(\frac{\partial \bar{f}_i}{\partial x_j})_{i,j=1, \dots, n}$ invertible in \bar{S} . Just take some lifts f_i and set $S = R[x_1, \dots, x_n, x_{n+1}]/(f_1, \dots, f_c, x_{n+1}\Delta - 1)$ where $\Delta = \det(\frac{\partial f_i}{\partial x_j})_{i,j=1, \dots, c}$ as in Example 10.132.8. This proves the lemma. \square

Lemma 10.138.12. *Consider a commutative diagram*

$$\begin{array}{ccccccc} 0 & \longrightarrow & J & \longrightarrow & B' & \longrightarrow & B & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I & \longrightarrow & A' & \longrightarrow & A & \longrightarrow & 0 \end{array}$$

with exact rows where $B' \rightarrow B$ and $A' \rightarrow A$ are surjective ring maps whose kernels are ideals of square zero. If $A \rightarrow B$ is étale, and $J = I \otimes_A B$, then $A' \rightarrow B'$ is étale.

Proof. By Lemma 10.138.11 there exists an étale ring map $A' \rightarrow C$ such that $C/IC = B$. Then $A' \rightarrow C$ is formally smooth (by Proposition 10.133.13) hence we get an A' -algebra map $\varphi : C \rightarrow B'$. Since $A' \rightarrow C$ is flat we have $I \otimes_A B = I \otimes_A C/IC = IC$. Hence the assumption that $J = I \otimes_A B$ implies that φ induces an isomorphism $IC \rightarrow J$ and an isomorphism $C/IC \rightarrow B'/IB'$, whence φ is an isomorphism. \square

Example 10.138.13. Let $n, m \geq 1$ be integers. Consider the ring map

$$\begin{array}{lcl} R = \mathbf{Z}[a_1, \dots, a_{n+m}] & \longrightarrow & S = \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m] \\ a_1 & \longmapsto & b_1 + c_1 \\ a_2 & \longmapsto & b_2 + b_1c_1 + c_2 \\ \dots & \dots & \dots \\ a_{n+m} & \longmapsto & b_n c_m \end{array}$$

of Example 10.131.7. Write symbolically

$$S = R[b_1, \dots, c_m]/(\{a_k(b_i, c_j) - a_k\}_{k=1, \dots, n+m})$$

where for example $a_1(b_i, c_j) = b_1 + c_1$. The matrix of partial derivatives is

$$\begin{pmatrix} 1 & c_1 & \dots & c_m & 0 & \dots & 0 \\ 0 & 1 & c_1 & \dots & c_m & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & 0 & 1 & c_1 & \dots & c_m \\ 1 & b_1 & \dots & b_n & 0 & \dots & 0 \\ 0 & 1 & b_1 & \dots & b_n & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & 0 & 1 & b_1 & \dots & b_n \end{pmatrix}$$

The determinant Δ of this matrix is better known as the *resultant* of the polynomials $g = x^n + b_1x^{n-1} + \dots + b_n$ and $h = x^m + c_1x^{m-1} + \dots + c_m$, and the matrix above is known as the *Sylvester matrix* associated to g, h . In a formula $\Delta = \text{Res}_x(g, h)$. The Sylvester matrix is the transpose of the matrix of the linear map

$$\begin{aligned} S[x]_{<m} \oplus S[x]_{<n} &\longrightarrow S[x]_{<n+m} \\ a \oplus b &\longmapsto ag + bh \end{aligned}$$

Let $\mathfrak{q} \subset S$ be any prime. By the above the following are equivalent:

- (1) $R \rightarrow S$ is étale at \mathfrak{q} ,
- (2) $\Delta = \text{Res}_x(g, h) \notin \mathfrak{q}$,
- (3) the images $\bar{g}, \bar{h} \in \kappa(\mathfrak{q})[x]$ of the polynomials g, h are relatively prime in $\kappa(\mathfrak{q})[x]$.

The equivalence of (2) and (3) holds because the image of the Sylvester matrix in $\text{Mat}(n+m, \kappa(\mathfrak{q}))$ has a kernel if and only if the polynomials \bar{g}, \bar{h} have a factor in common. We conclude that the ring map

$$R \longrightarrow S\left[\frac{1}{\Delta}\right] = S\left[\frac{1}{\text{Res}_x(g, h)}\right]$$

is étale.

Lemma 10.138.2 tells us that it does not really make sense to define a standard étale morphism to be a standard smooth morphism of relative dimension 0. As a model for an étale morphism we take the example given by a finite separable extension $k \subset k'$ of fields. Namely, we can always find an element $\alpha \in k'$ such that $k' = k(\alpha)$ and such that the minimal polynomial $f(x) \in k[x]$ of α has derivative f' which is relatively prime to f .

Definition 10.138.14. Let R be a ring. Let $g, f \in R[x]$. Assume that f is monic and the derivative f' is invertible in the localization $R[x]_g/(f)$. In this case the ring map $R \rightarrow R[x]_g/(f)$ is said to be *standard étale*.

Lemma 10.138.15. Let $R \rightarrow R[x]_g/(f)$ be standard étale.

- (1) The ring map $R \rightarrow R[x]_g/(f)$ is étale.
- (2) For any ring map $R \rightarrow R'$ the base change $R' \rightarrow R'[x]_g/(f)$ of the standard étale ring map $R \rightarrow R[x]_g/(f)$ is standard étale.
- (3) Any principal localization of $R[x]_g/(f)$ is standard étale over R .
- (4) A composition of standard étale maps is **not** standard étale in general.

Proof. Omitted. Here is an example for (4). The ring map $\mathbf{F}_2 \rightarrow \mathbf{F}_{2^2}$ is standard étale. The ring map $\mathbf{F}_{2^2} \rightarrow \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2}$ is standard étale. But the ring map $\mathbf{F}_2 \rightarrow \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2}$ is not standard étale. \square

Standard étale morphisms are a convenient way to produce étale maps. Here is an example.

Lemma 10.138.16. *Let R be a ring. Let \mathfrak{p} be a prime of R . Let $\kappa(\mathfrak{p}) \subset L$ be a finite separable field extension. There exists an étale ring map $R \rightarrow R'$ together with a prime \mathfrak{p}' lying over \mathfrak{p} such that the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{p}')$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$.*

Proof. By the theorem of the primitive element we may write $L = \kappa(\mathfrak{p})[\alpha]$. Let $\bar{f} \in \kappa(\mathfrak{p})[x]$ denote the minimal polynomial for α (in particular this is monic). After replacing α by $c\alpha$ for some $c \in R$, $c \notin \mathfrak{p}$ we may assume all the coefficients of \bar{f} are in the image of $R \rightarrow \kappa(\mathfrak{p})$ (verification omitted). Thus we can find a monic polynomial $f \in R[x]$ which maps to \bar{f} in $\kappa(\mathfrak{p})[x]$. Since $\kappa(\mathfrak{p}) \subset L$ is separable, we see that $\gcd(\bar{f}, \bar{f}') = 1$. Hence there is an element $\gamma \in L$ such that $\bar{f}'(\alpha)\gamma = 1$. Thus we get a R -algebra map

$$\begin{aligned} R[x, 1/f']/(f) &\longrightarrow L \\ x &\longmapsto \alpha \\ 1/f' &\longmapsto \gamma \end{aligned}$$

The left hand side is a standard étale algebra R' over R and the kernel of the ring map gives the desired prime. \square

Proposition 10.138.17. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \rightarrow S$ is étale at \mathfrak{q} , then there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is standard étale.*

Proof. The following proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 10.138.1 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is étale. Thus we may assume that S is étale over R .

Step 2. By Lemma 10.138.3 there exists an étale ring map $R_0 \rightarrow S_0$ with R_0 of finite type over \mathbf{Z} , and a ring map $R_0 \rightarrow R$ such that $R = R \otimes_{R_0} S_0$. Denote \mathfrak{q}_0 the prime of S_0 corresponding to \mathfrak{q} . If we show the result for $(R_0 \rightarrow S_0, \mathfrak{q}_0)$ then the result follows for $(R \rightarrow S, \mathfrak{q})$ by base change. Hence we may assume that R is Noetherian.

Step 3. Note that $R \rightarrow S$ is quasi-finite by Lemma 10.138.6. By Lemma 10.119.15 there exists a finite ring map $R \rightarrow S'$, an R -algebra map $S' \rightarrow S$, an element $g' \in S'$ such that $g' \notin \mathfrak{q}$ such that $S' \rightarrow S$ induces an isomorphism $S'_{g'} \cong S_{g'}$. (Note that of course S' is not étale over R in general.) Thus we may assume that (a) R is Noetherian, (b) $R \rightarrow S$ is finite and (c) $R \rightarrow S$ is étale at \mathfrak{q} (but no longer necessarily étale at all primes).

Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to \mathfrak{q} . Consider the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 10.51.2) and so a finite product of local rings

$$S \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1}^n A_i$$

see Proposition 10.59.6. One of the factors, say A_1 , is the local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 10.138.5. The other factors correspond to the other primes, say $\mathfrak{q}_2, \dots, \mathfrak{q}_n$ of S lying over \mathfrak{p} .

Step 5. We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha = 0$). Note that for any $\lambda \in \kappa(\mathfrak{p})^*$ the element $\lambda\alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$\bar{t} = (\alpha, 0, \dots, 0) \in \prod_{i=1}^n A_i = S \otimes_R \kappa(\mathfrak{p}).$$

After possibly replacing α by $\lambda\alpha$ as above we may assume that \bar{t} is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the R -algebra map $R[x] \rightarrow S$ which maps x to t . Set $S' = R[x]/I$, so $S' \subset S$. Here is a diagram

$$\begin{array}{ccccc} R[x] & \longrightarrow & S' & \longrightarrow & S \\ & \nearrow & \nearrow & \nearrow & \\ R & & & & \end{array}$$

By construction the primes \mathfrak{q}_j , $j \geq 2$ of S all lie over the prime (\mathfrak{p}, x) of $R[x]$, whereas the prime \mathfrak{q} lies over a different prime of $R[x]$ because $\alpha \neq 0$.

Step 6. Denote $\mathfrak{q}' \subset S'$ the prime of S' corresponding to \mathfrak{q} . By the above \mathfrak{q} is the only prime of S lying over \mathfrak{q}' . Thus we see that $S_{\mathfrak{q}} = S_{\mathfrak{q}'}$, see Lemma 10.40.11 (we have going up for $S' \rightarrow S$ by Lemma 10.35.20 since $S' \rightarrow S$ is finite as $R \rightarrow S$ is finite). It follows that $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is finite and injective as the localization of the finite injective ring map $S' \rightarrow S$. Consider the maps of local rings

$$R_{\mathfrak{p}} \rightarrow S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$$

The second map is finite and injective. We have $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} = \kappa(\mathfrak{q})$, see Lemma 10.138.5. Hence a fortiori $S_{\mathfrak{q}}/\mathfrak{q}'S_{\mathfrak{q}} = \kappa(\mathfrak{q})$. Since

$$\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}') \subset \kappa(\mathfrak{q})$$

and since α is in the image of $\kappa(\mathfrak{q}')$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa(\mathfrak{q}') = \kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 10.19.1 applied to the $S'_{\mathfrak{q}'}$ -module map $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$, the map $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is surjective. In other words, $S'_{\mathfrak{q}'} \cong S_{\mathfrak{q}}$.

Step 7. By Lemma 10.122.7 there exist $g \in S$, $g \notin \mathfrak{q}$ and $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S'_{g'} \cong S_g$. As R is Noetherian the ring S' is finite over R because it is an R -submodule of the finite R -module S . Hence after replacing S by S' we may assume that (a) R is Noetherian, (b) S finite over R , (c) S is étale over R at \mathfrak{q} , and (d) $S = R[x]/I$.

Step 8. Consider the ring $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]/\bar{I}$ where $\bar{I} = I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by I in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\bar{I} = (\bar{h})$ for some monic $\bar{h} \in \kappa(\mathfrak{p})$. After replacing \bar{h} by $\lambda \cdot \bar{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that \bar{h} is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose h monic.) Also, as in Step 4 we know that $S \otimes_R \kappa(\mathfrak{p}) = A_1 \times \dots \times A_n$ with $A_1 = \kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and A_2, \dots, A_n local. This implies that

$$\bar{h} = \bar{h}_1 \bar{h}_2^{e_2} \dots \bar{h}_n^{e_n}$$

for certain pairwise coprime irreducible monic polynomials $\bar{h}_i \in \kappa(\mathfrak{p})[x]$ and certain $e_2, \dots, e_n \geq 1$. Here the numbering is chosen so that $A_i = \kappa(\mathfrak{p})[x]/(\bar{h}_i^{e_i})$ as $\kappa(\mathfrak{p})[x]$ -algebras. Note that \bar{h}_1 is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \rightarrow R[x]/I$ is finite hence integral. Denote \bar{m} the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$\bar{m} = \bar{k} \bar{h}_1^{d_1} \bar{h}_2^{d_2} \dots \bar{h}_n^{d_n}$$

for some $d_1 \geq 1$, $d_j \geq e_j$, $j = 2, \dots, n$ and $\bar{k} \in \kappa(\mathfrak{p})[x]$ prime to all the \bar{h}_i . Set $f = m^l + h$ where $l \deg(m) > \deg(h)$, and $l \geq 2$. Then f is monic as a polynomial over R . Also, the image \bar{f} of f in $\kappa(\mathfrak{p})[x]$ factors as

$$\bar{f} = \bar{h}_1 \bar{h}_2^{e_2} \dots \bar{h}_n^{e_n} + \bar{k}^l \bar{h}_1^{ld_1} \bar{h}_2^{ld_2} \dots \bar{h}_n^{ld_n} = \bar{h}_1 (\bar{h}_2^{e_2} \dots \bar{h}_n^{e_n} + \bar{k}^l \bar{h}_1^{ld_1-1} \bar{h}_2^{ld_2} \dots \bar{h}_n^{ld_n}) = \bar{h}_1 \bar{w}$$

with \bar{w} a polynomial relatively prime to \bar{h}_1 . Set $g = f'$ (the derivative with respect to x).

Step 10. The ring map $R[x] \rightarrow S = R[x]/I$ has the properties: (1) it maps f to zero, and (2) it maps g to an element of $S \setminus \mathfrak{q}$. The first assertion is clear since f is an element of I . For the second assertion we just have to show that g does not map to zero in $\kappa(\mathfrak{q}) = \kappa(\mathfrak{p})[x]/(\bar{h}_1)$. The image of g in $\kappa(\mathfrak{p})[x]$ is the derivative of \bar{f} . Thus (2) is clear because

$$\bar{g} = \frac{d\bar{f}}{dx} = \bar{w} \frac{d\bar{h}_1}{dx} + \bar{h}_1 \frac{d\bar{w}}{dx},$$

\bar{w} is prime to \bar{h}_1 and \bar{h}_1 is separable.

Step 11. We conclude that $\varphi : R[x]/(f) \rightarrow S$ is a surjective ring map, $R[x]_g/(f)$ is étale over R (because it is standard étale, see Lemma 10.138.15) and $\varphi(g) \notin \mathfrak{q}$. Pick an element $g' \in R[x]/(f)$ such that also $\varphi(g') \notin \mathfrak{q}$ and $S_{\varphi(g')}$ is étale over R (which exists since S is étale over R at \mathfrak{q}). Then the ring map $R[x]_{gg'}/(f) \rightarrow S_{\varphi(g')}$ is a surjective map of étale algebras over R . Hence it is étale by Lemma 10.138.9. Hence it is a localization by Lemma 10.138.10. Thus a localization of S at an element not in \mathfrak{q} is isomorphic to a localization of a standard étale algebra over R which is what we wanted to show. \square

The following two lemmas say that the étale topology is coarser than the topology generated by Zariski coverings and finite flat morphisms. They should be skipped on a first reading.

Lemma 10.138.18. *Let $R \rightarrow S$ be a standard étale morphism. There exists a ring map $R \rightarrow S'$ with the following properties*

- (1) $R \rightarrow S'$ is finite, finitely presented, and flat (in other words S' is finite projective as an R -module),
- (2) $\text{Spec}(S') \rightarrow \text{Spec}(R)$ is surjective,
- (3) for every prime $\mathfrak{q} \subset S$, lying over $\mathfrak{p} \subset R$ and every prime $\mathfrak{q}' \subset S'$ lying over \mathfrak{p} there exists a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that the ring map $R \rightarrow S'_{g'}$ factors through a map $\varphi : S \rightarrow S'_{g'}$ with $\varphi^{-1}(\mathfrak{q}' S'_{g'}) = \mathfrak{q}$.

Proof. Let $S = R[x]_g/(f)$ be a presentation of S as in Definition 10.138.14. Write $f = x^n + a_1x^{n-1} + \dots + a_n$ with $a_i \in R$. By Lemma 10.131.9 there exists a finite locally free and faithfully flat ring map $R \rightarrow S'$ such that $f = \prod(x - \alpha_i)$ for certain $\alpha_i \in S'$. Hence $R \rightarrow S'$ satisfies conditions (1), (2). Let $\mathfrak{q} \subset R[x]_g/(f)$ be a prime ideal with $g \notin \mathfrak{q}$ (i.e., it corresponds to a prime of S). Let $\mathfrak{p} = R \cap \mathfrak{q}$ and let $\mathfrak{q}' \subset S'$ be a prime lying over \mathfrak{p} . Note that there are n maps of R -algebras

$$\begin{aligned} \varphi_i : R[x]_g/(f) &\longrightarrow S' \\ x &\longmapsto \alpha_i \end{aligned}$$

To finish the proof we have to show that for some i we have (a) the image of $\varphi_i(g)$ in $\kappa(\mathfrak{q}')$ is not zero, and (b) $\varphi_i^{-1}(\mathfrak{q}') = \mathfrak{q}$. Because then we can just take $g' = \varphi_i(g)$, and $\varphi = \varphi_i$ for that i .

Let \bar{f} denote the image of f in $\kappa(\mathfrak{p})[x]$. Note that as a point of $\text{Spec}(\kappa(\mathfrak{p})[x]/(\bar{f}))$ the prime \mathfrak{q} corresponds to an irreducible factor f_1 of \bar{f} . Moreover, $g \notin \mathfrak{q}$ means that f_1 does not divide the image \bar{g} of g in $\kappa(\mathfrak{p})[x]$. Denote $\bar{\alpha}_1, \dots, \bar{\alpha}_n$ the images of $\alpha_1, \dots, \alpha_n$ in $\kappa(\mathfrak{q}')$. Note that the polynomial \bar{f} splits completely in $\kappa(\mathfrak{q}')[x]$, namely

$$\bar{f} = \prod_i (x - \bar{\alpha}_i)$$

Moreover $\varphi_i(g)$ reduces to $\bar{g}(\bar{\alpha}_i)$. It follows we may pick i such that $f_1(\bar{\alpha}_i) = 0$ and $\bar{g}(\bar{\alpha}_i) \neq 0$. For this i properties (a) and (b) hold. Some details omitted. \square

Lemma 10.138.19. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is étale, and
- (2) $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective.

Then there exists a ring map $R \rightarrow S'$ such that

- (1) $R \rightarrow S'$ is finite, finitely presented, and flat (in other words it is finite projective as an R -module),
- (2) $\text{Spec}(S') \rightarrow \text{Spec}(R)$ is surjective,
- (3) for every prime $\mathfrak{q}' \subset S'$ there exists a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that the ring map $R \rightarrow S'_{g'}$ factors as $R \rightarrow S \rightarrow S'_{g'}$.

Proof. By Proposition 10.138.17 and the quasi-compactness of $\text{Spec}(S)$ (see Lemma 10.16.10) we can find $g_1, \dots, g_n \in S$ generating the unit ideal of S such that each $R \rightarrow S_{g_i}$ is standard étale. If we prove the lemma for the ring map $R \rightarrow \prod_{i=1, \dots, n} S_{g_i}$ then the lemma follows for the ring map $R \rightarrow S$. Hence we may assume that $S = \prod_{i=1, \dots, n} S_i$ is a finite product of standard étale morphisms.

For each i choose a ring map $R \rightarrow S'_i$ as in Lemma 10.138.18 adapted to the standard étale morphism $R \rightarrow S_i$. Set $S' = S'_1 \otimes_R \dots \otimes_R S'_n$; we will use the R -algebra maps $S'_i \rightarrow S'$ without further mention below. We claim this works. Properties (1) and (2) are immediate. For property (3) suppose that $\mathfrak{q}' \subset S'$ is a prime. Denote \mathfrak{p} its image in $\text{Spec}(R)$. Choose $i \in \{1, \dots, n\}$ such that \mathfrak{p} is in the image of $\text{Spec}(S_i) \rightarrow \text{Spec}(R)$; this is possible by assumption. Set $\mathfrak{q}'_i \subset S'_i$ the image of \mathfrak{q}' in the spectrum of S'_i . By construction of S'_i there exists a $g'_i \in S'_i$ such that $R \rightarrow (S'_i)_{g'_i}$ factors as $R \rightarrow S_i \rightarrow (S'_i)_{g'_i}$. Hence also $R \rightarrow S'_{g'_i}$ factors as

$$R \rightarrow S_i \rightarrow (S'_i)_{g'_i} \rightarrow S'_{g'_i}$$

as desired. \square

Lemma 10.138.20. *Let R be a ring. Let $f \in R[x]$ be a monic polynomial. Let \mathfrak{p} be a prime of R . Let $f \bmod \mathfrak{p} = \bar{g}\bar{h}$ be a factorization of the image of f in $\kappa(\mathfrak{p})[x]$. If $\gcd(\bar{g}, \bar{h}) = 1$, then there exist*

- (1) *an étale ring map $R \rightarrow R'$,*
- (2) *a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} , and*
- (3) *a factorization $f = gh$ in $R'[x]$*

such that

- (1) $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,
- (2) $\bar{g} = g \bmod \mathfrak{p}'$, $\bar{h} = h \bmod \mathfrak{p}'$, and
- (3) *the polynomials g, h generate the unit ideal in $R'[x]$.*

Proof. Suppose $\bar{g} = \bar{b}_0x^n + \bar{b}_1x^{n-1} + \dots + \bar{b}_n$, and $\bar{h} = \bar{c}_0x^m + \bar{c}_1x^{m-1} + \dots + \bar{c}_m$ with $\bar{b}_0, \bar{c}_0 \in \kappa(\mathfrak{p})$ nonzero. After localizing R at some element of R not contained in \mathfrak{p} we may assume \bar{b}_0 is the image of an invertible element $b_0 \in R$. Replacing \bar{g} by \bar{g}/b_0 and \bar{h} by $b_0\bar{h}$ we reduce to the case where \bar{g}, \bar{h} are monic (verification omitted). Say $\bar{g} = x^n + \bar{b}_1x^{n-1} + \dots + \bar{b}_n$, and $\bar{h} = x^m + \bar{c}_1x^{m-1} + \dots + \bar{c}_m$. Write $f = x^{n+m} + a_1x^{n-1} + \dots + a_{n+m}$. Consider the fibre product

$$R' = R \otimes_{\mathbf{Z}[a_1, \dots, a_{n+m}]} \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m]$$

where the map $\mathbf{Z}[a_k] \rightarrow \mathbf{Z}[b_i, c_j]$ is as in Examples 10.131.7 and 10.138.13. By construction there is an R -algebra map

$$R' = R \otimes_{\mathbf{Z}[a_1, \dots, a_{n+m}]} \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m] \longrightarrow \kappa(\mathfrak{p})$$

which maps b_i to \bar{b}_i and c_j to \bar{c}_j . Denote $\mathfrak{p}' \subset R'$ the kernel of this map. Since by assumption the polynomials \bar{g}, \bar{h} are relatively prime we see that the element $\Delta = \text{Res}_x(g, h) \in \mathbf{Z}[b_i, c_j]$ (see Example 10.138.13) does not map to zero in $\kappa(\mathfrak{p})$ under the displayed map. We conclude that $R \rightarrow R'$ is étale at \mathfrak{p}' . In fact a solution to the problem posed in the lemma is the ring map $R \rightarrow R'[1/\Delta]$ and the prime $\mathfrak{p}'R'[1/\Delta]$. Because $\text{Res}_x(f, g)$ is invertible in this ring the Sylvester matrix is invertible over R' and hence $1 = ag + bh$ for some $a, b \in R'[x]$ see Example 10.138.13. \square

The following lemmas say roughly that after an étale extension a quasi-finite ring map becomes finite. To help interpret the results recall that the locus where a finite type ring map is quasi-finite is open (see Lemma 10.119.14) and that formation of this locus commutes with arbitrary base change (see Lemma 10.118.8).

Lemma 10.138.21. *Let $R \rightarrow S' \rightarrow S$ be ring maps. Let $\mathfrak{p} \subset R$ be a prime. Let $g \in S'$ be an element. Assume*

- (1) *$R \rightarrow S'$ is integral,*
- (2) *$R \rightarrow S$ is finite type,*
- (3) *$S'_g \cong S_g$, and*
- (4) *g invertible in $S' \otimes_R \kappa(\mathfrak{p})$.*

Then there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $R_f \rightarrow S_f$ is finite.

Proof. By assumption the image T of $V(g) \subset \text{Spec}(S')$ under the morphism $\text{Spec}(S') \rightarrow \text{Spec}(R)$ does not contain \mathfrak{p} . By Section 10.40 especially, Lemma 10.40.6 we see T is closed. Pick $f \in R$, $f \notin \mathfrak{p}$ such that $T \cap V(f) = \emptyset$. Then we see that g becomes invertible in S'_f . Hence $S'_f \cong S_f$. Thus S_f is both of finite type and integral over R_f , hence finite. \square

Lemma 10.138.22. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p} \subset R$. Assume $R \rightarrow S$ finite type and quasi-finite at \mathfrak{q} . Then there exists*

- (1) *an étale ring map $R \rightarrow R'$,*
- (2) *a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} ,*
- (3) *a product decomposition*

$$R' \otimes_R S = A \times B$$

with the following properties

- (1) $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,
- (2) $R' \rightarrow A$ is finite,
- (3) A has exactly one prime \mathfrak{r} lying over \mathfrak{p}' , and
- (4) \mathfrak{r} lies over \mathfrak{q} .

Proof. Let $S' \subset S$ be the integral closure of R in S . Let $\mathfrak{q}' = S' \cap \mathfrak{q}$. By Zariski's Main Theorem 10.119.13 there exists a $g \in S'$, $g \notin \mathfrak{q}'$ such that $S'_g \cong S_g$. Consider the fibre rings $F = S \otimes_R \kappa(\mathfrak{p})$ and $F' = S' \otimes_R \kappa(\mathfrak{p})$. Denote $\bar{\mathfrak{q}}'$ the prime of F' corresponding to \mathfrak{q}' . Since F' is integral over $\kappa(\mathfrak{p})$ we see that $\bar{\mathfrak{q}}'$ is a closed point of $\text{Spec}(F')$, see Lemma 10.35.17. Note that \mathfrak{q} defines an isolated closed point $\bar{\mathfrak{q}}$ of $\text{Spec}(F)$ (see Definition 10.118.3). Since $S'_g \cong S_g$ we have $F'_g \cong F_g$, so $\bar{\mathfrak{q}}$ and $\bar{\mathfrak{q}}'$ have isomorphic open neighbourhoods in $\text{Spec}(F)$ and $\text{Spec}(F')$. We conclude the set $\{\bar{\mathfrak{q}}'\} \subset \text{Spec}(F')$ is open. Combined with \mathfrak{q}' being closed (shown above) we conclude that $\bar{\mathfrak{q}}'$ defines an isolated closed point of $\text{Spec}(F')$ as well.

An additional small remark is that under the map $\text{Spec}(F) \rightarrow \text{Spec}(F')$ the point $\bar{\mathfrak{q}}$ is the only point mapping to $\bar{\mathfrak{q}}'$. This follows from the discussion above.

By Lemma 10.22.3 we may write $F' = F'_1 \times F'_2$ with $\text{Spec}(F'_1) = \{\bar{\mathfrak{q}}'\}$. Since $F' = S' \otimes_R \kappa(\mathfrak{p})$, there exists an $s' \in S'$ which maps to the element $(r, 0) \in F'_1 \times F'_2 = F'$ for some $r \in R$, $r \notin \mathfrak{p}$. In fact, what we will use about s' is that it is an element of S' , not contained in \mathfrak{q}' , and contained in any other prime lying over \mathfrak{p} .

Let $f(x) \in R[x]$ be a monic polynomial such that $f(s') = 0$. Denote $\bar{f} \in \kappa(\mathfrak{p})[x]$ the image. We can factor it as $\bar{f} = x^e \bar{h}$ where $\bar{h}(0) \neq 0$. By Lemma 10.138.20 we can find an étale ring extension $R \rightarrow R'$, a prime \mathfrak{p}' lying over \mathfrak{p} , and a factorization $f = hi$ in $R'[x]$ such that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$, $x^e = h \bmod \mathfrak{p}'$, $\bar{i} = i \bmod \mathfrak{p}'$, and we can write $ah + bi = 1$ in $R'[x]$ (for suitable a, b).

Consider the elements $h(s'), i(s') \in R' \otimes_R S'$. By construction we have $h(s')i(s') = f(s') = 0$. On the other hand they generate the unit ideal since $a(s')h(s') + b(s')i(s') = 1$. Thus we see that $R' \otimes_R S'$ is the product of the localizations at these elements:

$$R' \otimes_R S' = (R' \otimes_R S')_{h(s')} \times (R' \otimes_R S')_{i(s')} = S'_1 \times S'_2$$

Moreover this product decomposition is compatible with the product decomposition we found for the fibre ring F' ; this comes from our choice of s', h which guarantee that $\bar{\mathfrak{q}}'$ is the only prime of F' which does not contain the image of $h(s')$ in F' . Here we use that the fibre ring of $R' \otimes_R S'$ over R' at \mathfrak{p}' is the same as F' due to the fact that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$. It follows that S'_1 has exactly one prime, say \mathfrak{r}' , lying over \mathfrak{p}' and that this prime lies over \mathfrak{q} . Hence the element $g \in S'$ maps to an element of S'_1 not contained in \mathfrak{r}' .

The base change $R' \otimes_R S$ inherits a similar product decomposition

$$R' \otimes_R S = (R' \otimes_R S)_{h(s')} \times (R' \otimes_R S)_{i(s')} = S_1 \times S_2$$

It follows from the above that S_1 has exactly one prime, say \mathfrak{r} , lying over \mathfrak{p}' (consider the fibre ring as above), and that this prime lies over \mathfrak{q} .

Now we may apply Lemma 10.138.21 to the ring maps $R' \rightarrow S'_1 \rightarrow S_1$, the prime \mathfrak{p}' and the element g to see that after replacing R' by a principal localization we can assume that S_1 is finite over R' as desired. \square

Lemma 10.138.23. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \rightarrow S$ finite type. Then there exists*

- (1) *an étale ring map $R \rightarrow R'$,*
- (2) *a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} ,*
- (3) *a product decomposition*

$$R' \otimes_R S = A_1 \times \dots \times A_n \times B$$

with the following properties

- (1) *we have $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,*
- (2) *each A_i is finite over R' ,*
- (3) *each A_i has exactly one prime \mathfrak{r}_i lying over \mathfrak{p}' , and*
- (4) *$R' \rightarrow B$ not quasi-finite at any prime lying over \mathfrak{p}' .*

Proof. Denote $F = S \otimes_R \kappa(\mathfrak{p})$ the fibre ring of S/R at the prime \mathfrak{p} . As F is of finite type over $\kappa(\mathfrak{p})$ it is Noetherian and hence $\text{Spec}(F)$ has finitely many isolated closed points. If there are no isolated closed points, i.e., no primes \mathfrak{q} of S over \mathfrak{p} such that S/R is quasi-finite at \mathfrak{q} , then the lemma holds. If there exists at least one such prime \mathfrak{q} , then we may apply Lemma 10.138.22. This gives a diagram

$$\begin{array}{ccc} S & \longrightarrow & R' \otimes_R S \xlongequal{\quad} A_1 \times B' \\ \uparrow & & \uparrow \nearrow \\ R & \longrightarrow & R' \end{array}$$

as in said lemma. Since the residue fields at \mathfrak{p} and \mathfrak{p}' are the same, the fibre rings of S/R and $(A \times B)/R'$ are the same. Hence, by induction on the number of isolated closed points of the fibre we may assume that the lemma holds for $R' \rightarrow B$ and \mathfrak{p}' . Thus we get an étale ring map $R' \rightarrow R''$, a prime $\mathfrak{p}'' \subset R''$ and a decomposition

$$R'' \otimes_{R'} B' = A_2 \times \dots \times A_n \times B$$

We omit the verification that the ring map $R \rightarrow R''$, the prime \mathfrak{p}'' and the resulting decomposition

$$R'' \otimes_R S = (R'' \otimes_{R'} A_1) \times A_2 \times \dots \times A_n \times B$$

is a solution to the problem posed in the lemma. \square

Lemma 10.138.24. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \rightarrow S$ finite type. Then there exists*

- (1) *an étale ring map $R \rightarrow R'$,*
- (2) *a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} ,*
- (3) *a product decomposition*

$$R' \otimes_R S = A_1 \times \dots \times A_n \times B$$

with the following properties

- (1) each A_i is finite over R' ,
- (2) each A_i has exactly one prime \mathfrak{r}_i lying over \mathfrak{p}' ,
- (3) the finite field extensions $\kappa(\mathfrak{p}') \subset \kappa(\mathfrak{r}_i)$ are purely inseparable, and
- (4) $R' \rightarrow B$ not quasi-finite at any prime lying over \mathfrak{p}' .

Proof. The strategy of the proof is to make two étale ring extensions: first we control the residue fields, then we apply Lemma 10.138.23.

Denote $F = S \otimes_R \kappa(\mathfrak{p})$ the fibre ring of S/R at the prime \mathfrak{p} . As in the proof of Lemma 10.138.23 there are finitely many primes, say $\mathfrak{q}_1, \dots, \mathfrak{q}_n$ of S lying over R at which the ring map $R \rightarrow S$ is quasi-finite. Let $\kappa(\mathfrak{p}) \subset L_i \subset \kappa(\mathfrak{q}_i)$ be the subfield such that $\kappa(\mathfrak{p}) \subset L_i$ is separable, and the field extension $L_i \subset \kappa(\mathfrak{q}_i)$ is purely inseparable. Let $\kappa(\mathfrak{p}) \subset L$ be a finite Galois extension into which L_i embeds for $i = 1, \dots, n$. By Lemma 10.138.16 we can find an étale ring extension $R \rightarrow R'$ together with a prime \mathfrak{p}' lying over \mathfrak{p} such that the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{p}')$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$. Thus the fibre ring of $R' \otimes_R S$ at \mathfrak{p}' is isomorphic to $F \otimes_{\kappa(\mathfrak{p})} L$. The primes lying over \mathfrak{q}_i correspond to primes of $\kappa(\mathfrak{q}_i) \otimes_{\kappa(\mathfrak{p})} L$ which is a product of fields purely inseparable over L by our choice of L and elementary field theory. These are also the only primes over \mathfrak{p}' at which $R' \rightarrow R' \otimes_R S$ is quasi-finite, by Lemma 10.118.8. Hence after replacing R by R' , \mathfrak{p} by \mathfrak{p}' , and S by $R' \otimes_R S$ we may assume that for all primes \mathfrak{q} lying over \mathfrak{p} for which S/R is quasi-finite the field extensions $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ are purely inseparable.

Next apply Lemma 10.138.23. The result is what we want since the field extensions do not change under this étale ring extension. \square

10.139. Local homomorphisms

Lemma 10.139.1. *Let $(R, \mathfrak{m}_R) \rightarrow (S, \mathfrak{m}_S)$ be a local homomorphism of local rings. Assume S is the localization of an étale ring extension of R . Then there exists a finite, finitely presented, faithfully flat ring map $R \rightarrow S'$ such that for every maximal ideal \mathfrak{m}' of S' there is a factorization*

$$R \rightarrow S \rightarrow S'_{\mathfrak{m}'}.$$

of the ring map $R \rightarrow S'_{\mathfrak{m}'}$.

Proof. Write $S = T_{\mathfrak{q}}$ for some étale R -algebra T . By Proposition 10.138.17 we may assume T is standard étale. Apply Lemma 10.138.18 to the ring map $R \rightarrow T$ to get $R \rightarrow S'$. Then in particular for every maximal ideal \mathfrak{m}' of S' we get a factorization $\varphi: T \rightarrow S'_{\mathfrak{g}'}$ for some $\mathfrak{g}' \notin \mathfrak{m}'$ such that $\mathfrak{q} = \varphi^{-1}(\mathfrak{m}' S'_{\mathfrak{g}'})$. Thus φ induces the desired local ring map $S \rightarrow S'_{\mathfrak{m}'}$. \square

10.140. Integral closure and smooth base change

Lemma 10.140.1. *Let R be a ring. Let $f \in R[x]$ be a monic polynomial. Let $R \rightarrow B$ be a ring map. If $h \in B[x]/(f)$ is integral over R , then the element $f'h$ can be written as $f'h = \sum_i b_i x^i$ with $b_i \in B$ integral over R .*

Proof. Say $h^e + r_1 h^{e-1} + \dots + r_e = 0$ in the ring $B[x]/(f)$ with $r_i \in R$. There exists a finite free ring extension $B \subset B'$ such that $f = (x - \alpha_1) \dots (x - \alpha_d)$ for some $\alpha_i \in B'$, see Lemma 10.131.9. Note that each α_i is integral over R . We may

represent $h = h_0 + h_1x + \dots + h_{d-1}x^{d-1}$ with $h_i \in B$. Then it is a universal fact that

$$f'h \equiv \sum_{i=1, \dots, d} h(\alpha_i)(x - \alpha_1) \dots \widehat{(x - \alpha_i)} \dots (x - \alpha_d)$$

as elements of $B[x]/(f)$. You prove this by evaluating both sides at the points α_i over the ring $B_{univ} = \mathbf{Z}[\alpha_i, h_j]$ (some details omitted). By our assumption that h satisfies $h^e + r_1h^{e-1} + \dots + r_e = 0$ in the ring $B[x]/(f)$ we see that

$$h(\alpha_i)^e + r_1h(\alpha_i)^{e-1} + \dots + r_e = 0$$

in B' . Hence $h(\alpha_i)$ is integral over R . Using the formula above we see that $f'h \equiv \sum_{j=0, \dots, d-1} b'_jx^j$ in $B'[x]/(f)$ with $b'_j \in B'$ integral over R . However, since $f'h \in B[x]/(f)$ and since $1, x, \dots, x^{d-1}$ is a B' -basis for $B'[x]/(f)$ we see that $b'_j \in B$ as desired. \square

Lemma 10.140.2. *Let $R \rightarrow S$ be an étale ring map. Let $R \rightarrow B$ be any ring map. Let $A \subset B$ be the integral closure of R in B . Let $A' \subset S \otimes_R B$ be the integral closure of S in $S \otimes_R B$. Then the canonical map $S \otimes_R A \rightarrow A'$ is an isomorphism.*

Proof. The map $S \otimes_R A \rightarrow A'$ is injective because $A \subset B$ and $R \rightarrow S$ is flat. We are going to use repeatedly that taking integral closure commutes with localization, see Lemma 10.35.9. Hence we may localize on S , by Lemma 10.23.2 (the criterion for checking whether an S -module map is an isomorphism). Thus we may assume that $S = R[x]_g/(f) = (R[x]/(f))_g$ is standard étale over R , see Proposition 10.138.17. Applying localization one more time we see that A' is $(A'')_g$ where A'' is the integral closure of $R[x]/(f)$ in $B[x]/(f)$. Suppose that $a \in A''$. It suffices to show that a is in $S \otimes_R A$. By Lemma 10.140.1 we see that $f'a = \sum a_i x^i$ with $a_i \in A$. Since f' is invertible in $B[x]_g/(f)$ (by definition of a standard étale ring map) we conclude that $a \in S \otimes_R A$ as desired. \square

Example 10.140.3. Let p be a prime number. For every $n > 0$ the ring extension

$$R = \mathbf{Z}[1/p] \subset R' = \mathbf{Z}[1/p][x]/(x^{p^n} - 1)$$

has the following property: For $d < p^n$ there exist elements $\alpha_0, \dots, \alpha_{d-1} \in R'$ such that

$$\prod_{0 \leq i < j < d} (\alpha_i - \alpha_j)$$

is a unit in R' . Namely, take α_i equal to the class of x^i in R' . Then we have

$$T^{p^n} - 1 = \prod_{i=0, \dots, p^n-1} (T - \alpha_i)$$

(for example because this is clear over \mathbf{Q}) and hence by taking derivatives on both sides

$$p^n \alpha_i^{p^n-1} = (\alpha_i - \alpha_1) \dots \widehat{(\alpha_i - \alpha_i)} \dots (\alpha_i - \alpha_1)$$

and we see this is invertible in R' .

Lemma 10.140.4. *Let $R \rightarrow S$ be a smooth ring map. Let $R \rightarrow B$ be any ring map. Let $A \subset B$ be the integral closure of R in B . Let $A' \subset S \otimes_R B$ be the integral closure of S in $S \otimes_R B$. Then the canonical map $S \otimes_R A \rightarrow A'$ is an isomorphism.*

Proof. Arguing as in the proof of Lemma 10.140.2 we may localize on S . Hence we may assume that $R \rightarrow S$ is a standard smooth ring map, see Lemma 10.132.10. By definition of a standard smooth ring map we see that S is étale over a polynomial ring $R[x_1, \dots, x_n]$. Since we have seen the result in the case of an étale ring

extension (Lemma 10.140.2) this reduces us to the case where $S = R[x]$. Thus we have to show

$$f = \sum b_i x^i \text{ integral over } R[x] \Leftrightarrow \text{each } b_i \text{ integral over } R.$$

The implication from right to left holds because the set of elements in $B[x]$ integral over $R[x]$ is a ring (Lemma 10.35.7) and contains x .

Suppose that $f \in B[x]$ is integral over $R[x]$, and assume that $f = \sum_{i < d} b_i x^i$ has degree $< d$. Since integral closure and localization commute, it suffices to show that each b_i is integral over $R[1/2]$ and over $R[1/3]$. Hence, we can find a finite free ring extension $R \subset R'$ such that R' contains $\alpha_1, \dots, \alpha_d$ with the property that $\prod_{i < j} (\alpha_i - \alpha_j)$ is a unit in R' , see Example 10.140.3. In this case we have the universal equality

$$f = \sum_i f(\alpha_i) \frac{(x - \alpha_1) \dots \widehat{(x - \alpha_i)} \dots (x - \alpha_d)}{(\alpha_i - \alpha_1) \dots \widehat{(\alpha_i - \alpha_i)} \dots (\alpha_i - \alpha_d)}.$$

OK, and the elements $f(\alpha_i)$ are integral over R' since $(R' \otimes_R B)[x] \rightarrow R' \otimes_R B$, $h \mapsto h(\alpha_i)$ is a ring map. Hence we see that the coefficients of f in $(R' \otimes_R B)[x]$ are integral over R' . Since R' is finite over R (hence integral over R) we see that they are integral over R also, as desired. \square

10.141. Formally unramified maps

It turns out to be logically more efficient to define the notion of a formally unramified map before introducing the notion of a formally étale one.

Definition 10.141.1. Let $R \rightarrow S$ be a ring map. We say S is *formally unramified over R* if for every commutative solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A/I \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & A \end{array}$$

where $I \subset A$ is an ideal of square zero, there exists at most one dotted arrow making the diagram commute.

Lemma 10.141.2. Let $R \rightarrow S$ be a ring map. The following are equivalent:

- (1) $R \rightarrow S$ is formally unramified,
- (2) the module of differentials $\Omega_{S/R}$ is zero.

Proof. Let $J = \text{Ker}(S \otimes_R S \rightarrow S)$ be the kernel of the multiplication map. Let $A_{\text{univ}} = S \otimes_R S/J^2$. Recall that $I_{\text{univ}} = J/J^2$ is isomorphic to $\Omega_{S/R}$, see Lemma 10.127.13. Moreover, the two R -algebra maps $\sigma_1, \sigma_2 : S \rightarrow A_{\text{univ}}$, $\sigma_1(s) = s \otimes 1 \text{ mod } J^2$, and $\sigma_2(s) = 1 \otimes s \text{ mod } J^2$ differ by the universal derivation $d : S \rightarrow \Omega_{S/R} = I_{\text{univ}}$.

Assume $R \rightarrow S$ formally unramified. Then we see that $\sigma_1 = \sigma_2$. Hence $d(s) = 0$ for all $s \in S$. Hence $\Omega_{S/R} = 0$.

Assume that $\Omega_{S/R} = 0$. Let $A, I, R \rightarrow A, S \rightarrow A/I$ be a solid diagram as in Definition 10.141.1. Let $\tau_1, \tau_2 : S \rightarrow A$ be two dotted arrows making the diagram commute. Consider the R -algebra map $A_{\text{univ}} \rightarrow A$ defined by the rule $s_1 \otimes s_2 \mapsto$

$\tau_1(s_1)\tau_2(s_2)$. We omit the verification that this is well defined. Since $A_{univ} \cong S$ as $I_{univ} = \Omega_{S/R} = 0$ we conclude that $\tau_1 = \tau_2$. \square

Lemma 10.141.3. *Let $R \rightarrow S$ be a ring map. The following are equivalent:*

- (1) $R \rightarrow S$ is formally unramified,
- (2) $R \rightarrow S_{\mathfrak{q}}$ is formally unramified for all primes \mathfrak{q} of S , and
- (3) $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is formally unramified for all primes \mathfrak{q} of S with $\mathfrak{p} = R \cap \mathfrak{q}$.

Proof. We have seen in Lemma 10.141.2 that (1) is equivalent to $\Omega_{S/R} = 0$. Similarly, by Lemma 10.127.8 we see that (2) and (3) are equivalent to $(\Omega_{S/R})_{\mathfrak{q}} = 0$ for all \mathfrak{q} . Hence the equivalence follows from Lemma 10.23.1. \square

Lemma 10.141.4. *Let $A \rightarrow B$ be a formally unramified ring map.*

- (1) For $S \subset A$ a multiplicative subset, $S^{-1}A \rightarrow S^{-1}B$ is formally unramified.
- (2) For $S \subset B$ a multiplicative subset, $A \rightarrow S^{-1}B$ is formally unramified.

Proof. Follows from Lemma 10.141.3. (You can also deduce it from Lemma 10.141.2 combined with Lemma 10.127.8.) \square

Lemma 10.141.5. *Let R be a ring. Let I be a directed partially ordered set. Let $(S_i, \varphi_{ii'})$ be a system of R -algebras over I . If each $R \rightarrow S_i$ is formally unramified, then $S = \text{colim}_{i \in I} S_i$ is formally unramified over R*

Proof. Consider a diagram as in Definition 10.141.1. By assumption there exists at most one R -algebra map $S_i \rightarrow A$ lifting the compositions $S_i \rightarrow S \rightarrow A/I$. Since every element of S is in the image of one of the maps $S_i \rightarrow S$ we see that there is at most one map $S \rightarrow A$ fitting into the diagram. \square

10.142. Conormal modules and universal thickenings

It turns out that one can define the first infinitesimal neighbourhood not just for a closed immersion of schemes, but already for any formally unramified morphism. This is based on the following algebraic fact.

Lemma 10.142.1. *Let $R \rightarrow S$ be a formally unramified ring map. There exists a surjection of R -algebras $S' \rightarrow S$ whose kernel is an ideal of square zero with the following universal property: Given any commutative diagram*

$$\begin{array}{ccc} S & \xrightarrow{a} & A/I \\ \uparrow & & \uparrow \\ R & \xrightarrow{b} & A \end{array}$$

where $I \subset A$ is an ideal of square zero, there is a unique R -algebra map $a' : S' \rightarrow A$ such that $S' \rightarrow A \rightarrow A/I$ is equal to $S' \rightarrow S \rightarrow A$.

Proof. Choose a set of generators $z_i \in S$, $i \in I$ for S as an R -algebra. Let $P = R[\{x_i\}_{i \in I}]$ denote the polynomial ring on generators x_i , $i \in I$. Consider the R -algebra map $P \rightarrow S$ which maps x_i to z_i . Let $J = \text{Ker}(P \rightarrow S)$. Consider the map

$$d : J/J^2 \longrightarrow \Omega_{P/R} \otimes_P S$$

see Lemma 10.127.9. This is surjective since $\Omega_{S/R} = 0$ by assumption, see Lemma 10.141.2. Note that $\Omega_{P/R}$ is free on dx_i , and hence the module $\Omega_{P/R} \otimes_P S$ is free over S . Thus we may choose a splitting of the surjection above and write

$$J/J^2 = K \oplus \Omega_{P/R} \otimes_P S$$

Let $J^2 \subset J' \subset J$ be the ideal of P such that J'/J^2 is the second summand in the decomposition above. Set $S' = P/J'$. We obtain a short exact sequence

$$0 \rightarrow J/J' \rightarrow S' \rightarrow S \rightarrow 0$$

and we see that $J/J' \cong K$ is a square zero ideal in S' . Hence

$$\begin{array}{ccc} S & \longrightarrow & S \\ \uparrow & \lrcorner & \uparrow \\ R & \longrightarrow & S' \end{array}$$

is a diagram as above. In fact we claim that this is an initial object in the category of diagrams. Namely, let $(I \subset A, a, b)$ be an arbitrary diagram. We may choose an R -algebra map $\beta : P \rightarrow A$ such that

$$\begin{array}{ccccc} S & \xrightarrow{1} & S & \xrightarrow{a} & A/I \\ \uparrow & & \uparrow & & \uparrow \\ R & \xrightarrow{\beta} & P & \xrightarrow{\beta} & A \end{array}$$

is commutative. Now it may not be the case that $\beta(J') = 0$, in other words it may not be true that β factors through $S' = P/J'$. But what is clear is that $\beta(J') \subset I$ and since $\beta(J) \subset I$ and $I^2 = 0$ we have $\beta(J^2) = 0$. Thus the “obstruction” to finding a morphism from $(J/J' \subset S', 1, R \rightarrow S')$ to $(I \subset A, a, b)$ is the corresponding S -linear map $\bar{\beta} : J'/J^2 \rightarrow I$. The choice in picking β lies in the choice of $\beta(x_i)$. A different choice of β , say β' , is gotten by taking $\beta'(x_i) = \beta(x_i) + \delta_i$ with $\delta_i \in I$. In this case, for $g \in J'$, we obtain

$$\beta'(g) = \beta(g) + \sum_i \delta_i \frac{\partial g}{\partial x_i}.$$

Since the map $d|_{J'/J^2} : J'/J^2 \rightarrow \Omega_{P/R} \otimes_P S$ given by $g \mapsto \frac{\partial g}{\partial x_i} dx_i$ is an isomorphism by construction, we see that there is a unique choice of $\delta_i \in I$ such that $\beta'(g) = 0$ for all $g \in J'$. (Namely, δ_i is $-\bar{\beta}(g)$ where $g \in J'/J^2$ is the unique element with $\frac{\partial g}{\partial x_j} = 1$ if $i = j$ and 0 else.) The uniqueness of the solution implies the uniqueness required in the lemma. \square

In the situation of Lemma 10.142.1 the R -algebra map $S' \rightarrow S$ is unique up to unique isomorphism.

Definition 10.142.2. Let $R \rightarrow S$ be a formally unramified ring map.

- (1) The *universal first order thickening* of S over R is the surjection of R -algebras $S' \rightarrow S$ of Lemma 10.142.1.
- (2) The *conormal module* of $R \rightarrow S$ is the kernel I of the universal first order thickening $S' \rightarrow S$, seen as a S -module.

We often denote the conormal module $C_{S/R}$ in this situation.

Lemma 10.142.3. *Let $I \subset R$ be an ideal of a ring. The universal first order thickening of R/I over R is the surjection $R/I^2 \rightarrow R/I$. The conormal module of R/I over R is $C_{(R/I)/R} = I/I^2$.*

Proof. Omitted. □

Lemma 10.142.4. *Let $A \rightarrow B$ be a formally unramified ring map. Let $\varphi : B' \rightarrow B$ be the universal first order thickening of B over A .*

- (1) *Let $S \subset A$ be a multiplicative subset. Then $S^{-1}B' \rightarrow S^{-1}B$ is the universal first order thickening of $S^{-1}B$ over $S^{-1}A$. In particular $S^{-1}C_{B/A} = C_{S^{-1}B/S^{-1}A}$.*
- (2) *Let $S \subset B$ be a multiplicative subset. Then $S' = \varphi^{-1}(S)$ is a multiplicative subset in B' and $(S')^{-1}B' \rightarrow S^{-1}B$ is the universal first order thickening of $S^{-1}B$ over A . In particular $S^{-1}C_{B/A} = C_{S^{-1}B/A}$.*

Note that the lemma makes sense by Lemma 10.141.4.

Proof. With notation and assumptions as in (1). Let $(S^{-1}B)' \rightarrow S^{-1}B$ be the universal first order thickening of $S^{-1}B$ over $S^{-1}A$. Note that $S^{-1}B' \rightarrow S^{-1}B$ is a surjection of $S^{-1}A$ -algebras whose kernel has square zero. Hence by definition we obtain a map $(S^{-1}B)' \rightarrow S^{-1}B'$ compatible with the maps towards $S^{-1}B$. Consider any commutative diagram

$$\begin{array}{ccccc} B & \longrightarrow & S^{-1}B & \longrightarrow & D/I \\ \uparrow & & \uparrow & & \uparrow \\ A & \longrightarrow & S^{-1}A & \longrightarrow & D \end{array}$$

where $I \subset D$ is an ideal of square zero. Since B' is the universal first order thickening of B over A we obtain an A -algebra map $B' \rightarrow D$. But it is clear that the image of S in D is mapped to invertible elements of D , and hence we obtain a compatible map $S^{-1}B' \rightarrow D$. Applying this to $D = (S^{-1}B)'$ we see that we get a map $S^{-1}B' \rightarrow (S^{-1}B)'$. We omit the verification that this map is inverse to the map described above.

With notation and assumptions as in (2). Let $(S^{-1}B)' \rightarrow S^{-1}B$ be the universal first order thickening of $S^{-1}B$ over A . Note that $(S')^{-1}B' \rightarrow S^{-1}B$ is a surjection of A -algebras whose kernel has square zero. Hence by definition we obtain a map $(S^{-1}B)' \rightarrow (S')^{-1}B'$ compatible with the maps towards $S^{-1}B$. Consider any commutative diagram

$$\begin{array}{ccccc} B & \longrightarrow & S^{-1}B & \longrightarrow & D/I \\ \uparrow & & \uparrow & & \uparrow \\ A & \longrightarrow & A & \longrightarrow & D \end{array}$$

where $I \subset D$ is an ideal of square zero. Since B' is the universal first order thickening of B over A we obtain an A -algebra map $B' \rightarrow D$. But it is clear that the image of S' in D is mapped to invertible elements of D , and hence we obtain a compatible map $(S')^{-1}B' \rightarrow D$. Applying this to $D = (S^{-1}B)'$ we see that we get a map $(S')^{-1}B' \rightarrow (S^{-1}B)'$. We omit the verification that this map is inverse to the map described above. □

Lemma 10.142.5. *Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $A \rightarrow B$ formally unramified. Let $B' \rightarrow B$ be the universal first order thickening of B over A . Then B' is formally unramified over A , and the canonical map $\Omega_{A/R} \otimes_A B \rightarrow \Omega_{B'/R} \otimes_{B'} B$ is an isomorphism.*

Proof. We are going to use the construction of B' from the proof of Lemma 10.142.1 although in principle it should be possible to deduce these results formally from the definition. Namely, we choose a presentation $B = P/J$, where $P = A[x_i]$ is a polynomial ring over A . Next, we choose elements $f_i \in J$ such that $df_i = dx_i \otimes 1$ in $\Omega_{P/A} \otimes_P B$. Having made these choices we have $B' = P/J'$ with $J' = (f_i) + J^2$, see proof of Lemma 10.142.1.

Consider the canonical exact sequence

$$J'/(J')^2 \rightarrow \Omega_{P/A} \otimes_P B' \rightarrow \Omega_{B'/A} \rightarrow 0$$

see Lemma 10.127.9. By construction the classes of the $f_i \in J'$ map to elements of the module $\Omega_{P/A} \otimes_P B'$ which generate it modulo J'/J^2 by construction. Since J'/J^2 is a nilpotent ideal, we see that these elements generate the module altogether (by Nakayama's Lemma 10.19.1). This proves that $\Omega_{B'/A} = 0$ and hence that B' is formally unramified over A , see Lemma 10.141.2.

Since P is a polynomial ring over A we have $\Omega_{P/R} = \Omega_{A/R} \otimes_A P \oplus \bigoplus P dx_i$. We are going to use this decomposition. Consider the following exact sequence

$$J'/(J')^2 \rightarrow \Omega_{P/R} \otimes_P B' \rightarrow \Omega_{B'/R} \rightarrow 0$$

see Lemma 10.127.9. We may tensor this with B and obtain the exact sequence

$$J'/(J')^2 \otimes_{B'} B \rightarrow \Omega_{P/R} \otimes_P B \rightarrow \Omega_{B'/R} \otimes_{B'} B \rightarrow 0$$

If we remember that $J' = (f_i) + J^2$ then we see that the first arrow annihilates the submodule $J^2/(J')^2$. In terms of the direct sum decomposition $\Omega_{P/R} \otimes_P B = \Omega_{A/R} \otimes_A B \oplus \bigoplus B dx_i$ given we see that the submodule $(f_i)/(J')^2 \otimes_{B'} B$ maps isomorphically onto the summand $\bigoplus B dx_i$. Hence what is left of this exact sequence is an isomorphism $\Omega_{A/R} \otimes_A B \rightarrow \Omega_{B'/R} \otimes_{B'} B$ as desired. \square

10.143. Formally étale maps

Definition 10.143.1. Let $R \rightarrow S$ be a ring map. We say S is *formally étale over R* if for every commutative solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A/I \\ \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & A \end{array}$$

where $I \subset A$ is an ideal of square zero, there exists a unique dotted arrow making the diagram commute.

Clearly a ring map is formally étale if and only if it is both formally smooth and formally unramified.

Lemma 10.143.2. *Let $R \rightarrow S$ be a ring map of finite presentation. The following are equivalent:*

- (1) $R \rightarrow S$ is formally étale,
- (2) $R \rightarrow S$ is étale.

Proof. Assume that $R \rightarrow S$ is formally étale. Then $R \rightarrow S$ is smooth by Proposition 10.133.13. By Lemma 10.141.2 we have $\Omega_{S/R} = 0$. Hence $R \rightarrow S$ is étale by definition.

Assume that $R \rightarrow S$ is étale. Then $R \rightarrow S$ is formally smooth by Proposition 10.133.13. By Lemma 10.141.2 it is formally unramified. Hence $R \rightarrow S$ is formally étale. \square

Lemma 10.143.3. *Let R be a ring. Let I be a directed partially ordered set. Let $(S_i, \varphi_{ii'})$ be a system of R -algebras over I . If each $R \rightarrow S_i$ is formally étale, then $S = \operatorname{colim}_{i \in I} S_i$ is formally étale over R .*

Proof. Consider a diagram as in Definition 10.143.1. By assumption we get unique R -algebra maps $S_i \rightarrow A$ lifting the compositions $S_i \rightarrow S \rightarrow A/I$. Hence these are compatible with the transition maps $\varphi_{ii'}$ and define a lift $S \rightarrow A$. This proves existence. The uniqueness is clear by restricting to each S_i . \square

Lemma 10.143.4. *Let R be a ring. Let $S \subset R$ be any multiplicative subset. Then the ring map $R \rightarrow S^{-1}R$ is formally étale.*

Proof. Let $I \subset A$ be an ideal of square zero. What we are saying here is that given a ring map $\varphi : R \rightarrow A$ such that $\varphi(f) \bmod I$ is invertible for all $f \in S$ we have also that $\varphi(f)$ is invertible in A for all $f \in S$. This is true because A^* is the inverse image of $(A/I)^*$ under the canonical map $A \rightarrow A/I$. \square

10.144. Unramified ring maps

The definition of a G-unramified ring map is the one from EGA. The definition of an unramified ring map is the one from [Ray70].

Definition 10.144.1. Let $R \rightarrow S$ be a ring map.

- (1) We say $R \rightarrow S$ is *unramified* if $R \rightarrow S$ is of finite type and $\Omega_{S/R} = 0$.
- (2) We say $R \rightarrow S$ is *G-unramified* if $R \rightarrow S$ is of finite presentation and $\Omega_{S/R} = 0$.
- (3) Given a prime \mathfrak{q} of S we say that S is *unramified at \mathfrak{q}* if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is unramified.
- (4) Given a prime \mathfrak{q} of S we say that S is *G-unramified at \mathfrak{q}* if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is G-unramified.

Of course a G-unramified map is unramified.

Lemma 10.144.2. *Let $R \rightarrow S$ be a ring map. The following are equivalent*

- (1) $R \rightarrow S$ is formally unramified and of finite type, and
- (2) $R \rightarrow S$ is unramified.

Moreover, also the following are equivalent

- (1) $R \rightarrow S$ is formally unramified and of finite presentation, and
- (2) $R \rightarrow S$ is G-unramified.

Proof. Follows from Lemma 10.141.2 and the definitions. \square

Lemma 10.144.3. *Properties of unramified and G-unramified ring maps.*

- (1) *The base change of an unramified ring map is unramified. The base change of a G-unramified ring map is G-unramified.*

- (2) *The composition of unramified ring maps is unramified. The composition of G -unramified ring maps is G -unramified.*
- (3) *Any principal localization $R \rightarrow R_f$ is G -unramified and unramified.*
- (4) *If $I \subset R$ is an ideal, then $R \rightarrow R/I$ is unramified. If $I \subset R$ is a finitely generated ideal, then $R \rightarrow R/I$ is G -unramified.*
- (5) *An étale ring map is G -unramified and unramified.*
- (6) *If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $(\Omega_{S/R})_{\mathfrak{q}} = 0$, then $R \rightarrow S$ is unramified (resp. G -unramified) at \mathfrak{q} .*
- (7) *If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $\Omega_{S/R} \otimes_S \kappa(\mathfrak{q}) = 0$, then $R \rightarrow S$ is unramified (resp. G -unramified) at \mathfrak{q} .*
- (8) *If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $(\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})})_{\mathfrak{q}} = 0$, then $R \rightarrow S$ is unramified (resp. G -unramified) at \mathfrak{q} .*
- (9) *If $R \rightarrow S$ is of finite type (resp. presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $(\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})}) \otimes_{S \otimes_R \kappa(\mathfrak{p})} \kappa(\mathfrak{q}) = 0$, then $R \rightarrow S$ is unramified (resp. G -unramified) at \mathfrak{q} .*
- (10) *If $R \rightarrow S$ is a ring map, $g_1, \dots, g_m \in S$ generate the unit ideal and $R \rightarrow S_{g_j}$ is unramified (resp. G -unramified) for $j = 1, \dots, m$, then $R \rightarrow S$ is unramified (resp. G -unramified).*
- (11) *If $R \rightarrow S$ is a ring map which is unramified (resp. G -unramified) at every prime of S , then $R \rightarrow S$ is unramified (resp. G -unramified).*
- (12) *If $R \rightarrow S$ is G -unramified, then there exists a finite type \mathbf{Z} -algebra R_0 and a G -unramified ring map $R_0 \rightarrow S_0$ and a ring map $R_0 \rightarrow R$ such that $S = R \otimes_{R_0} S_0$.*
- (13) *If $R \rightarrow S$ is unramified, then there exists a finite type \mathbf{Z} -algebra R_0 and an unramified ring map $R_0 \rightarrow S_0$ and a ring map $R_0 \rightarrow R$ such that S is a quotient of $R \otimes_{R_0} S_0$.*

Proof. We prove each point, in order.

Ad (1). Follows from Lemmas 10.127.12 and 10.13.2.

Ad (2). Follows from Lemmas 10.127.7 and 10.13.2.

Ad (3). Follows by direct computation of $\Omega_{R_f/R}$ which we omit.

Ad (4). We have $\Omega_{(R/I)/R} = 0$, see Lemma 10.127.5, and the ring map $R \rightarrow R/I$ is of finite type. If I is a finitely generated ideal then $R \rightarrow R/I$ is of finite presentation.

Ad (5). See discussion following Definition 10.138.1.

Ad (6). In this case $\Omega_{S/R}$ is a finite S -module (see Lemma 10.127.16) and hence there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $(\Omega_{S/R})_g = 0$. By Lemma 10.127.8 this means that $\Omega_{S_g/R} = 0$ and hence $R \rightarrow S_g$ is unramified as desired.

Ad (7). Use Nakayama's lemma (Lemma 10.19.1) to see that the condition is equivalent to the condition of (6).

Ad (8) & (9). These are equivalent in the same manner that (6) and (7) are equivalent. Moreover $\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})} = \Omega_{S/R} \otimes_S (S \otimes_R \kappa(\mathfrak{p}))$ by Lemma 10.127.12. Hence we see that (9) is equivalent to (7) since the $\kappa(\mathfrak{q})$ vector spaces in both are canonically isomorphic.

Ad (10). Follows from Lemmas 10.23.2 and 10.127.8.

Ad (11). Follows from (6) and (7) and the fact that the spectrum of S is quasi-compact.

Ad (12). Write $S = R[x_1, \dots, x_n]/(g_1, \dots, g_m)$. As $\Omega_{S/R} = 0$ we can write

$$dx_i = \sum h_{ij} dg_j + \sum a_{ijk} g_j dx_k$$

in $\Omega_{R[x_1, \dots, x_n]/R}$ for some $h_{ij}, a_{ijk} \in R[x_1, \dots, x_n]$. Choose a finitely generated \mathbf{Z} -subalgebra $R_0 \subset R$ containing all the coefficients of the polynomials g_i, h_{ij}, a_{ijk} . Set $S_0 = R_0[x_1, \dots, x_n]/(g_1, \dots, g_m)$. This works.

Ad (13). Write $S = R[x_1, \dots, x_n]/I$. As $\Omega_{S/R} = 0$ we can write

$$dx_i = \sum h_{ij} dg_{ij} + \sum g'_{ik} dx_k$$

in $\Omega_{R[x_1, \dots, x_n]/R}$ for some $h_{ij} \in R[x_1, \dots, x_n]$ and $g_{ij}, g'_{ik} \in I$. Choose a finitely generated \mathbf{Z} -subalgebra $R_0 \subset R$ containing all the coefficients of the polynomials g_{ij}, h_{ij}, g'_{ik} . Set $S_0 = R_0[x_1, \dots, x_n]/(g_{ij}, g'_{ik})$. This works. \square

Lemma 10.144.4. *Let $R \rightarrow S$ be a ring map. If $R \rightarrow S$ is unramified, then there exists an idempotent $e \in S \otimes_R S$ such that $S \otimes_R S \rightarrow S$ is isomorphic to $S \otimes_R S \rightarrow (S \otimes_R S)_e$.*

Proof. Let $J = \text{Ker}(S \otimes_R S \rightarrow S)$. By assumption $J/J^2 = 0$, see Lemma 10.127.13. Since S is of finite type over R we see that J is finitely generated, namely by $x_i \otimes 1 - 1 \otimes x_i$, where x_i generate S over R . We win by Lemma 10.20.5. \square

Lemma 10.144.5. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over \mathfrak{p} in R . If S/R is unramified at \mathfrak{q} then*

- (1) *we have $\mathfrak{p}S_{\mathfrak{q}} = \mathfrak{q}S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and*
- (2) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable.*

Proof. We may first replace S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ and assume that $R \rightarrow S$ is unramified. The base change $S \otimes_R \kappa(\mathfrak{p})$ is unramified over $\kappa(\mathfrak{p})$ by Lemma 10.144.3. By Lemma 10.135.3 it is smooth hence étale over $\kappa(\mathfrak{p})$. Hence we see that $S \otimes_R \kappa(\mathfrak{p}) = (R \setminus \mathfrak{p})^{-1} S / \mathfrak{p}S$ is a product of finite separable field extensions of $\kappa(\mathfrak{p})$ by Lemma 10.138.4. This implies the lemma. \square

Lemma 10.144.6. *Let $R \rightarrow S$ be a finite type ring map. Let \mathfrak{q} be a prime of S . If $R \rightarrow S$ is unramified at \mathfrak{q} then $R \rightarrow S$ is quasi-finite at \mathfrak{q} . In particular, an unramified ring map is quasi-finite.*

Proof. An unramified ring map is of finite type. Thus it is clear that the second statement follows from the first. To see the first statement apply the characterization of Lemma 10.118.2 part (2) using Lemma 10.144.5. \square

Lemma 10.144.7. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over a prime \mathfrak{p} of R . If*

- (1) *$R \rightarrow S$ is of finite type,*
- (2) *$\mathfrak{p}S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and*
- (3) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable,*

then $R \rightarrow S$ is unramified at \mathfrak{q} .

Proof. By Lemma 10.144.3 (8) it suffices to show that $\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})}$ is zero when localized at \mathfrak{q} . Hence we may replace S by $S \otimes_R \kappa(\mathfrak{p})$ and R by $\kappa(\mathfrak{p})$. In other words, we may assume that $R = k$ is a field and S is a finite type k -algebra. In this case the hypotheses imply that $S_{\mathfrak{q}} \cong \kappa(\mathfrak{q})$ and hence $S = \kappa(\mathfrak{q}) \times S'$ (see Lemma 10.118.1). Hence $(\Omega_{S/k})_{\mathfrak{q}} = \Omega_{\kappa(\mathfrak{q})/k}$ which is zero as desired. \square

Proposition 10.144.8. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \rightarrow S$ is unramified at \mathfrak{q} , then there exist*

- (1) a $g \in S$, $g \notin \mathfrak{q}$,
- (2) a standard étale ring map $R \rightarrow S'$, and
- (3) a surjective R -algebra map $S' \rightarrow S_g$.

Proof. This proof is the “same” as the proof of Proposition 10.138.17. The proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 10.144.1 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is unramified. Thus we may assume that S is unramified over R .

Step 2. By Lemma 10.144.3 there exists an unramified ring map $R_0 \rightarrow S_0$ with R_0 of finite type over \mathbf{Z} , and a ring map $R_0 \rightarrow R$ such that S is a quotient of $R \otimes_{R_0} S_0$. Denote \mathfrak{q}_0 the prime of S_0 corresponding to \mathfrak{q} . If we show the result for $(R_0 \rightarrow S_0, \mathfrak{q}_0)$ then the result follows for $(R \rightarrow S, \mathfrak{q})$ by base change. Hence we may assume that R is Noetherian.

Step 3. Note that $R \rightarrow S$ is quasi-finite by Lemma 10.144.6. By Lemma 10.119.15 there exists a finite ring map $R \rightarrow S'$, an R -algebra map $S' \rightarrow S$, an element $g' \in S'$ such that $g' \notin \mathfrak{q}$ such that $S' \rightarrow S$ induces an isomorphism $S'_{g'} \cong S_{g'}$. (Note that S' may not be unramified over R .) Thus we may assume that (a) R is Noetherian, (b) $R \rightarrow S$ is finite and (c) $R \rightarrow S$ is unramified at \mathfrak{q} (but no longer necessarily unramified at all primes).

Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to \mathfrak{q} . Consider the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 10.51.2) and so a finite product of local rings

$$S \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1}^n A_i$$

see Proposition 10.59.6. One of the factors, say A_1 , is the local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 10.144.5. The other factors correspond to the other primes, say $\mathfrak{q}_2, \dots, \mathfrak{q}_n$ of S lying over \mathfrak{p} .

Step 5. We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha = 0$). Note that for any $\lambda \in \kappa(\mathfrak{p})^*$ the element $\lambda\alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$\bar{t} = (\alpha, 0, \dots, 0) \in \prod_{i=1}^n A_i = S \otimes_R \kappa(\mathfrak{p}).$$

After possibly replacing α by $\lambda\alpha$ as above we may assume that \bar{t} is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the R -algebra map $R[x] \rightarrow S$ which maps x to

t. Set $S' = R[x]/I$, so $S' \subset S$. Here is a diagram

$$\begin{array}{ccccc}
 R[x] & \longrightarrow & S' & \longrightarrow & S \\
 & \nearrow & & \nearrow & \\
 R & & & &
 \end{array}$$

By construction the primes \mathfrak{q}_j , $j \geq 2$ of S all lie over the prime (\mathfrak{p}, x) of $R[x]$, whereas the prime \mathfrak{q} lies over a different prime of $R[x]$ because $\alpha \neq 0$.

Step 6. Denote $\mathfrak{q}' \subset S'$ the prime of S' corresponding to \mathfrak{q} . By the above \mathfrak{q} is the only prime of S lying over \mathfrak{q}' . Thus we see that $S_{\mathfrak{q}} = S_{\mathfrak{q}'}$, see Lemma 10.40.11 (we have going up for $S' \rightarrow S$ by Lemma 10.35.20 since $S' \rightarrow S$ is finite as $R \rightarrow S$ is finite). It follows that $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is finite and injective as the localization of the finite injective ring map $S' \rightarrow S$. Consider the maps of local rings

$$R_{\mathfrak{p}} \rightarrow S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$$

The second map is finite and injective. We have $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} = \kappa(\mathfrak{q})$, see Lemma 10.144.5. Hence a fortiori $S_{\mathfrak{q}}/\mathfrak{q}'S_{\mathfrak{q}} = \kappa(\mathfrak{q})$. Since

$$\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}') \subset \kappa(\mathfrak{q})$$

and since α is in the image of $\kappa(\mathfrak{q}')$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa(\mathfrak{q}') = \kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 10.19.1 applied to the $S'_{\mathfrak{q}'}$ -module map $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$, the map $S'_{\mathfrak{q}'} \rightarrow S_{\mathfrak{q}}$ is surjective. In other words, $S'_{\mathfrak{q}'} \cong S_{\mathfrak{q}}$.

Step 7. By Lemma 10.122.7 there exist $g \in S$, $g \notin \mathfrak{q}$ and $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S'_{g'} \cong S_g$. As R is Noetherian the ring S' is finite over R because it is an R -submodule of the finite R -module S . Hence after replacing S by S' we may assume that (a) R is Noetherian, (b) S finite over R , (c) S is unramified over R at \mathfrak{q} , and (d) $S = R[x]/I$.

Step 8. Consider the ring $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]/\bar{I}$ where $\bar{I} = I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by I in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\bar{I} = (\bar{h})$ for some monic $\bar{h} \in \kappa(\mathfrak{p})$. After replacing \bar{h} by $\lambda \cdot \bar{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that \bar{h} is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose h monic.) Also, as in Step 4 we know that $S \otimes_R \kappa(\mathfrak{p}) = A_1 \times \dots \times A_n$ with $A_1 = \kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and A_2, \dots, A_n local. This implies that

$$\bar{h} = \bar{h}_1 \bar{h}_2^{e_2} \dots \bar{h}_n^{e_n}$$

for certain pairwise coprime irreducible monic polynomials $\bar{h}_i \in \kappa(\mathfrak{p})[x]$ and certain $e_2, \dots, e_n \geq 1$. Here the numbering is chosen so that $A_i = \kappa(\mathfrak{p})[x]/(\bar{h}_i^{e_i})$ as $\kappa(\mathfrak{p})[x]$ -algebras. Note that \bar{h}_1 is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \rightarrow R[x]/I$ is finite hence integral. Denote \bar{m} the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$\bar{m} = \bar{k} \bar{h}_1^{d_1} \bar{h}_2^{d_2} \dots \bar{h}_n^{d_n}$$

for some $d_1 \geq 1$, $d_j \geq e_j$, $j = 2, \dots, n$ and $\bar{k} \in \kappa(\mathfrak{p})[x]$ prime to all the \bar{h}_i . Set $f = m^l + h$ where $l \deg(m) > \deg(h)$, and $l \geq 2$. Then f is monic as a polynomial

over R . Also, the image \bar{f} of f in $\kappa(\mathfrak{p})[x]$ factors as

$$\bar{f} = \bar{h}_1 \bar{h}_2^{e_2} \dots \bar{h}_n^{e_n} + k \bar{h}_1^{-l_1} \bar{h}_2^{-l_2} \dots \bar{h}_n^{-l_n} = \bar{h}_1 (\bar{h}_2^{e_2} \dots \bar{h}_n^{e_n} + k \bar{h}_1^{-l_1-1} \bar{h}_2^{-l_2} \dots \bar{h}_n^{-l_n}) = \bar{h}_1 \bar{w}$$

with \bar{w} a polynomial relatively prime to \bar{h}_1 . Set $g = f'$ (the derivative with respect to x).

Step 10. The ring map $R[x] \rightarrow S = R[x]/I$ has the properties: (1) it maps f to zero, and (2) it maps g to an element of $S \setminus \mathfrak{q}$. The first assertion is clear since f is an element of I . For the second assertion we just have to show that g does not map to zero in $\kappa(\mathfrak{q}) = \kappa(\mathfrak{p})[x]/(\bar{h}_1)$. The image of g in $\kappa(\mathfrak{p})[x]$ is the derivative of \bar{f} . Thus (2) is clear because

$$\bar{g} = \frac{d\bar{f}}{dx} = \bar{w} \frac{d\bar{h}_1}{dx} + \bar{h}_1 \frac{d\bar{w}}{dx},$$

\bar{w} is prime to \bar{h}_1 and \bar{h}_1 is separable.

Step 11. We conclude that $\varphi : R[x]/(f) \rightarrow S$ is a surjective ring map, $R[x]_g/(f)$ is étale over R (because it is standard étale, see Lemma 10.138.15) and $\varphi(g) \notin \mathfrak{q}$. Thus the map $(R[x]/(f))_g \rightarrow S_{\varphi(g)}$ is the desired surjection. \square

Lemma 10.144.9. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over $\mathfrak{p} \subset R$. Assume that $R \rightarrow S$ is of finite type and unramified at \mathfrak{q} . Then there exist*

- (1) an étale ring map $R \rightarrow R'$,
- (2) a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} .
- (3) a product decomposition

$$R' \otimes_R S = A \times B$$

with the following properties

- (1) $R' \rightarrow A$ is surjective, and
- (2) $\mathfrak{p}'A$ is a prime of A lying over \mathfrak{p}' and over \mathfrak{q} .

Proof. We may replace $(R \rightarrow S, \mathfrak{p}, \mathfrak{q})$ with any base change $(R' \rightarrow R' \otimes_R S, \mathfrak{p}', \mathfrak{q}')$ by a étale ring map $R \rightarrow R'$ with a prime \mathfrak{p}' lying over \mathfrak{p} , and a choice of \mathfrak{q}' lying over both \mathfrak{q} and \mathfrak{p}' . Note also that given $R \rightarrow R'$ and \mathfrak{p}' a suitable \mathfrak{q}' can always be found.

The assumption that $R \rightarrow S$ is of finite type means that we may apply Lemma 10.138.24. Thus we may assume that $S = A_1 \times \dots \times A_n \times B$, that each $R \rightarrow A_i$ is finite with exactly one prime \mathfrak{r}_i lying over \mathfrak{p} such that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is purely inseparable and that $R \rightarrow B$ is not quasi-finite at any prime lying over \mathfrak{p} . Then clearly $\mathfrak{q} = \mathfrak{r}_i$ for some i , since an unramified morphism is quasi-finite (see Lemma 10.144.6). Say $\mathfrak{q} = \mathfrak{r}_1$. By Lemma 10.144.5 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_1)$ is separable hence the trivial field extension, and that $\mathfrak{p}(A_1)_{\mathfrak{r}_1}$ is the maximal ideal. Also, by Lemma 10.40.11 (which applies to $R \rightarrow A_1$ because a finite ring map satisfies going up by Lemma 10.35.20) we have $(A_1)_{\mathfrak{r}_1} = (A_1)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 10.19.1 that the map of local rings $R_{\mathfrak{p}} \rightarrow (A_1)_{\mathfrak{p}} = (A_1)_{\mathfrak{r}_1}$ is surjective. Since A_1 is finite over R we see that there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $R_f \rightarrow (A_1)_f$ is surjective. After replacing R by R_f we win. \square

Lemma 10.144.10. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{p} be a prime of R . If $R \rightarrow S$ is unramified then there exist*

- (1) an étale ring map $R \rightarrow R'$,

- (2) a prime $\mathfrak{p}' \subset R'$ lying over \mathfrak{p} .
- (3) a product decomposition

$$R' \otimes_R S = A_1 \times \dots \times A_n \times B$$

with the following properties

- (1) $R' \rightarrow A_i$ is surjective,
- (2) $\mathfrak{p}'A_i$ is a prime of A_i lying over \mathfrak{p}' , and
- (3) there is no prime of B lying over \mathfrak{p}' .

Proof. We may apply Lemma 10.138.24. Thus, after an étale base change, we may assume that $S = A_1 \times \dots \times A_n \times B$, that each $R \rightarrow A_i$ is finite with exactly one prime \mathfrak{r}_i lying over \mathfrak{p} such that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is purely inseparable, and that $R \rightarrow B$ is not quasi-finite at any prime lying over \mathfrak{p} . Since $R \rightarrow S$ is quasi-finite (see Lemma 10.144.6) we see there is no prime of B lying over \mathfrak{p} . By Lemma 10.144.5 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is separable hence the trivial field extension, and that $\mathfrak{p}(A_i)_{\mathfrak{r}_i}$ is the maximal ideal. Also, by Lemma 10.40.11 (which applies to $R \rightarrow A_i$ because a finite ring map satisfies going up by Lemma 10.35.20) we have $(A_i)_{\mathfrak{r}_i} = (A_i)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 10.19.1 that the map of local rings $R_{\mathfrak{p}} \rightarrow (A_i)_{\mathfrak{p}} = (A_i)_{\mathfrak{r}_i}$ is surjective. Since A_i is finite over R we see that there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $R_f \rightarrow (A_i)_f$ is surjective. After replacing R by R_f we win. \square

10.145. Henselian local rings

In this section we discuss a bit the notion of a henselian local ring. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. For $a \in R$ we denote \bar{a} the image of a in κ . For a polynomial $f \in R[T]$ we often denote \bar{f} the image of f in $\kappa[T]$. Given a polynomial $f \in R[T]$ we denote f' the derivative of f with respect to T . Note that $\overline{f'} = \bar{f}'$.

Definition 10.145.1. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.

- (1) We say R is *henselian* if for every monic $f \in R[T]$ and every root $a_0 \in \kappa$ of \bar{f} such that $\bar{f}'(a_0) \neq 0$ there exists an $a \in R$ such that $f(a) = 0$ and $a_0 = \bar{a}$.
- (2) We say R is *strictly henselian* if R is henselian and its residue field is separably algebraically closed.

Note that the condition $\bar{f}'(a_0) \neq 0$ is equivalent to the condition that a_0 is a simple root of the polynomial \bar{f} . In fact, it implies that the lift $a \in R$, if it exists, is unique.

Lemma 10.145.2. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $f \in R[T]$. Let $a, b \in R$ such that $f(a) = f(b) = 0$, $a = b \pmod{\mathfrak{m}}$, and $f'(a) \notin \mathfrak{m}$. Then $a = b$.

Proof. Write $f(x+y) - f(x) = f'(x)y + g(x,y)y^2$ in $R[x,y]$ (this is possible as one sees by expanding $f(x+y)$; details omitted). Then we see that $0 = f(b) - f(a) = f(a + (b-a)) - f(a) = f'(a)(b-a) + c(b-a)^2$ for some $c \in R$. By assumption $f'(a)$ is a unit in R . Hence $(b-a)(1 + f'(a)^{-1}c(b-a)) = 0$. By assumption $b-a \in \mathfrak{m}$, hence $1 + f'(a)^{-1}c(b-a)$ is a unit in R . Hence $b-a = 0$ in R . \square

Here is the characterization of henselian local rings.

Lemma 10.145.3. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. The following are equivalent

- (1) R is henselian,
- (2) for every $f \in R[T]$ and every root $a_0 \in \kappa$ of \bar{f} such that $\bar{f}'(a_0) \neq 0$ there exists an $a \in R$ such that $f(a) = 0$ and $a_0 = \bar{a}$,

- (3) for any monic $f \in R[T]$ and any factorization $\bar{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \bar{g}$ and $h_0 = \bar{h}$,
- (4) for any monic $f \in R[T]$ and any factorization $\bar{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \bar{g}$ and $h_0 = \bar{h}$ and moreover $\deg_T(g) = \deg_T(g_0)$,
- (5) for any $f \in R[T]$ and any factorization $\bar{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \bar{g}$ and $h_0 = \bar{h}$,
- (6) for any $f \in R[T]$ and any factorization $\bar{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \bar{g}$ and $h_0 = \bar{h}$ and moreover $\deg_T(g) = \deg_T(g_0)$,
- (7) for any étale ring map $R \rightarrow S$ and prime \mathfrak{q} of S lying over \mathfrak{m} with $\kappa = \kappa(\mathfrak{q})$ there exists a section $\tau : S \rightarrow R$ of $R \rightarrow S$,
- (8) for any étale ring map $R \rightarrow S$ and prime \mathfrak{q} of S lying over \mathfrak{m} with $\kappa = \kappa(\mathfrak{q})$ there exists a section $\tau : S \rightarrow R$ of $R \rightarrow S$ with $\mathfrak{q} = \tau^{-1}(\mathfrak{m})$,
- (9) any finite R -algebra is a product of local rings,
- (10) any finite R -algebra is a finite product of local rings,
- (11) any finite type R -algebra S can be written as $A \times B$ with $R \rightarrow A$ finite and $R \rightarrow B$ not quasi-finite at any prime lying over \mathfrak{m} ,
- (12) any finite type R -algebra S can be written as $A \times B$ with $R \rightarrow A$ finite such that each irreducible component of $\text{Spec}(B \otimes_R \kappa)$ has dimension ≥ 1 , and
- (13) any quasi-finite R -algebra S can be written as $S = A \times B$ with $R \rightarrow A$ finite such that $B \otimes_R \kappa = 0$.

Proof. Here is a list of the easier implications:

- 2 \Rightarrow 1 because in (2) we consider all polynomials and in (1) only monic ones,
- 5 \Rightarrow 3 because in (5) we consider all polynomials and in (3) only monic ones,
- 6 \Rightarrow 4 because in (6) we consider all polynomials and in (4) only monic ones,
- 4 \Rightarrow 3 is obvious,
- 6 \Rightarrow 5 is obvious,
- 8 \Rightarrow 7 is obvious,
- 10 \Rightarrow 9 is obvious,
- 11 \Leftrightarrow 12 by definition of being quasi-finite at a prime,
- 11 \Rightarrow 13 by definition of being quasi-finite,

Proof of 1 \Rightarrow 8. Assume (1). Let $R \rightarrow S$ be étale, and let $\mathfrak{q} \subset S$ be a prime ideal such that $\kappa(\mathfrak{q}) \cong \kappa$. By Proposition 10.138.17 we can find a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_g$ is standard étale. After replacing S by S_g we may assume that $S = R[t]_g/(f)$ is standard étale. Since the prime \mathfrak{q} has residue field κ it corresponds to a root a_0 of \bar{f} which is not a root of \bar{g} . By definition of a standard étale algebra this also means that $\bar{f}'(a_0) \neq 0$. Since also f is monic by definition of a standard étale algebra again we may use that R is henselian to conclude that there exists an $a \in R$ with $a_0 = \bar{a}$ such that $f(a) = 0$. This implies that $g(a)$ is a unit of R and we obtain the desired map $\tau : S = R[t]_g/(f) \rightarrow R$ by the rule $t \mapsto a$. By construction $\tau^{-1}(\mathfrak{q}) = \mathfrak{m}$. This proves (8) holds.

Proof of 7 \Rightarrow 8. (This is really unimportant and should be skipped.) Assume (7) holds and assume $R \rightarrow S$ is étale. Let $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ be the other primes of S lying over \mathfrak{m} . Then we can find a $g \in S$, $g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_i$ for $i = 1, \dots, r$, see Lemma 10.14.2. Apply (7) to the étale ring map $R \rightarrow S_g$ and the prime $\mathfrak{q}S_g$. This gives a

section $\tau_g : S_g \rightarrow R$ such that the composition $\tau : S \rightarrow S_g \rightarrow R$ has the property $\tau^{-1}(\mathfrak{q}) = \mathfrak{m}$. Minor details omitted.

Proof of 8 \Rightarrow 11. Assume (8) and let $R \rightarrow S$ be a finite type ring map. Apply Lemma 10.138.23. We find an étale ring map $R \rightarrow R'$ and a prime $\mathfrak{m}' \subset R'$ lying over \mathfrak{m} with $\kappa = \kappa(\mathfrak{m}')$ such that $R' \otimes_R S = A' \times B'$ with A' finite over R' and B' not quasi-finite over R' at any prime lying over \mathfrak{m}' . Apply (8) to get a section $\tau : R' \rightarrow R$ with $\mathfrak{m} = \tau^{-1}(\mathfrak{m}')$. Then use that

$$S = (S \otimes_R R') \otimes_{R', \tau} R = (A' \times B') \otimes_{R', \tau} R = (A' \otimes_{R', \tau} R) \times (B' \otimes_{R', \tau} R)$$

which gives a decomposition as in (11).

Proof of 8 \Rightarrow 10. Assume (8) and let $R \rightarrow S$ be a finite ring map. Apply Lemma 10.138.23. We find an étale ring map $R \rightarrow R'$ and a prime $\mathfrak{m}' \subset R'$ lying over \mathfrak{m} with $\kappa = \kappa(\mathfrak{m}')$ such that $R' \otimes_R S = A'_1 \times \dots \times A'_n \times B'$ with A'_i finite over R' having exactly one prime over \mathfrak{m}' and B' not quasi-finite over R' at any prime lying over \mathfrak{m}' . Apply (8) to get a section $\tau : R' \rightarrow R$ with $\mathfrak{m} = \tau^{-1}(\mathfrak{m}')$. Then we obtain

$$\begin{aligned} S &= (S \otimes_R R') \otimes_{R', \tau} R \\ &= (A'_1 \times \dots \times A'_n \times B') \otimes_{R', \tau} R \\ &= (A'_1 \otimes_{R', \tau} R) \times \dots \times (A'_n \otimes_{R', \tau} R) \times (B' \otimes_{R', \tau} R) \\ &= A_1 \times \dots \times A_n \times B \end{aligned}$$

The factor B is finite over R but $R \rightarrow B$ is not quasi-finite at any prime lying over \mathfrak{m} . Hence $B = 0$. The factors A_i are finite R -algebras having exactly one prime lying over \mathfrak{m} , hence they are local rings. This proves that S is a finite product of local rings.

Proof of 9 \Rightarrow 10. This holds because if S is finite over the local ring R , then it has at most finitely many maximal ideals. Namely, by going up for $R \rightarrow S$ the maximal ideals of S all lie over \mathfrak{m} , and $S/\mathfrak{m}S$ is Artinian hence has finitely many primes.

Proof of 10 \Rightarrow 1. Assume (10). Let $f \in R[T]$ be a monic polynomial and $a_0 \in \kappa$ a simple root of \bar{f} . Then $S = R[T]/(f)$ is a finite R -algebra. Applying (10) we get $S = A_1 \times \dots \times A_r$ is a finite product of local R -algebras. In particular we see that $S/\mathfrak{m}S = \prod A_i/\mathfrak{m}A_i$ is the decomposition of $\kappa[T]/(\bar{f})$ as a product of local rings. This means that one of the factors, say $A_1/\mathfrak{m}A_1$ is the quotient $\kappa[T]/(\bar{f}) \rightarrow \kappa[T]/(T - a_0)$. Since A_1 is a summand of the finite free R -module S it is a finite free R -module itself. As $A_1/\mathfrak{m}A_1$ is a κ -vector space of dimension 1 we see that $A_1 \cong R$ as an R -module. Clearly this means that $R \rightarrow A_1$ is an isomorphism. Let $a \in R$ be the image of T under the map $R[T] \rightarrow S \rightarrow A_1 \rightarrow R$. Then $f(a) = 0$ and $\bar{a} = a_0$ as desired.

Proof of 13 \Rightarrow 1. Assume (13). Let $f \in R[T]$ be a monic polynomial and $a_0 \in \kappa$ a simple root of \bar{f} . Then $S_1 = R[T]/(f)$ is a finite R -algebra. Let $g \in R[T]$ be any element such that $\bar{g} = \bar{f}/(T - a_0)$. Then $S = (S_1)_g$ is a quasi-finite R -algebra such that $S \otimes_R \kappa \cong \kappa[T]_{\bar{g}}/(\bar{f}) \cong \kappa[T]/(T - a_0) \cong \kappa$. Applying (13) to S we get $S = A \times B$ with A finite over R and $B \otimes_R \kappa = 0$. In particular we see that $\kappa \cong S/\mathfrak{m}S = A/\mathfrak{m}A$. Since A is a summand of the flat R -algebra S we see that it is finite flat, hence free over R . As $A/\mathfrak{m}A$ is a κ -vector space of dimension 1 we see that $A \cong R$ as an R -module. Clearly this means that $R \rightarrow A$ is an isomorphism. Let $a \in R$ be the

image of T under the map $R[T] \rightarrow S \rightarrow A \rightarrow R$. Then $f(a) = 0$ and $\bar{a} = a_0$ as desired.

Proof of $8 \Rightarrow 2$. Assume (8). Let $f \in R[T]$ be any polynomial and let $a_0 \in \kappa$ be a simple root. Then the algebra $S = R[T]_{f'}/(f)$ is étale over R . Let $\mathfrak{q} \subset S$ be the prime generated by \mathfrak{m} and $T - b$ where $b \in R$ is any element such that $\bar{b} = a_0$. Apply (8) to S and \mathfrak{q} to get $\tau : S \rightarrow R$. Then the image $\tau(T) = a \in R$ works in (2).

At this point we see that (1), (2), (7), (8), (9), (10), (11), (12), (13) are all equivalent. The weakest assertion of (3), (4), (5) and (6) is (3) and the strongest is (6). Hence we still have to prove that (3) implies (1) and (1) implies (6).

Proof of $3 \Rightarrow 1$. Assume (3). Let $f \in R[T]$ be monic and let $a_0 \in \kappa$ be a simple root of \bar{f} . This gives a factorization $\bar{f} = (T - a_0)h_0$ with $h_0(a_0) \neq 0$, so $\gcd(T - a_0, h_0) = 1$. Apply (3) to get a factorization $f = gh$ with $\bar{g} = T - a_0$ and $\bar{h} = h_0$. Set $S = R[T]/(f)$ which is a finite free R -algebra. We will write g, h also for the images of g and h in S . Then $gS + hS = S$ by Nakayama's Lemma 10.19.1 as the equality holds modulo \mathfrak{m} . Since $gh = f = 0$ in S this also implies that $gS \cap hS = 0$. Hence by the Chinese Remainder theorem we obtain $S = S/(g) \times S/(h)$. This implies that $A = S/(g)$ is a summand of a finite free R -module, hence finite free. Moreover, the rank of A is 1 as $A/\mathfrak{m}A = \kappa[T]/(T - a_0)$. Thus the map $R \rightarrow A$ is an isomorphism. Setting $a \in R$ equal to the image of T under the maps $R[T] \rightarrow S \rightarrow A \rightarrow R$ gives an element of R with $f(a) = 0$ and $\bar{a} = a_0$.

Proof of $1 \Rightarrow 6$. Assume (1) or equivalently all of (1), (2), (7), (8), (9), (10), (11), (12), (13). Let $f \in R[T]$ be a polynomial. Suppose that $\bar{f} = g_0 h_0$ is a factorization with $\gcd(g_0, h_0) = 1$. We may and do assume that g_0 is monic. Consider $S = R[T]/(f)$. Because we have the factorization we see that the coefficients of f generate the unit ideal in R . This implies that S has finite fibres over R , hence is quasi-finite over R . It also implies that S is flat over R by Lemma 10.95.2. Combining (13) and (10) we may write $S = A_1 \times \dots \times A_n \times B$ where each A_i is local and finite over R , and $B \otimes_R \kappa = 0$. After reordering the factors A_1, \dots, A_n we may assume that

$$\kappa[T]/(g_0) = A_1/\mathfrak{m}A_1 \times \dots \times A_r/\mathfrak{m}A_r, \quad \kappa[T]/(h_0) = A_{r+1}/\mathfrak{m}A_{r+1} \times \dots \times A_n/\mathfrak{m}A_n$$

as quotients of $\kappa[T]$. The finite flat R -algebra $A = A_1 \times \dots \times A_r$ is free as an R -module, see Lemma 10.75.4. Its rank is $\deg_T(g_0)$. Let $g \in R[T]$ be the characteristic polynomial of the R -linear operator $T : A \rightarrow A$. Then g is a monic polynomial of degree $\deg_T(g) = \deg_T(g_0)$ and moreover $\bar{g} = g_0$. By Cayley-Hamilton (Lemma 10.15.1) we see that $g(T_A) = 0$ where T_A indicates the image of T in A . Hence we obtain a well defined surjective map $R[T]/(g) \rightarrow A$ which is an isomorphism by Nakayama's Lemma 10.19.1. The map $R[T] \rightarrow A$ factors through $R[T]/(f)$ by construction hence we may write $f = gh$ for some h . This finishes the proof. \square

Lemma 10.145.4. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring.*

- (1) *If $R \subset S$ is a finite ring extension then S is a finite product of henselian local rings.*
- (2) *If $R \subset S$ is a finite local homomorphism of local rings, then S is a henselian local ring.*
- (3) *If $R \rightarrow S$ is a finite type ring map, and \mathfrak{q} is a prime of S lying over \mathfrak{m} at which $R \rightarrow S$ is quasi-finite, then $S_{\mathfrak{q}}$ is henselian.*

(4) If $R \rightarrow S$ is quasi-finite then $S_{\mathfrak{q}}$ is henselian for every prime \mathfrak{q} lying over \mathfrak{m} .

Proof. Part (2) implies part (1) since S as in part (1) is a finite product of its localizations at the primes lying over \mathfrak{m} . Part (2) follows from Lemma 10.145.3 part (10) since any finite S -algebra is also a finite R -algebra. If $R \rightarrow S$ and \mathfrak{q} are as in (3), then $S_{\mathfrak{q}}$ is a local ring of a finite R -algebra by Lemma 10.145.3 part (11). Hence (3) follows from (1). Part (4) follows from part (3). \square

Lemma 10.145.5. *A filtered colimit of henselian local rings along local homomorphisms is henselian.*

Proof. Categories, Lemma 4.21.3 says that this is really just a question about a colimit of henselian local rings over a directed partially ordered set. Let $(R_i, \varphi_{ii'})$ be such a system with each $\varphi_{ii'}$ local. Then $R = \text{colim}_i R_i$ is local, and its residue field κ is $\text{colim}_i \kappa_i$ (argument omitted). Suppose that $f \in R[T]$ is monic and that $a_0 \in \kappa$ is a simple root of \bar{f} . Then for some large enough i there exists an $f_i \in R_i[T]$ mapping to f and an $a_{0,i} \in \kappa_i$ mapping to a_0 . Since $\bar{f}_i(a_{0,i}) \in \kappa_i$, resp. $\bar{f}'_i(a_{0,i}) \in \kappa_i$ maps to $0 = \bar{f}(a_0) \in \kappa$, resp. $0 \neq \bar{f}'(a_0) \in \kappa$ we conclude that $a_{0,i}$ is a simple root of \bar{f}_i . As R_i is henselian we can find $a_i \in R_i$ such that $f_i(a_i) = 0$ and $a_{0,i} = \bar{a}_i$. Then the image $a \in R$ of a_i is the desired solution. Thus R is henselian. \square

Lemma 10.145.6. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. Any finite type R -algebra S can be written as $S = A_1 \times \dots \times A_n \times B$ with A_i local and finite over R and $R \rightarrow B$ not quasi-finite at any prime of B lying over \mathfrak{m} .*

Proof. This is a combination of parts (11) and (10) of Lemma 10.145.3. \square

Lemma 10.145.7. *Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Any finite type R -algebra S can be written as $S = A_1 \times \dots \times A_n \times B$ with A_i local and finite over R and $\kappa \subset \kappa(\mathfrak{m}_{A_i})$ finite purely inseparable and $R \rightarrow B$ not quasi-finite at any prime of B lying over \mathfrak{m} .*

Proof. First write $S = A_1 \times \dots \times A_n \times B$ as in Lemma 10.145.6. The field extension $\kappa \subset \kappa(\mathfrak{m}_{A_i})$ is finite and κ is separably algebraically closed, hence it is finite purely inseparable. \square

Lemma 10.145.8. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. The category of finite étale ring extensions $R \rightarrow S$ is equivalent to the category of finite étale algebras $\kappa \rightarrow \bar{S}$ via the functor $S \mapsto S/\mathfrak{m}S$.*

Proof. Denote $\mathcal{C} \rightarrow \mathcal{D}$ the functor of categories of the statement. Suppose that $R \rightarrow S$ is finite étale. Then we may write

$$S = A_1 \times \dots \times A_n$$

with A_i local and finite étale over S , use either Lemma 10.145.6 or Lemma 10.145.3 part (10). In particular $A_i/\mathfrak{m}A_i$ is a finite separable field extension of κ , see Lemma 10.138.5. Thus we see that every object of \mathcal{C} and \mathcal{D} decomposes canonically into irreducible pieces which correspond via the given functor. Next, suppose that S_1, S_2 are finite étale over R such that $\kappa_1 = S_1/\mathfrak{m}S_1$ and $\kappa_2 = S_2/\mathfrak{m}S_2$ are fields (finite separable over κ). Then $S_1 \otimes_R S_2$ is finite étale over R and we may write

$$S_1 \otimes_R S_2 = A_1 \times \dots \times A_n$$

as before. Then we see that $\text{Hom}_R(S_1, S_2)$ is identified with the set of indices $i \in \{1, \dots, n\}$ such that $S_2 \rightarrow A_i$ is an isomorphism. To see this use that given any R -algebra map $\varphi : S_1 \rightarrow S_2$ the map $\varphi \times 1 : S_1 \otimes_R S_2 \rightarrow S_2$ is surjective, and hence is equal to projection onto one of the factors A_i . But in exactly the same way we see that $\text{Hom}_\kappa(\kappa_1, \kappa_2)$ is identified with the set of indices $i \in \{1, \dots, n\}$ such that $\kappa_2 \rightarrow A_i/\mathfrak{m}A_i$ is an isomorphism. By the discussion above these sets of indices match, and we conclude that our functor is fully faithful. Finally, let $\kappa \subset \kappa'$ be a finite separable field extension. By Lemma 10.138.16 there exists an étale ring map $R \rightarrow S$ and a prime \mathfrak{q} of S lying over \mathfrak{m} such that $\kappa \subset \kappa(\mathfrak{q})$ is isomorphic to the given extension. By part (1) we may write $S = A_1 \times \dots \times A_n \times B$. Since $R \rightarrow S$ is quasi-finite we see that there exists no prime of B over \mathfrak{m} . Hence $S_{\mathfrak{q}}$ is equal to A_i for some i . Hence $R \rightarrow A_i$ is finite étale and produces the given residue field extension. Thus the functor is essentially surjective and we win. \square

Lemma 10.145.9. *Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Let $R \rightarrow S$ be an unramified ring map. Then*

$$S = A_1 \times \dots \times A_n \times B$$

with each $R \rightarrow A_i$ surjective and no prime of B lying over \mathfrak{m} .

Proof. First write $S = A_1 \times \dots \times A_n \times B$ as in Lemma 10.145.6. Now we see that $R \rightarrow A_i$ is finite unramified and A_i local. Hence the maximal ideal of A_i is $\mathfrak{m}A_i$ and its residue field $A_i/\mathfrak{m}A_i$ is a finite separable extension of κ , see Lemma 10.144.5. However, the condition that R is strictly henselian means that κ is separably algebraically closed, so $\kappa = A_i/\mathfrak{m}A_i$. By Nakayama's Lemma 10.19.1 we conclude that $R \rightarrow A_i$ is surjective as desired. \square

Lemma 10.145.10. *Let $(R, \mathfrak{m}, \kappa)$ be a complete local ring, see Definition 10.149.1. Then R is henselian.*

Proof. Let $f \in R[T]$ be monic. Denote $f_n \in R/\mathfrak{m}^{n+1}[T]$ the image. Denote f'_n the derivative of f_n with respect to T . Let $a_0 \in \kappa$ be a simple root of f_0 . We lift this to a solution of f over R inductively as follows: Suppose given $a_n \in R/\mathfrak{m}^{n+1}$ such that $a_n \bmod \mathfrak{m} = a_0$ and $f_n(a_n) = 0$. Pick any element $b \in R/\mathfrak{m}^{n+2}$ such that $a_n = b \bmod \mathfrak{m}^{n+1}$. Then $f_{n+1}(b) \in \mathfrak{m}^{n+1}/\mathfrak{m}^{n+2}$. Set

$$a_{n+1} = b - f_{n+1}(b)/f'_{n+1}(b)$$

(Newton's method). This makes sense as $f'_{n+1}(b) \in R/\mathfrak{m}^{n+1}$ is invertible by the condition on a_0 . Then we compute $f_{n+1}(a_{n+1}) = f_{n+1}(b) - f_{n+1}(b) = 0$ in R/\mathfrak{m}^{n+2} . Since the system of elements $a_n \in R/\mathfrak{m}^{n+1}$ so constructed is compatible we get an element $a \in \lim R/\mathfrak{m}^n = R$ (here we use that R is complete). Moreover, $f(a) = 0$ since it maps to zero in each R/\mathfrak{m}^n . Finally $\bar{a} = a_0$ and we win. \square

Lemma 10.145.11. *Let (R, \mathfrak{m}) be a local ring of dimension 0. Then R is henselian.*

Proof. Let $R \rightarrow S$ be a finite ring map. By Lemma 10.145.3 it suffices to show that S is a product of local rings. By Lemma 10.35.19 S has finitely many primes $\mathfrak{m}_1, \dots, \mathfrak{m}_r$ which all lie over \mathfrak{m} . There are no inclusions among these primes, see Lemma 10.35.18, hence they are all maximal. Every element of $\mathfrak{m}_1 \cap \dots \cap \mathfrak{m}_r$ is nilpotent by Lemma 10.16.2. It follows S is the product of the localizations of S at the primes \mathfrak{m}_i by Lemma 10.51.5. \square

Lemma 10.145.12. *Let $R \rightarrow S$ be a ring map with S henselian local. Given*

- (1) an étale ring map $R \rightarrow A$,
- (2) a prime \mathfrak{q} of A lying over $\mathfrak{p} = R \cap \mathfrak{m}_S$,
- (3) a $\kappa(\mathfrak{p})$ -algebra map $\kappa(\mathfrak{q}) \rightarrow S/\mathfrak{m}_S$,

then there exists a unique homomorphism of R -algebras $f : A \rightarrow S$ such that $\mathfrak{q} = f^{-1}(\mathfrak{m}_S)$.

Proof. Consider $A \otimes_R S$. This is an étale algebra over S , see Lemma 10.138.3. Moreover, the kernel

$$\mathfrak{q}' = \text{Ker}(A \otimes_R S \rightarrow \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{m}_S) \rightarrow \kappa(\mathfrak{m}_S))$$

of the map using the map given in (3) is a prime ideal lying over \mathfrak{m}_S with residue field equal to the residue field of S . Hence by Lemma 10.145.3 there exists a unique splitting $\tau : A \otimes_R S \rightarrow S$ with $\tau^{-1}(\mathfrak{m}_S) = \mathfrak{q}'$. Set f equal to the composition $A \rightarrow A \otimes_R S \rightarrow S$. □

Lemma 10.145.13. *Let $R \rightarrow S$ be a ring map with S henselian local. Given*

- (1) an R -algebra A which is a filtered colimit of étale R -algebras,
- (2) a prime \mathfrak{q} of A lying over $\mathfrak{p} = R \cap \mathfrak{m}_S$,
- (3) a $\kappa(\mathfrak{p})$ -algebra map $\kappa(\mathfrak{q}) \rightarrow S/\mathfrak{m}_S$,

then there exists a unique homomorphism of R -algebras $f : A \rightarrow S$ such that $\mathfrak{q} = f^{-1}(\mathfrak{m}_S)$.

Proof. Write $A = \text{colim } A_i$ as a filtered colimit of étale R -algebras. Set $\mathfrak{q}_i = A_i \cap \mathfrak{q}$. We obtain $f_i : A_i \rightarrow S$ by applying Lemma 10.145.12. Set $f = \text{colim } f_i$. □

Lemma 10.145.14. *Let R be a ring. Let $A \rightarrow B$ be an R -algebra homomorphism. If A and B are filtered colimits of étale R -algebras, then B is a filtered colimit of étale A -algebras.*

Proof. Write $A = \text{colim } A_i$ and $B = \text{colim } B_j$ as filtered colimits with A_i and B_j étale over R . For each i we can find a j such that $A_i \rightarrow B$ factors through B_j , see Lemma 10.123.2. The factorization $A_i \rightarrow B_j$ is étale by Lemma 10.138.9. Since $A \rightarrow A \otimes_{A_i} B_j$ is étale (Lemma 10.138.3) it suffices to prove that $B = \text{colim } A \otimes_{A_i} B_j$ where the colimit is over pairs (i, j) and factorizations $A_i \rightarrow B_j \rightarrow B$ of $A_i \rightarrow B$ (this is a directed system; details omitted). This is clear because $\text{colim } A \otimes_{A_i} B_j = A \otimes_A B = B$. □

Lemma 10.145.15. *Let R be a ring. Given a commutative diagram of ring maps*

$$\begin{array}{ccc} S & \longrightarrow & K \\ \uparrow & & \uparrow \\ R & \longrightarrow & S' \end{array}$$

where S, S' are henselian local, S, S' are filtered colimits of étale R -algebras, K is a field and the arrows $S \rightarrow K$ and $S' \rightarrow K$ identify K with the residue field of both S and S' . Then there exists a unique R -algebra isomorphism $S \rightarrow S'$ compatible with the maps to K .

Proof. Follows immediately from Lemma 10.145.13. □

Lemma 10.145.16. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. There exists a local ring map $R \rightarrow R^h$ with the following properties*

- (1) R^h is henselian,
- (2) R^h is a filtered colimit of étale R -algebras,
- (3) $\mathfrak{m}R^h$ is the maximal ideal of R^h , and
- (4) $\kappa = R^h/\mathfrak{m}R^h$.

Proof. Consider the category of pairs (S, \mathfrak{q}) where $R \rightarrow S$ is an étale ring map, and \mathfrak{q} is a prime of S lying over \mathfrak{m} with $\kappa = \kappa(\mathfrak{q})$. A morphism of pairs $(S, \mathfrak{q}) \rightarrow (S', \mathfrak{q}')$ is given by an R -algebra map $\varphi : S \rightarrow S'$ such that $\varphi^{-1}(\mathfrak{q}') = \mathfrak{q}$. We set

$$R^h = \operatorname{colim}_{(S, \mathfrak{q})} S.$$

This clearly implies that R^h is canonical, since no choices were made in this construction. Moreover, property (2) is clear.

Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the pair (R, \mathfrak{m}) and hence is not empty, which proves part (1) of Categories, Definition 4.19.1. Note that for any pair (S, \mathfrak{q}) the prime ideal \mathfrak{q} is maximal, for example since $\kappa \rightarrow S/\mathfrak{q} \subset \kappa(\mathfrak{q})$ are isomorphisms. Suppose that (S, \mathfrak{q}) and (S', \mathfrak{q}') are two objects. Set $S'' = S \otimes_R S'$ and $\mathfrak{q}'' = \mathfrak{q}S'' + \mathfrak{q}'S''$. Then $S''/\mathfrak{q}'' = S/\mathfrak{q} \otimes_R S'/\mathfrak{q}' = \kappa$ by what we said above. Moreover, $R \rightarrow S''$ is étale by Lemma 10.138.3. This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi : (S, \mathfrak{q}) \rightarrow (S', \mathfrak{q}')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi, S, \psi} S') \otimes_{S' \otimes_R S'} S'$$

with prime ideal

$$\mathfrak{q}'' = (\mathfrak{q}' \otimes S' + S' \otimes \mathfrak{q}') \otimes S' + (S' \otimes_{\varphi, S, \psi} S') \otimes \mathfrak{q}'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R . Moreover, the canonical map $S' \rightarrow S''$ (using the right most factor for example) equalizes φ and ψ . This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that R^h consists of triples (S, \mathfrak{q}, f) with $f \in S$, and two such triples (S, \mathfrak{q}, f) , (S', \mathfrak{q}', f') define the same element of R^h if and only if there exists a pair (S'', \mathfrak{q}'') and morphisms of pairs $\varphi : (S, \mathfrak{q}) \rightarrow (S'', \mathfrak{q}'')$ and $\varphi' : (S', \mathfrak{q}') \rightarrow (S'', \mathfrak{q}'')$ such that $\varphi(f) = \varphi'(f')$.

Suppose that $x \in R^h$. Represent x by a triple (S, \mathfrak{q}, f) . Let $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ be the other primes of S lying over \mathfrak{m} . Then we can find a $g \in S$, $g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_i$ for $i = 1, \dots, r$, see Lemma 10.14.2. Consider the morphism of pairs $(S, \mathfrak{q}) \rightarrow (S_g, \mathfrak{q}S_g)$. In this way we see that we may always assume that x is given by a triple (S, \mathfrak{q}, f) where \mathfrak{q} is the only prime of S lying over \mathfrak{m} , i.e., $\sqrt{\mathfrak{m}S} = \mathfrak{q}$. But since $R \rightarrow S$ is étale, we have $\mathfrak{m}S_{\mathfrak{q}} = \mathfrak{q}S_{\mathfrak{q}}$, see Lemma 10.138.5. Hence we actually get that $\mathfrak{m}S = \mathfrak{q}$.

Suppose that $x \notin \mathfrak{m}R^h$. Represent x by a triple (S, \mathfrak{q}, f) with $\mathfrak{m}S = \mathfrak{q}$. Then $f \notin \mathfrak{m}S$, i.e., $f \notin \mathfrak{q}$. Hence $(S, \mathfrak{q}) \rightarrow (S_f, \mathfrak{q}S_f)$ is a morphism of pairs such that the image of f becomes invertible. Hence x is invertible with inverse represented by the triple $(S_f, \mathfrak{q}S_f, 1/f)$. We conclude that R^h is a local ring with maximal ideal $\mathfrak{m}R^h$. The residue field is κ since we can define $R^h/\mathfrak{m}R^h \rightarrow \kappa$ by mapping a triple (S, \mathfrak{q}, f) to the residue class of f module \mathfrak{q} .

We still have to show that R^h is henselian. Namely, suppose that $P \in R^h[T]$ is a monic polynomial and $a_0 \in \kappa$ is a simple root of the reduction $\bar{P} \in \kappa[T]$. Then we can find a pair (S, \mathfrak{q}) such that P is the image of a monic polynomial $Q \in S[T]$. Since $S \rightarrow R^h$ induces an isomorphism of residue fields we see that $S' = S[T]/(Q)$ has a

prime ideal $\mathfrak{q}' = (\mathfrak{q}, T - a_0)$ at which $S \rightarrow S'$ is standard étale. Moreover, $\kappa = \kappa(\mathfrak{q}')$. Pick $g \in S'$, $g \notin \mathfrak{q}'$ such that $S'' = S'_g$ is étale over S . Then $(S, \mathfrak{q}) \rightarrow (S'', \mathfrak{q}'S'')$ is a morphism of pairs. Now that triple $(S'', \mathfrak{q}'S'', \text{class of } T)$ determines an element $a \in R^h$ with the properties $P(a) = 0$, and $\bar{a} = a_0$ as desired. \square

Lemma 10.145.17. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $\kappa \subset \kappa^{sep}$ be a separable algebraic closure. There exists a commutative diagram*

$$\begin{array}{ccccc} \kappa & \longrightarrow & \kappa & \longrightarrow & \kappa^{sep} \\ \uparrow & & \uparrow & & \uparrow \\ R & \longrightarrow & R^h & \longrightarrow & R^{sh} \end{array}$$

with the following properties

- (1) the map $R^h \rightarrow R^{sh}$ is local
- (2) R^{sh} is strictly henselian,
- (3) R^{sh} is a filtered colimit of étale R -algebras,
- (4) $\mathfrak{m}R^{sh}$ is the maximal ideal of R^{sh} , and
- (5) $\kappa^{sep} = R^{sh}/\mathfrak{m}R^{sh}$.

Proof. This can be proved using the method followed in the proof of Lemma 10.145.16. The only difference is that, instead of pairs, one uses triples $(S, \mathfrak{q}, \alpha)$ where $R \rightarrow S$ étale, \mathfrak{q} is a prime of S lying over \mathfrak{m} , and $\alpha : \kappa(\mathfrak{q}) \rightarrow \kappa^{sep}$ is an embedding of extensions of κ .

But we can also deduce the result directly from the result of Lemma 10.145.16. Namely, for any finite separable field sub extension $\kappa \subset \kappa' \subset \kappa^{sep}$ there exists a unique (up to unique isomorphism) finite étale local ring extension $R^h \subset R^h(\kappa')$ whose residue field extension extension reproduces the given extension, see Lemma 10.145.8. Hence we can set

$$R^{sh} = \bigcup_{\kappa \subset \kappa' \subset \kappa^{sep}} R^h(\kappa')$$

The arrows in this system, compatible with the arrows on the level of residue fields, exist by Lemma 10.145.8. This will produce a henselian local ring by Lemma 10.145.5 since each of the rings $R^h(\kappa')$ is henselian by Lemma 10.145.4. By construction the residue field extension induced by $R^h \rightarrow R^{sh}$ is the field extension $\kappa \subset \kappa^{sep}$. We omit the proof that R^{sh} is a colimit of étale R -algebras. \square

Definition 10.145.18. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.

- (1) The local ring map $R \rightarrow R^h$ constructed in Lemma 10.145.16 is called the *henselization* of R .
- (2) Given a separable algebraic closure $\kappa \subset \kappa^{sep}$ the local ring map $R \rightarrow R^{sh}$ constructed in Lemma 10.145.17 is called the *strict henselization* of R with respect to $\kappa \subset \kappa^{sep}$.
- (3) A local ring map $R \rightarrow R^{sh}$ is called a *strict henselization* of R if it is isomorphic to one of the local ring maps constructed in Lemma 10.145.17

The maps $R \rightarrow R^h \rightarrow R^{sh}$ are flat local ring homomorphisms. By Lemma 10.145.15 the R -algebras R^h and R^{sh} are well defined up to unique isomorphism by the conditions that they are henselian local, filtered colimits of étale R -algebras with residue field κ and κ^{sep} . We will discuss this and the close relationship between R and its henselization in More on Algebra, Section 15.34. In the rest of this section

we prove some lemmas we discuss functoriality properties of (strict) henselizations. This should make it clear exactly how canonical these constructions really are.

Lemma 10.145.19. *Let $R \rightarrow S$ be a local map of local rings. Let $S \rightarrow S^h$ be the henselization. Let $R \rightarrow A$ be an étale ring map and let \mathfrak{q} be a prime of A lying over \mathfrak{m}_R such that $R/\mathfrak{m}_R \cong \kappa(\mathfrak{q})$. Then there exists a unique morphism of rings $f : A \rightarrow S^h$ fitting into the commutative diagram*

$$\begin{array}{ccc} A & \xrightarrow{f} & S^h \\ \uparrow & & \uparrow \\ R & \longrightarrow & S \end{array}$$

such that $f^{-1}(\mathfrak{m}_{S^h}) = \mathfrak{q}$.

Proof. This is a special case of Lemma 10.145.12. \square

Lemma 10.145.20. *Let $R \rightarrow S$ be a local map of local rings. Let $R \rightarrow R^h$ and $S \rightarrow S^h$ be the henselizations. There exists a unique local ring map $R^h \rightarrow S^h$ fitting into the commutative diagram*

$$\begin{array}{ccc} R^h & \xrightarrow{f} & S^h \\ \uparrow & & \uparrow \\ R & \longrightarrow & S \end{array}$$

Proof. Follows immediately from Lemma 10.145.13. \square

Here is a slightly different construction of the henselization.

Lemma 10.145.21. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Consider the category of pairs (S, \mathfrak{q}) where $R \rightarrow S$ is étale and \mathfrak{q} is a prime lying over \mathfrak{p} such that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$. This category is filtered and*

$$(R_{\mathfrak{p}})^h = \operatorname{colim}_{(S, \mathfrak{q})} S = \operatorname{colim}_{(S, \mathfrak{q})} S_{\mathfrak{q}}$$

canonically.

Proof. A morphism of pairs $(S, \mathfrak{q}) \rightarrow (S', \mathfrak{q}')$ is given by an R -algebra map $\varphi : S \rightarrow S'$ such that $\varphi^{-1}(\mathfrak{q}') = \mathfrak{q}$. Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the pair (R, \mathfrak{p}) and hence is not empty, which proves part (1) of Categories, Definition 4.19.1. Suppose that (S, \mathfrak{q}) and (S', \mathfrak{q}') are two pairs. Note that \mathfrak{q} , resp. \mathfrak{q}' correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak{p})$, resp. $S' \otimes \kappa(\mathfrak{p})$ with residue fields $\kappa(\mathfrak{p})$, hence they correspond to maximal ideals of $S \otimes \kappa(\mathfrak{p})$, resp. $S' \otimes \kappa(\mathfrak{p})$. Set $S'' = S \otimes_R S'$. By the above there exists a unique prime $\mathfrak{q}'' \subset S''$ lying over \mathfrak{q} and over \mathfrak{q}' whose residue field is $\kappa(\mathfrak{p})$. The ring map $R \rightarrow S''$ is étale by Lemma 10.138.3. This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi : (S, \mathfrak{q}) \rightarrow (S', \mathfrak{q}')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi, S, \psi} S') \otimes_{S' \otimes_R S'} S'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R . The fibre ring of S'' over \mathfrak{p} is

$$F'' = (F' \otimes_{\varphi, F, \psi} F') \otimes_{F' \otimes_{\kappa(\mathfrak{p})} F'} F'$$

where F', F are the fibre rings of S' and S . Since φ and ψ are morphisms of pairs the map $F' \rightarrow \kappa(\mathfrak{p})$ corresponding to \mathfrak{p}' extends to a map $F'' \rightarrow \kappa(\mathfrak{p})$ and in turn corresponds to a prime ideal $\mathfrak{q}'' \subset S''$ whose residue field is $\kappa(\mathfrak{p})$. The canonical map $S' \rightarrow S''$ (using the right most factor for example) is a morphism of pairs $(S', \mathfrak{q}') \rightarrow (S'', \mathfrak{q}'')$ which equalizes φ and ψ . This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that the category is filtered.

Recall that in the proof of Lemma 10.145.16 we constructed $(R_{\mathfrak{p}})^h$ as the corresponding colimit but starting with $R_{\mathfrak{p}}$ and its maximal ideal $\mathfrak{p}R_{\mathfrak{p}}$. Now, given any pair (S, \mathfrak{q}) for (R, \mathfrak{p}) we obtain a pair $(S_{\mathfrak{p}}, \mathfrak{q}S_{\mathfrak{p}})$ for $(R_{\mathfrak{p}}, \mathfrak{p}R_{\mathfrak{p}})$. Moreover, in this situation

$$S_{\mathfrak{p}} = \operatorname{colim}_{f \in R, f \notin \mathfrak{p}} S_f.$$

Hence in order to show the equalities of the lemma, it suffices to show that any pair $(S_{loc}, \mathfrak{q}_{loc})$ for $(R_{\mathfrak{p}}, \mathfrak{p}R_{\mathfrak{p}})$ is of the form $(S_{\mathfrak{p}}, \mathfrak{q}S_{\mathfrak{p}})$ for some pair (S, \mathfrak{q}) over (R, \mathfrak{p}) (some details omitted). This follows from Lemma 10.138.3. \square

Lemma 10.145.22. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $R \rightarrow R^h$ and $S \rightarrow S^h$ be the henselizations of $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$. The local ring map $R^h \rightarrow S^h$ of Lemma 10.145.20 identifies S^h with the henselization of $R^h \otimes_R S$ at the unique prime lying over \mathfrak{m}^h and \mathfrak{q} .*

Proof. By Lemma 10.145.21 we see that R^h , resp. S^h are filtered colimits of étale R , resp. S -algebras. Hence we see that $R^h \otimes_R S$ is a filtered colimit of étale S -algebras A_i (Lemma 10.138.3). By Lemma 10.145.14 we see that S^h is a filtered colimit of étale $R^h \otimes_R S$ -algebras. Since moreover S^h is a henselian local ring with residue field equal to $\kappa(\mathfrak{q})$, the statement follows from the uniqueness result of Lemma 10.145.15. \square

Lemma 10.145.23. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over \mathfrak{p} in R . Assume $R \rightarrow S$ is quasi-finite at \mathfrak{q} . The commutative diagram*

$$\begin{array}{ccc} R_{\mathfrak{p}}^h & \longrightarrow & S_{\mathfrak{q}}^h \\ \uparrow & & \uparrow \\ R_{\mathfrak{p}} & \longrightarrow & S_{\mathfrak{q}} \end{array}$$

of Lemma 10.145.20 identifies $S_{\mathfrak{q}}^h$ with the localization of $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ at the prime generated by \mathfrak{q} .

Proof. Note that $R_{\mathfrak{p}}^h \otimes_R S$ is quasi-finite over $R_{\mathfrak{p}}^h$ at the prime ideal corresponding to \mathfrak{q} , see Lemma 10.118.6. Hence the localization S' of $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 10.145.4. As a localization S' is a filtered colimit of étale $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ -algebras. By Lemma 10.145.22 we see that $S_{\mathfrak{q}}^h$ is the henselization of $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$. Thus $S' = S_{\mathfrak{q}}^h$ by the uniqueness result of Lemma 10.145.15. \square

Lemma 10.145.24. *Let R be a local ring with henselization R^h . Let $I \subset \mathfrak{m}_R$. Then R^h/IR^h is the henselization of R/I .*

Proof. This is a special case of Lemma 10.145.23. \square

Lemma 10.145.25. *Let $\varphi : R \rightarrow S$ be a local map of local rings. Let $S/\mathfrak{m}_S \subset \kappa^{sep}$ be a separable algebraic closure. Let $S \rightarrow S^{sh}$ be the strict henselization of S with respect to $S/\mathfrak{m}_S \subset \kappa^{sep}$. Let $R \rightarrow A$ be an étale ring map and let \mathfrak{q} be a prime of A lying over \mathfrak{m}_R . Given any commutative diagram*

$$\begin{array}{ccc} \kappa(\mathfrak{q}) & \xrightarrow{\phi} & \kappa^{sep} \\ \uparrow & & \uparrow \\ R/\mathfrak{m}_R & \xrightarrow{\varphi} & S/\mathfrak{m}_S \end{array}$$

there exists a unique morphism of rings $f : A \rightarrow S^{sh}$ fitting into the commutative diagram

$$\begin{array}{ccc} A & \xrightarrow{f} & S^{sh} \\ \uparrow & & \uparrow \\ R & \xrightarrow{\varphi} & S \end{array}$$

such that $f^{-1}(\mathfrak{m}_{S^{sh}}) = \mathfrak{q}$ and the induced map $\kappa(\mathfrak{q}) \rightarrow \kappa^{sep}$ is the given one.

Proof. This is a special case of Lemma 10.145.12. \square

Lemma 10.145.26. *Let $R \rightarrow S$ be a local map of local rings. Choose separable algebraic closures $R/\mathfrak{m}_R \subset \kappa_1^{sep}$ and $S/\mathfrak{m}_S \subset \kappa_2^{sep}$. Let $R \rightarrow R^{sh}$ and $S \rightarrow S^{sh}$ be the corresponding strict henselizations. Given any commutative diagram*

$$\begin{array}{ccc} \kappa_1^{sep} & \xrightarrow{\phi} & \kappa_2^{sep} \\ \uparrow & & \uparrow \\ R/\mathfrak{m}_R & \xrightarrow{\varphi} & S/\mathfrak{m}_S \end{array}$$

There exists a unique local ring map $R^{sh} \rightarrow S^{sh}$ fitting into the commutative diagram

$$\begin{array}{ccc} R^{sh} & \xrightarrow{f} & S^{sh} \\ \uparrow & & \uparrow \\ R & \xrightarrow{\varphi} & S \end{array}$$

and inducing ϕ on the residue fields of R^{sh} and S^{sh} .

Proof. Follows immediately from Lemma 10.145.13. \square

Lemma 10.145.27. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $\kappa(\mathfrak{p}) \subset \kappa^{sep}$ be a separable algebraic closure. Consider the category of triples (S, \mathfrak{q}, ϕ) where $R \rightarrow S$ is étale, \mathfrak{q} is a prime lying over \mathfrak{p} , and $\phi : \kappa(\mathfrak{q}) \rightarrow \kappa^{sep}$ is a $\kappa(\mathfrak{p})$ -algebra map. This category is filtered and*

$$(R_{\mathfrak{p}})^{sh} = \operatorname{colim}_{(S, \mathfrak{q}, \phi)} S = \operatorname{colim}_{(S, \mathfrak{q}, \phi)} S_{\mathfrak{q}}$$

canonically.

Proof. A morphism of triples $(S, \mathfrak{q}, \phi) \rightarrow (S', \mathfrak{q}', \phi')$ is given by an R -algebra map $\varphi : S \rightarrow S'$ such that $\varphi^{-1}(\mathfrak{q}') = \mathfrak{q}$ and such that $\phi' \circ \varphi = \phi$. Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the triple $(R, \mathfrak{p}, \kappa(\mathfrak{p})) \subset \kappa^{sep}$ and hence is not empty, which proves part

(1) of Categories, Definition 4.19.1. Suppose that (S, \mathfrak{q}, ϕ) and $(S', \mathfrak{q}', \phi')$ are two triples. Note that \mathfrak{q} , resp. \mathfrak{q}' correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak{p})$, resp. $S' \otimes \kappa(\mathfrak{p})$ with residue fields finite separable over $\kappa(\mathfrak{p})$ and ϕ , resp. ϕ' correspond to maps into κ^{sep} . Hence this data corresponds to $\kappa(\mathfrak{p})$ -algebra maps

$$\phi : S \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}, \quad \phi' : S' \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}.$$

Set $S'' = S \otimes_R S'$. Combining the maps the above we get a unique $\kappa(\mathfrak{p})$ -algebra map

$$\phi'' = \phi \otimes \phi' : S'' \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}$$

whose kernel corresponds to a prime $\mathfrak{q}'' \subset S''$ lying over \mathfrak{q} and over \mathfrak{q}' , and whose residue field maps via ϕ'' to the compositum of $\phi(\kappa(\mathfrak{q}))$ and $\phi'(\kappa(\mathfrak{q}'))$ in κ^{sep} . The ring map $R \rightarrow S''$ is étale by Lemma 10.138.3. Hence $(S'', \mathfrak{q}'', \phi'')$ is a triple dominating both (S, \mathfrak{q}, ϕ) and $(S', \mathfrak{q}', \phi')$. This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi : (S, \mathfrak{q}, \phi) \rightarrow (S', \mathfrak{q}', \phi')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi, S, \psi} S) \otimes_{S' \otimes_R S'} S'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R . The fibre ring of S'' over \mathfrak{p} is

$$F'' = (F' \otimes_{\varphi, F, \psi} F') \otimes_{F' \otimes_{\kappa(\mathfrak{p})} F'} F'$$

where F', F are the fibre rings of S' and S . Since φ and ψ are morphisms of triples the map $\phi' : F' \rightarrow \kappa^{sep}$ extends to a map $\phi'' : F'' \rightarrow \kappa^{sep}$ which in turn corresponds to a prime ideal $\mathfrak{q}'' \subset S''$. The canonical map $S' \rightarrow S''$ (using the right most factor for example) is a morphism of triples $(S', \mathfrak{q}', \phi') \rightarrow (S'', \mathfrak{q}'', \phi'')$ which equalizes φ and ψ . This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that the category is filtered.

We still have to show that the colimit R_{colim} of the system is equal to the strict henselization of $R_{\mathfrak{p}}$ with respect to κ^{sep} . To see this note that the system of triples (S, \mathfrak{q}, ϕ) contains as a subsystem the pairs (S, \mathfrak{q}) of Lemma 10.145.21. Hence R_{colim} contains $R_{\mathfrak{p}}^h$ by the result of that lemma. Moreover, it is clear that $R_{\mathfrak{p}}^h \subset R_{colim}$ is a directed colimit of étale ring extensions. It follows that R_{colim} is henselian by Lemmas 10.145.4 and 10.145.5. Finally, by Lemma 10.138.16 we see that the residue field of R_{colim} is equal to κ^{sep} . Hence we conclude that R_{colim} is strictly henselian and hence equals the strict henselization of $R_{\mathfrak{p}}$ as desired. Some details omitted. \square

Lemma 10.145.28. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Choose separable algebraic closures $\kappa(\mathfrak{p}) \subset \kappa_1^{sep}$ and $\kappa(\mathfrak{q}) \subset \kappa_2^{sep}$. Let R^{sh} and S^{sh} be the corresponding strict henselizations of $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$. Given any commutative diagram*

$$\begin{array}{ccc} \kappa_1^{sep} & \xrightarrow{\quad} & \kappa_2^{sep} \\ \uparrow & \searrow \phi & \uparrow \\ \kappa(\mathfrak{p}) & \xrightarrow{\quad \varphi} & \kappa(\mathfrak{q}) \end{array}$$

The local ring map $R^{sh} \rightarrow S^{sh}$ of Lemma 10.145.26 identifies S^{sh} with the strict henselization of $R^{sh} \otimes_R S$ at a prime lying over \mathfrak{m}^{sh} and \mathfrak{q} .

Proof. The proof is identical to the proof of Lemma 10.145.22 except that it uses Lemma 10.145.27 instead of Lemma 10.145.21. \square

Lemma 10.145.29. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{q} be a prime of S lying over \mathfrak{p} in R . Let $\kappa(\mathfrak{q}) \subset \kappa^{sep}$ be a separable algebraic closure. Assume $R \rightarrow S$ is quasi-finite at \mathfrak{q} . The commutative diagram*

$$\begin{array}{ccc} R_{\mathfrak{p}}^{sh} & \longrightarrow & S_{\mathfrak{q}}^{sh} \\ \uparrow & & \uparrow \\ R_{\mathfrak{p}} & \longrightarrow & S_{\mathfrak{q}} \end{array}$$

of Lemma 10.145.26 identifies $S_{\mathfrak{q}}^{sh}$ with a localization of $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$.

Proof. The residue field of $R_{\mathfrak{p}}^{sh}$ is the separable algebraic closure of $\kappa(\mathfrak{p})$ in κ^{sep} . Note that $R_{\mathfrak{p}}^{sh} \otimes_R S$ is quasi-finite over $R_{\mathfrak{p}}^{sh}$ at the prime ideal corresponding to \mathfrak{q} , see Lemma 10.118.6. Hence the localization S' of $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 10.145.4. Note that the residue field of S' is κ^{sep} since it contains both the separable algebraic closure of $\kappa(\mathfrak{p})$ and $\kappa(\mathfrak{q})$. Furthermore, as a localization S' is a filtered colimit of étale $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ -algebras. By Lemma 10.145.28 we see that $S_{\mathfrak{q}}^{sh}$ is a strict henselization of $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$. Thus $S' = S_{\mathfrak{q}}^{sh}$ by the uniqueness result of Lemma 10.145.15. \square

Lemma 10.145.30. *Let R be a local ring with strict henselization R^{sh} . Let $I \subset \mathfrak{m}_R$. Then R^{sh}/IR^{sh} is a strict henselization of R/I .*

Proof. This is a special case of Lemma 10.145.29. \square

Lemma 10.145.31. *Let $\varphi : R \rightarrow S$ be a local homomorphism of strictly henselian local rings. Let $P_1, \dots, P_n \in R[x_1, \dots, x_n]$ be polynomials such that $R[x_1, \dots, x_n]/(P_1, \dots, P_n)$ is étale over R . Then the map*

$$R^n \longrightarrow S^n, \quad (h_1, \dots, h_n) \longmapsto (\varphi(h_1), \dots, \varphi(h_n))$$

induces a bijection between

$$\{(r_1, \dots, r_n) \in R^n \mid P_i(r_1, \dots, r_n) = 0, \ i = 1, \dots, n\}$$

and

$$\{(s_1, \dots, s_n) \in S^n \mid P'_i(s_1, \dots, s_n) = 0, \ i = 1, \dots, n\}$$

where $P'_i \in S[x_1, \dots, x_n]$ are the images of the P_i under φ .

Proof. The first solution set is canonically isomorphic to the set

$$\mathrm{Hom}_R(R[x_1, \dots, x_n]/(P_1, \dots, P_n), R).$$

As R is henselian the map $R \rightarrow R/\mathfrak{m}_R$ induces a bijection between this set and the set of solutions in the residue field R/\mathfrak{m}_R , see Lemma 10.145.3. The same is true for S . Now since $R[x_1, \dots, x_n]/(P_1, \dots, P_n)$ is étale over R and R/\mathfrak{m}_R is separably algebraically closed we see that $R/\mathfrak{m}_R[x_1, \dots, x_n]/(\overline{P_1}, \dots, \overline{P_n})$ is a finite product of copies of R/\mathfrak{m}_R . Hence the tensor product

$$R/\mathfrak{m}_R[x_1, \dots, x_n]/(\overline{P_1}, \dots, \overline{P_n}) \otimes_{R/\mathfrak{m}_R} S/\mathfrak{m}_S = S/\mathfrak{m}_S[x_1, \dots, x_n]/(\overline{P'_1}, \dots, \overline{P'_n})$$

is also a finite product of copies of S/\mathfrak{m}_S with the same index set. This proves the lemma. \square

Lemma 10.145.32. *Let R be a henselian local ring. Any countably generated Mittag-Leffler module over R is a direct sum of finitely presented R -modules.*

Proof. Let M be a countably generated and Mittag-Leffler R -module. We claim that for any element $x \in M$ there exists a direct sum decomposition $M = N \oplus K$ with $x \in N$, the module N finitely presented, and K Mittag-Leffler.

Suppose the claim is true. Choose generators x_1, x_2, x_3, \dots of M . By the claim we can inductively find direct sum decompositions

$$M = N_1 \oplus N_2 \oplus \dots \oplus N_n \oplus K_n$$

with N_i finitely presented, $x_1, \dots, x_n \in N_1 \oplus \dots \oplus N_n$, and K_n Mittag-Leffler. Repeating ad infinitum we see that $M = \bigoplus N_i$.

We still have to prove the claim. Let $x \in M$. By Lemma 10.89.2 there exists an endomorphism $\alpha : M \rightarrow M$ such that α factors through a finitely presented module, and $\alpha(x) = x$. Say α factors as

$$M \xrightarrow{\pi} P \xrightarrow{i} M$$

Set $a = \pi \circ \alpha \circ i : P \rightarrow P$, so $i \circ a \circ \pi = \alpha^3$. By Lemma 10.15.2 there exists a monic polynomial $P \in R[T]$ such that $P(a) = 0$. Note that this implies formally that $\alpha^2 P(\alpha) = 0$. Hence we may think of M as a module over $R[T]/(T^2 P)$. Assume that $x \neq 0$. Then $\alpha(x) = x$ implies that $0 = \alpha^2 P(\alpha)x = P(1)x$ hence $P(1) = 0$ in R/I where $I = \{r \in R \mid rx = 0\}$ is the annihilator of x . As $x \neq 0$ we see $I \subset \mathfrak{m}_R$, hence 1 is a root of $\bar{P} = P \bmod \mathfrak{m}_R \in R/\mathfrak{m}_R[T]$. As R is henselian we can find a factorization

$$T^2 P = (T^2 Q_1) Q_2$$

for some $Q_1, Q_2 \in R[T]$ with $Q_2 = (T - 1)^e \bmod \mathfrak{m}_R R[T]$ and $Q_1(1) \neq 0 \bmod \mathfrak{m}_R$, see Lemma 10.145.3. Let $N = \text{Im}(\alpha^2 Q_1(\alpha) : M \rightarrow M)$ and $K = \text{Im}(Q_2(\alpha) : M \rightarrow M)$. As $T^2 Q_1$ and Q_2 generate the unit ideal of $R[T]$ we get a direct sum decomposition $M = N \oplus K$. Moreover, Q_2 acts as zero on N and $T^2 Q_1$ acts as zero on K . Note that N is a quotient of P hence is finitely generated. Also $x \in N$ because $\alpha^2 Q_1(\alpha)x = Q_1(1)x$ and $Q_1(1)$ is a unit in R . By Lemma 10.86.9 the modules N and K are Mittag-Leffler. Finally, the finitely generated module N is finitely presented as a finitely generated Mittag-Leffler module is finitely presented, see Example 10.88.1 part (1). \square

10.146. Serre's criterion for normality

We introduce the following properties of Noetherian rings.

Definition 10.146.1. Let R be a Noetherian ring. Let $k \geq 0$ be an integer.

- (1) We say R has property (R_k) if for every prime \mathfrak{p} of height $\leq k$ the local ring $R_{\mathfrak{p}}$ is regular. We also say that R is *regular in codimension $\leq k$* .
- (2) We say R has property (S_k) if for every prime \mathfrak{p} the local ring $R_{\mathfrak{p}}$ has depth at least $\min\{k, \dim(R_{\mathfrak{p}})\}$.
- (3) Let M be a finite R -module. We say M has property (S_k) if for every prime \mathfrak{p} the module $M_{\mathfrak{p}}$ has depth at least $\min\{k, \dim(\text{Supp}(M_{\mathfrak{p}}))\}$.

Any Noetherian ring has property (S_0) (and so does any finite module over it). Our convention that $\dim(\emptyset) = -\infty$ guarantees that the zero module has property (S_k) for all k .

Lemma 10.146.2. *Let R be a Noetherian ring. Let M be a finite R -module. The following are equivalent:*

- (1) M has no embedded associated prime, and
- (2) M has property (S_1) .

Proof. Let \mathfrak{p} be an embedded associated prime of M . Then there exists another associated prime \mathfrak{q} of M such that $\mathfrak{p} \supset \mathfrak{q}$. In particular this implies that $\dim(\text{Supp}(M_{\mathfrak{p}})) \geq 1$ (since \mathfrak{q} is in the support as well). On the other hand $\mathfrak{p}R_{\mathfrak{p}}$ is associated to $M_{\mathfrak{p}}$ (Lemma 10.62.14) and hence $\text{depth}(M_{\mathfrak{p}}) = 0$ (see Lemma 10.62.17). In other words (S_1) does not hold. Conversely, if (S_1) does not then there exists a prime \mathfrak{p} such that $\dim(\text{Supp}(M_{\mathfrak{p}})) \geq 1$ and $\text{depth}(M_{\mathfrak{p}}) = 0$. Then we see (arguing backwards using the lemmas cited above) that \mathfrak{p} is an embedded associated prime. \square

Lemma 10.146.3. *Let R be a Noetherian ring. The following are equivalent:*

- (1) R is reduced, and
- (2) R has properties (R_0) and (S_1) .

Proof. Suppose that R is reduced. Then $R_{\mathfrak{p}}$ is a field for every minimal prime \mathfrak{p} of R , according to Lemma 10.24.1. Hence we have (R_0) . Let \mathfrak{p} be a prime of height ≥ 1 . Then $A = R_{\mathfrak{p}}$ is a reduced local ring of dimension ≥ 1 . Hence its maximal ideal \mathfrak{m} is not an associated prime since this would mean there exists a $x \in \mathfrak{m}$ with annihilator \mathfrak{m} so $x^2 = 0$. Hence the depth of $A = R_{\mathfrak{p}}$ is at least one, by Lemma 10.62.9. This shows that (S_1) holds.

Conversely, assume that R satisfies (R_0) and (S_1) . If \mathfrak{p} is a minimal prime of R , then $R_{\mathfrak{p}}$ is a field by (R_0) , and hence is reduced. If \mathfrak{p} is not minimal, then we see that $R_{\mathfrak{p}}$ has depth ≥ 1 by (S_1) and we conclude there exists an element $t \in \mathfrak{p}R_{\mathfrak{p}}$ such that $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}[1/t]$ is injective. This implies that $R_{\mathfrak{p}}$ is a subring of localizations of R at primes of smaller height. Thus by induction on the height we conclude that R is reduced. \square

Lemma 10.146.4 (Serre's criterion for normality). *Let R be a Noetherian ring. The following are equivalent:*

- (1) R is a normal ring, and
- (2) R has properties (R_1) and (S_2) .

Proof. Suppose that R is normal. This means by definition that R is reduced and all localizations $R_{\mathfrak{p}}$ are normal domains. In particular we see that R has (R_0) and (S_1) by Lemma 10.146.3. Hence it suffices to show that a local Noetherian normal domain R of dimension d has depth $\geq \min(2, d)$ and is regular if $d = 1$. The assertion if $d = 1$ follows from Lemma 10.115.6.

Let R be a local Noetherian normal domain with maximal ideal \mathfrak{m} and dimension $d \geq 2$. Choose $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$. If $\text{depth}(R/xR) \geq 1$ then $\text{depth}(R) \geq 2$ and we win. Assume $\text{depth}(R/xR) = 0$ to get a contradiction. This means that $\mathfrak{m}/(x)$ is an associated prime of R/xR . In other words, there exists an element $z \in R$ such that $\mathfrak{m}z \subset (x)$, but $z \notin (x)$. Consider the element z/x of the fraction field of R . Let $c \in \mathfrak{m}$ be an arbitrary nonzero element. We claim that $cz^n/x^n \in R$. Namely, $cz^n/x^n = (cz/x)z^{n-1}/x^{n-1}$. By choice of z we have $cz = c'x$ for some $c' \in R$. Note that $c' \in \mathfrak{m}$ since $x \notin \mathfrak{m}^2$. Hence $cz^n/x^n = c'z^{n-1}/x^{n-1}$ which is an element of R by induction on n . In other words, this shows that z/x is almost integral over R ,

see Definition 10.36.3. By Lemma 10.36.4 we see that z/x is integral over R . As R is normal we see that $z/x \in R$ which is the desired contradiction.

Suppose that R satisfies (R_1) and (S_2) . By Lemma 10.146.3 we conclude that R is reduced. Hence it suffices to show that if R is a reduced local Noetherian ring of dimension d satisfying (S_2) and (R_1) then R is a normal domain. If $d = 0$, the result is clear. If $d = 1$, then the result follows from Lemma 10.115.6.

Let R be a reduced local Noetherian ring with maximal ideal \mathfrak{m} and dimension d which satisfies (R_1) and (S_2) . By Lemma 10.36.14 it suffices to show that R is integrally closed in its total ring of fractions. Pick $x = f/g$, with $f, g \in R$ and g a nonzerodivisor which satisfies a monic equation

$$(f/g)^n + \sum_{i=1}^n a_i (f/g)^{n-i} = 0$$

with $a_i \in R$. Our goal is to show that $f \in (g) = gR$. We will prove this by induction on d . By the remarks in the previous paragraph we know this is the case when $d = 0$, and when $d = 1$, which starts the induction. Assume $d \geq 2$. Consider the short exact sequence

$$0 \rightarrow R \rightarrow R \rightarrow R/(g) \rightarrow 0.$$

By Lemma 10.69.11 this implies $\text{depth}(R/(g)) \geq 1$. Hence there exists an element $t \in \mathfrak{m}$ which is a nonzerodivisor on $R/(g)$. Hence if f has a nonzero image in $R/(g)$ then it has a nonzero image in $(R/(g))[1/t] \cong R_t/gR_t$. But by induction on the dimension the image of f is zero in R_t/gR_t (for example by localizing at all the primes of $D(t) \subset \text{Spec}(R)$). Hence we win. \square

Lemma 10.146.5. *A regular ring is normal.*

Proof. Let R be a regular ring. By Lemma 10.146.4 it suffices to prove that R is (R_1) and (S_2) . As a regular local ring is Cohen-Macaulay, see Lemma 10.102.3, it is clear that R is (S_2) . Property (R_1) is immediate. \square

Lemma 10.146.6. *Let R be a Noetherian normal domain with fraction field K . Then*

- (1) *for any nonzero $a \in R$ the quotient R/aR has no embedded primes, and all its associated primes have height 1*
- (2)

$$R = \bigcap_{\text{height}(\mathfrak{p})=1} R_{\mathfrak{p}}$$

- (3) *For any nonzero $x \in K$ the quotient $R/(R \cap xR)$ has no embedded primes, and all its associated primes have height 1.*

Proof. By Lemma 10.146.4 we see that R has (S_2) . Hence for any nonzero element $a \in R$ we see that R/aR has (S_1) (use Lemma 10.69.11 for example) Hence R/aR has no embedded primes (Lemma 10.146.2). We conclude the associated primes of R/aR are exactly the minimal primes \mathfrak{p} over (a) , which have height 1 as a is not zero (Lemma 10.59.10). This proves (1).

Thus, given $b \in R$ we have $b \in aR$ if and only if $b \in aR_{\mathfrak{p}}$ for every minimal prime \mathfrak{p} over (a) (see Lemma 10.62.18). These primes all have height 1 as seen above so $b/a \in R$ if and only if $b/a \in R_{\mathfrak{p}}$ for all height 1 primes. Hence (2) holds.

For (3) write $x = a/b$. Let $\mathfrak{p}_1, \dots, \mathfrak{p}_r$ be the minimal primes over (ab) . These all have height 1 by the above. Then we see that $R \cap xR = \bigcap_{i=1, \dots, r} (R \cap xR_{\mathfrak{p}_i})$ by part (2) of the lemma. Hence $R/(R \cap xR)$ is a submodule of $\bigoplus R/(R \cap xR_{\mathfrak{p}_i})$. As $R_{\mathfrak{p}_i}$ is a discrete valuation ring (by property (R_1) for the Noetherian normal domain R , see Lemma 10.146.4) we have $xR_{\mathfrak{p}_i} = \mathfrak{p}_i^{e_i} R_{\mathfrak{p}_i}$ for some $e_i \in \mathbf{Z}$. Hence the direct sum is equal to $\bigoplus_{e_i > 0} R/\mathfrak{p}_i^{(e_i)}$, see Definition 10.63.1. By Lemma 10.63.2 the only associated prime of the module $R/\mathfrak{p}^{(n)}$ is \mathfrak{p} . Hence the set of associate primes of $R/(R \cap xR)$ is a subset of $\{\mathfrak{p}_i\}$ and there are no inclusion relations among them. This proves (3). \square

10.147. Formal smoothness of fields

In this section we show that field extensions are formally smooth if and only if they are separable. However, we first prove finitely generated field extensions are separable algebraic if and only if they are formally unramified.

Lemma 10.147.1. *Let $k \subset K$ be a finitely generated field extension. The following are equivalent*

- (1) K is a finite separable field extension of k ,
- (2) $\Omega_{K/k} = 0$,
- (3) K is formally unramified over k ,
- (4) K is unramified over k ,
- (5) K is formally étale over k ,
- (6) K is étale over k .

Proof. The equivalence of (2) and (3) is Lemma 10.141.2. By Lemma 10.138.4 we see that (1) is equivalent to (6). Property (6) implies (5) and (4) which both in turn imply (3) (Lemmas 10.143.2, 10.144.3, and 10.144.2). Thus it suffices to show that (2) implies (1). Choose a finitely generated k -subalgebra $A \subset K$ such that K is the fraction field of the domain A . Set $S = A \setminus \{0\}$. Since $0 = \Omega_{K/k} = S^{-1}\Omega_{A/k}$ (Lemma 10.127.8) and since $\Omega_{A/k}$ is finitely generated (Lemma 10.127.16), we can replace A by a localization A_f to reduce to the case that $\Omega_{A/k} = 0$ (details omitted). Then A is unramified over k , hence K/k is finite separable for example by Lemma 10.144.5 applied with $\mathfrak{q} = (0)$. \square

Lemma 10.147.2. *Let K be a field of characteristic $p > 0$. Let $a \in K$. Then $da = 0$ in Ω_{K/\mathbf{F}_p} if and only if a is a p th power.*

Proof. By Lemma 10.127.4 we see that there exists a subfield $\mathbf{F}_p \subset L \subset K$ such that $\mathbf{F}_p \subset L$ is a finitely generated field extension and such that da is zero in Ω_{L/\mathbf{F}_p} . Hence we may assume that K is a finitely generated field extension of \mathbf{F}_p .

Choose a transcendence basis $x_1, \dots, x_r \in K$ such that K is finite separable over $\mathbf{F}_p(x_1, \dots, x_r)$. We remark that the result holds for the purely transcendental subfield $\mathbf{F}_p(x_1, \dots, x_r) \subset K$. Namely,

$$\Omega_{\mathbf{F}_p(x_1, \dots, x_r)/\mathbf{F}_p} = \bigoplus_{i=1}^r \mathbf{F}_p(x_1, \dots, x_r) dx_i$$

and any rational function all of whose partial derivatives are zero is a p th power. Moreover, we also have

$$\Omega_{K/\mathbf{F}_p} = \bigoplus_{i=1}^r K dx_i$$

since $\mathbf{F}_p(x_1, \dots, x_r) \subset K$ is finite separable (computation omitted). Suppose $a \in K$ is an element such that $da = 0$ in the module of differentials. By our choice of x_i we see that the minimal polynomial $P(T) \in k(x_1, \dots, x_r)[T]$ of a is separable. Write

$$P(T) = T^d + \sum_{i=1}^d a_i T^{d-i}$$

and hence

$$0 = dP(a) = \sum_{i=1}^d a^{d-i} da_i$$

in Ω_{K/\mathbf{F}_p} . By the description of Ω_{K/\mathbf{F}_p} above and the fact that P was the minimal polynomial of a , we see that this implies $da_i = 0$. Hence $a_i = b_i^p$ for each i . Therefore by Fields, Lemma 9.25.2 we see that a is a p th power. \square

Lemma 10.147.3. *Let k be a field of characteristic $p > 0$. Let $a_1, \dots, a_n \in k$ be elements such that da_1, \dots, da_n are linearly independent in Ω_{k/\mathbf{F}_p} . Then the field extension $k(a_1^{1/p}, \dots, a_n^{1/p})$ has degree p^n over k .*

Proof. By induction on n . If $n = 1$ the result is Lemma 10.147.2. For the induction step, suppose that $k(a_1^{1/p}, \dots, a_{n-1}^{1/p})$ has degree p^{n-1} over k . We have to show that a_n does not map to a p th power in $k(a_1^{1/p}, \dots, a_{n-1}^{1/p})$. If it does then we can write

$$\begin{aligned} a_n &= \left(\sum_{I=(i_1, \dots, i_{n-1}), 0 \leq i_j \leq p-1} \lambda_I a_1^{i_1/p} \dots a_{n-1}^{i_{n-1}/p} \right)^p \\ &= \sum_{I=(i_1, \dots, i_{n-1}), 0 \leq i_j \leq p-1} \lambda_I^p a_1^{i_1} \dots a_{n-1}^{i_{n-1}} \end{aligned}$$

Applying d we see that da_n is linearly dependent on $da_i, i < n$. This is a contradiction. \square

Lemma 10.147.4. *Let k be a field of characteristic $p > 0$. The following are equivalent:*

- (1) *the field extension K/k is separable (see Definition 10.41.1), and*
- (2) *the map $K \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{K/\mathbf{F}_p}$ is injective.*

Proof. Write K as a directed colimit $K = \text{colim}_i K_i$ of finitely generated field extensions $k \subset K_i$. By definition K is separable if and only if each K_i is separable over k , and by Lemma 10.127.4 we see that $K \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{K/\mathbf{F}_p}$ is injective if and only if each $K_i \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{K_i/\mathbf{F}_p}$ is injective. Hence we may assume that K/k is a finitely generated field extension.

Assume $k \subset K$ is a finitely generated field extension which is separable. Choose $x_1, \dots, x_{r+1} \in K$ as in Lemma 10.41.3. In this case there exists an irreducible polynomial $G(X_1, \dots, X_{r+1}) \in k[X_1, \dots, X_{r+1}]$ such that $G(x_1, \dots, x_{r+1}) = 0$ and such that $\partial G / \partial X_{r+1}$ is not identically zero. Moreover K is the field of fractions of the domain. $S = K[X_1, \dots, X_{r+1}]/(G)$. Write

$$G = \sum a_I X^I, \quad X^I = X_1^{i_1} \dots X_{r+1}^{i_{r+1}}.$$

Using the presentation of S above we see that

$$\Omega_{S/\mathbf{F}_p} = \frac{S \otimes_k \Omega_k \oplus \bigoplus_{i=1, \dots, r+1} S dX_i}{\langle \sum X^I da_I + \sum \partial G / \partial X_i dX_i \rangle}$$

Since Ω_{K/\mathbf{F}_p} is the localization of the S -module Ω_{S/\mathbf{F}_p} (see Lemma 10.127.8) we conclude that

$$\Omega_{K/\mathbf{F}_p} = \frac{K \otimes_k \Omega_k \oplus \bigoplus_{i=1, \dots, r+1} K dX_i}{\langle \sum X^I da_I + \sum \partial G / \partial X_i dX_i \rangle}$$

Now, since the polynomial $\partial G / \partial X_{r+1}$ is not identically zero we conclude that the map $K \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{S/\mathbf{F}_p}$ is injective as desired.

Assume $k \subset K$ is a finitely generated field extension and that $K \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{K/\mathbf{F}_p}$ is injective. (This part of the proof is the same as the argument proving Lemma 10.43.1.) Let x_1, \dots, x_r be a transcendence basis of K over k such that the degree of inseparability of the finite extension $k(x_1, \dots, x_r) \subset K$ is minimal. If K is separable over $k(x_1, \dots, x_r)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in K$ which is not separable over $k(x_1, \dots, x_r)$. Let $P(T) \in k(x_1, \dots, x_r)[T]$ be its minimal polynomial. Because α is not separable actually P is a polynomial in T^p . Clear denominators to get an irreducible polynomial

$$G(X_1, \dots, X_r, T) = \sum a_{I,i} X^I T^i \in k[X_1, \dots, X_r, T]$$

such that $G(x_1, \dots, x_r, \alpha) = 0$ in L . Note that this means $k[X_1, \dots, X_r, T]/(G) \subset L$. We may assume that for some pair (I_0, i_0) the coefficient $a_{I_0, i_0} = 1$. We claim that dG/dX_i is not identically zero for at least one i . Namely, if this is not the case, then G is actually a polynomial in X_1^p, \dots, X_r^p, T^p . Then this means that

$$\sum_{(I,i) \neq (I_0, i_0)} x^I \alpha^i da_{I,i}$$

is zero in Ω_{K/\mathbf{F}_p} . Note that there is no k -linear relation among the elements

$$\{x^I \alpha^i \mid a_{I,i} \neq 0 \text{ and } (I, i) \neq (I_0, i_0)\}$$

of K . Hence the assumption that $K \otimes_k \Omega_{k/\mathbf{F}_p} \rightarrow \Omega_{K/\mathbf{F}_p}$ is injective this implies that $da_{I,i} = 0$ in Ω_{k/\mathbf{F}_p} for all (I, i) . By Lemma 10.147.2 we see that each $a_{I,i}$ is a p th power, which implies that G is a p th power contradicting the irreducibility of G . Thus, after renumbering, we may assume that dG/dX_1 is not zero. Then we see that x_1 is separably algebraic over $k(x_2, \dots, x_r, \alpha)$, and that x_2, \dots, x_r, α is a transcendence basis of L over k . This means that the degree of inseparability of the finite extension $k(x_2, \dots, x_r, \alpha) \subset L$ is less than the degree of inseparability of the finite extension $k(x_1, \dots, x_r) \subset L$, which is a contradiction. \square

Lemma 10.147.5. *Let $k \subset K$ be an extension of fields. If K is formally smooth over k , then K is a separable extension of k .*

Proof. Assume K is formally smooth over k . By Lemma 10.133.9 we see that $K \otimes_k \Omega_{k/\mathbf{Z}} \rightarrow \Omega_{K/\mathbf{Z}}$ is injective. Hence K is separable over k by Lemma 10.147.4. \square

Lemma 10.147.6. *Let $k \subset K$ be an extension of fields. Then K is formally smooth over k if and only if $H_1(L_{K/k}) = 0$.*

Proof. This follows from Proposition 10.133.8 and the fact that a vector spaces is free (hence projective). \square

Lemma 10.147.7. *Let $k \subset K$ be an extension of fields.*

- (1) *If K is purely transcendental over k , then K is formally smooth over k .*
- (2) *If K is separable algebraic over k , then K is formally smooth over k .*

(3) If K is separable over k , then K is formally smooth over k .

Proof. For (1) write $K = k(x_j; j \in J)$. Suppose that A is a k -algebra, and $I \subset A$ is an ideal of square zero. Let $\varphi : K \rightarrow A/I$ be a k -algebra map. Let $a_j \in A$ be an element such that $a_j \bmod I = \varphi(x_j)$. Then it is easy to see that there is a unique k -algebra map $K \rightarrow A$ which maps x_j to a_j and which reduces to $\varphi \bmod I$. Hence $k \subset K$ is formally smooth.

In case (2) we see that $k \subset K$ is a colimit of étale ring extensions. An étale ring map is formally étale (Lemma 10.143.2). Hence this case follows from Lemma 10.143.3 and the trivial observation that a formally étale ring map is formally smooth.

In case (3), write $K = \operatorname{colim} K_i$ as the filtered colimit of its finitely generated sub k -extensions. By Definition 10.41.1 each K_i is separable algebraic over a purely transcendental extension of k . Hence K_i/k is formally smooth by cases (1) and (2) and Lemma 10.133.3. Thus $H_1(L_{K_i/k}) = 0$ by Lemma 10.147.6. Hence $H_1(L_{K/k}) = 0$ by Lemma 10.129.9. Hence K/k is formally smooth by Lemma 10.147.6 again. \square

Lemma 10.147.8. *Let k be a field.*

- (1) *If the characteristic of k is zero, then any extension field of k is formally smooth over k .*
- (2) *If the characteristic of k is $p > 0$, then $k \subset K$ is formally smooth if and only if it is a separable field extension.*

Proof. Combine Lemmas 10.147.5 and 10.147.7. \square

Here we put together all the different characterizations of separable field extensions.

Proposition 10.147.9. *Let $k \subset K$ be a field extension. If the characteristic of k is zero then*

- (1) *K is separable over k ,*
- (2) *K is geometrically reduced over k ,*
- (3) *K is formally smooth over k ,*
- (4) *$H_1(L_{K/k}) = 0$, and*
- (5) *the map $K \otimes_k \Omega_{k/\mathbb{Z}} \rightarrow \Omega_{K/\mathbb{Z}}$ is injective.*

If the characteristic of k is $p > 0$, then the following are equivalent:

- (1) *K is separable over k ,*
- (2) *the ring $K \otimes_k k^{1/p}$ is reduced,*
- (3) *K is geometrically reduced over k ,*
- (4) *the map $K \otimes_k \Omega_{k/\mathbb{F}_p} \rightarrow \Omega_{K/\mathbb{F}_p}$ is injective,*
- (5) *$H_1(L_{K/k}) = 0$, and*
- (6) *K is formally smooth over k .*

Proof. This is a combination of Lemmas 10.43.1, 10.147.8 10.147.5, and 10.147.4. \square

Here is yet another characterization of finitely generated separable field extensions.

Lemma 10.147.10. *Let $k \subset K$ be a finitely generated field extension. Then K is separable over k if and only if K is the localization of a smooth k -algebra.*

Proof. Choose a finite type k -algebra R which is a domain whose fraction field is K . Lemma 10.135.9 says that $k \rightarrow R$ is smooth at (0) if and only if K/k is separable. This proves the lemma. \square

Lemma 10.147.11. *Let $k \subset K$ be a field extension. Then K is a filtered colimit of global complete intersection algebras over k . If K/k is separable, then K is a filtered colimit of smooth algebras over k .*

Proof. Suppose that $E \subset K$ is a finite subset. It suffices to show that there exists a k subalgebra $A \subset K$ which contains E and which is a global complete intersection (resp. smooth) over k . The separable/smooth case follows from Lemma 10.147.10. In general let $L \subset K$ be the subfield generated by E . Pick a transcendence basis $x_1, \dots, x_d \in L$ over k . The extension $k(x_1, \dots, x_d) \subset L$ is finite. Say $L = k(x_1, \dots, x_d)[y_1, \dots, y_r]$. Pick inductively polynomials $P_i \in k(x_1, \dots, x_d)[Y_1, \dots, Y_r]$ such that $P_i = P_i(Y_1, \dots, Y_i)$ is monic in Y_i over $k(x_1, \dots, x_d)[Y_1, \dots, Y_{i-1}]$ and maps to the minimum polynomial of y_i in $k(x_1, \dots, x_d)[y_1, \dots, y_{i-1}][Y_i]$. Then it is clear that P_1, \dots, P_r is a regular sequence in $k(x_1, \dots, x_r)[Y_1, \dots, Y_r]$ and that $L = k(x_1, \dots, x_r)[Y_1, \dots, Y_r]/(P_1, \dots, P_r)$. If $h \in k[x_1, \dots, x_d]$ is a polynomial such that $P_i \in k[x_1, \dots, x_d, 1/h, Y_1, \dots, Y_r]$, then we see that P_1, \dots, P_r is a regular sequence in $k[x_1, \dots, x_d, 1/h, Y_1, \dots, Y_r]$ and $A = k[x_1, \dots, x_d, 1/h, Y_1, \dots, Y_r]/(P_1, \dots, P_r)$ is a global complete intersection. After adjusting our choice of h we may assume $E \subset A$ and we win. \square

10.148. Constructing flat ring maps

The following lemma is occasionally useful.

Lemma 10.148.1. *Let (R, \mathfrak{m}, k) be a local ring. Let $k \subset K$ be a field extension. There exists a local ring (R', \mathfrak{m}', k') , a flat local ring map $R \rightarrow R'$ such that $\mathfrak{m}' = \mathfrak{m}R'$ and such that $k \subset k'$ is isomorphic to $k \subset K$.*

Proof. Suppose that $k \subset k' = k(\alpha)$ is a monogenic extension of fields. Then k' is the residue field of a flat local extension $R \subset R'$ as in the lemma. Namely, if α is transcendental over k , then we let R' be the localization of $R[x]$ at the prime $\mathfrak{m}R[x]$. If α is algebraic with minimal polynomial $T^d + \sum \bar{\lambda}_i T^{d-i}$, then we let $R' = R[T]/(T^d + \sum \lambda_i T^{d-i})$.

Consider the collection of triples $(k', R \rightarrow R', \phi)$, where $k \subset k' \subset K$ is a subfield, $R \rightarrow R'$ is a local ring map as in the lemma, and $\phi : R' \rightarrow k'$ induces an isomorphism $R'/\mathfrak{m}R' \cong k'$ of k -extensions. These form a “big” category \mathcal{C} with morphisms $(k_1, R_1, \phi_1) \rightarrow (k_2, R_2, \phi_2)$ given by ring maps $\psi : R_1 \rightarrow R_2$ such that

$$\begin{array}{ccccc} R_1 & \longrightarrow & k_1 & \longrightarrow & K \\ \psi \downarrow & & \phi_1 & & \parallel \\ R_2 & \longrightarrow & k_2 & \longrightarrow & K \end{array}$$

commutes. This implies that $k_1 \subset k_2$.

Suppose that I is a directed partially ordered set, and $((R_i, k_i, \phi_i), \psi_{ii'})$ is a system over I , see Categories, Section 4.21. In this case we can consider

$$R' = \operatorname{colim}_{i \in I} R_i$$

This is a local ring with maximal ideal $\mathfrak{m}R'$, and residue field $k' = \bigcup_{i \in I} k_i$. Moreover, the ring map $R \rightarrow R'$ is flat as it is a colimit of flat maps (and tensor products commute with directed colimits). Hence we see that (R', k', ϕ') is an “upper bound” for the system.

An almost trivial application of Zorn's Lemma would finish the proof if \mathcal{C} was a set, but it isn't. (Actually, you can make this work by finding a reasonable bound on the cardinals of the local rings occurring.) To get around this problem we choose a well ordering on K . For $x \in K$ we let $K(x)$ be the subfield of K generated by all elements of K which are $\leq x$. By transfinite induction on $x \in K$ we will produce ring maps $R \subset R(x)$ as in the lemma with residue field extension $k \subset K(x)$. Moreover, by construction we will have that $R(x)$ will contain $R(y)$ for all $y \leq x$. Namely, if x has a predecessor x' , then $K(x) = K(x')[x]$ and hence we can let $R(x') \subset R(x)$ be the local ring extension constructed in the first paragraph of the proof. If x does not have a predecessor, then we first set $R'(x) = \text{colim}_{x' < x} R(x')$ as in the third paragraph of the proof. The residue field of $R'(x)$ is $K'(x) = \bigcup_{x' < x} K(x')$. Since $K(x) = K'(x)[x]$ we see that we can use the construction of the first paragraph of the proof to produce $R'(x) \subset R(x)$. This finishes the proof of the lemma. \square

Lemma 10.148.2. *Let (R, \mathfrak{m}, k) be a local ring. If $k \subset K$ is a separable algebraic extension, then there exists a directed partially ordered set I and a system of finite étale extensions $R \subset R_i$, $i \in I$ of local rings such that $R' = \text{colim} R_i$ has residue field K (as extension of k).*

Proof. Let $R \subset R'$ be the extension constructed in the proof of Lemma 10.148.1. By construction $R' = \text{colim}_{\alpha \in A} R_\alpha$ where A is a well-ordered set and the transition maps $R_\alpha \rightarrow R_{\alpha+1}$ are finite étale and $R_\alpha = \text{colim}_{\beta < \alpha} R_\beta$ if α is not a successor. We will prove the result by transfinite induction.

Suppose the result holds for R_α , i.e., $R_\alpha = \text{colim} R_i$ with R_i finite étale over R . Since $R_\alpha \rightarrow R_{\alpha+1}$ is finite étale there exists an i and a finite étale extension $R_i \rightarrow R_{i,1}$ such that $R_{\alpha+1} = R_\alpha \otimes_{R_i} R_{i,1}$. Thus $R_{\alpha+1} = \text{colim}_{i' \geq i} R_{i'} \otimes_{R_i} R_{i,1}$ and the result holds for $\alpha + 1$. Suppose α is not a successor and the result holds for R_β for all $\beta < \alpha$. Since every finite subset $E \subset R_\alpha$ is contained in R_β for some $\beta < \alpha$ and we see that E is contained in a finite étale subextension by assumption. Thus the result holds for R_α . \square

Lemma 10.148.3. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime and let $\kappa(\mathfrak{p}) \subset L$ be a finite extension of fields. Then there exists a finite free ring map $R \rightarrow S$ such that $\mathfrak{q} = \mathfrak{p}S$ is prime and $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is isomorphic to the given extension $\kappa(\mathfrak{p}) \subset L$.*

Proof. By induction of the degree of $\kappa(\mathfrak{p}) \subset L$. If the degree is 1, then we take $R = S$. In general, if there exists a sub extension $\kappa(\mathfrak{p}) \subset L' \subset L$ then we win by induction on the degree (by first constructing $R \subset S'$ corresponding to $L'/\kappa(\mathfrak{p})$ and then construction $S' \subset S$ corresponding to L/L'). Thus we may assume that $L \supset \kappa(\mathfrak{p})$ is generated by a single element $\alpha \in L$. Let $X^d + \sum_{i < d} a_i X^i$ be the minimal polynomial of α over $\kappa(\mathfrak{p})$, so $a_i \in \kappa(\mathfrak{p})$. We may write a_i as the image of f_i/g for some $f_i, g \in R$ and $g \notin \mathfrak{p}$. After replacing α by $g\alpha$ (and correspondingly replacing a_i by $g^{d-i}a_i$) we may assume that a_i is the image of some $f_i \in R$. Then we simply take $S = R[x]/(x^d + \sum f_i x^i)$. \square

10.149. The Cohen structure theorem

Here is a fundamental notion in commutative algebra.

Definition 10.149.1. Let (R, \mathfrak{m}) be a local ring. We say R is a *complete local ring* if the canonical map

$$R \longrightarrow \lim_n R/\mathfrak{m}^n$$

to the completion of R with respect to \mathfrak{m} is an isomorphism⁷.

Note that an Artinian local ring R is a complete local ring because $\mathfrak{m}_R^n = 0$ for some $n > 0$. In this section we mostly focus on Noetherian complete local rings.

Lemma 10.149.2. *Let R be a Noetherian complete local ring. Any quotient of R is also a Noetherian complete local ring. Given a finite ring map $R \rightarrow S$, then S is a product of Noetherian complete local rings.*

Proof. The ring S is Noetherian by Lemma 10.30.1. As an R -module S is complete by Lemma 10.93.2. Hence S is the product of the completions at its maximal ideals by Lemma 10.93.19. \square

Lemma 10.149.3. *Let (R, \mathfrak{m}) be a complete local ring. If \mathfrak{m} is a finitely generated ideal then R is Noetherian.*

Proof. See Lemma 10.93.9. \square

Definition 10.149.4. Let (R, \mathfrak{m}) be a complete local ring. A subring $\Lambda \subset R$ is called a *coefficient ring* if the following conditions hold:

- (1) Λ is a complete local ring with maximal ideal $\Lambda \cap \mathfrak{m}$,
- (2) the residue field of Λ maps isomorphically to the residue field of R , and
- (3) $\Lambda \cap \mathfrak{m} = p\Lambda$, where p is the characteristic of the residue field of R .

Let us make some remarks on this definition. We split the discussion into the following cases:

- (1) The local ring R contains a field. This happens if either $\mathbf{Q} \subset R$, or $pR = 0$ where p is the characteristic of R/\mathfrak{m} . In this case a coefficient ring Λ is a field contained in R which maps isomorphically to R/\mathfrak{m} .
- (2) The characteristic of R/\mathfrak{m} is $p > 0$ but no power of p is zero in R . In this case Λ is a complete discrete valuation ring with uniformizer p and residue field R/\mathfrak{m} .
- (3) The characteristic of R/\mathfrak{m} is $p > 0$, and for some $n > 1$ we have $p^{n-1} \neq 0$, $p^n = 0$ in R . In this case Λ is an Artinian local ring whose maximal ideal is generated by p and which has residue field R/\mathfrak{m} .

The complete discrete valuation rings with uniformizer p above play a special role and we baptize them as follows.

Definition 10.149.5. A *Cohen ring* is a complete discrete valuation ring with uniformizer p a prime number.

Lemma 10.149.6. *Let p be a prime number. Let k be a field of characteristic p . There exists a Cohen ring Λ with $\Lambda/p\Lambda \cong k$.*

Proof. First note that the p -adic integers \mathbf{Z}_p form a Cohen ring for \mathbf{F}_p . Let k be an arbitrary field of characteristic p . Let $\mathbf{Z}_p \rightarrow R$ be a flat local ring map such that $\mathfrak{m}_R = pR$ and $R/pR = k$, see Lemma 10.148.1. Then clearly R is a discrete valuation ring. Hence its completion is a Cohen ring for k . \square

⁷This includes the condition that $\bigcap \mathfrak{m}^n = (0)$; in some texts this may be indicated by saying that R is complete and separated. Warning: It can happen that the completion $\lim_n R/\mathfrak{m}^n$ of a local ring is non-complete, see Examples, Lemma 82.6.1. This does not happen when \mathfrak{m} is finitely generated, see Lemma 10.93.7 in which case the completion is Noetherian, see Lemma 10.93.9.

Lemma 10.149.7. *Let $p > 0$ be a prime. Let Λ be a Cohen ring with residue field of characteristic p . For every $n \geq 1$ the ring map*

$$\mathbf{Z}/p^n\mathbf{Z} \rightarrow \Lambda/p^n\Lambda$$

is formally smooth.

Proof. If $n = 1$, this follows from Proposition 10.147.9. For general n we argue by induction on n . Namely, if $\mathbf{Z}/p^n\mathbf{Z} \rightarrow \Lambda/p^n\Lambda$ is formally smooth, then we can apply Lemma 10.133.12 to the ring map $\mathbf{Z}/p^{n+1}\mathbf{Z} \rightarrow \Lambda/p^{n+1}\Lambda$ and the ideal $I = (p^n) \subset \mathbf{Z}/p^{n+1}\mathbf{Z}$. \square

Theorem 10.149.8 (Cohen structure theorem). *Let (R, \mathfrak{m}) be a complete local ring.*

- (1) *R has a coefficient ring (see Definition 10.149.4),*
- (2) *if \mathfrak{m} is a finitely generated ideal, then R is isomorphic to a quotient*

$$\Lambda[[x_1, \dots, x_n]]/I$$

where Λ is either a field or a Cohen ring.

Proof. Let us prove a coefficient ring exists. First we prove this in case the characteristic of the residue field κ is zero. Namely, in this case we will prove by induction on $n > 0$ that there exists a section

$$\varphi_n : \kappa \longrightarrow R/\mathfrak{m}^n$$

to the canonical map $R/\mathfrak{m}^n \rightarrow \kappa = R/\mathfrak{m}$. This is trivial for $n = 1$. If $n > 1$, let φ_{n-1} be given. The field extension $\mathbf{Q} \subset \kappa$ is formally smooth by Proposition 10.147.9. Hence we can find the dotted arrow in the following diagram

$$\begin{array}{ccc} R/\mathfrak{m}^{n-1} & \longleftarrow & R/\mathfrak{m}^n \\ \uparrow \varphi_{n-1} & \nearrow & \uparrow \\ \kappa & \longleftarrow & \mathbf{Q} \end{array}$$

This proves the induction step. Putting these maps together

$$\lim_n \varphi_n : \kappa \longrightarrow R = \lim_n R/\mathfrak{m}^n$$

gives a map whose image is the desired coefficient ring.

Next, we prove the existence of a coefficient ring in the case where the characteristic of the residue field κ is $p > 0$. Namely, choose a Cohen ring Λ with $\kappa = \Lambda/p\Lambda$, see Lemma 10.149.6. In this case we will prove by induction on $n > 0$ that there exists a map

$$\varphi_n : \Lambda/p^n\Lambda \longrightarrow R/\mathfrak{m}^n$$

whose composition with the reduction map $R/\mathfrak{m}^n \rightarrow \kappa$ produces the given isomorphism $\Lambda/p\Lambda = \kappa$. This is trivial for $n = 1$. If $n > 1$, let φ_{n-1} be given. The ring map $\mathbf{Z}/p^n\mathbf{Z} \rightarrow \Lambda/p^n\Lambda$ is formally smooth by Lemma 10.149.7. Hence we can find the dotted arrow in the following diagram

$$\begin{array}{ccc} R/\mathfrak{m}^{n-1} & \longleftarrow & R/\mathfrak{m}^n \\ \uparrow \varphi_{n-1} & \nearrow & \uparrow \\ \Lambda/p^n\Lambda & \longleftarrow & \mathbf{Z}/p^n\mathbf{Z} \end{array}$$

This proves the induction step. Putting these maps together

$$\lim_n \varphi_n : \Lambda = \lim_n \Lambda/p^n \Lambda \longrightarrow R = \lim_n R/\mathfrak{m}^n$$

gives a map whose image is the desired coefficient ring.

The final statement of the theorem is now clear. Namely, if y_1, \dots, y_n are generators of the ideal \mathfrak{m} , then we can use the map $\Lambda \rightarrow R$ just constructed to get a map

$$\Lambda[[x_1, \dots, x_n]] \longrightarrow R, \quad x_i \longmapsto y_i.$$

This map is surjective on each R/\mathfrak{m}^n and hence is surjective as R is complete. Some details omitted. \square

Remark 10.149.9. If k is a field then the power series ring $k[[X_1, \dots, X_d]]$ is a Noetherian complete local regular ring of dimension d . If Λ is a Cohen ring then $\Lambda[[X_1, \dots, X_d]]$ is a complete local Noetherian regular ring of dimension $d+1$. Hence the Cohen structure theorem implies that any Noetherian complete local ring is a quotient of a regular local ring. In particular we see that a Noetherian complete local ring is universally catenary, see Lemma 10.101.6 and Lemma 10.102.3.

Lemma 10.149.10. *Let (R, \mathfrak{m}) be a Noetherian complete local domain. Then there exists a $R_0 \subset R$ with the following properties*

- (1) R_0 is a regular complete local ring,
- (2) $R_0 \subset R$ is finite and induces an isomorphism on residue fields,
- (3) R_0 is either isomorphic to $k[[X_1, \dots, X_d]]$ where k is a field or $\Lambda[[X_1, \dots, X_d]]$ where Λ is a Cohen ring.

Proof. Let Λ be a coefficient ring of R . Since R is a domain we see that either Λ is a field or Λ is a Cohen ring.

Case I: $\Lambda = k$ is a field. Let $d = \dim(R)$. Choose $x_1, \dots, x_d \in \mathfrak{m}$ which generate an ideal of definition $I \subset R$. (See Section 10.59.) By Lemma 10.93.14 we see that R is I -adically complete as well. Consider the map $R_0 = k[[X_1, \dots, X_d]] \rightarrow R$ which maps X_i to x_i . Note that R_0 is complete with respect to the ideal $I_0 = (X_1, \dots, X_d)$, and that $R/I_0 R \cong R/IR$ is finite over $k = R_0/I_0$ (because $\dim(R/I) = 0$, see Section 10.59.) Hence we conclude that $R_0 \rightarrow R$ is finite by Lemma 10.93.17. Since $\dim(R) = \dim(R_0)$ this implies that $R_0 \rightarrow R$ is injective (see Lemma 10.108.3), and the lemma is proved.

Case II: Λ is a Cohen ring. Let $d+1 = \dim(R)$. Let $p > 0$ be the characteristic of the residue field k . As R is a domain we see that p is a nonzerodivisor in R . Hence $\dim(R/pR) = d$, see Lemma 10.59.11. Choose $x_1, \dots, x_d \in R$ which generate an ideal of definition in R/pR . Then $I = (p, x_1, \dots, x_d)$ is an ideal of definition of R . By Lemma 10.93.14 we see that R is I -adically complete as well. Consider the map $R_0 = \Lambda[[X_1, \dots, X_d]] \rightarrow R$ which maps X_i to x_i . Note that R_0 is complete with respect to the ideal $I_0 = (p, X_1, \dots, X_d)$, and that $R/I_0 R \cong R/IR$ is finite over $k = R_0/I_0$ (because $\dim(R/I) = 0$, see Section 10.59.) Hence we conclude that $R_0 \rightarrow R$ is finite by Lemma 10.93.17. Since $\dim(R) = \dim(R_0)$ this implies that $R_0 \rightarrow R$ is injective (see Lemma 10.108.3), and the lemma is proved. \square

10.150. Nagata and Japanese rings

In this section we discuss finiteness of integral closure. It turns out that this is closely related to the relationship between a local ring and its completion.

Definition 10.150.1. Let R be a domain with field of fractions K .

- (1) We say R is *N-1* if the integral closure of R in K is a finite R -module.
- (2) We say R is *N-2*, or *Japanese* if for any finite extension $K \subset L$ of fields the integral closure of R in L is finite over R .

The main interest in these notions is for Noetherian rings, but here is a non-Noetherian example.

Example 10.150.2. Let k be a field. The domain $R = k[x_1, x_2, x_3, \dots]$ is Japanese, but not Noetherian. The reason is the following. Suppose that $R \subset L$ and the field L is a finite extension of the fraction field of R . Then there exists an integer n such that L comes from a finite extension $k(x_1, \dots, x_n) \subset L_0$ by adjoining the (transcendental) elements x_{n+1}, x_{n+2} , etc. Let S_0 be the integral closure of $k[x_1, \dots, x_n]$ in L_0 . By Proposition 10.150.31 below it is true that S_0 is finite over $k[x_1, \dots, x_n]$. Moreover, the integral closure of R in L is $S = S_0[x_{n+1}, x_{n+2}, \dots]$ (use Lemma 10.36.8) and hence finite over R . The same argument works for $R = \mathbf{Z}[x_1, x_2, x_3, \dots]$.

Lemma 10.150.3. *Let R be a domain. If R is N-1 then so is any localization of R . Same for N-2.*

Proof. These statements hold because taking integral closure commutes with localization, see Lemma 10.35.9. \square

Lemma 10.150.4. *Let R be a domain. Let $f_1, \dots, f_n \in R$ generate the unit ideal. If each domain R_{f_i} is N-1 then so is R . Same for N-2.*

Proof. Assume R_{f_i} is N-2 (or N-1). Let L be a finite extension of the fraction field of R (equal to the fraction field in the N-1 case). Let S be the integral closure of R in L . By Lemma 10.35.9 we see that S_{f_i} is the integral closure of R_{f_i} in L . Hence S_{f_i} is finite over R_{f_i} by assumption. Thus S is finite over R by Lemma 10.23.2. \square

Lemma 10.150.5. *Let R be a domain. Let $R \subset S$ be a quasi-finite extension of domains (for example finite). Assume R is N-2 and Noetherian. Then S is N-2.*

Proof. Let $K = f.f.(R) \subset L = f.f.(S)$. Note that this is a finite field extension (for example by Lemma 10.118.2 (2) applied to the fibre $S \otimes_R K$, and the definition of a quasi-finite ring map). Let S' be the integral closure of R in S . Then S' is contained in the integral closure of R in L which is finite over R by assumption. As R is Noetherian this implies S' is finite over R . By Lemma 10.119.15 there exist elements $g_1, \dots, g_n \in S'$ such that $S'_{g_i} \cong S_{g_i}$ and such that g_1, \dots, g_n generate the unit ideal in S . Hence it suffices to show that S' is N-2 by Lemmas 10.150.3 and 10.150.4. Thus we have reduced to the case where S is finite over R .

Assume $R \subset S$ with hypotheses as in the lemma and moreover that S is finite over R . Let M be a finite field extension of the fraction field of S . Then M is also a finite field extension of $f.f.(R)$ and we conclude that the integral closure T of R in M is finite over R . By Lemma 10.35.14 we see that T is also the integral closure of S in M and we win by Lemma 10.35.13. \square

Lemma 10.150.6. *Let R be a Noetherian domain. If $R[z, z^{-1}]$ is $N-1$, then so is R .*

Proof. Let R' be the integral closure of R in its field of fractions K . Let S' be the integral closure of $R[z, z^{-1}]$ in its field of fractions. Clearly $R' \subset S'$. Since $K[z, z^{-1}]$ is a normal domain we see that $S' \subset K[z, z^{-1}]$. Suppose that $f_1, \dots, f_n \in S'$ generate S' as $R[z, z^{-1}]$ -module. Say $f_i = \sum a_{ij}z^j$ (finite sum), with $a_{ij} \in K$. For any $x \in R'$ we can write

$$x = \sum h_i f_i$$

with $h_i \in R[z, z^{-1}]$. Thus we see that R' is contained in the finite R -submodule $\sum Ra_{ij} \subset K$. Since R is Noetherian we conclude that R' is a finite R -module. \square

Lemma 10.150.7. *Let R be a Noetherian domain, and let $R \subset S$ be a finite extension of domains. If S is $N-1$, then so is R . If S is $N-2$, then so is R .*

Proof. Omitted. (Hint: Integral closures of R in extension fields are contained in integral closures of S in extension fields.) \square

Lemma 10.150.8. *Let R be a Noetherian normal domain with fraction field K . Let $K \subset L$ be a finite separable field extension. Then the integral closure of R in L is finite over R .*

Proof. Consider the trace pairing

$$L \times L \longrightarrow K, \quad (x, y) \longmapsto \langle x, y \rangle := \text{Tr}_{L/K}(xy).$$

Since L/K is separable this is nondegenerate (exercise in Galois theory). Moreover, if $x \in L$ is integral over R , then $\text{Tr}_{L/K}(x)$ is integral over R also, and since R is normal we see $\text{Tr}_{L/K}(x) \in R$. Pick $x_1, \dots, x_n \in L$ which are integral over R and which form a K -basis of L . Then the integral closure $S \subset L$ is contained in the R -module

$$M = \{y \in L \mid \langle x_i, y \rangle \in R, \quad i = 1, \dots, n\}$$

By linear algebra we see that $M \cong R^{\oplus n}$ as an R -module. Hence $S \subset R^{\oplus n}$ is a finitely generated R -module as R is Noetherian. \square

Example 10.150.9. Lemma 10.150.8 does not work if the ring is not Noetherian. For example consider the action of $G = \{+1, -1\}$ on $A = \mathbf{C}[x_1, x_2, x_3, \dots]$ where -1 acts by mapping x_i to $-x_i$. The invariant ring $R = A^G$ is the \mathbf{C} -algebra generated by all $x_i x_j$. Hence $R \subset A$ is not finite. But R is a normal domain with fraction field $K = L^G$ the G -invariants in the fraction field L of A . And clearly A is the integral closure of R in L .

Lemma 10.150.10. *A Noetherian domain of characteristic zero is $N-1$ if and only if it is $N-2$ (i.e., Japanese).*

Proof. This is clear from Lemma 10.150.8 since every field extension in characteristic zero is separable. \square

Lemma 10.150.11. *Let R be a Noetherian domain with fraction field K of characteristic $p > 0$. Then R is Japanese if and only if for every finite purely inseparable extension $K \subset L$ the integral closure of R in L is finite over R .*

Proof. Assume the integral closure of R in every finite purely inseparable field extension of K is finite. Let $K \subset L$ be any finite extension. We have to show the integral closure of R in L is finite over R . Choose a finite normal field extension $K \subset M$ containing L . As R is Noetherian it suffices to show that the integral closure of R in M is finite over R . By Fields, Lemma 9.24.3 there exists a subextension $K \subset M_{insep} \subset M$ such that M_{insep}/K is purely inseparable, and M/M_{insep} is separable. By assumption the integral closure R' of R in M_{insep} is finite over R . By Lemma 10.150.8 the integral closure R'' of R' in M is finite over R' . Then R'' is finite over R by Lemma 10.7.3. Since R'' is also the integral closure of R in M (see Lemma 10.35.14) we win. \square

Lemma 10.150.12. *Let R be a Noetherian domain. If R is N-1 then $R[x]$ is N-1. If R is N-2 then $R[x]$ is N-2.*

Proof. Assume R is N-1. Let R' be the integral closure of R which is finite over R . Hence also $R'[x]$ is finite over $R[x]$. The ring $R'[x]$ is normal (see Lemma 10.36.8), hence N-1. This proves the first assertion.

For the second assertion, by Lemma 10.150.7 it suffices to show that $R'[x]$ is N-2. In other words we may and do assume that R is a normal N-2 domain. In characteristic zero we are done by Lemma 10.150.10. In characteristic $p > 0$ we have to show that the integral closure of $R[x]$ is finite in any finite purely inseparable extension of $f.f.(R[x]) = K(x) \subset L$ with $K = f.f.(R)$. Clearly there exists a finite purely inseparable field extension $K \subset L'$ and $q = p^e$ such that $L \subset L'(x^{1/q})$. As $R[x]$ is Noetherian it suffices to show that the integral closure of $R[x]$ in $L'(x^{1/q})$ is finite over $R[x]$. And this integral closure is equal to $R'[x^{1/q}]$ with $R \subset R' \subset L'$ the integral closure of R in L' . Since R is N-2 we see that R' is finite over R and hence $R'[x^{1/q}]$ is finite over $R[x]$. \square

Lemma 10.150.13 (Tate). *Let R be a ring. Let $x \in R$. Assume*

- (1) R is a normal Noetherian domain,
- (2) R/xR is a Japanese domain,
- (3) $R \cong \lim_n R/x^n R$ is complete with respect to x .

Then R is Japanese.

Proof. We may assume $x \neq 0$ since otherwise the lemma is trivial. Let K be the fraction field of R . If the characteristic of K is zero the lemma follows from (1), see Lemma 10.150.10. Hence we may assume that the characteristic of K is $p > 0$, and we may apply Lemma 10.150.11. Thus given $K \subset L$ be a finite purely inseparable field extension we have to show that the integral closure S of R in L is finite over R .

Let q be a power of p such that $L^q \subset K$. By enlarging L if necessary we may assume there exists an element $y \in L$ such that $y^q = x$. Since $R \rightarrow S$ induces a homeomorphism of spectra (see Lemma 10.45.2) there is a unique prime ideal $\mathfrak{q} \subset S$ lying over the prime ideal $\mathfrak{p} = xR$. It is clear that

$$\mathfrak{q} = \{f \in S \mid f^q \in \mathfrak{p}\} = yS$$

since $y^q = x$. Hence $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$ are discrete valuation rings, see Lemma 10.115.6. By Lemma 10.115.9 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is a finite field extension. Hence the integral closure $S' \subset \kappa(\mathfrak{q})$ of R/xR is finite over R/xR by assumption (2). Since $S/yS \subset S'$ this implies that S/yS is finite over R . Note that $S/y^n S$ has a finite

filtration whose subquotients are the modules $y^i S / y^{i+1} S \cong S / yS$. Hence we see that each $S / y^n S$ is finite over R . In particular S / xS is finite over R . Also, it is clear that $\bigcap x^n S = (0)$ since an element in the intersection has q th power contained in $\bigcap x^n R = (0)$ (Lemma 10.49.4). Thus we may apply Lemma 10.93.17 to conclude that S is finite over R , and we win. \square

Lemma 10.150.14. *Let R be a ring. If R is Noetherian, a domain, and N-2, then so is $R[[x]]$.*

Proof. Apply Lemma 10.150.13 to the element $x \in R[[x]]$. \square

Definition 10.150.15. Let R be a ring.

- (1) We say R is *universally Japanese* if for any finite type ring map $R \rightarrow S$ with S a domain we have that S is Japanese (i.e., N-2).
- (2) We say that R is a *Nagata ring* if R is Noetherian and for every prime ideal \mathfrak{p} the ring R/\mathfrak{p} is Japanese.

It is clear that a Noetherian universally Japanese ring is a Nagata ring. It is our goal to show that a Nagata ring is universally Japanese. This is not obvious at all, and requires some work. But first, here is a useful lemma.

Lemma 10.150.16. *Let R be a Nagata ring. Let $R \rightarrow S$ be essentially of finite type with S reduced. Then the integral closure of R in S is finite over R .*

Proof. As S is essentially of finite type over R it is Noetherian and has finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_m$, see Lemma 10.30.6. Since S is reduced we have $S \subset \prod S_{\mathfrak{q}_i}$ and each $S_{\mathfrak{q}_i} = K_i$ is a field, see Lemmas 10.24.4 and 10.24.1. It suffices to show that the integral closure A'_i of R in each K_i is finite over R . This is true because R is Noetherian and $A \subset \prod A'_i$. Let $\mathfrak{p}_i \subset R$ be the prime of R corresponding to \mathfrak{q}_i . As S is essentially of finite type over R we see that $K_i = S_{\mathfrak{q}_i} = \kappa(\mathfrak{q}_i)$ is a finitely generated field extension of $\kappa(\mathfrak{p}_i)$. Hence the algebraic closure L_i of $\kappa(\mathfrak{p}_i)$ in $\subset K_i$ is finite over $\kappa(\mathfrak{p}_i)$, see Fields, Lemma 9.23.10. It is clear that A'_i is the integral closure of R/\mathfrak{p}_i in L_i , and hence we win by definition of a Nagata ring. \square

Lemma 10.150.17. *Let R be a ring. To check that R is universally Japanese it suffices to show: If $R \rightarrow S$ is of finite type, and S a domain then S is N-1.*

Proof. Namely, assume the condition of the lemma. Let $R \rightarrow S$ be a finite type ring map with S a domain. Let $f.f.(S) \subset L$ be a finite extension of its fraction field. Then there exists a finite ring extension $S \subset S' \subset L$ with $f.f.(S') = L$. By assumption S' is N-1, and hence the integral closure S'' of S' in L is finite over S' . Thus S'' is finite over S (Lemma 10.7.3) and S'' is the integral closure of S in L (Lemma 10.35.14). We conclude that R is universally Japanese. \square

Lemma 10.150.18. *If R is universally Japanese then any algebra essentially of finite type over R is universally Japanese.*

Proof. The case of an algebra of finite type over R is immediate from the definition. The general case follows on applying Lemma 10.150.3. \square

Lemma 10.150.19. *Let R be a Nagata ring. If $R \rightarrow S$ is a quasi-finite ring map (for example finite) then S is a Nagata ring also.*

Proof. First note that S is Noetherian as R is Noetherian and a quasi-finite ring map is of finite type. Let $\mathfrak{q} \subset S$ be a prime ideal, and set $\mathfrak{p} = R \cap \mathfrak{q}$. Then $R/\mathfrak{p} \subset S/\mathfrak{q}$ is quasi-finite and hence we conclude that S/\mathfrak{q} is N-2 by Lemma 10.150.5 as desired. \square

Lemma 10.150.20. *A localization of a Nagata ring is a Nagata ring.*

Proof. Clear from Lemma 10.150.3. \square

Lemma 10.150.21. *Let R be a ring. Let $f_1, \dots, f_n \in R$ generate the unit ideal.*

- (1) *If each R_{f_i} is universally Japanese then so is R .*
- (2) *If each R_{f_i} is Nagata then so is R .*

Proof. Let $\varphi : R \rightarrow S$ be a finite type ring map so that S is a domain. Then $\varphi(f_1), \dots, \varphi(f_n)$ generate the unit ideal in S . Hence if each $S_{f_i} = S_{\varphi(f_i)}$ is N-1 then so is S , see Lemma 10.150.4. This proves (1).

If each R_{f_i} is Nagata, then each R_{f_i} is Noetherian and hence R is Noetherian, see Lemma 10.23.2. And if $\mathfrak{p} \subset R$ is a prime, then we see each $R_{f_i}/\mathfrak{p}R_{f_i} = (R/\mathfrak{p})_{f_i}$ is Japanese and hence we conclude R/\mathfrak{p} is Japanese by Lemma 10.150.4. This proves (2). \square

Lemma 10.150.22. *A Noetherian complete local ring is a Nagata ring.*

Proof. Let R be a complete local Noetherian ring. Let $\mathfrak{p} \subset R$ be a prime. Then R/\mathfrak{p} is also a complete local Noetherian ring, see Lemma 10.149.2. Hence it suffices to show that a Noetherian complete local domain R is N-2. By Lemmas 10.150.5 and 10.149.10 we reduce to the case $R = k[[X_1, \dots, X_d]]$ where k is a field or $R = \Lambda[[X_1, \dots, X_d]]$ where Λ is a Cohen ring.

In the case $k[[X_1, \dots, X_d]]$ we reduce to the statement that a field is N-2 by Lemma 10.150.14. This is clear. In the case $\Lambda[[X_1, \dots, X_d]]$ we reduce to the statement that a Cohen ring Λ is N-2. Applying Lemma 10.150.13 once more with $x = p \in \Lambda$ we reduce yet again to the case of a field. Thus we win. \square

Definition 10.150.23. Let (R, \mathfrak{m}) be a Noetherian local ring. We say R is *analytically unramified* if its completion $R^\wedge = \lim_n R/\mathfrak{m}^n$ is reduced. A prime ideal $\mathfrak{p} \subset R$ is said to be *analytically unramified* if R/\mathfrak{p} is analytically unramified.

At this point we know the following are true for any Noetherian local ring R : The map $R \rightarrow R^\wedge$ is a faithfully flat local ring homomorphism (Lemma 10.93.4). The completion R^\wedge is Noetherian (Lemma 10.93.9) and complete (Lemma 10.93.8). Hence the completion R^\wedge is a Nagata ring (Lemma 10.150.22). Moreover, we have seen in Section 10.149 that R^\wedge is a quotient of a regular local ring (Theorem 10.149.8), and hence universally catenary (Remark 10.149.9).

Lemma 10.150.24. *Let (R, \mathfrak{m}) be a Noetherian local ring.*

- (1) *If R is analytically unramified, then R is reduced.*
- (2) *If R is analytically unramified, then each minimal prime of R is analytically unramified.*
- (3) *If R is reduced with minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, and each \mathfrak{q}_i is analytically unramified, then R is analytically unramified.*
- (4) *If R is analytically unramified, then the integral closure of R in its total ring of fractions $Q(R)$ is finite over R .*

(5) *If R is a domain and analytically unramified, then R is N -1.*

Proof. In this proof we will use the remarks immediately following Definition 10.150.23. As $R \rightarrow R^\wedge$ is a faithfully flat local ring homomorphism it is injective and (1) follows.

Let \mathfrak{q} be a minimal prime of R , and assume R is analytically unramified. Then \mathfrak{q} is an associated prime of R (see Proposition 10.62.6). Hence there exists an $f \in R$ such that $\{x \in R \mid fx = 0\} = \mathfrak{q}$. Note that $(R/\mathfrak{q})^\wedge = R^\wedge/\mathfrak{q}^\wedge$, and that $\{x \in R^\wedge \mid fx = 0\} = \mathfrak{q}^\wedge$, because completion is exact (Lemma 10.93.3). If $x \in R^\wedge$ is such that $x^2 \in \mathfrak{q}^\wedge$, then $fx^2 = 0$ hence $(fx)^2 = 0$ hence $fx = 0$ hence $x \in \mathfrak{q}^\wedge$. Thus \mathfrak{q} is analytically unramified and (2) holds.

Assume R is reduced with minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, and each \mathfrak{q}_i is analytically unramified. Then $R \rightarrow R/\mathfrak{q}_1 \times \dots \times R/\mathfrak{q}_t$ is injective. Since completion is exact (see Lemma 10.93.3) we see that $R^\wedge \subset (R/\mathfrak{q}_1)^\wedge \times \dots \times (R/\mathfrak{q}_t)^\wedge$. Hence (3) is clear.

Assume R is analytically unramified. Let $\mathfrak{p}_1, \dots, \mathfrak{p}_s$ be the minimal primes of R^\wedge . Then we see that

$$Q(R^\wedge) = R_{\mathfrak{p}_1} \times \dots \times R_{\mathfrak{p}_s}$$

with each $R_{\mathfrak{p}_i}$ a field as R^\wedge is reduced (see Lemma 10.24.4). Hence the integral closure S of R^\wedge in $Q(R^\wedge)$ is equal to $S = S_1 \times \dots \times S_s$ with S_i the integral closure of R/\mathfrak{p}_i in its fraction field. In particular S is finite over R^\wedge . Denote R' the integral closure of R in $Q(R)$. As $R \rightarrow R^\wedge$ is flat we see that $R' \otimes_R R^\wedge \subset Q(R) \otimes_R R^\wedge \subset Q(R^\wedge)$. Moreover $R' \otimes_R R^\wedge$ is integral over R^\wedge (Lemma 10.35.11). Hence $R' \otimes_R R^\wedge \subset S$ is a R^\wedge -submodule. As R^\wedge is Noetherian it is a finite R^\wedge -module. Thus we may find $f_1, \dots, f_n \in R'$ such that $R' \otimes_R R^\wedge$ is generated by the elements $f_i \otimes 1$ as a R^\wedge -module. By faithful flatness we see that R' is generated by f_1, \dots, f_n as an R -module. This proves (4).

Part (5) is a special case of part (4). \square

Lemma 10.150.25. *Let R be a Noetherian local ring. Let $\mathfrak{p} \subset R$ be a prime. Assume*

- (1) $R_{\mathfrak{p}}$ is a discrete valuation ring, and
- (2) \mathfrak{p} is analytically unramified.

Then for any associated prime \mathfrak{q} of $R^\wedge/\mathfrak{p}R^\wedge$ the local ring $(R^\wedge)_{\mathfrak{q}}$ is a discrete valuation ring.

Proof. Assumption (2) says that $R^\wedge/\mathfrak{p}R^\wedge$ is a reduced ring. Hence an associated prime $\mathfrak{q} \subset R^\wedge$ of $R^\wedge/\mathfrak{p}R^\wedge$ is the same thing as a minimal prime over $\mathfrak{p}R^\wedge$. In particular we see that the maximal ideal of $(R^\wedge)_{\mathfrak{q}}$ is $\mathfrak{p}(R^\wedge)_{\mathfrak{q}}$. Choose $x \in R$ such that $xR_{\mathfrak{p}} = \mathfrak{p}R_{\mathfrak{p}}$. By the above we see that $x \in (R^\wedge)_{\mathfrak{q}}$ generates the maximal ideal. As $R \rightarrow R^\wedge$ is faithfully flat we see that x is a nonzerodivisor in $(R^\wedge)_{\mathfrak{q}}$. Hence we win. \square

Lemma 10.150.26. *Let (R, \mathfrak{m}) be a Noetherian local domain. Let $x \in \mathfrak{m}$. Assume*

- (1) $x \neq 0$,
- (2) R/xR has no embedded primes, and
- (3) for each associated prime $\mathfrak{p} \subset R$ of R/xR we have
 - (a) the local ring $R_{\mathfrak{p}}$ is regular, and
 - (b) \mathfrak{p} is analytically unramified.

Then R is analytically unramified.

Proof. Let $\mathfrak{p}_1, \dots, \mathfrak{p}_t$ be the associated primes of the R -module R/xR . Since R/xR has no embedded primes we see that each \mathfrak{p}_i has height 1, and is a minimal prime over (x) . For each i , let $\mathfrak{q}_{i1}, \dots, \mathfrak{q}_{is_i}$ be the associated primes of the R^\wedge -module $R^\wedge/\mathfrak{p}_i R^\wedge$. By Lemma 10.150.25 we see that $(R^\wedge)_{\mathfrak{q}_{ij}}$ is regular. By Lemma 10.64.3 we see that

$$\text{Ass}_{R^\wedge}(R^\wedge/xR^\wedge) = \bigcup_{\mathfrak{p} \in \text{Ass}_R(R/xR)} \text{Ass}_{R^\wedge}(R^\wedge/\mathfrak{p}R^\wedge) = \{\mathfrak{q}_{ij}\}.$$

Let $y \in R^\wedge$ with $y^2 = 0$. As $(R^\wedge)_{\mathfrak{q}_{ij}}$ is regular, and hence a domain (Lemma 10.102.2) we see that y maps to zero in $(R^\wedge)_{\mathfrak{q}_{ij}}$. Hence y maps to zero in R^\wedge/xR^\wedge by Lemma 10.62.18. Hence $y = xy'$. Since x is a nonzerodivisor (as $R \rightarrow R^\wedge$ is flat) we see that $(y')^2 = 0$. Hence we conclude that $y \in \bigcap x^n R^\wedge = (0)$ (Lemma 10.49.4). \square

Lemma 10.150.27. *Let (R, \mathfrak{m}) be a local ring. If R is Noetherian, a domain, and Nagata, then R is analytically unramified.*

Proof. By induction on $\dim(R)$. The case $\dim(R) = 0$ is trivial. Hence we assume $\dim(R) = d$ and that the lemma holds for all Noetherian Nagata domains of dimension $< d$.

Let $R \subset S$ be the integral closure of R in the field of fractions of R . By assumption S is a finite R -module. By Lemma 10.150.19 we see that S is Nagata. By Lemma 10.108.4 we see $\dim(R) = \dim(S)$. Let $\mathfrak{m}_1, \dots, \mathfrak{m}_t$ be the maximal ideals of S . Each of these lies over the maximal ideal \mathfrak{m} of R . Moreover

$$(\mathfrak{m}_1 \cap \dots \cap \mathfrak{m}_t)^n \subset \mathfrak{m}S$$

for sufficiently large n as $S/\mathfrak{m}S$ is Artinian. By Lemma 10.93.3 $R^\wedge \rightarrow S^\wedge$ is an injective map, and by the Chinese Remainder Lemma 10.14.3 combined with Lemma 10.93.14 we have $S^\wedge = \prod S_i^\wedge$ where S_i^\wedge is the completion of S with respect to the maximal ideal \mathfrak{m}_i . Hence it suffices to show that $S_{\mathfrak{m}_i}$ is analytically unramified. In other words, we have reduced to the case where R is a Noetherian normal Nagata domain.

Assume R is a Noetherian, normal, local Nagata domain. Pick a nonzero $x \in \mathfrak{m}$ in the maximal ideal. We are going to apply Lemma 10.150.26. We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is clear. We have that R/xR has no embedded primes by Lemma 10.146.6. Thus property (2) holds. The same lemma also tells us each associated prime \mathfrak{p} of R/xR has height 1. Hence $R_{\mathfrak{p}}$ is a 1-dimensional normal domain hence regular (Lemma 10.115.6). Thus (3)(a) holds. Finally (3)(b) holds by induction hypothesis, since R/\mathfrak{p} is Nagata (by Lemma 10.150.19 or directly from the definition). Thus we conclude R is analytically unramified. \square

Lemma 10.150.28. *Let R be a Noetherian domain. If there exists an $f \in R$ such that R_f is normal then*

$$U = \{\mathfrak{p} \in \text{Spec}(R) \mid R_{\mathfrak{p}} \text{ is normal}\}$$

is open in $\text{Spec}(R)$.

Proof. It is clear that the standard open $D(f)$ is contained in U . By Serre's criterion Lemma 10.146.4 we see that $\mathfrak{p} \notin U$ implies that for some $\mathfrak{q} \subset \mathfrak{p}$ we have either

- (1) Case I: $\text{depth}(R_{\mathfrak{q}}) < 2$ and $\dim(R_{\mathfrak{q}}) \geq 2$, and
- (2) Case II: $R_{\mathfrak{q}}$ is not regular and $\dim(R_{\mathfrak{q}}) = 1$.

This in particular also means that $R_{\mathfrak{q}}$ is not normal, and hence $f \in \mathfrak{q}$. In case I we see that $\text{depth}(R_{\mathfrak{q}}) = \text{depth}(R_{\mathfrak{q}}/fR_{\mathfrak{q}}) + 1$. Hence such a prime \mathfrak{q} is the same thing as an embedded associated prime of R/fR . In case II \mathfrak{q} is an associated prime of R/fR of height 1. Thus there is a finite set E of such primes \mathfrak{q} (see Lemma 10.62.5) and

$$\text{Spec}(R) \setminus U = \bigcup_{\mathfrak{q} \in E} V(\mathfrak{q})$$

as desired. □

Lemma 10.150.29. *Let R be a Noetherian domain. Assume*

- (1) *there exists a nonzero $f \in R$ such that R_f is normal, and*
- (2) *for every maximal ideal $\mathfrak{m} \subset R$ the local ring $R_{\mathfrak{m}}$ is $N-1$.*

Then R is $N-1$.

Proof. Set $K = f.f.(R)$. Suppose that $R \subset R' \subset K$ is a finite extension of R contained in K . Note that $R_f = R'_f$ since R_f is already normal. Hence by Lemma 10.150.28 the set of primes $\mathfrak{p}' \in \text{Spec}(R')$ with $R'_{\mathfrak{p}'}$ non-normal is closed in $\text{Spec}(R')$. Since $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is closed the image of this set is closed in $\text{Spec}(R)$. For such a ring R' denote $Z_{R'} \subset \text{Spec}(R)$ this image.

Pick a maximal ideal $\mathfrak{m} \subset R$. Let $R_{\mathfrak{m}} \subset R'_{\mathfrak{m}}$ be the integral closure of the local ring in K . By assumption this is a finite ring extension. By Lemma 10.35.9 we can find finitely many elements $r_1, \dots, r_n \in K$ integral over R such that $R'_{\mathfrak{m}}$ is generated by r_1, \dots, r_n over $R_{\mathfrak{m}}$. Let $R' = R[x_1, \dots, x_n] \subset K$. With this choice it is clear that $\mathfrak{m} \notin Z_{R'}$.

As $\text{Spec}(R)$ is quasi-compact, the above shows that we can find a finite collection $R \subset R'_i \subset K$ such that $\bigcap Z_{R'_i} = \emptyset$. Let R' be the subring of K generated by all of these. It is finite over R . Also $Z_{R'} = \emptyset$. Namely, every prime \mathfrak{p}' lies over a prime \mathfrak{p}'_i such that $(R'_i)_{\mathfrak{p}'_i}$ is normal. This implies that $R'_{\mathfrak{p}'} = (R'_i)_{\mathfrak{p}'_i}$ is normal too. Hence R' is normal, in other words R' is the integral closure of R in K . □

The following proposition says in particular that an algebra of finite type over a Nagata ring is a Nagata ring.

Proposition 10.150.30 (Nagata). *Let R be a ring. The following are equivalent:*

- (1) *R is a Nagata ring,*
- (2) *any finite type R -algebra is Nagata, and*
- (3) *R is universally Japanese and Noetherian.*

Proof. It is clear that a Noetherian universally Japanese ring is universally Nagata (i.e., condition (2) holds). Let R be a Nagata ring. We will show that any finitely generated R -algebra S is Nagata. This will prove the proposition.

Step 1. There exists a sequence of ring maps $R = R_0 \rightarrow R_1 \rightarrow R_2 \rightarrow \dots \rightarrow R_n = S$ such that each $R_i \rightarrow R_{i+1}$ is generated by a single element. Hence by induction it suffices to prove S is Nagata if $S \cong R[x]/I$.

Step 2. Let $\mathfrak{q} \subset S$ be a prime of S , and let $\mathfrak{p} \subset R$ be the corresponding prime of R . We have to show that S/\mathfrak{q} is N-2. Hence we have reduced to the proving the following: (*) Given a Nagata domain R and a monogenic extension $R \subset S$ of domains then S is N-2.

Step 3. Let R be a Nagata domain and $R \subset S$ a monogenic extension of domains. Let $R \subset R'$ be the integral closure of R in its fraction field. Let S' be the subring of $f.f.(S)$ generated by R' and S . As R' is finite over R (by the Nagata property) also S' is finite over S . Since S is Noetherian it suffices to prove that S' is N-2 (Lemma 10.150.7). Hence we have reduced to proving the following: (**) Given a normal Nagata domain R and a monogenic extension $R \subset S$ of domains then S is N-2.

Step 4: Let R be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains. Suppose the extension of fraction fields $f.f.(R) \subset f.f.(S)$ is purely transcendental. In this case $S = R[x]$. By Lemma 10.150.12 we see that S is N-2. Hence we have reduced to proving the following: (***) Given a normal Nagata domain R and a monogenic extension $R \subset S$ of domains inducing a finite extension of fraction fields then S is N-2.

Step 5. Let R be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains inducing a finite extension of fraction fields $K = f.f.(R) \subset f.f.(S) = L$. Choose an element $x \in S$ which generates S as an R -algebra. Let $L \subset M$ be a finite extension of fields. Let R' be the integral closure of R in M . Then the integral closure S' of S in M is equal to the integral closure of $R'[x]$ in M . Also $f.f.(R') = M$, and $R \subset R'$ is finite (by the Nagata property of R). This implies that R' is a Nagata ring (Lemma 10.150.19). To show that S' is finite over S is the same as showing that S' is finite over $R'[x]$. Replace R by R' and S by S' to reduce to the following statement: (***) Given a normal Nagata domain R with fraction field K , and $x \in K$, the ring $S \subset K$ generated by R and x is N-1.

Step 6. Let R be a normal Nagata domain with fraction field K . Let $x = b/a \in K$. We have to show that the ring $S \subset K$ generated by R and x is N-1. Note that $S_a \cong R_a$ is normal. Hence by Lemma 10.150.29 it suffices to show that $S_{\mathfrak{m}}$ is N-1 for every maximal ideal \mathfrak{m} of S .

With assumptions as in the preceding paragraph, pick such a maximal ideal and set $\mathfrak{n} = R \cap \mathfrak{m}$. The residue field extension $\kappa(\mathfrak{n}) \subset \kappa(\mathfrak{m})$ is finite (Theorem 10.33.1) and generated by the image of x . Hence there exists a monic polynomial $f(X) = X^d + \sum_{i=1, \dots, d} a_i X^{d-i}$ with $f(x) \in \mathfrak{m}$. Let $K \subset K''$ be a finite extension of fields such that $f(X)$ splits completely in $K''[X]$. Let R' be the integral closure of R in K'' . Let $S' \subset K'$ be the subring generated by R' and x . As R is Nagata we see R' is finite over R and Nagata (Lemma 10.150.19). Moreover, S' is finite over S . If for every maximal ideal \mathfrak{m}' of S' the local ring $S'_{\mathfrak{m}'}$ is N-1, then $S'_{\mathfrak{m}}$ is N-1 by Lemma 10.150.29, which in turn implies that $S_{\mathfrak{m}}$ is N-1 by Lemma 10.150.7. After replacing R by R' and S by S' , and \mathfrak{m} by any of the maximal ideals \mathfrak{m}' lying over \mathfrak{m} we reach the situation where the polynomial f above split completely: $f(X) = \prod_{i=1, \dots, d} (X - a_i)$ with $a_i \in R$. Since $f(x) \in \mathfrak{m}$ we see that $x - a_i \in \mathfrak{m}$ for some i . Finally, after replacing x by $x - a_i$ we may assume that $x \in \mathfrak{m}$.

To recapitulate: R is a normal Nagata domain with fraction field K , $x \in K$ and S is the subring of K generated by x and R , finally $\mathfrak{m} \subset S$ is a maximal ideal with $x \in \mathfrak{m}$. We have to show $S_{\mathfrak{m}}$ is N-1.

We will show that Lemma 10.150.26 applies to the local ring $S_{\mathfrak{m}}$ and the element x . This will imply that $S_{\mathfrak{m}}$ is analytically unramified, whereupon we see that it is N-1 by Lemma 10.150.24.

We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is trivial. Let $I = \text{Ker}(R[X] \rightarrow S)$ where $X \mapsto x$. We claim that I is generated by all linear forms $aX + b$ such that $ax = b$ in K . Clearly all these linear forms are in I . If $g = a_d X^d + \dots a_1 X + a_0 \in I$, then we see that $a_d x$ is integral over R (Lemma 10.119.1) and hence $b := a_d x \in R$ as R is normal. Then $g - (a_d X - b)X^{d-1} \in I$ and we win by induction on the degree. As a consequence we see that

$$S/xS = R[X]/(X, I) = R/J$$

where

$$J = \{b \in R \mid ax = b \text{ for some } a \in R\} = xR \cap R$$

By Lemma 10.146.6 we see that $S/xS = R/J$ has no embedded primes as an R -module, hence as an R/J -module, hence as an S/xS -module, hence as an S -module. This proves property (2). Take such an associated prime $\mathfrak{q} \subset S$ with the property $\mathfrak{q} \subset \mathfrak{m}$ (so that it is an associated prime of $S_{\mathfrak{m}}/xS_{\mathfrak{m}}$ – it does not matter for the arguments). Then \mathfrak{q} is minimal over xS and hence has height 1. By the sequence of equalities above we see that $\mathfrak{p} = R \cap \mathfrak{q}$ is an associated prime of R/J , and so has height 1 (see Lemma 10.146.6). Thus $R_{\mathfrak{p}}$ is a discrete valuation ring and therefore $R_{\mathfrak{p}} \subset S_{\mathfrak{q}}$ is an equality. This shows that $S_{\mathfrak{q}}$ is regular. This proves property (3)(a). Finally, $(S/\mathfrak{q})_{\mathfrak{m}}$ is a localization of S/\mathfrak{q} , which is a quotient of $S/xS = R/J$. Hence $(S/\mathfrak{q})_{\mathfrak{m}}$ is a localization of a quotient of the Nagata ring R , hence Nagata (Lemmas 10.150.19 and 10.150.20) and hence analytically unramified (Lemma 10.150.27). This shows (3)(b) holds and we are done. \square

Proposition 10.150.31. *The following types of rings are Nagata and in particular universally Japanese:*

- (1) *fields,*
- (2) *Noetherian complete local rings,*
- (3) \mathbf{Z} ,
- (4) *Dedekind domains with fraction field of characteristic zero,*
- (5) *finite type ring extensions of any of the above.*

Proof. The Noetherian complete local ring case is Lemma 10.150.22. In the other cases you just check if R/\mathfrak{p} is N-2 for every prime ideal \mathfrak{p} of the ring. This is clear whenever R/\mathfrak{p} is a field, i.e., \mathfrak{p} is maximal. Hence for the Dedekind ring case we only need to check it when $\mathfrak{p} = (0)$. But since we assume the fraction field has characteristic zero Lemma 10.150.10 kicks in. \square

Example 10.150.32. A discrete valuation ring is Nagata if and only if it is N-2 (this follows immediately from the definition). The discrete valuation ring A of Example 10.115.4 is not Nagata, i.e., it is not N-2. Namely, the finite extension $A \subset R = A[f]$ is not N-1. To see this say $f = \sum a_i x^i$. For every $n \geq 1$ set $g_n = \sum_{i < n} a_i x^i \in A$. Then $h_n = (f - g_n)/x^n$ is an element of the fraction field of R and $h_n^p \in k^p[[x]] \subset A$. Hence the integral closure R' of R contains h_1, h_2, h_3, \dots

Now, if R' were finite over R and hence A , then $f = x^n h_n + g_n$ would be contained in the submodule $A + x^n R'$ for all n . By Artin-Rees this would imply $f \in A$ (Lemma 10.49.4), a contradiction.

Lemma 10.150.33. *Let (A, \mathfrak{m}) be a Noetherian local domain which is Nagata and has fraction field of characteristic p . If $a \in A$ has a p th root in A^\wedge , then a has a p th root in A .*

Proof. Consider the ring extension $A \subset B = A[x]/(x^p - a)$. If a does not have a p th root in A , then B is a domain whose completion isn't a domain. This contradicts our earlier results, as B is a Nagata (Proposition 10.150.30) and hence analytically unramified by Lemma 10.150.27. \square

10.151. Ascending properties

In this section we start proving some algebraic facts concerning the “ascent” of properties of rings. To do this for depth of rings one uses the following result on ascending depth of modules, see [DG67, IV, Proposition 6.3.1].

Lemma 10.151.1. *We have*

$$\text{depth}_S(M \otimes_R N) = \text{depth}_R(M) + \text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N)$$

where $R \rightarrow S$ is a local homomorphism of local Noetherian rings, M is a finite R -module, and N is a finite S -module flat over R .

Proof. Denote n the right hand side. First assume that n is zero. Then both $\text{depth}_R(M) = 0$ and $\text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N) = 0$. This means there is a $z \in M$ whose annihilator is \mathfrak{m}_R and a $\bar{y} \in N/\mathfrak{m}_R N$ whose annihilator is $\mathfrak{m}_S/\mathfrak{m}_R S$. Let $y \in N$ be a lift of \bar{y} . Since N is flat over R the map $z : R/\mathfrak{m}_R \rightarrow M$ produces an injective map $N/\mathfrak{m}_R N \rightarrow M \otimes_R N$. Hence the annihilator of $z \otimes y$ is \mathfrak{m}_S . Thus $\text{depth}_S(M \otimes_R N) = 0$ as well.

Assume $n > 0$. If $\text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N) > 0$, then choose an $f \in \mathfrak{m}_S$ which maps to an $N/\mathfrak{m}_R N$ -regular element $\bar{f} \in S/\mathfrak{m}_R S$. Then $\text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N) = \text{depth}_{S/\mathfrak{m}_R S}(N/(f, \mathfrak{m}_R)N) + 1$ by Lemma 10.69.12. According to Lemma 10.95.1 the element $f \in S$ is a N -regular element and N/fN is flat over R . Hence by induction on n we have

$$\text{depth}_S(M \otimes_R N/fN) = \text{depth}_R(M) + \text{depth}_{S/\mathfrak{m}_R S}(N/(f, \mathfrak{m}_R)N).$$

Because N/fN is flat over R the sequence

$$0 \rightarrow M \otimes_R N \rightarrow M \otimes_R N \rightarrow M \otimes_R N/fN \rightarrow 0$$

is exact where the first map is multiplication by f (Lemma 10.38.11). Hence by Lemma 10.69.12 we find that $\text{depth}_S(M \otimes_R N) = \text{depth}_S(M \otimes_R N/fN) + 1$ and we conclude that equality holds in the formula of the lemma.

If $n > 0$, but $\text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N) = 0$, then we can choose an M -regular element $f \in \mathfrak{m}_R$. As N is flat over R it is also the case that f is $M \otimes_R N$ -regular. By induction on n again we have

$$\text{depth}_S(M/fM \otimes_R N) = \text{depth}_R(M/fM) + \text{depth}_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N).$$

In this case $\text{depth}_S(M \otimes_R N) = \text{depth}_S(M/fM \otimes_R N) + 1$ and $\text{depth}_R(M) = \text{depth}_R(M/fM) + 1$ by Lemma 10.69.12 and we conclude that equality holds in the formula of the lemma. \square

Lemma 10.151.2. *Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Then*

$$\text{depth}_S(S) = \text{depth}_R(R) + \text{depth}_S(S/\mathfrak{m}_R S).$$

Proof. This is a special case of Lemma 10.151.1. □

Lemma 10.151.3. *Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume*

- (1) $S/\mathfrak{m}_R S$ is Cohen-Macaulay, and
- (2) $R \rightarrow S$ is flat.

Then S is Cohen-Macaulay if and only if R is Cohen-Macaulay.

Proof. This follows from the definitions combined with Lemmas 10.151.2 and 10.108.7. □

Lemma 10.151.4. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) R is Noetherian,
- (2) S is Noetherian,
- (3) φ is flat,
- (4) the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are Cohen-Macaulay, and
- (5) R has property (S_k) .

Then S has property (S_k) .

Proof. Let \mathfrak{q} be a prime of S lying over a prime \mathfrak{p} of R . By Lemma 10.151.2 we have

$$\text{depth}(S_{\mathfrak{q}}) = \text{depth}(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + \text{depth}(R_{\mathfrak{p}}).$$

On the other hand, we have

$$\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}).$$

by Lemma 10.108.6. (Actually equality holds, by Lemma 10.108.7 but strictly speaking we do not need this.) Finally, as the fibre rings of the map are assumed Cohen-Macaulay we see that $\text{depth}(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. Thus the lemma follows by the following string of inequalities

$$\begin{aligned} \text{depth}(S_{\mathfrak{q}}) &= \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + \text{depth}(R_{\mathfrak{p}}) \\ &\geq \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + \min(k, \dim(R_{\mathfrak{p}})) \\ &= \min(\dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + k, \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) + \dim(R_{\mathfrak{p}})) \\ &\geq \min(k, \dim(S_{\mathfrak{q}})) \end{aligned}$$

as desired. □

Lemma 10.151.5. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) R is Noetherian,
- (2) S is Noetherian
- (3) φ is flat,
- (4) the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are regular, and
- (5) R has property (R_k) .

Then S has property (R_k) .

Proof. Let \mathfrak{q} be a prime of S lying over a prime \mathfrak{p} of R . Assume that $\dim(S_{\mathfrak{q}}) \leq k$. Since $\dim(S_{\mathfrak{q}}) = \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$ by Lemma 10.108.7 we see that $\dim(R_{\mathfrak{p}}) \leq k$. Hence $R_{\mathfrak{p}}$ is regular by assumption. It follows that $S_{\mathfrak{q}}$ is regular by Lemma 10.108.8. \square

Lemma 10.151.6. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) φ is smooth,
- (2) R is reduced.

Then S is reduced.

Proof. First assume R is Noetherian. In this case being reduced is the same as having properties (S_1) and (R_0) , see Lemma 10.146.3. Note that S is Noetherian, and $R \rightarrow S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 10.137). Hence we may apply Lemmas 10.151.4 and 10.151.5 and we see that S is (S_1) and (R_0) , in other words reduced by Lemma 10.146.3 again.

In the general case we may find a finitely generated \mathbf{Z} -subalgebra $R_0 \subset R$ and a smooth ring map $R_0 \rightarrow S_0$ such that $S \cong R \otimes_{R_0} S_0$, see remark (10) in Section 10.137. Now, if $x \in S$ is an element with $x^2 = 0$, then we can enlarge R_0 and assume that x comes from an element $x_0 \in S_0$. After enlarging R_0 once more we may assume that $x_0^2 = 0$ in S_0 . However, since $R_0 \subset R$ is reduced we see that S_0 is reduced and hence $x_0 = 0$ as desired. \square

Lemma 10.151.7. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) φ is smooth,
- (2) R is normal.

Then S is normal.

Proof. First assume R is Noetherian. In this case being normal is the same as having properties (S_2) and (R_1) , see Lemma 10.146.4. Note that S is Noetherian, and $R \rightarrow S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 10.137). Hence we may apply Lemmas 10.151.4 and 10.151.5 and we see that S is (S_2) and (R_1) , in other words normal by Lemma 10.146.4 again.

The general case. First note that R is reduced and hence S is reduced by Lemma 10.151.6. Let \mathfrak{q} be a prime of S and let \mathfrak{p} be the corresponding prime of R . Note that $R_{\mathfrak{p}}$ is a normal domain. We have to show that $S_{\mathfrak{q}}$ is a normal domain. To do this we may replace R by $R_{\mathfrak{p}}$ and S by $S_{\mathfrak{p}}$. Hence we may assume that R is a normal domain.

Assume $R \rightarrow S$ smooth, and R a normal domain. We may find a finitely generated \mathbf{Z} -subalgebra $R_0 \subset R$ and a smooth ring map $R_0 \rightarrow S_0$ such that $S \cong R \otimes_{R_0} S_0$, see remark (10) in Section 10.137. As R_0 is a Nagata domain (see Proposition 10.150.31) we see that its integral closure R'_0 is finite over R_0 . Moreover, as R is a normal domain it is clear that $R'_0 \subset R$. Hence we may replace R_0 by R'_0 and S_0 by $R'_0 \otimes_{R_0} S_0$ and assume that R_0 is a normal Noetherian domain. By the first paragraph of the proof we conclude that S_0 is a normal ring (it need not be a domain of course). In this way we see that $R = \bigcup R_{\lambda}$ is the union of normal Noetherian domains and correspondingly $S = \operatorname{colim} R_{\lambda} \otimes_{R_0} S_0$ is the colimit of normal rings. This implies that S is a normal ring. Some details omitted. \square

Lemma 10.151.8. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) φ is smooth,
- (2) R is a regular ring.

Then S is regular.

Proof. This follows from Lemma 10.151.5 applied for all (R_k) using Lemma 10.135.3 to see that the hypotheses are satisfied. \square

10.152. Descending properties

In this section we start proving some algebraic facts concerning the “descent” of properties of rings. It turns out that it is often “easier” to descend properties than it is to ascend them. In other words, the assumption on the ring map $R \rightarrow S$ are often weaker than the assumptions in the corresponding lemma of the preceding section. However, we warn the reader that the results on descent are often useless unless the corresponding ascent can also be shown! Here is a typical result which illustrates this phenomenon.

Lemma 10.152.1. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat, and
- (2) S is Noetherian.

Then R is Noetherian.

Proof. Let $I_0 \subset I_1 \subset I_2 \subset \dots$ be a growing sequence of ideals of R . By assumption we have $I_n S = I_{n+1} S = I_{n+2} S = \dots$ for some n . Since $R \rightarrow S$ is flat we have $I_k S = I_k \otimes_R S$. Hence, as $R \rightarrow S$ is faithfully flat we see that $I_n S = I_{n+1} S = I_{n+2} S = \dots$ implies that $I_n = I_{n+1} = I_{n+2} = \dots$ as desired. \square

Lemma 10.152.2. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat, and
- (2) S is reduced.

Then R is reduced.

Proof. This is clear as $R \rightarrow S$ is injective. \square

Lemma 10.152.3. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat, and
- (2) S is a normal ring.

Then R is a normal ring.

Proof. Since S is reduced it follows that R is reduced. Let \mathfrak{p} be a prime of R . We have to show that $R_{\mathfrak{p}}$ is a normal domain. Since $S_{\mathfrak{p}}$ is faithfully over $R_{\mathfrak{p}}$ too we may assume that R is local with maximal ideal \mathfrak{m} . Let \mathfrak{q} be a prime of S lying over \mathfrak{m} . Then we see that $R \rightarrow S_{\mathfrak{q}}$ is faithfully flat (Lemma 10.38.16). Hence we may assume S is local as well. In particular S is a normal domain. Since $R \rightarrow S$ is faithfully flat and S is a normal domain we see that R is a domain. Next, suppose that a/b is integral over R with $a, b \in R$. Then $a/b \in S$ as S is normal. Hence $a \in bS$. This means that $a : R \rightarrow R/bR$ becomes the zero map after base change to S . By faithful flatness we see that $a \in bR$, so $a/b \in R$. Hence R is normal. \square

Lemma 10.152.4. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat, and
- (2) S is a regular ring.

Then R is a regular ring.

Proof. We see that R is Noetherian by Lemma 10.152.1. Let $\mathfrak{p} \subset R$ be a prime. Choose a prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} . Then Lemma 10.106.9 applies to $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ and we conclude that $R_{\mathfrak{p}}$ is regular. Since \mathfrak{p} was arbitrary we see R is regular. \square

Lemma 10.152.5. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat of finite presentation, and
- (2) S is Noetherian and has property (S_k) .

Then R is Noetherian and has property (S_k) .

Proof. We have already seen that (1) and (2) imply that R is Noetherian, see Lemma 10.152.1. Let $\mathfrak{p} \subset R$ be a prime ideal. Choose a prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} which corresponds to a minimal prime of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. Then $A = R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}} = B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_A B$ an ideal of definition of B . Hence $\dim(A) = \dim(B)$ (Lemma 10.108.7) and $\text{depth}(A) = \text{depth}(B)$ (Lemma 10.151.2). Hence since B has (S_k) we see that A has (S_k) . \square

Lemma 10.152.6. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is faithfully flat and of finite presentation, and
- (2) S is Noetherian and has property (R_k) .

Then R is Noetherian and has property (R_k) .

Proof. We have already seen that (1) and (2) imply that R is Noetherian, see Lemma 10.152.1. Let $\mathfrak{p} \subset R$ be a prime ideal and assume $\dim(R_{\mathfrak{p}}) \leq k$. Choose a prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} which corresponds to a minimal prime of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. Then $A = R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}} = B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_A B$ an ideal of definition of B . Hence $\dim(A) = \dim(B)$ (Lemma 10.108.7). As S has (R_k) we conclude that B is a regular local ring. By Lemma 10.106.9 we conclude that A is regular. \square

Lemma 10.152.7. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) $R \rightarrow S$ is smooth and surjective on spectra, and
- (2) S is a Nagata ring.

Then R is a Nagata ring.

Proof. Recall that a Nagata ring is the same thing as a Noetherian universally Japanese ring (Proposition 10.150.30). We have already seen that R is Noetherian in Lemma 10.152.1. Let $R \rightarrow A$ be a finite type ring map into a domain. According to Lemma 10.150.17 it suffices to check that A is N-1. It is clear that $B = A \otimes_R S$ is a finite type S -algebra and hence Nagata (Proposition 10.150.30). Since $A \rightarrow B$ is smooth (Lemma 10.132.4) we see that B is reduced (Lemma 10.151.6). Since B is Noetherian it has only a finite number of minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$ (see Lemma 10.30.6). As $A \rightarrow B$ is flat each of these lies over $(0) \subset A$ (by going down, see Lemma 10.38.17) The total ring of fractions $Q(B)$ is the product of the $L_i = f.f.(B/\mathfrak{q}_i)$ (Lemmas 10.24.4 and 10.24.1). Moreover, the integral closure B' of B in $Q(B)$ is the product of the integral closures B'_i of the B/\mathfrak{q}_i in the factors L_i (compare with Lemma 10.36.14). Since B is universally Japanese the ring extensions $B/\mathfrak{q}_i \subset B'_i$ are finite and we conclude that $B' = \prod B'_i$ is finite over B . Since $A \rightarrow B$ is

flat we see that any nonzerodivisor on A maps to a nonzerodivisor on B . The corresponding map

$$Q(A) \otimes_A B = (A \setminus \{0\})^{-1} A \otimes_A B = (A \setminus \{0\})^{-1} B \rightarrow Q(B)$$

is injective (we used Lemma 10.11.15). Via this map A' maps into B' . This induces a map

$$A' \otimes_A B \longrightarrow B'$$

which is injective (by the above and the flatness of $A \rightarrow B$). Since B' is a finite B -module and B is Noetherian we see that $A' \otimes_A B$ is a finite B -module. Hence there exist finitely many elements $x_i \in A'$ such that the elements $x_i \otimes 1$ generate $A' \otimes_A B$ as a B -module. Finally, by faithful flatness of $A \rightarrow B$ we conclude that the x_i also generated A' as an A -module, and we win. \square

Remark 10.152.8. The property of being “universally catenary” does not descend; not even along étale ring maps. In Examples, Section 82.16 there is a construction of a finite ring map $A \rightarrow B$ with A local Noetherian and not universally catenary, B semi-local with two maximal ideals \mathfrak{m} , \mathfrak{n} with $B_{\mathfrak{m}}$ and $B_{\mathfrak{n}}$ regular of dimension 2 and 1 respectively, and the same residue fields as that of A . Moreover, \mathfrak{m}_A generates the maximal ideal in both $B_{\mathfrak{m}}$ and $B_{\mathfrak{n}}$ (so $A \rightarrow B$ is unramified as well as finite). By Lemma 10.144.10 there exists a local étale ring map $A \rightarrow A'$ such that $B \otimes_A A' = B_1 \times B_2$ decomposes with $A' \rightarrow B_i$ surjective. This shows that A' has two minimal primes \mathfrak{q}_i with $A'/\mathfrak{q}_i \cong B_i$. Since B_i is regular local (since it is étale over either $B_{\mathfrak{m}}$ or $B_{\mathfrak{n}}$) we conclude that A' is universally catenary.

10.153. Geometrically normal algebras

In this section we put some applications of ascent and descent of properties of rings.

Lemma 10.153.1. *Let k be a field. Let A be a k -algebra. The following properties of A are equivalent:*

- (1) $k' \otimes_k A$ is a normal ring for every field extension $k \subset k'$,
- (2) $k' \otimes_k A$ is a normal ring for every finitely generated field extension $k \subset k'$,
and
- (3) $k' \otimes_k A$ is a normal ring for every finite purely inseparable extension $k \subset k'$.

where normal ring is as defined in Definition 10.36.10.

Proof. It is clear that (1) \Rightarrow (2) \Rightarrow (3).

Assume (2) and let $k \subset k'$ be any field extension. Then we can write $k' = \text{colim}_i k_i$ as a directed colimit of finitely generated field extensions. Hence we see that $k' \otimes_k A = \text{colim}_i k_i \otimes_k A$ is a directed colimit of normal rings. Thus we see that $k' \otimes_k A$ is a normal ring by Lemma 10.36.15. Hence (1) holds.

Assume (3) and let $k \subset K$ be a finitely generated field extension. By Lemma 10.44.3 we can find a diagram

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is separable. By Lemma 10.147.10 there exists a smooth k' -algebra B such

that K' is the fraction field of B . Now we can argue as follows: Step 1: $k' \otimes_k A$ is a normal ring because we assumed (3). Step 2: $B \otimes_{k'} k' \otimes_k A$ is a normal ring as $k' \otimes_k A \rightarrow B \otimes_{k'} k' \otimes_k A$ is smooth (Lemma 10.132.4) and ascent of normality along smooth maps (Lemma 10.151.7). Step 3. $K' \otimes_{k'} k' \otimes_k A = K' \otimes_k A$ is a normal ring as it is a localization of a normal ring (Lemma 10.36.12). Step 4. Finally $K \otimes_k A$ is a normal ring by descent of normality along the faithfully flat ring map $K \otimes_k A \rightarrow K' \otimes_k A$ (Lemma 10.152.3). This proves the lemma. \square

Definition 10.153.2. Let k be a field. A k -algebra R is called *geometrically normal* over k if the equivalent conditions of Lemma 10.153.1 hold.

Lemma 10.153.3. *Let k be a field. A localization of a geometrically normal k -algebra is geometrically normal.*

Proof. This is clear as being a normal ring is checked at the localizations at prime ideals. \square

Lemma 10.153.4. *Let k be a field. Let A, B be k -algebras. Assume A is geometrically normal over k and B is a normal ring. Then $A \otimes_k B$ is a normal ring.*

Proof. Let \mathfrak{r} be a prime ideal of $A \otimes_k B$. Denote \mathfrak{p} , resp. \mathfrak{q} the corresponding prime of A , resp. B . Then $(A \otimes_k B)_{\mathfrak{r}}$ is a localization of $A_{\mathfrak{p}} \otimes_k B_{\mathfrak{q}}$. Hence it suffices to prove the result for the ring $A_{\mathfrak{p}} \otimes_k B_{\mathfrak{q}}$, see Lemma 10.36.12 and Lemma 10.153.3. Thus we may assume A and B are domains.

Assume that A and B are domains with fraction fields K and L . Note that B is the filtered colimit of its finite type normal k -sub algebras (as k is a Nagata ring, see Proposition 10.150.31, and hence the integral closure of a finite type k -sub algebra is still a finite type k -sub algebra by Proposition 10.150.30). By Lemma 10.36.15 we reduce to the case that B is of finite type over k .

Assume that A and B are domains with fraction fields K and L and B of finite type over k . In this case the ring $K \otimes_k B$ is of finite type over K , hence Noetherian (Lemma 10.30.1). In particular $K \otimes_k B$ has finitely many minimal primes (Lemma 10.30.6). Since $A \rightarrow A \otimes_k B$ is flat, this implies that $A \otimes_k B$ has finitely many minimal primes (by going down for flat ring maps – Lemma 10.38.17 – these primes all lie over $(0) \subset A$). Thus it suffices to prove that $A \otimes_k B$ is integrally closed in its total ring of fractions (Lemma 10.36.14).

We claim that $K \otimes_k B$ and $A \otimes_k L$ are both normal rings. If this is true then any element x of $Q(A \otimes_k B)$ which is integral over $A \otimes_k B$ is (by Lemma 10.36.11) contained in $K \otimes_k B \cap A \otimes_k L = A \otimes_k B$ and we're done. Since $A \otimes_k L$ is a normal ring by assumption, it suffices to prove that $K \otimes_k B$ is normal.

As A is geometrically normal over k we see K is geometrically normal over k (Lemma 10.153.3) hence K is geometrically reduced over k . Hence $K = \bigcup K_i$ is the union of finitely generated field extensions of k which are geometrically reduced (Lemma 10.42.2). Each K_i is the localization of a smooth k -algebra (Lemma 10.147.10). So $K_i \otimes_k B$ is the localization of a smooth B -algebra hence normal (Lemma 10.151.7). Thus $K \otimes_k B$ is a normal ring (Lemma 10.36.15) and we win. \square

10.154. Geometrically regular algebras

Let k be a field. Let A be a Noetherian k -algebra. Let $k \subset K$ be a finitely generated field extension. Then the ring $K \otimes_k A$ is Noetherian as well, see Lemma 10.30.7. Thus the following lemma makes sense.

Lemma 10.154.1. *Let k be a field. Let A be a k -algebra. Assume A is Noetherian. The following properties of A are equivalent:*

- (1) $k' \otimes_k A$ is regular for every finitely generated field extension $k \subset k'$, and
- (2) $k' \otimes_k A$ is regular for every finite purely inseparable extension $k \subset k'$.

Here regular ring is as in Definition 10.106.7.

Proof. The lemma makes sense by the remarks preceding the lemma. It is clear that (1) \Rightarrow (2).

Assume (2) and let $k \subset K$ be a finitely generated field extension. By Lemma 10.44.3 we can find a diagram

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is separable. By Lemma 10.147.10 there exists a smooth k' -algebra B such that K' is the fraction field of B . Now we can argue as follows: Step 1: $k' \otimes_k A$ is a regular ring because we assumed (2). Step 2: $B \otimes_{k'} k' \otimes_k A$ is a regular ring as $k' \otimes_k A \rightarrow B \otimes_{k'} k' \otimes_k A$ is smooth (Lemma 10.132.4) and ascent of regularity along smooth maps (Lemma 10.151.8). Step 3: $K' \otimes_{k'} k' \otimes_k A = K' \otimes_k A$ is a regular ring as it is a localization of a regular ring (immediate from the definition). Step 4. Finally $K \otimes_k A$ is a regular ring by descent of regularity along the faithfully flat ring map $K \otimes_k A \rightarrow K' \otimes_k A$ (Lemma 10.152.4). This proves the lemma. \square

Definition 10.154.2. Let k be a field. Let R be a Noetherian k -algebra. The k -algebra R is called *geometrically regular over k* if the equivalent conditions of Lemma 10.154.1 hold.

It is clear from the definition that $K \otimes_k R$ is a geometrically regular algebra over K for any finitely generated field extension K of k . We will see later (More on Algebra, Proposition 15.25.1) that it suffices to check $R \otimes_k k'$ is regular whenever $k \subset k' \subset k^{1/p}$ (finite).

Lemma 10.154.3. *Let k be a field. Let $A \rightarrow B$ be a faithfully flat k -algebra map. If B is geometrically regular over k , so is A .*

Proof. Assume B is geometrically regular over k . Let $k \subset k'$ be a finite, purely inseparable extension. Then $A \otimes_k k' \rightarrow B \otimes_k k'$ is faithfully flat as a base change of $A \rightarrow B$ (by Lemmas 10.29.3 and 10.38.6) and $B \otimes_k k'$ is regular by our assumption on B over k . Then $A \otimes_k k'$ is regular by Lemma 10.152.4. \square

Lemma 10.154.4. *Let k be a field. Let $A \rightarrow B$ be a smooth ring map of k -algebras. If A is geometrically regular over k , then B is geometrically regular over k .*

Proof. Let $k \subset k'$ be a finitely generated field extension. Then $A \otimes_k k' \rightarrow B \otimes_k k'$ is a smooth ring map (Lemma 10.132.4) and $A \otimes_k k'$ is regular. Hence $B \otimes_k k'$ is regular by Lemma 10.151.8. \square

Lemma 10.154.5. *Let k be a field. Let A be an algebra over k . Let $k = \operatorname{colim} k_i$ be a directed colimit of subfields. If A is geometrically regular over each k_i , then A is geometrically regular over k .*

Proof. Let $k \subset k'$ be a finite purely inseparable field extension. We can get k' by adjoining finitely many variables to k and imposing finitely many polynomial relations. Hence we see that there exists an i and a finite purely inseparable field extension $k_i \subset k'_i$ such that $k_i = k \otimes_{k_i} k'_i$. Thus $A \otimes_k k' = A \otimes_{k_i} k'_i$ and the lemma is clear. \square

Lemma 10.154.6. *Let $k \subset k'$ be a separable algebraic field extension. Let A be an algebra over k' . Then A is geometrically regular over k if and only if it is geometrically regular over k' .*

Proof. Let $k \subset L$ be a finite purely inseparable field extension. Then $L' = k' \otimes_k L$ is a field (see material in Fields, Section 9.25) and $A \otimes_k L = A \otimes_{k'} L'$. Hence if A is geometrically regular over k' , then A is geometrically regular over k .

Assume A is geometrically regular over k . Since k' is the filtered colimit of finite extensions of k we may assume by Lemma 10.154.5 that k'/k is finite separable. Consider the ring maps

$$k' \rightarrow A \otimes_k k' \rightarrow A.$$

Note that $A \otimes_k k'$ is geometrically regular over k' as a base change of A to k' . Note that $A \otimes_k k' \rightarrow A$ is the base change of $k' \otimes_k k' \rightarrow k'$ by the map $k' \rightarrow A$. Since k'/k is an étale extension of rings, we see that $k' \otimes_k k' \rightarrow k'$ is étale (Lemma 10.138.3). Hence A is geometrically regular over k' by Lemma 10.154.4. \square

10.155. Geometrically Cohen-Macaulay algebras

This section is a bit of a misnomer, since Cohen-Macaulay algebras are automatically geometrically Cohen-Macaulay. Namely, see Lemma 10.126.6 and Lemma 10.155.2 below.

Lemma 10.155.1. *Let k be a field and let $k \subset K$ and $k \subset L$ be two field extensions such that one of them is a field extension of finite type. Then $K \otimes_k L$ is a Noetherian Cohen-Macaulay ring.*

Proof. The ring $K \otimes_k L$ is Noetherian by Lemma 10.30.7. Say K is a finite extension of the purely transcendental extension $k(t_1, \dots, t_r)$. Then $k(t_1, \dots, t_r) \otimes_k L \rightarrow K \otimes_k L$ is a finite free ring map. By Lemma 10.108.9 it suffices to show that $k(t_1, \dots, t_r) \otimes_k L$ is Cohen-Macaulay. This is clear because it is a localization of the polynomial ring $L[t_1, \dots, t_r]$. (See for example Lemma 10.100.7 for the fact that a polynomial ring is Cohen-Macaulay.) \square

Lemma 10.155.2. *Let k be a field. Let S be a Noetherian k -algebra. Let $k \subset K$ be a finitely generated field extension, and set $S_K = K \otimes_k S$. Let $\mathfrak{q} \subset S$ be a prime of S . Let $\mathfrak{q}_K \subset S_K$ be a prime of S_K lying over \mathfrak{q} . Then $S_{\mathfrak{q}}$ is Cohen-Macaulay if and only if $(S_K)_{\mathfrak{q}_K}$ is Cohen-Macaulay.*

Proof. By Lemma 10.30.7 the ring S_K is Noetherian. Hence $S_{\mathfrak{q}} \rightarrow (S_K)_{\mathfrak{q}_K}$ is a flat local homomorphism of Noetherian local rings. Note that the fibre

$$(S_K)_{\mathfrak{q}_K}/\mathfrak{q}(S_K)_{\mathfrak{q}_K} \cong (\kappa(\mathfrak{q}) \otimes_k K)_{\mathfrak{q}'}$$

is the localization of the Cohen-Macaulay (Lemma 10.155.1) ring $\kappa(\mathfrak{q}) \otimes_k K$ at a suitable prime ideal \mathfrak{q}' . Hence the lemma follows from Lemma 10.151.3. \square

10.156. Colimits and maps of finite presentation, II

This section is a continuation of Section 10.123.

We start with an application of the openness of flatness. It says that we can approximate flat modules by flat modules which is useful.

Lemma 10.156.1. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume that*

- (1) $R \rightarrow S$ is of finite presentation,
- (2) M is a finitely presented S -module, and
- (3) M is flat over R .

In this case we have the following:

- (1) *There exists a finite type \mathbf{Z} -algebra R_0 and a finite type ring map $R_0 \rightarrow S_0$ and a finite S_0 -module M_0 such that M_0 is flat over R_0 , together with a ring maps $R_0 \rightarrow R$ and $S_0 \rightarrow S$ and an S_0 -module map $M_0 \rightarrow M$ such that $S \cong R \otimes_{R_0} S_0$ and $M = S \otimes_{S_0} M_0$.*
- (2) *If $R = \operatorname{colim}_{\lambda \in \Lambda} R_\lambda$ is written as a directed colimit, then there exists a λ and a ring map $R_\lambda \rightarrow S_\lambda$ of finite presentation, and an S_λ -module M_λ of finite presentation such that M_λ is flat over R_λ and such that $S = R \otimes_{R_\lambda} S_\lambda$ and $M = S \otimes_{S_\lambda} M_\lambda$.*
- (3) *If*

$$(R \rightarrow S, M) = \operatorname{colim}_{\lambda \in \Lambda} (R_\lambda \rightarrow S_\lambda, M_\lambda)$$

is written as a directed colimit such that

- (a) $R_\mu \otimes_{R_\lambda} S_\lambda \rightarrow S_\mu$ and $S_\mu \otimes_{S_\lambda} M_\lambda \rightarrow M_\mu$ are isomorphisms for $\mu \geq \lambda$,
 - (b) $R_\lambda \rightarrow S_\lambda$ is of finite presentation,
 - (c) M_λ is a finitely presented S_λ -module,
- then for all sufficiently large λ the module M_λ is flat over R_λ .*

Proof. We first write $(R \rightarrow S, M)$ as the directed colimit of a system $(R_\lambda \rightarrow S_\lambda, M_\lambda)$ as in as in Lemma 10.123.15. Let $\mathfrak{q} \subset S$ be a prime. Let $\mathfrak{p} \subset R$, $\mathfrak{q}_\lambda \subset S_\lambda$, and $\mathfrak{p}_\lambda \subset R_\lambda$ the corresponding primes. As seen in the proof of Theorem 10.125.4

$$((R_\lambda)_{\mathfrak{p}_\lambda}, (S_\lambda)_{\mathfrak{q}_\lambda}, (M_\lambda)_{\mathfrak{q}_\lambda})$$

is a system as in Lemma 10.123.11, and hence by Lemma 10.124.3 we see that for some $\lambda_{\mathfrak{q}} \in \Lambda$ for all $\lambda \geq \lambda_{\mathfrak{q}}$ the module M_λ is flat over R_λ at the prime \mathfrak{q}_λ .

By Theorem 10.125.4 we get an open subset $U_\lambda \subset \operatorname{Spec}(S_\lambda)$ such that M_λ flat over R_λ at all the primes of U_λ . Denote $V_\lambda \subset \operatorname{Spec}(S)$ the inverse image of U_λ under the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(S_\lambda)$. The argument above shows that for every $\mathfrak{q} \in \operatorname{Spec}(S)$ there exists a $\lambda_{\mathfrak{q}}$ such that $\mathfrak{q} \in V_\lambda$ for all $\lambda \geq \lambda_{\mathfrak{q}}$. Since $\operatorname{Spec}(S)$ is quasi-compact we see this implies there exists a single $\lambda_0 \in \Lambda$ such that $V_{\lambda_0} = \operatorname{Spec}(S)$.

The complement $\operatorname{Spec}(S_{\lambda_0}) \setminus U_{\lambda_0}$ is $V(I)$ for some ideal $I \subset S_{\lambda_0}$. As $V_{\lambda_0} = \operatorname{Spec}(S)$ we see that $IS = S$. Choose $f_1, \dots, f_r \in I$ and $s_1, \dots, s_n \in S$ such that $\sum f_i s_i = 1$. Since $\operatorname{colim} S_\lambda = S$, after increasing λ_0 we may assume there exist $s_{i, \lambda_0} \in S_{\lambda_0}$ such that $\sum f_i s_{i, \lambda_0} = 1$. Hence for this λ_0 we have $U_{\lambda_0} = \operatorname{Spec}(S_{\lambda_0})$. This proves (1).

Proof of (2). Let $(R_0 \rightarrow S_0, M_0)$ be as in (1) and suppose that $R = \operatorname{colim} R_\lambda$. Since R_0 is a finite type \mathbf{Z} algebra, there exists a λ and a map $R_0 \rightarrow R_\lambda$ such that

$R_0 \rightarrow R_\lambda \rightarrow R$ is the given map $R_0 \rightarrow R$ (see Lemma 10.123.2). Then, part (2) follows by taking $S_\lambda = R_\lambda \otimes_{R_0} S_0$ and $M_\lambda = S_\lambda \otimes_{S_0} M_0$.

Finally, we come to the proof of (3). Let $(R_\lambda \rightarrow S_\lambda, M_\lambda)$ be as in (3). Choose $(R_0 \rightarrow S_0, M_0)$ and $R_0 \rightarrow R$ as in (1). As in the proof of (2), there exists a λ_0 and a ring map $R_0 \rightarrow R_{\lambda_0}$ such that $R_0 \rightarrow R_{\lambda_0} \rightarrow R$ is the given map $R_0 \rightarrow R$. Since S_0 is of finite presentation over R_0 and since $S = \text{colim } S_\lambda$ we see that for some $\lambda_1 \geq \lambda_0$ we get an R_0 -algebra map $S_0 \rightarrow S_{\lambda_1}$ such that the composition $S_0 \rightarrow S_{\lambda_1} \rightarrow S$ is the given map $S_0 \rightarrow S$ (see Lemma 10.123.2). For all $\lambda \geq \lambda_1$ this gives maps

$$\Psi_\lambda : R_\lambda \otimes_{R_0} S_0 \longrightarrow R_\lambda \otimes_{R_{\lambda_1}} S_{\lambda_1} \cong S_\lambda$$

the last isomorphism by assumption. By construction $\text{colim}_\lambda \Psi_\lambda$ is an isomorphism. Hence Ψ_λ is an isomorphism for all λ large enough by Lemma 10.123.6. In the same vein, there exists a $\lambda_2 \geq \lambda_1$ and an S_0 -module map $M_0 \rightarrow M_{\lambda_2}$ such that $M_0 \rightarrow M_{\lambda_2} \rightarrow M$ is the given map $M_0 \rightarrow M$ (see Lemma 10.123.3). For $\lambda \geq \lambda_2$ there is an induced map

$$S_\lambda \otimes_{S_0} M_0 \longrightarrow S_\lambda \otimes_{S_{\lambda_2}} M_{\lambda_2} \cong M_\lambda$$

and for λ large enough this map is an isomorphism by Lemma 10.123.4. This implies (3) because M_0 is flat over R_0 . □

Lemma 10.156.2. *Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $A \rightarrow B$ faithfully flat of finite presentation. Then there exists a commutative diagram*

$$\begin{array}{ccccc} R & \longrightarrow & A_0 & \longrightarrow & B_0 \\ \parallel & & \downarrow & & \downarrow \\ R & \longrightarrow & A & \longrightarrow & B \end{array}$$

with $R \rightarrow A_0$ of finite presentation, $A_0 \rightarrow B_0$ faithfully flat of finite presentation and $B = A \otimes_{A_0} B_0$.

Proof. We first prove the lemma with R replaced \mathbf{Z} . By Lemma 10.156.1 there exists a diagram

$$\begin{array}{ccc} A_0 & \longrightarrow & A \\ \uparrow & & \uparrow \\ B_0 & \longrightarrow & B \end{array}$$

where A_0 is of finite type over \mathbf{Z} , B_0 is flat of finite presentation over A_0 such that $B = A \otimes_{A_0} B_0$. As $A_0 \rightarrow B_0$ is flat of finite presentation we see that the image of $\text{Spec}(B_0) \rightarrow \text{Spec}(A_0)$ is open, see Proposition 10.40.8. Hence the complement of the image is $V(I_0)$ for some ideal $I_0 \subset A_0$. As $A \rightarrow B$ is faithfully flat the map $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is surjective, see Lemma 10.38.15. Now we use that the base change of the image is the image of the base change. Hence $I_0 A = A$. Pick a relation $\sum f_i r_i = 1$, with $r_i \in A$, $f_i \in I_0$. Then after enlarging A_0 to contain the elements r_i (and correspondingly enlarging B_0) we see that $A_0 \rightarrow B_0$ is surjective on spectra also, i.e., faithfully flat.

Thus the lemma holds in case $R = \mathbf{Z}$. In the general case, take the solution $A'_0 \rightarrow B'_0$ just obtained and set $A_0 = A'_0 \otimes_{\mathbf{Z}} R$, $B_0 = B'_0 \otimes_{\mathbf{Z}} R$. □

Lemma 10.156.3. *Let $A = \operatorname{colim}_{i \in I} A_i$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_0 : B_0 \rightarrow C_0$ a map of A_0 -algebras. Assume*

- (1) $A \otimes_{A_0} B_0 \rightarrow A \otimes_{A_0} C_0$ is finite,
- (2) C_0 is of finite type over B_0 .

Then there exists an $i \geq 0$ such that the map $A_i \otimes_{A_0} B_0 \rightarrow A_i \otimes_{A_0} C_0$ is finite.

Proof. Let x_1, \dots, x_m be generators for C_0 over B_0 . Pick monic polynomials $P_j \in A \otimes_{A_0} B_0[T]$ such that $P_j(1 \otimes x_j) = 0$ in $A \otimes_{A_0} C_0$. For some $i \geq 0$ we can find $P_{j,i} \in A_i \otimes_{A_0} B_0[T]$ mapping to P_j . Since \otimes commutes with colimits we see that $P_{j,i}(1 \otimes x_j)$ is zero in $A_i \otimes_{A_0} C_0$ after possibly increasing i . Then this i works. \square

Lemma 10.156.4. *Let $A = \operatorname{colim}_{i \in I} A_i$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_0 : B_0 \rightarrow C_0$ a map of A_0 -algebras. Assume*

- (1) $A \otimes_{A_0} B_0 \rightarrow A \otimes_{A_0} C_0$ is surjective,
- (2) C_0 is of finite type over B_0 .

Then for some $i \geq 0$ the map $A_i \otimes_{A_0} B_0 \rightarrow A_i \otimes_{A_0} C_0$ is surjective.

Proof. Let x_1, \dots, x_m be generators for C_0 over B_0 . Pick $b_j \in A \otimes_{A_0} B_0$ mapping to $1 \otimes x_j$ in $A \otimes_{A_0} C_0$. For some $i \geq 0$ we can find $b_{j,i} \in A_i \otimes_{A_0} B_0$ mapping to b_j . Then this i works. \square

Lemma 10.156.5. *Let $A = \operatorname{colim}_{i \in I} A_i$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_0 : B_0 \rightarrow C_0$ a map of A_0 -algebras. Assume*

- (1) $A \otimes_{A_0} B_0 \rightarrow A \otimes_{A_0} C_0$ is étale,
- (2) $B_0 \rightarrow C_0$ is of finite presentation.

Then for some $i \geq 0$ the map $A_i \otimes_{A_0} B_0 \rightarrow A_i \otimes_{A_0} C_0$ is étale.

Proof. Note that $B_0 \rightarrow C_0$ is of finite presentation, see Lemma 10.6.2. Write $C_0 = B_0[x_1, \dots, x_n]/(f_{1,0}, \dots, f_{m,0})$. Write $B_i = A_i \otimes_{A_0} B_0$ and $C_i = A_i \otimes_{A_0} C_0$. Note that $C_i = B_i[x_1, \dots, x_n]/(f_{1,i}, \dots, f_{m,i})$ where $f_{j,i}$ is the image of $f_{j,0}$ in the polynomial ring over B_i . Write $B = A \otimes_{A_0} B_0$ and $C = A \otimes_{A_0} C_0$. Note that $C = B[x_1, \dots, x_n]/(f_1, \dots, f_m)$ where f_j is the image of $f_{j,0}$ in the polynomial ring over B . The assumption is that the map

$$d : (f_1, \dots, f_m)/(f_1, \dots, f_m)^2 \longrightarrow \bigoplus C dx_k$$

is an isomorphism. Thus for sufficiently large i we can find elements

$$\xi_{k,i} \in (f_{1,i}, \dots, f_{m,i})/(f_{1,i}, \dots, f_{m,i})^2$$

with $d\xi_{k,i} = dx_k$ in $\bigoplus C_i dx_k$. Moreover, on increasing i if necessary, we see that $\sum (\partial f_{j,i}/\partial x_k) \xi_{k,i} = f_{j,i} \bmod (f_{1,i}, \dots, f_{m,i})^2$ since this is true in the limit. Then this i works. \square

The following lemma is an application of the results above which doesn't seem to fit well anywhere else.

Lemma 10.156.6. *Let $R \rightarrow S$ be a faithfully flat ring map of finite presentation. Then there exists a commutative diagram*

$$\begin{array}{ccc} S & \xrightarrow{\quad} & S' \\ & \swarrow & \nearrow \\ & R & \end{array}$$

where $R \rightarrow S'$ is quasi-finite, faithfully flat and of finite presentation.

Proof. As a first step we reduce this lemma to the case where R is of finite type over \mathbf{Z} . By Lemma 10.156.2 there exists a diagram

$$\begin{array}{ccc} S_0 & \longrightarrow & S \\ \uparrow & & \uparrow \\ R_0 & \longrightarrow & R \end{array}$$

where R_0 is of finite type over \mathbf{Z} , and S_0 is faithfully flat of finite presentation over R_0 such that $S = R \otimes_{R_0} S_0$. If we prove the lemma for the ring map $R_0 \rightarrow S_0$, then the lemma follows for $R \rightarrow S$ by base change, as the base change of a quasi-finite ring map is quasi-finite, see Lemma 10.118.8. (Of course we also use that base changes of flat maps are flat and base changes of maps of finite presentation are of finite presentation.)

Assume $R \rightarrow S$ is a faithfully flat ring map of finite presentation and that R is Noetherian (which we may assume by the preceding paragraph). Let $W \subset \text{Spec}(S)$ be the open set of Lemma 10.126.4. As $R \rightarrow S$ is faithfully flat the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective, see Lemma 10.38.15. By Lemma 10.126.5 the map $W \rightarrow \text{Spec}(R)$ is also surjective. Hence by replacing S with a product $S_{g_1} \times \dots \times S_{g_m}$ we may assume $W = \text{Spec}(S)$; here we use that $\text{Spec}(R)$ is quasi-compact (Lemma 10.16.10), and that the map $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is open (Proposition 10.40.8). Suppose that $\mathfrak{p} \subset R$ is a prime. Choose a prime $\mathfrak{q} \subset S$ lying over \mathfrak{p} which corresponds to a maximal ideal of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. The Noetherian local ring $\overline{S}_{\mathfrak{q}} = S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ is Cohen-Macaulay, say of dimension d . We may choose f_1, \dots, f_d in the maximal ideal of $S_{\mathfrak{q}}$ which map to a regular sequence in $\overline{S}_{\mathfrak{q}}$. Choose a common denominator $g \in S$, $g \notin \mathfrak{q}$ of f_1, \dots, f_d , and consider the R -algebra

$$S' = S_g/(f_1, \dots, f_d).$$

By construction there is a prime ideal $\mathfrak{q}' \subset S'$ lying over \mathfrak{p} and corresponding to \mathfrak{q} (via $S_g \rightarrow S'_g$). Also by construction the ring map $R \rightarrow S'$ is quasi-finite at \mathfrak{q} as the local ring

$$S'_{\mathfrak{q}'}/\mathfrak{p}S'_{\mathfrak{q}'} = S_{\mathfrak{q}}/(f_1, \dots, f_d) + \mathfrak{p}S_{\mathfrak{q}} = \overline{S}_{\mathfrak{q}}/(\overline{f}_1, \dots, \overline{f}_d)$$

has dimension zero, see Lemma 10.118.2. Also by construction $R \rightarrow S'$ is of finite presentation. Finally, by Lemma 10.95.3 the local ring map $R_{\mathfrak{p}} \rightarrow S'_{\mathfrak{q}'}$ is flat (this is where we use that R is Noetherian). Hence, by openness of flatness (Theorem 10.125.4), and openness of quasi-finiteness (Lemma 10.119.14) we may after replacing g by gg' for a suitable $g' \in S$, $g' \notin \mathfrak{q}$ assume that $R \rightarrow S'$ is flat and quasi-finite. The image $\text{Spec}(S') \rightarrow \text{Spec}(R)$ is open and contains \mathfrak{p} . In other words we have shown a ring S' as in the statement of the lemma exists (except possibly the faithfulness part) whose image contains any given prime. Using one more time the quasi-compactness of $\text{Spec}(R)$ we see that a finite product of such rings does the job. \square

CHAPTER 11

Brauer groups

11.1. Introduction

A reference are the lectures by Serre in the Seminaire Cartan, see [Ser55a]. Serre in turn refers to [Deu68] and [ANT44]. We changed some of the proofs, in particular we used a fun argument of Rieffel to prove Wedderburn's theorem. Very likely this change is not an improvement and we strongly encourage the reader to read the original exposition by Serre.

11.2. Noncommutative algebras

Let k be a field. In this chapter an *algebra* A over k is a possibly noncommutative ring A together with a ring map $k \rightarrow A$ such that k maps into the center of A and such that 1 maps to an identity element of A . An *A -module* is a right A -module such that the identity of A acts as the identity.

Definition 11.2.1. Let A be a k -algebra. We say A is *finite* if $\dim_k(A) < \infty$. In this case we write $[A : k] = \dim_k(A)$.

Definition 11.2.2. A *skew field* is a possibly noncommutative ring with an identity element 1, with $1 \neq 0$, in which every nonzero element has a multiplicative inverse.

A skew field is a k -algebra for some k (e.g., for the prime field contained in it). We will use below that any module over a skew field is free because a maximal linearly independent set of vectors forms a basis and exists by Zorn's lemma.

Definition 11.2.3. Let A be a k -algebra. We say an A -module M is *simple* if it is nonzero and the only A -submodules are 0 and M . We say A is *simple* if the only two-sided ideals of A are 0 and A .

Definition 11.2.4. A k -algebra A is *central* if the center of A is the image of $k \rightarrow A$.

Definition 11.2.5. Given a k -algebra A we denote A^{op} the k -algebra we get by reversing the order of multiplication in A . This is called the *opposite algebra*.

11.3. Wedderburn's theorem

The following cute argument can be found in a paper of Rieffel, see [Rie65]. The proof could not be simpler (quote from Carl Faith's review).

Lemma 11.3.1. *Let A be a possibly noncommutative ring with 1 which contains no nontrivial two-sided ideal. Let M be a nonzero right ideal in A , and view M as a right A -module. Then A coincides with the bicommutant of M .*

Proof. Let $A' = \text{End}_A(M)$, and let $A'' = \text{End}_{A'}(M)$ (the bicommutant of M). Let $R : A \rightarrow A''$ be the natural homomorphism $R(a)(m) = ma$. Then R is injective, since $R(1) = \text{id}_M$ and A contains no nontrivial two-sided ideal. We claim that $R(M)$ is a right ideal in A'' . Namely, $R(m)a'' = R(ma'')$ for $a'' \in A''$ and m in M , because left multiplication of M by any element n of M represents an element of A' , and so $(nm)a'' = n(ma'')$, that is, $(R(m)a'')(n) = R(ma'')(n)$ for all n in M . Finally, the product ideal AM is a two-sided ideal, and so $A = AM$. Thus $R(A) = R(A)R(M)$, so that $R(A)$ is a right ideal in A'' . But $R(A)$ contains the identity element of A'' , and so $R(A) = A''$. \square

Lemma 11.3.2. *Let A be a k -algebra. If A is finite, then*

- (1) A has a simple module,
- (2) any nonzero module contains a simple submodule,
- (3) a simple module over A has finite dimension over k , and
- (4) if M is a simple A -module, then $\text{End}_A(M)$ is a skew field.

Proof. Of course (1) follows from (2) since A is a nonzero A -module. For (2), any submodule of minimal (finite) dimension as a k -vector space will be simple. There exists a finite dimensional one because a cyclic submodule is one. If M is simple, then $mA \subset M$ is a sub-module, hence we see (3). Any nonzero element of $\text{End}_A(M)$ is an isomorphism, hence (4) holds. \square

Theorem 11.3.3. *Let A be a simple finite k -algebra. Then A is a matrix algebra over a finite k -algebra K which is a skew field.*

Proof. We may choose a simple submodule $M \subset A$ and then the k -algebra $K = \text{End}_A(M)$ is a skew field, see Lemma 11.3.2. By Lemma 11.3.1 we see that $A = \text{End}_K(M)$. Since K is a skew field and M is finitely generated (since $\dim_k(M) < \infty$) we see that M is finite free as a left K -module. It follows immediately that $A \cong \text{Mat}(n \times n, K^{op})$. \square

11.4. Lemmas on algebras

Let A be a k -algebra. Let $B \subset A$ be a subalgebra. The *centralizer of B in A* is the subalgebra

$$C = \{y \in A \mid xy = yx \text{ for all } x \in B\}.$$

It is a k -algebra.

Lemma 11.4.1. *Let A, A' be k -algebras. Let $B \subset A, B' \subset A'$ be subalgebras with centralizers C, C' . Then the centralizer of $B \otimes_k B'$ in $A \otimes_k A'$ is $C \otimes_k C'$.*

Proof. Denote $C'' \subset A \otimes_k A'$ the centralizer of $B \otimes_k B'$. It is clear that $C \otimes_k C' \subset C''$. Conversely, every element of C'' commutes with $B \otimes 1$ hence is contained in $C \otimes_k A'$. Similarly $C'' \subset A \otimes_k C'$. Thus $C'' \subset C \otimes_k A' \cap A \otimes_k C' = C \otimes_k C'$. \square

Lemma 11.4.2. *Let A be a finite simple k -algebra. Then the center k' of A is a finite field extension of k .*

Proof. Write $A = \text{Mat}(n \times n, K)$ for some skew field K finite over k , see Theorem 11.3.3. By Lemma 11.4.1 the center of A is $k \otimes_k k'$ where $k' \subset K$ is the center of K . Since the center of a skew field is a field, we win. \square

Lemma 11.4.3. *Let V be a k vector space. Let K be a central k -algebra which is a skew field. Let $W \subset V \otimes_k K$ be a two-sided K -sub vector space. Then W is generated as a left K -vector space by $W \cap (V \otimes 1)$.*

Proof. Let $V' \subset V$ be the k -sub vector space generated by $v \in V$ such that $v \otimes 1 \in W$. Then $V' \otimes_k K \subset W$ and we have

$$W/(V' \otimes_k K) \subset (V/V') \otimes_k K.$$

If $\bar{v} \in V/V'$ is a nonzero vector such that $\bar{v} \otimes 1$ is contained in $W/V' \otimes_k K$, then we see that $v \otimes 1 \in W$ where $v \in V$ lifts \bar{v} . This contradicts our construction of V' . Hence we may replace V by V/V' and W by $W/V' \otimes_k K$ and it suffices to prove that $W \cap (V \otimes 1)$ is nonzero if W is nonzero.

To see this let $w \in W$ be a nonzero element which can be written as $w = \sum_{i=1, \dots, n} v_i \otimes k_i$ with n minimal. We may right multiply with k_1^{-1} and assume that $k_1 = 1$. If $n = 1$, then we win because $v_1 \otimes 1 \in W$. If $n > 1$, then we see that for any $c \in K$

$$cv - vc = \sum_{i=2, \dots, n} v_i \otimes (ck_i - k_i c) \in W$$

and hence $ck_i - k_i c = 0$ by minimality of n . This implies that k_i is in the center of K which is k by assumption. Hence $v = (v_1 + \sum k_i v_i) \otimes 1$ contradicting the minimality of n . \square

Lemma 11.4.4. *Let A be a k -algebra. Let K be a central k -algebra which is a skew field. Then any two-sided ideal $I \subset A \otimes_k K$ is of the form $J \otimes_k K$ for some two-sided ideal $J \subset A$. In particular, if A is simple, then so is $A \otimes_k K$.*

Proof. Set $J = \{a \in A \mid a \otimes 1 \in I\}$. This is a two-sided ideal of A . And $I = J \otimes_k K$ by Lemma 11.4.3. \square

Lemma 11.4.5. *Let R be a possibly noncommutative ring. Let $n \geq 1$ be an integer. Let $R_n = \text{Mat}(n \times n, R)$.*

- (1) *The functors $M \mapsto M^{\oplus n}$ and $N \mapsto Ne_{11}$ define quasi-inverse equivalences of categories $\text{Mod}_R \leftrightarrow \text{Mod}_{R_n}$.*
- (2) *A two-sided ideal of R_n is of the form IR_n for some two-sided ideal I of R .*
- (3) *The center of R_n is equal to the center of R .*

Proof. Part (1) proves itself. If $J \subset R_n$ is a two-sided ideal, then $J = \bigoplus e_{ii} J e_{jj}$ and all of the summands $e_{ii} J e_{jj}$ are equal to each other and are a two-sided ideal I of R . This proves (2). Part (3) is clear. \square

Lemma 11.4.6. *Let A be a finite simple k -algebra.*

- (1) *There exists exactly one simple A -module M up to isomorphism.*
- (2) *Any finite A -module is a direct sum of copies of a simple module.*
- (3) *Two finite A -modules are isomorphic if and only if they have the same dimension over k .*
- (4) *If $A = \text{Mat}(n \times n, K)$ with K a finite skew field extension of k , then $M = K^{\oplus n}$ is a simple A -module and $\text{End}_A(M) = K^{\text{op}}$.*
- (5) *If M is a simple A -module, then $L = \text{End}_A(M)$ is a skew field finite over k acting on the left on M , we have $A = \text{End}_L(M)$, and the centers of A and L agree. Also $[A : k][L : k] = \dim_k(M)^2$.*

- (6) For a finite A -module N the algebra $B = \text{End}_A(N)$ is a matrix algebra over the skew field L of (5). Moreover $\text{End}_B(N) = A$.

Proof. By Theorem 11.3.3 we can write $A = \text{Mat}(n \times n, K)$ for some finite skew field extension K of k . By Lemma 11.4.5 the category of modules over A is equivalent to the category of modules over K . Thus (1), (2), and (3) hold because every module over K is free. Part (4) holds because the equivalence transforms the K -module K to $M = K^{\oplus n}$. Using $M = K^{\oplus n}$ in (5) we see that $L = K^{op}$. The statement about the center of $L = K^{op}$ follows from Lemma 11.4.5. The statement about $\text{End}_L(M)$ follows from the explicit form of M . The formula of dimensions is clear. Part (6) follows as N is isomorphic to a direct sum of copies of a simple module. \square

Lemma 11.4.7. *Let A, A' be two simple k -algebras one of which is finite and central over k . Then $A \otimes_k A'$ is simple.*

Proof. Suppose that A' is finite and central over k . Write $A' = \text{Mat}(n \times n, K')$, see Theorem 11.3.3. Then the center of K' is k and we conclude that $A \otimes_k K'$ is simple by Lemma 11.4.4. Hence $A \otimes_k A' = \text{Mat}(n \times n, A \otimes_k K')$ is simple by Lemma 11.4.5. \square

Lemma 11.4.8. *The tensor product of finite central simple algebras over k is finite, central, and simple.*

Proof. Combine Lemmas 11.4.1 and 11.4.7. \square

Lemma 11.4.9. *Let A be a finite central simple algebra over k . Let $k \subset k'$ be a field extension. Then $A' = A \otimes_k k'$ is a finite central simple algebra over k' .*

Proof. Combine Lemmas 11.4.1 and 11.4.7. \square

Lemma 11.4.10. *Let A be a finite central simple algebra over k . Then $A \otimes_k A^{op} \cong \text{Mat}(n \times n, k)$ where $n = [A : k]$.*

Proof. By Lemma 11.4.8 the algebra $A \otimes_k A^{op}$ is simple. Hence the map

$$A \otimes_k A^{op} \longrightarrow \text{End}_k(A), \quad a \otimes a' \longmapsto (x \mapsto axa')$$

is injective. Since both sides of the arrow have the same dimension we win. \square

11.5. The Brauer group of a field

Let k be a field. Consider two finite central simple algebras A and B over k . We say A and B are *similar* if there exist $n, m > 0$ such that $\text{Mat}(n \times n, A) \cong \text{Mat}(m \times m, B)$ as k -algebras.

Lemma 11.5.1. *Similarity.*

- (1) *Similarity defines an equivalence relation on the set of isomorphism classes of finite central simple algebras over k .*
- (2) *Every similarity class contains a unique (up to isomorphism) finite central skew field extension of k .*
- (3) *If $A = \text{Mat}(n \times n, K)$ and $B = \text{Mat}(m \times m, K')$ for some finite central skew fields K, K' over k then A and B are similar if and only if $K \cong K'$ as k -algebras.*

Proof. Note that by Wedderburn's theorem (Theorem 11.3.3) we can always write a finite central simple algebra as a matrix algebra over a finite central skew field. Hence it suffices to prove the third assertion. To see this it suffices to show that if $A = \text{Mat}(n \times n, K) \cong \text{Mat}(m \times m, K') = B$ then $K \cong K'$. To see this note that for a simple module M of A we have $\text{End}_A(M) = K^{op}$, see Lemma 11.4.6. Hence $A \cong B$ implies $K^{op} \cong (K')^{op}$ and we win. \square

Given two finite central simple k -algebras A, B the tensor product $A \otimes_k B$ is another, see Lemma 11.4.8. Moreover if A is similar to A' , then $A \otimes_k B$ is similar to $A' \otimes_k B$ because tensor products and taking matrix algebras commute. Hence tensor product defines an operation on equivalence classes of finite central simple algebras which is clearly associative and commutative. Finally, Lemma 11.4.10 shows that $A \otimes_k A^{op}$ is isomorphic to a matrix algebra, i.e., that $A \otimes_k A^{op}$ is in the similarity class of k . Thus we obtain an abelian group.

Definition 11.5.2. Let k be a field. The *Brauer group* of k is the abelian group of similarity classes of finite central simple k -algebras defined above. Notation $\text{Br}(k)$.

For any map of fields $k \rightarrow k'$ we obtain a group homomorphism

$$\text{Br}(k) \longrightarrow \text{Br}(k'), \quad A \longmapsto A \otimes_k k'$$

see Lemma 11.4.9. In other words, $\text{Br}(-)$ is a functor from the category of fields to the category of abelian groups. Observe that the Brauer group of a field is zero if and only if every finite central skew field extension $k \subset K$ is trivial.

Lemma 11.5.3. *The Brauer group of an algebraically closed field is zero.*

Proof. Let $k \subset K$ be a finite central skew field extension. For any element $x \in K$ the subring $k[x] \subset K$ is a commutative finite integral k -sub algebra, hence a field, see Algebra, Lemma 10.35.17. Since k is algebraically closed we conclude that $k[x] = k$. Since x was arbitrary we conclude $k = K$. \square

Lemma 11.5.4. *Let A be a finite central simple algebra over a field k . Then $[A : k]$ is a square.*

Proof. This is true because $A \otimes_k \bar{k}$ is a matrix algebra over \bar{k} by Lemma 11.5.3. \square

11.6. Skolem-Noether

Theorem 11.6.1. *Let A be a finite central simple k -algebra. Let B be a simple k -algebra. Let $f, g : B \rightarrow A$ be two k -algebra homomorphisms. Then there exists an invertible element $x \in A$ such that $f(b) = xg(b)x^{-1}$ for all $b \in B$.*

Proof. Choose a simple A -module M . Set $L = \text{End}_A(M)$. Then L is a skew field with center k which acts on the left on M , see Lemmas 11.3.2 and 11.4.6. Then M has two $B \otimes_k L^{op}$ -module structures defined by $m \cdot_1 (b \otimes l) = lm f(b)$ and $m \cdot_2 (b \otimes l) = lm g(b)$. The k -algebra $B \otimes_k L^{op}$ is simple by Lemma 11.4.7. Since B is simple, the existence of a k -algebra homomorphism $B \rightarrow A$ implies that B is finite. Thus $B \otimes_k L^{op}$ is finite simple and we conclude the two $B \otimes_k L^{op}$ -module structures on M are isomorphic by Lemma 11.4.6. Hence we find $\varphi : M \rightarrow M$ intertwining these operations. In particular φ is in the commutant of L which implies that φ is multiplication by some $x \in A$, see Lemma 11.4.6. Working out the definitions we see that x is a solution to our problem. \square

Lemma 11.6.2. *Let A be a finite simple k -algebra. Any automorphism of A is inner. In particular, any automorphism of $\text{Mat}(n \times n, k)$ is inner.*

Proof. Note that A is a finite central simple algebra over the center of A which is a finite field extension of k , see Lemma 11.4.2. Hence the Skolem-Noether theorem (Theorem 11.6.1) applies. \square

11.7. The centralizer theorem

Theorem 11.7.1. *Let A be a finite central simple algebra over k , and let B be a simple subalgebra of A . Then*

- (1) *the centralizer C of B in A is simple,*
- (2) *$[A : k] = [B : k][C : k]$, and*
- (3) *the centralizer of C in A is B .*

Proof. Throughout this proof we use the results of Lemma 11.4.6 freely. Choose a simple A -module M . Set $L = \text{End}_A(M)$. Then L is a skew field with center k which acts on the left on M and $A = \text{End}_L(M)$. Then M is a right $B \otimes_k L^{op}$ -module and $C = \text{End}_{B \otimes_k L^{op}}(M)$. Since the algebra $B \otimes_k L^{op}$ is simple by Lemma 11.4.7 we see that C is simple (by Lemma 11.4.6 again).

Write $B \otimes_k L^{op} = \text{Mat}(m \times m, K)$ for some skew field K finite over k . Then $C = \text{Mat}(n \times n, K^{op})$ if M is isomorphic to a direct sum of n copies of the simple $B \otimes_k L^{op}$ -module $K^{\oplus m}$ (the lemma again). Thus we have $\dim_k(M) = nm[K : k]$, $[B : k][L : k] = m^2[K : k]$, $[C : k] = n^2[K : k]$, and $[A : k][L : k] = \dim_k(M)^2$ (by the lemma again). We conclude that (2) holds.

Part (3) follows because of (2) applied to $C \subset A$ shows that $[B : k] = [C' : k]$ where C' is the centralizer of C in A (and the obvious fact that $B \subset C'$). \square

Lemma 11.7.2. *Let A be a finite central simple algebra over k , and let B be a simple subalgebra of A . If B is a central k -algebra, then $A = B \otimes_k C$ where C is the (central simple) centralizer of B in A .*

Proof. We have $\dim_k(A) = \dim_k(B \otimes_k C)$ by Theorem 11.7.1. By Lemma 11.4.7 the tensor product is simple. Hence the natural map $B \otimes_k C \rightarrow A$ is injective hence an isomorphism. \square

Lemma 11.7.3. *Let A be a finite central simple algebra over k . If $K \subset A$ is a subfield, then the following are equivalent*

- (1) $[A : k] = [K : k]^2$,
- (2) K is its own centralizer, and
- (3) K is a maximal commutative subring.

Proof. Theorem 11.7.1 shows that (1) and (2) are equivalent. It is clear that (3) and (2) are equivalent. \square

Lemma 11.7.4. *Let A be a finite central skew field over k . Then every maximal subfield $K \subset A$ satisfies $[A : k] = [K : k]^2$.*

Proof. Special case of Lemma 11.7.3. \square

11.8. Splitting fields

Definition 11.8.1. Let A be a finite central simple k -algebra. We say a field extension $k \subset k'$ splits A , or k' is a *splitting field* for A if $A \otimes_k k'$ is a matrix algebra over k' .

Another way to say this is that the class of A maps to zero under the map $\text{Br}(k) \rightarrow \text{Br}(k')$.

Theorem 11.8.2. Let A be a finite central simple k -algebra. Let $k \subset k'$ be a finite field extension. The following are equivalent

- (1) k' splits A , and
- (2) there exists a finite central simple algebra B similar to A such that $k' \subset B$ and $[B : k] = [k' : k]^2$.

Proof. Assume (2). It suffices to show that $B \otimes_k k'$ is a matrix algebra. We know that $B \otimes_k B^{op} \cong \text{End}_k(B)$. Since k' is the centralizer of k' in B^{op} by Lemma 11.7.3 we see that $B \otimes_k k'$ is the centralizer of $k \otimes k'$ in $B \otimes_k B^{op} = \text{End}_k(B)$. Of course this centralizer is just $\text{End}_{k'}(B)$ where we view B as a k' vector space via the embedding $k' \rightarrow B$. Thus the result.

Assume (1). This means that we have an isomorphism $A \otimes_k k' \cong \text{End}_{k'}(V)$ for some k' -vector space V . Let B be the commutant of A in $\text{End}_k(V)$. Note that k' sits in B . By Lemma 11.7.2 the classes of A and B add up to zero in $\text{Br}(k)$. From the dimension formula in Theorem 11.7.1 we see that

$$[B : k][A : k] = \dim_k(V)^2 = [k' : k]^2 \dim_{k'}(V)^2 = [k' : k]^2 [A : k].$$

Hence $[B : k] = [k' : k]^2$. Thus we have proved the result for the opposite to the Brauer class of A . However, k' splits the Brauer class of A if and only if it splits the Brauer class of the opposite algebra, so we win anyway. \square

Lemma 11.8.3. A maximal subfield of a finite central skew field K over k is a splitting field for K .

Proof. Combine Lemma 11.7.4 with Theorem 11.8.2. \square

Lemma 11.8.4. Consider a finite central skew field K over k . Let $d^2 = [K : k]$. For any finite splitting field k' for K the degree $[k' : k]$ is divisible by d .

Proof. By Theorem 11.8.2 there exists a finite central simple algebra B in the Brauer class of K such that $[B : k] = [k' : k]^2$. By Lemma 11.5.1 we see that $B = \text{Mat}(n \times n, K)$ for some n . Then $[k' : k]^2 = n^2 d^2$ whence the result. \square

Proposition 11.8.5. Consider a finite central skew field K over k . There exists a maximal subfield $k \subset k' \subset K$ which is separable over k . In particular, every Brauer class has a finite separable spitting field.

Proof. Since every Brauer class is represented by a finite central skew field over k , we see that the second statement follows from the first by Lemma 11.8.3.

To prove the first statement, suppose that we are given a separable subfield $k' \subset K$. Then the centralizer K' of k' in K has center k' , and the problem reduces to finding a maximal subfield of K' separable over k' . Thus it suffices to prove, if $k \neq K$, that we can find an element $x \in K$, $x \notin k$ which is separable over k . This statement is clear in characteristic zero. Hence we may assume that k has characteristic $p > 0$.

If the ground field k is finite then, the result is clear as well (because extensions of finite fields are always separable). Thus we may assume that k is an infinite field of positive characteristic.

To get a contradiction assume no element of K is separable over k . By the discussion in Fields, Section 9.25 this means the minimal polynomial of any $x \in K$ is of the form $T^q - a$ where q is a power of p and $a \in k$. Since it is clear that every element of K has a minimal polynomial of degree $\leq \dim_k(K)$ we conclude that there exists a fixed p -power q such that $x^q \in k$ for all $x \in K$.

Consider the map

$$(-)^q : K \longrightarrow K$$

and write it out in terms of a k -basis $\{a_1, \dots, a_n\}$ of K with $a_1 = 1$. So

$$\left(\sum x_i a_i\right)^q = \sum f_i(x_1, \dots, x_n) a_i.$$

Since multiplication on A is k -bilinear we see that each f_i is a polynomial in x_1, \dots, x_n (details omitted). The choice of q above and the fact that k is infinite shows that f_i is identically zero for $i \geq 2$. Hence we see that it remains zero on extending k to its algebraic closure \bar{k} . But the algebra $A \otimes_k \bar{k}$ is a matrix algebra, which implies there are some elements whose q th power is not central (e.g., e_{11}). This is the desired contradiction. \square

The results above allow us to characterize finite central simple algebras as follows.

Lemma 11.8.6. *Let k be a field. For a k -algebra A the following are equivalent*

- (1) A is finite central simple k -algebra,
- (2) A is a finite dimensional k -vector space, k is the center of A , and A has no nontrivial two-sided ideal,
- (3) there exists $d \geq 1$ such that $A \otimes_k \bar{k} \cong \text{Mat}(d \times d, \bar{k})$,
- (4) there exists $d \geq 1$ such that $A \otimes_k k^{sep} \cong \text{Mat}(d \times d, k^{sep})$,
- (5) there exist $d \geq 1$ and a finite Galois extension $k \subset k'$ such that $A \otimes_{k'} k' \cong \text{Mat}(d \times d, k')$,
- (6) there exist $n \geq 1$ and a finite central skew field K over k such that $A \cong \text{Mat}(n \times n, K)$.

The integer d is called the degree of A .

Proof. The equivalence of (1) and (2) is a consequence of the definitions, see Section 11.2. Assume (1). By Proposition 11.8.5 there exists a separable splitting field $k \subset k'$ for A . Of course, then a Galois closure of k'/k is a splitting field also. Thus we see that (1) implies (5). It is clear that (5) \Rightarrow (4) \Rightarrow (3). Assume (3). Then $A \otimes_k \bar{k}$ is a finite central simple \bar{k} -algebra for example by Lemma 11.4.5. This trivially implies that A is a finite central simple k -algebra. Finally, the equivalence of (1) and (6) is Wedderburn's theorem, see Theorem 11.3.3. \square

Homological Algebra

12.1. Introduction

Basic homological algebra will be explained in this document. We add as needed in the other parts, since there is clearly an infinite amount of this stuff around. A reference is [ML63].

12.2. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

- (1) Nothing yet.

12.3. Preadditive and additive categories

Here is the definition of a preadditive category.

Definition 12.3.1. A category \mathcal{A} is called *preadditive* if each morphism set $\text{Mor}_{\mathcal{A}}(x, y)$ is endowed with the structure of an abelian group such that the compositions

$$\text{Mor}(x, y) \times \text{Mor}(y, z) \longrightarrow \text{Mor}(x, z)$$

are bilinear. A functor $F : \mathcal{A} \rightarrow \mathcal{B}$ of preadditive categories is called *additive* if and only if $F : \text{Mor}(x, y) \rightarrow \text{Mor}(F(x), F(y))$ is a homomorphism of abelian groups for all $x, y \in \text{Ob}(\mathcal{A})$.

In particular for every x, y there exists at least one morphism $x \rightarrow y$, namely the zero map.

Lemma 12.3.2. *Let \mathcal{A} be a preadditive category. Let x be an object of \mathcal{A} . The following are equivalent*

- (1) x is an initial object,
- (2) x is a final object, and
- (3) $id_x = 0$ in $\text{Mor}_{\mathcal{A}}(x, x)$.

Furthermore, if such an object 0 exists, then a morphism $\alpha : x \rightarrow y$ factors through 0 if and only if $\alpha = 0$.

Proof. Omitted. □

Definition 12.3.3. In a preadditive category \mathcal{A} we call *zero object*, and we denote it 0 any final and initial object as in Lemma 12.3.2 above.

Lemma 12.3.4. *Let \mathcal{A} be a preadditive category. Let $x, y \in \text{Ob}(\mathcal{A})$. If the product $x \times y$ exists, then so does the coproduct $x \coprod y$. If the coproduct $x \coprod y$ exists, then so does the product $x \times y$. In this case also $x \coprod y \cong x \times y$.*

Proof. Suppose that $z = x \times y$ with projections $p : z \rightarrow x$ and $q : z \rightarrow y$. Denote $i : x \rightarrow z$ the morphism corresponding to $(1, 0)$. Denote $j : y \rightarrow z$ the morphism corresponding to $(0, 1)$. Thus we have the commutative diagram

$$\begin{array}{ccc}
 x & \xrightarrow{1} & x \\
 & \searrow i & \nearrow p \\
 & & z \\
 & \nearrow j & \searrow q \\
 y & \xrightarrow{1} & y
 \end{array}$$

where the diagonal compositions are zero. It follows that $i \circ p + j \circ q : z \rightarrow z$ is the identity since it is a morphism which upon composing with p gives p and upon composing with q gives q . Suppose given morphisms $a : x \rightarrow w$ and $b : y \rightarrow w$. Then we can form the map $a \circ p + b \circ q : z \rightarrow w$. In this way we get a bijection $\text{Mor}(z, w) = \text{Mor}(x, w) \times \text{Mor}(y, w)$ which show that $z = x \coprod y$.

We leave it to the reader to construct the morphisms p, q given a coproduct $x \coprod y$ instead of a product. \square

Definition 12.3.5. Given a pair of objects x, y in a preadditive category \mathcal{A} we call *direct sum*, and we denote it $x \oplus y$ the product $x \times y$ endowed with the morphisms i, j, p, q as in Lemma 12.3.4 above.

Remark 12.3.6. Note that the proof of Lemma 12.3.4 shows that given p and q the morphisms i, j are uniquely determined by the rules $p \circ i = \text{id}_x$, $q \circ j = \text{id}_y$, $p \circ j = 0$, $q \circ i = 0$. Moreover, we automatically have $i \circ p + j \circ q = \text{id}_{x \oplus y}$. Similarly, given i, j the morphisms p and q are uniquely determined. Finally, given objects x, y, z and morphisms $i : x \rightarrow z$, $j : y \rightarrow z$, $p : z \rightarrow x$ and $q : z \rightarrow y$ such that $p \circ i = \text{id}_x$, $q \circ j = \text{id}_y$, $p \circ j = 0$, $q \circ i = 0$ and $i \circ p + j \circ q = \text{id}_z$, then z is the direct sum of x and y with the four morphisms equal to i, j, p, q .

Lemma 12.3.7. Let \mathcal{A}, \mathcal{B} be preadditive categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor. Then F transforms direct sums to direct sums and zero to zero.

Proof. Suppose F is additive. A direct sum z of x and y is characterized by having morphisms $i : x \rightarrow z$, $j : y \rightarrow z$, $p : z \rightarrow x$ and $q : z \rightarrow y$ such that $p \circ i = \text{id}_x$, $q \circ j = \text{id}_y$, $p \circ j = 0$, $q \circ i = 0$ and $i \circ p + j \circ q = \text{id}_z$, according to Remark 12.3.6. Clearly $F(x), F(y), F(z)$ and the morphisms $F(i), F(j), F(p), F(q)$ satisfy exactly the same relations (by additivity) and we see that $F(z)$ is a direct sum of $F(x)$ and $F(y)$. \square

Definition 12.3.8. A category \mathcal{A} is called *additive* if it is preadditive and finite products exist, in other words it has a zero object and direct sums.

Namely the empty product is a finite product and if it exists, then it is a final object.

Definition 12.3.9. Let \mathcal{A} be a preadditive category. Let $f : x \rightarrow y$ be a morphism.

- (1) A *kernel* of f is a morphism $i : z \rightarrow x$ such that (a) $f \circ i = 0$ and (b) for any $i' : z' \rightarrow x$ such that $f \circ i' = 0$ there exists a unique morphism $g : z' \rightarrow z$ such that $i' = i \circ g$.
- (2) If the kernel of f exists, then we denote this $\text{Ker}(f) \rightarrow x$.

- (3) A *cokernel* of f is a morphism $p : y \rightarrow z$ such that (a) $p \circ f = 0$ and (b) for any $p' : y \rightarrow z'$ such that $p' \circ f = 0$ there exists a unique morphism $g : z \rightarrow z'$ such that $p' = g \circ p$.
- (4) If a cokernel of f exists we denote this $y \rightarrow \text{Coker}(f)$.
- (5) If a kernel of f exists, then a *coimage* of f is a cokernel for the morphism $\text{Ker}(f) \rightarrow x$.
- (6) If a kernel and coimage exist then we denote this $x \rightarrow \text{Coim}(f)$.
- (7) If a cokernel of f exists, then the *image* of f is a kernel of the morphism $y \rightarrow \text{Coker}(f)$.
- (8) If a cokernel and image of f exist then we denote this $\text{Im}(f) \rightarrow y$.

We first relate the direct sum to kernels as follows.

Lemma 12.3.10. *Let \mathcal{C} be a preadditive category. Let $x \oplus y$ with morphisms i, j, p, q as in Lemma 12.3.4 be a direct sum in \mathcal{C} . Then $i : x \rightarrow x \oplus y$ is a kernel of $q : x \oplus y \rightarrow y$. Dually, p is a cokernel for j .*

Proof. Let $f : z \rightarrow x \oplus y$ be a morphism such that $q \circ f = 0$. We have to show that there exists a unique morphism $g : z \rightarrow x$ such that $f = i \circ g$. Since $i \circ p + j \circ q$ is the identity on $x \oplus y$ we see that

$$f = (i \circ p + j \circ q) \circ f = i \circ p \circ f$$

and hence $g = p \circ f$ works. Uniqueness holds because $p \circ i$ is the identity on x . The proof of the second statement is dual. \square

Lemma 12.3.11. *Let $f : x \rightarrow y$ be a morphism in a preadditive category such that the kernel, cokernel, image and coimage all exist. Then f can be factored uniquely as $x \rightarrow \text{Coim}(f) \rightarrow \text{Im}(f) \rightarrow y$.*

Proof. There is a canonical morphism $\text{Coim}(f) \rightarrow y$ because $\text{Ker}(f) \rightarrow x \rightarrow y$ is zero. The composition $\text{Coim}(f) \rightarrow y \rightarrow \text{Coker}(f)$ is zero, because it is the unique morphism which gives rise to the morphism $x \rightarrow y \rightarrow \text{Coker}(f)$ which is zero. Hence $\text{Coim}(f) \rightarrow y$ factors uniquely through $\text{Im}(f) \rightarrow y$, which gives us the desired map. \square

Example 12.3.12. Let k be a field. Consider the category of filtered vector spaces over k . (See Definition 12.16.1.) Consider the filtered vector spaces (V, F) and (W, F) with $V = W = k$ and

$$F^i V = \begin{cases} V & \text{if } i < 0 \\ 0 & \text{if } i \geq 0 \end{cases} \text{ and } F^i W = \begin{cases} W & \text{if } i \leq 0 \\ 0 & \text{if } i > 0 \end{cases}$$

The map $f : V \rightarrow W$ corresponding to id_k on the underlying vector spaces has trivial kernel and cokernel but is not an isomorphism. Note also that $\text{Coim}(f) = V$ and $\text{Im}(f) = W$. This means that the category of filtered vector spaces over k is not abelian.

12.4. Karoubian categories

Skip this section on a first reading.

Definition 12.4.1. Let \mathcal{C} be a preadditive category. We say \mathcal{C} is *Karoubian* if every idempotent endomorphism of an object of \mathcal{C} has a kernel.

The dual notion would be that every idempotent endomorphism of an object has a cokernel. However, in view of the (dual of the) following lemma that would be an equivalent notion.

Lemma 12.4.2. *Let \mathcal{C} be a preadditive category. The following are equivalent*

- (1) \mathcal{C} is Karoubian,
- (2) every idempotent endomorphism of an object of \mathcal{C} has a cokernel, and
- (3) given an idempotent endomorphism $p : z \rightarrow z$ of \mathcal{C} there exists a direct sum decomposition $z = x \oplus y$ such that p corresponds to the projection onto y .

Proof. Assume (1) and let $p : z \rightarrow z$ be as in (3). Let $x = \text{Ker}(p)$ and $y = \text{Ker}(1 - p)$. There are maps $x \rightarrow z$ and $y \rightarrow z$. Since $(1 - p)p = 0$ we see that $p : z \rightarrow z$ factors through y , hence we obtain a morphism $z \rightarrow y$. Similarly we obtain a morphism $z \rightarrow x$. We omit the verification that these four morphisms induce an isomorphism $x = y \oplus z$ as in Remark 12.3.6. Thus (1) \Rightarrow (3). The implication (2) \Rightarrow (3) is dual. Finally, condition (3) implies (1) and (2) by Lemma 12.3.10. \square

Lemma 12.4.3. *Let \mathcal{D} be a preadditive category.*

- (1) *If \mathcal{D} has countable products and kernels of maps which have a right inverse, then \mathcal{D} is Karoubian.*
- (2) *If \mathcal{D} has countable coproducts and cokernels of maps which have a left inverse, then \mathcal{D} is Karoubian.*

Proof. Let X be an object of \mathcal{D} and let $e : X \rightarrow X$ be an idempotent. The functor

$$W \mapsto \text{Ker}(\text{Mor}_{\mathcal{D}}(W, X) \xrightarrow{e} \text{Mor}_{\mathcal{D}}(W, X))$$

is representable if and only if e has a kernel. Note that for any abelian group A and idempotent endomorphism $e : A \rightarrow A$ we have

$$\text{Ker}(e : A \rightarrow A) = \text{Ker}(\Phi : \prod_{n \in \mathbb{N}} A \rightarrow \prod_{n \in \mathbb{N}} A)$$

where

$$\Phi(a_1, a_2, a_3, \dots) = (ea_1 + (1 - e)a_2, ea_2 + (1 - e)a_3, \dots)$$

Moreover, Φ has the right inverse

$$\Psi(a_1, a_2, a_3, \dots) = (a_1, (1 - e)a_1 + ea_2, (1 - e)a_2 + ea_3, \dots).$$

Hence (1) holds. The proof of (2) is dual (using the dual definition of a Karoubian category, namely condition (2) of Lemma 12.4.2). \square

12.5. Abelian categories

An abelian category is a category satisfying just enough axioms so the snake lemma holds. An axiom (that is sometimes forgotten) is that the canonical map $\text{Coim}(f) \rightarrow \text{Im}(f)$ of Lemma 12.3.11 is always an isomorphism. Example 12.3.12 shows that it is necessary.

Definition 12.5.1. A category \mathcal{A} is *abelian* if it is additive, if all kernels and cokernels exist, and if the natural map $\text{Coim}(f) \rightarrow \text{Im}(f)$ is an isomorphism for all morphisms f of \mathcal{A} .

Lemma 12.5.2. *Let \mathcal{A} be a preadditive category. The additions on sets of morphisms make \mathcal{A}^{opp} into a preadditive category. Furthermore, \mathcal{A} is additive if and only if \mathcal{A}^{opp} is additive, and \mathcal{A} is abelian if and only if \mathcal{A}^{opp} is abelian.*

Proof. Omitted. \square

Definition 12.5.3. Let $f : x \rightarrow y$ be a morphism in an abelian category.

- (1) We say f is *injective* if $\text{Ker}(f) = 0$.
- (2) We say f is *surjective* if $\text{Coker}(f) = 0$.

If $x \rightarrow y$ is injective, then we say that x is a *subobject* of y and we use the notation $x \subset y$. If $x \rightarrow y$ is surjective, then we say that y is a *quotient* of x .

Lemma 12.5.4. *Let $f : x \rightarrow y$ be a morphism in an abelian category. Then*

- (1) *f is injective if and only if f is a monomorphism, and*
- (2) *f is surjective if and only if f is an epimorphism.*

Proof. Omitted. \square

In an abelian category, if $x \subset y$ is a subobject, then we denote

$$x/y = \text{Coker}(x \rightarrow y).$$

Lemma 12.5.5. *Let \mathcal{A} be an abelian category. All finite limits and finite colimits exist in \mathcal{A} .*

Proof. To show that finite limits exist it suffices to show that finite products and equalizers exist, see Categories, Lemma 4.18.4. Finite products exist by definition and the equalizer of $a, b : x \rightarrow y$ is the kernel of $a - b$. The argument for finite colimits is similar but dual to this. \square

Example 12.5.6. Let \mathcal{A} be an abelian category. Pushouts and fibre products in \mathcal{A} have the following simple descriptions:

- (1) If $a : x \rightarrow y, b : z \rightarrow y$ are morphisms in \mathcal{A} , then we have the fibre product:
 $x \times_y z = \text{Ker}((a, -b) : x \oplus z \rightarrow y)$.
- (2) If $a : y \rightarrow x, b : y \rightarrow z$ are morphisms in \mathcal{A} , then we have the pushout:
 $x \amalg_y z = \text{Coker}((a, -b) : y \rightarrow x \oplus z)$.

Definition 12.5.7. Let \mathcal{A} be an additive category. We say a sequence of morphisms

$$\dots \rightarrow x \rightarrow y \rightarrow z \rightarrow \dots$$

in \mathcal{A} is a *complex* if the composition of any two (drawn) arrows is zero. If \mathcal{A} is abelian then we say a sequence as above is *exact at y* if $\text{Im}(x \rightarrow y) = \text{Ker}(y \rightarrow z)$. We say it is *exact* if it is exact at every object. A *short exact sequence* is an exact complex of the form

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0.$$

In the following lemma we assume the reader knows what it means for a sequence of abelian groups to be exact.

Lemma 12.5.8. *Let \mathcal{A} be an abelian category. Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a complex of \mathcal{A} .*

- (1) *$M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is exact if and only if*

$$0 \rightarrow \text{Hom}_{\mathcal{A}}(M_3, N) \rightarrow \text{Hom}_{\mathcal{A}}(M_2, N) \rightarrow \text{Hom}_{\mathcal{A}}(M_1, N)$$

is an exact sequence of abelian groups for all objects N of \mathcal{A} , and

(2) $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3$ is exact if and only if

$$0 \rightarrow \operatorname{Hom}_{\mathcal{A}}(N, M_1) \rightarrow \operatorname{Hom}_{\mathcal{A}}(N, M_2) \rightarrow \operatorname{Hom}_{\mathcal{A}}(N, M_3)$$

is an exact sequence of abelian groups for all objects N of \mathcal{A} .

Proof. Omitted. Hint: See Algebra, Lemma 10.10.1. \square

Definition 12.5.9. Let \mathcal{A} be an abelian category. Let $i : A \rightarrow B$ and $q : B \rightarrow C$ be morphisms of \mathcal{A} such that $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is a short exact sequence. We say the short exact sequence is *split* if there exist morphisms $j : C \rightarrow B$ and $p : B \rightarrow A$ such that (B, i, j, p, q) is the direct sum of A and C .

Lemma 12.5.10. Let \mathcal{A} be an abelian category. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence.

- (1) Given a morphism $s : C \rightarrow B$ left inverse to $B \rightarrow C$, there exists a unique $\pi : B \rightarrow A$ such that (s, π) splits the short exact sequence as in Definition 12.5.9.
- (2) Given a morphism $\pi : B \rightarrow A$ right inverse to $A \rightarrow B$, there exists a unique $s : C \rightarrow B$ such that (s, π) splits the short exact sequence as in Definition 12.5.9.

Proof. Omitted. \square

Lemma 12.5.11. Let \mathcal{A} be an abelian category. Let

$$\begin{array}{ccc} w & \xrightarrow{f} & y \\ g \downarrow & & \downarrow h \\ x & \xrightarrow{k} & z \end{array}$$

be a commutative diagram.

- (1) The diagram is cartesian if and only if

$$0 \rightarrow w \xrightarrow{(g, f)} x \oplus y \xrightarrow{(k, -h)} z$$

is exact.

- (2) The diagram is cocartesian if and only if

$$w \xrightarrow{(g, -f)} x \oplus y \xrightarrow{(k, h)} z \rightarrow 0$$

is exact.

Proof. Let $u = (g, f) : w \rightarrow x \oplus y$ and $v = (k, -h) : x \oplus y \rightarrow z$. Let $p : x \oplus y \rightarrow x$ and $q : x \oplus y \rightarrow y$ be the canonical projections. Let $i : \operatorname{Ker}(v) \rightarrow x \oplus y$ be the canonical injection. By Example 12.5.6, the diagram is cartesian if and only if there exists an isomorphism $r : \operatorname{Ker}(v) \rightarrow w$ with $f \circ r = q \circ i$ and $g \circ r = p \circ i$. The sequence $0 \rightarrow w \xrightarrow{u} x \oplus y \xrightarrow{v} z$ is exact if and only if there exists an isomorphism $r : \operatorname{Ker}(v) \rightarrow w$ with $u \circ r = i$. But given $r : \operatorname{Ker}(v) \rightarrow w$, we have $f \circ r = q \circ i$ and $g \circ r = p \circ i$ if and only if $q \circ u \circ r = f \circ r = q \circ i$ and $p \circ u \circ r = g \circ r = p \circ i$, hence if and only if $u \circ r = i$. This proves (1), and then (2) follows by duality. \square

Lemma 12.5.12. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccc} w & \xrightarrow{f} & y \\ g \downarrow & & \downarrow h \\ x & \xrightarrow{k} & z \end{array}$$

be a commutative diagram.

- (1) *If the diagram is cartesian, then the morphism $\text{Ker}(f) \rightarrow \text{Ker}(k)$ induced by g is an isomorphism.*
- (2) *If the diagram is cocartesian, then the morphism $\text{Coker}(f) \rightarrow \text{Coker}(k)$ induced by h is an isomorphism.*

Proof. Suppose the diagram is cartesian. Let $e : \text{Ker}(f) \rightarrow \text{Ker}(k)$ be induced by g . Let $i : \text{Ker}(f) \rightarrow w$ and $j : \text{Ker}(k) \rightarrow x$ be the canonical injections. There exists $t : \text{Ker}(k) \rightarrow w$ with $f \circ t = 0$ and $g \circ t = j$. Hence, there exists $u : \text{Ker}(k) \rightarrow \text{Ker}(f)$ with $i \circ u = t$. It follows $g \circ i \circ u \circ e = g \circ t \circ e = j \circ e = g \circ i$ and $f \circ i \circ u \circ e = 0 = f \circ i$, hence $i \circ u \circ e = i$. Since i is a monomorphism this implies $u \circ e = \text{id}_{\text{Ker}(f)}$. Furthermore, we have $j \circ e \circ u = g \circ i \circ u = g \circ t = j$. Since j is a monomorphism this implies $e \circ u = \text{id}_{\text{Ker}(k)}$. This proves (1). Now, (2) follows by duality. \square

Lemma 12.5.13. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccc} w & \xrightarrow{f} & y \\ g \downarrow & & \downarrow h \\ x & \xrightarrow{k} & z \end{array}$$

be a commutative diagram.

- (1) *If the diagram is cartesian and k is an epimorphism, then the diagram is cocartesian and f is an epimorphism.*
- (2) *If the diagram is cocartesian and g is a monomorphism, then the diagram is cartesian and h is a monomorphism.*

Proof. Suppose the diagram is cartesian and k is an epimorphism. Let $u = (g, f) : w \rightarrow x \oplus y$ and let $v = (k, -h) : x \oplus y \rightarrow z$. As k is an epimorphism, v is an epimorphism, too. Therefore and by Lemma 12.5.11, the sequence $0 \rightarrow w \xrightarrow{u} x \oplus y \xrightarrow{v} z \rightarrow 0$ is exact. Thus, the diagram is cocartesian by Lemma 12.5.11. Finally, f is an epimorphism by Lemma 12.5.12 and Lemma 12.5.4. This proves (1), and (2) follows by duality. \square

Lemma 12.5.14. *Let \mathcal{A} be an abelian category.*

- (1) *If $x \rightarrow y$ is surjective, then for every $z \rightarrow y$ the projection $x \times_y z \rightarrow z$ is surjective.*
- (2) *If $x \rightarrow y$ is injective, then for every $x \rightarrow z$ the morphism $z \rightarrow z \amalg_x y$ is injective.*

Proof. Immediately from Lemma 12.5.4 and Lemma 12.5.13. \square

Lemma 12.5.15. *Let \mathcal{A} be an abelian category. Let $f : x \rightarrow y$ and $g : y \rightarrow z$ be morphisms with $g \circ f = 0$. Then, the following statements are equivalent:*

- (1) *The sequence $x \xrightarrow{f} y \xrightarrow{g} z$ is exact.*

- (2) For every $h : w \rightarrow y$ with $g \circ h = 0$ there exist an object v , an epimorphism $k : v \rightarrow w$ and a morphism $l : v \rightarrow x$ with $h \circ k = f \circ l$.

Proof. Let $i : \text{Ker}(g) \rightarrow y$ be the canonical injection. Let $p : x \rightarrow \text{Coim}(f)$ be the canonical projection. Let $j : \text{Im}(f) \rightarrow \text{Ker}(g)$ be the canonical injection.

Suppose (1) holds. Let $h : w \rightarrow y$ with $g \circ h = 0$. There exists $c : w \rightarrow \text{Ker}(g)$ with $i \circ c = h$. Let $v = x \times_{\text{Ker}(g)} w$ with canonical projections $k : v \rightarrow w$ and $l : v \rightarrow x$, so that $c \circ k = p \circ l$. Then, $h \circ k = i \circ c \circ k = i \circ j \circ p \circ l = f \circ l$. As $j \circ p$ is an epimorphism by hypothesis, k is an epimorphism by Lemma 12.5.13. This implies (2).

Suppose (2) holds. Then, $g \circ i = 0$. So, there are an object w , an epimorphism $k : w \rightarrow \text{Ker}(g)$ and a morphism $l : w \rightarrow x$ with $f \circ l = i \circ k$. It follows $i \circ j \circ p \circ l = f \circ l = i \circ k$. Since i is a monomorphism we see that $j \circ p \circ l = k$ is an epimorphism. So, j is an epimorphisms and thus an isomorphism. This implies (1). \square

Lemma 12.5.16. Let \mathcal{A} be an abelian category. Let

$$\begin{array}{ccccc} x & \xrightarrow{f} & y & \xrightarrow{g} & z \\ \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma \\ u & \xrightarrow{k} & v & \xrightarrow{l} & w \end{array}$$

be a commutative diagram.

- (1) If the first row is exact and k is a monomorphism, then the induced sequence $\text{Ker}(\alpha) \rightarrow \text{Ker}(\beta) \rightarrow \text{Ker}(\gamma)$ is exact.
- (2) If the second row is exact and g is an epimorphism, then the induced sequence $\text{Coker}(\alpha) \rightarrow \text{Coker}(\beta) \rightarrow \text{Coker}(\gamma)$ is exact.

Proof. Suppose the first row is exact and k is a monomorphism. Let $a : \text{Ker}(\alpha) \rightarrow \text{Ker}(\beta)$ and $b : \text{Ker}(\beta) \rightarrow \text{Ker}(\gamma)$ be the induced morphisms. Let $h : \text{Ker}(\alpha) \rightarrow x$, $i : \text{Ker}(\beta) \rightarrow y$ and $j : \text{Ker}(\gamma) \rightarrow z$ be the canonical injections. As j is a monomorphism we have $b \circ a = 0$. Let $c : s \rightarrow \text{Ker}(\beta)$ with $b \circ c = 0$. Then, $g \circ i \circ c = j \circ b \circ c = 0$. By Lemma 12.5.15 there are an object t , an epimorphism $d : t \rightarrow s$ and a morphism $e : t \rightarrow x$ with $i \circ c \circ d = f \circ e$. Then, $k \circ a \circ e = \beta \circ f \circ e = \beta \circ i \circ c \circ d = 0$. As k is a monomorphism we get $a \circ e = 0$. So, there exists $m : t \rightarrow \text{Ker}(\alpha)$ with $h \circ m = e$. It follows $i \circ a \circ m = f \circ h \circ m = f \circ e = i \circ c \circ d$. As i is a monomorphism we get $a \circ m = c \circ d$. Thus, Lemma 12.5.15 implies (1), and then (2) follows by duality. \square

Lemma 12.5.17. Let \mathcal{A} be an abelian category. Let

$$\begin{array}{ccccccc} & & x & \xrightarrow{f} & y & \xrightarrow{g} & z & \longrightarrow & 0 \\ & & \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma & & \\ 0 & \longrightarrow & u & \xrightarrow{k} & v & \xrightarrow{l} & w & & \end{array}$$

be a commutative diagram with exact rows.

- (1) *There exists a unique morphism $\delta : \text{Ker}(\gamma) \rightarrow \text{Coker}(\alpha)$ such that the diagram*

$$\begin{array}{ccc} y & \xleftarrow{\pi'} y \times_z \text{Ker}(\gamma) \xrightarrow{\pi} & \text{Ker}(\gamma) \\ \beta \downarrow & & \downarrow \delta \\ v & \xrightarrow{\iota'} \text{Coker}(\alpha) \amalg_u v \xleftarrow{\iota} & \text{Coker}(\alpha) \end{array}$$

commutes, where π and π' are the canonical projections and ι and ι' are the canonical coprojections.

- (2) *The induced sequence*

$$\text{Ker}(\alpha) \xrightarrow{f'} \text{Ker}(\beta) \xrightarrow{g'} \text{Ker}(\gamma) \xrightarrow{\delta} \text{Coker}(\alpha) \xrightarrow{k'} \text{Coker}(\beta) \xrightarrow{l'} \text{Coker}(\gamma)$$

is exact. If f is injective then so is f' , and if l is surjective then so is l' .

Proof. As π is an epimorphism and ι is a monomorphism by Lemma 12.5.13, uniqueness of δ is clear. Let $p = y \times_z \text{Ker}(\gamma)$ and $q = \text{Coker}(\alpha) \amalg_u v$. Let $h : \text{Ker}(\beta) \rightarrow y$, $i : \text{Ker}(\gamma) \rightarrow z$ and $j : \text{Ker}(\pi) \rightarrow p$ be the canonical injections. Let $p : u \rightarrow \text{Coker}(\alpha)$ be the canonical projection. Keeping in mind Lemma 12.5.13 we get a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(\pi) & \xrightarrow{j} & p & \xrightarrow{\pi} & \text{Ker}(\gamma) \longrightarrow 0 \\ & & & & \downarrow \pi' & & \downarrow i \\ & & x & \xrightarrow{f} & y & \xrightarrow{g} & z \longrightarrow 0 \\ & & \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma \\ 0 & \longrightarrow & u & \xrightarrow{k} & v & \xrightarrow{l} & w \\ & & \downarrow p & & \downarrow \iota' & & \\ 0 & \longrightarrow & \text{Coker}(\alpha) & \xrightarrow{\iota} & q & & \end{array}$$

As $l \circ \beta \circ \pi' = \gamma \circ i \circ \pi = 0$ and as the third row of the diagram above is exact, there is an $a : p \rightarrow u$ with $k \circ a = \beta \circ \pi'$. As the upper right quadrangle of the diagram above is cartesian, Lemma 12.5.12 yields an epimorphism $b : x \rightarrow \text{Ker}(\pi)$ with $\pi' \circ j \circ b = f$. It follows $k \circ a \circ j \circ b = \beta \circ \pi' \circ j \circ b = \beta \circ f = k \circ \alpha$. As k is a monomorphism this implies $a \circ j \circ b = \alpha$. It follows $p \circ a \circ j \circ b = p \circ \alpha = 0$. As b is an epimorphism this implies $p \circ a \circ j = 0$. Therefore, as the top row of the diagram above is exact, there exists $\delta : \text{Ker}(\gamma) \rightarrow \text{Coker}(\alpha)$ with $\delta \circ \pi = p \circ a$. It follows $\iota \circ \delta \circ \pi = \iota \circ p \circ a = \iota' \circ k \circ a = \iota' \circ \beta \circ \pi'$ as desired.

As the upper right quadrangle in the diagram above is cartesian there is a $c : \text{Ker}(\beta) \rightarrow p$ with $\pi' \circ c = h$ and $\pi \circ c = g'$. It follows $\iota \circ \delta \circ g' = \iota \circ \delta \circ \pi \circ c = \iota' \circ \beta \circ \pi' \circ c = \iota' \circ \beta \circ h = 0$. As ι is a monomorphism this implies $\delta \circ g' = 0$.

Next, let $d : r \rightarrow \text{Ker}(\gamma)$ with $\delta \circ d = 0$. Applying Lemma 12.5.15 to the exact sequence $p \xrightarrow{\pi} \text{Ker}(\gamma) \rightarrow 0$ and d yields an object s , an epimorphism $m : s \rightarrow r$ and a morphism $n : s \rightarrow p$ with $\pi \circ n = d \circ m$. As $p \circ a \circ n = \delta \circ d \circ m = 0$, applying Lemma 12.5.15 to the exact sequence $x \xrightarrow{\alpha} u \xrightarrow{p} \text{Coker}(\alpha)$ and $a \circ n$ yields an object t , an epimorphism $\varepsilon : t \rightarrow s$ and a morphism $\zeta : t \rightarrow x$ with $a \circ n \circ \varepsilon = \alpha \circ \zeta$. It

holds $\beta \circ \pi' \circ n \circ \varepsilon = k \circ \alpha \circ \zeta = \beta \circ f \circ \zeta$. Let $\eta = \pi' \circ n \circ \varepsilon - f \circ \zeta : t \rightarrow y$. Then, $\beta \circ \eta = 0$. It follows that there is a $\vartheta : t \rightarrow \text{Ker}(\beta)$ with $\eta = h \circ \vartheta$. It holds $i \circ g' \circ \vartheta = g \circ h \circ \vartheta = g \circ \pi' \circ n \circ \varepsilon - g \circ f \circ \zeta = i \circ \pi \circ n \circ \varepsilon = i \circ d \circ m \circ \varepsilon$. As i is a monomorphism we get $g' \circ \vartheta = d \circ m \circ \varepsilon$. Thus, as $m \circ \varepsilon$ is an epimorphism, Lemma 12.5.15 implies that $\text{Ker}(\beta) \xrightarrow{g'} \text{Ker}(\gamma) \xrightarrow{\delta} \text{Coker}(\alpha)$ is exact. Then, the claim follows by Lemma 12.5.16 and duality. \square

Lemma 12.5.18. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccccccccc}
 & & x & \longrightarrow & y & \longrightarrow & z & \longrightarrow & 0 \\
 & & \swarrow & & \swarrow & & \swarrow & & \\
 & & x' & \longrightarrow & y' & \longrightarrow & z' & \longrightarrow & 0 \\
 & & \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma & & \\
 0 & \longrightarrow & u & \longrightarrow & v & \longrightarrow & w & \longrightarrow & 0 \\
 & & \swarrow & & \swarrow & & \swarrow & & \\
 & & u' & \longrightarrow & v' & \longrightarrow & w' & \longrightarrow & 0 \\
 & & \downarrow \alpha' & & \downarrow \beta' & & \downarrow \gamma' & & \\
 0 & \longrightarrow & u' & \longrightarrow & v' & \longrightarrow & w' & \longrightarrow & 0
 \end{array}$$

be a commutative diagram with exact rows. Then, the induced diagram

$$\begin{array}{ccccccccc}
 \text{Ker}(\alpha) & \longrightarrow & \text{Ker}(\beta) & \longrightarrow & \text{Ker}(\gamma) & \xrightarrow{\delta} & \text{Coker}(\alpha) & \longrightarrow & \text{Coker}(\beta) & \longrightarrow & \text{Coker}(\gamma) \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 \text{Ker}(\alpha') & \longrightarrow & \text{Ker}(\beta') & \longrightarrow & \text{Ker}(\gamma') & \xrightarrow{\delta'} & \text{Coker}(\alpha') & \longrightarrow & \text{Coker}(\beta') & \longrightarrow & \text{Coker}(\gamma')
 \end{array}$$

commutes.

Proof. Omitted. \square

Lemma 12.5.19. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccccccc}
 w & \longrightarrow & x & \longrightarrow & y & \longrightarrow & z \\
 \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma & & \downarrow \delta \\
 w' & \longrightarrow & x' & \longrightarrow & y' & \longrightarrow & z'
 \end{array}$$

be a commutative diagram with exact rows.

- (1) *If α, γ are surjective and δ is injective, then β is surjective.*
- (2) *If β, δ are injective and α is surjective, then γ is injective.*

Proof. Assume α, γ are surjective and δ is injective. We may replace w' by $\text{Im}(w' \rightarrow x')$, i.e., we may assume that $w' \rightarrow x'$ is injective. We may replace z by $\text{Im}(y \rightarrow z)$, i.e., we may assume that $y \rightarrow z$ is surjective. Then we may apply Lemma 12.5.17 to

$$\begin{array}{ccccccc}
 \text{Ker}(y \rightarrow z) & \longrightarrow & y & \longrightarrow & z & \longrightarrow & 0 \\
 \downarrow & & \downarrow & & \downarrow & & \\
 0 & \longrightarrow & \text{Ker}(y' \rightarrow z') & \longrightarrow & y' & \longrightarrow & z'
 \end{array}$$

to conclude that $\text{Ker}(y \rightarrow z) \rightarrow \text{Ker}(y' \rightarrow z')$ is surjective. Finally, we apply Lemma 12.5.17 to

$$\begin{array}{ccccccc} w & \longrightarrow & x & \longrightarrow & \text{Ker}(y \rightarrow z) & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & w' & \longrightarrow & x' & \longrightarrow & \text{Ker}(y' \rightarrow z') \end{array}$$

to conclude that $x \rightarrow x'$ is surjective. This proves (1). The proof of (2) is dual to this. \square

Lemma 12.5.20. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccccccccc} v & \longrightarrow & w & \longrightarrow & x & \longrightarrow & y & \longrightarrow & z \\ \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma & & \downarrow \delta & & \downarrow \epsilon \\ v' & \longrightarrow & w' & \longrightarrow & x' & \longrightarrow & y' & \longrightarrow & z' \end{array}$$

be a commutative diagram with exact rows. If β, δ are isomorphisms, ϵ is injective, and α is surjective then γ is an isomorphism.

Proof. Immediate consequence of Lemma 12.5.19. \square

12.6. Extensions

Definition 12.6.1. Let \mathcal{A} be an abelian category. Let $A, C \in \text{Ob}(\mathcal{A})$. An *extension* E of B by A is a short exact sequence

$$0 \rightarrow A \rightarrow E \rightarrow B \rightarrow 0.$$

By abuse of language we often omit mention of the morphisms $A \rightarrow E$ and $E \rightarrow B$, although they are definitively part of the structure of an extension.

Definition 12.6.2. Let \mathcal{A} be an abelian category. Let $A, B \in \text{Ob}(\mathcal{A})$. The set of isomorphism classes of extensions of B by A is denoted

$$\text{Ext}_{\mathcal{A}}(B, A).$$

This is called the *Ext-group*.

This definition works, because by our conventions \mathcal{A} is a set, and hence $\text{Ext}_{\mathcal{A}}(B, A)$ is a set. In any of the cases of “big” abelian categories listed in Categories, Remark 4.2.2. one can check by hand that $\text{Ext}_{\mathcal{A}}(B, A)$ is a set as well. Also, we will see later that this is always the case when \mathcal{A} has either enough projectives or enough injectives. Insert future reference here.

Actually we can turn $\text{Ext}_{\mathcal{A}}(-, -)$ into a functor

$$\mathcal{A}^{opp} \times \mathcal{A} \rightarrow \text{Sets}, \quad (A, B) \mapsto \text{Ext}_{\mathcal{A}}(A, B)$$

as follows:

- (1) Given a morphism $B' \rightarrow B$ and an extension E of B by A we define $E' = E \times_B B'$ so that we have the following commutative diagram of short exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & A & \longrightarrow & E' & \longrightarrow & B' \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & A & \longrightarrow & E & \longrightarrow & B \longrightarrow 0 \end{array}$$

The extension E' is called the *pullback of E via $B' \rightarrow B$* .

- (2) Given a morphism $A \rightarrow A'$ and an extension E of B by A we define $E' = A' \amalg_A E$ so that we have the following commutative diagram of short exact sequences

$$\begin{array}{ccccccccc} 0 & \longrightarrow & A & \longrightarrow & E & \longrightarrow & B & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A' & \longrightarrow & E' & \longrightarrow & B & \longrightarrow & 0 \end{array}$$

The extension E' is called the *pushout of E via $A \rightarrow A'$* .

To see that this defines a functor as indicated above there are several things to verify. First of all functoriality in the variable B requires that $(E \times_B B') \times_{B'} B'' = E \times_B B''$ which is a general property of fibre products. Dually one deals with functoriality in the variable A . Finally, given $A \rightarrow A'$ and $B' \rightarrow B$ we have to show that

$$A' \amalg_A (E \times_B B') \cong (A' \amalg_A E) \times_B B'$$

as extensions of B' by A' . Recall that $A' \amalg_A E$ is a quotient of $A' \oplus E$. Thus the right hand side is a quotient of $A' \oplus E \times_B B'$, and it is straightforward to see that the kernel is exactly what you need in order to get the left hand side.

Note that if E_1 and E_2 are extensions of B by A , then $E_1 \oplus E_2$ is an extension of $B \oplus B$ by $A \oplus A$. We pull back by the diagonal map $B \rightarrow B \oplus B$ and we push out by the sum map $A \oplus A \rightarrow A$ to get an extension $E_1 + E_2$ of B by A .

$$\begin{array}{ccccccccc} 0 & \longrightarrow & A \oplus A & \longrightarrow & E_1 \oplus E_2 & \longrightarrow & B \oplus B & \longrightarrow & 0 \\ & & \downarrow \Sigma & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A & \longrightarrow & E' & \longrightarrow & B \oplus B & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow \Delta & & \\ 0 & \longrightarrow & A & \longrightarrow & E_1 + E_2 & \longrightarrow & B & \longrightarrow & 0 \end{array}$$

The extension $E_1 + E_2$ is called the *Baer sum* of the given extensions.

Lemma 12.6.3. *The construction $(E_1, E_2) \mapsto E_1 + E_2$ above defines a commutative group law on $\text{Ext}_{\mathcal{A}}(B, A)$ which is functorial in both variables.*

Proof. Omitted. □

Lemma 12.6.4. *Let \mathcal{A} be an abelian category. Let $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ be a short exact sequence in \mathcal{A} .*

- (1) *There is a canonical six term exact sequence of abelian groups*

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Hom}_{\mathcal{A}}(M_3, N) & \longrightarrow & \text{Hom}_{\mathcal{A}}(M_2, N) & \longrightarrow & \text{Hom}_{\mathcal{A}}(M_1, N) \\ & & & & & & \swarrow \\ & & \text{Ext}_{\mathcal{A}}(M_3, N) & \longrightarrow & \text{Ext}_{\mathcal{A}}(M_2, N) & \longrightarrow & \text{Ext}_{\mathcal{A}}(M_1, N) \end{array}$$

for all objects N of \mathcal{A} , and

(2) there is a canonical six term exact sequence of abelian groups

$$\begin{array}{ccccccc}
 0 & \longrightarrow & \text{Hom}_{\mathcal{A}}(N, M_1) & \longrightarrow & \text{Hom}_{\mathcal{A}}(N, M_2) & \longrightarrow & \text{Hom}_{\mathcal{A}}(N, M_3) \\
 & & & & & & \swarrow \\
 & & \text{Ext}_{\mathcal{A}}(N, M_1) & \longrightarrow & \text{Ext}_{\mathcal{A}}(N, M_2) & \longrightarrow & \text{Ext}_{\mathcal{A}}(N, M_3)
 \end{array}$$

for all objects N of \mathcal{A} .

Proof. Omitted. Hint: The boundary maps are defined using either the pushout or pullback of the given short exact sequence. \square

12.7. Additive functors

Recall that we defined, in Categories, Definition 4.23.1 the notion of a “right exact”, “left exact” and “exact” functor in the setting of a functor between categories that have finite (co)limits. Thus this applies in particular to functors between abelian categories.

Lemma 12.7.1. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a functor.*

- (1) *If F is either left or right exact, then it is additive.*
- (2) *If F is additive then it is left exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$ is exact.*
- (3) *If F is additive then it is right exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$ is exact.*
- (4) *If F is additive then it is exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$ is exact.*

Proof. Let us first note that if F commutes with the empty limit or the empty colimit, then $F(0) = 0$. In particular F applied to the zero morphism is zero. We will use this below without mention.

Suppose that F is left exact, i.e., commutes with finite limits. Then $F(A \times A) = F(A) \times F(A)$ with projections $F(p)$ and $F(q)$. Hence $F(A \oplus A) = F(A) \oplus F(A)$ with all four morphisms $F(i), F(j), F(p), F(q)$ equal to their counterparts in \mathcal{B} as they satisfy the same relations, see Remark 12.3.6. Then $f = F(p + q)$ is a morphism $f : F(A) \oplus F(A) \rightarrow F(A)$ such that $f \circ F(i) = F(p \circ i + q \circ i) = F(\text{id}_A) = \text{id}_{F(A)}$. And similarly $f \circ F(j) = \text{id}_{F(A)}$. We conclude that $F(p + q) = F(p) + F(q)$. For any pair of morphisms $a, b : B \rightarrow A$ the map $g = F(i \circ a + j \circ b) : F(B) \rightarrow F(A) \oplus F(A)$ is a morphism such that $F(p) \circ g = F(p \circ (i \circ a + j \circ b)) = F(a)$ and similarly $F(q) \circ g = F(b)$. Hence $g = F(i) \circ F(a) + F(j) \circ F(b)$. The sum of a and b is the composition

$$B \xrightarrow{i \circ a + j \circ b} A \oplus A \xrightarrow{p+q} A.$$

Applying F we get

$$F(B) \xrightarrow{F(i) \circ F(a) + F(j) \circ F(b)} F(A) \oplus F(A) \xrightarrow{F(p) + F(q)} A.$$

where we used the expressions for f and g obtained above. Hence F is additive.¹

¹I'm sure there is an infinitely slicker proof of this.

Denote $f : B \rightarrow C$ a map from B to C . Exactness of $0 \rightarrow A \rightarrow B \rightarrow C$ just means that $A = \text{Ker}(f)$. Clearly the kernel of f is the equalizer of the two maps f and 0 from B to C . Hence if F commutes with limits, then $F(\text{Ker}(f)) = \text{Ker}(F(f))$ which exactly means that $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$ is exact.

Conversely, suppose that F is additive and transforms any short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C$ into an exact sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$. Because it is additive it commutes with direct sums and hence finite products in \mathcal{A} . To show it commutes with finite limits it therefore suffices to show that it commutes with equalizers. But equalizers in an abelian category are the same as the kernel of the difference map, hence it suffices to show that F commutes with taking kernels. Let $f : A \rightarrow B$ be a morphism. Factor f as $A \rightarrow I \rightarrow B$ with $f' : A \rightarrow I$ surjective and $i : I \rightarrow B$ injective. (This is possible by the definition of an abelian category.) Then it is clear that $\text{Ker}(f) = \text{Ker}(f')$. Also $0 \rightarrow \text{Ker}(f') \rightarrow A \rightarrow I \rightarrow 0$ and $0 \rightarrow I \rightarrow B \rightarrow B/I \rightarrow 0$ are short exact. By the condition imposed on F we see that $0 \rightarrow F(\text{Ker}(f')) \rightarrow F(A) \rightarrow F(I)$ and $0 \rightarrow F(I) \rightarrow F(B) \rightarrow F(B/I)$ are exact. Hence it is also the case that $F(\text{Ker}(f'))$ is the kernel of the map $F(A) \rightarrow F(B)$, and we win.

The proof of (3) is similar to the proof of (2). Statement (4) is a combination of (2) and (3). \square

Lemma 12.7.2. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. For every pair of objects A, B of \mathcal{A} the functor F induces an abelian group homomorphism*

$$\text{Ext}_{\mathcal{A}}(B, A) \longrightarrow \text{Ext}_{\mathcal{B}}(F(B), F(A))$$

which maps the extension E to $F(E)$.

Proof. Omitted. \square

The following lemma is used in the proof that the category of abelian sheaves on a site is abelian, where the functor b is sheafification.

Lemma 12.7.3. *Let $a : \mathcal{A} \rightarrow \mathcal{B}$ and $b : \mathcal{B} \rightarrow \mathcal{A}$ be functors. Assume that*

- (1) \mathcal{A}, \mathcal{B} are additive categories, a, b are additive functors, and a is right adjoint to b ,
- (2) \mathcal{B} is abelian and b is left exact, and
- (3) $ba \cong \text{id}_{\mathcal{A}}$.

Then \mathcal{A} is abelian.

Proof. As \mathcal{B} is abelian we see that all finite limits and colimits exist in \mathcal{B} by Lemma 12.5.5. Since b is a left adjoint we see that b is also right exact and hence exact, see Categories, Lemma 4.24.5. Let $\varphi : B_1 \rightarrow B_2$ be a morphism of \mathcal{B} . In particular, if $K = \text{Ker}(B_1 \rightarrow B_2)$, then K is the equalizer of 0 and φ and hence bK is the equalizer of 0 and $b\varphi$, hence bK is the kernel of $b\varphi$. Similarly, if $Q = \text{Coker}(B_1 \rightarrow B_2)$, then Q is the coequalizer of 0 and φ and hence bQ is the coequalizer of 0 and $b\varphi$, hence bQ is the cokernel of $b\varphi$. Thus we see that every morphism of the form $b\varphi$ in \mathcal{A} has a kernel and a cokernel. However, since $ba \cong \text{id}$ we see that every morphism of \mathcal{A} is of this form, and we conclude that kernels and cokernels exist in \mathcal{A} . In fact, the argument shows that if $\psi : A_1 \rightarrow A_2$ is a morphism then

$$\text{Ker}(\psi) = b\text{Ker}(a\psi), \quad \text{and} \quad \text{Coker}(\psi) = b\text{Coker}(a\psi).$$

Now we still have to show that $\text{Coim}(\psi) = \text{Im}(\psi)$. We do this as follows. First note that since \mathcal{A} has kernels and cokernels it has all finite limits and colimits (see proof of Lemma 12.5.5). Hence we see by Categories, Lemma 4.24.5 that a is left exact and hence transforms kernels (=equalizers) into kernels.

$$\begin{aligned}
\text{Coim}(\psi) &= \text{Coker}(\text{Ker}(\psi) \rightarrow A_1) && \text{by definition} \\
&= b\text{Coker}(a(\text{Ker}(\psi) \rightarrow A_1)) && \text{by formula above} \\
&= b\text{Coker}(\text{Ker}(a\psi) \rightarrow aA_1) && a \text{ preserves kernels} \\
&= b\text{Coim}(a\psi) && \text{by definition} \\
&= b\text{Im}(a\psi) && \mathcal{B} \text{ is abelian} \\
&= b\text{Ker}(aA_2 \rightarrow \text{Coker}(a\psi)) && \text{by definition} \\
&= \text{Ker}(baA_2 \rightarrow b\text{Coker}(a\psi)) && b \text{ preserves kernels} \\
&= \text{Ker}(A_2 \rightarrow b\text{Coker}(a\psi)) && ba = \text{id}_{\mathcal{A}} \\
&= \text{Ker}(A_2 \rightarrow \text{Coker}(\psi)) && \text{by formula above} \\
&= \text{Im}(\psi) && \text{by definition}
\end{aligned}$$

Thus the lemma holds. \square

12.8. Localization

In this section we note how Gabriel-Zisman localization interacts with the additive structure on a category.

Lemma 12.8.1. *Let \mathcal{C} be a preadditive category. Let S be a left or right multiplicative system. There exists a canonical preadditive structure on $S^{-1}\mathcal{C}$ such that the localization functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ is additive.*

Proof. We will prove this in the case S is a left multiplicative system. The case where S is a right multiplicative system is dual. Suppose that X, Y are objects of \mathcal{C} and that $\alpha, \beta : X \rightarrow Y$ are morphisms in $S^{-1}\mathcal{C}$. According to Categories, Lemma 4.25.3 we may represent these by pairs $s^{-1}f, s^{-1}g$ with common denominator s . In this case we define $\alpha + \beta$ to be the equivalence class of $s^{-1}(f + g)$. In the rest of the proof we show that this is well defined and that composition is bilinear. Once this is done it is clear that Q is an additive functor.

Let us show construction above is well defined. An abstract way of saying this is that filtered colimits of abelian groups agree with filtered colimits of sets and to use Categories, Equation (4.25.5.1). We can work this out in a bit more detail as follows. Say $s : Y \rightarrow Y_1$ and $f, g : X \rightarrow Y_1$. Suppose we have a second representation of α, β as $(s')^{-1}f', (s')^{-1}g'$ with $s' : Y \rightarrow Y_2$ and $f', g' : X \rightarrow Y_2$. By Categories, Remark 4.25.5 we can find a morphism $s_3 : Y \rightarrow Y_3$ and morphisms $a_1 : Y_1 \rightarrow Y_3$, $a_2 : Y_2 \rightarrow Y_3$ such that $a_1 \circ s = s_3 = a_2 \circ s'$ and also $a_1 \circ f = a_2 \circ f'$ and $a_1 \circ g = a_2 \circ g'$. Hence we see that $s^{-1}(f + g)$ is equivalent to

$$\begin{aligned}
s_3^{-1}(a_1 \circ (f + g)) &= s_3^{-1}(a_1 \circ f + a_1 \circ g) \\
&= s_3^{-1}(a_2 \circ f' + a_2 \circ g') \\
&= s_3^{-1}(a_2 \circ (f' + g'))
\end{aligned}$$

which is equivalent to $(s')^{-1}(f' + g')$.

Fix $s : Y \rightarrow Y'$ and $f, g : X \rightarrow Y'$ with $\alpha = s^{-1}f$ and $\beta = s^{-1}g$ as morphisms $X \rightarrow Y$ in $S^{-1}\mathcal{C}$. To show that composition is bilinear first consider the case of a morphism $\gamma : Y \rightarrow Z$ in $S^{-1}\mathcal{C}$. Say $\gamma = t^{-1}h$ for some $h : Y \rightarrow Z'$ and $t : Z \rightarrow Z'$ in S . Using LMS2 we choose morphisms $a : Y' \rightarrow Z''$ and $t' : Z' \rightarrow Z''$ in S such that $a \circ s = t' \circ h$. Picture

$$\begin{array}{ccccc}
 & & & & Z \\
 & & & & \downarrow t \\
 & & Y & \xrightarrow{h} & Z' \\
 & & \downarrow s & & \downarrow t' \\
 X & \xrightarrow{f,g} & Y' & \xrightarrow{a} & Z''
 \end{array}$$

Then $\gamma \circ \alpha = (t' \circ t)^{-1}(a \circ f)$ and $\gamma \circ \beta = (t' \circ t)^{-1}(a \circ g)$. Hence we see that $\gamma \circ (\alpha + \beta)$ is represented by $(t' \circ t)^{-1}(a \circ (f + g)) = (t' \circ t)^{-1}(a \circ f + a \circ g)$ which represents $\gamma \circ \alpha + \gamma \circ \beta$.

Finally, assume that $\delta : W \rightarrow X$ is another morphism of $S^{-1}\mathcal{C}$. Say $\delta = r^{-1}i$ for some $i : W \rightarrow X'$ and $r : X \rightarrow X'$ in S . We claim that we can find a morphism $s : Y' \rightarrow Y''$ in S and morphisms $a'', b'' : X' \rightarrow Y''$ such that the following diagram commutes

$$\begin{array}{ccccc}
 & & & & Y \\
 & & & & \downarrow s \\
 & & X & \xrightarrow{f,g,f+g} & Y' \\
 & & \downarrow s & & \downarrow s' \\
 W & \xrightarrow{i} & X' & \xrightarrow{a'',b'',a''+b''} & Y''
 \end{array}$$

Namely, using LMS2 we can first choose $s_1 : Y' \rightarrow Y_1$, $s_2 : Y' \rightarrow Y_2$ in S and $a : X' \rightarrow Y_1$, $b : X' \rightarrow Y_2$ such that $a \circ s = s_1 \circ f$ and $b \circ s = s_2 \circ f$. Then using that the category Y'/S is filtered (see Categories, Remark 4.25.5), we can find a $s' : Y' \rightarrow Y''$ and morphisms $a' : Y_1 \rightarrow Y''$, $b' : Y_2 \rightarrow Y''$ such that $s' = a' \circ s_1$ and $s' = b' \circ s_2$. Setting $a'' = a' \circ a$ and $b'' = b' \circ b$ works. At this point we see that the compositions $\alpha \circ \delta$ and $\beta \circ \delta$ are represented by $(s' \circ s)^{-1}a''$ and $(s' \circ s)^{-1}b''$. Hence $\alpha \circ \delta + \beta \circ \delta$ is represented by $(s' \circ s)^{-1}(a'' + b'')$ which by the diagram again is a representative of $(\alpha + \beta) \circ \delta$. \square

Lemma 12.8.2. *Let \mathcal{C} be an additive category. Let S be a left or right multiplicative system. Then $S^{-1}\mathcal{C}$ is an additive category and the localization functor $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$ is additive.*

Proof. By Lemma 12.8.1 we see that $S^{-1}\mathcal{C}$ is preadditive and that Q is additive. Recall that the functor Q commutes with finite colimits (resp. finite limits), see Categories, Lemmas 4.25.7 and 4.25.14. We conclude that $S^{-1}\mathcal{C}$ has a zero object and direct sums, see Lemmas 12.3.2 and 12.3.4. \square

The following lemma describes the kernel (see Definition 12.9.5) of the localization functor in case we invert a multiplicative system.

Lemma 12.8.3. *Let \mathcal{C} be an additive category. Let S be a multiplicative system. Let X be an object of \mathcal{C} . The following are equivalent*

- (1) $Q(X) = 0$ in $S^{-1}\mathcal{C}$,
- (2) there exists $Y \in \text{Ob}(\mathcal{C})$ such that $0 : X \rightarrow Y$ is an element of S , and
- (3) there exists $Z \in \text{Ob}(\mathcal{C})$ such that $0 : Z \rightarrow X$ is an element of S .

Proof. If (2) holds we see that $0 = Q(0) : Q(X) \rightarrow Q(Y)$ is an isomorphism. In the additive category $S^{-1}\mathcal{C}$ this implies that $Q(X) = 0$. Hence (2) \Rightarrow (1). Similarly, (3) \Rightarrow (1). Suppose that $Q(X) = 0$. This implies that the morphism $f : 0 \rightarrow X$ is transformed into an isomorphism in $S^{-1}\mathcal{C}$. Hence by Categories, Lemma 4.25.18 there exists a morphism $g : Z \rightarrow 0$ such that $fg \in S$. This proves (1) \Rightarrow (3). Similarly, (1) \Rightarrow (2). \square

Lemma 12.8.4. *Let \mathcal{A} be an abelian category.*

- (1) *If S is a left multiplicative system, then the category $S^{-1}\mathcal{A}$ has cokernels and the functor $Q : \mathcal{A} \rightarrow S^{-1}\mathcal{A}$ commutes with them.*
- (2) *If S is a right multiplicative system, then the category $S^{-1}\mathcal{A}$ has kernels and the functor $Q : \mathcal{A} \rightarrow S^{-1}\mathcal{A}$ commutes with them.*
- (3) *If S is a multiplicative system, then the category $S^{-1}\mathcal{A}$ is abelian and the functor $Q : \mathcal{A} \rightarrow S^{-1}\mathcal{A}$ is exact.*

Proof. Assume S is a left multiplicative system. Let $a : X \rightarrow Y$ be a morphism of $S^{-1}\mathcal{A}$. Then $a = s^{-1}f$ for some $s : Y \rightarrow Y'$ in S and $f : X \rightarrow Y'$. Since $Q(s)$ is an isomorphism we see that the existence of $\text{Coker}(a : X \rightarrow Y)$ is equivalent to the existence of $\text{Coker}(Q(f) : X \rightarrow Y')$. Since $\text{Coker}(Q(f))$ is the coequalizer of 0 and $Q(f)$ we see that $\text{Coker}(Q(f))$ is represented by $Q(\text{Coker}(f))$ by Categories, Lemma 4.25.7. This proves (1).

Part (2) is dual to part (1).

If S is a multiplicative system, then S is both a left and a right multiplicative system. Thus we see that $S^{-1}\mathcal{A}$ has kernels and cokernels and Q commutes with kernels and cokernels. To finish the proof of (3) we have to show that $\text{Coim} = \text{Im}$ in $S^{-1}\mathcal{A}$. Again using that any arrow in $S^{-1}\mathcal{A}$ is isomorphic to an arrow $Q(f)$ we see that the result follows from the result for \mathcal{A} . \square

12.9. Serre subcategories

In [Ser53, Chapter I, Section 1] a notion of a “class” of abelian groups is defined. This notion has been extended to abelian categories by many authors (in slightly different ways). We will use the following variant which is virtually identical to Serre’s original definition.

Definition 12.9.1. Let \mathcal{A} be an abelian category.

- (1) A *Serre subcategory* of \mathcal{A} is a nonempty full subcategory \mathcal{C} of \mathcal{A} such that given an exact sequence

$$A \rightarrow B \rightarrow C$$

with $A, C \in \text{Ob}(\mathcal{C})$, then also $B \in \text{Ob}(\mathcal{C})$.

- (2) A *weak Serre subcategory* of \mathcal{A} is a nonempty full subcategory \mathcal{C} of \mathcal{A} such that given an exact sequence

$$A_0 \rightarrow A_1 \rightarrow A_2 \rightarrow A_3 \rightarrow A_4$$

with A_0, A_1, A_3, A_4 in \mathcal{C} , then also A_2 in \mathcal{C} .

In some references the second notion is called a “thick” subcategory and in other references the first notion is called a “thick” subcategory. However, it seems that the notion of a Serre subcategory is universally accepted to be the one defined above. Note that in both cases the category \mathcal{C} is abelian and that the inclusion functor $\mathcal{C} \rightarrow \mathcal{A}$ is a fully faithful exact functor. Let’s characterize these types of subcategories in more detail.

Lemma 12.9.2. *Let \mathcal{A} be an abelian category. Let \mathcal{C} be a subcategory of \mathcal{A} . Then \mathcal{C} is a Serre subcategory if and only if the following conditions are satisfied:*

- (1) $0 \in \text{Ob}(\mathcal{C})$,
- (2) \mathcal{C} is a strictly full subcategory of \mathcal{A} ,
- (3) any subobject or quotient of an object of \mathcal{C} is an object of \mathcal{C} ,
- (4) if $A \in \text{Ob}(\mathcal{A})$ is an extension of objects of \mathcal{C} then also $A \in \text{Ob}(\mathcal{C})$.

Moreover, a Serre subcategory is an abelian category and the inclusion functor is exact.

Proof. Omitted. □

Lemma 12.9.3. *Let \mathcal{A} be an abelian category. Let \mathcal{C} be a subcategory of \mathcal{A} . Then \mathcal{C} is a weak Serre subcategory if and only if the following conditions are satisfied:*

- (1) $0 \in \text{Ob}(\mathcal{C})$,
- (2) \mathcal{C} is a strictly full subcategory of \mathcal{A} ,
- (3) kernels and cokernels in \mathcal{A} of morphisms between objects of \mathcal{C} are in \mathcal{C} ,
- (4) if $A \in \text{Ob}(\mathcal{A})$ is an extension of objects of \mathcal{C} then also $A \in \text{Ob}(\mathcal{C})$.

Moreover, a weak Serre subcategory is an abelian category and the inclusion functor is exact.

Proof. Omitted. □

Lemma 12.9.4. *Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Then the full subcategory of objects C of \mathcal{A} such that $F(C) = 0$ forms a Serre subcategory of \mathcal{A} .*

Proof. Omitted. □

Definition 12.9.5. Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Then the full subcategory of objects C of \mathcal{A} such that $F(C) = 0$ is called the *kernel of the functor F* , and is sometimes denoted $\text{Ker}(F)$.

Lemma 12.9.6. *Let \mathcal{A} be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a Serre subcategory. There exists an abelian category \mathcal{A}/\mathcal{C} and an exact functor*

$$F : \mathcal{A} \longrightarrow \mathcal{A}/\mathcal{C}$$

which is essentially surjective and whose kernel is \mathcal{C} . The category \mathcal{A}/\mathcal{C} and the functor F are characterized by the following universal property: For any exact functor $G : \mathcal{A} \rightarrow \mathcal{B}$ such that $\mathcal{C} \subset \text{Ker}(G)$ there exists a factorization $G = H \circ F$ for a unique exact functor $H : \mathcal{A}/\mathcal{C} \rightarrow \mathcal{B}$.

Proof. Consider the set of arrows of \mathcal{A} defined by the following formula

$$S = \{f \in \text{Arrows}(\mathcal{A}) \mid \text{Ker}(f), \text{Coker}(f) \in \text{Ob}(\mathcal{C})\}.$$

We claim that S is a multiplicative system. To prove this we have to check MS1, MS2, MS3, see Categories, Definition 4.25.1.

It is clear that identities are elements of S . Suppose that $f : A \rightarrow B$ and $g : B \rightarrow C$ are elements of S . There are exact sequences

$$\begin{array}{ccccccc} 0 & \rightarrow & \text{Ker}(f) & \rightarrow & \text{Ker}(gf) & \rightarrow & \text{Ker}(g) \\ & & \text{Coker}(f) & \rightarrow & \text{Coker}(gf) & \rightarrow & \text{Coker}(g) & \rightarrow & 0 \end{array}$$

Hence it follows that $gf \in S$. This proves MS1. (In fact, a similar argument will show that S is a saturated multiplicative system, see Categories, Definition 4.25.17.)

Consider a solid diagram

$$\begin{array}{ccc} A & \xrightarrow{g} & B \\ t \downarrow & & \downarrow s \\ C & \xrightarrow{f} & C \amalg_A B \end{array}$$

with $t \in S$. Set $W = C \amalg_A B = \text{Coker}((t, -g) : A \rightarrow C \oplus B)$. Then $\text{Ker}(t) \rightarrow \text{Ker}(s)$ is surjective and $\text{Coker}(t) \rightarrow \text{Coker}(s)$ is an isomorphism. Hence s is an element of S . This proves LMS2 and the proof of RMS2 is dual.

Finally, consider morphisms $f, g : B \rightarrow C$ and a morphism $s : A \rightarrow B$ in S such that $f \circ s = g \circ s$. This means that $(f - g) \circ s = 0$. In turn this means that $I = \text{Im}(f - g) \subset C$ is a quotient of $\text{Coker}(s)$ hence an object of \mathcal{C} . Thus $t : C \rightarrow C' = C/I$ is an element of S such that $t \circ (f - g) = 0$, i.e., such that $t \circ f = t \circ g$. This proves LMS3 and the proof of RMS3 is dual.

Having proved that S is a multiplicative system we set $\mathcal{A}/\mathcal{C} = S^{-1}\mathcal{A}$, and we set F equal to the localization functor Q . By Lemma 12.8.4 the category \mathcal{A}/\mathcal{C} is abelian and F is exact. If X is in the kernel of $F = Q$, then by Lemma 12.8.3 we see that $0 : X \rightarrow Z$ is an element of S and hence X is an object of \mathcal{C} , i.e., the kernel of F is \mathcal{C} . Finally, if G is as in the statement of the lemma, then G turns every element of S into an isomorphism. Hence we obtain the functor $H : \mathcal{A}/\mathcal{C} \rightarrow \mathcal{B}$ from the universal property of localization, see Categories, Lemma 4.25.6. \square

Lemma 12.9.7. *Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Let $\mathcal{C} = \text{Ker}(F)$. Then the induced functor $\overline{F} : \mathcal{A}/\mathcal{C} \rightarrow \mathcal{B}$ is faithful.*

Proof. This is true because the kernel of \overline{F} is zero by construction. Namely, if $f : X \rightarrow Y$ is a morphism in \mathcal{A}/\mathcal{C} such that $\overline{F}(f) = 0$, then $\text{Ker}(f) \rightarrow X$ and $Y \rightarrow \text{Coker}(f)$ are transformed into isomorphisms by \overline{F} , hence are isomorphisms by the remark on the kernel of \overline{F} . Thus $f = 0$. \square

12.10. K-groups

Definition 12.10.1. Let \mathcal{A} be an abelian category. We denote $K_0(\mathcal{A})$ the *zeroth K-group of \mathcal{A}* . It is the abelian group constructed as follows. Take the free abelian group on the objects on \mathcal{A} and for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ impose the relation $[B] - [A] - [C] = 0$.

Another way to say this is that there is a presentation

$$\bigoplus_{A \rightarrow B \rightarrow C \text{ ses}} \mathbf{Z}[A \rightarrow B \rightarrow C] \longrightarrow \bigoplus_{A \in \text{Ob}(\mathcal{A})} \mathbf{Z}[A] \longrightarrow K_0(\mathcal{A}) \longrightarrow 0$$

with $[A \rightarrow B \rightarrow C] \mapsto [B] - [A] - [C]$ of $K_0(\mathcal{A})$. The short exact sequence $0 \rightarrow 0 \rightarrow 0 \rightarrow 0 \rightarrow 0$ leads to the relation $[0] = 0$ in $K_0(\mathcal{A})$. There are no set-theoretical issues as all of our categories are “small” if not mentioned otherwise. Some examples of K -groups for categories of modules over rings were computed in Algebra, Section 10.53.

Lemma 12.10.2. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor between abelian categories. Then F induces a homomorphism of K -groups $K_0(F) : K_0(\mathcal{A}) \rightarrow K_0(\mathcal{B})$ by simply setting $K_0(F)([A]) = [F(A)]$.*

Proof. Proves itself. □

Suppose we are given an object M of an abelian category \mathcal{A} and a complex of the form

$$(12.10.2.1) \quad \dots \longrightarrow M \xrightarrow{\varphi} M \xrightarrow{\psi} M \xrightarrow{\varphi} M \longrightarrow \dots$$

In this situation we define

$$H^0(M, \varphi, \psi) = \text{Ker}(\psi)/\text{Im}(\varphi), \quad \text{and} \quad H^1(M, \varphi, \psi) = \text{Ker}(\varphi)/\text{Im}(\psi).$$

Lemma 12.10.3. *Let \mathcal{A} be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a Serre subcategory and set $\mathcal{B} = \mathcal{A}/\mathcal{C}$.*

- (1) *The exact functors $\mathcal{C} \rightarrow \mathcal{A}$ and $\mathcal{A} \rightarrow \mathcal{B}$ induce an exact sequence*

$$K_0(\mathcal{C}) \rightarrow K_0(\mathcal{A}) \rightarrow K_0(\mathcal{B}) \rightarrow 0$$

of K -groups, and

- (2) *the kernel of $K_0(\mathcal{C}) \rightarrow K_0(\mathcal{A})$ is equal to the collection of elements of the form*

$$[H^0(M, \varphi, \psi)] - [H^1(M, \varphi, \psi)]$$

where (M, φ, ψ) is a complex as in (12.10.2.1) with the property that it becomes exact in \mathcal{B} ; in other words that $H^0(M, \varphi, \psi)$ and $H^1(M, \varphi, \psi)$ are objects of \mathcal{C} .

Proof. We omit the proof of (1). The proof of (2) is in a sense completely combinatorial. First we remark that any class of the type $[H^0(M, \varphi, \psi)] - [H^1(M, \varphi, \psi)]$ is zero in $K_0(\mathcal{A})$ by the following calculation

$$\begin{aligned} 0 &= [M] - [M] \\ &= [\text{Ker}(\varphi)] + [\text{Im}(\varphi)] - [\text{Ker}(\psi)] - [\text{Im}(\psi)] \\ &= [\text{Ker}(\varphi)/\text{Im}(\psi)] - [\text{Ker}(\psi)/\text{Im}(\varphi)] \\ &= [H^1(M, \varphi, \psi)] - [H^0(M, \varphi, \psi)] \end{aligned}$$

as desired. Hence it suffices to show that any element in the kernel of $K_0(\mathcal{C}) \rightarrow K_0(\mathcal{A})$ is of this form.

Any element x in $K_0(\mathcal{C})$ can be represented as the difference $x = [P] - [Q]$ of two objects of \mathcal{C} (fun exercise). Suppose that this element maps to zero in $K_0(\mathcal{A})$. This means that there exist

- (1) a finite set $I = I^+ \amalg I^-$,
 (2) for each $i \in I$ a short exact sequence

$$0 \rightarrow A_i \rightarrow B_i \rightarrow C_i \rightarrow 0$$

in the abelian category \mathcal{A}

such that

$$[P] - [Q] = \sum_{i \in I^+} ([B_i] - [A_i] - [C_i]) - \sum_{i \in I^-} ([B_i] - [A_i] - [C_i])$$

in the free abelian group on the objects of \mathcal{A} . We can rewrite this as

$$[P] + \sum_{i \in I^+} ([A_i] + [C_i]) + \sum_{i \in I^-} [B_i] = [Q] + \sum_{i \in I^-} ([A_i] + [C_i]) + \sum_{i \in I^+} [B_i].$$

Since the right and left hand side should contain the same objects of \mathcal{A} counted with multiplicity, this means there should be a bijection τ between the terms which occur above. Set

$$T^+ = \{p\} \coprod \{a, c\} \times I^+ \coprod \{b\} \times I^-$$

and

$$T^- = \{q\} \coprod \{a, c\} \times I^- \coprod \{b\} \times I^+.$$

Set $T = T^+ \coprod T^- = \{p, q\} \coprod \{a, b, c\} \times I$. For $t \in T$ define

$$O(t) = \begin{cases} P & \text{if } t = p \\ Q & \text{if } t = q \\ A_i & \text{if } t = (a, i) \\ B_i & \text{if } t = (b, i) \\ C_i & \text{if } t = (c, i) \end{cases}$$

Hence we can view $\tau : T^+ \rightarrow T^-$ as a bijection such that $O(t) = O(\tau(t))$ for all $t \in T^+$. Let $t_0^- = \tau(p)$ and let $t_0^+ \in T^+$ be the unique element such that $\tau(t_0^+) = q$. Consider the object

$$M^+ = \bigoplus_{t \in T^+} O(t)$$

By using τ we see that it is equal to the object

$$M^- = \bigoplus_{t \in T^-} O(t)$$

Consider the map

$$\varphi : M^+ \longrightarrow M^-$$

which on the summand $O(t) = A_i$ corresponding to $t = (a, i)$, $i \in I^+$ uses the map $A_i \rightarrow B_i$ into the summand $O((b, i)) = B_i$ of M^- and on the summand $O(t) = B_i$ corresponding to (b, i) , $i \in I^-$ uses the map $B_i \rightarrow C_i$ into the summand $O((c, i)) = C_i$ of M^- . The map is zero on the summands corresponding to p and (c, i) , $i \in I^+$. Similarly, consider the map

$$\psi : M^- \longrightarrow M^+$$

which on the summand $O(t) = A_i$ corresponding to $t = (a, i)$, $i \in I^-$ uses the map $A_i \rightarrow B_i$ into the summand $O((b, i)) = B_i$ of M^+ and on the summand $O(t) = B_i$ corresponding to (b, i) , $i \in I^+$ uses the map $B_i \rightarrow C_i$ into the summand $O((c, i)) = C_i$ of M^+ . The map is zero on the summands corresponding to q and (c, i) , $i \in I^-$.

Note that the kernel of φ is equal to the direct sum of the summand P and the summands $O((c, i)) = C_i$, $i \in I^+$ and the subobjects A_i inside the summands $O((b, i)) = B_i$, $i \in I^-$. The image of ψ is equal to the direct sum of the summands $O((c, i)) = C_i$, $i \in I^+$ and the subobjects A_i inside the summands $O((b, i)) = B_i$, $i \in I^-$. In other words we see that

$$P \cong \text{Ker}(\varphi)/\text{Im}(\psi).$$

In exactly the same way we see that

$$Q \cong \text{Ker}(\psi)/\text{Im}(\varphi).$$

Since as we remarked above the existence of the bijection τ shows that $M^+ = M^-$ we see that the lemma follows. \square

12.11. Cohomological delta-functors

Definition 12.11.1. Let \mathcal{A}, \mathcal{B} be abelian categories. A *cohomological δ -functor* or simply a *δ -functor* from \mathcal{A} to \mathcal{B} is given by the following data:

- (1) a collection $F^n : \mathcal{A} \rightarrow \mathcal{B}$, $n \geq 0$ of additive functors, and
- (2) for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of \mathcal{A} a collection $\delta_{A \rightarrow B \rightarrow C} : F^n(C) \rightarrow F^{n+1}(A)$, $n \geq 0$ of morphisms of \mathcal{B} .

These data are assumed to satisfy the following axioms

- (1) for every short exact sequence as above the sequence

$$\begin{array}{ccccccc} 0 & \longrightarrow & F^0(A) & \longrightarrow & F^0(B) & \longrightarrow & F^0(C) \\ & & & & & \searrow & \delta_{A \rightarrow B \rightarrow C} \\ & & F^1(A) & \longrightarrow & F^1(B) & \longrightarrow & F^1(C) \\ & & & & & \searrow & \delta_{A \rightarrow B \rightarrow C} \\ & & F^2(A) & \longrightarrow & F^2(B) & \longrightarrow & \dots \end{array}$$

is exact, and

- (2) for every morphism $(A \rightarrow B \rightarrow C) \rightarrow (A' \rightarrow B' \rightarrow C')$ of short exact sequences of \mathcal{A} the diagrams

$$\begin{array}{ccc} F^n(C) & \xrightarrow{\delta_{A \rightarrow B \rightarrow C}} & F^{n+1}(A) \\ \downarrow & & \downarrow \\ F^n(C') & \xrightarrow{\delta_{A' \rightarrow B' \rightarrow C'}} & F^{n+1}(A') \end{array}$$

are commutative.

Note that this in particular implies that F^0 is left exact.

Definition 12.11.2. Let \mathcal{A}, \mathcal{B} be abelian categories. Let (F^n, δ_F) and (G^n, δ_G) be δ -functors from \mathcal{A} to \mathcal{B} . A *morphism of δ -functors* from F to G is a collection of transformation of functors $t^n : F^n \rightarrow G^n$, $n \geq 0$ such that for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of \mathcal{A} the diagrams

$$\begin{array}{ccc} F^n(C) & \xrightarrow{\delta_{F, A \rightarrow B \rightarrow C}} & F^{n+1}(A) \\ t^n \downarrow & & \downarrow t^{n+1} \\ G^n(C) & \xrightarrow{\delta_{G, A \rightarrow B \rightarrow C}} & G^{n+1}(A) \end{array}$$

are commutative.

Definition 12.11.3. Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F = (F^n, \delta_F)$ be a δ -functor from \mathcal{A} to \mathcal{B} . We say F is a *universal δ -functor* if and only if for every

δ -functor $G = (G^n, \delta_G)$ and any morphism of functors $t : F^0 \rightarrow G^0$ there exists a unique morphism of δ -functors $\{t^n\}_{n \geq 0} : F \rightarrow G$ such that $t = t^0$.

Lemma 12.11.4. *Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F = (F^n, \delta_F)$ be a δ -functor from \mathcal{A} to \mathcal{B} . Suppose that for every $n > 0$ and any $A \in \text{Ob}(\mathcal{A})$ there exists an injective morphism $u : A \rightarrow B$ (depending on A and n) such that $F^n(u) : F^n(A) \rightarrow F^n(B)$ is zero. Then F is a universal δ -functor.*

Proof. Let $G = (G^n, \delta_G)$ be a δ -functor from \mathcal{A} to \mathcal{B} and let $t : F^0 \rightarrow G^0$ be a morphism of functors. We have to show there exists a unique morphism of δ -functors $\{t^n\}_{n \geq 0} : F \rightarrow G$ such that $t = t^0$. We construct t^n by induction on n . For $n = 0$ we set $t^0 = t$. Suppose we have already constructed a unique sequence of transformation of functors t^i for $i \leq n$ compatible with the maps δ in degrees $\leq n$.

Let $A \in \text{Ob}(\mathcal{A})$. By assumption we may choose an embedding $u : A \rightarrow B$ such that $F^{n+1}(u) = 0$. Let $C = B/u(A)$. The long exact cohomology sequence for the short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ and the δ -functor F gives that $F^{n+1}(A) = \text{Coker}(F^n(B) \rightarrow F^n(C))$ by our choice of u . Since we have already defined t^n we can set

$$t_A^{n+1} : F^{n+1}(A) \rightarrow G^{n+1}(A)$$

equal to the unique map such that

$$\begin{array}{ccc} \text{Coker}(F^n(B) \rightarrow F^n(C)) & \xrightarrow{t^n} & \text{Coker}(G^n(B) \rightarrow G^n(C)) \\ \delta_{F, A \rightarrow B \rightarrow C} \downarrow & & \downarrow \delta_{G, A \rightarrow B \rightarrow C} \\ F^{n+1}(A) & \xrightarrow{t_A^{n+1}} & G^{n+1}(A) \end{array}$$

commutes. This is clearly uniquely determined by the requirements imposed. We omit the verification that this defines a transformation of functors. \square

Lemma 12.11.5. *Let \mathcal{A}, \mathcal{B} be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a functor. If there exists a universal δ -functor (F^n, δ_F) from \mathcal{A} to \mathcal{B} with $F^0 = F$, then it is determined up to unique isomorphism of δ -functors.*

Proof. Immediate from the definitions. \square

12.12. Complexes

Of course the notions of a chain complex and a cochain complex are dual and you only have to read one of the two parts of this section. So pick the one you like. (Actually, this doesn't quite work right since the conventions on numbering things are not adapted to an easy transition between chain and cochain complexes.)

A *chain complex* A_\bullet in an additive category \mathcal{A} is a complex

$$\dots \rightarrow A_{n+1} \xrightarrow{d_{n+1}} A_n \xrightarrow{d_n} A_{n-1} \rightarrow \dots$$

of \mathcal{A} . In other words, we are given an object A_i of \mathcal{A} for all $i \in \mathbf{Z}$ and for all $i \in \mathbf{Z}$ a morphism $d_i : A_i \rightarrow A_{i-1}$ such that $d_{i-1} \circ d_i = 0$ for all i . A *morphism of chain complexes* $f : A_\bullet \rightarrow B_\bullet$ is given by a family of morphisms $f_i : A_i \rightarrow B_i$ such that

all the diagrams

$$\begin{array}{ccc} A_i & \xrightarrow{d_i} & A_{i-1} \\ f_i \downarrow & & \downarrow f_{i-1} \\ B_i & \xrightarrow{d_i} & B_{i-1} \end{array}$$

commute. The *category of chain complexes of \mathcal{A}* is denoted $\text{Ch}(\mathcal{A})$. The full subcategory consisting of objects of the form

$$\dots \rightarrow A_2 \rightarrow A_1 \rightarrow A_0 \rightarrow 0 \rightarrow 0 \rightarrow \dots$$

is denoted $\text{Ch}_{\geq 0}(\mathcal{A})$. In other words, a chain complex A_{\bullet} belongs to $\text{Ch}_{\geq 0}(\mathcal{A})$ if and only if $A_i = 0$ for all $i < 0$. A *homotopy* h between a pair of morphisms of chain complexes $f, g : A_{\bullet} \rightarrow B_{\bullet}$ is a collection of morphisms $h_i : A_i \rightarrow B_{i+1}$ such that we have

$$f_i - g_i = d_{i+1} \circ h_i + h_{i-1} \circ d_i$$

for all i . Clearly, the notions of chain complex, morphism of chain complexes, and homotopies between morphisms of chain complexes makes sense even in a preadditive category.

Lemma 12.12.1. *Let \mathcal{A} be an additive category. Let $f, g : B_{\bullet} \rightarrow C_{\bullet}$ be morphisms of chain complexes. Suppose given morphisms of chain complexes $a : A_{\bullet} \rightarrow B_{\bullet}$, and $c : C_{\bullet} \rightarrow D_{\bullet}$. If $\{h_i : B_i \rightarrow C_{i+1}\}$ defines a homotopy between f and g , then $\{c_{i+1} \circ h_i \circ a_i\}$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.*

Proof. Omitted. □

In particular this means that it makes sense to define the category of chain complexes with maps up to homotopy. We'll return to this later.

Definition 12.12.2. Let \mathcal{A} be an additive category. We say a morphism $a : A_{\bullet} \rightarrow B_{\bullet}$ is a *homotopy equivalence* if there exists a morphism $b : B_{\bullet} \rightarrow A_{\bullet}$ such that there exists a homotopy between $a \circ b$ and id_B and there exists a homotopy between $b \circ a$ and id_A . If there exists such a morphism between A_{\bullet} and B_{\bullet} , then we say that A_{\bullet} and B_{\bullet} are *homotopy equivalent*.

In other words, two complexes are homotopy equivalent if they become isomorphic in the category of complexes up to homotopy.

Lemma 12.12.3. *Let \mathcal{A} be an abelian category.*

- (1) *The category of chain complexes in \mathcal{A} is abelian.*
- (2) *A morphism of complexes $f : A_{\bullet} \rightarrow B_{\bullet}$ is injective if and only if each $f_n : A_n \rightarrow B_n$ is injective.*
- (3) *A morphism of complexes $f : A_{\bullet} \rightarrow B_{\bullet}$ is surjective if and only if each $f_n : A_n \rightarrow B_n$ is surjective.*
- (4) *A sequence of chain complexes*

$$A_{\bullet} \xrightarrow{f} B_{\bullet} \xrightarrow{g} C_{\bullet}$$

is exact at B_{\bullet} if and only if each sequence

$$A_i \xrightarrow{f_i} B_i \xrightarrow{g_i} C_i$$

is exact at B_i .

Proof. Omitted. □

For any $i \in \mathbf{Z}$ the i th homology group of a chain complex A_\bullet in an abelian category is defined by the following formula

$$H_i(A_\bullet) = \text{Ker}(d_i) / \text{Im}(d_{i+1}).$$

If $f : A_\bullet \rightarrow B_\bullet$ is a morphism of chain complexes of \mathcal{A} then we get an induced morphism $H_i(f) : H_i(A_\bullet) \rightarrow H_i(B_\bullet)$ because clearly $f_i(\text{Ker}(d_i : A_i \rightarrow A_{i-1})) \subset \text{Ker}(d_i : B_i \rightarrow B_{i-1})$, and similarly for $\text{Im}(d_{i+1})$. Thus we obtain a functor

$$H_i : \text{Ch}(\mathcal{A}) \rightarrow \mathcal{A}.$$

Definition 12.12.4. Let \mathcal{A} be an abelian category.

- (1) A morphism of chain complexes $f : A_\bullet \rightarrow B_\bullet$ is called a *quasi-isomorphism* if the induced maps $H_i(f) : H_i(A_\bullet) \rightarrow H_i(B_\bullet)$ is an isomorphism for all $i \in \mathbf{Z}$.
- (2) A chain complex A_\bullet is called *acyclic* if all of its homology objects $H_i(A_\bullet)$ are zero.

Lemma 12.12.5. Let \mathcal{A} be an abelian category.

- (1) If the maps $f, g : A_\bullet \rightarrow B_\bullet$ are homotopic, then the induced maps $H_i(f)$ and $H_i(g)$ are equal.
- (2) If the map $f : A_\bullet \rightarrow B_\bullet$ is a homotopy equivalence, then f is a quasi-isomorphism.

Proof. Omitted. □

Lemma 12.12.6. Let \mathcal{A} be an abelian category. Suppose that

$$0 \rightarrow A_\bullet \rightarrow B_\bullet \rightarrow C_\bullet \rightarrow 0$$

is a short exact sequence of chain complexes of \mathcal{A} . Then there is a canonical long exact homology sequence

$$\begin{array}{ccccccc}
 & \dots & & \dots & & & \dots \\
 & & \swarrow & & \searrow & & \\
 H_i(A_\bullet) & \xrightarrow{\quad} & H_i(B_\bullet) & \xrightarrow{\quad} & H_i(C_\bullet) & & \\
 & & \swarrow & & \searrow & & \\
 H_{i-1}(A_\bullet) & \xrightarrow{\quad} & H_{i-1}(B_\bullet) & \xrightarrow{\quad} & H_{i-1}(C_\bullet) & & \\
 & & \swarrow & & \searrow & & \\
 \dots & & \dots & & \dots & &
 \end{array}$$

Proof. Omitted. The maps come from the Snake Lemma 12.5.17 applied to the diagrams

$$\begin{array}{ccccccc}
 A_i / \text{Im}(d_{A,i+1}) & \longrightarrow & B_i / \text{Im}(d_{B,i+1}) & \longrightarrow & C_i / \text{Im}(d_{C,i+1}) & \longrightarrow & 0 \\
 \downarrow d_{A,i} & & \downarrow d_{B,i} & & \downarrow d_{C,i} & & \\
 0 \longrightarrow & \text{Ker}(d_{A,i-1}) & \longrightarrow & \text{Ker}(d_{B,i-1}) & \longrightarrow & \text{Ker}(d_{C,i-1}) &
 \end{array}$$

□

A *cochain complex* A^\bullet in an additive category \mathcal{A} is a complex

$$\dots \rightarrow A^{n-1} \xrightarrow{d^{n-1}} A^n \xrightarrow{d^n} A^{n+1} \rightarrow \dots$$

of \mathcal{A} . In other words, we are given an object A^i of \mathcal{A} for all $i \in \mathbf{Z}$ and for all $i \in \mathbf{Z}$ a morphism $d^i : A^i \rightarrow A^{i+1}$ such that $d^{i+1} \circ d^i = 0$ for all i . A *morphism of cochain complexes* $f : A^\bullet \rightarrow B^\bullet$ is given by a family of morphisms $f^i : A^i \rightarrow B^i$ such that all the diagrams

$$\begin{array}{ccc} A^i & \xrightarrow{d^i} & A^{i+1} \\ f^i \downarrow & & \downarrow f^{i+1} \\ B^i & \xrightarrow{d^i} & B^{i+1} \end{array}$$

commute. The *category of cochain complexes* of \mathcal{A} is denoted $\text{CoCh}(\mathcal{A})$. The full subcategory consisting of objects of the form

$$\dots \rightarrow 0 \rightarrow 0 \rightarrow A^0 \rightarrow A^1 \rightarrow A^2 \rightarrow \dots$$

is denoted $\text{CoCh}_{\geq 0}(\mathcal{A})$. In other words, a cochain complex A^\bullet belongs to the subcategory $\text{CoCh}_{\geq 0}(\mathcal{A})$ if and only if $A^i = 0$ for all $i < 0$. A *homotopy* h between a pair of morphisms of cochain complexes $f, g : A^\bullet \rightarrow B^\bullet$ is a collection of morphisms $h^i : A^i \rightarrow B^{i-1}$ such that we have

$$f^i - g^i = d^{i-1} \circ h^i + h^{i+1} \circ d^i$$

for all i . Clearly, the notions of cochain complex, morphism of cochain complexes, and homotopies between morphisms of cochain complexes makes sense even in a preadditive category.

Lemma 12.12.7. *Let \mathcal{A} be an additive category. Let $f, g : B^\bullet \rightarrow C^\bullet$ be morphisms of cochain complexes. Suppose given morphisms of cochain complexes $a : A^\bullet \rightarrow B^\bullet$, and $c : C^\bullet \rightarrow D^\bullet$. If $\{h^i : B^i \rightarrow C^{i-1}\}$ defines a homotopy between f and g , then $\{c^{i-1} \circ h^i \circ a^i\}$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.*

Proof. Omitted. □

In particular this means that it makes sense to define the category of cochain complexes with maps up to homotopy. We'll return to this later.

Definition 12.12.8. Let \mathcal{A} be an additive category. We say a morphism $a : A^\bullet \rightarrow B^\bullet$ is a *homotopy equivalence* if there exists a morphism $b : B^\bullet \rightarrow A^\bullet$ such that there exists a homotopy between $a \circ b$ and id_B and there exists a homotopy between $b \circ a$ and id_A . If there exists such a morphism between A^\bullet and B^\bullet , then we say that A^\bullet and B^\bullet are *homotopy equivalent*.

In other words, two complexes are homotopy equivalent if they become isomorphic in the category of complexes up to homotopy.

Lemma 12.12.9. *Let \mathcal{A} be an abelian category.*

- (1) *The category of cochain complexes in \mathcal{A} is abelian.*
- (2) *A morphism of cochain complexes $f : A^\bullet \rightarrow B^\bullet$ is injective if and only if each $f^n : A^n \rightarrow B^n$ is injective.*
- (3) *A morphism of cochain complexes $f : A^\bullet \rightarrow B^\bullet$ is surjective if and only if each $f^n : A^n \rightarrow B^n$ is surjective.*

(4) A sequence of cochain complexes

$$A^\bullet \xrightarrow{f} B^\bullet \xrightarrow{g} C^\bullet$$

is exact at B^\bullet if and only if each sequence

$$A^i \xrightarrow{f^i} B^i \xrightarrow{g^i} C^i$$

is exact at B^i .

Proof. Omitted. \square

For any $i \in \mathbf{Z}$ the i th cohomology group of a cochain complex A^\bullet is defined by the following formula

$$H^i(A^\bullet) = \text{Ker}(d^i) / \text{Im}(d^{i-1}).$$

If $f : A^\bullet \rightarrow B^\bullet$ is a morphism of cochain complexes of \mathcal{A} then we get an induced morphism $H^i(f) : H^i(A^\bullet) \rightarrow H^i(B^\bullet)$ because clearly $f^i(\text{Ker}(d^i : A^i \rightarrow A^{i+1})) \subset \text{Ker}(d^i : B^i \rightarrow B^{i+1})$, and similarly for $\text{Im}(d^{i-1})$. Thus we obtain a functor

$$H^i : \text{CoCh}(\mathcal{A}) \longrightarrow \mathcal{A}.$$

Definition 12.12.10. Let \mathcal{A} be an abelian category.

- (1) A morphism of cochain complexes $f : A^\bullet \rightarrow B^\bullet$ of \mathcal{A} is called a *quasi-isomorphism* if the induced maps $H^i(f) : H^i(A^\bullet) \rightarrow H^i(B^\bullet)$ is an isomorphism for all $i \in \mathbf{Z}$.
- (2) A cochain complex A^\bullet is called *acyclic* if all of its cohomology objects $H^i(A^\bullet)$ are zero.

Lemma 12.12.11. Let \mathcal{A} be an abelian category.

- (1) If the maps $f, g : A^\bullet \rightarrow B^\bullet$ are homotopic, then the induced maps $H^i(f)$ and $H^i(g)$ are equal.
- (2) If $f : A^\bullet \rightarrow B^\bullet$ is a homotopy equivalence, then f is a quasi-isomorphism.

Proof. Omitted. \square

Lemma 12.12.12. Let \mathcal{A} be an abelian category. Suppose that

$$0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$$

is a short exact sequence of chain complexes of \mathcal{A} . Then there is a canonical long exact homology sequence

$$\begin{array}{ccccccc}
 & \dots & & \dots & & \dots & \\
 & & \swarrow & & \searrow & & \\
 & & H^i(A^\bullet) & \xrightarrow{\quad} & H^i(B^\bullet) & \xrightarrow{\quad} & H^i(C^\bullet) \\
 & & \swarrow & & \searrow & & \\
 & & H^{i+1}(A^\bullet) & \xrightarrow{\quad} & H^{i+1}(B^\bullet) & \xrightarrow{\quad} & H^{i+1}(C^\bullet) \\
 & \dots & & \dots & & \dots &
 \end{array}$$

Proof. Omitted. The maps come from the Snake Lemma 12.5.17 applied to the diagrams

$$\begin{array}{ccccccc}
 A^i/\text{Im}(d_A^{i-1}) & \longrightarrow & B^i/\text{Im}(d_B^{i-1}) & \longrightarrow & C^i/\text{Im}(d_C^{i-1}) & \longrightarrow & 0 \\
 \downarrow d_A^i & & \downarrow d_B^i & & \downarrow d_C^i & & \\
 0 & \longrightarrow & \text{Ker}(d_A^{i+1}) & \longrightarrow & \text{Ker}(d_B^{i+1}) & \longrightarrow & \text{Ker}(d_C^{i+1})
 \end{array}$$

□

12.13. Truncation of complexes

Let \mathcal{A} be an abelian category. Let A_\bullet be a chain complex. There are several ways to *truncate* the complex A_\bullet .

- (1) The “*stupid*” truncation $\sigma_{\leq n}$ is the subcomplex $\sigma_{\leq n}A_\bullet$ defined by the rule $(\sigma_{\leq n}A_\bullet)_i = 0$ if $i > n$ and $(\sigma_{\leq n}A_\bullet)_i = A_i$ if $i \leq n$. In a picture

$$\begin{array}{ccccccccccc}
 \sigma_{\leq n}A_\bullet & & \dots & \longrightarrow & 0 & \longrightarrow & A_n & \longrightarrow & A_{n-1} & \longrightarrow & \dots \\
 \downarrow & & & & \downarrow & & \downarrow & & \downarrow & & \\
 A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & A_n & \longrightarrow & A_{n-1} & \longrightarrow & \dots
 \end{array}$$

Note the property $\sigma_{\leq n}A_\bullet / \sigma_{\leq n-1}A_\bullet = A_n[-n]$.

- (2) The “*stupid*” truncation $\sigma_{\geq n}$ is the quotient complex $\sigma_{\geq n}A_\bullet$ defined by the rule $(\sigma_{\geq n}A_\bullet)_i = A_i$ if $i \geq n$ and $(\sigma_{\geq n}A_\bullet)_i = 0$ if $i < n$. In a picture

$$\begin{array}{ccccccccccc}
 A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & A_n & \longrightarrow & A_{n-1} & \longrightarrow & \dots \\
 \downarrow & & & & \downarrow & & \downarrow & & \downarrow & & \\
 \sigma_{\geq n}A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & A_n & \longrightarrow & 0 & \longrightarrow & \dots
 \end{array}$$

The map of complexes $\sigma_{\geq n}A_\bullet \rightarrow \sigma_{\geq n+1}A_\bullet$ is surjective with kernel $A_n[-n]$.

- (3) The *canonical truncation* $\tau_{\geq n}A_\bullet$ is defined by the picture

$$\begin{array}{ccccccccccc}
 \tau_{\geq n}A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & \text{Ker}(d_n) & \longrightarrow & 0 & \longrightarrow & \dots \\
 \downarrow & & & & \downarrow & & \downarrow & & \downarrow & & \\
 A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & A_n & \longrightarrow & A_{n-1} & \longrightarrow & \dots
 \end{array}$$

Note that these complexes have the property that

$$H_i(\tau_{\geq n}A_\bullet) = \begin{cases} H_i(A_\bullet) & \text{if } i \geq n \\ 0 & \text{if } i < n \end{cases}$$

- (4) The *canonical truncation* $\tau_{\leq n}A_\bullet$ is defined by the picture

$$\begin{array}{ccccccccccc}
 A_\bullet & & \dots & \longrightarrow & A_{n+1} & \longrightarrow & A_n & \longrightarrow & A_{n-1} & \longrightarrow & \dots \\
 \downarrow & & & & \downarrow & & \downarrow & & \downarrow & & \\
 \tau_{\leq n}A_\bullet & & \dots & \longrightarrow & 0 & \longrightarrow & \text{Coker}(d_{n+1}) & \longrightarrow & A_{n-1} & \longrightarrow & \dots
 \end{array}$$

Note that these complexes have the property that

$$H_i(\tau_{\leq n}A^\bullet) = \begin{cases} H_i(A^\bullet) & \text{if } i \leq n \\ 0 & \text{if } i > n \end{cases}$$

Let \mathcal{A} be an abelian category. Let A^\bullet be a cochain complex. There are four ways to truncate the complex A^\bullet .

- (1) The “stupid” truncation $\sigma_{\geq n}$ is the subcomplex $\sigma_{\geq n}A^\bullet$ defined by the rule $(\sigma_{\geq n}A^\bullet)^i = 0$ if $i < n$ and $(\sigma_{\geq n}A^\bullet)^i = A_i$ if $i \geq n$. In a picture

$$\begin{array}{ccccccc} \sigma_{\geq n}A^\bullet & \cdots & \longrightarrow & 0 & \longrightarrow & A^n & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \\ \downarrow & & & \downarrow & & \downarrow & & \downarrow & & \\ A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & A^n & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \end{array}$$

Note the property $\sigma_{\geq n}A^\bullet / \sigma_{\geq n+1}A^\bullet = A^n[-n]$.

- (2) The “stupid” truncation $\sigma_{\leq n}$ is the quotient complex $\sigma_{\leq n}A^\bullet$ defined by the rule $(\sigma_{\leq n}A^\bullet)^i = 0$ if $i > n$ and $(\sigma_{\leq n}A^\bullet)^i = A^i$ if $i \leq n$. In a picture

$$\begin{array}{ccccccc} A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & A^n & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \\ \downarrow & & & \downarrow & & \downarrow & & \downarrow & & \\ \sigma_{\leq n}A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & A^n & \longrightarrow & 0 & \longrightarrow & \cdots \end{array}$$

The map of complexes $\sigma_{\leq n}A^\bullet \rightarrow \sigma_{\leq n-1}A^\bullet$ is surjective with kernel $A^n[-n]$.

- (3) The canonical truncation $\tau_{\leq n}A^\bullet$ is defined by the picture

$$\begin{array}{ccccccc} \tau_{\leq n}A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & \text{Ker}(d^n) & \longrightarrow & 0 & \longrightarrow & \cdots \\ \downarrow & & & \downarrow & & \downarrow & & \downarrow & & \\ A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & A^n & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \end{array}$$

Note that these complexes have the property that

$$H^i(\tau_{\leq n}A^\bullet) = \begin{cases} H^i(A^\bullet) & \text{if } i \leq n \\ 0 & \text{if } i > n \end{cases}$$

- (4) The canonical truncation $\tau_{\geq n}A^\bullet$ is defined by the picture

$$\begin{array}{ccccccc} A^\bullet & \cdots & \longrightarrow & A^{n-1} & \longrightarrow & A^n & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \\ \downarrow & & & \downarrow & & \downarrow & & \downarrow & & \\ \tau_{\geq n}A^\bullet & \cdots & \longrightarrow & 0 & \longrightarrow & \text{Coker}(d^{n-1}) & \longrightarrow & A^{n+1} & \longrightarrow & \cdots \end{array}$$

Note that these complexes have the property that

$$H^i(\tau_{\geq n}A^\bullet) = \begin{cases} 0 & \text{if } i < n \\ H^i(A^\bullet) & \text{if } i \geq n \end{cases}$$

12.14. Homotopy and the shift functor

It is an annoying feature that signs and indices have to be part of any discussion of homological algebra².

²I am sure you think that my conventions are wrong. If so and if you feel strongly about it then drop me an email with an explanation.

Definition 12.14.1. Let \mathcal{A} be an additive category. Let A_\bullet be a chain complex with boundary maps $d_{A,n} : A_n \rightarrow A_{n-1}$. For any $k \in \mathbf{Z}$ we define the k -shifted chain complex $A[k]_\bullet$ as follows:

- (1) we set $A[k]_n = A_{n+k}$, and
- (2) we set $d_{A[k],n} : A[k]_n \rightarrow A[k]_{n-1}$ equal to $d_{A[k],n} = (-1)^k d_{A,n+k}$.

If $f : A_\bullet \rightarrow B_\bullet$ is a morphism of chain complexes, then we let $f[k] : A[k]_\bullet \rightarrow B[k]_\bullet$ be the morphism of chain complexes with $f[k]_n = f_{k+n}$.

Of course this means we have functors $[k] : \text{Ch}(\mathcal{A}) \rightarrow \text{Ch}(\mathcal{A})$ which mutually commute (on the nose, without any intervening isomorphisms of functors), such that $A[k][l]_\bullet = A[k+l]_\bullet$ and with $[0] = \text{id}_{\text{Ch}(\mathcal{A})}$.

Definition 12.14.2. Let \mathcal{A} be an abelian category. Let A_\bullet be a chain complex with boundary maps $d_{A,n} : A_n \rightarrow A_{n-1}$. For any $k \in \mathbf{Z}$ we identify $H_{i+k}(A_\bullet) \rightarrow H_i(A[k]_\bullet)$ via the identification $A_{i+k} = A[k]_i$.

This identification is functorial in A_\bullet . Note that since no signs are involved in this definition we actually get a compatible system of identifications of all the homology objects $H_{i-k}(A[k]_\bullet)$, which are further compatible with the identifications $A[k][l]_\bullet = A[k+l]_\bullet$ and with $[0] = \text{id}_{\text{Ch}(\mathcal{A})}$.

Let \mathcal{A} be an additive category. Suppose that A_\bullet and B_\bullet are chain complexes, $a, b : A_\bullet \rightarrow B_\bullet$ are morphisms of chain complexes, and $\{h_i : A_i \rightarrow B_{i+1}\}$ is a homotopy between a and b . Recall that this means that $a_i - b_i = d_{i+1} \circ h_i + h_{i-1} \circ d_i$. What if $a = b$? Then we obtain the formula $0 = d_{i+1} \circ h_i + h_{i-1} \circ d_i$, in other words, $-d_{i+1} \circ h_i = h_{i-1} \circ d_i$. By definition above this means the collection $\{h_i\}$ above defines a morphism of chain complexes

$$A_\bullet \longrightarrow B[1]_\bullet.$$

Such a thing is the same as a morphism $A[-1]_\bullet \rightarrow B_\bullet$ by our remarks above. This proves the following lemma.

Lemma 12.14.3. *Let \mathcal{A} be an additive category. Suppose that A_\bullet and B_\bullet are chain complexes. Given any morphism of chain complexes $a : A_\bullet \rightarrow B_\bullet$, there is a bijection between the set of homotopies from a to a and $\text{Mor}_{\text{Ch}(\mathcal{A})}(A_\bullet, B[1]_\bullet)$. More generally, the set of homotopies between a and b is either empty or a principal homogeneous space under the group $\text{Mor}_{\text{Ch}(\mathcal{A})}(A_\bullet, B[1]_\bullet)$.*

Proof. See above. □

Lemma 12.14.4. *Let \mathcal{A} be an abelian category. Let*

$$0 \rightarrow A_\bullet \rightarrow B_\bullet \rightarrow C_\bullet \rightarrow 0$$

be a sort exact sequence of complexes. Suppose that $\{s_n : C_n \rightarrow B_n\}$ is a family of morphisms which split the short exact sequences $0 \rightarrow A_n \rightarrow B_n \rightarrow C_n \rightarrow 0$. Let $\pi_n : B_n \rightarrow A_n$ be the associated projections, see Lemma 12.5.10. Then the family of morphisms

$$\pi_{n-1} \circ d_{B,n} \circ s_n : C_n \rightarrow A_{n-1}$$

define a morphism of complexes $\delta(s) : C_\bullet \rightarrow A[-1]_\bullet$.

Proof. Denote $i : A_\bullet \rightarrow B_\bullet$ and $q : B_\bullet \rightarrow C_\bullet$ the maps of complexes in the short exact sequence. Then $i_{n-1} \circ \pi_{n-1} \circ d_{B,n} \circ s_n = d_{B,n} \circ s_n - s_{n-1} \circ d_{C,n}$. Hence $i_{n-2} \circ d_{A,n-1} \circ \pi_{n-1} \circ d_{B,n} \circ s_n = d_{B,n-1} \circ (d_{B,n} \circ s_n - s_{n-1} \circ d_{C,n}) = -d_{B,n-1} \circ s_{n-1} \circ d_{C,n}$ as desired. \square

Lemma 12.14.5. *Notation and assumptions as in Lemma 12.14.4 above. The morphism of complexes $\delta(s) : C_\bullet \rightarrow A[-1]_\bullet$ induces the maps*

$$H_i(\delta(s)) : H_i(C_\bullet) \longrightarrow H_i(A[-1]_\bullet) = H_{i-1}(A_\bullet)$$

which occur in the long exact homology sequence associated to the short exact sequence of chain complexes by Lemma 12.12.6.

Proof. Omitted. \square

Lemma 12.14.6. *Notation and assumptions as in Lemma 12.14.4 above. Suppose $\{s'_n : C_n \rightarrow B_n\}$ is a second choice of splittings. Write $s'_n = s_n + i_n \circ h_n$ for some unique morphisms $h_n : C_n \rightarrow A_n$. The family of maps $\{h_n : C_n \rightarrow A[-1]_{n+1}\}$ is a homotopy between the associated morphisms $\delta(s), \delta(s') : C_\bullet \rightarrow A[-1]_\bullet$.*

Proof. Omitted. \square

Definition 12.14.7. Let \mathcal{A} be an additive category. Let A^\bullet be a cochain complex with boundary maps $d_A^n : A^n \rightarrow A^{n+1}$. For any $k \in \mathbf{Z}$ we define the k -shifted cochain complex $A[k]^\bullet$ as follows:

- (1) we set $A[k]^n = A^{n+k}$, and
- (2) we set $d_{A[k]}^n : A[k]^n \rightarrow A[k]^{n+1}$ equal to $d_{A[k]}^n = (-1)^k d_A^{n+k}$.

If $f : A^\bullet \rightarrow B^\bullet$ is a morphism of cochain complexes, then we let $f[k] : A[k]^\bullet \rightarrow B[k]^\bullet$ be the morphism of cochain complexes with $f[k]^n = f^{k+n}$.

Of course this means we have functors $[k] : \text{CoCh}(\mathcal{A}) \rightarrow \text{CoCh}(\mathcal{A})$ which mutually commute (on the nose, without any intervening isomorphisms of functors) and such that $A[k][l]^\bullet = A[k+l]^\bullet$ and with $[0] = \text{id}_{\text{CoCh}(\mathcal{A})}$.

Definition 12.14.8. Let \mathcal{A} be an abelian category. Let A^\bullet be a cochain complex with boundary maps $d_A^n : A^n \rightarrow A^{n+1}$. For any $k \in \mathbf{Z}$ we identify $H^{i+k}(A^\bullet) \rightarrow H^i(A[k]^\bullet)$ via the identification $A^{i+k} = A[k]^i$.

This identification is functorial in A^\bullet . Note that since no signs are involved in this definition we actually get a compatible system of identifications of all the homology objects $H^{i-k}(A[k]^\bullet)$, which are further compatible with the identifications $A[k][l]^\bullet = A[k+l]^\bullet$ and with $[0] = \text{id}_{\text{CoCh}(\mathcal{A})}$.

Let \mathcal{A} be an additive category. Suppose that A^\bullet and B^\bullet are cochain complexes, $a, b : A^\bullet \rightarrow B^\bullet$ are morphisms of cochain complexes, and $\{h^i : A^i \rightarrow B^{i-1}\}$ is a homotopy between a and b . Recall that this means that $a^i - b^i = d^{i-1} \circ h^i + h^{i+1} \circ d^i$. What if $a = b$? Then we obtain the formula $0 = d^{i-1} \circ h^i + h^{i+1} \circ d^i$, in other words, $-d^{i-1} \circ h^i = h^{i+1} \circ d^i$. By definition above this means the collection $\{h^i\}$ above defines a morphism of cochain complexes

$$A^\bullet \longrightarrow B[-1]^\bullet.$$

Such a thing is the same as a morphism $A[1]^\bullet \rightarrow B^\bullet$ by our remarks above. This proves the following lemma.

Lemma 12.14.9. *Let \mathcal{A} be an additive category. Suppose that A^\bullet and B^\bullet are cochain complexes. Given any morphism of cochain complexes $a : A^\bullet \rightarrow B^\bullet$ there is a bijection between the set of homotopies from a to a and $\text{Mor}_{\text{CoCh}(\mathcal{A})}(A^\bullet, B[-1]^\bullet)$. More generally, the set of homotopies between a and b is either empty or a principal homogeneous space under the group $\text{Mor}_{\text{CoCh}(\mathcal{A})}(A^\bullet, B[-1]^\bullet)$.*

Proof. See above. \square

Lemma 12.14.10. *Let \mathcal{A} be an additive category. Let*

$$0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$$

be a complex (!) of complexes. Suppose that we are given splittings $B^n = A^n \oplus C^n$ compatible with the maps in the displayed sequence. Let $s^n : C^n \rightarrow B^n$ and $\pi^n : B^n \rightarrow A^n$ be the corresponding maps. Then the family of morphisms

$$\pi^{n+1} \circ d_B^n \circ s^n : C^n \rightarrow A^{n+1}$$

define a morphism of complexes $\delta : C^\bullet \rightarrow A[1]^\bullet$.

Proof. Denote $i : A^\bullet \rightarrow B^\bullet$ and $q : B^\bullet \rightarrow C^\bullet$ the maps of complexes in the short exact sequence. Then $i^{n+1} \circ \pi^{n+1} \circ d_B^n \circ s^n = d_B^n \circ s^n - s^{n+1} \circ d_C^n$. Hence $i^{n+2} \circ d_A^{n+1} \circ \pi^{n+1} \circ d_B^n \circ s^n = d_B^{n+1} \circ (d_B^n \circ s^n - s^{n+1} \circ d_C^n) = -d_B^{n+1} \circ s^{n+1} \circ d_C^n$ as desired. \square

Lemma 12.14.11. *Notation and assumptions as in Lemma 12.14.10 above. Assume in addition that \mathcal{A} is abelian. The morphism of complexes $\delta : C^\bullet \rightarrow A[1]^\bullet$ induces the maps*

$$H^i(\delta) : H^i(C^\bullet) \longrightarrow H^i(A[1]^\bullet) = H^{i+1}(A^\bullet)$$

which occur in the long exact homology sequence associated to the short exact sequence of cochain complexes by Lemma 12.12.12.

Proof. Omitted. \square

Lemma 12.14.12. *Notation and assumptions as in Lemma 12.14.10. Let $\alpha : A^\bullet \rightarrow B^\bullet$, $\beta : B^\bullet \rightarrow C^\bullet$ be the given morphisms of complexes. Suppose $(s')^n : C^n \rightarrow B^n$ and $(\pi')^n : B^n \rightarrow A^n$ is a second choice of splittings. Write $(s')^n = s^n + \alpha^n \circ h^n$ and $(\pi')^n = \pi^n + g^n \circ \beta^n$ for some unique morphisms $h^n : C^n \rightarrow A^n$ and $g^n : C^n \rightarrow A^n$. Then*

- (1) $g^n = -h^n$, and
- (2) *the family of maps $\{g^n : C^n \rightarrow A[1]^{n-1}\}$ is a homotopy between $\delta, \delta' : C^\bullet \rightarrow A[1]^\bullet$, more precisely $(\delta')^n = \delta^n + g^{n+1} \circ d_C^n + d_{A[1]}^{n-1} \circ g^n$.*

Proof. As $(s')^n$ and $(\pi')^n$ are splittings we have $(\pi')^n \circ (s')^n = 0$. Hence

$$0 = (\pi^n + g^n \circ \beta^n) \circ (s^n + \alpha^n \circ h^n) = g^n \circ \beta^n \circ s^n + \pi^n \circ \alpha^n \circ h^n = g^n + h^n$$

which proves (1). We compute $(\delta')^n$ as follows

$$(\pi^{n+1} + g^{n+1} \circ \beta^{n+1}) \circ d_B^n \circ (s^n + \alpha^n \circ h^n) = \delta^n + g^{n+1} \circ d_C^n + d_{A[1]}^n \circ h^n$$

Since $h^n = -g^n$ and since $d_{A[1]}^{n-1} = -d_A^n$ we conclude that (2) holds. \square

12.15. Graded objects

We make the following definition.

Definition 12.15.1. Let \mathcal{A} be an additive category. The *category of graded objects of \mathcal{A}* , denoted $\text{Gr}(\mathcal{A})$, is the category with

- (1) objects $A = (A^i)$ are families of objects A^i , $i \in \mathbf{Z}$ of objects of \mathcal{A} , and
- (2) morphisms $f : A = (A^i) \rightarrow B = (B^i)$ are families of morphisms $f^i : A^i \rightarrow B^i$ of \mathcal{A} .

If \mathcal{A} has countable direct sums, then we can associate to an object $A = (A^i)$ of $\text{Gr}(\mathcal{A})$ the object

$$A = \bigoplus_{i \in \mathbf{Z}} A^i$$

and set $k^i A = A^i$. In this case $\text{Gr}(\mathcal{A})$ is equivalent to the category of pairs (A, k) consisting of an object A of \mathcal{A} and a direct sum decomposition

$$A = \bigoplus_{i \in \mathbf{Z}} k^i A$$

by direct summands indexed by \mathbf{Z} and a morphism $(A, k) \rightarrow (B, k)$ of such objects is given by a morphism $\varphi : A \rightarrow B$ of \mathcal{A} such that $\varphi(k^i A) \subset k^i B$ for all $i \in \mathbf{Z}$. Whenever our additive category \mathcal{A} has countable direct sums we will use this equivalence without further mention.

However, with our definitions an additive or abelian category does not necessarily have all (countable) direct sums. In this case our definition still makes sense. For example, if $\mathcal{A} = \text{Vect}_k$ is the category of finite dimensional vector spaces over a field k , then $\text{Gr}(\text{Vect}_k)$ is the category of vector spaces with a given gradation all of whose graded pieces are finite dimensional, and not the category of finite dimensional vector spaces with a given gradation.

Lemma 12.15.2. *Let \mathcal{A} be an abelian category. The category of graded objects $\text{Gr}(\mathcal{A})$ is abelian.*

Proof. Let $f : A = (A^i) \rightarrow B = (B^i)$ be a morphism of graded objects of \mathcal{A} given by morphisms $f^i : A^i \rightarrow B^i$ of \mathcal{A} . Then we have $\text{Ker}(f) = (\text{Ker}(f^i))$ and $\text{Coker}(f) = (\text{Coker}(f^i))$ in the category $\text{Gr}(\mathcal{A})$. Since we have $\text{Im} = \text{Coim}$ in \mathcal{A} we see the same thing holds in $\text{Gr}(\mathcal{A})$. \square

Remark 12.15.3 (Warning). There are abelian categories \mathcal{A} having countable direct sums but where countable direct sums are not exact. An example is the opposite of the category of abelian sheaves on \mathbf{R} . Namely, the category of abelian sheaves on \mathbf{R} has countable products, but countable products are not exact. For such a category the functor $\text{Gr}(\mathcal{A}) \rightarrow \mathcal{A}$, $(A^i) \mapsto \bigoplus A^i$ described above is not exact. It is still true that $\text{Gr}(\mathcal{A})$ is equivalent to the category of graded objects (A, k) of \mathcal{A} , but the kernel in the category of graded objects of a map $\varphi : (A, k) \rightarrow (B, k)$ is not equal to $\text{Ker}(\varphi)$ endowed with a direct sum decomposition, but rather it is the direct sum of the kernels of the maps $k^i A \rightarrow k^i B$.

Definition 12.15.4. Let \mathcal{A} be an additive category. If $A = (A^i)$ is a graded object, then the k th *shift* $A[k]$ is the graded object with $A[k]^i = A^{k+i}$.

If A and B are graded objects of \mathcal{A} , then we have

$$(12.15.4.1) \quad \text{Hom}_{\text{Gr}(\mathcal{A})}(A, B[k]) = \text{Hom}_{\text{Gr}(\mathcal{A})}(A[-k], B)$$

and an element of this group is sometimes called a map of graded objects *homogeneous of degree k* .

Given any set G we can define G -graded objects of \mathcal{A} as the category whose objects are $A = (A^g)_{g \in G}$ families of objects parametrized by elements of G . Morphisms $f : A \rightarrow B$ are defined as families of maps $f^g : A^g \rightarrow B^g$ where g runs over the elements of G . If G is an abelian group, then we can (unambiguously) define shift functors $[g]$ on the category of G -graded objects by the rule $(A[g])^{g_0} = A^{g+g_0}$. A particular case of this type of construction is when $G = \mathbf{Z} \times \mathbf{Z}$. In this case the objects of the category are called *bigraded* objects of \mathcal{A} . The (p, q) component of a bigraded object A is usually denoted $A^{p,q}$. For $(a, b) \in \mathbf{Z} \times \mathbf{Z}$ we write $A[a, b]$ instead of $A[(a, b)]$. A morphism $A \rightarrow A[a, b]$ is sometimes called a *map of bidegree (a, b)* .

12.16. Filtrations

A nice reference for this material is [Del71, Section 1]. (Note that our conventions regarding abelian categories are different.)

Definition 12.16.1. Let \mathcal{A} be an abelian category.

- (1) A *decreasing filtration* F on an object A is a family $(F^n A)_{n \in \mathbf{Z}}$ of subobjects of A such that

$$A \supset \dots \supset F^n A \supset F^{n+1} A \supset \dots \supset 0$$

- (2) A *filtered object* of \mathcal{A} is pair (A, F) consisting of an object A of \mathcal{A} and a decreasing filtration F on A .
- (3) A *morphism $(A, F) \rightarrow (B, F)$ of filtered objects* is given by a morphism $\varphi : A \rightarrow B$ of \mathcal{A} such that $\varphi(F^i A) \subset F^i B$ for all $i \in \mathbf{Z}$.
- (4) The category of filtered objects is denoted $\text{Fil}(\mathcal{A})$.
- (5) Given a filtered object (A, F) and a subobject $X \subset A$ the *induced filtration* on X is the filtration with $F^n X = X \cap F^n A$.
- (6) Given a filtered object (A, F) and a surjection $\pi : A \rightarrow Y$ the *quotient filtration* is the filtration with $F^n Y = \pi(F^n A)$.
- (7) A filtration F on an object A is said to be *finite* if there exist n, m such that $F^n A = A$ and $F^m A = 0$.
- (8) Given a filtered object (A, F) we say $\bigcap F^i A$ exists if there exists a biggest subobject of A contained in all $F^i A$. We say $\bigcup F^i A$ exists if there exists a smallest subobject of A containing all $F^i A$.
- (9) The filtration on a filtered object (A, F) is said to be *separated* if $\bigcap_i F^i A = 0$ and *exhaustive* if $\bigcup F^i A = A$.

By abuse of notation we say that a morphism $f : (A, F) \rightarrow (B, F)$ of filtered objects is *injective* if $f : A \rightarrow B$ is injective in the abelian category \mathcal{A} . Similarly we say f is *surjective* if $f : A \rightarrow B$ is surjective in the category \mathcal{A} . Being injective (resp. surjective) is equivalent to being a monomorphism (resp. epimorphism) in $\text{Fil}(\mathcal{A})$. By Lemma 12.16.2 this is also equivalent to having zero kernel (resp. cokernel).

Lemma 12.16.2. *Let \mathcal{A} be an abelian category. The category of filtered objects $\text{Fil}(\mathcal{A})$ has the following properties:*

- (1) *It is an additive category.*
- (2) *It has a zero object.*

- (3) *It has kernels and cokernels, images and coimages.*
- (4) *In general it is not an abelian category.*

Proof. It is clear that $\text{Fil}(\mathcal{A})$ is additive with direct sum given by $(A, F) \oplus (B, F) = (A \oplus B, F)$ where $F^p(A \oplus B) = F^p A \oplus F^p B$. The kernel of a morphism $f : (A, F) \rightarrow (B, F)$ of filtered objects is the injection $\text{Ker}(f) \subset A$ where $\text{Ker}(f)$ is endowed with the induced filtration. The cokernel of a morphism $f : A \rightarrow B$ of filtered objects is the surjection $B \rightarrow \text{Coker}(f)$ where $\text{Coker}(f)$ is endowed with the quotient filtration. Since all kernels and cokernels exist, so do all coimages and images. See Example 12.3.12 for the last statement. \square

Definition 12.16.3. Let \mathcal{A} be an abelian category. A morphism $f : A \rightarrow B$ of filtered objects of \mathcal{A} is said to be *strict* if $f(F^i A) = f(A) \cap F^i B$ for all $i \in \mathbf{Z}$.

This is also equivalent to requiring that $f^{-1}(F^i B) = F^i A + \text{Ker}(f)$ for all $i \in \mathbf{Z}$. We characterize strict morphisms as follows.

Lemma 12.16.4. *Let \mathcal{A} be an abelian category. Let $f : A \rightarrow B$ be a morphism of filtered objects of \mathcal{A} . The following are equivalent*

- (1) *f is strict,*
- (2) *the morphism $\text{Coim}(f) \rightarrow \text{Im}(f)$ of Lemma 12.3.11 is an isomorphism.*

Proof. Note that $\text{Coim}(f) \rightarrow \text{Im}(f)$ is an isomorphism of objects of \mathcal{A} , and that part (2) signifies that it is an isomorphism of filtered objects. By the description of kernels and cokernels in the proof of Lemma 12.16.2 we see that the filtration on $\text{Coim}(f)$ is the quotient filtration coming from $A \rightarrow \text{Coim}(f)$. Similarly, the filtration on $\text{Im}(f)$ is the induced filtration coming from the injection $\text{Im}(f) \rightarrow B$. The definition of strict is exactly that the quotient filtration is the induced filtration. \square

Lemma 12.16.5. *Let \mathcal{A} be an abelian category. Let $f : A \rightarrow B$ be a strict monomorphism of filtered objects. Let $g : A \rightarrow C$ be a morphism of filtered objects. Then $f \oplus g : A \rightarrow B \oplus C$ is a strict monomorphism.*

Proof. Clear from the definitions. \square

Lemma 12.16.6. *Let \mathcal{A} be an abelian category. Let $f : B \rightarrow A$ be a strict epimorphism of filtered objects. Let $g : C \rightarrow A$ be a morphism of filtered objects. Then $f \oplus g : B \oplus C \rightarrow A$ is a strict epimorphism.*

Proof. Clear from the definitions. \square

Lemma 12.16.7. *Let \mathcal{A} be an abelian category. Let $(A, F), (B, F)$ be filtered objects. Let $u : A \rightarrow B$ be a morphism of filtered objects. If u is injective then u is strict if and only if the filtration on A is the induced filtration. If u is surjective then u is strict if and only if the filtration on B is the quotient filtration.*

Proof. This is immediate from the definition. \square

Lemma 12.16.8. *Let \mathcal{A} be an abelian category. Let $f : A \rightarrow B, g : B \rightarrow C$ be strict morphisms of filtered objects.*

- (1) *In general the composition $g \circ f$ is not strict.*
- (2) *If g is injective, then $g \circ f$ is strict.*
- (3) *If f is surjective, then $g \circ f$ is strict.*

Proof. Let B a vector space over a field k with basis e_1, e_2 , with the filtration $F^n B = B$ for $n < 0$, with $F^0 B = ke_1$, and $F^n B = 0$ for $n > 0$. Now take $A = k(e_1 + e_2)$ and $C = B/ke_2$ with filtrations induced by B , i.e., such that $A \rightarrow B$ and $B \rightarrow C$ are strict (Lemma 12.16.7). Then $F^n(A) = A$ for $n < 0$ and $F^n(A) = 0$ for $n \geq 0$. Also $F^n(C) = C$ for $n \leq 0$ and $F^n(C) = 0$ for $n > 0$. So the (nonzero) composition $A \rightarrow C$ is not strict.

Assume g is injective. Then

$$\begin{aligned} g(f(F^p A)) &= g(f(A) \cap F^p B) \\ &= g(f(A)) \cap g(F^p(B)) \\ &= (g \circ f)(A) \cap (g(B) \cap F^p C) \\ &= (g \circ f)(A) \cap F^p C. \end{aligned}$$

The first equality as f is strict, the second because g is injective, the third because g is strict, and the fourth because $(g \circ f)(A) \subset g(B)$.

Assume f is surjective. Then

$$\begin{aligned} (g \circ f)^{-1}(F^i C) &= f^{-1}(F^i B + \text{Ker}(g)) \\ &= f^{-1}(F^i B) + f^{-1}(\text{Ker}(g)) \\ &= F^i A + \text{Ker}(f) + \text{Ker}(g \circ f) \\ &= F^i A + \text{Ker}(g \circ f) \end{aligned}$$

The first equality because g is strict, the second because f is surjective, the third because f is strict, and the last because $\text{Ker}(f) \subset \text{Ker}(g \circ f)$. \square

The following lemma says that subobjects of a filtered object have a well defined filtration independent of a choice of writing the object as a cokernel.

Lemma 12.16.9. *Let \mathcal{A} be an abelian category. Let (A, F) be a filtered object of \mathcal{A} . Let $X \subset Y \subset A$ be subobjects of A . On the object*

$$Y/X = \text{Ker}(A/X \rightarrow A/Y)$$

the quotient filtration coming from the induced filtration on Y and the induced filtration coming from the quotient filtration on A/X agree. Any of the morphisms $X \rightarrow Y$, $X \rightarrow A$, $Y \rightarrow A$, $Y \rightarrow A/X$, $Y \rightarrow Y/X$, $Y/X \rightarrow A/X$ are strict (with induced/quotient filtrations).

Proof. The quotient filtration Y/X is given by $F^p(Y/X) = F^p Y / (X \cap F^p Y) = F^p Y / F^p X$ because $F^p Y = Y \cap F^p A$ and $F^p X = X \cap F^p A$. The induced filtration from the injection $Y/X \rightarrow A/X$ is given by

$$\begin{aligned} F^p(Y/X) &= Y/X \cap F^p(A/X) \\ &= Y/X \cap (F^p A + X)/X \\ &= (Y \cap F^p A) / (X \cap F^p A) \\ &= F^p Y / F^p X. \end{aligned}$$

Hence the first statement of the lemma. The proof of the other cases is similar. \square

Lemma 12.16.10. *Let \mathcal{A} be an abelian category. Let $A, B, C \in \text{Fil}(\mathcal{A})$. Let $f : A \rightarrow B$ and $g : A \rightarrow C$ be morphisms. Then there exists a pushout*

$$\begin{array}{ccc} A & \xrightarrow{\quad} & B \\ g \downarrow & f & \downarrow g' \\ C & \xrightarrow{f'} & C \amalg_A B \end{array}$$

in $\text{Fil}(\mathcal{A})$. If f is strict, so is f' .

Proof. Set $C \amalg_A B$ equal to $\text{Coker}((1, -1) : A \rightarrow C \oplus B)$ in $\text{Fil}(\mathcal{A})$. This cokernel exists, by Lemma 12.16.2. It is a pushout, see Example 12.5.6. Note that $F^p(C \times_A B)$ is the image of $F^p C \oplus F^p B$. Hence

$$(f')^{-1}(F^p(C \times_A B)) = g(f^{-1}(F^p B)) + F^p C$$

Whence the last statement. □

Lemma 12.16.11. *Let \mathcal{A} be an abelian category. Let $A, B, C \in \text{Fil}(\mathcal{A})$. Let $f : B \rightarrow A$ and $g : C \rightarrow A$ be morphisms. Then there exists a pushout*

$$\begin{array}{ccc} B \times_A C & \xrightarrow{\quad} & B \\ g' \downarrow & f' & \downarrow g \\ C & \xrightarrow{f} & A \end{array}$$

in $\text{Fil}(\mathcal{A})$. If f is strict, so is f' .

Proof. This lemma is dual to Lemma 12.16.10. □

Let \mathcal{A} be an abelian category. Let (A, F) be a filtered object of \mathcal{A} . We denote $\text{gr}_F^p(A) = \text{gr}^p(A)$ the object $F^p A / F^{p+1} A$ of \mathcal{A} . This defines an additive functor

$$\text{gr}^p : \text{Fil}(\mathcal{A}) \longrightarrow \mathcal{A}, \quad (A, F) \longmapsto \text{gr}^p(A).$$

Recall that we have defined the category $\text{Gr}(\mathcal{A})$ of graded objects of \mathcal{A} in Section 12.15. For (A, F) in $\text{Fil}(\mathcal{A})$ we may set

$$\text{gr}(A) = \text{the graded object of } \mathcal{A} \text{ whose } p\text{th graded piece is } \text{gr}^p(A)$$

and if \mathcal{A} has countable direct sums, then we simply have

$$\text{gr}(A) = \bigoplus \text{gr}^p(A)$$

This defines an additive functor

$$\text{gr} : \text{Fil}(\mathcal{A}) \longrightarrow \text{Gr}(\mathcal{A}), \quad (A, F) \longmapsto \text{gr}(A).$$

Lemma 12.16.12. *Let \mathcal{A} be an abelian category.*

- (1) *Let A be a filtered object and $X \subset A$. Then for each p the sequence*

$$0 \rightarrow \text{gr}^p(X) \rightarrow \text{gr}^p(A) \rightarrow \text{gr}^p(A/X) \rightarrow 0$$

is exact (with induced filtration on X and quotient filtration on A/X).

- (2) *Let $f : A \rightarrow B$ be a morphism of filtered objects of \mathcal{A} . Then for each p the sequences*

$$0 \rightarrow \text{gr}^p(\text{Ker}(f)) \rightarrow \text{gr}^p(A) \rightarrow \text{gr}^p(\text{Coim}(f)) \rightarrow 0$$

and

$$0 \rightarrow \text{gr}^p(\text{Im}(f)) \rightarrow \text{gr}^p(B) \rightarrow \text{gr}^p(\text{Coker}(f)) \rightarrow 0$$

are exact.

Proof. We have $F^{p+1}X = X \cap F^{p+1}A$, hence map $\text{gr}^p(X) \rightarrow \text{gr}^p(A)$ is injective. Dually the map $\text{gr}^p(A) \rightarrow \text{gr}^p(A/X)$ is surjective. The kernel of $F^pA/F^{p+1}A \rightarrow A/X + F^{p+1}A$ is clearly $F^{p+1}A + X \cap F^pA/F^{p+1}A = F^pX/F^{p+1}X$ hence exactness in the middle. The two short exact sequence of (2) are special cases of the short exact sequence of (1). \square

Lemma 12.16.13. *Let \mathcal{A} be an abelian category. Let $f : A \rightarrow B$ be a morphism of finite filtered objects of \mathcal{A} . The following are equivalent*

- (1) f is strict,
- (2) the morphism $\text{Coim}(f) \rightarrow \text{Im}(f)$ is an isomorphism,
- (3) $\text{gr}(\text{Coim}(f)) \rightarrow \text{gr}(\text{Im}(f))$ is an isomorphism,
- (4) the sequence $\text{gr}(\text{Ker}(f)) \rightarrow \text{gr}(A) \rightarrow \text{gr}(B)$ is exact,
- (5) the sequence $\text{gr}(A) \rightarrow \text{gr}(B) \rightarrow \text{gr}(\text{Coker}(f))$ is exact, and
- (6) the sequence

$$0 \rightarrow \text{gr}(\text{Ker}(f)) \rightarrow \text{gr}(A) \rightarrow \text{gr}(B) \rightarrow \text{gr}(\text{Coker}(f)) \rightarrow 0$$

is exact.

Proof. The equivalence of (1) and (2) is Lemma 12.16.4. By Lemma 12.16.12 we see that (4), (5), (6) imply (3) and that (3) implies (4), (5), (6). Hence it suffices to show that (3) implies (2). Thus we have to show that if $f : A \rightarrow B$ is an injective and surjective map of finite filtered objects which induces an isomorphism $\text{gr}(A) \rightarrow \text{gr}(B)$, then f induces an isomorphism of filtered objects. In other words, we have to show that $f(F^pA) = F^pB$ for all p . As the filtrations are finite we may prove this by descending induction on p . Suppose that $f(F^{p+1}A) = F^{p+1}B$. Then commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & F^{p+1}A & \longrightarrow & F^pA & \longrightarrow & \text{gr}^p(A) & \longrightarrow & 0 \\ & & \downarrow f & & \downarrow f & & \downarrow \text{gr}^p(f) & & \\ 0 & \longrightarrow & F^{p+1}B & \longrightarrow & F^pB & \longrightarrow & \text{gr}^p(B) & \longrightarrow & 0 \end{array}$$

and the five lemma imply that $f(F^pA) = F^pB$. \square

Lemma 12.16.14. *Let \mathcal{A} be an abelian category. Let $A \rightarrow B \rightarrow C$ be a complex of filtered objects of \mathcal{A} . Assume $\alpha : A \rightarrow B$ and $\beta : B \rightarrow C$ are strict morphisms of filtered objects. Then $\text{gr}(\text{Ker}(\beta)/\text{Im}(\alpha)) = \text{Ker}(\text{gr}(\beta))/\text{Im}(\text{gr}(\alpha))$.*

Proof. This follows formally from Lemma 12.16.12 and the fact that $\text{Coim}(\alpha) \cong \text{Im}(\alpha)$ and $\text{Coim}(\beta) \cong \text{Im}(\beta)$ by Lemma 12.16.4. \square

Lemma 12.16.15. *Let \mathcal{A} be an abelian category. Let $A \rightarrow B \rightarrow C$ be a complex of filtered objects of \mathcal{A} . Assume A, B, C have finite filtrations and that $\text{gr}(A) \rightarrow \text{gr}(B) \rightarrow \text{gr}(C)$ is exact. Then*

- (1) for each $p \in \mathbf{Z}$ the sequence $\text{gr}^p(A) \rightarrow \text{gr}^p(B) \rightarrow \text{gr}^p(C)$ is exact,
- (2) for each $p \in \mathbf{Z}$ the sequence $F^p(A) \rightarrow F^p(B) \rightarrow F^p(C)$ is exact,
- (3) for each $p \in \mathbf{Z}$ the sequence $A/F^p(A) \rightarrow B/F^p(B) \rightarrow C/F^p(C)$ is exact,
- (4) the maps $A \rightarrow B$ and $B \rightarrow C$ are strict, and
- (5) $A \rightarrow B \rightarrow C$ is exact (as a sequence in \mathcal{A}).

Proof. Part (1) is immediate from the definitions. We will prove (3) by induction on the length of the filtrations. If each of A, B, C has only one nonzero graded part, then (3) holds as $\text{gr}(A) = A$, etc. Let n be the largest integer such that at least one of $F^n A, F^n B, F^n C$ is nonzero. Set $A' = A/F^n A, B' = B/F^n B, C' = C/F^n C$ with induced filtrations. Note that $\text{gr}(A) = F^n A \oplus \text{gr}(A')$ and similarly for B and C . The induction hypothesis applies to $A' \rightarrow B' \rightarrow C'$, which implies that $A/F^p(A) \rightarrow B/F^p(B) \rightarrow C/F^p(C)$ is exact for $p \geq n$. To conclude the same for $p = n + 1$, i.e., to prove that $A \rightarrow B \rightarrow C$ is exact we use the commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & F^n A & \longrightarrow & A & \longrightarrow & A' & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & F^n B & \longrightarrow & B & \longrightarrow & B' & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & F^n C & \longrightarrow & C & \longrightarrow & C' & \longrightarrow & 0 \end{array}$$

whose rows are short exact sequences of objects of \mathcal{A} . The proof of (2) is dual. Of course (5) follows from (2).

To prove (4) denote $f : A \rightarrow B$ and $g : B \rightarrow C$ the given morphisms. We know that $f(F^p(A)) = \text{Ker}(F^p(B) \rightarrow F^p(C))$ by (2) and $f(A) = \text{Ker}(g)$ by (5). Hence $f(F^p(A)) = \text{Ker}(F^p(B) \rightarrow F^p(C)) = \text{Ker}(g) \cap F^p(B) = f(A) \cap F^p(B)$ which proves that f is strict. The proof that g is strict is dual to this. \square

12.17. Spectral sequences

A nice discussion of spectral sequences may be found in [Eis95]. See also [McC01], [Lan02], etc.

Definition 12.17.1. Let \mathcal{A} be an abelian category.

- (1) A *spectral sequence in \mathcal{A}* is given by a system $(E_r, d_r)_{r \geq 1}$ where each E_r is an object of \mathcal{A} , each $d_r : E_r \rightarrow E_r$ is a morphism such that $d_r \circ d_r = 0$ and $E_{r+1} = \text{Ker}(d_r)/\text{Im}(d_r)$ for $r \geq 1$.
- (2) A *morphism of spectral sequences* $f : (E_r, d_r)_{r \geq 1} \rightarrow (E'_r, d'_r)_{r \geq 1}$ is given by a family of morphisms $f_r : E_r \rightarrow E'_r$ such that $f_r \circ d_r = d'_r \circ f_r$ and such that f_{r+1} is the morphism induced by f_r via the identifications $E_{r+1} = \text{Ker}(d_r)/\text{Im}(d_r)$ and $E'_{r+1} = \text{Ker}(d'_r)/\text{Im}(d'_r)$.

We will sometimes loosen this definition somewhat and allow E_{r+1} to be an object with a given isomorphism $E_{r+1} \rightarrow \text{Ker}(d_r)/\text{Im}(d_r)$. In addition we sometimes have a system $(E_r, d_r)_{r \geq r_0}$ for some r_0 satisfying the properties of the definition above for indices $\geq r$. We will also call this a spectral sequence since by a simple renumbering it falls under the definition anyway. In fact, sometimes it makes sense to allow $r_0 = 0$ or even $r_0 = -1$ due to conventions in the literature.

Given a spectral sequence $(E_r, d_r)_{r \geq 1}$ we define

$$0 = B_1 \subset B_2 \subset \dots \subset B_r \subset \dots \subset Z_r \subset \dots \subset Z_2 \subset Z_1 = E_1$$

by the following simple procedure. Set $B_2 = \text{Im}(d_1)$ and $Z_2 = \text{Ker}(d_1)$. Then it is clear that $d_2 : Z_2/B_2 \rightarrow Z_2/B_2$. Hence we can define B_3 as the unique subobject of E_1 containing B_2 such that B_3/B_2 is the image of d_2 . Similarly we can define

Z_3 as the unique subobject of E_1 containing B_2 such that Z_3/B_2 is the kernel of d_2 . And so on and so forth. In particular we have

$$E_r = Z_r/B_r$$

for all $r \geq 1$. In case the spectral sequence starts at $r = r_0$ then we can similarly construct B_i, Z_i as subobjects in E_{r_0} .

Definition 12.17.2. Let \mathcal{A} be an abelian category. Let $(E_r, d_r)_{r \geq 1}$ be a spectral sequence.

- (1) If the subobjects $Z_\infty = \bigcap Z_r$ and $B_\infty = \bigcup B_r$ of E_1 exist then we define the *limit* of the spectral sequence to be the object

$$E_\infty = Z_\infty/B_\infty.$$

- (2) We say that the spectral sequence *collapses at E_r* , or *degenerates at E_r* if the differentials d_r, d_{r+1}, \dots are all zero.

Note that if the spectral sequence collapses at E_r , then we have $E_r = E_{r+1} = \dots = E_\infty$ (and the limit exists of course). Also, almost any abelian category we will encounter has countable sums and intersections.

Remark 12.17.3 (Variant). It is often the case that the terms of a spectral sequence have additional structure, for example a grading or a bigrading. To accommodate this (and to get around certain technical issues) we introduce the following notion. Let \mathcal{A} be an abelian category. Let $(T_r)_{r \geq 1}$ be a sequence of *translation* or *shift* functors, i.e., $T_r : \mathcal{A} \rightarrow \mathcal{A}$ is an isomorphism of categories. In this setting a *spectral sequence* is given by a system $(E_r, d_r)_{r \geq 1}$ where each E_r is an object of \mathcal{A} , each $d_r : E_r \rightarrow T_r E_r$ is a morphism such that $T_r d_r \circ d_r = 0$ so that

$$\dots \longrightarrow T_r^{-1} E_r \xrightarrow{T_r^{-1} d_r} E_r \xrightarrow{d_r} T_r E_r \xrightarrow{T_r d_r} T_r^2 E_r \longrightarrow \dots$$

is a complex and $E_{r+1} = \text{Ker}(d_r)/\text{Im}(T_r^{-1} d_r)$ for $r \geq 1$. It is clear what a *morphism of spectral sequences* means in this setting. In this setting we can still define

$$0 = B_1 \subset B_2 \subset \dots \subset B_r \subset \dots \subset Z_r \subset \dots \subset Z_2 \subset Z_1 = E_1$$

and Z_∞ and B_∞ (if they exist) as above.

12.18. Spectral sequences: exact couples

Definition 12.18.1. Let \mathcal{A} be an abelian category.

- (1) An *exact couple* is a datum (A, E, α, f, g) where A, E are objects of \mathcal{A} and α, f, g are morphisms as in the following diagram

$$\begin{array}{ccc} A & \xrightarrow{\alpha} & A \\ & \swarrow f & \searrow g \\ & E & \end{array}$$

with the property that the kernel of each arrow is the image of its predecessor. So $\text{Ker}(\alpha) = \text{Im}(f)$, $\text{Ker}(f) = \text{Im}(g)$, and $\text{Ker}(g) = \text{Im}(\alpha)$.

- (2) A *morphism of exact couples* $t : (A, E, \alpha, f, g) \rightarrow (A', E', \alpha', f', g')$ is given by morphisms $t_A : A \rightarrow A'$ and $t_E : E \rightarrow E'$ such that $\alpha' \circ t_A = t_A \circ \alpha$, $f' \circ t_E = t_A \circ f$, and $g' \circ t_A = t_E \circ g$.

Lemma 12.18.2. *Let (A, E, α, f, g) be an exact couple in an abelian category \mathcal{A} . Set*

- (1) $d = g \circ f : E \rightarrow E$ so that $d \circ d = 0$,
- (2) $E' = \text{Ker}(d)/\text{Im}(d)$,
- (3) $A' = \text{Im}(\alpha)$,
- (4) $\alpha' : A' \rightarrow A'$ induced by α ,
- (5) $f' : E' \rightarrow A'$ induced by f ,
- (6) $g' : A' \rightarrow E'$ induced by " $g \circ \alpha^{-1}$ ".

Then we have

- (1) $\text{Ker}(d) = f^{-1}(\text{Ker}(g)) = f^{-1}(\text{Im}(\alpha))$,
- (2) $\text{Im}(d) = g(\text{Im}(f)) = g(\text{Ker}(\alpha))$,
- (3) $(A', E', \alpha', f', g')$ is an exact couple.

Proof. Omitted. □

Hence it is clear that given an exact couple (A, E, α, f, g) we get a spectral sequence by setting $E_1 = E$, $d_1 = d$, $E_2 = E'$, $d_2 = d' = g' \circ f'$, $E_3 = E''$, $d_3 = d'' = g'' \circ f''$, and so on.

Definition 12.18.3. Let \mathcal{A} be an abelian category. Let (A, E, α, f, g) be an exact couple. The *spectral sequence associated to the exact couple* is the spectral sequence $(E_r, d_r)_{r \geq 1}$ with $E_1 = E$, $d_1 = d$, $E_2 = E'$, $d_2 = d' = g' \circ f'$, $E_3 = E''$, $d_3 = d'' = g'' \circ f''$, and so on.

Lemma 12.18.4. *Let \mathcal{A} be an abelian category. Let (A, E, α, f, g) be an exact couple. Let $(E_r, d_r)_{r \geq 1}$ be the spectral sequence associated to the exact couple. In this case we have*

$$0 = B_1 \subset \dots \subset B_{r+1} = g(\text{Ker}(\alpha^r)) \subset \dots \subset Z_{r+1} = f^{-1}(\text{Im}(\alpha^r)) \subset \dots \subset Z_1 = E$$

and the map $d_{r+1} : E_{r+1} \rightarrow E_{r+1}$ is described by the following rule: For any (test) object T of \mathcal{A} and any elements $x : T \rightarrow Z_{r+1}$ and $y : T \rightarrow A$ such that $f \circ x = \alpha^r \circ y$ we have

$$d_{r+1} \circ \bar{x} = \overline{g \circ y}$$

where $\bar{x} : T \rightarrow E_{r+1}$ is the induced morphism.

Proof. Omitted. □

Note that in the situation of the lemma we obviously have

$$B_\infty = g \left(\bigcup_r \text{Ker}(\alpha^r) \right) \subset Z_\infty = f^{-1} \left(\bigcap_r \text{Im}(\alpha^r) \right)$$

provided these exist and in this case $E_\infty = Z_\infty/B_\infty$.

Remark 12.18.5 (Variant). Let \mathcal{A} be an abelian category. Let $S, T : \mathcal{A} \rightarrow \mathcal{A}$ be shift functors, i.e., isomorphisms of categories. We will indicate the n -fold compositions by $S^n A$ and $T^n A$ for $A \in \text{Ob}(\mathcal{A})$ and $n \in \mathbf{Z}$. In this situation an *exact couple* is a datum (A, E, α, f, g) where A, E are objects of \mathcal{A} and $\alpha : A \rightarrow T^{-1}A$, $f : E \rightarrow A$, $g : A \rightarrow SE$ are morphisms such that

$$TE \xrightarrow{Tf} TA \xrightarrow{T\alpha} A \xrightarrow{g} SE \xrightarrow{Sf} SA$$

is an exact complex. Let's visualize this as follows

$$\begin{array}{ccccccc}
 TA & \xrightarrow{T\alpha} & A & \xrightarrow{\alpha} & T^{-1}A \\
 & \searrow Tf & \swarrow g & \searrow f & \swarrow T^{-1}g \\
 & TE & \cdots & SE & E & \cdots & T^{-1}SE
 \end{array}$$

We set $d = g \circ f : E \rightarrow SE$. Then $d \circ S^{-1}d = g \circ f \circ S^{-1}g \circ S^{-1}f = 0$ because $f \circ S^{-1}g = 0$. Set $E' = \text{Ker}(d)/\text{Im}(S^{-1}d)$. Set $A' = \text{Im}(T\alpha)$. Let $\alpha' : A' \rightarrow T^{-1}A'$ induced by α . Let $f' : E' \rightarrow A'$ be induced by f which works because $f(\text{Ker}(d)) \subset \text{Ker}(g) = \text{Im}(T\alpha)$. Finally, let $g' : A' \rightarrow TSE'$ induced by “ $Tg \circ (T\alpha)^{-1}$ ”³.

In exactly the same way as above we find

- (1) $\text{Ker}(d) = f^{-1}(\text{Ker}(g)) = f^{-1}(\text{Im}(T\alpha))$,
- (2) $\text{Im}(d) = g(\text{Im}(f)) = g(\text{Ker}(\alpha))$,
- (3) $(A', E', \alpha', f', g')$ is an exact couple for the shift functors TS and T .

We obtain a spectral sequence (as in Remark 12.17.3) with $E_1 = E$, $E_2 = E'$, etc, with $d_r : E_r \rightarrow T^{r-1}SE_r$ for all $r \geq 1$. Lemma 12.18.4 tells us that

$$SB_{r+1} = g(\text{Ker}(T^{-r+1}\alpha \circ \dots \circ T^{-1}\alpha \circ \alpha))$$

and

$$Z_{r+1} = f^{-1}(\text{Im}(T\alpha \circ T^2\alpha \circ \dots \circ T^r\alpha))$$

in this situation. The description of the map d_{r+1} is similar to that given in the lemma. (It may be easier to use these explicit descriptions to prove one gets a spectral sequence from such an exact couple.)

12.19. Spectral sequences: differential objects

Definition 12.19.1. Let \mathcal{A} be an abelian category. A *differential object* of \mathcal{A} is a pair (A, d) consisting of an object A of \mathcal{A} endowed with a selfmap d such that $d \circ d = 0$. A *morphism of differential objects* $(A, d) \rightarrow (B, d)$ is given by a morphism $\alpha : A \rightarrow B$ such that $d \circ \alpha = \alpha \circ d$.

Lemma 12.19.2. *Let \mathcal{A} be an abelian category. The category of differential objects of \mathcal{A} is abelian.*

Proof. Omitted. □

Definition 12.19.3. For a differential object (A, d) we denote

$$H(A, d) = \text{Ker}(d)/\text{Im}(d)$$

its *homology*.

Lemma 12.19.4. *Let \mathcal{A} be an abelian category. Let $0 \rightarrow (A, d) \rightarrow (B, d) \rightarrow (C, d) \rightarrow 0$ be a short exact sequence of differential objects. Then we get an exact homology sequence*

$$\dots \rightarrow H(C, d) \rightarrow H(A, d) \rightarrow H(B, d) \rightarrow H(C, d) \rightarrow \dots$$

³This works because $TSE' = \text{Ker}(TSd)/\text{Im}(Td)$ and $Tg(\text{Ker}(T\alpha)) = Tg(\text{Im}(Tf)) = \text{Im}(T(d))$ and $TS(d)(\text{Im}(Tg)) = \text{Im}(TSg \circ TSf \circ Tg) = 0$.

Proof. Apply Lemma 12.12.12 to the short exact sequence of complexes

$$\begin{array}{ccccccccc}
 0 & \rightarrow & A & \rightarrow & B & \rightarrow & C & \rightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & \\
 0 & \rightarrow & A & \rightarrow & B & \rightarrow & C & \rightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & \\
 0 & \rightarrow & A & \rightarrow & B & \rightarrow & C & \rightarrow & 0
 \end{array}$$

where the vertical arrows are d . □

We come to an important example of a spectral sequence. Let \mathcal{A} be an abelian category. Let (A, d) be a differential object of \mathcal{A} . Let $\alpha : (A, d) \rightarrow (A, d)$ be an endomorphism of this differential object. If we assume α injective, then we get a short exact sequence

$$0 \rightarrow (A, d) \rightarrow (A, d) \rightarrow (A/\alpha A, d) \rightarrow 0$$

of differential objects. By the Lemma 12.19.4 we get an exact couple

$$\begin{array}{ccc}
 H(A, d) & \xrightarrow{\quad \bar{\alpha} \quad} & H(A, d) \\
 & \swarrow f & \searrow g \\
 & H(A/\alpha A, d) &
 \end{array}$$

where g is the canonical map and f is the map defined in the snake lemma. Thus we get an associated spectral sequence! Since in this case we have $E_1 = H(A/\alpha A, d)$ we see that it makes sense to define $E_0 = A/\alpha A$ and $d_0 = d$. In other words, we start the spectral sequence with $r = 0$. According to our conventions in Section 12.17 we define a sequence of subobjects

$$0 = B_0 \subset \dots \subset B_r \subset \dots \subset Z_r \subset \dots \subset Z_0 = E_0$$

with the property that $E_r = Z_r/B_r$. Namely we have for $r \geq 1$ that

- (1) B_r is the image of $(\alpha^{r-1})^{-1}(dA)$ under the natural map $A \rightarrow A/\alpha A$,
- (2) Z_r is the image of $d^{-1}(\alpha^r A)$ under the natural map $A \rightarrow A/\alpha A$, and
- (3) $d_r : E_r \rightarrow E_r$ is given as follows: given an element $z \in Z_r$ choose an element $y \in A$ such that $d(z) = \alpha^r(y)$. Then $d_r(z+B_r+\alpha A) = y+B_r+\alpha A$.

Warning: It is not necessarily the case that $\alpha A \subset (\alpha^{r-1})^{-1}(dA)$, nor $\alpha A \subset d^{-1}(\alpha^r A)$. It is true that $(\alpha^{r-1})^{-1}(dA) \subset d^{-1}(\alpha^r A)$. We have

$$E_r = \frac{d^{-1}(\alpha^r A) + \alpha A}{(\alpha^{r-1})^{-1}(dA) + \alpha A}.$$

It is not hard to verify directly that (1) – (3) give a spectral sequence.

Definition 12.19.5. Let \mathcal{A} be an abelian category. Let (A, d) be a differential object of \mathcal{A} . Let $\alpha : A \rightarrow A$ be an injective selfmap of A which commutes with d . The *spectral sequence associated to (A, d, α)* is the spectral sequence $(E_r, d_r)_{r \geq 0}$ described above.

Remark 12.19.6 (Variant). Let \mathcal{A} be an abelian category and let $S, T : \mathcal{A} \rightarrow \mathcal{A}$ be shift functors, i.e., isomorphisms of categories. Assume that $TS = ST$ as functors. Consider pairs (A, d) consisting of an object A of \mathcal{A} and a morphism $d : A \rightarrow SA$ such that $d \circ S^{-1}d = 0$. The category of these objects is abelian. We

define $H(A, d) = \text{Ker}(d)/\text{Im}(S^{-1}d)$ and we observe that $H(SA, Sd) = SH(A, d)$ (canonical isomorphism). Given a short exact sequence

$$0 \rightarrow (A, d) \rightarrow (B, d) \rightarrow (C, d) \rightarrow 0$$

we obtain a long exact homology sequence

$$\dots \rightarrow S^{-1}H(C, d) \rightarrow H(A, d) \rightarrow H(B, d) \rightarrow H(C, d) \rightarrow SH(A, d) \rightarrow \dots$$

(note the shifts in the boundary maps). Since $ST = TS$ the functor T defines a shift functor on pairs by setting $T(A, d) = (TA, Td)$. Next, let $\alpha : (A, d) \rightarrow T^{-1}(A, d)$ be injective with cokernel (Q, d) . Then we get an exact couple as in Remark 12.18.5 with shift functors TS and T given by

$$(H(A, d), S^{-1}H(Q, d), \bar{\alpha}, f, g)$$

where $\bar{\alpha} : H(A, d) \rightarrow T^{-1}H(A, d)$ is induced by α , the map $f : S^{-1}H(Q, d) \rightarrow H(A, d)$ is the boundary map and $g : H(A, d) \rightarrow TH(Q, d) = TS(S^{-1}H(Q, d))$ is induced by the quotient map $A \rightarrow TQ$. Thus we get a spectral sequence as above with $E_1 = S^{-1}H(Q, d)$ and differentials $d_r : E_r \rightarrow T^rSE_r$. As above we set $E_0 = S^{-1}Q$ and $d_0 : E_0 \rightarrow SE_0$ given by $S^{-1}d : S^{-1}Q \rightarrow Q$. If according to our conventions we define $B_r \subset Z_r \subset E_0$, then we have for $r \geq 1$ that

- (1) SB_r is the image of

$$(T^{-r+1}\alpha \circ \dots \circ T^{-1}\alpha)^{-1}\text{Im}(T^{-r}S^{-1}d)$$

under the natural map $T^{-1}A \rightarrow Q$,

- (2) Z_r is the image of

$$(S^{-1}T^{-1}d)^{-1}\text{Im}(\alpha \circ \dots \circ T^{r-1}\alpha)$$

under the natural map $S^{-1}T^{-1}A \rightarrow S^{-1}Q$.

The differentials can be described as follows: if $x \in Z_r$, then pick $x' \in S^{-1}T^{-1}A$ mapping to x . Then $S^{-1}T^{-1}d(x')$ is $(\alpha \circ \dots \circ T^{r-1}\alpha)(y)$ for some $y \in T^{r-1}A$. Then $d_r(x) \in T^rSE_r$ is represented by the class of the image of y in $T^rSE_0 = T^rQ$ modulo T^rSB_r .

12.20. Spectral sequences: filtered differential objects

We can build a spectral sequence starting with a filtered differential object.

Definition 12.20.1. Let \mathcal{A} be an abelian category. A *filtered differential object* (K, F, d) is a filtered object (K, F) of \mathcal{A} endowed with an endomorphism $d : (K, F) \rightarrow (K, F)$ whose square is zero: $d \circ d = 0$.

To describe the spectral sequence associated to such an object we assume, for the moment, that \mathcal{A} is an abelian category which has countable direct sums and countable direct sums are exact (this is not automatic, see Remark 12.15.3). Let (K, F, d) be a filtered differential object of \mathcal{A} . Note that each F^nK is a differential object by itself. Consider the object $A = \bigoplus F^nK$ and endow it with a differential d by using d on each summand. Then (A, d) is a differential object of \mathcal{A} which comes equipped with a grading. Consider the map

$$\alpha : A \rightarrow A$$

which is given by the inclusions $F^nA \rightarrow F^{n-1}A$. This is clearly an injective morphism of differential objects $\alpha : (A, d) \rightarrow (A, d)$. Hence, by Definition 12.19.5 we

get a spectral sequence. We will call this *the spectral sequence associated to the filtered differential object* (K, F, d) .

Let us figure out the terms of this spectral sequence. First, note that $A/\alpha A = \text{gr}(K)$ endowed with its differential $d = \text{gr}(d)$. Hence we see that

$$E_0 = \text{gr}(K), \quad d_0 = \text{gr}(d).$$

Hence the homology of the graded differential object $\text{gr}(K)$ is the next term:

$$E_1 = H(\text{gr}(K), \text{gr}(d)).$$

In addition we see that E_0 is a graded object of \mathcal{A} and that d_0 is compatible with the grading. Hence clearly E_1 is a graded object as well. But it turns out that the differential d_1 does not preserve this grading; instead it shifts the degree by 1.

To work this out precisely, we define

$$Z_r^p = \frac{F^p K \cap d^{-1}(F^{p+r} K) + F^{p+1} K}{F^{p+1} K}$$

and

$$B_r^p = \frac{F^p K \cap d(F^{p-r+1} K) + F^{p+1} K}{F^{p+1} K}.$$

This notation, although quite natural, seems to be different from the notation in most places in the literature. Perhaps it does not matter, since the literature does not seem to have a consistent choice of notation either. With these choices we see that $B_r \subset E_0$, resp. $Z_r \subset E_0$ (as defined in Section 12.19) is equal to $\bigoplus_p B_r^p$, resp. $\bigoplus_p Z_r^p$. Hence if we define

$$E_r^p = Z_r^p / B_r^p$$

for $r \geq 0$ and $p \in \mathbf{Z}$, then we have $E_r = \bigoplus_p E_r^p$. We can define a differential $d_r^p : E_r^p \rightarrow E_r^{p+r}$ by the rule

$$z + F^{p+1} K \mapsto dz + F^{p+r+1} K$$

where $z \in F^p K \cap d^{-1}(F^{p+r} K)$.

Lemma 12.20.2. *Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ in $\text{Gr}(\mathcal{A})$ associated to (K, F, d) such that $d_r : E_r \rightarrow E_r[1]$ for all r and such that the graded pieces E_r^p and maps $d_r^p : E_r^p \rightarrow E_r^{p+r}$ are as given above. Furthermore, $E_0^p = \text{gr}^p K$, $d_0^p = \text{gr}^p(d)$, and $E_1^p = H(\text{gr}^p K, d)$.*

Proof. If \mathcal{A} has countable direct sums and if countable direct sums are exact, then this follows from the discussion above. In general, we proceed as follows; we strongly suggest the reader skip this proof. Consider the object $A = (F^{p+1} K)$ of $\text{Gr}(\mathcal{A})$, i.e., we put $F^{p+1} K$ in degree p (the funny shift in numbering to get numbering correct later on). We endow it with a differential d by using d on each component. Then (A, d) is a differential object of $\text{Gr}(\mathcal{A})$. Consider the map

$$\alpha : A \rightarrow A[-1]$$

which is given in degree p by the inclusions $F^{p+1} A \rightarrow F^p A$. This is clearly an injective morphism of differential objects $\alpha : (A, d) \rightarrow (A, d)[-1]$. Hence, we can apply Remark 12.19.6 with $S = \text{id}$ and $T = [1]$. The corresponding spectral sequence $(E_r, d_r)_{r \geq 0}$ in $\text{Gr}(\mathcal{A})$ is the spectral sequence we are looking for. Let us unwind the

definitions a bit. First of all we have $E_r = (E_r^p)$ is an object of $\text{Gr}(\mathcal{A})$. Then, since $T^r S = [r]$ we have $d_r : E_r \rightarrow E_r[r]$ which means that $d_r^p : E_r^p \rightarrow E_r^{p+r}$.

To see that the description of the graded pieces hold, we argue as above. Namely, first we have $E_0 = \text{Coker}(\alpha : A \rightarrow A[-1])$ and by our choice of numbering above this gives $E_0^p = \text{gr}^p K$. The first differential is given by $d_0^p = \text{gr}^p d : E_0^p \rightarrow E_0^p$. Next, the description of the boundaries B_r and the cocycles Z_r in Remark 12.19.6 translates into a straightforward manner into the formulae for Z_r^p and B_r^p given above. \square

Lemma 12.20.3. *Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . The spectral sequence $(E_r, d_r)_{r \geq 0}$ associated to (K, F, d) has*

$$d_1^p : E_1^p = H(\text{gr}^p K) \longrightarrow H(\text{gr}^{p+1} K) = E_1^{p+1}$$

equal to the boundary map in homology associated to the short exact sequence of differential objects

$$0 \rightarrow \text{gr}^{p+1} K \rightarrow F^p K / F^{p+2} K \rightarrow \text{gr}^{p+1} K \rightarrow 0.$$

Proof. Omitted. \square

Definition 12.20.4. Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . The *induced filtration* on $H(K, d)$ is the filtration defined by $F^p H(K, d) = \text{Im}(H(F^p K, d) \rightarrow H(K, d))$.

Lemma 12.20.5. *Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . If Z_∞^p and B_∞^p exist (see proof), then associated graded $\text{gr}(H(K))$ of the cohomology of K is a graded subquotient of the graded object E_∞ having $E_\infty^p = Z_\infty^p / B_\infty^p$ in degree p .*

Proof. Here we have

$$Z_\infty^p = \bigcap_r Z_r^p = \frac{\bigcap_r (F^p K \cap d^{-1}(F^{p+r} K) + F^{p+1} K)}{F^{p+1} K}$$

and

$$B_\infty^p = \bigcup_r B_r^p = \frac{\bigcup_r (F^p K \cap d(F^{p-r+1} K) + F^{p+1} K)}{F^{p+1} K}.$$

Thus

$$E_\infty^p = \frac{\bigcap_r (F^p K \cap d^{-1}(F^{p+r} K) + F^{p+1} K)}{\bigcup_r (F^p K \cap d(F^{p-r+1} K) + F^{p+1} K)}.$$

and the top and bottom exist. On the other hand, we have

$$\text{gr}^p H(K) = \frac{\text{Ker}(d) \cap F^p K + F^{p+1} K}{\text{Im}(d) \cap F^p K + F^{p+1} K}$$

The result follows since

$$(12.20.5.1) \quad \text{Ker}(d) \cap F^p K + F^{p+1} K \subset \bigcup_r (F^p K \cap d^{-1}(F^{p+r} K) + F^{p+1} K)$$

and

$$(12.20.5.2) \quad \bigcap_r (F^p K \cap d(F^{p-r+1} K) + F^{p+1} K) \subset \text{Im}(d) \cap F^p K + F^{p+1} K.$$

\square

Definition 12.20.6. Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . We say the spectral sequence associated to (K, F, d) *converges* if $\text{gr}(H(K)) = E_\infty$ via Lemma 12.20.5. In this case we also say that $(E_r, d_r)_{r \geq 0}$ *abuts to or converges to* $H(K)$.

In the literature one finds more refined notions distinguishing between “weakly converging”, “abutting” and “converging”. Namely, one can require the filtration on $H(K)$ to be either “arbitrary”, or “exhaustive and separated”, or “exhaustive and complete” in addition to the condition that $\text{gr}(H(K)) = E_\infty$. We try to avoid introducing this notation by simply adding the relevant information in the statements of the results.

Lemma 12.20.7. *Let \mathcal{A} be an abelian category. Let (K, F, d) be a filtered differential object of \mathcal{A} . The associated spectral sequence converges if and only if for every $p \in \mathbf{Z}$ we have equality in equations (12.20.5.2) and (12.20.5.1).*

Proof. Immediate from the discussions above. \square

12.21. Spectral sequences: filtered complexes

Definition 12.21.1. Let \mathcal{A} be an abelian category. A *filtered complex* K^\bullet of \mathcal{A} is a complex of $\text{Fil}(\mathcal{A})$ (see Definition 12.16.1).

We will denote the filtration on the objects by F . Thus $F^p K^n$ denotes the p th step in the filtration of the n th term of the complex. Note that each $F^p K^\bullet$ is a complex of \mathcal{A} . Hence we could also have defined a filtered complex as a filtered object in the (abelian) category of complexes of \mathcal{A} . In particular $\text{gr}K^\bullet$ is a graded object of the category of complexes of \mathcal{A} .

To describe the spectral sequence associated to such an object we assume, for the moment, that \mathcal{A} is an abelian category which has countable direct sums and countable direct sums are exact (this is not automatic, see Remark 12.15.3). Let us denote d the differential of K . Forgetting the grading we can think of $\bigoplus K^n$ as a filtered differential object of \mathcal{A} . Hence according to Section 12.20 we obtain a spectral sequence $(E_r, d_r)_{r \geq 0}$. In this section we work out the terms of this spectral sequence, and we endow the terms of this spectral sequence with additional structure coming from the grading of K .

First we point out that $E_0^p = \text{gr}^p K^\bullet$ is a complex and hence is graded. Thus E_0 is bigraded in a natural way. It is customary to use the bigrading

$$E_0 = \bigoplus_{p,q} E_0^{p,q}, \quad E_0^{p,q} = \text{gr}^p K^{p+q}$$

The idea is that $p + q$ should be thought of as the *total degree* of the (co)homology classes. Also, p is called the *filtration degree*, and q is called the *complementary degree*. The differential d_0 is compatible with this bigrading in the following way

$$d_0 = \bigoplus d_0^{p,q}, \quad d_0^{p,q} : E_0^{p,q} \rightarrow E_0^{p,q+1}.$$

Namely, d_0^p is just the differential on the complex $\text{gr}^p K^\bullet$ (which occurs as $\text{gr}^p E_0$ just shifted a bit).

To go further we identify the objects B_r^p and Z_r^p introduced in Section 12.20 as graded objects and we work out the corresponding decompositions of the differentials. We do this in a completely straightforward manner, but again we warn the

reader that our notation is not the same as notation found elsewhere. We define

$$Z_r^{p,q} = \frac{F^p K^{p+q} \cap d^{-1}(F^{p+r} K^{p+q+1}) + F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}$$

and

$$B_r^{p,q} = \frac{F^p K^{p+q} \cap d(F^{p-r+1} K^{p+q-1}) + F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}.$$

and of course $E_r^{p,q} = Z_r^{p,q}/B_r^{p,q}$. With these definitions it is completely clear that $Z_r^p = \bigoplus_q Z_r^{p,q}$, $B_r^p = \bigoplus_q B_r^{p,q}$, and $E_r^p = \bigoplus_q E_r^{p,q}$. Moreover,

$$0 \subset \dots \subset B_r^{p,q} \subset \dots \subset Z_r^{p,q} \subset \dots \subset E_0^{p,q}$$

and hence it makes sense to define $Z_\infty^{p,q} = \bigcap_r Z_r^{p,q}$ and $B_\infty^{p,q} = \bigcup_r B_r^{p,q}$ and $E_\infty^{p,q} = Z_\infty^{p,q}/B_\infty^{p,q}$ provided these exist. Also, the map d_r^p decomposes as the direct sum of the maps

$$d_r^{p,q} : E_r^{p,q} \longrightarrow E_r^{p+r,q-r+1}, \quad z + F^{p+1} K^{p+q} \mapsto dz + F^{p+r+1} K^{p+q+1}$$

where $z \in F^p K^{p+q} \cap d^{-1}(F^{p+r} K^{p+q+1})$.

Lemma 12.21.2. *Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ in the category of bigraded objects of \mathcal{A} associated to (K^\bullet, F) such that d_r has bidegree $(r, -r+1)$ and such that E_r has bigraded pieces $E_r^{p,q}$ and maps $d_r^{p,q} : E_r^{p,q} \rightarrow E_r^{p+r,q-r+1}$ as given above. Furthermore, we have $E_0^{p,q} = \text{gr}^p(K^{p+q})$, $d_0^{p,q} = \text{gr}^p(d^{p+q})$, and $E_1^{p,q} = H^{p+q}(\text{gr}^p(K^\bullet))$.*

Proof. If \mathcal{A} has countable direct sums and if countable direct sums are exact, then this follows from the discussion above. In general, we proceed as follows; we strongly suggest the reader skip this proof. Consider the bigraded object $A = (F^{p+1} K^{p+1+q})$ of \mathcal{A} , i.e., we put $F^{p+1} K^{p+1+q}$ in degree (p, q) (the funny shift in numbering to get numbering correct later on). We endow it with a differential $d : A \rightarrow A[0, 1]$ by using d on each component. Then (A, d) is a differential bigraded object. Consider the map

$$\alpha : A \rightarrow A[-1, 1]$$

which is given in degree (p, q) by the inclusion $F^{p+1} K^{p+q} \rightarrow F^p K^{p+q}$. This is an injective morphism of differential objects $\alpha : (A, d) \rightarrow (A, d)[-1, 1]$. Hence, we can apply Remark 12.19.6 with $S = [0, 1]$ and $T = [1, -1]$. The corresponding spectral sequence $(E_r, d_r)_{r \geq 0}$ of bigraded objects is the spectral sequence we are looking for. Let us unwind the definitions a bit. First of all we have $E_r = (E_r^{p,q})$. Then, since $T^r S = [r, -r+1]$ we have $d_r : E_r \rightarrow E_r[r, -r+1]$ which means that $d_r^p : E_r^{p,q} \rightarrow E_r^{p+r,q-r+1}$.

To see that the description of the graded pieces hold, we argue as above. Namely, first we have

$$E_0 = \text{Coker}(\alpha : A \rightarrow A[-1, 1])[0, -1] = \text{Coker}(\alpha[0, -1] : A[0, -1] \rightarrow A[-1, 0])$$

and by our choice of numbering above this gives

$$E_0^{p,q} = \text{Coker}(F^{p+1} K^{p+q} \rightarrow F^p K^{p+q}) = \text{gr}^p K^{p+q}$$

The first differential is given by $d_0^{p,q} = \text{gr}^p d^{p+q} : E_0^{p,q} \rightarrow E_0^{p,q+1}$. Next, the description of the boundaries B_r and the cocycles Z_r in Remark 12.19.6 translates into a straightforward manner into the formulae for $Z_r^{p,q}$ and $B_r^{p,q}$ given above. \square

Lemma 12.21.3. *Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . Assume \mathcal{A} has countable direct sums. Let $(E_r, d_r)_{r \geq 0}$ be the spectral sequence associated to (K^\bullet, F) .*

(1) *The map*

$$d_1^{p,q} : E_1^{p,q} = H^{p+q}(gr^p(K^\bullet)) \longrightarrow E_1^{p+1,q} = H^{p+q+1}(gr^{p+1}(K^\bullet))$$

is equal to the boundary map in cohomology associated to the short exact sequence of complexes

$$0 \rightarrow gr^{p+1}(K^\bullet) \rightarrow F^p K^\bullet / F^{p+2} K^\bullet \rightarrow gr^{p+1}(K^\bullet) \rightarrow 0.$$

(2) *Assume that $d(F^p K) \subset F^{p+1} K$ for all $p \in \mathbf{Z}$. Then d induces the zero differential on $gr^p(K^\bullet)$ and hence $E_1^{p,q} = gr^p(K^\bullet)^{p+q}$. Furthermore, in this case*

$$d_1^{p,q} : E_1^{p,q} = gr^p(K^\bullet)^{p+q} \longrightarrow E_1^{p,q} = gr^{p+1}(K^\bullet)^{p+q+1}$$

is the morphism induced by d .

Proof. Omitted. But compare Lemma 12.20.3. □

Lemma 12.21.4. *Let \mathcal{A} be an abelian category. Let $\alpha : (K^\bullet, F) \rightarrow (L^\bullet, F)$ be a morphism of filtered complexes of \mathcal{A} . Let $(E_r(K), d_r)_{r \geq 0}$, resp. $(E_r(L), d_r)_{r \geq 0}$ be the spectral sequence associated to (K^\bullet, F) , resp. (L^\bullet, F) . The morphism α induces a canonical morphism of spectral sequences $\{\alpha_r : E_r(K) \rightarrow E_r(L)\}_{r \geq 0}$ compatible with the bigradings.*

Proof. Obvious from the explicit representation of the terms of the spectral sequences. □

Definition 12.21.5. Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . The *induced filtration* on $H^n(K^\bullet)$ is the filtration defined by $F^p H^n(K^\bullet) = \text{Im}(H^n(F^p K^\bullet) \rightarrow H^n(K^\bullet))$.

Lemma 12.21.6. *Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . If $Z_\infty^{p,q}$ and $B_\infty^{p,q}$ exist (see above), then the associated graded $gr(H^n(K^\bullet))$ of the cohomology of K^\bullet is a graded subquotient of the graded object $\bigoplus_{p+q=n} E_\infty^{p,q}$.*

Proof. Let $q = n - p$. As in the proof of Lemma 12.20.5 we see that

$$E_\infty^{p,q} = \frac{\bigcap_r (F^p K^n \cap d^{-1}(F^{p+r} K^{n+1}) + F^{p+1} K^n)}{\bigcup_r (F^p K^n \cap d(F^{p-r+1} K^{n-1}) + F^{p+1} K^n)}.$$

On the other hand, we have

$$(12.21.6.1) \quad gr^p H^n(K) = \frac{\text{Ker}(d) \cap F^p K^n + F^{p+1} K^n}{\text{Im}(d) \cap F^p K^n + F^{p+1} K^n}$$

The result follows since

(12.21.6.2)

$$\text{Ker}(d) \cap F^p K^n + F^{p+1} K^n \subset \bigcup_r (F^p K^n \cap d^{-1}(F^{p+r} K^{n+1}) + F^{p+1} K^n)$$

and

(12.21.6.3)

$$\bigcap_r (F^p K^n \cap d(F^{p-r+1} K^{n-1}) + F^{p+1} K^n) \subset \text{Im}(d) \cap F^p K^n + F^{p+1} K^n.$$

□

Definition 12.21.7. Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . We say the spectral sequence associated to (K^\bullet, F) converges if $\text{gr}H^n(K^\bullet) = \bigoplus_{p+q=n} E_\infty^{p,q}$ for every $n \in \mathbf{Z}$.

This is often symbolized by the notation $E_r^{p,q} \Rightarrow H^{p+q}(K^\bullet)$. Please read the remarks following Definition 12.20.6.

Lemma 12.21.8. Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . The associated spectral sequence converges if and only if for every $p, q \in \mathbf{Z}$ we have equality in equations (12.21.6.3) and (12.21.6.2).

Proof. Immediate from the discussions above. □

Lemma 12.21.9. Let \mathcal{A} be an abelian category. Let (K^\bullet, F) be a filtered complex of \mathcal{A} . Assume that the filtration on each K^n is finite (see Definition 12.16.1). Then

- (1) the filtration on each $H^n(K^\bullet)$ is finite, and
- (2) the spectral sequence associated to (K^\bullet, F) converges.

Proof. Part (1) is clear from Equation (12.21.6.1). We will use Lemma 12.21.8 to prove part (2). Fix $p, n \in \mathbf{Z}$. Look at the left hand side of Equation (12.21.6.3). The expression is equal to the right hand side since $F^m K^{n-1} = 0$ for $m \ll 0$. Similarly, use $F^m K^{n+1} = K^{n+1}$ for $m \gg 0$ to prove equality in Equation (12.21.6.2). □

12.22. Spectral sequences: double complexes

Definition 12.22.1. Let \mathcal{A} be an additive category. A double complex in \mathcal{A} is given by a system $(\{A^{p,q}, d_1^{p,q}, d_2^{p,q}\}_{p,q \in \mathbf{Z}})$, where each $A^{p,q}$ is an object of \mathcal{A} and $d_1^{p,q} : A^{p,q} \rightarrow A^{p+1,q}$ and $d_2^{p,q} : A^{p,q} \rightarrow A^{p,q+1}$ are morphisms of \mathcal{A} such that the following rules hold:

- (1) $d_1^{p+1,q} \circ d_1^{p,q} = 0$
- (2) $d_2^{p,q+1} \circ d_2^{p,q} = 0$
- (3) $d_1^{p,q+1} \circ d_2^{p,q} = d_2^{p+1,q} \circ d_1^{p,q}$

for all $p, q \in \mathbf{Z}$.

This is just the cochain version of the definition. It says that each $A^{p,\bullet}$ is a cochain complex and that each $d_1^{p,\bullet}$ is a morphism of complexes $A^{p,\bullet} \rightarrow A^{p+1,\bullet}$ such that $d_1^{p+1,\bullet} \circ d_1^{p,\bullet} = 0$ as morphisms of complexes. In other words a double complex can be seen as a complex of complexes. So in the diagram

any square commutes. Warning: In the literature one encounters a different definition where a “bicomplex” or a “double complex” has the property that the squares in the diagram anti-commute.

Example 12.22.2. Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Suppose that

$$\otimes : \mathcal{A} \times \mathcal{B} \longrightarrow \mathcal{C}, \quad (X, Y) \longmapsto X \otimes Y$$

is a functor which is bilinear on morphisms, see Categories, Definition 4.2.20 for the definition of $\mathcal{A} \times \mathcal{B}$. Given a complexes X^\bullet of \mathcal{A} and Y^\bullet of \mathcal{B} we obtain a double complex

$$K^{\bullet, \bullet} = X^\bullet \otimes Y^\bullet$$

in \mathcal{C} . Here the first differential $K^{p,q} \rightarrow K^{p+1,q}$ is the morphism $X^p \otimes Y^q \rightarrow X^{p+1} \otimes Y^q$ induced by the morphism $X^p \rightarrow X^{p+1}$ and the identity on Y^q . Similarly for the second differential.

Let $A^{\bullet, \bullet}$ be a double complex. It is customary to denote $H_I^p(A^{\bullet, \bullet})$ the complex with terms $\text{Ker}(d_1^{p,q})/\text{Im}(d_1^{p-1,q})$ (varying q) and differential induced by d_2 . Then $H_{II}^q(H_I^p(A^{\bullet, \bullet}))$ denotes its cohomology in degree q . It is also customary to denote $H_I^q(A^{\bullet, \bullet})$ the complex with terms $\text{Ker}(d_2^{p,q})/\text{Im}(d_2^{p,q-1})$ (varying p) and differential induced by d_1 . Then $H_{II}^p(H_I^q(A^{\bullet, \bullet}))$ denotes its cohomology in degree p . It will turn out that these cohomology groups show up as the terms in the spectral sequence for a filtration on the associated total complex.

Definition 12.22.3. Let \mathcal{A} be an additive category. Let $A^{\bullet, \bullet}$ be a double complex. The *associated simple complex* sA^\bullet , also sometimes called the *associated total complex* is given by

$$sA^n = \bigoplus_{n=p+q} A^{p,q}$$

(if it exists) with differential

$$d_{sA}^n = \sum_{n=p+q} (d_1^{p,q} + (-1)^p d_2^{p,q})$$

Alternatively, we sometimes write $\text{Tot}(A^{\bullet, \bullet})$ to denote this complex.

If countable direct sums exist in \mathcal{A} or if for each n at most finitely many $A^{p,n-p}$ are nonzero, then sA^\bullet exists. Note that the definition is *not* symmetric in the indices (p, q) .

There are two natural filtrations on the simple complex sA^\bullet associated to the double complex $A^{\bullet, \bullet}$. Namely, we define

$$F_I^p(sA^n) = \bigoplus_{i+j=n, i \geq p} A^{i,j} \quad \text{and} \quad F_{II}^p(sA^n) = \bigoplus_{i+j=n, j \geq p} A^{i,j}.$$

It is immediately verified that (sA^\bullet, F_I) and (sA^\bullet, F_{II}) are filtered complexes. By Section 12.21 we obtain two spectral sequences. It is customary to denote $({}'E_r, {}'d_r)_{r \geq 0}$ the spectral sequence associated to the filtration F_I and to denote $({}''E_r, {}''d_r)_{r \geq 0}$ the spectral sequence associated to the filtration F_{II} . Here is a description of these spectral sequences.

Lemma 12.22.4. *Let \mathcal{A} be an abelian category. Let $K^{\bullet, \bullet}$ be a double complex. The spectral sequences associated to $K^{\bullet, \bullet}$ have the following terms:*

- (1) $'E_0^{p,q} = K^{p,q}$ with $'d_0^{p,q} = (-1)^p d_2^{p,q} : K^{p,q} \rightarrow K^{p,q+1}$,
- (2) $''E_0^{p,q} = K^{q,p}$ with $''d_0^{p,q} = d_1^{q,p} : K^{q,p} \rightarrow K^{q+1,p}$,
- (3) $'E_1^{p,q} = H^q(K^{p, \bullet})$ with $'d_1^{p,q} = H^q(d_1^{p, \bullet})$,
- (4) $''E_1^{p,q} = H^q(K^{\bullet, p})$ with $''d_1^{p,q} = (-1)^q H^q(d_2^{\bullet, p})$,
- (5) $'E_2^{p,q} = H_I^p(H_{II}^q(K^{\bullet, \bullet}))$,
- (6) $''E_2^{p,q} = H_{II}^p(H_I^q(K^{\bullet, \bullet}))$.

Proof. Omitted. □

These spectral sequences define two filtrations on $H^n(sK^\bullet)$. We will denote these F_I and F_{II} .

Definition 12.22.5. Let \mathcal{A} be an abelian category. Let $K^{\bullet,\bullet}$ be a double complex. We say the spectral sequence $({}^I E_r, {}^I d_r)_{r \geq 0}$ converges if Definition 12.21.7 applies. In other words, for all n

$$\text{gr}_{F_I}(H^n(sK^\bullet)) = \bigoplus_{p+q=n} {}^I E_\infty^{p,q}$$

via the canonical comparison of Lemma 12.21.6. Similarly we say the spectral sequence $({}^{II} E_r, {}^{II} d_r)_{r \geq 0}$ converges if Definition 12.21.7 applies. In other words for all n

$$\text{gr}_{F_{II}}(H^n(sK^\bullet)) = \bigoplus_{p+q=n} {}^{II} E_\infty^{p,q}$$

via the canonical comparison of Lemma 12.21.6.

Same caveats as those following Definition 12.20.6.

Lemma 12.22.6 (First quadrant spectral sequence). *Let \mathcal{A} be an abelian category. Let $K^{\bullet,\bullet}$ be a double complex. Assume that for every $n \in \mathbf{Z}$ there are only finitely many nonzero $K^{p,q}$ with $p+q=n$. Then*

- (1) *the filtrations F_I, F_{II} on each $H^n(K^\bullet)$ are finite,*
- (2) *the spectral sequence $({}^I E_r, {}^I d_r)_{r \geq 0}$ converges, and*
- (3) *the spectral sequence $({}^{II} E_r, {}^{II} d_r)_{r \geq 0}$ converges.*

Proof. Follows immediately from Lemma 12.21.9. □

Here is our first application of spectral sequences.

Lemma 12.22.7. *Let \mathcal{A} be an abelian category. Let K^\bullet be a complex. Let $A^{\bullet,\bullet}$ be a double complex. Let $\alpha^p : K^p \rightarrow A^{p,0}$ be morphisms. Assume that*

- (1) *For every $n \in \mathbf{Z}$ there are only finitely many nonzero $A^{p,q}$ with $p+q=n$.*
- (2) *We have $A^{p,q} = 0$ if $q < 0$.*
- (3) *The morphisms α^p give rise to a morphism of complexes $\alpha : K^\bullet \rightarrow A^{\bullet,0}$.*
- (4) *The complex $A^{p,\bullet}$ is exact in all degrees $q \neq 0$ and the morphism $K^p \rightarrow A^{p,0}$ induces an isomorphism $K^p \rightarrow \text{Ker}(d_2^{p,0})$.*

Then α induces a quasi-isomorphism

$$K^\bullet \longrightarrow sA^\bullet$$

of complexes. Moreover, there is a variant of this lemma involving the second variable q instead of p .

Proof. The map is simply the map given by the morphisms $K^n \rightarrow A^{n,0} \rightarrow sA^n$, which are easily seen to define a morphism of complexes. Consider the spectral sequence $({}^I E_r, {}^I d_r)_{r \geq 0}$ associated to the double complex $A^{\bullet,\bullet}$. By Lemma 12.22.6 this spectral sequence converges and the induced filtration on $H^n(sA^\bullet)$ is finite for each n . By Lemma 12.22.4 and assumption (4) we have ${}^I E_1^{p,q} = 0$ unless $q = 0$ and ${}^I E_1^{p,0} = K^p$ with differential ${}^I d_1^{p,0}$ identified with d_K^p . Hence ${}^I E_2^{p,0} = H^p(K^\bullet)$ and zero otherwise. This clearly implies $d_2^{p,q} = d_3^{p,q} = \dots = 0$ for degree reasons. Hence we conclude that $H^n(sA^\bullet) = H^n(K^\bullet)$. We omit the verification that this identification is given by the morphism of complexes $K^\bullet \rightarrow sA^\bullet$ introduced above. □

Remark 12.22.8. Let \mathcal{A} be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a weak Serre subcategory (see Definition 12.9.1). Suppose that $K^{\bullet,\bullet}$ is a double complex to which Lemma 12.22.6 applies such that for some $r \geq 0$ all the objects $'E_r^{p,q}$ belong to \mathcal{C} . We claim all the cohomology groups $H^n(sK^\bullet)$ belong to \mathcal{C} . Namely, the assumptions imply that the kernels and images of $'d_r^{p,q}$ are in \mathcal{C} . Whereupon we see that each $'E_{r+1}^{p,q}$ is in \mathcal{C} . By induction we see that each $'E_\infty^{p,q}$ is in \mathcal{C} . Hence each $H^n(sK^\bullet)$ has a finite filtration whose subquotients are in \mathcal{C} . Using that \mathcal{C} is closed under extensions we conclude that $H^n(sK^\bullet)$ is in \mathcal{C} as claimed.

The same result holds for the second spectral sequence associated to $K^{\bullet,\bullet}$. Similarly, if (K^\bullet, F) is a filtered complex to which Lemma 12.21.9 applies and for some $r \geq 0$ all the objects $E_r^{p,q}$ belong to \mathcal{C} , then each $H^n(K^\bullet)$ is an object of \mathcal{C} .

Remark 12.22.9. Let \mathcal{A} be an additive category. Let $A^{\bullet,\bullet,\bullet}$ be a triple complex. The associated total complex is the complex with terms

$$\text{Tot}^n(A^{\bullet,\bullet,\bullet}) = \bigoplus_{p+q+r=n} A^{p,q,r}$$

and differential

$$d_{\text{Tot}(A^{\bullet,\bullet,\bullet})}^n = \sum_{p+q+r=n} d_1^{p,q,r} + (-1)^p d_2^{p,q,r} + (-1)^{p+q} d_3^{p,q,r}$$

With this definition a simple calculation shows that the associated total complex is equal to

$$\text{Tot}(A^{\bullet,\bullet,\bullet}) = \text{Tot}(\text{Tot}_{12}(A^{\bullet,\bullet,\bullet})) = \text{Tot}(\text{Tot}_{23}(A^{\bullet,\bullet,\bullet}))$$

In other words, we can either first combine the first two of the variables and then combine sum of those with the last, or we can first combine the last two variables and then combine the first with the sum of the last two.

Lemma 12.22.10. Let M^\bullet be a complex of abelian groups. Let

$$\dots \rightarrow A_2^\bullet \rightarrow A_1^\bullet \rightarrow A_0^\bullet \rightarrow M^\bullet \rightarrow 0$$

be an exact complex of complexes of abelian groups such that for all $p \in \mathbf{Z}$ the complexes

$$\dots \rightarrow \text{Ker}(d_{A_2}^p) \rightarrow \text{Ker}(d_{A_1}^p) \rightarrow \text{Ker}(d_{A_0}^p) \rightarrow \text{Ker}(d_{M^\bullet}^p) \rightarrow 0$$

are exact as well. Set $A^p = A_{-p}^q$ to obtain a double complex. Then $\text{Tot}(A^{\bullet,\bullet}) \rightarrow M^\bullet$ induced by $A_0^\bullet \rightarrow M^\bullet$ is a quasi-isomorphism.

Proof. Write $T^\bullet = \text{Tot}(A^{\bullet,\bullet})$. Let $x \in \text{Ker}(d_T^0)$ represent a cohomology class ξ . Write $x = \sum_{i=n,\dots,0} x_i$ with $x_i \in A_i^i$. Assume $n > 0$. Then x_n is in the kernel of $d_{A_n}^n$ and maps to zero in the cohomology of A_{n-1}^\bullet (because it maps to an element which is the boundary of x_{n-1} up to sign). The condition on exactness of kernels of differentials implies that the cohomology class of x_n is in the image of $H^n(A_{n+1}^\bullet) \rightarrow H^n(A_n^\bullet)$ (details omitted). Thus we can modify x by a boundary and reach the situation where x_n is a boundary. Modifying x once more we see that we may assume $x_n = 0$. By induction we see that every cohomology class ξ is represented by a cocycle $x = x_0$. Finally, the condition on exactness of kernels tells us two such cocycles x_0 and x'_0 are cohomologous if and only if their image in $H^0(M^\bullet)$ are the same. \square

Lemma 12.22.11. *Let M^\bullet be a complex of abelian groups. Let*

$$0 \rightarrow M^\bullet \rightarrow A_0^\bullet \rightarrow A_1^\bullet \rightarrow A_2^\bullet \rightarrow \dots$$

be an exact complex of complexes of abelian groups such that for all $p \in \mathbf{Z}$ the complexes

$$0 \rightarrow \text{Coker}(d_{M^\bullet}^p) \rightarrow \text{Coker}(d_{A_0^\bullet}^p) \rightarrow \text{Coker}(d_{A_1^\bullet}^p) \rightarrow \text{Coker}(d_{A_2^\bullet}^p) \rightarrow \dots$$

are exact as well. Set $A^{p,q} = A_p^q$ to obtain a double complex. Let $\text{Tot}_\pi(A^{\bullet,\bullet})$ be the product total complex associated to the double complex (see proof). Then the map $M^\bullet \rightarrow \text{Tot}_\pi(A^{\bullet,\bullet})$ induced by $M^\bullet \rightarrow A_0^\bullet$ is a quasi-isomorphism.

Proof. Abbreviating $T^\bullet = \text{Tot}_\pi(A^{\bullet,\bullet})$ we define

$$T^n = \prod_{p+q=n} A^{p,q} = \prod_{p+q=n} A_p^q$$

As differential we use

$$d((x_{p,q})) = (f_p(x_{p-1,q}) + (-1)^p d_{A_p^\bullet}(x_{p,q-1}))$$

Let $x \in \text{Ker}(d_{T^\bullet}^0)$ represent a cohomology class $\xi \in H^0(T^\bullet)$. Write $x = (x_i)$ with $x_i \in A_i^{-i}$. Note that x_0 maps to zero in $\text{Coker}(A_1^{-1} \rightarrow A_1^0)$. Hence we see that $x_0 = m_0 + d(y)$ for some $m_0 \in M^0$. Then $d(m_0) = 0$ because $d(x_0) = 0$ as x is a cocycle. Thus, replacing ξ by something in the image of $H^0(M^\bullet) \rightarrow H^0(T^\bullet)$ we may assume that x_0 is in the image of $d : A_0^{-1} \rightarrow A_0^0$.

Assume $x_0 \in \text{Im}(A_0^{-1} \rightarrow A_0^0)$. We claim that in this case $\xi = 0$. To prove this we find, by induction on n elements y_1, \dots, y_n with $y_i \in A_i^{-i-1}$ such that $x_0 = d(y_0)$ and $x_j = f_{j-1}(y_{j-1}) + (-1)^j d(y_j)$. This is clear for $n = 0$. Proof of induction step is omitted. Taking $y = (y_i)$ we find that $d(y) = \xi$.

This shows that $H^0(M^\bullet) \rightarrow H^0(T^\bullet)$ is surjective. We omit the proof of injectivity. □

12.23. Injectives

Definition 12.23.1. Let \mathcal{A} be an abelian category. An object $J \in \text{Ob}(\mathcal{A})$ is called *injective* if for every injection $A \hookrightarrow B$ and every morphism $A \rightarrow J$ there exists a morphism $B \rightarrow J$ making the following diagram commute

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \nearrow \\ J & & \end{array}$$

Here is the obligatory characterization of injective objects.

Lemma 12.23.2. *Let \mathcal{A} be an abelian category. Let I be an object of \mathcal{A} . The following are equivalent:*

- (1) *The object I is injective.*
- (2) *The functor $B \mapsto \text{Hom}_{\mathcal{A}}(B, I)$ is exact.*
- (3) *Any short exact sequence*

$$0 \rightarrow I \rightarrow A \rightarrow B \rightarrow 0$$

in \mathcal{A} is split.

- (4) *We have $\text{Ext}_{\mathcal{A}}(B, I) = 0$ for all $B \in \text{Ob}(\mathcal{A})$.*

Proof. Omitted. □

Lemma 12.23.3. *Let \mathcal{A} be an abelian category. Suppose I_ω , $\omega \in \Omega$ is a set of injective objects of \mathcal{A} . If $\prod_{\omega \in \Omega} I_\omega$ exists then it is injective.*

Proof. Omitted. □

Definition 12.23.4. Let \mathcal{A} be an abelian category. We say \mathcal{A} has *enough injectives* if every object A has an injective morphism $A \rightarrow J$ into an injective object J .

Definition 12.23.5. Let \mathcal{A} be an abelian category. We say that \mathcal{A} has *functorial injective embeddings* if there exists a functor

$$J : \mathcal{A} \longrightarrow \text{Arrows}(\mathcal{A})$$

such that

- (1) $s \circ J = \text{id}_{\mathcal{A}}$,
- (2) for any object $A \in \text{Ob}(\mathcal{A})$ the morphism $J(A)$ is injective, and
- (3) for any object $A \in \text{Ob}(\mathcal{A})$ the object $t(J(A))$ is an injective object of \mathcal{A} .

We will denote such a functor by $A \mapsto (A \rightarrow J(A))$.

12.24. Projectives

Definition 12.24.1. Let \mathcal{A} be an abelian category. An object $P \in \text{Ob}(\mathcal{A})$ is called *projective* if for every surjection $A \rightarrow B$ and every morphism $P \rightarrow B$ there exists a morphism $P \rightarrow A$ making the following diagram commute

$$\begin{array}{ccc} A & \longrightarrow & B \\ \uparrow & & \nearrow \\ P & & \end{array}$$

Here is the obligatory characterization of projective objects.

Lemma 12.24.2. *Let \mathcal{A} be an abelian category. Let P be an object of \mathcal{A} . The following are equivalent:*

- (1) *The object P is projective.*
- (2) *The functor $B \mapsto \text{Hom}_{\mathcal{A}}(P, B)$ is exact.*
- (3) *Any short exact sequence*

$$0 \rightarrow A \rightarrow B \rightarrow P \rightarrow 0$$

in \mathcal{A} is split.

- (4) *We have $\text{Ext}_{\mathcal{A}}(P, A) = 0$ for all $A \in \text{Ob}(\mathcal{A})$.*

Proof. Omitted. □

Lemma 12.24.3. *Let \mathcal{A} be an abelian category. Suppose P_ω , $\omega \in \Omega$ is a set of projective objects of \mathcal{A} . If $\prod_{\omega \in \Omega} P_\omega$ exists then it is projective.*

Proof. Omitted. □

Definition 12.24.4. Let \mathcal{A} be an abelian category. We say \mathcal{A} has *enough projectives* if every object A has a surjective morphism $P \rightarrow A$ from a projective object P onto it.

Definition 12.24.5. Let \mathcal{A} be an abelian category. We say that \mathcal{A} has *functorial projective surjections* if there exists a functor

$$P : \mathcal{A} \longrightarrow \text{Arrows}(\mathcal{A})$$

such that

- (1) $t \circ J = \text{id}_{\mathcal{A}}$,
- (2) for any object $A \in \text{Ob}(\mathcal{A})$ the morphism $P(A)$ is surjective, and
- (3) for any object $A \in \text{Ob}(\mathcal{A})$ the object $s(P(A))$ is an projective object of \mathcal{A} .

We will denote such a functor by $A \mapsto (P(A) \rightarrow A)$.

12.25. Injectives and adjoint functors

Here are some lemmas on adjoint functors and their relationship with injectives. See also Lemma 12.7.3.

Lemma 12.25.1. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume*

- (1) *u is right adjoint to v , and*
- (2) *v transforms injective maps into injective maps.*

Then u transforms injectives into injectives.

Proof. Let I be an injective object of \mathcal{A} . Let $\varphi : N \rightarrow M$ be an injective map in \mathcal{B} and let $\alpha : N \rightarrow uI$ be a morphism. By adjointness we get a morphism $\alpha : vN \rightarrow I$ and by assumption $v\varphi : vN \rightarrow vM$ is injective. Hence as I is an injective object we get a morphism $\beta : vM \rightarrow I$ extending α . By adjointness again this corresponds to a morphism $\beta : M \rightarrow uI$ as desired. \square

Remark 12.25.2. Let $\mathcal{A}, \mathcal{B}, u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be as in Lemma 12.25.1. In the presence of assumption (1) assumption (2) is equivalent to requiring that v is exact. Moreover, condition (2) is necessary. Here is an example. Let $A \rightarrow B$ be a ring map. Let $u : \text{Mod}_B \rightarrow \text{Mod}_A$ be $u(N) = N_A$ and let $v : \text{Mod}_A \rightarrow \text{Mod}_B$ be $v(M) = M \otimes_A B$. Then u is right adjoint to v , and u is exact and v is right exact, but v does not transform injective maps into injective maps in general (i.e., v is not left exact). Moreover, it is **not** the case that u transforms injective B -modules into injective A -modules. For example, if $A = \mathbf{Z}$ and $B = \mathbf{Z}/p\mathbf{Z}$, then the injective B -module $\mathbf{Z}/p\mathbf{Z}$ is not an injective \mathbf{Z} -module. In fact, the lemma applies to this example if and only if the ring map $A \rightarrow B$ is flat.

Lemma 12.25.3. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume*

- (1) *u is right adjoint to v ,*
- (2) *v transforms injective maps into injective maps,*
- (3) *\mathcal{A} has enough injectives, and*
- (4) *$vB = 0$ implies $B = 0$ for any $B \in \text{Ob}(\mathcal{B})$.*

Then \mathcal{B} has enough injectives.

Proof. Pick $B \in \text{Ob}(\mathcal{B})$. Pick an injection $vB \rightarrow I$ for I an injective object of \mathcal{A} . According to Lemma 12.25.1 and the assumptions the corresponding map $B \rightarrow uI$ is the injection of B into an injective object. \square

Remark 12.25.4. Let \mathcal{A} , \mathcal{B} , $u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be as in Lemma 12.25.3. In the presence of conditions (1) and (2) condition (4) is equivalent to v being faithful. Moreover, condition (4) is needed. An example is to consider the case where the functors u and v are both the zero functor.

Lemma 12.25.5. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume*

- (1) u is right adjoint to v ,
- (2) v transforms injective maps into injective maps,
- (3) \mathcal{A} has enough injectives,
- (4) $vB = 0$ implies $B = 0$ for any $B \in \text{Ob}(\mathcal{B})$, and
- (5) \mathcal{A} has functorial injective hulls.

Then \mathcal{B} has functorial injective hulls.

Proof. Let $A \mapsto (A \rightarrow J(A))$ be a functorial injective hull on \mathcal{A} . Then $B \mapsto (B \rightarrow uJ(vB))$ is a functorial injective hull on \mathcal{B} . Compare with the proof of Lemma 12.25.3. \square

Lemma 12.25.6. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $u : \mathcal{A} \rightarrow \mathcal{B}$ be a functor. If there exists a subset $\mathcal{P} \subset \text{Ob}(\mathcal{B})$ such that*

- (1) every object of \mathcal{B} is a quotient of an element of \mathcal{P} , and
- (2) for every $P \in \mathcal{P}$ there exists an object Q of \mathcal{A} such that $\text{Hom}_{\mathcal{A}}(Q, A) = \text{Hom}_{\mathcal{B}}(P, u(A))$ functorially in A ,

then there exists a left adjoint v of u .

Proof. By the Yoneda lemma (Categories, Lemma 4.3.5) the object Q of \mathcal{A} corresponding to P is defined up to unique isomorphism by the formula $\text{Hom}_{\mathcal{A}}(Q, A) = \text{Hom}_{\mathcal{B}}(P, u(A))$. Let us write $Q = v(P)$. Denote $i_P : P \rightarrow u(v(P))$ the map corresponding to $\text{id}_{v(P)}$ in $\text{Hom}_{\mathcal{A}}(v(P), v(P))$. Functoriality in (2) implies that the bijection is given by

$$\text{Hom}_{\mathcal{A}}(v(P), A) \rightarrow \text{Hom}_{\mathcal{B}}(P, u(A)), \quad \varphi \mapsto u(\varphi) \circ i_P$$

For any pair of elements $P_1, P_2 \in \mathcal{P}$ there is a canonical map

$$\text{Hom}_{\mathcal{B}}(P_2, P_1) \rightarrow \text{Hom}_{\mathcal{A}}(v(P_2), v(P_1)), \quad \varphi \mapsto v(\varphi)$$

which is characterized by the rule $u(v(\varphi)) \circ i_{P_2} = i_{P_1} \circ \varphi$ in $\text{Hom}_{\mathcal{B}}(P_2, u(v(P_1)))$. Note that $\varphi \mapsto v(\varphi)$ is compatible with composition; this can be seen directly from the characterization. Hence $P \mapsto v(P)$ is a functor from the full subcategory of \mathcal{B} whose objects are the elements of \mathcal{P} .

Given an arbitrary object B of \mathcal{B} choose an exact sequence

$$P_2 \rightarrow P_1 \rightarrow B \rightarrow 0$$

which is possible by assumption (1). Define $v(B)$ to be the object of \mathcal{A} fitting into the exact sequence

$$v(P_2) \rightarrow v(P_1) \rightarrow v(B) \rightarrow 0$$

Then

$$\begin{aligned} \text{Hom}_{\mathcal{A}}(v(B), A) &= \text{Ker}(\text{Hom}_{\mathcal{A}}(v(P_1), A) \rightarrow \text{Hom}_{\mathcal{A}}(v(P_2), A)) \\ &= \text{Ker}(\text{Hom}_{\mathcal{B}}(P_1, u(A)) \rightarrow \text{Hom}_{\mathcal{B}}(P_2, u(A))) \\ &= \text{Hom}_{\mathcal{B}}(B, u(A)) \end{aligned}$$

Hence we see that we may take $\mathcal{P} = \text{Ob}(\mathcal{B})$, i.e., we see that v is everywhere defined. \square

12.26. Essentially constant systems

In this section we discuss essentially constant systems with values in additive categories.

Lemma 12.26.1. *Let \mathcal{I} be a category, let \mathcal{A} be a pre-additive Karoubian category, and let $M : \mathcal{I} \rightarrow \mathcal{A}$ be a diagram.*

- (1) *Assume \mathcal{I} is filtered. The following are equivalent*
 - (a) *M is essentially constant,*
 - (b) *$X = \text{colim } M$ exists and there exists a cofinal filtered subcategory $\mathcal{I}' \subset \mathcal{I}$ and for $i' \in \text{Ob}(\mathcal{I}')$ a direct sum decomposition $M_{i'} = X_{i'} \oplus Z_{i'}$ such that $X_{i'}$ maps isomorphically to X and $Z_{i'}$ to zero in $M_{i''}$ for some $i' \rightarrow i''$ in \mathcal{I}' .*
- (2) *Assume \mathcal{I} is cofiltered. The following are equivalent*
 - (a) *M is essentially constant,*
 - (b) *$X = \lim M$ exists and there exists an initial cofiltered subcategory $\mathcal{I}' \subset \mathcal{I}$ and for $i' \in \text{Ob}(\mathcal{I}')$ a direct sum decomposition $M_{i'} = X_{i'} \oplus Z_{i'}$ such that X maps isomorphically to $X_{i'}$ and $M_{i''} \rightarrow Z_{i'}$ is zero for some $i'' \rightarrow i'$ in \mathcal{I}' .*

Proof. Assume (1)(a), i.e., \mathcal{I} is filtered and M is essentially constant. Let $X = \text{colim } M_i$. Choose i and $X \rightarrow M_i$ as in Categories, Definition 4.22.1. Let \mathcal{I}' be the full subcategory consisting of objects which are the target of a morphism with source i . Suppose $i' \in \text{Ob}(\mathcal{I}')$ and choose a morphism $i \rightarrow i'$. Then $X \rightarrow M_i \rightarrow M_{i'}$ composed with $M_{i'} \rightarrow X$ is the identity on X . As \mathcal{A} is Karoubian, we find a direct summand decomposition $M_{i'} = X_{i'} \oplus Z_{i'}$, where $Z_{i'} = \text{Ker}(M_{i'} \rightarrow X)$ and $X_{i'}$ maps isomorphically to X . Pick $i \rightarrow k$ and $i' \rightarrow k$ such that $M_{i'} \rightarrow X \rightarrow M_i \rightarrow M_k$ equals $M_{i'} \rightarrow M_k$ as in Categories, Definition 4.22.1. Then we see that $M_{i'} \rightarrow M_k$ annihilates $Z_{i'}$. Thus (1)(b) holds.

Assume (1)(b), i.e., \mathcal{I} is filtered and we have $\mathcal{I}' \subset \mathcal{I}$ and for $i' \in \text{Ob}(\mathcal{I}')$ a direct sum decomposition $M_{i'} = X_{i'} \oplus Z_{i'}$ as stated in the lemma. To see that M is essentially constant we can replace \mathcal{I} by \mathcal{I}' , see Categories, Lemmas 4.22.8 and 4.17.2. Pick any $i \in \text{Ob}(\mathcal{I})$ and denote $X \rightarrow M_i$ the inverse of the isomorphism $X_i \rightarrow X$ followed by the inclusion map $X_i \rightarrow M_i$. If j is a second object, then choose $j \rightarrow k$ such that $Z_j \rightarrow M_k$ is zero. Since \mathcal{I} is filtered we may also assume there is a morphism $i \rightarrow k$ (after possibly increasing k). Then $M_j \rightarrow X \rightarrow M_i \rightarrow M_k$ and $M_j \rightarrow M_k$ both annihilate Z_j . Thus after postcomposing by a morphism $M_k \rightarrow M_l$ which annihilates the summand Z_k , we find that $M_j \rightarrow X \rightarrow M_i \rightarrow M_l$ and $M_j \rightarrow M_l$ are equal, i.e., M is essentially constant.

The proof of (2) is dual. \square

Lemma 12.26.2. *Let \mathcal{I} be a category. Let \mathcal{A} be an additive, Karoubian category. Let $F : \mathcal{I} \rightarrow \mathcal{A}$ and $G : \mathcal{I} \rightarrow \mathcal{A}$ be functors. The following are equivalent*

- (1) *$\text{colim}_{\mathcal{I}} F \oplus G$ exists, and*
- (2) *$\text{colim}_{\mathcal{I}} F$ and $\text{colim}_{\mathcal{I}} G$ exist.*

In this case $\text{colim}_{\mathcal{I}} F \oplus G = \text{colim}_{\mathcal{I}} F \oplus \text{colim}_{\mathcal{I}} G$.

Proof. Assume (1) holds. Set $W = \operatorname{colim}_{\mathcal{I}} F \oplus G$. Note that the projection onto F defines natural transformation $F \oplus G \rightarrow F \oplus G$ which is idempotent. Hence we obtain an idempotent endomorphism $W \rightarrow W$ by Categories, Lemma 4.14.7. Since \mathcal{A} is Karoubian we get a corresponding direct sum decomposition $W = X \oplus Y$, see Lemma 12.4.2. A straightforward argument (omitted) shows that $X = \operatorname{colim}_{\mathcal{I}} F$ and $Y = \operatorname{colim}_{\mathcal{I}} G$. Thus (2) holds. We omit the proof that (2) implies (1). \square

Lemma 12.26.3. *Let \mathcal{I} be a filtered category. Let \mathcal{A} be an additive, Karoubian category. Let $F : \mathcal{I} \rightarrow \mathcal{A}$ and $G : \mathcal{I} \rightarrow \mathcal{A}$ be functors. The following are equivalent*

- (1) $F \oplus G : \mathcal{I} \rightarrow \mathcal{A}$ is essentially constant, and
- (2) F and G are essentially constant.

Proof. Assume (1) holds. In particular $W = \operatorname{colim}_{\mathcal{I}} F \oplus G$ exists and hence by Lemma 12.26.2 we have $W = X \oplus Y$ with $X = \operatorname{colim}_{\mathcal{I}} F$ and $Y = \operatorname{colim}_{\mathcal{I}} G$. A straightforward argument (omitted) using for example the characterization of Categories, Lemma 4.22.6 shows that F is essentially constant with value X and G is essentially constant with value Y . Thus (2) holds. The proof that (2) implies (1) is omitted. \square

12.27. Inverse systems

Let \mathcal{C} be a category. In Categories, Section 4.21 we defined the notion of an inverse system over a partially ordered set (with values in the category \mathcal{C}). If the partially ordered set is $\mathbf{N} = \{1, 2, 3, \dots\}$ with the usual ordering such an inverse system over \mathbf{N} is often simply called an *inverse system*. It consists quite simply of a pair $(M_i, f_{ii'})$ where each M_i , $i \in \mathbf{N}$ is an object of \mathcal{C} , and for each $i > i'$, $i, i' \in \mathbf{N}$ a morphism $f_{ii'} : M_i \rightarrow M_{i'}$ such that moreover $f_{ii''} \circ f_{i'i''} = f_{ii'}$ whenever this makes sense. It is clear that in fact it suffices to give the morphisms $M_2 \rightarrow M_1$, $M_3 \rightarrow M_2$, and so on. Hence an inverse system is frequently pictured as follows

$$M_1 \xleftarrow{\varphi_2} M_2 \xleftarrow{\varphi_3} M_3 \leftarrow \dots$$

Moreover, we often omit the transition maps φ_i from the notation and we simply say “let (M_i) be an inverse system”.

The collection of all inverse systems with values in \mathcal{C} forms a category with the obvious notion of morphism.

Lemma 12.27.1. *Let \mathcal{C} be a category.*

- (1) *If \mathcal{C} is an additive category, then the category of inverse systems with values in \mathcal{C} is an additive category.*
- (2) *If \mathcal{C} is an abelian category, then the category of inverse systems with values in \mathcal{C} is an abelian category. A sequence $(K_i) \rightarrow (L_i) \rightarrow (M_i)$ of inverse systems is exact if and only if each $K_i \rightarrow L_i \rightarrow M_i$ is exact.*

Proof. Omitted. \square

The limit (see Categories, Section 4.21) of such an inverse system is denoted $\lim M_i$, or $\lim_i M_i$. If \mathcal{C} is the category of abelian groups (or sets), then the limit always exists and in fact can be described as follows

$$\lim_i M_i = \{(x_i) \in \prod M_i \mid \varphi_i(x_i) = x_{i-1}, i = 2, 3, \dots\}$$

see Categories, Section 4.15. However, given a short exact sequence

$$0 \rightarrow (A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow 0$$

of inverse systems of abelian groups it is not always the case that the associated system of limits is exact. In order to discuss this further we introduce the following notion.

Definition 12.27.2. Let \mathcal{C} be an abelian category. We say the inverse system (A_i) satisfies the *Mittag-Leffler condition*, or for short is *ML*, if for every i there exists a $c = c(i) \geq i$ such that

$$\text{Im}(A_k \rightarrow A_i) = \text{Im}(A_c \rightarrow A_i)$$

for all $k \geq c$.

It turns out that the Mittag-Leffler condition is good enough to ensure that the lim-functor is exact, provided one works within the abelian category of abelian groups, or abelian sheaves, etc. It is shown in a paper by A. Neeman (see [Nee02]) that this condition is not strong enough in a general abelian category (where limits of inverse systems exist).

Lemma 12.27.3. *Let*

$$0 \rightarrow (A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow 0$$

be a short exact sequence of inverse systems of abelian groups.

(1) *In any case the sequence*

$$0 \rightarrow \lim_i A_i \rightarrow \lim_i B_i \rightarrow \lim_i C_i$$

is exact.

(2) *If (B_i) is ML, then also (C_i) is ML.*

(3) *If (A_i) is ML, then*

$$0 \rightarrow \lim_i A_i \rightarrow \lim_i B_i \rightarrow \lim_i C_i \rightarrow 0$$

is exact.

Proof. Nice exercise. See Algebra, Lemma 10.84.1 for part (3). \square

Lemma 12.27.4. *Let*

$$(A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow (D_i)$$

be an exact sequence of inverse systems of abelian groups. If the system (A_i) is ML, then the sequence

$$\lim_i B_i \rightarrow \lim_i C_i \rightarrow \lim_i D_i$$

is exact.

Proof. Let $Z_i = \text{Ker}(C_i \rightarrow D_i)$ and $I_i = \text{Im}(A_i \rightarrow B_i)$. Then $\lim Z_i = \text{Ker}(\lim C_i \rightarrow \lim D_i)$ and we get a short exact sequence of systems

$$0 \rightarrow (I_i) \rightarrow (B_i) \rightarrow (Z_i) \rightarrow 0$$

Moreover, by Lemma 12.27.3 we see that (I_i) has (ML), thus another application of Lemma 12.27.3 shows that $\lim B_i \rightarrow \lim Z_i$ is surjective which proves the lemma. \square

The following characterization of essentially constant inverse systems shows in particular that they have ML.

Lemma 12.27.5. *Let \mathcal{A} be an abelian category. Let (A_i) be an inverse system in \mathcal{A} with limit $A = \lim A_i$. Then (A_i) is essentially constant (see Categories, Definition 4.22.1) if and only if there exists an i and for all $j \geq i$ a direct sum decomposition $A_j = A \oplus Z_j$ such that (a) the maps $A_{j'} \rightarrow A_j$ are compatible with the direct sum decompositions, (b) for all j there exists some $j' \geq j$ such that $Z_{j'} \rightarrow Z_j$ is zero.*

Proof. Assume (A_i) is essentially constant. Then there exists an i and a morphism $A_i \rightarrow A$ such that for all $j \geq i$ there exists a $j' \geq j$ such that $A_{j'} \rightarrow A_j$ factors as $A_{j'} \rightarrow A_i \rightarrow A \rightarrow A_j$ (the last map comes from $A = \lim A_i$). Hence setting $Z_j = \text{Ker}(A_j \rightarrow A)$ for all $j \geq i$ works. Proof of the converse is omitted. \square

Lemma 12.27.6. *Let*

$$0 \rightarrow (A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow 0$$

be an exact sequence of inverse systems of abelian groups. If (A_i) has ML and (C_i) is essentially constant, then (B_i) has ML.

Proof. After renumbering we may assume that $C_i = C \oplus Z_i$ compatible with transition maps and that for all i there exists an $i' \geq i$ such that $Z_{i'} \rightarrow Z_i$ is zero, see Lemma 12.27.5. Pick i . Let $c \geq i$ be an integer such that $\text{Im}(A_c \rightarrow A) = \text{Im}(A_{i'} \rightarrow A_i)$ for all $i' \geq c$. Let $c' \geq c$ be an integer such that $Z_{c'} \rightarrow Z_c$ is zero. For $i' \geq c'$ consider the maps

$$\begin{array}{ccccccccc} 0 & \longrightarrow & A_{i'} & \longrightarrow & B_{i'} & \longrightarrow & C \oplus Z_{i'} & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A_{c'} & \longrightarrow & B_{c'} & \longrightarrow & C \oplus Z_{c'} & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A_c & \longrightarrow & B_c & \longrightarrow & C \oplus Z_c & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A_i & \longrightarrow & B_i & \longrightarrow & C \oplus Z_i & \longrightarrow & 0 \end{array}$$

Because $Z_{c'} \rightarrow Z_c$ is zero the image $\text{Im}(B_{c'} \rightarrow B_c)$ is an extension C by a subgroup $A' \subset A_c$ which contains the image of $A_{c'} \rightarrow A_c$. Hence $\text{Im}(B_{c'} \rightarrow B_i)$ is an extension of C by the image of A' which is the image of $A_c \rightarrow A_i$ by our choice of c . In exactly the same way one shows that $\text{Im}(B_{i'} \rightarrow B_i)$ is an extension of C by the image of $A_c \rightarrow A_i$. Hence $\text{Im}(B_{c'} \rightarrow B_i) = \text{Im}(B_{i'} \rightarrow B_i)$ and we win. \square

The “correct” version of the following lemma is More on Algebra, Lemma 15.61.2.

Lemma 12.27.7. *Let*

$$(A_i^{-2} \rightarrow A_i^{-1} \rightarrow A_i^0 \rightarrow A_i^1)$$

be an inverse system of complexes of abelian groups and denote $A^{-2} \rightarrow A^{-1} \rightarrow A^0 \rightarrow A^1$ its limit. Denote $(H_i^{-1}), (H_i^0)$ the inverse systems of cohomologies, and denote H^{-1}, H^0 the cohomologies of $A^{-2} \rightarrow A^{-1} \rightarrow A^0 \rightarrow A^1$. If (A_i^{-2}) and (A_i^{-1}) are ML and (H_i^{-1}) is essentially constant, then $H^0 = \lim H_i^0$.

Proof. Let $Z_i^j = \text{Ker}(A_i^j \rightarrow A_i^{j+1})$ and $I_i^j = \text{Im}(A_i^{j-1} \rightarrow A_i^j)$. Note that $\lim Z_i^0 = \text{Ker}(\lim A_i^0 \rightarrow \lim A_i^1)$ as taking kernels commutes with limits. The systems (I_i^{-1})

and (I_i^0) have ML as quotients of the systems (A_i^{-2}) and (A_i^{-1}) , see Lemma 12.27.3. Thus an exact sequence

$$0 \rightarrow (I_i^{-1}) \rightarrow (Z_i^{-1}) \rightarrow (H_i^{-1}) \rightarrow 0$$

of inverse systems where (I_i^{-1}) has ML and where (H_i^{-1}) is essentially constant by assumption. Hence (Z_i^{-1}) has ML by Lemma 12.27.6. The exact sequence

$$0 \rightarrow (Z_i^{-1}) \rightarrow (A_i^{-1}) \rightarrow (I_i^0) \rightarrow 0$$

and an application of Lemma 12.27.3 shows that $\lim A_i^{-1} \rightarrow \lim I_i^0$ is surjective. Finally, the exact sequence

$$0 \rightarrow (I_i^0) \rightarrow (Z_i^0) \rightarrow (H_i^0) \rightarrow 0$$

and Lemma 12.27.3 show that $\lim I_i^0 \rightarrow \lim Z_i^0 \rightarrow \lim H_i^0 \rightarrow 0$ is exact. Putting everything together we win. \square

Sometimes we need a version of the lemma above where we take limits over big ordinals.

Lemma 12.27.8. *Let α be an ordinal. Let K_β^\bullet , $\beta < \alpha$ be an inverse system of complexes of abelian groups over α . If for all $\beta < \alpha$ the complex K_β^\bullet is acyclic and the map*

$$K_\beta^n \longrightarrow \lim_{\gamma < \beta} K_\gamma^n$$

is surjective, then the complex $\lim_{\beta < \alpha} K_\beta^\bullet$ is acyclic.

Proof. By transfinite induction we prove this holds for every ordinal α and every system as in the lemma. In particular, whilst proving the result for α we may assume the complexes $\lim_{\gamma < \beta} K_\gamma^n$ are acyclic.

Let $x \in \lim_{\beta < \alpha} K_\alpha^0$ with $d(x) = 0$. We will find a $y \in K_\alpha^{-1}$ with $d(y) = x$. Write $x = (x_\beta)$ where $x_\beta \in K_\beta^0$ is the image of x for $\beta < \alpha$. We will construct $y = (y_\beta)$ by transfinite induction.

For $\beta = 0$ let $y_0 \in K_0^{-1}$ be any element with $d(y_0) = x_0$.

For $\beta = \gamma + 1$ a successor, we have to find an element y_β which maps both to y_γ by the transition map $f : K_\beta^\bullet \rightarrow K_\gamma^\bullet$ and to x_β under the differential. As a first approximation we choose y'_β with $d(y'_\beta) = x_\beta$. Then the difference $y_\gamma - f(y'_\beta)$ is in the kernel of the differential, hence equal to $d(z_\gamma)$ for some $z_\gamma \in K_\gamma^{-2}$. By assumption, the map $f^{-2} : K_\beta^{-2} \rightarrow K_\gamma^{-2}$ is surjective. Hence we write $z_\gamma = f(z_\beta)$ and change y'_β into $y_\beta = y'_\beta + d(z_\beta)$ which works.

If β is a limit ordinal, then we have the element $(y_\gamma)_{\gamma < \beta}$ in $\lim_{\gamma < \beta} K_\gamma^{-1}$ whose differential is the image of x_β . Thus we can argue in exactly the same manner as above using the termwise surjective map of complexes $f : K_\beta^\bullet \rightarrow \lim_{\gamma < \beta} K_\gamma^\bullet$ and the fact (see first paragraph of proof) that we may assume $\lim_{\gamma < \beta} K_\gamma^\bullet$ is acyclic by induction. \square

12.28. Exactness of products

Lemma 12.28.1. *Let I be a set. For $i \in I$ let $L_i \rightarrow M_i \rightarrow N_i$ be a complex of abelian groups. Let $H_i = \text{Ker}(M_i \rightarrow N_i)/\text{Im}(L_i \rightarrow M_i)$ be the cohomology. Then*

$$\prod L_i \rightarrow \prod M_i \rightarrow \prod N_i$$

is a complex of abelian groups with homology $\prod H_i$.

Proof. Omitted. □

Derived Categories

13.1. Introduction

We first discuss triangulated categories and localization in triangulated categories. Next, we prove that the homotopy category of complexes in an additive category is a triangulated category. Once this is done we define the derived category of an abelian category as the localization of the homotopy category with respect to quasi-isomorphisms. A good reference is Verdier's thesis [Ver96].

13.2. Triangulated categories

Triangulated categories are a convenient tool to describe the type of structure inherent in the derived category of an abelian category. Some references are [Ver96], [KS06], and [Nee01].

13.3. The definition of a triangulated category

In this section we collect most of the definitions concerning triangulated and pre-triangulated categories.

Definition 13.3.1. Let \mathcal{D} be an additive category. Let $[n] : \mathcal{D} \rightarrow \mathcal{D}$, $E \mapsto E[n]$ be a collection of additive functors indexed by $n \in \mathbf{Z}$ such that $[n] \circ [m] = [n + m]$ and $[0] = \text{id}$ (equality as functors). In this situation we call *triangle* a sixtuple (X, Y, Z, f, g, h) where $X, Y, Z \in \text{Ob}(\mathcal{D})$ and $f : X \rightarrow Y$, $g : Y \rightarrow Z$ and $h : Z \rightarrow X[1]$ are morphisms of \mathcal{D} . A *morphism of triangles* $(X, Y, Z, f, g, h) \rightarrow (X', Y', Z', f', g', h')$ is given by morphisms $a : X \rightarrow X'$, $b : Y \rightarrow Y'$ and $c : Z \rightarrow Z'$ of \mathcal{D} such that $b \circ f = f' \circ a$, $c \circ g = g' \circ b$ and $a[1] \circ h = h' \circ c$.

A morphism of triangles is visualized by the following commutative diagram

$$\begin{array}{ccccccc} X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\ \downarrow a & & \downarrow b & & \downarrow c & & \downarrow a[1] \\ X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1] \end{array}$$

Here is the definition of a triangulated category as given in Verdier's thesis.

Definition 13.3.2. A *triangulated category* consists of a triple $(\mathcal{D}, \{[n]\}_{n \in \mathbf{Z}}, \mathcal{T})$ where

- (1) \mathcal{D} is an additive category,
- (2) $[n] : \mathcal{D} \rightarrow \mathcal{D}$, $E \mapsto E[n]$ be a collection of additive functors indexed by $n \in \mathbf{Z}$ such that $[n] \circ [m] = [n + m]$ and $[0] = \text{id}$ (equality as functors), and
- (3) \mathcal{T} is a set of triangles called the *distinguished triangles*

subject to the following conditions

- TR1 Any triangle isomorphic to a distinguished triangle is a distinguished triangle. Any triangle of the form $(X, X, 0, \text{id}, 0, 0)$ is distinguished. For any morphism $f : X \rightarrow Y$ of \mathcal{D} there exists a distinguished triangle of the form (X, Y, Z, f, g, h) .
- TR2 The triangle (X, Y, Z, f, g, h) is distinguished if and only if the triangle $(Y, Z, X[1], g, h, -f[1])$ is.
- TR3 Given a solid commutative square

$$\begin{array}{ccccccc}
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\
 \downarrow a & & \downarrow b & & \downarrow & & \downarrow a[1] \\
 X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1]
 \end{array}$$

whose rows are distinguished triangles there exists a morphism $c : Z \rightarrow Z'$ such that (a, b, c) is a morphism of triangles.

- TR4 Given objects X, Y, Z of \mathcal{D} , and morphisms $f : X \rightarrow Y, g : Y \rightarrow Z$, and distinguished triangles $(X, Y, Q_1, f, p_1, d_1), (X, Z, Q_2, g \circ f, p_2, d_2)$, and (Y, Z, Q_3, g, p_3, d_3) , there exist morphisms $a : Q_1 \rightarrow Q_2$ and $b : Q_2 \rightarrow Q_3$ such that
 - (a) $(Q_1, Q_2, Q_3, a, b, p_1[1] \circ d_3)$ is a distinguished triangle,
 - (b) the triple (id_X, g, a) is a morphism of triangles $(X, Y, Q_1, f, p_1, d_1) \rightarrow (X, Z, Q_2, g \circ f, p_2, d_2)$, and
 - (c) the triple (f, id_Z, b) is a morphism of triangles $(X, Z, Q_2, g \circ f, p_2, d_2) \rightarrow (Y, Z, Q_3, g, p_3, d_3)$.

We will call $(\mathcal{D}, [], \mathcal{T})$ a *pre-triangulated category* if TR1, TR2 and TR3 hold.

The explanation of TR4 is that if you think of Q_1 as $Y/X, Q_2$ as Z/X and Q_3 as Z/Y , then TR4(a) expresses the isomorphism $(Z/X)/(Y/X) \cong Z/Y$ and TR(b) and TR(c) express that we can compare the triangles $X \rightarrow Y \rightarrow Q_1 \rightarrow X[1]$ etc with morphisms of triangles. For a more precise reformulation of this idea see the proof of Lemma 13.10.2.

The sign in TR2 means that if (X, Y, Z, f, g, h) is a distinguished triangle then in the long sequence

(13.3.2.1)

$$\dots \rightarrow Z[-1] \xrightarrow{-h[-1]} X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1] \xrightarrow{-f[1]} Y[1] \xrightarrow{-g[1]} Z[1] \rightarrow \dots$$

each four term sequence gives a distinguished triangle.

As usual we abuse notation and we simply speak of a (pre-)triangulated category \mathcal{D} without explicitly introducing notation for the additional data. The notion of a pre-triangulated category is useful in finding statements equivalent to TR4.

We have the following definition of a triangulated functor.

Definition 13.3.3. Let $\mathcal{D}, \mathcal{D}'$ be pre-triangulated categories. An *exact functor*, or a *triangulated functor* from \mathcal{D} to \mathcal{D}' is a functor $F : \mathcal{D} \rightarrow \mathcal{D}'$ together with given functorial isomorphisms $\xi_X : F(X[1]) \rightarrow F(X)[1]$ such that for every distinguished triangle (X, Y, Z, f, g, h) of \mathcal{D} the triangle $(F(X), F(Y), F(Z), F(f), F(g), \xi_X \circ F(h))$ is a distinguished triangle of \mathcal{D}' .

An exact functor is additive, see Lemma 13.4.15. When we say two triangulated categories are equivalent we mean that they are equivalent in the 2-category of triangulated categories. A 2-morphism $a : (F, \xi) \rightarrow (F', \xi')$ in this 2-category is simply a transformation of functors $a : F \rightarrow F'$ which is compatible with ξ and ξ' , i.e.,

$$\begin{array}{ccc} F \circ [1] & \xrightarrow{\xi} & [1] \circ F \\ a \star 1 \downarrow & & \downarrow 1 \star a \\ F' \circ [1] & \xrightarrow{\xi'} & [1] \circ F' \end{array}$$

commutes.

Definition 13.3.4. Let $(\mathcal{D}, [], \mathcal{T})$ be a pre-triangulated category. A *pre-triangulated subcategory*¹ is a pair $(\mathcal{D}', \mathcal{T}')$ such that

- (1) \mathcal{D}' is an additive subcategory of \mathcal{D} which is preserved under $[1]$ and $[-1]$,
- (2) $\mathcal{T}' \subset \mathcal{T}$ is a subset such that for every $(X, Y, Z, f, g, h) \in \mathcal{T}'$ we have $X, Y, Z \in \text{Ob}(\mathcal{D}')$ and $f, g, h \in \text{Arrows}(\mathcal{D}')$, and
- (3) $(\mathcal{D}', [], \mathcal{T}')$ is a pre-triangulated category.

If \mathcal{D} is a triangulated category, then we say $(\mathcal{D}', \mathcal{T}')$ is a *triangulated subcategory* if it is a pre-triangulated subcategory and $(\mathcal{D}', [], \mathcal{T}')$ is a triangulated category.

In this situation the inclusion functor $\mathcal{D}' \rightarrow \mathcal{D}$ is an exact functor with $\xi_X : X[1] \rightarrow X[1]$ given by the identity on $X[1]$.

We will see in Lemma 13.4.1 that for a distinguished triangle (X, Y, Z, f, g, h) in a pre-triangulated category the composition $g \circ f : X \rightarrow Z$ is zero. Thus the sequence (13.3.2.1) is a complex. A homological functor is one that turns this complex into a long exact sequence.

Definition 13.3.5. Let \mathcal{D} be a pre-triangulated category. Let \mathcal{A} be an abelian category. An additive functor $H : \mathcal{D} \rightarrow \mathcal{A}$ is called *homological* if for every distinguished triangle (X, Y, Z, f, g, h) the sequence

$$H(X) \rightarrow H(Y) \rightarrow H(Z)$$

is exact in the abelian category \mathcal{A} . An additive functor $H : \mathcal{D}^{opp} \rightarrow \mathcal{A}$ is called *cohomological* if the corresponding functor $\mathcal{D} \rightarrow \mathcal{A}^{opp}$ is homological.

If $H : \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor we often write $H^n(X) = H(X[n])$ so that $H(X) = H^0(X)$. Our discussion of TR2 above implies that a distinguished triangle (X, Y, Z, f, g, h) determines a long exact sequence

$$(13.3.5.1) \quad H^{-1}(Z) \xrightarrow{h[-1]} H^0(X) \xrightarrow{f} H^0(Y) \xrightarrow{g} H^0(Z) \xrightarrow{h} H^1(X)$$

This will be called the *long exact sequence* associated to the distinguished triangle and the homological functor. As indicated we will not use any signs for the morphisms in the long exact sequence. This has the side effect that maps in the long exact sequence associated to the rotation (TR2) of a distinguished triangle differ from the maps in the sequence above by some signs.

¹This definition may be nonstandard. If \mathcal{D}' is a full subcategory then \mathcal{T}' is the intersection of the set of triangles in \mathcal{D}' with \mathcal{T} , see Lemma 13.4.14. In this case we drop \mathcal{T}' from the notation.

Definition 13.3.6. Let \mathcal{A} be an abelian category. Let \mathcal{D} be a triangulated category. A δ -functor from \mathcal{A} to \mathcal{D} is given by a functor $G : \mathcal{A} \rightarrow \mathcal{D}$ and a rule which assigns to every short exact sequence

$$0 \rightarrow A \xrightarrow{a} B \xrightarrow{b} C \rightarrow 0$$

a morphism $\delta = \delta_{A \rightarrow B \rightarrow C} : G(C) \rightarrow G(A)[1]$ such that

- (1) the triangle $(G(A), G(B), G(C), G(a), G(b), \delta_{A \rightarrow B \rightarrow C})$ is a distinguished triangle of \mathcal{D} for any short exact sequence as above, and
- (2) for every morphism $(A \rightarrow B \rightarrow C) \rightarrow (A' \rightarrow B' \rightarrow C')$ of short exact sequences the diagram

$$\begin{array}{ccc} G(C) & \xrightarrow{\delta_{A \rightarrow B \rightarrow C}} & G(A)[1] \\ \downarrow & & \downarrow \\ G(C') & \xrightarrow{\delta_{A' \rightarrow B' \rightarrow C'}} & G(A')[1] \end{array}$$

is commutative.

In this situation we call $(G(A), G(B), G(C), G(a), G(b), \delta_{A \rightarrow B \rightarrow C})$ the *image of the short exact sequence under the given δ -functor*.

Note how a δ -functor comes equipped with additional structure. Strictly speaking it does not make sense to say that a given functor $\mathcal{A} \rightarrow \mathcal{D}$ is a δ -functor, but we will often do so anyway.

13.4. Elementary results on triangulated categories

Most of the results in this section are proved for pre-triangulated categories and a fortiori hold in any triangulated category.

Lemma 13.4.1. *Let \mathcal{D} be a pre-triangulated category. Let (X, Y, Z, f, g, h) be a distinguished triangle. Then $g \circ f = 0$, $h \circ g = 0$ and $f[1] \circ h = 0$.*

Proof. By TR1 we know $(X, X, 0, 1, 0, 0)$ is a distinguished triangle. Apply TR3 to

$$\begin{array}{ccccccc} X & \longrightarrow & X & \longrightarrow & 0 & \longrightarrow & X[1] \\ \downarrow 1 & & \downarrow f & & \downarrow \text{dotted} & & \downarrow 1[1] \\ X & \xrightarrow{f} & Y & \xrightarrow{g} & Z & \xrightarrow{h} & X[1] \end{array}$$

Of course the dotted arrow is the zero map. Hence the commutativity of the diagram implies that $g \circ f = 0$. For the other cases rotate the triangle, i.e., apply TR2. □

Lemma 13.4.2. *Let \mathcal{D} be a pre-triangulated category. For any object W of \mathcal{D} the functor $\text{Hom}_{\mathcal{D}}(W, -)$ is homological, and the functor $\text{Hom}_{\mathcal{D}}(-, W)$ is cohomological.*

Proof. Consider a distinguished triangle (X, Y, Z, f, g, h) . We have already seen that $g \circ f = 0$, see Lemma 13.4.1. Suppose $a : W \rightarrow Y$ is a morphism such that

$g \circ a = 0$. Then we get a commutative diagram

$$\begin{array}{ccccccc}
 W & \xrightarrow{\quad} & W & \xrightarrow{\quad} & 0 & \xrightarrow{\quad} & W[1] \\
 \vdots \downarrow b & & \downarrow a & & \downarrow 0 & & \downarrow b[1] \\
 X & \xrightarrow{\quad} & Y & \xrightarrow{\quad} & Z & \xrightarrow{\quad} & X[1]
 \end{array}$$

Both rows are distinguished triangles (use TR1 for the top row). Hence we can fill the dotted arrow b (first rotate using TR2, then apply TR3, and then rotate back). This proves the lemma. \square

Lemma 13.4.3. *Let \mathcal{D} be a pre-triangulated category. Let*

$$(a, b, c) : (X, Y, Z, f, g, h) \rightarrow (X', Y', Z', f', g', h')$$

be a morphism of distinguished triangles. If two among a, b, c are isomorphisms so is the third.

Proof. Assume that a and c are isomorphisms. For any object W of \mathcal{D} write $H_W(-) = \text{Hom}_{\mathcal{D}}(W, -)$. Then we get a commutative diagram of abelian groups

$$\begin{array}{ccccccccc}
 H_W(Z[-1]) & \longrightarrow & H_W(X) & \longrightarrow & H_W(Y) & \longrightarrow & H_W(Z) & \longrightarrow & H_W(X[1]) \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 H_W(Z'[-1]) & \longrightarrow & H_W(X') & \longrightarrow & H_W(Y') & \longrightarrow & H_W(Z') & \longrightarrow & H_W(X'[1])
 \end{array}$$

By assumption the right two and left two vertical arrows are bijective. As H_W is homological by Lemma 13.4.2 and the five lemma (Homology, Lemma 12.5.20) it follows that the middle vertical arrow is an isomorphism. Hence by Yoneda's lemma, see Categories, Lemma 4.3.5 we see that b is an isomorphism. This implies the other cases by rotating (using TR2). \square

Remark 13.4.4. Let \mathcal{D} be an additive category with translation functors $[n]$ as in Definition 13.3.1. Let us call a triangle (X, Y, Z, f, g, h) *special*² if for every object W of \mathcal{D} the long sequence of abelian groups

$$\dots \rightarrow \text{Hom}_{\mathcal{D}}(W, X) \rightarrow \text{Hom}_{\mathcal{D}}(W, Y) \rightarrow \text{Hom}_{\mathcal{D}}(W, Z) \rightarrow \text{Hom}_{\mathcal{D}}(W, X[1]) \rightarrow \dots$$

is exact. The proof of Lemma 13.4.3 shows that if

$$(a, b, c) : (X, Y, Z, f, g, h) \rightarrow (X', Y', Z', f', g', h')$$

is a morphism of special triangles and if two among a, b, c are isomorphisms so is the third. There is a dual statement for *co-special* triangles, i.e., triangles which turn into long exact sequences on applying the functor $\text{Hom}_{\mathcal{D}}(-, W)$. Thus distinguished triangles are special and co-special, but in general there are many more (co-)special triangles, then there are distinguished triangles.

Lemma 13.4.5. *Let \mathcal{D} be a pre-triangulated category. Let*

$$(0, b, 0), (0, b', 0) : (X, Y, Z, f, g, h) \rightarrow (X, Y, Z, f, g, h)$$

be endomorphisms of a distinguished triangle. Then $bb' = 0$.

²This is nonstandard notation.

Proof. Picture

$$\begin{array}{ccccccc}
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\
 \downarrow 0 & \nearrow \alpha & \downarrow b, b' & \nearrow \beta & \downarrow 0 & & \downarrow 0 \\
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1]
 \end{array}$$

Applying Lemma 13.4.2 we find dotted arrows α and β such that $b' = f \circ \alpha$ and $b = \beta \circ g$. Then $bb' = \beta \circ g \circ f \circ \alpha = 0$ as $g \circ f = 0$ by Lemma 13.4.1. \square

Lemma 13.4.6. *Let \mathcal{D} be a pre-triangulated category. Let (X, Y, Z, f, g, h) be a distinguished triangle. If*

$$\begin{array}{ccc}
 Z & \xrightarrow{h} & X[1] \\
 c \downarrow & & \downarrow a[1] \\
 Z & \xrightarrow{h} & X[1]
 \end{array}$$

is commutative and $a^2 = a$, $c^2 = c$, then there exists a morphism $b : Y \rightarrow Y$ with $b^2 = b$ such that (a, b, c) is an endomorphism of the triangle (X, Y, Z, f, g, h) .

Proof. By TR3 there exists a morphism b' such that (a, b', c) is an endomorphism of (X, Y, Z, f, g, h) . Then $(0, (b')^2 - b', 0)$ is also an endomorphism. By Lemma 13.4.5 we see that $(b')^2 - b'$ has square zero. Set $b = b' - (2b' - 1)((b')^2 - b') = 3(b')^2 - 2(b')^3$. A computation shows that (a, b, c) is an endomorphism and that $b^2 - b = (4(b')^2 - 4b' - 3)((b')^2 - b')^2 = 0$. \square

Lemma 13.4.7. *Let \mathcal{D} be a pre-triangulated category. Let $f : X \rightarrow Y$ be a morphism of \mathcal{D} . There exists a distinguished triangle (X, Y, Z, f, g, h) which is unique up to (nonunique) isomorphism of triangles. More precisely, given a second such distinguished triangle (X, Y, Z', f, g', h') there exists an isomorphism*

$$(1, 1, c) : (X, Y, Z, f, g, h) \longrightarrow (X, Y, Z', f, g', h')$$

Proof. Existence by TR1. Uniqueness up to isomorphism by TR3 and Lemma 13.4.3. \square

Lemma 13.4.8. *Let \mathcal{D} be a pre-triangulated category. Let $f : X \rightarrow Y$ be a morphism of \mathcal{D} . The following are equivalent*

- (1) f is an isomorphism,
- (2) $(X, Y, 0, f, 0, 0)$ is a distinguished triangle, and
- (3) for any distinguished triangle (X, Y, Z, f, g, h) we have $Z = 0$.

Proof. By TR1 the triangle $(X, X, 0, 1, 0, 0)$ is distinguished. Let (X, Y, Z, f, g, h) be a distinguished triangle. By TR3 there is a map of distinguished triangles $(1, f, 0) : (X, X, 0) \rightarrow (X, Y, Z)$. If f is an isomorphism, then $(1, f, 0)$ is an isomorphism of triangles by Lemma 13.4.3 and $Z = 0$. Conversely, if $Z = 0$, then $(1, f, 0)$ is an isomorphism of triangles as well, hence f is an isomorphism. \square

Lemma 13.4.9. *Let \mathcal{D} be a pre-triangulated category. Let (X, Y, Z, f, g, h) and (X', Y', Z', f', g', h') be triangles. The following are equivalent*

- (1) $(X \oplus X', Y \oplus Y', Z \oplus Z', f \oplus f', g \oplus g', h \oplus h')$ is a distinguished triangle,
- (2) both (X, Y, Z, f, g, h) and (X', Y', Z', f', g', h') are distinguished triangles.

Proof. Assume (2). By TR1 we may choose a distinguished triangle $(X \oplus X', Y \oplus Y', Q, f \oplus f', g'', h'')$. By TR3 we can find morphisms of distinguished triangles $(X, Y, Z, f, g, h) \rightarrow (X \oplus X', Y \oplus Y', Q, f \oplus f', g'', h'')$ and $(X', Y', Z', f', g', h') \rightarrow (X \oplus X', Y \oplus Y', Q, f \oplus f', g'', h'')$. Taking the direct sum of these morphisms we obtain a morphism of triangles

$$\begin{array}{c} (X \oplus X', Y \oplus Y', Z \oplus Z', f \oplus f', g \oplus g', h \oplus h') \\ \downarrow (1,1,c) \\ (X \oplus X', Y \oplus Y', Q, f \oplus f', g'', h''). \end{array}$$

In the terminology of Remark 13.4.4 this is a map of special triangles (because a direct sum of special triangles is special) and we conclude that c is an isomorphism. Thus (1) holds.

Assume (1). We will show that (X, Y, Z, f, g, h) is a distinguished triangle. First observe that (X, Y, Z, f, g, h) is a special triangle (terminology from Remark 13.4.4) as a direct summand of the distinguished hence special triangle $(X \oplus X', Y \oplus Y', Z \oplus Z', f \oplus f', g \oplus g', h \oplus h')$. Using TR1 let (X, Y, Q, f, g'', h'') be a distinguished triangle. By TR3 there exists a morphism of distinguished triangles $(X \oplus X', Y \oplus Y', Z \oplus Z', f \oplus f', g \oplus g', h \oplus h') \rightarrow (X, Y, Q, f, g'', h'')$. Composing this with the inclusion map we get a morphism of triangles

$$(1, 1, c) : (X, Y, Z, f, g, h) \longrightarrow (X, Y, Q, f, g'', h'')$$

By Remark 13.4.4 we find that c is an isomorphism and we conclude that (2) holds. \square

Lemma 13.4.10. *Let \mathcal{D} be a pre-triangulated category. Let (X, Y, Z, f, g, h) be a distinguished triangle.*

- (1) *If $h = 0$, then there exists a right inverse $s : Z \rightarrow Y$ to g .*
- (2) *For any right inverse $s : Z \rightarrow Y$ of g the map $f \oplus s : X \oplus Z \rightarrow Y$ is an isomorphism.*
- (3) *For any objects X', Z' of \mathcal{D} the triangle $(X', X' \oplus Z', Z', (1, 0), (0, 1), 0)$ is distinguished.*

Proof. To see (1) use that $\text{Hom}_{\mathcal{D}}(Z, Y) \rightarrow \text{Hom}_{\mathcal{D}}(Z, Z) \rightarrow \text{Hom}_{\mathcal{D}}(Z, X[1])$ is exact by Lemma 13.4.2. By the same token, if s is as in (2), then $h = 0$ and the sequence

$$0 \rightarrow \text{Hom}_{\mathcal{D}}(W, X) \rightarrow \text{Hom}_{\mathcal{D}}(W, Y) \rightarrow \text{Hom}_{\mathcal{D}}(W, Z) \rightarrow 0$$

is split exact (split by $s : Z \rightarrow Y$). Hence by Yoneda's lemma we see that $X \oplus Z \rightarrow Y$ is an isomorphism. The last assertion follows from TR1 and Lemma 13.4.9. \square

Lemma 13.4.11. *Let \mathcal{D} be a pre-triangulated category. Let $f : X \rightarrow Y$ be a morphism of \mathcal{D} . The following are equivalent*

- (1) *f has a kernel,*
- (2) *f has a cokernel,*
- (3) *f is isomorphic to a map $K \oplus Z \rightarrow Z \oplus Q$ induced by id_Z .*

Proof. Any morphism isomorphic to a map of the form $X' \oplus Z \rightarrow Z \oplus Y'$ has both a kernel and a cokernel. Hence (3) \Rightarrow (1), (2). Next we prove (1) \Rightarrow (3). Suppose first that $f : X \rightarrow Y$ is a monomorphism, i.e., its kernel is zero. By TR1 there exists a distinguished triangle (X, Y, Z, f, g, h) . By Lemma 13.4.1 the composition

$h[-1] \circ f = 0$. As f is a monomorphism we see that $h[-1] = 0$ and hence $h = 0$. Then Lemma 13.4.10 implies that $Y = X \oplus Z$, i.e., we see that (3) holds. Next, assume f has a kernel K . As $K \rightarrow X$ is a monomorphism we conclude $X = K \oplus X'$ and $f|_{X'} : X' \rightarrow Y$ is a monomorphism. Hence $Y = X' \oplus Y'$ and we win. The implication (2) \Rightarrow (3) is dual to this. \square

Lemma 13.4.12. *Let \mathcal{D} be a pre-triangulated category. If \mathcal{D} has countable products, then \mathcal{D} is Karoubian. If \mathcal{D} has countable coproducts, then \mathcal{D} is Karoubian.*

Proof. Assume \mathcal{D} has countable products. By Homology, Lemma 12.4.3 it suffices to check that morphisms which have a right inverse have kernels. Any morphism which has a right inverse is an epimorphism, hence has a kernel by Lemma 13.4.11. The second statement is dual to the first. \square

The following lemma makes it slightly easier to prove that a pre-triangulated category is triangulated.

Lemma 13.4.13. *Let \mathcal{D} be a pre-triangulated category. In order to prove TR4 it suffices to show that given any pair of composable morphisms $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ there exist*

- (1) *isomorphisms $i : X' \rightarrow X$, $j : Y' \rightarrow Y$ and $k : Z' \rightarrow Z$, and then setting $f' = j^{-1}fi : X' \rightarrow Y'$ and $g' = k^{-1}gj : Y' \rightarrow Z'$ there exist*
- (2) *distinguished triangles $(X', Y', Q_1, f', p_1, d_1)$, $(X', Z', Q_2, g' \circ f', p_2, d_2)$ and $(Y', Z', Q_3, g', p_3, d_3)$, such that the assertion of TR4 holds.*

Proof. The replacement of X, Y, Z by X', Y', Z' is harmless by our definition of distinguished triangles and their isomorphisms. The lemma follows from the fact that the distinguished triangles $(X', Y', Q_1, f', p_1, d_1)$, $(X', Z', Q_2, g' \circ f', p_2, d_2)$ and $(Y', Z', Q_3, g', p_3, d_3)$ are unique up to isomorphism by Lemma 13.4.7. \square

Lemma 13.4.14. *Let \mathcal{D} be a pre-triangulated category. Assume that \mathcal{D}' is an additive full subcategory of \mathcal{D} . The following are equivalent*

- (1) *there exists a set of triangles \mathcal{T}' such that $(\mathcal{D}', \mathcal{T}')$ is a pre-triangulated subcategory of \mathcal{D} ,*
- (2) *\mathcal{D}' is preserved under $[1], [-1]$ and given any morphism $f : X \rightarrow Y$ in \mathcal{D}' there exists a distinguished triangle (X, Y, Z, f, g, h) in \mathcal{D} such that Z is isomorphic to an object of \mathcal{D}' .*

In this case \mathcal{T}' is the set of distinguished triangles (X, Y, Z, f, g, h) of \mathcal{D} such that $X, Y, Z \in \text{Ob}(\mathcal{D}')$ and $f, g, h \in \text{Arrows}(\mathcal{D}')$. Finally, if \mathcal{D} is a triangulated category, then (1) and (2) are also equivalent to

- (3) *\mathcal{D}' is a triangulated subcategory.*

Proof. Omitted. \square

Lemma 13.4.15. *An exact functor of pre-triangulated categories is additive.*

Proof. Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor of pre-triangulated categories. Since $(0, 0, 0, 1_0, 1_0, 0)$ is a distinguished triangle of \mathcal{D} the triangle

$$(F(0), F(0), F(0), 1_{F(0)}, 1_{F(0)}, F(0))$$

is distinguished in \mathcal{D}' . This implies that $1_{F(0)} \circ 1_{F(0)}$ is zero, see Lemma 13.4.1. Hence $F(0)$ is the zero object of \mathcal{D}' . This also implies that F applied to any zero morphism is zero (since a morphism in an additive category is zero if and only if it

factors through the zero object). Next, using that $(X, X \oplus Y, Y, (1, 0), (0, 1), 0)$ is a distinguished triangle, we see that $(F(X), F(X \oplus Y), F(Y), F(1, 0), F(0, 1), 0)$ is one too. This implies that the map $F(1, 0) \oplus F(0, 1) : F(X) \oplus F(Y) \rightarrow F(X \oplus Y)$ is an isomorphism, see Lemma 13.4.10. We omit the rest of the argument. \square

Lemma 13.4.16. *Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be a fully faithful exact functor of pre-triangulated categories. Then a triangle (X, Y, Z, f, g, h) of \mathcal{D} is distinguished if and only if $(F(X), F(Y), F(Z), F(f), F(g), F(h))$ is distinguished in \mathcal{D}' .*

Proof. The “only if” part is clear. Assume $(F(X), F(Y), F(Z))$ is distinguished in \mathcal{D}' . Pick a distinguished triangle (X, Y, Z', f, g', h') in \mathcal{D} . By Lemma 13.4.7 there exists an isomorphism of triangles

$$(1, 1, c') : (F(X), F(Y), F(Z)) \longrightarrow (F(X), F(Y), F(Z')).$$

Since F is fully faithful, there exists a morphism $c : Z \rightarrow Z'$ such that $F(c) = c'$. Then $(1, 1, c)$ is an isomorphism between (X, Y, Z) and (X, Y, Z') . Hence (X, Y, Z) is distinguished by TR1. \square

Lemma 13.4.17. *Let $\mathcal{D}, \mathcal{D}', \mathcal{D}''$ be pre-triangulated categories. Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ and $F' : \mathcal{D}' \rightarrow \mathcal{D}''$ be exact functors. Then $F' \circ F$ is an exact functor.*

Proof. Omitted. \square

Lemma 13.4.18. *Let \mathcal{D} be a pre-triangulated category. Let \mathcal{A} be an abelian category. Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor.*

- (1) *Let \mathcal{D}' be a pre-triangulated category. Let $F : \mathcal{D}' \rightarrow \mathcal{D}$ be an exact functor. Then the composition $G \circ F$ is a homological functor as well.*
- (2) *Let \mathcal{A}' be an abelian category. Hence $G : \mathcal{A} \rightarrow \mathcal{A}'$ be an exact functor. Hence $G \circ H$ is a homological functor as well.*

Proof. Omitted. \square

Lemma 13.4.19. *Let \mathcal{D} be a triangulated category. Let \mathcal{A} be an abelian category. Let $G : \mathcal{A} \rightarrow \mathcal{D}$ be a δ -functor.*

- (1) *Let \mathcal{D}' be a triangulated category. Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor. Then the composition $F \circ G$ is a δ -functor as well.*
- (2) *Let \mathcal{A}' be an abelian category. Hence $H : \mathcal{A}' \rightarrow \mathcal{A}$ be an exact functor. Hence $G \circ H$ is a δ -functor as well.*

Proof. Omitted. \square

Lemma 13.4.20. *Let \mathcal{D} be a triangulated category. Let \mathcal{A} be an abelian category. Let $G : \mathcal{A} \rightarrow \mathcal{D}$ be a δ -functor. Let $H : \mathcal{D} \rightarrow \mathcal{B}$ be a homological functor. Assume that $H^{-1}(G(A)) = 0$ for all A in \mathcal{A} . Then the collection*

$$\{H^n \circ G, H^n(\delta_{A \rightarrow B \rightarrow C})\}_{n \geq 0}$$

is a δ -functor from $\mathcal{A} \rightarrow \mathcal{B}$, see Homology, Definition 12.11.1.

Proof. The notation signifies the following. If $0 \rightarrow A \xrightarrow{a} B \xrightarrow{b} C \rightarrow 0$ is a short exact sequence in \mathcal{A} , then

$$\delta = \delta_{A \rightarrow B \rightarrow C} : G(C) \rightarrow G(A)[1]$$

is a morphism in \mathcal{D} such that $(G(A), G(B), G(C), a, b, \delta)$ is a distinguished triangle, see Definition 13.3.6. Then $H^n(\delta) : H^n(G(C)) \rightarrow H^n(G(A)[1]) = H^{n+1}(G(A))$ is

clearly functorial in the short exact sequence. Finally, the long exact cohomology sequence (13.3.5.1) combined with the vanishing of $H^{-1}(G(C))$ gives a long exact sequence

$$0 \rightarrow H^0(G(A)) \rightarrow H^0(G(B)) \rightarrow H^0(G(C)) \xrightarrow{H^0(\delta)} H^1(G(A)) \rightarrow \dots$$

in \mathcal{B} as desired. □

The proof of the following result uses TR4.

Proposition 13.4.21. *Let \mathcal{D} be a triangulated category. Any commutative diagram*

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & & \downarrow \\ X' & \longrightarrow & Y' \end{array}$$

can be extended to a diagram

$$\begin{array}{ccccccc} X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X'' & \longrightarrow & Y'' & \longrightarrow & Z'' & \longrightarrow & X''[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X[1] & \longrightarrow & Y[1] & \longrightarrow & Z[1] & \longrightarrow & X[2] \end{array}$$

where all the squares are commutative, except for the lower right square which is anticommutative. Moreover, each of the rows and columns are distinguished triangles. Finally, the morphisms on the bottom row (resp. right column) are obtained from the morphisms of the top row (resp. left column) by applying [1].

Proof. During this proof we avoid writing the arrows in order to make the proof legible. Choose distinguished triangles (X, Y, Z) , (X', Y', Z') , (X, X', X'') , (Y, Y', Y'') , and (X, Y', A) . Note that the morphism $X \rightarrow Y'$ is both equal to the composition $X \rightarrow Y \rightarrow Y'$ and equal to the composition $X \rightarrow X' \rightarrow Y'$. Hence, we can find morphisms

- (1) $a : Z \rightarrow A$ and $b : A \rightarrow Y''$, and
- (2) $a' : X'' \rightarrow A$ and $b' : A \rightarrow Z'$

as in TR4. Denote $c : Y'' \rightarrow Z[1]$ the composition $Y'' \rightarrow Y[1] \rightarrow Z[1]$ and denote $c' : Z' \rightarrow X''[1]$ the composition $Z' \rightarrow X'[1] \rightarrow X''[1]$. The conclusion of our application TR4 are that

- (1) (Z, A, Y'', a, b, c) , (X'', A, Z', a', b', c') are distinguished triangles,
- (2) $(X, Y, Z) \rightarrow (X, Y', A)$, $(X, Y', A) \rightarrow (Y, Y', Y'')$, $(X, X', X'') \rightarrow (X, Y', A)$, $(X, Y', A) \rightarrow (X', Y', Z')$ are morphisms of triangles.

First using that $(X, X', X'') \rightarrow (X, Y', A)$ and $(X, Y', A) \rightarrow (Y, Y', Y'')$ are morphisms of triangles we see the first of the commutative diagrams

$$\begin{array}{ccc}
 X' & \longrightarrow & Y' \\
 \downarrow & & \downarrow \\
 X'' & \xrightarrow{b \circ a'} & Y'' \\
 \downarrow & & \downarrow \\
 X[1] & \longrightarrow & Y[1]
 \end{array}
 \qquad
 \begin{array}{ccccc}
 Y & \longrightarrow & Z & \longrightarrow & X[1] \\
 \downarrow & & \downarrow & \xrightarrow{b' \circ a} & \downarrow \\
 Y' & \longrightarrow & Z' & \longrightarrow & X'[1]
 \end{array}$$

is commutative. The second is commutative too using that $(X, Y, Z) \rightarrow (X, Y', A)$ and $(X, Y', A) \rightarrow (X', Y', Z')$ are morphisms of triangles. At this point we choose a distinguished triangle (X'', Y'', Z'') starting with the map $b \circ a' : X'' \rightarrow Y''$.

Next we apply TR4 one more time to the morphisms $X'' \rightarrow A \rightarrow Y''$ and the triangles (X'', A, Z', a', b', c') , (X'', Y'', Z'') , and $(A, Y'', Z[1], b, c, -a[1])$ to get morphisms $a'' : Z' \rightarrow Z''$ and $b'' : Z'' \rightarrow Z[1]$. Then $(Z', Z'', Z[1], a'', b'', -b'[1] \circ a[1])$ is a distinguished triangle, hence also $(Z, Z', Z'', -b' \circ a, a'', -b'')$ and hence also $(Z, Z', Z'', b' \circ a, a'', b'')$. Moreover, $(X'', A, Z') \rightarrow (X'', Y'', Z'')$ and $(X'', Y'', Z'') \rightarrow (A, Y'', Z[1], b, c, -a[1])$ are morphisms of triangles. At this point we have defined all the distinguished triangles and all the morphisms, and all that's left is to verify some commutativity relations.

To see that the middle square in the diagram commutes, note that the arrow $Y' \rightarrow Z'$ factors as $Y' \rightarrow A \rightarrow Z'$ because $(X, Y', A) \rightarrow (X', Y', Z')$ is a morphism of triangles. Similarly, the morphism $Y' \rightarrow Y''$ factors as $Y' \rightarrow A \rightarrow Y''$ because $(X, Y', A) \rightarrow (Y, Y', Y'')$ is a morphism of triangles. Hence the middle square commutes because the square with sides (A, Z', Z'', Y'') commutes as $(X'', A, Z') \rightarrow (X'', Y'', Z'')$ is a morphism of triangles (by TR4). The square with sides $(Y'', Z'', Y[1], Z[1])$ commutes because $(X'', Y'', Z'') \rightarrow (A, Y'', Z[1], b, c, -a[1])$ is a morphism of triangles and $c : Y'' \rightarrow Z[1]$ is the composition $Y'' \rightarrow Y[1] \rightarrow Z[1]$. The square with sides $(Z', X'[1], X''[1], Z'')$ is commutative because $(X'', A, Z') \rightarrow (X'', Y'', Z'')$ is a morphism of triangles and $c' : Z' \rightarrow X''[1]$ is the composition $Z' \rightarrow X'[1] \rightarrow X''[1]$. Finally, we have to show that the square with sides $(Z'', X''[1], Z[1], X[2])$ anticommutes. This holds because $(X'', Y'', Z'') \rightarrow (A, Y'', Z[1], b, c, -a[1])$ is a morphism of triangles and we're done. \square

13.5. Localization of triangulated categories

In order to construct the derived category starting from the homotopy category of complexes, we will use a localization process.

Definition 13.5.1. Let \mathcal{D} be a pre-triangulated category. We say a multiplicative system S is *compatible with the triangulated structure* if the following two conditions hold:

MS5 For $s \in S$ we have $s[n] \in S$ for all $n \in \mathbf{Z}$.

MS6 Given a solid commutative square

$$\begin{array}{ccccccc}
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\
 \downarrow s & & \downarrow s' & & \downarrow \cdot & & \downarrow s[1] \\
 X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1]
 \end{array}$$

whose rows are distinguished triangles with $s, s' \in S$ there exists a morphism $s'' : Z \rightarrow Z'$ in S such that (s, s', s'') is a morphism of triangles.

It turns out that these axioms are not independent of the axioms defining multiplicative systems.

Lemma 13.5.2. *Let \mathcal{D} be a pre-triangulated category. Let S be a set of morphisms of \mathcal{D} and assume that axioms MS1, MS5, MS6 hold (see Categories, Definition 4.25.1 and Definition 13.5.1). Then MS2 holds.*

Proof. Suppose that $f : X \rightarrow Y$ is a morphism of \mathcal{D} and $t : X \rightarrow X'$ an element of S . Choose a distinguished triangle (X, Y, Z, f, g, h) . Next, choose a distinguished triangle $(X', Y', Z, f', g', t[1] \circ h)$ (here we use TR1 and TR2). By MS5, MS6 (and TR2 to rotate) we can find the dotted arrow in the commutative diagram

$$\begin{array}{ccccccc}
 X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\
 \downarrow t & & \downarrow \cdot & & \downarrow 1 & & \downarrow t[1] \\
 X' & \longrightarrow & Y' & \longrightarrow & Z & \longrightarrow & X'[1]
 \end{array}$$

with moreover $s' \in S$. This proves LMS2. The proof of RMS2 is dual. □

Lemma 13.5.3. *Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor of pre-triangulated categories. Let*

$$S = \{f \in \text{Arrows}(\mathcal{D}) \mid F(f) \text{ is an isomorphism}\}$$

Then S is a saturated (see Categories, Definition 4.25.17) multiplicative system compatible with the triangulated structure on \mathcal{D} .

Proof. We have to prove axioms MS1 – MS6, see Categories, Definitions 4.25.1 and 4.25.17 and Definition 13.5.1. MS1, MS4, and MS5 are direct from the definitions. MS6 follows from TR3 and Lemma 13.4.3. By Lemma 13.5.2 we conclude that MS2 holds. To finish the proof we have to show that MS3 holds. To do this let $f, g : X \rightarrow Y$ be morphisms of \mathcal{D} , and let $t : Z \rightarrow X$ be an element of S such that $f \circ t = g \circ t$. As \mathcal{D} is additive this simply means that $a \circ t = 0$ with $a = f - g$. Choose a distinguished triangle (Z, X, Q, t, d, h) using TR1. Since $a \circ t = 0$ we see by Lemma 13.4.2 there exists a morphism $i : Q \rightarrow Y$ such that $i \circ d = a$. Finally, using TR1 again we can choose a triangle (Q, Y, W, i, j, k) . Here is a picture

$$\begin{array}{ccccccc}
 Z & \xrightarrow{t} & X & \xrightarrow{d} & Q & \longrightarrow & Z[1] \\
 & & \downarrow 1 & & \downarrow i & & \\
 & & X & \xrightarrow{a} & Y & & \\
 & & & & \downarrow j & & \\
 & & & & W & &
 \end{array}$$

OK, and now we apply the functor F to this diagram. Since $t \in S$ we see that $F(Q) = 0$, see Lemma 13.4.8. Hence $F(j)$ is an isomorphism by the same lemma, i.e., $j \in S$. Finally, $j \circ a = j \circ i \circ d = 0$ as $j \circ i = 0$. Thus $j \circ f = j \circ g$ and we see that LMS3 holds. The proof of RMS3 is dual. \square

Lemma 13.5.4. *Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor between a pre-triangulated category and an abelian category. Let*

$$S = \{f \in \text{Arrows}(\mathcal{D}) \mid H^i(f) \text{ is an isomorphism for all } i \in \mathbf{Z}\}$$

Then S is a saturated (see Categories, Definition 4.25.17) multiplicative system compatible with the triangulated structure on \mathcal{D} .

Proof. We have to prove axioms MS1 – MS6, see Categories, Definitions 4.25.1 and 4.25.17 and Definition 13.5.1. MS1, MS4, and MS5 are direct from the definitions. MS6 follows from TR3 and the long exact cohomology sequence (13.3.5.1). By Lemma 13.5.2 we conclude that MS2 holds. To finish the proof we have to show that MS3 holds. To do this let $f, g : X \rightarrow Y$ be morphisms of \mathcal{D} , and let $t : Z \rightarrow X$ be an element of S such that $f \circ t = g \circ t$. As \mathcal{D} is additive this simply means that $a \circ t = 0$ with $a = f - g$. Choose a distinguished triangle (Z, X, Q, t, g, h) using TR1 and TR2. Since $a \circ t = 0$ we see by Lemma 13.4.2 there exists a morphism $i : Q \rightarrow Y$ such that $i \circ g = a$. Finally, using TR1 again we can choose a triangle (Q, Y, W, i, j, k) . Here is a picture

$$\begin{array}{ccccccc} Z & \xrightarrow{t} & X & \xrightarrow{g} & Q & \longrightarrow & Z[1] \\ & & \downarrow 1 & & \downarrow i & & \\ & & X & \xrightarrow{a} & Y & & \\ & & & & \downarrow j & & \\ & & & & W & & \end{array}$$

OK, and now we apply the functors H^i to this diagram. Since $t \in S$ we see that $H^i(Q) = 0$ by the long exact cohomology sequence (13.3.5.1). Hence $H^i(j)$ is an isomorphism for all i by the same argument, i.e., $j \in S$. Finally, $j \circ a = j \circ i \circ g = 0$ as $j \circ i = 0$. Thus $j \circ f = j \circ g$ and we see that LMS3 holds. The proof of RMS3 is dual. \square

Proposition 13.5.5. *Let \mathcal{D} be a pre-triangulated category. Let S be a multiplicative system compatible with the triangulated structure. Then there exists a unique structure of a pre-triangulated category on $S^{-1}\mathcal{D}$ such that the localization functor $Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D}$ is exact. Moreover, if \mathcal{D} is a triangulated category, so is $S^{-1}\mathcal{D}$.*

Proof. We have seen that $S^{-1}\mathcal{D}$ is an additive category and that the localization functor Q is additive in Homology, Lemma 12.8.2, It is clear that we may define $Q(X)[n] = Q(X[n])$ since S is preserved under the shift functors $[n]$ by MS5. Finally, we say a triangle of $S^{-1}\mathcal{D}$ is distinguished if it is isomorphic to the image of a distinguished triangle under the localization functor Q .

Proof of TR1. The only thing to prove here is that if $a : Q(X) \rightarrow Q(Y)$ is a morphism of $S^{-1}\mathcal{D}$, then a fits into a distinguish triangle. Write $a = Q(s)^{-1} \circ Q(f)$ for some $s : Y \rightarrow Y'$ in S and $f : X \rightarrow Y'$. Choose a distinguished triangle

(X, Y', Z, f, g, h) in \mathcal{D} . Then we see that $(Q(X), Q(Y), Q(Z), a, Q(g) \circ Q(s), Q(h))$ is a distinguished triangle of $S^{-1}\mathcal{D}$.

Proof of TR2. This is immediate from the definitions.

Proof of TR3. Note that the existence of the dotted arrow which is required to exist may be proven after replacing the two triangles by isomorphic triangles. Hence we may assume given distinguished triangles (X, Y, Z, f, g, h) and (X', Y', Z', f', g', h') of \mathcal{D} and a commutative diagram

$$\begin{array}{ccc} Q(X) & \xrightarrow{Q(f)} & Q(Y) \\ a \downarrow & & \downarrow b \\ Q(X') & \xrightarrow{Q(f')} & Q(Y') \end{array}$$

in $S^{-1}\mathcal{D}$. Now we apply Categories, Lemma 4.25.8 to find a morphism $f'' : X'' \rightarrow Y''$ in \mathcal{D} and a commutative diagram

$$\begin{array}{ccccc} X & \xrightarrow{k} & X'' & \xleftarrow{s} & X' \\ f \downarrow & & \downarrow f'' & & \downarrow f' \\ Y & \xrightarrow{l} & Y'' & \xleftarrow{t} & Y' \end{array}$$

in \mathcal{D} with $s, t \in S$ and $a = s^{-1}k, b = t^{-1}l$. At this point we can use TR3 for \mathcal{D} and MS6 to find a commutative diagram

$$\begin{array}{ccccccc} X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\ \downarrow k & & \downarrow l & & \downarrow m & & \downarrow g[1] \\ X'' & \longrightarrow & Y'' & \longrightarrow & Z'' & \longrightarrow & X''[1] \\ \uparrow s & & \uparrow t & & \uparrow r & & \uparrow s[1] \\ X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1] \end{array}$$

with $r \in S$. It follows that setting $c = Q(r)^{-1}Q(m)$ we obtain the desired morphism of triangles

$$\begin{array}{c} (Q(X), Q(Y), Q(Z), Q(f), Q(g), Q(h)) \\ \downarrow (a,b,c) \\ (Q(X'), Q(Y'), Q(Z'), Q(f'), Q(g'), Q(h')) \end{array}$$

This proves the first statement of the lemma. If \mathcal{D} is also a triangulated category, then we still have to prove TR4 in order to show that $S^{-1}\mathcal{D}$ is triangulated as well. To do this we reduce by Lemma 13.4.13 to the following statement: Given composable morphisms $a : Q(X) \rightarrow Q(Y)$ and $b : Q(Y) \rightarrow Q(Z)$ we have to produce an octahedron after possibly replacing $Q(X), Q(Y), Q(Z)$ by isomorphic objects. To do this we may first replace Y by an object such that $a = Q(f)$ for some morphism $f : X \rightarrow Y$ in \mathcal{D} . (More precisely, write $a = s^{-1}f$ with $s : Y \rightarrow Y'$ in S and $f : X \rightarrow Y'$. Then replace Y by Y' .) After this we similarly replace Z by an object such that $b = Q(g)$ for some morphism $g : Y \rightarrow Z$. Now we can find distinguished triangles (X, Y, Q_1, f, p_1, d_1) , $(X, Z, Q_2, g \circ f, p_2, d_2)$, and

(Y, Z, Q_3, g, p_3, d_3) in \mathcal{D} (by TR1), and morphisms $a : Q_1 \rightarrow Q_2$ and $b : Q_2 \rightarrow Q_3$ as in TR4. Then it is immediately verified that applying the functor Q to all these data gives a corresponding structure in $S^{-1}\mathcal{D}$ \square

The universal property of the localization of a triangulated category is as follows (we formulate this for pre-triangulated categories, hence it holds a fortiori for triangulated categories).

Lemma 13.5.6. *Let \mathcal{D} be a pre-triangulated category. Let S be a multiplicative system compatible with the triangulated category. Let $Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D}$ be the localization functor, see Proposition 13.5.5.*

- (1) *If $H : \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor into an abelian category \mathcal{A} such that $H(s)$ is an isomorphism for all $s \in S$, then the unique factorization $H' : S^{-1}\mathcal{D} \rightarrow \mathcal{A}$ such that $H = H' \circ Q$ (see Categories, Lemma 4.25.6) is a homological functor too.*
- (2) *If $F : \mathcal{D} \rightarrow \mathcal{D}'$ is an exact functor into a pre-triangulated category \mathcal{D}' such that $F(s)$ is an isomorphism for all $s \in S$, then the unique factorization $F' : S^{-1}\mathcal{D} \rightarrow \mathcal{D}'$ such that $F = F' \circ Q$ (see Categories, Lemma 4.25.6) is an exact functor too.*

Proof. This lemma proves itself. Details omitted. \square

The following lemma describes the kernel (see Definition 13.6.5) of the localization functor.

Lemma 13.5.7. *Let \mathcal{D} be a pre-triangulated category. Let S be a multiplicative system compatible with the triangulated structure. Let Z be an object of \mathcal{D} . The following are equivalent*

- (1) $Q(Z) = 0$ in $S^{-1}\mathcal{D}$,
- (2) *there exists $Z' \in \text{Ob}(\mathcal{D})$ such that $0 : Z \rightarrow Z'$ is an element of S ,*
- (3) *there exists $Z' \in \text{Ob}(\mathcal{D})$ such that $0 : Z' \rightarrow Z$ is an element of S , and*
- (4) *there exists an object Z' and a distinguished triangle $(X, Y, Z \oplus Z', f, g, h)$ such that $f \in S$.*

If S is saturated, then these are also equivalent to

- (4) *the morphism $0 \rightarrow Z$ is an element of S ,*
- (5) *the morphism $Z \rightarrow 0$ is an element of S ,*
- (6) *there exists a distinguished triangle (X, Y, Z, f, g, h) such that $f \in S$.*

Proof. The equivalence of (1), (2), and (3) is Homology, Lemma 12.8.3. If (2) holds, then $(Z'[-1], Z'[-1] \oplus Z, Z, (1, 0), (0, 1), 0)$ is a distinguished triangle (see Lemma 13.4.10) with “ $0 \in S$ ”. By rotating we conclude that (4) holds. If $(X, Y, Z \oplus Z', f, g, h)$ is a distinguished triangle with $f \in S$ then $Q(f)$ is an isomorphism hence $Q(Z \oplus Z') = 0$ hence $Q(Z) = 0$. Thus (1) – (4) are all equivalent.

Next, assume that S is saturated. Note that each of (4), (5), (6) implies one of the equivalent conditions (1) – (4). Suppose that $Q(Z) = 0$. Then $0 \rightarrow Z$ is a morphism of \mathcal{D} which becomes an isomorphism in $S^{-1}\mathcal{D}$. According to Categories, Lemma 4.25.18 the fact that S is saturated implies that $0 \rightarrow Z$ is in S . Hence (1) \Rightarrow (4). Dually (1) \Rightarrow (5). Finally, if $0 \rightarrow Z$ is in S , then the triangle $(0, Z, Z, 0, \text{id}_Z, 0)$ is distinguished by TR1 and TR2 and is a triangle as in (4). \square

Lemma 13.5.8. *Let \mathcal{D} be a triangulated category. Let S be a saturated multiplicative system in \mathcal{D} that is compatible with the triangulated structure. Let (X, Y, Z, f, g, h) be a distinguished triangle in \mathcal{D} . Consider the category of morphisms of triangles*

$$\mathcal{I} = \{(s, s', s'') : (X, Y, Z, f, g, h) \rightarrow (X', Y', Z', f', g', h') \mid s, s', s'' \in S\}$$

Then \mathcal{I} is a filtered category and the functors $\mathcal{I} \rightarrow X/S$, $\mathcal{I} \rightarrow Y/S$, and $\mathcal{I} \rightarrow Z/S$ are cofinal.

Proof. We strongly suggest the reader skip the proof of this lemma and instead works it out on a napkin.

The first remark is that using rotation of distinguished triangles (TR2) gives an equivalence of categories between \mathcal{I} and the corresponding category for the distinguished triangle $(Y, Z, X[1], g, h, -f[1])$. Using this we see for example that if we prove the functor $\mathcal{I} \rightarrow X/S$ is cofinal, then the same thing is true for the functors $\mathcal{I} \rightarrow Y/S$ and $\mathcal{I} \rightarrow Z/S$.

Note that if $s : X \rightarrow X'$ is a morphism of S , then using MS2 we can find $s' : Y \rightarrow Y'$ and $f' : X' \rightarrow Y'$ such that $f' \circ s = s' \circ f$, whereupon we can use MS6 to complete this into an object of \mathcal{I} . Hence the functor $\mathcal{I} \rightarrow X/S$ is surjective on objects. Using rotation as above this implies the same thing is true for the functors $\mathcal{I} \rightarrow Y/S$ and $\mathcal{I} \rightarrow Z/S$.

Suppose given objects $s_1 : X \rightarrow X_1$ and $s_2 : X \rightarrow X_2$ in X/S and a morphism $a : X_1 \rightarrow X_2$ in X/S . Since S is saturated, we see that $a \in S$, see Categories, Lemma 4.25.18. By the argument of the previous paragraph we can complete $s_1 : X \rightarrow X_1$ to an object $(s_1, s'_1, s''_1) : (X, Y, Z, f, g, h) \rightarrow (X_1, Y_1, Z_1, f_1, g_1, h_1)$ in \mathcal{I} . Then we can repeat and find $(a, b, c) : (X_1, Y_1, Z_1, f_1, g_1, h_1) \rightarrow (X_2, Y_2, Z_2, f_2, g_2, h_2)$ with $a, b, c \in S$ completing the given $a : X_1 \rightarrow X_2$. But then (a, b, c) is a morphism in \mathcal{I} . In this way we conclude that the functor $\mathcal{I} \rightarrow X/S$ is also surjective on arrows. Using rotation as above, this implies the same thing is true for the functors $\mathcal{I} \rightarrow Y/S$ and $\mathcal{I} \rightarrow Z/S$.

The category \mathcal{I} is nonempty as the identity provides an object. This proves the condition (1) of the definition of a filtered category, see Categories, Definition 4.19.1.

We check condition (2) of Categories, Definition 4.19.1 for the category \mathcal{I} . Suppose given objects $(s_1, s'_1, s''_1) : (X, Y, Z, f, g, h) \rightarrow (X_1, Y_1, Z_1, f_1, g_1, h_1)$ and $(s_2, s'_2, s''_2) : (X, Y, Z, f, g, h) \rightarrow (X_2, Y_2, Z_2, f_2, g_2, h_2)$ in \mathcal{I} . We want to find an object of \mathcal{I} which is the target of an arrow from both $(X_1, Y_1, Z_1, f_1, g_1, h_1)$ and $(X_2, Y_2, Z_2, f_2, g_2, h_2)$. By Categories, Remark 4.25.5 the categories X/S , Y/S , Z/S are filtered. Thus we can find $X \rightarrow X_3$ in X/S and morphisms $s : X_2 \rightarrow X_3$ and $a : X_1 \rightarrow X_3$. By the above we can find a morphism $(s, s', s'') : (X_2, Y_2, Z_2, f_2, g_2, h_2) \rightarrow (X_3, Y_3, Z_3, f_3, g_3, h_3)$ with $s', s'' \in S$. After replacing (X_2, Y_2, Z_2) by (X_3, Y_3, Z_3) we may assume that there exists a morphism $a : X_1 \rightarrow X_2$ in X/S . Repeating the argument for Y and Z (by rotating as above) we may assume there is a morphism $a : X_1 \rightarrow X_2$ in X/S , $b : Y_1 \rightarrow Y_2$ in Y/S , and $c : Z_1 \rightarrow Z_2$ in Z/S . However, these morphisms do not necessarily give rise to a morphism of distinguished triangles. On the other hand, the necessary diagrams do commute in $S^{-1}\mathcal{D}$. Hence we see (for example) that there exists a morphism $s'_2 : Y_2 \rightarrow Y_3$ in S such that $s'_2 \circ f_2 \circ a = s'_2 \circ b \circ f_1$. Another replacement of (X_2, Y_2, Z_2) as above then gets us to

the situation where $f_2 \circ a = b \circ f_1$. Rotating and applying the same argument two more times we see that we may assume (a, b, c) is a morphism of triangles. This proves condition (2).

Next we check condition (3) of Categories, Definition 4.19.1. Suppose $(s_1, s'_1, s''_1) : (X, Y, Z) \rightarrow (X_1, Y_1, Z_1)$ and $(s_2, s'_2, s''_2) : (X, Y, Z) \rightarrow (X_2, Y_2, Z_2)$ are objects of \mathcal{I} , and suppose $(a, b, c), (a', b', c')$ are two morphisms between them. Since $a \circ s_1 = a' \circ s_1$ there exists a morphism $s_3 : X_2 \rightarrow X_3$ such that $s_3 \circ a = s_3 \circ a'$. Using the surjectivity statement we can complete this to a morphism of triangles $(s_3, s'_3, s''_3) : (X_2, Y_2, Z_2) \rightarrow (X_3, Y_3, Z_3)$ with $s_3, s'_3, s''_3 \in S$. Thus $(s_3 \circ s_2, s'_3 \circ s'_2, s''_3 \circ s''_2) : (X, Y, Z) \rightarrow (X_3, Y_3, Z_3)$ is also an object of \mathcal{I} and after composing the maps $(a, b, c), (a', b', c')$ with (s_3, s'_3, s''_3) we obtain $a = a'$. By rotating we may do the same to get $b = b'$ and $c = c'$.

Finally, we check that $\mathcal{I} \rightarrow X/S$ is cofinal, see Categories, Definition 4.17.1. The first condition is true as the functor is surjective. Suppose that we have an object $s : X \rightarrow X'$ in X/S and two objects $(s_1, s'_1, s''_1) : (X, Y, Z, f, g, h) \rightarrow (X_1, Y_1, Z_1, f_1, g_1, h_1)$ and $(s_2, s'_2, s''_2) : (X, Y, Z, f, g, h) \rightarrow (X_2, Y_2, Z_2, f_2, g_2, h_2)$ in \mathcal{I} as well as morphisms $t_1 : X' \rightarrow X_1$ and $t_2 : X' \rightarrow X_2$ in X/S . By property (2) of \mathcal{I} proved above we can find morphisms $(s_3, s'_3, s''_3) : (X_1, Y_1, Z_1, f_1, g_1, h_1) \rightarrow (X_3, Y_3, Z_3, f_3, g_3, h_3)$ and $(s_4, s'_4, s''_4) : (X_2, Y_2, Z_2, f_2, g_2, h_2) \rightarrow (X_3, Y_3, Z_3, f_3, g_3, h_3)$ in \mathcal{I} . We would be done if the compositions $X' \rightarrow X_1 \rightarrow X_3$ and $X' \rightarrow X_2 \rightarrow X_3$ where equal (see displayed equation in Categories, Definition 4.17.1). If not, then, because X/S is filtered, we can choose a morphism $X_3 \rightarrow X_4$ in S such that the compositions $X' \rightarrow X_1 \rightarrow X_3 \rightarrow X_4$ and $X' \rightarrow X_2 \rightarrow X_3 \rightarrow X_4$ are equal. Then we finally complete $X_3 \rightarrow X_4$ to a morphism $(X_3, Y_3, Z_3) \rightarrow (X_4, Y_4, Z_4)$ in \mathcal{I} and compose with that morphism to see that the result is true. \square

13.6. Quotients of triangulated categories

Given a triangulated category and a triangulated subcategory we can construct another triangulated category by taking the “quotient”. The construction uses a localization. This is similar to the quotient of an abelian category by a Serre subcategory, see Homology, Section 12.9. Before we do the actual construction we briefly discuss kernels of exact functors.

Definition 13.6.1. Let \mathcal{D} be a pre-triangulated category. We say a full pre-triangulated subcategory \mathcal{D}' of \mathcal{D} is *saturated* if whenever $X \oplus Y$ is isomorphic to an object of \mathcal{D}' then both X and Y are isomorphic to objects of \mathcal{D}' .

A saturated triangulated subcategory is sometimes called a *thick triangulated subcategory*. In some references, this is only used for strictly full triangulated subcategories (and sometimes the definition is written such that it implies strictness). There is another notion, that of an *épaisse triangulated subcategory*. The definition is that given a commutative diagram

$$\begin{array}{ccccc} & & S & & \\ & \nearrow & & \searrow & \\ X & \longrightarrow & Y & \longrightarrow & T \longrightarrow X[1] \end{array}$$

where the second line is a distinguished triangle and S and T isomorphic to objects of \mathcal{D}' , then also X and Y are isomorphic to objects of \mathcal{D} . It turns out that this

is equivalent to being saturated (this is elementary and can be found in [Ric89a]) and the notion of a saturated category is easier to work with.

Lemma 13.6.2. *Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor of pre-triangulated categories. Let \mathcal{D}'' be the full subcategory of \mathcal{D} with objects*

$$\text{Ob}(\mathcal{D}'') = \{X \in \text{Ob}(\mathcal{D}) \mid F(X) = 0\}$$

Then \mathcal{D}'' is a strictly full saturated pre-triangulated subcategory of \mathcal{D} . If \mathcal{D} is a triangulated category, then \mathcal{D}'' is a triangulated subcategory.

Proof. It is clear that \mathcal{D}'' is preserved under [1] and $[-1]$. If (X, Y, Z, f, g, h) is a distinguished triangle of \mathcal{D} and $F(X) = F(Y) = 0$, then also $F(Z) = 0$ as $(F(X), F(Y), F(Z), F(f), F(g), F(h))$ is distinguished. Hence we may apply Lemma 13.4.14 to see that \mathcal{D}'' is a pre-triangulated subcategory (respectively a triangulated subcategory if \mathcal{D} is a triangulated category). The final assertion of being saturated follows from $F(X) \oplus F(Y) = 0 \Rightarrow F(X) = F(Y) = 0$. \square

Lemma 13.6.3. *Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor of a pre-triangulated category into an abelian category. Let \mathcal{D}' be the full subcategory of \mathcal{D} with objects*

$$\text{Ob}(\mathcal{D}') = \{X \in \text{Ob}(\mathcal{D}) \mid H(X[n]) = 0 \text{ for all } n \in \mathbf{Z}\}$$

Then \mathcal{D}' is a strictly full saturated pre-triangulated subcategory of \mathcal{D} . If \mathcal{D} is a triangulated category, then \mathcal{D}' is a triangulated subcategory.

Proof. It is clear that \mathcal{D}' is preserved under [1] and $[-1]$. If (X, Y, Z, f, g, h) is a distinguished triangle of \mathcal{D} and $H(X[n]) = H(Y[n]) = 0$ for all n , then also $H(Z[n]) = 0$ for all n by the long exact sequence (13.3.5.1). Hence we may apply Lemma 13.4.14 to see that \mathcal{D}' is a pre-triangulated subcategory (respectively a triangulated subcategory if \mathcal{D} is a triangulated category). The assertion of being saturated follows from

$$\begin{aligned} H((X \oplus Y)[n]) = 0 &\Rightarrow H(X[n] \oplus Y[n]) = 0 \\ &\Rightarrow H(X[n]) \oplus H(Y[n]) = 0 \\ &\Rightarrow H(X[n]) = H(Y[n]) = 0 \end{aligned}$$

for all $n \in \mathbf{Z}$. \square

Lemma 13.6.4. *Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor of a pre-triangulated category into an abelian category. Let $\mathcal{D}_H^+, \mathcal{D}_H^-, \mathcal{D}_H^b$ be the full subcategory of \mathcal{D} with objects*

$$\begin{aligned} \text{Ob}(\mathcal{D}_H^+) &= \{X \in \text{Ob}(\mathcal{D}) \mid H(X[n]) = 0 \text{ for all } n \ll 0\} \\ \text{Ob}(\mathcal{D}_H^-) &= \{X \in \text{Ob}(\mathcal{D}) \mid H(X[n]) = 0 \text{ for all } n \gg 0\} \\ \text{Ob}(\mathcal{D}_H^b) &= \{X \in \text{Ob}(\mathcal{D}) \mid H(X[n]) = 0 \text{ for all } |n| \gg 0\} \end{aligned}$$

Each of these is a strictly full saturated pre-triangulated subcategory of \mathcal{D} . If \mathcal{D} is a triangulated category, then each is a triangulated subcategory.

Proof. Let us prove this for \mathcal{D}_H^+ . It is clear that it is preserved under [1] and $[-1]$. If (X, Y, Z, f, g, h) is a distinguished triangle of \mathcal{D} and $H(X[n]) = H(Y[n]) = 0$ for all $n \ll 0$, then also $H(Z[n]) = 0$ for all $n \ll 0$ by the long exact sequence (13.3.5.1).

Hence we may apply Lemma 13.4.14 to see that \mathcal{D}_H^+ is a pre-triangulated subcategory (respectively a triangulated subcategory if \mathcal{D} is a triangulated category). The assertion of being saturated follows from

$$\begin{aligned} H((X \oplus Y)[n]) = 0 &\Rightarrow H(X[n] \oplus Y[n]) = 0 \\ &\Rightarrow H(X[n]) \oplus H(Y[n]) = 0 \\ &\Rightarrow H(X[n]) = H(Y[n]) = 0 \end{aligned}$$

for all $n \in \mathbf{Z}$. □

Definition 13.6.5. Let \mathcal{D} be a (pre-)triangulated category.

- (1) Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor. The *kernel of F* is the strictly full saturated (pre-)triangulated subcategory described in Lemma 13.6.2.
- (2) Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor. The *kernel of H* is the strictly full saturated (pre-)triangulated subcategory described in Lemma 13.6.3.

These are sometimes denoted $\text{Ker}(F)$ or $\text{Ker}(H)$.

The proof of the following lemma uses TR4.

Lemma 13.6.6. *Let \mathcal{D} be a triangulated category. Let $\mathcal{D}' \subset \mathcal{D}$ be a full triangulated subcategory. Set*

$$(13.6.6.1) \quad S = \left\{ \begin{array}{l} f \in \text{Arrows}(\mathcal{D}) \text{ such that there exists a distinguished triangle} \\ (X, Y, Z, f, g, h) \text{ of } \mathcal{D} \text{ with } Z \text{ isomorphic to an object of } \mathcal{D}' \end{array} \right\}$$

Then S is a multiplicative system compatible with the triangulated structure on \mathcal{D} . In this situation the following are equivalent

- (1) *S is a saturated multiplicative system,*
- (2) *\mathcal{D}' is a saturated triangulated subcategory.*

Proof. To prove the first assertion we have to prove that MS1, MS2, MS3 and MS5, MS6 hold.

Proof of MS1. It is clear that identities are in S because $(X, X, 0, 1, 0, 0)$ is distinguished for every object X of \mathcal{D} and because 0 is an object of \mathcal{D}' . Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ be composable morphisms contained in S . Choose distinguished triangles (X, Y, Q_1, f, p_1, d_1) , $(X, Z, Q_2, g \circ f, p_2, d_2)$, and (Y, Z, Q_3, g, p_3, d_3) . By assumption we know that Q_1 and Q_3 are isomorphic to objects of \mathcal{D}' . By TR4 we know there exists a distinguished triangle (Q_1, Q_2, Q_3, a, b, c) . Since \mathcal{D}' is a triangulated subcategory we conclude that Q_2 is isomorphic to an object of \mathcal{D}' . Hence $g \circ f \in S$.

Proof of MS3. Let $a : X \rightarrow Y$ be a morphism and let $t : Z \rightarrow X$ be an element of S such that $a \circ t = 0$. To prove LMS3 it suffices to find an $s \in S$ such that $s \circ a = 0$, compare with the proof of Lemma 13.5.3. Choose a distinguished triangle (Z, X, Q, t, g, h) using TR1 and TR2. Since $a \circ t = 0$ we see by Lemma 13.4.2 there exists a morphism $i : Q \rightarrow Y$ such that $i \circ g = a$. Finally, using TR1 again we can

choose a triangle (Q, Y, W, i, s, k) . Here is a picture

$$\begin{array}{ccccccc}
 Z & \xrightarrow{t} & X & \xrightarrow{g} & Q & \longrightarrow & Z[1] \\
 & & \downarrow 1 & & \downarrow i & & \\
 & & X & \xrightarrow{a} & Y & & \\
 & & & & \downarrow s & & \\
 & & & & W & &
 \end{array}$$

Since $t \in S$ we see that Q is isomorphic to an object of \mathcal{D}' . Hence $s \in S$. Finally, $s \circ a = s \circ i \circ g = 0$ as $s \circ i = 0$ by Lemma 13.4.1. We conclude that LMS3 holds. The proof of RMS3 is dual.

Proof of MS5. Follows as distinguished triangles and \mathcal{D}' are stable under translations

Proof of MS6. Suppose given a commutative diagram

$$\begin{array}{ccc}
 X & \longrightarrow & Y \\
 \downarrow s & & \downarrow s' \\
 X' & \longrightarrow & Y'
 \end{array}$$

with $s, s' \in S$. By Proposition 13.4.21 we can extend this to a nine square diagram. As s, s' are elements of S we see that X'', Y'' are isomorphic to objects of \mathcal{D}' . Since \mathcal{D}' is a full triangulated subcategory we see that Z'' is also isomorphic to an object of \mathcal{D}' . Whence the morphism $Z \rightarrow Z'$ is an element of S . This proves MS6.

MS2 is a formal consequence of MS1, MS5, and MS6, see Lemma 13.5.2. This finishes the proof of the first assertion of the lemma.

Let's assume that S is saturated. (In the following we will use rotation of distinguished triangles without further mention.) Let $X \oplus Y$ be an object isomorphic to an object of \mathcal{D}' . Consider the morphism $f : 0 \rightarrow X$. The composition $0 \rightarrow X \rightarrow X \oplus Y$ is an element of S as $(0, X \oplus Y, X \oplus Y, 0, 1, 0)$ is a distinguished triangle. The composition $Y[-1] \rightarrow 0 \rightarrow X$ is an element of S as $(X, X \oplus Y, Y, (1, 0), (0, 1), 0)$ is a distinguished triangle, see Lemma 13.4.10. Hence $0 \rightarrow X$ is an element of S (as S is saturated). Thus X is isomorphic to an object of \mathcal{D}' as desired.

Finally, assume \mathcal{D}' is a saturated triangulated subcategory. Let

$$W \xrightarrow{h} X \xrightarrow{g} Y \xrightarrow{f} Z$$

be composable morphisms of \mathcal{D} such that $fg, gh \in S$. We will build up a picture of objects as in the diagram below.

First choose distinguished triangles (W, X, Q_1) , (X, Y, Q_2) , (Y, Z, Q_3) , (W, Y, Q_{12}) , and (X, Z, Q_{23}) . Denote $s : Q_2 \rightarrow Q_1[1]$ the composition $Q_2 \rightarrow X[1] \rightarrow Q_1[1]$. Denote $t : Q_3 \rightarrow Q_2[1]$ the composition $Q_3 \rightarrow Y[1] \rightarrow Q_2[1]$. By TR4 applied to the composition $W \rightarrow X \rightarrow Y$ and the composition $X \rightarrow Y \rightarrow Z$ there exist distinguished triangles (Q_1, Q_{12}, Q_2) and (Q_2, Q_{23}, Q_3) which use the morphisms s and t . The objects Q_{12} and Q_{23} are isomorphic to objects of \mathcal{D}' as $W \rightarrow Y$ and $X \rightarrow Z$ are assumed in S . Hence also $s[1]t$ is an element of S as S is closed under compositions and shifts. Note that $s[1]t = 0$ as $Y[1] \rightarrow Q_2[1] \rightarrow X[2]$ is zero, see Lemma 13.4.1. Hence $Q_3 \oplus Q_1[2]$ is isomorphic to an object of \mathcal{D}' , see Lemma 13.4.10. By assumption on \mathcal{D}' we conclude that Q_3, Q_1 are isomorphic to objects of \mathcal{D}' . Looking at the distinguished triangle (Q_1, Q_{12}, Q_2) we conclude that Q_2 is also isomorphic to an object of \mathcal{D}' . Looking at the distinguished triangle (X, Y, Q_2) we finally conclude that $g \in S$. (It also follows that $h, f \in S$, but we don't need this.) \square

Definition 13.6.7. Let \mathcal{D} be a triangulated category. Let \mathcal{B} be a full triangulated subcategory. We define the *quotient category* \mathcal{D}/\mathcal{B} by the formula $\mathcal{D}/\mathcal{B} = S^{-1}\mathcal{D}$, where S is the multiplicative system of \mathcal{D} associated to \mathcal{B} via Lemma 13.6.6. The localization functor $Q : \mathcal{D} \rightarrow \mathcal{D}/\mathcal{B}$ is called the *quotient functor* in this case.

Note that the quotient functor $Q : \mathcal{D} \rightarrow \mathcal{D}/\mathcal{B}$ is an exact functor of triangulated categories, see Proposition 13.5.5. The universal property of this construction is the following.

Lemma 13.6.8. *Let \mathcal{D} be a triangulated category. Let \mathcal{B} be a full triangulated subcategory of \mathcal{D} . Let $Q : \mathcal{D} \rightarrow \mathcal{D}/\mathcal{B}$ be the quotient functor.*

- (1) *If $H : \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor into an abelian category \mathcal{A} such that $\mathcal{B} \subset \text{Ker}(H)$ then there exists a unique factorization $H' : \mathcal{D}/\mathcal{B} \rightarrow \mathcal{A}$ such that $H = H' \circ Q$ and H' is a homological functor too.*
- (2) *If $F : \mathcal{D} \rightarrow \mathcal{D}'$ is an exact functor into a pre-triangulated category \mathcal{D}' such that $\mathcal{B} \subset \text{Ker}(F)$ then there exists a unique factorization $F' : \mathcal{D}/\mathcal{B} \rightarrow \mathcal{D}'$ such that $F = F' \circ Q$ and F' is an exact functor too.*

Proof. This lemma follows from Lemma 13.5.6. Namely, if $f : X \rightarrow Y$ is a morphism of \mathcal{D} such that for some distinguished triangle (X, Y, Z, f, g, h) the object Z is isomorphic to an object of \mathcal{B} , then $H(f)$, resp. $F(f)$ is an isomorphism under the assumptions of (1), resp. (2). Details omitted. \square

The kernel of the quotient functor can be described as follows.

Lemma 13.6.9. *Let \mathcal{D} be a triangulated category. Let \mathcal{B} be a full triangulated subcategory. The kernel of the quotient functor $Q : \mathcal{D} \rightarrow \mathcal{D}/\mathcal{B}$ is the strictly full subcategory of \mathcal{D} whose objects are*

$$\text{Ob}(\text{Ker}(Q)) = \left\{ \begin{array}{l} Z \in \text{Ob}(\mathcal{D}) \text{ such that there exists a } Z' \in \text{Ob}(\mathcal{D}) \\ \text{such that } Z \oplus Z' \text{ is isomorphic to an object of } \mathcal{B} \end{array} \right\}$$

In other words it is the smallest strictly full saturated triangulated subcategory of \mathcal{D} containing \mathcal{B} .

Proof. First note that the kernel is automatically a strictly full triangulated subcategory containing summands of any of its objects, see Lemma 13.6.2. The description of its objects follows from the definitions and Lemma 13.5.7 part (4). \square

Let \mathcal{D} be a triangulated category. At this point we have constructions which induce order preserving maps between

- (1) the partially ordered set of multiplicative systems S in \mathcal{D} compatible with the triangulated structure, and
- (2) the partially ordered set of full triangulated subcategories $\mathcal{B} \subset \mathcal{D}$.

Namely, the constructions are given by $S \mapsto \mathcal{B}(S) = \text{Ker}(Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D})$ and $\mathcal{B} \mapsto S(\mathcal{B})$ where $S(\mathcal{B})$ is the multiplicative set of (13.6.6.1), i.e.,

$$S(\mathcal{B}) = \left\{ \begin{array}{l} f \in \text{Arrows}(\mathcal{D}) \text{ such that there exists a distinguished triangle} \\ (X, Y, Z, f, g, h) \text{ of } \mathcal{D} \text{ with } Z \text{ isomorphic to an object of } \mathcal{B} \end{array} \right\}$$

Note that it is not the case that these operations are mutually inverse.

Lemma 13.6.10. *Let \mathcal{D} be a triangulated category. The operations described above have the following properties*

- (1) $S(\mathcal{B}(S))$ is the “saturation” of S , i.e., it is the smallest saturated multiplicative system in \mathcal{D} containing S , and
- (2) $\mathcal{B}(S(\mathcal{B}))$ is the “saturation” of \mathcal{B} , i.e., it is the smallest strictly full saturated triangulated subcategory of \mathcal{D} containing \mathcal{B} .

In particular, the constructions define mutually inverse maps between the (partially ordered) set of saturated multiplicative systems in \mathcal{D} compatible with the triangulated structure on \mathcal{D} and the (partially ordered) set of strictly full saturated triangulated subcategories of \mathcal{D} .

Proof. First, let’s start with a full triangulated subcategory \mathcal{B} . Then $\mathcal{B}(S(\mathcal{B})) = \text{Ker}(Q : \mathcal{D} \rightarrow \mathcal{D}/\mathcal{B})$ and hence (2) is the content of Lemma 13.6.9.

Next, suppose that S is multiplicative system in \mathcal{D} compatible with the triangulation on \mathcal{D} . Then $\mathcal{B}(S) = \text{Ker}(Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D})$. Hence (using Lemma 13.4.8 in the localized category)

$$\begin{aligned} S(\mathcal{B}(S)) &= \left\{ \begin{array}{l} f \in \text{Arrows}(\mathcal{D}) \text{ such that there exists a distinguished} \\ \text{triangle } (X, Y, Z, f, g, h) \text{ of } \mathcal{D} \text{ with } Q(Z) = 0 \end{array} \right\} \\ &= \{f \in \text{Arrows}(\mathcal{D}) \mid Q(f) \text{ is an isomorphism}\} \\ &= \hat{S} = S' \end{aligned}$$

in the notation of Categories, Lemma 4.25.18. The final statement of that lemma finishes the proof. \square

Lemma 13.6.11. *Let $H : \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor from a triangulated category \mathcal{D} to an abelian category \mathcal{A} , see Definition 13.3.5. The subcategory $\text{Ker}(H)$ of \mathcal{D} is a strictly full saturated triangulated subcategory of \mathcal{D} whose corresponding saturated multiplicative system (see Lemma 13.6.10) is the set*

$$S = \{f \in \text{Arrows}(\mathcal{D}) \mid H^i(f) \text{ is an isomorphism for all } i \in \mathbf{Z}\}.$$

The functor H factors through the quotient functor $Q : \mathcal{D} \rightarrow \mathcal{D}/\text{Ker}(H)$.

Proof. The category $\text{Ker}(H)$ is a strictly full saturated triangulated subcategory of \mathcal{D} by Lemma 13.6.3. The set S is a saturated multiplicative system compatible with the triangulated structure by Lemma 13.5.4. Recall that the multiplicative system corresponding to $\text{Ker}(H)$ is the set

$$\left\{ \begin{array}{l} f \in \text{Arrows}(\mathcal{D}) \text{ such that there exists a distinguished triangle} \\ (X, Y, Z, f, g, h) \text{ with } H^i(Z) = 0 \text{ for all } i \end{array} \right\}$$

By the long exact cohomology sequence, see (13.3.5.1), it is clear that f is an element of this set if and only if f is an element of S . Finally, the factorization of H through Q is a consequence of Lemma 13.6.8. \square

It is clear that in the lemma above the factorization of H through $\mathcal{D}/\text{Ker}(H)$ is the universal factorization. Namely, if $F : \mathcal{D} \rightarrow \mathcal{D}'$ is an exact functor of triangulated categories and if there exists a homological functor $H' : \mathcal{D}' \rightarrow \mathcal{A}$ such that $H \cong H' \circ F$, then F factors through the quotient functor $Q : \mathcal{D} \rightarrow \mathcal{D}/\text{Ker}(H)$.

13.7. Adjoint for exact functors

Results on adjoint functors between triangulated categories.

Lemma 13.7.1. *Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an exact functor between triangulated categories. If F has a right adjoint, then it is an exact functor.*

Proof. Let G be a right adjoint. Let X be an object of \mathcal{D} and A an object of \mathcal{D}' . Since F is an exact functor we see that

$$\begin{aligned} \text{Mor}_{\mathcal{D}}(X, G(A[1])) &= \text{Mor}_{\mathcal{D}'}(F(X), A[1]) \\ &= \text{Mor}_{\mathcal{D}'}(F(X)[-1], A) \\ &= \text{Mor}_{\mathcal{D}'}(F(X[-1]), A) \\ &= \text{Mor}_{\mathcal{D}}(X[-1], G(A)) \\ &= \text{Mor}_{\mathcal{D}}(X, G(A)[1]) \end{aligned}$$

By Yoneda's lemma (Categories, Lemma 4.3.5) we obtain a canonical isomorphism $G(A)[1] = G(A[1])$. Let $A \rightarrow B \rightarrow C \rightarrow A[1]$ be a distinguished triangle in \mathcal{D}' . Choose a distinguished triangle

$$G(A) \rightarrow G(B) \rightarrow X \rightarrow G(A)[1]$$

in \mathcal{D} . Then $F(G(A)) \rightarrow F(G(B)) \rightarrow F(X) \rightarrow F(G(A))[1]$ is a distinguished triangle in \mathcal{D}' . By TR3 we can choose a morphism of distinguished triangles

$$\begin{array}{ccccccc} F(G(A)) & \longrightarrow & F(G(B)) & \longrightarrow & F(X) & \longrightarrow & F(G(A))[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ A & \longrightarrow & B & \longrightarrow & C & \longrightarrow & A[1] \end{array}$$

Since G is the adjoint the new morphism determines a morphism $X \rightarrow G(C)$ such that the diagram

$$\begin{array}{ccccccc} G(A) & \longrightarrow & G(B) & \longrightarrow & X & \longrightarrow & G(A)[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ G(A) & \longrightarrow & G(B) & \longrightarrow & G(C) & \longrightarrow & G(A)[1] \end{array}$$

commutes. Applying the cohomological functor $\text{Hom}_{\mathcal{D}'}(W, -)$ for an object W of \mathcal{D}' we deduce from the 5 lemma that

$$\text{Hom}_{\mathcal{D}'}(W, X) \rightarrow \text{Hom}_{\mathcal{D}'}(W, G(C))$$

is a bijection and using the Yoneda lemma once more we conclude that $X \rightarrow G(C)$ is an isomorphism. Hence we conclude that $G(A) \rightarrow G(B) \rightarrow G(C) \rightarrow G(A)[1]$ is a distinguished triangle which is what we wanted to show. \square

Lemma 13.7.2. *Let \mathcal{D} , \mathcal{D}' be triangulated categories. Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ and $G : \mathcal{D}' \rightarrow \mathcal{D}$ be functors. Assume that*

- (1) *F and G are exact functors,*
- (2) *F is fully faithful,*
- (3) *G is a right adjoint to F , and*
- (4) *the kernel of G is zero.*

Then F is an equivalence of categories.

Proof. Since F is fully faithful the adjunction map $\text{id} \rightarrow G \circ F$ is an isomorphism (Categories, Lemma 4.24.3). Let X be an object of \mathcal{D}' . Choose a distinguished triangle

$$F(G(X)) \rightarrow X \rightarrow Y \rightarrow F(G(X))[1]$$

in \mathcal{D}' . Applying G and using that $G(F(G(X))) = G(X)$ we find a distinguished triangle

$$G(X) \rightarrow G(X) \rightarrow G(Y) \rightarrow G(X)[1]$$

Hence $G(Y) = 0$. Thus $Y = 0$. Thus $F(G(X)) \rightarrow X$ is an isomorphism. \square

13.8. The homotopy category

Let \mathcal{A} be an additive category. The homotopy category $K(\mathcal{A})$ of \mathcal{A} is the category of complexes of \mathcal{A} with morphisms given by morphisms of complexes up to homotopy. Here is the formal definition.

Definition 13.8.1. Let \mathcal{A} be an additive category.

- (1) We set $\text{Comp}(\mathcal{A}) = \text{CoCh}(\mathcal{A})$ be the *category of (cochain) complexes*.
- (2) A complex K^\bullet is said to be *bounded below* if $K^n = 0$ for all $n \ll 0$.
- (3) A complex K^\bullet is said to be *bounded above* if $K^n = 0$ for all $n \gg 0$.
- (4) A complex K^\bullet is said to be *bounded* if $K^n = 0$ for all $|n| \gg 0$.
- (5) We let $\text{Comp}^+(\mathcal{A})$, $\text{Comp}^-(\mathcal{A})$, resp. $\text{Comp}^b(\mathcal{A})$ be the full subcategory of $\text{Comp}(\mathcal{A})$ whose objects are the complexes which are bounded below, bounded above, resp. bounded.
- (6) We let $K(\mathcal{A})$ be the category with the same objects as $\text{Comp}(\mathcal{A})$ but as morphisms homotopy classes of maps of complexes (see Homology, Lemma 12.12.7).
- (7) We let $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, resp. $K^b(\mathcal{A})$ be the full subcategory of $K(\mathcal{A})$ whose objects are bounded below, bounded above, resp. bounded complexes of \mathcal{A} .

It will turn out that the categories $K(\mathcal{A})$, $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, and $K^b(\mathcal{A})$ are triangulated categories. To prove this we first develop some machinery related to cones and split exact sequences.

13.9. Cones and termwise split sequences

Let \mathcal{A} be an additive category, and let $K(\mathcal{A})$ denote the category of complexes of \mathcal{A} with morphisms given by morphisms of complexes up to homotopy. Note that the shift functors $[n]$ on complexes, see Homology, Definition 12.14.7, give rise to functors $[n] : K(\mathcal{A}) \rightarrow K(\mathcal{A})$ such that $[n] \circ [m] = [n + m]$ and $[0] = \text{id}$.

Definition 13.9.1. Let \mathcal{A} be an additive category. Let $f : K^\bullet \rightarrow L^\bullet$ be a morphism of complexes of \mathcal{A} . The *cone* of f is the complex $C(f)^\bullet$ given by $C(f)^n = L^n \oplus K^{n+1}$ and differential

$$d_{C(f)}^n = \begin{pmatrix} d_L^n & f^{n+1} \\ 0 & -d_K^{n+1} \end{pmatrix}$$

It comes equipped with canonical morphisms of complexes $i : L^\bullet \rightarrow C(f)^\bullet$ and $p : C(f)^\bullet \rightarrow K^\bullet[1]$ induced by the obvious maps $L^n \rightarrow C(f)^n \rightarrow K^{n+1}$.

In other words $(K, L, C(f), f, i, p)$ forms a triangle:

$$K^\bullet \rightarrow L^\bullet \rightarrow C(f)^\bullet \rightarrow K^\bullet[1]$$

The formation of this triangle is functorial in the following sense.

Lemma 13.9.2. *Suppose that*

$$\begin{array}{ccc} K_1^\bullet & \xrightarrow{f_1} & L_1^\bullet \\ a \downarrow & & \downarrow b \\ K_2^\bullet & \xrightarrow{f_2} & L_2^\bullet \end{array}$$

is a diagram of morphisms of complexes which is commutative up to homotopy. Then there exists a morphism $c : C(f_1)^\bullet \rightarrow C(f_2)^\bullet$ which gives rise to a morphism of triangles $(a, b, c) : (K_1^\bullet, L_1^\bullet, C(f_1)^\bullet, f_1, i_1, p_1) \rightarrow (K_2^\bullet, L_2^\bullet, C(f_2)^\bullet, f_2, i_2, p_2)$ of $K(\mathcal{A})$.

Proof. Let $h^n : K_1^n \rightarrow L_2^{n-1}$ be a family of morphisms such that $b \circ f_1 - f_2 \circ a = d \circ h + h \circ d$. Define c^n by the matrix

$$c^n = \begin{pmatrix} b^n & h^{n+1} \\ 0 & a^{n+1} \end{pmatrix} : L_1^n \oplus K_1^{n+1} \rightarrow L_2^n \oplus K_2^{n+1}$$

A matrix computation show that c is a morphism of complexes. It is trivial that $c \circ i_1 = i_2 \circ b$, and it is trivial also to check that $p_2 \circ c = a \circ p_1$. \square

Note that the morphism $c : C(f_1)^\bullet \rightarrow C(f_2)^\bullet$ constructed in the proof of Lemma 13.9.2 in general depends on the chosen homotopy h between $f_2 \circ a$ and $b \circ f_1$.

Lemma 13.9.3. *Suppose that $f : K^\bullet \rightarrow L^\bullet$ and $g : L^\bullet \rightarrow M^\bullet$ are morphisms of complexes such that $g \circ f$ is homotopic to zero. Then g factors through a morphism $C(f)^\bullet \rightarrow M^\bullet$ of $K(\mathcal{A})$.*

Proof. The assumptions say that the diagram

$$\begin{array}{ccc} K^\bullet & \xrightarrow{f} & L^\bullet \\ \downarrow & & \downarrow g \\ 0 & \longrightarrow & M^\bullet \end{array}$$

commutes up to homotopy. Since the cone on $0 \rightarrow M^\bullet$ is M^\bullet the map $C(f)^\bullet \rightarrow C(0 \rightarrow M^\bullet) = M^\bullet$ of Lemma 13.9.2 is the desired map. \square

Note that the morphism $C(f)^\bullet \rightarrow M^\bullet$ constructed in the proof of Lemma 13.9.3 in general depends on the chosen homotopy.

Definition 13.9.4. Let \mathcal{A} be an additive category. A *termwise split injection* $\alpha : A^\bullet \rightarrow B^\bullet$ is a morphism of complexes such that each $A^n \rightarrow B^n$ is isomorphic to the inclusion of a direct summand. A *termwise split surjection* $\beta : B^\bullet \rightarrow C^\bullet$ is a morphism of complexes such that each $B^n \rightarrow C^n$ is isomorphic to the projection onto a direct summand.

Lemma 13.9.5. *Let \mathcal{A} be an additive category. Let*

$$\begin{array}{ccc} A^\bullet & \xrightarrow{f} & B^\bullet \\ a \downarrow & & \downarrow b \\ C^\bullet & \xrightarrow{g} & D^\bullet \end{array}$$

be a diagram of morphisms of complexes commuting up to homotopy. If f is a split injection, then b is homotopic to a morphism which makes the diagram commute. If g is a split surjection, then a is homotopic to a morphism which makes the diagram commute.

Proof. Let $h^n : A^n \rightarrow D^{n-1}$ be a collection of morphisms such that $bf - ga = dh + hd$. Suppose that $\pi^n : B^n \rightarrow A^n$ are morphisms splitting the morphisms f^n . Take $b' = b - dh\pi - h\pi d$. Suppose $s^n : D^n \rightarrow C^n$ are morphisms splitting the morphisms $g^n : C^n \rightarrow D^n$. Take $a' = a + dsh + shd$. Computations omitted. \square

The following lemma can be used to replace a morphism of complexes by a morphism where in each degree the map is the injection of a direct summand.

Lemma 13.9.6. *Let \mathcal{A} be an additive category. Let $\alpha : K^\bullet \rightarrow L^\bullet$ be a morphism of complexes of \mathcal{A} . There exists a factorization*

$$K^\bullet \xrightarrow{\tilde{\alpha}} \tilde{L}^\bullet \xrightarrow{\pi} L^\bullet$$

α

such that

- (1) $\tilde{\alpha}$ is a termwise split injection (see Definition 13.9.4),
- (2) there is a map of complexes $s : L^\bullet \rightarrow \tilde{L}^\bullet$ such that $\pi \circ s = id_{L^\bullet}$ and such that $s \circ \pi$ is homotopic to $id_{\tilde{L}^\bullet}$.

Moreover, if both K^\bullet and L^\bullet are in $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$, then so is \tilde{L}^\bullet .

Proof. We set

$$\tilde{L}^n = L^n \oplus K^n \oplus K^{n+1}$$

and we define

$$d_{\tilde{L}}^n = \begin{pmatrix} d_L^n & 0 & 0 \\ 0 & d_K^n & id_{K^{n+1}} \\ 0 & 0 & -d_K^{n+1} \end{pmatrix}$$

In other words, $\tilde{L}^\bullet = L^\bullet \oplus C(1_{K^\bullet})$. Moreover, we set

$$\tilde{\alpha} = \begin{pmatrix} \alpha \\ id_{K^n} \\ 0 \end{pmatrix}$$

which is clearly a split injection. It is also clear that it defines a morphism of complexes. We define

$$\pi = (id_{L^n} \quad 0 \quad 0)$$

so that clearly $\pi \circ \tilde{\alpha} = \alpha$. We set

$$s = \begin{pmatrix} \text{id}_{L^n} \\ 0 \\ 0 \end{pmatrix}$$

so that $\pi \circ s = \text{id}_{L^\bullet}$. Finally, let $h^n : \tilde{L}^n \rightarrow \tilde{L}^{n-1}$ be the map which maps the summand K^n of \tilde{L}^n via the identity morphism to the summand K^n of \tilde{L}^{n-1} . Then it is a trivial matter (see computations in remark below) to prove that

$$\text{id}_{\tilde{L}^\bullet} - s \circ \pi = d \circ h + h \circ d$$

which finishes the proof of the lemma. \square

Remark 13.9.7. To see the last displayed equality in the proof above we can argue with elements as follows. We have $s\pi(l, k, k^+) = (l, 0, 0)$. Hence the morphism of the left hand side maps (l, k, k^+) to $(0, k, k^+)$. On the other hand $h(l, k, k^+) = (0, 0, k)$ and $d(l, k, k^+) = (dl, dk + k^+, -dk^+)$. Hence $(dh + hd)(l, k, k^+) = d(0, 0, k) + h(dl, dk + k^+, -dk^+) = (0, k, -dk) + (0, 0, dk + k^+) = (0, k, k^+)$ as desired.

Lemma 13.9.8. *Let \mathcal{A} be an additive category. Let $\alpha : K^\bullet \rightarrow L^\bullet$ be a morphism of complexes of \mathcal{A} . There exists a factorization*

$$K^\bullet \begin{array}{c} \xrightarrow{i} \tilde{K}^\bullet \xrightarrow{\tilde{\alpha}} \\ \searrow \alpha \nearrow \end{array} L^\bullet$$

such that

- (1) $\tilde{\alpha}$ is a termwise split surjection (see Definition 13.9.4),
- (2) there is a map of complexes $s : \tilde{K}^\bullet \rightarrow K^\bullet$ such that $s \circ i = \text{id}_{K^\bullet}$ and such that $i \circ s$ is homotopic to $\text{id}_{\tilde{K}^\bullet}$.

Moreover, if both K^\bullet and L^\bullet are in $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$, then so is \tilde{K}^\bullet .

Proof. Dual to Lemma 13.9.6. Take

$$\tilde{K}^n = K^n \oplus L^{n-1} \oplus L^n$$

and we define

$$d_{\tilde{K}}^n = \begin{pmatrix} d_K^n & 0 & 0 \\ 0 & -d_L^{n-1} & \text{id}_{L^n} \\ 0 & 0 & d_L^n \end{pmatrix}$$

in other words $\tilde{K}^\bullet = K^\bullet \oplus C(1_{L^\bullet[-1]})$. Moreover, we set

$$\tilde{\alpha} = (\alpha \quad 0 \quad \text{id}_{L^n})$$

which is clearly a split surjection. It is also clear that it defines a morphism of complexes. We define

$$i = \begin{pmatrix} \text{id}_{K^n} \\ 0 \\ 0 \end{pmatrix}$$

so that clearly $\tilde{\alpha} \circ i = \alpha$. We set

$$s = (\text{id}_{K^n} \quad 0 \quad 0)$$

so that $s \circ i = \text{id}_{K^\bullet}$. Finally, let $h^n : \tilde{K}^n \rightarrow \tilde{K}^{n-1}$ be the map which maps the summand L^{n-1} of \tilde{K}^n via the identity morphism to the summand L^{n-1} of \tilde{K}^{n-1} . Then it is a trivial matter to prove that

$$\text{id}_{\tilde{K}^\bullet} - i \circ s = d \circ h + h \circ d$$

which finishes the proof of the lemma. \square

Definition 13.9.9. Let \mathcal{A} be an additive category. A *termwise split sequence of complexes of \mathcal{A}* is a complex of complexes

$$0 \rightarrow A^\bullet \xrightarrow{\alpha} B^\bullet \xrightarrow{\beta} C^\bullet \rightarrow 0$$

together with given direct sum decompositions $B^n = A^n \oplus C^n$ compatible with α^n and β^n . We often write $s^n : C^n \rightarrow B^n$ and $\pi^n : B^n \rightarrow A^n$ for the maps induced by the direct sum decompositions. According to Homology, Lemma 12.14.10 we get an associated morphism of complexes

$$\delta : C^\bullet \longrightarrow A^\bullet[1]$$

which in degree n is the map $\pi^{n+1} \circ d_B^n \circ s^n$. In other words $(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta)$ forms a triangle

$$A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow A^\bullet[1]$$

This will be the *triangle associated to the termwise split sequence of complexes*.

Lemma 13.9.10. Let \mathcal{A} be an additive category. Let $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ be termwise split exact sequences as in Definition 13.9.9. Let $(\pi')^n, (s')^n$ be a second collection of splittings. Denote $\delta' : C^\bullet \rightarrow A^\bullet[1]$ the morphism associated to this second set of splittings. Then

$$(1, 1, 1) : (A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta) \longrightarrow (A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta')$$

is an isomorphism of triangles in $K(\mathcal{A})$.

Proof. The statement simply means that δ and δ' are homotopic maps of complexes. This is Homology, Lemma 12.14.12. \square

Remark 13.9.11. Let \mathcal{A} be an additive category. Let $0 \rightarrow A_i^\bullet \rightarrow B_i^\bullet \rightarrow C_i^\bullet \rightarrow 0$, $i = 1, 2$ be termwise split exact sequences. Suppose that $a : A_1^\bullet \rightarrow A_2^\bullet$, $b : B_1^\bullet \rightarrow B_2^\bullet$, and $c : C_1^\bullet \rightarrow C_2^\bullet$ are morphisms of complexes such that

$$\begin{array}{ccccc} A_1^\bullet & \longrightarrow & B_1^\bullet & \longrightarrow & C_1^\bullet \\ a \downarrow & & b \downarrow & & c \downarrow \\ A_2^\bullet & \longrightarrow & B_2^\bullet & \longrightarrow & C_2^\bullet \end{array}$$

commutes in $K(\mathcal{A})$. In general, there does **not** exist a morphism $b' : B_1^\bullet \rightarrow B_2^\bullet$ which is homotopic to b such that the diagram above commutes in the category of complexes. Namely, consider Examples, Equation (82.54.0.1). If we could replace the middle map there by a homotopic one such that the diagram commutes, then we would have additivity of traces which we do not.

Lemma 13.9.12. *Let \mathcal{A} be an additive category. Let $0 \rightarrow A_i^\bullet \rightarrow B_i^\bullet \rightarrow C_i^\bullet \rightarrow 0$, $i = 1, 2, 3$ be termwise split exact sequences of complexes. Let $b : B_1^\bullet \rightarrow B_2^\bullet$ and $b' : B_2^\bullet \rightarrow B_3^\bullet$ be morphisms of complexes such that*

$$\begin{array}{ccccc} A_1^\bullet & \longrightarrow & B_1^\bullet & \longrightarrow & C_1^\bullet \\ 0 \downarrow & & b \downarrow & & 0 \downarrow \\ A_2^\bullet & \longrightarrow & B_2^\bullet & \longrightarrow & C_2^\bullet \end{array} \quad \text{and} \quad \begin{array}{ccccc} A_2^\bullet & \longrightarrow & B_2^\bullet & \longrightarrow & C_2^\bullet \\ \downarrow 0 & & \downarrow b' & & \downarrow 0 \\ A_3^\bullet & \longrightarrow & B_3^\bullet & \longrightarrow & C_3^\bullet \end{array}$$

commute in $K(\mathcal{A})$. Then $b' \circ b = 0$ in $K(\mathcal{A})$.

Proof. By Lemma 13.9.5 we can replace b and b' by homotopic maps such that the right square of the left diagram commutes and the left square of the right diagram commutes. In other words, we have $\text{Im}(b^n) \subset \text{Im}(A_2^n \rightarrow B_2^n)$ and $\text{Ker}((b')^n) \supset \text{Im}(A_2^n \rightarrow B_2^n)$. Then $b \circ b' = 0$ as a map of complexes. \square

Lemma 13.9.13. *Let \mathcal{A} be an additive category. Let $f_1 : K_1^\bullet \rightarrow L_1^\bullet$ and $f_2 : K_2^\bullet \rightarrow L_2^\bullet$ be morphisms of complexes. Let*

$$(a, b, c) : (K_1^\bullet, L_1^\bullet, C(f_1)^\bullet, f_1, i_1, p_1) \longrightarrow (K_1^\bullet, L_1^\bullet, C(f_1)^\bullet, f_2, i_2, p_2)$$

be any morphism of triangles of $K(\mathcal{A})$. If a and b are homotopy equivalences then so is c .

Proof. Let $a^{-1} : K_2^\bullet \rightarrow K_1^\bullet$ be a morphism of complexes which is inverse to a in $K(\mathcal{A})$. Let $b^{-1} : L_2^\bullet \rightarrow L_1^\bullet$ be a morphism of complexes which is inverse to b in $K(\mathcal{A})$. Let $c' : C(f_2)^\bullet \rightarrow C(f_1)^\bullet$ be the morphism from Lemma 13.9.2 applied to $f_1 \circ a^{-1} = b^{-1} \circ f_2$. If we can show that $c \circ c'$ and $c' \circ c$ are isomorphisms in $K(\mathcal{A})$ then we win. Hence it suffices to prove the following: Given a morphism of triangles $(1, 1, c) : (K^\bullet, L^\bullet, C(f)^\bullet, f, i, p)$ in $K(\mathcal{A})$ the morphism c is an isomorphism in $K(\mathcal{A})$. By assumption the two squares in the diagram

$$\begin{array}{ccccc} L^\bullet & \longrightarrow & C(f)^\bullet & \longrightarrow & K^\bullet[1] \\ 1 \downarrow & & c \downarrow & & 1 \downarrow \\ L^\bullet & \longrightarrow & C(f)^\bullet & \longrightarrow & K^\bullet[1] \end{array}$$

commute up to homotopy. By construction of $C(f)^\bullet$ the rows form termwise split sequences of complexes. Thus we see that $(c - 1)^2 = 0$ in $K(\mathcal{A})$ by Lemma 13.9.12. Hence c is an isomorphism in $K(\mathcal{A})$ with inverse $2 - c$. \square

Hence if a and b are homotopy equivalences then the resulting morphism of triangles is an isomorphism of triangles in $K(\mathcal{A})$. It turns out that the collection of triangles of $K(\mathcal{A})$ given by cones and the collection of triangles of $K(\mathcal{A})$ given by termwise split sequences of complexes are the same up to isomorphisms, at least up to sign!

Lemma 13.9.14. *Let \mathcal{A} be an additive category.*

- (1) *Given a termwise split sequence of complexes $(\alpha : A^\bullet \rightarrow B^\bullet, \beta : B^\bullet \rightarrow C^\bullet, s^n, \pi^n)$ there exists a homotopy equivalence $C(\alpha)^\bullet \rightarrow C^\bullet$ such that the*

diagram

$$\begin{array}{ccccccc} A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C(\alpha)^\bullet & \xrightarrow{-p} & A^\bullet[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet & \xrightarrow{\delta} & A^\bullet[1] \end{array}$$

defines an isomorphism of triangles in $K(\mathcal{A})$.

- (2) Given a morphism of complexes $f : K^\bullet \rightarrow L^\bullet$ there exists an isomorphism of triangles

$$\begin{array}{ccccccc} K^\bullet & \longrightarrow & \tilde{L}^\bullet & \longrightarrow & M^\bullet & \xrightarrow{\delta} & K^\bullet[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ K^\bullet & \longrightarrow & L^\bullet & \longrightarrow & C(f)^\bullet & \xrightarrow{-p} & K^\bullet[1] \end{array}$$

where the upper triangle is the triangle associated to a termwise split exact sequence $K^\bullet \rightarrow \tilde{L}^\bullet \rightarrow M^\bullet$.

Proof. Proof of (1). We have $C(\alpha)^n = B^n \oplus A^{n+1}$ and we simply define $C(\alpha)^n \rightarrow C^n$ via the projection onto B^n followed by β^n . This defines a morphism of complexes because the compositions $A^{n+1} \rightarrow B^{n+1} \rightarrow C^{n+1}$ are zero. To get a homotopy inverse we take $C^\bullet \rightarrow C(\alpha)^\bullet$ given by $(s^n, -\delta^n)$ in degree n . This is a morphism of complexes because the morphism δ^n can be characterized as the unique morphism $C^n \rightarrow A^{n+1}$ such that $d \circ s^n - s^{n+1} \circ d = \alpha \circ \delta^n$, see proof of Homology, Lemma 12.14.10. The composition $C^\bullet \rightarrow C(f)^\bullet \rightarrow C^\bullet$ is the identity. The composition $C(f)^\bullet \rightarrow C^\bullet \rightarrow C(f)^\bullet$ is equal to the morphism

$$\begin{pmatrix} s^n \circ \beta^n & 0 \\ -\delta^n \circ \beta^n & 0 \end{pmatrix}$$

To see that this is homotopic to the identity map use the homotopy $h^n : C(\alpha)^n \rightarrow C(\alpha)^{n-1}$ given by the matrix

$$\begin{pmatrix} 0 & 0 \\ \pi^n & 0 \end{pmatrix} : C(\alpha)^n = B^n \oplus A^{n+1} \rightarrow B^{n-1} \oplus A^n = C(\alpha)^{n-1}$$

It is trivial to verify that

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} - \begin{pmatrix} s^n & \\ -\delta^n & \end{pmatrix} (\beta^n \quad 0) = \begin{pmatrix} d & \alpha^n \\ 0 & -d \end{pmatrix} \begin{pmatrix} 0 & 0 \\ \pi^n & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ \pi^{n+1} & 0 \end{pmatrix} \begin{pmatrix} d & \alpha^{n+1} \\ 0 & -d \end{pmatrix}$$

To finish the proof of (1) we have to show that the morphisms $-p : C(\alpha)^\bullet \rightarrow A^\bullet[1]$ (see Definition 13.9.1) and $C(\alpha)^\bullet \rightarrow C^\bullet \rightarrow A^\bullet[1]$ agree up to homotopy. This is clear from the above. Namely, we can use the homotopy inverse $(s, -\delta) : C^\bullet \rightarrow C(\alpha)^\bullet$ and check instead that the two maps $C^\bullet \rightarrow A^\bullet[1]$ agree. And note that $p \circ (s, -\delta) = -\delta$ as desired.

Proof of (2). We let $\tilde{f} : K^\bullet \rightarrow \tilde{L}^\bullet$, $s : L^\bullet \rightarrow \tilde{L}^\bullet$ and $\pi : L^\bullet \rightarrow L^\bullet$ be as in Lemma 13.9.6. By Lemmas 13.9.2 and 13.9.13 the triangles $(K^\bullet, L^\bullet, C(f), i, p)$ and $(K^\bullet, \tilde{L}^\bullet, C(\tilde{f}), \tilde{i}, \tilde{p})$ are isomorphic. Note that we can compose isomorphisms of triangles. Thus we may replace L^\bullet by \tilde{L}^\bullet and f by \tilde{f} . In other words we may assume that f is a termwise split injection. In this case the result follows from part (1). \square

Lemma 13.9.15. *Let \mathcal{A} be an additive category. Let $A_1^\bullet \rightarrow A_2^\bullet \rightarrow \dots \rightarrow A_n^\bullet$ be a sequence of composable morphisms of complexes. There exists a commutative diagram*

$$\begin{array}{ccccccc} A_1^\bullet & \longrightarrow & A_2^\bullet & \longrightarrow & \dots & \longrightarrow & A_n^\bullet \\ \uparrow & & \uparrow & & & & \uparrow \\ B_1^\bullet & \longrightarrow & B_2^\bullet & \longrightarrow & \dots & \longrightarrow & B_n^\bullet \end{array}$$

such that each morphism $B_i^\bullet \rightarrow B_{i+1}^\bullet$ is a split injection and each $B_i^\bullet \rightarrow A_i^\bullet$ is a homotopy equivalence. Moreover, if all A_i^\bullet are in $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$, then so are the B_i^\bullet .

Proof. The case $n = 1$ is without content. Lemma 13.9.6 is the case $n = 2$. Suppose we have constructed the diagram except for B_n^\bullet . Apply Lemma 13.9.6 to the composition $B_{n-1}^\bullet \rightarrow A_{n-1}^\bullet \rightarrow A_n^\bullet$. The result is a factorization $B_{n-1}^\bullet \rightarrow B_n^\bullet \rightarrow A_n^\bullet$ as desired. \square

Lemma 13.9.16. *Let \mathcal{A} be an additive category. Let $(\alpha : A^\bullet \rightarrow B^\bullet, \beta : B^\bullet \rightarrow C^\bullet, s^n, \pi^n)$ be a termwise split sequence of complexes. Let $(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta)$ be the associated triangle. Then the triangle $(C^\bullet[-1], A^\bullet, B^\bullet, \delta[-1], \alpha, \beta)$ is isomorphic to the triangle $(C^\bullet[-1], A^\bullet, C(\delta[-1])^\bullet, \delta[-1], i, p)$.*

Proof. We write $B^n = A^n \oplus C^n$ and we identify α^n and β^n with the natural inclusion and projection maps. By construction of δ we have

$$d_B^n = \begin{pmatrix} d_A^n & \delta^n \\ 0 & d_C^n \end{pmatrix}$$

On the other hand the cone of $\delta[-1] : C^\bullet[-1] \rightarrow A^\bullet$ is given as $C(\delta[-1])^n = A^n \oplus C^n$ with differential identical with the matrix above! Whence the lemma. \square

Lemma 13.9.17. *Let \mathcal{A} be an additive category. Let $f : K^\bullet \rightarrow L^\bullet$ be a morphism of complexes. The triangle $(L^\bullet, C(f)^\bullet, K^\bullet[1], i, p, f[1])$ is the triangle associated to the termwise split sequence*

$$0 \rightarrow L^\bullet \rightarrow C(f)^\bullet \rightarrow K^\bullet[1] \rightarrow 0$$

coming from the definition of the cone of f .

Proof. Immediate from the definitions. \square

13.10. Distinguished triangles in the homotopy category

Since we want our boundary maps in long exact sequences of cohomology to be given by the maps in the snake lemma without signs we define distinguished triangles in the homotopy category as follows.

Definition 13.10.1. Let \mathcal{A} be an additive category. A triangle (X, Y, Z, f, g, h) of $K(\mathcal{A})$ is called a *distinguished triangle* of $K(\mathcal{A})$ if it is isomorphic to the triangle associated to a termwise split exact sequence of complexes, see Definition 13.9.9. Same definition for $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, and $K^b(\mathcal{A})$.

Note that according to Lemma 13.9.14 a triangle of the form $(K^\bullet, L^\bullet, C(f)^\bullet, f, i, -p)$ is a distinguished triangle. This does indeed lead to a triangulated category, see Proposition 13.10.3. Before we can prove the proposition we need one more lemma in order to be able to prove TR4.

Lemma 13.10.2. *Let \mathcal{A} be an additive category. Suppose that $\alpha : A^\bullet \rightarrow B^\bullet$ and $\beta : B^\bullet \rightarrow C^\bullet$ are split injections of complexes. Then there exist distinguished triangles $(A^\bullet, B^\bullet, Q_1^\bullet, \alpha, p_1, d_1)$, $(A^\bullet, C^\bullet, Q_2^\bullet, \beta \circ \alpha, p_2, d_2)$ and $(B^\bullet, C^\bullet, Q_3^\bullet, \beta, p_3, d_3)$ for which TR4 holds.*

Proof. Say $\pi_1^n : B^n \rightarrow A^n$, and $\pi_3^n : C^n \rightarrow B^n$ are the splittings. Then also $A^\bullet \rightarrow C^\bullet$ is a split injection with splittings $\pi_2^n = \pi_1^n \circ \pi_3^n$. Let us write Q_1^\bullet , Q_2^\bullet and Q_3^\bullet for the “quotient” complexes. In other words, $Q_1^n = \text{Ker}(\pi_1^n)$, $Q_3^n = \text{Ker}(\pi_3^n)$ and $Q_2^n = \text{Ker}(\pi_2^n)$. Note that the kernels exist. Then $B^n = A^n \oplus Q_1^n$ and $C^n = B^n \oplus Q_3^n$, where we think of A^n as a subobject of B^n and so on. This implies $C^n = A^n \oplus Q_1^n \oplus Q_3^n$. Note that $\pi_2^n = \pi_1^n \circ \pi_3^n$ is zero on both Q_1^n and Q_3^n . Hence $Q_2^n = Q_1^n \oplus Q_3^n$. Consider the commutative diagram

$$\begin{array}{ccccccccc} 0 & \rightarrow & A^\bullet & \rightarrow & B^\bullet & \rightarrow & Q_1^\bullet & \rightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \rightarrow & A^\bullet & \rightarrow & C^\bullet & \rightarrow & Q_2^\bullet & \rightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \rightarrow & B^\bullet & \rightarrow & C^\bullet & \rightarrow & Q_3^\bullet & \rightarrow & 0 \end{array}$$

The rows of this diagram are termwise split exact sequences, and hence determine distinguished triangles by definition. Moreover downward arrows in the diagram above are compatible with the chosen splittings and hence define morphisms of triangles

$$(A^\bullet \rightarrow B^\bullet \rightarrow Q_1^\bullet \rightarrow A^\bullet[1]) \longrightarrow (A^\bullet \rightarrow C^\bullet \rightarrow Q_2^\bullet \rightarrow A^\bullet[1])$$

and

$$(A^\bullet \rightarrow C^\bullet \rightarrow Q_2^\bullet \rightarrow A^\bullet[1]) \longrightarrow (B^\bullet \rightarrow C^\bullet \rightarrow Q_3^\bullet \rightarrow B^\bullet[1]).$$

Note that the splittings $Q_3^n \rightarrow C^n$ of the bottom split sequence in the diagram provides a splitting for the split sequence $0 \rightarrow Q_1^\bullet \rightarrow Q_2^\bullet \rightarrow Q_3^\bullet \rightarrow 0$ upon composing with $C^n \rightarrow Q_2^n$. It follows easily from this that the morphism $\delta : Q_3^\bullet \rightarrow Q_1^\bullet[1]$ in the corresponding distinguished triangle

$$(Q_1^\bullet \rightarrow Q_2^\bullet \rightarrow Q_3^\bullet \rightarrow Q_1^\bullet[1])$$

is equal to the composition $Q_3^\bullet \rightarrow B^\bullet[1] \rightarrow Q_1^\bullet[1]$. Hence we get a structure as in the conclusion of axiom TR4. \square

Proposition 13.10.3. *Let \mathcal{A} be an additive category. The category $K(\mathcal{A})$ of complexes up to homotopy with its natural translation functors and distinguished triangles as defined above is a triangulated category.*

Proof. Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Also, any triangle $(A^\bullet, A^\bullet, 0, 1, 0, 0)$ is distinguished since $0 \rightarrow A^\bullet \rightarrow A^\bullet \rightarrow 0 \rightarrow 0$ is a termwise split sequence of complexes. Finally, given any morphism of complexes $f : K^\bullet \rightarrow L^\bullet$ the triangle $(K, L, C(f), f, i, -p)$ is distinguished by Lemma 13.9.14.

Proof of TR2. Let (X, Y, Z, f, g, h) be a triangle. Assume $(Y, Z, X[1], g, h, -f[1])$ is distinguished. Then there exists a termwise split sequence of complexes $A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet$ such that the associated triangle $(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta)$ is isomorphic to $(Y, Z, X[1], g, h, -f[1])$. Rotating back we see that (X, Y, Z, f, g, h) is isomorphic to $(C^\bullet[-1], A^\bullet, B^\bullet, -\delta[-1], \alpha, \beta)$. It follows from Lemma 13.9.16 that the triangle $(C^\bullet[-1], A^\bullet, B^\bullet, \delta[-1], \alpha, \beta)$ is isomorphic to $(C^\bullet[-1], A^\bullet, C(\delta[-1])^\bullet, \delta[-1], i, p)$.

Precomposing the previous isomorphism of triangles with -1 on Y it follows that (X, Y, Z, f, g, h) is isomorphic to $(C^\bullet[-1], A^\bullet, C(\delta[-1])^\bullet, \delta[-1], i, -p)$. Hence it is distinguished by Lemma 13.9.14. On the other hand, suppose that (X, Y, Z, f, g, h) is distinguished. By Lemma 13.9.14 this means that it is isomorphic to a triangle of the form $(K^\bullet, L^\bullet, C(f), f, i, -p)$ for some morphism of complexes f . Then the rotated triangle $(Y, Z, X[1], g, h, -f[1])$ is isomorphic to $(L^\bullet, C(f), K^\bullet[1], i, -p, -f[1])$ which is isomorphic to the triangle $(L^\bullet, C(f), K^\bullet[1], i, p, f[1])$. By Lemma 13.9.17 this triangle is distinguished. Hence $(Y, Z, X[1], g, h, -f[1])$ is distinguished as desired.

Proof of TR3. Let (X, Y, Z, f, g, h) and (X', Y', Z', f', g', h') be distinguished triangles of $K(\mathcal{A})$ and let $a : X \rightarrow X'$ and $b : Y \rightarrow Y'$ be morphisms such that $f' \circ a = b \circ f$. By Lemma 13.9.14 we may assume that $(X, Y, Z, f, g, h) = (X, Y, C(f), f, i, -p)$ and $(X', Y', Z', f', g', h') = (X', Y', C(f'), f', i', -p')$. At this point we simply apply Lemma 13.9.2 to the commutative diagram given by f, f', a, b .

Proof of TR4. At this point we know that $K(\mathcal{A})$ is a pre-triangulated category. Hence we can use Lemma 13.4.13. Let $A^\bullet \rightarrow B^\bullet$ and $B^\bullet \rightarrow C^\bullet$ be composable morphisms of $K(\mathcal{A})$. By Lemma 13.9.15 we may assume that $A^\bullet \rightarrow B^\bullet$ and $B^\bullet \rightarrow C^\bullet$ are split injective morphisms. In this case the result follows from Lemma 13.10.2. \square

Remark 13.10.4. Let \mathcal{A} be an additive category. Exactly the same proof as the proof of Proposition 13.10.3 shows that the categories $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, and $K^b(\mathcal{A})$ are triangulated categories. Namely, the cone of a morphisms between bounded (above, below) is bounded (above, below). But we prove below that these are triangulated subcategories of $K(\mathcal{A})$ which gives another proof.

Lemma 13.10.5. *Let \mathcal{A} be an additive subcategory. The categories $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, and $K^b(\mathcal{A})$ are full triangulated subcategories of $K(\mathcal{A})$.*

Proof. Each of the categories mentioned is a full additive subcategory. We use the criterion of Lemma 13.4.14 to show that they are triangulated subcategories. It is clear that each of the categories $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, and $K^b(\mathcal{A})$ is preserved under the shift functors $[1], [-1]$. Finally, suppose that $f : A^\bullet \rightarrow B^\bullet$ is a morphism in $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$. Then $(A^\bullet, B^\bullet, C(f)^\bullet, f, i, -p)$ is a distinguished triangle of $K(\mathcal{A})$ with $C(f)^\bullet \in K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$ as is clear from the construction of the cone. Thus the lemma is proved. (Alternatively, $K^\bullet \rightarrow L^\bullet$ is isomorphic to an termwise split injection of complexes in $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, or $K^b(\mathcal{A})$, see Lemma 13.9.6 and then one can directly take the associated distinguished triangle.) \square

Lemma 13.10.6. *Let \mathcal{A}, \mathcal{B} be additive categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor. The induced functors*

$$\begin{aligned} F : K(\mathcal{A}) &\longrightarrow K(\mathcal{B}) \\ F : K^+(\mathcal{A}) &\longrightarrow K^+(\mathcal{B}) \\ F : K^-(\mathcal{A}) &\longrightarrow K^-(\mathcal{B}) \\ F : K^b(\mathcal{A}) &\longrightarrow K^b(\mathcal{B}) \end{aligned}$$

are exact functors of triangulated categories.

Proof. Suppose $A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet$ is a termwise split sequence of complexes of \mathcal{A} with splittings (s^n, π^n) and associated morphism $\delta : C^\bullet \rightarrow A^\bullet[1]$, see Definition 13.9.9. Then $F(A^\bullet) \rightarrow F(B^\bullet) \rightarrow F(C^\bullet)$ is a termwise split sequence of complexes

with splittings $(F(s^n), F(\pi^n))$ and associated morphism $F(\delta) : F(C^\bullet) \rightarrow F(A^\bullet)[1]$. Thus F transforms distinguished triangles into distinguished triangles. \square

13.11. Derived categories

In this section we construct the derived category of an abelian category \mathcal{A} by inverting the quasi-isomorphisms in $K(\mathcal{A})$. Before we do this recall that the functors $H^i : \text{Comp}(\mathcal{A}) \rightarrow \mathcal{A}$ factor through $K(\mathcal{A})$, see Homology, Lemma 12.12.11. Moreover, in Homology, Definition 12.14.8 we have defined identifications $H^i(K^\bullet[n]) = H^{i+n}(K^\bullet)$. At this point it makes sense to redefine

$$H^i(K^\bullet) = H^0(K^\bullet[i])$$

in order to avoid confusion and possible sign errors.

Lemma 13.11.1. *Let \mathcal{A} be an abelian category. The functor*

$$H^0 : K(\mathcal{A}) \longrightarrow \mathcal{A}$$

is homological.

Proof. Because H^0 is a functor, and by our definition of distinguished triangles it suffices to prove that given a termwise split short exact sequence of complexes $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ the sequence $H^0(A^\bullet) \rightarrow H^0(B^\bullet) \rightarrow H^0(C^\bullet)$ is exact. This follows from Homology, Lemma 12.12.12. \square

In particular, this lemma implies that a distinguished triangle (X, Y, Z, f, g, h) in $K(\mathcal{A})$ gives rise to a long exact cohomology sequence (13.11.1.1)

$$\dots \longrightarrow H^i(X) \xrightarrow{H^i(f)} H^i(Y) \xrightarrow{H^i(g)} H^i(Z) \xrightarrow{H^i(h)} H^{i+1}(X) \longrightarrow \dots$$

see (13.3.5.1). Moreover, there is a compatibility with the long exact sequence of cohomology associated to a short exact sequence of complexes (insert future reference here). For example, if $(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta)$ is the distinguished triangle associated to a termwise split exact sequence of complexes (see Definition 13.9.9), then the cohomology sequence above agrees with the one defined using the snake lemma, see Homology, Lemma 12.12.12 and for agreement of sequences, see Homology, Lemma 12.14.11.

Recall that a complex K^\bullet is *acyclic* if $H^i(K^\bullet) = 0$ for all $i \in \mathbf{Z}$. Moreover, recall that a morphism of complexes $f : K^\bullet \rightarrow L^\bullet$ is a *quasi-isomorphism* if and only if $H^i(f)$ is an isomorphism for all i . See Homology, Definition 12.12.10.

Lemma 13.11.2. *Let \mathcal{A} be an abelian category. The full subcategory $Ac(\mathcal{A})$ of $K(\mathcal{A})$ consisting of acyclic complexes is a strictly full saturated triangulated subcategory of $K(\mathcal{A})$. The corresponding saturated multiplicative system (see Lemma 13.6.10) of $K(\mathcal{A})$ is the set $Qis(\mathcal{A})$ of quasi-isomorphisms. In particular, the kernel of the localization functor $Q : K(\mathcal{A}) \rightarrow Qis(\mathcal{A})^{-1}K(\mathcal{A})$ is $Ac(\mathcal{A})$ and the functor H^0 factors through Q .*

Proof. We know that H^0 is a homological functor by Lemma 13.11.1. Thus this lemma is a special case of Lemma 13.6.11. \square

Definition 13.11.3. Let \mathcal{A} be an abelian category. Let $\text{Ac}(\mathcal{A})$ and $\text{Qis}(\mathcal{A})$ be as in Lemma 13.11.2. The *derived category of \mathcal{A}* is the triangulated category

$$D(\mathcal{A}) = K(\mathcal{A})/\text{Ac}(\mathcal{A}) = \text{Qis}(\mathcal{A})^{-1}K(\mathcal{A}).$$

We denote $H^0 : D(\mathcal{A}) \rightarrow \mathcal{A}$ the unique functor whose composition with the quotient functor gives back the functor H^0 defined above. Using Lemma 13.6.4 we introduce the strictly full saturated triangulated subcategories $D^+(\mathcal{A}), D^-(\mathcal{A}), D^b(\mathcal{A})$ whose sets of objects are

$$\begin{aligned} \text{Ob}(D^+(\mathcal{A})) &= \{X \in \text{Ob}(D(\mathcal{A})) \mid H^n(X) = 0 \text{ for all } n \ll 0\} \\ \text{Ob}(D^-(\mathcal{A})) &= \{X \in \text{Ob}(D(\mathcal{A})) \mid H^n(X) = 0 \text{ for all } n \gg 0\} \\ \text{Ob}(D^b(\mathcal{A})) &= \{X \in \text{Ob}(D(\mathcal{A})) \mid H^n(X) = 0 \text{ for all } |n| \gg 0\} \end{aligned}$$

The category $D^b(\mathcal{A})$ is called the *bounded derived category* of \mathcal{A} .

If K^\bullet and L^\bullet are complexes of \mathcal{A} then we sometimes say “ K^\bullet is *quasi-isomorphic* to L^\bullet ” to indicate that K^\bullet and L^\bullet are isomorphic objects of $D(\mathcal{A})$.

Remark 13.11.4. In this chapter, we consistently work with “small” abelian categories (as is the convention in the Stacks project). For a “big” abelian category \mathcal{A} , it isn’t clear that the derived category $D(\mathcal{A})$ exists, because it isn’t clear that morphisms in the derived category are sets. In fact, in general they aren’t, see Examples, Lemma 82.52.1. However, if \mathcal{A} is a Grothendieck abelian category, and given K^\bullet, L^\bullet in $K(\mathcal{A})$, then by Injectives, Theorem 19.12.6 there exists a quasi-isomorphism $L^\bullet \rightarrow I^\bullet$ to a K-injective complex I^\bullet and Lemma 13.29.2 shows that

$$\text{Hom}_{D(\mathcal{A})}(K^\bullet, L^\bullet) = \text{Hom}_{K(\mathcal{A})}(K^\bullet, I^\bullet)$$

which is a set. Some examples of Grothendieck abelian categories are the category of modules over a ring, or more generally the category of sheaves of modules on a ringed site.

Each of the variants $D^+(\mathcal{A}), D^-(\mathcal{A}), D^b(\mathcal{A})$ can be constructed as a localization of the corresponding homotopy category. This relies on the following simple lemma.

Lemma 13.11.5. *Let \mathcal{A} be an abelian category. Let K^\bullet be a complex.*

- (1) *If $H^n(K^\bullet) = 0$ for all $n \ll 0$, then there exists a quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with L^\bullet bounded below.*
- (2) *If $H^n(K^\bullet) = 0$ for all $n \gg 0$, then there exists a quasi-isomorphism $M^\bullet \rightarrow K^\bullet$ with M^\bullet bounded above.*
- (3) *If $H^n(K^\bullet) = 0$ for all $|n| \gg 0$, then there exists a commutative diagram of morphisms of complexes*

$$\begin{array}{ccc} K^\bullet & \longrightarrow & L^\bullet \\ \uparrow & & \uparrow \\ M^\bullet & \longrightarrow & N^\bullet \end{array}$$

where all the arrows are quasi-isomorphisms, L^\bullet bounded below, M^\bullet bounded above, and N^\bullet a bounded complex.

Proof. Pick $a \ll 0 \ll b$ and set $M^\bullet = \tau_{\leq a}K^\bullet$, $L^\bullet = K^\bullet/\tau_{\leq b}K^\bullet$, and $N^\bullet = L^\bullet/M^\bullet$. See Homology, Section 12.13 for the truncation functors. □

To state the following lemma denote $\text{Ac}^+(\mathcal{A})$, $\text{Ac}^-(\mathcal{A})$, resp. $\text{Ac}^b(\mathcal{A})$ the intersection of $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, resp. $K^b(\mathcal{A})$ with $\text{Ac}(\mathcal{A})$. Denote $\text{Qis}^+(\mathcal{A})$, $\text{Qis}^-(\mathcal{A})$, resp. $\text{Qis}^b(\mathcal{A})$ the intersection of $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, resp. $K^b(\mathcal{A})$ with $\text{Qis}(\mathcal{A})$.

Lemma 13.11.6. *Let \mathcal{A} be an abelian category. The subcategories $\text{Ac}^+(\mathcal{A})$, $\text{Ac}^-(\mathcal{A})$, resp. $\text{Ac}^b(\mathcal{A})$ are strictly full saturated triangulated subcategories of $K^+(\mathcal{A})$, $K^-(\mathcal{A})$, resp. $K^b(\mathcal{A})$. The corresponding saturated multiplicative systems (see Lemma 13.6.10) are the sets $\text{Qis}^+(\mathcal{A})$, $\text{Qis}^-(\mathcal{A})$, resp. $\text{Qis}^b(\mathcal{A})$.*

- (1) *The kernel of the functor $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$ is $\text{Ac}^+(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^+(\mathcal{A})/\text{Ac}^+(\mathcal{A}) = \text{Qis}^+(\mathcal{A})^{-1}K^+(\mathcal{A}) \longrightarrow D^+(\mathcal{A})$$

- (2) *The kernel of the functor $K^-(\mathcal{A}) \rightarrow D^-(\mathcal{A})$ is $\text{Ac}^-(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^-(\mathcal{A})/\text{Ac}^-(\mathcal{A}) = \text{Qis}^-(\mathcal{A})^{-1}K^-(\mathcal{A}) \longrightarrow D^-(\mathcal{A})$$

- (3) *The kernel of the functor $K^b(\mathcal{A}) \rightarrow D^b(\mathcal{A})$ is $\text{Ac}^b(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^b(\mathcal{A})/\text{Ac}^b(\mathcal{A}) = \text{Qis}^b(\mathcal{A})^{-1}K^b(\mathcal{A}) \longrightarrow D^b(\mathcal{A})$$

Proof. The initial statements follow from Lemma 13.6.11 by considering the restriction of the homological functor H^0 . The statement on kernels in (1), (2), (3) is a consequence of the definitions in each case. Each of the functors is essentially surjective by Lemma 13.11.5. To finish the proof we have to show the functors are fully faithful. We first do this for the bounded below version.

Suppose that K^\bullet, L^\bullet are bounded above complexes. A morphism between these in $D(\mathcal{A})$ is of the form $s^{-1}f$ for a pair $f : K^\bullet \rightarrow (L')^\bullet$, $s : L^\bullet \rightarrow (L')^\bullet$ where s is a quasi-isomorphism. This implies that $(L')^\bullet$ has cohomology bounded below. Hence by Lemma 13.11.5 we can choose a quasi-isomorphism $s' : (L')^\bullet \rightarrow (L'')^\bullet$ with $(L'')^\bullet$ bounded below. Then the pair $(s' \circ f, s' \circ s)$ defines a morphism in $\text{Qis}^+(\mathcal{A})^{-1}K^+(\mathcal{A})$. Hence the functor is “full”. Finally, suppose that the pair $f : K^\bullet \rightarrow (L')^\bullet$, $s : L^\bullet \rightarrow (L')^\bullet$ defines a morphism in $\text{Qis}^+(\mathcal{A})^{-1}K^+(\mathcal{A})$ which is zero in $D(\mathcal{A})$. This means that there exists a quasi-isomorphism $s' : (L')^\bullet \rightarrow (L'')^\bullet$ such that $s' \circ f = 0$. Using Lemma 13.11.5 once more we obtain a quasi-isomorphism $s'' : (L'')^\bullet \rightarrow (L''')^\bullet$ with $(L''')^\bullet$ bounded below. Thus we see that $s'' \circ s' \circ f = 0$ which implies that $s^{-1}f$ is zero in $\text{Qis}^+(\mathcal{A})^{-1}K^+(\mathcal{A})$. This finishes the proof that the functor in (1) is an equivalence.

The proof of (2) is dual to the proof of (1). To prove (3) we may use the result of (2). Hence it suffices to prove that the functor $\text{Qis}^b(\mathcal{A})^{-1}K^b(\mathcal{A}) \rightarrow \text{Qis}^-(\mathcal{A})^{-1}K^-(\mathcal{A})$ is fully faithful. The argument given in the previous paragraph applies directly to show this where we consistently work with complexes which are already bounded above. \square

13.12. The canonical delta-functor

The derived category should be the receptacle for the universal cohomology functor. In order to state the result we use the notion of a δ -functor from an abelian category into a triangulated category, see Definition 13.3.6.

Consider the functor $\text{Comp}(\mathcal{A}) \rightarrow K(\mathcal{A})$. This functor is **not** a δ -functor in general. The easiest way to see this is to consider a nonsplit short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of objects of \mathcal{A} . Since $\text{Hom}_{K(\mathcal{A})}(C[0], A[1]) = 0$ we see that any distinguished triangle arising from this short exact sequence would look like $(A[0], B[0], C[0], a, b, 0)$. But the existence of such a distinguished triangle in $K(\mathcal{A})$ implies that the extension is split. A contradiction.

It turns out that the functor $\text{Comp}(\mathcal{A}) \rightarrow D(\mathcal{A})$ is a δ -functor. In order to see this we have to define the morphisms δ associated to a short exact sequence

$$0 \rightarrow A^\bullet \xrightarrow{a} B^\bullet \xrightarrow{b} C^\bullet \rightarrow 0$$

of complexes in the abelian category \mathcal{A} . Consider the cone $C(a)^\bullet$ of the morphism a . We have $C(a)^n = B^n \oplus A^{n+1}$ and we define $q^n : C(a)^n \rightarrow C^n$ via the projection to B^n followed by b^n . Hence a morphism of complexes

$$q : C(a)^\bullet \rightarrow C^\bullet.$$

It is clear that $q \circ i = b$ where i is as in Definition 13.9.1. Note that, as a^\bullet is injective in each degree, the kernel of q is identified with the cone of id_{A^\bullet} which is acyclic. Hence we see that q is a quasi-isomorphism. According to Lemma 13.9.14 the triangle

$$(A, B, C(a), a, i, -p)$$

is a distinguished triangle in $K(\mathcal{A})$. As the localization functor $K(\mathcal{A}) \rightarrow D(\mathcal{A})$ is exact we see that $(A, B, C(a), a, i, -p)$ is a distinguished triangle in $D(\mathcal{A})$. Since q is a quasi-isomorphism we see that q is an isomorphism in $D(\mathcal{A})$. Hence we deduce that

$$(A, B, C, a, b, -p \circ q^{-1})$$

is a distinguished triangle of $D(\mathcal{A})$. This suggests the following lemma.

Lemma 13.12.1. *Let \mathcal{A} be an abelian category. The functor $\text{Comp}(\mathcal{A}) \rightarrow D(\mathcal{A})$ defined has the natural structure of a δ -functor, with*

$$\delta_{A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet} = -p \circ q^{-1}$$

with p and q as explained above. The same construction turns the functors $\text{Comp}^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$, $\text{Comp}^-(\mathcal{A}) \rightarrow D^-(\mathcal{A})$, and $\text{Comp}^b(\mathcal{A}) \rightarrow D^b(\mathcal{A})$ into δ -functors.

Proof. We have already seen that this choice leads to a distinguished triangle whenever given a short exact sequence of complexes. We have to show that given a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & A^\bullet & \xrightarrow{a} & B^\bullet & \xrightarrow{b} & C^\bullet \longrightarrow 0 \\ & & \downarrow f & & \downarrow g & & \downarrow h \\ 0 & \longrightarrow & (A')^\bullet & \xrightarrow{a'} & (B')^\bullet & \xrightarrow{b'} & (C')^\bullet \longrightarrow 0 \end{array}$$

we get the desired commutative diagram of Definition 13.3.6 (2). By Lemma 13.9.2 the pair (f, g) induces a canonical morphism $c : C(a)^\bullet \rightarrow C(a')^\bullet$. It is a simple computation to show that $q' \circ c = h \circ q$ and $f[1] \circ p = p' \circ c$. From this the result follows directly. \square

Lemma 13.12.2. *Let \mathcal{A} be an abelian category. Let*

$$\begin{array}{ccccccc} 0 & \longrightarrow & A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & D^\bullet & \longrightarrow & E^\bullet & \longrightarrow & F^\bullet \longrightarrow 0 \end{array}$$

be a commutative diagram of morphisms of complexes such that the rows are short exact sequences of complexes, and the vertical arrows are quasi-isomorphisms. The δ -functor of Lemma 13.12.1 above maps the to short exact sequences $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ and $0 \rightarrow D^\bullet \rightarrow E^\bullet \rightarrow F^\bullet \rightarrow 0$ to isomorphic distinguished triangles.

Proof. Trivial from the fact that $K(\mathcal{A}) \rightarrow D(\mathcal{A})$ transforms quasi-isomorphisms into isomorphisms and that the associated distinguished triangles are functorial. \square

Lemma 13.12.3. *Let \mathcal{A} be an abelian category. Let*

$$0 \longrightarrow A^\bullet \longrightarrow B^\bullet \longrightarrow C^\bullet \longrightarrow 0$$

be a short exact sequences of complexes. Assume this short exact sequence is termwise split. Let $(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta)$ be the distinguished triangle of $K(\mathcal{A})$ associated to the sequence. The δ -functor of Lemma 13.12.1 above maps the short exact sequences $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ to a triangle isomorphic to the distinguished triangle

$$(A^\bullet, B^\bullet, C^\bullet, \alpha, \beta, \delta).$$

Proof. Follows from Lemma 13.9.14. \square

Remark 13.12.4. Let \mathcal{A} be an abelian category. Let K^\bullet be a complex of \mathcal{A} . Let $a \in \mathbf{Z}$. We claim there is a canonical distinguished triangle

$$\tau_{\leq a}K^\bullet \rightarrow K^\bullet \rightarrow \tau_{\geq a+1}K^\bullet \rightarrow (\tau_{\leq a}K^\bullet)[1]$$

in $D(\mathcal{A})$. Here we have used the canonical truncation functors τ from Homology, Section 12.13. Namely, we first take the distinguished triangle associated by our δ -functor (Lemma 13.12.1) to the short exact sequence of complexes

$$0 \rightarrow \tau_{\leq a}K^\bullet \rightarrow K^\bullet \rightarrow K^\bullet/\tau_{\leq a}K^\bullet \rightarrow 0$$

Next, we use that the map $K^\bullet \rightarrow \tau_{\geq a+1}K^\bullet$ factors through a quasi-isomorphism $K^\bullet/\tau_{\leq a}K^\bullet \rightarrow \tau_{\geq a+1}K^\bullet$ by the description of cohomology groups in Homology, Section 12.13. In a similar way we obtain canonical distinguished triangles

$$\tau_{\leq a}K^\bullet \rightarrow \tau_{\leq a+1}K^\bullet \rightarrow H^{a+1}(K^\bullet)[-a-1] \rightarrow (\tau_{\leq a}K^\bullet)[1]$$

and

$$H^a(K^\bullet)[-a] \rightarrow \tau_{\geq a}K^\bullet \rightarrow \tau_{\geq a+1}K^\bullet \rightarrow H^a(K^\bullet)[-a+1]$$

Lemma 13.12.5. *Let \mathcal{A} be an abelian category. Let*

$$K_0^\bullet \rightarrow K_1^\bullet \rightarrow \dots \rightarrow K_n^\bullet$$

be maps of complexes such that

- (1) $H^i(K_0^\bullet) = 0$ for $i > 0$,
- (2) $H^{-j}(K_j^\bullet) \rightarrow H^{-j}(K_{j+1}^\bullet)$ is zero.

Then the composition $K_0^\bullet \rightarrow K_n^\bullet$ factors through $\tau_{\leq -n}K_n^\bullet \rightarrow K_n^\bullet$ in $D(\mathcal{A})$.

Proof. The case $n = 1$. Since $\tau_{\leq 0}K_0^\bullet = K_0^\bullet$ in $D(\mathcal{A})$ we can replace K_0^\bullet by $\tau_{\leq 0}K_0^\bullet$ and K_1^\bullet by $\tau_{\leq 0}K_1^\bullet$. Consider the distinguished triangle

$$\tau_{\leq -1}K_1^\bullet \rightarrow K_1^\bullet \rightarrow H^0(K_1^\bullet)[0] \rightarrow (\tau_{\leq -1}K_1^\bullet)[1]$$

(Remark 13.12.4). The composition $K_0^\bullet \rightarrow K_1^\bullet \rightarrow H^0(K_1^\bullet)[0]$ is zero as it is equal to $K_0^\bullet \rightarrow H^0(K_0^\bullet)[0] \rightarrow H^0(K_1^\bullet)[0]$ which is zero by assumption. The fact that $\text{Hom}_{D(\mathcal{A})}(K_0^\bullet, -)$ is a homological functor (Lemma 13.4.2), allows us to find the desired factorization. For $n = 2$ we get a factorization $K_0^\bullet \rightarrow \tau_{\leq -1}K_1^\bullet$ by the case $n = 1$ and we can apply the case $n = 1$ to the map of complexes $\tau_{\leq -1}K_1^\bullet \rightarrow \tau_{\leq -1}K_2^\bullet$ to get a factorization $\tau_{\leq -1}K_1^\bullet \rightarrow \tau_{\leq -2}K_2^\bullet$. The general case is proved in exactly the same manner. \square

13.13. Triangulated subcategories of the derived category

Let \mathcal{A} be an abelian category. In this section we are going to look for strictly full saturated triangulated subcategories $\mathcal{D}' \subset D(\mathcal{A})$ and in the bounded versions.

Here is a simple construction. Let $\mathcal{B} \subset \mathcal{A}$ be a weak Serre subcategory, see Homology, Section 12.9. We let $D_{\mathcal{B}}(\mathcal{A})$ the full subcategory of $D(\mathcal{A})$ whose objects are

$$\text{Ob}(D_{\mathcal{B}}(\mathcal{A})) = \{X \in \text{Ob}(D(\mathcal{A})) \mid H^n(X) \text{ is an object of } \mathcal{B} \text{ for all } n\}$$

We also define $D_{\mathcal{B}}^+(\mathcal{A}) = D^+(\mathcal{A}) \cap D_{\mathcal{B}}(\mathcal{A})$ and similarly for the other bounded versions.

Lemma 13.13.1. *Let \mathcal{A} be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a weak Serre subcategory. The category $D_{\mathcal{B}}(\mathcal{A})$ is a strictly full saturated triangulated subcategory of $D(\mathcal{A})$. Similarly for the bounded versions.*

Proof. It is clear that $D_{\mathcal{B}}(\mathcal{A})$ is an additive subcategory preserved under the translation functors. If $X \oplus Y$ is in $D_{\mathcal{B}}(\mathcal{A})$, then both $H^n(X)$ and $H^n(Y)$ are kernels of maps between maps of objects of \mathcal{B} as $H^n(X \oplus Y) = H^n(X) \oplus H^n(Y)$. Hence both X and Y are in $D_{\mathcal{B}}(\mathcal{A})$. By Lemma 13.4.14 it therefore suffices to show that given a distinguished triangle (X, Y, Z, f, g, h) such that X and Y are in $D_{\mathcal{B}}(\mathcal{A})$ then Z is an object of $D_{\mathcal{B}}(\mathcal{A})$. The long exact cohomology sequence (13.11.1.1) and the definition of a weak Serre subcategory (see Homology, Definition 12.9.1) show that $H^n(Z)$ is an object of \mathcal{B} for all n . Thus Z is an object of $D_{\mathcal{B}}(\mathcal{A})$. \square

An interesting feature of the situation of the lemma is that the functor $D(\mathcal{B}) \rightarrow D(\mathcal{A})$ factors through a canonical exact functor

$$(13.13.1.1) \quad D(\mathcal{B}) \longrightarrow D_{\mathcal{B}}(\mathcal{A})$$

After all a complex made from objects of \mathcal{B} certainly gives rise to an object of $D_{\mathcal{B}}(\mathcal{A})$ and as distinguished triangles in $D_{\mathcal{B}}(\mathcal{A})$ are exactly the distinguished triangles of $D(\mathcal{A})$ whose vertices are in $D_{\mathcal{B}}(\mathcal{A})$ we see that the functor is exact since $D(\mathcal{B}) \rightarrow D(\mathcal{A})$ is exact. Similarly we obtain functors $D^+(\mathcal{B}) \rightarrow D_{\mathcal{B}}^+(\mathcal{A})$ etc for the bounded versions. A key question in many cases is whether the displayed functor is an equivalence.

Now, suppose that \mathcal{B} is a Serre subcategory of \mathcal{A} . In this case we have the quotient functor $\mathcal{A} \rightarrow \mathcal{A}/\mathcal{B}$, see Homology, Lemma 12.9.6. In this case $D_{\mathcal{B}}(\mathcal{A})$ is the kernel of the functor $D(\mathcal{A}) \rightarrow D(\mathcal{A}/\mathcal{B})$. Thus we obtain a canonical functor

$$D(\mathcal{A})/D_{\mathcal{B}}(\mathcal{A}) \longrightarrow D(\mathcal{A}/\mathcal{B})$$

by Lemma 13.6.8. Similarly for the bounded versions.

Lemma 13.13.2. *Let \mathcal{A} be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a Serre subcategory. Then $D(\mathcal{A}) \rightarrow D(\mathcal{A}/\mathcal{B})$ is essentially surjective.*

Proof. We will use the description of the category \mathcal{A}/\mathcal{B} in the proof of Homology, Lemma 12.9.6. Let (X^\bullet, d^\bullet) be a complex of \mathcal{A}/\mathcal{B} . For each i we have an object X^i of \mathcal{A} and $d^i = (s^i, f^i)$ where $s^i : Y^i \rightarrow X^i$ is a morphism of \mathcal{A} whose kernel and cokernel are in \mathcal{B} and $f^i : Y^i \rightarrow X^{i+1}$ is an arbitrary morphism of \mathcal{A} . Next, consider the complex

$$\dots \rightarrow X^i \oplus Y^i \oplus Y^{i+1} \rightarrow X^{i+1} \oplus Y^{i+1} \oplus Y^{i+2} \rightarrow \dots$$

in \mathcal{A} with differential given by

$$\begin{pmatrix} 0 & f^i & s^{i+1} \\ 0 & 0 & -\text{id}_{Y^{i+1}} \\ 0 & 0 & 0 \end{pmatrix}.$$

This complex becomes quasi-isomorphic to the complex (X^\bullet, d^\bullet) in \mathcal{A}/\mathcal{B} by the maps

$$(\text{id}_{X^i}, s^i, 0) : X^i \oplus Y^i \oplus Y^{i+1} \rightarrow X^i$$

Calculation omitted. □

Lemma 13.13.3. *Let \mathcal{A} be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a Serre subcategory. Suppose that the functor $v : \mathcal{A} \rightarrow \mathcal{A}/\mathcal{B}$ has a left adjoint $u : \mathcal{A}/\mathcal{B} \rightarrow \mathcal{A}$ such that $vu \cong \text{id}$. Then*

$$D(\mathcal{A})/D_{\mathcal{B}}(\mathcal{A}) = D(\mathcal{A}/\mathcal{B})$$

and similarly for the bounded versions.

Proof. The functor $D(v) : D(\mathcal{A}) \rightarrow D(\mathcal{A}/\mathcal{B})$ is essentially surjective by Lemma 13.13.2. For an object X of $D(\mathcal{A})$ the adjunction mapping $c_X : uvX \rightarrow X$ maps to an isomorphism in $D(\mathcal{A}/\mathcal{B})$ because $vuv \cong v$ by the assumption that $vu \cong \text{id}$. Thus in a distinguished triangle (uvX, X, Z, c_X, g, h) the object Z is an object of $D_{\mathcal{B}}(\mathcal{A})$ as we see by looking at the long exact cohomology sequence. Hence c_X is an element of the multiplicative system used to define the quotient category $D(\mathcal{A})/D_{\mathcal{B}}(\mathcal{A})$. Thus $uvX \cong X$ in $D(\mathcal{A})/D_{\mathcal{B}}(\mathcal{A})$. For $X, Y \in \text{Ob}(\mathcal{A})$ the map

$$\text{Hom}_{D(\mathcal{A})/D_{\mathcal{B}}(\mathcal{A})}(X, Y) \longrightarrow \text{Hom}_{D(\mathcal{A}/\mathcal{B})}(vX, vY)$$

is bijective because u gives an inverse (by the remarks above). □

13.14. Filtered derived categories

A reference for this section is [Ill72, I, Chapter V]. Let \mathcal{A} be an abelian category. In this section we will define the filtered derived category $DF(\mathcal{A})$ of \mathcal{A} . In short, we will define it as the derived category of the exact category of objects of \mathcal{A} endowed with a finite filtration. (Thus our construction is a special case of a more general construction of the derived category of an exact category, see for example [Büh10], [Kel90].) Illusie's filtered derived category is the full subcategory of ours consisting of those objects whose filtration is finite. (In our category the filtration is still finite in each degree, but may not be uniformly bounded.) The rationale for our choice is that it is not harder and it allows us to apply the discussion to the spectral sequences of Lemma 13.21.3, see also Remark 13.21.4.

We will use the notation regarding filtered objects introduced in Homology, Section 12.16. The category of filtered objects of \mathcal{A} is denoted $\text{Fil}(\mathcal{A})$. All filtrations will be decreasing by fiat.

Definition 13.14.1. Let \mathcal{A} be an abelian category. The *category of finite filtered objects of \mathcal{A}* is the category of filtered objects (A, F) of \mathcal{A} whose filtration F is finite. We denote it $\text{Fil}^f(\mathcal{A})$.

Thus $\text{Fil}^f(\mathcal{A})$ is a full subcategory of $\text{Fil}(\mathcal{A})$. For each $p \in \mathbf{Z}$ there is a functor $\text{gr}^p : \text{Fil}^f(\mathcal{A}) \rightarrow \mathcal{A}$. There is a functor

$$\text{gr} = \bigoplus_{p \in \mathbf{Z}} \text{gr}^p : \text{Fil}^f(\mathcal{A}) \rightarrow \text{Gr}(\mathcal{A})$$

where $\text{Gr}(\mathcal{A})$ is the category of graded objects of \mathcal{A} , see Homology, Definition 12.15.1. Finally, there is a functor

$$(\text{forget } F) : \text{Fil}^f(\mathcal{A}) \longrightarrow \mathcal{A}$$

which associates to the filtered object (A, F) the underlying object of \mathcal{A} . The category $\text{Fil}^f(\mathcal{A})$ is an additive category, but not abelian in general, see Homology, Example 12.3.12.

Because the functors gr^p , gr , $(\text{forget } F)$ are additive they induce exact functors of triangulated categories

$$\text{gr}^p, (\text{forget } F) : K(\text{Fil}^f(\mathcal{A})) \rightarrow K(\mathcal{A}) \quad \text{and} \quad \text{gr} : K(\text{Fil}^f(\mathcal{A})) \rightarrow K(\text{Gr}(\mathcal{A}))$$

by Lemma 13.10.6. By analogy with the case of the homotopy category of an abelian category we make the following definitions.

Definition 13.14.2. Let \mathcal{A} be an abelian category.

- (1) Let $\alpha : K^\bullet \rightarrow L^\bullet$ be a morphism of $K(\text{Fil}^f(\mathcal{A}))$. We say that α is a *filtered quasi-isomorphism* if the morphism $\text{gr}(\alpha)$ is a quasi-isomorphism.
- (2) Let K^\bullet be an object of $K(\text{Fil}^f(\mathcal{A}))$. We say that K^\bullet is *filtered acyclic* if the complex $\text{gr}(K^\bullet)$ is acyclic.

Note that $\alpha : K^\bullet \rightarrow L^\bullet$ is a filtered quasi-isomorphism if and only if each $\text{gr}^p(\alpha)$ is a quasi-isomorphism. Similarly a complex K^\bullet is filtered acyclic if and only if each $\text{gr}^p(K^\bullet)$ is acyclic.

Lemma 13.14.3. *Let \mathcal{A} be an abelian category.*

- (1) *The functor $K(\text{Fil}^f(\mathcal{A})) \rightarrow \text{Gr}(\mathcal{A})$, $K^\bullet \mapsto H^0(\text{gr}(K^\bullet))$ is homological.*
- (2) *The functor $K(\text{Fil}^f(\mathcal{A})) \rightarrow \mathcal{A}$, $K^\bullet \mapsto H^0(\text{gr}^p(K^\bullet))$ is homological.*
- (3) *The functor $K(\text{Fil}^f(\mathcal{A})) \rightarrow \mathcal{A}$, $K^\bullet \mapsto H^0((\text{forget } F)K^\bullet)$ is homological.*

Proof. This follows from the fact that $H^0 : K(\mathcal{A}) \rightarrow \mathcal{A}$ is homological, see Lemma 13.11.1 and the fact that the functors gr , gr^p , $(\text{forget } F)$ are exact functors of triangulated categories. See Lemma 13.4.18. \square

Lemma 13.14.4. *Let \mathcal{A} be an abelian category. The full subcategory $\text{FAC}(\mathcal{A})$ of $K(\text{Fil}^f(\mathcal{A}))$ consisting of filtered acyclic complexes is a strictly full saturated triangulated subcategory of $K(\text{Fil}^f(\mathcal{A}))$. The corresponding saturated multiplicative system (see Lemma 13.6.10) of $K(\text{Fil}^f(\mathcal{A}))$ is the set $\text{FQis}(\mathcal{A})$ of filtered quasi-isomorphisms. In particular, the kernel of the localization functor*

$$Q : K(\text{Fil}^f(\mathcal{A})) \longrightarrow \text{FQis}(\mathcal{A})^{-1}K(\text{Fil}^f(\mathcal{A}))$$

is $\text{FAc}(\mathcal{A})$ and the functor $H^0 \circ \text{gr}$ factors through Q .

Proof. We know that $H^0 \circ \text{gr}$ is a homological functor by Lemma 13.14.3. Thus this lemma is a special case of Lemma 13.6.11. \square

Definition 13.14.5. Let \mathcal{A} be an abelian category. Let $\text{FAc}(\mathcal{A})$ and $\text{FQis}(\mathcal{A})$ be as in Lemma 13.14.4. The *filtered derived category of \mathcal{A}* is the triangulated category

$$DF(\mathcal{A}) = K(\text{Fil}^f(\mathcal{A})) / \text{FAc}(\mathcal{A}) = \text{FQis}(\mathcal{A})^{-1}K(\text{Fil}^f(\mathcal{A})).$$

Lemma 13.14.6. *The functors $\text{gr}^p, \text{gr}, (\text{forget } F)$ induce canonical exact functors*

$$\text{gr}^p, \text{gr}, (\text{forget } F) : DF(\mathcal{A}) \longrightarrow D(\mathcal{A})$$

which commute with the localization functors.

Proof. This follows from the universal property of localization, see Lemma 13.5.6, provided we can show that a filtered quasi-isomorphism is turned into a quasi-isomorphism by each of the functors $\text{gr}^p, \text{gr}, (\text{forget } F)$. This is true by definition for the first two. For the last one the statement we have to do a little bit of work. Let $f : K^\bullet \rightarrow L^\bullet$ be a filtered quasi-isomorphism in $K(\text{Fil}^f(\mathcal{A}))$. Choose a distinguished triangle $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ which contains f . Then M^\bullet is filtered acyclic, see Lemma 13.14.4. Hence by the corresponding lemma for $K(\mathcal{A})$ it suffices to show that a filtered acyclic complex is an acyclic complex if we forget the filtration. This follows from Homology, Lemma 12.16.15. \square

Definition 13.14.7. Let \mathcal{A} be an abelian category. The *bounded filtered derived category $DF^b(\mathcal{A})$* is the full subcategory of $DF(\mathcal{A})$ with objects those X such that $\text{gr}(X) \in D^b(\mathcal{A})$. Similarly for the bounded below filtered derived category $DF^+(\mathcal{A})$ and the bounded above filtered derived category $DF^-(\mathcal{A})$.

Lemma 13.14.8. *Let \mathcal{A} be an abelian category. Let $K^\bullet \in K(\text{Fil}^f(\mathcal{A}))$.*

- (1) *If $H^n(\text{gr}(K^\bullet)) = 0$ for all $n < a$, then there exists a filtered quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with $L^n = 0$ for all $n < a$.*
- (2) *If $H^n(\text{gr}(K^\bullet)) = 0$ for all $n > b$, then there exists a filtered quasi-isomorphism $M^\bullet \rightarrow K^\bullet$ with $M^n = 0$ for all $n > b$.*
- (3) *If $H^n(\text{gr}(K^\bullet)) = 0$ for all $|n| \gg 0$, then there exists a commutative diagram of morphisms of complexes*

$$\begin{array}{ccc} K^\bullet & \longrightarrow & L^\bullet \\ \uparrow & & \uparrow \\ M^\bullet & \longrightarrow & N^\bullet \end{array}$$

where all the arrows are filtered quasi-isomorphisms, L^\bullet bounded below, M^\bullet bounded above, and N^\bullet a bounded complex.

Proof. Suppose that $H^n(\text{gr}(K^\bullet)) = 0$ for all $n < a$. By Homology, Lemma 12.16.15 the sequence

$$K^{a-1} \xrightarrow{d^{a-2}} K^{a-1} \xrightarrow{d^{a-1}} K^a$$

is an exact sequence of objects of \mathcal{A} and the morphisms d^{a-2} and d^{a-1} are strict. Hence $\text{Coim}(d^{a-1}) = \text{Im}(d^{a-1})$ in $\text{Fil}^f(\mathcal{A})$ and the map $\text{gr}(\text{Im}(d^{a-1})) \rightarrow \text{gr}(K^a)$

is injective with image equal to the image of $\text{gr}(K^{a-1}) \rightarrow \text{gr}(K^a)$, see Homology, Lemma 12.16.13. This means that the map $K^\bullet \rightarrow \tau_{\geq a} K^\bullet$ into the truncation

$$\tau_{\geq a} K^\bullet = (\dots \rightarrow 0 \rightarrow K^a/\text{Im}(d^{a-1}) \rightarrow K^{a+1} \rightarrow \dots)$$

is a filtered quasi-isomorphism. This proves (1). The proof of (2) is dual to the proof of (1). Part (3) follows formally from (1) and (2). \square

To state the following lemma denote $\text{FAC}^+(\mathcal{A})$, $\text{FAC}^-(\mathcal{A})$, resp. $\text{FAC}^b(\mathcal{A})$ the intersection of $K^+(\text{Fil}^f \mathcal{A})$, $K^-(\text{Fil}^f \mathcal{A})$, resp. $K^b(\text{Fil}^f \mathcal{A})$ with $\text{FAC}(\mathcal{A})$. Denote $\text{FQis}^+(\mathcal{A})$, $\text{FQis}^-(\mathcal{A})$, resp. $\text{FQis}^b(\mathcal{A})$ the intersection of $K^+(\text{Fil}^f \mathcal{A})$, $K^-(\text{Fil}^f \mathcal{A})$, resp. $K^b(\text{Fil}^f \mathcal{A})$ with $\text{FQis}(\mathcal{A})$.

Lemma 13.14.9. *Let \mathcal{A} be an abelian category. The subcategories $\text{FAC}^+(\mathcal{A})$, $\text{FAC}^-(\mathcal{A})$, resp. $\text{FAC}^b(\mathcal{A})$ are strictly full saturated triangulated subcategories of $K^+(\text{Fil}^f \mathcal{A})$, $K^-(\text{Fil}^f \mathcal{A})$, resp. $K^b(\text{Fil}^f \mathcal{A})$. The corresponding saturated multiplicative systems (see Lemma 13.6.10) are the sets $\text{FQis}^+(\mathcal{A})$, $\text{FQis}^-(\mathcal{A})$, resp. $\text{FQis}^b(\mathcal{A})$.*

- (1) *The kernel of the functor $K^+(\text{Fil}^f \mathcal{A}) \rightarrow DF^+(\mathcal{A})$ is $\text{FAC}^+(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^+(\text{Fil}^f \mathcal{A})/\text{FAC}^+(\mathcal{A}) = \text{FQis}^+(\mathcal{A})^{-1} K^+(\text{Fil}^f \mathcal{A}) \longrightarrow DF^+(\mathcal{A})$$

- (2) *The kernel of the functor $K^-(\text{Fil}^f \mathcal{A}) \rightarrow DF^-(\mathcal{A})$ is $\text{FAC}^-(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^-(\text{Fil}^f \mathcal{A})/\text{FAC}^-(\mathcal{A}) = \text{FQis}^-(\mathcal{A})^{-1} K^-(\text{Fil}^f \mathcal{A}) \longrightarrow DF^-(\mathcal{A})$$

- (3) *The kernel of the functor $K^b(\text{Fil}^f \mathcal{A}) \rightarrow DF^b(\mathcal{A})$ is $\text{FAC}^b(\mathcal{A})$ and this induces an equivalence of triangulated categories*

$$K^b(\text{Fil}^f \mathcal{A})/\text{FAC}^b(\mathcal{A}) = \text{FQis}^b(\mathcal{A})^{-1} K^b(\text{Fil}^f \mathcal{A}) \longrightarrow DF^b(\mathcal{A})$$

Proof. This follows from the results above, in particular Lemma 13.14.8, by exactly the same arguments as used in the proof of Lemma 13.11.6. \square

13.15. Derived functors in general

A reference for this section is Deligne's exposé XVII in [AGV71]. A very general notion of right and left derived functors exists where we have an exact functor between triangulated categories, a multiplicative system in the source category and we want to find the “correct” extension of the exact functor to the localized category.

Situation 13.15.1. Here $F : \mathcal{D} \rightarrow \mathcal{D}'$ is an exact functor of triangulated categories and S is a saturated multiplicative system in \mathcal{D} compatible with the structure of triangulated category on \mathcal{D} .

Let $X \in \text{Ob}(\mathcal{D})$. Recall from Categories, Remark 4.25.5 the filtered category X/S of arrows $s : X \rightarrow X'$ in S with source X . Dually, in Categories, Remark 4.25.12 we defined the cofiltered category S/X of arrows $s : X' \rightarrow X$ in S with target X .

Definition 13.15.2. Assumptions and notation as in Situation 13.15.1. Let $X \in \text{Ob}(\mathcal{D})$.

- (1) we say the *right derived functor* RF is defined at X if the ind-object

$$(X/S) \longrightarrow \mathcal{D}', \quad (s : X \rightarrow X') \longmapsto F(X')$$

is essentially constant³; in this case the value Y in \mathcal{D}' is called the *value of RF at X* .

- (2) we say the *left derived functor* LF is defined at X if the pro-object

$$(S/X) \longrightarrow \mathcal{D}', \quad (s : X' \rightarrow X) \longmapsto F(X')$$

is essentially constant; in this case the value Y in \mathcal{D}' is called the *value of LF at X* .

By abuse of notation we often denote the values simply $RF(X)$ or $LF(X)$.

It will turn out that the full subcategory of \mathcal{D} consisting of objects where RF is defined is a triangulated subcategory, and RF will define a functor on this subcategory which transforms morphisms of S into isomorphisms.

Lemma 13.15.3. *Assumptions and notation as in Situation 13.15.1. Let $f : X \rightarrow Y$ be a morphism of \mathcal{D} .*

- (1) *If RF is defined at X and Y then there exists a unique morphism $RF(f) : RF(X) \rightarrow RF(Y)$ between the values such that for any commutative diagram*

$$\begin{array}{ccc} X & \xrightarrow{s} & X' \\ f \downarrow & & \downarrow f' \\ Y & \xrightarrow{s'} & Y' \end{array}$$

with $s, s' \in S$ the diagram

$$\begin{array}{ccccc} F(X) & \longrightarrow & F(X') & \longrightarrow & RF(X) \\ \downarrow & & \downarrow & & \downarrow \\ F(Y) & \longrightarrow & F(Y') & \longrightarrow & RF(Y) \end{array}$$

commutes.

- (2) *If LF is defined at X and Y then there exists a unique morphism $LF(f) : LF(X) \rightarrow LF(Y)$ between the values such that for any commutative diagram*

$$\begin{array}{ccc} X' & \xrightarrow{s} & X \\ f' \downarrow & & \downarrow f \\ Y' & \xrightarrow{s'} & Y \end{array}$$

with s, s' in S the diagram

$$\begin{array}{ccccc} LF(X) & \longrightarrow & F(X') & \longrightarrow & F(X) \\ \downarrow & & \downarrow & & \downarrow \\ LF(Y) & \longrightarrow & F(Y') & \longrightarrow & F(Y) \end{array}$$

commutes.

³For a discussion of when an ind-object or pro-object of a category is essentially constant we refer to Categories, Section 4.22.

Proof. Part (1) holds if we only assume that the colimits

$$RF(X) = \operatorname{colim}_{s: X \rightarrow X'} F(X') \quad \text{and} \quad RF(Y) = \operatorname{colim}_{s': Y \rightarrow Y'} F(Y')$$

exist. Namely, to give a morphism $RF(X) \rightarrow RF(Y)$ between the colimits is the same thing as giving for each $s : X \rightarrow X'$ in $\operatorname{Ob}(X/S)$ a morphism $F(X') \rightarrow RF(Y)$ compatible with morphisms in the category X/S . To get the morphism we choose a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{s} & X' \\ f \downarrow & & \downarrow f' \\ Y & \xrightarrow{s'} & Y' \end{array}$$

with s, s' in S as is possible by MS2 and we set $F(X') \rightarrow RF(Y)$ equal to the composition $F(X') \rightarrow F(Y') \rightarrow RF(Y)$. To see that this is independent of the choice of the diagram above use MS3. Details omitted. The proof of (2) is dual. \square

Lemma 13.15.4. *Assumptions and notation as in Situation 13.15.1. Let $s : X \rightarrow Y$ be an element of S .*

- (1) *RF is defined at X if and only if it is defined at Y . In this case the map $RF(s) : RF(X) \rightarrow RF(Y)$ between values is an isomorphism.*
- (2) *LF is defined at X if and only if it is defined at Y . In this case the map $LF(s) : LF(X) \rightarrow LF(Y)$ between values is an isomorphism.*

Proof. Omitted. \square

Lemma 13.15.5. *Assumptions and notation as in Situation 13.15.1. Let X be an object of \mathcal{D} and $n \in \mathbf{Z}$.*

- (1) *RF is defined at X if and only if it is defined at $X[n]$. In this case there is a canonical isomorphism $RF(X)[n] = RF(X[n])$ between values.*
- (2) *LF is defined at X if and only if it is defined at $X[n]$. In this case there is a canonical isomorphism $LF(X)[n] \rightarrow LF(X[n])$ between values.*

Proof. Omitted. \square

Lemma 13.15.6. *Assumptions and notation as in Situation 13.15.1. Let (X, Y, Z, f, g, h) be a distinguished triangle of \mathcal{D} . If RF is defined at two out of three of X, Y, Z , then it is defined at the third. Moreover, in this case*

$$(RF(X), RF(Y), RF(Z), RF(f), RF(g), RF(h))$$

is a distinguished triangle in \mathcal{D}' . Similarly for LF .

Proof. Say RF is defined at X, Y with values A, B . Let $RF(f) : A \rightarrow B$ be the induced morphism, see Lemma 13.15.3. We may choose a distinguished triangle $(A, B, C, RF(f), b, c)$ in \mathcal{D}' . We claim that C is a value of RF at Z .

To see this pick $s : X \rightarrow X'$ in S such that there exists a morphism $\alpha : A \rightarrow F(X')$ as in Categories, Definition 4.22.1. We may choose a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{s} & X' \\ f \downarrow & & \downarrow f' \\ Y & \xrightarrow{s'} & Y' \end{array}$$

with $s' \in S$ by MS2. Using that Y/S is filtered we can (after replacing s' by some $s'' : Y \rightarrow Y''$ in S) assume that there exists a morphism $\beta : B \rightarrow F(Y')$ as in Categories, Definition 4.22.1. Picture

$$\begin{array}{ccccc} A & \xrightarrow{\alpha} & F(X') & \longrightarrow & A \\ \downarrow RF(f) & & \downarrow F(f') & & \downarrow RF(f) \\ B & \xrightarrow{\beta} & F(Y') & \longrightarrow & B \end{array}$$

It may not be true that the left square commutes, but the outer and right squares commute. The assumption that the ind-object $\{F(Y')\}_{s': Y' \rightarrow Y}$ is essentially constant means that there exists a $s'' : Y \rightarrow Y''$ in S and a morphism $h : Y' \rightarrow Y''$ such that $s'' = h \circ s'$ and such that $F(h)$ equal to $F(Y') \rightarrow B \rightarrow F(Y') \rightarrow F(Y'')$. Hence after replacing Y' by Y'' and β by $F(h) \circ \beta$ the diagram will commute (by direct computation with arrows).

Using MS6 choose a morphism of triangles

$$(s, s', s'') : (X, Y, Z, f, g, h) \longrightarrow (X', Y', Z', f', g', h')$$

with $s'' \in S$. By TR3 choose a morphism of triangles

$$(\alpha, \beta, \gamma) : (A, B, C, RF(f), b, c) \longrightarrow (F(X'), F(Y'), F(Z'), F(f'), F(g'), F(h'))$$

By Lemma 13.15.4 it suffices to prove that $RF(Z')$ is defined and has value C . Consider the category \mathcal{I} of Lemma 13.5.8 of triangles

$$\mathcal{I} = \{(t, t', t'') : (X', Y', Z', f', g', h') \rightarrow (X'', Y'', Z'', f'', g'', h'') \mid (t, t', t'') \in S\}$$

To show that the system $F(Z'')$ is essentially constant over the category Z'/S is equivalent to showing that the system of $F(Z'')$ is essentially constant over \mathcal{I} because $\mathcal{I} \rightarrow Z'/S$ is cofinal, see Categories, Lemma 4.22.8 (cofinality is proven in Lemma 13.5.8). For any object W in \mathcal{D}' we consider the diagram

$$\begin{array}{ccc} \operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(X'')) & \longleftarrow & \operatorname{Mor}_{\mathcal{D}'}(W, A) \\ \uparrow & & \uparrow \\ \operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(Y'')) & \longleftarrow & \operatorname{Mor}_{\mathcal{D}'}(W, B) \\ \uparrow & & \uparrow \\ \operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(Z'')) & \longleftarrow & \operatorname{Mor}_{\mathcal{D}'}(W, C) \\ \uparrow & & \uparrow \\ \operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(X''[1])) & \longleftarrow & \operatorname{Mor}_{\mathcal{D}'}(W, A[1]) \\ \uparrow & & \uparrow \\ \operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(Y''[1])) & \longleftarrow & \operatorname{Mor}_{\mathcal{D}'}(W, B[1]) \end{array}$$

where the horizontal arrows are given by composing with (α, β, γ) . Since filtered colimits are exact (Algebra, Lemma 10.8.9) the left column is an exact sequence. Thus the 5 lemma (Homology, Lemma 12.5.20) tells us the

$$\operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}'}(W, F(Z'')) \longrightarrow \operatorname{Mor}_{\mathcal{D}'}(W, C)$$

is bijective. Choose an object $(t, t', t'') : (X', Y', Z') \rightarrow (X'', Y'', Z'')$ of \mathcal{I} . Applying what we just showed to $W = F(Z'')$ and the element $\text{id}_{F(X'')}$ of the colimit we find a unique morphism $c_{(X'', Y'', Z'')} : F(Z'') \rightarrow C$ such that for some $(X''', Y''', Z''') \rightarrow (X''', Y''', Z''')$ in \mathcal{I}

$$F(Z'') \xrightarrow{c_{(X'', Y'', Z'')}} C \xrightarrow{\gamma} F(Z') \rightarrow F(Z'') \rightarrow F(Z''') \quad \text{equals} \quad F(Z'') \rightarrow F(Z''')$$

The family of morphisms $c_{(X'', Y'', Z'')}$ form an element c of $\lim_{\mathcal{I}} \text{Mor}_{\mathcal{D}'}(F(Z''), C)$ by uniqueness (computation omitted). Finally, we show that $\text{colim}_{\mathcal{I}} F(Z'') = C$ via the morphisms $c_{(X'', Y'', Z'')}$ which will finish the proof by Categories, Lemma 4.22.6. Namely, let W be an object of \mathcal{D}' and let $d_{(X'', Y'', Z'')} : F(Z'') \rightarrow W$ be a family of maps corresponding to an element of $\lim_{\mathcal{I}} \text{Mor}_{\mathcal{D}'}(F(Z''), W)$. If $d_{(X', Y', Z')} \circ \gamma = 0$, then for every object (X'', Y'', Z'') of \mathcal{I} the morphism $d_{(X'', Y'', Z'')}$ is zero by the existence of $c_{(X'', Y'', Z'')}$ and the morphism $(X'', Y'', Z'') \rightarrow (X''', Y''', Z''')$ in \mathcal{I} satisfying the displayed equality above. Hence the map

$$\lim_{\mathcal{I}} \text{Mor}_{\mathcal{D}'}(F(Z''), W) \longrightarrow \text{Mor}_{\mathcal{D}'}(C, W)$$

(coming from precomposing by γ) is injective. However, it is also surjective because the element c gives a left inverse. We conclude that C is the colimit by Categories, Remark 4.14.4. \square

Lemma 13.15.7. *Assumptions and notation as in Situation 13.15.1. Let X, Y be objects of \mathcal{D} .*

- (1) *If RF is defined at X and Y , then RF is defined at $X \oplus Y$.*
- (2) *If \mathcal{D}' is Karoubian and RF is defined at $X \oplus Y$, then RF is defined at both X and Y .*

In either case we have $RF(X \oplus Y) = RF(X) \oplus RF(Y)$. Similarly for LF .

Proof. If RF is defined at X and Y , then the distinguished triangle $X \rightarrow X \oplus Y \rightarrow Y \rightarrow X[1]$ (Lemma 13.4.10) and Lemma 13.15.6 shows that RF is defined at $X \oplus Y$ and that we have a distinguished triangle $RF(X) \rightarrow RF(X \oplus Y) \rightarrow RF(Y) \rightarrow RF(X)[1]$. Applying Lemma 13.4.10 to this once more we find that $RF(X \oplus Y) = RF(X) \oplus RF(Y)$. This proves (1) and the final assertion.

Conversely, assume that RF is defined at $X \oplus Y$ and that \mathcal{D}' is Karoubian. Since S is a saturated system S is the set of arrows which become invertible under the additive localization functor $Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D}$, see Categories, Lemma 4.25.18. Thus for any $s : X \rightarrow X'$ and $s' : Y \rightarrow Y'$ in S the morphism $s \oplus s' : X \oplus Y \rightarrow X' \oplus Y'$ is an element of S . In this way we obtain a functor

$$X/S \times Y/S \longrightarrow (X \oplus Y)/S$$

Recall that the categories $X/S, Y/S, (X \oplus Y)/S$ are filtered (Categories, Remark 4.25.5). By Categories, Lemma 4.22.9 $X/S \times Y/S$ is filtered and $F|_{X/S} : X/S \rightarrow \mathcal{D}'$ (resp. $G|_{Y/S} : Y/S \rightarrow \mathcal{D}'$) is essentially constant if and only if $F|_{X/S} \circ \text{pr}_1 : X/S \times Y/S \rightarrow \mathcal{D}'$ (resp. $G|_{Y/S} \circ \text{pr}_2 : X/S \times Y/S \rightarrow \mathcal{D}'$) is essentially constant. Below we will show that the displayed functor is cofinal, hence by Categories, Lemma 4.22.8. we see that $F|_{(X \oplus Y)/S}$ is essentially constant implies that $F|_{X/S} \circ \text{pr}_1 \oplus F|_{Y/S} \circ \text{pr}_2 : X/S \times Y/S \rightarrow \mathcal{D}'$ is essentially constant. By Homology, Lemma 12.26.3 (and this is where we use that \mathcal{D}' is Karoubian) we see that $F|_{X/S} \circ \text{pr}_1 \oplus F|_{Y/S} \circ \text{pr}_2$ being essentially constant implies $F|_{X/S} \circ \text{pr}_1$ and $F|_{Y/S} \circ \text{pr}_2$ are essentially constant proving that RF is defined at X and Y .

Proof that the displayed functor is cofinal. To do this pick any $t : X \oplus Y \rightarrow Z$ in S . Using MS2 we can find morphisms $Z \rightarrow X'$, $Z \rightarrow Y'$ and $s : X \rightarrow X'$, $s' : Y \rightarrow Y'$ in S such that

$$\begin{array}{ccccc} X & \longleftarrow & X \oplus Y & \longrightarrow & Y \\ \downarrow s & & \downarrow & & \downarrow s' \\ X' & \longleftarrow & Z & \longrightarrow & Y' \end{array}$$

commutes. This proves there is a map $Z \rightarrow X' \oplus Y'$ in $(X \oplus Y)/S$, i.e., we get part (1) of Categories, Definition 4.17.1. To prove part (2) it suffices to prove that given $t : X \oplus Y \rightarrow Z$ and morphisms $s_i \oplus s'_i : Z \rightarrow X'_i \oplus Y'_i$, $i = 1, 2$ in $(X \oplus Y)/S$ we can find morphisms $a : X'_1 \rightarrow X'$, $b : X'_2 \rightarrow X'$, $c : Y'_1 \rightarrow Y'$, $d : Y'_2 \rightarrow Y'$ in S such that $a \circ s_1 = b \circ s_2$ and $c \circ s'_1 = d \circ s'_2$. To do this we first choose any X' and Y' and maps a, b, c, d in S ; this is possible as X/S and Y/S are filtered. Then the two maps $a \circ s_1, b \circ s_2 : Z \rightarrow X'$ become equal in $S^{-1}\mathcal{D}$. Hence we can find a morphism $X' \rightarrow X''$ in S equalizing them. Similarly we find $Y' \rightarrow Y''$ in S equalizing $c \circ s'_1$ and $d \circ s'_2$. Replacing X' by X'' and Y' by Y'' we get $a \circ s_1 = b \circ s_2$ and $c \circ s'_1 = d \circ s'_2$.

The proof of the corresponding statements for LF are dual. □

Proposition 13.15.8. *Assumptions and notation as in Situation 13.15.1. The full subcategory \mathcal{E} of \mathcal{D} consisting of objects at which RF is defined is a strictly full triangulated subcategory of \mathcal{D} . Choosing values using the axiom of choice gives rise to an exact functor*

$$RF : \mathcal{E} \longrightarrow \mathcal{D}'$$

of triangulated categories. Elements of S with either source or target in \mathcal{E} are morphisms of \mathcal{E} . Any element of $S_{\mathcal{E}} = \text{Arrows}(\mathcal{E}) \cap S$ is transformed into an isomorphism by RF . Hence an exact functor

$$RF : S_{\mathcal{E}}^{-1}\mathcal{E} \longrightarrow \mathcal{D}'.$$

If \mathcal{D}' is Karoubian, then \mathcal{E} is a saturated triangulated subcategory of \mathcal{D} . A similar result holds for LF .

Proof. This is just a summary of the results obtained in Lemmas 13.15.3, 13.15.4, 13.15.5, 13.15.6, and 13.15.7. □

Definition 13.15.9. In Situation 13.15.1. We say F is *right deriveable*, or that RF *everywhere defined* if RF is defined at every object of \mathcal{D} . We say F is *left deriveable*, or that LF *everywhere defined* if LF is defined at every object of \mathcal{D} .

In this case we obtain a right (resp. left) derived functor

$$(13.15.9.1) \quad RF : S^{-1}\mathcal{D} \longrightarrow \mathcal{D}', \quad (\text{resp. } LF : S^{-1}\mathcal{D} \longrightarrow \mathcal{D}'),$$

see Proposition 13.15.8. In most interesting situations it is not the case that $RF \circ Q$ is equal to F . In fact, it might happen that the canonical map $F(X) \rightarrow RF(X)$ is never an isomorphism. In practice this does not happen, because in practice we only know how to prove F is right deriveable by showing that RF can be computed by evaluating F at judiciously chosen objects of the triangulated category \mathcal{D} . This warrants a definition.

Definition 13.15.10. In Situation 13.15.1.

- (1) An object X of \mathcal{D} *computes* RF if RF is defined at X and the canonical map $F(X) \rightarrow RF(X)$ is an isomorphism.
- (2) An object X of \mathcal{D} *computes* LF if LF is defined at X and the canonical map $LF(X) \rightarrow F(X)$ is an isomorphism.

Lemma 13.15.11. *Assumptions and notation as in Situation 13.15.1. Let X be an object of \mathcal{D} and $n \in \mathbf{Z}$.*

- (1) X *computes* RF if and only if $X[n]$ *computes* RF .
- (2) X *computes* LF if and only if $X[n]$ *computes* LF .

Proof. Omitted. □

Lemma 13.15.12. *Assumptions and notation as in Situation 13.15.1. Let (X, Y, Z, f, g, h) be a distinguished triangle of \mathcal{D} . If X, Y compute RF then so does Z . Similar for LF .*

Proof. By Lemma 13.15.6 we know that RF is defined at Z and that RF applied to the triangle produces a distinguished triangle. Consider the morphism of distinguished triangles

$$\begin{array}{c} (F(X), F(Y), F(Z), F(f), F(g), F(h)) \\ \downarrow \\ (RF(X), RF(Y), RF(Z), RF(f), RF(g), RF(h)) \end{array}$$

Two out of three maps are isomorphisms, hence so is the third. □

Lemma 13.15.13. *Assumptions and notation as in Situation 13.15.1. Let X, Y be objects of \mathcal{D} . If $X \oplus Y$ computes RF , then X and Y compute RF . Similarly for LF .*

Proof. If $X \oplus Y$ computes RF , then $RF(X \oplus Y) = F(X) \oplus F(Y)$. In the proof of Lemma 13.15.7 we have seen that the functor $X/S \times Y/S \rightarrow (X \oplus Y)/S$, $(s, s') \mapsto s \oplus s'$ is cofinal. We will use this without further mention. Let $s : X \rightarrow X'$ be an element of S . Then $F(X) \rightarrow F(X')$ has a section, namely,

$$F(X') \rightarrow F(X' \oplus Y) \rightarrow RF(X' \oplus Y) = RF(X \oplus Y) = F(X) \oplus F(Y) \rightarrow F(X).$$

where we have used Lemma 13.15.4. Hence $F(X') = F(X) \oplus E$ for some object E of \mathcal{D}' such that $E \rightarrow F(X' \oplus Y) \rightarrow RF(X' \oplus Y) = RF(X \oplus Y)$ is zero (Lemma 13.4.11). Because RF is defined at $X' \oplus Y$ with value $F(X) \oplus F(Y)$ we can find a morphism $t : X' \oplus Y \rightarrow Z$ of S such that $F(t)$ annihilates E . We may assume $Z = X'' \oplus Y''$ and $t = t' \oplus t''$ with $t', t'' \in S$. Then $F(t')$ annihilates E . It follows that F is essentially constant on X/S with value $F(X)$ as desired. □

Lemma 13.15.14. *Assumptions and notation as in Situation 13.15.1.*

- (1) *If for every object $X \in \text{Ob}(\mathcal{D})$ there exists an arrow $s : X \rightarrow X'$ in S such that X' computes RF , then RF is everywhere defined.*
- (2) *If for every object $X \in \text{Ob}(\mathcal{D})$ there exists an arrow $s : X' \rightarrow X$ in S such that X' computes LF , then LF is everywhere defined.*

Proof. This is clear from the definitions. □

Lemma 13.15.15. *Assumptions and notation as in Situation 13.15.1. If there exists a subset $\mathcal{I} \subset \text{Ob}(\mathcal{D})$ such that*

- (1) for all $X \in \text{Ob}(\mathcal{D})$ there exists $s : X \rightarrow X'$ in S with $X' \in \mathcal{I}$, and
- (2) for every arrow $s : X \rightarrow X'$ in S with $X, X' \in \mathcal{I}$ the map $F(s) : F(X) \rightarrow F(X')$ is an isomorphism,

then RF is everywhere defined and every $X \in \mathcal{I}$ computes RF . Dually, if there exists a subset $\mathcal{P} \subset \text{Ob}(\mathcal{D})$ such that

- (1) for all $X \in \text{Ob}(\mathcal{D})$ there exists $s : X' \rightarrow X$ in S with $X' \in \mathcal{P}$, and
- (2) for every arrow $s : X \rightarrow X'$ in S with $X, X' \in \mathcal{P}$ the map $F(s) : F(X) \rightarrow F(X')$ is an isomorphism,

then LF is everywhere defined and every $X \in \mathcal{P}$ computes LF .

Proof. Let X be an object of \mathcal{D} . Assumption (1) implies that the arrows $s : X \rightarrow X'$ in S with $X' \in \mathcal{I}$ are cofinal in the category X/S . Assumption (2) implies that F is constant on this cofinal subcategory. Clearly this implies that $F : (X/S) \rightarrow \mathcal{D}'$ is essentially constant with value $F(X')$ for any $s : X \rightarrow X'$ in S with $X' \in \mathcal{I}$. \square

Lemma 13.15.16. *Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be triangulated categories. Let S , resp. S' be a saturated multiplicative system in \mathcal{A} , resp. \mathcal{B} compatible with the triangulated structure. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be exact functors. Denote $F' : \mathcal{A} \rightarrow (S')^{-1}\mathcal{B}$ the composition of F with the localization functor.*

- (1) *If $RF', RG, R(G \circ F)$ are everywhere defined, then there is a canonical transformation of functors $t : R(G \circ F) \rightarrow RG \circ RF'$.*
- (2) *If $LF', LG, L(G \circ F)$ are everywhere defined, then there is a canonical transformation of functors $t : LG \circ LF' \rightarrow L(G \circ F)$.*

Proof. In this proof we try to be careful. Hence let us think of the derived functors as the functors

$$RF' : S^{-1}\mathcal{A} \rightarrow (S')^{-1}\mathcal{B}, \quad R(G \circ F) : S^{-1}\mathcal{A} \rightarrow \mathcal{C}, \quad RG : (S')^{-1}\mathcal{B} \rightarrow \mathcal{C}.$$

Let us denote $Q_A : \mathcal{A} \rightarrow S^{-1}\mathcal{A}$ and $Q_B : \mathcal{B} \rightarrow (S')^{-1}\mathcal{B}$ the localization functors. Then $F' = Q_B \circ F$. Note that for every object Y of \mathcal{B} there is a canonical map

$$G(Y) \longrightarrow RG(Q_B(Y))$$

in other words, there is a transformation of functors $t' : G \rightarrow RG \circ Q_B$. Let X be an object of \mathcal{A} . We have

$$\begin{aligned} R(G \circ F)(Q_A(X)) &= \text{colim}_{s: X \rightarrow X' \in S} G(F(X')) \\ &\xrightarrow{t'} \text{colim}_{s: X \rightarrow X' \in S} RG(Q_B(F(X'))) \\ &= \text{colim}_{s: X \rightarrow X' \in S} RG(F'(X')) \\ &= RG(\text{colim}_{s: X \rightarrow X' \in S} F'(X')) \\ &= RG(RF'(X)). \end{aligned}$$

The system $F'(X')$ is essentially constant in the category $(S')^{-1}\mathcal{B}$. Hence we may pull the colimit inside the functor RG in the third equality of the diagram above, see Categories, Lemma 4.22.5 and its proof. We omit the proof this this defines a transformation of functors. The case of left derived functors is similar. \square

13.16. Derived functors on derived categories

In practice derived functors come about most often when given an additive functor between abelian categories.

Situation 13.16.1. Here $F : \mathcal{A} \rightarrow \mathcal{B}$ is an additive functor between abelian categories. This induces exact functors

$$F : K(\mathcal{A}) \rightarrow K(\mathcal{B}), \quad K^+(\mathcal{A}) \rightarrow K^+(\mathcal{B}), \quad K^-(\mathcal{A}) \rightarrow K^-(\mathcal{B}).$$

We also denote F the composition $K(\mathcal{A}) \rightarrow D(\mathcal{B})$, $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$, and $K^-(\mathcal{A}) \rightarrow D^-(\mathcal{B})$ of F with the localization functor $K(\mathcal{B}) \rightarrow D(\mathcal{B})$, etc. This situation leads to four derived functors we will consider in the following.

- (1) The right derived functor of $F : K(\mathcal{A}) \rightarrow D(\mathcal{B})$ relative to the multiplicative system $\text{Qis}(\mathcal{A})$.
- (2) The right derived functor of $F : K^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ relative to the multiplicative system $\text{Qis}^+(\mathcal{A})$.
- (3) The left derived functor of $F : K(\mathcal{A}) \rightarrow D(\mathcal{B})$ relative to the multiplicative system $\text{Qis}(\mathcal{A})$.
- (4) The left derived functor of $F : K^-(\mathcal{A}) \rightarrow D^-(\mathcal{B})$ relative to the multiplicative system $\text{Qis}^-(\mathcal{A})$.

Each of these cases is an example of Situation 13.15.1.

Some of the ambiguity that may arise is alleviated by the following.

Lemma 13.16.2. *In Situation 13.16.1.*

- (1) *Let X be an object of $K^+(\mathcal{A})$. The right derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ is defined at X if and only if the right derived functor of $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is defined at X . Moreover, the values are canonically isomorphic.*
- (2) *Let X be an object of $K^+(\mathcal{A})$. Then X computes the right derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ if and only if X computes the right derived functor of $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$.*
- (3) *Let X be an object of $K^-(\mathcal{A})$. The left derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ is defined at X if and only if the left derived functor of $K^-(\mathcal{A}) \rightarrow D^-(\mathcal{B})$ is defined at X . Moreover, the values are canonically isomorphic.*
- (4) *Let X be an object of $K^-(\mathcal{A})$. Then X computes the left derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ if and only if X computes the left derived functor of $K^-(\mathcal{A}) \rightarrow D^-(\mathcal{B})$.*

Proof. Let X be an object of $K^+(\mathcal{A})$. Consider a quasi-isomorphism $s : X \rightarrow X'$ in $K(\mathcal{A})$. By Lemma 13.11.5 there exists quasi-isomorphism $X' \rightarrow X''$ with X'' bounded below. Hence we see that $X/\text{Qis}^+(\mathcal{A})$ is cofinal in $X/\text{Qis}(\mathcal{A})$. Thus it is clear that (1) holds. Part (2) follows directly from part (1). Parts (3) and (4) are dual to parts (1) and (2). \square

Given an object A of an abelian category \mathcal{A} we get a complex

$$A[0] = (\dots \rightarrow 0 \rightarrow A \rightarrow 0 \rightarrow \dots)$$

where A is placed in degree zero. Hence a functor $\mathcal{A} \rightarrow K(\mathcal{A})$, $A \mapsto A[0]$. Let us temporarily say that a partial functor is one that is defined on a subcategory.

Definition 13.16.3. In Situation 13.16.1.

- (1) The *right derived functors of F* are the partial functors RF associated to cases (1) and (2) of Situation 13.16.1.
- (2) The *left derived functors of F* are the partial functors LF associated to cases (3) and (4) of Situation 13.16.1.
- (3) An object A of \mathcal{A} is said to be *right acyclic for F*, or *acyclic for RF* if $A[0]$ computes RF .
- (4) An object A of \mathcal{A} is said to be *left acyclic for F*, or *acyclic for LF* if $A[0]$ computes RF .

The following few lemmas give some criteria for the existence of enough acyclics.

Lemma 13.16.4. *Let \mathcal{A} be an abelian category. Let $\mathcal{I} \subset \text{Ob}(\mathcal{A})$ be a subset containing 0 such that every object of \mathcal{A} is a subobject of an element of \mathcal{I} . Let $a \in \mathbf{Z}$.*

- (1) *Given K^\bullet with $K^n = 0$ for $n < a$ there exists a quasi-isomorphism $K^\bullet \rightarrow I^\bullet$ with $K^n \rightarrow I^n$ injective and $I^n \in \mathcal{I}$ for all n and $I^n = 0$ for $n < a$,*
- (2) *Given K^\bullet with $H^n(K^\bullet) = 0$ for $n < a$ there exists a quasi-isomorphism $K^\bullet \rightarrow I^\bullet$ with $I^n \in \mathcal{I}$ and $I^n = 0$ for $n < a$.*

Proof. Proof of part (1). Consider the following induction hypothesis IH_n : There are $I^j \in \mathcal{I}$, $j \leq n$ almost all zero, maps $d^j : I^j \rightarrow I^{j+1}$ for $j < n$ and injective maps $\alpha^j : K^j \rightarrow I^j$ for $j \leq n$ such that the diagram

$$\begin{array}{ccccccc} \dots & \longrightarrow & K^{n-1} & \longrightarrow & K^n & \longrightarrow & K^{n+1} \longrightarrow \dots \\ & & \downarrow \alpha & & \downarrow \alpha & & \\ \dots & \longrightarrow & I^{n-1} & \longrightarrow & I^n & & \end{array}$$

is commutative, such that $d^j \circ d^{j-1} = 0$ for $j < n$ and such that α induces isomorphisms $H^j(K^\bullet) \rightarrow \text{Ker}(d^j)/\text{Im}(d^{j-1})$ for $j < n$. Note that this implies

$$(13.16.4.1) \quad \alpha(\text{Im}(d_K^{n-1})) \subset \alpha(\text{Ker}(d_K^n)) \cap \text{Im}(d^{n-1}) \subset \alpha(K^n) \cap \text{Im}(d^{n-1}).$$

If these inclusions are not equalities, then choose an injection

$$I^n \oplus K^n/\text{Im}(d_K^{n-1}) \longrightarrow I$$

with $I \in \mathcal{I}$. Denote $\alpha' : K^n \rightarrow I$ the map obtained by composing $\alpha \oplus 1 : K^n \rightarrow I^n \oplus K^n/\text{Im}(d_K^{n-1})$ with the displayed injection. Denote $d' : I^{n-1} \rightarrow I$ the composition $I^{n-1} \rightarrow I^n \rightarrow I$ of d^{n-1} by the inclusion of the first summand. Then $\alpha'(K^n) \cap \text{Im}(d') = \alpha'(\text{Im}(d_K^{n-1}))$ simply because the intersection of $\alpha'(K^n)$ with the first summand of $I^n \oplus K^n/\text{Im}(d_K^{n-1})$ is equal to $\alpha'(\text{Im}(d_K^{n-1}))$. Hence, after replacing I^n by I , α by α' and d^{n-1} by d' we may assume that we have equality in Equation (13.16.4.1). Once this is the case consider the solid diagram

$$\begin{array}{ccc} K^n/\text{Ker}(d_K^n) & \longrightarrow & K^{n+1} \\ \downarrow & & \downarrow \text{dotted} \\ I^n/(\text{Im}(d^{n-1}) + \alpha(\text{Ker}(d_K^n))) & \dashrightarrow & M \end{array}$$

The horizontal arrow is injective by fiat and the vertical arrow is injective as we have equality in (13.16.4.1). Hence the push-out M of this diagram contains both K^{n+1} and $I^n/(\text{Im}(d^{n-1}) + \alpha(\text{Ker}(d_K^n)))$ as subobjects. Choose an injection $M \rightarrow I^{n+1}$ with $I^{n+1} \in \mathcal{I}$. By construction we get $d^n : I^n \rightarrow I^{n+1}$ and an injective map $\alpha^{n+1} : K^{n+1} \rightarrow I^{n+1}$. The equality in Equation (13.16.4.1) and the construction of

d^n guarantee that $\alpha : H^n(K^\bullet) \rightarrow \text{Ker}(d^n)/\text{Im}(d^{n-1})$ is an isomorphism. In other words IH_{n+1} holds.

We finish the proof of by the following observations. First we note that IH_n is true for $n = a$ since we can just take $I^j = 0$ for $j < a$ and $K^a \rightarrow I^a$ an injection of K^a into an element of \mathcal{I} . Next, we note that in the proof of $IH_n \Rightarrow IH_{n+1}$ we only modified the object I^n , the map d^{n-1} and the map α^n . Hence we see that proceeding by induction we produce a complex I^\bullet with $I^n = 0$ for $n < a$ consisting of objects from \mathcal{I} , and a termwise injective quasi-isomorphism $\alpha : K^\bullet \rightarrow I^\bullet$ as desired.

Proof of part (2). The assumption implies that the morphism $K^\bullet \rightarrow \tau_{\geq a}K^\bullet$ (Homology, Section 12.13) is a quasi-isomorphism. Apply part (1) to find $\tau_{\geq a}K^\bullet \rightarrow I^\bullet$. The composition $K^\bullet \rightarrow I^\bullet$ is the desired quasi-isomorphism. \square

Lemma 13.16.5. *Let \mathcal{A} be an abelian category. Let $\mathcal{P} \subset \text{Ob}(\mathcal{A})$ be a subset containing 0 such that every object of \mathcal{A} is a quotient of an element of \mathcal{P} . Let $a \in \mathbf{Z}$.*

- (1) *Given K^\bullet with $K^n = 0$ for $n > a$ there exists a quasi-isomorphism $P^\bullet \rightarrow K^\bullet$ with $P^n \in \mathcal{P}$ and $P^n \rightarrow K^n$ surjective for all n and $P^n = 0$ for $n > a$.*
- (2) *Given K^\bullet with $H^n(K^\bullet) = 0$ for $n > a$ there exists a quasi-isomorphism $P^\bullet \rightarrow K^\bullet$ with $P^n \in \mathcal{P}$ for all n and $P^n = 0$ for $n > a$.*

Proof. This lemma is dual to Lemma 13.16.4. \square

Lemma 13.16.6. *In Situation 13.16.1. Let $\mathcal{I} \subset \text{Ob}(\mathcal{A})$ be a subset with the following properties:*

- (1) *every object of \mathcal{A} is a subobject of an element of \mathcal{I} ,*
- (2) *for any short exact sequence $0 \rightarrow P \rightarrow Q \rightarrow R \rightarrow 0$ of \mathcal{A} with $P, Q \in \mathcal{I}$, then $R \in \mathcal{I}$, and $0 \rightarrow F(P) \rightarrow F(Q) \rightarrow F(R) \rightarrow 0$ is exact.*

Then every object of \mathcal{I} is acyclic for RF .

Proof. We may add 0 to \mathcal{I} if necessary. Pick $A \in \mathcal{I}$. Let $A[0] \rightarrow K^\bullet$ be a quasi-isomorphism with K^\bullet bounded below. Then we can find a quasi-isomorphism $K^\bullet \rightarrow I^\bullet$ with I^\bullet bounded below and each $I^n \in \mathcal{I}$, see Lemma 13.16.4. Hence we see that these resolutions are cofinal in the category $A[0]/\text{Qis}^+(\mathcal{A})$. To finish the proof it therefore suffices to show that for any quasi-isomorphism $A[0] \rightarrow I^\bullet$ with I^\bullet bounded above and $I^n \in \mathcal{I}$ we have $F(A)[0] \rightarrow F(I^\bullet)$ is a quasi-isomorphism. To see this suppose that $I^n = 0$ for $n < n_0$. Of course we may assume that $n_0 < 0$. Starting with $n = n_0$ we prove inductively that $\text{Im}(d^{n-1}) = \text{Ker}(d^n)$ and $\text{Im}(d^{-1})$ are elements of \mathcal{I} using property (2) and the exact sequences

$$0 \rightarrow \text{Ker}(d^n) \rightarrow I^n \rightarrow \text{Im}(d^n) \rightarrow 0.$$

Moreover, property (2) also guarantees that the complex

$$0 \rightarrow F(I^{n_0}) \rightarrow F(I^{n_0+1}) \rightarrow \dots \rightarrow F(I^{-1}) \rightarrow F(\text{Im}(d^{-1})) \rightarrow 0$$

is exact. The exact sequence $0 \rightarrow \text{Im}(d^{-1}) \rightarrow I^0 \rightarrow I^0/\text{Im}(d^{-1}) \rightarrow 0$ implies that $I^0/\text{Im}(d^{-1})$ is an element of \mathcal{I} . The exact sequence $0 \rightarrow A \rightarrow I^0/\text{Im}(d^{-1}) \rightarrow \text{Im}(d^0) \rightarrow 0$ then implies that $\text{Im}(d^0) = \text{Ker}(d^1)$ is an elements of \mathcal{I} and from then on one continues as before to show that $\text{Im}(d^{n-1}) = \text{Ker}(d^n)$ is an element of \mathcal{I} for all $n > 0$. Applying F to each of the short exact sequences mentioned above and using (2) we observe that $F(A)[0] \rightarrow F(I^\bullet)$ is an isomorphism as desired. \square

Lemma 13.16.7. *In Situation 13.16.1. Let $\mathcal{P} \subset \text{Ob}(\mathcal{A})$ be a subset with the following properties:*

- (1) *every object of \mathcal{A} is a quotient of an element of \mathcal{P} ,*
- (2) *for any short exact sequence $0 \rightarrow P \rightarrow Q \rightarrow R \rightarrow 0$ of \mathcal{A} with $Q, R \in \mathcal{P}$, then $P \in \mathcal{P}$, and $0 \rightarrow F(P) \rightarrow F(Q) \rightarrow F(R) \rightarrow 0$ is exact.*

Then every object of \mathcal{P} is acyclic for LF .

Proof. Dual to the proof of Lemma 13.16.6. □

Proposition 13.16.8. *In Situation 13.16.1.*

- (1) *If every object of \mathcal{A} injects into an object acyclic for RF , then RF is defined on all of $K^+(\mathcal{A})$ and we obtain an exact functor*

$$RF : D^+(\mathcal{B}) \longrightarrow D^+(\mathcal{A})$$

see (13.15.9.1). Moreover, any bounded below complex K^\bullet whose terms are acyclic for RF computes RF .

- (2) *If every object of \mathcal{A} is quotient of an object acyclic for LF , then LF is defined on all of $K^-(\mathcal{A})$ and we obtain an exact functor*

$$LF : D^-(\mathcal{B}) \longrightarrow D^-(\mathcal{A})$$

see (13.15.9.1). Moreover, any bounded above complex K^\bullet whose terms are acyclic for LF computes LF .

Proof. Suppose every object of \mathcal{A} injects into an object acyclic for RF . Let \mathcal{I} be the set of objects acyclic for RF . Let K^\bullet be a bounded below complex with $K^n \in \mathcal{I}$. By Lemma 13.16.4 the quasi-isomorphisms $\alpha : K^\bullet \rightarrow I^\bullet$ with I^\bullet bounded below and $I^n \in \mathcal{I}$ are cofinal in the category $K^\bullet/\text{Qis}^+(\mathcal{A})$. Hence in order to show that K^\bullet computes RF it suffices to show that $F(K^\bullet) \rightarrow F(I^\bullet)$ is an isomorphism. Note that $C(\alpha)^\bullet$ is an acyclic bounded below complex all of whose terms are in \mathcal{I} . Hence it suffices to show: given an acyclic bounded below complex I^\bullet all of whose terms are in \mathcal{I} the complex $F(I^\bullet)$ is acyclic.

Say $I^n = 0$ for $n < n_0$. Then we break I^\bullet into short exact sequences $0 \rightarrow \text{Im}(d^n) \rightarrow I^{n+1} \rightarrow \text{Im}(d^{n+1}) \rightarrow 0$ for $n \geq n_0$. These sequences induce distinguished triangles $(\text{Im}(d^n), I^{n+1}, \text{Im}(d^{n+1}))$ by Lemma 13.12.1. This implies inductively that each $\text{Im}(d^n)$ is acyclic for RF by Lemma 13.15.12. Moreover, the long exact cohomology sequences (13.11.1.1) associated to the distinguished triangles $(F(\text{Im}(d^n)), F(I^{n+1}), F(\text{Im}(d^{n+1})))$ of $D^+(\mathcal{B})$ imply that

$$0 \rightarrow F(\text{Im}(d^n)) \rightarrow F(I^{n+1}) \rightarrow F(\text{Im}(d^{n+1})) \rightarrow 0$$

is short exact, and this in turn proves that $F(I^\bullet)$ is exact.

Finally, since by Lemma 13.16.4 every object of $K^+(\mathcal{A})$ is quasi-isomorphic to such a bounded below complex with terms in \mathcal{I} we see that RF is everywhere defined, see Lemma 13.15.14. The proof in the case of LF is dual. □

13.17. Higher derived functors

The following simple lemma shows that right derived functors “move to the right”.

Lemma 13.17.1. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories. Let $K^\bullet \in K^+(\mathcal{A})$ and $a \in \mathbf{Z}$.*

- (1) If $H^i(K^\bullet) = 0$ for all $i < a$ and RF is defined at K^\bullet , then $H^i(RF(K^\bullet)) = 0$ for all $i < a$.
- (2) If RF is defined at K^\bullet and $\tau_{\leq a}K^\bullet$, then $H^i(RF(\tau_{\leq a}K^\bullet)) = H^i(RF(K^\bullet))$ for all $i \leq a$.

Proof. Assume K^\bullet satisfies the assumptions of (1). Let $K^\bullet \rightarrow L^\bullet$ be any quasi-isomorphism. Then it is also true that $K^\bullet \rightarrow \tau_{\geq a}L^\bullet$ is a quasi-isomorphism by our assumption on K^\bullet . Hence in the category $K^\bullet/\text{Qis}^+(\mathcal{A})$ the quasi-isomorphisms $s : K^\bullet \rightarrow L^\bullet$ with $L^n = 0$ for $n < a$ are cofinal. Thus RF is the value of the essentially constant ind-object $F(L^\bullet)$ for these s it follows that $H^i(RF(K^\bullet)) = 0$ for $i < 0$.

To prove (2) we use the distinguished triangle

$$\tau_{\leq a}K^\bullet \rightarrow K^\bullet \rightarrow \tau_{\geq a+1}K^\bullet \rightarrow (\tau_{\leq a}K^\bullet)[1]$$

of Remark 13.12.4 to conclude via Lemma 13.15.6 that RF is defined at $\tau_{\geq a+1}K^\bullet$ as well and that we have a distinguished triangle

$$RF(\tau_{\leq a}K^\bullet) \rightarrow RF(K^\bullet) \rightarrow RF(\tau_{\geq a+1}K^\bullet) \rightarrow RF(\tau_{\leq a}K^\bullet)[1]$$

in $D(\mathcal{B})$. By part (1) we see that $RF(\tau_{\geq a+1}K^\bullet)$ has vanishing cohomology in degrees $< a+1$. The long exact cohomology sequence of this distinguished triangle then shows what we want. \square

Definition 13.17.2. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories. Assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined. Let $i \in \mathbf{Z}$. The i th right derived functor R^iF of F is the functor

$$R^iF = H^i \circ RF : \mathcal{A} \rightarrow \mathcal{B}$$

The following lemma shows that it really does not make a lot of sense to take the right derived functor unless the functor is left exact.

Lemma 13.17.3. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined.

- (1) We have $R^iF = 0$ for $i < 0$,
- (2) R^0F is left exact,
- (3) the map $F \rightarrow R^0F$ is an isomorphism if and only if F is left exact.

Proof. Let A be an object of \mathcal{A} . Let $A[0] \rightarrow K^\bullet$ be any quasi-isomorphism. Then it is also true that $A[0] \rightarrow \tau_{\geq 0}K^\bullet$ is a quasi-isomorphism. Hence in the category $A[0]/\text{Qis}^+(\mathcal{A})$ the quasi-isomorphisms $s : A[0] \rightarrow K^\bullet$ with $K^n = 0$ for $n < 0$ are cofinal. Thus it is clear that $H^i(RF(A[0])) = 0$ for $i < 0$. Moreover, for such an s the sequence

$$0 \rightarrow A \rightarrow K^0 \rightarrow K^1$$

is exact. Hence if F is left exact, then $0 \rightarrow F(A) \rightarrow F(K^0) \rightarrow F(K^1)$ is exact as well, and we see that $F(A) \rightarrow H^0(F(K^\bullet))$ is an isomorphism for every $s : A[0] \rightarrow K^\bullet$ as above which implies that $H^0(RF(A[0])) = F(A)$.

Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence of \mathcal{A} . By Lemma 13.12.1 we obtain a distinguished triangle $(A[0], B[0], C[0], a, b, c)$ in $K^+(\mathcal{A})$. From the long exact cohomology sequence (and the vanishing for $i < 0$ proved above) we deduce that $0 \rightarrow R^0F(A) \rightarrow R^0F(B) \rightarrow R^0F(C)$ is exact. Hence R^0F is left exact. Of course this also proves that if $F \rightarrow R^0F$ is an isomorphism, then F is left exact. \square

Lemma 13.17.4. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined. Let A be an object of \mathcal{A} .*

- (1) *A is right acyclic for F if and only if $F(A) \rightarrow R^0F(A)$ is an isomorphism and $R^iF(A) = 0$ for all $i > 0$,*
- (2) *if F is left exact, then A is right acyclic for F if and only if $R^iF(A) = 0$ for all $i > 0$.*

Proof. If A is right acyclic for F , then $RF(A[0]) = F(A)[0]$ and in particular $F(A) \rightarrow R^0F(A)$ is an isomorphism and $R^iF(A) = 0$ for $i \neq 0$. Conversely, if $F(A) \rightarrow R^0F(A)$ is an isomorphism and $R^iF(A) = 0$ for all $i > 0$ then $F(A[0]) \rightarrow RF(A[0])$ is a quasi-isomorphism by Lemma 13.17.3 part (1) and hence A is acyclic. If F is left exact then $F = R^0F$, see Lemma 13.17.3. \square

Lemma 13.17.5. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor between abelian categories and assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence of \mathcal{A} .*

- (1) *If A and C are right acyclic for F then so is B .*
- (2) *If A and B are right acyclic for F then so is C .*
- (3) *If B and C are right acyclic for F and $F(B) \rightarrow F(C)$ is surjective then A is right acyclic for F .*

In each of the three cases

$$0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$$

is a short exact sequence of \mathcal{B} .

Proof. By Lemma 13.12.1 we obtain a distinguished triangle $(A[0], B[0], C[0], a, b, c)$ in $K^+(\mathcal{A})$. As RF is an exact functor and since $R^iF = 0$ for $i < 0$ and $R^0F = F$ (Lemma 13.17.3) we obtain an exact cohomology sequence

$$0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow R^1F(A) \rightarrow \dots$$

in the abelian category \mathcal{B} . Thus the lemma follows from the characterization of acyclic objects in Lemma 13.17.4. \square

Lemma 13.17.6. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined.*

- (1) *The functors R^iF , $i \geq 0$ come equipped with a canonical structure of a δ -functor from $\mathcal{A} \rightarrow \mathcal{B}$, see Homology, Definition 12.11.1.*
- (2) *If every object of \mathcal{A} is a subobject of a right acyclic object for F , then $\{R^iF, \delta\}_{i \geq 0}$ is a universal δ -functor, see Homology, Definition 12.11.3.*

Proof. The functor $\mathcal{A} \rightarrow \text{Comp}^+(\mathcal{A})$, $A \mapsto A[0]$ is exact. The functor $\text{Comp}^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$ is a δ -functor, see Lemma 13.12.1. The functor $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is exact. Finally, the functor $H^0 : D^+(\mathcal{B}) \rightarrow \mathcal{B}$ is a homological functor, see Definition 13.11.3. Hence we get the structure of a δ -functor from Lemma 13.4.20 and Lemma 13.4.19. Part (2) follows from Homology, Lemma 12.11.4 and the description of acyclics in Lemma 13.17.4. \square

Lemma 13.17.7 (Leray's acyclicity lemma). *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined. Let A^\bullet be a bounded below complex of F -acyclic objects. The canonical map*

$$F(A^\bullet) \longrightarrow RF(A^\bullet)$$

is an isomorphism in $D^+(\mathcal{B})$, i.e., A^\bullet computes RF .

Proof. First we claim the lemma holds for a bounded complex of acyclic objects. Namely, it holds for complexes with at most one nonzero object by definition. Suppose that A^\bullet is a complex with $A^n = 0$ for $n \notin [a, b]$. Using the “stupid” truncations we obtain a termwise split short exact sequence of complexes

$$0 \rightarrow \sigma_{\geq a+1}A^\bullet \rightarrow A^\bullet \rightarrow \sigma_{\leq a}A^\bullet \rightarrow 0$$

see Homology, Section 12.13. Thus a distinguished triangle $(\sigma_{\geq a+1}A^\bullet, A^\bullet, \sigma_{\leq a}A^\bullet)$. By induction hypothesis the two outer complexes compute RF . Then the middle one does too by Lemma 13.15.12.

Suppose that A^\bullet is a bounded below complex of acyclic objects. To show that $F(A) \rightarrow RF(A)$ is an isomorphism in $D^+(\mathcal{B})$ it suffices to show that $H^i(F(A)) \rightarrow H^i(RF(A))$ is an isomorphism for all i . Pick i . Consider the termwise split short exact sequence of complexes

$$0 \rightarrow \sigma_{\geq i+2}A^\bullet \rightarrow A^\bullet \rightarrow \sigma_{\leq i+1}A^\bullet \rightarrow 0.$$

Note that this induces a termwise split short exact sequence

$$0 \rightarrow \sigma_{\geq i+2}F(A^\bullet) \rightarrow F(A^\bullet) \rightarrow \sigma_{\leq i+1}F(A^\bullet) \rightarrow 0.$$

Hence we get distinguished triangles

$$\begin{array}{c} (\sigma_{\geq i+2}A^\bullet, A^\bullet, \sigma_{\leq i+1}A^\bullet) \\ (\sigma_{\geq a+1}F(A^\bullet), F(A^\bullet), \sigma_{\leq a}F(A^\bullet)) \\ (RF(\sigma_{\geq a+1}A^\bullet), RF(A^\bullet), RF(\sigma_{\leq a}A^\bullet)) \end{array}$$

Using the last two we obtain a map of exact sequences

$$\begin{array}{ccccccc} H^i(\sigma_{\geq i+2}F(A^\bullet)) & \longrightarrow & H^i(F(A^\bullet)) & \longrightarrow & H^i(\sigma_{\leq i+1}F(A^\bullet)) & \longrightarrow & H^{i+1}(\sigma_{\geq i+2}F(A^\bullet)) \\ \downarrow & & \downarrow \alpha & & \downarrow \beta & & \downarrow \\ R^iF(\sigma_{\geq i+2}A^\bullet) & \longrightarrow & R^iF(A^\bullet) & \longrightarrow & R^iF(\sigma_{\leq i+1}A^\bullet) & \longrightarrow & R^{i+1}F(\sigma_{\geq i+2}A^\bullet) \end{array}$$

By the results of the first paragraph the map β is an isomorphism. By inspection the objects on the upper left and the upper right are zero. Hence to finish the proof we have to show that $R^iF(\sigma_{\geq i+2}A^\bullet) = 0$ and $R^{i+1}F(\sigma_{\geq i+2}A^\bullet) = 0$. This follows immediately from Lemma 13.17.1. \square

Lemma 13.17.8. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor of abelian categories. Then*

- (1) every object of \mathcal{A} is right acyclic for F ,
- (2) $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is everywhere defined,
- (3) $RF : D(\mathcal{A}) \rightarrow D(\mathcal{B})$ is everywhere defined,
- (4) every complex computes RF , in other words, the canonical map $F(K^\bullet) \rightarrow RF(K^\bullet)$ is an isomorphism for all complexes, and
- (5) $R^iF = 0$ for $i \neq 0$.

Proof. This is true because F transforms acyclic complexes into acyclic complexes and quasi-isomorphisms into quasi-isomorphisms. Details omitted. \square

13.18. Injective resolutions

In this section we prove some lemmas regarding the existence of injective resolutions in abelian categories having enough injectives.

Definition 13.18.1. Let \mathcal{A} be an abelian category. Let $A \in \text{Ob}(\mathcal{A})$. An *injective resolution of A* is a complex I^\bullet together with a map $A \rightarrow I^0$ such that:

- (1) We have $I^n = 0$ for $n < 0$.
- (2) Each I^n is an injective object of \mathcal{A} .
- (3) The map $A \rightarrow I^0$ is an isomorphism onto $\text{Ker}(d^0)$.
- (4) We have $H^i(I^\bullet) = 0$ for $i > 0$.

Hence $A[0] \rightarrow I^\bullet$ is a quasi-isomorphism. In other words the complex

$$\dots \rightarrow 0 \rightarrow A \rightarrow I^0 \rightarrow I^1 \rightarrow \dots$$

is acyclic. Let K^\bullet be a complex in \mathcal{A} . An *injective resolution of K^\bullet* is a complex I^\bullet together with a map $\alpha : K^\bullet \rightarrow I^\bullet$ of complexes such that

- (1) We have $I^n = 0$ for $n \ll 0$, i.e., I^\bullet is bounded below.
- (2) Each I^n is an injective object of \mathcal{A} .
- (3) The map $\alpha : K^\bullet \rightarrow I^\bullet$ is a quasi-isomorphism.

In other words an injective resolution $K^\bullet \rightarrow I^\bullet$ gives rise to a diagram

$$\begin{array}{ccccccc} \dots & \longrightarrow & K^{n-1} & \longrightarrow & K^n & \longrightarrow & K^{n+1} & \longrightarrow & \dots \\ & & \downarrow & & \downarrow & & \downarrow & & \\ \dots & \longrightarrow & I^{n-1} & \longrightarrow & I^n & \longrightarrow & I^{n+1} & \longrightarrow & \dots \end{array}$$

which induces an isomorphism on cohomology objects in each degree. An injective resolution of an object A of \mathcal{A} is almost the same thing as an injective resolution of the complex $A[0]$.

Lemma 13.18.2. Let \mathcal{A} be an abelian category. Let K^\bullet be a complex of \mathcal{A} .

- (1) If K^\bullet has an injective resolution then $H^n(K^\bullet) = 0$ for $n \ll 0$.
- (2) If $H^n(K^\bullet) = 0$ for all $n \ll 0$ then there exists a quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with L^\bullet bounded below.

Proof. Omitted. For the second statement use $L^\bullet = \tau_{\geq n} K^\bullet$ for some $n \ll 0$. See Homology, Section 12.13 for the definition of the truncation $\tau_{\geq n}$. \square

Lemma 13.18.3. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives.

- (1) Any object of \mathcal{A} has an injective resolution.
- (2) If $H^n(K^\bullet) = 0$ for all $n \ll 0$ then K^\bullet has an injective resolution.
- (3) If K^\bullet is a complex with $K^n = 0$ for $n < a$, then there exists an injective resolution $\alpha : K^\bullet \rightarrow I^\bullet$ with $I^n = 0$ for $n < a$ such that each $\alpha^n : K^n \rightarrow I^n$ is injective.

Proof. Proof of (1). First choose an injection $A \rightarrow I^0$ of A into an injective object of \mathcal{A} . Next, choose an injection $I_0/A \rightarrow I^1$ into an injective object of \mathcal{A} . Denote d^0 the induced map $I^0 \rightarrow I^1$. Next, choose an injection $I^1/\text{Im}(d^0) \rightarrow I^2$ into an injective object of \mathcal{A} . Denote d^1 the induced map $I^1 \rightarrow I^2$. And so on. By Lemma 13.18.2 part (2) follows from part (3). Part (3) is a special case of Lemma 13.16.4. \square

Lemma 13.18.4. *Let \mathcal{A} be an abelian category. Let K^\bullet be an acyclic complex. Let I^\bullet be bounded below and consisting of injective objects. Any morphism $K^\bullet \rightarrow I^\bullet$ is homotopic to zero.*

Proof. Let $\alpha : K^\bullet \rightarrow I^\bullet$ be a morphism of complexes. Assume that $\alpha^j = 0$ for $j < n$. We will show that there exists a morphism $h : K^{n+1} \rightarrow I^n$ such that $\alpha^n = h \circ d$. Thus α will be homotopic to the morphism of complexes β defined by

$$\beta^j = \begin{cases} 0 & \text{if } j \leq n \\ \alpha^{n+1} - d \circ h & \text{if } j = n + 1 \\ \alpha^j & \text{if } j > n + 1 \end{cases}$$

This will clearly prove the lemma (by induction). To prove the existence of h note that $\alpha^n|_{d^{n-1}(K^{n-1})} = 0$ since $\alpha^{n-1} = 0$. Since K^\bullet is acyclic we have $d^{n-1}(K^{n-1}) = \text{Ker}(K^n \rightarrow K^{n+1})$. Hence we can think of α^n as a map into I^n defined on the subobject $\text{Im}(K^n \rightarrow K^{n+1})$ of K^{n+1} . By injectivity of the object I^n we can extend this to a map $h : K^{n+1} \rightarrow I^n$ as desired. \square

Remark 13.18.5. Let \mathcal{A} be an abelian category. Using the fact that $K(\mathcal{A})$ is a triangulated category we may use Lemma 13.18.4 to obtain proofs of some of the lemmas below which are usually proved by chasing through diagrams. Namely, suppose that $\alpha : K^\bullet \rightarrow L^\bullet$ is a quasi-isomorphism of complexes. Then

$$(K^\bullet, L^\bullet, C(\alpha)^\bullet, \alpha, i, -p)$$

is a distinguished triangle in $K(\mathcal{A})$ (Lemma 13.9.14) and $C(f)^\bullet$ is an acyclic complex (Lemma 13.11.2). Next, let I^\bullet be a bounded below complex of injective objects. Then

$$\begin{array}{ccccc} \text{Hom}_{K(\mathcal{A})}(C(\alpha)^\bullet, I^\bullet) & \longrightarrow & \text{Hom}_{K(\mathcal{A})}(L^\bullet, I^\bullet) & \longrightarrow & \text{Hom}_{K(\mathcal{A})}(K^\bullet, I^\bullet) \\ & & & \searrow & \\ & & & & \text{Hom}_{K(\mathcal{A})}(C(\alpha)^\bullet[-1], I^\bullet) \end{array}$$

is an exact sequence of abelian groups, see Lemma 13.4.2. At this point Lemma 13.18.4 guarantees that the outer two groups are zero and hence $\text{Hom}_{K(\mathcal{A})}(L^\bullet, I^\bullet) = \text{Hom}_{K(\mathcal{A})}(K^\bullet, I^\bullet)$.

Lemma 13.18.6. *Let \mathcal{A} be an abelian category. Consider a solid diagram*

$$\begin{array}{ccc} K^\bullet & \xrightarrow{\alpha} & L^\bullet \\ \gamma \downarrow & \searrow \beta & \\ I^\bullet & & \end{array}$$

where I^\bullet is bounded below and consists of injective objects, and α is a quasi-isomorphism.

- (1) *There exists a map of complexes β making the diagram commute up to homotopy.*
- (2) *If α is injective in every degree then we can find a β which makes the diagram commute.*

Proof. The “correct” proof of part (1) is explained in Remark 13.18.5. We also give a direct proof here.

We first show that (2) implies (1). Namely, let $\tilde{\alpha} : K \rightarrow \tilde{L}^\bullet$, π, s be as in Lemma 13.9.6. Since $\tilde{\alpha}$ is injective by (2) there exists a morphism $\tilde{\beta} : \tilde{L}^\bullet \rightarrow I^\bullet$ such that $\gamma = \tilde{\beta} \circ \tilde{\alpha}$. Set $\beta = \tilde{\beta} \circ s$. Then we have

$$\beta \circ \alpha = \tilde{\beta} \circ s \circ \pi \circ \tilde{\alpha} \sim \tilde{\beta} \circ \tilde{\alpha} = \gamma$$

as desired.

Assume that $\alpha : K^\bullet \rightarrow L^\bullet$ is injective. Suppose we have already defined β in all degrees $\leq n - 1$ compatible with differentials and such that $\gamma^j = \beta^j \circ \alpha^j$ for all $j \leq n - 1$. Consider the commutative solid diagram

Thus we see that the dotted arrow is prescribed on the subobjects $\alpha(K^n)$ and $d^{n-1}(L^{n-1})$. Moreover, these two arrows agree on $\alpha(d^{n-1}(K^{n-1}))$. Hence if

$$(13.18.6.1) \quad \alpha(d^{n-1}(K^{n-1})) = \alpha(K^n) \cap d^{n-1}(L^{n-1})$$

then these morphisms glue to a morphism $\alpha(K^n) + d^{n-1}(L^{n-1}) \rightarrow I^n$ and, using the injectivity of I^n , we can extend this to a morphism from all of L^n into I^n . After this by induction we get the morphism β for all n simultaneously (note that we can set $\beta^n = 0$ for all $n \ll 0$ since I^\bullet is bounded below – in this way starting the induction).

It remains to prove the equality (13.18.6.1). The reader is encouraged to argue this for themselves with a suitable diagram chase. Nonetheless here is our argument. Note that the inclusion $\alpha(d^{n-1}(K^{n-1})) \subset \alpha(K^n) \cap d^{n-1}(L^{n-1})$ is obvious. Take an object T of \mathcal{A} and a morphism $x : T \rightarrow L^n$ whose image is contained in the subobject $\alpha(K^n) \cap d^{n-1}(L^{n-1})$. Since α is injective we see that $x = \alpha \circ x'$ for some $x' : T \rightarrow K^n$. Moreover, since x lies in $d^{n-1}(L^{n-1})$ we see that $d^n \circ x = 0$. Hence using injectivity of α again we see that $d^n \circ x' = 0$. Thus x' gives a morphism $[x'] : T \rightarrow H^n(K^\bullet)$. On the other hand the corresponding map $[x] : T \rightarrow H^n(L^\bullet)$ induced by x is zero by assumption. Since α is a quasi-isomorphism we conclude that $[x'] = 0$. This of course means exactly that the image of x' is contained in $d^{n-1}(K^{n-1})$ and we win. \square

Lemma 13.18.7. *Let \mathcal{A} be an abelian category. Consider a solid diagram*

where I^\bullet is bounded below and consists of injective objects, and α is a quasi-isomorphism. Any two morphisms β_1, β_2 making the diagram commute up to homotopy are homotopic.

Proof. This follows from Remark 13.18.5. We also give a direct argument here.

Let $\tilde{\alpha} : K \rightarrow \tilde{L}^\bullet$, π , s be as in Lemma 13.9.6. If we can show that $\beta_1 \circ \pi$ is homotopic to $\beta_2 \circ \pi$, then we deduce that $\beta_1 \sim \beta_2$ because $\pi \circ s$ is the identity. Hence we may assume $\alpha^n : K^n \rightarrow L^n$ is the inclusion of a direct summand for all n . Thus we get a short exact sequence of complexes

$$0 \rightarrow K^\bullet \rightarrow L^\bullet \rightarrow M^\bullet \rightarrow 0$$

which is termwise split and such that M^\bullet is acyclic. We choose splittings $L^n = K^n \oplus M^n$, so we have $\beta_i^n : K^n \oplus M^n \rightarrow I^n$ and $\gamma^n : K^n \rightarrow I^n$. In this case the condition on β_i is that there are morphisms $h_i^n : K^n \rightarrow I^{n-1}$ such that

$$\gamma^n - \beta_i^n|_{K^n} = d \circ h_i^n + h_i^{n+1} \circ d$$

Thus we see that

$$\beta_1^n|_{K^n} - \beta_2^n|_{K^n} = d \circ (h_1^n - h_2^n) + (h_1^{n+1} - h_2^{n+1}) \circ d$$

Consider the map $h^n : K^n \oplus M^n \rightarrow I^{n-1}$ which equals $h_1^n - h_2^n$ on the first summand and zero on the second. Then we see that

$$\beta_1^n - \beta_2^n - (d \circ h^n + h^{n+1} \circ d)$$

is a morphism of complexes $L^\bullet \rightarrow I^\bullet$ which is identically zero on the subcomplex K^\bullet . Hence it factors as $L^\bullet \rightarrow M^\bullet \rightarrow I^\bullet$. Thus the result of the lemma follows from Lemma 13.18.4. \square

Lemma 13.18.8. *Let \mathcal{A} be an abelian category. Let I^\bullet be bounded below complex consisting of injective objects. Let $L^\bullet \in K(\mathcal{A})$. Then*

$$\text{Mor}_{K(\mathcal{A})}(L^\bullet, I^\bullet) = \text{Mor}_{D(\mathcal{A})}(L^\bullet, I^\bullet).$$

Proof. Let a be an element of the right hand side. We may represent $a = \gamma\alpha^{-1}$ where $\alpha : K^\bullet \rightarrow L^\bullet$ is a quasi-isomorphism and $\gamma : K^\bullet \rightarrow I^\bullet$ is a map of complexes. By Lemma 13.18.6 we can find a morphism $\beta : L^\bullet \rightarrow I^\bullet$ such that $\beta \circ \alpha$ is homotopic to γ . This proves that the map is surjective. Let b be an element of the left hand side which maps to zero in the right hand side. Then b is the homotopy class of a morphism $\beta : L^\bullet \rightarrow I^\bullet$ such that there exists a quasi-isomorphism $\alpha : K^\bullet \rightarrow L^\bullet$ with $\beta \circ \alpha$ homotopic to zero. Then Lemma 13.18.7 shows that β is homotopic to zero also, i.e., $b = 0$. \square

Lemma 13.18.9. *Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. For any short exact sequence $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ of $\text{Comp}^+(\mathcal{A})$ there exists a commutative diagram in $\text{Comp}^+(\mathcal{A})$*

$$\begin{array}{ccccccc} 0 & \longrightarrow & A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & I_1^\bullet & \longrightarrow & I_2^\bullet & \longrightarrow & I_3^\bullet \longrightarrow 0 \end{array}$$

where the vertical arrows are injective resolutions and the rows are short exact sequences of complexes. In fact, given any injective resolution $A^\bullet \rightarrow I^\bullet$ we may assume $I_1^\bullet = I^\bullet$.

Proof. Step 1. Choose an injective resolution $A^\bullet \rightarrow I^\bullet$ (see Lemma 13.18.3) or use the given one. Recall that $\text{Comp}^+(\mathcal{A})$ is an abelian category, see Homology, Lemma 12.12.9. Hence we may form the pushout along the injective map $A^\bullet \rightarrow I^\bullet$ to get

$$\begin{array}{ccccccc} 0 & \longrightarrow & A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & I^\bullet & \longrightarrow & E^\bullet & \longrightarrow & C^\bullet \longrightarrow 0 \end{array}$$

Note that the lower short exact sequence is termwise split, see Homology, Lemma 12.23.2. Hence it suffices to prove the lemma when $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ is termwise split.

Step 2. Choose splittings. In other words, write $B^n = A^n \oplus C^n$. Denote $\delta : C^\bullet \rightarrow A^\bullet[1]$ the morphism as in Homology, Lemma 12.14.10. Choose injective resolutions $f_1 : A^\bullet \rightarrow I_1^\bullet$ and $f_3 : C^\bullet \rightarrow I_3^\bullet$. (If A^\bullet is a complex of injectives, then use $I_1^\bullet = A^\bullet$.) We may assume f_3 is injective in every degree. By Lemma 13.18.6 we may find a morphism $\delta' : I_3^\bullet \rightarrow I_1^\bullet[1]$ such that $\delta' \circ f_3 = f_1[1] \circ \delta$ (equality of morphisms of complexes). Set $I_2^n = I_1^n \oplus I_3^n$. Define

$$d_{I_2}^n = \begin{pmatrix} d_{I_1}^n & (\delta')^n \\ 0 & d_{I_3}^n \end{pmatrix}$$

and define the maps $B^n \rightarrow I_2^n$ to be given as the sum of the maps $A^n \rightarrow I_1^n$ and $C^n \rightarrow I_3^n$. Everything is clear. \square

13.19. Projective resolutions

This section is dual to Section 13.18. We give definitions and state results, but we do not reprove the lemmas.

Definition 13.19.1. Let \mathcal{A} be an abelian category. Let $A \in \text{Ob}(\mathcal{A})$. An *projective resolution* of A is a complex P^\bullet together with a map $P^0 \rightarrow A$ such that:

- (1) We have $P^n = 0$ for $n > 0$.
- (2) Each P^n is a projective object of \mathcal{A} .
- (3) The map $P^0 \rightarrow A$ induces an isomorphism $\text{Coker}(d^{-1}) \rightarrow A$.
- (4) We have $H^i(P^\bullet) = 0$ for $i < 0$.

Hence $P^\bullet \rightarrow A[0]$ is a quasi-isomorphism. In other words the complex

$$\dots \rightarrow P^{-1} \rightarrow P^0 \rightarrow A \rightarrow 0 \rightarrow \dots$$

is acyclic. Let K^\bullet be a complex in \mathcal{A} . An *projective resolution* of K^\bullet is a complex P^\bullet together with a map $\alpha : P^\bullet \rightarrow K^\bullet$ of complexes such that

- (1) We have $P^n = 0$ for $n \gg 0$, i.e., P^\bullet is bounded above.
- (2) Each P^n is a projective object of \mathcal{A} .
- (3) The map $\alpha : P^\bullet \rightarrow K^\bullet$ is a quasi-isomorphism.

Lemma 13.19.2. Let \mathcal{A} be an abelian category. Let K^\bullet be a complex of \mathcal{A} .

- (1) If K^\bullet has a projective resolution then $H^n(K^\bullet) = 0$ for $n \gg 0$.
- (2) If $H^n(K^\bullet) = 0$ for $n \gg 0$ then there exists a quasi-isomorphism $L^\bullet \rightarrow K^\bullet$ with L^\bullet bounded above.

Proof. Dual to Lemma 13.18.2. \square

Lemma 13.19.3. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough projectives.

- (1) Any object of \mathcal{A} has a projective resolution.
- (2) If $H^n(K^\bullet) = 0$ for all $n \gg 0$ then K^\bullet has a projective resolution.
- (3) If K^\bullet is a complex with $K^n = 0$ for $n > a$, then there exists a projective resolution $\alpha : P^\bullet \rightarrow K^\bullet$ with $P^n = 0$ for $n > a$ such that each $\alpha^n : P^n \rightarrow K^n$ is surjective.

Proof. Dual to Lemma 13.18.3. □

Lemma 13.19.4. Let \mathcal{A} be an abelian category. Let K^\bullet be an acyclic complex. Let P^\bullet be bounded above and consisting of projective objects. Any morphism $P^\bullet \rightarrow K^\bullet$ is homotopic to zero.

Proof. Dual to Lemma 13.18.4. □

Remark 13.19.5. Let \mathcal{A} be an abelian category. Suppose that $\alpha : K^\bullet \rightarrow L^\bullet$ is a quasi-isomorphism of complexes. Let P^\bullet be a bounded above complex of projectives. Then

$$\mathrm{Hom}_{K(\mathcal{A})}(P^\bullet, K^\bullet) \longrightarrow \mathrm{Hom}_{K(\mathcal{A})}(P^\bullet, L^\bullet)$$

is an isomorphism. This is dual to Remark 13.18.5.

Lemma 13.19.6. Let \mathcal{A} be an abelian category. Consider a solid diagram

$$\begin{array}{ccc} K^\bullet & \xleftarrow{\alpha} & L^\bullet \\ \uparrow & & \nearrow \beta \\ P^\bullet & & \end{array}$$

where P^\bullet is bounded above and consists of projective objects, and α is a quasi-isomorphism.

- (1) There exists a map of complexes β making the diagram commute up to homotopy.
- (2) If α is surjective in every degree then we can find a β which makes the diagram commute.

Proof. Dual to Lemma 13.18.6. □

Lemma 13.19.7. Let \mathcal{A} be an abelian category. Consider a solid diagram

$$\begin{array}{ccc} K^\bullet & \xleftarrow{\alpha} & L^\bullet \\ \uparrow & & \nearrow \beta_i \\ P^\bullet & & \end{array}$$

where P^\bullet is bounded above and consists of projective objects, and α is a quasi-isomorphism. Any two morphisms β_1, β_2 making the diagram commute up to homotopy are homotopic.

Proof. Dual to Lemma 13.18.7. □

Lemma 13.19.8. Let \mathcal{A} be an abelian category. Let P^\bullet be bounded above complex consisting of projective objects. Let $L^\bullet \in K(\mathcal{A})$. Then

$$\mathrm{Mor}_{K(\mathcal{A})}(P^\bullet, L^\bullet) = \mathrm{Mor}_{D(\mathcal{A})}(P^\bullet, L^\bullet).$$

Proof. Dual to Lemma 13.18.8. □

Lemma 13.19.9. *Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough projectives. For any short exact sequence $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ of $\text{Comp}^+(\mathcal{A})$ there exists a commutative diagram in $\text{Comp}^+(\mathcal{A})$*

$$\begin{array}{ccccccc} 0 & \longrightarrow & P_1^\bullet & \longrightarrow & P_2^\bullet & \longrightarrow & P_3^\bullet \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & A^\bullet & \longrightarrow & B^\bullet & \longrightarrow & C^\bullet \longrightarrow 0 \end{array}$$

where the vertical arrows are projective resolutions and the rows are short exact sequences of complexes. In fact, given any projective resolution $P^\bullet \rightarrow C^\bullet$ we may assume $P_3^\bullet = P^\bullet$.

Proof. Dual to Lemma 13.18.9. □

Lemma 13.19.10. *Let \mathcal{A} be an abelian category. Let P^\bullet, K^\bullet be complexes. Let $n \in \mathbf{Z}$. Assume that*

- (1) P^\bullet is a bounded complex consisting of projective objects,
- (2) $P^i = 0$ for $i < n$, and
- (3) $H^i(K^\bullet) = 0$ for $i \geq n$.

Then $\text{Hom}_{K(\mathcal{A})}(P^\bullet, K^\bullet) = \text{Hom}_{D(\mathcal{A})}(P^\bullet, K^\bullet) = 0$.

Proof. The first equality follows from Lemma 13.19.8. Note that there is a distinguished triangle

$$(\tau_{\leq n-1}K^\bullet, K^\bullet, \tau_{\geq n}K^\bullet, f, g, h)$$

by Remark 13.12.4. Hence, by Lemma 13.4.2 it suffices to prove $\text{Hom}_{K(\mathcal{A})}(P^\bullet, \tau_{\leq n-1}K^\bullet) = 0$ and $\text{Hom}_{K(\mathcal{A})}(P^\bullet, \tau_{\geq n}K^\bullet) = 0$. The first vanishing is trivial and the second is Lemma 13.19.4. □

Lemma 13.19.11. *Let \mathcal{A} be an abelian category. Let $\beta : P^\bullet \rightarrow L^\bullet$ and $\alpha : E^\bullet \rightarrow L^\bullet$ be maps of complexes. Let $n \in \mathbf{Z}$. Assume*

- (1) P^\bullet is a bounded complex of projectives and $P^i = 0$ for $i < n$,
- (2) $H^i(\alpha)$ is an isomorphism for $i > n$ and surjective for $i = n$.

Then there exists a map of complexes $\gamma : P^\bullet \rightarrow E^\bullet$ such that $\alpha \circ \gamma$ and β are homotopic.

Proof. Consider the cone $C^\bullet = C(\alpha)^\bullet$ with map $i : L^\bullet \rightarrow C^\bullet$. Note that $i \circ \beta$ is zero by Lemma 13.19.10. Hence we can lift β to E^\bullet by Lemma 13.4.2. □

13.20. Right derived functors and injective resolutions

At this point we can use the material above to define the right derived functors of an additive functor between an abelian category having enough injectives and a general abelian category.

Lemma 13.20.1. *Let \mathcal{A} be an abelian category. Let $I \in \text{Ob}(\mathcal{A})$ be an injective object. Let I^\bullet be a bounded below complex of injectives in \mathcal{A} .*

- (1) I^\bullet computes RF relative to $\text{Qis}^+(\mathcal{A})$ for any exact functor $F : K^+(\mathcal{A}) \rightarrow \mathcal{D}$ into any triangulated category \mathcal{D} .
- (2) I is right acyclic for any additive functor $F : \mathcal{A} \rightarrow \mathcal{B}$ into any abelian category \mathcal{B} .

Proof. Part (2) is a direct consequences of part (1) and Definition 13.16.3. To prove (1) let $\alpha : I^\bullet \rightarrow K^\bullet$ be a quasi-isomorphism into a complex. By Lemma 13.18.7 we see that α has a left inverse. Hence the category $I^\bullet/\text{Qis}^+(\mathcal{A})$ is essentially constant with value $\text{id} : I^\bullet \rightarrow I^\bullet$. Thus also the ind-object

$$I^\bullet/\text{Qis}^+(\mathcal{A}) \longrightarrow \mathcal{D}, \quad (I^\bullet \rightarrow K^\bullet) \longmapsto F(K^\bullet)$$

is essentially constant with value $F(I^\bullet)$. This proves (1), see Definitions 13.15.2 and 13.15.10. \square

Lemma 13.20.2. *Let \mathcal{A} be an abelian category with enough injectives.*

- (1) *For any exact functor $F : K^+(\mathcal{A}) \rightarrow \mathcal{D}$ into a triangulated category \mathcal{D} the right derived functor*

$$RF : D^+(\mathcal{A}) \longrightarrow \mathcal{D}$$

is everywhere defined.

- (2) *For any additive functor $F : \mathcal{A} \rightarrow \mathcal{B}$ into an abelian category \mathcal{B} the right derived functor*

$$RF : D^+(\mathcal{A}) \longrightarrow D^+(\mathcal{B})$$

is everywhere defined.

Proof. Combine Lemma 13.20.1 and Proposition 13.16.8 for the second assertion. To see the first assertion combine Lemma 13.18.3, Lemma 13.20.1, Lemma 13.15.14, and Equation (13.15.9.1). \square

Lemma 13.20.3. *Let \mathcal{A} be an abelian category with enough injectives. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor.*

- (1) *The functor RF is an exact functor $D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$.*
- (2) *The functor RF induces an exact functor $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$.*
- (3) *The functor RF induces a δ -functor $\text{Comp}^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$.*
- (4) *The functor RF induces a δ -functor $\mathcal{A} \rightarrow D^+(\mathcal{B})$.*

Proof. This lemma simply reviews some of the results obtained so far. Note that by Lemma 13.20.2 RF is everywhere defined. Here are some references:

- (1) The derived functor is exact: This boils down to Lemma 13.15.6.
- (2) This is true because $K^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$ is exact and compositions of exact functors are exact.
- (3) This is true because $\text{Comp}^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$ is a δ -functor, see Lemma 13.12.1.
- (4) This is true because $\mathcal{A} \rightarrow \text{Comp}^+(\mathcal{A})$ is exact and precomposing a δ -functor by an exact functor gives a δ -functor.

\square

Lemma 13.20.4. *Let \mathcal{A} be an abelian category with enough injectives. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor.*

- (1) *For any short exact sequence $0 \rightarrow A^\bullet \rightarrow B^\bullet \rightarrow C^\bullet \rightarrow 0$ of complexes in $\text{Comp}^+(\mathcal{A})$ there is an associated long exact sequence*

$$\dots \rightarrow H^i(RF(A^\bullet)) \rightarrow H^i(RF(B^\bullet)) \rightarrow H^i(RF(C^\bullet)) \rightarrow H^{i+1}(RF(A^\bullet)) \rightarrow \dots$$
- (2) *The functors $R^i F : \mathcal{A} \rightarrow \mathcal{B}$ are zero for $i < 0$. Also $R^0 F = F : \mathcal{A} \rightarrow \mathcal{B}$.*
- (3) *We have $R^i F(I) = 0$ for $i > 0$ and I injective.*

- (4) The sequence $(R^i F, \delta)$ forms a universal δ -functor (see Homology, Definition 12.11.3) from \mathcal{A} to \mathcal{B} .

Proof. This lemma simply reviews some of the results obtained so far. Note that by Lemma 13.20.2 RF is everywhere defined. Here are some references:

- (1) This follows from Lemma 13.20.3 part (3) combined with the long exact cohomology sequence (13.11.1.1) for $D^+(\mathcal{B})$.
- (2) This is Lemma 13.17.3.
- (3) This is the fact that injective objects are acyclic.
- (4) This is Lemma 13.17.6.

□

13.21. Cartan-Eilenberg resolutions

This section can be expanded. The material can be generalized and applied in more cases. Resolutions need not use injectives and the method also works in the unbounded case in some situations.

Definition 13.21.1. Let \mathcal{A} be an abelian category. Let K^\bullet be a bounded below complex. A *Cartan-Eilenberg resolution* of K^\bullet is given by a double complex $I^{\bullet, \bullet}$ and a morphism of complexes $\epsilon : K^\bullet \rightarrow I^{\bullet, 0}$ with the following properties:

- (1) There exists a $i \ll 0$ such that $I^{p, q} = 0$ for all $p < i$ and all q .
- (2) We have $I^{p, q} = 0$ if $q < 0$.
- (3) The complex $I^{p, \bullet}$ is an injective resolution of K^p .
- (4) The complex $\text{Ker}(d_1^{p, \bullet})$ is an injective resolution of $\text{Ker}(d_K^p)$.
- (5) The complex $\text{Im}(d_1^{p, \bullet})$ is an injective resolution of $\text{Im}(d_K^p)$.
- (6) The complex $H_I^p(I^{\bullet, \bullet})$ is an injective resolution of $H^p(K^\bullet)$.

Lemma 13.21.2. Let \mathcal{A} be an abelian category with enough injectives. Let K^\bullet be a bounded below complex. There exists a Cartan-Eilenberg resolution of K^\bullet .

Proof. Suppose that $K^p = 0$ for $p < n$. Decompose K^\bullet into short exact sequences as follows: Set $Z^p = \text{Ker}(d^p)$, $B^p = \text{Im}(d^{p-1})$, $H^p = Z^p/B^p$, and consider

$$\begin{aligned} 0 &\rightarrow Z^n \rightarrow K^n \rightarrow B^{n+1} \rightarrow 0 \\ 0 &\rightarrow B^{n+1} \rightarrow Z^{n+1} \rightarrow H^{n+1} \rightarrow 0 \\ 0 &\rightarrow Z^{n+1} \rightarrow K^{n+1} \rightarrow B^{n+2} \rightarrow 0 \\ 0 &\rightarrow B^{n+2} \rightarrow Z^{n+2} \rightarrow H^{n+2} \rightarrow 0 \\ &\dots \end{aligned}$$

Set $I^{p, q} = 0$ for $p < n$. Inductively we choose injective resolutions as follows:

- (1) Choose an injective resolution $Z^n \rightarrow J_Z^{n, \bullet}$.
- (2) Using Lemma 13.18.9 choose injective resolutions $K^n \rightarrow I^{n, \bullet}$, $B^{n+1} \rightarrow J_B^{n+1, \bullet}$, and an exact sequence of complexes $0 \rightarrow J_Z^{n, \bullet} \rightarrow I^{n, \bullet} \rightarrow J_B^{n+1, \bullet} \rightarrow 0$ compatible with the short exact sequence $0 \rightarrow Z^n \rightarrow K^n \rightarrow B^{n+1} \rightarrow 0$.
- (3) Using Lemma 13.18.9 choose injective resolutions $Z^{n+1} \rightarrow J_Z^{n+1, \bullet}$, $H^{n+1} \rightarrow J_H^{n+1, \bullet}$, and an exact sequence of complexes $0 \rightarrow J_B^{n+1, \bullet} \rightarrow J_Z^{n+1, \bullet} \rightarrow J_H^{n+1, \bullet} \rightarrow 0$ compatible with the short exact sequence $0 \rightarrow B^{n+1} \rightarrow Z^{n+1} \rightarrow H^{n+1} \rightarrow 0$.
- (4) Etc.

Taking as maps $d_1^\bullet : I^{p, \bullet} \rightarrow I^{p+1, \bullet}$ the compositions $I^{p, \bullet} \rightarrow J_B^{p+1, \bullet} \rightarrow J_Z^{p+1, \bullet} \rightarrow I^{p+1, \bullet}$ everything is clear. □

Lemma 13.21.3. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor of abelian categories. Let K^\bullet be a bounded below complex of \mathcal{A} . Let $I^{\bullet,\bullet}$ be a Cartan-Eilenberg resolution for K^\bullet . The spectral sequences $({}^1E_r, {}^1d_r)_{r \geq 0}$ and $({}^2E_r, {}^2d_r)_{r \geq 0}$ associated to the double complex $F(I^{\bullet,\bullet})$ satisfy the relations⁴*

$${}^1E_2^{p,q} = H^p(R^qF(K^\bullet)) \quad \text{and} \quad {}^2E_2^{p,q} = R^pF(H^q(K^\bullet))$$

Moreover, these spectral sequences converge to $H^{p+q}(RF(K^\bullet))$ and the associated induced filtrations on $H^{p+q}(RF(K^\bullet))$ are finite.

Proof. We will use the following remarks without further mention:

- (1) As $I^{p,\bullet}$ is an injective resolution of K^p we see that RF is defined at $K^p[0]$ with value $F(I^{p,\bullet})$.
- (2) As $H_I^p(I^{\bullet,\bullet})$ is an injective resolution of $H^p(K^\bullet)$ the derived functor RF is defined at $H^p(K^\bullet)[0]$ with value $F(H_I^p(I^{\bullet,\bullet}))$.
- (3) By Homology, Lemma 12.22.7 the total complex sI^\bullet is an injective resolution of K^\bullet . Hence RF is defined at K^\bullet with value $F(sI^\bullet)$.

Consider the spectral sequences associated to the double complex $K^{\bullet,\bullet} = F(I^{\bullet,\bullet})$, see Homology, Lemma 12.22.4. These both converge, see Homology, Lemma 12.22.6, to the cohomology groups of the associated total complex $s(F(I^{\bullet,\bullet})) = F(sI^\bullet)$ which computes $H^n(RF(K^\bullet))$.

Computation of the first spectral sequence. We have ${}^1E_1^{p,q} = H^q(K^{p,\bullet})$ in other words

$${}^1E_1^{p,q} = H^q(F(I^{p,\bullet})) = R^qF(K^p)$$

and the maps ${}^1E_1^{p,q} \rightarrow {}^1E_1^{p+1,q}$ are the maps $R^qF(K^p) \rightarrow R^qF(K^{p+1})$ as desired.

Computation of the second spectral sequence. We have ${}^2E_1^{p,q} = H^q(K^{\bullet,p}) = H^q(F(I^{\bullet,p}))$. Note that the complex $I^{\bullet,p}$ is bounded below, consists of injectives, and moreover each kernel, image, and cohomology group of the differentials is an injective object of \mathcal{A} . Hence we can split the differentials, i.e., each differential is a split surjection onto a direct summand. It follows that the same is true after applying F . Hence ${}^2E_1^{p,q} = F(H^q(I^{\bullet,p})) = F(H_I^q(I^{\bullet,p}))$. The differentials on this are $(-1)^q$ times F applied to the differential of the complex $H_I^p(I^{\bullet,\bullet})$ which is an injective resolution of $H^p(K^\bullet)$. Hence the description of the E_2 terms. \square

Remark 13.21.4. The spectral sequences of Lemma 13.21.3 are functorial in the complex K^\bullet . This follows from functoriality properties of Cartan-Eilenberg resolutions. On the other hand, they are both examples of a more general spectral sequence which may be associated to a filtered complex of \mathcal{A} . The functoriality will follow from its construction. We will return to this in the section on the filtered derived category, see Remark 13.26.15.

13.22. Composition of right derived functors

Sometimes we can compute the right derived functor of a composition. Suppose that $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be left exact functors. Assume that the right derived functors $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$, $RG :$

⁴The notation $H^p(R^qF(K^\bullet))$ really means the p th cohomology group of the complex with terms $R^qF(K^n)$. Not the p th cohomology of the q th derived functor of F applied to K^\bullet .

$D^+(\mathcal{B}) \rightarrow D^+(\mathcal{C})$, and $R(G \circ F) : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{C})$ are everywhere defined. Then there exists a canonical transformation

$$t : R(G \circ F) \longrightarrow RG \circ RF$$

of functors from $D^+(\mathcal{A})$ to $D^+(\mathcal{C})$, see Lemma 13.15.16. This transformation need not always be an isomorphism.

Lemma 13.22.1. *Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Let $F : \mathcal{A} \rightarrow \mathcal{B}$ and $G : \mathcal{B} \rightarrow \mathcal{C}$ be left exact functors. Assume \mathcal{A}, \mathcal{B} have enough injectives. If $F(I)$ is right acyclic for G for each injective object I of \mathcal{A} , then we have an isomorphism of functors*

$$t : R(G \circ F) \longrightarrow RG \circ RF.$$

of functors from $D^+(\mathcal{A})$ to $D^+(\mathcal{C})$.

Proof. Let A^\bullet be a bounded below complex of \mathcal{A} . Choose an injective resolution $A^\bullet \rightarrow I^\bullet$. The map t is given (see proof of Lemma 13.15.16) by the maps

$$R(G \circ F)(A^\bullet) = (G \circ F)(I^\bullet) = G(F(I^\bullet)) \rightarrow RG(F(I^\bullet)) = RG(RF(A^\bullet))$$

where the arrow is an isomorphism by Lemma 13.17.7. \square

Lemma 13.22.2 (Grothendieck spectral sequence). *With assumptions as in Lemma 13.22.1. Let A be an object of \mathcal{A} . There exists a spectral sequence $(E_r^{p,q}, d_r^{p,q})_{r \geq 0}$ associated to a filtered complex with*

$$E_2^{p,q} = R^p G(R^q F(A))$$

converging to $R^{p+q}(G \circ F)(A)$. Moreover, the induced filtration on each $R^n(G \circ F)(A)$ is finite.

Proof. Choose an injective resolution $A \rightarrow I^\bullet$. Choose a Cartan-Eilenberg resolution $F(I^\bullet) \rightarrow I^{\bullet,\bullet}$ using Lemma 13.21.2. Apply Lemma 13.21.3 (use the second spectral sequence). Details omitted. \square

13.23. Resolution functors

Let \mathcal{A} be an abelian category with enough injectives. Denote \mathcal{I} the full additive subcategory of \mathcal{A} whose objects are the injective objects of \mathcal{A} . It turns out that $K^+(\mathcal{I})$ and $D^+(\mathcal{A})$ are equivalent in this case (see Proposition 13.23.1). For many purposes it therefore makes sense to think of $D^+(\mathcal{A})$ as the (easier to grok) category $K^+(\mathcal{I})$ in this case.

Proposition 13.23.1. *Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. Denote $\mathcal{I} \subset \mathcal{A}$ the strictly full additive subcategory whose objects are the injective objects of \mathcal{A} . The functor*

$$K^+(\mathcal{I}) \longrightarrow D^+(\mathcal{A})$$

is exact, fully faithful and essentially surjective, i.e., an equivalence of triangulated categories.

Proof. It is clear that the functor is exact. It is essentially surjective by Lemma 13.18.3. Fully faithfulness is a consequence of Lemma 13.18.8. \square

Proposition 13.23.1 implies that we can find resolution functors. It turns out that we can prove resolution functors exist even in some cases where the abelian category \mathcal{A} is a “big” category, i.e., has a class of objects.

Definition 13.23.2. Let \mathcal{A} be an abelian category with enough injectives. A resolution functor⁵ for \mathcal{A} is given by the following data:

- (1) for all $K^\bullet \in \text{Ob}(K^+(\mathcal{A}))$ a bounded below complex of injectives $j(K^\bullet)$, and
- (2) for all $K^\bullet \in \text{Ob}(K^+(\mathcal{A}))$ a quasi-isomorphism $i_{K^\bullet} : K^\bullet \rightarrow j(K^\bullet)$.

Lemma 13.23.3. Let \mathcal{A} be an abelian category with enough injectives. Given a resolution functor (j, i) there is a unique way to turn j into a functor and i into a 2-isomorphism producing a 2-commutative diagram

$$\begin{array}{ccc} K^+(\mathcal{A}) & \xrightarrow{j} & K^+(\mathcal{I}) \\ & \searrow & \swarrow \\ & D^+(\mathcal{A}) & \end{array}$$

where \mathcal{I} is the full additive subcategory of \mathcal{A} consisting of injective objects.

Proof. For every morphism $\alpha : K^\bullet \rightarrow L^\bullet$ of $K^+(\mathcal{A})$ there is a unique morphism $j(\alpha) : j(K^\bullet) \rightarrow j(L^\bullet)$ in $K^+(\mathcal{I})$ such that

$$\begin{array}{ccc} K^\bullet & \xrightarrow{\alpha} & L^\bullet \\ i_{K^\bullet} \downarrow & & \downarrow i_{L^\bullet} \\ j(K^\bullet) & \xrightarrow{j(\alpha)} & j(L^\bullet) \end{array}$$

is commutative in $K^+(\mathcal{A})$. To see this either use Lemmas 13.18.6 and 13.18.7 or the equivalent Lemma 13.18.8. The uniqueness implies that j is a functor, and the commutativity of the diagram implies that i gives a 2-morphism which witnesses the 2-commutativity of the diagram of categories in the statement of the lemma. \square

Lemma 13.23.4. Let \mathcal{A} be an abelian category. Assume \mathcal{A} has enough injectives. Then a resolution functor j exists and is unique up to unique isomorphism of functors.

Proof. Consider the set of all objects K^\bullet of $K^+(\mathcal{A})$. (Recall that by our conventions any category has a set of objects unless mentioned otherwise.) By Lemma 13.18.3 every object has an injective resolution. By the axiom of choice we can choose for each K^\bullet an injective resolution $i_{K^\bullet} : K^\bullet \rightarrow j(K^\bullet)$. \square

Lemma 13.23.5. Let \mathcal{A} be an abelian category with enough injectives. Any resolution functor $j : K^+(\mathcal{A}) \rightarrow K^+(\mathcal{I})$ is exact.

Proof. Denote $i_{K^\bullet} : K^\bullet \rightarrow j(K^\bullet)$ the canonical maps of Definition 13.23.2. First we discuss the existence of the functorial isomorphism $j(K^\bullet[1]) \rightarrow j(K^\bullet)[1]$. Consider the diagram

$$\begin{array}{ccc} K^\bullet[1] & \xlongequal{\quad} & K^\bullet[1] \\ \downarrow i_{K^\bullet[1]} & & \downarrow i_{K^\bullet[1]} \\ j(K^\bullet[1]) & \xrightarrow{\xi_{K^\bullet}} & j(K^\bullet)[1] \end{array}$$

⁵This is likely nonstandard terminology.

By Lemmas 13.18.6 and 13.18.7 there exists a unique dotted arrow ξ_{K^\bullet} in $K^+(\mathcal{I})$ making the diagram commute in $K^+(\mathcal{A})$. We omit the verification that this gives a functorial isomorphism. (Hint: use Lemma 13.18.7 again.)

Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle of $K^+(\mathcal{A})$. We have to show that $(j(K^\bullet), j(L^\bullet), j(M^\bullet), j(f), j(g), \xi_{K^\bullet} \circ j(h))$ is a distinguished triangle of $K^+(\mathcal{I})$. Note that we have a commutative diagram

$$\begin{array}{ccccccc}
 K^\bullet & \xrightarrow{f} & L^\bullet & \xrightarrow{g} & M^\bullet & \xrightarrow{h} & K^\bullet[1] \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 j(K^\bullet) & \xrightarrow{j(f)} & j(L^\bullet) & \xrightarrow{j(g)} & j(M^\bullet) & \xrightarrow{\xi_{K^\bullet} \circ j(h)} & j(K^\bullet)[1]
 \end{array}$$

in $K^+(\mathcal{A})$ whose vertical arrows are the quasi-isomorphisms i_K, i_L, i_M . Hence we see that the image of $(j(K^\bullet), j(L^\bullet), j(M^\bullet), j(f), j(g), \xi_{K^\bullet} \circ j(h))$ in $D^+(\mathcal{A})$ is isomorphic to a distinguished triangle and hence a distinguished triangle by TR1. Thus we see from Lemma 13.4.16 that $(j(K^\bullet), j(L^\bullet), j(M^\bullet), j(f), j(g), \xi_{K^\bullet} \circ j(h))$ is a distinguished triangle in $K^+(\mathcal{I})$. \square

Lemma 13.23.6. *Let \mathcal{A} be an abelian category which has enough injectives. Let j be a resolution functor. Write $Q : K^+(\mathcal{A}) \rightarrow D^+(\mathcal{A})$ for the natural functor. Then $j = j' \circ Q$ for a unique functor $j' : D^+(\mathcal{A}) \rightarrow K^+(\mathcal{I})$ which is quasi-inverse to the canonical functor $K^+(\mathcal{I}) \rightarrow D^+(\mathcal{A})$.*

Proof. By Lemma 13.11.6 Q is a localization functor. To prove the existence of j' it suffices to show that any element of $\text{Qis}^+(\mathcal{A})$ is mapped to an isomorphism under the functor j , see Lemma 13.5.6. This is true by the remarks following Definition 13.23.2. \square

Remark 13.23.7. Suppose that \mathcal{A} is a “big” abelian category with enough injectives such as the category of abelian groups. In this case we have to be slightly more careful in constructing our resolution functor since we cannot use the axiom of choice with a quantifier ranging over a class. But note that the proof of the lemma does show that any two localization functors are canonically isomorphic. Namely, given quasi-isomorphisms $i : K^\bullet \rightarrow I^\bullet$ and $i' : K^\bullet \rightarrow J^\bullet$ of a bounded below complex K^\bullet into bounded below complexes of injectives there exists a unique(!) morphism $a : I^\bullet \rightarrow J^\bullet$ in $K^+(\mathcal{I})$ such that $i' = i \circ a$ as morphisms in $K^+(\mathcal{I})$. Hence the only issue is existence, and we will see how to deal with this in the next section.

13.24. Functorial injective embeddings and resolution functors

In this section we redo the construction of a resolution functor $K^+(\mathcal{A}) \rightarrow K^+(\mathcal{I})$ in case the category \mathcal{A} has functorial injective embeddings. There are two reasons for this: (1) the proof is easier and (2) the construction also works if \mathcal{A} is a “big” abelian category. See Remark 13.24.3 below.

Let \mathcal{A} be an abelian category. As before denote \mathcal{I} the additive full subcategory of \mathcal{A} consisting of injective objects. Consider the category $\text{InjRes}(\mathcal{A})$ of arrows $\alpha : K^\bullet \rightarrow I^\bullet$ where K^\bullet is a bounded below complex of \mathcal{A} , I^\bullet is a bounded below complex of injectives of \mathcal{A} and α is a quasi-isomorphism. In other words, α is an injective resolution and K^\bullet is bounded below. There is an obvious functor

$$s : \text{InjRes}(\mathcal{A}) \longrightarrow \text{Comp}^+(\mathcal{A})$$

defined by $(\alpha : K^\bullet \rightarrow I^\bullet) \mapsto K^\bullet$. There is also a functor

$$t : \text{InjRes}(\mathcal{A}) \longrightarrow K^+(\mathcal{I})$$

defined by $(\alpha : K^\bullet \rightarrow I^\bullet) \mapsto I^\bullet$.

Lemma 13.24.1. *Let \mathcal{A} be an abelian category. Assume \mathcal{A} has functorial injective embeddings, see Homology, Definition 12.23.5.*

- (1) *There exists a functor $\text{inj} : \text{Comp}^+(\mathcal{A}) \rightarrow \text{InjRes}(\mathcal{A})$ such that $s \circ \text{inj} = \text{id}$.*
- (2) *For any functor $\text{inj} : \text{Comp}^+(\mathcal{A}) \rightarrow \text{InjRes}(\mathcal{A})$ such that $s \circ \text{inj} = \text{id}$ we obtain a resolution functor, see Definition 13.23.2.*

Proof. Let $A \mapsto (A \rightarrow J(A))$ be a functorial injective embedding, see Homology, Definition 12.23.5. We first note that we may assume $J(0) = 0$. Namely, if not then for any object A we have $0 \rightarrow A \rightarrow 0$ which gives a direct sum decomposition $J(A) = J(0) \oplus \text{Ker}(J(A) \rightarrow J(0))$. Note that the functorial morphism $A \rightarrow J(A)$ has to map into the second summand. Hence we can replace our functor by $J'(A) = \text{Ker}(J(A) \rightarrow J(0))$ if needed.

Let K^\bullet be a bounded below complex of \mathcal{A} . Say $K^p = 0$ if $p < B$. We are going to construct a double complex $I^{\bullet, \bullet}$ of injectives, together with a map $\alpha : K^\bullet \rightarrow I^{\bullet, 0}$ such that α induces a quasi-isomorphism of K^\bullet with the associated total complex of $I^{\bullet, \bullet}$. First we set $I^{p, q} = 0$ whenever $q < 0$. Next, we set $I^{p, 0} = J(K^p)$ and $\alpha^p : K^p \rightarrow I^{p, 0}$ the functorial embedding. Since J is a functor we see that $I^{\bullet, 0}$ is a complex and that α is a morphism of complexes. Each α^p is injective. And $I^{p, 0} = 0$ for $p < B$ because $J(0) = 0$. Next, we set $I^{p, 1} = J(\text{Coker}(K^p \rightarrow I^{p, 0}))$. Again by functoriality we see that $I^{\bullet, 1}$ is a complex. And again we get that $I^{p, 1} = 0$ for $p < B$. It is also clear that K^p maps isomorphically onto $\text{Ker}(I^{p, 0} \rightarrow I^{p, 1})$. As our third step we take $I^{p, 2} = J(\text{Coker}(I^{p, 0} \rightarrow I^{p, 1}))$. And so on and so forth.

At this point we can apply Homology, Lemma 12.22.7 to get that the map

$$\alpha : K^\bullet \rightarrow sI^\bullet$$

is a quasi-isomorphism. To prove we get a functor inj it rests to show that the construction above is functorial. This verification is omitted.

Suppose we have a functor inj such that $s \circ \text{inj} = \text{id}$. For every object K^\bullet of $\text{Comp}^+(\mathcal{A})$ we can write

$$\text{inj}(K^\bullet) = (i_{K^\bullet} : K^\bullet \rightarrow j(K^\bullet))$$

This provides us with a resolution functor as in Definition 13.23.2. □

Remark 13.24.2. Suppose inj is a functor such that $s \circ \text{inj} = \text{id}$ as in part (2) of Lemma 13.24.1. Write $\text{inj}(K^\bullet) = (i_{K^\bullet} : K^\bullet \rightarrow j(K^\bullet))$ as in the proof of that lemma. Suppose $\alpha : K^\bullet \rightarrow L^\bullet$ is a map of bounded below complexes. Consider the map $\text{inj}(\alpha)$ in the category $\text{InjRes}(\mathcal{A})$. It induces a commutative diagram

$$\begin{array}{ccc} K^\bullet & \xrightarrow{\alpha} & L^\bullet \\ i_K \downarrow & & \downarrow i_L \\ j(K)^\bullet & \xrightarrow{\text{inj}(\alpha)} & j(L)^\bullet \end{array}$$

of morphisms of complexes. Hence, looking at the proof of Lemma 13.23.3 we see that the functor $j : K^+(\mathcal{A}) \rightarrow K^+(\mathcal{I})$ is given by the rule

$$j(\alpha \text{ up to homotopy}) = inj(\alpha) \text{ up to homotopy} \in \text{Hom}_{K^+(\mathcal{I})}(j(K^\bullet), j(L^\bullet))$$

Hence we see that j matches $t \circ inj$ in this case, i.e., the diagram

$$\begin{array}{ccc} \text{Comp}^+(\mathcal{A}) & \xrightarrow{\quad t \circ inj \quad} & K^+(\mathcal{I}) \\ & \searrow & \nearrow j \\ & K^+(\mathcal{A}) & \end{array}$$

is commutative.

Remark 13.24.3. Let $Mod(\mathcal{O}_X)$ be the category of \mathcal{O}_X -modules on a ringed space (X, \mathcal{O}_X) (or more generally on a ringed site). We will see later that $Mod(\mathcal{O}_X)$ has enough injectives and in fact functorial injective embeddings, see Injectives, Theorem 19.8.4. Note that the proof of Lemma 13.23.4 does not apply to $Mod(\mathcal{O}_X)$. But the proof of Lemma 13.24.1 does apply to $Mod(\mathcal{O}_X)$. Thus we obtain

$$j : K^+(Mod(\mathcal{O}_X)) \longrightarrow K^+(\mathcal{I})$$

which is a resolution functor where \mathcal{I} is the additive category of injective \mathcal{O}_X -modules. This argument also works in the following cases:

- (1) The category Mod_R of R -modules over a ring R .
- (2) The category $PMod(\mathcal{O})$ of presheaves of \mathcal{O} -modules on a site endowed with a presheaf of rings.
- (3) The category $Mod(\mathcal{O})$ of sheaves of \mathcal{O} -modules on a ringed site.
- (4) Add more here as needed.

13.25. Right derived functors via resolution functors

The content of the following lemma is that we can simply define $RF(K^\bullet) = F(j(K^\bullet))$ if we are given a resolution functor j .

Lemma 13.25.1. *Let \mathcal{A} be an abelian category with enough injectives Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor into an abelian category. Let (i, j) be a resolution functor, see Definition 13.23.2. The right derived functor RF of F fits into the following 2-commutative diagram*

$$\begin{array}{ccc} D^+(\mathcal{A}) & \xrightarrow{\quad j' \quad} & K^+(\mathcal{I}) \\ & \searrow RF & \swarrow F \\ & D^+(\mathcal{B}) & \end{array}$$

where j' is the functor from Lemma 13.23.6.

Proof. By Lemma 13.20.1 we have $RF(K^\bullet) = F(j(K^\bullet))$. □

Remark 13.25.2. In the situation of Lemma 13.25.1 we see that we have actually lifted the right derived functor to an exact functor $F \circ j' : D^+(\mathcal{A}) \rightarrow K^+(\mathcal{B})$. It is occasionally useful to use such a factorization.

13.26. Filtered derived category and injective resolutions

Let \mathcal{A} be an abelian category. In this section we will show that if \mathcal{A} has enough injectives, then so does the category $\text{Fil}^f(\mathcal{A})$ in some sense. One can use this observation to compute in the filtered derived category of \mathcal{A} .

The category $\text{Fil}^f(\mathcal{A})$ is an example of an exact category, see Injectives, Remark 19.9.6. A special role is played by the strict morphisms, see Homology, Definition 12.16.3, i.e., the morphisms f such that $\text{Coim}(f) = \text{Im}(f)$. We will say that a complex $A \rightarrow B \rightarrow C$ in $\text{Fil}^f(\mathcal{A})$ is *exact* if the sequence $\text{gr}(A) \rightarrow \text{gr}(B) \rightarrow \text{gr}(C)$ is exact in \mathcal{A} . This implies that $A \rightarrow B$ and $B \rightarrow C$ are strict morphisms, see Homology, Lemma 12.16.15.

Definition 13.26.1. Let \mathcal{A} be an abelian category. We say an object I of $\text{Fil}^f(\mathcal{A})$ is *filtered injective* if each $\text{gr}^p(I)$ is an injective object of \mathcal{A} .

Lemma 13.26.2. *Let \mathcal{A} be an abelian category. An object I of $\text{Fil}^f(\mathcal{A})$ is filtered injective if and only if there exist $a \leq b$, injective objects I_n , $a \leq n \leq b$ of \mathcal{A} and an isomorphism $I \cong \bigoplus_{a \leq n \leq b} I_n$ such that $F^p I = \bigoplus_{n \geq p} I_n$.*

Proof. Follows from the fact that any injection $J \rightarrow M$ of \mathcal{A} is split if J is an injective object. Details omitted. \square

Lemma 13.26.3. *Let \mathcal{A} be an abelian category. Any strict monomorphism $u : I \rightarrow A$ of $\text{Fil}^f(\mathcal{A})$ where I is a filtered injective object is a split injection.*

Proof. Let p be the largest integer such that $F^p I \neq 0$. In particular $\text{gr}^p(I) = F^p I$. Let I' be the object of $\text{Fil}^f(\mathcal{A})$ whose underlying object of \mathcal{A} is $F^p I$ and with filtration given by $F^n I' = 0$ for $n > p$ and $F^n I' = I' = F^p I$ for $n \leq p$. Note that $I' \rightarrow I$ is a strict monomorphism too. The fact that u is a strict monomorphism implies that $F^p I \rightarrow A/F^{p+1}(A)$ is injective, see Homology, Lemma 12.16.13. Choose a splitting $s : A/F^{p+1}A \rightarrow F^p I$ in \mathcal{A} . The induced morphism $s' : A \rightarrow I'$ is a strict morphism of filtered objects splitting the composition $I' \rightarrow I \rightarrow A$. Hence we can write $A = I' \oplus \text{Ker}(s')$ and $I = I' \oplus \text{Ker}(s'|_I)$. Note that $\text{Ker}(s'|_I) \rightarrow \text{ker}(s')$ is a strict monomorphism and that $\text{Ker}(s'|_I)$ is a filtered injective object. By induction on the length of the filtration on I the map $\text{Ker}(s'|_I) \rightarrow \text{ker}(s')$ is a split injection. Thus we win. \square

Lemma 13.26.4. *Let \mathcal{A} be an abelian category. Let $u : A \rightarrow B$ be a strict monomorphism of $\text{Fil}^f(\mathcal{A})$ and $f : A \rightarrow I$ a morphism from A into a filtered injective object in $\text{Fil}^f(\mathcal{A})$. Then there exists a morphism $g : B \rightarrow I$ such that $f = g \circ u$.*

Proof. The pushout $f' : I \rightarrow I \amalg_A B$ of f by u is a strict monomorphism, see Homology, Lemma 12.16.10. Hence the result follows formally from Lemma 13.26.3. \square

Lemma 13.26.5. *Let \mathcal{A} be an abelian category with enough injectives. For any object A of $\text{Fil}^f(\mathcal{A})$ there exists a strict monomorphism $A \rightarrow I$ where I is a filtered injective object.*

Proof. Pick $a \leq b$ such that $\text{gr}^p(A) = 0$ unless $p \in \{a, a+1, \dots, b\}$. For each $n \in \{a, a+1, \dots, b\}$ choose an injection $u_n : A/F^n A \rightarrow I_n$ with I_n and injective object. Set $I = \bigoplus_{a \leq n \leq b} I_n$ with filtration $F^p I = \bigoplus_{n \geq p} I_n$ and set $u : A \rightarrow I$ equal to the direct sum of the maps u_n . \square

Lemma 13.26.6. *Let \mathcal{A} be an abelian category with enough injectives. For any object A of $\text{Fil}^f(\mathcal{A})$ there exists a filtered quasi-isomorphism $A[0] \rightarrow I^\bullet$ where I^\bullet is a complex of filtered injective objects with $I^n = 0$ for $n < 0$.*

Proof. First choose a strict monomorphism $u_0 : A \rightarrow I^0$ of A into a filtered injective object, see Lemma 13.26.5. Next, choose a strict monomorphism $u_1 : \text{Coker}(u_0) \rightarrow I^1$ into a filtered injective object of \mathcal{A} . Denote d^0 the induced map $I^0 \rightarrow I^1$. Next, choose a strict monomorphism $u_2 : \text{Coker}(u_1) \rightarrow I^2$ into a filtered injective object of \mathcal{A} . Denote d^1 the induced map $I^1 \rightarrow I^2$. And so on. This works because each of the sequences

$$0 \rightarrow \text{Coker}(u_n) \rightarrow I^{n+1} \rightarrow \text{Coker}(u_{n+1}) \rightarrow 0$$

is short exact, i.e., induces a short exact sequence on applying gr . To see this use Homology, Lemma 12.16.13. \square

Lemma 13.26.7. *Let \mathcal{A} be an abelian category with enough injectives. Let $f : A \rightarrow B$ be a morphism of $\text{Fil}^f(\mathcal{A})$. Given filtered quasi-isomorphisms $A[0] \rightarrow I^\bullet$ and $B[0] \rightarrow J^\bullet$ where I^\bullet, J^\bullet are complexes of filtered injective objects with $I^n = J^n = 0$ for $n < 0$, then there exists a commutative diagram*

$$\begin{array}{ccc} A[0] & \longrightarrow & B[0] \\ \downarrow & & \downarrow \\ I^\bullet & \longrightarrow & J^\bullet \end{array}$$

Proof. As $A[0] \rightarrow I^\bullet$ and $C[0] \rightarrow J^\bullet$ are filtered quasi-isomorphisms we conclude that $a : A \rightarrow I^0$, $b : B \rightarrow J^0$ and all the morphisms d_I^n, d_J^n are strict, see Homology, Lemma 13.14.4. We will inductively construct the maps f^n in the following commutative diagram

$$\begin{array}{ccccccc} A & \xrightarrow{a} & I^0 & \longrightarrow & I^1 & \longrightarrow & I^2 \longrightarrow \dots \\ f \downarrow & & \downarrow f^0 & & \downarrow f^1 & & \downarrow f^2 \\ B & \xrightarrow{b} & J^0 & \longrightarrow & J^1 & \longrightarrow & J^2 \longrightarrow \dots \end{array}$$

Because $A \rightarrow I^0$ is a strict monomorphism and because J^0 is filtered injective, we can find a morphism $f^0 : I^0 \rightarrow J^0$ such that $f^0 \circ a = b \circ f$, see Lemma 13.26.4. The composition $d_J^0 \circ b \circ f$ is zero, hence $d_J^0 \circ f^0 \circ a = 0$, hence $d_J^0 \circ f^0$ factors through a unique morphism

$$\text{Coker}(a) = \text{Coim}(d_I^0) = \text{Im}(d_I^0) \longrightarrow J^1.$$

As $\text{Im}(d_I^0) \rightarrow I^1$ is a strict monomorphism we can extend the displayed arrow to a morphism $f^1 : I^1 \rightarrow J^1$ by Lemma 13.26.4 again. And so on. \square

Lemma 13.26.8. *Let \mathcal{A} be an abelian category with enough injectives. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence in $\text{Fil}^f(\mathcal{A})$. Given filtered quasi-isomorphisms $A[0] \rightarrow I^\bullet$ and $C[0] \rightarrow J^\bullet$ where I^\bullet, J^\bullet are complexes of filtered injective objects with $I^n = J^n = 0$ for $n < 0$, then there exists a commutative*

diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & A[0] & \longrightarrow & B[0] & \longrightarrow & C[0] \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & I^\bullet & \longrightarrow & M^\bullet & \longrightarrow & J^\bullet \longrightarrow 0
 \end{array}$$

where the lower row is a termwise split sequence of complexes.

Proof. As $A[0] \rightarrow I^\bullet$ and $C[0] \rightarrow J^\bullet$ are filtered quasi-isomorphisms we conclude that $a : A \rightarrow I^0$, $c : C \rightarrow J^0$ and all the morphisms d_I^n , d_J^n are strict, see Homology, Lemma 13.14.4. We are going to step by step construct the south-east and the south arrows in the following commutative diagram

$$\begin{array}{ccccccc}
 B & \longrightarrow & C & \longrightarrow & J^0 & \longrightarrow & J^1 \longrightarrow \dots \\
 \uparrow \alpha & \searrow \beta & & \searrow c & \downarrow \delta^0 & & \downarrow \delta^1 \\
 A & \xrightarrow{a} & I^0 & \longrightarrow & I^1 & \longrightarrow & I^2 \longrightarrow \dots
 \end{array}$$

As $A \rightarrow B$ is a strict monomorphism, we can find a morphism $b : B \rightarrow I^0$ such that $b \circ \alpha = a$, see Lemma 13.26.4. As A is the kernel of the strict morphism $I^0 \rightarrow I^1$ and $\beta = \text{Coker}(\alpha)$ we obtain a unique morphism $\bar{b} : C \rightarrow I^1$ fitting into the diagram. As c is a strict monomorphism and I^1 is filtered injective we can find $\delta^0 : J^0 \rightarrow I^1$, see Lemma 13.26.4. Because $B \rightarrow C$ is a strict epimorphism and because $B \rightarrow I^0 \rightarrow I^1 \rightarrow I^2$ is zero, we see that $C \rightarrow I^1 \rightarrow I^2$ is zero. Hence $d_I^1 \circ \delta^0$ is zero on $C \cong \text{Im}(c)$. Hence $d_I^1 \circ \delta^0$ factors through a unique morphism

$$\text{Coker}(c) = \text{Coim}(d_J^0) = \text{Im}(d_J^0) \longrightarrow I^2.$$

As I^2 is filtered injective and $\text{Im}(d_J^0) \rightarrow J^1$ is a strict monomorphism we can extend the displayed morphism to a morphism $\delta^1 : J^1 \rightarrow I^2$, see Lemma 13.26.4. And so on. We set $M^\bullet = I^\bullet \oplus J^\bullet$ with differential

$$d_M^n = \begin{pmatrix} d_I^n & (-1)^{n+1} \delta^n \\ 0 & d_J^n \end{pmatrix}$$

Finally, the map $B[0] \rightarrow M^\bullet$ is given by $b \oplus c \circ \beta : M \rightarrow I^0 \oplus J^0$. □

Lemma 13.26.9. *Let \mathcal{A} be an abelian category with enough injectives. For every $K^\bullet \in K^+(\text{Fil}^f(\mathcal{A}))$ there exists a filtered quasi-isomorphism $K^\bullet \rightarrow I^\bullet$ with I^\bullet bounded below, each I^n a filtered injective object, and each $K^n \rightarrow I^n$ a strict monomorphism.*

Proof. After replacing K^\bullet by a shift (which is harmless for the proof) we may assume that $K^n = 0$ for $n < 0$. Consider the short exact sequences

$$\begin{array}{l}
 0 \rightarrow \text{Ker}(d_K^0) \rightarrow K^0 \rightarrow \text{Coim}(d_K^0) \rightarrow 0 \\
 0 \rightarrow \text{Ker}(d_K^1) \rightarrow K^1 \rightarrow \text{Coim}(d_K^1) \rightarrow 0 \\
 0 \rightarrow \text{Ker}(d_K^2) \rightarrow K^2 \rightarrow \text{Coim}(d_K^2) \rightarrow 0 \\
 \dots
 \end{array}$$

of the exact category $\text{Fil}^f(\mathcal{A})$ and the maps $u_i : \text{Coim}(d_K^i) \rightarrow \text{Ker}(d_K^{i+1})$. For each $i \geq 0$ we may choose filtered quasi-isomorphisms

$$\begin{array}{l}
 \text{Ker}(d_K^i)[0] \rightarrow I_{\text{ker},i}^\bullet \\
 \text{Coim}(d_K^i)[0] \rightarrow I_{\text{coim},i}^\bullet
 \end{array}$$

with $I_{ker,i}^n, I_{coim,i}^n$ filtered injective and zero for $n < 0$, see Lemma 13.26.6. By Lemma 13.26.7 we may lift u_i to a morphism of complexes $u_i^\bullet : I_{coim,i}^\bullet \rightarrow I_{ker,i+1}^\bullet$. Finally, for each $i \geq 0$ we may complete the diagrams

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ker}(d_K^i)[0] & \longrightarrow & K^i[0] & \longrightarrow & \text{Coim}(d_K^i)[0] \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & I_{ker,i}^\bullet & \xrightarrow{\alpha_i} & I_i^\bullet & \xrightarrow{\beta_i} & I_{coim,i}^\bullet \longrightarrow 0 \end{array}$$

with the lower sequence a termwise split exact sequence, see Lemma 13.26.8. For $i \geq 0$ set $d_i : I_i^\bullet \rightarrow I_{i+1}^\bullet$ equal to $d_i = \alpha_{i+1} \circ u_i^\bullet \circ \beta_i$. Note that $d_i \circ d_{i-1} = 0$ because $\beta_i \circ \alpha_i = 0$. Hence we have constructed a commutative diagram

$$\begin{array}{ccccccc} I_0^\bullet & \longrightarrow & I_1^\bullet & \longrightarrow & I_2^\bullet & \longrightarrow & \dots \\ \uparrow & & \uparrow & & \uparrow & & \\ K^0[0] & \longrightarrow & K^1[0] & \longrightarrow & K^2[0] & \longrightarrow & \dots \end{array}$$

Here the vertical arrows are filtered quasi-isomorphisms. The upper row is a complex of complexes and each complex consists of filtered injective objects with no nonzero objects in degree < 0 . Thus we obtain a double complex by setting $I^{a,b} = I_a^b$ and using

$$d_1^{a,b} : I^{a,b} = I_a^b \rightarrow I_{a+1}^b = I^{a+1,b}$$

the map d_a^b and using for

$$d_2^{a,b} : I^{a,b} = I_a^b \rightarrow I_a^{b+1} = I^{a,b+1}$$

the map $d_{I_a}^b$. Denote $\text{Tot}(I^{\bullet,\bullet})$ the total complex associated to this double complex, see Homology, Definition 12.22.3. Observe that the maps $K^n[0] \rightarrow I_n^\bullet$ come from maps $K^n \rightarrow I^{n,0}$ which give rise to a map of complexes

$$K^\bullet \longrightarrow \text{Tot}(I^{\bullet,\bullet})$$

We claim this is a filtered quasi-isomorphism. As $\text{gr}(-)$ is an additive functor, we see that $\text{gr}(\text{Tot}(I^{\bullet,\bullet})) = \text{Tot}(\text{gr}(I^{\bullet,\bullet}))$. Thus we can use Homology, Lemma 12.22.7 to conclude that $\text{gr}(K^\bullet) \rightarrow \text{gr}(\text{Tot}(I^{\bullet,\bullet}))$ is a quasi-isomorphism as desired. \square

Lemma 13.26.10. *Let \mathcal{A} be an abelian category. Let $K^\bullet, I^\bullet \in K(\text{Fil}^f(\mathcal{A}))$. Assume K^\bullet is filtered acyclic and I^\bullet bounded below and consisting of filtered injective objects. Any morphism $K^\bullet \rightarrow I^\bullet$ is homotopic to zero: $\text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(K^\bullet, I^\bullet) = 0$.*

Proof. Let $\alpha : K^\bullet \rightarrow I^\bullet$ be a morphism of complexes. Assume that $\alpha^j = 0$ for $j < n$. We will show that there exists a morphism $h : K^{n+1} \rightarrow I^n$ such that $\alpha^n = h \circ d$. Thus α will be homotopic to the morphism of complexes β defined by

$$\beta^j = \begin{cases} 0 & \text{if } j \leq n \\ \alpha^{n+1} - d \circ h & \text{if } j = n + 1 \\ \alpha^j & \text{if } j > n + 1 \end{cases}$$

This will clearly prove the lemma (by induction). To prove the existence of h note that $\alpha^n \circ d_K^{n-1} = 0$ since $\alpha^{n-1} = 0$. Since K^\bullet is filtered acyclic we see that d_K^{n-1} and d_K^n are strict and that

$$0 \rightarrow \text{Im}(d_K^{n-1}) \rightarrow K^n \rightarrow \text{Im}(d_K^n) \rightarrow 0$$

is an exact sequence of the exact category $\text{Fil}^f(\mathcal{A})$, see Homology, Lemma 12.16.15. Hence we can think of α^n as a map into I^n defined on $\text{Im}(d_K^n)$. Using that $\text{Im}(d_K^n) \rightarrow K^{n+1}$ is a strict monomorphism and that I^n is filtered injective we may lift this map to a map $h : K^{n+1} \rightarrow I^n$ as desired, see Lemma 13.26.4. \square

Lemma 13.26.11. *Let \mathcal{A} be an abelian category. Let $I^\bullet \in K(\text{Fil}^f(\mathcal{A}))$ be a bounded below complex consisting of filtered injective objects.*

- (1) *Let $\alpha : K^\bullet \rightarrow L^\bullet$ in $K(\text{Fil}^f(\mathcal{A}))$ be a filtered quasi-isomorphism. Then the map*

$$\text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(L^\bullet, I^\bullet) \rightarrow \text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(K^\bullet, I^\bullet)$$

is bijective.

- (2) *Let $L^\bullet \in K(\mathcal{A})$. Then*

$$\text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(L^\bullet, I^\bullet) = \text{Hom}_{DF(\mathcal{A})}(L^\bullet, I^\bullet).$$

Proof. Proof of (1). Note that

$$(K^\bullet, L^\bullet, C(\alpha)^\bullet, \alpha, i, -p)$$

is a distinguished triangle in $K(\text{Fil}^f(\mathcal{A}))$ (Lemma 13.9.14) and $C(f)^\bullet$ is a filtered acyclic complex (Lemma 13.14.4). Then

$$\begin{array}{ccccc} \text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(C(\alpha)^\bullet, I^\bullet) & \longrightarrow & \text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(L^\bullet, I^\bullet) & \longrightarrow & \text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(K^\bullet, I^\bullet) \\ & & & \searrow & \\ & & & & \text{Hom}_{K(\text{Fil}^f(\mathcal{A}))}(C(\alpha)^\bullet[-1], I^\bullet) \end{array}$$

is an exact sequence of abelian groups, see Lemma 13.4.2. At this point Lemma 13.26.10 guarantees that the outer two groups are zero and hence $\text{Hom}_{K(\mathcal{A})}(L^\bullet, I^\bullet) = \text{Hom}_{K(\mathcal{A})}(K^\bullet, I^\bullet)$.

Proof of (2). Let a be an element of the right hand side. We may represent $a = \gamma\alpha^{-1}$ where $\alpha : K^\bullet \rightarrow L^\bullet$ is a filtered quasi-isomorphism and $\gamma : K^\bullet \rightarrow I^\bullet$ is a map of complexes. By part (1) we can find a morphism $\beta : L^\bullet \rightarrow I^\bullet$ such that $\beta \circ \alpha$ is homotopic to γ . This proves that the map is surjective. Let b be an element of the left hand side which maps to zero in the right hand side. Then b is the homotopy class of a morphism $\beta : L^\bullet \rightarrow I^\bullet$ such that there exists a filtered quasi-isomorphism $\alpha : K^\bullet \rightarrow L^\bullet$ with $\beta \circ \alpha$ homotopic to zero. Then part (1) shows that β is homotopic to zero also, i.e., $b = 0$. \square

Lemma 13.26.12. *Let \mathcal{A} be an abelian category with enough injectives. Let $\mathcal{I}^f \subset \text{Fil}^f(\mathcal{A})$ denote the strictly full additive subcategory whose objects are the filtered injective objects. The canonical functor*

$$K^+(\mathcal{I}^f) \longrightarrow DF^+(\mathcal{A})$$

is exact, fully faithful and essentially surjective, i.e., an equivalence of triangulated categories. Furthermore the diagrams

$$\begin{array}{ccc} K^+(\mathcal{I}^f) & \longrightarrow & DF^+(\mathcal{A}) \\ \text{\scriptsize } gr^p \downarrow & & \downarrow \text{\scriptsize } gr^p \\ K^+(\mathcal{I}) & \longrightarrow & D^+(\mathcal{A}) \end{array} \quad \begin{array}{ccc} K^+(\mathcal{I}^f) & \longrightarrow & DF^+(\mathcal{A}) \\ \downarrow \text{\scriptsize } \textit{forget } F & & \downarrow \text{\scriptsize } \textit{forget } F \\ K^+(\mathcal{I}) & \longrightarrow & D^+(\mathcal{A}) \end{array}$$

are commutative, where $\mathcal{I} \subset \mathcal{A}$ is the strictly full additive subcategory whose objects are the injective objects.

Proof. The functor $K^+(\mathcal{I}^f) \rightarrow DF^+(\mathcal{A})$ is essentially surjective by Lemma 13.26.9. It is fully faithful by Lemma 13.26.11. It is an exact functor by our definitions regarding distinguished triangles. The commutativity of the squares is immediate. \square

Remark 13.26.13. We can invert the arrow of the lemma only if \mathcal{A} is a category in our sense, namely if it has a set of objects. However, suppose given a big abelian category \mathcal{A} with enough injectives, such as $Mod(\mathcal{O}_X)$ for example. Then for any given set of objects $\{A_i\}_{i \in I}$ there is an abelian subcategory $\mathcal{A}' \subset \mathcal{A}$ containing all of them and having enough injectives, see Sets, Lemma 3.12.1. Thus we may use the lemma above for \mathcal{A}' . This essentially means that if we use a set worth of diagrams, etc then we will never run into trouble using the lemma.

Let \mathcal{A}, \mathcal{B} be abelian categories. Let $T : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor. (We cannot use the letter F for the functor since this would conflict too much with our use of the letter F to indicate filtrations.) Note that T induces an additive functor

$$T : \text{Fil}^f(\mathcal{A}) \rightarrow \text{Fil}^f(\mathcal{B})$$

by the rule $T(A, F) = (T(A), F)$ where $F^p T(A) = T(F^p A)$ which makes sense as T is left exact. (Warning: It may not be the case that $\text{gr}(T(A)) = T(\text{gr}(A))$.) This induces functors of triangulated categories

$$(13.26.13.1) \quad T : K^+(\text{Fil}^f(\mathcal{A})) \longrightarrow K^+(\text{Fil}^f(\mathcal{B}))$$

The filtered right derived functor of T is the right derived functor of Definition 13.15.2 for this exact functor composed with the exact functor $K^+(\text{Fil}^f(\mathcal{B})) \rightarrow DF^+(\mathcal{B})$ and the multiplicative set $\text{FQis}^+(\mathcal{A})$. Assume \mathcal{A} has enough injectives. At this point we can redo the discussion of Section 13.20 to define the *filtered right derived functors*

$$(13.26.13.2) \quad RT : DF^+(\mathcal{A}) \longrightarrow DF^+(\mathcal{B})$$

of our functor T .

However, instead we will proceed as in Section 13.25, and it will turn out that we can define RT even if T is just additive. Namely, we first choose a quasi-inverse $j' : DF^+(\mathcal{A}) \rightarrow K^+(\mathcal{I}^f)$ of the equivalence of Lemma 13.26.12. By Lemma 13.4.16 we see that j' is an exact functor of triangulated categories. Next, we note that for a filtered injective object I we have a (noncanonical) decomposition

$$(13.26.13.3) \quad I \cong \bigoplus_{p \in \mathbf{Z}} I_p, \quad \text{with} \quad F^p I = \bigoplus_{q \geq p} I_q$$

by Lemma 13.26.2. Hence if T is any additive functor $T : \mathcal{A} \rightarrow \mathcal{B}$ then we get an additive functor

$$(13.26.13.4) \quad T_{ext} : \mathcal{I}^f \rightarrow \text{Fil}^f(\mathcal{B})$$

by setting $T_{ext}(I) = \bigoplus T(I_p)$ with $F^p T_{ext}(I) = \bigoplus_{q \geq p} T(I_q)$. Note that we have the property $\text{gr}(T_{ext}(I)) = T(\text{gr}(I))$ by construction. Hence we obtain a functor

$$(13.26.13.5) \quad T_{ext} : K^+(\mathcal{I}^f) \rightarrow K^+(\text{Fil}^f(\mathcal{B}))$$

which commutes with gr . Then we define (13.26.13.2) by the composition

$$(13.26.13.6) \quad RT = T_{ext} \circ j'.$$

Since $RT : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ is computed by injective resolutions as well, see Lemmas 13.20.1, the commutation of T with gr , and the commutative diagrams of Lemma 13.26.12 imply that

$$(13.26.13.7) \quad \text{gr}^p \circ RT \cong RT \circ \text{gr}^p$$

and

$$(13.26.13.8) \quad (\text{forget } F) \circ RT \cong RT \circ (\text{forget } F)$$

as functors $DF^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$.

The filtered derived functor RT (13.26.13.2) induces functors

$$\begin{aligned} RT &: \text{Fil}^f(\mathcal{A}) \rightarrow DF^+(\mathcal{B}), \\ RT &: \text{Comp}^+(\text{Fil}^f(\mathcal{A})) \rightarrow DF^+(\mathcal{B}), \\ RT &: KF^+(\mathcal{A}) \rightarrow DF^+(\mathcal{B}). \end{aligned}$$

Note that since $\text{Fil}^f(\mathcal{A})$, and $\text{Comp}^+(\text{Fil}^f(\mathcal{A}))$ are no longer abelian it does not make sense to say that RT restricts to a δ -functor on them. (This can be repaired by thinking of these categories as exact categories and formulating the notion of a δ -functor from an exact category into a triangulated category.) But it does make sense, and it is true by construction, that RT is an exact functor on the triangulated category $KF^+(\mathcal{A})$.

Lemma 13.26.14. *Let \mathcal{A}, \mathcal{B} be abelian categories. Let $T : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor. Assume \mathcal{A} has enough injectives. Let (K^\bullet, F) be an object of $\text{Comp}^+(\text{Fil}^f(\mathcal{A}))$. There exists a spectral sequence $(E_r^{p,q}, d_r)_{r \geq 0}$ which is the spectral sequence associated to an object of $\text{Comp}^+(\text{Fil}^f(\mathcal{B}))$ with*

$$E_1^{p,q} = R^{p+q}T(\text{gr}^p(K^\bullet))$$

which converges to $R^{p+q}T(K^\bullet)$ inducing a finite filtration on each $R^nT(K^\bullet)$. Moreover the construction of this spectral sequence is functorial in the object K^\bullet of $\text{Comp}^+(\text{Fil}^f(\mathcal{A}))$. In fact the terms (E_r, d_r) for $r \geq 2$ do not depend on any choices.

Proof. Choose a filtered quasi-isomorphism $K^\bullet \rightarrow I^\bullet$ with I^\bullet a bounded below complex of filtered injective objects, see Lemma 13.26.9. Consider the complex $RT(K^\bullet) = T_{ext}(I^\bullet)$, see (13.26.13.6). Thus we can consider the spectral sequence $(E_r, d_r)_{r \geq 0}$ associated to this as a filtered complex in \mathcal{B} , see Homology, Section 12.21. By Homology, Lemma 12.21.2 we have $E_1^{p,q} = H^{p+q}(\text{gr}^p(T(I^\bullet)))$. By Equation (13.26.13.3) we have $E_1^{p,q} = H^{p+q}(T(\text{gr}^p(I^\bullet)))$, and by definition of a filtered injective resolution the map $\text{gr}^p(K^\bullet) \rightarrow \text{gr}^p(I^\bullet)$ is an injective resolution. Hence $E_1^{p,q} = R^{p+q}T(\text{gr}^p(K^\bullet))$.

On the other hand, each I^n has a finite filtration and hence each $T(I^n)$ has a finite filtration. Thus we may apply Homology, Lemma 12.21.9 to conclude that the spectral sequence converges to $H^n(T(I^\bullet)) = R^nT(K^\bullet)$ moreover inducing finite filtrations on each of the terms.

Suppose that $K^\bullet \rightarrow L^\bullet$ is a morphism of $\text{Comp}^+(\text{Fil}^f(\mathcal{A}))$. Choose a filtered quasi-isomorphism $L^\bullet \rightarrow J^\bullet$ with J^\bullet a bounded below complex of filtered injective

objects, see Lemma 13.26.9. By our results above, for example Lemma 13.26.11, there exists a diagram

$$\begin{array}{ccc} K^\bullet & \longrightarrow & L^\bullet \\ \downarrow & & \downarrow \\ I^\bullet & \longrightarrow & J^\bullet \end{array}$$

which commutes up to homotopy. Hence we get a morphism of filtered complexes $T(I^\bullet) \rightarrow T(J^\bullet)$ which gives rise to the morphism of spectral sequences, see Homology, Lemma 12.21.4. The last statement follows from this. \square

Remark 13.26.15. As promised in Remark 13.21.4 we discuss the connection of the lemma above with the constructions using Cartan-Eilenberg resolutions. Namely, assume the notations of Lemma 13.21.3. In particular K^\bullet is a bounded below complex of \mathcal{A} and $T : \mathcal{A} \rightarrow \mathcal{B}$ is a left exact functor. We give an alternative construction of the spectral sequences $'E$ and $''E$

First spectral sequence. Consider the “stupid” filtration on K^\bullet obtained by setting $F^p(K^\bullet) = \sigma_{\geq p}(K^\bullet)$, see Homology, Section 12.13. Note that this stupid in the sense that $d(F^p(K^\bullet)) \subset F^{p+1}(K^\bullet)$, compare Homology, Lemma 12.21.3. Note that $\text{gr}^p(K^\bullet) = K^p[p]$ with this filtration. According to the above there is a spectral sequence with E_1 term $E_1^{p,q} = R^{p+q}T(K^p[p])$. Then the E_2 term is clearly $E_2^{p,q} = H^p(R^{p+q}T(K^\bullet))$ as in the spectral sequence $'E_r$.

Second spectral sequence. Consider the filtration on the complex K^\bullet obtained by setting $F^p(K^\bullet) = \tau_{\leq -p}(K^\bullet)$, see Homology, Section 12.13. The minus sign is necessary to get a decreasing filtration. Note that $\text{gr}^p(K^\bullet)$ is quasi-isomorphic to $H^{-p}(K^\bullet)[-p]$ with this filtration. According to the above there is a spectral sequence with E_1 term

$$E_1^{p,q} = R^{p+q}T(H^{-p}(K^\bullet)[-p]) = R^{2p+q}T(H^{-p}(K^\bullet)) = ''E_2^{i,j}$$

with $i = 2p+q$ and $j = -p$. (This looks unnatural, but note that we could just have well developed the whole theory of filtered complexes using increasing filtrations, with the end result that this then looks natural, but the other one doesn't.) We leave it to the reader to see that the differentials match up.

Actually, given a Cartan-Eilenberg resolution $K^\bullet \rightarrow I^{\bullet,\bullet}$ the induced morphism $K^\bullet \rightarrow sI^\bullet$ into the associated simple complex will be a filtered injective resolution for either filtration using suitable filtrations on sI^\bullet . This can be used to match up the spectral sequences exactly.

13.27. Ext groups

In this section we start describing the ext groups of objects of an abelian category. First we have the following very general definition.

Definition 13.27.1. Let \mathcal{A} be an abelian category. Let $i \in \mathbf{Z}$. Let X, Y be objects of $D(\mathcal{A})$. The i th extension group of X by Y is the group

$$\text{Ext}_{\mathcal{A}}^i(X, Y) = \text{Hom}_{D(\mathcal{A})}(X, Y[i]) = \text{Hom}_{D(\mathcal{A})}(X[-i], Y).$$

If $A, B \in \text{Ob}(\mathcal{A})$ we set $\text{Ext}_{\mathcal{A}}^i(A, B) = \text{Ext}_{\mathcal{A}}^i(A[0], B[0])$.

Since $\text{Hom}_{D(\mathcal{A})}(X, -)$, resp. $\text{Hom}_{D(\mathcal{A})}(-, Y)$ is a homological, resp. cohomological functor, see Lemma 13.4.2, we see that a distinguished triangle (Y, Y', Y'') , resp. (X, X', X'') leads to a long exact sequence

$$\dots \rightarrow \text{Ext}_{\mathcal{A}}^i(X, Y) \rightarrow \text{Ext}_{\mathcal{A}}^i(X, Y') \rightarrow \text{Ext}_{\mathcal{A}}^i(X, Y'') \rightarrow \text{Ext}_{\mathcal{A}}^{i+1}(X, Y) \rightarrow \dots$$

respectively

$$\dots \rightarrow \text{Ext}_{\mathcal{A}}^i(X'', Y) \rightarrow \text{Ext}_{\mathcal{A}}^i(X', Y) \rightarrow \text{Ext}_{\mathcal{A}}^i(X, Y) \rightarrow \text{Ext}_{\mathcal{A}}^{i+1}(X'', Y) \rightarrow \dots$$

Note that since $D^+(\mathcal{A})$, $D^-(\mathcal{A})$, $D^b(\mathcal{A})$ are full subcategories we may compute the ext groups by Hom groups in these categories provided X, Y are contained in them. In case the category \mathcal{A} has enough injectives or enough projectives we can compute the Ext groups using injective or projective resolutions. To avoid confusion, recall that having an injective (resp. projective) resolution implies vanishing of homology in all low (resp. high) degrees, see Lemmas 13.18.2 and 13.19.2.

Lemma 13.27.2. *Let \mathcal{A} be an abelian category. Let $X^\bullet, Y^\bullet \in \text{Ob}(K(\mathcal{A}))$.*

- (1) *Let $Y^\bullet \rightarrow I^\bullet$ be an injective resolution (Definition 13.18.1). Then*

$$\text{Ext}_{\mathcal{A}}^i(X^\bullet, Y^\bullet) = \text{Hom}_{K(\mathcal{A})}(X^\bullet, I^\bullet[i]).$$

- (2) *Let $P^\bullet \rightarrow X^\bullet$ be a projective resolution (Definition 13.19.1). Then*

$$\text{Ext}_{\mathcal{A}}^i(X^\bullet, Y^\bullet) = \text{Hom}_{K(\mathcal{A})}(P^\bullet[-i], Y^\bullet).$$

Proof. Follows immediately from Lemma 13.18.8 and Lemma 13.19.8. \square

In the rest of this section we discuss extensions of objects of the abelian category itself. First we observe the following.

Lemma 13.27.3. *Let \mathcal{A} be an abelian category.*

- (1) *Let X, Y be objects of $D(\mathcal{A})$. Given $a, b \in \mathbf{Z}$ such that $H^i(X) = 0$ for $i > a$ and $H^j(Y) = 0$ for $j < b$, we have $\text{Ext}_{\mathcal{A}}^n(X, Y) = 0$ for $n < b - a$ and*

$$\text{Ext}_{\mathcal{A}}^{b-a}(X, Y) = \text{Hom}_{\mathcal{A}}(H^a(X), H^b(Y))$$

- (2) *Let $A, B \in \text{Ob}(\mathcal{A})$. For $i < 0$ we have $\text{Ext}_{\mathcal{A}}^i(B, A) = 0$. We have $\text{Ext}_{\mathcal{A}}^0(B, A) = \text{Hom}_{\mathcal{A}}(B, A)$.*

Proof. Choose complexes X^\bullet and Y^\bullet representing X and Y . Since $Y^\bullet \rightarrow \tau_{\geq b} Y^\bullet$ is a quasi-isomorphism, we may assume that $Y^j = 0$ for $j < b$. Let $L^\bullet \rightarrow X^\bullet$ be any quasi-isomorphism. Then $\tau_{\leq a} L^\bullet \rightarrow X^\bullet$ is a quasi-isomorphism. Hence a morphism $X \rightarrow Y[n]$ in $D(\mathcal{A})$ can be represented as fs^{-1} where $s : L^\bullet \rightarrow X^\bullet$ is a quasi-isomorphism, $f : L^\bullet \rightarrow Y^\bullet[n]$ a morphism, and $L^i = 0$ for $i < a$. Note that f maps L^i to Y^{i+n} . Thus $f = 0$ if $n < b - a$ because always either L^i or Y^{i+n} is zero. If $n = b - a$, then f corresponds exactly to a morphism $H^a(X) \rightarrow H^b(Y)$. Part (2) is a special case of (1). \square

Let \mathcal{A} be an abelian category. Suppose that $0 \rightarrow A \rightarrow A' \rightarrow A'' \rightarrow 0$ is a short exact sequence of objects of \mathcal{A} . Then $0 \rightarrow A[0] \rightarrow A'[0] \rightarrow A''[0] \rightarrow 0$ leads to a distinguished triangle in $D(\mathcal{A})$ (see Lemma 13.12.1) hence a long exact sequence of Ext groups

$$0 \rightarrow \text{Ext}_{\mathcal{A}}^0(B, A) \rightarrow \text{Ext}_{\mathcal{A}}^0(B, A') \rightarrow \text{Ext}_{\mathcal{A}}^0(B, A'') \rightarrow \text{Ext}_{\mathcal{A}}^1(B, A) \rightarrow \dots$$

Similarly, given a short exact sequence $0 \rightarrow B \rightarrow B' \rightarrow B'' \rightarrow 0$ we obtain a long exact sequence of Ext groups

$$0 \rightarrow \text{Ext}_{\mathcal{A}}^0(B'', A) \rightarrow \text{Ext}_{\mathcal{A}}^0(B', A) \rightarrow \text{Ext}_{\mathcal{A}}^0(B, A) \rightarrow \text{Ext}_{\mathcal{A}}^1(B'', A) \rightarrow \dots$$

We may view these Ext groups as an application of the construction of the derived category. It shows one can define Ext groups and construct the long exact sequence of Ext groups without needing the existence of enough injectives or projectives. There is an alternative construction of the Ext groups due to Yoneda which avoids the use of the derived category, see [Yon60].

Definition 13.27.4. Let \mathcal{A} be an abelian category. Let $A, B \in \text{Ob}(\mathcal{A})$. A degree i Yoneda extension of B by A is an exact sequence

$$E : 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \dots \rightarrow Z_0 \rightarrow B \rightarrow 0$$

in \mathcal{A} . We say two Yoneda extensions E and E' of the same degree are *equivalent* if there exists a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & A & \longrightarrow & Z_{i-1} & \longrightarrow & \dots & \longrightarrow & Z_0 & \longrightarrow & B & \longrightarrow & 0 \\ & & \uparrow \text{id} & & \uparrow & & & & \uparrow & & \uparrow \text{id} & & \\ 0 & \longrightarrow & A & \longrightarrow & Z''_{i-1} & \longrightarrow & \dots & \longrightarrow & Z''_0 & \longrightarrow & B & \longrightarrow & 0 \\ & & \downarrow \text{id} & & \downarrow & & & & \downarrow & & \downarrow \text{id} & & \\ 0 & \longrightarrow & A & \longrightarrow & Z'_{i-1} & \longrightarrow & \dots & \longrightarrow & Z'_0 & \longrightarrow & B & \longrightarrow & 0 \end{array}$$

where the middle row is a Yoneda extension as well.

It is not immediately clear that the equivalence of the definition is an equivalence relation. Although it is instructive to prove this directly this will also follow from Lemma 13.27.5 below.

Let \mathcal{A} be an abelian category with objects A, B . Given a Yoneda extension $E : 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \dots \rightarrow Z_0 \rightarrow B \rightarrow 0$ we define an associated element $\delta(E) \in \text{Ext}_{\mathcal{A}}^i(B, A)$ as the morphism $\delta(E) = fs^{-1} : B[0] \rightarrow A[i]$ where s is the quasi-isomorphism

$$(\dots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \dots \rightarrow Z_0 \rightarrow 0 \rightarrow \dots) \longrightarrow B[0]$$

and f is the morphism of complexes

$$(\dots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \dots \rightarrow Z_0 \rightarrow 0 \rightarrow \dots) \longrightarrow A[i]$$

We call $\delta(E) = fs^{-1}$ the *class* of the Yoneda extension. It turns out that this class characterizes the equivalence class of the Yoneda extension.

Lemma 13.27.5. Let \mathcal{A} be an abelian category with objects A, B . Any element in $\text{Ext}_{\mathcal{A}}^i(B, A)$ is $\delta(E)$ for some degree i Yoneda extension of B by A . Given two Yoneda extensions E, E' of the same degree then E is equivalent to E' if and only if $\delta(E) = \delta(E')$.

Proof. Let $\xi : B[0] \rightarrow A[i]$ be an element of $\text{Ext}_{\mathcal{A}}^i(B, A)$. We may write $\xi = fs^{-1}$ for some quasi-isomorphism $s : L^{\bullet} \rightarrow B[0]$ and map $f : L^{\bullet} \rightarrow A[i]$. After replacing

L^\bullet by $\tau_{\leq 0}L^\bullet$ we may assume that $L^i = 0$ for $i > 0$. Picture

$$\begin{array}{ccccccc} L^{-i-1} & \longrightarrow & L^{-i} & \longrightarrow & \dots & \longrightarrow & L^0 \longrightarrow B \longrightarrow 0 \\ & & \downarrow & & & & \\ & & A & & & & \end{array}$$

Then setting $Z_{i-1} = (L^{-i+1} \oplus A)/L^{-i}$ and $Z_j = L^{-j}$ for $j = i - 2, \dots, 0$ we see that we obtain a degree i extension E of B by A whose class $\delta(E)$ equals ξ .

It is immediate from the definitions that equivalent Yoneda extensions have the same class. Suppose that $E : 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \dots \rightarrow Z_0 \rightarrow B \rightarrow 0$ and $E' : 0 \rightarrow A \rightarrow Z'_{i-1} \rightarrow Z'_{i-2} \rightarrow \dots \rightarrow Z'_0 \rightarrow B \rightarrow 0$ are Yoneda extensions with the same class. By construction of $D(\mathcal{A})$ as the localization of $K(\mathcal{A})$ at the set of quasi-isomorphisms, this means there exists a complex L^\bullet and quasi-isomorphisms

$$t : L^\bullet \rightarrow (\dots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \dots \rightarrow Z_0 \rightarrow 0 \rightarrow \dots)$$

and

$$t' : L^\bullet \rightarrow (\dots \rightarrow 0 \rightarrow A \rightarrow Z'_{i-1} \rightarrow \dots \rightarrow Z'_0 \rightarrow 0 \rightarrow \dots)$$

such that $s \circ t = s' \circ t'$ and $f \circ t = f' \circ t'$, see Categories, Section 4.25. Let E'' be the degree i extension of B by A constructed from the pair $L^\bullet \rightarrow B[0]$ and $L^\bullet \rightarrow A[i]$ in the first paragraph of the proof. Then the reader sees readily that there exists “morphisms” of degree i Yoneda extensions $E'' \rightarrow E$ and $E'' \rightarrow E'$ as in the definition of equivalent Yoneda extensions (details omitted). This finishes the proof. \square

Lemma 13.27.6. *Let \mathcal{A} be an abelian category. Let A, B be objects of \mathcal{A} . Then $\text{Ext}_{\mathcal{A}}^1(B, A)$ is the group $\text{Ext}_{\mathcal{A}}(B, A)$ constructed in Homology, Definition 12.6.2.*

Proof. This is the case $i = 1$ of Lemma 13.27.5. \square

13.28. Unbounded complexes

A reference for the material in this section is [Spa88]. The following lemma is useful to find “good” left resolutions of unbounded complexes.

Lemma 13.28.1. *Let \mathcal{A} be an abelian category. Let $\mathcal{P} \subset \text{Ob}(\mathcal{A})$ be a subset. Assume that every object of \mathcal{A} is a quotient of an element of \mathcal{P} . Let K^\bullet be a complex. There exists a commutative diagram*

$$\begin{array}{ccccccc} P_1^\bullet & \longrightarrow & P_2^\bullet & \longrightarrow & \dots & & \\ \downarrow & & \downarrow & & & & \\ \tau_{\leq 1}K^\bullet & \longrightarrow & \tau_{\leq 2}K^\bullet & \longrightarrow & \dots & & \end{array}$$

in the category of complexes such that

- (1) the vertical arrows are quasi-isomorphisms,
- (2) P_1^\bullet is a bounded above complex with terms in \mathcal{P} ,
- (3) the arrows $P_n^\bullet \rightarrow P_{n+1}^\bullet$ are termwise split injections and each cokernel P_{n+1}^i/P_n^i is an element of \mathcal{P} .

Proof. By Lemma 13.16.5 any bounded above complex has a resolution by a bounded above complex whose terms are in \mathcal{P} . Thus we obtain the first complex P_1^\bullet . By induction it suffices, given $P_1^\bullet, \dots, P_n^\bullet$ to construct P_{n+1}^\bullet and the maps $P_n^\bullet \rightarrow P_{n+1}^\bullet$ and $P_n^\bullet \rightarrow \tau_{\leq n+1}K^\bullet$. Consider the cone C_1^\bullet of the composition $P_n^\bullet \rightarrow \tau_{\leq n}K^\bullet \rightarrow \tau_{\leq n+1}K^\bullet$. This fits into the distinguished triangle

$$P_n^\bullet \rightarrow \tau_{\leq n+1}K^\bullet \rightarrow C_1^\bullet \rightarrow P_n^\bullet[1]$$

Note that C_1^\bullet is bounded above, hence we can choose a quasi-isomorphism $Q^\bullet \rightarrow C_1^\bullet$ where Q^\bullet is a bounded above complex whose terms are elements of \mathcal{P} . Take the cone C_2^\bullet of the map of complexes $Q^\bullet \rightarrow P_n^\bullet[1]$ to get the distinguished triangle

$$Q^\bullet \rightarrow P_n^\bullet[1] \rightarrow C_2^\bullet \rightarrow Q^\bullet[1]$$

By the axioms of triangulated categories we obtain a map of distinguished triangles

$$\begin{array}{ccccccc} P_n^\bullet & \longrightarrow & C_2^\bullet[-1] & \longrightarrow & Q^\bullet & \longrightarrow & P_n^\bullet[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ P_n^\bullet & \longrightarrow & \tau_{\leq n+1}K^\bullet & \longrightarrow & C_1^\bullet & \longrightarrow & P_n^\bullet[1] \end{array}$$

in the triangulated category $K(\mathcal{A})$. Set $P_{n+1}^\bullet = C_2^\bullet[-1]$. Note that (3) holds by construction. Choose an actual morphism of complexes $f : P_{n+1}^\bullet \rightarrow \tau_{\leq n+1}K^\bullet$. The left square of the diagram above commutes up to homotopy, but as $P_n^\bullet \rightarrow P_{n+1}^\bullet$ is a termwise split injection we can lift the homotopy and modify our choice of f to make it commute. Finally, f is a quasi-isomorphism, because both $P_n^\bullet \rightarrow P_n^\bullet$ and $Q^\bullet \rightarrow C_1^\bullet$ are. \square

In some cases we can use the lemma above to show that a left derived functor is everywhere defined.

Proposition 13.28.2. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor of abelian categories. Let $\mathcal{P} \subset \text{Ob}(\mathcal{A})$ be a subset. Assume*

- (1) every object of \mathcal{A} is a quotient of an element of \mathcal{P} ,
- (2) for any bounded above acyclic complex P^\bullet of \mathcal{A} with $P^n \in \mathcal{P}$ for all n the complex $F(P^\bullet)$ is exact,
- (3) \mathcal{A} and \mathcal{B} have colimits of systems over \mathbf{N} ,
- (4) colimits over \mathbf{N} are exact in both \mathcal{A} and \mathcal{B} , and
- (5) F commutes with colimits over \mathbf{N} .

Then LF is defined on all of $D(\mathcal{A})$.

Proof. By (1) and Lemma 13.16.5 for any bounded above complex K^\bullet there exists a quasi-isomorphism $P^\bullet \rightarrow K^\bullet$ with P^\bullet bounded above and $P^n \in \mathcal{P}$ for all n . Suppose that $s : P^\bullet \rightarrow (P')^\bullet$ is a quasi-isomorphism of bounded above complexes consisting of objects of \mathcal{P} . Then $F(P^\bullet) \rightarrow F((P')^\bullet)$ is a quasi-isomorphism because $F(C(s)^\bullet)$ is acyclic by assumption (2). This already shows that LF is defined on $D^-(\mathcal{A})$ and that a bounded above complex consisting of objects of \mathcal{P} computes LF , see Lemma 13.15.15.

Next, let K^\bullet be an arbitrary complex of \mathcal{A} . Choose a diagram

$$\begin{array}{ccccc} P_1^\bullet & \longrightarrow & P_2^\bullet & \longrightarrow & \dots \\ \downarrow & & \downarrow & & \\ \tau_{\leq 1}K^\bullet & \longrightarrow & \tau_{\leq 2}K^\bullet & \longrightarrow & \dots \end{array}$$

as in Lemma 13.28.1. Note that the map $\text{colim } P_n^\bullet \rightarrow K^\bullet$ is a quasi-isomorphism because colimits over \mathbf{N} in \mathcal{A} are exact and $H^i(P_n^\bullet) = H^i(K^\bullet)$ for $n > i$. We claim that

$$F(\text{colim } P_n^\bullet) = \text{colim } F(P_n^\bullet)$$

(termwise colimits) is $LF(K^\bullet)$, i.e., that $\text{colim } P_n^\bullet$ computes LF . To see this, by Lemma 13.15.15, it suffices to prove the following claim. Suppose that

$$\text{colim } Q_n^\bullet = Q^\bullet \xrightarrow{\alpha} P^\bullet = \text{colim } P_n^\bullet$$

is a quasi-isomorphism of complexes, such that each P_n^\bullet, Q_n^\bullet is a bounded above complex whose terms are in \mathcal{P} and the maps $P_n^\bullet \rightarrow \tau_{\leq n}P^\bullet$ and $Q_n^\bullet \rightarrow \tau_{\leq n}Q^\bullet$ are quasi-isomorphisms. Claim: $F(\alpha)$ is a quasi-isomorphism.

The problem is that we do not assume that α is given as a colimit of maps between the complexes P_n^\bullet and Q_n^\bullet . However, for each n we know that the solid arrows in the diagram

$$\begin{array}{ccccc} & & R^\bullet & & \\ & & \vdots & & \\ & & \downarrow & & \\ P_n^\bullet & \xleftarrow{\dots} & L^\bullet & \xrightarrow{\dots} & Q_n^\bullet \\ \downarrow & & & & \downarrow \\ \tau_{\leq n}P^\bullet & \xrightarrow{\tau_{\leq n}\alpha} & & & \tau_{\leq n}Q^\bullet \end{array}$$

are quasi-isomorphisms. Because quasi-isomorphisms form a multiplicative system in $K(\mathcal{A})$ (see Lemma 13.11.2) we can find a quasi-isomorphism $L^\bullet \rightarrow P_n^\bullet$ and map of complexes $L^\bullet \rightarrow Q_n^\bullet$ such that the diagram above commutes up to homotopy. Then $\tau_{\leq n}L^\bullet \rightarrow L^\bullet$ is a quasi-isomorphism. Hence (by the first part of the proof) we can find a bounded above complex R^\bullet whose terms are in \mathcal{P} and a quasi-isomorphism $R^\bullet \rightarrow L^\bullet$ (as indicated in the diagram). Using the result of the first paragraph of the proof we see that $F(R^\bullet) \rightarrow F(P_n^\bullet)$ and $F(R^\bullet) \rightarrow F(Q_n^\bullet)$ are quasi-isomorphisms. Thus we obtain a isomorphisms $H^i(F(P_n^\bullet)) \rightarrow H^i(F(Q_n^\bullet))$ fitting into the commutative diagram

$$\begin{array}{ccc} H^i(F(P_n^\bullet)) & \longrightarrow & H^i(F(Q_n^\bullet)) \\ \downarrow & & \downarrow \\ H^i(F(P^\bullet)) & \longrightarrow & H^i(F(Q^\bullet)) \end{array}$$

The exact same argument shows that these maps are also compatible as n varies. Since by (4) and (5) we have

$$H^i(F(P^\bullet)) = H^i(F(\text{colim } P_n^\bullet)) = H^i(\text{colim } F(P_n^\bullet)) = \text{colim } H^i(F(P_n^\bullet))$$

and similarly for Q^\bullet we conclude that $H^i(\alpha) : H^i(F(P^\bullet)) \rightarrow H^i(F(Q^\bullet))$ is an isomorphism and the claim follows. \square

Lemma 13.28.3. *Let \mathcal{A} be an abelian category. Let $\mathcal{I} \subset \text{Ob}(\mathcal{A})$ be a subset. Assume that every object of \mathcal{A} is a subobject of an element of \mathcal{I} . Let K^\bullet be a complex. There exists a commutative diagram*

$$\begin{array}{ccccc} \dots & \longrightarrow & \tau_{\geq -2}K^\bullet & \longrightarrow & \tau_{\geq -1}K^\bullet \\ & & \downarrow & & \downarrow \\ \dots & \longrightarrow & I_2^\bullet & \longrightarrow & I_1^\bullet \end{array}$$

in the category of complexes such that

- (1) the vertical arrows are quasi-isomorphisms,
- (2) I_1^\bullet is a bounded above complex with terms in \mathcal{I} ,
- (3) the arrows $I_{n+1}^\bullet \rightarrow I_n^\bullet$ are termwise split surjections and $\text{Ker}(I_{n+1}^\bullet \rightarrow I_n^\bullet)$ is an element of \mathcal{I} .

Proof. This lemma is dual to Lemma 13.28.1. □

The following lemma is an example of why it is easier to work with unbounded derived categories. Namely, without having the unbounded derived functors, the lemma could not even be stated.

Lemma 13.28.4. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ and $G : \mathcal{B} \rightarrow \mathcal{A}$ be functors such that F is a right adjoint to G . If the derived functors $RF : D(\mathcal{A}) \rightarrow D(\mathcal{B})$ and $LG : D(\mathcal{B}) \rightarrow D(\mathcal{A})$ exist, then RF is a right adjoint to LG .*

Proof. Let K^\bullet be a complex of \mathcal{A} and let M^\bullet be a complex of \mathcal{B} . Since RF is defined at K^\bullet , we see that the rule which assigns to a quasi-isomorphism $s : K^\bullet \rightarrow I^\bullet$ the object $F(I^\bullet)$ is essentially constant as an ind-object of $D(\mathcal{B})$ with value $RF(K^\bullet)$. Similarly, the rule which assigns to a quasi-isomorphism $t : P^\bullet \rightarrow M^\bullet$ the object $G(P^\bullet)$ is essentially constant as a pro-object of $D(\mathcal{A})$ with value $LG(M^\bullet)$. Thus we have

$$\begin{aligned} \text{Hom}_{D(\mathcal{B})}(M^\bullet, RF(K^\bullet)) &= \text{colim}_{s:K^\bullet \rightarrow I^\bullet} \text{Hom}_{D(\mathcal{B})}(M^\bullet, F(I^\bullet)) \\ &= \text{colim}_{s:K^\bullet \rightarrow I^\bullet} \text{colim}_{t:P^\bullet \rightarrow M^\bullet} \text{Hom}_{K(\mathcal{B})}(P^\bullet, F(I^\bullet)) \\ &= \text{colim}_{t:P^\bullet \rightarrow M^\bullet} \text{colim}_{s:K^\bullet \rightarrow I^\bullet} \text{Hom}_{K(\mathcal{B})}(P^\bullet, F(I^\bullet)) \\ &= \text{colim}_{t:P^\bullet \rightarrow M^\bullet} \text{colim}_{s:K^\bullet \rightarrow I^\bullet} \text{Hom}_{K(\mathcal{A})}(G(P^\bullet), I^\bullet) \\ &= \text{colim}_{s:K^\bullet \rightarrow I^\bullet} \text{Hom}_{D(\mathcal{A})}(G(P^\bullet), K^\bullet) \\ &= \text{Hom}_{D(\mathcal{A})}(LG(M^\bullet), K^\bullet) \end{aligned}$$

The first equality holds by Categories, Lemma 4.22.6. The second equality holds by the definition of morphisms in $D(\mathcal{B})$. The third equality holds by Categories, Lemma 4.14.9. The fourth equality holds because F and G are adjoint. The fifth equality holds by definition of morphism in $D(\mathcal{A})$. The sixth equality holds by Categories, Lemma 4.22.7. □

13.29. K-injective complexes

The following types of complexes can be used to compute right derived functors on the unbounded derived category.

Definition 13.29.1. Let \mathcal{A} be an abelian category. A complex I^\bullet is *K-injective* if for every acyclic complex M^\bullet we have $\text{Hom}_{K(\mathcal{A})}(M^\bullet, I^\bullet) = 0$.

In the situation of the definition we have in fact $\text{Hom}_{K(\mathcal{A})}(M^\bullet[i], I^\bullet) = 0$ for all i as the translate of an acyclic complex is acyclic.

Lemma 13.29.2. *Let \mathcal{A} be an abelian category. Let I^\bullet be a complex. The following are equivalent*

- (1) I^\bullet is K -injective,
 (2) for every quasi-isomorphism $M^\bullet \rightarrow N^\bullet$ the map

$$\text{Hom}_{K(\mathcal{A})}(N^\bullet, I^\bullet) \rightarrow \text{Hom}_{K(\mathcal{A})}(M^\bullet, I^\bullet)$$

is bijective, and

- (3) for every complex N^\bullet the map

$$\text{Hom}_{K(\mathcal{A})}(N^\bullet, I^\bullet) \rightarrow \text{Hom}_{D(\mathcal{A})}(N^\bullet, I^\bullet)$$

is an isomorphism.

Proof. Assume (1). Then (2) holds because the functor $\text{Hom}_{K(\mathcal{A})}(-, I^\bullet)$ is cohomological and the cone on a quasi-isomorphism is acyclic.

Assume (2). A morphism $N^\bullet \rightarrow I^\bullet$ in $D(\mathcal{A})$ is of the form $fs^{-1} : N^\bullet \rightarrow I^\bullet$ where $s : M^\bullet \rightarrow N^\bullet$ is a quasi-isomorphism and $f : M^\bullet \rightarrow I^\bullet$ is a map. By (2) this corresponds to a unique morphism $N^\bullet \rightarrow I^\bullet$ in $K(\mathcal{A})$, i.e., (3) holds.

Assume (3). If M^\bullet is acyclic then M^\bullet is isomorphic to the zero complex in $D(\mathcal{A})$ hence $\text{Hom}_{D(\mathcal{A})}(N^\bullet, I^\bullet) = 0$, whence $\text{Hom}_{K(\mathcal{A})}(N^\bullet, I^\bullet) = 0$ by (3), i.e., (1) holds. \square

Lemma 13.29.3. *Let \mathcal{A} be an abelian category. Let (K, L, M, f, g, h) be a distinguished triangle of $K(\mathcal{A})$. If two out of K, L, M are K -injective complexes, then the third is too.*

Proof. Follows from the definition, Lemma 13.4.2, and the fact that $K(\mathcal{A})$ is a triangulated category (Proposition 13.10.3). \square

Lemma 13.29.4. *Let \mathcal{A} be an abelian category. A bounded below complex of injectives is K -injective.*

Proof. Follows from Lemmas 13.29.2 and 13.18.8. \square

Lemma 13.29.5. *Let \mathcal{A} be an abelian category. Let $F : K(\mathcal{A}) \rightarrow \mathcal{D}'$ be an exact functor of triangulated categories. Then RF is defined at every complex in $K(\mathcal{A})$ which is quasi-isomorphic to a K -injective complex. In fact, every K -injective complex computes RF .*

Proof. By Lemma 13.15.4 it suffices to show that RF is defined at a K -injective complex, i.e., it suffices to show a K -injective complex I^\bullet computes RF . Any quasi-isomorphism $I^\bullet \rightarrow N^\bullet$ is a homotopy equivalence as it has an inverse by Lemma 13.29.2. Thus $I^\bullet \rightarrow I^\bullet$ is a final object of $I^\bullet/\text{Qis}(\mathcal{A})$ and we win. \square

Lemma 13.29.6. *Let \mathcal{A} be an abelian category. Assume every complex has a quasi-isomorphism towards a K -injective complex. Then any exact functor $F : K(\mathcal{A}) \rightarrow \mathcal{D}'$ of triangulated categories has a right derived functor*

$$RF : D(\mathcal{A}) \longrightarrow \mathcal{D}'$$

and $RF(I^\bullet) = F(I^\bullet)$ for K -injective complexes I^\bullet .

Proof. To see this we apply Lemma 13.15.15 with \mathcal{I} the collection of K-injective complexes. Since (1) holds by assumption, it suffices to prove that if $I^\bullet \rightarrow J^\bullet$ is a quasi-isomorphism of K-injective complexes, then $F(I^\bullet) \rightarrow F(J^\bullet)$ is an isomorphism. This is clear because $I^\bullet \rightarrow J^\bullet$ is a homotopy equivalence, i.e., an isomorphism in $K(\mathcal{A})$, by Lemma 13.29.2. \square

The following lemma can be generalized to limits over bigger ordinals.

Lemma 13.29.7. *Let \mathcal{A} be an abelian category. Let*

$$\dots \rightarrow I_3^\bullet \rightarrow I_2^\bullet \rightarrow I_1^\bullet$$

be an inverse system of K-injective complexes. Assume

- (1) *each I_n^\bullet is K-injective,*
- (2) *each map $I_{n+1}^m \rightarrow I_n^m$ is a split surjection,*
- (3) *the limits $I^m = \lim I_n^m$ exist.*

Then the complex I^\bullet is K-injective.

Proof. Let M^\bullet be an acyclic complex. Let us abbreviate $H_n(a, b) = \text{Hom}_{\mathcal{A}}(M^a, I_n^b)$. With this notation $\text{Hom}_{K(\mathcal{A})}(M^\bullet, I^\bullet)$ is the cohomology of the complex

$$\prod_m \lim_n H_n(m, m-2) \rightarrow \prod_m \lim_n H_n(m, m-1) \rightarrow \prod_m \lim_n H_n(m, m) \rightarrow \prod_m \lim_n H_n(m, m+1)$$

in the third spot from the left. We may exchange the order of \prod and \lim and each of the complexes

$$\prod_m H_n(m, m-2) \rightarrow \prod_m H_n(m, m-1) \rightarrow \prod_m H_n(m, m) \rightarrow \prod_m H_n(m, m+1)$$

is exact by assumption (1). By assumption (2) the maps in the systems

$$\dots \rightarrow \prod_m H_3(m, m-2) \rightarrow \prod_m H_2(m, m-2) \rightarrow \prod_m H_1(m, m-2)$$

are surjective. Thus the lemma follows from Homology, Lemma 12.27.4. \square

Remark 13.29.8. It appears that a combination of Lemmas 13.28.3, 13.29.4, and 13.29.7 produces “enough K-injectives” for any abelian category with enough injectives and countable limits. Actually, this may not work! Namely, suppose that K^\bullet is a complex and I_n^\bullet is the system of bounded above complexes of injectives produced by Lemma 13.28.3. Each complex I_n^\bullet is K-injective by Lemma 13.29.4. Let $I^\bullet = \lim I_n^\bullet$ be the termwise limit which is K-injective by Lemma 13.29.7. The problem is that the map $K^\bullet \rightarrow I^\bullet$ may not be a quasi-isomorphism. The following lemma shows that it does work if \mathcal{A} has countable exact products.

Lemma 13.29.9. *Let \mathcal{A} be an abelian category having enough injectives and exact countable products. Then for every complex there is a quasi-isomorphism to a K-injective complex.*

Proof. Let K^\bullet be a complex. Let I_n^\bullet be the system of bounded above complexes of injectives produced by Lemma 13.28.3. Choose direct sum decompositions $I_{n+1}^p = C_{n+1}^p \oplus I_n^p$ for all $n \geq 1$. Set $C_1^p = I_1^p$. Each complex I_n^\bullet is K-injective by Lemma 13.29.4. Then $I^\bullet = \lim I_n^\bullet$ exists because $I^p = \prod_{n \geq 1} C_n^p$. The I^\bullet is K-injective by Lemma 13.29.7. Fix $p \in \mathbf{Z}$. We claim there is a short exact sequence

$$0 \rightarrow I^p \rightarrow \prod I_n^p \rightarrow \prod I_n^p \rightarrow 0$$

of objects of \mathcal{A} . Here the first map is given by the projection maps $I^p \rightarrow I_n^p$ and the second map by $(x_n) \mapsto (x_n - f_{n+1}^p(x_{n+1}))$ where $f_n^p : I_n^p \rightarrow I_{n-1}^p$ are the transition maps. In fact, the sequence is split exact as $I_n^p = \prod_{m \leq n} C_m^p$ and the f_n are the projection maps (details omitted). We obtain a short exact sequence of complexes

$$0 \rightarrow I^\bullet \rightarrow \prod I_n^\bullet \rightarrow \prod I_n^\bullet \rightarrow 0$$

Now, using that countable products are exact, we see that we get a long exact cohomology sequence

$$\dots \rightarrow H^p(I^\bullet) \rightarrow \prod H^p(I_m^\bullet) \rightarrow \prod H^p(I_m^\bullet) \rightarrow \dots$$

Since I_m^\bullet is quasi-isomorphic to $\tau_{\geq -m} K^\bullet$ for each m we see that the system of objects $H^p(I_m^\bullet)$ (fixed p varying m) is eventually constant with value $H^p(K)$. Thus the map $\prod H^p(I_m^\bullet) \rightarrow \prod H^p(I_m^\bullet)$ is surjective with kernel $H^p(K^\bullet)$ (details omitted). This proves that $K^\bullet \rightarrow I^\bullet$ is a quasi-isomorphism as desired. \square

Lemma 13.29.10. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $u : \mathcal{A} \rightarrow \mathcal{B}$ and $v : \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume*

- (1) *u is right adjoint to v , and*
- (2) *v is exact.*

Then u transforms K -injective complexes into K -injective complexes.

Proof. Let I^\bullet be a K -injective complex of \mathcal{A} . Let M^\bullet be a acyclic complex of \mathcal{B} . As v is exact we see that $v(M^\bullet)$ is an acyclic complex. By adjointness we get

$$0 = \text{Hom}_{K(\mathcal{A})}(v(M^\bullet), I^\bullet) = \text{Hom}_{K(\mathcal{B})}(M^\bullet, u(I^\bullet))$$

hence the lemma follows. \square

13.30. Bounded cohomological dimension

There is another case where the unbounded derived functor exists. Namely, when the functor has bounded cohomological dimension.

Lemma 13.30.1. *Let \mathcal{A} be an abelian category. Let $d : \text{Ob}(\mathcal{A}) \rightarrow \{0, 1, 2, \dots, \infty\}$ be a function. Assume that*

- (1) *every object of \mathcal{A} is a subobject of an object A with $d(A) = 0$,*
- (2) *if $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is a short exact sequence then $d(C) \leq \max\{d(A) - 1, d(B)\}$.*

Let K^\bullet be a complex such that $n + d(K^n)$ tends to $-\infty$ as $n \rightarrow -\infty$. Then there exists a quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with $d(L^n) = 0$ for all $n \in \mathbf{Z}$.

Proof. By Lemma 13.16.4 we can find a quasi-isomorphism $\sigma_{\geq 0} K^\bullet \rightarrow M^\bullet$ with $M^n = 0$ for $n < 0$ and $d(M^n) = 0$ for $n \geq 0$. Then K^\bullet is quasi-isomorphic to the complex

$$\dots \rightarrow K^{-2} \rightarrow K^{-1} \rightarrow M^0 \rightarrow M^1 \rightarrow \dots$$

Hence we may assume that $d(K^n) = 0$ for $n \gg 0$. Note that the condition $n + d(K^n) \rightarrow -\infty$ as $n \rightarrow -\infty$ is not violated by this replacement.

We are going to improve K^\bullet by an (infinite) sequence of elementary replacements. An *elementary replacement* is the following. Choose an index n such that $d(K^n) >$

0. Choose an injection $K^n \rightarrow M$ where $d(M) = 0$. Set $M' = \text{Coker}(K^n \rightarrow M \oplus K^{n+1})$. Consider the map of complexes

$$\begin{array}{ccccccc}
 K^\bullet : & & K^{n-1} & \longrightarrow & K^n & \longrightarrow & K^{n+1} & \longrightarrow & K^{n+2} \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 (K')^\bullet : & & K^{n-1} & \longrightarrow & M & \longrightarrow & M' & \longrightarrow & K^{n+2}
 \end{array}$$

It is clear that $K^\bullet \rightarrow (K')^\bullet$ is a quasi-isomorphism. Moreover, it is clear that $d((K')^n) = 0$ and $d((K')^{n+1}) \leq \max\{d(K^{n+1}), d(K^n) - 1\}$ and the other values are unchanged.

To finish the proof we carefully choose the order in which to do the elementary replacements so that for every integer m the complex $\sigma_{\geq m} K^\bullet$ is changed only a finite number of times. To do this set

$$\xi(K^\bullet) = \max\{n + d(K^n) \mid d(K^n) > 0\}$$

and

$$I = \{n \in \mathbf{Z} \mid \xi(K^\bullet) = n + d(K^n) \wedge d(K^n) > 0\}$$

Our assumption that $n + d(K^n)$ tends to $-\infty$ as $n \rightarrow -\infty$ and the fact that $d(K^n) = 0$ for $n \gg 0$ implies $\xi(K^\bullet) < +\infty$ and that I is a finite set. It is clear that $\xi((K')^\bullet) \leq \xi(K^\bullet)$ for an elementary transformation as above. An elementary transformation changes the complex in degrees $\leq \xi(K^\bullet) + 1$. Hence if we can find finite sequence of elementary transformations which decrease $\xi(K^\bullet)$, then we win. However, note that if we do an elementary transformation starting with the smallest element $n \in I$, then we either decrease the size of I , or we increase $\min I$. Since every element of I is $\leq \xi(K^\bullet)$ we see that we win after a finite number of steps. \square

Lemma 13.30.2. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor of abelian categories. If*

- (1) *every object of \mathcal{A} is a subobject of an object which is right acyclic for F ,*
- (2) *there exists an integer n such that $R^n F = 0$,*

then $RF : D(\mathcal{A}) \rightarrow D(\mathcal{B})$ exists. Any complex consisting of right acyclic objects for F computes RF and any complex is the source of a quasi-isomorphism into such a complex.

Proof. Note that the first condition implies that $RF : D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ exists, see Proposition 13.16.8. Let A be an object of \mathcal{A} . Choose an injection $A \rightarrow A'$ with A' acyclic. Then we see that $R^{n+1}F(A) = R^n F(A'/A) = 0$ by the long exact cohomology sequence. Hence we conclude that $R^{n+1}F = 0$. Continuing like this using induction we find that $R^m F = 0$ for all $m \geq n$.

We are going to use Lemma 13.30.1 with the function $d : \text{Ob}(\mathcal{A}) \rightarrow \{0, 1, 2, \dots\}$ given by $d(A) = \min\{0\} \cup \{i \mid R^i F(A) \neq 0\}$. The first assumption of Lemma 13.30.1 is our assumption (1) and the second assumption of Lemma 13.30.1 follows from the long exact cohomology sequence. Hence for every complex K^\bullet there exists a quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with L^n right acyclic for F . We claim that if $L^\bullet \rightarrow M^\bullet$ is a quasi-isomorphism of complexes of right acyclic objects for F , then $F(L^\bullet) \rightarrow F(M^\bullet)$ is a quasi-isomorphism. If we prove this claim then we are done by Lemma 13.15.15. To prove the claim pick an integer $i \in \mathbf{Z}$. Consider the distinguished triangle

$$\sigma_{\geq i-n-1} L^\bullet \rightarrow \sigma_{\geq i-n-1} M^\bullet \rightarrow Q^\bullet,$$

i.e., let Q^\bullet be the cone of the first map. Note that Q^\bullet is bounded below and that $H^j(Q^\bullet)$ is zero except possibly for $j = i - n - 1$ or $j = i - n - 2$. We may apply RF to Q^\bullet . Using the spectral sequence of Lemma 13.21.3 and the assumed vanishing of cohomology (2) we conclude that $R^jF(Q^\bullet)$ is zero except possibly for $j \in \{i - n - 2, \dots, i - 1\}$. Hence we see that $RF(\sigma_{\geq i-n-1}L^\bullet) \rightarrow RF(\sigma_{\geq i-n-1}M^\bullet)$ induces an isomorphism of cohomology objects in degrees $\geq i$. By Proposition 13.16.8 we know that $RF(\sigma_{\geq i-n-1}L^\bullet) = \sigma_{\geq i-n-1}F(L^\bullet)$ and $RF(\sigma_{\geq i-n-1}M^\bullet) = \sigma_{\geq i-n-1}F(M^\bullet)$. We conclude that $F(L^\bullet) \rightarrow F(M^\bullet)$ is an isomorphism in degree i as desired. \square

Lemma 13.30.3. *Let $F : \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor of abelian categories. If*

- (1) *every object of \mathcal{A} is a quotient of an object which is left acyclic for F ,*
- (2) *there exists an integer n such that $L^n F = 0$,*

then $LF : D(\mathcal{A}) \rightarrow D(\mathcal{B})$ exists. Any complex consisting of left acyclic objects for F computes LF and any complex is the target of a quasi-isomorphism into such a complex.

Proof. This is dual to Lemma 13.30.2. \square

13.31. Derived colimits

In a triangulated category there is a notion of derived colimit.

Definition 13.31.1. Let \mathcal{D} be a triangulated category. Let (K_n, f_n) be a system of objects of \mathcal{D} . We say an object K is a *derived colimit*, or a *homotopy colimit* of the system (K_n) if the direct sum $\bigoplus K_n$ exists and there is a distinguished triangle

$$\bigoplus K_n \rightarrow \bigoplus K_n \rightarrow K \rightarrow \bigoplus K_n[1]$$

where the map $\bigoplus K_n \rightarrow \bigoplus K_n$ is given by $1 - f_n$ in degree n . If this is the case, then we sometimes indicate this by the notation $K = \text{hocolim} K_n$.

By TR3 a derived colimit, if it exists, is unique up to (non-unique) isomorphism. Moreover, by TR1 a derived colimit of K_n exists as soon as $\bigoplus K_n$ exists. The derived category $D(\text{Ab})$ of the category of abelian groups is an example. More generally we have the following lemma.

Lemma 13.31.2. *Let \mathcal{A} be an abelian category. If \mathcal{A} has exact countable direct sums, then $D(\mathcal{A})$ has countable direct sums. In fact given a collection of complexes K_i^\bullet indexed by a countable index set I the termwise direct sum $\bigoplus K_i^\bullet$ is the direct sum of K_i^\bullet in $D(\mathcal{A})$.*

Proof. Let L^\bullet be a complex. Suppose given maps $\alpha_i : K_i^\bullet \rightarrow L^\bullet$ in $D(\mathcal{A})$. This means there exist quasi-isomorphisms $s_i : M_i^\bullet \rightarrow K_i^\bullet$ of complexes and maps of complexes $f_i : M_i^\bullet \rightarrow L^\bullet$ such that $\alpha_i = f_i s_i^{-1}$. By assumption the map of complexes

$$s : \bigoplus M_i^\bullet \longrightarrow \bigoplus K_i^\bullet$$

is a quasi-isomorphism. Hence setting $f = \bigoplus f_i$ we see that $\alpha = f s^{-1}$ is a map in $D(\mathcal{A})$ whose composition with the coprojection $K_i^\bullet \rightarrow \bigoplus K_i^\bullet$ is α_i . We omit the verification that α is unique. \square

Lemma 13.31.3. *Let \mathcal{A} be an abelian category. Assume colimits over \mathbf{N} exist and are exact. Then countable direct sums exist and are exact. Moreover, if (A_n, f_n) is a system over \mathbf{N} , then there is a short exact sequence*

$$0 \rightarrow \bigoplus A_n \rightarrow \bigoplus A_n \rightarrow \operatorname{colim} A_n \rightarrow 0$$

where the first map in degree n is given by $1 - f_n$.

Proof. The first statement follows from $\bigoplus A_n = \operatorname{colim}(A_1 \oplus \dots \oplus A_n)$. For the second, note that for each n we have the short exact sequence

$$0 \rightarrow A_1 \oplus \dots \oplus A_{n-1} \rightarrow A_1 \oplus \dots \oplus A_n \rightarrow A_n \rightarrow 0$$

where the first map is given by the maps $1 - f_i$ and the second map is the sum of the transition maps. Take the colimit to get the sequence of the lemma. \square

Lemma 13.31.4. *Let \mathcal{A} be an abelian category. Let L_n^\bullet be a system of complexes of \mathcal{A} . Assume colimits over \mathbf{N} exist and are exact in \mathcal{A} . Then the termwise colimit $L^\bullet = \operatorname{colim} L_n^\bullet$ is a homotopy colimit of the system in $D(\mathcal{A})$.*

Proof. We have an exact sequence of complexes

$$0 \rightarrow \bigoplus L_n^\bullet \rightarrow \bigoplus L_n^\bullet \rightarrow L^\bullet \rightarrow 0$$

by Lemma 13.31.3. The direct sums are direct sums in $D(\mathcal{A})$ by Lemma 13.31.2. Thus the result follows from the definition of derived colimits in Definition 13.31.1 and the fact that a short exact sequence of complexes gives a distinguished triangle (Lemma 13.12.1). \square

The following lemma tells us that taking maps out of a compact object (to be defined later) commutes with derived colimits.

Lemma 13.31.5. *Let \mathcal{D} be a triangulated category with countable direct sums. Let $K \in \mathcal{D}$ be an object such that for every countable set of objects $E_n \in \mathcal{D}$ the canonical map*

$$\bigoplus \operatorname{Hom}_{\mathcal{D}}(K, E_n) \longrightarrow \operatorname{Hom}_{\mathcal{D}}(K, \bigoplus E_n)$$

is a bijection. Then, given any system L_n of \mathcal{D} over \mathbf{N} whose derived colimit $L = \operatorname{hocolim} L_n$ exists we have that

$$\operatorname{colim} \operatorname{Hom}_{\mathcal{D}}(K, L_n) \longrightarrow \operatorname{Hom}_{\mathcal{D}}(K, L)$$

is a bijection.

Proof. Consider the defining distinguished triangle

$$\bigoplus L_n \rightarrow \bigoplus L_n \rightarrow L \rightarrow \bigoplus L_n[1]$$

Apply the cohomological functor $\operatorname{Hom}_{\mathcal{D}}(K, -)$ (see Lemma 13.4.2). By elementary considerations concerning colimits of abelian groups we get the result. \square

13.32. Derived limits

In a triangulated category there is a notion of derived limit.

Definition 13.32.1. Let \mathcal{D} be a triangulated category. Let (K_n, f_n) be an inverse system of objects of \mathcal{D} . We say an object K is a *derived limit*, or a *homotopy limit* of the system (K_n) if the product $\prod K_n$ exists and there is a distinguished triangle

$$K \rightarrow \prod K_n \rightarrow \prod K_n \rightarrow K[1]$$

where the map $\prod K_n \rightarrow \prod K_n$ is given by $(k_n) \mapsto (k_n - f_{n+1}(k_{n+1}))$. If this is the case, then we sometimes indicate this by the notation $K = R\lim K_n$.

By TR3 a derived limit, if it exists, is unique up to (non-unique) isomorphism. Moreover, by TR1 a derived limit $R\lim K_n$ exists as soon as $\prod K_n$ exists. The derived category $D(\text{Ab})$ of the category of abelian groups is an example. More generally, we have the following lemma.

Lemma 13.32.2. *Let \mathcal{A} be an abelian category. If \mathcal{A} has exact countable products, then $D(\mathcal{A})$ has countable products. In fact given a collection of complexes K_i^\bullet indexed by a countable index set I the termwise product $\prod K_i^\bullet$ is the product of K_i^\bullet in $D(\mathcal{A})$.*

Proof. Let L^\bullet be a complex. Suppose given maps $\alpha_i : L^\bullet \rightarrow K_i^\bullet$ in $D(\mathcal{A})$. This means there exist quasi-isomorphisms $s_i : K_i^\bullet \rightarrow M_i^\bullet$ of complexes and maps of complexes $f_i : L^\bullet \rightarrow M_i^\bullet$ such that $\alpha_i = s_i^{-1}f_i$. By assumption the map of complexes

$$s : \prod K_i^\bullet \longrightarrow \prod M_i^\bullet$$

is a quasi-isomorphism. Hence setting $f = \prod f_i$ we see that $\alpha = s^{-1}f$ is a map in $D(\mathcal{A})$ whose composition with the projection $\prod K_i^\bullet \rightarrow K_i^\bullet$ is α_i . We omit the verification that α is unique. \square

The duals of Lemmas 13.31.3, 13.31.4, and 13.31.5 should be stated here and proved. However, we do not know any applications of these lemmas for now.

13.33. Generators of triangulated categories

In this section we briefly introduce a few of the different notions of a generator for a triangulated category. Our terminology is taken from [BV03] (except that we use “saturated” for what they call “épaisse”, see Definition 13.6.1).

Let \mathcal{D} be a triangulated category. Let E be an object of \mathcal{D} . Denote $\langle E \rangle_1$ the strictly full subcategory of \mathcal{D} consisting of objects in \mathcal{D} isomorphic to direct summands of finite direct sums

$$\bigoplus E[n_i]$$

of shifts of E . For $n > 1$ let $\langle E \rangle_n$ denote the full subcategory of \mathcal{D} consisting of objects of \mathcal{D} isomorphic to direct summands of objects X which fit into a distinguished triangle

$$A \rightarrow X \rightarrow B \rightarrow A[1]$$

where A and B are objects of $\langle E \rangle_{n-1}$. Each of the categories $\langle E \rangle_n$ is a strictly full additive subcategory of \mathcal{D} preserved under shifts and under taking summands.

But, $\langle E \rangle_n$ is not necessarily closed under “taking cones”, hence not necessarily a triangulated subcategory. By the same token, the subcategory

$$\langle E \rangle = \bigcup_n \langle E \rangle_n$$

is a strictly full, saturated, triangulated subcategory of \mathcal{D} and it is the smallest such subcategory of \mathcal{D} containing the object E .

Definition 13.33.1. Let \mathcal{D} be a triangulated category. Let E be an object of \mathcal{D} .

- (1) We say E is a *classical generator* of \mathcal{D} if the smallest strictly full, saturated, triangulated subcategory of \mathcal{D} containing E is equal to \mathcal{D} , in other words, if $\langle E \rangle = \mathcal{D}$.
- (2) We say E is a *strong generator* of \mathcal{D} if $\langle E \rangle_n = \mathcal{D}$ for some $n \geq 1$.
- (3) We say E is a *weak generator* or a *generator* of \mathcal{D} if for any nonzero object K of \mathcal{D} there exists an integer n and a nonzero map $E \rightarrow K[n]$.

This definition can be generalized to the case of a family of objects.

Lemma 13.33.2. Let \mathcal{D} be a triangulated category. Let E, K be objects of \mathcal{D} . The following are equivalent

- (1) $\text{Hom}(E, K[i]) = 0$ for all $i \in \mathbf{Z}$,
- (2) $\text{Hom}(E', K) = 0$ for all $E' \in \langle E \rangle$.

Proof. The implication (2) \Rightarrow (1) is immediate. Conversely, assume (1). Then $\text{Hom}(X, K) = 0$ for all X in $\langle E \rangle_1$. Arguing by induction on n and using Lemma 13.4.2 we see that $\text{Hom}(X, K) = 0$ for all X in $\langle E \rangle_n$. \square

Lemma 13.33.3. Let \mathcal{D} be a triangulated category. Let E be an object of \mathcal{D} . If E is a classical generator of \mathcal{D} , then E is a generator.

Proof. Assume E is a classical generator. Let K be an object of \mathcal{D} such that $\text{Hom}(E, K[i]) = 0$ for all $i \in \mathbf{Z}$. By Lemma 13.33.2 $\text{Hom}(E', K) = 0$ for all $E' \in \langle E \rangle$. However, since $\mathcal{D} = \langle E \rangle$ we conclude that $\text{id}_K = 0$, i.e., $K = 0$. \square

13.34. Compact objects

Here is the definition.

Definition 13.34.1. Let \mathcal{D} be an additive category with arbitrary direct sums. A *compact object* of \mathcal{D} is an object K such that the map

$$\bigoplus_{i \in I} \text{Hom}_{\mathcal{D}}(K, E_i) \longrightarrow \text{Hom}_{\mathcal{D}}(K, \bigoplus_{i \in I} E_i)$$

is bijective for any set I and objects $E_i \in \text{Ob}(\mathcal{D})$ parametrized by $i \in I$.

This notion turns out to be very useful in algebraic geometry. It is an intrinsic condition on objects that forces the objects to be, well, compact.

Lemma 13.34.2. Let \mathcal{D} be a (pre-)triangulated category with direct sums. Then the compact objects of \mathcal{D} form the objects of a Karoubian, saturated, strictly full, (pre-)triangulated subcategory \mathcal{D}_c of \mathcal{D} .

Proof. Let (X, Y, Z, f, g, h) be a distinguished triangle of \mathcal{D} with X and Y compact. Then it follows from Lemma 13.4.2 and the five lemma (Homology, Lemma 12.5.20) that Z is a compact object too. It is clear that if $X \oplus Y$ is compact, then X, Y are compact objects too. Hence \mathcal{D}_c is a saturated triangulated subcategory. Since \mathcal{D} is Karoubian by Lemma 13.4.12 we conclude that the same is true for \mathcal{D}_c . \square

Lemma 13.34.3. *Let \mathcal{D} be a triangulated category with direct sums. Let $E_i, i \in I$ be a family of compact objects of \mathcal{D} such that $\bigoplus E_i$ generates \mathcal{D} . Then every object X of \mathcal{D} can be written as*

$$X = \text{hocolim} X_n$$

where X_1 is a direct sum of shifts of the E_i and each transition morphism fits into a distinguished triangle $Y_n \rightarrow X_n \rightarrow X_{n+1} \rightarrow Y_n[1]$ where Y_n is a direct sum of shifts of the E_i .

Proof. Set $X_1 = \bigoplus_{(i,m,\varphi)} E_i[m]$ where the direct sum is over all triples (i, m, φ) such that $i \in I, m \in \mathbf{Z}$ and $\varphi : E_i[m] \rightarrow X$. Then X_1 comes equipped with a canonical morphism $X_1 \rightarrow X$. Given $X_n \rightarrow X$ we set $Y_n = \bigoplus_{(i,m,\varphi)} E_i[m]$ where the direct sum is over all triples (i, m, φ) such that $i \in I, m \in \mathbf{Z}$, and $\varphi : E_i[m] \rightarrow X_n$ is a morphism such that $E_i[m] \rightarrow X_n \rightarrow X$ is zero. Choose a distinguished triangle $Y_n \rightarrow X_n \rightarrow X_{n+1} \rightarrow Y_n[1]$ and let $X_{n+1} \rightarrow X$ be any morphism such that $X_n \rightarrow X_{n+1} \rightarrow X$ is the given one; such a morphism exists by our choice of Y_n . We obtain a morphism $\text{hocolim} X_n \rightarrow X$ by the construction of our maps $X_n \rightarrow X$. Choose a distinguished triangle

$$C \rightarrow \text{hocolim} X_n \rightarrow X \rightarrow C[1]$$

Let $E_i[m] \rightarrow C$ be a morphism. Since E_i is compact, the composition $E_i[m] \rightarrow X \rightarrow \text{hocolim} X_n$ factors through X_n for some n , say by $E_i[m] \rightarrow X_n$. Then the construction of Y_n shows that the composition $E_i[m] \rightarrow X_n \rightarrow X_{n+1}$ is zero. In other words, the composition $E_i[m] \rightarrow C \rightarrow \text{hocolim} X_n$ is zero. This means that our morphism $E_i[m] \rightarrow C$ comes from a morphism $E_i[m] \rightarrow X[-1]$. The construction of X_1 then shows that such morphism lifts to $\text{hocolim} X_n$ and we conclude that our morphism $E_i[m] \rightarrow C$ is zero. The assumption that $\bigoplus E_i$ generates \mathcal{D} implies that C is zero and the proof is done. \square

Lemma 13.34.4. *With assumptions and notation as in Lemma 13.34.3. If C is a compact object and $C \rightarrow X_n$ is a morphism, then there is a factorization $C \rightarrow E \rightarrow X_n$ where E is an object of $\langle E_{i_1} \oplus \dots \oplus E_{i_t} \rangle$ for some $i_1, \dots, i_t \in I$.*

Proof. We prove this by induction on n . The base case $n = 1$ is clear. If $n > 1$ consider the composition $C \rightarrow X_n \rightarrow Y_{n-1}[1]$. This can be factored through some $E'[1] \rightarrow Y_{n-1}[1]$ where E' is a finite direct sum of shifts of the E_i . Let $I' \subset I$ be the finite set of indices that occur in this direct sum. Thus we obtain

$$\begin{array}{ccccccc} E' & \longrightarrow & C' & \longrightarrow & C & \longrightarrow & E'[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ Y_{n-1} & \longrightarrow & X_{n-1} & \longrightarrow & X_n & \longrightarrow & Y_{n-1}[1] \end{array}$$

By induction the morphism $C' \rightarrow X_{n-1}$ factors through $E'' \rightarrow X_{n-1}$ with E'' an object of $\langle \bigoplus_{i \in I''} E_i \rangle$ for some finite subset $I'' \subset I$. Choose a distinguished triangle

$$E' \rightarrow E'' \rightarrow E \rightarrow E'[1]$$

then E is an object of $\langle \bigoplus_{i \in I' \cup I''} E_i \rangle$. By construction and the axioms of a triangulated category we can choose morphisms $C \rightarrow E$ and a morphism $E \rightarrow X_n$ fitting into morphisms of triangles $(E', C', C) \rightarrow (E', E'', E)$ and $(E', E'', E) \rightarrow (Y_{n-1}, X_{n-1}, X_n)$. The composition $C \rightarrow E \rightarrow X_n$ may not equal the given morphism $C \rightarrow X_n$, but the compositions into Y_{n-1} are equal. Let $C \rightarrow X_{n-1}$ be

a morphism that lifts the difference. By induction assumption we can factor this through a morphism $E''' \rightarrow X_{n-1}$ with E'' an object of $\langle \bigoplus_{i \in I'''} E_i \rangle$ for some finite subset $I' \subset I$. Thus we see that we get a solution on considering $E \oplus E''' \rightarrow X_n$ because $E \oplus E'''$ is an object of $\langle \bigoplus_{i \in I' \cup I'' \cup I'''} E_i \rangle$. \square

Definition 13.34.5. Let \mathcal{D} be a triangulated category with arbitrary direct sums. We say \mathcal{D} is *compactly generated* if there exists a set $E_i, i \in I$ of compact objects such that $\bigoplus E_i$ generates \mathcal{D} .

The following proposition clarifies the relationship between classical generators and weak generators.

Proposition 13.34.6. *Let \mathcal{D} be a triangulated category with direct sums. Let E be a compact object of \mathcal{D} . The following are equivalent*

- (1) E is a classical generator for \mathcal{D}_c and \mathcal{D} is compactly generated, and
- (2) E is a generator for \mathcal{D} .

Proof. If E is a classical generator for \mathcal{D}_c , then $\mathcal{D}_c = \langle E \rangle$. It follows formally from the assumption that \mathcal{D} is compactly generated and Lemma 13.33.2 that E is a generator for \mathcal{D} .

The converse is more interesting. Assume that E is a generator for \mathcal{D} . Let X be a compact object of \mathcal{D} . Apply Lemma 13.34.3 with $I = \{1\}$ and $E_1 = E$ to write

$$X = \text{hocolim} X_n$$

as in the lemma. Since X is compact we find that $X \rightarrow \text{hocolim} X_n$ factors through X_n for some n (Lemma 13.31.5). Thus X is a direct summand of X_n . By Lemma 13.34.4 we see that X is an object of $\langle E \rangle$ and the lemma is proven. \square

13.35. Brown representability

A reference for the material in this section is [Nee96].

Lemma 13.35.1. *Let \mathcal{D} be a triangulated with direct sums which is compactly generated. Let $H : \mathcal{D} \rightarrow \text{Ab}$ be a contravariant cohomological functor which transforms direct sums into products. Then H is representable.*

Proof. Let $E_i, i \in I$ be a set of compact objects such that $\bigoplus_{i \in I} E_i$ generates \mathcal{D} . We may and do assume that the set of objects $\{E_i\}$ is preserved under shifts. Consider pairs (i, a) where $i \in I$ and $a \in H(E_i)$ and set

$$X_1 = \bigoplus_{(i,a)} E_i$$

Since $H(X_1) = \prod_{(i,a)} H(E_i)$ we see that $(a)_{(i,a)}$ defines an element $a_1 \in H(X_1)$. Set $H_1 = \text{Hom}_{\mathcal{D}}(-, X_1)$. By Yoneda's lemma (Categories, Lemma 4.3.5) the element a_1 defines a natural transformation $H_1 \rightarrow H$.

We are going to inductively construct X_n and transformations $a_n : H_n \rightarrow H$ where $H_n = \text{Hom}_{\mathcal{D}}(-, X_n)$. Namely, we apply the procedure above to the functor $\text{Ker}(H_n \rightarrow H)$ to get an object

$$K_{n+1} = \bigoplus_{(i,k), k \in \text{Ker}(H_n(E_i) \rightarrow H(E_i))} E_i$$

and a transformation $\text{Hom}_{\mathcal{D}}(-, K_{n+1}) \rightarrow \text{Ker}(H_n \rightarrow H)$. By Yoneda's lemma the composition $\text{Hom}_{\mathcal{D}}(-, K_{n+1}) \rightarrow H_n$ gives a morphism $K_{n+1} \rightarrow X_n$. We choose a distinguished triangle

$$K_{n+1} \rightarrow X_n \rightarrow X_{n+1} \rightarrow K_{n+1}[1]$$

in \mathcal{D} . The element $a_n \in H(X_n)$ maps to zero in $H(K_{n+1})$ by construction. Since H is cohomological we can lift it to an element $a_{n+1} \in H(X_{n+1})$.

We claim that $X = \text{hocolim} X_n$ represents H . First of all, by our definition of derived colimits and the fact that H transforms direct sums into products, we see that $H(X) = \lim H(X_n)$. Thus $a = (a_n)$ gives an element in $H(X)$ and hence a natural transformation $\text{Hom}_{\mathcal{D}}(-, X) \rightarrow H$ such that

$$\text{Hom}_{\mathcal{D}}(-, X_1) \rightarrow \text{Hom}_{\mathcal{D}}(-, X_2) \rightarrow \text{Hom}_{\mathcal{D}}(-, X_3) \rightarrow \dots \rightarrow \text{Hom}_{\mathcal{D}}(-, X) \rightarrow H$$

commutes. For each i the map $\text{Hom}_{\mathcal{D}}(E_i, X) \rightarrow H(E_i)$ is surjective, by construction of X_1 . On the other hand, by construction of $X_n \rightarrow X_{n+1}$ the kernel of $\text{Hom}_{\mathcal{D}}(E_i, X_n) \rightarrow H(E_i)$ is killed by the map $\text{Hom}_{\mathcal{D}}(E_i, X_n) \rightarrow \text{Hom}_{\mathcal{D}}(E_i, X_{n+1})$. Since

$$\text{Hom}_{\mathcal{D}}(E_i, X) = \text{colim} \text{Hom}_{\mathcal{D}}(E_i, X_n)$$

by Lemma 13.31.5 we see that $\text{Hom}_{\mathcal{D}}(E_i, X) \rightarrow H(E_i)$ is injective.

To finish the proof, consider the subcategory

$$\mathcal{D}' = \{Y \in \text{Ob}(\mathcal{D}) \mid \text{Hom}_{\mathcal{D}}(Y[n], X) \rightarrow H(Y[n]) \text{ is an isomorphism for all } n\}$$

As $\text{Hom}_{\mathcal{D}}(-, X) \rightarrow H$ is a transformation between cohomological functors, the subcategory \mathcal{D}' is a strictly full, saturated, triangulated subcategory of \mathcal{D} (details omitted; see proof of Lemma 13.6.3). Moreover, as both H and $\text{Hom}_{\mathcal{D}}(-, X)$ transform direct sums into products, we see that direct sums of objects of \mathcal{D}' are in \mathcal{D}' . Thus derived colimits of objects of \mathcal{D}' are in \mathcal{D}' . Since $\{E_i\}$ is preserved under shifts, we see that E_i is an object of \mathcal{D}' for all i . It follows from Lemma 13.34.3 that $\mathcal{D}' = \mathcal{D}$ and the proof is complete. \square

Proposition 13.35.2. *Let \mathcal{D} be a triangulated with direct sums which is compactly generated. Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be an additive functor of triangulated categories which transforms direct sums into direct sums. Then F has a right adjoint. If F is an exact functor, then so is the adjoint.*

Proof. For an object Y of \mathcal{D}' consider the contravariant functor

$$\mathcal{D} \rightarrow \text{Ab}, \quad W \mapsto \text{Hom}_{\mathcal{D}'}(F(W), Y)$$

This is a cohomological functors as F is exact and transforms direct sums into products as F transforms direct sums into direct sums. Thus by Lemma 13.35.1 we find an object X of \mathcal{D} such that $\text{Hom}_{\mathcal{D}}(W, X) = \text{Hom}_{\mathcal{D}'}(F(W), Y)$. The existence of the adjoint follows from Categories, Lemma 4.24.2. Exactness if F is exact, follows from Lemma 13.7.1. \square

Simplicial Methods

14.1. Introduction

This is a minimal introduction to simplicial methods. We just add here whenever something is needed later on. A general reference to this material is perhaps [GJ99]. An example of the things you can do is the paper by Quillen on Homotopical Algebra, see [Qui67] or the paper on Étale Homotopy by Artin and Mazur, see [AM69].

14.2. The category of finite ordered sets

The category Δ is the category with

- (1) objects $[0], [1], [2], \dots$ with $[n] = \{0, 1, 2, \dots, n\}$ and
- (2) a morphism $[n] \rightarrow [m]$ is a nondecreasing map $\{0, 1, 2, \dots, n\} \rightarrow \{0, 1, 2, \dots, m\}$ between the corresponding sets.

Here *nondecreasing* for a map $\varphi : [n] \rightarrow [m]$ means by definition that $\varphi(i) \geq \varphi(j)$ if $i \geq j$. In other words, Δ is a category equivalent to the “big” category of finite totally ordered sets and nondecreasing maps. There are exactly $n + 1$ morphisms $[0] \rightarrow [n]$ and there is exactly 1 morphism $[n] \rightarrow [0]$. There are exactly $(n + 1)(n + 2)/2$ morphisms $[1] \rightarrow [n]$ and there are exactly $n + 2$ morphisms $[n] \rightarrow [1]$. And so on and so forth.

Definition 14.2.1. For any integer $n \geq 1$, and any $0 \leq j \leq n$ we let $\delta_j^n : [n - 1] \rightarrow [n]$ denote the injective order preserving map skipping j . For any integer $n \geq 0$, and any $0 \leq j \leq n$ we denote $\sigma_j^n : [n + 1] \rightarrow [n]$ the surjective order preserving map with $(\sigma_j^n)^{-1}(\{j\}) = \{j, j + 1\}$.

Lemma 14.2.2. Any morphism in Δ can be written as a composition of the morphisms δ_j^n and σ_j^n .

Proof. Let $\varphi : [n] \rightarrow [m]$ be a morphism of Δ . If $j \notin \text{Im}(\varphi)$, then we can write φ as $\delta_j^m \circ \psi$ for some morphism $\psi : [n] \rightarrow [m - 1]$. If $\varphi(j) = \varphi(j + 1)$ then we can write φ as $\psi \circ \sigma_j^{n-1}$ for some morphism $\psi : [n - 1] \rightarrow [m]$. The result follows because each replacement as above lowers $n + m$ and hence at some point φ is both injective and surjective, hence an identity morphism. \square

Lemma 14.2.3. The morphisms δ_j^n and σ_j^n satisfy the following relations.

- (1) If $0 \leq i < j \leq n + 1$, then $\delta_j^{n+1} \circ \delta_i^n = \delta_i^{n+1} \circ \delta_{j-1}^n$. In other words the diagram

commutes.

- (2) If $0 \leq i < j \leq n - 1$, then $\sigma_j^{n-1} \circ \delta_i^n = \delta_i^{n-1} \circ \sigma_{j-1}^{n-2}$. In other words the diagram

commutes.

- (3) If $0 \leq j \leq n - 1$, then $\sigma_j^{n-1} \circ \delta_j^n = id_{[n-1]}$ and $\sigma_j^{n-1} \circ \delta_{j+1}^n = id_{[n-1]}$. In other words the diagram

commutes.

- (4) If $0 < j + 1 < i \leq n$, then $\sigma_j^{n-1} \circ \delta_i^n = \delta_{i-1}^{n-1} \circ \sigma_j^{n-2}$. In other words the diagram

commutes.

- (5) If $0 \leq i \leq j \leq n - 1$, then $\sigma_j^{n-1} \circ \sigma_i^n = \sigma_i^{n-1} \circ \sigma_{j+1}^n$. In other words the diagram

commutes.

Proof. Omitted. □

Lemma 14.2.4. *The category Δ is the universal category with objects $[n]$, $n \geq 0$ and morphisms δ_j^n and σ_j^n such that (a) every morphism is a composition of these morphisms, (b) the relations listed in Lemma 14.2.3 are satisfied, and (c) any relation among the morphisms is a consequence of those relations.*

Proof. Omitted. □

14.3. Simplicial objects

Definition 14.3.1. Let \mathcal{C} be a category.

- (1) A *simplicial object* U of \mathcal{C} is a contravariant functor U from Δ to \mathcal{C} , in a formula:

$$U : \Delta^{opp} \longrightarrow \mathcal{C}$$

- (2) If \mathcal{C} is the category of sets, then we call U a *simplicial set*.
 (3) If \mathcal{C} is the category of abelian groups, then we call U a *simplicial abelian group*.
 (4) A *morphism of simplicial objects* $U \rightarrow U'$ is a transformation of functors.
 (5) The *category of simplicial objects of \mathcal{C}* is denoted $\text{Simp}(\mathcal{C})$.

This means there are objects $U([0]), U([1]), U([2]), \dots$ and for φ any nondecreasing map $\varphi : [m] \rightarrow [n]$ a morphism $U(\varphi) : U([n]) \rightarrow U([m])$, satisfying $U(\varphi \circ \psi) = U(\psi) \circ U(\varphi)$.

In particular there is a unique morphism $U([0]) \rightarrow U([n])$ and there are exactly $n+1$ morphisms $U([n]) \rightarrow U([0])$ corresponding to the $n+1$ maps $[0] \rightarrow [n]$. Obviously we need some more notation to be able to talk intelligently about these simplicial objects. We do this by considering the morphisms we singled out in Section 14.2 above.

Lemma 14.3.2. *Let \mathcal{C} be a category.*

- (1) *Given a simplicial object U in \mathcal{C} we obtain a sequence of objects $U_n = U([n])$ endowed with the morphisms $d_j^n = U(\delta_j^n) : U_n \rightarrow U_{n-1}$ and $s_j^n = U(\sigma_j^n) : U_n \rightarrow U_{n+1}$. These morphisms satisfy the opposites of the relations displayed in Lemma 14.2.3.*
 (2) *Conversely, given a sequence of objects U_n and morphisms d_j^n, s_j^n satisfying these relations there exists a unique simplicial object U in \mathcal{C} such that $U_n = U([n])$, $d_j^n = U(\delta_j^n)$, and $s_j^n = U(\sigma_j^n)$.*

- (3) A morphism between simplicial objects U and U' is given by a family of morphisms $U_n \rightarrow U'_n$ commuting with the morphisms d_j^n and s_j^n .

Proof. This follows from Lemma 14.2.4. \square

Remark 14.3.3. By abuse of notation we sometimes write $d_i : U_n \rightarrow U_{n-1}$ instead of d_i^n , and similarly for $s_i : U_n \rightarrow U_{n+1}$. The relations among the morphisms d_i^n and s_i^n may be expressed as follows:

- (1) If $i < j$, then $d_i \circ d_j = d_{j-1} \circ d_i$.
- (2) If $i < j$, then $d_i \circ s_j = s_{j-1} \circ d_i$.
- (3) We have $\text{id} = d_j \circ s_j = d_{j+1} \circ s_j$.
- (4) If $i > j + 1$, then $d_i \circ s_j = s_j \circ d_{i-1}$.
- (5) If $i \leq j$, then $s_i \circ s_j = s_{j+1} \circ s_i$.

This means that whenever the compositions on both the left and the right are defined then the corresponding equality should hold.

We get a unique morphism $s_0^0 = U(\sigma_0^0) : U_0 \rightarrow U_1$ and two morphisms $d_0^1 = U(\delta_0^1)$, and $d_1^1 = U(\delta_1^1)$ which are morphisms $U_1 \rightarrow U_0$. There are two morphisms $s_0^1 = U(\sigma_0^1)$, $s_1^1 = U(\sigma_1^1)$ which are morphisms $U_1 \rightarrow U_2$. Three morphisms $d_0^2 = U(\delta_0^2)$, $d_1^2 = U(\delta_1^2)$, $d_2^2 = U(\delta_2^2)$ which are morphisms $U_3 \rightarrow U_2$. And so on.

Pictorially we think of U as follows:

$$U_2 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} U_1 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} U_0$$

Here the d -morphisms are the arrows pointing right and the s -morphisms are the arrows pointing left.

Example 14.3.4. The simplest example is the *constant* simplicial object with value $X \in \text{Ob}(\mathcal{C})$. In other words, $U_n = X$ and all maps are id_X .

Example 14.3.5. Suppose that $Y \rightarrow X$ is a morphism of \mathcal{C} such that all the fibred products $Y \times_X Y \times_X \dots \times_X Y$ exist. Then we set U_n equal to the $(n+1)$ -fold fibre product, and we let $\varphi : [n] \rightarrow [m]$ correspond to the map (on “coordinates”) $(y_0, \dots, y_m) \mapsto (y_{\varphi(0)}, \dots, y_{\varphi(n)})$. In other words, the map $U_0 = Y \rightarrow U_1 = Y \times_X Y$ is the diagonal map. The two maps $U_1 = Y \times_X Y \rightarrow U_0 = Y$ are the projection maps.

Geometrically Example 14.3.5 above is an important example. It tells us that it is a good idea to think of the maps $d_j^n : U_n \rightarrow U_{n-1}$ as projection maps (forgetting the j th component), and to think of the maps $s_j^n : U_n \rightarrow U_{n+1}$ as diagonal maps (repeating the j th coordinate). We will return to this in the sections below.

Lemma 14.3.6. Let \mathcal{C} be a category. Let U be a simplicial object of \mathcal{C} . Each of the morphisms $s_i^n : U_n \rightarrow U_{n+1}$ has a left inverse. In particular s_i^n is a monomorphism.

Proof. This is true because $d_i^{n+1} \circ s_i^n = \text{id}_{U_n}$. \square

14.4. Simplicial objects as presheaves

Another observation is that we may think of a simplicial object of \mathcal{C} as a presheaf with values in \mathcal{C} over Δ . See Sites, Definition 7.2.2. And in fact, if U, U' are simplicial objects of \mathcal{C} , then we have

$$(14.4.0.1) \quad \text{Mor}(U, U') = \text{Mor}_{\text{PSh}(\Delta)}(U, U').$$

Some of the material below could be replaced by the more general constructions in the chapter on sites. However, it seems a clearer picture arises from the arguments specific to simplicial objects.

14.5. Cosimplicial objects

A cosimplicial object of a category \mathcal{C} could be defined simply as a simplicial object of the opposite category \mathcal{C}^{opp} . This is not really how the human brain works, so we introduce them separately here and point out some simple properties.

Definition 14.5.1. Let \mathcal{C} be a category.

- (1) A *cosimplicial object* U of \mathcal{C} is a covariant functor U from Δ to \mathcal{C} , in a formula:

$$U : \Delta \longrightarrow \mathcal{C}$$

- (2) If \mathcal{C} is the category of sets, then we call U a *cosimplicial set*.
 (3) If \mathcal{C} is the category of abelian groups, then we call U a *cosimplicial abelian group*.
 (4) A *morphism of cosimplicial objects* $U \rightarrow U'$ is a transformation of functors.
 (5) The *category of cosimplicial objects of \mathcal{C}* is denoted $\text{CoSimp}(\mathcal{C})$.

This means there are objects $U([0]), U([1]), U([2]), \dots$ and for φ any nondecreasing map $\varphi : [m] \rightarrow [n]$ a morphism $U(\varphi) : U([m]) \rightarrow U([n])$, satisfying $U(\varphi \circ \psi) = U(\varphi) \circ U(\psi)$.

In particular there is a unique morphism $U([n]) \rightarrow U([0])$ and there are exactly $n+1$ morphisms $U([0]) \rightarrow U([n])$ corresponding to the $n+1$ maps $[0] \rightarrow [n]$. Obviously we need some more notation to be able to talk intelligently about these simplicial objects. We do this by considering the morphisms we singled out in Section 14.2 above.

Lemma 14.5.2. Let \mathcal{C} be a category.

- (1) Given a cosimplicial object U in \mathcal{C} we obtain a sequence of objects $U_n = U([n])$ endowed with the morphisms $\delta_j^n = U(\delta_j^n) : U_{n-1} \rightarrow U_n$ and $\sigma_j^n = U(\sigma_j^n) : U_{n+1} \rightarrow U_n$. These morphisms satisfy the relations displayed in Lemma 14.2.3.
 (2) Conversely, given a sequence of objects U_n and morphisms δ_j^n, σ_j^n satisfying these relations there exists a unique cosimplicial object U in \mathcal{C} such that $U_n = U([n])$, $\delta_j^n = U(\delta_j^n)$, and $\sigma_j^n = U(\sigma_j^n)$.
 (3) A morphism between cosimplicial objects U and U' is given by a family of morphisms $U_n \rightarrow U'_n$ commuting with the morphisms δ_j^n and σ_j^n .

Proof. This follows from Lemma 14.2.4. □

Remark 14.5.3. By abuse of notation we sometimes write $\delta_i : U_{n-1} \rightarrow U_n$ instead of δ_i^n , and similarly for $\sigma_i : U_{n+1} \rightarrow U_n$. The relations among the morphisms δ_i^n and σ_i^n may be expressed as follows:

- (1) If $i < j$, then $\delta_j \circ \delta_i = \delta_i \circ \delta_{j-1}$.
 (2) If $i < j$, then $\sigma_j \circ \delta_i = \delta_i \circ \sigma_{j-1}$.
 (3) We have $\text{id} = \sigma_j \circ \delta_j = \sigma_j \circ \delta_{j+1}$.
 (4) If $i > j + 1$, then $\sigma_j \circ \delta_i = \delta_{i-1} \circ \sigma_j$.
 (5) If $i \leq j$, then $\sigma_j \circ \sigma_i = \sigma_i \circ \sigma_{j+1}$.

This means that whenever the compositions on both the left and the right are defined then the corresponding equality should hold.

We get a unique morphism $\sigma_0^0 = U(\sigma_0^0) : U_1 \rightarrow U_0$ and two morphisms $\delta_0^1 = U(\delta_0^1)$, and $\delta_1^1 = U(\delta_1^1)$ which are morphisms $U_0 \rightarrow U_1$. There are two morphisms $\sigma_0^1 = U(\sigma_0^1)$, $\sigma_1^1 = U(\sigma_1^1)$ which are morphisms $U_2 \rightarrow U_1$. Three morphisms $\delta_0^2 = U(\delta_0^2)$, $\delta_1^2 = U(\delta_1^2)$, $\delta_2^2 = U(\delta_2^2)$ which are morphisms $U_2 \rightarrow U_3$. And so on.

Pictorially we think of U as follows:

$$U_0 \begin{array}{c} \xrightarrow{\delta_0^1} \\ \xleftarrow{\sigma_0^1} \\ \xrightarrow{\delta_1^1} \\ \xleftarrow{\sigma_1^1} \end{array} U_1 \begin{array}{c} \xrightarrow{\delta_1^2} \\ \xleftarrow{\sigma_1^2} \\ \xrightarrow{\delta_2^2} \\ \xleftarrow{\sigma_2^2} \end{array} U_2$$

Here the δ -morphisms are the arrows pointing right and the σ -morphisms are the arrows pointing left.

Example 14.5.4. The simplest example is the *constant* cosimplicial object with value $X \in \text{Ob}(\mathcal{C})$. In other words, $U_n = X$ and all maps are id_X .

Example 14.5.5. Suppose that $Y \rightarrow X$ is a morphism of \mathcal{C} such that all the pushouts $Y \amalg_X Y \amalg_X \dots \amalg_X Y$ exist. Then we set U_n equal to the $(n+1)$ -fold pushout, and we let $\varphi : [n] \rightarrow [m]$ correspond to the map

$$(y \text{ in } i\text{th component}) \mapsto (y \text{ in } \varphi(i)\text{th component})$$

on “coordinates”. In other words, the map $U_1 = Y \amalg_X Y \rightarrow U_0 = Y$ is the identity on each component. The two maps $U_0 = Y \rightarrow U_1 = Y \amalg_X Y$ are the two natural maps.

Lemma 14.5.6. *Let \mathcal{C} be a category. Let U be a cosimplicial object of \mathcal{C} . Each of the morphisms $\delta_i^n : U_{n-1} \rightarrow U_n$ has a left inverse. In particular δ_i^n is a monomorphism.*

Proof. This is true because $\sigma_i^{n-1} \circ \delta_i^n = \text{id}_{U_n}$ for $j < n$. □

14.6. Products of simplicial objects

Of course we should define the product of simplicial objects as the product in the category of simplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the product directly as follows.

Definition 14.6.1. Let \mathcal{C} be a category. Let U and V be simplicial objects of \mathcal{C} . Assume the products $U_n \times V_n$ exist in \mathcal{C} . The *product of U and V* is the simplicial object $U \times V$ defined as follows:

- (1) $(U \times V)_n = U_n \times V_n$,
- (2) $d_i^n = (d_i^n, d_i^n)$, and
- (3) $s_i^n = (s_i^n, s_i^n)$.

In other words, $U \times V$ is the product of the presheaves U and V on Δ .

Lemma 14.6.2. *If U and V are simplicial objects in the category \mathcal{C} , and if $U \times V$ exists, then we have*

$$\text{Mor}(W, U \times V) = \text{Mor}(W, U) \times \text{Mor}(W, V)$$

for any third simplicial object W of \mathcal{C} .

Proof. Omitted. □

14.7. Fibre products of simplicial objects

Of course we should define the fibre product of simplicial objects as the fibre product in the category of simplicial objects. This may lead to the potentially confusing situation where the fibre product exists but is not described as below. To avoid this we define the fibre product directly as follows.

Definition 14.7.1. Let \mathcal{C} be a category. Let U, V, W be simplicial objects of \mathcal{C} . Let $a : V \rightarrow U$, $b : W \rightarrow U$ be morphisms. Assume the fibre products $V_n \times_{U_n} W_n$ exist in \mathcal{C} . The *fibre product of V and W over U* is the simplicial object $V \times_U W$ defined as follows:

- (1) $(V \times_U W)_n = V_n \times_{U_n} W_n$,
- (2) $d_i^n = (d_i^n, d_i^n)$, and
- (3) $s_i^n = (s_i^n, s_i^n)$.

In other words, $V \times_U W$ is the fibre product of the presheaves V and W over the presheaf U on Δ .

Lemma 14.7.2. *If U, V, W are simplicial objects in the category \mathcal{C} , and if $a : V \rightarrow U$, $b : W \rightarrow U$ are morphisms and if $V \times_U W$ exists, then we have*

$$\text{Mor}(T, V \times_U W) = \text{Mor}(T, V) \times_{\text{Mor}(T, U)} \text{Mor}(T, W)$$

for any fourth simplicial object T of \mathcal{C} .

Proof. Omitted. □

14.8. Pushouts of simplicial objects

Of course we should define the pushout of simplicial objects as the pushout in the category of simplicial objects. This may lead to the potentially confusing situation where the pushouts exist but are not as described below. To avoid this we define the pushout directly as follows.

Definition 14.8.1. Let \mathcal{C} be a category. Let U, V, W be simplicial objects of \mathcal{C} . Let $a : U \rightarrow V$, $b : U \rightarrow W$ be morphisms. Assume the pushouts $V_n \amalg_{U_n} W_n$ exist in \mathcal{C} . The *pushout of V and W over U* is the simplicial object $V \amalg_U W$ defined as follows:

- (1) $(V \amalg_U W)_n = V_n \amalg_{U_n} W_n$,
- (2) $d_i^n = (d_i^n, d_i^n)$, and
- (3) $s_i^n = (s_i^n, s_i^n)$.

In other words, $V \amalg_U W$ is the pushout of the presheaves V and W over the presheaf U on Δ .

Lemma 14.8.2. *If U, V, W are simplicial objects in the category \mathcal{C} , and if $a : U \rightarrow V$, $b : U \rightarrow W$ are morphisms and if $V \amalg_U W$ exists, then we have*

$$\text{Mor}(V \amalg_U W, T) = \text{Mor}(V, T) \times_{\text{Mor}(U, T)} \text{Mor}(W, T)$$

for any fourth simplicial object T of \mathcal{C} .

Proof. Omitted. □

14.9. Products of cosimplicial objects

Of course we should define the product of cosimplicial objects as the product in the category of cosimplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the product directly as follows.

Definition 14.9.1. Let \mathcal{C} be a category. Let U and V be cosimplicial objects of \mathcal{C} . Assume the products $U_n \times V_n$ exist in \mathcal{C} . The *product of U and V* is the cosimplicial object $U \times V$ defined as follows:

- (1) $(U \times V)_n = U_n \times V_n$,
- (2) for any $\varphi : [n] \rightarrow [m]$ the map $(U \times V)(\varphi) : U_n \times V_n \rightarrow U_m \times V_m$ is the product $U(\varphi) \times V(\varphi)$.

Lemma 14.9.2. *If U and V are cosimplicial objects in the category \mathcal{C} , and if $U \times V$ exists, then we have*

$$\text{Mor}(W, U \times V) = \text{Mor}(W, U) \times \text{Mor}(W, V)$$

for any third cosimplicial object W of \mathcal{C} .

Proof. Omitted. □

14.10. Fibre products of cosimplicial objects

Of course we should define the fibre product of cosimplicial objects as the fibre product in the category of cosimplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the fibre product directly as follows.

Definition 14.10.1. Let \mathcal{C} be a category. Let U, V, W be cosimplicial objects of \mathcal{C} . Let $a : V \rightarrow U$ and $b : W \rightarrow U$ be morphisms. Assume the fibre products $V_n \times_{U_n} W_n$ exist in \mathcal{C} . The *fibre product of V and W over U* is the cosimplicial object $V \times_U W$ defined as follows:

- (1) $(V \times_U W)_n = V_n \times_{U_n} W_n$,
- (2) for any $\varphi : [n] \rightarrow [m]$ the map $(V \times_U W)(\varphi) : V_n \times_{U_n} W_n \rightarrow V_m \times_{U_m} W_m$ is the product $V(\varphi) \times_{U(\varphi)} W(\varphi)$.

Lemma 14.10.2. *If U, V, W are cosimplicial objects in the category \mathcal{C} , and if $a : V \rightarrow U$, $b : W \rightarrow U$ are morphisms and if $V \times_U W$ exists, then we have*

$$\text{Mor}(T, V \times_U W) = \text{Mor}(T, V) \times_{\text{Mor}(T, U)} \text{Mor}(T, W)$$

for any fourth cosimplicial object T of \mathcal{C} .

Proof. Omitted. □

14.11. Simplicial sets

Let U be a simplicial set. It is a good idea to think of U_0 as the 0-*simplices*, the set U_1 as the 1-*simplices*, the set U_2 as the 2-*simplices*, and so on.

We think of the maps $s_j^n : U_n \rightarrow U_{n+1}$ as the map that associates to an n -simplex A the degenerate $(n+1)$ -simplex B whose $(j, j+1)$ -edge is collapsed to the vertex j of A . We think of the map $d_j^n : U_n \rightarrow U_{n-1}$ as the map that associates to an n -simplex A one of the faces, namely the face that omits the vertex j . In this way it become possible to visualize the relations among the maps s_j^n and d_j^n geometrically.

Definition 14.11.1. Let U be a simplicial set. We say x is an n -simplex of U to signify that x is an element of U_n . We say that y is the j th face of x to signify that $d_j^n x = y$. We say that z is the j th degeneracy of x if $z = s_j^n x$. A simplex is called *degenerate* if it is the degeneracy of another simplex.

Here are a few fundamental examples.

Example 14.11.2. For every $n \geq 0$ we denote $\Delta[n]$ the simplicial set

$$\begin{aligned} \Delta^{opp} &\longrightarrow \text{Sets} \\ [k] &\longmapsto \text{Mor}_\Delta([k], [n]) \end{aligned}$$

We leave it to the reader to verify the following statements. Every m -simplex of $\Delta[n]$ with $m > n$ is degenerate. There is a unique nondegenerate n -simplex of $\Delta[n]$, namely $\text{id}_{[n]}$.

Lemma 14.11.3. Let U be a simplicial set. Let $n \geq 0$ be an integer. There is a canonical bijection

$$\text{Mor}(\Delta[n], U) \longrightarrow U_n$$

which maps a morphism φ to the value of φ on the unique nondegenerate n -simplex of $\Delta[n]$.

Proof. Omitted. □

Example 14.11.4. Consider the category $\Delta/[n]$ of objects over $[n]$ in Δ , see Categories, Example 4.2.13. There is a functor $p : \Delta/[n] \rightarrow \Delta$. The fibre category of p over $[k]$, see Categories, Section 4.33, has as objects the set $\Delta[n]_k$ of k -simplices in $\Delta[n]$, and as morphisms only identities. For every morphism $\varphi : [k] \rightarrow [l]$ of Δ , and every object $\psi : [l] \rightarrow [n]$ in the fibre category over $[l]$ there is a unique object over $[k]$ with a morphism covering φ , namely $\psi \circ \varphi : [k] \rightarrow [n]$. Thus $\Delta/[n]$ is fibred in sets over Δ . In other words, we may think of $\Delta/[n]$ as a presheaf of sets over Δ . See also, Categories, Example 4.36.7. And this presheaf of sets agrees with the simplicial set $\Delta[n]$. In particular, from Equation (14.4.0.1) and Lemma 14.11.3 above we get the formula

$$\text{Mor}_{PSh(\Delta)}(\Delta/[n], U) = U_n$$

for any simplicial set U .

Lemma 14.11.5. Let U, V be simplicial sets. Let $a, b \geq 0$ be integers. Assume every n -simplex of U is degenerate if $n > a$. Assume every n -simplex of V is degenerate if $n > b$. Then every n -simplex of $U \times V$ is degenerate if $n > a + b$.

Proof. Suppose $n > a + b$. Let $(u, v) \in (U \times V)_n = U_n \times V_n$. By assumption, there exists a $\alpha : [n] \rightarrow [a]$ and a $u' \in U_a$ and a $\beta : [n] \rightarrow [b]$ and a $v' \in V_b$ such that $u = U(\alpha)(u')$ and $v = V(\beta)(v')$. Because $n > a + b$, there exists an $0 \leq i \leq a + b$ such that $\alpha(i) = \alpha(i + 1)$ and $\beta(i) = \beta(i + 1)$. It follows immediately that (u, v) is in the image of s_i^{n-1} . □

14.12. Truncated simplicial objects and skeleton functors

Let $\Delta_{\leq n}$ denote the full subcategory of Δ with objects $[0], [1], [2], \dots, [n]$. Let \mathcal{C} be a category.

Definition 14.12.1. An n -truncated simplicial object of \mathcal{C} is a contravariant functor from $\Delta_{\leq n}$ to \mathcal{C} . A morphism of n -truncated simplicial objects is a transformation of functors. We denote the category of n -truncated simplicial objects of \mathcal{C} by the symbol $\text{Simp}_n(\mathcal{C})$.

Given a simplicial object U of \mathcal{C} the truncation $\text{sk}_n U$ is the restriction of U to the subcategory $\Delta_{\leq n}$. This defines a skeleton functor

$$\text{sk}_n : \text{Simp}(\mathcal{C}) \longrightarrow \text{Simp}_n(\mathcal{C})$$

from the category of simplicial objects of \mathcal{C} to the category of n -truncated simplicial objects of \mathcal{C} . See Remark 14.20.6 to avoid possible confusion with other functors in the literature.

14.13. Products with simplicial sets

Let \mathcal{C} be a category. Let U be a simplicial set. Let V be a simplicial object of \mathcal{C} . We can consider the covariant functor which associates to a simplicial object W of \mathcal{C} the set

$$(14.13.0.1) \quad \left\{ (f_{n,u} : V_n \rightarrow W_n)_{n \geq 0, u \in U_n} \text{ such that } \forall \varphi : [m] \rightarrow [n] \quad f_{m, U(\varphi)(u)} \circ V(\varphi) = W(\varphi) \circ f_{n,u} \right\}$$

If this functor is of the form $\text{Mor}_{\text{Simp}(\mathcal{C})}(Q, -)$ then we can think of Q as the product of U with V . Instead of formalizing this in this way we just directly define the product as follows.

Definition 14.13.1. Let \mathcal{C} be a category such that the coproduct of any two objects of \mathcal{C} exists. Let U be a simplicial set. Let V be a simplicial object of \mathcal{C} . Assume that each U_n is finite nonempty. In this case we define the product $U \times V$ of U and V to be the simplicial object of \mathcal{C} whose n th term is the object

$$(U \times V)_n = \coprod_{u \in U_n} V_n$$

with maps for $\varphi : [m] \rightarrow [n]$ given by the morphism

$$\coprod_{u \in U_n} V_n \longrightarrow \coprod_{u' \in U_m} V_m$$

which maps the component V_n corresponding to u to the component V_m corresponding to $u' = U(\varphi)(u)$ via the morphism $V(\varphi)$. More loosely, if all of the coproducts displayed above exist (without assuming anything about \mathcal{C}) we will say that the product $U \times V$ exists.

Lemma 14.13.2. Let \mathcal{C} be a category such that the coproduct of any two objects of \mathcal{C} exists. Let U be a simplicial set. Let V be a simplicial object of \mathcal{C} . Assume that each U_n is finite nonempty. The functor $W \mapsto \text{Mor}_{\text{Simp}(\mathcal{C})}(U \times V, W)$ is canonically isomorphic to the functor which maps W to the set in Equation (14.13.0.1).

Proof. Omitted. □

Lemma 14.13.3. Let \mathcal{C} be a category such that the coproduct of any two objects of \mathcal{C} exists. Let us temporarily denote FSSets the category of simplicial sets all of whose components are finite nonempty.

- (1) The rule $(U, V) \mapsto U \times V$ defines a functor $\text{FSSets} \times \text{Simp}(\mathcal{C}) \rightarrow \text{Simp}(\mathcal{C})$.

(2) For every U, V as above there is a canonical map of simplicial objects

$$U \times V \longrightarrow V$$

defined by taking the identity on each component of $(U \times V)_n = \coprod_u V_n$.

Proof. Omitted. \square

We briefly study a special case of the construction above. Let \mathcal{C} be a category. Let X be an object of \mathcal{C} . Let $k \geq 0$ be an integer. If all coproducts $X \coprod \dots \coprod X$ exist then according to the definition above the product

$$X \times \Delta[k]$$

exists, where we think of X as the corresponding constant simplicial object.

Lemma 14.13.4. *With X and k as above. For any simplicial object V of \mathcal{C} we have the following canonical bijection*

$$\text{Mor}_{\text{Simp}(\mathcal{C})}(X \times \Delta[k], V) \longrightarrow \text{Mor}_{\mathcal{C}}(X, V_k).$$

which maps γ to the restriction of the morphism γ_k to the component corresponding to $\text{id}_{[k]}$. Similarly, for any $n \geq k$, if W is an n -truncated simplicial object of \mathcal{C} , then we have

$$\text{Mor}_{\text{Simp}_n(\mathcal{C})}(sk_n(X \times \Delta[k]), W) = \text{Mor}_{\mathcal{C}}(X, W_k).$$

Proof. A morphism $\gamma : X \times \Delta[k] \rightarrow V$ is given by a family of morphisms $\gamma_\alpha : X \rightarrow V_n$ where $\alpha : [n] \rightarrow [k]$. The morphisms have to satisfy the rules that for all $\varphi : [m] \rightarrow [n]$ the diagrams

$$\begin{array}{ccc} X & \xrightarrow{\gamma_\alpha} & V_n \\ \downarrow \text{id}_X & & \downarrow V(\varphi) \\ X & \xrightarrow{\gamma_{\alpha \circ \varphi}} & V_m \end{array}$$

commute. Taking $\alpha = \text{id}_{[k]}$, we see that for any $\varphi : [m] \rightarrow [k]$ we have $\gamma_\varphi = V(\varphi) \circ \gamma_{\text{id}_{[k]}}$. Thus the morphism γ is determined by the value of γ on the component corresponding to $\text{id}_{[k]}$. Conversely, given such a morphism $f : X \rightarrow V_k$ we easily construct a morphism γ by putting $\gamma_\alpha = V(\alpha) \circ f$.

The truncated case is similar, and left to the reader. \square

A particular example of this is the case $k = 0$. In this case the formula of the lemma just says that

$$\text{Mor}_{\mathcal{C}}(X, V_0) = \text{Mor}_{\text{Simp}(\mathcal{C})}(X, V)$$

where on the right hand side X indicates the constant simplicial object with value X . We will use this formula without further mention in the following.

14.14. Hom from simplicial sets into cosimplicial objects

Let \mathcal{C} be a category. Let U be a simplicial object of \mathcal{C} , and let V be a cosimplicial object of \mathcal{C} . Then we get a cosimplicial set $\text{Hom}_{\mathcal{C}}(U, V)$ as follows:

- (1) we set $\text{Hom}_{\mathcal{C}}(U, V)_n = \text{Mor}_{\mathcal{C}}(U_n, V_n)$, and
- (2) for $\varphi : [m] \rightarrow [n]$ we take the map $\text{Hom}_{\mathcal{C}}(U, V)_m \rightarrow \text{Hom}_{\mathcal{C}}(U, V)_n$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$.

This is our motivation for the following definition.

Definition 14.14.1. Let \mathcal{C} be a category with finite products. Let V be a cosimplicial object of \mathcal{C} . Let U be a simplicial set such that each U_n is finite nonempty. We define $\text{Hom}(U, V)$ to be the cosimplicial object of \mathcal{C} defined as follows:

- (1) we set $\text{Hom}(U, V)_n = \prod_{u \in U_n} V_n$, in other words the unique object of \mathcal{C} such that its X -valued points satisfy

$$\text{Mor}_{\mathcal{C}}(X, \text{Hom}(U, V)_n) = \text{Map}(U_n, \text{Mor}_{\mathcal{C}}(X, V_n))$$

and

- (2) for $\varphi : [m] \rightarrow [n]$ we take the map $\text{Hom}(U, V)_m \rightarrow \text{Hom}(U, V)_n$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$ on X -valued points as above.

We leave it to the reader to spell out the definition in terms of maps between products. We also point out that the construction is functorial in both U (contravariantly) and V (covariantly), exactly as in Lemma 14.13.3 in the case of products of simplicial sets with simplicial objects.

14.15. Internal Hom

Let \mathcal{C} be a category with finite nonempty products. Let U, V be simplicial objects of \mathcal{C} . In some cases the functor

$$\begin{aligned} \text{Simp}(\mathcal{C})^{opp} &\longrightarrow \text{Sets} \\ W &\longmapsto \text{Mor}_{\text{Simp}(\mathcal{C})}(W \times V, U) \end{aligned}$$

is representable. In this case we denote $\mathcal{H}om(V, U)$ the resulting simplicial object of \mathcal{C} , and we say that the *internal hom of V into U exists*. Moreover, in this case we would have

$$\begin{aligned} \text{Mor}_{\mathcal{C}}(X, \mathcal{H}om(V, U)_n) &= \text{Mor}_{\text{Simp}(\mathcal{C})}(X \times \Delta[n], \mathcal{H}om(V, U)) \\ &= \text{Mor}_{\text{Simp}(\mathcal{C})}(X \times \Delta[n] \times V, U) \\ &= \text{Mor}_{\text{Simp}(\mathcal{C})}(X, \mathcal{H}om(\Delta[n] \times V, U)) \\ &= \text{Mor}_{\mathcal{C}}(X, \mathcal{H}om(\Delta[n] \times V, U)_0) \end{aligned}$$

provided that $\mathcal{H}om(\Delta[n] \times V, U)$ exists also. Here we have used the material from Section 14.13.

The lesson we learn from this is that, given U and V , if we want to construct the internal hom then we should try to construct the objects

$$\mathcal{H}om(\Delta[n] \times V, U)_0$$

because these should be the n th term of $\mathcal{H}om(V, U)$. In the next section we study a construction of simplicial objects “ $\text{Hom}(\Delta[n], U)$ ”.

14.16. Hom from simplicial sets into simplicial objects

Motivated by the discussion on internal hom we define what should be the simplicial object classifying morphisms from a simplicial set into a given simplicial object of the category \mathcal{C} .

Definition 14.16.1. Let \mathcal{C} be a category such that the coproduct of any two objects exists. Let U be a simplicial set, with U_n finite nonempty for all $n \geq 0$. Let V be a simplicial object of \mathcal{C} . We denote $\text{Hom}(U, V)$ any simplicial object of \mathcal{C} such that

$$\text{Mor}_{\text{Simp}(\mathcal{C})}(W, \text{Hom}(U, V)) = \text{Mor}_{\text{Simp}(\mathcal{C})}(W \times U, V)$$

functorially in the simplicial object W of \mathcal{C} .

Of course $\text{Hom}(U, V)$ need not exist. Also, by the discussion in Section 14.15 we expect that if it does exist, then $\text{Hom}(U, V)_n = \text{Hom}(U \times \Delta[n], V)_0$. We do not use the italic notation for these Hom objects since $\text{Hom}(U, V)$ is not an internal hom.

Lemma 14.16.2. *Assume the category \mathcal{C} has coproducts of any two objects and countable limits. Let U be a simplicial set, with U_n finite nonempty for all $n \geq 0$. Let V be a simplicial object of \mathcal{C} . Then the functor*

$$\begin{aligned} \mathcal{C}^{opp} &\longrightarrow \text{Sets} \\ X &\longmapsto \text{Mor}_{\text{Simp}(\mathcal{C})}(X \times U, V) \end{aligned}$$

is representable.

Proof. A morphism from $X \times U$ into V is given by a collection of morphisms $f_u : X \rightarrow V_n$ with $n \geq 0$ and $u \in U_n$. And such a collection actually defines a morphism if and only if for all $\varphi : [m] \rightarrow [n]$ all the diagrams

$$\begin{array}{ccc} X & \xrightarrow{f_u} & V_n \\ \text{id}_X \downarrow & & \downarrow V(\varphi) \\ X & \xrightarrow{f_{U(\varphi)(u)}} & V_m \end{array}$$

commute. Thus it is natural to introduce a category \mathcal{U} and a functor $\mathcal{V} : \mathcal{U}^{opp} \rightarrow \mathcal{C}$ as follows:

- (1) The set of objects of \mathcal{U} is $\coprod_{n \geq 0} U_n$,
- (2) a morphism from $u' \in U_m$ to $u \in U_n$ is a $\varphi : [m] \rightarrow [n]$ such that $U(\varphi)(u) = u'$
- (3) for $u \in U_n$ we set $\mathcal{V}(u) = V_n$, and
- (4) for $\varphi : [m] \rightarrow [n]$ such that $U(\varphi)(u) = u'$ we set $\mathcal{V}(\varphi) = V(\varphi) : V_n \rightarrow V_m$.

At this point it is clear that our functor is nothing but the functor defining

$$\lim_{\mathcal{U}^{opp}} \mathcal{V}$$

Thus if \mathcal{C} has countable limits then this limit and hence an object representing the functor of the lemma exist. \square

Lemma 14.16.3. *Assume the category \mathcal{C} has coproducts of any two objects and finite limits. Let U be a simplicial set, with U_n finite nonempty for all $n \geq 0$. Assume that all n -simplices of U are degenerate for all $n \gg 0$. Let V be a simplicial object of \mathcal{C} . Then the functor*

$$\begin{aligned} \mathcal{C}^{opp} &\longrightarrow \text{Sets} \\ X &\longmapsto \text{Mor}_{\text{Simp}(\mathcal{C})}(X \times U, V) \end{aligned}$$

is representable.

Proof. We have to show that the category \mathcal{U} described in the proof of Lemma 14.16.2 has a finite subcategory \mathcal{U}' such that the limit of \mathcal{V} over \mathcal{U}' is the same as the limit of \mathcal{V} over \mathcal{U} . We will use Categories, Lemma 4.17.4. For $m > 0$ let $\mathcal{U}_{\leq m}$ denote the full subcategory with objects $\coprod_{0 \leq n \leq m} U_n$. Let m_0 be an integer such that every n -simplex of the simplicial set U is degenerate if $n > m_0$. For any $m \geq m_0$ large enough, the subcategory $\mathcal{U}_{\leq m}$ satisfies property (1) of Categories, Definition 4.17.3.

Suppose that $u \in U_n$ and $u' \in U_{n'}$ with $n, n' \leq m_0$ and suppose that $\varphi : [k] \rightarrow [n]$, $\varphi' : [k] \rightarrow [n']$ are morphisms such that $U(\varphi)(u) = U(\varphi')(u')$. A simple combinatorial argument shows that if $k > 2m_0$, then there exists an index $0 \leq i \leq 2m_0$ such that $\varphi(i) = \varphi(i + 1)$ and $\varphi'(i) = \varphi'(i + 1)$. (The pigeon hole principle would tell you this works if $k > m_0^2$ which is good enough for the argument below anyways.) Hence, if $k > 2m_0$, we may write $\varphi = \psi \circ \sigma_i^{k-1}$ and $\varphi' = \psi' \circ \sigma_i^{k-1}$ for some $\psi : [k - 1] \rightarrow [n]$ and some $\psi' : [k - 1] \rightarrow [n']$. Since $s_i^{k-1} : U_{k-1} \rightarrow U_k$ is injective, see Lemma 14.3.6, we conclude that $U(\psi)(u) = U(\psi')(u')$ also. Continuing in this fashion we conclude that given morphisms $u \rightarrow z$ and $u' \rightarrow z$ of \mathcal{U} with $u, u' \in \mathcal{U}_{\leq m_0}$, there exists a commutative diagram

with $a \in \mathcal{U}_{\leq 2m_0}$.

It is easy to deduce from this that the finite subcategory $\mathcal{U}_{\leq 2m_0}$ works. Namely, suppose given $x' \in U_n$ and $x'' \in U_{n'}$ with $n, n' \leq 2m_0$ as well as morphisms $x' \rightarrow x$ and $x'' \rightarrow x$ of \mathcal{U} with the same target. By our choice of m_0 we can find objects u, u' of $\mathcal{U}_{\leq m_0}$ and morphisms $u \rightarrow x', u' \rightarrow x''$. By the above we can find $a \in \mathcal{U}_{\leq 2m_0}$ and morphisms $u \rightarrow a, u' \rightarrow a$ such that

is commutative. Turning this diagram 90 degrees clockwise we get the desired diagram as in (2) of Categories, Definition 4.17.3. \square

Lemma 14.16.4. *Assume the category \mathcal{C} has coproducts of any two objects and finite limits. Let U be a simplicial set, with U_n finite nonempty for all $n \geq 0$. Assume that all n -simplices of U are degenerate for all $n \gg 0$. Let V be a simplicial object of \mathcal{C} . Then $\text{Hom}(U, V)$ exists, moreover we have the expected equalities*

$$\text{Hom}(U, V)_n = \text{Hom}(U \times \Delta[n], V)_0.$$

Proof. We construct this simplicial object as follows. For $n \geq 0$ let $\text{Hom}(U, V)_n$ denote the object of \mathcal{C} representing the functor

$$X \longmapsto \text{Mor}_{\text{Simp}(\mathcal{C})}(X \times U \times \Delta[n], V)$$

This exists by Lemma 14.16.3 because $U \times \Delta[n]$ is a simplicial set with finite sets of simplices and no nondegenerate simplices in high enough degree, see Lemma 14.11.5. For $\varphi : [m] \rightarrow [n]$ we obtain an induced map of simplicial sets $\varphi : \Delta[m] \rightarrow \Delta[n]$.

Hence we obtain a morphism $X \times U \times \Delta[m] \rightarrow X \times U \times \Delta[n]$ functorial in X , and hence a transformation of functors, which in turn gives

$$\text{Hom}(U, V)(\varphi) : \text{Hom}(U, V)_n \longrightarrow \text{Hom}(U, V)_m.$$

Clearly this defines a contravariant functor $\text{Hom}(U, V)$ from Δ into the category \mathcal{C} . In other words, we have a simplicial object of \mathcal{C} .

We have to show that $\text{Hom}(U, V)$ satisfies the desired universal property

$$\text{Mor}_{\text{Simp}(\mathcal{C})}(W, \text{Hom}(U, V)) = \text{Mor}_{\text{Simp}(\mathcal{C})}(W \times U, V)$$

To see this, let $f : W \rightarrow \text{Hom}(U, V)$ be given. We want to construct the element $f' : W \times U \rightarrow V$ of the right hand side. By construction, each $f_n : W_n \rightarrow \text{Hom}(U, V)_n$ corresponds to a morphism $f_n : W_n \times U \times \Delta[n] \rightarrow V$. Further, for every morphism $\varphi : [m] \rightarrow [n]$ the diagram

$$\begin{array}{ccc} W_n \times U \times \Delta[m] & \xrightarrow{W(\varphi) \times \text{id} \times \text{id}} & W_m \times U \times \Delta[m] \\ \text{id} \times \text{id} \times \varphi \downarrow & & \downarrow f_m \\ W_n \times U \times \Delta[n] & \xrightarrow{f_n} & V \end{array}$$

is commutative. For $\psi : [n] \rightarrow [k]$ in $(\Delta[n])_k$ we denote $(f_n)_{k,\psi} : W_n \times U_k \rightarrow V_k$ the component of $(f_n)_k$ corresponding to the element ψ . We define $f'_n : W_n \times U_n \rightarrow V_n$ as $f'_n = (f_n)_{n,\text{id}}$, in other words, as the restriction of $(f_n)_n : W_n \times U_n \times (\Delta[n])_n \rightarrow V_n$ to $W_n \times U_n \times \text{id}_{[n]}$. To see that the collection (f'_n) defines a morphism of simplicial objects, we have to show for any $\varphi : [m] \rightarrow [n]$ that $V(\varphi) \circ f'_n = f'_m \circ W(\varphi) \times U(\varphi)$. The commutative diagram above says that $(f_n)_{m,\varphi} : W_n \times U_m \rightarrow V_m$ is equal to $(f_m)_{m,\text{id}} \circ W(\varphi) : W_n \times U_m \rightarrow V_m$. But then the fact that f_n is a morphism of simplicial objects implies that the diagram

$$\begin{array}{ccc} W_n \times U_n \times (\Delta[n])_n & \xrightarrow{(f_n)_n} & V_n \\ \text{id} \times U(\varphi) \times \varphi \downarrow & & \downarrow V(\varphi) \\ W_n \times U_m \times (\Delta[n])_m & \xrightarrow{(f_n)_m} & V_m \end{array}$$

is commutative. And this implies that $(f_n)_{m,\varphi} \circ U(\varphi)$ is equal to $V(\varphi) \circ (f_n)_{n,\text{id}}$. Altogether we obtain $V(\varphi) \circ (f_n)_{n,\text{id}} = (f_n)_{m,\varphi} \circ U(\varphi) = (f_m)_{m,\text{id}} \circ W(\varphi) \circ U(\varphi) = (f_m)_{m,\text{id}} \circ W(\varphi) \times U(\varphi)$ as desired.

On the other hand, given a morphism $f' : W \times U \rightarrow V$ we define a morphism $f : W \rightarrow \text{Hom}(U, V)$ as follows. By Lemma 14.13.4 the morphisms $\text{id} : W_n \rightarrow W_n$ corresponds to a unique morphism $c_n : W_n \times \Delta[n] \rightarrow W$. Hence we can consider the composition

$$W_n \times \Delta[n] \times U \xrightarrow{c_n} W \times U \xrightarrow{f'} V.$$

By construction this corresponds to a unique morphism $f_n : W_n \rightarrow \text{Hom}(U, V)_n$. We leave it to the reader to see that these define a morphism of simplicial sets as desired.

We also leave it to the reader to see that $f \mapsto f'$ and $f' \mapsto f$ are mutually inverse operations. \square

We spell out the construction above in a special case. Let X be an object of a category \mathcal{C} . Assume that self products $X \times \dots \times X$ exist. Let k be an integer. Consider the simplicial object U with terms

$$U_n = \prod_{\alpha \in \text{Mor}([k],[n])} X$$

and maps given $\varphi : [m] \rightarrow [n]$

$$\begin{aligned} U(\varphi) : \prod_{\alpha \in \text{Mor}([k],[n])} X &\longrightarrow \prod_{\alpha' \in \text{Mor}([k],[m])} X \\ (f_\alpha)_\alpha &\longmapsto (f_{\varphi \circ \alpha'})_{\alpha'} \end{aligned}$$

In terms of “coordinates”, the element $(x_\alpha)_\alpha$ is mapped to the element $(x_{\varphi \circ \alpha'})_{\alpha'}$. We claim this object is equal to

$$\text{Hom}(\Delta[k], X)$$

where we think of X as the constant simplicial object X .

Lemma 14.16.5. *With X , k and U as above.*

- (1) *For any simplicial object V of \mathcal{C} we have the following canonical bijection*

$$\text{Mor}_{\text{Simp}(\mathcal{C})}(V, U) \longrightarrow \text{Mor}_{\mathcal{C}}(V_k, X).$$

which maps γ to the morphism γ_k composed with the projection onto the factor corresponding to $\text{id}_{[k]}$.

- (2) *Similarly, if W is an k -truncated simplicial object of \mathcal{C} , then we have*

$$\text{Mor}_{\text{Simp}_k(\mathcal{C})}(W, sk_k U) = \text{Mor}_{\mathcal{C}}(W_k, X).$$

- (3) *The object U constructed above is an incarnation of $\text{Hom}(\Delta[k], X)$.*

Proof. We first prove (1). Suppose that $\gamma : V \rightarrow U$ is a morphism. This is given by a family of morphisms $\gamma_\alpha : V_n \rightarrow X$ for $\gamma : [k] \rightarrow [n]$. The morphisms have to satisfy the rules that for all $\varphi : [m] \rightarrow [n]$ the diagrams

$$\begin{array}{ccc} X & \xleftarrow{\gamma_{\varphi \circ \alpha'}} & V_n \\ \downarrow \text{id}_X & & \downarrow V(\varphi) \\ X & \xleftarrow{\gamma_{\alpha'}} & V_m \end{array}$$

commute for all $\alpha' : [k] \rightarrow [m]$. Taking $\alpha' = \text{id}_{[k]}$, we see that for any $\varphi : [k] \rightarrow [n]$ we have $\gamma_\varphi = \gamma_{\text{id}_{[k]}} \circ V(\varphi)$. Thus the morphism γ is determined by the component of γ_k corresponding to $\text{id}_{[k]}$. Conversely, given such a morphism $f : V_k \rightarrow X$ we easily construct a morphism γ by putting $\gamma_\alpha = f \circ V(\alpha)$.

The truncated case is similar, and left to the reader.

To see (3) we argue as follows:

$$\begin{aligned} \text{Mor}(V, \text{Hom}(\Delta[k], X)) &= \text{Mor}(V \times \Delta[k], X) \\ &= \{(f_n : V_n \times \Delta[k]_n \rightarrow X) \mid f_n \text{ compatible}\} \\ &= \{(f_n : V_n \rightarrow \prod_{\Delta[k]_n} X) \mid f_n \text{ compatible}\} \\ &= \text{Mor}(V, U) \end{aligned}$$

Thus U and $\text{Hom}(\Delta[k], X)$ define the same functor on the category of simplicial objects and hence are canonically isomorphic. \square

Lemma 14.16.6. *Assume the category \mathcal{C} has coproducts of any two objects and finite limits. Let $a : U \rightarrow V$, $b : U \rightarrow W$ be morphisms of simplicial sets. Assume U_n, V_n, W_n finite nonempty for all $n \geq 0$. Assume that all n -simplices of U, V, W are degenerate for all $n \gg 0$. Let T be a simplicial object of \mathcal{C} . Then*

$$\mathrm{Hom}(V, T) \times_{\mathrm{Hom}(U, T)} \mathrm{Hom}(W, T) = \mathrm{Hom}(V \amalg_U W, T)$$

In other words, the fibre product on the left hand side is represented by the Hom object on the right hand side.

Proof. By Lemma 14.16.4 all the required Hom objects exist and satisfy the correct functorial properties. Now we can identify the n th term on the left hand side as the object representing the functor that associates to X the first set of the following sequence of functorial equalities

$$\begin{aligned} & \mathrm{Mor}(X \times \Delta[n], \mathrm{Hom}(V, T) \times_{\mathrm{Hom}(U, T)} \mathrm{Hom}(W, T)) \\ &= \mathrm{Mor}(X \times \Delta[n], \mathrm{Hom}(V, T)) \times_{\mathrm{Mor}(X \times \Delta[n], \mathrm{Hom}(U, T))} \mathrm{Mor}(X \times \Delta[n], \mathrm{Hom}(W, T)) \\ &= \mathrm{Mor}(X \times \Delta[n] \times V, T) \times_{\mathrm{Mor}(X \times \Delta[n] \times U, T)} \mathrm{Mor}(X \times \Delta[n] \times W, T) \\ &= \mathrm{Mor}(X \times \Delta[n] \times (V \amalg_U W), T) \end{aligned}$$

Here we have used the fact that

$$(X \times \Delta[n] \times V) \times_{X \times \Delta[n] \times U} (X \times \Delta[n] \times W) = X \times \Delta[n] \times (V \amalg_U W)$$

which is easy to verify term by term. The result of the lemma follows as the last term in the displayed sequence of equalities corresponds to $\mathrm{Hom}(V \amalg_U W, T)_n$. \square

14.17. Splitting simplicial objects

A subobject N of an object X of the category \mathcal{C} is an object N of \mathcal{C} together with a monomorphism $N \rightarrow X$. Of course we say (by abuse of notation) that the subobjects N, N' are equal if there exists an isomorphism $N \rightarrow N'$ compatible with the morphisms to X . The collection of subobjects forms a partially ordered set. (Because of our conventions on categories; not true for category of spaces up to homotopy for example.)

Definition 14.17.1. Let \mathcal{C} be a category which admits finite nonempty coproducts. We say a simplicial object U of \mathcal{C} is *split* if there exist subobjects $N(U_m)$ of U_m , $m \geq 0$ with the property that

$$(14.17.1.1) \quad \coprod_{\varphi: [n] \rightarrow [m] \text{ surjective}} N(U_m) \longrightarrow U_n$$

is an isomorphism for all $n \geq 0$.

If this is the case, then $N(U_0) = U_0$. Next, we have $U_1 = U_0 \amalg N(U_1)$. Second we have

$$U_2 = U_0 \amalg N(U_1) \amalg N(U_1) \amalg N(U_2).$$

It turns out that in many categories \mathcal{C} every simplicial object is split.

Lemma 14.17.2. *Let U be a simplicial set. Then U has a splitting with $N(U_m)$ equal to the set of nondegenerate m -simplices.*

Proof. Let $x \in U_n$. Suppose that there are surjections $\varphi : [n] \rightarrow [k]$ and $\psi : [n] \rightarrow [l]$ and nondegenerate simplices $y \in U_k, z \in U_l$ such that $x = U(\varphi)(y)$ and $x = U(\psi)(z)$. Choose a right inverse $\xi : [l] \rightarrow [n]$ of ψ , i.e., $\psi \circ \xi = \text{id}_{[l]}$. Then $z = U(\xi)(x)$. Hence $z = U(\xi)(x) = U(\varphi \circ \xi)(y)$. Since z is nondegenerate we conclude that $\varphi \circ \xi : [l] \rightarrow [k]$ is surjective, and hence $l \geq k$. Similarly $k \geq l$. Hence we see that $\varphi \circ \xi : [l] \rightarrow [k]$ has to be the identity map for any choice of right inverse ξ of ψ . This easily implies that $\psi = \varphi$. \square

Of course it can happen that a map of simplicial sets maps a nondegenerate n -simplex to a degenerate n -simplex. Thus the splitting of Lemma 14.17.2 is not functorial. Here is a case where it is functorial.

Lemma 14.17.3. *Let $f : U \rightarrow V$ be a morphism of simplicial sets. Suppose that (a) the image of every nondegenerate simplex of U is a nondegenerate simplex of V and (b) no two nondegenerate simplices of U are mapped to the same simplex of V . Then f_n is injective for all n . Same holds with “injective” replaced by “surjective” or “bijective”.*

Proof. Under hypothesis (a) we see that the map f preserves the disjoint union decompositions of the splitting of Lemma 14.17.2, in other words that we get commutative diagrams

$$\begin{array}{ccc} \coprod_{\varphi: [n] \rightarrow [m] \text{ surjective}} N(U_m) & \longrightarrow & U_n \\ \downarrow & & \downarrow \\ \coprod_{\varphi: [n] \rightarrow [m] \text{ surjective}} N(V_m) & \longrightarrow & V_n. \end{array}$$

And then (b) clearly shows that the left vertical arrow is injective (resp. surjective, resp. bijective). \square

Lemma 14.17.4. *Let U be a simplicial set. Let $n \geq 0$ be an integer. The rule*

$$U'_m = \bigcup_{\varphi: [m] \rightarrow [i], i \leq n} \text{Im}(U(\varphi))$$

defines a sub simplicial set $U' \subset U$ with $U'_i = U_i$ for $i \leq n$. Moreover, all m -simplices of U' are degenerate for all $m > n$.

Proof. If $x \in U_m$ and $x = U(\varphi)(y)$ for some $y \in U_i, i \leq n$ and some $\varphi : [m] \rightarrow [i]$ then any image $U(\psi)(x)$ for any $\psi : [m'] \rightarrow [m]$ is equal to $U(\varphi \circ \psi)(y)$ and $\varphi \circ \psi : [m'] \rightarrow [i]$. Hence U' is a simplicial set. By construction all simplices in dimension $n + 1$ and higher are degenerate. \square

Lemma 14.17.5. *Let U be a simplicial abelian group. Then U has a splitting obtained by taking $N(U_0) = U_0$ and for $m \geq 1$ taking*

$$N(U_m) = \bigcap_{i=0}^{m-1} \text{Ker}(d_i^m).$$

Moreover, this splitting is functorial on the category of simplicial abelian groups.

Proof. By induction on n we will show that the choice of $N(U_m)$ in the lemma guarantees that (14.17.1.1) is an isomorphism for $m \leq n$. This is clear for $n = 0$. In the rest of this proof we are going to drop the superscripts from the maps d_i and s_i in order to improve readability. We will also repeatedly use the relations from Remark 14.3.3.

First we make a general remark. For $0 \leq i \leq m$ and $z \in U_m$ we have $d_i(s_i(z)) = z$. Hence we can write any $x \in U_{m+1}$ uniquely as $x = x' + x''$ with $d_i(x') = 0$ and $x'' \in \text{Im}(s_i)$ by taking $x' = (x - s_i(d_i(x)))$ and $x'' = s_i(d_i(x))$. Moreover, the element $z \in U_m$ such that $x'' = s_i(z)$ is unique because s_i is injective.

Here is a procedure for decomposing any $x \in U_{n+1}$. First, write $x = x_0 + s_0(z_0)$ with $d_0(x_0) = 0$. Next, write $x_0 = x_1 + s_1(z_1)$ with $d_1(x_1) = 0$. Continue like this to get

$$\begin{aligned} x &= x_0 + s_0(z_0), \\ x_0 &= x_1 + s_1(z_1), \\ x_1 &= x_2 + s_2(z_2), \\ \dots &\dots \dots \\ x_{n-1} &= x_n + s_n(z_n) \end{aligned}$$

where $d_i(x_i) = 0$ for all $i = n, \dots, 0$. By our general remark above all of the x_i and z_i are determined uniquely by x . We claim that $x_i \in \text{Ker}(d_0) \cap \text{Ker}(d_1) \cap \dots \cap \text{Ker}(d_i)$ and $z_i \in \text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_{i-1})$ for $i = n, \dots, 0$. Here and in the following an empty intersection of kernels indicates the whole space; i.e., the notation $z_0 \in \text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_{i-1})$ when $i = 0$ means $z_0 \in U_n$ with no restriction.

We prove this by ascending induction on i . It is clear for $i = 0$ by construction of x_0 and z_0 . Let us prove it for $0 < i \leq n$ assuming the result for $i - 1$. First of all we have $d_i(x_i) = 0$ by construction. So pick a j with $0 \leq j < i$. We have $d_j(x_{i-1}) = 0$ by induction. Hence

$$0 = d_j(x_{i-1}) = d_j(x_i) + d_j(s_i(z_i)) = d_j(x_i) + s_{i-1}(d_j(z_i)).$$

The last equality by the relations of Remark 14.3.3. These relations also imply that $d_{i-1}(d_j(x_i)) = d_j(d_i(x_i)) = 0$ because $d_i(x_i) = 0$ by construction. Then the uniqueness in the general remark above shows the equality $0 = x' + x'' = d_j(x_i) + s_{i-1}(d_j(z_i))$ can only hold if both terms are zero. We conclude that $d_j(x_i) = 0$ and by injectivity of s_{i-1} we also conclude that $d_j(z_i) = 0$. This proves the claim.

The claim implies we can uniquely write

$$x = s_0(z_0) + s_1(z_1) + \dots + s_n(z_n) + x_0$$

with $x_0 \in N(U_{n+1})$ and $z_i \in \text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_{i-1})$. We can reformulate this as saying that we have found a direct sum decomposition

$$U_{n+1} = N(U_{n+1}) \oplus \bigoplus_{i=0}^{i=n} s_i \left(\text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_{i-1}) \right)$$

with the property that

$$\text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_j) = N(U_{n+1}) \oplus \bigoplus_{i=j+1}^{i=n} s_i \left(\text{Ker}(d_n) \cap \dots \cap \text{Ker}(d_{i-1}) \right)$$

for $j = 0, \dots, n$. The result follows from this statement as follows. Each of the z_i in the expression for x can be written uniquely as

$$z_i = s_i(z'_{i,i}) + \dots + s_{n-1}(z'_{i,n-1}) + z_{i,0}$$

with $z_{i,0} \in N(U_n)$ and $z'_{i,j} \in \text{Ker}(d_0) \cap \dots \cap \text{Ker}(d_{j-1})$. The first few steps in the decomposition of z_i are zero because z_i already is in the kernel of d_0, \dots, d_i . This

in turn uniquely gives

$$x = x_0 + s_0(z_{0,0}) + s_1(z_{1,0}) + \dots + s_n(z_{n,0}) + \sum_{0 \leq i \leq j \leq n-1} s_i(s_j(z'_{i,j})).$$

Continuing in this fashion we see that we in the end obtain a decomposition of x as a sum of terms of the form

$$s_{i_1} s_{i_2} \dots s_{i_k}(z)$$

with $0 \leq i_1 \leq i_2 \leq \dots \leq i_k \leq n - k + 1$ and $z \in N(U_{n+1-k})$. This is exactly the required decomposition, because any surjective map $[n+1] \rightarrow [n+1-k]$ can be uniquely expressed in the form

$$\sigma_{i_k}^{n-k} \dots \sigma_{i_2}^{n-1} \sigma_{i_1}^n$$

with $0 \leq i_1 \leq i_2 \leq \dots \leq i_k \leq n - k + 1$. □

Lemma 14.17.6. *Let \mathcal{A} be an abelian category. Let U be a simplicial object in \mathcal{A} . Then U has a splitting obtained by taking $N(U_0) = U_0$ and for $m \geq 1$ taking*

$$N(U_m) = \bigcap_{i=0}^{m-1} \text{Ker}(d_i^m).$$

Moreover, this splitting is functorial on the category of simplicial objects of \mathcal{A} .

Proof. For any object A of \mathcal{A} we obtain a simplicial abelian group $\text{Mor}_{\mathcal{A}}(A, U)$. Each of these are canonically split by Lemma 14.17.5. Moreover,

$$N(\text{Mor}_{\mathcal{A}}(A, U_m)) = \bigcap_{i=0}^{m-1} \text{Ker}(d_i^m) = \text{Mor}_{\mathcal{A}}(A, N(U_m)).$$

Hence we see that the morphism (14.17.1.1) becomes an isomorphism after applying the functor $\text{Mor}_{\mathcal{A}}(A, -)$ for any object of \mathcal{A} . Hence it is an isomorphism by the Yoneda lemma. □

Lemma 14.17.7. *Let \mathcal{A} be an abelian category. Let $f : U \rightarrow V$ be a morphism of simplicial objects of \mathcal{A} . If the induced morphisms $N(f)_i : N(U)_i \rightarrow N(V)_i$ are injective for all i , then f_i is injective for all i . Same holds with “injective” replaced with “surjective”, or “isomorphism”.*

Proof. This is clear from Lemma 14.17.6 and the definition of a splitting. □

Lemma 14.17.8. *Let \mathcal{A} be an abelian category. Let U be a simplicial object in \mathcal{A} . Let $N(U_m)$ as in Lemma 14.17.6 above. Then $d_m^m(N(U_m)) \subset N(U_{m-1})$.*

Proof. For $j = 0, \dots, m-2$ we have $d_j^{m-1} d_m^m = d_{m-1}^{m-1} d_j^m$ by the relations in Remark 14.3.3. The result follows. □

Lemma 14.17.9. *Let \mathcal{A} be an abelian category. Let U be a simplicial object of \mathcal{A} . Let $n \geq 0$ be an integer. The rule*

$$U'_m = \sum_{\varphi: [m] \rightarrow [n], i \leq n} \text{Im}(U(\varphi))$$

defines a sub simplicial object $U' \subset U$ with $U'_i = U_i$ for $i \leq n$. Moreover, $N(U'_m) = 0$ for all $m > n$.

Proof. Pick $m, i \leq n$ and some $\varphi : [m] \rightarrow [i]$. The image under $U(\psi)$ of $\text{Im}(U(\varphi))$ for any $\psi : [m'] \rightarrow [m]$ is equal to the image of $U(\varphi \circ \psi)$ and $\varphi \circ \psi : [m'] \rightarrow [i]$. Hence U' is a simplicial object. Pick $m > n$. We have to show $N(U'_m) = 0$. By definition of $N(U_m)$ and $N(U'_m)$ we have $N(U'_m) = U'_m \cap N(U_m)$ (intersection of subobjects). Since U is split by Lemma 14.17.6, it suffices to show that U'_m is contained in the sum

$$\sum_{\varphi: [m] \rightarrow [m'] \text{ surjective, } m' < m} \text{Im}(U(\varphi)|_{N(U_{m'})}).$$

By the splitting each $U_{m'}$ is the sum of images of $N(U_{m''})$ via $U(\psi)$ for surjective maps $\psi : [m'] \rightarrow [m'']$. Hence the displayed sum above is the same as

$$\sum_{\varphi: [m] \rightarrow [m'] \text{ surjective, } m' < m} \text{Im}(U(\varphi)).$$

Clearly U'_m is contained in this by the simple fact that any $\varphi : [m] \rightarrow [i], i \leq n$ occurring in the definition of U'_m may be factored as $[m] \rightarrow [m'] \rightarrow [i]$ with $[m] \rightarrow [m']$ surjective and $m' < m$ as in the last displayed sum above. \square

14.18. Coskeleton functors

Let \mathcal{C} be a category. The *coskeleton functor* (if it exists) is a functor

$$\text{cosk}_n : \text{Simp}_n(\mathcal{C}) \longrightarrow \text{Simp}(\mathcal{C})$$

which is right adjoint to the skeleton functor. In a formula

$$(14.18.0.1) \quad \text{Mor}_{\text{Simp}(\mathcal{C})}(U, \text{cosk}_n V) = \text{Mor}_{\text{Simp}_n(\mathcal{C})}(\text{sk}_n U, V)$$

Given a n -truncated simplicial object V we say that $\text{cosk}_n V$ exists if there exists a $\text{cosk}_n V \in \text{Ob}(\text{Simp}(\mathcal{C}))$ and a morphism $\text{sk}_n \text{cosk}_n V \rightarrow V$ such that the displayed formula holds, in other words if the functor $U \mapsto \text{Mor}_{\text{Simp}_n(\mathcal{C})}(\text{sk}_n U, V)$ is representable. If it exists it is unique up to unique isomorphism by the Yoneda lemma. See Categories, Section 4.3.

Example 14.18.1. Suppose the category \mathcal{C} has finite nonempty self products. A 0-truncated simplicial object of \mathcal{C} is the same as an object X of \mathcal{C} . In this case we claim that $\text{cosk}_0(X)$ is the simplicial object U with $U_n = X^{n+1}$ the $(n+1)$ -fold self product of X , and structure of simplicial object as in Example 14.3.5. Namely, a morphism $V \rightarrow U$ where V is a simplicial object is given by morphisms $V_n \rightarrow X^{n+1}$, such that all the diagrams

$$\begin{array}{ccc} V_n & \longrightarrow & X^{n+1} \\ \downarrow V([0] \rightarrow [n], 0 \rightarrow i) & & \downarrow \text{pr}_i \\ V_0 & \longrightarrow & X \end{array}$$

commute. Clearly this means that the map determines and is determined by a unique morphism $V_0 \rightarrow X$. This proves that formula (14.18.0.1) holds.

Recall the category $\Delta/[n]$, see Example 14.11.4. We let $(\Delta/[n])_{\leq m}$ denote the full subcategory of $\Delta/[n]$ consisting of objects $[k] \rightarrow [n]$ of $\Delta/[n]$ with $k \leq m$. In other

words we have the following commutative diagram of categories and functors

$$\begin{array}{ccc} (\Delta/[n])_{\leq m} & \longrightarrow & \Delta/[n] \\ \downarrow & & \downarrow \\ \Delta_{\leq m} & \longrightarrow & \Delta \end{array}$$

Given a m -truncated simplicial object U of \mathcal{C} we define a functor

$$U(n) : (\Delta/[n])_{\leq m}^{\text{opp}} \longrightarrow \mathcal{C}$$

by the rules

$$\begin{aligned} ([k] \rightarrow [n]) & \longmapsto U_k \\ \psi : ([k'] \rightarrow [n]) \rightarrow ([k] \rightarrow [n]) & \longmapsto U(\psi) : U_k \rightarrow U_{k'} \end{aligned}$$

For a given morphism $\varphi : [n] \rightarrow [n']$ of Δ we have an associated functor

$$\bar{\varphi} : (\Delta/[n])_{\leq m} \longrightarrow (\Delta/[n'])_{\leq m}$$

which maps $\alpha : [k] \rightarrow [n]$ to $\varphi \circ \alpha : [k] \rightarrow [n']$. The composition $U(n') \circ \bar{\varphi}$ is equal to the functor $U(n)$.

Lemma 14.18.2. *If the category \mathcal{C} has finite limits, then cosk_m functors exist for all m . Moreover, for any m -truncated simplicial object U the simplicial object $\text{cosk}_m U$ is described by the formula*

$$(\text{cosk}_m U)_n = \lim_{(\Delta/[n])_{\leq m}^{\text{opp}}} U(n)$$

and for $\varphi : [n] \rightarrow [n']$ the map $\text{cosk}_m U(\varphi)$ comes from the identification $U(n') \circ \bar{\varphi} = U(n)$ above via Categories, Lemma 4.14.8.

Proof. During the proof of this lemma we denote $\text{cosk}_m U$ the simplicial object with $(\text{cosk}_m U)_n$ equal to $\lim_{(\Delta/[n])_{\leq m}^{\text{opp}}} U(n)$. We will conclude at the end of the proof that it does satisfy the required mapping property.

Suppose that V is a simplicial object. A morphism $\gamma : V \rightarrow \text{cosk}_m U$ is given by a sequence of morphisms $\gamma_n : V_n \rightarrow (\text{cosk}_m U)_n$. By definition of a limit, this is given by a collection of morphisms $\gamma(\alpha) : V_n \rightarrow U_k$ where α ranges over all $\alpha : [k] \rightarrow [n]$ with $k \leq m$. These morphisms then also satisfy the rules that

$$\begin{array}{ccc} V_n & \xrightarrow{\quad} & U_k \\ \uparrow V(\varphi) & \gamma(\alpha) & \uparrow U(\psi) \\ V_{n'} & \xrightarrow{\quad} & U_{k'} \\ & \gamma(\alpha') & \end{array}$$

are commutative, given any $0 \leq k, k' \leq m$, $0 \leq n, n'$ and any $\psi : [k] \rightarrow [k']$, $\varphi : [n] \rightarrow [n']$, $\alpha : [k] \rightarrow [n]$ and $\alpha' : [k'] \rightarrow [n']$ in Δ such that $\varphi \circ \alpha = \alpha' \circ \psi$. Taking $n = k$, $\varphi = \alpha'$, and $\alpha = \psi = \text{id}_{[k]}$ we deduce that $\gamma(\alpha') = \gamma(\text{id}_{[k]}) \circ V(\alpha')$. In other words, the morphisms $\gamma(\text{id}_{[k]})$, $k \leq m$ determine the morphism γ . And it is easy to see that these morphisms form a morphism $\text{sk}_m V \rightarrow U$.

Conversely, given a morphism $\gamma : \text{sk}_m V \rightarrow U$, we obtain a family of morphisms $\gamma(\alpha)$ where α ranges over all $\alpha : [k] \rightarrow [n]$ with $k \leq m$ by setting $\gamma(\alpha) = \gamma(\text{id}_{[k]}) \circ V(\alpha)$. These morphisms satisfy all the displayed commutativity restraints pictured above, and hence give rise to a morphism $V \rightarrow \text{cosk}_m U$. \square

Lemma 14.18.3. *Let \mathcal{C} be a category. Let U be an m -truncated simplicial object of \mathcal{C} . For $n \leq m$ the limit $\lim_{(\Delta/[n])_{\leq m}^{opp}} U(n)$ exists and is canonically isomorphic to U_n .*

Proof. This is true because the category $(\Delta/[n])_{\leq m}$ has an final object in this case, namely the identity map $[n] \rightarrow [n]$. \square

Lemma 14.18.4. *Let \mathcal{C} be a category with finite limits. Let U be an n -truncated simplicial object of \mathcal{C} . The morphism $sk_n \text{cosk}_n U \rightarrow U$ is an isomorphism.*

Proof. Combine Lemmas 14.18.2 and 14.18.3. \square

Let us describe a particular instance of the coskeleton functor in more detail. By abuse of notation we will denote sk_n also the restriction functor $\text{Simp}_{n'}(\mathcal{C}) \rightarrow \text{Simp}_n(\mathcal{C})$ for any $n' \geq n$. We are going to describe a right adjoint of the functor $sk_n : \text{Simp}_{n+1}(\mathcal{C}) \rightarrow \text{Simp}_n(\mathcal{C})$. For $n \geq 1$, $0 \leq i < j \leq n+1$ define $\delta_{i,j}^{n+1} : [n-1] \rightarrow [n+1]$ to be the increasing map omitting i and j . Note that $\delta_{i,j}^{n+1} = \delta_j^{n+1} \circ \delta_i^n = \delta_i^{n+1} \circ \delta_{j-1}^n$, see Lemma 14.2.3. This motivates the following lemma.

Lemma 14.18.5. *Let n be an integer ≥ 1 . Let U be a n -truncated simplicial object of \mathcal{C} . Consider the contravariant functor from \mathcal{C} to Sets which associates to an object T the set*

$$\{(f_0, \dots, f_{n+1}) \in \text{Mor}_{\mathcal{C}}(T, U_n) \mid d_{j-1}^n \circ f_i = d_i^n \circ f_j \ \forall 0 \leq i < j \leq n+1\}$$

If this functor is representable by some object U_{n+1} of \mathcal{C} , then

$$U_{n+1} = \lim_{(\Delta/[n+1])_{\leq n}^{opp}} U(n)$$

Proof. The limit, if it exists, represents the functor that associates to an object T the set

$$\{(f_\alpha)_{\alpha: [k] \rightarrow [n+1], k \leq n} \mid f_{\alpha \circ \psi} = U(\psi) \circ f_\alpha \ \forall \psi : [k'] \rightarrow [k], \alpha : [k] \rightarrow [n+1]\}.$$

In fact we will show this functor is isomorphic to the one displayed in the lemma. The map in one direction is given by the rule

$$(f_\alpha)_\alpha \longmapsto (f_{\delta_0^{n+1}}, \dots, f_{\delta_{n+1}^{n+1}}).$$

This satisfies the conditions of the lemma because

$$d_{j-1}^n \circ f_{\delta_i^{n+1}} = f_{\delta_i^{n+1} \circ \delta_{j-1}^n} = f_{\delta_j^{n+1} \circ \delta_i^n} = d_i^n \circ f_{\delta_j^{n+1}}$$

by the relations we recalled above the lemma. To construct a map in the other direction we have to associate to a system (f_0, \dots, f_{n+1}) as in the displayed formula of the lemma a system of maps f_α . Let $\alpha : [k] \rightarrow [n+1]$ be given. Since $k \leq n$ the map α is not surjective. Hence we can write $\alpha = \delta_i^{n+1} \circ \psi$ for some $0 \leq i \leq n+1$ and some $\psi : [k] \rightarrow [n]$. We have no choice but to define

$$f_\alpha = U(\psi) \circ f_i.$$

Of course we have to check that this is independent of the choice of the pair (i, ψ) . First, observe that given i there is a unique ψ which works. Second, suppose that (j, ϕ) is another pair. Then $i \neq j$ and we may assume $i < j$. Since both i, j are

not in the image of α we may actually write $\alpha = \delta_{i,j}^{n+1} \circ \xi$ and then we see that $\psi = \delta_{j-1}^n \circ \xi$ and $\phi = \delta_i^n \circ \xi$. Thus

$$\begin{aligned} U(\psi) \circ f_i &= U(\delta_{j-1}^n \circ \xi) \circ f_i \\ &= U(\xi) \circ d_{j-1}^n \circ f_i \\ &= U(\xi) \circ d_i^n \circ f_j \\ &= U(\delta_i^n \circ \xi) \circ f_j \\ &= U(\phi) \circ f_j \end{aligned}$$

as desired. We still have to verify that the maps f_α so defined satisfy the rules of a system of maps $(f_\alpha)_\alpha$. To see this suppose that $\psi : [k'] \rightarrow [k]$, $\alpha : [k] \rightarrow [n+1]$ with $k, k' \leq n$. Set $\alpha' = \alpha \circ \psi$. Choose i not in the image of α . Then clearly i is not in the image of α' also. Write $\alpha = \delta_i^{n+1} \circ \phi$ (we cannot use the letter ψ here because we've already used it). Then obviously $\alpha' = \delta_i^{n+1} \circ \phi \circ \psi$. By construction above we then have

$$U(\psi) \circ f_\alpha = U(\psi) \circ U(\phi) \circ f_i = U(\phi \circ \psi) \circ f_i = f_{\alpha \circ \psi} = f_{\alpha'}$$

as desired. We leave to the reader the pleasant task of verifying that our constructions are mutually inverse bijections, and are functorial in T . \square

Lemma 14.18.6. *Let n be an integer ≥ 1 . Let U be a n -truncated simplicial object of \mathcal{C} . Consider the contravariant functor from \mathcal{C} to Sets which associates to an object T the set*

$$\{(f_0, \dots, f_{n+1}) \in \text{Mor}_{\mathcal{C}}(T, U_n) \mid d_{j-1}^n \circ f_i = d_i^n \circ f_j \ \forall 0 \leq i < j \leq n+1\}$$

If this functor is representable by some object U_{n+1} of \mathcal{C} , then there exists an $(n+1)$ -truncated simplicial object \tilde{U} , with $\text{sk}_n \tilde{U} = U$ and $\tilde{U}_{n+1} = U_{n+1}$ such that the following adjointness holds

$$\text{Mor}_{\text{Simp}_{n+1}(\mathcal{C})}(V, \tilde{U}) = \text{Mor}_{\text{Simp}_n(\mathcal{C})}(\text{sk}_n V, U)$$

Proof. By Lemma 14.18.3 there are identifications

$$U_i = \lim_{(\Delta/[i])_{\leq n}^{\text{opp}}} U(i)$$

for $0 \leq i \leq n$. By Lemma 14.18.5 we have

$$U_{n+1} = \lim_{(\Delta/[n+1])_{\leq n}^{\text{opp}}} U(n).$$

Thus we may define for any $\varphi : [i] \rightarrow [j]$ with $i, j \leq n+1$ the corresponding map $\tilde{U}(\varphi) : \tilde{U}_j \rightarrow \tilde{U}_i$ exactly as in Lemma 14.18.2. This defines an $(n+1)$ -truncated simplicial object \tilde{U} with $\text{sk}_n \tilde{U} = U$.

To see the adjointness we argue as follows. Given any element $\gamma : \text{sk}_n V \rightarrow U$ of the right hand side of the formula consider the morphisms $f_i = \gamma_n \circ d_i^{n+1} : V_{n+1} \rightarrow V_n \rightarrow U_n$. These clearly satisfy the relations $d_{j-1}^n \circ f_i = d_i^n \circ f_j$ and hence define a unique morphism $V_{n+1} \rightarrow U_{n+1}$ by our choice of U_{n+1} . Conversely, given a morphism $\gamma' : V \rightarrow \tilde{U}$ of the left hand side we can simply restrict to $\Delta_{\leq n}$ to get an element of the right hand side. We leave it to the reader to show these are mutually inverse constructions. \square

Remark 14.18.7. Let U , and U_{n+1} be as in Lemma 14.18.6. On T -valued points we can easily describe the face and degeneracy maps of \tilde{U} . Explicitly, the maps $d_i^{n+1} : U_{n+1} \rightarrow U_n$ are given by

$$(f_0, \dots, f_{n+1}) \mapsto f_i.$$

And the maps $s_j^n : U_n \rightarrow U_{n+1}$ are given by

$$\begin{aligned} f \mapsto & (s_{j-1}^{n-1} \circ d_0^{n-1} \circ f, \\ & s_{j-1}^{n-1} \circ d_1^{n-1} \circ f, \\ & \dots \\ & s_{j-1}^{n-1} \circ d_{j-1}^{n-1} \circ f, \\ & f, \\ & f, \\ & s_j^{n-1} \circ d_{j+1}^{n-1} \circ f, \\ & s_j^{n-1} \circ d_{j+2}^{n-1} \circ f, \\ & \dots \\ & s_j^{n-1} \circ d_n^{n-1} \circ f) \end{aligned}$$

where we leave it to the reader to verify that the RHS is an element of the displayed set of Lemma 14.18.6. For $n = 0$ there is one map, namely $f \mapsto (f, f)$. For $n = 1$ there are two maps, namely $f \mapsto (f, f, s_0 d_1 f)$ and $f \mapsto (s_0 d_0 f, f, f)$. For $n = 2$ there are three maps, namely $f \mapsto (f, f, s_0 d_1 f, s_0 d_2 f)$, $f \mapsto (s_0 d_0 f, f, f, s_1 d_2 f)$, and $f \mapsto (s_1 d_0 f, s_1 d_1 f, f, f)$. And so on and so forth.

Remark 14.18.8. The construction of Lemma 14.18.6 above in the case of simplicial sets is the following. Given an n -truncated simplicial set U , we make a canonical $(n + 1)$ -truncated simplicial set \tilde{U} as follows. We add a set of $(n + 1)$ -simplices U_{n+1} by the formula of the lemma. Namely, an element of U_{n+1} is a numbered collection of (f_0, \dots, f_{n+1}) of n -simplices, with the property that they glue as they would in a $(n + 1)$ -simplex. In other words, the i th face of f_j is the $(j - 1)$ st face of f_i for $i < j$. Geometrically it is obvious how to define the face and degeneracy maps for \tilde{U} . If V is an $(n + 1)$ -truncated simplicial set, then its $(n + 1)$ -simplices give rise to compatible collections of n -simplices (f_0, \dots, f_{n+1}) with $f_i \in V_n$. Hence there is a natural map $\text{Mor}(\text{sk}_n V, U) \rightarrow \text{Mor}(V, \tilde{U})$ which is inverse to the canonical restriction mapping the other way.

Also, it is enough to do the combinatorics of the construction in the case of truncated simplicial sets. Namely, for any object T of the category \mathcal{C} , and any n -truncated simplicial object U of \mathcal{C} we can consider the n -truncated simplicial set $\text{Mor}(T, U)$. We may apply the construction to this, and take its set of $(n + 1)$ -simplices, and require this to be representable. This is a good way to think about the result of Lemma 14.18.6.

Remark 14.18.9. *Inductive construction of coskeleta.* Suppose that \mathcal{C} is a category with finite limits. Suppose that U is an m -truncated simplicial object in \mathcal{C} . Then we can inductively construct n -truncated objects U^n as follows:

- (1) To start, set $U^m = U$.
- (2) Given U^n for $n \geq m$ set $U^{n+1} = \tilde{U}^n$, where \tilde{U}^n is constructed from U^n as in Lemma 14.18.6.

Since the construction of Lemma 14.18.6 has the property that it leaves the n -skeleton of U^n unchanged, we can then define $\text{cosk}_m U$ to be the simplicial object with $(\text{cosk}_m U)_n = U_n^n = U_n^{n+1} = \dots$. And it follows formally from Lemma 14.18.6 that U^n satisfies the formula

$$\text{Mor}_{\text{Simp}_n(\mathcal{C})}(V, U^n) = \text{Mor}_{\text{Simp}_m(\mathcal{C})}(\text{sk}_m V, U)$$

for all $n \geq m$. It also then follows formally from this that

$$\text{Mor}_{\text{Simp}(\mathcal{C})}(V, \text{cosk}_m U) = \text{Mor}_{\text{Simp}_m(\mathcal{C})}(\text{sk}_m V, U)$$

with $\text{cosk}_m U$ chosen as above.

Lemma 14.18.10. *Let \mathcal{C} be a category which has finite limits.*

- (1) *For every n the functor $sk_n : \text{Simp}(\mathcal{C}) \rightarrow \text{Simp}_n(\mathcal{C})$ has a right adjoint cosk_n .*
- (2) *For every $n' \geq n$ the functor $sk_n : \text{Simp}_{n'}(\mathcal{C}) \rightarrow \text{Simp}_n(\mathcal{C})$ has a right adjoint, namely $sk_{n'} \text{cosk}_n$.*
- (3) *For every $m \geq n \geq 0$ and every n -truncated simplicial object U of \mathcal{C} we have $\text{cosk}_m sk_m \text{cosk}_n U = \text{cosk}_n U$.*
- (4) *If U is a simplicial object of \mathcal{C} such that the canonical map $U \rightarrow \text{cosk}_n sk_n U$ is an isomorphism for some $n \geq 0$, then the canonical map $U \rightarrow \text{cosk}_m sk_m U$ is an isomorphism for all $m \geq n$.*

Proof. The existence in (1) follows from Lemma 14.18.2 above. Parts (2) and (3) follow from the discussion in Remark 14.18.9. After this (4) is obvious. \square

Remark 14.18.11. We do not need all finite limits in order to be able to define the coskeleton functors. Here are some remarks

- (1) We have seen in Examples 14.18.1 that if \mathcal{C} has products of pairs of objects then cosk_0 exists.
- (2) For $k > 0$ the functor cosk_k exists if \mathcal{C} has finite connected limits.

This is clear from the inductive procedure of constructing coskeleta (Remarks 14.18.8 and 14.18.9) but it also follows from the fact that the categories $(\Delta/[n])_{\leq k}$ for $k \geq 1$ and $n \geq k + 1$ used in Lemma 14.18.2 are connected. Observe that we do not need the categories for $n \leq k$ by Lemma 14.18.3 or Lemma 14.18.4. (As k gets higher the categories $(\Delta/[n])_{\leq k}$ for $k \geq 1$ and $n \geq k + 1$ are more and more connected in a topological sense.)

Lemma 14.18.12. *Let U, V be n -truncated simplicial objects of a category \mathcal{C} . Then*

$$\text{cosk}_n(U \times V) = \text{cosk}_n U \times \text{cosk}_n V$$

whenever the left and right hand sides exist.

Proof. Let W be a simplicial object. We have

$$\begin{aligned} \text{Mor}(W, \text{cosk}_n(U \times V)) &= \text{Mor}(\text{sk}_n W, U \times V) \\ &= \text{Mor}(\text{sk}_n W, U) \times \text{Mor}(\text{sk}_n W, V) \\ &= \text{Mor}(W, \text{cosk}_n U) \times \text{Mor}(W, \text{cosk}_n V) \\ &= \text{Mor}(W, \text{cosk}_n U \times \text{cosk}_n V) \end{aligned}$$

The lemma follows. \square

Lemma 14.18.13. *Assume \mathcal{C} has fibre products. Let U, V, W be n -truncated simplicial objects of the category \mathcal{C} . Then*

$$\text{cosk}_n(V \times_U W) = \text{cosk}_n U \times_{\text{cosk}_n U} \text{cosk}_n V$$

whenever the left and right hand side exist.

Proof. Omitted, but very similar to the proof of Lemma 14.18.12 above. \square

Lemma 14.18.14. *Let \mathcal{C} be a category with finite limits. Let $X \in \text{Ob}(\mathcal{C})$. The functor $\mathcal{C}/X \rightarrow \mathcal{C}$ commutes with the coskeleton functors cosk_k for $k \geq 1$.*

Proof. The statement means that if U is a simplicial object of \mathcal{C}/X which we can think of as a simplicial object of \mathcal{C} with a morphism towards the constant simplicial object X , then $\text{cosk}_k U$ computed in \mathcal{C}/X is the same as computed in \mathcal{C} . This follows for example from Categories, Lemma 4.16.2 because the categories $(\Delta/[n])_{\leq k}$ for $k \geq 1$ and $n \geq k + 1$ used in Lemma 14.18.2 are connected. Observe that we do not need the categories for $n \leq k$ by Lemma 14.18.3 or Lemma 14.18.4. \square

Lemma 14.18.15. *The canonical map $\Delta[n] \rightarrow \text{cosk}_1 \text{sk}_1 \Delta[n]$ is an isomorphism.*

Proof. Consider a simplicial set U and a morphism $f : U \rightarrow \Delta[n]$. This is a rule that associates to each $u \in U_i$ a map $f_u : [i] \rightarrow [n]$ in Δ . Furthermore, these maps should have the property that $f_u \circ \varphi = f_{U(\varphi)(u)}$ for any $\varphi : [j] \rightarrow [i]$. Denote $\epsilon_j^i : [0] \rightarrow [i]$ the map which maps 0 to j . Denote $F : U_0 \rightarrow [n]$ the map $u \mapsto f_u(0)$. Then we see that

$$f_u(j) = F(\epsilon_j^i(u))$$

for all $0 \leq j \leq i$ and $u \in U_i$. In particular, if we know the function F then we know the maps f_u for all $u \in U_i$ all i . Conversely, given a map $F : U_0 \rightarrow [n]$, we can set for any i , and any $u \in U_i$ and any $0 \leq j \leq i$

$$f_u(j) = F(\epsilon_j^i(u))$$

This does not in general define a morphism f of simplicial sets as above. Namely, the condition is that all the maps f_u are nondecreasing. This clearly is equivalent to the condition that $F(\epsilon_j^i(u)) \leq F(\epsilon_{j'}^i(u))$ whenever $0 \leq j \leq j' \leq i$ and $u \in U_i$. But in this case the morphisms

$$\epsilon_j^i, \epsilon_{j'}^i : [0] \rightarrow [i]$$

both factor through the map $\epsilon_{j,j'}^i : [1] \rightarrow [i]$ defined by the rules $0 \mapsto j, 1 \mapsto j'$. In other words, it is enough to check the inequalities for $i = 1$ and $u \in X_1$. In other words, we have

$$\text{Mor}(U, \Delta[n]) = \text{Mor}(\text{sk}_1 U, \text{sk}_1 \Delta[n])$$

as desired. \square

14.19. Augmentations

Definition 14.19.1. Let \mathcal{C} be a category. Let U be a simplicial object of \mathcal{C} . An *augmentation* $\epsilon : U \rightarrow X$ of U towards an object X of \mathcal{C} is a morphism from U into the constant simplicial object X .

Lemma 14.19.2. *Let \mathcal{C} be a category. Let $X \in \text{Ob}(\mathcal{C})$. Let U be a simplicial object of \mathcal{C} . To give an augmentation of U towards X is the same as giving a morphism $\epsilon_0 : U_0 \rightarrow X$ such that $\epsilon_0 \circ d_0^1 = \epsilon_0 \circ d_1^1$.*

Proof. Given a morphism $\epsilon : U \rightarrow X$ we certainly obtain an ϵ_0 as in the lemma. Conversely, given ϵ_0 as in the lemma, define $\epsilon_n : U_n \rightarrow X$ by choosing any morphism $\alpha : [0] \rightarrow [n]$ and taking $\epsilon_n = \epsilon_0 \circ U(\alpha)$. Namely, if $\beta : [0] \rightarrow [n]$ is another choice, then there exists a morphism $\gamma : [1] \rightarrow [n]$ such that α and β both factor as $[0] \rightarrow [1] \rightarrow [n]$. Hence the condition on ϵ_0 shows that ϵ_n is well defined. Then it is easy to show that $(\epsilon_n) : U \rightarrow X$ is a morphism of simplicial objects. \square

Lemma 14.19.3. *Let \mathcal{C} be a category with fibred products. Let $f : Y \rightarrow X$ be a morphism of \mathcal{C} . Let U be the simplicial object of \mathcal{C} whose n th term is the $(n + 1)$ fold fibred product $Y \times_X Y \times_X \dots \times_X Y$. See Example 14.3.5. For any simplicial object V of \mathcal{C} we have*

$$\begin{aligned} \text{Mor}_{\text{Simp}(\mathcal{C})}(V, U) &= \text{Mor}_{\text{Simp}_1(\mathcal{C})}(\text{sk}_1 V, \text{sk}_1 U) \\ &= \{g_0 : V_0 \rightarrow Y \mid f \circ g_0 \circ d_0^1 = f \circ g_0 \circ d_1^1\} \end{aligned}$$

In particular we have $U = \text{cosk}_1 \text{sk}_1 U$.

Proof. Suppose that $g : \text{sk}_1 V \rightarrow \text{sk}_1 U$ is a morphism of 1-truncated simplicial objects. Then the diagram

$$\begin{array}{ccc} V_1 & \xrightarrow{d_0^1} & V_0 \\ g_1 \downarrow & \begin{array}{c} \xrightarrow{d_1^1} \\ \xrightarrow{\text{pr}_1} \end{array} & \downarrow g_0 \\ Y \times_X Y & \xrightarrow{\text{pr}_0} & Y \longrightarrow X \end{array}$$

is commutative, which proves that the relation shown in the lemma holds. We have to show that, conversely, given a morphism g_0 satisfying the relation $f \circ g_0 \circ d_0^1 = f \circ g_0 \circ d_1^1$ we get a unique morphism of simplicial objects $g : V \rightarrow U$. This is done as follows. For any $n \geq 1$ let $g_{n,i} = g_0 \circ V([0] \rightarrow [n], 0 \mapsto i) : V_n \rightarrow Y$. The equality above implies that $f \circ g_{n,i} = f \circ g_{n,i+1}$ because of the commutative diagram

$$\begin{array}{ccc} [0] & & [n] \\ \searrow & \xrightarrow{0 \mapsto i} & \nearrow \\ 0 \mapsto 0 & & \\ \searrow & \xrightarrow{0 \mapsto i, 1 \mapsto i+1} & \nearrow \\ [1] & & [n] \\ 0 \mapsto 1 & & \\ \searrow & \xrightarrow{0 \mapsto i+1} & \nearrow \\ [0] & & [n] \end{array}$$

Hence we get $(g_{n,0}, \dots, g_{n,n}) : V_n \rightarrow Y \times_X \dots \times_X Y = U_n$. We leave it to the reader to see that this is a morphism of simplicial objects. The last assertion of the lemma is equivalent to the first equality in the displayed formula of the lemma. \square

Remark 14.19.4. Let \mathcal{C} be a category with fibre products. Let V be a simplicial object. Let $\epsilon : V \rightarrow X$ be an augmentation. Let U be the simplicial object whose n th term is the $(n + 1)$ st fibred product of V_0 over X . By a simple combination of Lemmas 14.19.2 and 14.19.3 we obtain a canonical morphism $V \rightarrow U$.

14.20. Left adjoints to the skeleton functors

In this section we construct a left adjoint $i_{m!}$ of the skeleton functor sk_m in certain cases. The adjointness formula is

$$\text{Mor}_{\text{Simp}_m(\mathcal{C})}(U, \text{sk}_m V) = \text{Mor}_{\text{Simp}(\mathcal{C})}(i_{m!}U, V).$$

It turns out that this left adjoint exists when the category \mathcal{C} has finite colimits.

We use a similar construction as in Section 14.12. Recall the category $[n]/\Delta$ of objects under $[n]$, see Categories, Example 4.2.14. Its objects are morphisms $\alpha : [n] \rightarrow [k]$ and its morphisms are commutative triangles. We let $([n]/\Delta)_{\leq m}$ denote the full subcategory of $[n]/\Delta$ consisting of objects $[n] \rightarrow [k]$ with $k \leq m$. Given a m -truncated simplicial object U of \mathcal{C} we define a functor

$$U(n) : ([n]/\Delta)_{\leq m}^{\text{opp}} \rightarrow \mathcal{C}$$

by the rules

$$\begin{aligned} ([n] \rightarrow [k]) &\longmapsto U_k \\ \psi : ([n] \rightarrow [k']) \rightarrow ([n] \rightarrow [k]) &\longmapsto U(\psi) : U_k \rightarrow U_{k'} \end{aligned}$$

For a given morphism $\varphi : [n] \rightarrow [n']$ of Δ we have an associated functor

$$\underline{\varphi} : ([n']/\Delta)_{\leq m} \rightarrow ([n]/\Delta)_{\leq m}$$

which maps $\alpha : [n'] \rightarrow [k]$ to $\varphi \circ \alpha : [n] \rightarrow [k]$. The composition $U(n) \circ \underline{\varphi}$ is equal to the functor $U(n')$.

Lemma 14.20.1. *Let \mathcal{C} be a category which has finite colimits. The functors $i_{m!}$ exist for all m . Let U be an m -truncated simplicial object of \mathcal{C} . The simplicial object $i_{m!}U$ is described by the formula*

$$(i_{m!}U)_n = \text{colim}_{([n]/\Delta)_{\leq m}^{\text{opp}}} U(n)$$

and for $\varphi : [n] \rightarrow [n']$ the map $i_{m!}U(\varphi)$ comes from the identification $U(n) \circ \underline{\varphi} = U(n')$ above via Categories, Lemma 4.14.7.

Proof. In this proof we denote $i_{m!}U$ the simplicial object whose n th term is given by the displayed formula of the lemma. We will show it satisfies the adjointness property.

Let V be a simplicial object of \mathcal{C} . Let $\gamma : U \rightarrow \text{sk}_m V$ be given. A morphism

$$\text{colim}_{([n]/\Delta)_{\leq m}^{\text{opp}}} U(n) \rightarrow T$$

is given by a compatible system of morphisms $f_\alpha : U_k \rightarrow T$ where $\alpha : [n] \rightarrow [k]$ with $k \leq m$. Certainly, we have such a system of morphisms by taking the compositions

$$U_k \xrightarrow{\gamma_k} V_k \xrightarrow{V(\alpha)} V_n.$$

Hence we get an induced morphism $(i_{m!}U)_n \rightarrow V_n$. We leave it to the reader to see that these form a morphism of simplicial objects $\gamma' : i_{m!}U \rightarrow V$.

Conversely, given a morphism $\gamma' : i_{m!}U \rightarrow V$ we obtain a morphism $\gamma : U \rightarrow \text{sk}_m V$ by setting $\gamma_i : U_i \rightarrow V_i$ equal to the composition

$$U_i \xrightarrow{\text{id}_{[i]}} \text{colim}_{([i]/\Delta)_{\leq m}^{\text{opp}}} U(i) \xrightarrow{\gamma'_i} V_i$$

for $0 \leq i \leq n$. We leave it to the reader to see that this is the inverse of the construction above. □

Lemma 14.20.2. *Let \mathcal{C} be a category. Let U be an m -truncated simplicial object of \mathcal{C} . For any $n \leq m$ the colimit*

$$\operatorname{colim}_{([n]/\Delta)_{\leq m}^{\operatorname{opp}}} U(n)$$

exists and is equal to U_n .

Proof. This is so because the category $([n]/\Delta)_{\leq m}$ has an initial object, namely $\operatorname{id} : [n] \rightarrow [n]$. \square

Lemma 14.20.3. *Let \mathcal{C} be a category which has finite colimits. Let U be an m -truncated simplicial object of \mathcal{C} . The map $U \rightarrow \operatorname{sk}_m i_{m!} U$ is an isomorphism.*

Proof. Combine Lemmas 14.20.1 and 14.20.2. \square

Lemma 14.20.4. *If U is an m -truncated simplicial set and $n > m$ then all n -simplices of $i_{m!} U$ are degenerate.*

Proof. This can be seen from the construction of $i_{m!} U$ in Lemma 14.20.1, but we can also argue directly as follows. Write $V = i_{m!} U$. Let $V' \subset V$ be the simplicial subset with $V'_i = V_i$ for $i \leq m$ and all i simplices degenerate for $i > m$, see Lemma 14.17.4. By the adjunction formula, since $\operatorname{sk}_m V' = U$, there is an inverse to the injection $V' \rightarrow V$. Hence $V' = V$. \square

Lemma 14.20.5. *Let U be a simplicial set. Let $n \geq 0$ be an integer. The morphism $i_{n!} \operatorname{sk}_n U \rightarrow U$ identifies $i_{n!} \operatorname{sk}_n U$ with the simplicial set $U' \subset U$ defined in Lemma 14.17.4.*

Proof. By Lemma 14.20.4 the only nondegenerate simplices of $i_{n!} \operatorname{sk}_n U$ are in degrees $\leq n$. The map $i_{n!} \operatorname{sk}_n U \rightarrow U$ is an isomorphism in degrees $\leq n$. Combined we conclude that the map $i_{n!} \operatorname{sk}_n U \rightarrow U$ maps nondegenerate simplices to nondegenerate simplices and no two nondegenerate simplices have the same image. Hence Lemma 14.17.3 applies. Thus $i_{n!} \operatorname{sk}_n U \rightarrow U$ is injective. The result follows easily from this. \square

Remark 14.20.6. In some texts the composite functor

$$\operatorname{Simp}(\mathcal{C}) \xrightarrow{\operatorname{sk}_m} \operatorname{Simp}_m(\mathcal{C}) \xrightarrow{i_{m!}} \operatorname{Simp}(\mathcal{C})$$

is denoted sk_m . This makes sense for simplicial sets, because then Lemma 14.20.5 says that $i_{m!} \operatorname{sk}_m V$ is just the sub simplicial set of V consisting of all i -simplices of V , $i \leq m$ and their degeneracies. In those texts it is also customary to denote the composition

$$\operatorname{Simp}(\mathcal{C}) \xrightarrow{\operatorname{sk}_m} \operatorname{Simp}_m(\mathcal{C}) \xrightarrow{\operatorname{cosk}_m} \operatorname{Simp}(\mathcal{C})$$

by cosk_m .

Lemma 14.20.7. *Let $U \subset V$ be simplicial sets. Suppose $n \geq 0$ and $x \in V_n$, $x \notin U_n$ are such that*

- (1) $V_i = U_i$ for $i < n$,
- (2) $V_n = U_n \cup \{x\}$,
- (3) any $z \in V_j$, $z \notin U_j$ for $j > n$ is degenerate.

Let $\Delta[n] \rightarrow V$ be the unique morphism mapping the nondegenerate n -simplex of $\Delta[n]$ to x . In this case the diagram

$$\begin{array}{ccc} \Delta[n] & \longrightarrow & V \\ \uparrow & & \uparrow \\ i_{(n-1)!} \text{sk}_{n-1} \Delta[n] & \longrightarrow & U \end{array}$$

is a pushout diagram.

Proof. Let us denote $\partial\Delta[n] = i_{(n-1)!} \text{sk}_{n-1} \Delta[n]$ for convenience. There is a natural map $U \amalg_{\partial\Delta[n]} \Delta[n] \rightarrow V$. We have to show that it is bijective in degree j for all j . This is clear for $j \leq n$. Let $j > n$. The third condition means that any $z \in V_j$, $z \notin U_j$ is a degenerate simplex, say $z = s_i^{j-1}(z')$. Of course $z' \notin U_{j-1}$. By induction it follows that z' is a degeneracy of x . Thus we conclude that all j -simplices of V are either in U or degeneracies of x . This implies that the map $U \amalg_{\partial\Delta[n]} \Delta[n] \rightarrow V$ is surjective. Note that a nondegenerate simplex of $U \amalg_{\partial\Delta[n]} \Delta[n]$ is either the image of a nondegenerate simplex of U , or the image of the (unique) nondegenerate n -simplex of $\Delta[n]$. Since clearly x is nondegenerate we deduce that $U \amalg_{\partial\Delta[n]} \Delta[n] \rightarrow V$ maps nondegenerate simplices to nondegenerate simplices and is injective on nondegenerate simplices. Hence it is injective, by Lemma 14.17.3. \square

Lemma 14.20.8. *Let $U \subset V$ be simplicial sets, with U_n, V_n finite nonempty for all n . Assume that U and V have finitely many nondegenerate simplices. Then there exists a sequence of sub simplicial sets*

$$U = W^0 \subset W^1 \subset W^2 \subset \dots \subset W^r = V$$

such that Lemma 14.20.7 applies to each of the inclusions $W^i \subset W^{i+1}$.

Proof. Let n be the smallest integer such that V has a nondegenerate simplex that does not belong to U . Let $x \in V_n$, $x \notin U_n$ be such a nondegenerate simplex. Let $W \subset V$ be the set of elements which are either in U , or are a (repeated) degeneracy of x (in other words, are of the form $V(\varphi)(x)$ with $\varphi : [m] \rightarrow [n]$ surjective). It is easy to see that W is a simplicial set. The inclusion $U \subset W$ satisfies the conditions of Lemma 14.20.7. Moreover the number of nondegenerate simplices of V which are not contained in W is exactly one less than the number of nondegenerate simplices of V which are not contained in U . Hence we win by induction on this number. \square

Lemma 14.20.9. *Let \mathcal{A} be an abelian category. Let U be an m -truncated simplicial object of \mathcal{A} . For $n > m$ we have $N(i_{m!}U)_n = 0$.*

Proof. Write $V = i_{m!}U$. Let $V' \subset V$ be the simplicial subobject of V with $V'_i = V_i$ for $i \leq m$ and $N(V'_i) = 0$ for $i > m$, see Lemma 14.17.9. By the adjunction formula, since $\text{sk}_m V' = U$, there is an inverse to the injection $V' \rightarrow V$. Hence $V' = V$. \square

Lemma 14.20.10. *Let \mathcal{A} be an abelian category. Let U be a simplicial object of \mathcal{A} . Let $n \geq 0$ be an integer. The morphism $i_{n!} \text{sk}_n U \rightarrow U$ identifies $i_{n!} \text{sk}_n U$ with the simplicial subobject $U' \subset U$ defined in Lemma 14.17.9.*

Proof. By Lemma 14.20.9 we have $N(i_{n!} \text{sk}_n U)_i = 0$ for $i > n$. The map $i_{n!} \text{sk}_n U \rightarrow U$ is an isomorphism in degrees $\leq n$, see Lemma 14.20.3. Combined we conclude that the map $i_{n!} \text{sk}_n U \rightarrow U$ induces injective maps $N(i_{n!} \text{sk}_n U)_i \rightarrow N(U)_i$ for all i .

Hence Lemma 14.17.7 applies. Thus $i_n! \text{sk}_n U \rightarrow U$ is injective. The result follows easily from this. \square

Here is another way to think about the coskeleton functor using the material above.

Lemma 14.20.11. *Let \mathcal{C} be a category with finite coproducts and finite limits. Let V be a simplicial object of \mathcal{C} . In this case*

$$(\text{cosk}_n \text{sk}_n V)_{n+1} = \text{Hom}(i_n! \text{sk}_n \Delta[n+1], V)_0.$$

Proof. By Lemma 14.13.4 the object on the left represents the functor which assigns to X the first set of the following equalities

$$\begin{aligned} \text{Mor}(X \times \Delta[n+1], \text{cosk}_n \text{sk}_n V) &= \text{Mor}(X \times \text{sk}_n \Delta[n+1], \text{sk}_n V) \\ &= \text{Mor}(X \times i_n! \text{sk}_n \Delta[n+1], V). \end{aligned}$$

The object on the right in the formula of the lemma is represented by the functor which assigns to X the last set in the sequence of equalities. This proves the result.

In the sequence of equalities we have used that $\text{sk}_n(X \times \Delta[n+1]) = X \times \text{sk}_n \Delta[n+1]$ and that $i_n!(X \times \text{sk}_n \Delta[n+1]) = X \times i_n! \text{sk}_n \Delta[n+1]$. The first equality is obvious. For any (possibly truncated) simplicial object W of \mathcal{C} and any object X of \mathcal{C} denote temporarily $\text{Mor}_{\mathcal{C}}(X, W)$ the (possibly truncated) simplicial set $[n] \mapsto \text{Mor}_{\mathcal{C}}(X, W_n)$. From the definitions it follows that $\text{Mor}(U \times X, W) = \text{Mor}(U, \text{Mor}_{\mathcal{C}}(X, W))$ for any (possibly truncated) simplicial set U . Hence

$$\begin{aligned} \text{Mor}(X \times i_n! \text{sk}_n \Delta[n+1], W) &= \text{Mor}(i_n! \text{sk}_n \Delta[n+1], \text{Mor}_{\mathcal{C}}(X, W)) \\ &= \text{Mor}(\text{sk}_n \Delta[n+1], \text{sk}_n \text{Mor}_{\mathcal{C}}(X, W)) \\ &= \text{Mor}(X \times \text{sk}_n \Delta[n+1], \text{sk}_n W) \\ &= \text{Mor}(i_n!(X \times \text{sk}_n \Delta[n+1]), W). \end{aligned}$$

This proves the second equality used, and ends the proof of the lemma. \square

Lemma 14.20.12. *Let \mathcal{C} be a category with finite coproducts and finite limits. Let X be an object of \mathcal{C} . Let $k \geq 0$. The canonical map*

$$\text{Hom}(\Delta[k], X) \longrightarrow \text{cosk}_1 \text{sk}_1 \text{Hom}(\Delta[k], X)$$

is an isomorphism.

Proof. For any simplicial object V we have

$$\begin{aligned} \text{Mor}(V, \text{cosk}_1 \text{sk}_1 \text{Hom}(\Delta[k], X)) &= \text{Mor}(\text{sk}_1 V, \text{sk}_1 \text{Hom}(\Delta[k], X)) \\ &= \text{Mor}(i_1! \text{sk}_1 V, \text{Hom}(\Delta[k], X)) \\ &= \text{Mor}(i_1! \text{sk}_1 V \times \Delta[k], X) \end{aligned}$$

The first equality by the adjointness of sk and cosk , the second equality by the adjointness of $i_1!$ and sk_1 , and the first equality by Definition 14.16.1 where the last X denotes the constant simplicial object with value X . By Lemma 14.19.2 an element in this set depends only on the terms of degree 0 and 1 of $i_1! \text{sk}_1 V \times \Delta[k]$. These agree with the degree 0 and 1 terms of $V \times \Delta[k]$, see Lemma 14.20.3. Thus the set above is equal to $\text{Mor}(V \times \Delta[k], X) = \text{Mor}(V, \text{Hom}(\Delta[k], X))$. \square

Lemma 14.20.13. *Let \mathcal{C} be a category with finite coproducts and finite limits. Let X be an object of \mathcal{C} . Let $k \geq 0$. The canonical map*

$$\text{Hom}(\Delta[k], X)_1 \longrightarrow (\text{cosk}_0 \text{sk}_0 \text{Hom}(\Delta[k], X))_1$$

is identified with the map

$$\prod_{\alpha: [k] \rightarrow [1]} X \longrightarrow X \times X$$

which is the projection onto the factors where α is a constant map.

Proof. It is shown in Example 14.18.1 that $\text{cosk}_0 Z$ equals $Z \times Z$ in degree 1. Moreover, it is true in general that the morphism $V_1 \rightarrow (\text{cosk}_0 V)_1$ is the morphism $(d_0^1, d_1^1) : V_1 \rightarrow V_0 \times V_0$ (left to the reader). Thus we simply have to compute the 0th and 1st term of $\text{Hom}(\Delta[k], X)$. According to Lemma 14.16.5 we have $\text{Hom}(\Delta[k], X)_0 = \prod_{\alpha: [k] \rightarrow [0]} X = X$, and $\text{Hom}(\Delta[k], X)_1 = \prod_{\alpha: [k] \rightarrow [1]} X$. The lemma follows from the description of the morphisms of the simplicial object just above Lemma 14.16.5. \square

14.21. Simplicial objects in abelian categories

Recall that an abelian category is defined in Homology, Section 12.5.

Lemma 14.21.1. *Let \mathcal{A} be an abelian category.*

- (1) *The categories $\text{Simp}(\mathcal{A})$ and $\text{CoSimp}(\mathcal{A})$ are abelian.*
- (2) *A morphism of (co)simplicial objects $f : A \rightarrow B$ is injective if and only if each $f_n : A_n \rightarrow B_n$ is injective.*
- (3) *A morphism of (co)simplicial objects $f : A \rightarrow B$ is surjective if and only if each $f_n : A_n \rightarrow B_n$ is surjective.*
- (4) *A sequence of (co)simplicial objects*

$$A \xrightarrow{f} B \xrightarrow{g} C$$

is exact at B if and only if each sequence

$$A_i \xrightarrow{f_i} B_i \xrightarrow{g_i} C_i$$

is exact at B_i .

Proof. Pre-additivity is easy. A final object is given by $U_n = 0$ in all degrees. Existence of direct products we saw in Lemmas 14.6.2 and 14.9.2. Kernels and cokernels are obtained by taking termwise kernels and cokernels. \square

For an object A of \mathcal{A} and an integer k consider the k -truncated simplicial object U with

- (1) $U_i = 0$ for $i < k$,
- (2) $U_k = A$,
- (3) all morphisms $U(\varphi)$ equal to zero, except $U(\text{id}_{[k]}) = \text{id}_A$.

Since \mathcal{A} has both finite limits and finite colimits we see that both $\text{cosk}_k U$ and $i_{k!} U$ exist. We will describe both of these and the canonical map $i_{k!} U \rightarrow \text{cosk}_k U$.

Lemma 14.21.2. *With A, k and U as above, so $U_i = 0, i < k$ and $U_k = A$.*

- (1) *Given a k -truncated simplicial object V we have*

$$\text{Mor}(U, V) = \{f : A \rightarrow V_k \mid d_i^k \circ f = 0, i = 0, \dots, k\}$$

and

$$\text{Mor}(V, U) = \{f : V_k \rightarrow A \mid f \circ s_i^{k-1} = 0, i = 0, \dots, k-1\}.$$

- (2) *The object $i_{k!} U$ has n th term equal to $\bigoplus_{\alpha} A$ where α runs over all surjective morphisms $\alpha : [n] \rightarrow [k]$.*

- (3) For any $\varphi : [m] \rightarrow [n]$ the map $i_{k!}U(\varphi)$ is described as the mapping $\bigoplus_{\alpha} A \rightarrow \bigoplus_{\alpha'} A$ which maps to component corresponding to $\alpha : [n] \rightarrow [k]$ to zero if $\alpha \circ \varphi$ is not surjective and by the identity to the component corresponding to $\alpha \circ \varphi$ if it is surjective.
- (4) The object $\text{cosk}_k U$ has n th term equal to $\bigoplus_{\beta} A$, where β runs over all injective morphisms $\beta : [k] \rightarrow [n]$.
- (5) For any $\varphi : [m] \rightarrow [n]$ the map $\text{cosk}_k U(\varphi)$ is described as the mapping $\bigoplus_{\beta} A \rightarrow \bigoplus_{\beta'} A$ which maps to component corresponding to $\beta : [k] \rightarrow [n]$ to zero if β does not factor through φ and by the identity to each of the components corresponding to β' such that $\beta = \varphi \circ \beta'$ if it does.
- (6) The canonical map $c : i_{k!}U \rightarrow \text{cosk}_k U$ in degree n has (α, β) coefficient $A \rightarrow A$ equal to zero if $\alpha \circ \beta$ is not the identity and equal to id_A if it is.
- (7) The canonical map $c : i_{k!}U \rightarrow \text{cosk}_k U$ is injective.

Proof. The proof of (1) is left to the reader.

Let us take the rules of (2) and (3) as the definition of a simplicial object, call it \tilde{U} . We will show that it is an incarnation of $i_{k!}U$. This will prove (2), (3) at the same time. We have to show that given a morphism $f : U \rightarrow \text{sk}_k V$ there exists a unique morphism $\tilde{f} : \tilde{U} \rightarrow V$ which recovers f upon taking the k -skeleton. From (1) we see that f corresponds with a morphism $f_k : A \rightarrow V_k$ which maps into the kernel of d_i^k for all i . For any surjective $\alpha : [n] \rightarrow [k]$ we set $\tilde{f}_{\alpha} : A \rightarrow V_n$ equal to the composition $\tilde{f}_{\alpha} = V(\alpha) \circ f_k : A \rightarrow V_n$. We define $\tilde{f}_n : \tilde{U}_n \rightarrow V_n$ as the sum of the \tilde{f}_{α} over $\alpha : [n] \rightarrow [k]$ surjective. Such a collection of \tilde{f}_{α} defines a morphism of simplicial objects if and only if for any $\varphi : [m] \rightarrow [n]$ the diagram

$$\begin{array}{ccc} \bigoplus_{\alpha: [n] \rightarrow [k] \text{ surjective}} A & \xrightarrow{\tilde{f}_n} & V_n \\ \text{(3)} \downarrow & & \downarrow V(\varphi) \\ \bigoplus_{\alpha': [m] \rightarrow [k] \text{ surjective}} A & \xrightarrow{\tilde{f}_m} & V_m \end{array}$$

is commutative. Choosing $\varphi = \alpha$ shows our choice of \tilde{f}_{α} is uniquely determined by f_k . The commutativity in general may be checked for each summand of the left upper corner separately. It is clear for the summands corresponding to α where $\alpha \circ \varphi$ is surjective, because those get mapped by id_A to the summand with $\alpha' = \alpha \circ \varphi$, and we have $\tilde{f}_{\alpha'} = V(\alpha') \circ f_k = V(\alpha \circ \varphi) \circ f_k = V(\varphi) \circ \tilde{f}_{\alpha}$. For those where $\alpha \circ \varphi$ is not surjective, we have to show that $V(\varphi) \circ \tilde{f}_{\alpha} = 0$. By definition this is equal to $V(\varphi) \circ V(\alpha) \circ f_k = V(\alpha \circ \varphi) \circ f_k$. Since $\alpha \circ \varphi$ is not surjective we can write it as $\delta_i^k \circ \psi$, and we deduce that $V(\varphi) \circ V(\alpha) \circ f_k = V(\psi) \circ d_i^k \circ f_k = 0$ see above.

Let us take the rules of (4) and (5) as the definition of a simplicial object, call it \tilde{U} . We will show that it is an incarnation of $\text{cosk}_k U$. This will prove (4), (5) at the same time. The argument is completely dual to the proof of (2), (3) above, but we give it anyway. We have to show that given a morphism $f : \text{sk}_k V \rightarrow U$ there exists a unique morphism $\tilde{f} : V \rightarrow \tilde{U}$ which recovers f upon taking the k -skeleton. From (1) we see that f corresponds with a morphism $f_k : V_k \rightarrow A$ which is zero on the image of s_i^{k-1} for all i . For any injective $\beta : [k] \rightarrow [n]$ we set $\tilde{f}_{\beta} : V_n \rightarrow A$ equal to the composition $\tilde{f}_{\beta} = f_k \circ V(\beta) : V_n \rightarrow A$. We define $\tilde{f}_n : V_n \rightarrow \tilde{U}_n$ as the sum of the \tilde{f}_{β} over $\beta : [k] \rightarrow [n]$ injective. Such a collection of \tilde{f}_{β} defines a morphism of

simplicial objects if and only if for any $\varphi : [m] \rightarrow [n]$ the diagram

$$\begin{array}{ccc} V_n & \xrightarrow{\tilde{f}_n} & \bigoplus_{\beta:[k] \rightarrow [n]} \text{injective } A \\ \downarrow V(\varphi) & & \downarrow (5) \\ V_m & \xrightarrow{\tilde{f}_m} & \bigoplus_{\beta':[k] \rightarrow [m]} \text{injective } A \end{array}$$

is commutative. Choosing $\varphi = \beta$ shows our choice of \tilde{f}_β is uniquely determined by f_k . The commutativity in general may be checked for each summand of the right lower corner separately. It is clear for the summands corresponding to β' where $\varphi \circ \beta'$ is injective, because these summands get mapped into by exactly the summand with $\beta = \varphi \circ \beta'$ and we have in that case $\tilde{f}_{\beta'} \circ V(\varphi) = f_k \circ V(\beta') \circ V(\varphi) = f_k \circ V(\beta) = \tilde{f}_\beta$. For those where $\varphi \circ \beta'$ is not injective, we have to show that $\tilde{f}_{\beta'} \circ V(\varphi) = 0$. By definition this is equal to $f_k \circ V(\beta') \circ V(\varphi) = f_k \circ V(\varphi \circ \beta')$. Since $\varphi \circ \beta'$ is not injective we can write it as $\psi \circ \sigma_i^{k-1}$, and we deduce that $f_k \circ V(\beta') \circ V(\varphi) = f_k \circ \sigma_i^{k-1} \circ V(\psi) = 0$ see above.

The composition $i_{k!}U \rightarrow \text{cosk}_k U$ is the unique map of simplicial objects which is the identity on $A = U_k = (i_{k!}U)_k = (\text{cosk}_k U)_k$. Hence it suffices to check that the proposed rule defines a morphism of simplicial objects. To see this we have to show that for any $\varphi : [m] \rightarrow [n]$ the diagram

$$\begin{array}{ccc} \bigoplus_{\alpha:[n] \rightarrow [k]} \text{surjective } A & \xrightarrow{(6)} & \bigoplus_{\beta:[k] \rightarrow [n]} \text{injective } A \\ (3) \downarrow & & \downarrow (5) \\ \bigoplus_{\alpha':[m] \rightarrow [k]} \text{surjective } A & \xrightarrow{(6)} & \bigoplus_{\beta':[k] \rightarrow [m]} \text{injective } A \end{array}$$

is commutative. Now we can think of this in terms of matrices filled with only 0's and 1's as follows: The matrix of (3) has a nonzero (α', α) entry if and only if $\alpha' = \alpha \circ \varphi$. Likewise the matrix of (5) has a nonzero (β', β) entry if and only if $\beta = \varphi \circ \beta'$. The upper matrix of (6) has a nonzero (α, β) entry if and only if $\alpha \circ \beta = \text{id}_{[k]}$. Similarly for the lower matrix of (6). The commutativity of the diagram then comes down to computing the (α, β') entry for both compositions and seeing they are equal. This comes down to the following equality

$$\# \{ \beta \mid \beta = \varphi \circ \beta' \wedge \alpha \circ \beta = \text{id}_{[k]} \} = \# \{ \alpha' \mid \alpha' = \alpha \circ \varphi \wedge \alpha' \circ \beta' = \text{id}_{[k]} \}$$

whose proof may safely be left to the reader.

Finally, we prove (7). This follows directly from Lemmas 14.17.7, 14.18.4, 14.20.3 and 14.20.9. \square

Definition 14.21.3. Let \mathcal{A} be an abelian category. Let A be an object of \mathcal{A} and let k be an integer ≥ 0 . The *Eilenberg-MacLane object* $K(A, k)$ is given by the object $K(A, k) = i_{k!}U$ which is described in Lemma 14.21.2 above.

Lemma 14.21.4. Let \mathcal{A} be an abelian category. Let A be an object of \mathcal{A} and let k be an integer ≥ 0 . Consider the simplicial object E defined by the following rules

- (1) $E_n = \bigoplus_{\alpha} A$, where the sum is over $\alpha : [n] \rightarrow [k+1]$ whose image is either $[k]$ or $[k+1]$.

- (2) Given $\varphi : [m] \rightarrow [n]$ the map $E_n \rightarrow E_m$ maps the summand corresponding to α via id_A to the summand corresponding to $\alpha \circ \varphi$, provided $Im(\alpha \circ \varphi)$ is equal to $[k]$ or $[k + 1]$.

Then there exists a short exact sequence

$$0 \rightarrow K(A, k) \rightarrow E \rightarrow K(A, k + 1) \rightarrow 0$$

which is term by term split exact.

Proof. The maps $K(A, k)_n \rightarrow E_n$ resp. $E_n \rightarrow K(A, k + 1)_n$ are given by the inclusion of direct sums, resp. projection of direct sums which is obvious from the inclusions of index sets. It is clear that these are maps of simplicial objects. \square

Lemma 14.21.5. *Let \mathcal{A} be an abelian category. For any simplicial object V of \mathcal{A} we have*

$$V = \operatorname{colim}_n i_{n!} \operatorname{sk}_n V$$

where all the transition maps are injections.

Proof. This is true simply because each V_m is equal to $(i_{n!} \operatorname{sk}_n V)_m$ as soon as $n \geq m$. See also Lemma 14.20.10 for the transition maps. \square

14.22. Simplicial objects and chain complexes

Let \mathcal{A} be an abelian category. See Homology, Section 12.12 for conventions and notation regarding chain complexes. Let U be a simplicial object of \mathcal{A} . The associated chain complex $s(U)$ of U , sometimes called the *Moore complex*, is the chain complex

$$\dots \rightarrow U_2 \rightarrow U_1 \rightarrow U_0 \rightarrow 0 \rightarrow 0 \rightarrow \dots$$

with boundary maps $d_n : U_n \rightarrow U_{n-1}$ given by the formula

$$d_n = \sum_{i=0}^n (-1)^i d_i^n.$$

This is a complex because, by the relations listed in Remark 14.3.3, we have

$$\begin{aligned} d_n \circ d_{n+1} &= \left(\sum_{i=0}^n (-1)^i d_i^n \right) \circ \left(\sum_{j=0}^{n+1} (-1)^j d_j^{n+1} \right) \\ &= \sum_{0 \leq i < j \leq n+1} (-1)^{i+j} d_{j-1}^n \circ d_i^{n+1} + \sum_{n \geq i \geq j \geq 0} (-1)^{i+j} d_i^n \circ d_j^{n+1} \\ &= 0. \end{aligned}$$

The signs cancel! We denote the associated chain complex $s(U)$. Clearly, the construction is functorial and hence defines a functor

$$s : \operatorname{Simp}(\mathcal{A}) \longrightarrow \operatorname{Ch}_{\geq 0}(\mathcal{A}).$$

Thus we have the confusing but correct formula $s(U)_n = U_n$.

Lemma 14.22.1. *The functor s is exact.*

Proof. Clear from Lemma 14.21.1. \square

Lemma 14.22.2. *Let \mathcal{A} be an abelian category. Let A be an object of \mathcal{A} and let k be an integer. Let E be the object described in Lemma 14.21.4. Then the complex $s(E)$ is acyclic.*

Proof. For a morphism $\alpha : [n] \rightarrow [k + 1]$ we define $\alpha' : [n + 1] \rightarrow [k + 1]$ to be the map such that $\alpha'|_{[n]} = \alpha$ and $\alpha'(n + 1) = k + 1$. Note that if the image of α is $[k]$ or $[k + 1]$, then the image of α' is $[k + 1]$. Consider the family of maps $h_n : E_n \rightarrow E_{n+1}$ which maps the summand corresponding to α to the summand corresponding to α' via the identity on A . Let us compute $d_{n+1} \circ h_n - h_{n-1} \circ d_n$. We will first do this in case the category \mathcal{A} is the category of abelian groups. Let us use the notation x_α to indicate the element $x \in A$ in the summand of E_n corresponding to the map α occurring in the index set. Let us also adopt the convention that x_α designates the zero element of E_n whenever $\text{Im}(\alpha)$ is not $[k]$ or $[k + 1]$. With these conventions we see that

$$d_{n+1}(h_n(x_\alpha)) = \sum_{i=0}^{n+1} (-1)^i x_{\alpha' \circ \delta_i^{n+1}}$$

and

$$h_{n-1}(d_n(x_\alpha)) = \sum_{i=0}^n (-1)^i x_{(\alpha \circ \delta_i^n)'}$$

It is easy to see that $\alpha' \circ \delta_i^{n+1} = (\alpha \circ \delta_i^n)'$ for $i = 0, \dots, n$. It is also easy to see that $\alpha' \circ \delta_{n+1}^{n+1} = \alpha$. Thus we see that

$$(d_{n+1} \circ h_n - h_{n-1} \circ d_n)(x_\alpha) = (-1)^{n+1} x_\alpha$$

These identities continue to hold if \mathcal{A} is any abelian category because they hold in the simplicial abelian group $[n] \mapsto \text{Hom}(A, E_n)$; details left to the reader. We conclude that the identity map on E is homotopic to zero, with homotopy given by the system of maps $h'_n = (-1)^{n+1} h_n : E_n \rightarrow E_{n+1}$. Hence we see that E is acyclic, for example by Homology, Lemma 12.12.5. \square

Lemma 14.22.3. *Let \mathcal{A} be an abelian category. Let A be an object of \mathcal{A} and let k be an integer. We have $H_i(s(K(A, k))) = A$ if $i = k$ and 0 else.*

Proof. First, let us prove this if $k = 0$. In this case we have $K(A, 0)_n = A$ for all n . Furthermore, all the maps in this simplicial abelian group are id_A , in other words $K(A, 0)$ is the constant simplicial object with value A . The boundary maps $d_n = \sum_{i=0}^n (-1)^i \text{id}_A = 0$ if n odd and $= \text{id}_A$ if n is even. Thus $s(K(A, 0))$ looks like this

$$\dots \rightarrow A \xrightarrow{0} A \xrightarrow{1} A \xrightarrow{0} A \rightarrow 0$$

and the result is clear.

Next, we prove the result for all k by induction. Given the result for k consider the short exact sequence

$$0 \rightarrow K(A, k) \rightarrow E \rightarrow K(A, k + 1) \rightarrow 0$$

from Lemma 14.21.4. By Lemma 14.21.1 the associated sequence of chain complexes is exact. By Lemma 14.22.2 we see that $s(E)$ is acyclic. Hence the result for $k + 1$ follows from the long exact sequence of homology, see Homology, Lemma 12.12.6. \square

There is a second chain complex we can associate to a simplicial object of \mathcal{A} . Recall that by Lemma 14.17.6 any simplicial object U of \mathcal{A} is canonically split with $N(U_m) = \bigcap_{i=0}^{m-1} \text{Ker}(d_i^m)$. We define the *normalized chain complex* $N(U)$ to be the chain complex

$$\dots \rightarrow N(U_2) \rightarrow N(U_1) \rightarrow N(U_0) \rightarrow 0 \rightarrow 0 \rightarrow \dots$$

with boundary map $d_n : N(U_n) \rightarrow N(U_{n-1})$ given by the restriction of $(-1)^n d_n^n$ to the direct summand $N(U_n)$ of U_n . Note that Lemma 14.17.8 implies that $d_n^n(N(U_n)) \subset N(U_{n-1})$. It is a complex because $d_n^n \circ d_{n+1}^{n+1} = d_n^n \circ d_{n+1}^{n+1}$ and d_{n+1}^{n+1} is zero on $N(U_{n+1})$ by definition. Thus we obtain a second functor

$$N : \text{Simp}(\mathcal{A}) \longrightarrow \text{Ch}_{\geq 0}(\mathcal{A}).$$

Here is the reason for the sign in the differential.

Lemma 14.22.4. *Let \mathcal{A} be an abelian category. Let U be a simplicial object of \mathcal{A} . The canonical map $N(U_n) \rightarrow U_n$ gives rise to a morphism of complexes $N(U) \rightarrow s(U)$.*

Proof. This is clear because the differential on $s(U)_n = U_n$ is $\sum (-1)^i d_i^n$ and the maps d_i^n , $i < n$ are zero on $N(U_n)$, whereas the restriction of $(-1)^n d_n^n$ is the boundary map of $N(U)$ by definition. \square

Lemma 14.22.5. *Let \mathcal{A} be an abelian category. Let A be an object of \mathcal{A} and let k be an integer. We have $N(K(A, k))_i = A$ if $i = k$ and 0 else.*

Proof. It is clear that $N(K(A, k))_i = 0$ when $i < k$ because $K(A, k)_i = 0$ in that case. It is clear that $N(K(A, k))_k = A$ since $K(A, k)_{k-1} = 0$ and $K(A, k)_k = A$. For $i > k$ we have $N(K(A, k))_i = 0$ by Lemma 14.20.9 and the definition of $K(A, k)$, see Definition 14.21.3. \square

Lemma 14.22.6. *Let \mathcal{A} be an abelian category. Let U be a simplicial object of \mathcal{A} . The canonical morphism of chain complexes $N(U) \rightarrow s(U)$ is split. In fact,*

$$s(U) = N(U) \oplus A(U)$$

for some complex $A(U)$. The construction $U \mapsto A(U)$ is functorial.

Proof. Define $A(U)_n$ to be the image of

$$\bigoplus_{\varphi: [n] \rightarrow [m] \text{ surjective}, m < n} N(U_m) \xrightarrow{\bigoplus U(\varphi)} U_n$$

which is a subobject of U_n complementary to $N(U_n)$ according to Lemma 14.17.6 and Definition 14.17.1. We show that $A(U)$ is a subcomplex. Pick a surjective map $\varphi : [n] \rightarrow [m]$ with $m < n$ and consider the composition

$$N(U_m) \xrightarrow{U(\varphi)} U_n \xrightarrow{d_n} U_{n-1}.$$

This composition is the sum of the maps

$$N(U_m) \xrightarrow{U(\varphi \circ \delta_i^n)} U_{n-1}$$

with sign $(-1)^i$, $i = 0, \dots, n$.

First we will prove by ascending induction on m , $0 \leq m < n - 1$ that all the maps $U(\varphi \circ \delta_i^n)$ map $N(U_m)$ into $A(U)_{n-1}$. (The case $m = n - 1$ is treated below.) Whenever the map $\varphi \circ \delta_i^n : [n - 1] \rightarrow [m]$ is surjective then the image of $N(U_m)$ under $U(\varphi \circ \delta_i^n)$ is contained in $A(U)_{n-1}$ by definition. If $\varphi \circ \delta_i^n : [n - 1] \rightarrow [m]$ is not surjective, set $j = \varphi(i)$ and observe that i is the unique index whose image under φ is j . We may write $\varphi \circ \delta_i^n = \delta_j^m \circ \psi \circ \delta_i^n$ for some $\psi : [n - 1] \rightarrow [m - 1]$. Hence $U(\varphi \circ \delta_i^n) = U(\psi \circ \delta_i^n) \circ d_j^m$ which is zero on $N(U_m)$ unless $j = m$. If $j = m$, then $d_m^m(N(U_m)) \subset N(U_{m-1})$ and hence $U(\varphi \circ \delta_i^n)(N(U_m)) \subset U(\psi \circ \delta_i^n)(N(U_{m-1}))$ and we win by induction hypothesis.

To finish proving that $A(U)$ is a subcomplex we still have to deal with the composition

$$N(U_m) \xrightarrow{U(\varphi)} U_n \xrightarrow{d_n} U_{n-1}.$$

in case $m = n - 1$. In this case $\varphi = \sigma_j^{n-1}$ for some $0 \leq j \leq n - 1$ and $U(\varphi) = s_j^{n-1}$. Thus the composition is given by the sum

$$\sum (-1)^i d_i^n \circ s_j^{n-1}$$

Recall from Remark 14.3.3 that $d_j^n \circ s_j^{n-1} = d_{j+1}^n \circ s_j^{n-1} = \text{id}$ and these drop out because the corresponding terms have opposite signs. The map $d_n^n \circ s_j^{n-1}$, if $j < n - 1$, is equal to $s_j^{n-2} \circ d_{n-1}^{n-1}$. Since d_{n-1}^{n-1} maps $N(U_{n-1})$ into $N(U_{n-2})$, we see that the image $d_n^n(s_j^{n-1}(N(U_{n-1})))$ is contained in $s_j^{n-2}(N(U_{n-2}))$ which is contained in $A(U_{n-1})$ by definition. For all other combinations of (i, j) we have either $d_i^n \circ s_j^{n-1} = s_{j-1}^{n-2} \circ d_i^{n-1}$ (if $i < j$), or $d_i^n \circ s_j^{n-1} = s_j^{n-2} \circ d_{i-1}^{n-1}$ (if $n > i > j + 1$) and in these cases the map is zero because of the definition of $N(U_{n-1})$. \square

Lemma 14.22.7. *The functor N is exact.*

Proof. By Lemma 14.22.1 and the functorial decomposition of Lemma 14.22.6. \square

Lemma 14.22.8. *Let \mathcal{A} be an abelian category. Let V be a simplicial object of \mathcal{A} . The canonical morphism of chain complexes $N(V) \rightarrow s(V)$ is a quasi-isomorphism. In other words, the complex $A(V)$ of Lemma 14.22.6 is acyclic.*

Proof. Note that the result holds for $K(A, k)$ for any object A and any $k \geq 0$, by Lemmas 14.22.3 and 14.22.5. Consider the hypothesis $IH_{n,m}$: for all V such that $V_j = 0$ for $j \leq m$ and all $i \leq n$ the map $N(V) \rightarrow s(V)$ induces an isomorphism $H_i(N(V)) \rightarrow H_i(s(V))$.

To start of the induction, note that $IH_{n,n}$ is trivially true, because in that case $N(V)_n = 0$ and $s(V)_n = 0$.

Assume $IH_{n,m}$, with $m \leq n$. Pick a simplicial object V such that $V_j = 0$ for $j < m$. By Lemma 14.21.2 and Definition 14.21.3 we have $K(V_m, m) = i_m! \text{sk}_m V$. By Lemma 14.20.10 the natural morphism

$$K(V_m, m) = i_m! \text{sk}_m V \rightarrow V$$

is injective. Thus we get a short exact sequence

$$0 \rightarrow K(V_m, m) \rightarrow V \rightarrow W \rightarrow 0$$

for some W with $W_i = 0$ for $i = 0, \dots, m$. This short exact sequence induces a morphism of short exact sequence of associated complexes

$$\begin{array}{ccccccc} 0 & \longrightarrow & N(K(V_m, m)) & \longrightarrow & N(V) & \longrightarrow & N(W) \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & s(K(V_m, m)) & \longrightarrow & s(V) & \longrightarrow & s(W) \longrightarrow 0 \end{array}$$

see Lemmas 14.22.1 and 14.22.7. Hence we deduce the result for V from the result on the ends. \square

14.23. Dold-Kan

Lemma 14.23.1. *Let \mathcal{A} be an abelian category. The functor N is faithful, and reflects isomorphisms, injections and surjections.*

Proof. The faithfulness is immediate from the canonical splitting of Lemma 14.17.6. The statement on reflecting injections, surjections, and isomorphisms follows from Lemma 14.17.7. \square

Lemma 14.23.2. *Let \mathcal{A} and \mathcal{B} be abelian categories. Let $N : \mathcal{A} \rightarrow \mathcal{B}$, and $S : \mathcal{B} \rightarrow \mathcal{A}$ be functors. Suppose that*

- (1) *the functors S and N are exact,*
- (2) *there is an isomorphism $g : N \circ S \rightarrow id_{\mathcal{B}}$ to the identity functor of \mathcal{B} ,*
- (3) *N is faithful, and*
- (4) *S is essentially surjective.*

Then S and N are quasi-inverse equivalences of categories.

Proof. It suffices to construct a functorial isomorphism $S(N(A)) \cong A$. To do this choose B and an isomorphism $f : A \rightarrow S(B)$. Consider the map

$$f^{-1} \circ g_{S(B)} \circ S(N(f)) : S(N(A)) \rightarrow S(N(S(B))) \rightarrow S(B) \rightarrow A.$$

It is easy to show this does not depend on the choice of f, B and gives the desired isomorphism $S \circ N \rightarrow id_{\mathcal{A}}$. \square

Theorem 14.23.3. *Let \mathcal{A} be an abelian category. The functor N induces an equivalence of categories*

$$N : \text{Simp}(\mathcal{A}) \longrightarrow \text{Ch}_{\geq 0}(\mathcal{A})$$

Proof. We will describe a functor in the reverse direction inspired by the construction of Lemma 14.21.4 (except that we throw in a sign to get the boundaries right). Let A_{\bullet} be a chain complex with boundary maps $d_{A,n} : A_n \rightarrow A_{n-1}$. For each $n \geq 0$ denote

$$I_n = \left\{ \alpha : [n] \rightarrow \{0, 1, 2, \dots\} \mid \text{Im}(\alpha) = [k] \text{ for some } k \right\}.$$

For $\alpha \in I_n$ we denote $k(\alpha)$ the unique integer such that $\text{Im}(\alpha) = [k]$. We define a simplicial object $S(A_{\bullet})$ as follows:

- (1) $S(A_{\bullet})_n = \bigoplus_{\alpha \in I_n} A_{k(\alpha)}$, which we will write as $\bigoplus_{\alpha \in I_n} A_{k(\alpha)} \cdot \alpha$ to suggest thinking of “ α ” as a basis vector for the summand corresponding to it,
- (2) given $\varphi : [m] \rightarrow [n]$ we define $S(A_{\bullet})(\varphi)$ by its restriction to the direct summand $A_{k(\alpha)} \cdot \alpha$ of $S(A_{\bullet})_n$ as follows
 - (a) $\alpha \circ \varphi \notin I_m$ then we set it equal to zero,
 - (b) $\alpha \circ \varphi \in I_m$ but $k(\alpha \circ \varphi)$ not equal to either $k(\alpha)$ or $k(\alpha) - 1$ then we set it equal to zero as well,
 - (c) if $\alpha \circ \varphi \in I_m$ and $k(\alpha \circ \varphi) = k(\alpha)$ then we use the identity map to the summand $A_{k(\alpha \circ \varphi)} \cdot (\alpha \circ \varphi)$ of $S(A_{\bullet})_m$, and
 - (d) if $\alpha \circ \varphi \in I_m$ and $k(\alpha \circ \varphi) = k(\alpha) - 1$ then we use $(-1)^{k(\alpha)} d_{A, k(\alpha)}$ to the summand $A_{k(\alpha \circ \varphi)} \cdot (\alpha \circ \varphi)$ of $S(A_{\bullet})_m$.

It is an exercise (FIXME) to show that this is a simplicial complex; one has to use in particular that the compositions $d_{A,k} \circ d_{A,k-1}$ are all zero.

Having verified this, the correct way to proceed with the proof would be to prove directly that N and S are quasi-inverse functors (FIXME). Instead we prove this

by an indirect method using Eilenberg-MacLane objects and truncations. It is clear that $A_\bullet \mapsto S(A_\bullet)$ is an exact functor from chain complexes to simplicial objects. If $A_i = 0$ for $i = 0, \dots, n$ then $S(A_\bullet)_i = 0$ for $i = 0, \dots, n$. The objects $K(A, k)$, see Definition 14.21.3, are equal to $S(A[-k])$ where $A[-k]$ is the chain complex with A in degree k and zero elsewhere.

Moreover, for each integer k we get a sub simplicial object $S_{\leq k}(A_\bullet)$ by considering only those α with $k(\alpha) \leq k$. In fact this is nothing but $S(\sigma_{\leq k}A_\bullet)$, where $\sigma_{\leq k}A_\bullet$ is the “stupid” truncation of A_\bullet at k (which simply replaces A_i by 0 for $i > k$). Also, by Lemma 14.20.10 we see that it is equal to $i_{k!}sk_k S(A_\bullet)$. Clearly, the quotient $S_{\leq k}(A_\bullet)/S_{\leq k-1}(A_\bullet) = K(A_k, k)$ and the quotient $S(A_\bullet)/S_{\leq k}(A_\bullet) = S(A/\sigma_{\leq k}A_\bullet)$ is a simplicial object whose i th term is zero for $i = 0, \dots, k$. Since $S_{\leq k-1}(A_\bullet)$ is filtered with subquotients $K(A_i, i)$, $i < k$ we see that $N(S_{\leq k-1}(A_\bullet))_k = 0$ by exactness of the functor N , see Lemma 14.22.7. All in all we conclude that the maps

$$N(S(A_\bullet))_k \leftarrow N(S_{\leq k}(A_\bullet))_k \rightarrow N(S(A_k[-k])) = N(K(A_k, k))_k = A_k$$

are functorial isomorphisms.

It is actually easy to identify the map $A_k \rightarrow N(S(A_\bullet))_k$. Note that there is a unique map $A_k \rightarrow S(A_\bullet)_k$ corresponding to the summand $\alpha = \text{id}_{[k]}$. Note that $\text{Im}(\text{id}_{[k]} \circ \delta_i^k)$ has cardinality $k - 1$ but does not have image $[k - 1]$ unless $i = k$. Hence d_i^k kills the summand $A_k \cdot \text{id}_{[k]}$ for $i = 0, \dots, k - 1$. From the abstract computation of $N(S(A_\bullet))_k$ above we conclude that the summand $A_k \cdot \text{id}_{[k]}$ is equal to $N(S(A_\bullet))_k$.

In order to show that $N \circ S$ is the identity functor on $\text{Ch}_{\geq 0}(\mathcal{A})$, the last thing we have to verify is that we recover the map $d_{A,k+1} : A_{k+1} \rightarrow A_k$ as the differential on the complex $N(S(A_\bullet))$ as follows

$$A_{k+1} = N(S(A_\bullet))_{k+1} \rightarrow N(S(A_\bullet))_k = A_k$$

By definition the map $N(S(A_\bullet))_{k+1} \rightarrow N(S(A_\bullet))_k$ corresponds to the restriction of $(-1)^{k+1}d_{k+1}^{k+1}$ to $N(S(A_\bullet))$ which is the summand $A_{k+1} \cdot \text{id}_{[k+1]}$. And by the definition of $S(A_\bullet)$ above the map d_{k+1}^{k+1} maps $A_{k+1} \cdot \text{id}_{[k+1]}$ into $A_k \cdot \text{id}_{[k]}$ by $(-1)^{k+1}d_{A,k+1}$. The signs cancel and hence the desired equality.

We know that N is faithful, see Lemma 14.23.1. If we can show that S is essentially surjective, then it will follow that N is an equivalence, see Homology, Lemma 14.23.2. Note that if A_\bullet is a chain complex then $S(A_\bullet) = \text{colim}_n S_{\leq n}(A_\bullet) = \text{colim}_n S(\sigma_{\leq n}A_\bullet) = \text{colim}_n i_{n!}sk_n S(A_\bullet)$ by construction of S . By Lemma 14.21.5 it suffices to show that $i_{n!}V$ is in the essential image for any n -truncated simplicial object V . By induction on n it suffices to show that any extension

$$0 \rightarrow S(A_\bullet) \rightarrow V \rightarrow K(A, n) \rightarrow 0$$

where $A_i = 0$ for $i \geq n$ is in the essential image of S . By Homology, Lemma 12.7.2 we have abelian group homomorphisms

$$\text{Ext}_{\text{Simp}(\mathcal{A})}(K(A, n), S(A_\bullet)) \begin{matrix} \xrightarrow{N} \\ \xleftarrow{S} \end{matrix} \text{Ext}_{\text{Ch}_{\geq 0}(\mathcal{A})}(A[-n], A_\bullet)$$

between ext groups (see Homology, Definition 12.6.2). We want to show that S is surjective. We know that $N \circ S = \text{id}$. Hence it suffices to show that $\text{Ker}(N) = 0$. Clearly an extension

$$\begin{array}{ccccccccccc}
 0 & \longrightarrow & 0 & \longrightarrow & A_{n-1} & \longrightarrow & A_{n-2} & \longrightarrow & \dots & \longrightarrow & A_0 & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & & & \downarrow & & \\
 E : & 0 & \longrightarrow & A & \longrightarrow & A_{n-1} & \longrightarrow & A_{n-2} & \longrightarrow & \dots & \longrightarrow & A_0 & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & & & \downarrow & & \\
 0 & \longrightarrow & A & \longrightarrow & 0 & \longrightarrow & 0 & \longrightarrow & \dots & \longrightarrow & 0 & \longrightarrow & 0
 \end{array}$$

of A_\bullet by $A[-n]$ in $\text{Ch}(\mathcal{A})$ is zero if and only if the map $A \rightarrow A_{n-1}$ is zero. Thus we have to show that any extension

$$0 \rightarrow S(A_\bullet) \rightarrow V \rightarrow K(A, n) \rightarrow 0$$

such that $A = N(V)_n \rightarrow N(V)_{n-1}$ is zero is split. By Lemma 14.21.2 we have

$$\text{Mor}(K(A, n), V) = \left\{ f : A \rightarrow \bigcap_{i=0}^n \text{Ker}(d_i^n : V_n \rightarrow V_{n-1}) \right\}$$

and if $A = N(V)_n \rightarrow N(V)_{n-1}$ is zero, then the intersection occurring in the formula above is equal to A . Let $i : K(A, n) \rightarrow V$ be the morphism corresponding to id_A on the right hand side of the displayed formula. Clearly this is a section to the map $V \rightarrow K(A, n)$ and the extension is split as desired. \square

14.24. Dold-Kan for cosimplicial objects

Let \mathcal{A} be an abelian category. According to Homology, Lemma 12.5.2 also \mathcal{A}^{opp} is abelian. It follows formally from the definitions that

$$\text{CoSimp}(\mathcal{A}) = \text{Simp}(\mathcal{A}^{opp})^{opp}.$$

Thus Dold-Kan (Theorem 14.23.3) implies that $\text{CoSimp}(\mathcal{A})$ is equivalent to the category $\text{Ch}_{\geq 0}(\mathcal{A}^{opp})^{opp}$. And it follows formally from the definitions that

$$\text{CoCh}_{\geq 0}(\mathcal{A}) = \text{Ch}_{\geq 0}(\mathcal{A}^{opp})^{opp}.$$

Putting these arrows together we obtain an equivalence

$$Q : \text{CoSimp}(\mathcal{A}) \longrightarrow \text{CoCh}_{\geq 0}(\mathcal{A}).$$

In this section we describe Q .

First we define the *cochain complex* $s(U)$ associated to a *cosimplicial object* U . It is the cochain complex with terms zero in negative degrees, and $s(U)^n = U_n$ for $n \geq 0$. As differentials we use the maps $d^n : s(U)^n \rightarrow s(U)^{n+1}$ defined by $d^n = \sum_{i=0}^{n+1} (-1)^i \delta_i^{n+1}$. In other words the complex $s(U)$ looks like

$$0 \longrightarrow U_0 \xrightarrow{\delta_0^1 - \delta_1^1} U_1 \xrightarrow{\delta_0^2 - \delta_1^2 + \delta_2^2} U_2 \longrightarrow \dots$$

This is sometimes also called the *Moore complex* associated to U .

On the other hand, given a cosimplicial object U of \mathcal{A} set $Q(U)^0 = U_0$ and

$$Q(U)^n = \text{Coker} \left(\bigoplus_{i=0}^{n-1} U_{n-1} \xrightarrow{\delta_i^n} U_n \right).$$

The differential $d^n : Q(U)^n \rightarrow Q(U)^{n+1}$ is induced by $(-1)^{n+1}\delta_{n+1}^{n+1}$, i.e., by fitting the morphism $(-1)^{n+1}\delta_{n+1}^{n+1}$ into a commutative diagram

$$\begin{array}{ccc} U_n & \xrightarrow{\quad (-1)^{n+1}\delta_{n+1}^{n+1} \quad} & U_{n+1} \\ \downarrow & & \downarrow \\ Q(U)^n & \xrightarrow{\quad d_n \quad} & Q(U)^{n+1}. \end{array}$$

We leave it to the reader to show that this diagram makes sense, i.e., that the image of δ_i^n maps into the kernel of the right vertical arrow for $i = 0, \dots, n - 1$. (This is dual to Lemma 14.17.8.) Thus our cochain complex $Q(U)$ looks like this

$$0 \rightarrow Q(U)^0 \rightarrow Q(U)^1 \rightarrow Q(U)^2 \rightarrow \dots$$

This is called the *normalized cochain complex associated to U* . The dual to the Dold-Kan Theorem 14.23.3 is the following.

Lemma 14.24.1. *Let \mathcal{A} be an abelian category.*

- (1) *The functor $s : \text{CoSimp}(\mathcal{A}) \rightarrow \text{CoCh}_{\geq 0}(\mathcal{A})$ is exact.*
- (2) *The maps $s(U)^n \rightarrow Q(U)^n$ define a morphism of cochain complexes.*
- (3) *There exists a functorial direct sum decomposition $s(U) = A(U) \oplus Q(U)$ in $\text{CoCh}_{\geq 0}(\mathcal{A})$.*
- (4) *The functor Q is exact.*
- (5) *The morphism of complexes $s(U) \rightarrow Q(U)$ is a quasi-isomorphism.*
- (6) *The functor $U \mapsto Q(U)^\bullet$ defines an equivalence of categories $\text{CoSimp}(\mathcal{A}) \rightarrow \text{CoCh}_{\geq 0}(\mathcal{A})$.*

Proof. Omitted. But the results are the exact dual statements to Lemmas 14.22.1, 14.22.4, 14.22.6, 14.22.7, 14.22.8, and Theorem 14.23.3. \square

14.25. Homotopies

Consider the simplicial sets $\Delta[0]$ and $\Delta[1]$. Recall that there are two morphisms

$$e_0, e_1 : \Delta[0] \longrightarrow \Delta[1],$$

coming from the morphisms $[0] \rightarrow [1]$ mapping 0 to an element of $[1] = \{0, 1\}$. Recall also that each set $\Delta[1]_k$ is finite. Hence, if the category \mathcal{C} has finite coproducts, then we can form the product

$$U \times \Delta[1]$$

for any simplicial object U of \mathcal{C} , see Definition 14.13.1. Note that $\Delta[0]$ has the property that $\Delta[0]_k = \{*\}$ is a singleton for all $k \geq 0$. Hence $U \times \Delta[0] = U$. Thus e_0, e_1 above gives rise to morphisms

$$e_0, e_1 : U \rightarrow U \times \Delta[1].$$

Definition 14.25.1. Let \mathcal{C} be a category having finite coproducts. Suppose that U and V are two simplicial objects of \mathcal{C} . Let $a, b : U \rightarrow V$ be two morphisms.

- (1) We say a morphism

$$h : U \times \Delta[1] \longrightarrow V$$

is a *homotopy connecting a to b* if $a = h \circ e_0$ and $b = h \circ e_1$.

- (2) We say morphisms a and b are *homotopic* if there exists a homotopy connecting a to b or a homotopy connecting b to a .

Warning: Being homotopic is **not** an equivalence relation on the set of all morphisms from U to V ! The relation “there exists a homotopy from a to b ” is not symmetric.

It turns out we can define homotopies between pairs of maps of simplicial objects in any category. To do this you just work out what it means to have the morphisms $h_n : (U \times \Delta[1])_n \rightarrow V_n$ in terms of the mapping property of coproducts.

Let \mathcal{C} be a category with finite coproducts. Let U, V be simplicial objects of \mathcal{C} . Let $a, b : U \rightarrow V$ be morphisms. Further, suppose that $h : U \times \Delta[1] \rightarrow V$ is a homotopy connecting a to b . For every $n \geq 0$ let us write

$$\Delta[1]_n = \{\alpha_0^n, \dots, \alpha_{n+1}^n\}$$

where $\alpha_i^n : [n] \rightarrow [1]$ is the map such that

$$\alpha_i^n(j) = \begin{cases} 0 & \text{if } j < i \\ 1 & \text{if } j \geq i \end{cases}$$

Thus

$$h_n : (U \times \Delta[1])_n = \coprod U_n \cdot \alpha_i^n \longrightarrow V_n$$

has a component $h_{n,i} : U_n \rightarrow V_n$ which is the restriction to the summand corresponding to α_i^n for all $i = 0, \dots, n+1$.

Lemma 14.25.2. *In the situation above, we have the following relations:*

- (1) We have $h_{n,0} = b_n$ and $h_{n,n+1} = a_n$.
- (2) We have $d_j^n \circ h_{n,i} = h_{n-1,i-1} \circ d_j^n$ for $i > j$.
- (3) We have $d_j^n \circ h_{n,i} = h_{n-1,i} \circ d_j^n$ for $i \leq j$.
- (4) We have $s_j^n \circ h_{n,i} = h_{n+1,i+1} \circ s_j^n$ for $i > j$.
- (5) We have $s_j^n \circ h_{n,i} = h_{n+1,i} \circ s_j^n$ for $i \leq j$.

Conversely, given a system of maps $h_{n,i}$ satisfying the properties listed above, then these define a morphism h which is a homotopy between a and b .

Proof. Omitted. You can prove the last statement using the fact, see Lemma 14.2.4 that to give a morphism of simplicial objects is the same as giving a sequence of morphisms h_n commuting with all d_j^n and s_j^n . \square

Example 14.25.3. Suppose in the situation above $a = b$. Then there is a *trivial* homotopy between a and b , namely the one with $h_{n,i} = a_n = b_n$.

Remark 14.25.4. Let \mathcal{C} be any category (no assumptions whatsoever). We say that a pair of morphisms $a, b : U \rightarrow V$ of simplicial objects are *homotopic* if there exist morphisms¹ $h_{n,i} : U_n \rightarrow V_n$, for $n \geq 0, i = 0, \dots, n+1$ satisfying the relations of Lemma 14.25.2 (potentially with the roles of a and b switched). This is a “better” definition, because it applies to any category. Also it has the following property: if $F : \mathcal{C} \rightarrow \mathcal{C}'$ is any functor then a homotopic to b implies trivially that $F(a)$ is homotopic to $F(b)$. Since the lemma says that the newer notion is the same as the old one in case finite coproduct exist, we deduce in particular that functors preserve the old notion whenever both categories have finite coproducts.

¹In the literature, often the maps $h_{n+1,i} \circ s_i : U_n \rightarrow V_{n+1}$ are used instead of the maps $h_{n,i}$. Of course the relations these maps satisfy are different from the ones in Lemma 14.25.2.

Remark 14.25.5. Let \mathcal{C} be any category. Suppose two morphisms $a, a' : U \rightarrow V$ of simplicial objects are homotopic. Then for any morphism $b : V \rightarrow W$ the two maps $b \circ a, b \circ a' : U \rightarrow W$ are homotopic. Similarly, for any morphism $c : X \rightarrow U$ the two maps $a \circ c, a' \circ c : X \rightarrow V$ are homotopic. In fact the maps $b \circ a \circ c, b \circ a' \circ c : X \rightarrow W$ are homotopic. Namely, if the maps $h_{n,i} : U \rightarrow U$ define a homotopy between a and a' then the maps $b \circ h_{n,i} \circ c$ define a homotopy between $b \circ a \circ c$ and $b \circ a' \circ c$.

Definition 14.25.6. Let U and V be two simplicial objects of a category \mathcal{C} . We say a morphism $a : U \rightarrow V$ is a *homotopy equivalence* if there exists a morphism $b : V \rightarrow U$ such that $a \circ b$ is homotopic to id_V and $b \circ a$ is homotopic to id_U . If there exists such a morphism between U and V , then we say that U and V are *homotopy equivalent*².

Example 14.25.7. The simplicial set $\Delta[m]$ is homotopy equivalent to $\Delta[0]$. Namely, there is a unique morphism $f : \Delta[m] \rightarrow \Delta[0]$ and we take $g : \Delta[0] \rightarrow \Delta[m]$ to be given by the inclusion of the last 0-simplex of $\Delta[m]$. We have $f \circ g = \text{id}$ and we will give a homotopy $h : \Delta[m] \times \Delta[1] \rightarrow \Delta[m]$ between $\text{id}_{\Delta[m]}$ and $g \circ f$. Namely h given by the maps

$$\text{Mor}_{\Delta}([n], [m]) \times \text{Mor}_{\Delta}([n], [1]) \rightarrow \text{Mor}_{\Delta}([n], [m])$$

which send (φ, α) to

$$k \mapsto \begin{cases} \varphi(k) & \text{if } \alpha(k) = 0 \\ m & \text{if } \alpha(k) = 1 \end{cases}$$

Note that this only works because we took g to be the inclusion of the last 0-simplex. If we took g to be the inclusion of the first 0-simplex we could find a homotopy from $g \circ f$ to $\text{id}_{\Delta[m]}$. This is an illustration of the asymmetry inherent in homotopies in the category of simplicial sets.

The following lemma says that $U \times \Delta[1]$ is homotopy equivalent to U .

Lemma 14.25.8. *Let \mathcal{C} be a category with finite coproducts. Let U be a simplicial object of \mathcal{C} . Consider the maps $e_1, e_0 : U \rightarrow U \times \Delta[1]$, and $\pi : U \times \Delta[1] \rightarrow U$, see Lemma 14.13.3.*

- (1) *We have $\pi \circ e_1 = \pi \circ e_0 = \text{id}_U$, and*
- (2) *The morphisms $\text{id}_{U \times \Delta[1]}$, and $e_0 \circ \pi$ are homotopic.*
- (3) *The morphisms $\text{id}_{U \times \Delta[1]}$, and $e_1 \circ \pi$ are homotopic.*

Proof. The first assertion is trivial. For the second, consider the map of simplicial sets $\Delta[1] \times \Delta[1] \rightarrow \Delta[1]$ which in degree n assigns to a pair (β_1, β_2) , $\beta_i : [n] \rightarrow [1]$ the morphism $\beta : [n] \rightarrow [1]$ defined by the rule

$$\beta(i) = \max\{\beta_1(i), \beta_2(i)\}.$$

It is a morphism of simplicial sets, because the action $\Delta[1](\varphi) : \Delta[1]_n \rightarrow \Delta[1]_m$ of $\varphi : [m] \rightarrow [n]$ is by precomposing. Clearly, using notation from Section 14.25, we have $\beta = \beta_1$ if $\beta_2 = \alpha_0^n$ and $\beta = \alpha_{n+1}^n$ if $\beta_2 = \alpha_{n+1}^n$. This implies easily that the induced morphism

$$U \times \Delta[1] \times \Delta[1] \rightarrow U \times \Delta[1]$$

of Lemma 14.13.3 is a homotopy between $\text{id}_{U \times \Delta[1]}$ and $e_0 \circ \pi$. Similarly for $e_1 \circ \pi$ (use minimum instead of maximum). \square

²Warning: This notion is **not** an equivalence relation on objects in general.

Lemma 14.25.9. *Let $f : Y \rightarrow X$ be a morphism of a category \mathcal{C} with fibre products. Assume f has a section s . Consider the simplicial object U constructed in Example 14.3.5 starting with f . The morphism $U \rightarrow U$ which in each degree is the self map $(s \circ f)^{n+1}$ of $Y \times_X \dots \times_X Y$ given by $s \circ f$ on each factor is homotopic to the identity on U . In particular, U is homotopy equivalent to the constant simplicial object X .*

Proof. Set $g^0 = \text{id}_Y$ and $g^1 = s \circ f$. We use the morphisms

$$\begin{aligned} Y \times_X \dots \times_X Y \times \text{Mor}([n], [1]) &\rightarrow Y \times_X \dots \times_X Y \\ (y_0, \dots, y_n) \times \alpha &\mapsto (g^{\alpha(0)}(y_0), \dots, g^{\alpha(n)}(y_n)) \end{aligned}$$

where we use the functor of points point of view to define the maps. Another way to say this is to say that $h_{n,0} = \text{id}$, $h_{n,n+1} = (s \circ f)^{n+1}$ and $h_{n,i} = \text{id}_Y^{i+1} \times (s \circ f)^{n+1-i}$. We leave it to the reader to show that these satisfy the relations of Lemma 14.25.2. Hence they define the desired homotopy. See also Remark 14.25.4 which shows that we do not need to assume anything else on the category \mathcal{C} . \square

Lemma 14.25.10. *Let \mathcal{C} be a category.*

- (1) *If $a_t, b_t : X_t \rightarrow Y_t$, $t \in T$ are homotopic morphisms between simplicial objects of \mathcal{C} , then $\prod a_t, \prod b_t : \prod X_t \rightarrow \prod Y_t$ are homotopic morphisms between simplicial objects of \mathcal{C} , provided $\prod X_t$ and $\prod Y_t$ exist in $\text{Simp}(\mathcal{C})$.*
- (2) *If (X_t, Y_t) , $t \in T$ are homotopy equivalent pairs of simplicial objects of \mathcal{C} , then $\prod X_t$ and $\prod Y_t$ are homotopy equivalent pairs of simplicial objects of \mathcal{C} , provided $\prod X_t$ and $\prod Y_t$ exist in $\text{Simp}(\mathcal{C})$.*

Proof. If $h_t = (h_{t,n,i})$ are homotopies connecting a_t and b_t (see Remark 14.25.4), then $h = (\prod_t h_{t,n,i})$ is a homotopy connecting $\prod a_t$ and $\prod b_t$. This proves (1). Part (2) follows from part (1) and the definitions. \square

14.26. Homotopies in abelian categories

Let \mathcal{A} be an abelian category. Let U, V be simplicial objects of \mathcal{A} . Let $a, b : U \rightarrow V$ be morphisms. Further, suppose that $h : U \times \Delta[1] \rightarrow V$ is a homotopy connecting a and b . Consider the two morphisms of chain complexes $s(a), s(b) : s(U) \rightarrow s(V)$. Using the notation introduced above Lemma 14.25.2 we define

$$s(h)_n : U_n \rightarrow V_{n+1}$$

by the formula

$$(14.26.0.1) \quad s(h)_n = \sum_{i=0}^n (-1)^{i+1} h_{n+1,i+1} \circ s_i^n.$$

Let us compute $d_{n+1} \circ s(h)_n + s(h)_{n-1} \circ d_n$. We first compute

$$\begin{aligned}
d_{n+1} \circ s(h)_n &= \sum_{j=0}^{n+1} \sum_{i=0}^n (-1)^{j+i+1} d_j^{n+1} \circ h_{n+1,i+1} \circ s_i^n \\
&= \sum_{1 \leq i+1 \leq j \leq n+1} (-1)^{j+i+1} h_{n,i+1} \circ d_j^{n+1} \circ s_i^n \\
&\quad + \sum_{n \geq i \geq j \geq 0} (-1)^{i+j+1} h_{n,i} \circ d_j^{n+1} \circ s_i^n \\
&= \sum_{1 \leq i+1 < j \leq n+1} (-1)^{j+i+1} h_{n,i+1} \circ s_i^{n-1} \circ d_{j-1}^n \\
&\quad + \sum_{1 \leq i+1=j \leq n+1} (-1)^{j+i+1} h_{n,i+1} \\
&\quad + \sum_{n \geq i=j \geq 0} (-1)^{i+j+1} h_{n,i} \\
&\quad + \sum_{n \geq i > j \geq 0} (-1)^{i+j+1} h_{n,i} \circ s_{i-1}^{n-1} \circ d_j^n
\end{aligned}$$

We leave it to the reader to see that the first and the last of the four sums cancel exactly against all the terms of

$$s(h)_{n-1} \circ d_n = \sum_{i=0}^{n-1} \sum_{j=0}^n (-1)^{i+1+j} h_{n,i+1} \circ s_i^{n-1} \circ d_j^n.$$

Hence we obtain

$$\begin{aligned}
d_{n+1} \circ s(h)_n + s(h)_{n-1} \circ d_n &= \sum_{j=1}^{n+1} (-1)^{2j} h_{n,j} + \sum_{i=0}^n (-1)^{2i+1} h_{n,i} \\
&= h_{n,n+1} - h_{n,0} \\
&= a_n - b_n
\end{aligned}$$

Thus we've proved part of the following lemma.

Lemma 14.26.1. *Let \mathcal{A} be an abelian category. Let $a, b : U \rightarrow V$ be morphisms of simplicial objects of \mathcal{A} . If a, b are homotopic, then $s(a), s(b) : s(U) \rightarrow s(V)$, and $N(a), N(b) : N(U) \rightarrow N(V)$ are homotopic maps of chain complexes.*

Proof. The part about $s(a)$ and $s(b)$ is clear from the calculation above the lemma. On the other hand, it follows from Lemma 14.22.6 that $N(a), N(b)$ are compositions

$$N(U) \rightarrow s(U) \rightarrow s(V) \rightarrow N(V)$$

where we use $s(a), s(b)$ in the middle. Hence the assertion follows from Homology, Lemma 12.12.1. \square

Lemma 14.26.2. *Let \mathcal{A} be an abelian category. Let $a : U \rightarrow V$ be a morphism of simplicial objects of \mathcal{A} . If a is a homotopy equivalence, then $s(a) : s(U) \rightarrow s(V)$, and $N(a) : N(U) \rightarrow N(V)$ are homotopy equivalences of chain complexes.*

Proof. Omitted. See Lemma 14.26.1 above. \square

14.27. Homotopies and cosimplicial objects

Let \mathcal{C} be a category with finite products. Let V be a cosimplicial object and consider $\text{Hom}(\Delta[1], V)$, see Section 14.14. The morphisms $e_0, e_1 : \Delta[0] \rightarrow \Delta[1]$ produce two morphisms $e_0, e_1 : \text{Hom}(\Delta[1], V) \rightarrow V$.

Definition 14.27.1. Let \mathcal{C} be a category having finite products. Suppose that U and V are two cosimplicial objects of \mathcal{C} . We say morphisms $a, b : U \rightarrow V$ are *homotopic* if there exists a morphism

$$h : U \longrightarrow \text{Hom}(\Delta[1], V)$$

such that $a = e_0 \circ h$ and $b = e_1 \circ h$. In this case h is called a *homotopy connecting a and b* .

This is really exactly the same as the notion we introduced for simplicial objects earlier. In particular, recall that $\Delta[1]_n$ is a finite set, and that

$$h_n = (h_{n,\alpha}) : U \longrightarrow \prod_{\alpha \in \Delta[1]_n} V_n$$

is given by a collection of maps $h_{n,\alpha} : U_n \rightarrow V_n$ parametrized by elements of $\Delta[1]_n = \text{Mor}_\Delta([n], [1])$. As in Lemma 14.25.2 these morphisms satisfy some relations. Namely, for every $f : [n] \rightarrow [m]$ in Δ we should have

$$(14.27.1.1) \quad h_{m,\alpha} \circ U(f) = V(f) \circ h_{n,\alpha \circ f}$$

The condition that $a = e_0 \circ h$ means that $a_n = h_{n,0:[n] \rightarrow [1]}$ where $0 : [n] \rightarrow [1]$ is the constant map with value zero. Similarly, we should have $b_n = h_{n,1:[n] \rightarrow [1]}$. In particular we deduce once more that the notion of homotopy can be formulated between cosimplicial objects of any category, i.e., existence of products is not necessary. Here is a precise formulation of why this is dual to the notion of a homotopy between morphisms of simplicial objects.

Lemma 14.27.2. *Let \mathcal{C} be a category having finite products. Suppose that U and V are two cosimplicial objects of \mathcal{C} . Let $a, b : U \rightarrow V$ be morphisms of cosimplicial objects. Recall that U, V correspond to simplicial objects U', V' of \mathcal{C}^{opp} . Moreover a, b correspond to morphisms $a', b' : V' \rightarrow U'$. The following are equivalent*

- (1) *The morphisms $a, b : U \rightarrow V$ of cosimplicial objects are homotopic.*
- (2) *The morphisms $a', b' : V' \rightarrow U'$ of simplicial objects of \mathcal{C}^{opp} are homotopic.*

Proof. If \mathcal{C} has finite products, then \mathcal{C}^{opp} has finite coproducts. And the contravariant functor $(-)' : \mathcal{C} \rightarrow \mathcal{C}^{opp}$ transforms products into coproducts. Then it is immediate from the definitions that $(\text{Hom}(\Delta[1], V))' = V' \times \Delta[1]$. And so on and so forth. \square

Lemma 14.27.3. *Let $\mathcal{C}, \mathcal{C}', \mathcal{D}, \mathcal{D}'$ be categories such that $\mathcal{C}, \mathcal{C}'$ have finite products, and $\mathcal{D}, \mathcal{D}'$ have finite coproducts.*

- (1) *Let $a, b : U \rightarrow V$ be morphisms of simplicial objects of \mathcal{D} . Let $F : \mathcal{D} \rightarrow \mathcal{D}'$ be a covariant functor. If a and b are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(U) \rightarrow F(V)$ of simplicial objects.*
- (2) *Let $a, b : U \rightarrow V$ be morphisms of cosimplicial objects of \mathcal{C} . Let $F : \mathcal{C} \rightarrow \mathcal{C}'$ be a covariant functor. If a and b are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(U) \rightarrow F(V)$ of cosimplicial objects.*
- (3) *Let $a, b : U \rightarrow V$ be morphisms of simplicial objects of \mathcal{D} . Let $F : \mathcal{D} \rightarrow \mathcal{C}$ be a contravariant functor. If a and b are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(V) \rightarrow F(U)$ of cosimplicial objects.*
- (4) *Let $a, b : U \rightarrow V$ be morphisms of cosimplicial objects of \mathcal{C} . Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a contravariant functor. If a and b are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(V) \rightarrow F(U)$ of simplicial objects.*

Proof. By Lemma 14.27.2 above, we can turn F into a covariant functor between a pair of categories which have finite coproducts, and we have to show that the functor preserves homotopic pairs of maps. It is explained in Remark 14.25.4 how this is the case. Even if the functor does not commute with coproducts! \square

Lemma 14.27.4. *Let $f : Y \rightarrow X$ be a morphism of a category \mathcal{C} with pushouts. Assume f has a section s . Consider the cosimplicial object U constructed in Example 14.5.5 starting with f . The morphism $U \rightarrow U$ which in each degree is the self map of $Y \amalg_X \dots \amalg_X Y$ given by $s \circ f$ on each factor is homotopic to the identity on U . In particular, U is homotopy equivalent to the constant cosimplicial object X .*

Proof. The dual statement which is Lemma 14.25.9. Hence this lemma follows on applying Lemma 14.27.2. \square

Lemma 14.27.5. *Let \mathcal{A} be an abelian category. Let $a, b : U \rightarrow V$ be morphisms of cosimplicial objects of \mathcal{A} . If a, b are homotopic, then $s(a), s(b) : s(U) \rightarrow s(V)$, and $Q(a), Q(b) : Q(U) \rightarrow Q(V)$ are homotopic maps of cochain complexes.*

Proof. Let $(-)' : \mathcal{A} \rightarrow \mathcal{A}^{opp}$ be the contravariant functor $A \mapsto A$. By Lemma 14.27.4 the maps a' and b' are homotopic. By Lemma 14.26.1 we see that $s(a')$ and $s(b')$ are homotopic maps of chain complexes. Since $s(a') = (s(a))'$ and $s(b') = (s(b))'$ we conclude that also $s(a)$ and $s(b)$ are homotopic by applying the additive contravariant functor $(-)' : \mathcal{A}^{opp} \rightarrow \mathcal{A}$. The result for the Q -complexes follows from the direct sum decomposition of Lemma 14.24.1 for example. \square

14.28. More homotopies in abelian categories

Let \mathcal{A} be an abelian category. In this section we show that a homotopy between morphisms in $\text{Ch}_{\geq 0}(\mathcal{A})$ always comes from a morphism $U \times \Delta[1] \rightarrow V$ in the category of simplicial objects. In some sense this will provide a converse to Lemma 14.26.1. We first develop some material on homotopies between morphisms of chain complexes.

Lemma 14.28.1. *Let \mathcal{A} be an abelian category. Let A be a chain complex. Consider the covariant functor*

$$B \mapsto \{(a, b, h) \mid a, b : A \rightarrow B \text{ and } h \text{ a homotopy between } a, b\}$$

There exists a chain complex $\diamond A$ such that $\text{Mor}_{\text{Ch}(\mathcal{A})}(\diamond A, -)$ is isomorphic to the displayed functor. The construction $A \mapsto \diamond A$ is functorial.

Proof. We set $\diamond A_n = A_n \oplus A_n \oplus A_{n-1}$, and we define $d_{\diamond A, n}$ by the matrix

$$d_{\diamond A, n} = \begin{pmatrix} d_{A, n} & 0 & \text{id}_{A_{n-1}} \\ 0 & d_{A, n} & -\text{id}_{A_{n-1}} \\ 0 & 0 & -d_{A, n-1} \end{pmatrix} : A_n \oplus A_n \oplus A_{n-1} \rightarrow A_{n-1} \oplus A_{n-1} \oplus A_{n-2}$$

If \mathcal{A} is the category of abelian groups, and $(x, y, z) \in A_n \oplus A_n \oplus A_{n-1}$ then $d_{\diamond A, n}(x, y, z) = (d_n(x) + z, d_n(y) - z, -d_{n-1}(z))$. It is easy to verify that $d^2 = 0$. Clearly, there are two maps $\diamond a, \diamond b : A \rightarrow \diamond A$ (first summand and second summand), and a map $\diamond A \rightarrow A[-1]$ which give a short exact sequence

$$0 \rightarrow A \oplus A \rightarrow \diamond A \rightarrow A[-1] \rightarrow 0$$

which is termwise split. Moreover, there is a sequence of maps $\diamond h_n : A_n \rightarrow \diamond A_{n+1}$, namely the identity from A_n to the summand A_n of $\diamond A_{n+1}$, such that $\diamond h$ is a homotopy between $\diamond a$ and $\diamond b$.

We conclude that any morphism $f : \diamond A \rightarrow B$ gives rise to a triple (a, b, h) by setting $a = f \circ \diamond a$, $b = f \circ \diamond b$ and $h_n = f_{n+1} \circ \diamond h_n$. Conversely, given a triple (a, b, h) we get a morphism $f : \diamond A \rightarrow B$ by taking

$$f_n = (a_n, b_n, h_{n-1}).$$

To see that this is a morphism of chain complexes you have to do a calculation. We only do this in case \mathcal{A} is the category of abelian groups: Say $(x, y, z) \in \diamond A_n = A_n \oplus A_n \oplus A_{n-1}$. Then

$$\begin{aligned} f_{n-1}(d_n(x, y, z)) &= f_{n-1}(d_n(x) + z, d_n(y) - z, -d_{n-1}(z)) \\ &= a_n(d_n(x)) + a_n(z) + b_n(d_n(y)) - b_n(z) - h_{n-2}(d_{n-1}(z)) \end{aligned}$$

and

$$\begin{aligned} d_n(f_n(x, y, z)) &= d_n(a_n(x) + b_n(y) + h_{n-1}(z)) \\ &= d_n(a_n(x)) + d_n(b_n(y)) + d_n(h_{n-1}(z)) \end{aligned}$$

which are the same by definition of a homotopy. \square

Note that the extension

$$0 \rightarrow A \oplus A \rightarrow \diamond A \rightarrow A[-1] \rightarrow 0$$

comes with sections of the morphisms $\diamond A_n \rightarrow A[-1]_n$ with the property that the associated morphism $\delta : A[-1] \rightarrow (A \oplus A)[-1]$, see Homology, Lemma 12.14.4 equals the morphism $(1, -1) : A[-1] \rightarrow A[-1] \oplus A[-1]$.

Lemma 14.28.2. *Let \mathcal{A} be an abelian category. Let*

$$0 \rightarrow A \oplus A \rightarrow B \rightarrow C \rightarrow 0$$

be a short exact sequence of chain complexes of \mathcal{A} . Suppose given in addition morphisms $s_n : C_n \rightarrow B_n$ splitting the associated short exact sequence in degree n . Let $\delta(s) : C \rightarrow (A \oplus A)[-1] = A[-1] \oplus A[-1]$ be the associated morphism of complexes, see Homology, Lemma 12.14.4. If $\delta(s)$ factors through the morphism $(1, -1) : A[-1] \rightarrow A[-1] \oplus A[-1]$, then there is a unique morphism $B \rightarrow \diamond A$ fitting into a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & A \oplus A & \longrightarrow & B & \longrightarrow & C & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & A \oplus A & \longrightarrow & \diamond A & \longrightarrow & A[-1] & \longrightarrow & 0 \end{array}$$

where the vertical maps are compatible with the splittings s_n and the splittings of $\diamond A_n \rightarrow A[-1]_n$ as well.

Proof. Denote $(p_n, q_n) : B_n \rightarrow A_n \oplus A_n$ the morphism π_n of Homology, Lemma 12.14.4. Also write $(a, b) : A \oplus A \rightarrow B$, and $r : B \rightarrow C$ for the maps in the short exact sequence. Write the factorization of $\delta(s)$ as $\delta(s) = (1, -1) \circ f$. This means that $p_{n-1} \circ d_{B,n} \circ s_n = f_n$, and $q_{n-1} \circ d_{B,n} \circ s_n = -f_n$, and Set $B_n \rightarrow \diamond A_n = A_n \oplus A_n \oplus A_{n-1}$ equal to $(p_n, q_n, f_n \circ r_n)$.

Now we have to check that this actually defines a morphism of complexes. We will only do this in the case of abelian groups. Pick $x \in B_n$. Then $x = a_n(x_1) + b_n(x_2) + s_n(x_3)$ and it suffices to show that our definition commutes with differential for each term separately. For the term $a_n(x_1)$ we have $(p_n, q_n, f_n \circ r_n)(a_n(x_1)) = (x_1, 0, 0)$

and the result is obvious. Similarly for the term $b_n(x_2)$. For the term $s_n(x_3)$ we have

$$\begin{aligned} (p_n, q_n, f_n \circ r_n)(d_n(s_n(x_3))) &= (p_n, q_n, f_n \circ r_n)(\\ &\quad a_n(f_n(x_3)) - b_n(f_n(x_3)) + s_n(d_n(x_3))) \\ &= (f_n(x_3), -f_n(x_3), f_n(d_n(x_3))) \end{aligned}$$

by definition of f_n . And

$$\begin{aligned} d_n(p_n, q_n, f_n \circ r_n)(s_n(x_3)) &= d_n(0, 0, f_n(x_3)) \\ &= (f_n(x_3), -f_n(x_3), d_{A[-1],n}(f_n(x_3))) \end{aligned}$$

The result follows as f is a morphism of complexes. □

Lemma 14.28.3. *Let \mathcal{A} be an abelian category. Let U, V be simplicial objects of \mathcal{A} . Let $a, b : U \rightarrow V$ be a pair of morphisms. Assume the corresponding maps of chain complexes $N(a), N(b) : N(U) \rightarrow N(V)$ are homotopic by a homotopy $\{N_n : N(U)_n \rightarrow N(V)_{n+1}\}$. Then a, b are homotopic in the sense of Definition 14.25.1. Moreover, one can choose the homotopy $h : U \times \Delta[1] \rightarrow V$ such that $N_n = N(h)_n$ where $N(h)$ is the homotopy coming from h as in Section 14.26.*

Proof. Let $(\diamond N(U), \diamond a, \diamond b, \diamond h)$ be as in Lemma 14.28.1 and its proof. By that lemma there exists a morphism $\diamond N(U) \rightarrow N(V)$ representing the triple $(N(a), N(b), \{N_n\})$. We will show there exists a morphism $\psi : N(U \times \Delta[1]) \rightarrow \diamond N(U)$ such that $\diamond a = \psi \circ N(e_0)$, and $\diamond b = \psi \circ N(e_1)$. Moreover, we will show that the homotopy between $N(e_0), N(e_1) : N(U) \rightarrow N(U \times \Delta[1])$ coming from (14.26.0.1) and Lemma 14.26.1 with $h = \text{id}_{U \times \Delta[1]}$ is mapped via ψ to the canonical homotopy $\diamond h$ between the two maps $\diamond a, \diamond b : N(U) \rightarrow \diamond N(U)$. Certainly this will imply the lemma.

Note that $N : \text{Simp}(\mathcal{A}) \rightarrow \text{Ch}_{\geq 0}(\mathcal{A})$ as a functor is a direct summand of the functor $N : \text{Simp}(\mathcal{A}) \rightarrow \text{Ch}_{\geq 0}(\mathcal{A})$. Also, the functor \diamond is compatible with direct sums. Thus it suffices instead to construct a morphism $\Psi : s(U \times \Delta[1]) \rightarrow \diamond s(U)$ with the corresponding properties. This is what we do below.

By Definition 14.25.1 the morphisms $e_0 : U \rightarrow U \times \Delta[1]$ and $e_1 : U \rightarrow U \times \Delta[1]$ are homotopic with homotopy $\text{id}_{U \times \Delta[1]}$. By Lemma 14.26.1 we get an explicit homotopy $\{h_n : s(U)_n \rightarrow s(U \times \Delta[1])_{n+1}\}$ between the morphisms of chain complexes $s(e_0) : s(U) \rightarrow s(U \times \Delta[1])$ and $s(e_1) : s(U) \rightarrow s(U \times \Delta[1])$. By Lemma 14.28.2 above we get a corresponding morphism

$$\Phi : \diamond s(U) \rightarrow s(U \times \Delta[1])$$

According to the construction, Φ_n restricted to the summand $s(U)[-1]_n = s(U)_{n-1}$ of $\diamond s(U)_n$ is equal to h_{n-1} . And

$$h_{n-1} = \sum_{i=0}^{n-1} (-1)^{i+1} s_i^n \cdot \alpha_{i+1}^n : U_{n-1} \rightarrow \bigoplus_j U_n \cdot \alpha_j^n.$$

with obvious notation.

On the other hand, the morphisms $e_i : U \rightarrow U \times \Delta[1]$ induce a morphism $(e_0, e_1) : U \oplus U \rightarrow U \times \Delta[1]$. Denote W the cokernel. Note that, if we write $(U \times \Delta[1])_n =$

$\bigoplus_{\alpha: [n] \rightarrow [1]} U_n \cdot \alpha$, then we may identify $W_n = \bigoplus_{i=1}^n U_n \cdot \alpha_i^n$ with α_i^n as in Section 14.25. We have a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & U \oplus U & \longrightarrow & U \times \Delta[1] & \longrightarrow & W \longrightarrow 0 \\ & & & \searrow (1,1) & \downarrow \pi & & \\ & & & & U & & \end{array}$$

This implies we have a similar commutative diagram after applying the functor s . Next, we choose the splittings $\sigma_n : s(W)_n \rightarrow s(U \times \Delta[1])_n$ by mapping the summand $U_n \cdot \alpha_i^n \subset W_n$ via $(-1, 1)$ to the summands $U_n \cdot \alpha_0^n \oplus U_n \cdot \alpha_i^n \subset (U \times \Delta[1])_n$. Note that $s(\pi)_n \circ \sigma_n = 0$. It follows that $(1, 1) \circ \delta(\sigma)_n = 0$. Hence $\delta(\sigma)$ factors as in Lemma 14.28.2. By that lemma we obtain a canonical morphism $\Psi : s(U \times \Delta[1]) \rightarrow \diamond s(U)$.

To compute Ψ we first compute the morphism $\delta(\sigma) : s(W) \rightarrow s(U)[-1] \oplus s(U)[-1]$. According to Homology, Lemma 12.14.4 and its proof, to do this we have compute

$$d_{s(U \times \Delta[1]), n} \circ \sigma_n - \sigma_{n-1} \circ d_{s(W), n}$$

and write it as a morphism into $U_{n-1} \cdot \alpha_0^{n-1} \oplus U_{n-1} \cdot \alpha_n^{n-1}$. We only do this in case \mathcal{A} is the category of abelian groups. We use the short hand notation x_α for $x \in U_n$ to denote the element x in the summand $U_n \cdot \alpha$ of $(U \times \Delta[1])_n$. Recall that

$$d_{s(U \times \Delta[1]), n} = \sum_{i=0}^n (-1)^i d_i^n$$

where d_i^n maps the summand $U_n \cdot \alpha$ to the summand $U_{n-1} \cdot (\alpha \circ \delta_i^n)$ via the morphism d_i^n of the simplicial object U . In terms of the notation above this means

$$d_{s(U \times \Delta[1]), n}(x_\alpha) = \sum_{i=0}^n (-1)^i (d_i^n(x))_{\alpha \circ \delta_i^n}$$

Starting with $x_\alpha \in W_n$, in other words $\alpha = \alpha_j^n$ for some $j \in \{1, \dots, n\}$, we see that $\sigma_n(x_\alpha) = x_\alpha - x_{\alpha_0^n}$ and hence

$$(d_{s(U \times \Delta[1]), n} \circ \sigma_n)(x_\alpha) = \sum_{i=0}^n (-1)^i (d_i^n(x))_{\alpha \circ \delta_i^n} - \sum_{i=0}^n (-1)^i (d_i^n(x))_{\alpha_0^n \circ \delta_i^n}$$

To compute $d_{s(W), n}(x_\alpha)$, we have to omit all terms where $\alpha \circ \delta_i^n = \alpha_0^{n-1}, \alpha_n^{n-1}$. Hence we get

$$\begin{aligned} & (\sigma_{n-1} \circ d_{s(W), n})(x_\alpha) = \\ & \sum_{i=0, \dots, n \text{ and } \alpha \circ \delta_i^n \neq \alpha_0^{n-1} \text{ or } \alpha_n^{n-1}} \left((-1)^i (d_i^n(x))_{\alpha \circ \delta_i^n} - (-1)^i (d_i^n(x))_{\alpha_0^{n-1}} \right) \end{aligned}$$

Clearly the difference of the two terms is the sum

$$\sum_{i=0, \dots, n \text{ and } \alpha \circ \delta_i^n = \alpha_0^{n-1} \text{ or } \alpha_n^{n-1}} \left((-1)^i (d_i^n(x))_{\alpha \circ \delta_i^n} - (-1)^i (d_i^n(x))_{\alpha_0^{n-1}} \right)$$

Of course, if $\alpha \circ \delta_i^n = \alpha_0^{n-1}$ then the term drops out. Recall that $\alpha = \alpha_j^n$ for some $j \in \{1, \dots, n\}$. The only way $\alpha_j^n \circ \delta_i^n = \alpha_n^{n-1}$ is if $j = n$ and $i = n$. Thus we actually get 0 unless $j = n$ and in that case we get $(-1)^n (d_n^n(x))_{\alpha_n^{n-1}} - (-1)^n (d_n^n(x))_{\alpha_0^{n-1}}$. In other words, we conclude the morphism

$$\delta(\sigma)_n : W_n \rightarrow (s(U)[-1] \oplus s(U)[-1])_n = U_{n-1} \oplus U_{n-1}$$

is zero on all summands except $U_n \cdot \alpha_n^n$ and on that summand it is equal to $((-1)^n d_n^n, -(-1)^n d_n^n)$. (Namely, the first summand of the two corresponds to the factor with α_n^{n-1} because that is the map $[n-1] \rightarrow [1]$ which maps everybody to 0, and hence corresponds to e_0 .)

We obtain a canonical diagram

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & s(U) \oplus s(U) & \longrightarrow & \diamond s(U) & \longrightarrow & s(U)[-1] & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow \Phi & & \downarrow & & \\
 0 & \longrightarrow & s(U) \oplus s(U) & \longrightarrow & s(U \times \Delta[1]) & \longrightarrow & s(W) & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow \Psi & & \downarrow & & \\
 0 & \longrightarrow & s(U) \oplus s(U) & \longrightarrow & \diamond s(U) & \longrightarrow & s(U)[-1] & \longrightarrow & 0
 \end{array}$$

We claim that $\Phi \circ \Psi$ is the identity. To see this it is enough to prove that the composition of Φ and $\delta(\sigma)$ as a map $s(U)[-1] \rightarrow s(W) \rightarrow s(U)[-1] \oplus s(U)[-1]$ is the identity in the first factor and minus identity in the second. By the computations above it is $((-1)^n d_0^n, -(-1)^n d_0^n) \circ (-1)^n s_n^n = (1, -1)$ as desired. \square

14.29. Trivial Kan fibrations

Recall that for $n \geq 0$ the simplicial set $\Delta[n]$ is given by the rule $[k] \mapsto \text{Mor}_\Delta([k], [n])$, see Example 14.11.2. Recall that $\Delta[n]$ has a unique nondegenerate n -simplex and all nondegenerate simplices are faces of this n -simplex. In fact, the nondegenerate simplices of $\Delta[n]$ correspond exactly to injective morphisms $[k] \rightarrow [n]$, which we may identify with subsets of $[n]$. Moreover, recall that $\text{Mor}(\Delta[n], X) = X_n$ for any simplicial set X (Lemma 14.11.3). We set

$$\partial\Delta[n] = i_{(n-1)!} \text{sk}_{n-1} \Delta[n]$$

and we call it the *boundary* of $\Delta[n]$. From Lemma 14.20.5 we see that $\partial\Delta[n] \subset \Delta[n]$ is the simplicial subset having the same nondegenerate simplices in degrees $\leq n-1$ but not containing the nondegenerate n -simplex.

Definition 14.29.1. A map $X \rightarrow Y$ of simplicial sets is called a *trivial Kan fibration* if $X_0 \rightarrow Y_0$ is surjective and for all $n \geq 1$ and any commutative solid diagram

$$\begin{array}{ccc}
 \partial\Delta[n] & \longrightarrow & X \\
 \downarrow & \nearrow & \downarrow \\
 \Delta[n] & \longrightarrow & Y
 \end{array}$$

a dotted arrow exists making the diagram commute.

A trivial Kan fibration satisfies a very general lifting property.

Lemma 14.29.2. *Let $f : X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. For any solid commutative diagram*

$$\begin{array}{ccc}
 Z & \xrightarrow{\quad} & X \\
 \downarrow & \nearrow & \downarrow \\
 W & \xrightarrow{\quad} & Y
 \end{array}$$

of simplicial sets with $Z \rightarrow W$ (termwise) injective a dotted arrow exists making the diagram commute.

Proof. Suppose that $Z \neq W$. Let n be the smallest integer such that $Z_n \neq W_n$. Let $x \in W_n, x \notin Z_n$. Denote $Z' \subset W$ the simplicial subset containing Z, x , and all degeneracies of x . Let $\varphi : \Delta[n] \rightarrow Z'$ be the morphism corresponding to x (Lemma 14.11.3). Then $\varphi|_{\partial\Delta[n]}$ maps into Z as all the nondegenerate simplices of $\partial\Delta[n]$ end up in Z . By assumption we can extend $b \circ \varphi|_{\partial\Delta[n]}$ to $\beta : \Delta[n] \rightarrow X$. By Lemma 14.20.7 the simplicial set Z' is the pushout of $\Delta[n]$ and Z along $\partial\Delta[n]$. Hence b and β define a morphism $b' : Z' \rightarrow X$. In other words, we have extended the morphism b to a bigger simplicial subset of Z .

The proof is finished by an application of Zorn's lemma (omitted). \square

Lemma 14.29.3. *Let $f : X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. Let $Y' \rightarrow Y$ be a morphism of simplicial sets. Then $X \times_Y Y' \rightarrow Y'$ is a trivial Kan fibration.*

Proof. This follows immediately from the functorial properties of the fibre product (Lemma 14.7.2) and the definitions. \square

Lemma 14.29.4. *The composition of two trivial Kan fibrations is a trivial Kan fibration.*

Proof. Omitted. \square

Lemma 14.29.5. *Let $\dots \rightarrow U^2 \rightarrow U^1 \rightarrow U^0$ be a sequence of trivial Kan fibrations. Let $U = \lim U^t$ defined by taking $U_n = \lim U_n^t$. Then $U \rightarrow U^0$ is a trivial Kan fibration.*

Proof. Omitted. Hint: use that for a countable sequence of surjections of sets the inverse limit is nonempty. \square

Lemma 14.29.6. *Let $X_i \rightarrow Y_i$ be a set of trivial Kan fibrations. Then $\prod X_i \rightarrow \prod Y_i$ is a trivial Kan fibration.*

Proof. Omitted. \square

Lemma 14.29.7. *A filtered colimit of trivial Kan fibrations is a trivial Kan fibration.*

Proof. Omitted. Hint: See description of filtered colimits of sets in Categories, Section 4.19. \square

Lemma 14.29.8. *Let $f : X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. Then f is a homotopy equivalence.*

Proof. By Lemma 14.29.2 we can choose a right inverse $g : Y \rightarrow X$ to f . Consider the diagram

$$\begin{array}{ccc} \partial\Delta[1] \times X & \longrightarrow & X \\ \downarrow & \nearrow & \downarrow \\ \Delta[1] \times X & \longrightarrow & Y \end{array}$$

Here the top horizontal arrow is given by id_X and $g \circ f$ where we use that $(\partial\Delta[1] \times X)_n = X_n \amalg X_n$ for all $n \geq 0$. The bottom horizontal arrow is given by the map $\Delta[1] \rightarrow \Delta[0]$ and $f : X \rightarrow Y$. The diagram commutes as $f \circ g \circ f = f$. By Lemma 14.29.2 we can fill in the dotted arrow and we win. \square

14.30. Kan fibrations

Let n, k be integers with $0 \leq k \leq n$ and $1 \leq n$. Let $\sigma_0, \dots, \sigma_n$ be the $n + 1$ faces of the unique nondegenerate n -simplex σ of $\Delta[n]$, i.e., $\sigma_i = d_i\sigma$. We let

$$\Lambda_k[n] \subset \Delta[n]$$

be the k th horn of the n -simplex $\Delta[n]$. It is the simplicial subset of $\Delta[n]$ generated by $\sigma_0, \dots, \hat{\sigma}_k, \dots, \sigma_n$. In other words, the image of the displayed inclusion contains all the nondegenerate simplices of $\Delta[n]$ except for σ and σ_k .

Definition 14.30.1. A map $X \rightarrow Y$ of simplicial sets is called a *Kan fibration* if for all k, n with $1 \leq n, 0 \leq k \leq n$ and any commutative solid diagram

$$\begin{array}{ccc} \Lambda_k[n] & \longrightarrow & X \\ \downarrow & \dashrightarrow & \downarrow \\ \Delta[n] & \longrightarrow & Y \end{array}$$

a dotted arrow exists making the diagram commute. A *Kan complex* is a simplicial set X such that $X \rightarrow *$ is a Kan fibration, where $*$ is the constant simplicial set on a singleton.

Note that $\Lambda_k[n]$ is always nonempty. This a morphism from the empty simplicial set to any simplicial set is always a Kan fibration. It follows from Lemma 14.29.2 that a trivial Kan fibration is a Kan fibration.

Lemma 14.30.2. *Let $f : X \rightarrow Y$ be a Kan fibration of simplicial sets. Let $Y' \rightarrow Y$ be a morphism of simplicial sets. Then $X \times_Y Y' \rightarrow Y'$ is a Kan fibration.*

Proof. This follows immediately from the functorial properties of the fibre product (Lemma 14.7.2) and the definitions. □

Lemma 14.30.3. *The composition of two Kan fibrations is a Kan fibration.*

Proof. Omitted. □

Lemma 14.30.4. *Let $\dots \rightarrow U^2 \rightarrow U^1 \rightarrow U^0$ be a sequence of Kan fibrations. Let $U = \lim U^t$ defined by taking $U_n = \lim U_n^t$. Then $U \rightarrow U^0$ is a Kan fibration.*

Proof. Omitted. Hint: use that for a countable sequence of surjections of sets the inverse limit is nonempty. □

Lemma 14.30.5. *Let $X_i \rightarrow Y_i$ be a set of Kan fibrations. Then $\prod X_i \rightarrow \prod Y_i$ is a Kan fibration.*

Proof. Omitted. □

The following lemma is due to J.C. Moore, see [Moo55].

Lemma 14.30.6. *Let X be a simplicial group. Then X is a Kan complex.*

Proof. The following proof is basically just a translation into English of the proof in the reference mentioned above. Using the terminology as explained in the introduction to this section, suppose $f : \Lambda_k[n] \rightarrow X$ is a morphism from a horn. Set $x_i = f(\sigma_i) \in X_{n-1}$ for $i = 0, \dots, \hat{k}, \dots, n$. This means that for $i < j$ we have $d_i x_j = d_{j-1} x_i$ whenever $i, j \neq k$. We have to find an $x \in X_n$ such that $x_i = d_i x$ for $i = 0, \dots, \hat{k}, \dots, n$.

We first prove there exists a $u \in X_n$ such that $d_i u = x_i$ for $i < k$. This is trivial for $k = 0$. If $k > 0$, one defines by induction an element $u^r \in X_n$ such that $d_i u^r = x_i$ for $0 \leq i \leq r$. Start with $u^0 = s_0 x_0$. If $r < k - 1$, we set

$$y^r = s_{r+1}((d_{r+1}u^r)^{-1}x_{r+1}), \quad u^{r+1} = u^r y^r.$$

An easy calculation shows that $d_i y^r = 1$ (unit element of the group X_{n-1}) for $i \leq r$ and $d_{r+1} y^r = (d_{r+1}u^r)^{-1}x_{r+1}$. It follows that $d_i u^{r+1} = x_i$ for $i \leq r + 1$. Finally, take $u = u^{k-1}$ to get u as promised.

Next we prove, by induction on the integer r , $0 \leq r \leq n - k$, there exists a $x^r \in X_n$ such that

$$d_i x^r = x_i \quad \text{for } i < k \text{ and } i > n - r.$$

Start with $x^0 = u$ for $r = 0$. Having defined x^r for $r \leq n - k - 1$ we set

$$z^r = s_{n-r-1}((d_{n-r}x^r)^{-1}x_{n-r}), \quad x^{r+1} = x^r z^r$$

A simple calculation, using the given relations, shows that $d_i z^r = 1$ for $i < k$ and $i > n - r$ and that $d_{n-r}(z^r) = (d_{n-r}x^r)^{-1}x_{n-r}$. It follows that $d_i x^{r+1} = x_i$ for $i < k$ and $i > n - r - 1$. Finally, we take $x = x^{n-k}$ which finishes the proof. \square

Lemma 14.30.7. *Let $f : X \rightarrow Y$ be a homomorphism of simplicial abelian groups which is termwise surjective. Then f is a Kan fibration of simplicial sets.*

Proof. Consider a commutative solid diagram

$$\begin{array}{ccc} \Lambda_k[n] & \xrightarrow{a} & X \\ \downarrow & \nearrow & \downarrow \\ \Delta[n] & \xrightarrow{b} & Y \end{array}$$

as in Definition 14.30.1. The map a corresponds to $x_0, \dots, \hat{x}_k, \dots, x_n \in X_{n-1}$ satisfying $d_i x_j = d_{j-1} x_i$ for $i < j$, $i, j \neq k$. The map b corresponds to an element $y \in Y_n$ such that $d_i y = f(x_i)$ for $i \neq k$. Our task is to produce an $x \in X_n$ such that $d_i x = x_i$ for $i \neq k$ and $f(x) = y$.

Since f is termwise surjective we can find $x \in X_n$ with $f(x) = y$. Replace y by $0 = y - f(x)$ and x_i by $x_i - d_i x$ for $i \neq k$. Then we see that we may assume $y = 0$. In particular $f(x_i) = 0$. In other words, we can replace X by $\text{Ker}(f) \subset X$ and Y by 0 . In this case the statement become Lemma 14.30.6. \square

Lemma 14.30.8. *Let $f : X \rightarrow Y$ be a homomorphism of simplicial abelian groups which is termwise surjective and induces a quasi-isomorphism on associated chain complexes. Then f is a trivial Kan fibration of simplicial sets.*

Proof. Consider a commutative solid diagram

$$\begin{array}{ccc} \partial\Delta[n] & \xrightarrow{a} & X \\ \downarrow & \nearrow & \downarrow \\ \Delta[n] & \xrightarrow{b} & Y \end{array}$$

as in Definition 14.29.1. The map a corresponds to $x_0, \dots, x_n \in X_{n-1}$ satisfying $d_i x_j = d_{j-1} x_i$ for $i < j$. The map b corresponds to an element $y \in Y_n$ such that $d_i y = f(x_i)$. Our task is to produce an $x \in X_n$ such that $d_i x = x_i$ and $f(x) = y$.

Since f is termwise surjective we can find $x \in X_n$ with $f(x) = y$. Replace y by $0 = y - f(x)$ and x_i by $x_i - d_i x$. Then we see that we may assume $y = 0$. In particular $f(x_i) = 0$. In other words, we can replace X by $\text{Ker}(f) \subset X$ and Y by 0 . This works, because by Homology, Lemma 12.12.6 the homology of the chain complex associated to $\text{Ker}(f)$ is zero and hence $\text{Ker}(f) \rightarrow 0$ induces a quasi-isomorphism on associated chain complexes.

Since X is a Kan complex (Lemma 14.30.6) we can find $x \in X_n$ with $d_i x = x_i$ for $i = 0, \dots, n - 1$. After replacing x_i by $x_i - d_i x$ for $i = 0, \dots, n$ we may assume that $x_0 = x_1 = \dots = x_{n-1} = 0$. In this case we see that $d_i x_n = 0$ for $i = 0, \dots, n - 1$. Thus $x_n \in N(X)_{n-1}$ and lies in the kernel of the differential $N(X)_{n-1} \rightarrow N(X)_{n-2}$. Here $N(X)$ is the normalized chain complex associated to X , see Section 14.22. Since $N(X)$ is quasi-isomorphic to $s(X)$ (Lemma 14.22.8) and thus acyclic we find $x \in N(X_n)$ whose differential is x_n . This x answers the question posed by the lemma and we are done. \square

Lemma 14.30.9. *Let $f : X \rightarrow Y$ be a map of simplicial abelian groups. If f is termwise surjective³ and a homotopy equivalence of simplicial sets, then f induces a quasi-isomorphism of associated chain complexes.*

Proof. By assumption there exists a map $g : Y \rightarrow X$ of simplicial sets, a homotopy $h : X \times \Delta[1] \rightarrow X$ between $g \circ f$ and id_X , and a homotopy $h' : Y \times \Delta[1] \rightarrow Y$ between $f \circ g$ and id_Y . During this proof we will write $H_n(X) = H_n(s(X)) = H_n(N(X))$, see Section 14.22.

Note that $H_0(X)$ is the cokernel of the difference map $d_1 - d_0 : X_1 \rightarrow X_0$. Observe that $x \in X_0$ corresponds to a morphism $\Delta[0] \rightarrow X$. Composing h with the induced map $\Delta[0] \times \Delta[1] \rightarrow X \times \Delta[1]$ we see that x and $g(f(x))$ are equal to $d_0 x'$ and $d_1 x'$ for some $x' \in X_1$. Similarly for $y \in Y_0$. We conclude that f defines a bijection $H_0(X) \rightarrow H_0(Y)$.

Let $n \geq 1$. Consider the simplicial set S which is the pushout of

$$\begin{array}{ccc} \partial\Delta[n] & \longrightarrow & * \\ \downarrow & & \downarrow \\ \Delta[n] & \longrightarrow & S \end{array}$$

Concretely, we take

$$S_k = \{\varphi : [k] \rightarrow [n] \mid \varphi \text{ is surjective}\} \amalg \{*\}.$$

Denote $E = \mathbf{Z}[S]$ the free abelian group on S . The inclusion $\Delta[0] \rightarrow S$ coming from $* \in S_0$ determines an injection $K(\mathbf{Z}, 0) \rightarrow E$ whose cokernel is the object $K(\mathbf{Z}, n)$, i.e., we have a short exact sequence

$$0 \rightarrow K(\mathbf{Z}, 0) \rightarrow E \rightarrow K(\mathbf{Z}, n) \rightarrow 0$$

See Definition 14.21.3 and the description of the Eilenberg-MacLane objects in Lemma 14.21.2. Note that the extension above is split, for example because the

³This assumption is not necessary. Also the proof as currently given is not the right one. A better proof is to define the homotopy groups of Kan complex and show that these are equal to the homology groups of the associated complex for a simplicial abelian group.

element $\xi = [\text{id}_{[n]}] - [*] \in E_n$ satisfies $d_i \xi = 0$ and maps to the “generator” of $K(\mathbf{Z}, n)$. We have

$$\text{Mor}_{\text{Simp}(\text{Sets})}(S, X) = \text{Mor}_{\text{Simp}(Ab)}(E, X) = X_0 \times \bigcap_{i=0, \dots, n} \text{Ker}(d_i : X_n \rightarrow X_{n-1})$$

This uses the choice of our splitting above and the description of morphisms out of Eilenberg-MacLane objects given in Lemma 14.21.2. Note that we can think of $\bigcap_{i=0, \dots, n} \text{Ker}(d_i : X_n \rightarrow X_{n-1})$ as the cycles in degree n in the normalized chain complex associated to X , see Section 14.22. If two maps $a, b : S \rightarrow X$ are homotopic (as maps of simplicial sets), then the corresponding maps $a', b' : E \rightarrow X$ are homotopic as maps of simplicial abelian groups (because taking the free abelian group on is a functor). Thus if a , resp. b correspond to (a_0, a_n) , resp. (b_0, b_n) in the formula above, then a_0 and b_0 define the same element of $H_0(X)$ and a_n and b_n define the same class in $H_n(X)$. See Lemma 14.26.1.

We come the final arguments of the proof. An element y of $H_n(Y)$ can be represented by an element y_n in $\bigcap_{i=0, \dots, n} \text{Ker}(d_i : Y_n \rightarrow Y_{n-1})$. Let $a : S \rightarrow Y$ be the map of simplicial sets corresponding to $(0, y_n)$. Then $b = g \circ a$ corresponds to some (b_0, b_n) as above for X . Using the homotopy h' we see $(f(b_0), f(b_n))$ and $(0, y_n)$ come from homotopic maps $S \rightarrow Y$ and hence y_n and $f(b_n)$ define the same element of $H_n(Y)$. Clearly this shows that $H_n(f)$ is surjective. Conversely, suppose x_n in $\bigcap_{i=0, \dots, n} \text{Ker}(d_i : X_n \rightarrow X_{n-1})$ and $f(x_n) = d(y')$ with $y' \in N(Y_{n+1})$. Since f is termwise surjective so is the induced map $f : N(X_{n+1}) \rightarrow N(Y_{n+1})$ (see Lemma 14.22.6). Thus we can pick $x' \in N(X_{n+1})$ mapping to y' . After replacing x_n by $x_n - d(x')$ we reach the point where $f(x_n) = 0$. This means that the morphism $a : S \rightarrow X$ corresponding to $(0, x_n)$ has the property that $f \circ a$ is the constant morphism with value 0 in Y . Hence $g \circ f \circ a$ is also a constant morphism, i.e., corresponds to a pair $(b_0, 0)$. Since as before x_n and 0 represent the same element of $H_n(X)$ we conclude. □

14.31. A homotopy equivalence

Suppose that A, B are sets, and that $f : A \rightarrow B$ is a map. Consider the associated map of simplicial sets

$$\begin{array}{ccc} \text{cosk}_0(A) & \longleftarrow & \left(\dots A \times A \times A \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} A \times A \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} A \right) \\ & & \downarrow \qquad \qquad \qquad \downarrow \qquad \qquad \qquad \downarrow \\ \text{cosk}_0(B) & \longleftarrow & \left(\dots B \times B \times B \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} B \times B \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \end{array} B \right) \end{array}$$

See Example 14.18.1. The case $n = 0$ of the following lemma says that this map of simplicial sets is a trivial Kan fibration if f is surjective.

Lemma 14.31.1. *Let $f : V \rightarrow U$ be a morphism of simplicial sets. Let $n \geq 0$ be an integer. Assume*

- (1) *The map $f_i : V_i \rightarrow U_i$ is a bijection for $i < n$.*
- (2) *The map $f_n : V_n \rightarrow U_n$ is a surjection.*
- (3) *The canonical morphism $U \rightarrow \text{cosk}_n sk_n U$ is an isomorphism.*
- (4) *The canonical morphism $V \rightarrow \text{cosk}_n sk_n V$ is an isomorphism.*

Then f is a trivial Kan fibration.

Proof. Consider a solid diagram

$$\begin{array}{ccc} \partial\Delta[k] & \longrightarrow & V \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \Delta[k] & \longrightarrow & U \end{array}$$

as in Definition 14.29.1. Let $x \in U_k$ be the k -simplex corresponding to the lower horizontal arrow. If $k \leq n$ then the dotted arrow is the one corresponding to a lift $y \in V_k$ of x ; the diagram will commute as the other nondegenerate simplices of $\Delta[k]$ are in degrees $< k$ where f is an isomorphism. If $k > n$, then by conditions (3) and (4) we have (using adjointness of skeleton and coskeleton functors)

$$\text{Mor}(\Delta[k], U) = \text{Mor}(\text{sk}_n \Delta[k], \text{sk}_n U) = \text{Mor}(\text{sk}_n \partial\Delta[k], \text{sk}_n U) = \text{Mor}(\partial\Delta[k], U)$$

and similarly for V because $\text{sk}_n \Delta[k] = \text{sk}_n \partial\Delta[k]$ for $k > n$. Thus we obtain a unique dotted arrow fitting into the diagram in this case also. \square

Let A, B be sets. Let $f^0, f^1 : A \rightarrow B$ be maps of sets. Consider the induced maps $f^0, f^1 : \text{cosk}_0(A) \rightarrow \text{cosk}_0(B)$ abusively denoted by the same symbols. The following lemma for $n = 0$ says that f^0 is homotopic to f^1 . In fact, the homotopy is given by the map $h : \text{cosk}_0(A) \times \Delta[1] \rightarrow \text{cosk}_0(A)$ with components

$$\begin{aligned} h_m : A \times \dots \times A \times \text{Mor}_\Delta([m], [1]) &\longrightarrow A \times \dots \times A, \\ (a_0, \dots, a_m, \alpha) &\longmapsto (f^{\alpha(0)}(a_0), \dots, f^{\alpha(m)}(a_m)) \end{aligned}$$

To check that this works, note that for a map $\varphi : [k] \rightarrow [m]$ the induced maps are $(a_0, \dots, a_m) \mapsto (a_{\varphi(0)}, \dots, a_{\varphi(k)})$ and $\alpha \mapsto \alpha \circ \varphi$. Thus $h = (h_m)_{m \geq 0}$ is clearly a map of simplicial sets as desired.

Lemma 14.31.2. *Let $f^0, f^1 : V \rightarrow U$ be maps of a simplicial sets. Let $n \geq 0$ be an integer. Assume*

- (1) *The maps $f_i^j : V_i \rightarrow U_i, j = 0, 1$ are equal for $i < n$.*
- (2) *The canonical morphism $U \rightarrow \text{cosk}_n \text{sk}_n U$ is an isomorphism.*
- (3) *The canonical morphism $V \rightarrow \text{cosk}_n \text{sk}_n V$ is an isomorphism.*

Then f^0 is homotopic to f^1 .

First proof. Let W be the n -truncated simplicial set with $W_i = U_i$ for $i < n$ and $W_n = U_n / \sim$ where \sim is the equivalence relation generated by $f^0(y) \sim f^1(y)$ for $y \in V_n$. This makes sense as the morphisms $U(\varphi) : U_n \rightarrow U_i$ corresponding to $\varphi : [i] \rightarrow [n]$ for $i < n$ factor through the quotient map $U_n \rightarrow W_n$ because f^0 and f^1 are morphisms of simplicial sets and equal in degrees $< n$. Next, we upgrade W to a simplicial set by taking $\text{cosk}_n W$. By Lemma 14.31.1 the morphism $g : U \rightarrow W$ is a trivial Kan fibration. Observe that $g \circ f^0 = g \circ f^1$ by construction and denote this morphism $f : V \rightarrow W$. Consider the diagram

$$\begin{array}{ccc} \partial\Delta[1] \times V & \xrightarrow{f^0, f^1} & U \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \Delta[1] \times V & \xrightarrow{f} & W \end{array}$$

By Lemma 14.29.2 the dotted arrow exists and the proof is done. \square

Second proof. We have to construct a morphism of simplicial sets $h : V \times \Delta[1] \rightarrow U$ which recovers f^i on composing with e_i . The case $n = 0$ was dealt with above the lemma. Thus we may assume that $n \geq 1$. The map $\Delta[1] \rightarrow \text{cosk}_1 \text{sk}_1 \Delta[1]$ is an isomorphism, see Lemma 14.18.15. Thus we see that $\Delta[1] \rightarrow \text{cosk}_n \text{sk}_n \Delta[1]$ is an isomorphism as $n \geq 1$, see Lemma 14.18.10. And hence $V \times \Delta[1] \rightarrow \text{cosk}_n \text{sk}_n (V \times \Delta[1])$ is an isomorphism too, see Lemma 14.18.12. In other words, in order to construct the homotopy it suffices to construct a suitable morphism of n -truncated simplicial sets $h : \text{sk}_n V \times \text{sk}_n \Delta[1] \rightarrow \text{sk}_n U$.

For $k = 0, \dots, n-1$ we define h_k by the formula $h_k(v, \alpha) = f^0(v) = f^1(v)$. The map $h_n : V_n \times \text{Mor}_\Delta([k], [1]) \rightarrow U_n$ is defined as follows. Pick $v \in V_n$ and $\alpha : [n] \rightarrow [1]$:

- (1) If $\text{Im}(\alpha) = \{0\}$, then we set $h_n(v, \alpha) = f^0(v)$.
- (2) If $\text{Im}(\alpha) = \{0, 1\}$, then we set $h_n(v, \alpha) = f^0(v)$.
- (3) If $\text{Im}(\alpha) = \{1\}$, then we set $h_n(v, \alpha) = f^1(v)$.

Let $\varphi : [k] \rightarrow [l]$ be a morphism of $\Delta_{\leq n}$. We will show that the diagram

$$\begin{array}{ccc} V_l \times \text{Mor}([l], [1]) & \longrightarrow & U_l \\ \downarrow & & \downarrow \\ V_k \times \text{Mor}([k], [1]) & \longrightarrow & U_k \end{array}$$

commutes. Pick $v \in V_l$ and $\alpha : [l] \rightarrow [1]$. The commutativity means that

$$h_k(V(\varphi)(v), \alpha \circ \varphi) = U(\varphi)(h_l(v, \alpha)).$$

In almost every case this holds because $h_k(V(\varphi)(v), \alpha \circ \varphi) = f^0(V(\varphi)(v))$ and $U(\varphi)(h_l(v, \alpha)) = U(\varphi)(f^0(v))$, combined with the fact that f^0 is a morphism of simplicial sets. The only cases where this does not hold is when either (A) $\text{Im}(\alpha) = \{1\}$ and $l = n$ or (B) $\text{Im}(\alpha \circ \varphi) = \{1\}$ and $k = n$. Observe moreover that necessarily $f^0(v) = f^1(v)$ for any degenerate n -simplex of V . Thus we can narrow the cases above down even further to the cases (A) $\text{Im}(\alpha) = \{1\}$, $l = n$ and v nondegenerate, and (B) $\text{Im}(\alpha \circ \varphi) = \{1\}$, $k = n$ and $V(\varphi)(v)$ nondegenerate.

In case (A), we see that also $\text{Im}(\alpha \circ \varphi) = \{1\}$. Hence we see that not only $h_l(v, \alpha) = f^1(v)$ but also $h_k(V(\varphi)(v), \alpha \circ \varphi) = f^1(V(\varphi)(v))$. Thus we see that the relation holds because f^1 is a morphism of simplicial sets.

In case (B) we conclude that $l = k = n$ and φ is bijective, since otherwise $V(\varphi)(v)$ is degenerate. Thus $\varphi = \text{id}_{[n]}$, which is a trivial case. \square

Lemma 14.31.3. *Let A, B be sets, and that $f : A \rightarrow B$ is a map. Consider the simplicial set U with n -simplices*

$$A \times_B A \times_B \dots \times_B A \text{ (} n + 1 \text{ factors)}.$$

see Example 14.3.5. If f is surjective, the morphism $U \rightarrow B$ where B indicates the constant simplicial set with value B is a trivial Kan fibration.

Proof. Observe that U fits into a cartesian square

$$\begin{array}{ccc} U & \longrightarrow & \text{cosk}_0(B) \\ \downarrow & & \downarrow \\ B & \longrightarrow & \text{cosk}_0(A) \end{array}$$

Since the right vertical arrow is a trivial Kan fibration by Lemma 14.31.1, so is the left by Lemma 14.29.3. \square

14.32. Standard resolutions

Some of the material in this section can be found in [God73, Appendix 1] and [Ill72, I 1.5].

Situation 14.32.1. Let \mathcal{A}, \mathcal{S} be categories and let $i : \mathcal{A} \rightarrow \mathcal{S}$ be a functor with a left adjoint $F : \mathcal{S} \rightarrow \mathcal{A}$.

In this very general situation we will construct a simplicial object X in the category of functors from \mathcal{A} to \mathcal{A} . Please keep the following example in mind while we do this.

Example 14.32.2. As an example of the above we can take $i : \mathit{Rings} \rightarrow \mathit{Sets}$ to be the forgetful functor and $F : \mathit{Sets} \rightarrow \mathit{Rings}$ to be the functor that associates to a set E the polynomial algebra $\mathbf{Z}[E]$ on E over \mathbf{Z} . The simplicial object X when evaluated on an ring A will give the simplicial ring

$$\mathbf{Z}[\mathbf{Z}[\mathbf{Z}[A]]] \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} \mathbf{Z}[\mathbf{Z}[A]] \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} \mathbf{Z}[A]$$

which comes with an augmentation towards A . We will also show this augmentation is a homotopy equivalence.

For the general construction we will use the horizontal composition as defined in Categories, Section 4.26. The definition of the adjunction morphisms $k : F \circ i \rightarrow \text{id}_{\mathcal{A}}$ and $t : \text{id}_{\mathcal{S}} \rightarrow i \circ F$ in Categories, Section 4.24 shows that the compositions

$$(14.32.2.1) \quad i \xrightarrow{t \star 1_i} i \circ F \circ i \xrightarrow{1_i \star k} i \quad \text{and} \quad F \xrightarrow{1_F \star t} F \circ i \circ F \xrightarrow{k \star 1_F} F$$

are the identity morphisms. Here to define the morphism $t \star 1$ we silently identify i with $\text{id}_{\mathcal{S}} \circ i$ and 1 stands for $\text{id}_i : i \rightarrow i$. We will use this notation and these relations repeatedly in what follows. For $n \geq 0$ we set

$$X_n = (F \circ i)^{\circ(n+1)} = F \circ i \circ F \circ \dots \circ i \circ F$$

In other words, X_n is the $(n + 1)$ -fold composition of $F \circ i$ with itself. We also set $X_{-1} = \text{id}_{\mathcal{A}}$. We have $X_{n+m+1} = X_n \circ X_m$ for all $n, m \geq -1$. We will endow this sequence of functors with the structure of a simplicial object of $\text{Fun}(\mathcal{A}, \mathcal{A})$ by constructing the morphisms of functors

$$d_j^n : X_n \rightarrow X_{n-1}, \quad s_j^n : X_n \rightarrow X_{n+1}$$

satisfying the relations displayed in Lemma 14.2.3. Namely, we set

$$d_j^n = 1_{X_{j-1}} \star k \star 1_{X_{n-j-1}} \quad \text{and} \quad s_j^n = 1_{X_{j-1} \circ F} \star t \star 1_{i \circ X_{n-j-1}}$$

Finally, write $\epsilon_0 = k : X_0 \rightarrow X_{-1}$.

Example 14.32.3. In Example 14.32.2 we have $X_n(A) = \mathbf{Z}[\mathbf{Z}[\dots[A]\dots]]$ with $n + 1$ brackets. We describe the maps constructed above using a typical element $\xi = \sum n_i [n_{ij} [a_{ij}]]$ of $X_1(A)$. The maps $d_0, d_1 : \mathbf{Z}[\mathbf{Z}[A]] \rightarrow \mathbf{Z}[A]$ are given by

$$d_0(\xi) = \sum n_i n_{ij} [a_{ij}] \quad \text{and} \quad d_1(\xi) = \sum n_i [n_{ij} a_{ij}].$$

The maps $s_0, s_1 : \mathbf{Z}[\mathbf{Z}[A]] \rightarrow \mathbf{Z}[\mathbf{Z}[\mathbf{Z}[A]]]$ are given by

$$s_0(\xi) = \sum n_i [[n_{ij} [a_{ij}]]] \quad \text{and} \quad s_1(\xi) = \sum n_i [n_{ij} [[a_{ij}]]].$$

Lemma 14.32.4. *In Situation 14.32.1 the system $X = (X_n, d_j^n, s_j^n)$ is a simplicial object of $\text{Fun}(\mathcal{A}, \mathcal{A})$ and ϵ_0 defines an augmentation ϵ from X to the constant simplicial object with value $X_{-1} = \text{id}_{\mathcal{A}}$.*

Proof. Suppose that we have shown that X is a simplicial object. Then to prove that $\epsilon_0 = k$ defines an augmentation we have to check that $\epsilon_0 \circ d_0^1 = \epsilon_0 \circ d_1^1$ as morphisms $X_1 \rightarrow X_{-1}$, see Lemma 14.19.2. In other words, we have to check that the diagram

$$\begin{array}{ccc} F \circ i \circ F \circ i & \xrightarrow{1_{F \circ i} \star k} & F \circ i \\ k \star 1_{F \circ i} \downarrow & & \downarrow k \\ F \circ i & \xrightarrow{k} & \text{id}_{\mathcal{A}} \end{array}$$

is commutative. More precisely we should write this as the equality

$$(k \star 1_{\text{id}_{\mathcal{A}}}) \circ (1_{F \circ i} \star k) = (1_{\text{id}_{\mathcal{A}}} \star k) \circ (k \star 1_{F \circ i})$$

as morphisms $(F \circ i) \circ (F \circ i) \rightarrow \text{id}_{\mathcal{A}} \circ \text{id}_{\mathcal{A}}$. Applying the general property of Categories, Lemma 4.26.2 both sides expand to $k \star k$ when equality holds.

To prove that X is a simplicial object we have to check (see Remark 14.3.3):

- (1) If $i < j$, then $d_i \circ d_j = d_{j-1} \circ d_i$.
- (2) If $i < j$, then $d_i \circ s_j = s_{j-1} \circ d_i$.
- (3) We have $\text{id} = d_j \circ s_j = d_{j+1} \circ s_j$.
- (4) If $i > j + 1$, then $d_i \circ s_j = s_j \circ d_{i-1}$.
- (5) If $i \leq j$, then $s_i \circ s_j = s_{j+1} \circ s_i$.

Relation (1) is proved in exactly the same manner as the proof of the equality $\epsilon_0 \circ d_0^1 = \epsilon_0 \circ d_1^1$ above.

The simplest case of equality (5) is the commutativity of the diagram

$$\begin{array}{ccc} F \circ i & \xrightarrow{1_F \star t \star 1_i} & F \circ i \circ F \circ i \\ 1_F \star t \star 1_i \downarrow & & \downarrow 1_F \star t \star 1_{i \circ F \circ i} \\ F \circ i \circ F \circ i & \xrightarrow{1_{F \circ i \circ F} \star t \star 1_i} & F \circ i \circ F \circ i \circ F \circ i \end{array}$$

which holds because both compositions expand to the morphism $1_F \star t \star t \star 1_i$ from $F \circ \text{id}_{\mathcal{A}} \circ \text{id}_{\mathcal{A}} \circ i$ to $F \circ (i \circ F) \circ (i \circ F) \circ i$. All other cases of (5) are proved in the same manner.

The simplest case of equalities (2) and (4) is the commutativity of the diagram

$$\begin{array}{ccc} F \circ i \circ F \circ i & \xrightarrow{1_F \star k \star 1_i} & F \circ i \\ 1_{F \circ i \circ F \circ i} \star t \downarrow & & \downarrow 1_{F \circ i} \star t \\ F \circ i \circ F \circ i \circ F \circ i & \xrightarrow{1_F \star k \star 1_{i \circ F \circ i \circ F}} & F \circ i \circ F \circ i \end{array}$$

which again holds because both compositions expand to give $1_F \star k \star 1_i \star t$ as maps from $F \circ (i \circ F) \circ i \circ \text{id}_{\mathcal{A}}$ to $F \circ \text{id}_{\mathcal{A}} \circ i \circ (F \circ i)$. All other cases of (2) and (4) are proved in the same manner.

The relations (3) are the only nontrivial ones and these are consequences of the fact that the compositions in (14.32.2.1) are the identity. For example, the simplest case

of (3) states that the compositions

$$\begin{array}{ccc} F \circ i & \xrightarrow{1_{F \circ i} \star t} & F \circ i \circ F \circ i \\ t \star 1_{F \circ i} \downarrow & & \downarrow 1_{F \star k \star 1_i} \\ F \circ i \circ F \circ i & \xrightarrow{1_{F \star k \star 1_i}} & F \circ i \end{array}$$

go around the diagram either way evaluate out to the identity. Going around the top the composition evaluates to $1_F \star ((k \star 1_i) \circ (1_i \star t))$ which is the identity by what was said above. The other cases of (3) are proved in the same manner. \square

Before reading the proof of the following lemma, we strongly urge the reader to look at the example discussed in Example 14.32.6 in order to understand the purpose of the lemma.

Lemma 14.32.5. *In Situation 14.32.1 the maps*

$$1_i \star \epsilon : i \circ X \rightarrow i, \quad \text{and} \quad \epsilon \star 1_F : X \circ F \rightarrow F$$

are homotopy equivalences.

Proof. Denote $\epsilon_n : X_n \rightarrow X_{-1}$ the components of the augmentation morphism. We observe that $\epsilon_n = k^{*(n+1)}$, the $(n+1)$ -fold \star -composition of k . Recall that $t : \text{id}_S \rightarrow i \circ F$ is the adjunction map. We have the morphisms

$$t^{*(n+1)} \star 1_i : i \rightarrow i \circ (F \circ i)^{\circ(n+1)} = i \circ X_n$$

which are right inverse to $1_i \star \epsilon_n$ and the morphisms

$$1_F \star t^{*(n+1)} : F \rightarrow (F \circ i)^{\circ(n+1)} \circ F = X_n \circ F$$

which are right inverse to $\epsilon_n \star 1_F$. These morphisms determine morphisms of simplicial objects $b : i \rightarrow i \circ X$ and $c : F \rightarrow X \circ F$ (proof omitted). To finish it suffices to construct a homotopy between the morphisms $1, b \circ (1_i \star \epsilon) : i \circ X \rightarrow i \circ X$ and between the two morphisms $1, c \circ (\epsilon \star 1_F) : X \circ F \rightarrow X \circ F$.

To show the morphisms $b \circ (1_i \star \epsilon), 1 : i \circ X \rightarrow i \circ X$ are homotopic we have to construct morphisms

$$h_{n,j} : i \circ X_n \rightarrow i \circ X_n$$

for $n \geq 0$ and $0 \leq j \leq n+1$ satisfying the relations described in Lemma 14.25.2. See also Remark 14.25.4. We are forced to set $h_{n,0} = 1$ and

$$h_{n,n+1} = b_n \circ (1_i \star \epsilon_n) = (t^{*(n+1)} \star 1_i) \circ (1_i \star k^{*(n+1)})$$

Thus a logical choice is

$$h_{n,j} = (t^{*(j)} \star 1) \circ (1_i \star k^{*(j)} \star 1)$$

Here and in the rest of the proof we drop the subscript from 1 if it is clear by knowing the source and the target of the morphism what this subscript should be. Writing

$$i \circ X_n = i \circ F \circ i \circ \dots \circ F \circ i$$

we can think of the morphism $h_{n,j}$ as collapsing the first j pairs $(F \circ i)$ to id_S using $k^{*(j)}$, then adding a id_S in front and expanding this to j pairs $(i \circ F)$ using $t^{*(j)}$. We have to prove

- (1) We have $d_m^n \circ h_{n,j} = h_{n-1,j-1} \circ d_m^n$ for $j > m$.
- (2) We have $d_m^n \circ h_{n,j} = h_{n-1,j} \circ d_m^n$ for $j \leq m$.

- (3) We have $s_m^n \circ h_{n,j} = h_{n+1,j+1} \circ s_m^n$ for $j > m$.
- (4) We have $s_m^n \circ h_{n,j} = h_{n+1,j} \circ s_m^n$ for $j \leq m$.

Recall that d_m^n is given by applying k to the $(m + 1)$ st pair $(F \circ i)$ in the functor $X_n = (F \circ i)^{\circ(n+1)}$. Thus it is clear that (2) holds (because k does \star -commute with k , but not with t). Similarly, s_m^n is given by applying $1_F \star t \star i_i$ to the $(m + 1)$ st pair $(F \circ i)$ in $X_n = (F \circ i)^{\circ(n+1)}$. Thus it is clear that (4) holds. In the two remaining cases one uses the fact that the compositions in (14.32.2.1) are the identity causes the drop in the index j . Some details omitted.

To show the morphisms $1, c \circ (\epsilon \star 1_F) : X \circ F \rightarrow X \circ F$ are homotopic we have to construct morphisms

$$h_{n,j} : X_n \circ F \longrightarrow X_n \circ F$$

for $n \geq 0$ and $0 \leq j \leq n + 1$ satisfying the relations described in Lemma 14.25.2. See also Remark 14.25.4. We are forced to set $h_{n,0} = 1$ and

$$h_{n,n+1} = c_n \circ (\epsilon_n \star 1_F) = (1_F \star t^{\star(n+1)}) \circ (k^{\star(n+1)} \star 1_F)$$

Thus a logical choice is

$$h_{n,j} = (1_F \star t^{\star(j)} \star 1) \circ (k^{\star(j)} \star 1)$$

Here and in the rest of the proof we drop the subscript from 1 if it is clear by knowing the source and the target of the morphism what this subscript should be. Writing

$$X_n \circ F = F \circ i \circ F \circ \dots \circ i \circ F$$

we can think of the morphism $h_{n,j}$ as collapsing the first j pairs $(F \circ i)$ to id_S using $k^{\star(j)}$, then inserting a id_S just after the first F and expanding this to j pairs $(i \circ F)$ using $t^{\star(j)}$. We have to prove

- (1) We have $d_m^n \circ h_{n,j} = h_{n-1,j-1} \circ d_m^n$ for $j > m$.
- (2) We have $d_m^n \circ h_{n,j} = h_{n-1,j} \circ d_m^n$ for $j \leq m$.
- (3) We have $s_m^n \circ h_{n,j} = h_{n+1,j+1} \circ s_m^n$ for $j > m$.
- (4) We have $s_m^n \circ h_{n,j} = h_{n+1,j} \circ s_m^n$ for $j \leq m$.

Recall that d_m^n is given by applying k to the $(m + 1)$ st pair $(F \circ i)$ in the functor $X_n = (F \circ i)^{\circ(n+1)}$. Thus it is clear that (2) holds (because k does \star -commute with k , but not with t). Similarly, s_m^n is given by applying $1_F \star t \star i_i$ to the $(m + 1)$ st pair $(F \circ i)$ in $X_n = (F \circ i)^{\circ(n+1)}$. Thus it is clear that (4) holds. In the two remaining cases one uses the fact that the compositions in (14.32.2.1) are the identity causes the drop in the index j . Some details omitted. \square

Example 14.32.6. Going back to the example discussed in Example 14.32.2 our Lemma 14.32.5 signifies that for any ring A the map of simplicial rings

$$\begin{array}{ccccc} \mathbf{Z}[\mathbf{Z}[\mathbf{Z}[A]]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[\mathbf{Z}[A]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[A] \\ \downarrow & & \downarrow & & \downarrow \\ A & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & A & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & A \end{array}$$

is a homotopy equivalence on underlying simplicial sets. Moreover, the inverse map constructed in Lemma 14.32.5 is in degree n given by

$$a \mapsto [\dots [a] \dots]$$

with obvious notation. In the other direction the lemma tells us that for every set E there is a homotopy equivalence

$$\begin{array}{ccccc} \mathbf{Z}[\mathbf{Z}[\mathbf{Z}[\mathbf{Z}[E]]]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[\mathbf{Z}[\mathbf{Z}[E]]] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[\mathbf{Z}[E]] \\ \downarrow & & \downarrow & & \downarrow \\ \mathbf{Z}[E] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[E] & \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} & \mathbf{Z}[E] \end{array}$$

of rings. The inverse map constructed in the lemma is in degree n given by the ring map

$$\sum m_{e_1, \dots, e_p} [e_1][e_2] \cdots [e_p] \mapsto \sum m_{e_1, \dots, e_p} [\dots [e_1] \dots][\dots [e_2] \dots] \cdots [\dots [e_p] \dots]$$

(with obvious notation).

More on Algebra

15.1. Introduction

In this chapter we prove some results in commutative algebra which are less elementary than those in the first chapter on commutative algebra, see Algebra, Section 10.1. A reference is [Mat70].

15.2. Advice for the reader

More than in the chapter on commutative algebra, each of the sections in this chapter stands on its own. Starting with Section 15.43 we freely use the (unbounded) derived category of modules over rings and all the machinery that comes with it.

15.3. A comment on the Artin-Rees property

Some of this material is taken from [CdJ02]. A general discussion with additional references can be found in [EH05, Section 1].

Let A be a Noetherian ring and let $I \subset A$ be an ideal. Given a homomorphism $f : M \rightarrow N$ of finite A -modules there exists a $c \geq 0$ such that

$$f(M) \cap I^n N \subset f(I^{n-c} M)$$

for all $n \geq c$, see Algebra, Lemma 10.49.3. In this situation we will say c works for f in the Artin-Rees lemma.

Lemma 15.3.1. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal contained in the Jacobson radical of A . Let*

$$S : L \xrightarrow{f} M \xrightarrow{g} N \quad \text{and} \quad S' : L \xrightarrow{f'} M \xrightarrow{g'} N$$

be two complexes of finite A -modules as shown. Assume that

- (1) c works in the Artin-Rees lemma for f and g ,
- (2) the complex S is exact, and
- (3) $f' = f \bmod I^{c+1} M$ and $g' = g \bmod I^{c+1} N$.

Then c works in the Artin-Rees lemma for g' and the complex S' is exact.

Proof. We first show that $g'(L) \cap I^n M \subset g'(I^{n-c} L)$ for $n \geq c$. Let a be an element of M such that $g'(a) \in I^n N$. We want to adjust a by an element of $f'(L)$, i.e., without changing $g'(a)$, so that $a \in I^{n-c} M$. Assume that $a \in I^r M$, where $r < n - c$. Then

$$g(a) = g'(a) + (g - g')(a) \in I^n N + I^{r+c+1} N = I^{r+c+1} N.$$

By Artin-Rees for g we have $g(a) \in g(I^{r+1} M)$. Say $g(a) = g(a_1)$ with $a_1 \in I^{r+1} M$. Since the sequence S is exact, $a - a_1 \in f(L)$. Accordingly, we write $a = f(b) + a_1$ for some $b \in L$. Then $f(b) = a - a_1 \in I^r M$. Artin-Rees for f shows that if $r \geq c$,

we may replace b by an element of $I^{r-c}L$. Then in all cases, $a = f'(b) + a_2$, where $a_2 = (f - f')(b) + a_1 \in I^{r+1}M$. (Namely, either $c \geq r$ and $(f - f')(b) \in I^{r+1}M$ by assumption, or $c < r$ and $b \in I^{r-c}$, whence again $(f - f')(b) \in I^{c+1}I^{r-c}M = I^{r+1}M$.) So we can adjust a by the element $f'(b) \in f'(L)$ to increase r by 1.

In fact, the argument above shows that $(g')^{-1}(I^n M) \subset f'(L) + I^{n-c}M$ for all $n \geq c$. Hence S' is exact because

$$(g')^{-1}(0) = (g')^{-1}\left(\bigcap I^n N\right) \subset \bigcap f'(L) + I^{n-c}M = f'(L)$$

as $I \subset \text{rad}(A)$, see Algebra, Lemma 10.49.5. \square

Given an ideal $I \subset A$ of a ring A and an A -module M we set

$$\text{Gr}_I(M) = \bigoplus I^n M / I^{n+1} M.$$

We think of this as a graded $\text{Gr}_I(A)$ -module.

Lemma 15.3.2. *Assumptions as in Lemma 15.3.1. Let $Q = \text{Coker}(g)$ and $Q' = \text{Coker}(g')$. Then $\text{Gr}_I(Q) \cong \text{Gr}_I(Q')$ as graded $\text{Gr}_I(A)$ -modules.*

Proof. In degree n we have $\text{Gr}_I(Q)_n = I^n N / (I^{n+1} N + g(M) \cap I^n N)$ and similarly for Q' . We claim that

$$g(M) \cap I^n N \subset I^{n+1} N + g'(M) \cap I^n N.$$

By symmetry (the proof of the claim will only use that c works for g which also holds for g' by the lemma) this will imply that

$$I^{n+1} N + g(M) \cap I^n N = I^{n+1} N + g'(M) \cap I^n N$$

whence $\text{Gr}_I(Q)_n$ and $\text{Gr}_I(Q')_n$ agree as subquotients of N , implying the lemma. Observe that the claim is clear for $n \leq c$ as $f = f' \pmod{I^{c+1}N}$. If $n > c$, then suppose $b \in g(M) \cap I^n N$. Write $b = g(a)$ for $a \in I^{n-c}M$. Set $b' = g'(a)$. We have $b - b' = (g - g')(a) \in I^{n+1}N$ as desired. \square

Lemma 15.3.3. *Let $A \rightarrow B$ be a flat map of Noetherian rings. Let $I \subset A$ be an ideal. Let $f : M \rightarrow N$ be a homomorphism of finite A -modules. Assume that c works for f in the Artin-Rees lemma. Then c works for $f \otimes 1 : M \otimes_A B \rightarrow N \otimes_A B$ in the Artin-Rees lemma for the ideal IB .*

Proof. Note that

$$(f \otimes 1)(M) \cap I^n N \otimes_A B = (f \otimes 1)\left((f \otimes 1)^{-1}(I^n N \otimes_A B)\right)$$

On the other hand,

$$\begin{aligned} (f \otimes 1)^{-1}(I^n N \otimes_A B) &= \text{Ker}(M \otimes_A B \rightarrow N \otimes_A B / (I^n N \otimes_A B)) \\ &= \text{Ker}(M \otimes_A B \rightarrow (N/I^n N) \otimes_A B) \end{aligned}$$

As $A \rightarrow B$ is flat taking kernels and cokernels commutes with tensoring with B , whence this is equal to $f^{-1}(I^n N) \otimes_A B$. By assumption $f^{-1}(I^n N)$ is contained in $\text{Ker}(f) + I^{n-c}M$. Thus the lemma holds. \square

15.4. Fibre products of rings

Fibre products of rings have to do with pushouts of schemes. A special case of pushouts of schemes is discussed in More on Morphisms, Section 36.11.

Lemma 15.4.1. *Let R be a ring. Let $A \rightarrow B$ and $C \rightarrow B$ be R -algebra maps. Assume*

- (1) R is Noetherian,
- (2) A, B, C are of finite type over R ,
- (3) $A \rightarrow B$ is surjective, and
- (4) B is finite over C .

Then $A \times_B C$ is of finite type over R .

Proof. Set $D = A \times_B C$. There is a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & I & \longrightarrow & A & \longrightarrow & B & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I & \longrightarrow & D & \longrightarrow & C & \longrightarrow & 0 \end{array}$$

with exact rows. Choose $y_1, \dots, y_n \in B$ which are generators for B as a C -module. Choose $x_i \in A$ mapping to y_i . Then $1, x_1, \dots, x_n$ are generators for A as a D -module. The map $D \rightarrow A \times C$ is injective, and the ring $A \times C$ is finite as a D -module (because it is the direct sum of the finite D -modules A and C). Hence the lemma follows from the Artin-Tate lemma (Algebra, Lemma 10.49.7). \square

Lemma 15.4.2. *Let R be a Noetherian ring. Let I be a finite set. Suppose given a cartesian diagram*

$$\begin{array}{ccc} P & \longrightarrow & \prod A_i \\ \downarrow & & \downarrow \Pi \varphi_i \\ Q & \xrightarrow{\Pi \psi_i} & \prod B_i \end{array}$$

with ψ_i and φ_i surjective, and Q, A_i, B_i of finite type over R . Then P is of finite type over R .

Proof. Follows from Lemma 15.4.1 and induction on the size of I . Namely, let $I = I' \amalg \{i_0\}$. Let P' be the ring defined by the diagram of the lemma using I' . Then P' is of finite type by the lemma. Finally, P sits in a fibre product diagram

$$\begin{array}{ccc} P & \longrightarrow & A_{i_0} \\ \downarrow & & \downarrow \\ P' & \longrightarrow & B_{i_0} \end{array}$$

to which the lemma applies. \square

Lemma 15.4.3. *Suppose given a cartesian diagram of rings*

$$\begin{array}{ccc} B & \xrightarrow{s} & R \\ \uparrow & & \uparrow t \\ B' & \longrightarrow & R', \end{array}$$

i.e., $B' = B \times_R R'$. If $h \in B'$ corresponds to $g \in B$ and $f \in R'$ such that $s(g) = t(f)$, then the diagram

$$\begin{array}{ccc} B_g & \xrightarrow{s} & R_{s(g)} = R_{t(f)} \\ \uparrow & & \uparrow t \\ (B')_h & \longrightarrow & (R')_f \end{array}$$

is cartesian too.

Proof. Note that $B' = \{(b, r') \in B \times R' \mid s(b) = t(r')\}$. So $h = (g, f) \in B'$. First we show that $(B')_h$ maps injectively into $B_g \times (R')_f$. Namely, suppose that $(x, y)/h^n$ maps to zero. This means that $g^N x = 0$ for some N and $f^M y$ is zero for some M . Thus $h^{\max(N, M)}(x, y) = 0$ in B' and hence $(x, y)/h^n = 0$ in B'_h . Next, suppose that x/g^n and y/f^m are elements which map to the same element of $R_{s(g)}$. This means that $s(g)^N(t(f)^m s(x) - s(g)^n t(y)) = 0$ in R' for some $N \gg 0$. We can rewrite this as $s(g^{m+N} x) = t(f^{n+N} y)$. Hence we see that the pair $(x/g^n, y/f^m)$ is the image of the element $(g^{m+N} x, f^{n+N} y)/h^{n+m+N}$ of $(B')_h$. \square

Situation 15.4.4. In the following we will consider ring maps

$$B \longrightarrow A \longleftarrow A'$$

where we assume $A' \rightarrow A$ is surjective with kernel I . In this situation we set $B' = B \times_A A'$ to obtain a cartesian square

$$\begin{array}{ccc} A & \longleftarrow & A' \\ \uparrow & & \uparrow \\ B & \longleftarrow & B' \end{array}$$

We'd like to understand B' -modules in terms of modules over A' , A , and B . In order to do this we consider the functor (where the fibre product of categories as constructed in Categories, Example 4.29.3)

$$(15.4.4.1) \quad \text{Mod}_{B'} \longrightarrow \text{Mod}_B \times_{\text{Mod}_A} \text{Mod}_{A'}, \quad L' \longmapsto (L' \otimes_{B'} B, L' \otimes_{B'} A', \text{can})$$

where can is the canonical identification $L' \otimes_{B'} B \otimes_B A = L' \otimes_{B'} A' \otimes_{A'} A$. In the following we will write (N, M', φ) for an object of the right hand side, i.e., N is a B -module, M' is an A' -module and $\varphi : N \otimes_B A \rightarrow M' \otimes_{A'} A$ is an isomorphism. However, it is often more convenient think of φ as a B -linear map $\varphi : N \rightarrow M'/IM'$ which induces an isomorphism $N \otimes_B A \rightarrow M' \otimes_{A'} A = M'/IM'$.

Lemma 15.4.5. *In Situation 15.4.4 the functor (15.4.4.1) has a right adjoint, namely the functor*

$$F : (N, M', \varphi) \longmapsto N \times_{\varphi, M} M'$$

where $M = M'/IM'$. Moreover, the composition of F with (15.4.4.1) is the identity functor on $\text{Mod}_B \times_{\text{Mod}_A} \text{Mod}_{A'}$. In other words, setting $N' = N \times_{\varphi, M} M'$ we have $N' \otimes_{B'} B = N$ and $N' \otimes_{B'} A' = M'$.

Proof. The adjointness statement is that for a B' -module L' and a triple (N, M', φ) we have

$$\text{Hom}_{B'}(L', N \times_{\varphi, M} M') = \text{Hom}_B(L' \otimes_{B'} B, N) \times_{\text{Hom}_A(L' \otimes_{B'} A, M)} \text{Hom}_{A'}(L' \otimes_{B'} A', M')$$

This follows from Algebra, Lemma 10.13.3 and the fact that an element of the left hand side is given by a pair of B' -linear maps $L' \rightarrow N$ and $L' \rightarrow M'$ agreeing as maps to M . To prove the final assertion, recall that $B' = B \times_A A'$ and $N' = N \times_{\varphi, M} M'$ and extend these equalities to

$$\begin{array}{ccccc} A & \longleftarrow & A' & \longleftarrow & I \\ \uparrow & & \uparrow & & \uparrow \\ B & \longleftarrow & B' & \longleftarrow & J \end{array} \quad \text{and} \quad \begin{array}{ccccc} M & \longleftarrow & M' & \longleftarrow & K \\ \uparrow & & \uparrow & & \uparrow \\ N & \longleftarrow & N' & \longleftarrow & L \end{array}$$

where I, J, K, L are the kernels of the horizontal maps of the original diagrams. We present the proof as a sequence of observations:

- (1) $K = IM'$ (see statement lemma),
- (2) $B' \rightarrow B$ is surjective with kernel J and $J \rightarrow I$ is bijective,
- (3) $N' \rightarrow N$ is surjective with kernel L and $L \rightarrow K$ is bijective,
- (4) $JN' \subset L$,
- (5) $\text{Im}(N \rightarrow M)$ generates M as an A -module (because $N \otimes_B A = M$),
- (6) $\text{Im}(N' \rightarrow M')$ generates M' as an A' -module (because it holds modulo K and L maps isomorphically to K),
- (7) $JN' = L$ (because $L \cong K = IM'$ is generated by images of elements xn' with $x \in I$ and $n' \in N'$ by the previous statement),
- (8) $N' \otimes_{B'} B = N$ (because $N = N'/L$, $B = B'/J$, and the previous statement),
- (9) there is a map $\gamma : N' \otimes_{B'} A' \rightarrow M'$,
- (10) γ is surjective (see above),
- (11) the kernel of the composition $N' \otimes_{B'} A' \rightarrow M' \rightarrow M$ is generated by elements $l \otimes 1$ and $n' \otimes x$ with $l \in K$, $n' \in N'$, $x \in I$ (because $M = N \otimes_B A$ by assumption and because $N' \rightarrow N$ and $A' \rightarrow A$ are surjective with kernels L and I),
- (12) any element of $N' \otimes_{B'} A'$ in the submodule generated by the elements $l \otimes 1$ and $n' \otimes x$ with $l \in L$, $n' \in N'$, $x \in I$ can be written as $l \otimes 1$ for some $l \in L$ (because J maps isomorphically to I we see that $n' \otimes x = n'x \otimes 1$ in $N' \otimes_{B'} A'$; similarly $xn' \otimes a' = n' \otimes xa' = n'(xa') \otimes 1$ in $N' \otimes_{B'} A'$ when $n' \in N'$, $x \in J$ and $a' \in A'$; since we have seen that $JN' = L$ this proves the assertion),
- (13) the kernel of γ is zero (because by (10) and (11) any element of the kernel is of the form $l \otimes 1$ with $l \in L$ which is mapped to $l \in K \subset M'$ by γ).

This finishes the proof. □

Lemma 15.4.6. *In the situation of Lemma 15.4.5 for a B' -module L' the adjunction map*

$$L' \longrightarrow (L' \otimes_{B'} B) \times_{(L' \otimes_{B'} A)} (L' \otimes_{B'} A')$$

is surjective but in general not injective.

Proof. As in the proof of Lemma 15.4.5 let $J \subset B'$ be the kernel of the map $B' \rightarrow B$. Then $L' \otimes_{B'} B = L'/JL'$. Hence to prove surjectivity it suffices to show that elements of the form $(0, z)$ of the fibre product are in the image of the map of the lemma. The kernel of the map $L' \otimes_{B'} A' \rightarrow L' \otimes_{B'} A$ is the image of $L' \otimes_{B'} I \rightarrow L' \otimes_{B'} A'$. Since the map $J \rightarrow I$ induced by $B' \rightarrow A'$ is an isomorphism

the composition

$$L' \otimes_{B'} J \rightarrow L' \rightarrow (L' \otimes_{B'} B) \times_{(L' \otimes_{B'} A)} (L' \otimes_{B'} A')$$

induces a surjection of $L' \otimes_{B'} J$ onto the set of elements of the form $(0, z)$. To see the map is not injective in general we present a simple example. Namely, take a field k , set $B' = k[x, y]/(xy)$, $A = B'/(x)$, $B = B'/(y)$, $A = B'/(x, y)$ and $L' = B'/(x - y)$. In that case the class of x in L' is nonzero but is mapped to zero under the displayed arrow. \square

Lemma 15.4.7. *In Situation 15.4.4 let $(N_1, M'_1, \varphi_1) \rightarrow (N_2, M'_2, \varphi_2)$ be a morphism of $\text{Mod}_B \times_{\text{Mod}_A} \text{Mod}_{A'}$ with $N_1 \rightarrow N_2$ and $M'_1 \rightarrow M'_2$ surjective. Then*

$$N_1 \times_{M_1} M'_1 \rightarrow N_2 \times_{M_2} M'_2$$

is surjective.

Proof. Pick $(x_2, y_2) \in N_2 \times_{M_2} M'_2$. Choose $x_1 \in N_1$ mapping to x_2 . Since $M'_1 \rightarrow M_1$ is surjective we can find $y_1 \in M'_1$ mapping to $\varphi_1(x_1)$. Then (x_1, y_1) maps to (x_2, y'_2) in $N_2 \times_{M_2} M'_2$. Thus it suffices to show that elements of the form $(0, y_2)$ are in the image of the map. Here we see that $y_2 \in IM'_2$. Write $y_2 = \sum t_i y_{2,i}$ with $t_i \in I$. Choose $y_{1,i} \in M'_1$ mapping to $y_{2,i}$. Then $y_1 = \sum t_i y_{1,i} \in IM'_1$ and the element $(0, y_1)$ does the job. \square

Situation 15.4.8. Let A, A', B, B', I be as in Situation 15.4.4. Let $B' \rightarrow D'$ be a ring map. Set $D = D' \otimes_{B'} B$, $C' = D' \otimes_{B'} A'$, and $C = D' \otimes_{B'} A$. This leads to a big commutative diagram

of rings. Observe that we do **not** assume that the map $D' \rightarrow D \times_C C'$ is an isomorphism. In this situation we have the functor

$$(15.4.8.1) \quad \text{Mod}_{D'} \longrightarrow \text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'}, \quad L' \longmapsto (L' \otimes_{D'} D, L' \otimes_{D'} C', \text{can})$$

analogous to (15.4.4.1). Note that $L' \otimes_{D'} D = L \otimes_{D'} (D' \otimes_{B'} B) = L \otimes_{B'} B$ and similarly $L' \otimes_{D'} C' = L \otimes_{D'} (D' \otimes_{B'} A') = L \otimes_{B'} A'$ hence the diagram

$$\begin{array}{ccc} \text{Mod}_{D'} & \longrightarrow & \text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'} \\ \downarrow & & \downarrow \\ \text{Mod}_{B'} & \longrightarrow & \text{Mod}_B \times_{\text{Mod}_A} \text{Mod}_{A'} \end{array}$$

is commutative. In the following we will write (N, M', φ) for an object of $\text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'}$, i.e., N is a D -module, M' is an C' -module and $\varphi : N \otimes_B A \rightarrow M' \otimes_{A'} A$ is an isomorphism of C -modules. However, it is often more convenient think of φ

as a D -linear map $\varphi : N \rightarrow M'/IM'$ which induces an isomorphism $N \otimes_B A \rightarrow M' \otimes_{A'} A = M'/IM'$.

Lemma 15.4.9. *In Situation 15.4.8 the functor (15.4.8.1) has a right adjoint, namely the functor*

$$F : (N, M', \varphi) \longmapsto N \times_{\varphi, M} M'$$

where $M = M'/IM'$. Moreover, the composition of F with (15.4.8.1) is the identity functor on $\text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'}$. In other words, setting $N' = N \times_{\varphi, M} M'$ we have $N' \otimes_{D'} D = N$ and $N' \otimes_{D'} C' = M'$.

Proof. The adjointness statement is that for a D' -module L' and a triple (N, M', φ) we have

$$\text{Hom}_{D'}(L', N \times_{\varphi, M} M') = \text{Hom}_D(L' \otimes_{D'} D, N) \times_{\text{Hom}_C(L' \otimes_{D'} C, M)} \text{Hom}_{C'}(L' \otimes_{D'} C', M')$$

This follows from Algebra, Lemma 10.13.3 and the fact that an element of the left hand side is given by a pair of D' -linear maps $L' \rightarrow N$ and $L' \rightarrow M'$ agreeing as maps to M . The final assertion follows from the corresponding assertion of Lemma 15.4.5. \square

Lemma 15.4.10. *In Situation 15.4.8 the map $JD' \rightarrow IC'$ is surjective where $J = \text{Ker}(B' \rightarrow B)$.*

Proof. Since $C' = D' \otimes_{B'} A'$ we have that IC' is the image of $D' \otimes_{B'} I = C' \otimes_{A'} I \rightarrow C'$. As the ring map $B' \rightarrow A'$ induces an isomorphism $J \rightarrow I$ the lemma follows. \square

Lemma 15.4.11. *Let $A, A', B, B', C, C', D, D', I, M', M, N, \varphi$ be as in Lemma 15.4.9. If N finite over D and M' finite over C' , then $N' = N \times_M M'$ is finite over D' .*

Proof. We will use the results of Lemma 15.4.9 without further mention. Choose generators x_1, \dots, x_r of N over B and generators y_1, \dots, y_s of M' over A' . Using that $N = N' \otimes_{D'} D$ and $D' \rightarrow D$ is surjective we can find $u_1, \dots, u_r \in N'$ mapping to x_1, \dots, x_r in N . Using that $M' = N' \otimes_{D'} C'$ we can find $v_1, \dots, v_t \in N'$ such that $y_i = \sum v_j \otimes c'_{ij}$ for some $c'_{ij} \in C'$. In particular we see that the images \bar{v}_j of the v_j generate M' over C' . We claim that $u_1, \dots, u_r, v_1, \dots, v_t$ generate N' as a D' -module. Namely, pick $\xi \in N'$. We first choose $d'_1, \dots, d'_r \in D'$ such that ξ and $\sum d'_i u_i$ map to the same element of N . This is possible because $D' \rightarrow D$ is surjective and x_1, \dots, x_r generate N . The difference $\xi - \sum d'_i u_i$ is of the form $(0, \theta)$ for some θ in IM' . Say θ is $\sum t_j \bar{v}_j$ with $t_j \in IC'$. By Lemma 15.4.10 we can choose $s_j \in JD'$ mapping to t_j . Because $N' = N \times_M M'$ it follows that $\xi = \sum b'_i u_i + \sum s_j v_j$ as desired. \square

Lemma 15.4.12. *With $A, A', B, B', C, C', D, D', I$ as in Situation 15.4.8.*

- (1) *Let (N, M', φ) be an object of $\text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'}$. If M' is flat over A' and N is flat over B , then $N' = N \times_M M'$ is flat over B' .*
- (2) *If L' is a D' -module flat over B' , then $L' = (L \otimes_{D'} D) \times_{(L \otimes_{D'} C)} (L \otimes_{D'} C')$.*
- (3) *The category of D' -modules flat over B' is equivalent to the categories of objects (N, M', φ) of $\text{Mod}_D \times_{\text{Mod}_C} \text{Mod}_{C'}$ with N flat over B and M' flat over A' .*

Proof. Proof of (1). Let $J \subset B'$ be an ideal. We have to show that $J \otimes_{B'} N' \rightarrow N'$ is injective, see Algebra, Lemma 10.38.4. We know that

$$J/(J \cap I) \otimes_{B'} N' = J/(J \cap I) \otimes_B N \rightarrow N$$

is injective as N is flat over B . As $J \cap I \rightarrow J \rightarrow J/(J \cap I) \rightarrow 0$ is exact, we conclude that it suffices to show that $(J \cap I) \otimes_{B'} N' \rightarrow N'$ is injective. Thus we may assume that $J \subset I$; in particular we can think of J as an A' -module and an ideal of A' and

$$J \otimes_{B'} N' = J \otimes_{A'} A' \otimes_{B'} N' = J \otimes_{A'} M'$$

which maps injectively into M' by our assumption that M' is flat over A' . We conclude that $J \otimes_{B'} N' \rightarrow N' \rightarrow M'$ is injective and hence the first map is injective as desired.

Proof of (2). This follows by tensoring the short exact sequence $0 \rightarrow B' \rightarrow B \oplus A' \rightarrow A \rightarrow 0$ with L' over B' and using that $L' \otimes_{D'} D = L' \otimes_{B'} B$, $L' \otimes_{D'} C' = L' \otimes_{B'} A'$, and $L' \otimes_{D'} C = L' \otimes_{B'} A$, see discussion in Situation 15.4.8.

Proof of (3). Immediate consequence of (1) and (2). □

Lemma 15.4.13. *Let $A, A', B, B', C, C', D, D', I, M', M, N, \varphi$ be as in Lemma 15.4.9. If*

- (1) N is finitely presented over D and flat over B ,
- (2) M' finitely presented over C' and flat over A' , and
- (3) the ring map $B' \rightarrow D'$ factors as $B' \rightarrow D'' \rightarrow D'$ with $B' \rightarrow D''$ flat and $D'' \rightarrow D'$ of finite presentation,

then $N' = N \times_M M'$ is finitely presented over D' .

Proof. Choose a surjection $D''' = D''[x_1, \dots, x_n] \rightarrow D'$ with finitely generated kernel J . By Algebra, Lemma 10.7.4 it suffices to show that N' is finitely presented as a D''' -module. Moreover, $D''' \otimes_{B'} B \rightarrow D' \otimes_{B'} B = D$ and $D''' \otimes_{B'} A' \rightarrow D' \otimes_{B'} A' = C'$ are surjections whose kernels are generated by the image of J , hence N is a finitely presented $D''' \otimes_{B'} B$ -module and M' is a finitely presented $D''' \otimes_{B'} A'$ -module by Algebra, Lemma 10.7.4 again. Thus we may replace D' by D''' and D by $D''' \otimes_{B'} B$, etc. Since D''' is flat over B' , it follows that we may assume that $B' \rightarrow D'$ is flat.

Assume $B' \rightarrow D'$ is flat. By Lemma 15.4.11 the module N' is finite over D' . Choose a surjection $(D')^{\oplus n} \rightarrow N'$ with kernel K' . By base change we obtain maps $D^{\oplus n} \rightarrow N$, $(C')^{\oplus n} \rightarrow M'$, and $C^{\oplus n} \rightarrow M$ with kernels K_D , $K_{C'}$, and K_C . There is a canonical map

$$K' \longrightarrow K_D \times_{K_C} K_{C'}$$

On the other hand, since $N' = N \times_M M'$ and $D' = D \times_C C'$ (by Lemma 15.4.12) there is also a canonical map $K_D \times_{K_C} K_{C'} \rightarrow K'$ inverse to the displayed arrow. Hence the displayed map is an isomorphism. By Algebra, Lemma 10.5.3 the modules K_D and $K_{C'}$ are finite. We conclude from Lemma 15.4.11 that K' is a finite D' -module provided that $K_D \rightarrow K_C$ and $K_{C'} \rightarrow K_C$ induce isomorphisms $K_D \otimes_{B'} A = K_C = K_{C'} \otimes_{A'} A$. This is true because the flatness assumptions implies the sequences

$$0 \rightarrow K_D \rightarrow D^{\oplus n} \rightarrow N \rightarrow 0 \quad \text{and} \quad 0 \rightarrow K_{C'} \rightarrow (C')^{\oplus n} \rightarrow M' \rightarrow 0$$

stay exact upon tensoring, see Algebra, Lemma 10.38.11. □

Lemma 15.4.14. *Let A, A', B, B', I be as in Situation 15.4.4. Let (D, C', φ) be a system consisting of an B -algebra D , a A' -algebra C' and an isomorphism $D \otimes_B A \rightarrow C'/IC = C$. Set $D' = D \times_C C'$ (as in Lemma 15.4.5). Then*

- (1) $B' \rightarrow D'$ is finite type if and only if $B \rightarrow D$ and $A' \rightarrow C'$ are finite type,

- (2) $B' \rightarrow D'$ is flat if and only if $B \rightarrow D$ and $A' \rightarrow C'$ are flat,
- (3) $B' \rightarrow D'$ is flat and of finite presentation if and only if $B \rightarrow D$ and $A' \rightarrow C'$ are flat and of finite presentation,
- (4) $B' \rightarrow D'$ is smooth if and only if $B \rightarrow D$ and $A' \rightarrow C'$ are smooth,
- (5) $B' \rightarrow D'$ is étale if and only if $B \rightarrow D$ and $A' \rightarrow C'$ are étale.

Moreover, if D' is a flat B' -algebra, then $D' \rightarrow (D' \otimes_{B'} B) \times_{(D' \otimes_{B'} A)} (D' \otimes_{B'} A')$ is an isomorphism. In this way the category of flat B' -algebras is equivalent to the categories of systems (D, C', φ) as above with D flat over B and C' flat over A' .

Proof. The implication “ \Rightarrow ” follows from Algebra, Lemmas 10.13.2, 10.38.6, 10.132.4, and 10.138.3 because we have $D' \otimes_{B'} B = D$ and $D' \otimes_{B'} A' = C'$ by Lemma 15.4.5. Thus it suffices to prove the implications in the other direction.

Ad (1). Assume D of finite type over B and C' of finite type over A' . We will use the results of Lemma 15.4.5 without further mention. Choose generators x_1, \dots, x_r of D over B and generators y_1, \dots, y_s of C' over A' . Using that $N = N' \otimes_{B'} B$ and $B' \rightarrow B$ is surjective we can find $u_1, \dots, u_r \in D'$ mapping to x_1, \dots, x_r in D . Using that $C' = D' \otimes_{B'} A'$ we can find $v_1, \dots, v_t \in D'$ such that $y_i = \sum v_j \otimes a'_{ij}$ for some $a'_{ij} \in A'$. In particular, the images of v_j in C' generate C' as an A' -algebra. Set $N = r + t$ and consider the cube of rings

Observe that the back square is cartesian as well. Consider the ring map

$$B'[x_1, \dots, x_N] \rightarrow D', \quad x_i \mapsto u_i \quad \text{and} \quad x_{r+j} \mapsto v_j.$$

Then we see that the induced maps $B[x_1, \dots, x_N] \rightarrow D$ and $A'[x_1, \dots, x_N] \rightarrow C'$ are surjective, in particular finite. We conclude from Lemma 15.4.11 that $B'[x_1, \dots, x_N] \rightarrow D'$ is finite, which implies that D' is of finite type over B' for example by Algebra, Lemma 10.6.2.

Ad (2). The implication “ \Leftarrow ” follows from Lemma 15.4.12. Moreover, the final statement follows from the final statement of Lemma 15.4.12.

Ad (3). Assume $B \rightarrow D$ and $A' \rightarrow C'$ are flat and of finite presentation. The flatness of $B' \rightarrow D'$ we've seen in (2). We know $B' \rightarrow D'$ is of finite type by (1). Choose a surjection $B'[x_1, \dots, x_N] \rightarrow D'$. By Algebra, Lemma 10.6.3 the ring D is of finite presentation as a $B[x_1, \dots, x_N]$ -module and the ring C' is of finite presentation as a $A'[x_1, \dots, x_N]$ -module. By Lemma 15.4.13 we see that D' is of finite presentation as a $B'[x_1, \dots, x_N]$ -module, i.e., $B' \rightarrow D'$ is of finite presentation.

Ad (4). Assume $B \rightarrow D$ and $A' \rightarrow C'$ smooth. By (3) we see that $B' \rightarrow D'$ is flat and of finite presentation. By Algebra, Lemma 10.132.16 it suffices to check that

$D' \otimes_{B'} k$ is smooth for any field k over B' . If the composition $J \rightarrow B' \rightarrow k$ is zero, then $B' \rightarrow k$ factors as $B' \rightarrow B \rightarrow k$ and we see that

$$D' \otimes_{B'} k = D' \otimes_{B'} B \otimes_B k = D \otimes_B k$$

is smooth as $B \rightarrow D$ is smooth. If the composition $J \rightarrow B' \rightarrow k$ is nonzero, then there exists an $h \in J$ which does not map to zero in k . Then $B' \rightarrow k$ factors as $B' \rightarrow B'_h \rightarrow k$. Observe that h maps to zero in B , hence $B_h = 0$. Thus by Lemma 15.4.3 we have $B'_h = A'_h$ and we get

$$D' \otimes_{B'} k = D' \otimes_{B'} B'_h \otimes_{B'_h} k = C'_h \otimes_{A'_h} k$$

is smooth as $A' \rightarrow C'$ is smooth.

Ad (5). Assume $B \rightarrow D$ and $A' \rightarrow C'$ are étale. By (4) we see that $B' \rightarrow D'$ is smooth. As we can read off whether or not a smooth map is étale from the dimension of fibres we see that (5) holds (argue as in the proof of (4) to identify fibres – some details omitted). \square

Remark 15.4.15. In Situation 15.4.8. Assume $B' \rightarrow D'$ is of finite presentation and suppose we are given a D' -module L' . We claim there is a bijective correspondence between

- (1) surjections of D' -modules $L' \rightarrow Q'$ with Q' of finite presentation over D' and flat over B' , and
- (2) pairs of surjections of modules $(L' \otimes_{D'} D \rightarrow Q_1, L' \otimes_{D'} C' \rightarrow Q_2)$ with
 - (a) Q_1 of finite presentation over D and flat over B ,
 - (b) Q_2 of finite presentation over C' and flat over A' ,
 - (c) $Q_1 \otimes_D C = Q_2 \otimes_{C'} C$ as quotients of $L' \otimes_{D'} C$.

The correspondence between these is given by $Q \mapsto (Q_1, Q_2)$ with $Q_1 = Q \otimes_{D'} D$ and $Q_2 = Q \otimes_{D'} C'$. And for the converse we use $Q = Q_1 \times_{Q_{12}} Q_2$ where Q_{12} the common quotient $Q_1 \otimes_D C = Q_2 \otimes_{C'} C$ of $L' \otimes_{D'} C$. As quotient map we use

$$L' \longrightarrow (L' \otimes_{D'} D) \times_{(L' \otimes_{D'} C)} (L' \otimes_{D'} C') \longrightarrow Q_1 \times_{Q_{12}} Q_2 = Q$$

where the first arrow is surjective by Lemma 15.4.6 and the second by Lemma 15.4.7. The claim follows by Lemmas 15.4.12 and 15.4.13.

15.5. Fitting ideals

The fitting ideals of a finite module are the ideals determined by the construction of Lemma 15.5.2.

Lemma 15.5.1. *Let R be a ring. Let A be an $n \times m$ matrix with coefficients in R . Let $I_r(A)$ be the ideal generated by the $r \times r$ -minors of A with the convention that $I_0(A) = R$ and $I_r(A) = 0$ if $r > \min(n, m)$. Then*

- (1) $I_0(A) \supset I_1(A) \supset I_2(A) \dots$,
- (2) if B is an $(n + n') \times m$ matrix, and A is the first n rows of B , then $I_{r+n'}(B) \subset I_r(A)$,
- (3) if C is an $n \times n$ matrix then $I_r(CA) \subset I_r(A)$.
- (4) If A is a block matrix

$$\begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix}$$

$$\text{then } I_r(A) = \sum_{r_1+r_2=r} I_{r_1}(A_1)I_{r_2}(A_2).$$

- (5) Add more here.

Proof. Omitted. (Hint: Use that a determinant can be computed by expanding along a column or a row.) \square

Lemma 15.5.2. *Let R be a ring. Let M be a finite R -module. Choose a presentation*

$$\bigoplus_{j \in J} R \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0.$$

of M . Let $A = (a_{ij})_{i=1, \dots, n, j \in J}$ be the matrix of the map $\bigoplus_{j \in J} R \rightarrow R^{\oplus n}$. The ideal $\text{Fit}_k(M)$ generated by the $(n-k) \times (n-k)$ minors of A is independent of the choice of the presentation.

Proof. Let $K \subset R^{\oplus n}$ be the kernel of the surjection $R^{\oplus n} \rightarrow M$. Pick $z_1, \dots, z_{n-k} \in K$ and write $z_j = (z_{1j}, \dots, z_{nj})$. Another description of the ideal $\text{Fit}_k(M)$ is that it is the ideal generated by the $(n-k) \times (n-k)$ minors of all the matrices (z_{ij}) we obtain in this way.

Suppose we change the surjection into the surjection $R^{\oplus n+n'} \rightarrow M$ with kernel K' where we use the original map on the first n standard basis elements of $R^{\oplus n+n'}$ and 0 on the last n' basis vectors. Then the corresponding ideals are the same. Namely, if $z_1, \dots, z_{n-k} \in K$ as above, let $z'_j = (z_{1j}, \dots, z_{nj}, 0, \dots, 0) \in K'$ for $j = 1, \dots, n-k$ and $z'_{n+j'} = (0, \dots, 0, 1, 0, \dots, 0) \in K'$. Then we see that the ideal of $(n-k) \times (n-k)$ minors of (z_{ij}) agrees with the ideal of $(n+n'-k) \times (n+n'-k)$ minors of (z'_{ij}) . This gives one of the inclusions. Conversely, given $z'_1, \dots, z'_{n+n'-k}$ in K' we can project these to $R^{\oplus n}$ to get $z_1, \dots, z_{n+n'-k}$ in K . By Lemma 15.5.1 we see that the ideal generated by the $(n+n'-k) \times (n+n'-k)$ minors of (z'_{ij}) is contained in the ideal generated by the $(n-k) \times (n-k)$ minors of (z_{ij}) . This gives the other inclusion.

Let $R^{\oplus m} \rightarrow M$ be another surjection with kernel L . By the previous paragraph we may assume $m = n$. By Algebra, Lemma 10.5.2 we can choose a map $R^{\oplus n} \rightarrow R^{\oplus m}$ commuting with the surjections to M . Let $C = (c_{li})$ be the matrix of this map (it is a square matrix as $n = m$). Then given $z_1, \dots, z_{n-k} \in K$ as above we get $Cz_1, \dots, Cz_{n-k} \in L$. By Lemma 15.5.1 we get one of the inclusions. By symmetry we get the other. \square

Definition 15.5.3. Let R be a ring. Let M be a finite R -module. Let $k \geq 0$. The k th fitting ideal of M is the ideal $\text{Fit}_k(M)$ constructed in Lemma 15.5.2. Set $\text{Fit}_{-1}(M) = 0$.

Since the fitting ideals are the ideals of minors of a big matrix (numbered in reverse ordering from the ordering in Lemma 15.5.1) we see that

$$0 = \text{Fit}_{-1}(M) \subset \text{Fit}_0(M) \subset \text{Fit}_1(M) \subset \dots \subset \text{Fit}_t(M) = R$$

for some $t \gg 0$. Here are some basic properties of fitting ideals.

Lemma 15.5.4. *Let R be a ring. Let M be a finite R -module.*

- (1) *If M can be generated by n elements, then $\text{Fit}_n(M) = R$.*
- (2) *Given a second finite R -module M' we have*

$$\text{Fit}_k(M \oplus M') = \sum_{k+k'=l} \text{Fit}_k(M) \text{Fit}_{k'}(M')$$

- (3) *If $R \rightarrow R'$ is a ring map, then $\text{Fit}_k(M \otimes_R R')$ is the ideal of R' generated by the image of $\text{Fit}_k(M)$.*

- (4) If M is an R -module of finite presentation, then $\text{Fit}_k(M)$ is a finitely generated ideal.
- (5) If $M \rightarrow M'$ is a surjection, then $\text{Fit}_k(M) \subset \text{Fit}_k(M')$.
- (6) Add more here.

Proof. Part (1) follows from the fact that $I_0(A) = R$ in Lemma 15.5.1. part (2) follows from the corresponding statement in Lemma 15.5.1. Part (3) follows from the fact that $\otimes_R R'$ is right exact, so the base change of a presentation of M is a presentation of $M \otimes_R R'$. Proof of (4). Let $R^{\oplus m} \xrightarrow{A} R^{\oplus n} \rightarrow M \rightarrow 0$ be a presentation. Then $\text{Fit}_k(M)$ is the ideal generated by the $n - k \times n - k$ minors of the matrix A . Part (5) is immediate from the definition. \square

Example 15.5.5. Let R be a ring. The fitting ideals of the finite free module $M = R^{\oplus n}$ are $\text{Fit}_k(M) = 0$ for $k < n$ and $\text{Fit}_k(M) = R$ for $k \geq n$.

Lemma 15.5.6. Let R be a ring. Let M be a finite R -module. Let $k \geq 0$. Let \mathfrak{p} be a prime ideal with $\text{Fit}_k(M) \not\subset \mathfrak{p}$. Then there exists an $f \in R$, $f \notin \mathfrak{p}$ such that M_f can be generated by k elements over R_f .

Proof. By Nakayama's lemma (Algebra, Lemma 10.19.1) we see that M_f can be generated by k elements over R_f for some $f \in R$, $f \notin \mathfrak{p}$ if $M \otimes_R \kappa(\mathfrak{p})$ can be generated by k elements. This reduces the problem to the case where R is a field and $\mathfrak{p} = (0)$. In this case the result follows from Example 15.5.5. \square

Lemma 15.5.7. Let R be a ring. Let M be a finite R -module. Let $r \geq 0$. The following are equivalent

- (1) M is finite locally free of rank k (Algebra, Definition 10.75.1),
- (2) $\text{Fit}_{r-1}(M) = 0$ and $\text{Fit}_r(M) = R$, and
- (3) $\text{Fit}_k(M) = 0$ for $k < r$ and $\text{Fit}_k(M) = R$ for $k \geq r$.

Proof. It is immediate that (2) is equivalent to (3) because the fitting ideals form an increasing sequence of ideals. Since the formation of $\text{Fit}_k(M)$ commutes with base change (Lemma 15.5.4) we see that (1) implies (2) by Example 15.5.5 and glueing results (Algebra, Section 10.23). Conversely, assume (2). By Lemma 15.5.6 we may assume that M is generated by r elements. Thus a presentation $\bigoplus_{j \in J} R \rightarrow R^{\oplus r} \rightarrow M \rightarrow 0$. But now the assumption that $\text{Fit}_{r-1}(M) = 0$ implies that all entries of the matrix of the map $\bigoplus_{j \in J} R \rightarrow R^{\oplus r}$ are zero. Thus M is free. \square

15.6. Lifting

In this section we collection some lemmas concerning lifting statements of the following kind: If A is a ring and $I \subset A$ is an ideal, and $\bar{\xi}$ is some kind of structure over A/I , then we can lift $\bar{\xi}$ to a similar kind of structure ξ over A or over some étale extension of A . Here are some types of structure for which we have already proved some results:

- (1) idempotents, see Algebra, Lemmas 10.31.5 and 10.31.6,
- (2) projective modules, see Algebra, Lemma 10.74.4,
- (3) basis elements, see Algebra, Lemmas 10.97.1 and 10.97.3,
- (4) ring maps, i.e., proving certain algebras are formally smooth, see Algebra, Lemma 10.133.4, Proposition 10.133.13, and Lemma 10.133.16,
- (5) syntomic ring maps, see Algebra, Lemma 10.131.18,
- (6) smooth ring maps, see Algebra, Lemma 10.132.19,

- (7) étale ring maps, see Algebra, Lemma 10.138.11,
- (8) factoring polynomials, see Algebra, Lemma 10.138.20, and
- (9) Algebra, Section 10.145 discusses henselian local rings.

The interested reader will find more results of this nature in Smoothing Ring Maps, Section 16.4 in particular Smoothing Ring Maps, Proposition 16.4.2.

Let A be a ring and let $I \subset A$ be an ideal. Let $\bar{\xi}$ be some kind of structure over A/I . In the following lemmas we look for étale ring maps $A \rightarrow A'$ which induce isomorphisms $A/I \rightarrow A'/IA'$ and objects ξ' over A' lifting $\bar{\xi}$. A general remark is that given étale ring maps $A \rightarrow A' \rightarrow A''$ such that $A/I \cong A'/IA'$ and $A'/IA' \cong A''/IA''$ the composition $A \rightarrow A''$ is also étale (Algebra, Lemma 10.138.3) and also satisfies $A/I \cong A''/IA''$. We will frequently use this in the following lemmas without further mention. Here is a trivial example of the type of result we are looking for.

Lemma 15.6.1. *Let A be a ring, let $I \subset A$ be an ideal, let $\bar{u} \in A/I$ be an invertible element. There exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and an invertible element $u' \in A'$ lifting \bar{u} .*

Proof. Choose any lift $f \in A$ of \bar{u} and set $A' = A_f$ and u' the image of f in A' . \square

Lemma 15.6.2. *Let A be a ring, let $I \subset A$ be an ideal, let $\bar{e} \in A/I$ be an idempotent. There exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and an idempotent $e' \in A'$ lifting \bar{e} .*

Proof. Choose any lift $x \in A$ of \bar{e} . Set

$$A' = A[t]/(t^2 - t) \left[\frac{1}{t - 1 + x} \right].$$

The ring map $A \rightarrow A'$ is étale because $(2t - 1)dt = 0$ and $(2t - 1)(2t - 1) = 1$ which is invertible. We have $A'/IA' = A/I[t]/(t^2 - t) \left[\frac{1}{t - 1 + \bar{e}} \right] \cong A/I$ the last map sending t to \bar{e} which works as \bar{e} is a root of $t^2 - t$. This also shows that setting e' equal to the class of t in A' works. \square

Lemma 15.6.3. *Let A be a ring, let $I \subset A$ be an ideal. Let $\text{Spec}(A/I) = \coprod_{j \in J} \bar{U}_j$ be a finite disjoint open covering. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a finite disjoint open covering $\text{Spec}(A') = \coprod_{j \in J} U'_j$ lifting the given covering.*

Proof. This follows from Lemma 15.6.2 and the fact that open and closed subsets of Spectra correspond to idempotents, see Algebra, Lemma 10.20.3. \square

Lemma 15.6.4. *Let $A \rightarrow B$ be a ring map and $J \subset B$ an ideal. If $A \rightarrow B$ is étale at every prime of $V(J)$, then there exists a $g \in B$ mapping to an invertible element of B/J such that $A' = B_g$ is étale over A .*

Proof. The set of points of $\text{Spec}(B)$ where $A \rightarrow B$ is not étale is a closed subset of $\text{Spec}(B)$, see Algebra, Definition 10.138.1. Write this as $V(J')$ for some ideal $J' \subset B$. Then $V(J') \cap V(J) = \emptyset$ hence $J + J' = B$ by Algebra, Lemma 10.16.2. Write $1 = f + g$ with $f \in J$ and $g \in J'$. Then g works. \square

Next we have three lemmas saying we can lift factorizations of polynomials.

Lemma 15.6.5. *Let A be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f} = \bar{g}\bar{h}$ be a factorization of f in $A/I[x]$ such that \bar{g} and \bar{h} are monic and generate the unit ideal in $A/I[x]$. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a factorization $f = g'h'$ in $A'[x]$ with g', h' monic lifting the given factorization over A/I .*

Proof. Say $\deg(\bar{g}) = n$ and $\deg(\bar{h}) = m$ so that $\deg(f) = n + m$. Write $f = x^{n+m} + \sum \alpha_i x^{n+m-i}$ for some $\alpha_1, \dots, \alpha_{n+m} \in A$. Consider the ring map

$$R = \mathbf{Z}[a_1, \dots, a_{n+m}] \longrightarrow S = \mathbf{Z}[b_1, \dots, b_n, c_1, \dots, c_m]$$

of Algebra, Example 10.138.13. Let $R \rightarrow A$ be the ring map which sends a_i to α_i . Set

$$B = A \otimes_R S$$

By construction the image of f in $B[x]$ factors. Write $\bar{g} = x^n + \sum \bar{\beta}_i x^{n-i}$ and $\bar{h} = x^m + \sum \bar{\gamma}_i x^{m-i}$. The A -algebra map

$$B \longrightarrow A/I, \quad 1 \otimes b_i \mapsto \bar{\beta}_i, \quad 1 \otimes c_i \mapsto \bar{\gamma}_i$$

maps the factorization of f over B to the given factorization over A/I . The displayed map is surjective; denote $J \subset B$ its kernel. From the discussion in Algebra, Example 10.138.13 it is clear that $A \rightarrow B$ is étale at all points of $V(J) \subset \text{Spec}(B)$. Choose $g \in B$ as in Lemma 15.6.4 and set $A' = B_g$. \square

The assumption on the leading coefficient in the following lemma will be removed in Lemma 15.6.7.

Lemma 15.6.6. *Let A be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f} = \bar{g}\bar{h}$ be a factorization of f in $A/I[x]$ and assume*

- (1) *the leading coefficient of \bar{g} is an invertible element of A/I , and*
- (2) *\bar{g}, \bar{h} generate the unit ideal in $A/I[x]$.*

Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a factorization $f = g'h'$ in $A'[x]$ lifting the given factorization over A/I .

Proof. Applying Lemma 15.6.1 we may assume that the leading coefficient of \bar{g} is the reduction of an invertible element $u \in A$. Then we may replace \bar{g} by $u^{-1}\bar{g}$ and \bar{h} by $u\bar{h}$. Thus we may assume that \bar{g} is monic. Since f is monic we conclude that \bar{h} is monic too. In this case the result follows from Lemma 15.6.5. \square

Lemma 15.6.7. *Let A be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f} = \bar{g}\bar{h}$ be a factorization of f in $A/I[x]$ and assume that \bar{g}, \bar{h} generate the unit ideal in $A/I[x]$. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a factorization $f = g'h'$ in $A'[x]$ lifting the given factorization over A/I .*

Proof. Say $f = x^d + a_1x^{d-1} + \dots + a_d$ has degree d . Write $\bar{g} = \sum \bar{b}_j x^j$ and $\bar{h} = \sum \bar{c}_j x^j$. Then we see that $1 = \sum \bar{b}_j \bar{c}_{d-j}$. It follows that $\text{Spec}(A/I)$ is covered by the standard opens $D(\bar{b}_j \bar{c}_{d-j})$. However, each point \mathfrak{p} of $\text{Spec}(A/I)$ is contained in at most one of these as by looking at the induced factorization of f over the field $\kappa(\mathfrak{p})$ we see that $\deg(\bar{g} \bmod \mathfrak{p}) + \deg(\bar{h} \bmod \mathfrak{p}) = d$. Hence our open covering is a disjoint open covering. Applying Lemma 15.6.3 (and replacing A by A') we see that we may assume there is a corresponding disjoint open covering of $\text{Spec}(A)$. This

disjoint open covering corresponds to a product decomposition of A , see Algebra, Lemma 10.22.3. It follows that

$$A = A_0 \times \dots \times A_d, \quad I = I_0 \times \dots \times I_d,$$

where the image of \bar{g} , resp. \bar{h} in A_j/I_j has degree j , resp. $d-j$ with invertible leading coefficient. Clearly, it suffices to prove the result for each factor A_j separately. Hence the lemma follows from Lemma 15.6.6. \square

Lemma 15.6.8. *Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal of R and let $J \subset S$ be an ideal of S . If the closure of the image of $V(J)$ in $\text{Spec}(R)$ is disjoint from $V(I)$, then there exists an element $f \in R$ which maps to 1 in R/I and to an element of J in S .*

Proof. Let $I' \subset R$ be an ideal such that $V(I')$ is the closure of the image of $V(J)$. Then $V(I) \cap V(I') = \emptyset$ by assumption and hence $I + I' = R$ by Algebra, Lemma 10.16.2. Write $1 = g + f$ with $g \in I$ and $f \in I'$. We have $V(f') \supset V(J)$ where f' is the image of f in S . Hence $(f')^n \in J$ for some n , see Algebra, Lemma 10.16.2. Replacing f by f^n we win. \square

Lemma 15.6.9. *Let A be a ring, let $I \subset A$ be an ideal. Let $A \rightarrow B$ be an integral ring map. Let $\bar{e} \in B/IB$ be an idempotent. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and an idempotent $e' \in B \otimes_A A'$ lifting \bar{e} .*

Proof. Choose an element $y \in B$ lifting \bar{e} . Then $z = y^2 - y$ is an element of IB . By Algebra, Lemma 10.37.4 there exist a monic polynomial $g(x) = x^d + \sum a_j x^j$ of degree d with $a_j \in I$ such that $g(z) = 0$ in B . Hence $f(x) = g(x^2 - x) \in A[x]$ is a monic polynomial such that $f(x) \equiv x^d(x-1)^d \pmod{I}$ and such that $f(y) = 0$ in B . By Lemma 15.6.6 we can find an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and such that $f = gh$ in $A[x]$ with $g(x) = x^d \pmod{IA'}$ and $h(x) = (x-1)^d \pmod{IA'}$. After replacing A by A' we may assume that the factorization is defined over A . In that case we see that $b_1 = g(y) \in B$ is a lift of $\bar{e}^d = \bar{e}$ and $b_2 = h(y) \in B$ is a lift of $(\bar{e}-1)^d = (-1)^d(1-\bar{e})^d = (-1)^d(1-\bar{e})$ and moreover $b_1 b_2 = 0$. Thus $(b_1, b_2)B/IB = B/IB$ and $V(b_1, b_2) \subset \text{Spec}(B)$ is disjoint from $V(IB)$. Since $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is closed (see Algebra, Lemmas 10.35.20 and 10.40.6) we can find an $a \in A$ which maps to an invertible element of A/I whose image in B lies in (b_1, b_2) , see Lemma 15.6.8. After replacing A by the localization A_a we get that $(b_1, b_2) = B$. Then $\text{Spec}(B) = D(b_1) \amalg D(b_2)$; disjoint union because $b_1 b_2 = 0$. Let $e \in B$ be the idempotent corresponding to the open and closed subset $D(b_1)$, see Algebra, Lemma 10.20.3. Since b_1 is a lift of \bar{e} and b_2 is a lift of $\pm(1-\bar{e})$ we conclude that e is a lift of \bar{e} by the uniqueness statement in Algebra, Lemma 10.20.3. \square

Lemma 15.6.10. *Let A be a ring, let $I \subset A$ be an ideal. Let \bar{P} be finite projective A/I -module. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a finite projective A' -module P' lifting \bar{P} .*

Proof. We can choose an integer n and a direct sum decomposition $(A/I)^{\oplus n} = \bar{P} \oplus \bar{K}$ for some R/I -module \bar{K} . Choose a lift $\varphi : A^{\oplus n} \rightarrow A^{\oplus n}$ of the projector \bar{p} associated to the direct summand \bar{P} . Let $f \in A[x]$ be the characteristic polynomial of φ . Set $B = A[x]/(f)$. By Cayley-Hamilton (Algebra, Lemma 10.15.1) there is a map $B \rightarrow \text{End}_A(A^{\oplus n})$ mapping x to φ . For every prime $\mathfrak{p} \supset I$ the image of f in

$\kappa(\mathfrak{p})$ is $(x - 1)^r x^{n-r}$ where r is the dimension of $\overline{P} \otimes_{A/I} \kappa(\mathfrak{p})$. Hence $(x - 1)^n x^n$ maps to zero in $B \otimes_A \kappa(\mathfrak{p})$ for all $\mathfrak{p} \supset I$. Hence the image of $(x - 1)^n x^n$ in B is contained in

$$\bigcup_{\mathfrak{p} \supset I} \mathfrak{p}B = \left(\bigcup_{\mathfrak{p} \supset I} \mathfrak{p} \right) B = \sqrt{IB}$$

the first equality because B is a free A -module and the second by Algebra, Lemma 10.16.2. Thus $(x - 1)^N x^N$ is contained in IB for some N . It follows that $x^N + (1 - x)^N$ is a unit in B/IB and that

$$\bar{e} = \text{image of } \frac{x^N}{x^N + (1 - x)^N} \text{ in } B/IB$$

is an idempotent as both assertions hold in $\mathbf{Z}[x]/(x^n(x - 1)^N)$. The image of \bar{e} in $\text{End}_{A/I}((A/I)^{\oplus n})$ is

$$\frac{\bar{p}^N}{\bar{p}^N + (1 - \bar{p})^N} = \bar{p}$$

as \bar{p} is an idempotent. After replacing A by an étale extension A' as in the lemma, we may assume there exists an idempotent $e \in B$ which maps to \bar{e} in B/IB , see Lemma 15.6.9. Then the image of e under the map

$$B = A[x]/(f) \longrightarrow \text{End}_A(A^{\oplus n}).$$

is an idempotent element p which lifts \bar{p} . Setting $P = \text{Im}(p)$ we win. □

Lemma 15.6.11. *Let A be a ring. Let $0 \rightarrow K \rightarrow A^{\oplus m} \rightarrow M \rightarrow 0$ be a sequence of A -modules. Consider the A -algebra $C = \text{Sym}_A^*(M)$ with its presentation $\alpha : A[y_1, \dots, y_m] \rightarrow C$ coming from the surjection $A^{\oplus m} \rightarrow M$. Then*

$$NL(\alpha) = (K \otimes_A C \rightarrow \bigoplus_{j=1, \dots, m} C dy_j)$$

(see Algebra, Section 10.129) in particular $\Omega_{C/A} = M \otimes_A C$.

Proof. Let $J = \text{Ker}(\alpha)$. The lemma asserts that $J/J^2 \cong K \otimes_A C$. Note that α is a homomorphism of graded algebras. We will prove that in degree d we have $(J/J^2)_d = K \otimes_A C_{d-1}$. Note that

$$J_d = \text{Ker}(\text{Sym}_A^d(A^{\oplus m}) \rightarrow \text{Sym}_A^d(M)) = \text{Im}(K \otimes_A \text{Sym}_A^{d-1}(A^{\oplus m}) \rightarrow \text{Sym}_A^d(A^{\oplus m})),$$

see Algebra, Lemma 10.12.2. It follows that $(J^2)_d = \sum_{a+b=d} J_a \cdot J_b$ is the image of

$$K \otimes_A K \otimes_A \text{Sym}_A^{d-2}(A^{\oplus m}) \rightarrow \text{Sym}_A^d(A^{\oplus m}).$$

The cokernel of the map $K \otimes_A \text{Sym}_A^{d-2}(A^{\oplus m}) \rightarrow \text{Sym}_A^{d-1}(A^{\oplus m})$ is $\text{Sym}_A^{d-1}(M)$ by the lemma referenced above. Hence it is clear that $(J/J^2)_d = J_d/(J^2)_d$ is equal to

$$\begin{aligned} \text{Coker}(K \otimes_A K \otimes_A \text{Sym}_A^{d-2}(A^{\oplus m}) \rightarrow K \otimes_A \text{Sym}_A^{d-1}(A^{\oplus m})) &= K \otimes_A \text{Sym}_A^{d-1}(M) \\ &= K \otimes_A C_{d-1} \end{aligned}$$

as desired. □

Lemma 15.6.12. *Let A be a ring. Let M be an A -module. Then $C = \text{Sym}_A^*(M)$ is smooth over A if and only if M is a finite projective A -module.*

Proof. Let $\sigma : C \rightarrow A$ be the projection onto the degree 0 part of C . Then $J = \text{Ker}(\sigma)$ is the part of degree > 0 and we see that $J/J^2 = M$ as an A -module. Hence if $A \rightarrow C$ is smooth then M is a finite projective A -module by Algebra, Lemma 10.134.4.

Conversely, assume that M is finite projective and choose a surjection $A^{\oplus n} \rightarrow M$ with kernel K . Of course the sequence $0 \rightarrow K \rightarrow A^{\oplus n} \rightarrow M \rightarrow 0$ is split as M is projective. In particular we see that K is a finite A -module and hence C is of finite presentation over A as C is a quotient of $A[x_1, \dots, x_n]$ by the ideal generated by $K \subset \bigoplus Ax_i$. The computation of Lemma 15.6.11 shows that $NL_{C/A}$ is homotopy equivalent to $(K \rightarrow M) \otimes_A C$. Hence $NL_{C/A}$ is quasi-isomorphic to $C \otimes_A M$ placed in degree 0 which means that C is smooth over A by Algebra, Definition 10.132.1. \square

Lemma 15.6.13. *Let A be a ring, let $I \subset A$ be an ideal. Consider a commutative diagram*

where B is a smooth A -algebra. Then there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and an A -algebra map $B \rightarrow A'$ lifting the ring map $B \rightarrow A/I$.

Proof. Let $J \subset B$ be the kernel of $B \rightarrow A/I$ so that $B/J = A/I$. By Algebra, Lemma 10.134.3 the sequence

$$0 \rightarrow I/I^2 \rightarrow J/J^2 \rightarrow \Omega_{B/A} \otimes_B B/J \rightarrow 0$$

is split exact. Thus $\overline{P} = J/(J^2 + IB) = \Omega_{B/A} \otimes_B B/J$ is a finite projective A/I -module. Choose an integer n and a direct sum decomposition $A/I^{\oplus n} = \overline{P} \oplus \overline{K}$. By Lemma 15.6.10 we can find an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ and a finite projective A -module K which lifts \overline{K} . We may and do replace A by A' . Set $B' = B \otimes_A \text{Sym}_A^*(K)$. Since $A \rightarrow \text{Sym}_A^*(K)$ is smooth by Lemma 15.6.12 we see that $B \rightarrow B'$ is smooth which in turn implies that $A \rightarrow B'$ is smooth (see Algebra, Lemmas 10.132.4 and 10.132.13). Moreover the section $\text{Sym}_A^*(K) \rightarrow A$ determines a section $B' \rightarrow B$ and we let $B' \rightarrow A/I$ be the composition $B' \rightarrow B \rightarrow A/I$. Let $J' \subset B'$ be the kernel of $B' \rightarrow A/I$. We have $JB' \subset J'$ and $B \otimes_A K \subset J'$. These maps combine to give an isomorphism

$$(A/I)^{\oplus n} \cong J/J^2 \oplus \overline{K} \longrightarrow J'/((J')^2 + IB')$$

Thus, after replacing B by B' we may assume that $J/(J^2 + IB) = \Omega_{B/A} \otimes_B B/J$ is a free A/I -module of rank n .

In this case, choose $f_1, \dots, f_n \in J$ which map to a basis of $J/(J^2 + IB)$. Consider the finitely presented A -algebra $C = B/(f_1, \dots, f_n)$. Note that we have an exact sequence

$$0 \rightarrow H_1(L_{C/A}) \rightarrow (f_1, \dots, f_n)/(f_1, \dots, f_n)^2 \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow 0$$

see Algebra, Lemma 10.129.4 (note that $H_1(L_{B/A}) = 0$ and that $\Omega_{B/A}$ is finite projective, in particular flat so the Tor group vanishes). For any prime $\mathfrak{q} \supset J$ of B

the module $\Omega_{B/A, \mathfrak{q}}$ is free of rank n because $\Omega_{B/A}$ is finite projective and because $\Omega_{B/A} \otimes_B B/J$ is free of rank n . By our choice of f_1, \dots, f_n the map

$$((f_1, \dots, f_n)/(f_1, \dots, f_n)^2)_{\mathfrak{q}} \rightarrow \Omega_{B/A, \mathfrak{q}}$$

is surjective modulo I . Hence we see that this map of modules over the local ring $C_{\mathfrak{q}}$ has to be an isomorphism. Thus $H_1(L_{C/A})_{\mathfrak{q}} = 0$ and $\Omega_{C/A, \mathfrak{q}} = 0$. By Algebra, Lemma 10.132.12 we see that $A \rightarrow C$ is smooth at the prime $\bar{\mathfrak{q}}$ of C corresponding to \mathfrak{q} . Since $\Omega_{C/A, \mathfrak{q}} = 0$ it is actually étale at $\bar{\mathfrak{q}}$. Thus $A \rightarrow C$ is étale at all primes of C containing JC . By Lemma 15.6.4 we can find an $f \in C$ mapping to an invertible element of C/JC such that $A \rightarrow C_f$ is étale. By our choice of f it is still true that $C_f/JC_f = A/I$. The map $C_f/IC_f \rightarrow A/I$ is surjective and étale by Algebra, Lemma 10.138.9. Hence A/I is isomorphic to the localization of C_f/IC_f at some element $g \in C$, see Algebra, Lemma 10.138.10. Set $A' = C_{fg}$ to conclude the proof. \square

15.7. Henselian pairs

Some of the results of Section 15.6 may be viewed as results about henselian pairs. In this section a *pair* is a pair (A, I) where A is a ring and $I \subset A$ is an ideal. A *morphism of pairs* $(A, I) \rightarrow (B, J)$ is a ring map $\varphi : A \rightarrow B$ with $\varphi(I) \subset J$. As in Section 15.6 given an object ξ over A we denote $\bar{\xi}$ the “base change” of ξ to an object over A/I (provided this makes sense).

Definition 15.7.1. A *henselian pair* is a pair (A, I) satisfying

- (1) I is contained in the Jacobson radical of A , and
- (2) for any monic polynomial $f \in A[T]$ and factorization $\bar{f} = g_0 h_0$ with $g_0, h_0 \in A/I[T]$ monic generating the unit ideal in $A/I[T]$, there exists a factorization $f = gh$ in $A[T]$ with g, h monic and $g_0 = \bar{g}$ and $h_0 = \bar{h}$.

Observe that if A is a local ring and $I = \mathfrak{m}$ is the maximal ideal, then (A, I) is a henselian pair if and only if A is a henselian local ring, see Algebra, Lemma 10.145.3. In Lemma 15.7.7 we give a number of equivalent characterizations of henselian pairs (and we will add more as time goes on).

Lemma 15.7.2. *Let (A, I) be a pair with I locally nilpotent. Then the functor $B \mapsto B/IB$ induces an equivalence between the category of étale algebras over A and the category of étale algebras over A/I . Moreover, the pair is henselian.*

Proof. Essential surjectivity holds by Algebra, Lemma 10.138.11. If B, B' are étale over A and $B/IB \rightarrow B'/IB'$ is a morphism of A/I -algebras, then we can lift this by Algebra, Lemma 10.133.16. Finally, suppose that $f, g : B \rightarrow B'$ are two A -algebra maps with $f \bmod I = g \bmod I$. Choose an idempotent $e \in B \otimes_A B$ generating the kernel of the multiplication map $B \otimes_A B \rightarrow B$, see Algebra, Lemmas 10.144.4 and 10.144.3 (to see that étale is unramified). Then $(f \otimes g)(e) \in IB$. Since IB is locally nilpotent (Algebra, Lemma 10.31.2) this implies $(f \otimes g)(e) = 0$ by Algebra, Lemma 10.31.5. Thus $f = g$.

It is clear that I is contained in the radical of A . Let $f \in A[T]$ be a monic polynomial and let $\bar{f} = g_0 h_0$ be a factorization of $\bar{f} = f \bmod I$ with $g_0, h_0 \in A/I[T]$ monic generating the unit ideal in $A/I[T]$. By Lemma 15.6.5 there exists an étale ring map $A \rightarrow A'$ which induces an isomorphism $A/I \rightarrow A'/IA'$ such that the factorization

lifts to a factorization into monic polynomials over A' . By the above we have $A = A'$ and the factorization is over A . \square

Lemma 15.7.3. *Let (A, I) be a pair. If A is I -adically complete, then the pair is henselian.*

Proof. By Algebra, Lemma 10.93.11 the ideal I is contained in the radical of A . Let $f \in A[T]$ be a monic polynomial and let $\bar{f} = g_0 h_0$ be a factorization of $\bar{f} = f \bmod I$ with $g_0, h_0 \in A/I[T]$ monic generating the unit ideal in $A/I[T]$. By Lemma 15.7.2 we can successively lift this factorization to $f \bmod I^n = g_n h_n$ with g_n, h_n monic in $A/I^n[T]$ for all $n \geq 1$. As $A = \lim A/I^n$ this finishes the proof. \square

Lemma 15.7.4. *Let (A, I) be a pair. If I is contained in the Jacobson radical of A , then the map from idempotents of A to idempotents of A/I is injective.*

Proof. An idempotent of a local ring is either 0 or 1. Thus an idempotent is determined by the set of maximal ideals where it vanishes, by Algebra, Lemma 10.23.1. \square

Lemma 15.7.5. *Let (A, I) be a pair. Let $A \rightarrow B$ be an integral ring map such that $B/IB = C_1 \times C_2$ as A/I -algebra with $A/I \rightarrow C_1$ injective. Any element $b \in B$ mapping to $(0, 1)$ in B/IB is the zero of a monic polynomial $f \in A[T]$ with $f \bmod I = gT^n$ and $g(0)$ a unit in A/I .*

Proof. Let $b \in B$ map to $(0, 1)$ in $C_1 \times C_2$. Let $J \subset A[T]$ be the kernel of the map $A[T] \rightarrow B$, $T \mapsto b$. Since B is integral over A , it is integral over $A[T]$. Hence the image of $\text{Spec}(B)$ in $\text{Spec}(A[T])$ is closed by Algebra, Lemmas 10.40.6 and 10.35.20. Hence this image is equal to $V(J) = \text{Spec}(A[T]/J)$ by Algebra, Lemma 10.29.5. Intersecting with the inverse image of $V(I)$ our choice of b shows we have $V(J + IA[T]) \subset V(T^2 - T)$. Hence there exists an $n \geq 1$ and $g \in J$ with $g \bmod IA[T] = (T^2 - T)^n$. On the other hand, as $A \rightarrow B$ is integral there exists a monic polynomial $h \in J$. Note that $h(0) \bmod I$ maps to zero under the composition $A[T] \rightarrow B \rightarrow B/IB \rightarrow C_1$. Since $A/I \rightarrow C_1$ is injective we conclude $h \bmod IA[T] = h_0 T$ for some $h_0 \in A/I[T]$. Set

$$f = g + h^m$$

for $m > n$. If m is large enough, this is a monic polynomial and

$$f \bmod IA[T] = (T^2 - T)^n + h_0^m T^m = T^n((T - 1)^n + h_0^m T^{m-n})$$

and hence the desired conclusion. \square

Lemma 15.7.6. *Let (A, I) be a pair. Let $A \rightarrow B$ be a finite type ring map such that $B/IB = C_1 \times C_2$ with $A/I \rightarrow C_1$ finite. Let B' be the integral closure of A in B . Then we can write $B'/IB' = C_1 \times C_2'$ such that the map $B'/IB' \rightarrow B/IB$ preserves product decompositions and there exists a $g \in B'$ mapping to $(1, 0)$ in $C_1 \times C_2'$ with $B'_g \rightarrow B_g$ an isomorphism.*

Proof. Observe that $A \rightarrow B$ is quasi-finite at every prime of the closed subset $T = \text{Spec}(C_1) \subset \text{Spec}(B)$ (this follows by looking at fibre rings, see Algebra,

Definition 10.118.3). Consider the diagram of topological spaces

$$\begin{array}{ccc} \text{Spec}(B) & \xrightarrow{\phi} & \text{Spec}(B') \\ & \searrow \psi & \swarrow \psi' \\ & \text{Spec}(A) & \end{array}$$

By Algebra, Theorem 10.119.13 for every $\mathfrak{p} \in T$ there is a $h_{\mathfrak{p}} \in B'$, $h_{\mathfrak{p}} \notin \mathfrak{p}$ such that $B'_h \rightarrow B_h$ is an isomorphism. The union $U = \bigcup D(h_{\mathfrak{p}})$ gives an open $U \subset \text{Spec}(B')$ such that $\phi^{-1}(U) \rightarrow U$ is a homeomorphism and $T \subset \phi^{-1}(U)$. Since T is open in $\psi^{-1}(V(I))$ we conclude that $\phi(T)$ is open in $U \cap (\psi')^{-1}(V(I))$. Thus $\phi(T)$ is open in $(\psi')^{-1}(V(I))$. On the other hand, since C_1 is finite over A/I it is finite over B' . Hence $\phi(T)$ is a closed subset of $\text{Spec}(B')$ by Algebra, Lemmas 10.40.6 and 10.35.20. We conclude that $\text{Spec}(B'/IB') \supset \phi(T)$ is open and closed. By Algebra, Lemma 10.22.3 we get a corresponding product decomposition $B'/IB' = C'_1 \times C'_2$. The map $B'/IB' \rightarrow B/IB$ maps C'_1 into C_1 and C'_2 into C_2 as one sees by looking at what happens on spectra (hint: the inverse image of $\phi(T)$ is exactly T ; some details omitted). Pick a $g \in B'$ mapping to $(1, 0)$ in $C'_1 \times C'_2$ such that $D(g) \subset U$; this is possible because $\text{Spec}(C'_1)$ and $\text{Spec}(C'_2)$ are disjoint and closed in $\text{Spec}(B')$ and $\text{Spec}(C'_1)$ is contained in U . Then $B'_g \rightarrow B_g$ defines a homeomorphism on spectra and an isomorphism on local rings (by our choice of U above). Hence it is an isomorphism, as follows for example from Algebra, Lemma 10.23.1. Finally, it follows that $C'_1 = C_1$ and the proof is complete. \square

Lemma 15.7.7. *Let (A, I) be a pair. The following are equivalent*

- (1) (A, I) is a henselian pair,
- (2) given an étale ring map $A \rightarrow A'$ and an A -algebra map $\sigma : A' \rightarrow A/I$, there exists an A -algebra map $A' \rightarrow A$ lifting σ ,
- (3) for any finite A -algebra B the map $B \rightarrow B/IB$ induces a bijection on idempotents, and
- (4) for any integral A -algebra B the map $B \rightarrow B/IB$ induces a bijection on idempotents.

Proof. Assume (2) holds. Then I is contained in the Jacobson radical of A , since otherwise there would be a nonunit $f \in A$ not contained in I and the map $A \rightarrow A_f$ would contradict (2). Hence $IB \subset B$ is contained in the Jacobson radical of B for B integral over A because $\text{Spec}(B) \rightarrow \text{Spec}(A)$ is closed by Algebra, Lemmas 10.40.6 and 10.35.20. Thus the map from idempotents of B to idempotents of B/IB is injective by Lemma 15.7.4. On the other hand, since (2) holds, every idempotent of B/IB lifts to an idempotent of B by Lemma 15.6.9. In this way we see that (2) implies (4).

The implication (4) \Rightarrow (3) is trivial.

Assume (3). Let \mathfrak{m} be a maximal ideal and consider the finite map $A \rightarrow B = A/(I \cap \mathfrak{m})$. The condition that $B \rightarrow B/IB$ induces a bijection on idempotents implies that $I \subset \mathfrak{m}$ (if not, then $B = A/I \times A/\mathfrak{m}$ and $B/IB = A/I$). Thus we see that I is contained in the Jacobson radical of A . Let $f \in A[T]$ be monic and suppose given a factorization $\bar{f} = g_0 h_0$ with $g_0, h_0 \in A/I[T]$ monic. Set $B = A[T]/(f)$. Let \bar{e} be the nontrivial idempotent of B/IB corresponding to the decomposition

$$B/IB = A/I[T]/(g_0) \times A[T]/(h_0)$$

of A -algebras. Let $e \in B$ be an idempotent lifting \bar{e} which exists as we assumed (3). This gives a product decomposition

$$B = eB \times (1 - e)B$$

Note that B is free of rank $\deg(f)$ as an A -module. Hence eB and $(1 - e)B$ are finite locally free A -modules. However, since eB and $(1 - e)B$ have constant rank $\deg(g_0)$ and $\deg(h_0)$ over A/I we find that the same is true over $\text{Spec}(A)$. We conclude that

$$f = \det_A(T : B \rightarrow B) = \det_A(T : eB \rightarrow eB) \det_A(T : (1 - e)B \rightarrow (1 - e)B)$$

is a factorization into monic polynomials reducing to the given factorization modulo I . Thus (3) implies (1).

Assume (1). Let $A \rightarrow A'$ be an étale ring map and let $\sigma : A' \rightarrow A/I$ be an A -algebra map. This implies that $A'/IA' = A/I \times C$ for some ring C . Let $A'' \subset A'$ be the integral closure of A in A' . By Lemma 15.7.6 we can write $A''/IA'' = A/I \times C'$ such that $A''/IA'' \rightarrow A'/IA'$ maps A/I isomorphically to A'/IA' and C' to C and such that there exists a $a \in A''$ mapping to $(1, 0)$ in $A/I \times C'$ such that $A''_a \cong A'_a$. By Lemma 15.7.5 we see that a satisfies a monic polynomial $f \in A[T]$ whose reduction modulo I factors as $\bar{f} = g_0 T^n$ where T, g_0 generate the unit ideal in $A/I[T]$. Thus by assumption we can factor f as $f = gh$ where g is a monic lift of g_0 and h is a monic lift of T^n . Because I is contained in the Jacobson radical of A , we find that g and h generate the unit ideal in $A[T]$ (details omitted; hint: use that $A[T]/(g, h)$ is finite over A). Thus $A[T]/(f) = A[T]/(h) \times A[T]/(g)$ and we find a corresponding product decomposition $A'' = A''_1 \times A''_2$. By construction we have $A''_1/IA''_1 = A/I$ and $A''_2/IA''_2 = C'$. Since A''_1 is integral over A and I is contained in the Jacobson radical of A we see that a maps to an invertible element of A''_1 . Hence $A''_a = A''_1 \times (A''_2)_a$. It follows that $A \rightarrow A''_1$ is integral as well as étale, hence finite locally free. However, $A''_1/IA''_1 = A/I$ thus A''_1 has rank 1 as an A -module along $V(I)$. Since I is contained in the Jacobson radical of A we conclude that A''_1 has rank 1 everywhere and it follows that $A \rightarrow A''_1$ is an isomorphism. Thus $A' \rightarrow A'_a \cong A''_a \rightarrow (A''_1)_a = A''_1 = A$ is the desired lift of σ . In this way we see that (1) implies (2). \square

Lemma 15.7.8. *Let A be a ring. Let $I, J \subset A$ be ideals with $V(I) = V(J)$. Then (A, I) is henselian if and only if (A, J) is henselian.*

Proof. For any integral ring map $A \rightarrow B$ we see that $V(IB) = V(JB)$. Hence idempotents of B/IB and B/JB are in bijective correspondence (Algebra, Lemma 10.20.3). It follows that $B \rightarrow B/IB$ induces a bijection on sets of idempotents if and only if $B \rightarrow B/JB$ induces a bijection on sets of idempotents. Thus we conclude by Lemma 15.7.7. \square

Lemma 15.7.9. *Let (A, I) be a henselian pair and let $A \rightarrow B$ be an integral ring map. Then (B, IB) is a henselian pair.*

Proof. Immediate from the fourth characterization of henselian pairs in Lemma 15.7.7 and the fact that the composition of integral ring maps is integral. \square

Lemma 15.7.10. *Let J be a set and let $\{(A_j, I_j)\}_{j \in J}$ be a collection of pairs. Then $(\prod_{j \in J} A_j, \prod_{j \in J} I_j)$ is Henselian if and only if so is each (A_j, I_j) .*

Proof. For every $j \in J$, the projection $\prod_{j \in J} A_j \rightarrow A_j$ is an integral ring map, so Lemma 15.7.9 proves that each (A_j, I_j) is Henselian if $(\prod_{j \in J} A_j, \prod_{j \in J} I_j)$ is Henselian.

Conversely, suppose that each (A_j, I_j) is a Henselian pair. Then every $1 + x$ with $x \in \prod_{j \in J} I_j$ is a unit in $\prod_{j \in J} A_j$ because it is so componentwise by Algebra, Lemma 10.18.1 and Definition 15.7.1. Thus, by Algebra, Lemma 10.18.1 again, $\prod_{j \in J} I_j$ is contained in the Jacobson radical of $\prod_{j \in J} A_j$. Continuing to work componentwise, it likewise follows that for every monic $f \in (\prod_{j \in J} A_j)[T]$ and every factorization $\bar{f} = g_0 h_0$ with monic $g_0, h_0 \in (\prod_{j \in J} A_j / \prod_{j \in J} I_j)[T] = (\prod_{j \in J} A_j / I_j)[T]$ that generate the unit ideal in $(\prod_{j \in J} A_j / \prod_{j \in J} I_j)[T]$, there exists a factorization $f = gh$ in $(\prod_{j \in J} A_j)[T]$ with g, h monic and reducing to g_0, h_0 . In conclusion, according to Definition 15.7.1 $(\prod_{j \in J} A_j, \prod_{j \in J} I_j)$ is a Henselian pair. \square

Lemma 15.7.11. *Let (A, I) be a henselian pair. Let $\mathfrak{p} \subset A$ be a prime ideal. Then $V(\mathfrak{p} + I)$ is connected.*

Proof. By Lemma 15.7.9 we see that $(A/\mathfrak{p}, I + \mathfrak{p}/\mathfrak{p})$ is a henselian pair. Thus it suffices to prove: If (A, I) is a henselian pair and A is a domain, then $\text{Spec}(A/I) = V(I)$ is connected. If not, then A/I has a nontrivial idempotent, whence by Lemma 15.7.7 A has a nontrivial idempotent. This is a contradiction. \square

Lemma 15.7.12. *Let (A, I) be a henselian pair. The functor $B \rightarrow B/IB$ determines an equivalence between finite étale A -algebras and finite étale A/I -algebras.*

Proof. Let B, B' be two A -algebras finite étale over A . Then $B' \rightarrow B'' = B \otimes_A B'$ is finite étale as well (Algebra, Lemmas 10.138.3 and 10.35.11). Now we have 1-to-1 correspondences between

- (1) A -algebra maps $B \rightarrow B'$,
- (2) sections of $B' \rightarrow B''$, and
- (3) idempotents e of B'' such that $B' \rightarrow B'' \rightarrow eB''$ is an isomorphism.

The bijection between (2) and (3) sends $\sigma : B'' \rightarrow B'$ to e such that $(1 - e)$ is the idempotent that generates the kernel of σ which exists by Algebra, Lemmas 10.138.9 and 10.138.10. There is a similar correspondence between A/I -algebra maps $B/IB \rightarrow B'/IB'$ and idempotents \bar{e} of B''/IB'' such that $B'/IB' \rightarrow B''/IB'' \rightarrow \bar{e}(B''/IB'')$ is an isomorphism. However every idempotent \bar{e} of B''/IB'' lifts uniquely to an idempotent e of B'' (Lemma 15.7.7). Moreover, if $B''/IB'' \rightarrow \bar{e}(B''/IB'')$ is an isomorphism, then $B' \rightarrow eB''$ is an isomorphism too by Nakayama's lemma (Algebra, Lemma 10.19.1). In this way we see that the functor is fully faithful.

Essential surjectivity. Let $A/I \rightarrow C$ be a finite étale map. By Algebra, Lemma 10.138.11 there exists an étale map $A \rightarrow B$ such that $B/IB \cong C$. Let B' be the integral closure of A in B . By Lemma 15.7.6 we have $B'/IB' = C \times C'$ for some ring C' and $B'_g \cong B_g$ for some $g \in B'$ mapping to $(1, 0) \in C \times C'$. Since idempotents lift (Lemma 15.7.7) we get $B' = B'_1 \times B'_2$ with $C = B'_1/IB'_1$ and $C' = B'_2/IB'_2$. The image of g in B'_1 is invertible and $(B'_2)_g = 0$ because IB' is contained in the Jacobson radical of B' (for example because (B', IB') is a henselian pair by Lemma 15.7.9). We conclude that $B'_1 = B_g$ is finite étale over A and the proof is done. \square

Lemma 15.7.13. *The inclusion functor*

$$\text{category of henselian pairs} \longrightarrow \text{category of pairs}$$

has a left adjoint $(A, I) \mapsto (A^h, I^h)$.

Proof. Let (A, I) be a pair. Consider the category \mathcal{C} consisting of étale ring maps $A \rightarrow B$ such that $A/I \rightarrow B/IB$ is an isomorphism. We will show that the category \mathcal{C} is directed and that $A^h = \text{colim}_{B \in \mathcal{C}} B$ with ideal $I^h = IA^h$ gives the desired adjoint.

We first prove that \mathcal{C} is directed (Categories, Definition 4.19.1). It is nonempty because $\text{id} : A \rightarrow A$ is an object. If B and B' are two objects of \mathcal{C} , then $B'' = B \otimes_A B'$ is an object of \mathcal{C} (use Algebra, Lemma 10.138.3) and there are morphisms $B \rightarrow B''$ and $B' \rightarrow B''$. Suppose that $f, g : B \rightarrow B'$ are two maps between objects of \mathcal{C} . Then a coequalizer is $B' \otimes_{f, B, g} B'$ which is étale over A by Algebra, Lemmas 10.138.3 and 10.138.9. Thus the category \mathcal{C} is directed.

Since $B/IB = A/I$ for all objects B of \mathcal{C} we see that $A^h/I^h = A^h/IA^h = \text{colim } B/IB = \text{colim } A/I = A/I$.

Next, we show that $A^h = \text{colim}_{B \in \mathcal{C}} B$ with $I^h = IA^h$ is a henselian pair. To do this we will verify condition (2) of Lemma 15.7.7. Namely, suppose given an étale ring map $A^h \rightarrow A'$ and an A^h -algebra map $\sigma : A' \rightarrow A^h/I^h$. Then there exists a $B \in \mathcal{C}$ and an étale ring map $B \rightarrow B'$ such that $A' = B' \otimes_B A^h$. See Algebra, Lemma 10.138.3. Since $A^h/I^h = A/IB$, the map σ induces an A -algebra map $s : B' \rightarrow A/I$. Then $B'/IB' = A/I \times C$ as A/I -algebra, where C is the kernel of the map $B'/IB' \rightarrow A/I$ induced by s . Let $g \in B'$ map to $(1, 0) \in A/I \times C$. Then $B \rightarrow B'_g$ is étale and $A/I \rightarrow B'_g/IB'_g$ is an isomorphism, i.e., B'_g is an object of \mathcal{C} . Thus we obtain a canonical map $B'_g \rightarrow A^h$ such that

$$\begin{array}{ccc} B'_g & \longrightarrow & A^h \\ \uparrow & \nearrow & \\ B & & \end{array} \quad \text{and} \quad \begin{array}{ccccc} B' & \longrightarrow & B'_g & \longrightarrow & A^h \\ & \searrow & & & \downarrow \\ & & & & A/I \\ & & & \nearrow & \\ & & & s & \end{array}$$

commute. This induces a map $A' = B' \otimes_B A^h \rightarrow A^h$ compatible with σ as desired.

Let $(A, I) \rightarrow (A', I')$ be a morphism of pairs with (A', I') henselian. We will show there is a unique factorization $A \rightarrow A^h \rightarrow A'$ which will finish the proof. Namely, for each $A \rightarrow B$ in \mathcal{C} the ring map $A' \rightarrow B' = A' \otimes_A B$ is étale and induces an isomorphism $A'/I' \rightarrow B'/I'B'$. Hence there is a section $\sigma_B : B' \rightarrow A'$ by Lemma 15.7.7. Given a morphism $B_1 \rightarrow B_2$ in \mathcal{C} we claim the diagram

$$\begin{array}{ccc} B_1 & \longrightarrow & B_2 \\ \searrow & & \swarrow \\ & A' & \end{array} \begin{array}{l} \sigma_{B_1} \\ \sigma_{B_2} \end{array}$$

commutes. This follows once we prove that for every B in \mathcal{C} the section σ_B is the unique A' -algebra map $B' \rightarrow A'$. We have $B' \otimes_{A'} B' = B' \times R$ for some ring R , see Algebra, Lemma 10.144.4. In our case $R/I'R = 0$ as $B'/I'B' = A'/I'$. Thus given two A' -algebra maps $\sigma_B, \sigma'_B : B' \rightarrow A'$ then $e = (\sigma_B \otimes \sigma'_B)(0, 1) \in A'$ is

an idempotent contained in I' . We conclude that $e = 0$ by Lemma 15.7.4. Hence $\sigma_B = \sigma'_B$ as desired. Using the commutativity we obtain

$$A^h = \operatorname{colim}_{B \in \mathcal{C}} B \rightarrow \operatorname{colim}_{B \in \mathcal{C}} A' \otimes_A B \xrightarrow{\operatorname{colim} \sigma_B} A'$$

as desired. The uniqueness of the maps σ_B also guarantees that this map is unique. Hence $(A, I) \mapsto (A^h, I^h)$ is the desired adjoint. \square

Lemma 15.7.14. *The functor of Lemma 15.7.13 associates to a local ring (A, \mathfrak{m}) its henselization.*

Proof. First proof: in the proof of Algebra, Lemma 10.145.16 it is shown that the henselization of A is given by the the colimit used to construct A^h in Lemma 15.7.13. Second proof: Both the henselization S and the ring A^h of Lemma 15.7.13 are filtered colimits of étale A -algebras, henselian, and have residue fields equal to $\kappa(\mathfrak{m})$. Hence they are canonically isomorphic by Algebra, Lemma 10.145.15. \square

Lemma 15.7.15. *Let (A, I) be a pair. Let (A^h, I^h) be as in Lemma 15.7.13. Then $A \rightarrow A^h$ is flat, $I^h = IA^h$ and $A/I^n \rightarrow A^h/I^n A^h$ is an isomorphism for all n .*

Proof. In the proof of Lemma 15.7.13 we have seen that A^h is a filtered colimit of étale A -algebras B such that $A/I \rightarrow B/IB$ is an isomorphism and we have seen that $I^h = IA^h$. As an étale ring map is flat (Algebra, Lemma 10.138.3) we conclude that $A \rightarrow A^h$ is flat by Algebra, Lemma 10.38.2. Since each $A \rightarrow B$ is flat we find that the maps $A/I^n \rightarrow B/I^n B$ are isomorphisms as well (for example by Algebra, Lemma 10.97.3). Taking the colimit we find that $A/I^n = A^h/I^n A^h$ as desired. \square

Lemma 15.7.16. *Let (A, I) be a pair with A Noetherian. Let (A^h, I^h) be as in Lemma 15.7.13. Then the map of I -adic completions*

$$A^\wedge \rightarrow (A^h)^\wedge$$

is an isomorphism. Moreover, A^h is Noetherian, the maps $A \rightarrow A^h \rightarrow A^\wedge$ are flat, and $A^h \rightarrow A^\wedge$ is faithfully flat.

Proof. The first statement is an immediate consequence of Lemma 15.7.15 and in fact holds without assuming A is Noetherian. In the proof of Lemma 15.7.13 we have seen that A^h is a filtered colimit of étale A -algebras B such that $A/I \rightarrow B/IB$ is an isomorphism. For each such $A \rightarrow B$ the induced map $A^\wedge \rightarrow B^\wedge$ is an isomorphism (see proof of Lemma 15.7.15). By Algebra, Lemma 10.93.3 the ring map $B \rightarrow A^\wedge = B^\wedge = (A^h)^\wedge$ is flat for each B . Thus $A^h \rightarrow A^\wedge = (A^h)^\wedge$ is flat by Algebra, Lemma 10.38.5. Since $I^h = IA^h$ is contained in the radical ideal of A^h and since $A^h \rightarrow A^\wedge$ induces an isomorphism $A^h/I^h \rightarrow A/I$ we see that $A^h \rightarrow A^\wedge$ is faithfully flat by Algebra, Lemma 10.38.14. By Algebra, Lemma 10.93.10 the ring A^\wedge is Noetherian. Hence we conclude that A^h is Noetherian by Algebra, Lemma 10.152.1. \square

Lemma 15.7.17. *Let $(A, I) = \operatorname{colim}(A_i, I_i)$ be a colimit of pairs. The functor of Lemma 15.7.13 gives $A^h = \operatorname{colim} A_i^h$ and $I^h = \operatorname{colim} I_i^h$.*

Proof. This is true for any left adjoint, see Categories, Lemma 4.24.4. \square

15.8. Auto-associated rings

Some of this material is in [Laz69].

Definition 15.8.1. A ring R is said to be *auto-associated* if R is local and its maximal ideal \mathfrak{m} is weakly associated to R .

Lemma 15.8.2. *An auto-associated ring R has the following property: (P) Every proper finitely generated ideal $I \subset R$ has a nonzero annihilator.*

Proof. By assumption there exists a nonzero element $x \in R$ such that for every $f \in \mathfrak{m}$ we have $f^n x = 0$. Say $I = (f_1, \dots, f_r)$. Then x is in the kernel of $R \rightarrow \bigoplus R_{f_i}$. Hence we see that there exists a nonzero $y \in R$ such that $f_i y = 0$ for all i , see Algebra, Lemma 10.22.4. As $y \in \text{Ann}_R(I)$ we win. \square

Lemma 15.8.3. *Let R be a ring having property (P) of Lemma 15.8.2. Let $u : N \rightarrow M$ be a homomorphism of projective R -modules. Then u is universally injective if and only if u is injective.*

Proof. Assume u is injective. Our goal is to show u is universally injective. First we choose a module Q such that $N \oplus Q$ is free. On considering the map $N \oplus Q \rightarrow M \oplus Q$ we see that it suffices to prove the lemma in case N is free. In this case N is a directed colimit of finite free R -modules. Thus we reduce to the case that N is a finite free R -module, say $N = R^{\oplus n}$. We prove the lemma by induction on n . The case $n = 0$ is trivial.

Let $u : R^{\oplus n} \rightarrow M$ be an injective module map with M projective. Choose an R -module Q such that $M \oplus Q$ is free. After replacing u by the composition $R^{\oplus n} \rightarrow M \rightarrow M \oplus Q$ we see that we may assume that M is free. Then we can find a direct summand $R^{\oplus m} \subset M$ such that $u(R^{\oplus n}) \subset R^{\oplus m}$. Hence we may assume that $M = R^{\oplus m}$. In this case u is given by a matrix $A = (a_{ij})$ so that $u(x_1, \dots, x_n) = (\sum x_i a_{i1}, \dots, \sum x_i a_{im})$. As u is injective, in particular $u(x, 0, \dots, 0) = (xa_{11}, xa_{12}, \dots, xa_{1m}) \neq 0$ if $x \neq 0$, and as R has property (P) we see that $a_{11}R + a_{12}R + \dots + a_{1m}R = R$. Hence see that $R(a_{11}, \dots, a_{1m}) \subset R^{\oplus m}$ is a direct summand of $R^{\oplus m}$, in particular $R^{\oplus m}/R(a_{11}, \dots, a_{1m})$ is a projective R -module. We get a commutative diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & R & \longrightarrow & R^{\oplus n} & \longrightarrow & R^{\oplus n-1} \longrightarrow 0 \\
 & & \downarrow 1 & & \downarrow u & & \downarrow \\
 0 & \longrightarrow & R & \xrightarrow{(a_{11}, \dots, a_{1m})} & R^{\oplus m} & \longrightarrow & R^{\oplus m}/R(a_{11}, \dots, a_{1m}) \longrightarrow 0
 \end{array}$$

with split exact rows. Thus the right vertical arrow is injective and we may apply the induction hypothesis to conclude that the right vertical arrow is universally injective. It follows that the middle vertical arrow is universally injective. \square

Lemma 15.8.4. *Let R be a ring. The following are equivalent*

- (1) R has property (P) of Lemma 15.8.2,
- (2) any injective map of projective R -modules is universally injective,
- (3) if $u : N \rightarrow M$ is injective and N, M are finite projective R -modules then $\text{Coker}(u)$ is a finite projective R -module,
- (4) if $N \subset M$ and N, M are finite projective as R -modules, then N is a direct summand of M , and

(5) any injective map $R \rightarrow R^{\oplus n}$ is a split injection.

Proof. The implication (1) \Rightarrow (2) is Lemma 15.8.3. It is clear that (3) and (4) are equivalent. We have (2) \Rightarrow (3), (4) by Algebra, Lemma 10.79.4. Part (5) is a special case of (4). Assume (5). Let $I = (a_1, \dots, a_n)$ be a proper finitely generated ideal of R . As $I \neq R$ we see that $R \rightarrow R^{\oplus n}$, $x \mapsto (xa_1, \dots, xa_n)$ is not a split injection. Hence it has a nonzero kernel and we conclude that $\text{Ann}_R(I) \neq 0$. Thus (1) holds. \square

Example 15.8.5. If the equivalent conditions of Lemma 15.8.4 hold, then it is not always the case that every injective map of free R -modules is a split injection. For example suppose that $R = k[x_1, x_2, x_3, \dots]/(x_i^2)$. This is an auto-associated ring. Consider the map of free R -modules

$$u : \bigoplus_{i \geq 1} Re_i \longrightarrow \bigoplus_{i \geq 1} Rf_i, \quad e_i \longmapsto f_i - x_i f_{i+1}.$$

For any integer n the restriction of u to $\bigoplus_{i=1, \dots, n} Re_i$ is injective as the images $u(e_1), \dots, u(e_n)$ are R -linearly independent. Hence u is injective and hence universally injective by the lemma. Since $u \otimes \text{id}_k$ is bijective we see that if u were a split injection then u would be surjective. But u is not surjective because the inverse image of f_1 would be the element

$$\sum_{i \geq 0} x_1 \dots x_i e_{i+1} = e_1 + x_1 e_2 + x_1 x_2 e_3 + \dots$$

which is not an element of the direct sum. A side remark is that $\text{Coker}(u)$ is a flat (because u is universally injective), countably generated R -module which is not projective (as u is not split), hence not Mittag-Leffler (see Algebra, Lemma 10.90.1).

15.9. Flattening stratification

Let $R \rightarrow S$ be a ring map and let N be an S -module. For any R -algebra R' we can consider the base changes $S' = S \otimes_R R'$ and $M' = M \otimes_R R'$. We say $R \rightarrow R'$ flattens M if the module M' is flat over R' . We would like to understand the structure of the collection of ring maps $R \rightarrow R'$ which flatten M . In particular we would like to know if there exists a universal flattening $R \rightarrow R_{\text{univ}}$ of M , i.e., a ring map $R \rightarrow R_{\text{univ}}$ which flattens M and has the property that any ring map $R \rightarrow R'$ which flattens M factors through $R \rightarrow R_{\text{univ}}$. It turns out that such a universal solution usually does not exist.

We will discuss *universal flattenings* and *flattening stratifications* in a scheme theoretic setting $\mathcal{F}/X/S$ in More on Flatness, Section 37.20. If the universal flattening $R \rightarrow R_{\text{univ}}$ exists then the morphism of schemes $\text{Spec}(R_{\text{univ}}) \rightarrow \text{Spec}(R)$ is the universal flattening of the quasi-coherent module \widetilde{M} on $\text{Spec}(S)$.

In this and the next few sections we prove some basic algebra facts related to this. The most basic result is perhaps the following.

Lemma 15.9.1. *Let R be a ring. Let M be an R -module. Let I_1, I_2 be ideals of R . If $M/I_1 M$ is flat over R/I_1 and $M/I_2 M$ is flat over R/I_2 , then $M/(I_1 \cap I_2)M$ is flat over $R/(I_1 \cap I_2)$.*

Proof. By replacing R with $R/(I_1 \cap I_2)$ and M by $M/(I_1 \cap I_2)M$ we may assume that $I_1 \cap I_2 = 0$. Let $J \subset R$ be an ideal. To prove that M is flat over R we have to show that $J \otimes_R M \rightarrow M$ is injective, see Algebra, Lemma 10.38.4. By flatness of M/I_1M over R/I_1 the map

$$J/(J \cap I_1) \otimes_R M = (J + I_1)/I_1 \otimes_{R/I_1} M/I_1M \longrightarrow M/I_1M$$

is injective. As $0 \rightarrow (J \cap I_1) \rightarrow J \rightarrow J/(J \cap I_1) \rightarrow 0$ is exact we obtain a diagram

$$\begin{array}{ccccccc} (J \cap I_1) \otimes_R M & \longrightarrow & J \otimes_R M & \longrightarrow & J/(J \cap I_1) \otimes_R M & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ M & \xlongequal{\quad} & M & \longrightarrow & M/I_1M & & \end{array}$$

hence it suffices to show that $(J \cap I_1) \otimes_R M \rightarrow M$ is injective. Since $I_1 \cap I_2 = 0$ the ideal $J \cap I_1$ maps isomorphically to an ideal $J' \subset R/I_2$ and we see that $(J \cap I_1) \otimes_R M = J' \otimes_{R/I_2} M/I_2M$. By flatness of M/I_2M over R/I_2 the map $J' \otimes_{R/I_2} M/I_2M \rightarrow M/I_2M$ is injective, which clearly implies that $(J \cap I_1) \otimes_R M \rightarrow M$ is injective. \square

15.10. Flattening over an Artinian ring

A universal flattening exists when the base ring is an Artinian local ring. It exists for an arbitrary module. Hence, as we will see later, a flattening stratification exists when the base scheme is the spectrum of an Artinian local ring.

Lemma 15.10.1. *Let R be an Artinian ring. Let M be an R -module. Then there exists a smallest ideal $I \subset R$ such that M/IM is flat over R/I .*

Proof. This follows directly from Lemma 15.9.1 and the Artinian property. \square

This ideal has the following universal property.

Lemma 15.10.2. *Let R be an Artinian ring. Let M be an R -module. Let $I \subset R$ be the smallest ideal $I \subset R$ such that M/IM is flat over R/I . Then I has the following universal property: For every ring map $\varphi : R \rightarrow R'$ we have*

$$R' \otimes_R M \text{ is flat over } R' \Leftrightarrow \text{we have } \varphi(I) = 0.$$

Proof. Note that I exists by Lemma 15.10.1. The implication \Rightarrow follows from Algebra, Lemma 10.38.6. Let $\varphi : R \rightarrow R'$ be such that $M \otimes_R R'$ is flat over R' . Let $J = \text{Ker}(\varphi)$. By Algebra, Lemma 10.97.7 and as $R' \otimes_R M = R' \otimes_{R/J} M/JM$ is flat over R' we conclude that M/JM is flat over R/J . Hence $I \subset J$ as desired. \square

15.11. Flattening over a closed subset of the base

Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let M be an S -module. In the following we will consider the following condition

$$(15.11.0.1) \quad \forall \mathfrak{q} \in V(IS) \subset \text{Spec}(S) : M_{\mathfrak{q}} \text{ is flat over } R.$$

Geometrically, this means that M is flat over R along the inverse image of $V(I)$ in $\text{Spec}(S)$. If R and S are Noetherian rings and M is a finite S -module, then (15.11.0.1) is equivalent to the condition that M/I^nM is flat over R/I^n for all $n \geq 1$, see Algebra, Lemma 10.95.11.

Lemma 15.11.1. *Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let M be an S -module. Let $R \rightarrow R'$ be a ring map and $IR' \subset I' \subset R'$ an ideal. If (15.11.0.1) holds for $(R \rightarrow S, I, M)$, then (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', I', M \otimes_R R')$.*

Proof. Assume (15.11.0.1) holds for $(R \rightarrow S, I \subset R, M)$. Let $I'(S \otimes_R R') \subset \mathfrak{q}'$ be a prime of $S \otimes_R R'$. Let $\mathfrak{q} \subset S$ be the corresponding prime of S . Then $IS \subset \mathfrak{q}$. Note that $(M \otimes_R R')_{\mathfrak{q}'}$ is a localization of the base change $M_{\mathfrak{q}} \otimes_R R'$. Hence $(M \otimes_R R')_{\mathfrak{q}'}$ is flat over R' as a localization of a flat module, see Algebra, Lemmas 10.38.6 and 10.38.19. \square

Lemma 15.11.2. *Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let M be an S -module. Let $R \rightarrow R'$ be a ring map and $IR' \subset I' \subset R'$ an ideal such that*

- (1) *the map $V(I') \rightarrow V(I)$ induced by $\text{Spec}(R') \rightarrow \text{Spec}(R)$ is surjective, and*
- (2) *$R'_{\mathfrak{p}'}$ is flat over R for all primes $\mathfrak{p}' \in V(I')$.*

If (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', I', M \otimes_R R')$, then (15.11.0.1) holds for $(R \rightarrow S, I, M)$.

Proof. Assume (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', IR', M \otimes_R R')$. Pick a prime $IS \subset \mathfrak{q} \subset S$. Let $I \subset \mathfrak{p} \subset R$ be the corresponding prime of R . By assumption there exists a prime $\mathfrak{p}' \in V(I')$ of R' lying over \mathfrak{p} and $R_{\mathfrak{p}} \rightarrow R'_{\mathfrak{p}'}$ is flat. Choose a prime $\bar{\mathfrak{q}}' \subset \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$ which corresponds to a prime $\mathfrak{q}' \subset S \otimes_R R'$ which lies over \mathfrak{q} and over \mathfrak{p}' . Note that $(S \otimes_R R')_{\mathfrak{q}'}$ is a localization of $S_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} R'_{\mathfrak{p}'}$. By assumption the module $(M \otimes_R R')_{\mathfrak{q}'}$ is flat over $R'_{\mathfrak{p}'}$. Hence Algebra, Lemma 10.96.1 implies that $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ which is what we wanted to prove. \square

Lemma 15.11.3. *Let $R \rightarrow S$ be a ring map of finite presentation. Let M be an S -module of finite presentation. Let $R' = \text{colim}_{\lambda \in \Lambda} R_{\lambda}$ be a directed colimit of R -algebras. Let $I_{\lambda} \subset R_{\lambda}$ be ideals such that $I_{\lambda} R_{\mu} \subset I_{\mu}$ for all $\mu \geq \lambda$ and set $I' = \text{colim}_{\lambda} I_{\lambda}$. If (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', I', M \otimes_R R')$, then there exists a $\lambda \in \Lambda$ such that (15.11.0.1) holds for $(R_{\lambda} \rightarrow S \otimes_R R_{\lambda}, I_{\lambda}, M \otimes_R R_{\lambda})$.*

Proof. We are going to write $S_{\lambda} = S \otimes_R R_{\lambda}$, $S' = S \otimes_R R'$, $M_{\lambda} = M \otimes_R R_{\lambda}$, and $M' = M \otimes_R R'$. The base change S' is of finite presentation over R' and M' is of finite presentation over S' and similarly for the versions with subscript λ , see Algebra, Lemma 10.13.2. By Algebra, Theorem 10.125.4 the set

$$U' = \{\mathfrak{q}' \in \text{Spec}(S') \mid M'_{\mathfrak{q}'} \text{ is flat over } R'\}$$

is open in $\text{Spec}(S')$. Note that $V(I'S')$ is a quasi-compact space which is contained in U' by assumption. Hence there exist finitely many $g'_j \in S'$, $j = 1, \dots, m$ such that $D(g'_j) \subset U'$ and such that $V(I'S') \subset \bigcup D(g'_j)$. Note that in particular $(M')_{g'_j}$ is a flat module over R' .

We are going to pick increasingly large elements $\lambda \in \Lambda$. First we pick it large enough so that we can find $g_{j,\lambda} \in S_{\lambda}$ mapping to g'_j . The inclusion $V(I'S') \subset \bigcup D(g'_j)$ means that $I'S' + (g'_1, \dots, g'_m) = S'$ which can be expressed as $1 = \sum z_s h_s + \sum f_j g'_j$ for some $z_s \in I'$, $h_s, f_j \in S'$. After increasing λ we may assume such an equation holds in S_{λ} . Hence we may assume that $V(I_{\lambda} S_{\lambda}) \subset \bigcup D(g_{j,\lambda})$. By Algebra, Lemma 10.156.1 we see that for some sufficiently large λ the modules $(M_{\lambda})_{g_{j,\lambda}}$ are flat over R_{λ} . In particular the module M_{λ} is flat over R_{λ} at all the primes lying over the ideal I_{λ} . \square

15.12. Flattening over a closed subsets of source and base

In this section we slightly generalize the discussion in Section 15.11. We strongly suggest the reader first read and understand that section.

Situation 15.12.1. Let $R \rightarrow S$ be a ring map. Let $J \subset S$ be an ideal. Let M be an S -module.

In this situation, given an R -algebra R' and an ideal $I' \subset R'$ we set $S' = S \otimes_R R'$ and $M' = M \otimes_R R'$. We will consider the condition

$$(15.12.1.1) \quad \forall \mathfrak{q}' \in V(I'S' + JS') \subset \text{Spec}(S') : M'_{\mathfrak{q}'}$$
 is flat over R' .

Geometrically, this means that M' is flat over R' along the intersection of the inverse image of $V(I')$ with the inverse image of $V(J)$. Since $(R \rightarrow S, J, M)$ are fixed, condition (15.12.1.1) only depends on the pair (R', I') where R' is viewed as an R -algebra.

Lemma 15.12.2. *In Situation 15.12.1 let $R' \rightarrow R''$ be an R -algebra map. Let $I' \subset R'$ and $I'R'' \subset I'' \subset R''$ be ideals. If (15.12.1.1) holds for (R', I') , then (15.12.1.1) holds for (R'', I'') .*

Proof. Assume (15.12.1.1) holds for (R', I') . Let $I''S'' + JS'' \subset \mathfrak{q}''$ be a prime of S'' . Let $\mathfrak{q}' \subset S'$ be the corresponding prime of S' . Then both $I'S' \subset \mathfrak{q}'$ and $JS' \subset \mathfrak{q}'$ because the corresponding conditions hold for \mathfrak{q}'' . Note that $(M'')_{\mathfrak{q}''}$ is a localization of the base change $M'_{\mathfrak{q}'} \otimes_{R'} R''$. Hence $(M'')_{\mathfrak{q}''}$ is flat over R'' as a localization of a flat module, see Algebra, Lemmas 10.38.6 and 10.38.19. \square

Lemma 15.12.3. *In Situation 15.12.1 let $R' \rightarrow R''$ be an R -algebra map. Let $I' \subset R'$ and $I'R'' \subset I'' \subset R''$ be ideals. Assume*

- (1) *the map $V(I'') \rightarrow V(I')$ induced by $\text{Spec}(R'') \rightarrow \text{Spec}(R')$ is surjective, and*
- (2) *$R''_{\mathfrak{p}'}$ is flat over R' for all primes $\mathfrak{p}'' \in V(I'')$.*

If (15.12.1.1) holds for (R'', I'') , then (15.12.1.1) holds for (R', I') .

Proof. Assume (15.12.1.1) holds for (R'', I'') . Pick a prime $I'S' + JS' \subset \mathfrak{q}' \subset S'$. Let $I' \subset \mathfrak{p}' \subset R'$ be the corresponding prime of R' . By assumption there exists a prime $\mathfrak{p}'' \in V(I'')$ of R'' lying over \mathfrak{p}' and $R'_{\mathfrak{p}'} \rightarrow R''_{\mathfrak{p}''}$ is flat. Choose a prime $\bar{\mathfrak{q}}'' \subset \kappa(\mathfrak{q}') \otimes_{\kappa(\mathfrak{p}')} \kappa(\mathfrak{p}'')$. This corresponds to a prime $\mathfrak{q}'' \subset S'' = S' \otimes_{R'} R''$ which lies over \mathfrak{q}' and over \mathfrak{p}'' . In particular we see that $I''S'' \subset \mathfrak{q}''$ and that $JS'' \subset \mathfrak{q}''$. Note that $(S' \otimes_{R'} R'')_{\mathfrak{q}''}$ is a localization of $S'_{\mathfrak{q}'} \otimes_{R'_{\mathfrak{p}'}} R''_{\mathfrak{p}''}$. By assumption the module $(M' \otimes_{R'} R'')_{\mathfrak{q}''}$ is flat over $R''_{\mathfrak{p}''}$. Hence Algebra, Lemma 10.96.1 implies that $M'_{\mathfrak{q}'}$ is flat over $R'_{\mathfrak{p}'}$, which is what we wanted to prove. \square

Lemma 15.12.4. *In Situation 15.12.1 assume $R \rightarrow S$ is essentially of finite presentation and M is an S -module of finite presentation. Let $R' = \text{colim}_{\lambda \in \Lambda} R_{\lambda}$ be a directed colimit of R -algebras. Let $I_{\lambda} \subset R_{\lambda}$ be ideals such that $I_{\lambda}R_{\mu} \subset I_{\mu}$ for all $\mu \geq \lambda$ and set $I' = \text{colim}_{\lambda} I_{\lambda}$. If (15.12.1.1) holds for (R', I') , then there exists a $\lambda \in \Lambda$ such that (15.12.1.1) holds for $(R_{\lambda}, I_{\lambda})$.*

Proof. We first prove the lemma in case $R \rightarrow S$ is of finite presentation and then we explain what needs to be changed in the general case. We are going to write $S_{\lambda} = S \otimes_R R_{\lambda}$, $S' = S \otimes_R R'$, $M_{\lambda} = M \otimes_R R_{\lambda}$, and $M' = M \otimes_R R'$. The base change S' is of finite presentation over R' and M' is of finite presentation over S'

and similarly for the versions with subscript λ , see Algebra, Lemma 10.13.2. By Algebra, Theorem 10.125.4 the set

$$U' = \{\mathfrak{q}' \in \text{Spec}(S') \mid M'_{\mathfrak{q}'}, \text{ is flat over } R'\}$$

is open in $\text{Spec}(S')$. Note that $V(I'S' + JS')$ is a quasi-compact space which is contained in U' by assumption. Hence there exist finitely many $g'_j \in S'$, $j = 1, \dots, m$ such that $D(g'_j) \subset U'$ and such that $V(I'S' + JS') \subset \bigcup D(g'_j)$. Note that in particular $(M')_{g'_j}$ is a flat module over R' .

We are going to pick increasingly large elements $\lambda \in \Lambda$. First we pick it large enough so that we can find $g_{j,\lambda} \in S_\lambda$ mapping to g'_j . The inclusion $V(I'S' + JS') \subset \bigcup D(g'_j)$ means that $I'S' + JS' + (g'_1, \dots, g'_m) = S'$ which can be expressed as

$$1 = \sum y_t k_t + \sum z_s h_s + \sum f_j g'_j$$

for some $z_s \in I'$, $y_t \in J$, $k_t, h_s, f_j \in S'$. After increasing λ we may assume such an equation holds in S_λ . Hence we may assume that $V(I_\lambda S_\lambda + JS_\lambda) \subset \bigcup D(g_{j,\lambda})$. By Algebra, Lemma 10.156.1 we see that for some sufficiently large λ the modules $(M_\lambda)_{g_{j,\lambda}}$ are flat over R_λ . In particular the module M_λ is flat over R_λ at all the primes corresponding to points of $V(I_\lambda S_\lambda + JS_\lambda)$.

In the case that S is essentially of finite presentation, we can write $S = \Sigma^{-1}C$ where $R \rightarrow C$ is of finite presentation and $\Sigma \subset C$ is a multiplicative subset. We can also write $M = \Sigma^{-1}N$ for some finitely presented C -module N , see Algebra, Lemma 10.122.3. At this point we introduce $C_\lambda, C', N_\lambda, N'$. Then in the discussion above we obtain an open $U' \subset \text{Spec}(C')$ over which N' is flat over R' . The assumption that (15.12.1.1) is true means that $V(I'S' + JS')$ maps into U' , because for a prime $\mathfrak{q}' \subset S'$, corresponding to a prime $\mathfrak{r}' \subset C'$ we have $M'_{\mathfrak{q}'} = N'_{\mathfrak{r}'}$. Thus we can find $g'_j \in C'$ such that $\bigcup D(g'_j)$ contains the image of $V(I'S' + JS')$. The rest of the proof is exactly the same as before. \square

Lemma 15.12.5. *In Situation 15.12.1. Let $I \subset R$ be an ideal. Assume*

- (1) R is a Noetherian ring,
- (2) S is a Noetherian ring,
- (3) M is a finite S -module, and
- (4) for each $n \geq 1$ and any prime $\mathfrak{q} \in V(J + IS)$ the module $(M/I^n M)_{\mathfrak{q}}$ is flat over R/I^n .

Then (15.12.1.1) holds for (R, I) , i.e., for every prime $\mathfrak{q} \in V(J + IS)$ the localization $M_{\mathfrak{q}}$ is flat over R .

Proof. Let $\mathfrak{q} \in V(J + IS)$. Then Algebra, Lemma 10.95.11 applied to $R \rightarrow S_{\mathfrak{q}}$ and $M_{\mathfrak{q}}$ implies that $M_{\mathfrak{q}}$ is flat over R . \square

15.13. Flattening over a Noetherian complete local ring

The following three lemmas give a completely algebraic proof of the existence of the “local” flattening stratification when the base is a complete local Noetherian ring R and the given module is finite over a finite type R -algebra S .

Lemma 15.13.1. *Let $R \rightarrow S$ be a ring map. Let M be an S -module. Assume*

- (1) (R, \mathfrak{m}) is a complete local Noetherian ring,
- (2) S is a Noetherian ring, and

(3) M is finite over S .

Then there exists an ideal $I \subset \mathfrak{m}$ such that

- (1) $(M/IM)_{\mathfrak{q}}$ is flat over R/I for all primes \mathfrak{q} of S/IS lying over \mathfrak{m} , and
- (2) if $J \subset R$ is an ideal such that $(M/JM)_{\mathfrak{q}}$ is flat over R/J for all primes \mathfrak{q} lying over \mathfrak{m} , then $I \subset J$.

In other words, I is the smallest ideal of R such that (15.11.0.1) holds for $(\overline{R} \rightarrow \overline{S}, \overline{\mathfrak{m}}, \overline{M})$ where $\overline{R} = R/I$, $\overline{S} = S/IS$, $\overline{\mathfrak{m}} = \mathfrak{m}/I$ and $\overline{M} = M/IM$.

Proof. Let $J \subset R$ be an ideal. Apply Algebra, Lemma 10.95.11 to the module M/JM over the ring R/J . Then we see that $(M/JM)_{\mathfrak{q}}$ is flat over R/J for all primes \mathfrak{q} of S/JS if and only if $M/(J + \mathfrak{m}^n)M$ is flat over $R/(J + \mathfrak{m}^n)$ for all $n \geq 1$. We will use this remark below.

For every $n \geq 1$ the local ring R/\mathfrak{m}^n is Artinian. Hence, by Lemma 15.10.1 there exists a smallest ideal $I_n \supset \mathfrak{m}^n$ such that $M/I_n M$ is flat over R/I_n . It is clear that $I_{n+1} + \mathfrak{m}^n$ contains I_n and applying Lemma 15.9.1 we see that $I_n = I_{n+1} + \mathfrak{m}^n$. Since $R = \lim_n R/\mathfrak{m}^n$ we see that $I = \lim_n I_n/\mathfrak{m}^n$ is an ideal in R such that $I_n = I + \mathfrak{m}^n$ for all $n \geq 1$. By the initial remarks of the proof we see that I verifies (1) and (2). Some details omitted. \square

Lemma 15.13.2. *With notation $R \rightarrow S$, M , and I and assumptions as in Lemma 15.13.1. Consider a local homomorphism of local rings $\varphi : (R, \mathfrak{m}) \rightarrow (R', \mathfrak{m}')$ such that R' is Noetherian. Then the following are equivalent*

- (1) condition (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', \mathfrak{m}', M \otimes_R R')$, and
- (2) $\varphi(I) = 0$.

Proof. The implication (2) \Rightarrow (1) follows from Lemma 15.11.1. Let $\varphi : R \rightarrow R'$ be as in the lemma satisfying (1). We have to show that $\varphi(I) = 0$. This is equivalent to the condition that $\varphi(I)R' = 0$. By Artin-Rees in the Noetherian local ring R' (see Algebra, Lemma 10.49.4) this is equivalent to the condition that $\varphi(I)R' + (\mathfrak{m}')^n = (\mathfrak{m}')^n$ for all $n > 0$. Hence this is equivalent to the condition that the composition $\varphi_n : R \rightarrow R' \rightarrow R'/(\mathfrak{m}')^n$ annihilates I for each n . Now assumption (1) for φ implies assumption (1) for φ_n by Lemma 15.11.1. This reduces us to the case where R' is Artinian local.

Assume R' Artinian. Let $J = \text{Ker}(\varphi)$. We have to show that $I \subset J$. By the construction of I in Lemma 15.13.1 it suffices to show that $(M/JM)_{\mathfrak{q}}$ is flat over R/J for every prime \mathfrak{q} of S/JS lying over \mathfrak{m} . As R' is Artinian, condition (1) signifies that $M \otimes_R R'$ is flat over R' . As R' is Artinian and $R/J \rightarrow R'$ is a local injective ring map, it follows that R/J is Artinian too. Hence the flatness of $M \otimes_R R' = M/JM \otimes_{R/J} R'$ over R' implies that M/JM is flat over R/J by Algebra, Lemma 10.97.7. This concludes the proof. \square

Lemma 15.13.3. *With notation $R \rightarrow S$, M , and I and assumptions as in Lemma 15.13.1. In addition assume that $R \rightarrow S$ is of finite type. Then for any local homomorphism of local rings $\varphi : (R, \mathfrak{m}) \rightarrow (R', \mathfrak{m}')$ the following are equivalent*

- (1) condition (15.11.0.1) holds for $(R' \rightarrow S \otimes_R R', \mathfrak{m}', M \otimes_R R')$, and
- (2) $\varphi(I) = 0$.

Proof. The implication (2) \Rightarrow (1) follows from Lemma 15.11.1. Let $\varphi : R \rightarrow R'$ be as in the lemma satisfying (1). As R is Noetherian we see that $R \rightarrow S$ is of finite

presentation and M is an S -module of finite presentation. Write $R' = \operatorname{colim}_\lambda R_\lambda$ as a directed colimit of local R -subalgebras $R_\lambda \subset R'$, with maximal ideals $\mathfrak{m}_\lambda = R_\lambda \cap \mathfrak{m}'$ such that each R_λ is essentially of finite type over R . By Lemma 15.11.3 we see that condition (15.11.0.1) holds for $(R_\lambda \rightarrow S \otimes_R R_\lambda, \mathfrak{m}_\lambda, M \otimes_R R_\lambda)$ for some λ . Hence Lemma 15.13.2 applies to the ring map $R \rightarrow R_\lambda$ and we see that I maps to zero in R_λ , a fortiori it maps to zero in R' . \square

15.14. Descent flatness along integral maps

First a few simple lemmas.

Lemma 15.14.1. *Let R be a ring. Let $P(T)$ be a monic polynomial with coefficients in R . If there exists an $\alpha \in R$ such that $P(\alpha) = 0$, then $P(T) = (T - \alpha)Q(T)$ for some monic polynomial $Q(T) \in R[T]$.*

Proof. By induction on the degree of P . If $\deg(P) = 1$, then $P(T) = T - \alpha$ and the result is true. If $\deg(P) > 1$, then we can write $P(T) = (T - \alpha)Q(T) + r$ for some polynomial $Q \in R[T]$ of degree $< \deg(P)$ and some $r \in R$ by long division. By assumption $0 = P(\alpha) = (\alpha - \alpha)Q(\alpha) + r = r$ and we conclude that $r = 0$ as desired. \square

Lemma 15.14.2. *Let R be a ring. Let $P(T)$ be a monic polynomial with coefficients in R . There exists a finite free ring map $R \rightarrow R'$ such that $P(T) = (T - \alpha)Q(T)$ for some $\alpha \in R'$ and some monic polynomial $Q(T) \in R'[T]$.*

Proof. Write $P(T) = T^d + a_1 T^{d-1} + \dots + a_0$. Set $R' = R[x]/(x^d + a_1 x^{d-1} + \dots + a_0)$. Set α equal to the congruence class of x . Then it is clear that $P(\alpha) = 0$. Thus we win by Lemma 15.14.1. \square

Lemma 15.14.3. *Let $R \rightarrow S$ be a finite ring map. There exists a finite free ring extension $R \subset R'$ such that $S \otimes_R R'$ is a quotient of a ring of the form*

$$R'[T_1, \dots, T_n]/(P_1(T_1), \dots, P_n(T_n))$$

with $P_i(T) = \prod_{j=1, \dots, d_i} (T - \alpha_{ij})$ for some $\alpha_{ij} \in R'$.

Proof. Let $x_1, \dots, x_n \in S$ be generators of S over R . For each i we can choose a monic polynomial $P_i(T) \in R[T]$ such that $P_i(x_i) = 0$ in S , see Algebra, Lemma 10.35.3. Say $\deg(P_i) = d_i$. By Lemma 15.14.2 (applied $\sum d_i$ times) there exists a finite free ring extension $R \subset R'$ such that each P_i splits completely:

$$P_i(T) = \prod_{j=1, \dots, d_i} (T - \alpha_{ij})$$

for certain $\alpha_{ik} \in R'$. Let $R'[T_1, \dots, T_n] \rightarrow S \otimes_R R'$ be the R' -algebra map which maps T_i to $x_i \otimes 1$. As this maps $P_i(T_i)$ to zero, this induces the desired surjection. \square

Lemma 15.14.4. *Let R be a ring. Let $S = R[T_1, \dots, T_n]/J$. Assume J contains elements of the form $P_i(T_i)$ with $P_i(T) = \prod_{j=1, \dots, d_i} (T - \alpha_{ij})$ for some $\alpha_{ij} \in R$. For $\underline{k} = (k_1, \dots, k_n)$ with $1 \leq k_i \leq d_i$ consider the ring map*

$$\Phi_{\underline{k}}: R[T_1, \dots, T_n] \rightarrow R, \quad T_i \mapsto \alpha_{ik_i}$$

Set $J_{\underline{k}} = \Phi_{\underline{k}}(J)$. Then the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is equal to $V(\bigcap J_{\underline{k}})$.

Proof. This lemma proves itself. Hint: $V(\bigcap J_{\underline{k}}) = \bigcup V(J_{\underline{k}})$. \square

The following result is due to Ferrand, see [Fer69].

Lemma 15.14.5. *Let $R \rightarrow S$ be a finite injective homomorphism of Noetherian rings. Let M be an R -module. If $M \otimes_R S$ is a flat S -module, then M is a flat R -module.*

Proof. Let M be an R -module such that $M \otimes_R S$ is flat over S . By Algebra, Lemma 10.38.7 in order to prove that M is flat we may replace R by any faithfully flat ring extension. By Lemma 15.14.3 we can find a finite locally free ring extension $R \subset R'$ such that $S' = S \otimes_R R' = R'[T_1, \dots, T_n]/J$ for some ideal $J \subset R'[T_1, \dots, T_n]$ which contains the elements of the form $P_i(T_i)$ with $P_i(T) = \prod_{j=1, \dots, d_i} (T - \alpha_{ij})$ for some $\alpha_{ij} \in R'$. Note that R' is Noetherian and that $R' \subset S'$ is a finite extension of rings. Hence we may replace R by R' and assume that S has a presentation as in Lemma 15.14.4. Note that $\text{Spec}(S) \rightarrow \text{Spec}(R)$ is surjective, see Algebra, Lemma 10.35.15. Thus, using Lemma 15.14.4 we conclude that $I = \bigcap J_k$ is an ideal such that $V(I) = \text{Spec}(R)$. This means that $I \subset \sqrt{(0)}$, and since R is Noetherian that I is nilpotent. The maps Φ_k induce commutative diagrams

$$\begin{array}{ccc} S & \longrightarrow & R/J_k \\ & \searrow & \nearrow \\ & R & \end{array}$$

from which we conclude that $M/J_k M$ is flat over R/J_k . By Lemma 15.9.1 we see that M/IM is flat over R/I . Finally, applying Algebra, Lemma 10.97.5 we conclude that M is flat over R . \square

Lemma 15.14.6. *Let $R \rightarrow S$ be an injective integral ring map. Let M be a finitely presented module over $R[x_1, \dots, x_n]$. If $M \otimes_R S$ is flat over S , then M is flat over R .*

Proof. Choose a presentation

$$R[x_1, \dots, x_n]^{\oplus t} \rightarrow R[x_1, \dots, x_n]^{\oplus r} \rightarrow M \rightarrow 0.$$

Let's say that the first map is given by the $r \times t$ -matrix $T = (f_{ij})$ with $f_{ij} \in R[x_1, \dots, x_n]$. Write $f_{ij} = \sum f_{ij,I} x^I$ with $f_{ij,I} \in R$ (multi-index notation). Consider diagrams

$$\begin{array}{ccc} R & \longrightarrow & S \\ \uparrow & & \uparrow \\ R_\lambda & \longrightarrow & S_\lambda \end{array}$$

where R_λ is a finitely generated \mathbf{Z} -subalgebra of R containing all $f_{ij,I}$ and S_λ is a finite R_λ -subalgebra of S . Let M_λ be the finite $R_\lambda[x_1, \dots, x_n]$ -module defined by a presentation as above, using the same matrix T but now viewed as a matrix over $R_\lambda[x_1, \dots, x_n]$. Note that S is the directed colimit of the S_λ (details omitted). By Algebra, Lemma 10.156.1 we see that for some λ the module $M_\lambda \otimes_{R_\lambda} S_\lambda$ is flat over S_λ . By Lemma 15.14.5 we conclude that M_λ is flat over R_λ . Since $M = M_\lambda \otimes_{R_\lambda} R$ we win by Algebra, Lemma 10.38.6. \square

15.15. Torsion and flatness

In this section we discuss the relationship between torsion and flatness.

Definition 15.15.1. Let R be a domain. Let M be an R -module.

- (1) We say an element $x \in M$ is *torsion* if there exists a nonzero $f \in R$ such that $fx = 0$.
- (2) We say M is *torsion free* if the only torsion element of M is 0.

Lemma 15.15.2. Let R be a domain. Let M be an R -module. The set of torsion elements of M forms a submodule $M_{tors} \subset M$. The quotient module M/M_{tors} is torsion free.

Proof. Omitted. □

Lemma 15.15.3. Let R be a domain. Any flat R -module is torsion free.

Proof. If $x \in R$ is nonzero, then $x : R \rightarrow R$ is injective, and hence if M is flat over R , then $x : M \rightarrow M$ is injective. Thus if M is flat over R , then M is torsion free. □

Lemma 15.15.4. Let A be a valuation ring. An A -module M is flat over A if and only if M is torsion free.

Proof. The implication “flat \Rightarrow torsion free” is Lemma 15.15.3. For the converse, assume M is torsion free. By the equational criterion of flatness (see Algebra, Lemma 10.38.10) we have to show that every relation in M is trivial. To do this assume that $\sum_{i=1, \dots, n} a_i x_i = 0$ with $x_i \in M$ and $f_i \in A$. After renumbering we may assume that $v(a_1) \leq v(a_i)$ for all i . Hence we can write $a_i = a'_i a_1$ for some $a'_i \in A$. Note that $a'_1 = 1$. As A is torsion free we see that $x_1 = -\sum_{i \geq 2} a'_i x_i$. Thus, if we choose $y_i = x_i$, $i = 2, \dots, n$ then

$$x_1 = \sum_{j \geq 2} -a'_j y_j, \quad x_i = y_i, (i \geq 2) \quad 0 = a_1 \cdot (-a'_j) + a_j \cdot 1 (j \geq 2)$$

shows that the relation was trivial (to be explicit the elements a_{ij} are defined by setting $a_{1j} = -a'_j$ and $a_{ij} = \delta_{ij}$ for $i, j \geq 2$). □

15.16. Content ideals

The definition may not be what you expect.

Definition 15.16.1. Let A be a ring. Let M be a flat A -module. Let $x \in M$. If the set of ideals I in A such that $x \in IM$ has a smallest element, we call it the *content ideal* of x .

Note that since M is flat over A , for a pair of ideals I, I' of A we have $IM \cap I'M = (I \cap I')M$ as can be seen by tensoring the exact sequence $0 \rightarrow I \cap I' \rightarrow I \oplus I' \rightarrow I + I' \rightarrow 0$ by M .

Lemma 15.16.2. Let A be a ring. Let M be a flat A -module. Let $x \in M$. The content ideal of x , if it exists, is finitely generated.

Proof. Say $x \in IM$. Then we can write $x = \sum_{i=1, \dots, n} f_i x_i$ with $f_i \in I$ and $x_i \in M$. Hence $x \in I'M$ with $I' = (f_1, \dots, f_n)$. □

Lemma 15.16.3. *Let (A, \mathfrak{m}) be a local ring. Let $u : M \rightarrow N$ be a map of flat A -modules such that $\bar{u} : M/\mathfrak{m}M \rightarrow N/\mathfrak{m}N$ is injective. If $x \in M$ has content ideal I , then $u(x)$ has content ideal I as well.*

Proof. It is clear that $u(x) \in IN$. If $u(x) \in I'N$, then $u(x) \in (I' \cap I)N$, see discussion following Definition 15.16.1. Hence it suffices to show: if $x \in I'N$ and $I' \subset I$, $I' \neq I$, then $u(x) \notin I'N$. Since I/I' is a nonzero finite A -module (Lemma 15.16.2) there is a nonzero map $\chi : I/I' \rightarrow A/\mathfrak{m}$ of A -modules by Nakayama's lemma (Algebra, Lemma 10.19.1). Since I is the content ideal of x we see that $x \notin I''M$ where $I'' = \text{Ker}(\chi)$. Hence x is not in the kernel of the map

$$IM = I \otimes_A M \xrightarrow{\chi \otimes 1} A/\mathfrak{m} \otimes M \cong M/\mathfrak{m}M$$

Applying our hypothesis on \bar{u} we conclude that $u(x)$ does not map to zero under the map

$$IN = I \otimes_A N \xrightarrow{\chi \otimes 1} A/\mathfrak{m} \otimes N \cong N/\mathfrak{m}N$$

and we conclude. \square

Lemma 15.16.4. *Let A be a ring. Let M be a flat Mittag-Leffler module. Then every element of M has a content ideal.*

Proof. This is a special case of Algebra, Lemma 10.88.2. \square

15.17. Flatness and finiteness conditions

In this section we discuss some implications of the type “flat + finite type \Rightarrow finite presentation”. We will revisit this result in the chapter on flatness, see More on Flatness, Section 37.1. A first result of this type was proved in Algebra, Lemma 10.104.6.

Lemma 15.17.1. *Let R be a ring. Let $S = R[x_1, \dots, x_n]$ be a polynomial ring over R . Let M be an S -module. Assume*

- (1) *there exist finitely many primes $\mathfrak{p}_1, \dots, \mathfrak{p}_m$ of R such that the map $R \rightarrow \prod R_{\mathfrak{p}_j}$ is injective,*
- (2) *M is a finite S -module,*
- (3) *M flat over R , and*
- (4) *for every prime \mathfrak{p} of R the module $M_{\mathfrak{p}}$ is of finite presentation over $S_{\mathfrak{p}}$.*

Then M is of finite presentation over S .

Proof. Choose a presentation

$$0 \rightarrow K \rightarrow S^{\oplus r} \rightarrow M \rightarrow 0$$

of M as an S -module. Let \mathfrak{q} be a prime ideal of S lying over a prime \mathfrak{p} of R . By assumption there exist finitely many elements $k_1, \dots, k_t \in K$ such that if we set $K' = \sum Sk_j \subset K$ then $K'_{\mathfrak{p}} = K_{\mathfrak{p}}$ and $K'_{\mathfrak{p}_j} = K_{\mathfrak{p}_j}$ for $j = 1, \dots, m$. Setting $M' = S^{\oplus r}/K'$ we deduce that in particular $M'_{\mathfrak{q}} = M_{\mathfrak{q}}$. By openness of flatness, see Algebra, Theorem 10.125.4 we conclude that there exists a $g \in S$, $g \notin \mathfrak{q}$ such that M'_g is flat over R . Thus $M'_g \rightarrow M_g$ is a surjective map of flat R -modules. Consider

the commutative diagram

$$\begin{array}{ccc} M'_g & \longrightarrow & M_g \\ \downarrow & & \downarrow \\ \prod (M'_g)_{\mathfrak{p}_j} & \longrightarrow & \prod (M_g)_{\mathfrak{p}_j} \end{array}$$

The bottom arrow is an isomorphism by choice of k_1, \dots, k_t . The left vertical arrow is an injective map as $R \rightarrow \prod R_{\mathfrak{p}_j}$ is injective and M'_g is flat over R . Hence the top horizontal arrow is injective, hence an isomorphism. This proves that M_g is of finite presentation over S_g . We conclude by applying Algebra, Lemma 10.23.2. \square

Lemma 15.17.2. *Let $R \rightarrow S$ be a ring homomorphism. Assume*

- (1) *there exist finitely many primes $\mathfrak{p}_1, \dots, \mathfrak{p}_m$ of R such that the map $R \rightarrow \prod R_{\mathfrak{p}_j}$ is injective,*
- (2) *$R \rightarrow S$ is of finite type,*
- (3) *S flat over R , and*
- (4) *for every prime \mathfrak{p} of R the ring $S_{\mathfrak{p}}$ is of finite presentation over $R_{\mathfrak{p}}$.*

Then S is of finite presentation over R .

Proof. By assumption S is a quotient of a polynomial ring over R . Thus the result follows directly from Lemma 15.17.1. \square

Lemma 15.17.3. *Let R be a ring. Let $S = R[x_1, \dots, x_n]$ be a graded polynomial algebra over R , i.e., $\deg(x_i) > 0$ but not necessarily equal to 1. Let M be a graded S -module. Assume*

- (1) *R is a local ring,*
- (2) *M is a finite S -module, and*
- (3) *M is flat over R .*

Then M is finitely presented as an S -module.

Proof. Let $M = \bigoplus M_d$ be the grading on M . Pick homogeneous generators $m_1, \dots, m_r \in M$ of M . Say $\deg(m_i) = d_i \in \mathbf{Z}$. This gives us a presentation

$$0 \rightarrow K \rightarrow \bigoplus_{i=1, \dots, r} S(-d_i) \rightarrow M \rightarrow 0$$

which in each degree d leads to the short exact sequence

$$0 \rightarrow K_d \rightarrow \bigoplus_{i=1, \dots, r} S_{d-d_i} \rightarrow M_d \rightarrow 0.$$

By assumption each M_d is a finite flat R -module. By Algebra, Lemma 10.75.4 this implies each M_d is a finite free R -module. Hence we see each K_d is a finite R -module. Also each K_d is flat over R by Algebra, Lemma 10.38.12. Hence we conclude that each K_d is finite free by Algebra, Lemma 10.75.4 again.

Let \mathfrak{m} be the maximal ideal of R . By the flatness of M over R the short exact sequences above remain short exact after tensoring with $\kappa = \kappa(\mathfrak{m})$. As the ring $S \otimes_R \kappa$ is Noetherian we see that there exist homogeneous elements $k_1, \dots, k_t \in K$ such that the images \bar{k}_j generate $K \otimes_R \kappa$ over $S \otimes_R \kappa$. Say $\deg(k_j) = e_j$. Thus for any d the map

$$\bigoplus_{j=1, \dots, t} S_{d-e_j} \longrightarrow K_d$$

becomes surjective after tensoring with κ . By Nakayama's lemma (Algebra, Lemma 10.19.1) this implies the map is surjective over R . Hence K is generated by k_1, \dots, k_t over S and we win. \square

Lemma 15.17.4. *Let R be a ring. Let $S = \bigoplus_{n \geq 0} S_n$ be a graded R -algebra. Let $M = \bigoplus_{d \in \mathbf{Z}} M_d$ be a graded S -module. Assume S is finitely generated as an R -algebra, assume S_0 is a finite R -algebra, and assume there exist finitely many primes \mathfrak{p}_j , $i = 1, \dots, m$ such that $R \rightarrow \prod R_{\mathfrak{p}_j}$ is injective.*

- (1) *If S is flat over R , then S is a finitely presented R -algebra.*
- (2) *If M is flat as an R -module and finite as an S -module, then M is finitely presented as an S -module.*

Proof. As S is finitely generated as an R -algebra, it is finitely generated as an S_0 algebra, say by homogeneous elements $t_1, \dots, t_n \in S$ of degrees $d_1, \dots, d_n > 0$. Set $P = R[x_1, \dots, x_n]$ with $\deg(x_i) = d_i$. The ring map $P \rightarrow S$, $x_i \rightarrow t_i$ is finite as S_0 is a finite R -module. To prove (1) it suffices to prove that S is a finitely presented P -module. To prove (2) it suffices to prove that M is a finitely presented P -module. Thus it suffices to prove that if $S = P$ is a graded polynomial ring and M is a finite S -module flat over R , then M is finitely presented as an S -module. By Lemma 15.17.3 we see $M_{\mathfrak{p}}$ is a finitely presented $S_{\mathfrak{p}}$ -module for every prime \mathfrak{p} of R . Thus the result follows from Lemma 15.17.1. \square

Remark 15.17.5. Let R be a ring. When does R satisfy the condition mentioned in Lemmas 15.17.1, 15.17.2, and 15.17.4? This holds if

- (1) R is local,
- (2) R is Noetherian,
- (3) R is a domain,
- (4) R is a reduced ring with finitely many minimal primes, or
- (5) R has finitely many weakly associated primes, see Algebra, Lemma 10.65.16.

Thus these lemmas hold in all cases listed above.

The following lemma will be improved on in More on Flatness, Proposition 37.12.9.

Lemma 15.17.6. *Let A be a valuation ring. Let $A \rightarrow B$ be a ring map of finite type. Let M be a finite B -module.*

- (1) *If B is flat over A , then B is a finitely presented A -algebra.*
- (2) *If M is flat as an A -module, then M is finitely presented as a B -module.*

Proof. We are going to use that an A -module is flat if and only if it is torsion free, see Lemma 15.15.4. By Algebra, Lemma 10.55.10 we can find a graded A -algebra S with $S_0 = A$ and generated by finitely many elements in degree 1, an element $f \in S_1$ and a finite graded S -module N such that $B \cong S_{(f)}$ and $M \cong N_{(f)}$. If M is torsion free, then we can take N torsion free by replacing it by N/N_{tors} , see Lemma 15.15.2. Similarly, if B is torsion free, then we can take S torsion free by replacing it by S/S_{tors} . Hence in case (1), we may apply Lemma 15.17.4 to see that S is a finitely presented A -algebra, which implies that $B = S_{(f)}$ is a finitely presented A -algebra. To see (2) we may first replace S by a graded polynomial ring, and then we may apply Lemma 15.17.3 to conclude. \square

15.18. Blowing up and flatness

In this section we begin our discussion of results of the form: “After a blow up the strict transform becomes flat”. More results of this type may be found in More on Flatness, Section 37.27.

Definition 15.18.1. Let R be a domain. Let M be an R -module. Let $R \subset R'$ be an extension of domains. The *strict transform of M along $R \rightarrow R'$* ¹ is the torsion free R' -module

$$M' = (M \otimes_R R') / (M \otimes_R R')_{tors}.$$

The following is a very weak version of flattening by blowing up, but it is already sometimes a useful result.

Lemma 15.18.2. *Let (R, \mathfrak{m}) be a local domain with fraction field K . Let S be a finite type R -algebra. Let M be a finite S -module. For every valuation ring $A \subset K$ dominating R there exists an ideal $I \subset \mathfrak{m}$ and a nonzero element $a \in I$ such that*

- (1) I is finitely generated,
- (2) A has center on $R[\frac{I}{a}]$,
- (3) the fibre ring of $R \rightarrow R[\frac{I}{a}]$ at \mathfrak{m} is not zero, and
- (4) the strict transform $S_{I,a}$ of S along $R \rightarrow R[\frac{I}{a}]$ is flat and of finite presentation over R , and the strict transform $M_{I,a}$ of M along $R \rightarrow R[\frac{I}{a}]$ is flat over R and finitely presented over $S_{I,a}$.

Proof. Note that the assertion makes sense as $R[\frac{I}{a}]$ is a domain, and $R \rightarrow R[\frac{I}{a}]$ is injective, see Algebra, Lemmas 10.56.4 and 10.56.6. Before we start the proof of the Lemma, note that there is no loss in generality assuming that $S = R[x_1, \dots, x_n]$ is a polynomial ring over R . We also fix a presentation

$$0 \rightarrow K \rightarrow S^{\oplus r} \rightarrow M \rightarrow 0.$$

Let M_A be the strict transform of M along $R \rightarrow A$. It is a finite module over $S_A = A[x_1, \dots, x_n]$. By Lemma 15.15.4 we see that M_A is flat over A . By Lemma 15.17.6 we see that M_A is finitely presented. Hence there exist finitely many elements $k_1, \dots, k_t \in S_A^{\oplus r}$ which generate the kernel of the presentation $S_A^{\oplus r} \rightarrow M_A$ as an S_A -module. For any choice of $a \in I \subset \mathfrak{m}$ satisfying (1), (2), and (3) we denote $M_{I,a}$ the strict transform of M along $R \rightarrow R[\frac{I}{a}]$. It is a finite module over $S_{I,a} = R[\frac{I}{a}][x_1, \dots, x_n]$. By Algebra, Lemma 10.56.7 we have $A = \text{colim}_{I,a} R[\frac{I}{a}]$. This implies that $S_A = \text{colim}_{I,a} S_{I,a}$ and $M_A = \text{colim}_{I,a} M_{I,a}$. Thus we may choose $a \in I \subset R$ such that k_1, \dots, k_t are elements of $S_{I,a}^{\oplus r}$ and map to zero in $M_{I,a}$. For any such pair (I, a) we set

$$M'_{I,a} = S_{I,a}^{\oplus r} / \sum S_{I,a} k_j.$$

Since $M_A = S_A^{\oplus r} / \sum S_A k_j$ we see that also $M_A = \text{colim}_{I,a} M'_{I,a}$. At this point we may apply Algebra, Lemma 10.156.1 (3) to conclude that $M'_{I,a}$ is flat for some pair (I, a) . (This lemma does not apply a priori to the system $M_{I,a}$ as the transition maps may not satisfy the assumptions of the lemma.) Since flatness implies torsion free (Lemma 15.15.3), we also conclude that $M'_{I,a} = M_{I,a}$ for such a pair and we win. \square

¹This is somewhat nonstandard notation.

15.19. Completion and flatness

In this section we discuss when the completion of a “big” flat module is flat.

Lemma 15.19.1. *Let R be a ring. Let $I \subset R$ be an ideal. Let A be a set. Assume R is Noetherian and complete with respect to I . There is a canonical map*

$$\left(\bigoplus_{\alpha \in A} R\right)^\wedge \longrightarrow \prod_{\alpha \in A} R$$

from the I -adic completion of the direct sum into the product which is universally injective.

Proof. By definition an element x of the left hand side is $x = (x_n)$ where $x_n = (x_{n,\alpha}) \in \bigoplus_{\alpha \in A} R/I^n$ such that $x_{n,\alpha} = x_{n+1,\alpha} \bmod I^n$. As $R = R^\wedge$ we see that for any α there exists a $y_\alpha \in R$ such that $x_{n,\alpha} = y_\alpha \bmod I^n$. Note that for each n there are only finitely many α such that the elements $x_{n,\alpha}$ are nonzero. Conversely, given $(y_\alpha) \in \prod_{\alpha \in A} R$ such that for each n there are only finitely many α such that $y_\alpha \bmod I^n$ is nonzero, then this defines an element of the left hand side. Hence we can think of an element of the left hand side as infinite “convergent sums” $\sum_{\alpha} y_\alpha$ with $y_\alpha \in R$ such that for each n there are only finitely many y_α which are nonzero modulo I^n . The displayed map maps this element to the element (y_α) in the product. In particular the map is injective.

Let Q be a finite R -module. We have to show that the map

$$Q \otimes_R \left(\bigoplus_{\alpha \in A} R\right)^\wedge \longrightarrow Q \otimes_R \left(\prod_{\alpha \in A} R\right)$$

is injective, see Algebra, Theorem 10.79.3. Choose a presentation $R^{\oplus k} \rightarrow R^{\oplus m} \rightarrow Q \rightarrow 0$ and denote $q_1, \dots, q_m \in Q$ the corresponding generators for Q . By Artin-Rees (Algebra, Lemma 10.49.2) there exists a constant c such that $\text{Im}(R^{\oplus k} \rightarrow R^{\oplus m}) \cap (I^N)^{\oplus m} \subset \text{Im}((I^{N-c})^{\oplus k} \rightarrow R^{\oplus m})$. Let us contemplate the diagram

$$\begin{array}{ccccccc} \bigoplus_{l=1}^k \left(\bigoplus_{\alpha \in A} R\right)^\wedge & \longrightarrow & \bigoplus_{j=1}^m \left(\bigoplus_{\alpha \in A} R\right)^\wedge & \longrightarrow & Q \otimes_R \left(\bigoplus_{\alpha \in A} R\right)^\wedge & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \bigoplus_{l=1}^k \left(\prod_{\alpha \in A} R\right) & \longrightarrow & \bigoplus_{j=1}^m \left(\prod_{\alpha \in A} R\right) & \longrightarrow & Q \otimes_R \left(\prod_{\alpha \in A} R\right) & \longrightarrow & 0 \end{array}$$

with exact rows. Pick an element $\sum_j \sum_{\alpha} y_{j,\alpha}$ of $\bigoplus_{j=1, \dots, m} \left(\bigoplus_{\alpha \in A} R\right)^\wedge$. If this element maps to zero in the module $Q \otimes_R \left(\prod_{\alpha \in A} R\right)$, then we see in particular that $\sum_j q_j \otimes y_{j,\alpha} = 0$ in Q for each α . Thus we can find an element $(z_{1,\alpha}, \dots, z_{k,\alpha}) \in \bigoplus_{l=1, \dots, k} R$ which maps to $(y_{1,\alpha}, \dots, y_{m,\alpha}) \in \bigoplus_{j=1, \dots, m} R$. Moreover, if $y_{j,\alpha} \in I^{N_\alpha}$ for $j = 1, \dots, m$, then we may assume that $z_{l,\alpha} \in I^{N_\alpha - c}$ for $l = 1, \dots, k$. Hence the sum $\sum_l \sum_{\alpha} z_{l,\alpha}$ is “convergent” and defines an element of $\bigoplus_{l=1, \dots, k} \left(\bigoplus_{\alpha \in A} R\right)^\wedge$ which maps to the element $\sum_j \sum_{\alpha} y_{j,\alpha}$ we started out with. Thus the right vertical arrow is injective and we win. \square

The following lemma can also be deduced from Lemma 15.19.4 below.

Lemma 15.19.2. *Let R be a ring. Let $I \subset R$ be an ideal. Let A be a set. Assume R is Noetherian. The completion $\left(\bigoplus_{\alpha \in A} R\right)^\wedge$ is a flat R -module.*

Proof. Denote R^\wedge the completion of R with respect to I . As $R \rightarrow R^\wedge$ is flat by Algebra, Lemma 10.93.3 it suffices to prove that $(\bigoplus_{\alpha \in A} R)^\wedge$ is a flat R^\wedge -module (use Algebra, Lemma 10.38.3). Since

$$\left(\bigoplus_{\alpha \in A} R\right)^\wedge = \left(\bigoplus_{\alpha \in A} R^\wedge\right)^\wedge$$

we may replace R by R^\wedge and assume that R is complete with respect to I (see Algebra, Lemma 10.93.8). In this case Lemma 15.19.1 tells us the map $(\bigoplus_{\alpha \in A} R)^\wedge \rightarrow \prod_{\alpha \in A} R$ is universally injective. Thus, by Algebra, Lemma 10.79.7 it suffices to show that $\prod_{\alpha \in A} R$ is flat. By Algebra, Proposition 10.87.5 (and Algebra, Lemma 10.87.4) we see that $\prod_{\alpha \in A} R$ is flat. \square

Lemma 15.19.3. *Let A be a Noetherian ring. Let I be an ideal of A . Let M be a finite A -module. For every $p > 0$ there exists a $c > 0$ such that $\text{Tor}_p^A(M, A/I^{n+c}) \rightarrow \text{Tor}_p^A(M, A/I^n)$ is zero.*

Proof. Proof for $p = 1$. Choose a short exact sequence $0 \rightarrow K \rightarrow R^{\oplus t} \rightarrow M \rightarrow 0$. Then $\text{Tor}_1^A(M, A/I^n) = K \cap (I^n)^{\oplus t} / I^n K$. By Artin-Rees (Algebra, Lemma 10.49.2) there is a constant $c \geq 0$ such that $K \cap (I^{n+c})^{\oplus t} \subset I^n K$. Thus the result for $p = 1$. For $p > 1$ we have $\text{Tor}_p^A(M, A/I^n) = \text{Tor}_{p-1}^A(K, A/I^n)$. Thus the lemma follows by induction. \square

Lemma 15.19.4. *Let A be a Noetherian ring. Let I be an ideal of A . Let (M_n) be an inverse system of A -modules such that*

- (1) M_n is a flat A/I^n -module,
- (2) $M_{n+1} \rightarrow M_n$ is surjective.

Then $M = \lim M_n$ is a flat A -module and $Q \otimes_A M = \lim Q \otimes_A M_n$ for every finite A -module Q .

Proof. We first show that $Q \otimes_A M = \lim Q \otimes_A M_n$ for every finite A -module Q . Choose a resolution $F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow Q \rightarrow 0$ by finite free A -modules F_i . Then

$$F_2 \otimes_A M_n \rightarrow F_1 \otimes_A M_n \rightarrow F_0 \otimes_A M_n$$

is a chain complex whose homology in degree 0 is $Q \otimes_A M_n$ and whose homology in degree 1 is

$$\text{Tor}_1^A(Q, M_n) = \text{Tor}_1^A(Q, A/I^n) \otimes_{A/I^n} M_n$$

as M_n is flat over A/I^n . By Lemma 15.19.3 we see that this system is essentially constant (with value 0). It follows from Homology, Lemma 12.27.7 that $\lim Q \otimes_A A/I^n = \text{Coker}(\lim F_1 \otimes_A M_n \rightarrow \lim F_0 \otimes_A M_n)$. Since F_i is finite free this equals $\text{Coker}(F_1 \otimes_A M \rightarrow F_0 \otimes_A M) = Q \otimes_A M$.

Next, let $Q \rightarrow Q'$ be an injective map of finite A -modules. We have to show that $Q \otimes_A M \rightarrow Q' \otimes_A M$ is injective (Algebra, Lemma 10.38.4). By the above we see

$$\text{Ker}(Q \otimes_A M \rightarrow Q' \otimes_A M) = \text{Ker}(\lim Q \otimes_A M_n \rightarrow \lim Q' \otimes_A M_n).$$

For each n we have an exact sequence

$$\text{Tor}_1^A(Q', M_n) \rightarrow \text{Tor}_1^A(Q'', M_n) \rightarrow Q \otimes_A M_n \rightarrow Q' \otimes_A M_n$$

where $Q'' = \text{Coker}(Q \rightarrow Q')$. Above we have seen that the inverse systems of Tor 's are essentially constant with value 0. It follows from Homology, Lemma 12.27.7 that the inverse limit of the right most maps is injective. \square

Lemma 15.19.5. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R -module. Assume*

- (1) I is finitely generated,
- (2) R/I is Noetherian,
- (3) M/IM is flat over R/I ,
- (4) $\text{Tor}_1^R(M, R/I) = 0$.

Then the I -adic completion R^\wedge is a Noetherian ring and M^\wedge is flat over R^\wedge .

Proof. By Algebra, Lemma 10.95.8 the modules $M/I^n M$ are flat over R/I^n for all n . By Algebra, Lemmas 10.93.6 and 10.93.7 we have (a) R^\wedge and M^\wedge are I -adically complete and (b) $R/I^n = R^\wedge/I^n R^\wedge$ for all n . By Algebra, Lemma 10.93.9 the ring R^\wedge is Noetherian. Applying Lemma 15.19.4 we conclude that $M^\wedge = \lim M/I^n M$ is flat as an R^\wedge -module. \square

15.20. The Koszul complex

We define the Koszul complex as follows.

Definition 15.20.1. Let R be a ring. Let $\varphi : E \rightarrow R$ be an R -module map. The *Koszul complex* $K_\bullet(\varphi)$ associated to φ is the commutative differential graded algebra defined as follows:

- (1) the underlying graded algebra is the exterior algebra $K_\bullet(\varphi) = \wedge(E)$,
- (2) the differential $d : K_\bullet(\varphi) \rightarrow K_\bullet(\varphi)$ is the unique derivation such that $d(e) = \varphi(e)$ for all $e \in E = K_1(\varphi)$.

Explicitly, if $e_1 \wedge \dots \wedge e_n$ is one of the generators of degree n in $K_\bullet(\varphi)$, then

$$d(e_1 \wedge \dots \wedge e_n) = \sum_{i=1, \dots, n} (-1)^{i+1} \varphi(e_i) e_1 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_n.$$

It is straightforward to see that this gives a well defined derivation on the tensor algebra, which annihilates $e \otimes e$ and hence factors through the exterior algebra.

We often assume that E is a finite free module, say $E = R^{\oplus n}$. In this case the map φ is given by a sequence of elements $f_1, \dots, f_n \in R$.

Definition 15.20.2. Let R be a ring and let $f_1, \dots, f_r \in R$. The *Koszul complex on f_1, \dots, f_r* is the Koszul complex associated to the map $(f_1, \dots, f_r) : R^{\oplus r} \rightarrow R$. Notation $K_\bullet(f_\bullet)$, $K_\bullet(f_1, \dots, f_r)$, $K_\bullet(R, f_1, \dots, f_r)$, or $K_\bullet(R, f_\bullet)$.

Of course, if E is finite locally free, then $K_\bullet(\varphi)$ is locally on $\text{Spec}(R)$ isomorphic to a Koszul complex $K_\bullet(f_1, \dots, f_r)$. This complex has many interesting formal properties.

Lemma 15.20.3. *Let $\varphi : E \rightarrow R$ and $\varphi' : E' \rightarrow R$ be R -module maps. Let $\psi : E \rightarrow E'$ be an R -module map such that $\varphi' \circ \psi = \varphi$. Then ψ induces a homomorphism of differential graded algebras $K_\bullet(\varphi) \rightarrow K_\bullet(\varphi')$.*

Proof. This is immediate from the definitions. \square

Lemma 15.20.4. *Let $f_1, \dots, f_r \in R$ be a sequence. Let (x_{ij}) be an invertible $r \times r$ -matrix with coefficients in R . Then the complexes $K_\bullet(f_\bullet)$ and*

$$K_\bullet\left(\sum x_{1j} f_j, \sum x_{2j} f_j, \dots, \sum x_{cj} f_j\right)$$

are isomorphic.

Proof. Set $g_i = \sum x_{ij} f_j$. The matrix (x_{ij}) gives an isomorphism $x : R^{\oplus r} \rightarrow R^{\oplus r}$ such that $(g_1, \dots, g_r) \circ x = (f_1, \dots, f_r)$. Hence this follows from the functoriality of the Koszul complex described in Lemma 15.20.3. \square

Lemma 15.20.5. *Let R be a ring. Let $\varphi : E \rightarrow R$ be an R -module map. Let $e \in E$ with image $f = \varphi(e)$ in R . Then*

$$f = de + ed$$

as endomorphisms of $K_\bullet(\varphi)$.

Proof. This is true because $d(ea) = d(e)a - ed(a) = fa - ed(a)$. \square

Lemma 15.20.6. *Let R be a ring. Let $f_1, \dots, f_r \in R$ be a sequence. Multiplication by f_i on $K_\bullet(f_\bullet)$ is homotopic to zero, and in particular the cohomology modules $H_i(K_\bullet(f_\bullet))$ are annihilated by the ideal (f_1, \dots, f_r) .*

Proof. Special case of Lemma 15.20.5. \square

In Derived Categories, Section 13.9 we defined the cone of a morphism of cochain complexes. The cone $C(f)_\bullet$ of a morphism of chain complexes $f : A_\bullet \rightarrow B_\bullet$ is the complex $C(f)_\bullet$ given by $C(f)_n = B_n \oplus A_{n-1}$ and differential

$$(15.20.6.1) \quad d_{C(f),n} = \begin{pmatrix} d_{B,n} & f_{n-1} \\ 0 & -d_{A,n-1} \end{pmatrix}$$

It comes equipped with canonical morphisms of complexes $i : B_\bullet \rightarrow C(f)_\bullet$ and $p : C(f)_\bullet \rightarrow A_\bullet[-1]$ induced by the obvious maps $B_n \rightarrow C(f)_n \rightarrow A_{n-1}$.

Lemma 15.20.7. *Let R be a ring. Let $\varphi : E \rightarrow R$ be an R -module map. Let $f \in R$. Set $E' = E \oplus R$ and define $\varphi' : E' \rightarrow R$ by φ on E and multiplication by f on R . The complex $K_\bullet(\varphi')$ is isomorphic to the cone of the map of complexes*

$$f : K_\bullet(\varphi) \rightarrow K_\bullet(\varphi).$$

Proof. Denote $e_0 \in E'$ the element $1 \in R \subset R \oplus E$. By our definition of the cone above we see that

$$C(f)_n = K_n(\varphi) \oplus K_{n-1}(\varphi) = \wedge^n(E) \oplus \wedge^{n-1}(E) = \wedge^n(E')$$

where in the last $=$ we map $(0, e_1 \wedge \dots \wedge e_{n-1})$ to $e_0 \wedge e_1 \wedge \dots \wedge e_{n-1}$ in $\wedge^n(E')$. A computation shows that this isomorphism is compatible with differentials. Namely, this is clear for elements of the first summand as $\varphi'|_E = \varphi$ and $d_{C(f)}$ restricted to the first summand is just $d_{K_\bullet(\varphi)}$. On the other hand, if $e_1 \wedge \dots \wedge e_{n-1}$ is in the first summand, then

$$d_{C(f)}(0, e_1 \wedge \dots \wedge e_{n-1}) = f e_1 \wedge \dots \wedge e_{n-1} - d_{K_\bullet(\varphi)}(e_1 \wedge \dots \wedge e_{n-1})$$

and on the other hand

$$\begin{aligned} & d_{K_\bullet(\varphi')}(e_0 \wedge e_1 \wedge \dots \wedge e_{n-1}) \\ &= \sum_{i=0, \dots, n-1} (-1)^i \varphi'(e_i) e_0 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_{n-1} \\ &= f e_1 \wedge \dots \wedge e_{n-1} + \sum_{i=1, \dots, n-1} (-1)^i \varphi(e_i) e_0 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_{n-1} \\ &= f e_1 \wedge \dots \wedge e_{n-1} - e_0 \left(\sum_{i=1, \dots, n-1} (-1)^{i+1} \varphi(e_i) e_1 \wedge \dots \wedge \widehat{e}_i \wedge \dots \wedge e_{n-1} \right) \end{aligned}$$

which is the image of the result of the previous computation. \square

Lemma 15.20.8. *Let R be a ring. Let f_1, \dots, f_r be a sequence of elements of R . The complex $K_\bullet(f_1, \dots, f_r)$ is isomorphic to the cone of the map of complexes*

$$f_n : K_\bullet(f_1, \dots, f_{r-1}) \longrightarrow K_\bullet(f_1, \dots, f_{r-1}).$$

Proof. Special case of Lemma 15.20.7. □

Lemma 15.20.9. *Let R be a ring. Let A_\bullet be a complex of R -modules. Let $f, g \in R$. Let $C(f)_\bullet$ be the cone of $f : A_\bullet \rightarrow A_\bullet$. Define similarly $C(g)_\bullet$ and $C(fg)_\bullet$. Then $C(fg)_\bullet$ is homotopy equivalent to the cone of a map*

$$C(f)_\bullet[1] \longrightarrow C(g)_\bullet.$$

Proof. We first prove this if A_\bullet is the complex consisting of R placed in degree 0. In this case the map we use is

$$\begin{array}{ccccccccc} 0 & \longrightarrow & 0 & \longrightarrow & R & \xrightarrow{f} & R & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & R & \xrightarrow{g} & R & \longrightarrow & 0 & \longrightarrow & 0 \end{array}$$

The cone of this is the chain complex consisting of $R \oplus R$ placed in degrees 1 and 0 and differential (15.20.6.1)

$$\begin{pmatrix} g & 1 \\ 0 & -f \end{pmatrix} : R^{\oplus 2} \longrightarrow R^{\oplus 2}$$

We leave it to the reader to show this this chain complex is homotopic to the complex $fg : R \rightarrow R$. In general we write $C(f)_\bullet$ and $C(g)_\bullet$ as the total complex of the double complexes

$$(R \xrightarrow{f} R) \otimes_R A_\bullet \quad \text{and} \quad (R \xrightarrow{g} R) \otimes_R A_\bullet$$

and in this way we deduce the result from the special case discussed above. Some details omitted. □

Lemma 15.20.10. *Let R be a ring. Let $\varphi : E \rightarrow R$ be an R -module map. Let $f, g \in R$. Set $E' = E \oplus R$ and define $\varphi'_f, \varphi'_g, \varphi'_{fg} : E' \rightarrow R$ by φ on E and multiplication by f, g, fg on R . The complex $K_\bullet(\varphi'_{fg})$ is isomorphic to the cone of a map of complexes*

$$K_\bullet(\varphi'_f)[1] \longrightarrow K_\bullet(\varphi'_g).$$

Proof. By Lemma 15.20.7 the complex $K_\bullet(\varphi'_f)$ is isomorphic to the cone of multiplication by f on $K_\bullet(\varphi)$ and similarly for the other two cases. Hence the lemma follows from Lemma 15.20.9. □

Lemma 15.20.11. *Let R be a ring. Let f_1, \dots, f_{r-1} be a sequence of elements of R . Let $f, g \in R$. The complex $K_\bullet(f_1, \dots, f_{r-1}, fg)$ is homotopy equivalent to the cone of a map of complexes*

$$K_\bullet(f_1, \dots, f_{r-1}, f)[1] \longrightarrow K_\bullet(f_1, \dots, f_{r-1}, g)$$

Proof. Special case of Lemma 15.20.10. □

Lemma 15.20.12. *Let A be a ring. Let $f_1, \dots, f_r, g_1, \dots, g_s$ be elements of A . Then there is an isomorphism of Koszul complexes*

$$K_\bullet(A, f_1, \dots, f_r, g_1, \dots, g_s) = \text{Tot}(K_\bullet(A, f_1, \dots, f_r) \otimes_A K_\bullet(A, g_1, \dots, g_s)).$$

Proof. Omitted. Hint: If $K_\bullet(A, f_1, \dots, f_r)$ is generated as a differential graded algebra by x_1, \dots, x_r with $d(x_i) = f_i$ and $K_\bullet(A, g_1, \dots, g_s)$ is generated as a differential graded algebra by y_1, \dots, y_s with $d(y_j) = g_j$, then we can think of $K_\bullet(A, f_1, \dots, f_r, g_1, \dots, g_s)$ as the differential graded algebra generated by the sequence of elements $x_1, \dots, x_r, y_1, \dots, y_s$ with $d(x_i) = f_i$ and $d(y_j) = g_j$. \square

Lemma 15.20.13. *Let R be a ring. Let $f_1, \dots, f_r \in R$. The extended alternating Čech complex*

$$R \rightarrow \prod_{i_0} R_{f_{i_0}} \rightarrow \prod_{i_0 < i_1} R_{f_{i_0} f_{i_1}} \rightarrow \dots \rightarrow R_{f_1 \dots f_r}$$

is a colimit of the Koszul complexes $K(R, f_1^n, \dots, f_r^n)$.

Proof. The transition maps $K(R, f_1^n, \dots, f_r^n) \rightarrow K(R, f_1^{n+1}, \dots, f_r^{n+1})$ are the maps sending $e_{i_1} \wedge \dots \wedge e_{i_p}$ to $f_{i_{p+1}} \dots f_{i_r} e_{i_1} \wedge \dots \wedge e_{i_p}$ where the indices are such that $\{1, \dots, r\} = \{i_1, \dots, i_r\}$. In particular the transition maps are always 1 in degree r and equal to $f_1 \dots f_r$ in degree 0. The terms of the colimit are equal to the terms of the extended alternating Čech complex by Algebra, Lemma 10.9.9. \square

15.21. Koszul regular sequences

Please take a look at Algebra, Sections 10.67 and 10.68 before looking at this one.

Definition 15.21.1. Let R be a ring. Let $r \geq 0$ and let $f_1, \dots, f_r \in R$ be a sequence of elements. Let M be an R -module. The sequence f_1, \dots, f_r is called

- (1) M -Koszul-regular if $H_i(K_\bullet(f_1, \dots, f_r) \otimes_R M) = 0$ for all $i \neq 0$,
- (2) M - H_1 -regular if $H_1(K_\bullet(f_1, \dots, f_r) \otimes_R M) = 0$,
- (3) Koszul-regular if $H_i(K_\bullet(f_1, \dots, f_r)) = 0$ for all $i \neq 0$, and
- (4) H_1 -Koszul-regular if $H_1(K_\bullet(f_1, \dots, f_r)) = 0$.

We will see in Lemmas 15.21.2 and 15.21.5 that for elements f_1, \dots, f_r of a ring R we have the following implications

$$\begin{aligned} f_1, \dots, f_r \text{ is a regular sequence} &\Rightarrow f_1, \dots, f_r \text{ is a Koszul-regular sequence} \\ &\Rightarrow f_1, \dots, f_r \text{ is an } H_1\text{-regular sequence} \\ &\Rightarrow f_1, \dots, f_r \text{ is a quasi-regular sequence.} \end{aligned}$$

In general none of these implications can be reversed, but if R is a Noetherian local ring and $f_1, \dots, f_r \in \mathfrak{m}_R$, then the 4 conditions are all equivalent (Lemma 15.21.6). If $f = f_1 \in R$ is a length 1 sequence then it is clear that the following are all equivalent

- (1) f is a regular sequence of length one,
- (2) f is a Koszul-regular sequence of length one, and
- (3) f is a H_1 -regular sequence of length one.

It is also clear that these imply that f is a quasi-regular sequence of length one. But there do exist quasi-regular sequences of length 1 which are not regular sequences. Namely, let

$$R = k[x, y_0, y_1, \dots] / (xy_0, xy_1 - y_0, xy_2 - y_1, \dots)$$

and let f be the image of x in R . Then f is a zerodivisor, but $\bigoplus_{n \geq 0} (f^n) / (f^{n+1}) \cong k[x]$ is a polynomial ring.

Lemma 15.21.2. *An M -regular sequence is M -Koszul-regular. A regular sequence is Koszul-regular.*

Proof. Let R be a ring and let M be an R -module. It is immediate that an M -regular sequence of length 1 is M -Koszul-regular. Let f_1, \dots, f_r be an M -regular sequence. Then f_1 is a nonzero divisor on M . Hence

$$0 \rightarrow K_\bullet(f_2, \dots, f_r) \otimes M \xrightarrow{f_1} K_\bullet(f_2, \dots, f_r) \otimes M \rightarrow K_\bullet(\bar{f}_2, \dots, \bar{f}_r) \otimes M/f_1M \rightarrow 0$$

is a short exact sequence of complexes where \bar{f}_i is the image of f_i in $R/(f_1)$. By Lemma 15.20.8 the complex $K_\bullet(R, f_1, \dots, f_r)$ is isomorphic to the cone of multiplication by f_1 on $K_\bullet(f_2, \dots, f_r)$. Thus $K_\bullet(R, f_1, \dots, f_r) \otimes M$ is isomorphic to the cone on the first map. Hence $K_\bullet(\bar{f}_2, \dots, \bar{f}_r) \otimes M/f_1M$ is quasi-isomorphic to $K_\bullet(f_1, \dots, f_r) \otimes M$. As $\bar{f}_2, \dots, \bar{f}_r$ is an M/f_1M -regular sequence in $R/(f_1)$ the result follows from the case $r = 1$ and induction. \square

Lemma 15.21.3. *Let $f_1, \dots, f_{r-1} \in R$ be a sequence and $f, g \in R$. Let M be an R -module.*

- (1) *If f_1, \dots, f_{r-1}, f and f_1, \dots, f_{r-1}, g are M - H_1 -regular then f_1, \dots, f_{r-1}, fg is M - H_1 -regular too.*
- (2) *If f_1, \dots, f_{r-1}, f and f_1, \dots, f_{r-1}, g are M -Koszul-regular then f_1, \dots, f_{r-1}, fg is M -Koszul-regular too.*

Proof. By Lemma 15.20.11 we have exact sequences

$$H_i(K_\bullet(f_1, \dots, f_{r-1}, f) \otimes M) \rightarrow H_i(K_\bullet(f_1, \dots, f_{r-1}, fg) \otimes M) \rightarrow H_i(K_\bullet(f_1, \dots, f_{r-1}, g) \otimes M)$$

for all i . \square

Lemma 15.21.4. *Let $\varphi : R \rightarrow S$ be a flat ring map. Let $f_1, \dots, f_r \in R$. Let M be an R -module and set $N = M \otimes_R S$.*

- (1) *If f_1, \dots, f_r in R is an M - H_1 -regular sequence, then $\varphi(f_1), \dots, \varphi(f_r)$ is an N - H_1 -regular sequence in S .*
- (2) *If f_1, \dots, f_r is an M -Koszul-regular sequence in R , then $\varphi(f_1), \dots, \varphi(f_r)$ is an N -Koszul-regular sequence in S .*

Proof. This is true because $K_\bullet(f_1, \dots, f_r) \otimes_R S = K_\bullet(\varphi(f_1), \dots, \varphi(f_r))$ and therefore $(K_\bullet(f_1, \dots, f_r) \otimes_R M) \otimes_R S = K_\bullet(\varphi(f_1), \dots, \varphi(f_r)) \otimes_S N$. \square

Lemma 15.21.5. *An M - H_1 -regular sequence is M -quasi-regular.*

Proof. Let R be a ring and let M be an R -module. Let f_1, \dots, f_r be an M - H_1 -regular sequence. Denote $J = (f_1, \dots, f_r)$. The assumption means that we have an exact sequence

$$\wedge^2(R^r) \otimes M \rightarrow R^{\oplus r} \otimes M \rightarrow JM \rightarrow 0$$

where the first arrow is given by $e_i \wedge e_j \otimes m \mapsto (f_i e_j - f_j e_i) \otimes m$. In particular this implies that

$$JM/J^2M = JM \otimes_R R/J = (M/JM)^{\oplus r}$$

is a finite free module. To finish the proof we have to prove for every $n \geq 2$ the following: if

$$\xi = \sum_{|I|=n, I=(i_1, \dots, i_r)} m_I f_1^{i_1} \dots f_r^{i_r} \in J^{n+1}M$$

then $m_I \in JM$ for all I . Note that $f_1, \dots, f_{r-1}, f_r^n$ is an M - H_1 -regular sequence by Lemma 15.21.3. Hence we see that the required result holds for the multi-index $I = (0, \dots, 0, n)$. It turns out that we can reduce the general case to this case as follows.

Let $S = R[x_1, x_2, \dots, x_r, 1/x_r]$. The ring map $R \rightarrow S$ is faithfully flat, hence f_1, \dots, f_r is an M - H_1 -regular sequence in S , see Lemma 15.21.4. By Lemma 15.20.4 we see that

$$g_1 = f_1 - x_1/x_r f_r, \dots, g_{r-1} = f_{r-1} - x_{r-1}/x_r f_r, g_r = (1/x_r) f_r$$

is an M - H_1 -regular sequence in S . Finally, note that our element ξ can be rewritten

$$\xi = \sum_{|I|=n, I=(i_1, \dots, i_r)} m_I (g_1 + x_r g_r)^{i_1} \dots (g_{r-1} + x_r g_r)^{i_{r-1}} (x_r g_r)^{i_r}$$

and the coefficient of g_r^n in this expression is

$$\sum m_I x_1^{i_1} \dots x_r^{i_r} \in J(M \otimes_R S).$$

Since the monomials $x_1^{i_1} \dots x_r^{i_r}$ form part of an R -basis of S over R we conclude that $m_I \in J$ for all I as desired. \square

For nonzero finite modules over Noetherian local rings all of the types of regular sequences introduced so far are equivalent.

Lemma 15.21.6. *Let (R, \mathfrak{m}) be a Noetherian local ring. Let M be a nonzero finite R -module. Let $f_1, \dots, f_r \in \mathfrak{m}$. The following are equivalent*

- (1) f_1, \dots, f_r is an M -regular sequence,
- (2) f_1, \dots, f_r is a M -Koszul-regular sequence,
- (3) f_1, \dots, f_r is an M - H_1 -regular sequence,
- (4) f_1, \dots, f_r is an M -quasi-regular sequence.

In particular the sequence f_1, \dots, f_r is a regular sequence in R if and only if it is a Koszul regular sequence, if and only if it is a H_1 -regular sequence, if and only if it is a quasi-regular sequence.

Proof. The implication (1) \Rightarrow (2) is Lemma 15.21.2. The implication (2) \Rightarrow (3) is immediate. The implication (3) \Rightarrow (4) is Lemma 15.21.5. The implication (4) \Rightarrow (1) is Algebra, Lemma 10.68.6. \square

Lemma 15.21.7. *Let A be a ring. Let $I \subset A$ be an ideal. Let g_1, \dots, g_m be a sequence in A whose image in A/I is H_1 -regular. Then $I \cap (g_1, \dots, g_m) = I(g_1, \dots, g_m)$.*

Proof. Consider the exact sequence of complexes

$$0 \rightarrow I \otimes_A K_\bullet(A, g_1, \dots, g_m) \rightarrow K_\bullet(A, g_1, \dots, g_m) \rightarrow K_\bullet(A/I, g_1, \dots, g_m) \rightarrow 0$$

Since the complex on the right has $H_1 = 0$ by assumption we see that

$$\text{Coker}(I^{\oplus m} \rightarrow I) \rightarrow \text{Coker}(A^{\oplus m} \rightarrow A)$$

is injective. This is equivalent to the assertion of the lemma. \square

Lemma 15.21.8. *Let A be a ring. Let $I \subset J \subset A$ be ideals. Assume that $J/I \subset A/I$ is generated by an H_1 -regular sequence. Then $I \cap J^2 = IJ$.*

Proof. To prove this choose $g_1, \dots, g_m \in J$ whose images in A/I form a H_1 -regular sequence which generates J/I . In particular $J = I + (g_1, \dots, g_m)$. Suppose that $x \in I \cap J^2$. Because $x \in J^2$ can write

$$x = \sum a_{ij} g_i g_j + \sum a_j g_j + a$$

with $a_{ij} \in A$, $a_j \in I$ and $a \in I^2$. Then $\sum a_{ij} g_i g_j \in I \cap (g_1, \dots, g_m)$ hence by Lemma 15.21.7 we see that $\sum a_{ij} g_i g_j \in I(g_1, \dots, g_m)$. Thus $x \in IJ$ as desired. \square

Lemma 15.21.9. *Let A be a ring. Let I be an ideal generated by a quasi-regular sequence f_1, \dots, f_n in A . Let $g_1, \dots, g_m \in A$ be elements whose images $\bar{g}_1, \dots, \bar{g}_m$ form an H_1 -regular sequence in A/I . Then $f_1, \dots, f_n, g_1, \dots, g_m$ is a quasi-regular sequence in A .*

Proof. We claim that g_1, \dots, g_m forms an H_1 -regular sequence in A/I^d for every d . By induction assume that this holds in A/I^{d-1} . We have a short exact sequence of complexes

$$0 \rightarrow K_\bullet(A, g_\bullet) \otimes_A I^{d-1}/I^d \rightarrow K_\bullet(A/I^d, g_\bullet) \rightarrow K_\bullet(A/I^{d-1}, g_\bullet) \rightarrow 0$$

Since f_1, \dots, f_n is quasi-regular we see that the first complex is a direct sum of copies of $K_\bullet(A/I, g_1, \dots, g_m)$ hence acyclic in degree 1. By induction hypothesis the last complex is acyclic in degree 1. Hence also the middle complex is. In particular, the sequence g_1, \dots, g_m forms a quasi-regular sequence in A/I^d for every $d \geq 1$, see Lemma 15.21.5. Now we are ready to prove that $f_1, \dots, f_n, g_1, \dots, g_m$ is a quasi-regular sequence in A . Namely, set $J = (f_1, \dots, f_n, g_1, \dots, g_m)$ and suppose that (with multinomial notation)

$$\sum_{|N|+|M|=d} a_{N,M} f^N g^M \in J^{d+1}$$

for some $a_{N,M} \in A$. We have to show that $a_{N,M} \in J$ for all N, M . Let $e \in \{0, 1, \dots, d\}$. Then

$$\sum_{|N|=d-e, |M|=e} a_{N,M} f^N g^M \in (g_1, \dots, g_m)^{e+1} + I^{d-e+1}$$

Because g_1, \dots, g_m is a quasi-regular sequence in A/I^{d-e+1} we deduce

$$\sum_{|N|=d-e} a_{N,M} f^N \in (g_1, \dots, g_m) + I^{d-e+1}$$

for each M with $|M| = e$. By Lemma 15.21.7 applied to I^{d-e}/I^{d-e+1} in the ring A/I^{d-e+1} this implies $\sum_{|N|=d-e} a_{N,M} f^N \in I^{d-e}(g_1, \dots, g_m)$. Since f_1, \dots, f_n is quasi-regular in A this implies that $a_{N,M} \in J$ for each N, M with $|N| = d - e$ and $|M| = e$. This proves the lemma. \square

Lemma 15.21.10. *Let A be a ring. Let I be an ideal generated by an H_1 -regular sequence f_1, \dots, f_n in A . Let $g_1, \dots, g_m \in A$ be elements whose images $\bar{g}_1, \dots, \bar{g}_m$ form an H_1 -regular sequence in A/I . Then $f_1, \dots, f_n, g_1, \dots, g_m$ is an H_1 -regular sequence in A .*

Proof. We have to show that $H_1(A, f_1, \dots, f_n, g_1, \dots, g_m) = 0$. To do this consider the commutative diagram

$$\begin{array}{ccccccc} \Lambda^2(A^{\oplus n+m}) & \longrightarrow & A^{\oplus n+m} & \longrightarrow & A & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ \Lambda^2(A/I^{\oplus m}) & \longrightarrow & A/I^{\oplus m} & \longrightarrow & A/I & \longrightarrow & 0 \end{array}$$

Consider an element $(a_1, \dots, a_{n+m}) \in A^{\oplus n+m}$ which maps to zero in A . Because $\bar{g}_1, \dots, \bar{g}_m$ form an H_1 -regular sequence in A/I we see that $(\bar{a}_{n+1}, \dots, \bar{a}_{n+m})$ is the image of some element $\bar{\alpha}$ of $\Lambda^2(A/I^{\oplus m})$. We can lift $\bar{\alpha}$ to an element $\alpha \in \Lambda^2(A^{\oplus n+m})$ and subtract the image of it in $A^{\oplus n+m}$ from our element (a_1, \dots, a_{n+m}) .

Thus we may assume that $a_{n+1}, \dots, a_{n+m} \in I$. Since $I = (f_1, \dots, f_n)$ we can modify our element (a_1, \dots, a_{n+m}) by linear combinations of the elements

$$(0, \dots, g_j, 0, \dots, 0, f_i, 0, \dots, 0)$$

in the image of the top left horizontal arrow to reduce to the case that a_{n+1}, \dots, a_{n+m} are zero. In this case $(a_1, \dots, a_n, 0, \dots, 0)$ defines an element of $H_1(A, f_1, \dots, f_n)$ which we assumed to be zero. \square

Lemma 15.21.11. *Let A be a ring. Let $f_1, \dots, f_n, g_1, \dots, g_m \in A$ be an H_1 -regular sequence. Then the images $\bar{g}_1, \dots, \bar{g}_m$ in $A/(f_1, \dots, f_n)$ form an H_1 -regular sequence.*

Proof. Set $I = (f_1, \dots, f_n)$. We have to show that any relation $\sum_{j=1, \dots, m} \bar{a}_j \bar{g}_j$ in A/I is a linear combination of trivial relations. Because $I = (f_1, \dots, f_n)$ we can lift this relation to a relation

$$\sum_{j=1, \dots, m} a_j g_j + \sum_{i=1, \dots, n} b_i f_i = 0$$

in A . By assumption this relation in A is a linear combination of trivial relations. Taking the image in A/I we obtain what we want. \square

Lemma 15.21.12. *Let A be a ring. Let I be an ideal generated by a Koszul-regular sequence f_1, \dots, f_n in A . Let $g_1, \dots, g_m \in A$ be elements whose images $\bar{g}_1, \dots, \bar{g}_m$ form a Koszul-regular sequence in A/I . Then $f_1, \dots, f_n, g_1, \dots, g_m$ is a Koszul-regular sequence in A .*

Proof. Our assumptions say that $K_\bullet(A, f_1, \dots, f_n)$ is a finite free resolution of A/I and $K_\bullet(A/I, \bar{g}_1, \dots, \bar{g}_m)$ is a finite free resolution of $A/(f_i, g_j)$ over A/I . Then

$$\begin{aligned} K_\bullet(A, f_1, \dots, f_n, g_1, \dots, g_m) &= \text{Tot}(K_\bullet(A, f_1, \dots, f_n) \otimes_A K_\bullet(A, g_1, \dots, g_m)) \\ &\cong A/I \otimes_A K_\bullet(A, g_1, \dots, g_m) \\ &= K_\bullet(A/I, \bar{g}_1, \dots, \bar{g}_m) \\ &\cong A/(f_i, g_j) \end{aligned}$$

The first equality by Lemma 15.20.12. The first quasi-isomorphism \cong by (the dual of) Homology, Lemma 12.22.7 as the q th row of the double complex $K_\bullet(A, f_1, \dots, f_n) \otimes_A K_\bullet(A, g_1, \dots, g_m)$ is a resolution of $A/I \otimes_A K_q(A, g_1, \dots, g_m)$. The second equality is clear. The last quasi-isomorphism by assumption. Hence we win. \square

To conclude in the following lemma it is necessary to assume that both f_1, \dots, f_n and $f_1, \dots, f_n, g_1, \dots, g_m$ are Koszul-regular. A counter example to dropping the assumption that f_1, \dots, f_n is Koszul-regular is Examples, Lemma 82.13.1.

Lemma 15.21.13. *Let A be a ring. Let $f_1, \dots, f_n, g_1, \dots, g_m \in A$. If both f_1, \dots, f_n and $f_1, \dots, f_n, g_1, \dots, g_m$ are Koszul-regular sequences in A , then $\bar{g}_1, \dots, \bar{g}_m$ in $A/(f_1, \dots, f_n)$ form a Koszul-regular sequence.*

Proof. Set $I = (f_1, \dots, f_n)$. Our assumptions say that $K_\bullet(A, f_1, \dots, f_n)$ is a finite free resolution of A/I and $K_\bullet(A, f_1, \dots, f_n, g_1, \dots, g_m)$ is a finite free resolution of

$A/(f_i, g_j)$ over A . Then

$$\begin{aligned} A/(f_i, g_j) &\cong K_\bullet(A, f_1, \dots, f_n, g_1, \dots, g_m) \\ &= \text{Tot}(K_\bullet(A, f_1, \dots, f_n) \otimes_A K_\bullet(A, g_1, \dots, g_m)) \\ &\cong A/I \otimes_A K_\bullet(A, g_1, \dots, g_m) \\ &= K_\bullet(A/I, \bar{g}_1, \dots, \bar{g}_m) \end{aligned}$$

The first quasi-isomorphism \cong by assumption. The first equality by Lemma 15.20.12. The second quasi-isomorphism by (the dual of) Homology, Lemma 12.22.7 as the q th row of the double complex $K_\bullet(A, f_1, \dots, f_n) \otimes_A K_\bullet(A, g_1, \dots, g_m)$ is a resolution of $A/I \otimes_A K_q(A, g_1, \dots, g_m)$. The second equality is clear. Hence we win. \square

Lemma 15.21.14. *Let R be a ring. Let I be an ideal generated by $f_1, \dots, f_r \in R$.*

- (1) *If I can be generated by a quasi-regular sequence of length r , then f_1, \dots, f_r is a quasi-regular sequence.*
- (2) *If I can be generated by an H_1 -regular sequence of length r , then f_1, \dots, f_r is an H_1 -regular sequence.*
- (3) *If I can be generated by a Koszul-regular sequence of length r , then f_1, \dots, f_r is a Koszul-regular sequence.*

Proof. If I can be generated by a quasi-regular sequence of length r , then I/I^2 is free of rank r over R/I . Since f_1, \dots, f_r generate by assumption we see that the images \bar{f}_i form a basis of I/I^2 over R/I . It follows that f_1, \dots, f_r is a quasi-regular sequence as all this means, besides the freeness of I/I^2 , is that the maps $\text{Sym}_{R/I}^n(I/I^2) \rightarrow I^n/I^{n+1}$ are isomorphisms.

We continue to assume that I can be generated by a quasi-regular sequence, say g_1, \dots, g_r . Write $g_j = \sum a_{ij} f_i$. As f_1, \dots, f_r is quasi-regular according to the previous paragraph, we see that $\det(a_{ij})$ is invertible mod I . The matrix a_{ij} gives a map $R^{\oplus r} \rightarrow R^{\oplus r}$ which induces a map of Koszul complexes $\alpha : K_\bullet(R, f_1, \dots, f_r) \rightarrow K_\bullet(R, g_1, \dots, g_r)$, see Lemma 15.20.3. This map becomes an isomorphism on inverting $\det(a_{ij})$. Since the cohomology modules of both $K_\bullet(R, f_1, \dots, f_r)$ and $K_\bullet(R, g_1, \dots, g_r)$ are annihilated by I , see Lemma 15.20.6, we see that α is a quasi-isomorphism. Hence if g_1, \dots, g_r is H_1 -regular, then so is f_1, \dots, f_r . Similarly for Koszul-regular. \square

Lemma 15.21.15. *Let $A \rightarrow B$ be a ring map. Let f_1, \dots, f_r be a sequence in B such that $B/(f_1, \dots, f_r)$ is A -flat. Let $A \rightarrow A'$ be a ring map. Then the canonical map*

$$H_1(K_\bullet(B, f_1, \dots, f_r)) \otimes_A A' \longrightarrow H_1(K_\bullet(B', f'_1, \dots, f'_r))$$

is surjective, where $B' = B \otimes_A A'$ and $f'_i \in B'$ is the image of f_i .

Proof. The sequence

$$\wedge^2(B^{\oplus r}) \rightarrow B^{\oplus r} \rightarrow B \rightarrow B/J \rightarrow 0$$

is a complex of A -modules with B/J flat over A and cohomology group $H_1 = H_1(K_\bullet(B, f_1, \dots, f_r))$ in the spot $B^{\oplus r}$. If we tensor this with A' we obtain a complex

$$\wedge^2((B')^{\oplus r}) \rightarrow (B')^{\oplus r} \rightarrow B' \rightarrow B'/J' \rightarrow 0$$

which is exact at B' and B'/J' . In order to compute its cohomology group $H'_1 = H_1(K_\bullet(B', f'_1, \dots, f'_r))$ at $(B')^{\oplus r}$ we split the first sequence above into short exact

sequences $0 \rightarrow J \rightarrow B \rightarrow B/J \rightarrow 0$ and $0 \rightarrow K \rightarrow B^{\oplus r} \rightarrow J \rightarrow 0$ and $\wedge^2(B^{\oplus r}) \rightarrow K \rightarrow H_1 \rightarrow 0$. Tensoring with A' over A we obtain the exact sequences

$$\begin{aligned} 0 \rightarrow J \otimes_A A' \rightarrow B \otimes_A A' \rightarrow (B/J) \otimes_A A' \rightarrow 0 \\ K \otimes_A A' \rightarrow B^{\oplus r} \otimes_A A' \rightarrow J \otimes_A A' \rightarrow 0 \\ \wedge^2(B^{\oplus r}) \otimes_A A' \rightarrow K \otimes_A A' \rightarrow H_1 \otimes_A A' \rightarrow 0 \end{aligned}$$

where the first one is exact as B/J is flat over A , see Algebra, Lemma 10.38.11. Hence we conclude what we want. \square

Lemma 15.21.16. *Let R be a ring. Let $a_1, \dots, a_n \in R$ be elements such that $R \rightarrow R^{\oplus n}$, $x \mapsto (xa_1, \dots, xa_n)$ is injective. Then the element $\sum a_i t_i$ of the polynomial ring $R[t_1, \dots, t_n]$ is a nonzerodivisor.*

Proof. If one of the a_i is a unit this is just the statement that any element of the form $t_1 + a_2 t_2 + \dots + a_n t_n$ is a nonzero divisor in the polynomial ring over R .

Case I: R is Noetherian. Let \mathfrak{q}_j , $j = 1, \dots, m$ be the associated primes of R . We have to show that each of the maps

$$\sum a_i t_i : \text{Sym}^d(R^{\oplus n}) \longrightarrow \text{Sym}^{d+1}(R^{\oplus n})$$

is injective. As $\text{Sym}^d(R^{\oplus n})$ is a free R -module its associated primes are \mathfrak{q}_j , $j = 1, \dots, m$. For each j there exists an $i = i(j)$ such that $a_i \notin \mathfrak{q}_j$ because there exists an $x \in R$ with $\mathfrak{q}_j x = 0$ but $a_i x \neq 0$ for some i by assumption. Hence a_i is a unit in $R_{\mathfrak{q}_j}$ and the map is injective after localizing at \mathfrak{q}_j . Thus the map is injective, see Algebra, Lemma 10.62.18.

Case II: R general. We can write R as the union of Noetherian rings R_λ with $a_1, \dots, a_n \in R_\lambda$. For each R_λ the result holds, hence the result holds for R . \square

Lemma 15.21.17. *Let R be a ring. Let f_1, \dots, f_n be a Koszul-regular sequence in R . Consider the faithfully flat, smooth ring map*

$$R \longrightarrow S = R[\{t_{ij}\}_{i \leq j}, t_{11}^{-1}, t_{22}^{-1}, \dots, t_{nn}^{-1}]$$

For $1 \leq i \leq n$ set

$$g_i = \sum_{i \leq j} t_{ij} f_j \in S.$$

Then g_1, \dots, g_n is a regular sequence in S and $(f_1, \dots, f_n)S = (g_1, \dots, g_n)$.

Proof. The equality of ideals is obvious as the matrix

$$\begin{pmatrix} t_{11} & t_{12} & t_{13} & \dots \\ 0 & t_{22} & t_{23} & \dots \\ 0 & 0 & t_{33} & \dots \\ \dots & \dots & \dots & \dots \end{pmatrix}$$

is invertible in S . Because f_1, \dots, f_n is a Koszul-regular sequence we see that the kernel of $R \rightarrow R^{\oplus n}$, $x \mapsto (xf_1, \dots, xf_n)$ is zero (as it computes the n th Koszul homology of R w.r.t. f_1, \dots, f_n). Hence by Lemma 15.21.16 we see that $g_1 = f_1 t_{11} + \dots + f_n t_{1n}$ is a nonzerodivisor in $S' = R[t_{11}, t_{12}, \dots, t_{1n}, t_{11}^{-1}]$. We see that g_1, f_2, \dots, f_n is a Koszul-sequence in S' by Lemma 15.21.4 and 15.21.14. We conclude that f_2, \dots, f_n is a Koszul-regular sequence in $S'/(g_2)$ by Lemma 15.21.13. Hence by induction on n we see that the images $\bar{g}_2, \dots, \bar{g}_n$ of g_2, \dots, g_n in $S'/(g_2)[\{t_{ij}\}_{2 \leq i \leq j}, t_{22}^{-1}, \dots, t_{nn}^{-1}]$ form a regular sequence. This in turn means that g_1, \dots, g_n forms a regular sequence in S . \square

15.22. Regular ideals

We will discuss the notion of a regular ideal sheaf in great generality in Divisors, Section 30.12. Here we define the corresponding notion in the affine case, i.e., in the case of an ideal in a ring.

Definition 15.22.1. Let R be a ring and let $I \subset R$ be an ideal.

- (1) We say I is a *regular ideal* if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and a regular sequence $f_1, \dots, f_r \in R_g$ such that I_g is generated by f_1, \dots, f_r .
- (2) We say I is a *Koszul-regular ideal* if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and a Koszul-regular sequence $f_1, \dots, f_r \in R_g$ such that I_g is generated by f_1, \dots, f_r .
- (3) We say I is a *H_1 -regular ideal* if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and an H_1 -regular sequence $f_1, \dots, f_r \in R_g$ such that I_g is generated by f_1, \dots, f_r .
- (4) We say I is a *quasi-regular ideal* if for every $\mathfrak{p} \in V(I)$ there exists a $g \in R$, $g \notin \mathfrak{p}$ and a quasi-regular sequence $f_1, \dots, f_r \in R_g$ such that I_g is generated by f_1, \dots, f_r .

It is clear that given $I \subset R$ we have the implications

$$\begin{aligned} I \text{ is a regular ideal} &\Rightarrow I \text{ is a Koszul-regular ideal} \\ &\Rightarrow I \text{ is a } H_1\text{-regular ideal} \\ &\Rightarrow I \text{ is a quasi-regular ideal} \end{aligned}$$

see Lemmas 15.21.2 and 15.21.5. Such an ideal is always finitely generated.

Lemma 15.22.2. *A quasi-regular ideal is finitely generated.*

Proof. Let $I \subset R$ be a quasi-regular ideal. Since $V(I)$ is quasi-compact, there exist $g_1, \dots, g_m \in R$ such that $V(I) \subset D(g_1) \cup \dots \cup D(g_m)$ and such that I_{g_j} is generated by a quasi-regular sequence $g_{j1}, \dots, g_{jr_j} \in R_{g_j}$. Write $g_{ji} = g'_{ji}/g_j^{e_{ij}}$ for some $g'_{ji} \in I$. Write $1 + x = \sum g_j h_j$ for some $x \in I$ which is possible as $V(I) \subset D(g_1) \cup \dots \cup D(g_m)$. Note that $\text{Spec}(R) = D(g_1) \cup \dots \cup D(g_m) \cup D(x)$. Then I is generated by the elements g'_{ij} and x as these generate on each of the pieces of the cover, see Algebra, Lemma 10.23.2. \square

Lemma 15.22.3. *Let $I \subset R$ be a quasi-regular ideal of a ring. Then I/I^2 is a finite projective R/I -module.*

Proof. This follows from Algebra, Lemma 10.75.2 and the definitions. \square

We prove flat descent for Koszul-regular, H_1 -regular, quasi-regular ideals.

Lemma 15.22.4. *Let $A \rightarrow B$ be a faithfully flat ring map. Let $I \subset A$ be an ideal. If IB is a Koszul-regular (resp. H_1 -regular, resp. quasi-regular) ideal in B , then I is a Koszul-regular (resp. H_1 -regular, resp. quasi-regular) ideal in A .*

Proof. We fix the prime $\mathfrak{p} \supset I$ throughout the proof. Assume IB is quasi-regular. By Lemma 15.22.2 IB is a finite module, hence I is a finite A -module by Algebra, Lemma 10.80.2. As $A \rightarrow B$ is flat we see that

$$I/I^2 \otimes_{A/I} B/IB = I/I^2 \otimes_A B = IB/(IB)^2.$$

As IB is quasi-regular, the B/IB -module $IB/(IB)^2$ is finite locally free. Hence I/I^2 is finite projective, see Algebra, Proposition 10.80.3. In particular, after replacing A by A_f for some $f \in A$, $f \notin \mathfrak{p}$ we may assume that I/I^2 is free of rank r . Pick $f_1, \dots, f_r \in I$ which give a basis of I/I^2 . By Nakayama’s lemma (see Algebra, Lemma 10.19.1) we see that, after another replacement $A \rightsquigarrow A_f$ as above, I is generated by f_1, \dots, f_r .

Proof of the “quasi-regular” case. Above we have seen that I/I^2 is free on the r -generators f_1, \dots, f_r . To finish the proof in this case we have to show that the maps $\text{Sym}^d(I/I^2) \rightarrow I^d/I^{d+1}$ are isomorphisms for each $d \geq 2$. This is clear as the faithfully flat base changes $\text{Sym}^d(IB/(IB)^2) \rightarrow (IB)^d/(IB)^{d+1}$ are isomorphisms locally on B by assumption. Details omitted.

Proof of the “ H_1 -regular” and “Koszul-regular” case. Consider the sequence of elements f_1, \dots, f_r generating I we constructed above. By Lemma 15.21.14 we see that f_1, \dots, f_r map to a H_1 -regular or Koszul-regular sequence in B_g for any $g \in B$ such that IB is generated by an H_1 -regular or Koszul-regular sequence. Hence $K_\bullet(A, f_1, \dots, f_r) \otimes_A B_g$ has vanishing H_1 or H_i , $i > 0$. Since the homology of $K_\bullet(B, f_1, \dots, f_r) = K_\bullet(A, f_1, \dots, f_r) \otimes_A B$ is annihilated by IB (see Lemma 15.20.6) and since $V(IB) \subset \bigcup_{g \text{ as above}} D(g)$ we conclude that $K_\bullet(A, f_1, \dots, f_r) \otimes_A B$ has vanishing homology in degree 1 or all positive degrees. Using that $A \rightarrow B$ is faithfully flat we conclude that the same is true for $K_\bullet(A, f_1, \dots, f_r)$. \square

Lemma 15.22.5. *Let A be a ring. Let $I \subset J \subset A$ be ideals. Assume that $J/I \subset A/I$ is a H_1 -regular ideal. Then $I \cap J^2 = IJ$.*

Proof. Follows immediately from Lemma 15.21.8 by localizing. \square

15.23. Local complete intersection maps

We can use the material above to define a local complete intersection map between rings using presentations by (finite) polynomial algebras.

Lemma 15.23.1. *Let $A \rightarrow B$ be a finite type ring map. If for some presentation $\alpha : A[x_1, \dots, x_n] \rightarrow B$ the kernel I is a Koszul-regular ideal then for any presentation $\beta : A[y_1, \dots, y_m] \rightarrow B$ the kernel J is a Koszul-regular ideal.*

Proof. Choose $f_j \in A[x_1, \dots, x_n]$ with $\alpha(f_j) = \beta(y_j)$ and $g_i \in A[y_1, \dots, y_m]$ with $\beta(g_i) = \alpha(x_i)$. Then we get a commutative diagram

$$\begin{CD} A[x_1, \dots, x_n, y_1, \dots, y_m] @>y_j \mapsto f_j>> A[x_1, \dots, x_n] \\ @Vx_i \mapsto g_iVV @VVV \\ A[y_1, \dots, y_m] @>>> B \end{CD}$$

Note that the kernel K of $A[x_i, y_j] \rightarrow B$ is equal to $K = (I, y_j - f_j) = (J, x_i - f_i)$. In particular, as I is finitely generated by Lemma 15.22.2 we see that $J = K/(x_i - f_i)$ is finitely generated too.

Pick a prime $\mathfrak{q} \subset B$. Since $I/I^2 \oplus B^{\oplus m} = J/J^2 \oplus B^{\oplus n}$ (Algebra, Lemma 10.129.15) we see that

$$\dim J/J^2 \otimes_B \kappa(\mathfrak{q}) + n = \dim I/I^2 \otimes_B \kappa(\mathfrak{q}) + m.$$

Pick $p_1, \dots, p_t \in I$ which map to a basis of $I/I^2 \otimes \kappa(\mathfrak{q}) = I \otimes_{A[x_i]} \kappa(\mathfrak{q})$. Pick $q_1, \dots, q_s \in J$ which map to a basis of $J/J^2 \otimes \kappa(\mathfrak{q}) = J \otimes_{A[y_j]} \kappa(\mathfrak{q})$. So $s + n = t + m$.

By Nakayama's lemma there exist $h \in A[x_i]$ and $h' \in A[y_j]$ both mapping to a nonzero element of $\kappa(\mathfrak{q})$ such that $I_h = (p_1, \dots, p_t)$ in $A[x_i, 1/h]$ and $J_{h'} = (q_1, \dots, q_s)$ in $A[y_j, 1/h']$. As I is Koszul-regular we may also assume that I_h is generated by a Koszul regular sequence. This sequence must necessarily have length $t = \dim I/I^2 \otimes_B \kappa(\mathfrak{q})$, hence we see that p_1, \dots, p_t is a Koszul-regular sequence by Lemma 15.21.14. As also $y_1 - f_1, \dots, y_m - f_m$ is a regular sequence we conclude

$$y_1 - f_1, \dots, y_m - f_m, p_1, \dots, p_t$$

is a Koszul-regular sequence in $A[x_i, y_j, 1/h]$ (see Lemma 15.21.12). This sequence generates the ideal K_h . Hence the ideal $K_{hh'}$ is generated by a Koszul-regular sequence of length $m + t = n + s$. But it is also generated by the sequence

$$x_1 - g_1, \dots, x_n - g_n, q_1, \dots, q_s$$

of the same length which is thus a Koszul-regular sequence by Lemma 15.21.14. Finally, by Lemma 15.21.13 we conclude that the images of q_1, \dots, q_s in

$$A[x_i, y_j, 1/hh']/(x_1 - g_1, \dots, x_n - g_n) \cong A[y_j, 1/h'']$$

form a Koszul-regular sequence generating $J_{h''}$. Since h'' is the image of hh' it doesn't map to zero in $\kappa(\mathfrak{q})$ and we win. \square

This lemma allows us to make the following definition.

Definition 15.23.2. A ring map $A \rightarrow B$ is called a *local complete intersection* if it is of finite type and for some (equivalently any) presentation $B = A[x_1, \dots, x_n]/I$ the ideal I is Koszul-regular.

This notion is local.

Lemma 15.23.3. *Let $R \rightarrow S$ be a ring map. Let $g_1, \dots, g_m \in S$ generate the unit ideal. If each $R \rightarrow S_{g_j}$ is a local complete intersection so is $R \rightarrow S$.*

Proof. Let $S = R[x_1, \dots, x_n]/I$ be a presentation. Pick $h_j \in R[x_1, \dots, x_n]$ mapping to g_j in S . Then $R[x_1, \dots, x_n, x_{n+1}]/(I, x_{n+1}h_j - 1)$ is a presentation of S_{g_j} . Hence $I_j = (I, x_{n+1}h_j - 1)$ is a Koszul-regular ideal in $R[x_1, \dots, x_n, x_{n+1}]$. Pick a prime $I \subset \mathfrak{q} \subset R[x_1, \dots, x_n]$. Then $h_j \notin \mathfrak{q}$ for some j and $\mathfrak{q}_j = (\mathfrak{q}, x_{n+1}h_j - 1)$ is a prime ideal of $V(I_j)$ lying over \mathfrak{q} . Pick $f_1, \dots, f_r \in I$ which map to a basis of $I/I^2 \otimes \kappa(\mathfrak{q})$. Then $x_{n+1}h_j - 1, f_1, \dots, f_r$ is a sequence of elements of I_j which map to a basis of $I_j \otimes \kappa(\mathfrak{q}_j)$. By Nakayama's lemma there exists an $h \in R[x_1, \dots, x_n, x_{n+1}]$ such that $(I_j)_h$ is generated by $x_{n+1}h_j - 1, f_1, \dots, f_r$. We may also assume that $(I_j)_h$ is generated by a Koszul regular sequence of some length e . Looking at the dimension of $I_j \otimes \kappa(\mathfrak{q}_j)$ we see that $e = r + 1$. Hence by Lemma 15.21.14 we see that $x_{n+1}h_j - 1, f_1, \dots, f_r$ is a Koszul-regular sequence generating $(I_j)_h$ for some $h \in R[x_1, \dots, x_n, x_{n+1}]$, $h \notin \mathfrak{q}_j$. By Lemma 15.21.13 we see that $I_{hh'}$ is generated by a Koszul-regular sequence for some $h' \in R[x_1, \dots, x_n]$, $h' \notin \mathfrak{q}$ as desired. \square

Lemma 15.23.4. *Let R be a ring. Let $R[x_1, \dots, x_n]/(f_1, \dots, f_c)$ be a relative global complete intersection. Then f_1, \dots, f_c is a Koszul regular sequence.*

Proof. Recall that the homology groups $H_i(K_\bullet(f_\bullet))$ are annihilated by the ideal (f_1, \dots, f_c) . Hence it suffices to show that $H_i(K_\bullet(f_\bullet))_{\mathfrak{q}}$ is zero for all primes $\mathfrak{q} \subset R[x_1, \dots, x_n]$ containing (f_1, \dots, f_c) . This follows from Algebra, Lemma 10.131.13 and the fact that a regular sequence is Koszul regular (Lemma 15.21.2). \square

Lemma 15.23.5. *A syntomic ring map is a local complete intersection.*

Proof. Combine Lemmas 15.23.4 and 15.23.3 and Algebra, Lemma 10.131.15. \square

For a local complete intersection $R \rightarrow S$ we have $H_n(L_{S/R}) = 0$ for $n \geq 2$. Since we haven't (yet) defined the full cotangent complex we can't state and prove this, but we can deduce one of the consequences.

Lemma 15.23.6. *Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $B \rightarrow C$ is a local complete intersection homomorphism. Choose a presentation $\alpha : A[x_s, s \in S] \rightarrow B$ with kernel I . Choose a presentation $\beta : B[y_1, \dots, y_m] \rightarrow C$ with kernel J . Let $\gamma : A[x_s, y_t] \rightarrow C$ be the induced presentation of C with kernel K . Then we get a canonical commutative diagram*

$$\begin{array}{ccccccc} 0 & \longrightarrow & \Omega_{A[x_s]/A} \otimes C & \longrightarrow & \Omega_{A[x_s, y_t]/A} \otimes C & \longrightarrow & \Omega_{B[y_t]/B} \otimes C \longrightarrow 0 \\ & & \uparrow & & \uparrow & & \uparrow \\ 0 & \longrightarrow & I/I^2 \otimes C & \longrightarrow & K/K^2 & \longrightarrow & J/J^2 \longrightarrow 0 \end{array}$$

with exact rows. In particular, the six term exact sequence of Algebra, Lemma 10.129.4 can be completed with a zero on the left, i.e., the sequence

$$0 \rightarrow H_1(NL_{B/A} \otimes_B C) \rightarrow H_1(L_{C/A}) \rightarrow H_1(L_{C/B}) \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

is exact.

Proof. The only thing to prove is the injectivity of the map $I/I^2 \otimes C \rightarrow K/K^2$. By assumption the ideal J is Koszul-regular. Hence we have $IA[x_s, y_j] \cap K^2 = IK$ by Lemma 15.22.5. This means that the kernel of $K/K^2 \rightarrow J/J^2$ is isomorphic to $IA[x_s, y_j]/IK$. Since $I/I^2 \otimes_A C = IA[x_s, y_j]/IK$ this provides us with the desired injectivity of $I/I^2 \otimes_A C \rightarrow K/K^2$ so that the result follows from the snake lemma, see Homology, Lemma 12.5.17. \square

Lemma 15.23.7. *Let $A \rightarrow B \rightarrow C$ be ring maps. If $B \rightarrow C$ is a filtered colimit of local complete intersection homomorphisms then the conclusion of Lemma 15.23.6 remains valid.*

Proof. Follows from Lemma 15.23.6 and Algebra, Lemma 10.129.9. \square

15.24. Cartier's equality and geometric regularity

A reference for this section and the next is [Mat70, Section 39]. In order to comfortably read this section the reader should be familiar with the naive cotangent complex and its properties, see Algebra, Section 10.129.

Lemma 15.24.1 (Cartier equality). *Let K/k be a finitely generated field extension. Then $\Omega_{K/k}$ and $H_1(L_{K/k})$ are finite dimensional and $\text{trdeg}_k(K) = \dim_K \Omega_{K/k} - \dim_K H_1(L_{K/k})$.*

Proof. We can find a global complete intersection $A = k[x_1, \dots, x_n]/(f_1, \dots, f_c)$ over k such that K is isomorphic to the fraction field of A , see Algebra, Lemma 10.147.11 and its proof. In this case we see that $NL_{K/k}$ is homotopy equivalent to the complex

$$\bigoplus_{j=1, \dots, c} K \longrightarrow \bigoplus_{i=1, \dots, n} K dx_i$$

by Algebra, Lemmas 10.129.2 and 10.129.13. The transcendence degree of K over k is the dimension of A (by Algebra, Lemma 10.112.1) which is $n - c$ and we win. \square

Lemma 15.24.2. *Let $K \subset L \subset M$ be field extensions. Then the Jacobi-Zariski sequence*

$$0 \rightarrow H_1(L_{L/K}) \otimes_L M \rightarrow H_1(L_{M/K}) \rightarrow H_1(L_{M/L}) \rightarrow \Omega_{L/K} \otimes_L M \rightarrow \Omega_{M/K} \rightarrow \Omega_{M/L} \rightarrow 0$$

is exact.

Proof. Combine Lemma 15.23.7 with Algebra, Lemma 10.147.11. □

Lemma 15.24.3. *Given a commutative diagram of fields*

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

with $k \subset k'$ and $K \subset K'$ finitely generated field extensions the kernel and cokernel of the maps

$$\alpha : \Omega_{K/k} \otimes_K K' \rightarrow \Omega_{K'/k'} \quad \text{and} \quad \beta : H_1(L_{K/k}) \otimes_K K' \rightarrow H_1(L_{K'/k'})$$

are finite dimensional and

$$\dim \text{Ker}(\alpha) - \dim \text{Coker}(\alpha) - \dim \text{Ker}(\beta) + \dim \text{Coker}(\beta) = \text{trdeg}_k(k') - \text{trdeg}_K(K')$$

Proof. The Jacobi-Zariski sequences for $k \subset k' \subset K'$ and $k \subset K \subset K'$ are

$$0 \rightarrow H_1(L_{k'/k}) \otimes_{K'} K' \rightarrow H_1(L_{K'/k'}) \rightarrow H_1(L_{K'/K'}) \rightarrow \Omega_{k'/k} \otimes_{K'} K' \rightarrow \Omega_{K'/k} \rightarrow \Omega_{K'/K'} \rightarrow 0$$

and

$$0 \rightarrow H_1(L_{K/k}) \otimes_{K'} K' \rightarrow H_1(L_{K'/k'}) \rightarrow H_1(L_{K'/K}) \rightarrow \Omega_{K/k} \otimes_{K'} K' \rightarrow \Omega_{K'/k} \rightarrow \Omega_{K'/K} \rightarrow 0$$

By Lemma 15.24.1 the vector spaces $\Omega_{k'/k}$, $\Omega_{K'/K}$, $H_1(L_{K'/K})$, and $H_1(L_{k'/k})$ are finite dimensional and the alternating sum of their dimensions is $\text{trdeg}_k(k') - \text{trdeg}_K(K')$. The lemma follows. □

15.25. Geometric regularity

Let k be a field. Let (A, \mathfrak{m}, K) be a Noetherian local k -algebra. The Jacobi-Zariski sequence (Algebra, Lemma 10.129.4) is a canonical exact sequence

$$H_1(L_{K/k}) \rightarrow \mathfrak{m}/\mathfrak{m}^2 \rightarrow \Omega_{A/k} \otimes_A K \rightarrow \Omega_{K/k} \rightarrow 0$$

because $H_1(L_{K/A}) = \mathfrak{m}/\mathfrak{m}^2$ by Algebra, Lemma 10.129.6. We will show that exactness on the left of this sequence characterizes whether or not a regular local ring A is geometrically regular over k . We will link this to the notion of formal smoothness in Section 15.29.

Proposition 15.25.1. *Let k be a field of characteristic $p > 0$. Let (A, \mathfrak{m}, K) be a Noetherian local k -algebra. The following are equivalent*

- (1) *A is geometrically regular over k ,*
- (2) *for all $k \subset k' \subset k^{1/p}$ finite over k the ring $A \otimes_k k'$ is regular,*
- (3) *A is regular and the canonical map $H_1(L_{K/k}) \rightarrow \mathfrak{m}/\mathfrak{m}^2$ is injective, and*
- (4) *A is regular and the map $\Omega_{k/\mathbf{F}_p} \otimes_k K \rightarrow \Omega_{A/\mathbf{F}_p} \otimes_A K$ is injective.*

Proof. Proof of (3) \Rightarrow (1). Assume (3). Let $k \subset k'$ be a finite purely inseparable extension. Set $A' = A \otimes_k k'$. This is a local ring with maximal ideal \mathfrak{m}' . Set $K' = A'/\mathfrak{m}'$. We get a commutative diagram

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & H_1(L_{K/k}) \otimes K' & \longrightarrow & \mathfrak{m}/\mathfrak{m}^2 \otimes K' & \longrightarrow & \Omega_{A/k} \otimes_A K' & \longrightarrow & \Omega_{K/k} \otimes K' & \longrightarrow & 0 \\
 & & \beta \downarrow & & \downarrow & & \cong \downarrow & & \alpha \downarrow & & \\
 & & H_1(L_{K'/k'}) & \longrightarrow & \mathfrak{m}'/(\mathfrak{m}')^2 & \longrightarrow & \Omega_{A'/k'} \otimes_{A'} K' & \longrightarrow & \Omega_{K'/k'} & \longrightarrow & 0
 \end{array}$$

with exact rows. The third vertical arrow is an isomorphism by base change for modules of differentials (Algebra, Lemma 10.127.12). Thus α is surjective. By Lemma 15.24.3 we have

$$\dim \text{Ker}(\alpha) - \dim \text{Ker}(\beta) + \dim \text{Coker}(\beta) = 0$$

(and these dimensions are all finite). A diagram chase shows that $\dim \mathfrak{m}'/(\mathfrak{m}')^2 \leq \dim \mathfrak{m}/\mathfrak{m}^2$. However, since $A \rightarrow A'$ is finite flat we see that $\dim(A) = \dim(A')$, see Algebra, Lemma 10.108.6. Hence A' is regular by definition.

Equivalence of (3) and (4). Consider the Jacobi-Zariski sequences for rows of the commutative diagram

$$\begin{array}{ccccc}
 \mathbf{F}_p & \longrightarrow & A & \longrightarrow & K \\
 \uparrow & & \uparrow & & \uparrow \\
 \mathbf{F}_p & \longrightarrow & k & \longrightarrow & K
 \end{array}$$

to get a commutative diagram

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & \mathfrak{m}/\mathfrak{m}^2 & \longrightarrow & \Omega_{A/\mathbf{F}_p} \otimes_A K & \longrightarrow & \Omega_{K/\mathbf{F}_p} & \longrightarrow & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \uparrow \\
 0 & \longrightarrow & H_1(L_{K/k}) & \longrightarrow & \Omega_{k/\mathbf{F}_p} \otimes_k K & \longrightarrow & \Omega_{K/\mathbf{F}_p} & \longrightarrow & \Omega_{K/k} \longrightarrow 0
 \end{array}$$

with exact rows. We have used that $H_1(L_{K/A}) = \mathfrak{m}/\mathfrak{m}^2$ and that $H_1(L_{K/\mathbf{F}_p}) = 0$ as K/\mathbf{F}_p is separable, see Algebra, Proposition 10.147.9. Thus it is clear that the kernels of $H_1(L_{K/k}) \rightarrow \mathfrak{m}/\mathfrak{m}^2$ and $\Omega_{k/\mathbf{F}_p} \otimes_k K \rightarrow \Omega_{A/\mathbf{F}_p} \otimes_A K$ have the same dimension.

Proof of (2) \Rightarrow (4) following Faltings, see [Fal78]. Let $a_1, \dots, a_n \in k$ be elements such that da_1, \dots, da_n are linearly independent in Ω_{k/\mathbf{F}_p} . Consider the field extension $k' = k(a_1^{1/p}, \dots, a_n^{1/p})$. By Algebra, Lemma 10.147.3 we see that $k' = k[x_1, \dots, x_n]/(x_1^p - a_1, \dots, x_n^p - a_n)$. In particular we see that the naive cotangent complex of k'/k is homotopic to the complex $\bigoplus_{j=1, \dots, n} k' \rightarrow \bigoplus_{i=1, \dots, n} k'$ with the zero differential as $d(x_j^p - a_j) = 0$ in $\Omega_{k[x_1, \dots, x_n]/k}$. Set $A' = A \otimes_k k'$ and $K' = A'/\mathfrak{m}'$ as above. By Algebra, Lemma 10.129.8 we see that $NL_{A'/A}$ is homotopy equivalent to the complex $\bigoplus_{j=1, \dots, n} A' \rightarrow \bigoplus_{i=1, \dots, n} A'$ with the zero differential, i.e., $H_1(L_{A'/A})$ and $\Omega_{A'/A}$ are free of rank n . The Jacobi-Zariski sequence for $\mathbf{F}_p \rightarrow A \rightarrow A'$ is

$$H_1(L_{A'/A}) \rightarrow \Omega_{A/\mathbf{F}_p} \otimes_A A' \rightarrow \Omega_{A'/\mathbf{F}_p} \rightarrow \Omega_{A'/A} \rightarrow 0$$

Using the presentation $A[x_1, \dots, x_n] \rightarrow A'$ with kernel $(x_j^p - a_j)$ we see, unwinding the maps in Algebra, Lemma 10.129.4, that the j th basis vector of $H_1(L_{A'/A})$ maps

to $da_j \otimes 1$ in $\Omega_{A/\mathbf{F}_p} \otimes A'$. As $\Omega_{A'/A}$ is free (hence flat) we get on tensoring with K' an exact sequence

$$K'^{\oplus n} \rightarrow \Omega_{A/\mathbf{F}_p} \otimes_A K' \xrightarrow{\beta} \Omega_{A'/\mathbf{F}_p} \otimes_{A'} K' \rightarrow K'^{\oplus n} \rightarrow 0$$

We conclude that the elements $da_j \otimes 1$ generate $\text{Ker}(\beta)$ and we have to show that are linearly independent, i.e., we have to show $\dim(\text{Ker}(\beta)) = n$. Consider the following big diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathfrak{m}'/(\mathfrak{m}')^2 & \longrightarrow & \Omega_{A'/\mathbf{F}_p} \otimes K' & \longrightarrow & \Omega_{K'/\mathbf{F}_p} \longrightarrow 0 \\ & & \uparrow \alpha & & \uparrow \beta & & \uparrow \gamma \\ 0 & \longrightarrow & \mathfrak{m}/\mathfrak{m}^2 \otimes K' & \longrightarrow & \Omega_{A/\mathbf{F}_p} \otimes K' & \longrightarrow & \Omega_{K/\mathbf{F}_p} \otimes K' \longrightarrow 0 \end{array}$$

By Lemma 15.24.1 and the Jacobi-Zariski sequence for $\mathbf{F}_p \rightarrow K \rightarrow K'$ we see that the kernel and cokernel of γ have the same finite dimension. By assumption A' is regular (and of the same dimension as A , see above) hence the kernel and cokernel of α have the same dimension. It follows that the kernel and cokernel of β have the same dimension which is what we wanted to show.

The implication (1) \Rightarrow (2) is trivial. This finishes the proof of the proposition. \square

Lemma 15.25.2. *Let k be a field of characteristic $p > 0$. Let (A, \mathfrak{m}, K) be a Noetherian local k -algebra. Assume A is geometrically regular over k . Let $k \subset F \subset K$ be a finitely generated subextension. Let $\varphi : k[y_1, \dots, y_m] \rightarrow A$ be a k -algebra map such that y_i maps to an element of F in K and such that dy_1, \dots, dy_m map to a basis of $\Omega_{F/k}$. Set $\mathfrak{p} = \varphi^{-1}(\mathfrak{m})$. Then*

$$k[y_1, \dots, y_m]_{\mathfrak{p}} \rightarrow A$$

is flat and $A/\mathfrak{p}A$ is regular.

Proof. Set $A_0 = k[y_1, \dots, y_m]_{\mathfrak{p}}$ with maximal ideal \mathfrak{m}_0 and residue field K_0 . Note that $\Omega_{A_0/k}$ is free of rank m and $\Omega_{A_0/k} \otimes K_0 \rightarrow \Omega_{K_0/k}$ is an isomorphism. It is clear that A_0 is geometrically regular over k . Hence $H_1(L_{K_0/k}) \rightarrow \mathfrak{m}_0/\mathfrak{m}_0^2$ is an isomorphism, see Proposition 15.25.1. Now consider

$$\begin{array}{ccc} H_1(L_{K_0/k}) \otimes K & \longrightarrow & \mathfrak{m}_0/\mathfrak{m}_0^2 \otimes K \\ \downarrow & & \downarrow \\ H_1(L_{K/k}) & \longrightarrow & \mathfrak{m}/\mathfrak{m}^2 \end{array}$$

Since the left vertical arrow is injective by Lemma 15.24.2 and the lower horizontal by Proposition 15.25.1 we conclude that the right vertical one is too. Hence a regular system of parameters in A_0 maps to part of a regular system of parameters in A . We win by Algebra, Lemmas 10.124.2 and 10.102.3. \square

15.26. Topological rings and modules

Let's quickly discuss some properties of topological abelian groups. An abelian group M is a *topological abelian group* if M is endowed with a topology such that addition $M \times M \rightarrow M$ is continuous. A *homomorphism of topological abelian groups* is just a homomorphism of abelian groups which is continuous. The category of commutative topological groups is additive and has kernels and cokernels, but is

not abelian (as the axiom $\text{Im} = \text{Coim}$ doesn't hold). If $N \subset M$ is a subgroup, then we think of N and M/N as topological groups also, namely using the induced topology on N and the quotient topology on M/N (i.e., such that $M \rightarrow M/N$ is submersive). Note that if $N \subset M$ is an open subgroup, then the topology on M/N is discrete.

We say the topology on M is *linear* if there exists a fundamental system of neighbourhoods of 0 consisting of subgroups. If so then these subgroups are also open. An example is the following. Let I be a directed partially ordered set and let G_i be an inverse system of (discrete) abelian groups over I . Then

$$G = \lim_{i \in I} G_i$$

with the inverse limit topology is linearly topologized with a fundamental system of neighbourhoods of 0 given by $\text{Ker}(G \rightarrow G_i)$. Conversely, let M be a linearly topologized abelian group. Choose any fundamental system of open subgroups $U_i \subset M$, $i \in I$ (i.e., the U_i form a fundamental system of open neighbourhoods and each U_i is a subgroup of M). Setting $i \geq i' \Leftrightarrow U_i \subset U_{i'}$ we see that I is a directed partially ordered set. We obtain a homomorphism of linearly topologized abelian groups

$$c : M \longrightarrow \lim_{i \in I} M/U_i.$$

It is clear that M is *separated* (as a topological space) if and only if c is injective. We say that M is *complete* if c is an isomorphism². We leave it to the reader to check that this condition is independent of the choice of fundamental system of open subgroups $\{U_i\}_{i \in I}$ chosen above. In fact the topological abelian group $M^\wedge = \lim_{i \in I} M/U_i$ is independent of this choice and is sometimes called the *completion* of M . Any $G = \lim G_i$ as above is complete, in particular, the completion M^\wedge is always complete.

Definition 15.26.1 (Topological rings). Let R be a ring and let M be an R -module.

- (1) We say R is a *topological ring* if R is endowed with a topology such that both addition and multiplication are continuous as maps $R \times R \rightarrow R$ where $R \times R$ has the product topology. In this case we say M is a *topological module* if M is endowed with a topology such that addition $M \times M \rightarrow M$ and scalar multiplication $R \times M \rightarrow M$ are continuous.
- (2) A *homomorphism of topological modules* is just a continuous R -module map. A *homomorphism of topological rings* is a ring homomorphism which is continuous for the given topologies.
- (3) We say M is *linearly topologized* if 0 has a fundamental system of neighbourhoods consisting of submodules. We say R is *linearly topologized* if 0 has a fundamental system of neighbourhoods consisting of ideals.
- (4) If R is linearly topologized, we say that $I \subset R$ is an *ideal of definition* if I is open and if every neighbourhood of 0 contains I^n for some n .
- (5) If R is linearly topologized, we say that R is *pre-admissible* if R has an ideal of definition.

²We include being separated as part of being complete as we'd like to have a unique limits in complete groups. There is a definition of completeness for any topological group, agreeing, modulo the separation issue, with this one in our special case.

- (6) If R is linearly topologized, we say that R is *admissible* if it is pre-admissible and complete³.
- (7) If R is linearly topologized, we say that R is *pre-adic* if there exists an ideal of definition I such that $\{I^n\}_{n \geq 0}$ forms a fundamental system of neighbourhoods of 0.
- (8) If R is linearly topologized, we say that R is *adic* if R is pre-adic and complete.

Note that a (pre)adic topological ring is the same thing as a (pre)admissible topological ring which has an ideal of definition I such that I^n is open for all $n \geq 1$.

Let R be a ring and let M be an R -module. Let $I \subset R$ be an ideal. Then we can consider the linear topology on R which has $\{I^n\}_{n \geq 0}$ as a fundamental system of neighbourhoods of 0. This topology is called the I -adic topology; R is a pre-adic topological ring in the I -adic topology⁴. Moreover, the linear topology on M which has $\{I^n M\}_{n \geq 0}$ as a fundamental system of open neighbourhoods of 0 turns M into a topological R -module. This is called the *I -adic topology* on M . We see that M is I -adically complete (as defined in Algebra, Definition 10.93.5) if and only if M is complete in the I -adic topology⁵. In particular, we see that R is I -adically complete if and only if R is an adic topological ring in the I -adic topology.

As a special case, note that the discrete topology is the 0-adic topology and that any ring in the discrete topology is adic.

Lemma 15.26.2. *Let $\varphi : R \rightarrow S$ be a ring map. Let $I \subset R$ and $J \subset S$ be ideals and endow R with the I -adic topology and S with the J -adic topology. Then φ is a homomorphism of topological rings if and only if $\varphi(I^n) \subset J$ for some $n \geq 1$.*

Proof. Omitted. □

15.27. Formally smooth maps of topological rings

There is a version of formal smoothness which applies to homomorphisms of topological rings.

Definition 15.27.1. Let $R \rightarrow S$ be a homomorphism of topological rings with R and S linearly topologized. We say S is *formally smooth over R* if for every commutative solid diagram

$$\begin{array}{ccc}
 S & \longrightarrow & A/J \\
 \uparrow & \dashrightarrow & \uparrow \\
 R & \longrightarrow & A
 \end{array}$$

of homomorphisms of topological rings where A is a discrete ring and $J \subset A$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute.

We will mostly use this notion when given ideals $\mathfrak{m} \subset R$ and $\mathfrak{n} \subset S$ and we endow R with the \mathfrak{m} -adic topology and S with the \mathfrak{n} -adic topology. Continuity of $\varphi : R \rightarrow S$ holds if and only if $\varphi(\mathfrak{m}^m) \subset \mathfrak{n}$ for some $m \geq 1$, see Lemma 15.26.2. It turns out that in this case only the topology on S is relevant.

³By our conventions this includes separated.

⁴Thus the I -adic topology is sometimes called the I -pre-adic topology.

⁵It may happen that the I -adic completion M^\wedge is not I -adically complete, even though M^\wedge is always complete with respect to the limit topology. If I is finitely generated then the I -adic topology and the limit topology on M^\wedge agree, see Algebra, Lemma 10.93.7 and its proof.

Lemma 15.27.2. *Let $\varphi : R \rightarrow S$ be a ring map.*

- (1) *If $R \rightarrow S$ is formally smooth in the sense of Algebra, Definition 10.133.1, then $R \rightarrow S$ is formally smooth for any linear topology on R and any pre-adic topology on S such that $R \rightarrow S$ is continuous.*
- (2) *Let $\mathfrak{n} \subset S$ and $\mathfrak{m} \subset R$ ideals such that φ is continuous for the \mathfrak{m} -adic topology on R and the \mathfrak{n} -adic topology on S . Then the following are equivalent*
 - (a) *φ is formally smooth for the \mathfrak{m} -adic topology on R and the \mathfrak{n} -adic topology on S , and*
 - (b) *φ is formally smooth for the discrete topology on R and the \mathfrak{n} -adic topology on S .*

Proof. Assume $R \rightarrow S$ is formally smooth in the sense of Algebra, Definition 10.133.1. If S has a pre-adic topology, then there exists an ideal $\mathfrak{n} \subset S$ such that S has the \mathfrak{n} -adic topology. Suppose given a solid commutative diagram as in Definition 15.27.1. Continuity of $S \rightarrow A/J$ means that \mathfrak{n}^k maps to zero in A/J for some $k \geq 1$, see Lemma 15.26.2. We obtain a ring map $\psi : S \rightarrow A$ from the assumed formal smoothness of S over R . Then $\psi(\mathfrak{n}^k) \subset J$ hence $\psi(\mathfrak{n}^{2k}) = 0$ as $J^2 = 0$. Hence ψ is continuous by Lemma 15.26.2. This proves (1).

The proof of (2)(b) \Rightarrow (2)(a) is the same as the proof of (1). Assume (2)(a). Suppose given a solid commutative diagram as in Definition 15.27.1 where we use the discrete topology on R . Since φ is continuous we see that $\varphi(\mathfrak{m}^n) \subset \mathfrak{n}$ for some $n \geq 1$. As $S \rightarrow A/J$ is continuous we see that \mathfrak{n}^k maps to zero in A/J for some $k \geq 1$. Hence \mathfrak{m}^{nk} maps into J under the map $R \rightarrow A$. Thus \mathfrak{m}^{2nk} maps to zero in A and we see that $R \rightarrow A$ is continuous in the \mathfrak{m} -adic topology. Thus (2)(a) gives a dotted arrow as desired. \square

Definition 15.27.3. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{n} \subset S$ be an ideal. If the equivalent conditions (2)(a) and (2)(b) of Lemma 15.27.2 hold, then we say $R \rightarrow S$ is *formally smooth for the \mathfrak{n} -adic topology*.

This property is inherited by the completions.

Lemma 15.27.4. *Let (R, \mathfrak{m}) and (S, \mathfrak{n}) be rings endowed with finitely generated ideals. Endow R and S with the \mathfrak{m} -adic and \mathfrak{n} -adic topologies. Let $R \rightarrow S$ be a homomorphism of topological rings. The following are equivalent*

- (1) *$R \rightarrow S$ is formally smooth for the \mathfrak{n} -adic topology,*
- (2) *$R \rightarrow S^\wedge$ is formally smooth for the \mathfrak{n}^\wedge -adic topology,*
- (3) *$R^\wedge \rightarrow S^\wedge$ is formally smooth for the \mathfrak{n}^\wedge -adic topology.*

Here R^\wedge and S^\wedge are the \mathfrak{m} -adic and \mathfrak{n} -adic completions of R and S .

Proof. The assumption that \mathfrak{m} is finitely generated implies that R^\wedge is $\mathfrak{m}R^\wedge$ -adically complete, that $\mathfrak{m}R^\wedge = \mathfrak{m}^\wedge$ and that $R^\wedge/\mathfrak{m}^n R^\wedge = R/\mathfrak{m}^n$, see Algebra, Lemma 10.93.7 and its proof. Similarly for (S, \mathfrak{n}) . Thus it is clear that diagrams as in Definition 15.27.1 for the cases (1), (2), and (3) are in 1-to-1 correspondence. \square

The advantage of working with adic rings is that one gets a stronger lifting property.

Lemma 15.27.5. *Let $R \rightarrow S$ be a ring map. Let \mathfrak{n} be an ideal of S . Assume that $R \rightarrow S$ is formally smooth in the \mathfrak{n} -adic topology. Consider a solid commutative*

diagram

$$\begin{array}{ccc}
 S & \longrightarrow & A/J \\
 \uparrow & \searrow \psi & \uparrow \\
 R & \longrightarrow & A
 \end{array}$$

of homomorphisms of topological rings where A is adic and A/J is the quotient (as topological ring) of A by a closed ideal $J \subset A$ such that J^t is contained in an ideal of definition of A for some $t \geq 1$. Then there exists a dotted arrow in the category of topological rings which makes the diagram commute.

Proof. Let $I \subset A$ be an ideal of definition so that $I \supset J^t$ for some n . Then $A = \lim A/I^n$ and $A/J = \lim A/J + I^n$ because J is assumed closed. Consider the following diagram of discrete R algebras $A_{n,m} = A/J^n + I^m$:

$$\begin{array}{ccccc}
 A/J^3 + I^3 & \longrightarrow & A/J^2 + I^3 & \longrightarrow & A/J + I^3 \\
 \downarrow & & \downarrow & & \downarrow \\
 A/J^3 + I^2 & \longrightarrow & A/J^2 + I^2 & \longrightarrow & A/J + I^2 \\
 \downarrow & & \downarrow & & \downarrow \\
 A/J^3 + I & \longrightarrow & A/J^2 + I & \longrightarrow & A/J + I
 \end{array}$$

Note that each of the commutative squares defines a surjection

$$A_{n+1,m+1} \longrightarrow A_{n+1,m} \times_{A_{n,m}} A_{n,m+1}$$

of R -algebras whose kernel has square zero. We will inductively construct R -algebra maps $\varphi_{n,m} : S \rightarrow A_{n,m}$. Namely, we have the maps $\varphi_{1,m} = \psi \bmod J + I^m$. Note that each of these maps is continuous as ψ is. We can inductively choose the maps $\varphi_{n,1}$ by starting with our choice of $\varphi_{1,1}$ and lifting up, using the formal smoothness of S over R , along the right column of the diagram above. We construct the remaining maps $\varphi_{n,m}$ by induction on $n + m$. Namely, we choose $\varphi_{n+1,m+1}$ by lifting the pair $(\varphi_{n+1,m}, \varphi_{n,m+1})$ along the displayed surjection above (again using the formal smoothness of S over R). In this way all of the maps $\varphi_{n,m}$ are compatible with the transition maps of the system. As $J^t \subset I$ we see that for example $\varphi_n = \varphi_{nt,n} \bmod I^n$ induces a map $S \rightarrow A/I^n$. Taking the limit $\varphi = \lim \varphi_n$ we obtain a map $S \rightarrow A = \lim A/I^n$. The composition into A/J agrees with ψ as we have seen that $A/J = \lim A/J + I^n$. Finally we show that φ is continuous. Namely, we know that $\psi(\mathfrak{n}^r) \subset J + I^r/J$ for some r by our assumption that ψ is a morphism of topological rings, see Lemma 15.26.2. Hence $\varphi(\mathfrak{n}^r) \subset J + I$ hence $\varphi(\mathfrak{n}^{rt}) \subset I$ as desired. \square

Lemma 15.27.6. *Let $R \rightarrow S$ be a ring map. Let $\mathfrak{n} \subset \mathfrak{n}' \subset S$ be ideals. If $R \rightarrow S$ is formally smooth for the \mathfrak{n} -adic topology, then $R \rightarrow S$ is formally smooth for the \mathfrak{n}' -adic topology.*

Proof. Omitted. \square

Lemma 15.27.7. *A composition of formally smooth continuous homomorphisms of linearly topologized rings is formally smooth.*

Proof. Omitted. (Hint: This is completely formal, and follows from considering a suitable diagram.) \square

Lemma 15.27.8. *Let R, S be rings. Let $\mathfrak{n} \subset S$ be an ideal. Let $R \rightarrow S$ be formally smooth for the \mathfrak{n} -adic topology. Let $R \rightarrow R'$ be any ring map. Then $R' \rightarrow S' = S \otimes_R R'$ is formally smooth in the $\mathfrak{n}' = \mathfrak{n}S'$ -adic topology.*

Proof. Let a solid diagram

$$\begin{array}{ccccc} S & \longrightarrow & S' & \longrightarrow & A/J \\ \uparrow & \dashrightarrow & \uparrow & \dashrightarrow & \uparrow \\ R & \longrightarrow & R' & \longrightarrow & A \end{array}$$

as in Definition 15.27.1 be given. Then the composition $S \rightarrow S' \rightarrow A/J$ is continuous. By assumption the longer dotted arrow exists. By the universal property of tensor product we obtain the shorter dotted arrow. \square

We have seen descent for formal smoothness along faithfully flat ring maps in Algebra, Lemma 10.133.15. Something similar holds in the current setting of topological rings. However, here we just prove the following very simple and easy to prove version which is already quite useful.

Lemma 15.27.9. *Let R, S be rings. Let $\mathfrak{n} \subset S$ be an ideal. Let $R \rightarrow R'$ be a ring map. Set $S' = S \otimes_R R'$ and $\mathfrak{n}' = \mathfrak{n}S'$. If*

- (1) *the map $R \rightarrow R'$ embeds R as a direct summand of R' as an R -module,*
- and*
- (2) *$R' \rightarrow S'$ is formally smooth for the \mathfrak{n}' -adic topology,*

then $R \rightarrow S$ is formally smooth in the \mathfrak{n} -adic topology.

Proof. Let a solid diagram

$$\begin{array}{ccc} S & \longrightarrow & A/J \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Definition 15.27.1 be given. Set $A' = A \otimes_R R'$ and $J' = \text{Im}(J \otimes_R R' \rightarrow A')$. The base change of the diagram above is the diagram

$$\begin{array}{ccc} S' & \longrightarrow & A'/J' \\ \uparrow & \dashrightarrow \psi' & \uparrow \\ R' & \longrightarrow & A' \end{array}$$

with continuous arrows. By condition (2) we obtain the dotted arrow $\psi' : S' \rightarrow A'$. Using condition (1) choose a direct summand decomposition $R' = R \oplus C$ as R -modules. (Warning: C isn't an ideal in R' .) Then $A' = A \oplus A \otimes_R C$. Set

$$J'' = \text{Im}(J \otimes_R C \rightarrow A \otimes_R C) \subset J' \subset A'.$$

Then $J' = J \oplus J''$ as A -modules. The image of the composition $\psi : S \rightarrow A'$ of ψ' with $S \rightarrow S'$ is contained in $A + J' = A \oplus J''$. However, in the ring $A + J' = A \oplus J''$ the A -submodule J'' is an ideal! (Use that $J^2 = 0$.) Hence the composition $S \rightarrow A + J' \rightarrow (A + J')/J'' = A$ is the arrow we were looking for. \square

The following lemma will be improved on in Section 15.29.

Lemma 15.27.10. *Let k be a field and let (A, \mathfrak{m}, K) be a Noetherian local k -algebra. If $k \rightarrow A$ is formally smooth for the \mathfrak{m} -adic topology, then A is a regular local ring.*

Proof. Let $k_0 \subset k$ be the prime field. Then k_0 is perfect, hence k/k_0 is separable, hence formally smooth by Algebra, Lemma 10.147.7. By Lemmas 15.27.2 and 15.27.7 we see that $k_0 \rightarrow A$ is formally smooth for the \mathfrak{m} -adic topology on A . Hence we may assume $k = \mathbf{Q}$ or $k = \mathbf{F}_p$.

By Algebra, Lemmas 10.93.4 and 10.106.9 it suffices to prove the completion A^\wedge is regular. By Lemma 15.27.4 we may replace A by A^\wedge . Thus we may assume that A is a Noetherian complete local ring. By the Cohen structure theorem (Algebra, Theorem 10.149.8) there exist a map $K \rightarrow A$. As k is the prime field we see that $K \rightarrow A$ is a k -algebra map.

Let $x_1, \dots, x_n \in \mathfrak{m}$ be elements whose images form a basis of $\mathfrak{m}/\mathfrak{m}^2$. Set $T = K[[X_1, \dots, X_n]]$. Note that

$$A/\mathfrak{m}^2 \cong K[x_1, \dots, x_n]/(x_i x_j)$$

and

$$T/\mathfrak{m}_T^2 \cong K[X_1, \dots, X_n]/(X_i X_j).$$

Let $A/\mathfrak{m}^2 \rightarrow T/\mathfrak{m}_T^2$ be the local K -algebra isomorphism given by mapping the class of x_i to the class of X_i . Denote $f_1 : A \rightarrow T/\mathfrak{m}_T^2$ the composition of this isomorphism with the quotient map $A \rightarrow A/\mathfrak{m}^2$. The assumption that $k \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology means we can lift f_1 to a map $f_2 : A \rightarrow T/\mathfrak{m}_T^3$, then to a map $f_3 : A \rightarrow T/\mathfrak{m}_T^4$, and so on, for all $n \geq 1$. Warning: the maps f_n are continuous k -algebra maps and may not be K -algebra maps. We get an induced map $f : A \rightarrow T = \lim T/\mathfrak{m}_T^n$ of local k -algebras. By our choice of f_1 , the map f induces an isomorphism $\mathfrak{m}/\mathfrak{m}^2 \rightarrow \mathfrak{m}_T/\mathfrak{m}_T^2$ hence each f_n is surjective and we conclude f is surjective as A is complete. This implies $\dim(A) \geq \dim(T) = n$. Hence A is regular by definition. (It also follows that f is an isomorphism.) \square

The following result will be improved on in Section 15.29

Lemma 15.27.11. *Let k be a field. Let (A, \mathfrak{m}, K) be a regular local k -algebra such that K/k is separable. Then $k \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology.*

Proof. It suffices to prove that the completion of A is formally smooth over k , see Lemma 15.27.4. Hence we may assume that A is a complete local regular k -algebra with residue field K separable over k . Since K is formally smooth over k by Algebra, Proposition 10.147.9 we can successively find maps

$$\begin{array}{ccccccc}
 & & & & & & K \\
 & & & & & & \downarrow \\
 \dots & \xleftarrow{\quad} & A/\mathfrak{m}^4 & \xleftarrow{\quad} & A/\mathfrak{m}^3 & \xrightarrow{\quad} & A/\mathfrak{m}^2 \xrightarrow{\quad} K
 \end{array}$$

of k -algebras. Since A is complete this defines a k -algebra map $K \rightarrow A$. Pick $a_1, \dots, a_n \in \mathfrak{m}$ which map to a K -basis of $\mathfrak{m}/\mathfrak{m}^2$. Consider the K -algebra map

$$c : K[[x_1, \dots, x_n]] \rightarrow A$$

which maps x_i to a_i (existence of c follows from the universal property of the powerseries ring). By construction the maps $K[[x_1, \dots, x_n]] \rightarrow A/\mathfrak{m}^e$ are surjective

for all $e \geq 1$. Since $K[[x_1, \dots, x_n]]$ is complete we see that c is surjective. Since $\dim(A) = n$ as A is regular and since $K[[x_1, \dots, x_n]]$ is a domain of dimension n we see that the kernel of c is zero. Hence c is an isomorphism.

We win because the power series ring $K[[x_1, \dots, x_n]]$ is formally smooth over k . Namely, K is formally smooth over k and $K[x_1, \dots, x_n]$ is formally smooth over K as a polynomial algebra. Hence $K[x_1, \dots, x_n]$ is formally smooth over k by Algebra, Lemma 10.133.3. It follows that $k \rightarrow K[x_1, \dots, x_n]$ is formally smooth for the (x_1, \dots, x_n) -adic topology by Lemma 15.27.2. Finally, it follows that $k \rightarrow K[[x_1, \dots, x_n]]$ is formally smooth for the (x_1, \dots, x_n) -adic topology by Lemma 15.27.4. \square

Lemma 15.27.12. *Let $A \rightarrow B$ be a finite type ring map with A Noetherian. Let $\mathfrak{q} \subset B$ be a prime ideal lying over $\mathfrak{p} \subset A$. The following are equivalent*

- (1) $A \rightarrow B$ is smooth at \mathfrak{q} , and
- (2) $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth in the \mathfrak{q} -adic topology.

Proof. The implication (2) \Rightarrow (1) follows from Algebra, Lemma 10.136.2. Conversely, if $A \rightarrow B$ is smooth at \mathfrak{q} , then $A \rightarrow B_g$ is smooth for some $g \in B$, $g \notin \mathfrak{q}$. Then $A \rightarrow B_g$ is formally smooth by Algebra, Proposition 10.133.13. Hence $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth as localization preserves formal smoothness (for example by the criterion of Algebra, Proposition 10.133.8 and the fact that the cotangent complex behaves well with respect to localization, see Algebra, Lemmas 10.129.11 and 10.129.13). Finally, Lemma 15.27.2 implies that $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is formally smooth in the \mathfrak{q} -adic topology. \square

15.28. Some results on power series rings

Questions on formally smooth maps between Noetherian local rings can often be reduced to questions on maps between power series rings. In this section we prove some helper lemmas to facilitate this kind of argument.

Lemma 15.28.1. *Let K be a field of characteristic 0 and $A = K[[x_1, \dots, x_n]]$. Let L be a field of characteristic $p > 0$ and $B = L[[x_1, \dots, x_n]]$. Let Λ be a Cohen ring. Let $C = \Lambda[[x_1, \dots, x_n]]$.*

- (1) $\mathbf{Q} \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology.
- (2) $\mathbf{F}_p \rightarrow B$ is formally smooth in the \mathfrak{m} -adic topology.
- (3) $\mathbf{Z} \rightarrow C$ is formally smooth in the \mathfrak{m} -adic topology.

Proof. By the universal property of power series rings it suffices to prove:

- (1) $\mathbf{Q} \rightarrow K$ is formally smooth.
- (2) $\mathbf{F}_p \rightarrow L$ is formally smooth.
- (3) $\mathbf{Z} \rightarrow \Lambda$ is formally smooth in the \mathfrak{m} -adic topology.

The first two are Algebra, Proposition 10.147.9. The third follows from Algebra, Lemma 10.149.7 since for any test diagram as in Definition 15.27.1 some power of p will be zero in A/J and hence some power of p will be zero in A . \square

Lemma 15.28.2. *Let K be a field and $A = K[[x_1, \dots, x_n]]$. Let Λ be a Cohen ring and let $B = \Lambda[[x_1, \dots, x_n]]$.*

- (1) *If $y_1, \dots, y_n \in A$ is a regular system of parameters then $K[[y_1, \dots, y_n]] \rightarrow A$ is an isomorphism.*

- (2) If $z_1, \dots, z_r \in A$ form part of a regular system of parameters for A , then $r \leq n$ and $A/(z_1, \dots, z_r) \cong K[[y_1, \dots, y_{n-r}]]$.
- (3) If $p, y_1, \dots, y_n \in B$ is a regular system of parameters then $\Lambda[[y_1, \dots, y_n]] \rightarrow B$ is an isomorphism.
- (4) If $p, z_1, \dots, z_r \in B$ form part of a regular system of parameters for B , then $r \leq n$ and $B/(z_1, \dots, z_r) \cong \Lambda[[y_1, \dots, y_{n-r}]]$.

Proof. Proof of (1). Set $A' = K[[y_1, \dots, y_n]]$. It is clear that the map $A' \rightarrow A$ induces an isomorphism $A'/\mathfrak{m}_A^n \rightarrow A/\mathfrak{m}_A^n$ for all $n \geq 1$. Since A and A' are both complete we deduce that $A' \rightarrow A$ is an isomorphism. Proof of (2). Extend z_1, \dots, z_r to a regular system of parameters $z_1, \dots, z_r, y_1, \dots, y_{n-r}$ of A . Consider the map $A' = K[[z_1, \dots, z_r, y_1, \dots, y_{n-r}]] \rightarrow A$. This is an isomorphism by (1). Hence (2) follows as it is clear that $A'/(z_1, \dots, z_r) \cong K[[y_1, \dots, y_{n-r}]]$. The proofs of (3) and (4) are exactly the same as the proofs of (1) and (2). \square

Lemma 15.28.3. *Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. Then there exists a commutative diagram*

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

with the following properties:

- (1) the horizontal arrows are surjective,
- (2) if the characteristic of A/\mathfrak{m}_A is zero, then S and R are power series rings over fields,
- (3) if the characteristic of A/\mathfrak{m}_A is $p > 0$, then S and R are power series rings over Cohen rings, and
- (4) $R \rightarrow S$ maps a regular system of parameters of R to part of a regular system of parameters of S .

In particular $R \rightarrow S$ is flat (see Algebra, Lemma 10.124.2) with regular fibre $S/\mathfrak{m}_R S$ (see Algebra, Lemma 10.102.3).

Proof. Use the Cohen structure theorem (Algebra, Theorem 10.149.8) to choose a surjection $S \rightarrow B$ as in the statement of the lemma where we choose S to be a power series over a Cohen ring if the residue characteristic is $p > 0$ and a power series over a field else. Let $J \subset S$ be the kernel of $S \rightarrow B$. Next, choose a surjection $R = \Lambda[[x_1, \dots, x_n]] \rightarrow A$ where we choose Λ to be a Cohen ring if the residue characteristic of A is $p > 0$ and Λ equal to the residue field of A otherwise. We lift the composition $\Lambda[[x_1, \dots, x_n]] \rightarrow A \rightarrow B$ to a map $\varphi : R \rightarrow S$. This is possible because $\Lambda[[x_1, \dots, x_n]]$ is formally smooth over \mathbf{Z} in the \mathfrak{m} -adic topology (see Lemma 15.28.1) by an application of Lemma 15.27.5. Finally, we replace φ by the map $\varphi' : R = \Lambda[[x_1, \dots, x_n]] \rightarrow S' = S[[y_1, \dots, y_n]]$ with $\varphi'|_\Lambda = \varphi|_\Lambda$ and $\varphi'(x_i) = \varphi(x_i) + y_i$. We also replace $S \rightarrow B$ by the map $S' \rightarrow B$ which maps y_i to zero. After this replacement it is clear that a regular system of parameters of R maps to part of a regular sequence in S' and we win. \square

There should be an elementary proof of the following lemma.

Lemma 15.28.4. *Let $S \rightarrow R$ and $S' \rightarrow R$ be surjective maps of complete Noetherian local rings. Then $S \times_R S'$ is a complete Noetherian local ring.*

Proof. Let k be the residue field of R . If the characteristic of k is $p > 0$, then we denote Λ a Cohen ring (Algebra, Definition 10.149.5) with residue field k (Algebra, Lemma 10.149.6). If the characteristic of k is 0 we set $\Lambda = k$. Choose a surjection $\Lambda[[x_1, \dots, x_n]] \rightarrow R$ (as in the Cohen structure theorem, see Algebra, Theorem 10.149.8) and lift this to maps $\Lambda[[x_1, \dots, x_n]] \rightarrow S$ and $\varphi : \Lambda[[x_1, \dots, x_n]] \rightarrow S$ and $\varphi' : \Lambda[[x_1, \dots, x_n]] \rightarrow S'$ using Lemmas 15.28.1 and 15.27.5. Next, choose $f_1, \dots, f_m \in S$ generating the kernel of $S \rightarrow R$ and $f'_1, \dots, f'_{m'} \in S'$ generating the kernel of $S' \rightarrow R$. Then the map

$$\Lambda[[x_1, \dots, x_n, y_1, \dots, y_m, z_1, \dots, z_{m'}]] \longrightarrow S \times_R S,$$

which sends x_i to $(\varphi(x_i), \varphi'(x_i))$ and y_j to $(f_j, 0)$ and $z_{j'}$ to $(0, f'_{j'})$ is surjective. Thus $S \times_R S'$ is a quotient of a complete local ring, whence complete. \square

15.29. Geometric regularity and formal smoothness

In this section we combine the results of the previous sections to prove the following characterization of geometrically regular local rings over fields. We then recycle some of our arguments to prove a characterization of formally smooth maps in the \mathfrak{m} -adic topology between Noetherian local rings.

Theorem 15.29.1. *Let k be a field. Let (A, \mathfrak{m}, K) be a Noetherian local k -algebra. If the characteristic of k is zero then the following are equivalent*

- (1) A is a regular local ring, and
- (2) $k \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology.

If the characteristic of k is $p > 0$ then the following are equivalent

- (1) A is geometrically regular over k ,
- (2) $k \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology.
- (3) for all $k \subset k' \subset k^{1/p}$ finite over k the ring $A \otimes_k k'$ is regular,
- (4) A is regular and the canonical map $H_1(L_{K/k}) \rightarrow \mathfrak{m}/\mathfrak{m}^2$ is injective, and
- (5) A is regular and the map $\Omega_{k/\mathbb{F}_p} \otimes_k K \rightarrow \Omega_{A/\mathbb{F}_p} \otimes_A K$ is injective.

Proof. If the characteristic of k is zero, then the equivalence of (1) and (2) follows from Lemmas 15.27.10 and 15.27.11.

If the characteristic of k is $p > 0$, then it follows from Proposition 15.25.1 that (1), (3), (4), and (5) are equivalent. Assume (2) holds. By Lemma 15.27.8 we see that $k' \rightarrow A' = A \otimes_k k'$ is formally smooth for the $\mathfrak{m}' = \mathfrak{m}A$ -adic topology. Hence if $k \subset k'$ is finite purely inseparable, then A' is a regular local ring by Lemma 15.27.10. Thus we see that (1) holds.

Finally, we will prove that (5) implies (2). Choose a solid diagram

$$\begin{array}{ccc} A & \xrightarrow{\quad} & B/J \\ \uparrow i & \searrow \bar{\psi} & \uparrow \pi \\ k & \xrightarrow{\quad \varphi & B \end{array}$$

as in Definition 15.27.1. As $J^2 = 0$ we see that J has a canonical B/J module structure and via $\bar{\psi}$ an A -module structure. As $\bar{\psi}$ is continuous for the \mathfrak{m} -adic topology we see that $\mathfrak{m}^n J = 0$ for some n . Hence we can filter J by B/J -submodules $0 \subset J_1 \subset J_2 \subset \dots \subset J_n = J$ such that each quotient J_{t+1}/J_t is annihilated by \mathfrak{m} . Considering the sequence of ring maps $B \rightarrow B/J_1 \rightarrow B/J_2 \rightarrow \dots \rightarrow B/J$ we see

that it suffices to prove the existence of the dotted arrow when J is annihilated by \mathfrak{m} , i.e., when J is a K -vector space.

Assume given a diagram as above such that J is annihilated by \mathfrak{m} . By Lemma 15.27.11 we see that $\mathbf{F}_p \rightarrow A$ is formally smooth in the \mathfrak{m} -adic topology. Hence we can find a ring map $\psi : A \rightarrow B$ such that $\pi \circ \psi = \bar{\psi}$. Then $\psi \circ i, \varphi : k \rightarrow B$ are two maps whose compositions with π are equal. Hence $D = \psi \circ i - \varphi : k \rightarrow J$ is a derivation. By Algebra, Lemma 10.127.3 we can write $D = \xi \circ d$ for some k -linear map $\xi : \Omega_{k/\mathbf{F}_p} \rightarrow J$. Using the K -vector space structure on J we extend ξ to a K -linear map $\xi' : \Omega_{k/\mathbf{F}_p} \otimes_k K \rightarrow J$. Using (5) we can find a K -linear map $\xi'' : \Omega_{A/\mathbf{F}_p} \otimes_A K$ whose restriction to $\Omega_{k/\mathbf{F}_p} \otimes_k K$ is ξ' . Write

$$D' : A \xrightarrow{d} \Omega_{A/\mathbf{F}_p} \rightarrow \Omega_{A/\mathbf{F}_p} \otimes_A K \xrightarrow{\xi''} J.$$

Finally, set $\psi' = \psi - D' : A \rightarrow B$. The reader verifies that ψ' is a ring map such that $\pi \circ \psi' = \bar{\psi}$ and such that $\psi' \circ i = \varphi$ as desired. \square

Example 15.29.2. Let k be a field of characteristic $p > 0$. Suppose that $a \in k$ is an element which is not a p th power. A standard example of a geometrically regular local k -algebra whose residue field is purely inseparable over k is the ring

$$A = k[x, y]_{(x, y^p - a)} / (y^p - a - x)$$

Namely, A is a localization of a smooth algebra over k hence $k \rightarrow A$ is formally smooth, hence $k \rightarrow A$ is formally smooth for the \mathfrak{m} -adic topology. A closely related example is the following. Let $k = \mathbf{F}_p(s)$ and $K = \mathbf{F}_p(t)^{perf}$. We claim the ring map

$$k \longrightarrow A = K[[x]], \quad s \longmapsto t + x$$

is formally smooth for the (x) -adic topology on A . Namely, Ω_{k/\mathbf{F}_p} is 1-dimensional with basis ds . It maps to the element $dx + dt = dx$ in Ω_{A/\mathbf{F}_p} . We leave it to the reader to show that Ω_{A/\mathbf{F}_p} is free on dx as an A -module. Hence we see that condition (5) of Theorem 15.29.1 holds and we conclude that $k \rightarrow A$ is formally smooth in the (x) -adic topology.

Lemma 15.29.3. *Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Assume $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology. Then $A \rightarrow B$ is flat.*

Proof. We may assume that A and B a Noetherian complete local rings by Lemma 15.27.4 and Algebra, Lemma 10.93.10 (this also uses Algebra, Lemma 10.38.8 and 10.93.4 to see that flatness of the map on completions implies flatness of $A \rightarrow B$). Choose a commutative diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Lemma 15.28.3 with $R \rightarrow S$ flat. Let $I \subset R$ be the kernel of $R \rightarrow A$. Because B is formally smooth over A we see that the A -algebra map

$$S/IS \longrightarrow B$$

has a section, see Lemma 15.27.5. Hence B is a direct summand of the flat A -module S/IS (by base change of flatness, see Algebra, Lemma 10.38.6), whence flat. \square

Proposition 15.29.4. *Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Let k be the residue field of A and $\overline{B} = B \otimes_A k$ the special fibre. The following are equivalent*

- (1) $A \rightarrow B$ is flat and \overline{B} is geometrically regular over k ,
- (2) $A \rightarrow B$ is flat and $k \rightarrow \overline{B}$ is formally smooth in the $\mathfrak{m}_{\overline{B}}$ -adic topology, and
- (3) $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology.

Proof. The equivalence of (1) and (2) follows from Theorem 15.29.1.

Assume (3). By Lemma 15.29.3 we see that $A \rightarrow B$ is flat. By Lemma 15.27.8 we see that $k \rightarrow \overline{B}$ is formally smooth in the $\mathfrak{m}_{\overline{B}}$ -adic topology. Thus (2) holds.

Assume (2). Lemma 15.27.4 tells us formal smoothness is preserved under completion. The same is true for flatness by Algebra, Lemma 10.93.4. Hence we may replace A and B by their respective completions and assume that A and B are Noetherian complete local rings. In this case choose a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Lemma 15.28.3. We will use all of the properties of this diagram without further mention. Fix a regular system of parameters t_1, \dots, t_d of R with $t_1 = p$ in case the characteristic of k is $p > 0$. Set $\overline{S} = S \otimes_R k$. Consider the short exact sequence

$$0 \rightarrow J \rightarrow S \rightarrow B \rightarrow 0$$

Since B is flat over A we see that $J \otimes_R k$ is the kernel of $\overline{S} \rightarrow \overline{B}$. As \overline{B} and \overline{S} are regular we see that $J \otimes_R k$ is generated by elements $\overline{x}_1, \dots, \overline{x}_r$ which form part of a regular system of parameters of \overline{S} , see Algebra, Lemma 10.102.4. Lift these elements to $x_1, \dots, x_r \in J$. Then $t_1, \dots, t_d, x_1, \dots, x_r$ is part of a regular system of parameters for S . Hence $S/(x_1, \dots, x_r)$ is a power series ring over a field (if the characteristic of k is zero) or a power series ring over a Cohen ring (if the characteristic of k is $p > 0$), see Lemma 15.28.2. Moreover, it is still the case that $R \rightarrow S/(x_1, \dots, x_r)$ maps t_1, \dots, t_d to a part of a regular system of parameters of $S/(x_1, \dots, x_r)$. In other words, we may replace S by $S/(x_1, \dots, x_r)$ and assume we have a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Lemma 15.28.3 with moreover $\overline{S} = \overline{B}$. In this case the map

$$S \otimes_R A \longrightarrow B$$

is an isomorphism as it is surjective and an isomorphism on special fibres, see Algebra, Lemma 10.95.1. Thus by Lemma 15.27.8 it suffices to show that $R \rightarrow S$ is formally smooth in the \mathfrak{m}_S -adic topology. Of course, since $\overline{S} = \overline{B}$, we have that \overline{S} is formally smooth over $k = R/\mathfrak{m}_R$.

Choose elements $y_1, \dots, y_m \in S$ such that $t_1, \dots, t_d, y_1, \dots, y_m$ is a regular system of parameters for S . If the characteristic of k is zero, choose a coefficient field $K \subset S$

and if the characteristic of k is $p > 0$ choose a Cohen ring $\Lambda \subset S$ with residue field K . At this point the map $K[[t_1, \dots, t_d, y_1, \dots, y_m]] \rightarrow S$ (characteristic zero case) or $\Lambda[[t_2, \dots, t_d, y_1, \dots, y_m]] \rightarrow S$ (characteristic $p > 0$ case) is an isomorphism, see Lemma 15.28.2. From now on we think of S as the above power series ring.

The rest of the proof is analogous to the argument in the proof of Theorem 15.29.1. Choose a solid diagram

$$\begin{array}{ccc} S & \longrightarrow & N/J \\ \uparrow i & \searrow \bar{\psi} & \uparrow \pi \\ R & \xrightarrow{\varphi} & N \end{array}$$

as in Definition 15.27.1. As $J^2 = 0$ we see that J has a canonical N/J module structure and via $\bar{\psi}$ a S -module structure. As $\bar{\psi}$ is continuous for the \mathfrak{m}_S -adic topology we see that $\mathfrak{m}_S^n J = 0$ for some n . Hence we can filter J by N/J -submodules $0 \subset J_1 \subset J_2 \subset \dots \subset J_n = J$ such that each quotient J_{t+1}/J_t is annihilated by \mathfrak{m}_S . Considering the sequence of ring maps $N \rightarrow N/J_1 \rightarrow N/J_2 \rightarrow \dots \rightarrow N/J$ we see that it suffices to prove the existence of the dotted arrow when J is annihilated by \mathfrak{m}_S , i.e., when J is a K -vector space.

Assume given a diagram as above such that J is annihilated by \mathfrak{m}_S . As $\mathbf{Q} \rightarrow S$ (characteristic zero case) or $\mathbf{Z} \rightarrow S$ (characteristic $p > 0$ case) is formally smooth in the \mathfrak{m}_S -adic topology (see Lemma 15.28.1), we can find a ring map $\psi : S \rightarrow N$ such that $\pi \circ \psi = \bar{\psi}$. Since S is a power series ring in t_1, \dots, t_d (characteristic zero) or t_2, \dots, t_d (characteristic $p > 0$) over a subring, it follows from the universal property of power series rings that we can change our choice of ψ so that $\psi(t_i)$ equals $\varphi(t_i)$ (automatic for $t_1 = p$ in the characteristic p case). Then $\psi \circ i$ and $\varphi : R \rightarrow N$ are two maps whose compositions with π are equal and which agree on t_1, \dots, t_d . Hence $D = \psi \circ i - \varphi : R \rightarrow J$ is a derivation which annihilates t_1, \dots, t_d . By Algebra, Lemma 10.127.3 we can write $D = \xi \circ d$ for some R -linear map $\xi : \Omega_{R/\mathbf{Z}} \rightarrow J$ which annihilates dt_1, \dots, dt_d (by construction) and $\mathfrak{m}_R \Omega_{R/\mathbf{Z}}$ (as J is annihilated by \mathfrak{m}_R). Hence ξ factors as a composition

$$\Omega_{R/\mathbf{Z}} \rightarrow \Omega_{k/\mathbf{Z}} \xrightarrow{\xi'} J$$

where ξ' is k -linear. Using the K -vector space structure on J we extend ξ' to a K -linear map

$$\xi'' : \Omega_{k/\mathbf{Z}} \otimes_k K \rightarrow J.$$

Using that \bar{S}/k is formally smooth we see that

$$\Omega_{k/\mathbf{Z}} \otimes_k K \rightarrow \Omega_{\bar{S}/\mathbf{Z}} \otimes_S K$$

is injective by Theorem 15.29.1 (this is true also in the characteristic zero case as it is even true that $\Omega_{k/\mathbf{Z}} \rightarrow \Omega_{K/\mathbf{Z}}$ is injective in characteristic zero, see Algebra, Proposition 10.147.9). Hence we can find a K -linear map $\xi''' : \Omega_{\bar{S}/\mathbf{Z}} \otimes_S K \rightarrow J$ whose restriction to $\Omega_{k/\mathbf{Z}} \otimes_k K$ is ξ'' . Write

$$D' : S \xrightarrow{d} \Omega_{S/\mathbf{Z}} \rightarrow \Omega_{\bar{S}/\mathbf{Z}} \otimes_S K \xrightarrow{\xi'''} J.$$

Finally, set $\psi' = \psi - D' : S \rightarrow N$. The reader verifies that ψ' is a ring map such that $\pi \circ \psi' = \bar{\psi}$ and such that $\psi' \circ i = \varphi$ as desired. \square

As an application of the result above we prove that deformations of formally smooth algebras are unobstructed.

Lemma 15.29.5. *Let A be a Noetherian complete local ring with residue field k . Let B be a Noetherian complete local k -algebra. Assume $k \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology. Then there exists a Noetherian complete local ring C and a local homomorphism $A \rightarrow C$ which is formally smooth in the \mathfrak{m}_C -adic topology such that $C \otimes_A k \cong B$.*

Proof. Choose a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Lemma 15.28.3. Let t_1, \dots, t_d be a regular system of parameters for R with $t_1 = p$ in case the characteristic of k is $p > 0$. As B and $\bar{S} = S \otimes_A k$ are regular we see that $\text{Ker}(\bar{S} \rightarrow B)$ is generated by elements $\bar{x}_1, \dots, \bar{x}_r$ which form part of a regular system of parameters of \bar{S} , see Algebra, Lemma 10.102.4. Lift these elements to $x_1, \dots, x_r \in S$. Then $t_1, \dots, t_d, x_1, \dots, x_r$ is part of a regular system of parameters for S . Hence $S/(x_1, \dots, x_r)$ is a power series ring over a field (if the characteristic of k is zero) or a power series ring over a Cohen ring (if the characteristic of k is $p > 0$), see Lemma 15.28.2. Moreover, it is still the case that $R \rightarrow S/(x_1, \dots, x_r)$ maps t_1, \dots, t_d to a part of a regular system of parameters of $S/(x_1, \dots, x_r)$. In other words, we may replace S by $S/(x_1, \dots, x_r)$ and assume we have a diagram

$$\begin{array}{ccc} S & \longrightarrow & B \\ \uparrow & & \uparrow \\ R & \longrightarrow & A \end{array}$$

as in Lemma 15.28.3 with moreover $\bar{S} = B$. In this case $R \rightarrow S$ is formally smooth in the \mathfrak{m}_S -adic topology by Proposition 15.29.4. Hence the base change $C = S \otimes_R A$ is formally smooth over A in the \mathfrak{m}_C -adic topology by Lemma 15.27.8. \square

Remark 15.29.6. The assertion of Lemma 15.29.5 is quite strong. Namely, suppose that we have a diagram

$$\begin{array}{ccc} & & B \\ & & \uparrow \\ A & \longrightarrow & A' \end{array}$$

of local homomorphisms of Noetherian complete local rings where $A \rightarrow A'$ induces an isomorphism of residue fields $k = A/\mathfrak{m}_A = A'/\mathfrak{m}_{A'}$ and with $B \otimes_{A'} k$ formally smooth over k . Then we can extend this to a commutative diagram

$$\begin{array}{ccc} C & \longrightarrow & B \\ \uparrow & & \uparrow \\ A & \longrightarrow & A' \end{array}$$

of local homomorphisms of Noetherian complete local rings where $A \rightarrow C$ is formally smooth in the \mathfrak{m}_C -adic topology and where $C \otimes_A k \cong B \otimes_{A'} k$. Namely, pick $A \rightarrow C$ as in Lemma 15.29.5 lifting $B \otimes_{A'} k$ over k . By formal smoothness we can

find the arrow $C \rightarrow B$, see Lemma 15.27.5. Denote $C \otimes_A^\wedge A'$ the completion of $C \otimes_A A'$ with respect to the ideal $C \otimes_A \mathfrak{m}_{A'}$. Note that $C \otimes_A^\wedge A'$ is a Noetherian complete local ring (see Algebra, Lemma 10.93.9) which is flat over A' (see Algebra, Lemma 10.95.11). We have moreover

- (1) $C \otimes_A^\wedge A' \rightarrow B$ is surjective,
- (2) if $A \rightarrow A'$ is surjective, then $C \rightarrow B$ is surjective,
- (3) if $A \rightarrow A'$ is finite, then $C \rightarrow B$ is finite, and
- (4) if $A' \rightarrow B$ is flat, then $C \otimes_A^\wedge A' \cong B$.

Namely, by Nakayama's lemma for nilpotent ideals (see Algebra, Lemma 10.19.1) we see that $C \otimes_A k \cong B \otimes_{A'} k$ implies that $C \otimes_A A'/\mathfrak{m}_{A'}^n \rightarrow B/\mathfrak{m}_{A'}^n B$ is surjective for all n . This proves (1). Parts (2) and (3) follow from part (1). Part (4) follows from Algebra, Lemma 10.95.1.

15.30. Regular ring maps

Let k be a field. Recall that a Noetherian k -algebra A is said to be *geometrically regular* over k if and only if $A \otimes_k k'$ is regular for all finite purely inseparable extensions k' of k , see Algebra, Definition 10.154.2. Moreover, if this is the case then $A \otimes_k k'$ is regular for every finitely generated field extension $k \subset k'$, see Algebra, Lemma 10.154.1. We use this notion in the following definition.

Definition 15.30.1. A ring map $R \rightarrow \Lambda$ is *regular* if it is flat and for every prime $\mathfrak{p} \subset R$ the fibre ring

$$\Lambda \otimes_R \kappa(\mathfrak{p}) = \Lambda_{\mathfrak{p}}/\mathfrak{p}\Lambda_{\mathfrak{p}}$$

is Noetherian and geometrically regular over $\kappa(\mathfrak{p})$.

If $R \rightarrow \Lambda$ is a ring map with Λ Noetherian, then the fibre rings are always Noetherian.

Lemma 15.30.2 (Regular is a local property). *Let $R \rightarrow \Lambda$ be a ring map with Λ Noetherian. The following are equivalent*

- (1) $R \rightarrow \Lambda$ is regular,
- (2) $R_{\mathfrak{p}} \rightarrow \Lambda_{\mathfrak{q}}$ is regular for all $\mathfrak{q} \subset \Lambda$ lying over $\mathfrak{p} \subset R$, and
- (3) $R_{\mathfrak{m}} \rightarrow \Lambda_{\mathfrak{m}'}$ is regular for all maximal ideals $\mathfrak{m}' \subset \Lambda$ lying over \mathfrak{m} in R .

Proof. This is true because a Noetherian ring is regular if and only if all the local rings are regular local rings, see Algebra, Definition 10.106.7 and a ring map is flat if and only if all the induced maps of local rings are flat, see Algebra, Lemma 10.38.19. \square

Lemma 15.30.3 (Regular maps and base change). *Let $R \rightarrow \Lambda$ be a regular ring map. For any finite type ring map $R \rightarrow R'$ the base change $R' \rightarrow \Lambda \otimes_R R'$ is regular too.*

Proof. Flatness is preserved under any base change, see Algebra, Lemma 10.38.6. Consider a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p} \subset R$. The residue field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{p}')$ is finitely generated as R' is of finite type over R . Hence the fibre ring

$$(\Lambda \otimes_R R') \otimes_{R'} \kappa(\mathfrak{p}') = \Lambda \otimes_R \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$$

is Noetherian by Algebra, Lemma 10.30.7 and the assumption on the fibre rings of $R \rightarrow \Lambda$. Geometric regularity of the fibres is preserved by Algebra, Lemma 10.154.1. \square

Lemma 15.30.4 (Composition of regular maps). *Let $A \rightarrow B \rightarrow C$ be regular ring maps. If the fibre rings of $A \rightarrow C$ are Noetherian, then $A \rightarrow C$ is regular.*

Proof. Let $\mathfrak{p} \subset A$ be a prime. Let $\kappa(\mathfrak{p}) \subset k$ be a finite purely inseparable extension. We have to show that $C \otimes_A k$ is regular. By Lemma 15.30.3 we may assume that $A = k$ and we reduce to proving that C is regular. The assumption is that B is regular and that $B \rightarrow C$ is flat with regular fibres. Then C is regular by Algebra, Lemma 10.108.8. Some details omitted. \square

Lemma 15.30.5. *Let R be a ring. Let $(A_i, \varphi_{ii'})$ be a directed system of smooth R -algebras. Set $\Lambda = \operatorname{colim} A_i$. If the fibre rings $\Lambda \otimes_R \kappa(\mathfrak{p})$ are Noetherian for all $\mathfrak{p} \subset R$, then $R \rightarrow \Lambda$ is regular.*

Proof. Note that Λ is flat over R by Algebra, Lemmas 10.38.2 and 10.132.10. Let $\kappa(\mathfrak{p}) \subset k$ be a finite purely inseparable extension. Note that

$$\Lambda \otimes_R \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} k = \Lambda \otimes_R k = \operatorname{colim} A_i \otimes_R k$$

is a colimit of smooth k -algebras, see Algebra, Lemma 10.132.4. Since each local ring of a smooth k -algebra is regular by Algebra, Lemma 10.135.3 we conclude that all local rings of $\Lambda \otimes_R k$ are regular by Algebra, Lemma 10.102.8. This proves the lemma. \square

Let's see when a field extension defines a regular ring map.

Lemma 15.30.6. *Let $k \subset K$ be a field extension. Then $k \rightarrow K$ is a regular ring map if and only if K is a separable field extension of k .*

Proof. If $k \rightarrow K$ is regular, then K is geometrically reduced over k , hence K is separable over k by Algebra, Proposition 10.147.9. Conversely, if K/k is separable, then K is a colimit of smooth k -algebras, see Algebra, Lemma 10.147.11 hence is regular by Lemma 15.30.5. \square

Lemma 15.30.7. *Let $A \rightarrow B \rightarrow C$ be ring maps. If $A \rightarrow C$ is regular and $B \rightarrow C$ is flat and surjective on spectra, then $A \rightarrow B$ is regular.*

Proof. By Algebra, Lemma 10.38.9 we see that $A \rightarrow B$ is flat. Let $\mathfrak{p} \subset A$ be a prime. The ring map $B \otimes_A \kappa(\mathfrak{p}) \rightarrow C \otimes_A \kappa(\mathfrak{p})$ is flat and surjective on spectra. Hence $B \otimes_A \kappa(\mathfrak{p})$ is geometrically regular by Algebra, Lemma 10.154.3. \square

15.31. Ascending properties along regular ring maps

This section is the analogue of Algebra, Section 10.151 but where the ring map $R \rightarrow S$ is regular.

Lemma 15.31.1. *Let $\varphi : R \rightarrow S$ be a ring map. Assume*

- (1) φ is regular,
- (2) S is Noetherian, and
- (3) R is Noetherian and reduced.

Then S is reduced.

Proof. For Noetherian rings being reduced is the same as having properties (S_1) and (R_0) , see Algebra, Lemma 10.146.3. Hence we may apply Algebra, Lemmas 10.151.4 and 10.151.5. \square

15.32. Permanence of properties under completion

Given a Noetherian local ring A we denote A^\wedge the completion of A with respect to its maximal ideal. We will use without further mention that A^\wedge is a Noetherian complete local ring (Algebra, Lemmas 10.93.10 and 10.93.7) and that $A \rightarrow A^\wedge$ is flat (Algebra, Lemma 10.93.3).

Lemma 15.32.1. *Let A be a Noetherian local ring. Then $\dim(A) = \dim(A^\wedge)$.*

Proof. See for example Algebra, Lemma 10.108.7. \square

Lemma 15.32.2. *Let A be a Noetherian local ring. Then $\text{depth}(A) = \text{depth}(A^\wedge)$.*

Proof. See Algebra, Lemma 10.151.2. \square

Lemma 15.32.3. *Let A be a Noetherian local ring. Then A is Cohen-Macaulay if and only if A^\wedge is so.*

Proof. A local ring A is Cohen-Macaulay if and only if $\dim(A) = \text{depth}(A)$. As both of these invariants are preserved under completion (Lemmas 15.32.1 and 15.32.2) the claim follows. \square

Lemma 15.32.4. *Let A be a Noetherian local ring. Then A is regular if and only if A^\wedge is so.*

Proof. If A^\wedge is regular, then A is regular by Algebra, Lemma 10.106.9. Assume A is regular. Let \mathfrak{m} be the maximal ideal of A . Then $\dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2 = \dim(A) = \dim(A^\wedge)$ (Lemma 15.32.1). On the other hand, $\mathfrak{m}A^\wedge$ is the maximal ideal of A^\wedge and hence \mathfrak{m}_{A^\wedge} is generated by at most $\dim(A^\wedge)$ elements. Thus A^\wedge is regular. (You can also use Algebra, Lemma 10.108.8.) \square

Lemma 15.32.5. *Let A be a Noetherian local ring. Then A is a discrete valuation ring if and only if A^\wedge is so.*

Proof. This follows from Lemmas 15.32.1 and 15.32.4 and Algebra, Lemma 10.115.6. \square

Lemma 15.32.6. *Let A be a Noetherian local ring.*

- (1) *If A^\wedge is reduced, then so is A .*
- (2) *In general A reduced does not imply A^\wedge is reduced.*
- (3) *If A is Nagata, then A is reduced if and only if A^\wedge is reduced.*

Proof. As $A \rightarrow A^\wedge$ is faithfully flat we have (1) by Algebra, Lemma 10.152.2. For (2) see Algebra, Example 10.115.4 (there are also examples in characteristic zero, see Algebra, Remark 10.115.5). For (3) see Algebra, Lemmas 10.150.27 and 10.150.24. \square

Lemma 15.32.7. *Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings such that $\mathfrak{m}_A B = \mathfrak{m}_B$ and $\kappa(\mathfrak{m}_A) = \kappa(\mathfrak{m}_B)$. Then $A \rightarrow B$ induces an isomorphism $A^\wedge \rightarrow B^\wedge$ of completions.*

Proof. By Algebra, Lemma 10.93.18 we see that B^\wedge is the \mathfrak{m}_A -adic completion of B and that $A^\wedge \rightarrow B^\wedge$ is finite. Since $A \rightarrow B$ is flat we have $\text{Tor}_1^A(B, \kappa(\mathfrak{m}_A)) = 0$. Hence we see that B^\wedge is flat over A^\wedge by Lemma 15.19.5. Thus B^\wedge is a free A^\wedge -module by Algebra, Lemma 10.75.4. Since $A^\wedge \rightarrow B^\wedge$ induces an isomorphism $\kappa(\mathfrak{m}_A) = A^\wedge/\mathfrak{m}_A A^\wedge \rightarrow B^\wedge/\mathfrak{m}_A B^\wedge = B^\wedge/\mathfrak{m}_B B^\wedge = \kappa(\mathfrak{m}_B)$ by our assumptions

(and Algebra, Lemmas 10.93.6 and 10.93.7), we see that B^\wedge is free of rank 1. Thus $A^\wedge \rightarrow B^\wedge$ is an isomorphism. \square

15.33. Permanence of properties under étale maps

In this section we consider an étale ring map $\varphi : A \rightarrow B$ and we study which properties of A are inherited by B and which properties of the local ring of B at \mathfrak{q} are inherited by the local ring of A at $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$. Basically, this section reviews and collects earlier results and does not add any new material.

We will use without further mention that an étale ring map is flat (Algebra, Lemma 10.138.3) and that a flat local homomorphism of local rings is faithfully flat (Algebra, Lemma 10.38.16).

Lemma 15.33.1. *If $A \rightarrow B$ is an étale ring map and \mathfrak{q} is a prime of B lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is Noetherian if and only if $B_{\mathfrak{q}}$ is Noetherian.*

Proof. Since $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is faithfully flat we see that $B_{\mathfrak{q}}$ Noetherian implies that $A_{\mathfrak{p}}$ is Noetherian, see Algebra, Lemma 10.152.1. Conversely, if $A_{\mathfrak{p}}$ is Noetherian, then $B_{\mathfrak{q}}$ is Noetherian as it is a localization of a finite type $A_{\mathfrak{p}}$ -algebra. \square

Lemma 15.33.2. *If $A \rightarrow B$ is an étale ring map and \mathfrak{q} is a prime of B lying over $\mathfrak{p} \subset A$, then $\dim(A_{\mathfrak{p}}) = \dim(B_{\mathfrak{q}})$.*

Proof. Namely, because $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is flat we have going down, and hence the inequality $\dim(A_{\mathfrak{p}}) \leq \dim(B_{\mathfrak{q}})$, see Algebra, Lemma 10.108.1. On the other hand, suppose that $\mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \dots \subset \mathfrak{q}_n$ is a chain of primes in $B_{\mathfrak{q}}$. Then the corresponding sequence of primes $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_n$ (with $\mathfrak{p}_i = \mathfrak{q}_i \cap A_{\mathfrak{p}}$) is chain also (i.e., no equalities in the sequence) as an étale ring map is quasi-finite (see Algebra, Lemma 10.138.6) and a quasi-finite ring map induces a map of spectra with discrete fibres (by definition). This means that $\dim(A_{\mathfrak{p}}) \geq \dim(B_{\mathfrak{q}})$ as desired. \square

Lemma 15.33.3. *If $A \rightarrow B$ is an étale ring map and \mathfrak{q} is a prime of B lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is regular if and only if $B_{\mathfrak{q}}$ is regular.*

Proof. By Lemma 15.33.1 we may assume both $A_{\mathfrak{p}}$ and $B_{\mathfrak{q}}$ are Noetherian in order to prove the equivalence. Let $x_1, \dots, x_t \in \mathfrak{p}A_{\mathfrak{p}}$ be a minimal set of generators. As $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is faithfully flat we see that the images y_1, \dots, y_t in $B_{\mathfrak{q}}$ form a minimal system of generators for $\mathfrak{p}B_{\mathfrak{q}} = \mathfrak{q}B_{\mathfrak{q}}$ (Algebra, Lemma 10.138.5). Regularity of $A_{\mathfrak{p}}$ by definition means $t = \dim(A_{\mathfrak{p}})$ and similarly for $B_{\mathfrak{q}}$. Hence the lemma follows from the equality $\dim(A_{\mathfrak{p}}) = \dim(B_{\mathfrak{q}})$ of Lemma 15.33.2. \square

Lemma 15.33.4. *If $A \rightarrow B$ is an étale ring map and A is a Dedekind domain, then B is a finite product of Dedekind domains. In particular, the localizations $B_{\mathfrak{q}}$ for $\mathfrak{q} \subset B$ maximal are discrete valuation rings.*

Proof. The statement on the local rings follows from Lemmas 15.33.2 and 15.33.3 and Algebra, Lemma 10.115.6. It follows that B is a Noetherian normal ring of dimension 1. By Algebra, Lemma 10.36.14 we conclude that B is a finite product of normal domains of dimension 1. These are Dedekind domains by Algebra, Lemma 10.116.13. \square

15.34. Permanence of properties under henselization

Given a local ring R we denote R^h , resp. R^{sh} the henselization, resp. strict henselization of R , see Algebra, Definition 10.145.18. Many of the properties of R are reflected in R^h and R^{sh} as we will show in this section.

Lemma 15.34.1. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Then we have the following*

- (1) $R \rightarrow R^h \rightarrow R^{sh}$ are faithfully flat ring maps,
- (2) $\mathfrak{m}R^h = \mathfrak{m}^h$ and $\mathfrak{m}R^{sh} = \mathfrak{m}^h R^{sh} = \mathfrak{m}^{sh}$,
- (3) $R/\mathfrak{m}^n = R^h/\mathfrak{m}^n R^h$ for all n ,
- (4) there exist elements $x_i \in R^{sh}$ such that $R^{sh}/\mathfrak{m}^n R^{sh}$ is a free R/\mathfrak{m}^n -module on $x_i \bmod \mathfrak{m}^n R^{sh}$.

Proof. By construction R^h is a colimit of étale R -algebras, see Algebra, Lemma 10.145.16. Since étale ring maps are flat (Algebra, Lemma 10.138.3) we see that R^h is flat over R by Algebra, Lemma 10.38.2. As a flat local ring homomorphism is faithfully flat (Algebra, Lemma 10.38.16) we see that $R \rightarrow R^h$ is faithfully flat. The ring map $R^h \rightarrow R^{sh}$ is a colimit of finite étale ring maps, see proof of Algebra, Lemma 10.145.17. Hence the same arguments as above show that $R^h \rightarrow R^{sh}$ is faithfully flat.

Part (2) follows from Algebra, Lemmas 10.145.16 and 10.145.17. Part (3) follows from Algebra, Lemma 10.97.1 because $R/\mathfrak{m} \rightarrow R^h/\mathfrak{m}R^h$ is an isomorphism and $R/\mathfrak{m}^n \rightarrow R^h/\mathfrak{m}^n R^h$ is flat as a base change of the flat ring map $R \rightarrow R^h$ (Algebra, Lemma 10.38.6). Let κ^{sep} be the residue field of R^{sh} (it is a separable algebraic closure of κ). Choose $x_i \in R^{sh}$ mapping to a basis of κ^{sep} as a κ -vector space. Then (4) follows from Algebra, Lemma 10.97.1 in exactly the same way as above. \square

Lemma 15.34.2. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Then*

- (1) $R \rightarrow R^h$, $R^h \rightarrow R^{sh}$, and $R \rightarrow R^{sh}$ are formally étale,
- (2) $R \rightarrow R^h$, $R^h \rightarrow R^{sh}$, resp. $R \rightarrow R^{sh}$ are formally smooth in the \mathfrak{m}^h , \mathfrak{m}^{sh} , resp. \mathfrak{m}^{sh} -topology.

Proof. Part (1) follows from the fact that R^h and R^{sh} are directed colimits of étale algebras (by construction), that étale algebras are formally étale (Algebra, Lemma 10.143.2), and that colimits of formally étale algebras are formally étale (Algebra, Lemma 10.143.3). Part (2) follows from the fact that a formally étale ring map is formally smooth and Lemma 15.27.2. \square

Lemma 15.34.3. *Let R be a local ring. The following are equivalent*

- (1) R is Noetherian,
- (2) R^h is Noetherian, and
- (3) R^{sh} is Noetherian.

In this case we have

- (a) $(R^h)^\wedge$ and $(R^{sh})^\wedge$ are Noetherian complete local rings,
- (b) $R^\wedge \rightarrow (R^h)^\wedge$ is an isomorphism,
- (c) $R^h \rightarrow (R^h)^\wedge$ and $R^{sh} \rightarrow (R^{sh})^\wedge$ are flat,
- (d) $R^\wedge \rightarrow (R^{sh})^\wedge$ is formally smooth in the $\mathfrak{m}_{(R^{sh})^\wedge}$ -adic topology.

Proof. Since $R \rightarrow R^h \rightarrow R^{sh}$ are faithfully flat (Lemma 15.34.1), we see that R^h or R^{sh} being Noetherian implies that R is Noetherian, see Algebra, Lemma 10.152.1. In the rest of the proof we assume R is Noetherian.

As $\mathfrak{m} \subset R$ is finitely generated it follows that $\mathfrak{m}^h = \mathfrak{m}R^h$ and $\mathfrak{m}^{sh} = \mathfrak{m}R^{sh}$ are finitely generated, see Lemma 15.34.1. Hence $(R^h)^\wedge$ and $(R^{sh})^\wedge$ are Noetherian by Algebra, Lemma 10.149.3. This proves (a).

Note that (b) is immediate from Lemma 15.34.1. In particular we see that $(R^h)^\wedge$ is flat over R , see Algebra, Lemma 10.93.4.

Next, we show that $R^h \rightarrow (R^h)^\wedge$ is flat. Write $R^h = \operatorname{colim}_i R_i$ as a directed colimit of localizations of étale R -algebras. By Algebra, Lemma 10.38.5 if $(R^h)^\wedge$ is flat over each R_i , then $R^h \rightarrow (R^h)^\wedge$ is flat. Note that $R^h = R_i^h$ (by construction). Hence $R_i^\wedge = (R^h)^\wedge$ by part (b) is flat over R_i as desired. To finish the proof of (c) we show that $R^{sh} \rightarrow (R^{sh})^\wedge$ is flat. To do this, by a limit argument as above, it suffices to show that $(R^{sh})^\wedge$ is flat over R . Note that it follows from Lemma 15.34.1 that $(R^{sh})^\wedge$ is the completion of a free R -module. By Lemma 15.19.2 we see this is flat over R as desired. This finishes the proof of (c).

At this point we know (c) is true and that $(R^h)^\wedge$ and $(R^{sh})^\wedge$ are Noetherian. It follows from Algebra, Lemma 10.152.1 that R^h and R^{sh} are Noetherian.

Part (d) follows from Lemma 15.34.2 and Lemma 15.27.4. \square

Lemma 15.34.4. *Let R be a local ring. The following are equivalent: R is reduced, the henselization R^h of R is reduced, and the strict henselization R^{sh} of R is reduced.*

Proof. The ring maps $R \rightarrow R^h \rightarrow R^{sh}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 10.152.2. Conversely, assume R is reduced. Since R^h and R^{sh} are filtered colimits of étale, hence smooth R -algebras, the result follows from Algebra, Lemma 10.151.6. \square

Lemma 15.34.5. *Let R be a local ring. Let $\operatorname{nil}(R)$ denote the ideal of nilpotent elements of R . Then $\operatorname{nil}(R)R^h = \operatorname{nil}(R^h)$ and $\operatorname{nil}(R)R^{sh} = \operatorname{nil}(R^{sh})$.*

Proof. Note that $\operatorname{nil}(R)$ is the biggest ideal consisting of nilpotent elements such that the quotient $R/\operatorname{nil}(R)$ is reduced. Note that $\operatorname{nil}(R)R^h$ consists of nilpotent elements by Algebra, Lemma 10.31.2. Also, note that $R^h/\operatorname{nil}(R)R^h$ is the henselization of $R/\operatorname{nil}(R)$ by Algebra, Lemma 10.145.24. Hence $R^h/\operatorname{nil}(R)R^h$ is reduced by Lemma 15.34.4. We conclude that $\operatorname{nil}(R)R^h = \operatorname{nil}(R^h)$ as desired. Similarly for the strict henselization but using Algebra, Lemma 10.145.30. \square

Lemma 15.34.6. *Let R be a local ring. The following are equivalent: R is a normal domain, the henselization R^h of R is a normal domain, and the strict henselization R^{sh} of R is a normal domain.*

Proof. A preliminary remark is that a local ring is normal if and only if it is a normal domain (see Algebra, Definition 10.36.10). The ring maps $R \rightarrow R^h \rightarrow R^{sh}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 10.152.3. Conversely, assume R is normal. Since R^h and R^{sh} are filtered colimits of étale, hence smooth R -algebras, the result follows from Algebra, Lemma 10.151.7. \square

Lemma 15.34.7. *Given any local ring R we have $\dim(R) = \dim(R^h) = \dim(R^{sh})$.*

Proof. Since $R \rightarrow R^{sh}$ is faithfully flat (Lemma 15.34.1) we see that $\dim(R^{sh}) \geq \dim(R)$ by going down, see Algebra, Lemma 10.108.1. For the converse, we write $R^{sh} = \operatorname{colim}_i R_i$ as a directed colimit of local rings R_i each of which is a localization

of an étale R -algebra. Now if $\mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \dots \subset \mathfrak{q}_n$ is a chain of prime ideals in R^{sh} , then for some sufficiently large i the sequence

$$R_i \cap \mathfrak{q}_0 \subset R_i \cap \mathfrak{q}_1 \subset \dots \subset R_i \cap \mathfrak{q}_n$$

is a chain of primes in R_i . Thus we see that $\dim(R^{sh}) \leq \sup_i \dim(R_i)$. But by the result of Lemma 15.33.2 we have $\dim(R_i) = \dim(R)$ for each i and we win. \square

Lemma 15.34.8. *Given a Noetherian local ring R we have $\text{depth}(R) = \text{depth}(R^h) = \text{depth}(R^{sh})$.*

Proof. By Lemma 15.34.3 we know that R^h and R^{sh} are Noetherian. Hence the lemma follows from Algebra, Lemma 10.151.2. \square

Lemma 15.34.9. *Let R be a Noetherian local ring. The following are equivalent: R is Cohen-Macaulay, the henselization R^h of R is Cohen-Macaulay, and the strict henselization R^{sh} of R is Cohen-Macaulay.*

Proof. By Lemma 15.34.3 we know that R^h and R^{sh} are Noetherian, hence the lemma makes sense. Since we have $\text{depth}(R) = \text{depth}(R^h) = \text{depth}(R^{sh})$ and $\dim(R) = \dim(R^h) = \dim(R^{sh})$ by Lemmas 15.34.8 and 15.34.7 we conclude. \square

Lemma 15.34.10. *Let R be a Noetherian local ring. The following are equivalent: R is a regular local ring, the henselization R^h of R is a regular local ring, and the strict henselization R^{sh} of R is a regular local ring.*

Proof. By Lemma 15.34.3 we know that R^h and R^{sh} are Noetherian, hence the lemma makes sense. Let \mathfrak{m} be the maximal ideal of R . Let $x_1, \dots, x_t \in \mathfrak{m}$ be a minimal system of generators of \mathfrak{m} , i.e., such that the images in $\mathfrak{m}/\mathfrak{m}^2$ form a basis over $\kappa = R/\mathfrak{m}$. Because $R \rightarrow R^h$ and $R \rightarrow R^{sh}$ are faithfully flat, it follows that the images x_1^h, \dots, x_t^h in R^h , resp. $x_1^{sh}, \dots, x_t^{sh}$ in R^{sh} are a minimal system of generators for $\mathfrak{m}^h = \mathfrak{m}R^h$, resp. $\mathfrak{m}^{sh} = \mathfrak{m}R^{sh}$. Regularity of R by definition means $t = \dim(R)$ and similarly for R^h and R^{sh} . Hence the lemma follows from the equality of dimensions $\dim(R) = \dim(R^h) = \dim(R^{sh})$ of Lemma 15.34.7 \square

Lemma 15.34.11. *Let R be a Noetherian local ring. Then R is a discrete valuation ring if and only if R^h is a discrete valuation ring if and only if R^{sh} is a discrete valuation ring.*

Proof. This follows from Lemmas 15.34.7 and 15.34.10 and Algebra, Lemma 10.115.6. \square

Lemma 15.34.12. *Let A be a ring. Let B be a filtered colimit of étale A -algebras. Let \mathfrak{p} be a prime of A . If B is Noetherian, then there are finitely many primes $\mathfrak{q}_1, \dots, \mathfrak{q}_r$ lying over \mathfrak{p} , we have $B \otimes_A \kappa(\mathfrak{p}) = \prod \kappa(\mathfrak{q}_i)$, and each of the field extensions $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}_i)$ is separable algebraic.*

Proof. Write B as a filtered colimit $B = \text{colim } B_i$ with $A \rightarrow B_i$ étale. Then on the one hand $B \otimes_A \kappa(\mathfrak{p}) = \text{colim } B_i \otimes_A \kappa(\mathfrak{p})$ is a filtered colimit of étale $\kappa(\mathfrak{p})$ -algebras, and on the other hand it is Noetherian. An étale $\kappa(\mathfrak{p})$ -algebra is a finite product of finite separable field extensions (Algebra, Lemma 10.138.4). Hence there are no nontrivial specializations between the primes (which are all maximal and minimal primes) of the algebras $B_i \otimes_A \kappa(\mathfrak{p})$ and hence there are no nontrivial specializations between the primes of $B \otimes_A \kappa(\mathfrak{p})$. Thus $B \otimes_A \kappa(\mathfrak{p})$ is reduced and has finitely many primes which all minimal. Thus it is a finite product of fields (use Algebra, Lemma

10.24.4 or Algebra, Proposition 10.59.6). Each of these fields is a colimit of finite separable extensions and hence the final statement of the lemma follows. \square

Lemma 15.34.13. *Let R be a Noetherian local ring. Let $\mathfrak{p} \subset R$ be a prime. Then*

$$R^h \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1, \dots, t} \kappa(\mathfrak{q}_i) \quad \text{resp.} \quad R^{sh} \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1, \dots, s} \kappa(\mathfrak{r}_i)$$

where $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, resp. $\mathfrak{r}_1, \dots, \mathfrak{r}_s$ are the prime of R^h , resp. R^{sh} lying over \mathfrak{p} . Moreover, the field extensions $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}_i)$ resp. $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ are separable algebraic.

Proof. This can be deduced from the more general Lemma 15.34.12 using that the henselization and strict henselization are Noetherian (as we've seen above). But we also give a direct proof as follows.

We will use without further mention the results of Lemmas 15.34.1 and 15.34.3. Note that $R^h/\mathfrak{p}R^h$, resp. $R^{sh}/\mathfrak{p}R^{sh}$ is the henselization, resp. strict henselization of R/\mathfrak{p} , see Algebra, Lemma 10.145.24 resp. Algebra, Lemma 10.145.30. Hence we may replace R by R/\mathfrak{p} and assume that R is a Noetherian local domain and that $\mathfrak{p} = (0)$. Since R^h , resp. R^{sh} is Noetherian, it has finitely many minimal primes $\mathfrak{q}_1, \dots, \mathfrak{q}_t$, resp. $\mathfrak{r}_1, \dots, \mathfrak{r}_s$. Since $R \rightarrow R^h$, resp. $R \rightarrow R^{sh}$ is flat these are exactly the primes lying over $\mathfrak{p} = (0)$ (by going down). Finally, as R is a domain, we see that R^h , resp. R^{sh} is reduced, see Lemma 15.34.4. Thus we see that $R^h \otimes_R f.f.(R) = R^h \otimes_R \kappa(\mathfrak{p})$ resp. $R^{sh} \otimes_R f.f.(R) = R^{sh} \otimes_R \kappa(\mathfrak{p})$ is a reduced Noetherian ring with finitely many primes, all of which are minimal (and hence maximal). Thus these rings are Artinian and are products of their localizations at maximal ideals, each necessarily a field (see Algebra, Proposition 10.59.6 and Algebra, Lemma 10.24.1).

The final statement follows from the fact that $R \rightarrow R^h$, resp. $R \rightarrow R^{sh}$ is a colimit of étale ring maps and hence the induced residue field extensions are colimits of finite separable extensions, see Algebra, Lemma 10.138.5. \square

15.35. Field extensions, revisited

In this section we study some peculiarities of field extensions in characteristic $p > 0$.

Definition 15.35.1. Let p be a prime number. Let $k \rightarrow K$ be an extension of fields of characteristic p . Denote kK^p the compositum of k and K^p in K .

- (1) A subset $\{x_i\} \subset K$ is called *p -independent over k* if the elements $x^E = \prod x_i^{e_i}$ where $0 \leq e_i < p$ are linearly independent over kK^p .
- (2) A subset $\{x_i\}$ of K is called a *p -basis of K over k* if the elements x^E form a basis of K over kK^p .

This is related to the notion of a p -basis of a \mathbf{F}_p -algebra which we will discuss later (insert future reference here).

Lemma 15.35.2. *Let $k \subset K$ be a field extension. Assume k has characteristic $p > 0$. Let $\{x_i\}$ be a subset of K . The following are equivalent*

- (1) *the elements $\{x_i\}$ are p -independent over k , and*
- (2) *the elements dx_i are K -linearly independent in $\Omega_{K/k}$.*

Any p -independent collection can be extended to a p -basis of K over k . In particular, the field K has a p -basis over k . Moreover, the following are equivalent:

- (a) *$\{x_i\}$ is a p -basis of K over k , and*
- (b) *dx_i is a basis of the K -vector space $\Omega_{K/k}$.*

Proof. Assume (2) and suppose that $\sum a_E x^E = 0$ is a linear relation with $a_E \in kK^p$. Let $\theta_i : K \rightarrow K$ be a k -derivation such that $\theta_i(x_j) = \delta_{ij}$ (Kronecker delta). Note that any k -derivation of K annihilates kK^p . Applying θ_i to the given relation we obtain new relations

$$\sum_{E, e_i > 0} e_i a_E x_1^{e_1} \dots x_i^{e_i-1} \dots x_n^{e_n} = 0$$

Hence if we pick $\sum a_E x^E$ as the relation with minimal total degree $|E| = \sum e_i$ for some $a_E \neq 0$, then we get a contradiction. Hence (2) holds.

If $\{x_i\}$ is a p -basis for K over k , then $K \cong kK^p[X_i]/(X_i^p - x_i^p)$. Hence we see that dx_i forms a basis for $\Omega_{K/k}$ over K . Thus (a) implies (b).

Let $\{x_i\}$ be a p -independent subset of K over k . An application of Zorn's lemma shows that we can enlarge this to a maximal p -independent subset of K over k . We claim that any maximal p -independent subset $\{x_i\}$ of K is a p -basis of K over k . The claim will imply that (1) implies (2) and establish the existence of p -bases. To prove the claim let L be the subfield of K generated by kK^p and the x_i . We have to show that $L = K$. If $x \in K$ but $x \notin L$, then $x^p \in L$ and $L(x) \cong L[z]/(z^p - x)$. Hence $\{x_i\} \cup \{x\}$ is p -independent over k , a contradiction.

Finally, we have to show that (b) implies (a). By the equivalence of (1) and (2) we see that $\{x_i\}$ is a maximal p -independent subset of K over k . Hence by the claim above it is a p -basis. \square

Lemma 15.35.3. *Let $k \subset K$ be a field extension. Let $\{K_\alpha\}_{\alpha \in A}$ be a collection of subfields of K with the following properties*

- (1) $k \subset K_\alpha$ for all $\alpha \in A$,
- (2) $k = \bigcap_{\alpha \in A} K_\alpha$,
- (3) for $\alpha, \alpha' \in A$ there exists an $\alpha'' \in A$ such that $K_{\alpha''} \subset K_\alpha \cap K_{\alpha'}$.

Then for $n \geq 1$ and $V \subset K^{\oplus n}$ a K -vector space we have $V \cap k^{\oplus n} \neq 0$ if and only if $V \cap K_\alpha^{\oplus n} \neq 0$ for all $\alpha \in A$.

Proof. By induction on n . The case $n = 1$ follows from the assumptions. Assume the result proven for subspaces of $K^{\oplus n-1}$. Assume that $V \subset K^{\oplus n}$ has nonzero intersection with $K_\alpha^{\oplus n}$ for all $\alpha \in A$. If $V \cap 0 \oplus k^{\oplus n-1}$ is nonzero then we win. Hence we may assume this is not the case. By induction hypothesis we can find an α such that $V \cap 0 \oplus K_\alpha^{\oplus n-1}$ is zero. Let $v = (x_1, \dots, x_n) \in V \cap K_\alpha$ be a nonzero element. By our choice of α we see that x_1 is not zero. Replace v by $x_1^{-1}v$ so that $v = (1, x_2, \dots, x_n)$. Note that if $v' = (x'_1, \dots, x'_n) \in V \cap K_{\alpha'}$, then $v' - x'_1 v = 0$ by our choice of α . Hence we see that $V \cap K_\alpha^{\oplus n} = K_\alpha v$. If we choose some α' such that $K_{\alpha'} \subset K_\alpha$, then we see that necessarily $v \in V \cap K_{\alpha'}^{\oplus n}$ (by the same arguments applied to α'). Hence

$$x_2, \dots, x_n \in \bigcap_{\alpha' \in A, K_{\alpha'} \subset K_\alpha} K_{\alpha'}$$

which equals k by (2) and (3). \square

Lemma 15.35.4. *Let K be a field of characteristic p . Let $\{K_\alpha\}_{\alpha \in A}$ be a collection of subfields of K with the following properties*

- (1) $K^p \subset K_\alpha$ for all $\alpha \in A$,
- (2) $K^p = \bigcap_{\alpha \in A} K_\alpha$,
- (3) for $\alpha, \alpha' \in A$ there exists an $\alpha'' \in A$ such that $K_{\alpha''} \subset K_\alpha \cap K_{\alpha'}$.

Then

- (1) the intersection of the kernels of the maps $\Omega_{K/\mathbf{F}_p} \rightarrow \Omega_{K/K_\alpha}$ is zero,
- (2) for any finite extension $K \subset L$ we have $L^p = \bigcap_{\alpha \in A} L^p K_\alpha$.

Proof. Proof of (1). Choose a p -basis $\{x_i\}$ for K over \mathbf{F}_p . Suppose that $\eta = \sum_{i \in I'} y_i dx_i$ maps to zero in Ω_{K/K_α} for every $\alpha \in A$. Here the index set I' is finite. By Lemma 15.35.2 this means that for every α there exists a relation

$$\sum_E a_{E,\alpha} x^E, \quad a_{E,\alpha} \in K_\alpha$$

where E runs over multi-indices $E = (e_i)_{i \in I'}$ with $0 \leq e_i < p$. On the other hand, Lemma 15.35.2 guarantees there is no such relation $\sum a_E x^E = 0$ with $a_E \in K^p$. This is a contradiction by Lemma 15.35.3.

Proof of (2). Suppose that we have a tower $K \subset M \subset L$ of finite extensions of fields. Set $M_\alpha = M^p K_\alpha$ and $L_\alpha = L^p K_\alpha = L^p M_\alpha$. Then we can first prove that $M^p = \bigcap_{\alpha \in A} M_\alpha$, and after that prove that $L^p = \bigcap_{\alpha \in A} L_\alpha$. Hence it suffices to prove (2) for primitive field extensions having no nontrivial subfields. First, assume that $L = K(\theta)$ is separable over K . Then L is generated by θ^p over K , hence we may assume that $\theta \in L^p$. In this case we see that

$$L^p = K^p \oplus K^p \theta \oplus \dots \oplus K^p \theta^{d-1} \quad \text{and} \quad L^p K_\alpha = K_\alpha \oplus K_\alpha \theta \oplus \dots \oplus K_\alpha \theta^{d-1}$$

where $d = [L : K]$. Thus the conclusion is clear in this case. The other case is where $L = K(\theta)$ with $\theta^p = t \in K$, $t \notin K^p$. In this case we have

$$L^p = K^p \oplus K^p t \oplus \dots \oplus K^p t^{p-1} \quad \text{and} \quad L^p K_\alpha = K_\alpha \oplus K_\alpha t \oplus \dots \oplus K_\alpha t^{p-1}$$

Again the result is clear. □

Lemma 15.35.5. *Let k be a field of characteristic $p > 0$. Let $n, m \geq 0$. As k' ranges through all subfields $k^p \subset k' \subset k$ with $[k : k'] < \infty$ the subfields*

$$f.f.(k'[[x_1^p, \dots, x_n^p]][y_1^p, \dots, y_m^p]) \subset f.f.(k[[x_1, \dots, x_n]][y_1, \dots, y_m])$$

form a family of subfields as in Lemma 15.35.4. Moreover, each of the ring extensions $k'[[x_1^p, \dots, x_n^p]][y_1^p, \dots, y_m^p] \subset k[[x_1, \dots, x_n]][y_1, \dots, y_m]$ is finite.

Proof. Write $A = k[[x_1, \dots, x_n]][y_1, \dots, y_m]$ and $A' = k'[[x_1^p, \dots, x_n^p]][y_1^p, \dots, y_m^p]$. We also set $K = f.f.(A)$ and $K' = f.f.(A')$. The ring extension $k'[[x_1^p, \dots, x_n^p]] \subset k[[x_1, \dots, x_n]]$ is finite by Algebra, Lemma 10.93.18 which implies that $A \rightarrow A'$ is finite. For $f \in A$ we see that $f^p \in A'$. Hence $K^p \subset K'$. Any element of K' can be written as a/b^p with $a \in A'$ and $b \in A$ nonzero. Suppose that $f/g^p \in K$, $f, g \in A$, $g \neq 0$ is contained in K' for every choice of k' . Fix a choice of k' for the moment. By the above we see $f/g^p = a/b^p$ for some $a \in A'$ and some nonzero $b \in A$. Hence $b^p f \in A'$. For any A' -derivation $D : A \rightarrow A$ we see that $0 = D(b^p f) = b^p D(f)$ hence $D(f) = 0$ as A is a domain. Taking $D = \partial_{x_i}$ and $D = \partial_{y_j}$ we conclude that that $f \in k[[x_1^p, \dots, x_n^p]][y_1^p, \dots, y_m^p]$. Applying a k' -derivation $\theta : k \rightarrow k$ we similarly conclude that all coefficients of f are in k' , i.e., $f \in A'$. Since it is clear that $A = \bigcap_{k'} A'$ where k' ranges over all subfields as in the lemma we win. □

15.36. The singular locus

Let R be a Noetherian ring. The *regular locus* $\text{Reg}(X)$ of $X = \text{Spec}(R)$ is the set of primes \mathfrak{p} such that $R_{\mathfrak{p}}$ is a regular local ring. The *singular locus* $\text{Sing}(X)$ of $X = \text{Spec}(R)$ is the complement $X \setminus \text{Reg}(X)$, i.e., the set of primes \mathfrak{p} such that $R_{\mathfrak{p}}$ is not a regular local ring. By the discussion preceding Algebra, Definition 10.106.7 we see that $\text{Reg}(X)$ is stable under generalization. In the section we study conditions that guarantee that $\text{Reg}(X)$ is open.

Definition 15.36.1. Let R be a Noetherian ring. Let $X = \text{Spec}(R)$.

- (1) We say R is *J-0* if $\text{Reg}(X)$ contains a nonempty open.
- (2) We say R is *J-1* if $\text{Reg}(X)$ is open.
- (3) We say R is *J-2* if any finite type R -algebra is J-1.

The ring $\mathbf{Q}[x]/(x^2)$ does not satisfy J-0. On the other hand J-1 implies J-0 for domains and even reduced rings as such a ring is regular at the minimal primes. Here is a characterization of the J-1 property.

Lemma 15.36.2. *Let R be a Noetherian ring. Let $X = \text{Spec}(R)$. The ring R is J-1 if and only if $V(\mathfrak{p}) \cap \text{Reg}(X)$ contains a nonempty open subset of $V(\mathfrak{p})$ for all $\mathfrak{p} \in \text{Reg}(X)$.*

Proof. This follows immediately from Topology, Lemma 5.15.5. \square

Lemma 15.36.3. *Let R be a Noetherian ring. Let $X = \text{Spec}(R)$. Assume that for all $\mathfrak{p} \subset R$ the ring R/\mathfrak{p} is J-0. Then R is J-1.*

Proof. We will show that the criterion of Lemma 15.36.2 applies. Let $\mathfrak{p} \in \text{Reg}(X)$ be a prime of height r . Pick $f_1, \dots, f_r \in \mathfrak{p}$ which map to generators of $\mathfrak{p}R_{\mathfrak{p}}$. Since $\mathfrak{p} \in \text{Reg}(X)$ we see that f_1, \dots, f_r maps to a regular sequence in $R_{\mathfrak{p}}$, see Algebra, Lemma 10.102.3. Thus by Algebra, Lemma 10.67.8 we see that after replacing R by R_g for some $g \in R$, $g \notin \mathfrak{p}$ the sequence f_1, \dots, f_r is a regular sequence in R . Next, let $\mathfrak{p} \subset \mathfrak{q}$ be a prime ideal such that $(R/\mathfrak{p})_{\mathfrak{q}}$ is a regular local ring. By the assumption of the lemma there exists a non-empty open subset of $V(\mathfrak{p})$ consisting of such primes, hence it suffices to prove $R_{\mathfrak{q}}$ is regular. Note that f_1, \dots, f_r is a regular sequence in $R_{\mathfrak{q}}$ such that $R_{\mathfrak{q}}/(f_1, \dots, f_r)R_{\mathfrak{q}}$ is regular. Hence $R_{\mathfrak{q}}$ is regular by Algebra, Lemma 10.102.7. \square

Lemma 15.36.4. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) R is a Noetherian domain,
- (2) $R \rightarrow S$ is injective and of finite type, and
- (3) S is a domain and J-0.

Then R is J-0.

Proof. After replacing S by S_g for some nonzero $g \in S$ we may assume that S is a regular ring. By generic flatness we may assume that also $R \rightarrow S$ is faithfully flat, see Algebra, Lemma 10.114.1. Then R is regular by Algebra, Lemma 10.152.4. \square

Lemma 15.36.5. *Let $R \rightarrow S$ be a ring map. Assume that*

- (1) R is a Noetherian domain and J-0,
- (2) $R \rightarrow S$ is injective and of finite type, and
- (3) S is a domain and $f.f.(R) \rightarrow f.f.(S)$ is separable.

Then S is J-0.

Proof. We may replace R by a principal localization and assume R is a regular ring. By Algebra, Lemma 10.135.9 the ring map $R \rightarrow S$ is smooth at (0) . Hence after replacing S by a principal localization we may assume that S is smooth over R . Then S is regular too, see Algebra, Lemma 10.151.8. \square

Lemma 15.36.6. *Let R be a Noetherian ring. The following are equivalent*

- (1) R is J-2,
- (2) every finite type R -algebra which is a domain is J-0,
- (3) every finite R -algebra is J-1,
- (4) for every prime \mathfrak{p} and every finite purely inseparable extension $\kappa(\mathfrak{p}) \subset L$ there exists a finite R -algebra R' which is a domain, which is J-0, and whose field of fractions is L .

Proof. It is clear that we have the implications $(1) \Rightarrow (2)$ and $(2) \Rightarrow (4)$. Recall that a domain which is J-1 is J-0. Hence we also have the implications $(1) \Rightarrow (3)$ and $(3) \Rightarrow (4)$.

Let $R \rightarrow S$ be a finite type ring map and let's try to show S is J-1. By Lemma 15.36.3 it suffices to prove that S/\mathfrak{q} is J-0 for every prime \mathfrak{q} of S . In this way we see $(2) \Rightarrow (1)$.

Assume (4). We will show that (2) holds which will finish the proof. Let $R \rightarrow S$ be a finite type ring map with S a domain. Let $\mathfrak{p} = \text{Ker}(R \rightarrow S)$. Set $K = f.f.(S)$. There exists a diagram of fields

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ \kappa(\mathfrak{p}) & \longrightarrow & L \end{array}$$

where the horizontal arrows are finite purely inseparable field extensions and where K'/L is separable, see Algebra, Lemma 10.41.4. Choose $R' \subset L$ as in (4) and let S' be the image of the map $S \otimes_R R' \rightarrow K'$. Then S' is a domain whose fraction field is K' , hence S' is J-0 by Lemma 15.36.5 and our choice of R' . Then we apply Lemma 15.36.4 to see that S is J-0 as desired. \square

15.37. Regularity and derivations

Let $R \rightarrow S$ be a ring map. Let $D : R \rightarrow R$ be a derivation. We say that D extends to S if there exists a derivation $D' : S \rightarrow S$ such that

$$\begin{array}{ccc} S & \longrightarrow & S \\ \uparrow & \xrightarrow{D'} & \uparrow \\ R & \xrightarrow{D} & R \end{array}$$

is commutative.

Lemma 15.37.1. *Let R be a ring. Let $D : R \rightarrow R$ be a derivation.*

- (1) For any ideal $I \subset R$ the derivation D extends canonically to a derivation $D^\wedge : R^\wedge \rightarrow R^\wedge$ on the I -adic completion.
- (2) For any multiplicative subset $S \subset R$ the derivation D extends uniquely to the localization $S^{-1}R$ of R .

If $R \subset R'$ is a finite type extension of rings such that $R_g \cong R'_g$ for some nonzero-divisor $g \in R$, then $g^N D$ extends to R' for some $N \geq 0$.

Proof. Proof of (1). For $n \geq 2$ we have $D(I^n) \subset I^{n-1}$ by the Leibniz rule. Hence D induces maps $D_n : R/I^n \rightarrow R/I^{n-1}$. Taking the limit we obtain D^\wedge . We omit the verification that D^\wedge is a derivation.

Proof of (2). To extend D to $S^{-1}R$ just set $D(r/s) = D(r)/s - rD(s)/s^2$ and check the axioms.

Proof of the final statement. Let $x_1, \dots, x_n \in R'$ be generators of R' over R . Choose an N such that $g^N x_i \in R$. Consider $g^{N+1}D$. By (2) this extends to R_g . Moreover, by the Leibniz rule and our construction of the extension above we have

$$g^{N+1}D(x_i) = g^{N+1}D(g^{-N}g^N x_i) = -Ng^N x_i D(g) + gD(g^N x_i)$$

and both terms are in R . This implies that

$$g^{N+1}D(x_1^{e_1} \dots x_n^{e_n}) = \sum e_i x_1^{e_1} \dots x_i^{e_i-1} \dots x_n^{e_n} g^{N+1}D(x_i)$$

is an element of R' . Hence every element of R' (which can be written as a sum of monomials in the x_i with coefficients in R) is mapped to an element of R' by $g^{N+1}D$ and we win. \square

Lemma 15.37.2. *Let R be a regular ring. Let $f \in R$. Assume there exists a derivation $D : R \rightarrow R$ such that $D(f)$ is a unit of $R/(f)$. Then $R/(f)$ is regular.*

Proof. It suffices to prove this when R is a local ring with maximal ideal \mathfrak{m} and residue field κ . In this case it suffices to prove that $f \notin \mathfrak{m}^2$, see Algebra, Lemma 10.102.3. However, if $f \in \mathfrak{m}^2$ then $D(f) \in \mathfrak{m}$ by the Leibniz rule, a contradiction. \square

Lemma 15.37.3. *Let R be a regular \mathbf{F}_p -algebra. Let $f \in R$. Assume there exists a derivation $D : R \rightarrow R$ such that $D(f)$ is a unit of R . Then $R[z]/(z^p - f)$ is regular.*

Proof. Apply Lemma 15.37.2 to the extension of D to $R[z]$ which maps z to zero. \square

Lemma 15.37.4. *Let p be a prime number. Let B be a domain with $p = 0$ in B . Let $f \in B$ be an element which is not a p th power in the fraction field of B . If B is of finite type over a Noetherian complete local ring, then there exists a derivation $D : B \rightarrow B$ such that $D(f)$ is not zero.*

Proof. Let R be a Noetherian complete local ring such that there exists a finite type ring map $R \rightarrow B$. Of course we may replace R by its image in B , hence we may assume R is a domain of characteristic $p > 0$ (as well as Noetherian complete local). By Algebra, Lemma 10.149.10 we can write R as a finite extension of $k[[x_1, \dots, x_n]]$ for some field k and integer n . Hence we may replace R by $k[[x_1, \dots, x_n]]$. Next, we use Algebra, Lemma 10.111.7 to factor $R \rightarrow B$ as

$$R \subset R[y_1, \dots, y_d] \subset B' \subset B$$

with B' finite over $R[y_1, \dots, y_d]$ and $B'_g \cong B_g$ for some nonzero $g \in R$. Note that $f' = g^{pN} f \in B'$ for some large integer N . It is clear that f' is not a p th power in $f.f.(B')$. If we can find a derivation $D' : B' \rightarrow B'$ with $D'(f') \neq 0$, then Lemma 15.37.1 guarantees that $D = g^M D'$ extends to S for some $M > 0$. Then

$D(f) = g^N D'(f) = g^M D'(g^{-pN} f') = g^{M-pN} D'(f')$ is nonzero. Thus it suffices to prove the lemma in case B is a finite extension of $A = k[[x_1, \dots, x_n]][y_1, \dots, y_m]$.

Note that df is not zero in $\Omega_{f.f.(B)/\mathbf{F}_p}$, see Algebra, Lemma 10.147.2. We apply Lemma 15.35.5 to find a subfield $k' \subset k$ of finite index such that with $A' = k'[[x_1^p, \dots, x_n^p]][y_1^p, \dots, y_m^p]$ the element df does not map to zero in $\Omega_{f.f.(B)/f.f.(A')}$. Thus we can choose a $f.f.(A')$ -derivation $D' : f.f.(B) \rightarrow f.f.(B)$ with $D'(f) \neq 0$. Since $A' \subset A$ and $A \subset B$ are finite by construction we see that $A' \subset B$ is finite. Choose $b_1, \dots, b_t \in B$ which generate B as an A' -module. Then $D'(b_i) = f_i/g_i$ for some $f_i, g_i \in B$ with $g_i \neq 0$. Setting $D = g_1 \dots g_t D'$ we win. \square

Lemma 15.37.5. *Let A be a Noetherian complete local domain. Then A is J-0.*

Proof. By Algebra, Lemma 10.149.10 we can find a regular subring $A_0 \subset A$ with A finite over A_0 . If $f.f.(A_0) \subset f.f.(A)$ is separable, then we are done by Lemma 15.36.5. If not, then A_0 and A have characteristic $p > 0$. For any subextension $f.f.(A_0) \subset M \subset f.f.(A)$ there exists a finite subextension $A_0 \subset B \subset A$ such that $f.f.(B) = M$. Hence, arguing by induction on $[f.f.(A) : f.f.(A_0)]$ we may assume there exists $A_0 \subset B \subset A$ such that B is J-0 and $f.f.(B) \subset f.f.(A)$ has no nontrivial subextensions. In this case, if $f.f.(B) \subset f.f.(A)$ is separable, then we see that A is J-0 by Lemma 15.36.5. If not, then $f.f.(A) = f.f.(B)[z]/(z^p - b)$ for some $b \in B$ which is not a p th power in $f.f.(B)$. By Lemma 15.37.4 we can find a derivation $D : B \rightarrow B$ with $D(f) \neq 0$. Applying Lemma 15.37.3 we see that $A_{\mathfrak{p}}$ is regular for any prime \mathfrak{p} of A lying over a regular prime of B and not containing $D(f)$. As B is J-0 we conclude A is too. \square

Proposition 15.37.6. *The following types of rings are J-2:*

- (1) *fields,*
- (2) *Noetherian complete local rings,*
- (3) \mathbf{Z} ,
- (4) *Dedekind domains with fraction field of characteristic zero,*
- (5) *finite type ring extensions of any of the above.*

Proof. For fields, \mathbf{Z} and Dedekind domains of characteristic zero you just check condition (4) of Lemma 15.36.6. In the case of Noetherian complete local rings, note that if $R \rightarrow R'$ is finite and R is a Noetherian complete local ring, then R' is a product of Noetherian complete local rings, see Algebra, Lemma 10.149.2. Hence it suffices to prove that a Noetherian complete local ring which is a domain is J-0, which is Lemma 15.37.5. \square

15.38. Formal smoothness and regularity

The title of this section refers to Proposition 15.38.2.

Lemma 15.38.1. *Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Let $D : A \rightarrow A$ be a derivation. Assume that B is complete and $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology. Then there exists an extension $D' : B \rightarrow B$ of D .*

Proof. Denote $B[\epsilon] = B[x]/(x^2)$ the ring of dual numbers over B . Consider the ring map $\psi : A \rightarrow B[\epsilon]$, $a \mapsto a + \epsilon D(a)$. Consider the commutative diagram

$$\begin{array}{ccc} B & \longrightarrow & B \\ \uparrow & & \uparrow \\ A & \xrightarrow{\psi} & B[\epsilon] \end{array}$$

By Lemma 15.27.5 and the assumption of formal smoothness of B/A we find a map $\varphi : B \rightarrow B[\epsilon]$ fitting into the diagram. Write $\varphi(b) = b + \epsilon D'(b)$. Then $D' : B \rightarrow B$ is the desired extension. \square

Proposition 15.38.2. *Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. The following are equivalent*

- (1) $A \rightarrow B$ is regular,
- (2) $A \rightarrow B$ is flat and \overline{B} is geometrically regular over k ,
- (3) $A \rightarrow B$ is flat and $k \rightarrow \overline{B}$ is formally smooth in the $\mathfrak{m}_{\overline{B}}$ -adic topology, and
- (4) $A \rightarrow B$ is formally smooth in the \mathfrak{m}_B -adic topology.

Proof. We have seen the equivalence of (2), (3), and (4) in Proposition 15.29.4. It is clear that (1) implies (2). Thus we assume the equivalent conditions (2), (3), and (4) hold and we prove (1).

Let \mathfrak{p} be a prime of A . We will show that $B \otimes_A \kappa(\mathfrak{p})$ is geometrically regular over $\kappa(\mathfrak{p})$. By Lemma 15.27.8 we may replace A by A/\mathfrak{p} and B by $B/\mathfrak{p}B$. Thus we may assume that A is a domain and that $\mathfrak{p} = (0)$.

Choose $A_0 \subset A$ as in Algebra, Lemma 10.149.10. We will use all the properties stated in that lemma without further mention. As $A_0 \rightarrow A$ induces an isomorphism on residue fields, and as $B/\mathfrak{m}_A B$ is geometrically regular over A/\mathfrak{m}_A we can find a diagram

$$\begin{array}{ccc} C & \longrightarrow & B \\ \uparrow & & \uparrow \\ A_0 & \longrightarrow & A \end{array}$$

with $A_0 \rightarrow C$ formally smooth in the \mathfrak{m}_C -adic topology such that $B = C \otimes_{A_0} A$, see Remark 15.29.6. (Completion in the tensor product is not needed as $A_0 \rightarrow A$ is finite, see Algebra, Lemma 10.93.2.) Hence it suffices to show that $C \otimes_{A_0} f.f.(A_0)$ is a geometrically regular algebra over $f.f.(A_0)$.

The upshot of the preceding paragraph is that we may assume that $A = k[[x_1, \dots, x_n]]$ where k is a field or $A = \Lambda[[x_1, \dots, x_n]]$ where Λ is a Cohen ring. In this case B is a regular ring, see Algebra, Lemma 10.108.8. Hence $B \otimes_A f.f.(A)$ is a regular ring too and we win if the characteristic of $f.f.(A)$ is zero.

Thus we are left with the case where $A = k[[x_1, \dots, x_n]]$ and k is a field of characteristic $p > 0$. Set $K = f.f.(A)$. Let $L \supset K$ be a finite purely inseparable field extension. We will show by induction on $[L : K]$ that $B \otimes_A L$ is regular. The base case is $L = K$ which we've seen above. Let $K \subset M \subset L$ be a subfield such that L is a degree p extension of M obtained by adjoining a p th root of an element $f \in M$. Let A' be a finite A -subalgebra of M with fraction field M . Clearing denominators,

we may and do assume $f \in A'$. Set $A'' = A'[z]/(z^p - f)$ and note that $A' \subset A''$ is finite and that the fraction field of A'' is L . By induction we know that $B \otimes_A M$ ring is regular. We have

$$B \otimes_A L = B \otimes_A M[z]/(z^p - f)$$

By Lemma 15.37.4 we know there exists a derivation $D : A' \rightarrow A'$ such that $D(f) \neq 0$. As $A' \rightarrow B \otimes_A A'$ is formally smooth in the \mathfrak{m} -adic topology by Lemma 15.27.9 we can use Lemma 15.38.1 to extend D to a derivation $D' : B \otimes_A A' \rightarrow B \otimes_A A'$. Note that $D'(f) = D(f)$ is a unit in $B \otimes_A M$ as $D(f)$ is not zero in $A' \subset M$. Hence $B \otimes_A L$ is regular by Lemma 15.37.3 and we win. \square

15.39. G-rings

Let A be a Noetherian local ring A . In Section 15.32 we have seen that some but not all properties of A are reflected in the completion A^\wedge of A . To study this further we introduce some terminology. For a prime \mathfrak{q} of A the fibre ring

$$(A^\wedge) \otimes_A \kappa(\mathfrak{q}) = (A^\wedge)_{\mathfrak{q}}/\mathfrak{q}(A^\wedge)_{\mathfrak{q}}$$

is called a *formal fibre* of A . We think of the formal fibre as an algebra over $\kappa(\mathfrak{q})$. Thus $A \rightarrow A^\wedge$ is a regular ring homomorphism if and only if all the formal fibres are geometrically regular algebras.

Definition 15.39.1. A ring R is called a *G-ring* if R is Noetherian and for every prime \mathfrak{p} of R the ring map $R_{\mathfrak{p}} \rightarrow (R_{\mathfrak{p}})^\wedge$ is regular.

By the discussion above we see that R is a G-ring if and only if every local ring $R_{\mathfrak{p}}$ has geometrically regular formal fibres. Note that if $\mathbf{Q} \subset R$, then it suffices to check the formal fibres are regular. Another way to express the G-ring condition is described in the following lemma.

Lemma 15.39.2. *Let R be a Noetherian ring. Then R is a G-ring if and only if for every pair of primes $\mathfrak{q} \subset \mathfrak{p} \subset R$ the algebra*

$$(R/\mathfrak{q})_{\mathfrak{p}}^\wedge \otimes_{R/\mathfrak{q}} \kappa(\mathfrak{q})$$

is geometrically regular over $\kappa(\mathfrak{q})$.

Proof. This follows from the fact that

$$R_{\mathfrak{p}}^\wedge \otimes_R \kappa(\mathfrak{q}) = (R/\mathfrak{q})_{\mathfrak{p}}^\wedge \otimes_{R/\mathfrak{q}} \kappa(\mathfrak{q})$$

as algebras over $\kappa(\mathfrak{q})$. \square

Lemma 15.39.3. *Let $R \rightarrow R'$ be a finite type map of Noetherian rings and let*

$$\begin{array}{ccccc} \mathfrak{q}' & \longrightarrow & \mathfrak{p}' & \longrightarrow & R' \\ \downarrow & & \downarrow & & \uparrow \\ \mathfrak{q} & \longrightarrow & \mathfrak{p} & \longrightarrow & R \end{array}$$

be primes. Assume $R \rightarrow R'$ is quasi-finite at \mathfrak{p}' .

- (1) *If the formal fibre $R_{\mathfrak{p}}^\wedge \otimes_R \kappa(\mathfrak{q})$ is geometrically regular over $\kappa(\mathfrak{q})$, then the formal fibre $R'_{\mathfrak{p}'} \otimes_{R'} \kappa(\mathfrak{q}')$ is geometrically regular over $\kappa(\mathfrak{q}')$.*
- (2) *If the formal fibres of $R_{\mathfrak{p}}$ are geometrically regular, then the formal fibres of $R'_{\mathfrak{p}'}$ are geometrically regular.*

(3) If $R \rightarrow R'$ is quasi-finite and R is a G-ring, then R' is a G-ring.

Proof. It is clear that (1) \Rightarrow (2) \Rightarrow (3). Assume $R_{\mathfrak{p}}^{\wedge} \otimes_R \kappa(\mathfrak{q})$ is geometrically regular over $\kappa(\mathfrak{q})$. By Algebra, Lemma 10.120.3 we see that

$$R_{\mathfrak{p}}^{\wedge} \otimes_R R' = (R'_{\mathfrak{p}'})^{\wedge} \times B$$

for some $R_{\mathfrak{p}}^{\wedge}$ -algebra B . Hence $R'_{\mathfrak{p}'} \rightarrow (R'_{\mathfrak{p}'})^{\wedge}$ is a factor of a base change of the map $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$. It follows that $(R'_{\mathfrak{p}'})^{\wedge} \otimes_{R'} \kappa(\mathfrak{q}')$ is a factor of

$$R_{\mathfrak{p}}^{\wedge} \otimes_R R' \otimes_{R'} \kappa(\mathfrak{q}') = R_{\mathfrak{p}}^{\wedge} \otimes_R \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} \kappa(\mathfrak{q}').$$

Thus the result follows as extension of base field preserves geometric regularity, see Algebra, Lemma 10.154.1. \square

Lemma 15.39.4. *Let R be a Noetherian ring. Then R is a G-ring if and only if for every finite free ring map $R \rightarrow S$ the formal fibres of S are regular rings.*

Proof. Assume that for any finite free ring map $R \rightarrow S$ the ring S has regular formal fibres. Let $\mathfrak{q} \subset \mathfrak{p} \subset R$ be primes and let $\kappa(\mathfrak{q}) \subset L$ be a finite purely inseparable extension. To show that R is a G-ring it suffices to show that

$$R_{\mathfrak{p}}^{\wedge} \otimes_R \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} L$$

is a regular ring. Choose a finite free extension $R \rightarrow R'$ such that $\mathfrak{q}' = \mathfrak{q}R'$ is a prime and such that $\kappa(\mathfrak{q}')$ is isomorphic to L over $\kappa(\mathfrak{q})$, see Algebra, Lemma 10.148.3. By Algebra, Lemma 10.93.19 we have

$$R_{\mathfrak{p}}^{\wedge} \otimes_R R' = \prod (R'_{\mathfrak{p}'_i})^{\wedge}$$

where \mathfrak{p}'_i are the primes of R' lying over \mathfrak{p} . Thus we have

$$R_{\mathfrak{p}}^{\wedge} \otimes_R \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{q})} L = R_{\mathfrak{p}}^{\wedge} \otimes_R R' \otimes_{R'} \kappa(\mathfrak{q}') = \prod (R'_{\mathfrak{p}'_i})^{\wedge} \otimes_{R'_{\mathfrak{p}'_i}} \kappa(\mathfrak{q}')$$

Our assumption is that the rings on the right are regular, hence the ring on the left is regular too. Thus R is a G-ring. The converse follows from Lemma 15.39.3. \square

Lemma 15.39.5. *Let k be a field of characteristic p . Let $A = k[[x_1, \dots, x_n]][y_1, \dots, y_n]$ and denote $K = f.f.(A)$. Let $\mathfrak{p} \subset A$ be a prime. Then $A_{\mathfrak{p}}^{\wedge} \otimes_A K$ is geometrically regular over K .*

Proof. Let $L \supset K$ be a finite purely inseparable field extension. We will show by induction on $[L : K]$ that $A_{\mathfrak{p}}^{\wedge} \otimes L$ is regular. The base case is $L = K$: as A is regular, $A_{\mathfrak{p}}^{\wedge}$ is regular (Lemma 15.32.4), hence the localization $A_{\mathfrak{p}}^{\wedge} \otimes K$ is regular. Let $K \subset M \subset L$ be a subfield such that L is a degree p extension of M obtained by adjoining a p th root of an element $f \in M$. Let B be a finite A -subalgebra of M with fraction field M . Clearing denominators, we may and do assume $f \in B$. Set $C = B[z]/(z^p - f)$ and note that $B \subset C$ is finite and that the fraction field of C is L . Since $A \subset B \subset C$ are finite and $L/M/K$ are purely inseparable we see that for every element of B or C some power of it lies in A . Hence there is a unique prime $\mathfrak{r} \subset B$, resp. $\mathfrak{q} \subset C$ lying over \mathfrak{p} . Note that

$$A_{\mathfrak{p}}^{\wedge} \otimes_A M = B_{\mathfrak{r}}^{\wedge} \otimes_B M$$

see Algebra, Lemma 10.93.19. By induction we know that this ring is regular. In the same manner we have

$$A_{\mathfrak{p}}^{\wedge} \otimes_A L = C_{\mathfrak{q}}^{\wedge} \otimes_C L = B_{\mathfrak{r}}^{\wedge} \otimes_B M[z]/(z^p - f)$$

the last equality because the completion of $C = B[z]/(z^p - f)$ equals $B_{\mathfrak{c}}^{\wedge}[z]/(z^p - f)$. By Lemma 15.37.4 we know there exists a derivation $D : B \rightarrow B$ such that $D(f) \neq 0$. In other words, $g = D(f)$ is a unit in M ! By Lemma 15.37.1 D extends to a derivation of $B_{\mathfrak{c}}$, $B_{\mathfrak{c}}^{\wedge}$ and $B_{\mathfrak{c}}^{\wedge} \otimes_B M$ (successively extending through a localization, a completion, and a localization). Since it is an extension we end up with a derivation of $B_{\mathfrak{c}}^{\wedge} \otimes_B M$ which maps f to g and g is a unit of the ring $B_{\mathfrak{c}}^{\wedge} \otimes_B M$. Hence $A_{\mathfrak{p}}^{\wedge} \otimes_A L$ is regular by Lemma 15.37.3 and we win. \square

Proposition 15.39.6. *A Noetherian complete local ring is a G-ring.*

Proof. Let A be a Noetherian complete local ring. By Lemma 15.39.2 it suffices to check that $B = A/\mathfrak{q}$ has geometrically regular formal fibres over the minimal prime (0) of B . Thus we may assume that A is a domain and it suffices to check the condition for the formal fibres over the minimal prime (0) of A . Set $K = f.f(A)$.

We can choose a subring $A_0 \subset A$ which is a regular complete local ring such that A is finite over A_0 , see Algebra, Lemma 10.149.10. Moreover, we may assume that A_0 is a power series ring over a field or a Cohen ring. By Lemma 15.39.3 we see that it suffices to prove the result for A_0 .

Assume that A is a power series ring over a field or a Cohen ring. Since A is regular the localizations $A_{\mathfrak{p}}$ are regular (see Algebra, Definition 10.106.7 and the discussion preceding it). Hence the completions $A_{\mathfrak{p}}^{\wedge}$ are regular, see Lemma 15.32.4. Hence the fibre $A_{\mathfrak{p}}^{\wedge} \otimes_A K$ is, as a localization of $A_{\mathfrak{p}}^{\wedge}$, also regular. Thus we are done if the characteristic of K is 0. The positive characteristic case is the case $A = k[[x_1, \dots, x_d]]$ which is a special case of Lemma 15.39.5. \square

Lemma 15.39.7. *Let R be a Noetherian ring. Then R is a G-ring if and only if $R_{\mathfrak{m}}$ has geometrically regular formal fibres for every maximal ideal \mathfrak{m} of R .*

Proof. Assume $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is regular for every maximal ideal \mathfrak{m} of R . Let \mathfrak{p} be a prime of R and choose a maximal ideal $\mathfrak{p}' \subset \mathfrak{m}$. Since $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is faithfully flat we can choose a prime \mathfrak{p}' of $R_{\mathfrak{m}}^{\wedge}$ lying over $\mathfrak{p}R_{\mathfrak{m}}$. Consider the commutative diagram

$$\begin{array}{ccccc} R_{\mathfrak{m}}^{\wedge} & \longrightarrow & (R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'} & \longrightarrow & (R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'}^{\wedge} \\ \uparrow & & \uparrow & & \uparrow \\ R_{\mathfrak{m}} & \longrightarrow & R_{\mathfrak{p}} & \longrightarrow & R_{\mathfrak{p}}^{\wedge} \end{array}$$

By assumption the ring map $R_{\mathfrak{m}} \rightarrow R_{\mathfrak{m}}^{\wedge}$ is regular. By Proposition 15.39.6 $(R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'} \rightarrow (R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'}^{\wedge}$ is regular. Hence $R_{\mathfrak{m}} \rightarrow (R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'}^{\wedge}$ is regular and since it factors through the localization $R_{\mathfrak{p}}$, also the ring map $R_{\mathfrak{p}} \rightarrow (R_{\mathfrak{m}}^{\wedge})_{\mathfrak{p}'}^{\wedge}$ is regular. Thus we may apply Lemma 15.30.7 to see that $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$ is regular. \square

Lemma 15.39.8. *Let R be a Noetherian local ring which is a G-ring. Then the henselization R^h and the strict henselization R^{sh} are G-rings.*

Proof. We will use the criterion of Lemma 15.39.7. Let $\mathfrak{q} \subset R^h$ be a prime and set $\mathfrak{p} = R \cap \mathfrak{q}$. Set $\mathfrak{q}_1 = \mathfrak{q}$ and let $\mathfrak{q}_2, \dots, \mathfrak{q}_t$ be the other primes of R^h lying over \mathfrak{p} , so that $R^h \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1, \dots, t} \kappa(\mathfrak{q}_i)$, see Lemma 15.34.13. Using that $(R^h)^{\wedge} = R^{\wedge}$ (Lemma 15.34.3) we see

$$\prod_{i=1, \dots, t} (R^h)^{\wedge} \otimes_{R^h} \kappa(\mathfrak{q}_i) = (R^h)^{\wedge} \otimes_{R^h} (R^h \otimes_R \kappa(\mathfrak{p})) = R^{\wedge} \otimes_R \kappa(\mathfrak{p})$$

Hence $(R^h)^\wedge \otimes_{R^h} \kappa(\mathfrak{q}_i)$ is geometrically regular over $\kappa(\mathfrak{p})$ by assumption. Since $\kappa(\mathfrak{q}_i)$ is separable algebraic over $\kappa(\mathfrak{p})$ it follows from Algebra, Lemma 10.154.6 that $(R^h)^\wedge \otimes_{R^h} \kappa(\mathfrak{q}_i)$ is geometrically regular over $\kappa(\mathfrak{q}_i)$.

Let $\mathfrak{r} \subset R^{sh}$ be a prime and set $\mathfrak{p} = R \cap \mathfrak{r}$. Set $\mathfrak{r}_1 = \mathfrak{r}$ and let $\mathfrak{r}_2, \dots, \mathfrak{r}_s$ be the other primes of R^{sh} lying over \mathfrak{p} , so that $R^{sh} \otimes_R \kappa(\mathfrak{p}) = \prod_{i=1, \dots, t} \kappa(\mathfrak{q}_i)$, see Lemma 15.34.13. Then we see that

$$\prod_{i=1, \dots, t} (R^{sh})^\wedge \otimes_{R^{sh}} \kappa(\mathfrak{r}_i) = (R^{sh})^\wedge \otimes_{R^{sh}} (R^{sh} \otimes_R \kappa(\mathfrak{p})) = (R^{sh})^\wedge \otimes_R \kappa(\mathfrak{p})$$

Note that $R^\wedge \rightarrow (R^{sh})^\wedge$ is formally smooth in the $\mathfrak{m}_{(R^{sh})^\wedge}$ -adic topology, see Lemma 15.34.3. Hence $R^\wedge \rightarrow (R^{sh})^\wedge$ is regular by Proposition 15.38.2. We conclude that $(R^{sh})^\wedge \otimes_{R^h} \kappa(\mathfrak{q}_i)$ is regular over $\kappa(\mathfrak{p})$ by Lemma 15.30.4 as $R^\wedge \otimes_R \kappa(\mathfrak{p})$ is regular over $\kappa(\mathfrak{p})$ by assumption. Since $\kappa(\mathfrak{r}_i)$ is separable algebraic over $\kappa(\mathfrak{p})$ it follows from Algebra, Lemma 10.154.6 that $(R^{sh})^\wedge \otimes_{R^{sh}} \kappa(\mathfrak{r}_i)$ is geometrically regular over $\kappa(\mathfrak{r}_i)$. \square

Lemma 15.39.9. *Let p be a prime number. Let A be a Noetherian complete local domain with fraction field K of characteristic p . Let $\mathfrak{q} \subset A[x]$ be a maximal ideal lying over the maximal ideal of A and let $\mathfrak{r} \subset \mathfrak{q}$ be a prime lying over $(0) \subset A$. Then $A[x]^\wedge_{\mathfrak{q}} \otimes_{A[x]} \kappa(\mathfrak{r})$ is geometrically regular over $\kappa(\mathfrak{r})$.*

Proof. Note that $K \subset \kappa(\mathfrak{r})$ is finite. Hence, given a finite purely inseparable extension $\kappa(\mathfrak{r}) \subset L$ there exists a finite extension of Noetherian complete local domains $A \subset B$ such that $\kappa(\mathfrak{r}) \otimes_A B$ surjects onto L . Namely, you take $B \subset L$ a finite A -subalgebra whose field of fractions is L . Denote $\mathfrak{r}' \subset B[x]$ the kernel of the map $B[x] = A[x] \otimes_A B \rightarrow \kappa(\mathfrak{r}) \otimes_A B \rightarrow L$ so that $\kappa(\mathfrak{r}') = L$. Then

$$A[x]^\wedge_{\mathfrak{q}} \otimes_{A[x]} L = A[x]^\wedge_{\mathfrak{q}} \otimes_{A[x]} B[x] \otimes_{B[x]} \kappa(\mathfrak{r}') = \prod B[x]^\wedge_{\mathfrak{q}_i} \otimes_{B[x]} \kappa(\mathfrak{r}')$$

where $\mathfrak{q}_1, \dots, \mathfrak{q}_t$ are the primes of $B[x]$ lying over \mathfrak{q} , see Algebra, Lemma 10.93.19. Thus we see that it suffices to prove the rings $B[x]^\wedge_{\mathfrak{q}_i} \otimes_{B[x]} \kappa(\mathfrak{r}')$ are regular. This reduces us to showing that $A[x]^\wedge_{\mathfrak{q}} \otimes_{A[x]} \kappa(\mathfrak{r})$ is regular in the special case that $K = \kappa(\mathfrak{r})$.

Assume $K = \kappa(\mathfrak{r})$. In this case we see that $\mathfrak{r}K[x]$ is generated by $x - f$ for some $f \in K$ and

$$A[x]^\wedge_{\mathfrak{q}} \otimes_{A[x]} \kappa(\mathfrak{r}) = (A[x]^\wedge_{\mathfrak{q}} \otimes_A K)/(x - f)$$

The derivation $D = d/dx$ of $A[x]$ extends to $K[x]$ and maps $x - f$ to a unit of $K[x]$. Moreover D extends to $A[x]^\wedge_{\mathfrak{q}} \otimes_A K$ by Lemma 15.37.1. As $A \rightarrow A[x]^\wedge_{\mathfrak{q}}$ is formally smooth (see Lemmas 15.27.2 and 15.27.4) the ring $A[x]^\wedge_{\mathfrak{q}} \otimes_A K$ is regular by Proposition 15.38.2 (the arguments of the proof of that proposition simplify significantly in this particular case). We conclude by Lemma 15.37.2. \square

Proposition 15.39.10. *Let R be a G-ring. If $R \rightarrow S$ is essentially of finite type then S is a G-ring.*

Proof. Since being a G-ring is a property of the local rings it is clear that a localization of a G-ring is a G-ring. Conversely, if every localization at a prime is a G-ring, then the ring is a G-ring. Thus it suffices to show that $S_{\mathfrak{q}}$ is a G-ring for every finite type R -algebra S and every prime \mathfrak{q} of S . Writing S as a quotient of $R[x_1, \dots, x_n]$ we see from Lemma 15.39.3 that it suffices to prove that $R[x_1, \dots, x_n]$

is a G-ring. By induction on n it suffices to prove that $R[x]$ is a G-ring. Let $\mathfrak{q} \subset R[x]$ be a maximal ideal. By Lemma 15.39.7 it suffices to show that

$$R[x]_{\mathfrak{q}} \longrightarrow R[x]_{\mathfrak{q}}^{\wedge}$$

is regular. If \mathfrak{q} lies over $\mathfrak{p} \subset R$, then we may replace R by $R_{\mathfrak{p}}$. Hence we may assume that R is a Noetherian local G-ring with maximal ideal \mathfrak{m} and that $\mathfrak{q} \subset R[x]$ lies over \mathfrak{m} . Note that there is a unique prime $\mathfrak{q}' \subset R^{\wedge}[x]$ lying over \mathfrak{q} . Consider the diagram

$$\begin{array}{ccc} R[x]_{\mathfrak{q}}^{\wedge} & \longrightarrow & (R^{\wedge}[x]_{\mathfrak{q}'})^{\wedge} \\ \uparrow & & \uparrow \\ R[x]_{\mathfrak{q}} & \longrightarrow & R^{\wedge}[x]_{\mathfrak{q}'} \end{array}$$

Since R is a G-ring the lower horizontal arrow is regular (as a localization of a base change of the regular ring map $R \rightarrow R^{\wedge}$). Suppose we can prove the right vertical arrow is regular. Then it follows that the composition $R[x]_{\mathfrak{q}} \rightarrow (R^{\wedge}[x]_{\mathfrak{q}'})^{\wedge}$ is regular, and hence the left vertical arrow is regular by Lemma 15.30.7. Hence we see that we may assume R is a Noetherian complete local ring and \mathfrak{q} a prime lying over the maximal ideal of R .

Let R be a Noetherian complete local ring and let $\mathfrak{q} \subset R[x]$ be a maximal ideal lying over the maximal ideal of R . Let $\mathfrak{r} \subset \mathfrak{q}$ be a prime ideal. We want to show that $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is a geometrically regular algebra over $\kappa(\mathfrak{r})$. Set $\mathfrak{p} = R \cap \mathfrak{r}$. Then we can replace R by R/\mathfrak{p} and \mathfrak{q} and \mathfrak{r} by their images in $R/\mathfrak{p}[x]$, see Lemma 15.39.2. Hence we may assume that R is a domain and that $\mathfrak{r} \cap R = (0)$.

By Algebra, Lemma 10.149.10 we can find $R_0 \subset R$ which is regular and such that R is finite over R_0 . Applying Lemma 15.39.3 we see that it suffices to prove $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is geometrically regular over $\kappa(\mathfrak{r})$ when, in addition to the above, R is a regular complete local ring.

Now R is a regular complete local ring, we have $\mathfrak{q} \subset \mathfrak{r} \subset R[x]$, we have $(0) = R \cap \mathfrak{r}$ and \mathfrak{q} is a maximal ideal lying over the maximal ideal of R . Since R is regular the ring $R[x]$ is regular (Algebra, Lemma 10.151.8). Hence the localization $R[x]_{\mathfrak{q}}$ is regular. Hence the completions $R[x]_{\mathfrak{q}}^{\wedge}$ are regular, see Lemma 15.32.4. Hence the fibre $R[x]_{\mathfrak{q}}^{\wedge} \otimes_{R[x]} \kappa(\mathfrak{r})$ is, as a localization of $R[x]_{\mathfrak{q}}^{\wedge}$, also regular. Thus we are done if the characteristic of $f.f.(R)$ is 0.

If the characteristic of R is positive, then $R = k[[x_1, \dots, x_n]]$. In this case we split the argument in two subcases:

- (1) The case $\mathfrak{r} = (0)$. The result is a direct consequence of Lemma 15.39.5.
- (2) The case $\mathfrak{r} \neq (0)$. This is Lemma 15.39.9.

□

Remark 15.39.11. Let R be a G-ring and let $I \subset R$ be an ideal. In general it is not the case that the I -adic completion R^{\wedge} is a G-ring. An example was given by Nishimura in [Nis81]. A generalization and, in some sense, clarification of this example can be found in the last section of [Dum00].

Proposition 15.39.12. *The following types of rings are G-rings:*

- (1) *fields,*
- (2) *Noetherian complete local rings,*

- (3) \mathbf{Z} ,
- (4) Dedekind domains with fraction field of characteristic zero,
- (5) finite type ring extensions of any of the above.

Proof. For fields, \mathbf{Z} and Dedekind domains of characteristic zero this follows immediately from the definition and the fact that the completion of a discrete valuation ring is a discrete valuation ring. A Noetherian complete local ring is a G-ring by Proposition 15.39.6. The statement on finite type overrings is Proposition 15.39.10. \square

Lemma 15.39.13. *Let (A, \mathfrak{m}) be a henselian local ring. Then A is a filtered colimit of a system of henselian local Noetherian G-rings with local transition maps.*

Proof. Write $A = \text{colim } A_i$ as a filtered colimit of finite type \mathbf{Z} -algebras. Let \mathfrak{p}_i be the prime ideal of A_i lying under \mathfrak{m} . We may replace A_i by the localization of A_i at \mathfrak{p}_i . Then A_i is a Noetherian local G-ring (Proposition 15.39.12). By Lemma 15.7.17 we see that $A = \text{colim } A_i^h$. By Lemma 15.39.8 the rings A_i^h are G-rings. \square

Lemma 15.39.14. *Let A be a Noetherian G-ring. Let $I \subset A$ be an ideal and let A^\wedge be the completion of A with respect to I . Then $A \rightarrow A^\wedge$ is regular.*

Proof. The ring map $A \rightarrow A^\wedge$ is flat by Algebra, Lemma 10.93.3. The ring A^\wedge is Noetherian by Algebra, Lemma 10.93.10. Thus it suffices to check the third condition of Lemma 15.30.2. Let $\mathfrak{m}' \subset A^\wedge$ be a maximal ideal lying over $\mathfrak{m} \subset A$. By Algebra, Lemma 10.93.11 we have $IA^\wedge \subset \mathfrak{m}'$. Since $A^\wedge/IA^\wedge = A/I$ we see that $I \subset \mathfrak{m}$, $\mathfrak{m}/I = \mathfrak{m}'/IA^\wedge A/\mathfrak{m} = A^\wedge/\mathfrak{m}'$. Since A^\wedge/\mathfrak{m}' is a field, we conclude that \mathfrak{m} is a maximal ideal as well. Then $A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}'}^\wedge$ is a flat local ring homomorphism of Noetherian local rings which identifies residue fields and such that $\mathfrak{m}A_{\mathfrak{m}'}^\wedge = \mathfrak{m}'A_{\mathfrak{m}'}^\wedge$. Thus it induces an isomorphism on complete local rings, see Lemma 15.32.7. Let $(A_{\mathfrak{m}})^\wedge$ be the completion of $A_{\mathfrak{m}}$ with respect to its maximal ideal. The ring map

$$(A^\wedge)_{\mathfrak{m}'} \rightarrow ((A^\wedge)_{\mathfrak{m}'})^\wedge = (A_{\mathfrak{m}})^\wedge$$

is faithfully flat (Algebra, Lemma 10.93.4). Thus we can apply Lemma 15.30.7 to the ring maps

$$A_{\mathfrak{m}} \rightarrow (A^\wedge)_{\mathfrak{m}'} \rightarrow (A_{\mathfrak{m}})^\wedge$$

to conclude because $A_{\mathfrak{m}} \rightarrow (A_{\mathfrak{m}})^\wedge$ is regular as A is a G-ring. \square

Lemma 15.39.15. *Let A be a Noetherian G-ring. Let $I \subset A$ be an ideal. Let (A^h, I^h) be the henselization of the pair (A, I) , see Lemma 15.7.13. Then A^h is a Noetherian G-ring.*

Proof. Let $\mathfrak{m}^h \subset A^h$ be a maximal ideal. We have to show that the map from $A_{\mathfrak{m}^h}^h$ to its completion has geometrically regular fibres, see Lemma 15.39.7. Let \mathfrak{m} be the inverse image of \mathfrak{m}^h in A . Note that $I^h \subset \mathfrak{m}^h$ and hence $I \subset \mathfrak{m}$ as (A^h, I^h) is a henselian pair. Recall that A^h is Noetherian, $I^h = IA^h$, and that $A \rightarrow A^h$ induces an isomorphism on I -adic completions, see Lemma 15.7.16. Then the local homomorphism of Noetherian local rings

$$A_{\mathfrak{m}} \rightarrow A_{\mathfrak{m}^h}^h$$

induces an isomorphism on completions at maximal ideals by Lemma 15.32.7 (details omitted). Let \mathfrak{q}^h be a prime of the middle ring lying over $\mathfrak{q} \subset A_{\mathfrak{m}}$. Set $\mathfrak{q}_1 = \mathfrak{q}^h$ and let $\mathfrak{q}_2, \dots, \mathfrak{q}_t$ be the other primes of A^h lying over \mathfrak{q} , so that $A^h \otimes_A \kappa(\mathfrak{q}) =$

$\prod_{i=1, \dots, t} \kappa(\mathfrak{q}_i)$, see Lemma 15.34.12. Using that $(A^h)_{\mathfrak{m}^h}^\wedge = (A_{\mathfrak{m}})^\wedge$ as discussed above we see

$$\prod_{i=1, \dots, t} (A_{\mathfrak{m}^h}^h)^\wedge \otimes_{A_{\mathfrak{m}^h}^h} \kappa(\mathfrak{q}_i) = (A_{\mathfrak{m}^h}^h)^\wedge \otimes_{A_{\mathfrak{m}^h}^h} (A_{\mathfrak{m}^h}^h \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})) = (A_{\mathfrak{m}})^\wedge \otimes_{A_{\mathfrak{m}}} \kappa(\mathfrak{q})$$

Hence, as one of the components, the ring

$$(A_{\mathfrak{m}^h}^h)^\wedge \otimes_{A_{\mathfrak{m}^h}^h} \kappa(\mathfrak{q}^h)$$

is geometrically regular over $\kappa(\mathfrak{q})$ by assumption on A . Since $\kappa(\mathfrak{q}^h)$ is separable algebraic over $\kappa(\mathfrak{q})$ it follows from Algebra, Lemma 10.154.6 that

$$(A_{\mathfrak{m}^h}^h)^\wedge \otimes_{A_{\mathfrak{m}^h}^h} \kappa(\mathfrak{q}^h)$$

is geometrically regular over $\kappa(\mathfrak{q}^h)$ as desired. \square

15.40. Excellent rings

In this section we discuss Grothendieck's notion of excellent rings. For the definitions of G-rings, J-2 rings, and universally catenary rings we refer to Definition 15.39.1, Definition 15.36.1, and Algebra, Definition 10.101.5.

Definition 15.40.1. Let R be a ring.

- (1) We say R is *quasi-excellent* if R is Noetherian, a G-ring, and J-2.
- (2) We say R is *excellent* if R is quasi-excellent and universally catenary.

Thus a Noetherian ring is quasi-excellent if it has geometrically regular formal fibres and if any finite type algebra over it has closed singular set. For such a ring to be excellent we require in addition that there exists (locally) a good dimension function.

Lemma 15.40.2. *Any localization of a finite type ring over a (quasi-)excellent ring is (quasi-)excellent.*

Proof. For finite type algebras this follows from the definitions for the properties J-2 and universally catenary. For G-rings, see Proposition 15.39.10. We omit the proof that localization preserves (quasi-)excellency. \square

Lemma 15.40.3. *A quasi-excellent ring is Nagata.*

Proof. Let R be quasi-excellent. Using that a finite type algebra over R is quasi-excellent (Lemma 15.40.2) we see that it suffices to show that any quasi-excellent domain is N-1, see Algebra, Lemma 10.150.17. Applying Algebra, Lemma 10.150.29 (and using that a quasi-excellent ring is J-2) we reduce to showing that a quasi-excellent local domain R is N-1. As $R \rightarrow R^\wedge$ is regular we see that R^\wedge is reduced by Lemma 15.31.1. In other words, R is analytically unramified. Hence R is N-1 by Algebra, Lemma 10.150.24. \square

Proposition 15.40.4. *The following types of rings are excellent:*

- (1) *fields,*
- (2) *Noetherian complete local rings,*
- (3) \mathbf{Z} ,
- (4) *Dedekind domains with fraction field of characteristic zero,*
- (5) *finite type ring extensions of any of the above.*

Proof. See Propositions 15.39.12 and 15.37.6 to see that these rings are G-rings and have J-2. Any Cohen-Macaulay ring is universally catenary, see Algebra, Lemma 10.101.6. In particular fields, Dedekind rings, and more generally regular rings are universally catenary. Via the Cohen structure theorem we see that complete local rings are universally catenary, see Algebra, Remark 10.149.9. \square

15.41. Injective abelian groups

In this section we show the category of abelian groups has enough injectives. Recall that an abelian group M is *divisible* if and only if for every $x \in M$ and every $n \in \mathbf{N}$ there exists a $y \in M$ such that $ny = x$.

Lemma 15.41.1. *An abelian group J is an injective object in the category of abelian groups if and only if J is divisible.*

Proof. Suppose that J is not divisible. Then there exists an $x \in J$ and $n \in \mathbf{N}$ such that there is no $y \in J$ with $ny = x$. Then the morphism $\mathbf{Z} \rightarrow J$, $m \mapsto mx$ does not extend to $\frac{1}{n}\mathbf{Z} \supset \mathbf{Z}$. Hence J is not injective.

Let $A \subset B$ be abelian groups. Assume that J is a divisible abelian group. Let $\varphi : A \rightarrow J$ be a morphism. Consider the set of homomorphisms $\varphi' : A' \rightarrow J$ with $A \subset A' \subset B$ and $\varphi'|_A = \varphi$. Define $(A', \varphi') \geq (A'', \varphi'')$ if and only if $A' \supset A''$ and $\varphi'|_{A''} = \varphi''$. If $(A_i, \varphi_i)_{i \in I}$ is a totally ordered collection of such pairs, then we obtain a map $\bigcup_{i \in I} A_i \rightarrow J$ defined by $a \in A_i$ maps to $\varphi_i(a)$. Thus Zorn's lemma applies. To conclude we have to show that if the pair (A', φ') is maximal then $A' = B$. In other words, it suffices to show, given any subgroup $A \subset B$, $A \neq B$ and any $\varphi : A \rightarrow J$, then we can find $\varphi' : A' \rightarrow J$ with $A \subset A' \subset B$ such that (a) the inclusion $A \subset A'$ is strict, and (b) the morphism φ' extends φ .

To prove this, pick $x \in B$, $x \notin A$. If there exists no $n \in \mathbf{N}$ such that $nx \in A$, then $A \oplus \mathbf{Z} \cong A + \mathbf{Z}x$. Hence we can extend φ to $A' = A + \mathbf{Z}x$ by using φ on A and mapping x to zero for example. If there does exist an $n \in \mathbf{N}$ such that $nx \in A$, then let n be the minimal such integer. Let $z \in J$ be an element such that $nz = \varphi(nx)$. Define a morphism $\tilde{\varphi} : A \oplus \mathbf{Z} \rightarrow J$ by $(a, m) \mapsto \varphi(a) + mz$. By our choice of z the kernel of $\tilde{\varphi}$ contains the kernel of the map $A \oplus \mathbf{Z} \rightarrow B$, $(a, m) \mapsto a + mx$. Hence $\tilde{\varphi}$ factors through the image $A' = A + \mathbf{Z}x$, and this extends the morphism φ . \square

We can use this lemma to show that every abelian group can be embedded in a injective abelian group. But this is a special case of the result of the following section.

15.42. Injectives in the category of modules

In this section we prove that there are enough injective modules over a ring R . We start with the fact that \mathbf{Q}/\mathbf{Z} is an injective abelian group. This follows from Lemma 15.41.1.

Definition 15.42.1. Let R be a ring.

- (1) For any R -module M over R we denote $M^\vee = \text{Hom}(M, \mathbf{Q}/\mathbf{Z})$ with its natural R -module structure. We think of $M \mapsto M^\vee$ as a contravariant functor from the category of R -modules to itself.

(2) For any R -module M we denote

$$F(M) = \bigoplus_{m \in M} R[m]$$

the *free module* with basis given by the elements $[m]$ with $m \in M$. We let $F(M) \rightarrow M$, $\sum f_i[m_i] \mapsto \sum f_i m_i$ be the natural surjection of R -modules. We think of $M \mapsto (F(M) \rightarrow M)$ as a functor from the category of R -modules to the category of arrows in R -modules.

Lemma 15.42.2. *Let R be a ring. The functor $M \mapsto M^\vee$ is exact.*

Proof. This because \mathbf{Q}/\mathbf{Z} is an injective abelian group by Lemma 15.41.1. \square

There is a canonical map $ev : M \rightarrow (M^\vee)^\vee$ given by evaluation: given $x \in M$ we let $ev(x) \in (M^\vee)^\vee = \text{Hom}(M^\vee, \mathbf{Q}/\mathbf{Z})$ be the map $\varphi \mapsto \varphi(x)$.

Lemma 15.42.3. *For any R -module M the evaluation map $ev : M \rightarrow (M^\vee)^\vee$ is injective.*

Proof. You can check this using that \mathbf{Q}/\mathbf{Z} is an injective abelian group. Namely, if $x \in M$ is not zero, then let $M' \subset M$ be the cyclic group it generates. There exists a nonzero map $M' \rightarrow \mathbf{Q}/\mathbf{Z}$ which necessarily does not annihilate x . This extends to a map $\varphi : M \rightarrow \mathbf{Q}/\mathbf{Z}$. And then $ev(x)(\varphi) = \varphi(x) \neq 0$. \square

The canonical surjection $F(M) \rightarrow M$ of R -modules turns into a canonical injection, see above, of R -modules

$$(M^\vee)^\vee \longrightarrow (F(M^\vee))^\vee.$$

Set $J(M) = (F(M^\vee))^\vee$. The composition of ev with this the displayed map gives $M \rightarrow J(M)$ functorially in M .

Lemma 15.42.4. *Let R be a ring. For every R -module M the R -module $J(M)$ is injective.*

Proof. Note that $J(M) \cong \prod_{\varphi \in M^\vee} R^\vee$ as an R -module. As the product of injective modules is injective, it suffices to show that R^\vee is injective. For this we use that

$$\text{Hom}_R(N, R^\vee) = \text{Hom}_R(N, \text{Hom}_{\mathbf{Z}}(R, \mathbf{Q}/\mathbf{Z})) = N^\vee$$

and the fact that $(-)^\vee$ is an exact functor by Lemma 15.42.2. \square

Lemma 15.42.5. *Let R be a ring. The construction above defines a covariant functor $M \mapsto (M \rightarrow J(M))$ from the category of R -modules to the category of arrows of R -modules such that for every module M the output $M \rightarrow J(M)$ is an injective map of M into an injective R -module $J(M)$.*

Proof. Follows from the above. \square

In particular, for any map of R -modules $M \rightarrow N$ there is an associated morphism $J(M) \rightarrow J(N)$ making the following diagram commute:

$$\begin{array}{ccc} M & \longrightarrow & N \\ \downarrow & & \downarrow \\ J(M) & \longrightarrow & J(N) \end{array}$$

This is the kind of construction we would like to have in general. In Homology, Section 12.23 we introduced terminology to express this. Namely, we say this means that the category of R -modules has functorial injective embeddings.

15.43. Derived categories of modules

In this section we put some generalities concerning the derived category of modules over a ring.

Let A be a ring. The category of A -modules has products and products are exact. The category of A -modules has enough injectives by Lemma 15.42.5. Hence every complex of A -modules is quasi-isomorphic to a K -injective complex (Derived Categories, Lemma 13.29.9). It follows that $D(A)$ has countable products (Derived Categories, Lemma 13.32.2) and in fact arbitrary products (Injectives, Lemma 19.13.4). This implies that every inverse system of objects of $D(A)$ has a derived limit (well defined up to isomorphism), see Derived Categories, Section 13.32.

Lemma 15.43.1. *Let $R \rightarrow S$ be a flat ring map. If I^\bullet is a K -injective complex of S -modules, then I^\bullet is K -injective as a complex of R -modules.*

Proof. This is true because $\mathrm{Hom}_{K(R)}(M^\bullet, I^\bullet) = \mathrm{Hom}_{K(S)}(M^\bullet \otimes_R S, I^\bullet)$ by Algebra, Lemma 10.13.3 and the fact that tensoring with S is exact. \square

Lemma 15.43.2. *Let $R \rightarrow S$ be an epimorphism of rings. Let I^\bullet be a complex of S -modules. If I^\bullet is K -injective as a complex of R -modules, then I^\bullet is a K -injective complex of S -modules.*

Proof. This is true because $\mathrm{Hom}_{K(R)}(N^\bullet, I^\bullet) = \mathrm{Hom}_{K(S)}(N^\bullet, I^\bullet)$ for any complex of S -modules N^\bullet , see Algebra, Lemma 10.103.14. \square

Lemma 15.43.3. *Let $A \rightarrow B$ be a ring map. If I^\bullet is a K -injective complex of A -modules, then $\mathrm{Hom}_A(B, I^\bullet)$ is a K -injective complex of B -modules.*

Proof. This is true because $\mathrm{Hom}_{K(B)}(N^\bullet, \mathrm{Hom}_A(B, I^\bullet)) = \mathrm{Hom}_{K(A)}(N^\bullet, I^\bullet)$ by Algebra, Lemma 10.13.4. \square

15.44. Computing Tor

Let R be a ring. We denote $D(R)$ the derived category of the abelian category Mod_R of R -modules. Note that Mod_R has enough projectives as every free R -module is projective. Thus we can define the left derived functors of any additive functor from Mod_R to any abelian category.

This implies in particular to the functor $-\otimes_R M : \mathrm{Mod}_R \rightarrow \mathrm{Mod}_R$ whose right derived functors are the Tor functors $\mathrm{Tor}_i^R(-, M)$, see Algebra, Section 10.72. There is also a total right derived functor

$$(15.44.0.1) \quad - \otimes_R^{\mathbf{L}} M : D^-(R) \longrightarrow D^-(R)$$

which is denoted $-\otimes_R^{\mathbf{L}} M$. Its satellites are the Tor modules, i.e., we have

$$H^{-p}(N \otimes_R^{\mathbf{L}} M) = \mathrm{Tor}_p^R(N, M).$$

A special situation occurs when we consider the tensor product with an R -algebra A . In this case we think of $-\otimes_R A$ as a functor from Mod_R to Mod_A . Hence the total right derived functor

$$(15.44.0.2) \quad - \otimes_R^{\mathbf{L}} A : D^-(R) \longrightarrow D^-(A)$$

which is denoted $-\otimes_R^{\mathbf{L}} A$. Its satellites are the tor groups, i.e., we have

$$H^{-p}(N \otimes_R^{\mathbf{L}} A) = \mathrm{Tor}_p^R(N, A).$$

In particular these Tor groups naturally have the structure of A -modules.

15.45. Derived tensor product

We can construct the derived tensor product in greater generality. In fact, it turns out that the boundedness assumptions are not necessary, provided we choose K-flat resolutions. In this section we use Homology, Example 12.22.2 and Homology, Definition 12.22.3 to turn a pair of complexes of modules into a double complex and its associated total complex.

Lemma 15.45.1. *Let R be a ring. Let P^\bullet be a complex of R -modules. Let $\alpha, \beta : L^\bullet \rightarrow M^\bullet$ be homotopy equivalent maps of complexes. Then α and β induce homotopy equivalent maps*

$$\text{Tot}(\alpha \otimes \text{id}_P), \text{Tot}(\beta \otimes \text{id}_P) : \text{Tot}(L^\bullet \otimes_R P^\bullet) \longrightarrow \text{Tot}(M^\bullet \otimes_R P^\bullet).$$

In particular the construction $L^\bullet \mapsto \text{Tot}(L^\bullet \otimes_R P^\bullet)$ defines an endo-functor of the homotopy category of complexes.

Proof. Say $\alpha = \beta + dh + hd$ for some homotopy h defined by $h^n : L^n \rightarrow M^{n-1}$. Set

$$H^n = \bigoplus_{a+b=n} h^a \otimes \text{id}_{P^b} : \bigoplus_{a+b=n} L^a \otimes_R P^b \longrightarrow \bigoplus_{a+b=n} M^{a-1} \otimes_R P^b$$

Then a straightforward computation shows that

$$\text{Tot}(\alpha \otimes \text{id}_P) = \text{Tot}(\beta \otimes \text{id}_P) + dH + Hd$$

as maps $\text{Tot}(L^\bullet \otimes_R P^\bullet) \rightarrow \text{Tot}(M^\bullet \otimes_R P^\bullet)$. \square

Lemma 15.45.2. *Let R be a ring. Let P^\bullet be a complex of R -modules. The functor*

$$K(\text{Mod}_R) \longrightarrow K(\text{Mod}_R), \quad L^\bullet \longmapsto \text{Tot}(L^\bullet \otimes_R P^\bullet)$$

is an exact functor of triangulated categories.

Proof. By our definition of the triangulated structure on $K(\text{Mod}_R)$ we have to check that our functor maps a termwise split short exact sequence of complexes to a termwise split short exact sequence of complexes. As the terms of $\text{Tot}(L^\bullet \otimes_R P^\bullet)$ are direct sums of the tensor products $L^a \otimes_R P^b$ this is clear. \square

The following definition will allow us to think intelligently about derived tensor products of unbounded complexes.

Definition 15.45.3. Let R be a ring. A complex K^\bullet is called *K-flat* if for every acyclic complex M^\bullet the total complex $\text{Tot}(M^\bullet \otimes_R K^\bullet)$ is acyclic.

Lemma 15.45.4. *Let R be a ring. Let K^\bullet be a K-flat complex. Then the functor*

$$K(\text{Mod}_R) \longrightarrow K(\text{Mod}_R), \quad L^\bullet \longmapsto \text{Tot}(L^\bullet \otimes_R K^\bullet)$$

transforms quasi-isomorphisms into quasi-isomorphisms.

Proof. Follows from Lemma 15.45.2 and the fact that quasi-isomorphisms in $K(\text{Mod}_R)$ and $K(\text{Mod}_A)$ are characterized by having acyclic cones. \square

Lemma 15.45.5. *Let $R \rightarrow R'$ be a ring map. If K^\bullet is a K-flat complex of R -modules, then $K^\bullet \otimes_R R'$ is a K-flat complex of R' -modules.*

Proof. Follows from the definitions and the fact that $(K^\bullet \otimes_R R') \otimes_{R'} L^\bullet = K^\bullet \otimes_R L^\bullet$ for any complex L^\bullet of R' -modules. \square

Lemma 15.45.6. *Let R be a ring. If K^\bullet, L^\bullet are K -flat complexes of R -modules, then $\text{Tot}(K^\bullet \otimes_R L^\bullet)$ is a K -flat complex of R -modules.*

Proof. Follows from the isomorphism

$$\text{Tot}(M^\bullet \otimes_R \text{Tot}(K^\bullet \otimes_R L^\bullet)) = \text{Tot}(\text{Tot}(M^\bullet \otimes_R K^\bullet) \otimes_R L^\bullet)$$

and the definition. □

Lemma 15.45.7. *Let R be a ring. Let $(K_1^\bullet, K_2^\bullet, K_3^\bullet)$ be a distinguished triangle in $K(\text{Mod}_R)$. If two out of three of K_i^\bullet are K -flat, so is the third.*

Proof. Follows from Lemma 15.45.2 and the fact that in a distinguished triangle in $K(\text{Mod}_A)$ if two out of three are acyclic, so is the third. □

Lemma 15.45.8. *Let R be a ring. Let P^\bullet be a bounded above complex of flat R -modules. Then P^\bullet is K -flat.*

Proof. Let L^\bullet be an acyclic complex of R -modules. Let $\xi \in H^n(\text{Tot}(L^\bullet \otimes_R P^\bullet))$. We have to show that $\xi = 0$. Since $\text{Tot}^n(L^\bullet \otimes_R P^\bullet)$ is a direct sum with terms $L^a \otimes_R P^b$ we see that ξ comes from an element in $H^n(\text{Tot}(\tau_{\leq m} L^\bullet \otimes_R P^\bullet))$ for some $m \in \mathbf{Z}$. Since $\tau_{\leq m} L^\bullet$ is also acyclic we may replace L^\bullet by $\tau_{\leq m} L^\bullet$. Hence we may assume that L^\bullet is bounded above. In this case the spectral sequence of Homology, Lemma 12.22.6 has

$${}^I E_1^{p,q} = H^p(L^\bullet \otimes_R P^q)$$

which is zero as P^q is flat and L^\bullet acyclic. Hence $H^*(\text{Tot}(L^\bullet \otimes_R P^\bullet)) = 0$. □

In the following lemma by a colimit of a system of complexes we mean the termwise colimit.

Lemma 15.45.9. *Let R be a ring. Let $K_1^\bullet \rightarrow K_2^\bullet \rightarrow \dots$ be a system of K -flat complexes. Then $\text{colim}_i K_i^\bullet$ is K -flat.*

Proof. Because we are taking termwise colimits it is clear that

$$\text{colim}_i \text{Tot}(M^\bullet \otimes_R K_i^\bullet) = \text{Tot}(M^\bullet \otimes_R \text{colim}_i K_i^\bullet)$$

Hence the lemma follows from the fact that filtered colimits are exact. □

Lemma 15.45.10. *Let R be a ring. For any complex M^\bullet there exists a K -flat complex K^\bullet and a quasi-isomorphism $K^\bullet \rightarrow M^\bullet$. Moreover each K^n is a flat R -module.*

Proof. Let $\mathcal{P} \subset \text{Ob}(\text{Mod}_R)$ be the class of flat R -modules. By Derived Categories, Lemma 13.28.1 there exists a system $K_1^\bullet \rightarrow K_2^\bullet \rightarrow \dots$ and a diagram

$$\begin{array}{ccccccc} K_1^\bullet & \longrightarrow & K_2^\bullet & \longrightarrow & \dots & & \\ \downarrow & & \downarrow & & & & \\ \tau_{\leq 1} M^\bullet & \longrightarrow & \tau_{\leq 2} M^\bullet & \longrightarrow & \dots & & \end{array}$$

with the properties (1), (2), (3) listed in that lemma. These properties imply each complex K_i^\bullet is a bounded above complex of flat modules. Hence K_i^\bullet is K -flat by Lemma 15.45.8. The induced map $\text{colim}_i K_i^\bullet \rightarrow M^\bullet$ is a quasi-isomorphism by construction. The complex $\text{colim}_i K_i^\bullet$ is K -flat by Lemma 15.45.9. The final assertion of the lemma is true because the colimit of a system of flat modules is flat, see Algebra, Lemma 10.38.2. □

Remark 15.45.11. In fact, we can do better than Lemma 15.45.10. Namely, we can find a quasi-isomorphism $P^\bullet \rightarrow M^\bullet$ where P^\bullet is a complex of A -modules endowed with a filtration

$$0 = F_{-1}P^\bullet \subset F_0P^\bullet \subset F_1P^\bullet \subset \dots \subset P^\bullet$$

by differential graded submodules such that

- (1) $P^\bullet = \bigcup F_p P^\bullet$,
- (2) the inclusions $F_i P^\bullet \rightarrow F_{i+1} P^\bullet$ are termwise split injections,
- (3) the quotients $F_{i+1} P^\bullet / F_i P^\bullet$ are isomorphic to direct sums of shifts $A[k]$ (as complexes, so differentials are zero).

This was shown in Differential Graded Algebra, Lemma 22.13.4. Moreover, given such a complex we obtain a distinguished triangle

$$\bigoplus F_i P^\bullet \rightarrow \bigoplus F_i P^\bullet \rightarrow M^\bullet \rightarrow \bigoplus F_i P^\bullet[1]$$

in $D(A)$. Using this we can sometimes reduce statements about general complexes to statements about $A[k]$ (this of course only works if the statement is preserved under taking direct sums). More precisely, let T be a property of objects of $D(A)$. Suppose that

- (1) if $K_i \in D(A)$, $i \in I$ is a family of objects with $T(K_i)$ for all $i \in I$, then $T(\bigoplus K_i)$,
- (2) if $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle and T holds for two, then T holds for the third object,
- (3) $T(A[k])$ holds for all k .

Then T holds for all objects of $D(A)$.

Lemma 15.45.12. *Let R be a ring. Let $\alpha : P^\bullet \rightarrow Q^\bullet$ be a quasi-isomorphism of K -flat complexes of R -modules. For every complex L^\bullet of R -modules the induced map*

$$\text{Tot}(id_L \otimes \alpha) : \text{Tot}(L^\bullet \otimes_R P^\bullet) \longrightarrow \text{Tot}(L^\bullet \otimes_R Q^\bullet)$$

is a quasi-isomorphism.

Proof. Choose a quasi-isomorphism $K^\bullet \rightarrow L^\bullet$ with K^\bullet a K -flat complex, see Lemma 15.45.10. Consider the commutative diagram

$$\begin{array}{ccc} \text{Tot}(K^\bullet \otimes_R P^\bullet) & \longrightarrow & \text{Tot}(K^\bullet \otimes_R Q^\bullet) \\ \downarrow & & \downarrow \\ \text{Tot}(L^\bullet \otimes_R P^\bullet) & \longrightarrow & \text{Tot}(L^\bullet \otimes_R Q^\bullet) \end{array}$$

The result follows as by Lemma 15.45.4 the vertical arrows and the top horizontal arrow are quasi-isomorphisms. □

Let R be a ring. Let M^\bullet be an object of $D(R)$. Choose a K -flat resolution $K^\bullet \rightarrow M^\bullet$, see Lemma 15.45.10. By Lemmas 15.45.1 and 15.45.2 we obtain an exact functor of triangulated categories

$$K(\text{Mod}_R) \longrightarrow K(\text{Mod}_R), \quad L^\bullet \longmapsto \text{Tot}(L^\bullet \otimes_R K^\bullet)$$

By Lemma 15.45.4 this functor induces a functor $D(R) \rightarrow D(R)$ simply because $D(R)$ is the localization of $K(\text{Mod}_R)$ at quasi-isomorphism. By Lemma 15.45.12 the resulting functor (up to isomorphism) does not depend on the choice of the K -flat resolution.

Definition 15.45.13. Let R be a ring. Let M^\bullet be an object of $D(R)$. The *derived tensor product*

$$-\otimes_R^{\mathbf{L}} M^\bullet : D(R) \longrightarrow D(R)$$

is the exact functor of triangulated categories described above.

This functor extends the functor (15.44.0.1). It is clear from our explicit constructions that there is a canonical isomorphism

$$M^\bullet \otimes_R^{\mathbf{L}} L^\bullet \cong L^\bullet \otimes_R^{\mathbf{L}} M^\bullet$$

whenever both L^\bullet and M^\bullet are in $D(R)$. Hence when we write $M^\bullet \otimes_R^{\mathbf{L}} L^\bullet$ we will usually be agnostic about which variable we are using to define the derived tensor product with.

15.46. Derived change of rings

Let $R \rightarrow A$ be a ring map. Let N be an A -module. We can also use K -flat resolutions to define a functor

$$-\otimes_R^{\mathbf{L}} N : D(R) \rightarrow D(A)$$

which is the left derived functor of the functor $\text{Mod}_R \rightarrow \text{Mod}_A$, $M \mapsto M \otimes_R N$. In particular, taking $N = A$ we obtain a derived base change functor

$$-\otimes_R^{\mathbf{L}} A : D(R) \rightarrow D(A)$$

extending the functor (15.44.0.2). Namely, for every complex of R -modules M^\bullet we can choose a K -flat resolution $K^\bullet \rightarrow M^\bullet$ and set $M^\bullet \otimes_R^{\mathbf{L}} N = K^\bullet \otimes_R N$. You can use Lemmas 15.45.10 and 15.45.12 to see that this is well defined. However, to cross all the t 's and dot all the i 's it is perhaps more convenient to use some general theory.

Lemma 15.46.1. *The construction above is independent of choices and defines an exact functor of triangulated categories $-\otimes_R^{\mathbf{L}} N : D(R) \rightarrow D(A)$. There is a functorial isomorphism*

$$E \otimes_R^{\mathbf{L}} N = (E \otimes_R^{\mathbf{L}} A) \otimes_A^{\mathbf{L}} N$$

for E in $D(R)$.

Proof. To prove the existence of the derived functor $-\otimes_R^{\mathbf{L}} N$ we use the general theory developed in Derived Categories, Section 13.15. Set $\mathcal{D} = K(\text{Mod}_R)$ and $\mathcal{D}' = D(A)$. Let us write $F : \mathcal{D} \rightarrow \mathcal{D}'$ the exact functor of triangulated categories defined by the rule $F(M^\bullet) = M^\bullet \otimes_R N$. We let S be the set of quasi-isomorphisms in $\mathcal{D} = K(\text{Mod}_R)$. This gives a situation as in Derived Categories, Situation 13.15.1 so that Derived Categories, Definition 13.15.2 applies. We claim that LF is everywhere defined. This follows from Derived Categories, Lemma 13.15.15 with $\mathcal{P} \subset \text{Ob}(\mathcal{D})$ the collection of K -flat complexes: (1) follows from Lemma 15.45.10 and (2) follows from Lemma 15.45.12. Thus we obtain a derived functor

$$LF : D(R) = S^{-1}\mathcal{D} \longrightarrow \mathcal{D}' = D(A)$$

see Derived Categories, Equation (13.15.9.1). Finally, Derived Categories, Lemma 13.15.15 guarantees that $LF(K^\bullet) = F(K^\bullet) = K^\bullet \otimes_R N$ when K^\bullet is K -flat, i.e., LF is indeed computed in the way described above. Moreover, by Lemma 15.45.5 the complex $K^\bullet \otimes_R A$ is a K -flat complex of A -modules. Hence

$$(K^\bullet \otimes_R^{\mathbf{L}} A) \otimes_A^{\mathbf{L}} N = (K^\bullet \otimes_R A) \otimes_A N = K^\bullet \otimes_A N = K^\bullet \otimes_A^{\mathbf{L}} N$$

which proves the final statement of the lemma. \square

Remark 15.46.2 (Warning). Let $R \rightarrow A$ be a ring map, and let N and N' be A -modules. Denote N_R and N'_R the restriction of N and N' to R -modules, see Algebra, Section 10.13. In this situation, the objects $N_R \otimes_R^{\mathbf{L}} N'$ and $N \otimes_R^{\mathbf{L}} N'_R$ of $D(A)$ are in general not isomorphic! In other words, one has to pay careful attention as to which of the two sides is being used to provide the A -module structure.

For a specific example, set $R = k[x, y]$, $A = R/(xy)$, $N = R/(x)$ and $N' = A = R/(xy)$. The resolution $0 \rightarrow R \xrightarrow{xy} R \rightarrow N'_R \rightarrow 0$ shows that $N \otimes_R^{\mathbf{L}} N'_R = N[1] \oplus N$ in $D(A)$. The resolution $0 \rightarrow R \xrightarrow{x} R \rightarrow N_R \rightarrow 0$ shows that $N_R \otimes_R^{\mathbf{L}} N'$ is represented by the complex $A \xrightarrow{x} A$. To see these two complexes are not isomorphic, one can show that the second complex is not isomorphic in $D(A)$ to the direct sum of its cohomology groups, or one can show that the first complex is not a perfect object of $D(A)$ whereas the second one is. Some details omitted.

Lemma 15.46.3. *Let $A \rightarrow B \rightarrow C$ be ring maps. Let M be an A -module, N a B -module, and K a C -module. Then*

$$(M \otimes_A^{\mathbf{L}} N) \otimes_B^{\mathbf{L}} K = (M \otimes_A^{\mathbf{L}} K) \otimes_C^{\mathbf{L}} (N \otimes_B^{\mathbf{L}} C) = (M \otimes_A^{\mathbf{L}} C) \otimes_C^{\mathbf{L}} (N \otimes_B^{\mathbf{L}} K)$$

in $D(C)$.

Proof. Let $M^\bullet \rightarrow M$ be a free resolution of M as an A -module and let N^\bullet be a free resolution of N as a B -module. We have

$$\begin{aligned} M \otimes_A^{\mathbf{L}} N &= M^\bullet \otimes_A N \\ &= M^\bullet \otimes_A B \otimes_B N \\ &\leftarrow \text{Tot}((M^\bullet \otimes_A B) \otimes_B N^\bullet) \\ &= \text{Tot}(M^\bullet \otimes_A N^\bullet) \end{aligned}$$

Here the arrow is a quasi-isomorphism in $D(B)$ as $M^\bullet \otimes_A B$ is a bounded above complex of free B -modules, hence K -flat (Lemma 15.45.8) and hence Lemma 15.45.4 applies. Now the complex $\text{Tot}(M^\bullet \otimes_A N^\bullet)$ is a complex of free B -modules hence we see that

$$(M \otimes_A^{\mathbf{L}} N) \otimes_B^{\mathbf{L}} K = \text{Tot}(M^\bullet \otimes_A N^\bullet) \otimes_B K = \text{Tot}(M^\bullet \otimes_A N^\bullet \otimes_B K)$$

On the other hand,

$$M \otimes_A^{\mathbf{L}} K = M^\bullet \otimes_A K \quad \text{and} \quad N \otimes_B^{\mathbf{L}} C = N^\bullet \otimes_B C$$

and the second is a bounded above complex of free C -modules hence we see that

$$(M \otimes_A^{\mathbf{L}} K) \otimes_C^{\mathbf{L}} (N \otimes_B^{\mathbf{L}} C) = \text{Tot}((M^\bullet \otimes_A K) \otimes_C (N^\bullet \otimes_B C)) = \text{Tot}(M^\bullet \otimes_A N^\bullet \otimes_B K)$$

which proves the first equality of the statement of the lemma. To prove the second we use that

$$M \otimes_A^{\mathbf{L}} C = M^\bullet \otimes_A C \quad \text{and} \quad N \otimes_B^{\mathbf{L}} K = N^\bullet \otimes_B K$$

and the first is a bounded above complex of free C -modules so that

$$(M \otimes_A^{\mathbf{L}} C) \otimes_C^{\mathbf{L}} (N \otimes_B^{\mathbf{L}} K) = \text{Tot}((M^\bullet \otimes_A C) \otimes_C (N^\bullet \otimes_B K)) = \text{Tot}(M^\bullet \otimes_A N^\bullet \otimes_B K)$$

as before. \square

15.47. Tor independence

Consider a commutative diagram

$$\begin{array}{ccc} A & \longrightarrow & A' \\ \uparrow & & \uparrow \\ R & \longrightarrow & R' \end{array}$$

of rings. Given an object K of $D(A)$ we can consider its restriction to an object of $D(R)$. We can then consider take the derived change of rings of K to an object of $D(A')$ and $D(R')$. We claim there is a functorial comparison map

$$(15.47.0.1) \quad K \otimes_R^{\mathbf{L}} R' \longrightarrow K^{\bullet} \otimes_A^{\mathbf{L}} A'$$

in $D(R')$. To construct this comparison map choose a K -flat complex K^{\bullet} of A -modules representing K . Next, choose a quasi-isomorphism $E^{\bullet} \rightarrow K^{\bullet}$ where E^{\bullet} is a K -flat complex of R -modules. The map above is the map

$$K \otimes_R^{\mathbf{L}} R' = E^{\bullet} \otimes_R R' \longrightarrow K^{\bullet} \otimes_A A' = K \otimes_A^{\mathbf{L}} A'$$

In general there is no chance that this map is an isomorphism.

However, we often encounter the situation where the diagram above is a “base change” diagram of rings, i.e., $A' = A \otimes_R R'$. In this situation, for any A -module M we have $M \otimes_A A' = M \otimes_R R'$. Thus $-\otimes_R R'$ is equal to $-\otimes_A A'$ as a functor $\text{Mod}_A \rightarrow \text{Mod}_{A'}$. In general this equality **does not extend** to derived tensor products. In other words, the comparison map is not an isomorphism. A simple example is to take $R = k[x]$, $A = R' = A' = k[x]/(x) = k$ and $K^{\bullet} = A[0]$. Clearly, a necessary condition is that $\text{Tor}_p^R(A, R') = 0$ for all $p > 0$.

Definition 15.47.1. Let R be a ring. Let A, B be R -algebras. We say A and B are *Tor independent over R* if $\text{Tor}_p^R(A, B) = 0$ for all $p > 0$.

Lemma 15.47.2. *The comparison map (15.47.0.1) is an isomorphism if $A' = A \otimes_R R'$ and A and R' are Tor independent over R .*

Proof. To prove this we choose a free resolution $F^{\bullet} \rightarrow R'$ of R' as an R -module. Because A and R' are Tor independent over R we see that $F^{\bullet} \otimes_R A$ is a free A -module resolution of A' over A . By our general construction of the derived tensor product above we see that

$$K^{\bullet} \otimes_A A' \cong \text{Tot}(K^{\bullet} \otimes_A (F^{\bullet} \otimes_R A)) = \text{Tot}(K^{\bullet} \otimes_R F^{\bullet}) \cong \text{Tot}(E^{\bullet} \otimes_R F^{\bullet}) \cong E^{\bullet} \otimes_R R'$$

as desired. □

Lemma 15.47.3. *Consider a commutative diagram of rings*

$$\begin{array}{ccccc} A' & \longleftarrow & R' & \longrightarrow & B' \\ \uparrow & & \uparrow & & \uparrow \\ A & \longleftarrow & R & \longrightarrow & B \end{array}$$

Assume that R' is flat over R and A' is flat over $A \otimes_R R'$ and B' is flat over $R' \otimes_R B$. Then

$$\text{Tor}_i^R(A, B) \otimes_{(A \otimes_R B)} (A' \otimes_{R'} B') = \text{Tor}_i^{R'}(A', B')$$

Proof. By Algebra, Section 10.73 there are canonical maps

$$\mathrm{Tor}_i^R(A, B) \longrightarrow \mathrm{Tor}_i^{R'}(A \otimes_R R', B \otimes_R R') \longrightarrow \mathrm{Tor}_i^{R'}(A', B')$$

These induce a map from left to right in the formula of the lemma.

Take a free resolution $F_\bullet \rightarrow A$ of A as an R -module. Then we see that $F_\bullet \otimes_R R'$ is a resolution of $A \otimes_R R'$. Hence $\mathrm{Tor}_i^{R'}(A \otimes_R R', B \otimes_R R')$ is computed by $F_\bullet \otimes_R B \otimes_R R'$. By our assumption that R' is flat over R , this computes $\mathrm{Tor}_i^R(A, B) \otimes_R R'$. Thus $\mathrm{Tor}_i^{R'}(A \otimes_R R', B \otimes_R R') = \mathrm{Tor}_i^R(A, B) \otimes_R R'$ (uses only flatness of R' over R).

By Lazard's theorem (Algebra, Theorem 10.78.4) we can write A' , resp. B' as a filtered colimit of finite free $A \otimes_R R'$, resp. $B \otimes_R R'$ -modules. Say $A' = \mathrm{colim} M_i$ and $B' = \mathrm{colim} N_j$. The result above gives

$$\mathrm{Tor}_i^{R'}(M_i, N_j) = \mathrm{Tor}_i^R(A, B) \otimes_{A \otimes_R B} (M_i \otimes_{R'} N_j)$$

as one can see by writing everything out in terms of bases. Taking the colimit we get the result of the lemma. \square

Lemma 15.47.4. *Let R be a ring. Let A, B be R -algebras. The following are equivalent*

- (1) A and B are Tor independent over R ,
- (2) for every pair of primes $\mathfrak{p} \subset A$ and $\mathfrak{q} \subset B$ lying over the same prime $\mathfrak{r} \subset R$ the rings $A_{\mathfrak{p}}$ and $B_{\mathfrak{q}}$ are Tor independent over $R_{\mathfrak{r}}$, and
- (3) For every prime \mathfrak{s} of $A \otimes_R B$ the module

$$\mathrm{Tor}_i^R(A, B)_{\mathfrak{s}} = \mathrm{Tor}_i^{R_{\mathfrak{r}}}(A_{\mathfrak{p}}, B_{\mathfrak{q}})_{\mathfrak{s}}$$

(where $\mathfrak{p} = A \cap \mathfrak{s}$, $\mathfrak{q} = B \cap \mathfrak{s}$ and $\mathfrak{r} = R \cap \mathfrak{s}$) is zero.

Proof. Let \mathfrak{s} be a prime of $A \otimes_R B$ as in (3). The equality

$$\mathrm{Tor}_i^R(A, B)_{\mathfrak{s}} = \mathrm{Tor}_i^{R_{\mathfrak{r}}}(A_{\mathfrak{p}}, B_{\mathfrak{q}})_{\mathfrak{s}}$$

where $\mathfrak{p} = A \cap \mathfrak{s}$, $\mathfrak{q} = B \cap \mathfrak{s}$ and $\mathfrak{r} = R \cap \mathfrak{s}$ follows from Lemma 15.47.3. Hence (2) implies (3). Since we can test the vanishing of modules by localizing at primes (Algebra, Lemma 10.23.1) we conclude that (3) implies (1). For (1) \Rightarrow (2) we use that

$$\mathrm{Tor}_i^{R_{\mathfrak{r}}}(A_{\mathfrak{p}}, B_{\mathfrak{q}}) = \mathrm{Tor}_i^R(A, B) \otimes_{(A \otimes_R B)} (A_{\mathfrak{p}} \otimes_{R_{\mathfrak{r}}} B_{\mathfrak{q}})$$

again by Lemma 15.47.3. \square

15.48. Spectral sequences for Tor

In this section we collect various spectral sequences that come up when considering the Tor functors.

Example 15.48.1. Let R be a ring. Let K_\bullet be a bounded above chain complex of R -modules. Let M be an R -module. Then there is a spectral sequence with E_2 -page

$$\mathrm{Tor}_i^R(H_j(K_\bullet), M) \Rightarrow H_{i+j}(K_\bullet \otimes_R^{\mathbf{L}} M)$$

and another spectral sequence with E_1 -page

$$\mathrm{Tor}_i^R(K_j, M) \Rightarrow H_{i+j}(K_\bullet \otimes_R^{\mathbf{L}} M)$$

This follows from the dual to Derived Categories, Lemma 13.21.3.

Example 15.48.2. Let $R \rightarrow S$ be a ring map. Let M be an R -module and let N be an S -module. Then there is a spectral sequence

$$\mathrm{Tor}_n^S(\mathrm{Tor}_m^R(M, S), N) \Rightarrow \mathrm{Tor}_{n+m}^R(M, N).$$

To construct it choose a R -free resolution P_\bullet of M . Then we have

$$M \otimes_R^{\mathbf{L}} N = P_\bullet \otimes_R N = (P_\bullet \otimes_R S) \otimes_S N$$

and then apply the first spectral sequence of Example 15.48.1.

Example 15.48.3. Consider a commutative diagram

$$\begin{array}{ccc} B & \longrightarrow & B' = B \otimes_A A' \\ \uparrow & & \uparrow \\ A & \longrightarrow & A' \end{array}$$

and B -modules M, N . Set $M' = M \otimes_A A' = M \otimes_B B'$ and $N' = N \otimes_A A' = N \otimes_B B'$. Assume that $A \rightarrow B$ is flat and that M and N are A -flat. Then there is a spectral sequence

$$\mathrm{Tor}_i^A(\mathrm{Tor}_j^B(M, N), A') \Rightarrow \mathrm{Tor}_{i+j}^{B'}(M', N')$$

The reason is as follows. Choose free resolution $F_\bullet \rightarrow M$ as a B -module. As B and M are A -flat we see that $F_\bullet \otimes_A A'$ is a free B' -resolution of M' . Hence we see that the groups $\mathrm{Tor}_n^{B'}(M', N')$ are computed by the complex

$$(F_\bullet \otimes_A A') \otimes_{B'} N' = (F_\bullet \otimes_B N) \otimes_A A' = (F_\bullet \otimes_B N) \otimes_A^{\mathbf{L}} A'$$

the last equality because $F_\bullet \otimes_B N$ is a complex of flat A -modules as N is flat over A . Hence we obtain the spectral sequence by applying the spectral sequence of Example 15.48.1.

Example 15.48.4. Let K^\bullet, L^\bullet be objects of $D^-(R)$. Then there are spectral sequences

$$E_2^{p,q} = H^p(K^\bullet \otimes_R^{\mathbf{L}} H^q(L^\bullet)) \Rightarrow H^{p+q}(K^\bullet \otimes_R^{\mathbf{L}} L^\bullet)$$

with $d_2^{p,q} : E_2^{p,q} \rightarrow E_2^{p+2,q-1}$ and

$$H^q(H^p(K^\bullet) \otimes_R^{\mathbf{L}} L^\bullet) \Rightarrow H^{p+q}(K^\bullet \otimes_R^{\mathbf{L}} L^\bullet)$$

After replacing K^\bullet and L^\bullet by bounded above complexes of projectives, these spectral sequences are simply the two spectral sequences for computing the cohomology of $\mathrm{Tot}(K^\bullet \otimes L^\bullet)$ discussed in Homology, Section 12.22.

15.49. Products and Tor

The simplest example of the product maps comes from the following situation. Suppose that $K^\bullet, L^\bullet \in D(R)$ with one of them contained in $D^-(R)$. Then there are maps

$$(15.49.0.1) \quad H^i(K^\bullet) \otimes_R H^j(L^\bullet) \longrightarrow H^{i+j}(K^\bullet \otimes_R^{\mathbf{L}} L^\bullet)$$

Namely, to define these maps we may assume that one of K^\bullet, L^\bullet is a bounded above complex of projective R -modules. In that case $K^\bullet \otimes_R^{\mathbf{L}} L^\bullet$ is represented by the complex $\mathrm{Tot}(K^\bullet \otimes_R L^\bullet)$, see Section 15.44. Next, suppose that $\xi \in H^i(K^\bullet)$ and $\zeta \in H^j(L^\bullet)$. Choose $k \in \mathrm{Ker}(K^i \rightarrow K^{i+1})$ and $l \in \mathrm{Ker}(L^j \rightarrow L^{j+1})$ representing ξ and ζ . Then we set

$$\xi \cup \zeta = \text{class of } k \otimes l \text{ in } H^{i+j}(\mathrm{Tot}(K^\bullet \otimes_R L^\bullet)).$$

This makes sense because the formula (see Homology, Definition 12.22.3) for the differential d on the total complex shows that $k \otimes l$ is a cocycle. Moreover, if $k' = d_K(k'')$ for some $k'' \in K^{i-1}$, then $k' \otimes l = d(k'' \otimes l)$ because l is a cocycle. Similarly, altering the choice of l representing ζ does not change the class of $k \otimes l$. It is equally clear that \cup is bilinear, and hence to a general element of $H^i(K^\bullet) \otimes_R H^j(L^\bullet)$ we assign

$$\sum \xi_i \otimes \zeta_i \mapsto \sum \xi_i \cup \zeta_i$$

in $H^{i+j}(\text{Tot}(K^\bullet \otimes_R L^\bullet))$.

Let $R \rightarrow A$ be a ring map. Let $K^\bullet, L^\bullet \in D^-(R)$. Then we have a canonical identification

$$(15.49.0.2) \quad (K^\bullet \otimes_R^{\mathbf{L}} A) \otimes_A^{\mathbf{L}} (L^\bullet \otimes_R^{\mathbf{L}} A) = (K^\bullet \otimes_R^{\mathbf{L}} L^\bullet) \otimes_R^{\mathbf{L}} A$$

in $D(A)$. It is constructed as follows. First, choose projective resolutions $P^\bullet \rightarrow K^\bullet$ and $Q^\bullet \rightarrow L^\bullet$ over R . Then the left hand side is represented by the complex $\text{Tot}((P^\bullet \otimes_R A) \otimes_A (Q^\bullet \otimes_R A))$ and the right hand side by the complex $\text{Tot}(P^\bullet \otimes_R Q^\bullet) \otimes_R A$. These complexes are canonically isomorphic. Thus the construction above induces products

$$\text{Tor}_n^R(K^\bullet, A) \otimes_A \text{Tor}_m^R(L^\bullet, A) \longrightarrow \text{Tor}_{n+m}^R(K^\bullet \otimes_R L^\bullet, A)$$

which are occasionally useful.

Let M, N be R -modules. Using the general construction above and functoriality of Tor we obtain canonical maps

$$(15.49.0.3) \quad \text{Tor}_n^R(M, A) \otimes_A \text{Tor}_m^R(N, A) \longrightarrow \text{Tor}_{n+m}^R(M \otimes_R N, A)$$

Here is a direct construction using projective resolutions. First, choose projective resolutions

$$P_\bullet \rightarrow M, \quad Q_\bullet \rightarrow N, \quad T_\bullet \rightarrow M \otimes_R N$$

over R . We have $H_0(\text{Tot}(P_\bullet \otimes_R Q_\bullet)) = M \otimes_R N$ by right exactness of \otimes_R . Hence Derived Categories, Lemmas 13.19.6 and 13.19.7 guarantee the existence and uniqueness of a map of complexes $\mu : \text{Tot}(P_\bullet \otimes_R Q_\bullet) \rightarrow T_\bullet$ such that $H_0(\mu) = \text{id}_{M \otimes_R N}$. This induces a canonical map

$$\begin{aligned} (M \otimes_R^{\mathbf{L}} A) \otimes_A^{\mathbf{L}} (N \otimes_R^{\mathbf{L}} A) &= \text{Tot}((P_\bullet \otimes_R A) \otimes_A (Q_\bullet \otimes_R A)) \\ &= \text{Tot}(P_\bullet \otimes_R Q_\bullet) \otimes_R A \\ &\rightarrow T_\bullet \otimes_R A \\ &= (M \otimes_R N) \otimes_R^{\mathbf{L}} A \end{aligned}$$

in $D(A)$. Hence the products (15.49.0.3) above are constructed using (15.49.0.1) over A to construct

$$\text{Tor}_n^R(M, A) \otimes_A \text{Tor}_m^R(N, A) \rightarrow H^{-n-m}((M \otimes_R^{\mathbf{L}} A) \otimes_A^{\mathbf{L}} (N \otimes_R^{\mathbf{L}} A))$$

and then composing by the displayed map above to end up in $\text{Tor}_{n+m}^R(M \otimes_R N, A)$.

An interesting special case of the above occurs when $M = N = B$ where B is an R -algebra. In this case we obtain maps

$$\text{Tor}_n^R(B, A) \otimes_A \text{Tor}_m^R(B, A) \longrightarrow \text{Tor}_n^R(B \otimes_R B, A) \longrightarrow \text{Tor}_n^R(B, A)$$

the second arrow being induced by the multiplication map $B \otimes_R B \rightarrow B$ via functoriality for Tor . In other words we obtain an A -algebra structure on $\text{Tor}_\star^R(B, A)$.

This algebra structure has many intriguing properties (associativity, graded commutative, B -algebra structure, divided powers in some case, etc) which we will discuss elsewhere (insert future reference here).

Lemma 15.49.1. *Let R be a ring. Let A, B, C be R -algebras and let $B \rightarrow C$ be an R -algebra map. Then the induced map*

$$\mathrm{Tor}_*^R(B, A) \longrightarrow \mathrm{Tor}_*^R(C, A)$$

is an A -algebra homomorphism.

Proof. Omitted. Hint: You can prove this by working through the definitions, writing all the complexes explicitly. \square

15.50. Pseudo-coherent modules

Suppose that R is a ring. Recall that an R -module M is of finite type if there exists a surjection $R^{\oplus a} \rightarrow M$ and of finite presentation if there exists a presentation $R^{\oplus a_1} \rightarrow R^{\oplus a_0} \rightarrow M \rightarrow 0$. Similarly, we can consider those R -modules for which there exists a length n resolution

$$(15.50.0.1) \quad R^{\oplus a_n} \rightarrow R^{\oplus a_{n-1}} \rightarrow \dots \rightarrow R^{\oplus a_0} \rightarrow M \rightarrow 0$$

by finite free R -modules. A module is called *pseudo-coherent* if we can find such a resolution for every n . Here is the formal definition.

Definition 15.50.1. Let R be a ring. Denote $D(R)$ its derived category. Let $m \in \mathbf{Z}$.

- (1) An object K^\bullet of $D(R)$ is *m -pseudo-coherent* if there exists a bounded complex E^\bullet of finite free R -modules and a morphism $\alpha : E^\bullet \rightarrow K^\bullet$ such that $H^i(\alpha)$ is an isomorphism for $i > m$ and $H^m(\alpha)$ is surjective.
- (2) An object K^\bullet of $D(R)$ is *pseudo-coherent* if it is quasi-isomorphic to a bounded above complex of finite free R -modules.
- (3) An R -module M is called *m -pseudo-coherent* if $M[0]$ is an m -pseudo-coherent object of $D(R)$.
- (4) An R -module M is called *pseudo-coherent*⁶ if $M[0]$ is a pseudo-coherent object of $D(R)$.

As usual we apply this terminology also to complexes of R -modules. Since any morphism $E^\bullet \rightarrow K^\bullet$ in $D(R)$ is represented by an actual map of complexes, see Derived Categories, Lemma 13.19.8, there is no ambiguity. It turns out that K^\bullet is pseudo-coherent if and only if K^\bullet is m -pseudo-coherent for all $m \in \mathbf{Z}$, see Lemma 15.50.5. Also, if the ring is Noetherian the condition can be understood as a finite generation condition on the cohomology, see Lemma 15.50.16. Let us first relate this to the informal discussion above.

Lemma 15.50.2. *Let R be a ring and $m \in \mathbf{Z}$. Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle in $D(R)$.*

- (1) *If K^\bullet is $(m+1)$ -pseudo-coherent and L^\bullet is m -pseudo-coherent then M^\bullet is m -pseudo-coherent.*
- (2) *If K^\bullet, M^\bullet are m -pseudo-coherent, then L^\bullet is m -pseudo-coherent.*
- (3) *If L^\bullet is $(m+1)$ -pseudo-coherent and M^\bullet is m -pseudo-coherent, then K^\bullet is $(m+1)$ -pseudo-coherent.*

⁶This clashes with what is meant by a pseudo-coherent module in [Bou61].

Proof. Proof of (1). Choose $\alpha : P^\bullet \rightarrow K^\bullet$ with P^\bullet a bounded complex of finite free modules such that $H^i(\alpha)$ is an isomorphism for $i > m + 1$ and surjective for $i = m + 1$. We may replace P^\bullet by $\sigma_{\geq m+1} P^\bullet$ and hence we may assume that $P^i = 0$ for $i < m + 1$. Choose $\beta : E^\bullet \rightarrow L^\bullet$ with E^\bullet a bounded complex of finite free modules such that $H^i(\beta)$ is an isomorphism for $i > m$ and surjective for $i = m$. By Derived Categories, Lemma 13.19.11 we can find a map $\alpha : P^\bullet \rightarrow E^\bullet$ such that the diagram

$$\begin{array}{ccc} K^\bullet & \longrightarrow & L^\bullet \\ \uparrow & & \uparrow \\ P^\bullet & \xrightarrow{\alpha} & E^\bullet \end{array}$$

is commutative in $D(R)$. The cone $C(\alpha)^\bullet$ is a bounded complex of finite free R -modules, and the commutativity of the diagram implies that there exists a morphism of distinguished triangles

$$(P^\bullet, E^\bullet, C(\alpha)^\bullet) \longrightarrow (K^\bullet, L^\bullet, M^\bullet).$$

It follows from the induced map on long exact cohomology sequences and Homology, Lemmas 12.5.19 and 12.5.20 that $C(\alpha)^\bullet \rightarrow M^\bullet$ induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . Hence M^\bullet is m -pseudo-coherent.

Assertions (2) and (3) follow from (1) by rotating the distinguished triangle. \square

Lemma 15.50.3. *Let R be a ring. Let K^\bullet be a complex of R -modules. Let $m \in \mathbf{Z}$.*

- (1) *If K^\bullet is m -pseudo-coherent and $H^i(K^\bullet) = 0$ for $i > m$, then $H^m(K^\bullet)$ is a finite type R -module.*
- (2) *If K^\bullet is m -pseudo-coherent and $H^i(K^\bullet) = 0$ for $i > m+1$, then $H^{m+1}(K^\bullet)$ is a finitely presented R -module.*

Proof. Proof of (1). Choose a bounded complex E^\bullet of finite projective R -modules and a map $\alpha : E^\bullet \rightarrow K^\bullet$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . It is clear that it suffices to prove the result for E^\bullet . Let n be the largest integer such that $E^n \neq 0$. If $n = m$, then the result is clear. If $n > m$, then $E^{n-1} \rightarrow E^n$ is surjective as $H^n(E^\bullet) = 0$. As E^n is finite projective we see that $E^{n-1} = E' \oplus E^n$. Hence it suffices to prove the result for the complex $(E')^\bullet$ which is the same as E^\bullet except has E' in degree $n - 1$ and 0 in degree n . We win by induction on n .

Proof of (2). Choose a bounded complex E^\bullet of finite projective R -modules and a map $\alpha : E^\bullet \rightarrow K^\bullet$ which induces an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . As in the proof of (1) we can reduce to the case that $E^i = 0$ for $i > m + 1$. Then we see that $H^{m+1}(K^\bullet) \cong H^{m+1}(E^\bullet) = \text{Coker}(E^m \rightarrow E^{m+1})$ which is of finite presentation. \square

Lemma 15.50.4. *Let R be a ring. Let M be an R -module. Then*

- (1) *M is 0-pseudo-coherent if and only if M is a finite type R -module,*
- (2) *M is (-1) -pseudo-coherent if and only if M is a finitely presented R -module,*
- (3) *M is $(-d)$ -pseudo-coherent if and only if there exists a resolution*

$$R^{\oplus a_d} \rightarrow R^{\oplus a_{d-1}} \rightarrow \dots \rightarrow R^{\oplus a_0} \rightarrow M \rightarrow 0$$

of length d , and

- (4) M is pseudo-coherent if and only if there exists an infinite resolution

$$\dots \rightarrow R^{\oplus a_1} \rightarrow R^{\oplus a_0} \rightarrow M \rightarrow 0$$

by finite free R -modules.

Proof. If M is of finite type (resp. of finite presentation), then M is 0-pseudo-coherent (resp. (-1) -pseudo-coherent) as follows from the discussion preceding Definition 15.50.1. Conversely, if M is 0-pseudo-coherent, then $M = H^0(M[0])$ is of finite type by Lemma 15.50.3. If M is (-1) -pseudo-coherent, then it is 0-pseudo-coherent hence of finite type. Choose a surjection $R^{\oplus a} \rightarrow M$ and denote $K = \text{Ker}(R^{\oplus a} \rightarrow M)$. By Lemma 15.50.2 we see that K is 0-pseudo-coherent, hence of finite type, whence M is of finite presentation.

To prove the third and fourth statement use induction and an argument similar to the above (details omitted). \square

Lemma 15.50.5. *Let R be a ring. Let K^\bullet be a complex of R -modules. The following are equivalent*

- (1) K^\bullet is pseudo-coherent,
- (2) K^\bullet is m -pseudo-coherent for every $m \in \mathbf{Z}$, and
- (3) K^\bullet is quasi-isomorphic to a bounded above complex of finite projective R -modules.

Proof. We see that (1) \Rightarrow (3) as a finite free module is a finite projective R -module. Conversely, suppose P^\bullet is a bounded above complex of finite projective R -modules. Say $P^i = 0$ for $i > n_0$. We choose a direct sum decompositions $F^{n_0} = P^{n_0} \oplus C^{n_0}$ with F^{n_0} a finite free R -module, and inductively

$$F^{n-1} = P^{n-1} \oplus C^n \oplus C^{n-1}$$

for $n \leq n_0$ with F^{n_0} a finite free R -module. As a complex F^\bullet has maps $F^{n-1} \rightarrow F^n$ which agree with $P^{n-1} \rightarrow P^n$, induce the identity $C^n \rightarrow C^n$, and are zero on C^{n-1} . The map $F^\bullet \rightarrow P^\bullet$ is a quasi-isomorphism (even a homotopy equivalence) and hence (3) implies (1).

Assume (1). Let E^\bullet be a bounded above complex of finite free R -modules and let $E^\bullet \rightarrow K^\bullet$ be a quasi-isomorphism. Then the induced maps $\sigma_{\geq m} E^\bullet \rightarrow K^\bullet$ from the stupid truncation of E^\bullet to K^\bullet show that K^\bullet is m -pseudo-coherent. Hence (1) implies (2).

Assume (2). We first apply (2) for $n = 0$ to obtain a map of complexes $\alpha : F^\bullet \rightarrow K^\bullet$ where F^\bullet is bounded above, consists of finite free R -modules and such that $H^i(\alpha)$ is an isomorphism for $i > 0$ and surjective for $i = 0$. Note that these conditions remain satisfied after replacing F^\bullet by $\sigma_{\geq 0} F^\bullet$. Picture

$$\begin{array}{ccccccc} F^0 & \longrightarrow & F^1 & \longrightarrow & \dots & & \\ & & \downarrow \alpha & & \downarrow \alpha & & \\ K^{-1} & \longrightarrow & K^0 & \longrightarrow & K^1 & \longrightarrow & \dots \end{array}$$

By induction on $n < 0$ we are going to extend F^\bullet to a complex $F^n \rightarrow F^{n+1} \rightarrow \dots \rightarrow F^{-1} \rightarrow F^0 \rightarrow \dots$ of finite free R -modules and extend α such that $H^i(\alpha)$ is an isomorphism for $i > n$ and surjective for $i = n$. By shifting it suffices to

prove the induction step for $n = -1$, i.e., it suffices to extend the diagram above by adding F^{-1} . Let C^\bullet be the cone on α (Derived Categories, Definition 13.9.1). The long exact sequence of cohomology shows that $H^i(C^\bullet) = 0$ for $i \geq 0$. By Lemma 15.50.2 we see that C^\bullet is (-1) -pseudo-coherent. By Lemma 15.50.3 we see that $H^{-1}(C^\bullet)$ is a finite R -module. Choose a finite free R -module F^{-1} and a map $\beta : F^{-1} \rightarrow C^{-1}$ such that the composition $F^{-1} \rightarrow C^{-1} \rightarrow C^0$ is zero and such that F^{-1} surjects onto $H^{-1}(C^\bullet)$. Since $C^{-1} = K^{-1} \oplus F^0$ we can write $\beta = (\alpha^{-1}, -d^{-1})$. The vanishing of the composition $F^{-1} \rightarrow C^{-1} \rightarrow C^0$ implies these maps fit into a morphism of complexes

$$\begin{array}{ccccccc} F^{-1} & \xrightarrow{\quad} & F^0 & \xrightarrow{\quad} & F^1 & \xrightarrow{\quad} & \dots \\ & & \downarrow d^{-1} & & \downarrow \alpha & & \\ & & \downarrow \alpha^{-1} & & \downarrow \alpha & & \\ \dots & \longrightarrow & K^{-1} & \longrightarrow & K^0 & \longrightarrow & K^1 \longrightarrow \dots \end{array}$$

Moreover, these maps define a morphism of distinguished triangles

$$\begin{array}{ccccccc} (F^0 \rightarrow \dots) & \longrightarrow & (F^{-1} \rightarrow \dots) & \longrightarrow & F^{-1} & \longrightarrow & (F^0 \rightarrow \dots)[1] \\ & & \downarrow & & \downarrow \beta & & \downarrow \\ (F^0 \rightarrow \dots) & \longrightarrow & K^\bullet & \longrightarrow & C^\bullet & \longrightarrow & (F^0 \rightarrow \dots)[1] \end{array}$$

Hence our choice of β implies that the map of complexes $(F^{-1} \rightarrow \dots) \rightarrow K^\bullet$ induces an isomorphism on cohomology in degrees ≥ 0 and a surjection in degree -1 . This finishes the proof of the lemma. \square

Lemma 15.50.6. *Let R be a ring. Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle in $D(R)$. If two out of three of $K^\bullet, L^\bullet, M^\bullet$ are pseudo-coherent then the third is also pseudo-coherent.*

Proof. Combine Lemmas 15.50.2 and 15.50.5. \square

Lemma 15.50.7. *Let R be a ring. Let K^\bullet be a complex of R -modules. Let $m \in \mathbf{Z}$.*

- (1) *If $H^i(K^\bullet) = 0$ for all $i \geq m$, then K^\bullet is m -pseudo-coherent.*
- (2) *If $H^i(K^\bullet) = 0$ for $i > m$ and $H^m(K^\bullet)$ is a finite R -module, then K^\bullet is m -pseudo-coherent.*
- (3) *If $H^i(K^\bullet) = 0$ for $i > m + 1$, the module $H^{m+1}(K^\bullet)$ is of finite presentation, and $H^m(K^\bullet)$ is of finite type, then K^\bullet is m -pseudo-coherent.*

Proof. It suffices to prove (3). Set $M = H^{m+1}(K^\bullet)$. Note that $\tau_{\geq m+1}K^\bullet$ is quasi-isomorphic to $M[-m-1]$. By Lemma 15.50.4 we see that $M[-m-1]$ is m -pseudo-coherent. Since we have the distinguished triangle

$$(\tau_{\leq m}K^\bullet, K^\bullet, \tau_{\geq m+1}K^\bullet)$$

(Derived Categories, Remark 13.12.4) by Lemma 15.50.2 it suffices to prove that $\tau_{\leq m}K^\bullet$ is pseudo-coherent. By assumption $H^m(\tau_{\leq m}K^\bullet)$ is a finite type R -module. Hence we can find a finite free R -module E and a map $E \rightarrow \text{Ker}(d_K^m)$ such that the composition $E \rightarrow \text{Ker}(d_K^m) \rightarrow H^m(\tau_{\leq m}K^\bullet)$ is surjective. Then $E[-m] \rightarrow \tau_{\leq m}K^\bullet$ witnesses the fact that $\tau_{\leq m}K^\bullet$ is m -pseudo-coherent. \square

Lemma 15.50.8. *Let R be a ring. Let $m \in \mathbf{Z}$. If $K^\bullet \oplus L^\bullet$ is m -pseudo-coherent (resp. pseudo-coherent) so are K^\bullet and L^\bullet .*

Proof. In this proof we drop the superscript \bullet . Assume that $K \oplus L$ is m -pseudo-coherent. It is clear that $K, L \in D^-(R)$. Note that there is a distinguished triangle

$$(K \oplus L, K \oplus L, L \oplus L[1]) = (K, K, 0) \oplus (L, L, L \oplus L[1])$$

see Derived Categories, Lemma 13.4.9. By Lemma 15.50.2 we see that $L \oplus L[1]$ is m -pseudo-coherent. Hence also $L[1] \oplus L[2]$ is m -pseudo-coherent. By induction $L[n] \oplus L[n+1]$ is m -pseudo-coherent. By Lemma 15.50.7 we see that $L[n]$ is m -pseudo-coherent for large n . Hence working backwards, using the distinguished triangles

$$(L[n], L[n] \oplus L[n-1], L[n-1])$$

we conclude that $L[n], L[n-1], \dots, L$ are m -pseudo-coherent as desired. The pseudo-coherent case follows from this and Lemma 15.50.5. \square

Lemma 15.50.9. *Let R be a ring. Let $m \in \mathbf{Z}$. Let K^\bullet be a bounded above complex of R -modules such that K^i is $(m-i)$ -pseudo-coherent for all i . Then K^\bullet is m -pseudo-coherent. In particular, if K^\bullet is a bounded above complex of pseudo-coherent R -modules, then K^\bullet is pseudo-coherent.*

Proof. We may replace K^\bullet by $\sigma_{\geq m-1} K^\bullet$ (for example) and hence assume that K^\bullet is bounded. Then the complex K^\bullet is m -pseudo-coherent as each $K^i[-i]$ is m -pseudo-coherent by induction on the length of the complex: use Lemma 15.50.2 and the stupid truncations. For the final statement, it suffices to prove that K^\bullet is m -pseudo-coherent for all $m \in \mathbf{Z}$, see Lemma 15.50.5. This follows from the first part. \square

Lemma 15.50.10. *Let R be a ring. Let $m \in \mathbf{Z}$. Let $K^\bullet \in D^-(R)$ such that $H^i(K^\bullet)$ is $(m-i)$ -pseudo-coherent (resp. pseudo-coherent) for all i . Then K^\bullet is m -pseudo-coherent (resp. pseudo-coherent).*

Proof. Assume K^\bullet is an object of $D^-(R)$ such that each $H^i(K^\bullet)$ is $(m-i)$ -pseudo-coherent. Let n be the largest integer such that $H^n(K^\bullet)$ is nonzero. We will prove the lemma by induction on n . If $n < m$, then K^\bullet is m -pseudo-coherent by Lemma 15.50.7. If $n \geq m$, then we have the distinguished triangle

$$(\tau_{\leq n-1} K^\bullet, K^\bullet, H^n(K^\bullet)[-n])$$

(Derived Categories, Remark 13.12.4) Since $H^n(K^\bullet)[-n]$ is m -pseudo-coherent by assumption, we can use Lemma 15.50.2 to see that it suffices to prove that $\tau_{\leq n-1} K^\bullet$ is m -pseudo-coherent. By induction on n we win. (The pseudo-coherent case follows from this and Lemma 15.50.5.) \square

Lemma 15.50.11. *Let $A \rightarrow B$ be a ring map. Assume that B is pseudo-coherent as an A -module. Let K^\bullet be a complex of B -modules. The following are equivalent*

- (1) K^\bullet is m -pseudo-coherent as a complex of B -modules, and
- (2) K^\bullet is m -pseudo-coherent as a complex of A -modules.

The same equivalence holds for pseudo-coherence.

Proof. Assume (1). Choose a bounded complex of finite free B -modules E^\bullet and a map $\alpha : E^\bullet \rightarrow K^\bullet$ which is an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . Consider the distinguished triangle $(E^\bullet, K^\bullet, C(\alpha)^\bullet)$. By Lemma 15.50.7 $C(\alpha)^\bullet$ is m -pseudo-coherent as a complex of A -modules. Hence it suffices to prove that E^\bullet is pseudo-coherent as a complex of A -modules, which

follows from Lemma 15.50.9. The pseudo-coherent case of (1) \Rightarrow (2) follows from this and Lemma 15.50.5.

Assume (2). Let n be the largest integer such that $H^n(K^\bullet) \neq 0$. We will prove that K^\bullet is m -pseudo-coherent as a complex of B -modules by induction on $n - m$. The case $n < m$ follows from Lemma 15.50.7. Choose a bounded complex of finite free A -modules E^\bullet and a map $\alpha : E^\bullet \rightarrow K^\bullet$ which is an isomorphism on cohomology in degrees $> m$ and a surjection in degree m . Consider the induced map of complexes

$$\alpha \otimes 1 : E^\bullet \otimes_A B \rightarrow K^\bullet.$$

Note that $C(\alpha \otimes 1)^\bullet$ is acyclic in degrees $\geq n$ as $H^n(E) \rightarrow H^n(E^\bullet \otimes_A B) \rightarrow H^n(K^\bullet)$ is surjective by construction and since $H^i(E^\bullet \otimes_A B) = 0$ for $i > n$ by the spectral sequence of Example 15.48.4. On the other hand, $C(\alpha \otimes 1)^\bullet$ is m -pseudo-coherent as a complex of A -modules because both K^\bullet and $E^\bullet \otimes_A B$ (see Lemma 15.50.9) are so, see Lemma 15.50.2. Hence by induction we see that $C(\alpha \otimes 1)^\bullet$ is m -pseudo-coherent as a complex of B -modules. Finally another application of Lemma 15.50.2 shows that K^\bullet is m -pseudo-coherent as a complex of B -modules (as clearly $E^\bullet \otimes_A B$ is pseudo-coherent as a complex of B -modules). The pseudo-coherent case of (2) \Rightarrow (1) follows from this and Lemma 15.50.5. \square

Lemma 15.50.12. *Let $A \rightarrow B$ be a ring map. Let K^\bullet be an m -pseudo-coherent (resp. pseudo-coherent) complex of A -modules. Then $K^\bullet \otimes_A^L B$ is an m -pseudo-coherent (resp. pseudo-coherent) complex of B -modules.*

Proof. First we note that the statement of the lemma makes sense as K^\bullet is bounded above and hence $K^\bullet \otimes_A^L B$ is defined by Equation (15.44.0.2). Having said this, choose a bounded complex E^\bullet of finite free A -modules and $\alpha : E^\bullet \rightarrow K^\bullet$ with $H^i(\alpha)$ an isomorphism for $i > m$ and surjective for $i = m$. Then the cone $C(\alpha)^\bullet$ is acyclic in degrees $\geq m$. Since $-\otimes_A^L B$ is an exact functor we get a distinguished triangle

$$(E^\bullet \otimes_A^L B, K^\bullet \otimes_A^L B, C(\alpha)^\bullet \otimes_A^L B)$$

of complexes of B -modules. By the dual to Derived Categories, Lemma 13.17.1 we see that $H^i(C(\alpha)^\bullet \otimes_A^L B) = 0$ for $i \geq m$. Since E^\bullet is a complex of projective R -modules we see that $E^\bullet \otimes_A^L B = E^\bullet \otimes_A B$ and hence

$$E^\bullet \otimes_A B \longrightarrow K^\bullet \otimes_A^L B$$

is a morphism of complexes of B -modules that witnesses the fact that $K^\bullet \otimes_A^L B$ is m -pseudo-coherent. The case of pseudo-coherent complexes follows from the case of m -pseudo-coherent complexes via Lemma 15.50.5. \square

Lemma 15.50.13. *Let $A \rightarrow B$ be a flat ring map. Let M be an m -pseudo-coherent (resp. pseudo-coherent) A -module. Then $M \otimes_A B$ is an m -pseudo-coherent (resp. pseudo-coherent) B -module.*

Proof. Immediate consequence of Lemma 15.50.12 and the fact that $M \otimes_A^L B = M \otimes_A B$ because B is flat over A . \square

The following lemma also follows from the stronger Lemma 15.50.14.

Lemma 15.50.14. *Let R be a ring. Let $f_1, \dots, f_r \in R$ be elements which generate the unit ideal. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of R -modules. If for each i*

the complex $K^\bullet \otimes_R R_{f_i}$ is m -pseudo-coherent (resp. pseudo-coherent), then K^\bullet is m -pseudo-coherent (resp. pseudo-coherent).

Proof. We will use without further mention that $-\otimes_R R_{f_i}$ is an exact functor and that therefore

$$H^i(K^\bullet)_{f_i} = H^i(K^\bullet) \otimes_R R_{f_i} = H^i(K^\bullet \otimes_R R_{f_i}).$$

Assume $K^\bullet \otimes_R R_{f_i}$ is m -pseudo-coherent for $i = 1, \dots, r$. Let $n \in \mathbf{Z}$ be the largest integer such that $H^n(K^\bullet \otimes_R R_{f_i})$ is nonzero for some i . This implies in particular that $H^i(K^\bullet) = 0$ for $i > n$ (and that $H^n(K^\bullet) \neq 0$) see Algebra, Lemma 10.23.2. We will prove the lemma by induction on $n - m$. If $n < m$, then the lemma is true by Lemma 15.50.7. If $n \geq m$, then $H^n(K^\bullet)_{f_i}$ is a finite R_{f_i} -module for each i , see Lemma 15.50.3. Hence $H^n(K^\bullet)$ is a finite R -module, see Algebra, Lemma 10.23.2. Choose a finite free R -module E and a surjection $E \rightarrow H^n(K^\bullet)$. As E is projective we can lift this to a map of complexes $\alpha : E[-n] \rightarrow K^\bullet$. Then the cone $C(\alpha)^\bullet$ has vanishing cohomology in degrees $\geq n$. On the other hand, the complexes $C(\alpha)^\bullet \otimes_R R_{f_i}$ are m -pseudo-coherent for each i , see Lemma 15.50.2. Hence by induction we see that $C(\alpha)^\bullet$ is m -pseudo-coherent as a complex of R -modules. Applying Lemma 15.50.2 once more we conclude. \square

Lemma 15.50.15. *Let R be a ring. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of R -modules. Let $R \rightarrow R'$ be a faithfully flat ring map. If the complex $K^\bullet \otimes_R R'$ is m -pseudo-coherent (resp. pseudo-coherent), then K^\bullet is m -pseudo-coherent (resp. pseudo-coherent).*

Proof. We will use without further mention that $-\otimes_R R'$ is an exact functor and that therefore

$$H^i(K^\bullet) \otimes_R R' = H^i(K^\bullet \otimes_R R').$$

Assume $K^\bullet \otimes_R R'$ is m -pseudo-coherent. Let $n \in \mathbf{Z}$ be the largest integer such that $H^n(K^\bullet)$ is nonzero; then n is also the largest integer such that $H^n(K^\bullet \otimes_R R')$ is nonzero. We will prove the lemma by induction on $n - m$. If $n < m$, then the lemma is true by Lemma 15.50.7. If $n \geq m$, then $H^n(K^\bullet) \otimes_R R'$ is a finite R' -module, see Lemma 15.50.3. Hence $H^n(K^\bullet)$ is a finite R -module, see Algebra, Lemma 10.80.2. Choose a finite free R -module E and a surjection $E \rightarrow H^n(K^\bullet)$. As E is projective we can lift this to a map of complexes $\alpha : E[-n] \rightarrow K^\bullet$. Then the cone $C(\alpha)^\bullet$ has vanishing cohomology in degrees $\geq n$. On the other hand, the complex $C(\alpha)^\bullet \otimes_R R'$ is m -pseudo-coherent, see Lemma 15.50.2. Hence by induction we see that $C(\alpha)^\bullet$ is m -pseudo-coherent as a complex of R -modules. Applying Lemma 15.50.2 once more we conclude. \square

Lemma 15.50.16. *Let R be a Noetherian ring. Then*

- (1) *A complex of R -modules K^\bullet is m -pseudo-coherent if and only if $K^\bullet \in D^-(R)$ and $H^i(K^\bullet)$ is a finite R -module for $i \geq m$.*
- (2) *A complex of R -modules K^\bullet is pseudo-coherent if and only if $K^\bullet \in D^-(R)$ and $H^i(K^\bullet)$ is a finite R -module for all i .*
- (3) *An R -module is pseudo-coherent if and only if it is finite.*

Proof. In Algebra, Lemma 10.69.1 we have seen that any finite R -module is pseudo-coherent. On the other hand, a pseudo-coherent module is finite, see Lemma 15.50.4. Hence (3) holds. Suppose that K^\bullet is an m -pseudo-coherent complex. Then there exists a bounded complex of finite free R -modules E^\bullet such that $H^i(K^\bullet)$ is

isomorphic to $H^i(E^\bullet)$ for $i > m$ and such that $H^m(K^\bullet)$ is a quotient of $H^m(E^\bullet)$. Thus it is clear that each $H^i(K^\bullet)$, $i \geq m$ is a finite module. The converse implication in (1) follows from Lemma 15.50.10 and part (3). Part (2) follows from (1) and Lemma 15.50.5. \square

Remark 15.50.17. Let R be ring map. Let L, M, N be R -modules. Consider the canonical map

$$\text{Hom}_R(M, N) \otimes_R L \rightarrow \text{Hom}_R(M, N \otimes_R L)$$

Choose a two term free resolution $F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$. Assuming L flat over R we obtain a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Hom}_R(M, N) \otimes_R L & \longrightarrow & \text{Hom}_R(F_0, N) \otimes_R L & \longrightarrow & \text{Hom}_R(F_1, N) \otimes_R L \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \text{Hom}_R(M, N \otimes_R L) & \longrightarrow & \text{Hom}_R(F_0, N \otimes_R L) & \longrightarrow & \text{Hom}_R(F_1, N \otimes_R L) \end{array}$$

with exact rows. We conclude that if F_0 and F_1 are finite free, i.e., if M is finitely presented, then the first displayed map is an isomorphism. Similarly, if M is $(-m)$ -pseudo-coherent and still assuming L is flat over R , then the map

$$\text{Ext}_R^i(M, N) \otimes_R L \rightarrow \text{Ext}_R^i(M, N \otimes_R L)$$

is an isomorphism for $i < m$.

Remark 15.50.18. Let R be ring map. Let M, N be R -modules. Let $R \rightarrow R'$ be a flat ring map. By Algebra, Lemma 10.70.1 we have $\text{Ext}_{R'}^i(M \otimes_R R', N \otimes_R R') = \text{Ext}_R^i(M, N \otimes_R R')$. Combined with Remark 15.50.17 we conclude that

$$\text{Hom}_R(M, N) \otimes_R R' = \text{Hom}_{R'}(M \otimes_R R', N \otimes_R R')$$

if M is a finitely presented R -module and that

$$\text{Ext}_R^i(M, N) \otimes_R R' = \text{Ext}_{R'}^i(M \otimes_R R', N \otimes_R R')$$

is an isomorphism for $i < m$ if M is $(-m)$ -pseudo-coherent. In particular if R is Noetherian and M is a finite module this holds for all i .

15.51. Tor dimension

Instead of resolving by projective modules we can look at resolutions by flat modules. This leads to the following concept.

Definition 15.51.1. Let R be a ring. Denote $D(R)$ its derived category. Let $a, b \in \mathbf{Z}$.

- (1) An object K^\bullet of $D(R)$ has *tor-amplitude in* $[a, b]$ if $H^i(K^\bullet \otimes_R^{\mathbf{L}} M) = 0$ for all R -modules M and all $i \notin [a, b]$.
- (2) An object K^\bullet of $D(R)$ has *finite tor dimension* if it has tor-amplitude in $[a, b]$ for some a, b .
- (3) An R -module M has *tor dimension* $\leq d$ if if $M[0]$ as an object of $D(R)$ has tor-amplitude in $[-d, 0]$.
- (4) An R -module M has *finite tor dimension* if $M[0]$ as an object of $D(R)$ has finite tor dimension.

We observe that if K^\bullet has finite tor dimension, then $K^\bullet \in D^b(R)$.

Lemma 15.51.2. *Let R be a ring. Let K^\bullet be a bounded above complex of flat R -modules with tor-amplitude in $[a, b]$. Then $\text{Coker}(d_K^{a-1})$ is a flat R -module.*

Proof. As K^\bullet is a bounded above complex of flat modules we see that $K^\bullet \otimes_R M = K^\bullet \otimes_R^{\mathbf{L}} M$. Hence for every R -module M the sequence

$$K^{a-2} \otimes_R M \rightarrow K^{a-1} \otimes_R M \rightarrow K^a \otimes_R M$$

is exact in the middle. Since $K^{a-2} \rightarrow K^{a-1} \rightarrow K^a \rightarrow \text{Coker}(d_K^{a-1}) \rightarrow 0$ is a flat resolution this implies that $\text{Tor}_1^R(\text{Coker}(d_K^{a-1}), M) = 0$ for all R -modules M . This means that $\text{Coker}(d_K^{a-1})$ is flat, see Algebra, Lemma 10.72.7. \square

Lemma 15.51.3. *Let R be a ring. Let K^\bullet be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent*

- (1) K^\bullet has tor-amplitude in $[a, b]$.
- (2) K^\bullet is quasi-isomorphic to a complex E^\bullet of flat R -modules with $E^i = 0$ for $i \notin [a, b]$.

Proof. If (2) holds, then we may compute $K^\bullet \otimes_R^{\mathbf{L}} M = E^\bullet \otimes_R M$ and it is clear that (1) holds. Assume that (1) holds. We may replace K^\bullet by a projective resolution. Let n be the largest integer such that $K^n \neq 0$. If $n > b$, then $K^{n-1} \rightarrow K^n$ is surjective as $H^n(K^\bullet) = 0$. As K^n is projective we see that $K^{n-1} = K' \oplus K^n$. Hence it suffices to prove the result for the complex $(K')^\bullet$ which is the same as K^\bullet except has K' in degree $n-1$ and 0 in degree n . Thus, by induction on n , we reduce to the case that K^\bullet is a complex of projective R -modules with $K^i = 0$ for $i > b$.

Set $E^\bullet = \tau_{\geq a} K^\bullet$. Everything is clear except that E^a is flat which follows immediately from Lemma 15.51.2 and the definitions. \square

Lemma 15.51.4. *Let R be a ring. Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle in $D(R)$. Let $a, b \in \mathbf{Z}$.*

- (1) *If K^\bullet has tor-amplitude in $[a+1, b+1]$ and L^\bullet has tor-amplitude in $[a, b]$ then M^\bullet has tor-amplitude in $[a, b]$.*
- (2) *If K^\bullet, M^\bullet have tor-amplitude in $[a, b]$, then L^\bullet has tor-amplitude in $[a, b]$.*
- (3) *If L^\bullet has tor-amplitude in $[a+1, b+1]$ and M^\bullet has tor-amplitude in $[a, b]$, then K^\bullet has tor-amplitude in $[a+1, b+1]$.*

Proof. Omitted. Hint: This just follows from the long exact cohomology sequence associated to a distinguished triangle and the fact that $-\otimes_R^{\mathbf{L}} M$ preserves distinguished triangles. The easiest one to prove is (2) and the others follow from it by translation. \square

Lemma 15.51.5. *Let R be a ring. Let M be an R -module. Let $d \geq 0$. The following are equivalent*

- (1) M has tor dimension $\leq d$, and
- (2) there exists a resolution

$$0 \rightarrow F_d \rightarrow \dots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

with F_i a flat R -module.

In particular an R -module has tor dimension 0 if and only if it is a flat R -module.

Proof. Assume (2). Then the complex E^\bullet with $E^{-i} = F_i$ is quasi-isomorphic to M . Hence the Tor dimension of M is at most d by Lemma 15.51.3. Conversely, assume (1). Let $P^\bullet \rightarrow M$ be a projective resolution of M . By Lemma 15.51.2 we see that $\tau_{\geq -d} P^\bullet$ is a flat resolution of M of length d , i.e., (2) holds. \square

Lemma 15.51.6. *Let R be a ring. Let $a, b \in \mathbf{Z}$. If $K^\bullet \oplus L^\bullet$ has tor amplitude in $[a, b]$ so do K^\bullet and L^\bullet .*

Proof. Clear from the fact that the Tor functors are additive. \square

Lemma 15.51.7. *Let R be a ring. Let K^\bullet be a bounded complex of R -modules such that K^i has tor amplitude in $[a - i, b - i]$ for all i . Then K^\bullet has tor amplitude in $[a, b]$. In particular if K^\bullet is a finite complex of R -modules of finite tor dimension, then K^\bullet has finite tor dimension.*

Proof. Follows by induction on the length of the finite complex: use Lemma 15.51.4 and the stupid truncations. \square

Lemma 15.51.8. *Let R be a ring. Let $a, b \in \mathbf{Z}$. Let $K^\bullet \in D^b(R)$ such that $H^i(K^\bullet)$ has tor amplitude in $[a - i, b - i]$ for all i . Then K^\bullet has tor amplitude in $[a, b]$. In particular if $K^\bullet \in D^-(R)$ and all its cohomology groups have finite tor dimension then K^\bullet has finite tor dimension.*

Proof. Follows by induction on the length of the finite complex: use Lemma 15.51.4 and the canonical truncations. \square

Lemma 15.51.9. *Let $A \rightarrow B$ be a ring map. Assume that B is flat as an A -module. Let K^\bullet be a complex of B -modules. Let $a, b \in \mathbf{Z}$. If K^\bullet as a complex of B -modules has tor amplitude in $[a, b]$, then K^\bullet as a complex of A -modules has tor amplitude in $[a, b]$.*

Proof. This is true because $K^\bullet \otimes_A^L M = K^\bullet \otimes_B^L (M \otimes_A B)$ since any projective resolution of K^\bullet as a complex of B -modules is a flat resolution of K^\bullet as a complex of A -modules and can be used to compute $K^\bullet \otimes_A^L M$. \square

Lemma 15.51.10. *Let $A \rightarrow B$ be a ring map. Assume that B has tor dimension $\leq d$ as an A -module. Let K^\bullet be a complex of B -modules. Let $a, b \in \mathbf{Z}$. If K^\bullet as a complex of B -modules has tor amplitude in $[a, b]$, then K^\bullet as a complex of A -modules has tor amplitude in $[a - d, b]$.*

Proof. Let M be an A -module. Choose a free resolution $F^\bullet \rightarrow M$. Then

$$K^\bullet \otimes_A^L M = \text{Tot}(K^\bullet \otimes_A F^\bullet) = \text{Tot}(K^\bullet \otimes_B (F^\bullet \otimes_A B)) = K^\bullet \otimes_B^L (M \otimes_A^L B).$$

By our assumption on B as an A -module we see that $M \otimes_A^L B$ has cohomology only in degrees $-d, -d + 1, \dots, 0$. Because K^\bullet has tor amplitude in $[a, b]$ we see from the spectral sequence in Example 15.48.4 that $K^\bullet \otimes_B^L (M \otimes_A^L B)$ has cohomology only in degrees $[-d + a, b]$ as desired. \square

Lemma 15.51.11. *Let $A \rightarrow B$ be a ring map. Let $a, b \in \mathbf{Z}$. Let K^\bullet be a complex of A -modules with tor amplitude in $[a, b]$. Then $K^\bullet \otimes_A^L B$ as a complex of B -modules has tor amplitude in $[a, b]$.*

Proof. By Lemma 15.51.3 we can find a quasi-isomorphism $E^\bullet \rightarrow K^\bullet$ where E^\bullet is a complex of flat A -modules with $E^i = 0$ for $i \notin [a, b]$. Then $E^\bullet \otimes_A B$ computes $K^\bullet \otimes_A^L B$ by construction and each $E^i \otimes_A B$ is a flat B -module by Algebra, Lemma 10.38.6. Hence we conclude by Lemma 15.51.3. \square

Lemma 15.51.12. *Let $A \rightarrow B$ be a flat ring map. Let $d \geq 0$. Let M be an A -module of tor dimension $\leq d$. Then $M \otimes_A B$ is a B -module of tor dimension $\leq d$.*

Proof. Immediate consequence of Lemma 15.51.11 and the fact that $M \otimes_A^L B = M \otimes_A B$ because B is flat over A . \square

Lemma 15.51.13. *Let R be a ring. Let $f_1, \dots, f_r \in R$ be elements which generate the unit ideal. Let $a, b \in \mathbf{Z}$. Let K^\bullet be a complex of R -modules. If for each i the complex $K^\bullet \otimes_R R_{f_i}$ has tor amplitude in $[a, b]$, then K^\bullet has tor amplitude in $[a, b]$.*

Proof. Note that $-\otimes_R R_{f_i}$ is an exact functor and that therefore

$$H^i(K^\bullet)_{f_i} = H^i(K^\bullet) \otimes_R R_{f_i} = H^i(K^\bullet \otimes_R R_{f_i}).$$

and similarly for every R -module M we have

$$H^i(K^\bullet \otimes_R^L M)_{f_i} = H^i(K^\bullet \otimes_R^L M) \otimes_R R_{f_i} = H^i(K^\bullet \otimes_R R_{f_i} \otimes_{R_{f_i}}^L M_{f_i}).$$

Hence the result follows from the fact that an R -module N is zero if and only if N_{f_i} is zero for each i , see Algebra, Lemma 10.23.2. \square

Lemma 15.51.14. *Let R be a ring. Let $a, b \in \mathbf{Z}$. Let K^\bullet be a complex of R -modules. Let $R \rightarrow R'$ be a faithfully flat ring map. If the complex $K^\bullet \otimes_R R'$ has tor amplitude in $[a, b]$, then K^\bullet has tor amplitude in $[a, b]$.*

Proof. Let M be an R -module. Since $R \rightarrow R'$ is flat we see that

$$(M \otimes_R^L K^\bullet) \otimes_R R' = ((M \otimes_R R') \otimes_{R'}^L (K^\bullet \otimes_R R'))$$

and taking cohomology commutes with tensoring with R' . Hence $\text{Tor}_i^{R'}(M, K^\bullet) = \text{Tor}_i^{R'}(M \otimes_R R', K^\bullet \otimes_R R')$. Since $R \rightarrow R'$ is faithfully flat, the vanishing of $\text{Tor}_i^{R'}(M \otimes_R R', K^\bullet \otimes_R R')$ for $i \notin [a, b]$ implies the same thing for $\text{Tor}_i^R(M, K^\bullet)$. \square

Lemma 15.51.15. *Let R be a ring of finite global dimension d . Then*

- (1) every module has finite tor dimension $\leq d$,
- (2) a complex of R -modules K^\bullet with $H^i(K^\bullet) \neq 0$ only if $i \in [a, b]$ has tor amplitude in $[a - d, b]$, and
- (3) a complex of R -modules K^\bullet has finite tor dimension if and only if $K^\bullet \in D^b(R)$.

Proof. The assumption on R means that every module has a finite projective resolution of length at most d , in particular every module has finite tor dimension. The second statement follows from Lemma 15.51.8 and the definitions. The third statement is a rephrasing of the second. \square

15.52. Projective dimension

We defined the projective dimension of a module in Algebra, Definition 10.105.2.

Definition 15.52.1. Let R be a ring. Let K be an object of $D(R)$. We say K has *finite projective dimension* if K can be represented by a finite complex of projective modules. We say K has *projective-amplitude in $[a, b]$* if K is quasi-isomorphic to a complex

$$\dots \rightarrow 0 \rightarrow P^a \rightarrow P^{a+1} \rightarrow \dots \rightarrow P^{b-1} \rightarrow P^b \rightarrow 0 \rightarrow \dots$$

where P^i is a projective R -module for all $i \in \mathbf{Z}$.

Clearly, K has bounded projective dimension if and only if K has projective-amplitude in $[a, b]$ for some $a, b \in \mathbf{Z}$. Furthermore, if K has bounded projective dimension, then K is bounded. Here is the obligatory lemma.

Lemma 15.52.2. *Let R be a ring. Let K be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent*

- (1) K has projective-amplitude in $[a, b]$,
- (2) $\text{Ext}_R^i(K, N) = 0$ for all R -modules N and all $i \notin [-b, -a]$.

Proof. Assume (1). We may assume K is the complex

$$\dots \rightarrow 0 \rightarrow P^a \rightarrow P^{a+1} \rightarrow \dots \rightarrow P^{b-1} \rightarrow P^b \rightarrow 0 \rightarrow \dots$$

where P^i is a projective R -module for all $i \in \mathbf{Z}$. In this case we can compute the ext groups by the complex

$$\dots \rightarrow 0 \rightarrow \text{Hom}_R(P^b, N) \rightarrow \dots \rightarrow \text{Hom}_R(P^a, N) \rightarrow 0 \rightarrow \dots$$

and we obtain (2).

Assume (2) holds. Choose an injection $H^n(K) \rightarrow I$ where I is an injective R -module. Since $\text{Hom}_R(-, I)$ is an exact functor, we see that $\text{Ext}^{-n}(K, I) = \text{Hom}_R(H^n(K), I)$. We conclude that $H^n(K)$ is zero for $n \notin [a, b]$. In particular, K is bounded above and we can choose a quasi-isomorphism

$$P^\bullet \rightarrow K$$

with P^i projective (for example free) for all $i \in \mathbf{Z}$ and $P^i = 0$ for $i > b$. See Derived Categories, Lemma 13.16.5. Let $Q = \text{Coker}(P^{a-1} \rightarrow P^a)$. Then K is quasi-isomorphic to the complex

$$\dots \rightarrow 0 \rightarrow Q \rightarrow P^{a+1} \rightarrow \dots \rightarrow P^b \rightarrow 0 \rightarrow \dots$$

Denote $K' = (P^{a+1} \rightarrow \dots \rightarrow P^b)$ the corresponding object of $D(R)$. We obtain a distinguished triangle

$$K' \rightarrow K \rightarrow Q[-a] \rightarrow K'[1]$$

in $D(R)$. Thus for every R -module N an exact sequence

$$\text{Ext}^{-a}(K', N) \rightarrow \text{Ext}^1(Q, N) \rightarrow \text{Ext}^{1-a}(K, N)$$

By assumption the term on the right vanishes. By the implication (1) \Rightarrow (2) the term on the left vanishes. Thus Q is a projective R -module by Algebra, Lemma 10.74.2. \square

Example 15.52.3. Let k be a field and let R be the ring of dual numbers over k , i.e., $R = k[x]/(x^2)$. Denote $\epsilon \in R$ the class of x . Let $M = R/(\epsilon)$. Then M is quasi-isomorphic to the complex

$$R \xrightarrow{\epsilon} R \xrightarrow{\epsilon} R \rightarrow \dots$$

but M does not have finite projective dimension as defined in Algebra, Definition 10.105.2. This explains why we consider bounded (in both directions) complexes of projective modules in our definition of bounded projective dimension of objects of $D(R)$.

15.53. Injective dimension

This section is the dual of the section on projective dimension.

Definition 15.53.1. Let R be a ring. Let K be an object of $D(R)$. We say K has *finite injective dimension* if K can be represented by a finite complex of injective R -modules. We say K has *injective-amplitude in $[a, b]$* if K is isomorphic to a complex

$$\dots \rightarrow 0 \rightarrow I^a \rightarrow I^{a+1} \rightarrow \dots \rightarrow I^{b-1} \rightarrow I^b \rightarrow 0 \rightarrow \dots$$

with I^i an injective R -module for all $i \in \mathbf{Z}$.

Clearly, K has bounded injective dimension if and only if K has injective-amplitude in $[a, b]$ for some $a, b \in \mathbf{Z}$. Furthermore, if K has bounded injective dimension, then K is bounded. Here is the obligatory lemma.

Lemma 15.53.2. *Let R be a ring. Let K be an object of $D(R)$. Let $a, b \in \mathbf{Z}$. The following are equivalent*

- (1) K has injective-amplitude in $[a, b]$,
- (2) $\text{Ext}_R^i(N, K) = 0$ for all R -modules N and all $i \notin [a, b]$.

Proof. Assume (1). We may assume K is the complex

$$\dots \rightarrow 0 \rightarrow I^a \rightarrow I^{a+1} \rightarrow \dots \rightarrow I^{b-1} \rightarrow I^b \rightarrow 0 \rightarrow \dots$$

where I^i is an injective R -module for all $i \in \mathbf{Z}$. In this case we can compute the ext groups by the complex

$$\dots \rightarrow 0 \rightarrow \text{Hom}_R(N, I^a) \rightarrow \dots \rightarrow \text{Hom}_R(N, I^b) \rightarrow 0 \rightarrow \dots$$

and we obtain (2).

Assume (2) holds. Choose an surjection $P \rightarrow H^n(K)$ where P is a projective R -module. Since $\text{Hom}_R(P, -)$ is an exact functor, we see that $\text{Ext}^n(P, K) = \text{Hom}_R(P, H^n(K))$. We conclude that $H^n(K)$ is zero for $n \notin [a, b]$. In particular, K is bounded below and we can choose a quasi-isomorphism

$$K \rightarrow I^\bullet$$

with I^i injective for all $i \in \mathbf{Z}$ and $I^i = 0$ for $i < a$. See Derived Categories, Lemma 13.16.4. Let $J = \text{Ker}(I^b \rightarrow I^{b+1})$. Then K is quasi-isomorphic to the complex

$$\dots \rightarrow 0 \rightarrow I^a \rightarrow \dots \rightarrow I^{b-1} \rightarrow J \rightarrow 0 \rightarrow \dots$$

Denote $K' = (I^a \rightarrow \dots \rightarrow I^{b-1})$ the corresponding object of $D(R)$. We obtain a distinguished triangle

$$J[-b] \rightarrow K \rightarrow K' \rightarrow J[1-b]$$

in $D(R)$. Thus for every R -module N an exact sequence

$$\text{Ext}^b(N, K') \rightarrow \text{Ext}^1(N, J) \rightarrow \text{Ext}^{1+b}(N, K)$$

By assumption the term on the right vanishes. By the implication (1) \Rightarrow (2) the term on the left vanishes. Thus J is a injective R -module by Homology, Lemma 12.23.2. \square

Example 15.53.3. Let k be a field and let R be the ring of dual numbers over k , i.e., $R = k[x]/(x^2)$. Denote $\epsilon \in R$ the class of x . Let $M = R/(\epsilon)$. Then M is quasi-isomorphic to the complex

$$\dots \rightarrow R \xrightarrow{\epsilon} R \xrightarrow{\epsilon} R$$

and R is an injective R -module. However one usually does not consider M to have finite injective dimension in this situation. This explains why we consider bounded (in both directions) complexes of injective modules in our definition of bounded injective dimension of objects of $D(R)$.

Lemma 15.53.4. *Let R be a ring. Let $K \in D(R)$.*

- (1) *If K is in $D^b(R)$ and $H^i(K)$ has finite injective dimension for all i , then K has finite injective dimension.*
- (2) *If K^\bullet represents K , is a bounded complex of R -modules, and K^i has finite injective dimension for all i , then K has finite injective dimension.*

Proof. Omitted. Hint: Apply the spectral sequences of Derived Categories, Lemma 13.21.3 to the functor $F = \text{Hom}_R(N, -)$ to get a computation of $\text{Ext}_A^i(N, K)$ and use the criterion of Lemma 15.53.2. □

15.54. Hom complexes

Let R be a ring. Let L^\bullet and M^\bullet be two complexes of R -modules. We construct a complex $\text{Hom}^\bullet(L^\bullet, M^\bullet)$. Namely, for each n we set

$$\text{Hom}^n(L^\bullet, M^\bullet) = \prod_{n=p+q} \text{Hom}_R(L^{-q}, M^p)$$

It is a good idea to think of Hom^n as the R -module of all R -linear maps from L^\bullet to M^\bullet (viewed as graded modules) which are homogenous of degree n . In this terminology, we define the differential by the rule

$$d(f) = d_M \circ f - (-1)^n f \circ d_L$$

for $f \in \text{Hom}^n(L^\bullet, M^\bullet)$. We omit the verification that $d^2 = 0$. This construction is a special case of Differential Graded Algebra, Example 22.19.6. It follows immediately from the construction that we have

$$(15.54.0.1) \quad H^n(\text{Hom}^\bullet(L^\bullet, M^\bullet)) = \text{Hom}_{K(R)}(L^\bullet, M^\bullet[n])$$

for all $n \in \mathbf{Z}$.

Lemma 15.54.1. *Let R be a ring. Given complexes $K^\bullet, L^\bullet, M^\bullet$ of R -modules there is a canonical isomorphism*

$$\text{Hom}^\bullet(K^\bullet, \text{Hom}^\bullet(L^\bullet, M^\bullet)) = \text{Hom}^\bullet(\text{Tot}(K^\bullet \otimes_R L^\bullet), M^\bullet)$$

of complexes of R -modules.

Proof. Let α be an element of degree n on the left hand side. Thus

$$\alpha = (\alpha^{p,q}) \in \prod_{p+q=n} \text{Hom}_R(K^{-q}, \text{Hom}^p(L^\bullet, M^\bullet))$$

Each $\alpha^{p,q}$ is an element

$$\alpha^{p,q} = (\alpha^{r,s,q}) \in \prod_{r+s+q=n} \text{Hom}_R(K^{-q}, \text{Hom}_R(L^{-s}, M^r))$$

If we make the identifications

$$(15.54.1.1) \quad \text{Hom}_R(K^{-q}, \text{Hom}_R(L^{-s}, M^r)) = \text{Hom}_R(K^{-q} \otimes_R L^{-s}, M^r)$$

then by our sign rules we get

$$\begin{aligned} d(\alpha^{r,s,q}) &= d_{\text{Hom}^\bullet(L^\bullet, M^\bullet)} \circ \alpha^{r,s,q} - (-1)^n \alpha^{r,s,q} \circ d_K \\ &= d_M \circ \alpha^{r,s,q} - (-1)^{r+s} \alpha^{r,s,q} \circ d_L - (-1)^{r+s+q} \alpha^{r,s,q} \circ d_K \end{aligned}$$

On the other hand, if β is an element of degree n of the right hand side, then

$$\beta = (\beta^{r,s,q}) \in \prod_{r+s+q=n} \text{Hom}_R(K^{-q} \otimes_R L^{-s}, M^r)$$

and by our sign rule (Homology, Definition 12.22.3) we get

$$\begin{aligned} d(\beta^{r,s,q}) &= d_M \circ \beta^{r,s,q} - (-1)^n \beta^{r,s,q} \circ d_{\text{Tot}(K^\bullet \otimes L^\bullet)} \\ &= d_M \circ \beta^{r,s,q} - (-1)^{r+s+q} (\beta^{r,s,q} \circ d_K + (-1)^{-q} \beta^{r,s,q} \circ d_L) \end{aligned}$$

Thus we see that the map induced by the identifications (15.54.1.1) indeed is a morphism of complexes. \square

Lemma 15.54.2. *Let R be a ring. Given complexes $K^\bullet, L^\bullet, M^\bullet$ of R -modules there is a canonical morphism*

$$\text{Tot}(\text{Hom}^\bullet(L^\bullet, M^\bullet) \otimes_R \text{Hom}^\bullet(K^\bullet, L^\bullet)) \longrightarrow \text{Hom}^\bullet(K^\bullet, M^\bullet)$$

of complexes of R -modules.

Proof. An element α of degree n of the left hand side is

$$\alpha = (\alpha^{p,q}) \in \bigoplus_{p+q=n} \text{Hom}^p(L^\bullet, M^\bullet) \otimes_R \text{Hom}^q(K^\bullet, L^\bullet)$$

The element $\alpha^{p,q}$ is a finite sum $\alpha^{p,q} = \sum \beta_i^p \otimes \gamma_i^q$ with

$$\beta_i^p = (\beta_i^{r,s}) \in \prod_{r+s=p} \text{Hom}_R(L^{-s}, M^r)$$

and

$$\gamma_i^q = (\gamma_i^{u,v}) \in \prod_{u+v=q} \text{Hom}_R(K^{-v}, L^u)$$

The map is given by sending α to $\delta = (\delta^{r,v})$ with

$$\delta^{r,v} = \sum_{i,s} \beta_i^{r,s} \circ \gamma_i^{-s,v} \in \text{Hom}_R(K^{-v}, M^r)$$

For given $r+v=n$ this sum is finite as there are only finitely many nonzero $\alpha^{p,q}$, hence only finitely many nonzero β_i^p and γ_i^q . By our sign rules we have

$$\begin{aligned} d(\alpha^{p,q}) &= d_{\text{Hom}^\bullet(L^\bullet, M^\bullet)}(\alpha^{p,q}) + (-1)^p d_{\text{Hom}^\bullet(K^\bullet, L^\bullet)}(\alpha^{p,q}) \\ &= \sum \left(d_M \circ \beta_i^p \circ \gamma_i^q - (-1)^p \beta_i^p \circ d_L \circ \gamma_i^q \right) \\ &\quad + (-1)^p \sum \left(\beta_i^p \circ d_L \circ \gamma_i^q - (-1)^q \beta_i^p \circ \gamma_i^q \circ d_K \right) \\ &= \sum \left(d_M \circ \beta_i^p \circ \gamma_i^q - (-1)^n \beta_i^p \circ \gamma_i^q \circ d_K \right) \end{aligned}$$

It follows that the rules $\alpha \mapsto \delta$ is compatible with differentials and the lemma is proved. \square

Lemma 15.54.3. *Let R be a ring. Given complexes $K^\bullet, L^\bullet, M^\bullet$ of R -modules there is a canonical morphism*

$$\text{Tot}(\text{Hom}^\bullet(L^\bullet, M^\bullet) \otimes_R K^\bullet) \longrightarrow \text{Hom}^\bullet(\text{Hom}^\bullet(K^\bullet, L^\bullet), M^\bullet)$$

of complexes of R -modules functorial in all three complexes.

Proof. Consider an element β of degree n of the right hand side. Then

$$\beta = (\beta^{p,q}) \in \prod_{p+q=n} \text{Hom}_R(\text{Hom}^{-q}(K^\bullet, L^\bullet), M^p)$$

Each $\beta^{p,q}$ is an element

$$\beta^{p,q} = (\beta^{p,r,s}) \in \prod_{p+r+s=n} \text{Hom}_R(\text{Hom}_R(K^s, L^{-r}), M^p)$$

We can apply the differentials d_M and $d_{\text{Hom}^\bullet(K^\bullet, L^\bullet)}$ to the element $\beta^{p,q}$ and we can apply the differentials d_K, d_L, d_M to the element $\beta^{p,r,s}$. We omit the precise definitions. The our sign rules tell us that

$$\begin{aligned} d(\beta^{p,r,s}) &= d_M(\beta^{p,r,s}) - (-1)^n d_{\text{Hom}^\bullet(K^\bullet, L^\bullet)}(\beta^{p,r,s}) \\ &= d_M(\beta^{p,r,s}) - (-1)^n (d_L(\beta^{p,r,s}) - (-1)^{r+s} d_K(\beta^{p,r,s})) \\ &= d_M(\beta^{p,r,s}) - (-1)^n d_L(\beta^{p,r,s}) + (-1)^p d_K(\beta^{p,r,s}) \end{aligned}$$

On the other hand, an element α of degree n of the left hand side looks like

$$\alpha = (\alpha^{t,s}) \in \bigoplus_{t+s=n} \text{Hom}^t(L^\bullet, M^\bullet) \otimes K^s$$

Each $\alpha^{t,s}$ is an element

$$\alpha^{t,s} = (\alpha^{p,r,s}) \in \prod_{p+r+s=n} \text{Hom}_R(L^{-r}, M^p) \otimes_R K^s$$

By our sign rules and with conventions as above we get

$$\begin{aligned} d(\alpha^{p,r,s}) &= d_{\text{Hom}^\bullet(L^\bullet, M^\bullet)}(\alpha^{p,r,s}) + (-1)^{p+r} d_K(\alpha^{p,r,s}) \\ &= d_M(\alpha^{p,r,s}) - (-1)^{p+r} d_L(\alpha^{p,r,s}) + (-1)^{p+r} d_K(\alpha^{p,r,s}) \end{aligned}$$

To define our map we will use the canonical maps

$$c_{p,r,s} : \text{Hom}_R(L^{-r}, M^p) \otimes_R K^s \longrightarrow \text{Hom}_R(\text{Hom}_R(K^s, L^{-r}), M^p)$$

which sends $\varphi \otimes k$ to the map $\psi \mapsto \varphi(\psi(k))$. This is functorial in all three variables. However, since the signs above do not match we need to use instead some map

$$\epsilon_{p,r,s} c_{p,r,s}$$

for some sign $\epsilon_{p,r,s}$. Looking at the signs above we find that we need to find a solution for the equations

$$\epsilon_{p,r,s} = \epsilon_{p+1,r,s}, \quad \epsilon_{p,r,s}(-1)^s = \epsilon_{p,r+1,s}, \quad \epsilon_{p,r,s}(-1)^r = \epsilon_{p,r,s+1}$$

A good solution is to take $\epsilon_{p,r,s} = (-1)^{rs}$. The choice of this sign is explained in the remark following the proof. \square

Remark 15.54.4. In the yoga of super vector spaces the sign used in the proof of Lemma 15.54.3 above can be explained as follows. A super vector space is just a vector space V which comes with a direct sum decomposition $V = V^+ \oplus V^-$. Here we think of the elements of V^+ as the even elements and the elements of V^- as the odd ones. Given two super vector spaces V and W we set

$$(V \otimes W)^+ = (V^+ \otimes W^+) \oplus (V^- \otimes W^-)$$

and similarly for the odd part. In the category of super vector spaces the isomorphism

$$V \otimes W \longrightarrow W \otimes V$$

is defined to be the usual one, except that on the summand $V^- \otimes W^-$ we use the negative of the usual identification. In this way we obtain a tensor category (where

\otimes is symmetric and associative with 1). The category of super vector spaces has an internal hom which we denote V^\vee . One checks that the canonical isomorphisms $\text{Hom}(V, W) = W \otimes V^\vee$ and $\text{Hom}(V, W)^\vee = V \otimes W^\vee$ do not involve signs. Finally, given three super vector spaces U, V, W we can consider the analogue

$$c : \text{Hom}(V, W) \otimes U \longrightarrow \text{Hom}(\text{Hom}(U, V), W)$$

of the maps $c_{p,r,s}$ which occur in the lemma above. Using the formulae given above (which do not involve signs) this becomes a map

$$W \otimes V^\vee \otimes U \longrightarrow W \otimes U \otimes V^\vee$$

which involves a (-1) on elements $w \otimes v^\vee \otimes u$ if v^\vee and u are odd.

Lemma 15.54.5. *Let R be a ring. Given complexes K^\bullet, L^\bullet of R -modules there is a canonical morphism*

$$K^\bullet \longrightarrow \text{Hom}^\bullet(L^\bullet, \text{Tot}(K^\bullet \otimes_R L^\bullet))$$

of complexes of R -modules functorial in both complexes.

Proof. Let α be an element of degree n of the right hand side. Thus

$$\alpha = (\alpha^{p,q}) \in \prod_{p+q=n} \text{Hom}_R(L^{-q}, \text{Tot}^p(K^\bullet \otimes_R L^\bullet))$$

Each $\alpha^{p,q}$ is an element

$$\alpha^{p,q} = (\alpha^{r,s,q}) \in \bigoplus_{r+s+q=n} \text{Hom}_R(L^{-q}, K^r \otimes_R L^s)$$

By our sign rules we get

$$\begin{aligned} d(\alpha^{r,s,q}) &= d_{\text{Tot}(K^\bullet \otimes_R L^\bullet)} \circ \alpha^{r,s,q} - (-1)^n \alpha^{r,s,q} \circ d_L \\ &= d_K \circ \alpha^{r,s,q} + (-1)^r d_L \circ \alpha^{r,s,q} - (-1)^n \alpha^{r,s,q} \circ d_L \end{aligned}$$

Now an element $\beta \in K^n$ we send to α with $\alpha^{n,n-q,q} = \beta \otimes \text{id}_{L^{-q}}$ and $\alpha^{r,s,q} = 0$ if $r \neq n$. This is indeed an element as above, as for fixed q there is only one nonzero $\alpha^{r,s,q}$. The description of the differential shows this is compatible with differentials. \square

15.55. Derived hom

The derived hom functor is an internal hom in the derived category of R -modules in the sense that it is characterized by the formula

$$(15.55.0.1) \quad \text{Hom}_{D(R)}(K, R\text{Hom}(L, M)) = \text{Hom}_{D(R)}(K \otimes_R^L L, M)$$

for objects K, L, M of $D(R)$. Note that this formula characterizes the objects up to unique isomorphism by the Yoneda lemma. A construction can be given as follows. Choose a K-injective complex I^\bullet of R -modules representing M , choose an complex L^\bullet representing L , and set

$$R\text{Hom}(L, M) = \text{Hom}^\bullet(L^\bullet, I^\bullet)$$

with notation as in Section 15.54. A generalization of this construction is discussed in Differential Graded Algebra, Section 22.21. From (15.54.0.1) and Derived Categories, Lemma 13.29.2 that we have

$$(15.55.0.2) \quad H^n(R\text{Hom}(L, M)) = \text{Hom}_{D(R)}(L, M[n])$$

for all $n \in \mathbf{Z}$. In particular, the object $R\text{Hom}(L, M)$ of $D(R)$ is well defined, i.e., independent of the choice of the K-injective complex I^\bullet .

Lemma 15.55.1. *Let R be a ring. Let K, L, M be objects of $D(R)$. There is a canonical isomorphism*

$$R\mathrm{Hom}(K, R\mathrm{Hom}(L, M)) = R\mathrm{Hom}(K \otimes_R^{\mathbf{L}} L, M)$$

in $D(R)$ functorial in K, L, M which recovers (15.55.0.1) by taking H^0 .

Proof. Choose a K-injective complex I^\bullet representing M and a K-flat complex of R -modules L^\bullet representing L . For any complex of R -modules K^\bullet we have

$$\mathrm{Hom}^\bullet(K^\bullet, \mathrm{Hom}^\bullet(L^\bullet, I^\bullet)) = \mathrm{Hom}^\bullet(\mathrm{Tot}(K^\bullet \otimes_R L^\bullet), I^\bullet)$$

by Lemma 15.54.1. The lemma follows by the definition of $R\mathrm{Hom}$ and because $\mathrm{Tot}(K^\bullet \otimes_R L^\bullet)$ represents the derived tensor product. \square

Lemma 15.55.2. *Let R be a ring. Let P^\bullet be a bounded above complex of projective R -modules. Let L^\bullet be a complex of R -modules. Then $R\mathrm{Hom}(P^\bullet, L^\bullet)$ is represented by the complex $\mathrm{Hom}^\bullet(P^\bullet, L^\bullet)$.*

Proof. By (15.54.0.1) and Derived Categories, Lemma 13.19.8 the cohomology groups of the complex are “correct”. Hence if we choose a quasi-isomorphism $L^\bullet \rightarrow I^\bullet$ with I^\bullet a K-injective complex of R -modules then the induced map

$$\mathrm{Hom}^\bullet(P^\bullet, L^\bullet) \longrightarrow \mathrm{Hom}^\bullet(P^\bullet, I^\bullet)$$

is a quasi-isomorphism. As the right hand side is our definition of $R\mathrm{Hom}(P^\bullet, L^\bullet)$ we win. \square

Lemma 15.55.3. *Let R be a ring. Let K, L, M be objects of $D(R)$. There is a canonical morphism*

$$R\mathrm{Hom}(L, M) \otimes_R^{\mathbf{L}} K \longrightarrow R\mathrm{Hom}(R\mathrm{Hom}(K, L), M)$$

in $D(R)$ functorial in K, L, M .

Proof. Choose a K-injective complex I^\bullet representing M , a K-injective complex J^\bullet representing L , and a K-flat complex K^\bullet representing K . The map is defined using the map

$$\mathrm{Tot}(\mathrm{Hom}^\bullet(J^\bullet, I^\bullet) \otimes_R K^\bullet) \longrightarrow \mathrm{Hom}^\bullet(\mathrm{Hom}^\bullet(K^\bullet, J^\bullet), I^\bullet)$$

of Lemma 15.54.3. We omit the proof that this is functorial in all three objects of $D(R)$. \square

Lemma 15.55.4. *Let R be a ring. Given K, L, M in $D(R)$ there is a canonical morphism*

$$R\mathrm{Hom}(L, M) \otimes_R^{\mathbf{L}} R\mathrm{Hom}(K, L) \longrightarrow R\mathrm{Hom}(K, M)$$

in $D(R)$.

Proof. In general (without suitable finiteness conditions) we do not see how to get this map from Lemma 15.54.2. Instead, we use the maps

$$\begin{array}{c} R\mathrm{Hom}(L, M) \otimes_R^{\mathbf{L}} R\mathrm{Hom}(K, L) \otimes_R^{\mathbf{L}} K \\ \downarrow \\ R\mathrm{Hom}(R\mathrm{Hom}(K, L), M) \otimes_R^{\mathbf{L}} R\mathrm{Hom}(K, L) \\ \downarrow \\ M \end{array}$$

gotten by applying Lemma 15.55.3 twice. Finally, we use Lemma 15.55.1 to translate the composition

$$R\text{Hom}(L, M) \otimes_R^{\mathbf{L}} R\text{Hom}(K, L) \otimes_R^{\mathbf{L}} K \longrightarrow M$$

into a map as in the statement of the lemma. □

Lemma 15.55.5. *Let R be a ring. Let K, L, M be objects of $D(R)$. the map*

$$R\text{Hom}(L, M) \otimes_R^{\mathbf{L}} K \longrightarrow R\text{Hom}(R\text{Hom}(K, L), M)$$

of Lemma 15.55.3 is an isomorphism in the following two cases

- (1) K perfect, or
- (2) K is pseudo-coherent, $L \in D^+(R)$, and M finite injective dimension.

Proof. Choose a K -injective complex I^\bullet representing M , a K -injective complex J^\bullet representing L , and a bounded above complex of finite projective modules K^\bullet representing K . Consider the map of complexes

$$\text{Tot}(\text{Hom}^\bullet(J^\bullet, I^\bullet) \otimes_R K^\bullet) \longrightarrow \text{Hom}^\bullet(\text{Hom}^\bullet(K^\bullet, J^\bullet), I^\bullet)$$

of Lemma 15.54.3 which is given by the maps

$$c_{p,r,s} : \text{Hom}_R(J^{-r}, I^p) \otimes_R K^s \longrightarrow \text{Hom}_R(\text{Hom}_R(K^s, J^{-r}), I^p)$$

Since each K^s is finite projective, these maps are isomorphisms. Now observe that for every element $\alpha = (\alpha^{p,r,s})$ of degree n of the right hand side, there are only finitely many values of s such that $\alpha^{p,r,s}$ is nonzero (for some p, r with $n = p+r+s$). Hence our map is an isomorphism if the same vanishing condition is forced on the elements $\beta = (\beta^{p,r,s})$ of the right hand side. If K^\bullet is a bounded complex of finite projective modules, this is clear. On the other hand, if we can choose I^\bullet bounded and J^\bullet bounded below, then $\beta^{p,r,s}$ is zero for p outside a fixed range, for $s \gg 0$, and for $r \gg 0$. Hence among solutions of $n = p+r+s$ with $\beta^{p,r,s}$ nonzero only a finite number of s values occur. □

Lemma 15.55.6. *Let R be a ring. Let K, L, M be objects of $D(R)$. the map*

$$R\text{Hom}(L, M) \otimes_R^{\mathbf{L}} K \longrightarrow R\text{Hom}(R\text{Hom}(K, L), M)$$

of Lemma 15.55.3 is an isomorphism if the following three conditions are satisfied

- (1) L, M have finite injective dimension,
- (2) $R\text{Hom}(L, M)$ has finite tor dimension,
- (3) for every $n \in \mathbf{Z}$ the truncation $\tau_{\leq n}K$ is pseudo-coherent

Proof. Pick an integer n and consider the distinguished triangle

$$\tau_{\leq n}K \rightarrow K \rightarrow \tau_{\geq n+1}K \rightarrow \tau_{\leq n}K[1]$$

see Derived Categories, Remark 13.12.4. By assumption (3) and Lemma 15.55.5 the map is an isomorphism for $\tau_{\leq n}K$. Hence it suffices to show that both

$$R\text{Hom}(L, M) \otimes_R^{\mathbf{L}} \tau_{\geq n+1}K \quad \text{and} \quad R\text{Hom}(R\text{Hom}(\tau_{\geq n+1}K, L), M)$$

have vanishing cohomology in degrees $\leq n-c$ for some c . This follows immediately from assumptions (2) and (1). □

Lemma 15.55.7. *Let $R \rightarrow R'$ be a flat ring map. Let $K, L \in D(R)$. If K is pseudo-coherent and $L \in D^+(R)$, then there is a canonical isomorphism*

$$R\mathrm{Hom}(K, L) \otimes_R R' \longrightarrow R\mathrm{Hom}(K \otimes_R R', L \otimes_R R')$$

in $D(R')$.

Proof. We represent K by a bounded above complex K^\bullet of finite free R -modules. We represent L by a bounded below complex L^\bullet of R -modules. Then we see that $R\mathrm{Hom}(K, L)$ is represented by $\mathrm{Hom}^\bullet(K^\bullet, L^\bullet)$ and that $R\mathrm{Hom}(K \otimes_R R', L \otimes_R R')$ is represented by $\mathrm{Hom}^\bullet(K^\bullet \otimes_R R', L^\bullet \otimes_R R')$. See Lemma 15.55.2. Thus it suffices to observe that the canonical map

$$\mathrm{Hom}^\bullet(K^\bullet, L^\bullet) \otimes_R R' \longrightarrow \mathrm{Hom}^\bullet(K^\bullet \otimes_R R', L^\bullet \otimes_R R')$$

coming from the maps on components

$$\mathrm{Hom}_R(K^{-q}, L^p) \otimes_R R' \longrightarrow \mathrm{Hom}_{R'}(K^{-q} \otimes_R R', L^p \otimes_R R')$$

is an isomorphism. Each of the component maps is an isomorphism as K^{-q} is finite free and the map in total is an isomorphism as the products in the definition of $\mathrm{Hom}^\bullet(K^\bullet, L^\bullet)$ are finite (whence commute with tensor products) by the boundedness properties of the complexes K^\bullet and L^\bullet . \square

Lemma 15.55.8. *Let R be a ring. Given complexes K, L in $D(R)$ there is a canonical morphism*

$$K \longrightarrow R\mathrm{Hom}(L, K \otimes_R^L L)$$

in $D(R)$ functorial in both K and L .

Proof. Choose a K -flat complexes K^\bullet and L^\bullet representing K and L . Choose a quasi-isomorphism $\mathrm{Tot}(K^\bullet \otimes_R L^\bullet) \rightarrow I^\bullet$ where I^\bullet is K -injective. Then we use the map

$$K^\bullet \rightarrow \mathrm{Hom}^\bullet(L^\bullet, \mathrm{Tot}(K^\bullet \otimes_R L^\bullet)) \rightarrow \mathrm{Hom}^\bullet(L^\bullet, I^\bullet)$$

where the first map is the map from Lemma 15.54.5. \square

15.56. Perfect complexes

A perfect complex is a pseudo-coherent complex of finite tor dimension. But we can also define the directly as follows.

Definition 15.56.1. Let R be a ring. Denote $D(R)$ the derived category of the abelian category of R -modules.

- (1) An object K of $D(R)$ is *perfect* if it is quasi-isomorphic to a bounded complex of finite projective R -modules.
- (2) An R -module M is *perfect* if $M[0]$ is a perfect object in $D(R)$.

For example, over a Noetherian ring a finite module is perfect if and only if it has finite projective dimension, see Lemma 15.56.3 and Algebra, Definition 10.105.2.

Lemma 15.56.2. *Let K^\bullet be an object of $D(R)$. The following are equivalent*

- (1) K^\bullet is perfect, and
- (2) K^\bullet is pseudo-coherent and has finite tor dimension.

Proof. It is clear that (1) implies (2), see Lemmas 15.50.5 and 15.51.3. Assume (2). Choose a bounded above complex F^\bullet of finite free R -modules and a quasi-isomorphism $F^\bullet \rightarrow K^\bullet$. Assume that K^\bullet has tor-amplitude in $[a, b]$. Set $E^\bullet = \tau_{\geq a} F^\bullet$. Note that E^i is finite free except E^a which is a finitely presented R -module. By Lemma 15.51.2 E^a is flat. Hence by Algebra, Lemma 10.75.2 we see that E^a is finite projective. \square

Lemma 15.56.3. *Let M be a module over a ring R . The following are equivalent*

- (1) M is a perfect module, and
- (2) there exists a resolution

$$0 \rightarrow F_d \rightarrow \dots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

with each F_i a finite projective R -module.

Proof. Assume (2). Then the complex E^\bullet with $E^{-i} = F_i$ is quasi-isomorphic to $M[0]$. Hence M is perfect. Conversely, assume (1). By Lemmas 15.56.2 and 15.50.4 we can find resolution $E^\bullet \rightarrow M$ with E^{-i} a finite free R -module. By Lemma 15.51.2 we see that $F_d = \text{Coker}(E^{d-1} \rightarrow E^d)$ is flat for some d sufficiently large. By Algebra, Lemma 10.75.2 we see that F_d is finite projective. Hence

$$0 \rightarrow F_d \rightarrow E^{-d+1} \rightarrow \dots \rightarrow E^0 \rightarrow M \rightarrow 0$$

is the desired resolution. \square

Lemma 15.56.4. *Let R be a ring. Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle in $D(R)$. If two out of three of $K^\bullet, L^\bullet, M^\bullet$ are perfect then the third is also perfect.*

Proof. Combine Lemmas 15.56.2, 15.50.6, and 15.51.4. \square

Lemma 15.56.5. *Let R be a ring. If $K^\bullet \oplus L^\bullet$ is perfect, then so are K^\bullet and L^\bullet .*

Proof. Follows from Lemmas 15.56.2, 15.50.8, and 15.51.6. \square

Lemma 15.56.6. *Let R be a ring. Let K^\bullet be a bounded complex of perfect R -modules. Then K^\bullet is a perfect complex.*

Proof. Follows by induction on the length of the finite complex: use Lemma 15.56.4 and the stupid truncations. \square

Lemma 15.56.7. *Let R be a ring. If $K^\bullet \in D^b(R)$ and all its cohomology modules are perfect, then K^\bullet is perfect.*

Proof. Follows by induction on the length of the finite complex: use Lemma 15.56.4 and the canonical truncations. \square

Lemma 15.56.8. *Let $A \rightarrow B$ be a ring map. Assume that B is perfect as an A -module. Let K^\bullet be a perfect complex of B -modules. Then K^\bullet is perfect as a complex of A -modules.*

Proof. Using Lemma 15.56.2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.51.10 and Lemma 15.50.11 for those results. \square

Lemma 15.56.9. *Let $A \rightarrow B$ be a ring map. Let K^\bullet be a perfect complex of A -modules. Then $K^\bullet \otimes_A^L B$ is a perfect complex of B -modules.*

Proof. Using Lemma 15.56.2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.51.11 and Lemma 15.50.12 for those results. \square

Lemma 15.56.10. *Let $A \rightarrow B$ be a flat ring map. Let M be a perfect A -module. Then $M \otimes_A B$ is a perfect B -module.*

Proof. By Lemma 15.56.3 the assumption implies that M has a finite resolution F_\bullet by finite projective R -modules. As $A \rightarrow B$ is flat the complex $F_\bullet \otimes_A B$ is a finite length resolution of $M \otimes_A B$ by finite projective modules over B . Hence $M \otimes_A B$ is perfect. \square

Lemma 15.56.11. *Let R be a ring. Let $f_1, \dots, f_r \in R$ be elements which generate the unit ideal. Let K^\bullet be a complex of R -modules. If for each i the complex $K^\bullet \otimes_R R_{f_i}$ is perfect, then K^\bullet is perfect.*

Proof. Using Lemma 15.56.2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.51.13 and Lemma 15.50.14 for those results. \square

Lemma 15.56.12. *Let R be a ring. Let $a, b \in \mathbf{Z}$. Let K^\bullet be a complex of R -modules. Let $R \rightarrow R'$ be a faithfully flat ring map. If the complex $K^\bullet \otimes_R R'$ has tor amplitude in $[a, b]$, then K^\bullet has tor amplitude in $[a, b]$.*

Proof. Using Lemma 15.56.2 this translates into the corresponding results for pseudo-coherent modules and modules of finite tor dimension. See Lemma 15.51.14 and Lemma 15.50.15 for those results. \square

Lemma 15.56.13. *Let R be a regular ring of finite dimension. Then*

- (1) *an R -module is perfect if and only if it is a finite R -module, and*
- (2) *a complex of R -modules K^\bullet is perfect if and only if $K^\bullet \in D^b(R)$ and each $H^i(K^\bullet)$ is a finite R -module.*

Proof. By Algebra, Lemma 10.106.8 the assumption on R means that R has finite global dimension. Hence every module has finite tor dimension, see Lemma 15.51.15. On the other hand, as R is Noetherian, a module is pseudo-coherent if and only if it is finite, see Lemma 15.50.16. This proves part (1).

Let K^\bullet be a complex of R -modules. If K^\bullet is perfect, then it is in $D^b(R)$ and it is quasi-isomorphic to a finite complex of finite projective R -modules so certainly each $H^i(K^\bullet)$ is a finite R -module (as R is Noetherian). Conversely, suppose that K^\bullet is in $D^b(R)$ and each $H^i(K^\bullet)$ is a finite R -module. Then by (1) each $H^i(K^\bullet)$ is a perfect R -module, whence K^\bullet is perfect by Lemma 15.56.7 \square

Lemma 15.56.14. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let K^\bullet be a pseudo-coherent complex of R -modules. Assume that for some $i \in \mathbf{Z}$ the map*

$$H^i(K^\bullet) \otimes_R \kappa(\mathfrak{p}) \longrightarrow H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{p}))$$

is surjective. Then there exists an $f \in R$, $f \notin \mathfrak{p}$ such that $\tau_{\geq i+1} K^\bullet \otimes_R R_f$ is a perfect object of $D(R_f)$ with tor amplitude in $[i+1, \infty]$ and such that there exists an isomorphism

$$K^\bullet \otimes_R R_f \cong \tau_{\leq i} K^\bullet \otimes_R R_f \oplus \tau_{\geq i+1} K^\bullet \otimes_R R_f$$

in $D(R_f)$.

Proof. In this proof all tensor products are over R and we write $\kappa = \kappa(\mathfrak{p})$. We may assume that K^\bullet is a bounded above complex of finite free R -modules. Let us inspect what is happening in degree i :

$$\dots \rightarrow K^{i-1} \xrightarrow{d^{i-1}} K^i \xrightarrow{d^i} K^{i+1} \rightarrow \dots$$

Let $0 \subset V \subset W \subset K^i \otimes \kappa$ be defined by the formulas

$$V = \text{Im}(K^{i-1} \otimes \kappa \rightarrow K^i \otimes \kappa) \quad \text{and} \quad W = \text{Ker}(K^i \otimes \kappa \rightarrow K^{i+1} \otimes \kappa)$$

Set $\dim(V) = r$, $\dim(W/V) = s$, and $\dim(K^i \otimes \kappa/W) = t$. We can pick $x_1, \dots, x_r \in K^{i-1}$ which map by d^{i-1} to a basis of V . By our assumption we can pick $y_1, \dots, y_s \in \text{Ker}(d^i)$ mapping to a basis of W/V . Finally, choose $z_1, \dots, z_t \in K^i$ mapping to a basis of $K^i \otimes \kappa/W$. Then we see that the elements $d^i(z_1), \dots, d^i(z_t) \in K^{i+1}$ are linearly independent in $K^{i+1} \otimes_R \kappa$. By Algebra, Lemma 10.76.3 we may after replacing R by R_f for some $f \in R$, $f \notin \mathfrak{p}$ assume that

- (1) $d^i(x_a), y_b, z_c$ is an R -basis of K^i ,
- (2) $d^i(z_1), \dots, d^i(z_t)$ are R -linearly independent in K^{i+1} , and
- (3) the quotient $K^{i+1}/\sum R d^i(z_c)$ is finite projective.

Since d^i annihilates $d^{i-1}(x_a)$ and y_b , we deduced from condition (2) that $\text{Im}(d^{i-1}) \subset \sum R d^{i-1}(x_a) + \sum R y_b$. Set

$$E^\bullet = (\dots \rightarrow 0 \rightarrow \bigoplus_{c=1, \dots, t} R z_c \rightarrow K^{i+1} \rightarrow \dots)$$

We obtain a morphism of complexes $K^\bullet \rightarrow E^\bullet$ where in degree i we take the projection of K^i onto the summand generated by the basis vectors z_c which is possible by (1). It is clear that this induces an isomorphism $\tau_{\geq i+1} K^\bullet \rightarrow \tau_{\geq i+1} E^\bullet$ and a quasi-isomorphism $E^\bullet \rightarrow \tau_{\geq i+1} E^\bullet$. By condition (3) the complex $\tau_{\geq i+1} E^\bullet$ is a finite complex of finite projective modules supported in degrees $\geq i+1$, hence perfect of tor amplitude contained in $[i+1, \infty]$. Finally, the inclusion $E^\bullet \subset K^\bullet$ gives a section to the map $K^\bullet \rightarrow \tau_{\geq i+1} K^\bullet$ in the derived category. Since we have the canonical distinguished triangle

$$\tau_{\leq i} K^\bullet \rightarrow K^\bullet \rightarrow \tau_{\geq i+1} K^\bullet \rightarrow (\tau_{\leq i} K^\bullet)[1]$$

in $D(R)$, see Derived Categories, Remark 13.12.4 we conclude by Derived Categories, Lemma 13.4.10. \square

Lemma 15.56.15. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let K^\bullet be a pseudo-coherent complex of R -modules. Assume that for some $i \in \mathbf{Z}$ the maps*

$$H^i(K^\bullet) \otimes_{R\kappa(\mathfrak{p})} \longrightarrow H^i(K^\bullet \otimes_{R\kappa(\mathfrak{p})}^{\mathbf{L}} \kappa(\mathfrak{p})) \quad \text{and} \quad H^{i-1}(K^\bullet) \otimes_{R\kappa(\mathfrak{p})} \longrightarrow H^{i-1}(K^\bullet \otimes_{R\kappa(\mathfrak{p})}^{\mathbf{L}} \kappa(\mathfrak{p}))$$

are surjective. Then there exists an $f \in R$, $f \notin \mathfrak{p}$ such that

- (1) $\tau_{\geq i+1} K^\bullet \otimes_R R_f$ is a perfect object of $D(R_f)$ with tor amplitude in $[i+1, \infty]$,
- (2) $H^i(K^\bullet)_f$ is a finite projective R_f -module, and
- (3) $K^\bullet \otimes_R R_f \cong \tau_{\leq i-1} K^\bullet \otimes_R R_f \oplus H^i(K^\bullet)_f \oplus \tau_{\geq i+1} K^\bullet \otimes_R R_f$ in $D(R_f)$.

Proof. We get (1) from Lemma 15.56.14 as well as a splitting $K^\bullet \otimes_R R_f = \tau_{\leq i} K^\bullet \otimes_R R_f \oplus \tau_{\geq i+1} K^\bullet \otimes_R R_f$ in $D(R_f)$. Applying Lemma 15.56.14 once more to $\tau_{\leq i} K^\bullet \otimes_R R_f$ we obtain (after suitably choosing f) a splitting $\tau_{\leq i} K^\bullet \otimes_R R_f = \tau_{\leq i-1} K^\bullet \otimes_R R_f \oplus H^i(K^\bullet)_f$ in $D(R_f)$ as well as the conclusion that $H^i(K)_f$ is a flat perfect module, i.e., finite projective. \square

Lemma 15.56.16. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $i \in \mathbf{Z}$. Let K^\bullet be a pseudo-coherent complex of R -modules such that $H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{p})) = 0$. Then there exists an $f \in R$, $f \notin \mathfrak{p}$ such that*

$$K^\bullet \otimes_R R_f = \tau_{\geq i+1} K^\bullet \otimes_R R_f \oplus \tau_{\leq i-1} K^\bullet \otimes_R R_f$$

in $D(R_f)$ with $\tau_{\geq i+1} K^\bullet \otimes_R R_f$ a perfect complex with tor amplitude in $[i+1, j]$ for some $j \in \mathbf{Z}$.

Proof. One can deduce this from the (more general) Lemma 15.56.14 but we will also prove it directly here. We may assume that K^\bullet is a bounded above complex of finite free R -modules. Let us inspect what is happening in degree i :

$$\dots \rightarrow K^{i-2} \rightarrow R^{\oplus l} \rightarrow R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow K^{i+2} \rightarrow \dots$$

Let A be the $m \times l$ matrix corresponding to $K^{i-1} \rightarrow K^i$ and let B be the $n \times m$ matrix corresponding to $K^i \rightarrow K^{i+1}$. The assumption is that $A \bmod \mathfrak{p}$ has rank r and that $B \bmod \mathfrak{p}$ has rank $m - r$. In other words, there is some $r \times r$ minor a of A which is not in \mathfrak{p} and there is some $(m - r) \times (m - r)$ -minor b of B which is not in \mathfrak{p} . Set $f = ab$. Then after inverting f we can find direct sum decompositions $K^{i-1} = R^{\oplus l-r} \oplus R^{\oplus r}$, $K^i = R^{\oplus r} \oplus R^{\oplus m-r}$, $K^{i+1} = R^{\oplus m-r} \oplus R^{\oplus n-m+r}$ such that the module map $K^{i-1} \rightarrow K^i$ kills of $R^{\oplus l-r}$ and induces an isomorphism of $R^{\oplus r}$ onto the corresponding summand of K^i and such that the module map $K^i \rightarrow K^{i+1}$ kills of $R^{\oplus r}$ and induces an isomorphism of $R^{\oplus m-r}$ onto the corresponding summand of K^{i+1} . Thus K^\bullet becomes quasi-isomorphic to

$$\dots \rightarrow K^{i-2} \rightarrow R^{\oplus l-r} \rightarrow 0 \rightarrow R^{\oplus n-m+r} \rightarrow K^{i+2} \rightarrow \dots$$

and everything is clear. □

Lemma 15.56.17. *Let R be a ring. Let $a, b \in \mathbf{Z}$. Let K^\bullet be a pseudo-coherent complex of R -modules. The following are equivalent*

- (1) K^\bullet is perfect with tor amplitude in $[a, b]$,
- (2) for every prime \mathfrak{p} we have $H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{p})) = 0$ for all $i \notin [a, b]$, and
- (3) for every maximal ideal \mathfrak{m} we have $H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{m})) = 0$ for all $i \notin [a, b]$.

Proof. We omit the proof of the implications (1) \Rightarrow (2) \Rightarrow (3). Assume (3). Let $i \in \mathbf{Z}$ with $i \notin [a, b]$. By Lemma 15.56.16 we see that the assumption implies that $H^i(K^\bullet)_{\mathfrak{m}} = 0$ for all maximal ideals of R . Hence $H^i(K^\bullet) = 0$, see Algebra, Lemma 10.23.1. Moreover, Lemma 15.56.16 now also implies that for every maximal ideal \mathfrak{m} there exists an element $f \in R$, $f \notin \mathfrak{m}$ such that $K^\bullet \otimes_R R_f$ is perfect with tor amplitude in $[a, b]$. Hence we conclude by appealing to Lemmas 15.56.11 and 15.51.13. □

Lemma 15.56.18. *Let R be a ring. Let K^\bullet be a pseudo-coherent complex of R -modules. The following are equivalent*

- (1) K^\bullet is perfect,
- (2) for every prime ideal \mathfrak{p} the complex $K^\bullet \otimes_R R_{\mathfrak{p}}$ is perfect,
- (3) for every prime \mathfrak{p} we have $H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{p})) = 0$ for all $i \ll 0$,
- (4) for every maximal ideal \mathfrak{m} the complex $K^\bullet \otimes_R R_{\mathfrak{m}}$ is perfect,
- (5) for every maximal ideal \mathfrak{m} we have $H^i(K^\bullet \otimes_R^{\mathbf{L}} \kappa(\mathfrak{m})) = 0$ for all $i \ll 0$.

Proof. Assume (5). Pick a maximal ideal \mathfrak{m} of R . By Lemma 15.56.16 we see that the assumption implies that $K^\bullet \otimes_R R_f$ is a perfect complex for some $f \in R$,

$f \notin \mathfrak{m}$. Since $\text{Spec}(R)$ is quasi-compact we conclude that K^\bullet is perfect by Lemmas 15.56.11. The proof of the other implications is omitted. \square

The following lemma useful in order to find perfect complexes over a polynomial ring $B = A[x_1, \dots, x_d]$.

Lemma 15.56.19. *Let $A \rightarrow B$ be a ring map. Let $a, b \in \mathbf{Z}$. Let $d \geq 0$. Let K^\bullet be a complex of B -modules. Assume*

- (1) *the ring map $A \rightarrow B$ is flat,*
- (2) *for every prime $\mathfrak{p} \subset A$ the ring $B \otimes_A \kappa(\mathfrak{p})$ has finite global dimension $\leq d$,*
- (3) *K^\bullet is pseudo-coherent as a complex of B -modules, and*
- (4) *K^\bullet has tor amplitude in $[a, b]$ as a complex of A -modules.*

Then K^\bullet is perfect as a complex of B -modules with tor amplitude in $[a - d, b]$.

Proof. We may assume that K^\bullet is a bounded above complex of finite free B -modules. In particular, K^\bullet is flat as a complex of A -modules and $K^\bullet \otimes_A M = K^\bullet \otimes_A^{\mathbf{L}} M$ for any A -module M . For every prime \mathfrak{p} of A the complex

$$K^\bullet \otimes_A \kappa(\mathfrak{p})$$

is a bounded above complex of finite free modules over $B \otimes_A \kappa(\mathfrak{p})$ with vanishing H^i except for $i \in [a, b]$. As $B \otimes_A \kappa(\mathfrak{p})$ has global dimension d we see from Lemma 15.51.15 that $K^\bullet \otimes_A \kappa(\mathfrak{p})$ has tor amplitude in $[a - d, b]$. Let \mathfrak{q} be a prime of B lying over \mathfrak{p} . Since $K^\bullet \otimes_A \kappa(\mathfrak{p})$ is a bounded above complex of free $B \otimes_A \kappa(\mathfrak{q})$ -modules we see that

$$\begin{aligned} K^\bullet \otimes_B^{\mathbf{L}} \kappa(\mathfrak{q}) &= K^\bullet \otimes_B \kappa(\mathfrak{q}) \\ &= (K^\bullet \otimes_A \kappa(\mathfrak{p})) \otimes_{B \otimes_A \kappa(\mathfrak{q})} \kappa(\mathfrak{q}) \\ &= (K^\bullet \otimes_A \kappa(\mathfrak{p})) \otimes_{B \otimes_A \kappa(\mathfrak{q})}^{\mathbf{L}} \kappa(\mathfrak{q}) \end{aligned}$$

Hence the arguments above imply that $H^i(K^\bullet \otimes_B^{\mathbf{L}} \kappa(\mathfrak{q})) = 0$ for $i \notin [a - d, b]$. We conclude by Lemma 15.56.17. \square

The following lemma is a local version of Lemma 15.56.19. It can be used to find perfect complexes over regular local rings.

Lemma 15.56.20. *Let $A \rightarrow B$ be a local ring homomorphism. Let $a, b \in \mathbf{Z}$. Let $d \geq 0$. Let K^\bullet be a complex of B -modules. Assume*

- (1) *the ring map $A \rightarrow B$ is flat,*
- (2) *the ring $B/\mathfrak{m}_A B$ is regular of dimension d ,*
- (3) *K^\bullet is pseudo-coherent as a complex of B -modules, and*
- (4) *K^\bullet has tor amplitude in $[a, b]$ as a complex of A -modules, in fact it suffices if $H^i(K^\bullet \otimes_A^{\mathbf{L}} \kappa(\mathfrak{m}_A))$ is nonzero only for $i \in [a, b]$.*

Then K^\bullet is perfect as a complex of B -modules with tor amplitude in $[a - d, b]$.

Proof. By (3) we may assume that K^\bullet is a bounded above complex of finite free B -modules. We compute

$$\begin{aligned} K^\bullet \otimes_B^{\mathbf{L}} \kappa(\mathfrak{m}_B) &= K^\bullet \otimes_B \kappa(\mathfrak{m}_B) \\ &= (K^\bullet \otimes_A \kappa(\mathfrak{m}_A)) \otimes_{B/\mathfrak{m}_A B} \kappa(\mathfrak{m}_B) \\ &= (K^\bullet \otimes_A \kappa(\mathfrak{m}_A)) \otimes_{B/\mathfrak{m}_A B}^{\mathbf{L}} \kappa(\mathfrak{m}_B) \end{aligned}$$

The first equality because K^\bullet is a bounded above complex of flat B -modules. The second equality follows from basic properties of the tensor product. The third equality holds because $K^\bullet \otimes_A \kappa(\mathfrak{m}_A) = K^\bullet / \mathfrak{m}_A K^\bullet$ is a bounded above complex of flat $B/\mathfrak{m}_A B$ -modules. Since K^\bullet is a bounded above complex of flat A -modules by (1), the cohomology modules H^i of the complex $K^\bullet \otimes_A \kappa(\mathfrak{m}_A)$ are nonzero only for $i \in [a, b]$ by assumption (4). Thus the spectral sequence of Example 15.48.1 and the fact that $B/\mathfrak{m}_A B$ has finite global dimension d (by (2) and Algebra, Proposition 10.106.1) shows that $H^j(K^\bullet \otimes_B^L \kappa(\mathfrak{m}_B))$ is zero for $j \notin [a - d, b]$. This finishes the proof by Lemma 15.56.17. \square

Lemma 15.56.21. *Let K^\bullet be a perfect complex over a ring A . There exists a perfect complex E^\bullet such that we have functorial isomorphisms*

$$H^0(K^\bullet \otimes_A^L L^\bullet) = \text{Ext}_A^0(E^\bullet, L^\bullet)$$

for $L^\bullet \in D(A)$.

Proof. We may assume that K^\bullet is a finite complex of finite projective A -modules. The cohomology group on the left is simply $H^0(\text{Tot}(K^\bullet \otimes_A L^\bullet))$. Set $E^\bullet = \text{Hom}_A(K^\bullet, A)$, i.e., $E^n = \text{Hom}_A(K^{-n}, A)$ with differentials the transpose of the differentials of K^\bullet . Observe that E^\bullet is a finite complex of finite projective A -modules. The group on the right is $\text{Mor}_{K(\text{Mod}_A)}(E^\bullet, L^\bullet)$ by Derived Categories, Lemma 13.19.8 and the definition of Ext groups, see Derived Categories, Section 13.27. By definition this is the cohomology of

$$\prod_n \text{Hom}_A(E^n, L^{n-1}) \rightarrow \prod_n \text{Hom}_A(E^n, L^n) \rightarrow \prod_n \text{Hom}_A(E^n, L^{n+1})$$

Using $\text{Hom}_A(E^n, L) = K^{-n} \otimes_A L$ as K^{-n} is finite projective, we see that the cohomology groups are the same. \square

15.57. Characterizing perfect complexes

Let R be a ring. Recall that $D(R)$ has direct sums which are given simply by taking direct sums of complexes, see Derived Categories, Lemma 13.31.2. We will use this in the lemmas of this section without further mention.

Lemma 15.57.1. *Let R be a ring. Let $K \in D(R)$ be an object such that for every countable set of objects $E_n \in D(R)$ the canonical map*

$$\bigoplus \text{Hom}_{D(R)}(K, E_n) \longrightarrow \text{Hom}_{D(R)}(K, \bigoplus E_n)$$

is a bijection. Then, given any system L_n^\bullet of complexes over \mathbf{N} we have that

$$\text{colim} \text{Hom}_{D(R)}(K, L_n^\bullet) \longrightarrow \text{Hom}_{D(R)}(K, L^\bullet)$$

is a bijection, where L^\bullet is the termwise colimit, i.e., $L^m = \text{colim} L_n^m$ for all $m \in \mathbf{Z}$.

Proof. Consider the short exact sequence of complexes

$$0 \rightarrow \bigoplus L_n^\bullet \rightarrow \bigoplus L_n^\bullet \rightarrow L^\bullet \rightarrow 0$$

where the first map is given by $1 - t_n$ in degree n where $t_n : L_n^\bullet \rightarrow L_{n+1}^\bullet$ is the transition map. By Derived Categories, Lemma 13.12.1 this is a distinguished

triangle in $D(R)$. Apply the homological functor $\text{Hom}_{D(R)}(K, -)$, see Derived Categories, Lemma 13.4.2. Thus a long exact cohomology sequence

$$\begin{array}{ccccccc}
 & & & & \dots & \longrightarrow & \text{Hom}_{D(R)}(K, \text{colim } L_n^\bullet[-1]) \\
 & & & & & \swarrow & \\
 & & & & & & \\
 \text{Hom}_{D(R)}(K, \bigoplus L_n^\bullet) & \longrightarrow & \text{Hom}_{D(R)}(K, \bigoplus L_n^\bullet) & \longrightarrow & \text{Hom}_{D(R)}(K, \text{colim } L_n^\bullet) & & \\
 & & & & & \swarrow & \\
 & & & & & & \\
 \text{Hom}_{D(R)}(K, \bigoplus L_n^\bullet[1]) & \longrightarrow & \dots & & & &
 \end{array}$$

Since we have assumed that $\text{Hom}_{D(R)}(K, \bigoplus L_n^\bullet)$ is equal to $\bigoplus \text{Hom}_{D(R)}(K, L_n^\bullet)$ we see that the first map on every row of the diagram is injective (by the explicit description of this map as the sum of the maps induced by $1 - t_n$). Hence we conclude that $\text{Hom}_{D(R)}(K, \text{colim } L_n^\bullet)$ is the cokernel of the first map of the middle row in the diagram above which is what we had to show. \square

The following proposition, characterizing perfect complexes as the compact objects (Derived Categories, Definition 13.34.1) of the derived category, shows up in various places. See for example [Ric89b, proof of Proposition 6.3] (this treats the bounded case), [TT90, Theorem 2.4.3] (the statement doesn't match exactly), and [BN93, Proposition 6.4] (watch out for horrendous notational conventions).

Proposition 15.57.2. *Let R be a ring. For an object K of $D(R)$ the following are equivalent*

- (1) K is perfect, and
- (2) K is a compact object of $D(R)$.

Proof. Assume K is perfect, i.e., K is quasi-isomorphic to a bounded complex P^\bullet of finite projective modules, see Definition 15.56.1. If E_i is represented by the complex E_i^\bullet , then $\bigoplus E_i$ is represented by the complex whose degree n term is $\bigoplus E_i^n$. On the other hand, as P^n is projective for all n we have $\text{Hom}_{D(R)}(P^\bullet, K^\bullet) = \text{Hom}_{K(R)}(P^\bullet, K^\bullet)$ for every complex of R -modules K^\bullet , see Derived Categories, Lemma 13.19.8. Thus $\text{Hom}_{D(R)}(P^\bullet, E^\bullet)$ is the cohomology of the complex

$$\prod \text{Hom}_R(P^n, E^{n-1}) \rightarrow \prod \text{Hom}_R(P^n, E^n) \rightarrow \prod \text{Hom}_R(P^n, E^{n+1}).$$

Since P^\bullet is bounded we see that we may replace the \prod signs by \bigoplus signs in the complex above. Since each P^n is a finite R -module we see that $\text{Hom}_R(P^n, \bigoplus_i E_i^m) = \bigoplus_i \text{Hom}_R(P^n, E_i^m)$ for all n, m . Combining these remarks we see that the map of Derived Categories, Definition 13.34.1 is a bijection.

Conversely, assume K is compact. Represent K by a complex K^\bullet and consider the map

$$K^\bullet \longrightarrow \bigoplus_{n \geq 0} \tau_{\geq n} K^\bullet$$

where we have used the canonical truncations, see Homology, Section 12.13. This makes sense as in each degree the direct sum on the right is finite. By assumption this map factors through a finite direct sum. We conclude that $K \rightarrow \tau_{\geq n} K$ is zero for at least one n , i.e., K is in $D^-(R)$.

Since $K \in D^-(R)$ and since every R -module is a quotient of a free module, we may represent K by a bounded above complex K^\bullet of free R -modules, see Derived Categories, Lemma 13.16.5. Note that we have

$$K^\bullet = \bigcup_{n \leq 0} \sigma_{\geq n} K^\bullet$$

where we have used the stupid truncations, see Homology, Section 12.13. Hence by Lemma 15.57.1 we see that $1 : K^\bullet \rightarrow K^\bullet$ factors through $\sigma_{\geq n} K^\bullet \rightarrow K^\bullet$ in $D(R)$. Thus we see that $1 : K^\bullet \rightarrow K^\bullet$ factors as

$$K^\bullet \xrightarrow{\varphi} L^\bullet \xrightarrow{\psi} K^\bullet$$

in $D(R)$ for some complex L^\bullet which is bounded and whose terms are free R -modules. Say $L^i = 0$ for $i \notin [a, b]$. Fix a, b from now on. Let c be the largest integer $\leq b + 1$ such that we can find a factorization of 1_{K^\bullet} as above with L^i is finite free for $i < c$. We will show by induction that $c = b + 1$. Namely, write $L^c = \bigoplus_{\lambda \in \Lambda} R$. Since L^{c-1} is finite free we can find a finite subset $\Lambda' \subset \Lambda$ such that $L^{c-1} \rightarrow L^c$ factors through $\bigoplus_{\lambda \in \Lambda'} R \subset L^c$. Consider the map of complexes

$$\pi : L^\bullet \longrightarrow \left(\bigoplus_{\lambda \in \Lambda \setminus \Lambda'} R \right)[-i]$$

given by the projection onto the factors corresponding to $\Lambda \setminus \Lambda'$ in degree i . By our assumption on K we see that, after possibly replacing Λ' by a larger finite subset, we may assume that $\pi \circ \varphi = 0$ in $D(R)$. Let $(L')^\bullet \subset L^\bullet$ be the kernel of π . Since π is surjective we get a short exact sequence of complexes, which gives a distinguished triangle in $D(R)$ (see Derived Categories, Lemma 13.12.1). Since $\text{Hom}_{D(R)}(K, -)$ is homological (see Derived Categories, Lemma 13.4.2) and $\pi \circ \varphi = 0$, we can find a morphism $\varphi' : K^\bullet \rightarrow (L')^\bullet$ in $D(R)$ whose composition with $(L')^\bullet \rightarrow L^\bullet$ gives φ . Setting ψ' equal to the composition of ψ with $(L')^\bullet \rightarrow L^\bullet$ we obtain a new factorization. Since $(L')^\bullet$ agrees with L^\bullet except in degree c and since $(L')^c = \bigoplus_{\lambda \in \Lambda'} R$ the induction step is proved.

The conclusion of the discussion of the preceding paragraph is that $1_K : K \rightarrow K$ factors as

$$K \xrightarrow{\varphi} L \xrightarrow{\psi} K$$

in $D(R)$ where L can be represented by a finite complex of free R -modules. In particular we see that L is perfect. Note that $e = \varphi \circ \psi \in \text{End}_{D(R)}(L)$ is an idempotent. By Derived Categories, Lemma 13.4.12 we see that $L = \text{Ker}(e) \oplus \text{Ker}(1 - e)$. The map $\varphi : K \rightarrow L$ induces an isomorphism with $\text{Ker}(1 - e)$ in $D(R)$. Hence we finally conclude that K is perfect by Lemma 15.56.5. \square

Lemma 15.57.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let \overline{P}^\bullet be a complex of R/I -modules. Let K be an object of $D(R)$. Assume that*

- (1) \overline{P}^\bullet is a bounded above complex of projective R/I -modules,
- (2) $K \otimes_R^L R/I$ is represented by \overline{P}^\bullet in $D(R/I)$, and
- (3) I is a nilpotent ideal.

Then there exists a bounded above complex P^\bullet of projective R -modules representing K in $D(R)$ such that $P^\bullet \otimes_R R/I$ is isomorphic to \overline{P}^\bullet .

Proof. Assumption (3) means that $I^n = 0$ for some n . The result holds if $n = 1$. Below we will prove the result holds for $n = 2$. This implies for $n > 2$ that \overline{P}^\bullet lifts

to a complex of projective R/I^2 -modules representing $K \otimes_R^{\mathbf{L}} R/I^2$. Then the result will follow by induction on n as $(I^2)^{\lceil n/2 \rceil} = 0$. Thus we may and do assume $I^2 = 0$.

Let us represent K by a K -flat complex K^\bullet with all K^n flat, see Lemma 15.45.10. Then we have a short exact sequence of complexes

$$0 \rightarrow IK^\bullet \rightarrow K^\bullet \rightarrow K^\bullet/IK^\bullet \rightarrow 0$$

and K^\bullet/IK^\bullet represents $K \otimes_R^{\mathbf{L}} R/I$ by construction of the derived tensor product. By flatness we see that

$$IK^\bullet = K^\bullet \otimes_R I = K^\bullet \otimes_R R/I \otimes_{R/I} I$$

represents $K \otimes_R^{\mathbf{L}} R/I \otimes_{R/I}^{\mathbf{L}} I$ because $K^\bullet \otimes_R R/I$ is a K -flat complex over R/I , see Lemma 15.45.5. By assumption (2) and Derived Categories, Lemma 13.19.8 there is a quasi-isomorphism $\bar{\alpha} : \bar{P}^\bullet \rightarrow K^\bullet/IK^\bullet$. Since \bar{P}^\bullet is K -flat we see that the induced map $\bar{P}^\bullet \otimes_{R/I} I \rightarrow IK^\bullet$ is a quasi-isomorphism too.

Suppose that $\bar{P}^i = 0$ for $i > b$. We will show by induction on a that we can find a complex $P^a \rightarrow P^{a+1} \rightarrow \dots \rightarrow P^b$ lifting $\bar{P}^a \rightarrow \bar{P}^{a+1} \rightarrow \dots \rightarrow \bar{P}^b$ and a map of complexes

$$\alpha : (P^a \rightarrow P^{a+1} \rightarrow \dots \rightarrow P^b) \rightarrow K$$

lifting $\bar{\alpha}$ such that $H^i(\alpha)$ is an isomorphism for $i > a$ and surjective for $i = a$. If $a > b$ then we just take $P^i = 0$ for all i . Suppose we have a solution for some a . Consider the cone C^\bullet of α , see Derived Categories, Definition 13.9.1. Note that C^\bullet/IC^\bullet and IC^\bullet are the cones of the induced maps $\bar{\alpha}$ and $\alpha \otimes \text{id}_I$. Then $H^i(C^\bullet)$, $H^i(C^\bullet/IC^\bullet)$, and $H^i(IC^\bullet)$ are 0 for $i \geq a$ (use long exact cohomology sequence associated to the cones; details omitted), in particular $H^{a-1}(C^\bullet) \rightarrow H^{a-1}(C^\bullet/IC^\bullet)$ is surjective. The given maps $\bar{P}^{a-1} \rightarrow K^{a-1}/IK^{a-1}$ and $\bar{P}^{a-1} \rightarrow \bar{P}^a$ induce a map

$$\bar{P}^{a-1}[a-1] \rightarrow C^\bullet/IC^\bullet$$

in $D(R/I)$. Choose a lift P^{a-1} of \bar{P}^{a-1} , see Algebra, Lemma 10.74.4. Because $H^{a-1}(C^\bullet) \rightarrow H^{a-1}(C^\bullet/IC^\bullet)$ is surjective, see above, we can lift the displayed map to a map

$$P^{a-1}[a-1] \rightarrow C^\bullet$$

in $D(R)$. The composition with the map $C^\bullet \rightarrow (P^a \rightarrow \dots \rightarrow P^b)[1]$ determines a map $P^{a-1} \rightarrow P^a$ whose composition with $P^a \rightarrow P^{a+1}$ is zero. On the other hand, we have $C^{a-1} = K^{a-1} \oplus P^a$ and a calculation shows that the resulting map $P^{a-1} \rightarrow K^{a-1}$ gives the desired extension of α . \square

Lemma 15.57.4. *Let R be a ring. Let $I \subset R$ be an ideal. Let K be an object of $D(R)$. Assume that*

- (1) $K \otimes_R^{\mathbf{L}} R/I$ is perfect in $D(R/I)$, and
- (2) I is a nilpotent ideal.

Then K is perfect in $D(R)$.

Proof. Choose a finite complex \bar{P}^\bullet of finite projective R/I -modules representing $K \otimes_R^{\mathbf{L}} R/I$, see Definition 15.56.1. By Lemma 15.57.3 there exists a complex P^\bullet of projective R -modules representing K such that $\bar{P}^\bullet = P^\bullet/IP^\bullet$. It follows from Nakayama's lemma (Algebra, Lemma 10.19.1) that P^\bullet is a finite complex of finite projective R -modules. \square

Lemma 15.57.5. *Let R be a ring. Let $I, J \subset R$ be ideals. Let K be an object of $D(R)$. Assume that*

- (1) $K \otimes_R^{\mathbf{L}} R/I$ is perfect in $D(R/I)$, and
- (2) $K \otimes_R^{\mathbf{L}} R/J$ is perfect in $D(R/J)$.

Then $K \otimes_R^{\mathbf{L}} R/IJ$ is perfect in $D(R/IJ)$.

Proof. It is clear that we may assume replace R by R/IJ and K by $K \otimes_R^{\mathbf{L}} R/IJ$. Then $R \rightarrow R/(I \cap J)$ is a surjection whose kernel has square zero. Hence by Lemma 15.57.4 it suffices to prove that $K \otimes_R^{\mathbf{L}} R/(I \cap J)$ is perfect. Thus we may assume that $I \cap J = 0$.

We prove the lemma in case $I \cap J = 0$. First, we may represent K by a K -flat complex K^\bullet with all K^n flat, see Lemma 15.45.10. Then we see that we have a short exact sequence of complexes

$$0 \rightarrow K^\bullet \rightarrow K^\bullet/IK^\bullet \oplus K^\bullet/JK^\bullet \rightarrow K^\bullet/(I+J)K^\bullet \rightarrow 0$$

Note that K^\bullet/IK^\bullet represents $K \otimes_R^{\mathbf{L}} R/I$ by construction of the derived tensor product. Similarly for K^\bullet/JK^\bullet and $K^\bullet/(I+J)K^\bullet$. Note that $K^\bullet/(I+J)K^\bullet$ is a perfect complex of $R/(I+J)$ -modules, see Lemma 15.56.9. Hence the complexes K^\bullet/IK^\bullet , and K^\bullet/JK^\bullet and $K^\bullet/(I+J)K^\bullet$ have finitely many nonzero cohomology groups (since a perfect complex has finite Tor-amplitude, see Lemma 15.56.2). We conclude that $K \in D^b(R)$ by the long exact cohomology sequence associated to short exact sequence of complexes displayed above. In particular we assume K^\bullet is a bounded above complex of free R -modules (see Derived Categories, Lemma 13.16.5).

We will now show that K is perfect using the criterion of Proposition 15.57.2. Thus we let $E_j \in D(R)$ be a family of objects parametrized by a set J . We choose complexes E_j^\bullet with flat terms representing E_j , see for example Lemma 15.45.10. It is clear that

$$0 \rightarrow E_j^\bullet \rightarrow E_j^\bullet/IE_j^\bullet \oplus E_j^\bullet/JE_j^\bullet \rightarrow E_j^\bullet/(I+J)E_j^\bullet \rightarrow 0$$

is a short exact sequence of complexes. Taking direct sums we obtain a similar short exact sequence

$$0 \rightarrow \bigoplus E_j^\bullet \rightarrow \bigoplus E_j^\bullet/IE_j^\bullet \oplus E_j^\bullet/JE_j^\bullet \rightarrow \bigoplus E_j^\bullet/(I+J)E_j^\bullet \rightarrow 0$$

(Note that $- \otimes_R R/I$ commutes with direct sums.) This short exact sequence determines a distinguished triangle in $D(R)$, see Derived Categories, Lemma 13.12.1. Apply the homological functor $\text{Hom}_{D(R)}(K, -)$ (see Derived Categories, Lemma

13.4.2) to get a commutative diagram

$$\begin{array}{ccc}
 \bigoplus \text{Hom}_{D(R)}(K^\bullet, E_j^\bullet/(I+J))[-1] & \longrightarrow & \text{Hom}_{D(R)}(K^\bullet, \bigoplus E_j^\bullet/(I+J))[-1] \\
 \downarrow & & \downarrow \\
 \bigoplus \text{Hom}_{D(R)}(K^\bullet, E_j^\bullet/I \oplus E_j^\bullet/J)[-1] & \longrightarrow & \text{Hom}_{D(R)}(K^\bullet, \bigoplus E_j^\bullet/I \oplus E_j^\bullet/J)[-1] \\
 \downarrow & & \downarrow \\
 \bigoplus \text{Hom}_{D(R)}(K^\bullet, E_j^\bullet) & \longrightarrow & \text{Hom}_{D(R)}(K^\bullet, \bigoplus E_j^\bullet) \\
 \downarrow & & \downarrow \\
 \bigoplus \text{Hom}_{D(R)}(K^\bullet, E_j^\bullet/I \oplus E_j^\bullet/J) & \longrightarrow & \text{Hom}_{D(R)}(K^\bullet, \bigoplus E_j^\bullet/I \oplus E_j^\bullet/J) \\
 \downarrow & & \downarrow \\
 \bigoplus \text{Hom}_{D(R)}(K^\bullet, E_j^\bullet/(I+J)) & \longrightarrow & \text{Hom}_{D(R)}(K^\bullet, \bigoplus E_j^\bullet/(I+J))
 \end{array}$$

with exact columns. It is clear that, for any complex E^\bullet of R -modules we have

$$\begin{aligned}
 \text{Hom}_{D(R)}(K^\bullet, E^\bullet/I) &= \text{Hom}_{K(R)}(K^\bullet, E^\bullet/I) \\
 &= \text{Hom}_{K(R/I)}(K^\bullet/IK^\bullet, E^\bullet/I) \\
 &= \text{Hom}_{D(R/I)}(K^\bullet/IK^\bullet, E^\bullet/I)
 \end{aligned}$$

and similarly for when dividing by J or $I+J$, see Derived Categories, Lemma 13.19.8. Derived Categories. Thus all the horizontal arrows, except for possibly the middle one, are isomorphisms as the complexes K^\bullet/IK^\bullet , K^\bullet/JK^\bullet , $K^\bullet/(I+J)K^\bullet$ are perfect complexes of R/I , R/J , $R/(I+J)$ -modules, see Proposition 15.57.2. It follows from the 5-lemma (Homology, Lemma 12.5.20) that the middle map is an isomorphism and the lemma follows by Proposition 15.57.2. \square

15.58. Relatively finitely presented modules

Let R be a ring. Let $A \rightarrow B$ be a finite map of finite type R -algebras. Let M be a finite B -module. In this case it is **not true** that

$$M \text{ of finite presentation over } B \Leftrightarrow M \text{ of finite presentation over } A$$

A counter example is $R = k[x_1, x_2, x_3, \dots]$, $A = R$, $B = R/(x_i)$, and $M = B$. To “fix” this we introduce a relative notion of finite presentation.

Lemma 15.58.1. *Let $R \rightarrow A$ be a ring map of finite type. Let M be an A -module. The following are equivalent*

- (1) *for some presentation $\alpha : R[x_1, \dots, x_n] \rightarrow A$ the module M is a finitely presented $R[x_1, \dots, x_n]$ -module,*
- (2) *for all presentations $\alpha : R[x_1, \dots, x_n] \rightarrow A$ the module M is a finitely presented $R[x_1, \dots, x_n]$ -module, and*
- (3) *for any surjection $A' \rightarrow A$ where A' is a finitely presented R -algebra, the module M is finitely presented as A' -module.*

In this case M is a finitely presented A -module.

Proof. If $\alpha : R[x_1, \dots, x_n] \rightarrow A$ and $\beta : R[y_1, \dots, y_m] \rightarrow A$ are presentations. Choose $f_j \in R[x_1, \dots, x_n]$ with $\alpha(f_j) = \beta(y_j)$ and $g_i \in R[y_1, \dots, y_m]$ with $\beta(g_i) = \alpha(x_i)$. Then we get a commutative diagram

$$\begin{array}{ccc} R[x_1, \dots, x_n, y_1, \dots, y_m] & \xrightarrow{y_j \mapsto f_j} & R[x_1, \dots, x_n] \\ \downarrow x_i \mapsto g_i & & \downarrow \\ R[y_1, \dots, y_m] & \xrightarrow{\quad} & A \end{array}$$

Hence the equivalence of (1) and (2) follows by applying Algebra, Lemmas 10.6.4 and 10.7.4. The equivalence of (2) and (3) follows by choosing a presentation $A' = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and using Algebra, Lemma 10.7.4 to show that M is finitely presented as A' -module if and only if M is finitely presented as a $R[x_1, \dots, x_n]$ -module. \square

Definition 15.58.2. Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module. We say M is an A -module *finitely presented relative to R* if the equivalent conditions of Lemma 15.58.1 hold.

Note that if $R \rightarrow A$ is of finite presentation, then M is an A -module finitely presented relative to R if and only if M is a finitely presented A -module. It is equally clear that A as an A -module is finitely presented relative to R if and only if A is of finite presentation over R . If R is Noetherian the notion is uninteresting. Now we can formulate the result we were looking for.

Lemma 15.58.3. *Let R be a ring. Let $A \rightarrow B$ be a finite map of finite type R -algebras. Let M be a B -module. Then M is an A -module finitely presented relative to R if and only if M is a B -module finitely presented relative to R .*

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Choose $y_1, \dots, y_m \in B$ which generate B over A . As $A \rightarrow B$ is finite each y_i satisfies a monic equation with coefficients in A . Hence we can find monic polynomials $P_j(T) \in R[x_1, \dots, x_n][T]$ such that $P_j(y_j) = 0$ in B . Then we get a commutative diagram

$$\begin{array}{ccc} R[x_1, \dots, x_n] & \longrightarrow & R[x_1, \dots, x_n, y_1, \dots, y_m]/(P_j(y_j)) \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

Since the top arrow is a finite and finitely presented ring map we conclude by Algebra, Lemma 10.7.4 and the definition. \square

With this result in hand we see that the relative notion makes sense and behaves well with regards to finite maps of rings of finite type over R . It is also stable under localization, stable under base change, and "glues" well.

Lemma 15.58.4. *Let R be a ring, $f \in R$ an element, $R_f \rightarrow A$ is a finite type ring map, $g \in A$, and M an A -module. If M of finite presentation relative to R_f , then M_g is an A_g -module of finite presentation relative to R .*

Proof. Choose a presentation $R_f[x_1, \dots, x_n] \rightarrow A$. We write $R_f = R[x_0]/(fx_0 - 1)$. Consider the presentation $R[x_0, x_1, \dots, x_n, x_{n+1}] \rightarrow A_g$ which extends the

given map, maps x_0 to the image of $1/f$, and maps x_{n+1} to $1/g$. Choose $g' \in R[x_0, x_1, \dots, x_n]$ which maps to g (this is possible). Suppose that

$$R_f[x_1, \dots, x_n]^{\oplus s} \rightarrow R_f[x_1, \dots, x_n]^{\oplus t} \rightarrow M \rightarrow 0$$

is a presentation of M given by a matrix (h_{ij}) . Pick $h'_{ij} \in R[x_0, x_1, \dots, x_n]$ which map to h_{ij} . Then

$$R[x_0, x_1, \dots, x_n, x_{n+1}]^{\oplus s+2t} \rightarrow R[x_0, x_1, \dots, x_n, x_{n+1}]^{\oplus t} \rightarrow M_g \rightarrow 0$$

is a presentation of M_f . Here the $t \times (s + 2t)$ matrix defining the map has a first $t \times s$ block consisting of the matrix h'_{ij} , a second $t \times t$ block which is $(x_0 f -)I_t$, and a third block which is $(x_{n+1} g' - 1)I_t$. \square

Lemma 15.58.5. *Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module finitely presented relative to R . For any ring map $R \rightarrow R'$ the $A \otimes_R R'$ -module*

$$M \otimes_A A' = M \otimes_R R'$$

is finitely presented relative to R' .

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Choose a presentation

$$R[x_1, \dots, x_n]^{\oplus s} \rightarrow R[x_1, \dots, x_n]^{\oplus t} \rightarrow M \rightarrow 0$$

Then

$$R'[x_1, \dots, x_n]^{\oplus s} \rightarrow R'[x_1, \dots, x_n]^{\oplus t} \rightarrow M \otimes_R R' \rightarrow 0$$

is a presentation of the base change and we win. \square

Lemma 15.58.6. *Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module finitely presented relative to R . Let $A \rightarrow A'$ be a ring map of finite presentation. The A' -module $M \otimes_A A'$ is finitely presented relative to R .*

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Choose a presentation $A' = A[y_1, \dots, y_m]/(g_1, \dots, g_l)$. Pick $g'_i \in R[x_1, \dots, x_n, y_1, \dots, y_m]$ mapping to g_i . Say

$$R[x_1, \dots, x_n]^{\oplus s} \rightarrow R[x_1, \dots, x_n]^{\oplus t} \rightarrow M \rightarrow 0$$

is a presentation of M given by a matrix (h_{ij}) . Then

$$R[x_1, \dots, x_n, y_1, \dots, y_m]^{\oplus s+tl} \rightarrow R[x_0, x_1, \dots, x_n, y_1, \dots, y_m]^{\oplus t} \rightarrow M \otimes_A A' \rightarrow 0$$

is a presentation of $M \otimes_A A'$. Here the $t \times (s + tl)$ matrix defining the map has a first $t \times s$ block consisting of the matrix h_{ij} , followed by l blocks of size $t \times t$ which are $g'_i I_t$. \square

Lemma 15.58.7. *Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let M be a B -module. If M is finitely presented relative to A and A is of finite presentation over R , then M is finitely presented relative to R .*

Proof. Choose a surjection $A[x_1, \dots, x_n] \rightarrow B$. Choose a presentation

$$A[x_1, \dots, x_n]^{\oplus s} \rightarrow A[x_1, \dots, x_n]^{\oplus t} \rightarrow M \rightarrow 0$$

given by a matrix (h_{ij}) . Choose a presentation

$$A = R[y_1, \dots, y_m]/(g_1, \dots, g_u).$$

Choose $h'_{ij} \in R[y_1, \dots, y_m, x_1, \dots, x_n]$ mapping to h_{ij} . Then we obtain the presentation

$$R[y_1, \dots, y_m, x_1, \dots, x_n]^{\oplus s+tu} \rightarrow R[y_1, \dots, y_m, x_1, \dots, x_n]^{\oplus t} \rightarrow M \rightarrow 0$$

where the $t \times (s + tu)$ -matrix is given by a first $t \times s$ block consisting of h'_{ij} followed by u blocks of size $t \times t$ given by $g_i I_t$, $i = 1, \dots, u$. \square

Lemma 15.58.8. *Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module. Let $f_1, \dots, f_r \in A$ generate the unit ideal. The following are equivalent*

- (1) *each M_{f_i} is finitely presented relative to R , and*
- (2) *M is finitely presented relative to R .*

Proof. The implication (2) \Rightarrow (1) is in Lemma 15.58.4. Assume (1). Write $1 = \sum f_i g_i$ in A . Choose a surjection $R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r] \rightarrow A$ such that y_i maps to f_i and z_i maps to g_i . Then we see that there exists a surjection

$$P = R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r] / (\sum y_i z_i - 1) \longrightarrow A.$$

By Lemma 15.58.1 we see that M_{f_i} is a finitely presented A_{f_i} -module, hence by Algebra, Lemma 10.23.2 we see that M is a finitely presented A -module. Hence M is a finite P -module (with P as above). Choose a surjection $P^{\oplus t} \rightarrow M$. We have to show that the kernel K of this map is a finite P -module. Since P_{y_i} surjects onto A_{f_i} we see by Lemma 15.58.1 and Algebra, Lemma 10.5.3 that the localization K_{y_i} is a finitely generated P_{y_i} -module. Choose elements $k_{i,j} \in K$, $i = 1, \dots, r$, $j = 1, \dots, s_i$ such that the images of $k_{i,j}$ in K_{y_i} generate. Set $K' \subset K$ equal to the P -module generated by the elements $k_{i,j}$. Then K/K' is a module whose localization at y_i is zero for all i . Since $(y_1, \dots, y_r) = P$ we see that $K/K' = 0$ as desired. \square

Lemma 15.58.9. *Let $R \rightarrow A$ be a finite type ring map. Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be a short exact sequence of A -modules.*

- (1) *If M' , M'' are finitely presented relative to R , then so is M .*
- (2) *If M' is a finite type A -module and M is finitely presented relative to R , then M'' is finitely presented relative to R .*

Proof. Follows immediately from Algebra, Lemma 10.5.3. \square

Lemma 15.58.10. *Let $R \rightarrow A$ be a finite type ring map. Let M, M' be A -modules. If $M \oplus M'$ is finitely presented relative to R , then so are M and M' .*

Proof. Omitted. \square

15.59. Relatively pseudo-coherent modules

This section is the analogue of Section 15.58 for pseudo-coherence.

Lemma 15.59.1. *Let R be a ring. Let K^\bullet be an object of $D^-(R)$. Consider the R -algebra map $R[x] \rightarrow R$ which maps x to zero. Then*

$$K^\bullet \otimes_{R[x]}^L R \cong K^\bullet \oplus K^\bullet[1]$$

in $D(R)$.

Proof. Choose a projective resolution $P^\bullet \rightarrow K^\bullet$ over R . Then

$$P^\bullet \otimes_R R[x] \xrightarrow{x} P^\bullet \otimes_R R[x]$$

is a double complex of projective $R[x]$ -modules whose associated total complex is quasi-isomorphic to P^\bullet . Hence

$$\begin{aligned} K^\bullet \otimes_{R[x]}^L R &\cong \text{Tot}(P^\bullet \otimes_R R[x] \xrightarrow{x} P^\bullet \otimes_R R[x]) \otimes_{R[x]} R = \text{Tot}(P^\bullet \xrightarrow{0} P^\bullet) \\ &= P^\bullet \oplus P^\bullet[1] \cong K^\bullet \oplus K^\bullet[1] \end{aligned}$$

as desired. □

Lemma 15.59.2. *Let R be a ring and K^\bullet a complex of R -modules. Let $m \in \mathbf{Z}$. Consider the R -algebra map $R[x] \rightarrow R$ which maps x to zero. Then K^\bullet is m -pseudo-coherent as a complex of R -modules if and only if K^\bullet is m -pseudo-coherent as a complex of $R[x]$ -modules.*

Proof. This is a special case of Lemma 15.50.11. We also prove it in another way as follows.

Note that $0 \rightarrow R[x] \rightarrow R[x] \rightarrow R \rightarrow 0$ is exact. Hence R is pseudo-coherent as an $R[x]$ -module. Thus one implication of the lemma follows from Lemma 15.50.11. To prove the other implication, assume that K^\bullet is m -pseudo-coherent as a complex of $R[x]$ -modules. By Lemma 15.50.12 we see that $K^\bullet \otimes_{R[x]}^L R$ is m -pseudo-coherent as a complex of R -modules. By Lemma 15.59.1 we see that $K^\bullet \oplus K^\bullet[1]$ is m -pseudo-coherent as a complex of R -modules. Finally, we conclude that K^\bullet is m -pseudo-coherent as a complex of R -modules from Lemma 15.50.8. □

Lemma 15.59.3. *Let $R \rightarrow A$ be a ring map of finite type. Let K^\bullet be a complex of A -modules. Let $m \in \mathbf{Z}$. The following are equivalent*

- (1) *for some presentation $\alpha : R[x_1, \dots, x_n] \rightarrow A$ the complex K^\bullet is an m -pseudo-coherent complex of $R[x_1, \dots, x_n]$ -modules,*
- (2) *for all presentations $\alpha : R[x_1, \dots, x_n] \rightarrow A$ the complex K^\bullet is an m -pseudo-coherent complex of $R[x_1, \dots, x_n]$ -modules.*

In particular the same equivalence holds for pseudo-coherence.

Proof. If $\alpha : R[x_1, \dots, x_n] \rightarrow A$ and $\beta : R[y_1, \dots, y_m] \rightarrow A$ are presentations. Choose $f_j \in R[x_1, \dots, x_n]$ with $\alpha(f_j) = \beta(y_j)$ and $g_i \in R[y_1, \dots, y_m]$ with $\beta(g_i) = \alpha(x_i)$. Then we get a commutative diagram

$$\begin{array}{ccc}
 R[x_1, \dots, x_n, y_1, \dots, y_m] & \xrightarrow{y_j \mapsto f_j} & R[x_1, \dots, x_n] \\
 \downarrow x_i \mapsto g_i & & \downarrow \\
 R[y_1, \dots, y_m] & \xrightarrow{\hspace{2cm}} & A
 \end{array}$$

After a change of coordinates the ring homomorphism $R[x_1, \dots, x_n, y_1, \dots, y_m] \rightarrow R[x_1, \dots, x_n]$ is isomorphic to the ring homomorphism which maps each y_i to zero. Similarly for the left vertical map in the diagram. Hence, by induction on the number of variables this lemma follows from Lemma 15.59.2. The pseudo-coherent case follows from this and Lemma 15.50.5. □

Definition 15.59.4. Let $R \rightarrow A$ be a finite type ring map. Let K^\bullet be a complex of A -modules. Let M be an A -module. Let $m \in \mathbf{Z}$.

- (1) We say K^\bullet is *m -pseudo-coherent relative to R* if the equivalent conditions of Lemma 15.59.3 hold.
- (2) We say K^\bullet is *pseudo-coherent relative to R* if K^\bullet is m -pseudo-coherent relative to R for all $m \in \mathbf{Z}$.
- (3) We say M is *m -pseudo-coherent relative to R* if $M[0]$ is m -pseudo-coherent.
- (4) We say M is *pseudo-coherent relative to R* if $M[0]$ is pseudo-coherent relative to R .

Part (2) means that K^\bullet is pseudo-coherent as a complex of $R[x_1, \dots, x_n]$ -modules for any surjection $R[y_1, \dots, y_m] \rightarrow A$, see Lemma 15.50.5. This definition has the following pleasing property.

Lemma 15.59.5. *Let R be a ring. Let $A \rightarrow B$ be a finite map of finite type R -algebras. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of B -modules. Then K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to R if and only if K^\bullet seen as a complex of A -modules is m -pseudo-coherent (pseudo-coherent) relative to R .*

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Choose $y_1, \dots, y_m \in B$ which generate B over A . As $A \rightarrow B$ is finite each y_i satisfies a monic equation with coefficients in A . Hence we can find monic polynomials $P_j(T) \in R[x_1, \dots, x_n][T]$ such that $P_j(y_j) = 0$ in B . Then we get a commutative diagram

$$\begin{array}{ccc}
 & R[x_1, \dots, x_n, y_1, \dots, y_m] & \\
 & \downarrow & \\
 R[x_1, \dots, x_n] & \longrightarrow & R[x_1, \dots, x_n, y_1, \dots, y_m]/(P_j(y_j)) \\
 \downarrow & & \downarrow \\
 A & \longrightarrow & B
 \end{array}$$

The top horizontal arrow and the top right vertical arrow satisfy the assumptions of Lemma 15.50.11. Hence K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) as a complex of $R[x_1, \dots, x_n]$ -modules if and only if K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) as a complex of $R[x_1, \dots, x_n, y_1, \dots, y_m]$ -modules. \square

Lemma 15.59.6. *Let R be a ring. Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $(K^\bullet, L^\bullet, M^\bullet, f, g, h)$ be a distinguished triangle in $D(A)$.*

- (1) *If K^\bullet is $(m+1)$ -pseudo-coherent relative to R and L^\bullet is m -pseudo-coherent relative to R then M^\bullet is m -pseudo-coherent relative to R .*
- (2) *If K^\bullet, M^\bullet are m -pseudo-coherent relative to R , then L^\bullet is m -pseudo-coherent relative to R .*
- (3) *If L^\bullet is $(m+1)$ -pseudo-coherent relative to R and M^\bullet is m -pseudo-coherent relative to R , then K^\bullet is $(m+1)$ -pseudo-coherent relative to R .*

Moreover, if two out of three of $K^\bullet, L^\bullet, M^\bullet$ are pseudo-coherent relative to R , the so is the third.

Proof. Follows immediately from Lemma 15.50.2 and the definitions. \square

Lemma 15.59.7. *Let $R \rightarrow A$ be a finite type ring map. Let M be an A -module. Then*

- (1) *M is 0-pseudo-coherent relative to R if and only if M is a finite type A -module,*
- (2) *M is (-1) -pseudo-coherent relative to R if and only if M is a finitely presented relative to R ,*
- (3) *M is $(-d)$ -pseudo-coherent relative to R if and only if for every surjection $R[x_1, \dots, x_n] \rightarrow A$ there exists a resolution*

$$R[x_1, \dots, x_n]^{\oplus a_d} \rightarrow R[x_1, \dots, x_n]^{\oplus a_{d-1}} \rightarrow \dots \rightarrow R[x_1, \dots, x_n]^{\oplus a_0} \rightarrow M \rightarrow 0$$

of length d , and

(4) M is pseudo-coherent relative to R if and only if for every presentation $R[x_1, \dots, x_n] \rightarrow A$ there exists an infinite resolution

$$\dots \rightarrow R[x_1, \dots, x_n]^{\oplus a_1} \rightarrow R[x_1, \dots, x_n]^{\oplus a_0} \rightarrow M \rightarrow 0$$

by finite free $R[x_1, \dots, x_n]$ -modules.

Proof. Follows immediately from Lemma 15.50.4 and the definitions. □

Lemma 15.59.8. *Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^\bullet, L^\bullet \in D(A)$. If $K^\bullet \oplus L^\bullet$ is m -pseudo-coherent (resp. pseudo-coherent) relative to R so are K^\bullet and L^\bullet .*

Proof. Immediate from Lemma 15.50.8 and the definitions. □

Lemma 15.59.9. *Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let K^\bullet be a bounded above complex of A -modules such that K^i is $(m - i)$ -pseudo-coherent relative to R for all i . Then K^\bullet is m -pseudo-coherent relative to R . In particular, if K^\bullet is a bounded above complex of A -modules pseudo-coherent relative to R , then K^\bullet is pseudo-coherent relative to R .*

Proof. Immediate from Lemma 15.50.9 and the definitions. □

Lemma 15.59.10. *Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let $K^\bullet \in D^-(A)$ such that $H^i(K^\bullet)$ is $(m - i)$ -pseudo-coherent (resp. pseudo-coherent) relative to R for all i . Then K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to R .*

Proof. Immediate from Lemma 15.50.10 and the definitions. □

Lemma 15.59.11. *Let R be a ring, $f \in R$ an element, $R_f \rightarrow A$ is a finite type ring map, $g \in A$, and K^\bullet a complex of A -modules. If K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to R_f , then $K^\bullet \otimes_A A_g$ is m -pseudo-coherent (resp. pseudo-coherent) relative to R .*

Proof. First we show that K^\bullet is m -pseudo-coherent relative to R . Namely, suppose $R_f[x_1, \dots, x_n] \rightarrow A$ is surjective. Write $R_f = R[x_0]/(fx_0 - 1)$. Then $R[x_0, x_1, \dots, x_n] \rightarrow A$ is surjective, and $R_f[x_1, \dots, x_n]$ is pseudo-coherent as an $R[x_0, \dots, x_n]$ -module. Hence by Lemma 15.50.11 we see that K^\bullet is m -pseudo-coherent as a complex of $R[x_0, x_1, \dots, x_n]$ -modules.

Choose an element $g' \in R[x_0, x_1, \dots, x_n]$ which maps to $g \in A$. By Lemma 15.50.12 we see that

$$\begin{aligned} K^\bullet \otimes_{R[x_0, x_1, \dots, x_n]}^L R[x_0, x_1, \dots, x_n, \frac{1}{g'}] &= K^\bullet \otimes_{R[x_0, x_1, \dots, x_n]} R[x_0, x_1, \dots, x_n, \frac{1}{g'}] \\ &= K^\bullet \otimes_A A_f \end{aligned}$$

is m -pseudo-coherent as a complex of $R[x_0, x_1, \dots, x_n, \frac{1}{g'}]$ -modules. write

$$R[x_0, x_1, \dots, x_n, \frac{1}{g'}] = R[x_0, \dots, x_n, x_{n+1}]/(x_{n+1}g' - 1).$$

As $R[x_0, x_1, \dots, x_n, \frac{1}{g'}]$ is pseudo-coherent as a $R[x_0, \dots, x_n, x_{n+1}]$ -module we conclude (see Lemma 15.50.11) that $K^\bullet \otimes_A A_g$ is m -pseudo-coherent as a complex of $R[x_0, \dots, x_n, x_{n+1}]$ -modules as desired. □

Lemma 15.59.12. *Let $R \rightarrow A$ be a finite type ring map. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of A -modules which is m -pseudo-coherent (resp. pseudo-coherent) relative to R . Let $R \rightarrow R'$ be a ring map such that A and R' are Tor independent over R . Set $A' = A \otimes_R R'$. Then $K^\bullet \otimes_A^{\mathbf{L}} A'$ is m -pseudo-coherent (resp. pseudo-coherent) relative to R' .*

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Note that

$$K^\bullet \otimes_A^{\mathbf{L}} A' = K^\bullet \otimes_R^{\mathbf{L}} R' = K^\bullet \otimes_{R[x_1, \dots, x_n]}^{\mathbf{L}} R'[x_1, \dots, x_n]$$

by Lemma 15.47.2 applied twice. Hence we win by Lemma 15.50.12. \square

Lemma 15.59.13. *Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of A -modules. Assume B as a B -module is pseudo-coherent relative to A . If K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to R , then $K^\bullet \otimes_A^{\mathbf{L}} B$ is m -pseudo-coherent (resp. pseudo-coherent) relative to R .*

Proof. Choose a surjection $A[y_1, \dots, y_m] \rightarrow B$. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Combined we get a surjection $R[x_1, \dots, x_n, y_1, \dots, y_m] \rightarrow B$. Choose a resolution $E^\bullet \rightarrow B$ of B by a complex of finite free $A[y_1, \dots, y_m]$ -modules (which is possible by our assumption on the ring map $A \rightarrow B$). We may assume that K^\bullet is a bounded above complex of flat A -modules. Then

$$\begin{aligned} K^\bullet \otimes_A^{\mathbf{L}} B &= \text{Tot}(K^\bullet \otimes_A B[0]) \\ &= \text{Tot}(K^\bullet \otimes_A A[y_1, \dots, y_m] \otimes_{A[y_1, \dots, y_m]} B[0]) \\ &\cong \text{Tot}((K^\bullet \otimes_A A[y_1, \dots, y_m]) \otimes_{A[y_1, \dots, y_m]} E^\bullet) \\ &= \text{Tot}(K^\bullet \otimes_A E^\bullet) \end{aligned}$$

in $D(A[y_1, \dots, y_m])$. The quasi-isomorphism \cong comes from an application of Lemma 15.45.8. Thus we have to show that $\text{Tot}(K^\bullet \otimes_A E^\bullet)$ is m -pseudo-coherent as a complex of $R[x_1, \dots, x_n, y_1, \dots, y_m]$ -modules. Note that $\text{Tot}(K^\bullet \otimes_A E^\bullet)$ has a filtration by subcomplexes with successive quotients the complexes $K^\bullet \otimes_A E^i[-i]$. Note that for $i \ll 0$ the complexes $K^\bullet \otimes_A E^i[-i]$ have zero cohomology in degrees $\leq m$ and hence are m -pseudo-coherent (over any ring). Hence, applying Lemma 15.59.6 and induction, it suffices to show that $K^\bullet \otimes_A E^i[-i]$ is pseudo-coherent relative to R for all i . Note that $E^i = 0$ for $i > 0$. Since also E^i is finite free this reduces to proving that $K^\bullet \otimes_A A[y_1, \dots, y_m]$ is m -pseudo-coherent relative to R which follows from Lemma 15.59.12 for instance. \square

Lemma 15.59.14. *Let $R \rightarrow A \rightarrow B$ be finite type ring maps. Let $m \in \mathbf{Z}$. Let M be an A -module. Assume B is flat over A and B as a B -module is pseudo-coherent relative to A . If M is m -pseudo-coherent (resp. pseudo-coherent) relative to R , then $M \otimes_A B$ is m -pseudo-coherent (resp. pseudo-coherent) relative to R .*

Proof. Immediate from Lemma 15.59.13. \square

Lemma 15.59.15. *Let R be a ring. Let $A \rightarrow B$ be a map of finite type R -algebras. Let $m \in \mathbf{Z}$. Let K^\bullet be a complex of B -modules. Assume A is pseudo-coherent relative to R . Then the following are equivalent*

- (1) K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to A , and
- (2) K^\bullet is m -pseudo-coherent (resp. pseudo-coherent) relative to R .

Proof. Choose a surjection $R[x_1, \dots, x_n] \rightarrow A$. Choose a surjection $A[y_1, \dots, y_m] \rightarrow B$. Then we get a surjection

$$R[x_1, \dots, x_n, y_1, \dots, y_m] \rightarrow A[y_1, \dots, y_m]$$

which is a flat base change of $R[x_1, \dots, x_n] \rightarrow A$. By assumption A is a pseudo-coherent module over $R[x_1, \dots, x_n]$ hence by Lemma 15.50.13 we see that $A[y_1, \dots, y_m]$ is pseudo-coherent over $R[x_1, \dots, x_n, y_1, \dots, y_m]$. Thus the lemma follows from Lemma 15.50.11 and the definitions. \square

Lemma 15.59.16. *Let $R \rightarrow A$ be a finite type ring map. Let K^\bullet be a complex of A -modules. Let $m \in \mathbf{Z}$. Let $f_1, \dots, f_r \in A$ generate the unit ideal. The following are equivalent*

- (1) *each $K^\bullet \otimes_A A_{f_i}$ is m -pseudo-coherent relative to R , and*
- (2) *K^\bullet is m -pseudo-coherent relative to R .*

The same equivalence holds for pseudo-coherence.

Proof. The implication (2) \Rightarrow (1) is in Lemma 15.59.11. Assume (1). Write $1 = \sum f_i g_i$ in A . Choose a surjection $R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r] \rightarrow A$ such that y_i maps to f_i and z_i maps to g_i . Then we see that there exists a surjection

$$P = R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r] / (\sum y_i z_i - 1) \longrightarrow A.$$

Note that P is pseudo-coherent as an $R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r]$ -module and that $P[1/y_i]$ is pseudo-coherent as an $R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r, 1/y_i]$ -module. Hence by Lemma 15.50.11 we see that $K^\bullet \otimes_A A_{f_i}$ is an m -pseudo-coherent complex of $P[1/y_i]$ -modules for each i . Thus by Lemma 15.50.14 we see that K^\bullet is pseudo-coherent as a complex of P -modules, and Lemma 15.50.11 shows that K^\bullet is pseudo-coherent as a complex of $R[x_1, \dots, x_n, y_1, \dots, y_r, z_1, \dots, z_r]$ -modules. \square

Lemma 15.59.17. *Let R be a Noetherian ring. Let $R \rightarrow A$ be a finite type ring map. Then*

- (1) *A complex of A -modules K^\bullet is m -pseudo-coherent relative to R if and only if $K^\bullet \in D^-(A)$ and $H^i(K^\bullet)$ is a finite A -module for $i \geq m$.*
- (2) *A complex of A -modules K^\bullet is pseudo-coherent relative to R if and only if $K^\bullet \in D^-(A)$ and $H^i(K^\bullet)$ is a finite A -module for all i .*
- (3) *An A -module is pseudo-coherent relative to R if and only if it is finite.*

Proof. Immediate consequence of Lemma 15.50.16 and the definitions. \square

15.60. Pseudo-coherent and perfect ring maps

We can define these types of ring maps as follows.

Definition 15.60.1. Let $A \rightarrow B$ be a ring map.

- (1) We say $A \rightarrow B$ is a *pseudo-coherent ring map* if it is of finite type and B , as a B -module, is pseudo-coherent relative to A .
- (2) We say $A \rightarrow B$ is a *perfect ring map* if it is a pseudo-coherent ring map such that B as an A -module has finite tor dimension.

This terminology may be nonstandard. Using Lemma 15.59.7 we see that $A \rightarrow B$ is pseudo-coherent if and only if $B = A[x_1, \dots, x_n]/I$ and B as an $A[x_1, \dots, x_n]$ -module has a resolution by finite free $A[x_1, \dots, x_n]$ -modules. The motivation for

the definition of a perfect ring map is Lemma 15.56.2. The following lemmas gives a more useful and intuitive characterization of a perfect ring map.

Lemma 15.60.2. *A ring map $A \rightarrow B$ is perfect if and only if $B = A[x_1, \dots, x_n]/I$ and B as an $A[x_1, \dots, x_n]$ -module has a finite resolution by finite projective $A[x_1, \dots, x_n]$ -modules.*

Proof. If $A \rightarrow B$ is perfect, then $B = A[x_1, \dots, x_n]/I$ and B is pseudo-coherent as an $A[x_1, \dots, x_n]$ -module and has finite tor dimension as an A -module. Hence Lemma 15.56.19 implies that B is perfect as a $A[x_1, \dots, x_n]$ -module, i.e., it has a finite resolution by finite projective $A[x_1, \dots, x_n]$ -modules (Lemma 15.56.3). Conversely, if $B = A[x_1, \dots, x_n]/I$ and B as an $A[x_1, \dots, x_n]$ -module has a finite resolution by finite projective $A[x_1, \dots, x_n]$ -modules then B is pseudo-coherent as an $A[x_1, \dots, x_n]$ -module, hence $A \rightarrow B$ is pseudo-coherent. Moreover, the given resolution over $A[x_1, \dots, x_n]$ is a finite resolution by flat A -modules and hence B has finite tor dimension as an A -module. \square

Lots of the results of the preceding sections can be reformulated in terms of this terminology. We also refer to More on Morphisms, Sections 36.40 and 36.41 for the corresponding discussion concerning morphisms of schemes.

Lemma 15.60.3. *A finite type ring map of Noetherian rings is pseudo-coherent.*

Proof. See Lemma 15.59.17. \square

Lemma 15.60.4. *A ring map which is flat and of finite presentation is perfect.*

Proof. Let $A \rightarrow B$ be a ring map which is flat and of finite presentation. It is clear that B has finite tor dimension. By Algebra, Lemma 10.156.1 there exists a finite type \mathbf{Z} -algebra $A_0 \subset A$ and a flat finite type ring map $A_0 \rightarrow B_0$ such that $B = B_0 \otimes_{A_0} A$. By Lemma 15.59.17 we see that $A_0 \rightarrow B_0$ is pseudo-coherent. As $A_0 \rightarrow B_0$ is flat we see that B_0 and A are tor independent over A_0 , hence we may use Lemma 15.59.12 to conclude that $A \rightarrow B$ is pseudo-coherent. \square

Lemma 15.60.5. *Let $A \rightarrow B$ be a finite type ring map with A a regular ring of finite dimension. Then $A \rightarrow B$ is perfect.*

Proof. By Algebra, Lemma 10.106.8 the assumption on A means that A has finite global dimension. Hence every module has finite tor dimension, see Lemma 15.51.15, in particular B does. By Lemma 15.60.3 the map is pseudo-coherent. \square

Lemma 15.60.6. *A local complete intersection homomorphism is perfect.*

Proof. Let $A \rightarrow B$ be a local complete intersection homomorphism. By Definition 15.23.2 this means that $B = A[x_1, \dots, x_n]/I$ where I is a Koszul ideal in $A[x_1, \dots, x_n]$. By Lemmas 15.60.2 and 15.56.3 it suffices to show that I is a perfect module over $A[x_1, \dots, x_n]$. By Lemma 15.56.11 this is a local question. Hence we may assume that I is generated by a Koszul-regular sequence (by Definition 15.22.1). Of course this means that I has a finite free resolution and we win. \square

15.61. Rlim of abelian groups and modules

We briefly discuss $R\lim$ on abelian groups and modules. In this section we will denote $Ab(\mathbf{N})$ the abelian category of inverse systems of abelian groups. This makes sense as an inverse system of abelian groups is the same thing as a sheaf of

groups on the category \mathbf{N} (with a unique morphism $i \rightarrow j$ if $i \leq j$), see Remark 15.61.4. Many of the arguments in this section duplicate the arguments used to construct the cohomological machinery for modules on ringed sites.

Lemma 15.61.1. *The functor $\lim : Ab(\mathbf{N}) \rightarrow Ab$ has a right derived functor*

$$(15.61.1.1) \quad R\lim : D(Ab(\mathbf{N})) \longrightarrow D(Ab)$$

As usual we set $R^p \lim(K) = H^p(R\lim(K))$. Moreover, we have

- (1) for any (A_n) in $Ab(\mathbf{N})$ we have $R^p \lim A_n = 0$ for $p > 1$,
- (2) the object $R\lim A_n$ of $D(Ab)$ is represented by the complex

$$\prod A_n \rightarrow \prod A_n, \quad (x_n) \mapsto (x_n - f_{n+1}(x_{n+1}))$$

sitting in degrees 0 and 1,

- (3) if (A_n) is ML, then $R^1 \lim A_n = 0$, i.e., (A_n) is right acyclic for \lim ,
- (4) every $K^\bullet \in D(Ab(\mathbf{N}))$ is quasi-isomorphic to a complex whose terms are right acyclic for \lim , and
- (5) if each $K^p = (K_n^p)$ is right acyclic for \lim , i.e., of $R^1 \lim_n K_n^p = 0$, then $R\lim K$ is represented by the complex whose term in degree p is $\lim_n K_n^p$.

Proof. Let (A_n) be an arbitrary inverse system. Let (B_n) be the inverse system with

$$B_n = A_n \oplus A_{n-1} \oplus \dots \oplus A_1$$

and transition maps given by projections. Let $A_n \rightarrow B_n$ be given by $(1, f_n, f_{n-1} \circ f_n, \dots, f_2 \circ \dots \circ f_n)$ where $f_i : A_i \rightarrow A_{i-1}$ are the transition maps. In this way we see that every inverse system is a subobject of a ML system (Homology, Section 12.27). It follows from Derived Categories, Lemma 13.16.6 using Homology, Lemma 12.27.3 that every ML system is right acyclic for \lim , i.e., (3) holds. This already implies that RF is defined on $D^+(Ab(\mathbf{N}))$, see Derived Categories, Proposition 13.16.8. Set $C_n = A_{n-1} \oplus \dots \oplus A_1$ for $n > 1$ and $C_1 = 0$ with transition maps given by projections as well. Then there is a short exact sequence of inverse systems $0 \rightarrow (A_n) \rightarrow (B_n) \rightarrow (C_n) \rightarrow 0$ where $B_n \rightarrow C_n$ is given by $(x_i) \mapsto (x_i - f_{i+1}(x_{i+1}))$. Since (C_n) is ML as well, we conclude that (2) holds (by proposition reference above) which also implies (1). Finally, this implies by Derived Categories, Lemma 13.30.2 that $R\lim$ is in fact defined on all of $D(Ab(\mathbf{N}))$. In fact, the proof of Derived Categories, Lemma 13.30.2 proceeds by proving assertions (4) and (5). \square

We give two simple applications. The first is the “correct” formulation of Homology, Lemma 12.27.7.

Lemma 15.61.2. *Let*

$$(A_n^{-2} \rightarrow A_n^{-1} \rightarrow A_n^0 \rightarrow A_n^1)$$

be an inverse system of complexes of abelian groups and denote $A^{-2} \rightarrow A^{-1} \rightarrow A^0 \rightarrow A^1$ its limit. Denote $(H_n^{-1}), (H_n^0)$ the inverse systems of cohomologies, and denote H^{-1}, H^0 the cohomologies of $A^{-2} \rightarrow A^{-1} \rightarrow A^0 \rightarrow A^1$. If

- (1) (A_n^{-2}) and (A_n^{-1}) have vanishing $R^1 \lim$,
- (2) (H_n^{-1}) has vanishing $R^1 \lim$,

then $H^0 = \lim H_i^0$.

Proof. Let $K \in D(\text{Ab}(\mathbf{N}))$ be the object represented by the system of complexes whose n th constituent is the complex $A_n^{-2} \rightarrow A_n^{-1} \rightarrow A_n^0 \rightarrow A_n^1$. We will compute $H^0(R \lim K)$ using both spectral sequences⁷ of Derived Categories, Lemma 13.21.3. The first has E_1 -page

$$\begin{array}{cccc} 0 & 0 & R^1 \lim A_n^0 & R^1 \lim A_n^1 \\ A^{-2} & A^{-1} & A^0 & A^1 \end{array}$$

with horizontal differentials and all higher differentials are zero. The second has E_2 page

$$\begin{array}{cccc} R^1 \lim H_n^{-2} & 0 & R^1 \lim H_n^0 & R^1 \lim H_n^1 \\ \lim H_n^{-2} & \lim H_n^{-1} & \lim H_n^0 & \lim H_n^1 \end{array}$$

and degenerates at this point. The result follows. \square

Lemma 15.61.3. *Let \mathcal{D} be a triangulated category. Let (K_n) be an inverse system of objects of \mathcal{D} . Let K be a derived limit of the system (K_n) . Then for every L in \mathcal{D} we have short exact sequences*

$$0 \rightarrow R^1 \lim \text{Hom}_{\mathcal{D}}(L, K_n[1]) \rightarrow \text{Hom}_{\mathcal{D}}(L, K) \rightarrow \lim \text{Hom}_{\mathcal{D}}(L, K_n) \rightarrow 0$$

Proof. This follows from Derived Categories, Definition 13.32.1 and Lemma 13.4.2, and the description of \lim and $R^1 \lim$ in Lemma 15.61.1 above. \square

Remark 15.61.4 (Rlim as cohomology). Consider the category \mathbf{N} whose objects are natural numbers and whose morphisms are unique arrows $i \rightarrow j$ if $j \geq i$. Endow \mathbf{N} with the chaotic topology (Sites, Example 7.6.6) so that a sheaf \mathcal{F} is the same thing as an inverse system

$$\mathcal{F}_1 \leftarrow \mathcal{F}_2 \leftarrow \mathcal{F}_3 \leftarrow \dots$$

of sets over \mathbf{N} . Note that $\Gamma(\mathbf{N}, \mathcal{F}) = \lim \mathcal{F}_n$. For an inverse system of abelian groups \mathcal{F}_n we have

$$R^p \lim \mathcal{F}_n = H^p(\mathbf{N}, \mathcal{F})$$

because both sides are the higher right derived functors of $\mathcal{F} \mapsto \lim \mathcal{F}_n = H^0(\mathbf{N}, \mathcal{F})$. Thus the existence of $R \lim$ also follows from the general material in Cohomology on Sites, Sections 21.3 and 21.19.

Warning. An object of $D(\text{Ab}(\mathbf{N}))$ is a complex of inverse systems of abelian groups. You can also think of this as an inverse system (K_n^\bullet) of complexes. However, this is **not** the same thing as an inverse system of objects of $D(\text{Ab})$; we will come back and explain the difference later.

The products in the following lemma can be seen as termwise products of complexes or as products in the derived category $D(\text{Ab})$, see Derived Categories, Lemma 13.32.2. This lemma in particular shows the notation in this section is compatible with the notation introduced in Derived Categories, Section 13.32. See Remark 15.61.16 for more explanation.

⁷To use these spectral sequences we have to show that $\text{Ab}(\mathbf{N})$ has enough injectives. A inverse system (I_n) of abelian groups is injective if and only if each I_n is an injective abelian group and the transition maps are split surjections. Every system embeds in one of these. Details omitted.

Lemma 15.61.5. *Let $K = (K_n^\bullet)$ be an object of $D(\text{Ab}(\mathbf{N}))$. There exists a canonical distinguished triangle*

$$R \lim K \rightarrow \prod_n K_n^\bullet \rightarrow \prod_n K_n^\bullet \rightarrow R \lim K[1]$$

in $D(\text{Ab})$ where the middle map fits into the commutative diagrams

$$\begin{array}{ccc} \prod_n K_n^\bullet & \longrightarrow & \prod_n K_n^\bullet \\ \downarrow & & \downarrow \\ K_n^\bullet \oplus K_{n+1}^\bullet & \xrightarrow{1-\pi} & K_n^\bullet \end{array}$$

whose vertical maps are projections and where $\pi : K_{n+1}^\bullet \rightarrow K_n^\bullet$ is the transition map of the system.

Proof. Suppose that for each p the inverse system (K_n^p) is right acyclic for \lim . By Lemma 15.61.1 this gives a short exact sequence

$$0 \rightarrow \lim_n K_n^p \rightarrow \prod_n K_n^p \rightarrow \prod_n K_n^p \rightarrow 0$$

for each p . Since the complex consisting of $\lim_n K_n^p$ computes $R \lim K$ by Lemma 15.61.1 we see that the lemma holds in this case.

Next, assume $K = (K_n^\bullet)$ is general. By Lemma 15.61.1 there is a quasi-isomorphism $K \rightarrow L$ in $D(\text{Ab}(\mathbf{N}))$ such that (L_n^p) is acyclic for each p . Then $\prod K_n^\bullet$ is quasi-isomorphic to $\prod L_n^\bullet$ as products are exact in Ab , whence the result for L (proved above) implies the result for K . \square

Lemma 15.61.6. *With notation as in Lemma 15.61.5 the long exact cohomology sequence associated to the distinguished triangle breaks up into short exact sequences*

$$0 \rightarrow R^1 \lim_n H^{p-1}(K_n^\bullet) \rightarrow H^p(R \lim K) \rightarrow \lim_n H^p(K_n^\bullet) \rightarrow 0$$

Proof. The long exact sequence of the distinguished triangle is

$$\dots \rightarrow H^p(R \lim K) \rightarrow \prod_n H^p(K_n^\bullet) \rightarrow \prod_n H^p(K_n^\bullet) \rightarrow H^{p+1}(R \lim K) \rightarrow \dots$$

The map in the middle has kernel $\lim_n H^p(K_n^\bullet)$ by its explicit description given in the lemma. The cokernel of this map is $R^1 \lim_n H^p(K_n^\bullet)$ by Lemma 15.61.1. \square

Lemma 15.61.7. *Let $E \rightarrow D$ be a morphism of $D(\text{Ab}(\mathbf{N}))$. Let (E_n) , resp. (D_n) be the system of objects of $D(\text{Ab})$ associated to E , resp. D . If $(E_n) \rightarrow (D_n)$ is an isomorphism of pro-objects, then $R \lim E \rightarrow R \lim D$ is an isomorphism in $D(\text{Ab})$.*

Proof. The assumption in particular implies that the pro-objects $H^p(E_n)$ and $H^p(D_n)$ are isomorphic. By the short exact sequences of Lemma 15.61.6 it suffices to show that given a map $(A_n) \rightarrow (B_n)$ of inverse systems of abelian groups which induces an isomorphism of pro-objects, then $\lim A_n \cong \lim B_n$ and $R^1 \lim A_n \cong R^1 \lim B_n$.

The assumption implies there are $1 \leq m_1 < m_2 < m_3 < \dots$ and maps $\varphi_n : B_{m_n} \rightarrow A_n$ such that $(\varphi_n) : (B_{m_n}) \rightarrow (A_n)$ is a map of systems which is inverse to the given map $\psi = (\psi_n) : (A_n) \rightarrow (B_n)$ as a morphism of pro-objects. What this means is that (after possibly replacing m_n by larger integers) we may assume that the compositions $A_{m_n} \rightarrow B_{m_n} \rightarrow A_n$ and $B_{m_n} \rightarrow A_n \rightarrow B_n$ are equal to the transition maps of the inverse systems. Now, if $(b_n) \in \lim B_n$ we can set $a_n = \varphi_{m_n}(b_{m_n})$.

This defines an inverse $\lim B_n \rightarrow \lim A_n$ (computation omitted). Let us use the cokernel of the map

$$\prod B_n \longrightarrow \prod B_n$$

as an avatar of $R^1 \lim B_n$ (Lemma 15.61.1). Any element in this cokernel can be represented by an element (b_i) with $b_i = 0$ if $i \neq m_n$ for some n (computation omitted). We can define a map $R^1 \lim B_n \rightarrow R^1 \lim A_n$ by mapping the class of such a special element (b_n) to the class of $(\varphi_n(b_{m_n}))$. We omit the verification this map is inverse to the map $R^1 \lim A_n \rightarrow R^1 \lim B_n$. \square

Lemma 15.61.8. *Let (A_n) be an inverse system of abelian groups. The following are equivalent*

- (1) (A_n) is zero as a pro-object,
- (2) $\lim A_n = 0$ and $R^1 \lim A_n = 0$ and the same holds for $\bigoplus_{i \in \mathbf{N}} (A_n)$.

Proof. It follows from Lemma 15.61.7 that (1) implies (2). For $m \geq n$ let $A_{n,m} = \text{Im}(A_m \rightarrow A_n)$ so that $A_n = A_{n,n} \supset A_{n,n+1} \supset \dots$. Note that (A_n) is zero as a pro-object if and only if for every n there is an $m \geq n$ such that $A_{n,m} = 0$. Note that (A_n) is ML if and only if for every n there is an $m_n \geq n$ such that $A_{n,m} = A_{n,m+1} = \dots$. In the ML case it is clear that $\lim A_n = 0$ implies that $A_{n,m_n} = 0$ because the maps $A_{n+1,m_{n+1}} \rightarrow A_{n,m}$ are surjective.

Assume (A_n) is not zero as a pro-object and not ML. Then we can pick an n and a sequence of integers $n < m_1 < m_2 < \dots$ and elements $x_i \in A_{m_i}$ whose image $y_i \in A_n$ is not in A_{n,m_i+1} . Set $B_n = \bigoplus_{i \in \mathbf{N}} A_n$. Let $\xi = (\xi_n) \in \prod B_n$ be the element with $\xi_n = 0$ unless $n = m_i$ and $\xi_{m_i} = (0, \dots, 0, x_i, 0, \dots)$ with x_i placed in the i th summand. We claim that ξ is not in the image of the map $\prod B_n \rightarrow \prod B_n$ of Lemma 15.61.1. This shows that $R^1 \lim B_n$ is nonzero and finishes the proof. Namely, suppose that ξ is the image of $\eta = (z_1, z_2, \dots)$ with $z_n = \sum z_{n,i} \in \bigoplus_i A_n$. Observe that $x_i = z_{m_i,i} \pmod{A_{m_i,m_i+1}}$. Then $z_{m_i-1,i}$ is the image of $z_{m_i,i}$ under $A_{m_i} \rightarrow A_{m_i-1}$, and so on, and we conclude that $z_{n,i}$ is the image of $z_{m_i,i}$ under $A_{m_i} \rightarrow A_n$. We conclude that $z_{n,i}$ is congruent to y_i modulo A_{n,m_i+1} . In particular $z_{n,i} \neq 0$. This is impossible as $\sum z_{n,i} \in \bigoplus_i A_n$ hence only a finite number of $z_{n,i}$ can be nonzero. \square

Let (A_n) be an inverse system of rings. We will denote $\text{Mod}(\mathbf{N}, (A_n))$ the category of inverse systems (M_n) of abelian groups such that each M_n is given the structure of a A_n -module and the transition maps $M_{n+1} \rightarrow M_n$ are A_{n+1} -module maps. This is an abelian category. Set $A = \lim A_n$. Given an object (M_n) of $\text{Mod}(\mathbf{N}, (A_n))$ the limit $\lim M_n$ is an A -module.

Lemma 15.61.9. *In the situation above. The functor $\lim : \text{Mod}(\mathbf{N}, (A_n)) \rightarrow \text{Mod}_A$ has a right derived functor*

$$R \lim : D(\text{Mod}(\mathbf{N}, (A_n))) \longrightarrow D(A)$$

As usual we set $R^p \lim(K) = H^p(R \lim(K))$. Moreover, we have

- (1) for any (A_n) in $\text{Mod}(\mathbf{N}, (A_n))$ we have $R^p \lim A_n = 0$ for $p > 1$,
- (2) the object $R \lim A_n$ of $D(\text{Mod}_A)$ is represented by the complex

$$\prod A_n \rightarrow \prod A_n, \quad (x_n) \mapsto (x_n - f_{n+1}(x_{n+1}))$$

sitting in degrees 0 and 1,

- (3) if (A_n) is ML, then $R^1 \lim A_n = 0$, i.e., (A_n) is right acyclic for \lim ,

- (4) every $K^\bullet \in D(\text{Mod}(\mathbf{N}, (A_n)))$ is quasi-isomorphic to a complex whose terms are right acyclic for \lim , and
- (5) if each $K^p = (K_n^p)$ is right acyclic for \lim , i.e., of $R^1 \lim_n K_n^p = 0$, then $R\lim K$ is represented by the complex whose term in degree p is $\lim_n K_n^p$.

Proof. The proof of this is word for word the same as the proof of Lemma 15.61.1. □

Remark 15.61.10. This remark is a continuation of Remark 15.61.4. A sheaf of rings on \mathbf{N} is just an inverse system of rings (A_n) . A sheaf of modules over (A_n) is exactly the same thing as an object of the category $\text{Mod}(\mathbf{N}, (A_n))$ defined above. The derived functor $R\lim$ of Lemma 15.61.9 is simply $R\Gamma(\mathbf{N}, -)$ from the derived category of modules to the derived category of modules over the global sections of the structure sheaf. It is true in general that cohomology of groups and modules agree, see Cohomology on Sites, Lemma 21.12.4.

Lemma 15.61.11. *Let (A_n) be an inverse system of rings. Every $K \in D(\text{Mod}(\mathbf{N}, (A_n)))$ can be represented by a system of complexes (M_n^\bullet) such that all the transition maps $M_{n+1}^\bullet \rightarrow M_n^\bullet$ are surjective.*

Proof. Let K be represented by the system (K_n^\bullet) . Set $M_1^\bullet = K_1^\bullet$. Suppose we have constructed surjective maps of complexes $M_n^\bullet \rightarrow M_{n-1}^\bullet \rightarrow \dots \rightarrow M_1^\bullet$ and homotopy equivalences $\psi_e : K_e^\bullet \rightarrow M_e^\bullet$ such that the diagrams

$$\begin{array}{ccc} K_{e+1}^\bullet & \longrightarrow & K_e^\bullet \\ \downarrow & & \downarrow \\ M_{e+1}^\bullet & \longrightarrow & M_e^\bullet \end{array}$$

commute for all $e < n$. Then we consider the diagram

$$\begin{array}{ccc} K_{n+1}^\bullet & \longrightarrow & K_n^\bullet \\ & & \downarrow \\ & & M_n^\bullet \end{array}$$

By Derived Categories, Lemma 13.9.8 we can factor the composition $K_{n+1}^\bullet \rightarrow M_n^\bullet$ as $K_{n+1}^\bullet \rightarrow M_{n+1}^\bullet \rightarrow M_n^\bullet$ such that the first arrow is a homotopy equivalence and the second a termwise split surjection. The lemma follows from this and induction. □

Lemma 15.61.12. *Let (A_n) be an inverse system of rings. Every $K \in D(\text{Mod}(\mathbf{N}, (A_n)))$ can be represented by a system of complexes (K_n^\bullet) such that each K_n^\bullet is K -flat.*

Proof. First use Lemma 15.61.11 to represent K by a system of complexes (M_n^\bullet) such that all the transition maps $M_{n+1}^\bullet \rightarrow M_n^\bullet$ are surjective. Next, let $K_1^\bullet \rightarrow M_1^\bullet$ be a quasi-isomorphism with K_1^\bullet a K -flat complex of A_1 -modules (Lemma 15.45.10). Suppose we have constructed $K_n^\bullet \rightarrow K_{n-1}^\bullet \rightarrow \dots \rightarrow K_1^\bullet$ and maps of complexes $\psi_e : K_e^\bullet \rightarrow M_e^\bullet$ such that

$$\begin{array}{ccc} K_{e+1}^\bullet & \longrightarrow & K_e^\bullet \\ \downarrow & & \downarrow \\ M_{e+1}^\bullet & \longrightarrow & M_e^\bullet \end{array}$$

commutes for all $e < n$. Then we consider the diagram

$$\begin{array}{ccc} C^\bullet & \xrightarrow{\quad} & K_n^\bullet \\ \downarrow & & \downarrow \psi_n \\ M_{n+1}^\bullet & \xrightarrow{\varphi_n} & M_n^\bullet \end{array}$$

in $D(A_{n+1})$. As $M_{n+1}^\bullet \rightarrow M_n^\bullet$ is termwise surjective, the complex C^\bullet fitting into the left upper corner with terms

$$C^p = M_{n+1}^p \times_{M_n^p} K_n^p$$

is quasi-isomorphic to M_{n+1}^\bullet (details omitted). Choose a quasi-isomorphism $K_{n+1}^\bullet \rightarrow C^\bullet$ with K_{n+1}^\bullet K -flat. Thus the lemma holds by induction. \square

Lemma 15.61.13. *Let (A_n) be an inverse system of rings. Given $K, L \in D(\text{Mod}(\mathbf{N}, (A_n)))$ there is a canonical derived tensor product $K \otimes^{\mathbf{L}} L$ in $D(\mathbf{N}, (A_n))$ compatible with the maps to $D(A_n)$. The construction is symmetric in K and L and an exact functor of triangulated categories in each variable.*

Proof. Choose a representative (K_n^\bullet) for K such that each K_n^\bullet is a K -flat complex (Lemma 15.61.12). Then you can define $K \otimes^{\mathbf{L}} L$ as the object represented by the system of complexes

$$(\text{Tot}(K_n^\bullet \otimes_{A_n} L_n^\bullet))$$

for any choice of representative (L_n^\bullet) for L . This is well defined in both variables by Lemmas 15.45.4 and 15.45.12. Compatibility with the map to $D(A_n)$ is clear. Exactness follows exactly as in Lemma 15.45.2. \square

As in the case of abelian groups an object $M = (M_n^\bullet)$ of $D(\text{Mod}(\mathbf{N}, (A_n)))$ is an inverse system of complexes of modules, which is **not** the same thing as an inverse system of objects in the derived categories. In the following lemma we show how an inverse system of objects in derived categories always lifts to an object of $D(\text{Mod}(\mathbf{N}, (A_n)))$.

Lemma 15.61.14. *Let (A_n) be an inverse system of rings. Suppose that we are given*

- (1) *for every n an object K_n^\bullet of $D(A_n)$, and*
- (2) *for every n a map $\varphi_n : K_{n+1}^\bullet \rightarrow K_n^\bullet$ of $D(A_{n+1})$ where we think of K_n^\bullet as an object of $D(A_{n+1})$ by restriction via the restriction map $A_{n+1} \rightarrow A_n$.*

There exists an object $M = (M_n^\bullet) \in D(\text{Mod}(\mathbf{N}, (A_n)))$ and isomorphisms $\psi_n : M_n^\bullet \rightarrow K_n^\bullet$ in $D(A_n)$ such that the diagrams

$$\begin{array}{ccc} M_{n+1}^\bullet & \longrightarrow & M_n^\bullet \\ \psi_{n+1} \downarrow & & \downarrow \psi_n \\ K_n^\bullet & \xrightarrow{\varphi_n} & K_n^\bullet \end{array}$$

commute in $D(A_{n+1})$.

Proof. Namely, set $M_1^\bullet = K_1^\bullet$. Suppose we have constructed $M_n^\bullet \rightarrow M_{n-1}^\bullet \rightarrow \dots \rightarrow M_1^\bullet$ and maps of complexes $\psi_e : M_e^\bullet \rightarrow K_e^\bullet$ such that the diagrams above

commute for all $e < n$. Then we consider the diagram

$$\begin{array}{ccc} & & M_n^\bullet \\ & & \downarrow \psi_n \\ K_{n+1}^\bullet & \xrightarrow{\varphi_n} & K_n^\bullet \end{array}$$

in $D(A_{n+1})$. By the definition of morphisms in $D(A_{n+1})$ we can find a quasi-isomorphism $\psi_{n+1} : M_{n+1}^\bullet \rightarrow K_{n+1}^\bullet$ of complexes of A_{n+1} -modules such that there exists a morphism of complexes $M_{n+1}^\bullet \rightarrow M_n^\bullet$ of A_{n+1} -modules representing the composition $\psi_n^{-1} \circ \varphi_n \circ \psi_{n+1}$ in $D(A_{n+1})$. Thus the lemma holds by induction. \square

Remark 15.61.15. With assumptions as in Lemma 15.61.14. A priori there are many isomorphism classes of objects M of $D(\text{Mod}(\mathbf{N}, (A_n)))$ which give rise to the system (K_n^\bullet, φ_n) as above. For each such M we can consider the complex $R\text{lim } M \in D(A)$ where $A = \lim A_n$. By Lemma 15.61.5 there exists a canonical distinguished triangle

$$R\text{lim } M \rightarrow \prod_n K_n^\bullet \rightarrow \prod_n K_n^\bullet \rightarrow R\text{lim } M[1]$$

in $D(A)$. Hence we see that the isomorphism class of $R\text{lim } M$ in $D(A)$ is independent of the choices made in constructing M , by axiom TR3 of triangulated categories and Derived Categories, Lemma 13.4.3.

Remark 15.61.16. Let (K_n) be an inverse system of objects of $D(\text{Ab})$. Let $K = R\text{lim } K_n$ be a derived limit of this system (see Derived Categories, Section 13.32). Such a derived limit exists because $D(\text{Ab})$ has countable products (Derived Categories, Lemma 13.32.2). By Lemma 15.61.14 we can also lift (K_n) to an object M of $D(\mathbf{N})$. Then $K \cong R\text{lim } M$ where $R\text{lim}$ is the functor (15.61.1.1) because $R\text{lim } M$ is also a derived limit of the system (K_n) (by Lemma 15.61.5) and derived limits are unique up to isomorphism. In particular for every $p \in \mathbf{Z}$ there is a canonical short exact sequence

$$0 \rightarrow R^1\text{lim } H^{p-1}(K_n) \rightarrow H^p(K) \rightarrow \lim H^p(K_n) \rightarrow 0$$

as follows from Lemma 15.61.5 for M . This can also be seen directly, without invoking the existence of M , by applying the argument of the proof of Lemma 15.61.5 to the (defining) distinguished triangle $K \rightarrow \prod K_n \rightarrow \prod K_n \rightarrow K[1]$.

Remark 15.61.17. Let A be a ring. Let (E_n) be an inverse system of objects of $D(A)$. We've seen above that a derived limit $R\text{lim } E_n$ exists. Thus for every object K of $D(A)$ also the derived limit $R\text{lim}(K \otimes_A^{\mathbf{L}} E_n)$ exists. It turns out that we can construct these derived limits functorially in K and obtain an exact functor

$$R\text{lim}(- \otimes_A^{\mathbf{L}} E_n) : D(A) \longrightarrow D(A)$$

of triangulated categories. Namely, we first lift (E_n) to an object E of $D(\mathbf{N}, A)$, see Lemma 15.61.14. (The functor will depend on the choice of this lift.) Next, observe that there is a “diagonal” or “constant” functor

$$\Delta : D(A) \longrightarrow D(\mathbf{N}, A)$$

mapping the complex K^\bullet to the constant inverse system of complexes with value K^\bullet . Then we simply define

$$R\text{lim}(K \otimes_A^{\mathbf{L}} E_n) = R\text{lim}(\Delta(K) \otimes^{\mathbf{L}} E)$$

where on the right hand side we use the functor $R\lim$ of Lemma 15.61.9 and the functor $-\otimes^{\mathbf{L}}-$ of Lemma 15.61.13.

Lemma 15.61.18. *Let A be a ring. Let $E \rightarrow D \rightarrow F \rightarrow E[1]$ be a distinguished triangle of $D(\mathbf{N}, A)$. Let (E_n) , resp. (D_n) , resp. (F_n) be the system of objects of $D(A)$ associated to E , resp. D , resp. F . Then for every $K \in D(A)$ there is a canonical distinguished triangle*

$$R\lim(K \otimes_A^{\mathbf{L}} E_n) \rightarrow R\lim(K \otimes_A^{\mathbf{L}} D_n) \rightarrow R\lim(K \otimes_A^{\mathbf{L}} F_n) \rightarrow R\lim(K \otimes_A^{\mathbf{L}} E_n)[1]$$

in $D(A)$ with notation as in Remark 15.61.17.

Proof. This is clear from the construction in Remark 15.61.17 and the fact that $\Delta : D(A) \rightarrow D(\mathbf{N}, A)$, $-\otimes^{\mathbf{L}}-$, and $R\lim$ are exact functors of triangulated categories. \square

Lemma 15.61.19. *Let A be a ring. Let $E \rightarrow D$ be a morphism of $D(\mathbf{N}, A)$. Let (E_n) , resp. (D_n) be the system of objects of $D(A)$ associated to E , resp. D . If $(E_n) \rightarrow (D_n)$ is an isomorphism of pro-objects, then for every $K \in D(A)$ the corresponding map*

$$R\lim(K \otimes_A^{\mathbf{L}} E_n) \longrightarrow R\lim(K \otimes_A^{\mathbf{L}} D_n)$$

in $D(A)$ is an isomorphism (notation as in Remark 15.61.17).

Proof. Follows from the definitions and Lemma 15.61.7. \square

15.62. Torsion modules

In this section “torsion modules” will refer to modules supported on a given closed subset $V(I)$ of an affine scheme $\text{Spec}(R)$. This is different, but analogous to, the notion of a torsion module over a domain (Definition 15.15.1).

Definition 15.62.1. Let R be a ring. Let M be an R -module.

- (1) Let $I \subset R$ be an ideal. We say M is an I -power torsion module if for every $m \in M$ there exists an $n > 0$ such that $I^n m = 0$.
- (2) Let $f \in R$. We say M is an f -power torsion module if for each $m \in M$, there exists an $n > 0$ such that $f^n m = 0$.

Thus an f -power torsion module is the same thing as a I -power torsion module for $I = (f)$. We will use the notation

$$M[I^n] = \{m \in M \mid I^n m = 0\}$$

and

$$M[I^\infty] = \bigcup M[I^n]$$

for an R -module M . Thus M is I -power torsion if and only if $M = M[I^\infty]$ if and only if $M = \bigcup M[I^n]$.

Lemma 15.62.2. *Let R be a ring. Let I be an ideal of R . Let M be an I -power torsion module. Then M admits a resolution*

$$\dots \rightarrow K_2 \rightarrow K_1 \rightarrow K_0 \rightarrow M \rightarrow 0$$

with each K_i a direct sum of copies of R/I^n for n variable.

Proof. There is a canonical surjection

$$\bigoplus_{m \in M} R/I^{n_m} \rightarrow M \rightarrow 0$$

where n_m is the smallest positive integer such that $I^{n_m} \cdot m = 0$. The kernel of the preceding surjection is also an I -power torsion module. Proceeding inductively, we construct the desired resolution of M . \square

Lemma 15.62.3. *Let R be a ring. Let I be an ideal of R . For any R -module M set $M[I^n] = \{m \in M \mid I^n m = 0\}$. If I is finitely generated then the following are equivalent*

- (1) $M[I] = 0$,
- (2) $M[I^n] = 0$ for all $n \geq 1$, and
- (3) if $I = (f_1, \dots, f_t)$, then the map $M \rightarrow \bigoplus M_{f_i}$ is injective.

Proof. This follows from Algebra, Lemma 10.22.4. \square

Lemma 15.62.4. *Let R be a ring. Let I be a finitely generated ideal of R .*

- (1) *For any R -module M we have $(M/M[I^\infty])[I] = 0$.*
- (2) *An extension of I -power torsion modules is I -power torsion.*

Proof. Let $m \in M$. If m maps to an element of $(M/M[I^\infty])[I]$ then $Im \subset M[I^\infty]$. Write $I = (f_1, \dots, f_t)$. Then we see that $f_i m \in M[I^\infty]$, i.e., $I^{n_i} f_i m = 0$ for some $n_i > 0$. Thus we see that $I^N m = 0$ with $N = \sum n_i + 2$. Hence m maps to zero in $(M/M[I^\infty])$ which proves the first statement of the lemma.

For the second, suppose that $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ is a short exact sequence of modules with M' and M'' both I -power torsion modules. Then $M[I^\infty] \supset M'$ and hence $M/M[I^\infty]$ is a quotient of M'' and therefore I -power torsion. Combined with the first statement and Lemma 15.62.3 this implies that it is zero \square

Lemma 15.62.5. *Let I be a finitely generated ideal of a ring R . The I -power torsion modules form a Serre subcategory of the abelian category Mod_R , see Homology, Definition 12.9.1.*

Proof. It is clear that a submodule and a quotient module of an I -power torsion module is I -power torsion. Moreover, the extension of two I -power torsion modules is I -power torsion by Lemma 15.62.4. Hence the statement of the lemma by Homology, Lemma 12.9.2. \square

Lemma 15.62.6. *Let R be a ring and let $I \subset R$ be a finitely generated ideal. The subcategory I^∞ -torsion $\subset \text{Mod}_R$ depends only on the closed subset $Z = V(I) \subset \text{Spec}(R)$. In fact, an R -module M is I -power torsion if and only if its support is contained in Z .*

Proof. Let M be an R -module. Let $x \in M$. If $x \in M[I^\infty]$, then x maps to zero in M_f for all $f \in I$. Hence x maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \not\supset I$. Conversely, if x maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \not\supset I$, then x maps to zero in M_f for all $f \in I$. Hence if $I = (f_1, \dots, f_r)$, then $f_i^{n_i} x = 0$ for some $n_i \geq 1$. It follows that $x \in M[I^{\sum n_i}]$. Thus $M[I^\infty]$ is the kernel of $M \rightarrow \prod_{\mathfrak{p} \notin Z} M_{\mathfrak{p}}$. The second statement of the lemma follows and it implies the first. \square

15.63. Formal glueing of module categories

Fix a noetherian scheme X , and a closed subscheme Z with complement U . Our goal is to explain how coherent sheaves on X can be constructed (uniquely) from coherent sheaves on the formal completion of X along Z , and those on U with a suitable compatibility on the overlap. We first do this using only commutative algebra (this section) and later we explain this in the setting of algebraic spaces (Pushouts of Spaces, Section 59.3).

Here are some references treating some of the material in this section: [Art70, Section 2], [FR70, Appendix], [BL95], [MB96], and [dJ95, Section 4.6].

Lemma 15.63.1. *Let $\varphi : R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. The following are equivalent*

- (1) φ is flat and $R/I \rightarrow S/IS$ is faithfully flat,
- (2) φ is flat, and the map $\text{Spec}(S/IS) \rightarrow \text{Spec}(R/I)$ is surjective.
- (3) φ is flat, and the base change functor $M \mapsto M \otimes_R S$ is faithful on modules annihilated by I , and
- (4) φ is flat, and the base change functor $M \mapsto M \otimes_R S$ is faithful on I -power torsion modules.

Proof. If $R \rightarrow S$ is flat, then $R/I^n \rightarrow S/I^n S$ is flat for every n , see Algebra, Lemma 10.38.6. Hence (1) and (2) are equivalent by Algebra, Lemma 10.38.15. The equivalence of (1) with (3) follows by identifying I -torsion R -modules with R/I -modules, using that

$$M \otimes_R S = M \otimes_{R/I} S/IS$$

for R -modules M annihilated by I , and Algebra, Lemma 10.38.13. The implication (4) \Rightarrow (3) is immediate. Assume (3). We have seen above that $R/I^n \rightarrow S/I^n S$ is flat, and by assumption it induces a surjection on spectra, as $\text{Spec}(R/I^n) = \text{Spec}(R/I)$ and similarly for S . Hence the base change functor is faithful on modules annihilated by I^n . Since any I -power torsion module M is the union $M = \bigcup M_n$ where M_n is annihilated by I^n we see that the base change functor is faithful on the category of all I -power torsion modules (as tensor product commutes with colimits). \square

Lemma 15.63.2. *Assume $(\varphi : R \rightarrow S, I)$ satisfies the equivalent conditions of Lemma 15.63.1. The following are equivalent*

- (1) for any I -power torsion module M , the natural map $M \rightarrow M \otimes_R S$ is an isomorphism, and
- (2) $R/I \rightarrow S/IS$ is an isomorphism.

Proof. The implication (1) \Rightarrow (2) is immediate. Assume (2). First assume that M is annihilated by I . In this case, M is an R/I -module. Hence, we have an isomorphism

$$M \otimes_R S = M \otimes_{R/I} S/IS = M \otimes_{R/I} R/I = M$$

proving the claim. Next we prove by induction that $M \rightarrow M \otimes_R S$ is an isomorphism for any module M is annihilated by I^n . Assume the induction hypothesis holds for n and assume M is annihilated by I^{n+1} . Then we have a short exact sequence

$$0 \rightarrow I^n M \rightarrow M \rightarrow M/I^n M \rightarrow 0$$

and as $R \rightarrow S$ is flat this gives rise to a short exact sequence

$$0 \rightarrow I^n M \otimes_R S \rightarrow M \otimes_R S \rightarrow M/I^n M \otimes_R S \rightarrow 0$$

Using that the canonical map is an isomorphism for $M' = I^n M$ and $M'' = M/I^n M$ (by induction hypothesis) we conclude the same thing is true for M . Finally, suppose that M is a general I -power torsion module. Then $M = \bigcup M_n$ where M_n is annihilated by I^n and we conclude using that tensor products commute with colimits. \square

Lemma 15.63.3. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R/I \rightarrow S/IS$ is an isomorphism. Then*

- (1) *for any R -module M the map $M \rightarrow M \otimes_R S$ induces an isomorphism $M[I^\infty] \rightarrow (M \otimes_R S)[(IS)^\infty]$ of I -power torsion submodules,*
- (2) *the natural map*

$$\text{Hom}_R(M, N) \longrightarrow \text{Hom}_S(M \otimes_R S, N \otimes_R S)$$

is an isomorphism if either M or N is I -power torsion, and

- (3) *the base change functor $M \mapsto M \otimes_R S$ defines an equivalence of categories between I -power torsion modules and IS -power torsion modules.*

Proof. Note that the equivalent conditions of both Lemma 15.63.1 and Lemma 15.63.2 are satisfied. We will use these without further mention. We first prove (1). Let M be any R -module. Set $M' = M/M[I^\infty]$ and consider the exact sequence

$$0 \rightarrow M[I^\infty] \rightarrow M \rightarrow M' \rightarrow 0$$

As $M[I^\infty] = M[I^\infty] \otimes_R S$ we see that it suffices to show that $(M' \otimes_R S)[(IS)^\infty] = 0$. Write $I = (f_1, \dots, f_t)$. By Lemma 15.62.4 we see that $M'[I^\infty] = 0$. Hence for every $n > 0$ the map

$$M' \longrightarrow \bigoplus_{i=1, \dots, t} M', \quad x \longmapsto (f_1^n x, \dots, f_t^n x)$$

is injective. As S is flat over R also the corresponding map $M' \otimes_R S \rightarrow \bigoplus_{i=1, \dots, t} M' \otimes_R S$ is injective. This means that $(M' \otimes_R S)[I^n] = 0$ as desired.

Next we prove (2). If N is I -power torsion, then $N \otimes_R S = N$ and the displayed map of (2) is an isomorphism by Algebra, Lemma 10.13.3. If M is I -power torsion, then the image of any map $M \rightarrow N$ factors through $M[I^\infty]$ and the image of any map $M \otimes_R S \rightarrow N \otimes_R S$ factors through $(N \otimes_R S)[(IS)^\infty]$. Hence in this case part (1) guarantees that we may replace N by $N[I^\infty]$ and the result follows from the case where N is I -power torsion we just discussed.

Next we prove (3). The functor is fully faithful by (2). For essential surjectivity, we simply note that for any IS -power torsion S -module N , the natural map $N \otimes_R S \rightarrow N$ is an isomorphism. \square

Lemma 15.63.4. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R/I \rightarrow S/IS$ is an isomorphism. For any $f_1, \dots, f_r \in R$ such that $V(f_1, \dots, f_r) = V(I)$*

- (1) *the map of Koszul complexes $K(R, f_1, \dots, f_r) \rightarrow K(S, f_1, \dots, f_r)$ is a quasi-isomorphism, and*

(2) *The map of extended alternating Čech complexes*

$$\begin{array}{ccccccc}
 R & \rightarrow & \prod_{i_0} R_{f_{i_0}} & \rightarrow & \prod_{i_0 < i_1} R_{f_{i_0} f_{i_1}} & \rightarrow & \dots \rightarrow R_{f_1 \dots f_r} \\
 & & & & \downarrow & & \\
 S & \rightarrow & \prod_{i_0} S_{f_{i_0}} & \rightarrow & \prod_{i_0 < i_1} S_{f_{i_0} f_{i_1}} & \rightarrow & \dots \rightarrow S_{f_1 \dots f_r}
 \end{array}$$

is a quasi-isomorphism.

Proof. In both cases we have a complex K_\bullet of R modules and we want to show that $K_\bullet \rightarrow K_\bullet \otimes_R S$ is a quasi-isomorphism. By Lemma 15.63.2 and the flatness of $R \rightarrow S$ this will hold as soon as all homology groups of K are I -power torsion. This is true for the Koszul complex by Lemma 15.20.6. Since the alternating Čech complex is a colimit of Koszul complexes (Lemma 15.20.13) the case of the Koszul complex implies the second statement too. \square

Lemma 15.63.5. *Let R be a ring. Let $I = (f_1, \dots, f_n)$ be a finitely generated ideal of R . Let M be the R -module generated by elements e_1, \dots, e_n subject to the relations $f_i e_j - f_j e_i = 0$. There exists a short exact sequence*

$$0 \rightarrow K \rightarrow M \rightarrow I \rightarrow 0$$

such that K is annihilated by I .

Proof. This is just a truncation of the Koszul complex. The map $M \rightarrow I$ is determined by the rule $e_i \mapsto f_i$. If $m = \sum a_i e_i$ is in the kernel of $M \rightarrow I$, i.e., $\sum a_i f_i = 0$, then $f_j m = \sum f_j a_i e_i = (\sum f_i a_i) e_j = 0$. \square

Lemma 15.63.6. *Let R be a ring. Let $I = (f_1, \dots, f_n)$ be a finitely generated ideal of R . For any R -module N set*

$$H_1(N, f_\bullet) = \frac{\{(x_1, \dots, x_n) \in N^{\oplus n} \mid f_i x_j = f_j x_i\}}{\{f_1 x, \dots, f_n x \mid x \in N\}}$$

For any R -module N there exists a canonical short exact sequence

$$0 \rightarrow \text{Ext}_R(R/I, N) \rightarrow H_1(N, f_\bullet) \rightarrow \text{Hom}_R(K, N)$$

where K is as in Lemma 15.63.5.

Proof. The notation above indicates the Ext-groups in Mod_R as defined in Homology, Section 12.6. These are denoted $\text{Ext}_R(M, N)$. Using the long exact sequence of Homology, Lemma 12.6.4 associated to the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow R/I \rightarrow 0$ and the fact that $\text{Ext}_R(R, N) = 0$ we see that

$$\text{Ext}_R(R/I, N) = \text{Coker}(N \rightarrow \text{Hom}(I, N))$$

Using the short exact sequence of Lemma 15.63.5 we see that we get a complex

$$N \rightarrow \text{Hom}(M, N) \rightarrow \text{Hom}_R(K, N)$$

whose homology in the middle is canonically isomorphic to $\text{Ext}_R(R/I, N)$. The proof of the lemma is now complete as the cokernel of the first map is canonically isomorphic to $H_1(N, f_\bullet)$. \square

Lemma 15.63.7. *Let R be a ring. Let $I = (f_1, \dots, f_n)$ be a finitely generated ideal of R . For any R -module N the Koszul homology group $H_1(N, f_\bullet)$ defined in Lemma 15.63.6 is annihilated by I .*

Proof. Let $(x_1, \dots, x_n) \in N^{\oplus n}$ with $f_i x_j = f_j x_i$. Then we have $f_i(x_1, \dots, x_n) = (f_i x_1, \dots, f_i x_n)$. In other words f_i annihilates $H_1(N, f_\bullet)$. \square

We can improve on the full faithfulness of Lemma 15.63.3 by showing that Ext-groups whose source is I -power torsion are insensitive to passing to S as well. See Dualizing Complexes, Lemma 43.8.14 for a derived version of the following lemma.

Lemma 15.63.8. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I \subset R$ is a finitely generated ideal such that $R/I \rightarrow S/IS$ is an isomorphism. Let M, N be R -modules. Assume M is I -power torsion. Given an short exact sequence*

$$0 \rightarrow N \otimes_R S \rightarrow \tilde{E} \rightarrow M \otimes_R S \rightarrow 0$$

there exists a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & N & \longrightarrow & E & \longrightarrow & M & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & N \otimes_R S & \longrightarrow & \tilde{E} & \longrightarrow & M \otimes_R S & \longrightarrow & 0 \end{array}$$

with exact rows.

Proof. As M is I -power torsion we see that $M \otimes_R S = M$, see Lemma 15.63.2. We will use this identification without further mention. As $R \rightarrow S$ is flat, the base change functor is exact and we obtain a functorial map of Ext-groups

$$\text{Ext}_R(M, N) \longrightarrow \text{Ext}_S(M \otimes_R S, N \otimes_R S),$$

see Homology, Lemma 12.7.2. The claim of the lemma is that this map is surjective when M is I -power torsion. In fact we will show that it is an isomorphism. By Lemma 15.62.2 we can find a surjection $M' \rightarrow M$ with M' a direct sum of modules of the form R/I^n . Using the long exact sequence of Homology, Lemma 12.6.4 we see that it suffices to prove the lemma for M' . Using compatibility of Ext with direct sums (details omitted) we reduce to the case where $M = R/I^n$ for some n .

Let f_1, \dots, f_t be generators for I^n . By Lemma 15.63.6 we have a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Ext}_R(R/I^n, N) & \longrightarrow & H_1(N, f_\bullet) & \longrightarrow & \text{Hom}_R(K, N) \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \text{Ext}_S(S/I^n S, N \otimes S) & \longrightarrow & H_1(N \otimes S, f_\bullet) & \longrightarrow & \text{Hom}_S(K \otimes S, N \otimes S) \end{array}$$

with exact rows where K is as in Lemma 15.63.5. Hence it suffices to prove that the two right vertical arrows are isomorphisms. Since K is annihilated by I^n we see that $\text{Hom}_R(K, N) = \text{Hom}_S(K \otimes_R S, N \otimes_R S)$ by Lemma 15.63.3. As $R \rightarrow S$ is flat we have $H_1(N, f_\bullet) \otimes_R S = H_1(N \otimes_R S, f_\bullet)$. As $H_1(N, f_\bullet)$ is annihilated by I^n , see Lemma 15.63.7 we have $H_1(N, f_\bullet) \otimes_R S = H_1(N, f_\bullet)$ by Lemma 15.63.2. \square

Let $R \rightarrow S$ be a ring map. Let $f_1, \dots, f_t \in R$ and $I = (f_1, \dots, f_t)$. Then for any R -module M we can define a complex

$$(15.63.8.1) \quad 0 \rightarrow M \xrightarrow{\alpha} M \otimes_R S \times \prod M_{f_i} \xrightarrow{\beta} \prod (M \otimes_R S)_{f_i} \times \prod M_{f_i f_j}$$

where $\alpha(m) = (m \otimes 1, m/1, \dots, m/1)$ and

$$\beta(m', m_1, \dots, m_t) = ((m'/1 - m_1 \otimes 1, \dots, m'/1 - m_t \otimes 1), (m_1 - m_2, \dots, m_{t-1} - m_t)).$$

We would like to know when this complex is exact.

Lemma 15.63.9. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I = (f_1, \dots, f_t) \subset R$ is an ideal such that $R/I \rightarrow S/IS$ is an isomorphism. Let M be an R -module. Then the complex (15.63.8.1) is exact.*

Proof. First proof. Denote $\check{C}_R \rightarrow \check{C}_S$ the quasi-isomorphism of extended alternating Čech complexes of Lemma 15.63.4. Since these complexes are bounded with flat terms, we see that $M \otimes_R \check{C}_R \rightarrow M \otimes_R \check{C}_S$ is a quasi-isomorphism too (Lemmas 15.45.8 and 15.45.12). Now the complex (15.63.8.1) is a truncation of the cone of the map $M \otimes_R \check{C}_R \rightarrow M \otimes_R \check{C}_S$ and we win.

Second computational proof. Let $m \in M$. If $\alpha(m) = 0$, then $m \in M[I^\infty]$, see Lemma 15.62.3. Pick n such that $I^n m = 0$ and consider the map $\varphi : R/I^n \rightarrow M$. If $m \otimes 1 = 0$, then $\varphi \otimes 1_S = 0$, hence $\varphi = 0$ (see Lemma 15.63.3) hence $m = 0$. In this way we see that α is injective.

Let $(m', m'_1, \dots, m'_t) \in \text{Ker}(\beta)$. Write $m'_i = m_i/f_i^n$ for some $n > 0$ and $m_i \in M$. We may, after possibly enlarging n assume that $f_i^n m'_i = m_i \otimes 1$ in $M \otimes_R S$ and $f_j^n m_i - f_i^n m_j = 0$ in M . In particular we see that (m_1, \dots, m_t) defines an element ξ of $H_1(M, (f_1^n, \dots, f_t^n))$. Since $H_1(M, (f_1^n, \dots, f_t^n))$ is annihilated by I^{t+1} (see Lemma 15.63.7) and since $R \rightarrow S$ is flat we see that

$$H_1(M, (f_1^n, \dots, f_t^n)) = H_1(M, (f_1^n, \dots, f_t^n)) \otimes_R S = H_1(M \otimes_R S, (f_1^n, \dots, f_t^n))$$

by Lemma 15.63.2 The existence of m' implies that ξ maps to zero in the last group, i.e., the element ξ is zero. Thus there exists an $m \in M$ such that $m_i = f_i^n m$. Then $(m', m'_1, \dots, m'_t) - \alpha(m) = (m'', 0, \dots, 0)$ for some $m'' \in (M \otimes_R S)[(IS)^\infty]$. By Lemma 15.63.3 we conclude that $m'' \in M[I^\infty]$ and we win. \square

Remark 15.63.10. In this remark we define a category of glueing data. Let $R \rightarrow S$ be a ring map. Let $f_1, \dots, f_t \in R$ and $I = (f_1, \dots, f_t)$. Consider the category $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ as the category whose

- (1) objects are systems $(M', M_i, \alpha_i, \alpha_{ij})$, where M' is an S -module, M_i is an R_{f_i} -module, $\alpha_i : (M')_{f_i} \rightarrow M_i \otimes_R S$ is an isomorphism, and $\alpha_{ij} : (M_i)_{f_j} \rightarrow (M_j)_{f_i}$ are isomorphisms such that
 - (a) $\alpha_{ij} \circ \alpha_i = \alpha_j$ as maps $(M')_{f_i f_j} \rightarrow (M_j)_{f_i}$, and
 - (b) $\alpha_{jk} \circ \alpha_{ij} = \alpha_{ik}$ as maps $(M_i)_{f_j f_k} \rightarrow (M_k)_{f_i f_j}$ (cocycle condition).
- (2) morphisms $(M', M_i, \alpha_i, \alpha_{ij}) \rightarrow (N', N_i, \beta_i, \beta_{ij})$ are given by maps $\varphi' : M' \rightarrow N'$ and $\varphi_i : M_i \rightarrow N_i$ compatible with the given maps $\alpha_i, \beta_i, \alpha_{ij}, \beta_{ij}$.

There is a canonical functor

$$\text{Can} : \text{Mod}_R \longrightarrow \text{Glue}(R \rightarrow S, f_1, \dots, f_t), \quad M \longmapsto (M \otimes_R S, M_{f_i}, \text{can}_i, \text{can}_{ij})$$

where $\text{can}_i : (M \otimes_R S)_{f_i} \rightarrow M_{f_i} \otimes_R S$ and $\text{can}_{ij} : (M_{f_i})_{f_j} \rightarrow (M_{f_j})_{f_i}$ are the canonical isomorphisms. For any object $\mathbf{M} = (M', M_i, \alpha_i, \alpha_{ij})$ of the category $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ we define

$$H^0(\mathbf{M}) = \{(m', m_i) \mid \alpha_i(m') = m_i \otimes 1, \alpha_{ij}(m_i) = m_j\}$$

in other words defined by the exact sequence

$$0 \rightarrow H^0(\mathbf{M}) \rightarrow M' \times \prod M_i \rightarrow \prod M'_{f_i} \times \prod (M_i)_{f_j}$$

similar to (15.63.8.1). We think of $H^0(\mathbf{M})$ as an R -module. Thus we also get a functor

$$H^0 : \text{Glue}(R \rightarrow S, f_1, \dots, f_t) \longrightarrow \text{Mod}_R$$

Our next goal is to show that the functors Can and H^0 are sometimes quasi-inverse to each other.

Lemma 15.63.11. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I = (f_1, \dots, f_t) \subset R$ is an ideal such that $R/I \rightarrow S/IS$ is an isomorphism. Then the functor H^0 is a left quasi-inverse to the functor Can of Remark 15.63.10.*

Proof. This is a reformulation of Lemma 15.63.9. □

Lemma 15.63.12. *Assume $\varphi : R \rightarrow S$ is a flat ring map and let $I = (f_1, \dots, f_t) \subset R$ be an ideal. Then $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ is an abelian category, and the functor Can is exact and commutes with arbitrary colimits.*

Proof. Given a morphism $(\varphi', \varphi_i) : (M', M_i, \alpha_i, \alpha_{ij}) \rightarrow (N', N_i, \beta_i, \beta_{ij})$ of the category $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ we see that its kernel exists and is equal to the object $(\text{Ker}(\varphi'), \text{Ker}(\varphi_i), \alpha_i, \alpha_{ij})$ and its cokernel exists and is equal to the object $(\text{Coker}(\varphi'), \text{Coker}(\varphi_i), \beta_i, \beta_{ij})$. This works because $R \rightarrow S$ is flat, hence taking kernels/cokernels commutes with $-\otimes_R S$. Details omitted. The exactness follows from the R -flatness of R_{f_i} and S , while commuting with colimits follows as tensor products commute with colimits. □

Lemma 15.63.13. *Let $\varphi : R \rightarrow S$ be a flat ring map and $(f_1, \dots, f_t) = R$. Then Can and H^0 are quasi-inverse equivalences of categories*

$$\text{Mod}_R = \text{Glue}(R \rightarrow S, f_1, \dots, f_t)$$

Proof. Consider an object $\mathbf{M} = (M', M_i, \alpha_i, \alpha_{ij})$ of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$. By Algebra, Lemma 10.23.4 there exists a unique module M and isomorphisms $M_{f_i} \rightarrow M_i$ which recover the glueing data α_{ij} . Then both M' and $M \otimes_R S$ are S -modules which recover the modules $M_i \otimes_R S$ upon localizing at f_i . Whence there is a canonical isomorphism $M \otimes_R S \rightarrow M'$. This shows that \mathbf{M} is in the essential image of Can . Combined with Lemma 15.63.11 the lemma follows. □

Lemma 15.63.14. *Let $\varphi : R \rightarrow S$ be a flat ring map and $I = (f_1, \dots, f_t)$ and ideal. Let $R \rightarrow R'$ be a flat ring map, and set $S' = S \otimes_R R'$. Then we obtain a commutative diagram of categories and functors*

$$\begin{array}{ccccc} \text{Mod}_R & \xrightarrow{\text{Can}} & \text{Glue}(R \rightarrow S, f_1, \dots, f_t) & \xrightarrow{H^0} & \text{Mod}_R \\ \downarrow -\otimes_R R' & & \downarrow -\otimes_R R' & & \downarrow -\otimes_R R' \\ \text{Mod}_{R'} & \xrightarrow{\text{Can}} & \text{Glue}(R' \rightarrow S', f_1, \dots, f_t) & \xrightarrow{H^0} & \text{Mod}_{R'} \end{array}$$

Proof. Omitted. □

Proposition 15.63.15. *Assume $\varphi : R \rightarrow S$ is a flat ring map and $I = (f_1, \dots, f_t) \subset R$ is an ideal such that $R/I \rightarrow S/IS$ is an isomorphism. Then Can and H^0 are quasi-inverse equivalences of categories*

$$\text{Mod}_R = \text{Glue}(R \rightarrow S, f_1, \dots, f_t)$$

Proof. We have already seen that $H^0 \circ \text{Can}$ is isomorphic to the identity functor, see Lemma 15.63.11. Consider an object $\mathbf{M} = (M', M_i, \alpha_i, \alpha_{ij})$ of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$. We get a natural morphism

$$\Psi : (H^0(\mathbf{M}) \otimes_R S, H^0(\mathbf{M})_{f_i}, \text{can}_i, \text{can}_{ij}) \longrightarrow (M', M_i, \alpha_i, \alpha_{ij}).$$

Namely, by definition $H^0(\mathbf{M})$ comes equipped with compatible R -module maps $H^0(\mathbf{M}) \rightarrow M'$ and $H^0(\mathbf{M}) \rightarrow M_i$. We have to show that this map is an isomorphism.

Pick an index i and set $R' = R_{f_i}$. Combining Lemmas 15.63.14 and 15.63.13 we see that $\Psi \otimes_R R'$ is an isomorphism. Hence the kernel, resp. cokernel of Ψ is a system of the form $(K, 0, 0, 0)$, resp. $(Q, 0, 0, 0)$. Note that $H^0((K, 0, 0, 0)) = K$, that H^0 is left exact, and that by construction $H^0(\Psi)$ is bijective. Hence we see $K = 0$, i.e., the kernel of Ψ is zero.

The conclusion of the above is that we obtain a short exact sequence

$$0 \rightarrow H^0(\mathbf{M}) \otimes_R S \rightarrow M' \rightarrow Q \rightarrow 0$$

and that $M_i = H^0(\mathbf{M})_{f_i}$. Note that we may think of Q as an R -module which is I -power torsion so that $Q = Q \otimes_R S$. By Lemma 15.63.8 we see that there exists a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & H^0(\mathbf{M}) & \longrightarrow & E & \longrightarrow & Q & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & H^0(\mathbf{M}) \otimes_R S & \longrightarrow & M' & \longrightarrow & Q & \longrightarrow & 0 \end{array}$$

with exact rows. This clearly determines an isomorphism $\text{Can}(E) \rightarrow (M', M_i, \alpha_i, \alpha_{ij})$ in the category $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ and we win. (Of course, a posteriori we have $Q = 0$.) \square

Lemma 15.63.16. *Let $\varphi : R \rightarrow S$ be a flat ring map and let $I \subset R$ be a finitely generated ideal such that $R/I \rightarrow S/IS$ is an isomorphism.*

- (1) *Given an R -module N , an S -module M' and an S -module map $\varphi : M' \rightarrow N \otimes_R S$ whose kernel and cokernel are I -power torsion, there exists an R -module map $\psi : M \rightarrow N$ and an isomorphism $M \otimes_R S = M'$ compatible with φ and ψ .*
- (2) *Given an R -module M , an S -module N' and an S -module map $\varphi : M \otimes_R S \rightarrow N'$ whose kernel and cokernel are I -power torsion, there exists an R -module map $\psi : M \rightarrow N$ and an isomorphism $N \otimes_R S = N'$ compatible with φ and ψ .*

In both cases we have $\text{Ker}(\varphi) \cong \text{Ker}(\psi)$ and $\text{Coker}(\varphi) \cong \text{Coker}(\psi)$.

Proof. Proof of (1). Say $I = (f_1, \dots, f_t)$. It is clear that the localization φ_{f_i} is an isomorphism. Thus we see that $(M', N_{f_i}, \varphi_{f_i}, \text{can}_{ij})$ is an object of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$, see Remark 15.63.10. By Proposition 15.63.15 we conclude that there exists an R -module M such that $M' = M \otimes_R S$ and $N_{f_i} = M_{f_i}$ compatibly with the isomorphisms φ_{f_i} and can_{ij} . There is a morphism

$$(M \otimes_R S, M_{f_i}, \text{can}_i, \text{can}_{ij}) = (M', N_{f_i}, \varphi_{f_i}, \text{can}_{ij}) \rightarrow (N \otimes_R S, N_{f_i}, \text{can}_i, \text{can}_{ij})$$

of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ which uses φ in the first component. This corresponds to an R -module map $\psi : M \rightarrow N$ (by the equivalence of categories of Proposition

15.63.15). The composition of the base change of $M \rightarrow N$ with the isomorphism $M' \cong M \otimes_R S$ is φ , in other words $M \rightarrow N$ is compatible with φ .

Proof of (2). This is just the dual of the argument above. Namely, the localization φ_{f_i} is an isomorphism. Thus we see that $(N', M_{f_i}, \varphi_{f_i}^{-1}, \text{can}_{ij})$ is an object of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$, see Remark 15.63.10. By Proposition 15.63.15 we conclude that there exists an R -module N such that $N' = N \otimes_R S$ and $N_{f_i} = M_{f_i}$ compatibly with the isomorphisms $\varphi_{f_i}^{-1}$ and can_{ij} . There is a morphism

$$(M \otimes_R S, M_{f_i}, \text{can}_i, \text{can}_{ij}) \rightarrow (N', M_{f_i}, \varphi_{f_i}, \text{can}_{ij}) = (N \otimes_R S, N_{f_i}, \text{can}_i, \text{can}_{ij})$$

of $\text{Glue}(R \rightarrow S, f_1, \dots, f_t)$ which uses φ in the first component. This corresponds to an R -module map $\psi : M \rightarrow N$ (by the equivalence of categories of Proposition 15.63.15). The composition of the base change of $M \rightarrow N$ with the isomorphism $N' \cong N \otimes_R S$ is φ , in other words $M \rightarrow N$ is compatible with φ .

The final statement follows for example from Lemma 15.63.3. \square

Next, we specialize this very general proposition to get something more useable. Namely, if $I = (f)$ is a principal ideal then the objects of $\text{Glue}(R \rightarrow S, f)$ are simply triples (M', M_1, α_1) and there is *no* cocycle condition to check!

Theorem 15.63.17. *Let R be a ring, and let $f \in R$. Let $\varphi : R \rightarrow S$ be a flat ring map inducing an isomorphism $R/fR \rightarrow S/fS$. Then the functor*

$$\text{Mod}_R \longrightarrow \text{Mod}_S \times_{\text{Mod}_{S_f}} \text{Mod}_{R_f}, \quad M \longmapsto (M \otimes_R S, M_f, \text{can})$$

is an equivalence.

Proof. The category appearing on the right side of the arrow is the category of triples (M', M_1, α_1) where M' is an S -module, M_1 is a R_f -module, and $\alpha_1 : M'_f \rightarrow M_1 \otimes_R S$ is a S_f -isomorphism, see Categories, Example 4.29.3. Hence this theorem is a special case of Proposition 15.63.15. \square

A useful special case of Theorem 15.63.17 is when R is noetherian, and S is a completion of R at an element f . The completion $R \rightarrow S$ is flat, and the functor $M \mapsto M \otimes_R S$ can be identified with the f -adic completion functor when M is finitely generated. To state this more precisely, let Mod_R^{fg} denote the category of finitely generated R -modules.

Proposition 15.63.18. *Let R be a noetherian ring. Let $f \in R$ be an element. Let R^\wedge be the f -adic completion of R . Then the functor $M \mapsto (M^\wedge, M_f, \text{can})$ defines an equivalence*

$$\text{Mod}_R^{fg} \longrightarrow \text{Mod}_{R^\wedge}^{fg} \times_{\text{Mod}_{(R^\wedge)_f}^{fg}} \text{Mod}_{R_f}^{fg}$$

Proof. The ring map $R \rightarrow R^\wedge$ is flat by Algebra, Lemma 10.93.3. It is clear that $R/fR = R^\wedge/fR^\wedge$. By Algebra, Lemma 10.93.2 the completion of a finite R -module M is equal to $M \otimes_R R^\wedge$. Hence the displayed functor of the proposition is equal to the functor occurring in Theorem 15.63.17. In particular it is fully faithful. Let (M_1, M_2, ψ) be an object of the right hand side. By Theorem 15.63.17 there exists an R -module M such that $M_1 = M \otimes_R R^\wedge$ and $M_2 = M_f$. As $R \rightarrow R^\wedge \times_{R_f}$ is faithfully flat we conclude from Algebra, Lemma 10.23.2 that M is finitely generated, i.e., $M \in \text{Mod}_R^{fg}$. This proves the proposition. \square

Remark 15.63.19. The equivalences of Proposition 15.63.15, Theorem 15.63.17, and Proposition 15.63.18 preserve properties of modules. For example if M corresponds to $\mathbf{M} = (M', M_i, \alpha_i, \alpha_{ij})$ then M is finite, or finitely presented, or flat, or projective over R if and only if M' and M_i have the corresponding property over S and R_{f_i} . This follows from the fact that $R \rightarrow S \times \prod R_{f_i}$ is faithfully flat and descent and ascent of these properties along faithfully flat maps, see Algebra, Lemma 10.80.2 and Theorem 10.92.5. These functors also preserve the \otimes -structures on either side. Thus, it defines equivalences of various categories built out of the pair (Mod_R, \otimes) , such as the category of algebras.

Remark 15.63.20. Given a differential manifold X with a compact closed submanifold Z having complement U , specifying a sheaf on X is the same as specifying a sheaf on U , a sheaf on an unspecified tubular neighbourhood T of Z in X , and an isomorphism between the two resulting sheaves along $T \cap U$. Tubular neighbourhoods do not exist in algebraic geometry as such, but results such as Proposition 15.63.15, Theorem 15.63.17, and Proposition 15.63.18 allow us to work with formal neighbourhoods instead.

15.64. Derived Completion

Some references for the material in this section are [DG02], [GM92], [Lur11] (especially Chapter 4). Our exposition follows [BS13]. The analogue (or “dual”) of this section for torsion modules is Dualizing Complexes, Section 43.8. The relationship between the derived category of complexes with torsion cohomology and derived complete complexes can be found in Dualizing Complexes, Section 43.9.

Let $K \in D(A)$. Let $f \in A$. We denote $T(K, f)$ a derived limit of the system

$$\dots \rightarrow K \xrightarrow{f} K \xrightarrow{f} K$$

in $D(A)$.

Lemma 15.64.1. *Let A be a ring. Let $f \in A$. Let $K \in D(A)$. The following are equivalent*

- (1) $\text{Ext}_A^n(A_f, K) = 0$ for all n ,
- (2) $\text{Hom}_{D(A)}(E, K) = 0$ for all E in $D(A_f)$,
- (3) $T(K, f) = 0$,
- (4) for every $p \in \mathbf{Z}$ we have $T(H^p(K), f) = 0$,
- (5) for every $p \in \mathbf{Z}$ we have $\text{Hom}_A(A_f, H^p(K)) = 0$ and $\text{Ext}_A^1(A_f, H^p(K)) = 0$,
- (6) $R\text{Hom}(A_f, K) = 0$,
- (7) add more here.

Proof. It is clear that (2) implies (1) and that (1) is equivalent to (6). Assume (1). Let I^\bullet be a K-injective complex of A -modules representing K . Condition (1) signifies that $\text{Hom}_A(A_f, I^\bullet)$ is acyclic. Let M^\bullet be a complex of A_f -modules representing E . Then

$$\text{Hom}_{D(A)}(E, K) = \text{Hom}_{K(A)}(M^\bullet, I^\bullet) = \text{Hom}_{K(A_f)}(M^\bullet, \text{Hom}_A(A_f, I^\bullet))$$

by Algebra, Lemma 10.13.4. As $\text{Hom}_A(A_f, I^\bullet)$ is a K-injective complex of A_f -modules by Lemma 15.43.3 the fact that it is acyclic implies that it is homotopy equivalent to zero (Derived Categories, Lemma 13.29.2). Thus we get (2).

A free resolution of the A -module A_f is given by

$$0 \rightarrow \bigoplus_{n \in \mathbf{N}} A \rightarrow \bigoplus_{n \in \mathbf{N}} A \rightarrow A_f \rightarrow 0$$

where the first map sends the (x_0, x_1, \dots) to $(fx_0 - x_1, fx_1 - x_2, \dots)$ and the second map sends (x_0, x_1, \dots) to $x_0 + x_1/f + x_2/f^2 + \dots$. Applying $\text{Hom}_A(-, I^\bullet)$ we get

$$0 \rightarrow \text{Hom}_A(A_f, I^\bullet) \rightarrow \prod I^\bullet \rightarrow \prod I^\bullet \rightarrow 0$$

This means that the object $T(K, f)$ is a representative of $R\text{Hom}_A(A_f, K)$ in $D(A)$. Thus the equivalence of (1) and (3).

There is a spectral sequence

$$E_2^{p,q} = \text{Ext}_A^q(A_f, H^p(K)) \Rightarrow \text{Ext}_A^{p+q}(A_f, K)$$

(details omitted). This spectral sequence degenerates at E_2 because A_f has a length 1 resolution by projective A -modules (see above) hence the E_2 -page has only 2 nonzero rows. Thus we obtain short exact sequences

$$0 \rightarrow \text{Ext}_A^1(A_f, H^{p-1}(K)) \rightarrow \text{Ext}_A^p(A_f, K) \rightarrow \text{Hom}_A(A_f, H^p(K)) \rightarrow 0$$

This proves (4) and (5) are equivalent to (1). □

Lemma 15.64.2. *Let A be a ring. Let $K \in D(A)$. The set I of $f \in A$ such that $T(K, f) = 0$ is an ideal of A .*

Proof. We will use the results of Lemma 15.64.1 without further mention. If $f \in I$, and $g \in A$, then A_{gf} is an A_f -module hence $\text{Ext}_A^n(A_{gf}, K) = 0$ for all n , hence $gf \in I$. Suppose $f, g \in I$. Then there is a short exact sequence

$$0 \rightarrow A_{f+g} \rightarrow A_{f(f+g)} \oplus A_{g(f+g)} \rightarrow A_{gf(f+g)} \rightarrow 0$$

because f, g generate the unit ideal in A_{f+g} . This follows from Algebra, Lemma 10.22.1 and the easy fact that the last arrow is surjective. By the long exact sequence of Ext and the vanishing of $\text{Ext}_A^n(A_{f(f+g)}, K)$, $\text{Ext}_A^n(A_{g(f+g)}, K)$, and $\text{Ext}_A^n(A_{gf(f+g)}, K)$ we get the vanishing of $\text{Ext}_A^n(A_{f+g}, K)$. □

Lemma 15.64.3. *Let A be a ring. Let $I \subset A$ be an ideal. Let M be an A -module.*

- (1) *If M is I -adically complete, then $T(M, f) = 0$ for all $f \in I$.*
- (2) *Conversely, if $T(M, f) = 0$ for all $f \in I$ and I is finitely generated, then $M \rightarrow \lim M/I^n M$ is surjective.*

Proof. Proof of (1). Assume M is I -adically complete. By Lemma 15.64.1 it suffices to prove $\text{Ext}_A^1(A_f, M) = 0$ and $\text{Hom}_A(A_f, M) = 0$. Since $M = \lim M/I^n M$ and since $\text{Hom}_A(A_f, M/I^n M) = 0$ it follows that $\text{Hom}_A(A_f, M) = 0$. Suppose we have an extension

$$0 \rightarrow M \rightarrow E \rightarrow A_f \rightarrow 0$$

For $n \geq 0$ pick $e_n \in E$ mapping to $1/f^n$. Set $\delta_n = fe_{n+1} - e_n \in M$ for $n \geq 0$. Replace e_n by

$$e'_n = e_n + \delta_n + f\delta_{n+1} + f^2\delta_{n+2} + \dots$$

The infinite sum exists as M is complete with respect to I and $f \in I$. A simple calculation shows that $fe'_{n+1} = e'_n$. Thus we get a splitting of the extension by mapping $1/f^n$ to e'_n .

Proof of (2). Assume that $I = (f_1, \dots, f_r)$ and that $T(M, f_i) = 0$ for $i = 1, \dots, r$. By Algebra, Lemma 10.93.12 we may assume $I = (f)$ and $T(M, f) = 0$. Let $x_n \in M$ for $n \geq 0$. Consider the extension

$$0 \rightarrow M \rightarrow E \rightarrow A_f \rightarrow 0$$

given by

$$E = M \oplus \bigoplus A e_n / \langle x_n - f e_{n+1} + e_n \rangle$$

mapping e_n to $1/f^n$ in A_f (see above). By assumption and Lemma 15.64.1 this extension is split, hence we obtain an element $x + e_0$ which generates a copy of A_f in E . Then

$$x + e_0 = x - x_0 + f e_1 = x - x_0 - x_1 + f^2 e_2 = \dots$$

Since $M/f^n M = E/f^n E$ by the snake lemma, we see that $x = x_0 + f x_1 + \dots + f^{n-1} x_{n-1}$ modulo $f^n M$. In other words, the map $M \rightarrow \lim M/f^n M$ is surjective as desired. \square

Motivated by the results above we make the following definition.

Definition 15.64.4. Let A be a ring. Let $K \in D(A)$. Let $I \subset A$ be an ideal. We say K is *derived complete with respect to I* if for every $f \in I$ we have $T(K, f) = 0$. If M is an A -module, then we say M is *derived complete with respect to I* if $M[0] \in D(A)$ is derived complete with respect to I .

The full subcategory $D_{\text{comp}}(A) = D_{\text{comp}}(A, I) \subset D(A)$ consisting of derived complete objects is a strictly full, saturated triangulated subcategory, see Derived Categories, Definitions 13.3.4 and 13.6.1. This subcategory is preserved under products and homotopy limits in $D(A)$. But it is not preserved under countable direct sums in general. We will often simply say M is a derived complete module if the choice of the ideal I is clear from the context.

Proposition 15.64.5. *Let $I \subset A$ be a finitely generated ideal of a ring A . Let M be an A -module. The following are equivalent*

- (1) M is I -adically complete, and
- (2) M is derived complete with respect to I and $\bigcap I^n M = 0$.

Proof. This is clear from the results of Lemma 15.64.3. \square

The next lemma shows that the category \mathcal{C} of derived complete modules is abelian. It turns out that \mathcal{C} is not a Grothendieck abelian category, see Examples, Section 82.10.

Lemma 15.64.6. *Let I be an ideal of a ring A .*

- (1) *The derived complete A -modules form a weak Serre subcategory \mathcal{C} of Mod_A .*
- (2) *$D_{\mathcal{C}}(A) \subset D(A)$ is the full subcategory of derived complete objects.*

Proof. Part (2) is immediate from Lemma 15.64.1 and the definitions. For part (1), suppose that $M \rightarrow N$ is a map of derived complete modules. Denote $K = (M \rightarrow N)$ the corresponding object of $D(A)$. Pick $f \in I$. Then $\text{Ext}_A^n(A_f, K)$ is zero for all n because $\text{Ext}_A^n(A_f, M)$ and $\text{Ext}_A^n(A_f, N)$ are zero for all n . Hence K is derived complete. By (2) we see that $\text{Ker}(M \rightarrow N)$ and $\text{Coker}(M \rightarrow N)$ are objects of \mathcal{C} . Finally, suppose that $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ is a short exact sequence of A -modules and M_1, M_3 are derived complete. Then it follows from the long exact

sequence of Ext's that M_2 is derived complete. Thus \mathcal{C} is a weak Serre subcategory by Homology, Lemma 12.9.3. \square

If the ring is I -adically complete, then one obtains an ample supply of derived complete complexes.

Lemma 15.64.7. *Let A be a ring and $I \subset A$ an ideal. If A is I -adically complete then any pseudo-coherent object of $D(A)$ is derived complete.*

Proof. Let K be a pseudo-coherent object of $D(A)$. By definition this means K is represented by a bounded above complex K^\bullet of finite free A -modules. Since A is I -adically complete, hence derived complete (Lemma 15.64.3). It follows that $H^n(K)$ is derived complete for all n , by part (1) of Lemma 15.64.6. This in turn implies that K is derived complete by part (2) of the same lemma. \square

Lemma 15.64.8. *Let A be a ring. Let $f, g \in A$. Then for $K \in D(A)$ we have $R\text{Hom}(A_f, R\text{Hom}(A_g, K)) = R\text{Hom}(A_{fg}, K)$.*

Proof. This follows from Lemma 15.55.1. \square

Lemma 15.64.9. *Let I be a finitely generated ideal of a ring A . The inclusion functor $D_{\text{comp}}(A, I) \rightarrow D(A)$ has a left adjoint, i.e., given any object K of $D(A)$ there exists a map $K \rightarrow K^\wedge$ of K into a derived complete object of $D(A)$ such that the map*

$$\text{Hom}_{D(A)}(K^\wedge, E) \longrightarrow \text{Hom}_{D(A)}(K, E)$$

is bijective whenever E is a derived complete object of $D(A)$. In fact, if I is generated by $f_1, \dots, f_r \in A$, then we have

$$K^\wedge = R\text{Hom}\left(\left(A \rightarrow \prod_{i_0} A_{f_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{f_{i_0}f_{i_1}} \rightarrow \dots \rightarrow A_{f_1 \dots f_r}\right), K\right)$$

functorially in K .

Proof. Define K^\wedge by the last displayed formula of the lemma. There is a map of complexes

$$\left(A \rightarrow \prod_{i_0} A_{f_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{f_{i_0}f_{i_1}} \rightarrow \dots \rightarrow A_{f_1 \dots f_r}\right) \longrightarrow A$$

which induces a map $K \rightarrow K^\wedge$. It suffices to prove that K^\wedge is derived complete and that $K \rightarrow K^\wedge$ is an isomorphism if K is derived complete.

Let $f \in A$. By Lemma 15.64.8 the object $R\text{Hom}(A_f, K^\wedge)$ is equal to

$$R\text{Hom}\left(\left(A_f \rightarrow \prod_{i_0} A_{ff_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{ff_{i_0}f_{i_1}} \rightarrow \dots \rightarrow A_{ff_1 \dots f_r}\right), K\right)$$

If $f \in I$, then f_1, \dots, f_r generate the unit ideal in A_f , hence the extended alternating Čech complex

$$A_f \rightarrow \prod_{i_0} A_{ff_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{ff_{i_0}f_{i_1}} \rightarrow \dots \rightarrow A_{ff_1 \dots f_r}$$

is zero in $D(A)$ by Lemma 15.20.13. (In fact, if $f = f_i$ for some i , then this complex is homotopic to zero; this is the only case we need.) Hence $R\text{Hom}(A_f, K^\wedge) = 0$ and we conclude that K^\wedge is derived complete by Lemma 15.64.1.

Conversely, if K is derived complete, then $R\text{Hom}(A_f, K)$ is zero for all $f = f_{i_0} \dots f_{i_p}$, $p \geq 0$. Thus $K \rightarrow K^\wedge$ is an isomorphism in $D(A)$. \square

Alternative proof existence completion. For each $i \in \{1, \dots, r\}$ let $D_i(A)$ denote the full subcategory of objects which are derived complete with respect to (f_i) . Then $D_{\text{comp}}(A) = D_1(A) \cap \dots \cap D_r(A)$. A formal argument shows it suffices to construct a left adjoint for $D_i(A) \rightarrow D(A)$. Thus we may and do assume $I = (f)$ for some $f \in A$. Any object of $D(A)$ can be represented by a K-injective complex of A -modules J^\bullet . Then $\text{Hom}_A(A_f, J^\bullet)$ is a K-injective complex of A_f -modules and K-injective as a complex of A -modules, by Lemmas 15.43.3 and 15.43.1. We claim that

$$C^\bullet = \text{Cone}(\text{Hom}_A(A_f, J^\bullet) \rightarrow J^\bullet)$$

endowed with the canonical from J^\bullet is the derived completion. Namely, we have a distinguished triangle

$$\text{Hom}_A(A_f, J^\bullet) \rightarrow J^\bullet \rightarrow C^\bullet \rightarrow \text{Hom}_A(A_f, J^\bullet)[1]$$

and for any derived complete complex N^\bullet we have

$$\text{Hom}_{D(A)}(\text{Hom}_A(A_f, J^\bullet), N^\bullet) = 0$$

by Lemma 15.64.1. The long exact sequence of Hom's easily shows that C^\bullet has the desired universal property. \square

Lemma 15.64.10. *Let A be a ring and let $I \subset A$ be a finitely generated ideal. Let K^\bullet be a complex of A -modules such that $f : K^\bullet \rightarrow K^\bullet$ is an isomorphism for some $f \in I$, i.e., K^\bullet is a complex of A_f -modules. Then the derived completion of K^\bullet is zero.*

Proof. Indeed, in this case the $R\text{Hom}(K, L)$ is zero for any derived complete complex L , see Lemma 15.64.1. Hence K^\wedge is zero by the universal property in Lemma 15.64.9. \square

Lemma 15.64.11. *Let A be a ring and let $I \subset A$ be a finitely generated ideal. Let $K, L \in D(A)$. Then*

$$R\text{Hom}(K, L)^\wedge = R\text{Hom}(K, L^\wedge) = R\text{Hom}(K^\wedge, L^\wedge)$$

Proof. By Lemma 15.64.9 we know that derived completion is given by $R\text{Hom}(C, -)$ for some $C \in D(A)$. Then

$$R\text{Hom}(C, R\text{Hom}(K, L)) = R\text{Hom}(C \otimes_A^L K, L) = R\text{Hom}(K, R\text{Hom}(C, L))$$

by Lemma 15.55.1. This proves the first equation. The map $K \rightarrow K^\wedge$ induces a map

$$R\text{Hom}(K^\wedge, L^\wedge) \rightarrow R\text{Hom}(K, L^\wedge)$$

which is an isomorphism in $D(A)$ by definition of the derived completion as the left adjoint to the inclusion functor. \square

Let A be a ring and let $I \subset A$ be an ideal. For any $K \in D(A)$ we can consider the derived limit

$$K' = R\lim(K \otimes_A^L A/I^n)$$

This is a functor in K , see Remark 15.61.17. The system of maps $A \rightarrow A/I^n$ induces a map $K \rightarrow K'$. It turns out that K' is derived complete with respect to I . This “naive” derived completion construction does not agree with the adjoint of Lemma 15.64.9 in general. For example, if $A = \mathbf{Z}_p \oplus \mathbf{Q}_p/\mathbf{Z}_p$ with the second summand an ideal of square zero, $K = A[0]$, and $I = (p)$, then the naive derived completion gives

$\mathbf{Z}_p[0]$, but the construction of Lemma 15.64.9 gives $K^\wedge \cong \mathbf{Z}_p[1] \oplus \mathbf{Z}_p[0]$ (computation omitted).

Lemma 15.64.12. *Let A be a ring and let $I \subset A$ be an ideal. For $K \in D(A)$ the naive derived completion $K' = R\lim(K \otimes_A^{\mathbf{L}} A/I^n)$ is derived complete with respect to I .*

Proof. Let $f \in I$. The groups $\text{Ext}_A^p(A_f, K')$ sit in short exact sequences

$$0 \rightarrow R^1 \lim \text{Ext}_A^{p-1}(A_f, K \otimes_A^{\mathbf{L}} A/I^n) \rightarrow \text{Ext}_A^p(A_f, K') \rightarrow \lim \text{Ext}_A^p(A_f, K \otimes_A^{\mathbf{L}} A/I^n) \rightarrow 0$$

by Lemma 15.61.3. We conclude since f acts both as an isomorphism and nilpotently on the outer terms. \square

Lemma 15.64.13. *Let A be a ring. Let $f \in A$. If there exists an integer $c \geq 1$ such that $A[f^c] = A[f^{c+1}] = A[f^{c+2}] = \dots$ (for example if A is Noetherian), then for all $n \geq 1$ there exist maps*

$$(A \xrightarrow{f^n} A) \longrightarrow A/(f^n), \quad \text{and} \quad A/(f^{n+c}) \longrightarrow (A \xrightarrow{f^n} A)$$

in $D(A)$ inducing an isomorphism of the pro-objects $\{A/(f^n)\}$ and $\{(f^n : A \rightarrow A)\}$ in $D(A)$.

Proof. The first displayed arrow is obvious. We can define the second arrow of the lemma by the diagram

$$\begin{array}{ccc} A/A[f^c] & \xrightarrow{f^{n+c}} & A \\ f^c \downarrow & & \downarrow 1 \\ A & \xrightarrow{f^n} & A \end{array}$$

Since the top horizontal arrow is injective the complex in the top row is quasi-isomorphic to $A/f^{n+c}A$. We omit the calculation of compositions needed to show the statement on pro objects. \square

Let A be a ring. Let $f_1, \dots, f_r \in A$. We are going to consider the sequence of Koszul complexes $K_n^\bullet = K_\bullet(A, f_1^n, \dots, f_r^n)$ placed in cohomological degrees $-r, -r+1, \dots, 0$. Using the functoriality of Lemma 15.20.3 we get maps

$$\dots \rightarrow K_3^\bullet \rightarrow K_2^\bullet \rightarrow K_1^\bullet$$

compatible with $H^0(K_n^\bullet) = A/(f_1^n, \dots, f_r^n)$ and the natural maps between these quotients. A key feature of the discussion below will use that for $m > n$ the map

$$K_m^{-p} = \wedge^p(A^{\oplus r}) \rightarrow \wedge^p(A^{\oplus r}) = K_n^{-p}$$

is given by multiplication by $f_{i_1}^{m-n} \dots f_{i_p}^{m-n}$ on the basis element $e_{i_1} \wedge \dots \wedge e_{i_p}$. Finally, note that there is a compatible system of maps $A \rightarrow K_n^\bullet$.

Lemma 15.64.14. *With notation as above, let $I = (f_1, \dots, f_r) \subset A$. For $K \in D(A)$ the object $K' = R\lim(K \otimes_A^{\mathbf{L}} K_n^\bullet)$ is derived complete with respect to I .*

Proof. Let $f \in I$. We have short exact sequences

$$0 \rightarrow R^1 \lim \text{Ext}_A^{p-1}(A_f, K \otimes_A^{\mathbf{L}} K_n^\bullet) \rightarrow \text{Ext}_A^p(A_f, K') \rightarrow \lim \text{Ext}_A^p(A_f, K \otimes_A^{\mathbf{L}} K_n^\bullet) \rightarrow 0$$

by Lemma 15.61.3. We conclude the middle term is zero as f acts both as an isomorphism and nilpotently on the outer terms (recall that f_i^n acts by an endomorphism of K_n^\bullet which is homotopic to zero). Thus K is derived complete with respect to I . \square

Lemma 15.64.15. *With notation as above. Let $I = (f_1, \dots, f_r)$. Let $K \in D(A)$. The following are equivalent*

- (1) K is derived complete with respect to I , and
- (2) the canonical map $K \rightarrow R\lim(K \otimes_A^L K_n^\bullet)$ is an isomorphism of $D(A)$.

Proof. If (2) holds, then K is derived complete with respect to I by Lemma 15.64.14. Conversely, assume that K is derived complete with respect to I . Consider the filtrations

$$K_n^\bullet \supset \sigma_{\geq -r+1} K_n^\bullet \supset \sigma_{\geq -r+2} K_n^\bullet \supset \dots \supset \sigma_{\geq -1} K_n^\bullet \supset \sigma_{\geq 0} K_n^\bullet = A$$

by stupid truncations (Homology, Section 12.13). Because the construction $R\lim(K \otimes E)$ is exact in the second variable (Lemma 15.61.18) we see that it suffices to show

$$R\lim(K \otimes_A^L (\sigma_{\geq p} K_n^\bullet / \sigma_{\geq p+1} K_n^\bullet)) = 0$$

for $p < 0$. The explicit description of the Koszul complexes above shows that

$$R\lim(K \otimes_A^L (\sigma_{\geq p} K_n^\bullet / \sigma_{\geq p+1} K_n^\bullet)) = \bigoplus_{i_1, \dots, i_{-p}} T(K, f_{i_1} \dots f_{i_{-p}})$$

which is zero for $p < 0$ by assumption on K . □

Lemma 15.64.16. *With notation as above. Let $I = (f_1, \dots, f_r) \subset A$. The functor which sends $K \in D(A)$ to the derived limit $K' = R\lim(K \otimes_A^L K_n^\bullet)$ is the left adjoint to the inclusion functor $D_{\text{comp}}(A) \rightarrow D(A)$ constructed in Lemma 15.64.9.*

Proof. The assignment $K \rightsquigarrow K'$ is a functor and K' is derived complete with respect to I by Lemma 15.64.14. By a formal argument (omitted) we see that it suffices to show $K \rightarrow K'$ is an isomorphism if K is derived complete with respect to I . This is Lemma 15.64.15. □

Lemma 15.64.17. *Let A be a ring and let $I \subset A$ be an ideal which can be generated by r elements. Then derived completion has finite cohomological dimension:*

- (1) *If $K \rightarrow L$ is a morphism of $D(A)$ which induces an isomorphism on $H^i(K) \rightarrow H^i(L)$ for $i \geq 0$ then $H^i(K^\wedge) \rightarrow H^i(L^\wedge)$ is an isomorphism for $i \geq 1$.*
- (2) *If $K \rightarrow L$ is a morphism of $D(A)$ which induces an isomorphism on $H^i(K) \rightarrow H^i(L)$ for $i \leq 0$ then $H^i(K^\wedge) \rightarrow H^i(L^\wedge)$ is an isomorphism for $i \leq -r - 1$.*

Proof. Say I is generated by f_1, \dots, f_r . By Lemma 15.64.16 we have

$$H^i(K^\wedge) = H^i(R\lim K \otimes_A^L K_n^\bullet)$$

and hence this fits into a short exact sequence

$$0 \rightarrow R^1 \lim H^{i-1}(K \otimes_A^L K_n^\bullet) \rightarrow H^i(K^\wedge) \rightarrow \lim H^i(K \otimes_A^L K_n^\bullet) \rightarrow 0$$

by Lemma 15.61.6. Thus it suffices to prove that $H^i(K \otimes_A^L K_n^\bullet)$ only depends on $H^j(K)$ for $j \in \{i, \dots, i+r\}$. As K_n^\bullet is a complex of finite free modules sitting in degrees $-r, \dots, 0$ this follows from an straightforward argument which we omit. □

Lemma 15.64.18. *With notation as above. If A is Noetherian, then for every n there exists an $m \geq n$ such that $K_m^\bullet \rightarrow K_n^\bullet$ factors through the map $K_m^\bullet \rightarrow A/(f_1^m, \dots, f_r^m)$. In other words, the pro-objects $\{K_n^\bullet\}$ and $\{A/(f_1^n, \dots, f_r^n)\}$ of $D(A)$ are isomorphic.*

Proof. Note that the Koszul complexes have length r . Thus the dual of Derived Categories, Lemma 13.12.5 implies it suffices to show that for every $p < 0$ and $n \in \mathbf{N}$ there exists an $m \geq n$ such that $H^p(K_m^\bullet) \rightarrow H^p(K_n^\bullet)$ is zero. Since A is Noetherian, we see that

$$H^p(K_n^\bullet) = \frac{\text{Ker}(K_n^p \rightarrow K_n^{p+1})}{\text{Im}(K_n^{p-1} \rightarrow K_n^p)}$$

is a finite A -module. Moreover, the map $K_m^p \rightarrow K_n^p$ is given by a diagonal matrix whose entries are in the ideal $(f_1^{m-n}, \dots, f_r^{m-n})$ if $p < 0$ (in fact they are in the $|p|$ th power of that ideal). Note that $H^p(K_n^\bullet)$ is annihilated by $I = (f_1^n, \dots, f_r^n)$, see Lemma 15.20.6. Now $I^t \subset (f_1^{m-n}, \dots, f_r^{m-n})$ for $m = n + tr$. Thus by Artin-Rees (Algebra, Lemma 10.49.2) for some m large enough we see that the image of $K_m^p \rightarrow K_n^p$ intersected with $\text{Ker}(K_n^p \rightarrow K_n^{p+1})$ is contained in $I\text{Ker}(K_n^p \rightarrow K_n^{p+1})$. For this m we get the zero map. \square

Proposition 15.64.19. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. The functor which sends $K \in D(A)$ to the derived limit $K' = R\lim(K \otimes_A^{\mathbf{L}} A/I^n)$ is the left adjoint to the inclusion functor $D_{\text{comp}}(A) \rightarrow D(A)$ constructed in Lemma 15.64.9.*

Proof. Say $(f_1, \dots, f_r) = I$ and let K_n^\bullet be the Koszul complex with respect to f_1^n, \dots, f_r^n . By Lemma 15.64.16 it suffices to prove that

$$R\lim(K \otimes_A^{\mathbf{L}} K_n^\bullet) = R\lim(K \otimes_A^{\mathbf{L}} A/(f_1^n, \dots, f_r^n)) = R\lim(K \otimes_A^{\mathbf{L}} A/I^n).$$

By Lemma 15.64.18 the pro-objects $\{K_n^\bullet\}$ and $\{A/(f_1^n, \dots, f_r^n)\}$ of $D(A)$ are isomorphic. It is clear that the pro-objects $\{A/(f_1^n, \dots, f_r^n)\}$ and $\{A/I^n\}$ are isomorphic. Thus the map from left to right is an isomorphism by Lemma 15.61.19. \square

As an application of the proposition above we identify the derived completion in the Noetherian case for pseudo-coherent complexes.

Lemma 15.64.20. *Let A be a Noetherian ring and $I \subset A$ an ideal. Let K be an object of $D(A)$ such that $H^n(A)$ a finite A -module for all $n \in \mathbf{Z}$. Then the cohomology modules $H^n(K^\wedge)$ of the derived completion are the I -adic completions of the cohomology modules $H^n(K)$.*

Proof. The complex $\tau_{\leq m}K$ is pseudo-coherent for all m by Lemma 15.50.16. Thus $\tau_{\leq m}K$ is represented by a bounded above complex P^\bullet of finite free A -modules. Then $\tau_{\leq m}K \otimes_A^{\mathbf{L}} A/I^n = P^\bullet/I^n P^\bullet$. Hence $(\tau_{\leq m}K)^\wedge = R\lim P^\bullet/I^n P^\bullet$ (Proposition 15.64.19) and since the $R\lim$ is just given by termwise \lim (Lemma 15.61.9) and since I -adic completion is an exact functor on finite A -modules (Algebra, Lemma 10.93.3) we conclude the result holds for $\tau_{\leq m}K$. Hence the result holds for K as derived completion has finite cohomological dimension, see Lemma 15.64.17. \square

Lemma 15.64.21. *Let I be a finitely generated ideal of a ring A . Let M be a derived complete A -module. If $M/IM = 0$, then $M = 0$.*

Proof. Assume that M/IM is zero. Let $I = (f_1, \dots, f_r)$. Let $i < r$ be the largest integer such that $N = M/(f_1, \dots, f_i)M$ is nonzero. If i does not exist, then $M = 0$ which is what we want to show. Then N is derived complete as a cokernel of a map

between derived complete modules, see Lemma 15.64.6. By our choice of i we have that $f_{i+1} : N \rightarrow N$ is surjective. Hence

$$\lim(\dots \rightarrow N \xrightarrow{f_{i+1}} N \xrightarrow{f_{i+1}} N)$$

is nonzero, contradicting the derived completeness of N . \square

Lemma 15.64.22. *Let I be an ideal of a Noetherian ring A . Let M be a derived complete A -module. If M/IM is a finite A/I -module, then $M = \lim M/I^n M$ and M is a finite A^\wedge -module.*

Proof. Assume M/IM is finite. Pick $x_1, \dots, x_t \in M$ which map to generators of M/IM . We obtain a map $A^{\oplus t} \rightarrow M$ mapping the i th basis vector to x_i . By Proposition 15.64.19 the derived completion of A is $A^\wedge = \lim A/I^n$. As M is derived complete, we see that our map factors through a map $q : (A^\wedge)^{\oplus t} \rightarrow M$. The module $\text{Coker}(q)$ is zero by Lemma 15.64.21. Thus M is a finite A^\wedge -module. Since A^\wedge is Noetherian and complete with respect to IA^\wedge , it follows that M is I -adically complete (use Algebra, Lemmas 10.93.9, 10.93.16, and 10.49.2). \square

Remark 15.64.23. Let A be a ring and $f \in A$. Set $I = (f)$. In this situation we have the naive derived I -adic completion functor $K \mapsto K' = R\lim(K \otimes_A^{\mathbf{L}} A/f^n A)$ and the functor

$$K \mapsto K^\wedge = R\lim(K \otimes_A^{\mathbf{L}} (A \xrightarrow{f^n} A))$$

of Lemmas 15.64.16 and 15.64.9. There is a natural transformation of functors $K^\wedge \rightarrow K'$. Thus we ask: When is this transformation an isomorphism of functors? We have seen in Proposition 15.64.19 that this is true if A is Noetherian. More generally, the same argument shows this is true if the pro-objects $\{(f^n : A \rightarrow A)\}$ and $\{A/f^n A\}$ are equal, for example if f -torsion is bounded (Lemma 15.64.13). Conversely, we see from Lemma 15.61.18 that the condition is exactly that

$$R\lim(K \otimes_A^{\mathbf{L}} A[f^n])$$

is zero for all $K \in D(A)$. Here the maps of the system $(A[f^n])$ are given by multiplication by f . Taking $K = A$ and $K = \bigoplus_{i \in \mathbf{N}} A$ we see from Lemma 15.61.8 this implies $(A[f^n])$ is zero as a pro-object, i.e., $f^{n-1}A[f^n] = 0$ for some n , i.e., $A[f^{n-1}] = A[f^n]$, i.e., the f -torsion is bounded.

Example 15.64.24. Let A be a ring. Let $f \in A$ be a nonzerodivisor. An example to keep in mind is $A = \mathbf{Z}_p$ and $f = p$. Let M be an A -module. Claim: M is derived complete with respect to f if and only if there exists a short exact sequence

$$0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$$

where K, L are f -adically complete modules whose f -torsion is zero. Namely, if there is a such a short exact sequence, then

$$M \otimes_A^{\mathbf{L}} (A \xrightarrow{f^n} A) = (K/f^n K \rightarrow L/f^n L)$$

because f is a nonzero divisor on K and L and we conclude that $R\lim(M \otimes_A^{\mathbf{L}} (A \xrightarrow{f^n} A))$ is quasi-isomorphic to $K \rightarrow L$, i.e., M . This shows that M is derived complete by Lemma 15.64.15. Conversely, suppose that M is derived complete. Choose a surjection $F \rightarrow M$ where F is a free A -module. Since f is a nonzero divisor on F the derived completion of F is $L = \lim F/f^n F$. Note that L is f -torsion free: if (x_n) with $x_n \in F$ represents an element ξ of L and $f\xi = 0$, then $x_n = x_{n+1} + f^n z_n$

and $fx_n = f^n y_n$ for some $z_n, y_n \in F$. Then $f^n y_n = fx_n = fx_{n+1} + f^{n+1} z_n = f^{n+1} y_{n+1} + f^{n+1} z_n$ and since f is a nonzero divisor on F we see that $y_n \in fF$ which implies that $x_n \in f^n F$, i.e., $\xi = 0$. Since L is the derived completion, the universal property gives a map $L \rightarrow M$ factoring $F \rightarrow M$. Let $K = \text{Ker}(L \rightarrow M)$ be the kernel. Again K is f -torsion free, hence the derived completion of K is $\lim K/f^n K$. On the other hand, both K and L are derived complete, hence K is too by Lemma 15.64.6. It follows that $K = \lim K/f^n K$ and the claim is proved.

Lemma 15.64.25. *Let $A \rightarrow B$ be a ring map. Let $I \subset A$ be an ideal. The inverse image of $D_{\text{comp}}(A, I)$ under the restriction functor $D(B) \rightarrow D(A)$ is $D_{\text{comp}}(B, IB)$.*

Proof. Using Lemma 15.64.2 we see that $L \in D(B)$ is in $D_{\text{comp}}(B, IB)$ if and only if $T(L, f)$ is zero for every local section $f \in I$. Observe that the cohomology of $T(L, f)$ is computed in the category of abelian groups, so it doesn't matter whether we think of f as an element of A or take the image of f in B . The lemma follows immediately from this and the definition of derived complete objects. \square

Lemma 15.64.26. *Let $A \rightarrow B$ be a ring map. Let $I \subset A$ be a finitely generated ideal. If $A \rightarrow B$ is flat and $A/I \cong B/IB$, then the restriction functor $D(B) \rightarrow D(A)$ induces an equivalence $D_{\text{comp}}(B, IB) \rightarrow D_{\text{comp}}(A, I)$.*

Proof. Choose generators f_1, \dots, f_r of I . Denote $\check{C}_A^\bullet \rightarrow \check{C}_B^\bullet$ the quasi-isomorphism of extended alternating Čech complexes of Lemma 15.63.4. Let $K \in D_{\text{comp}}(A, I)$. Let I^\bullet be a K-injective complex of A -modules representing K . Since $\text{Ext}_A^n(A_f, K)$ and $\text{Ext}_A^n(B_f, K)$ are zero for all $f \in I$ and $n \in \mathbf{Z}$ (Lemma 15.64.1) we conclude that $\check{C}_A^\bullet \rightarrow A$ and $\check{C}_B^\bullet \rightarrow B$ induce quasi-isomorphisms

$$I^\bullet = \text{Hom}_A(A, I^\bullet) \longrightarrow \text{Tot}(\text{Hom}_A(\check{C}_A^\bullet, I^\bullet))$$

and

$$\text{Hom}_A(B, I^\bullet) \longrightarrow \text{Tot}(\text{Hom}_A(\check{C}_B^\bullet, I^\bullet))$$

Some details omitted. Since $\check{C}_A^\bullet \rightarrow \check{C}_B^\bullet$ is a quasi-isomorphism and I^\bullet is K-injective we conclude that $\text{Hom}_A(B, I^\bullet) \rightarrow I^\bullet$ is a quasi-isomorphism. As the complex $\text{Hom}_A(B, I^\bullet)$ is a complex of B -modules we conclude that K is in the image of the restriction map, i.e., the functor is essentially surjective

In fact, the argument shows that $F : D_{\text{comp}}(A, I) \rightarrow D_{\text{comp}}(B, IB)$, $K \mapsto \text{Hom}_A(B, I^\bullet)$ is a left inverse to restriction. Finally, suppose that $L \in D_{\text{comp}}(B, IB)$. Represent L by a K-injective complex J^\bullet of B -modules. Then J^\bullet is also K-injective as a complex of A -modules (Lemma 15.43.1) hence $F(\text{restriction of } L) = \text{Hom}_A(B, J^\bullet)$. There is a map $J^\bullet \rightarrow \text{Hom}_A(B, J^\bullet)$ of complexes of B -modules, whose composition with $\text{Hom}_A(B, J^\bullet) \rightarrow J^\bullet$ is the identity. We conclude that F is also a right inverse to restriction and the proof is finished. \square

15.65. Taking limits of complexes

In this section we discuss what happens when we have a “formal deformation” of a complex and we take its limit. More precisely, we have a ring A an ideal I and objects $K_n \in D(A/I^n)$ which fit together in the sense that

$$K_n = K_{n+1} \otimes_{A/I^{n+1}}^L A/I^n.$$

Under some additional hypotheses we can show that $K = R\lim K_n$ reproduces the system in the sense that $K_n = K \otimes_A^{\mathbf{L}} A/I^n$. We do not know if the following lemma holds for unbounded complexes.

Lemma 15.65.1. *Let A be a ring and $I \subset A$ an ideal. Suppose given $K_n \in D(A/I^n)$ and maps $K_{n+1} \rightarrow K_n$ in $D(A/I^{n+1})$. If*

- (1) A is Noetherian,
- (2) K_1 is bounded above, and
- (3) the maps induce isomorphisms $K_{n+1} \otimes_{A/I^{n+1}}^{\mathbf{L}} A/I^n \rightarrow K_n$,

then $K = R\lim K_n$ is a derived complete object of $D^-(A)$ and $K \otimes_A^{\mathbf{L}} A/I^n \rightarrow K_n$ is an isomorphism for all n .

Proof. Suppose that $H^i(K_1) = 0$ for $i > b$. Then we can find a complex of free A/I -modules P_1^\bullet representing K_1 with $P_1^i = 0$ for $i > b$. By Lemma 15.57.3 we can, by induction on $n > 1$, find complexes P_n^\bullet of free A/I^n -modules representing K_n and maps $P_n^\bullet \rightarrow P_{n-1}^\bullet$ representing the maps $K_n \rightarrow K_{n-1}$ inducing isomorphisms (!) of complexes $P_n^\bullet/I^{n-1}P_n^\bullet \rightarrow P_{n-1}^\bullet$.

Thus we have arrived at the situation where $R\lim K_n$ is represented by $P^\bullet = \lim P_n^\bullet$, see Lemma 15.61.9 and Remark 15.61.15. The complexes P_n^\bullet are uniformly bounded above complexes of flat A/I^n -modules and the transition maps are termwise surjective. Then P^\bullet is a bounded above complex of flat A -modules by Lemma 15.19.4. It follows that $K \otimes_A^{\mathbf{L}} A/I^t$ is represented by $P^\bullet \otimes_A A/I^t$. We have $P^\bullet \otimes_A A/I^t = \lim P_n^\bullet \otimes_A A/I^t$ termwise by Lemma 15.19.4. The transition maps $P_{n+1}^\bullet \otimes_A A/I^t \rightarrow P_n^\bullet \otimes_A A/I^t$ are isomorphisms for $n \geq t$. Hence we have $\lim P_n^\bullet \otimes_A A/I^t = R\lim P_n^\bullet \otimes_A A/I^t$. By assumption and our choice of P_n^\bullet the complex $P_n^\bullet \otimes_A A/I^t = P_n^\bullet \otimes_{A/I^n}^{\mathbf{L}} A/I^t$ represents $K_n \otimes_{A/I^n}^{\mathbf{L}} A/I^t = K_t$ for all $n \geq t$. We conclude

$$P^\bullet \otimes_A A/I^t = R\lim P_n^\bullet \otimes_A A/I^t = R\lim K_t = K_t$$

In other words, we have $K \otimes_A^{\mathbf{L}} A/I^t = K_t$. This proves the lemma as it follows that K is derived complete by Proposition 15.64.19. \square

Lemma 15.65.2. *Let A be a ring and $I \subset A$ an ideal. Suppose given $K_n \in D(A/I^n)$ and maps $K_{n+1} \rightarrow K_n$ in $D(A/I^{n+1})$. Assume*

- (1) A is I -adically complete,
- (2) K_1 is pseudo-coherent, and
- (3) the maps induce isomorphisms $K_{n+1} \otimes_{A/I^{n+1}}^{\mathbf{L}} A/I^n \rightarrow K_n$.

Then $K = R\lim K_n$ is a pseudo-coherent, derived complete object of $D(A)$ and $K \otimes_A^{\mathbf{L}} A/I^n \rightarrow K_n$ is an isomorphism for all n .

Proof. By assumption we can find a bounded above complex of finite free A/I -modules P_1^\bullet representing K_1 , see Definition 15.50.1. By Lemma 15.57.3 we can, by induction on $n > 1$, find complexes P_n^\bullet of finite free A/I^n -modules representing K_n and maps $P_n^\bullet \rightarrow P_{n-1}^\bullet$ representing the maps $K_n \rightarrow K_{n-1}$ inducing isomorphisms (!) of complexes $P_n^\bullet/I^{n-1}P_n^\bullet \rightarrow P_{n-1}^\bullet$.

Thus $R\lim K_n$ is represented by $P^\bullet = \lim P_n^\bullet$, see Lemma 15.61.9 and Remark 15.61.15. Since A is I -adically complete the modules P^i are finite free A -modules. Thus K is pseudo-coherent. Moreover, P^\bullet is a bounded above complex of flat A -modules. It follows that $K \otimes_A^{\mathbf{L}} A/I^t$ is represented by $P^\bullet \otimes_A A/I^t$. We have $P^\bullet \otimes_A$

$A/I^t = \lim P_n^\bullet \otimes_A A/I^t$ termwise. The transition maps $P_{n+1}^\bullet \otimes_A A/I^t \rightarrow P_n^\bullet \otimes_A A/I^t$ are isomorphisms for $n \geq t$. Hence we have $\lim P_n^\bullet \otimes_A A/I^t = R\lim P_n^\bullet \otimes_A A/I^t$. By assumption and our choice of P_n^\bullet the complex $P_n^\bullet \otimes_A A/I^t = P_n^\bullet \otimes_{A/I^n} A/I^t$ represents $K_n \otimes_{A/I^n}^L A/I^t = K_t$ for all $n \geq t$. We conclude

$$P^\bullet \otimes_A A/I^t = R\lim P_n^\bullet \otimes_A A/I^t = R\lim K_t = K_t$$

In other words, we have $K \otimes_A^L A/I^t = K_t$. Finally, K_n is a derived complete object of $D(A)$ as it is annihilated by I^n . Since the category of derived objects is preserved under homotopy limits we see that K is derived complete. This proves the lemma. \square

Lemma 15.65.3. *Let A be a ring and $I \subset A$ an ideal. Suppose given $K_n \in D(A/I^n)$ and maps $K_{n+1} \rightarrow K_n$ in $D(A/I^{n+1})$. Assume*

- (1) A is I -adically complete,
- (2) K_1 is a perfect object, and
- (3) the maps induce isomorphisms $K_{n+1} \otimes_{A/I^{n+1}}^L A/I^n \rightarrow K_n$.

Then $K = R\lim K_n$ is a perfect, derived complete object of $D(A)$ and $K \otimes_A^L A/I^n \rightarrow K_n$ is an isomorphism for all n .

Proof. By Lemma 15.65.2 we see that K is bounded above, pseudo-coherent, and that $K \otimes_A^L A/I^n \rightarrow K_n$ is an isomorphism for all n . Thus it suffices to show that $H^i(K \otimes_A^L \kappa) = 0$ for $i \ll 0$ and every surjective map $A \rightarrow \kappa$ whose kernel is a maximal ideal \mathfrak{m} , see Lemma 15.56.18. Since A is I -adically complete we have $I \subset \mathfrak{m}$, see Algebra, Lemma 10.93.11. Hence
